   - If there is no value for License Server ID, verify that the appropriate LLS packages are installed and running using the following commands:

     ```
     rpm -qa | grep fneserver
     ps aux | grep fneserver
     ```

Register the Server

You can register the server in two ways:

- Register the server online in the Download Central Portal.
- Create an offline capability request in NetWitness Suite and upload the request to the Download Central Portal.

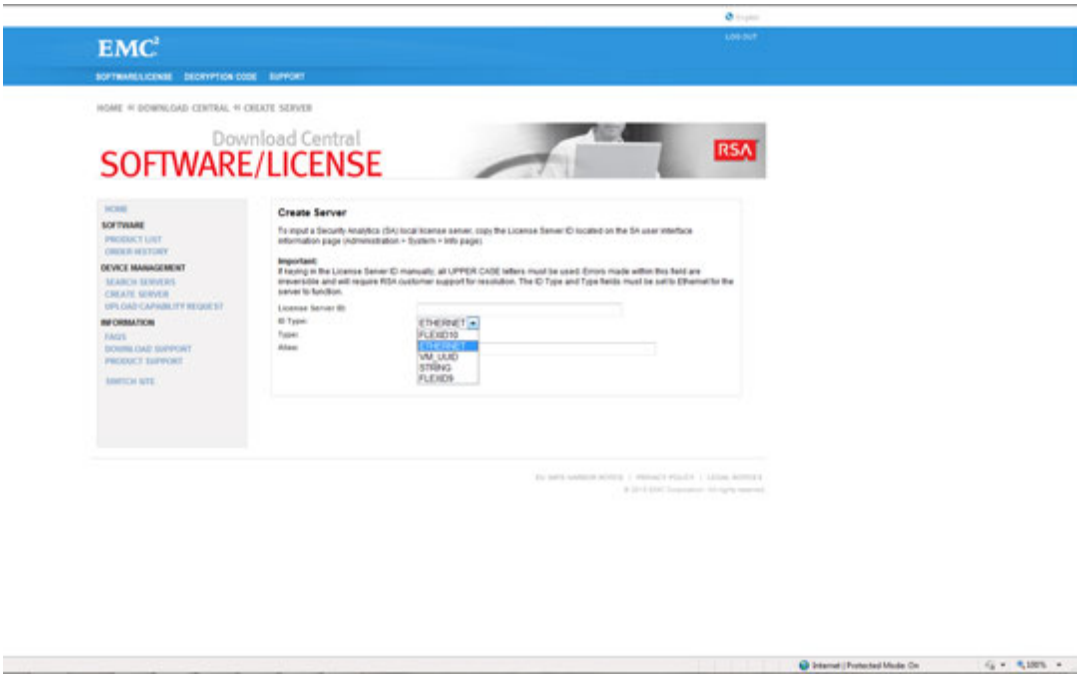
Register Online

To register the License Server ID online:

1. Navigate to the Download Central Portal at https://download.rsasecurity.com/ and log on with your user credentials.

   The **Download Central Menu** is displayed.

2. Do one of the following:
   - If you have already entered a server, under **Management** select **Search Servers** and skip to Step 3.
   - If you have not entered the server information, under **Appliance Management** select **Create Server**.
   - The **Create Server** dialog is displayed.



3. Complete these fields in the dialog:
   - Copy or enter (in uppercase letters) the License Server ID in the License Server ID field.
   - In the **ID Type** drop-down, select **ETHERNET** (the default value).

- In the **Type** drop-down, select **Ethernet** (the default value).
- (Optional) In the **Alias** field, type an alias to your Appliance ID.

4. Click **Create Server**.

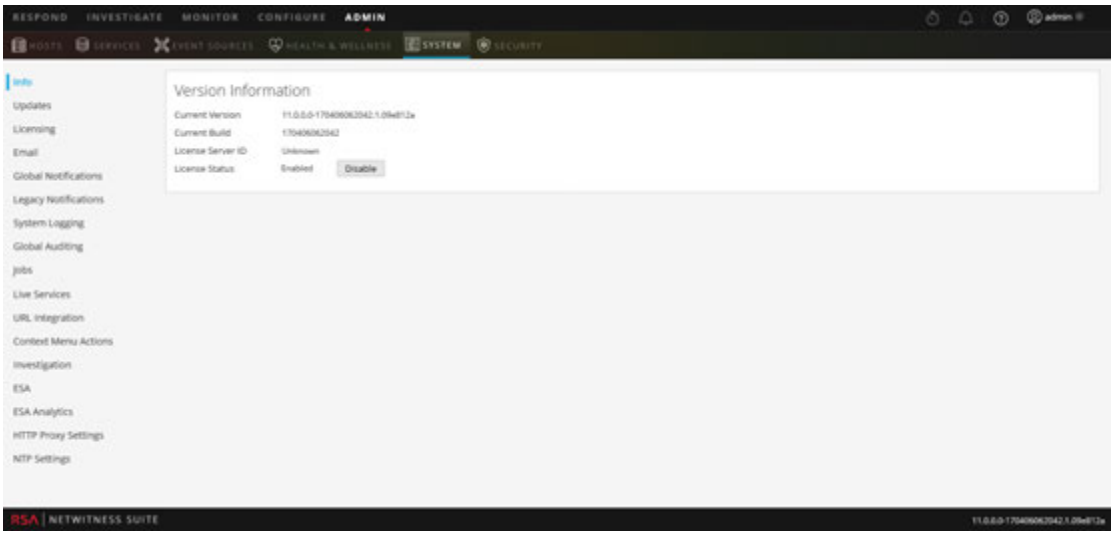
The server is registered and you can now map entitlements as described below.

Register Using an Offline Capability Request

If you do not want to register the NetWitness Server online, you can download an offline capability request in NetWitness Suite and upload that binary request to the Download Central Portal.

To register the server using an offline capability request:

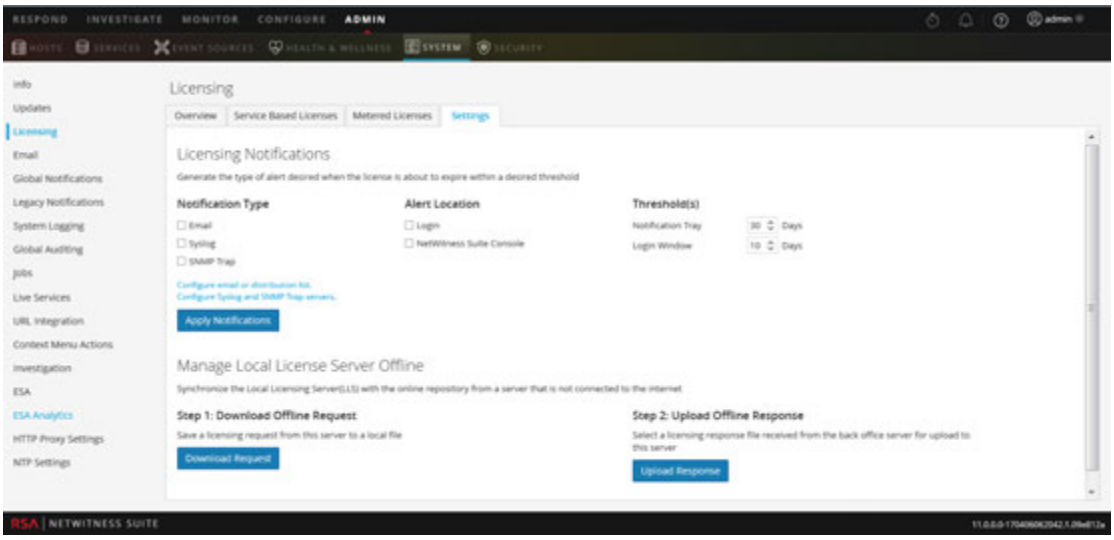
1. Log on to the NetWitness Server at **https://<*NW-IP*>**, where **<*NW-IP*>** is the NetWitness Server IP address.
2. Go to **ADMIN > System**.



The Admin System view is displayed.

3. Select the **Settings** tab.

The Licensing panel is displayed.



4. In the **Download Offline Request** section, click **Download Request**.

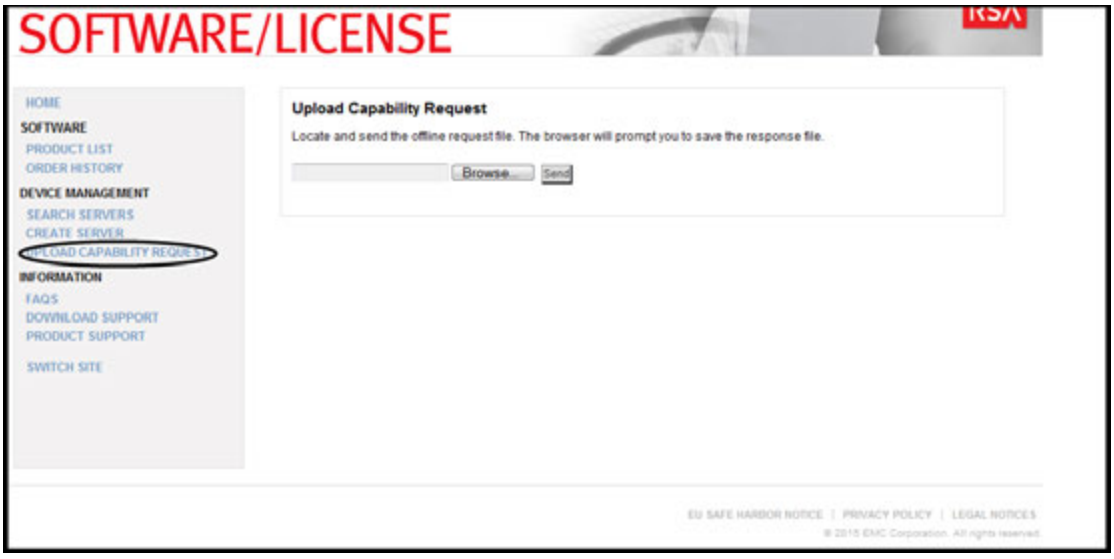
   A file called **OfflineCapabilityRequest.bin** is downloaded to the local system. This file contains current licensing information for the NetWitness Server.

5. Navigate to the Download Central Portal at https://download.rsasecurity.com/ and log on with your user credentials.

   The Download Central menu is displayed.

6. Under **Device Management**, click **Upload Capability Request**.

   The **Upload Capability Request** dialog is displayed.



7. Click **Choose File** and browse the local file system to find the file downloaded from the NetWitness Server. Select **OfflineCapabilityRequest.bin**.

   The filename is displayed next to the **Choose File** button.

8. Click **Send**.

   The server is created in Download Central, and the server information is displayed in the **View Server** dialog. This information includes the data just entered as well as information about any entitlements that have been added to the NetWitness Server. If the server has just been added, there are no entries under **Add-Ons**.

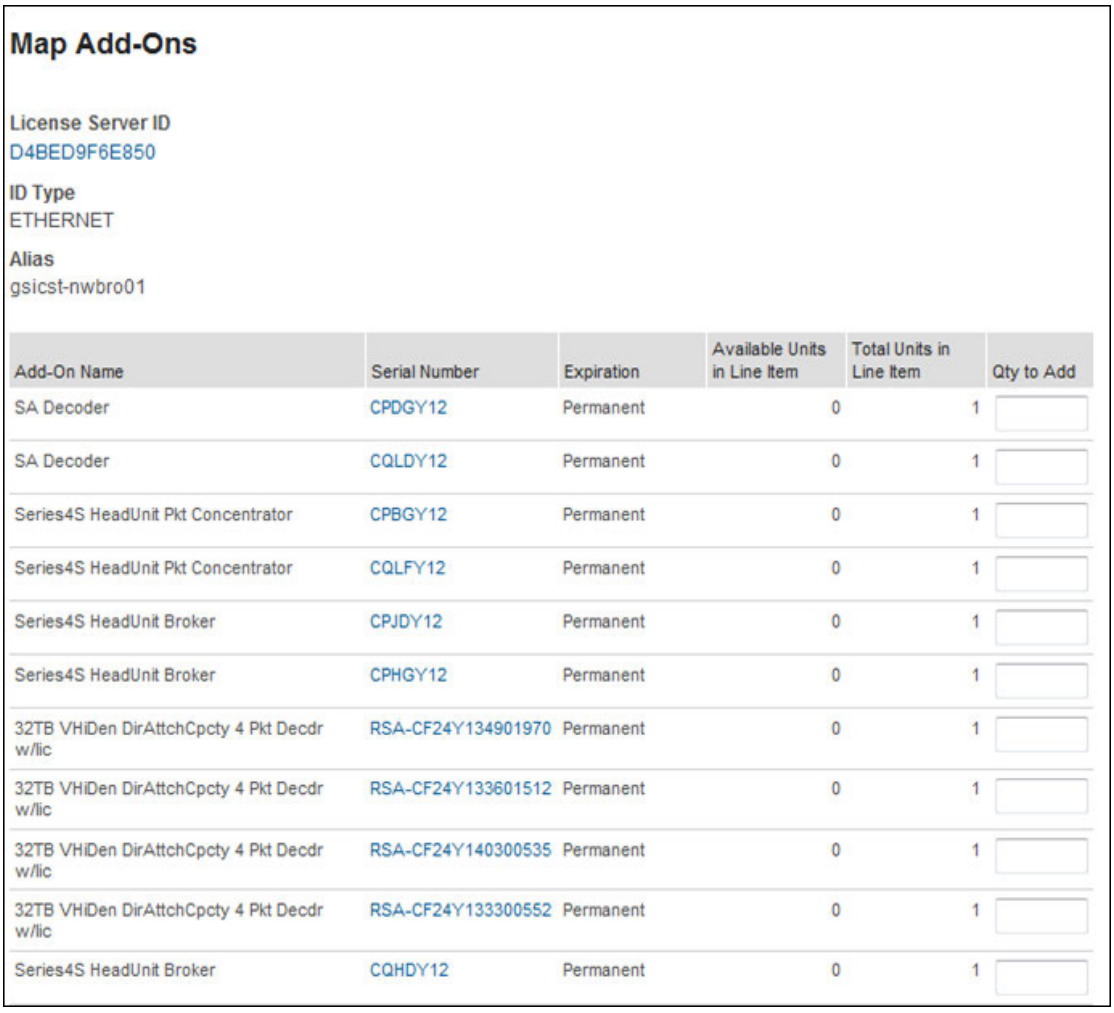
   The server is registered and you can now map entitlements as described below.

Map Entitlements

Mapping entitlements involves choosing the quantity of available licensed appliance entitlements to pull to this NetWitness Server during synchronization. To map appliance entitlements to the server:

1. In the **View Server** page, click **Map Add-Ons**.

   The Map Add-Ons section is displayed.



Map Add-Ons

License Server ID
D4BED9F6E850

ID Type
ETHERNET

Alias
gsicst-nwbro01

Add-On Name	Serial Number	Expiration	Available Units in Line Item	Total Units in Line Item	Qty to Add
SA Decoder	CPDGY12	Permanent	0	1	
SA Decoder	CQLDY12	Permanent	0	1	
Series4S HeadUnit Pkt Concentrator	CPBGY12	Permanent	0	1	
Series4S HeadUnit Pkt Concentrator	CQLFY12	Permanent	0	1	
Series4S HeadUnit Broker	CPJDY12	Permanent	0	1	
Series4S HeadUnit Broker	CPHGY12	Permanent	0	1	
32TB VHiDen DirAttchCpcty 4 Pkt Decdr w/lic	RSA-CF24Y134901970	Permanent	0	1	
32TB VHiDen DirAttchCpcty 4 Pkt Decdr w/lic	RSA-CF24Y133601512	Permanent	0	1	
32TB VHiDen DirAttchCpcty 4 Pkt Decdr w/lic	RSA-CF24Y140300535	Permanent	0	1	
32TB VHiDen DirAttchCpcty 4 Pkt Decdr w/lic	RSA-CF24Y133300552	Permanent	0	1	
Series4S HeadUnit Broker	CQHDY12	Permanent	0	1	

The Add-On table lists all entitlements that are available for your account. The table has a row for each appliance entitlement, with the following information:

- **Add-On Name**: The name of the entitlement; for example, SMC Concentrator or SMC Decoder.
- **Serial Number**: The serial number associated with an order.
- **Expiration**: For keys that are not permanent, the expiration information. The value in this field is a specific date (for example, 12/11/2017) or a time range (for example, 90 days). If the value is a time range, the expiration period begins when the add-on is mapped to a server.
- **Available Units in Line Item**: The quantity of entitlements currently available in an add-on order. This quantity is the difference between the Total Units and the entitlements that have been pulled to a NetWitness Server for appliance licensing.

- **Total Units in Line Item**: The total quantity of entitlements tied to a specific add-on order.
- **Quantity to Add**: The number of entitlements tied to a specific add-on order.

2. To designate the quantity of entitlements to pull to the NetWitness Server from an add-on order, type a quantity in the **Units to Configure** column.
3. Click **Map Add-Ons**.

   The View Server page displays a message indicating that the entitlements were successfully mapped to the NetWitness Server.

   Entitlements are now dedicated and set aside from an accounts pool. The message **Waiting to add to appliance** is displayed in the **Status** for each entitlement. The entitlements are not yet pulled to the server.

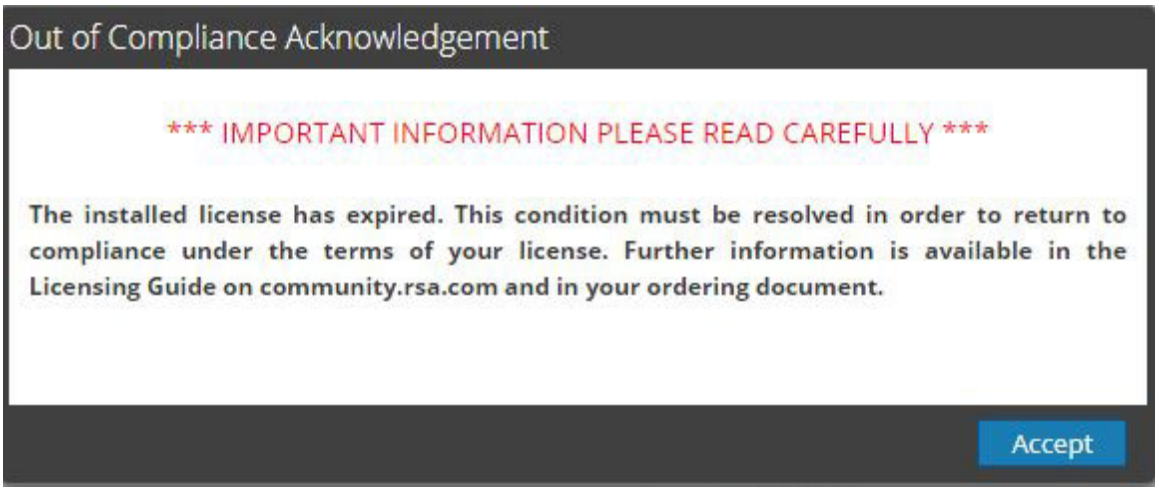
4. (Optional) If you want to add more entitlements, use the **Map Add-Ons** option.
5. (Optional) If you want to remove entitlements, use the **Remove Add-Ons** option.

Now you can synchronize to pull down the mapped entitlements to the NetWitness Server.

What Happens if No License is Installed

If you have not installed a NetWitness Suite Version 11.0 license, an Out-of-Compliance banner is displayed when you log in to the system at the end of 90 days.

The following Out of Compliance Acknowledgement message is displayed.



Click **Accept** to continue using your product.

Note: In a multiple NetWitness Suite deployment where the services are connected to both primary and secondary NetWitness Suite and the services are licensed only with the primary NetWitness Suite, a license expiry message is shown for the same services on the secondary NetWitness Suite. You can ignore the message and continue using the product.

Step 2. Synchronize NetWitness Server

This topic provides instructions for the second step of the NetWitness Suite entitlement process, synchronizing the NetWitness Server with the online repository and downloading mapped entitlements to the Local License Server (LLS).

Prerequisites

Before you perform this step, the NetWitness Server must be registered to Download Central and entitlements must be mapped. If you are doing online synchronization, NetWitness Suite must have access to the internet as well as have a designated nameserver (DNS). Internet access is not required for offline synchronization.

Verify That the Server Has a DNS

To verify that the server has a DNS:

1. Do one of the following:
   a. Manually enter the `nameserver` information within `/etc/resolv.conf` for static IP environments.
   b. Set the `BOOTPROTO` to `static` in the management IP configuration.
2. Restart the network services using the following command:

   ```
   service network restart
   ```

3. Verify the capability to reach external systems via a hostname. Update with FNO-OD hostname.

Synchronize with Download Central

There are two methods of synchronizing NetWitness Suite with Download Central: automatic (online) and offline. You can also force online synchronization by refreshing the view of LLS entitlements in the Performance Licensing tab.

Synchronize Automatically (Online)

By default NetWitness Suite is configured to synchronize with Download Central at regular intervals. No action is required.

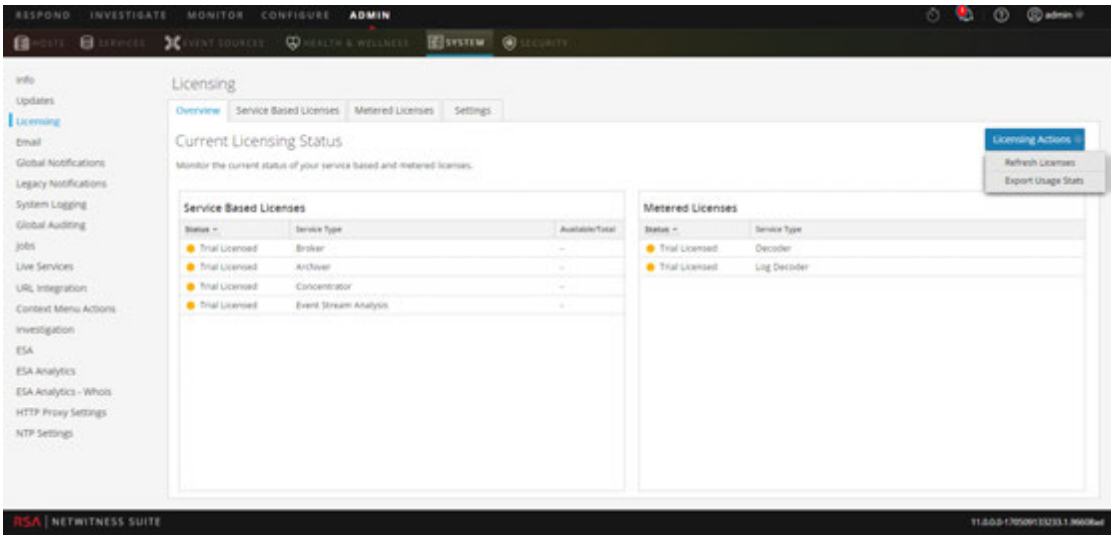
Refresh Licenses

Refreshing your licenses performs the following behind-the-scenes tasks:

- Restarts the LLS server to ensure the latest licenses are pulled down from the central Flexera server.
- Associates any unlicensed service with a valid license (if available).
- Replaces expired or Out-of-the-Box license with valid licenses (if available).

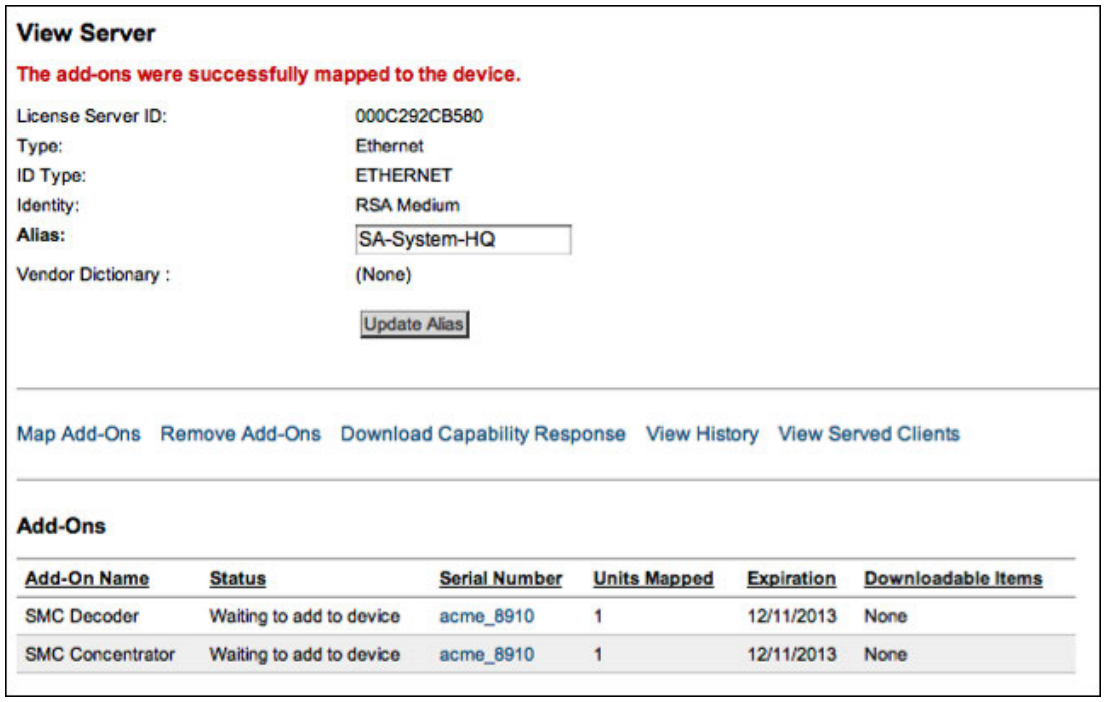
To refresh the view of available files on the Local License Server:

1. Log on to NetWitness Suite.
2. Go to **ADMIN > System.**
3. Select **Licensing** in the options panel.
   The Licensing panel is displayed.
4. Select **Refresh Licenses** from the Licensing Actions drop-down menu.

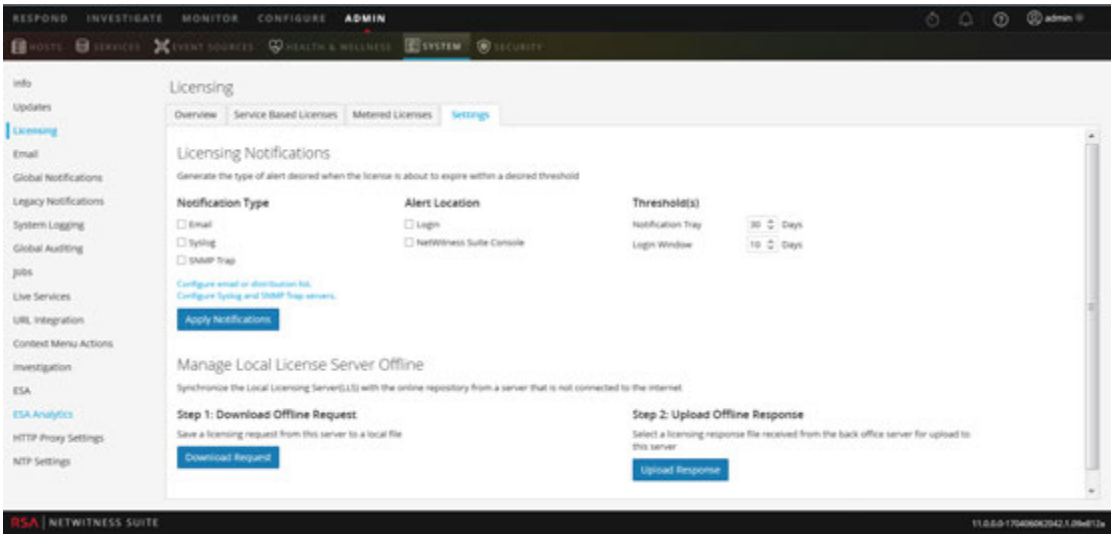


Synchronize Offline

If the NetWitness Server is not connected to the Internet, you can perform offline synchronization of entitlements through the View Server page in Download Central.



1. In the **View Server** page, select **Download Capability Response**.
   A prompt asks you to save a **response.bin** file.
2. From a system with access to the NetWitness Server, log on to the NetWitness Server at **https://*<NW-IP>***, where ***<NW-IP>*** is the NetWitness Server IP address.
3. Navigate to the Licensing panel and select the **Settings** tab.



4. In the **Manage Local License Server Offline** section, click **Upload Response**.
   The Upload Offline Capability Response dialog is displayed:

5. In the dialog, select the **response.bin** file so that it is displayed in the Upload File (bin) field.
6. Click **Upload**.
7. To verify a successful synchronization, do one or both of the following:
   - To view results in NetWitness Suite, refresh the **Performance Licensing** tab.

     The individual product entitlements that have been pulled down to NetWitness Suite are displayed in the **Available/Total** column.

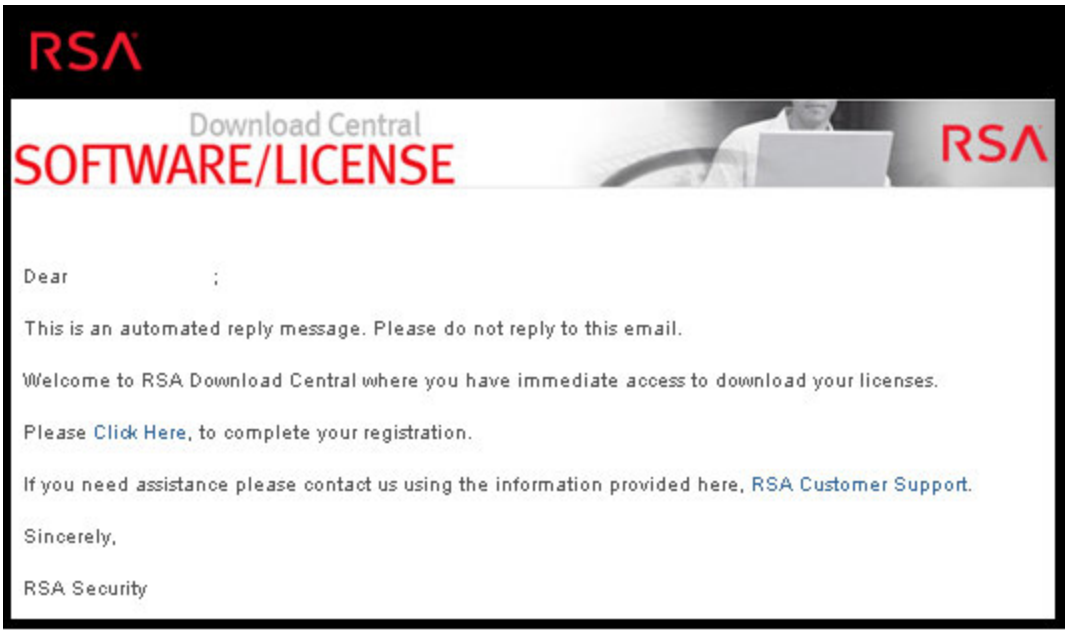
Product	Feature/Version	Available/Total
Concentrator	smcConcentrator 2013.1111	10 of 10
Decoder	smcDecoder 2013.1111	10 of 10

   - Within the Download Central interface, you can see the status for entitlements changed to **In Sync**.

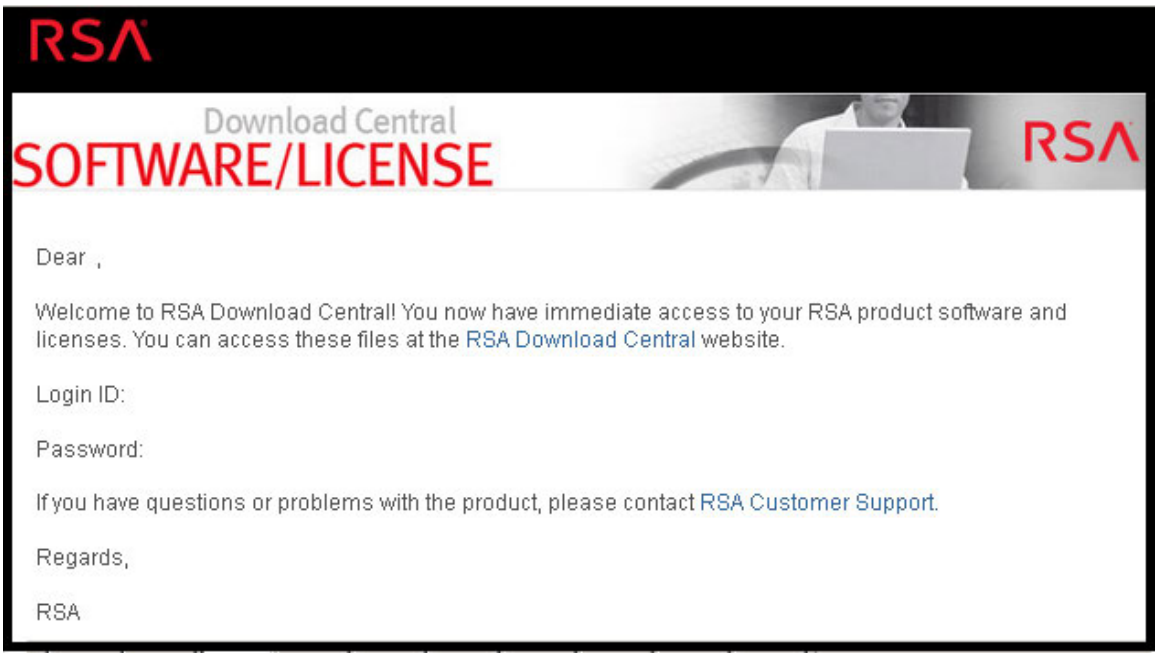
Step 3: Install Product Licenses from Download Central (DLC)

This topic provides instructions for downloading your RSA product licenses from Download Central (DLC).

1. At SAP order delivery, a DLC Welcome e-mail message is sent to all Customer Contacts that are included on the SAP Sales Order. Each contact receives an e-mail confirmation of the order. If the Customer Contact is a new DLC user, they also receive an e-mail message containing instructions explaining how to create their account.
   For new users, the Instructions e-mail message contains a **Click Here** link, as shown in the following example. This link takes you to the Enrollment Portal, where you must configure a Risk-Based Authentication (RBA) method for your account.

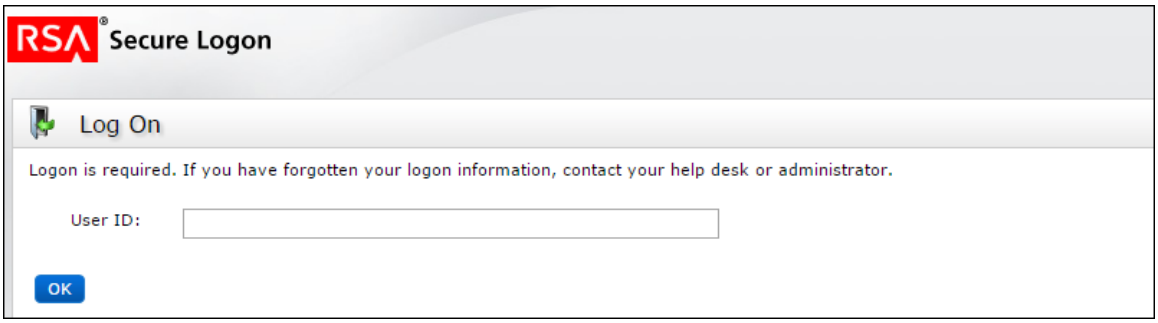


2. After the RBA method is enabled, you receive a Confirmation e-mail message containing your User ID (which is your e-mail address), along with a temporary password. During the initial login session, you are prompted to change your password. Once your password is changed, you are logged into Download Central (DLC).



Note: If the Customer Contact has a pre-existing account for the Link or RSA Online websites, they receive only one e-mail message that instructs them on how to use those existing login credentials. The Customer Contact will log into DLC with their existing User ID, password, and RSA method(s).

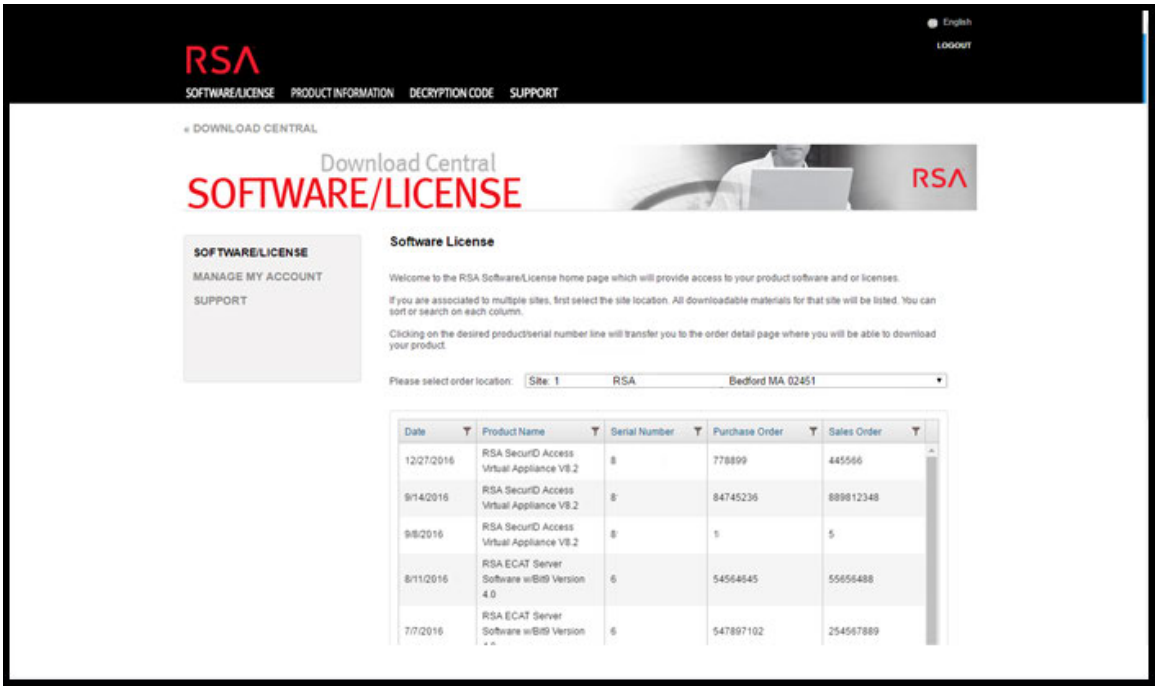
3. When you navigate to https://download.rsasecurity.com, the **RSA Secure Logon** screen is displayed, as shown in the example below.



4. Enter your User ID and click **OK**, which displays the **Password** field. After you enter your password, you are logged into Download Central.
   Your contact e-mail address is used to authenticate your User ID. If the Customer Authentication process is successful, the Download Central Software/License page displays a list of all downloadable RSA Products, Serial Numbers, Purchase Orders, and Sales Orders that is associated with this particular Customer Contact.

Note: You may be prompted to verify your identity via your RBA method if you fail the login several times in a row, or if you have not logged into DLC within the past several months.

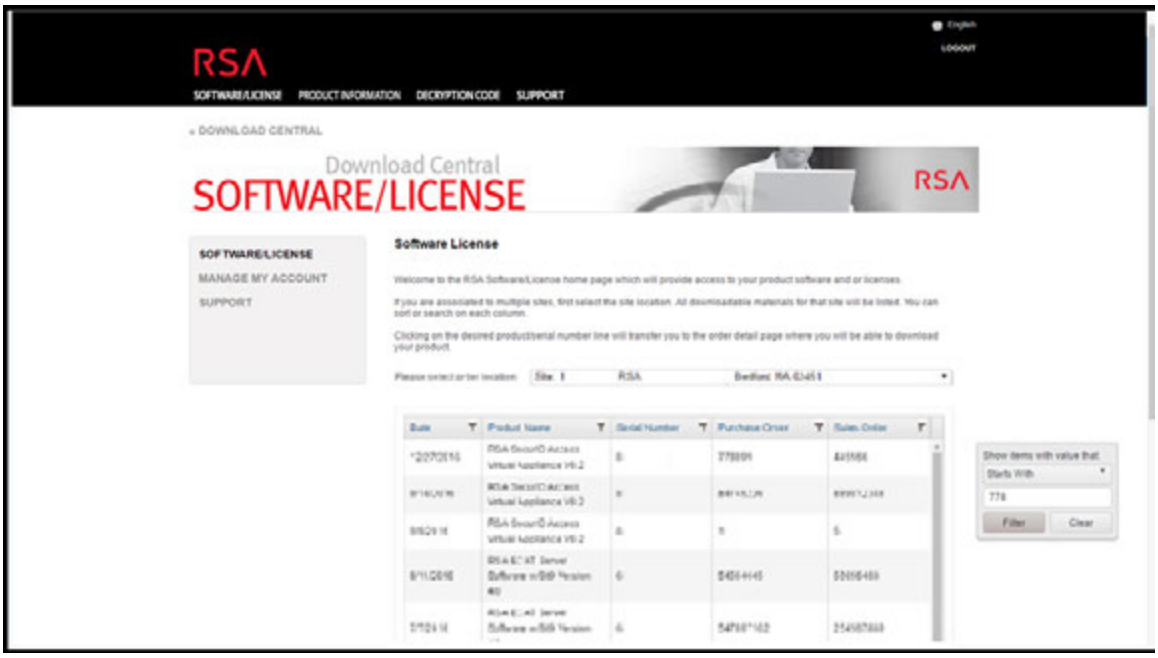
The list of products, sales orders, and purchase orders is filtered and displays only those which were ordered for the Order Location you selected in the drop-down menu, as shown in the following example.



5. If the desired order is not displayed, you can use the Column Filter to narrow your search by filtering on any of the following criteria:

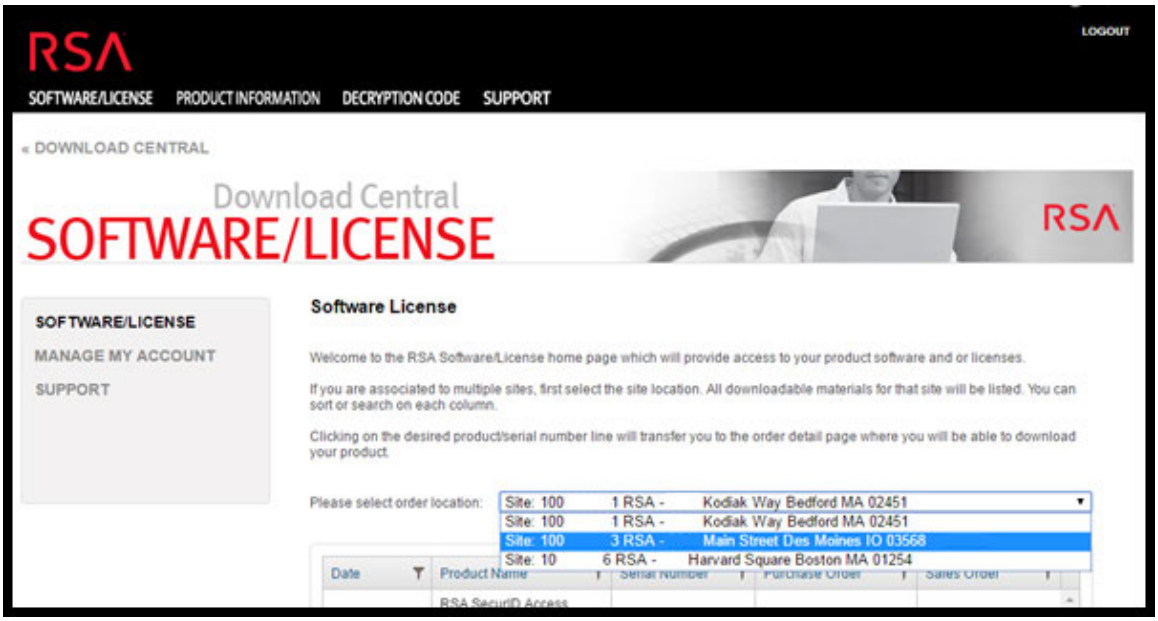
- Date
- Product Name
- Serial Number
- Purchase Order
- Sales Order

In the following example, the **Purchase Order** filter was used to locate Customer Purchase Order 778899.

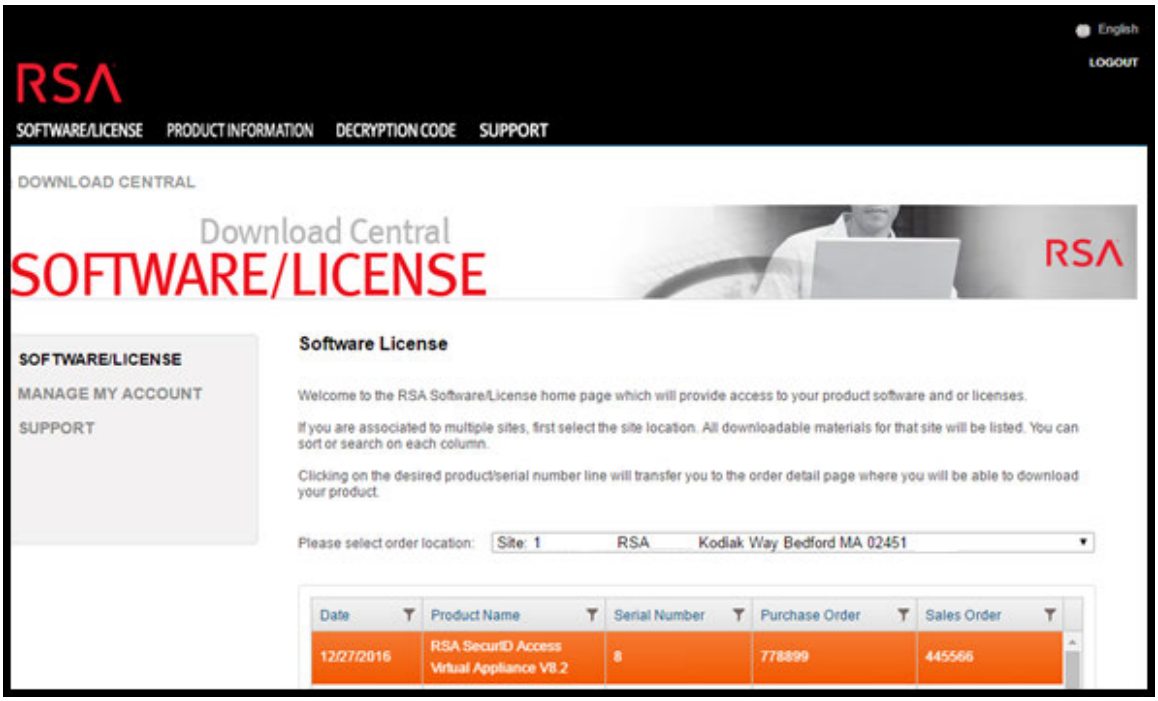


Note: Each contact is associated with at least one Customer ID Site. This Site ID is the Install At (physical location) shown in the Purchase Order that the customer submitted to RSA. Some contacts may be associated with multiple Site IDs, each with their own list of downloads.
To switch between Site IDs, click the **Please select order location** drop-down menu, and select the appropriate address.

6. When your desired download is located in the **Please select order location** drop-down menu, click on the highlighted line item, as shown in the following example.

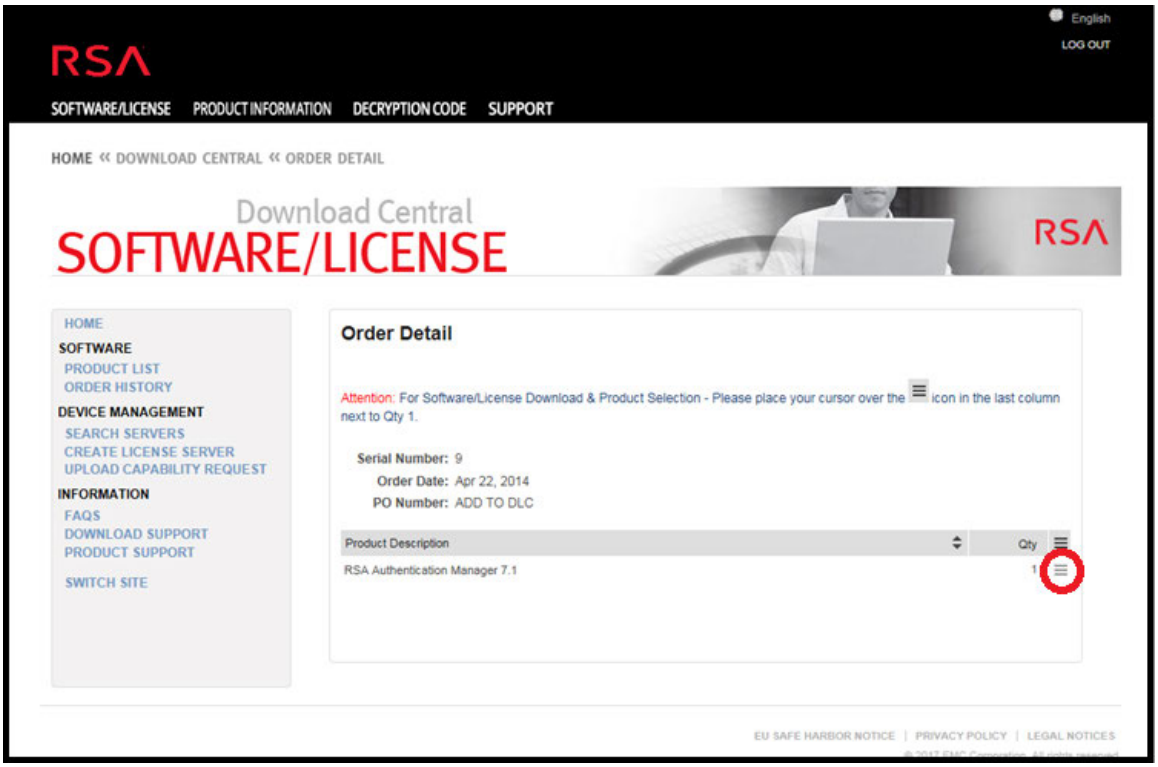


7. Click on the highlighted line item.



8. To download your product license, place your cursor over the

icon in the last column next to the quantity, as shown in the following example.

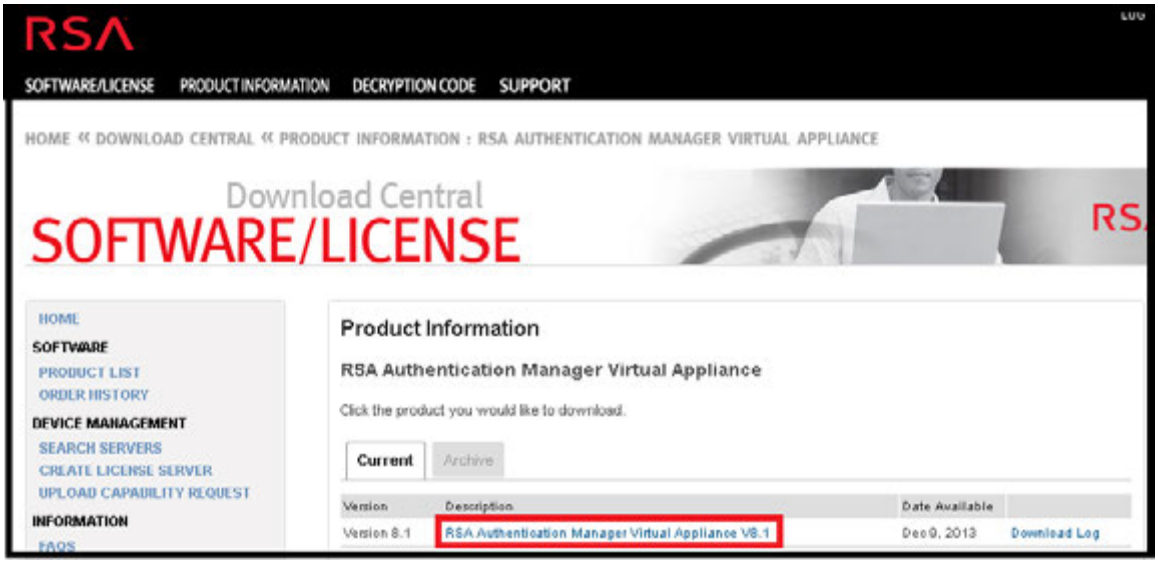


The **Order Detail** screen is displayed.

9. Two options are available for downloading your product license.

   - If you select **License(s)**, you are forwarded to the License Information page where you can download your license file by clicking the **Download** button.

   - If you select **Product List**, you are forwarded to the **Product Information** page where you can download your product software by clicking the **Description** and following the screen prompts.



Additional Procedures

This topic is a collection of individual procedures, which an Administrator may perform at any time, and they are not required for initial setup of licensing.

These procedures are presented in alphabetical order

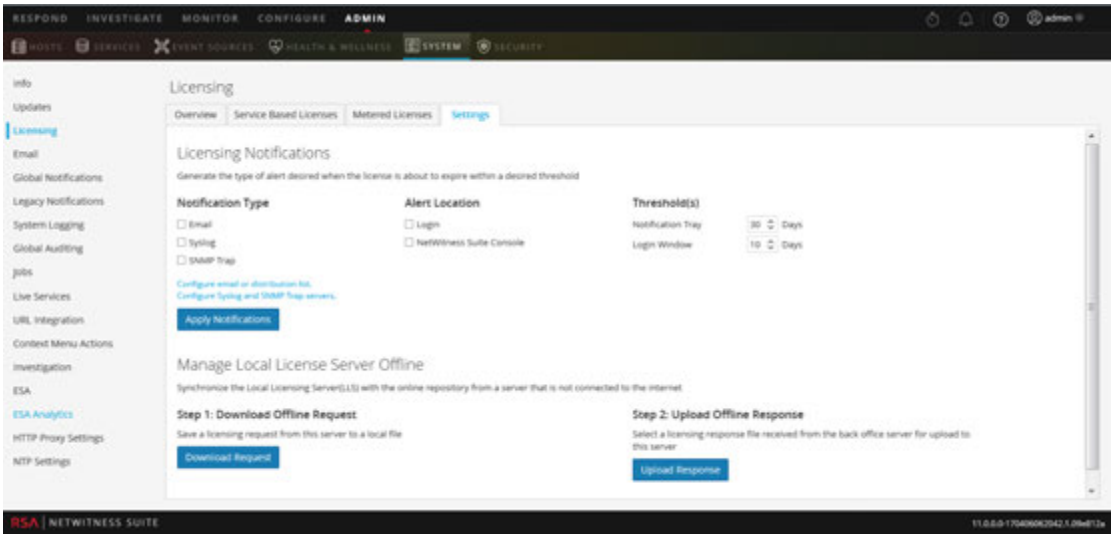
- Configure NetWitness Suite Notifications
- Dismiss Out-of-Compliance Banner
- Export Usage Stats and View Decoder Usage Stats
- Synchronize Local Licensing Server Offline
- View Current Entitlements
- View and Manage License Pools on LLS

Configure NetWitness Suite Notifications

This topic provides instructions for configuring notification settings for the Local License Server (LLS). If you wish to receive alerts about the approaching license expiration date you can configure NetWitness Suite to send notifications. You can receive notification by email, syslog and SNMP. The notification can also be viewed during system log on and also in the Notification Tray. You can also specify the number of days before expiration as a threshold for notification.

To configure the NetWitness Suite notification:

1. Log on to NetWitness Suite, and go to **ADMIN > System.**
2. Select **Licensing** in the options panel.
3. Select the **Settings** tab.



4. Select each of the methods for NetWitness Suite to use when sending a notification about the license nearing its expiration date. You can select none or all.
   a. To receive a notification at log on, select **Login** and specify the number of days before the license expires that you want to receive notification in the **Login Window Threshold** field.
   b. To receive a notification in the Notifications tray, select **NetWitness Suite Console** and specify the number of days before the license expires that you want to receive notification in the **Notification Tray Threshold** field.
   c. To receive an Email notification to a configured distribution list, select **Email** and select **Configure email or distribution list**. The Email panel is displayed in a separate tab, and you can configure NetWitness Suite notifications in the Email Server Settings section. Refer to the *System Configuration Guide* for further details.

d. To receive syslog notifications, select **Syslog** and select **Configure Syslog and SNMP Trap servers**. The System Auditing panel opens in another tab and you can configure the system auditing settings as usual.

e. To receive notifications through SNMP Trap, select **SNMP Trap** and select **Configure Syslog and SNMP Trap servers.** The System Auditing panel opens in another tab and you can configure the SNMP auditing settings as usual.

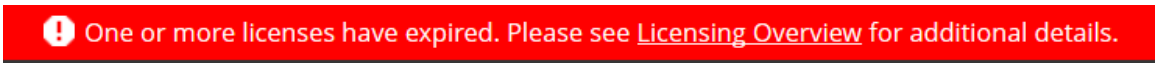
5. Click **Apply Notifications**.
   The settings are saved and go into effect immediately.

Dismiss Out-of-Compliance Banner

This topic explains what you need to do if you see a yellow or red banner displayed after you log on to your NetWitness Server. Banner notifications automatically display during system log on to let you know the status of your license and usage compliance.

A yellow banner is displayed when you are approaching your usage threshold or your licensing is approaching expiration.

A red banner is displayed when your license is out of compliance or you have exceeded your allotted threshold.



To dismiss the yellow banner, click **Dismiss**.

Note: Red banner cannot be dismissed. You must resolve your license issue.

Export Usage Stats and View Decoder Usage Stats

NetWitness Suite Version 11.0 provides the ability for Administrators to view usage statistics of device types that are eligible for a Metered license. Licensing usage statistics are made available to Administrators in CSV and PDF formats.

Hourly statistics are captured for all supported services connected to the NetWitness Server.

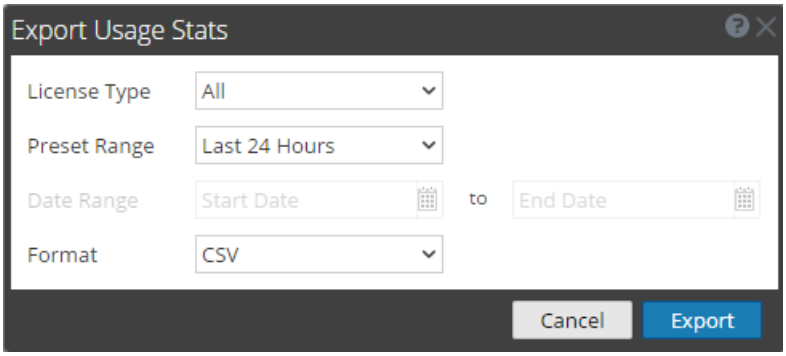
Metrics can be tracked securely, allowing Administrators to save data locally on their systems to use in reporting usage compliance.

To access Export Usage Stats:

1. Go **ADMIN > System** and select **Licensing** in the Options panel.
2. Select the **Overview** tab.

   The **Overview** tab is displayed.
3. Select **Export Usage Stats** from the Licensing Actions drop-down menu.

   The **Export Usage Stats** dialog is displayed.



4. Select a **License Type**, **Preset Range**, **Date Range**, and **Format** that you want the statistics report saved in.
5. Do one of the following:
   a. Click **Export** to export the report.
   b. Click **Cancel** to return to the **Overview** tab

Note: The downloaded file is in zip format with multiple files in it. Each zip file contains aggregate usage for all devices under each license type.

Examine Decoder Service Usage Statistics in the Explore View

The Decoder has service usage statistics that can help you determine the best way to manage packet traffic, so that the Decoder is kept within the usage limits allowed by its license. These statistics are located in the `/decoder/stats` folder for each Decoder service, and you can see them in Administration > Explore view.

- `capture.netfilter.bytes`: This statistic tracks the total size of packets that were filtered out due to matching network rules. Packets are only considered filtered at this stage if the network rule specifies that the packets will not be assembled into sessions.
- `capture.appfilter.bytes`: This statistic tracks the total size of bytes removed from the packet stream due to application rule actions. Application rules may filter packet or truncate packets. If an application rule filters packets, the entire packet is dropped from the collection. If the packet is truncated, only the packet payload is dropped, while the header is still stored. This statistics counts up how many bytes are dropped, be they from entire packets, or dropped payloads.
- `capture.processed.bytes`: This statistic is equal to the total bytes processed, minus any bytes counted in the `capture.appfilter.bytes` or `capture.netfilter.bytes` statistics.

Synchronize Local Licensing Server Offline

NetWitness Suite manages licensing through a Local License Server (LLS). Each client appliance is shipped with an installed LLS. This topic provides instructions for synchronizing the Local License Server (LLS) with the online repository from a server that is not connected to the Internet. Please refer to Entitlement Capability Implementation for a functional description of the LLS.

Prerequisites

If the NetWitness Server is not connected to the Internet, you can perform offline synchronization of entitlements through the View Server page in Download Central. You can:

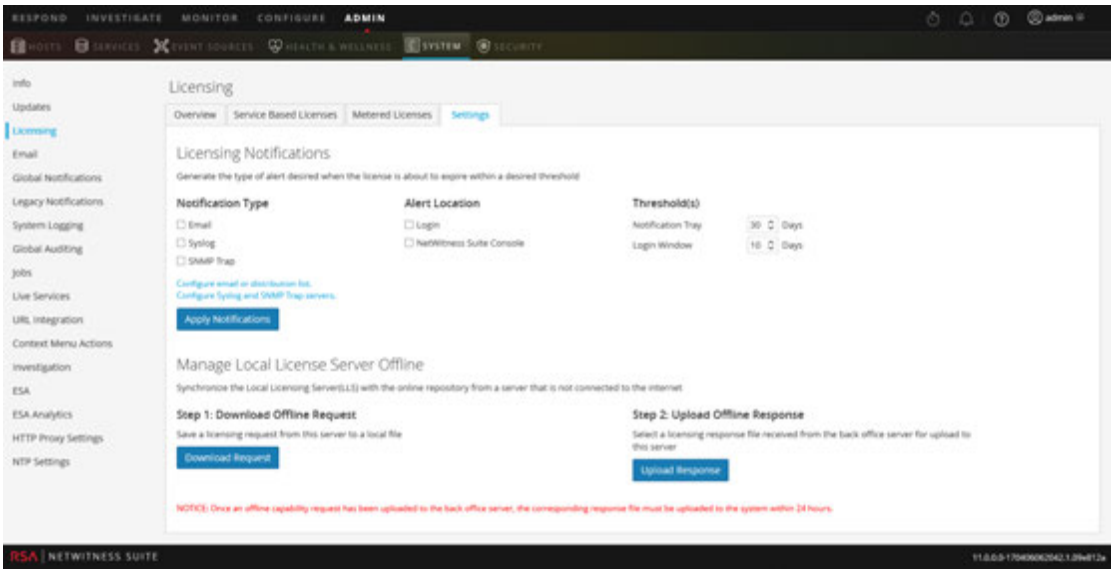
- Download an Offline Capability Request in NetWitness Suite for submission to Download Central.
- Within 24 hours, upload to NetWitness Suite an Offline Response that was received from Download Central.

Download a Capability Request for Submission to Download Central

To download an offline capability request from the NetWitness Suite LLS into a local file for processing by a back-office server.

1. Go to **ADMIN > System.**
2. In the **Options** panel, select **Licensing**.

   The Licensing panel is displayed with the **Overview** tab open.
3. Select the **Settings** tab.



4. In the **Manage Local License Server Offline** section, click **Download Request**.

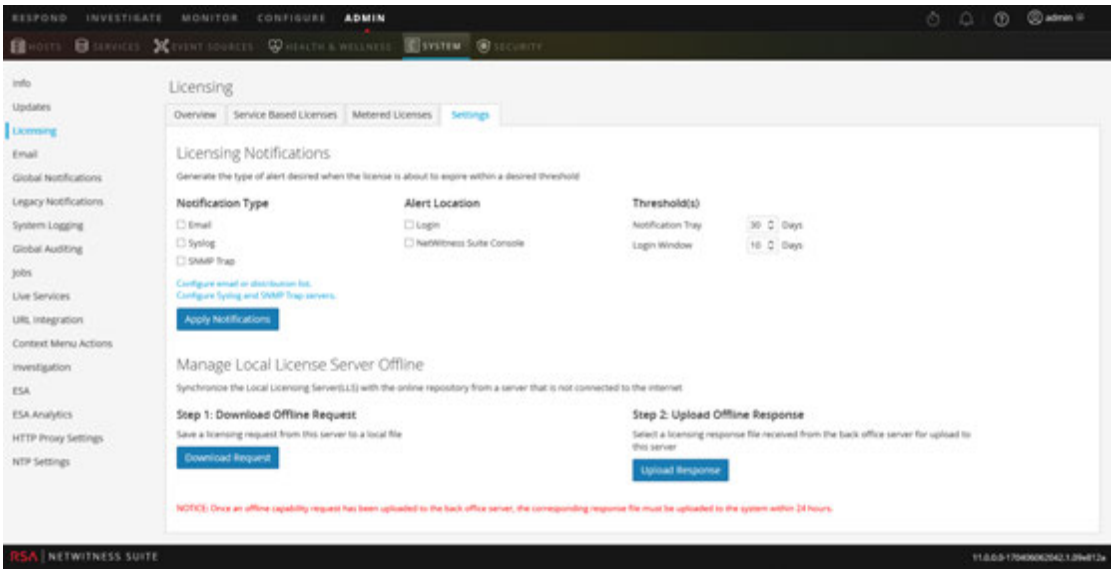
   The Offline Capability Request file (**OfflineCapailityRequest.bin**) is downloaded to the local file system.

Upload an Offline Capability Response to NetWitness Suite

If the NetWitness Server is not connected to the Internet, you can perform offline synchronization of entitlements through the View Server page in Download Central. To upload an offline capability response (**response.bin**) file saved to the local file system from Download Central:

1. Go to **ADMIN > System**.
2. In the **options panel**, select **Licensing**.

   The Licensing panel is displayed with the **Overview** tab open.
3. Select the **Settings** tab.



4. In the **Upload Offline Response** section, click **Upload Response**.

   A dialog prompts for the file.

5. Browse for and select the **response.bin** file so that it is displayed in the Upload File (bin) field.
6. Click **Upload**.

   The entitlements are uploaded to NetWitness Suite and the licenses added to the grid in the **Overview Licensing** tab. They are available for licensing appliances.

View Current Entitlements

This topic describes how to view your current licensing status on NetWitness Suite.

Prerequisites

Each NetWitness Server is a license server providing capabilities to entitle services connected to it. To make entitlements available for licensing services, the entitlements must be downloaded and mapped to the Local License Server (LLS) on the NetWitness Server.

View Current License Status

To view the current license status of individual services connected to the NetWitness Server:

1. Go to **ADMIN > System**. .

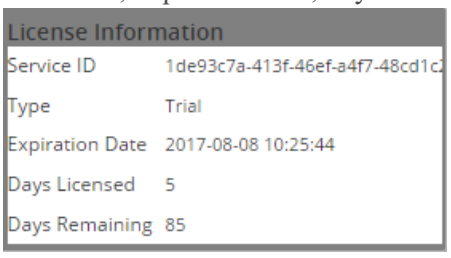
   In the Service grid, each service connected to the NetWitness Suite is listed. Part of the information is whether the service is licensed.

   Note: If no services are listed, you need to add services before continuing.

2. To view additional information about a service license, hover over the icon in the **Licensed** column. The information displayed depends on the type of license.

   - For a permanent license, the following information is displayed: service ID and type of license.

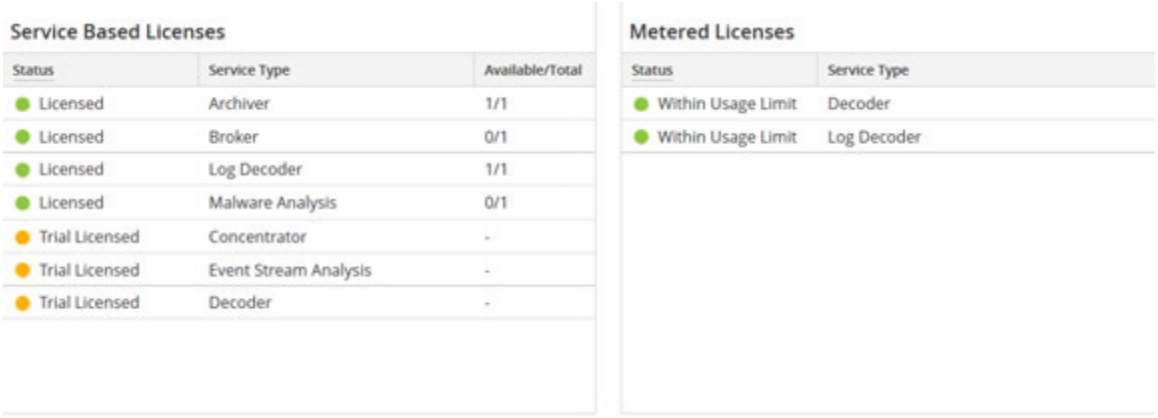
   For a license with an expiration date, the following information is displayed: service ID, type of license, expiration date, days licensed, and days remaining.

3. To display the current license status, in the main menu, select **Licensing** from the panel in the **System** grid.

   The License status for the selected services changes to green (licensed), yellow (approaching expiration), or red (license expired), depending upon the current license status. The services that you licensed are counted and the quantity is subtracted from the **Available** quantity in the **ADMIN > System view > Licensing** panel.

Note: If licensing a hybrid system, which has a Concentrator and Decoder on the same appliance, license each component separately. Reporting Engine, Log Collector, IPDB Extractor, Warehouse Connector, Incident Management, and Workbench do not require a license.



Service Based Licenses

Status	Service Type	Available/Total
Licensed	Archiver	1/1
Licensed	Broker	0/1
Licensed	Log Decoder	1/1
Licensed	Malware Analysis	0/1
Trial Licensed	Concentrator	-
Trial Licensed	Event Stream Analysis	-
Trial Licensed	Decoder	-

Metered Licenses

Status	Service Type
Within Usage Limit	Decoder
Within Usage Limit	Log Decoder

View and Manage License Pools on LLS

In NetWitness Suite, you can view the entitlements that are available to the Local License Server (LLS) on this instance of NetWitness Suite. You can manage the license pool with the option to refresh the view with the current LLS pool entitlements and availability.

View Available Entitlements

To view the entitlements that are available to the Local License Server (LLS) on this instance of NetWitness Suite:

1. Go to **ADMIN > System.**
2. In the **Options** panel, select **Licensing**.

   The **Overview** tab is displayed.

   Each entitlement is listed in the grid by service type, which is an add-on from a Download Central entitlement. Information includes the status of the license indicated using color-coded circles.

3. To refresh the view, select **Refresh Licenses** from the **Licensing Actions** drop-down menu.

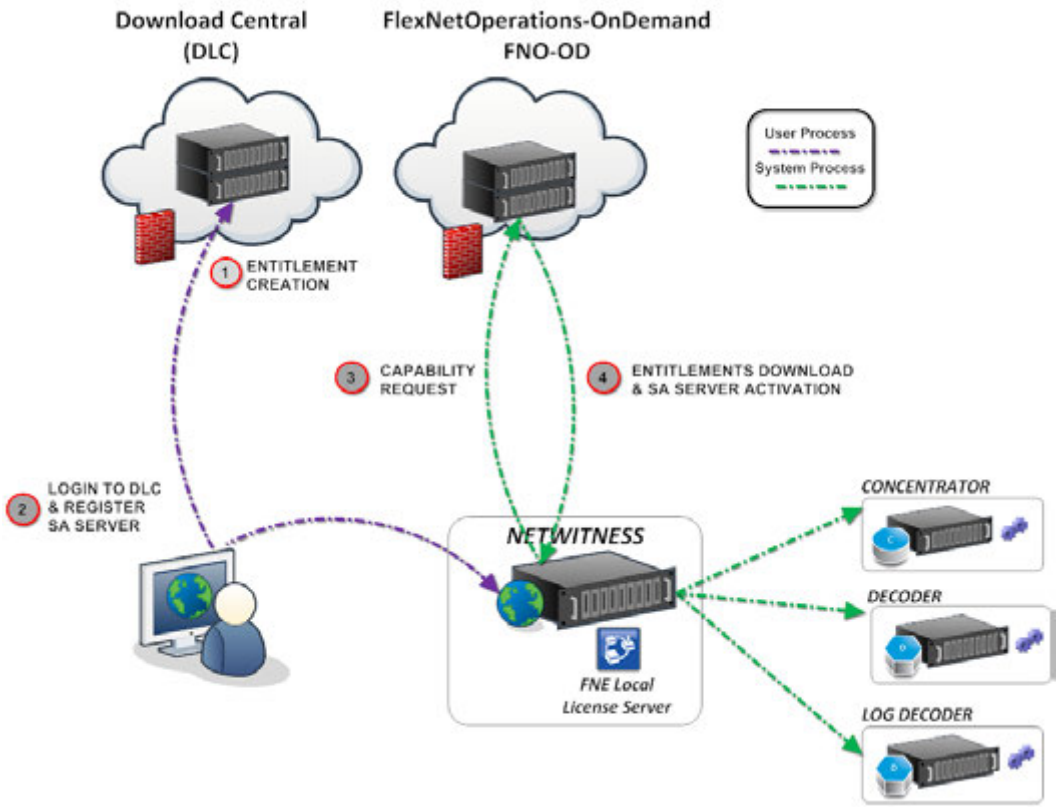
   Entitlements pulled from Download Central are refreshed in the **Service-Based Licenses** and **Metered Licenses** panels.

References

This topic is a collection of references, which describe the user interface and more detailed information about how licensing works in NetWitness Suite. These topics are presented in alphabetical order.

Entitlement Capability Implementation

This topic introduces the way in which licensing of appliances and services is implemented in NetWitness Suite. The entitlement capability leverages RSA Download Central (https://download.rsasecurity.com/) as the mechanism for entitlement delivery.



Key	Description
1	**Entitlements Created and Available to Customer.** After a customer order is processed, the entitlements (licenses) become available in Download Central. The entitlements are tied to an individual account.

Key	Description
2	**Register NetWitness Server on Download Central and Map Entitlements to the Local License Server (LLS).** • Customers log on to Download Central and view the entitlements to which they have access within their account. • Customers map entitlements to their Local License Server using the License Server ID (displayed in the NetWitness Suite ADMIN > System > Info panel). The License Server ID is used only for mapping entitlements to a Local License Server and does not pertain to appliance activation.
3	**Synchronize the Server and Download Mapped Entitlements.** There are two methods for customers to synchronize with FNO-OD and download the mapped entitlements to their LLS. • **Sites with Internet connectivity.** If the LLS has Internet connectivity, the LLS attempts to synch with FNO-OD every 24 hours over HTTP (TCP-80). Customers with Internet connectivity can also perform on-demand synchronization, using the **Refresh** option in the ADMIN > System > Licensing panel on the NetWitness Server. • **Sites in closed environments.** Customers can synchronize the mapped entitlements by downloading a capability request and importing it on the NetWitness Server. After either synchronization method, entitlements that were mapped to the Local License Server on the NetWitness Suite appliance are synchronized, but the entitlements have not been used in any way. For example, if a customer had purchased 10 Decoders and 10 Concentrators, 10 of 10 Decoder entitlements and 10 of 10 Concentrator entitlements would be available on the NetWitness Server.

Note: FlexNet Operations-On Demand (FNO-OD) is the license server in the cloud on DLC. URL is rsasecurity.subscribenet.com. The customer's firewall must allow communications between this URL (whatever it resolves to when using lookup or whois) and the NetWitness Suite IP address.

Licensing Panel

This topic introduces the features of the System Licensing panel. NetWitness Suite manages licensing through a Local License Server (LLS). Each client appliance is shipped with an installed LLS.

Workflow

This workflow shows the end-to-end licensing process.

What do you want to do?

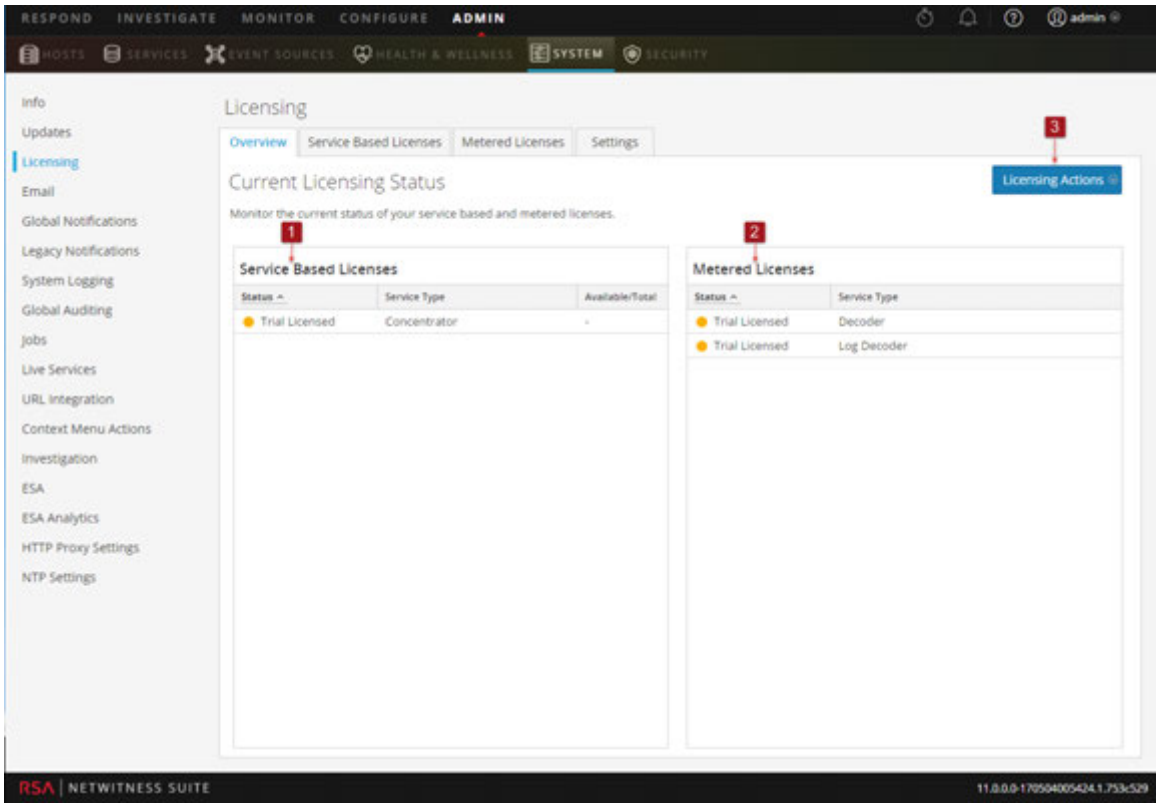
Role	I want to...	Documentation
Administrator	Check license status*	Metered Licenses Tab Service-Based Licenses Tab
Administrator	Configure licensing notifications	Configure NetWitness Suite Notifications
Administrator	Export usage stats*	Export Usage Stats and View Decoder Usage Stats
Administrator	Download license request offline.	Synchronize Local Licensing Server Offline

*You can complete these tasks here.

Quick Look

The Licensing panel has four tabs, which are described in separate subtopics:

- Metered Licenses Tab
- Overview Tab
- Service-Based Licenses Tab
- Settings Tab



The following table describes the features of the Licensing panel.

1.	Displays the status of your Service Based license or licenses. There are five statuses: • Licensed • Expiring License • Expired License • Trial Licensed • Not Licensed
2	Displays the status of your Metered license or licenses. There are six statuses: • Expired License • Over Usage Limit • Near Usage Limit

	• Within Usage Limit • Trial License • Expiring License
3	Displays the Licensing Actions button that offers the following options: **Refresh Licenses:** Refreshes the **Overview** tab in order to display the most current license information. **Export Usage Statistics:** Exports license usage statistics.

Metered Licenses Tab

The Metered Licensing tab (System view > Licensing Metered Licenses tab) has the information you need to check the status of licenses.

Workflow

This workflow illustrates the end-to-end licensing process.

What do you want to do?

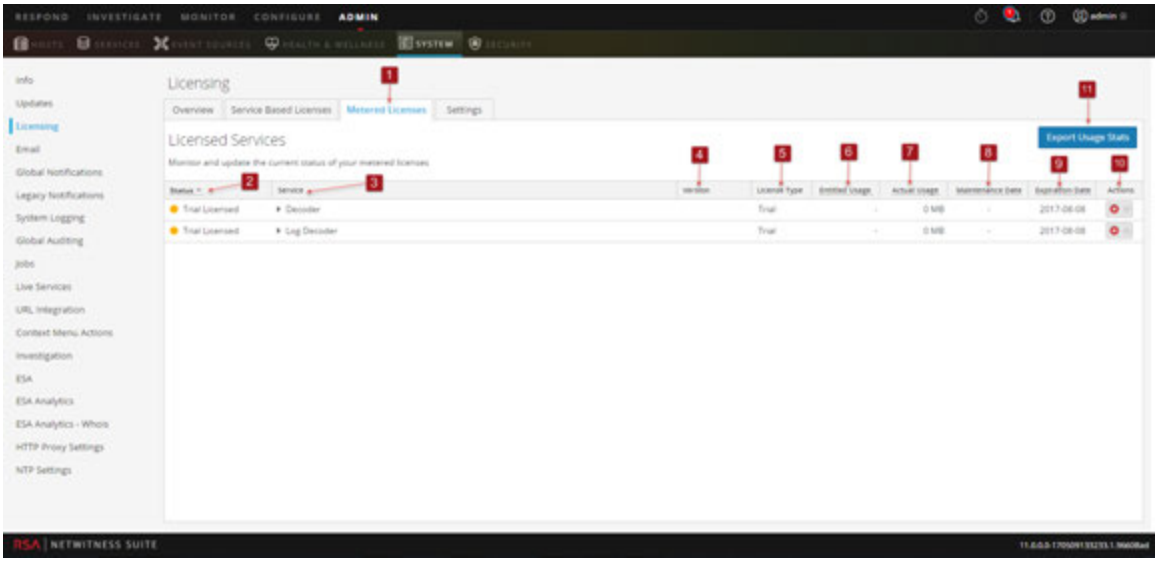
Role	I want to...	Show me how...
Administrator	Check License Status.	View Current Entitlements

Related Topics

Export Usage Stats and View Decoder Usage Stats

Quick Look

The **Metered Licenses** tab has one grid and an Export Usage Stats button.



The following table describes the features of the Licensed Services grid.

1	Displays the Metered Licenses tab.

2	Displays the status of the license. There are four statuses: • Expired License • Over Usage Limit • Near Usage Limit • Within Usage Limit
3	Displays the host and type of service to which the license is assigned.
4	Displays the version number of the service.
5	Displays the type of license assigned to the service or host. There are license types: • Trial • Duration • Permanent
6	Displays the daily usage of the entitled usage.
7	Displays the daily average of the actual usage.
8	Displays the maintenance expiration date for the permanent license or licenses.
9	Displays the date on which the license or licenses expire.
10	Licenses can be sorted in either ascending or descending order.
11	Administrators can view the usage statistics available for NetWitness Suite services.

Out-of-Compliance Banners

This topic explains what to do when your license is out of compliance. A red banner is displayed during system log on if your license is expired, or you have exceeded your allotted usage. You may also see a red banner if your license has internal errors.

Note: Red banner cannot be dismissed. You must resolve your license issue.

A yellow banner is displayed during system log on if your license is approaching expiration or you are nearing your allotted usage. You can dismiss the yellow banner by clicking the **Dismiss** button.

Workflow

This workflow illustrates the end-to-end licensing process.

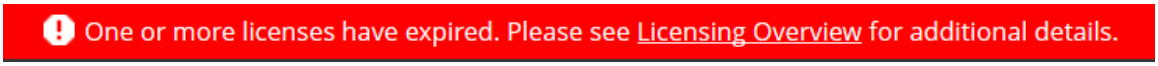
View Current Entitlements

Out-of-Compliance State

The following sample banner is displayed when a license is expired:



If your license has internal errors, the following banner is displayed:

In addition to a red banner being displayed during system log on, an Out of Compliance Acknowledgement dialog is also displayed. Click **Accept** to continue using your NetWitness Suite product.

Version 11.0.0.0 licenses can enter an out-of-compliance state for the reasons provided in the following table:

Red Banner Message	Possible Causes	Solutions
One or more services is not licensed.	Trial license period has expired. There are pre-11.0.0.0 services in the deployment that are not licensed.	Contact RSA Sales team to procure a NetWitness Suite license. Upgrade the services to NetWitness Suite version 11.0.0.0.
One or more licenses is expired.	If the deployment has a valid Metered license, you can move the service under it. Note that the usage will increase and may go over the entitled usage.	Contact RSA Sales team to renew the license.
You have exceeded license usage limits.	If the allotted daily usage is exceeded on four or more occasions, the Grace Period begins. The Grace Period begins on the day of the fourth occurrence and ends at the end of the following calendar month. Seven continuous days of standard usage will end the Grace Period. If the daily allotted usage is still being exceeded at the end of the Grace Period, the 30-day Breach Period begins. Seven continuous days of standard usage will end the Breach Period.	Contact RSA Sales to extend or increase your allotted usage by purchasing a NetWitness Suite license.
Your Trial license has internal errors.	An internal licensing issue was reported during your Out-of-the-Box Trial period.	Contact RSA Technical Support to resolve this issue.

Note: If a license has not been installed within 90 days, you must contact RSA Sales to purchase a NetWitness Suite Version 11.0.0.0 license.

License Approaching Out-of-Compliance

When your license is approaching expiration, or it is nearing its allotted usage, a yellow banner with a brief description is displayed. A yellow banner is displayed 14 days before your license is due to expire. You will also see a yellow banner if you are approaching your allotted license usage. You can get rid of the yellow banner by clicking the **Dismiss** button.

The following sample banner is displayed in the NetWitness Suite screen if your license is approaching its allotted usage:

The following table explains the messages that are displayed when you see a yellow banner.

Yellow Banner Message	Possible Causes	Solutions
You are nearing license usage limits.	One or more Metered licenses has exceeded your allotted usage for three times during the current calendar month. The fourth time that you exceed your allotted usage during the current month will push the deployment into an Out-of-Compliance state.	Contact RSA Sales if your allotted usage spikes four times within a calendar month.
One or more licenses is expiring.	One or more licenses is due to expire within 14 days.	Contact RSA Sales to purchase a new license.

Overview Tab

The Overview tab (System view > Overview tab) has the information you need to check the status of licenses and view current license statistics.

Workflow

This workflow illustrates the end-to-end licensing process.

What do you want to do?

Role	I want to...	Show me how
Administrator	*Check License Status.	Select the **Overview** tab to monitor and update the current status of your Service Based and Metered licenses.
Administrator	*View Current License Statistics.	Select **Export Usage Stats** from the **Licensing Actions** drop-down menu.

* You can perform this task here.

Related Topics

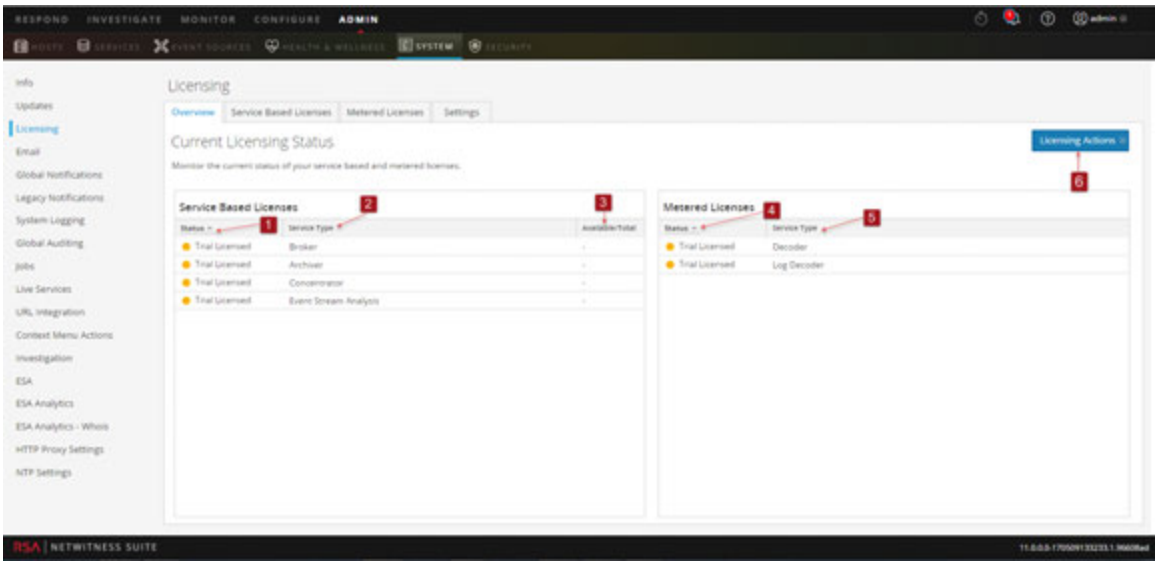
- View Current Entitlements
- Export Usage Stats and View Decoder Usage Stats

Quick Look

The **Overview** tab displays the **Licensing Actions** menu and two panels:

- Service Based Licenses
- Metered Licenses

Note: On initial start up, the usage shown in the Licensing page displays zero usage for the initial one hour.



The following table describes the **Overview** tab.

1	Displays the status of your Service Based license or licenses. There are five statuses: • Licensed • Expiring License • Expired License • Trial Licensed • Not Licensed
2	Displays the type of service to which the Service Based license is assigned.
3	Available number of Service Based licenses can be sorted in ascending or descending order.
4	Displays the status of your Metered license or licenses. There are six statuses: • Expired License • Over Usage Limit • Near Usage Limit • Within Usage Limit • Trial Licensed • Expiring License

5	Displays type of service to which your Metered license is assigned.
6	Displays the **Licensing Actions** menu that offers the following options: **Refresh Licenses:** Refreshes the **Overview** tab in order to display the most current information. **Export Usage Stats:** Exports license usage statistics.

Export Usage Statistics

NetWitness Suite Version 11.0.0.0 provides the ability for Administrators to view the current usage statistics of the service. Licensing usage statistics are made available to Administrators in CSV and PDF formats.

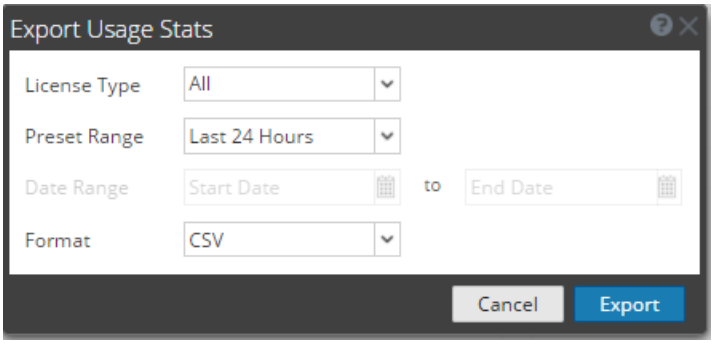
The data provided specifies the hourly statistics captured by supported services connected to the NetWitness Server.

Metrics can be tracked securely, allowing Administrators to save data locally on their systems to use in reporting usage compliance.

The following example shows the **Export Usage Stats** dialog.

To access the **Export Usage Stats** dialog:

1. Click the **Licensing Actions** button.
2. In the dialog box, select a **License Type**, **Preset Range**, **Date Range**, and **Format** that you want for the licensing usage statistics.
3. Click **Export** to save the license usage statistics. Click **Cancel** to return to the **Overview** tab.



Service-Based Licenses Tab

This topic provides a description of the System view > Licensing panel > Service-Based Licenses tab. In the Service-Based Licenses tab, you can monitor and update the current status of your Service-Based licenses.

Workflow

This workflow illustrates the end-to-end licensing process.

What do you want to do?

Role	I want to...	Show me how
Administrator	Check License Status.	View Current Entitlements

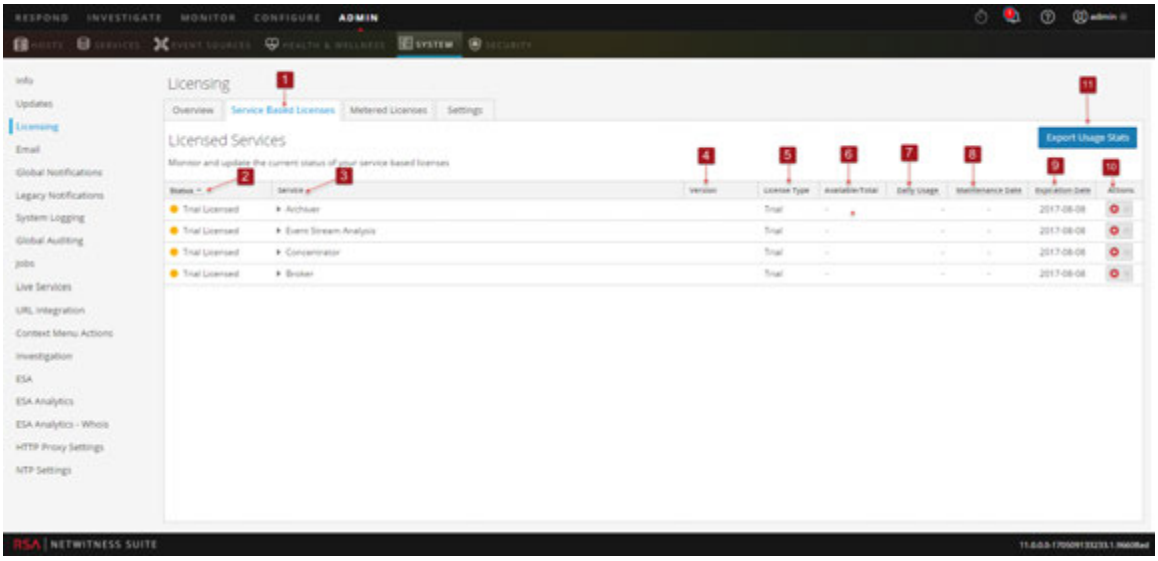
Related Topics

View Current Entitlements

Quick Look

In the **Service-Based Licenses** tab, you can monitor and update the current status of your Service- Based licenses.

The **Service-Based Licenses** tab has one grid and an **Export Usage Stats** button.



The following table describes the features of the Licensed Services grid.

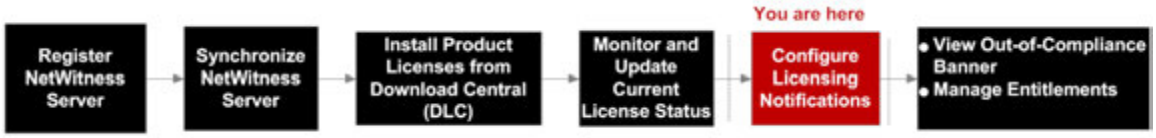
1	Displays the Service Based Licenses tab.
2	Displays the status of the license. There are five statuses: • Licensed • Expiring License • Expired License • Trial License • Not Licensed
3	Displays the host and type of service to which the license is assigned.
4	Displays the version number of the service.
5	Displays the type of license assigned to the service or host. There are three license types: • Trial • Duration • Permanent
6	Displays the daily usage of the entitled usage.
7	Displays the daily average of the actual usage.
8	Displays the maintenance expiration date for the permanent license or licenses.
9	Displays the date on which the license or licenses expire.
10	Licenses can be sorted in either ascending or descending order.
11	Administrators can view the usage statistics available for NetWitness Suite services.

Settings Tab

This topic describes the notification settings for the NetWitness Suite in the Licensing panel > Settings tab.

Workflow

This workflow illustrates the end-to-end licensing process.



What do you want to do?

Role	I want to...	Show me how
Administrator	Configure Licensing Notifications	Configure NetWitness Suite Notifications

Related Topics

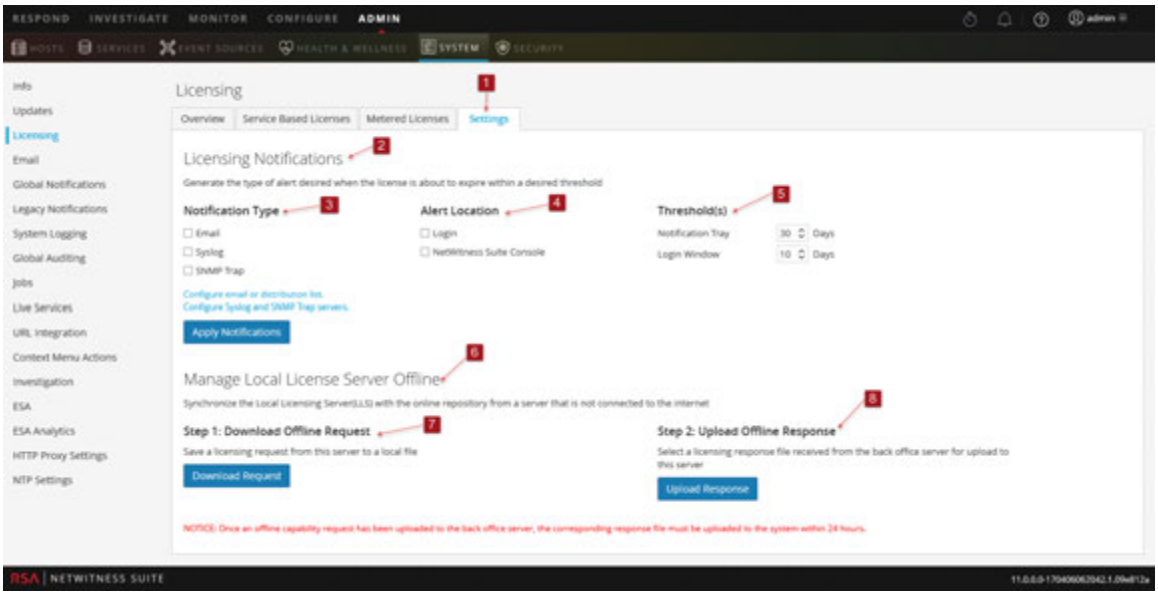
Step 1. Register the NetWitness Server

Configure NetWitness Suite Notifications.

Quick Look

From the **Settings** tab you can:

- Configure licensing notifications.
- Download an Offline Capability Request in NetWitness Suite for submission to Download Central.
- Within 24 hours, upload to NetWitness Suite an Offline Response that was received from Download Central.



The following table describes the **Settings** tab features.

1	Displays the **Settings** tab.
2	Displays the **Licensing Notifications** panel.
3	Displays the **Notification Type**. There are three types of notifications: • **Email:** Checkbox to receive a notification of approaching license expiration in an email message. The email is sent to the configured email or distribution list. • **Syslog:** Checkbox to receive a notification of approaching license expiration in an syslog message. The syslog is generated in accordance with the settings in the Syslog Auditing Settings. • **SNMP Trap:** Checkbox to receive a notification of approaching license expiration in an SNMP trap. The trap is generated in accordance with the settings in the SNMP Auditing Settings.
4	Displays the type of **Alert Notification**. • **Login:** Select this checkbox to receive a notification of your approaching license expiration when you log on to NetWitness Suite. The **Login Window Threshold** field specifies the number of days before the license expires to display the notification at log on. • **NW Console:** Select this checkbox to receive a notification of approaching license expiration in the Notifications tray.
5	Displays the **Threshold** field, which specifies the number of days before the license expires to send a notification to the Notifications tray.

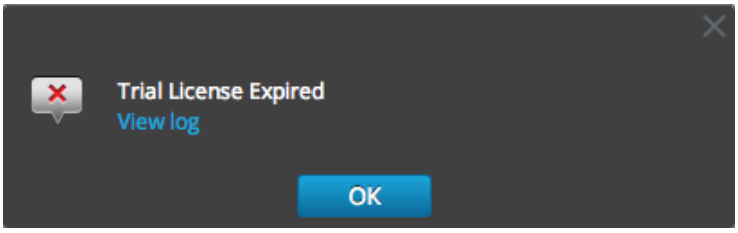
6	Displays the **Manage Local License Server Offline** panel.
7	Displays the **Download Offline Request** button. This button enables you to download a request from the NetWitness Suite LLS into a local file for processing by a back-office server. The downloaded bin file should be uploaded to Download Central (DLC) to generate the offline response.
8	Displays the **Upload Offline Request** button. This button enables you to browse for an offline response that you received from the back-office server, and uploads the selected response to NetWitness Suite. The file must be uploaded within 24 hours after receiving the file.

Troubleshoot Licensing

This topic provides information about possible issues that NetWitness Suite users may encounter when setting up licensing in NetWitness Suite. Look for explanations and solutions in this topic. NetWitness Suite notifies users of issues using the popup notifications and the system log as described in the **Troubleshoot NetWitness Suite** topic in the *System Maintenance Guide*.

Simple Error Notification about a Problem with a License

If there is a problem with the license you are attempting to install, NetWitness Suite provides feedback in the form of a simple error notification and a log entry.



Common Log and Configuration Files

When troubleshooting licensing, the following files contain information that may help to diagnose the problem. Specific conditions for searching the files are described in the troubleshooting tables.

On the NetWitness Server

- `/var/log/messages`
- `/var/log/fneserver/fne-error.log`
- Run `wget` for the following flles when ssh'ed onto the NetWitness Server:
  - `http://localhost:3333/fne/xml/properties`
  - `http://localhost:3333/fne/xml/reservations`
  - `http://localhost:3333/fne/xml/features`
  - `http://localhost:3333/fne/xml/diagnostics`

NetWitness Server Problems

This table lists possible problems with the NetWitness Server errors that can affect entitlements.

Problem	Possible Causes	Solutions
The NetWitness Serverdisplays the Out-of-Compliance banner message that states, "Your trial license has internal errors. Please contact RSA customer support for help.”	Ensure that the mongod service is running on your NetWitness Suite appliance.	To resolve the error: 1. Execute the command `systemctl status mongod` from the NetWitness Suite appliance console. 2. If problem persists, please contact RSA customer support for help.
Some features have been mapped in the central Flexera server, but the NetWitness Server doesn’t display them.	Ensure that the NetWitness Server is connected to the internet.	To resolve the error: 1. Execute a License Refresh as follows: 2. In NetWitness Suite, navigate to **ADMIN > Services > Licensing.** 3. Under the **Licensing Actions menu,** select **Refresh Licenses**. **Note:** If the NetWitness Server is not connected to the internet, try to do an Offline Synchronization.
When you remove a service from NetWitness Server, your trial license for that service is also removed.	Various possible causes.	To resolve the error: Add the service again. Your service will continue to function fully even if a message informs you that the service is in a Not Licensed state.

Problem	Possible Causes	Solutions
The NetWitness Server displays the following message when I try to activate a license: "Cannot license this service explicitly."	Services running on NetWitness Suite Version 11.0 do not require that licenses be activated manually.	To resolve the error: 1. Execute a License Refresh as follows: 2. In main menu, navigate to **Admin > Services > Licensing**. 3. Under the**Licensing Actions** menu, select **Refresh Licenses**.
A few Version 11.0 services are not getting licensed.	Ensure that you have the required entitlements pulled down from the Flexera server.	To resolve the error: 1. Execute a License Refresh as follows: 2. In main menu, navigate to **Admin > Services > Licensing**. 3. Under the**Licensing Actions** menu, select **Refresh Licenses**.

Start Date Issue

Problem	Possible Causes	Solutions
NetWitness Suite Start date displays as "Internal Error" under System page for services licensed using SIEM licenses.	Various possible causes.	Change to your old Mac address and restart your FNE server.

License Usage Stats Issues

Problem	Possible Causes	Solutions
NetWitness Suite Licensing page not showing any license information although there are services available.	Mongod server is down or not responding.	• Check the status of the mongod server: `systemctl status mongod` • Start the server if it is down: `system start mongod`
Actual usage of service is showing no value, not even 0 MB is being displayed.	Rabbitmq-server on NetWitness Suite appliance is not running or is not responding.	• Check the status of rabbitmq-server and start if it is down: `systemctl status rabbitmq-server` `systemctl start rabbitmq-server`

Problem	Possible Causes	Solutions

Actual usage of service is always showing 0 MB usage, even though the service/appliance (for example, LogDecoder or Decoder) is processing data.	Rabbitmq-server or collectd service on appliance (for example, LogDecoder or Decoder appliance) is not running or not responding.	• Check the status of rabbitmq-server or collectd services: `systemctl status rabbitmq-server`
		
		`systemctl status collectd`
		• Start the services if not responding or down: `systemctl start rabbitmq-server`
		
		`systemctl start collectd`

Download Central (DLC) Issues

Problem	Possible Causes
Unable to refresh licenses from subscribernet. Also unable to download an offline response from DLC.	Various possible causes.

Problem	Possible Causes
Solution Contact Customer Support for assistance in installing licenses.	
Customer unable to login to Download Central.	Various possible causes.
Solution Contact Customer Support for Offline Capability Response file to re-apply license in NetWitness Server. Also reset all licenses from all services.	
Licenses were not mapped in DLC.	Various possible causes.
Solution License reset from User Interface resolved the mapping issue.	

Wrong License Mapping Issues

Problem	Possible Causes
Perpetual license appears to be in use, although there is no Service-based license.	The NetWitness Suite entitlement database contains an object that holds the entitlement for a service that is licensed to the NetWitness Server.

Problem	Possible Causes

Solution
1. From the main menu, select **ADMIN > System > Licensing > Overview.**
2. SSH into the NetWitness Server as `root`.
3. Connect to the entitlement database using the following command:
`mongo sa`
4. Check the current entitlement status as follows:
`db.entitlement.find()`
From the output, note the `ObjectId` for the services that appear to use Trial licenses.
5. Remove the `ObjectId` for the missing endpoint that appears in`/var/lib/netwitness/uax/logs/sa.log`.
`db.entitlement.remove( {_id: ObjectId("<ObjectId>") } )`
`For example:`
`db.entitlement.remove( { _id: ObjectId("5595c9a9f2806lac50735xxx") } )`
6. Repeat Step 5 for all missing `ObjectIds`, as well as the ones noted in Step 4.
7. Type exit to close the database.
8. From the NetWitness Suite User Interface, select the **Licensing Actions** menu and select **Refresh Licenses**.
9. Once the Refresh process completes, confirm that the services are entitled with the Perpetual licenses.	

Decoder license not available due to core appliances being removed from the NetWitness Server without releasing the license. Several core appliance licenses were not available for use.	Various possible causes.
Solution Reset license on NetWitness Server and re-license each appliance.	
Archiver DACs are not mapped to the license server with all other appliances' licenses.	Various possible causes.

Problem	Possible Causes
Solution: 1. Enter **1** in Quantity field to add for each license. 2. Select **Map Add-ons** at the bottom of the screen. 3. Click **Download Capability Request** and upload license to the Offline Capability Request in the User Interface under the **License** tab.	
Two new appliances were installed: Log Hybrid and one Log Archiver. Able to license the Log Hybrid, but the following error occurred when attempting to license the Archiver: "There is an issue with registering your product, please contact RSA Customer Support." Also, one of the Concentrators showed as a Trial license, and a separate Log Decoder showed as a Trial license when they should be licensed.	After looking into Flexera, Customer Support found that the new equipment had not been mapped to the License Server.
Solution Map add ons to DLC and upload the `.bin` file into the NetWitness Suite User Interface.	
Mapping to License Server ID was not created.	Various possible causes.
Solution Licenses must be re-entitled and status of all appliances is displayed as licensed.	

Problem	Possible Causes
Customer unable to delete Trial licenses when Service-based licenses are in use.	Customer had two different NetWitness Server for two different sites (CHN and NOI). Each site had separate mapped entitlements. The red compliance banner was seen on the NOI site, because some Concentrators were attached to the NOI NetWitness Server that was entitled by the CHN site. The reason for the banner was that the NOI NetWitness Server did not have any more concentrator entitlements available for the CHN concentrators attached for investigation. The customer only has Trial licenses for 90 days from the date the NOI NetWitness Server and services were marked as out-of-compliance. **Note:** When there is more than one NetWitness Server in use, NetWitness SuiteVersion 10.5 and above requires a separate license for each NetWitness Server. Also, if you move one or more appliances to a different location, check to make sure there is a valid license for each appliance. A red out-of-compliance banner is displayed if there is no valid license.
Solution Customer was informed that their services will continue to function as required. The out-of-compliance banner can be dismissed by procuring additional entitlements to map onto the NOI NetWitness Server.	
License missing after re-imaging.	Various possible causes.
Solution Download license from DLC.

Live Services Management

RSA NetWitness Suite Live is the gateway to a rich environment that offers access to feeds, tools, and other resources.

NetWitness Suite Live

Live is the component of NetWitness Suite that manages communication and synchronization between NetWitness Suite services and a library of Live content available to RSA NetWitness Suite customers. Live provides a simple interface for browsing, selecting, and deploying content from the NetWitness Suite Live Content Management System to NetWitness Suite services and software. In addition to managing feeds from the CMS Library, Live allows users to deploy custom feeds and packages.

The CMS Library

The content management system (CMS) library (known as *Live*) is a valuable source of the latest internet security resources for NetWitness Suite customers. It provides a view into the collective intelligence and analytical skills of the worldwide security community to ensure that users have the most current visibility into attack vectors.

Live gathers the best advanced threat intelligence and content in the global security community - the ideas, research, ongoing tracking, and analysis - and brings it directly into the user's security operations center to definitively classify computers associated with botnets, malware, and other malicious exploits. Live aggregates, consolidates, and illuminates only the most pertinent information relevant to an organization on a real-time basis.

NetWitness Suite Feedback and Data Sharing

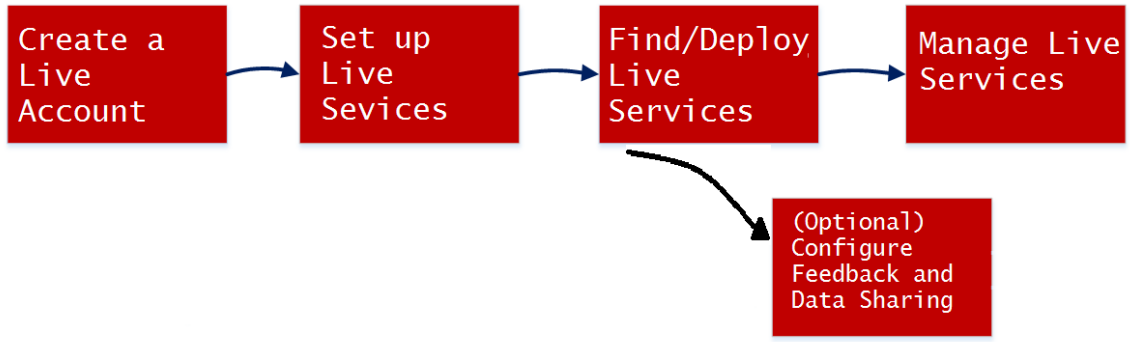
Live Feedback is intended to help improve RSA NetWitness Suite. Once you set up and configure a Live account, usage data is shared with RSA.

RSA Live Connect is a cloud based threat intelligence service. This service collects, analyzes, and assesses threat intelligence data such as IP addresses, domains, and files collected from various sources. It **Threat Insights**, which provide analysts the ability to pull threat intelligence data from the Live Connect service. It also offers **Analyst Behaviors**, an automated data collection service with the goal of sharing potential threat intelligence for analysis.

For more details, see NetWitness Suite Feedback and Data Sharing.

Live Services Required Procedures

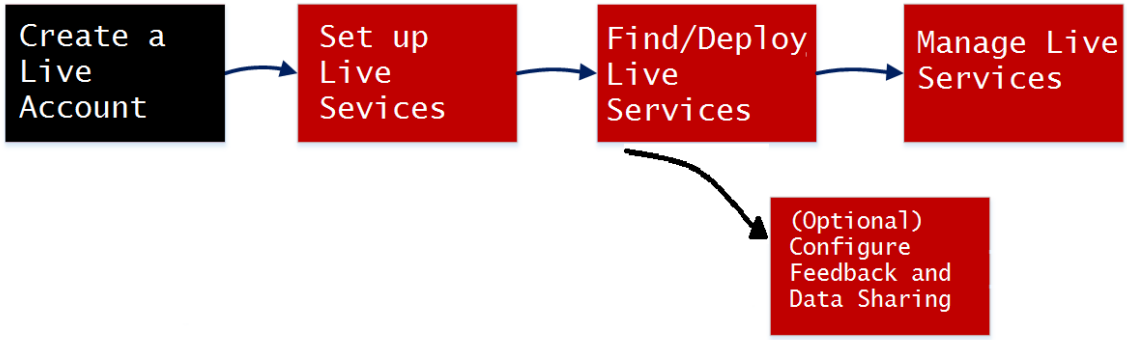
The following workflow breaks out the basic setup into four steps, which you can do individually. The easiest way to set up the Decoder is to follow the end-to-end procedure in this section, Live Services Required Procedures), which includes all of the steps.



Configuration Step	Description
Create Live Account	Create a Live Account on the RSA Live Registration portal URL: https://cms.netwitness.com/registration/. If you have an existing account, you can manage your account using this portal.
Set Up Live Services on NetWitness Suite	Set Up Live Services on NetWitness Suite by configuring a connection with the CMS server.
Find and Deploy Live Resources	Search and browse for resources in the Live Search view, an then, deploy the selected resources.
Manage Live Resources	Procedures for administrators to search for, subscribe to, and deploy resources from Live.
NetWitness Suite Feedback and Data Sharing	Describes the feedback and data sharing features provided in RSA NetWitness® Suite, from Live Services. Participation is optional, but can help to provide useful threat intelligence for the community.

Create Live Account

You must create a Live account using the RSA Live Registration Portal on the CMS server. The CMS Library provides access to all RSA content in one place where you can view, search, deploy, and subscribe to RSA content. You must register on the RSA Live Registration Portal and select a subscription level.



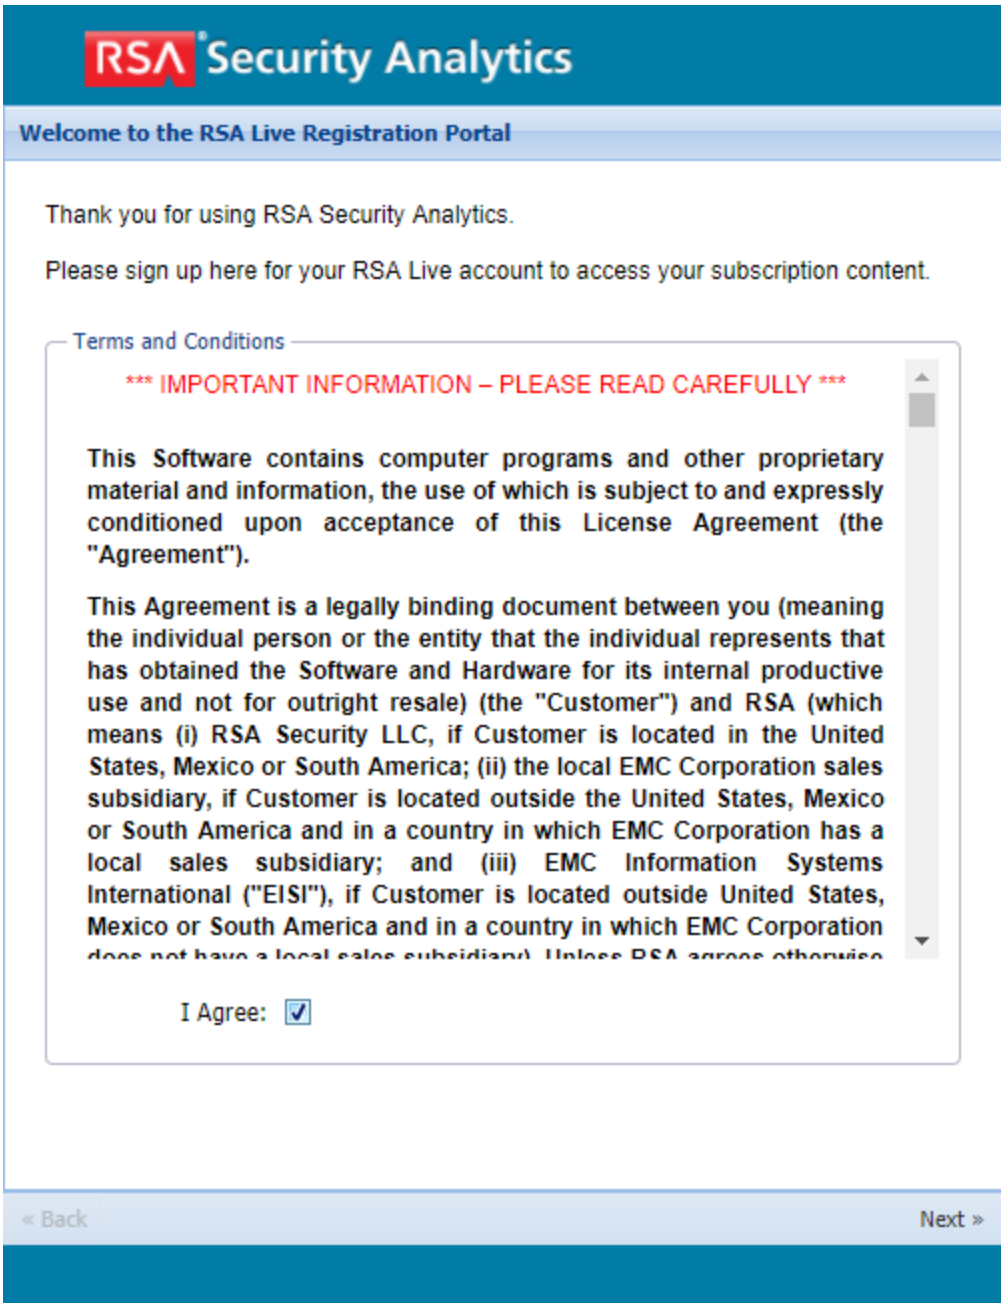
Make sure the following are available to set up a RSA Live account:

- Active internet connection to access the portal.
- A valid and registered NetWitness Suite License Server on the Flexera Server, before you can register for a Live account. You can view the License ID on the **ADMIN > System > Info** panel.

Note: If the License Server is not set up, contact RSA customer support.

To create a Live Account:

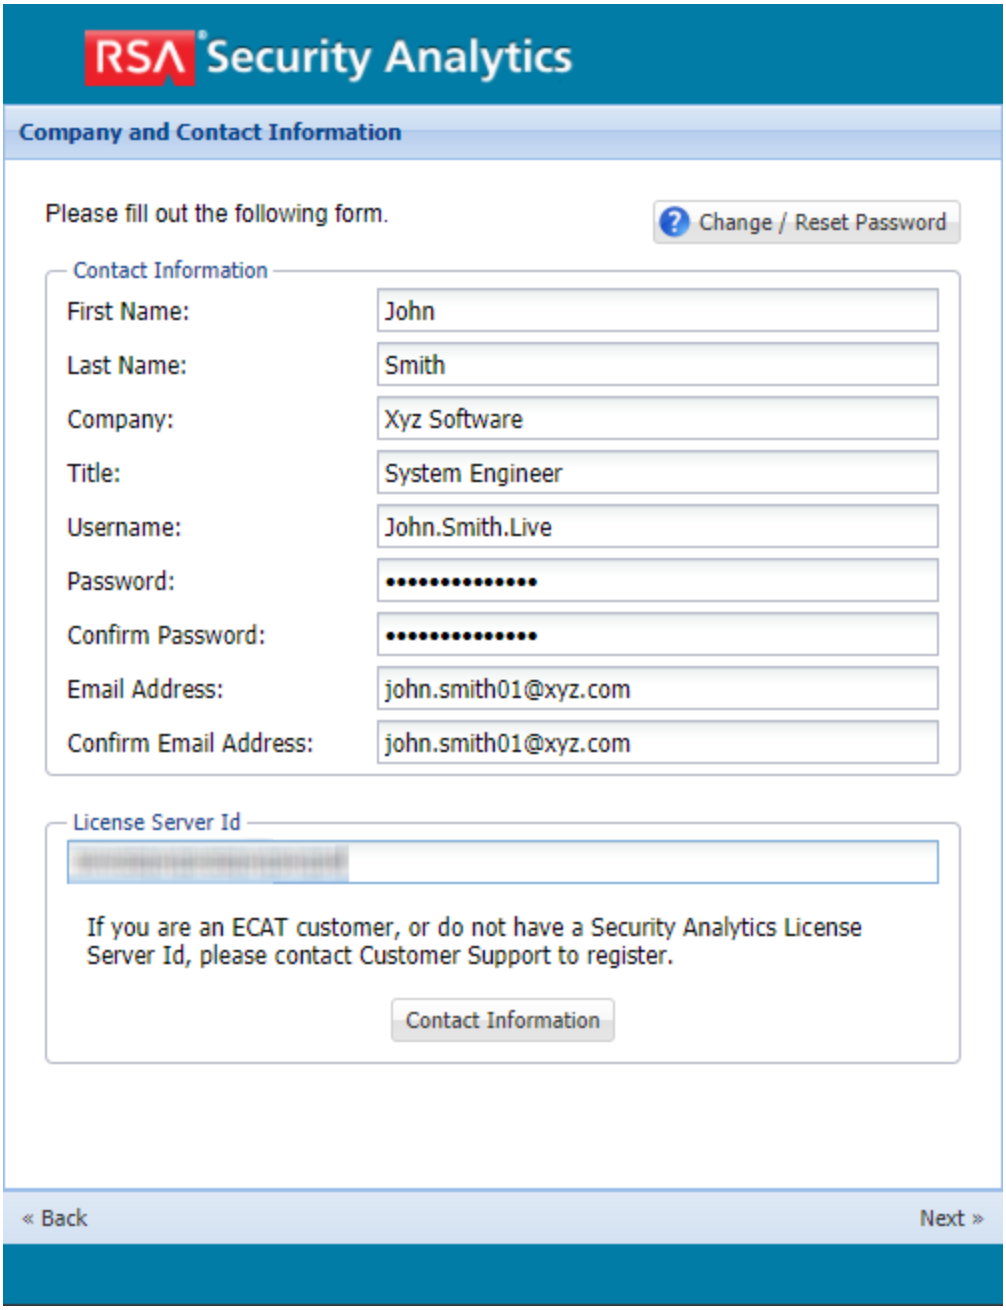
1. Access the RSA Live Registration Portal using the URL: https://cms.netwitness.com/registration/.
   The Welcome page is displayed.
2. Read the Terms and Conditions carefully and select the **I Agree** check box, as shown below:



3. Click **Next**.
4. In the **Contact Information** section, enter all the fields, as shown below:
   - The **username** must contain a minimum of nine characters and a maximum of 60 characters.
   - The **password** must contain a minimum of nine characters and a maximum of 60 characters, with at least one uppercase, one lowercase, one number, and one special

character.

- The **email address** you enter is used to send notifications related to your Live account.



5. In the **Subscription Level** section, select one of the following subscription levels:

   - **Basic** - This provides access to the Live content that is tagged for groups such as Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.
   - **Enhanced** - This provides access to the Live content that is tagged for groups such as Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.

- **Premium** - This provides access to the Live content that is tagged for groups such as Premium, Verisign Premium, Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.

6. In the **Confirm Subscription Level** section, select the subscription level once again to confirm.
7. Enter the **License Server Id**. You can view the License Id on the **ADMIN > SYSTEM > Info** page.

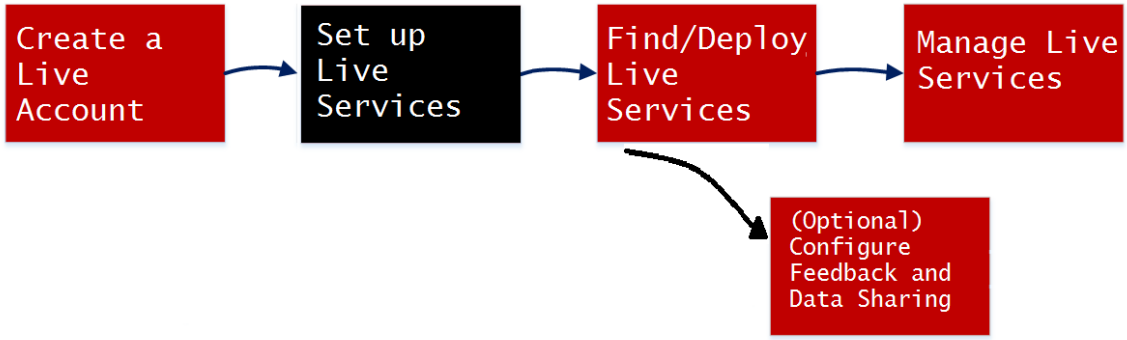
   Caution: Make sure that the license server ID on NetWitness Suite is valid and it is registered on the Flexera Server. If not, contact RSA Customer Support.

8. Click **Next**.

If the registration is successful you will receive RSA Live Account Confirmation email with your username. You now have access to the content subscribed.

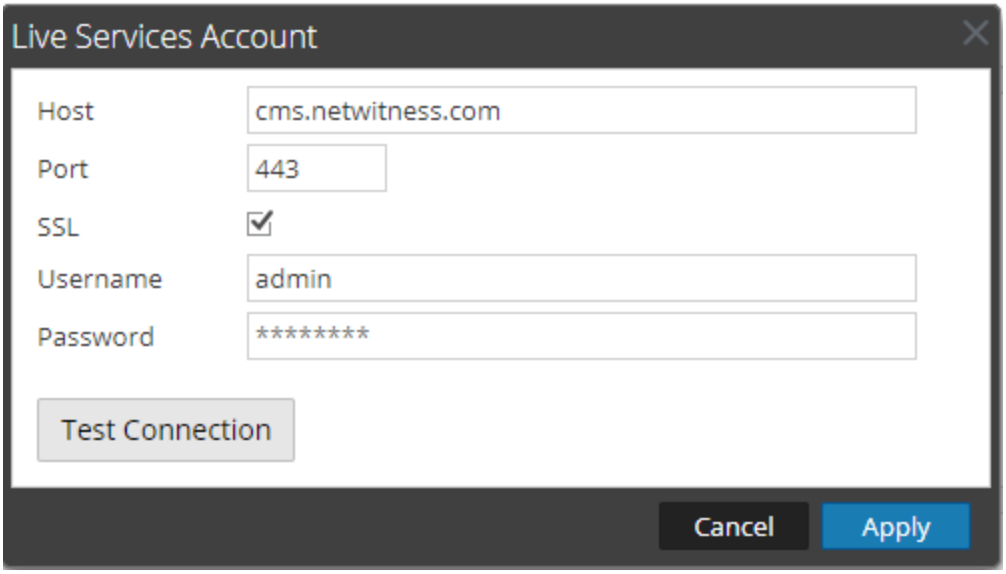
Set Up Live Services on NetWitness Suite

To set up Live on NetWitness Suite, you configure the connection and synchronization between the CMS server and NetWitness Suite. The user interface for this setup is the ADMIN > System > Live Services Configuration panel.



To configure the connection to the CMS Server:

1. Configure the connection to the CMS server and the Live account.

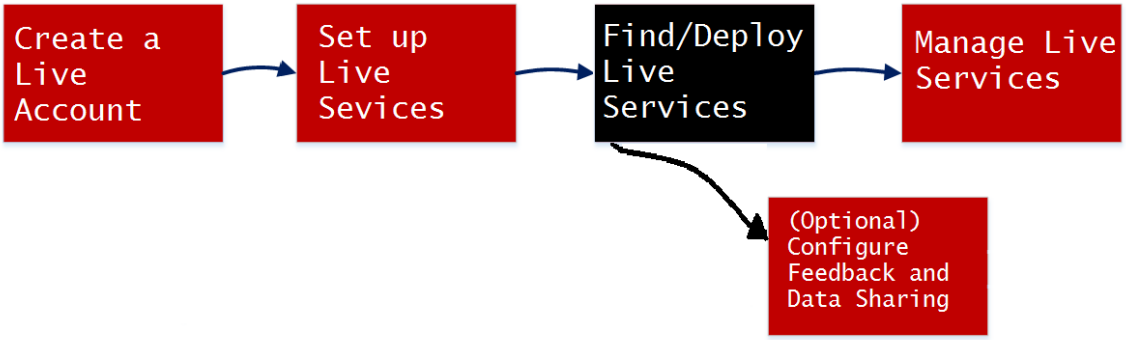


2. Configure the timing for synchronization of NetWitness Suite with updates from Live.

For more details, see the "Configure Live Services Settings" topic in the *System Configuration Guide*.

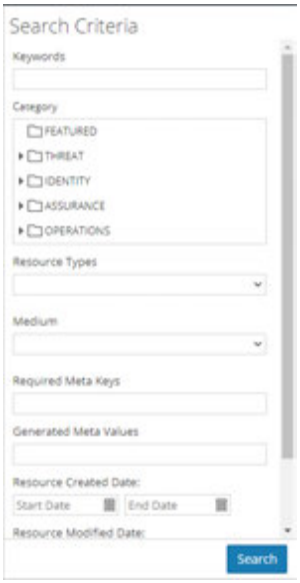
Find and Deploy Live Resources

Administrators can search for resources in the Live Search view, which is also the same as browsing the Live CMS for resources using the Search Criteria panel of the Live Search View.



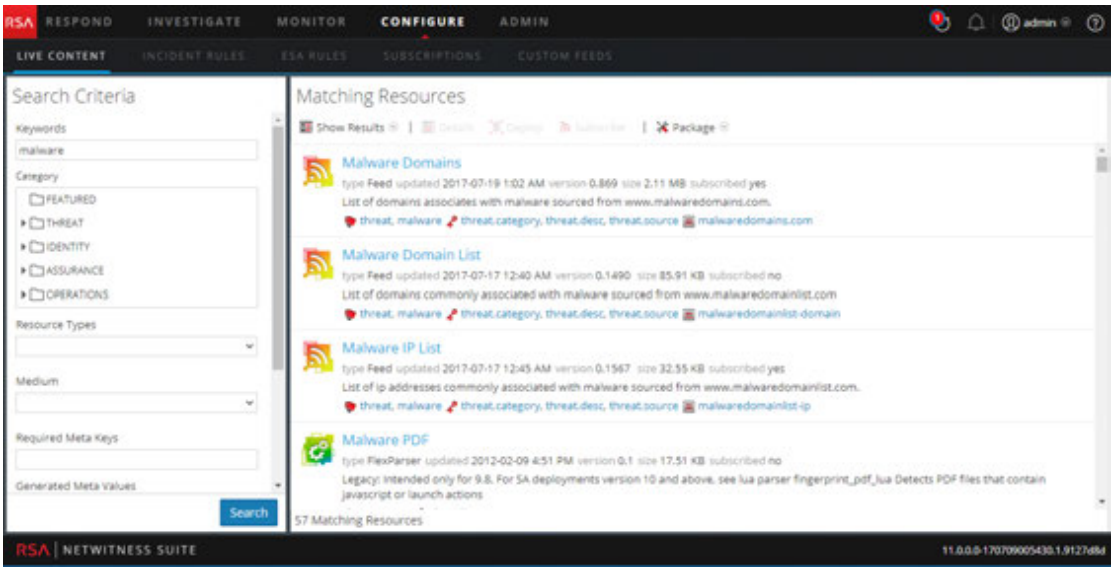
Find Resources

1. In the **Search Criteria** panel, specify search criteria. Enter any or all of these: keyword, category, type of resource, medium, meta keys, meta values, date resource was created, and date resource was modified.



2. Click **Search**.

   Detailed results are shown in the Matching Resources panel.



3. (Optional) To further narrow the results In the Matching Resources panel, click on a tag, meta key, medium or resource meta value in a result.

Deploy Resources in Live

In RSA NetWitness Suite, you can deploy selected resources manually, using the Deployment Wizard, or you can subscribe to a group of resources.

- When you have results from browsing resources in NetWitness Suite Live, you can deploy resources manually to a service or a service group without subscribing to the resources.
- Deploying resources manually deploys to services without taking advantage of the powerful resource management capabilities of NetWitness Suite. If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy them in the Live Configure View.

For manual deployment, this is the basic procedure:

1. Select a resource or group of resources, or select a previously-created package of resources.
2. Click Deploy, which starts the Deployment Wizard.
3. Review the list of selected resources.
4. Select the Services or Service Groups on which to deploy the selected resources
5. Review your previous selections
6. Deploy

The following procedure describes how to deploy a group of resources or a resource package:

- You can select one or more resources in the Live Resource View , then deploy them to services.
- Or, if you have previously created and saved a resource package, you can deploy the package to services. Please refer to Resource Package Deployment Wizard for instructions on how to create a package.

To deploy resources manually:

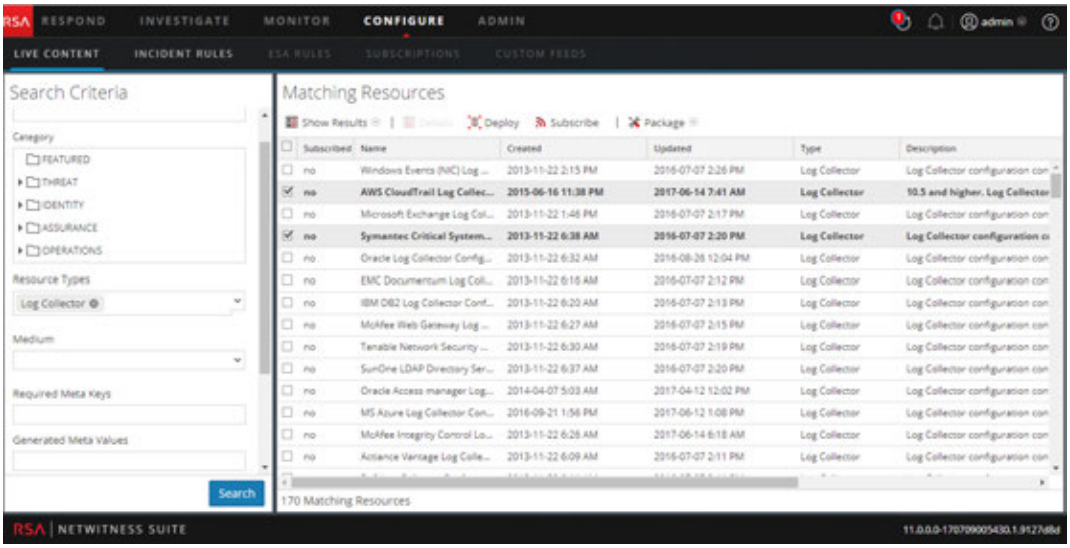
1. Go to **CONFIGURE > Live Content**.
2. Select a group of resources, or a previously created resource package.

   To select a resource or group of resources:

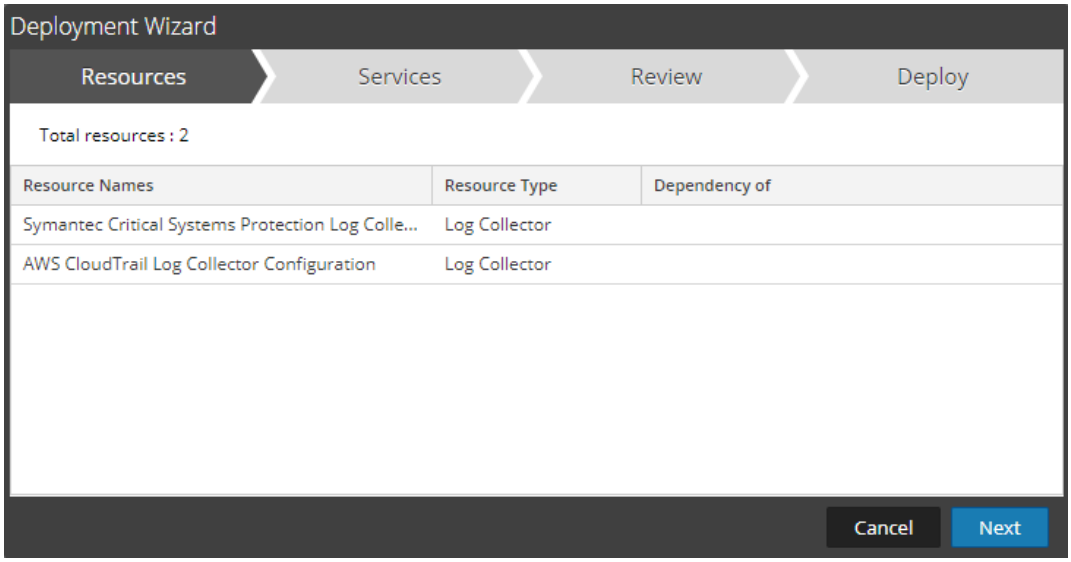
   a. In the **Live Search View,** browse Live resources (for example, search for the **Log Collector** resource Type).

   b. In the **Matching Resources** panel, select **Show Results > Grid**.

   c. Select the checkbox to the left of the resources that you want to deploy.



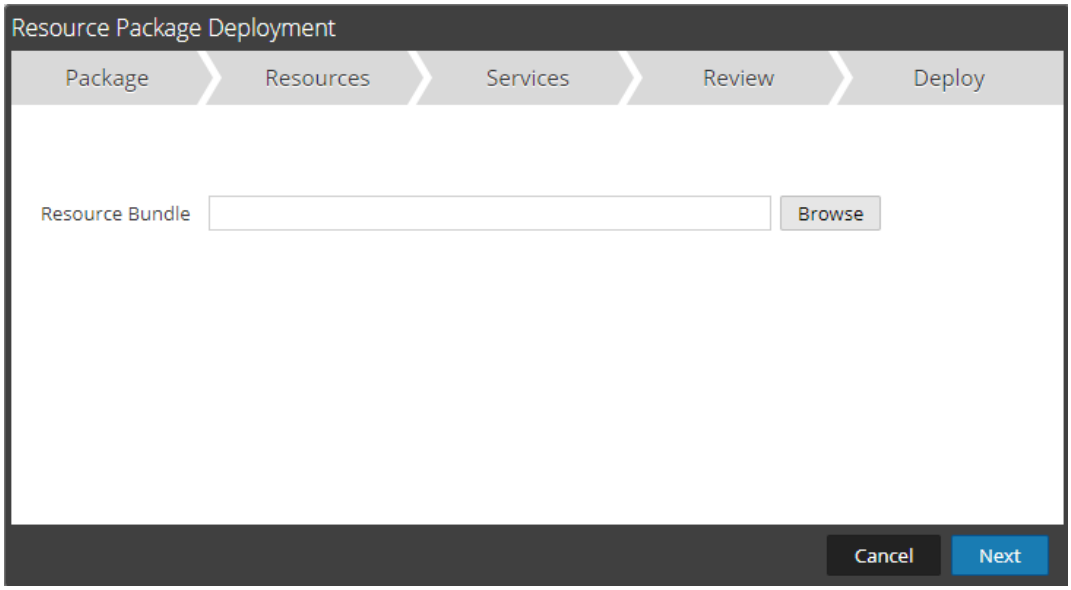
d. In the Matching Resources toolbar, click Deploy.



3. To select a resource package to deploy:

a. In the **Live Search** view **- Matching Resources** toolbar, select **Package** > **Deploy** :

The Package page of the Resource Package Deployment wizard is displayed.



b. Click Browse and select a package from your network (for example **resourceBundle-FeedsParsersContent.zip**).

c. Click **Open**.

At this point, whether you are deploying a package or a group of resources, the **Deployment Wizard** opens, and the **Resources** page is displayed.

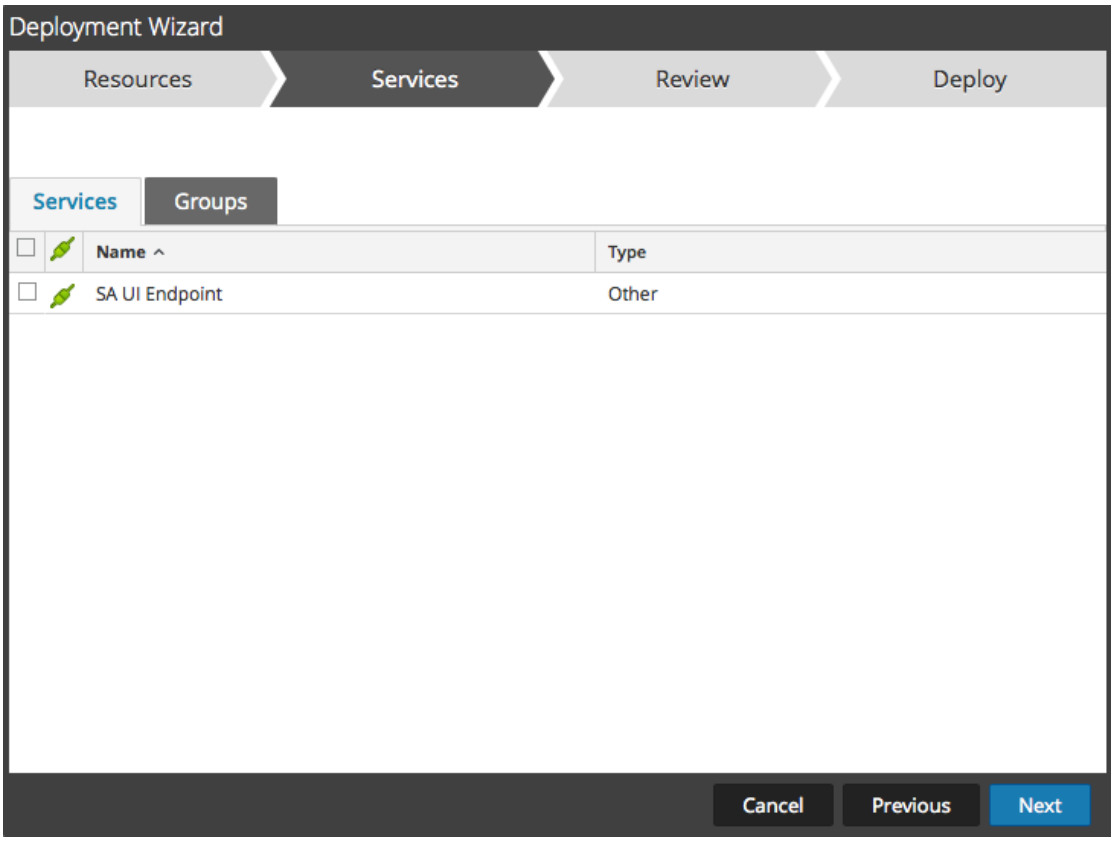
4. Click **Next**.

   The **Services** page displayed has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the Admin > Services view. The columns are a subset of the columns available in the Services view.

   Note: The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.

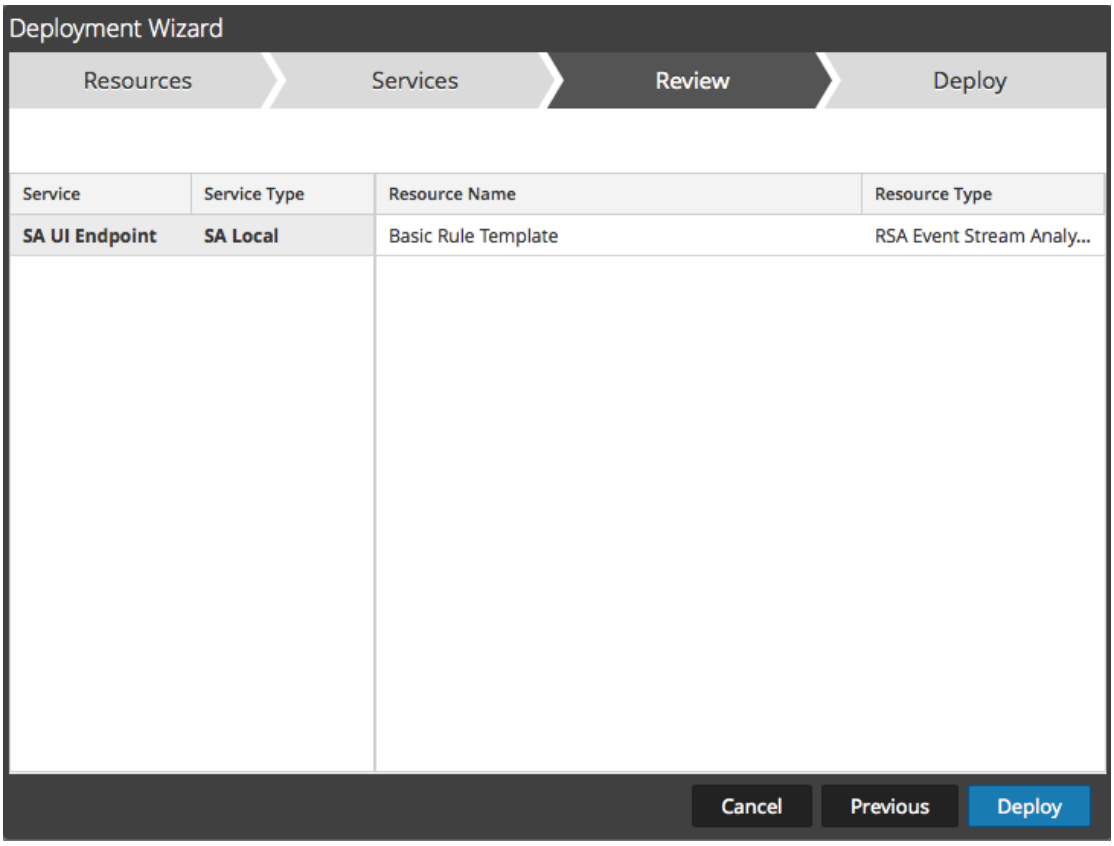
5. Select the services to which you want to deploy the content. You can select any combination of services and service groups.

   - Use the **Services** tab to select individual services, list of services and service groups that are configured in the ADMIN Services view.
   - Use the **Groups** tab to select groups of services



6. Click **Next**.

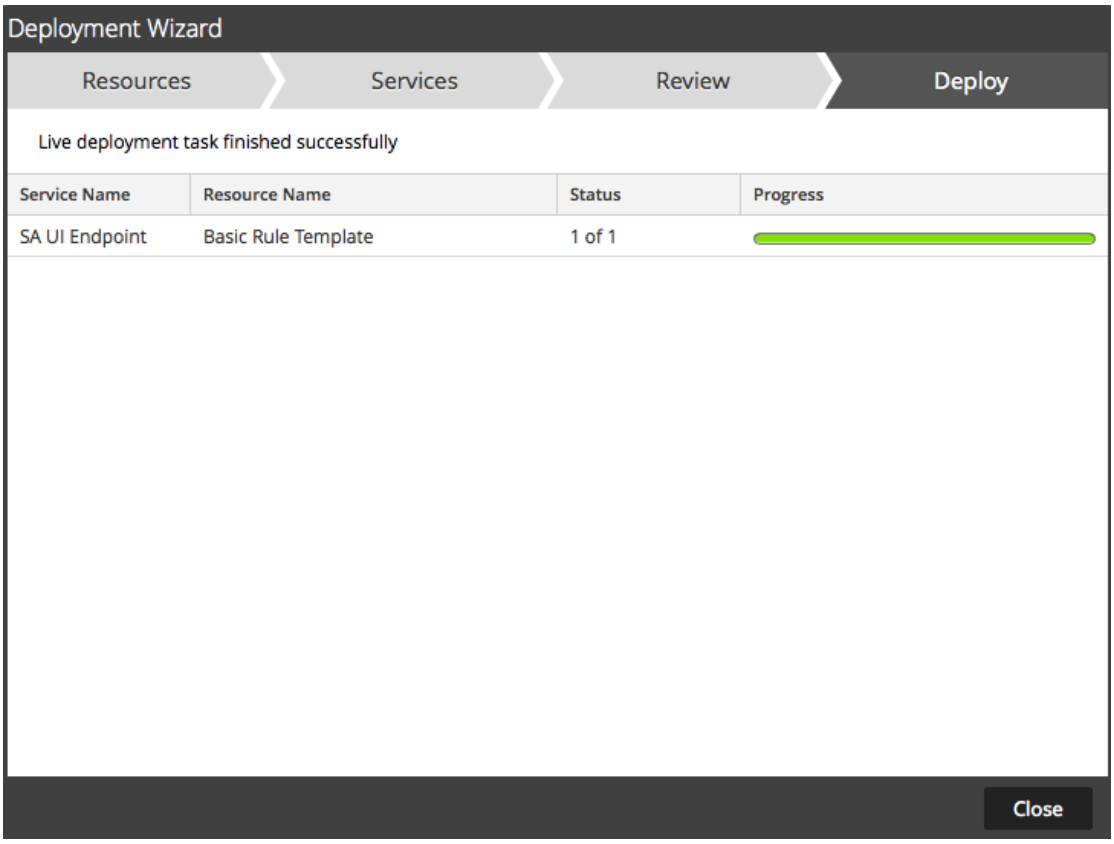
   The **Review** page is displayed.



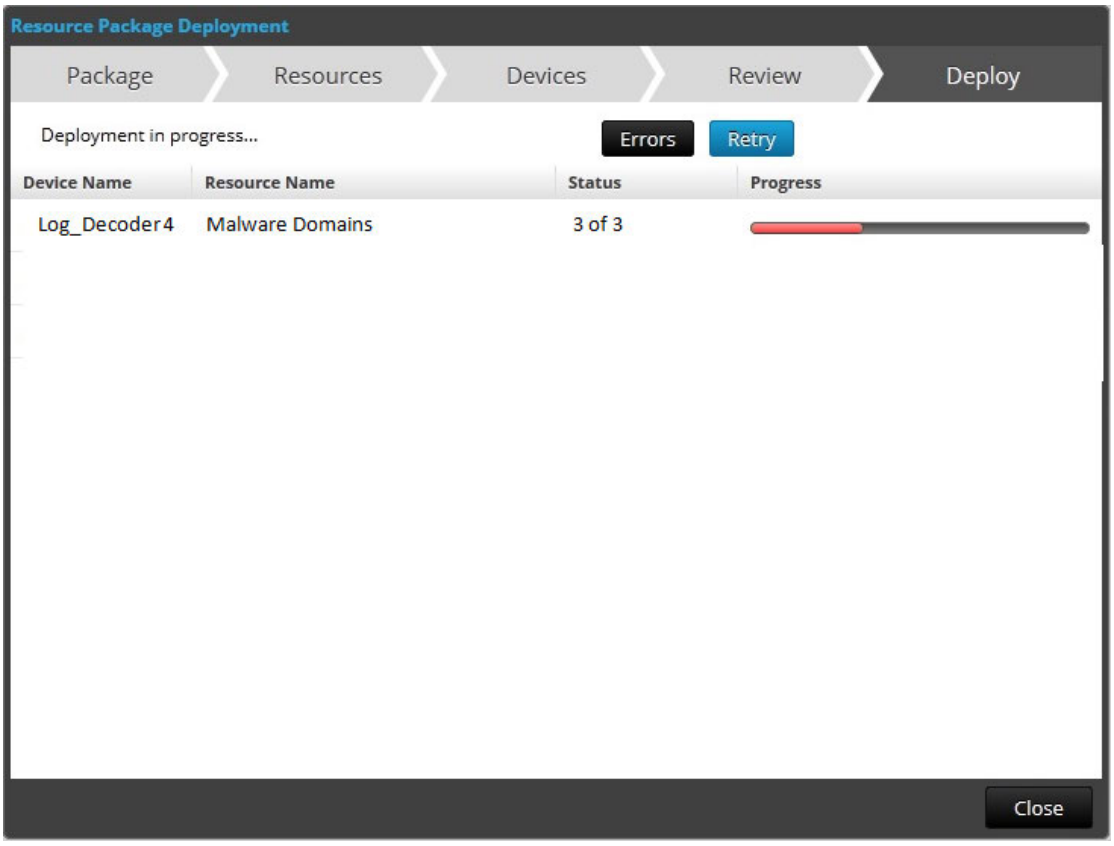
Make sure that you have selected correct resources and the services to which you want to deploy them.

7. Click **Deploy**.

   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.



If you try to deploy resources and services that are not compatible, NetWitness Suite displays the Errors and Retry buttons, which you click to review the errors and re-attempt the deployment.



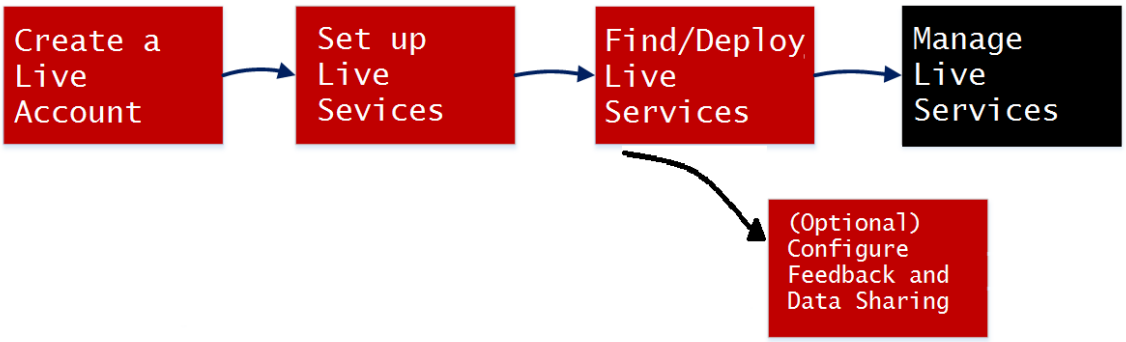
8. Click **Close**.

Next steps

After deploying parsers to Decoders and Log Decoders, you must enable parsers on the individual services as described in the *Decoder and Log Decoder Configuration Guide*.

Manage Live Resources

These procedures are required when administrators want to search for, subscribe to, and/or deploy resources from Live. With a connection to the CMS server, you can search for, subscribe to, and deploy resources from Live in accordance with your subscription level. Once you have found resources, you deploy them to services and service groups that have been configured in the Admin Services view.



Procedures

There are several possible workflows for deploying resources to services and managing those deployments. These include:

- Subscribe and deploy resources.
- Deploy a resource bundle.
- Remove deployments of resources.
- Download resources.
- Set up data feeds.

Manage Subscription and Deployment

The subscription and deployment workflow takes advantage of the resource management tools available in Live. By subscribing to resources, you agree to receive updated resources in accordance with the synchronization configured in the **ADMIN > Live Configuration** panel.

By adding subscribed resources to the deployments list, you configure NetWitness Suite to automatically push those resources to the selected services at the configured synchronization intervals. This method requires some planning of service groups and services where resources are deployed. In addition:

- You can remove a resource from the deployments list in the Deployments Tab.
- You can unsubscribe from a resource in the Subscriptions Tab and the Live Resource View.

To manage subscriptions and deployment:

1. In the **ADMIN > SYSTEM > Live** panel, specify an interval at which NetWitness Suite checks for updates to subscribed resources in Live and specify the email addresses of people to receive an email listing subscribed resources that have been updated.
2. In the **Live** > **Search** view, search for and subscribe to Live resources.
3. In the **Live** > **Configure** view > **Deployments** tab, select subscribed resources and add them to the deployment list for services groups.
4. (Optional) In the **ADMIN**> **SYSTEM**> **Live** panel, click 
to deploy the resources listed in the Deployments tab immediately.
5. In the **Live** > **Configure** view > **Deployments** tab, select deployed resources and remove them from services groups.
6. In the **Live** > **Configure** view > **Subscriptions** tab, unsubscribe from resources.

Remove a Deployed Resource

Once deployed to a service, Live resources remain on the service until removed. It is a good practice to remove unused resources from services on which they are deployed.

To remove resources, go to the Live Resource View, unsubscribe from a resource, and remove the resource from services where it is deployed.

Deploy a Resource Bundle

To deploy a content package, use the Resource Package Deployment Wizard. You can deploy a content package created in Live to one or more services. NetWitness Suite accepts packages in **.nwp** files or **.zip** files.

Download Resources

To download resources to your local file system, use the **Download** button in the Live Resource view.

Set Up Data Feeds

In the **Live** > **Feeds** view, you can set up and maintain Custom and Identify feeds.

Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration or use of Live Services.

- Export Data to RSA
- Manage Custom Feeds
  - Create a Custom Feed
  - Create a STIX Custom Feed
  - Create and Manage an Identity Feed
  - Edit a Feed
  - Remove a Feed
- Miscellaneous Live Services Procedures

Export Data to RSA

A NetWitness Suite administrator can export the metrics in NetWitness Suite for Live Feedback.

About Live Feedback

If the Live Account is not configured, you can manually upload the usage data to RSA. For more information, see the "Configure Live Services Panel" topic in the *System Configuration Guide*.

In the Live Services Configuration panel, there is a Live Feedback Activity Log which enables you to download the usage data required for Live Feedback. This is active regardless of the Live Account configuration.

You can first download the Live Feedback historical data, and then upload it to share with RSA

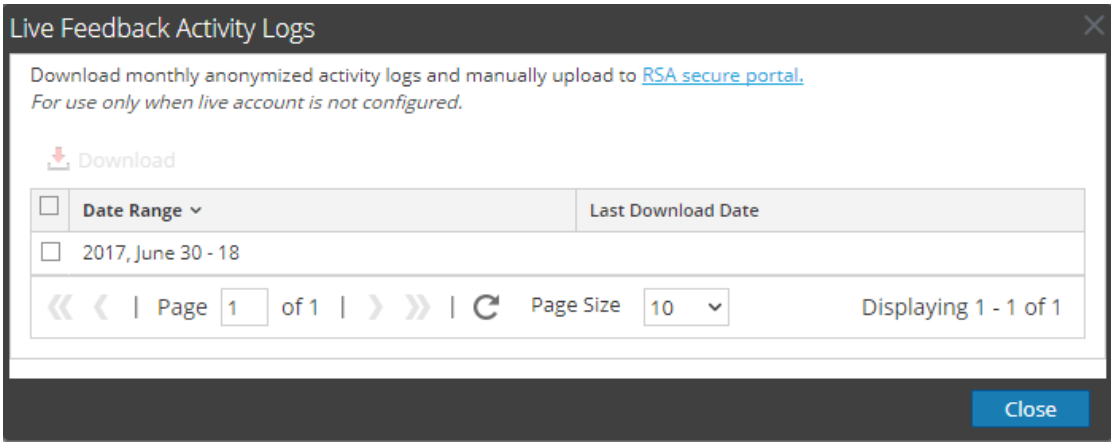
Download Live Feedback Historical Data

To download the Live Feedback historical data:

1. Go to **ADMIN** > **System**.
2. In the options panel, select **Live Services**.

   The **Live Account** screen is displayed which consists of the **RSA Live Status** and Download **Live Feedback Activity Log**.
3. Click **Download Live Feedback Activity Log**.

   The **Download Live Feedback Activity Log** window opens which allows you to download the required Live Feedback historical data.



4. Select one or multiple entries by selecting the checkboxes and click **Download**.

Note: If you select multiple entries in the history table, the downloaded zip file consists of an individual JSON file for each month.

The downloaded Live Feedback data is in JSON format, and is bundled as a .zip file. For more information, see "Live Feedback Overview" in the *System Configuration Guide*.

Share Data to RSA

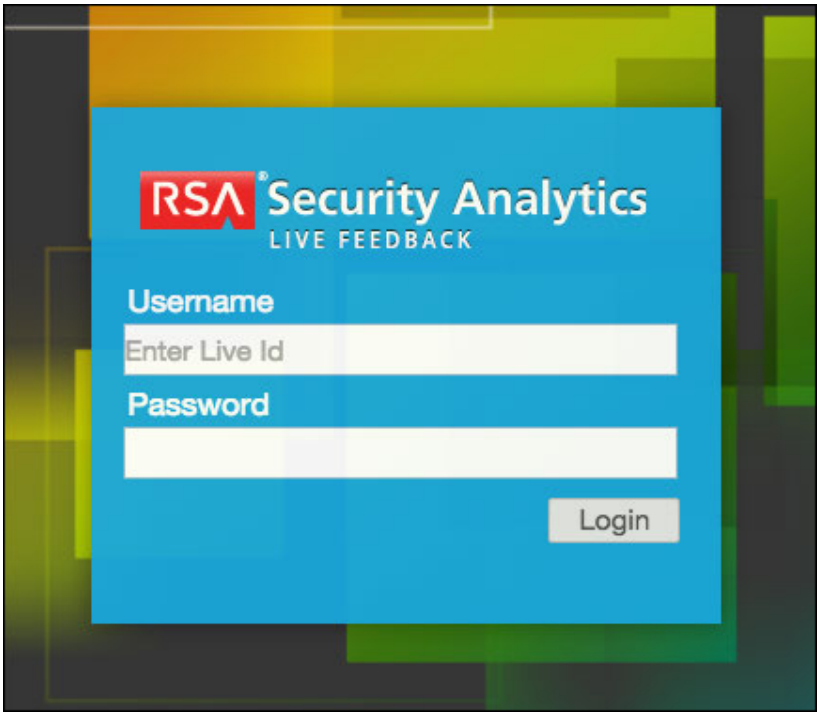
After you download the Live Feedback data, you can then upload it using the following procedure.

To share the data to RSA:

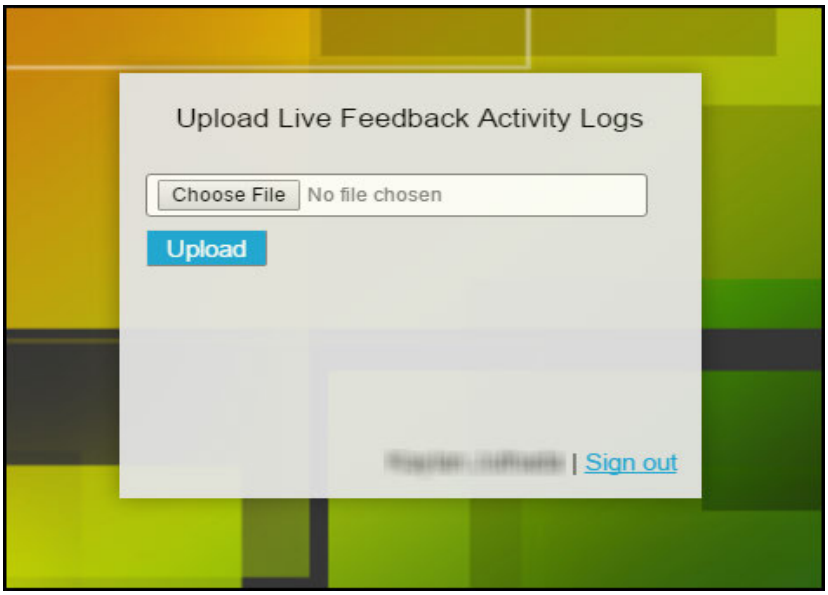
1. Click on the **RSA Secure Portal** available on the **Live Feedback Activity Logs** window.

   The RSA NetWitness Suite Live Feedback log on screen is displayed.

2. Log on to the Upload Live Feedback Activity Logs portal using your Live ID credentials.



3. Click **Download Live Feedback Activity Log**.



4. Click **Upload**.

Manage Custom Feeds

This topic introduces the custom feed capability, which is implemented using the Custom Feed Wizard in RSA NetWitness Suite, to quickly populate Decoders with custom and identity feeds.

Custom Feed Creation

You use the **Live** > **Feeds** > **Setup Feed** > **Configure a Custom Feed** wizard to quickly create and deploy Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides you through the process to create both on-demand and recurring feeds, you should understand the form and content of a feed file when you create a feed.

Feed file names in RSA NetWitness Suite are in the form `<filename>.feed`. To create a feed, NetWitness Suite requires a feed **data** file in `.csv` or `.xml` (for STIX) format and a feed **definition** file in `.xml` format, which describes the structure of a feed data file. The Configure a Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness Suite can fetch the most current version of the file for each recurrence. After a NetWitness Suite feed is created, you can download the feed to your local file system, edit the feed files, and then edit the NetWitness Suite feed to use the updated feed files.

Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness Suite creates based on your entries in the Feed wizards. It defines the structure of the feed data file named `dynamic_dns.csv`.

Note: The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

```
<?xml version="1.0" encoding="utf-8"?>
 <FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">

   <FlatFileFeed name="Dynamic DNS Domain Feed"
   path="dynamic_dns.csv"
   separator=","
   comment="#"
   version="1">

   <MetaCallback
   name="alias.host"
   valuetype="Text"
   apptype="0"
```

```
  truncdomain="true"/>

  <LanguageKeys>
           <LanguageKey name="threat.source" valuetype="Text" />
           <LanguageKey name="threat.category" valuetype="Text" />
           <LanguageKey name="threat.desc" valuetype="Text" />
  </LanguageKeys>

  <Fields>
  <Field index="1" type="index" key="alias.host" />
  <Field index="4" type="value" key="threat.desc" />
  <Field index="2" type="value" key="threat.source" />
  <Field index="3" type="value" key="threat.category" />
  </Fields>
  </FlatFileFeed>

</FDF>
```

Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Suite Feeds wizard provide options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (.xml) file.

NetWitness Suite Parameter	Feed Definition File Equivalent
Define Feed tab	
Feed Type	Select: **Default** - to define a feed based on a `.csv` formatted feed data file. **STIX** - to define a feed based on STIX formatted `.xml` file.
Feed Task Type	Select: **Adhoc** - to create an on-demand feed. **Recurring** - to create a feed that recurs automatically.
Name	The custom feed name in the feed data file. It corresponds to the **`flatfeedfile name`** attribute in the feed definition file; for example, Dynamic DNS Test Feed.
File/ Browse	This is the name of the feed data file. It corresponds to the **`flatfeedfile path`** attribute in the feed definition file; for example, dynamic_dns.csv.

NetWitness Suite Parameter	Feed Definition File Equivalent
(STIX, Recurring) **Trust All Certificate**	Select **Trust All Certificate**, if you do not want to validate the REST server certificate. This option is enabled by default (checked).
(STIX, Recurring) **Certificate/Browse**	For client authentication with the REST URL, in the **Certificate** field, click **Browse** and select the self signed certificate. The supported certificate formats are .cer, .crt with Base64 & DER encoded files.
	Define Feed tab - Advanced Options
XML Feed File	The name of the feed definition file, for example, `dynamic_dns.xml`.
Separator	The separator character used to separate attributes in the feed data file. It corresponds to the **`flatfeedfile separator`** in the feed definition file; for example, a comma.
Comment	The character used to identify a comment in the feed data file. It corresponds to the **`flatfeedfile comment`** attribute in the feed definition file; for example, #.
Remove STIX data older than	The number of days for which the STIX packages downloaded from TAXII server have to be stored. The STIX packages older than the specified number of days are deleted automatically. The default value is 180 days, which is also the maximum.
Select Services tab	Select the services to which you want to send the data feed.
(Define Columns tab, Define Index) **Type**	The type of lookup value in the index position of the feed data file. **IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42). **IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24). **Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index.

NetWitness Suite Parameter	Feed Definition File Equivalent
(Define Columns tab, Define Index) **CIDR**	Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation.
(Define Columns tab, Define Index) **Service Type**	For a Non IP index, the integer service type to filter meta lookups. It corresponds to **MetaCallback apptype** attribute in the feed definition file. A value of **0** indicates no filtering by service type.
(Define Columns tab, Define Index) **Truncate Domain**	For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the **MetaCallback truncdomain** attribute. If the value is www.example.com, it is truncated to example.com. A value of **False** selects no truncation, and **True** selects truncation.
(Define Columns tab, Define Index) **Callback Keys**	For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list. The Callback Key corresponds to the **MetaCallback name** attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the username meta key is chosen, the index column of the csv file needs to be populated with users to be matched.
(Define Columns tab, Define Index) **Index Column**	Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on. You can select multiple index columns, if the **Feed Type** is **STIX** and **Index Type** is **Non IP**. When you select multiple index columns the values from all the selected columns are merged in the first index column that you selected.

NetWitness Suite Parameter	Feed Definition File Equivalent
(DEFINE VALUES) **Key**	The name of the **LanguageKey**, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the **Field key** attribute in the feed definition file. A key applies only to a field whose type is set to **value**. In the feed definition file, there is a list of LanguageKeys from **index.xml**, or a summary name if Source Name and Destination Name are used. For example, **reputation** is a summary name for **reputation.src** and **reputation.dst**). This value is referenced by the Field key attribute.

- Edit a Feed
- Remove a Feed

Create a Custom Feed

This topic provides instructions for creating a custom feed using a .csv or STIX formatted feed data file in RSA NetWitness Suite.

Note: From 10.6.1 or later, NetWitness Suite supports Structured Threat Information Expression (STIX). For more information about STIX and creating a STIX custom feed, see Create a STIX Custom Feed.

You can easily create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv`or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

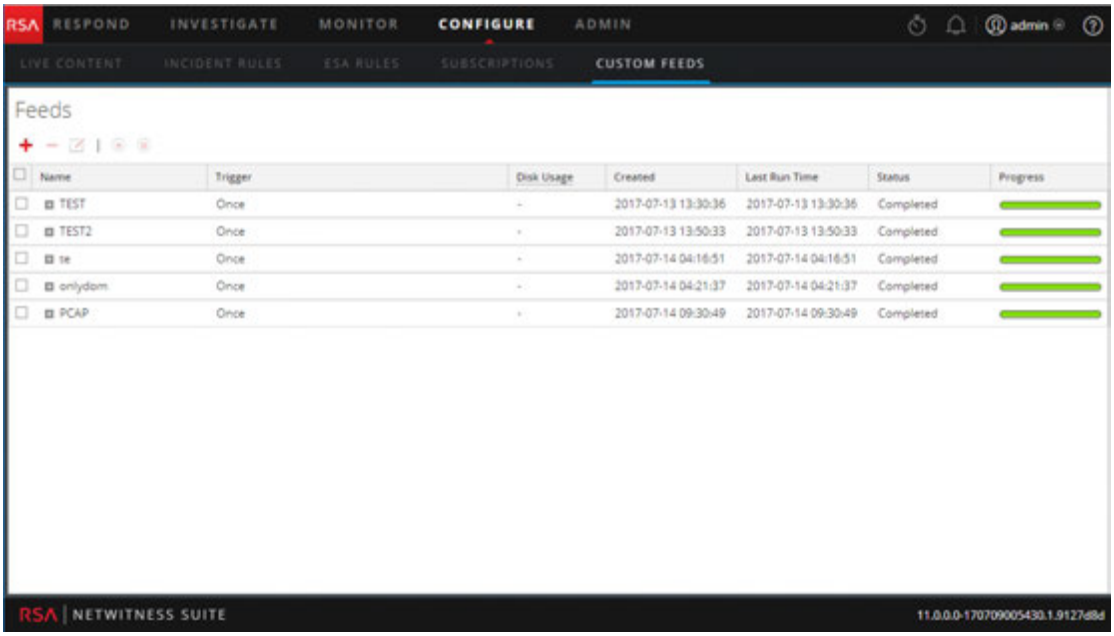
After completing this procedure, you will have created a custom feed.

The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness Suite server.

To create a custom feed:

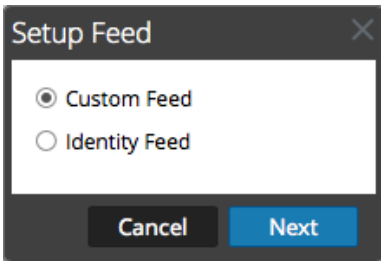
1. Go to t **CONFIGURE > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



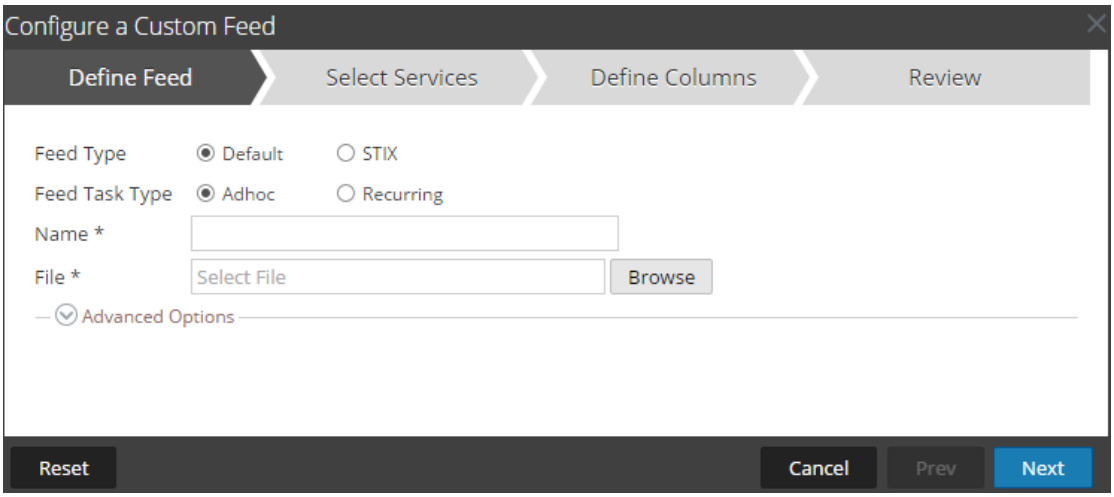
2. In the toolbar, click +.

   The Setup Feed dialog is displayed.



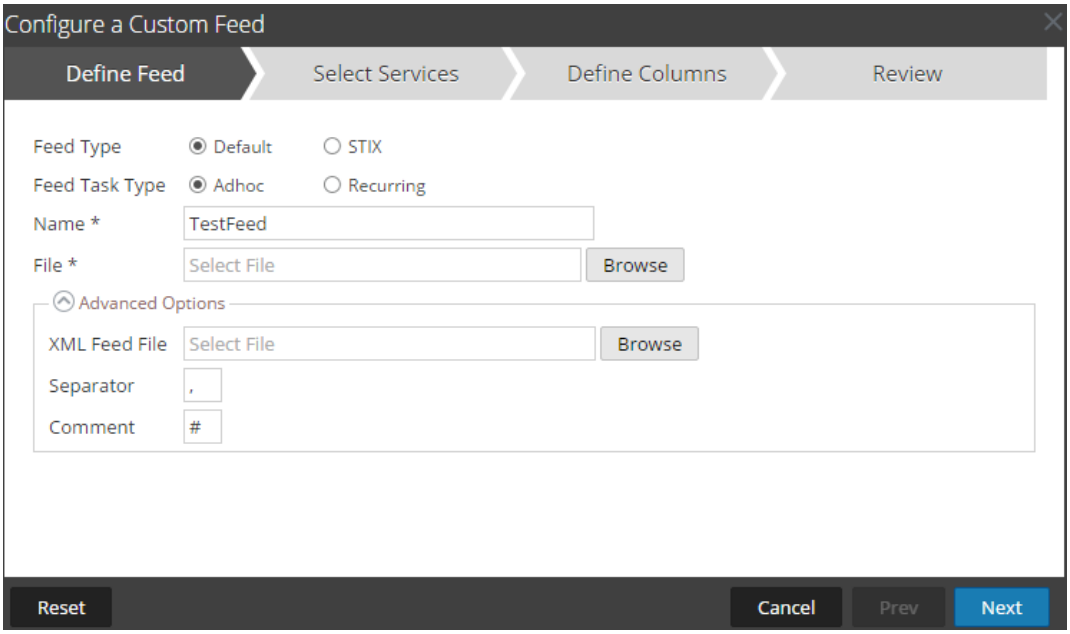
3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



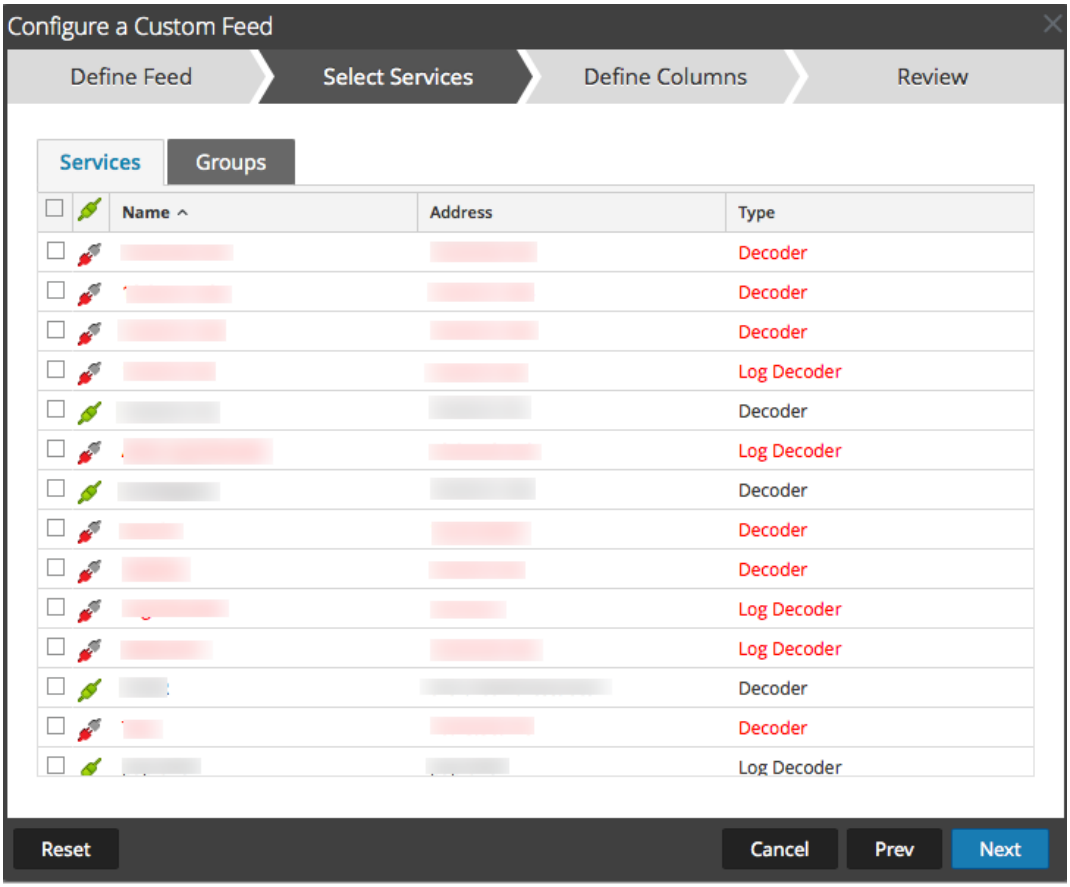
4. To define a feed based on a `.csv` formatted feed data file, select **Default** in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on a .csv formatted feed data file, type the feed **Name**, select a .csv content **File** from the local file system, and click **Next**.
   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      The Advanced Options are displayed:



c. Select an XML feed file from the local file system, choose the **Separator** (default is comma), and specify the **Comment** characters used in the feed data file (default is #), and click **Next**.

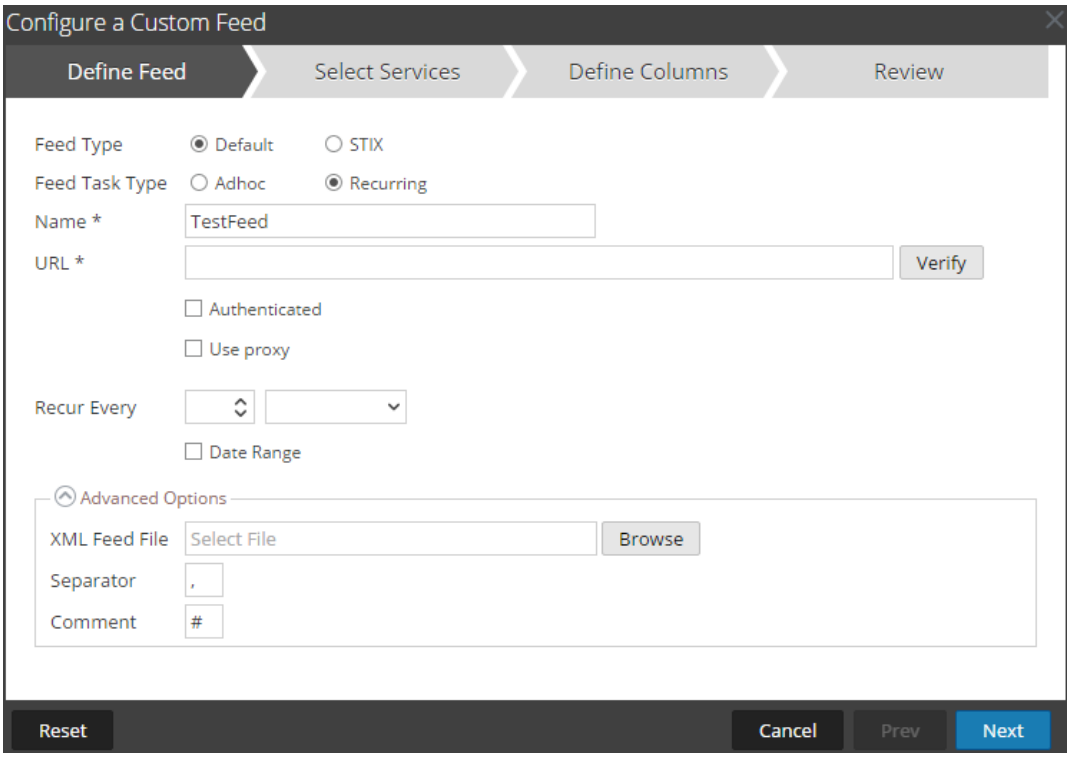
d. The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.



6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.

a. Select **Recurring** in the **Feed Task Type** field.

The Define Feed form includes the fields for a recurring feed.



b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**.

   NetWitness Suite verifiies the location where the file is stored, so that NetWitness Suite can check for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

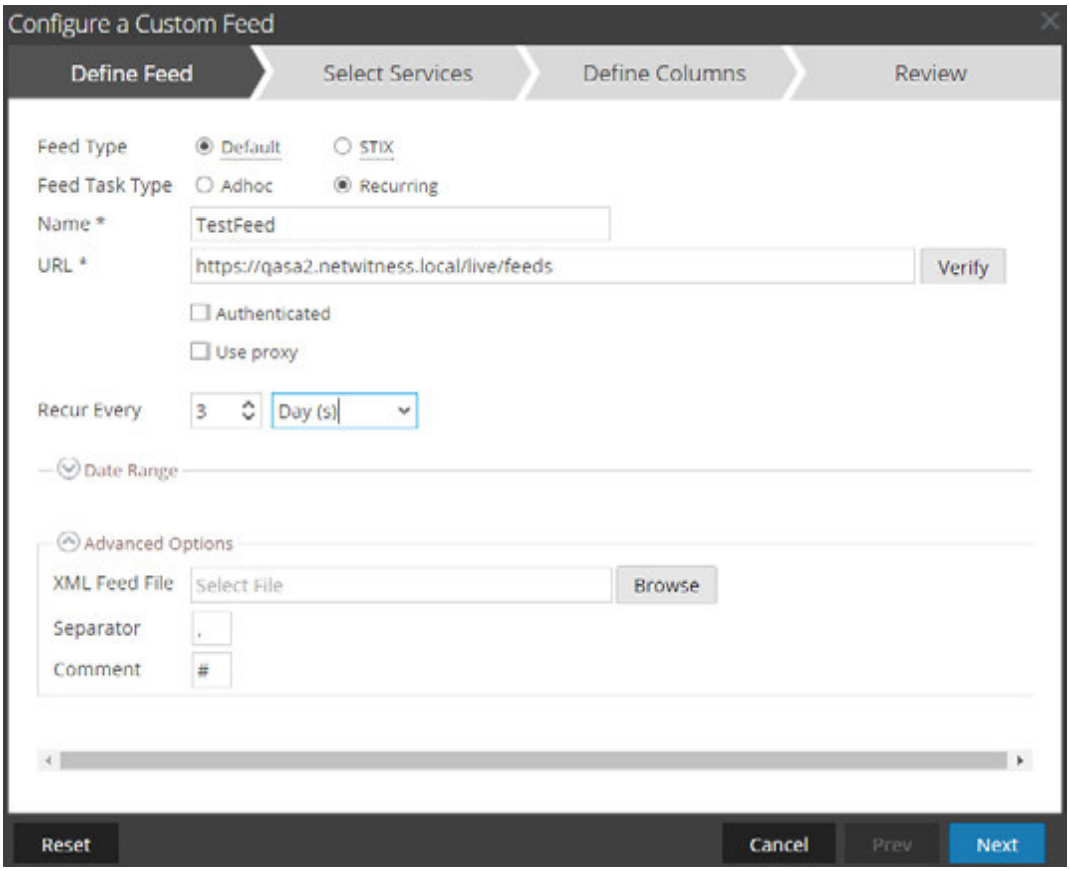
   NetWitness Suite provides your user name and password for authentication to the URL.

d. If you want the NetWitness Suite server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see the **Configure Proxy for NetWitness Suite** topic in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not selected.

e. To define the interval for recurrence, do one of the following:

   - Specify the number of minutes, hours, or days between recurrences of the feed.
   - Specify recurrence every week, and select the days of the week.

f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.



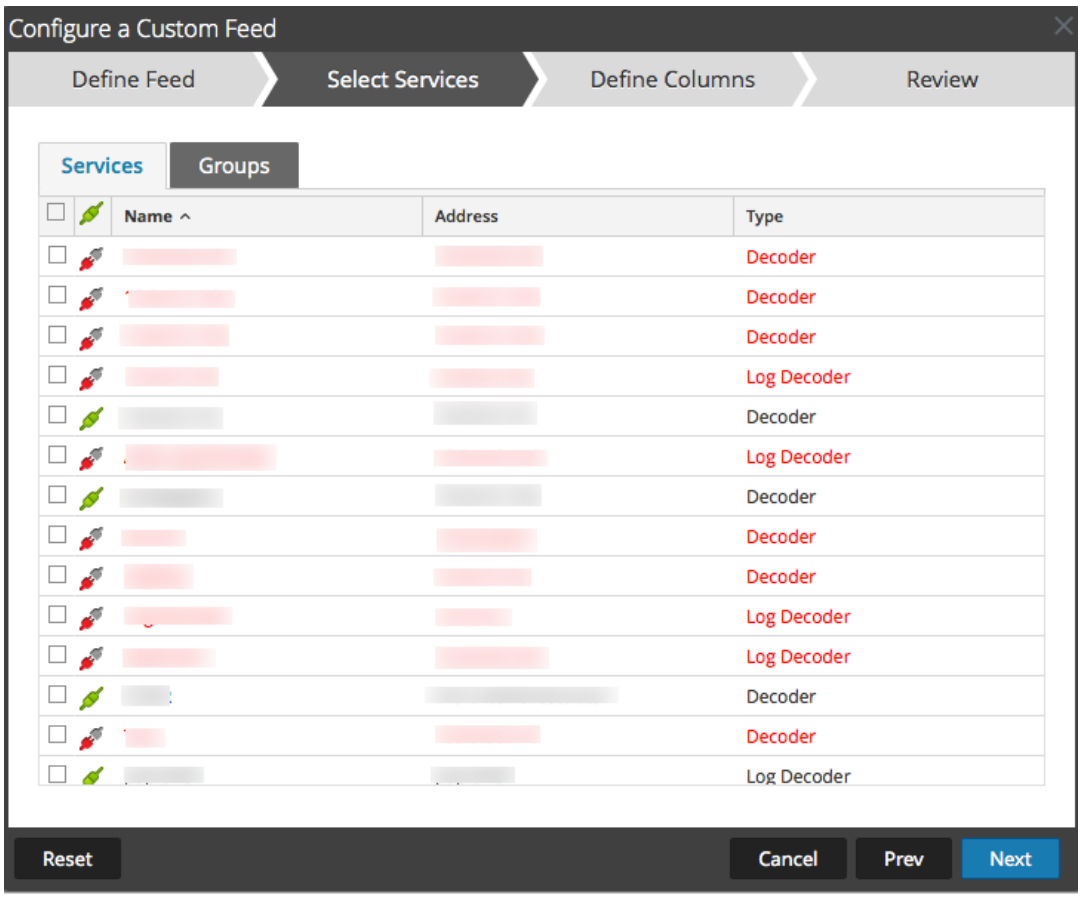
7. (Conditional) If you want to define a feed based on an XML feed file:

   - Type the feed **Name**, select **Advanced Options**.

     The Advanced Options fields are displayed.

   - Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**.

The Select Services form is displayed.



8. To identify services on which to deploy the feed, do one of the following:

   a. Select one or more Decoders and Log Decoders, and click **Next**.

   b. Click the **Groups** tab and select a group. Click **Next**.

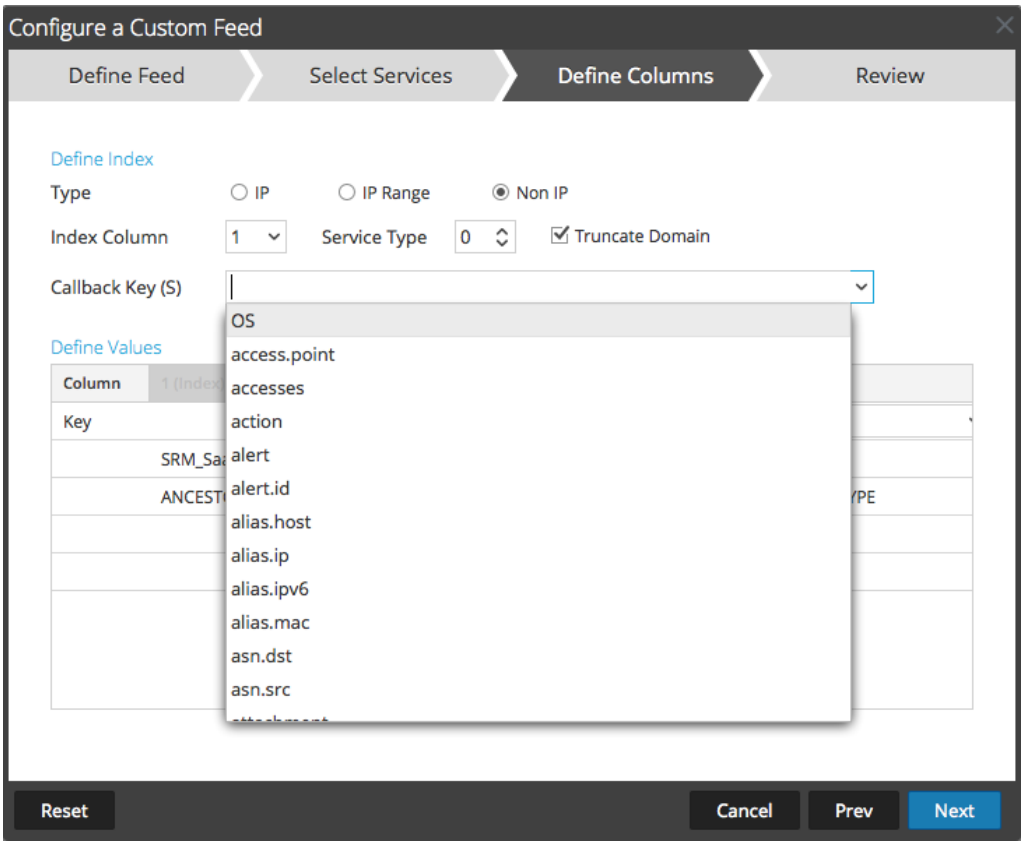
      The Define Columns form is displayed.

9. To map columns in the Define Columns form:

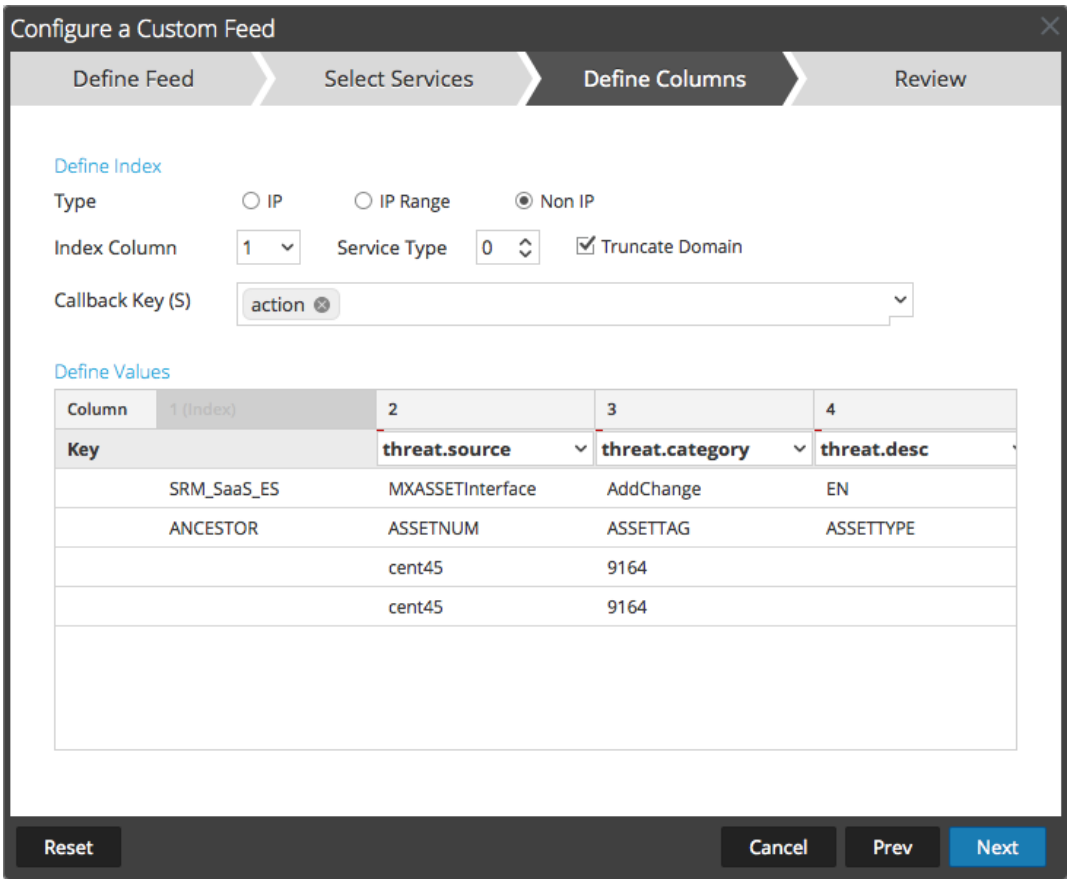
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.

   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR.**

   c. (Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.

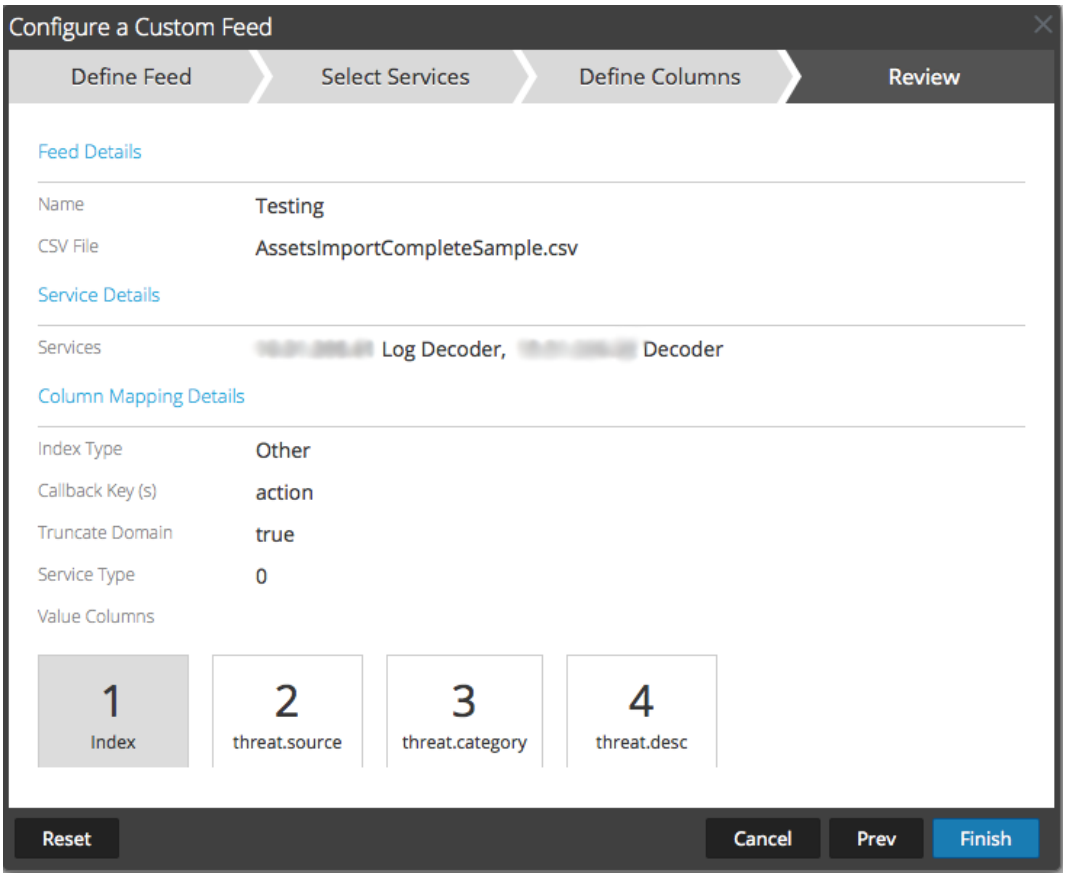


d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.



e. Click **Next**.

The Review form is displayed.



10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).

11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

MetaCallback Feeds using CIDR Index Range for IPv4 and IPv6

This section describes how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a .csv file and an .xml file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

.csv file:

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

.xml file:

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
        <MetaCallback name="DstIP" valuetype="IPv4" apptype="0" truncdomain="false">
                <Meta name="ip.dst"/>
        </MetaCallback>
        <LanguageKeys>
                <LanguageKey name="alert" valuetype="Text" />
        </LanguageKeys>
        <Fields>
                <Field index="1" type="index" range="cidr"/>
                <Field index="2" type="value" key="alert" />
        </Fields>
</FlatFileFeed>
</FDF>
```

Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with range="cidr". Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Create a STIX Custom Feed

You can create a custom feed using a .csv or STIX formatted feed data file in RSA NetWitness Suite.

Note: NetWitness Suite supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

Note: From 10.6.1 or later, Security Analytics supports Structured Threat Information Expression (STIX).

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://stixproject.github.io/.

Caution: If STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness Suite 11.0, you must re-configure the STIX recurring feed.

In NetWitness Suite, STIX (`.xml`) feed of type Indicator or Observable which contains the properties such as the IP addresses, File hashes, Domain names, URIs and Email addresses are supported. The properties values in the Equals operator is only supported. And, the attributes such as Type and Title are also read from the STIX (`.xml`). The STIX (`.xml`) with a single STIX_Package is only supported.

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.

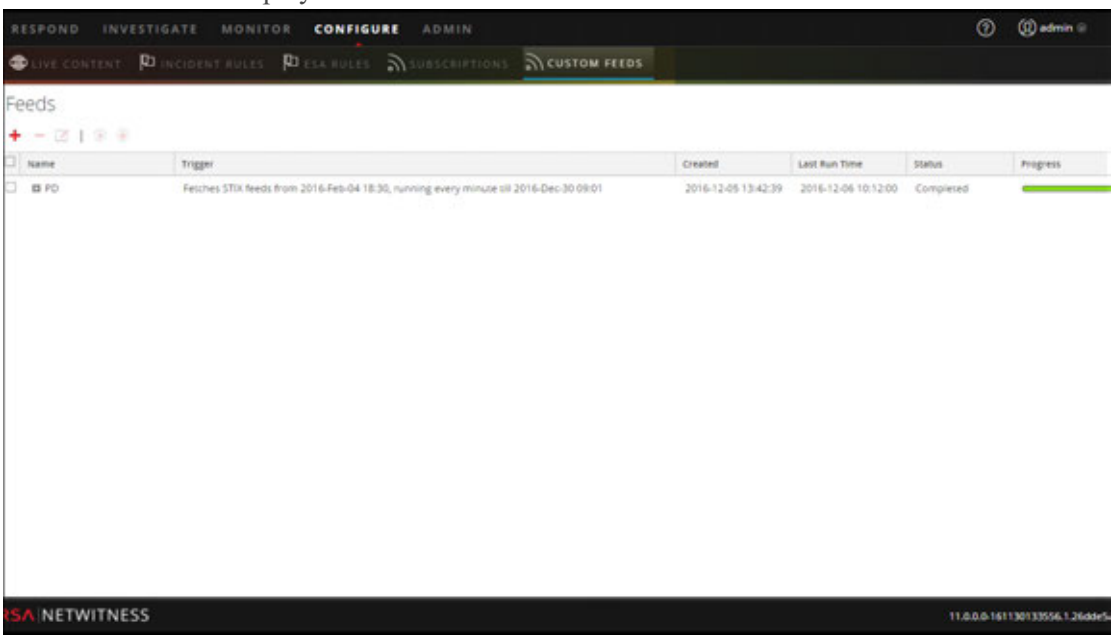
Apart from TAXII server, STIX data can also reside on REST server and you can fetch STIX file from the REST server by providing the URL of the REST server. For example, http://stixrestserver.internal.com.

The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness Suite server.

To create a STIX custom feed:

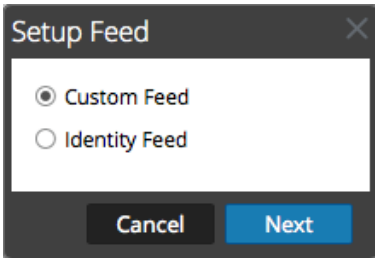
1. Go to **Configure > Custom Feeds**.

   The Feeds view is displayed.



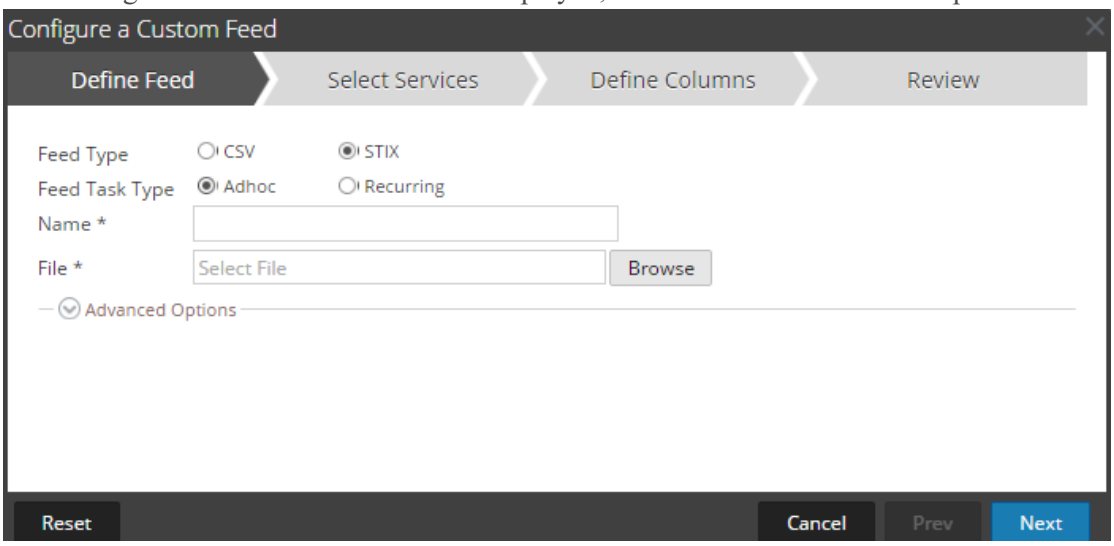
2. In the toolbar, click +.

   The Setup Feed dialog is displayed.



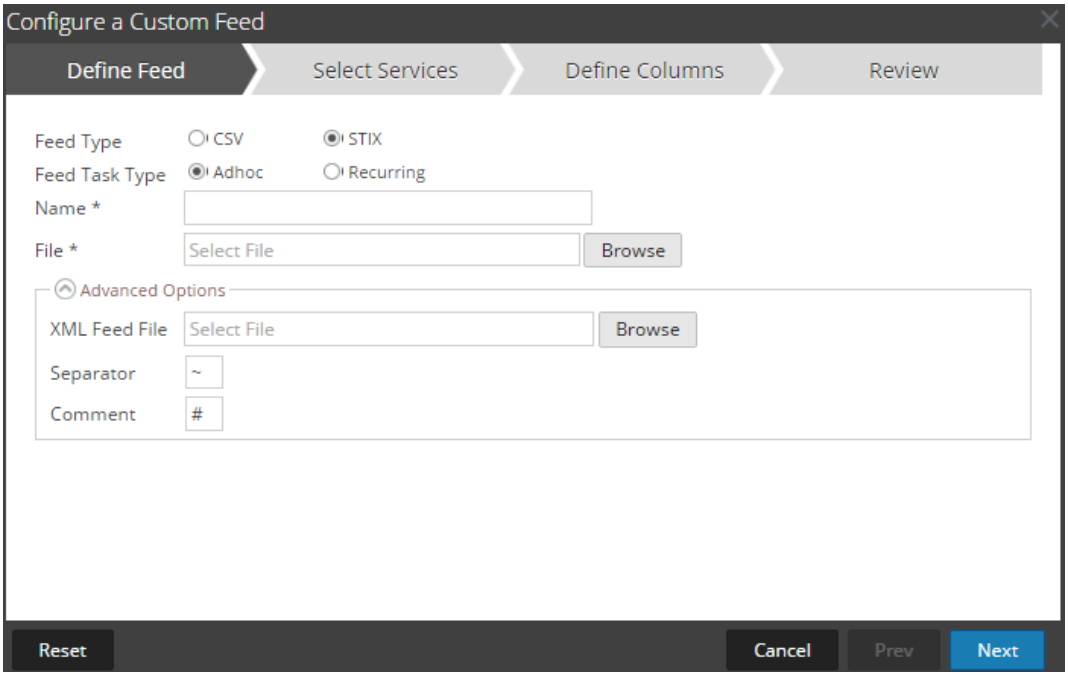
3. To select the feed type, click **Custom Feed** and **Next**.

The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



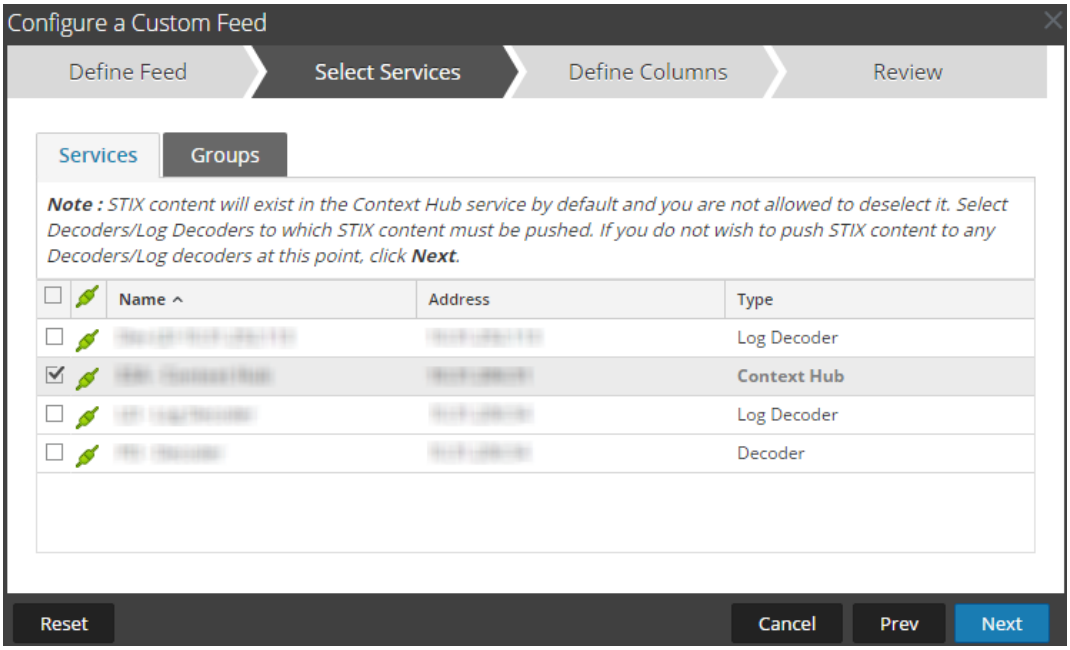
4. To define a feed based on a STIX formatted `.xml` file, select **STIX** in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on STIX formatted `.xml` file, type the feed **Name**, select a STIX formatted `.xml` content **File** from the local file system, and click **Next**.
   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      The Advanced Options are displayed:



c. Select an XML feed file from the local file system, choose the **Separator** (default is comma), and specify the **Comment** characters used in the feed data file (default is #), and click **Next**.

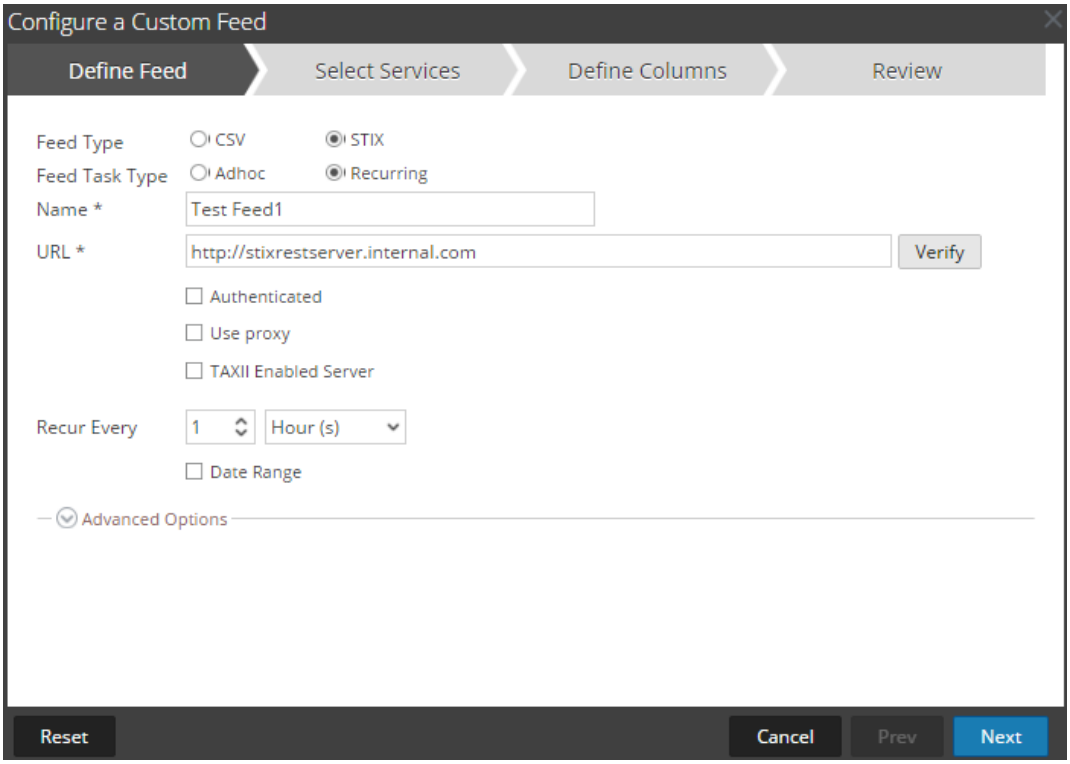
d. The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.



6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.

a. Select **Recurring** in the **Feed Task Type** field.

The Define Feed form includes the fields for a recurring feed.



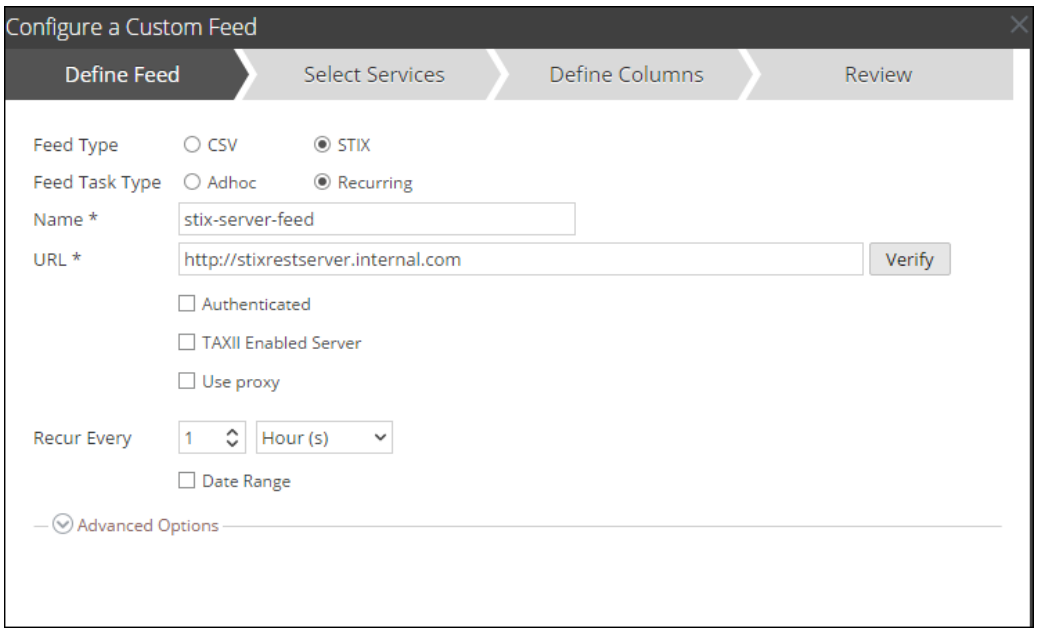
b. In the **URL** field, do one of the following:

- To define a recurring feed based on STIX which pulls STIX packages from a TAXII Server, enter the TAXII server's discovery service URL, for example, http://hailataxii.com/taxii-discovery-service.

  Note: Context Hub service installed on Event Stream Analysis host must be reachable for the specified TAXII server.

- To define a recurring feed based on a STIX formatted .xml file using REST Server, enter the URL of the REST server where the STIX data file is located, for example,

http://stixrestserver.internal.com.



NetWitness Suite verifies the connection to the server, so that NetWitness Suite can check for the latest file automatically before each recurrence.

c. If you do not want NetWitness Suite to verify the REST server's SSL certificate, Select **Trust All Certificate**. This option is enabled by default (checked)

d. For client authentication with the REST URL, in the **Certificate** field, click **Browse** and select the self signed certificate. The supported certificate formats are .cer, .crt with Base64 & DER encoded files.

e. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

NetWitness Suite provides your user name and password for authentication to the URL.

f. Select **TAXII Enabled Server**, if you want to select a TAXII collection from the list. For a valid URL, one or more TAXII collections that contains the STIX data file is displayed based on your credentials. Select the required TAXII collection from the list. Only one collection can be added from a TAXII server for a feed.

Note: Though multiple feeds from multiple TAXII servers are supported, only one account (username and password) is supported per TAXII server.

g. If you want the NetWitness Suite server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see the **Configure Proxy for**

NetWitness Suite topic in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not selected.

h. (Optional) Click **Verify** to test the settings.

Note: Make sure all the required connection parameters such Authentication, Proxy, Certificate trust, TAXII Enabled Server etc. are configured before you click **Verify**.

i. To define the interval of recurrence for pushing to Decoder or Log Decoder, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.
- Specify recurrence every week, and select the days of the week.

j. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time. The Start Date should be defined from when you want to fetch the data. Make sure that the **Start Date** is not before 180 days from today.

7. (Conditional) If you want to define a feed based on an XML feed file:

- Type the feed **Name**, select **Advanced Options**.

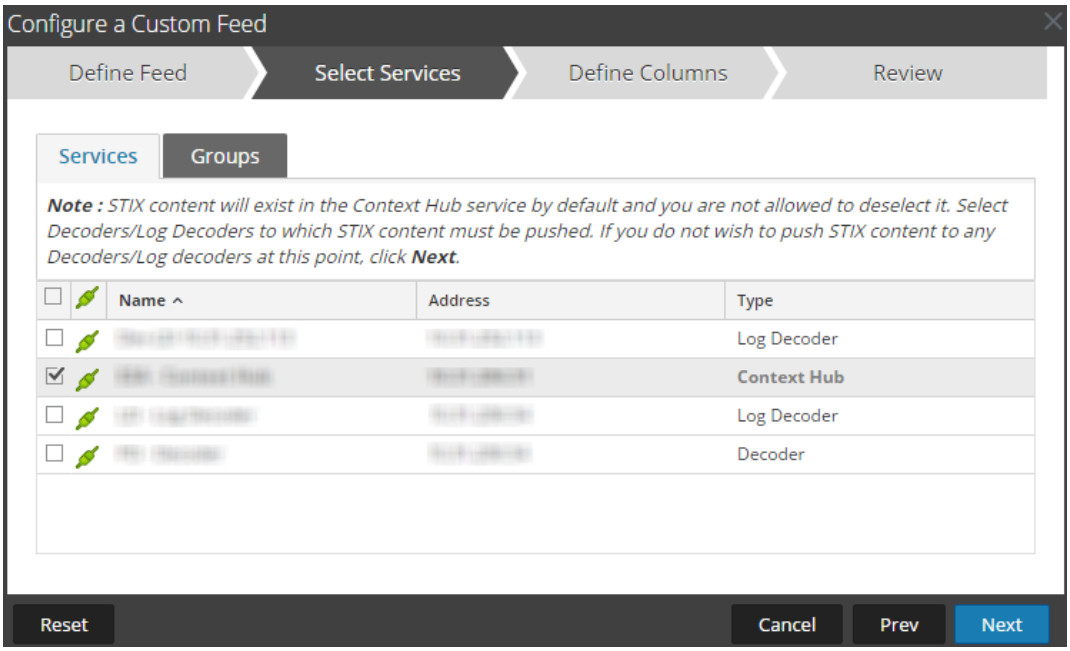
  The Advanced Options fields are displayed.
- Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #).
- In the **Remove STIX data older than** field, specify the number of days for which STIX packages pulled from TAXII server is to be stored. The STIX packages older than the specified number of days is deleted automatically.
- Click **Next**.

  The Select Services form is displayed.

8. To identify services on which to deploy the feed, do one of the following:

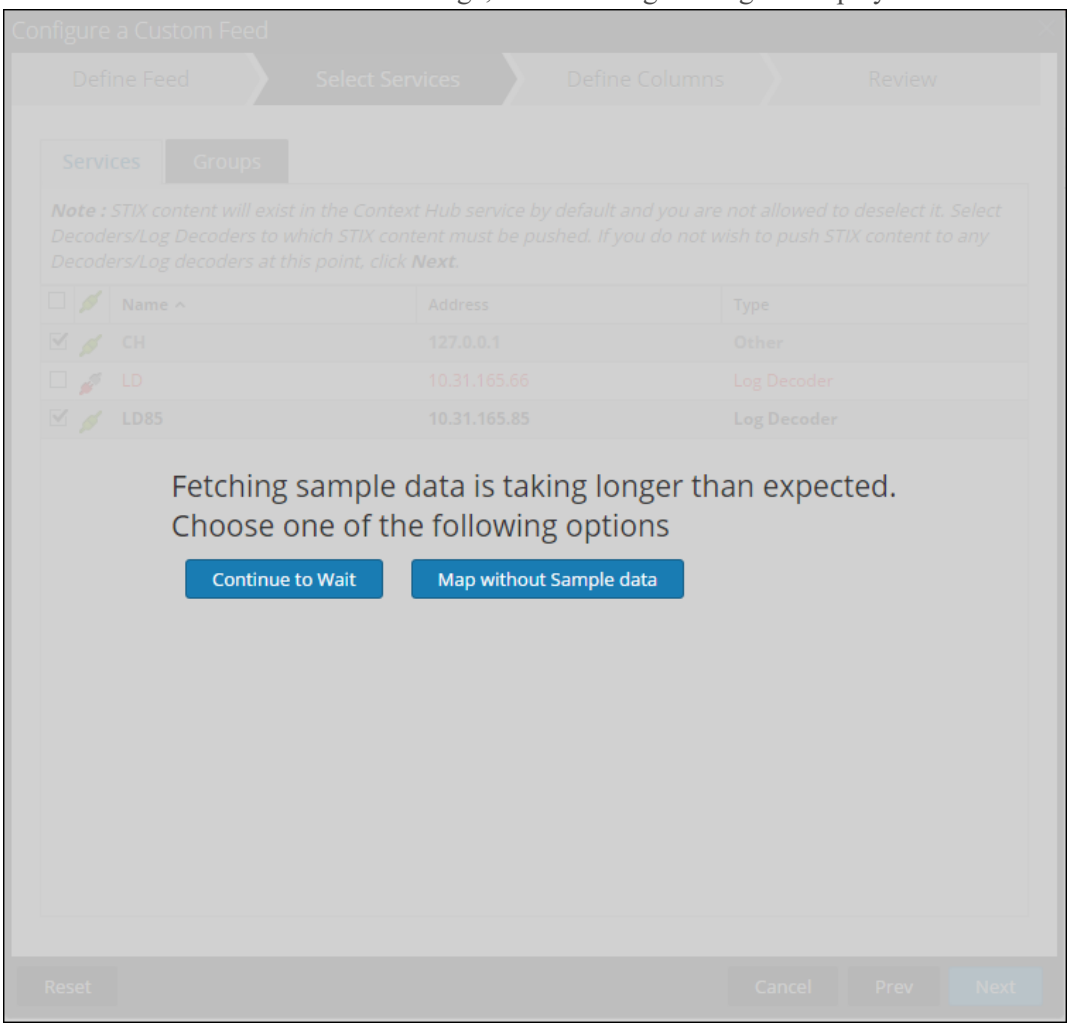
a. Select one or more Decoders and Log Decoders, and click **Next**.

b. In case of STIX feed, Context Hub will be selected by default and you are not allowed to deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or Click the **Groups** tab and select a group. Click **Next**.



Configure a Custom Feed
Define Feed
Select Services
Define Columns
Review
Services
Groups
Note : STIX content will exist in the Context Hub service by default and you are not allowed to deselect it. Select Decoders/Log Decoders to which STIX content must be pushed. If you do not wish to push STIX content to any Decoders/Log decoders at this point, click Next.
Name
Address
Type
Log Decoder
Context Hub
Log Decoder
Decoder
Reset
Cancel
Prev
Next

If the data from the STIX server is large, the following message is displayed:

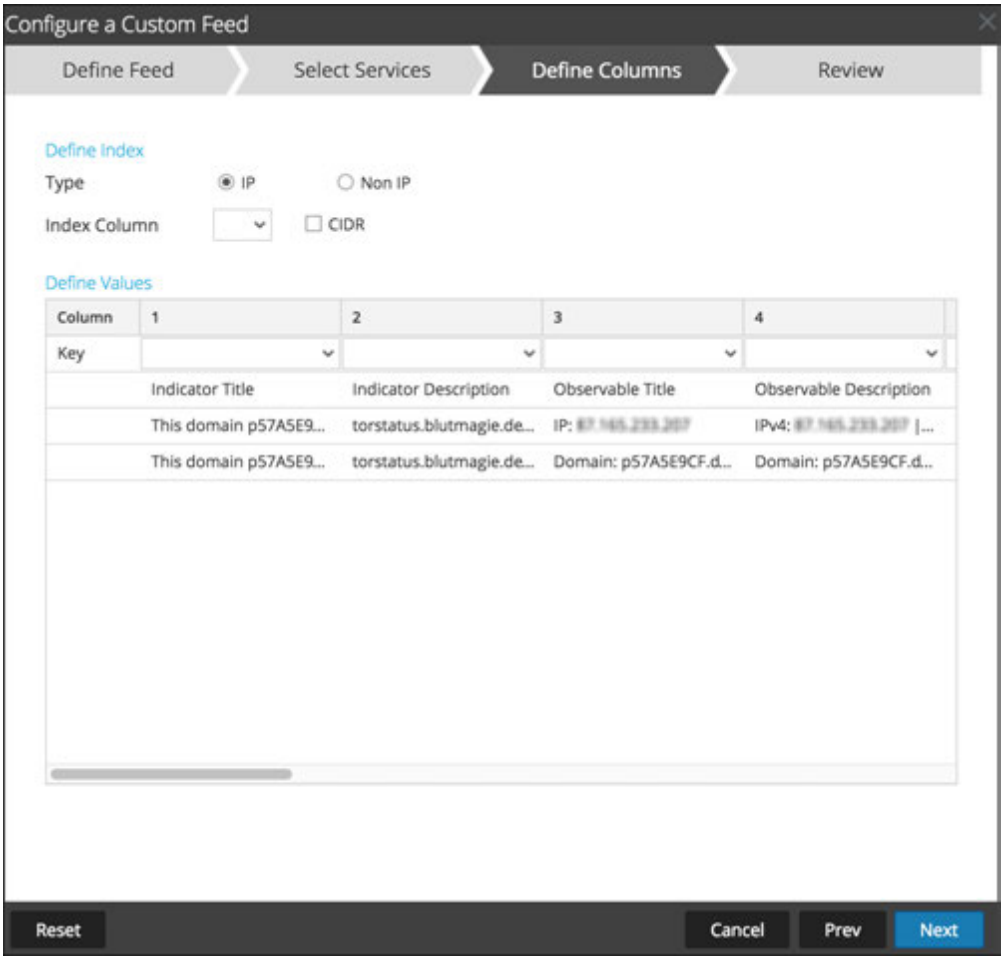


- If you click **Continue to Wait**, it continues to wait till the sample data is fetched or timeout (10 minutes) whichever is sooner. In case of timeout no sample data is retrieved even after 10 minutes.
- If you click **Map Without Sample data**, the mapping column is displayed without any sample data.

The Define Columns form is displayed.

9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. (Conditional) If the index type is **Non IP**, additional settings are displayed. Select the

service type and **Callback Keys,** and optionally select the **Truncate Domain** option.

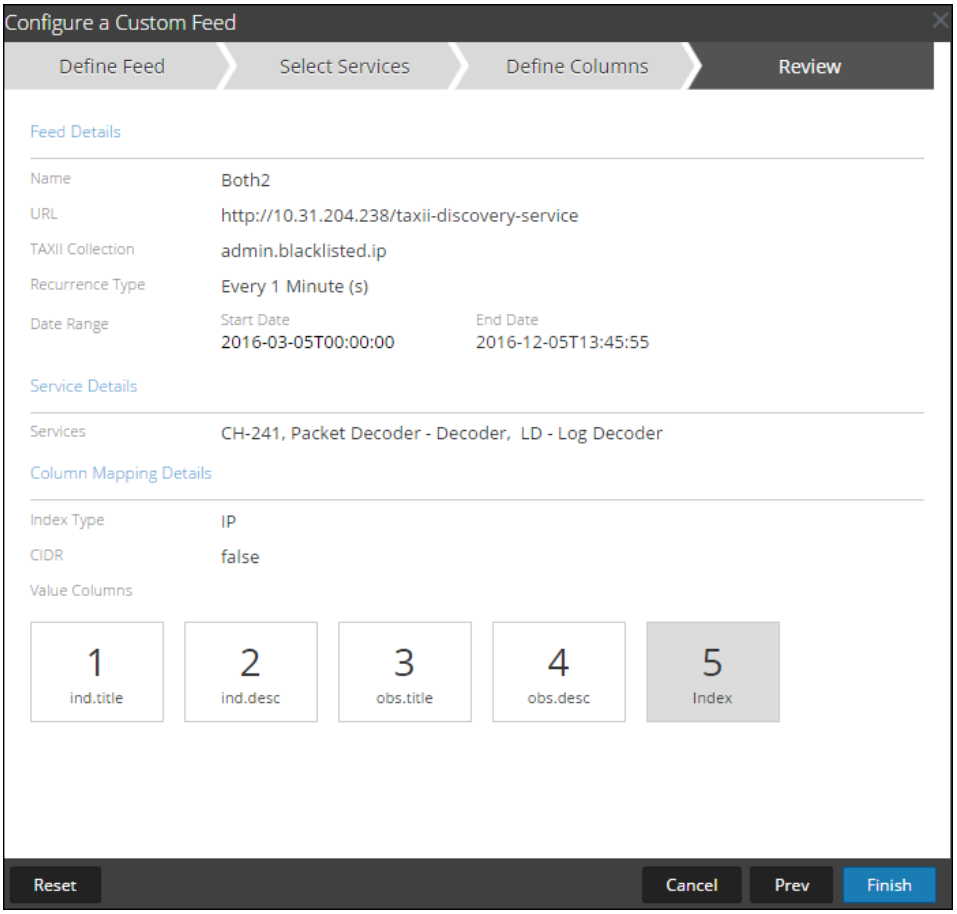


Note:
- If the **Index Type** is Non IP, you can select multiple index columns in the **Index Column(S)**. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the **Index Column(S)** if you select 2,4,7 as index columns the values from the 2,4 and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for the columns such as Indicator Title, Indicator Description, Observable Title, Observable Description, as the look up cannot be performed for those columns.

d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

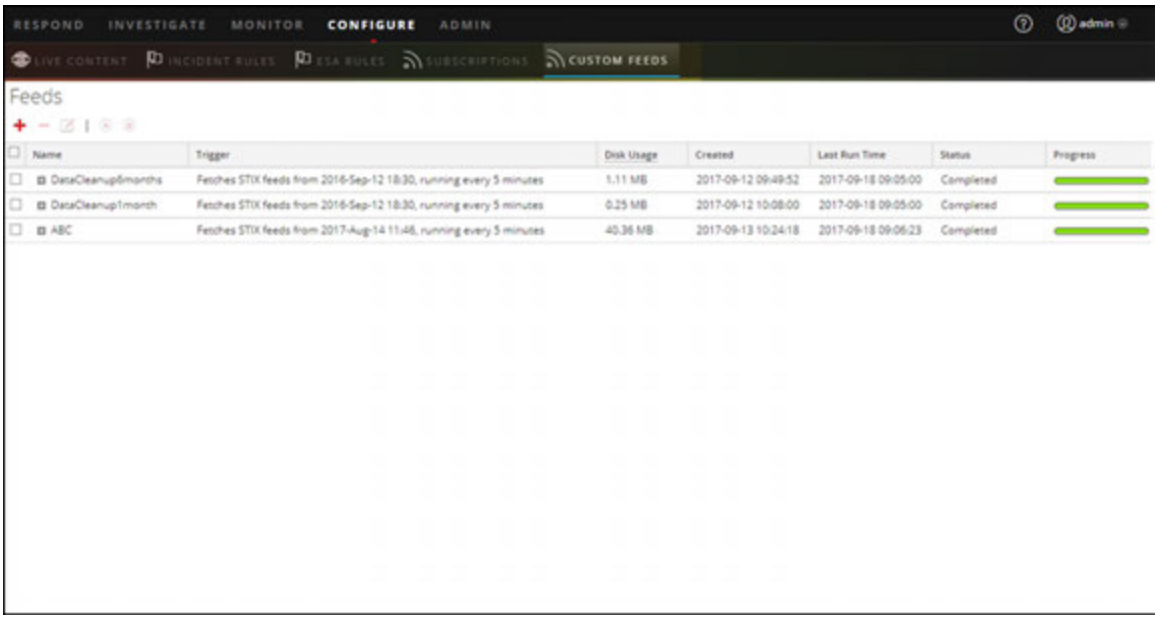
e. Click **Next**.

The Review form is displayed.



10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).

11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



Note: Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy due to low memory. For more information on how to troubleshoot `OutOfMemoryError` on `Contexthub` Server, refer to "Troubleshooting" in the *Live Services Management Guide*.

MetaCallback Feeds using CIDR Index Range for IPv4 and IPv6

This section describes how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using Metacallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a .csv file and an .xml file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

.csv file:

192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne

.xml file:

```
<?xml version="1.0" encoding="UTF-8"?>

<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">

<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">

        <MetaCallback name="DstIP" valuetype="IPv4" apptype="0" truncdomain="false">

                <Meta name="ip.dst"/>
```

```
        </MetaCallback>
        <LanguageKeys>
                <LanguageKey name="alert" valuetype="Text" />
        </LanguageKeys>
        <Fields>
                <Field index="1" type="index" range="cidr"/>
                <Field index="2" type="value" key="alert" />
        </Fields>
</FlatFileFeed>
</FDF>
```

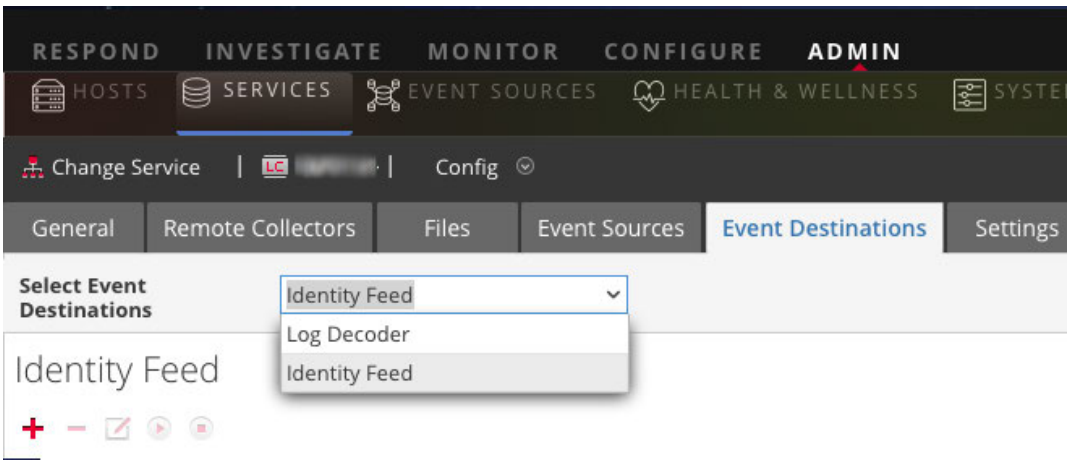
Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with range="cidr". Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Create and Manage an Identity Feed

You can easily create an Identity feed and populate it to selected Decoders and Log Decoders. After completing this procedure, you will have created an Identity feed.

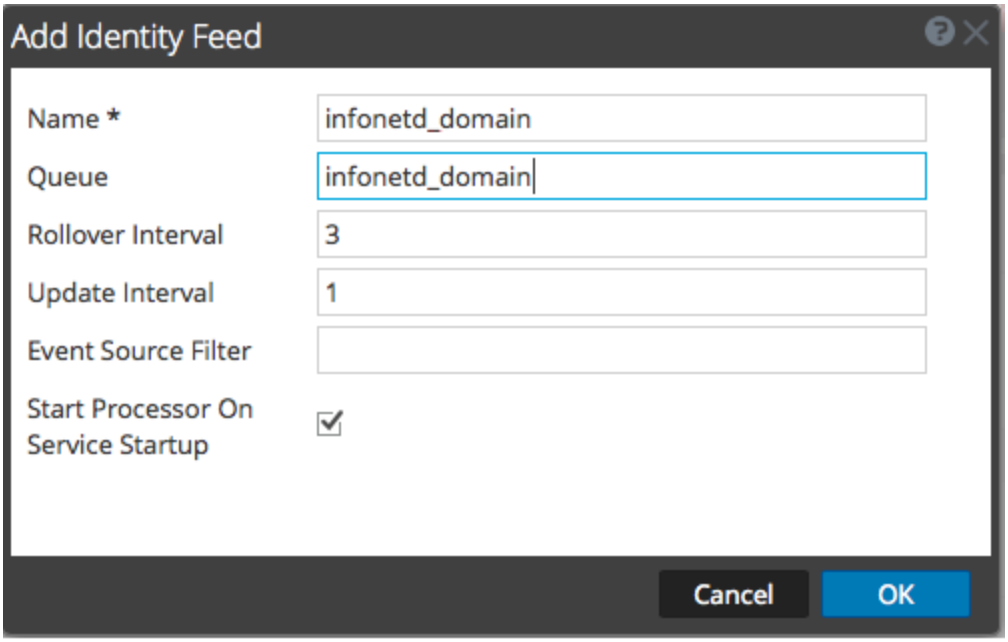
To create an identity feed:

1. Add a destination for the feed.
   a. Go to **ADMIN > Services**, in the **Services** list select a **Log Collector** service, and **View > Config**.
   b. Select the **Event Destinations** tab.
   c. In the Select **Event Destinations** field, select **Identity Feed**.



d. Click + and enter a unique name for the feed.

The Queue name identifies the feed within the log collector. Use the name of the feed for the Queue.

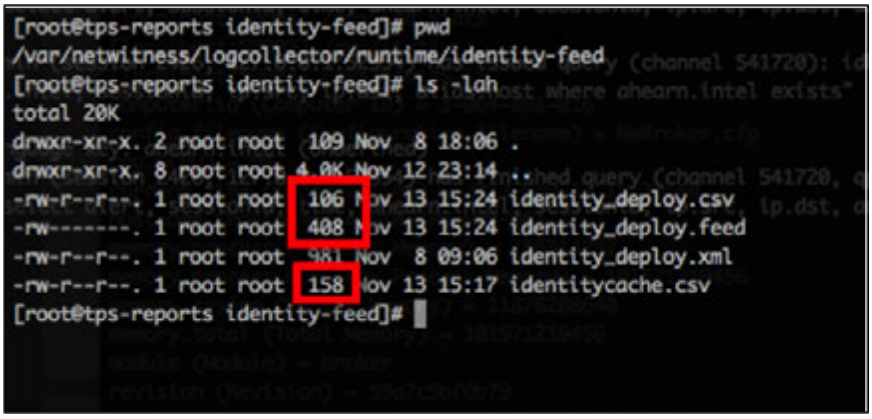


e. Click **OK**.

2. Test generation of messages.

a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

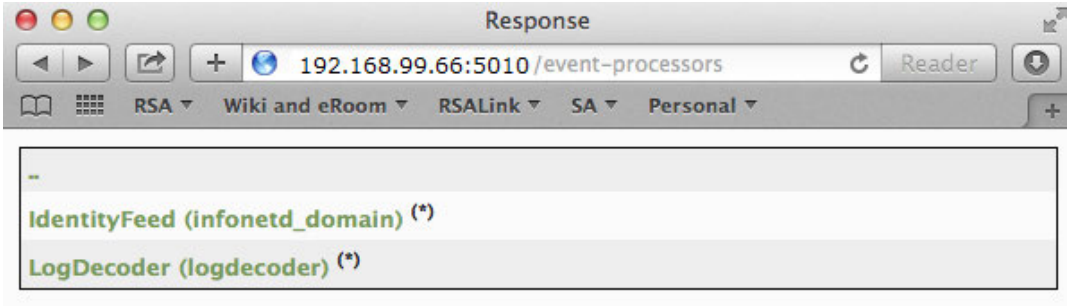
b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.



c. Open up a web browser (Non-Internet Explore browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your log collector is 192.168.99.66, the URL would be:

- SSL not enabled: **http://192.168.99.66:50101/event-processors**
- SSL enabled: **https://192.168.99.66:50101/event-processors**

The browser screen should look like this:

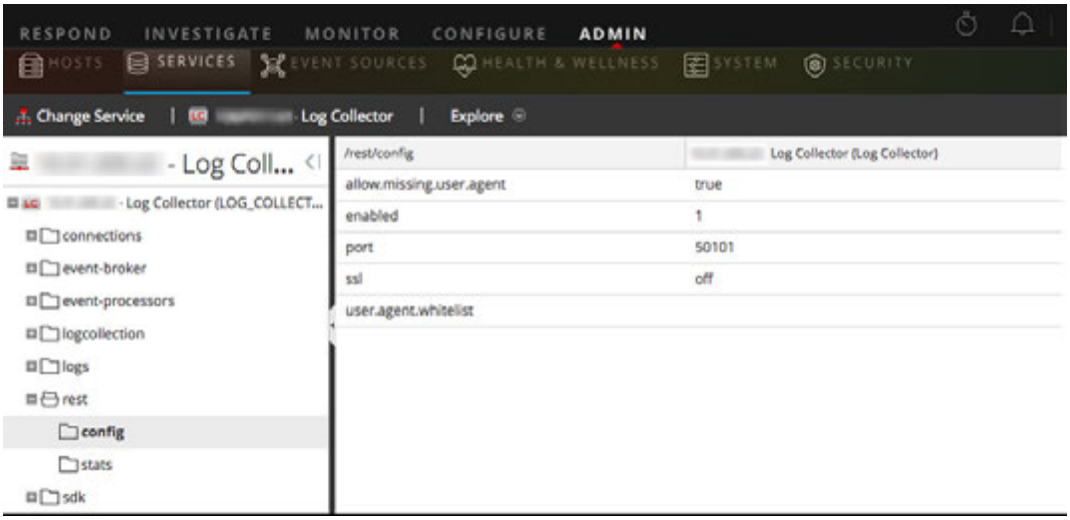


Notice the screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to **AdMIN > Services > *<Log Collector being setup>***  **> View > Explore**.

e. In the left pane, expand **rest > config**.



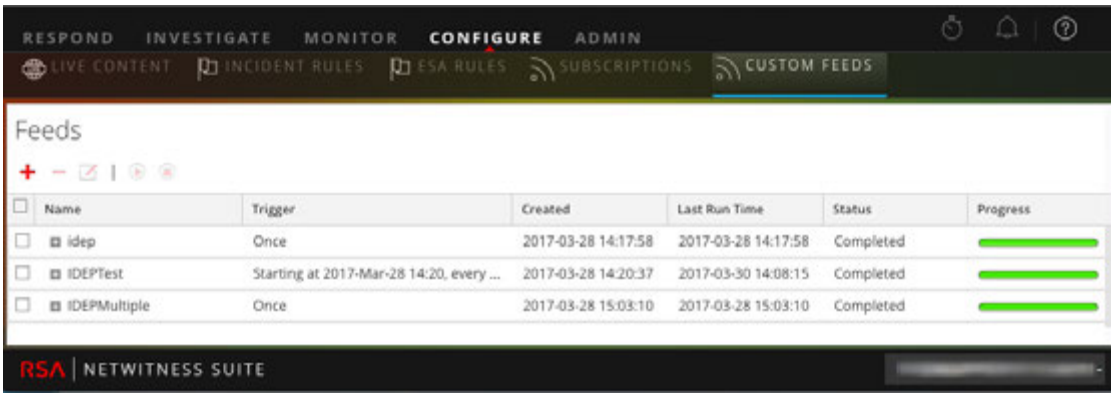
For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

Note: If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

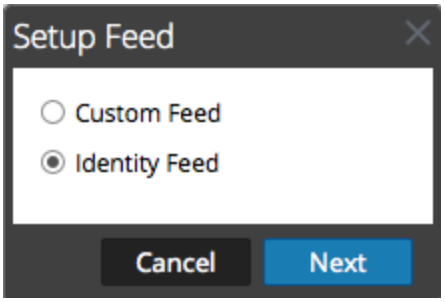
3. Go to **CONFIGURE > Live Content > Custom Feeds**.

   The Feeds grid is displayed.



4. In the toolbar, click +.

   The Setup Feed dialog is displayed.



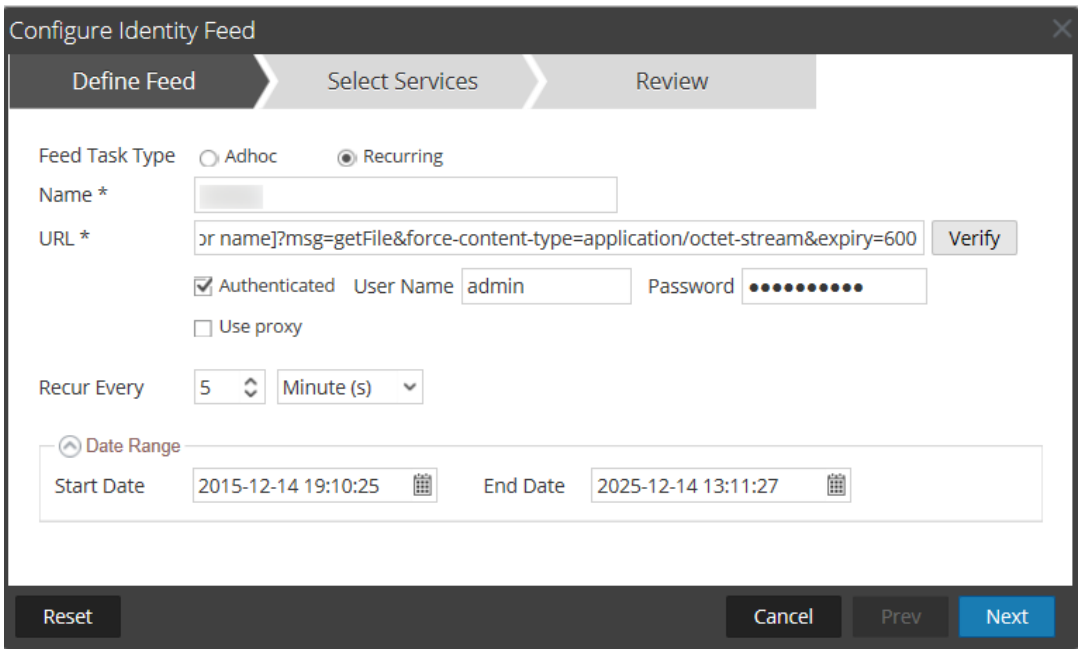
5. Ensure **Identity Feed** is selected and click **Next**.

   The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** form includes the fields for a recurring feed.



Note: RSA NetWitness Suite verifies the location where the file is stored, so that Security Analytics can check for the latest file automatically before each recurrence.

7. Fill in and verify the URL field.

   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. You need to know the following information to construct the URL:

   - The IP address of the log collector being used to construct the Identity Feed file.
   - The identity queue name, as set in step 2c.
   - Whether or not SSL is enabled on the log collector REST port, as set in step 2f.

   You construct this value as follows:

   - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
   - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

   So, using our example from earlier, the complete value that you would enter into this field is as follows:

```
http://192.168.99.66:50101/event-processors/infonetd_
domain?msg=getFile&force-content-type=application/octet-
stream&expiry=600?msg=getFile&force-content-
type=application/octet-stream&expiry=600
```

b. For the URL verification to work correctly, it is important that the Security Analytics UI server can access the log collector's REST API port (50101). This can be tested by going to the Security Analytics UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the Security Analytics UI server and the Log Collector.

Example of Bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of Good connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105
(#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu)
libcurl/7.19.7 NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18
libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*
>
< HTTP/1.1 401 Unauthorized
< Content-Length: 71
< Connection: Keep-Alive
< Pragma: no-cache
```

```
< Expires: -1
< Cache-Control: no-cache, no-store, must-revalidate
< WWW-Authenticate: Basic realm="NetWitness"
< Content-Type: text/xml; charset=utf-8
<
<?xml version="1.0" encoding="utf-8"?>
<error>401 Unauthorized</error>
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the log collector. This can be any username and password that is available on the service itself. For details, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to **ADMIN > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.)

9. To define the interval for recurrence, do one of the following:

   - Specify the number of minutes, hours, or days between recurrences of the feed.
   - To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

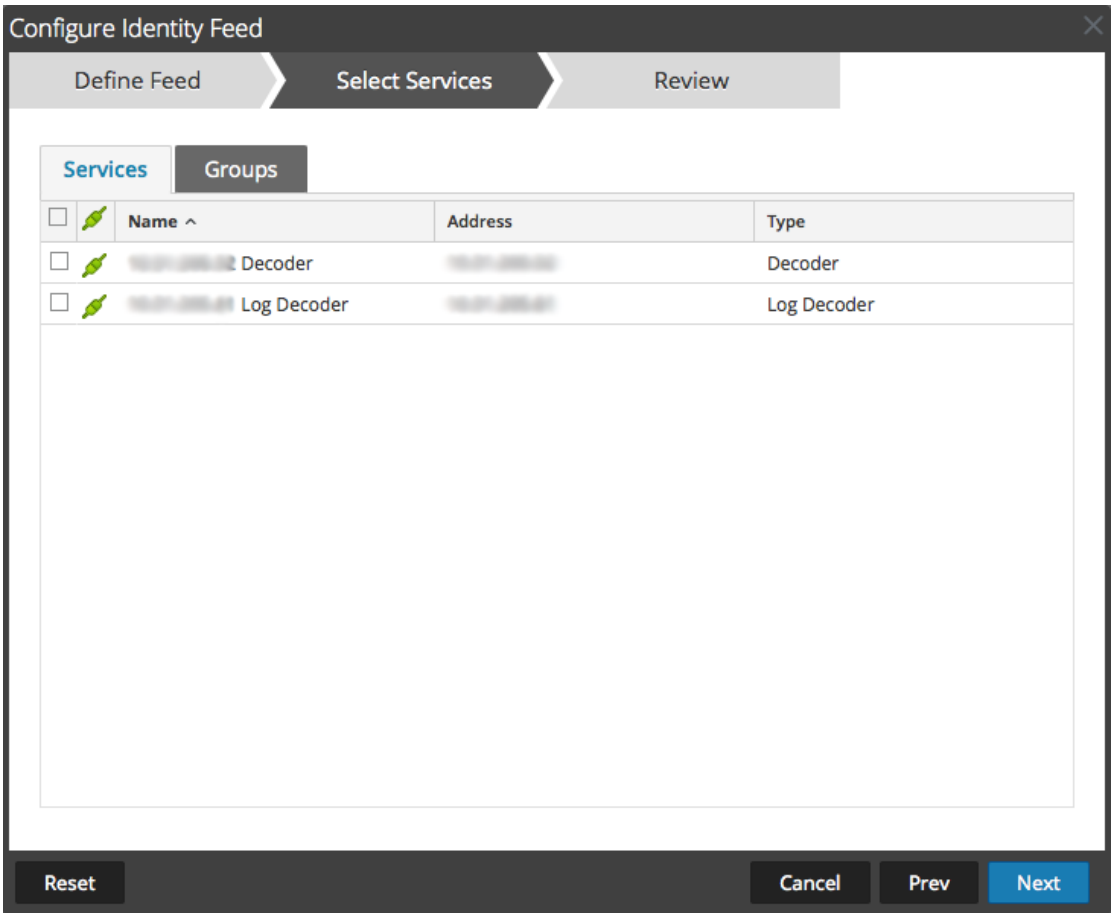
10. If using SSL encryption, you need to install the REST API SSL certificate for the log Collector into the Security Analytics UI server. For details, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.

11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services form.

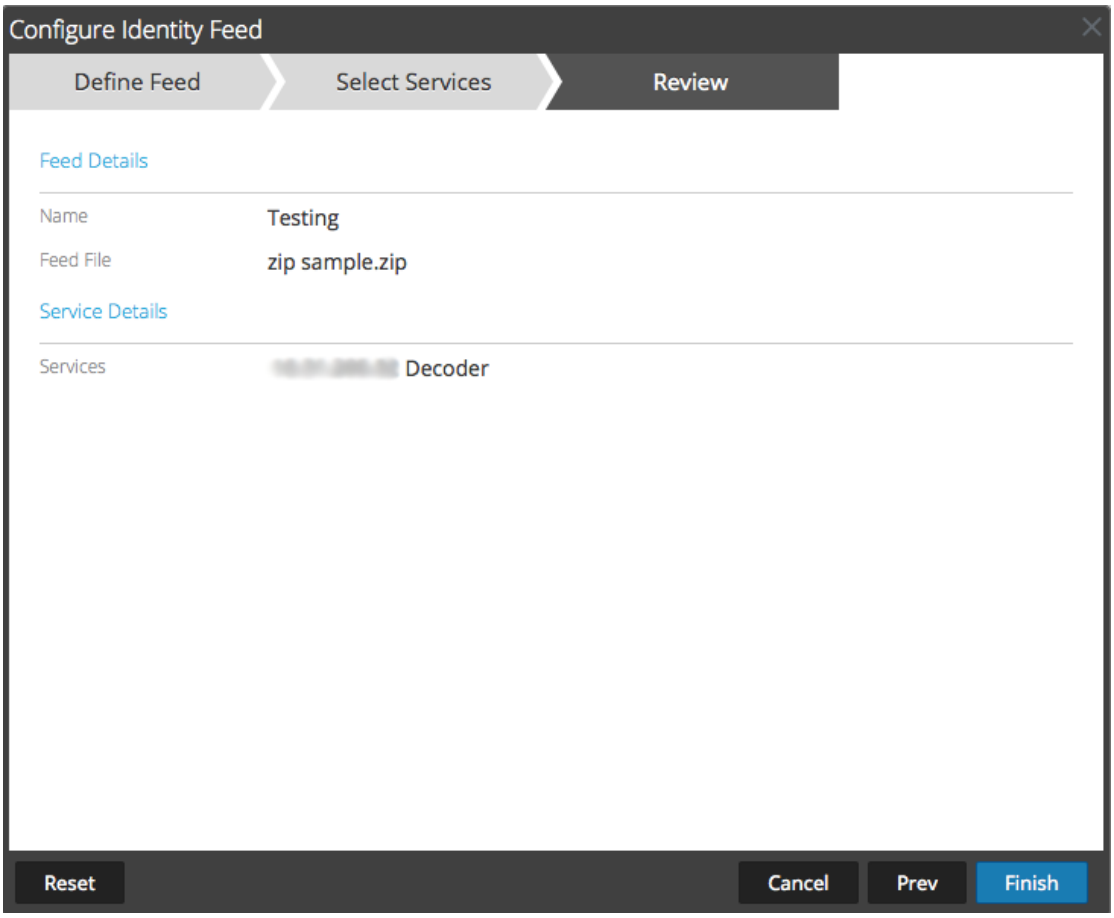
12. Click **Next**.

    The Select Services form is displayed.



13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

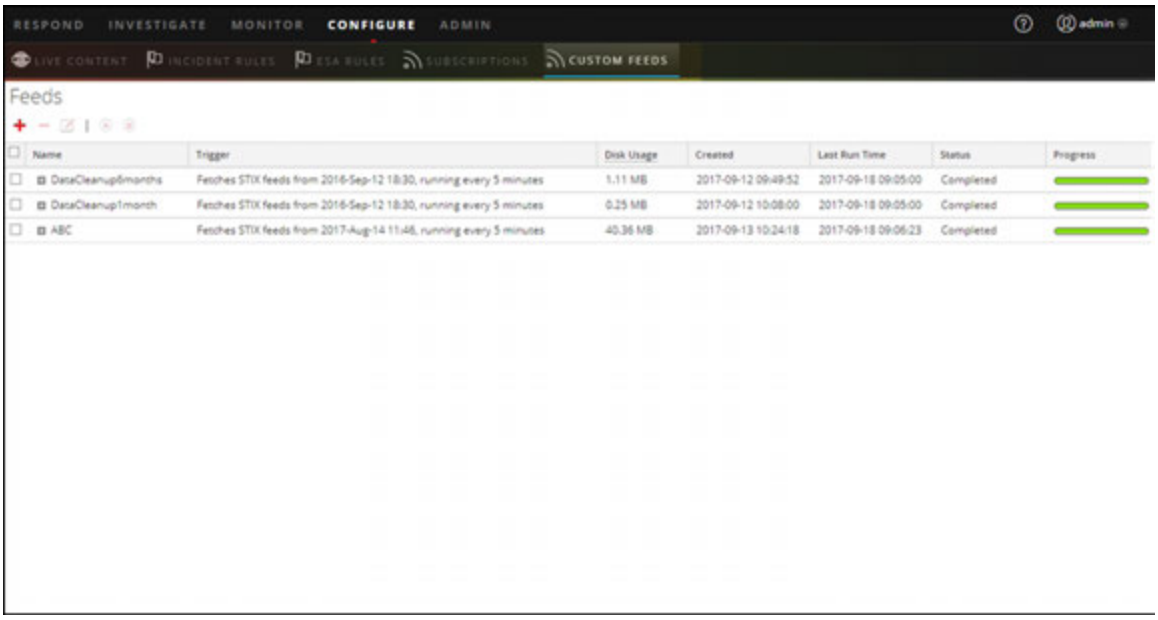
    The Review form is displayed.



Note: If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the Security Analytics UI server key store. If this certificate is not imported, the Security Analytics UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the log collector, SSH into the Security Analytics UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne
   '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' >
   /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`.

   For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed
   -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' >
   /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the Security Analytics UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file
   <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

   ```
   keytool -importcert -alias logcollector01 -file
   /tmp/logcollector.cert -keystore /etc/pki/java/cacerts
   ```

3. The system requests a password. Enter the password for the keystore on the Security Analytics UI server, not for the jetty keystore. The default password is **changeit**.
4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are still issues, it is possible that the internal name of the certificate does not match the hostname of the log collector. The following procedure checks this.

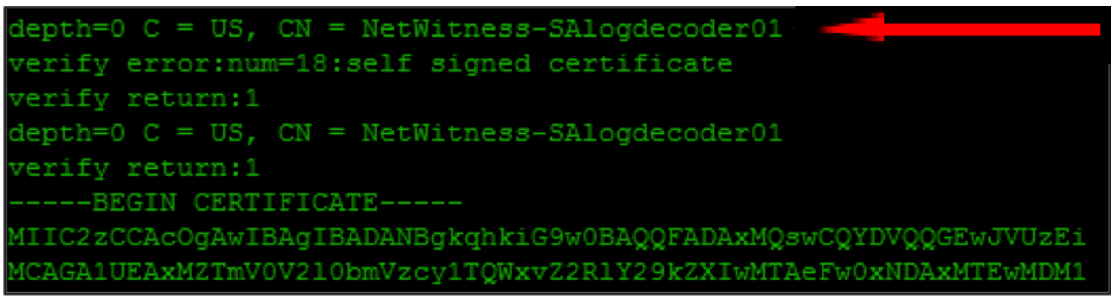
1. SSH to the Security Analytics UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
   echo -n | openssl s_client -connect <log decoder>:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

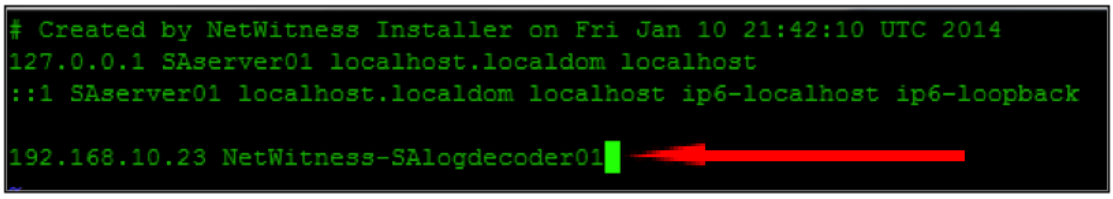
   Example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 | sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.



4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.



5. Restart the network service on the appliance.
6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.

Investigate an Identity Feed

An identity feed tracks interactive log on events from the Windows operating system. Identity feeds do not track interactive log off events.

In order for an identity feed to process events and tag them, the events need to be collected using a Windows Log Collection module where an Active Domain Controller/non-Domain Controller is configured. Note that identity feeds can only be processed via an Identity Feed Event Processor.

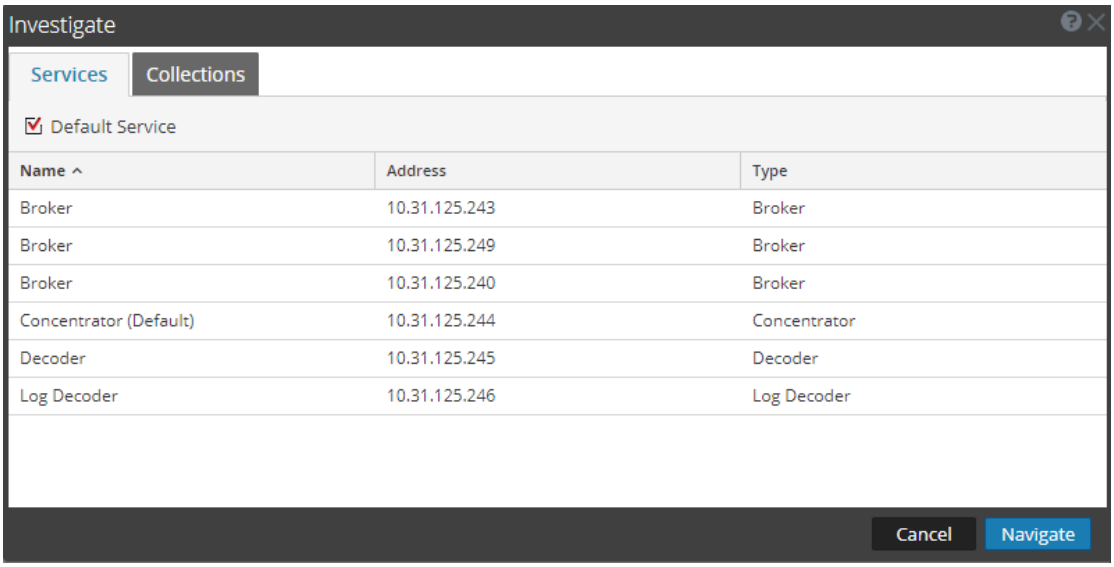
Note: An identity feed only tracks one log in at a time. If two users log in to a system at the same time, the second user will overwrite the first user's data in the identity feed.

Once you have created an identity feed, you can view the results by investigating the feed.

To investigate a configured identity feed:

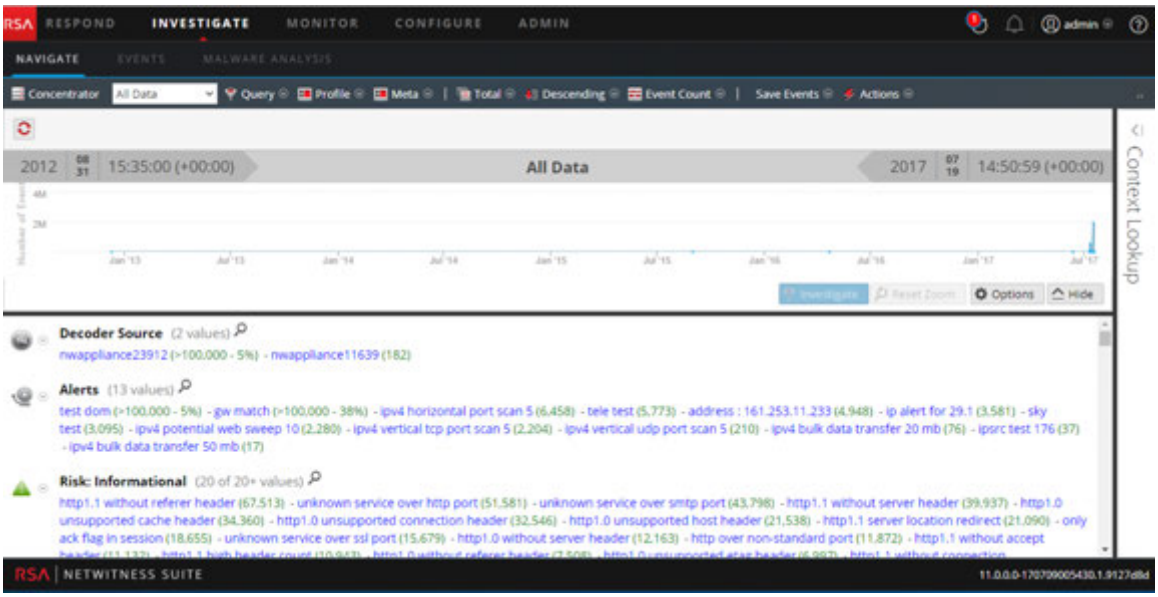
1. Go to **INVESTIGATE > Navigate**.

   If no default service is selected, the Investigate dialog is displayed.



2. Select a service, usually a Concentrator, and click **Navigate**.
3. Select **Load Values** to retrieve meta data.

In the Values panel, scroll down to find the Meta Keys shown in the following illustration.



The identity feed provides information to selected Decoders and Log Decoders. It associates the Host IP data from the Windows operating system to the user logging into that Host in order to tag all logs associated with that IP and investigate.

Edit a Feed

This topic provides instructions for editing a custom feed using the Custom Feed Wizard.

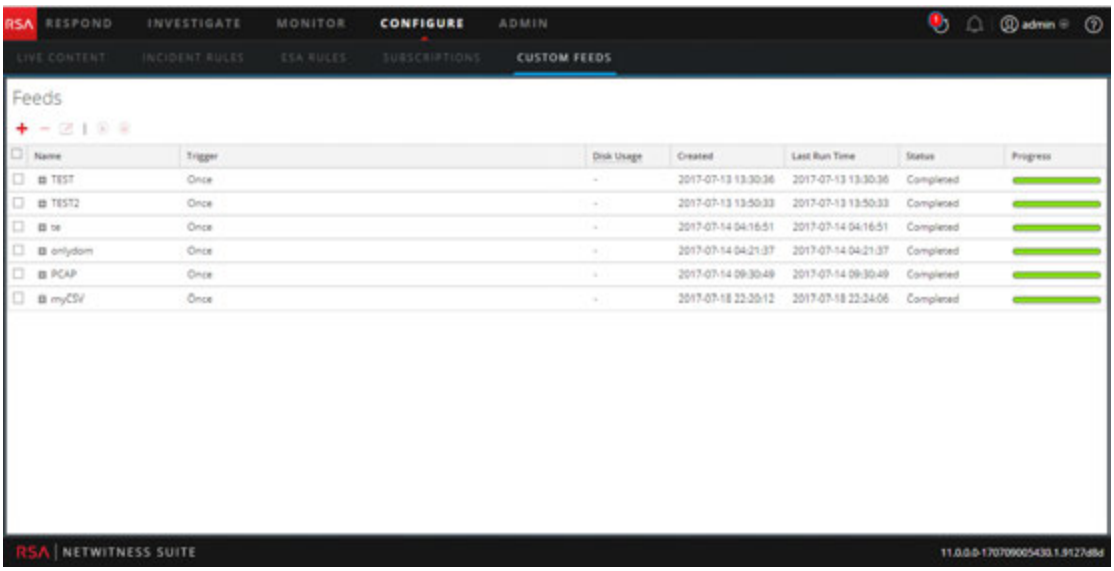
Completing this procure will result in:

- An existing custom feed opened.
- The feed (**.zip** format) or the file used to create the feed (**.csv** or **.xml**) downloaded and edited.
- The feed recreated with the updated file and new feed specifications.

To edit an existing feed:

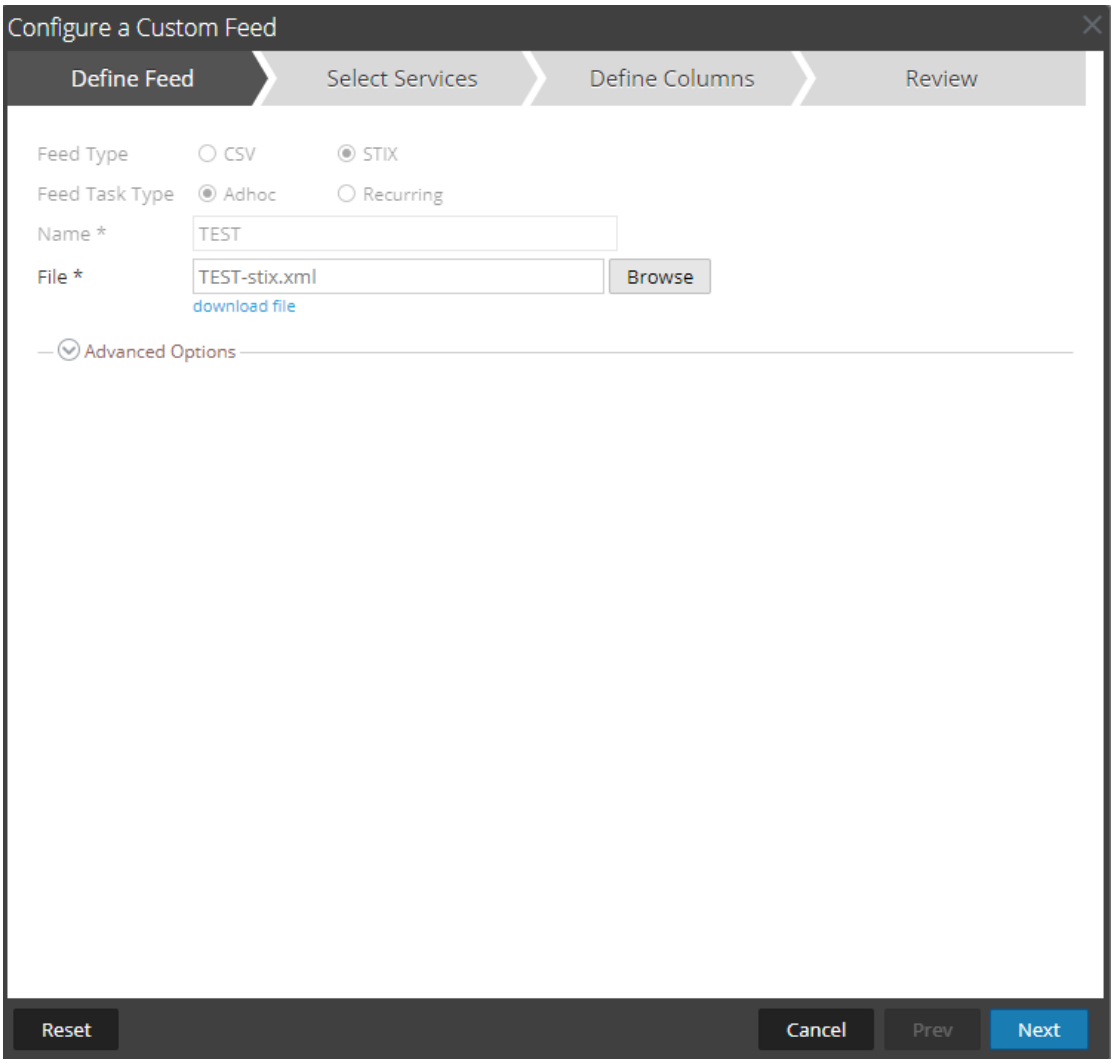
1. Go to **CONFIGURE > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



2. In the toolbar, select a feed and click .

   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.



3. If you want to edit the feed file:
   a. Click **download file**.

      For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system.

   b. Edit and save the file.

   c. In the **Define Feed** tab, browse for and open the edited file.
4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:
   - Click **Cancel** to close the wizard without saving your changes.
   - Click **Reset** to clear the data in the wizard.

- Click **Next** to display the next form (if not viewing the last form).
- Click **Prev** to display the previous form (if not viewing the first form).

6. In the **Review** tab, review the feed information, and if correct, click **Finish**.

The feed is added to the feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.

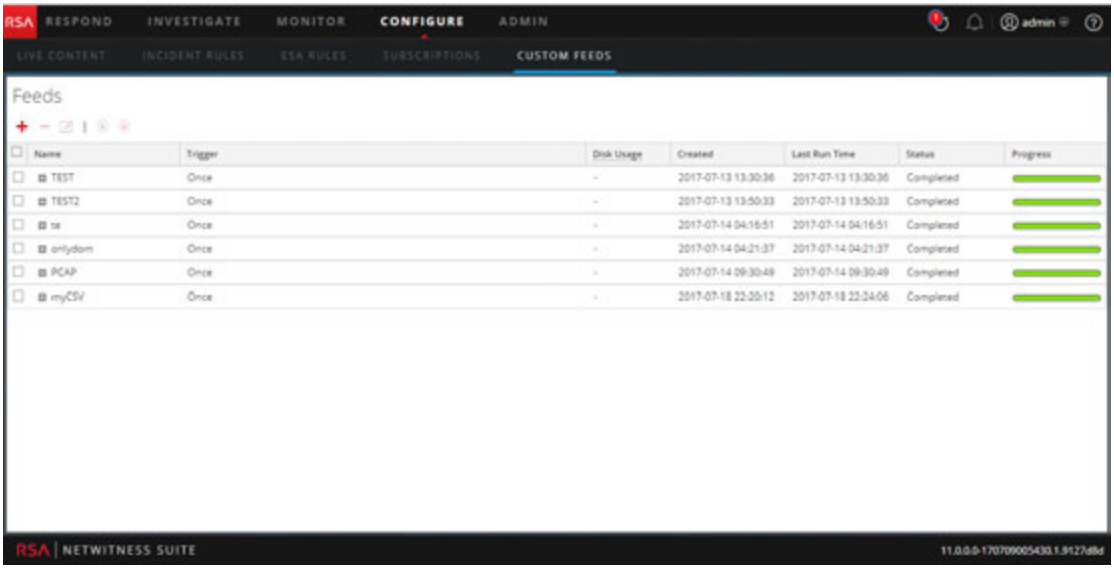
Remove a Feed

This topic provides instructions for removing a feed.

To remove a feed:

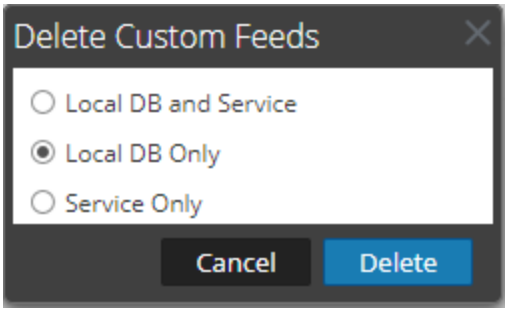
1. Go to **CONFIGURE > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



2. In the toolbar, select a feed and click − .

   The Delete Custom Feeds dialog is displayed.



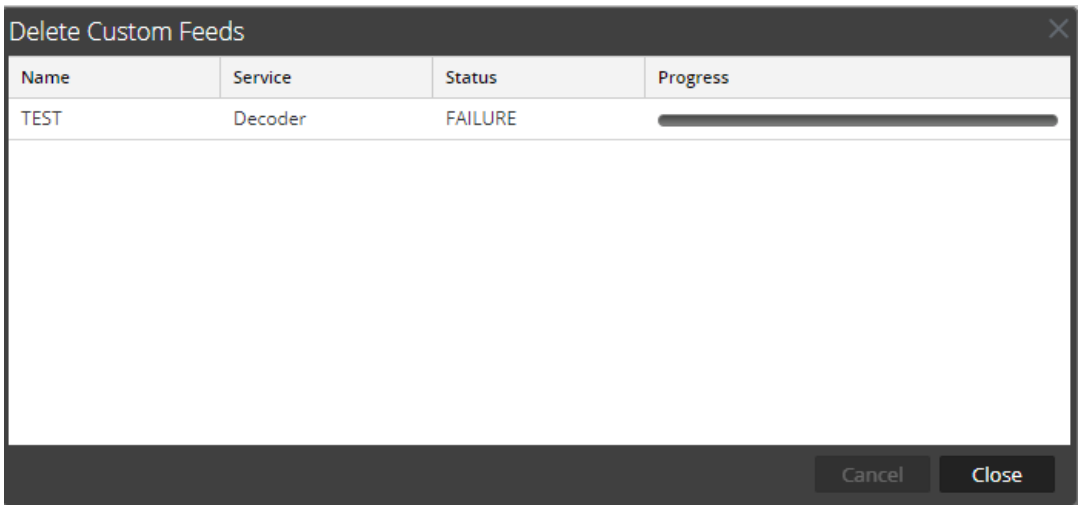
You can select one of the following options to delete the feed:

- If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness Suite box. The deleted feed will no longer seen on the NetWitness Suite user interface.
- If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness Suite box. The deleted feed will not be seen on the NetWitness Suite user interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.
- If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness Suite user interface and can be deployed again

3. Select where you want to delete the feed and click **Delete**.

   A warning dialog is displayed.

4. Click **yes** to confirm that you want to delete the feed from the select areas.
   - If you chose to delete the feed from the **Local DB Only**, the feed is deleted.
   - If you chose to delete the feed from the **Local DB and Service** or **Service Only**, the Delete Custom Feeds view is displayed showing the progress of the deletion on the service.



Packaging Resources

The primary use for creating and subsequently deploying a resource package is for customers using an air gap network environment. In this case, you create a resource package on the network that is connected to the internet, and then deploy the resource package on the more secure network.

Create and Deploy Resource Package Use Case

The basic steps are as follows:

1. Access NetWitness Suite Live Services using an instance that is connected to the internet.
2. Create a Resource package as described below, adding whichever content items you need.
3. Copy the ZIP archive of the packages to your secure NetWitness Suite instance, by using a thumb drive or other manual copying process.
4. On the secure NetWitness Suite instance, deploy the resource package. Details for this procedure are in Resource Package Deployment Wizard.

Prerequisites to Create a Resource Package

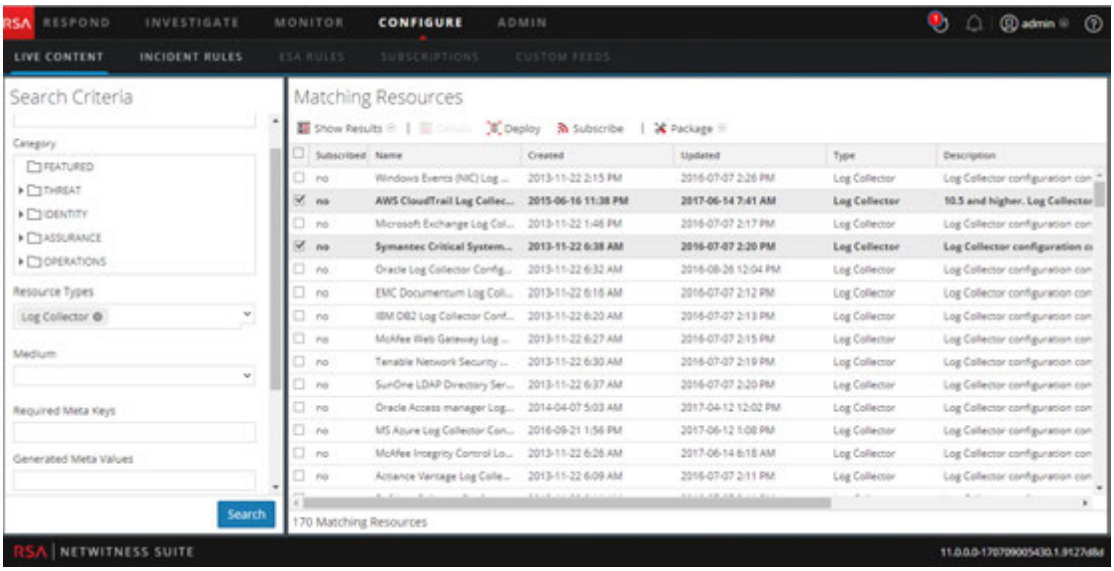
A prerequisite for creating resource packages is configuration of the connection and synchronization between the CMS server and NetWitness Suite and the ability to search for resources in the User Interface.

Procedure to Create a Resource Package

The following procedure creates a resource package, as a ZIP archive, which is saved to your local file system.

To create a resource package:

1. Navigate to CONFIGURE > Live Content from the RSA NetWitness UI.
2. Select the resources that you want to package in the Matching Resources grid.



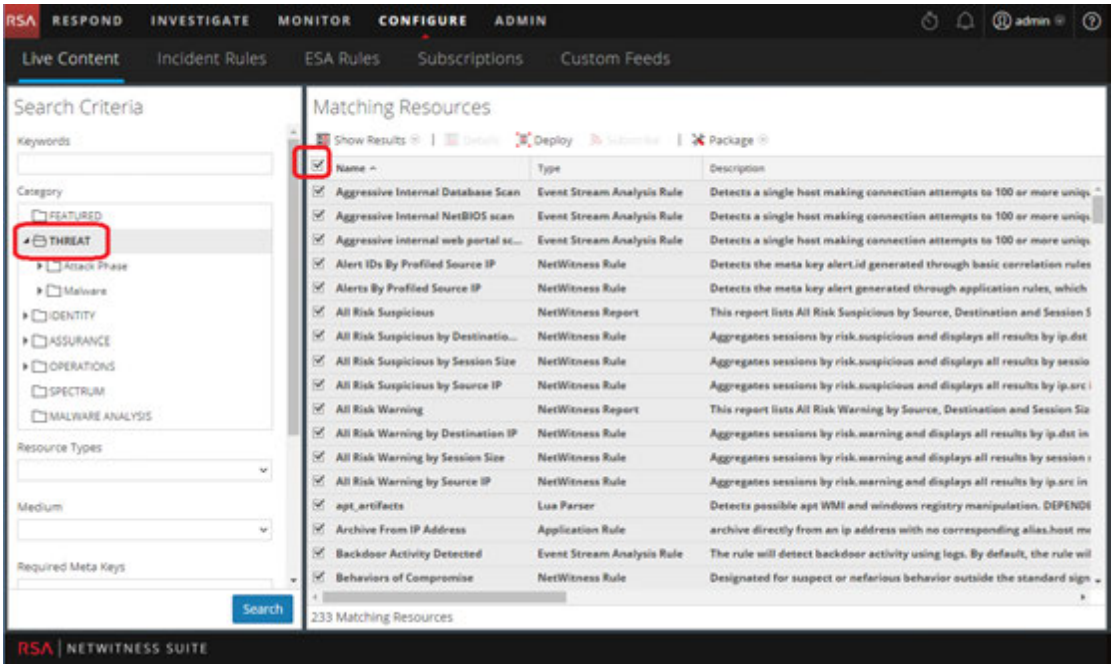
3. Select some or all of the resources that are listed in the Matches Resources pane.
4. Select Package > **Create**.

NetWitness Suite creates a **.zip** archive that contains the selected resources and downloads it to your default download folder. NetWitness Suite gives the package a generic name. You should rename it when you save it so that it identifies the resources contained in the package.

Example: Create Threat Package

In this example, we create a resource package that contains all the content that is categorized as **Threat**. Then we rename it, using the type of content and date.

1. Navigate to CONFIGURE > Live Content from the RSA NetWitness UI.
2. From the **Category** section, select THREAT.
3. Select all items returned by clicking on the checkbox in the column header row of the **Matching Resources** pane.



4. Select Package > **Create**.

   A ZIP archive is saved to your Downloads folder. For example, **resourceBundle8740753704980701969.zip**.

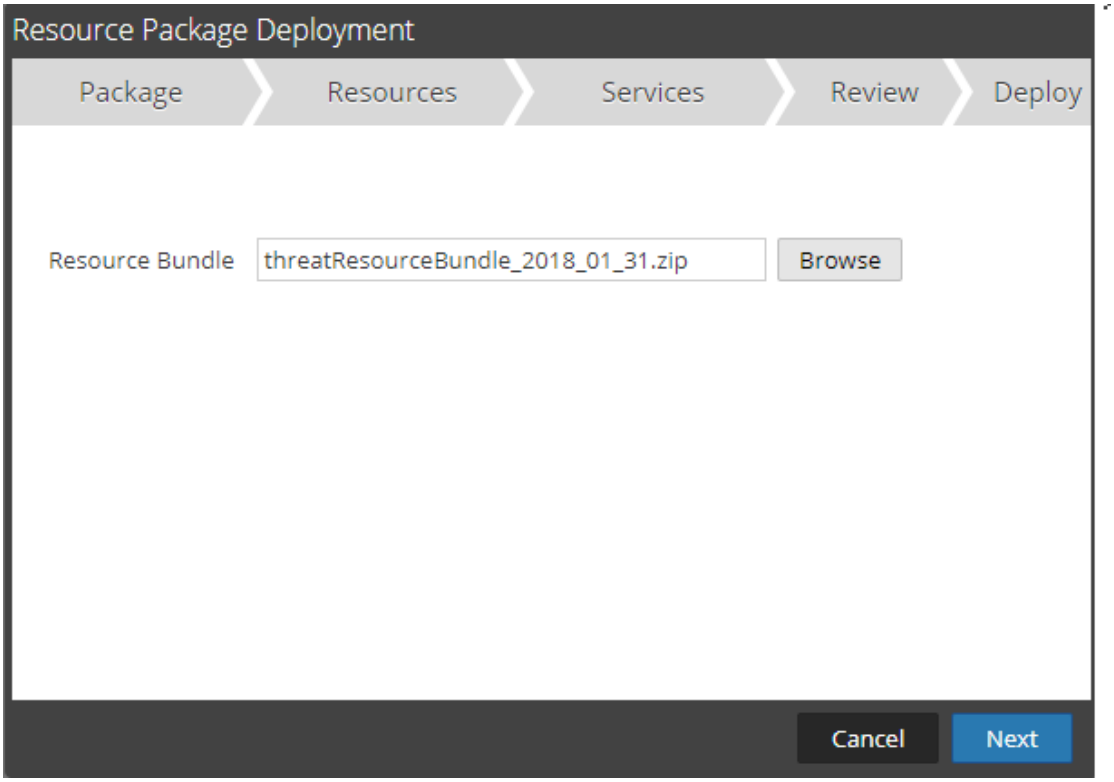
5. Rename the package to something meaningful. For example, in this case, you cold change the package name to **threatResourceBundle_2018_01_31.zip** (assuming today's date is January 31, 2018).

The resource package is now available for later deployment.

Example: Deploy Threat Package

Continuing the previous example, we deploy the resource package that we created.

1. Navigate to CONFIGURE > Live Content from the RSA NetWitness UI.
2. In the **Matching Resources** pane, select Package > **Deploy**.
3. Click Browse and navigate to the **threatResourceBundle_2018_01_31.zip** file that we created earlier.



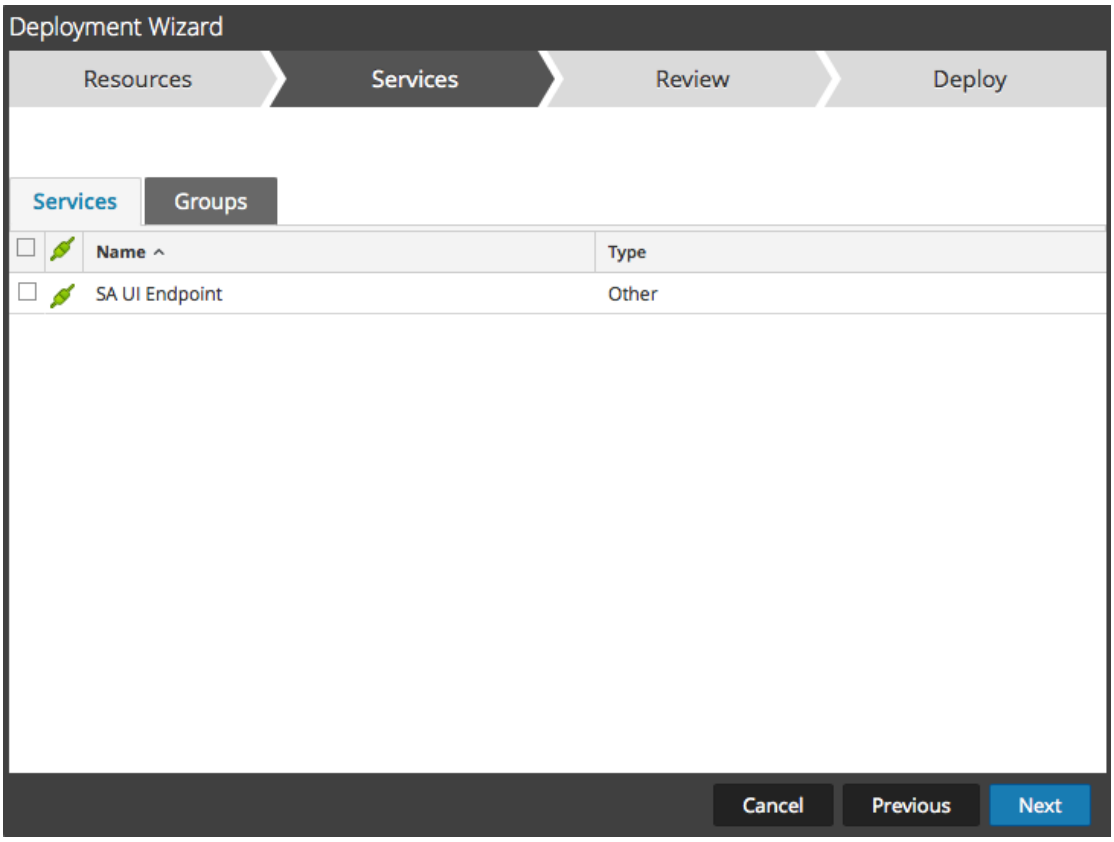
4. Click **Next**.

   The **Resources** page is displayed, showing details for the resources in the package.

5. Click **Next**.

   The **Services** page displayed has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the Admin > Services view. The columns are a subset of the columns available in the Services view.

6. Select the services to which you want to deploy the content. You can select any combination of services and service groups.



Click **Next**.

The **Review** page is displayed.

Make sure that you have selected correct resources and the services to which you want to deploy them.

7. Click **Deploy** to complete the deployment process. Alternatively, you can choose **Cancel** or **Previous** to either cancel the deployment or go back to the previous screen.

Miscellaneous Live Services Procedures

This section covers the following procedures:

Add Subscribed Resources for Deployment to Services

1. Navigate to the **CONFIGURE > SUBSCRIPTIONS > Deployments Tab**.
2. In the **Groups** panel, select a group.
   Subscribed resources, if any, are listed in the Deployments tab Subscriptions panel.
3. In the **Subscriptions** panel, click  .

   The Add Subscription dialog, which lists subscriptions available for deployment, is displayed.
4. Select the subscribed resources that you want to deploy to the services group.
5. Click **Save**.

   The dialog closes and the subscriptions are added to the listing in the Deployments tab, Subscriptions panel. This stages the resources for deployment at the next synchronization.

Delete a Subscription

When you delete a subscription to a resource, deployed instances of the resource are not deleted. The deployed resource remains on services until explicitly removed, but the resource is no longer synchronized with the resource in NetWitness Suite Live.

To delete a subscription:

1. In the **Subscriptions tab**, select the subscriptions that you want to delete.
2. Click .

   A dialog asks for confirmation that you want to delete the subscription.
3. To confirm removal, click **Yes**.

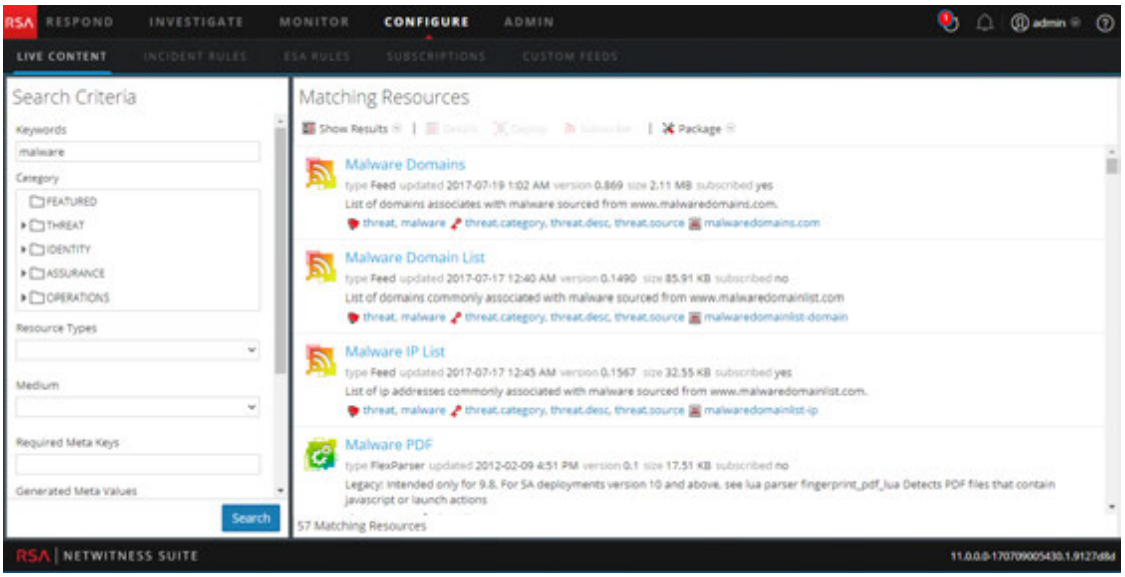
   The subscription is deleted from the subscriptions list, but any deployed instances of the subscribed resource remain on the services.

Display Resource Details in Live Resource View

After you select a resource (in the Live Resource View), you can display its detailed information.

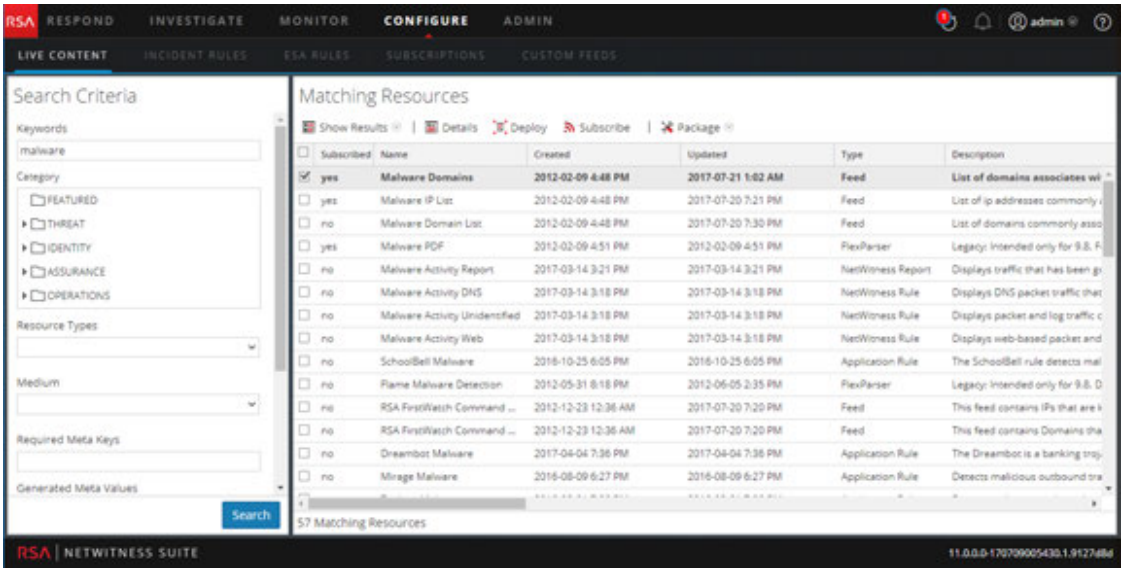
To open a separate tab in the Live Resource view with details of a selected resource, do one of the following:

- If you are viewing the **Detailed Results**, click the resource type icon or the resource name.



- If you are viewing the list results, double-click a resource or select a resource and click

Details.



Download a Resource

You can download a single resource from the Live Resource View.

To download a resource:

1. Go to **CONFIGURE > Live Content**.
2. In the **Search Criteria** panel, enter the criteria needed to return the resource that you want to download.
3. Select a single resource, then click Details.
4. Click Download.

The resource is saved as a ZIP archive to your local Downloads folder.

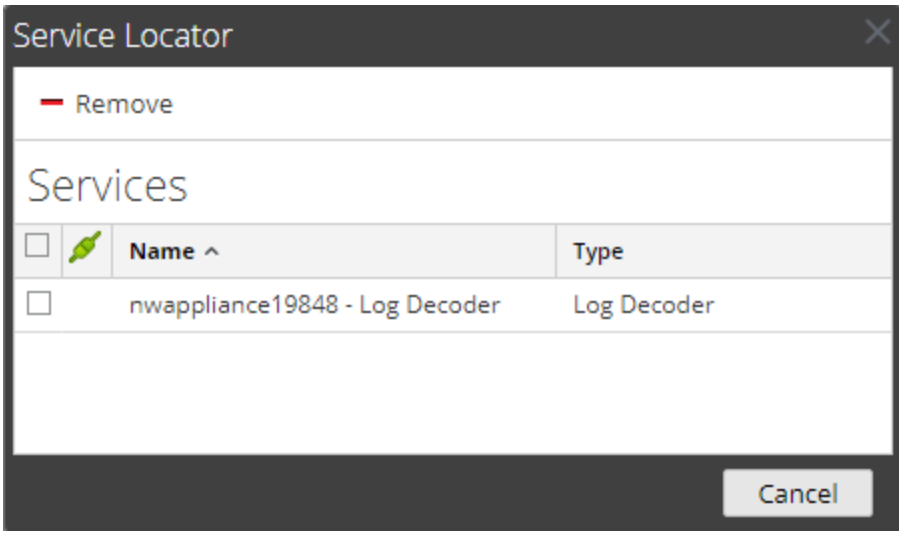
Locate and Remove a Deployed Resource from Services

You can locate and remove a deployed resource from services from the Live Resource View.

To view a list of services on which a resource is deployed:

1. With a resource displayed in the **Resource View**, click Service Locator.

   The Service Locator dialog is displayed.



2. Select one or more services in the **Services** list.
3. Click .

   The resource is removed from the selected services.

Remove Subscribed Resources from the Deployments Subscriptions Grid

Subscriptions that are selected for deployment to a service group are deployed during synchronization. You can remove subscriptions from the Live Configure view > Deployments tab > Subscriptions panel, but any that have actually been deployed to services remain deployed until someone removes them.

To remove resources from the Deployments tab Subscriptions panel:

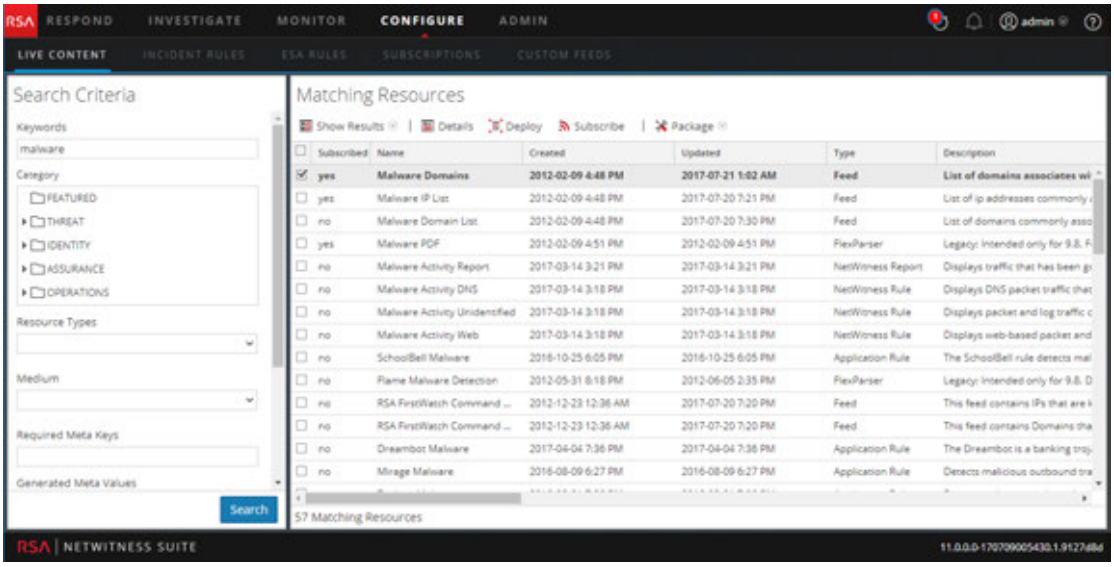
1. In the **Groups** panel, select a group.

   Subscribed resources, if any, are listed in the Subscriptions panel.
2. In the Subscriptions panel, click .

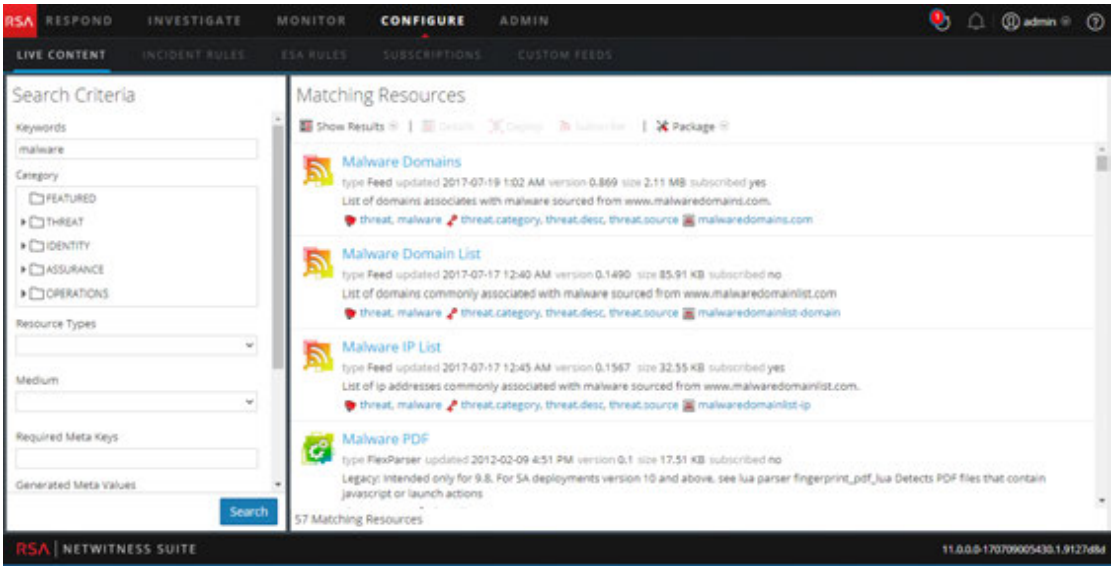
   A dialog requests confirmation that you want to delete the resource from the service group. The resource is removed from the Deployments tab Subscriptions panel, but is not removed from services on which it is deployed.

Show Results as a List or in Detail

1. To change to grid results when viewing detailed results, select **Show Results > Grid**.



2. To change to detailed results when viewing grid results, select **Show Results > Detailed**.



Subscribe and Unsubscribe to a Resource

Subscribe

When you subscribe to resources, you will receive notification when new versions of the resources are available.

To subscribe to a resource:

1. Navigate to the Live > Search view.
2. In the **Search Criteria** panel, specify search criteria and click **Search**.
3. Select one or more resources and click Subscribe.

   A confirmation dialog is displayed: **By subscribing to these resources, you are indicating that you wish to receive notification when new versions are available.**
4. To confirm that you want to subscribe to the resource, click **OK**.

   The resource is added to the subscriptions managed in the Subscriptions tab and is available for deployment in the Deployments tab.

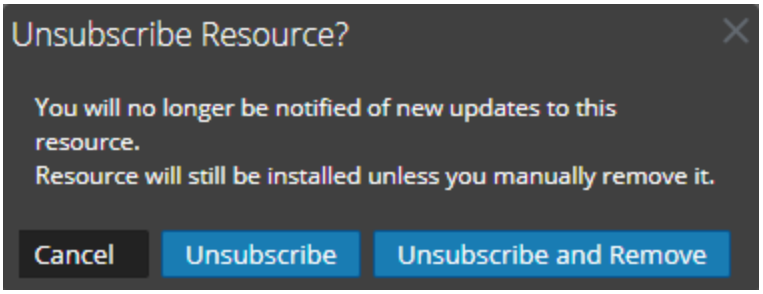
Unsubscribe

When unsubscribing from a resource, you have the option to leave the resource on services on which it is deployed or to remove it from services.

To unsubscribe from a resource:

1. With a resource displayed in **SUBSCRIPTIONS**, click Unsubscribe.

   A confirmation dialog is displayed.



2. Do one of the following:
   - To confirm that you want to unsubscribe from the resource and leave it on the services where it is deployed, click **Unsubscribe**.
   - To confirm that you want to unsubscribe from the resource and remove it from the services where it is deployed, click **Unsubscribe and Remove from Services**.
   - To close the dialog without unsubscribing, click **Cancel**.

   The selected action is applied.

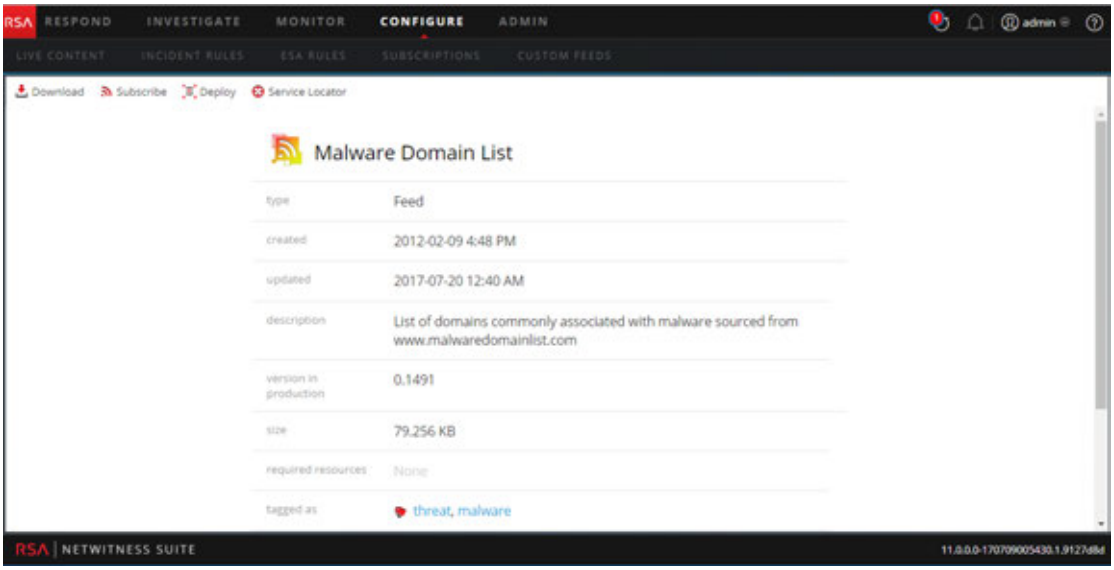
View Resource Details

You can display detailed information about a subscribed resource in the Resource View.

To view details:

1. In the **Subscriptions tab**, select a single subscription.
2. Click Details .

   The details of the resource are displayed in the Resource View.



View Subscribed Resources Selected to Deploy on Services

In the Live Configure view > Deployments tab you can view subscribed resources that have been selected for deployment on services.

To view subscribed resources that have been selected for deployment on services:

In the **Groups** panel, select a group, and expand it to view services in the group.

The resource subscriptions selected for deployment are listed in the Deployments tab Subscriptions panel.

Troubleshooting

This section provides troubleshooting instructions for issues faced when using the Live Services module in NetWitness Suite.

Troubleshooting OutOfMemoryError on Contexthub Server

This section provide troubleshooting instructions when you encounter OutOfMemoryError on Context Hub server and the service becomes unresponsive.

If there are any TAXII feeds configured, Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy because of low memory, perform the following:

1. Make sure that the feeds **Start Date** is within 180 days.
2. Check if any TAXII feed is consuming too much disk space. A TAXII feed can consume maximum of 300 MB. If it consumes more disk space, you must reduce the value in the **Remove STIX data older than** field under **Advanced Options** in the **Custom Feed Creation Wizard** when you edit a TAXII feeds.

Note: If the issue still persists, you must execute step 3.

3. Decrease the number of parallel threads available for processing STIX, perform the following:
    a. Go to **ADMIN** > **Services** > **Context Hub service** > **View** > **Explore**.
    b. In the tree panel, navigate to **enrichment/stix/ config**.
    c. In the right panel, set the **stix-query-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to process queries for STIX data at the same time.
    d. Set the **taxii-poll-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to poll TAXII servers at the same time.
    e. Restart the Context Hub server.

References

This topic is a collection of references, which describe the user interface and more detailed information about how Live works in NetWitness Suite. These topics are presented in alphabetical order.

- Deployments Tab
- Discontinued Resources Tab
- Live Configure View
- Live Feeds View
- Live Resource View

- RSA Live Registration Portal
- Subscriptions Tab

Live Configure View

In the Live Configure view, NetWitness Suite provides integrated tools for managing Live resources. You can manage resource subscriptions, deployments to services and discontinued resources. The required role to access this view is **Configure Live Resources**. For a high-level description of how to use the different views in NetWitness Suite Live, please read Live Services Management.

To access this view, go to **CONFIGURE > Subscriptions**. This view has the following tabs:

- Deployments Tab
- Subscriptions Tab
- Discontinued Resources Tab

Deployments Tab

The Deployments tab provides a user interface in the Live Configure view for:

- Viewing subscribed resources that are selected for deployment on services in a service group.
- Selecting subscribed resources to deploy to services in a service group.

- Removing resources that are selected for deployment on services in a service group.

The resources listed here are not deployed immediately after adding to a service group. Instead the subscribed resources are pushed to the services when NetWitness Suite synchronizes with RSA NetWitness Suite Live. The synchronization schedule is configured in the Live Configuration panel. If you do not want to wait for the scheduled synchronization, you can also tell NetWitness Suite to synchronize now in the Live Configuration panel.

Likewise, resources deleted from the Deployments panel are not deleted from service where they have been deployed. To delete resources from services, delete them in the Live Resource View.

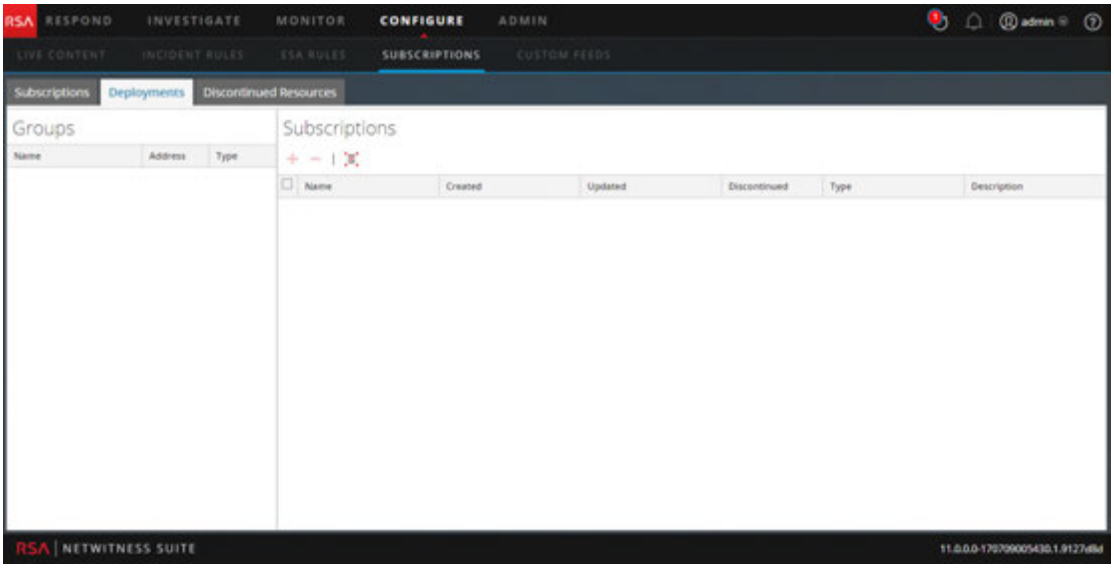
The required permission to access this view is **Manage Live Resources**.

To access this view:

1. Go to **CONFIGURE > Subscriptions**.

   The **Subscriptions** tab is open by default.

2. Click the **Deployments** tab.



The Deployments tab has two panels: **Groups** and **Subscriptions**.

Groups Panel

The Groups panel is a static display of configured service groups that were created in the Administration Services view. Selecting a group in the Groups panel populates the Subscriptions panel with a list of subscriptions that are selected for deployment on the services in the service group.

Feature	Description
Name	This is the service group name. Clicking the plus sign displays a nested list of services in the group.
Address	This is the IP address of each service in the group.
Type	This is the type of service.

Subscriptions Panel

The following table describes the features in the Subscriptions panel.

Feature	Description
	Click  to open a dialog that lists subscriptions that were added in the Live Search view or in the Live Resource view and are available for deployment.
	Click to delete the selected subscriptions from the deployment list for service group.
	Click  to synchronize your resources to the latest versions available on Live.
Name	This is the name of the resource.
Created	This is the date and time that the resource was created.
Updated	This is the date and time that the resource was last updated.
Type	This is the type of resource.
Description	This is a description of the resource.

Subscriptions Tab

Subscriptions are NetWitness Suite Live resources to which you subscribed in the Live Search view or Live Resource view. When you subscribe to a resource, you agree to receive updates on a regular basis from RSA NetWitness Suite Live. The choices made in the Live Configuration panel determine how often synchronization occurs and if you receive email notifications of updates. In addition, if you don't want to wait for the next update, you can force an immediate synchronization.

The Subscriptions tab provides a way to manage subscriptions. Each resource to which NetWitness Suite is subscribed is listed in this tab.

In the Subscriptions tab, you can:

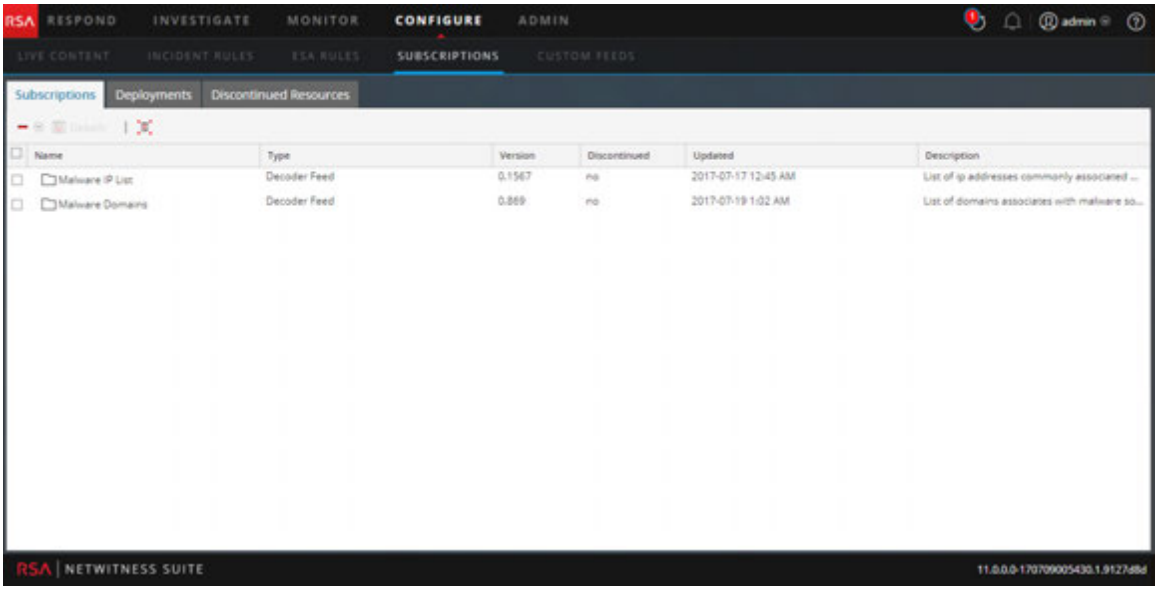
- View all resources to which this NetWitness Suite instance is subscribed.
- Open a detailed view of a subscription in the Live Resource View.
- Delete a subscription.

Note: Subscribing to a resource does not deploy the resource to any services. To deploy one or more subscribed resources, go to the Deployments tab. To deploy a single resource manually, use the Deploy option in the Resource View.

The required permission to access this view is **Manage Live Resources**.

To access this view, in the main menu, select **CONFIGURE > Subscriptions**.

The Subscriptions tab is open by default.



The **Subscriptions** tab has a toolbar and a grid.

Toolbar

This table describes the options available in the toolbar.

Feature	Description
	Deletes the selected subscriptions.
	Displays the details of a single subscribed resource in the Resource View.
	Check the Live Server for the latest discontinued resources.

Grid

Column	Description
	Selects subscribed resources to view in detail or delete. You can view details for a single resource. You can delete one or more resources from the subscribed resources, in effect unsubscribing.
Name	This is the name of the subscribed resource.
Type	This is the type of subscribed resource.
Version	This is the version of the subscribed resource.
Discontinued	Indicates the status of the discontinued resources for the subscribed resource. **Yes** - Resource is discontinued. **No** - Resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Updated	This is the date and time when the subscribed resource was last updated.
Description	This is a description of the subscribed resource.

Discontinued Resources Tab

This topic introduces the features of the **Live Configure view > Discontinued Resources** tab.

The Discontinued Resources tab provides a user interface in the Live Configure view for:

- Scanning the services for the discontinued resources.
- Removing the discontinued resources from any service or service group.

The required permission to access this view is **Manage Live Resources**.

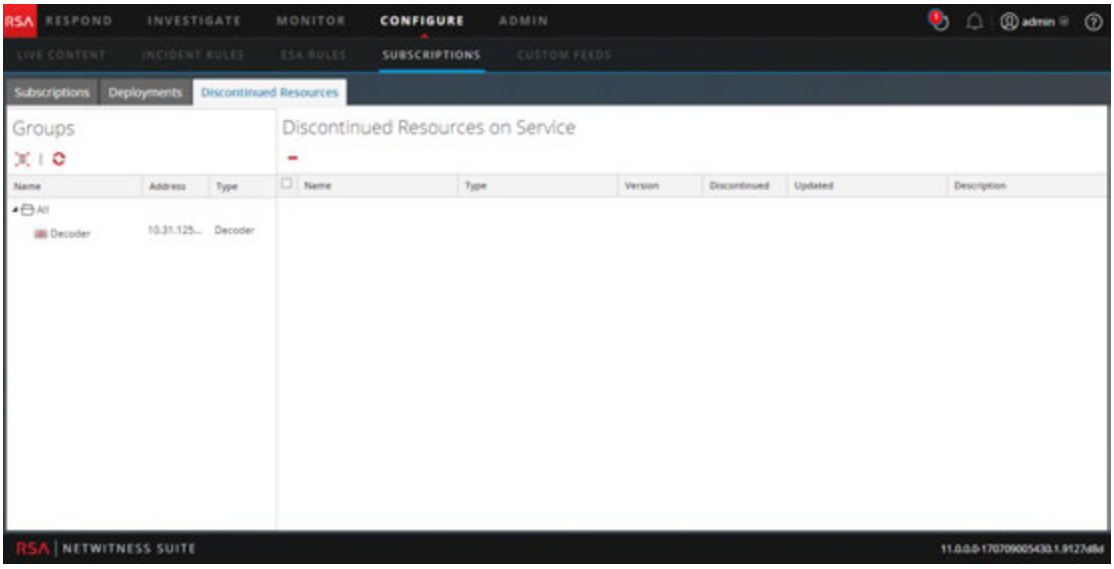
To access this view:

1. Go to t **CONFIGURE > Subscriptions**.

   The **Subscriptions** tab is open by default.

2. Click the **Discontinued Resources** tab.

   This is an example of the Discontinued Resources tab.



The Discontinued tab has two panels: Groups and Discontinued Resources on Service.

Groups Panel

The Groups panel is a static display of configured service groups that were created in the Admin Services view. Selecting a group in the Groups panel populates the Discontinued Resources panel with a list of discontinued resources which are deployment on the selected service or service group.

Feature	Description
	Click  to scan the services for a discontinued resource.
	Displays the current status of the discontinued resources on a service. **Note:** The status of a service may change while the services are being scanned.
Name	This is the service group name. Clicking the plus sign displays a nested list of services in the group.

Feature	Description
Address	This is the IP address of each service in the group.
Type	This is the type of service.

Discontinued Resources on Service Panel

The following table describes the features in the Discontinued Resources on Service panel.

Feature	Description
	Click  to delete the selected resources from the service or service group.
Name	This is the name of the resource.
Type	This is the type of resource.
Version	Version of the discontinued resource.
Discontinued	Indicates the status of the discontinued resources for the subscribed resource. **Yes** - The resource is discontinued. **No** - The resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Updated	This is the date and time that the resource was last updated.
Description	This is a description of the resource.

Live Feeds View

Use the Live Feeds View to:

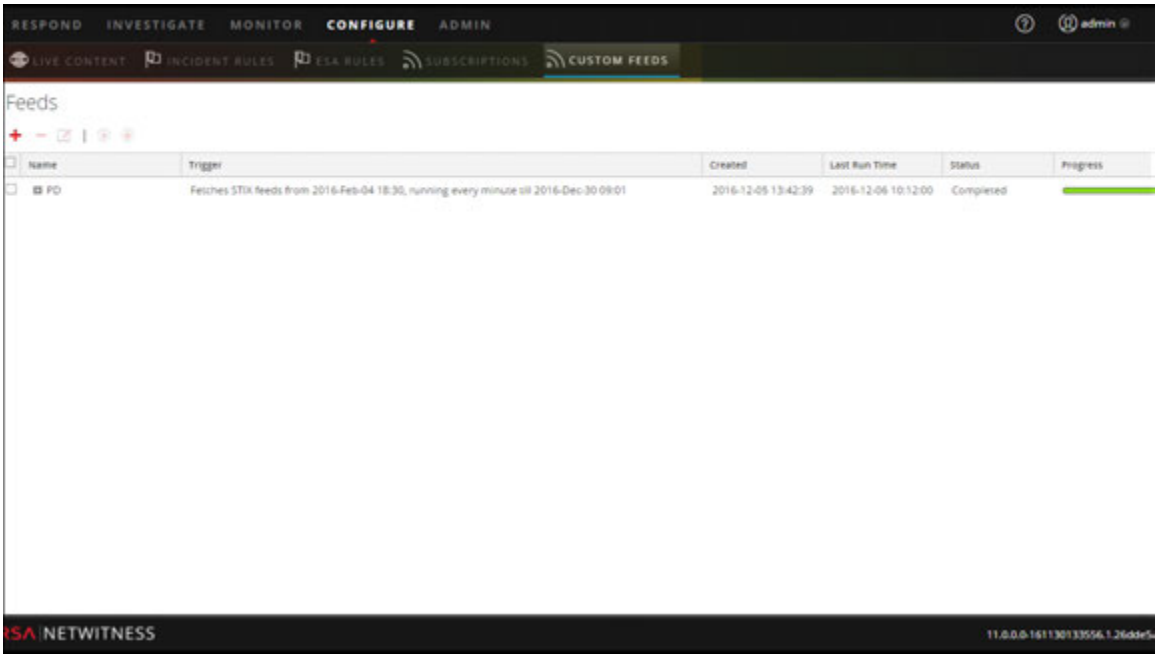
- Create custom feeds.
- Create identity feeds.
- Edit feeds.

The required role to access this view is **Manage Devices**.

To access this view, do one of the following:

- In the main menu, select **Live > Feeds.**
- From any view in the Live Module, select **Feeds** in the main menu.

This is an example of the Feeds view.



The **Feeds** tab has a toolbar and a grid.

Toolbar

This table describes the options in the toolbar.

Feature	Description
+	Initiates the creation of a custom or identify feed by displaying the **Setup Feed** dialog is displayed.  • Custom Feed opens the **Configure a Custom Feed** wizard. • Identity Feed opens the **Configure Identity Feeds** wizard.

Feature	Description
	Deletes the feed that you selected.
	Opens the Configure Custom Feed or Configure Identity Feed wizard for the feed that you selected (see Edit a Feed.
	Start or resume data feed.
	Stop or pause data feed.

Feeds Grid

This table describes the columns in the grid.

Column	Description
	Selects a feed.
Name	Name of the feed. **Note:** You can now use special characters to define the name of the custom feed.
Trigger	Displays how often the feed runs which is determined by what you defined in **Feed Task Type** when the feed was created.
Created	This is the date and time when the feed was created.
Disk Usage	Displays the MongoDB storage size used by the TAXII feed.
Last Run Time	This is the date and time when the feed was last run.
Status	The status of the feed.
Progress	Progress bar.

Live Resource View

The Live Resource View shows a detailed view of a selected resource, and has options to:

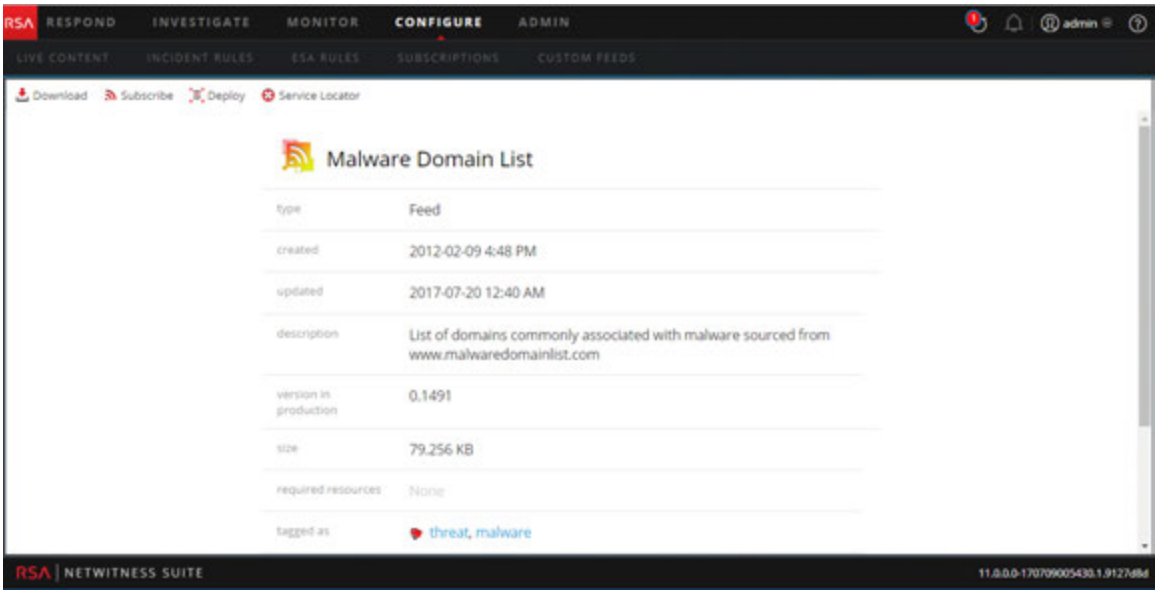
- Download the resource.
- Subscribe or unsubscribe the resource.
- Deploy the resource to services.
- Locate services on which the resource is deployed and remove the resource from services.

The required permission to access this view is View Live Resource Details.

To access this view, do one of the following:

1. In the main menu, select **CONFIGURE > LIVE CONTENT > Search Criteria**.
2. In the Live Search view, **Detailed Results**, click the resource type icon or the resource name.
3. In the Live Search view, **Grid Results**, double-click a resource or select a resource and click **Details**.

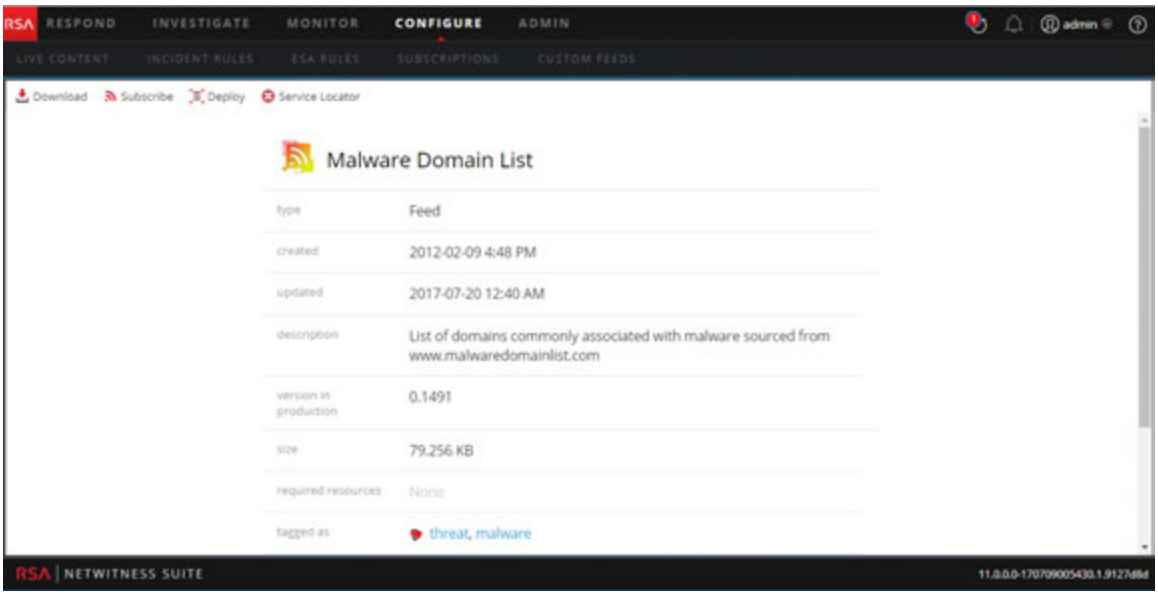
This is an example of the Resource view.



The Live Resource View has a detailed view of a single resource and a toolbar.

Resource Details

This is an example of the resource details displayed in the Resource View.



The following table describes the elements in the Resource Details section.

Feature	Description
Resource Type Icon	A graphic representation of the resource type, for example  .
Name	The name of the resource, for example, **fingerprint_office_lua**.
Type	The type of resource, for example, **RSA Lua Parser**.
Created	The date the resource was created, for example, **2013-09-15 02:16 PM**.
Updated	The date the resource was last updated, for example, **2013-09-15 02:16 PM**
Description	The description of the resource, for example, **Identifies Microsoft Office 95, 2007 Word, Excel, and PowerPoint documents**.
Version in production	The version of the resource, for example, **0.1**.
Size	The size of the resource, for example, **9.079 KB**.
Required Resources	A list of resources on which this resource depends, for example, **NetWitness Lua Library**. Clicking a resource replaces the currently displayed details with the details of the one you clicked.

Feature	Description
Tagged as	The tags  that apply to the resource. In the example, the tag is **featured, informational**. Clicking a tag opens the Live Search View with the search narrowed to match resources with that tag.
Required Meta Keys	The meta keys  that apply to the resource. In the example, there are no meta keys required. Clicking a meta key opens the Live Search View with the search narrowed to match resources with that meta key.
Generates Meta Values	The meta values  that the resource generates. In the example, there are no meta values generated. Clicking a meta value opens the Live Search View with the search narrowed to match resources with that meta value.
Permissions	The permissions required for the resource.

Resource View Toolbar

This table describes the Live Resource view toolbar options.

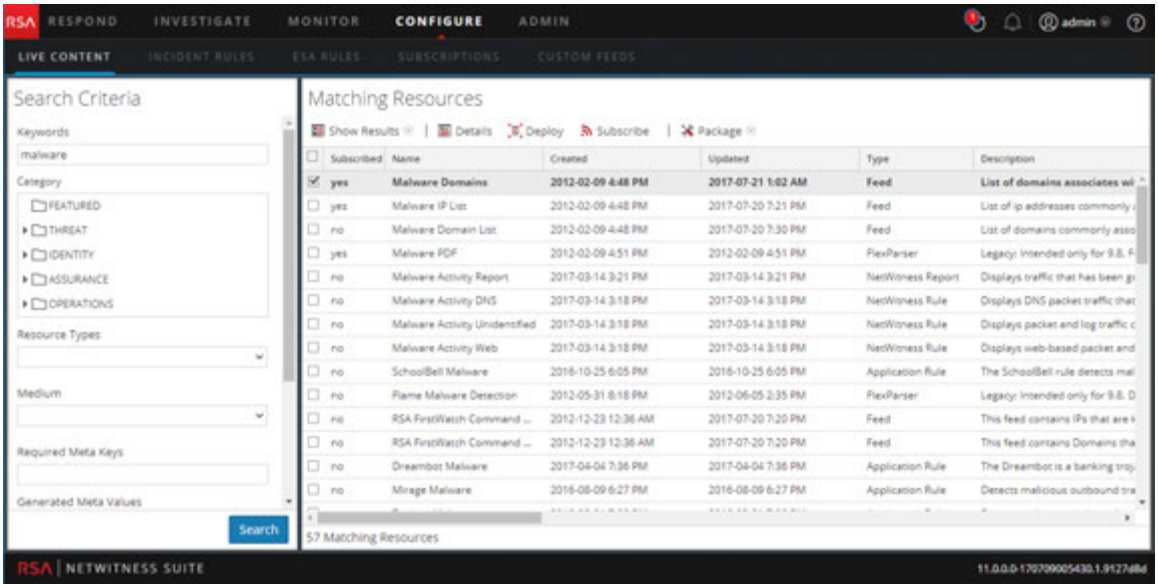
Feature	Icon	Description
Download		This option downloads the resource currently displayed in the Resource View.
Subscribe or Unsubscribe		This option subscribes to or unsubscribes from the resource currently displayed in the Resource View. • Clicking **Subscribe** opens a dialog notifying that you are agreeing to receive notification when the selected resources are updated. You can cancel or click **OK**. • Clicking **Unsubscribe** asks for confirmation that you want to stop receiving notification when the selected resources are updated. You can then choose to cancel or you can click **Unsubscribe** or **Unsubscribe and Remove**, which also removes the resource from services on which it is deployed.

Feature	Icon	Description
Deploy	Deploy	This option provides a way to deploy the resource currently displayed in the Resource View. Clicking **Deploy** opens the Manual Resource Deployment dialog.
Service Locator	Service Locator	This option displays a list of services on which the currently displayed resource is deployed. You can remove the resource from all services or selected services.

Live Search View

The Live Search view provides the ability to browse the configured Live CMS for resources. Once matching resources are found, you can view details, subscribe to resources, and deploy resources to services and service groups.

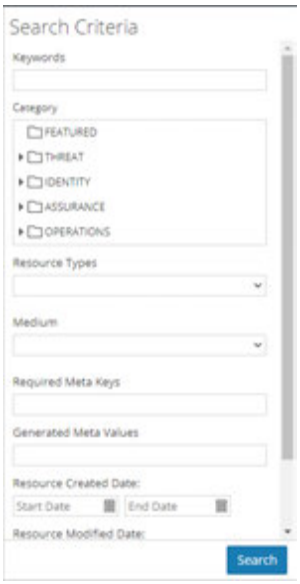
This is an example of the Search view.



The Live Search view has a panel for specifying search criteria and a panel that displays matching resources. The Search Criteria panel is collapsible to provide more width for viewing the Matching Resources panel.

Search Criteria Panel

This is an example of the Search Criteria panel.



The following table provides descriptions of the Search Criteria panel features.

Feature	Description
Keyword(s)	Enter a keyword or keywords to browse for resources that have the keyword in the resource name or the resource description. You can use wildcards when you enter a keyword.
Category	The categories mirror the hierarchical Investigation Model that RSA uses to organize resources. The purpose of the Investigation model is to deliver an accurate path to information security incident response. For more details, see the Investigation Model topic.

Feature	Description
Resource Types	Select resources types from the drop-down list to filter resources by type of resource. Possible values are: • Advanced Analytics (Warehouse) • Application Rule • Bundle • Correlation Rule • Event Stream Analysis Rule • Feed • FlexParser • Log Collector • Log Device • Lua Parser • Malware Rules • NetWitness List • NetWitness Report • NetWitness Rule
Medium	Select one or more mediums from the drop-down list to search for content based on the meta data source. Available values for medium are as follows: • **log**: applied to content that uses meta derived from log data • **packet**: applied to content that uses meta derived from network packets • **log and packet**: applied to content that correlates meta derived across log and packet data
Tags	Select meta tags from the drop-down list to browse based on how the meta is tagged. For example, to browse resources for a Log Decoder, select the **netwitness for logs** tag. Alternatively, you can click a tag in the Matching Resources panel to insert that tag in this field.

Feature	Description
Required Meta Key(s)	Enter a specific meta key; for example, **threat.source**. Alternatively, you can click a meta key in the Matching Resources panel to insert that tag in this field.
Generated Meta Value(s)	Enter a generated meta value; for example, **netwitness**. Alternatively, you can click a generated meta key in the Matching Resources panel to insert that tag in this field.
Research Created Date	Specify a date range during which resources were created. For example, to browse resources that were created between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click  and pick dates from a calendar.
Research Modified Date	Specify a date range during which resources were modified. For example, to browse resources that were modified between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click  and pick dates from a calendar.
Search	Click **Search** to send the search request to the Live server. More specific search criteria return matching resources more quickly.
Cancel	Click **Cancel** to cancel the search in progress.
Include Discontinued Resources	Check **Include Discontinued Resources** to include the discontinued resources in the search result. For an up-to-date list of resources that have been discontinued, see the Discontinued Content topic.

Matching Resources Panel

The Matching Resources panel presents search results based on the selections made in the Search Criteria panel. Results are initially displayed in a grid, but you can switch between two Show Results options: Detailed or Grid.

Detailed Results

In the detailed results, you can click a tag, meta key, or resource meta value to auto fill the Search Criteria panel and pivot the search results.

The following table describes the elements in the detailed results.

Feature	Description
Resource Type Icon	A graphic representation of the resource type. For example  .
Name	The name of the resource, for example, **Group Management**. **Note:** (Discontinued) is displayed next to the resource name if a resource is discontinued.
Type	The type of the resource, for example, **Rule**.
Updated	The date the resource was last updated, for example, **2015-09-15 4:27 PM**.
Version	The version of the resource, for example, **0.1**.
Size	The size of the resource, for example, **153 B**.
Subscribed	Subscription status: • **yes**: This NetWitness Suite instance is subscribed to this content resource. • **no**: This NetWitness Suite instance has not subscribed to this content resource.
Description	The description of the resource, for example, **Compliance Rule-Group Management**.
Tags	The tags that apply to the resource. Clicking a tag narrows the search to resources with that tag. For example,  .
Meta Keys	The meta keys that apply to the resource. Clicking a meta key narrows the search to resources with that meta key. For example,  .
Resource Meta Values	The meta values generated by the resource. Clicking a meta value narrows the search to resources that generated the meta value. For example,  .

Grid Results

In the grid view, you can select one or more resources and use additional options in the toolbar to view the details of a single resource, subscribe to resources, and deploy resources.

The following table describes the elements in the grid results.

Feature	Description
Subscribed	Subscription status: • **yes**: This NetWitness Suite instance is subscribed to this content resource. • **no**: This NetWitness Suite instance has not subscribed to this content resource.
Name	The name of the resource, for example, **Group Management**. **Note:** The resource name is displayed in red color if it is discontinued.
Created	The date the resource was created, for example, **2015-08-12 3:11 PM**.
Updated	The date the resource was last updated, for example, **2015-09-15 4:27 PM**.
Type	The type of the resource, for example, **Rule**.
Discontinued	The status of the discontinued resources: **yes** - The resource that matches the search criteria is discontinued. **no** - The resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Description	The description of the resource, for example, **Compliance Rule-Group Management**.
Toolbar	
	This menu offers two ways to view search results: **Detailed** and **Grid**.
	This option applies to a single selected resource. Clicking **Details** opens the selected resource in the Live Resource view.
	This option applies to one or more selected resources.

Feature	Description
Subscribe	This option applies to one or more selected resources. Clicking **Subscribe** opens a dialog that asks for confirmation that you want to receive notification when the selected resources are updated.

Package	This menu offers two packaging functions for the selected resources:
	• **Create**: creates a **resourceBundle.zip** file that contains the selected resources and opens a dialog in which you can either:
	  • open the file, or
	  • save the file for subsequent deployment.
	• **Deploy**: opens the Deployment Wizard, in which you can choose a **resourceBundle.zip** file and deploy it.

See Also

- For more details on Deployment (Deploy), see Find and Deploy Live Resources.
- For more details on Deploying a Package (Package), see the Resource Package Deployment Wizard,.

Resource Package Deployment Wizard

If you have created a package of resources and saved it on a network drive, you can use the Resource Package Deployment Wizard to deploy the resources manually to a service or a service group without subscribing to the resources. NetWitness Suite accepts packages in **.nwp** files or **.zip** files.

Deploying resources manually deploys them directly to the services without taking advantage of the powerful resource management capabilities of NetWitness Suite.

If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy the resources in the **Live Configure** view.

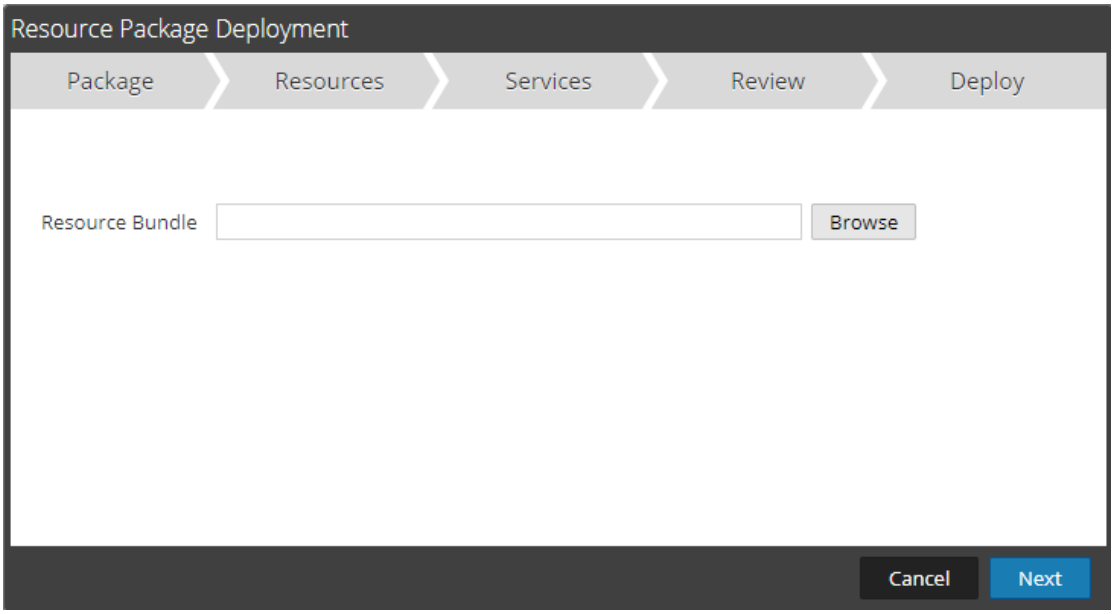
Note: Use NetWitness Suite Live to create resource bundles; this is a different application that is not part of NetWitness Suite. Selecting **Package** > **Create** in the **Live Search - Matching Resources** toolbar displays the Content Package Tool window. You can choose resources to include in a package and save the package as a NetWitness Suite Package File.

The required permission to access this view is **Deploy Live Resources**.

To access this view:

1. In the main menu, select **CONFIGURE > LIVE CONTENT**.
2. In the **Live Search - Matching Resources** toolbar, select **Package** > **Deploy**.

   The Resource Package Deployment wizard is displayed.



Features

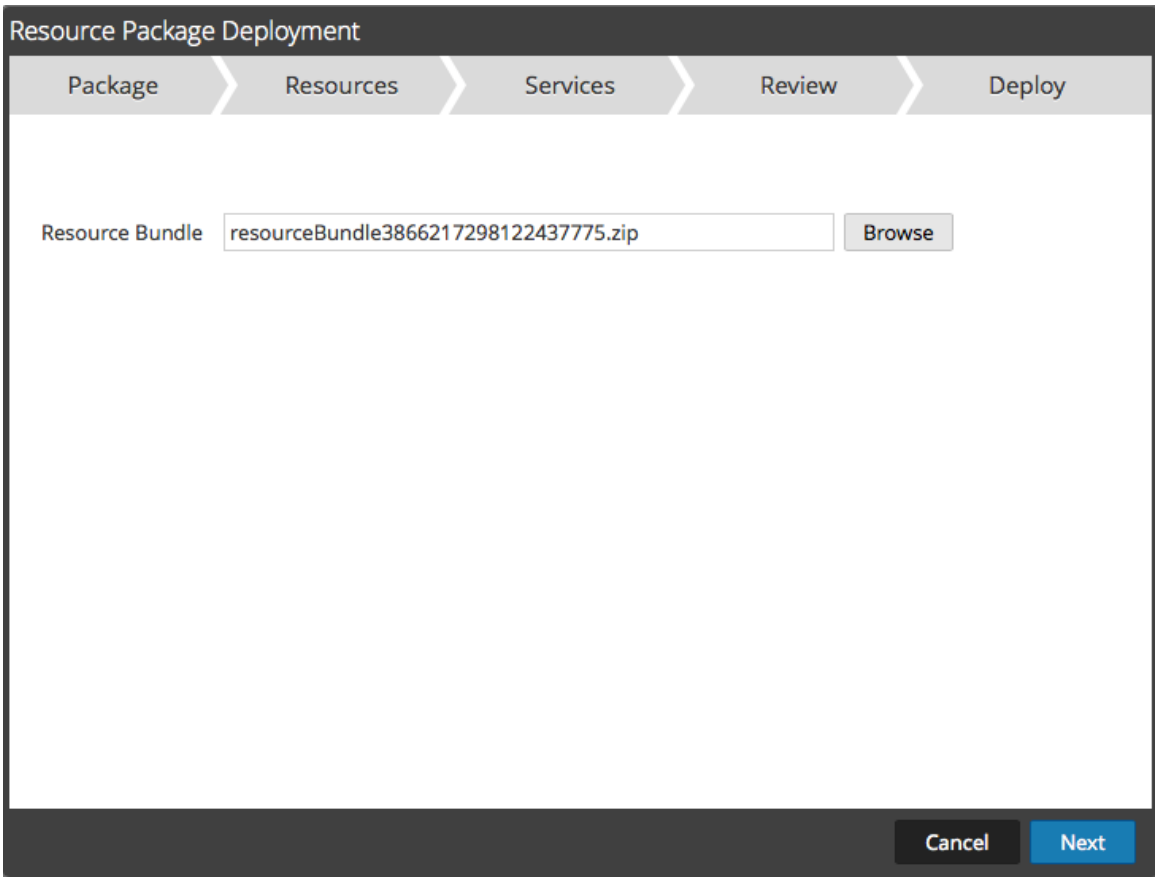
The Deployment Wizard has five tabs: **Package, Resources**, **Services**, **Review** and **Deploy**. Use **Close** to exit before you complete the wizard.

When you complete the wizard, NetWitness Suite returns to the Live Resources View.

Package Tab

You use this tab to select a resource bundle from your network in this page.

This is an example of the Package tab, with a resource bundle already selected.



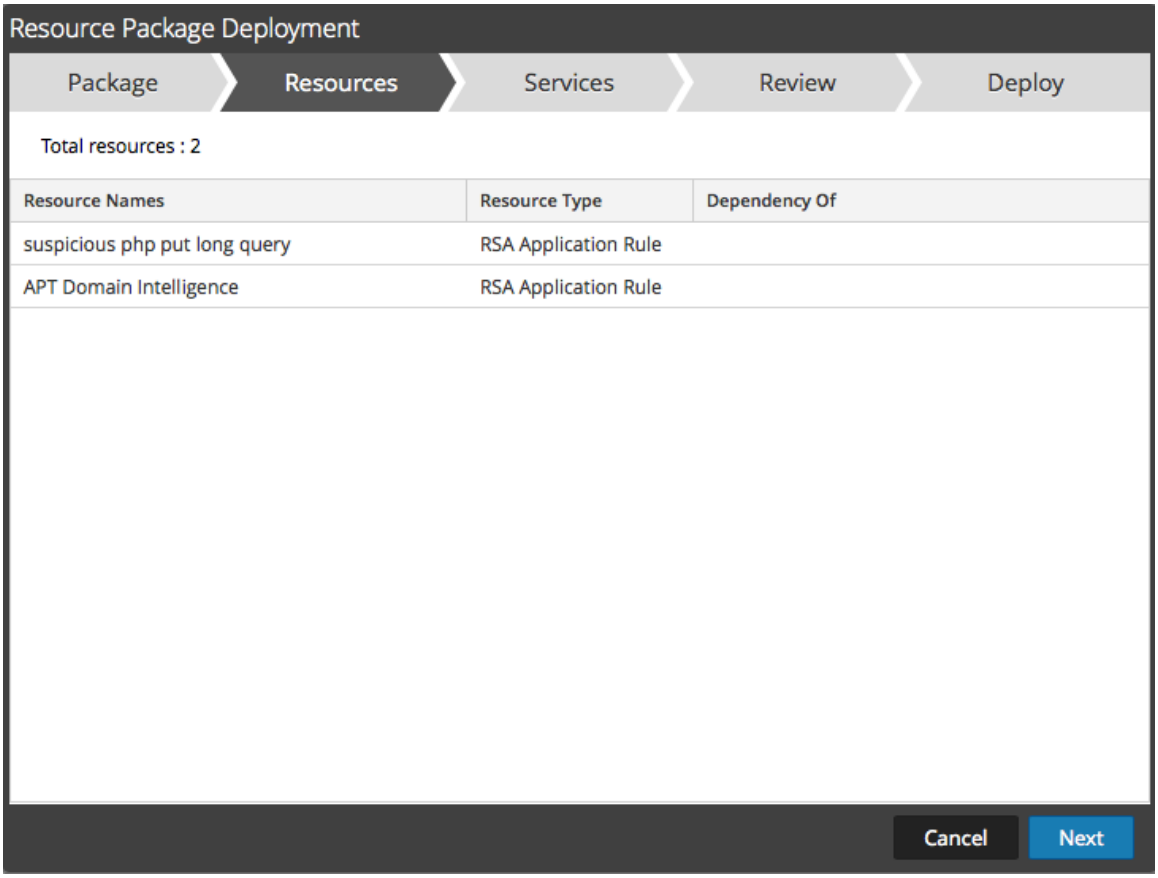
The following table describes the elements in the Package tab.

Column	Description
Resource Bundle	The input field to specify a resource bundle. You can type a path in this field or search using the Browse button.
Command Buttons	
Browse	This button opens a File Upload dialog in which you can browse the local file system and select a bundle.
Cancel	Cancels the deployment and closes the wizard.
Next	Displays the next tab of the wizard.

Resources Tab

This tab displays the resources contained in the bundle.

The following figure shows an example of the Resources tab.



The following table describes elements in the Resources tab.

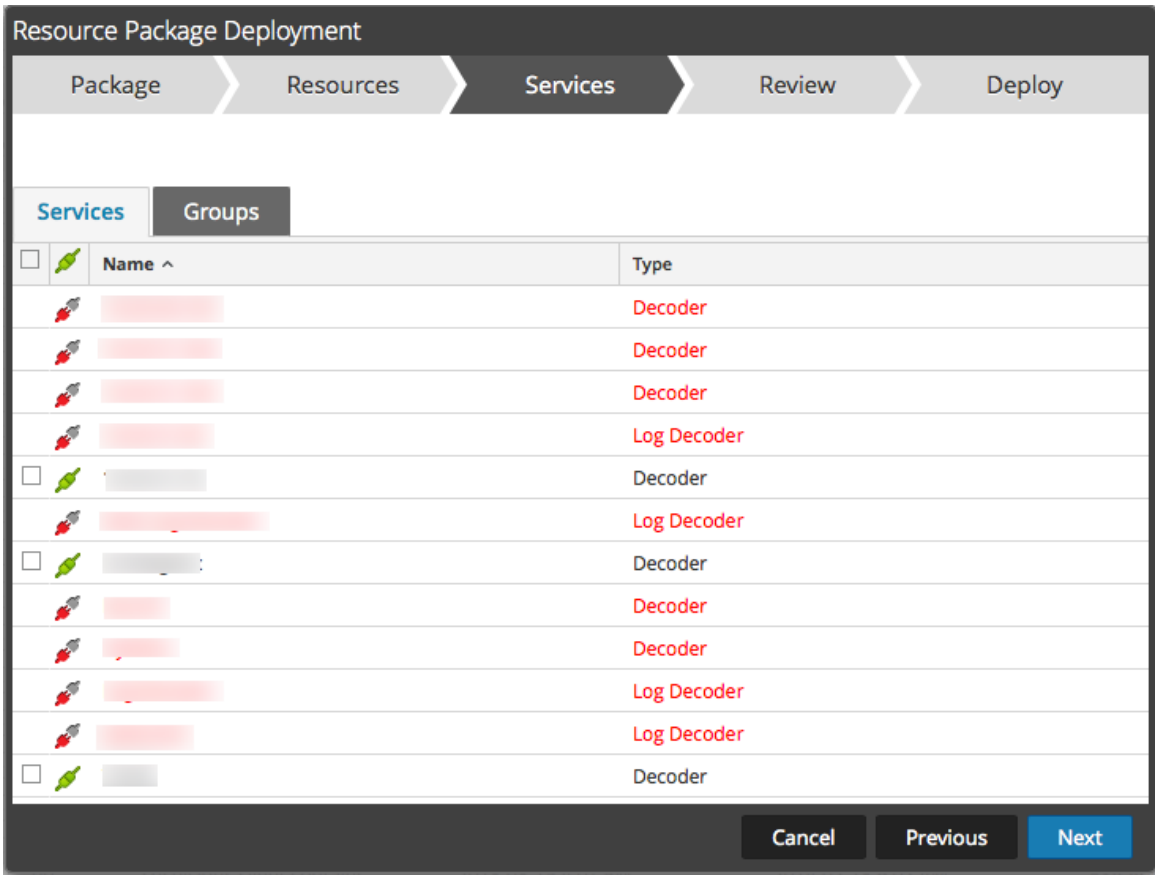
Column	Description
Resource Name	Displays the name of the resources in the bundle (for example, **NetWitness Lua Library**).
Resource Type	Displays the resource types for the resources in the bundle (for example, **RSA Lua Parser**)
Dependency Of	Displays Resources on which the selected resource depends (for example, **AIM lua**).

Services Tab

You select the services to which you want to deploy the resources in the bundle.

The Services tab has two tabs, **Services** and **Groups**. These provide a list of services and service groups that are configured in the ADMIN > Services view. The columns are a subset of the columns available in the Services view. You can select the services or the service groups to which you want to deploy the resources in the bundle.

This is an example of the Services tab.



The following table describes the elements in the Services tab.

Column	Description
Services	
	Selects services to which you want to deploy the content. You can select any combination of services and service groups.
Name	Displays the services in your environment to which you can deploy the content.
Host	Displays the name of the resource host.
Type	Displays the type of NetWitness Suite service.

Column	Description
Groups	
	Selects service groups (if you have service groups defined in your environment).
Name	Displays the names of the service groups.

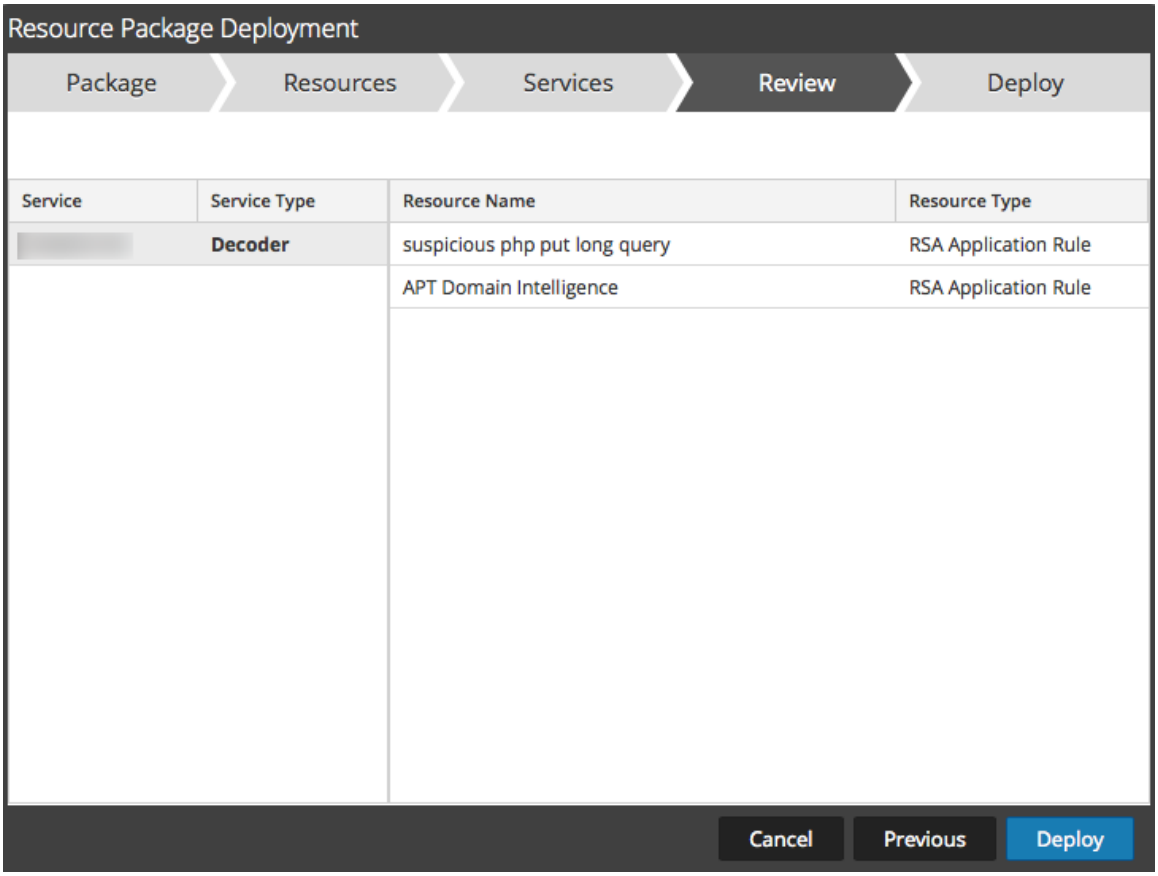
Review Tab

Displays the resources and services on which the resources will be deployed.

In this tab, you can do the following:

- Review the content and services before you deploy.
- Initiate the deployment of the resources.

The following figure shows an example of the Review tab.



The following table describes the elements in the Review tab.

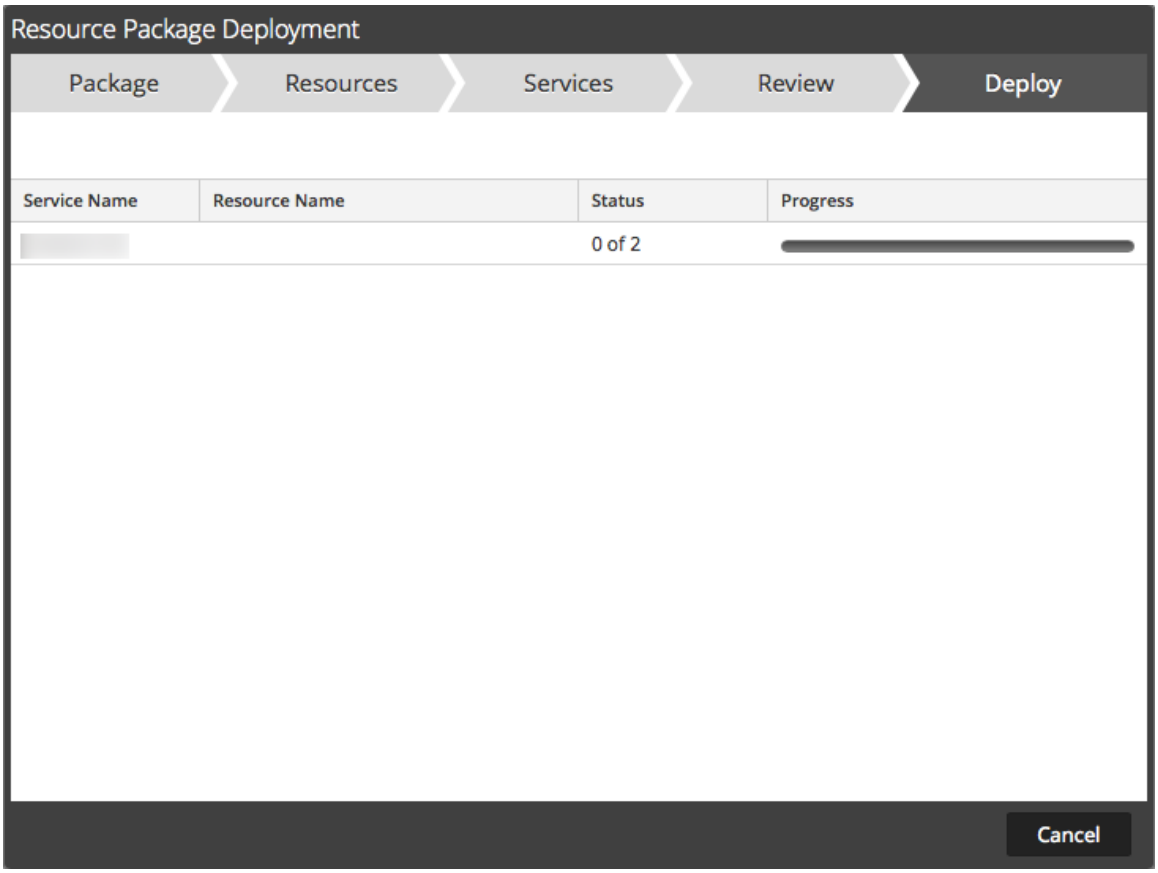
Column	Description
Service Information	
Service	Displays the services in your environment to which you can deploy the content.
Service Type	Displays the type of each NetWitness Suite service (type of host/service).
Resource Information	
Resource Name	Displays the name of the resources you have selected (for example, **NetWitness Lua Library**).
Resource Type	Displays the resource types for the resources you have selected (for example, **RSA Lua Parser**).
Deploy	Initiates the deployment of the resources and displays the **Deploy** page (final page of the wizard).

Deploy Tab

This tab allows you to do the following:

- View the progress of the job
- Cancel the job

This is an example of the Deploy tab.



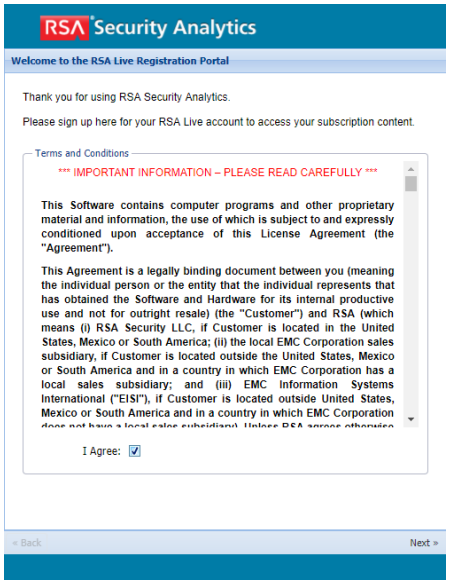
The following table describes the elements in the Deploy tab.

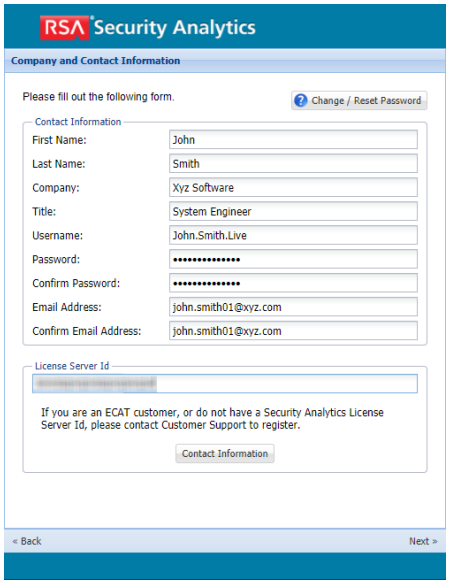
Feature	Description
Service Name	Name of the services to which resources are deployed.
Resource Name	Name of the resources.
Status	Status of the manual deployment.
Progress	Progress of the manual deployment in a progress bar. When complete, the bar is solid green.
Command Buttons	
Close	Closes the wizard.

Feature	Description
Errors	Only displays if NetWitness Suite encountered any errors. Click to display the errors.
Retry	Only displays if NetWitness Suite encountered any errors. Click this button to try to deploy the resources again using the wizard.

RSA Live Registration Portal

The RSA Live Registration Portal is a self-service wizard in which customers can set up a Live account and change or reset the password. A Live account is required to get access to the feeds, parsers, rules, and other content in RSA Live library. To access the portal, go to the following URL: https://cms.netwitness.com/registration/.





After you agree to the Terms and Conditions, click **Next**: the fields for setting up an account are displayed. These include Contact Information, Subscription Level, and License Server Id.

The following table lists the contact information section fields and its descriptions:

Parameter	Description
Change / Reset Password	Allows users to change or reset their RSA Live password.
First Name	Your first name.

Parameter	Description
Last Name	Your last name.
Company	The name of your company.
Title	Your job title or function in the company.
Username	The username used to log on to RSA Live account. The username must contain a minimum of nine characters and a maximum of 60 characters.
Password	The password for the RSA Live account. The password must contain minimum of nine characters and the maximum length is 60, with at least one uppercase, one lowercase, one number, and one special character.
Confirm Password	Confirmation of your password.
Email Address	The email address where you want to receive notifications related to the Live account.
Confirm Email Address	Confirmation of the email address.
Subscription Level / Confirm Subscription Level	• **Basic** - This provides access to the Live content that is tagged for groups like Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis. • **Enhanced** - This provides access to the Live content that is tagged for groups like Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis. • **Premium** - This provides access to the Live content that is tagged for groups like Premium, Verisign Premium, Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.
License Server Id	This is the License Id on the **ADMIN > SYSTEM > Info** page. **Caution:** The license server ID on NetWitness Suite must be valid and must be registered on the Flexera Server. If not, contact RSA Customer Support.

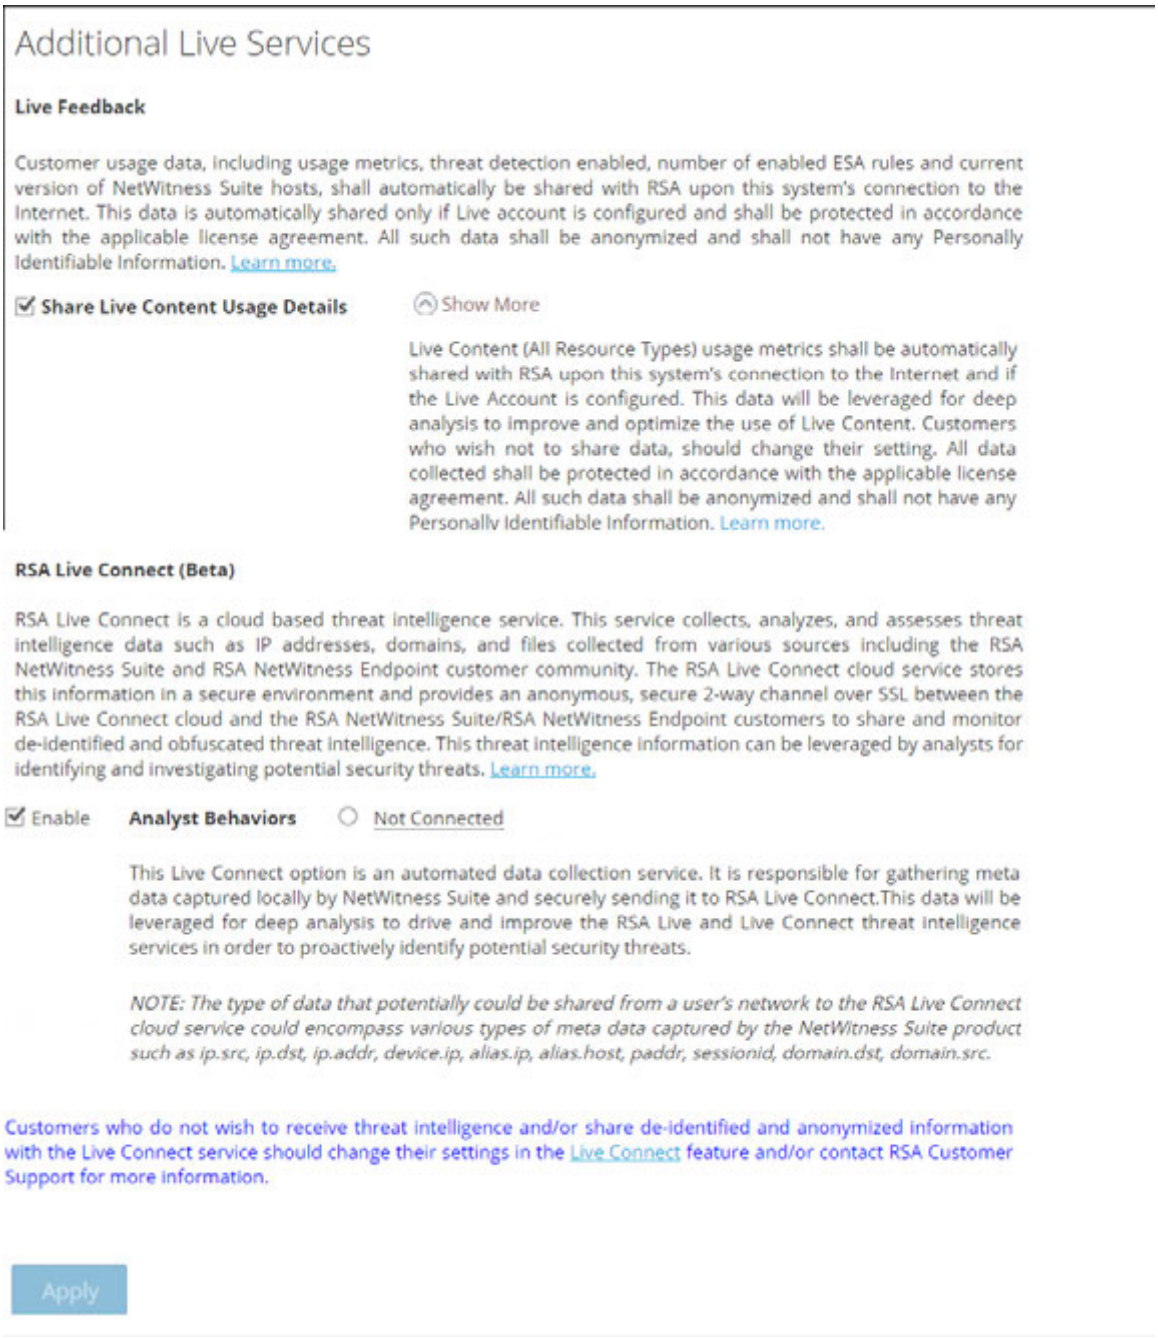
NetWitness Suite Feedback and Data Sharing

This topic introduces the Feedback and Data Sharing features of NetWitness Suite.

The settings for these features are available in **ADMIN** > **SYSTEM** > **Live Services** view, in the Additional Live Services section.

Additional Live Services

Participation in the Additional Live Services is configured in the **ADMIN > SYSTEM > Live Services** view.



Live Feedback

Live Feedback is intended to help improve RSA NetWitness Suite.

Once you set up and configure a Live account, usage data is shared with RSA. The data is protected in accordance with the applicable license agreement. Customer usage data, including usage metrics and current version of NetWitness Suite hosts, is automatically shared with RSA upon the system's connection to the Internet.

Before data is sent to RSA, all Personally Identifiable Information is removed. Thus, only anonymous usage data gets transferred to RSA.

For more information, see the **Live Feedback Overview** topic in the *System Configuration Guide*.

RSA Live Connect

RSA Live Connect is a cloud based threat intelligence service. This service collects, analyzes, and assesses threat intelligence data such as IP addresses, domains, and files collected from various sources including the RSA NetWitness Suite and RSA ECAT customer community. RSA Live Connect consists of the following features:

- Threat Insights
- Analyst Behaviors

Threat Insights

Threat Insights provides analysts the opportunity to pull threat intelligence data such as IP related information from the Live Connect service to be leveraged by the analysts during investigation.

By default, **Threat Insights** is enabled in **Additional Live Services** section. If Context Hub service is configured, Live Connect is automatically added as a data source for Context Hub. For more information, see the **Configure Live Connect Data Source for Context Hub** topic in the *Context Hub Configuration Guide*.

With Live Connect as a data source for context hub, you can use the Context Lookup option in Investigation > Navigate view or Investigation > Events view to fetch contextual information. For instructions, see View Additional Context for a Data Point.

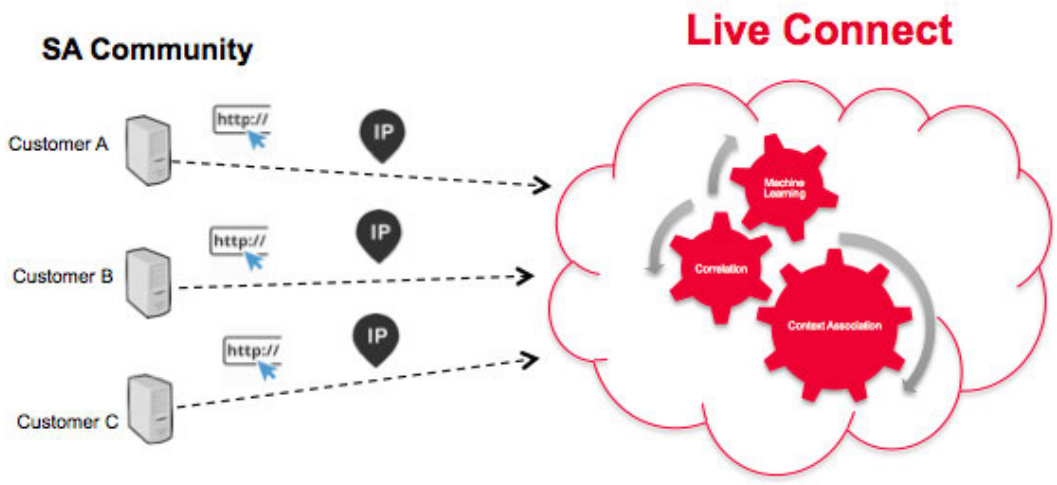
Analyst Behaviors

Analyst Behaviors is a feature where analysts participate in sharing data to RSA community. This is an automated data collection service. Its goal is to share potential threat intelligence data to the RSA Live Connect cloud service for analysis. The type of data that could be shared from your network to RSA Live Connect includes various types of meta data captured by NetWitness Suite such as ip.src, ip.dst, ip.addr, device.ip, alias.ip, alias.host, paddr, sessionid, domain.dst, domain.src.

Note: All data collected locally is de-identified and obfuscated and then sent securely and anonymously to the RSA Live Connect cloud service, where it is stored in a secure environment.

Description

Live Connect Threat Data Sharing has been developed as a Community based threat intelligence sharing platform.



It has the following characteristics and goals:

- Crowd-sourced: the RSA community contributes to the entire collection of intelligence
- Centrally collect and analyze data from the RSA community
- Reduce the intelligence cycle time from days to minutes

Some details to consider:

- We are leveraging analyst investigation activity
- We are harvesting meta data such as IP addresses and domain names
- We are doing deep data analysis: Trending, correlation, anomaly detection
- Remember, this feature is currently in Beta

Participation

Customer participation is optional. Upon initial install or upgrade to NetWitness Suite 11.0, you are presented with a confirmation screen. By default, you are entered into the program, but you can opt out at any time.

Cloud Authentication

Authentication for the program is done in the NetWitness Suite UI, where you configure the Live account in the Live services section.

Configuration

To view or change the settings for Live Connect Threat Data Sharing, in the main menu, select **ADMIN > SYSTEM > Live Services**. Check or clear the **Enable** box to participate or stop participating in the program.

Data Collection

Data is collected as follows:

- Data Attribution: Anonymous
- Data Source: Subset of meta keys and meta values of a NetWitness Suite analyst's page views from the NetWitness Suite Core Query logs.
- Query Log Harvesting Process:
  - Timing: Batch mode every 24 hours (4 AM – 6 AM UTC)
  - Log Collection: NetWitness Suite server collects NetWitness Suite core device log entries for the previous 24 hours
  - Log Entries: Only SDK-Value and SDK-Query API calls that contain a where clause are collected
  - Log Attribute Parsing: Each entry must have one of the following meta key indicators present: **ip.src**, **ip.dst**, **ip.addr**, **device.ip**, **alias.ip**, **alias.host**, **paddr**, **sessionid**, **domain.dst**, or **domain.src**. If so, meta keys and meta values from the entry will be collected.

Note: Once the above criteria is met, NetWitness Suite sends all of the meta keys and values from the query to the cloud—not just the meta key indicators.

The log report is sent in JSON format, over SSL. It contains:

- Timestamps
- Live CMS username (sha256)
- NetWitness Suitelicense server ID (sha256)
- List of SA endpoint IDs (sha256)
- Harvested meta values (MD5 and SHA256 hashed)

Example

This section lists entries from a log, and then the corresponding section of extrapolated data.

Section from a log file:

```
User admin (session 204298, 10.4.50.60:57454) has issued values (channel 205237)
(thread 2332): fieldName=filter id1=1 id2=23138902 threshold=100000 size=20
flags=sessions,sort-total,order-descending,ignore-cache where="(alias.host =
'mail.google.com') && (ip.src = 161.253.31.130) && time=\"2015-12-07 18:08:00\"-
\"2015-12-07 21:07:59\""
```

Data extrapolation with hashing:

```
{
    timestamp: 1452282588000,
    session: 204298,
    id1: 1,
    id2: 23138902,
    userName: "8c6976e5b5410415bde908bd4dee15dfb167a9c873fc4bb8a81f6f2ab448a918",
    loggerName: "SDK-Values",
    timeRange: "\"2015-12-07 18:08:00\"-\"2015-12-07 21:07:59\"",
  - metaList: [
      - {
            metaKey: "alias.host",
          - properties: {
                domain_hint: "mai*********.com",
                domain_tld: "com",
                md5_value: "be5cab0695415d9363d18ad1345c73eb",
                sha256_value: "3f2728499a4b29460f3e3150df508e06b19edf0f58efd051fac777844d28e452"
            }
        },
      - {
            metaKey: "ip.src",
          - properties: {
                md5_value: "03b81ffdff109a05a3dac88dbec10c59",
                sha256_value: "1d88c6893797c896070bd5470d0026e11b515d5dee97c6173771a43719fa7e78"
            }
        }
    ]
},
```

Troubleshooting

This section discusses a bit about troubleshooting Live Connect Threat Data Sharing.

Query Log Retrieval Sample

To retrieve a sample of threat intelligence data sent to Live Connect, you construct a URL by setting the following parameters:

- **sendReport**: value is **true** or **false**: true to send this report to the Live Connect server. False to just create the report for viewing. The value defaults to false.
- **hashValues**: value is **true** or **false**: true to hash the values as md5/sha256. False to show values in clear text – should use only for manual viewing. Defaults to false.
- **startDate / endDate**: Dates for time boundaries for log entries. Format: YYYY-MM-DD HH:mm:ss

The following is an example of the URL to use to retrieve query logs:

`https://<server>/admin/liveconnect/force_aggregation?`**`startDate=2016-01-18%2000:00:00&endDate=2016-01-19%2010:10:00&sendReport=false&hashValues=true`**

System Logging: Debug

You can access some debug information as follows.

1. Select **ADMIN > SYSTEM > System Logging**.
2. Select the **Settings** tab.

3. In the Package Configuration section, select **com > netwitness > platform > server > liveconnect > service (DEBUG)**.

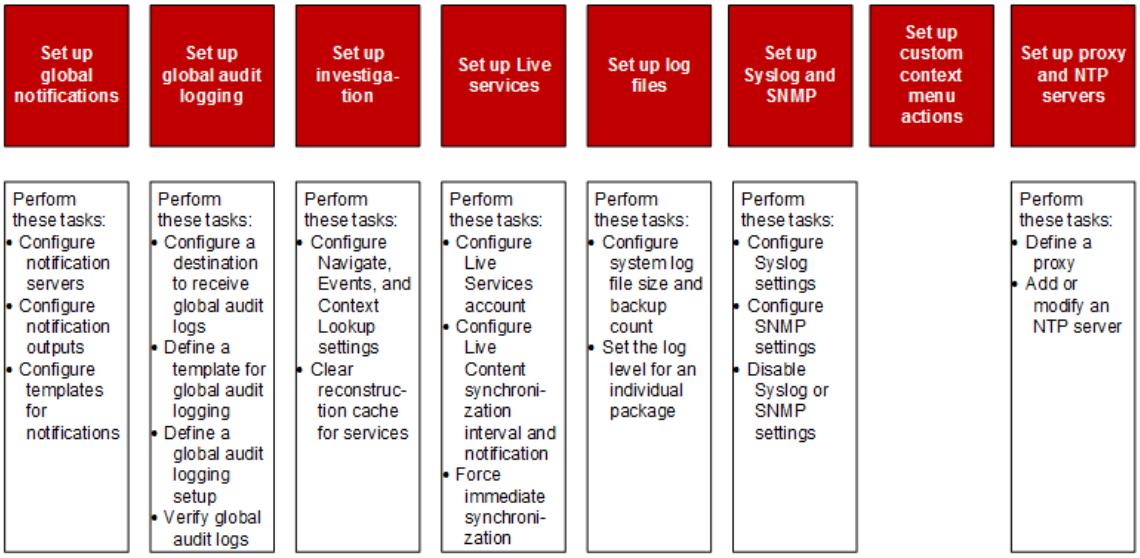
System Configuration Overview

In the Administration System view, administrators can configure system settings to receive optimal performance from NetWitness Suite. This diagram show the available configuration options.



In this guide, the standard procedures provide instructions for administrators who want to customize settings that apply across the system in NetWitness Suite. Although some of these settings have default values, the administrator needs to view and evaluate all default values.

Additional procedures are not essential for the set up of NetWitness Suite, they include certain customization options that are beyond the usual setup; for example, adding custom context menus or setting up a proxy.

In addition, reference topics and troubleshooting topics supply detailed information about the user interface and suggestions for resolving possible issues.

The following sections describe system configuration:

- Standard Procedures provide instructions for administrators who want to customize settings that apply across the system in NetWitness Suite.
- Additional Procedures provide instructions for setting up customization options that are beyond the usual system configuration.

Standard Procedures

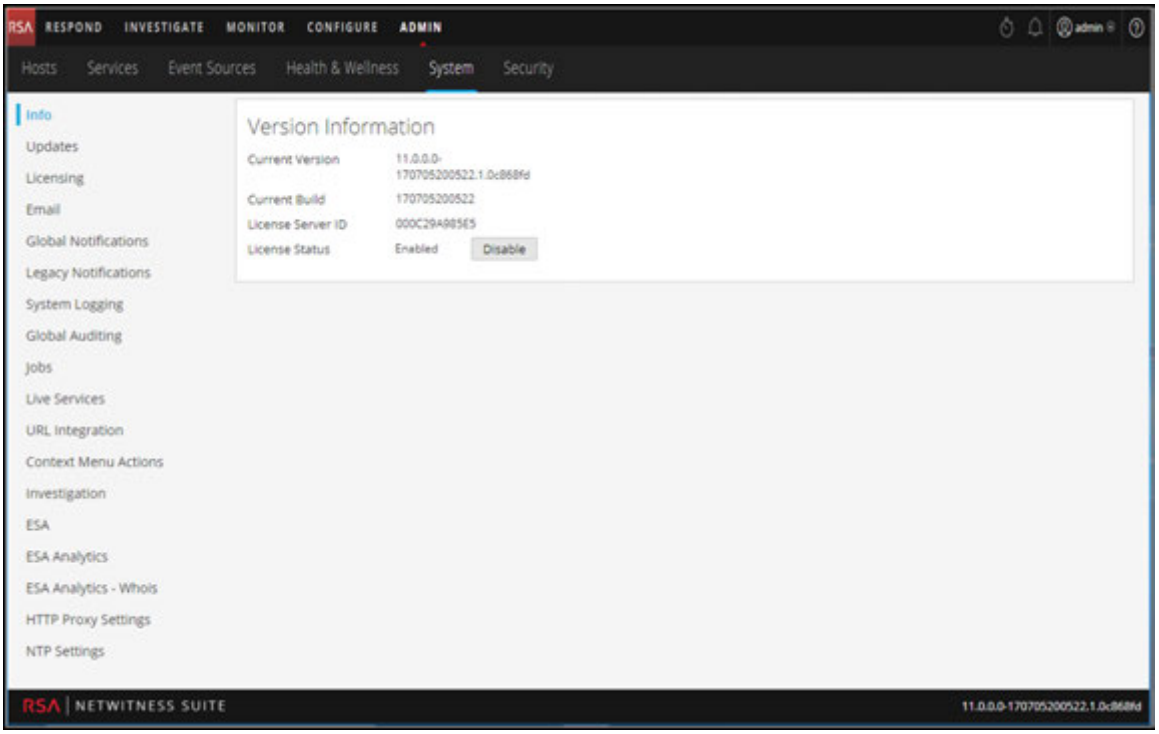
The topics in this section provide instructions for administrators who want to customize settings that apply across the system in NetWitness Suite. Although some of these settings have default values, the administrator needs to view and evaluate all default values. The procedures can be performed in any sequence and are listed alphabetically.

Access System Settings

This topic introduces system configuration capabilities of NetWitness Suite in the Administration System view. Administrators can configure notifications, email notifications, global audit logging, logging settings, connection to Live Services, and URL integration in NetWitness Suite.

To access the system settings:

Go to **ADMIN > System**.
The Administration System view is displayed.



On the left panel of the Administration System view is an options panel listing all system nodes available for configuration. When you select a node, the associated content is displayed in the right panel.

Configure Notification Servers

This topic provides instructions on how to configure notification servers. For ESA, notification servers are required to define an ESA rule. A notification server is also required to configure global audit logging.

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond. Notification Servers define the servers from which you want to receive notifications from the system. For Global Audit Logging, define Log Decoders as Syslog Notification Servers.

You can define, delete, edit, import, and export a notification server in NetWitness Suite. Individual topics describe the relevant procedures. For more information on ESA alert configuration, see "Notification Methods" in the*Alerting Using ESA Guide*. You delete, edit, import, and export notification outputs and notification servers in the same way as templates. You cannot disable or delete notification servers associated with global audit logging configurations.

Notification Servers Overview

This topic provides an overview of notification servers. You configure notification servers in the Administration System view (ADMIN > System > Notifications > Servers tab).

Global Notifications are used by a variety of components in NetWitness Suite, such as Event Stream Analysis (ESA), Respond, Health and Wellness, Event Source Management (ESM), and Global Audit Logging. Notification settings are called **Notification Servers**.

Event Stream Analysis sends notifications to users through email, SNMP, or Syslog about various system events. In ESA, these alert notification settings are called Notification Servers. You can configure multiple notification servers and use them while defining an ESA rule, for example, you can configure multiple mail servers or Syslog servers and use the settings while defining an ESA rule.

You can configure the following notification servers:

- Email
- SNMP
- Syslog
- Script

Email notification servers enable you to configure email server settings to send alert notifications. SNMP notification servers enable you to configure SNMP trap host settings as a notification server to send alert notifications.

Syslog notification servers enable you to configure Syslog settings as a notification server to send notifications. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis. For Global Audit Logging, you can only use Syslog Notification Servers.

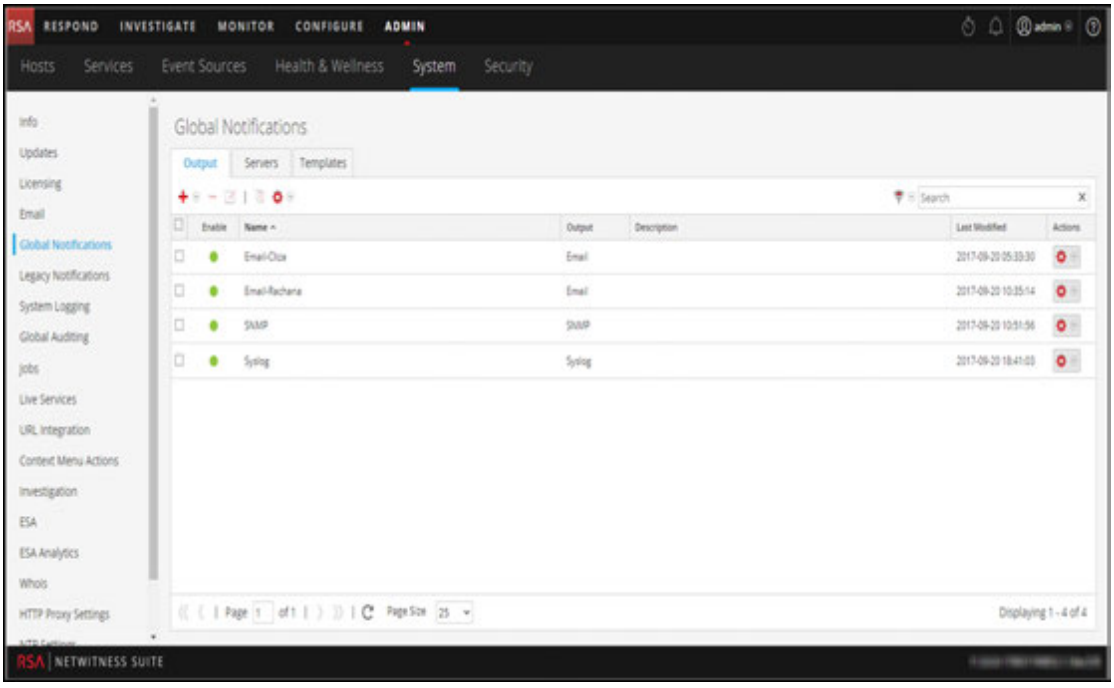
Script notification servers enable you to configure Script as a notification server.

For detailed information on the different notification server configurations, including parameters and descriptions, see Define Notification Server Dialogs.

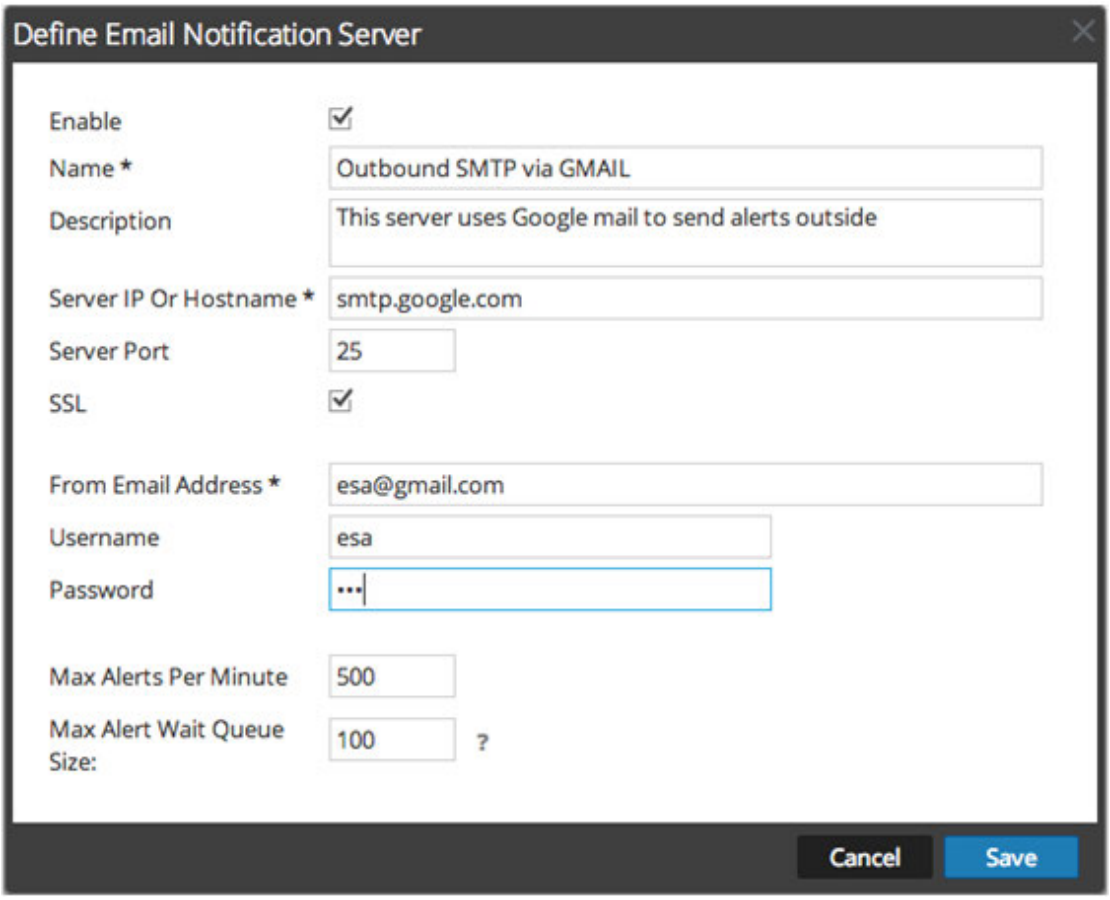
Configure the Email Settings as Notification Server

To configure email server settings as a notification server to send alert notifications:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
   The **Notifications** configuration panel is displayed with the **Output** tab open.
3. Click the **Servers** tab.



4. From the + drop-down menu, select **Email**.



5. In the **Define Email Notification Server** dialog, provide the required information and click **Save**.

Note: For ESM/SMS and ESA notifications, you must specify only the hostname/FQDN in the Server IP or Hostname field.

For details of the parameters and descriptions, see Define Notification Server Dialogs .

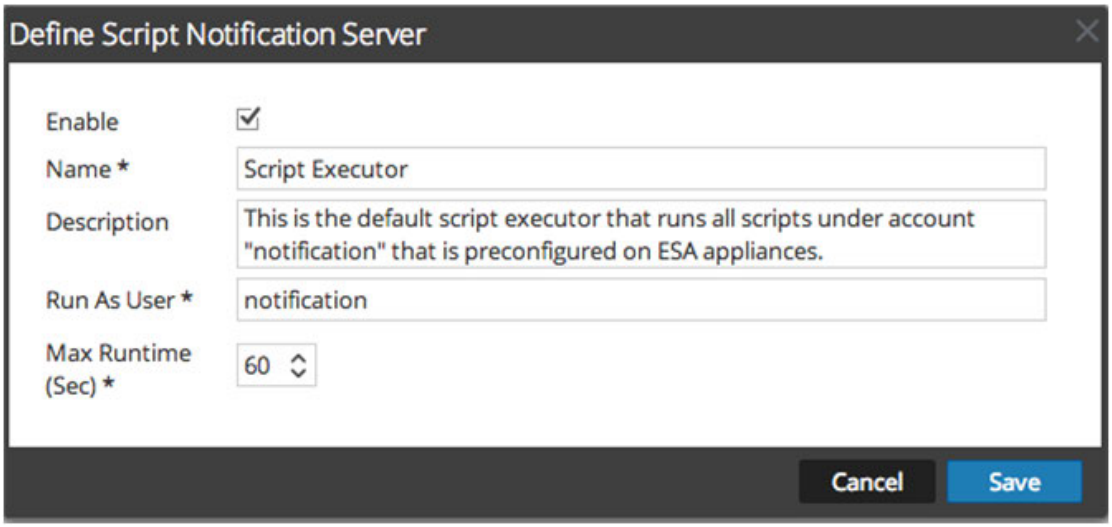
Configure Script as a Notification Server

ESA allows you to run scripts in response to ESA alerts. However, you must first configure the user identity and other details that are required to run the scripts.

To configure Script as a notification server:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the + drop-down menu, select **Script**.



5. In the **Define Script Notification Server** dialog, provide the required information and click **Save**.

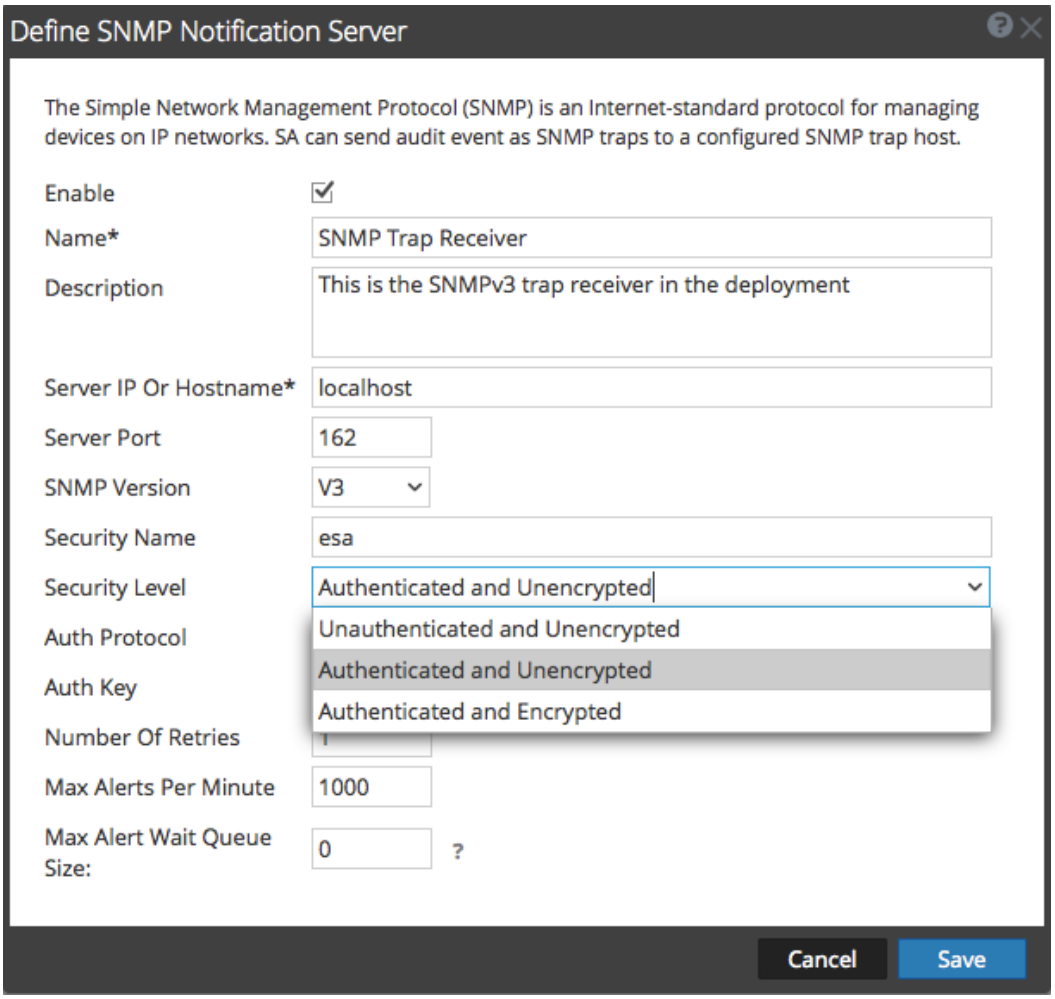
For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure the SNMP Settings as Notification Server

To configure the SNMP trap host settings as a notification server to send alert notifications:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the + drop-down menu, select **SNMP**.



5. In the **Define SNMP Notification Server** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

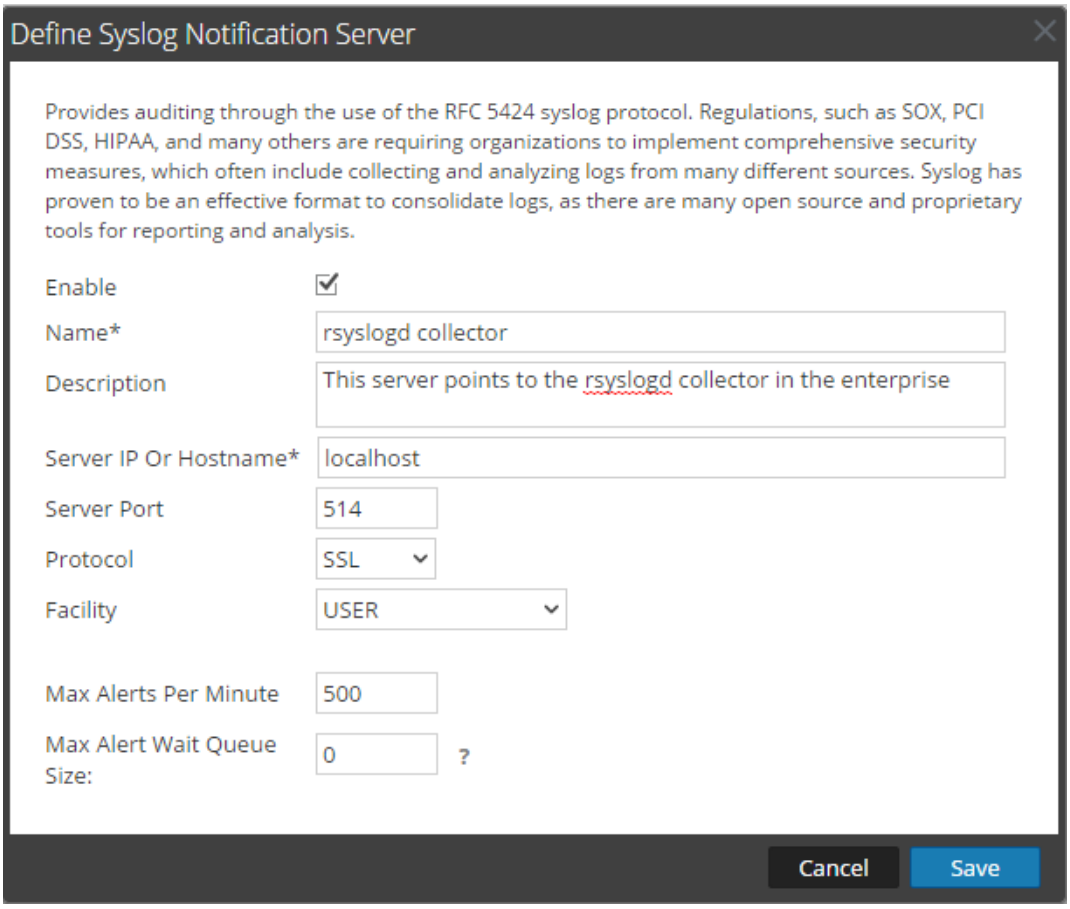
Configure a Syslog Notification Server

This topic provides instructions on how to configure a Syslog notification server. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

To configure Syslog as a notification server:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.

3. Click the **Servers** tab.
4. From the + drop-down menu, select **Syslog**.



5. In the **Define Syslog Notification Server** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Notification Outputs

This topic provides instructions on how configure notification outputs. These notification outputs are required to define an ESA rule.

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Note: You do not need to configure the Output tab for Global Audit Logging.

Notification Output configurations define email addresses and subject lines, SNMP trap OID settings, syslog output settings, and script code.

You can define, delete, edit, import, and export notification outputs in NetWitness Suite. Individual topics describe the relevant procedures. For more information on ESA alert configuration, see "Notification Methods." You delete, edit, import, and export notification outputs and notification servers in the same way as templates. If you attempt to delete a notification output being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use.

Notification Outputs Overview

This topic provides an overview of notification outputs. These notification outputs are required when defining an ESA rule. You configure notification outputs in the Administration System view (Administration > System > Notifications > Outputs tab).

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Note: You do not need to configure notification outputs (the Output tab) for Global Audit Logging.

Notification outputs are the destinations used for sending notifications. For ESA, notification outputs enable you to define how you want to receive the ESA alerts. The following are the different notification outputs supported by NetWitness Suite:

- Email
- SNMP
- Syslog
- Script

Email notification settings define the destination email address to which you can send the alerts. You can also add a custom description in the subject of the email and define multiple destination email addresses.

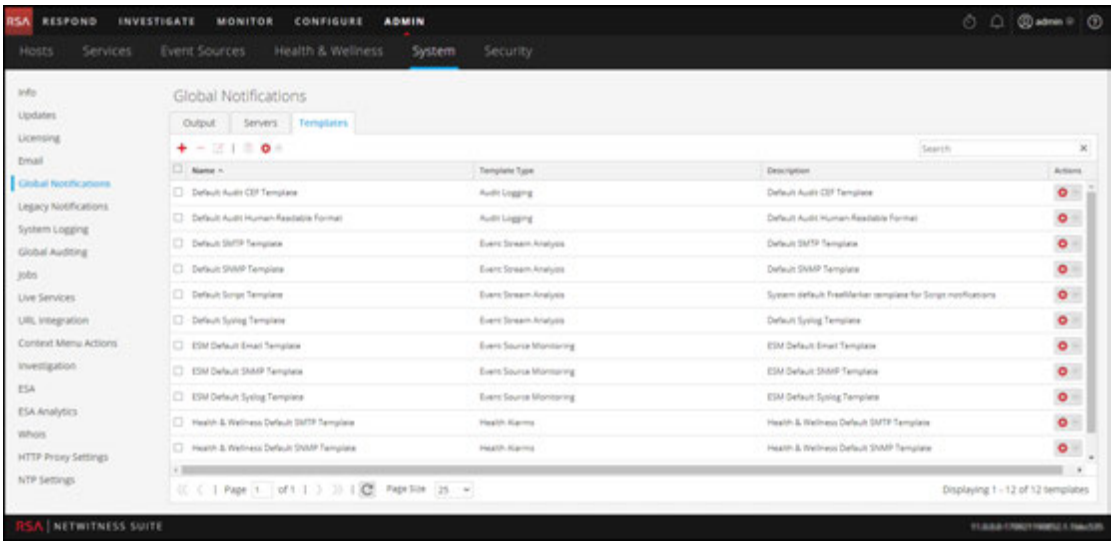
SNMP notification settings enable you to define the SNMP settings to send alert notifications. Syslog notifications enable you to define the Syslog settings used to send alert notifications. Script notifications enable you to define the Script that executes in response to the alert.

For detailed information on the notification configurations, including parameters and descriptions, see Define Notification Server Dialogs.

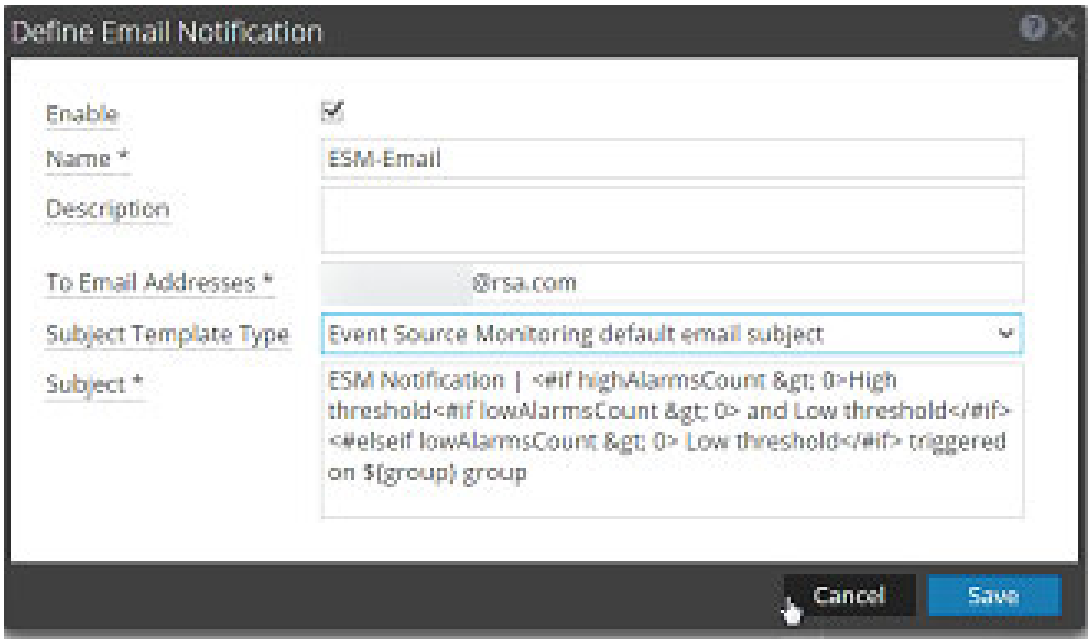
Configure Email as a Notification

To configure Email as a notification:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.



3. On the **Output** tab, from the + drop-down menu, select **Email**.



4. In the **Define Email Notification** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

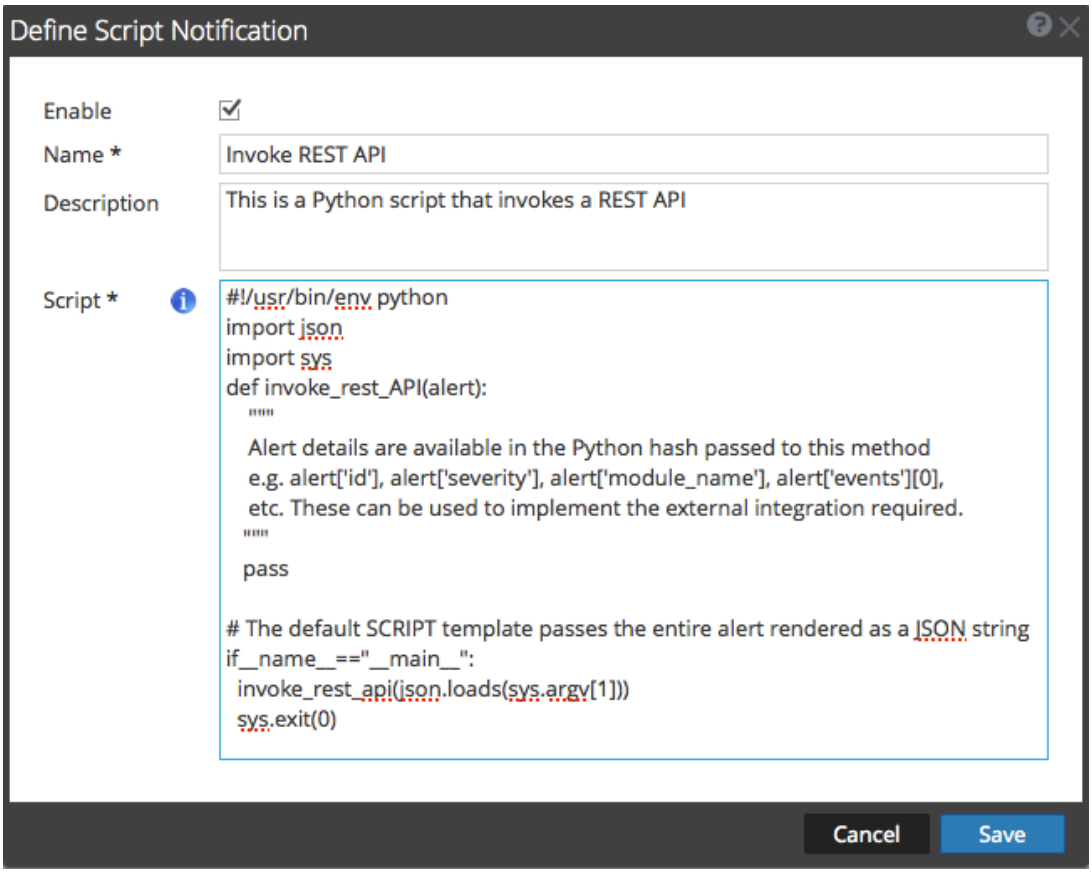
Configure Script as a Notification

This topic provides instructions to define the Script and configure it as a notification output. ESA allows you to run scripts in response to ESA alerts. You need to define the script using the ADMIN > System > Notifications > Output tab. You can use any script for ESA notifications.

To configure the script as a notification:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.

3. On the Output tab, from the + drop-down menu, select **Script**.



4. In the **Define Script Notification** dialog, provide the required information and click **Save**.

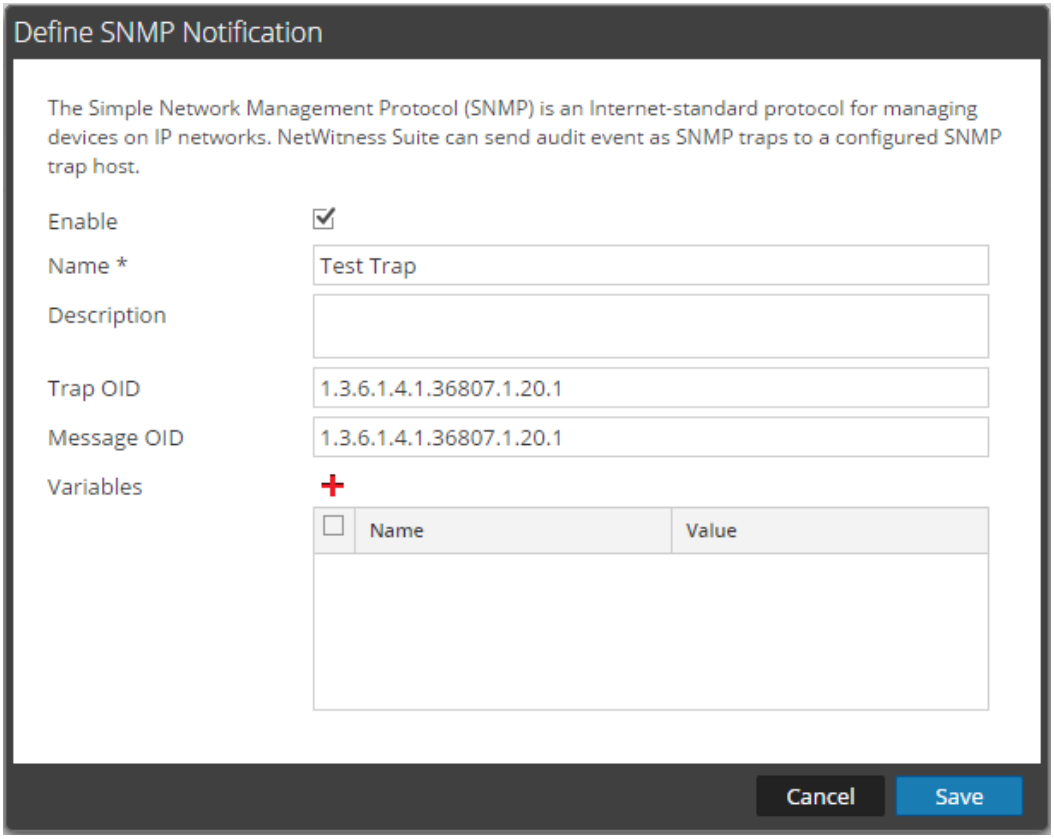
For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure SNMP as a Notification

To configure SNMP as a notification output to send alert notifications:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.

3. On the Output tab, from the + drop-down menu, select **SNMP**.



4. In the SNMP Notification dialog, provide the required information and click **Save**.

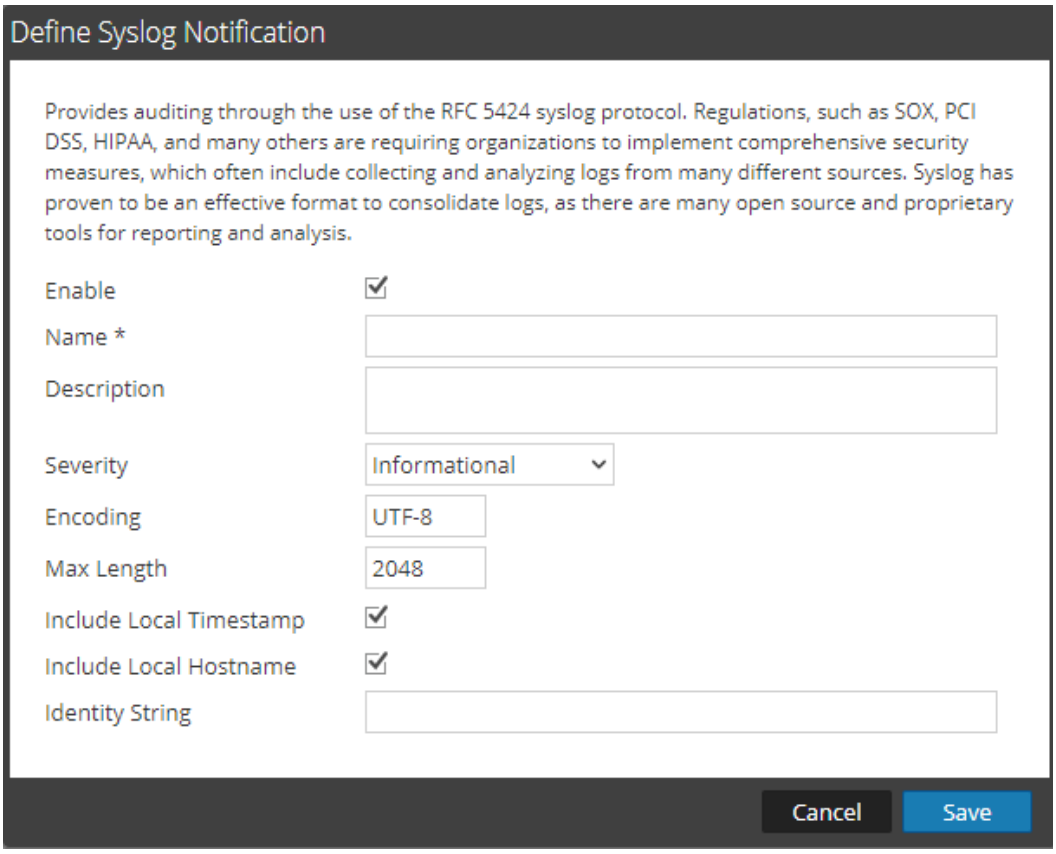
For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Syslog as a Notification

To configure Syslog as a notification output when sending alert notifications:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.

3. On the Output tab, from the + drop-down menu, select **Syslog**.



4. In the **Define Syslog Notification** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Templates for Notifications

You configure notification templates in the Administration System view (ADMIN > System > Notifications > Templates tab). A notification template defines the format and message fields of the notifications. There are different template types for the notifications that you can configure:

- Audit Logging
- Event Stream Analysis
- Event Source Monitoring
- Health Alarms

You can use the available default templates or you can configure your own templates for Email, SNMP, Syslog, and Script, depending on the template type.

Global audit logging sends audit logs in the format specified in the Audit Logging template. You can use the default audit logging templates or you can define your own audit logging template. For more information on how to define an Audit Logging template, see Define a Template for Global Audit Logging.

Event Stream Analysis (ESA) sends notifications in the format specified in the Event Stream Analysis templates. The default Event Stream Analysis templates for email, SNMP, Syslog, and Script are available on installation. You can customize these templates as well as create new templates which you can use for the notifications. For more information on how to define ESA templates, see Define a Template for ESA Alert Notifications.

For more information on ESA alert configuration, see "Notification Methods" in the **Alerting Using ESA Guide**. You cannot delete templates associated with global audit log configurations.

Note: When upgrading from NetWitness Suite 10.4, all existing notification templates migrate to the Event Stream Analysis template type.

To learn how to define, delete, edit, duplicate, import, and export a notification template in NetWitness Suite, see:

Configure Global Notifications Templates

Define a Template for ESA Alert Notifications

Import and Export a Global Notifications Template

Configure Global Notifications Templates

This topic provides instructions for adding, editing, duplicating, and deleting global notifications templates.

You can use the available default templates or you can configure your own templates for Email, SNMP, Syslog, and Script, depending on the template type.

Global audit logging sends audit logs in the format specified in the Audit Logging template. You can use the default audit logging templates or you can define your own audit logging template. For more information on how to define an Audit Logging template, see "Define a Template for Global Audit Logging."

Event Stream Analysis (ESA) sends notifications in the format specified in the Event Stream Analysis templates. The default Event Stream Analysis templates for email, SNMP, Syslog, and Script are available on installation. You can customize these templates as well as create new templates which you can use for the notifications. For more information on how to define ESA templates, see Define a Template for ESA Alert Notifications.

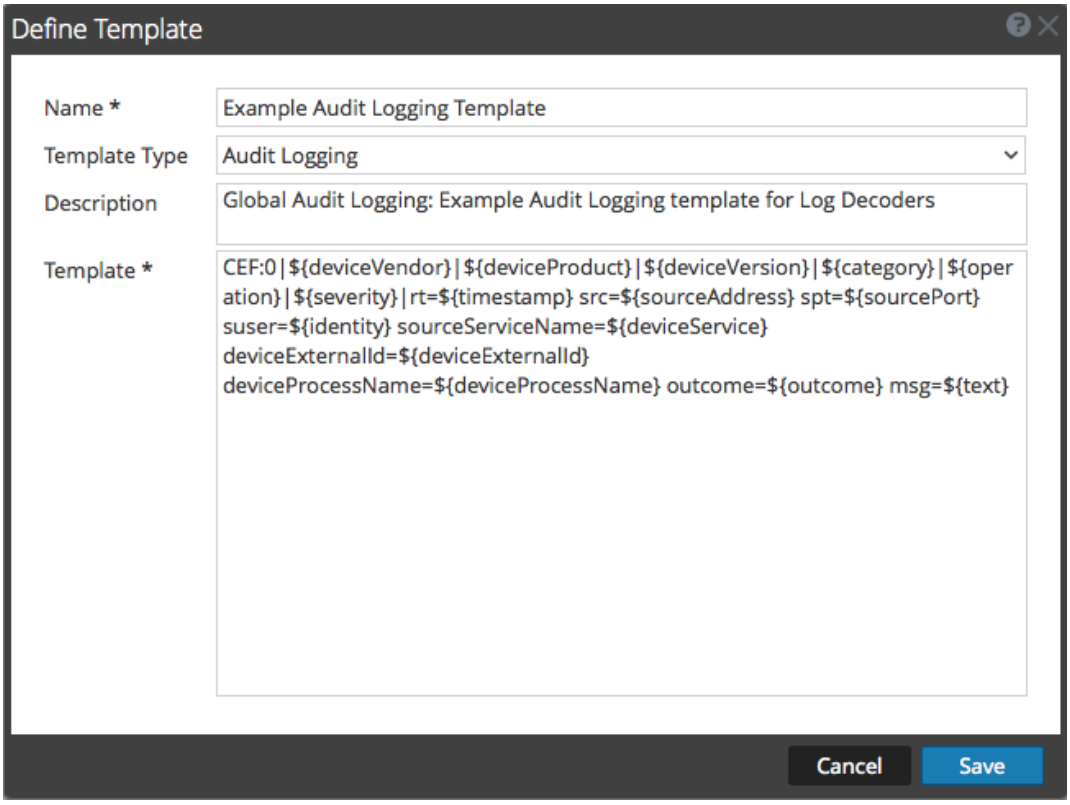
When upgrading from NetWitness Suite 10.4, all existing notification templates migrate to the Event Stream Analysis template type.

Add a Template

You can use the default templates provided or you can configure your own templates. To configure your own template:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Click + to configure a template.
5. In the **Define Template** dialog, provide the following information:
    a. In the **Name** field, type the name for the template.
    b. In the **Template Type** field, select the type of template you want to create. For example, if you are creating a template for global audit logging, select the Audit Logging template type.
    c. In the **Description** field, type a brief description for the template.
    d. In the **Template** field, specify the format for the template.

e. Click **Save** to save the template.



Duplicate a Template

You can make a copy of an existing default or user-defined template. To duplicate a template:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select the template that you want to duplicate and click .

   The Duplicate Alert Template dialog is displayed.

5. Type the name for the duplicate template.
6. Click **OK**.

You can modify a default or user-defined template. When you edit a template, the changes are reflected only when the alert is triggered.

Edit a Template

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select a template and click  .
5. In the **Define Template** dialog, modify the **Name**, **Template Type**, **Description**, and **Template** fields as required.
6. Click **Save** to save the template.

Delete a Template

You can delete a user-defined template. When you delete a template that is used in an ESA rule, the Event Stream Analysis default template is used for alerts. You cannot delete templates associated with global audit logging configurations.

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select one or more templates and click .

   A confirmation dialog is displayed.
5. Click **Yes**.

   The selected template is deleted.

Define a Template for ESA Alert Notifications

This topic describes how you can define a template for alert notifications. Event Stream Analysis (ESA) allows you to define useful templates for alerts. You need to have a good understanding of FreeMarker and the ESA data model to define a template. For more information on FreeMarker, see FreeMarker Template Author's Guide.

ESA Data Model

Consider an ESA alert rule as shown below:

```
@Name('module_144d43f5_f0b4_4cd0_8c6c_5ce65c37e624_Alert')
@Description('Brute Force Login To Same Destination')
@RSAAlert(oneInSeconds=0, identifiers={"ip_dst"})
SELECT* FROMEvent (ec_activity = 'Logon',ec_theme = 'Authentication',ec
outcome = 'Failure',ip_dst IS NOT NULL)
.std:groupwin(ip_dst)
.win:time_length_batch(60 seconds, 2)
GROUPBYip_dst HAVING COUNT(*) = 2;
```

When a rule like the above is fired, the alert generated will have two constituent events each resembling a NextGen session with multiple meta values. The alert data-object passed to the FreeMarker template evaluator will be as follows:

```
(root)
 |
 +- id = "4e67012f-9c53-4f0b-ac44-753e2c982b79"              // Unique identifier for each alert
 |
 +- severity = 1                                  // The severity of the alert
 +- time = 2013-12-31T11:02Z                          // The alert time (needs a ?datetime for proper rendering)
 | +- moduleType = "ootb"                           // The module type
 |
 +- moduleName = "Brute Force Login To Same Destination"        // A description of the module
 |
 +- statement = "module_144d43f5_f0b4_4cd0_8c6c_5ce65c37e624_Alert" // The name of the EPL statement
 | +- events                                        // The constituent events - as a sequence of event maps
    |  +- [0]                                     // offset 0 (i.e. the first constituent event)
    | |    | |
    |  +- event_cat_name = "User.Activity.Failed Logins"
    |  +- device_class = "Firewall"                    // event meta (accessible as ${events[0].device_class}$)
    | |    |  +- event_source_id = "uttam:50002:1703395"   // Investigation URI to the individual session (used by SA)
    | |
    |  +- ...                                    // Other meta
    | |
    |  +- sessionid = 1703395                          // NextGen sessionid
    | |
    |  +- time = 1388487764                            // event/session time at NextGen source (as a long Unix timestamp)
    | |
    |  +- user_dst = "user5"
    |
    +- [1]                                       // offset 1 (i.e. the second consituent event)
       |
       +- device_class = "Firewall"
       |
       +- event_cat_name = "User.Activity.Failed Logins"
       |
       +- event_source_id = "uttam:50002:1703405"
       |
       +- ...
       |
       +- sessionid = 1703405
       |
       +- time = 1388487766
       |
       +- user_dst = "user5"
```

There are two types of template variables available in the data model:

- **Alert Meta Data:** These hold alert level details like statement name, module name, alert id, alert time, severity, and others. In FreeMarker terminology, these are top level variables associated with the alert instance itself and can be referenced simply by their names like `${moduleName}`. The `time` meta is special because it is of type `Date` and it needs to be suffixed with a `?datetime` to be properly rendered.

- **Constituent Event Meta Data**: These include the session meta fields from individual events that constitute the alert. An alert can have multiple constituent events, so there can be more than one such maps in the same alert. These show up as a sequence of hashes to the FreeMarker template evaluator and must be referenced. For instance, the alert has two constituent events the event_source_id for the first is available as `${events[0].event_source_id}` and the same for the second is accessible as ${events[1].event_source_id.} You also need to be aware of which meta fields are multi-valued because those need be treated as sequences, for example ${events[0].alias_host} will not work because it is a sequence.

Note: The metadata available in the constituent events for a given alert is determined by the EPL SELECT clause. For example, alerts from `SELECT sessionid, time FROM ...` will have only two meta values available (sessionid, time). Constituent events in `SELECT * FROM Event ...` will carry all meta fields from the `Event` type with **non-null** values.

If your template uses meta keys that are not present in all alert output, you should consider using the FreeMarker provisions for default values.

For example, if a template with text Id=${id},ec_outcome=${ec_outcome} is evaluated for an alert which does not include the meta key `ec_outcome` then the template evaluation fails. In such cases, you can use the missing value placeholder `${ec_outcome!"default"}`.

Import and Export a Global Notifications Template

This topic provides instructions on how to import and export a template for notifications.

- You can export default or user-defined templates.
- You can import a template that has been exported from the NetWitness Suite instance. If you import a template with the same name as an existing template, then the existing template will be overwritten.

Import a Template

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.

3. Click the **Templates** tab.
4. In the toolbar, select  **> Import**.

   The **Import** dialog is displayed.
5. In the **Enter File Name** field, type the filename or click **Browse** and select the file to be imported.
6. Click **Import**.

Export a Template

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select the template you want to export.

   Note: You can export all the templates using the  **> Export All** option.
5. In the **Actions** column, select  **> Export**.

   The **Export** dialog is displayed.
6. In the **Enter File Name** field, type the filename.
7. Click **Save**.

Configure Email Servers and Notification Accounts

This topic provides instructions for configuring email so that users can receive notifications in NetWitness Suite. RSA NetWitness® Suite can send notifications to users via email about various system events. To be able to configure these email notifications, you must first configure the SMTP email server. The Email Configuration panel provides a way to:

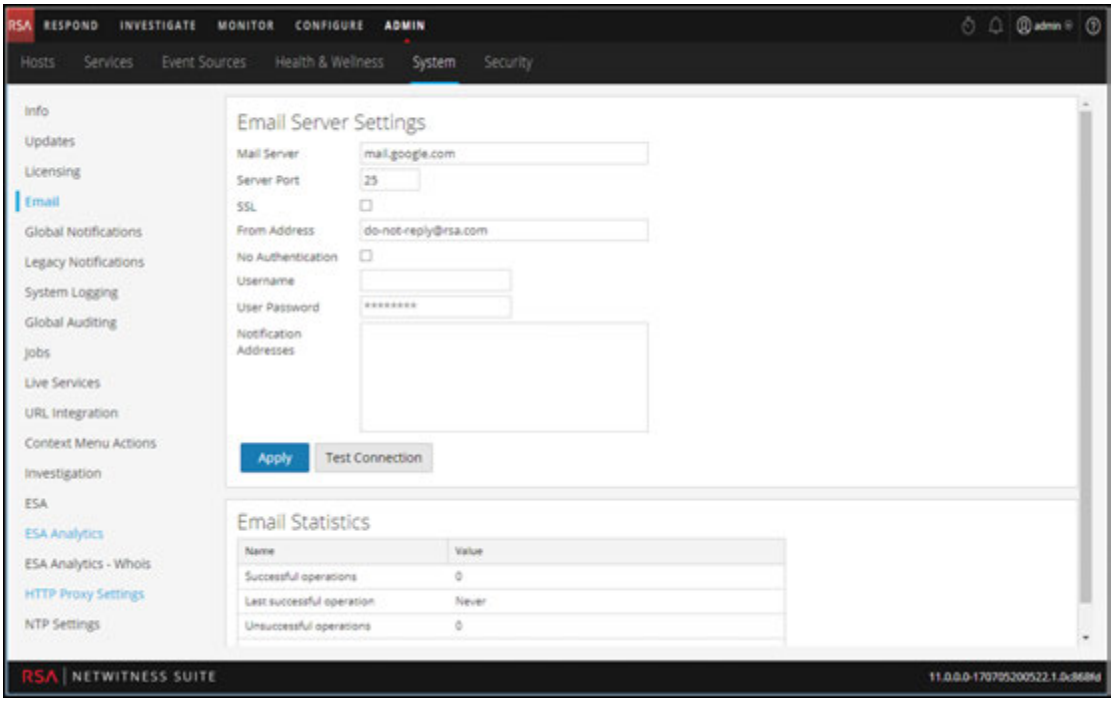
- Configure the email server.
- Set up an email account to receive notifications.
- View statistics on email operations.

NetWitness Suite requires access to an SMTP mail server in order to send reports to users. Each user account can be configured to receive emailed reports. These reports can be generated manually, through the user interface, or automatically, through the auditing system. The following guidelines apply:

- Any SMTP mail host can be used to deliver emails, and each host requires a different configuration. The SMTP provider provides the settings for configuration.
- Some SMTP servers require user authentication in order to relay emails successfully. Typically, this is the login and password for the email account.
- Best practice is to create a new, dedicated email account on the SMTP email server for NetWitness Suite reports.

To configure NetWitness Suite email notifications:

1. Go to **ADMIN > System**.
   The Administration System view is displayed.
2. In options panel, select **Email**.



3. If you want to change the default mail server, specify the **Mail server** name and **Server port**.
4. If the email server communicates with NetWitness Suite using SSL, check the box next to **Use SSL**.
5. In the **From address** field, type the name of the email account sending NetWitness Suite email notifications.
6. If the SMTP server requires user authentication to relay emails successfully, type the **Username** and **User Password** for logging in to the email account.

7. To activate the settings, click **Apply**.
   You can now configure NetWitness Suite modules to receive various notifications by email.

Configure Global Audit Logging

Global Audit Logging provides NetWitness Suite Auditors with consolidated visibility into user activities within NetWitness Suite in real-time from one centralized location. This visibility includes audit logs gathered from the NetWitness Suite system and the different services throughout the NetWitness Suite infrastructure.

NetWitness Suite audit logs collect in a centralized system that converts them into the required format and forwards them to an external syslog system. The external syslog system can be a third-party syslog server or a Log Decoder.

You configure global audit logging in the Global Audit Logging Configurations panel. An audit logging template defines the format and message fields of the audit log entries. A Syslog Notification Server configuration defines the destination to send the audit logs. If you want to forward audit logs to a Log Decoder, configure a Syslog type of Notification Server for the Log Decoder.

The following are some of the user actions logged from NetWitness Suite:

- User login success
- User login failure
- User logouts
- Maximum Login failures exceeded
- All UI pages accessed
- Committed configuration changes (including when a user changes their own password)
- Queries performed by the user
- User access denied
- Data export operations

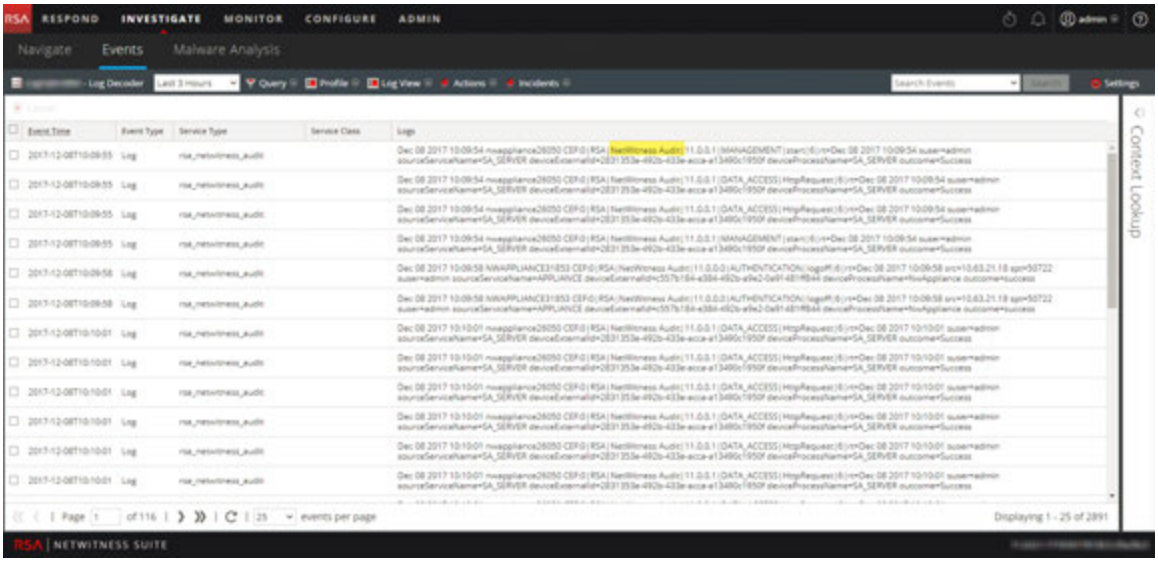
After you create a global audit logging configuration, audit logs containing these user actions automatically go to the external syslog system in the format specified in the selected Audit Logging template. You can create multiple global audit logging configurations for different destinations that use different templates. For example, you can create a global audit logging configuration for an external Syslog server with a template that contains all of the available meta keys and another configuration for a Log Decoder with a template that contains selected meta keys.

For Log Decoders, you use the Default Audit CEF Template. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions and Supported CEF Meta Keys describes the CEF meta keys available to use in the audit logging templates.

For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.

Auditors can view the audit logs on the selected Log Decoder or third-party syslog server. If using a Log Decoder, auditors can view the audit logs using NetWitness Suite Investigations or Reports.

The following figure shows global audit logs in Investigation (INVESTIGATE > Events).



For examples of some of the user actions logged, see Add New Configuration Dialog. For a list of message types being logged by the various NetWitness Suite components, see Global Audit Logging Operation Reference.

Global Audit Logging - High-Level Procedure

Global Audit Logging is configured in the Global Audit Logging Configurations panel, which is accessed from ADMIN> System view > Global Auditing. Before you can configure Global Audit Logging, you need to configure a Syslog Notification Server and an Audit Logging template. A Syslog Notification Server defines the destination to send the audit logs. An Audit Logging template defines the format and message fields of the audit log entry.

The Global Audit Logging Configuration panel provides a **view settings** link that takes you to the Global Notifications panel (Administration System view > Global Notifications) where you can configure the Syslog Notification Server and Audit Logging template.

Perform the following procedures in the order shown to configure Global Audit Logging.

Procedures	Reference / Instructions
1. Configure a Syslog Notification Server.	Configure a Syslog Notification Server to use for Global Audit Logging. You can define a third-party syslog server or Log Decoder as a destination to receive the audit logs. Configure a Destination to Receive Global Audit Logs. Global Audit Logging configurations use the Syslog notification server type. If you want to forward audit logs to a Log Decoder, create a Notification Server of the Syslog type.
2. Select or configure an Audit Logging template to use.	Select an Audit Logging template for the Syslog notification server. You can use a default Audit Logging template or define your own audit logging template. Global Audit Logging configurations use the Audit Logging template type and a Syslog notification server. Configure Templates for Notifications provides additional information. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions. For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.
3. (Optional - Only if consuming with a Log Decoder) Deploy the Common Event Format parser to your Log Decoder from Live.	Ensure that you have deployed and enabled the latest Common Event Format parser from Live. Find and Deploy Live Resources and Enable and Disable Log Parsers provide instructions.

Procedures	Reference / Instructions
4. Define a global audit logging configuration, which defines how the global audit logs are forwarded to external Syslog systems.	Define a Global Audit Logging Configuration provides instructions. After you add a Global Audit Logging configuration, audit logs are forwarded to the selected Notification Server in the configuration.
5. Verify that the global audit logs show the audit events.	Test your audit logs to ensure that they show the audit events as defined in your audit logging template. Verify Global Audit Logs provides instructions.

Configure a Destination to Receive Global Audit Logs

In Global Audit Logging, Syslog Notification Servers are the configurations that define the destinations to receive global audit logs. You need to configure a Syslog Notification Server to use Global Audit Logging. You can define a third-party syslog server or a Log Decoder as the destination to receive the audit logs.

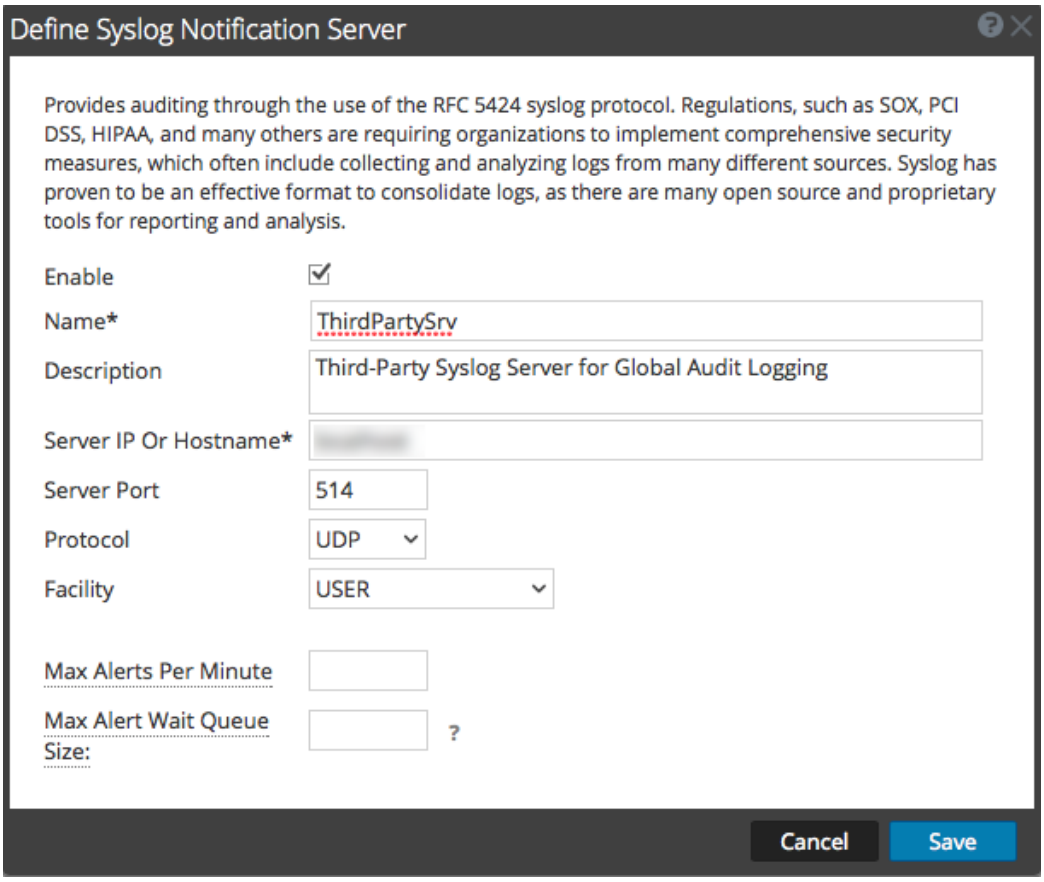
Configure a Syslog Notification Server for a Third-Party Syslog Server

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

   Note: You do not need to configure the Output tab for Global Audit Logging.

4. From the  drop-down menu, select **Syslog**.

   The **Define Syslog Notification Server** dialog is displayed.



5. Configure the Syslog notification server as described in the following table.

Field	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the third-party syslog server.
Description	(Optional) A brief description of the notification server.
Server IP or Hostname	The third-party syslog server hostname or IP address.
Server Port	The port number where the target syslog process is listening.
Protocol	The protocol to be used for transferring formatted audit logs to the third-party syslog server.
Facility	The syslog facility to be used for writing formatted audit logs to the third-party syslog server.

The **Max Alerts Per Minute** and **Max Alert Wait Queue Size** fields are not used for Global Audit Logging.

6. Click **Save**.

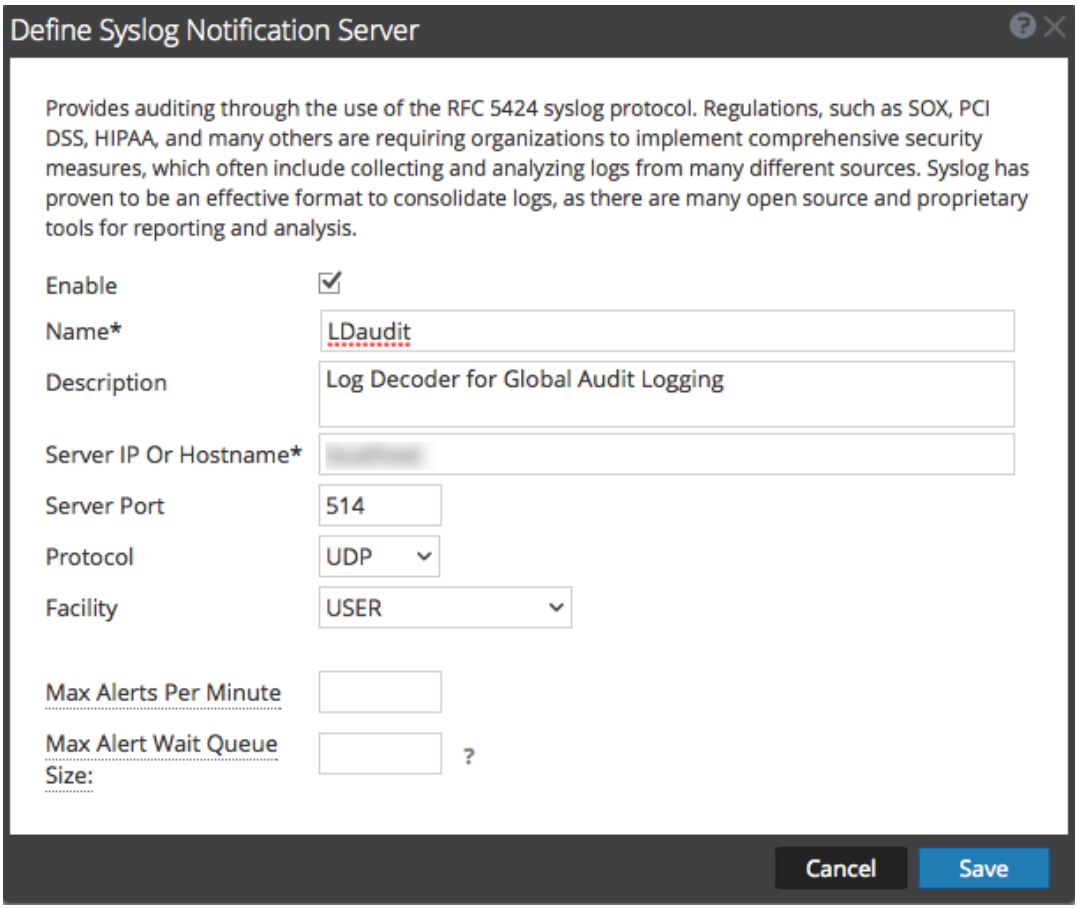
Configure a Syslog Notification Server for a Log Decoder

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

   Note: You do not need to configure the Output tab for Global Audit Logging.

4. From the  drop-down menu, select **Syslog**.

   The **Define Syslog Notification Server** dialog is displayed.



5. Configure the Syslog notification server as described in the following table.

Field	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the Log Decoder syslog notification server.
Description	(Optional) A brief description of the notification server.
Server IP or Hostname	The Log Decoder hostname or IP address.
Server Port	The port number where the target syslog process is listening.
Protocol	The protocol to be used for transferring formatted audit logs to the Log Decoder.
Facility	The Syslog facility to be used for writing formatted audit logs to the Log Decoder.

The **Max Alerts Per Minute** and **Max Alert Wait Queue Size** fields are not used for Global Audit Logging.

6. Click **Save**.

Next Steps

Select a default Audit Logging template to use for Global Audit Logging. If necessary, you can define your own custom template. Define a Template for Global Audit Logging provides additional information.

Define a Template for Global Audit Logging

This topic provides instructions on how to define an audit logging template to use for Global Audit Logging. Before you configure Global Audit Logging, configure a Syslog notification server and select an Audit Logging template. You can choose to use a default audit logging template or you can define your own template.

NetWitness Suite includes two default audit logging templates:

- **Default Audit CEF Template**: You can use this template for Log Decoders and third-party syslog servers.
- **Default Audit Human-Readable Format**: You can use this template only for third-party syslog servers. Do not forward messages from this template to a Log Decoder.

The first procedure provides instructions on how to define an audit logging template for a Log Decoder. The audit logging template defines the format and message fields of the audit logs sent to the Log Decoder or third-party syslog server.

Global audit logging templates that you define for a Log Decoder use Common Event Format (CEF) and must meet the following specific standard requirements:

- Include the CEF headers in the template.
- Use only the extensions (Key=Value) listed in the Supported CEF Meta Keys table.
- Ensure that the extensions are in the `key=${string}<space>key=${string}` format.

The second procedure provides instructions on how to define a custom global audit logging template in human-readable format for a third-party syslog server. For third-party syslog servers, you can define your own format (CEF or non-CEF).

Define a Global Audit Logging Template for a Log Decoder

You can use the **Default Audit CEF Template** to send global audit logs to a Log Decoder. To define your own template:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.

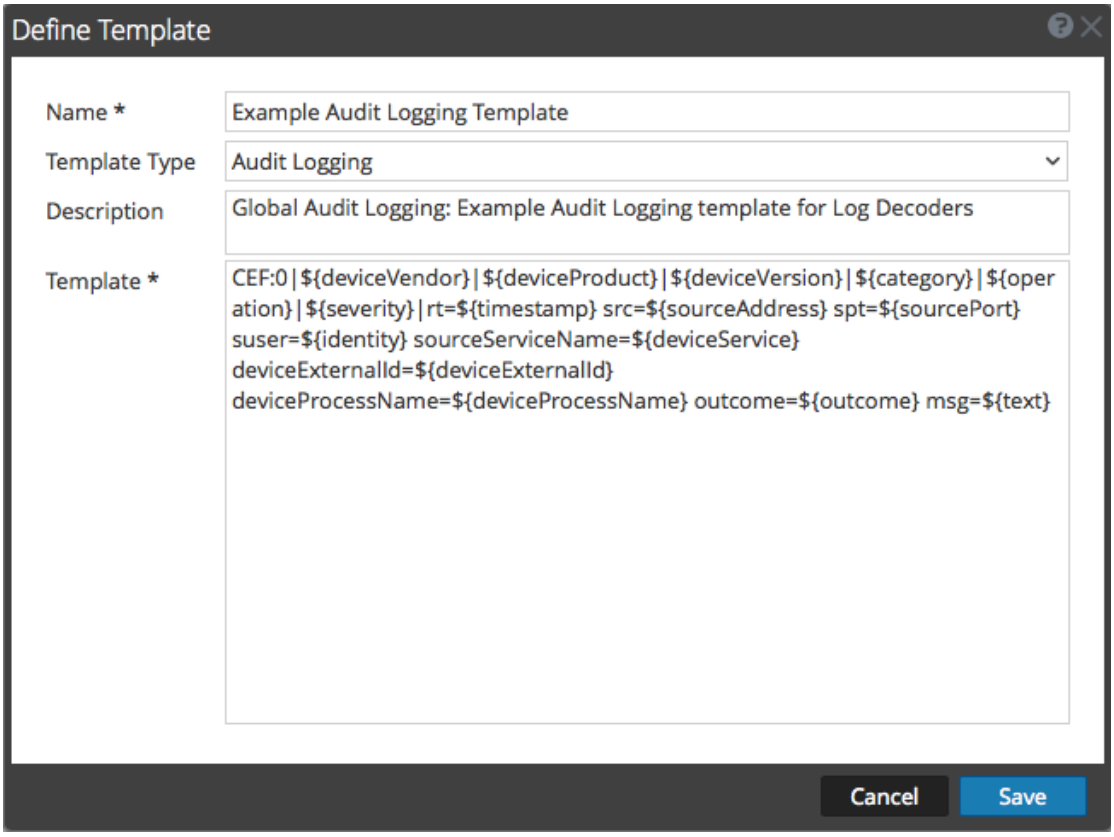
3. Click the **Templates** tab.
4. Click + to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the **Audit Logging** template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, enter the format for the audit logging template.
   The following format is a customized template provided as an example. It differs from the default CEF template.

```
CEF:0|${deviceVendor}|${deviceProduct}|${deviceVersion}|${category}|${oper
ation}|${severity}| rt=${timestamp} src=${sourceAddress}
spt=${sourcePort}
suser=${identity} sourceServiceName=${deviceService}
deviceExternalId=${deviceExternalId} dst=${destinationAddress}
dpt=${destinationPort} dvcpid=${deviceProcessId}
deviceProcessName=${deviceProcessName} outcome=${outcome}
msg=${text}
```

   The highlighed CEF syslog header is required to conform to the CEF standard and is a requirement for the CEF parser in the Log Decoder. The other keys are optional and you can configure them. See all the supported meta keys that are supported by the CEF parser in the Log Decoder in the Supported CEF Meta Keys table.

Note: Use all of the extensions in the following format:
`deviceProcessName=${deviceProcessName} outcome=${outcome}`
Include a `<space>` between each key=${string} pair in the extension keys section.

6. Click **Save**.



After you define the CEF audit logging template, ensure that you have deployed and enabled the latest Common Event Format (CEF) parser from Live. "Find and Deploy Live Resources" and "Enable and Disable Log Parsers" in the *Live Services Management Guide* and *Decoder and Log Decoder Configuration Guide* provide instructions.

Note: If you need to use a specific meta key for Investigations and Reporting, ensure that the meta keys that you select are indexed in the **table-map.xml** file on the Log Decoder. If they are not indexed, follow the Maintain the Table Map Files topic in the *Host and Services Configuration Guide* procedure to update the table mappings. Ensure that the meta keys are also indexed in the **index-concentrator.xml** on the Concentrator. "Edit a Service Index File" topic in the *Host and Services Configuration Guide* provides additional information.

Define a Custom Global Audit Logging Template

For third-party syslog servers, you can define your own template format (CEF or non-CEF). You can use the **Default Audit Human-Readable Format** template to send global audit logs to a third-party syslog server in a format that is easier to read than the CEF format. If you want to define your own template in human-readable format, follow this procedure.

For Log Decoders, you must use a CEF template with some specific requirements. The *Define an Audit Logging Template for a Log Decoder* procedure above provides instructions for creating a template in CEF format.

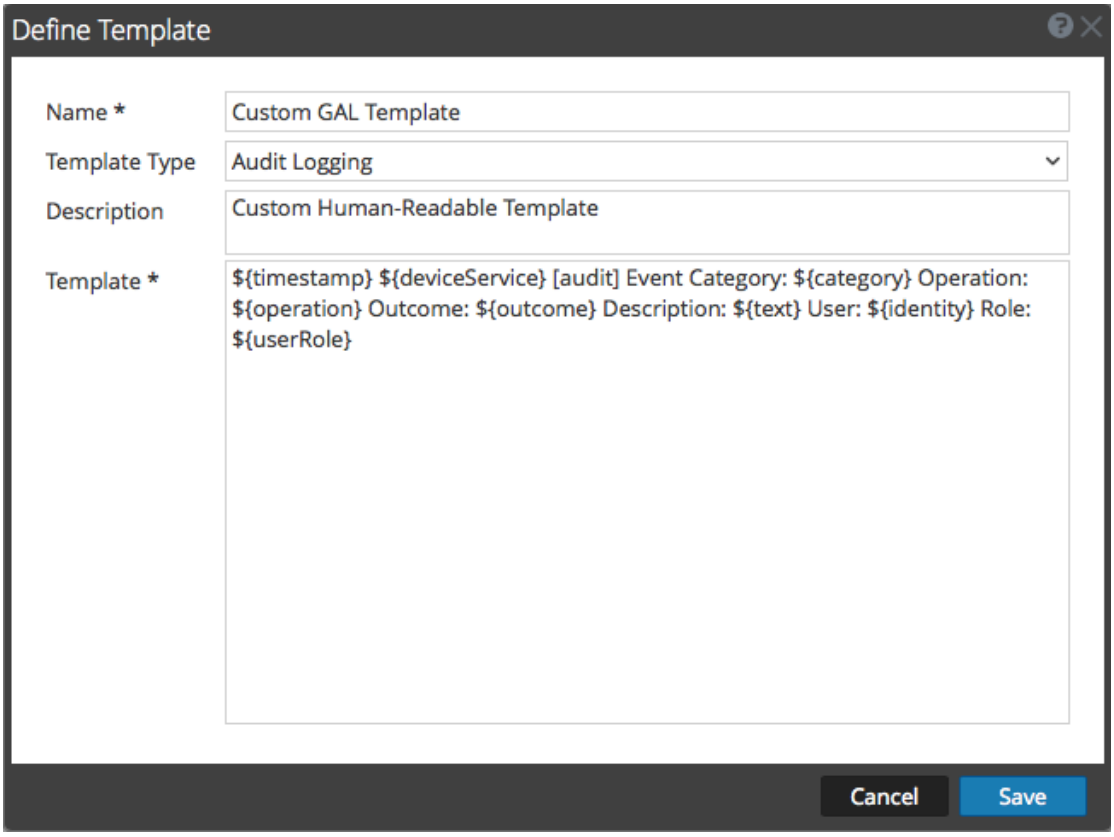
To define a custom global audit logging template in human-readable format:

1. Go to **ADMIN > System**.
2. In the left navigation panel, select **Notifications**.
3. Click the **Templates** tab.
4. Click + to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the **Audit Logging** template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, enter the format for the audit logging template. The following example is in human-readable format with selected meta key variables.

```
${timestamp} ${deviceService} [audit] Event Category: ${category}
Operation: ${operation} Outcome: ${outcome} Description: ${text}
User: ${identity} Role: ${userRole}
```

   You can use any of the meta key variables that are supported by global audit logging shown in the Supported Global Audit Logging Meta Key Variables table.

6. Click **Save**.



The following example shows global audit logs in human-readable format for this template:

```
06 2015 14:16:04 REPORTING_ENGINE [audit] Event Category: CONFIGURATION
Operation: Set Outcome: null Description: null User: admin Role:
Administrators+Administrators+PRIVILEGED_CONNECTION_AUTHORITY

Apr 06 2015 14:16:04 REPORTING_ENGINE [audit] Event Category:
CONFIGURATION Operation: IPDBConfig Outcome: SUCCESS Description: Config
update event occurred User: admin Role:
Administrators+Administrators+PRIVILEGED_CONNECTION_AUTHORITY

Apr 06 2015 14:16:04 NW_SERVER [audit] Event Category: DATA_ACCESS
Operation: /admin/1/config Outcome: Success Description: null User:
admin Role: Administrators+Administrators+PRIVILEGED_CONNECTION_
AUTHORITY
```

Next Step

Define a Global Audit Logging Configuration provides instructions for defining a global audit logging configuration for NetWitness Suite.

Define a Global Audit Logging Configuration

This topic tells administrators how to define a global audit logging configuration. This procedure is required only if you choose to set up centralized audit logging in your environment. These global audit logging configurations define how the global audit logs are forwarded to external syslog systems or Log Decoders. Audit logs are forwarded to the selected Notification Servers.

Prerequisites

Before starting this procedure, configure the following to use for global audit logging:

- Syslog Notification Server
- Audit Logging Template

You configure the notification server and template on the Global Notifications panel. You can access the Global Notifications panel by clicking the **view settings** link on the Global Audit Logging Configurations panel. You can only define a Syslog type of Notification Server for global audit logging. For Log Decoders, use a Syslog type of Notification Server and a Common Event Format (CEF) audit logging template. You can use a default audit logging template or define your own template. You can create multiple audit logging templates and Syslog Notification Servers to use for your global audit logging configurations.

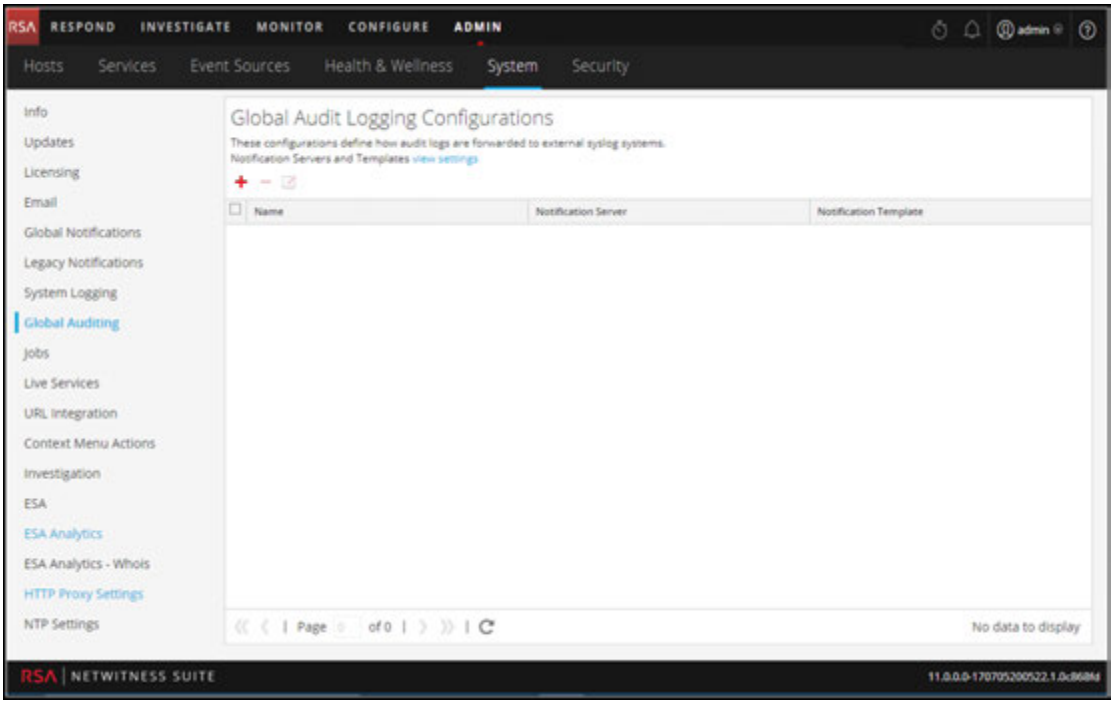
If you are forwarding global audit logs to a Log Decoder, deploy the Common Event Format parser to your Log Decoder from Live.

Add a Global Audit Logging Configuration

1. Go to **ADMIN > System**.

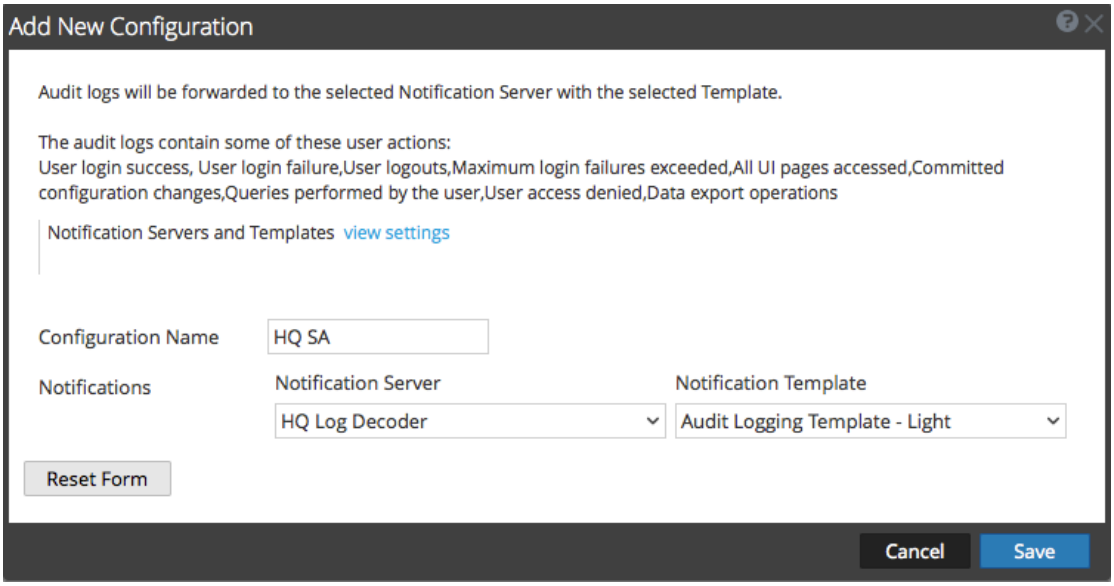
2. In the options panel, select **Global Auditing**.

   The **Global Audit Logging Configurations** panel is displayed.



3. Click + to add a global audit logging configuration.

   The **Add New Configuration** dialog is displayed.



4. In the **Configuration Name** field, type a unique name for the global audit logging configuration. For example, you can create a configuration for a specific type of global audit logging configuration, such as HQ NW for a NetWitness Suite headquarters configuration.

5. In the **Notifications** section, select the syslog **Notification Server** to use for this configuration. The notification server is the destination to send the global audit logs.
6. Select the audit logging **Notification Template** to use for this configuration. The Audit Logging template defines the format and audit log message fields to be sent.
7. Click **Save**.

Add New Configuration Dialog provides additional information and examples of the user actions logged. For a list of message types being logged by the various NetWitness Suite components, see Global Audit Logging Configurations Panel.

Edit a Global Audit Logging Configuration

This topic provides instructions on how to edit a global audit logging configuration. You can edit a global audit logging configuration to change the destination of the global audit logs for your user audits by selecting a different Notification Server. You can also change the format and message fields of the global audit log entries by selecting a different Notification Template. You make changes to the Notification Server or Template on the Global Notifications panel. You can access the Global Notifications panel by clicking the **view settings** link on the Global Audit Logging Configurations panel.

You cannot change which NetWitness Suite user actions are logged and sent in the global audit logs.

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Auditing**.
3. In the **Global Audit Logging Configurations** panel, select a configuration to edit and click  .
4. In the **Add New Configuration** dialog, modify the global audit logging configuration as required. You can modify the **Configuration Name** and select a different **NotificationServer** or **Template**.
5. Click **Save.**

Delete a Global Audit Logging Configuration

Deleting a global audit configuration does not delete the associated notification server and template. After you delete a global audit logging configuration, the forwarding of global audit logs specified in that configuration is discontinued.

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Auditing**.

3. In the **Global Audit Logging Configurations** panel, select a configuration to delete and click .

   A confirmation dialog is displayed.

4. Click **Yes**.

   The selected configuration is deleted.

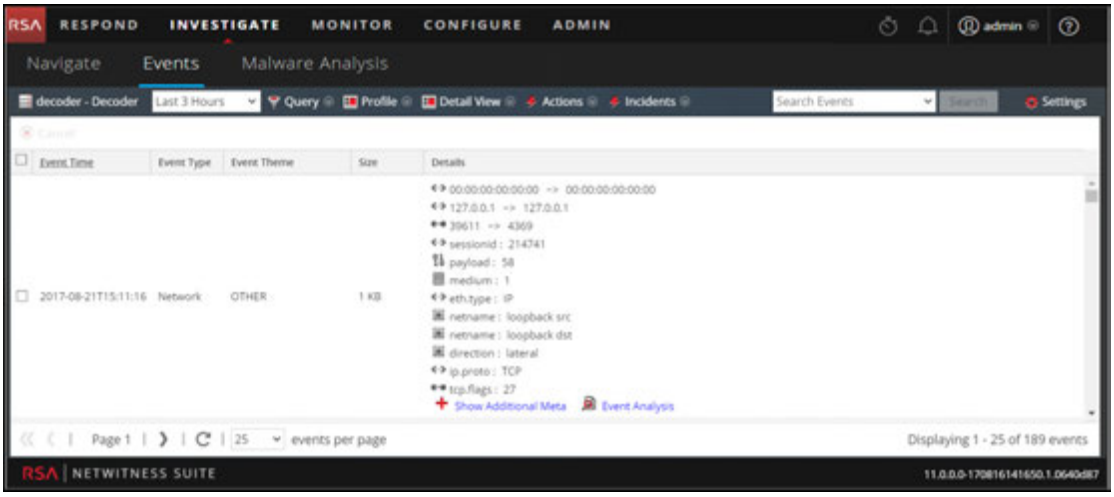
Verify Global Audit Logs

This topic provides instructions on how to verify global audit logs. After you have configured global audit logging, you need to test your global audit logs to ensure that they show the audit events as defined in your global audit logging template.

Before starting this task, complete the steps detailed in Configure Global Audit Logging.

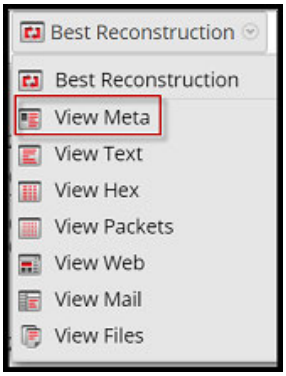
To view and verify the global audit logs if you are using a Log Decoder:

1. Go to **Investigate > Events**.
2. From within the Navigate view, select the Log Decoder, and click **Navigate**.

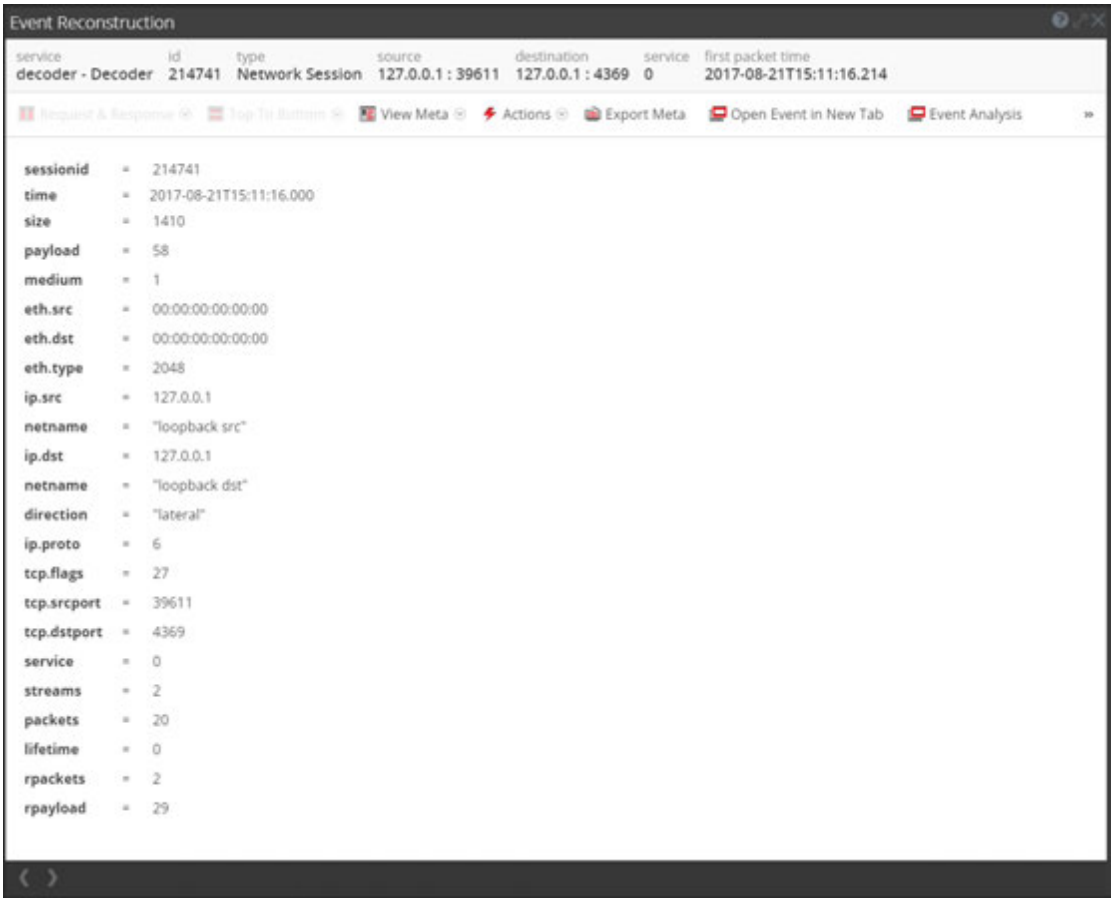


3. Compare the fields in the global audit logs with the fields defined in the global audit logging template that you used in your global audit logging configuration.

4. Double-click a log and in the Event Reconstruction dialog, select **View Meta**.



5. Verify that the meta that you want to audit is correct.



Example CEF Output

The following example shows global audit logs for an audit logging Common Event Format (CEF) template.

Template:

```
CEF:0|${deviceVendor}|${deviceProduct}|${deviceVersion}|${category}|${oper
ation}|${severity}| rt=${timestamp} src=${sourceAddress}
spt=${sourcePort}
suser=${identity} sourceServiceName=${deviceService}
deviceExternalId=${deviceExternalId} dst=${destinationAddress}
dpt=${destinationPort} dvcpid=${deviceProcessId}
deviceProcessName=${deviceProcessName} outcome=${outcome} msg=${text}
```

Example logs:

```
2017-04-09T18:45:46.313096+00:00 <hostname> CEF:0|RSA|Security Analytics
Audit|11.0.0.0|AUTHENTICATION|login|6|rt=Apr 09 2017 18:45:46
src=10.20.252.197 spt=51366 suser=admin sourceServiceName=LOG_DECODER
deviceExternalId=96b08193-a9d0-4a79-b362-87b56851f411 outcome=success
2017-04-09T18:45:46.322132+00:00 <hostname> CEF:0|RSA|Security Analytics
Audit|11.0.0.0|AUTHENTICATION|logoff|6|rt=Apr 09 2017 18:45:46
src=10.20.204.33 spt=47690 suser=admin sourceServiceName=BROKER
deviceExternalId= 314fb8c8-afe4-4249-9468-a36035008a52 outcome=success
2017-04-09T18:45:46.325792+00:00 <hostname> CEF:0|RSA|Security Analytics
Audit|11.0.0.0|AUTHENTICATION|logoff|6|rt=Apr 09 2017 18:45:46
src=10.20.252.197 spt=59495 suser=admin sourceServiceName=CONCENTRATOR
deviceExternalId= 96b08193-a9d0-4a79-b362-87b56851f411 outcome=success
```

Where `<hostname>` is the syslog header hostname (alias.host).

For CEF templates, if an audit event does not have a value for a field in the template, then the corresponding event arriving at the third party syslog server or Log Decoder will have the field removed.

Example Human-Readable Format Output

The following example shows global audit logs for an audit logging human-readable format template on a third-party syslog server.

Template:

```
${timestamp} ${deviceService} [audit] Event Category: ${category}
Operation: ${operation} Outcome: ${outcome} Description: ${text}
User: ${identity} Role: ${userRole}
```

Example logs:

```
06 2017 14:16:04 REPORTING_ENGINE [audit] Event Category: CONFIGURATION
Operation: Set Outcome: null Description: null User: admin Role:
Administrators+Administrators+PRIVILEGED_CONNECTION_AUTHORITY

Apr 06 2017 14:16:04 REPORTING_ENGINE [audit] Event Category:
CONFIGURATION Operation: IPDBConfig Outcome: SUCCESS Description: Config
update event occurred User: admin Role:
Administrators+Administrators+PRIVILEGED_CONNECTION_AUTHORITY

Apr 06 2017 14:16:04 SA_SERVER [audit] Event Category: DATA_ACCESS
Operation: /admin/1/config Outcome: Success Description: null User:
admin Role: Administrators+Administrators+PRIVILEGED_CONNECTION_
AUTHORITY
```

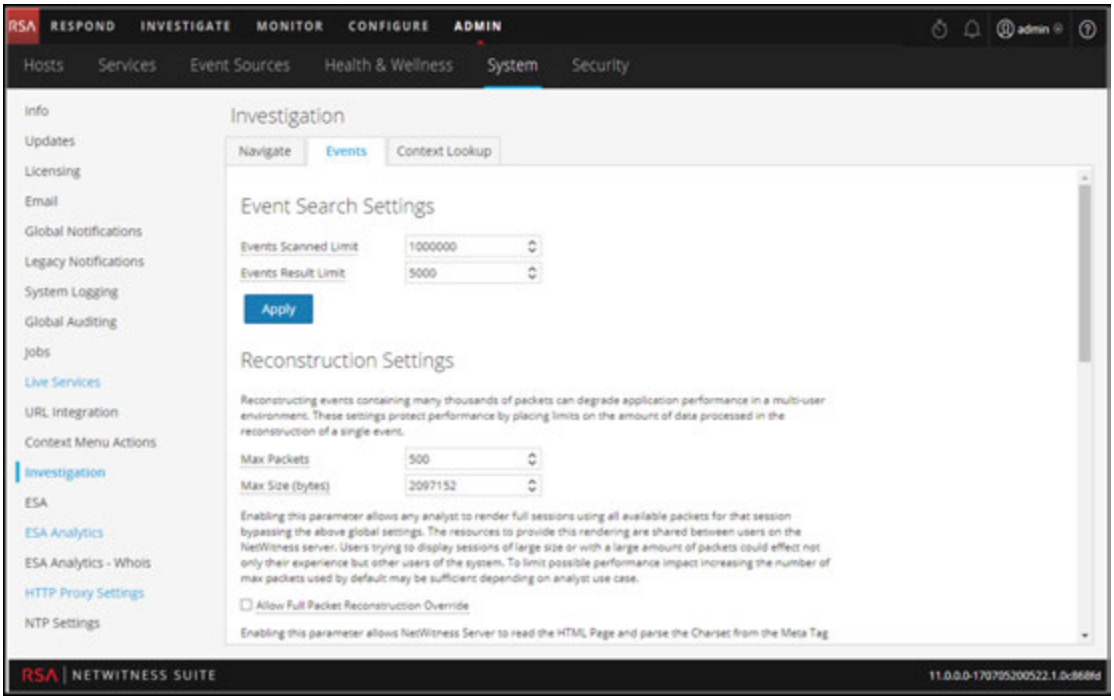
Configure Investigation Settings

This topic provides instructions for administrators who are configuring the settings that apply to all Investigations on the NetWitness Suiteinstance being configured. The settings for configuring and tuning behavior of NetWitness Suite Investigation are available in the System view > Investigation panel. These settings apply to all investigations and reconstructions on the current instance of NetWitness Suite.

Configure Navigate, Events, and Context Lookup Settings

1. Go to **ADMIN > System.**

2. In the options panel, select **Investigation.**
   The Investigation Configuration panel is displayed.



3. In the **Navigate** tab, in the **Render Threads Settings** field, select the maximum number of concurrent meta key values that are loaded by a single user in the navigate view. Click **Apply**.
4. In the **Navigate** tab, in the **Parallel Coordinates Settings** section, set the maximum limits for meta values scanned and meta value results that can be included in a parallel coordinates visualization. For better performance, these are the recommended settings: Meta Values Scan Limit -100000 and Meta Values Result Limit to 1,000-10,000
   Click **Apply**.
5. In the **Events** tab, in the **Event Search Settings** section, set the maximum numbers of events scanned and event results displayed when an analyst is conducting an event search in the Events view. Click **Apply**.
6. In the **Events** tab, in the **Reconstruction Settings** section, set the limits for the amount of data processed in the reconstruction of a single event. The default values are 100 maximum packets and 2097152 bytes. If analysts are seeing slow performance when reconstructing sessions in Investigation, the reconstructing settings may need adjustment. Click **Apply.**

> **Caution:** Setting a higher value affects the performance of the NetWitness Server by increasing the time and memory taken to create a reconstruction of an event. Setting the value to zero disables any limit and may lead to a NetWitness Server crash.

7. (Optional) In the **Events** tab, in the **Web View Reconstruction Settings** section, enable the use of supporting files in a web view reconstruction, and configure the additional settings to calibrate web view reconstructions. These include the time range (in seconds) to scan for related events, the maximum number of related events to scan, and overrides to Reconstruction Settings for use with web view reconstructions. Click **Apply**.
8. In the **Context Lookup** tab, manage mapping of Context Hub meta types with meta keys in Investigation. You can add or remove meta keys to the list of meta types supported in Investigation by Context Hub. Procedures associated with this are provided in"Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*.

Note: The options on the Context Lookup tab are only available if the Context Hub service is configured.

Clear Reconstruction Cache for Services

Under Reconstruction Cache Settings, administrators can clear the cache for one or more services. For example, the administrator can clear the cache for a single Broker, a Broker and Decoder, or all connected services. These are a few examples of causes for stale cache being used in a reconstruction.

- The downstream services may have their sessions invalidated or data reset. As an example, if Investigation is browsing a Broker and a downstream Concentrator or Decoder has a data reset, the meta and session data for the investigating service (Broker) does not match the content if the downstream service has reset and repopulated. The reconstruction in Investigation shows content from cache, which does not match the real content. Even if the Decoder is offline, content is still displayed in the Broker reconstruction. Clearing cache on the Broker causes the NetWitness Suite to reach out to the Decoder and an error is returned because the Decoder is offline.
- Another case where cache may be stale is when a service ID for a downstream service changes. This can happen when exporting, importing, deleting, and adding services to NetWitness Suite because NetWitness Suite can reuse service IDs. In this case, clearing the cache on the Broker causes NetWitness Suite to request data from the services.

To clear reconstruction cache, do one of the following:

1. To clear cache for one or more services, select the services and click **Clear Cache for the Selected Services**.

2. To clear the cache for all listed services, click **Clear Cache for All Services.**
   The reconstruction cache for the selected services is cleared. NetWitness Suite sends a request for data to the services.

Configure Live Services Settings

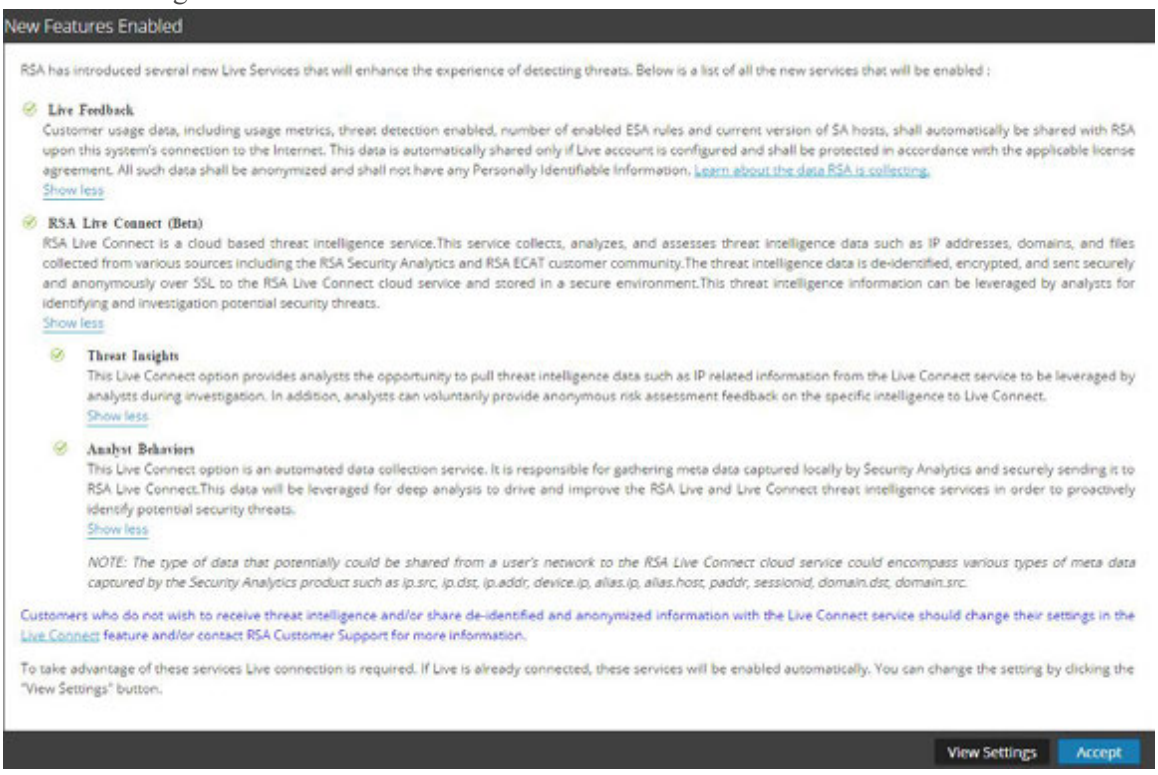
Options for configuring Live Services are in the System view > Live Services Configuration panel. The Live Configuration panel allows you to configure:

- The Live account.
- The Live Content update schedule and preferences for notification of updates.
- Participation in Live Services Feedback.
- Sharing Live Content Usage
- RSA Live Connect (Beta)

Prerequisite

To activate your Live account for NetWitness Suite, please contact RSA Customer Care. When you have a confirmation that your Live account has been set up, you can configure and test the CMS server connection.

When you log on to NetWitness Suite for the first time, you are prompted with **New Features Enabled** dialog.



When you click **Accept**, you automatically agree to the following:

- Participate in Live Feedback.
- Use Live Connect features to receive threat intelligence data.
- Allow NetWitness Suite to send anonymous, technical data about your environment to RSA.

If you click **View Settings**, you are redirected to the Live Services user interface to view the settings for Live Feedback and Live Connect Threat Data Sharing. If you have not configured the Live Account a masked screen is displayed.

For information on Analyst Behaviors and Data Sharing, see the "NetWitness Suite Feedback and Data Sharing" topic in the *Live Services Management Guide*.

About Live Feedback Participation

When you participate in Live Feedback, it collects relevant information for further improvement. For information on Live Feedback, see Live Feedback Overview.

When you install NetWitness Suite, you will be prompted to participate in Live Feedback. For information, see Configure Live Services Settings

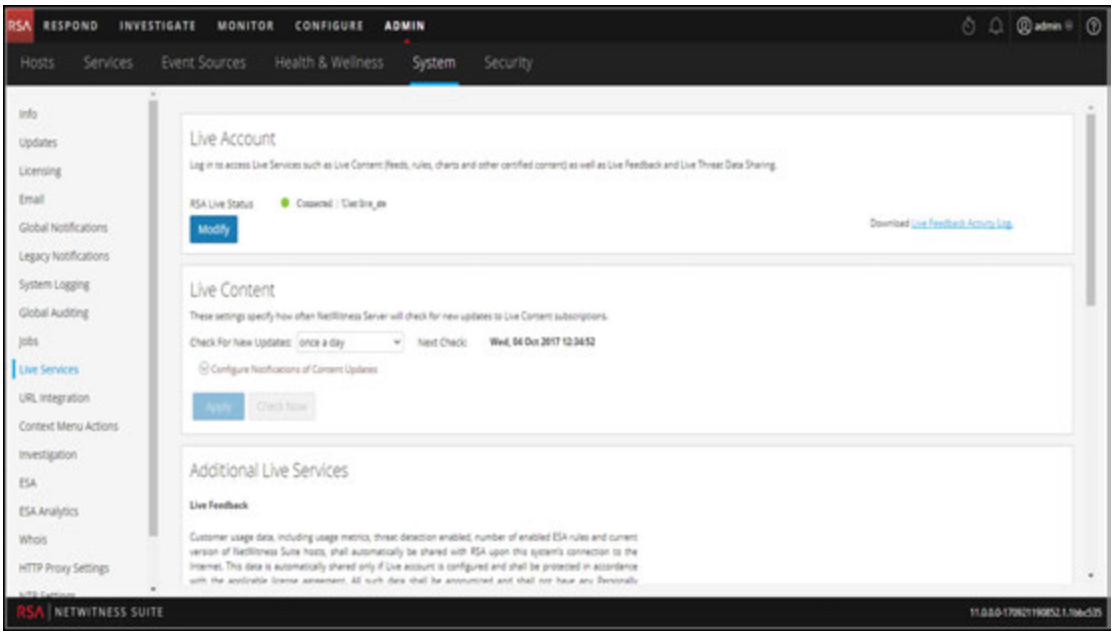
If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.

This topic contains the following procedures:

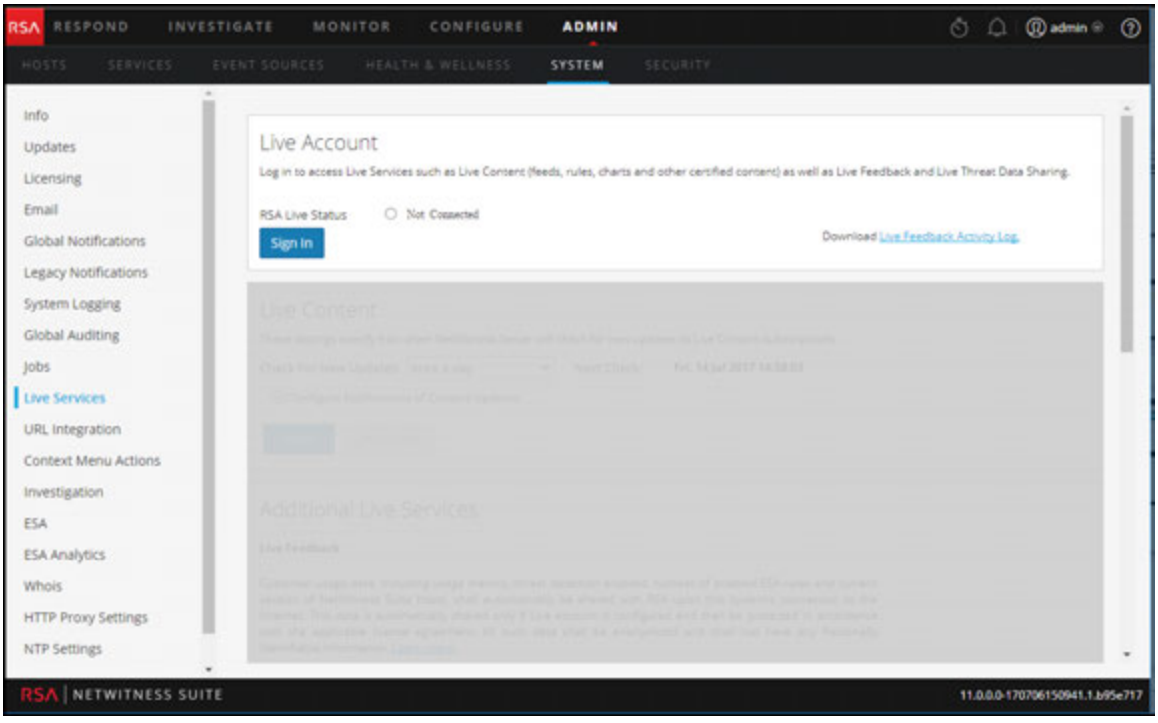
- Access the Live Services Configuration Panel
- Configure Live Account
- Configure the Live Content Synchronization Interval and Notification
- Force Immediate Synchronization
- Using RSA Live Connect (Beta)

Access the Live Services Configuration Panel

1. Go to **ADMIN > System**.
2. In the option panel, select **Live Services**.



Note: If you are not signed in with your Live Account credentials, a masked screen is displayed.



Configure Live Account

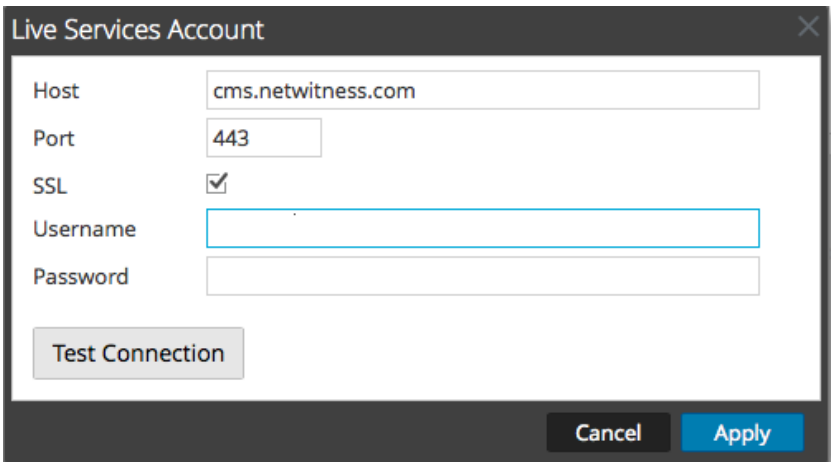
In the **Live Account** section, you must set up the user's Live account. The information needed to set up the user's Live account consists of the Username, Password, and Live URL for the Content Management System. This information is provided by Customer Care.

To configure a Live account:

1. In the **Live Account** section, click **Sign In**.

   Note: The **Modify** button shows that the live account is configured. Click **Modify** to change the user that is accessing Live Services.

2. In the Live Services Account dialog box, enter the Host (typically **cms.netwitness.com**) and type your username and password.

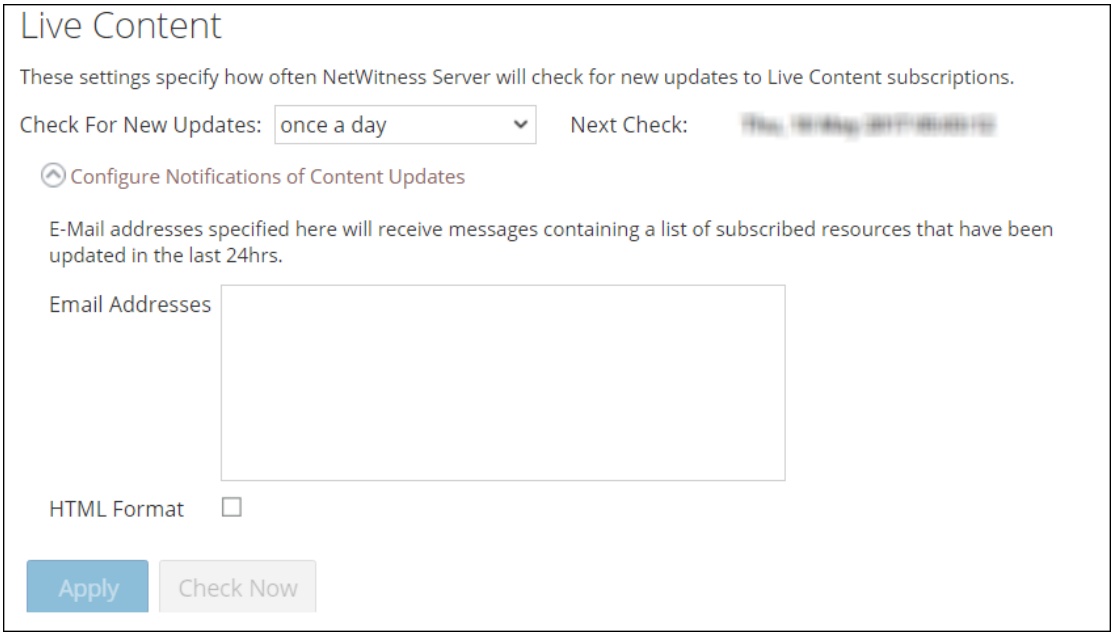


3. (Optional) If you are using a different CMS, type the host URL for the Content Management System. The default points to the CMS at **cms.netwitness.com**.
4. (Optional) If you are using a different CMS, type the communications port for Live to send requests to the Content Management System. The default for this field is **443**, which is the communications port on the Content Management System.
5. (Optional) If you do not want to use SSL, uncheck the **SSL** option. (SSL is enabled by default.)
6. Click **Test connection** to test the connection to CMS.
7. To save and apply the configuration, click **Apply**.

Configure the Live Content Synchronization Interval and Notification

You can change the interval at which NetWitness Suite checks for new updates to Live Content:

1. Use the **Check for New Updates** field to change the interval. Select an interval from the drop-down list. The default value for this setting is **once a day**.



2. To configure Live Services to send update reports to one or more people, in the **Email Addresses** field, type the email addresses as a comma-separated list, for example, **john@company.com,ted@company.com,brian@company.com**
3. (Optional) To receive messages in HTML format rather than plain text, select **HTML Format**.
4. To save and apply, click **Apply**.

   The time and date of the next scheduled Live synchronization based on the configured interval for checking is displayed.

Force Immediate Synchronization

Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness Suite. One use for this is to see the immediate impact of a configuration change. For example, a new service has been added, or new resources have been toggled for automatic deployment. The scheduled synchronization could take place hours later if Live Services is set to synchronize a few times a day.

Caution: Synchronization can cause a parser reload if a FlexParser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.

To force immediate synchronization, click **Check Now**. NetWitness Suite checks for updates in subscribed resources.

Using RSA Live Connect (Beta)

RSA Live Connect is a cloud based threat intelligence service. This service collects, analyzes, and assesses threat intelligence data such as IP addresses, domains, and files collected from various sources including the RSA NetWitness® Suite and RSA NetWitness® Endpoint customer community. RSA Live Connect consists of the following features:

- Threat Insights
- Analyst Behaviors

Threat Insights

Threat Insights provides analysts the opportunity to pull threat intelligence data such as IP related information from the Live Connect service to be leveraged by the analysts during investigation.

By default, **Threat Insights** is enabled in **Additional Live Services** section. If Context Hub service is configured, Live Connect is automatically added as a data source for Context Hub. For more information, see the "Configure Live Connect Data Source for Context Hub" topic in the *Context Hub Configuration Guide*.

With Live Connect as a data source for context hub, you can use the Context Lookup option in INVESTIGATE > Navigate view or Investigation > Events view to fetch contextual information. For instructions, see the "View Additional Context for a Data Point" topic in the *Investigation and Malware Analysis Guide*.

Analyst Behaviors

Analyst Behaviors is a feature where analysts participate in sharing data to RSA community. This is an automated data collection service. Its goal is to share potential threat intelligence data to the RSA Live Connect cloud service for analysis. The type of data that could be shared from your network to RSA Live Connect includes various types of meta data captured by NetWitness Suite such as ip.src, ip.dst, ip.addr, device.ip, alias.ip, alias.host, paddr, sessionid, domain.dst, domain.src. For information on Analyst Behaviors and Data Sharing, see the "NetWitness Suite Feedback and Data Sharing" topic in the *Live Services Management Guide*.

Live Feedback Overview

This topic provides an introduction to Live Feedback. Live Feedback collects relevant information such as the Licensing usage data for Packet Decoder, Log Decoder and Malware Analysis, Threat Detection Enabled or Disabled status, Number of enabled ESA rules,and version number details of all the services of NetWitness Suite. For more information about the licensing usage data for Packer Decoder, Log Decoder and Malware Analysis, see the "Metered Licenses Tab" topic in the *Licensing Guide*. The information is collected to improve future releases of NetWitness Suite. You will automatically be signed on to live feedback and you cannot disable this option.

In addition to this, information on the Live Content Usage can also be shared with RSA. Live Content usage metrics for resource types from **CONFIGURE > Live Content> Search Criteria** such as total count of RSA Application Rule, RSA Correlation Rule etc. can be shared with RSA. The information collected is used to improve the use of Live Content. For more information about sharing live content configuration, see Live Services Configuration Panel.

About Live Feedback Participation

When you participate in Live Feedback, it collects relevant information for further improvement. For information on Live Feedback, see Live Feedback Overview.

When you install NetWitness Suite, you will be prompted to participate in Live Feedback. For information, see Configure Live Services Settings

If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.

Note: Live Feedback is activated only if you have configured your Live account.

The Live Feedback data is in JSON format as mentioned below. When you sign up with your Live Account credentials, a single encrypted JSON file is automatically uploaded to the RSA servers everyday.

JSON File

The JSON file consists of usage data information for a component or a set of components. In case of a set of components with the same license id, the usage data for all the components is aggregated and represented as a component called Entitlement. However, even if there is a single component such as a log decoder or decoder, an Entitlement component will be generated and will display the usage data for a single component. This aggregation is for components namely log decoders, decoders or malware analysis.

Note: The version of Entitlement is always null as it is the aggregate for a license data.

For example, if there are three Decoders with the same license id "xxx" with the following usage data:
Decoder1 = 150 MB
Decoder2 = 250 MB
Decoder3 = 100 MB
The aggregated usage data of 500 MB is displayed.

This JSON file is described in the following sections:

- Components
- Metrics
- Other Product Details
- Sample

Components

Details of each service in your NetWitness Suite deployment. This is represented as Component. For each component the following details are displayed.

Component	Description
Version	Version number of the component in the NetWitness Suite deployment. For example, 11.0.0.0.x.x.x.x.
ID	This is the unique Component ID that represents the host and is used to link to the metrics generated.
Properties	• **Name** - This is the name of the property for that component. For example, malware analysis, ESA, log decoder, etc. • **Value** - This is the unique value to identify the component.

Metrics

Metrics of the components (hosts) namely log decoder, decoder and malware analysis. The license usage data for each host is shared. For Live Content usage metrics, resource types from **Live > Search** such as total count of RSA Application Rule, RSA Correlation Rule etc. are shared.

Component	Description
StartTimeUTC	This is the time from when the metrics is collected. (in EPOCH format).

Component	Description
Stats	• **Value** - This is the value generated for the specific component ID for each component. • **Name** - This is the name of the statistics for which the metrics is collected. For example, Capture Total Bytes.
EndTimeUTC	This is the time when the metrics collection is complete (in EPOCH format).
Component ID	This is the ID of the component for which the value is recorded.

Other Product Details

- **Product Type** - This is the name of the product. In this example, the Product Type is NetWitness Suite.
- **Version** - This is the version of the JSON file which tracks the changes made to the file format.
- **Product Instance** - This is the License Server ID.
- **Checksum** - This is the information which is used for integrity checks.

The following table describes details of the JSON file with examples.

Metrics	Description
Content	Displays the content that contains all the Components, Metrics, Product Type and Product Instance data except Checksum.

Metrics	Description
Components	The details of all the services in NetWitness Suite are represented as a Component. The details of the component such as the version number of the component, the name, and the value is displayed as shown below:  **Version**: Displays the version of NetWitness Suite service. For example, 11.0.0.0. **ID**: Displays an unique id which is generated for the NetWitness Suite service and is used to link to the metrics for that particular component. In this example, the ID for Malware Analysis is 5 and the metrics is displayed for ComponentId 5 in bytes, as shown below:  **Properties**: Displays the properties for the component such as name and value as shown in the above figure. **Value**: Displays the value of the property which is an internal UUID for a component as shown in the above figure This is generated by NetWitness Suite. For example, For malware analysis the value displayed as "55f7a0b30e502231c42d063f" **Name: "InstanceId"**: Displays the name of the property as shown in the above figure. **Name": "malwareanalysis"**: Displays the name of component which is a service name such as LogDecoder, Decoder, or MalwareAnalysis.

Metrics	Description

Metrics	Displays the list of the metrics with the usage data for components namely log decoder, decoder and malware analysis.
	In this example, the metrics is displayed for ComponentId 5 in bytes, as shown below.
	 	"Metrics": [{
	"StartTimeUTC": 1442102400000,
	"Stats": [{
	"Value": "1582940012678",
	"Name": "Total FileBytes"
	}],
	"EndTimeUTC": 1442188799000,
	"ComponentId": 5
	},
	StartTimeUTC: Displays the time when the metrics is collected, in the EPOCH format.
	Stats: Displays the usage value and usage type statistics of the component.
	Value: Displays the value of the statistics. For example, "Value": "1582940012678" as shown in the above figure.
	Name: Displays the name of the statistics. For example, Capture Total Bytes or Total File bytes.
	EndTimeUTC: Displays the time when the metrics collection is complete, in the EPOCH format.
	ComponentId: Displays the component id for which the metric values are collected. This is the same as the "ID" in the Components section.

Content	Displays the content that contains all the Components, Metrics, Product Type and Product Instance data except Checksum.

Metrics	Description
Components	The details of all the services in NetWitness Suite are represented as a Component. The details of the component such as the version number of the component, the name, and the value is displayed as shown below:

```
"Content": {
    "Components": [{
        "Version": "10.6.2.0",
        "Id": 6,
        "Properties": [{
            "Value": "57444ddde4b0dd618093064d",
            "Name": "InstanceId"
        }],
        "Name": "reportingengine"
    },
```

Version: Displays the version of NetWitness Suite service. For example, 11.0.0.0

ID: Displays an unique id which is generated for the NetWitness Suite service and is used to link to the metrics for that particular component. In this example, the ID for Reporting Engine is 6 and the metrics is displayed for ComponentId 6 in Total Count, as shown below:

```
"Metrics": [{
    "StartTimeUTC": 1473292800000,
    "Stats": [{
        "Value": "10",
        "Name": "Number of RE Report"
    },
    {
        "Value": "2",
        "Name": "Number of RE Alert"
    },
    {
        "Value": "1",
        "Name": "Number of RE Chart"
    },
    {
        "Value": "14",
        "Name": "Number of RE Rule"
    },
    {
        "Value": "2",
        "Name": "Number of Enabled RE Alert"
    },
    {
        "Value": "1",
        "Name": "Number of Enabled RE Chart"
    }],
    "EndTimeUTC": 1473379199000,
    "ComponentId": 6
},
```

Metrics	Description
	Properties: Displays the properties for the component such as name and value as shown in the above figure.
	Value: Displays the value of the property which is an internal UUID for a component as shown in the above figure. This is generated by NetWitness Suite. For example, for Reporting Engine the value displayed as "57444ddde4b0dd618093064d"
	Name: "**InstanceId**": Displays the name of the property as shown in the above figure.
	Name": "**reportingengine**": Displays the name of component which is a service name such as LogDecoder, Decoder, or ReportingEngine.
	Name: Displays the list of the metrics with the usage data for components namely log decoder, decoder and reportingengine. In this example, the metrics is displayed for ComponentId 6 in bytes, as shown below. 	StartTimeUTC: Displays the time when the metrics is collected, in the EPOCH format.

Metrics	Description
	Stats: Displays the usage value and usage type statistics of the component.
	Value: Displays the value of the statistics. For example, Number of RE Report is 10, Number of RE Alert is 2, Number of RE chart is 1 etc as shown in the above figure.
	Name: Displays the name of the statistics. For example, Number of RE Report, Number of RE Alert, Number of RE chart, Number of RE Rule, Number of Enabled RE Alert, Number of Enabled RE Chart.
	EndTimeUTC: Displays the time when the metrics collection is complete, in the EPOCH format.
	ComponentId: Displays the component id for which the metric values are collected. This is the same as the "ID" in the Components section.
ProductType	Displays the product type that generates the file. For example, `"ProductType": "NetWitness Suite"`
ProductInstance	Displays the License server Id and is unique per NetWitness Suite. For example, `"ProductInstance": "00-0C-29-6C-66-E3"`
Checksum	Displays the Checksum for the "Content" section in the file. Used by RSA for integrity check. For example, `"Checksum": "883DACF97E4BCD9F590A1461A4DD0A312B5883A6CF82E0518E77AAB6A6DDB654"`

Sample

Here is a sample JSON file.

```
{
    "Content": {
        "Components": [{
            "Version": "10.6.1.0",
            "Id": 7,

```

Upload Data to RSA for Live Feedback

This topic provides instructions for a NetWitness Suite administrator to export the metrics in NetWitness Suite for Live Feedback.

If the Live Account is not configured, you can manually upload the usage data to RSA. For more information, see Live Services Configuration Panel.

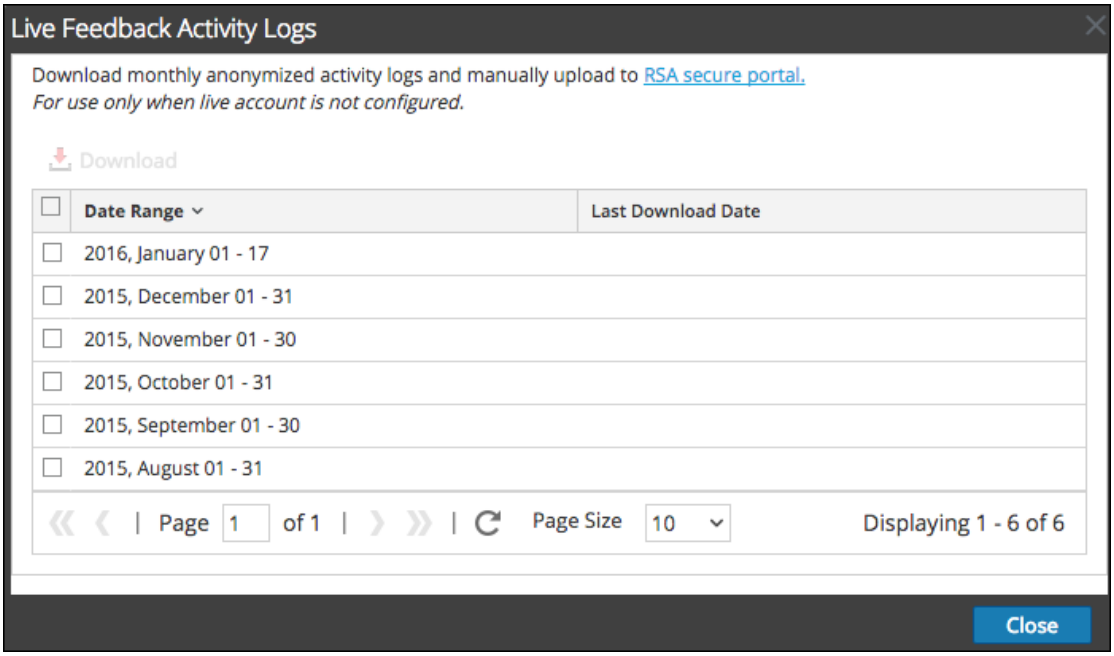
The Live Account section has a Live Feedback Activity Log which enables you to download the usage data required for Live Feedback. This is active regardless of the Live Account configuration.

You can first download the Live Feedback historical data, and then upload it to share with RSA.

Download Live Feedback Historical Data

To download the Live Feedback historical data:

1. Go to **ADMIN** > **System**.
2. In the options panel, select **Live Services**.
   The **Live Account** screen is displayed which consists of the **RSA Live Status** and Download **Live Feedback Activity Log**.
3. Click the **Download Live Feedback Activity Log**.
   The **Download Live Feedback Activity Log** window opens which allows the NetWitness Suite user to download the required Live Feedback historical data.



4. Select one or multiple entries by selecting the checkboxes and click **Download**.

Note: If you select multiple entries in the history table, the downloaded zip file consists of an individual JSON file for each month.

The downloaded Live Feedback data is in JSON format, and is bundled as a .zip file. For more information, see Live Feedback Overview.

Share Data with RSA

After you download the Live Feedback data, you can then upload it using the following procedure.

To share the data to RSA:

1. Click on the **RSA Secure Portal** available on the **Live Feedback Activity Logs** window. The RSA NetWitness® Suite Live Feedback login screen is displayed.
2. Login to the Upload Live Feedback Activity Logs portal using your Live ID credentials.
3. Click **Choose File**, and select the downloaded file.
4. Click **Upload.**

Configure Log File Settings

In RSA NetWitness® Suite, you can configure the size of the log files, the number of backup log files maintained, as well as the default logging levels for the packages within NetWitness Suite.

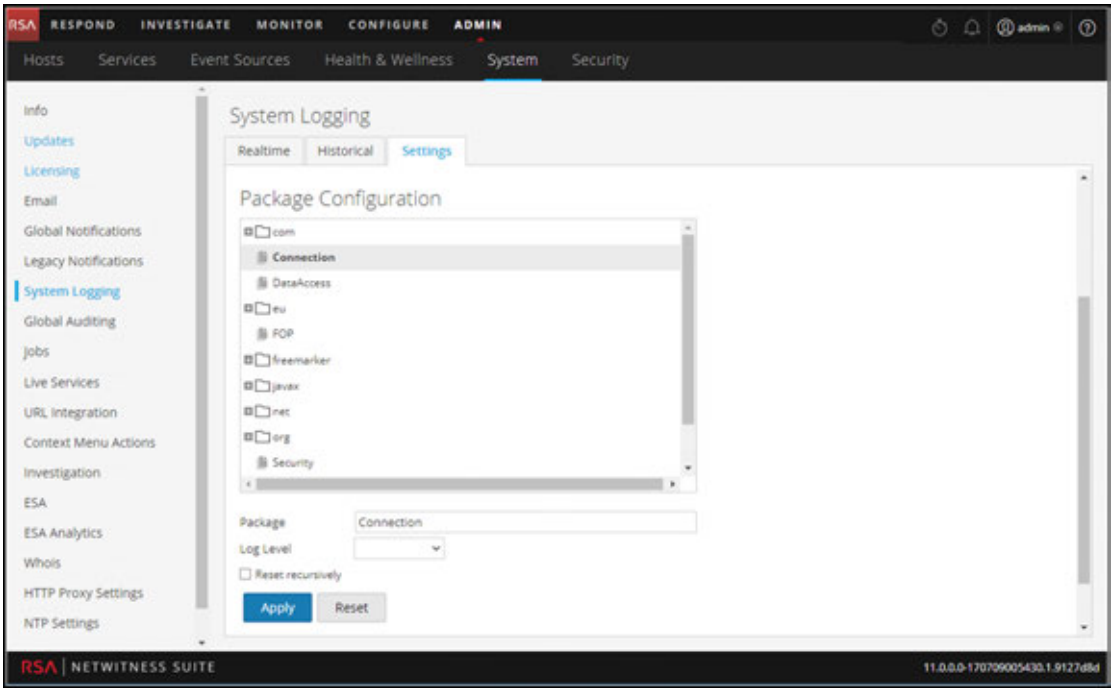
Configure System Log File Size and Backup Count

The log file size and backup count are configured with default values. If you want to change the default values for the log file size and number of backups:

1. Go to **ADMIN > System.**
2. In options panel, select **System Logging**.

   The System Logging Configuration panel opens to the Realtime tab by default.

3. Click the **Settings** tab.

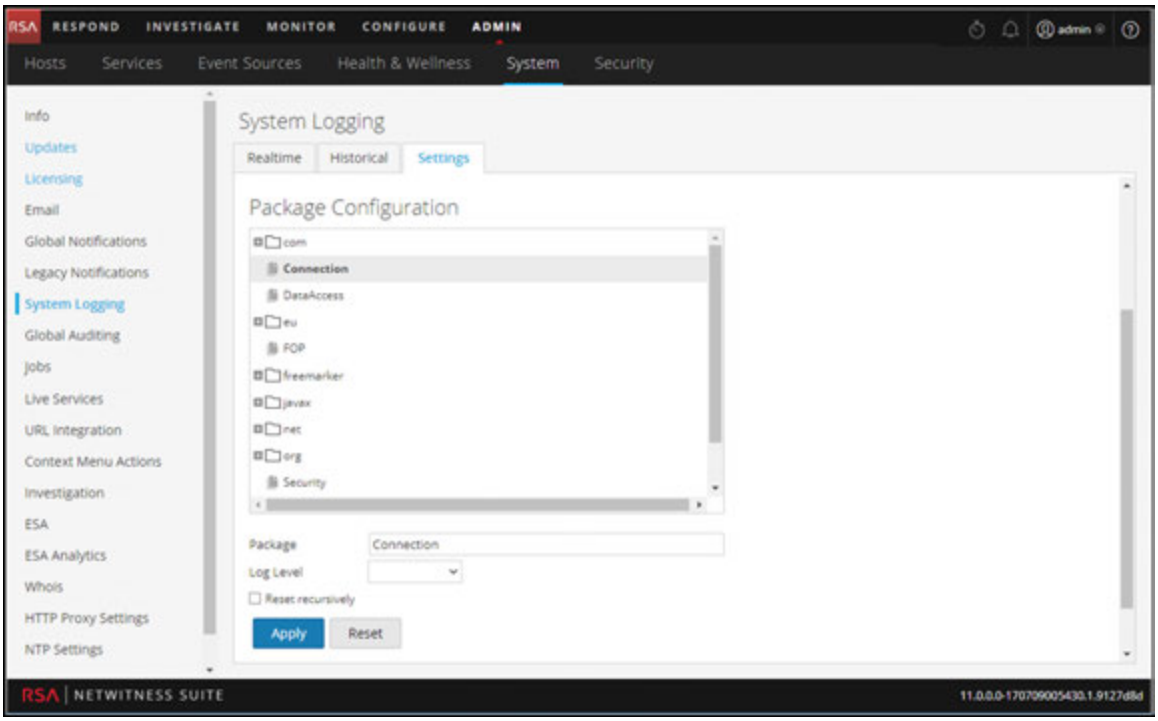


4. In the **Max Log Size** field, type the maximum size in bytes. The minimum value for this setting is **4096**.
5. In the **Max # Backup Files** field, type the maximum number of backup logs to maintain. The minimum value for this setting is **0**. When the maximum number of log files is attained, and a new backup file is made, the oldest backup is discarded.
6. Click **Apply**.
   The changes go into effect immediately.

Set the Log Level for an Individual Package

The Package Configuration section shows the NetWitness Packets in a tree structure. The tree contains all the packages used within NetWitness Suite. You can drill down into the tree to view the log levels of each package. The log level for all packages that are not explicitly set is the same as the **root** log level. To set the log level for a package:

1. Select the package in the **Package** tree.
   The name of the package is displayed in the **Package** field. If a log level is already set for the package, that level is shown.



2. Select the **Log Level** in the drop-down list.
3. Click **Apply**.

   The new log level becomes effective immediately.
4. (Optional) If you want to revert to the default log level specified for **root**, click **Reset**.

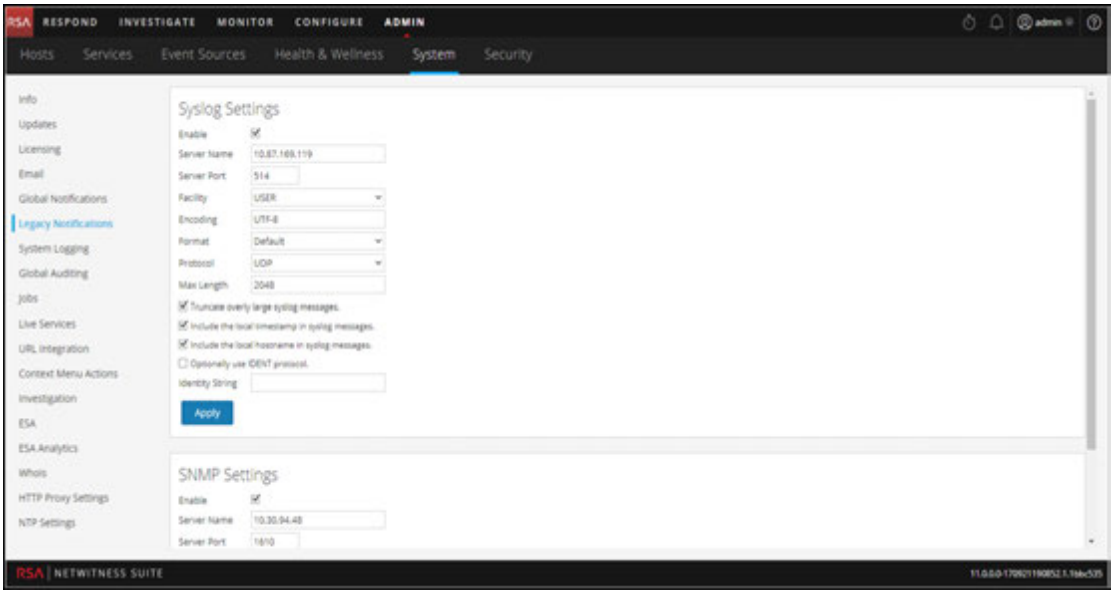
Configure Syslog and SNMP Settings

On the Legacy Notifications panel, you can configure syslog and SNMP notification settings. These configurations are used for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Configure and Enable Syslog Settings

1. Go to **ADMIN > System**.

2. In the options panel, select **Legacy Notifications**.
   The Legacy Notifications Configuration panel is displayed.



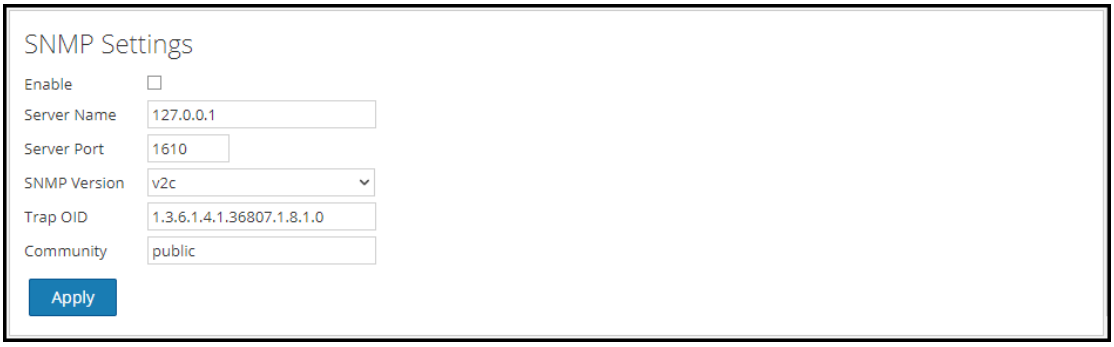
3. In the **Server Name** and **Server Port** fields under **Syslog Settings**, type the host name where the target syslog process is running and the port where the target syslog process is listening.
4. In the **Facility**, **Encoding**, **Format**, and **Max length** fields, specify the syslog facility, message text encoding, message format, and maximum message length.
5. In the **Protocol** field, select either UDP or TCP.
6. (Optional) Select the options for what to include in messages: **Truncate overly large syslog messages**, **Include the local timestamp in syslog messages**, and **Include the local hostname in syslog messages**.
7. (Optional) Configure syslog to prepend an Identity String before each syslog alert.
8. Click the **Enable** checkbox.
9. Click **Apply**.
   Syslog notifications are immediately enabled.

Legacy Notifications Configuration Panel provides detailed information about these settings.

Configure and Enable SNMP Settings

1. Go to **ADMIN > System**.
2. In the options panel, select **Legacy Notifications**.
   The Legacy Notifications Configuration panel is displayed, with SNMP Settings at the

bottom of the panel.



3. In the **Server Name** and **Server Port** fields under **SNMP Settings**, type the host name and listening port of the SNMP trap host.
4. Select the **SNMP version** in the drop-down menu, **v1** or **v2c**.
5. In the **Trap OID** field. specify the object ID for the SNMP trap on the trap host that receives the audit event. The default value is **0.0.0.0.0.1**.
6. In the **Community** field, specify the community string used to authenticate on the SNMP trap host, the default value is **public**.
7. Click the **Enable** checkbox.
8. Click **Apply**.
   SNMP notifications are immediately enabled.

Legacy Notifications Configuration Panel provides detailed information about these settings.

Disable Syslog or SNMP Settings

To disable syslog or SNMP settings on this NetWitness Suite instance:

1. Clear the appropriate **Enable** checkbox.
2. Click **Apply**.
   The selected settings are immediately disabled.

Additional Procedures

Additional procedures are not essential for the set up of NetWitness Suite, they include certain customization options that are beyond the usual setup; for example, adding custom context menus or setting up a proxy.

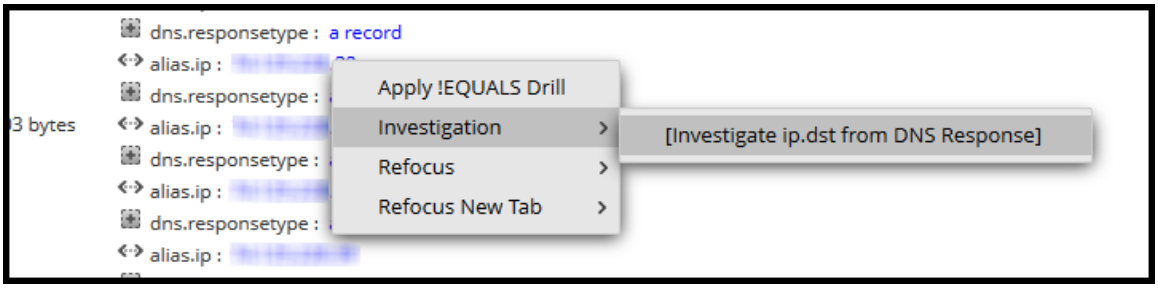
Add Custom Context Menu Actions

In the Context Menu Actions panel, administrators can view, add, and edit context menu actions for the current instance of NetWitness Suite. Each context menu action applies to a specific context in the NetWitness Suite user interface, and appears as an option when you right-click a specific location in the user interface.

Some context menu actions are built into NetWitness Suite; you cannot edit or delete any of the default context menu actions. You can create and edit custom context menu actions. If you want to create a custom variation of a built-in context menu action, you can copy the configuration to a new context menu action and modify the custom context menu action. A context menu action is defined by cascading style sheet (CSS) code that defines:

- The title of the option in the context menu.
- The NetWitness Suite module in which the context menu is available.
- The content to which the action applies.

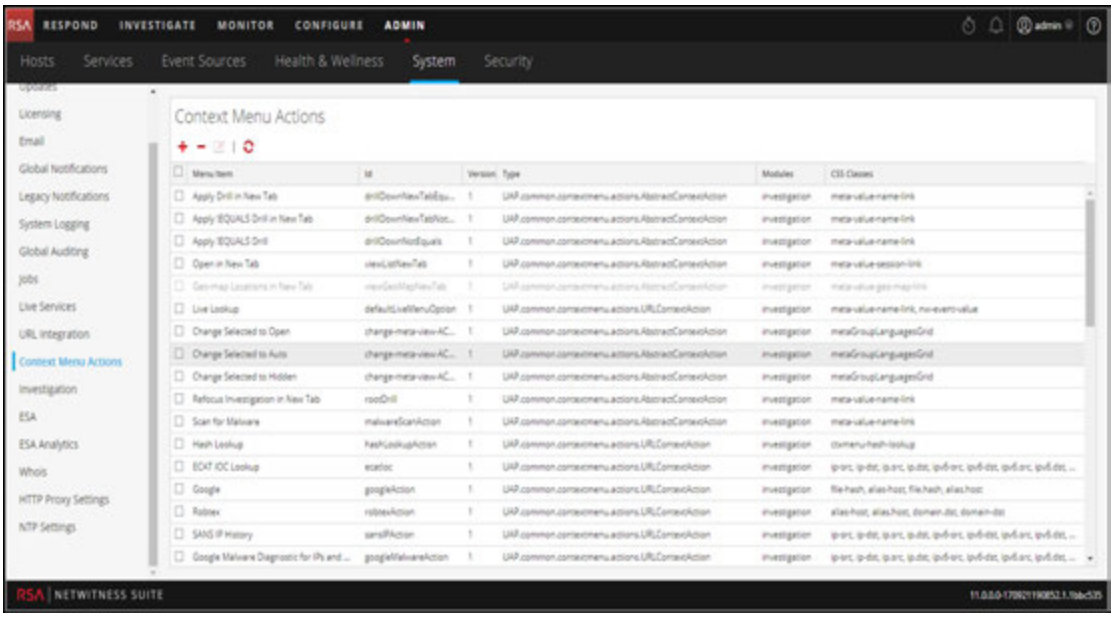
This is an example of a custom context menu action; the steps and CSS code to create this example are provided as an example procedure below.



View Context Menu Actions in NetWitness Suite

To view existing context actions in NetWitness Suite both default and custom:

1. Go to **ADMIN > System.**
2. In the options panel, select **Context Menu Actions**.



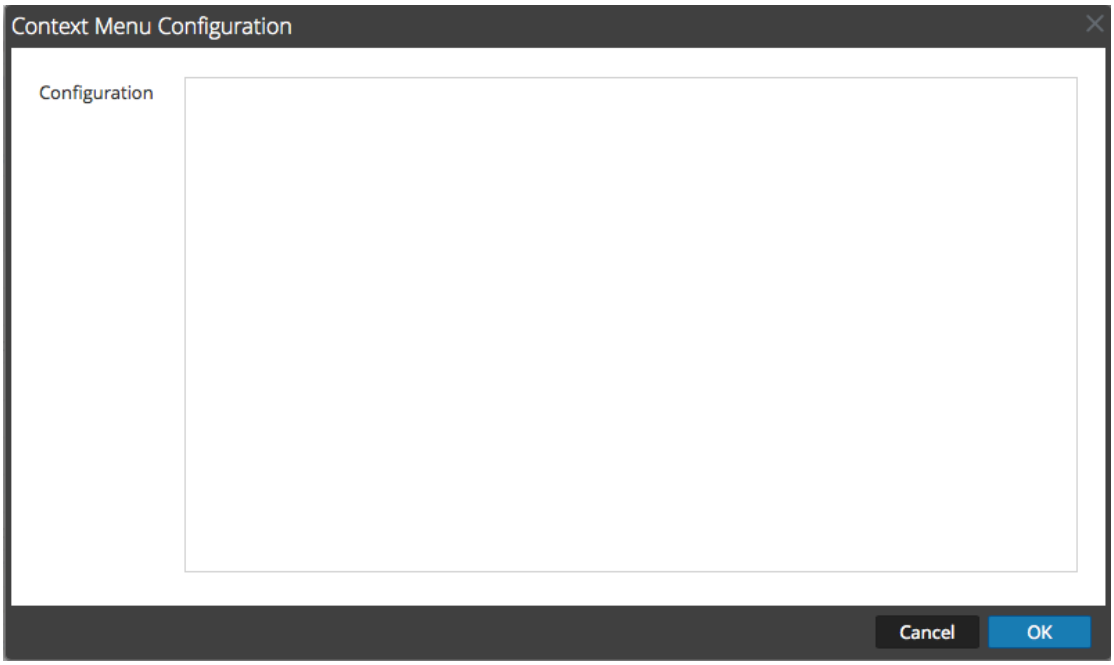
Details of the information in the Context Menu Action panel are provided in Context Menu Actions Panel.

Add a Context Menu Action

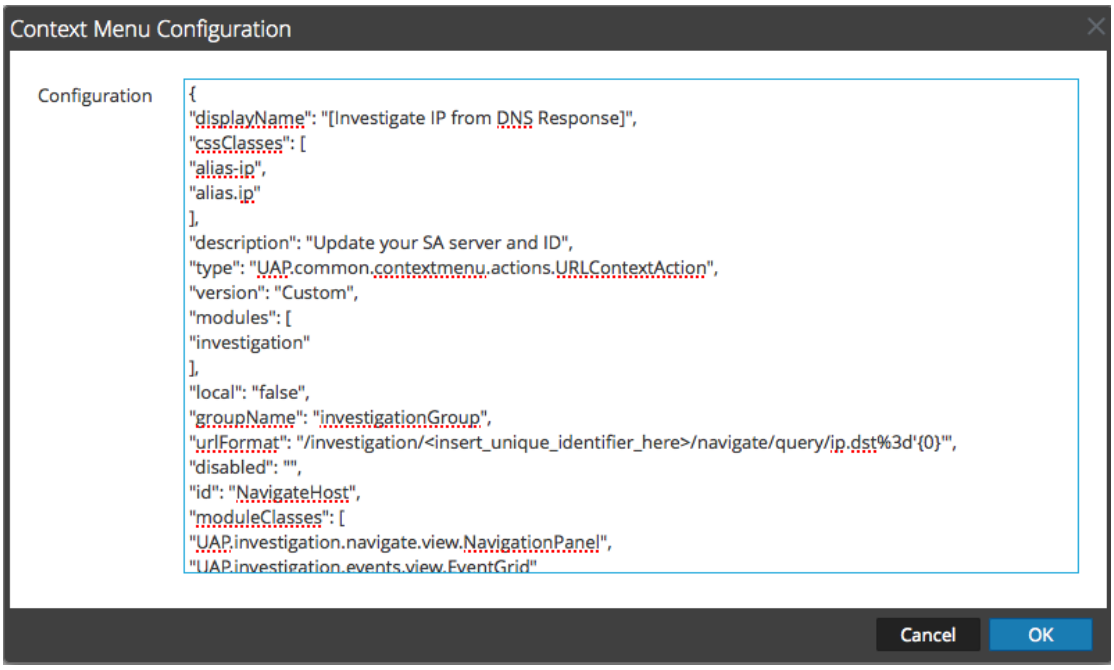
To add a context menu action in NetWitness Suite:

1. In the toolbar, click +.

   The Context Menu Configuration dialog is displayed.



2. Type the CSS code to define the context menu action. The example procedure at the end of this topic provides step-by-step instructions that you can use to create a useful context menu action.



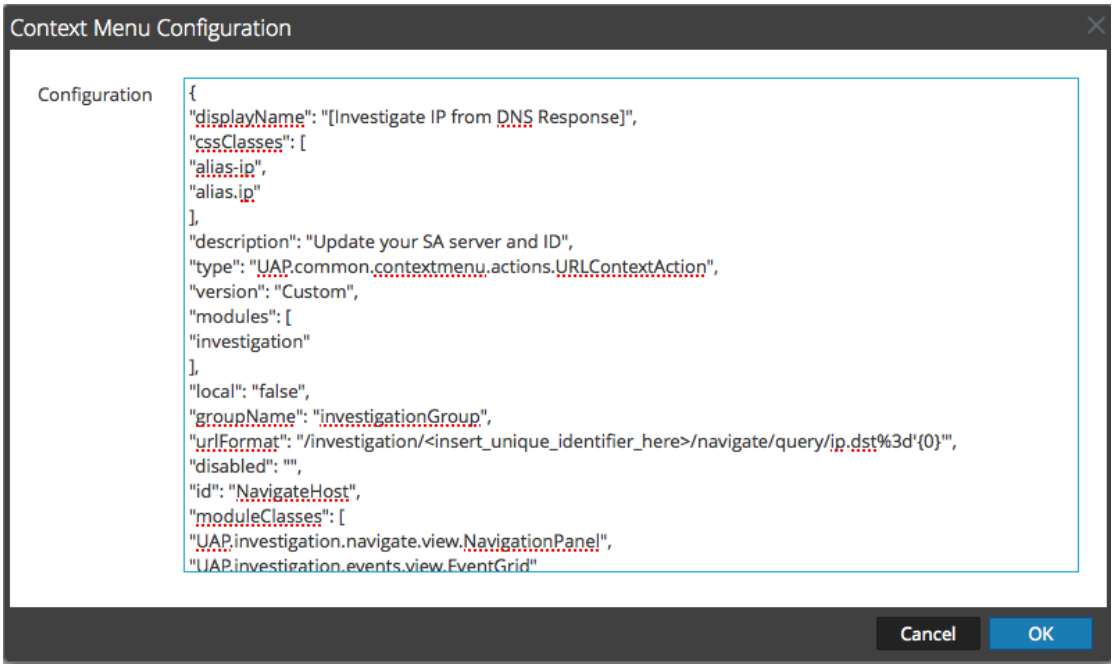
3. Click **OK.**
   The new context menu action is created and added at the end of the list of context menu actions.

4. To activate the new context menu action, restart the browser.
   The context menu action becomes available in the configured location.

Edit a Context Action

To edit a context action:

1. Select the row in the grid and either **double-click** the row or click .
   The **Context Menu Configuration Dialog** is displayed.



2. Edit the **Configuration**.
3. To save the changes, click **OK**.
4. To use the updated action, restart the browser.

Delete a Context Action

To remove a context menu action from NetWitness Suite entirely:

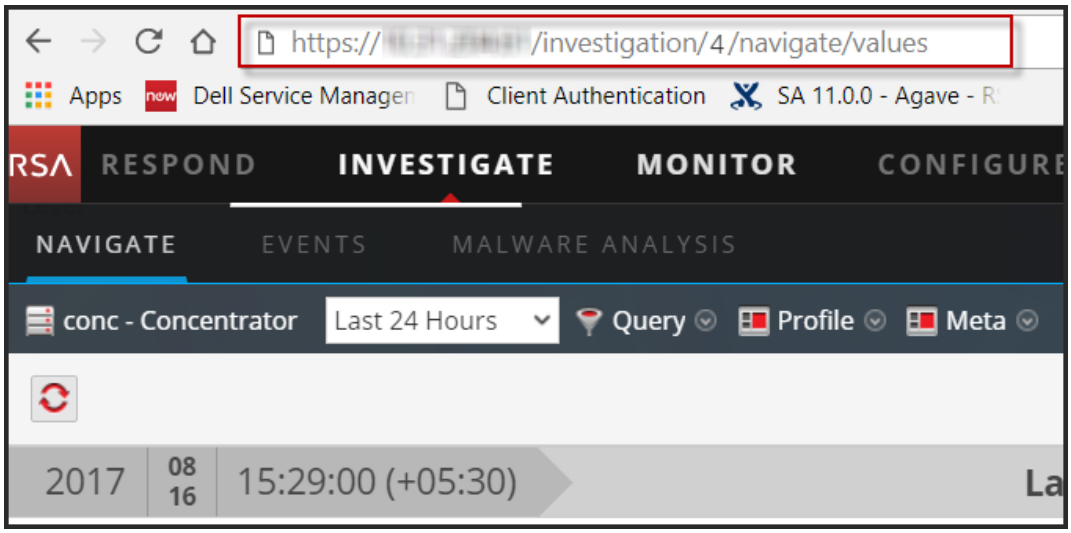
1. Select the action.
2. Click .
   A dialog requests confirmation that you want to delete the context menu action.
3. Click **Yes**.
   The option is removed from the Context Menu Actions panel.
4. Restart the browser to remove the action from the context menus in which it appeared.

Example Procedure: Context Menu Action to Investigate ip.dst from alias.ip

This example adds a context menu action that allows analysts to pivot from the `alias.ip` values (the IP addresses returned from a DNS request) to the `ip.dst` meta key. It helps analysts to locate any detected traffic to the IP address that was returned for a DNS query.

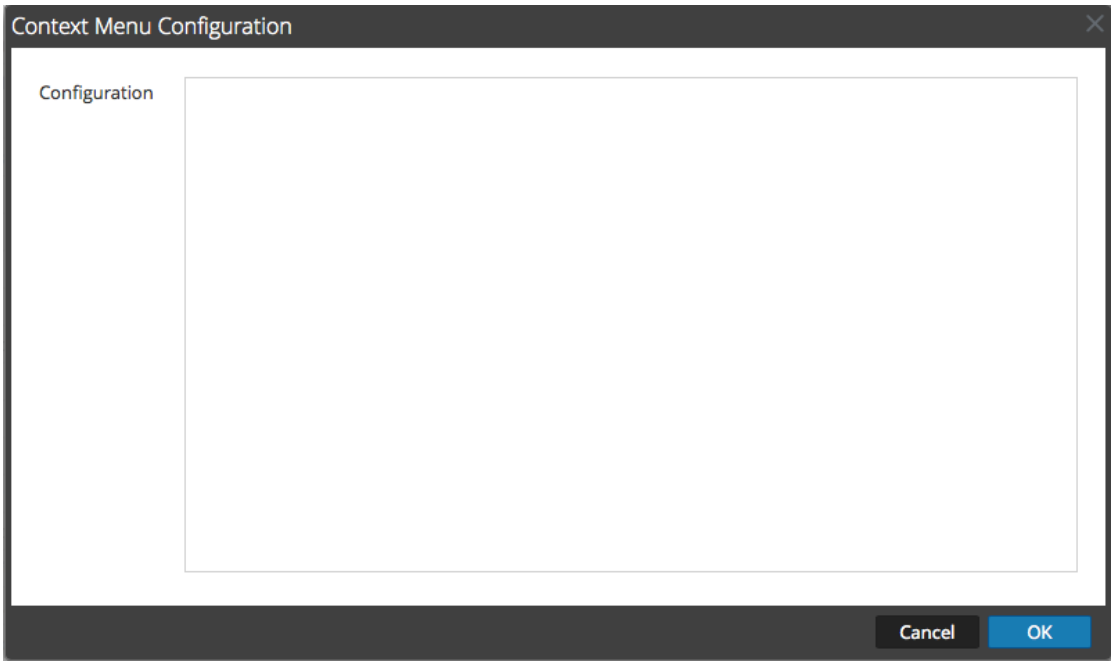
To implement the context menu action:

1. Determine the unique identifier for your NetWitness Server as follows:
   a. Log onto NetWitness Suite, in the main menu, select **INVESTIGATE > Navigate**, choose a service (for example, a Concentrator) to investigate, and wait for the values to load.
   b. Look for the URL and locate the number after `investigation`. In this example, the unique identifier for the action is 4. You need this unique identifier to add to the context menu action.



2. In the toolbar, click +.

   The Context Menu Configuration dialog is displayed.

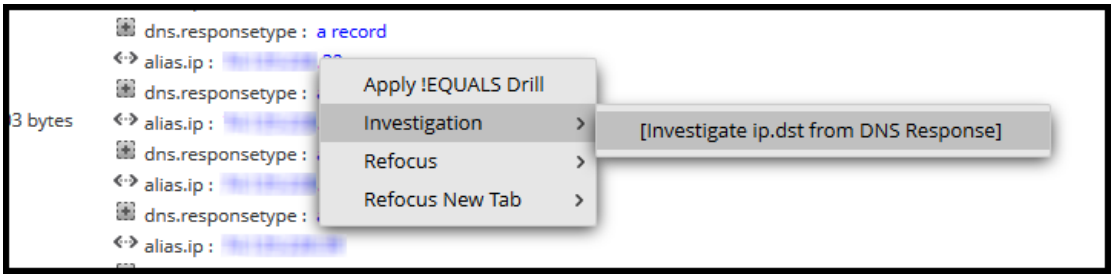


3. Copy the entire sample code block below and paste it in the window.

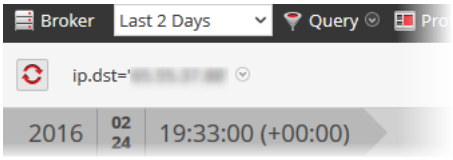
```
{
    "displayName": "[Investigate IP from DNS Response]",
    "cssClasses": [
        "alias-ip",
        "alias.ip"
    ],
    "description": "Update your NW server and ID",
    "type": "UAP.common.contextmenu.actions.URLContextAction",
    "version": "Custom",
    "modules": [
        "investigation"
    ],
    "local": "false",
    "groupName": "investigationGroup",
    "urlFormat": "/investigation/<insert_unique_identifier_
here>/navigate/query/ip.dst%3d'{0}'",
    "disabled": "",
    "id": "NavigateHost",
    "moduleClasses": [
```

```
            "UAP.investigation.navigate.view.NavigationPanel",
            "UAP.investigation.events.view.EventGrid"
        ],
        "openInNewTab": "true"
    }
```

4. In the **urlFormat** line replace **<insert-unique_identifier_here>** with your unique identifier. The URL should look like this:
   `"/investigation/4/navigate/query/ip.dst%3d'{0}'"`
5. Click **OK**, and restart your browser.
6. To test the action, open an investigation in the Navigate view and right-click on the meta key `alias.ip`.
   The context menu with the Investigation option should look like the following figure.



7. Should produce a pivot like this.



8. If you are using this example for DNS traffic investigation, you may want to consider creating a meta group specific to DNS traffic as described in "Manage User-Defined Meta Groups" in the *Investigation and Malware Analysis Guide*.

Configure NTP Servers

This topic provides instructions on how to configure Network Time Protocol (NTP) servers. NTP is a protocol designed to synchronize host machine clocks over a network. For more information on NTP go to their home page (http://www.ntp.org/).

Note: NW Core hosts must be able to communicate with the NW host with UDP port 123 for NTP time synchronization.

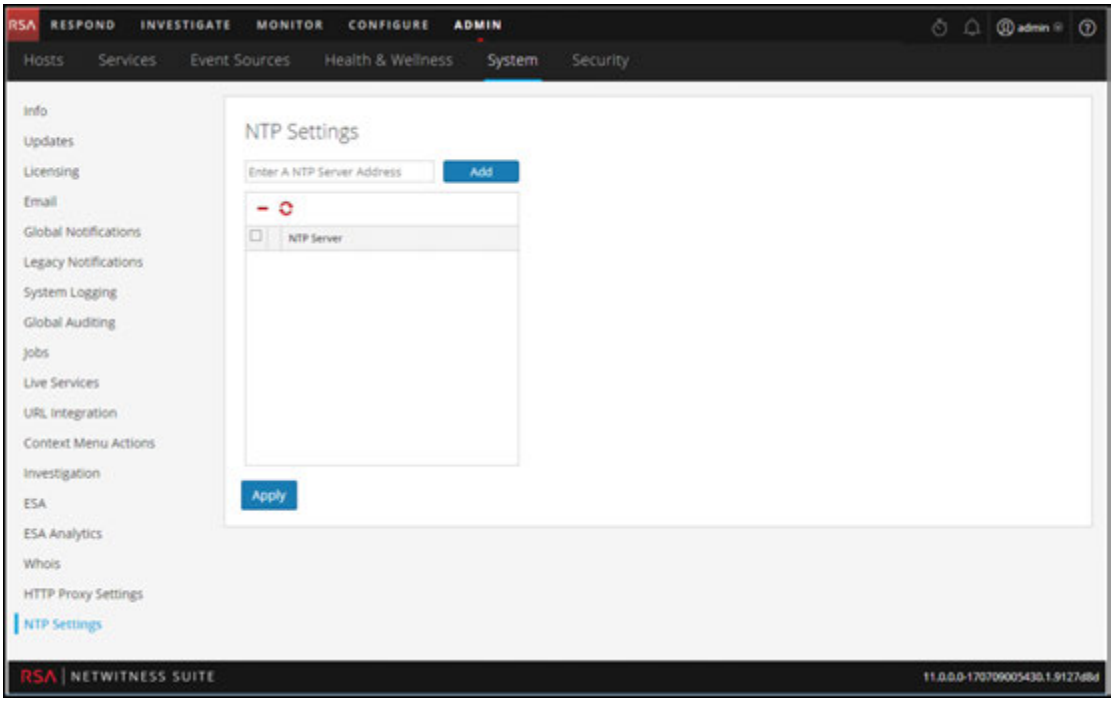
You use the **ADMIN** > **System** > **NTP Settings** view to configure one or more NTP servers. After you configure an NTP server, NetWitness Suite uses NTP to synchronize the host machine clocks. You configure multiple NTP servers for Fail Over purposes. This topic contains the following procedures:

- Add an NTP Server
- Modify an NTP Server

Add an NTP Server

To add an NTP server:

1. Go to **ADMIN > System**.
2. In the options panel, select **NTP Settings**.
   The NTP Settings panel is displayed prompting you to enter the hostname (that is, the IP Address or FQDN) of an NTP server.



3. Enter the IP address or FQDN for an NTP server.
   If the hostname syntax is invalid, NetWitness Suite disables the **Add** and **Apply** buttons and displays **Entered an invalid hostname**.
4. Click **Add**.
   - If the hostname syntax is valid and NetWitness Suite can reach the server, it displays **Validating**.

- If the hostname syntax is valid and NetWitness Suite cannot reach a server, the following is displayed, where ***hostname*** is the hostname that you attempted to add: **The NTP server *hostname* is unreachable. Please verify the address or check your firewall settings.**

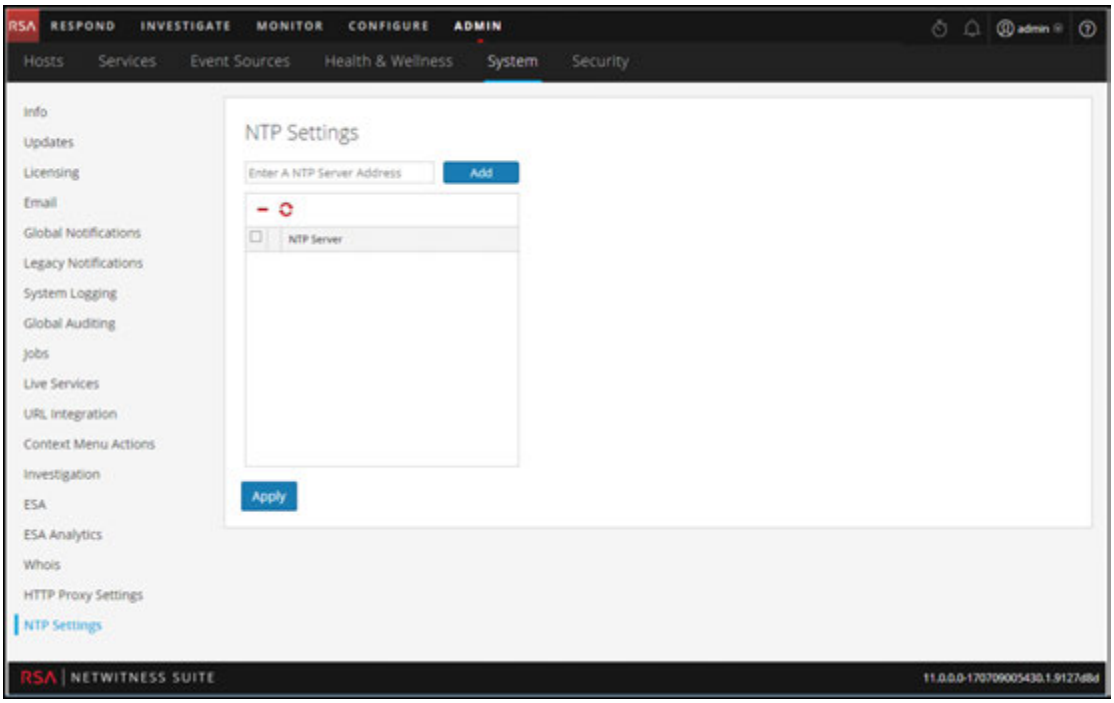
5. Click **Apply**.
   A dialog displays notification that the settings have been saved and requests confirmation that you want to apply the settings now.
6. Click **Yes**.
   The NTP server specified now ensures that your host machine clocks are synchronized. If you decide to configure multiple NTP servers and a server is down, NetWitness Suite will fail over to next server configured.

For details of the parameters and descriptions, see NTP Settings Panel.

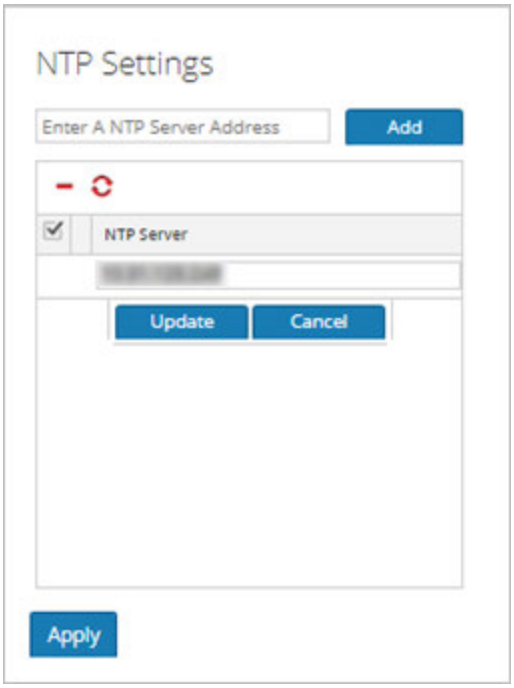
Modify an NTP Server

To modify an existing NTP server:

1. Go to **ADMIN > System**.
2. In the options panel, select **NTP Settings**.
   The NTP Setting panel is displayed.



3. Double-click the **NTP Server** hostname that you want to modify.
   The NTP Server textbox becomes editable and the Update and Cancel buttons are displayed.



4. Edit the hostname, click **Update**, and click **Apply.** (click **Cancel** before you click **Apply** to cancel the edit.)
   NetWitness Suite changes the hostname according to your edits.

Add New Configuration Dialog

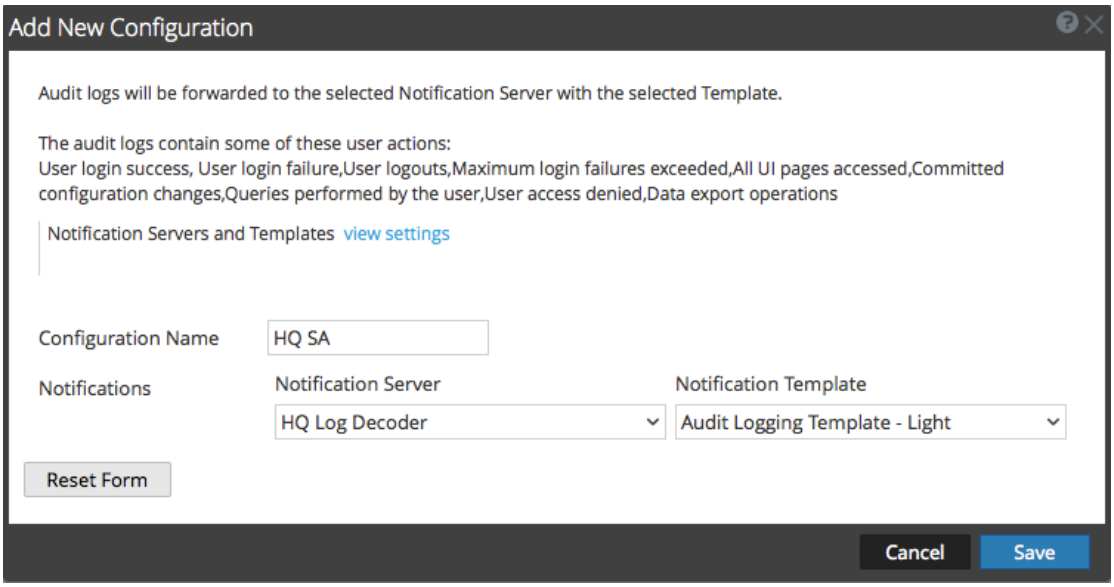
In the RSA NetWitness® Suite Administration System view Global Audit Logging Configurations panel, you can create multiple global audit logging configurations. These configurations are used to forward global audit logs to a central location to perform user audits.

Procedures related to global audit logging are described in Configure Global Audit Logging.

To access the **Add New Configuration** dialog:

1. In the main menu, select **ADMIN > System**.
2. In the options panel, select **Global Auditing**.
3. In the **Global Audit Logging Configurations** panel, click +.

   The **Add New Configuration** dialog is displayed.



The Notifications section enables you to select a syslog notification server for the global audit logging configuration and a template to use for the global audit logs. The template defines the details of the global audit log entries.

Features

The following table describes the features in the Add New Configuration and Edit Configuration dialogs.

Feature	Description
Notifications Servers and Templates **view settings** link	Takes you to the Global Notifications panel where you can view or configure the notification server and template settings. A syslog notification server and an audit logging template are required before you can create a global audit configuration.
Configuration Name	Specifies the unique name used to identify the global audit logging configuration.
Notification Server	Specifies the syslog notification server to send the selected audit log information. Configure a Destination to Receive Global Audit Logs provides instructions on how to create a Syslog Notification Server for global audit logging.
Notification Template	Specifies the template to use for the global audit logging configuration. The template should be an Audit Logging template. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions. For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.
Reset Form button	Clears the configuration settings in the dialog.

User Actions Logged

The following table provides examples of some of the user actions logged from NetWitness Suite. These actions are the minimum user actions logged when applicable.

User Action	Example
User login success	A user logs on with valid credentials.
User login failure	A user tries to log on using invalid credentials.
User logouts	A user logs out from NetWitness Suite (Administration > Sign Out) or a user logs out due to a session timeout.
Max login failures exceeded	A user tries to log on using invalid credentials five times. Five (5) is the number of Max Login Failures defined in Administration Security view > Settings tab (Administration > Security > Settings tab).
All UI pages accessed	When a user accesses the Reporting module (Administration > Reports), it logs as `[REP] Reports`. When a user accesses the Administration System view (Administration > System), it logs as `[ADM] System`.
Committed configuration changes	A user changes his or her password and or any security setting (Administration > Security > Settings tab).
Queries performed by the user	A user performs an investigation query.
User access denied	A user tries to access a module and does not have permissions to access it.
Data export operations	A user exports data from the Events view (Investigation > Events > Actions > Export).

For lists of message type being logged by the various NetWitness Suite components, see Global Audit Logging Operation Reference.

Troubleshooting System Configuration

The topics in this section provide troubleshooting information for administrators who are configuring settings that apply across the system in NetWitness Suite.

Troubleshoot Global Audit Logging

This topic provides information about possible issues that NetWitness Suite users may encounter when implementing Global Audit Logging in NetWitness Suite. Look for explanations and solutions in this topic.

After you configure Global Audit Logging, you should test your audit logs to ensure that they show the audit events as defined in your audit logging template. If you cannot view the audit logs on your third-party syslog server or Log Decoder, or the audit logs do not appear as expected, look at the basic troubleshooting suggestions below. If you are still having issues, you can look at the advanced troubleshooting suggestions.

Basic Troubleshooting

If you cannot view audit logs on a third-party syslog server or Log Decoder:

- Verify that RabbitMQ is up and running.
- Verify the syslog notification server configuration and make sure it is enabled.
  (This configuration is located at ADMIN > System > Global Notifications. Do not select Legacy Notifications.)
- Check the Global Audit Logging configuration.

Configure Global Audit Logging and Verify Global Audit Logs provide instructions. If you are sending audit logs to a Log Decoder:

- Ensure that the Log Decoder is aggregating on the Concentrator on the same host (ADMIN > Services > (Select Concentrator) >  > View > Config).
- Verify that the latest CEF parser is deployed and enabled.
- Check the audit logging notification template. You must use a CEF template and all logs feeding into the Log Decoder must use a CEF template.

If you are sending audit logs to a third-party syslog server:

- Ensure that the destination port configured for the third-party syslog server is not blocked by a firewall.

Advanced Troubleshooting

In order to use Global Audit Logging on your network, RabbitMQ must be functioning.

For centralized audit logging, each of the NetWitness Suite services writes audit logs to rsyslog listening on port 50514 using UDP on the local host. The rsyslog plugin provided in the audit logging package adds additional information and uploads these logs to RabbitMQ.
Logstash running on the NetWitness Serverhost aggregates audit logs from all of the NetWitness Suite services, coverts them to the required format, and sends them to a third-party syslog server or Log Decoder for investigation. You configure the format of the global audit logs and the destination used by Logstash through the NetWitness Suite user interface.

Define a Global Audit Logging Configuration provides instructions.

Verify the Packages and Services on the Hosts

NetWitness Suite Host

The following packages or services must be present on the NetWitness Server host:

- rsyslog-8.4.1
- rsa-audit-rt
- logstash-1.5.4-1
- rsa-audit-plugins
- rabbitmq server

Services on a Host other than the NetWitness Suite Host

The following packages or services must be present on each of the NetWitness Suite hosts other than the NetWitness Server host:

- rsyslog-8.4.1
- rsa-audit-rt
- rabbitmq server

Log Decoder

If you forward global audit logs to a Log Decoder, the following parser should be present and enabled:

- CEF

Possible Issues

What if I perform an action on a service but audit logs do not reach the configured third-party syslog server or Log Decoder?

The possible causes could be one or all of the following:

- A service is not logging to the local syslog server.
- Audit logs are not getting uploaded to RabbitMQ from the local syslog.
- Audit logs are not aggregated on the NetWitness Server host.
- Aggregated logs on the NetWitness Server host are not being forwarded to the configured third-party syslog server or Log Decoder.
- The Log Decoder is not configured to receive global audit logs in CEF format:
  - Log Decoder capture is not turned on
  - CEF Parser is not present
  - CEF Parser is not enabled

Possible Solutions

The following table provides possible solutions for the issues.

Issue	Possible Solutions

A service is not logging to the local syslog server.	• Ensure that rsyslog is up and running.
	You could use the following command:
	`service rsyslog status`
	• Ensure that rsyslog is listening on port 50514 using UDP.
	You could use the following command:
	`netstat -tulnp|grep rsyslog`
	• Ensure the application or component is sending audit logs to port 50514. Run the tcpdump utility on the local interface for port 50514.
	You could use the following command:
	`sudo tcpdump -i lo -A udp and port 50514`
	
	See "Solution Examples" below to view the command outputs.

Issue	Possible Solutions

Audit logs are not getting uploaded to RabbitMQ from the local syslog.	• Ensure that the rsyslog plugin is up and running. You could use the following command:
	`ps -ef|grep rsa_audit_onramp`
	• Ensure the RabbitMQ server is up and running. You could use the following command:
	`service rabbitmq-server status`
	See "Solution Examples" to view the command outputs.

Audit logs are not aggregated on the NetWitness Server host.	• Ensure Logstash is up and running. You could use the following commands:
	`ps -ef|grep logstash`
	`service logstash status`
	• Ensure the RabbitMQ server is up and running. You could use the following command:
	`service rabbitmq-server status`
	• Ensure the RabbitMQ server is listening on port 5672. You could use the following command:
	`netstat -tulnp|grep 5672`
	• Check for any errors generated at the Logstash level. You could use the following command for the location of the log files:
	`ls -l /var/log/logstash/logstash.*`
	See "Solution Examples" to view the command outputs.

Issue	Possible Solutions

Aggregated logs on the NetWitness Server host are not being forwarded to the configured third-party syslog server or Log Decoder.	• Ensure Logstash is up and running.
	You could use the following commands:
	`ps -ef|grep logstash`
	`service logstash status`
	• Check for any errors generated at the Logstash level.
	You could type the following command for the location of the log files:
	`ls -l /var/log/logstash/logstash.`
	See "Solution Examples" below to view the command outputs.
	• Ensure that the destination service is up and running.
	• Ensure that the destination service is listening on the correct port using the correct protocol.
	• Ensure that the configured port on the destination host is not blocked.

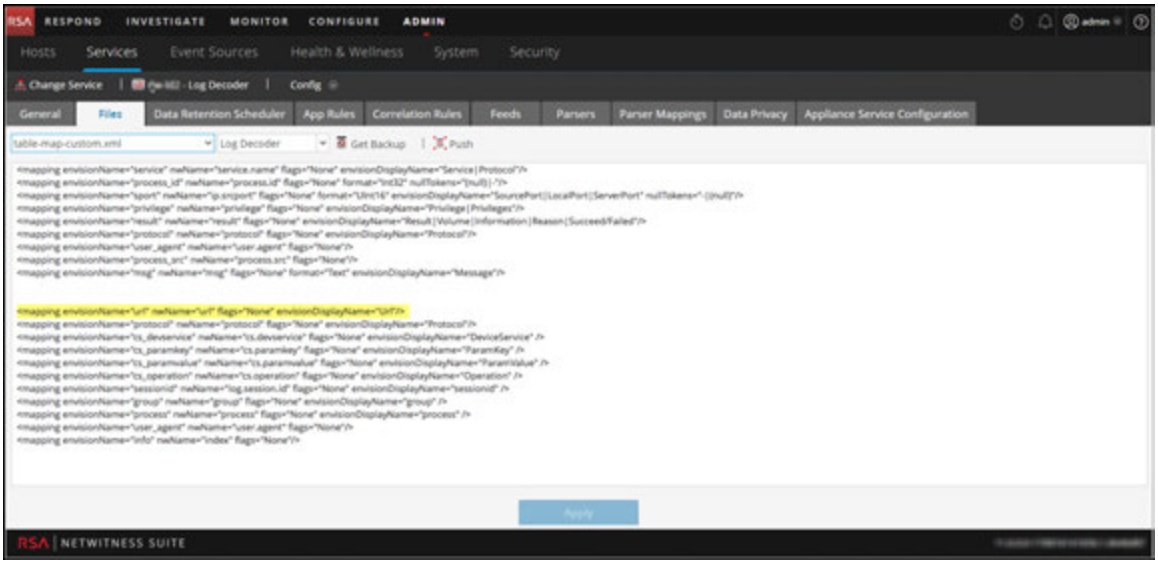
Audit logs forwarded from the Logstash lead to parse failure at the Log Decoder.	• Ensure that you are using an appropriate notification template. Audit Logs parsed by a Log Decoder must be in CEF format. The destination from which audit logs directly or indirectly make their way to the Log Decoder must also use a CEF Template. • The Notification Template must follow the CEF standard. Follow the steps in this guide to either use the default CEF template or create a custom CEF template following strict guidelines. Define a Template for Global Audit Logging provides additional information. • Verify the Logstash configuration.

Why can't we see the custom metadata in Investigation?

Usually, if a meta key is not visible in Investigation, it is not being indexed. If you need to use custom meta keys for Investigations and Reporting, ensure that the meta keys that you select are indexed in the **table-map-custom.xml** file on the Log Decoder. Follow the "Maintain the Table Map Files" procedure to modify the **table-map-custom.xml** file on the Log Decoder.

Ensure that the custom meta keys are also indexed in the **index-concentrator-custom.xml** on the Concentrator. "Edit a Service Index File" provides additional information.

The following figure shows an example **table-map-custom.xml** file in NetWitness Server (ADMIN > Services > (select the Log Decoder) > >View > Config) with a custom meta `url` example highlighted.

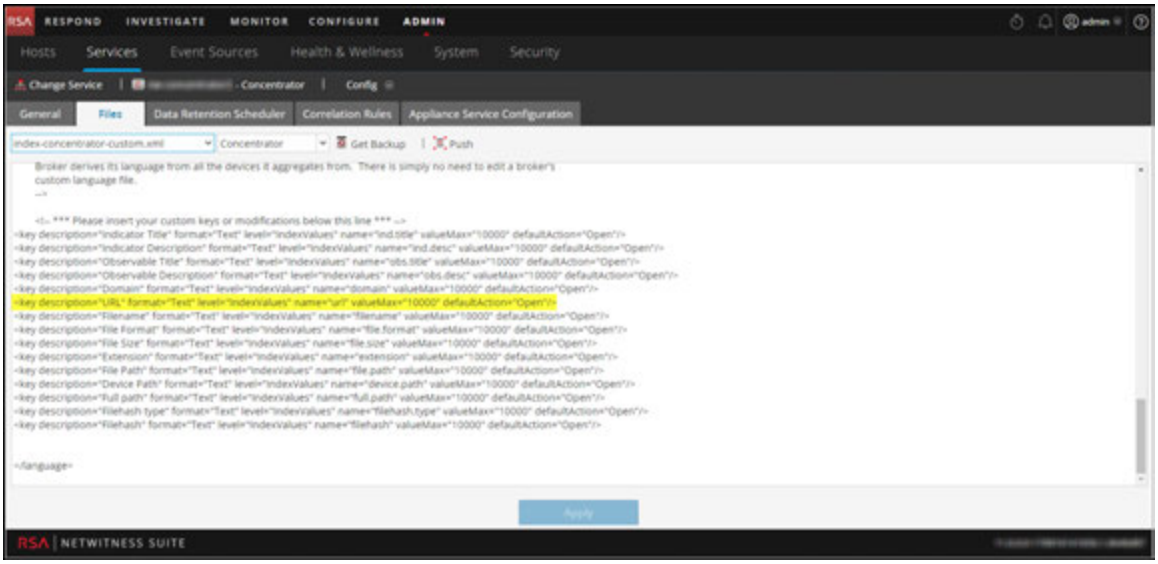


The `url` custom meta example is highlighted in the following code sample from the **table-map-custom.xml** file above:

```
<mapping envisionName="url" nwName="url" flags="None"
envisionDisplayName="Url"/>
<mapping envisionName="protocol" nwName="protocol" flags="None"
envisionDisplayName="Protocol"/><mapping envisionName="cs_devservice"
nwName="cs.devservice" flags="None" envisionDisplayName="DeviceService"
/><mapping envisionName="cs_paramkey" nwName="cs.paramkey" flags="None"
envisionDisplayName="ParamKey" /><mapping envisionName="cs_paramvalue"
nwName="cs.paramvalue" flags="None" envisionDisplayName="ParamValue"
/><mapping envisionName="cs_operation" nwName="cs.operation"
flags="None" envisionDisplayName="Operation" /><mapping
envisionName="sessionid" nwName="log.session.id" flags="None"
envisionDisplayName="sessionid" /><mapping envisionName="group"
```

```
nwName="group" flags="None" envisionDisplayName="group" /><mapping
envisionName="process" nwName="process" flags="None"
envisionDisplayName="process" /><mapping envisionName="user_agent"
nwName="user.agent" flags="None"/><mapping envisionName="info"
nwName="index" flags="None"/>
```

The following figure shows an example **index-concentrator-custom.xml** file in NetWitness Server (ADMIN > Services > (select the Concentrator) >  > View > Config) with a custom meta `url` example highlighted.



The `url` custom meta example is highlighted in the following code sample from the **index-concentrator-custom.xml** file above:

```
<key description="Severity" level="IndexValues" name="severity"
valueMax="10000" format="Text"/><key description="Result"
level="IndexValues" name="result" format="Text"/><key
level="IndexValues"  name="ip.srcport" format="UInt16"
description="SourcePort"/><key description="Process" level="IndexValues"
name="process" format="Text"/><key description="Process ID"
level="IndexValues" name="process_id" format="Text"/><key
description="Protocol" level="IndexValues" name="protocol"
format="Text"/><key description="UserAgent" level="IndexValues"
name="user_agent" format="Text"/><key description="DestinationAddress"
level="IndexValues" name="ip.dst" format="IPv4"/><key
description="SourceProcessName" level="IndexValues" name="process.src"
```

```
format="Text"/><key description="Username" level="IndexValues"
name="username"  format="Text"/><key description="Info"
level="IndexValues" name="index"  format="Text"/><key
description="customdevservice" level="IndexValues" name="cs.devservice"
format="Text"/>
<key description="url" level="IndexValues" name="url"  format="Text"/>
<key description="Custom Key" level="IndexValues" name="cs.paramkey"
format="Text"/><key description="Custom Value" level="IndexValues"
name="cs.paramvalue"  format="Text"/><key description="Operation"
level="IndexValues" name="cs.operation"  format="Text"/><key
description="CS Device Service" level="IndexValues" name="cs.device"
format="Text" valueMax="10000" defaultAction="Closed"/>
```

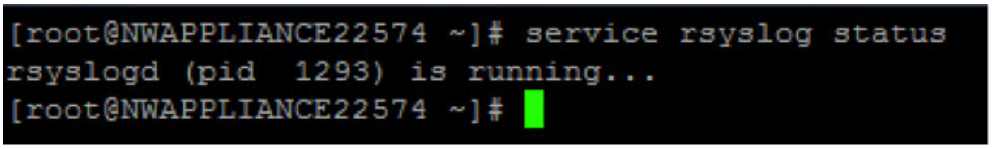
Solution Examples

The following possible solution examples show the outputs of the example commands. See the above table for the complete listing of possible solutions.

Ensure that rsyslog is up and running

You can use the following command:

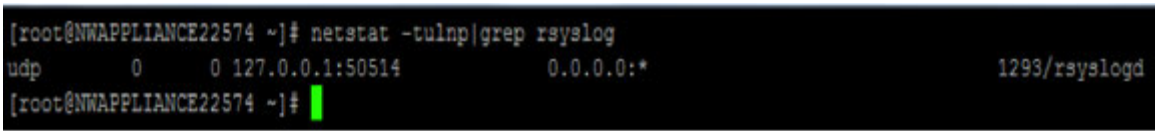
```
service rsyslog status
```



Ensure that rsyslog is listening on port 50514 using UDP

You can use the following command:

```
netstat -tulnp|grep rsyslog
```

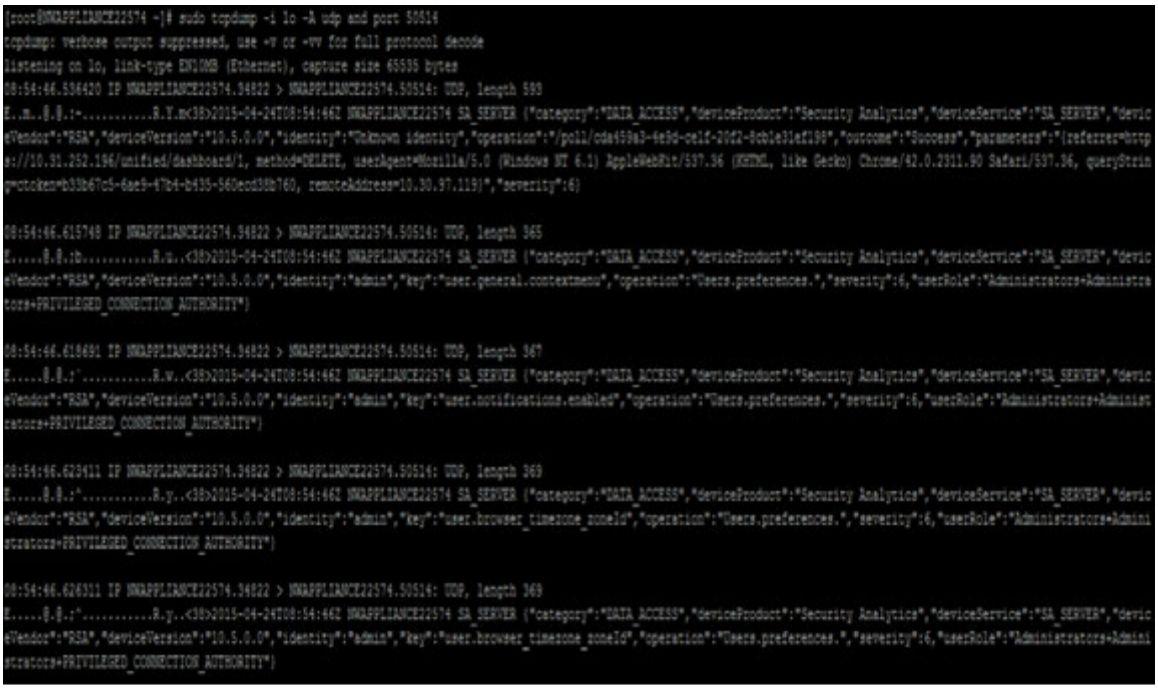


Ensure that the application or component is sending audit logs to port 50514

The following figure shows the output of running the tcpdump utility on the local interface for port 50514.

You can use the following command:

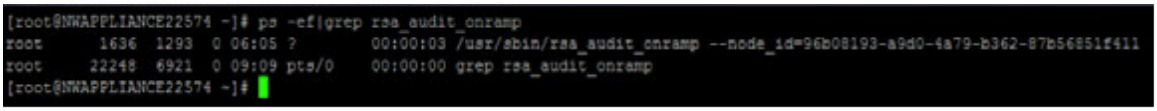
```
sudo tcpdump -i lo -A udp and port 50514
```



Ensure that the rsyslog plugin is up and running

You can use the following command:

```
ps -ef|grep rsa_audit_onramp
```



Ensure the RabbitMQ server is up and running

You can use the following command:

```
service rabbitmq-server status
```

```
[root@NWAPPLIANCE22574 ~]# service rabbitmq-server status
Status of node sa@localhost ...
[{pid,1862},
 {running_applications,
     [{rabbitmq_federation_management,"RabbitMQ Federation Management",
         "3.4.2"},
      {rabbitmq_management,"RabbitMQ Management Console","3.4.2"},
      {rabbitmq_web_dispatch,"RabbitMQ Web Dispatcher","3.4.2"},
      {webmachine,"webmachine","1.10.3-rmq3.4.2-gite9359c7"},
      {mochiweb,"MochiMedia Web Server","2.7.0-rmq3.4.2-git680dba8"},
      {rabbitmq_federation,"RabbitMQ Federation","3.4.2"},
      {rabbitmq_stomp,"Embedded Rabbit Stomp Adapter","3.4.2"},
      {rabbitmq_management_agent,"RabbitMQ Management Agent","3.4.2"},
      {rabbit,"RabbitMQ","3.4.2"},
      {ssl,"Erlang/OTP SSL application","5.3.2"},
      {public_key,"Public key infrastructure","0.21"},
      {crypto,"CRYPTO version 2","3.2"},
      {asn1,"The Erlang ASN1 compiler version 2.0.4","2.0.4"},
      {os_mon,"CPO  CXC 138 46","2.2.14"},
      {inets,"INETS  CXC 138 49","5.9.7"},
      {mnesia,"MNESIA  CXC 138 12","4.11"},
      {amqp_client,"RabbitMQ AMQP Client","3.4.2"},
      {rabbitmq_auth_mechanism_ssl,
          "RabbitMQ SSL authentication (SASL EXTERNAL)","3.4.2"},
      {xmerl,"XML parser","1.3.5"},
      {sasl,"SASL  CXC 138 11","2.3.4"},
      {stdlib,"ERTS  CXC 138 10","1.19.4"},
      {kernel,"ERTS  CXC 138 10","2.16.4"}]},
 {os,{unix,linux}},
 {erlang_version,
     "Erlang R16B03 (erts-5.10.4) [source] [64-bit] [smp:2:2] [async-threads:30] [kernel-poll:true]\n"},
```

Ensure logstash is up and running

You can use the following commands:

```
ps -ef|grep logstash
service logstash status
```

```
[root@NWAPPLIANCE22574 ~]# ps -ef|grep logstash
logstash  1583     1  0 06:05 ?        00:01:09 /usr/bin/java -Djava.io.tmpdir=/var/lib/logstash -Xmx500m -XX:+UseParNewGC -XX:+UseConcMarkSweepGC -Djava.awt.headless=true -XX:
MSInitiatingOccupancyFraction=75 -XX:+UseCMSInitiatingOccupancyOnly -jar /opt/logstash/vendor/jar/jruby-complete-1.7.11.jar -I/opt/logstash/lib /opt/logstash/lib/logstash/runne
.rb agent --pluginpath /opt/logstash -f /etc/logstash/conf.d -l /var/log/logstash/logstash.log
root      8509  4921  0 09:31 pts/0    00:00:00 grep logstash
[root@NWAPPLIANCE22574 ~]# service logstash status
logstash is running
[root@NWAPPLIANCE22574 ~]#
```

Ensure the RabbitMQ server is listening on port 5672

For example, type the following command:

```
netstat -tulnp|grep 5672
```

```
[root@NWAPPLIANCE22574 ~]# netstat -tulnp|grep 5672
tcp        0      0 127.0.0.1:5672              0.0.0.0:*                   LISTEN      1862/beam.smp
tcp        0      0 0.0.0.0:25672               0.0.0.0:*                   LISTEN      1862/beam.smp
[root@NWAPPLIANCE22574 ~]#
```

Check for any errors generated at the Logstash level

You can type the following command for the location of the log files:

```
ls -l /var/log/logstash/logstash.*
```

```
[root@NWAPPLIANCE22574 ~]# ls -l /var/log/logstash/logstash.*
-rw-r--r--. 1 root     root        0 Apr 24 06:05 /var/log/logstash/logstash.err
-rw-r--r--. 1 logstash logstash 1043 Apr 24 06:04 /var/log/logstash/logstash.log
-rw-r--r--. 1 root     root       57 Apr 24 06:12 /var/log/logstash/logstash.stdout
[root@NWAPPLIANCE22574 ~]#
```

See the Possible Solutions table above for the complete listing of issues and possible solutions.

Troubleshooting NTP Server Configuration

This topic describes NTP server configuration issues that you may encounter and suggests solutions to these problems.

Issues Identified by Messages in the NTP Settings Panel or Log Files

This section provides troubleshooting information for issues identified by messages NetWitness Suite displays in the NTP Settings panel and log files.

Message	User Interface: **Unexpected error occurred. First check the logs then contact Customer Care to resolve error.** **System Log:** **Timestamp Level Message** *yyyy-dd-mmThh:mm:ss:ms* ERROR com.rsa.smc.sa.adm.exception.MCOAgent Exception: No request sent, we did not discover any nodes
Possible Cause	Low level NetWitness Suite configuration is in error or supporting service is not running.
Solution	Contact Customer Care.
Message	User Interface: **Specified an invalid Hostname syntax**.
Possible Cause	Tried to enter NTP server hostname that does not confirm to IP address or FQDN syntax.
Solution	Reenter hostname in using correct syntax.
Message	User Interface: **Specified NTP server that already exists.**
Possible Cause	Tried to enter NTP server hostname that is already defined in NetWitness Suite.
Solution	Enter hostname for an NTP server not configured in NetWitness Suite.
Message	User Interface: **Cannot reach NTP server *hostname***. Please verify the server address and your firewall settings.
Possible Cause	The server address or firewall settings may be in error.

Solution	Verify the server address and your firewall settings and correct them if required.

References

This topic provides reference materials that describe the user interface for configuring system settings in NetWitness Suite and define parameters. Administrators use options in the Administration System view to configure system settings. Each panel is described in a separate topic.

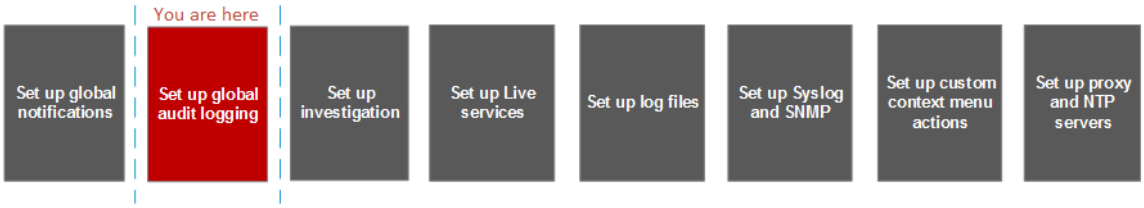
Global Audit Logging Configurations Panel

In the **Global Audit Logging Configurations** panel (ADMIN > System > Global Auditing), you configure global audit logging by adding configurations that define how global audit logs are forwarded to external syslog systems. Global audit logs are forwarded to the selected Notification Server in your global audit logging configuration using the selected Notification Template.

Global Audit Logging provides auditors with consolidated visibility into user activities within NetWitness Suite in real-time from one centralized location.

Workflow

This workflow shows the necessary procedures to configure and verify Global Audit Logging.



Before you can define a Global Audit Logging configuration, you need to create a Syslog Notification Server on the Global Notifications > Server tab. The Syslog Notification Server is the destination that receives the global audit logs. Next, you need to select or define an Audit Logging template on the Global Notifications > Templates tab. The Audit Logging template defines the format and message fields of the audit logs sent to the Log Decoder or third-party syslog server. If you are consuming with a Log Decoder, deploy the Common Event Format parser to your Log Decoder from Live.

Note: You do not need to configure the Global Notifications > Output tab for Global Audit Logging.

After you add a Global Audit Logging configuration here, audit logs are forwarded to the selected Notification Server in the configuration. Verify your audit logs to ensure that they show the audit events as defined in your audit logging template.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Create a Syslog Notification Server.	Configure a Destination to Receive Global Audit Logs

Role	I want to ...	Show me how
Administrator	Choose an Audit Logging template.	Define a Template for Global Audit Logging
Administrator	Configure Global Audit Logging	Define a Global Audit Logging Configuration For the complete procedure, see "Global Audit Logging - High-Level Procedure" in Configure Global Audit Logging.
Administrator	Verify Global Audit logs	Verify Global Audit Logs

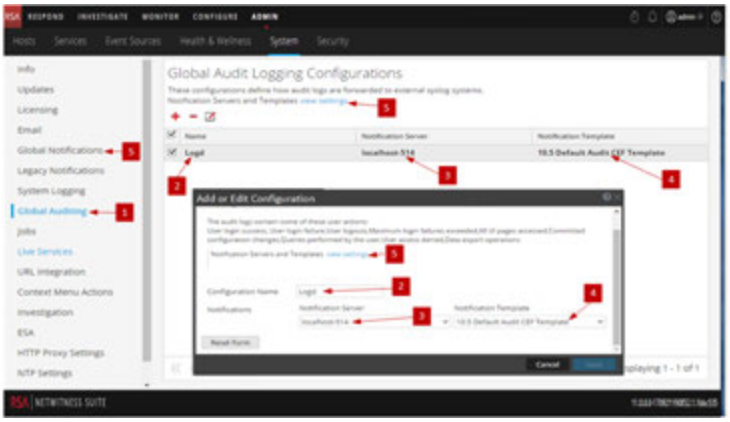
Quick Look

The following example illustrates a Global Audit Logging configuration. The configuration defines how NetWitness Suite forwards global audit logs to external syslog systems.



1 Displays the Global Audit Logging Configurations panel.

2 Name that identifies the Global Audit Logging configuration.

3	Notification Server assigned to the Global Audit Logging configuration.
4	Notification Template assigned to the Global Audit Logging configuration.
5	Displays the Global Notifications panel where you set up Servers and Templates required to configure a Global Audit Logging configuration.

Toolbar

The following table describes the toolbar actions

Icon	Description
	Adds a global audit logging configuration.
	Deletes a global audit logging configuration. Deleting a global audit configuration does not delete the associated notification server and template. After you delete a global audit logging configuration, the forwarding of global audit logs specified in that configuration is discontinued.
	Edits a global audit logging configuration. You can change the destination of the global audit logs for your user audits by selecting a different Notification Server. You can also change the format and message fields of the global audit log entries by selecting a different Notification Template. You cannot change which NetWitness Suite user actions are logged and sent in the global audit logs.

Configurations

The following table describes the listed configurations.

Title	Description
	To select an individual configuration, select the checkbox next to the configuration. To select all configurations, select the checkbox in the title bar of the table.

Title	Description
Name	Displays the name of the global auditing configuration. For example, you can name the configurations based on the destination of the global audit logs, such as HQ SA and My Syslog Server.
Notification Server	Displays the Syslog Notification Server selected as the destination for the global audit logs. If you want to forward global audit logs to a Log Decoder, create a Syslog type of Notification Server. Configure a Destination to Receive Global Audit Logs provides instructions on how to create a Syslog Notification Server for global audit logging.
Notification Template	Displays the Audit Logging Notification Template selected for the configuration. It defines the format and message fields of the audit log entries. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions and Supported CEF Meta Keys describes the available CEF meta keys. For, third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available meta key variables.

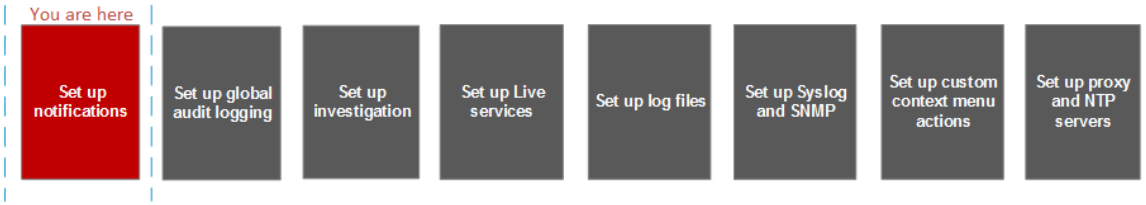
Global Notifications Panel

Global Notifications panel introduces the features for configuring notification settings. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

In the Global Notifications panel, you can configure the following global notification settings:

- Notification Outputs
- Notification Servers
- Templates

WorkFlow



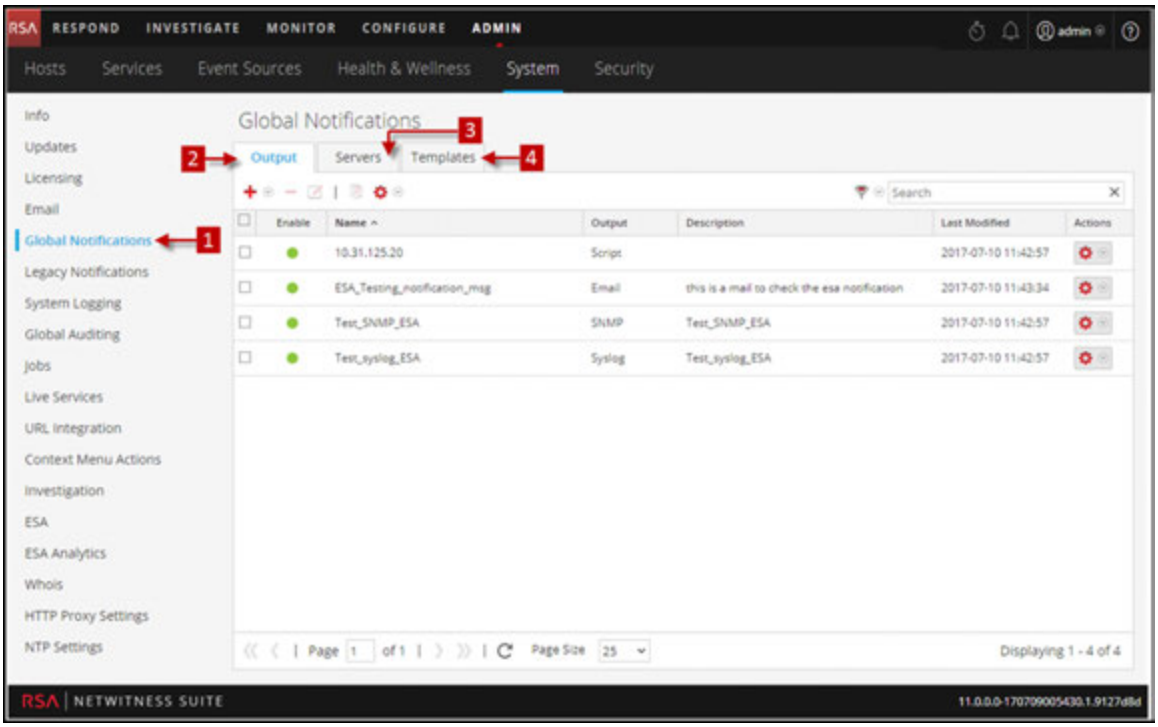
What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Notification Servers	Servers Tab
Administrator	Configure Notification Outputs	Output Tab
Administrator	Configure Notification Templates	Templates Tab

Related Topics

- Configure a Syslog Notification Server
- Configure Script as a Notification Server

Quick Look



1 Displays the Global Notification Panel.

2 Displays the Output Tab

3 Displays the Servers Tab

4 Displays the Templates Tab

Toolbar and Features

The Global Notifications panel has three tabs: Output, Servers, and Templates.

Feature	Description
Output tab	This tab enables you to configure notification outputs. See Output Tab for more information.
Servers tab	This tab enables you to configure notification servers. See Servers Tab for more information.
Templates tab	This tab enables you to configure notification templates. See Templates Tab for more information.

This table describes the columns in the grid for Notification Outputs and Notification Servers.

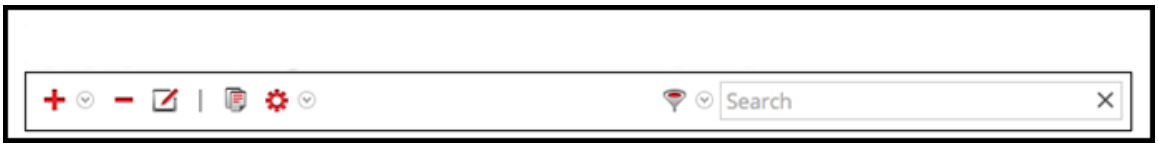
Column	Description
	Selects a row for an action in the toolbar. Clicking the checkbox in the column title selects or deselects all rows in the grid.
Enable	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
Name	A name that identifies or labels the configuration.
Output	The configuration output. The outputs are Email, SNMP, Syslog, and Script.
Description	A brief description about the configuration.
Last Modified	Shows the date and time of the last configuration change.
Actions	Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

This table describes the columns in the grid for Notification Templates.

Column	Description
	Selects a row for an action in the toolbar. Clicking the checkbox in the column title selects or deselects all rows in the grid.
Name	A name that identifies or labels the template.
Template Type	The type of template. The types are Audit Logging, Event Stream Analysis, Event Source Monitoring, and Health Alarms.
Description	A brief description about the template.
Actions	Provides an Actions menu for the selected configuration with actions that can be taken on the template. The Actions menu enables you to delete, edit, duplicate, and export the template.

Global Notifications Panel Toolbar

The Global Notifications panel toolbar is at the top of the Output, Servers, and Templates tabs. The following figure shows the toolbar on the Output and Servers tabs.



The following figure shows the toolbar on the Templates tab.

The following table describes the features of the Global Notifications panel toolbar.

Feature	Description
	Adds a notification server on the Servers tab, adds a notification output (notification) on the Output tab, and adds a notification template on the Templates tab. On the Servers and Output tabs, you can select to configure Email, SNMP, Syslog, and Script notification settings.
	Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting > Delete.
	Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting > Edit.

Feature	Description
	Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting  > Duplicate.
	Displays the following options: • **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration. • **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations. • **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting  > Export.
	Filters by Email, SNMP, Syslog, or Script.
	Searches configurations in the grid.

Define Notification Server Dialogs

This topic describes the Define Notification Server dialogs used to configure the settings of the various types of notification servers. You configure notification servers in the Administration > System > Notifications > Servers tab.

Notifications are used by a variety of components in NetWitness Suite, such as Event Stream Analysis (ESA), RESPOND, and Global Audit Logging. Notification settings are called Notification Servers. In the Servers tab of the Administration System view Notifications panel, you can create multiple Notification Server configurations.

You can configure the following types of notification server settings in NetWitness Suite:

- Email
- SNMP
- Syslog
- Script

For Global Audit Logging, you can only use Syslog Notification Servers.

Procedures related to notification servers are described in Configure Notification Servers.

To access the Define Notification Server dialogs:

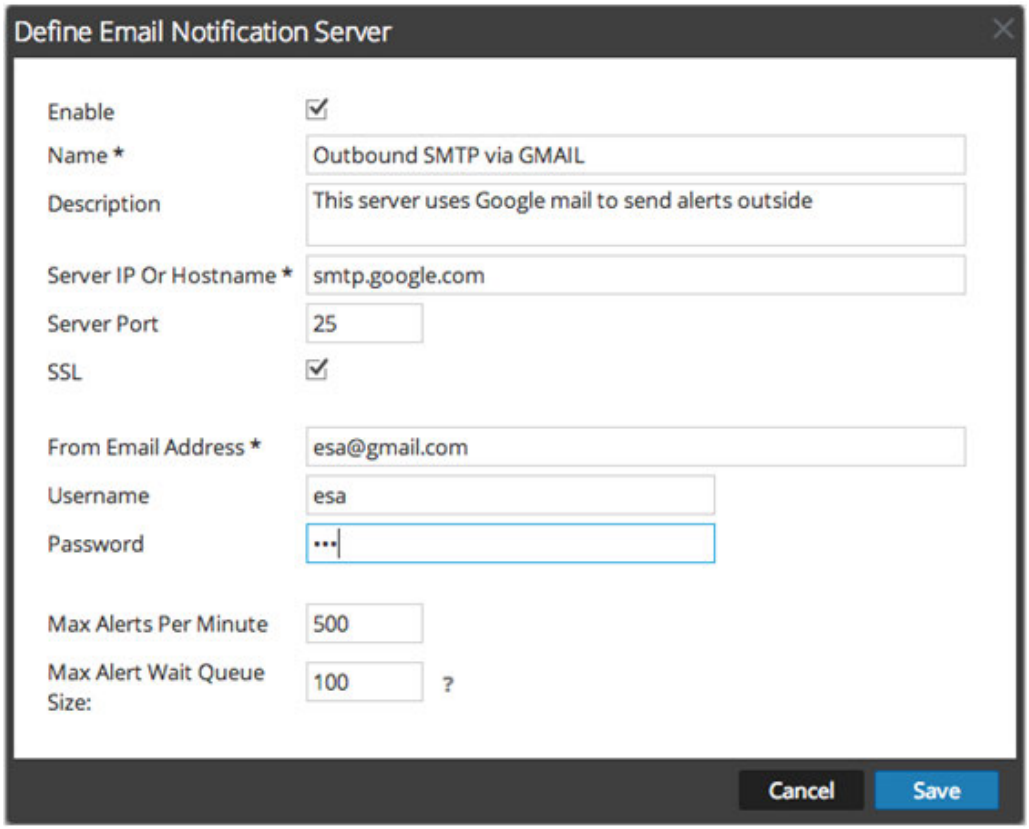
1. Go to **ADMIN > System**.
2. In the left navigation panel, select **Global Notifications**.
3. In the **Notifications Servers** panel, click + and then select a type of notification server (Email, SNMP, Syslog, or Script)
   The Define Notification Server dialog is displayed for your selection.

There are four notification server dialogs, which allow you to configure notification servers.

Email

Email notification servers enable you to configure email server settings to send alert notifications.

The following figure shows the Define Email Notification Server dialog.



The following table lists the various parameters that you need to define for the email notification servers.

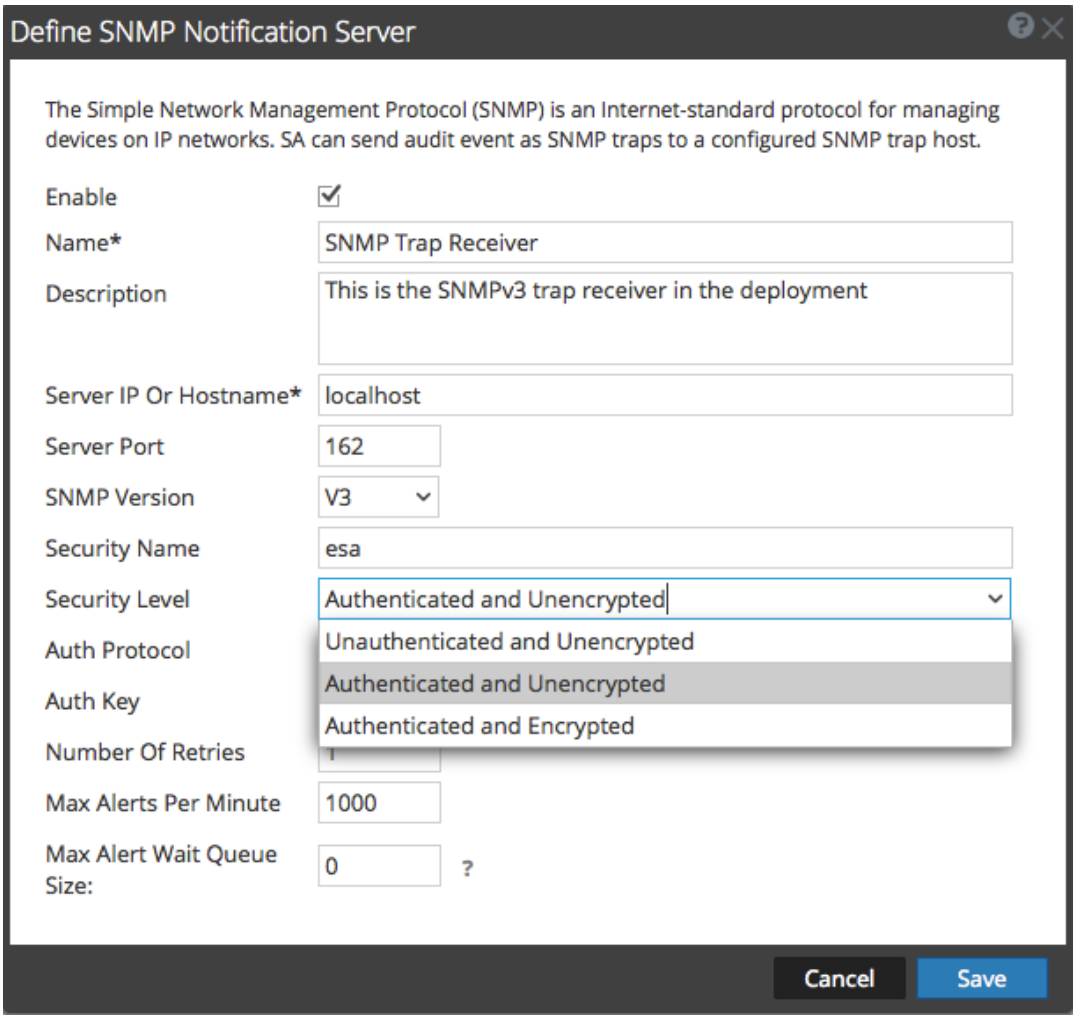
Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	Hostname of the email server. For ESM/SMS and ESA notifications, you must specify only the hostname/FQDN.
Server Port	The server port.
SSL	Select the option if you want the communication to happen through SSL.

Parameters	Description
From EMail Address	Email account from which you want to send email notifications.
Username	Username for logging into the email account if the SMTP server requires user authentication to relay emails successfully.
Password	User password for logging into the email account if the SMTP server requires user authentication to relay emails successfully.
Max Alerts Per Minute	Describes the maximum number of alerts per minute.
Max Alert Wait Queue Size	Describes the maximum number of alerts to be queued before they are dropped.

SNMP

SNMP notification servers enable you to configure SNMP trap host settings as a notification server to send alert notifications.

The following figure shows the Define SNMP Notification Server dialog.



The following table lists the various parameters that you need to define for the SNMP notification servers.

Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	SNMP trap host IP address or hostname.

Parameters	Description
Server Port	Listening port number on the SNMP trap host.

<table>
<tr><th>Parameters</th><th>Description</th></tr>
<tr><td>SNMP Version</td><td>SNMP version. The following are the options:
V1
V2C
V3
If you select SNMP Version 3 (v3), the following parameters are displayed:<table><tr><th>Parameters</th><th>Description</th></tr><tr><td>Notification Type</td><td>Based on the notification type a SNMP messages are sent each time an alert is generated.
The following notification types are supported:
Inform - Inform is acknowledged trap. The sender gets an acknowledgement from the receiver.
Trap - Trap is unacknowledged notification</td></tr><tr><td>Authoritative Engine ID (This optioin is availabe only for notification type TRAP)</td><td>An identifier which is used to identify the agents. Authoritative engine ID along with the username is used to uniquely identify the agent.</td></tr><tr><td>Security Level</td><td>Define the security level. The following are the options:
Unauthenticated and Unencrypted
Authenticated and Unencrypted
Authenticated and Encrypted</td></tr></table></td></tr>
</table>

Parameters	Description	
	Auth Protocol (This option is available only for security level Authenticated and Unencrypted and Authenticated and Encrypted)	Authentication protocol which is used to validate a user before providing an access to the server. The options are: • SHA • MD5
	Auth Key (This option is available only for security level Authenticated and Unencrypted and Authenticated and Encrypted)	A password that you want to use for authentication.
	Privacy Protocol (This option is available only for security level Authenticated and Encrypted)	Privacy protocol is an encryption technique for data communication.
	Private Key (This option is avaliable only for security level Authenticated and Encrypted)	A password that you want to use for encryption.
Community	Community string used to authenticate on the SNMP trap host. The default value is **public**.	

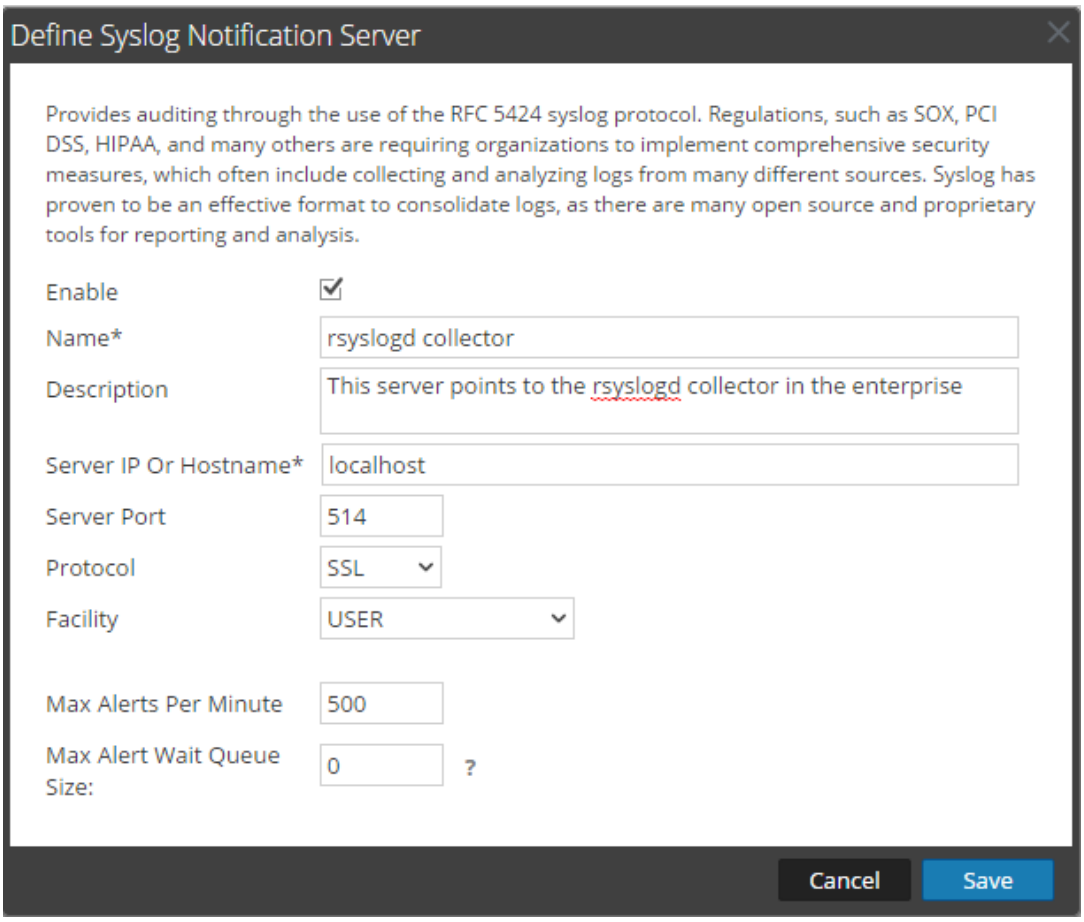
Parameters	Description
Number of Retries	Number of retries for the trap.
Max Alerts Per Minute	Maximum number of alerts per minute.
Max Alert Wait Queue Size	Maximum number of alerts to be queued before they are dropped.

Syslog

Syslog notification servers allow you to configure Syslog settings as a notification server to send notifications. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

You cannot disable notification servers associated with global audit logging configurations.

The following figure shows the Define Syslog Notification Server dialog.



The following table lists the various parameters that you need to define for the Syslog notification servers.

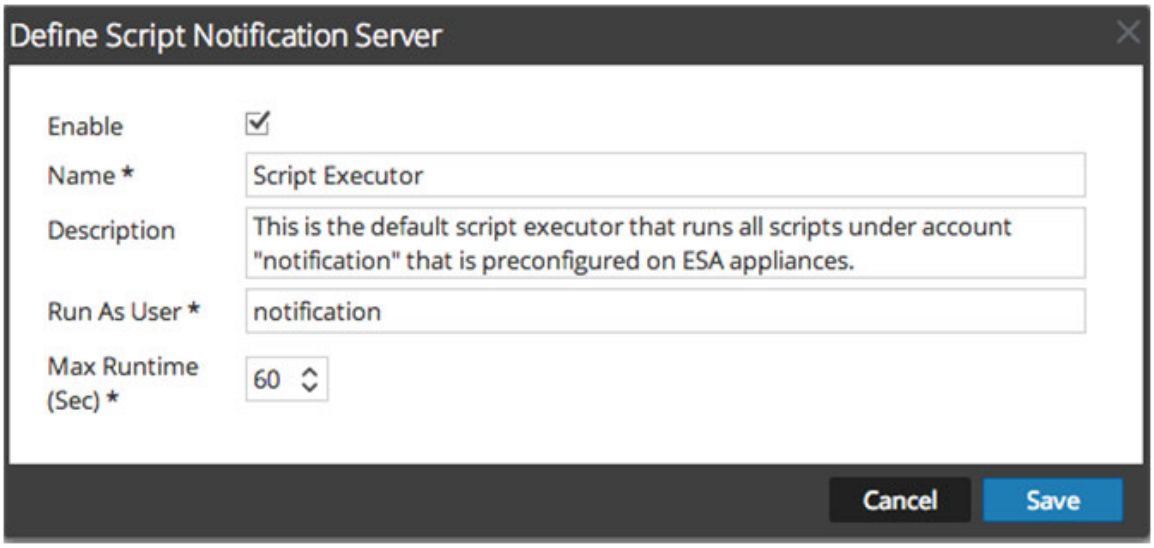
Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	The hostname of the host where the target Syslog process is running.
Server Port	The port number where the target Syslog process is listening.
Protocol	The protocol to be used to transfer the Syslog files.

Parameters	Description
Facility	The designated Syslog facility to use for all outgoing messages. It is used to specify what type of program is logging the message. Some possible values are KERN, USER, MAIL, and DAEMON. This lets the configuration file specify that messages from different facilities will be handled differently.
Max Alerts Per Minute	Maximum number of alerts per minute. This field is not used for Global Audit Logging.
Max Alert Wait Queue Size	Maximum number of alerts to be queued before they are dropped. This field is not used for Global Audit Logging.

Script

Script notification servers enable you to configure Script as a Notification Server.

The following figure shows the Define Script Notification Server dialog.



The following table lists the various parameters that you need to define for the Script notification servers.

Parameters	Description
Enable	Select to enable the notification server.

Parameters	Description
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Run As User	Name of the user identity under which the script is executed. The default user identity is **notification**. For ESA, you cannot set this to anything else unless you have created the account on the ESA host.
Max Runtime (Sec)	The maximum time (in seconds) the script is allowed to run.

Define Notification Output Dialogs

This topic provides descriptions of the various notification output dialogs. You configure notification outputs in the ADMIN > System > Notifications > Output tab. Notifications are basically the destinations used for sending notifications. For ESA, notifications enable you to define how you want to receive the ESA alerts. The following are the different notifications supported by NetWitness Suite:

- Email
- SNMP
- Syslog
- Script

Procedures related to notifications are described in Configure Notification Outputs.

To access the Define Notification dialogs:

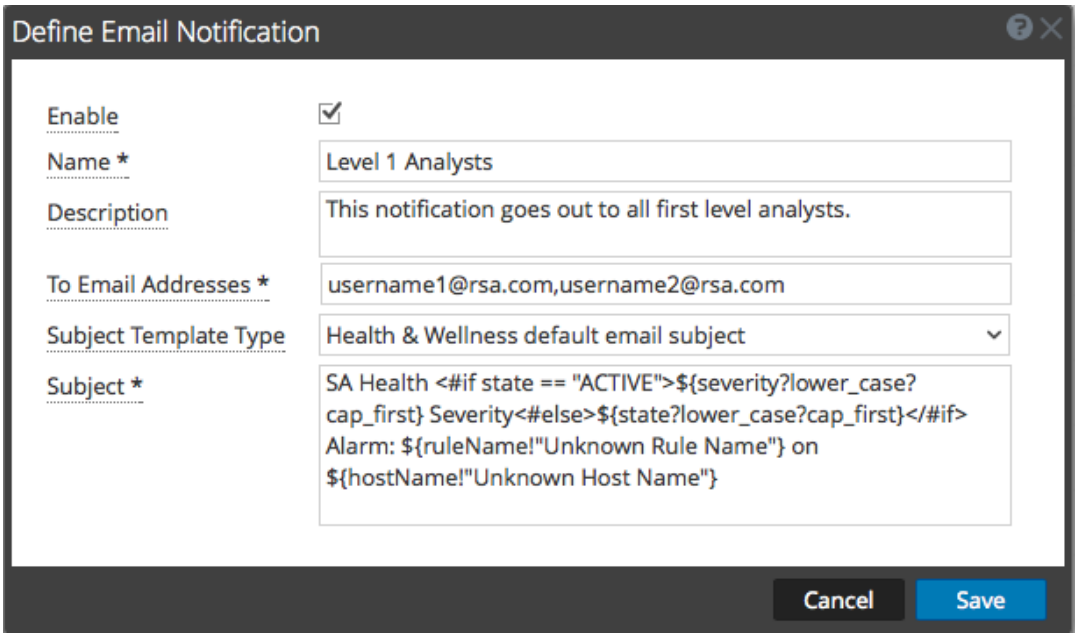
1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. On the **Output** tab, click + and then select a notification output (Email, SNMP, Syslog, or Script)
   The Define Notification dialog is displayed for your selection.

There are four notification dialogs, which allow you to configure notification outputs.

Email

Email notifications enable you to define the destination email address to which you can send the alerts. It also enables you to add a custom description in the subject of the email and also to define multiple destination email addresses.

The following figure shows the Define Email Notification dialog.



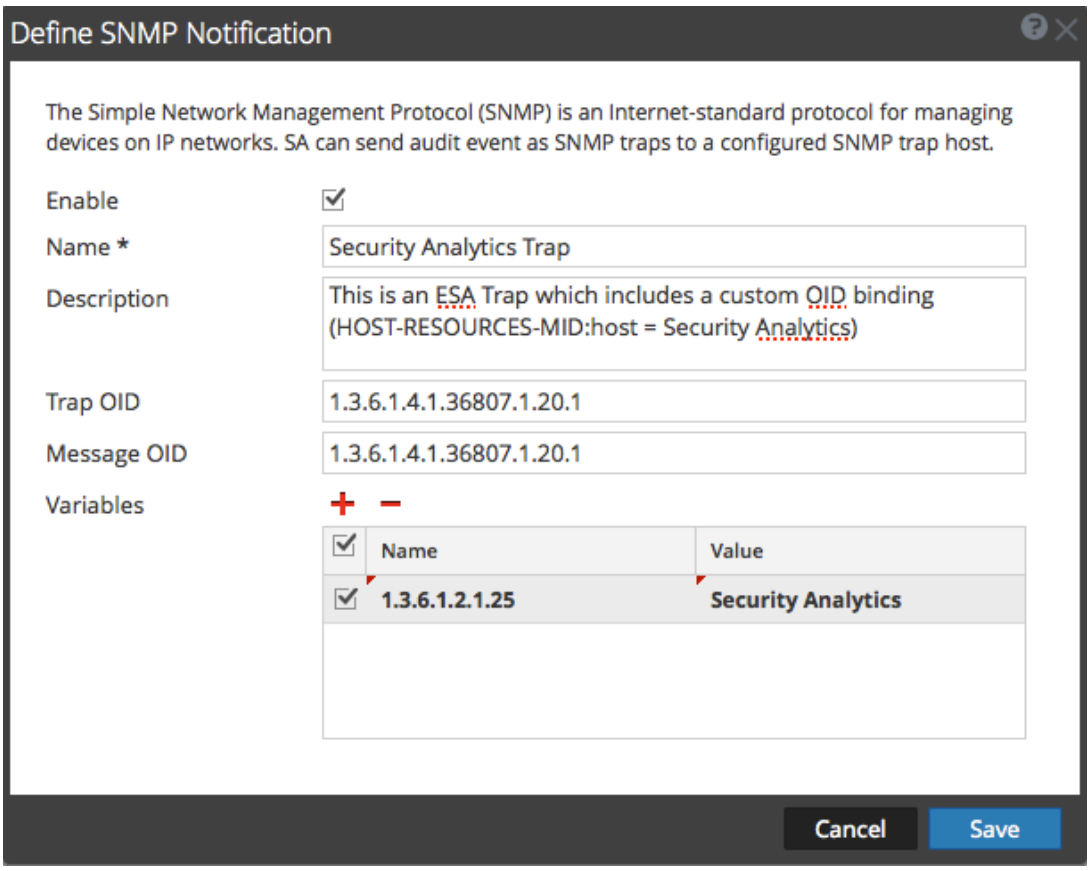
The following table lists the various parameters that you need to define for the email notifications.

Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
To Email Addresses	Describes the destination email address to which the alert needs to be sent. **Note:** You can define multiple email addresses.
Subject Template Type	Lists available templates for creating a subject. When you choose a template, the Subject field is automatically filled in with the code for your chosen template.
Subject	Custom description about the triggered alert. This information is automatically filled in if you choose one of the predefined templates from the Subject Template Type drop-down menu. **Note:** To provide a custom subject, please refer to "Include the Default Email Subject Line" topic in the *System Maintenance Guide*.

SNMP

SNMP notifications enable you to define the SNMP settings to send alert notifications.

The following figure shows the Define SNMP Notification dialog.



The following table lists the various parameters that you need to define for the SNMP notifications.

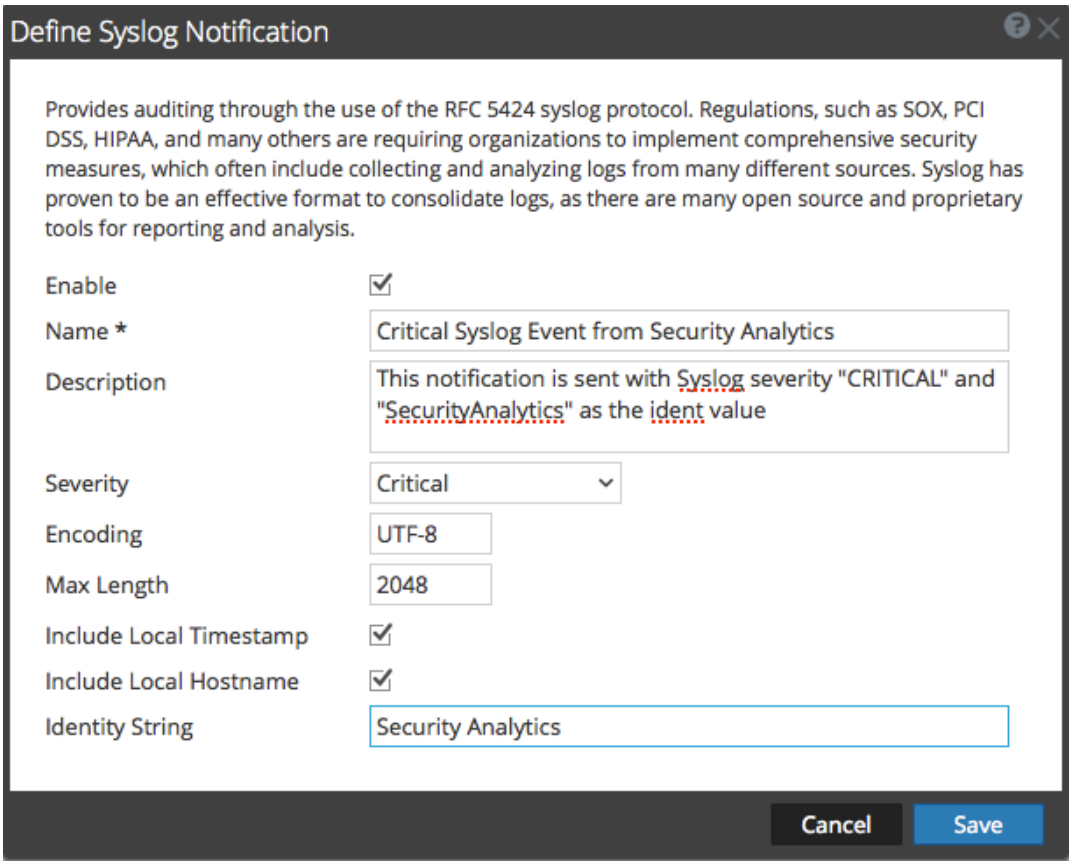
Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
Trap OID	The object ID for the SNMP trap on the trap host that receives the event. The default value is **1.3.6.1.4.1.36807.1.20.1**. This value is a hierarchical name that represents the system that generates the trap. 1.3.6.1.4.1 is the common prefix for all enterprises and 36807.1.20.1 identifies NetWitness Suite.

Parameter	Description
Message OID	The message object identifier for the SNMP trap.
Variables	Additional information that should be included within the trap. It is a variable that is a name value pair.

Syslog

Syslog notifications enable you to define the Syslog settings to send alert notifications.

The following figure shows the Define Syslog Notification dialog.



The following table lists the various parameters that you need to define for the Syslog notifications.

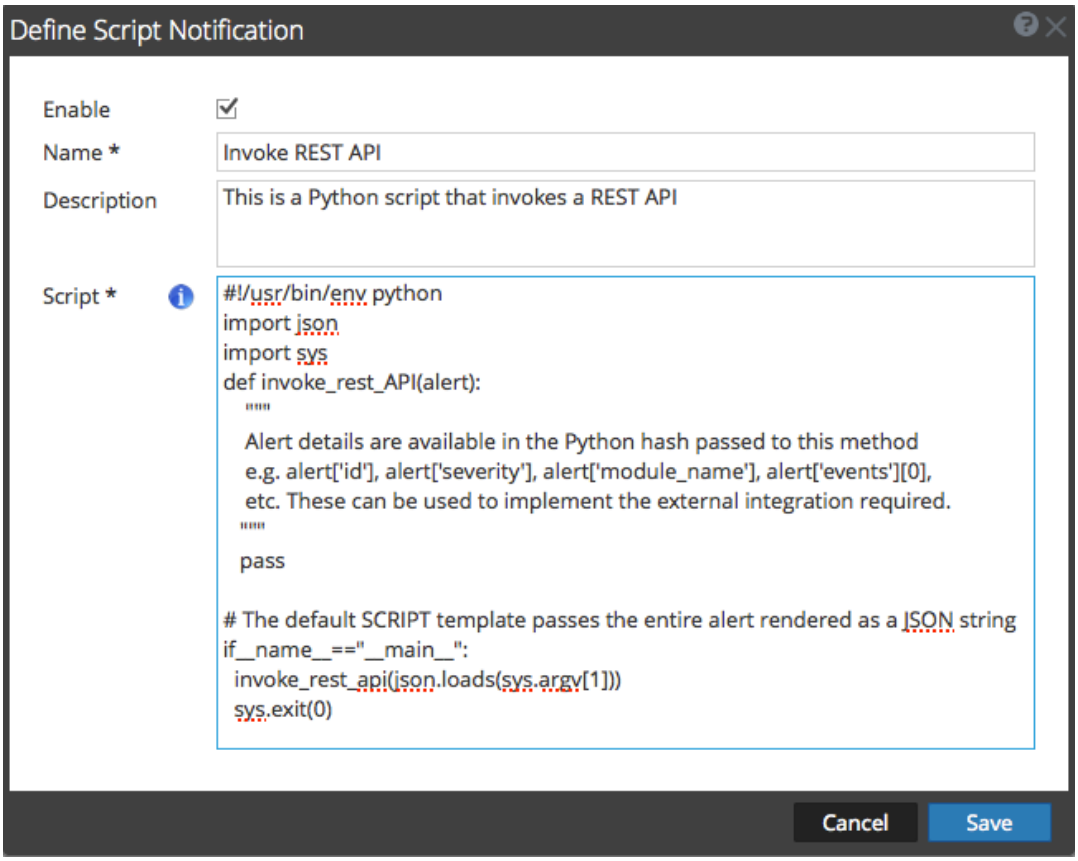
Parameter	Description
Enable	Select to enable the notification.

Parameter	Description
Name	A name to identify or label the notification.
Description	A brief description about the notification.
Severity	Defines the severity of the alert.
Encoding	Defines the encoding format. In some environments where no regular character sets are used (for example, Japanese characters), this field will help selecting the right encoding of the characters.
Max Length	The maximum length of a Syslog message in bytes. The default value is **2048**. Messages that exceed the maximum length are truncated when the **Truncate overly large syslog messages** checkbox is selected, which is found in Administration > System > Legacy Notifications. Legacy Notifications Configuration Panel provides additional information.
Include Local Timestamp	Select to include the local timestamp in messages.
Include Local Hostname	Select to include the local hostname in Syslog messages.
Identity String	An identity string to be prefixed to each Syslog alert. If the string is blank, no identity string is prefixed to the outgoing Syslog alerts. You can use this to identify the alerts from ESA.

Script

Script notifications enable you to define the Script that executes in response to the alert. You can use any script for ESA notifications.

The following figure shows the Define Script Notification dialog.



The following table lists the various parameters that you need to define for the Script notifications.

Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
Script	Defines the script.

Define Notification Template Dialog

In the Global Notifications panel, you can configure global notification settings for Notification Servers, Notification Outputs, and Notification Templates. On the Templates tab, you configure the templates for various notifications. The notification template defines the format and message fields of the notifications. You can select a default template or you can use the Define Template dialog to configure and edit templates.

You can define the following template types:

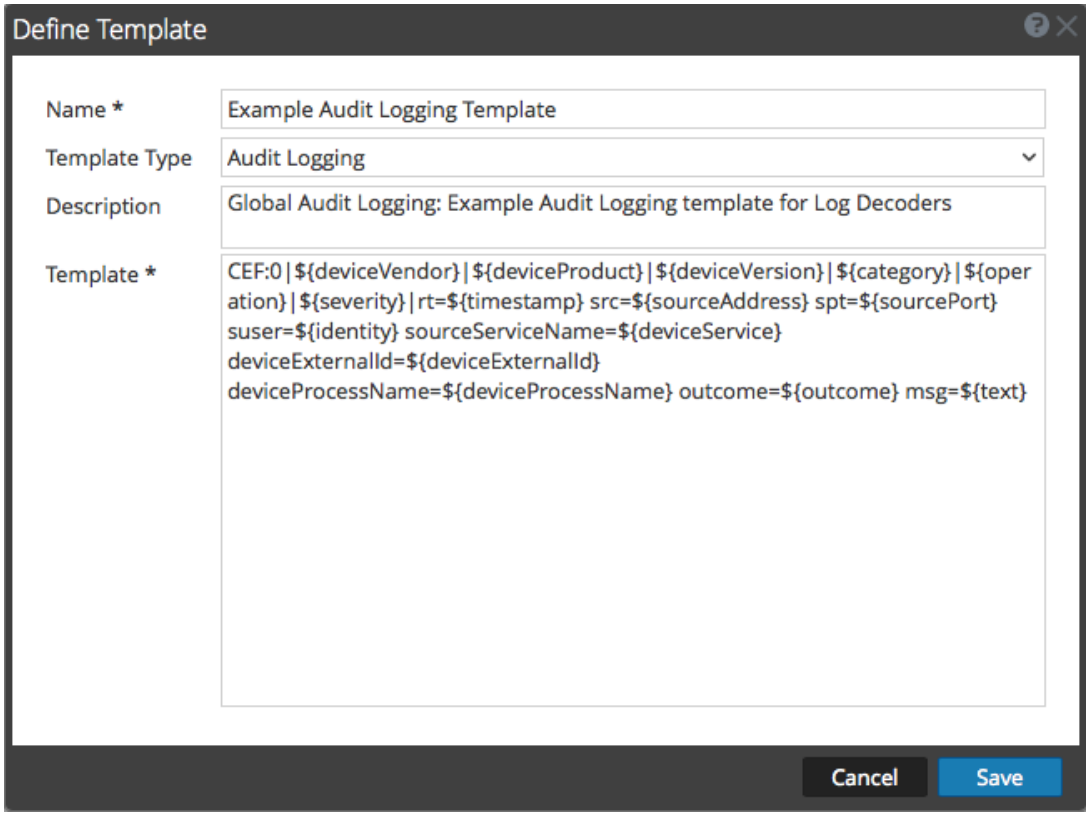
- Audit Logging
- Event Stream Analysis
- Event Source Monitoring
- Health Alarms

Procedures related to notification templates are described in Configure Templates for Notifications.

To access the Define Template dialog:

1. Go to **ADMIN > System**.
2. In the left navigation panel, select **Global Notifications > Template Tab**.
3. In the **Notifications Configurations** panel, click +, or select a configuration and click  .

The **Define Template** dialog is displayed.



Features

The following table describes the features in the Define Template dialog.

Field	Description
Name	Type a unique name for the notification template.
Template Type	Select the type of template that you want to create: • **Audit Logging**: Use this template for Global Audit Logging. • **Event Stream Analysis**: Use this template type for ESA alert notifications. • **Event Source Monitoring**: Use this template type for ESM notifications. • **Health Alarms**: Use this template type for Health and Wellness notifications.

Field	Description
Description	Add a description for the template. For example, if you create a notification template for Log Decoders to use for Global Audit Logging, you could mention that information in the description.
Template	Specify the format for the template. Define a Template for Global Audit Logging provides instructions on how to define an audit logging template to use for Global Audit Logging. To define a template for Event Stream Analysis (ESA), see Define a Template for ESA Alert Notifications.

Output Tab

In the **Global Notifications** panel, in the **Output** tab (Admin > System > Notifications > Output), you configure notification outputs. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and RESPOND.

Notification Output configurations define email addresses and subject lines, SNMP trap OID settings, syslog output settings, and script code.

Notifications are the destinations configured for the alert notifications that are sent by ESA service. You can configure the following as destinations using the Output tab:

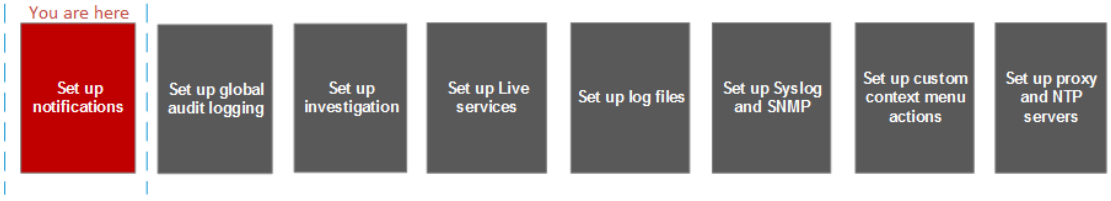
- Email
- SNMP
- Syslog
- Script

Note: You do not need to configure the Output tab for Global Audit Logging. For detailed steps, see Configure Global Audit Logging.

Workflow

This workflow shows the necessary procedures to configure and verify the output for Global Notifications. You can perform the following:

- Configure the Email settings as notification.
- Configure SNMP settings as notification.
- Configure Syslog settings as notification.
- Configure a Script as notification.



What do you want to do?

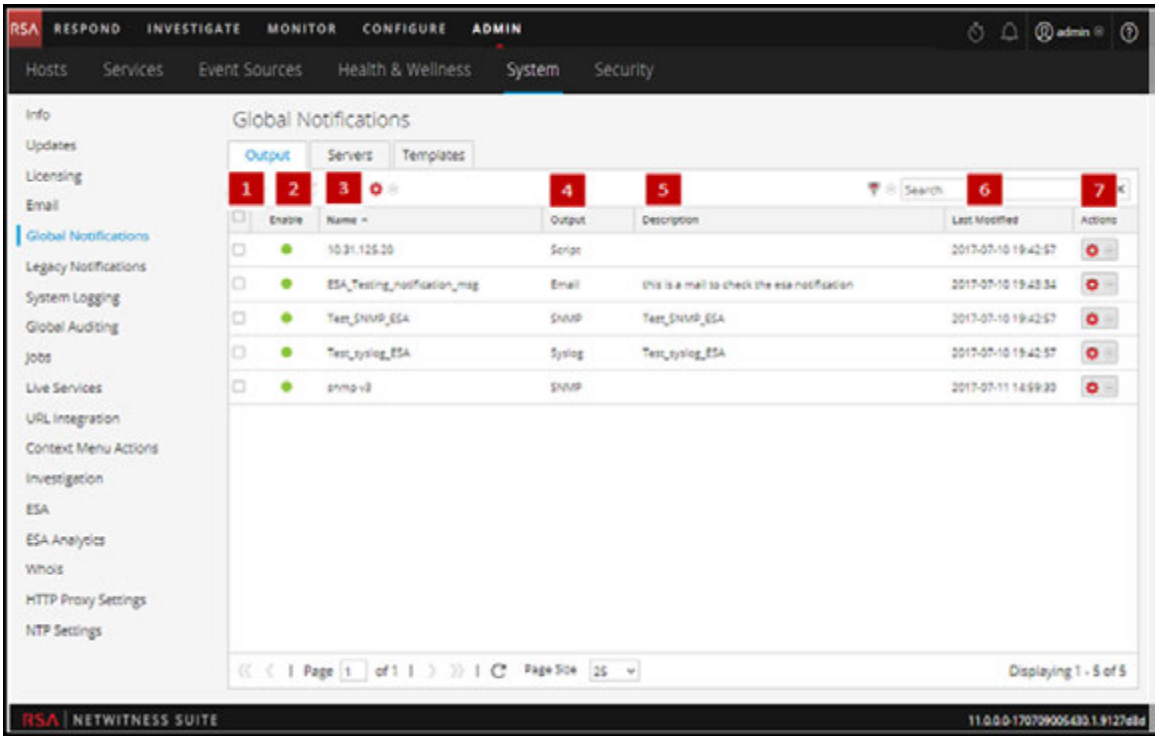
Role	I want to ...	Show me how
Administrator	Define notification outputs.	Configure Notification Outputs

Related Topics

- Notification Outputs Overview
- Configure Email as a Notification
- Configure Script as a Notification
- Configure SNMP as a Notification
- Configure Syslog as a Notification

Quick Look

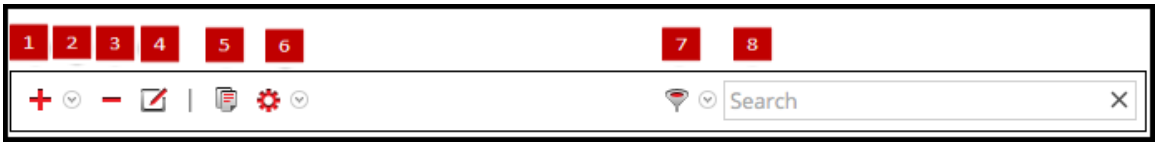
The following example illustrates Global Notification Outputs configuration.



1	Selects a row for an action in the toolbar. Selecting the check box in the column title selects or deselects all rows in the grid.
2	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
3	Identifies or labels the configuration.
4	Identifies the configuration output. The outputs are Email, SNMP, Syslog, and Script.
5	Describes the configuration.

6	Shows the date and time of the last configuration change.
7	Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

The Global Notifications panel toolbar is at the top of the Output tag and provides the following options:



1	Adds a notification output
2	Configures Email, SNMP, Syslog, and Script notification settings.
3	Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting > Delete.
4	Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting > Edit.
5	Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting > Duplicate.
6	Displays the following options: • **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration. • **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations. • **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting > Export.
7	Filters by Email, SNMP, Syslog, or Script.
8	Searches configurations in the grid.

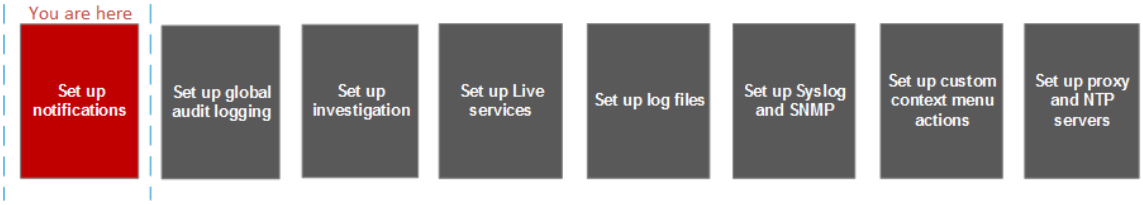
Servers Tab

Servers Tab describes the components of the Global Notifications > Servers tab. This tab enables to configure notification servers. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and RESPOND.

Configure **Notification Servers** in the Servers tab. On the Servers tab, add the servers from which you want to receive notifications from the system. For Global Audit Logging, define Log Decoders as Syslog Notification Servers.

Event Stream Analysis can send notifications to users through email, SNMP, or Syslog when an alert is triggered on the ESA service. These alert notification senders are called Notification Servers. You can configure multiple notification settings and use them while defining an ESA rule, for example, you can configure multiple mail servers or Syslog servers and use the settings while defining an ESA rule.

Workflow



The workflow shows the necessary procedures to configure and verify the Servers for Global Notifications. You can perform the following:

- Configure the Email settings as a notification server.
- Configure SNMP settings as a notification server.
- Configure Syslog settings as a notification server.
- Configure a Script as a notification server.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Define notification Servers	Configure Notification Servers

Related Topics

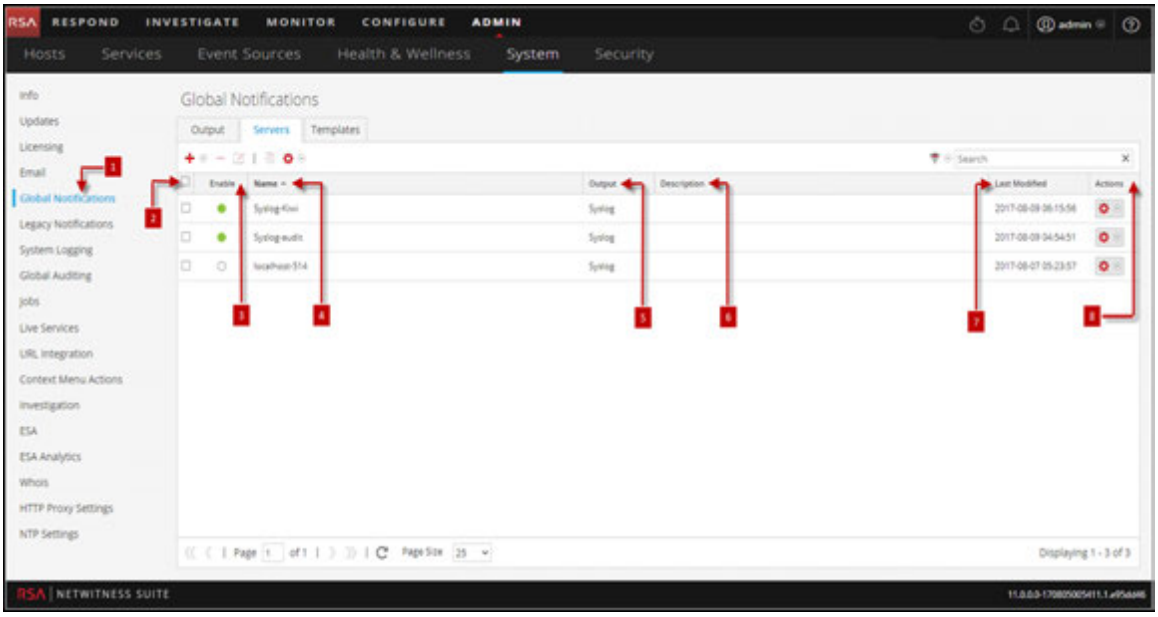
Quick Look

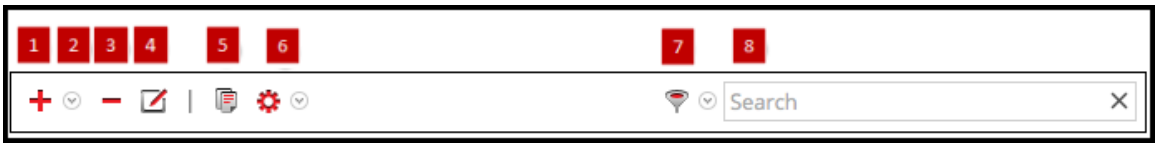
The following example illustrates Global Notification Servers configuration.



1	Displays the Server Tab Panel.
2	Selects a row for an action in the toolbar. Selecting the checkbox in the column title selects or deselects all rows in the grid.
3	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
4	Identifies or labels the configuration.
5	Identifies the configuration output. The outputs are Email, SNMP, Syslog, and Script.
6	Describes the configuration.
7	Shows the date and time of the last configuration change.
8	Provides an Actions menu for the selected configuration with actions that can be

taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

The Global Notifications panel toolbar is at the top of the Output tag and provides the following options:



1. Adds a notification output
2. Configures Email, SNMP, Syslog, and Script notification settings.
3. Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting > Delete.
4. Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting > Edit.
5. Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting > Duplicate.
6. Displays the following options:
   - **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration.
   - **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations.
   - **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting > Export.
7. Filters by Email, SNMP, Syslog, or Script.
8. Searches configurations in the grid.

Templates Tab

The Notification Templates tab enables to configure notification templates. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and RESPOND. Notification templates define the format and message fields of the notifications.

Select a default template or configure templates for Email, SNMP, Syslog, and Script, depending on the template type. For Event Stream Analysis (ESA) templates, configure Email, SNMP, Syslog, and Script. For Audit Logging templates, configure Syslog.

Event Stream Analysis templates are not specific to any type of alert notifications, that is, the same template can be used for all types of notifications.

When upgrading from NetWitness Suite 10.4, all existing notification templates migrate to the Event Stream Analysis template type.

4. Describes the templates
5. Provides an Actions menu for the selected templates with actions that can be taken on the Templates. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

HTTP Proxy Settings Panel

HTTP Proxy Settings Panel introduces the proxy support features of the Administration System view > HTTP Proxy Settings panel.

Note: Proxy support is only for HTTP and HTTPS proxies and not SOCKS5.

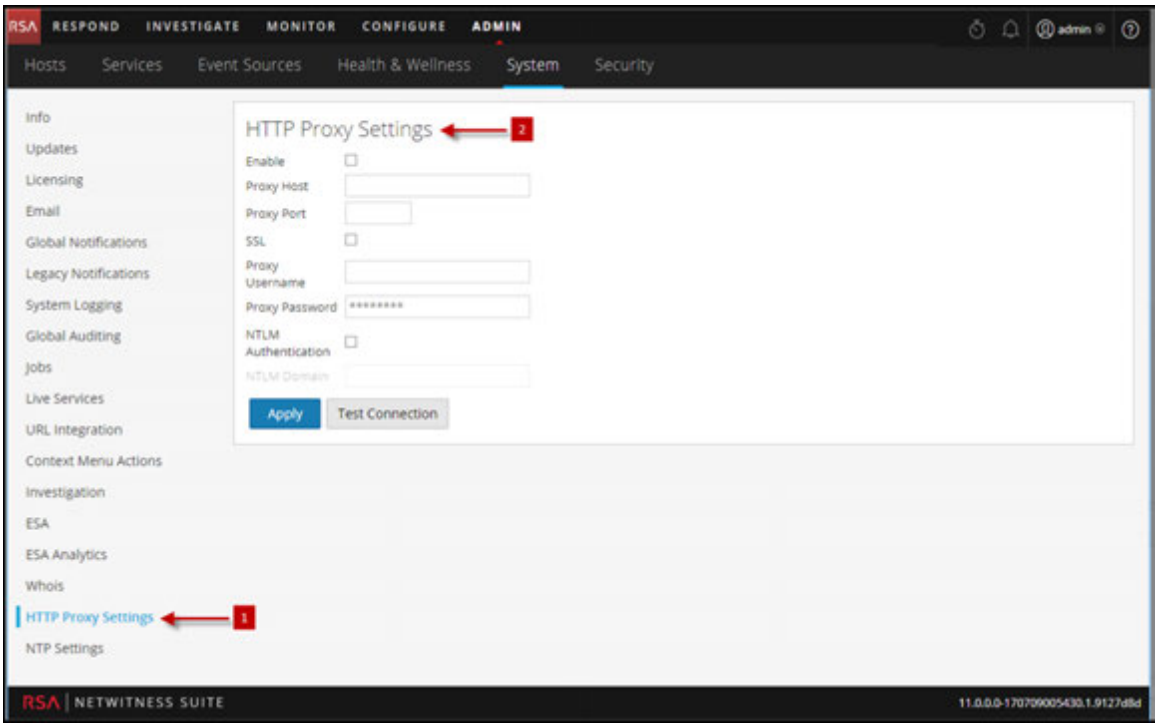
The HTTP Proxy Settings panel provides a user interface for configuring a proxy for use across NetWitness Suite modules and services. The Proxy Settings set up a proxy to be used wherever a proxy is needed in NetWitness Suite. The settings in this panel override any proxy settings configured for an individual service such as Malware Analysis or Live.

Related topics

Configure Proxy for NetWitness Suite

Quick Look

The following example illustrates an HTTP Proxy Settings Panel.



1	Displays the HTTP Proxy Settings Panel.
2	Allows the user to configure HTTP Proxy Sittings.

Toolbar and Features

This table describes the features in the Proxy Settings section.

Feature	Description
Enable	Enable the system proxy configuration for use in NetWitness Suite.
Proxy Host	The hostname for the proxy host.
Proxy Port	The port used for communication on the proxy host.
Proxy Username	(Optional) The user name used to log on to the proxy host if the proxy requires authentication.
Proxy Password	(Optional) The user password used to log on to the proxy host if the proxy requires authentication.
Use NTLM Authentication	Use NT LAN Manager authentication and session security protocols.
NTLM Domain	The name of NTLM domain.
Use SSL	(Optional) Enable communication using SSL.
Apply	Applies any changes made, and they become effective immediately.

Email Configuration Panel

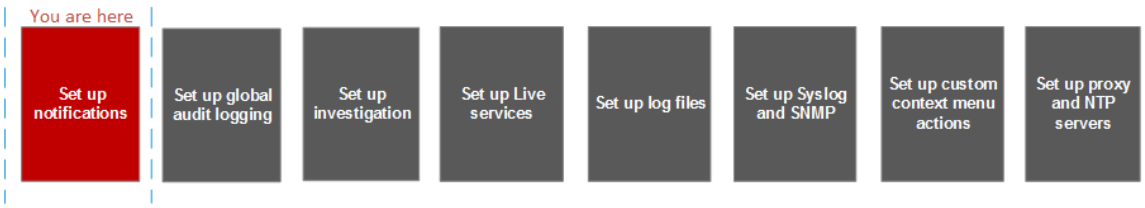
The Email Configuration Panel provides information about email configuration settings in the System View > Email Configuration panel. RSA NetWitness® Suitesends notifications to users via email about various system events. To be able to configure these email notifications, first configure the SMTP email server (See Configure Email Servers and Notification Accounts).

The Email Configuration panel provides a way to:

- Configure the email server.
- Set up an email account to receive notifications.
- View statistics on email operations.

Workflow

This workflow shows the necessary procedures to configure and verify Email Panel.



What do you want to do?

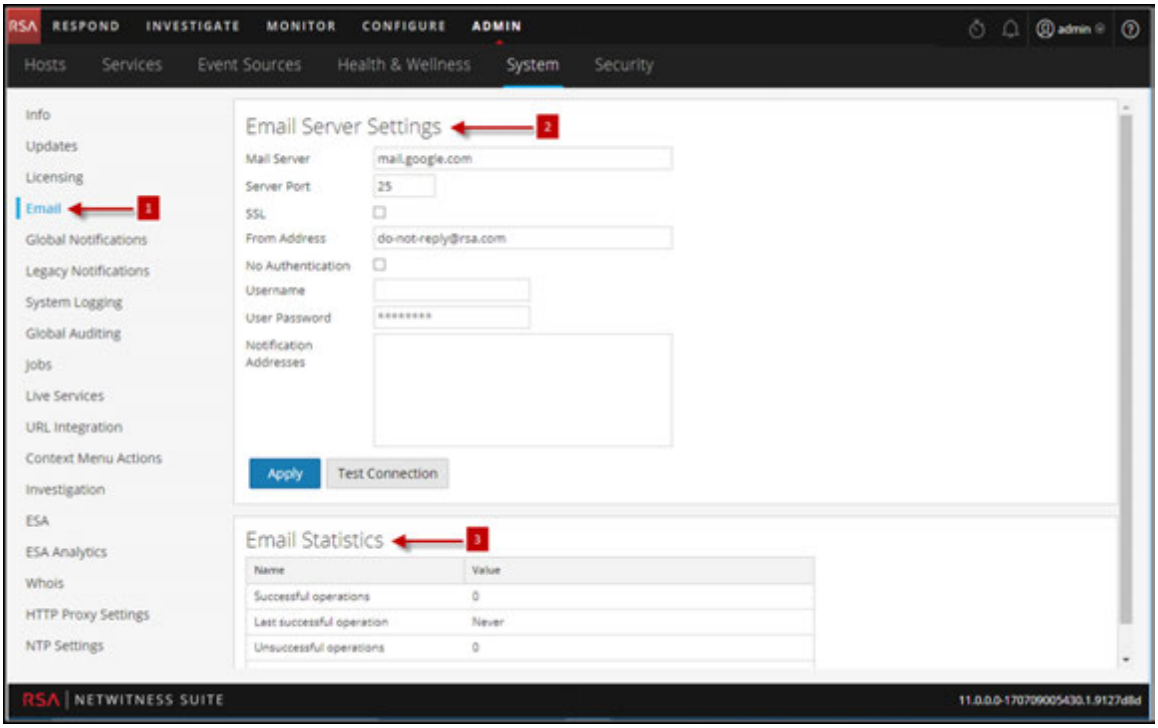
Role	I want to ...	Show me how
Administrator	Configure the SMTP Email Server	Configure Email Servers and Notification Accounts
Administrator	Email Setting as Notification Server	Configure the Email Settings as Notification Server
Administrator	Setup, Verify and Activate the Email Account	Receive Notification on Email

Related Topics

- Configure the Email Settings as Notification Server
- Configure Email as a Notification
- Configure Email Servers and Notification Accounts

Quick Look

The following example illustrates an Email configuration. The configuration defines how events are notified on Email.



1. Displays the Email Configuration Panel.
2. Allows the user to configure Email Server sittings.
3. Provides feedback on Email operations.

Toolbar and Features

The **Email Configuration** panel has two sections: **Email Server Settings** and **Email Statistics**.

Email Server Settings

In the **Email Server Settings** section, you configure the following parameters.

Feature	Description
Mail server	The email server name. The default value is **mail.google.com**.
Server port	The server port used to send and receive emails. The default value is **25**.

Feature	Description
Use SSL	The preference for SSL use in communications between the email server and NetWitness Suite. The default value is to not use SSL (unchecked).
From address	The address that appears in all emails from NetWitness Suite. The default from address for emails is **do-not-reply@rsa.com**.
Username	The username to access the email server. The default value is **blank**.
User password	The user password to access the email server. The default value is **blank**.
Test connection	Tests the connection to the email server.
Apply	Applies the email configuration to this instance of NetWitness Suite.

Email Statistics

The Email Statistics section provides feedback on the number of successful and failed email operations as well as the time of the last successful and unsuccessful email operation. For each statistic the name of the statistic and the value is displayed.

ESA Settings Panel

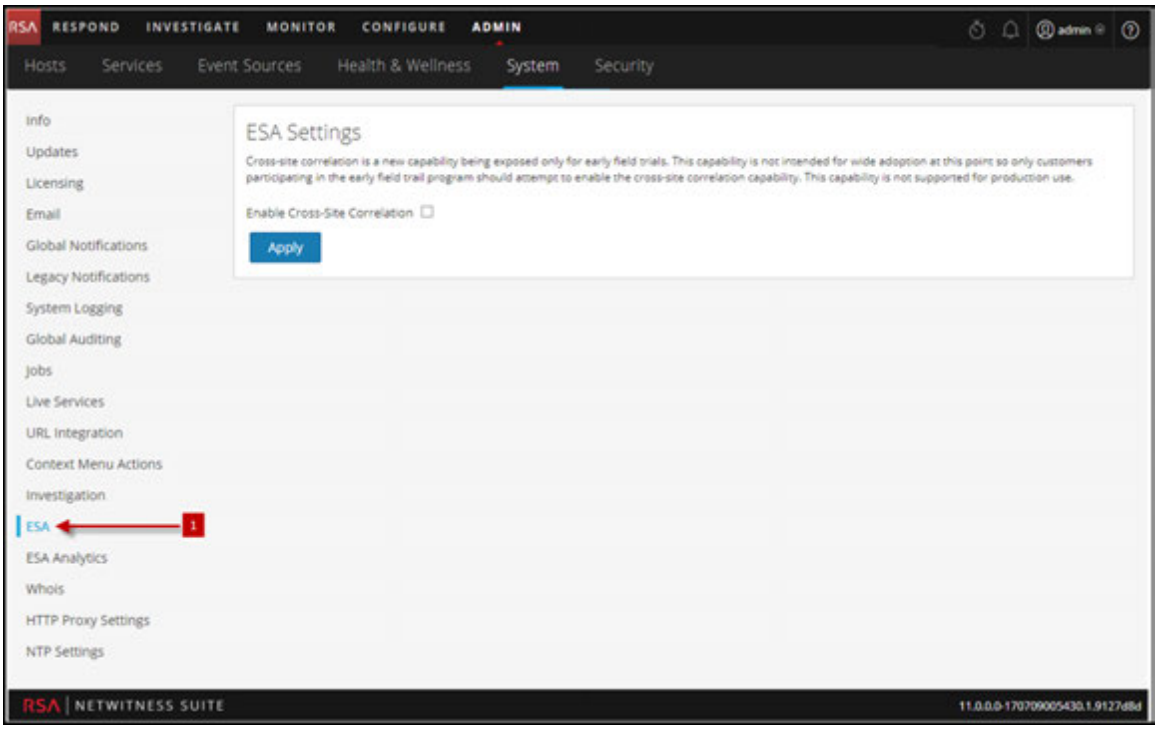
The ESA settings panel is where you enable and disable cross-site correlation. Cross-site correlation is a new capability being exposed only for early field trials. This capability is not intended for wide adoption.

Caution: Only customers participating in the early field trial program should attempt to enable the cross-site correlation capability. This capability is not supported for production use.

Related Topics

- Define a Template for ESA Alert Notifications
- Investigation and Malware Analysis Guide
- Context Hub Configuration Guide

Quick Look



1 Displays the ESA Setting Panel.

Toolbar and Features

The features of the ESA Settings panel are:

- Enable Cross-Site Correlation checkbox: when checked enables cross-site correlation in ESA. When you add a deployment in ADMIN > Alerts > Configure, you can deploy the same rule set on multiple ESA services for centralized rules processing.
- Apply button: activates your selection.

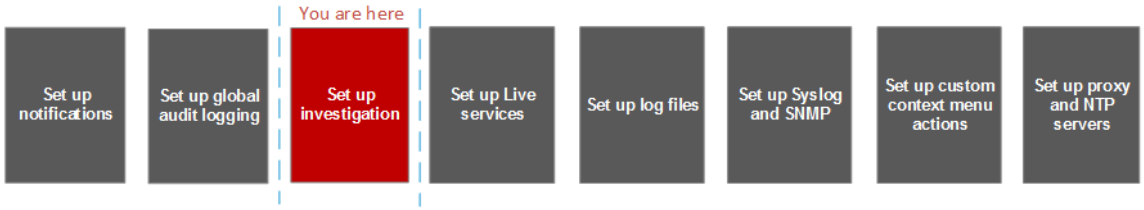
Investigation Configuration Panel

The System view > Investigation Configuration panel, which provides the user interface for Administrators to configure the system-wide settings that NetWitness Suite Investigation uses when analyzing data and reconstructing an event.

The Investigation Configuration settings allow an administrator to manage application performance for Investigation. As analysts analyze and reconstruct sessions that they are investigating, performance can be affected by operations that involve loading, searching, visualizing, and reconstructing large amounts of data.

Note: Analysts can also set individual preferences for Investigation in the Profiles view and in the Navigation view.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure navigate, events and context lookup settings	Configure Investigation Settings
Administrator	Clear reconstruction cache for services	Configure Investigation Settings

Related Topics

- Standard Procedures

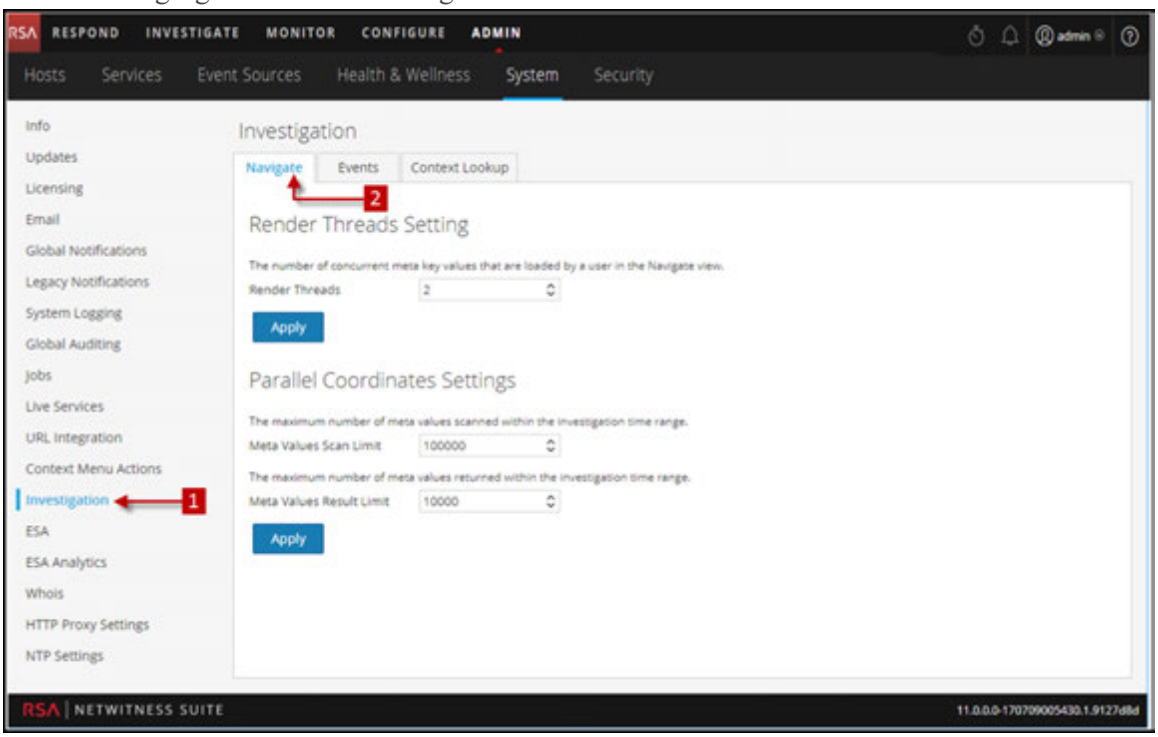
Quick Look

The Investigation Configuration panel has three tabs: Navigate, Events, and Context Lookup.

Though most fields in the tabs have a selection list with specific increments through the range of possible values, you can enter a value within the allowed range manually. An invalid entry is signaled by the field highlighted in red. When valid values are selected, clicking Apply in a given section puts the changes into effect immediately.

Navigate Tab

The following figure shows the Navigate tab.



1 Displays the Investigation Configuration Panel.

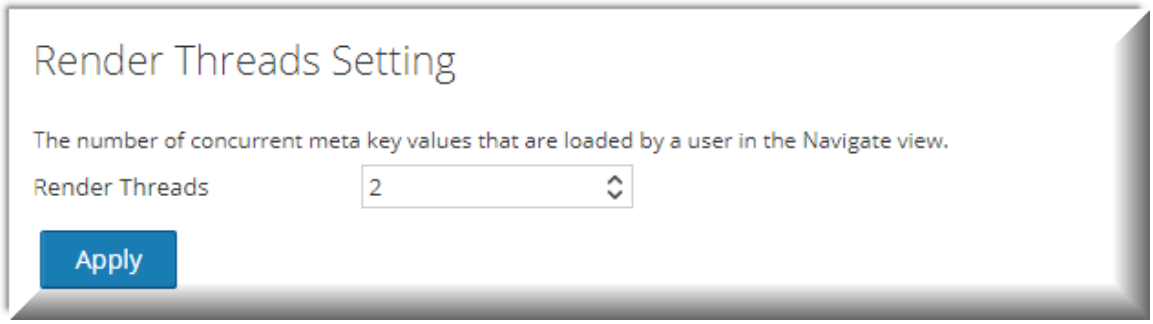
2 Displays the Navigate Tab.

Toolbar and Features

The Navigate tab has two sections: Render Threads Setting and Parallel Coordinates Settings.

Render Threads Setting

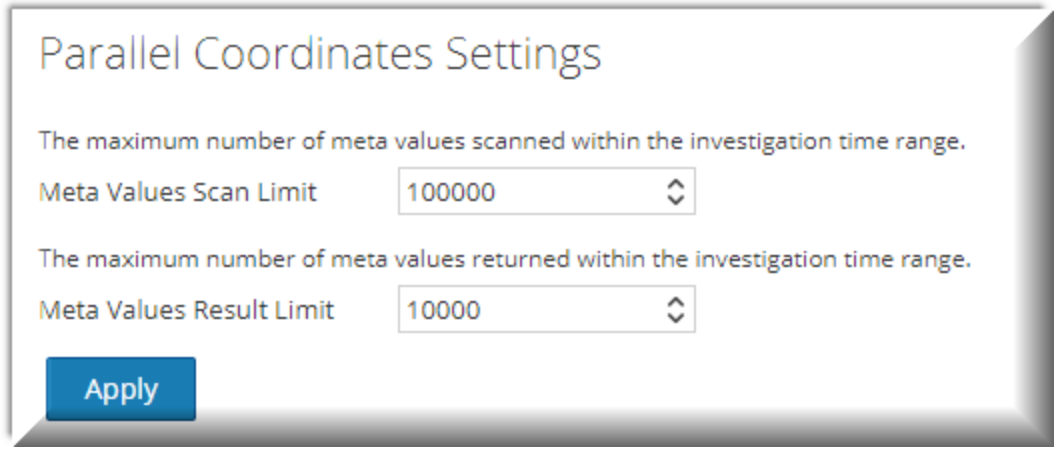
The Render Threads Setting is a selectable value between 1 and 20, which defines the number of concurrent (Values) loads in the Navigate view. The default value is 1.



Parallel Coordinates Settings

The Parallel Coordinates Settings apply to the Parallel Coordinates visualization in the Navigate view. There is a fixed limit on the amount of data that can be rendered as a parallel coordinates chart. In NetWitness Suite the administrator can configure parallel coordinates limits here.

Note: For better performance, recommended settings are **Meta Values Scan Limit: 100000** and **Meta Values Result Limit: 1000-10000**.



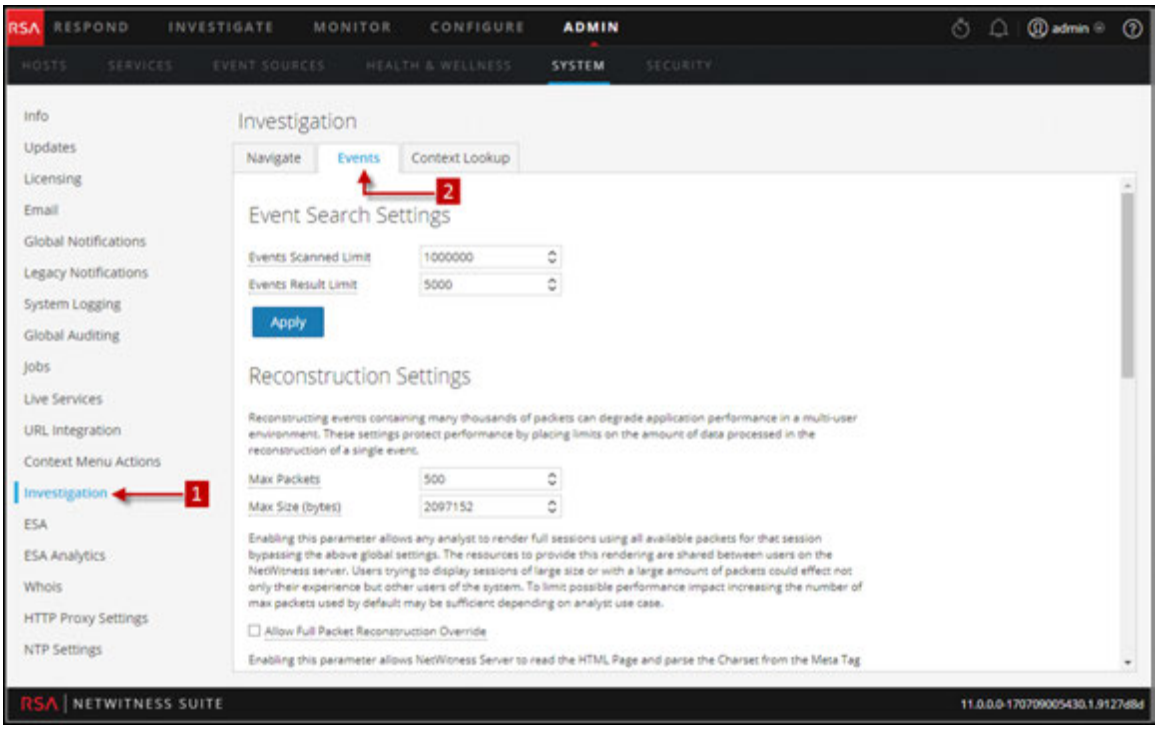
The following table describes the Parallel Coordinates Settings.

Parameter	Description
Meta Values Scan Limit	The maximum number of meta values scanned within the Investigation time range the analyst has selected in the Navigate view. Possible values are in the range of 1,000 to 10,000,000. The default value is 100,000.
Meta Values Result Limit	The maximum number of meta values returned within the Investigation time range the analyst has selected in the Navigate view. Possible values are in the range of 100 to 1,000,000,000. The default value is 10,000.

Quick Look

Events Tab

The following figure shows the Events tab.



Procedures associated with this panel are provided in Standard Procedures.

1 Displays the Investigation Configuration Panel.

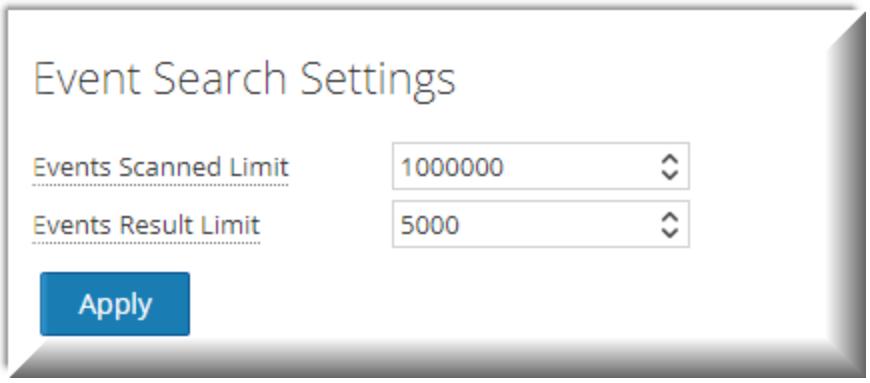
2 Displays the Events Tab.

Toolbar and Features

The Events tab provides configurable settings that affect the investigation of events. This tab has four sections: Event Search Settings, Reconstruction Settings, Web View Reconstruction Settings, and Reconstruction Cache Settings.

Event Search Settings

The Event Search Settings help to limit the number of events scanned when searching in the Events view.



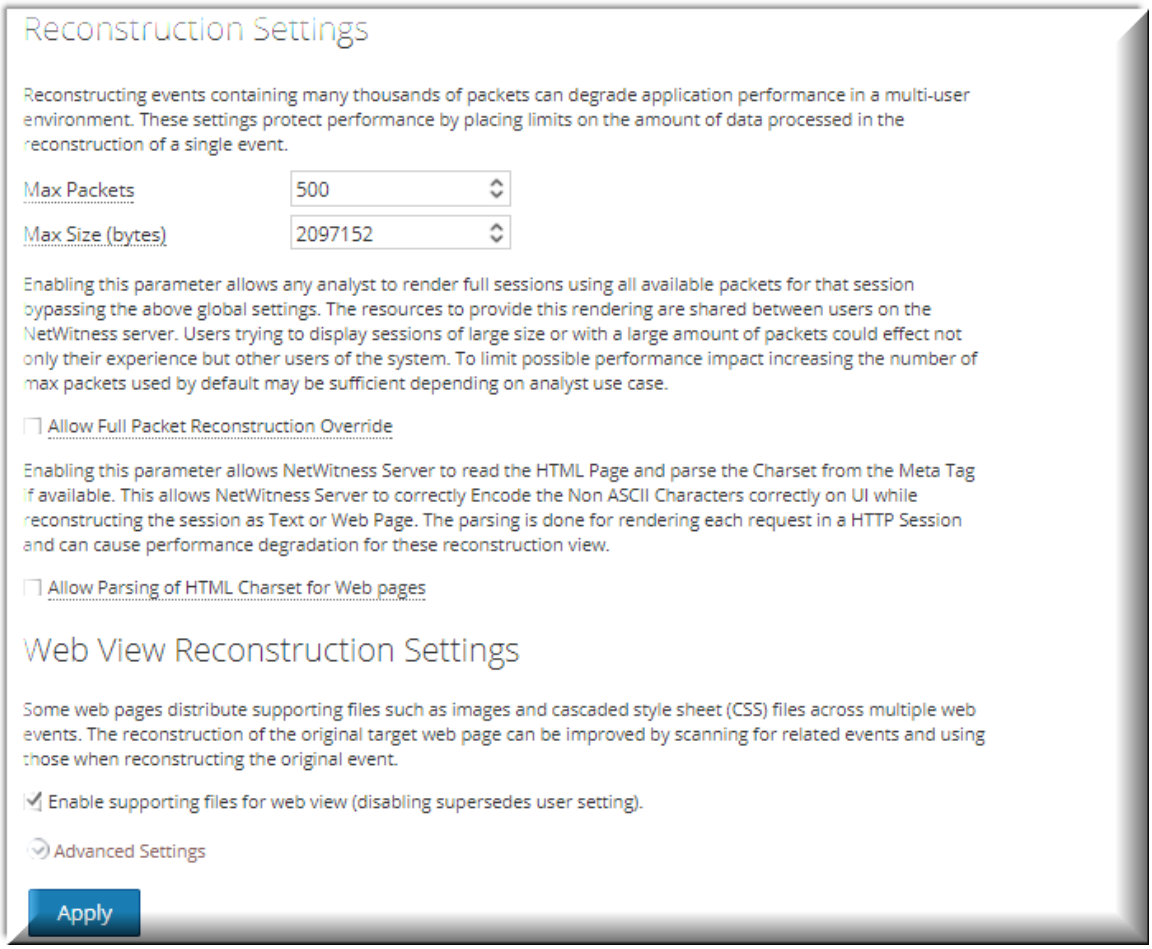
The following table describes the Event Search Settings.

Parameter	Description
Events Scanned Limit	The maximum number of events to scan when searching in the Events view.
Events Result Limit	The maximum number of results to return when searching in the Events view.

Reconstruction Settings

As analysts reconstruct sessions that they are investigating, some events can be very large and contain many thousands of source packets. Reconstructing these sessions, especially in a multi-user environment, can degrade application performance. The Reconstruction Settings allow an administrator to limit the number of packets and the size of a single event during reconstruction.

Note: An override to the Reconstruction Settings section is configurable for web views (under Web View Reconstruction Settings).



The following table describes the Reconstruction Settings features.

Parameter	Description
Maximum number of packets for a single event	This setting protects performance by placing a limit on the number of packets processed for a single event reconstruction. Possible values are in the range from 100 to 10,000 packets, using manual entry or increments of 100 from the selection list. The default value is 100 packets.
Maximum size, in bytes of a single event	This setting protects performance by placing a limit on the maximum size, in bytes, of a single event reconstruction. Possible values are in the range from 102,400 to 104,857,600 bytes, using manual entry or increments of 10,240 from the selection list. The default value is 2,097,152 bytes.
Allow Full Packet Reconstruction Override	When this checkbox is selected, the analysts is provided with a Use More Packets button in the Reconstruction Panel. This enables the NW Server to regenerate events using all the packets available in the Event.
Allow Parsing of HTML Charset for Web pages	This option allows the NetWitness Server to identify the web page encoding defined in the HTML meta tag instead of the HTTP header. The default setting is disabled.

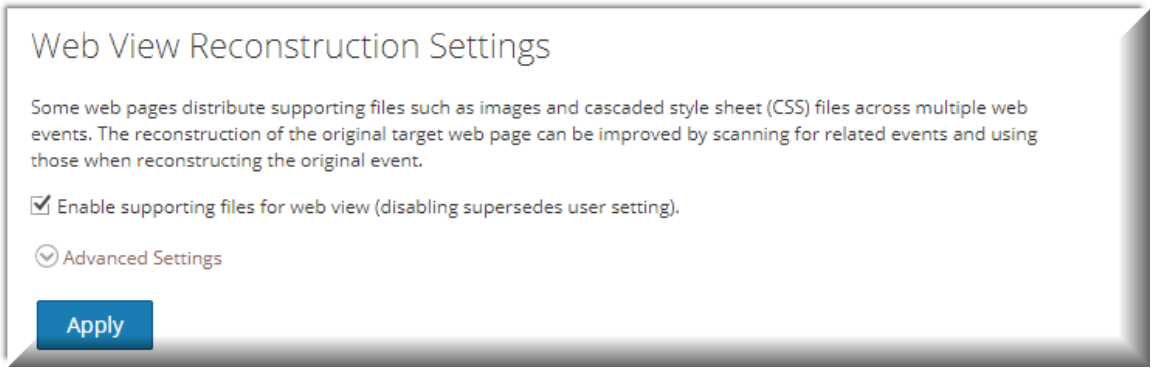
Web View Reconstruction Settings

The Web View Reconstruction Settings allow an administrator to configure settings that improve the reconstruction of a web view by scanning and reconstructing related events that contain the same supporting files. When NetWitness Suite is reconstructing a web view that spans multiple events, it is possible to improve the reconstruction of the target event by scanning and reconstructing related events that contain the same supporting files, such as images and cascaded style sheet (CSS) files.

- The only related events scanned are HTTP service type events with the same source address as the target event, and a time stamp within a specified time range before and after the target event.

- The maximum number of related events to scan is configurable.

Clicking on the Advanced Settings option displays all configurable settings in this section.



The following table describes the Web View Reconstruction Settings.

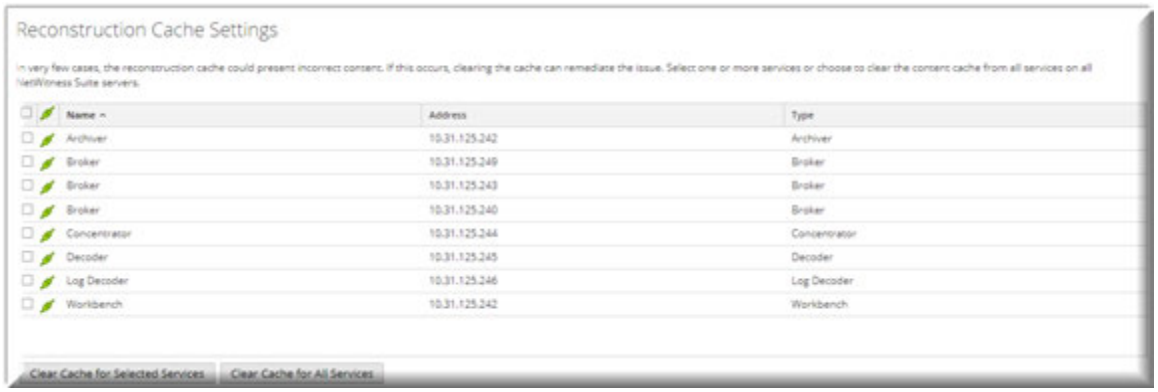
Parameter	Description
Enable supporting files for web view	This option determines how web views that have related data in other sessions are reconstructed. The default setting is enabled. When enabled, supporting files from related events can be used in the reconstruction of web views. Additional settings for calibrating the performance are enabled in this section, and Analysts have the option to enable CSS use in reconstructions. When disabled, supporting files from related events are not used and the setting for analysts to enable CSS use in reconstructions is disabled.

Parameter	Description
Time Range to Scan Related Events	Available when **Enable supporting files for web view** is checked. Configures the time range within which NetWitness Suite scans related events that are of the service type HTTP and have the same source address as the target event. This is a value between 0 and 60. • Seconds Before Target Event • Seconds After Target Event
Limit the number of related events processed	Allows configuration of the maximum number of related events that NetWitness Suite scans within the specified time range to discover supporting files for the target event. By default, this is disabled. When enabled, the Maximum Related Events field becomes active.
Max Related Events	When **Limit the number of events processed** is enabled, this field specifies the maximum number of related events that NetWitness Suite scans within the specified time range to discover supporting files for the target event. This is a selectable value between 10 and 1,000, using an increment of 100. The default value is 100.
Limit the number of packets and size of each related event	Overrides the general settings for the maximum number of packets and maximum size (in bytes) for individual related events.

Parameter	Description
Maximum Number of Packets for a Single Related Event	Possible values are in the range from 100 to 10,000 packets, using increments of 100 from the selection list. The default value is 100 packets.
Maximum Size, in Bytes, of a Single Related Event	Possible values are in the range from 102,400 to 104,857,600 bytes, using increments of 10,240 from the selection list. The default value is 524,288 bytes.

Reconstruction Cache Settings

In some cases, the reconstruction cache can present incorrect content; for this reason NetWitness Suite removes reconstructions that are older than a day from the cache. The cache is cleaned every day at midnight. Between the daily cache cleanings, certain actions may result in stale cache being used for a reconstruction, and if the need arises, administrators can manually clear cache for one or more services that are connected to the current NetWitness Server.



The following table describes the Reconstruction Cache Settings features.

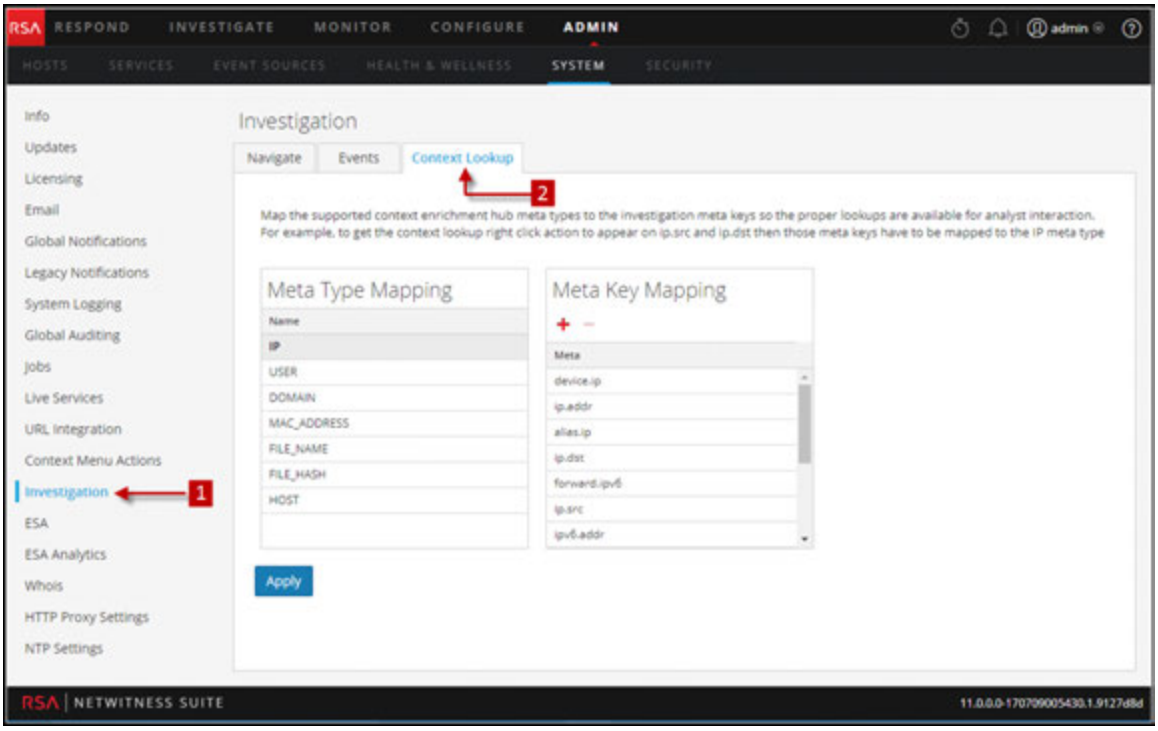
Feature	Description
Selection box	Selection box in individual rows and in the title bar allow selection of one or more, or all services that need to have cache cleared manually.

Feature	Description
Clear Cache for Selected Services	Clears the reconstruction cache for each selected service.
Clear Cache for All Services	Clears the reconstruction cache for all services.

Quick Look

Context Lookup Tab

The following figure shows the Context Lookup tab.



Procedures associated with this panel are provided in "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*.

1 Displays the Investigation Configuration Panel.

2 Displays the Context Lookup Tab.

Toolbar and Features

The Context Lookup tab enables the administrator to configure the Investigation meta keys and meta type mapping. The administrator can add or remove meta keys found in Investigation to the list of meta types supported by Context Hub service.

The following table describes the features of the Context Lookup tab.

Feature	Description
+	Adds an meta key to the selected meta type supported by Context Hub.
−	Deletes the meta key from the selected meta type.
Apply	Saves the changes made to the Context Lookup tab.

Live Services Configuration Panel

Live Services Configuration Panel introduces the features for setting up your Live account and the CMS server connection.

Live Account consists of two sections, namely RSA Live Status and Download Live Feedback Activity Log. **Sign In** by entering your Live Account credentials to access the Live Services. To activate your Live account for NetWitness Suite, please contact RSA Customer Care. When you have confirmation that your Live account has been set up, you can configure the CMS server connection as described in Configure Live Services Settings

The Live Services panel provides the user interface for:

- The Live account
- The Live Content update schedule and preferences for notification of updates
- Participation in Live Feedback
- Sharing Live Content Usage Details
- RSA Live Connect (Beta)

New Features Enabled Dialog

When you log onto NetWitness Suite for the first time, you will be prompted with **New Features Enabled** dialog.

Feature	Description
Accept	Clicking Accept indicates that you agree to the following: • Participate in Live Feedback • Allow NetWitness Suite to send RSA the usage metrics and version of NW hosts about your environment to RSA, provided a Live Account is configured. • Receive threat intelligence data from Live Connect.
View Settings	Clicking **View Settings** redirects you to the Live Services UI to view the settings. If you have not configured the Live Account, a masked screen is displayed.

For information on Live Feedback, see Live Feedback Overview

For information on Analyst Behaviors and Data Sharing, see the **"NetWitness Suite Feedback and Data Sharing"** topic in the *Live Services Management Guide*.

For information on Live Connect Threat Insights, see Configure Live Services Settings

Workflow

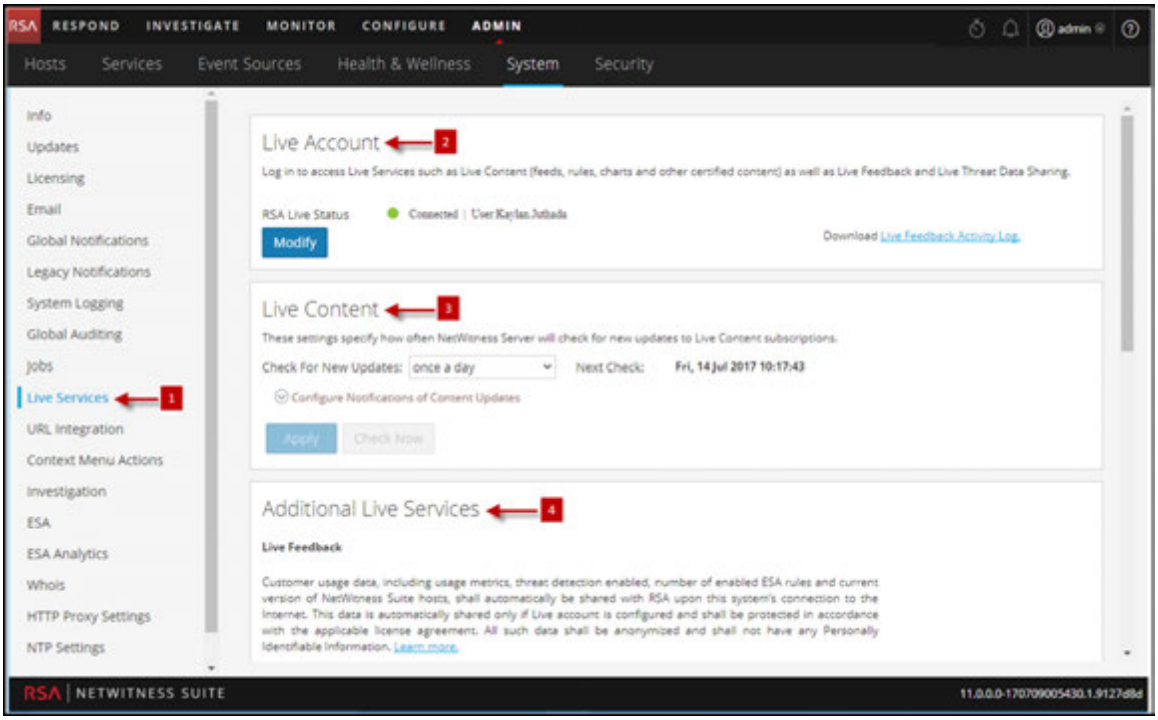
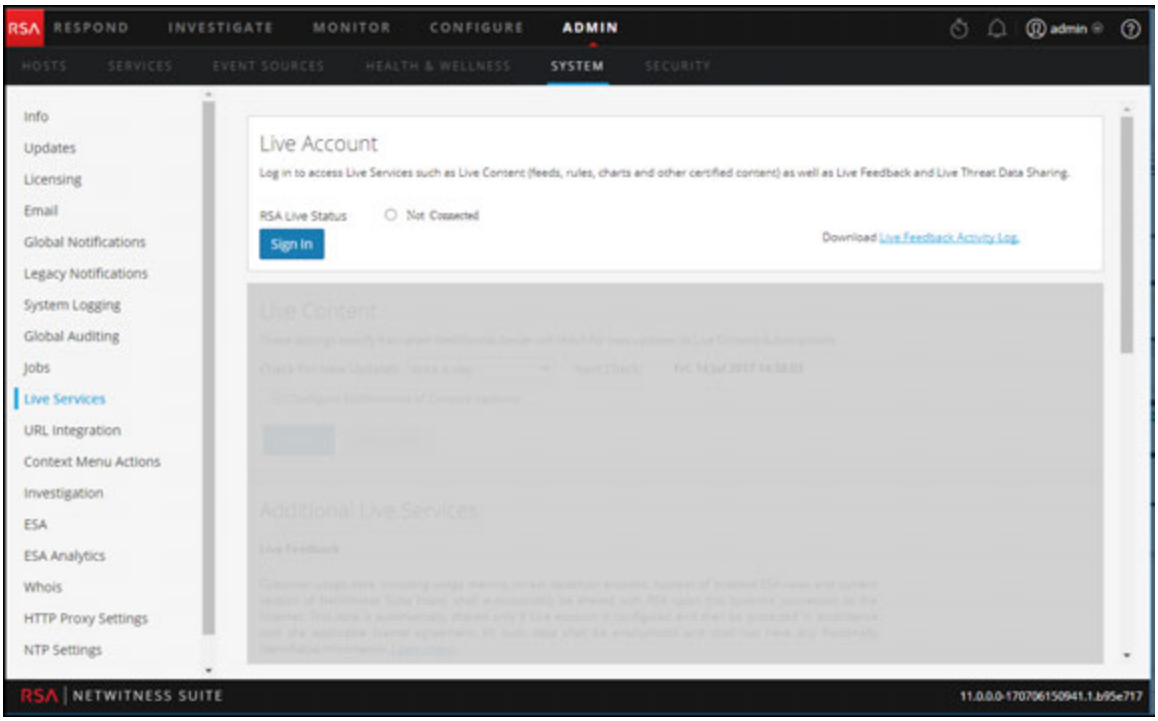
Live Services Quick Look

You access this view in the **ADMIN > SYSTEM > Live Services**.



Note: If you are not signed in with your Live Account credentials, a masked screen is displayed.

1	Displays the Live Services Configuration Panel
2	Enter Live Account Credentials With the Help of Customer Care.
3	Provides Update On Live Content
4	Additional Live Services Provides Live Feedback



Toolbar and Features

The Live Configuration panel has three sections: Live Account, Live Content, and Additional Live Services.

Live Account Section

In the **Live Account** section, you must enter the Live credentials. The information needed to set up the user's Live account consists of the Username, Password, and Live URL for the RSA Content Management System. This information is provided by Customer Care.

The following table describes the Live Account section features.

Feature	Description
Host	The Live URL for the Content Management System. The default value points to the RSA CMS at **cms.netwitness.com**.
Port	The communications port for Live to send requests to the Content Management System. The default value for this field is **443**, which is the communications port on the Content Management System.
SSL	Allows the user to communicate via SSL.
Username	The Live account user name as provided by RSA Customer Care.
Password	The Live account user password as provided by RSA Customer Care.

Feature	Description
Test connection	Tests if the connection is successful or not.
Apply	Saves and applies the configuration.

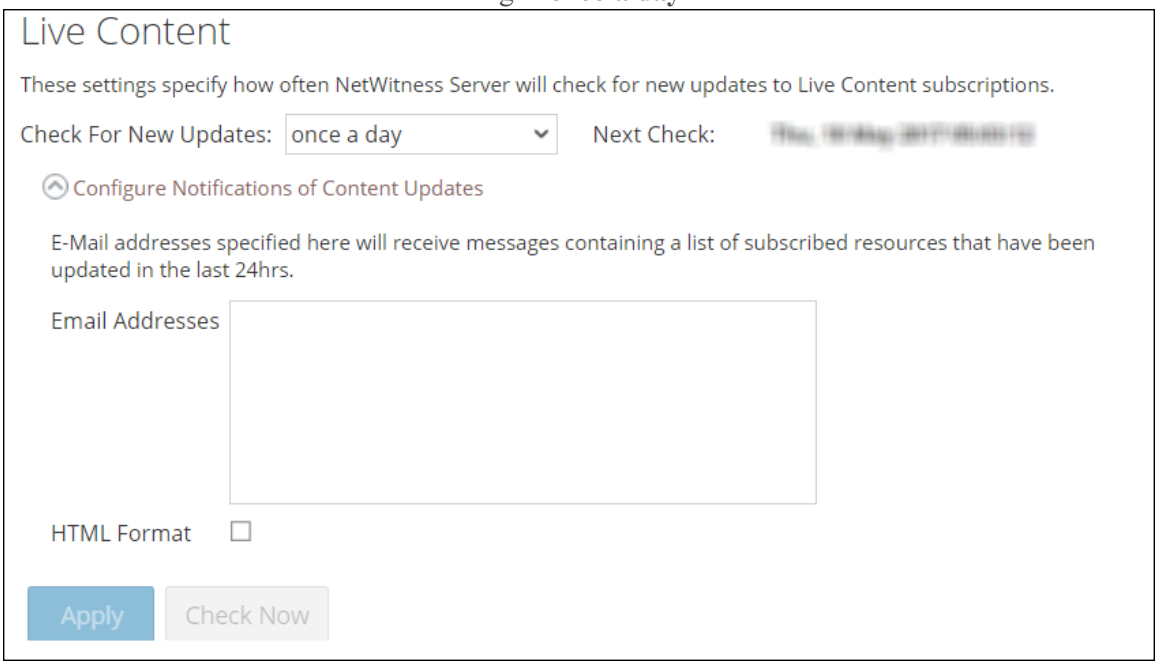
The Live Account section, provides an option to download and share the Live Feedback historical data by clicking Live Feedback Activity Log.

For more information about how to download historical data, see Upload Data to RSA for Live Feedback

Live Content Section

You can configure the Live Content Synchronization interval and notification at which NetWitness Suite checks for new updates to Live Content:

Use the **Check for New Updates** field to change the interval. Select an interval from the drop-down list. The default value for this setting is **once a day**.



The following table describes the Live Content features.

Feature	Description
Check for new updates	This setting dictates how often NetWitness Suite checks for new updates to Live Subscriptions and synchronizes subscribed resources and tags: • once a day • twice a day • four times a day • every hour • every other hour • every half hour The default value for this setting is once a day.
Next Check	Displays the time and date of the next scheduled Live synchronization based on the configured interval for checking.
Email Addresses	Email addresses specified here receive messages containing a list of subscribed resources that have been updated in the last 24 hours.
HTML format	Specifies the format of email messages. • Checked = HTML • Not checked = text
Check Now	Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness Suite. **Caution:** Use this feature with caution because synchronization can cause a parser reload if a Lua Parser or Flex Parser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.
Apply	Applies the changed configuration to the subscription synchronization behavior. The changes become effective immediately. The **Next Live synchronization is scheduled for** field is updated if the time changed.

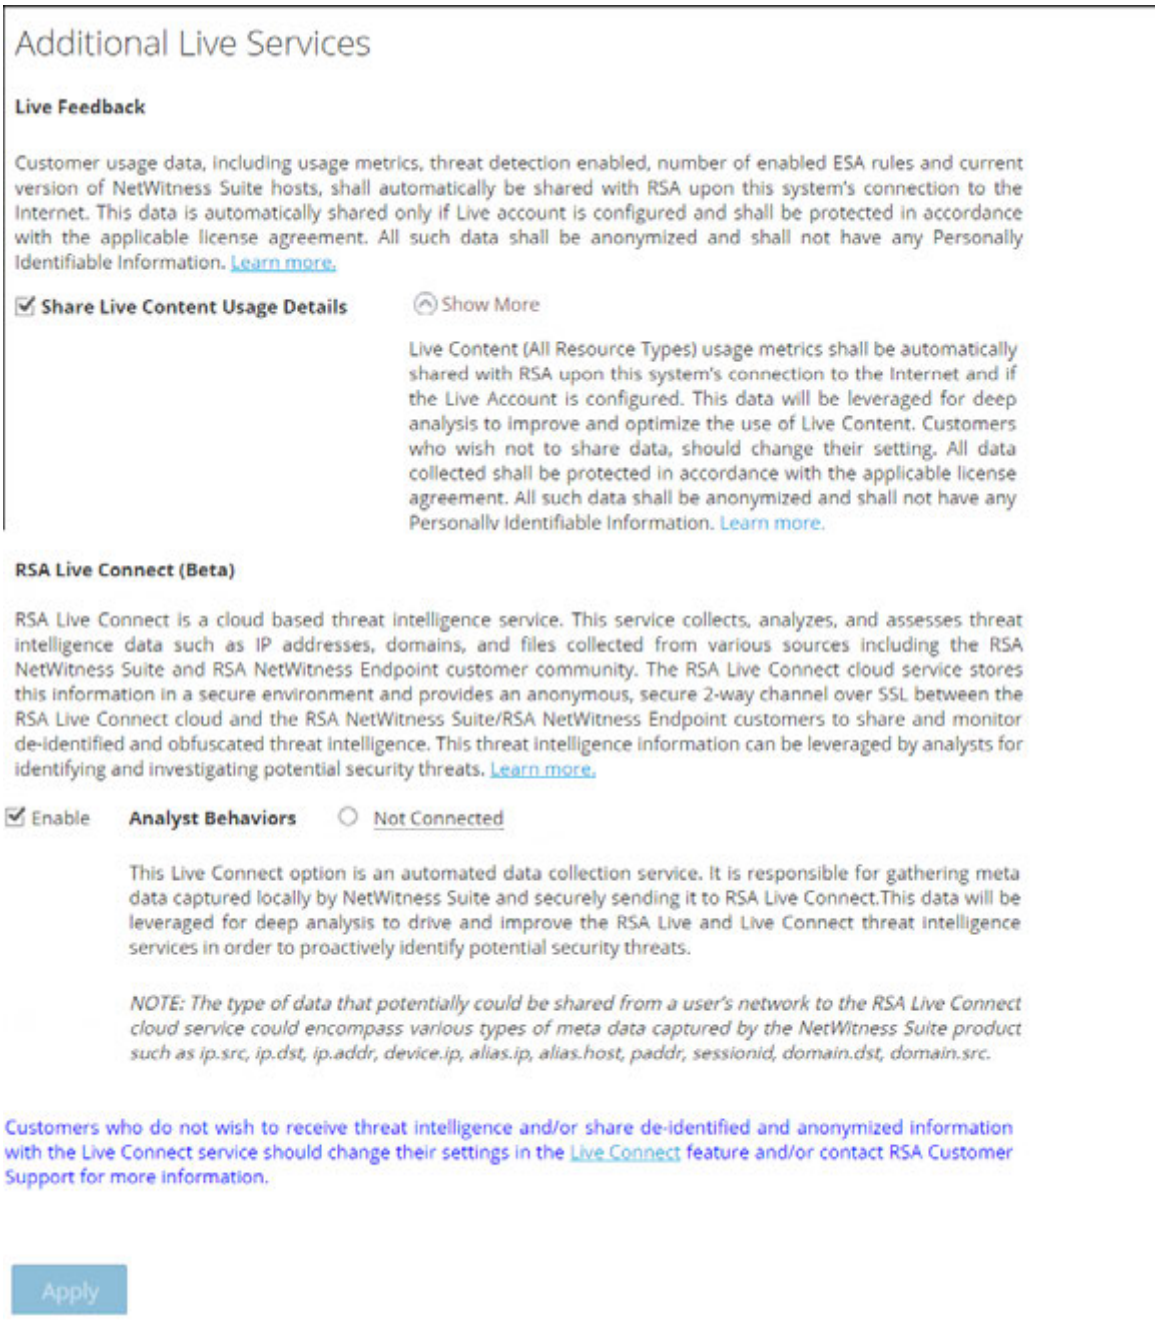
Force Immediate Synchronization

To force immediate synchronization, click **Check Now**. NetWitness Suite checks for updates in subscribed resources.

Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness Suite. One use for this is to see the immediate impact of a configuration change. For example, a new service has been added, or new resources have been toggled for automatic deployment. The scheduled synchronization could take place hours later if Live Services is set to synchronize a few times a day.

Caution: Synchronization can cause a parser reload if a Flex Parser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.

Additional Live Services



Note: Click on Learn more to know more about the data RSA is collecting. For more information, see Live Feedback Overview

The following tables describes the Additional Live Services features.

Feature	Description

Live Feedback	Lists the types of data RSA is collecting:
	• Product Name
	• Product Version
	• Product Instance
	• Activation Key
	• Details of each Component such as:
	  • ID
	  • Name
	  • Version
	  • Instance ID
	• Metrics for each component

Share Live Content Usage Details)	Enables NetWitness Suite to send anonymous, technical data about the content usage metrics to RSA. This option is enabled by default.
RSA Live Connect	Provides more information about Live Connect service and configuring Live Services.
Enable (Threat Insights)	Enables Threat Insights feature where Live Connect is added as a data source for Context Hub service and the analyst can pull threat intel data during investigation. Ensure that context hub is already configured before enabling this feature. This option is enabled by default (checked)
Enable (Analyst Behaviors)	Enables NetWitness Suite to send anonymous, technical data about your environment to RSA. This option is enabled by default (checked)

Feature	Description
Apply	Applies the configured changes. The changes become effective immediately. **Note:** This option is applicable only for Threat Insights and Analyst Behaviors.

About Live Feedback Participation

When you participate in Live Feedback, it collects relevant information for further improvement. For information on Live Feedback, see Live Feedback Overview.

When you install NetWitness Suite, you will be prompted to participate in Live Feedback. For information, see Configure Live Services Settings

If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.

NTP Settings Panel

NTP setting panel is a protocol designed to synchronize the host machine clocks over a network. For more information on NTP see their home page (http://www.ntp.org/).

Note: NetWitness Suite core hosts must be able to communicate with the NW host with UDP port 123 for NTP time synchronization.

You use the**ADMIN** > **System** > **NTP Settings** view to configure one or more NTP servers. After you configure an NTP server, NetWitness Suite uses NTP to synchronize the host machine clocks. You configure multiple NTP servers for Fail Over purposes.

Workflow

3. click on an existing hostname

Toolbar and Features

The following table describes the settings in the NTP Settings panel.

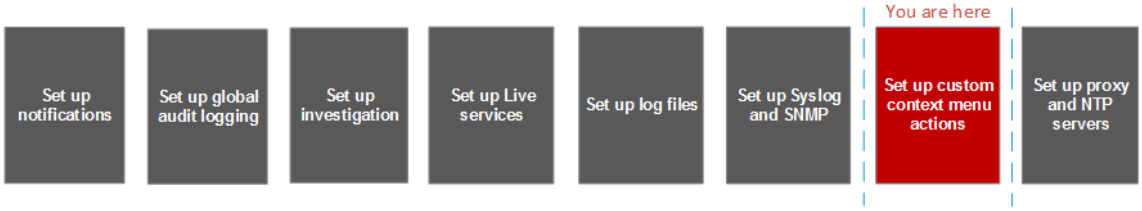
Setting	Description
	Enter the NTP Server IP Address or hostname.
Add	Adds the NTP server to NetWitness Suite.
−	Delete the selected NTP server.
	Synchronizes the selected NTP server.
	Selects the NTP server that you want to delete or synchronize.

Setting	Description
NTP Server	NTP Server IP Address or hostname. If you click on an existing hostname, NetWitness Suite makes the hostname editable and displays the following command buttons: • **Update** - Applies your edits. • **Cancel** - Cancels your edits.
Apply	Applies the NTP server settings and synchronizes host machine clocks to NTP.

Context Menu Actions Panel

In the Context Menu Actions panel, Administrators can view built-in context menu actions, and add, edit, or delete custom context menu actions that appear as options in a context menu.

Workflow



What do you want to do?

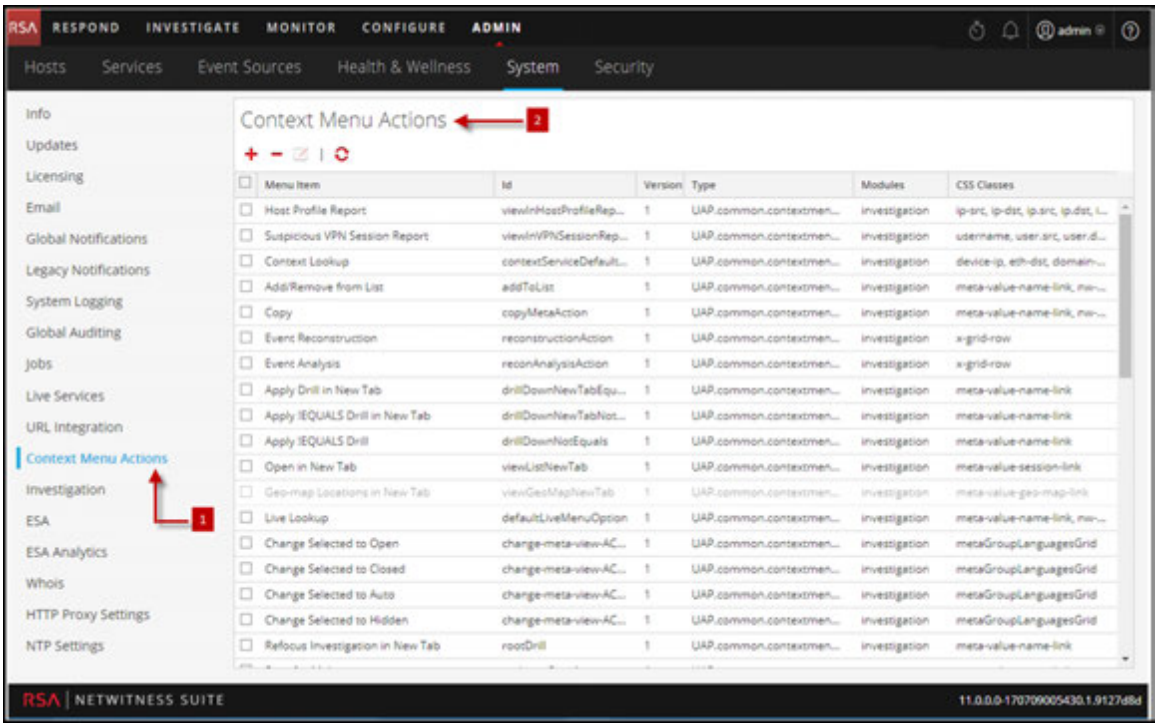
Role	I want to ...	Show me how
Administrator	Custom Context Menu Actions panel	Add Custom Context Menu Actions.

Related Topics

- Add Custom Context Menu Actions

Quick Look

The following figure is an example of the Context Menu Actions panel.



1 Displays the Context Menu Actions Panel

2 Toolbar allows the user to Add, Edit, Delete Context Menu Actions

Toolbar and Features

The Context Menu Actions panel has a grid and a toolbar. The following table describes the toolbar options and grid features.

Features	Description
+	Displays the Context Menu Configuration dialog, in which you can create a new context action.
↻	Refreshes the list.
−	Deletes the selected context actions. NetWitness Suite does not request confirmation that you want to delete the action. The selected actions are immediately deleted with no opportunity to cancel.
✎	Displays the Edit Context Action dialog, in which you can edit an existing context action.

Features	Description
Menu Item	The menu item as it appears in the context menu. When creating a context menu action, the parameter is `displayName`. Here is a line of sample code: `"displayName": "User Agent String Lookup”`
ID	The unique ID for the context action. When creating a context menu action, the parameter is `id`. Here is a line of sample code: `"id": "UserAgentStringAction"`
Version	The version number of the context action. When creating a context menu action, the parameter is `version`. Here is a line of sample code: `"version": "1"`
Type	The type of context action. When creating a context menu action, the parameter is `type`. All NetWitness Suite context action types begin with this string: `UAP.common.contextmenu.actions`. The last part of the string identifies the menu within NetWitness Suite, for example, `URLContextAction` or `LivePostContextAction`. Here is a line of sample code: `"type": "UAP.common.contextmenu.actions.URLContextAction"`

Modules	The names of the modules in which the context action is available. Currently all built-in context menu actions are for the Investigation module.
	When creating a context menu action, the parameter is `modules`.
	Here is a line of sample code:
	`"modules": [`
	`"investigation"`
	`],`

Features	Description

Module Classes	The CSS classes that identify the names of the module views in which the context action is available. Currently all built-in context menu actions are for the Investigation module and the non-meta key module classes are described in detail below.
	Here are a few lines of sample code:
	`"moduleClasses": [`
	`"UAP.investigation.navigate.view.NavigationPanel”,`
	`<-- Enabled in Navigate pane-->`
	`“UAP.investigation.events.view.EventGrid”`
	`],`

CSS Classes	The CSS classes to which the context menu action applies. The CSS classes define where the context menu shows up inside investigation when you right-click. When creating a context menu action, the parameter is `cssClasses`.
	Here is a line of sample code:
	`"cssClasses": [`
	`“client”`
	`]`
	Most of the CSS Classes that you can add are meta keys. You can also add certain non-meta key CSS classes. See additional details and examples below.

CSS Classes and Examples

CSS classes can be meta keys and non-meta keys.

Meta Key CSS Classes

One type of CSS class that you can add is meta keys. For meta keys that have a period, change the period to a dash when defining a CSS class. For example, the meta key `alias.host` becomes the CSS class `alias-host`. The meta key `ip.src` becomes the CSS class `ip-src`.

Non-Meta Key CSS Classes

Built-in non-meta key CSS Classes are also available. The classes in the following table define actions and the part of the user interface where the action is available.

CSS Class	Type	Description
meta-value-session-link	Action	Open on meta session count number
meta-value-name-link	Action	Open on meta value name
nw-event-value	Action	Use for reconstruction context actions on meta value
UAP.investigation.navigate.view. NavigationPanel	User interface	Applies to Navigate view
UAP.investigation.events.view. EventGrid	User interface	Applies to Event View
UAP.investigation.reconstruction.view. content.ReconstructedEventDataGrid	User interface	Applies to Event Reconstruction View

Example

This is a commented example of a context menu action to validate the user agent from the Client Application (client) meta key. The comments are removed automatically once applied in the Administration System view. The new menu item is displayed after restarting the browser.

```
{
     "displayName": "User Agent String Lookup”, <!-- What name shows up
in NW UI -->
     "cssClasses": [
         “client”  <!-- What meta key to launch from -->
     ],
     "description": "",
     "type": "UAP.common.contextmenu.actions.URLContextAction",
     "version": "1",
     "modules": [
         "investigation"
     ],
     "local": "false",
     "groupName": "externalLookupGroup”, <!-- What group to show link
in. Remove line to show in main list -->
     "urlFormat": "http://www.useragentstring.com/?uas={0}&getText=all”, <!-- The
{0} gets replaced with whatever was right clicked on -->
     "disabled": "",
```

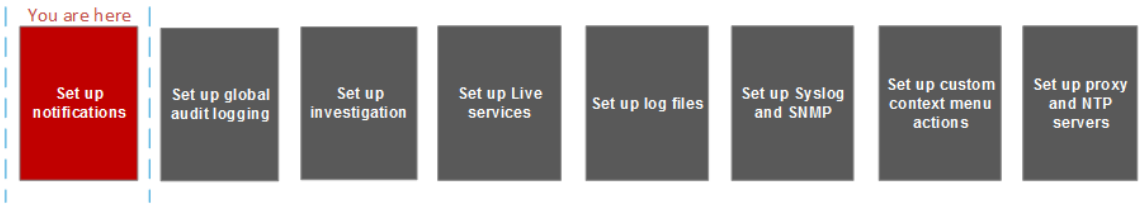
```
     "id": "UserAgentStringAction",
    "moduleClasses": [
         "UAP.investigation.navigate.view.NavigationPanel”, <-- Enabled
in Navigate pane-->
        “UAP.investigation.events.view.EventGrid” <-- Enabled in Event
View pane -->
     ],
     "openInNewTab": "true",
     "order": "15"
 }
```

Legacy Notifications Configuration Panel

The Legacy Notifications Configuration panel provides the ability to configure syslog and SNMP notification settings. These configurations are used for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Procedures related to these settings are described in Configure Syslog and SNMP Settings.

Workflow



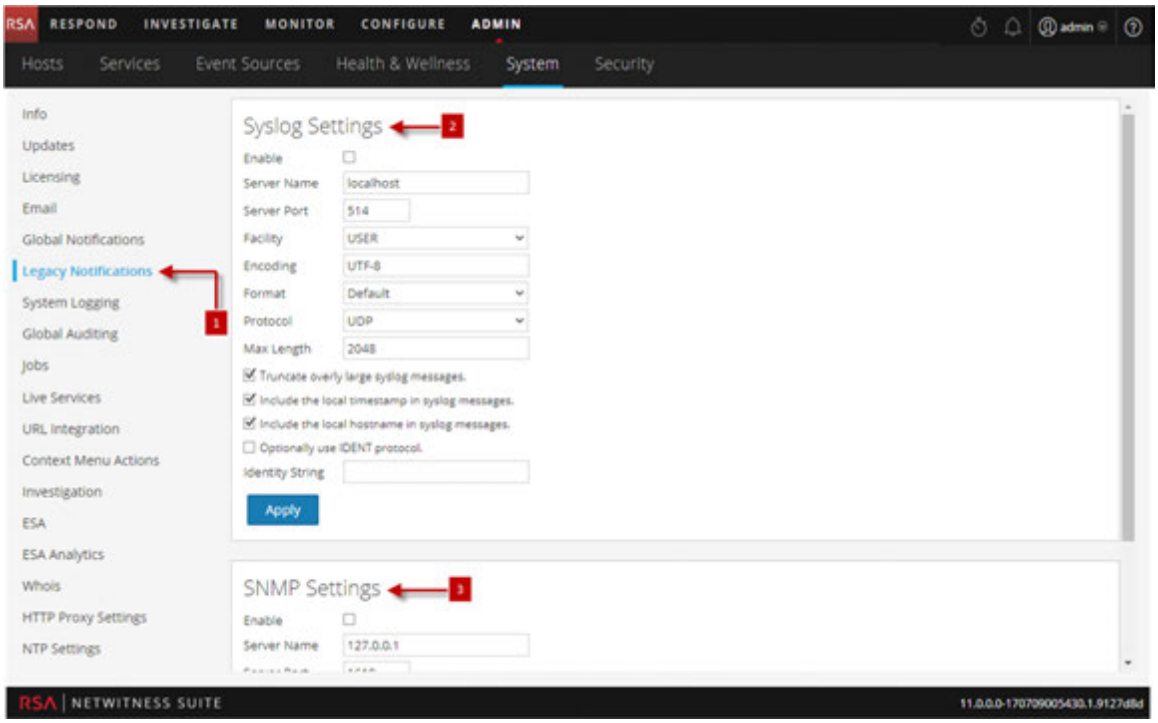
What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Syslog Settings	Configure Syslog and SNMP Settings
Administrator	Configure SNMP Settings	Configure Syslog and SNMP Settings

Related Topics

- Configure Syslog and SNMP Settings

Quick Look



1	Displays the Legacy Notification Configuration Panel.
2	Allows the user to configure syslog notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.
3	Allows the user to configure SNMP notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Toolbar and Features

The Legacy Notifications Configuration Panel consists of two sections: Syslog Settings and SNMP Settings.

Syslog Settings

The following table describes the available options for configuring syslog notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Feature	Description
Enable	Enables the syslog settings configured here.
Server Name	Specifies the host where the target syslog process is running.

Feature	Description
Server port	Specifies the port where the target syslog process is listening.
Facility	Specifies the designated syslog facility to use for all outgoing messages. Possible values are KERN, USER, MAIL, DAEMON, AUTH, SYSLOG, LPR, NEWS, UUCP, CRON, AUTHPRIV, FTP, LOCAL1 through LOCAL7.
Encoding	Specifies the encoding to use for text in syslog messages, for example, UTF-8.
Format	Specifies the message format. Possible values are: Default, PCI DSS, or SEC.
Protocol	Specifies the communications protocol used when sending syslogs: UDP or TCP. By default, the UDP protocol is selected.
Max length	Specifies the maximum length in bytes of any syslog message. The default value is **2048**. Messages that exceed the maximum length are truncated when the **Truncate overly large syslog messages** checkbox is selected.
Truncate overly large syslog messages	When checked, any messages exceeding the maximum length are truncated.
Include the local timestamp in syslog messages	When checked, NetWitness Suite includes the local timestamp in messages.
Include the local hostname in syslog messages	When checked, NetWitness Suite includes the local hostname in syslog messages.
Optionally use IDENT protocol	When checked, NetWitness Suite prepends the identity string to outgoing syslog alerts.

Feature	Description
Identity string	This is an identity string to be prepended to each syslog alert. If the string is blank, no identity string is prepended to the outgoing syslog alerts. You can use this to identify the source of the alert. Users conventionally set it to the name of the program that sends the syslog message.
Apply	Applies the syslog configuration settings.

SNMP Settings

The following table describes the available options for configuring SNMP notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Feature	Description
Enable	Enables the SNMP settings configured here.
Server Name	Specifies the SNMP trap host.
Server port	Specifies the listening port on the SNMP trap host
SNMP version	Specifies the SNMP version, **v1** or **v2c**.
Trap OID	Specifies the object ID for the SNMP trap on the trap host that receives the audit event. The default value is **0.0.0.0.0.1**.
Community	Specifies the community string used to authenticate on the SNMP trap host, the default value is **public**.
Enable	Enables SNMP notifications as configured here.
Apply	Applies the SNMP configuration settings.

Supported CEF Meta Keys

This topic describes the Common Event Format (CEF) meta keys that NetWitness Suite global audit logging supports.

Global audit logging templates that you define for a Log Decoder use Common Event Format (CEF) and must meet the following specific standard requirements:

- Include the CEF headers in the template.
- Use only the extensions and custom extensions in a (Key=Value) format from the meta key table below.
- Ensure that the extensions and custom extensions are in the `key=${string}<space>key=${string}` format.

For third-party syslog servers, you can define your own format (CEF or non-CEF).

Procedures related to this table are described in Define a Template for Global Audit Logging and Configure Global Audit Logging.

Supported Common Event Format (CEF) Meta Keys

The following table describes the CEF Syslog meta keys that NetWitness Suite global audit logging supports. The Datetime and Hostname fields in the Syslog Prefix are not configurable and not included in the template, but they are prepended to every log message by default. The CEF Header is required to conform to the CEF standard and for any CEF parser. The Extensions and Custom Extensions are optional. The Default Audit CEF Template contains many of the fields in this table. You can add any of the Extensions and Custom Extensions listed to the global audit logging template that you define.

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
Syslog Prefix				
Datetime	Not Configurable	Syslog Header date time	event.time.str	Transient
Hostname	Not Configurable	Syslog Header hostname	alias.host	None

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
CEF Header		The CEF Header fields are required to conform to the CEF standard and for any CEF parser.		
CEF:Version	CEF:0	CEF Header	--STATIC--	N/A
DeviceVendor	${deviceVendor}	The product vendor, RSA	-	N/A
DeviceProduct	${deviceProduct}	The product family. This is always NetWitness Suite Audit.	product	Transient
DeviceVersion	${deviceVersion}	Host/Service version	version	Transient
Signature ID	${category}	Identifier of the audit event. It specifies the the category of the audit event.	event.type	None
Name	${operation}	Description of the event	event.desc	None
Severity	${severity}	Severity of the audit event	severity	Transient
Extensions				

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
deviceExternalId	${deviceExternalId}	Unique ID of the host or service generating the audit event	hardware.id	Transient
deviceFacility	${deviceFacility}	Syslog facility used when writing the event to syslog daemon. For example, authpriv.	cs.devfacility	Custom
deviceProcessName	${deviceProcessName}	Name of the executable corresponding to dvcpid	process	None
dpt	${destinationPort}	Destination Port	ip.dstport	None
dst	${destinationAddress}	Destination IP Address	ip.dst	None
dvcpid	${deviceProcessId}	ID of the process generating the event, which is the process ID of the NetWitness Suite service	process.id	Transient

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
msg	${text}	Free text, extra information, or actual description for the event	msg	Transient
outcome	${outcome}	Outcome of the operation performed corresponding to the audit event	result	Transient
proto	${transportProtocol}	Network protocol used	protocol	Transient
requestClientApplication	${userAgent}	Browser detail of the user accessing the page	user.agent	Transient
rt	${timestamp}	Time at which the event is reported	event.time	None
sourceServiceName	${sourceService}	The service that is responsible for generating this event	service.name	Transient
spt	${sourcePort}	Source Port	ip.srcport	Transient

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
spriv	${userRole}	User role permissions assignment. For example: admin.owner, appliance.manage, connections.manage, everyone, logs.manage, services.manage, storedproc.execute, storedproc.manage, sys.manage, users.manage	privilege	Transient
src	${sourceAddress}	Source IP Address	ip.src	None
suser	${identity}	Identity of the logged on user responsible for generating the audit event	user.dst	None
Custom Extensions				
deviceService	${deviceService}	Service responsible for generating the event	cs.devservice	Custom

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
parameters	${parameters}	API and Operation parameters, which capture specific parameters about a query	index	Transient
paramKey	${key}	A configuration item key. It is the config param for which the audit event is captured. For example: /sys/config/stat.interval	cs.key	Custom
paramValue	${value}	A configuration value. It is the value captured during the update.	cs.value	Custom

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
userGroup	${userGroup}	Role assignment. For example: Administrators, Analysts, MalwareAnalysts, Malware_Analysts, Operators, PRIVILEGED_CONNECTION_AUTHORITY, SOC_Managers	group	None
referrerURL	${referrerUrl}	The parent URL that refers to the current URL	url	Transient
sessionId	${sessionId}	Session or connection identifier	log.session.id	Transient

Note: Use all of the extensions in the following format:
`deviceProcessName=${deviceProcessName} outcome=${outcome}`
Include a `<space>` between a value and a tagname.

By default, all meta keys are not indexed. In the above table, the **Index in Log Decoder** column shows the state of the `flags` keyword (Transient, None, and Custom). If a key is set to `Transient`, it is parsed but not stored in the database. If it is set to `None`, it is indexed and stored in the database. A key listed as "Custom" does not exist in the table-map.xml file and, therefore, it is not stored or parsed at all.

"Maintain the Table Map Files" provides instructions for verifying and updating the table mappings. "Edit a Service Index File" provides information on updating the custom index file on the Concentrator.

Supported Global Audit Logging Meta Key Variables

This topic describes the meta key variables that NetWitness Suite global audit logging supports.

NetWitness Suite provides predefined global audit logging templates that you can use for your global audit logging configurations. For third-party syslog servers, you can define your own template format (CEF or non-CEF) using supported meta key variables.

Procedures related to this table are described in Define a Template for Global Audit Logging and Configure Global Audit Logging.

Supported Global Audit Logging Meta Key Variables

The following table describes the meta key variables that NetWitness Suite global audit logging supports. Use these values to create a custom audit logging template for a third-party syslog server.

Variable	Description
${category}	Identifier of the audit event. It specifies the the category of the audit event.
${destinationAddress}	Destination IP Address
${destinationPort}	Destination Port
${deviceExternalId}	Unique ID of the service generating the audit event
${deviceFacility}	Syslog facility used when writing the event to syslog daemon. For example, authpriv.
${deviceProcessId}	ID of the process generating the event, which is the process ID of the NetWitness Suite service
${deviceProcessName}	Name of the executable corresponding to dvcpid
${deviceProduct}	The product family. This is always NetWitness Suite Audit.
${deviceService}	Service responsible for generating the event
${deviceVendor}	The product vendor, RSA
${deviceVersion}	Host/Service version

Variable	Description
${identity}	Identity of the logged on user responsible for generating the audit event
${key}	A configuration item key. It is the config param for which the audit event is captured.
${operation}	Description of the event
${outcome}	Outcome of the operation performed corresponding to the audit event
${parameters}	API and Operation parameters, which capture specific parameters about a query
${referrerUrl}	The parent URL that refers to the current URL
${sessionId}	Session or connection identifier
${severity}	Severity of the audit event
${sourceAddress}	Source IP Address
${sourcePort}	Source Port
${sourceService}	The service that is responsible for generating this event
${text}	Free text, extra information, or actual description for the event
${timestamp}	Time at which the event is reported
${transportProtocol}	Network protocol used
${userAgent}	Browser detail of the user accessing the page
${userGroup}	Role assignment
${userRole}	User role permissions assignment
${value}	A configuration value. It is the value captured during the update

Global Audit Logging Operation Reference

This topic lists message types being logged by the various NetWitness Suite components. Most messages plainly state the operation being logged; when necessary the meaning of the message is explained.

After you create a global audit logging configuration, audit logs automatically go to the external syslog system in the format specified in the selected audit logging template. The message types being logged by the various NetWitness Suite components are shown in the following tables.

CARLOS

The following table lists the operations logged by CARLOS.

Serial #	Operation Name	Meaning
1	SetProviderConfiguration	A new notification server (for example, SMTP server) was added or updated
2	SetInstanceConfiguration	A new notification type (for example, email destination) was added or updated
3	SetTemplateDefinition	A new template was added or updated
4	RemoveProviderConfiguration	A notification server was removed
5	RemoveInstanceConfiguration	A notification type was removed
6	RemoveTemplateDefinition	A template definition was removed
7	Commit	A configuration bean change was committed
8	Set	A JMX property value was set via NetWitness Suite Explore view

ESA

The following table lists the operations logged by the Event Stream Analysis (ESA).

Serial #	Operation Name	Meaning
9	SetSourceRequest	A concentrator was added or updated to ESA as source
10	RemoveSourceRequest	A concentrator was removed from ESA as source
11	SetEplModule	An EPL module was deployed or updated to ESA
12	RemoveEplModule	An EPL module was removed from ESA
13	SetEnrichmentSourceRequest	An ESA enrichment source was added/updated
14	RemoveEnrichmentSourceRequest	An ESA enrichment source was removed
15	SetDatabaseReference	An enrichment database reference was made to ESA
16	UpdateEnrichmentData	Data rows added to an ESA enrichment source
17	SetEnrichmentConnection	A connection was made between an EPL module and an enrichment source
18	RemoveEnrichmentConnection	A connection between an EPL module and an enrichment source was removed
19	DisableTrialModule	ESA Trial rules were disabled

Investigation

The following table lists the operations logged by Investigations.

Serial #	Operation Name	Meaning
1	VisualizePreferences	Operations related to Informer Visualization Request.
2	ParallelCoordinates	Operations related to Loading of Co-Ordinate View Navigation.
3	TimeLine	Operations related to Loading of Timeline View Navigation.
4	ExteralQuery	Operation when a Direct Query is fired via URL.
5	PrintView	Operations to open Investigation in Print View.
6	submitExtractFiles	Operation to submit a Request to Extract files from Sessions.
7	submitExtractLogs	Operation to submit a Request to Extract Logs from Sessions.
8	submitExtractPcap	Operation to submit a Request to Extract Sessions from Sessions.
9	DataScienceDrill	Operation to investigate from Data Science Report.
10	breadCrumbs	Operation to access the Query Breadcumbs.
11	Create	Operation when a new Investigation Query is being saved as a predicate to be used for URL Integration.

Serial #	Operation Name	Meaning
12	userPredicates	Operation to access Recent Queries of a user.
13	chartDefaultMetas	Operation to access last used Meta for generating Coordinate Chart.
14	defaultDevice	Operation to access the Default Investigation Device.
15	deleteDefaultDevice	Operation to delete the Default Investigation Device.
16	chartPreferences	Operation to edit an Investigation Navigation Chart Parameters such as Height.
17	devicePreferences	Operation to save the preferences about the Investigation Device such asTime Range, Profile, Meta Groups etc.
18	topValues	Operation to get the Top Values for Metas. Normally called from Top Values Dashlet.
19	MetaLanguages	Operation to read the Meta Languages from a Device.
20	MetaGroups	Operations related to Investigation Meta Groups.
21	DefaultMetaKeys	Operations related to Investigation Default Meta Keys.
22	UpdateDefaultMetaKeys	Operations to update Investigation Default Meta Keys.

Serial #	Operation Name	Meaning
23	UpdateMetaGroup	Operations to update Investigation Meta Groups.
24	ApplyMetaGroup	Operations to use Investigation Meta Groups.
25	DeactivateMetaGroup	Operations to reset Investigation Meta Groups in UI.
26	DeleteMetaGroup	Operations to remove Investigation Meta Group.
27	DeleteMetaGroups	Operations to remove multiple Investigation Meta Groups.
28	ImportMetaGroups	Operations to import Investigation Meta Groups.
29	ExportMetaGroup	Operations to export multiple Investigation Meta Groups.
30	GeoMap	Operation to access the Geo Map View of Investigation.
31	deleteEndpointCache	Operation to clear Reconstruction Cache of a Device.
32	delete	Operation to delete Alert Templates.
33	CustomColumnGroup	Operation to apply or read Custom Column Group.
34	Import	Operations related to Import of Column Group or Profiles.
35	Export	Operations related to Export of Column Group or Profiles.

Serial #	Operation Name	Meaning
36	SaveProfile	Operation to save an Investigation Profile.
37	ApplyProfile	Operation to apply an Investigation Profile.
38	DeactivateProfile	Operation to deactivate an Investigation Profile.
39	DeleteProfile	Operation to delete an Investigation Profile.
40	DeleteProfiles	Operation to delete multiple Investigation Profiles.

Reporting Engine

The following table lists the operations logged by the Reporting Engine.

Serial #	Operation Name	Meaning
1	TEMPLATE	For all operations related to template
2	CHART	For all operations related to chart
3	REPORT	For all operations related to report
4	RULE	For all operations related to rule
5	IMAGE	For all operations related to Logo Images used in Reports.
6	LIST	For all operations related to list
7	ALERT	For all operations related to alert
8	CONFIG	For all operations related to configuration change

Serial #	Operation Name	Meaning
9	SCHEDULE	For all operations related to schedule
10	ROLE	For all operations related to role/authorization
11	BATCH_JOB	For all operations related to batch jobs
12	SCHEDULER	For all operations related to scheduler
13	QUERYPROCESSOR	For all operations related to queryprocessor
14	FORMATTER	For all operations related to formatter
15	OUTPUTACTION	For all operations related to outputaction
16	STATUSMANAGER	For all operations related to statusmanager
17	BATCH_RUNDEF	For all operations related to batch rundef
18	CHARTGROUP	For all operations related to chart group
19	REPORTGROUP	For all operations related to report group
20	RULEGROUP	For all operations related to rule group
21	LISTGROUP	For all operations related to list group
22	DISKSPACE	For all operations related to disk space

Warehouse Connector

The following table lists the operations logged by the Warehouse Connector.

Serial #	Operation Name	Meaning
1	LockBox Password Create	Operation to create LockBox Password.
2	LockBox Password Update	Operation to update LockBox Password.
3	LockBox Password Refresh	Operation to refresh LockBox Password.
4	Adding Stream	Operation to add a Stream.
5	Adding Source	Operation to add a Source.
6	Adding Destination	Operation to add a Destination.
7	Removing	Operation to remove a Source, Stream, or Destination.
8	Changing Password	Operation to change the Password.
9	Updating Source	Operation to update a Source.
10	Adding Source to Stream	Operation to add a Source to a Stream.
11	Deleting Source from Stream	Operation to delete a Source from a Stream.
12	Setting Destination to Stream	Operation to set a Destination to a Stream.
13	Finalizing Stream	Operation to finalize a Stream and initiate the aggregation.
14	Stopping Stream	Operation to stop a Stream.

Serial #	Operation Name	Meaning
15	Starting Stream	Operation to start a Stream.
16	Reloading Stream	Operation to reload a Stream.

Health & Wellness

The following table lists the operations logged by Health & Wellness.

Serial #	Operation Name	Meaning
1	SavePolicyRequest	Operation while adding or modifying a Policy.
2	RemovePolicyRequest	Operation while removing a Policy.

NetWitness Suite Core Services

The following table lists the operations logged by NetWitness Suite Core Services.

Serial #	Operation Name	Meaning
1	FILE-Command	Operation to list, retrieve and delete files from approved directories on this device.
2	SERVICE-Start	Service started
3	SERVICE-Stop	Service stopped
4	REDIRECT-Syslog	Operation for syslog forwarding.
5	ADD-Monitor	Issuing a filesystem monitor operation
6	DELETE-Monitor	Issuing a filesystem monitor deletion operation
7	SHUTDOWN-Service/shutdown.service	Shutting down appliance service
8	REBOOT-Service	Restarting appliance service

Serial #	Operation Name	Meaning
9	CONFIGURE-Network	Issuing Network Configuration change
10	SET-NTP	Issuing NTP set operation
11	STOP-NTP	Issuing NTP stop operation
12	NTP-Timesync	Issuing NTP time sync operation
13	SET-SNMP	Issuing SNMP set
14	UPGRADE/upgrade	Issuing upgrade operation
15	create.collection	Operation to create an empty collection.
16	restore	Issuing restore
17	session.aggregation	Issuing aggregation start/stop
18	add.device	Adding a device for aggregation
19	edit.device	Editing a device used for aggregation
20	delete.device	Deleting a device used for aggregation
21	capture.start	Starting capture operation
22	capture.stop	Stopping capture operation
23	select.interface	Selecting capture interface
24	export	Operation to export packets or sessions.
25	reload	Issuing a parser reload
26	schema	Issuing a schema request for loaded parsers
27	upload/file.upload	Issuing file upload

Serial #	Operation Name	Meaning
28	notify	Issuing feed notify
29	delete	Issuing file deletion
30	edit.config	Configuration change operation
31	parsers.transforms	Perform a language key transformation
32	data.reset	Data reset operation
33	timeout	REST request timeout
34	cancel	Cancel a running query
35	timeroll	Operation to delete the database files that exceed a given limit.
36	dump	Operation to dump information out of the database in nwd formatted files.
37	session.wipe	Issuing a session wipe operation
38	REPLACE-Rule	Issuing a rule replace operation
39	MERGE-Rule	Issuing a rule merge operation
40	ERASE-Rule	Issuing deletion of a set of all rules
41	ADD-Rule	Issuing a rule addition operation
42	DELETE-Rule	Issuing deletion of a set of rules
43	sdk.info	Issuing SDK summary info.
44	sdk.session	Issuing SDK session info.
45	sdk.language	Issuing SDK language
46	sdk.aliases	Issuing SDK alias request

Serial #	Operation Name	Meaning
47	sdk.transform	Issuing SDK transformation request
48	sdk.search	Issuing session content search request
49	sdk.cache	Operation related to session content cache
50	sdk.content	Issuing session content request
51	check.authorization	Operation to check user roles for permissions to execute an operation.
52	close.connection	Issuing a connection close operation
53	handshake	Issuing an SSL handshake
54	logon/login	Operation to login from NW to the other services, mostly to privileged users.
55	STOREDPROCOP	Issuing file upload cancel/start
56	ADD-Task	Added scheduled task
57	DELETE-Task	Deleted scheduled task
58	logoff	Issuing logout operation
59	list.cacerts	Issuing list trusted CA certificate operation
60	delete.cacerts	Issuing delete trusted CA certificate operation
61	add.cacerts	Issuing addition of trusted CA certificate operation
62	restart.command	Issuing restart command line option

Serial #	Operation Name	Meaning
63	delete.file/file.delete	Operation to delete system configuration files.
64	update.file/file.update	Operation to update system configuration file.
65	create.file	Issuing file creation operation
66	query	Issue a database query
67	unlock	Issuing unlock user account operation
68	user.add	Operation to create user accounts on individual devices.
69	user.delete	Operation to delete a user on individual devices.
70	group.create	Operation to add a new group to the system.
71	user.remove	Remove a user account from a group
72	group.delete	Delete a group from the /users/groups tree
73	add.user	Issuing add user command to collection
74	delete.user	Issuing delete user command to collection
75	remove.user	Removing an user from collection
76	collection.open	Issuing an open command for a collection

Serial #	Operation Name	Meaning
77	collection.close	Issuing a close command for a collection
78	collection.delete	Issuing collection deletion command
79	reingest.start	Operation to start reingesting of packet data in collection.
80	feed.notify	Issuing a feed notify command
81	collect	Issuing a collect command
82	collect.start	Issuing a data collection start
83	collection.global	Issuing import parser command
84	parser.reload	Issuing parser reload command
85	reingest	Operation to reingest packet data in collection.
86	collection.create	Issuing a create collection command
87	collection.restore	Issuing a restore collection command
88	collection.clone	Issuing a clone collection command
89	parser.reload	Issuing parser reload command
90	sdk.query	Performs a query against the meta database
91	sdk.msearch	Search for pattern matches in many sessions or packets
92	sdk.values	Performs a value count query and returns the matching values for a report

Serial #	Operation Name	Meaning
93	sdk.timeline	Returns the count of sessions/size/packets in discrete time intervals

Malware Analysis

The following table lists the operations logged by the Malware Analysis (MA) component.

Serial #	Operation Name	Meaning
1	GetDashBoardSummaryRequest	Get dashboard analysis statistics
2	GetFileScoreSummaryRequest	Get aggregated file scores by score type and risk level
3	CountEventsAndFilesRequest	Get count of events and files over a time frame
4	GetAvVendorDetectionRequest	Get AV vendor analysis results
5	GetAVVendorsRequest	Get list of AV Vendors supported
6	SetInstalledAVVendors	Request Update list of installed AV Vendors in config
7	CountEventByCriteriaRequest	Count events by criteria
8	FindEventByIdRequest	Get event by id
9	FindEventByCriteriaRequest	Get event by criteria
10	DeleteEventRequest	Delete event
11	CommentOnEventRequest	Add comment to event
12	ReSubmitEventRequest	Resubmit event for analysis
13	FindEventScoreByIdRequest	Get event score by event id

Serial #	Operation Name	Meaning
14	FindEventScoreByCriteriaRequest	Get event score by criteria
15	FindMetaByIdRequest	Get meta by id
16	FindMetaByCriteriaRequest	Get meta by criteria
17	FindMetaValueByCriteriaRequest	Get meta value by criteria
18	CountByDistinctMetaValueRequest	Count distinct meta values
19	CountByMetaNameAndValueWithDate RangeIntervalRequest	Count meta and values with interval for charting
20	CountByValueAndAverageOverallScore Request	Count meta and map to overall scores for events
21	CountByValueAndAverageGroupScore Request	Count meta and map to group scores for events
22	CountFileEntryByCriteriaRequest	Count files by criteria
23	FindFileEntryByIdRequest	Get file by id
24	FindFileEntryByCriteriaRequest	Get file by criteria
25	ReSubmitFileEntryRequest	Resubmit file for analysis
26	FileDownloadRequest	Download file from repository
27	FileUploadRequest	Upload file for analysis
28	FindFileScoreByIdRequest	Get file score by id
29	FindFileScoreByCriteriaRequest	Get file score by criteria
30	FindHashValueByIdRequest	Get whitelist/blacklist Hash value by id
31	FindHashValueByCriteriaRequest	Get whitelist/blacklist Hash value by criteria
32	AddHashValueRequest	Add whitelist/blacklist Hash value

Serial #	Operation Name	Meaning
33	UpdateHashValueRequest	Update whitelist/blacklist Hash value
34	DeleteHashValueRequest	Delete whitelist/blacklist Hash value
35	FindHashValueByMd5Request	Find whitelist/blacklist Hash value by md5
36	AddHashValueInFileRequest	Add File to repository as well as hash value
37	GetDefaultRulesRequest	Get default IOC Rules configuration
38	ResetToDefaultRulesRequest	Reset IOC Rules configuration to default
39	GetAllOverrideRulesRequest	Get IOC Rules user created override configuration
40	FindOverrideRuleByIdRequest	Find IOC override rule by id
41	AddOverrideRuleRequest	Add IOC override rule
42	UpdateOverrideRuleRequest	Update IOC override rule
43	DeleteOverrideRuleRequest	Delete IOC override rule
44	SubmitOnDemandNextGenRequest	Submit new ondemand nextgen scan
45	FindOnDemandJobEntryByIdRequest	Get ondemand job entity by id
46	FindOnDemandJobEntryByCriteria Request	Get ondemand job entity by criteria
47	GetOnDemandJobInfoRequest	Get ondemand job reference entity by id
48	GetOnDemandDefaultConfiguration	Request Get ondemand default configuration

Serial #	Operation Name	Meaning
49	CancelOnDemandJobRequest	Cancel ondemand job in progress
50	DeleteOnDemandJobRequest	Delete ondemand job
51	ReSubmitOnDemandJobRequest	Resubmit ondemand job
52	SubscriptionRequest	Subscribe to MA Cloud communication
53	UnSubscribeRequest	Unsubscribe from MA Cloud communication
54	GetTopEventInfluencesRequest	Get Top N event influences
55	GetServerInfoRequest	Get server info, such as server time
56	DataResetRequest	Reset database
57	OnDemandJobStatusNotification	Report ondemandjob progress to subscribers
58	LicenseStatusNotification	Report license status - num samples analyzed
59	DataResetNotification	Report that data was reset
60	GetIocSummaryRequest	Get IOC rules aggregated by event/file scores
61	FindAlertTemplatesByCriteriaRequest	Get rabbitmq alert templates by criteria
62	SaveAlertTemplateRequest	Update alert template
63	DeleteAlertTemplateRequest	Delete alert template
64	GetJobStatusRequest	Get in progress job analysis thread status
65	GetEventTypeCountSummaryRequest	Get event analysis counts by date chart

Serial #	Operation Name	Meaning
66	Logon	Logon to the MA Service
67	Modified	Modifying config changes
68	GetNextGenSummaryRequest	Get nextgen dashboard summary statistics

NetWitness Suite User Interface

The following table lists the operations logged by the NetWitness Suite User Interface component.

Serial #	Operation Name	Meaning
1	uploadTrialLicense	Upload Trial License
2	LicenseEntitle	Entitle License
3	LicenseDeactivation	Deactivate License
4	ExpiredLicense	License Expired
5	LicenseOutOfComplianceAcknowledgement	EULA Acknowledgement
6	resetLicense	Reset License
7	usageDateExport	License data usage - csv/pdf
8	refreshLicense	Refresh LLS license
9	LicenseOutOfCompliance	Out of Compliance
10	OOTBEntitlementOutOfCompliance	OOTB Trial license Out of Compliance
11	OOTBEntitlementFirstLoginTimeModified	OOTB time modified
12	OOTBEntitlementFileDeleted	OOTB File deleted
13	OOTBEntitlementDataTampering	OOTB data tampering

Serial #	Operation Name	Meaning
14	uploadOfflineResponse	Upload offline response
15	offlineDownloadCapRequest	Download offline request
16	movePerpetualToMetered	Move Service-based license to Metered
17	moveMeteredToPerpetual	Mover Metered to Service-based license
18	mapServiceLicense	Map Service to Real license
19	delete	Operation to delete Alert Templates.
20	HttpRequest	Operation for Audit Logging of the accessed URL.
21	Page Accessed	Operation for Audit Logging of the accessed page.
22	Navigate	Operation to navigate to the accessed page.
23	Events	Operation to view the accessed event page.
24	Recon	Operation for Event Reconstruction requested.
25	Services	Operation while reading the list of available devices for investigation.
26	Service	Operation for a List of devices requested to be investigated.

Serial #	Operation Name	Meaning
27	Collections	Operation to view the list of collections requested.
28	Profiles	Operation to apply a Profile.
29	ColumnGroups	Operation to apply or read Column Group.
30	ParallelCoordinates	Operations related to Loading of co-ordinate view navigation.
31	Timeline	Operations related to loading of timeline view navigation.
32	PrintView	Operations to open investigation in print view.
33	Preferences	Operations related to Informer Request.
34	import	Operations related to Import of Column Group or Profiles.
35	export	Operations related to Export of Column Group or Profiles.
36	Predicate	Operations related to Queries (Predicates) used for Investigation.
37	Languages	Operation for Language requested from a Device.
38	CancelLanguageLoad	Operation for Language Load Canceled from Navigate Page.

Serial #	Operation Name	Meaning
39	summary	Operation for a summary requested from a Device.
40	languages	Operation for a language requested from a device.
41	aliases	Operation for meta aliases requested from a device.
42	query	Operation for SDK Query requested from a device.
43	msearch	Operation for a meta search requested from a device.
44	nodeListing	Node Listing for a node requested from a Device.
45	content	SDK Content call requested from a Device for downloading a PCAP or Log.
46	Export Files	File Listing Requested for a Session in File View or Extraction jobs.
47	packets	Packets requested for sessions in Packet View or Extraction Jobs.
48	deleteEndpointCache	Operation to clear reconstruction cache of a device.

Serial #	Operation Name	Meaning
49	Logon	Operation for user to sign in to NetWitness Suite User Interface.
50	Logoff	Operation for user to sign out of NetWitness Suite User Interface.
51	defaultDevice	Operation to access the Default SA UI Device.
52	deleteDefaultDevice	Operation to delete the Default investigation device.
53	submitExtractFiles	Operation to submit a request to Extract files from Sessions.
54	submitExtractLogs	Operation to submit a Request to Extract Logs from Sessions.
55	submitExtractPcap	Operation to submit a Request to Extract Sessions from Sessions.
56	MetaGroup	Operations related to SA UI Meta Groups.
57	ExternalQuery	Operation when a Direct Query is fired via URL.
58	GeoMap	Operation to access the Geo Map View of Investigation.
59	SaveProfile	Operation to save an Investigation Profile.

Serial #	Operation Name	Meaning
60	ApplyProfile	Operation to apply an Investigation Profile.
61	DeleteProfile	Operation to apply an Investigation Profile.
62	DeactivateProfile	Operation to apply an Investigation Profile.
63	VisualizePreferences	Operations related to Informer Visualization Request.
64	ExportMetaGroup	Operations to export multiple SA UI Meta Groups.
65	userPredicates	Operations to export multiple SA UI Meta Groups.
66	FileView	Operation for reconstruction request for File View.
67	resource.update	Operation when Live Subscription State changes.

Respond

The following table lists the operations logged by the RESPOND component.

Serial #	Operation Name	Meaning
1	update	Update notification setting
2	update	Update integration settings configuration
3	delete	Delete Alerts
4	create	Create new incident

Serial #	Operation Name	Meaning
5	update	Update incident details
6	read	Read incident details
7	delete	Delete incidents
8	read	Read remediation tasks
9	delete	Delete Remediation tasks
10	update	Update remediation tasks
11	create	Create new rule
12	update	Update existing alert rule
13	reorder	Reorder priority of alert rules

Local Audit Log Locations

NetWitness Suite has global audit logging capabilities. When you configure global audit logging, audit logs from all NetWitness Suite components collect in a centralized system, which converts them into the required format and forwards them to a third-party syslog server or a Log Decoder.

To view audit logs from the individual services, you can look at the local audit log locations.The following table shows the local directory paths of the audit logs for the NetWitness Suite user interface and the various NetWitness Suite services.

Service/Module	Audit Log Location
NetWitness Suite User Interface (NetWitness Suite Web Server)	The NetWitness Suite user interface sends audit logs to the following locations: • **/var/lib/netwitness/uax/logs/audit/audit.log** (human-readable format) • Syslog running on the local host (JSON format) The NetWitness Suite user interface uses the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (/var/lib/netwitness/uax/logs/audit/audit.log).
Core Services (Decoder, Log Decoder, Concentrator, Broker, and Archiver), Log Collector, Warehouse Connector, Workbench, and IPDB Extractor	The Core services and similar services send audit logs to Syslog running on the local host. Path: **/var/log/secure** (JSON format) The Core services use the AUTHPRIV facility of syslog to write audit logs to syslog.

Service/Module	Audit Log Location
Reporting Engine, Malware Analysis, RESPOND, and Event Stream Analysis (ESA)	These services send audit logs to the following locations: • **<application home directory>/logs/audit/audit.log** (human-readable format) • Syslog running on the local host (JSON format) The following are the audit log locations of these services: Reporting Engine: **/home/rsasoc/rsa/soc/reporting-engine/logs/audit/audit.log** Respond Server /var/log/netwitness/respond-server/respond-server-audit.log Malware Analysis: **/var/lib/netwitness/rsamalware/spectrum/logs/audit/audit.log** Event Stream Analysis: **/opt/rsa/esa/logs/audit/audit.log** These services use the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (<application home directory>/logs/audit/audit.log).
Health & Wellness, Event Source Management (ESM), and Appliance and Service Grouping (ASG)	These Services send audit logs to the following locations: • **/opt/rsa/sms/logs/audit/audit.log** (human-readable format) • Syslog running on the local host (JSON format) These services use the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (/opt/rsa/sms/logs/audit/audit.log).

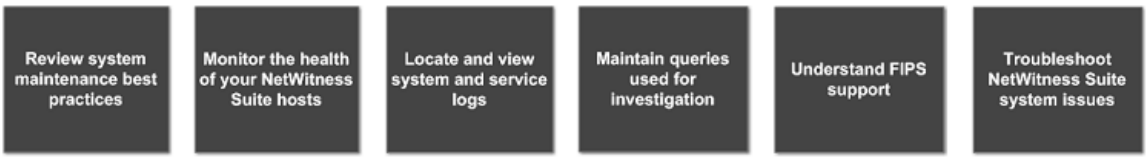
NetWitness Suite System Maintenance

This guide encompasses the tasks that administrators perform after initial network setup to allow NetWitness Suite to manage hosts and services in the network, maintain and monitor the network, manage jobs, and tune performance.

The following diagram shows the different system maintenance tasks available to you.



The following topics describe these tasks:

- Best Practices
- Monitoring Health and Wellness of NetWitness Suite
- Displaying System and Service Logs
- Maintaining Queries Using URL Integration
- Managing NetWitness Suite Updates
- FIPS Support
- Troubleshoot NetWitness Suite

Best Practices

Safeguarding Assets with RSA Supplied Policies

The purpose of the RSA Core Policies delivered with NetWitness Suite is to help you safeguarding your NetWitness Suite Domain assets immediately (before you configure rules specific to your environment and your Security Policy).

RSA recommends that you set up email notifications to the appropriate asset owners for these policies as soon as possible. This will notify them when performance and capacity thresholds are crossed so they can take action immediately.

RSA also recommends that you evaluate the Core policies and disable a policy or change its service/group assignments according to your specific monitoring requirements.

Safeguarding Assets with Policies Based on Your Environment

RSA Core Policies are generic and may not provide sufficient monitoring coverage for your environment. RSA recommends that you gather issues over a period of time, not identified by the RSA Core Policies, and configure rules to help you prevent these issues.

Creating Rules and Notifications Judiciously

RSA recommends that you make sure that each rule and policy is necessary before you implement it, if possible. RSA also recommends that you review implemented policies or a regular basis for their validity. Invalid alarms and email notifications can adversely affect the focus of the asset owners.

Troubleshooting Issues

RSA recommends that you review Troubleshooting Health & Wellness and Troubleshoot NetWitness Suite when you receive error messages in the user interface and log files from hosts and services.

Monitoring Health and Wellness of NetWitness Suite

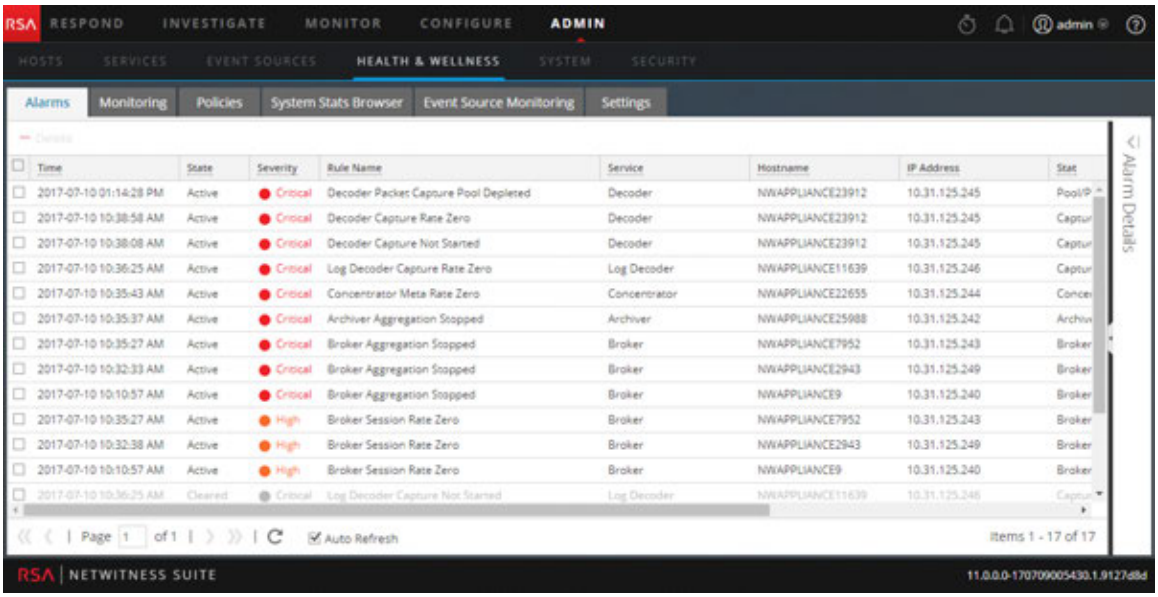
The Health & Wellness module of NetWitness Suite provides the ability to:

- View the current health of all the hosts, services running on the hosts, and various aspects of the hosts' health.
- Monitor the hosts and services in your network environment.
- View details of various event sources configured with NetWitness Suite.
- View system stats for the selected hosts by filtering the views as required.

In addition, you can configure Archiver monitoring and Warehouse Connector monitoring, use the procedures on monitoring host statistics, and work with system logs to monitor NetWitness Suite.

Note: All users have permission to view the entire Health and Wellness interface by default. The Administrator and the Operator roles are the only roles that can manage the Policies view by default. Please refer to the **Role Permissions** topic in the *Security User Management Guide* for a complete list of the default permissions for the NetWitness Suite Interface.

The figure displays the Health & Wellness module of the NetWitness Suite user interface and various sections in the Health & Wellness module.



Manage Policies

Policies are either user-defined or supplied by RSA. A policy defines:

- Services and hosts to which the policy applies.
- Rules that specify statistical thresholds that govern alarms.
- When to suppress the policy.
- Who to notify when an alarm triggers and when to notify them.

For the related reference topics, see NetWitness Suite Out-of-the-Box Policies

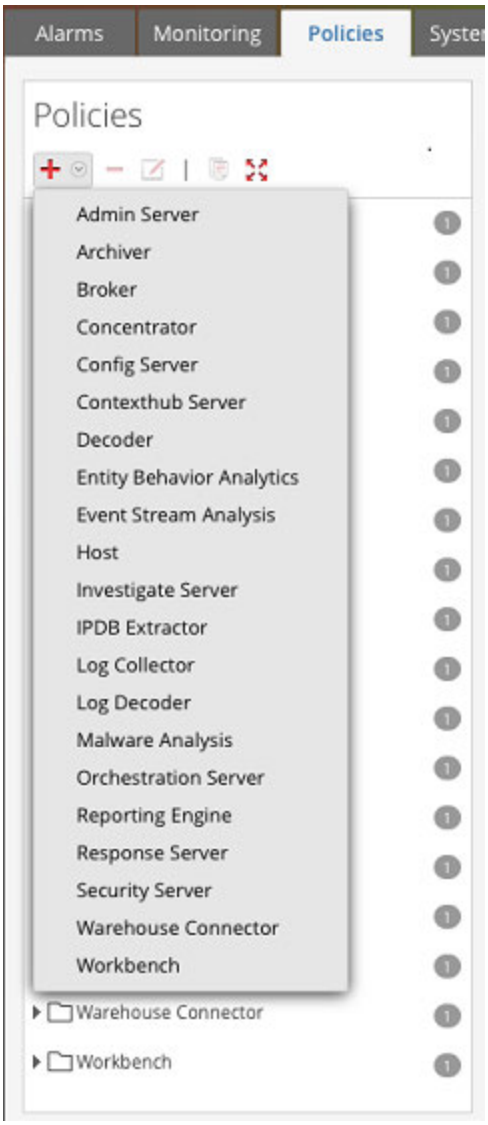
Note: You can now configure a policy to notify Public Key Infrastructure (PKI) certificate expiration status.

Add a Policy

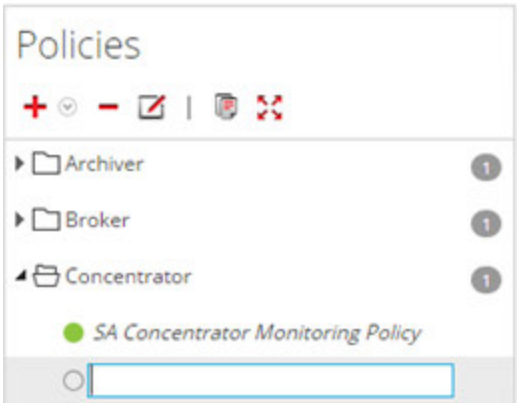
1. Go to **ADMIN > Health & Wellness.**
2. Click **Policies** tab.

   The Policies view is displayed.
3. Click  in the **Policies** panel.

   A list of your hosts and services displays for which you can create health policies.



4. Select a host or service (for example, **Concentrator**).
   For PKI policy, you must select a host (for example, Host).
   The host or service is displayed in the Policies panel with a blank Policy Detail panel.



5. Enter a name for the Policy (for example, **Concentrator Policy Status**) in the **Policies** panel.

   The name (for example, **Concentrator Policy Status**) is now displayed as the policy name in Policy Detail panel.

6. Create a Policy in the Policy Detail panel:

   a. Select the **Enable** checkbox.

   b. Add relevant services (in this example, any relevant Concentrator services) that you want to monitor for health statistics.
   For PKI policy, you must select the LOCALHOST to monitor for health statistics.

   c. Add relevant rule conditions you want to configure for the policy.

   d. Suppress enforcement of the policy for the time periods you want.

   e. Add any email notifications you want for the policy.

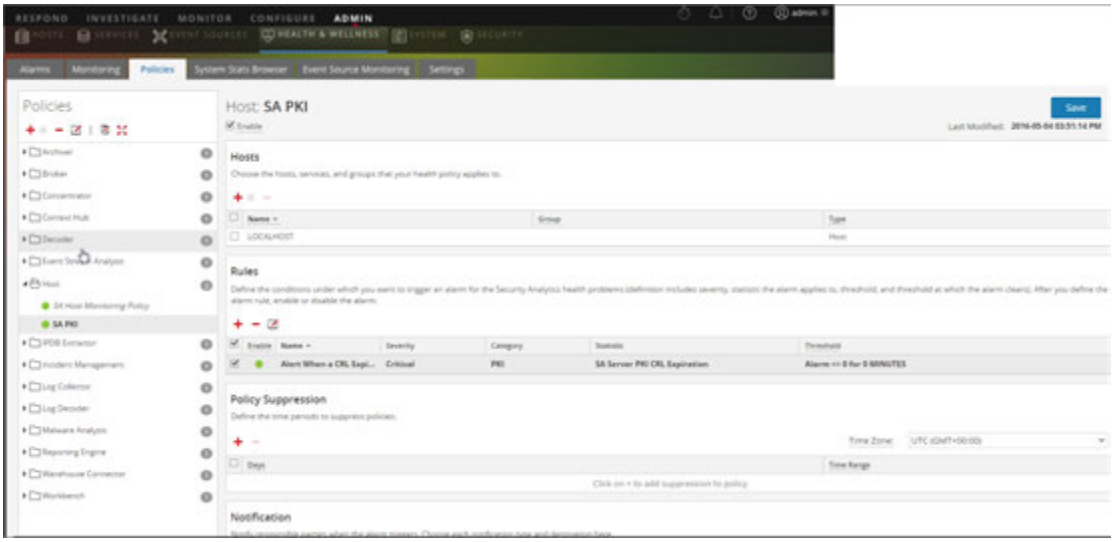
   f. Click **Save** in the Policy Detail panel.

      The Policy is added.

Add Policy Example

Below is the high-level example for configuring PKI policy:

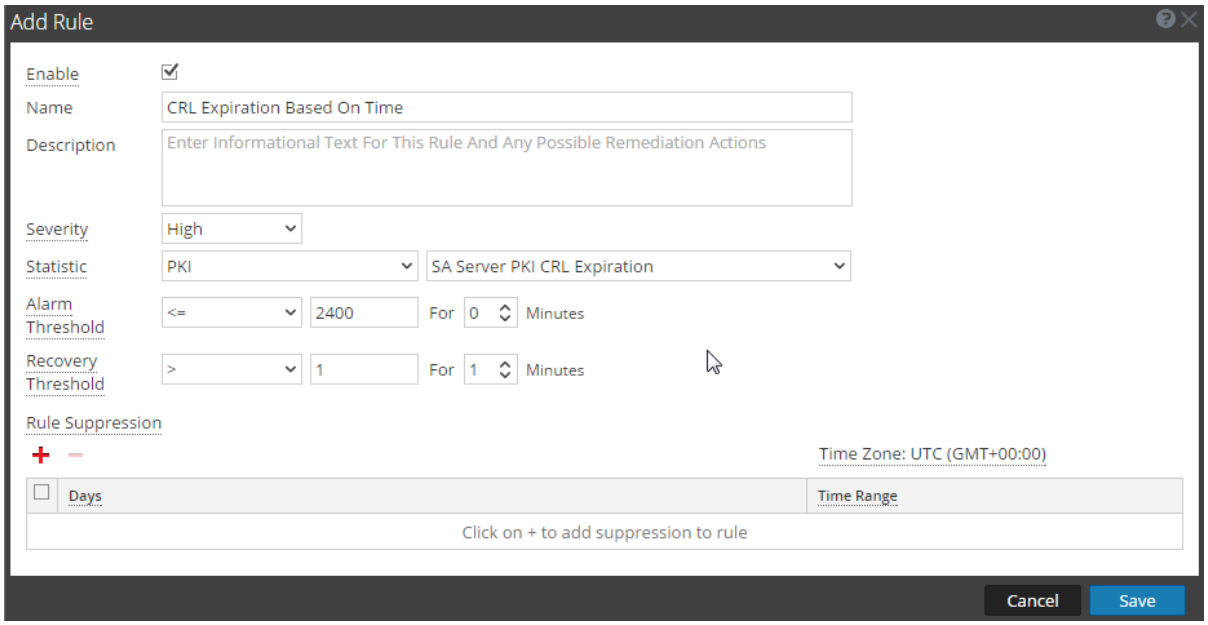
1. Add a new PKI policy.



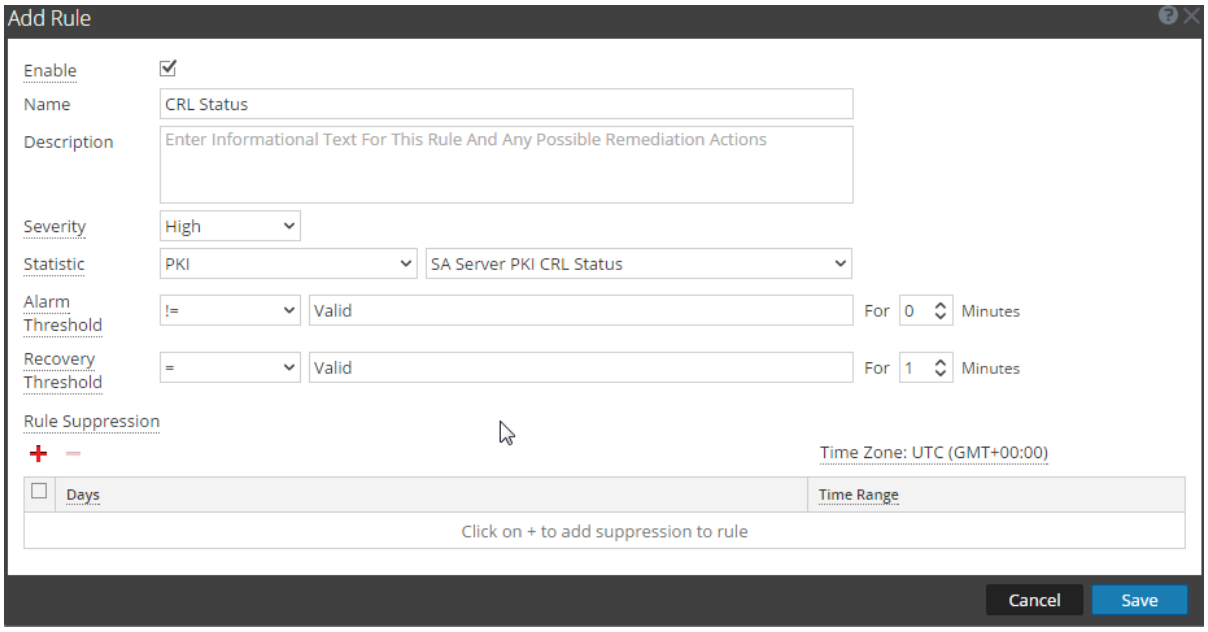
2. Add a Rule with Statistics:

   - For CA Expiration

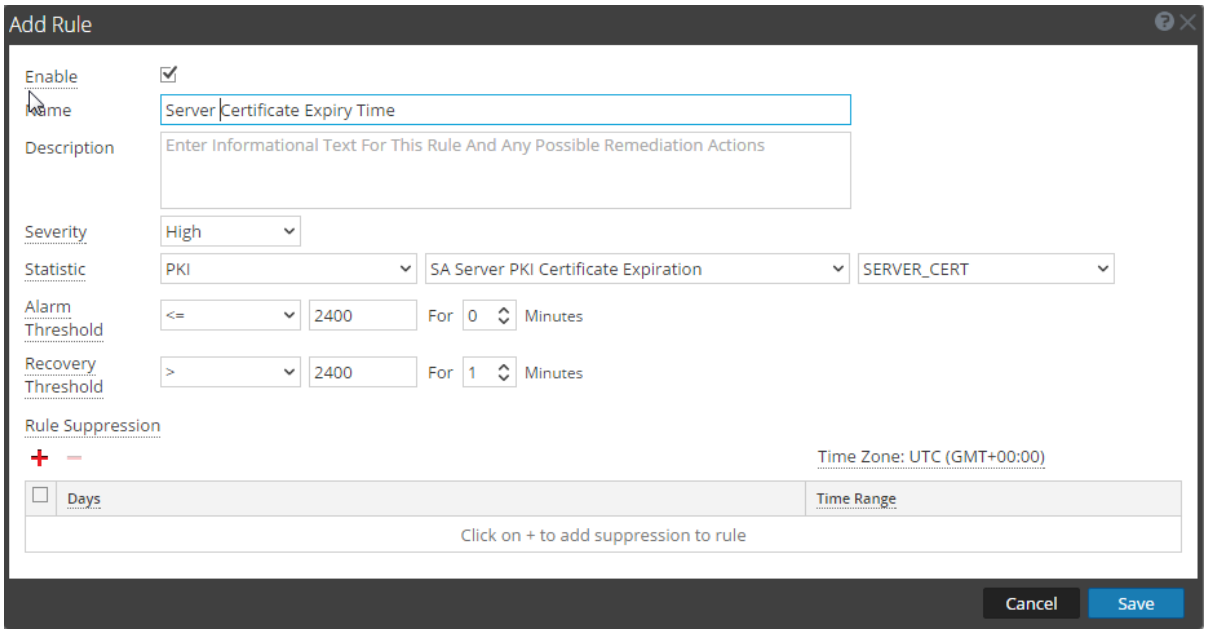
   - For CRL Expiration



- For CRL Status



- For Server Certificate Expiration



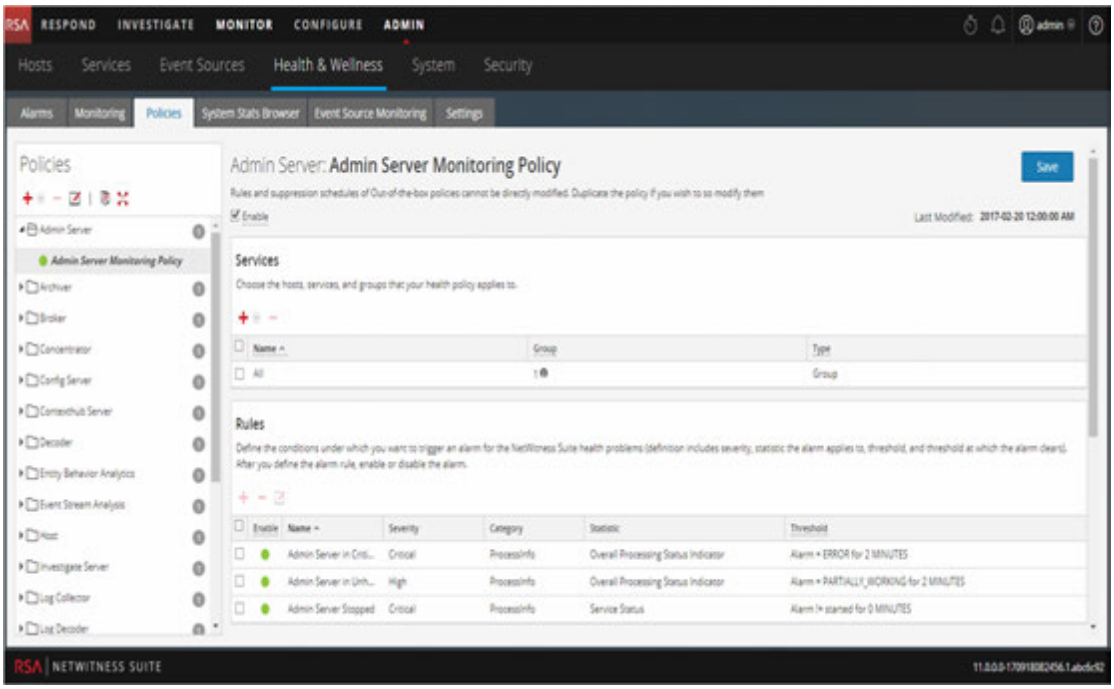
Edit a Policy

1. Go to **ADMIN > Health & Wellness.**
2. Click the **Policies** tab.

   The Policies view is displayed.
3. Select a policy (for example, **Concentrator Policy Status**) under a host or service.

   The Policy Detail is displayed.
4. Click .

   The policy name (for example, **Admin Server Monitoring Policy**) and policy detail panel become editable.

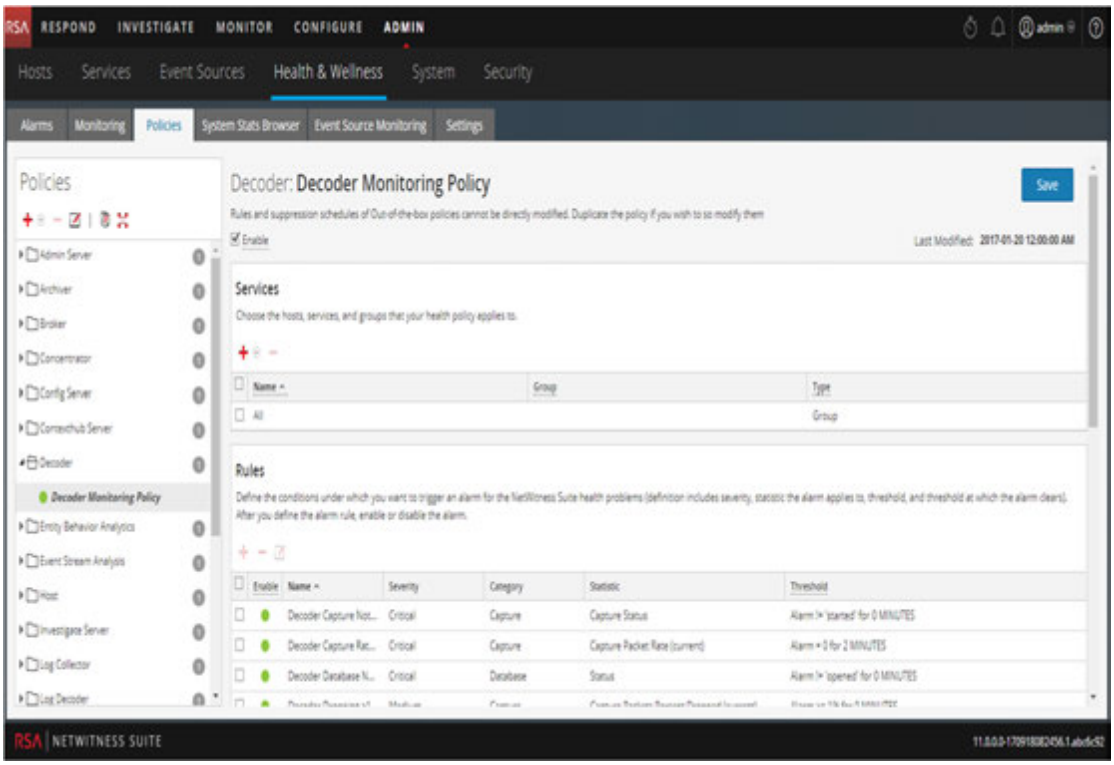


5. Make the required changes and click **Save** in the Policy Detail panel. You can:
   - Edit the Policy name.
   - Enable or disable the policy.
   - Add or delete hosts and services in the policy.
   - Add, delete or modify rules in the policy.
   - Add/Edit/Delete suppressions in the policy.
   - Add/Edit/Delete notifications in the policy.

Note: Save applies the policy rules based on the selection of enable/disable. It also resets the rule condition timers for changed rules, and the entire Policy.

Duplicate a Policy

1. Go to **ADMIN > Health & Wellness**.
2. Click the **Policies** tab.
3. Select a policy (for example, **Concentrator Policy Status**) under a host or service.
4. Click .NetWitness Suite copies the policy and lists it with **(1)** appended to the original policy's name.



5. Click and rename the Policy [for example, rename **Decoder Monitoring Policy(1)** to **New Concentrator Policy Status**.

> **Note:** A duplicated policy is disabled by default and the host and service assignments are not duplicated. Assign any relevant hosts and services to the duplicated policy before you use it to monitor health and wellness of the NetWitness Suite infrastructure.

Assign Services or Groups

To assign hosts or services to a policy:

1. Go to **ADMIN > Health & Wellness.**
2. Click the **Policies** tab.

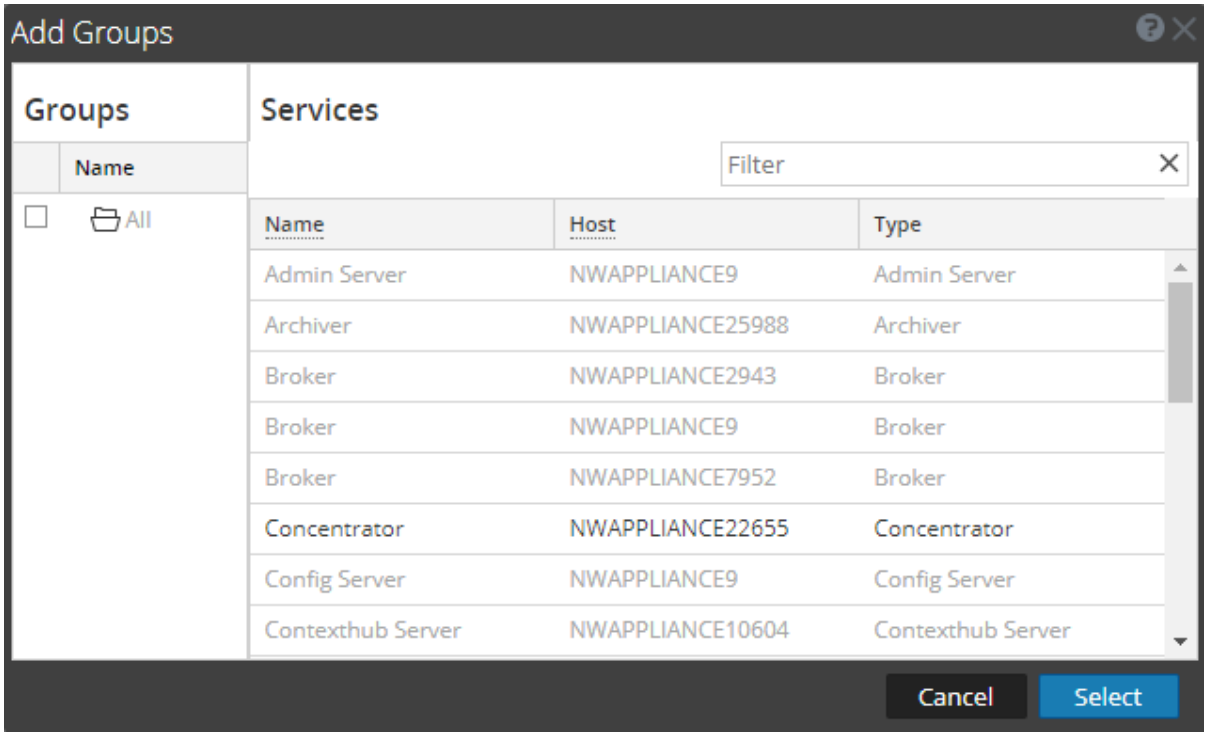
   The Policies view is displayed.
3. Select a policy (for example, **First Policy**) under a host or service.

   The Policy Detail is displayed.
4. Click in the Services and Groups list toolbar.
5. Choose one of the following actions:

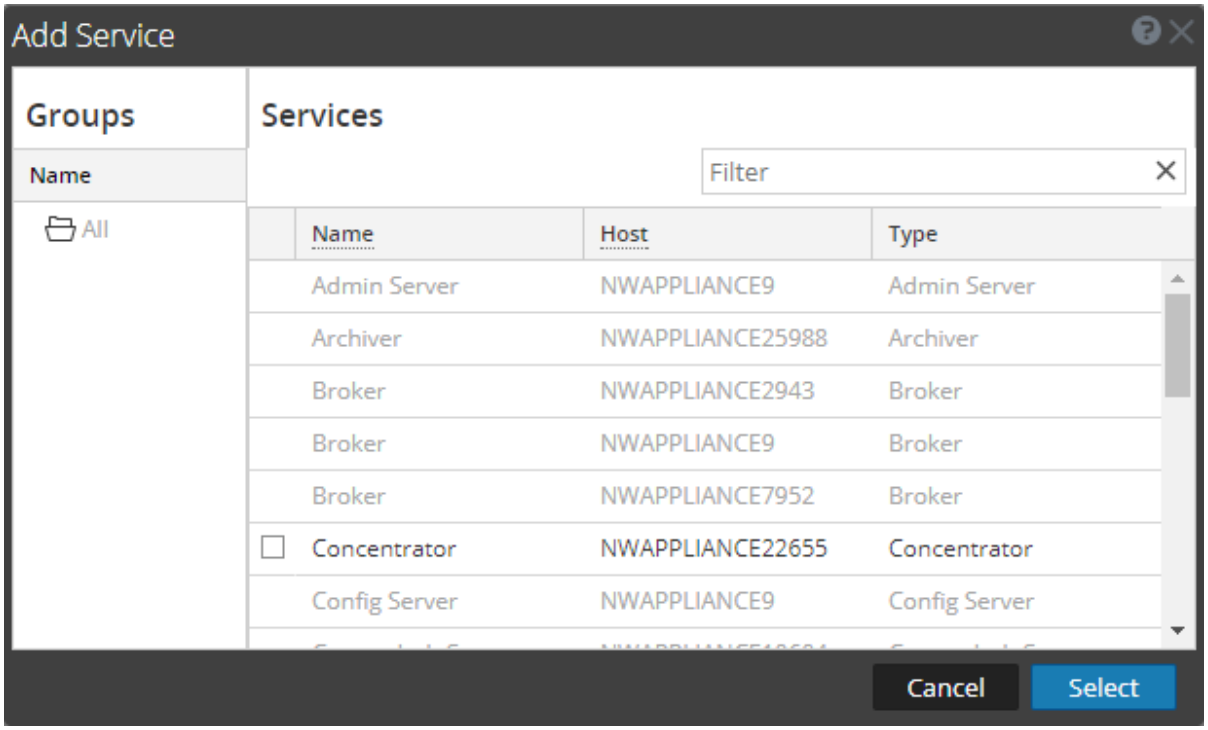
- For Hosts, select **Groups** or **Hosts** from the selection menu.
- For Services, select **Groups** or **Services** from the selection menu.

6. Depending on whether you are assigning services or groups, perform one of the following actions:

- **Groups**, the **Groups** dialog is displayed from which you can select predefined groups of hosts or services.



- **Services**, the **Services** dialog is displayed from which you can select individual services.



7. Select the checkbox next to the groups or services you want to assign to the policy, click **Select** in the dialog, and click **Save** in the Policy Detail panel.

Note: Services are filtered for selection based on the type of policies. For example, you can only select concentrator services for a concentrator type policy.

Remove Services or Groups

To remove a host or service from a policy:

1. Go to **ADMIN > Health & Wellness**.
2. Click **Policies** tab.

   The Policies view is displayed.
3. Select a policy under a service.

   The Policy Detail is displayed.
4. Select a host or service.
5. Click − .

   The host or service is removed from the policy.

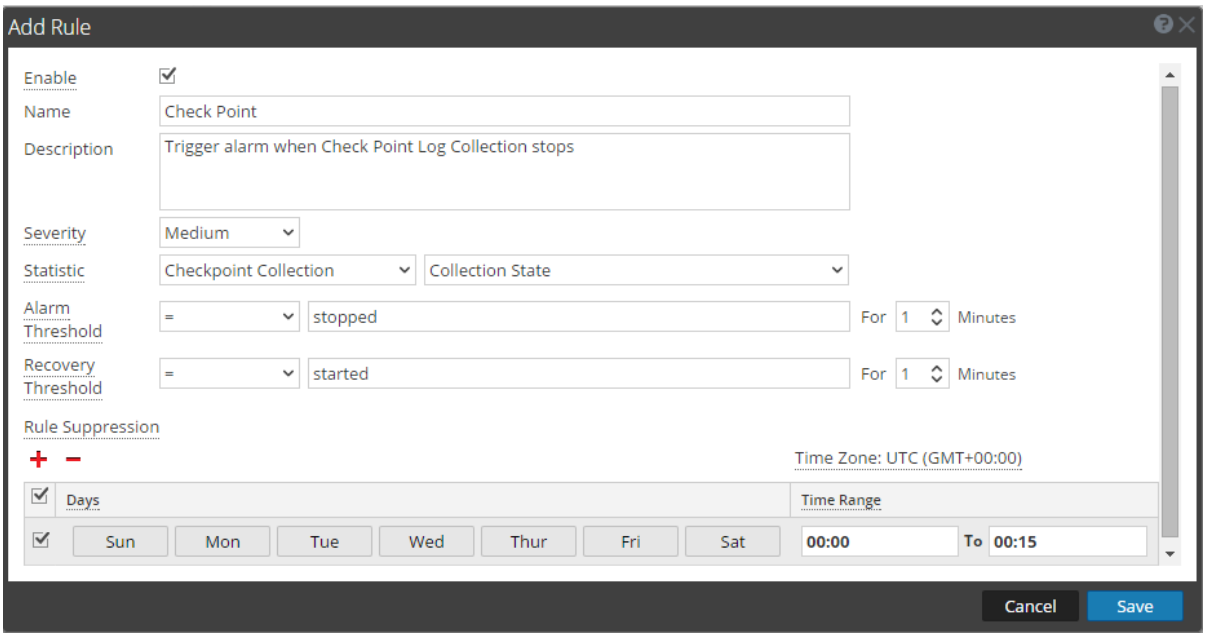
Add or Edit a Rule

To add a rule to a policy:

1. Go to **ADMIN > Health & Wellness.**
2. Click the **Policies** tab.

   The Policies view is displayed.
3. Select a policy (for example, **Checkpoint**) under a host or service.

   The Policy Detail is displayed.
4. Depending on whether you are adding an existing rule or adding a rule, do the following:
   - To add: click + in the Rules list toolbar.
   - To edit: select a rule from the Rules list and click .
5. Complete the dialog to define or update the rule.
6. Add the **Description** field as shown in the following example.



7. Click **OK**.

   The rule is added (or updated) to the policy.

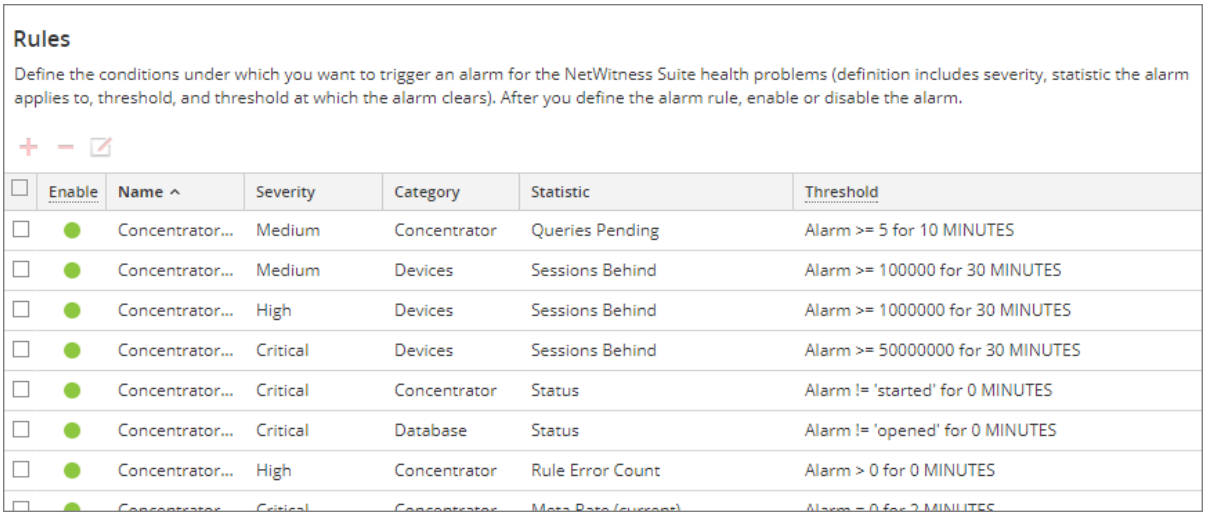
Hide or Show Rule Conditions Columns

To hide or show rule conditions columns in the Rules panel:

1. Go to **ADMIN > Health & Wellness.**
2. Click **Policies** tab.

   The Policies view is displayed.
3. Select a policy under a service.

   The Policy Detail is displayed.
4. Go to the **Rules** panel.



5. Click **v** to the right of **Category** , select **Columns**, and uncheck the **Static** and **Threshold** rule conditions.

   You can check or uncheck any Rules column to show or hide it.
   The **Rules** panel displays without the rule conditions.

Delete a Rule

To remove a host or service from a policy:

1. Go to **ADMIN > Health & Wellness.**
2. Click the **Policies** tab.

   The Policies view is displayed.
3. Select a policy under a service.

   The Policy Detail is displayed.
4. Select a rule from the **Rules** list (for example, **Checkpoint**).
5. Click .

   The rule is removed from the policy.

Suppress a Rule

1. Click the **Policies** tab.
   The Policies view is displayed.
2. Select a policy under a service.
   The Policy Detail is displayed. You can specify rule suppressions time ranges when you initially add it or you can edit the rule and specify suppression time ranges.
3. Add or edit a rule.
4. In the **Rules Suppression** panel of the **Add** or **Edit Rule** dialog, specify the days and time ranges during which you want the rule suppressed.

Suppress a Policy

1. Add or edit a policy.
   The Policies view is displayed.
2. In the **Policy Suppression** panel:
   a. Select a time zone from the **Time Zone** drop-down list.
      This time zone applies to the entire policy (both policy suppression and rule suppression).
   b. Click + in the toolbar.
   c. Specify the days and time ranges during which you want the policy suppressed.

Add an Email Notification

To add an email notification to a policy:

1. Add or edit a policy.
   The Policies view is displayed.
2. In the **Notification** panel:
   a. Click + in the toolbar.
      A blank EMAIL notification row is displayed.
   b. Select the email:
      - Notification types in the Recipient column (see **Configure Notification Outputs** in the *NetWitness Suite System Configuration Guide* for the source of the values in this drop-down list).

- Notification server in the Notification Server column (see **Configure Notification Servers** in the *NetWitness Suite System Configuration Guide* for the source of the values in this drop-down list).
- Template server in the Template column (see **Configure Notification Templates** in the *NetWitness Suite System Configuration Guide*for the source of the values in this drop-down list).

> **Note:** Refer to **Include the Default Email Subject Line** if you want to include the default Email subject line from the Health & Wellness template in your Health & Wellness Email notifications for specified recipients.

Delete an Email Notification

To add an email notification to a policy:

1. Add or edit a policy.
   The Policies view is displayed.
2. In the **Notification** panel:
   a. Select an email notification.
   b. Click .
      The notification is removed.

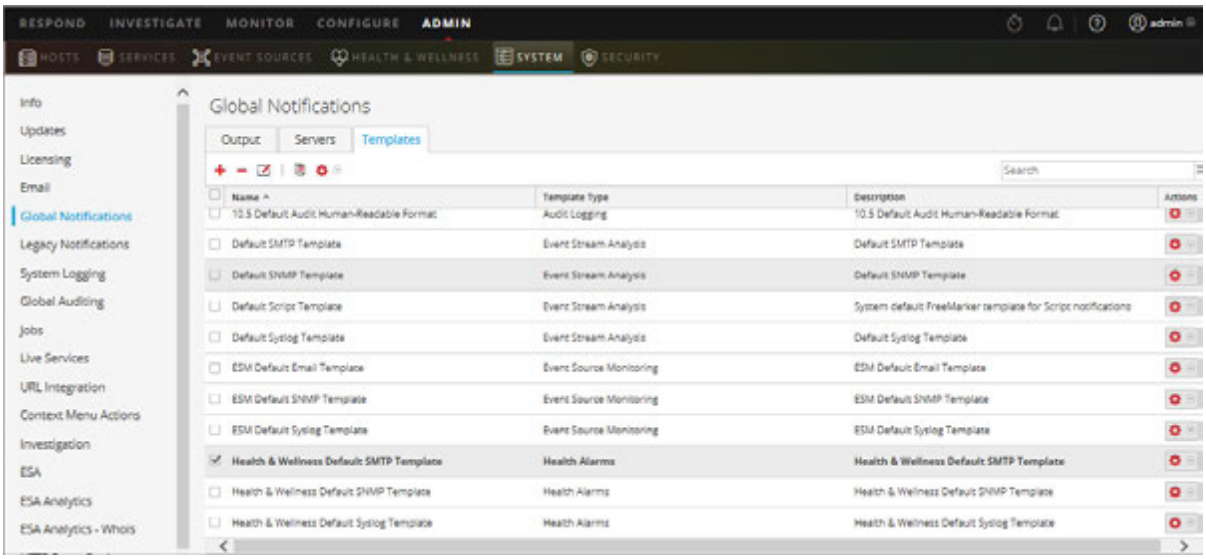
Include the Default Email Subject Line

The emails generated by the notifications you set up for policies do not include the subject line from the Health & Wellness Default Email Notification templates. You need to specify the subject line in the do not include subject lines. This procedure shows you how to insert a subject line into the templates.

For related reference topics, see Policies View and NetWitness Suite Out-of-the-Box Policies.

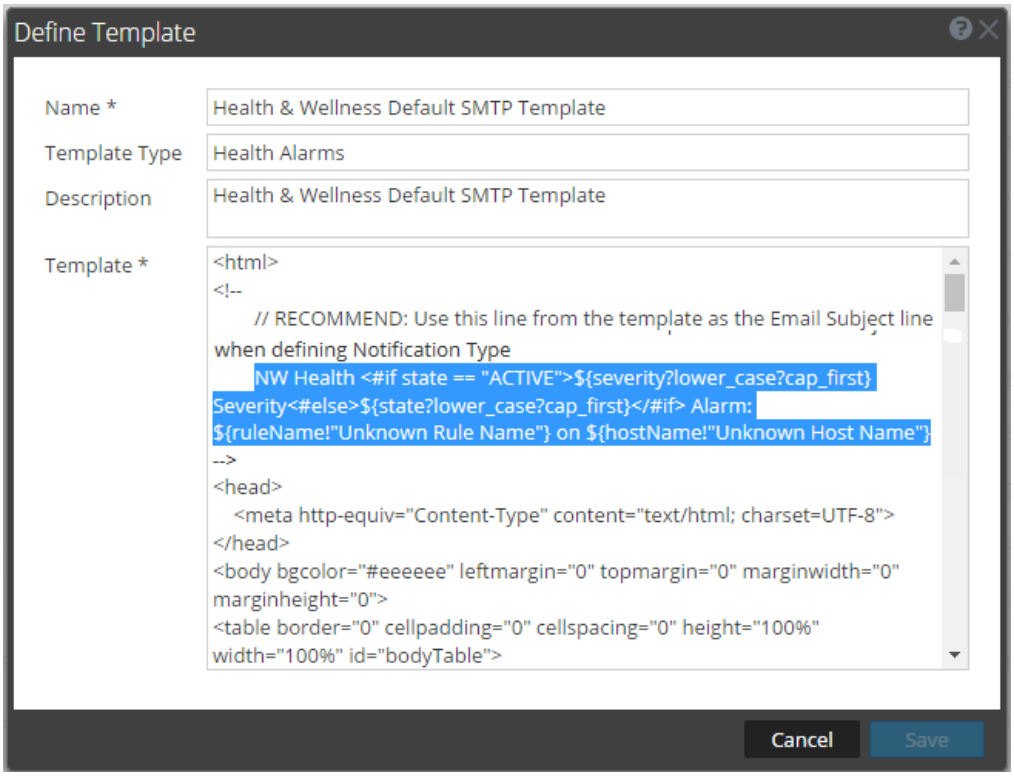
To include the subject line from a Health & Wellness email template in your email notification:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Select a Health & Wellness Email Template (for example, **Health & Wellness Default SMTP Template**).



The Define Template dialog is displayed.

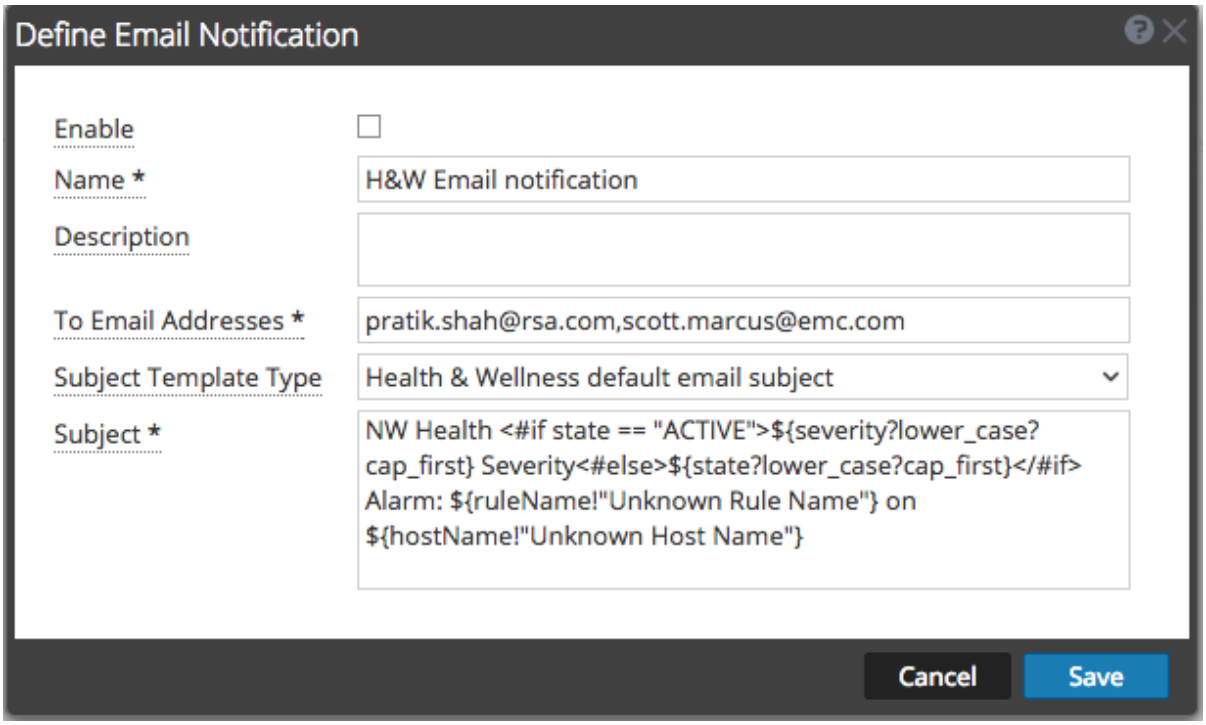
4. Click , then in the **Template** field, copy the Subject Line (Highlight the subject line and press Ctrl-C) into the buffer.



5. Click **Cancel** to close the Template.
6. Click the **Output** tab and select a notification (for example **Health & Wellness**).
7. Click .

The **Define Email Notification** dialog is displayed.

8. Replace the value in **Subject** field text box with the subject line that you have in the buffer (highlight the existing text and press Ctl-V).



9. Click **Save**.

Monitor System Statistics

The System Stats Browser filters statistics by the selected host, component running on the host, statistical category, individual statistic, or any combination of host, component, category, and statistic. You can also choose the order in which to display this information.

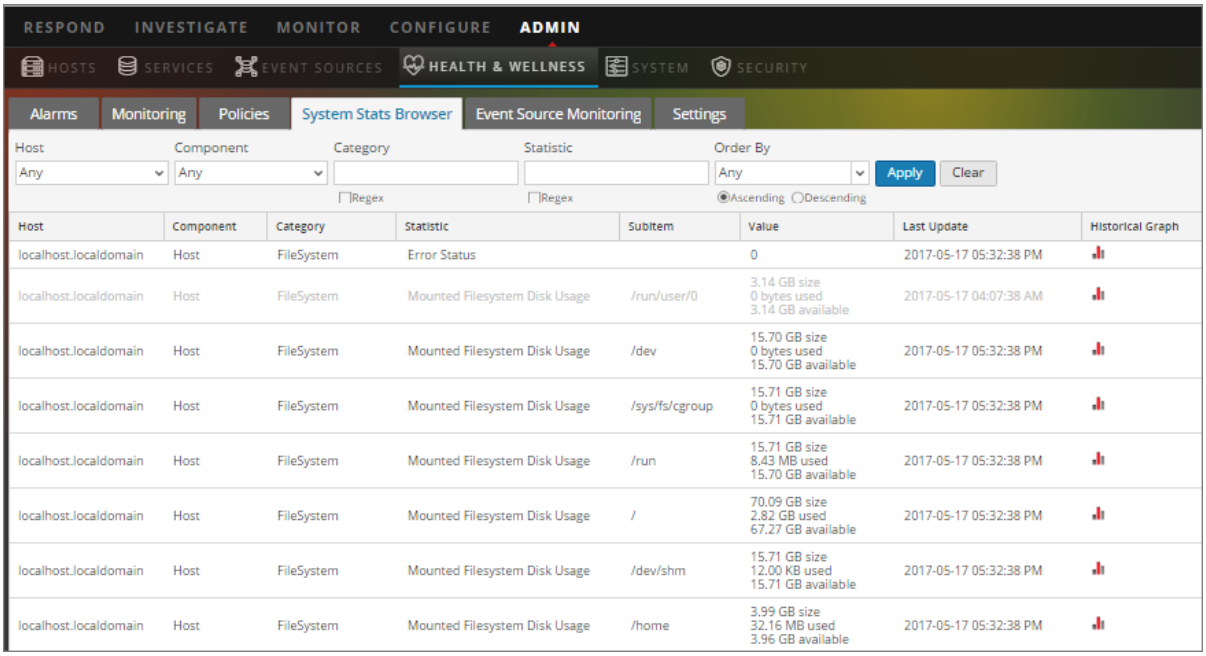
To access the System Stats browser:

1. Go to **ADMIN** > **Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Click the **System Stats Browser** tab.

The System Stats Browser tab is displayed.



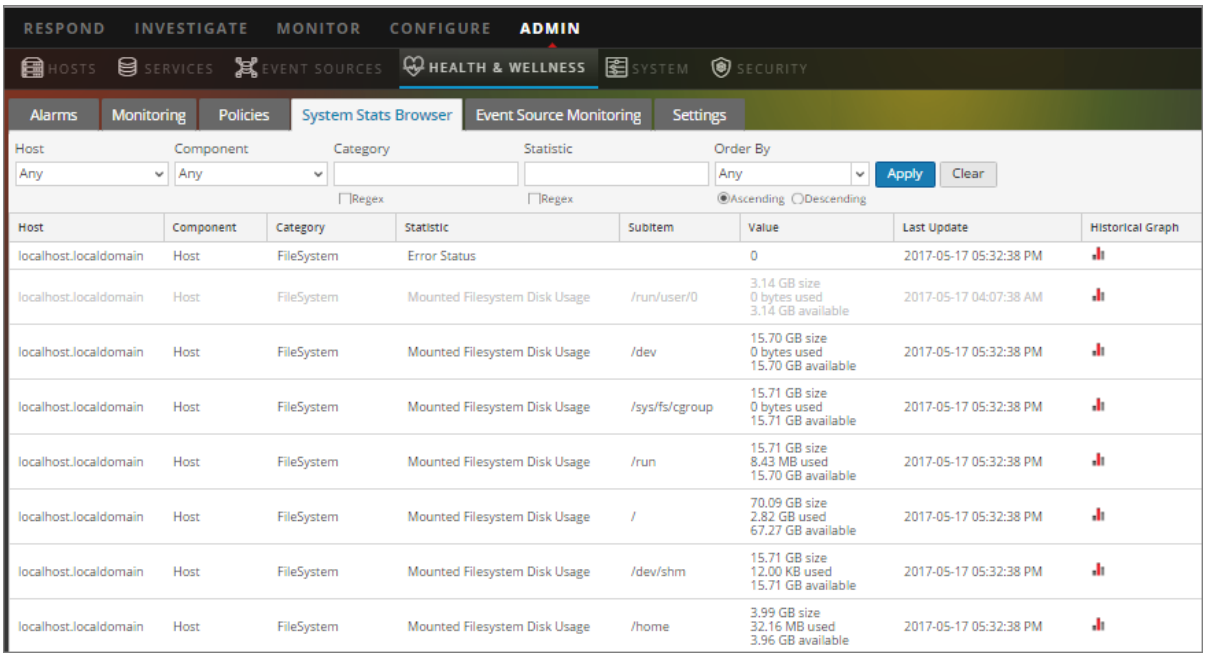
Filter System Statistics

You can filter the System Statistics in one of the following ways to monitor:

- Statistics collected for a particular host
- Statistics collected for a particular component
- Statistics collected of a particular type or that belongs to a certain category
- Statistics listed in an ordered way as per the selection chosen

To filter the list of system statistics:

1. Go to **ADMIN > Health & Wellness**.
   The Health & Wellness view is displayed with the Alarms tab open.
2. Click **System Stats Browser**.
   The System Stats Browser tab is displayed.

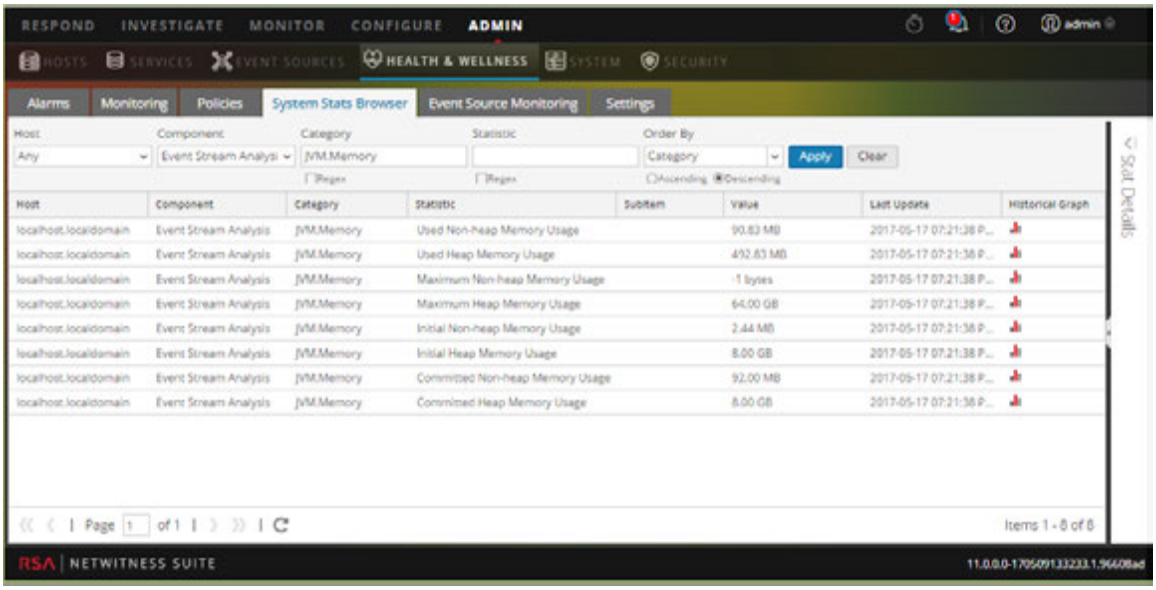


Filter the list of System Statistics in one of the following ways:

- To view System Stats of a particular host, select the host in the **Host** drop-down list.
  The System Stats for the selected host is displayed.
- To view System Stats of a particular component, select the component in the **Component** drop-down list.
  The System Stats for the selected component is displayed.
- To view System Stats of a particular category, type the category name in the **Category** field.
  Select **Regex** to enable Regex filter. It performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching.
  The System Stats for the selected category is displayed.
- To order the list of statistics in a preferred order you can set the order in the **OrderBy** column
- To view a particular statistic across hosts, type the statistic name in the **Statistic** field.
  Select **Regex** to enable Regex filter. It performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching.
  The System Stats for the selected statistics is displayed.

  The following figure shows the System Stats Browser filtered by the

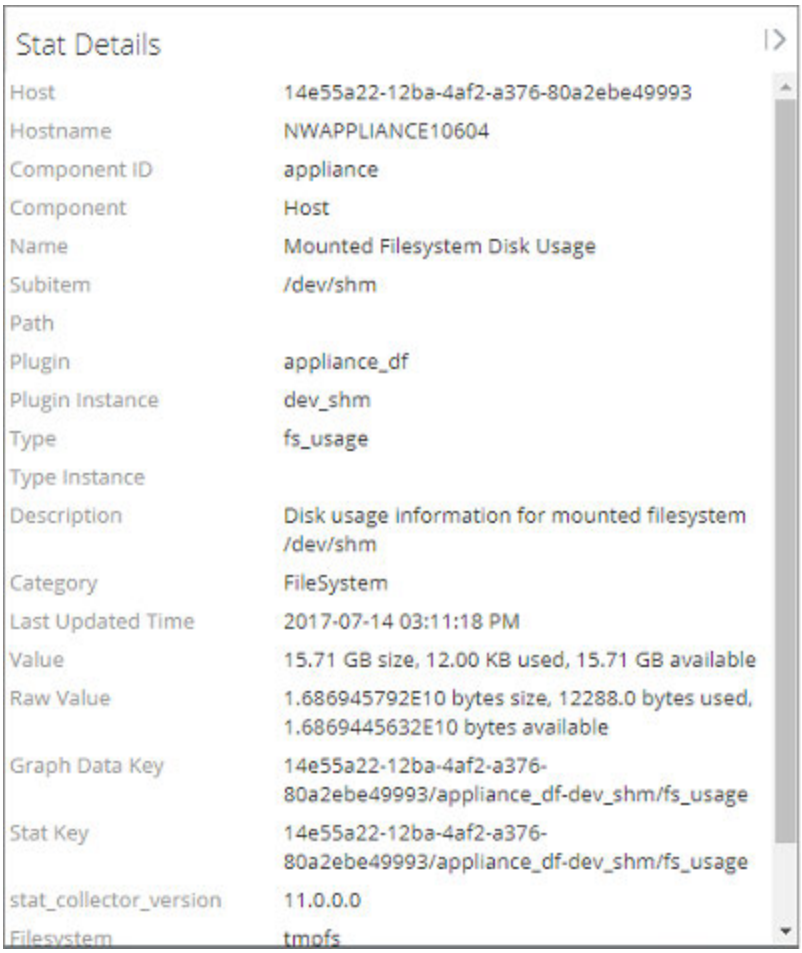
NWAPPLIANCE10604 host listed in descending statistical category order.



4. To view the details for an individual statistic:

   a. Select a row to select a statistic.

   b. Click <|.
   The Stat Details is displayed.



For details on various parameters in the **ADMIN** > **Health & Wellness** > **System Stats Browser** view, see System Stats Browser View

View Historical Graph of System Statistics

The historical graph of the collected system stats gives you information about the variation of the stats over a time frame selected.

To view a historical graph:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

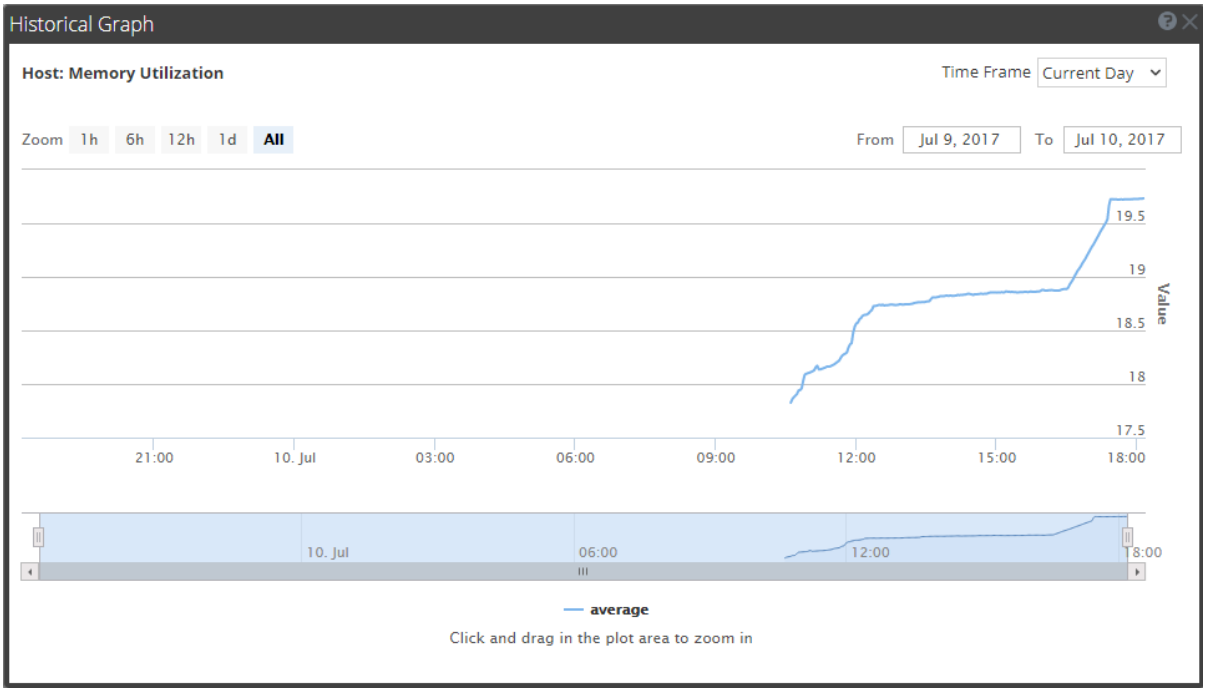
2. Click the **System Stats Browser** tab.

3. In the System Stats Browser tab, specify the filter criteria to display the statistics you want.

4. In the **Historical Graph** column, select .

   The Historical graph for the selected statistic is displayed.

The figure below gives an example of the historical graph for Memory Utilization statistic for a host.



The graphical view is customized to display the statistics collected for the current day and the values are zoomed in for an interval of an hour (10.15 - 11.15 hrs). Hover over the graph to view the details at a particular instant. For example, in the figure it displays the memory utilization at 11.00 hrs.

Note: You can customize the graph view by selecting the Time Frame and Date range. You can zoom in using the zoom in value, time window, or by just a click and a drag in the plot area. For details on the parameters to customize and zoom in functions, see Historical Graph for System Stats. Any break or gap in chart line indicates that the service or host was down during that time.

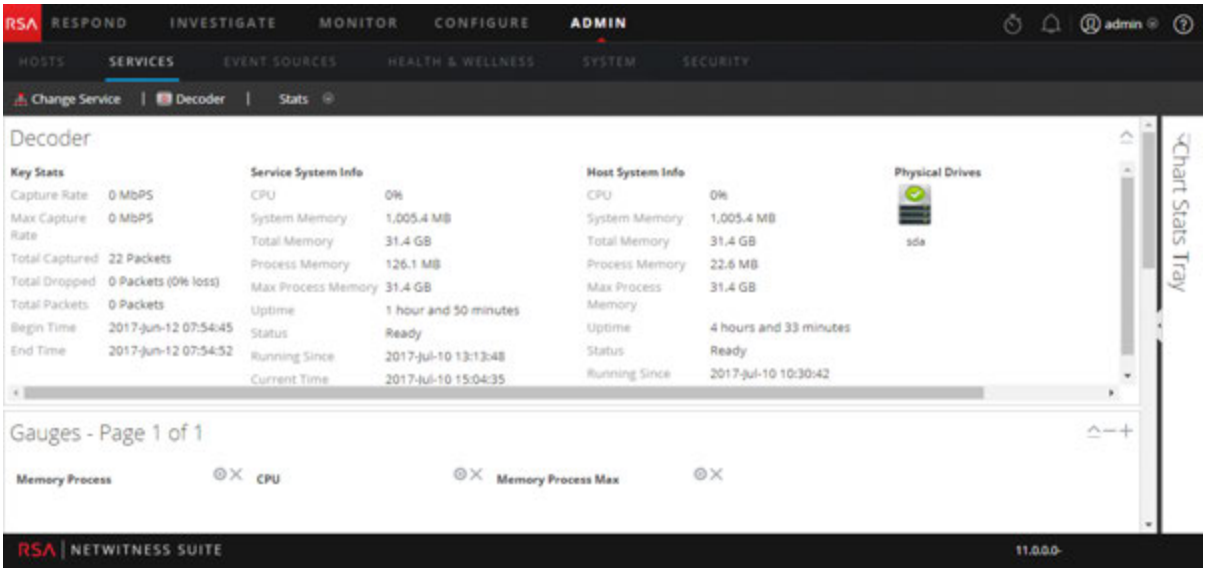
Monitor Service Statistics

NetWitness Suite provides a way to monitor the status and operations of a service. The Service Stats view displays key statistics, service system information, and host system information for a device. In addition more than 80 statistics are available for viewing as gauges, and in timeline charts. Only statistics for session size, sessions, and packets are viewable in historical timeline charts.

Although different statistics are available for different types of services, certain elements are common for any Core device.

To monitor service statistics in NetWitness Suite:

1. Go to **ADMIN > Services**.
   The Services view is displayed.
2. Select a service, and select **View > Stats** in the Actions column.



3. To customize the view: Collapse or expand charts, for example expand the Chart Stats Tray to see available charts. Drag a section up or down to change the sequence. For example, drag the Gauges section to the top so that it is above the Summary Stats section.

Add Statistics to a Gauge or Chart

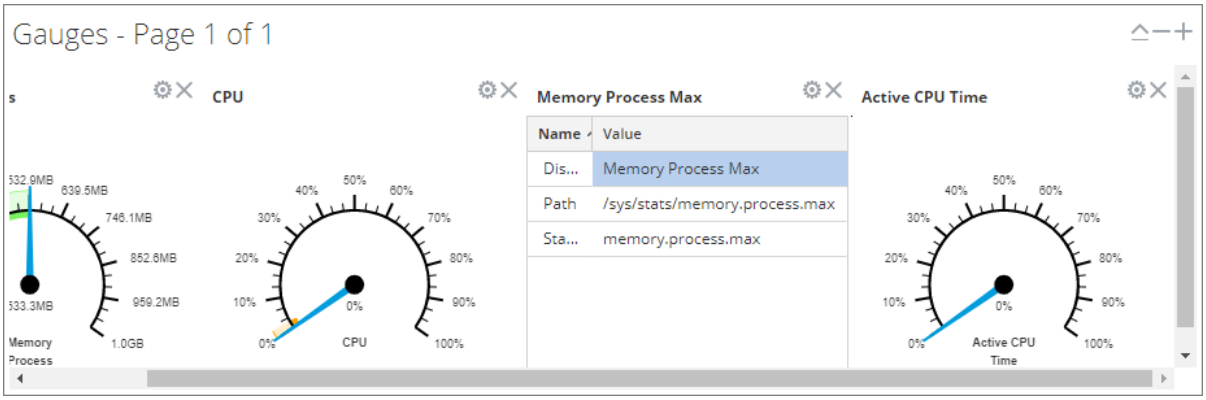
In the Services Stats view, you can customize the monitored statistics for individual services. The Chart Stats Tray lists all available statistics for the service. The number of statistics varies according to the type of service being monitored. Any statistic in the Chart Stats Tray can be displayed in a gauge or a timeline chart. Only statistics for session size, sessions, and packets are viewable in historical timeline charts.

Create a Gauge for a Statistic

To create a gauge for a statistic in the Services Stats view:

1. Go to **ADMIN > Services**.
   The Admin Services View is displayed.
2. Select a service and select **View > Stats** in the Actions column.
   The Chart Stats Tray is displayed on the right side.
3. If the tray is collapsed, click <| to view the list of available statistics.
4. From the **Chart Stats Tray**, click on any statistic and drag it into the **Gauges** section.

A gauge is created for the statistic. If there is no space for the gauge, a new page is created on the Gauges section and the gauge is added to the new page. In the example, the Active CPU Time chart was added to the Gauges section by dragging it from the Chart Stats Tray.

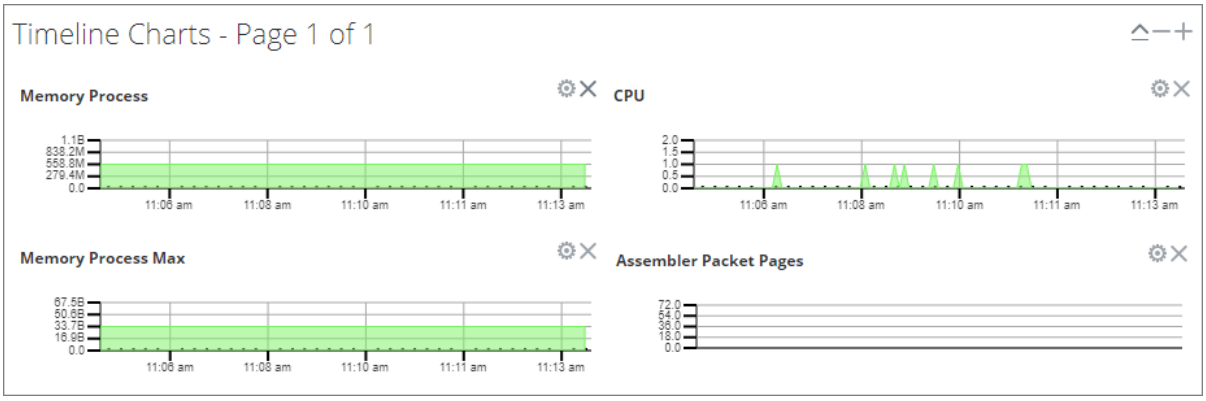


Create a Timeline Chart for a Statistic

To create a timeline for a statistic:

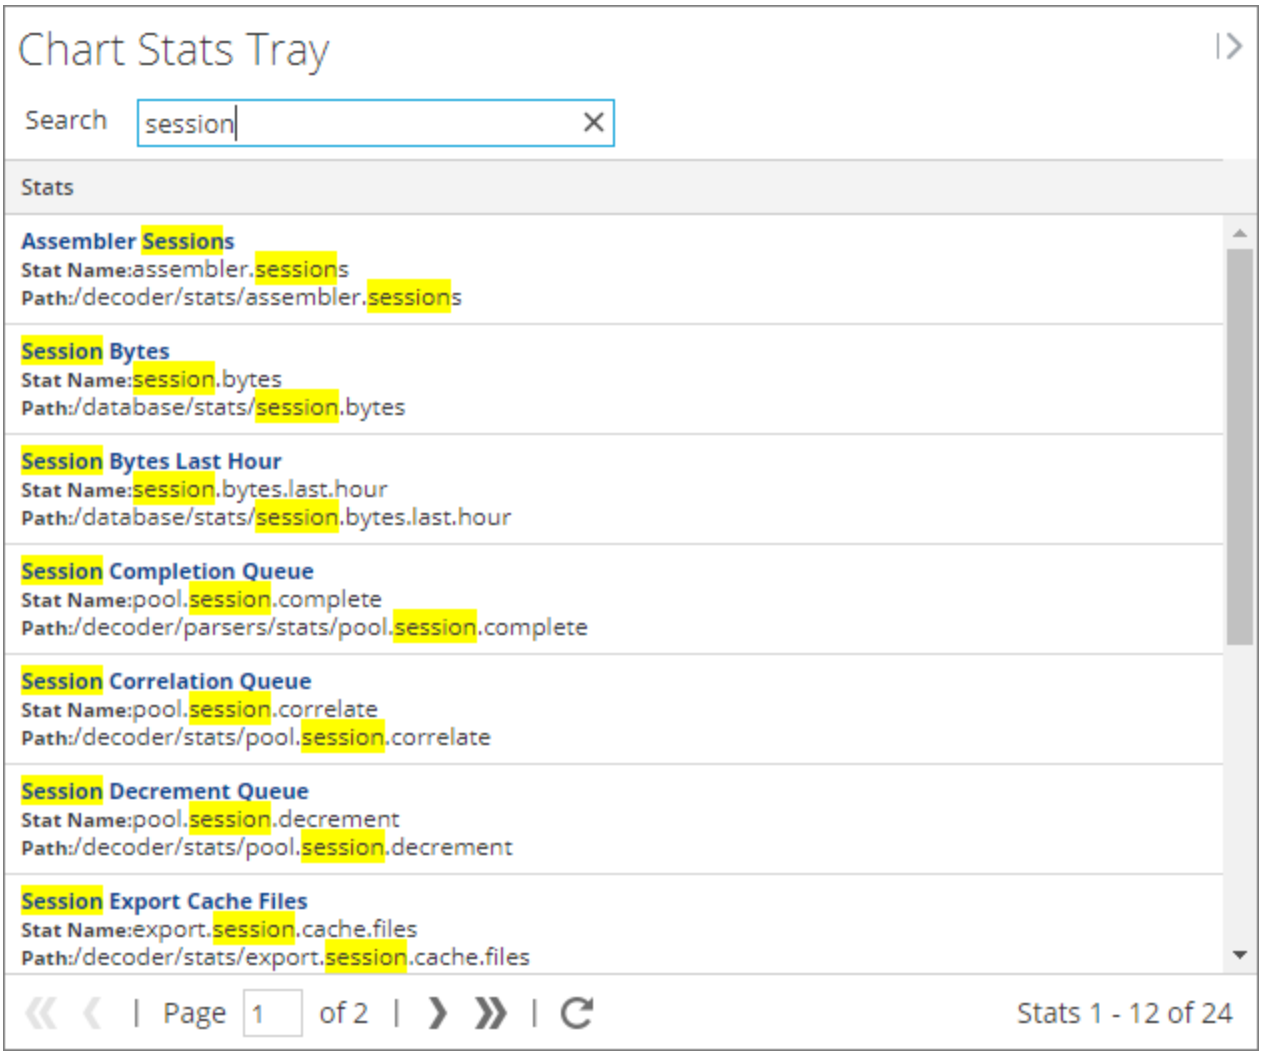
From the **Chart Stats Tray**, click on a statistic and drag it into the **Timeline Charts** or the **Historical Timeline Charts** section.

A timeline chart is created for the statistic. If there is no space for the chart, a new page is created on the Timeline Chart section and the chart is added to the new page. In the example, the Assembler Packet Pages chart was added to the Timeline Charts section by dragging it from the Chart Stats Tray.



Search for a Statistic in the Chart Stats Tray

To search for a statistic, type a search term; for example, **session**, in the Search field and press **RETURN**. Statistics that match are displayed with the matching word highlighted.



Edit Properties of Statistics Gauges

The Gauges section of the Service Stats view presents statistics in the form of an analog gauge. The properties of each individual gauge are editable; all gauges have an editable title and some have additional editable properties.

Edit Properties of a Gauge

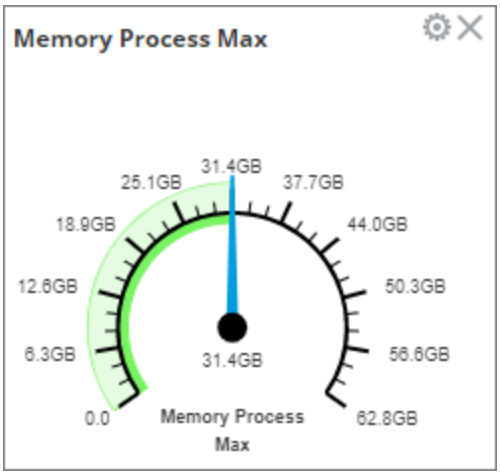
1. Go to **ADMIN > Services**

   The Admin Services view is displayed.

2. Select a service and select **View > Stats** in the Actions column.

   The Service Stats view includes the Gauges section.

3. Go to the gauge for which you want to edit properties (for example, **Memory Process**).



4. Click the Properties icon ( ) to display the parameter names and values.
5. To highlight the value of the **Display Name** field, double-click on the value; for example, **Memory Process**.

> **Note:** Clicking the other two values does nothing because the properties are not editable in the gauge.

5. Type a new value for the Display Name and click the **Properties** icon ( ).
   The new title replaces **Memory Process**.

Add Stats to the Gauges Section

You can add more gauges by dragging a statistic from the **Chart Stats Tray** into the **Gauges** section.

1. To expand the Chart Stats Tray, click .
2. Scroll down and select a statistic, for example, **Session Rate (maximum)**.
3. Drag the statistic to the **Gauges** section.
   The new gauge is displayed in the Gauges section.

Edit Properties of Timeline Charts

Timeline charts display statistics in a running timeline. The Service Stats view includes two types of timelines: current time and historical. You can drag any statistic available in the Chart Stats Tray to the Timeline Charts section. Only statistics for session size, sessions, and packets are viewable in historical timeline charts. The properties of an individual timeline chart are editable; all timeline charts have an editable title and some have additional editable properties.

To access the charts:

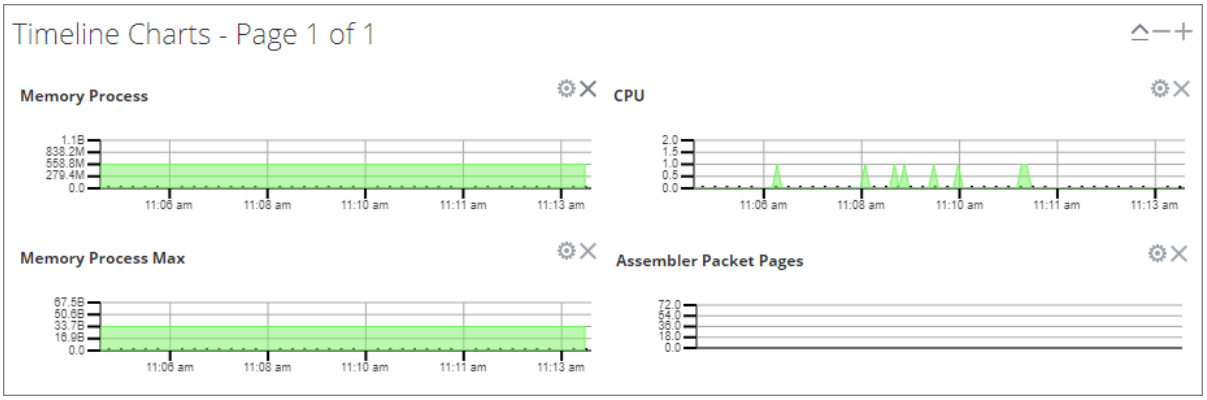
1. Go to **ADMIN > Services**.
2. Select a service and click **Stats**.

   The Services Stats view is displayed. The charts are in this view.

Edit Properties of a Timeline

To edit properties of a timeline chart:

1. Go to the timeline chart for which you want to edit properties (for example, **Memory Process**).



2. Click the **Properties** icon ( ) to display the parameter names and values.
3. Double-click on a value (for example, the **Display Name** field) to make the value editable.

   Note: Clicking the other two values does nothing because the properties are not editable in the chart.

4. Type a new value and click the **Properties** icon ( ).

   The timeline chart is displayed with new values.

Edit Properties of a Historical Timeline

To edit properties of a historical timeline chart:

1. Go to Historical Timeline Charts.
2. Click the **Properties** icon ( ) to display the parameter names and values.
3. Click on a value (for example, **01/27/2015** for the **Begin Date** field) to make the value editable.
4. Type a new value.
5. Edit the **End Date** and **Display Name** if required.

6. Click the **Properties** icon ( ).

   The historical timeline is displayed with new values.

Note: To return the properties of the historical timeline chart back to the default so that the values dynamically update, remove the Begin Date and the End Date, place your cursor in the Begin Date field, and refresh your browser.

Add Stats to Timeline Charts

You can add timeline charts by dragging a statistic from the Chart Stats Tray into the Timelines section.

1. To expand the Chart Stats Tray, click .
2. Scroll down and select a statistic; for example, **Session Rate (maximum)**.
3. Drag the statistic to the **Timelines Section**.

   The new timeline is displayed in the Timelines section.

Monitor Hosts and Services

NetWitness Suite provides a way to monitor the status of hosts and services installed. You can view the current health of all the hosts, services running on the hosts, their CPU usage and memory consumption and the host details and service details.

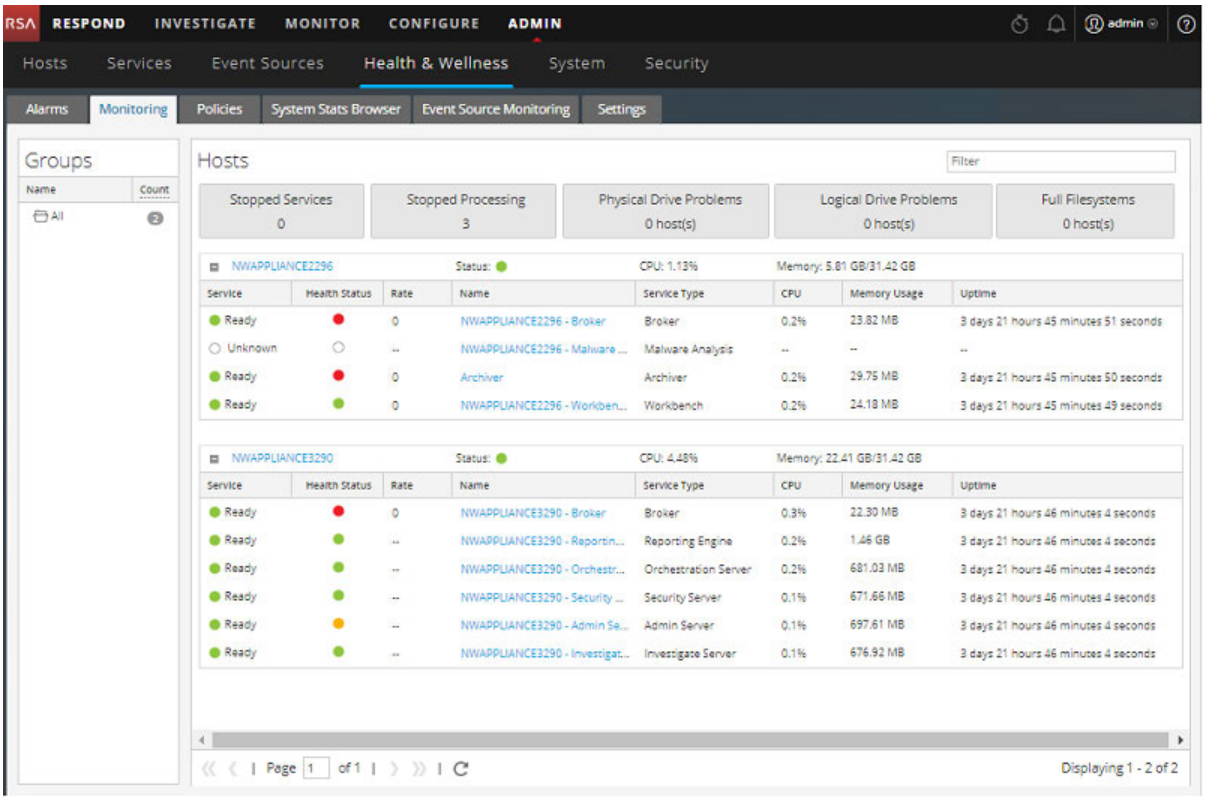
To monitor hosts and services in NetWitness Suite:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.
2. Select the **Monitoring** tab.

   A list of all hosts and their associated services that belong to the group **All** is displayed by default.

   The operational status, CPU usage, and memory usage for each host is displayed.



Click ⊞ to the left of a host (⊞ is visible if there are services installed on a host)

3. A list of services installed on the selected host is displayed.
   The name, operating status, CPU usage, memory usage, and the time operating for each service is displayed.

Filter Hosts and Services in the Monitoring View

You can filter hosts and services in the monitoring view in one of the following ways:

- Hosts belonging to a particular group
- Specific host and its associated services
- Hosts whose services are stopped
- Hosts whose services have stopped processing or processing has been turned off
- Hosts that have Physical drive problems
- Hosts that have Logical drive problems
- Hosts that have Full File systems

For the related reference topic, see Monitoring View.

To filter hosts and services:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open by default.

2. Select the **Monitoring** tab.

3. Filter the hosts and services in one of the following ways:

   - To view a list of hosts and their associated services belonging to a particular group, select the group in the Groups panel.

     All hosts and their associated services belonging to the specified group are displayed in the Hosts panel.

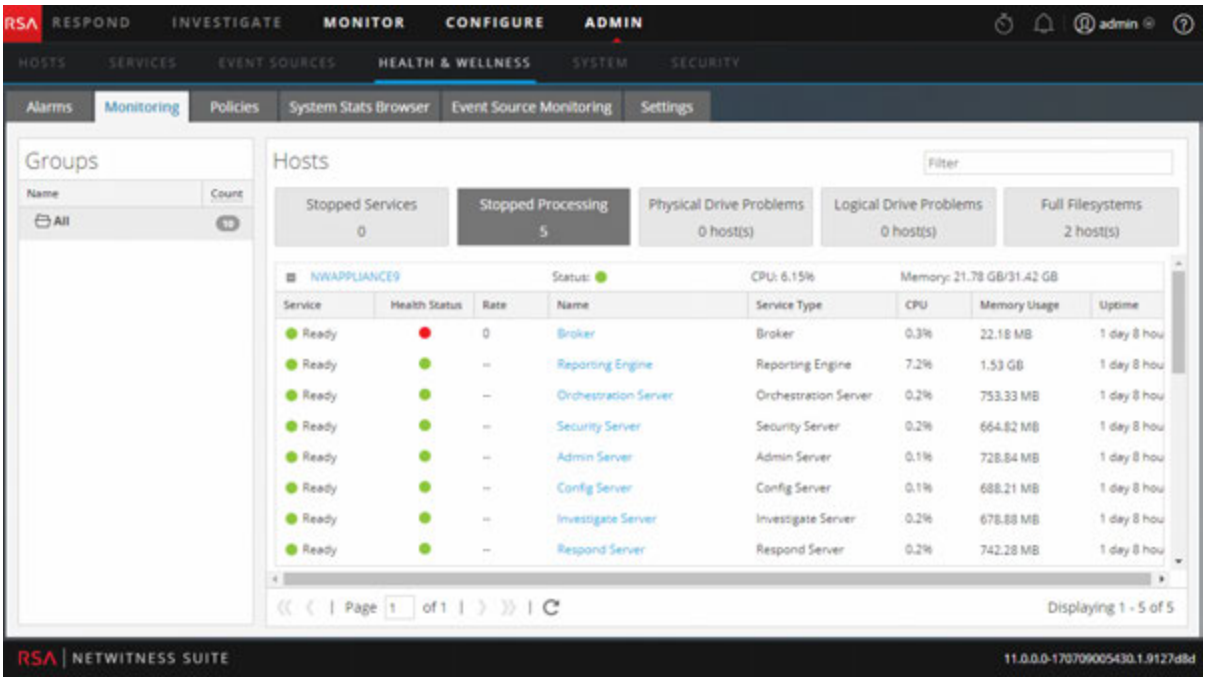
     Note: The grouping of hosts is derived from the groups created in the Administration page. All groups created in the Administration page are displayed here.

     For example, if you select the group **LC_Group** in the Groups panel, a list of all hosts that are part of the group are displayed.

   - To view a list of all services that have stopped processing, click **Stopped Processing** in the Hosts panel.

     A list of all the hosts that have at least one service with the status as stopped processing is displayed.

     Note: The buttons on the top display the System Statistics for all the hosts configured in NetWitness Suite and does not change with application of filters on groups.



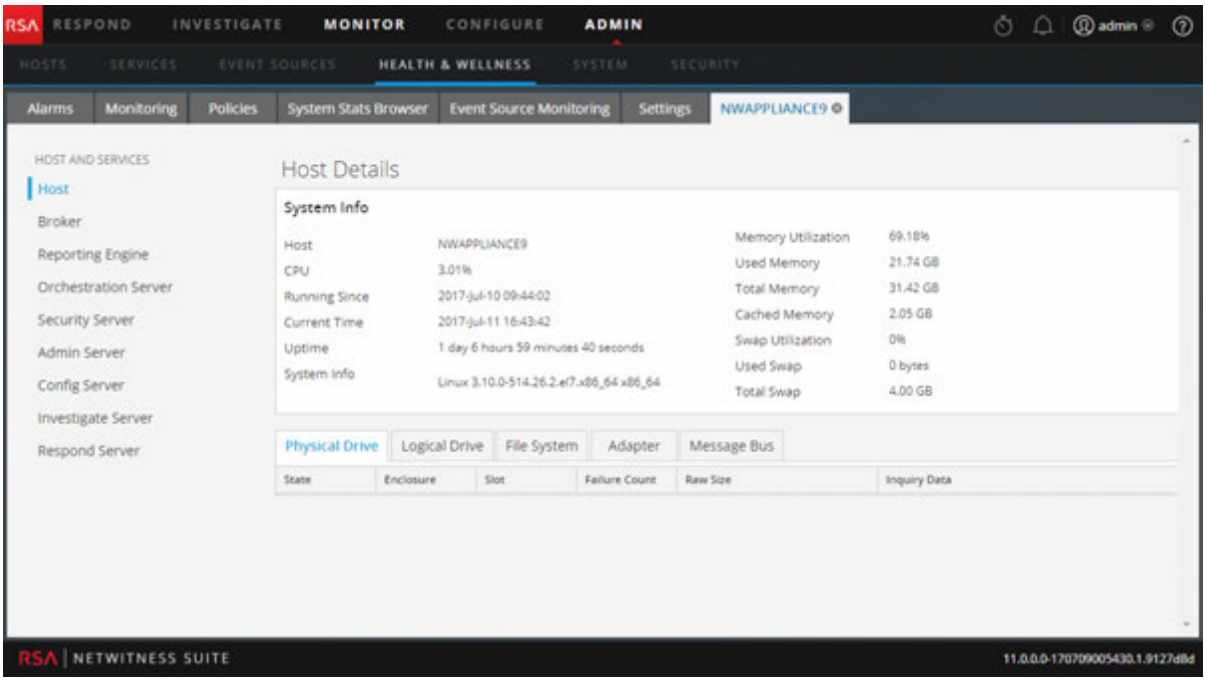
Note: In a similar way you can filter the list of hosts and the associated services by choosing the right filter
- Click Stopped Services to display a list of all stopped services.
- Click Physical Drive Problems to display a list of host with Physical Drive Problems.
- Type the host name in the Filter box to display only the required host and the services running on the host.

Monitor Host Details

You can view the details of the host, its memory and CPU usage, system information, the physical drive, logical drive and file system details to further investigate if you encounter some problem with the host.

To view host details:

1. Go to **ADMIN > Health & Wellness**.
   The Health & Wellness view is displayed with the Alarms tab open.
2. Select the **Monitoring** tab.
3. Click a host in the **Hosts** panel.
   The Host Details view is displayed as a new page.



Monitor Service Details

You can view the details of a service, its memory and CPU usage, system information, and various details depending on the service selected.

To view service details:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Select the **Monitoring** tab.

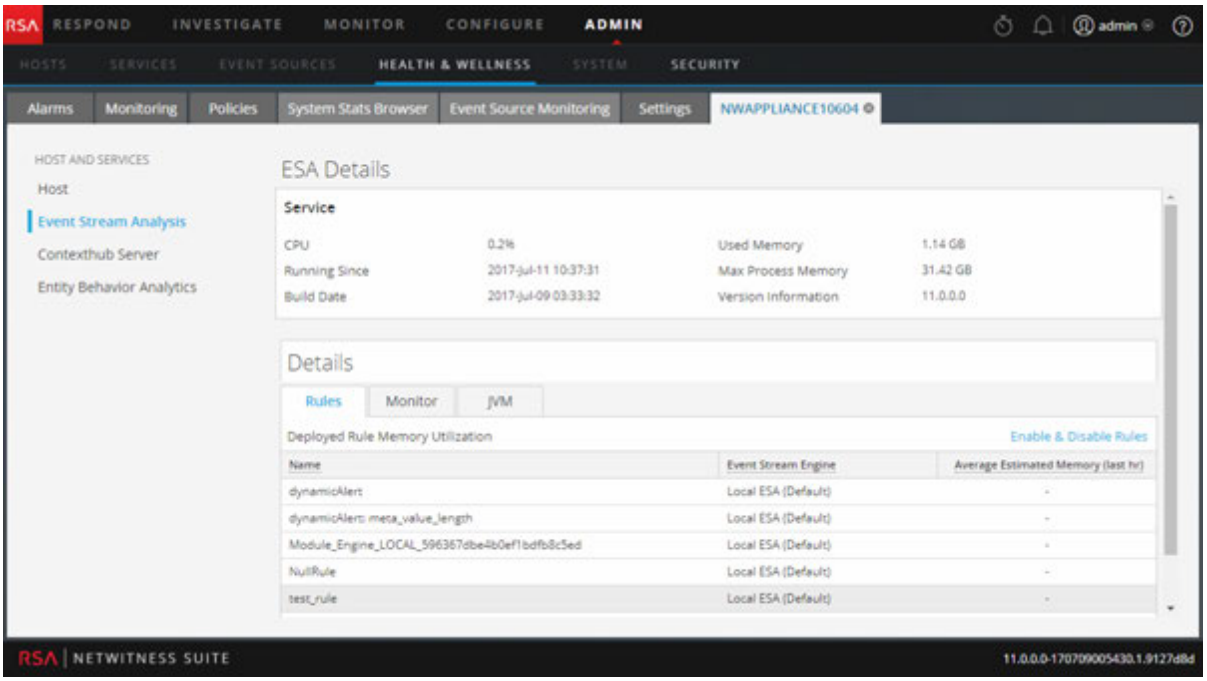
3. Click ⊞ for a host in the Hosts panel.

   A list of services running on the host is displayed.

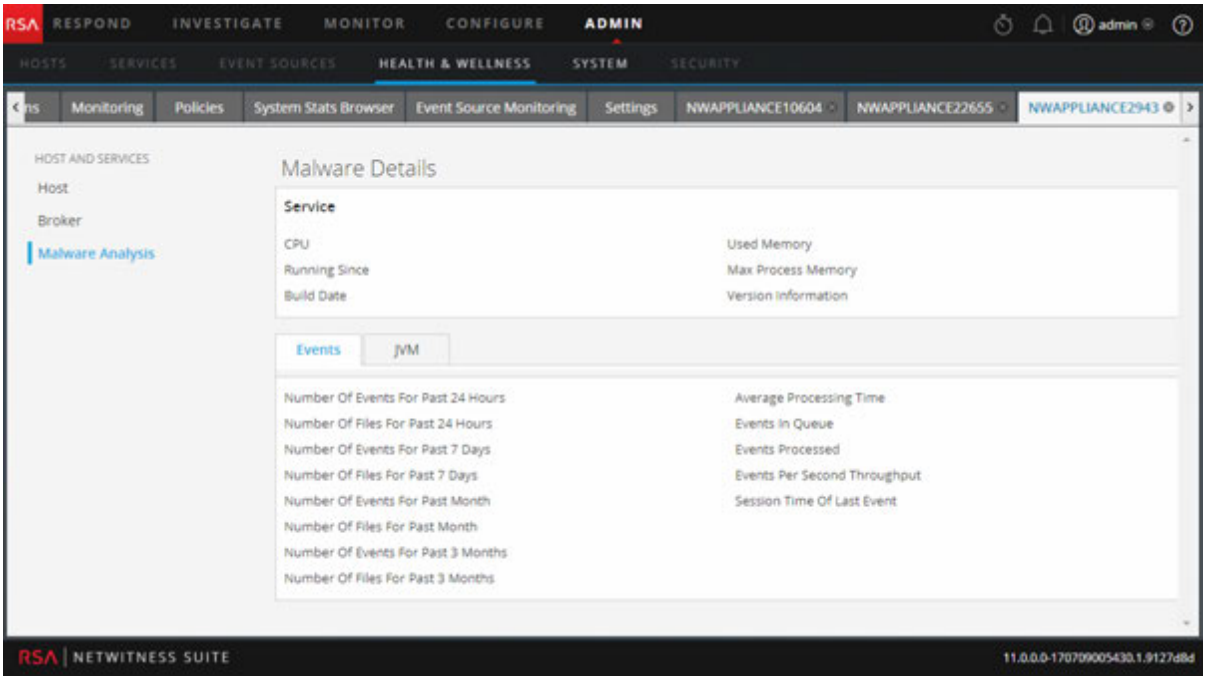
4. Click on any service.

   The service details view is displayed as a new page. The Archiver, Broker, Concentrator, and Decoder service details views have the **Service** and **Details** panels.

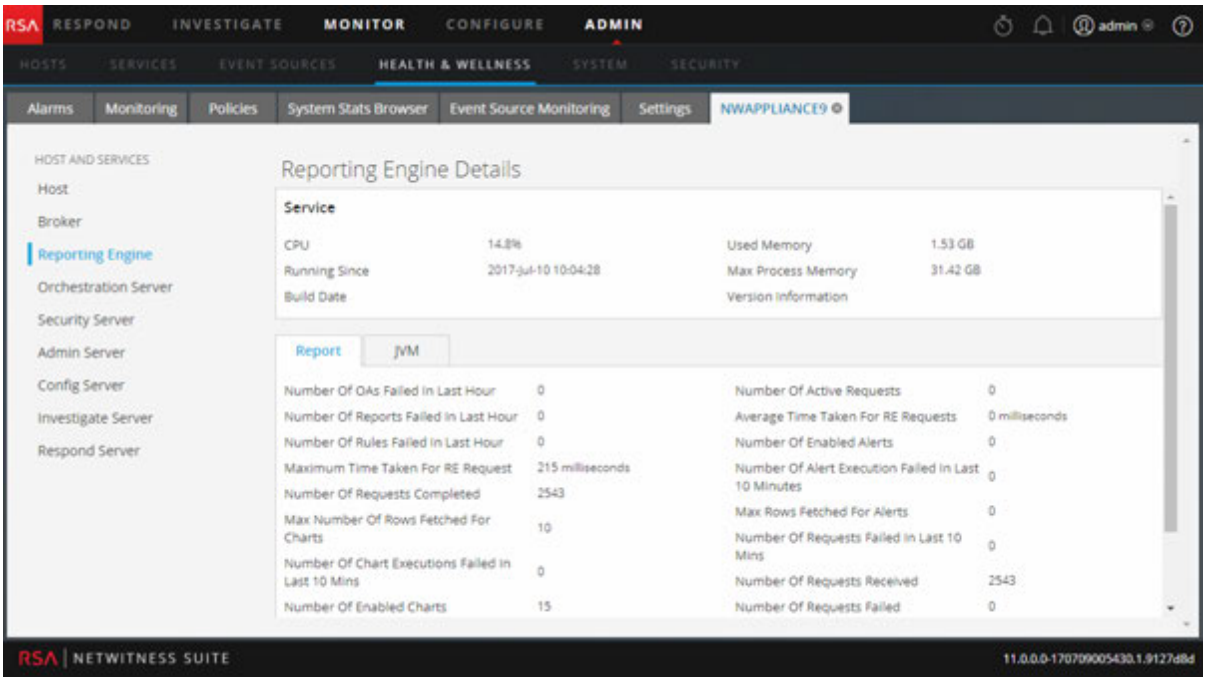
   The Event Stream Analysis (ESA) service details view has the **Service**and **Details** panels, plus the **Monitor** and **JVM** tabs that show additional statistics.



The Malware Analysis service details view has the **Service** panel plus the **Rules, Events,** and **JVM** tabs that show additional statistics.



The Reporting Engine service details view has the **Service** panel plus the **Report** and **JVM** tabs that show additional statistics.



Note: Alternatively, you can access the service details page by clicking the services listed in the options panel in the Host Details view.

Refer to Monitoring View for a detailed description of the Details view for each service.

Monitor Event Sources

The event source monitoring feature of NetWitness Suite provides the following functionalities:

- Support for failover
- Provides a consolidated list of event sources and their associated collector and log decoder devices
- Regex support for rules
- Decommission
- Filtering capabilities
- Historical graph

In addition, you can monitor event sources, check the number of events generated from a source type and view the historical graph of the events collected. To monitor event sources you have to configure the event sources so that they generate and send out notifications when required.

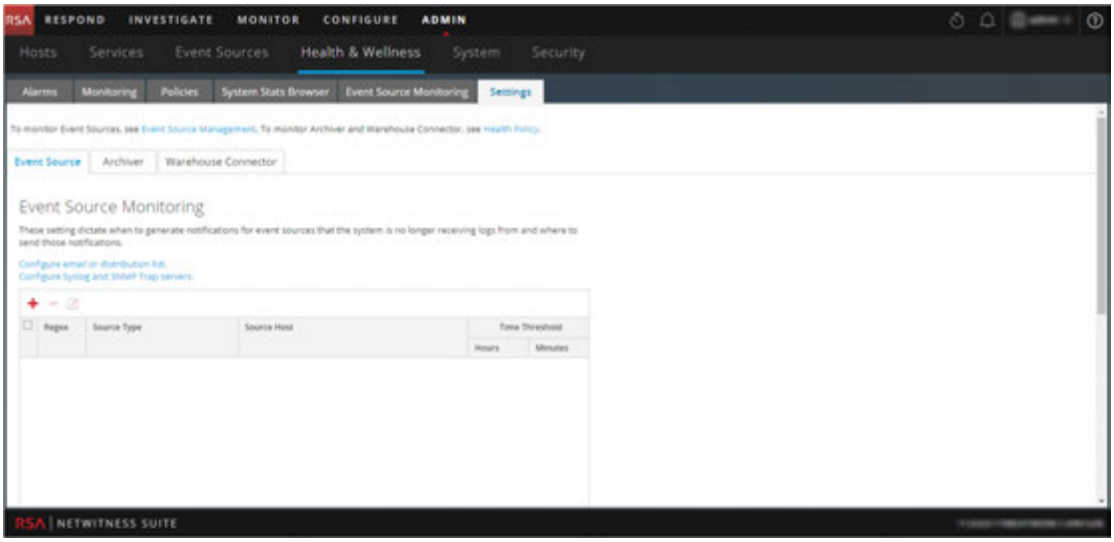
Configure Event Source Monitoring

To monitor event sources you have to configure the event sources so that they generate and send out notifications when required. For the related reference topic, see Health and Wellness Settings View - Event Sources.

To configure and enable event monitoring in NetWitness Suite:

1. Go to **ADMIN** > **Health & Wellness**.
2. Select **Settings** > **Event Source**.

   The Event Source tab is displayed.

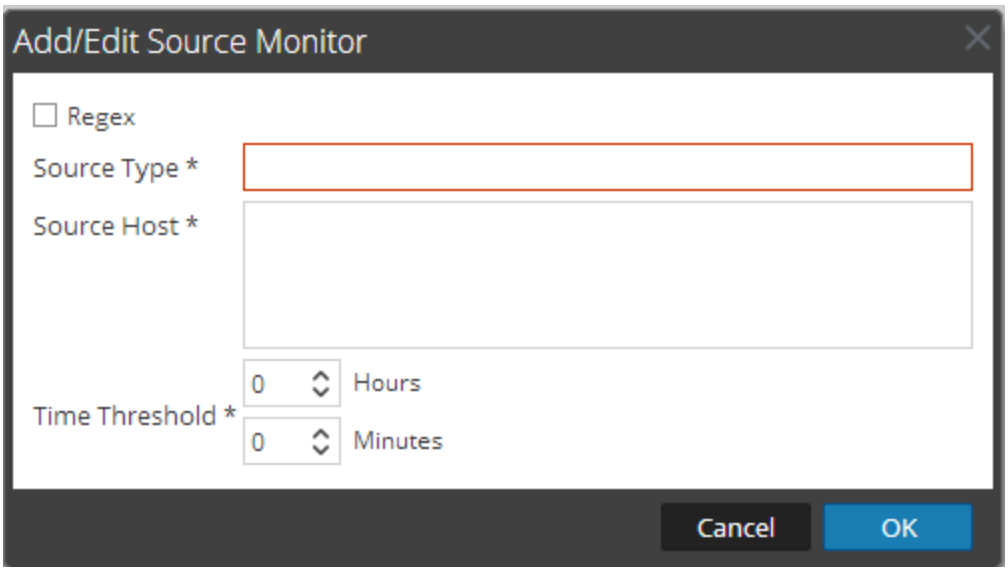


3. Under **Event Source Monitoring**, click +.

   The Add/Edit Source Monitor dialog is displayed.

4. Define the **Source Type**, **Source Host**, and **Time Threshold** for the source of the event source that you want to monitor to detect when NetWitness Suite stops receiving logs from it. If you do not specify a **Time Threshold**, NetWitness Suite monitors the event source until you set a threshold.

   Note: For **Source Type** and **Source Host**, you must specify the values that you configured for the event source in the **Event Sources** tab of the **Administration** > **Services** > Log Collector service > **View** > **Config** view. You add or modify the the event sources that you want to monitor. The two parameters that identify an event source are **Source Type** and **Source Host**. You can use **globbing** (pattern matching and wildcard characters) to specify the **Source Type** and **Source Host** of event sources



5. Click **OK**.

   The event source is displayed in the panel.

6. Configure the method of notification, by doing one of the following:

   - Select **Configure email or distribution list**.

     The AMIN > System > Email Configuration Panel is displayed so that you can specify to whom the notifications are sent.

   - Select **Configure Syslog and SNMP Trap servers**.

     The Administration > System Auditing Configuration panel is displayed so that you can configure the Syslog and SNMP Traps to which the notifications are sent.

7. Click **Apply**.

   NetWitness Suite begins sending notifications when it stops receiving events from this event source after the time threshold has elapsed.

For details on parameters in the Event Source Monitoring settings view, see Event Source Monitoring View.

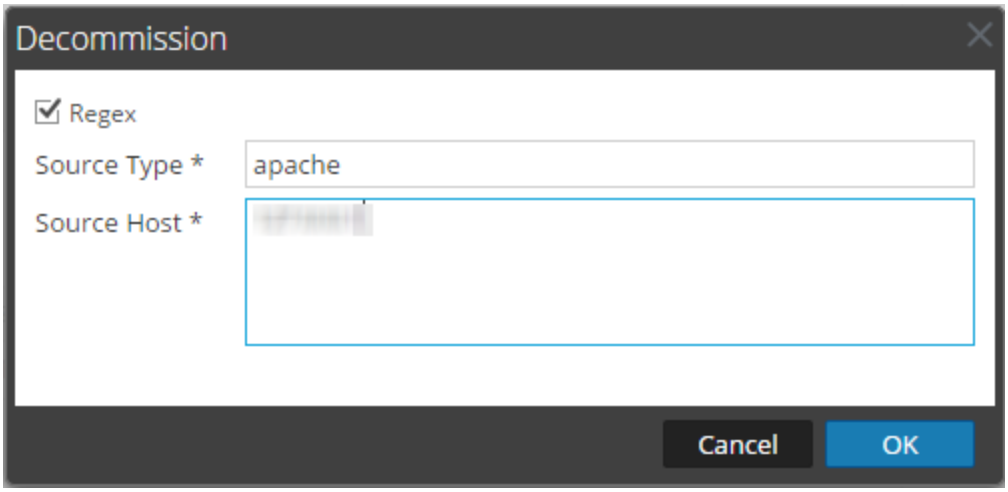
Decommission Event Source Monitoring

If a Log Collector service (Local Collector or Remote Collector) for which you set up Event Source monitoring becomes inoperable, NetWitness Suite continues to notify that you it is not receiving events from it until you decommission the Collector.

Caution: If you configured a failover Local Collector for a Remote Collector and the Local Collector fails over to a standby Log Decoder, you must decommission the Local Collector to stop the notifications.

To decommission event source monitoring for an event source:

1. Go to **ADMIN**> **Health & Wellness**.
2. Select **Settings** > **Event Source**.
   The **Event Source** tab is displayed.
3. Under **Decommission**, click +.
   The **Decommission** dialog displays.
4. Define the **Source Type** and the **Source Host** for the source for which you want to decommission event monitoring notifications.



Filter Event Sources

You can choose a filter to display:

- Events belonging to a particular event source
- Events belonging to particular event source types
- Events collected from a particular log Collector
- Events list arranged in a order based on the Event Source Type, Log Collector, Log Decoder or Last Event Time.

To filter the list of event sources:

1. Go to **ADMIN > Health & Wellness**.
2. Select **Event Source Monitoring**.
3. Filter the list in one of the following ways:

- To view the events generated by a particular event source, type the required event source in the **Event Source** field. Select **Regex** to enable Regex filter and click **Apply**. It performs a

regular expression search against text and lists out the specified category. This field also supports globbing pattern matching.

All events generated by the Event Source specified are displayed.

- To view events collected from a particular Log Collector, select a Log Collector from the drop-down list and click **Apply**.

  A list of all events being collected from the specified Log Collector from various event sources is displayed.

Note: Similarly, you can also choose the following filters:
- To view events belonging to an event source type, select the event source type and click **Apply**.
- To view events received in a specified time frame, select the required time frame and click **Apply**. You can further filter the query results to contain only event sources that logs have been received from within the selected time or the query results to contain only event sources that logs have not been received from within the selected time.

For details on various parameters and description, see Event Source Monitoring View.

View Historical Graph of Events Collected for an Event Source

The historical graph of the events collected from an event source gives you information about the variation of the collection over a time frame selected.

To view a historical graph:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Click **Event Source Monitoring**.

   The Event Source Monitoring view is displayed.

3. In the **Historical Graph** column, select .

   The Historical graph for the selected event source is displayed.

   The figure below gives an example of the historical graph for the event source type **winevent_snare**.

The graphical view is customized to display the events collected for the current day and the values are zoomed in for an interval of an hour (09.05 - 105.05 hrs). Hover over the graph to view the details at a particular instant. For example, in the figure it displays the average rate of collection at 09.30 hrs.

Note: You can customize the graph view by selecting the Time Frame and Date range. You can zoom in using the zoom in value, time window, or by just a click and a drag in the plot area. For details on the parameters to customize and zoom in functions see Health and Wellness Historical Graphs collected from an event source.

If there is no data displayed on the chart it may be due to one of the following reasons:

- event source is down.
- event source is not processing anything right now.

Monitor Alarms

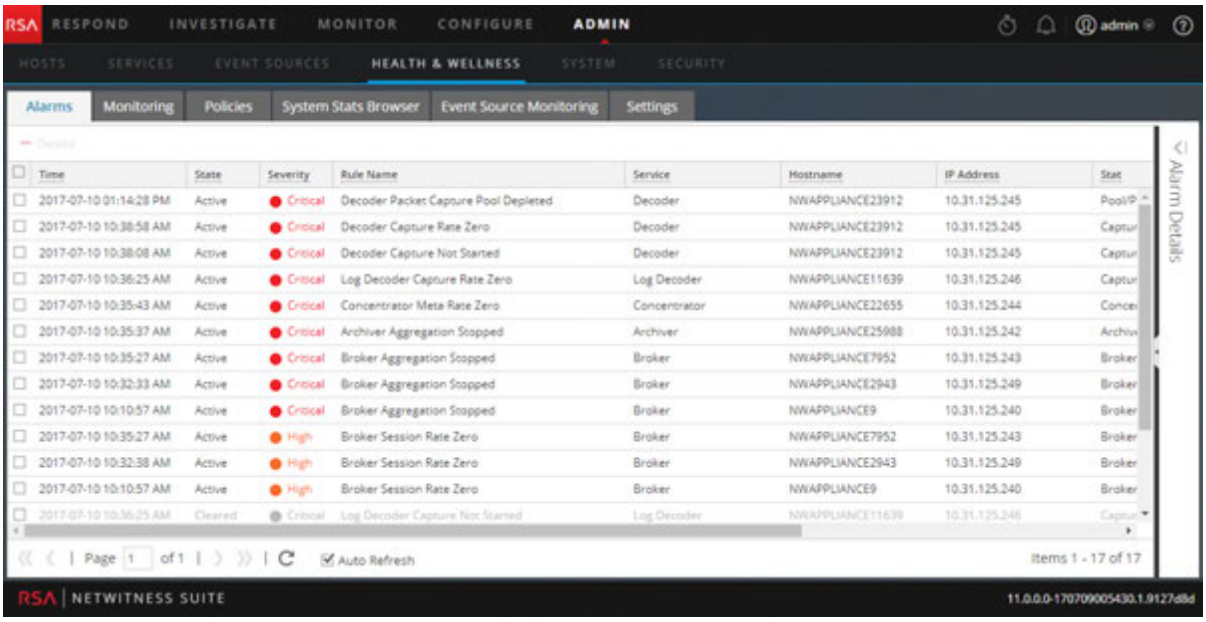
You can set up alarms and monitor them in the Health and Wellness interface for the hosts and services in your NetWitness Suite domain. Alarms display in the view as **Active** when the Policy-rule-defined statistical thresholds for hosts and services have been crossed. Alarms are grayed out and change to the **Cleared** status when the clearing threshold has been crossed.

You set up the parameters for alarms in Manage PoliciesManage Policies For the related reference topic, see Health and Wellness View - Alarms View.

To monitor the alarms set up in NetWitness Suite:

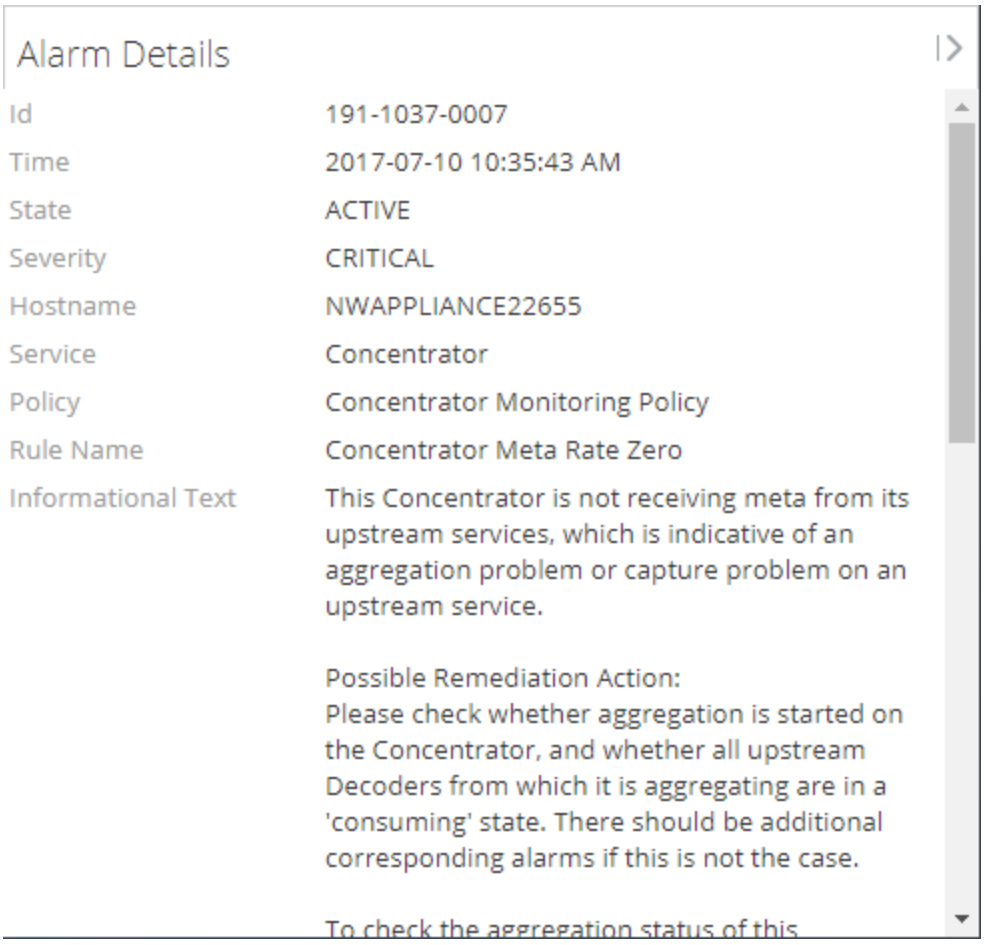
1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open by default.



2. Click on the alarm for which you want to display details in the Details Panel.

3. Click <| (expand) to view the details for the alarm you selected.



Monitor Health and Wellness Using SNMP Alerts

You can monitor an NetWitness Server component to proactively alert using Simple Network Management Protocol (SNMP) based on the thresholds or system failures.

You can monitor the following for NetWitness Suite components:

- CPU utilization that reaches a defined threshold.
- Memory utilization that reaches a defined threshold.
- Disk utilization that reaches a defined threshold.

SNMP Configuration

The NetWitness Servers can be configured to send out SNMPv3 Threshold Traps and Monitor Traps. Threshold traps are sent in conjunction with configured node thresholds by the NetWitness Suite Core applications themselves. Monitor traps are sent by the SNMP daemon itself for the items indicated in its configuration file. The customer must set up the SNMP daemon on another service to receive SNMP traps from NetWitness Suite. You can set up SNMP on NetWitness Suite in the configuration setting for the NetWitness Server. For more information, see **Service Configuration Settings** in the *NetWitness Suite Host and Services Getting Started Guide* for the specific host.

Thresholds

Thresholds can be set on any service statistics that can accept the setLimit message. You can retrieve the current thresholds using the getLimit message. To set a limit, you can pass a low and high threshold value.

When the value of the stat crosses either the low or high threshold, a SNMP trap is triggered indicating the threshold is crossed. The trap will not be triggered if the value is below the low and above the high value, but another trap is triggered if it crosses back into the normal range (above the low and below the high).

You must set the threshold for the service using the Service Explorer view or the REST API.

Following is a sample threshold for monitoring CPU usage (below 10% or above 90%):

```
/sys/stats/cpu setLimit low=10 high=90
```

Following is an example of how the threshold is set using REST API:

```
http://<log decoder>:50102/sys/stats/cpu?msg=setLimit&low=10&high=90
```

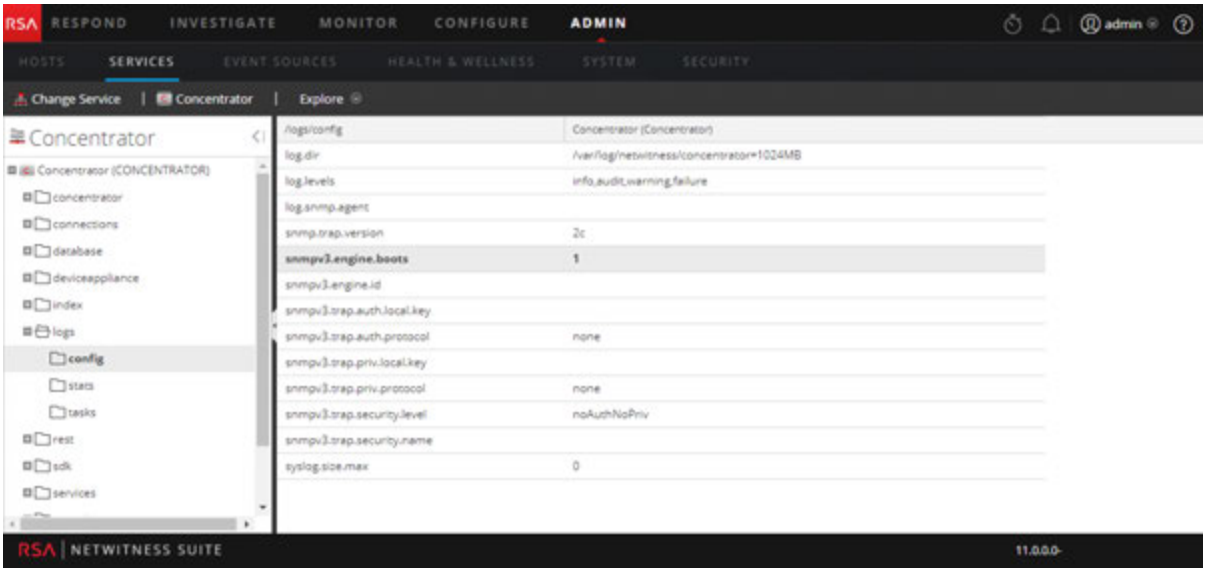
If the CPU usage spikes to 90% or higher, a SNMP trap will be generated:

```
23435333 2013-Dec-16 11:08:35 Threshold warning path=/sys/stats/cpu
old=77% new=91
```

Configure SNMPv3 for a Host

1. Go to **ADMIN > Services**.
   The Services view is displayed.
2. Select the service.
3. In the Actions column, select **View > Explore**.
4. In the nodes list, expand the list and select a config folder. For example, logs > config

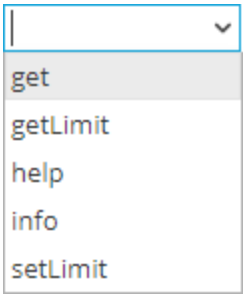
5. Set the SNMPv3 configuration.



Set the Threshold for a Service

1. Go to **ADMIN > Services**.
   The Services view is displayed.
2. Select the service.
3. In the Actions column, select **View > Explore**.
4. In the nodes list, expand the list and select a stat folder.
5. Select a stat, for example, cpu, and right-click.
6. From the drop-down menu, select **Properties.**

   The Properties panel is displayed. The Properties panel has a drop-down list of available messages for the parameter.



7. Select setLimit.
8. Specify the low and high values.

Troubleshooting Health & Wellness

Issues Common to All Hosts and Services

You may see the wrong statistics in the Health & Wellness interface if:

- Some or all the hosts and services are not provisioned and enabled correctly.
- You have a mixed-version deployment (that is, hosts updated to different NetWitness Suite versions).
- Supporting services are not running.

Issues Identified by Messages in the Interface or Log Files

This section provides troubleshooting information for issues identified by messages NetWitness Suite displays in the Health & Wellness Interface or includes in the Health & Wellness log files.

Message	User Interface: **Cannot connect to System Management Service**
	System Management Service (SMS) logs:
	
	`Caught an exception during connection recovery!`
	`java.io.IOException`

Possible Cause	RabbitMQ service not running on the NetWitness Server.

Solution	Restart the RabbitMQ, SMS, and NetWitness Suite services using the following commands.
	`systemctl restart rabbitmq-server`
	`systemctl restart rsa-sms`
	`systemctl restart jetty`

Message/ Problem	User Interface: **Cannot connect to System Management Service**
Cause	The System Management Service, RabbitMQ, or Mongo service is not running.

Solution	Run the following commands on NetWitness Server to make sure all these services are running.
	`[root@nwserver ~]# systemctl status rsa-sms`
	`RSA NetWitness SMS :: Server is not running.`
	`[root@nwserver ~]# systemctl start rsa-sms`
	`Starting RSA NetWitness SMS :: Server...`
	`[root@nwserver ~]# systemctl status rsa-sms`
	`RSA NetWitness SMS :: Server is running (5687).`
	`[root@nwserver ~]# systemctl status mongod`

	mongod (pid 2779) is running... systemctl status rabbitmq-server Status of node nw@localhost ... [{pid,2501}, {running_applications, [{rabbitmq_federation_management,"RabbitMQ Federation Management", "3.3.4"},

Message/ Problem	User Interface: **Cannot connect to System Management Service**
Possible Cause	`/var/lib/rabbitmq` partition usage is 70% or greater.
Solution	Contact Customer Care.

Message/ Problem	User Interface: **Host migration failed.**
Possible Cause	One or more NetWitness Suite services may be in a **stopped** state.
Solution	Make sure that the following services are running then restart the NetWitness Server: Archiver, Broker, Concentrator, Decoder, Event Stream Analysis, Response Server, IPDB Extractor, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, Workbench.

Message/ Problem	User Interface: **Server Unavailable.**

Possible Cause	One or more NetWitness Suite services may be in a **stopped** state.
Solution	Make sure that the following services are running then restart the NetWitness Server: Archiver, Broker, Concentrator, Decoder, Event Stream Analysis, Response Server, IPDB Extractor, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, Workbench.

Message/ Problem	User Interface: **Server Unavailable**
Possible Cause	System Management Service (SMS), RabbitMQ, or Mongo service is not running.

Solution 1	Run the following commands on NetWitness Server to make sure all these services are running.
	`[root@nwserver ~]# systemctl status rsa-sms`
	`RSA NetWitness SMS :: Server is not running.`
	`[root@nwserver ~]# systemctl start rsa-sms`
	`Starting RSA NetWitness SMS :: Server...`
	`[root@nwserver ~]# systemctl status rsa-sms`
	`RSA NetWitness SMS :: Server is running (5687).`
	`[root@nwserver ~]# systemctl status mongod`
	`mongod (pid 2779) is running...`
	`systemctl status rabbitmq-server`
	`Status of node nw@localhost ...`
	`[{pid,2501},`
	`{running_applications,`
	`[{rabbitmq_federation_management,"RabbitMQ Federation Management",`
	`"3.3.4"},`

Solution 2	Make sure `/var/lib/rabbitmq` partition is less than 75% full
Solution 3	Check NetWitness Server log files

	(`var/lib/netwitness/uax/logs/nw.log`) for any errors.

Message/ Problem	ContextHub stops and does not allow you to add or edit data sources and lists.
Possible Cause	The storage is full by 95% or above.
Solution 1	Increase the storage by updating the YML file, located at /etc/netwitness/contexthub-server/ contexthub-server.yml. For example, to increase storage from 120 to 150 GB, enter a value (in bytes) by editing the relevant parameter: `rsa.contexthub.data.disk-size: 161061273600`
Solution 2	Delete unwanted or unused large list.
Solution 3	Configure the TTL index for the list to automatically delete STIX and TAXI data and to clean up storage space.

Message/ Problem	Context Hub runs on a fixed memory and 50% is reserved for cache. When cache is 100% full, the cache response stops. For all new lookups the response will be slow.
Possible Cause	The cache is full by 50% or above.
Solution 1	By default, Context Hub cleans the cache every 30 minutes. Reduce the cache expiration time of data sources.
Solution 2	Disable cache for data sources.
Solution 3	Increase the RAM of the CH Java process by editing the `-Xmx` option available in the /etc/netwitness/contexthub-server/contexthub-server.conf file. In `JAVA_OPTS`, search for the `-Xmx` option. For example, edit the entry as follows: `-Xmx8G` where `8G` represents 8GB space. Then restart the ContextHub service.

	Note: The memory is less than the available system memory. Be aware that there are many other services running on the host.

Message/ Problem	List Data Source displays an unhealthy stats or status.
Possible Cause 1	Unable to: • access the data source • parse or read a CSV file • schema mismatched CSV
Possible Cause 2	Unable to authenticate when accessing the data source.
Solution 1	Make sure to save the csv file at correct location i.e/var/lib/netwitness/contexthub-server/data/ and verify the required read permissions.
Solution 2	Make sure the csv file schema specified while configuring the data source matches. If not, then either create a new data source with the new schema or edit the csv file to match the schema. For example, if you configure a List Data Source with a schema with column1, column2, and column3. And next time you update the csv file where the number of column increase or decrease or the order of the columns are changed. In this case there is a schema mismatch and the configured list data source will show "Unhealthy" in Health and Wellness stats.
Solution 3	Make sure the password is correct. To confirm edit the data source, enter the password and click test connection. For more information related the above solutions, see Configure Lists as a Data Source topic in the *Context Hub Configuration Guide*.

Issues Not Identified by the User Interface or Logs

This section provides troubleshooting information for issues that are not identified by messages NetWitness Suite displays in the Health & Wellness Interface or includes in the Health & Wellness log files. For example, you may see incorrect statistical information in the Interface.

Problem	Incorrect statistics displayed in Health and Wellness interface.
Possible Cause	SMS service is not running. SMS service must be running on the NetWitness Server.
Solution	Restart SMS service.

Problem	NetWitness Suite does not show the version to which you upgraded until you restart jettysrv (jeTTy server).
Possible Cause	When NetWitness Suite checks a connection, it polls a service every 30 seconds to see if it is active. During that 30 seconds, if the service comes back up, it will not get the new version.
Solution	1. Manually stop the service. 2. Wait until you see that it is it offline. 3. Restart the service. NetWitness Suite displays the correct version.

Problem	NetWitness Server does not display the **Service Unavailable** page.
Possible Cause	After you upgrade to NetWitness Suite version 10.5, JDK 1.8 is not default version and this causes the jettysrv (jeTTy server) to fail to start. Without the jeTTy server, the NetWitness Suite server cannot display the **Service Unavailable** page.
Solution	Restart jettysrv.

Problem	The SMS service is stopped and the following error is displayed in the log file: `java.lang.OutOfMemoryError: Java heap space`
Solution	You can use the following solution to increase the memory according to your needs. 1. Open /opt/rsa/sms/conf/wrapper.conf  2. Replace `wrapper.java.additional.1=-Xmx8192m` with: `wrapper.java.additional.1=-Xmx16g` 3. Restart the SMS service: `systemctl start rsa-sms`

Managing NetWitness Suite Updates

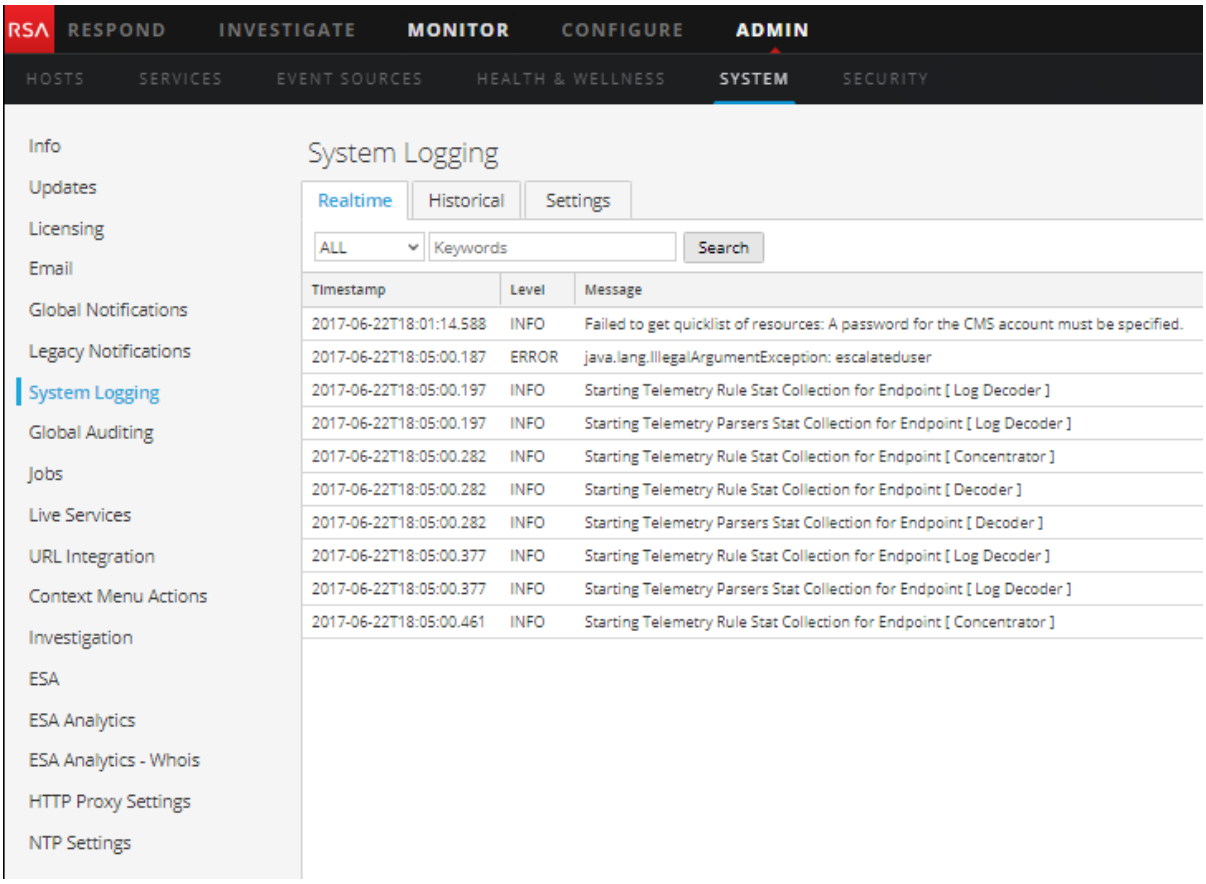
RSA issues NetWitness Suite software version updates on a regular basis as it strives to continually improve the product. A software version update consists of a release, service pack, or patch (including security patch) and ancillary software on which the release, service pack, or patch depends. User guides are provided for each software version update release, which include detailed steps for installing the update. It is important that you download the update guide for the release from RSA Link (https://community.rsa.com/community/products/netwitness) and follow the steps described there. Additional information is available in the "Update Existing Host to New Version" topic in the *Hosts and Services Getting Started Guide*.

Displaying System and Service Logs

NetWitness Suite provides views into system logs and service logs. When you view service logs, you can also select messages for the service or host.

View System Logs

1. Go to **ADMIN > System.**
2. In the options panel, select **System Logging**.

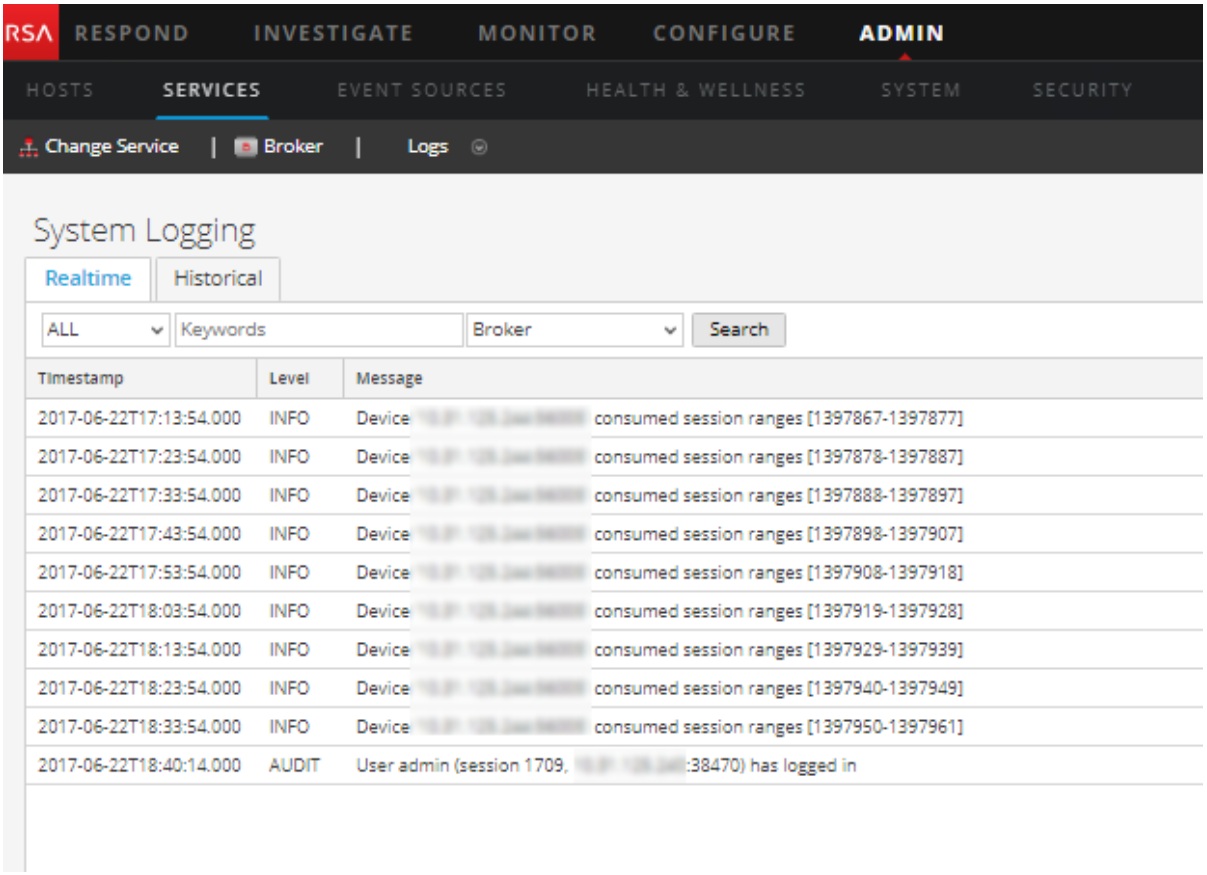


Display Service Logs

To display NetWitness Suite service logs:

1. Go to **ADMIN > Services**.
2. In the **Services** grid, select a service.

3. In the **Actions** column, select **View > Logs**.



Filter Log Entries

To filter the results shown in the Realtime tab:

1. (Optional) For system and service logs, select a **Log Level** and a **Keyword**, or both. System logs have seven log levels. Service logs have only six log levels because they do not include the **TRACE** level. The default is **ALL** log entries.
2. (Optional) For service logs, select the Service: host or service.
3. Click **Filter**.

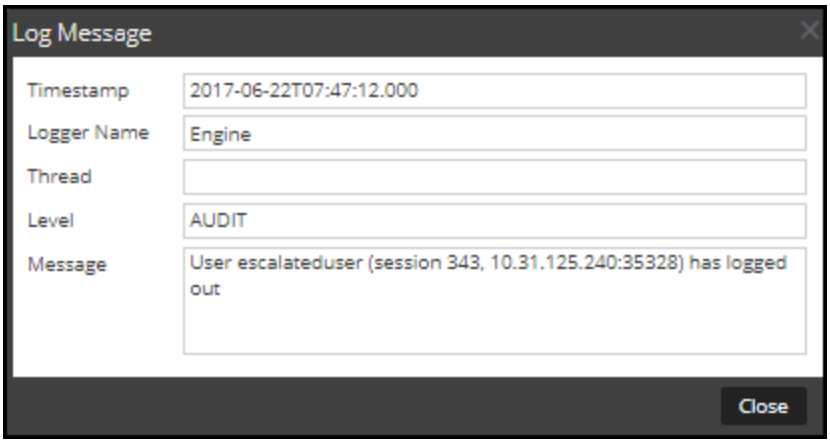
   The view is refreshed with the most recent 10 entries matching your filter. As new matching log entries become available, the view is updated to show those entries.

Show Details of a Log Entry

Each row of the Realtime tab Log grid provides the summary information of a log entry. To view complete details:

1. Double-click a log entry.

   The **Log Message** dialog, which contains the Timestamp, Logger Name, Thread, Level and Message, is displayed.



2. After viewing, click **Close**.

Access Reporting Engine Log File

All Log Files

The Reporting Engine stores the following logs in the **rsasoc/rsa/soc/reporting-engine/log** directory:

- Current logs in the **reporting-engine.log** file.
- Backup copies of previous logs in the **reporting-engine.log.*** file.
- All UNIX script logs in the files that have the following syntax: **reporting-engine.sh_*timestamp*.log** (for example, **reporting-engine.sh_20120921.log**).

The Reporting Engine rarely writes command line error messages to the **rsasoc/nohup.out** file.

Upstart Logs

The Reporting Engine appends the log messages and output written by upstart daemon and the commands used to start the reporting-engine to the **/var/log/secure** directory.

An upstart log file is a system log file so only the root user can read it. The Reporting Engine generates log files, retains backup copies of previous log files, stores UNIX script log files, and appends upstart log files to another directory.

Search and Export Historical Logs

NetWitness Suite provides a searchable view of the NetWitness Suite log or the service log in a paged format. When initially loaded, the grid shows the last page of the log entries for the system or the service. You can export logs from the current view.

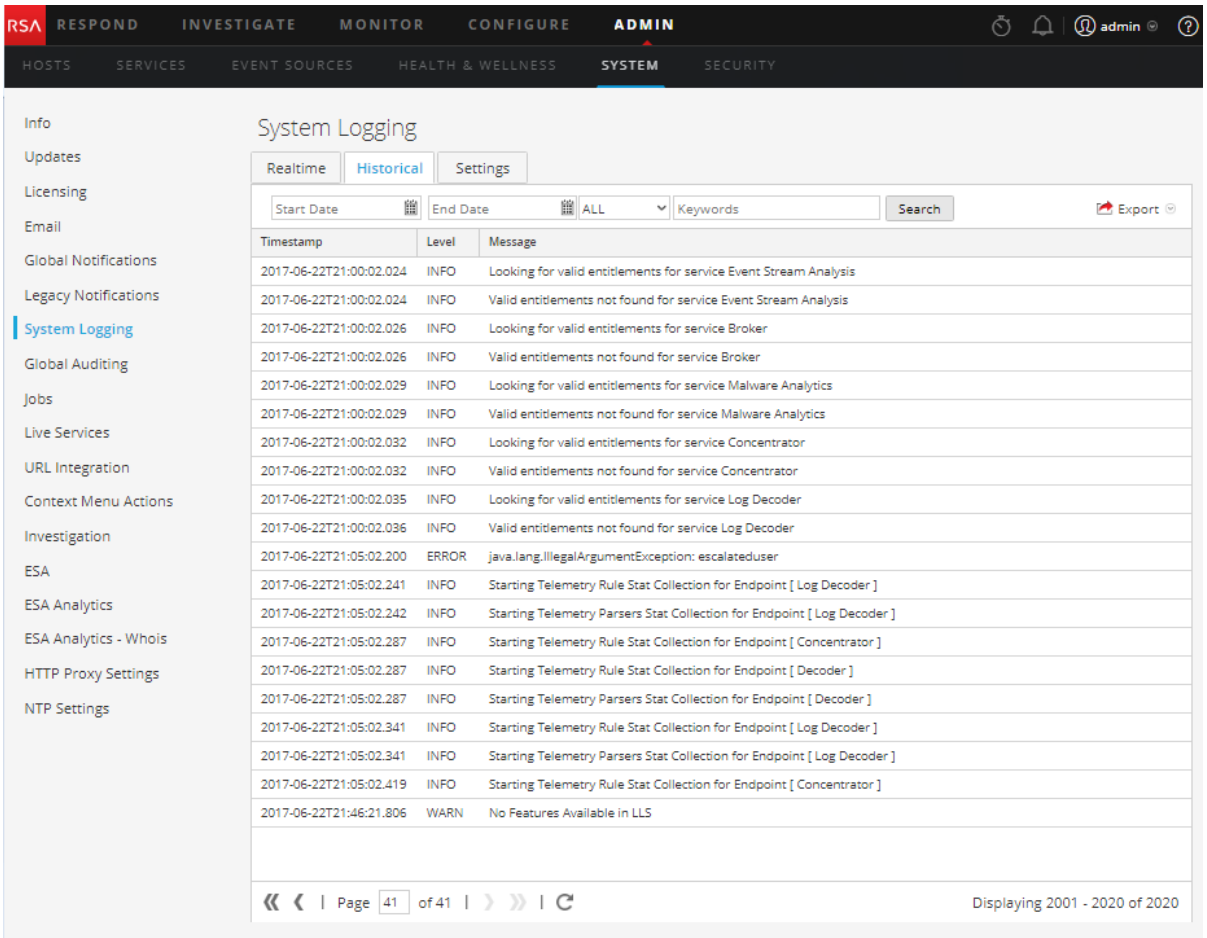
Display the Historical System Log

To display the historical log for the system:

1. Go to **ADMIN > System.**
2. In the options panel, select **System Logging**.

   The System Logging panel is opened to the Realtime tab by default.
3. Click the **Historical** tab.

   A list of historical logs for the system is displayed.



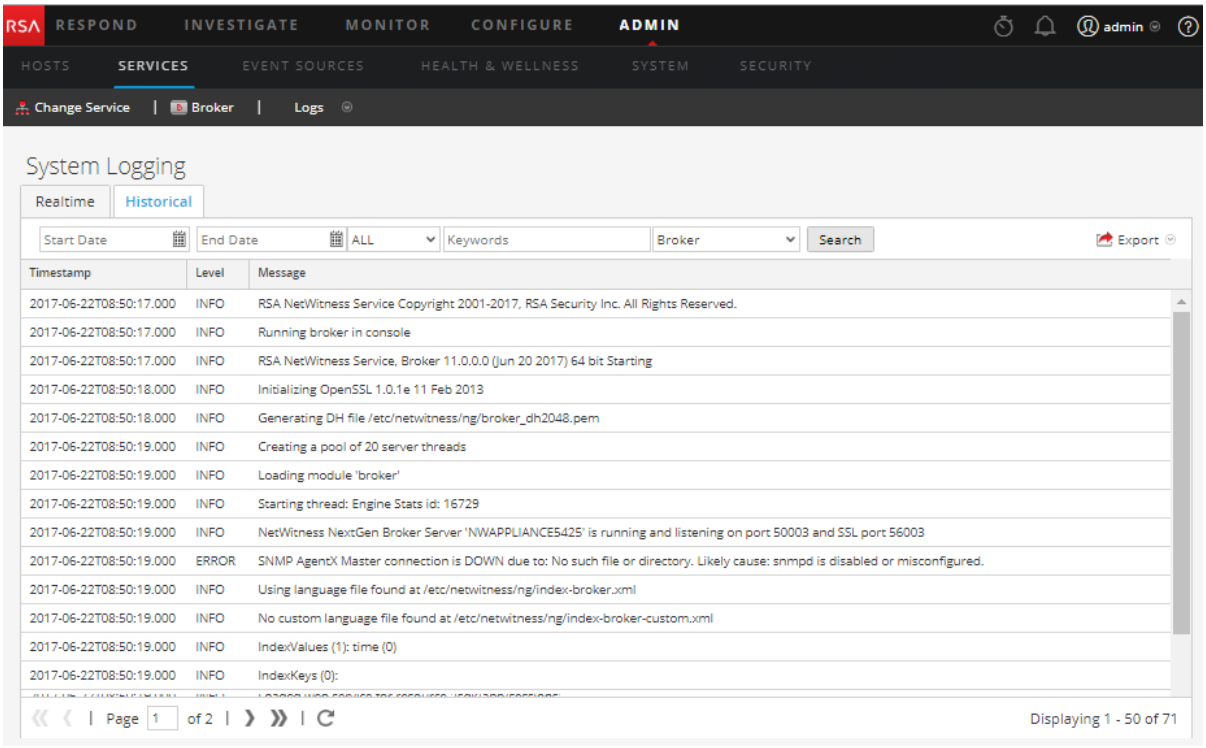
Display a Historical Service Log

To display the historical log for services:

1. Select **ADMIN > Services**.
2. Select a service.
3. In the **Actions** column, select **View > Logs**.

   The service logs view is displayed with the Realtime tab open.
4. Click the **Historical** tab.

   A list of historical logs for the selected service is displayed.



Search Log Entries

To search the results shown in the **Historical** tab:

1. (Optional) Select a **Start Date** and **End Date**. Optionally, select a **Start Time** and **End Time**.
2. (Optional) For system and service logs, select a **Log Level** and a **Keyword**, or both. System logs have seven log levels. Service logs have only six log levels because they do not include the **TRACE** level. The default is **ALL** log entries.
3. (Optional) For service logs, select the Service: host or service.
4. Click **Search**.

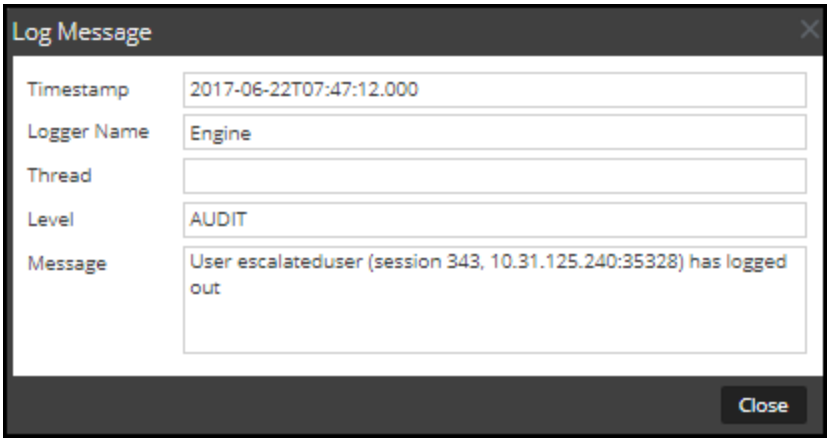
   The view is refreshed with the most recent 10 entries matching your filter. As new matching log entries become available, the view is updated to show those entries.

Show Details of a Log Entry

Each row of the **Historical** tab Log grid provides the summary information of a log entry. To display all the details for a log message:

1. Double-click a log entry.

   The **Log Message** dialog, which contains the Timestamp, Logger Name, Thread, Level and Message, is displayed.



2. After viewing, click **Close**.

   The dialog closes.

Page Through Log Entries

To peruse the different pages of the grid, use the paging controls on the bottom of the grid as follows:

- Use the navigation buttons
- Manually type the page number you want to view, and press **ENTER**.

Export a Log File

To export the logs in the current view:

Click **Export**, and select one of the drop-down options: **CSV Format** or **Tab Delimited**.
The file is downloaded with a filename that identifies the log type and the field delimiter. For example, a NetWitness Suite system log exported with comma-separated values is named **UAP_log_export_CSV.txt**, and a host log exported with tab-separated values is named **APPLIANCE_log_export_TAB.txt**.

Maintaining Queries Using URL Integration

A URL integration provides a way to represent the bread crumbs, or query path, you take when actively investigating a service in the Navigate view. You do not need to display and edit these objects often.

A URL integration maps a unique ID that is automatically created each time you click on a navigation link in the Navigation view to drill into data. When the drill-down completes, the URL reflects the query IDs for the current drill point. The Display Name is displayed in the bread crumb in the Navigate view.

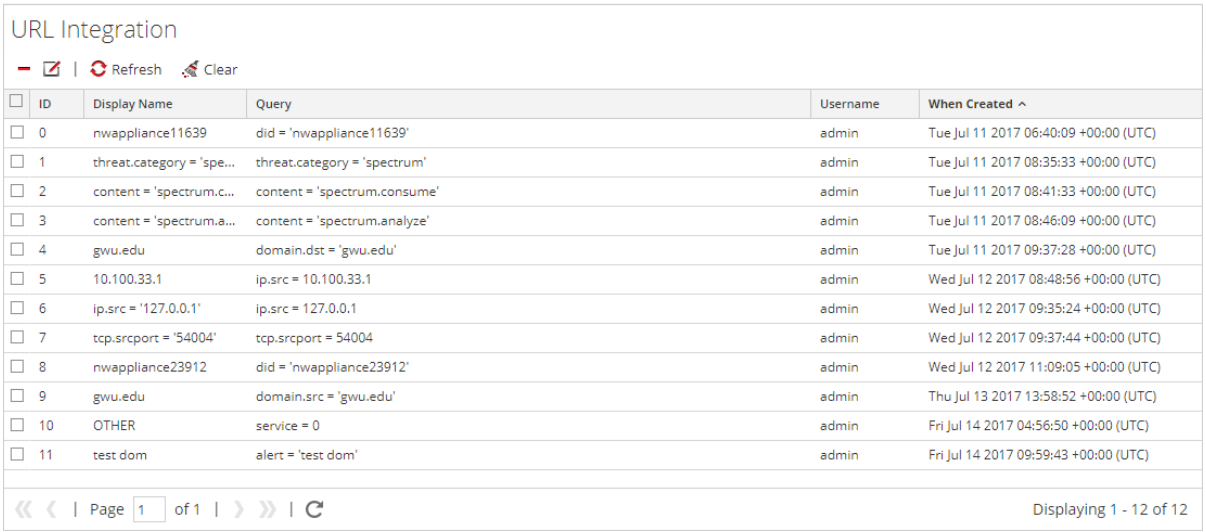
The **URL Integration** panel provides a list of queries and allows users who have the proper permissions to modify this underlying source of data and analyze the query patterns of other users of the NetWitness Suite system. Within the panel, you can:

- Refresh the list.
- Edit a query.
- Delete a query.
- Clear all queries in the list.

Caution: After a query has been removed from the system, any Investigation URLs that included the ID of that query will no longer function.

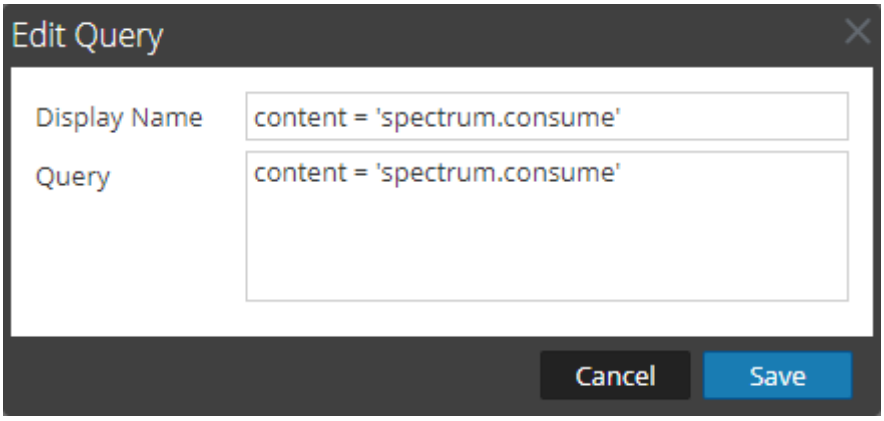
Edit a Query

1. Go to **ADMIN > System**.
2. In the options panel, select **URL Integration**.



3. Select the row in the grid and either double-click the row or click .

   The **Edit Query Dialog** is displayed.



4. Edit the **Display Name** and the **Query**, but do not leave either field blank.
5. To save the changes, click **Save**.

Delete a Query

Caution: After a query has been removed from the system, any Investigation URLs that included the ID of that query will no longer function.

To remove a query from NetWitness Suite entirely:

1. Select the query.
2. Click

   A dialog requests confirmation that you want to delete the query.
3. Click **Yes**.

Clear All Queries

To clear all queries from the list:

- Click Clear

  The entire list is cleared.

Use a Query in a URI

URL Integration facilitates integrations with third-party products by allowing a search against the NetWitness Suite architecture. By using a query in a URI, you can pivot directly from any product that allows custom links, into a specific drill point in the Investigation view in NetWitness Suite.

The format for entering a URI using a URL-encoded query is:

http://<nw host:port>/investigation/<serviceId>/navigate/query/<encoded query>/date/<start date>/<enddate>
where

- **<nw host: port>** is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is only needed if access is configured over a non-standard port through a proxy.
- **<serviceId>** is the internal Service ID in the NetWitness Suite instance for the service to query against. The service ID can be represented only as an integer. You can see the relevant service ID from the url when accessing the investigation view within NetWitness Suite. This value will change based on the service being connected to for analysis.
- **<encoded query>** is the URL-encoded NetWitness Suite query. The length of query is limited by the HTML URL limitations.
- **<start date>** and **<end date>** define the date range for the query. The format is <yyyy-mm-dd>T<hh:mm>. The start and end dates are required. Relative ranges (for example, Last Hour) are not supported in this version. All times are run as UTC.

For example:
http://localhost:9191/investigation/12/navigate/query/alias%20exists/date/2012-09-01T00:00/2012-10-31T00:00

Examples

These are query examples where the NetWitness Server is 192.168.1.10 and the serviceID is identified as 2.

All activity on 03/12/2013 between 5:00 and 6:00 AM with a hostname registered

- Custom Pivot: alias.host exists
- https://192.168.1.10/investigation/2...13-03-12T06:00

All activity on 3/12/2013 between 5:00 and 5:10 PM with http traffic to and from IP address 10.10.10.3

- Custom Pivot: service=80 && (ip.src=10.10.10.3 || ip.dst=10.0.3.3)
- Encoded Pivot Dissected:
  - service=80 => service&3D80
  - ip.src=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3
  - ip.dst=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3
  - https://192.168.1.10/investigation/2...13-03-12T17:10

Additional Notes

Some values may not need to be encoded as part of the query. For example, commonly the IP src and dst is used for this integration point. If leveraging a third-party application for integration of this feature, it is possible to reference those without encoding applied.

FIPS Support

NetWitness Suite 11.0 ships with FIPS-validated 140-2 Cryptographic Modules that support all cryptographic operations within NetWitness Suite. NetWitness Suite leverages two modules that support a level 3 design assurance:

- RSA BSAFE Crypto-J
- OpenSSL with BSAFE (OWB)

Both modules have been certified with an operational environment comparable to the standard NetWitness Suite configuration.

By default, the cryptographic modules enforce the usage of FIPS-certified cipher suites wherever possible. For exceptions, refer to the information below and to the release notes. For additional information about the FIPS modules, see http://csrc.nist.gov/groups/STM/cmvp/documents/140-1/140val-all.htm.

The RSA BSAFE Crtypo-J FIPS Certificate number is 2468 and the OWB FIPS Certificate is included in the RSA BSAFE Crypto-C Micro Edition with certificate number 2300.

In 11.0.0.0, FIPS is enabled on all services except Log Collector. This includes Log Decoder and Decoder if they were FIPS-enabled in 10.6.4.x. FIPS cannot be disabled on any services except for Log Collector, Log Decoder and Decoder.

Note: For a fresh installation of 11.0.0.0, by default, all core services will be FIPS enforced except Log Collector and Log Decoder. FIPS cannot be disabled on any services except for Log Collector, Log Decoder and Packet Decoder.

Note: For upgrades to 11.0.0.0 from 10.6.4.x, the following conditions apply for the Log Collector, Log Decoder and Decoder services:
- Log Collector is not FIPS enabled after upgrading to 11.0.0.0, even if FIPS was enabled in 10.6.4.x. You must enable FIPS support after upgrading to 11.0.0.0. See the instructions in FIPS support for Log Collectors.
- If FIPS was enabled for the Log Decoder and Packet Decoder services in 10.6.4.x, FIPS will also be enabled in 11.0.0.0. However, if Log Decoder and Packet Decoder were NOT FIPS enabled in 10.6.4.x, they will not be enabled in 11.0.0.0, and you can manually enable FIPS for these services if required. See the instructions in FIPS support for Log Decoders and Decoders.

FIPS support for Log Collectors

To enable FIPS for Log Collectors:

1. Stop the Log Collector service.
2. Open the `/etc/systemd/system/nwlogcollector.service.d/nwlogcollector-opts-managed.conf` file.
3. Change the value of the following variable to **off** as described here:
   `Environment="OWB_ALLOW_NON_FIPS=on"`
   to
   `Environment="OWB_ALLOW_NON_FIPS=off"`
4. Reload the system daemon by running the following command:
   `systemctl daemon-reload`
5. Restart the Log Collector service.
6. Set the FIPS mode for the Log Collector service in the UI :

   Note: This step is not required if you are upgrading from 10.6.4 to 11.0.0.0 and FIPS was enabled in 10.6.4.

   a. Go to **ADMIN** > **Services**.
   b. Select the Log Collector service and go to **View** > **Config**.
   c. In SSL FIPS Mode, select the checkbox under Config Value and click **Apply**.

FIPS support for Log Decoders and Decoders

To enable FIPS for Log Decoders and Decoders that did not have FIPS enabled in 10.6.4.x:

1. Go to **ADMIN** > **Services** and select a Log Decoder or Packet Decoder service.
2. Select **View** > **Config**, and in **System Configuration**, enable **SSL FIPS Mode** by selecting the check box in the **Config Value** column.
3. Restart the service.
4. Click **Apply**.

Troubleshoot NetWitness Suite

For information about troubleshooting NetWitness Suite, see the following topics:

Debugging Information

NetWitness Suite Log Files

The following files contain NetWitness Suite log information.

Component	File
rabbitmq	/var/log/rabbitmq/nw@localhost.log /var/log/rabbitmq/nw@localhost-sasl.log
collectd	/var/log/messages
nwlogcollector	/var/log/messages
nwlogdecoder	/var/log/messages
sms	/opt/rsa/sms/wrapper.log
sms	/opt/rsa/sms/logs/sms.log
sms	/opt/rsa/sms/logs/audit/audit.log
NetWitness Suite	/var/lib/netwitness/uax/logs/nw.log
NetWitness Suite	/var/lib/netwitness/uax/logs/ audit/audit.log
NetWitness Suite	/opt/rsa/jetty9/logs

Files of Interest

The following files are used in key NetWitness Suite components, and can be useful when trying to track down miscellaneous issues.

Component	File	Description
rabbit	/etc/rabbitmq/rabbitmq.config	RabbitMQ configuration file. This configuration file partially drives the behavior of RabbitMQ, particularly around network/SSL settings.
rabbit	/etc/rabbitmq/rabbitmq-env.conf	RabbitMQ environment configuration file. This file specifies the RabbitMQ node name and location of the enabled plugins file.
rabbit	/etc/rabbitmq/rsa_enabled_plugins	This file specifies the list of enabled plugins in RabbitMQ. This file is managed by the RabbitMQ server, via the rabbitmq-plugins command. This file overrides the /etc/rabbitmq/enabled_plugins path, in order to work around issues with upgrading the Log Collector from early versions.

Component	File	Description
rabbit	/etc/rabbitmq/ssl/truststore.pem	The RabbitMQ trust store. This file contains a sequence of PEM-encoded X.509 certificates, represented trust CAs. Any clients that connect to RabbitMQ and present a certificate that is signed by a CA in this list is considered a trusted client.

Component	File	Description
rabbit	/var/log/rabbitmq/mnesia/nw@localhost	The RabbitMQ Mnesia directory. Mnesia is the Erlang/OTP database technology, for storing Erlang objects persistently. RabbitMQ uses this technology for storing information such as the current set of policies, persistent exchanges and queues, and so forth. Importantly, the msg_store_ persistent and msg_store_transient directories are where RabbitMQ stores messages that have been spooled to disk, e.g., if messages are published as persistent messages, or which have paged off to disk due to memory limitations. Keep a close eye on this directory, if the disk or memory alarms have tripped in RabbitMQ. **Caution:** Do not delete these files manually. Use RabbitMQ tools to purge or delete queues. Modifying these files manually may render your RabbitMQ instance inoperable.

Miscellaneous Tips

Harden the Admin Account

The STIG Hardening Guide in the NetWitness Suite Documentation on RSA Link (https://community.rsa.com/docs/DOC-64211) has this information.

Audit Log Messages

It can be useful to see which user actions result in which log message types in the **/var/log/**messages file.

The event categories spreadsheet included in the log parser package in the NetWitness Suite Parser v2.0.zip archive lists the event categories and the event parser lines to help with building reports, alerts, and queries.

NwConsole for Health & Wellness

RSA has added a command option called **logParse** in **NwConsole**. This command option supports log parsing, a convenient way to check log parser without setting up the full system to do log parse. For more information about the **logParse** command, at the command line, type `help logParse`.

Thick Client Error: remote content device entry not found

Error: "*The remote content device entry was not found*," generated for a correlation rule applied to a concentrator.

Problem: in Investigation, if you click the `correlation-rule-name` meta value in the Alert meta key, you do not get session information.

Solution: Instead of using correlation rules on decoders and concentrators, use ESA rules. The ESA rules **do** record the correlation sessions that match the ESA rule.

View Example Parsers

Since flex and lua parsers are encrypted when they are delivered by Live, you cannot easily view their contents.

However, some plain text examples are available here: **https://community.emc.com/docs/DOC-41108**.

Configure WinRM Event Sources

The following Inside EMC article has a video that walks through the process of setting up Windows RM (Remote Management) collection: **https://inside.emc.com/docs/DOC-122732**.

Additionally, it contains two scripts that are shortcuts for procedures described in the "Windows Event Source Configuration Guide."

NwLogPlayer

NwLogPlayer is a utility that simulates syslog traffic. In the hosted environment, `NwLogPlayer.exe` is a command line utility located on the RSA NetWitness® Suite Client machine in the following directory:

`C:\Program Files\NetWitness\NetWitness 9.8`

NwLogPlayer is also located on the Log Decoder host in `/usr/bin`.

Usage

At the command line, type `nwlogplayer.exe -h` to list the available options, as reproduced here:

`--priority arg`	set log priority level
`-h [ --help ]`	show this message
`-f [ --file ] arg (=stdin)`	input message; defaults to **stdin**
`-d [dir ] arg`	input directory
`-s [ --server ] arg (=localhost)`	remote server; defaults to **localhost**
`-p [ --port ] arg (=514)`	remote port; defaults to **514**
`-r [ --raw ] arg (=0)`	Determines raw mode. • 0 = add priority mark (default) • 1= File contents will be copied line by line to the server. • 3 = auto detect • 4 = enVision stream • 5 = binary object
`-m [ --memory ] arg`	Speed test mode. Read up to 1 Megabyte of messages from the file content and replays.

`--rate arg`	Number of events per second. This argument has no effect if **rate** > eps that the program can achieve in continuous mode.
`--maxcnt arg`	maximum number of messages to be sent
`-c [ --multiconn ]`	multiple connection
`-t [ --time ] arg`	simulate time stamp time; format is `yyyy-m-d-hh:mm:ss`
`-v [ --verbose ]`	If **true**, output is verbose
`--ip arg`	simulate an IP tag
`--ssl`	use SSL to connect
`--certdir arg`	OpenSSL certificate authority directory
`--clientcert arg`	use this PEM-encoded SSL client certificate
`--udp`	send in UDP

Troubleshoot Feeds

Overview

The purpose of the feed generator is to generate a mapping of an event source to the list of groups to which it belongs.

If you have an event source from which you are collecting messages, and yet it is not displayed in the correct event source groups, then this topic provides background and information to help you track down the problem.

Details

The ESM Feed maps multiple keys to single value. It maps the DeviceAddress, Forwarder, and DeviceType attributes to groupName.

The purpose of the ESM feed is to enrich event source Meta with the groupName collected on the Log Decoder.

How it Works

The feed generator is scheduled to update every minute. However, it is triggered only if there are any changes (create, update, or delete) in event sources or groups.

It generates a single feed file with event source to group mapping, and pushes the same feed to all of the Log Decoders that are connected to NetWitness Suite.

Once the feed file is uploaded on the Log Decoders, for any new events, it enriches events Meta data with groupName, and appends this groupName to logstats.

Once the groupName is in logstats, the ESM Aggregator groups information and sends it to ESM. At this point, you should see the **Group Name** column under the **Event Source Monitoring** tab.

The entire process can take some time. Therefore, you may need to wait for several seconds after you add a new group or event source, before the Group name is displayed.

Note: If the event source type attribute changes when the feed is updated, NetWitness Suite adds a new logstats entry, rather than updating the existing one. Thus, there will be two different logstats entries in logdecoder. Previously existing messages would have been listed under the previous type, and all new messages are logged for the new event source type.

Feed File

The format of the feed file is as follows:

```
DeviceAddress, Forwarder, DeviceType, GroupName
```

The `DeviceAddress` is either `ipv4, ipv6`, or `hostname`, depending on which of these have been defined for the event source.

The following is a sample of the feed file:

```
"12.12.12.12","d6","NETFLOW","grp1"
"12.12.12.12","ld4","netflow","grp1"
"12.12.12.12","d6","netfow","grp1"
"0:E:507:E6:D4DB:E:59C:A","10.25.50.243","apache","Apachegrp"
"1.2.3.4","LCC","apache","Apachegrp"
"10.100.33.234","LC1","apache","Apachegrp"
"10.25.50.248","10.25.50.242","apache","Apachegrp"
"10.25.50.251","10.25.50.241","apache","Apachegrp"
"10.25.50.252","10.25.50.255","apache","Apachegrp"
"10.25.50.253","10.25.50.251","apache","Apachegrp"
"10.25.50.254","10.25.50.230","apache","Apachegrp"
"10.25.50.255","10.25.50.254","apache","Apachegrp"
"13.13.13.13","LC1","apache","Apachegrp"
"AB:F255:9:8:6C88:EEC:44CE:7",,"apache","Apachegrp"
"Appliance1234",,"apache","Apachegrp"
```

```
"CB:F255:9:8:6C88:EEC:44CE:7","10.25.50.253","apache","Apache
grp"
```

Troubleshooting

You can check the following items to narrow down where the problem is occurring.

Feed File Existence

Verify that the feeds ZIP archive exists in the following location:

`/opt/rsa/sms/esmfeed.zip`

Do not modify this file.

Group Meta Populated on LD

Verify that the group meta is populated on the Log Decoder. Navigate to the Log Decoder REST and check logstats:

```
http://LogDecoderIP:50102/decoder?msg=logStats&force-content-
type=text/plain
```

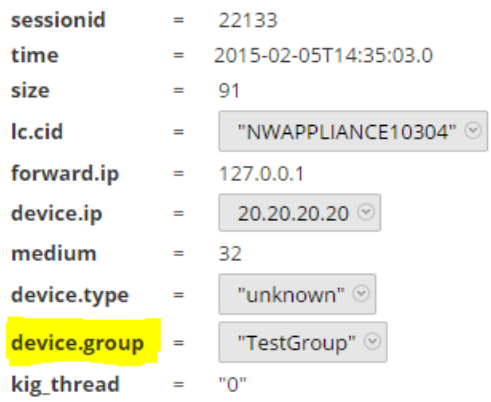
This is a sample logstats file with group information:

```
device=apache  forwarder=NWAPPLIANCE10304  source=1.2.3.4  count=338
lastSeenTime=2015-Feb-04 22:30:19  lastUpdatedTime=2015-Feb-04 22:30:19
groups=IP1234Group,apacheGroup
device=apachetomcat  forwarder=NWAPPLIANCE10304  source=5.6.7.8
count=1301  lastSeenTime=2015-Feb-04 22:30:19  lastUpdatedTime=2015-Feb-
04 22:30:19  groups=AllOtherGroup,ApacheTomcatGroup
```

In the above text, the group information is **bold**.

Device Group Meta on Concentrator

Verify that the **Device Group** meta exists on the Concentrator, and that events have values for the `device.group` field.



SMS Log File

Check the SMS log file in the following location to view informational and error messages: `/opt/rsa/sms/logs/sms.log`

The following are example informational messages:

```
Feed generator triggered...
Created CSV feed file.
Created zip feed file.
Pushed ESM Feed to LogDeocder : <logdecoder IP>
```

The following are example error messages:

```
Error creating CSV File : <reason>Unable to push the ESM Feed: Unable to create feed zip archive.
Failed to add Group in CSV: GroupName: <groupName> : Error: <error>
Unable to push the ESM Feed: CSV file is empty, make sure you have al-least on group with al-least one eventsource.
Unable to push the ESM Feed: No LogDecoders found.
Unable to push the ESM Feed: Unable to push feed file on LogDecoder-<logdecoderIP>Unable to push the ESM Feed: admin@<logdecoderIP>:50002/decoder/parsers received error: The zip archive "/etc/netwitness/ng/upload/<esmfeedfileName>.zip" could not be opened
Unable to push the ESM Feed: <reason>
```

Verify Logstats data is getting Read & Published by ESMReader & ESMAggregator

These are the steps to verify that logstats are collected by **collectd** and published to Event Source Management.

ESMReader

1. On LogDecoders add **debug "true"** flag in **/etc/collectd.d/NwLogDecoder_ESM.conf**:

```
#
# Copyright (c) 2014 RSA The Security Division of EMC
#
<Plugin generic_cpp>    PluginModulePath "/usr/lib64/collectd"
    debug "true"

    <Module "NgEsmReader" "all">        port      "56002"
        ssl       "yes"
        keypath   "/var/lib/puppet/ssl/private_keys/d4c6dcd4-6737-
4838-a2f7-    ba7e9a165aae.pem"
        certpath  "/var/lib/puppet/ssl/certs/d4c6dcd4-6737-4838-
a2f7-   ba7e9a165aae.pem"
        interval  "600"
        query     "all"
        <stats>        </stats>    </Module>    <Module
"NgEsmReader" "update">        port      "56002"
        ssl       "yes"
        keypath   "/var/lib/puppet/ssl/private_keys/d4c6dcd4-6737-
4838-a2f7-    ba7e9a165aae.pem"
        certpath  "/var/lib/puppet/ssl/certs/d4c6dcd4-6737-4838-
a2f7-   ba7e9a165aae.pem"
        interval  "60"
        query     "update"
        <stats>        </stats>    </Module></Plugin>
```

2. Run the command:
   `collectd service restart`
3. Run the following command:
   `tail –f /var/log/messages | grep collectd`
   Verify that ESMReader is reading logstats and there are no errors. If there are any read issues, you will see errors similar to the following:

```
Apr 29 18:47:45 NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_
all: error getting ESM data for field "groups" from logstat
```

```
device=checkpointfw1 forwarder=PSRTEST source=1.11.51.212. Reason:
<reason>Apr 29 18:58:36 NWAPPLIANCE15788 collectd[14569]: DEBUG:
NgEsmReader_update: error getting ESM data for field "forwarder" from
logstat device=apachetomcat source=10.31.204.240. Reason: <reason>
```

ESMAggregator

1. On NetWitness Suite, uncomment the verbose flag in **/etc/collectd.d/ESMAggregator.conf**:

```
# ESMAggregator module collectd.conf configuration file
#
# Copyright (c) 2014 RSA The Security Divsion of EMC
#

<Plugin generic_cpp>    PluginModulePath "/usr/lib64/collectd"

<Module "ESMAggregator">
        verbose 1
        interval "60"
        cache_save_interval "600"
        persistence_dir "/var/lib/netwitness/collectd"
</Module>    </Plugin>
```

2. Run the following:
   `collectd service restart.`
3. Run the following command:
   `run "tail -f /var/log/messages | grep ESMA`
   Look for for ESMAggregator data and make sure your logstat entry is available in logs.

Sample output:

```
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator:
MetaData[0] logdecoder[0] = d4c6dcd4-6737-4838-a2f7-ba7e9a165aae

```

Configure JMX Feed Generator Job Interval

Although the feed generation job is scheduled to execute every minute by default, you can change this by using `jconsole`, if necessary.

To change the feed generator job interval:

1. Open **jconsole** for the SMS service.
2. On the MBeans tab, navigate to **com.rsa.netwitness.sms** > **API** > **esmConfiguration** > **Attributes**.
3. Modify the value for the property **FeedGeneratorJobIntervalInMinutes**.
4. Go to **Operations** under the same navigation tree, an click **commit()**. This persists the new value in the corresponding json file under **/opt/rsa/sms/conf**, and uses the value if SMS is restarted.

Setting a new value reschedules the feed generator job for the new interval.

References

This section describes the NetWitness Suite user interface views in which you can perform system maintenance tasks. You use this interface to:

- Monitor and maintain services (settings, statistics, command and message syntax, REST API, RSA Console utility, and protocols supported in NetWitness Suite).
- Display the current NetWitness Suite version and license status.
- Manage your Local Update Repository from which you apply software version updates to hosts.

The following topics describe each interface in detail:

- Health and Wellness View
- System View - System Info Panel

Health and Wellness View

The Health and Wellness settings allow you to set and view alarms, monitor events, and view policies and system statistics. For more details on each of these, see the following topics:

- Health and Wellness View - Alarms View
- Event Source Monitoring View
- Health and Wellness Historical Graphs
- Health and Wellness Settings View - Archiver
- Health and Wellness Settings View - Event Sources
- Health and Wellness Settings View - Warehouse Connector
- Monitoring View
- Policies View
- System Stats Browser View

Health and Wellness View - Alarms View

You can monitor hosts and services to determine when user-defined limitations have been reached by viewing all the active alarms. Policy rules, that you define or assign to hosts and services, in the **Policies tab** trigger these alarms. You can:

- View all the alarms that are currently active for all your systems and services
- Select an alarm and view its details

What do you want to do?

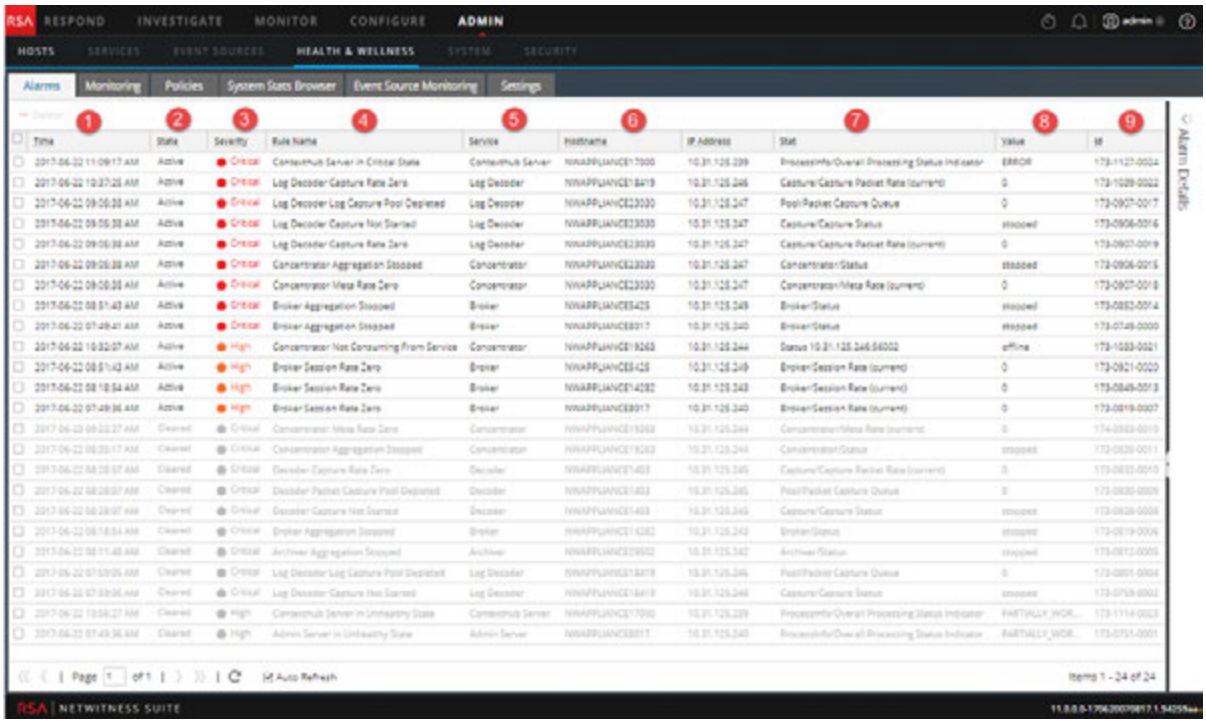
Role	I want to ...	Show me how
Administrator	View the alarm status of NetWitness Servers and services.	Monitor Alarms
Administrator	View detailed information about a specific alarm.	Monitor Alarms

Related Topics

Manage Policies

Quick Look

The required permission to access this view is **Manage services**. To access the Alarms view, go to **Admin** > **Health & Wellness**. The Health & Wellness view opens with the Alarms tab displayed. The Alarms tab contains an alarms list and an Alarm Details panel.



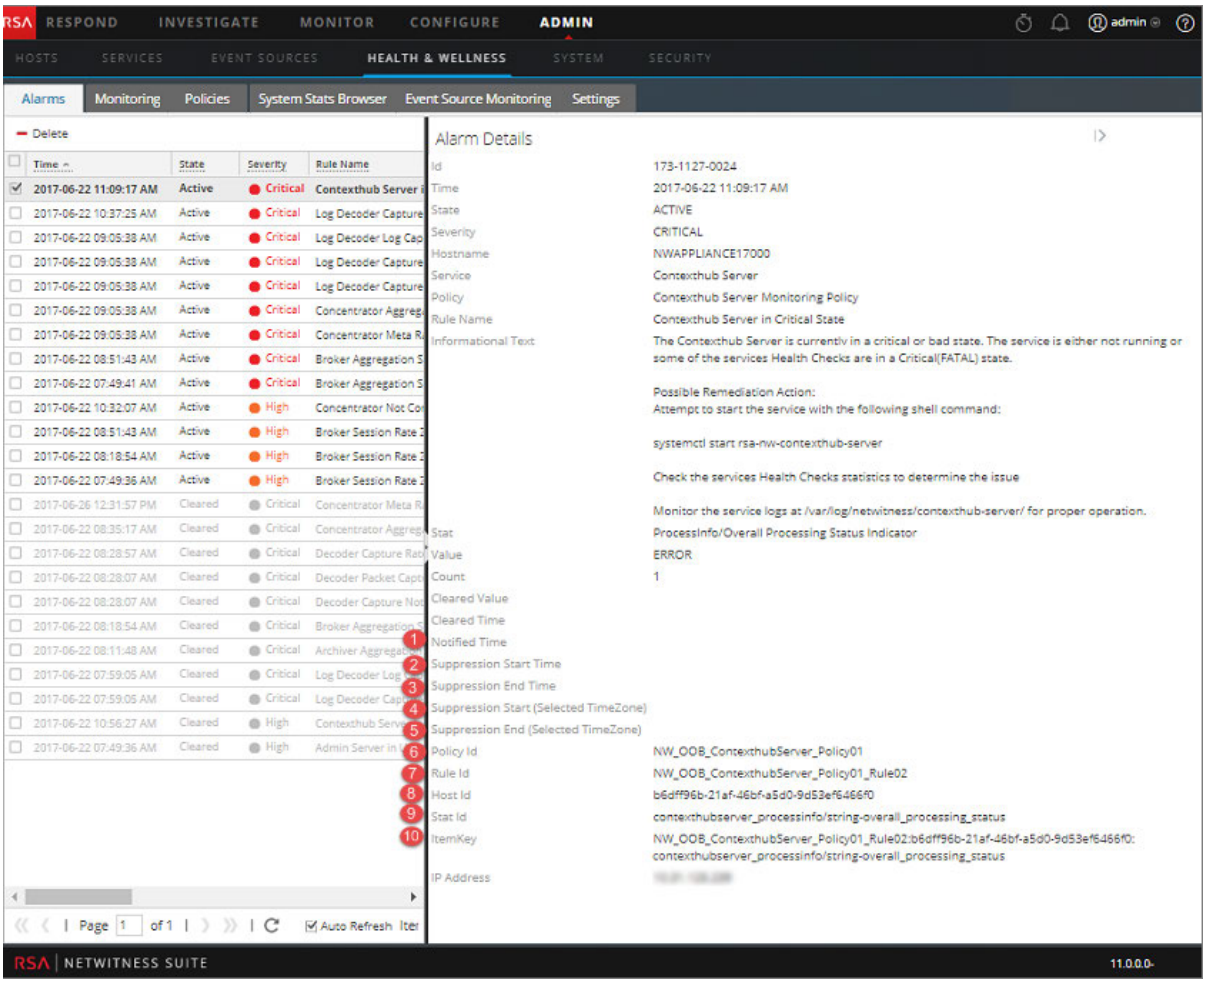
1 Time when the alarm was triggered.

2 Status of the alarm:

	• **Active -** the statistical threshold was crossed triggering the alarm. • **Cleared -** the clearing threshold was crossed and the alarm is no longer active.
3	Severity assigned to this alarm: • **Critical** • **High** • **Medium** • **Low**
4	Name of the rule that triggers the alarm.
5	Service defined in the rule.
6	Host on which the alarm is triggered.
7	Statistic selected in the rule that triggers the alarm.
8	Value of the statistic that triggered the alarm.
9	Identification number of the alarm.

Note: NetWitness Suite sorts the alarms in time order. You can sort the relevant parameters in ascending or descending order.

This figure shows the Alarms tab with the Alarm Details panel expanded.



Alarm Details Panel

The Alarm Details panel displays information for the alarm selected in the Alarms list. It contains all the information in the Alarms list plus the following fields.

1	Alarm Notified time
2	Suppression start time
3	Suppression end time
4	Suppression start (selected time zone)
5	Suppression end (selected time zone)
6	The Policy ID
7	The Rule ID
8	The Host ID
9	The Stat ID

10 Item key

Event Source Monitoring View

Note: To manage Event Sources, see 'About Event Source Management' in the *NetWitness Suite Event Source Management Guide*.

NetWitness Suite provides a way to monitor the statistics for various event sources in the User Interface. The information displayed is historical and comes from the Log decoder. You can customize the view depending on the parameter you select to filter the data.

To access the Event Source Monitoring view:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Click **Event Source Monitoring**.

What do you want to do?

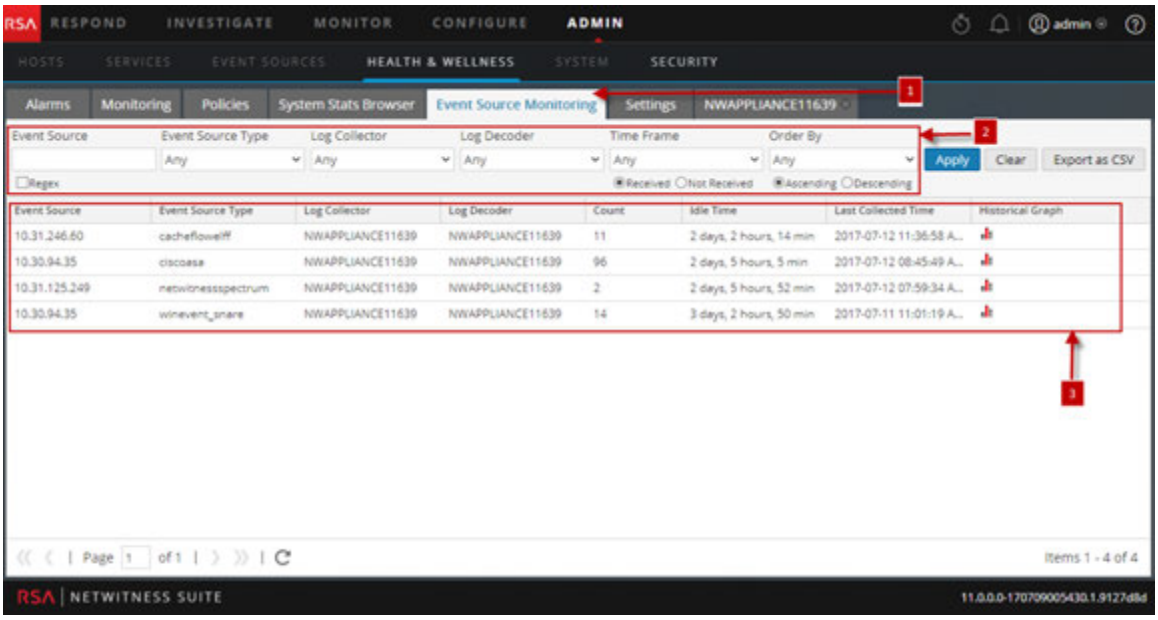
Role	I want to ...	Show me how
Administrator	View the Events Collected from an Event Source	Historical Graph View for Events Collected from an Event Source

Related Topics

- Monitor Event Sources
- Filter Event Sources
- View Historical Graph of Events Collected for an Event Source

Quick Look

The Event Source Monitoring view is displayed.



1 Displays Event Source Monitoring tab.

2 Toolbar used to filter and customize the Event Source Monitoring tab.

3 Displays Event Source Stats panel.

Filters

This table lists the various parameters you can use to filter and customize the event source monitoring view.

Parameter	Description
Event Source	Type the name of an event source you want to monitor. Select Regex to enable Regex filter. It performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching.
Event Source Type	Select an event source type for the event source selected.
Log Collector	Select the Log Collector to display the data collected by the specified Log Collector.
Log Decoder	Select a Log Decoder to display the data collected by the specified Log Decoder.

Parameter	Description
Time Frame	Select the time frame for which you want the stats. Select **Received** if you need the query results to contain only event sources that logs have been received from within the selected time. or Select **Not Received** if you need the query results to contain only event sources that logs have not been received from within the selected time
Order By	Select the order in which the list needs to be filtered. Select Ascending to filter it in an ascending order.
Apply	Click to apply the filters chosen and display the list accordingly.
Clear	Click to clear the chosen filters.
Export as CSV	Click to export the information as a csv file.

Event Source Stats View Display

Parameter	Description
Event Source	Displays the name of the event source.
Event Source Type	Displays the event source type.
Log Collector	Displays the Log Collector from where the events were initially captured.
Log Decoder	Displays the Log Decoder where the events are being processed.
Count	Displays the number of events received by Log Decoder since last reset of count value.
Idle Time	Displays the time lapsed after the last stat collection.
Last Collected Time	Displays the time at which the Log Decoder last processed an event for the event source

Parameter	Description
Historical Graph	Click  to view the historical graph of the stats collected for the event source.

Health and Wellness Historical Graphs

Configuring the Archiver monitoring enables you to automatically generate notification when critical thresholds concerning Archiver aggregation and storage have been met. The Historical Graph view provides a visualization of historical data,

See the following topics for more details:

- Historical Graph View for Events Collected from an Event Source
- Historical Graph for System Stats

Historical Graph View for Events Collected from an Event Source

The Historical Graph view for events collected from an event source provides a visualization of historical data. To access this view:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Monitoring tab open.

2. Click **Event Source Monitoring**.

   The Event Source Monitoring view is displayed.

3. In the **Historical Graph** column, select  .

   The Historical graph for the selected event source type is displayed in a popup window.

The figure displays the events collected from the event source type **winevent_snare**.

You can customize the graph as required. The table lists the various parameters used to customize the historical graph.

Parameter	Description
Time Frame	Select the Time Frame for which you want to view the historical data. The available options are: Current Day, Current, Week, Current Month.
From <date> To <date>	Select the date range for which you want to view the historical data.

You can zoom in for a detailed view of the data in the Historical graph.

Zoom In Function 1 and 2

You can select one of the values to view the historical data for the selected value. The figure below displays an example for the 6h frame selected for zoom in. The slider bar at the right bottom corner is also changed to a 6h window.

Alternatively, you can slide the bar in the right hand corner to zoom in to a required frame.

Zoom In Function 3

You can click and drag in the plot area to zoom in for a required frame of time.

Historical Graph for System Stats

To access the Historical Graph for the System Stats:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

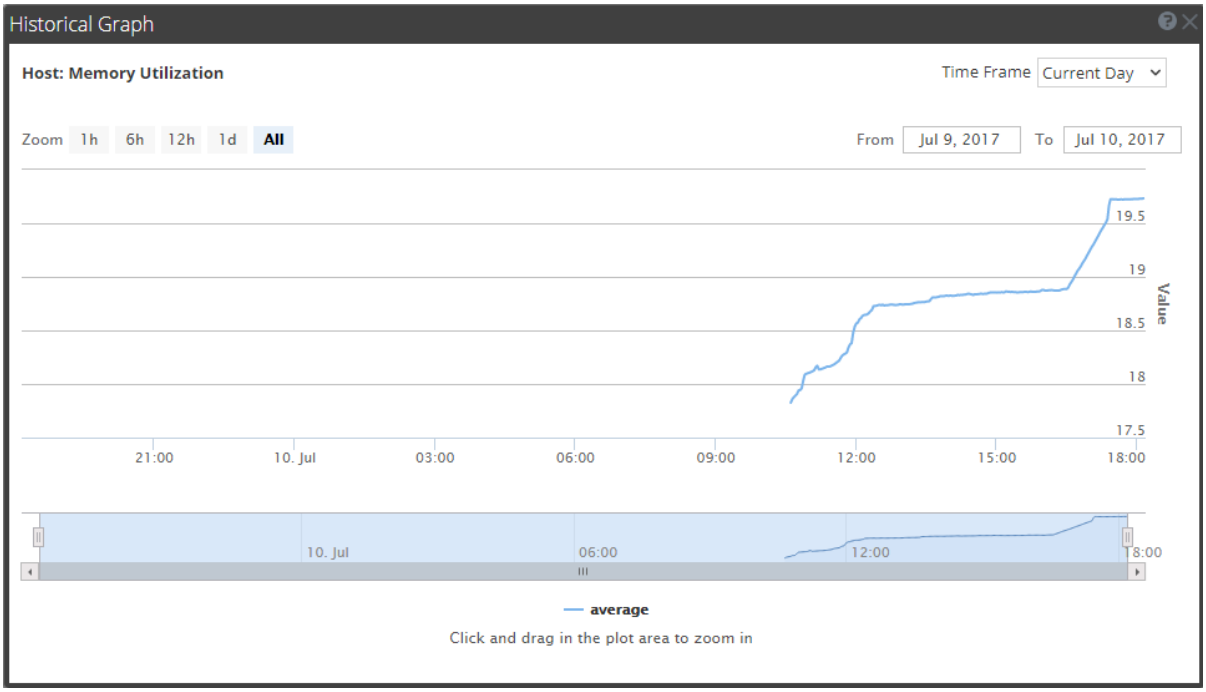
2. Click the **System Stats Browser** tab.

   The System Stats Browser tab is displayed.

3. In the **Historical Graph** column, select .

   The Historical graph for the selected statistic for a host is displayed.

   The figure displays the system stats view for the Memory Utilization statistics.



Parameters

You can customize the graph view as required. The table lists the various parameters used to customize the historical graph view.

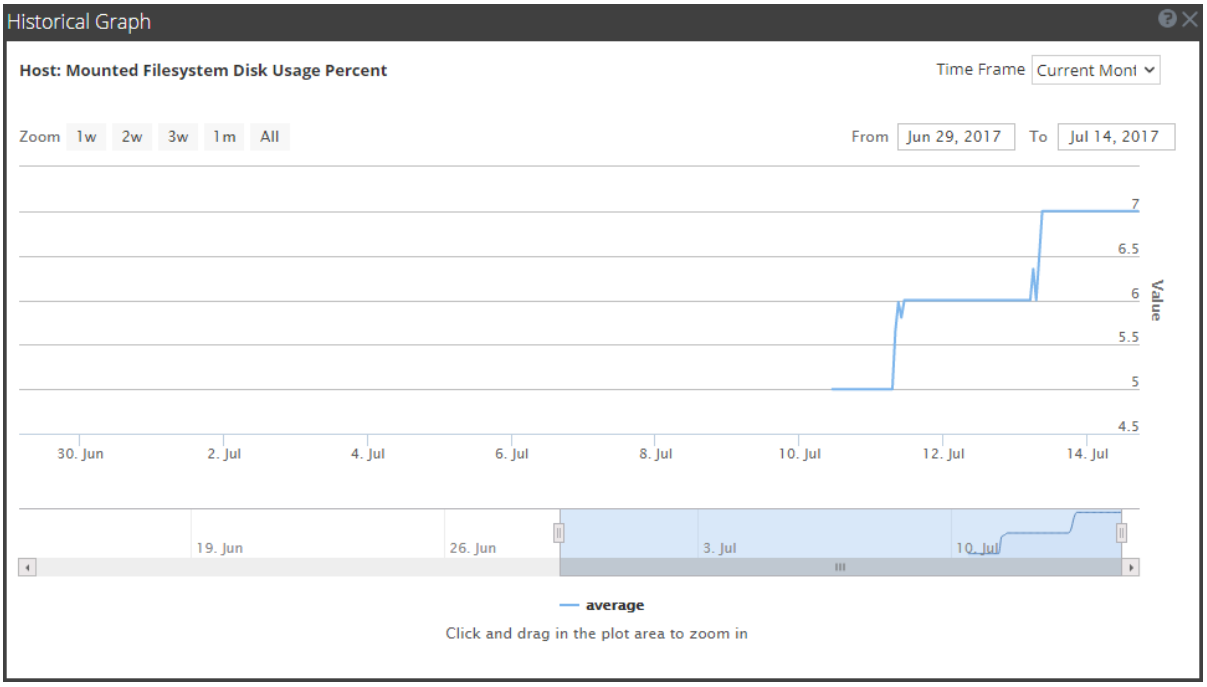
Parameter	Description
Time Frame	Select the time frame for which you want to view the historical data. The available options are: **Current Day**, **Current Week**, **Current Month**, and **Current Year**.
From <date> To <date>	Select the date range for which you want to view the historical data,

You can zoom in for a detailed view of the data in the Historical graph.

Zoom in function 1 and 2:

You can select one of the values to view the historical data for the selected value. The figure below displays an example for the 6h frame selected for zoom in. The slider bar at the right bottom corner is also changed to a 6h window.

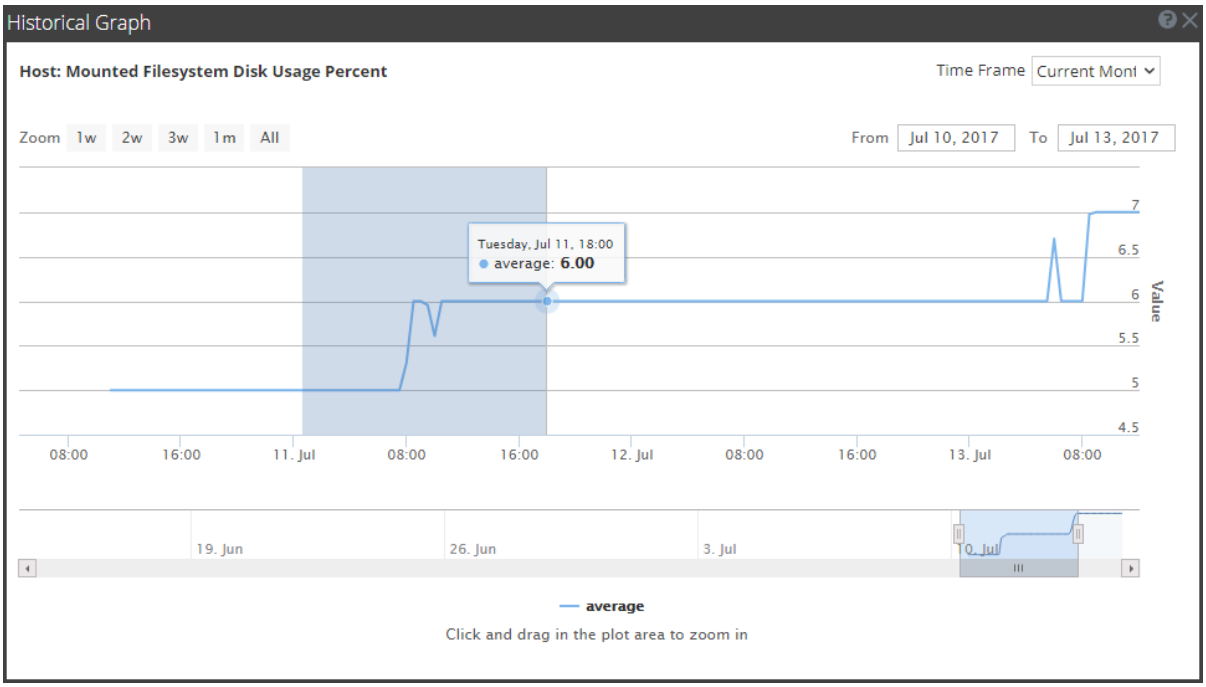
Alternatively, you can slide the bar in the right hand corner to zoom in to a required frame.



Zoom in function 3:

You can click and drag in the plot area to zoom in for a required frame of time.

The figure below displays an example of how the graph appears while you click and drag.



Health and Wellness Settings View - Archiver

Note: To monitor Archiver and Warehouse Connector, see Health Policy.

To access the Archiver Monitoring view:

1. Go to **Administration > Health & Wellness**.
2. Select **Settings > Archiver**.

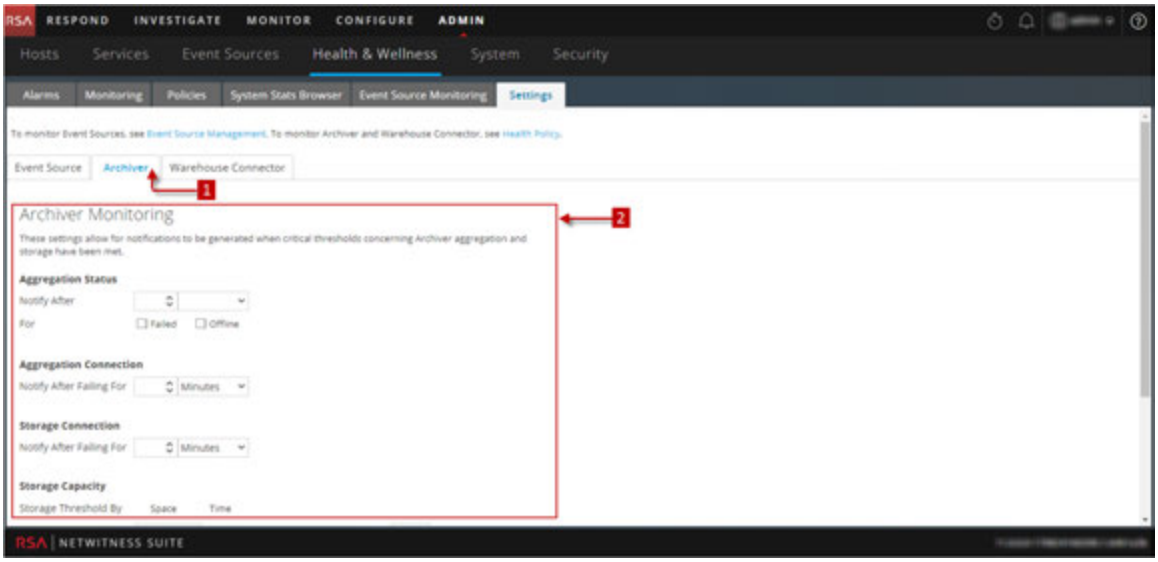
What do you want to do?

Role	I want to ...	Show me how
Administrator	Monitor service details of Archiver	Monitor Service Details

Related Topics

Monitor Service Details

Quick Look



1	Displays Archiver Monitoring Panel
2	Configure Archiver Monitoring Panel to automatically receive notification

Features

The following table lists the parameters required to configure the Archiver to automatically generate notification when critical thresholds are reached.

Parameter	Value	Description
Aggregation Status	Notify After	Number of minutes or hours after which the you will get notified of the Aggregation status
	For	Failed - If enabled, you get notification when the Archiver aggregation status is failed for the defined number of minutes or hours. Offline - If enabled, you get a notification when the Archiver aggregation status is offline for the defined number of minutes or hours

Parameter	Value	Description
Aggregation Connection	Notify After Failing for	Number of minutes or hours after which you will receive a notification if the Archiver aggregation connection fails.
Storage Connection	Notify After Failing for	Number of minutes or hours after which you will receive a notification if the Archiver storage connection fails.
Storage Capacity	Storage Threshold By	Select **Space**, if you want to receive a notification when the Archiver storage capacity exceeds the percentage defined in the **When Storage Size Is** field. Select **Time**, if you want to receive a notification when the files stored in the Archiver exceeds the defined number of days in the **When Oldest Storage File Is** field
	When Storage Size Is	Enter what percent full the storage size should be if you want to receive a notification.
	When Warm Storage Size Is	Enter what percent full the warm storage size should be if want to receive a notification.
Notification Type	Configure email or distribution list	Click to configure email so that you can receive notifications in NetWitness Suite.
	Configure Syslog and SNMP Trap servers	Click to configure audit logs.
	NW Console, Email, Syslog Notification, SNMP Trap Notification	Enable NW Console to get notifications on the NetWitness Suite UI notification toolbar. Enable Email to get email notifications. Enable Syslog Notification to generate syslog events. Enable SNMP Trap Notification to get audit events as SNMP traps.

Health and Wellness Settings View - Event Sources

Note: To manage Event Sources, see **About Event Source Management** in the *RSA NetWitness Suite Event Source Management Guide*.

The Event Source Monitoring view consists of the Event Source panel, Add/Edit Source Monitor dialog, Decommission panel, and the Decommission dialog. You use the view to configure:

- When to generate notifications for event sources from which the Log Collector is no longer receiving logs.
- Where to send those notifications.
- When to decommission a Log Collector when a Remote Collector and the Local Collector fails over to a standby Log Decoder.

The required role to access this view is **Manage NW Auditing**. To access this view:

1. Go to **Admin > Health & Wellness**.
2. Select **Settings > Event Source**.

What do you want to do?

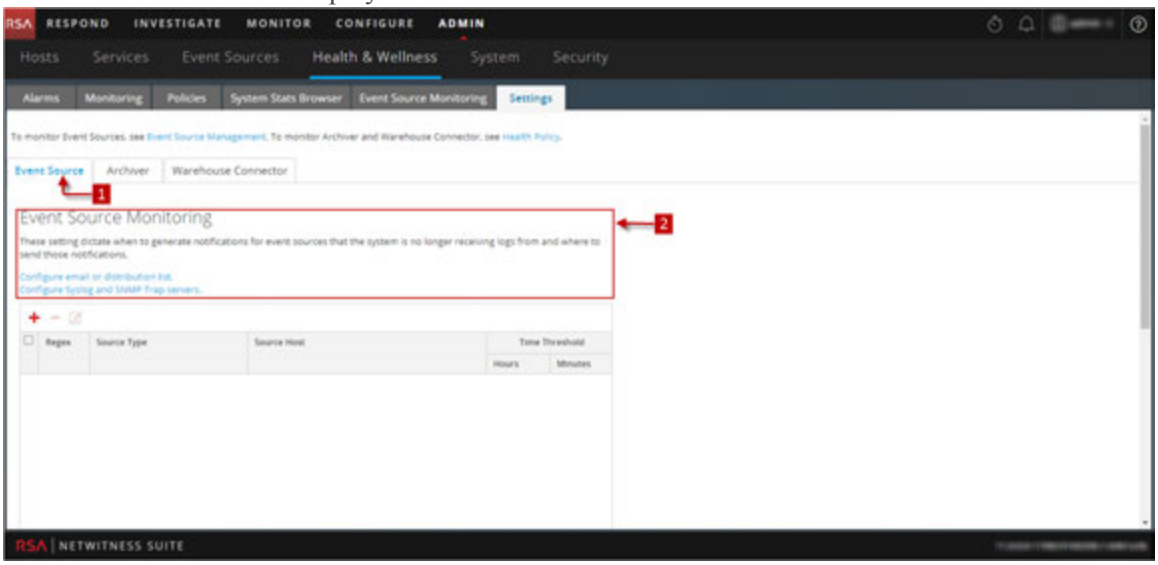
Role	I want to ...	Show me how
Administrator	View the functionality of Event Source Monitoring	Monitor Event Sources

Related Topics

Configure Event Source Monitoring

Quick Look

The Event Source tab is displayed.



1	Displays Event Source Monitoring Panel
2	Configure Event Source Monitoring Panel to receive notification

Event Source Monitoring Panel

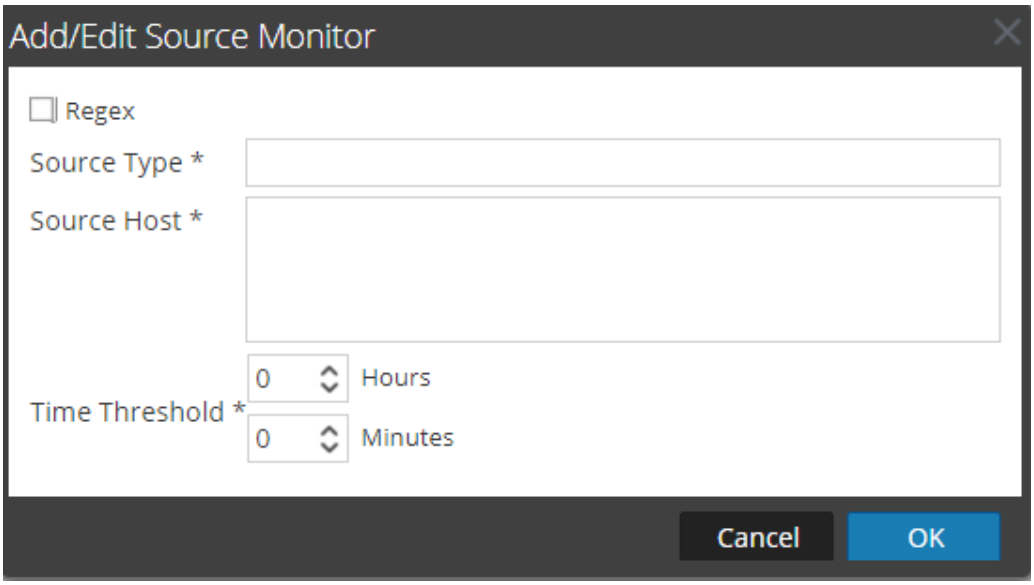
Feature	Description
Configure email or distribution list.	Opens the **Administration** > **System** > **Email view** so you can adjust the email distribution for the Event Source Monitoring output, if necessary.
Configure Syslog and SNMP Trap servers.	Opens the **Administration** > **System** > **Auditing view** so you can adjust the Syslog and SNMP trap distribution for the Event Source Monitoring output, if necessary.
+	Displays the Add/Edit Source Monitor dialog in which you add or modify event sources to monitor.
−	Deletes the selected event sources from monitoring.
☐	Selects an event source.
Source Type	Displays the source type of the event source.

Feature	Description
Source Host	Displays the source host of the event source.
Time Threshold	Displays the time period after which NetWitness Suite stops sending notifications (Time Threshold).
Apply	Applies any additions, deletions, or changes and they become effective immediately.
Cancel	Cancels any additions, deletion, or changes.

Decommission Panel

Feature	Description
	Displays the Decommission dialog in which you add or modify event sources to decommission.
	Deletes the selected event sources from decommissioning.
	Selects an event source.
Regex	Displays if you choose to use regular expressions
Source Type	Displays the source type of the decommissioned event source.
Source Host	Displays the source host of the decommissioned event source.
Apply	Applies any additions, deletions, or changes and they become effective immediately.
Cancel	Cancels any additions, deletions, or changes.

Add/Edit Source Monitor Dialog



In **Add/Edit Source Monitor** dialog, you add or modify the the event sources that you want to monitor. The two parameters that identify an event source are **Source Type** and **Source Host**. You can use **globbing** (pattern matching and wildcard characters) to specify the Source Type and Source Host of event sources as shown in the following example:

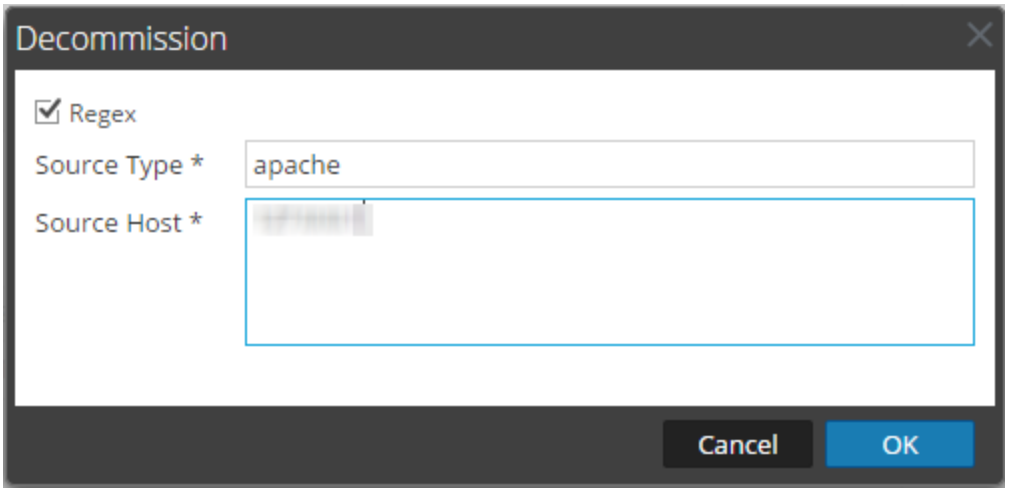
Source Type	Source Host
ciscopix	**1.1.1.1**
*	**1.1.1.1**
*	*
*	**1.1.1.1|1.1.1.2**
*	**1.1.1.[1|2]**
*	**1.1.1.[123]**
*	**1.1.1.[0-9]**
*	**1.1.1.11[0-5]**
*	**1.1.1.1,1.1.1.2**
*	**1.1.1.[0-9]|1.1.1.11[0-5]**

Source Type	Source Host
*	**1.1.1.[0-9]|1.1.1.11[0-5],10.31.204.20**
*	**1.1.1.***
*	**1.1.1.[0-9]{1,3}**

Features

Feature	Description
Regex	Select the checkbox if you want to use regular expressions
Source Type	The source type of the event source. You must use the value that you configured for the event source in the **Event Sources** tab of the **Administration** > **Services** > Log Collector service > **View** > **Config** view.
Source Host	Hostname or IP address of the event source. You must use the value that you configured for the event source in the **Event Sources** tab of the **Administration** > **Services** > Log Collector device > **View** > **Config** view.
Time Threshold	The time period after which NetWitness Suite starts sending notifications.
Cancel	Closes the dialog without adding the event source, or changes to the event source, to the Event Source Monitoring panel.
OK	Adds the event source to the Event Source Monitoring panel.

Decommission Dialog



Feature	Description
Source Type	The source type of the event source. You must use the value that you configured for the event source in the **Event Sources** tab of the **Administration** > **Services** > Log Collector device > **View** > **Config** view.
Source Host	Hostname or IP address of the event source. You must use the value that you configured for the event source in the **Event Sources** tab of the **Administration** > **Services** > Log Collector service > **View** > **Config** view.
Cancel	Closes the dialog without applying any event source additions, deletions, or changes to the Decommissioning panel.
OK	Applies any event source additions, deletions, or changes to the Decommissioning panel.

Health and Wellness Settings View - Warehouse Connector

Note: To monitor Archiver and Warehouse Connector, see Health Policy.

Configuring the Warehouse Connector monitoring enables you to automatically generate notification when critical thresholds concerning Warehouse Connector and storage have been met.

Access the Warehouse Connector Monitoring view

1. Go to **Admin > Health & Wellness**.
2. Select **Settings > Warehouse Connector**.

What do you want to do?

Role	I want to ...	Show me how
Administrator	View the details of Warehouse connector	Warehouse Connector Details View

Related topics

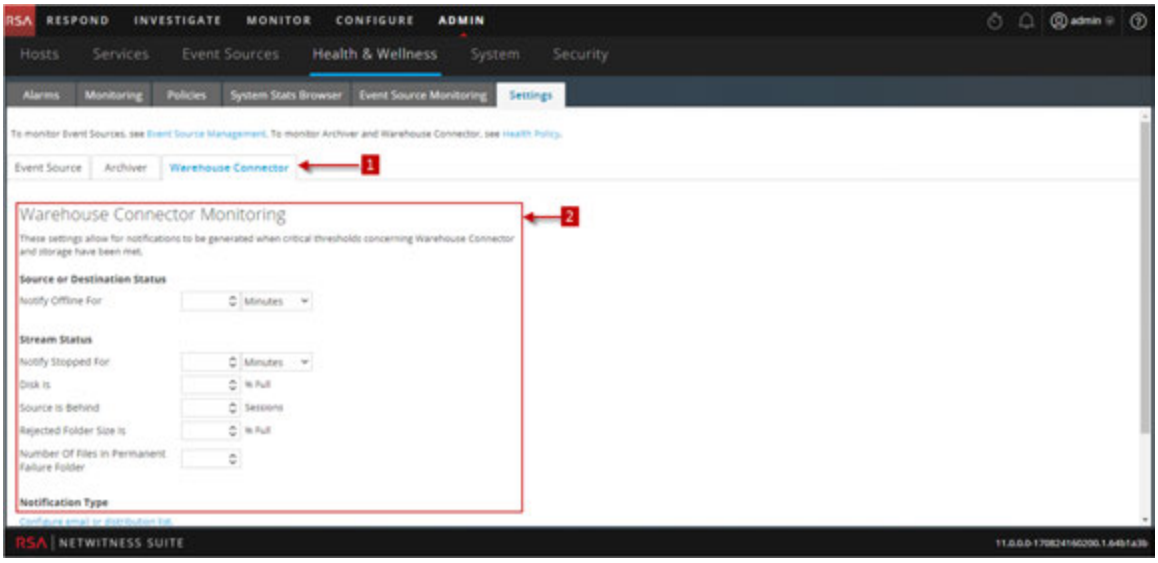
Quick Look

The Warehouse Connector Monitoring view is displayed.



1	Displays Warehouse Connector Monitoring view Panel
2	Allows to configure Warehouse Connector Monitoring parameters

Warehouse Connector Monitoring parameters

The following table lists the parameters required to configure the Warehouse Connector to automatically generate notification when critical thresholds are reached.

Parameter	Value	Description
Source or Destination Status	Notify Offline For	Number of minutes or hours after which the you will receive a notification if the source or destination connection fails.
Stream Status	Notify Stopped For	Number of minutes or hours after which you would like to receive a notification when the Stream goes offline.
	Disk Is	The limit on the percentage of disk usage after which you would like to receive a notification.
	Source Is Behind	Number of sessions after which a notification is raised if the source goes behind the defined number of sessions.
	Rejected Folder Size Is	Limit on the percentage of folder usage after which you would like to receive a notification.
	Number Of Files in Permanent Failure Folder	Limit on the number of files in the permanent failure folder after which you would like to receive a notification.
Notification Type	Configure email or distribution list	Click to configure email so that you can receive notifications in NetWitness Suite.
	Configure Syslog and SNMP Trap servers	Click to configure audit logs.
	NW Console, Email, Syslog Notification, SNMP Trap Notification	Enable NW Console to get notifications on the NetWitness Suite UI notification toolbar. Enable Email to get email notifications. Enable Syslog Notification to generate syslog events. Enable SNMP Trap Notification to get audit events as SNMP traps.

Monitoring View

NetWitness Suite provides detailed statistics and other information about the host and the individual NetWitness Suite services on Details views. You can view the current health of all the hosts, services running on the hosts, various aspects of the hosts' health, host details and service details in the Monitoring view.

To access this view:

1. Go to **ADMIN > Health & Wellness**.
2. Click the **Monitoring** tab.

What do you want to do?

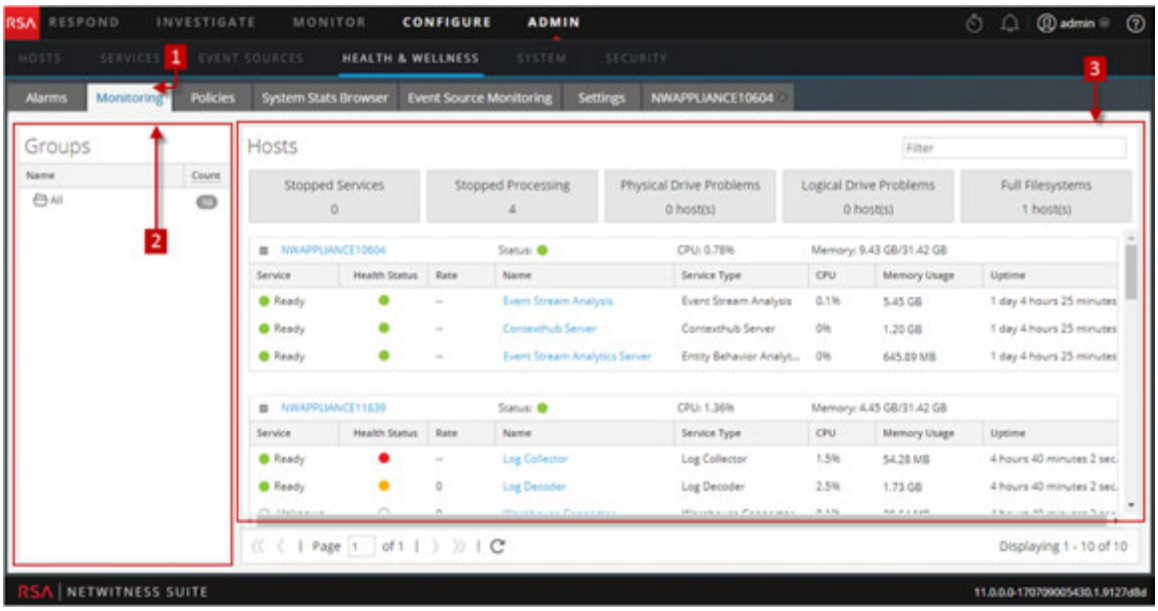
Role	I want to ...	Show me how
Administrator	View and Perform Procedures	Monitor Hosts and Services

Related Topics

- Monitor Hosts and Services

Quick Look

The Monitoring view is displayed.



1	Displays Monitoring tab.
2	Group Panel to select a Group.
3	Hosts panel displays operational statistics.

Groups Panel

The Groups panel lists all the groups of hosts available. When you select a group, the associated content is displayed in the Hosts panel.

Note: If the total host **Count** in the **Groups** panel is lower than the actual number of hosts displayed in the **Hosts** panel, please refer to the Troubleshooting Health & Wellness topic for possible causes of this issue and recommended solutions.

Hosts Panel

The Hosts panel displays operational statistics for hosts and the services running on each host.

Parameter	Description
Filter	Type a host name or a service name in the Filter field to display the corresponding hosts and services in the Host panel.
Stopped Services	Click **Stopped Services** to display a list of all stopped services. It also displays the host on which the service is installed.
Stopped Processing	Click **Stopped Processing** to display a list of all the hosts that have services installed on them that are in the stopped processing status.
Physical drive Problems <#> host(s)	Click to view the hosts that have physical drive problems.
Logical Drive Problems <#> host(s)	Click to view the hosts that have logical drive problems.
Full Filesystems <#> host(s)	Click to view the hosts that have full file systems.

Note: The summary information in the boxes at the top displays the System Statistics for all the hosts configured in NetWitness Suite and does not change with host of filters on groups.

The top panel is followed by a list of hosts, the services installed on them and information regarding the hosts and services.

Parameter	Description
Host Name	Displays the host name. If a host has services installed you will see a ⊞ prefixed to the host name. Click ⊞ to view all the services installed on the host.
Status	Displays the status of the Host. ● - denotes that the host is active and running. ● - denotes that the host is stopped or yet to start processing.
CPU	Displays the current CPU usage of the host.
Memory	Displays the Memory used by the host.

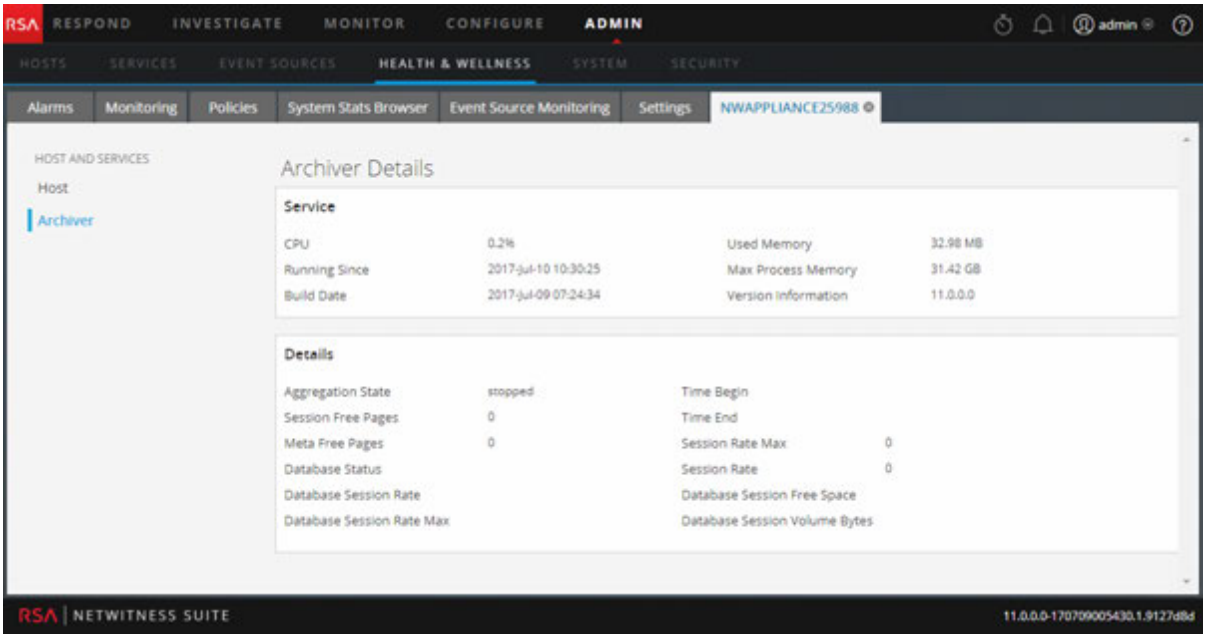
When you click ⊞ prefixed to the host name, a list of all the services installed on the host is displayed. The table below describes various parameters displayed for a service and their description.

Parameter	Description
Service	Displays the status of the service. ● Ready - denotes that the service is active and running. ● Stopped - denotes that the service is stopped or yet to start processing.
Health Status	Displays the processing status of the Service. ● - denotes that the process is running and the data is being processed at a rate greater than zero. ● - denotes that the processing is stopped. ● - denotes that the processing is turned on but the data is not being processed.
Rate	Denotes the rate at which the data is being processed.
Name	Name of the service.

Parameter	Description
Service Type	Name of the type of service.
CPU	Displays the current CPU usage of the service.
Memory Usage	Displays the Memory used by the service.
Uptime	Displays the time for which the service has been running.

Archiver Details View

The Archiver Details view provides information about the Archiver. The following figure depicts the Archiver Details.



For the related procedure, see Monitor Service Details

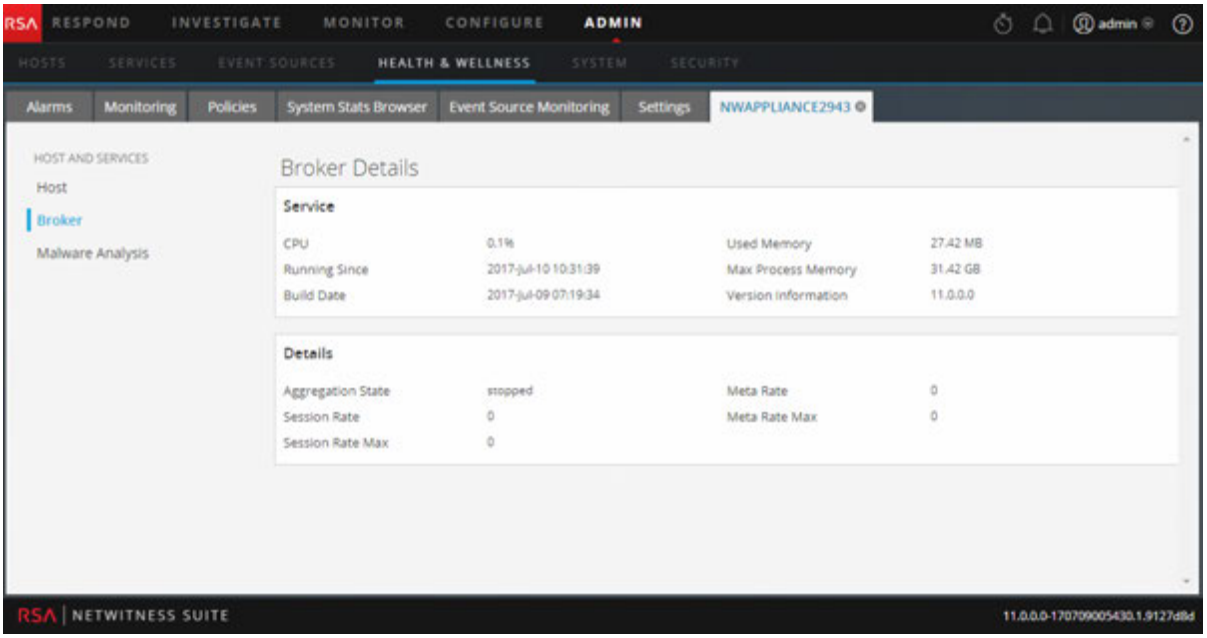
This section displays the current generic statistics for the service.

Statistic	Description
Aggregation State	State of data aggregation.
Time Begin	Time (UTC) when the first session was tracked by the index.
Session Free Pages	Session pages available for aggregation.
Time End	Time (UTC) when the last session was tracked by the index.
Meta Free Pages	Pages available for aggregation.
Session Rate Max	Maximum sessions per second rate.

Statistic	Description
Database Status	Status of databases. Valid values are: • **closed** - not available for QUERY and UPDATE (databases are being initialized). This value is seldom seen. • **opened** - available for QUERY and UPDATE. • **failure** - failed to open. This can happen for any number of reasons. You can check this if CAPTURE fails to start or if queries fail to return data. This is normally caused by database corruption.
Session Rate	Sessions per second rate.
Database Session Rate	Per second rate at which the service is writing sessions to the database.
Database Session Free Space	Amount of session free space available for aggregation.
Database Session Rate Max	Maximum per second rate at which the service is writing sessions to the database.
Database Session Volume Bytes	Number of session bytes in the database.

Broker Details View

The Broker Details view provides information for the Broker. The following figure depicts the Broker Details.



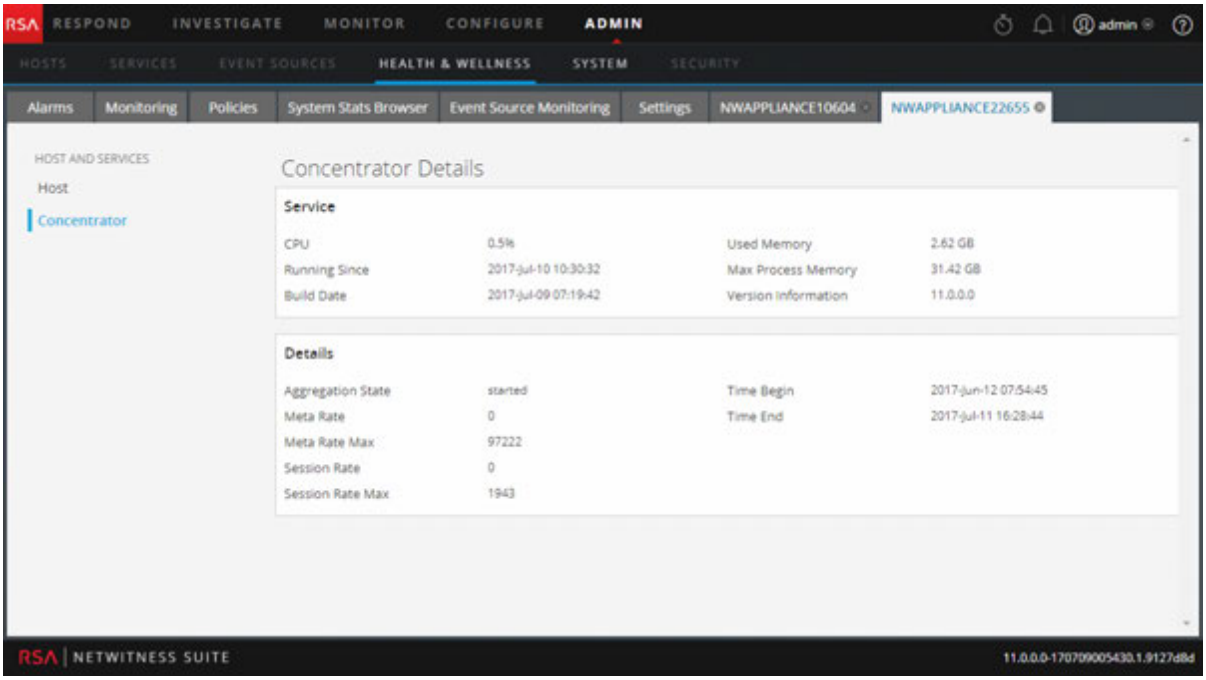
For the related procedure, see Monitor Service Details.

This section displays the current generic statistics for the service.

Statistic	Description
Aggregation State	State of data aggregation.
Meta Rate	Metadata objects per second rate.
Session Rate	Sessions per second rate.
Meta Rate Max	Maximum metadata objects per second rate.
Session Rate Max	Maximum sessions per second rate.

Concentrator Details View

The Concentrator Details view provides information for the Concentrator. The following figure depicts the Concentrator Details.



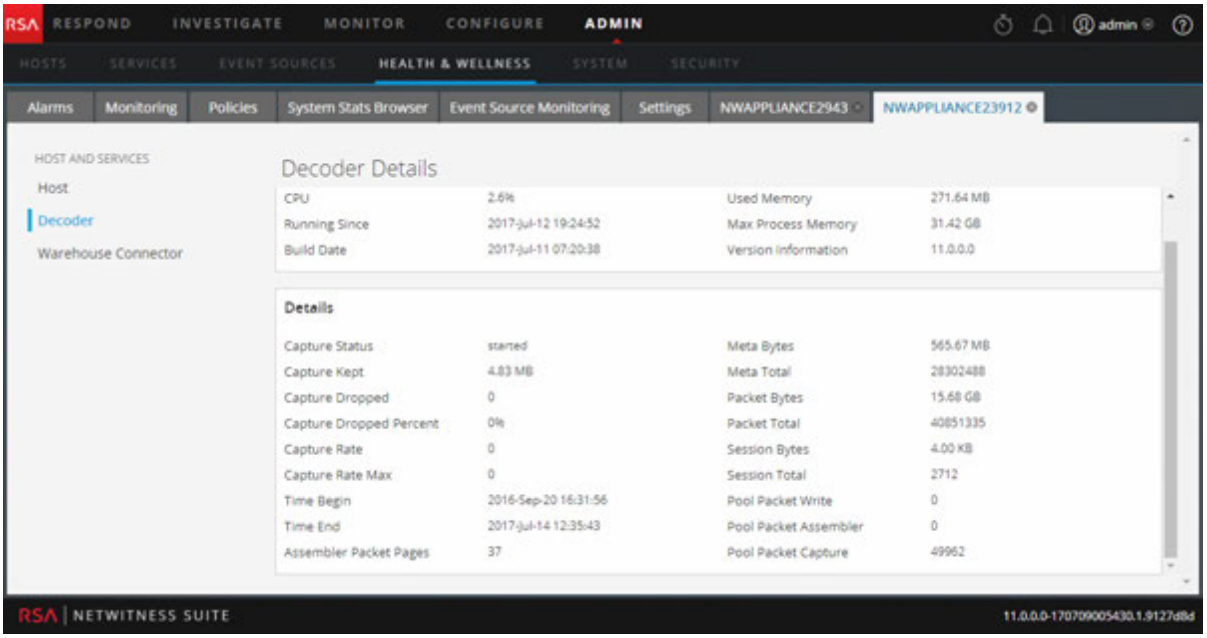
For the related procedure, see Monitor Service Details

The section displays the current generic statistics for the service.

Statistic	Description
Aggregation State	State of data aggregation.
Time Begin	Time (UTC) when the first session was tracked by the index.
Meta Rate	Metadata objects per second rate.
Time End	Time (UTC) when the last session was tracked by the index.
Meta Rate Max	Maximum metadata objects per second rate.
Session Rate	Sessions per second rate.
Session Rate Max	Maximum sessions per second rate.

Decoder Details View

The Decoder Details view provides information for the Decoder. The following figure depicts the Decoder Details.



For the related procedure, see Monitor Service Details.

This section displays the current generic statistics for the service.

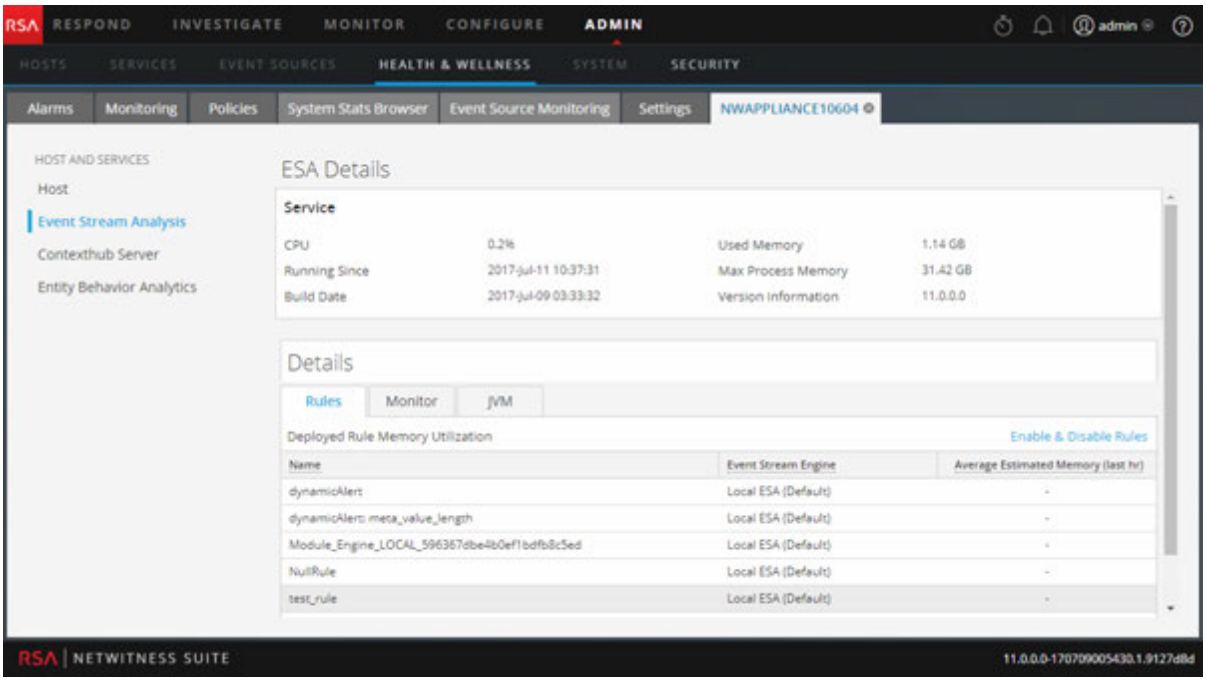
Statistic	Description
Capture Status	Status of data capture. Valid values are: • **starting** - Starting data capture (not capturing data yet). • **started**- Capturing data. • **stopping**- Stopping data capture (received request to stop data capture, but not have not stopped capturing data yet). • **stopped** - Not capturing data. • **disabled** - Not configured as a Decoder service.
Meta Bytes	Number of meta bytes in the database.
Capture Kept	Number of packets kept during capture.

Statistic	Description
Meta Total	Number of metadata in the database.
Capture Dropped	Number of packets reported by the network card as dropped. After the service stops capturing data, rate is reset to zero.
Packet Bytes	Number of packet bytes in the database.
Capture Dropped Percent	Packets reported by the network card as dropped as a percentage.
Packet Total	Number of packet objects held in the packet database. The total decreases when the database rolls files off due to size constraints. After the service stops capturing data, the number is not reset.
Capture Rate	Megabits per second rate at which the service is capturing data. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, rate is reset to zero.
Session Bytes	Number of session bytes in the database.
Capture Rate Max	Maximum megabits per second rate at which the service is capturing data. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, displays the maximum rate during data capture.
Session Total	Number of sessions held in the session database. This value shrinks when the database rolls files off due to size constraints. After the service stops capturing data, the number is not reset.
Time Begin	Time when first packet was captured (time when the first packet was stored in the packet database). This time increases as packets are rolled out of the packet database.

Statistic	Description
Pool Packet Write	Number of packet pages currently in the PCS pipeline that need to be written to the database.
Time End	Time when the last packet was captured (time when packet was written to the database). The time increases as new packets are captured.
Pool Packet Assembler	Number of packet pages waiting to be assembled.
Assembler Packet Pages	Number of packet pages waiting to be assembled.
Pool Packet Capture	Number of packet pages available for capture.

Event Steam Analysis (ESA) Details View

The Event Stream Analysis Details view provides information for ESA. The following figure depicts the Event Stream Analysis Details.



For the related procedure, see Monitor Service Details.

This section displays the current generic statistics and Rule information for the service. It consists of **Rules**, **Monitor**, and Java Virtual Machine (**JVM**) tabs that show Event Stream Analysis rules and additional statistics.

Monitor tab

Displays the following generic statistical information for the Event Stream Analysis service:

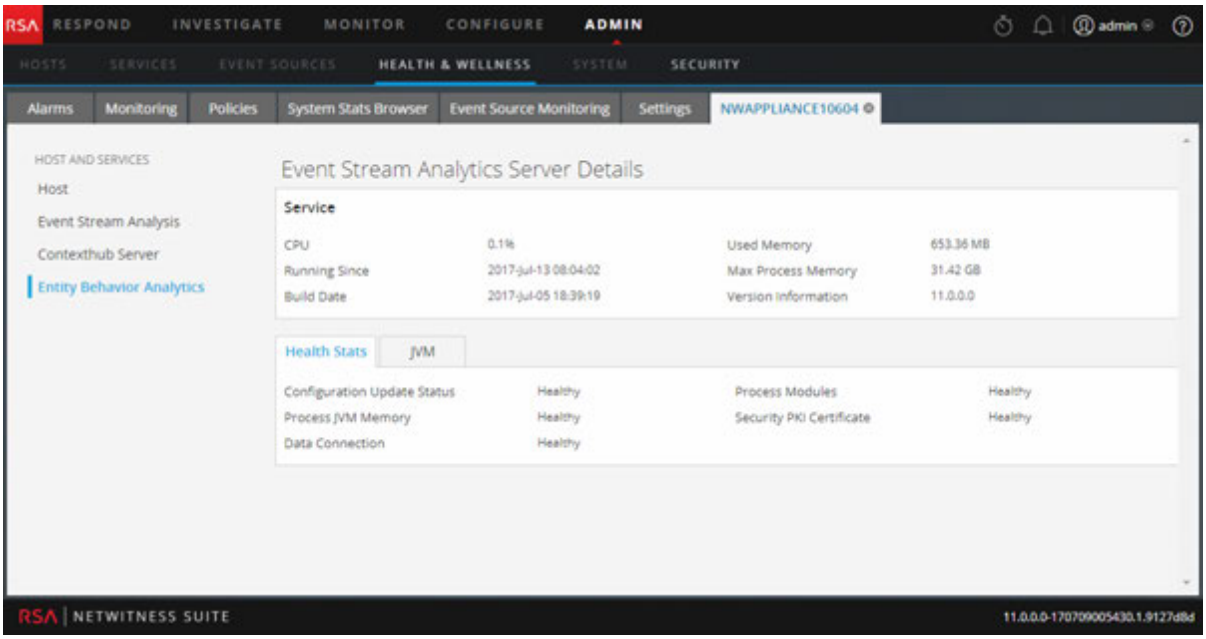
- Average number of bytes received per event message field.
- Average number of bytes received per event message.
- Total number of bytes of bytes received.
- Total number of fields received.
- Number of rules deployed on the ESA Service. The Sum of Enabled rules and Disabled rules should equal to Deployed
- Total number of events matched to all rules on the ESA service.
- Total number of events analyzed by the ESA Service since the last service start.
- Total number of alerts fired based on all the rules on the ESA service.
- Total dropped as late.
- Total fed on time.

- Total exit early.
- Seconds between feeds.
- Time span in window.
- Total events in window.
- Percent window consumed.
- Total source work units.
- Total bus dropped by payload.
- Total bus dropped events.
- Total bus dropped by fields.
- Total number of alerts sent to the message bus.
- Total number of bus events.
- Total number of Bus work units.
- Total endpoints detected.
- Total lost endpoints.
- Total failed client count.
- Total successful client count.
- Total successful server count.
- Minutes since last success.
- Number of times proxy was requested and granted.
- Total successful requests.
- Number of times proxy was requested and not granted.
- Total unsuccessful requests.

ESA Analytics Details View

The ESA Analytics Details view provides health status information about the selected ESA Analytics service. ESA Analytics services process the data for automated threat detection. It is important that you address any checked item that shows a status other than green (healthy), so that data processing is not interrupted and critical events are not missed.

The following figure shows the ESA Analytics Details view.



For the related procedure, see Monitor Service Details.

ESA Analytics Details

This section displays the current generic statistics for the selected ESA Analytics service.

Health Status

The Health Status section shows the health of the following items for the selected ESA Analytics service:

- Mongo
- JVM (Java Virtual Machine)
- Disk Space
- Suspicious Domains Module
- User Behavior Analytics Module

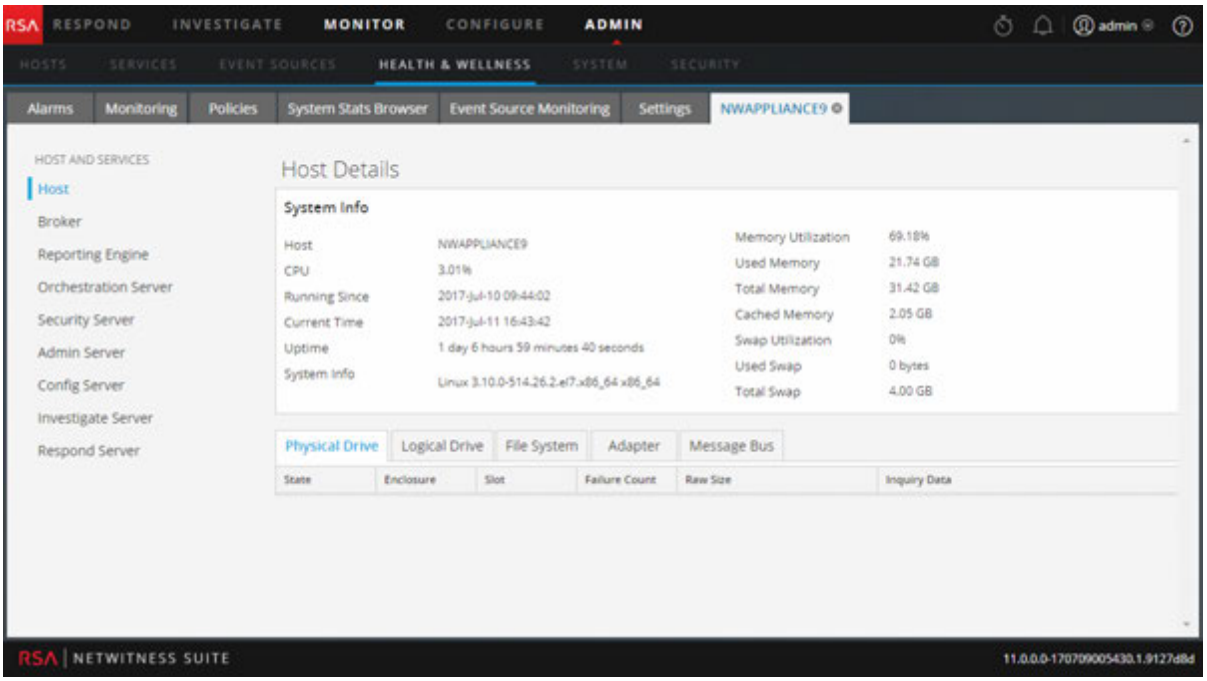
The following table describes the meaning of each health status.

Health Status	Description
Green	Healthy
Yellow	Unhealthy
Red	Critical and it needs immediate attention.

Health Status	Description
- -	Inapplicable

Host Details View

The Host Details view provides information about a host. The following figure depicts the Host Details.



The options panel on the left displays the host and the services installed on the host. You can click on Host any service to view the statistics and other pertinent information for that host or service.

The Details panel displays information that is specific to the host and provides additional information regarding the hardware of the host.

For the related procedure, see .Monitor Service Details

This section displays the current performance, capacity, and historical statistics for the host.

Parameter	Description
Host	Hostname.
CPU	Current CPU usage of the host.
Running Since	Time when the host was started.

Parameter	Description
Current Time	Current time on the host
Uptime	Time for which the host has been active.
System Info	OS version installed on the host.
Memory Utilization	Percentage of memory utilized by the host.
Used Memory	Memory used in GB.
Total Memory	Capacity of the memory installed on the system.
Cached Memory	Memory that is cached to disk in GB.
Swap Utilization	Percentage of system swap in use.
Used Swap	Swap used in GB.
Total Swap	Capacity of the swap installed on the system.

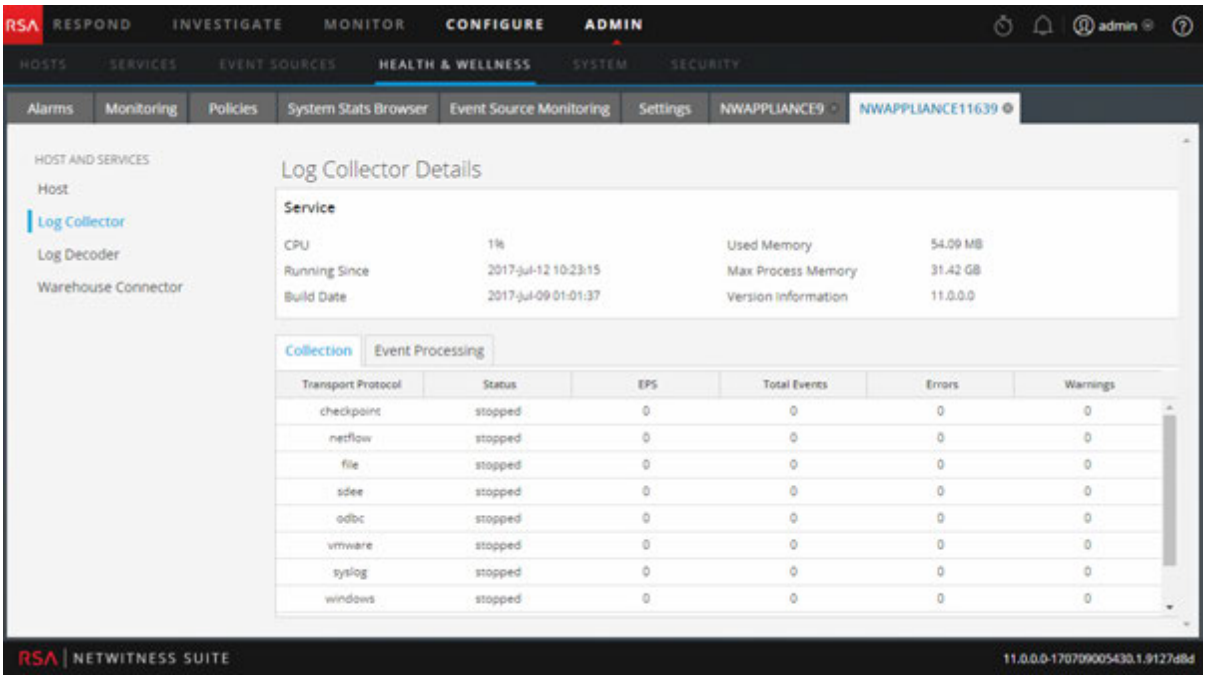
The lower section displays the current generic statistics for the host in the tabs described in the following table.

Tab	Description
Physical Drive	Type of physical drive, its usage and additional information of the physical drive on the host.
Logical Drive	Logical drive on the host.
File System	File system information, the size, current usage and available capacity on the host.
Adapter	Adapter used on the host.

Tab	Description
Message Bus	**Publish In Rate** - rate at which incoming messages are published to the message bus queue. **Total Messages Queued** - number of messages in the message queue. **Memory Used** - amount of memory used by the message bus (in bytes). **Disk Free** - free disk space available for the message bus (in bytes). **Memory Limit** - system memory limit. If the memory usage exceeds this value, this trips the **Memory Alarm** and Security Analytics stops accepting messages. **Disk Free Limit** - limit of free disk space available for the message bus. If the available disk space falls below this value, this trips the **Disk Free Alarm** and Security Analytics stops accepting messages. **Memory Limit Available** - Amount of memory available to this message broker (in bytes) before the **Memory Used Alarm** is tripped. **Disk Limit Available** - Amount of free disk space available to this message broker (in bytes) before the **Disk Free Limit** alarm is tripped. **Disk Free Alarm** - **True** or **False**. **True** indicates that the available disk space is below the value set in **Disk Free Limit** and Security Analytics has stopped accepting messages. **Memory Alarm** - **True** or **False**. **True** indicates that the available memory is below the value set in **Memory Limit** and Security Analytics has stopped accepting messages.

Log Collector Details View

The Log Collector Details view provides information for the Log Collector. The following figure depicts the Log Collector Details.



For the related procedure, see Monitor Service Details.

The lower section consists of the **Collection** and **Event Processing** tabs that display generic statistics for the service.

Collection Tab

Displays the event collection statistics for each Log Collection protocol you have implemented in NetWitness Suite (see the ***Log Collection Getting Started Guide*** in the ***Log Collection Guides***).

Event Processing Tab

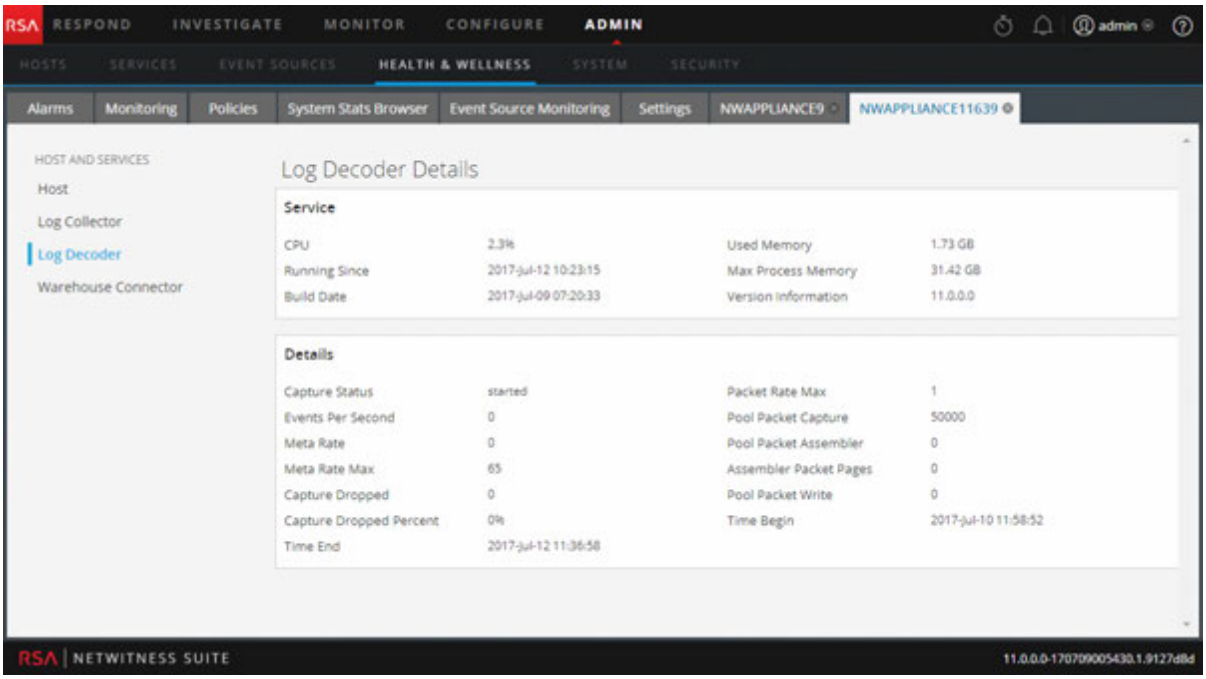
Displays statistics for the NetWitness Suite internal event processing protocol (that is, the Log Decoder) for Log Collection.

Parameter	Description
Transport Protocol	NetWitness Suite protocol use for Log Collections (that is, the Log Decoder).

Parameter	Description
Status	Status of the Log Decoder. Valid values are: • **starting** - Starting data capture (not capturing data yet). • **started** - Capturing data. • **stopping**- Stopping data capture (received request to stop data capture, but not have not stopped capturing data yet). • **stopped** - Not capturing data. • **disabled** - Not configured as a Decoder service.
EPS	Rate (events per second) at which this the Log Decoder is processing events from the Log Collector.
Total Events	Total events processed by the Log Decoder.
Errors	Number of errors encountered.
Warnings	Number of warnings encountered.
Byte Rate	Current throughput in bytes per second.

Log Decoder Details View

The Log Decoder Details view provides information for the Log Decoder. The following figure depicts the Log Decoder Details.



For the related procedure, see Monitor Service Details.

This section displays the current generic statistics for the service.

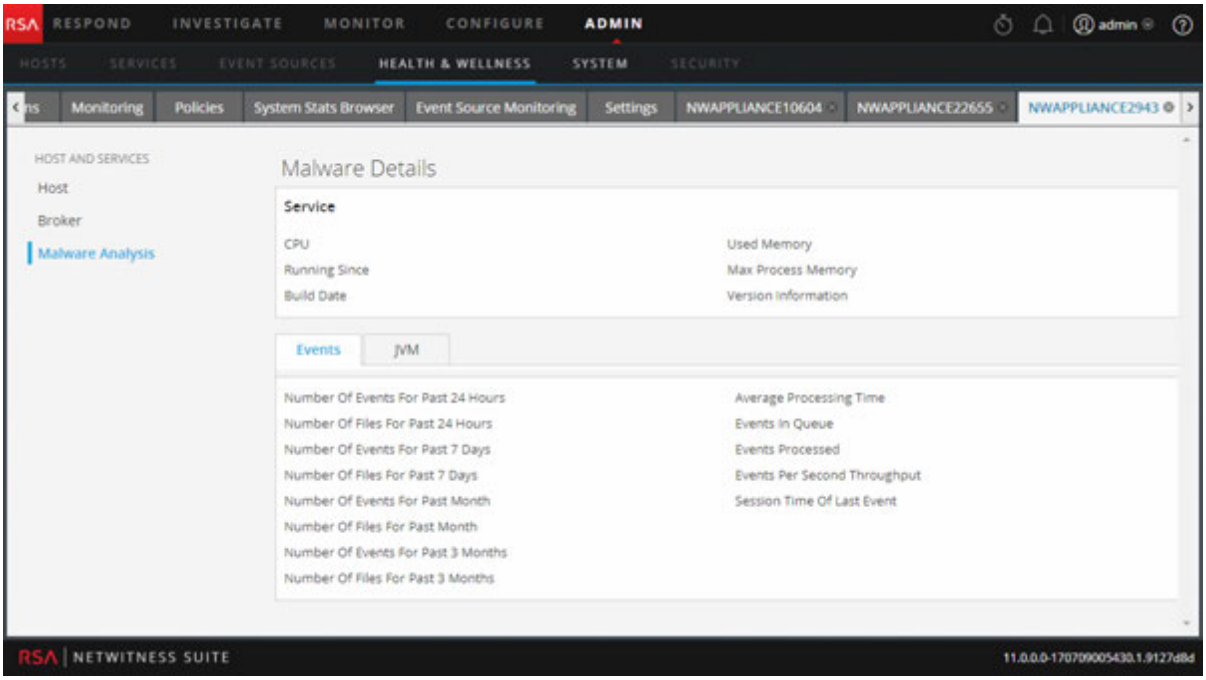
Statistic	Description
Capture Status	Status of data capture. Valid values are: • **starting** - Starting data capture (not capturing data yet). • **started** - Capturing data. • **stopping** - Stopping data capture (received request to stop data capture, but not have not stopped capturing data yet). • **stopped** - Not capturing data. • **disabled** - Not configured as a Log Decoder service.
Packet Rate Max	Maximum per second rate at which the service is writing packets to the database. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, displays the maximum rate during data capture.
Events Per Second	Rate (events per second) at which the Log Decoder is processing events from the Log Collector.

Statistic	Description
Pool Packet Capture	Number of packet pages available for capture.
Meta Rate	Per second rate at which the service is writing metadata objects to the database. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, rate is reset to zero.
Pool Packet Assembler	Number of packet pages waiting to be assembled.
Meta Rate Max	Maximum per second rate at which the service is writing metadata objects to the database. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, displays the maximum rate reached during data capture.
Assembler Packet Pages	Number of packet pages waiting to be assembled.
Capture Dropped	Number of packets reported by the network card as dropped. After the service stops capturing data, rate is reset to zero.
Pool Packet Write	Number of packet pages in the PCS pipeline that need to be written to the database.
Capture Dropped Percent	Packets reported by the network card as dropped as a percentage.
Time Begin	Time when first packet was captured (time when the first packet was stored in the packet database). This time increases as packets are rolled out of the packet database.

Statistic	Description
Time End	Time when the last packet was captured (time when packet was written to the database). The time increases as new packets are captured.

Malware Details View

The Malware Details view provides information for Malware Analysis. The following figure depicts the Malware Details.



For the related procedure, see Monitor Service Details.

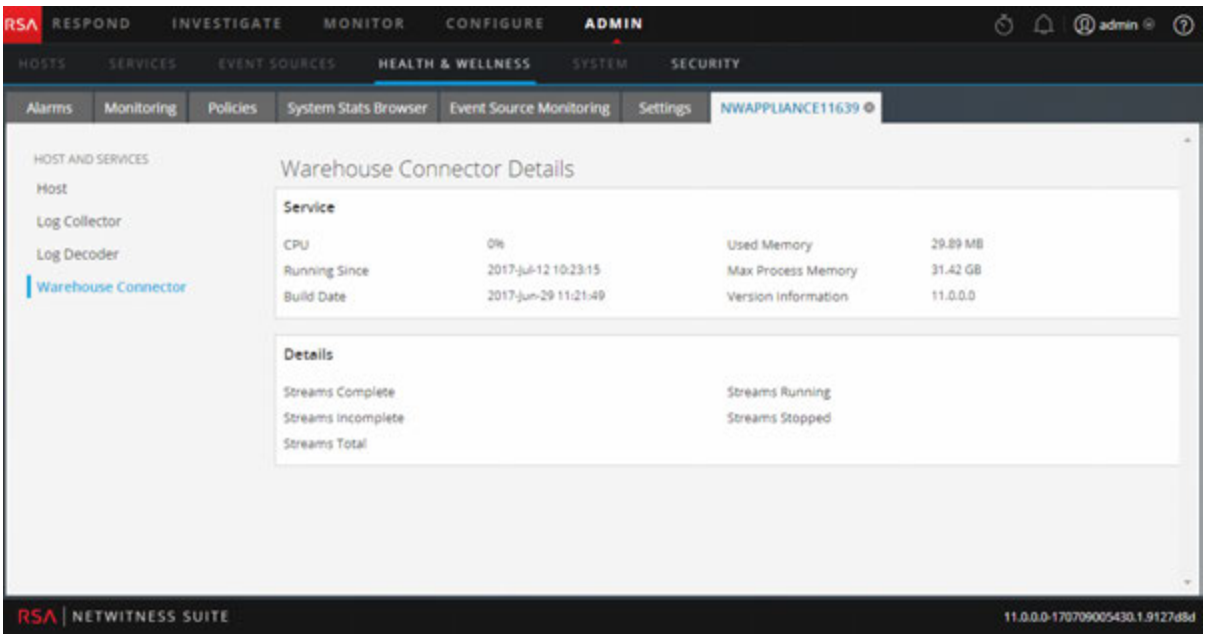
Displays the following event-related statistical information for the Malware Analysis service.

- Number of events for the past 24 hours
- Average processing time
- Number of files for the past 24 hours
- Events in queue
- Number of events for the past 7 days
- Events processed
- Number of events for the past 7 days
- Events per second throughput

- Number of events for the past month
- Session time of the last event
- Number of files for the past month
- Number of events for the past 3 months
- Number of files for the past 3 months

Warehouse Connector Details View

The Warehouse Connector Details tab provides information for the Warehouse Connector, such as the date it was built, CPU, and version information. The following figure depicts the Warehouse Connector Details.



For the related procedure, see Monitor Service Details.

Policies View

The required permission to access this view is **Manage services**.

What do you want to do?

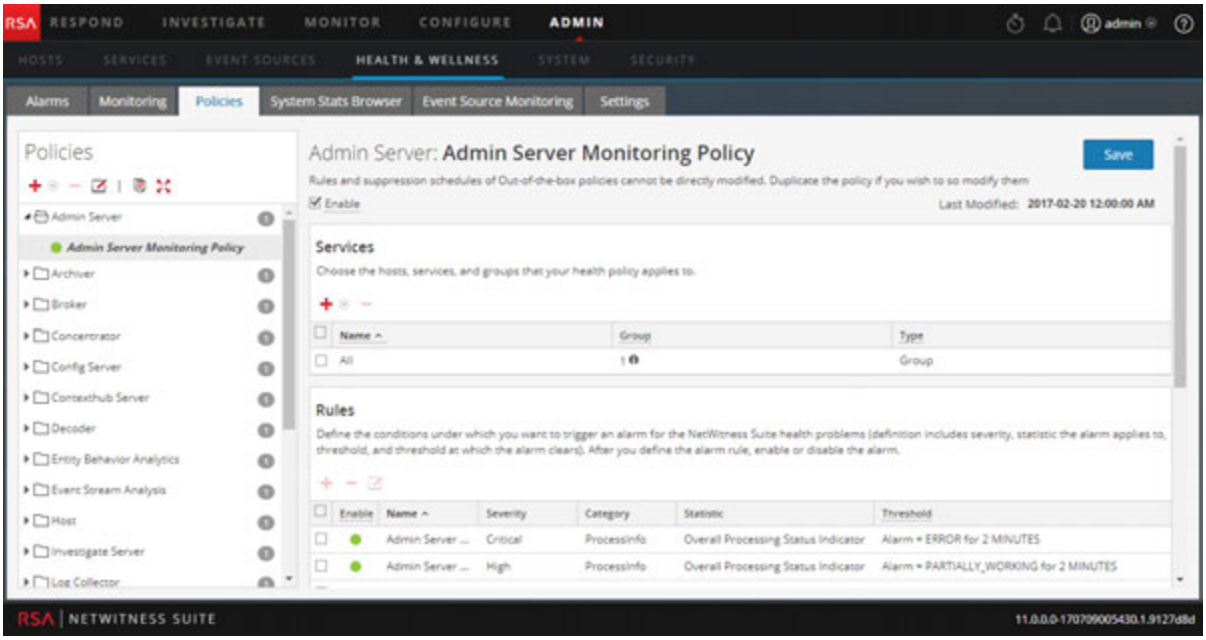
Role	I want to ...	Show me how
Administrator	View the policies NetWitness Server and Services	Manage Policies
Administrator	Add, Edit, Duplicate, and Delete Policies	Manage Policies

Related Topics

Manage Policies

Quick Look

The figure depicts the Policies view.



1	Policies Panel
2	Policy Detail Panel

1. Go to **ADMIN > Health & Wellness**.
2. Click the **Policies** tab.

Policies Panel

In the Policies panel, you can add or delete policies for hosts and services in this panel.

Feature	Description
	Displays available service types to create a new policy . Select one so that you can define a policy or policies for it.
	Deletes the selected policy from the Policies panel. You can only delete one policy at a time.
	Allows you to change the name of the policy.

Feature	Description
	Creates a copy of the selected policy. For example, if you select **First Policy** and click  , NetWitness Suite creates a copy of this policy and names it First Policy (1).
	Expands the list of policies under the services and hosts in the **Policies** panel.
	Contracts the list of policies under the services and hosts in the **Policies** panel.
	List of: • Services and hosts for which you have defined policies. • RSA standard policies that you can apply to hosts and services.

Policy Detail Panel

The **Policy Detail** panel displays the policy selected from the Policies panel.

Feature	Description
Save	Saves any changes you made in this panel.
Policy Type	Displays the type of policy you selected.
Modified Date	Displays the last date this policy was modified.
☐ Enable	Select and deselect this checkbox to enable and disable the policy.
Services	
	Displays menu in which you select: • **Groups** to display the **Groups** dialog from which you select service groups to this policy. • **Service/Host** to display the **Services/Hosts** dialog from which you select services to add to this policy. If policy type is **Host**, the menu will have **Host** not **Service**. You can select services based on policy type.
	Deletes the selected service or group from this policy.

Feature	Description
Rules	
	Displays the Add Rule dialog in which you define a rule for this policy.
	Deletes the selected rule from this policy.
	Displays the Edit Rule dialog for the selected rule.
Policy Suppression	
	Adds a policy suppression timeframe row.
	Deletes the selected policy suppression timeframe row.
Time Zone	Selects the time zone for the Policy from the drop-down list. This time zone applies to both Policy Suppression and Rule Suppression.
	Selects the checkbox to select a policy suppression timeframe row.
Days	Days of the week that you want to suppress the policy according to the time range specified. Click on the day of the week that you want to suppress the policy. You can select any combination of days including all days.
Time Range	Time range during which the policy is suppressed for the days selected.
Notifications	
	Adds an EMAIL notification row.
	Deletes the selected policy suppression timeframe row.
Notification Settings	Opens the Notification Servers view in which you can define the Email notification settings.
	Selecting the checkbox selects a policy suppression time frame row.

Feature	Description
Output	The type of notification defined on the Global Notifications page. Can be email, SNMP, Syslog, or Script.
Recipient	The name of the person receiving the notification.
Notification Server	Select the EMAIL notification server. See 'Configure Notification Servers' in the *System Configuration Guide* for the source of the values in this drop-down list.
Template	Select the Template for this EMAIL notification. RSA provides the Health & Wellness Default SMTP Template and the alarms template. See **Configure Notification Templates**in the *System Configuration Guide* for the source of the other values in this drop-down list. **Note:** Refer to Include the Default Email Subject Line if you want to include the default Email subject line from the Health & Wellness template in your Health & Wellness Email notifications for specified recipients.

Groups dialog

Feature	Description
Groups panel	
Name	Displays the service groups you have defined. You can select: • **All** to display all your services in the **Services** panel. • A group to display the services in comprise that group in the **Services** panel.
Services panel	
Name	Displays the name of the service.
Host	Displays the host on which the service is running.
Type	Displays the type of service.

Rules Dialog

Feature	Description
☐ Enable	Select and deselect this checkbox to enable and disable the rule for this policy.
Name	Enter the name of the rule.
Description	Enter the description of the rule. RSA suggests that you include the following information in this field. • Informational description - purpose of the rule and what problem it monitors. • Remediation - steps to take to resolve the condition that triggers the alarm for this rule.
Severity	Select the severity of the rule. Valid values are: • Critical • High • Medium • Low
Statistic	Select the statistics you want to check with this rule. You can select: • Statistical category from the left drop-down list. • Statistic from the right drop-down list. **Note:** For Public Key Infrastructure (PKI) policy, select PKI in the category and statistics as any one of the following: - NetWitness Server PKI Certificate Expiration - Displays the time left before the certificate expires. - NetWitness Server PKI CRL Expiration - Displays the time left before the Certificate Revocation List (CRL) expires. - NetWitness Server PKI CRL Status - Displays the current status of the CRL. Please refer to the System Stats Browser View for examples of the statistics you may want to check with a rule.

Feature	Description
Alarm Threshold	Define the threshold of the rule that will trigger the policy alarm: • Amount **Note:** For CRL expiry the supported format is ddddhhmm, for example: - 10000 represent 1 day - 2359 represent 23 hours and 59 minutes - 10023 represent 1 day and 23 minutes - 3650100 represent 365 days and 1 hour • Time in minutes

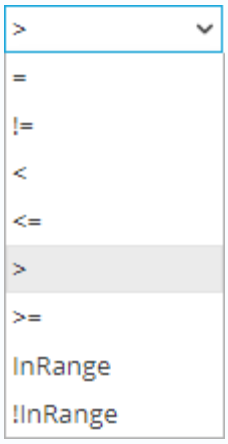
Recovery	Defines when to clear the threshold of the rule:
	• Operator:
	  • For NetWitness Suite 10.5 (=, !=, <, <=, >, or >=)
	  • For NetWitness Suite 10.5.0.1 and later (See Threshold Operators below)
	• Amount
	• Time in minutes

Rule Suppression	
+	Selecting this option allows you to add a rule suppression timeframe row.
−	Selecting this option allows you to delete the selected rule suppression time frame row.
☐	Selecting the checkbox allows you to select a rule suppression time frame row.
Time Zone: *time-zone*	Displays the Policy time zone. You select the time zone for a policy in the Policy Suppression panel.
Days	Days of the week that you want to suppress the rule according to the time range specified. Click on the day of the week that you want to suppress the rule. You can select any combination of days including all days.
Time Range	Time range during which the rule is suppressed for the days selected.

Threshold Operators

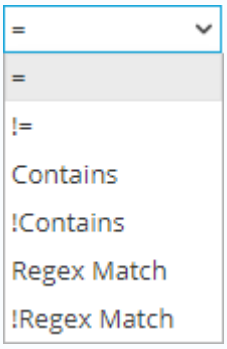
The **Alarm Threshold** and **Recovery Threshold** fields in the **Rules** dialog prompt you for either numeric or string operators based on the statistic criteria you specify.

Numeric operators drop-down menu:



=
!=
<
<=
>
>=
InRange
!InRange

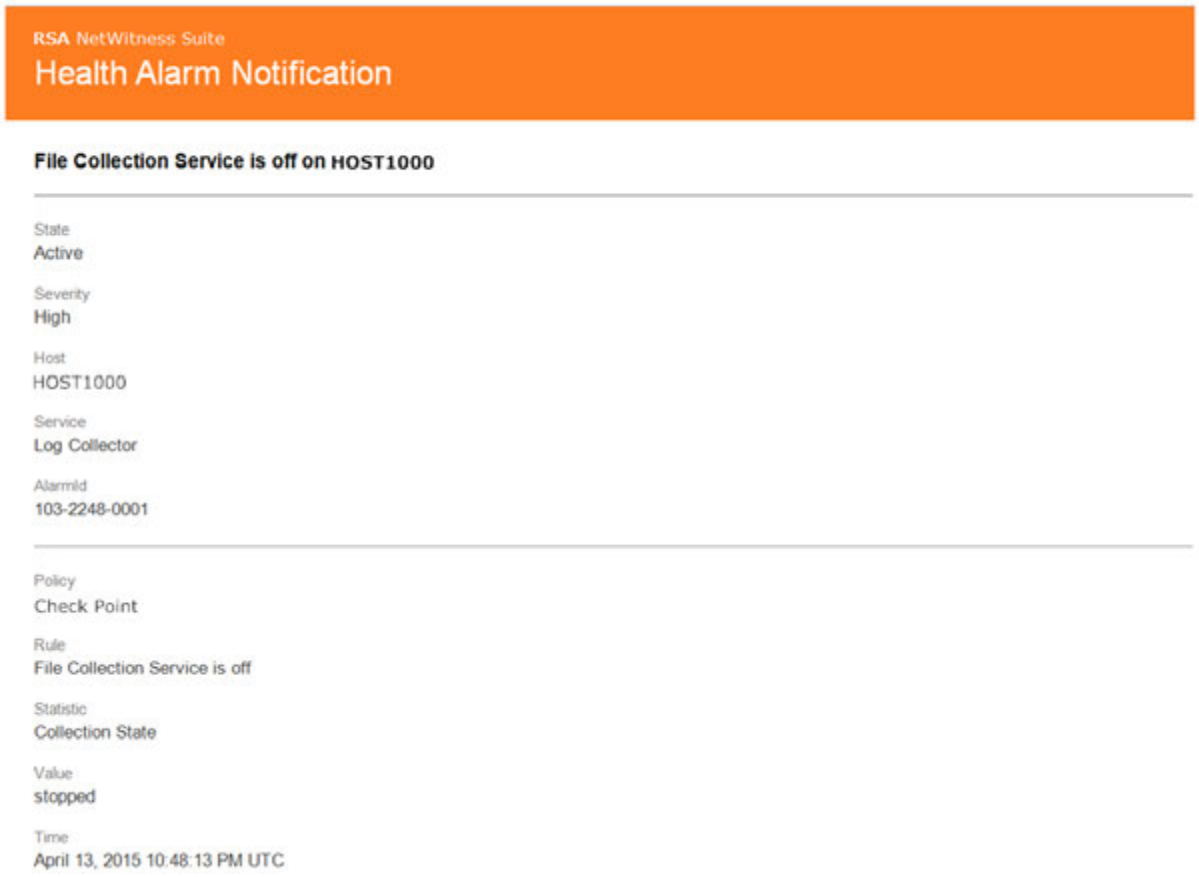
String operators drop-down menu:



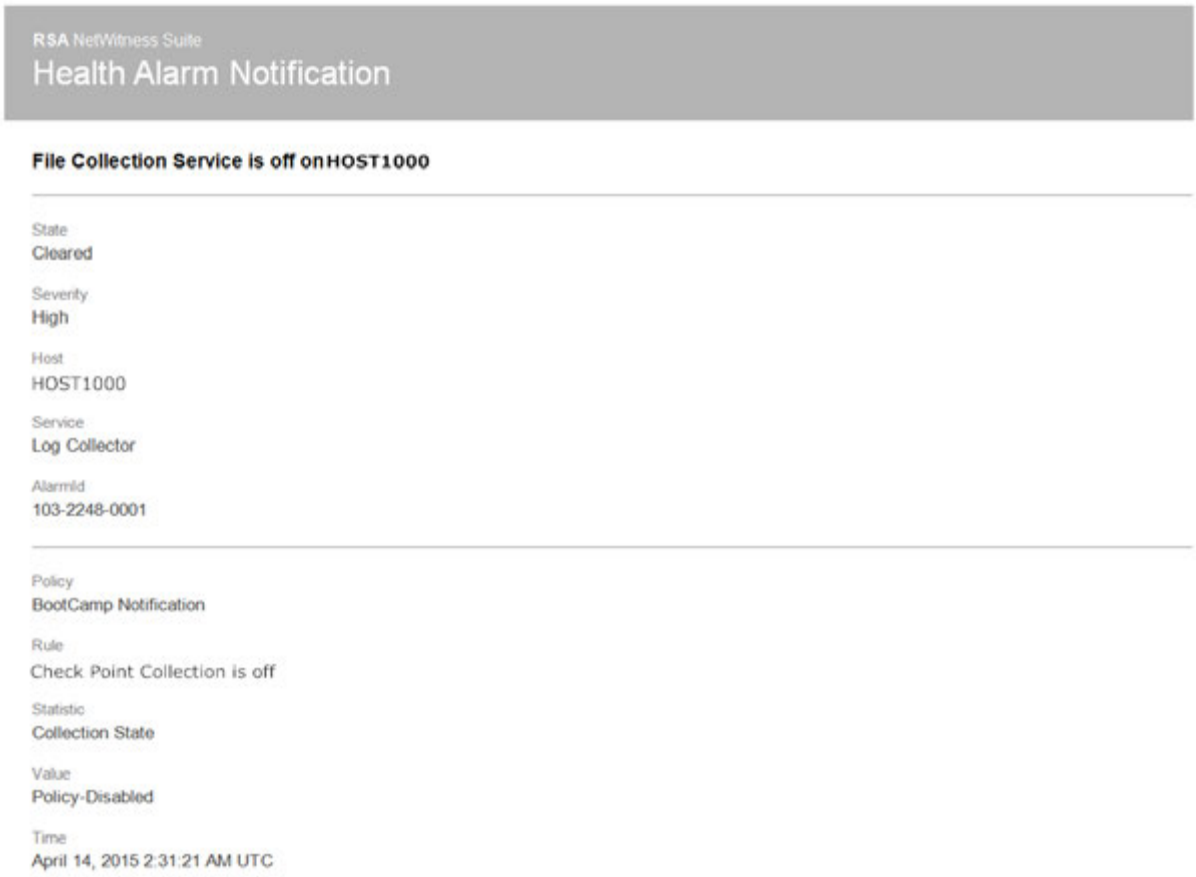
RSA Health & Wellness Email Templates

Note: Please refer to Include the Default Email Subject Line if you want to include the default Email subject line from the Health & Wellness template in your Health & Wellness Email notifications for specified recipients.

Health & Wellness Default SMTP Template



Alarms Template



NetWitness Suite Out-of-the-Box Policies

The following table lists the NetWitness Suite Out-of-the-Box Policies with the rules defined for each policy.

You can perform the following tasks on any of these policies:

- Change service/group assignments.
- Disable/enable them.

You cannot perform the following tasks on any of these policies:

- Delete them.
- Edit Policy names.

Note: Additional information about the Out-of-the-Box Policies can be found in the User Interface under
Health & Wellness – Policies.

Policy Name	Rule Name	Alarm Triggered
	Communication Failure Between Master Security Analytics Host and a Remote Host	Host is down, Network is down, Message Broker is Down, or Invalid or missing security certificates for 10 minutes or more.

Policy Name	Rule Name	Alarm Triggered
NetWitness Server Monitoring Policy	Critical Usage on Rabbitmq Message Broker Filesystem	For `var/lib/rabbitmq`, Mounted Filesystem Disk Usage goes over 75%.
	Filesystem is Full	Overall Mounted Filesystem Disk Usage reaches 100%.
	High Filesystem Usage	Overall Mounted Filesystem Disk Usage goes over 95%.
	High System Swap Utilization	Swap Utilization goes under 5 % for 5 minutes or more.
	High Usage on Rabbitmq Message Broker Filesystem	Mounted Filesystem Disk Usage for `var/lib/rabbitmq` goes over 60%.
	Host Unreachable	Host down.
	LogCollector Event Processor Exchange Bindings Status	Issue with Log Collection Message Broker Queues for 10 minutes or more.
	LogCollector Event Processor Queue with No Bindings	Issue with Log Collection Message Broker Queues for 10 minutes or more.
	LogCollector Event Processor Queue with No Consumers	Issue with Log Collection Message Broker Queues for 10 minutes or more.
	Power Supply Failure	Host not receiving power.
	RAID Logical Drive Degraded	For Raid Logical Drive, Drive State equals Degraded or Partially Degraded.

Policy Name	Rule Name	Alarm Triggered
	RAID Logical Drive Failed	For Raid Logical Drive, Logical Drive State equals Offline, Failed, or Unknown.
	RAID Logical Drive Rebuilding	For Raid Logical Drive, Logical Drive State equals Rebuild.
	RAID Physical Drive Failed	For Raid Physical Drive, Physical Drive State does not equal Online, Online Spun Up, or Hotspare.
	RAID Physical Drive Failure Predicted	For Raid Physical Drive, Physical Drive Predictive Failure Count is greater than 1.
	RAID Physical Drive Rebuilding	For Raid Physical Drive, Physical Drive State equals Rebuild.
	RAID Physical Drive Unconfigured	For Raid Physical Drive, Physical Drive State contains Unconfigured(good).
	SD Card Failure	SD Card Status does not equal ok.
NetWitness Suite Archiver Monitoring Policy	Archiver Aggregation Stopped	Archiver Status does not equal started.
	Archiver Database(s) Not Open	Database Status does not equal opened.
	Archiver Not Consuming From Service	Devices Status does not equal consuming.
	Archiver Service in Bad State	Service State does not equal started or ready.
	Archiver Service Stopped	Server Status does not equal started.

Policy Name	Rule Name	Alarm Triggered
NetWitness Suite Broker Monitoring Policy	Broker >5 Pending Queries	Queries Pending greater than or equal to 5 for 10 minutes or more.
	Broker Aggregation Stopped	Broker Status does not equal started.
	Broker Not Consuming From Service	Devices Status does not equal consuming.
	Broker Service in Bad State	Service State does not equal started or ready.
	Broker Service Stopped	Server Status does not equal started.
	Broker Session Rate Zero	Session Rate (current) equals 0 for 2 minutes or more.

Policy Name	Rule Name	Alarm Triggered
NetWitness Suite Concentrator Monitoring Policy	Concentrator >5 Pending Queries	Queries Pending greater than or equal to 5 for 10 minutes or more.
	Concentrator Aggregation Behind >100K Sessions	Devices Sessions Behind is greater than or equal to 100000 for 1 minute or more.
	Concentrator Aggregation Behind >1M Sessions	Devices Sessions Behind is greater than or equal to 1000000 for 1 minute or more.
	Concentrator Aggregation Behind >50M Sessions	Devices Sessions Behind is greater than or equal to 50000000 for 1 minute or more.
	Concentrator Aggregation Stopped	Broker Status does not equal started.
	Concentrator Database(s) Not Open	Database Status does not equal opened.
	Concentrator Meta Rate Zero	Concentrator Meta Rate (current) equals 0 for 2 minutes or more.
	Concentrator Not Consuming From Service	Devices Status does not equal consuming.
	Concentrator Service in Bad State	Service State does not equal started or ready.
	Concentrator Service Stopped	Server Status does not equal started.

Policy Name	Rule Name	Alarm Triggered
NetWitness Suite Decoder Monitoring Policy	Decoder Capture Not Started	Capture Status does not equal started.
	Decoder Capture Rate Zero	Capture Rate (current) equals 0 for 2 minutes or more.
	Decoder Database Not Open	Database Status does not equal opened.
	Decoder Dropping >1% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 1%.
	Decoder Dropping >10% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 10%.
	Decoder Dropping >5% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 5%.
	Decoder Packet Capture Pool Depleted	Packet Capture Queue equals 0 for 2 minutes or more.
	Decoder Service in Bad State	Service State does not equal started or ready.
	Decoder Service Stopped	Server Status does not equal started.
NetWitness Suite Event Steam Analysis Monitoring Policy	ESA Overall Memory Utilization > 85%	Total ESA Memory Usage % is greater than or equal to 85 %.
	ESA Overall Memory Utilization > 95%	Total ESA Memory Usage % is greater than or equal to 95 %.
	ESA Service Stopped	Server Status does not equal started.
	ESA Trial Rules Disabled	Trial Rules Status does not equal enabled.

Policy Name	Rule Name	Alarm Triggered
NetWitness Suite IPDB Extractor Monitoring Policy	IPDB Extractor Service in Bad State	Service State does not equal started or ready.
	IPDB Extractor Service Stopped	Server Status does not equal started.
NetWitness Suite Incident Management Monitoring Policy	Incident Management Service Stopped	Server Status does not equal started.
NetWitness Suite Log Collector Monitoring Policy	Log Collector Service Stopped	Server Status does not equal started.
	Log Decoder Event Queue > 50% Full	Number of events currently in the queue is using 50% or more of the queue.
	Log Decoder Event Queue > 80% Full	Number of events currently in the queue is using 80% or more of the queue.
	Log Collector Service in Bad State	Service State does not equal started or ready.

Policy Name	Rule Name	Alarm Triggered
NetWitness Suite Log Decoder Monitoring Policy	Decoder Dropping>10% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 10%
	Log Capture Not Started	Capture Status does not equal started.
	Log Decoder Capture Rate Zero	Capture Rate (current) equals 0 for 2 minutes or more.
	Log Decoder Database Not Open	Database Status does not equal opened.
	Log Decoder Dropping >1% of Logs	Capture Packets Percent Dropped (current) is greater than or equal to 1%.
	Log Decoder Dropping >5% of Logs	Capture Packets Percent Dropped (current) is greater than or equal to 5%.
	Log Decoder Packet Capture Pool Depleted	Packet Capture Queue equals 0 for 2 minutes or more.
	Log Decoder Service Stopped	Server Status does not equal started.
	Log Decoder Service in Bad State	Service State does not equal started or ready.
NetWitness Suite Malware Analysis Monitoring Policy	Malware Analysis Service Stopped	Server Status does not equal started.

Policy Name	Rule Name	Alarm Triggered
NetWitness Suite Reporting Engine Monitoring Policy	Reporting Engine Alerts Critical Utilization	Alerts Utilization is greater than or equal to 10 for 5 minutes or more.
	Reporting Engine Available Disk <10%	Available disk space is less than 10%.
	Reporting Engine Available Disk <5%	Available disk space is less than or equal to 5%.
	Reporting Engine Charts Critical Utilization	Charts Utilization is greater than or equal to 10 for 5 minutes or more.
	Reporting Engine Rules Critical Utilization	Rules Utilization is greater than or equal to 10 for 5 minutes or more.
	Reporting Engine Schedule Task Pool Critical Utilization	Schedule Task Pool Utilization is greater than or equal to 10 for 15 minutes or more.
	Reporting Engine Service Stopped	Server Status does not equal started.
	Reporting Engine Shared Task Critical Utilization	Shared Task Pool Utilization is greater than or equal to 10 for 5 minutes or more.

Policy Name	Rule Name	Alarm Triggered
NetWitness Suite Warehouse Connector Monitoring Policy	Warehouse Connector Service in Bad State	Service State does not equal started or ready.
	Warehouse Connector Service Stopped	Server Status does not equal started.
	Warehouse Connector Stream Behind	Stream Behind is greater than or equal to 2000000.
	Warehouse Connector Stream Disk Utilization > 75%	Stream Disk Usage (Pending Destination Load) is greater than or equal to 75.
	Warehouse Connector Stream in Bad State	Stream Status does not equal consuming or online for 10 minutes r more.
	Warehouse Connector Stream Permanently Rejected Files > 300	Number of files in the permanently rejected files is greater than or equal to 300.
	Warehouse Connector Stream Permanently Rejected Folder > 75% Full	Rejected folder usage is greater than or equal to 75%.
NetWitness Suite Workbench Monitoring Policy	Workbench Service in Bad State	Service State does not equal started or ready.
	Workbench Service Stopped	Server Status does not equal started.

System Stats Browser View

NetWitness Suite provides a way to monitor the status and operations of hosts and services. The System Stats Browser tab displays key statistics, service system information, and host system information for a host or service.

You can customize the stats view depending on the parameter you select to filter the data.

To access the System Stats Browser view:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Click the **System Stats Browser** tab.

What do you want to do?

Role	I want to ...	Show me how
Administrator	View the System Stat Historical Graph	Historical Graph for System Stats

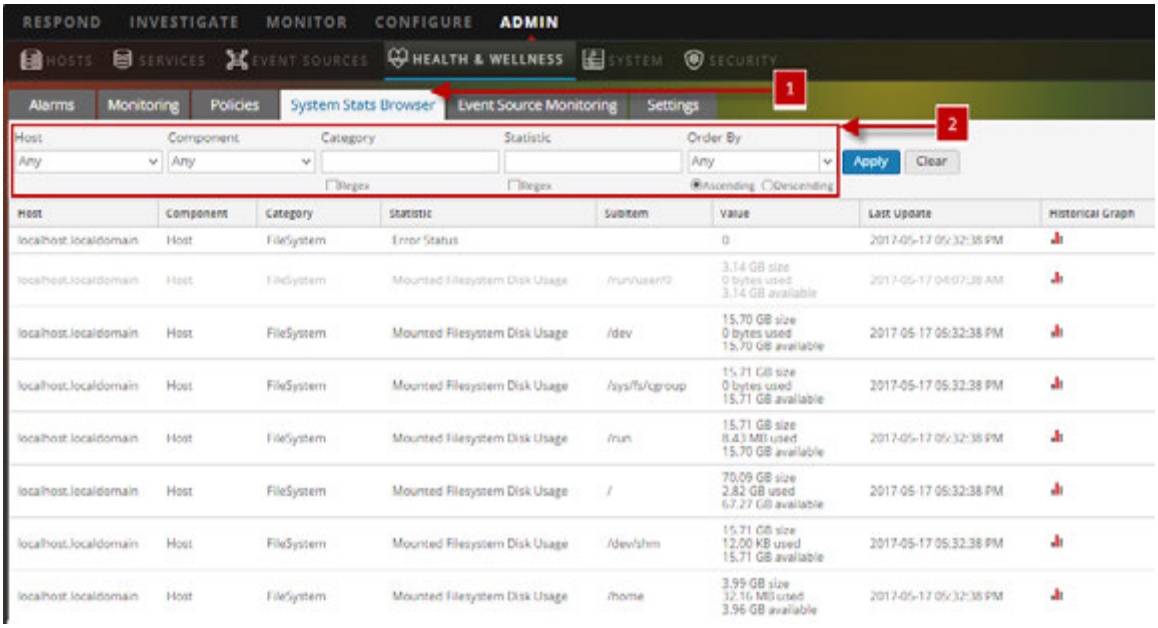
Filter System Statistics

View Historical Graph of System Statistics

Quick Look

The System Stats Browser view is displayed.



1 Displays System Stats Browser View

2 Toolbar used to filter and customize the System Stats Browser View

Filters

This table lists the various parameters you can use to filter and customize the System Stats view.

Parameter	Description
Host	Select a host from the drop-down menu to display the stats of the selected host. Select **Any** to list all the available hosts.
Component	Select a component from the drop-down menu to display the stats for the selected component. Select **Any** to list out all the components on a selected host.
Category	Type the category to display the stats for the required category. Select Regex to enable Regex filter. It performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching.
Statistic	Type the statistic to display the required statistic on all the hosts or components. Select Regex to enable Regex filter. This performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching.
Order By	Select the order in which the list needs to be filtered. Select Ascending to filter the list it in an ascending order.

Commands

Command	Action
Apply	Click to apply the filters chosen and display the list accordingly.
Clear	Click to clear the chosen filters.

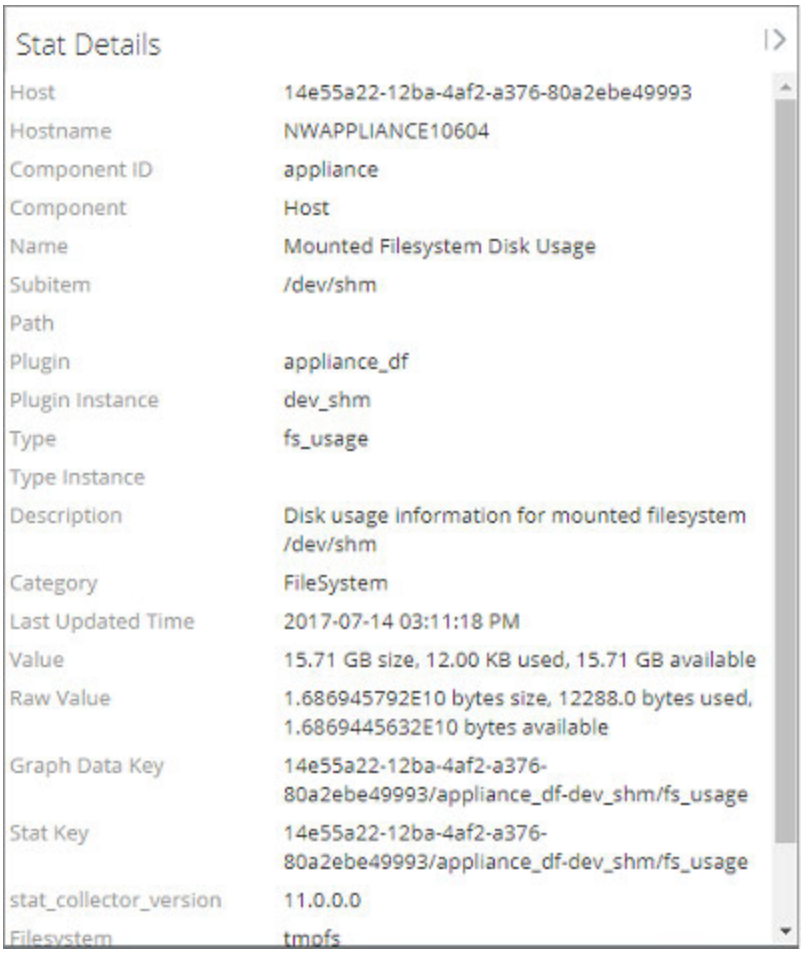
System Stats View Display

Displays statistics, service system information, and host system information for a host or service.

Access Stats Details

Select one of the stats and click **Stats Details** on the right hand side of the panel.

The Stats details panel opens with details of the selected stats.



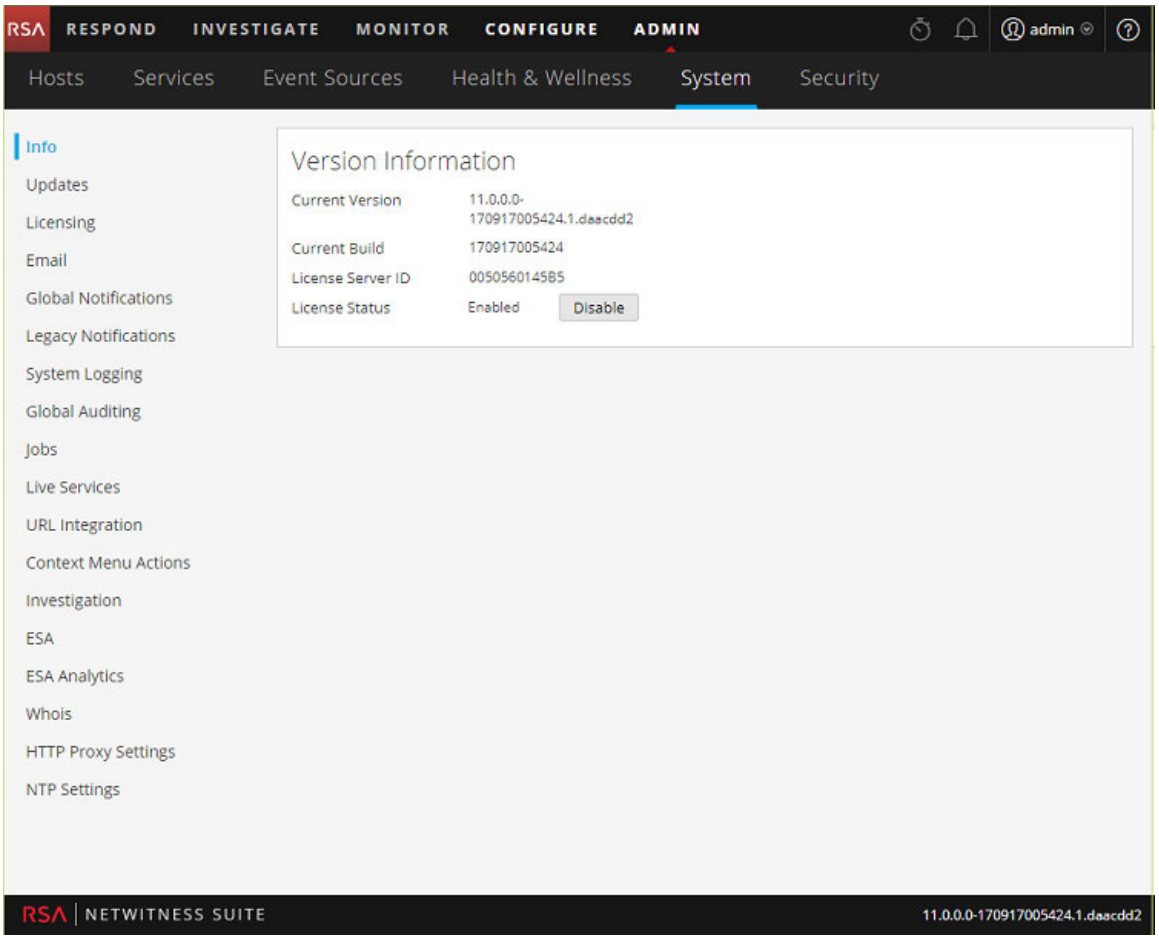
System View - System Info Panel

This topic describes the System Information panel, which displays information about the system version and license status.

The required role to access this view is **Manage System Settings**.

To access this view, do one of the following:

- Go to **ADMIN > System**.
  The System Information panel is displayed by default.
- When you receive a notification that a new version of NetWitness Suite is available in the Notifications tray, click **View**.



The Version Information section displays version information about the version of NetWitness Suite that is currently installed. The following table describes the features of the Version Information section.

Name	Description
Current Version	Displays the version of Security Analytics that is currently running. The format of the version is *major-relase.minor-release.stability-id.build-number*. Possible values for the *stability-id* are: • 1 - Development • 2 - Alpha • 3 - Beta • 4 - RC • 5 - Gold

Name	Description
Current Build	Identifies the current build revision for use in troubleshooting situations.
License Server ID	Each client host is shipped with the Local Licensing Server (LLS) installed to manage host licenses. This field indicates whether the LLS is installed for this instance of Security Analytics. • When the LLS is installed, the Licensing Server ID is displayed. • **Unknown** indicates that the LLS is not installed.
License Status	Indicates whether or not the license is enabled. If the license is: • Enabled, **Enabled** is displayed in this field and there is a **Disable** button to the right so you can disable it. • Disabled, **Disabled** is displayed in this field and there is an **Enable** button to the right so you can enable it.

System Logging - Settings View

The RSA NetWitness SuiteSettings view in the System Logging panel configures the size of the log files, the number of backup log files maintained, as well as the default logging levels for the packages within NetWitness Suite. The **Configure Log File Settings** topic in the *System Configuration Guide* provides detailed procedures.

To access the Settings tab:

1. Go to **ADMIN > System.**
2. In the options panel, select **System Logging**.
   The System Logging panel opens to the Realtime tab by default.
3. Click the **Settings** tab.

What do you want to do?

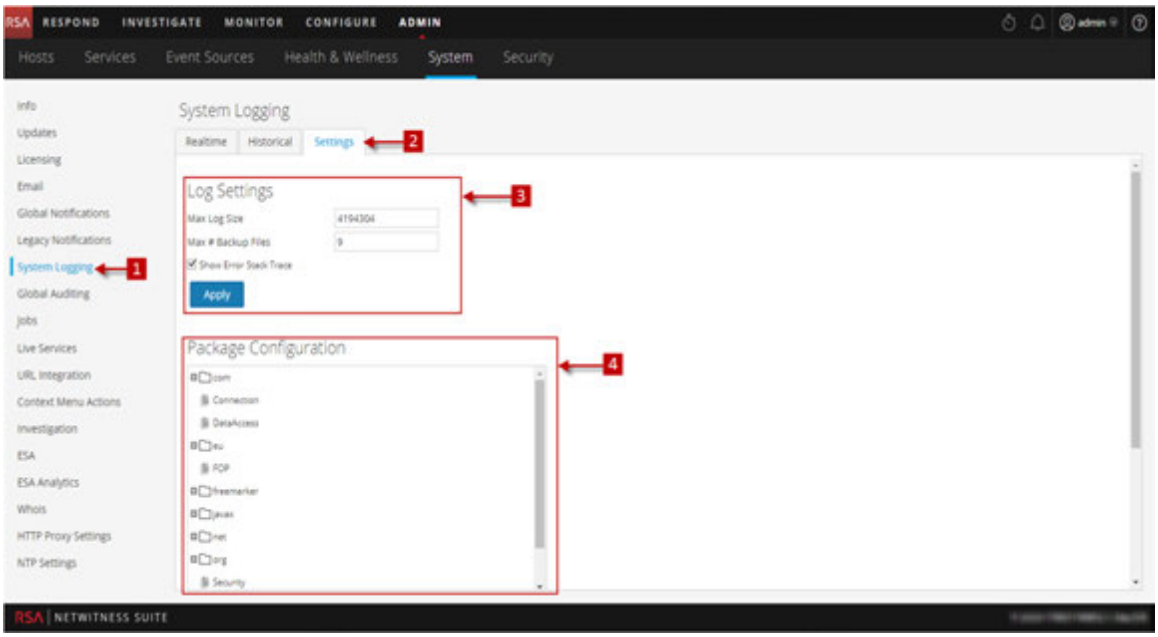
Role	I want to ...	Show me how
Administrator	Configure the size of the Log files	Setup the Log Settings Toolbar

Related Topics

System Logging - Historical Tab

System Logging - Realtime Tab

Quick Look



1	Displays System Logging Panel
2	Displays Settings Tab
3	The section allows the user to configure Log Settings
4	The section allows the user to configure Package

Features

The **Settings** tab has two sections: Log Settings and Package Configuration.

Log Settings

The Log Settings section configures the size of the NetWitness Suite log files and the number of backup logs that NetWitness Suite maintains.

Feature	Description
Max Log Size	Configures the maximum size in bytes of each log file. The minimum value for this setting is **4096**.

Feature	Description
Max # Backup Files	Specifies how many backup log files are maintained. The minimum value for this setting is **0**. When the maximum number of log files is attained, and a new backup file is made, the oldest backup is discarded.
Show Error Stack Trace	Select checkbox to display ERROR, STACK, and TRACE log messages.
Apply	Puts the settings into effect immediately for all future logs.

Package Configuration

The Package Configuration section shows the NetWitness Suite packages in a tree structure.

Feature	Description
Package tree	The tree contains all the packages used within NetWitness Suite. You can drill down into the tree to view the log levels of each package. The **root** logging level represents the default log level for all packages that are not explicitly set. The root level is set to **INFO**
Package field	This field is populated with the name of the selected package when you select a package in the **Package** tree.
Log Level	If the selected package has a log level explicitly set, the value is displayed in the **Log Level** field.
Reset recursively	Select checkbox to reset the log recursively.
Apply	This button puts the settings into effect immediately for all future logs.
Reset	This button resets the selected package to the log level of **root**.

System Logging - Realtime Tab

This topic describes the features of the System Logging > Realtime tab and the Services Logs view > Realtime tab.

The **Realtime** tab is a view of the NetWitness Suitelog or a service log. When it is initially loaded, the view contains the last 10 log entries. As new entries become available, the view is updated with those entries.

To access the Realtime tab:

1. Go to **ADMIN > System.**
2. In the options panel, select **System Logging**.
   The System Logging panel opens to the **Realtime** tab by default.

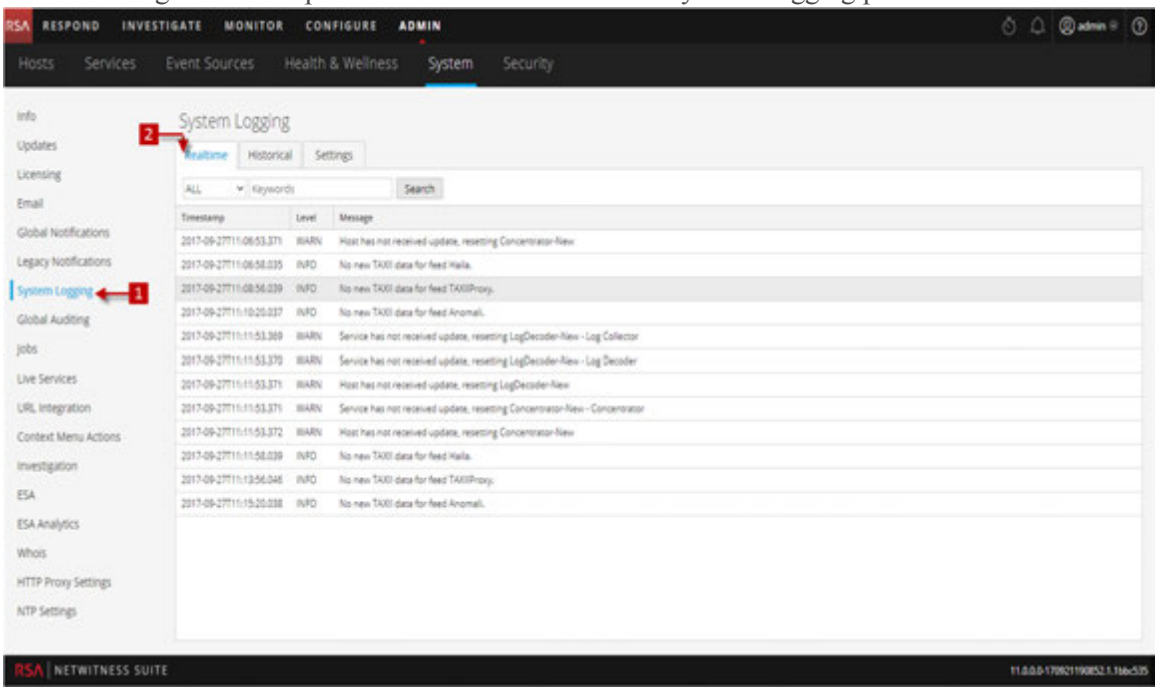
System Logging - Historical Tab

"Settings Tab" topic in the *Hosts and Services Getting Started Guide*

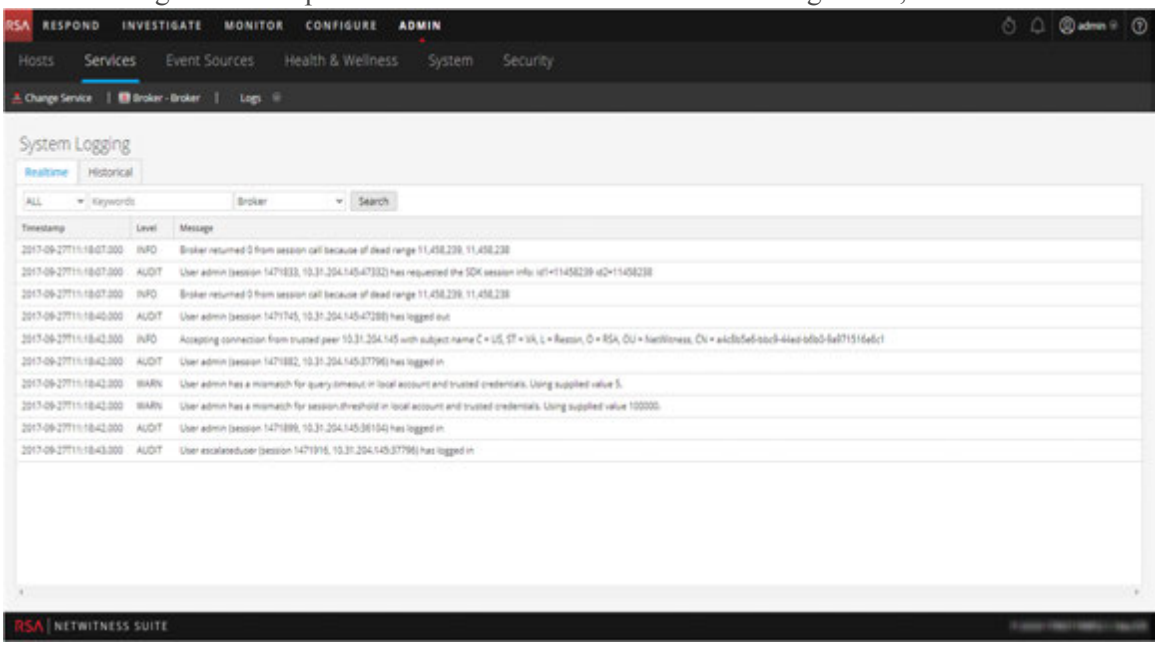
Quick Look

The following is an example of the **Realtime** tab in the System Logging panel.



1	Displays System Logging Panel
2	Displays Realtime Tab

The following is an example of the **Realtime** tab in the Services Logs view, which is similar.



Features

The **Realtime** tab has a toolbar with input fields to allow filtering of the entries, and below the toolbar is a grid containing the log entries.

Toolbar

Feature	Description
Log Level drop-down 	Selects the log level for entries to display in the grid. The **Log Level** drop-down shows the available log levels for the system or the service. • System logs have seven log levels. • Service logs have only six log levels because they do not include the **TRACE** level. • The default is **ALL** log entries.
Keywords field	Specifies a keyword to use when filtering entries. This field is the same for system and service log filtering.
Service field (Service Logs only)	Specifies the service type to use when filtering service log entries. Possible values are the host or the service.
Filter button	Click to activate filtering based on the log level, keyword, and service selections.

Log Grid Columns

Column	Description
Timestamp	This is the timestamp for the entry.
Level	This is the log level for the message.
Message	This is the text of the log entry.

System Logging - Historical Tab

The Historical tab provides a searchable view of the NetWitness Suite log or the service log in a paged format. When initially loaded, the grid shows the last page of the log entries for the system or the system.

To access the Historical tab:

1. Go to **ADMIN > System.**
2. In the options panel, select **System Logging**.

   The System Logging panel opens to the **Realtime** tab by default.
3. Click the **Historical** tab.

What do you want to do?

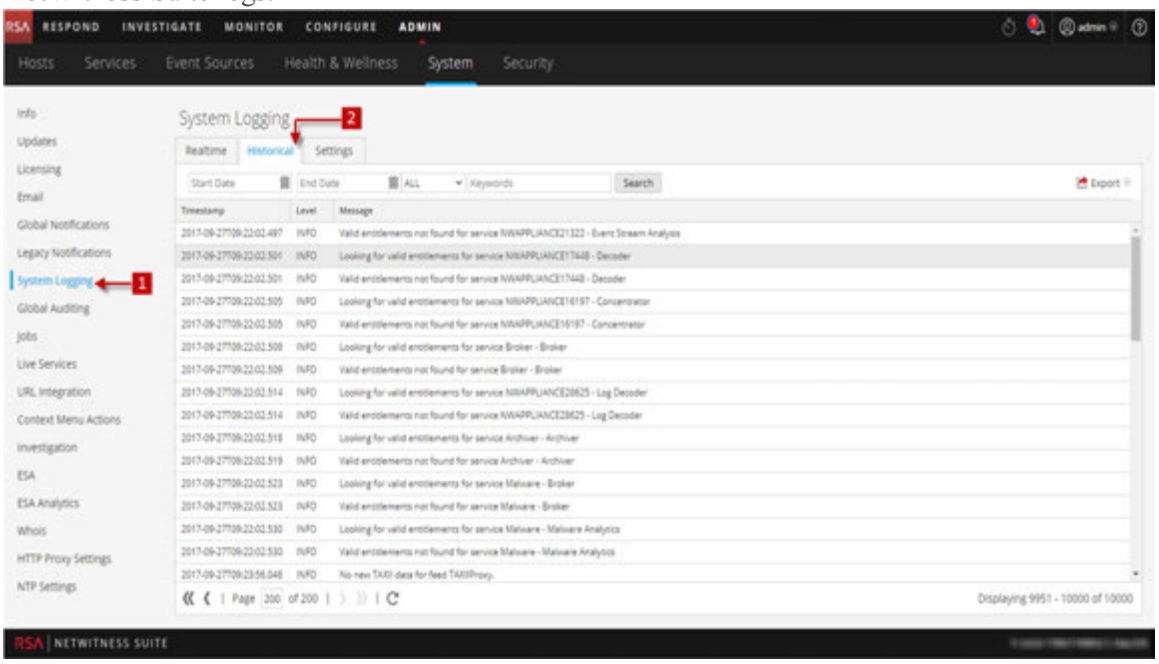
System Logging - Realtime Tab

System Logging - Settings View

Quick Look

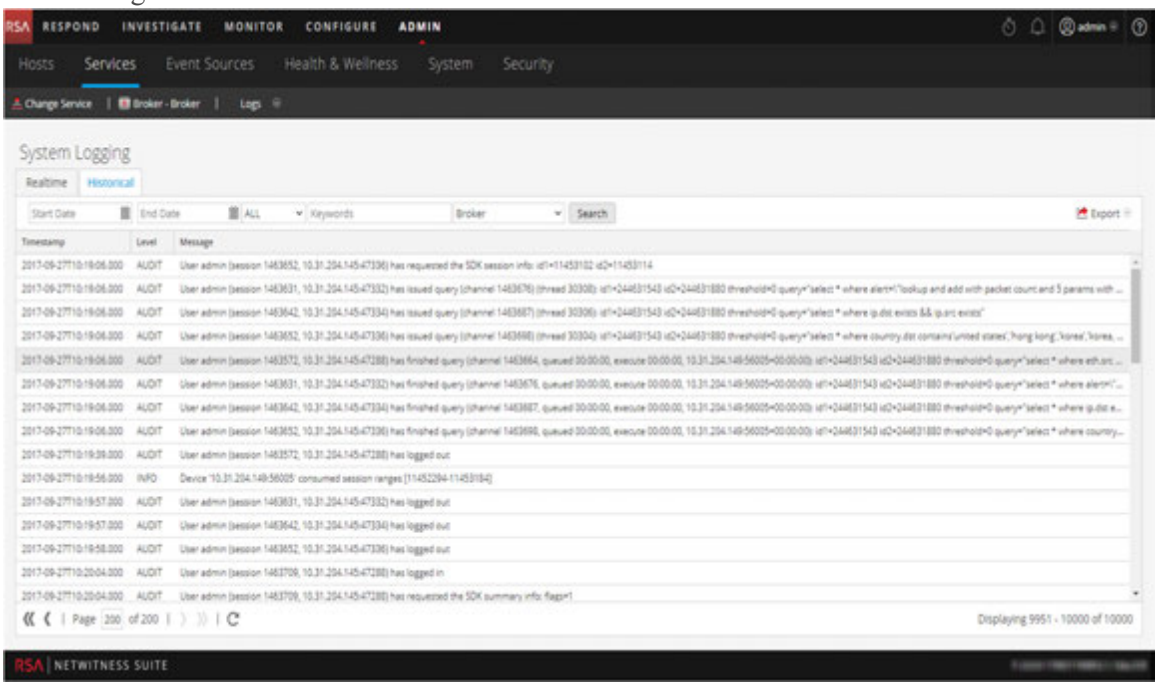
The following is an example of the **Historical** tab in the System Logging panel. It shows the NetWitness Suite logs.



1 Displays System Logging Tab

2 Displays Historical Tab

The following is an example of the **Historical** tab in the Services Logs view. It shows the services logs.



Features

The **Historical** tab has a toolbar with input fields to allow filtering of the entries, a grid containing the log entries, and paging tools.

Feature	Description
Start Date and **End Date**	The **Start Date** and **End Date** range search options limit the log entries to a point in time. When used, you must provide both a start and end date. The times are optional. The date range is validated to assure that the end date is not before the start date.
Log Level drop-down 	Selects the log level for entries to display in the grid. The **Log Level** drop-down shows the available log levels for the system or the service. • System logs have seven log levels. • Service logs have only six log levels because they do not include the **TRACE** level. • The default is **ALL** log entries.
Keyword field	Specifies a keyword to use when filtering entries. This field is the same for system and service log filtering.
Service field (Service Logs only)	Specifies the service type to use when filtering service log entries. Possible values are the host or the service.
Search button	Click to activate a search based on the start and end date, log level, keyword, and service selections.
Export	Click to export the currently viewed grid entries to a text file. You can select either comma-separated or tab-separated format for the entries in the file.

Column	Description
Timestamp	This is the timestamp for the entry.
Level	This is the log level for the message.
Message	This is the text of the log entry.

The paging tools below the grid provide a way to navigate through the pages of log entries.

Search Log Entries

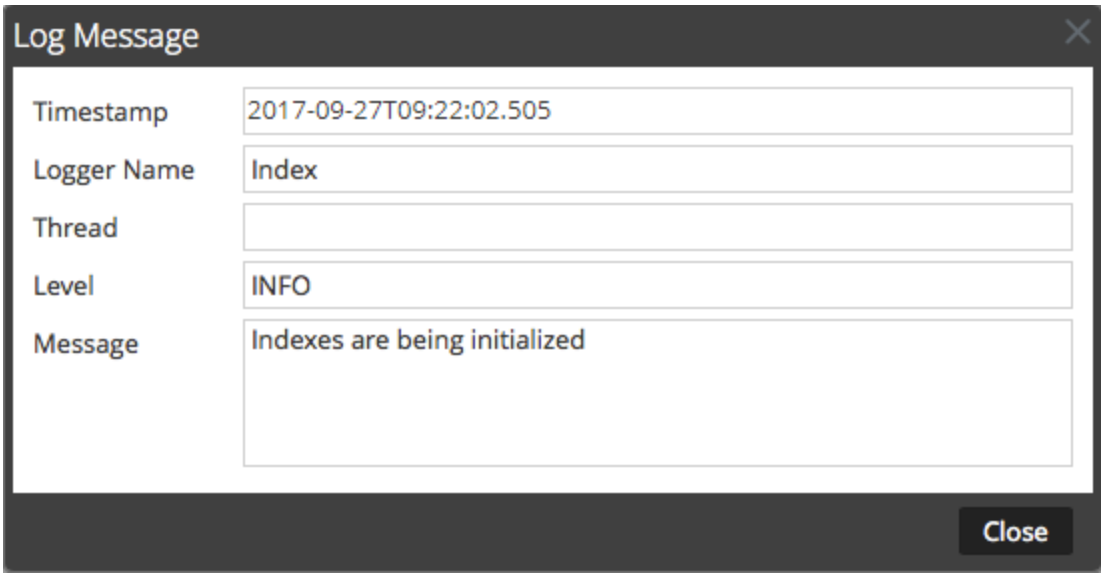
To search the results shown in the **Historical** tab:

1. (Optional) Select a **Start Date** and **End Date**. Optionally, select a **Start Time** and **End Time**.
2. (Optional) For system and service logs, select a **Log Level** and a **Keyword**, or both.
3. (Optional) For service logs, select the **Service**: host or service.
4. Click **Search**.
   The view is refreshed with the most recent 10 entries matching your filter. As new matching log entries become available, the view is updated to show those entries.

Show Details of a Log Entry

Each row of the **Historical** tab Log grid provides the summary information of a log entry. To view complete details:

1. Double-click a log entry.
   The Log Message dialog, which contains the Timestamp, Logger Name, Thread, Level and Message, is displayed.



2. When finished viewing, click **Close**.

Page Through the Entries

To view the different pages of the grid, use the paging controls on the bottom of the grid as follows:

- Use the navigation buttons
- Manually enter the page you want to view, and press **ENTER**.

Export

To export the logs in the current view:

Click **Export**, and select one of the drop-down options, **CSV Format** or **Tab Delimited**.
The file is downloaded with a filename that identifies the log type and the field delimiter. For example, a NetWitness Suite system log exported with comma-separated values is named **UAP_log_export_CSV.txt**, and an appliance log exported with tab-separated values is named **APPLIANCE_log_export_TAB.txt**.

System Security and User Management

This guide provides information about setting up security and controlling user access. The System Administrator needs to understand system-wide settings, user accounts, system roles, permissions, and access to services.

Topics

Set Up System Security

This topic introduces a set of end-to-end procedures for implementing system security. Each step in the following topics explains a system-wide setting. Follow the steps in order to set up security in NetWitness Suite.

Topics

Step 1. Configure Password Complexity

This topic provides instructions to set system-wide NetWitness Suite password complexity requirements.

Passwords are an important part of your network security strategy. They provide critical front-line protection for your computer systems and help prevent attacks and unauthorized access to private information.

Password policies, designed to enhance the security of corporate networks, vary depending on the industry, corporate requirements, and regulations. Because of these password policy variations, NetWitness Suite software allows you to configure the password complexity requirements for internal NetWitness Suite users to conform to your corporate password policy guidelines.

Password complexity requirements apply only to internal users and are not enforced for external users. External users rely on their own methods and systems to enforce password complexity.

In addition, you can set a global default user expiration period and determine if and when internal users receive notification that their passwords are about to expire. The password expiration notification consists of a password expiration message when a user logs on to NetWitness Suite.

Password Strength

Strong passwords make it more difficult for attackers to guess user passwords and help prevent unauthorized access to your organization's network. You can define the appropriate level of password strength for your NetWitness Suite users. When you configure the password strength settings, they apply to internal NetWitness Suite users, including the admin user.

You can choose to enforce any combination of the following password strength requirements when a NetWitness Suite user creates or changes their password:

- Minimum password length
- Minimum number of uppercase characters
- Minimum number of lowercase characters
- Minimum number of decimals (0 through 9)
- Minimum number of special characters
- Minimum number of non-Latin alphabetic characters (includes Unicode characters from Asian languages)
- Whether or not the password can contain the username

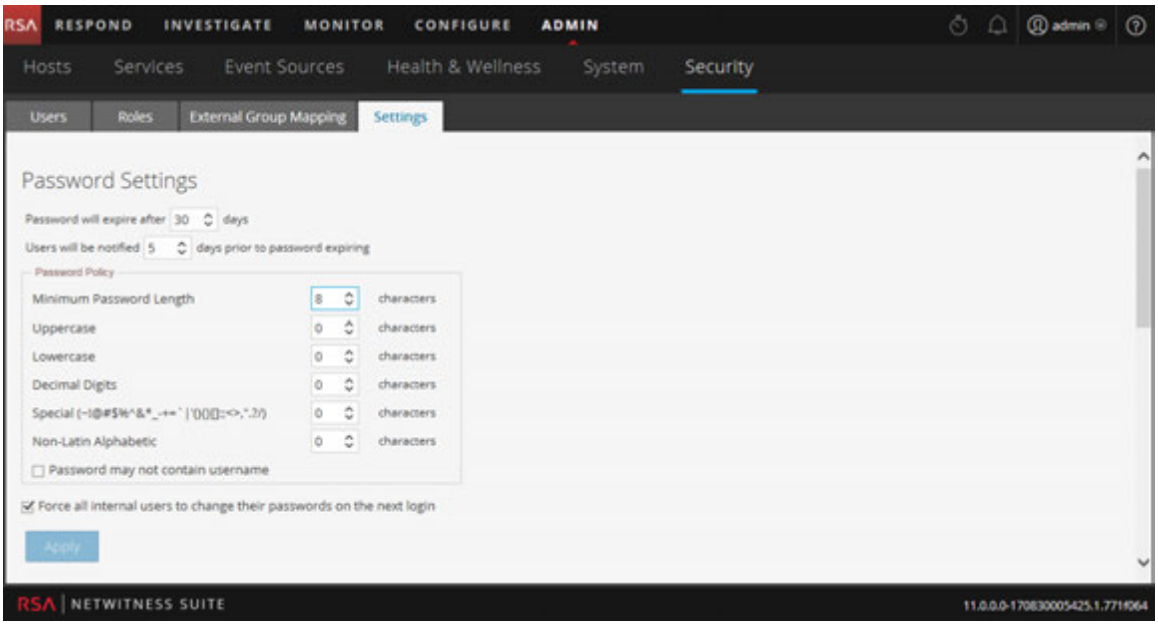
For example, you can create a strong password requirement that has a minimum of 8 characters, cannot contain the username of the user, and contains a mix of uppercase and lowercase letters, numbers, and special characters.

If you choose to enforce a minimum number of non-Latin alphabetic characters, ensure that your users have these characters available to them when setting their passwords.

The topic "STIG Compliant Passwords" in the *System Maintenance Guide* provides an example of a strong password policy.

Configure Password Strength

1. In NetWitness Suite, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.



3. In the **Password Settings** section, select the password complexity requirements to enforce when NetWitness Suite users set their passwords and specify the minimum characters required, if applicable. Set the value to 0 for requirements you do not want to enforce, except for Minimum Password Length, which has a minimum value of 4 characters.

Requirement	Description
Password will expire after <n> days	The default number of days before a password expires for all internal NetWitness Suite users. A value of zero (0) disables password expiration. For new installations, the default value is 30. For upgrades, the previous value will migrate automatically to the upgraded installation.
Users will be notified <n> days prior to password expiring	The number of days before the password expiration date, to notify a user that their password is about to expire. Users see a Password Expiration Message dialog when they log on to NetWitness Suite. The minimum value is 1 day.
Minimum Password Length	Specifies a minimum password length. A minimum password length prevents users from using short passwords that are easy to guess. There is a minimum password length of 4 characters required by default.
Uppercase	Specifies a minimum number of uppercase characters for the password. This includes European language characters A through Z, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic uppercase: Д Ц • Greek uppercase: Π Λ
Lowercase	Specifies a minimum number of lowercase characters for the password. This includes European language characters a through z, sharp-s, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic lowercase: д ц • Greek lowercase: π λ
Decimal Digits	Specifies a minimum number of decimal characters (0 through 9) for the password.
Special (~!@#$%^&*_-+=`|'(){}[]:;<>,".?/)	Specifies a minimum number of special characters for the password: ~!@#$%^&*_-+=`|'(){}[]:;<>,".?/

Requirement	Description
Non-Latin Alphabetic	Specifies a minimum number of Unicode alphabetic characters that are not uppercase or lowercase. This includes Unicode characters from Asian languages. For example: • Kanji (Japanese): 頁 (leaf) 枒 (tree)
Password May Not Contain Username	Specifies that a password cannot contain the case-insensitive username of the user.

4. If you want your password policy changes to take effect at the next login instead of the next password change, select **Force all internal users to change their passwords on the next login**. Note that this setting is checked by default.
5. Click **Apply**.
   The password strength settings take effect when internal users create or change their passwords. If you selected **Force all internal users to change their passwords on the next login**, all internal users must change their password the next time they log on to NetWitness Suite.

Step 2. Change the Default Admin Passwords

This topic provides instructions for changing the admin password for the NetWitness Suite service and for the Core services.

The system administrator's user account is installed with NetWitness Suite. The username is **admin** and the default password is the password that was entered in the Text-based User Interface (TUI) during the NetWitness Suite installation process. The **Administrators** role is assigned to admin. This role has full system privileges to control what a user can do and which services a user can access. The only modification you can make to this account is to change the password. Unlike other NetWitness Suite users, changes to the **admin** user password do not automatically propagate to downstream services. When you configure the password strength settings, they apply to all NetWitness Suite users, including the admin user.

Passwords, an important aspect of computer security, are the front line of protection for your system. The **admin** user is pre-installed in NetWitness Suite and on each Core service. For security, you create the Users and Roles for your organization in NetWitness Suite, and on each Core service.

Best Practices

RSA recommends the following best practices:

- Change the **admin** password of each service from the default.
- Create a different password for the **admin** account on each service.

Change the admin Password for the NetWitness Suite

Change the **admin** password for the NetWitness Suite in the Profile view. See "Change Password" in the *NetWitness Suite Getting Started Guide*. The password of the **admin** user does not propagate to Core services.

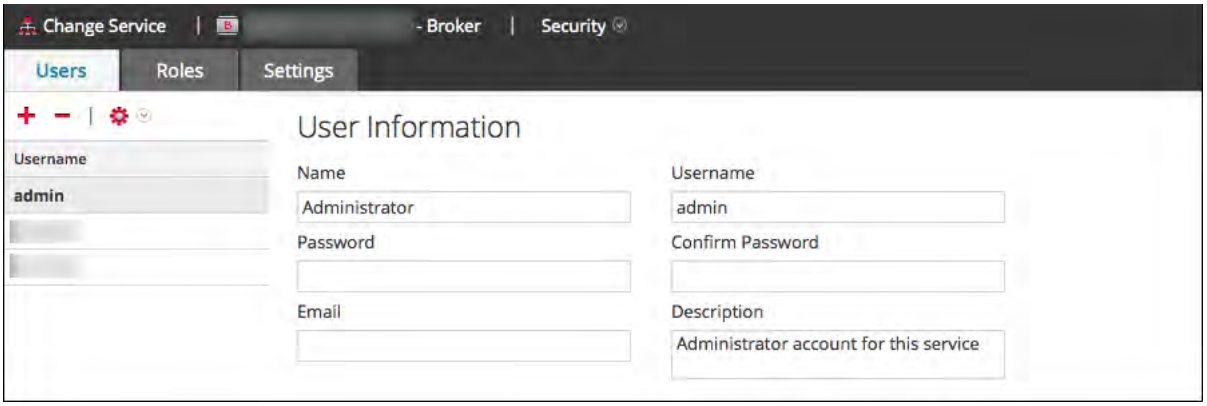
Note: After you change the admin password, you must remove and re-add a Data Source on the Reporting Engine. For more information, see the **Remove and re-add a Data Source on the Reporting Engine** section below.

Change the admin Password for Core Services

To change the admin password for a Core service:

1. In NetWitness Suite, go to **ADMIN > Services.**
2. Select a service, and then select  **> View > Security**.

3. On the **Users** tab, select the **admin** user.



4. In the **Password** field, type a new admin password for the selected service.
5. In the **Confirm Password** field, retype the new password.
6. Click **Apply**.

Note: After you change the admin password, you must remove and re-add a Data Source on the Reporting Engine. For more information, see **Remove and re-add a Data Source on the Reporting Engine** below.

Remove and re-add a Data Source on the Reporting Engine

Reporting Engine validates a Data Source using the Data Source username and password. If you change the username or password of a Data Source, you must remove and re-add the Data Source.

To remove and re-add a data source on the Reporting Engine:

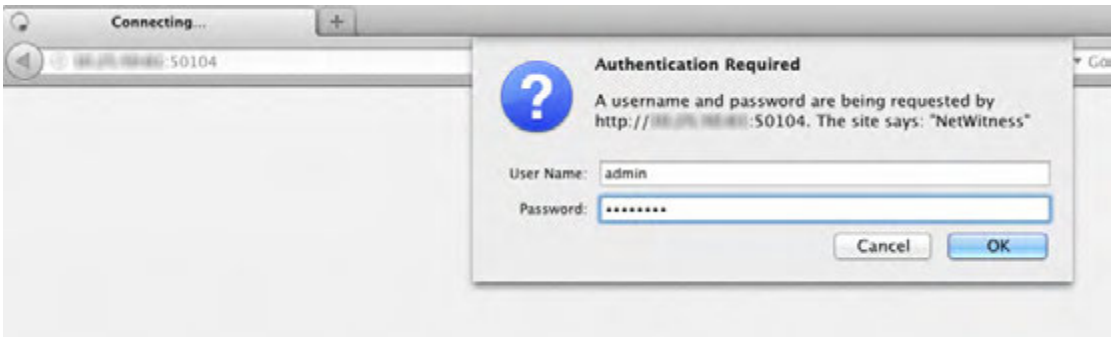
1. In NetWitness Suite, go to **ADMIN > Services**.
2. In the Services view, select Reporting Engine and **View > Config**.
3. Click the **Sources** tab.
4. Select a service to remove and click −
5. Click + and select **Available Services.**
6. Select the service you removed in step 4 and click **OK**.
7. When prompted, enter the new username and password for the service.

Change the admin Password for a Service Using the REST API

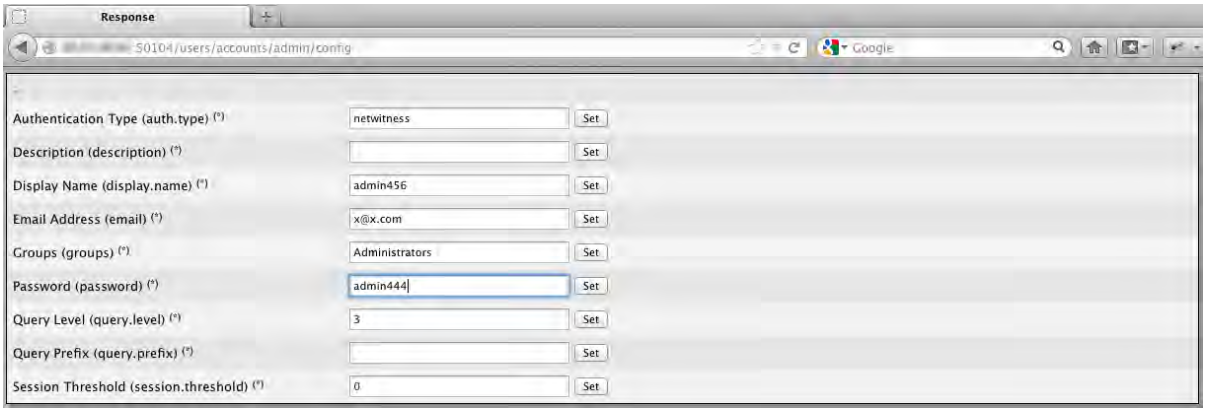
In rare circumstances, you may need to change the admin password for a Core service outside of the NetWitness Suite user interface. This is simply another way to perform the Core service password change, and is not the preferred method.

To change the admin password for the service using the REST User Interface:

1. Open a web browser, and go to the following URL:
   <hostname>:<port>
   where the **hostname** is the name of a NetWitness Suite Core service and **port** is the port used for REST communication. Here is an example for a Decoder:
   `http://10.20.30.40:50104`
   The authentication dialog is displayed.



2. In the dialog enter the user name and password used for authentication as admin on the service, and click **OK**. The default user name is **admin** and the default password is **netwitness**.
   The REST window for the service is displayed.
3. Navigate through the node structure to **users/accounts/admin/config**.
   The user configuration fields for admin are displayed in the browser window.



4. In the Password field, type a new admin password and click **Set**.

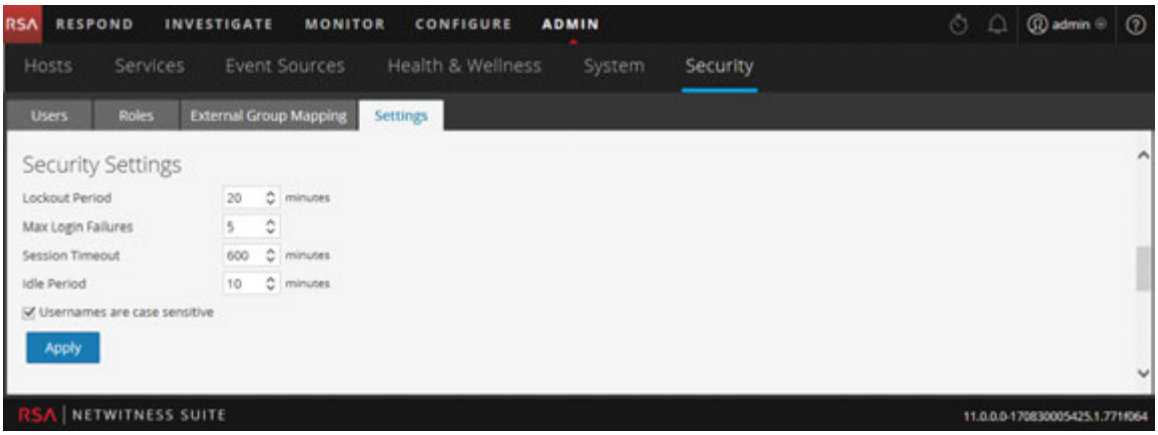
Step 3. Configure System-Level Security Settings

This topic explains how to set system-wide security parameters.

Most global security settings, such as the maximum number of failed login attempts to allow, apply to all NetWitness Suite users and sessions. Settings related to passwords in the Password Strength section, such as password expiration period and the default number of days before user passwords expire, apply to internal NetWitness Suite users, but not external users.

Configure Security Settings

1. In NetWitness Suite, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.



3. In the **Security Settings** section, specify values for the fields as described in the following table.

Field	Description
Lockout Period	Number of minutes to lock a user out of NetWitness Suite after the configured number of failed logins is exceeded. The default value is 20 minutes.
Max Login Failures	The maximum number of unsuccessful login attempts before a user is locked out. The default value is 5.

Field	Description
Session Timeout	The maximum duration of a user session before timing out in minutes. The default value is 600. The session times out when the configured time has elapsed, after which the user must log in again. The maximum allowed value is 30,000. **Note:** If you migrated to NetWitness Suite 11.0 from version 10.6.x and previously used a value of 0 for an unlimited session timeout, the value was reset automatically to 30,000 minutes, as a value of 0 is no longer supported.
Idle Period	Number of minutes of inactivity before a session times out. The default value is 10. The maximum allowed value is 30,000. **Note:** If you migrated to NetWitness Suite 11.0 from version 10.6.x and previously used a value of 0 for an unlimited idle period, the value was reset automatically to the default value of 10, as a value of 0 is no longer supported.
Usernames are case sensitive	Select this option if you want the Username field on the NetWitness Suite login screen to be case sensitive. For example, if usernames are case sensitive, you could use admin to log on to NetWitness Suite, but you could not use Admin.

4. Click **Apply**. The Security Settings take effect immediately. If a password expires, the user receives a prompt to change the password when they log on to NetWitness Suite.

Step 4. (Optional) Configure External Authentication

This topic introduces the external authentication methods that NetWitness Suite supports.

When a user logs in, NetWitness Suite first attempts to authenticate locally. If no local user is found, and External Authentication configuration is enabled, an attempt is made to authenticate externally.

External authentication allows users who do not have an internal NetWitness Suite user account to log on to NetWitness Suite and receive role-based permissions.

NetWitness Suite supports two methods of external authentication, Active Directory and Pluggable Authentication Modules (PAM). Topics in this section describe how to configure and test each method.

Topics

- Configure Active Directory
- Configure PAM Login Capability

Configure Active Directory

This topic explains how to configure NetWitness Suite to use Active Directory to authenticate external user logins.

When a user logs in, NetWitness Suite first attempts to authenticate locally. If no local user is found, and Active Directory configuration is enabled, an attempt is made to authenticate with Active Directory Service. You can configure Active Directory settings to enable authentication of external groups in the Admin > Security view > Settings tab.

In an environment with multiple authentication servers, LDAP forwarding allows LDAP referral following for AD group lookups. LDAP forwarding can increase the time required to log on because AD group lookups are extended to connected authentication servers. When your AD instance attempts to contact domain controllers that are blocked by your firewall, users can experience a delay of several minutes in logging on to NetWitness Suite. NetWitness Suite has a configuration option that specifies whether LDAP forwarding occurs; by default, LDAP referrals are disabled. When disabled, your AD instance does not attempt to contact referred domain controllers.

Note: The Settings tab also provides the option to enable PAM configuration, which can be used simultaneously with Active Directory configurations. For information on enabling and configuring PAM authentication, see Configure PAM Login Capability.

Procedures

Configure Active Directory Authentication

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.
   The Active Directory Configurations list is displayed in the panel so that you can add or edit

a configuration.

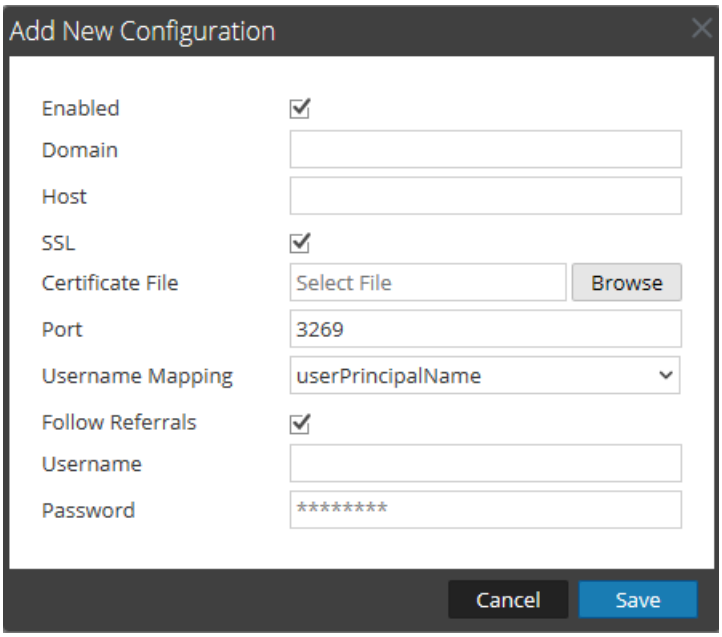
3. Add, edit, or delete domains as necessary, as described in the following sections.
   The domains added to this list are automatically populated in the External Group Mapping tab so that you can map security roles to each group.

Note: To configure security roles used for Active Directory access, see Step 5. (Optional) Map User Roles to External Groups.

Add a New Active Directory Configuration

To add a new active directory configuration in the Active Directory Configurations list:

1. Under Active Directory Configurations, click +.
   The Add New Configuration dialog is displayed.



2. Click the **Enabled** checkbox.
3. Enter **Domain**, **Host** and **Port** information for the Active Directory Service.
4. (Optional) To select SSL for this configuration, check the **Use SSL** checkbox. You must then enter a certificate file by clicking **Browse** and selecting the desired file to upload. If the AD server uses a public CA signed certificate, you do not need to upload a certificate. If the AD server uses a self-signed certificate, then you must upload either the CA certificate or the self-signed certificate
5. In the **Username Mapping** field, select the Active Directory search field to use for username mapping. You can select userPrincipalName (UPN) or sAMAccountName.
6. For sites that have multiple authentication servers, click **Follow Referrals** to enable or disable LDAP referral following for AD group lookups.
7. To provide credentials to bind to the Active Directory Service while searching Active Directory group, enter the credentials in the **Username** and **Password** fields.

Note: If you selected sAMAccountName in the **Username Mapping** field, you must enter the username in the format "domain\user" to authenticate.

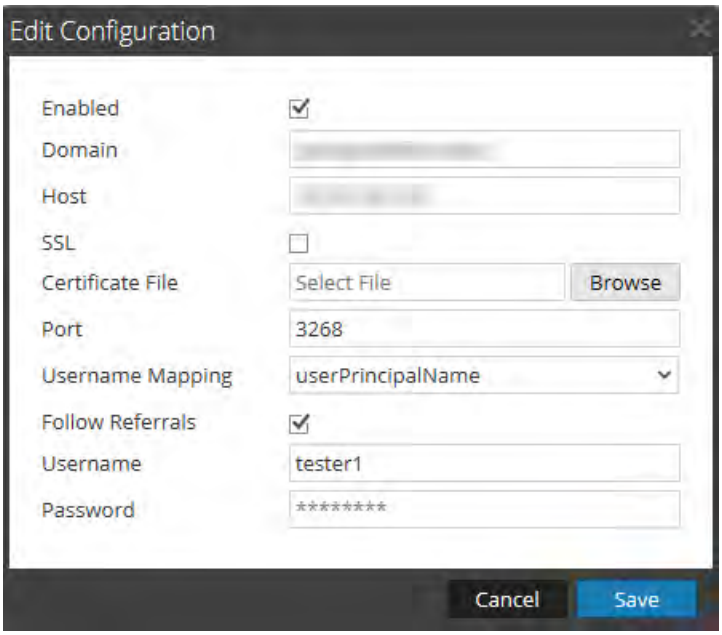
8. Click **Save**.
   The new configuration is listed in the Active Directory Configurations list.

Edit an Active Directory Configuration

To edit an active directory configuration in the Active Directory Configurations list:

1. Under **Active Directory Configurations**, select the configuration you wish to edit and click .

   The Edit Configuration dialog is displayed.



2. (Optional) Enter the **Domain**, **Host** and **Port** information for the Active Directory Service.
3. (Optional) To select SSL for this configuration, check the **Use SSL** checkbox. You must then enter a certificate file by clicking **Browse** and selecting the desired file.
4. (Optional) In the **Username Mapping** field, select the the Active Directory search field to use for username mapping.
5. To specify the Follow LDAP referrals behavior in environments with multiple authentication servers, click the **Follow Referrals** checkbox.
   a. If you want to disable LDAP forwarding, uncheck the box.
   b. If you want to enable LDAP forwarding, check the box.
6. To provide credentials to bind to the Active Directory Service while searching Active Directory group, enter the credentials in the **Username** and **Password** fields.
7. Click **Save**.
   The configuration is listed in the Active Directory Configurations list.

Test an Active Directory Configuration

To test an active directory configuration:

1. Select the configuration to be tested from the Active Directory Configurations list.
2. In the toolbar, click Test.
   A message that the test is successful is displayed.
3. If the test does not succeed, review and edit the configuration.

Delete an Active Directory Configuration

To delete an active directory configuration:

1. Under Active Directory Configurations, select the configuration to be deleted from the Active Directory Configurations list.
2. In the toolbar, click −.
   A message is displayed warning you that all users in the selected Active Directory configuration will not be able to log in to NetWitness Suite if it is deleted.
3. Do one of the following:
   a. To confirm the deletion, click **Yes**.
   b. To cancel the deletion, click **No**.

Configure PAM Login Capability

This topic explains how to configure NetWitness Suite to use Pluggable Authentication Modules (PAM) to authenticate external user logins.

PAM login capability involves two separate components:

- PAM for user authentication
- NSS for group authorization

Together they provide external users the capability to log on to NetWitness Suite without having an internal NetWitness Suite account, and to receive permissions or roles determined by mapping the external group to a NetWitness Suite security role. Both components are required for a login to succeed.

External authentication is a system-level setting. Before configuring PAM, carefully review all of the information here.

Pluggable Authentication Modules

PAM is a Linux-provided library responsible for authenticating users against authentication providers such as RADIUS, Kerberos, or LDAP. For implementation, each authentication provider uses its own module, which is in the form of an operating system (OS) package such as pam_ldap. NetWitness Suite uses the OS-provided PAM library, and the module that the PAM library is configured to use, to authenticate users.

Note: The PAM provides only the ability to authenticate.

Name Service Switch

NSS is a Linux feature that provides databases that the OS and applications use to discover information like hostnames; user attributes like home directory, primary group, and login shell; and to list users that belong to a given group. Similar to PAM, NSS is configurable and uses modules to interact with different types of providers. NetWitness Suite uses OS-provided NSS capabilities to authorize external PAM users by looking up whether a user is known to NSS and then requesting from NSS the groups of which that user is a member. NetWitness Suite compares the results of the request to the NetWitness Suite External Group Mapping and if a matching group is found, the user is granted access to log on to NW with the level of security defined in the External Group Mapping.

Note: NSS does not provide authentication.

PAM and NSS Combination

Both PAM (authentication) and NSS (authorization) must succeed in order for an external user to be allowed to log on to NetWitness Suite. The procedure for configuring and troubleshooting PAM is different than the procedure for configuring and troubleshooting NSS. The PAM examples in this guide include Kerberos, LDAP, and Radius. The NSS examples include Samba, LDAP, and UNIX. The PAM and NSS module combination used is determined by site needs.

Process Overview

To configure PAM login capability, follow the instructions in this document to complete each step:

1. Configure and test the PAM module.
2. Configure and test the NSS service.
3. Enable PAM in NetWitness Server.
4. Create group mappings in NetWitness Server.

Prerequisites

Before beginning the setup of PAM, review the procedure and gather the external authentication server details depending on the PAM module you want to implement.

Before beginning the setup of NSS, review the procedure, identify the group names that you will use in the External Group mapping, and gather the external authentication server details, depending on the NSS service being used.

Before beginning setup of PAM in NetWitness Suite, identify the group names that you will use in the External Group mapping. When mapping roles, the role in NetWitness Suite must match a group name that exists in the external authentication server.

Configure and Test the PAM Module

Choose one of the following sections to set up and configure the PAM component:

- PAM Kerberos
- PAM LDAP
- PAM RADIUS
- SecurID

PAM Kerberos

Kerberos Communication Ports – TCP 88

To configure PAM authentication using Kerberos:

1. Execute the following command (but first verify that the `krb5-workstation` package is installed in your environment):
   `yum install krb5-workstation pam_krb5`
2. Edit the following lines in the Kerberos configuration file `/etc/krb5.conf`. Replace variables, which are delimited by <angle brackets>, with your values and omitting the angle brackets. Capitalization is required where shown.

```
# Configuration snippets may be placed in this directory as well
includedir /etc/krb5.conf.d/

[logging]
default = FILE:/var/log/krb5libs.log
kdc = FILE:/var/log/krb5kdc.log
admin_server = FILE:/var/log/kadmind.log

[libdefaults]
 dns_lookup_realm = false
 ticket_lifetime = 24h
 dns_lookup_kdc = true
 renew_lifetime = 7d
 forwardable = true
 rdns = false
 default_realm = <DOMAIN.COM>
 default_ccache_name = KEYRING:persistent:%{uid}

[realms]
 <DOMAIN.COM> = {
 kdc = <SERVER.DOMAIN.COM>
 admin_server = <SERVER.DOMAIN.COM>
 }

 [domain_realm]
 <domain.com> = <DOMAIN.COM>
 <.domain.com> = <DOMAIN.COM>
```

3. Test the Kerberos configuration with the command:
   `kinit <user>@<DOMAIN.COM>`
   No output after entering the password indicates success.

4. Edit the NetWitness Server PAM configuration file `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:
   `auth sufficient pam_krb5.so no_user_check`

This completes the configuration for PAM Kerberos. Now, proceed to the next section, *Configure and Test the NSS Service*.

PAM LDAP

LDAP Communication Ports - TCP 389 or TCP 636

TCP 389 can be used for both unencrypted and in most cases encrypted traffic and is usually sufficient. Most modern LDAP implementations support the `start_tls` command once connected to port 389, which upgrades the connection from an unencrypted to an encrypted state. In this instance, LDAP URIs still begin with `ldap://` even when using `start_tls`.

TCP 636 is used only in instances where the LDAP server does not support the `start_tls` command. In this case, LDAP URIs begin with `ldaps://` and the `start_tls` command is not used.

To configure PAM authentication using LDAP:

1. Execute the following command (but first verify that the `openldap-clients` package is installed in your environment):
   `yum install nss-pam-ldapd openldap-clients`
2. Edit the LDAP configuration file `/etc/nslcd.conf` as shown in the following example:

Note: Replace variables, which are delimited by <angle brackets>, with your values and omit the angle brackets. Capitalization is required where shown.

Sample `/etc/nslcd.conf` file entries:

```
uri ldap://<server.domain.com>
 base <dc=domain,dc=com>
 binddn <cn=bineuser,dc=domain,dc=com>
 bindpw <secret>
```

3. After modifying the `/etc/nslcd.conf` file, run the following command:
   `systemctl restart nslcd`
4. (Optional) To enable secure transport for LDAP communication with peer certificate verification (more secure), refer to Linux man page for nslcd for the correct code modification for the `/etc/nslcd.conf` file.

> **Note:** Windows domain controllers do not by default enable secure LDAP transport. They require the installation of a server certificate for Server Authentication. Obtaining and installing this certificate onto the DC is outside the scope of this document. Some guidance on this is available at https://social.technet.microsoft.com/wiki/contents/articles/2980.ldap-over-ssl-ldaps-certificate.aspx.

5. (Optional) To enable secure transport for LDAP communication without peer certificate, refer to Linux man page for nslcd for the correct code modification for the `/etc/nslcd.conf` file.
6. To troubleshoot the LDAP configuration, first stop the `nslcd` service by entering the following command:
   ```
   systemctl stop nlscd
   ```
7. To output troubleshooting and status information from the service to the console, run the `nslcd` service in debug mode from the command line:
   ```
   nslcd -d
   ```
8. Edit the NetWitness Server PAM configuration file `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:
   ```
   auth sufficient pam_ldap.so
   ```

This completes the configuration for PAM LDAP. Now, proceed to the next section, *Configure and Test the NSS Service*.

PAM RADIUS

Radius Communication Ports - UDP 1812 or UDP 1813

To configure PAM authentication using Radius you must add the NetWitness Server to your Radius Server's Client list and configure a shared secret. Contact the Radius Server Administrator for this procedure.

To configure PAM authentication for RADIUS using LDAP:

1. Execute the following command (but first verify that the `pam_radius` package is installed in your environment):
   ```
   yum install pam_radius
   ```
2. Edit the RADIUS configuration file, `/etc/raddb/server` as follows:
   ```
   # server[:port] shared_secret  timeout (s)
   server    secret     3
   ```
3. Edit the NetWitness Server PAM configuration file `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:
   ```
   auth sufficient pam_radius_auth.so
   ```

Caution: For PAM RADIUS to work, the `/etc/raddb/server` files must have write permission. The command needed for this is: `chown netwitness:netwitness /etc/raddb/server`.

The PAM Modules and associated services output information to `/var/log/messages` and `/var/log/secure`. These outputs can be used to assist in troubleshooting configuration problems.

The following procedure is an example of the steps to configure PAM authentication for RADIUS using SecurID:

Note: The examples in these tasks use RSA Authentication Manager as the RADIUS server.

1. Execute the following command (but first verify that the `pam_radius` package is installed in your environment):

   ```
   yum install pam_radius
   ```

2. Edit the RADIUS configuration file, `/etc/raddb/server` and update it with the authentication manager instance hostname, shared secret and timeout value:

   ```
   # server[:port] shared_secret timeout (s)
   111.222.33.44       secret      1
   #other-server       other-secret 3
   192.168.12.200:6369 securid     10
   ```

   Note: You must comment out `127.0.0.1` & `other-server` lines and add the IP address of the authentication manager primary instance with RADIUS port number (for example, `192.168.12.200:1812`), RADIUS shared secret and a timeout value of 10.

3. Edit the NetWitness Server PAM configuration file `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:

   ```
   auth sufficient pam_radius_auth.so
   ```

   Note: You can add `debug` to the end of the above line in the `/etc/pam.d/securityanalytics` file to enables PAM debugging (for example, `auth sufficient pam_radius_auth.so debug`)

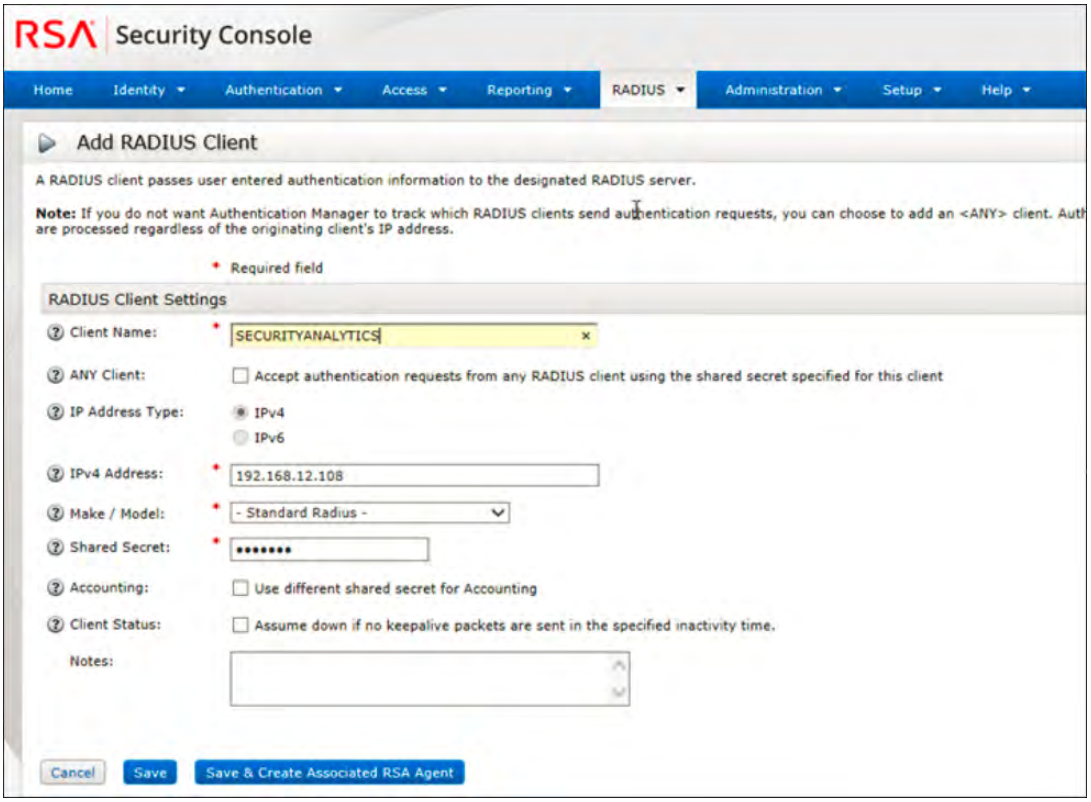
The PAM Modules and associated services output information to `/var/log/messages` and `/var/log/secure`.These outputs can be used to assist in troubleshooting configuration problems.

Add a RADIUS Client and Associated Agent

Note: The examples in these tasks use RSA Authentication Manager as the RADIUS server. You must use administrative account credentials to log on RSA Authentication Manager Security Console.

To add a RADIUS Client and Associated Agent:

1. Log on to RSA Authentication Manager.
   The Security Console is displayed.
2. In the Security Console, Click **RADIUS > RADIUS Client > Add New**.
   The Add RADIUS Client page is displayed.

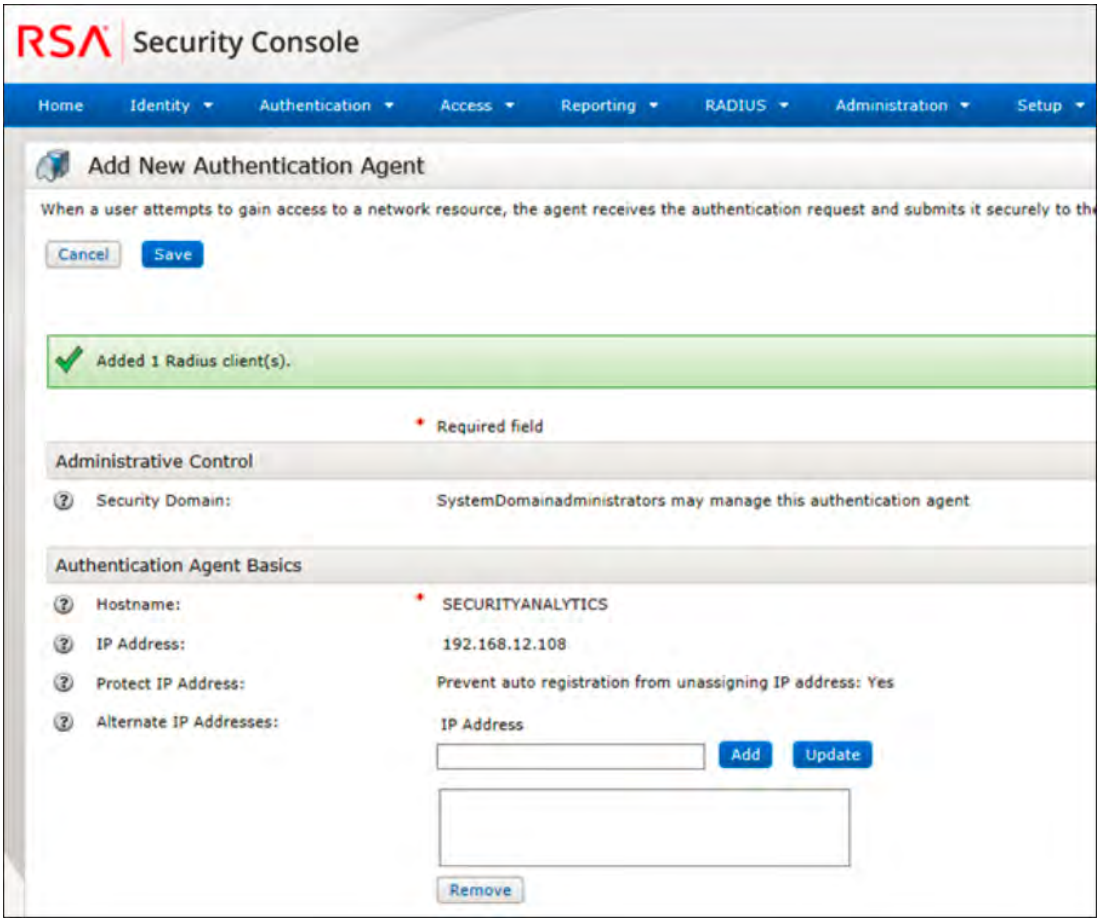


3. In RADIUS Client Settings, provide the following information:
   a. In the **Client Name** field, enter the name of the client, for example, NetWitness Suite.
   b. In the **IPv4 Address** field, enter the IPv4 address of the RADIUS client, for example, 192.168.12.108.
   c. In the **Make/Model** drop-down list, select the type of RADIUS client, for example,

Fortinet.

d. In the **Shared Secret** field, enter the authentication shared secret.

4. Click **Save & Create Associated RSA Agent**.



5. Click **Save**.

If Authentication Manager Instance is unable to find the authentication agent on the network, A warning page is displayed. Click **Yes, Save Agent**.

For more information, see Add a RADIUS Client topic in *RSA Authentication Manager 8.2 Administrator's Guide*.

This completes the configuration for PAM RADIUS. Now, proceed to the next section, *Configure and Test the NSS Service*.

PAM Agent for SecurID

PAM Communication Port - UDP 5500

Prerequisites

The RSA SecurID PAM module is supported only under the following conditions:

1. Trusted connections must be enabled and functioning between NetWitness Suite and Core services.

Process Overview

The high-level steps to configure the SecurID PAM module are:

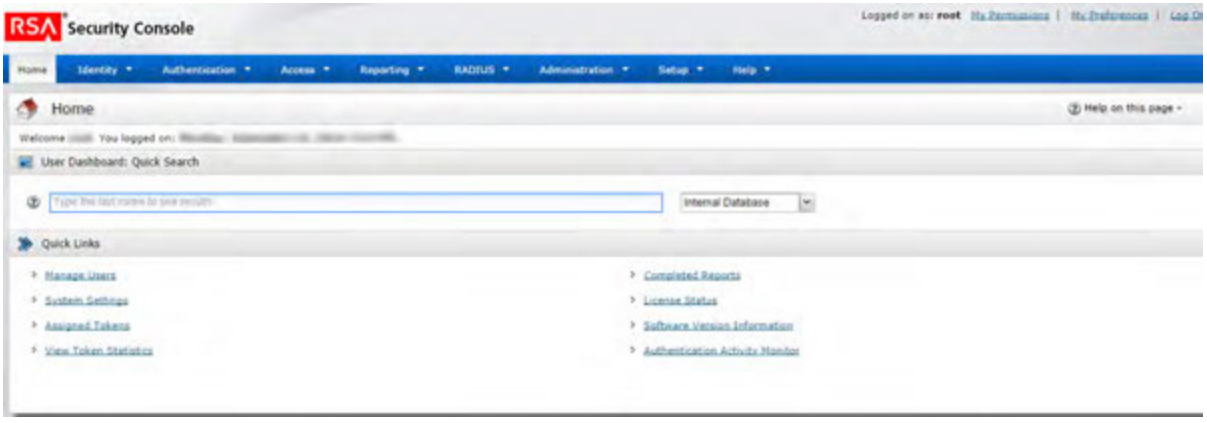
1. Configure **Authentication Manager**:
   a. Add Authentication Agent.
   b. Download configuration file.
2. Configure **NetWitness Server**:
   a. Copy configuration file from Authentication Manager and customize it.
   b. Install the PAM SecurID Module.
3. Test connectivity and authentication.

Then follow the remaining procedures in the sections that follow:

- Configure NSS.
- Enable PAM in NetWitness Server.
- Configure group mappings in NetWitness Server.

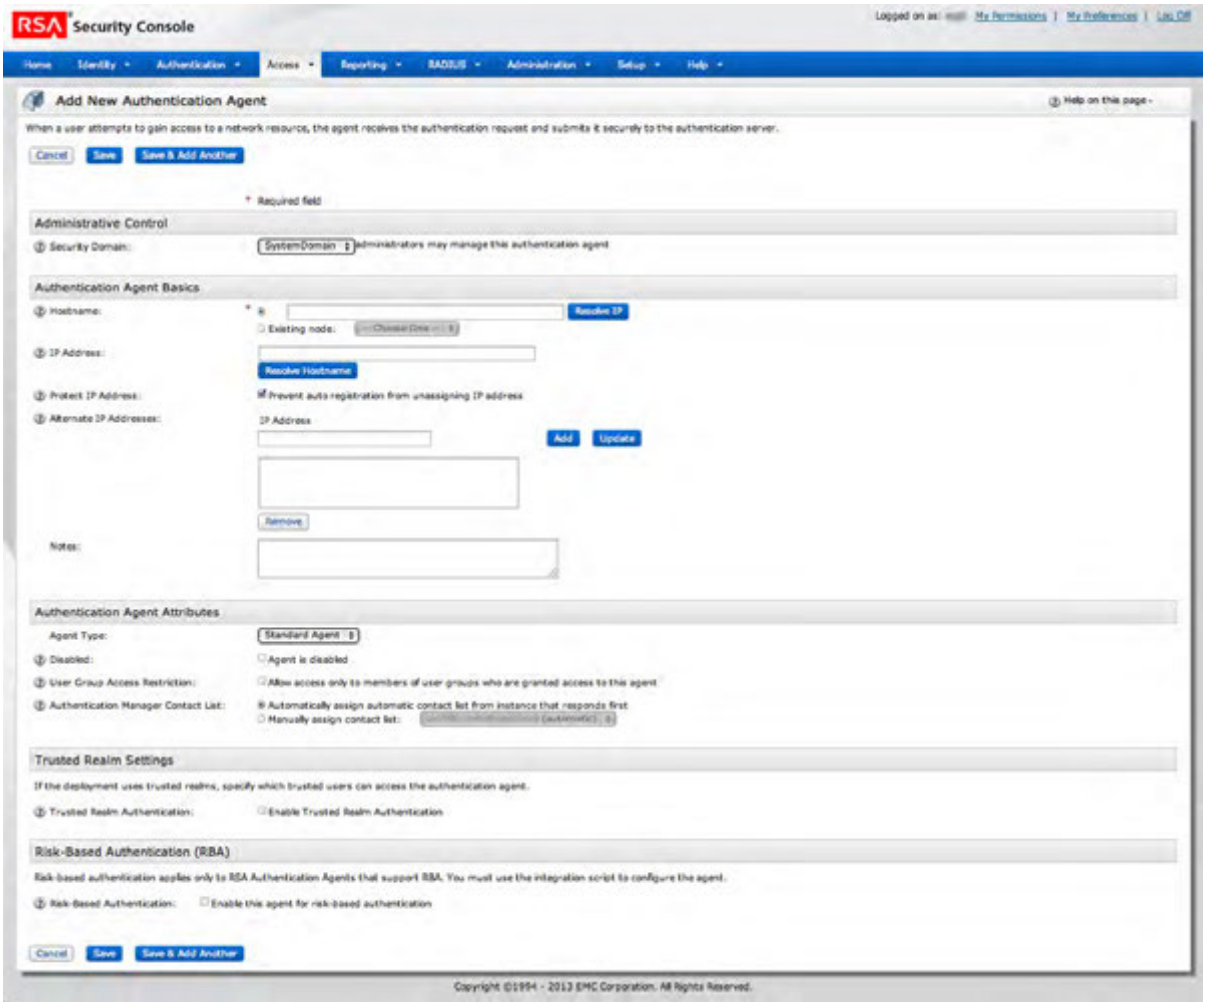
To configure Authentication Manager:

1. Log on to RSA Authentication Manager.
   The Security Console is displayed.

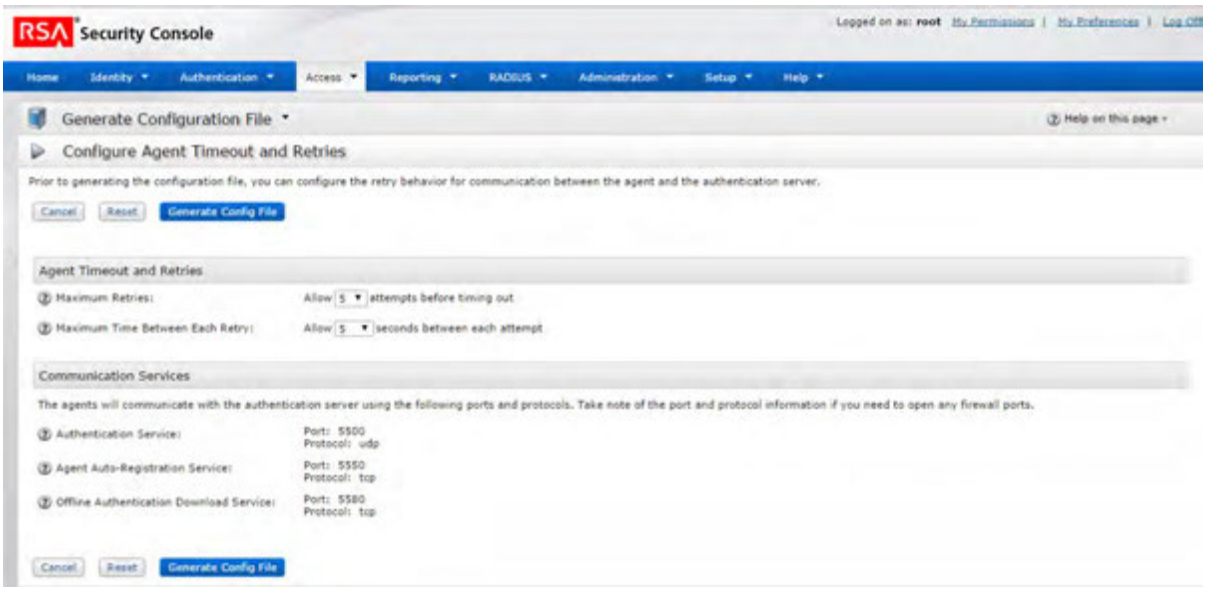


2. In the Security Console, add a new authentication agent.
   Click **Access > Authentication Agents > Add New.**

The Add New Authentication Agent page is displayed.



3. In the **Hostname** field, type the hostname of the NetWitness Server.
4. Click **Resolve IP**.
   The IP address of the NetWitness Server is automatically displayed in the **IP Address** field.
5. Keep the default settings and click **Save**.
6. Generate a configuration file.
   Go to **Access > Authentication Agents > Generate Configuration File**.
   The Generate Configuration File page is displayed.



7. Keep the defaults and click **Generate Config File**.
   This creates **AM_Config.zip**, which contains two files.
8. Click **Download Now**.

To install and configure the PAM SecurID module:

1. On the NetWitness Server, make a directory:
   `mkdir /var/ace`
2. On the NetWitness Server, copy `sdconf.rec` from the .zip file to `/var/ace`.
3. Create a text file `sdopts.rec` in the `/var/ace` directory.
4. Insert the following line:
   `CLIENT_IP=<IP address of NetWitness Server>`
5. Install the SecurID Authorization Agent for PAM, which is available in the yum repository:
   `yum install sid-pam-installer`
6. Run the install script:
   `/opt/rsa/pam-agent-installer/install_pam.sh`
7. Follow the prompts to accept or change the defaults.
8. Edit the NetWitness Server PAM configuration file, `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:
   `auth sufficient pam_securid.so`

This completes the installation of the SecurID PAM module. Next, test the connectivity and authentication. Then, follow the procedures in Configure and Test the NSS Service.

Note: If the PAM SecurID setup is not complete, it may crash the Jetty server and the NetWitness Suite UI will not be displayed. You must wait until the PAM authentication configuration is complete and then restart the Jetty server.

To test connectivity and authentication:

1. Run `/opt/pam/bin/64bit/acetest`, enter **username** and **passcode**.
2. (Optional) If acetest fails, turn on debugging:

   ```
   vi/etc/sd_pam.conf
   RSATRACELEVEL=15
   ```

3. Run `/opt/pam/bin/64bit/acestatus`. Output below

   ```
   RSA ACE/Server Limits
    ---------------------
    Configuration Version : 15 Client Retries : 5
    Client Timeout : 5 DES Enabled : Yes

   RSA ACE/Static Information
    --------------------------
    Service : securid Protocol : udp Port Number : 5500

   RSA ACE/Dynamic Information
    ---------------------------
    Server Release : 8.1.0.0 Communication : 5

   RSA ACE/Server List
    -------------------
    Server Name :  auth81.netwitness.local
    Server Address :  192.168.100.10
    Server Active Address : 192.168.100.10
    Master : Yes Slave : No Primary : Yes
    Usage : Available for Authentications
   ```

4. (Optional) To troubleshoot the Authentication Manager server, go to **Reporting > Real-time Activity Monitors > Authentication Activity Monitor.** Then click **Start Monitor**.
5. If you changed the setting, reset RSATRACELEVEL to 0:

   ```
   vi/etc/sd_pam.conf
   RSATRACELEVEL=0
   ```

Caution: After installation, verify that VAR_ACE in the `/etc/sd_pam.conf` file points to the correct location of the sdconf.rec file. This is the path to the configuration files. The command needed for this is: `chown -R netwitness:netwitness /var/ace`.

This completes the configuration for PAM Agent for SecurID. Now, proceed to the next section, *Configure and Test the NSS Service*.

Configure and Test the NSS Service

Choose an NSS Service

There are three NSS service options: Samba, LDAP, and UNIX. There are advantages and disadvantages to all three.

NSS Samba Pros	NSS Samba Cons
Purpose built for Active Directory	Cannot be used with non-AD back-ends
Minimal to no configuration must be performed in Active Directory	Potentially more difficult to configure and troubleshoot
No special user accounts needed	Requires the NW Server machine be joined to the Active Directory Domain
	Uses many ports to communicate with Active Directory; more difficult to implement across firewalls and proxies

NSS LDAP Pros	NSS LDAP Cons
Basic configuration is simpler	May require additional configuration and roles inside of Active Directory
Can communicate with any LDAP implementation	Requires configuration of an LDAP bind account
Uses a single TCP port for communication - easier to work with firewalls and proxies	More difficult to enable secure transport unless configured to not validate server certificates
Does not require joining NW host to AD domain	

NSS UNIX

No configuration is necessary to enable the NSS UNIX module; it is enabled in the host operating system by default. To authorize a user for a specific group, simply add that user to the operating system and add them to a group:

1. Create an OS group to use add your external user to with this command:
   ```
   groupadd <groupname>
   ```
2. Add the external user to the OS with this command:
   ```
   adduser -G <groupname> -M -N <externalusername>
   ```

Note: Note that this does NOT permit or allow access to the NW Server console.

This completes the configuration for NSS UNIX. Next, go to Test NSS Functionality.

NSS Samba

AD Winbind Communication Ports

The following ports are the minimum ports internal testing indicates should be open to permit NSS Samba functionality. These are provided only as a reference.

TCP 88 - Kerberos
TCP 139 - Netbios
TCP 389 - LDAP
UDP 53 - DNS
UDP 88 - Kerberos
UDP 389 - LDAP

Additional ports may be needed, depending on site-specific requirements of implementation. See the following article for information on all ports Active Directory communication may require: http://technet.microsoft.com/en-us/library/dd772723%28ws.10%29.aspx

To configure NSS Samba:

1. Edit the Samba configuration file, `/etc/samba/smb.conf`, as follows. Replace variables, which are delimited by <angle brackets>, with your values and omitting the angle brackets. Capitalization is required where shown.

```
[global]
workgroup = domain
netbios name = <NW_APPLIANCE_HOSTNAME>
password server = <ADSERVER.DOMAIN.COM>
realm = <DOMAIN.COM>

local master = no
security = ads
syslog only = yes
log file = /var/log/samba/log.%m
max log size = 5120
idmap config * : range = 16777216-33554431
template shell = /bin/bash
winbind use default domain = true
winbind offline logon = false
winbind enum groups = yes
```

2. To enable and start the Windows binding service, `winbind`, enter the following commands:

```
systemctl enable winbind
systemctl start winbind
```

3. Edit the NSS configuration file, `/etc/nsswitch.conf`. Update only the below 2 entries and leave the rest all default:

```
passwd:     files winbind
group:      files winbind
```

4. To join the Domain, enter the following command:

```
net ads join -U <DomainAdminUser>
```

5. To store the Domain Controller SID, enter the following command:

```
net rpc getsid -S <SERVER.DOMAIN.COM>
```

6. Test NSS functionality as described in the *Test NSS Functionality* section.

7. When you have confirmed that NSS is working properly from the command line, to reboot the host for the NSS changes to take effect, enter the following command.

```
reboot
```

To troubleshoot NSS Samba:

To confirm whether NSS Winbind is able to communicate successfully with Active Directory:

1. Enter the following commands:
   `wbinfo -u` to return a list of AD users
   `wbinfo -g` to return a list of AD groups
2. If neither command succeeds, run `winbind` in console debug mode by entering the following commands:
   ```
   systemctl stop winbind
   winbindd -S -F -d <optional debugleve 0-10>
   ```
3. From a separate ssh session, repeat step 1 and watch the `winbindd` output for any indication of the problem.
   Increase `winbindd` debugging verbosity as needed.
4. Make any necessary adjustments to `/etc/samba/smb.conf`.
5. In the `winbindd` debug window from step 2, stop `winbindd` by typing `CTRL-C`.
   Repeat steps 1 and 2 and continue troubleshooting until the `wbinfo` commands succeed.
6. Once the `wbinfo` commands succeed, use the `getent` commands from the Testing NSS Functionality section of this guide to test NSS.
   ```
   getent passwd <pamUser>
   getent group <groupOfPamUser>
   ```
7. When `getent` succeeds, stop the command line `winbindd` by typing `CTRL-C` and enter the following command to start the service daemon:
   ```
   systemctl start winbind
   ```

If `wbinfo -g` succeeds from the command line but search for external group mapping does not display any Active Directory groups:

1. Add the following line to to `/etc/samba/smb.conf`:
   ```
   allow trusted domains = no
   ```
2. Type `systemctl restart winbind .`

This completes the configuration for NSS Samba. Next, go to Test NSS Functionality.

NSS LDAP

Note: These instructions require all Active Directory PAM user and NSS group objects to have their `uidNumber` and `gidNumber` attributes set to UNIX-style UID and GID numbers in order to be used by NSS LDAP. Older Active Directory schemas may not have these attributes by default. Newer AD schemas may have these attributes but they may not be defined in each object. Correctly configuring these attributes is beyond the scope of this document. Contact your Active Directory administrator to have these attributes defined for your PAM users and NSS groups.

An LDAP bind user must be created in Active Directory in order for NSS to be used. This user should be configured to not have its password expire. Because these credentials must be specified to the NSS LDAP service in plaintext, the permissions of `/etc/nslcd.conf` should be left at their default of 600 so the file cannot be read by system users other than root.

LDAP Communication Ports - TCP 389 or TCP 636

TCP 389 can be used for both unencrypted and in most cases encrypted traffic and is usually sufficient. Most modern LDAP implementations support the `start_tls` command once connected to port 389, which upgrades the connection from an unencrypted to an encrypted state. In this instance, LDAP URIs still begin with `ldap://` even when using `start_tls`.

TCP 636 is only used in instances where the LDAP server does not support the `start_tls` command. In this instance, LDAP URIs begin with `ldaps://` and the `start_tls` command is not used.

To configure the NSS module for LDAP with Active Directory:

1. Obtain the `nss-pam-ldapd` package from the SMCUPDATE repository or from the NetWitness Server Updates Repository if the server is synchronized with SMCUPDATE. This requires a configured Live Account in NetWitness Suite.
2. To install the package, enter the following command:
   ```
   yum install nss-pam-ldapd
   ```
3. Edit `/etc/nslcd.conf` to include the lines below, ensuring that all existing lines in the file are first commented out using a hash mark # at the beginning of the line:
   ```
   uid nslcd
   gid ldap
   uri ldap://<server.domain.com>
   base <dc=domain,dc=com>
   binddn <cn=binduser,dc=domain,dc=com
   bindpw <secret>
   ```
   Note: You will need to add additional mappings between NSS lookups and LDAP lookups for your specific environment. Please refer to Linux man page for nslcd for specific details.

4. (Optional) To enable secure transport for LDAP communication with peer certificate verification (more secure), refer to Linux man page for nslcd for the correct code modification for the `/etc/nslcd.conf` file.

Note: Windows Domain Controllers do not by default enable secure LDAP transport. They require the installation of a server certificate for Server Authentication. Obtaining and installing this certificate onto the DC is outside the scope of this document. Some guidance on this is available from this URL: https://social.technet.microsoft.com/wiki/contents/articles/2980.ldap-over-ssl-ldaps-certificate.aspx

5. (Optional) To enable secure transport for LDAP communication without peer certificate, refer to Linux man page for nslcd for the correct code modification for the `/etc/nslcd.conf` file.
6. Edit the NSS configuration file `/etc/nsswitch.conf`. Update only the below two entries and leave the rest at their default values:
   ```
   passwd:files ldap
   group:files ldap
   ```
7. To enable and start the NSLCD service, enter these commands:
   ```
   systemctl enable nslcd
   systemctl start nslcd
   ```
8. Test NSS functionality using guidance in the *Test NSS Functionality* section. If NSS tests fail, troubleshoot NSS LDAP as described in *Troubleshoot NSS LDAP*.
9. When you have confirmed that NSS is working properly from the command line, reboot the host for the NSS changes to take effect.
   ```
   reboot
   ```

To troubleshoot NSS LDAP:

1. To troubleshoot NSS LDAP, first stop the nslcd service by entering the following command:
   ```
   systemctl stop nslcd
   ```
2. To output troubleshooting and status information from the service to the console, run the nslcd service in debug mode from the command line.
   ```
   nslcd -d
   ```
3. (Optional) To increase debug verbosity, add an additional d multiple times to the end of nslcd -d, for example, enter the following command:
   ```
   nslcd -ddd
   ```

4. From a separate ssh session, use the `getent` commands from the Testing NSS Functionality section of this guide to test NSS. Watch the debug output from nslcd for any indications of where the failure is occurring. Increase nslcd debugging verbosity as needed.
   ```
   getent passwd <pamUser>
   getent group <groupOfPamUser>
   ```
5. Make any necessary adjustments to `/etc/nslcd.conf` based on the output of step 2 or 3.
6. In the nslcd debug window from step 2 or 3, stop `nslcd` with `CTRL-C`. Repeat step 2 or 3 and continue troubleshooting until the `getent` command succeeds.
7. When `getent` succeeds, stop the command line `nslcd` and start the service daemon:
   ```
   systemctl start nslcd
   ```

Common problems may include:

- LDAP secure transport SSL certificate not installed on LDAP/AD server.
- CA certificate verification failed – comment out the `tls_cacert` line in `/etc/nslcd.conf` and instead try `tls_reqcert never`. If it succeeds, you know that certificate verification that is failing.
  - Root CA certificate is not in PEM format.
  - Using issuing CA certificate rather than root CA certificate.
  - LDAP server's SSL certificate name does not match its hostname.
- Incorrect base DN.
- LDAP bind user or password is not specified correctly.
- Incorrectly specifying `ldaps://` instead of `ldap://` in `uri` line of `/etc/nslcd.conf`. `ldaps://` should only be used when using LDAPS but not using the `start_tls` command.
- Active Directory users and groups do not have `uidNumber` or `gidNumber` attributes set.
- Network firewall is blocking communications.
- LDAP server hostname specified cannot be resolved.
  - Incorrect DNS settings in `/etc/resolv.conf`.
  - Bad hostname specified in `uri` line of `/etc/nslcd.conf`.

This completes the configuration for NSS LDAP. Next, go to Test NSS Functionality.

Test NSS Functionality

To test whether NSS is working with any of the previous NSS services, use the following commands:

```
getent passwd <pamUser>
 getent group <groupOfPamUser>
```

Output should be similar to:

```
[root@~]# getent passwd myuser
 myuser:*:10000:10000::/home/myuser:/bin/sh
```

```
[root@~]# getent group mygroup
 mygroup:*:10000:myuser3
```

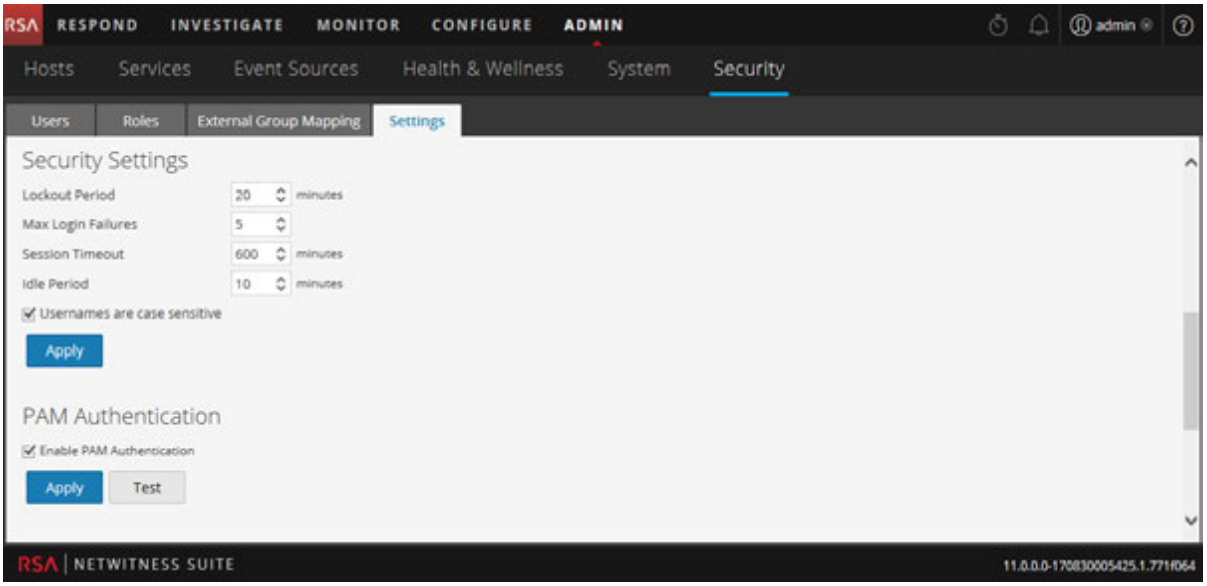
- If neither command produces output, NSS is not working properly for external authorization. Refer to the troubleshooting guidance for your NSS module provided in this document.
- If `getent` commands succeed and authentication success is confirmed in `/var/log/secure` but NetWitness Suite still fails to allow External users to login:
  - Was the correct group name specified for the NSS group in NW External Group Mapping? See Enable PAM and Create Group Mappings below.
  - It is possible that the NSS configuration has changed and NetWitness Suite has not picked up the change. A reboot of the NetWitness Suite host will cause NetWitness Suite to pick up NSS configuration changes. A restart of `jetty` is not sufficient.

Proceed to the next section, Enable PAM in NetWitness Server.

Enable PAM in NetWitness Server

1. In NetWitness Suite, go to **ADMIN > Security**.
   The Admin > Security view is displayed with the Users tab open.
2. Click the **Settings** tab.

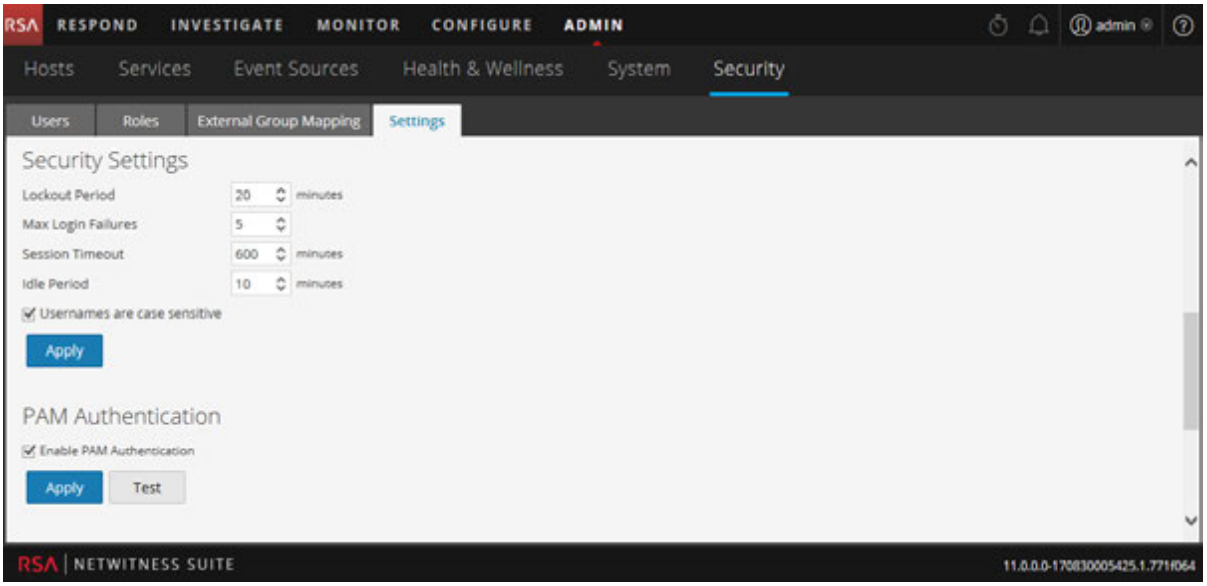
3. Under **PAM Authentication**, select **Enable PAM Authentication** and click **Apply**.



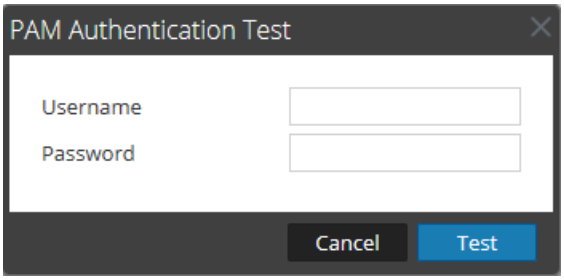
Test PAM Authentication

To test external authentication for PAM:

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.
3. Under **PAM Authentication**, select **Enable PAM Authentication**.



4. Under **PAM Authentication** options, click **Test.**
   The **PAM Authentication Test** dialog is displayed.



5. Type a user name and password that you want to test for authentication using the current PAM configuration.
6. Click **Test**.
   The external authentication method is tested to ensure connectivity.
7. If the test does not succeed, review and edit the configuration.

PAM is enabled, and Active Directory configurations will also remain enabled. PAM configurations are automatically populated in the External Group Mapping tab so that you can map security roles to each group. To configure security roles used for PAM access, see Step 5. (Optional) Map User Roles to External Groups.

How Role-Based Access Control Works

This topic explains role-based access control (RBAC) when there is a trusted connection between NetWitness Server and a Core service.

In the RSA NetWitness® Suite, roles determine what users can do. A role has permissions assigned to it and you must assign a role to each user. The user then has permission to do what the role allows.

Pre-Configured Roles

To simplify the process of creating roles and assigning permissions, there are pre-configured roles in NetWitness Suite. You can also add roles customized for your organization.

The following table lists each pre-configured role and the permissions assigned to it. All permissions are assigned to the Administrators role. A subset of permissions is assigned to each of the other roles.

Role	Permission
Administrators	Full system access. The System Administrators persona is granted all permissions by default.
Operators	Access to configurations but not to meta and session content. The System Operators persona is focused on system configuration, but not Investigation, ESA, Alerting, Reporting, and Respond.
Analysts	Access to meta and session content but not to configurations. The Security Operation Center (SOC) Analysts persona is centered around Investigation, ESA Alerting, Reporting, and Respond, but not system configuration.
Respond_ Administrator	Access to all Respond permissions.
SOC_ Managers	Same access as Analysts plus additional permission to handle incidents. The SOC Managers persona is identical to Analysts, but with permissions necessary to configure Respond.

Role	Permission
Malware_ Analysts	Access to investigations and malware events. The only access granted to the Malware Analysts persona is the Malware Analysis module.
Data_Privacy_ Officers	The Data Privacy Officer (DPO) persona is similar to Administrators with additional focus on configuration options that manage obfuscation and viewing of sensitive data within the system (see *Data Privacy Management*). Users with the DPO role can see which meta keys are flagged for obfuscation, and they also see obfuscated meta keys and values created for the flagged meta keys.

Trusted Connections Between Server and Service

In a trusted connection, a service explicitly trusts NetWitness Server to manage and authenticate users. This reduces administration on each service because authenticated users do not have to be defined locally in each Core service.

As the following table shows, you perform all user management tasks on the server.

Task	Location
Add a user	Server
Maintain usernames	Server
Maintain passwords	Server
Authenticate internal NetWitness Suite users	Server
(Optional) Authenticate external users with: - Active Directory - PAM	 Server Server
Install and configure PAM	Server

The benefits of a trusted connection and centralized user management are that:

- You perform all user administration tasks once, on NetWitness Server only.
- You control access to services but do not have to set up and authenticate users on the services.
- Users enter passwords once at NetWitness Suite logon and are authenticated by the server.
- Users, already authenticated by the server, access every Core service in ADMIN > Services without entering a password.

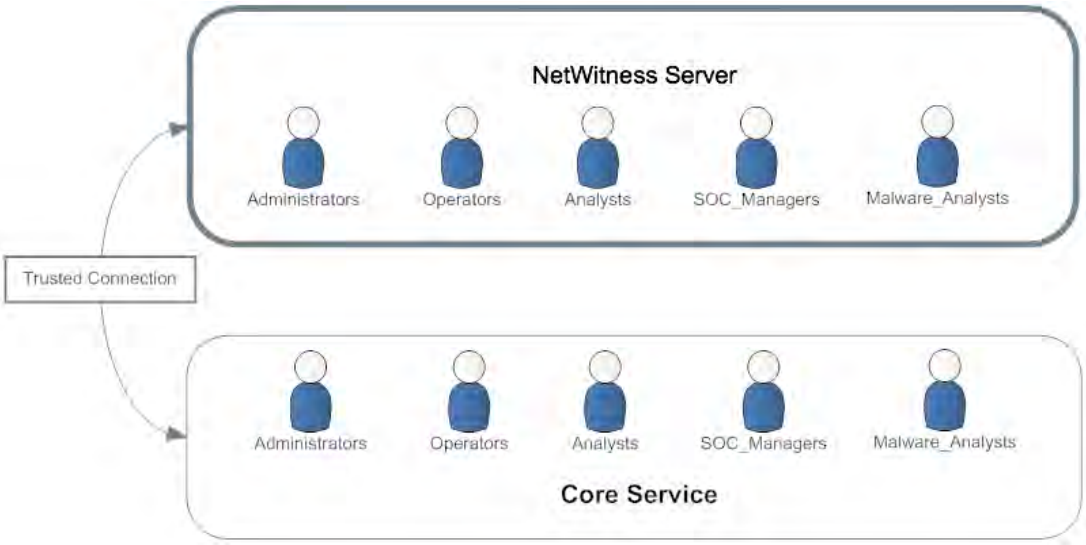
How Trusted Connections Are Established

When you install or upgrade to 11.0, trusted connections are established by default with two settings:

1. SSL is enabled.
2. The Core service is connected to an encrypted SSL port.

Common Role Names on the Server and Services

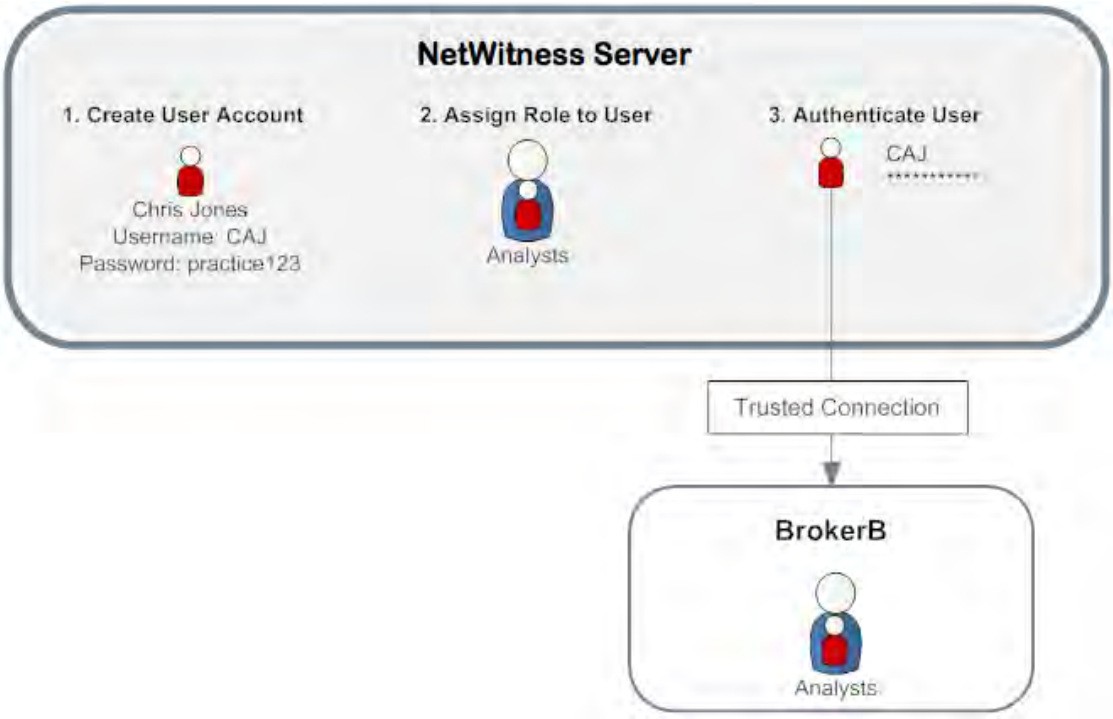
Trusted connections rely on common role names on the server and service. On a fresh installation, NetWitness Suite installs the five pre-configured roles on the server and each Core service.



If you add a custom role, such as JuniorAnalysts, you must add the role to each service, such as ArchiverA and BrokerB. Role names are case-senstive, cannot contain spaces and must be identical. For example, JuniorAnalyst (singular) and JuniorAnalysts (plural) do not meet the requirements for common role names.

End-to-End Workflow for User Setup and Service Access

This workflow shows how role-based access control works when there is a trusted connection between NetWitness Server and the service BrokerB.



1. On NetWitness Server, create an account for a new user:
   Name: Chris Jones
   Username: CAJ
   Password: practice123
2. Determine if you want to assign a pre-configured or custom role to Chris Jones:
   - **Pre-Configured role**
     a. Keep or modify the default permissions assigned to the **Analysts role,** which include permissions such as access to the Alerting, Investigation and Malware modules,
     b. Assign the Analysts role to Chris Jones.
   - **Custom role**
     a. Create the custom role, such as JuniorAnalysts.
     b. Assign permissions to the **JuniorAnalysts role**.

c. Assign the JuniorAnalysts role to Chris Jones.

d. Add the JuniorAnalysts role to the service, such as BrokerB.

3. The user, Chris Jones, logs on to NetWitness Server:
   Username: CAJ
   Password: practice123
4. The server authenticates Chris.
5. The trusted connection allows the authenticated user, Chris, to access BrokerB without entering another password.

For more detailed descriptions and procedures, see Manage Users with Roles and Permissions.

Related Topic

- Role Permissions

Role Permissions

This topic describes access to the user interface that users assigned to the built-in NetWitness Suite roles have by default.

Within NetWitness Suite, user access to each module, dashlet, and view is restricted based on the assigned permissions described in this topic. You can locate these role permissions in the Add or Edit Roles dialogs accessible from the Admin > Security > Roles tab.

In the Add or Edit Role dialogs, the tabs in the Permission section represent different areas of the NetWitness Suite and show the available permissions for those areas. For example, the Administration tab shows the permissions available in the Admin view.

Note: There is no Configure tab in the Add/Edit Role dialogs that corresponds to the Configure view. To assign permissions in the Configure view, assign permissions to the views contained within the Configure view: Live Content (Live), Incident Rules (Incidents), ESA Rules (Alerting), Subscriptions (Live), and Custom Feeds (Live).

Note: To the left of the Administration tab is a tab marked with an asterisk (*). This tab indicates access to management of backend services only.

The tables that follow show the default permissions assigned to each NetWitness Suite user role:

- Administrators
- Operators
- Analysts
- Respond Administrator
- SOC Managers (SOC Mgrs)
- Malware Analysts (MAs)
- Data Privacy Officers (DPOs)

Since the Administrators role has all of the permissions by default, it is not included in the tables.

Service Permissions Format for New Services

The service permissions for some new NetWitness Suite services contain three parts in the following format:

<service name>.<resource>.<action>

For example, for the **investigate-server.metrics.read** permission:

- service name = **investigate-server**
- resource = **metrics**
- action = **read**

Users assigned this permission can read any metrics that the investigate-server service exposes.

Administration

The following table lists the permissions in the Administration tab assigned to each role. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Administration Module	Yes	Yes	Yes	Yes	Yes
Access Health & Wellness	Yes	Yes	Yes	Yes	Yes
Apply System Updates	Yes				
Can Opt In to Live Intelligence Sharing	Yes				
Manage Global Auditing	Yes				Yes
Manage Health & Wellness Policy	Yes				
Manage Advanced Settings	Yes				
Manage Auditing	Yes				Yes
Manage Email	Yes				
Manage LLS	Yes				
Manage Logs	Yes				Yes
Manage Notifications	Yes				

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Manage Plugins	Yes				
Manage Predicates	Yes				
Manage SReconstruction	Yes				
Manage Security	Yes				Yes
Manage Services	Yes				Yes
Manage System Settings	Yes				
Modify ESA Settings	Yes				
Modify Event Sources	Yes				
Modify Hosts	Yes				
Modify Services	Yes				Yes
View Event Sources	Yes		Yes		
View Health & Wellness Policy	Yes	Yes	Yes		
View Health & Wellness Stats Browser	Yes	Yes	Yes		Yes
View Hosts	Yes				Yes
View Services	Yes				Yes

Admin-server

The following table describes the permissions in the Admin-server tab. The Administrators role has all of the permissions and is the only role granted permissions by default.

Permission	Description
admin-server.configuration.manage	Permission to view and modify all service configuration parameters
admin-server.health.read	Permission to read any health notifications that the service exposes
admin-server.logs.manage	Permission to change log-related configuration
admin-server.metrics.read	Permission to read any metrics that the service exposes
admin-server.process.manage	Permission to start and stop the service
admin-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
admin-server.security.read	Permission to read security-related resources

Alerting

The following table lists the permissions in the Alerting tab assigned to each role. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Alerting Module	Yes	Yes	Yes		Yes
Manage Rules	Yes		Yes		Yes
View Alerts		Yes	Yes		Yes
View Rules	Yes		Yes		Yes

Config-server

The following table describes the permissions in the Config-server tab. The Administrators role has all of the permissions and is the only role granted permissions by default.

Permission	Description
config-server.*	All permissions (everything below)

Permission	Description
config-server.configuration.manage	Permission to view and modify all service configuration parameters
config-server.health.read	Permission to read any health notifications that the service exposes
config-server.logs.manage	Permission to change log-related configuration
config-server.metrics.read	Permission to read any metrics that the service exposes
config-server.process.manage	Permission to start and stop the service
config-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
config-server.security.read	Permission to read security-related resources

Dashboard

The following table lists the permissions in the Dashboard tab assigned to each role. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Dashlet Access - Admin Device List Dashlet	Yes	Yes	Yes		Yes
Dashlet Access - Admin Device Monitor Dashlet	Yes				Yes
Dashlet Access - Admin News Dashlet	Yes	Yes	Yes		Yes
Dashlet Access - Alert Variance Dashlet		Yes	Yes		Yes

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Dashlet Access - Alerting Recent Alerts Dashlet		Yes	Yes		Yes
Dashlet Access - Investigation Jobs Dashlet		Yes	Yes		Yes
Dashlet Access - Investigation Top Values Dashlet		Yes	Yes		Yes
Dashlet Access - Live Featured Resources Dashlet	Yes	Yes	Yes		Yes
Dashlet Access - Live New Resources Dashlet	Yes	Yes	Yes		Yes
Dashlet Access - Live Subscriptions Dashlet	Yes	Yes	Yes		Yes
Dashlet Access - Live Updated Resources Dashlet	Yes	Yes	Yes		Yes
Dashlet Access - Malware Jobs Dashlet		Yes	Yes		Yes
Dashlet Access - Reporting Recent Report Dashlet		Yes	Yes		Yes
Dashlet Access - Reporting Charts Dashlet		Yes	Yes		Yes
Dashlet Access - Top Alerts Dashlet		Yes	Yes		Yes
Dashlet Access - Unified RSA First Watch Dashlet	Yes	Yes	Yes		Yes

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Dashlet Access - Unified Shortcuts Dashlet	Yes	Yes	Yes		Yes

Esa-analytics-server

The following table describes the permissions in the Esa-Analytics-server tab. The Administrators and Operators roles have all of the permissions and are the only roles granted permissions by default.

Permission	Description
esa-analytics-server.*	All permissions (everything below)
esa-analytics-server.analytics.manage	Permission to view and modify ESA analytics
esa-analytics-server.analytics.read	Permission to view ESA analytics
esa-analytics-server.configuration.manage	Permission to view and modify all service configuration parameters
esa-analytics-server.health.read	Permission to read any health notifications that the service exposes
esa-analytics-server.logs.manage	Permission to change log-related configuration
esa-analytics-server.metrics.read	Permission to read any metrics that the service exposes
esa-analytics-server.model.manage	Permission to view and modify ESA models
esa-analytics-server.model.read	Permission to view ESA models
esa-analytics-server.process.manage	Permission to start and stop the service
esa-analytics-server.security.read	Permission to read security-related resources

Incidents

The following table lists the permissions in the Incidents tab assigned to each role. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Incident Module		Yes	Yes	Yes	Yes
Configure Incident Management Integration			Yes		Yes
Delete Alerts and incidents					Yes
Manage Alert Handling Rules			Yes		Yes
View and Manage Incidents		Yes	Yes	Yes	Yes

Investigate

The following table lists the permissions in the Investigate tab assigned to each role. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Investigation Module		Yes	Yes	Yes	Yes
Context Lookup		Yes	Yes	Yes	
Create Incidents from Investigation		Yes	Yes	Yes	
Manage List from Investigation		Yes	Yes	Yes	
Navigate Events		Yes	Yes	Yes	Yes
Navigate Values		Yes	Yes	Yes	Yes

Investigate-server

The following table describes the permissions in the Investigate-server tab.

Permission	Description
investigate-server.*	All permissions (everything below)
investigate-server.configuration.manage	Permission to change any configuration properties for the server
investigate-server.health.read	Permission to read any health notifications that the service exposes
investigate-server.logs.manage	Permission to change log-related configuration
investigate-server.metrics.read	Permission to read any metrics that the service exposes
Investigate-server.process.manage	Permission to start and stop the service
investigate-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
investigate-server.security.read	Permission to read security-related resources

The following table lists the permissions in the Investigate-server tab assigned to each role. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
investigate-server.*		Yes	Yes	Yes	Yes
investigate-server.configuration.manage					
investigate-server.health.read					
investigate-server.logs.manage					
investigate-server.metrics.read					

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
investigate-server.process.manage					
investigate-server.security.manage					
investigate-server.security.read					

Live

The following table lists the permissions in the Live tab assigned to each role. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Live					
Access Live Module	Yes	Yes	Yes		Yes
Manage Live System Settings	Yes				
Resources					
Deploy Live Resources	Yes				Yes
Manage Live Feeds	Yes				Yes
Manage Live Resources	Yes				Yes
Search Live Resources	Yes	Yes	Yes		Yes
View Live Resource Details	Yes	Yes	Yes		Yes

Orchestration-server

The following table describes the permissions in the Orchestration-server tab. The Administrators, Operators, and Data Privacy Officers roles have all of the permissions and are the only roles granted permissions by default.

Permission	Description
orchestration-server.*	All permissions (everything below)
orchestration-server.configuration.manage	Permission to view and modify all service configuration parameters
orchestration-server.health.read	Permission to read any health notifications that the service exposes
orchestration-server.logs.manage	Permission to change log-related configuration
orchestration-server.metrics.read	Permission to read any metrics that the service exposes
orchestration-server.process.manage	Permission to start and stop the service
orchestration-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
orchestration-server.security.read	Permission to read security-related resources

Malware

The following table lists the permissions in the Malware tab assigned to each role. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Download Malware File(s)		Yes	Yes	Yes	Yes
Initiate Malware Analysis Scan		Yes	Yes	Yes	Yes
View Malware Analysis Events		Yes	Yes	Yes	Yes

Reports

The following table lists the permissions in the Reports tab assigned to each role. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Alert					
Define RE Alert		Yes	Yes		Yes
Export RE Alert Definition		Yes	Yes		Yes
Manage RE Alerts		Yes	Yes		Yes
View RE Alerts		Yes	Yes		Yes
View Scheduled RE Alerts		Yes	Yes		Yes
Chart					
Define Chart		Yes	Yes		Yes
Delete Chart		Yes	Yes		Yes
Export Chart Definition		Yes	Yes		Yes
Manage Charts		Yes	Yes		Yes
View Charts		Yes	Yes		Yes
List					
Define Lists		Yes	Yes		Yes
Delete List		Yes	Yes		Yes
Export List		Yes	Yes		Yes
Manage Lists		Yes	Yes		Yes
Report					

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Define Report		Yes	Yes		Yes
Delete Report		Yes	Yes		Yes
Export Report		Yes	Yes		Yes
Manage Reports		Yes	Yes		Yes
View Reports		Yes	Yes		Yes
Reports					
Access Configure		Yes	Yes		Yes
Access Reporter Module		Yes	Yes		Yes
Access Reporter search		Yes	Yes		Yes
Access View		Yes	Yes		Yes
Rule					
Add RE Alert Definition from Rule		Yes	Yes		Yes
Define Rule		Yes	Yes		Yes
Delete Rule		Yes	Yes		Yes
Export Rule		Yes	Yes		Yes
Manage Rules		Yes	Yes		Yes
View Rule Usage		Yes	Yes		Yes
Schedules					
Define Schedule		Yes	Yes		Yes
Delete Schedule		Yes	Yes		Yes

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
View Schedules		Yes	Yes		Yes
Warehouse Analytics					
Define Jobs		Yes	Yes		Yes
Delete Jobs		Yes	Yes		Yes
Manage Jobs		Yes	Yes		Yes
View Jobs		Yes	Yes		Yes

Respond-server

The following table describes the permissions in the Respond-server tab.

Permission	Description
respond-server.*	All permissions (everything below)
respond-server.alert.delete	Permission to delete alerts
respond-server.alert.manage	Permission to create, update, or delete alerts
respond-server.alert.read	Permission to view alerts
respond-server.alertrule.manage	Permission to create, update, or delete alert aggregation rules
respond-server.alertrule.read	Permission to view alert aggregation rules
respond-server.configuration.manage	Permission to change any configuration properties for the service
respond-server.health.read	Permission to read any health notifications that the service exposes
respond-server.incident.delete	Permission to delete incidents

Permission	Description
respond-server.incident.manage	Permission to create, update, or delete incidents
respond-server.incident.read	Permission to view incidents
respond-server.journal.manage	Permission to create, update, or delete journal entries for an incident
respond-server.journal.read	Permission to view journal entries for an incident
respond-server.logs.manage	Permission to change log-related configuration
respond-server.metrics.read	Permission to read any metrics that the service exposes
respond-server.process.manage	Permission to start and stop the service
respond-server.remediation.manage	Permission to create, update, or delete remediation tasks
respond-server.remediation.read	Permission to view remediation tasks
respond-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
respond-server.security.read	Permission to read security-related resources

The following table lists the permissions in the Respond-server tab assigned to each role. The Administrators and Respond Administrator roles have all of the permissions by default and are not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
respond-server.*					Yes
respond-server.alert.delete					

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
respond-server.alert.manage		Yes	Yes	Yes	
respond-server.alert.read		Yes	Yes	Yes	
respond-server.alertrule.manage			Yes		
respond-server.alertrule.read			Yes		
respond-server.configuration.manage					
respond-server.health.read					
respond-server.incident.delete					
respond-server.incident.manage		Yes	Yes	Yes	
respond-server.incident.read		Yes	Yes	Yes	
respond-server.journal.manage		Yes	Yes	Yes	
respond-server.journal.read		Yes	Yes	Yes	
respond-server.logs.manage					
respond-server.metrics.read					
respond-server.process.manage					
respond-server.remediation.manage		Yes	Yes	Yes	
respond-server.remediation.read		Yes	Yes	Yes	
respond-server.security.manage					
respond-server.security.read					

Security-server

The following table describes the permissions in the Security-server tab. The Administrators, Operators, and Data Privacy Officers roles have all of the permissions and are the only roles granted permissions by default.

Permission	Description
security-server.*	All permissions (everything below)
security-server.account.manage	Permission to view, create, modify, or remove NetWitness Suite local accounts
security-server.account.read	Permission to view NetWitness Suite local accounts
security-server.configuration.manage	Permission to view and modify all service configuration parameters
security-server.health.read	Permission to read any health notifications that the service exposes
security-server.logs.manage	Permission to change log-related configuration
security-server.metrics.read	Permission to read any metrics that the service exposes
security-server.permission.manage	Permission to create or remove NetWitness Suite permissions
security-server.process.manage	Permission to start and stop the service
security-server.role.manage	Permission to create, modify, or remove NetWitness Suite roles (for example, add role permissions)
security-server.role.read	Permission to view NetWitness Suite role definitions
security-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)

Permission	Description
security-server.security.read	Permission to read security-related resources
security-server.user.manage	Permission to view, create, modify, or remove NetWitness Suite user profiles
security-server.user.read	Permission to view NetWitness Suite user profile details (for example, roles, login times, and so on)

Manage Users with Roles and Permissions

This topic introduces a set of end-to-end procedures for managing users in NetWitness Suite. These steps explain how to add a user in NetWitness Suite and then how to control what the user can do.

Topics

Step 1. Review the Pre-Configured NetWitness Roles

To simplify the process of creating roles and assigning permissions, there are pre-configured roles in NetWitness Suite.

Role	Permission
Administrators	Full system access
Operators	Access to configurations but not to meta and session content
Analysts	Access to meta and session content but not to configurations
Respond_ Administrator	Access to all Respond server and Incidents permissions.
SOC_ Managers	Same access as Analysts plus additional permission to handle incidents
Malware_ Analysts	Access to malware events and to meta and session content
Data_Privacy_ Officers	Access to meta and session content as well as configuration options that manage obfuscation and viewing of sensitive data within the system (see Data Privacy Management).

The administrator can also add custom roles.

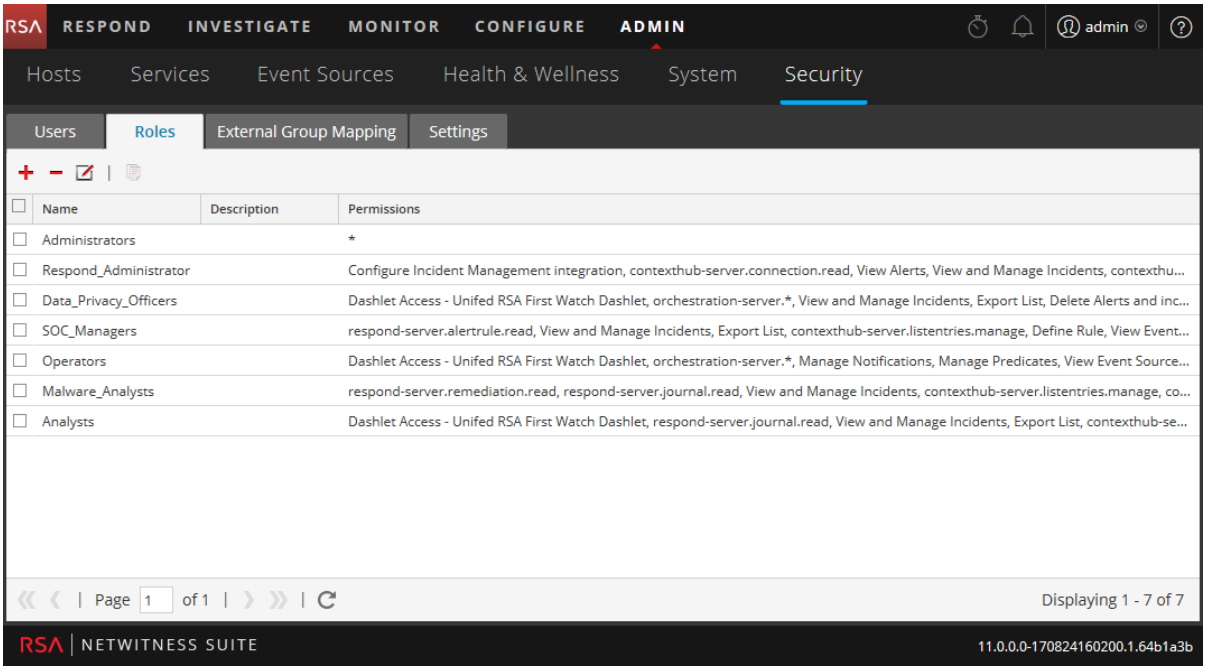
Step 2. (Optional) Add a Role and Assign Permissions

Although NetWitness Suite has pre-configured roles, you can add custom roles. For example, in addition to the pre-configured Analysts role you could add custom roles for AnalystsEurope and AnalystsAsia. For a detailed list of permissions, see Role Permissions.

Each of the following procedures starts on the **Roles** tab.

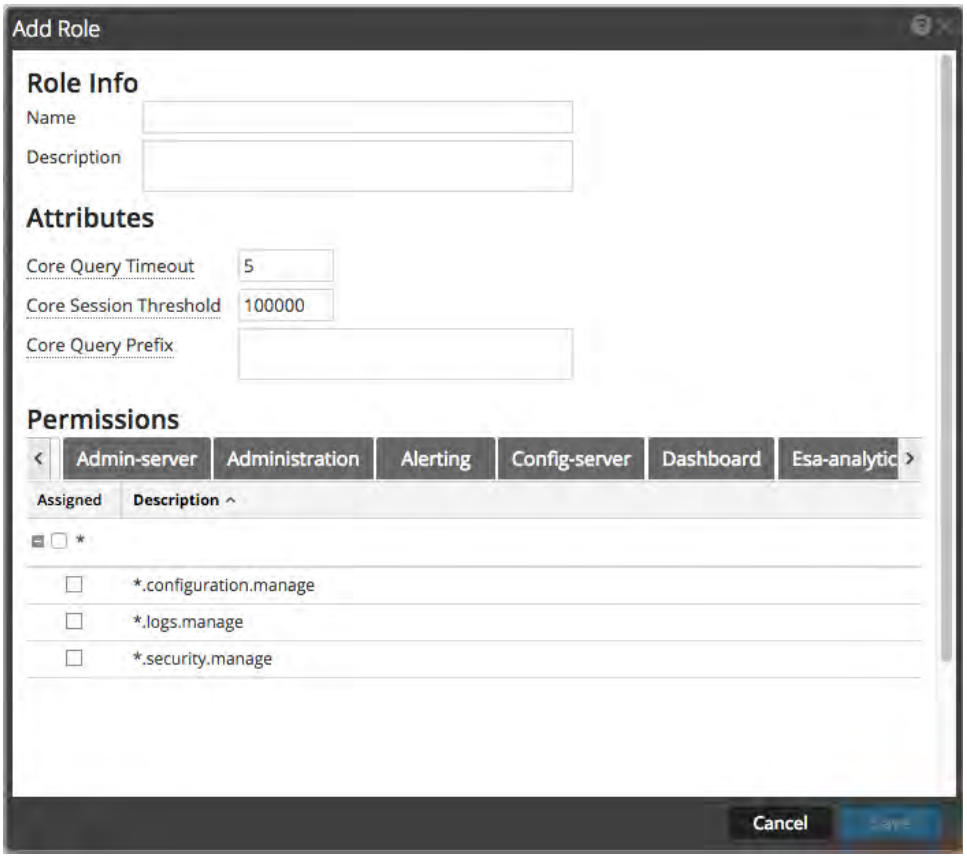
To navigate to the Roles tab:

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Roles** tab.



Add a Role and Assign Permissions

1. In the **Roles** tab, click ✚ in the toolbar.
2. The **Add Role** dialog is displayed.



3. In the **Role Info** section, type the following information for the role:
   - **Name**
   - (Optional) **Description**
4. In the **Attributes** section, enter the desired values for each attribute. For more information on attributes, see Step 3. Verify Query and Session Attributes per Role.
5. In the **Permissions** section:
   - Click ‹ and › to scroll through the modules.
   - Select a module the role will access.
   - Select each permission the role will have.

5. Repeat the previous step until you select all permissions to assign to the role.
6. Click **Save** to add the new role, which is effective immediately. You can now assign the new role to users.

Duplicate a Role

An efficient way to add a new role is to duplicate a similar role, save it with a new name and revise the permissions that are already assigned.

1. In the **Roles** tab, select the role you want to duplicate and click  .
2. Type a new role name and click **Save**.
3. To change the permissions, follow the steps in the next procedure.

Change Permissions Assigned to a Role

1. In the **Roles** tab, select the role and click  .
   The **Edit Role** dialog is displayed.
2. In the **Permissions** section:
   - Click and  to scroll through the modules.
   - Select a module to revise permissions for it.
   - Select or deselect each permission.
3. Repeat the previous step until the role has the required permissions.
4. Click **Save**. The revised permissions are effective immediately.

Delete a Role

You can delete a role if it is not assigned to any users.

1. In the **Roles** tab, select the role and click .
2. A dialog requests confirmation that you want to delete the role. Click **Yes**.

Step 3. Verify Query and Session Attributes per Role

This topic explains the query and session attributes and provides instructions for setting these attributes for user roles. This topic also describes how these role settings impact individual user settings and what happens if a user is a member of multiple roles.

After you define your user roles, it is important to verify the query and session attributes that are set for each role. You can adjust these settings according to your requirements.

Query and Session Attributes

Query and session attributes determine how to handle the queries that a user runs. These attributes enable you to lock down the information that users can retrieve. These attributes apply to all sessions of users assigned to a role.

Depending on your requirements, you can specify the following query-handling attributes for a user role:

- **Core Query Timeout** is an optional setting that applies to NetWitness Suite 10.5 and later Core services. It specifies the maximum number of minutes that a user can run a query. If this value is set, it must be zero (0) or greater. A value of zero represents no timeout.
- **Core Session Threshold** is a required setting. This value must be zero (0) or greater. If the threshold is greater than zero, a query optimization will extrapolate the total session counts that exceed the threshold. When the meta value returned by the query reaches the threshold, the system will:
  - Stop its determination of the session count
  - Show the threshold and percentage of query time used to reach the threshold
- **Core Query Prefix** is an optional filter applied to queries the user runs. The prefix restricts query results that the user sees. For example, the `'service' = 80` query prefix prepends to any queries run by the user and the user can only access meta of HTTP sessions.

The query-handing attribute settings applied for a user depend on the role memberships of the user. It is important to verify the query-handling attribute settings for your roles.

How Query-Handling Attribute Settings Apply to Individual Users

If a user is a member of multiple roles, the following logic applies for the user:

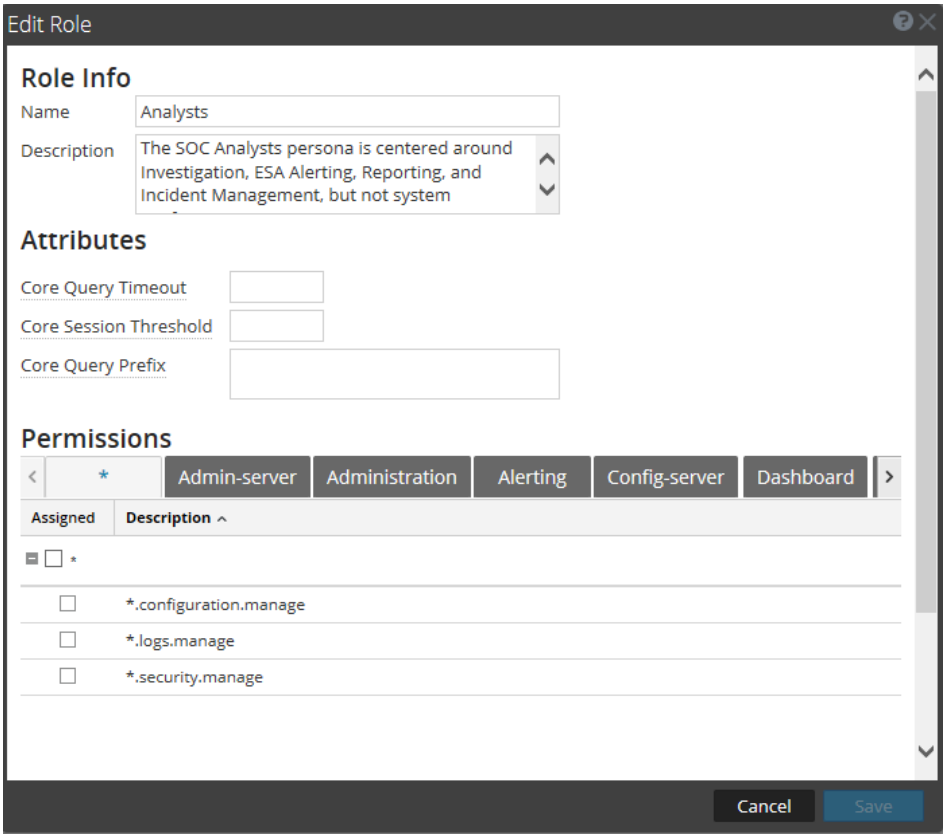
- **Query Timeout:** The most permissive (highest) value of all assigned roles applied to the user.

- **Query Prefix:** The query prefixes of each of the user roles are AND'd together.
- **Session Threshold:** The highest value of all the assigned roles applied to the user.

Procedure

To set query handling attributes for a user role:

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Roles** tab. If you are adding a role, click  . If you are editing a role, select the role and click  .
   The Add or Edit Role dialog is displayed.



3. To set the attributes for the role, in the **Attributes** section:
   - (Optional) In the **Core Query Timeout** field, type the maximum number of minutes that a user can run a query. The default value is 5 minutes. This timeout only applies to queries performed from Investigation. NetWitness Suite 10.5 and later Core services use this field.
     When migrating to NetWitness Suite 10.5 and later, if there is no value set in the roles, 5

minutes is set by default.

- Type a **Core Session Threshold** for the system to stop its determination of the session count. The default is *100000*. The limit you specify here overrides the **Max Session Export** value defined in the INVESTIGATE view settings.
- (Optional) Type a **Core Query Prefix** to filter query results that the role members see. By default, this is blank.

> **Note:** A value shown in italics indicates a default value, for example *5*. A value shown without italics indicates a change from the default value, for example, 1200.

4. Click **Save.**

Step 4. Set Up a User

This topic introduces procedures to set up a new user.

Topics

Add a User and Assign a Role

This topic explains how to add a new user to each type of user account, local and external. It also explains how to assign a role to a local user.

All NetWitness Suite users must have a local or external user account.

The following considerations are important when managing local and external user accounts.

Local User Account	External User Account
Managed within NetWitness Suite	Managed externally and outside the scope of this document
Roles assigned directly	Roles assigned by external group mapping
Derives permissions from each role assigned to the user, as explained in this topic	Derives permissions from each role mapped to the account's external user group, as explained in Step 5. (Optional) Map User Roles to External Groups.
NetWitness Suite manages all user information.	NetWitness Suite manages user identification only. This includes Username, Full Name and Email.

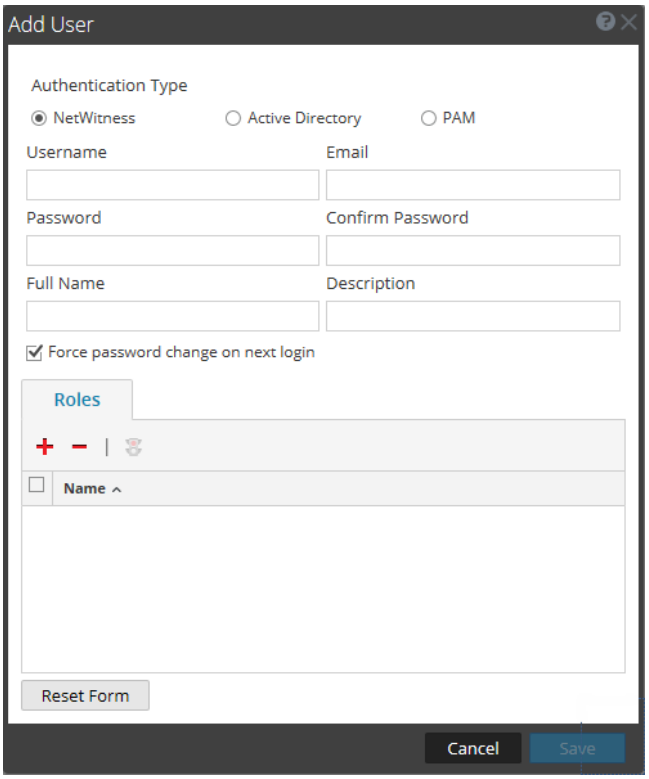
Procedures

Each of the following procedures starts on the Users tab. To navigate to the Users tab, go to **ADMIN > Security**. The Security view is displayed with the Users tab open.

Add a User and Assign a Role

To add a local user account and assign a role to the user:

1. In the **Users** tab, click  in the toolbar.
   The **Add User** dialog is displayed.



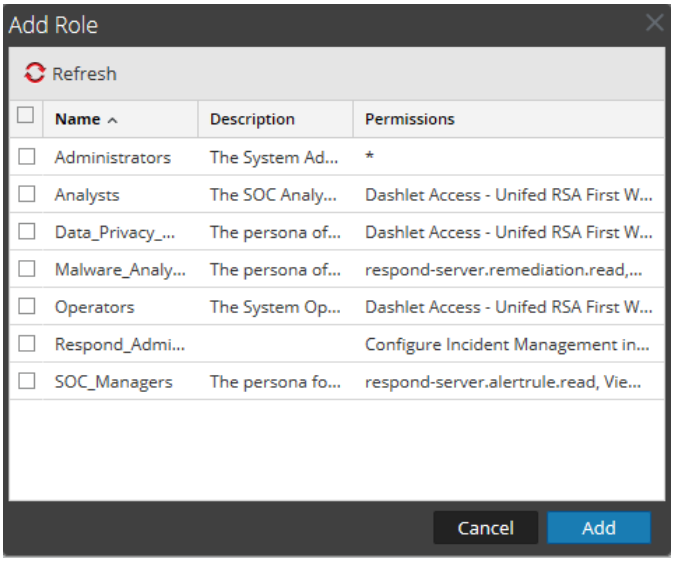
2. Type the following account information for the new user:
   - **Authentication Type**: **NetWitness** is selected by default and is the correct choice when adding a local user. This option is only displayed when there are AD or PAM configurations set up to allow for selecting that authentication type. If there are no AD or PAM configurations, the authentication type is set to NetWitness automatically and there are no other options available.
   - **Username** for logging on to NetWitness Suite
   - **Email** address
   - Password for logging on to NetWitness Suite, in the **Password** and **Confirm Password** fields
   - **Full Name** of the new user
   - (Optional) **Description** of the user account
3. To expire the user password the next time the user logs on, select **Force password change on next login**.

   This does not affect any active user sessions. The  appears in the user row to show that the user password expired. After a password is expired, you cannot undo it. This checkbox is

cleared the next time you edit the user account.

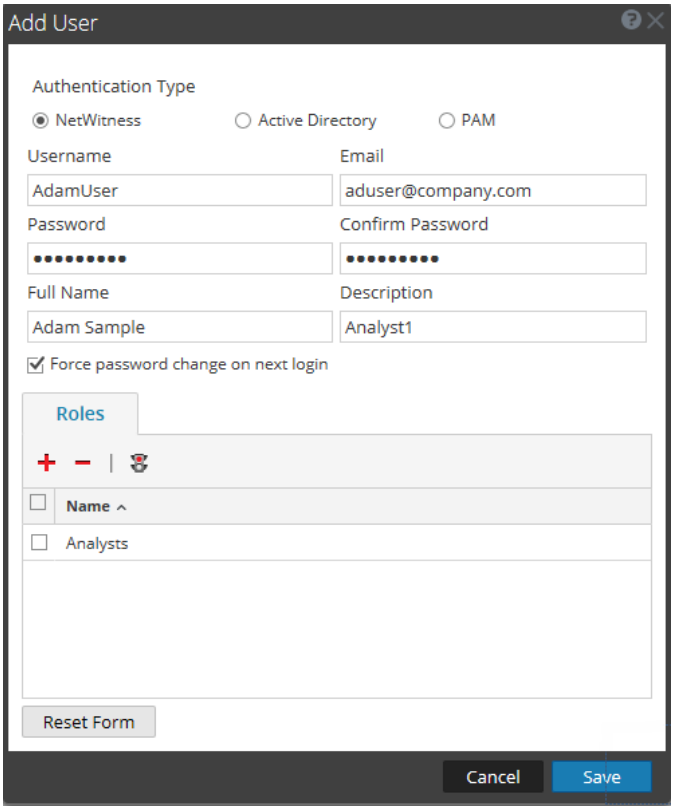
4. To assign a role to the user, click + in the **Roles** tab.

   The **Add Role** selection dialog shows the list of available roles.



5. Select each role to assign and click **Add**.

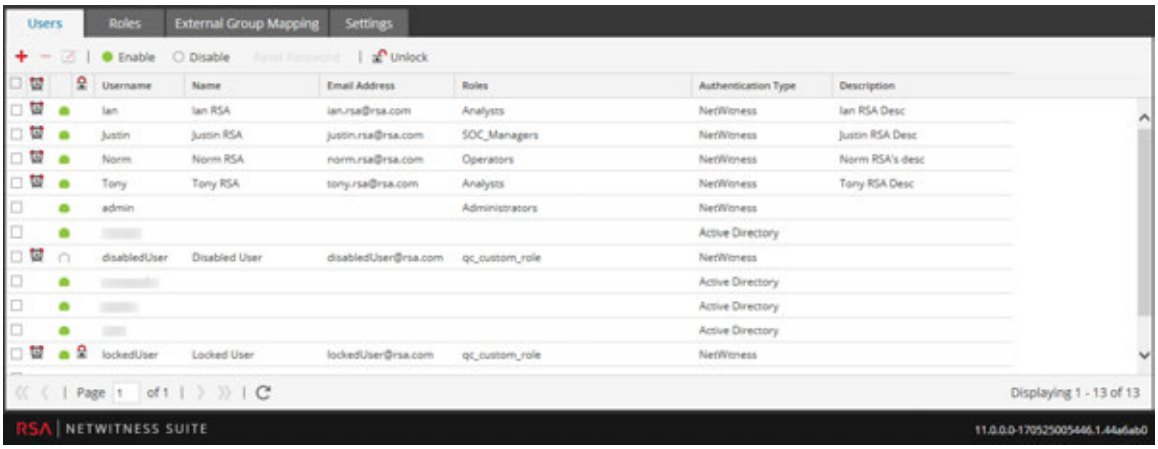
   The **Add User** dialog shows each role assigned to the user.



6. (Optional) Select a role and click to **Show all permissions** for the role.

7. Click **Save**.

   The **Users** tab shows the new user and each role assigned to the user. The account is active immediately.



Add a User for External Authentication

Prerequisite: External authentication must be configured. Refer to Step 4. (Optional) Configure External Authentication.

To add a user that is authenticated externally, outside of NetWitness Suite:

1. In the **Users** tab, click + in the toolbar.

   The **Add User** dialog is displayed.

2. For **Authentication Type**, select either **Active Directory** or **PAM**. The dialog will update to show the required fields for the selected external authentication type.

3. Type the following information:

   - **Domain** (if select Active Directory authentication only): Select the Active Directory domain for the user from the drop-down list of available domains.

- **Username** for logging on to NetWitness Suite
- **Email** address
- **Full Name** of the new user
- (Optional) **Description** of the user account

4. Click **Save**. The Users tab shows the new user account, which still needs a role and permissions.
5. To map a role to the new user, see Step 5. (Optional) Map User Roles to External Groups.

Change User Information or Roles

To change a user's account information or assigned roles:

1. In the **Users** tab, select a user and click  in the toolbar.
   The **Edit User** dialog is displayed.
2. To edit user information, change any of the following fields:
   - **Email**
   - **Full Name**
   - **Description**
3. To expire the **internal** user password the next time the user logs on, select **Force password change on next login**.
   This does not affect any active user sessions. The  appears in the user row to show that the user password expired. After a password is expired, you cannot undo it. This checkbox is cleared the next time you edit the user account.
4. In the **Roles** section:
   - To assign another role, click  , select a role and click **Add**.
   - To remove an assigned role, select the role and click .
7. Click **Save**.

Delete a User

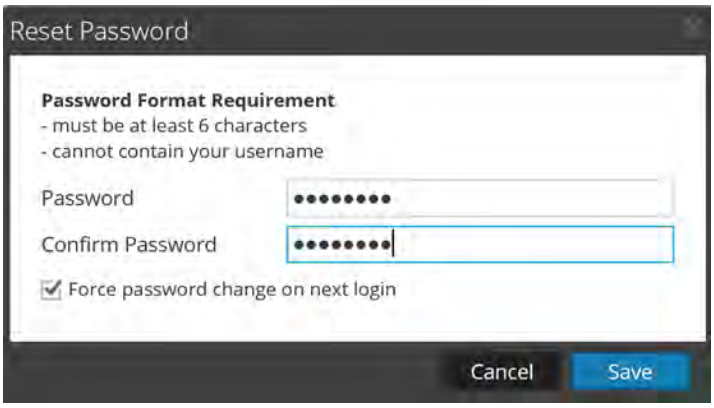
1. In the **Users** tab, select a user.
2. In the toolbar, click .

3. Click **Save**.

Note: To fully delete a user that is externally authenticated by Active Directory, you must also delete the user from the AD Group.

Reset a User Password

1. In the **Users** tab, select a user.
2. In the toolbar, click **Reset Password**.



The **Password Format Requirement** section lists the specific requirements for the password. Administrators can adjust these requirements for all internal users in the password policy. See Step 1. Configure Password Complexity.

3. Choose whether to force a password change the next time the user logs in to NetWitness Suite.
4. Click **Save**.

Enable, Unlock, and Delete User Accounts

This topic provides instructions for enabling, unlocking, and deleting user accounts.

All users of NetWitness Suite must either have a local user account with username and password or have an external user account. Within NetWitness Suite, you can enable, disable, and delete local user accounts.

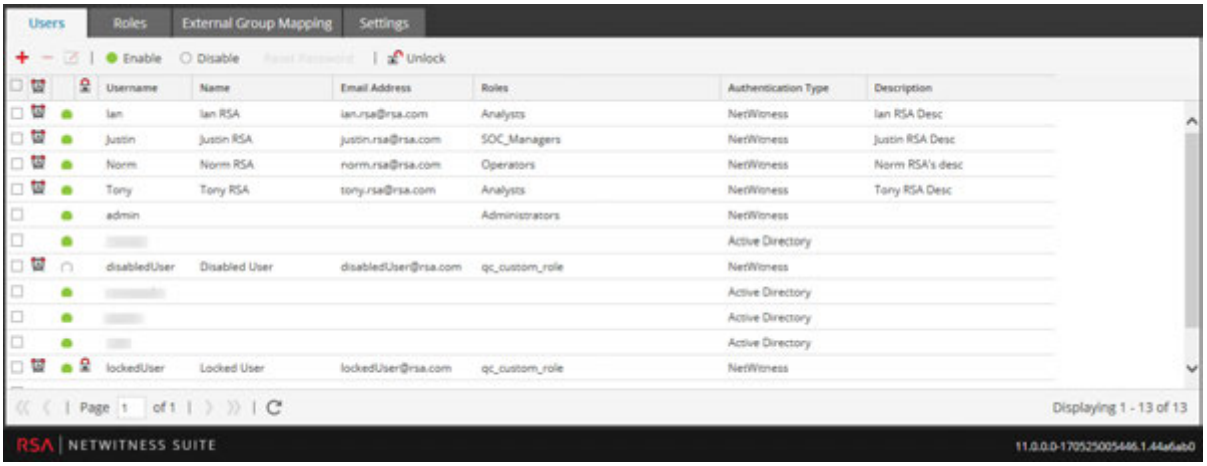
The first time an external user logs into NetWitness Suite, a new user entry is automatically created with NetWitness Suite. NetWitness Suite manages only user identification information; for example, Full Name and Email.

You can unlock locked accounts for both local and external users.

Enable Disabled NetWitness Suite User Accounts

To enable NetWitness Suite user accounts that have been disabled:

1. In NetWitness Suite, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.



2. In the **Users** grid, select one or more accounts.
3. Click Enable.
   A dialog requests confirmation.
4. If you want to enable the accounts, click **Yes**.
   The accounts are enabled, and the user can log in to NetWitness Suite.

Disable NetWitness Suite User Accounts

You can block user access by disabling users. Disabling the user does not delete user preferences. This action blocks user access without deleting user preferences so that upon re-enabling users, user preferences are intact. You can re-enable users to restore user access. Disabling users applies only to Local users and not External Users.

To disable NetWitness Suite user accounts:

1. In the **Users** grid, select one or more accounts.
2. Click Disable.

   A dialog requests confirmation.
3. If you want to disable the accounts, click **Yes**.

   The accounts are disabled, and the user can no longer log in to NetWitness Suite.

Unlock Locked NetWitness Suite User Accounts

A user is locked out for a period of time after a number of failed consecutive login attempts. To unlock NetWitness Suite user accounts that are locked due to excessive failed login attempts:

1. In the **Users** grid, select one or more accounts.
2. Click Unlock.

   A dialog requests confirmation.
3. If you want to unlock the accounts, click **Yes**.

   The accounts are unlocked, and the user can log on to NetWitness Suite.

Delete NetWitness Suite User Accounts

If not using External Authentication, a user can log on to NetWitness Suite using a local account. These local accounts are directly managed using NetWitness Suite. To revoke access to a local user, either disable the account or delete the account completely from the system.

Note: This deletes all user preferences for the account from NetWitness Suite. If this is not the intention, disable the user instead of deleting the user.

To delete NetWitness Suite user accounts:

1. Go to **ADMIN > Security**.

   The Security view is displayed with the **Users** tab open.
2. In the Users list, select one or more accounts.
3. Click .

   A warning dialog requests confirmation.
4. If you want to delete the accounts, click **Yes**.

   The accounts are removed from NetWitness Suite, and the users can no longer log in to NetWitness Suite.

Step 5. (Optional) Map User Roles to External Groups

This topic describes the method for mapping NetWitness Suite user roles to external groups.

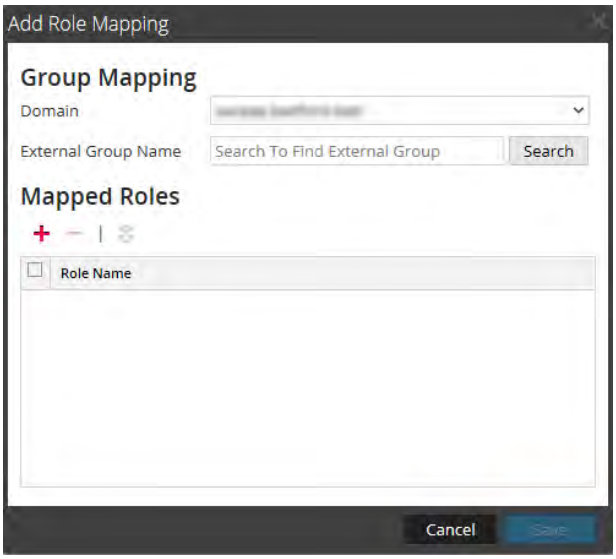
In NetWitness Suite, external groups derive permissions for various modules and views from NetWitness Suite user roles, which have permissions assigned to them. To provide access to an external group, map user roles to it. To modify an external group's access, edit the roles mapped to it. Add and delete roles until the external group has the necessary access. Changes take effect immediately.

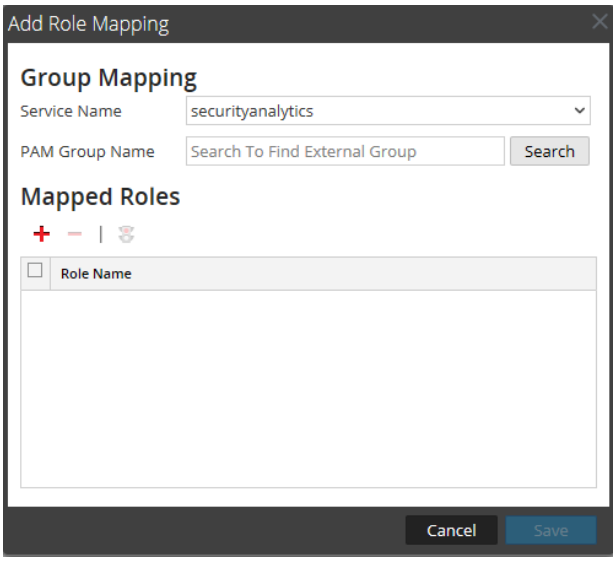
Prerequisites

In the Settings tab, you must set up a method for external user authentication to make external groups visible to NetWitness Suite.

Add Role Mapping for an External Group

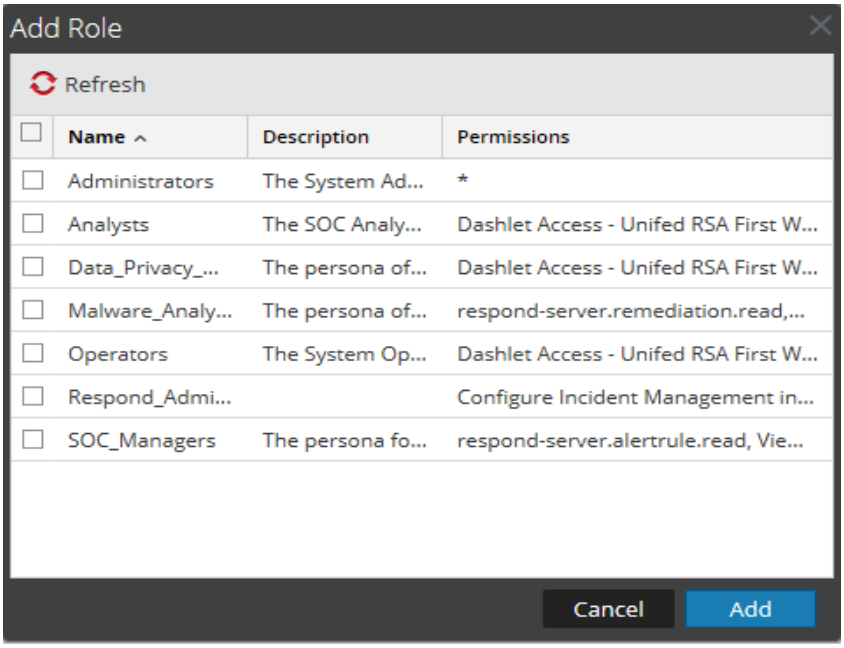
1. In NetWitness Suite, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **External Group Mapping** tab.
3. In the toolbar, click +.
   The **Add Role Mapping** dialog for the external authentication method you selected is displayed.





4. Click **Search** and search for an external group name in the Search for External Groups, then select an external group name.

5. To add roles to the group mapping, click + in the **Mapped Roles** section.
   The **Add Role** dialog is displayed.



6. Click the checkbox in the title bar to select all roles, or select roles individually.
7. To add the roles to the **Mapped Roles** section in the Add Role Mapping dialog, click **Add**.
   The dialog closes and the selected roles are displayed in the Mapped Roles section.
8. If you want to delete roles from the **Mapped Roles** section, select the roles and click −.
9. When the **Add Role Mapping** dialog reflects the role mapping that you want to define for the group, click **Save**.
   The Add Role Mapping dialog closes, and the new role mapping is listed in the External Group Mapping tab list.

Edit Role Mapping for a Group

1. In the **External Group Mapping** action bar, click **Edit**.
   The **Edit Role Mapping** dialog is displayed with the group name in the **External Group Name** field.
2. To add roles to the mapping, click + in the **Mapped Roles** section.
   The Add Role dialog is displayed.
3. Click the checkbox in the title bar to select all roles, or select roles individually.
4. To add the roles to the **Mapped Roles** section in the **Add Role Mapping** dialog, click **Add**.
   The dialog closes, and the selected roles are displayed in the Mapped Roles section.

5. If you want to delete roles from the **Mapped Roles** section, select the roles and click −.
6. When the **Edit Role Mapping** dialog reflects the role mapping that you want to define for the group, click **Save**.
   The dialog closes, and the edited role mapping is listed in the External Group Mapping tab.

- Search for External Groups

Search for External Groups

This topic provides instructions for searching for external groups that have NetWitness Suite user roles mapped to them.

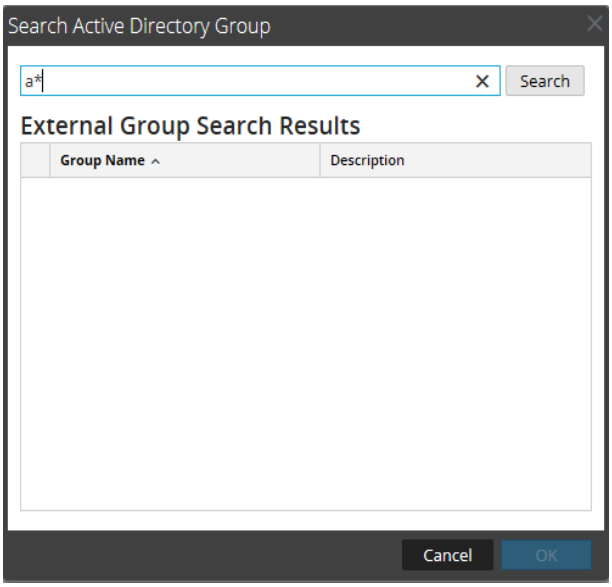
Prerequisites

A method for external user authentication must be enabled.

Procedure

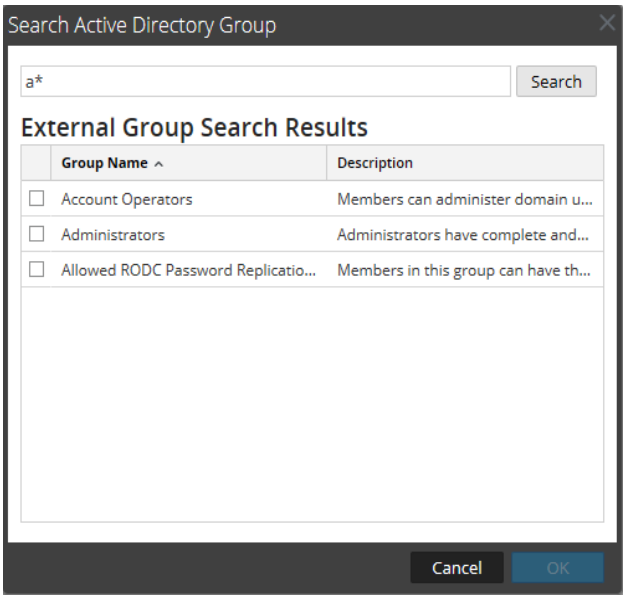
To search for an external group:

1. In NetWitness Suite, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **External Group Mapping** tab.
3. In the toolbar, click + or .
   The **Add Role Mapping** dialog for the external authentication method you selected is displayed.
4. The **Group Mapping** section is dependent on the selected external authentication method.
   - For **Active Directory**, select a **Domain**. Then click **Search** next to **External Group Name**.
   - For **PAM**, click **Search** next to **PAM Group Name**.
     The **Search External Groups** dialog is displayed.
5. In **Common Name**, type a group name or part of a group name with the wild card character (*).



6. Click **Search**.

   The results are displayed in the **External Group Search Results** section.



7. Select the group to which you want to assign roles and click **OK**.

References

This topic is a collection of references for system security and user management in NetWitness Suite.

Topics

Admin Security View

This topic describes each user interface element in the Admin > Security view and in all related dialogs and tabs. The interface components are listed in alphabetical order.

The Admin > Security view provides the capability to manage user accounts, manage user roles, map external groups to NetWitness Suite roles, and modify other security-related system parameters. These apply to the NetWitness Suite system and are used in conjunction with the security settings for individual services.

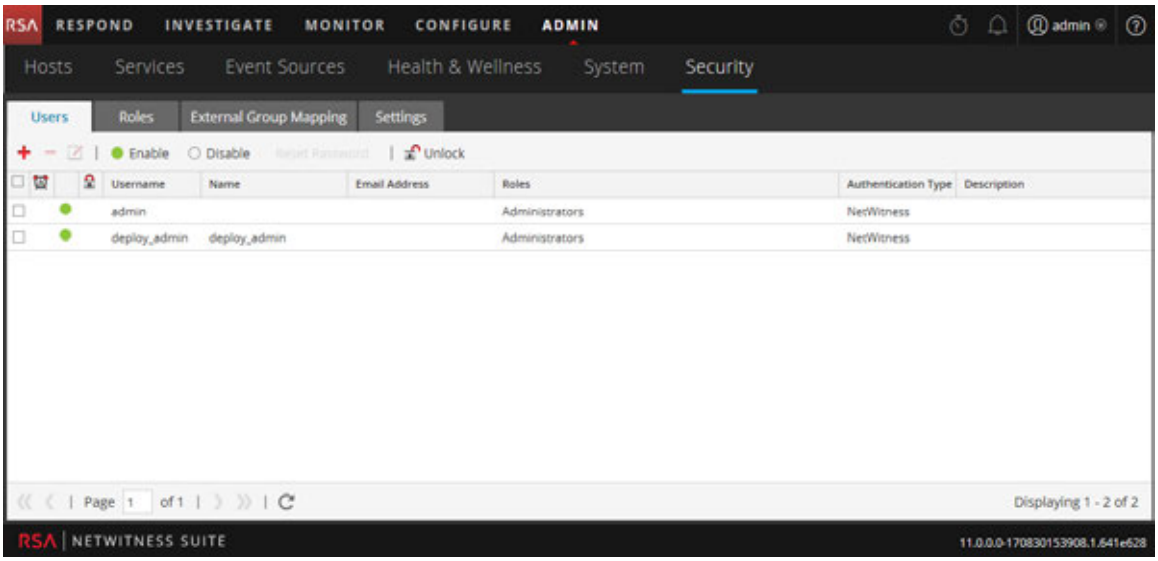
What do you want to do?

Role	I want to ...	Show me how
Admin	Manage users	Step 4. Set Up a User
Admin	Manage roles	Step 1. Review the Pre-Configured NetWitness Roles Step 2. (Optional) Add a Role and Assign Permissions
Admin	(Optional) Configure external group mappings	Step 5. (Optional) Map User Roles to External Groups
Admin	Configure settings	Step 3. Configure System-Level Security Settings

Related topics

- Users Tab
- Roles Tab
- External Group Mapping Tab
- Settings Tab

To display the Admin Security view, go to **ADMIN > Security**.



The Admin > Security view has four tabs:

- The **Users** tab provides a way to manage user accounts.
- The **Roles** tab provides a way to define security roles and assign roles to user accounts.
- The **External Group Mapping** tab provides a way to manage access parameters for LDAP groups.
- The **Settings** tab provides a way to configure password complexity and expiration for internal NetWitness Suite users and to configure system behavior due to failed logins and inactivity. It also provides a way to configure external authentication.

Users Tab

This topic introduces the features and functions to set up a user account in the Admin > Security view > Users tab.

Each NetWitness Suite user must have a user account. In the Users tab, you can create, edit, delete, enable/disable and unlock a user account.

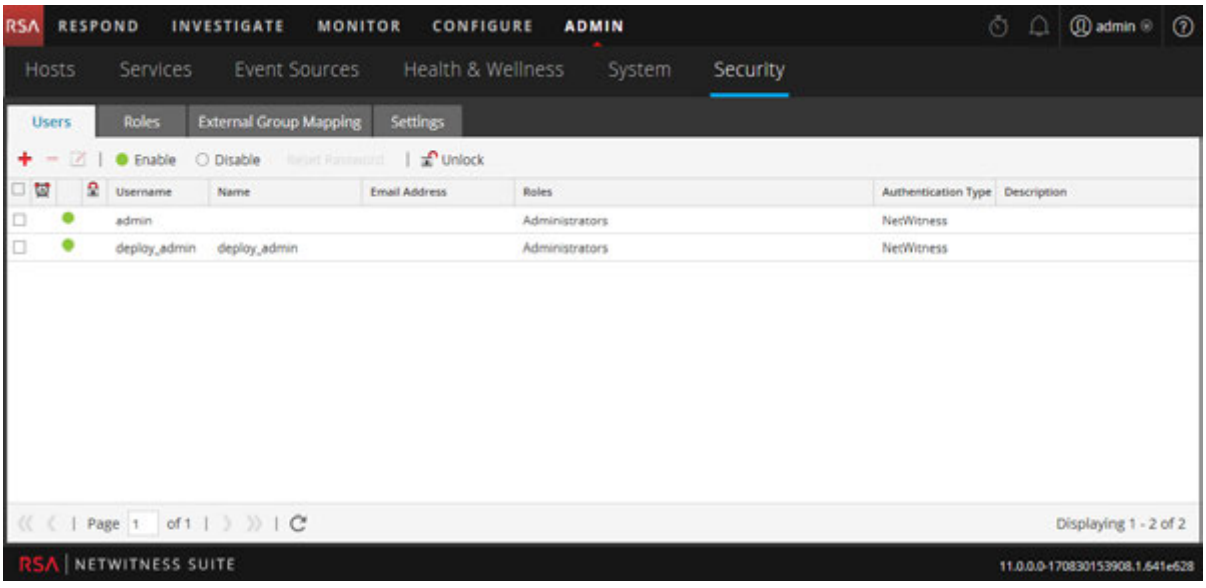
What do you want to do?

Role	I want to ...	Show me how
Admin	Set up a new user	Step 4. Set Up a User Add a User and Assign a Role
Admin	Manage user accounts	Enable, Unlock, and Delete User Accounts

Related Topics

- Add or Edit User Dialog

To access this view, go to **ADMIN > Security**. The Security view opens to the **Users** tab by default.



The Users tab consists of the User list with a toolbar at the top. These are the toolbar features.

Feature	Description
	Opens the Add User dialog.
	Deletes the selected user.
	Opens the Edit User dialog for the selected user.
	Enables a disabled user account with all user preferences intact.
	Blocks user access without deleting user preferences so that upon re-enabling users, user preferences are intact.
Reset Password	Opens the Reset Password dialog, which enables you to change the password of the selected user. This dialog lists the password format requirements necessary to change the password and allows you to force the user to change their password on the next login.
 Unlock	Unlocks a user account that has been locked due to too many failed login attempts.

The **Users** list has these columns.

Column	Description
	If this icon appears in a user row, it indicates that the user password has expired.
Username	Username to log on to NetWitness Suite.
Name	Name of the user to whom the account belongs.
Email Address	Email address of the user.
Roles	Role assigned to the user.
External	Authentication method, which could be external by Active Directory or PAM or internal by NetWitness Suite.
Description	Description of the user account.

Add or Edit User Dialog

This topic introduces the Add User and Edit User dialogs accessible from the Admin > Security view > Users tab.

All users must either have a local user account with username and password or an external user account that is mapped to NetWitness Suite.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Add a User and Assign a Role	Step 2. (Optional) Add a Role and Assign Permissions
Administrator	Change User Information	Step 2. (Optional) Add a Role and Assign Permissions
Administrator	Reset a User Password	Step 2. (Optional) Add a Role and Assign Permissions
Administrator	Add a User for External Authentication	Step 2. (Optional) Add a Role and Assign Permissions

Related Topics

- Manage Users with Roles and Permissions
- Enable, Unlock, and Delete User Accounts

User Preferences

To display the **Add User** or **Edit User** dialog:

1. In NetWitness Suite, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Do one of the following:
   - In the action bar, click  .
     The **Add User** dialog is displayed.

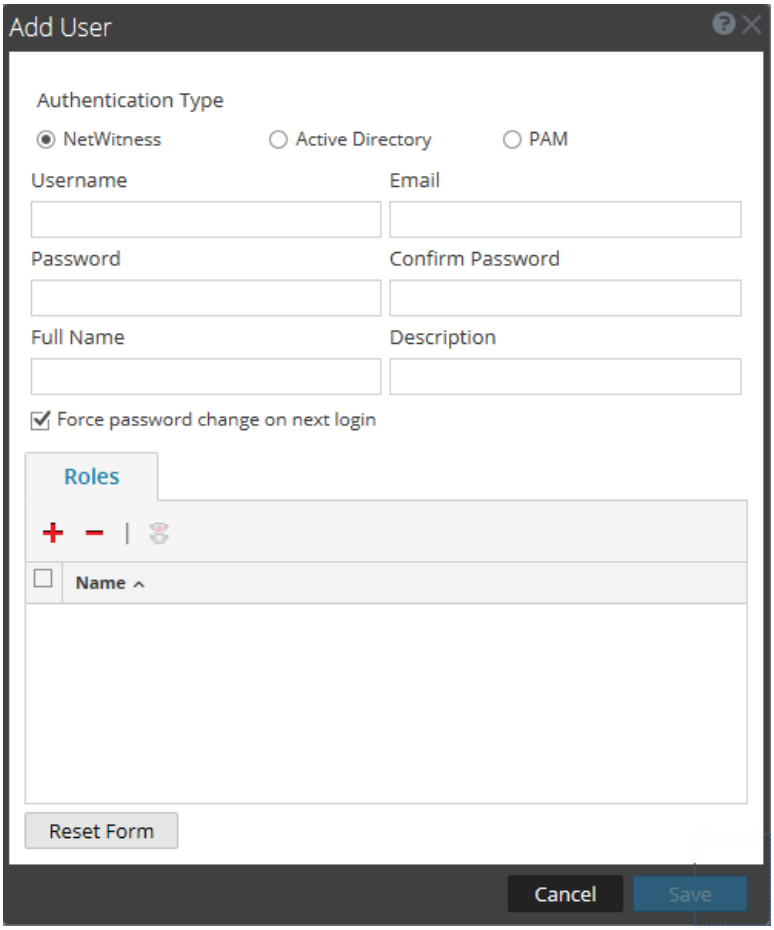
- Select a user and in the action bar, click .

  The **Edit User** dialog is displayed.

The Add User and Edit User dialogs are the same except that the Add User dialog contains additional **Password** and **Confirm Password** fields. You can add a password for a new user in the Add User dialog. Users can change their own passwords in the user preferences. You can reset a password for a user directly from the Users tab.

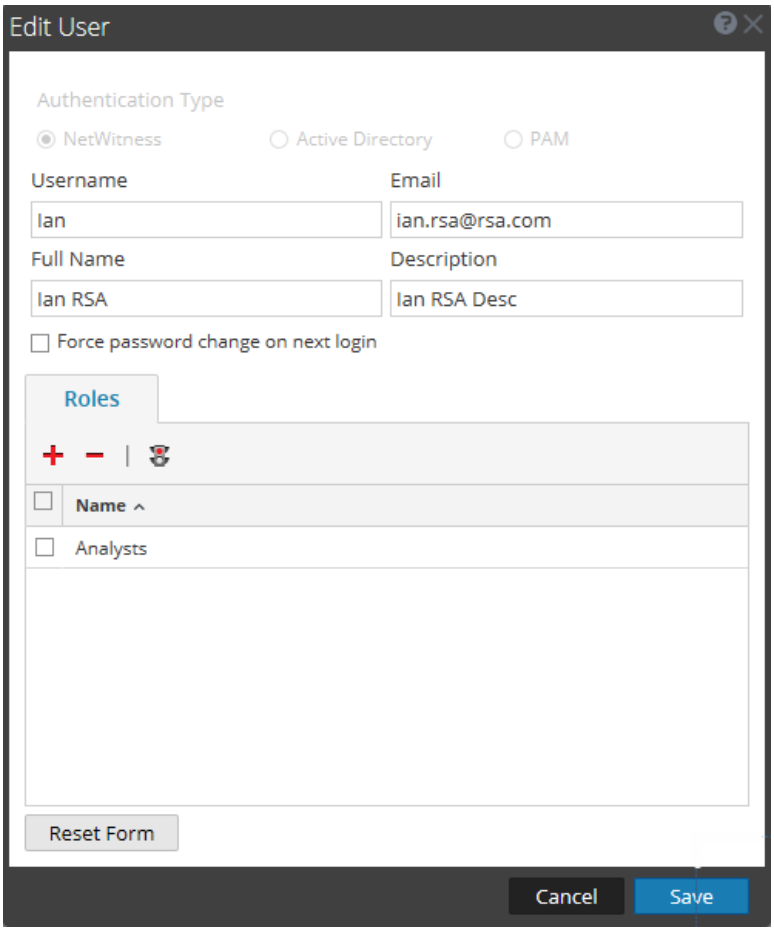
Add User Dialog

This is the Add User dialog for an internal user.



Edit User Dialog

This is the Edit User dialog for an internal user.



The Add User and Edit User dialogs show:

- Authentication type
- User information
- Roles to which the user belongs

User Information

The following table provides descriptions of the user information.

Field	Description
Authentication Type	The authentication type for the user. Default selection is NetWitness, which designates an internal user. Options for external users are Active Directory and PAM. This field is disabled when editing a user.
Username	Username for the NetWitness Suite user account.

Field	Description
Full Name	Name of the user.
Password	(Add User dialog only) Password to log on to NetWitness Suite.
Confirm Password	(Add User dialog only) Password confirmation for adding the user password.
Email	Email address of the user.
Description	(Optional) Description of the user.
Force password change on next login	Expires the user password the next time the user logs on to NetWitness Suite. This field applies only to internal users. This does not affect any active user sessions. The  appears in the user row to show that the user password expired. After a password is expired, you cannot undo it. This checkbox is cleared the next time you edit the user account.
Reset Form	Removes any changes in process.

Roles Tab

The following table provides descriptions of the Roles tab options. The Roles tab shows the roles that are assigned to the user.

Option	Description
	Opens the Add Role dialog that lists roles you could assign to the user.
	Removes the selected role from being assigned to the user.
	Shows permissions for the selected role.
Name	Lists each role assigned to the user.

Roles Tab

This topic introduces the functions of the Admin > Security view > Roles tab.

Roles are assigned to all NetWitness Suite users. Users receive the permissions the roles allow. In the Roles tab you can create, duplicate, edit and delete a role. You can also see a list of all roles and their respective permissions.

What do you want to do?

Role	I want to ...	Show me how
Admin	View preconfigured roles	Step 1. Review the Pre-Configured NetWitness Roles
Admin	Create a new role	Step 2. (Optional) Add a Role and Assign Permissions

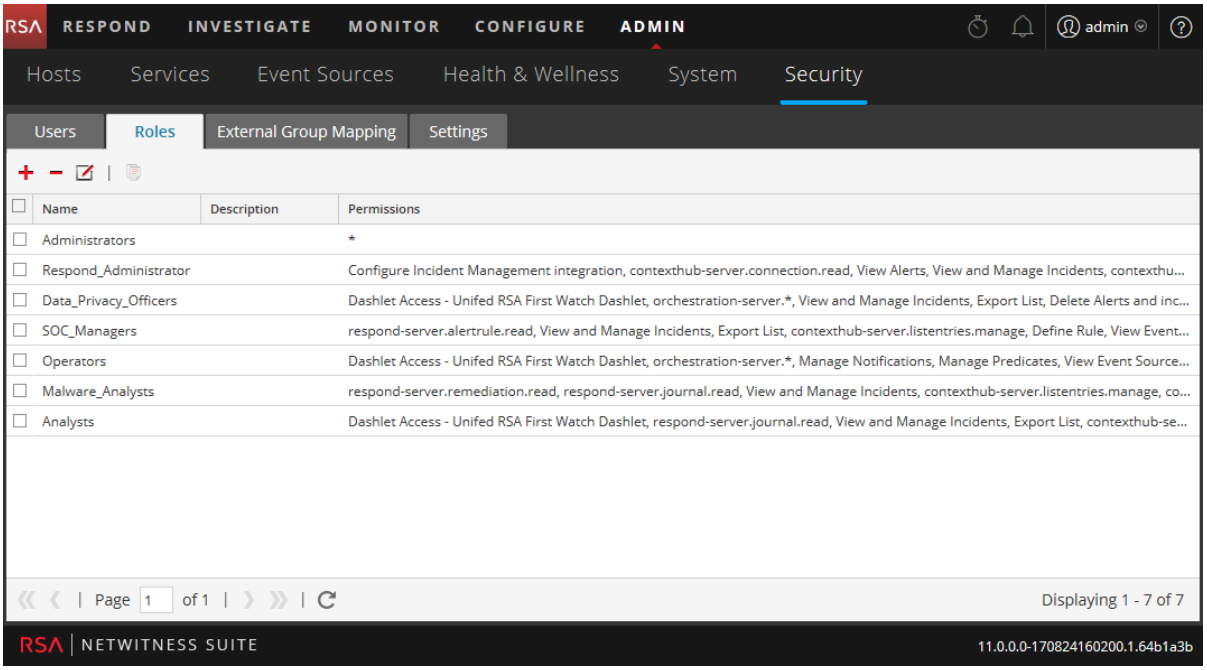
Related Topics

- Add or Edit Role Dialog

To access this view:

1. Go to **ADMIN > Security**.
   The Security view opens to the **Users** tab by default.

2. Click the **Roles** tab.



The Roles tab consists of the Roles list with a toolbar at the top.

The following table describes the toolbar features.

Feature	Description
+	Displays the Add Role dialog.
	Displays the Edit Role dialog.
−	Displays a warning message, and asks for confirmation that you want to delete a role.
	Duplicates a role to save with a different name.

The following table describes the roles list features.

Column	Description
Name	Displays the name of a role that can be given to a user.
Description	Displays a description of the role.
Permissions	Displays the permissions assigned to the role.

Add or Edit Role Dialog

This topic introduces the Add Role and Edit Role dialogs accessible from the Admin > Security view > Roles tab.

In the Add Role and Edit Role dialogs, you can add or edit a role and the permissions assigned to it. You can also specify the query-handling attributes for role members to lock down the information that they can retrieve. The structure of these dialogs is the same. The only difference is that you either add a new role or modify an existing role.

When you change permissions for a role, the change is immediately applied to users who are assigned the particular role after the role is saved.

What do you want to do?

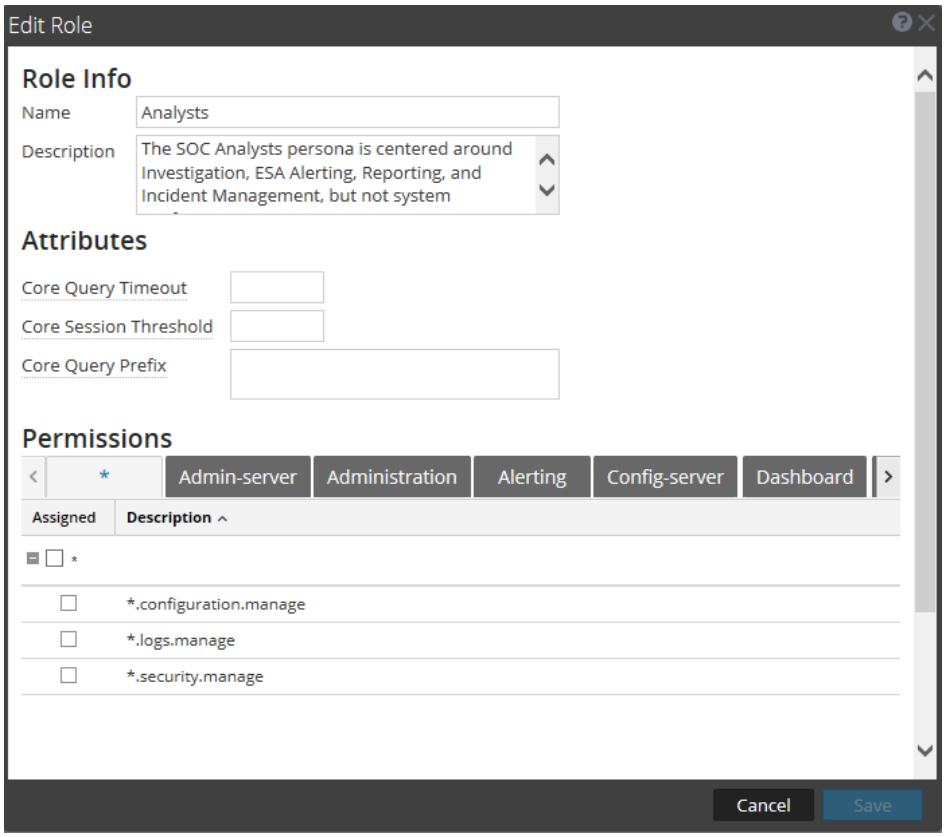
Role	I want to ...	Show me how
Admin	View preconfigured roles	Step 1. Review the Pre-Configured NetWitness Roles
Admin	Create a new role	Step 2. (Optional) Add a Role and Assign Permissions
Admin	Edit a role	Step 2. (Optional) Add a Role and Assign Permissions
Admin	Delete a role	Step 2. (Optional) Add a Role and Assign Permissions

To access this view:

1. In NetWitness Suite, go to **ADMIN > Security**.
   The Security view opens to the **Users** tab by default.
2. Click the **Roles** tab.
3. Do one of the following:
   - In the action bar, click  .
     The **Add Role** dialog is displayed.

- Select a role and in the action bar, click .

  The **Edit Role** dialog is displayed.



The Add Role and Edit Role dialogs include three sections: **Role Info**, **Attributes**, and **Permissions**.

Role Info

This is the information in the **Role Info** section.

Feature	Description
Name	The name of the user role.
Description	An optional description of the user role.

Attributes

This is the information in the **Attributes** section. A value shown in italics indicates a default value, for example, *5*. A value shown without italics indicates a change from the default value, for example, `1200`. Step 3. Verify Query and Session Attributes per Role provides more information.

Feature	Description
Core Query Timeout	(Optional) Specifies the maximum number of minutes that a user can run a query. The default value is 5 minutes. This timeout only applies to queries performed from Investigation. If this value is set, it must be zero (0) or greater. A value of zero represents no timeout. When migrating to NetWitness Suite 10.5 and later, if there is no value set in the roles, 5 minutes is set by default. **Note:** NetWitness Suite 10.5 and later Core services use this field.
Core Session Threshold	Controls how the service scans meta values to determine session counts. This value must be zero (0) or greater. If this value is greater than zero, a query optimization will extrapolate the total session counts that exceed the threshold. When the meta value returned by the query reaches the threshold, the system will: • Stop its determination of the session count • Show the threshold and percentage of query time used to reach the threshold The default value is `100000`. The limit you specify here overrides the **Max Session Export** value defined in the INVESTIGATE view settings.
Core Query Prefix	(Optional) Filters query results to restrict what the role members see. By default, this is blank. For example, the `'service' = 80` query prefix prepends to any queries run by the user and the user can only access meta of HTTP sessions.

Permissions

This is the information in the **Permissions** section. Role Permissions describes the permissions.

Feature	Description
Module tabs	There are eight tabs, one for each module: Administration, Alerting, Incidents, Investigation, Live, Malware, Reports, and Dashboard. Each tab lists the permissions for a module.
Description column	List of all permissions for the module.
Assigned column	Checkbox that indicates if a module permission is assigned to the role.
Save	Saves the role with the selected permissions assigned to it.
Cancel	Cancels any work and closes the dialog.

External Group Mapping Tab

If you set up external user authentication, you can map NetWitness Suite user roles to an external group. The External Group Mapping tab provides information about each external group to which you have mapped roles.

What do you want to do?

Role	I want to ...	Show me how
Admin	Map a role to an external group	Step 5. (Optional) Map User Roles to External Groups
Admin	Search for an external group	Search for External Groups

Related Topics

- Add Role Mapping Dialog
- Search External Groups Dialog

To access this view:

1. In NetWitness Suite, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **External Group Mapping** tab.

The External Group Mapping tab consists of a toolbar and list.

The list has the following features.

Feature	Description
Group type	In the column on the left, click either **Active Directory** or **PAM** to show groups for the selected type.
Selection box	In a row, toggles selection of a group name. In the title bar, toggles selection of all group names.
Group Name	Displays the name of the external group that has access to NetWitness Suite.
Mapped Roles	Displays the NetWitness Suite roles mapped to the external group.

The **toolbar** has the following features.

Feature	Description
	Displays the Add Role Mapping dialog in which you can select an external group and map it to a NetWitness Suite role.
	Displays a warning message and asks for confirmation to remove all NetWitness Suite roles mapped to the external group.
	Displays the Edit Role Mapping dialog in which you can add or remove NetWitness Suite roles from the external group.

Add Role Mapping Dialog

This topic introduces the features of the Admin >Security > External Group Mapping tab > Add Role Mapping dialog.

In NetWitness Suite each user role has its own set of permissions. You can map one or more NetWitness Suite roles to an external group, which grants the group the same set of permissions that each role has.

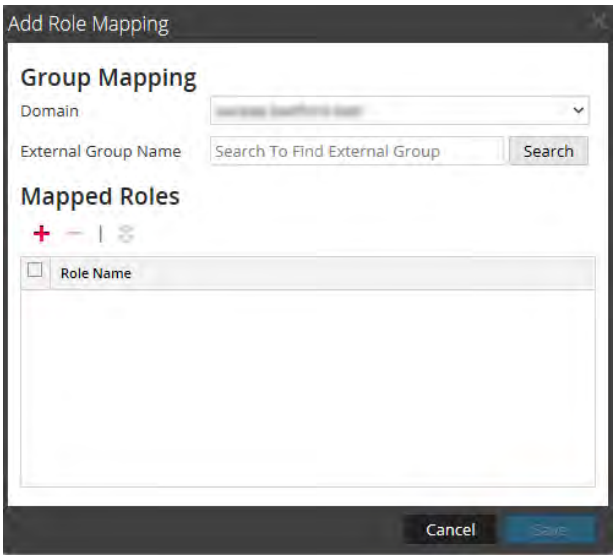
What do you want to do?

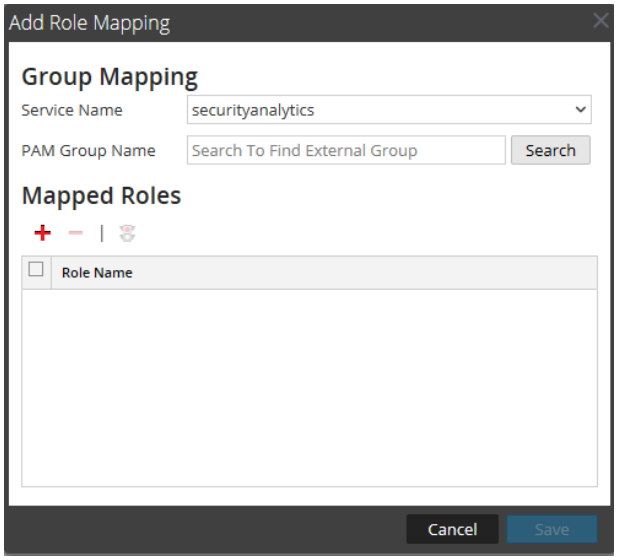
Role	I want to ...	Show me how
Admin	Map a role to an external group	Step 5. (Optional) Map User Roles to External Groups
Admin	Search for an external group	Search for External Groups

To access this dialog:

1. In NetWitness Suite, go to **ADMIN > Security**.
2. Click the **External Group Mapping** tab.
3. In the toolbar, click +.

   The **Add Role Mapping** dialog for the external authentication method you set up is displayed.





The Add Role Mapping and the Edit Role Mapping dialogs are nearly identical. The only difference is that you cannot search in the Edit Role Mapping dialog.

Group Mapping

The **Group Mapping** section has the following features.

Feature	Description
Domain	Displayed if you set up Active Directory for external user authentication.The domain name of the external AD group to which roles are mapped.

Feature	Description
External Group Name	Displayed if you set up Active Directory for external user authentication.The external group to which roles are mapped.
PAM Group Name	Displayed if you configured PAM for external user authentication. The name of the external group to which roles are mapped.
Search	Displays a search dialog in which you can search for external groups. Search is not available in the Edit Role Mapping dialog.

Mapped Roles

The **Mapped Roles** section has the following features.

Feature	Description
+	Opens the Add Role dialog, in which configured NetWitness Suite user roles to add are listed.
−	Removes selected roles from the Mapped Roles grid.
Name	Displays the name of the NetWitness Suite user role.
Permissions	Displays the permissions associated with the NetWitness Suite user role.
Cancel	Cancels the new group mapping or changed group mapping and closes the dialog.
Save	Saves the new group mapping or changed group mapping and closes the dialog.

Search External Groups Dialog

This topic describes the features of the Admin > Security view > Search External Groups dialog.

If you set up external user authentication, you can map NetWitness Suite user roles to external groups. You search for external groups to select the groups to which you want to map NetWitness Suite roles.

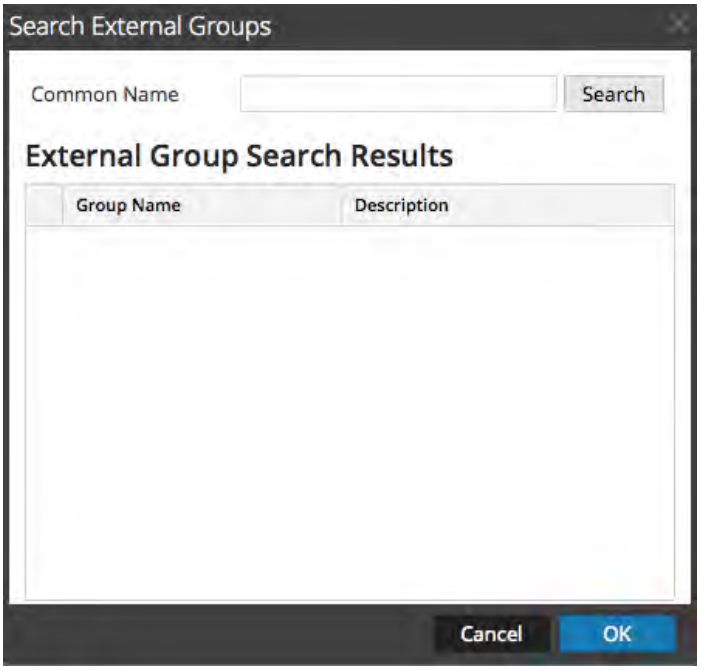
What do you want to do?

Role	I want to ...	Show me how
Admin	Map a role to an external group	Step 5. (Optional) Map User Roles to External Groups
Admin	View external group mappings	External Group Mapping Tab
Admin	Search for external groups	Search for External Groups

To access this dialog:

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **External Group Mapping** tab.
3. In the toolbar, click +.
   The Add Role Mapping dialog for the external authentication method you set up is displayed.
4. In the Group Mapping section, select a **domain**.

5. In the Group Mapping section, click **Search**.
   The **Search External Groups** dialog is displayed.



The following table describes the features of the Search External Groups dialog.

Feature	Description
Common Name	Group name for which you are searching. Can be the exact name or can contain the wild card character (*) to match any character.
Group Name	External group to which you could map roles.
Description	Optional text about the group.
OK	Displays the Add Role Mapping dialog, showing the external group you selected.
Cancel	Closes the dialog.

Settings Tab

This topic explains the Admin > Security view > Settings tab. In the Settings tab, you configure password complexity for internal NetWitness Suite users and system-wide security parameters.

For information on configuring NetWitness Suite security, see Set Up System Security.

Password complexity requirements apply only to internal users and are not enforced for external users. External users rely on their own methods and systems to enforce password complexity.

What do you want to do?

Role	I want to ...	Show me how
Admin	Configure password complexity	Step 1. Configure Password Complexity
Admin	Configure system-level security settings	Step 3. Configure System-Level Security Settings
Admin	(Optional) Configure external authentication	Step 4. (Optional) Configure External Authentication

Related Topics

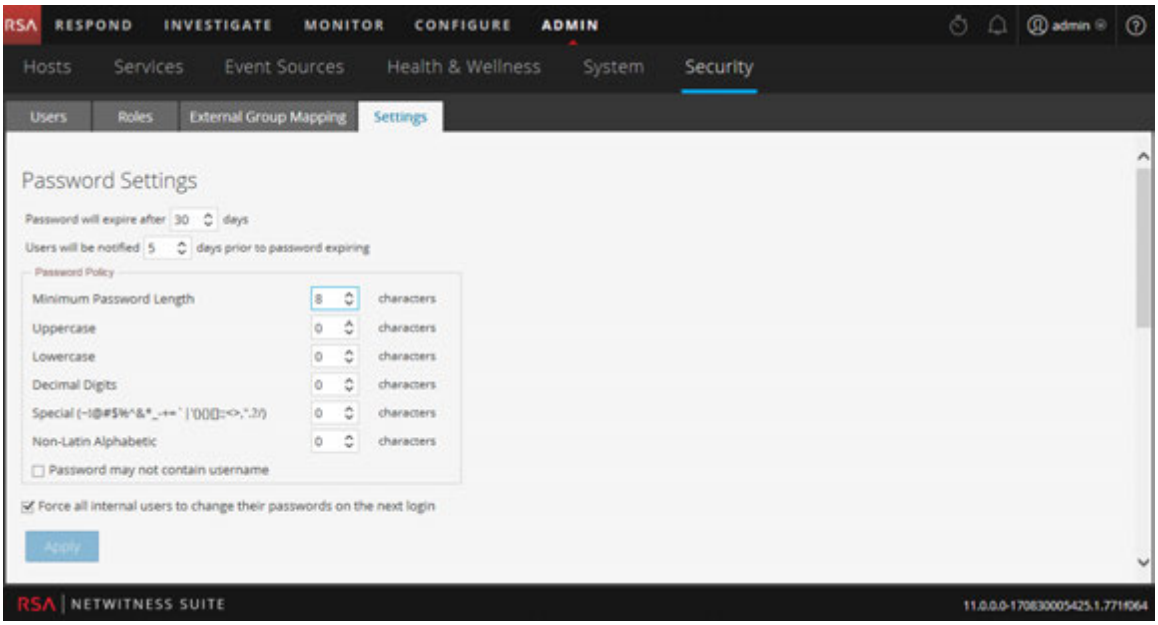
- Set Up System Security

Admin Security View Settings Tab

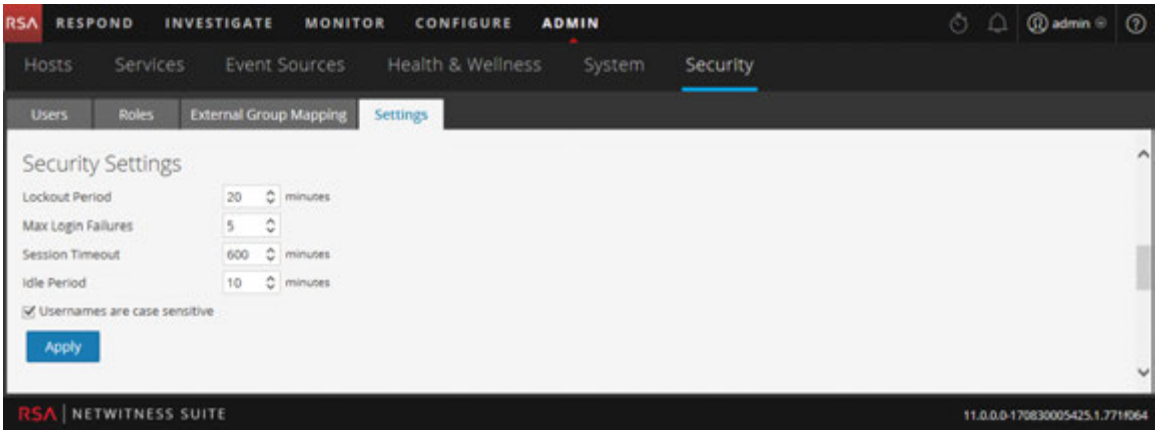
To access the Settings tab:

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.

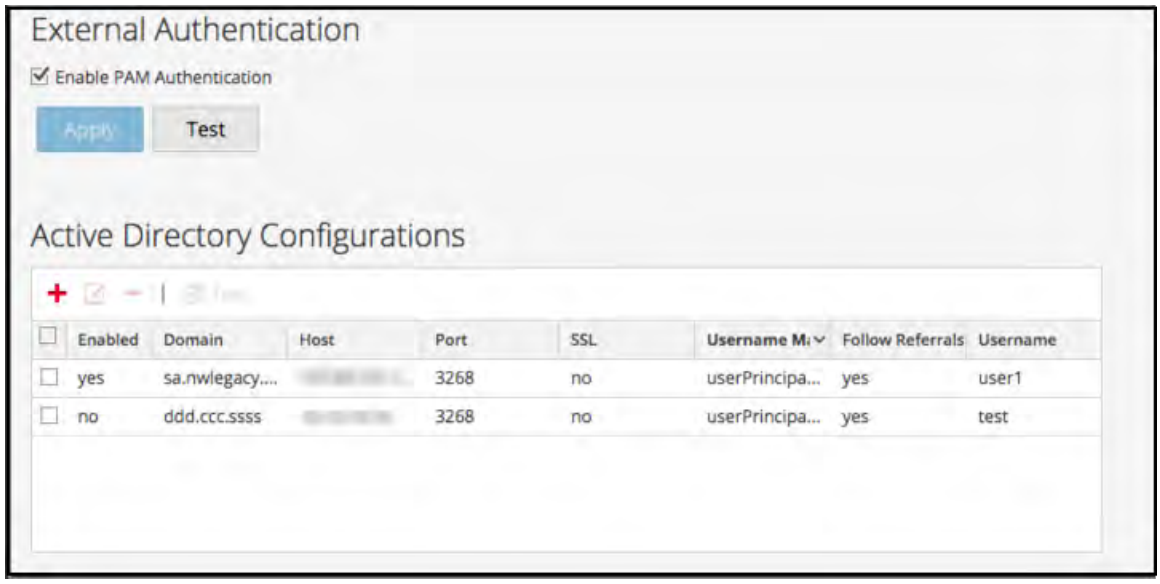
The following figure shows the Password Settings section of the Settings tab.



The following figure shows the Security Settings section of the Settings tab.



The following figure shows the PAM Authentication and Active Directory Configurations sections of the Settings tab.



Password Settings

The Password Policy section enables you to configure password complexity requirements for internal NetWitness Suite users when they set their passwords.

Option	Description
Password will expire after <n> days	The default number of days before a password expires for all internal NetWitness Suite users. A value of zero (0) disables password expiration. For new installations, the default value is 30. For upgrades, the previous value will migrate automatically to the upgraded installation.
Users will be notified <n> days prior to password expiring	The number of days before the password expiration date, to notify a user that their password is about to expire. Users receive a one-time email on the specified date before their passwords expire. They also see a Password Expiration Message dialog when they log on to NetWitness Suite. The minimum value is 1 day.
Minimum Password Length	Specifies a minimum password length requirement for NetWitness Suite user passwords. A minimum password length prevents users from using short passwords that are easy to guess.

Option	Description
Uppercase	Specifies a minimum number of uppercase characters for the password. This includes European language characters A through Z, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic uppercase: Д Ц • Greek uppercase: Π Λ
Lowercase	Specifies a minimum number of lowercase characters for the password. This includes European language characters a through z, sharp-s, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic lowercase: д ц • Greek lowercase: π λ
Decimal Digits	Specifies a minimum number of decimal characters (0 through 9) for the password.
Special (~!@#$%^&*_-+=`|'(){}[]:;<>,".?/)	Specifies a minimum number of special characters for the password: `~!@#$%^&*_-+=`|'(){}[]:;<>,".?/`
Non-Latin Alphabetic	Specifies a minimum number of Unicode alphabetic characters that are not uppercase or lowercase. This includes Unicode characters from Asian languages. For example: • Kanji (Japanese): 頁 (leaf) 栞 (tree)
Password May Not Contain Username	Specifies that a password cannot contain the case-insensitive username of the user.

Option	Description
Force all internal users to change their passwords on the next login	Forces all internal users to change their passwords the next time they log on to NetWitness Suite instead of when they create or change their passwords. Note that this setting is checked by default.
Apply	Password strength settings take effect when NetWitness Suite users create or change their passwords. If **Force all internal users to change their passwords on the next login** is selected, all internal users must change their password the next time they log on to NetWitness Suite.

Security Settings

The Security Settings section enables you to configure global security settings for NetWitness Suite users.

Option	Description
Lockout Period	Number of minutes to lock a user out of NetWitness Suite after the configured number of failed logins is exceeded. The default value is 20 minutes.
Max Login Failures	The maximum number of unsuccessful login attempts before a user is locked out. The default value is 5
Session Timeout	The maximum duration of a user session before timing out in minutes. The default value is 600. If the value is 0, there is no maximum time for a session. If the value is a positive integer, the session times out when the configured time has elapsed. The user must log in again.
Idle Period	Number of minutes of inactivity before a session times out. The default value is 10. If the value is 0, the session will not timeout.
Usernames are case sensitive	Select this option if you want the Username field on the NetWitness Suite login screen to be case sensitive. For example, if usernames are case sensitive, you could use admin to log on to NetWitness Suite, but you could not use Admin.

Option	Description
Apply	Makes the settings become effective immediately.

PAM Authentication

The PAM Authentication section enables you to configure NetWitness Suite to use Active Directory or PAM to authenticate and test external user logins.

Option	Description
Enable PAM Authentication	Allows NetWitness Suite to use Pluggable Authentication Modules (PAM) to authenticate external user logons.
Apply	Makes the PAM configuration settings become effective in the next logon.
Test	Prompts for a username and password, then tests the currently enabled PAM authentication method.

Active Directory Configurations

The Active Directory Configuration section enables you to configure NetWitness Suite to use Active Directory to authenticate external user logins.

Option	Description
Enabled	Enables Active Directory authentication for NetWitness Suite users.
Domain	Domain name where the Active Directory Service is located.
Host	Host name or IP address where the Active Directory Service is located.
Port	Port on the host that is used for Active Directory Service authentication.
SSL	Indicates whether the Active Directory Service uses SSL.
Username Mapping	Indicates the Active Directory search field to use for username mapping. You can specify userPrincipalName (UPN) or sAMAccountName.
Follow Referrals	Indicates whether NetWitness Suite will follow LDAP referrals made by Active Directory.

Option	Description
Username	If Username is provided here, it binds to the Active Directory Service while searching Active Directory groups. This credential is not used for any other purpose.

Getting Started with ESA

This topic covers quick start topics for RSA NetWitness® Suite Event Stream Analysis (ESA) to help you get started in using ESA. The following topics are designed to assist you in working with ESA Correlation Rules.

- Best Practices helps you to understand how to best set up, deploy, and create rules.
- Troubleshoot ESA helps you to troubleshoot different aspects of ESA, including rule writing and deployment.
- View Memory Metrics for Rules helps you to work with memory metrics to understand memory usage for ESA services.

There are two ESA services that can run on an ESA host:

- Event Stream Analysis (ESA Correlation rules)
- Event Stream Analytics Server (ESA Analytics)

The first service is the Event Stream Analysis service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live. This user guide covers alerting using ESA Correlation Rules. For information on configuring ESA Correlation Rules, see the "Configure ESA Correlation Rules" section of the *ESA Configuration Guide*.

The second service is the ESA Analytics service, which is used for Automated Threat Detection. Because the ESA Analytics service uses preconfigured ESA Analytics modules for Automated Threat Detection, you do not have to create or download rules to use it. For information on the ESA Analytics service, see the *Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *ESA Configuration Guide*.

Best Practices

Best practices provide guidelines to help you write and manage rules, deploy rules, and maintain system health for your ESA services.

Understand Event Stream Analysis Rule Types

The Event Stream Analysis service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators. However, when working with Event Stream Analysis, you should be aware of the factors that affect resource usage in order to create effective rules.

Each event that is received by ESA is evaluated to determine if it may trigger a rule. There are three types of rules that can be deployed in order to determine what the ESA engine should do with the incoming event. Each of these rule types have different impacts on system resource utilization. All three rule types may be created via the Rule Builder, Advanced EPL rules, or downloaded via RSA Live. The table below lists the rule type and the impact this rule may have on system resources.

Rule Type	Description
Simple Filter Rule	This rule has no correlation to other events. At ingestion time, this rule is evaluated against a set of conditions, and if those conditions are met an alert is generated. If no conditions match, the event is quickly released by the engine to free up memory usage. These rules do not take up memory since the events are not retained beyond the initial evaluation. The memory resource usage does not increase as more simple filter rules are deployed. However, if the filter condition is too generic, it is possible that this rule can generate too many alerts, which will strain the system resources for the storage and retrieval of these alerts. For example, you might write a rule to generate an alert when HTTP network activity arrives over a non-standard HTTP port.
Event Window Rule	This rule evaluates a set of events over a time period for specific conditions. At ingestion time, the rule is evaluated against a set of conditions. If those conditions are met, the event is retained in memory for a specific amount of time. After the specified time passes, the events are removed from the time window if the number of events collected does not meet the threshold to trigger an alert. The memory consumption of such rules are highly dependent on the incoming event rate (traffic), the amount of data per event, and the time length specified in the event window. Each matching event is retained in memory until the time window has passed, so the longer the time window, the greater the potential volume. For example, you might write a rule that generates an alert if a user fails to log into any system five times within a ten minute time frame.

Rule Type	Description
Followed By Rule	This rule evaluates a chain of incoming events to determine if the sequence of events matches a particular condition. At ingestion time, the rule is evaluated against a set of conditions. If the conditions are met, one of two actions occurs: • If this is the first event of the sequence, a new event thread is started, and the event is retained as the head of the sequence. • If the event belongs to an existing event thread, it is added to that sequence. In both cases, the event is retained in memory. The amount of resource usage is particularly sensitive to the customer environment for this type of rule. If the filter condition generates many event threads, resources are consumed for each new thread (in addition to the event). Additionally, if the end of the event thread is never met (i.e., an alert is never generated), then the entire event is saved in memory indefinitely. For example, you might write a rule to generate an alert when a user fails to log in to a server, then performs a successful login, and then creates a new account.

In addition to the memory usage discussed above, alert generation also consumes system resources. Each alert that is generated must be stored for retrieval and must also be processed by NetWitness Respond. This process uses disk space for storage, requires database memory to be consumed, and increases CPU utilization running queries.

When writing and deploying rules, you should be aware that each of these actions "cost" you system resources. The sections below are designed to help you keep your usage at a healthy level and monitor for problems if systems are becoming overloaded.

Best Practices for Writing Rules

These are general guidelines for writing rules.

- **Create alerts for actionable events.** The purpose of an alert should be to notify you of an event that requires immediate and specific action. For events that do not require action, or only require you to have awareness of the event, you can create a report.
- **Configure new rules as trial rules so you can observe how they react in your environment**. If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded. You can also use the memory snapshot feature to see how much memory was being used when a trial rule was disabled. For more details, see Work with Trial Rules.

- **Configure Alert notifications only after your rule testing and tuning is complete**. This can help ensure you do not get flooded with notifications if a rule behaves differently than you expect.
- **Rules need to be specific so that you limit resource usage**. Use the following guidelines to limit usage:
  - Make the filters on the rule exclude all but the necessary events for the rule to fire accurately.
  - Make the size of your windows (window time for correlation) as small as possible.
  - Limit the events that you include in the window: For example, if you only want to see IDS events, ensure that you only include those events in your time window.
- **Rules need to be tuned to an alert level that is manageable**. If you are flooded with alerts, then the purpose and utility of an alert is lost. For example, maybe you want to know about encrypted traffic to other countries. But, you could limit the list to countries that are known risks. This limits the volume of alerts to a level you can manage.

Best Practices for Working with RSA Live Rules

These are guidelines for RSA Live Rules.

- **Deploy RSA Live rules in small batches**. Not every rule is suited to every environment. The best way to ensure your RSA Live rules are successful is to deploy them in small batches so you can test them in your environment. If you deploy small batches, it's much easier to tell if a particular rule has an issue.
- **Read the rule descriptions provided with RSA Live rules**. ESA rules are not “one size fits all.” Not all rules will work in your environment. The rule descriptions tell you which parameters you will need to modify to successfully deploy a rule in your environment.
- **Set your parameters**. RSA Live rules have parameters that need to be modified. If you do not modify your parameters, the rule may not work or it may exhaust your memory.
- **Deploy new rules as trial rules so you can observe how they react in your environment.** If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded. For more details, see Work with Trial Rules.

Best Practices for Deploying Rules

These are general guidelines for deploying rules.

- **Deploy rules in small batches so you can observe how they react in your environment.** Not all environments are the same, and a rule will need to be tuned for memory usage, alert volume, and effective detection of events.
- **Test rules before you configure alert notifications**. Configure Alert notifications only after your rule testing and tuning is complete. This can help ensure you do not get flooded with alerts if a rule behaves differently than you expect.
- **Monitor system health as a part of your deployment process**. When you deploy rules, monitor your system's health as a part of your deployment process. You can view total memory utilization for your ESA in the Health and Wellness tab. For more information, see "Viewing Health and Wellness statistics" in Troubleshoot ESA.

Best Practices for System Health

These are general guidelines for system health.

- **Set up new rules as trial rules**. A common issue is that new rules may cause memory issues. To prevent this, you can set up new rules as trial rules. If the configured memory threshold is met, all trial rules are disabled to prevent the system from running out of memory. For more information about trial rules, see Work with Trial Rules.
- **Set up thresholds in the Health & Wellness module to alert you if memory usage is too high**. There are metrics in the Health & Wellness module that track memory usage. You can set up alerts and notifications to send you an email if those thresholds are crossed. For more information about the memory statistics you can view, see "Viewing Health and Wellness statistics" in Troubleshoot ESA.
- **Monitor memory metrics for each rule in the Health & Wellness module**. For each rule, you can view the estimated memory usage in the Health & Wellness module. You can use this information to ensure that rules do not use too much memory. For more information about the memory statistics you can view, see "Viewing Health and Wellness statistics" in Troubleshoot ESA.

Troubleshoot ESA

This section describes common issues that may occur while using ESA, and it suggests common solutions to these problems.

Troubleshoot ESA Services

Problem	Possible Causes	Solutions
On the NetWitness Suite Dashboard, the ESA service appears in red to indicate it is offline. In the **CONFIGURE** > **ESA Rules** view, the following message appears: "The Service is either offline or not reachable."	Several	When an ESA service is offline, there are many possible causes. However, a common issue is that you have created a rule that uses excessive memory and causes the ESA service to fail. To troubleshoot this problem, see Steps to Troubleshoot Memory Issues with an ESA Service Offline. Other common causes might be that your firewall is blocking the connection between the ESA and NetWitness Suite, or the ESA service machine may be down.
		To bring up ESA Services: From **ADMIN** > **Services**, select the actions icon  for your ESA service, and choose **start**. If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.
After a recent upgrade, the ESA service appears in red on the NetWitness Suite Dashboard to indicate it is offline. In the **CONFIGURE** > **ESA Rules** view, the following message appears: "The Service is either offline or not reachable."	Configuration issues	If your system has been recently upgraded, you may have made a configuration error. Under **ADMIN** > **Services**, select your ESA service, and click **Edit Service**. On the Edit Service field, click Test Connection. If the connections fails, you likely have a configuration error. Attempt to fix your configuration error, and try again.

Problem	Possible Causes	Solutions
The ESA appears to be running slowly.	Configuration issues	You may be able to improve performance by modifying the buffer (the default value is *1048576 bytes*), or setting the TCP setting to TCPNoDelay to prevent a delay in receiving TPC acknowledgments (Acks). You can modify these settings (*readBufferSize* and *tcpNoDelay*) by going to */Workflow/Source/nextgenAggregation* in the Explore view.

Troubleshoot RSA Live Rules for ESA

Problem	Possible Causes	Solutions
I imported a group of rules from RSA Live, and now my ESA service is crashing. Why?	You may not have configured the parameters for the RSA Live rule to tune it for your environment.	Each rule in RSA Live has a description that includes the parameters you must configure and prerequisites for your environment. Review this description to see if the rule is appropriate for your environment. To ensure that you deploy rules safely in your environment, configure new rules as trial rules to test them in your environment. Trial rules add a safeguard for testing new rules. For details on this, see Deploy Rules as Trial Rules.

Problem	Possible Causes	Solutions
I imported a group of rules from RSA Live, and while the rules deployed without errors, they were later disabled.	Not all RSA Live rules are meant for every environment. You may not have the correct meta in your ESA for the rule to run.	You can verify that a rule was disabled by going to **CONFIGURE > ESA Rules > Services > Deployed Rule Stats**. If the rule is disabled, the green icon does not display next to the rule. If a rule deployed correctly but was disabled, check the logs for exceptions related to the rule. Specifically, check to see if the rules were disabled due to missing meta. To do this, go to **ADMIN** > **Services**, select your ESA service and then > **View** > **Logs**. Then, search for a message similar to the following: "Property named '<meta_name>' is not valid in any stream" For example, you might see: `Failed to validate filter expression '(medium=1 and streams=2 or medium=3...(238 chars)': Property named 'tcp_flags_seen' is not valid in any stream` If a similar message displays, you may need to add a custom meta key to the Log Decoder or Concentrator. To do this, follow these instructions: "Create Custom Meta Keys Using Custom Feed " in the *Decoder and Log Decoder Configuration Guide*.

Troubleshoot Deployments

Problem	Possible Causes	Solutions
I created a rule, and I checked the syntax. The rule looked fine. When I went to deploy the rule, I got an error. Why?	You may not have the correct meta to deploy the rule.	Check the Meta key references. You may not have the correct meta to deploy the rule.

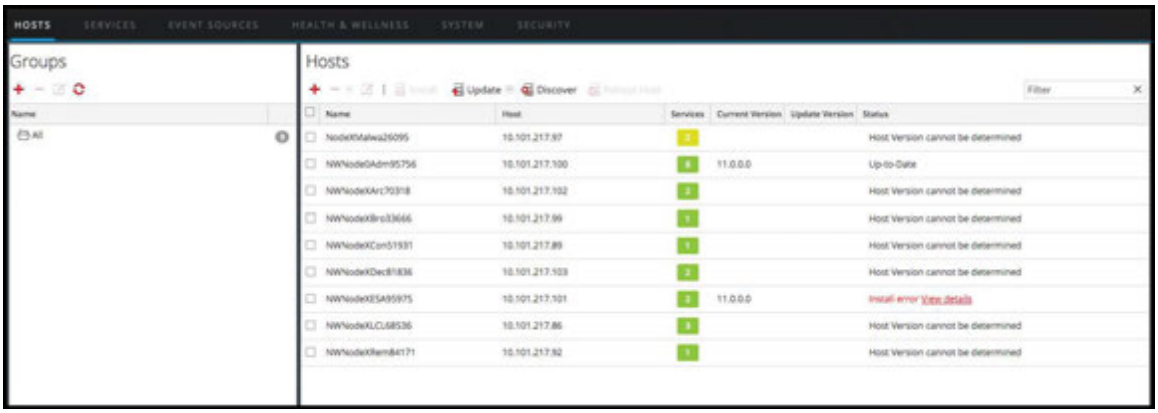
Troubleshoot Rules

Problem	Possible Causes	Solutions
I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why?	You may have connectivity issues.	Check the 'Offered Rate' statistic on the **CONFIGURE** > **ESA Rules** > **Services** tab. If the offered rate is zero, then the ESA service is not receiving data from Concentrators. Validate the Concentrator connectivity. Go to **ADMIN** > **Services**, select your ESA, and then **View** > **Config**. Ensure the concentrator is enabled. Select the concentrator and click on **test connection**. If the offered rate is not zero, the meta key name and type used in the rule likely doesn't match the meta key present in events. Check to see if the meta key name and type used in the rule is valid by searching for the meta key name in **CONFIGURE** > **ESA Rules** > **Settings** tab (Meta key references search).
	There may be a problem with the rule.	**If a specific rule is not firing**, go to **CONFIGURE** > **ESA Rules** > **Services** to see if the rule was disabled. In the **Deployed Rule Stats** section, a rule that is disabled displays a clear enabled button (instead of the green enabled button). You can also check Events Matched field. Go to **CONFIGURE** > **ESA Rules** > **Services**. From there, you can see the number of events that were matched in the **Events Matched** column. If no events matched, check the logic of your rule for errors. For example, check the syntax for uppercase and lowercase errors, and check the time window. If the rule still doesn't fire, consider simplifying the logic of the rule to see if it fires when there is less complexity.

Steps to Troubleshoot Memory Issues with an ESA Service Offline

Step 1: Verify that your Host Is Running

The first step to troubleshooting is to ensure that your host is running. To do this, go to **ADMIN**> **HOSTS**. If the host is down, the system parameters will not display (updating host information can sometimes be delayed), the **Services** display in red, and the **Updates** field displays an error message.



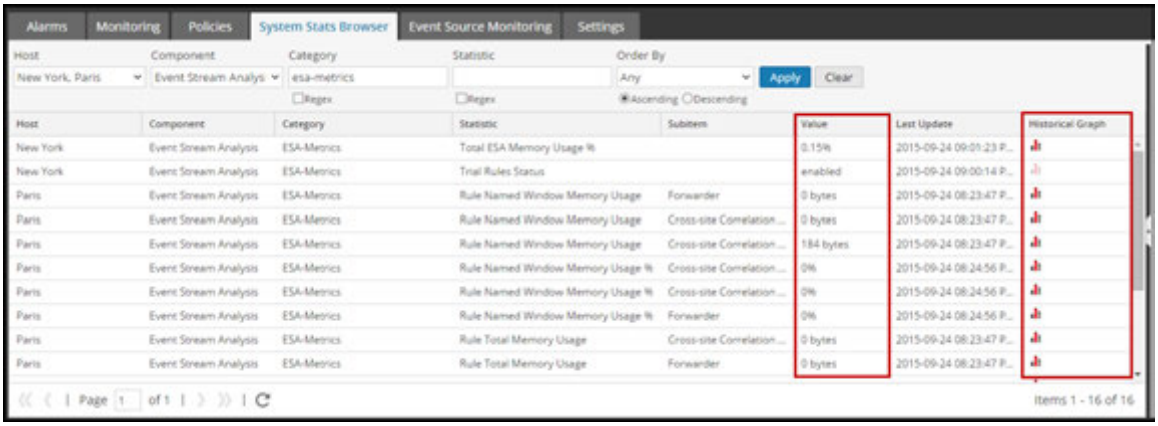
If your host is down, contact your NetWitness Suite Administrator to restart it. Otherwise, go to Step 2.

Step 2: View Detailed Statistics in Health & Wellness

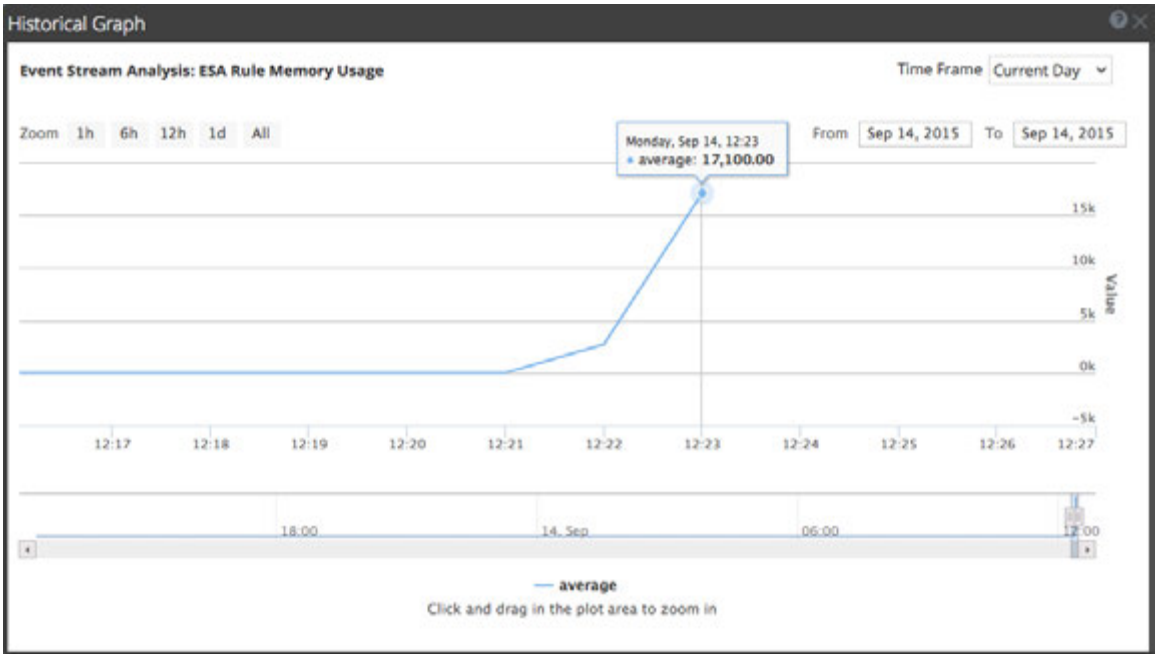
Once you are sure your ESA service is down, you can go to Health & Wellness to see where potential issues are occurring. The most common problem is that your ESA service is exceeding memory thresholds, which causes it to stop or fail.

1. Go to **ADMIN** > **Health & Wellness** > **Alarms** to see if the ESA triggered any alarms. Look for the following alarms:
   - ESA Overall Memory Utilization > 85%
   - ESA Overall Memory Utilization > 95%
   - ESA Service Stopped
2. Go to **ADMIN** > **Health & Wellness** > **System Stats Browser** to see the memory metrics for each rule's performance. To view the metrics, enter the following:

Host	Component	Category
<your host>	Event Stream Analysis	esa-metrics



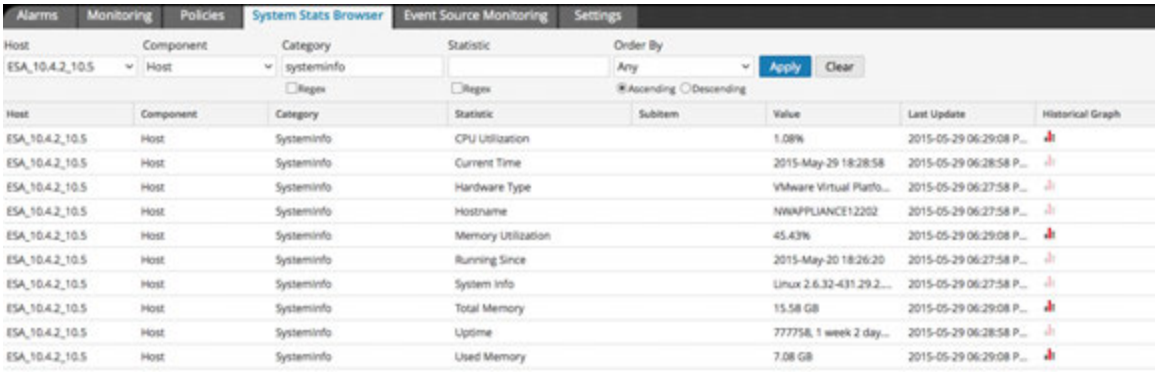
The memory for each rule is displayed in the **Value** column, and the value is displayed in bytes. You can view a historical view of memory usage in the **Historical Graph** column.



3. Go to **ADMIN** > **Health & Wellness** > **System Stats Browser** to see details of your ESA performance. Select your host, and use the following filters to view the following statistics:

Host	Component	Category	Statistic	Example
<your host>	Host	SystemInfo	CPU Utilization	1.08%
<your host>	Host	SystemInfo	Memory Utilization	45.43%
<your host>	Host	SystemInfo	Used Memory	7.08 GB
<your host>	Host	SystemInfo	Total Memory	15.58 GB
<your host>	Host	SystemInfo	Uptime	77758, 1 week, 2 day...
<your host>	Event Stream Analysis	ProcessInfo	Memory Utilization	7.07 GB

Host	Component	Category	Statistic	Example
<your host>	Event Stream Analysis	ProcessInfo	CPU Utilization	0.2%
<your host>	Event Stream Analysis	JVM.Memory	all	Committed Heap Memory Usage 8.0 GB
<your host>	Event Stream Analysis	ESA-Metrics	Total ESA Memory Usage %	4.64%



If you are having a problem with memory or CPU utilization, continue to step 3.

Step 3: Bring up your ESA Services

1. From **ADMIN** > **Services**, select the actions icon  for your ESA service and choose **start**.
2. Return to the ESA Service to troubleshoot which rules have created memory issues.

If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.

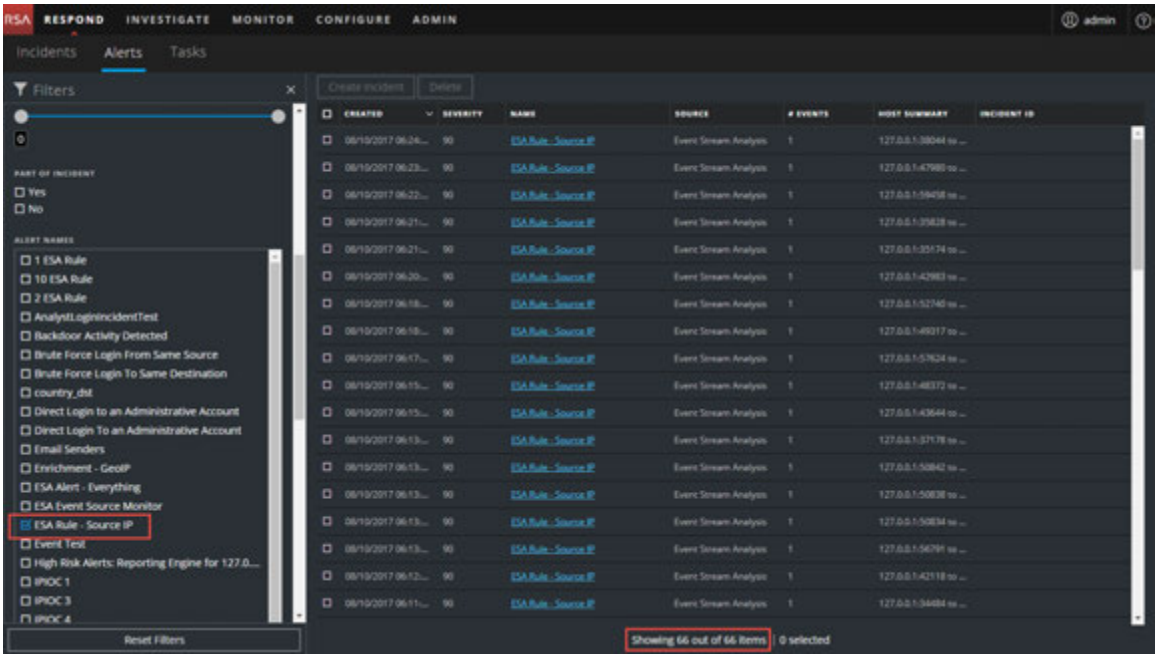
If you are able to start your ESA service without a shutdown, continue to step 4.

Step 4: Check the Alerts and Events Volume

Once you are able to restart your ESA service without an immediate shutdown, you can review the stats for your rules to see which rules are consuming too many resources. Sometimes, ESA services fail because a rule is generating too many alerts or a rule is matching too many events. Check for both of these issues if you have determined that memory usage is causing your ESA service to shut down.

View Alert Summaries

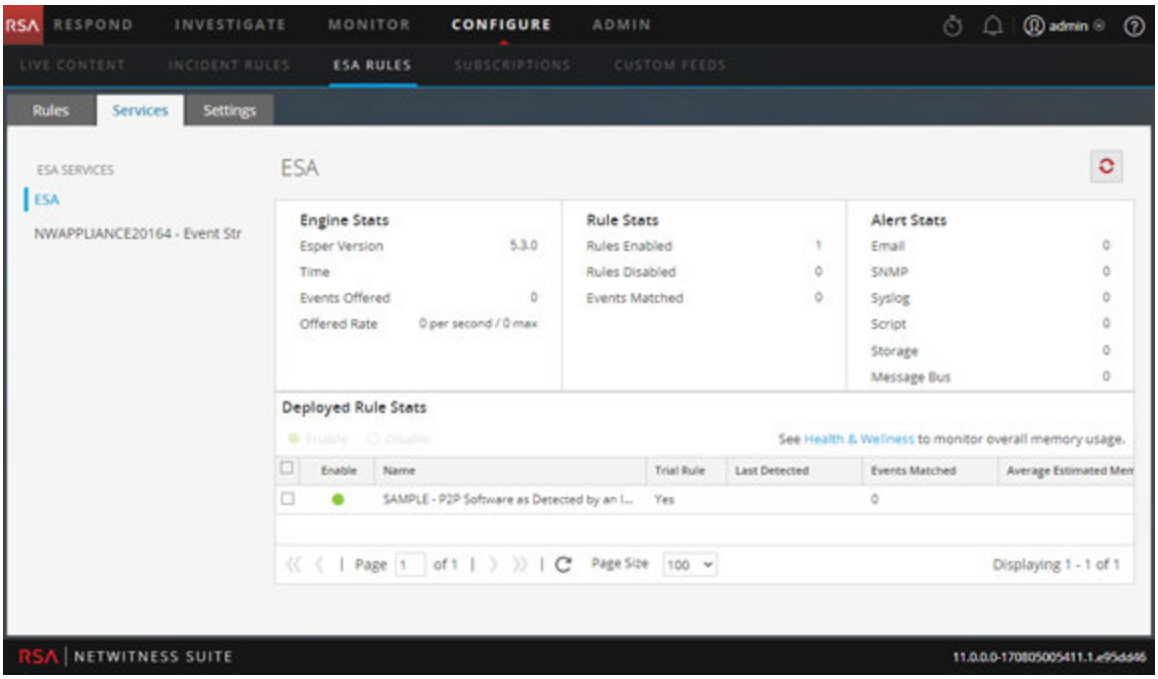
Rules that generate a high volume of alerts can overwhelm the system and cause it to fail or restart. To view the alert summaries, go to **RESPOND > Alerts**. In the **Filters** panel on the left, in the **ALERT NAMES** section, select the alert name for the rule. The number of alerts with that name appears at the bottom of the Alerts list results. If the number is significantly high for a particular rule, you need to disable the rule and rewrite it to be more efficient.



To clear your filter, click **Reset Filters**.

View Events Matched

Sometimes a rule matches too many events, which can use up excessive memory. This typically occurs if you create a large event window where a great number of events accumulates without triggering an alert. These are a problem because each event is stored in memory while the rule waits for the alert to trigger. To check for this issue, go to **CONFIGURE > ESA Rules > Services.** From there, you can see the number of events that were matched in the **Events Matched** column. If there was a high number of events matched for a given rule, you can investigate the rule further to see if you can make it more efficient.



Step 5: Disable and Repair the Rule that Caused Issues

Once you have determined the rules that need to be rewritten, disable them and rewrite rules so that they don't generate such a high volume of alerts or events. For pointers on how to write more efficient rules, see Best Practices.

Disable Rules

1. To disable rules, go to **CONFIGURE** > **ESA Rules** > **Services**, and select the rules you want to disable in the **Deployed Rules Stats** field.
2. Select **Disable** to disable the rules.

Edit Rules

1. To repair the rules, go to **CONFIGURE** > **ESA Rules** > **Rules** > **Rule Library**. Select the rule to edit, and click the actions icon  .
2. Select **Edit**.
3. Edit the rule to be more efficient. For instructions on creating rules, see Add Rules to the Rule Library
4. Once you are satisfied with your rule, you can save the rule as a trial rule to ensure that any memory issues do not affect ESA services performance. To do this, follow the steps listed in Work with Trial Rules.

Enable Rules

1. To enable rules, go to CONFIGURE > **ESA Rules** > **Services**, and select the rules you want to enable in the **Deployed Rules Stats** field.
2. Select **Enable** to enable the rules.

(Optional) Check the ESA Log Files for More Information

Once you verify that your services are down and some potential causes for the system going down, check to see if the service is stopping and restarting in a loop. To do this, go to the ESA logs. From the **ADMIN** > **Services** view, select your ESA service, and then select  > **View** > **Logs**.

If you cannot access the ESA logs from the NetWitness Suite interface, you can use SSH to get in the system and go to:`opt/rsa/esa/logs/esa.log`.

View Memory Metrics for Rules

This topic tells ESA rule writers how to view memory metrics for rules. You can see estimated memory usage for each rule running on a server, and you can use this information to modify your rule statements and conditions if they use too much memory.

Rules can sometimes consume more memory than you expect, causing your ESA to slow down or stop. To see approximately how much memory a rule is using, you can configure memory metrics. Memory metrics allow you to view an estimated memory usage for each rule in the Health & Wellness System Stats browser (so you will need permissions to access this module). You can use this information to modify your rules to be more efficient.

At a high level, you will need to complete the following steps to use the memory metrics to troubleshoot memory usage for rules:

1. Ensure that the memory metrics feature is enabled (via Explorer > CEP > Metrics > EnableStats). The Memory Metrics feature is enabled by default.
2. Ensure you have the correct permissions to view the Health & Wellness module. For information on roles and permissions, see Role Permissions.
3. View the memory statistics in Health & Wellness.
4. (Recommended) Configure Health & Wellness ESA policies to send an email if memory thresholds are exceeded. See "Manage Policies" in the *System Maintenance Guide* for instructions on sending email notifications.
5. Use the memory metrics data to modify rules to be more efficient, if necessary.

Prerequisites

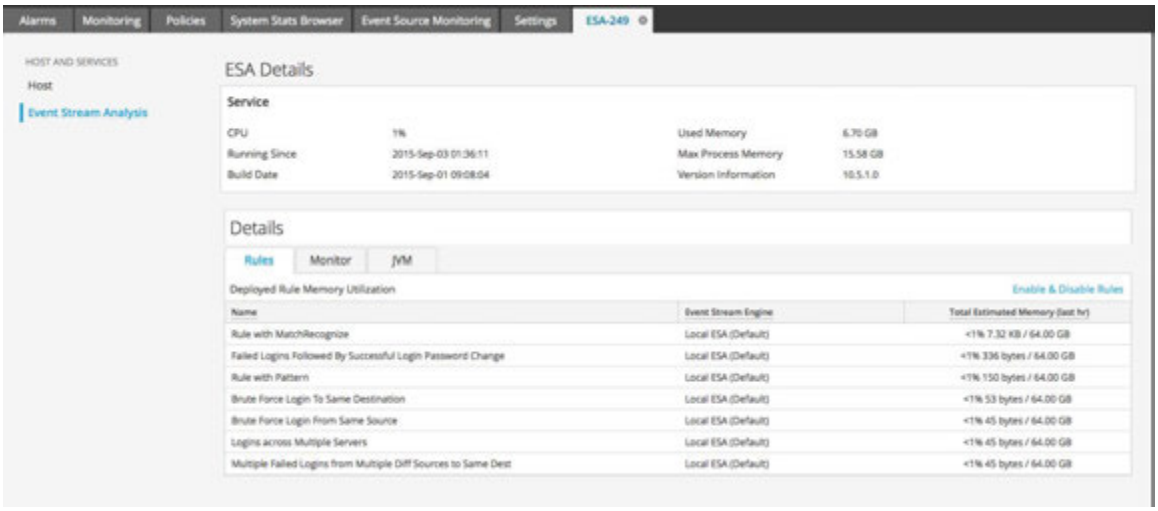
The following are requirements for using memory metrics:

- Memory Metrics feature is enabled (via **Explorer** > **CEP** > **Metrics** > **EnableStats**).
- The user must have the appropriate permissions to view Health & Wellness statistics.
- (Recommended) Configure the ESA Health & Wellness policy to send an email when memory thresholds are exceeded.

Procedures

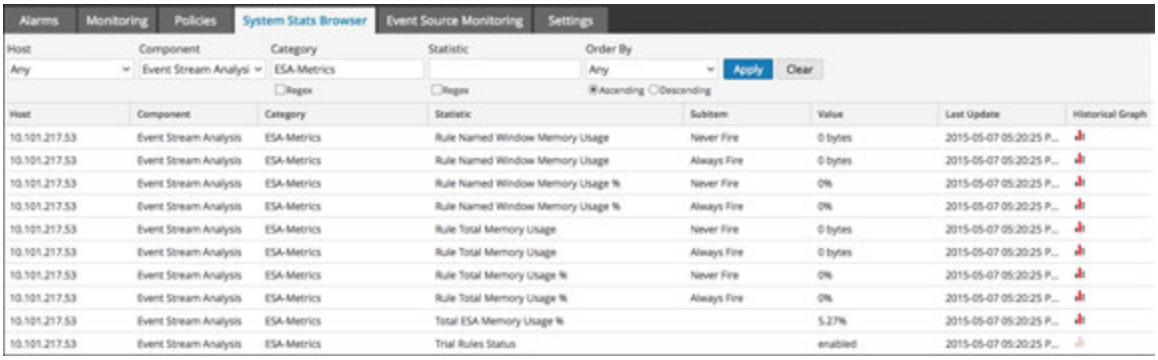
View Memory Metrics in the Health & Wellness System Monitoring Module

1. Go to **ADMIN** > **Health & Wellness** > **Monitoring**
2. View the details for your ESA service.
3. Click the **Rules** tab.
4. You can view the average memory usage for each rule for the previous hour.



View Memory Metrics in the Health & Wellness System Stats Browser

1. Go to **ADMIN** > **Health & Wellness** > **System Stats Browser**.
2. For component, select **Event Stream Analysis**. For category, enter **ESA-Metrics**.



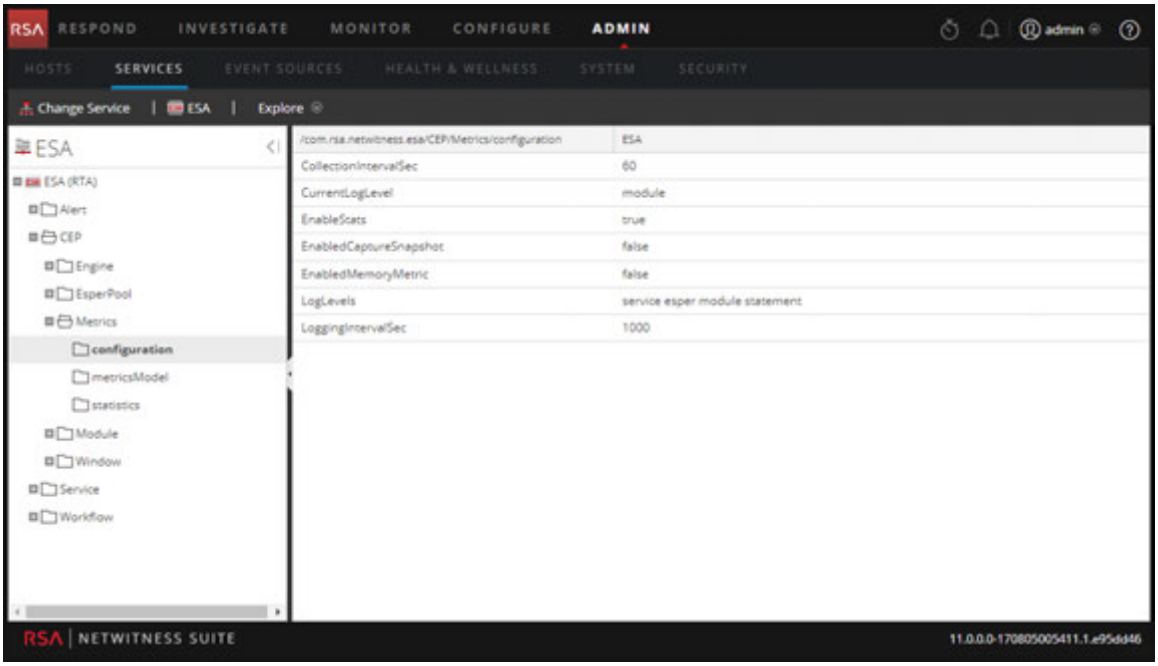
The name of the rule is displayed in the **Subitem** field, and the memory usage is displayed in the **Value** column.

3. To view the historical memory usage for the rule, click on the **Historical Graph** icon.

Note: The **Last Update** field reflects when Health & Wellness polls ESA. However, the Memory Metrics is not synchronized with the Health & Wellness polling. For example, if the memory threshold is exceeded on 10/10/15 at 12 p.m., but Health & Wellness polls at 10/10/15 at 12:10 p.m., the **Last Update** field will display a timestamp of 10/10/15 12:10 p.m.

Enable or Disable the Memory Metrics Feature

1. Go to **ADMIN** > **Services**and select your ESA.
2. Once you've selected your ESA, click **Actions** > **View**> **Explore**, and navigate to **CEP** > **Metrics** > **Configuration** as shown below.



3. Change the field EnabledStats to **true** or **false** depending on whether you want to enable or disable the memory metrics feature.

How ESA Generates Alerts

This topic provides a brief description of how an Event Stream Analysis (ESA) service runs rules to generate alerts. The Event Stream Analysis (ESA) service runs rules that specify criteria for problem behavior or threatening events in your network. When ESA detects a threat that matches rule criteria, it generates an alert.

To generate alerts, ESA performs the following functions:

1. Gathers data
2. Runs ESA rules against the data
3. Captures events that meet rule criteria
4. Generates alerts for those captured events

You can use the Alerts module to gain visibility into your network and to detect problems in it.

Sensitive Data

This topic explains how ESA treats sensitive data, such as usernames or IP address, that it receives from Core services. The Data Privacy Officer (DPO) role can identify meta keys that contain sensitive data and should display obfuscated data. ESA will not display or store sensitive meta. Consequently, ESA will not pass sensitive data to NetWitness Respond.

Optionally, ESA can add an obfuscated version of the sensitive data to an event. For example, the DPO identifies user_dst as sensitive. ESA can add an obfuscated version, such as user_dst_hash, to an event. The obfuscated meta is not sensitive, so ESA will display and store it the same way as any other non-sensitive meta.

For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

This topic explains the following:

- How ESA treats sensitive data it receives from Core services
- How to prevent sensitive data leaks in an Advanced EPL rule

How ESA Treats Sensitive Data from Core Services

When ESA receives sensitive data from Core services, ESA passes on only the obfuscated version of the data. ESA does not store or show sensitive data.

The following features are impacted:

- Outputs – ESA does not forward sensitive data to outputs, which include alerts, notifications and MongoDB storage.
- Advanced EPL rules – If an EPL statement creates an alias for a sensitive meta key, sensitive data will leak. This topic illustrates how this happens so you can avoid it.
- Enrichments – If a sensitive meta key is used in the join condition, sensitive data will leak. This topic illustrates how this happens so you can avoid it.

Advanced EPL Rule

If an EPL query statement renames a sensitive meta key, the data will not be protected.

ESA identifies a sensitive meta key by the name:

ip_src is the sensitive meta key.
ip_src_hash is the non-sensitive, obfuscated version.

To support data privacy, the sensitive meta key must not be renamed in an EPL query. If a sensitive meta key is renamed, the data will no longer be protected.

For example, in a rule such as select ip_src as ip_alias..., ip_alias contains the sensitive data but it is not protected because ESA only knows about ip_src, not ip_alias. In this case, IP addresses would not be obfuscated. Real values would be displayed.

Enrichment Source

When a sensitive meta key is used in a join condition, sensitive data can be displayed.

The enrichment database, which is the other part of the join condition, has one column that matches the sensitive meta key. This cross reference is to actual values not obscured values. Consequently, actual values are displayed.

In the following example, both parts of the join condition are highlighted.

- ip_src contains sensitive data.
- ipv4 will be added to the alert and exposed as non-sensitive data

Because the ipv4 value is the same as the ip_src value, ipv4 contains and displays sensitive data.

ESA Rule Types

This topic describes each type of ESA rule, when to use them and the permissions each role has with them. The following table lists each type, describes it, and explains when to use it.

Rule Type	Description	When to Use
Rule Builder	In the rule builder, you define rule criteria in an easy-to-use interface.	Use the rule builder to create your first rules. You choose many of the rule conditions from lists.
Advanced EPL	With the Event Processing Language (EPL), you define rule criteria by writing a query.	Use advanced EPL rules to define rule criteria in the EPL syntax.
RSA Live ESA	RSA Live has a catalog of ESA rules that you can download and modify to run in your network.	Download RSA Live ESA rules to leverage rules that are already built. Modify the configurable parameters to customize to meet your requirements.

Starter Pack Rules

A few sample Rule Builder rules come with NetWitness Suite and appear in the Rule Library. Use starter pack rules to get comfortable working with rules before creating your own. You can safely edit and deploy these sample rules.

Trial Rules Mode

For any type of rule, you can select the Trial Rule setting as an additional safeguard. Trial rules get disabled if they exceed a memory threshold the administrator sets. Run a rule in trial mode to monitor memory usage and to disable the rule automatically if it uses more memory than the threshold allows.

Role Permissions

This topic lists all ESA permissions and shows which permissions are assigned to each pre-configured NetWitness Suite role. User access is restricted based on roles and permissions assigned to roles.

- Administrators
- Operators
- Analyst
- Security Operations Center (SOC) Managers
- Malware Analysts (MA)
- Data Privacy Officer

There are four permissions for ESA:

1. Access Alerting Module – Is required for any permission
2. View Rules – Allows view-only permission for rules in the Rule Library
3. View Alerts – Allows view-only permission for alerts ESA generates
4. Manage Rules – Allows you to view, create, edit and delete rules

The following table lists permissions for ESA and the roles to which they are assigned. Use this table to see how each role can work with rules and alerts.

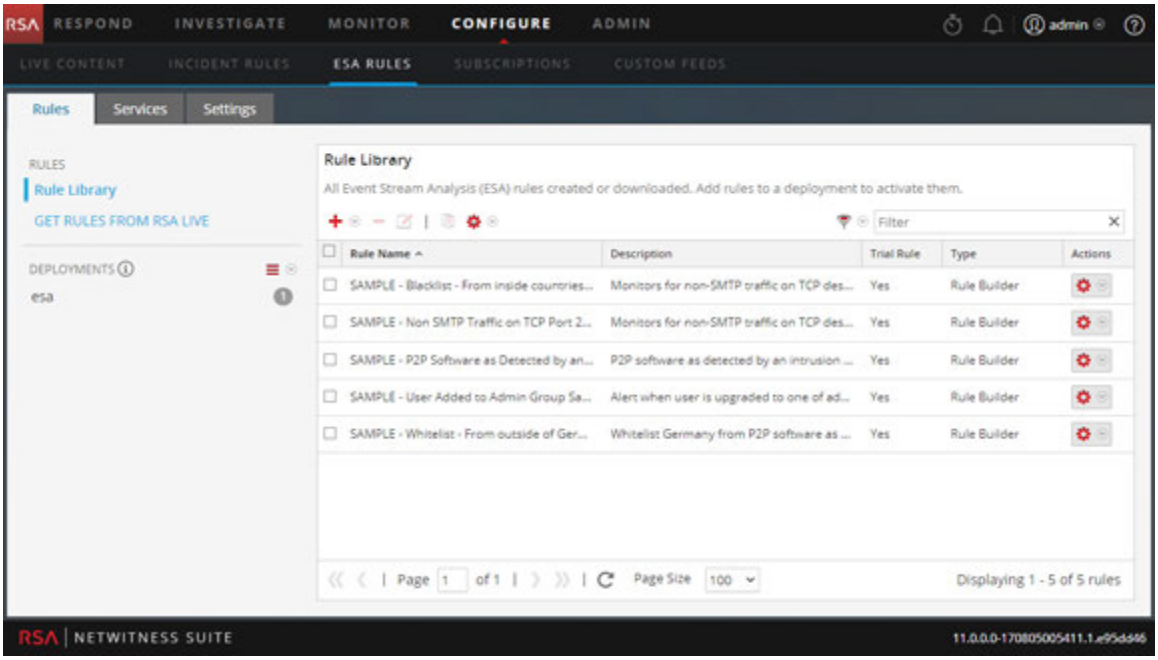
Permission	Administrators	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Alerting Module	Yes	Yes	Yes	Yes		Yes
View Rules	Yes	Yes		Yes		Yes
View Alerts	Yes		Yes	Yes		Yes
Manage Rules	Yes	Yes		Yes		Yes

For more information on roles and permissions, see the *System Security and User Management Guide*.

Practice with Starter Pack Rules

NetWitness Suite comes with starter pack rules so analysts can become familiar with how rules look before you create your own rules. Use the starter pack rules to become familiar with the Rule Builder and to practice editing and deploying a rule.

Starter pack rules are installed in the Rule Library, which will contain every rule you download or create. The following figure shows sample rules in the Rule Library.



These are the available starter pack rules:

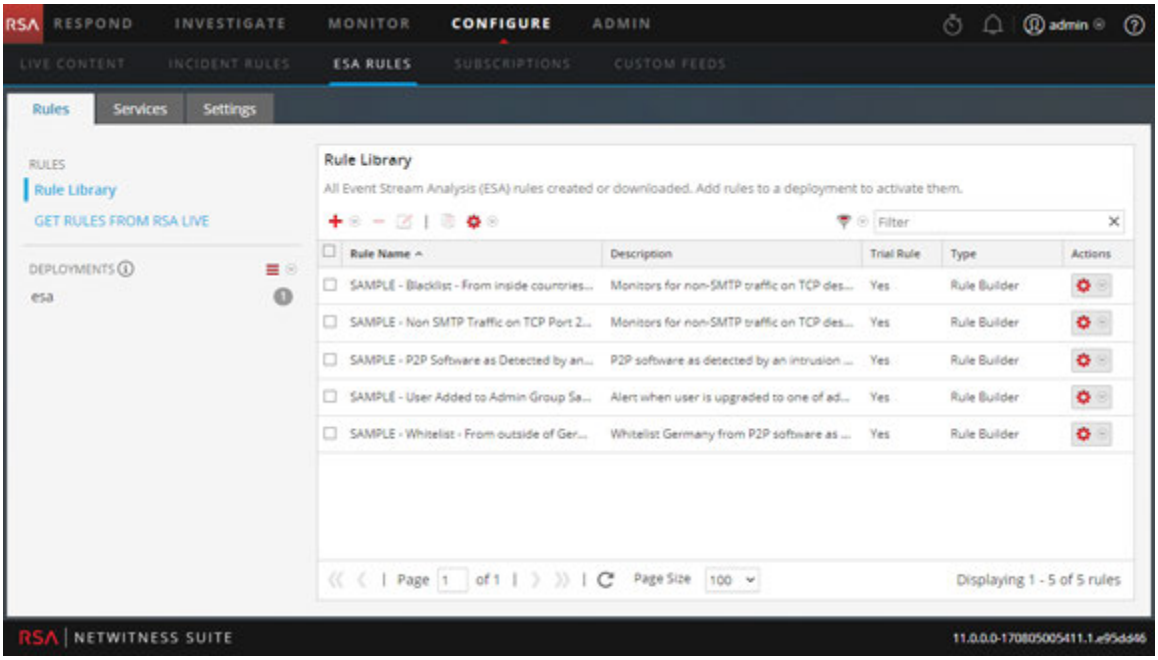
- SAMPLE: P2P Software as Detected by an Intrusion Detection Device
- SAMPLE: Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE: Whitelist - From outside of Germany, P2P Software as Detected by an Intrusion Detection Device.
- SAMPLE: Blacklist - From inside countries that are not the US, Non-SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE: User Added to Admin Group Same User su Sudo

Each name begins with SAMPLE to distinguish the rules that are installed with NetWitness Suite from the rules you download and create.

Rule Library

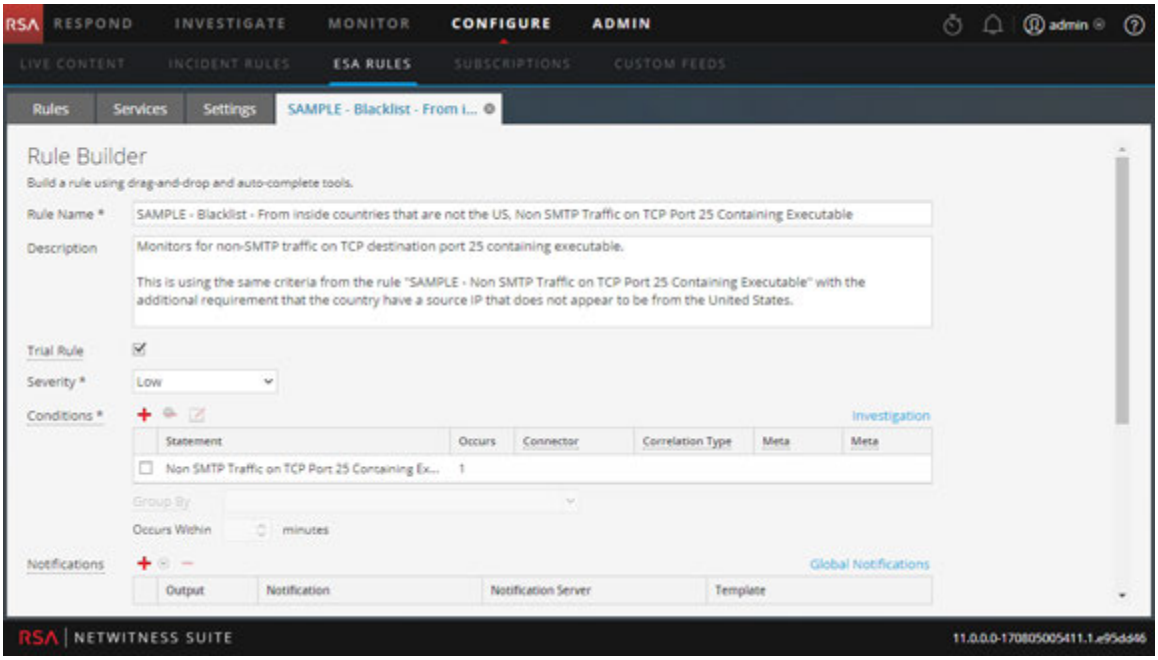
The Rule Library shows the following information for a rule:

- **Name** summarizes the data or events the rule collects.
- **Description** explains the rule in more detail, although only the beginning shows in the Rule Library.
- **Trial Rule** indicates if trial mode is enabled or disabled for the rule.
- **Type** shows the origin of the rule, built in Rule Builder or Advanced EPL, or downloaded from RSA Live.



Procedure

1. Go to **CONFIGURE > ESA Rules**.
   The ESA Rules view is displayed with the Rules tab open.
2. In the **Rule Library**, select a sample rule and click , or double-click a rule.
   The rule is opened in Rule Builder.



3. To practice with a starter pack rule, refer to the following topics for detailed descriptions and procedures:
   - To familiarize yourself with the Rule Builder user interface, see Rule Builder Tab for a description of each field.
   - To learn how to edit a rule, see Add a Rule Builder Rule for a step-by-step procedure.
   - To deploy a starter pack rule, see Deploy Rules to Run on ESA to learn how to associate the rule with an ESA service.

After you practice with starter pack rules, you will be able to download, create, and deploy your own rules.

Work with Trial Rules

When rules use too much memory, your ESA service can become slow or unresponsive. To ensure rules do not use excessive memory, you can enable trial rules for any type of rule. By default, new rules you create and RSA Live rules you import are configured to be trial rules. RSA recommends you disable the trial rule setting only after testing the new rule in your environment during normal and peak network traffic. When you create a trial rule, you set a global threshold of the percentage of memory that rules may use. If that configured memory threshold is exceeded, all trial rules are disabled.

The NetWitness Suite Event Stream Analysis (ESA) service is capable of processing large volumes of disparate event data from Concentrators. However, when working with Event Stream Analysis, it is possible to create rules that use excessive memory. This can slow your ESA service or even cause it to shut down unexpectedly. To ensure that this doesn't happen, you can configure your rule as a trial rule. When you configure a trial rule, you also set global threshold of the percentage of memory that rules may use. If that configured memory threshold is exceeded, all trial rules are disabled automatically.

For suggestions on creating more efficient rules, see "Best Practices for Writing Rules" in Best Practices

By default, new rules and RSA Live rules are configured as trial rules. As a best practice, when you edit an existing rule, select the Trial Rule option, which allows you to:

- Deploy the rule with an added safeguard.
- Optionally, view a snapshot of memory utilization to understand if the rule creates memory issues.
- Know if you must modify the rule criteria to improve performance.

Note: Run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.

Deploy Rules as Trial Rules

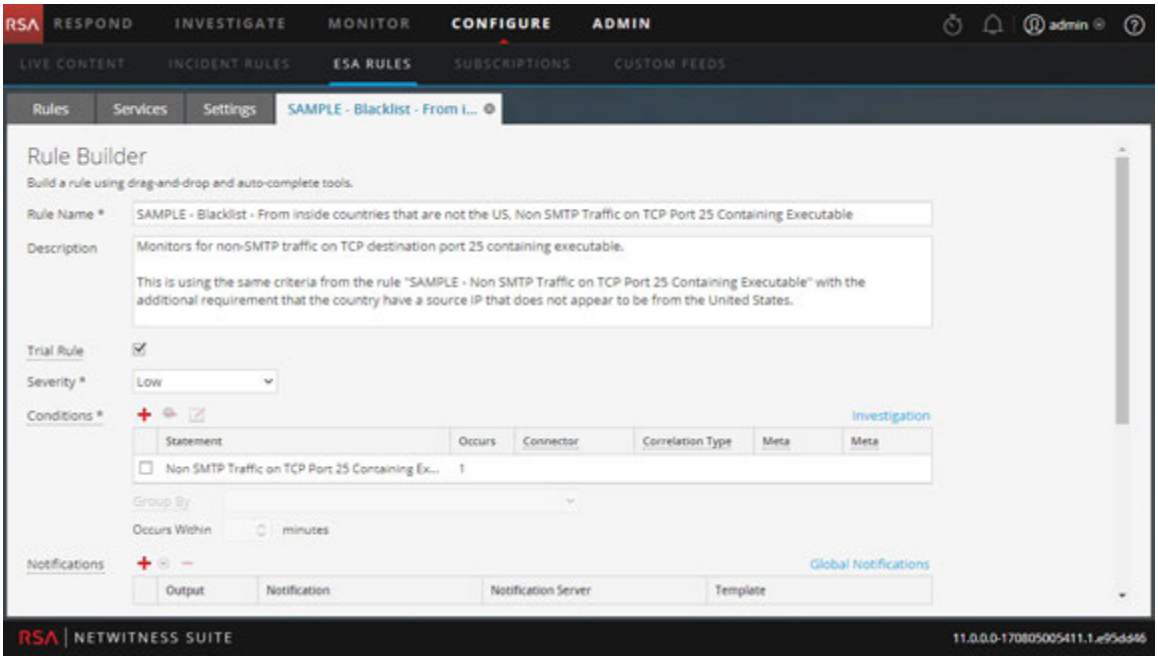
This topic explains to administrators how to enable trial rules when creating new rules or editing rules. Trial rules are automatically disabled if a specified total JVM memory utilization threshold is exceeded.

Procedure

To deploy rules as trial rules:

1. Go to **CONFIGURE** > **ESA Rules**.
   The Configure ESA Rules view is displayed with the Rules tab open.

2. From the Rule Library, choose to add or edit a rule. The rule builder is displayed in a new tab.



3. To make a new or existing rule a trial rule, select the **Trial Rule** checkbox.
4. Add the rule conditions or modify the rule as needed. For instructions on editing rules, see Add Rules to the Rule Library.
5. Click **Save**.
6. Ensure that trial rules are enabled for your ESA and that you are satisfied with the thresholds configured for trial rules.
   The memory threshold is set in the configuration file. To configure it, see "Change Memory Threshold for Trial Rules" in the *ESA Configuration Guide*.
   The threshold is configured per ESA and is a percentage of Java Virtual Memory.
   The configuration parameter, MemoryThresholdforTrialRules default is 85.
7. Optionally, you can set up the policies in Health and Wellness to send you an email notification if the total JVM memory utilization threshold is exceeded.

The next time you deploy the rule, it runs in trial rule mode.

Note: If a trial rule is disabled, you will need to go to the **CONFIGURE** > **ESA Rules** > **Services** tab to re-enable the trial rules. For more instructions on re-enabling trial rules on a service, see View ESA Stats and Alerts.

View Memory Metrics for Rules Using Trial Mode

This topic tells ESA rule writers how to view memory metrics when the memory threshold configured for trial rules is exceeded. If the memory threshold is exceeded, you can configure a snapshot to be taken of the memory usage for ESA rules at the time that trial rules are disabled, allowing you to investigate memory usage and edit the rules to be more efficient.

When you configure trial rules and enable the Memory Snapshot feature, if the memory threshold is exceeded, all trial rules are disabled and a snapshot of the memory usage for all ESA rules is taken at the time of disablement. This allows you to see how much memory was used so that you can modify your ESA rules to be more efficient. The memory snapshot can be viewed in the Health & Wellness System Stats browser, so you will need permissions to access this module. Once you view the details in the System Stats browser, you can modify the trial rule syntax and re-enable the trial rules.

At a high level, you will need to complete the following steps to use the Memory Snapshot to troubleshoot memory usage for rules:

1. Enable trial rules for any new rules you deploy. See Deploy Rules as Trial Rules.
2. Ensure that you have configured Health & Wellness ESA policies to send an email if memory thresholds are exceeded.
3. Ensure you have the correct permissions to view the Health & Wellness module. For information on roles and permissions, see Role Permissions.
4. Ensure that the Memory Snapshot feature is enabled (via the EnabledCaptureSnapshot parameter via NetWitness Suite Explorer). The Memory Snapshot feature is disabled by default. See "Enabling and Disabling the Memory Snapshot Feature" below. RSA recommends you disable the feature once you have completed testing new rules.
5. View the memory threshold statistics in Health & Wellness if the memory threshold is triggered for trial rules.
6. Modify the rule or rules that triggered the alarm. For best practices for rule writing, see Best Practices.
7. Re-enable the trial rules that were disabled when the memory threshold was triggered. For instructions on re-enabling trial rules on a service, see View ESA Stats and Alerts.
8. Continue to test the trial rules.

Note: Like any Debug tool, there can be exceptional overhead associated with using the Memory Snapshot feature. When actively taking a snapshot, the Memory Snapshot feature can add delays to your ESA services. The ESA service stops generating alerts while taking a snapshot. RSA recommends you disable the feature once you have completed testing new rules. If you disable the Memory Snapshot feature, trial rules will still be disabled when memory usage exceeds configured thresholds, but the memory snapshot will not be taken, and the statistics will not appear in the Health & Wellness System Stats browser.

Prerequisites

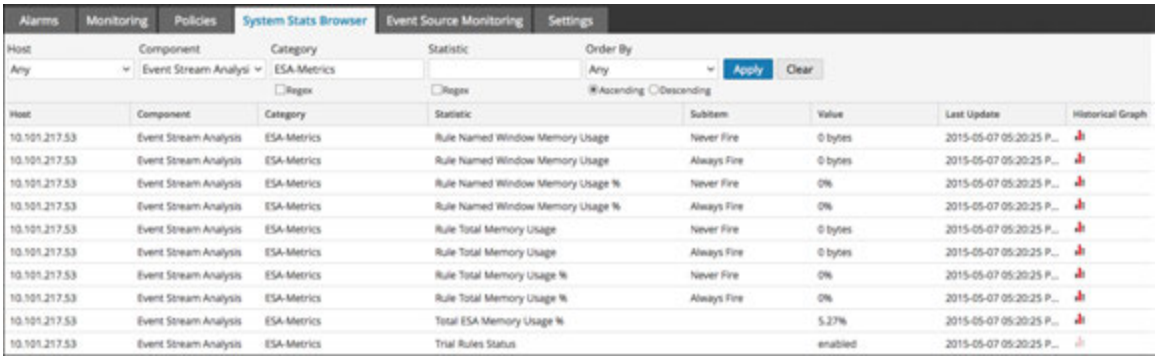
These are the requirements for viewing memory metrics:

- One or more ESA rules must be configured as a trial rule.
- Memory Snapshot must be enabled (via the EnabledCaptureSnapshot parameter via NetWitness Suite Explorer).
- The user must have the appropriate permissions to view Health & Wellness statistics.
- The user must have configured the ESA Health & Wellness policy to send an email when memory thresholds are exceeded.

Procedures

View Memory Metrics

1. Go to **ADMIN** > **Health & Wellness** > **System Stats Browser**.
2. For component, select **Event Stream Analysis**. For category, enter **ESA-Metrics**.

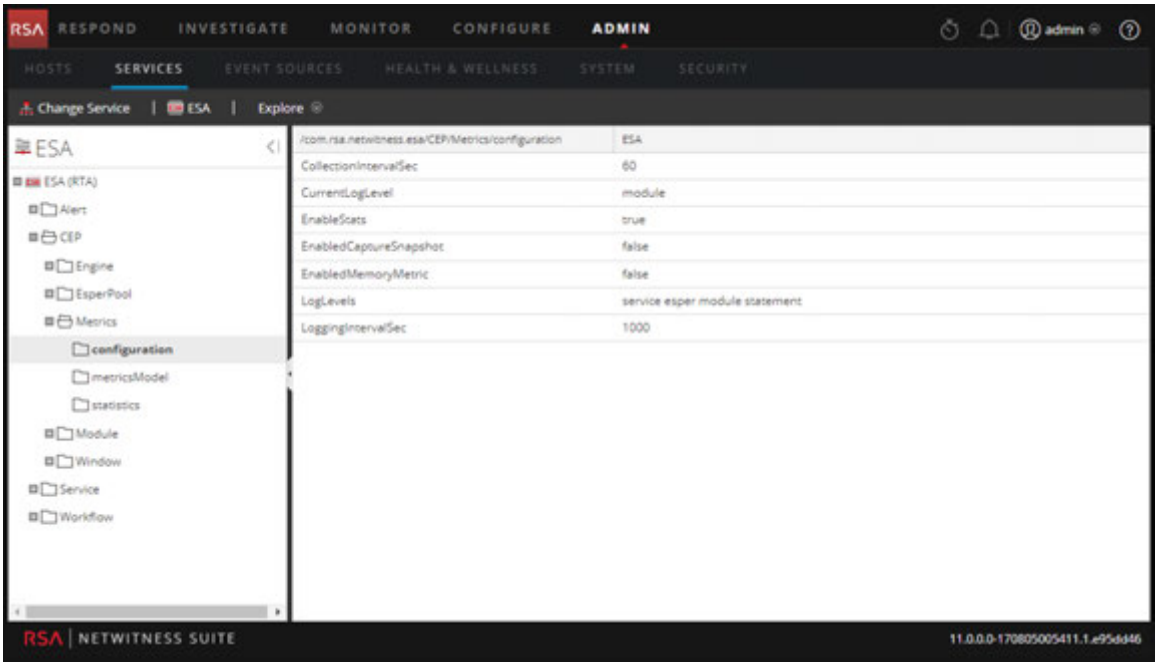


The name of the rule is displayed in the **Subitem** field, and the memory usage is displayed in the **Value** column.

Note: The **Last Update** field reflects when Health & Wellness polls ESA. However, the Memory Snapshot only occurs when memory thresholds are exceeded, so this field does not reflect when the snapshot was taken or updated. The snapshot remains static until the memory threshold is exceeded again. For example, if the memory threshold is exceeded on 10/10/15 at 12 p.m., but Health & Wellness polls at 10/10/15 at 3 p.m., the **Last Update** field will display a date of 10/10/15 3 p.m.

Enable or Disable the Memory Snapshot Feature

1. Go to **ADMIN** > **Services**and select your ESA.
2. Select  > **View** > **Explore**, and navigate to CEP > Metrics > Configuration as shown below.



3. Change the field EnabledCaptureSnapshot to **true** or **false** depending on whether you want to enable or disable the Memory Snapshot feature.

Add Rules to the Rule Library

This topic explains how to add each type of rule to the rule library. You must add a rule to the Rule Library before you can deploy it. Permission to manage rules is required for all tasks in this section. To add rules, you can download them from ESA Live, create a rule via the Rule Builder, or write advanced EPL rules.

For more details on each of these procedures, see:

- Download Configurable RSA Live ESA Rules
- Add a Rule Builder Rule
- Add an Advanced EPL Rule

In addition to deploying a rule, you can edit, duplicate, import, export, and remove a rule in the Rule Library. For details on these procedures, see Working with RulesWorking with Rules

Download Configurable RSA Live ESA Rules

This topic explains how to download configurable rules from the NetWitness Suite Live Content Management System so you can customize them to meet your needs.

RSA Live contains a catalog of rules. Each rule has configurable parameters so you can customize the rule for your environment. If RSA Live has a rule to detect events that you want to detect in your network, download the rule to save time. You can edit the configurable parameters and save the rule in your Rule Library.

This is a sample of how each RSA Live ESA rule is described on RSA Live:

Rule Name	Description
Logins across Multiple Servers	Detects logins from the same user across 3 or more separate servers within 5 minutes. The time window and number of unique destinations are configurable.

As the name shows, the rule looks for logins across multiple servers. The description explains the rule criteria in more detail and specifies which parameters you modify.

Note: When a rule description includes a configurable parameter, the default setting for the parameter is used. In the sample rule, the description states 5 minutes. However, the time window is configurable so 5 is the default number of minutes.

Prerequisites

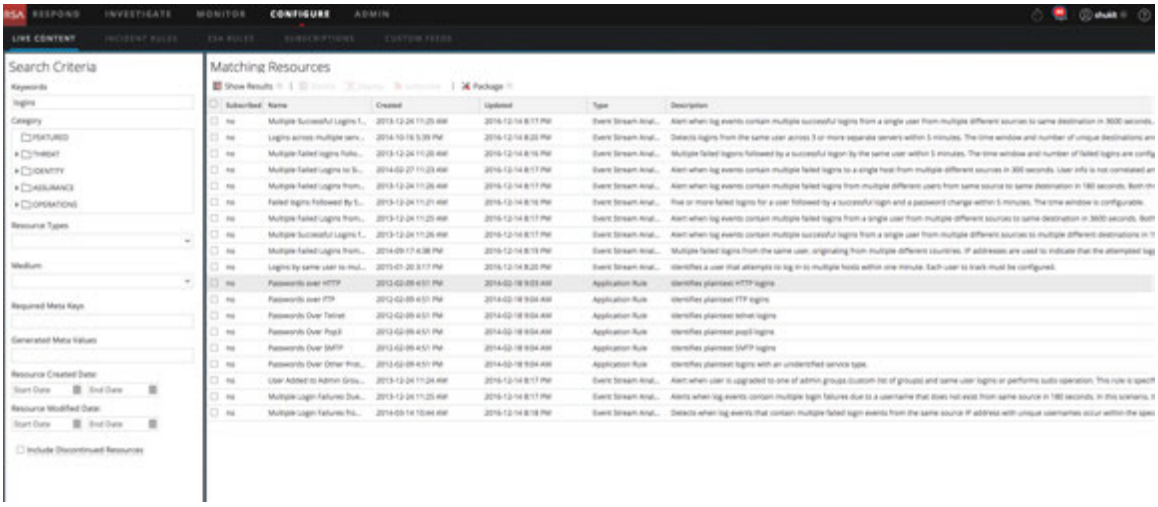
These are the prerequisites for downloading configurable RSA Live ESA rules;

- Have permission to manage rules
- Create a Live Account. See the *Live Services Management Guide* for details.
- Set up Live on NetWitness Suite. See the *Live Services Management Guide*for details.

Procedure

To download configurable RSA Live ESA rules:

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed.
2. In the options panel, click **Get Rules from RSA Live**.
   The Live Content Search view is displayed.



3. In **Search Criteria**, for **Resource Type** select **RSA Event Stream Analysis Rule**.
4. Specify any of the following criteria to find a rule to configure for your environment.
   For a detailed description of the search criteria, see "The Live Search View" in the *Live Services Management Guide*.
   a. Keywords
   b. Tags
   c. Required Meta Keys
   d. Generated Meta Values

e. Resource Created Date

f. Resource Modified Date

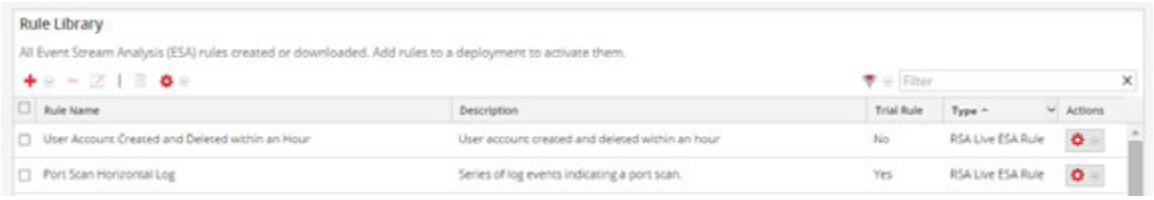
5. Click **Search**. Rules that match the search criteria are displayed in Matching Resources.
6. Select each rule to download and click **Deploy**.
   The Deployment Wizard is displayed
7. Follow the steps in the wizard. If you need more information, see "Deploy Resources in Live" in the *Live Services Management Guide*.

When you finish the steps in the wizard, the selected rules are displayed in the Rule Library.

Customize an RSA Live ESA Rule

This topic explains how to configure parameters in an RSA Live ESA rule. When you download an RSA Live ESA rule, the rule appears in the Rule Library which includes the following columns:

- Name
- Description
- Trial Rule
- Type



The type is RSA Live ESA Rule.

Prerequisites

- Administrator, Operator, SOC Manager, or DPO role permissions are required.
- Rules must be downloaded to the Rule Library.

Procedure

To customize an RSA Live ESA rule:

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the **Rule Library**, select an RSA Live ESA Rule and click .
   The RSA Live ESA Rule tab is displayed.

3. (Optional) Change the following fields:
   - Rule Name
   - Description
   - Trial Rule (Enabled by default. RSA recommends you run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.)
   - Severity
4. To configure the rule for your environment, in the **Parameters** section replace the default in the **Value** Column.

Parameters

Name ^	Value
With this number of events	200
Within this number of seconds	60

5. Click **Save**

Add a Rule Builder Rule

This topic introduces a set of end-to-end procedures for adding a Rule Builder type rule.

Each ESA rule is designed to detect something in your network and to generate an alert for it:

- User activity that is not allowed, such as attempting to download software that is not sanctioned
- Suspicious behavior, such as mass audit clearing
- Known malicious threats, such as worm propagation or a password-cracking tool

There are two methods to design a rule in ESA:

- Rule Builder is an easy-to-use interface. You provide a meta key and value, then select choices from lists to complete the criteria.
- Advanced EPL allows you to write queries in the Event Processing Language. You must know EPL syntax.

If you know EPL, you can use either method. If you do not know EPL, you must use Rule Builder. These topics explain the Rule Builder.

Step 1. Name and Describe the Rule

This topic provides instructions to identify a rule, indicate if it is a trial rule and assign a severity level. When you add a new rule, the first information to provide is a unique name and description of what the rule detects. After you save the rule, this information is displayed in the Rule Library.

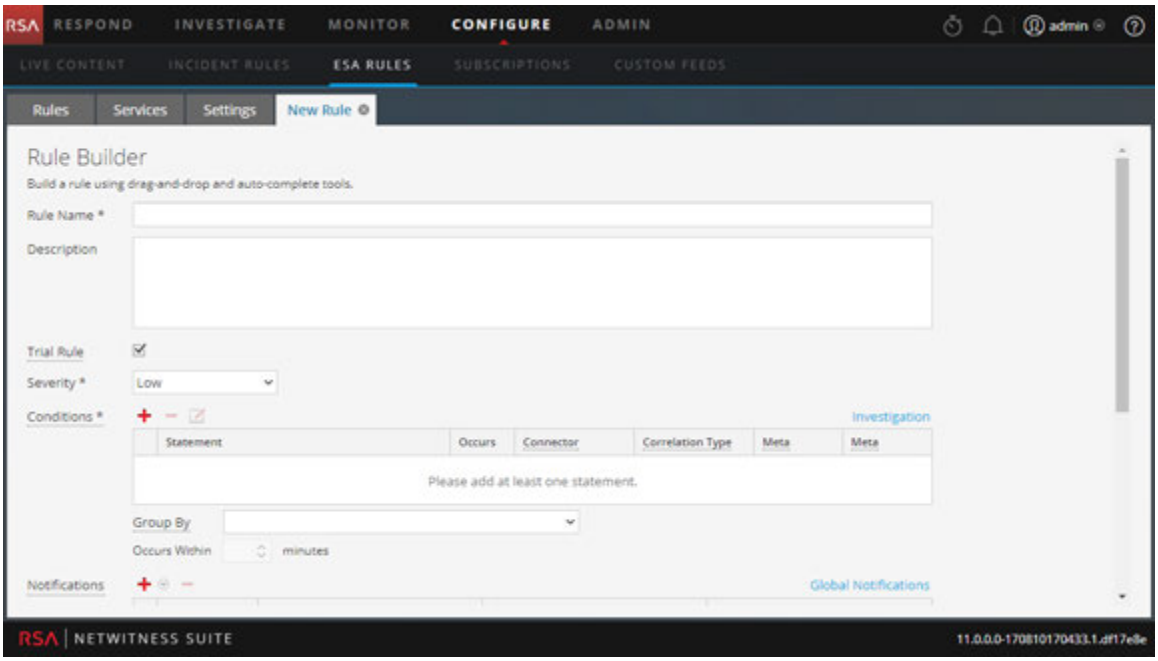
Prerequisites

You must have permission to manage rules. See Role Permissions.

Procedure

To name and describe a rule:

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the **Rule Library**, select + > **Rule Builder**.
   The New Rule tab is displayed.



3. Type a unique, descriptive name in the **Rule Name** field.
   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.
4. In the **Description** field, explain which events the rule detects.
   The beginning of this description will appear in the Rule Library

5. By default, new rules are configured as a Trial Rule. A trial rule automatically disables the rule if all trial rules collectively exceed the memory threshold. If you are editing an existing rule, you can select **Trial Rule** to safely test the rule edits.
   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Work with Trial Rules.
6. For **Severity**, classify the rule as Low, Medium, High or Critical.

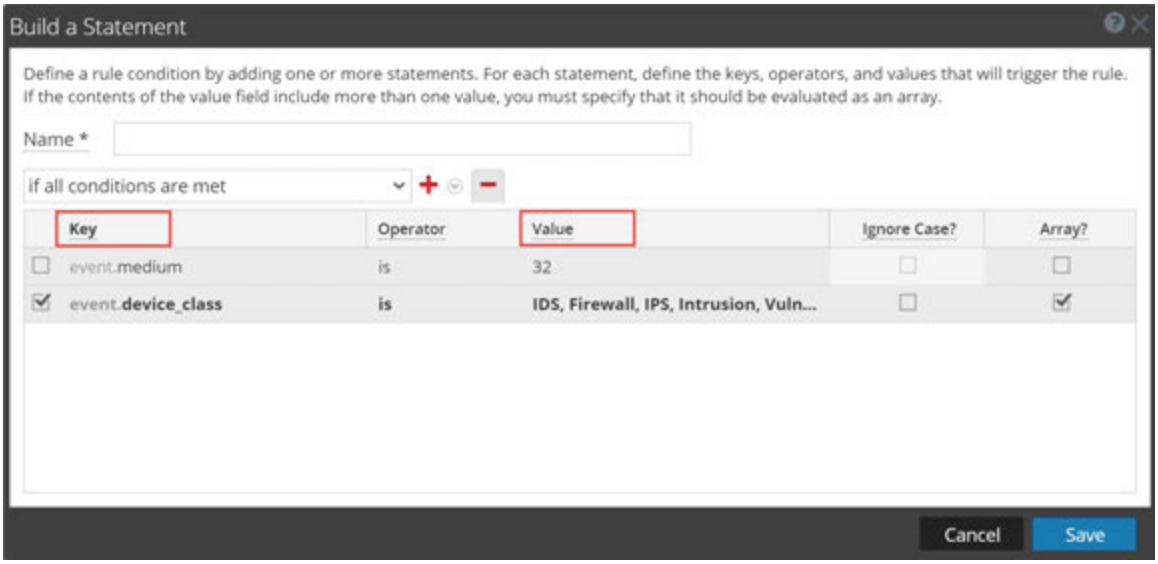
Step 2. Build a Rule Statement

This topic provides instructions to define rule criteria in Rule Builder by adding statements. A statement is a logical grouping of rule criteria in the Rule Builder. You add statements to define what a rule detects.

Example

The following graphic shows an example of a Rule Builder statement.

Every statement contains a key and value. Then, you build logic around the pair by selecting an option in each other field.



Prerequisites

To build a rule statement, you must know the meta key and the meta value.
For a complete list of meta keys, go to **CONFIGURE > ESA Rules > Settings > Meta Key References**.

Procedure

To build a rule statement:

1. Go to **CONFIGURE > ESA Rules**.

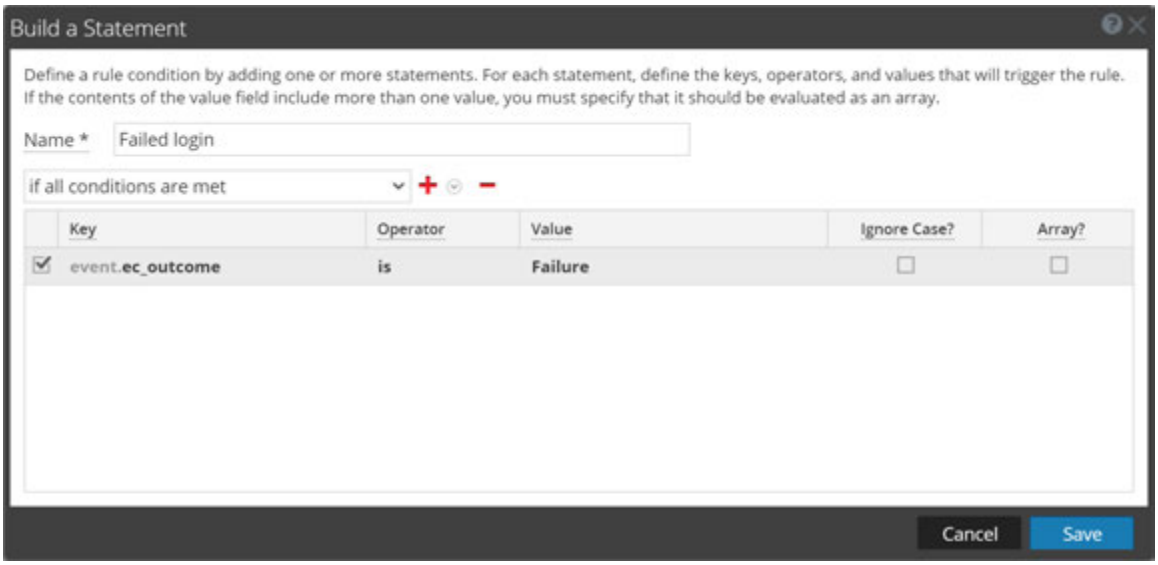
   The Rules tab is displayed by default.

2. In the **Rule Library**, click  **> Rule Builder** or edit an existing Rule Builder rule.

   The Rule Builder view is displayed.

3. In the **Conditions** section, click  .

   The Build Statement dialog is displayed.



4. **Name** the statement. Be clear and specific. The statement name will appear in the Rule Builder.
5. From the drop-down list, select which circumstances the rule requires:
   - if **all conditions** are met
   - if **one of these conditions** are met
6. Specify the criteria for the statement:
   a. For **Key,** type the name of the **Meta Key**.
   b. For **Operator** specify the relationship between the meta key and the value you will provide for it.
      The choices are: is, is not, is not null, is greater than (>), is greater than or equal to (>=), is less than (<), is less than or equal to (<=), contains, not contains, begins with, ends with
   c. Type the **Value** for the meta key.
      Do not add quotes around a value. Separate multiple values with a comma.

d. The **Ignore Case?** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN."

e. The **Array?** field indicates if the contents of the Value field represent one or more than one value.

   Select the Array checkbox if you entered multiple, comma-separated values in the **Value** field. For example, "ec_activity is Logon, Logoff" requires you to select the Array checkbox.

7. To use another meta key in the statement, click +, select **Add Meta Condition** and repeat step 6.
8. To add a whitelist, click + and select **Add Whitelist Condition**.
9. To add a blacklist, click + and select **Add a Blacklist Condition**.
10. To save the statement, click **Save**.

To Add a Whitelist

You use a whitelist to ensure that specified events are excluded from triggering the rule. Whitelists can be based on geographic location or by customer-defined enrichment CSV sources. For example, if you want to create a rule that only triggers for IP addresses outside of the US, you can create a whitelist of US IP addresses.

1. After you add a meta condition, click + and select **Add Whitelist Condition**.
2. In the **EnterWhitelist Name** field, select an enrichment source. Any enrichment source loaded from a CSV or a named window in Esper can be used as source for a whitelist.
3. If you used a GeoIP source for the whitelist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter *ipv4 is ip_src* to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the whitelist, you might want to add a subcondition to specify the geographic region to exclude from the rule results. For example, to specify that the country code must be USA, enter "*CountryCode is US*".

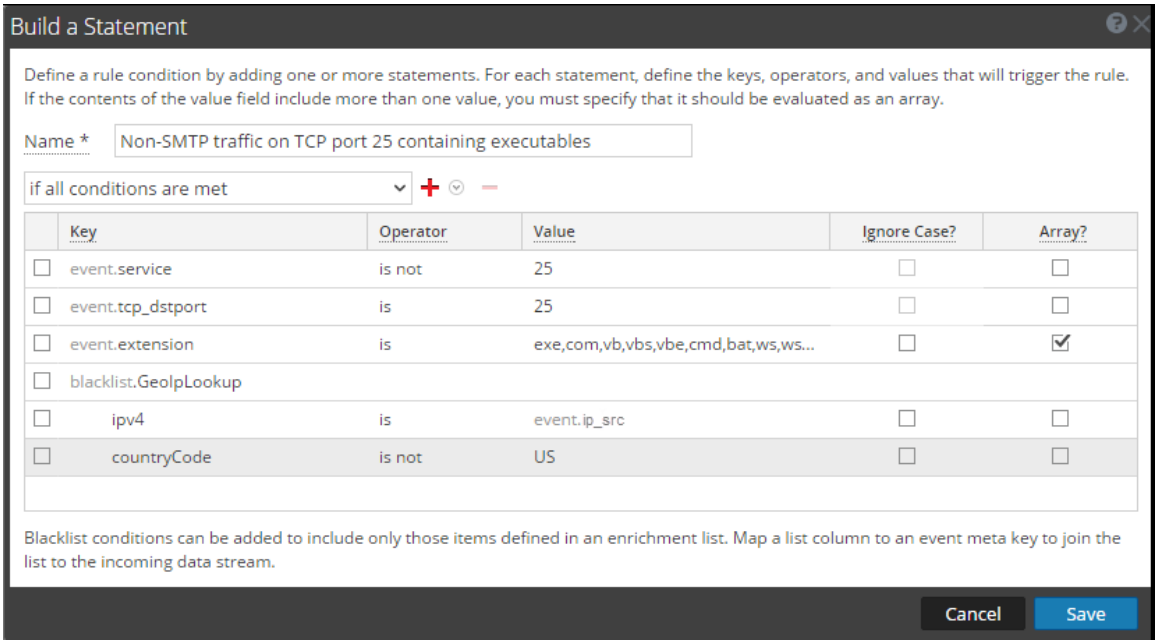
To Add a Blacklist

You use a blacklist to ensure that specified events trigger the rule. Blacklists can be based on geographic location or by customer-defined enrichment CSV sources. For example, you can specify that the rule only includes results from Germany.

1. After you add a meta condition, click + and select **Add Blacklist Condition**.
2. In the **Enter Blacklist Name** field, select an enrichment source. Any enrichment source loaded from a CSV or a named window in Esper can be used as source for a blacklist.
3. If you used a GeoIP source for the blacklist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter ipv4 is ip_src to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the blacklist, you might want to add a subcondition to specify the geographic region to include in the rule results. For example, to specify that the rule only includes results for Germany, enter "*CountryCode is DE*".

Example: Blacklist

The following statement shows a blacklist statement for a rule that monitors for non-SMTP traffic on TCP destination port 25 containing an executable from countries that are outside of the United States.



Statement	Description
service is not 25	The traffic is not SMTP traffic.
tcp_dstport is 25	The traffic is running on TCP port 25.
extension is exe, com,vb,vbs,vbe,cmd,bat,ws,wsf,src,sh	The file extension is an executable.
GeoIpLookup	The blacklist is based on a GeoIPLookup source.
ipv4 is ip_src	The GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database.
countryCode is not US	When looking up the IP address Event.ip_src in the GeoIP database, the record it returns does not contain "US" in the countryCode field.

Example: Ignoring Case, Strict Pattern Matching, and Using The *Is Not Null* Operator

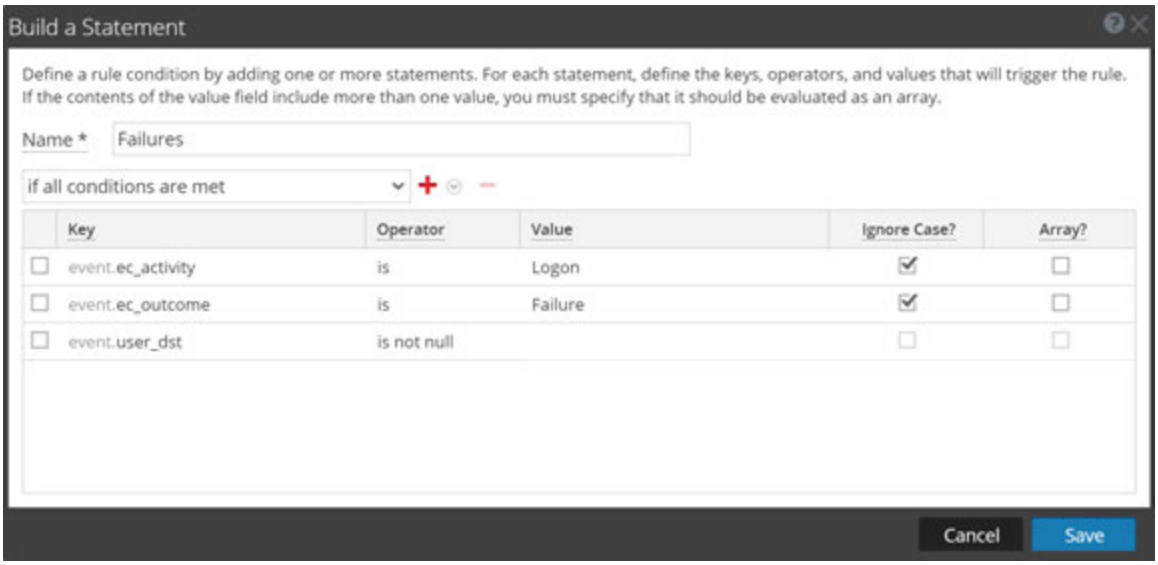
The following example uses the ability to ignore case, exclude null values, and create a strict pattern match to ensure that it returns the expected rule results. The following conditions make up the rule:

Rule Condition	Description
Failures	This condition searches for five failed logins with a "followed by" connector, meaning that the condition (Failures) must be followed by the next condition (Success).

Rule Condition	Description
Success	This condition searches for one successful login.
ModifyPassword	This condition searches for an instance where the password is modified.
GroupBy: user_dst, device class	The GroupBy field ensures that all the previous conditions are grouped by the user_dst meta (the user destination account) and device class. This is important to the construction of the rule because the rule attempts to find a case where a user has attempted to log into the same destination account multiple times, finally logged in successfully, and then changed the password. Grouping by device class ensures that the user logged in from the same machine attempted to log into an account multiple times. The rule may give unexpected results if you do not group the results.
Occurs within 5 minutes	The time window for the events to occur is five minutes. If the events occur outside of this time window, the rule does not trigger.
Event Sequence: Strict	The event sequence is configured for a strict pattern match. This means that the pattern must match exactly as it is specifiedwith no intervening events. Strict pattern matching allows you to ensure that the Esper engine only generates alerts for rules that exactly match the pattern you want to find. For example, a common rule might be to search for five failed logins followed by a successful login. If you select a loose pattern match, this rule will trigger if there are any number of successful logins between the failed logins. Since the point of the rule is to find frequent *and* sequential login attempts, a strict match is required to ensure that you get the results you expect.

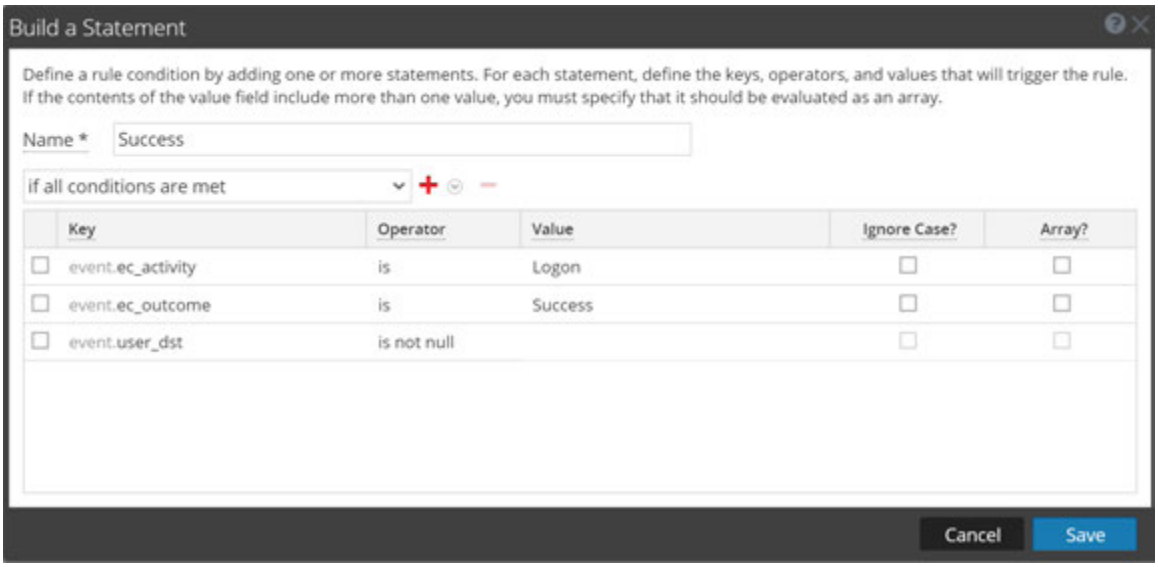
Note: Each of these conditions is explained in further detail in the sections below.

For each condition, a statement is built in the Rule Builder. The following statement makes up the Failures condition:



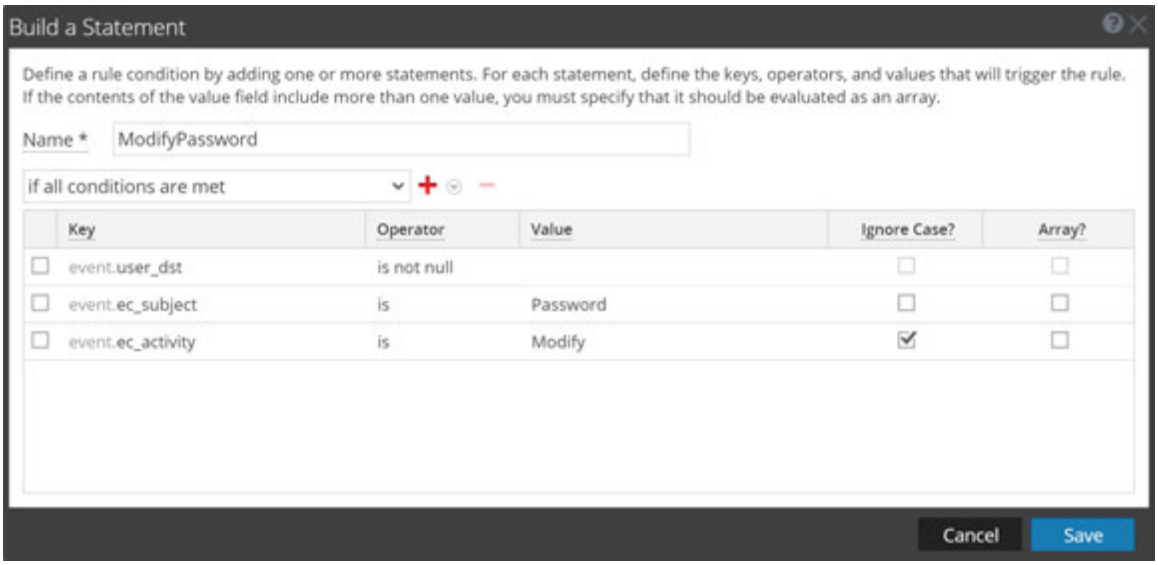
Rule Statement	Description
ec-activity is Logon (ignore case)	Identifies activity that attempts to log on to a system. The **Ignore Case** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. You may want to use this field if you are unsure what case may be used when logging a particular event. Because the case is ignored, the rule can trigger if the activity is logged as Logon, logon, or LoGoN.
ec_outcome is Failure (ignore case)	Identifies activity outcome logged as "failure." Because the case is ignored, the rule can trigger if the activity is logged as "failure", "Failure," or "FaiLuRe."
user_dst is not null	Ensures that the condition is only true if user_dst is populated. The **is not null** operator allows you to ensure that a field returns a value. You may want to use this field when a rule depends on a particular field returning a value. For example, you want to create a rule that identifies the same user attempting to log into the same destination account multiple times (potentially a password-guessing attack). If the field that represents the user destination account is empty, you don't want the rule to trigger. To ensure the field contains a value, you use the **is not null** operator.

The following statement makes up the Success condition:



Rule Statement	Description
ec_activity is Logon	Identifies logon activity.
ec_outcome is Success	Identifies a logon that is successful.
user_dst is not null	Ensures that user destination account field must be populated for the condition to be true.

The following statement makes up the ModifyPassword condition:

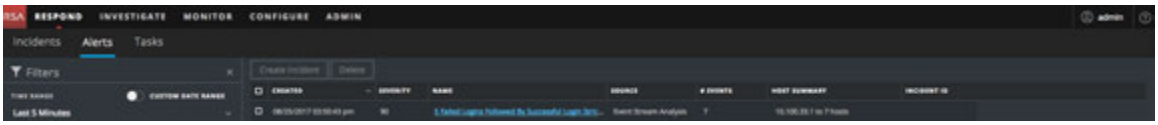


Rule Statement	Description
user_dst is not null	Ensures the user destination account field must be populated for the condition to be true.
ec_subject is Password	Identifies a subject of Password.
ec_activity is Modify	Identifies activity where the password was modified.

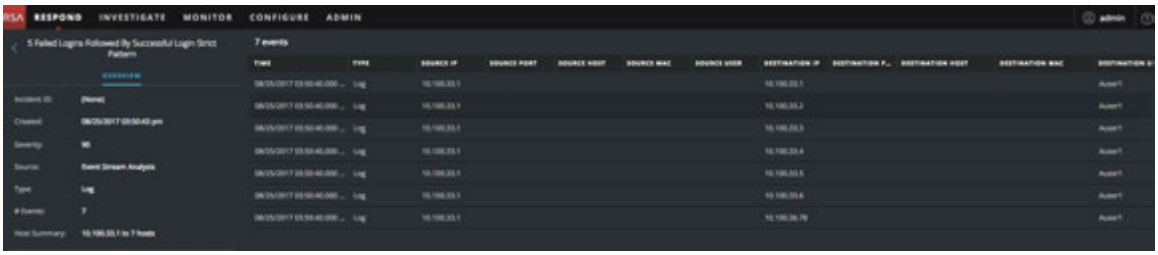
Example Results

When the alert fires for the example rule, you can see that the rule triggered for seven events, and that each event contains a user. You can also see that the events follow a strict pattern: five failed login events, followed by a successful login event, followed by a modification to the account.

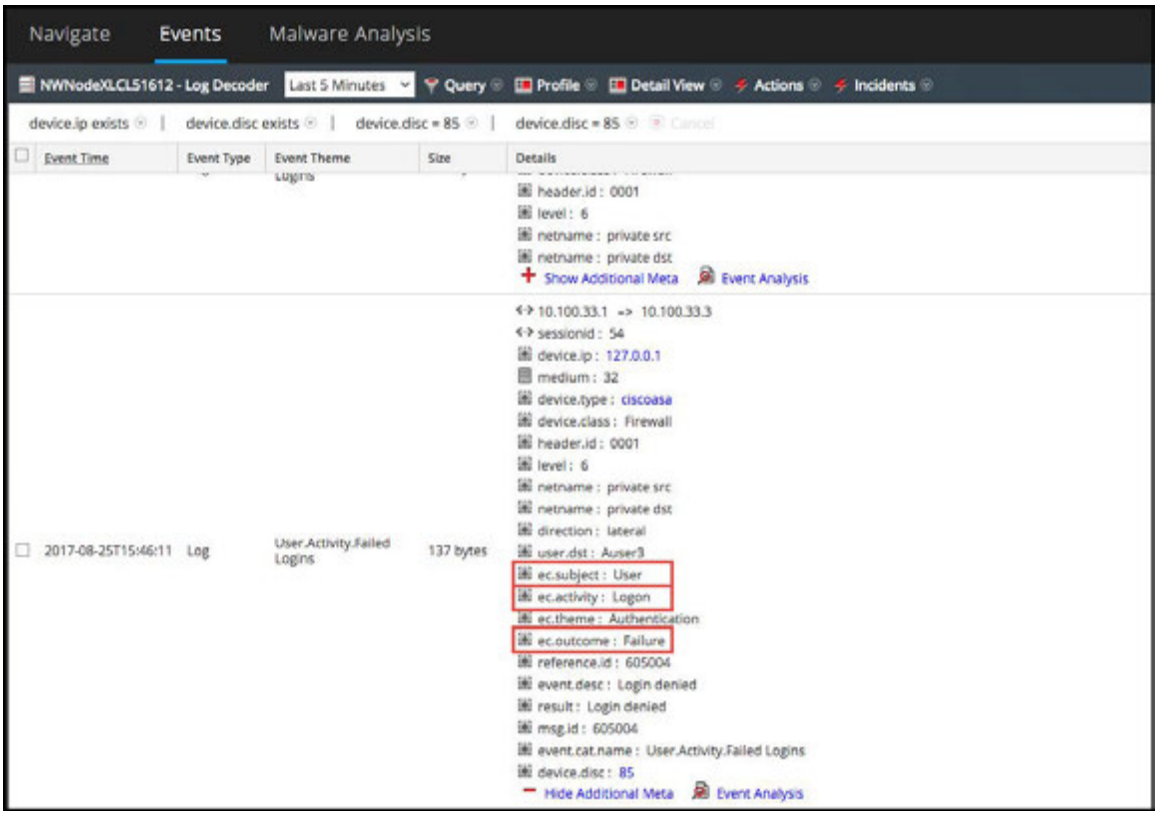
The following figure shows the alert in the Respond Alerts List view.



The next figure shows the events in the alert in the Respond Alert Details view.



Drilling down into the Investigation module by clicking on the source for one of the events, you can see the case for each of the string values. Because you used **Ignore Case**, the rule would trigger if the string values were upper or lower case.

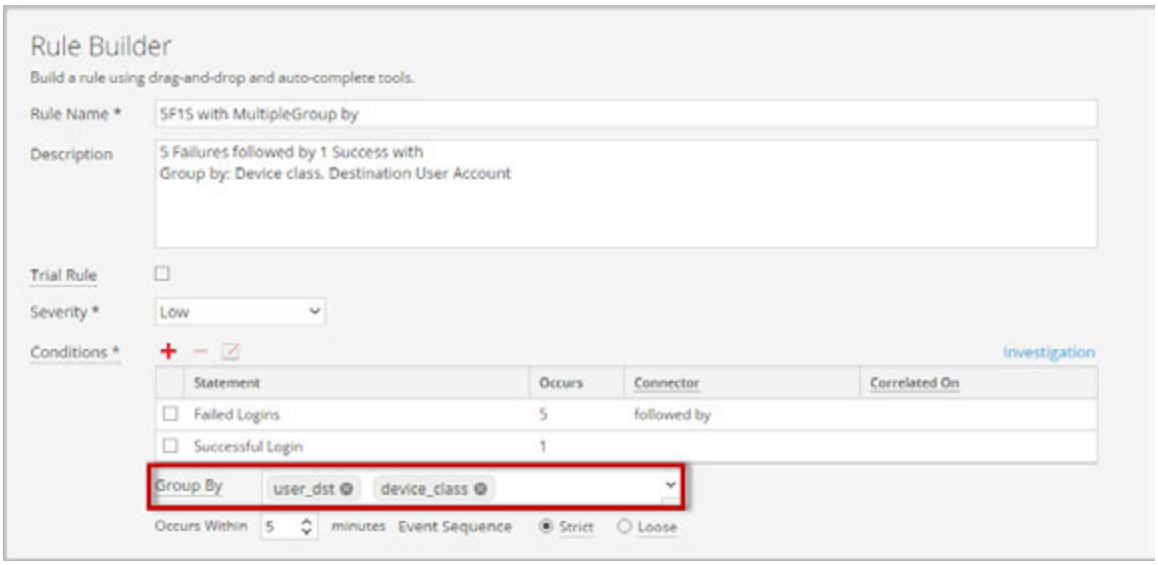


Example: Grouping the Rule Results

The **Group By** field allows you to group and filter rule results. For example, suppose that there are three user accounts; Joe, Jane, and John and you use the **Group By** meta, user_dst. The result will show events grouped under the accounts for Joe, Jane, and John.

You can also group by multiple keys, which can further filter rule results. For example, you might want to group by user destination account and machine to see if a user logged into the same destination account from the same machine attempts to log into an account multiple times. To do this, you might group by device_class and user_dst.

The following example shows a rule grouped by device_class and user_dst.

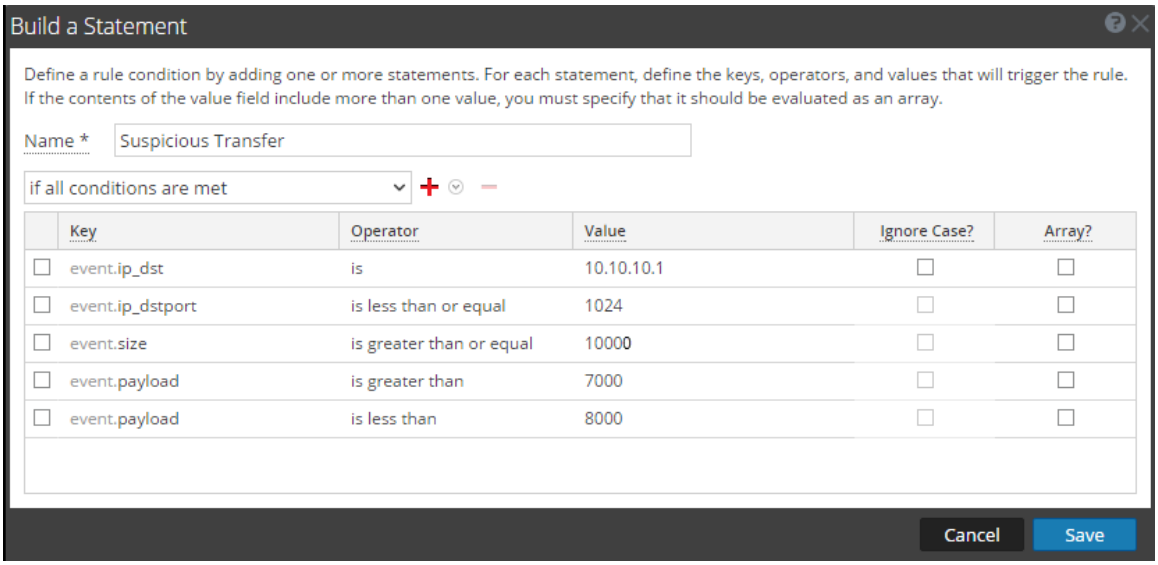


Rule Condition	Description
Failed Logins	Identifies five failed login attempts (must be followed by the next condition; i.e., the five failed logins must be followed by a successful login).
Successful Login	Identifies one successful login.
Group By: user_dst and device_class	Groups the rule results by user_dst (user destination account) and device_class (type of machine the user is logging in from). This allows the rule to look for a user logged in from the same machine to the same destination account, resulting in a much more targeted rule result.
Occurs within 5 minutes with a strict pattern match	The events must occur within five minutes, and the pattern matching is strict, meaning it must follow the pattern exactly for the rule to trigger.

Example: Working with Numeric Operators

Numeric operators allow you to write rules against numeric values, such as specifying that a value is greater than, less than, or equal to a specific value. This is useful particularly for cases where you might want to specify a numeric threshold, i.e., *payload is greater than 7000*.

The following example attempts to identify a data transfer to a particular destination through the common ports where the transfer size is high and the payload is in a suspicious range.



Rule Statement	Description
ip_dst is 10.10.10.1	The destination port is 10.10.10.1.
ip_dstport is greater than or equal to 1024	The destination port is in a commonly used port range, 1024 or greater.
size is greater than or equal to 10000	The size of the transfer is 10000 or greater, which is a suspiciously large transfer.
payload is greater than 7000	The payload is between 7000 and 8000, which is a suspiciously large payload.
payload is less than 8000	The payload is between 7000 and 8000, which is a suspiciously large payload.

Step 3. Add Conditions to a Rule Statement

This topic provides instructions to add conditions, such as specifying a certain time frame, to a rule statement. When you build a statement, you specify what a rule detects. You add conditions to make further stipulations, such as how many times or when the criteria must occur.

Example

The following graphic shows an example of the conditions for Rule Builder statements. Combined, the statements and conditions comprise the rule criteria.

This rule detects 5 failed logon attempts followed by one successful logon, which could be the sign that someone has hacked into user account. This is the criteria for the rule:

A. 5 failed logons are required.

B. 1 successful logon must follow the failures

C. A password was changed.

D. All events must occur within 5 minutes.

E. Group alerts by user (user_dst), because steps A and B must be performed on the same user destination account. Also, group by machine (device_class) to ensure that the user logged in from the same machine attempts to log into an account multiple times.

F. The match is a strict pattern, meaning that the pattern must match exactly with no intervening events.

Procedure

To add conditions to a rule statement:

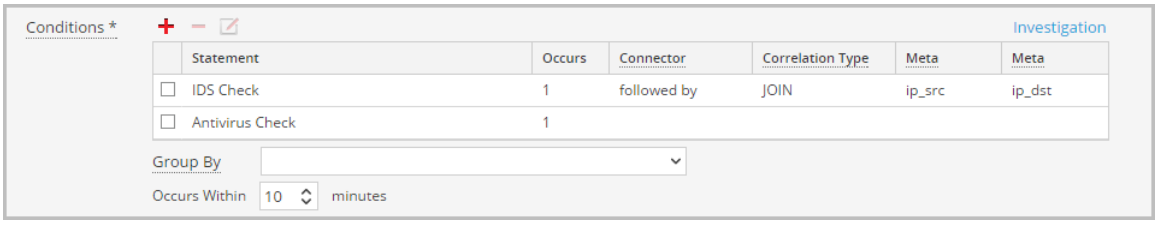
1. In the **Conditions** section, select a statement and click  .
2. For **Occurs**, enter a value to specify how many occurrences are required to meet the rule criteria.

3. If you have multiple statements, in the **Connector** field select a logical operator to join one statement to another:
   - followed by
   - not followed by
   - AND
   - OR
4. **Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert. See the examples below for a use case where two meta from different sources are joined.
5. If events must happen within a specific timeframe, enter a number of minutes in the **Occurs Within** field.
6. Choose whether the pattern must follow a **Strict** match or a **Loose** match. If you specify a strict match, this means that the pattern must occur in the exact sequence you specified with no additional events occurring in between. For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.
7. Choose the fields to group by from the dropdown list. The **Group by** field allows you to group and evaluate the incoming events. For example, in the rule that detects 5 failed logon attempts followed by 1 successful attempt, the user must be the same, so user_dst is the **Group By** meta key. You can also group by multiple keys. Using the previous example, you might want to group by user and machine to ensure that the same user logged in from the same machine attempts to log into an account multiple times. To do this, you might group by device_class and user_dst.

Example

The following graphic shows an example of the conditions for a rule that allow you to evaluate the same entities across multiple devices so you can accomplish complex use cases. For example, you can create a rule that triggers if an IDS (Intrusion Detection System) alert is followed by an AV(Anti-virus) alert for the same workstation. The work station key is not the same between the two (IDS & AV) sources, so you can perform a JOIN in order to evaluate the different entities.

In the IDS alert, the workstation is identified by the source IP address from the IDS alert, and would be compared to the destination IP address from the AV alert.



This is the criteria for the rule:

A. An IDS alert occurs.

B. The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.

C. An Antivirus alert follows the IDS alert.

Add an Advanced EPL Rule

This topic provides instructions to define rule criteria by writing an EPL query. EPL is a declarative language for handling high-frequency time-based event data. It is used to express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events.

Write an advanced EPL rule when rule criteria is more complex than what you can specify in Rule Builder.

It is outside the scope of this guide to explain EPL syntax.

- For EPL Documentation, see http://www.espertech.com/esper/documentation.php.
- For the EPL Online Tool, see http://esper-epl-tryout.appspot.com/epltryout/mainform.htm

Prerequisites

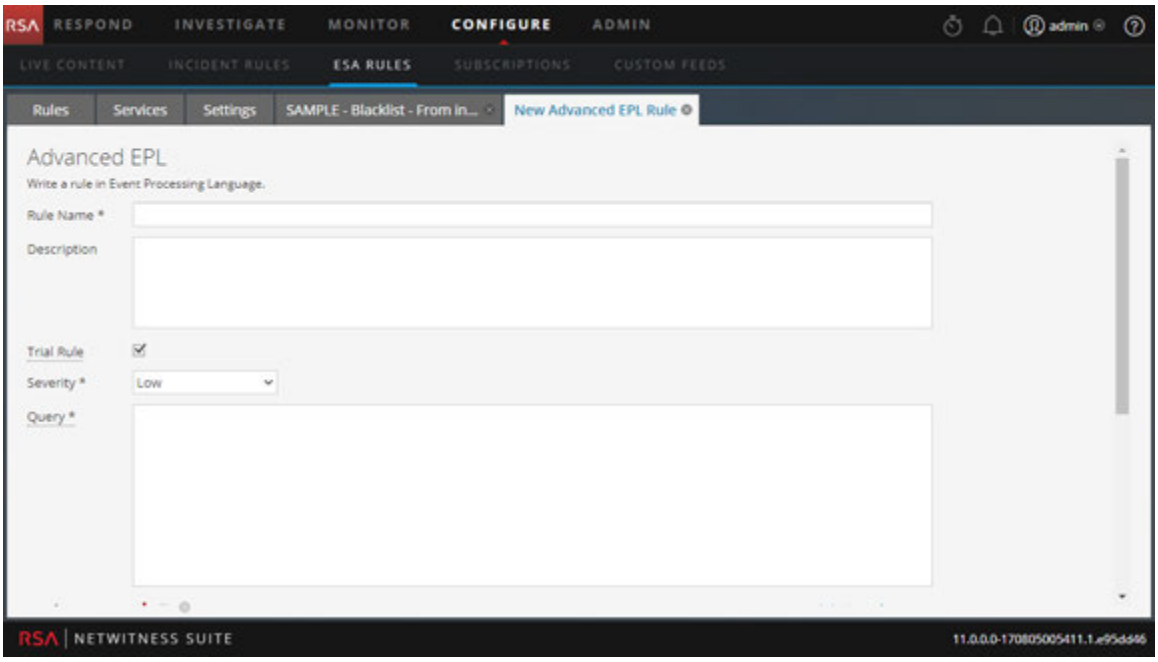
The following are prerequisites for adding an advanced rule:

- You must know Event Processing Language (EPL).
- You must understand ESA Annotations to mark which EPL statements are linked to generating alerts.

Procedure

To add an Advanced EPL rule:

1. Go to **CONFIGURE > ESA Rules**.
2. In the **Rule Library**, select + > **Advanced EPL**.



3. Type a unique, descriptive name in the **Rule Name** field.

   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.

4. In the **Description** field, explain which events the rule detects.

   The beginning of this description will appear in the Rule Library

5. Select **Trial Rule** to automatically disable the rule if all trial rules collectively exceed the memory threshold.

   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Work with Trial Rules.

6. For **Severity**, classify the rule as Low, Medium, High or Critical.
7. To define rule criteria, write a **Query** in EPL.

Note: For all meta key names, use an underscore not a period. For example, `ec_outcome` is correct but `ec.outcome` is not.

8. For dynamic statement name generation in ESA, you must enclose the meta keys in curly brackets and include this annotation in the syntax:

   ```
   @Name("RIG {ip_src} {alias_host} {ec_activity}")
   ```

   where,

   - RIG is the static part of the statement name
   - {ip_src}, {alias_host}, {ec_activity} is the dynamic part of the statement name

   Note: If any of the metas in the dynamic part of the statement name has a null value, it is displayed as a static text.

   If a rule should generate an alert, include this ESA annotation in the syntax:

   ```
   @RSAAlert
   ```

   For more information on ESA Annotations, see ESA Annotations.

Event Processing Language (EPL)

This topic describes Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. ESA uses Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. It is used for express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events. It can perform, but is not limited to, the following functions:

- Filter Event
- Alert Suppression
- Compute percentages or rations
- Average, count, min and max for a given time window
- Correlate events arriving in multiple stream
- Correlate events that arrive out of order
- On-Off Windows
- Followed-by and Not Followed-by support
- Regex filter support

Databases require explicit querying to return meaningful data and are not suited to push data as it changes. The developer must implement the temporal and aggregation logic himself. By contrast, the EPL engine provides a higher abstraction and intelligence and can be thought of as a database turned upside-down. Instead of storing the data and running queries against stored data, EPL allows applications to store queries and continuously run the data through. Response from the EPL engine is real-time when conditions occur that match user defined queries.

Advanced ESA rules require correct character case, but in the Investigation view all characters are converted to lowercase. However, the meta may not be lowercase despite appearances in the Investigation view. To ensure you are using the correct case, RSA recommends you use the *toLowerCase()* function. For example,

```
@RSAAlert(oneInSeconds=0)
SELECT * FROM Event(
/* Statement: Download PDF File */
(filetype.toLowerCase() IN ( 'pdf' ) AND medium IN ( 1 ))
OR
/* Statement: Download EXE File */
(filetype.toLowerCase() IN ( 'windows_executable' , 'x86 pe' , 'windows executable' ) AND medium IN ( 1 ))
).win:time(5 Minutes)
MATCH_RECOGNIZE (
PARTITION BY ip_src
MEASURES E1 as e1_data , E2 as e2_data
PATTERN (E1+ E2)
DEFINE
E1 as (E1.filetype.toLowerCase() IN ( 'pdf' ) AND E1.medium IN ( 1 )),
E2 as (E2.filetype.toLowerCase() IN ( 'windows_executable' , 'x86 pe' , 'windows executable' ) AND E2.medium IN ( 1 ))
```

For the purposes of online help, basic statements are used to illustrate how to set up ESA; however, for more information about writing EPL statements, the http://www.espertech.com site provides tutorials and examples.

Note: ESA supports Esper version 5.3.0.

ESA Annotations

This topic describes annotations that NetWitness Suite provides to use in advanced EPL rules.

@RSAAlert Annotation

The @RSAAlert annotation is used to mark which EPL statements are linked to generating alert notifications. It is designed to work with the alert notification suppression feature in the Rule Builder user interface.

The @RSAAlert annotation can be useful when working with alert notifications, especially if you want to filter notifications, such as sending one notification for each user that triggers an alert.

For example, suppose you want to generate alert notifications for login failures. You could add the following statement:

*@RSAAlert select * from event(msg_id="login_fail")*

Event number	Message ID	username	src_IP	Time
1	login_fail	alice	1.2.3.4	10:00
2	login_fail	alice	1.2.3.4	10:01
3	login_fail	alice	6.7.8.9	10:01
4	login_fail	bob	1.2.3.4	10:01
5	login_fail	alice	1.2.3.4	10:03

For the above statement, five alert notifications are generated.

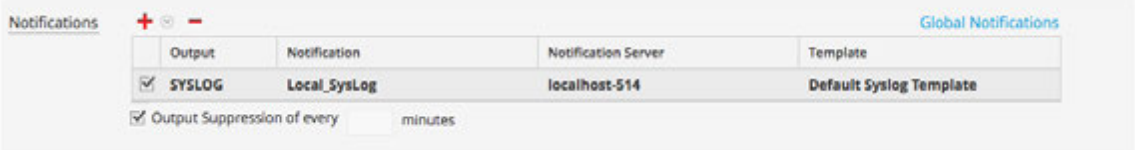
However, suppose you wanted to modify the statement to generate one alert for each separate username. You can use the *identifier* attribute. For example, the statement *@RSAAlert (identifier={"username"}) SELECT* FROM Event(msg_id="login_fail")* generates one notification for the first alert for "bob" and one for the first alert for "alice." Subsequent alerts for "bob" and "alice" are ignored.

You can further distinguish the users by adding details via the identifier variable. For example, you can distinguish by user and IP address using the following statement: *@RSAAlert(identifier={"username", "src_ip"}) SELECT* FROM Event(msg_id="login_fail")*. Then, you would see notifications generated by user name and IP address (one alert for "alice" at 1.2.3.4, another alert for "alice" at 6.7.8.9, and an alert for "bob" at 1.2.3.4).

To Use Identifiers with Alert Notification Suppression:

The @RSAAlert annotation is designed to work with the alert notification suppression feature in the Rule Builder user interface. To do this:

1. Create a rule in the Rule Builder user interface, and select the alert suppression feature when configuring notifications.



2. Copy the code from the Rule Builder rule into a new advanced rule.
3. Configure the advanced rule to include identifiers (as described above) and save the advanced rule.
4. Delete the original rule builder rule.

@RSAPersist Annotation

The @RSAPersist annotation is used to mark a named window as an ESA managed window for persistence. By marking the named window as an ESA managed window, ESA periodically writes the contents of the window to disk and restores them back if the window is un-deployed and re-deployed. The systems take a snapshot just before the module is un-deployed and the window is removed. Conversely, it restores the window contents from the snapshot just after the module is re-deployed. This ensures that the contents of the window are not lost if the module state is altered or if the ESA service goes down.

For example, consider a named window, `DHCPTracker` that holds a mapping from IP addresses to each assigned hostname.You can annotate the statement with the @RSAPersist annotation as:

```
@RSAPersist
 create window DHCPTracker.std:unique(ip_src) as (ip_src string, alias_
host string);
 insert into DHCPTracker select IP as ip_src, HostName as alias_
host from DHCPAssignment(ID=32);
```

Note: All windows definitions are not suitable for persistence. `@RSAPersist` annotation must be used with care. If the window has timed-records or if it depends on time based constraints it is very likely that the reverted snapshots will not restore it to the correct state. Also, any changes to the window definition will invalidate the snapshots and reset the window to a blank state. The system does not do any semantic analysis to determine if the changes to the window definition are conflicting or not. Note that other parts of a module (i.e. other than the particular CREATE WINDOW call that defines the window) may change, without invalidating the snapshots.

@UsesEnrichment (10.6.1.1 and later)

The @UsesEnrichment can be used in advanced EPL rules to reference enrichments. In order to synchronize enrichments with ESA, all enrichment dependencies in EPL rules must be referenced with the @UsesEnrichment annotation.

The @UsesEnrichment annotation uses the following format:

```
@UsesEnrichment(name= '<enrichment_name>')
```

For example, the following EPL references a whitelist enrichment:

```
@UsesEnrichment(name = 'Whitelist')
@RSAAlert
SELECT * FROM Event(ip_src NOT IN (SELECT ip_address FROM Whitelist))
```

@Name

The @Name is the statement name defined in ESA advanced rules. It is used to dynamically generate statement names in ESA alerts. The statement name of only an alert triggering statement is displayed. This annotation has meta keys enclosed in curly brackets.

The @Name annotation uses the following format:

```
@Name("<static_part_of_statement_name> {meta_key1} {meta_
key2}…")
```

For example, the following EPL references meta keys *ip_src* and *user_name* whose values will be dynamically generated.

@Name(“Login Event to {ip_src} by {user_name}”)

Note: You can specify any number of meta keys in the statement for dynamic statement name generation.
The length of individual meta key is limited to 64, after which the value is truncated and appended with “…”.
The length of the dynamic generation of statement name is limited to 128, after which the value is truncated to 128 and appended with “…”. All the remaining values post truncation will be treated as static values.

Sample Advanced EPL Rules

Following are the examples of Advanced ESA rules. Each example has multiple ways of implementing the same use-case.

Example #1:

Create an user account and delete the same user account in 300s. User information is stored in user_src meta.

EPL #1:

Rule Name	CreateuseraccountFollowedbyDeletionof Useraccount1
Rule	Create a user account followed by an action to delete the same user account in

Description	300 seconds.
Rule Code	SELECT * FROM Event(ec_subject='User' AND ec_outcome='Success' AND user_src is NOT NULL AND ec_activity IN ('Create', 'Delete')).win:time(300 seconds) match_recognize (partition by user_src measures C as c, D as d pattern (C D) define C as C.ec_activity='Create' , D as D.ec_activity='Delete');
Note	• Filter events needed for pattern in given time frame. Filter conditions should be such that only required events are passed to match recognize function. In this case, they are create and delete user account Events. i.e. Event(ec_subject='User' AND ec_outcome='Success' AND user_src is NOT NULL AND ec_activity IN ('Create', 'Delete') • Partition by creates buckets. In this case, esper creates buckets per value of user_src. And hence value of user_src is common between both events. • Define pattern you want. Right now it is set to Create Followed by Delete. You can do multiple creates followed by delete (C+ D). Pattern is very similar to regular expression. • Most efficient use case.

EPL #2:

Rule Name	CreateuseraccountFollowedbyDeletionof Useraccount2
Rule Description	Create a user account followed by an action to delete the same user account in 300 seconds.
Rule Code	SELECT * from pattern[every (a= Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create')) ->(Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create') AND

	`user_src = a.user_src)` `) )where timer:within(300 Sec) ];`
Note	• Lets say same user is created twice and deleted once in that order. Then the above pattern will fire 2 alerts. • A thread is created for every User creation. • There is no way to control threads. It is important to have time bonds and preferably small intervals.

Example #2:

Detect pattern where user created followed by login by same user and user is deleted in end. In case of windows logs user info is stored in either user_dst or user_src depending on event.

user_src(create) = user_dst(Login) = user_src(Delete)

EPL #3:

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.

Rule Code	`SELECT * FROM Event(ec_subject='User'`
	`and ec_activity in ('Create','Logon','Delete')`
	`and ec_theme in ('UserGroup', 'Authentication')`
	`and ec_outcome='Success'`
	`).win:time(300 seconds)`
	`match_recognize (measures C as c, L as l, D as d`
	`pattern (C L D)`
	`define`
	`C as C.ec_activity = 'Create',`
	`L as L.ec_activity = 'Logon' AND L.user_dst = C.user_src,`
	`D as D.ec_activity = 'Delete' AND D.user_src = C.user_src`
	`);`

Note	• Since user_src/user_dst is not common across all events we can't use partition. It will be 1 single bucket running 1 pattern at a time. For example, for user 1 and 2 if the stream of events are C1C2L1D1, C1L1C2D1, there will be no alert because C1 thread got reset by C2. Alert will be fired only if C1L1D1 are in order and no other event either from same user or other user falls in between.

	• Another solution would be to use Named Window and merge user_dst and user_src into single column and then run match recognize. (EPL #3). • Pattern can also be used. You might get more alerts than expected. (EPL #4).

EPL #4: Using NamedWindows and match recognize

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.

Rule Code	`@Name('NormalizedWindow')create window FilteredEvents.win:time(300 sec) (user String, ecactivity string, sessionid Long);`
	`@Name('UsersrcEvents') Insert into FilteredEvents select user_src as user, ec_activity as ecactivity, sessionid from Event(ec_subject='User' and ec_activity in ('Create','Delete') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_src is not null );`
	`@Name('UsrdstEvents') Insert into FilteredEvents select user_dst as user, ec_activity`
	`as ecactivity, sessionid from Event(ec_subject='User' and ec_activity in (Logon') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_dst is not null );`
	`@Name('Pattern')`
	`@RSAAlert(oneInSeconds=0, identifiers={"user"})`
	`select * from FilteredEvents`
	`match_recognize (`
	`partition by user`
	`measures C as c, L as l, D as d`
	`pattern (C L+D)`
	`define C as C.ecactivity= 'Create',`
	`L as L.ecactivity= 'Logon',`
	`D as D.ecactivity='Delete'`
	`);`

EPL #5: Using Every @RSAAlert(oneInSeconds=0, identifiers={"user_src"})

SELECT a.time as time,a.ip_src as ip_src,a.user_dst as user_dst,a.ip_dst as ip_dst,a.alias_host as alias_host from pattern[every (a=Event (ec_subject='User' and ec_activity='Create' and ec_theme='UserGroup' and ec_outcome='Success') -> (Event(ec_subject='User' and ec_activity='Logon' and ec_theme='Authentication' and user_src=a.user_dst) -> b=Event (ec_subject='User' and ec_activity='Delete' and ec_theme='UserGroup' and user_dst=a.user_dst))) where timer:within(300 sec)];

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.

Example #3:

Excessive login failures from same sourceIP

EPL #6: @RSAAlert(oneInSeconds=0, identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule Description	The same user tried logging in from the same Source IP and faced login failures
Rule Code	`SELECT * FROM Event( ip_src IS NOT NULL AND ec_activity='Logon' AND ec_outcome = 'Failure' ).std:groupwin(ip_src).win:time_length_batch(300 sec, 10) GROUP BY ip_src HAVING COUNT(*) = 10;`
Note	• Creates window per ip_src • Uses time_length_batch: Looks at events in batches(tumbling window). Every event will be part of only 1 window. Window releases events either when time elapses or count is reached. • One of issues with tumbling windows that events occurring towards end of batch might not lead to an alert. In below sequence of events at t=301 even though 10 login failures occurred for same login in last 300 secs there will be no alert because batch of events was dropped at t=300

Time t	Login Failures for Specific Users	Alert	Time Batch
0	0	0	1
295	6	0	1
299	3	0	1
301	1	0	2
420	6	0	2
550	3	0	2
600	0	0	3
720	6	0	3
850	3	0	3
900	1	1	3 ends and 4 begins

- Above problem can be resolved using win:time windows (EPL#7)instead of win:time_length_batch windows.
- Outer group by is to control events when time elapses. Say you have 9 events at end of 60 secs, esper engine will push those 9 events to listener. Group by and count will restrict it since count is not equal to 10.
- Time and count can be modified as needed.

EPL #7: @RSAAlert(oneInSeconds=0, identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule Description	The same user tried logging in from the same Source IP and faced login failures

Rule Code	`SELECT * FROM`
	`  Event(`
	`  ip_src IS NOT NULL AND ec_activity='Logon' AND ec_outcome = 'Failure'`
	`  ).std:groupwin(ip_src).win:time (300 sec) GROUP BY ip_src HAVING COUNT(*) = 10`

Note	• This is sliding window and hence once alert is fired for a set of events they can be used for another alert as well till time has passed. • If 10 events were involved in causing alert only last event will appear

	• If < or > are used then you might see more than 1 alert. You should use alert suppression accordingly.

Example #4:

Multiple failed logins from multiple different users from same source to same destination, a single user from multiple different sources to same destination.

EPL #8: using groupwin , time_length_batch and unique

Rule Name	MultiplefailedLogins
Rule Description	There are multiple failed logins for the following cases: - From multiple users from same source to same destination. - Single user from multiple sources to the same destination.
Rule Code	`SELECT * FROM Event( ec_activity='Logon' AND ec_outcome='Failure' AND ip_src IS NOT NULL AND ip_dst IS NOT NULL AND user_dst IS NOT NULL ).std:groupwin(ip_src,ip_dst).win:time_length_batch(300 seconds, 5}).std:unique(user_dst) group by ip_src,ip_dst having count(*) = 5;`
Note	• ip.dst and ip.src are common across all events. • user_dst is unique for all events. • Alert is fired when there are atleast 5 different users try to login from same ip.src and ip.dst combination.

Example #5:

No Log traffic from a device in a given timeframe.

EPL #9: using groupwin , time_length_batch and unique

Rule Name	NoLogTraffic
Rule Description	There is no log traffic observed from a device in a given time frame.
Rule Code	`SELECT * FROM pattern [every a = Event(device_ip IN ('10.0.0.0','10.0.0.1') AND medium = 32) -> (timer:interval (3600 seconds) AND NOT Event(device_ip = a.device_ip AND`

Note	`device_type = a.device_type AND medium = 32))];`
	• Rule only detects sudden loss of traffic. It won't alert if there is no traffic to begin with. You need at least 1 event for rule to alert. • List of device ip address or device hostnames as input. Only these systems will be tracked. • Time input is required. Alert is fired when time interval between events exceeds input time.

Example #6:

Multiple Failed Logins NOT followed by a Lockout event by the same user.

EPL #10: using groupwin , time_length_batch and unique

Rule Name	FailedloginswoLockout
Rule Description	There are multiple failed logins that are not followed by Lockout event by the same user.

Rule Code	`SELECT * FROM pattern [every-distinct(a.user_dst, a.device_ip, 1 msec) (a= Event(ec_activity='Logon' and ec_outcome='Failure' and user_dst IS NOT NULL)-> [2]( Event( device_ip =a.device_ip and ec_activity='Logon' and ec_outcome='Failure' and user_dst=a.user_dst)`
	`AND NOT Event( ( ec_activity='Logon' and ec_outcome='Success' and device_ip = a.device_ip and user_dst=a.user_dst) or (ec_activity='Lockout' and device_ip = a.device_ip and user_dst=a.user_dst))))`
	`where timer:within(60 seconds) -> (timer:interval(30 seconds) and not Event(device_ip=a.device_ip and user_dst=a.user_dst and ec_activity='Lockout'))];`

Note	• Above query detects the absence of a Lockout Event after the occurrence of 2 failed logins from same user. • The occurrence of the multiple failed logins are timed and are assumed to occur within a certain period of time. Also, in-practice the Lockout event is assumed to occur within a short time after the occurrence of the last failed login event because the threshold value of Failed logins per user is set in a

	given domain. • In current query, every distinct will suppress new thread for combination of user and device for 1 millisec. • Time allowed for 3 failed logins is 60 secs since 1st failed attempt. Wait period for lockout event to occur is 30 secs

Example #7:

Custom functions to perform LIKE and REGEX operations for ARRAY elements.

EPL #11: @RSAAlert(oneInSeconds=0)

Rule Name	MatchLikeRegex
Rule Description	There are custom functions to perform LIKE and REGEX comparisons of array meta keys.

Rule Code	`SELECT * FROM pattern[`
	`e1=Event(matchLike(alias_host, "10.0.0.%")) AND`
	`e2=Event(matchRegex(alias_host, "10\.0\.0\.1[0-9][0-9]"))`
	`where timer:within(5 Minutes)];`

Note:
1. “.” in meta keys should be replaced with (”_”).
2. All patterns should be time bound.
3. Use of appropriate tags in front of statements
 a) @RSAPersist:
 b) @RSAAlert:

For additional details you can refer to:

- EPL Documentation: http://www.espertech.com/esper/documentation.php
- EPL Online Tool: http://esper-epl-tryout.appspot.com/epltryout/mainform.html

Working with Rules

This topic discusses additional procedures you can perform on rules. You may want to perform any of the following procedures:

Edit, Duplicate or Delete a Rule

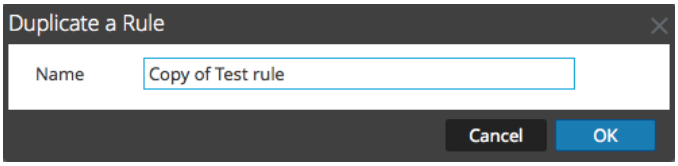
This topic provides instructions to edit, duplicate, or delete an Event Stream Analysis (ESA) rule. When you edit a rule, ESA applies the updated criteria going forward. No changes are made to previously generated alerts.

Procedures

Edit a Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the **Rule Library**, select the rule you want to edit and click  .
   Depending on the rule type, the respective rule tab is displayed.
3. Modify the required parameters.
4. Click **Save**.

Duplicate a Rule

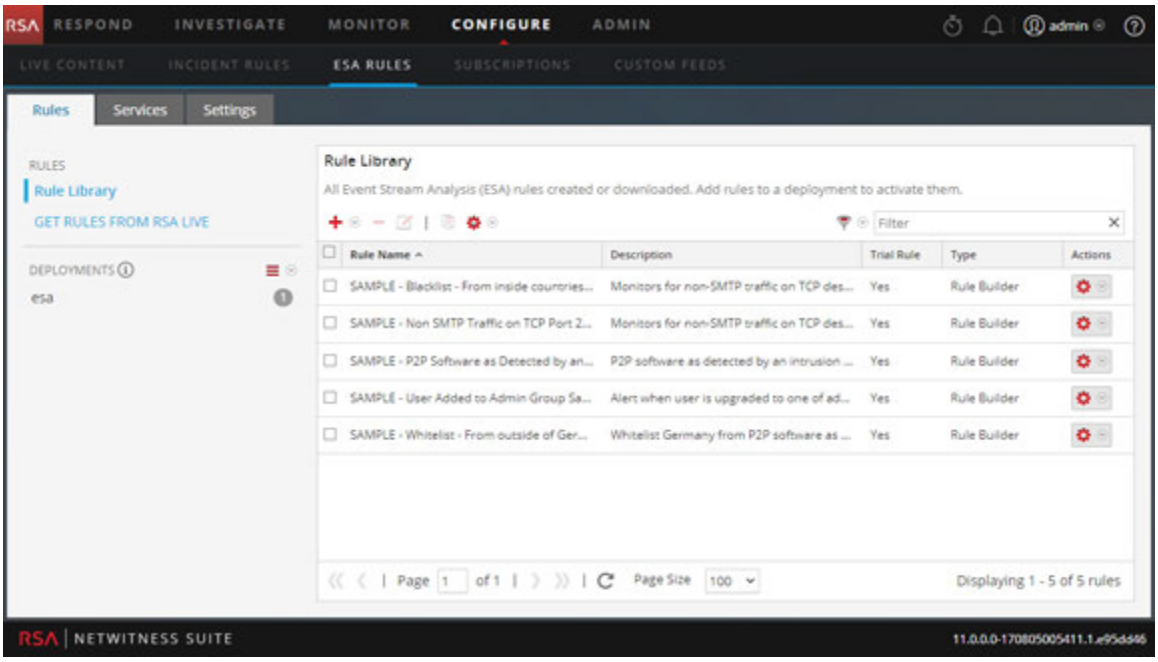
1. In the **Rule Library**, select the rule you want to duplicate and click  .
2. The Duplicate a Rule dialog is displayed. The system adds **Copy of** in front of the rule name.
   


3. In the **Name** field, type a unique name for the duplicate rule and click **OK**.

A duplicate rule with the new name is added to the Rule Library.

Delete a Rule

1. Go to **CONFIGURE > ESA Rules > Rules**.
   The Rules tab is displayed.



2. In the Rule Library, select one or more rules and click .

   A warning dialog is displayed.

3. Click **Yes**.
   A confirmation message that the rule is deleted successfully is displayed and the selected rule is deleted from the Rule Library.

Filter or Search for Rules

This topic shows analysts how to specify the type of rules that display in the Rule Library.

Prerequisites

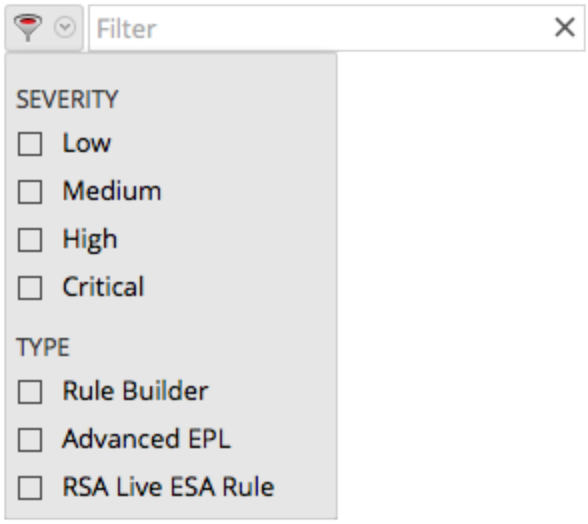
Make sure that you understand the Rule Library view components. For more information, see Rule Library Panel.

Procedures

Filter

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed by default.

2. In the **Rule Library** panel toolbar, click and select the severity and type of rules that you would like to appear in the Rule Library list. The following figure shows the Filter drop-down list.



The selected rule types appear in the list.

Search

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library** panel toolbar, type a rule name in the Filter field.
   The Rule Library panel lists the rules that match the names entered in the Filter field.

Import or Export Rules

The topic provides instructions to import ESA rules from a NetWitness Suite instance and to export ESA rules to your hard drive so you can keep a local copy.

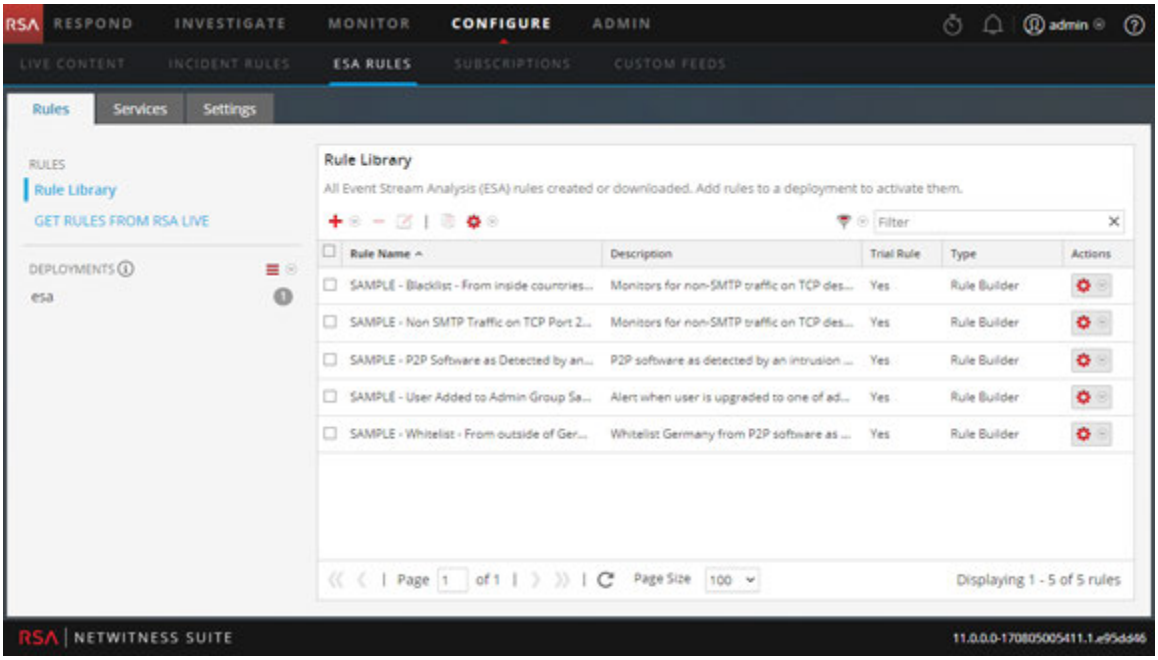
If you exported a rule in an earlier version of NetWitness Suite, the following conditions apply when you import the rule in version 10.5 or later:

- Exported in version 10.3 – You cannot import rules to version 10.5 or later.
- Exported in version 10.4 – Rule behavior depends if cross-correlation is disabled, which is the default, or enabled:
  - Disabled – You can import rules to version 10.5 or later.
  - Enabled – You must restart NetWitness Suite or make a minor change to the rule, save, remove the minor change and save again. Either procedure generates the forwarding rule that the 10.5 or later cross-site correlation feature requires.

Procedures

Import ESA Rules

1. Go to **CONFIGURE >ESA Rules > Rules** tab.
   The Rules tab is displayed.



2. In the **Rules Library** toolbar, select > **Import**.
   The Import ESA Rules dialog is displayed.

3. Click **Browse** to browse and select the file containing the ESA rules.
4. Click **Import**.

Export

1. Select an ESA rule or multiple rules and select > **Export** in the Rule Library toolbar.
   A warning dialog is displayed.
2. Click **Yes**.
   The Export Rules dialog is displayed.

3. In the **Enter File Name** field, type a filename for the file with the ESA rules and click **Export**.
   The file is exported as a binary file to your machine.

Note: The binary file cannot be edited.

Choose How to be Notified of Alerts

This topic explains the different notification methods and how to add a notification method to a rule. Administrator, SOC Manager or DPO role permissions are required for all tasks in this section.

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- SNMP
- Syslog
- Script

To configure a notification, you configure these components:

- Notification server – After you configure a notification server, you can add it to a rule. When the rule triggers an alert, the rule will use that server to send alert notifications.
- Notifications – These are the outputs, which can be email, script, SNMP, and Syslog. When you design a rule, you can specify the notification for an alert.
- Templates – The format of an alert notification is defined in a template.

Alert suppression and alert rate regulation are two features that Event Stream Analysis provides. Alert suppression ensures that multiple emails are not sent out for the same alert. For example, consider a rule to detect failed user logins. If you set the alert suppression to three minutes, you will see only the alerts generated in that time frame. This is fewer than the number of alerts you would see without alert suppression. Some alerts can be duplicates. With alert suppression, emails are not sent for duplicate alerts. This ensures the inbox is not flooded with redundant alert notifications.

Alert rate regulation is a preventive measure to ensure that alerts from misconstrued rules do not flood the system. This ensures that ESA does not send more than the configured limit of emails within one minute.

Notification servers, notifications, and templates are configured in the Administration System view. For more information, see "Configure Notification Servers", "Configure Notification Outputs", and "Configure Templates for Notifications" in the *System Configuration Guide*.

Notification Methods

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- SNMP
- Syslog
- Script

Email Notifications

Event Stream Analysis can send notifications to users through email about various system events.

To configure these email notifications, you need to:

- Configure the SMTP email server as an output provider. For instructions, see "Configure the Email Settings as Notification Server" in the *System Configuration Guide*.
- Set up an email account to receive notifications. For instructions, see "Configure Email as a Notification" in the *System Configuration Guide*.
- Configure a template for email notification. For instructions, see "Configure a Template" in the *System Configuration Guide*.

SNMP

Event Stream Analysis can send events as an SNMP trap to a configured SNMP trap host.

Note:
The MIB file **NETWITNESS-MIB.txt** is located on the ESA RPM at the following location */usr/share/snmp/mibs*. With the MIB file, you will be able to identify the SNMP alerts trigerred from ESA. And, the Trap OID value for ESA is 20.

To configure these SNMP notifications, you need to:

- Configure SNMP trap host settings as an output provider. For instructions, see "Configure the SNMP Settings as Notification Server" in the *System Configuration Guide*.
- Configure SNMP trap settings as an output action. For instructions, see "Configure SNMP as a Notification" in the *System Configuration Guide*.
- Configure a template for SNMP. For instructions, see "Configure a Template" in the *System Configuration Guide*.

Syslog

Event Stream Analysis can send events and consolidate logs in Syslog format to a Syslog server.

To configure these Syslog notifications, you need to:

- Configure Syslog server settings as an output provider. For instructions, see "Configure the Syslog Settings as Notification Server" in the *System Configuration Guide*.
- Configure Syslog message format as an output action. For instructions, see "Configure Syslog as a Notification" in the *System Configuration Guide.*
- Configure a template for Syslog. For instructions, see "Configure a Template" in the *System Configuration Guide*.

Script Alerter

Apart from the alert notifications ESA allows users to run scripts in response to ESA alerts.

Scripts enable you to do custom integration with applications that exist in your environment. For example, if you want to open an incident ticket from an application when a specific alert is triggered, Script Alerter lets you write a script that calls the application API and has ESA invoke it when the specific ESA rule is triggered. You can configure a FreeMarker template to define what details you want to extract from the output of the ESA rule and pass it as command line arguments to the script.

To use the Script Alert, you need to:

- Configure the user identity and other details that are required to execute the script. For instructions, see "Configure Script as a Notification Server" in the *System Configuration Guide*.
- Define the Script. For instructions, see "Configure Script as a Notification" in the *System Configuration Guide*.
- Configure a template for the script. For instructions, see "Configure a Template" in the *System Configuration Guide*.

Add Notification Method to a Rule

This topic tells administrators how to add a notification, such as email, to a rule. ESA uses the notification method when it generates an alert for an event that meets rule criteria.

You add a notification to a rule so ESA can let you know when a rule triggers an alert. Although the notification fields are not required, it is a best practice to add a notification to a rule.

When you add a notification method to a rule, you select the following information:

- Output
- Notification
- Notification Server
- Template

Prerequisites

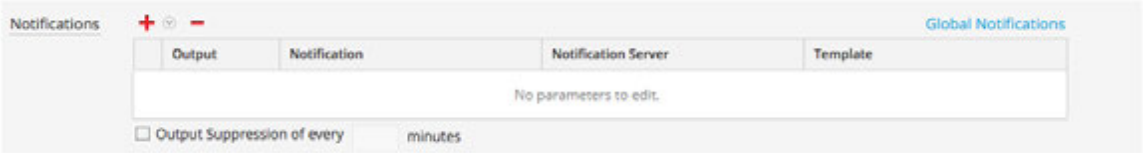
- Your role must have permission to manage rules.
- The rule must exist.
- The notification method must be configured with a supported server and template:
  Go to **ADMIN** > **System > Global Notifications**.

  For detailed procedures, see the *System Configuration Guide*.

Procedure

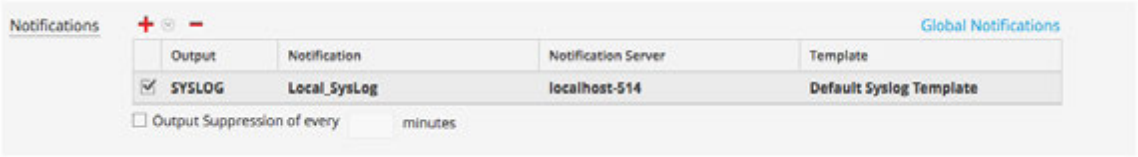
To add a notification method to a rule:

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the **Rule Library**, click  to add a new rule or select an existing rule and click  .
   Depending on the rule type, the Rule Builder or Advanced EPL tab is displayed.
   The Notifications section is the same for both tabs.



3. Click  and select the **Output** for the alert:
   - Email
   - SNMP
   - Syslog
   - Script
4. Double-click the **Notification** field and select the name of a previously configured output.
   For example, Level 1 Analyst could be the name of an email notification that goes to the L1-Analysts email distribution group.
5. Double-click the **Notification Server** field and select the server that sends the notification.

6. Double-click the **Template** field and select a format for the alert.
   The following figure shows the settings for a Syslog notification.

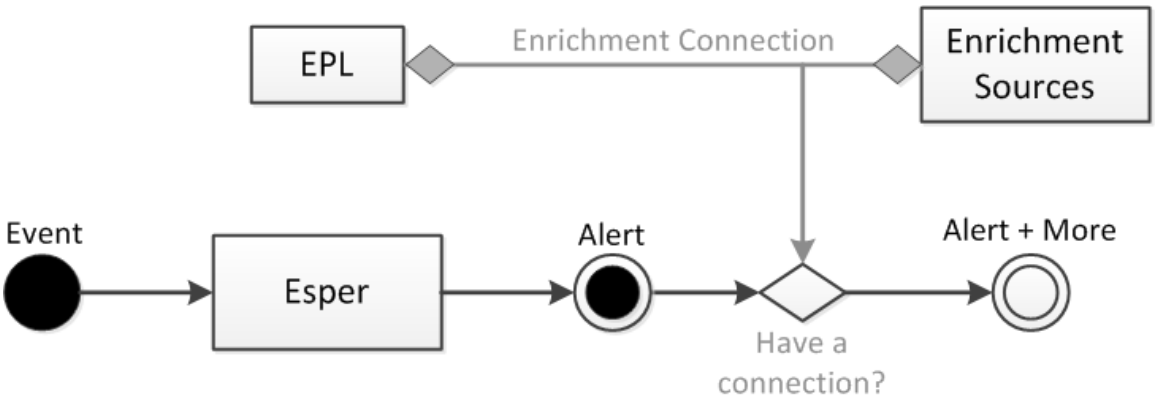


7. If you want to specify frequency, select **Output Suppression**, then enter the number of **minutes**.
8. If you want to add another notification, repeat steps 3-7.
9. Click **Save**.
   When ESA generates an alert for an event that matches the rule criteria, you will be notified of the alert via each notification method added to the rule.

Add a Data Enrichment Source

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Enrichments provide the ability to include contextual information into correlation logic and alert output. Without enrichments, all information included in an ESA alert is from a Core service. With enrichments, you can request for look ups into a variety of sources and include the results into the outgoing alerts. The following figure illustrates the enrichment feature.



Enrichment configuration is made up of two logical units:

- Enrichment Sources – These are data stores of contextual information.
- Enrichment Connections – These act as connectors between alert meta and source columns.

ESA allows you to make connections between Event Processing Language (EPL) statements and enrichment sources. Once the connections are established, the system joins the selected fields from the alert output with the information in the sources and uses the matching data to enrich the alert that is sent out. ESA can connect with the following sources:

- Esper Named Windows
- Relational Database tables
- MaxMindGeoIP Database
- RSA Warehouse Analytics Watchlists

Note: The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

Sample Rule with Enrichment

The following sample rule illustrates the enrichment feature provided by ESA:

```
@RSAAlert @Name("simple") SELECT * FROM CoreEvent(ec_theme='Login
Failure')
```

The rule generates an alert for every logon failure and thus if the following (simplified) event stream is received at ESA:

sessionid	ec_ theme	username	ip_src	ip_dst	host_dst
1	Login Success	dshrute	23.xx.23x.16		
2	Login Failure	jhalpert	23.xx.23x.16	31.1x.x9.1x8	www.facebook.com

An alert with the following constituent `events` might be generated in response to the second session:

```
{
     "events": [
         {
             "username": "jhalpert",
             "host_dst": "www.facebook.com",
             "ip_dst": "31.1x.x9.1x8",
             "sessionid": 2,
             "ec_theme": "Login Failure",
             "esa_time": 1406148964130,
             "ip_src": "23.xx.23x.16"
         }
     ]
 }
```

The JSON output shows all the information available for inclusion into an ESA notification using an appropriate FreeMarker
template. For instance, the template expression `${events[0].username}` would evalute to `jhalpert`.

With enrichments, the same module, with the same event stream, can generate the alert shown below. The system
can make multiple enrichment connections and pull contextual data to make the alert more meaningful.

For example:
`${events[0]["RSADataScienceLookup"][0].score}` gives the **"risk"** score of the destination domain computed by the RSA Warehouse Analytics module while `${events[0]["orgchart"][0].supervisor}` gives the name of the supervisor of the employee that the alert pertains to (pulled from an HR database) and `${events[0]["LoginRegister"][0].username}` gives the name of the user with the last successful logon from the same `ip_src` (using a stream based Named Window).

```
{"events": [
     {
         "username": "jhalpert",
         "host_dst": "www.facebook.com",
         "GeoIpLookup": [
         {
             "city": "Cambridge",
             "longitude": -71,
             "countryCode": "US",
             "areaCode": 617,
             "metroCode": 506,
             "region": "MA",
             "dmaCode": 506,
             "ipv4Obj": "/23.62.236.16",
             "countryName": "United States",
             "postalCode": "02142",
             "ipv4": "23.62.236.16",
             "latitude": 42,
             "organization": "Verizon Business"
         }
     ],
     "RSADataScienceLookup": [
         {
             "model_id": "suspiciousDomains_1",
             "_id": "EXEC_BATCH_1_20140630153740_facebook.com",
             "score": 10,
             "key": "www.facebook.com"
         }
     ],
     "orgchart": [
         {
             "supervisor": "mscott",
             "name": "James Halpert",
             "extension": 3692,

Configure a Database Connection

This topic provides information to configure a connection to an external database that can provide additional information in alerts. You configure a database connection so you can then configure the database as an enrichment source, to add further details to alerts. There are three steps in the process:

1. Configure a connection to a database.
2. Configure the external database as an enrichment source.
3. Add the enrichment source to a rule

This topic explains Step 1.

Example

This example illustrates how adding a database as an enrichment source adds value to alerts.

A rule detects users that attempt to sign up for a stealth email service. Twenty-five users match the rule criteria. Without the enrichment, the alert contains 25 User IDs. With the enrichment, the alert also includes the following information for each User ID:

- Name
- Title
- Department
- Office Location

Dependencies

When you configure a database, the following conditions apply:

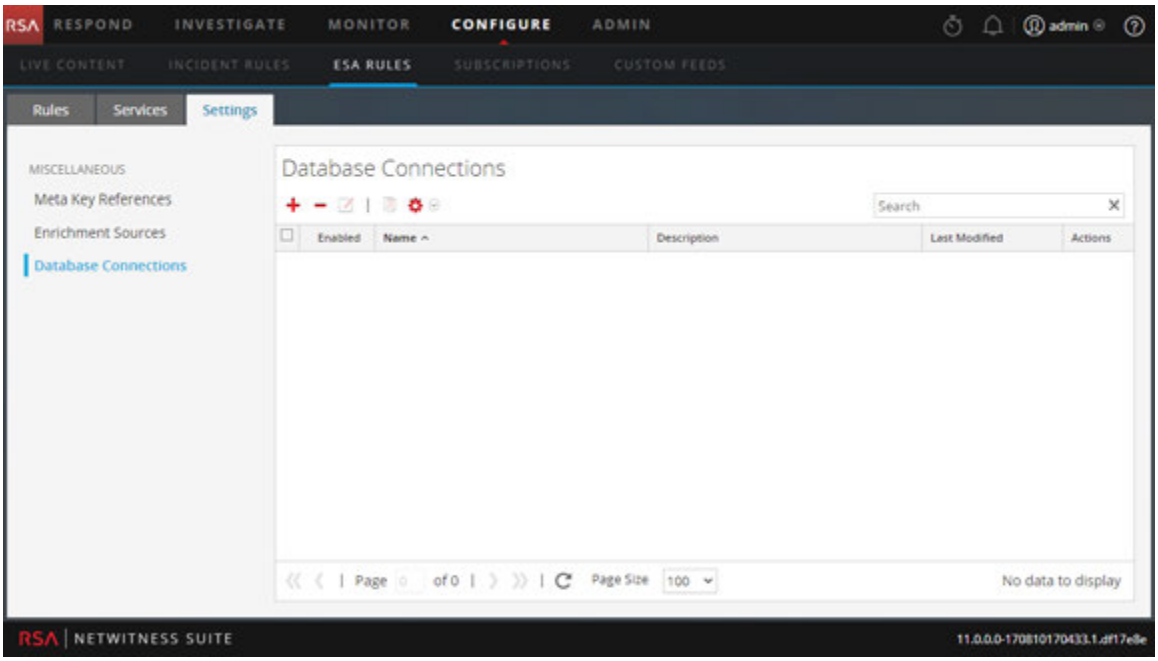
- A reference to the database is deployed on every ESA, even if the ESA does not deploy rules that use the database as an enrichment source.
- If the server that hosts the database goes down, it impacts a deployment.
  - An active deployment will continue to gather data and run rules but enrichments will not appear in alerts.
  - A new deployment will fail until you restart the host.

Procedure

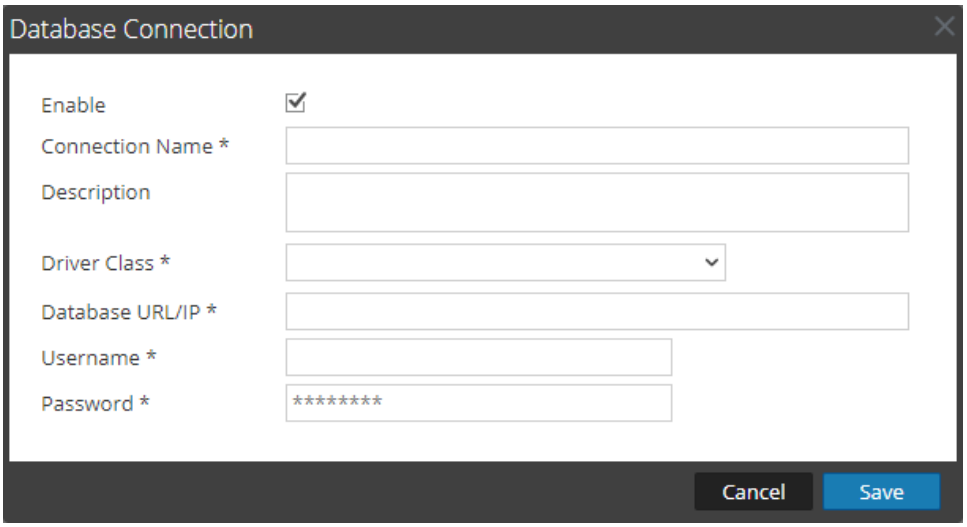
To configure a database connection:

1. Go to **CONFIGURE > ESA Rules**.
2. Click the **Settings** tab.
3. In the options panel, select **Database Connections**.

   The Database Connections panel is displayed.



4. Click + to add a database connection.



5. In the **Database Connection** dialog, provide the following information.

Field	Description
Enable	Select Enable to enrich the alert with additional data. By default, Enable is selected. Deselect Enable to exclude additional data from the alert.
Connection Name	Type a name to identify the connection. When you add a database as an enrichment source, this name appears in the list of Database Connections.
Description	(Optional) Type a brief description about the database connection.
Driver Class	Select an appropriate driver class for the database. Two drivers come with NetWitness Suite, MongoDB and Postgres.
Database URL or IP address	Type the URL or the IP address of the database to configure.
Username	Type the username to access the Database.
Password	Type the password to access the Database.

6. Click **Save**.

For related information, see Settings Tab.

Enrichment Sources

This topic explains options for adding an external data source to provide additional information in alerts. Enrichment sources provide additional information in alerts. For example, a database can provide a name, department, and office location if a user matches rule criteria. There are three types of enrichment sources:

- External DB Reference
- In-Memory Table
- Warehouse Analytics

Configure a Database as Enrichment Source

You can configure a database as an enrichment source so you can add it to a rule. Then the Esper engine that analyzes events can access the information in the database to provide additional information in the alert.

For example, a rule detects users that attempt to sign up for a stealth email service. Twenty-five users match the rule criteria. The alert contains 25 User IDs. An external database would enhance the alert by providing the following additional information for each User ID:

- Name
- Title
- Department
- Office Location
- Reports To

You can edit, duplicate, import or export a database connection.

Prerequisites

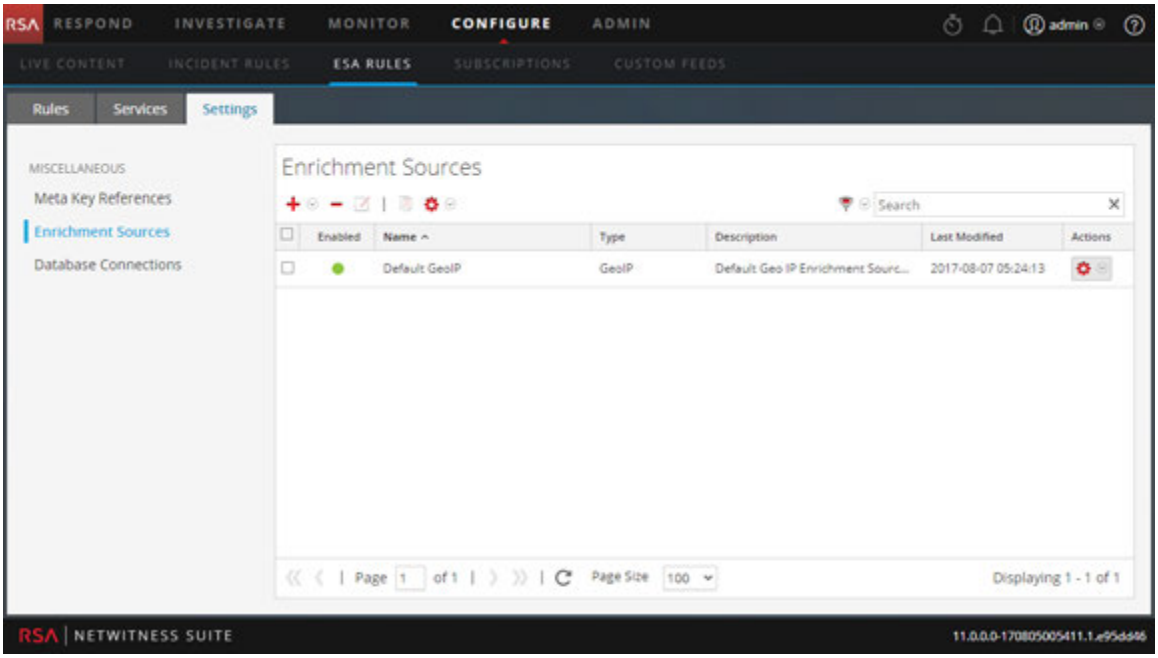
You must configure a database connection. For more information, see Configure a Database Connection.

Procedure

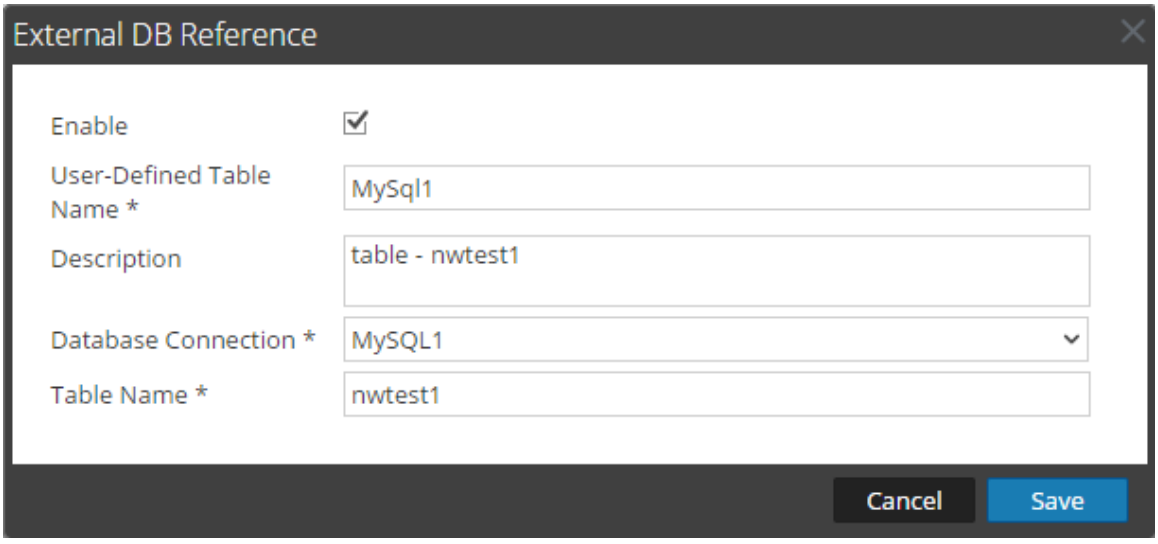
To configure database as an enrichment source:

1. Go to **CONFIGURE > ESA Rules**.
2. Click the **Settings** tab.
   The Settings tab is displayed.

3. In the options panel, select **Enrichment Sources**.
   The Enrichment Sources panel is displayed.



4. From the  drop-down menu, select **External DB Reference**. You have to add a DB reference in order for the DB to be listed.
   The External DB Reference dialog is displayed.



5. Select **Enable** to enrich alert with additional data. This is selected by default. If disabled, the alert will not be enriched with additional data.
6. In the **User-Defined Table Name** field, type a name to identify or label the database configuration.

7. In the **Description** field, type a brief description about the database configuration.
8. In the **Database Connection** drop-down menu, select the database connections defined.
9. In the **Table Name** field, enter database table name.
10. Click **Save**.

For details on parameters and their descriptions, see Settings Tab.

Configure In-Memory Table as Enrichment Source

This topic provides instructions on how to configure an in-memory table. When you configure an in-memory table, you upload a .CSV file as an input to the table. You can associate this table with a rule as an enrichment source. When the associated rule generates an alert, ESA will enrich the alert with relevant information from the in-memory table.

For example, a rule could be configured to detect when a user tries to download freeware and to identify the person by user ID in the alert. The alert could be enriched with additional information from an in-memory table that contains details such as full name, title, office location and employee number.

An in-memory table is ideal for handling lightweight data. It is easy to set up and requires less maintenance than a database. For example, the AllTech Company is a small organization so the system administrator can maintain employee information in a .CSV file. If AllTech grows into a very large company, the administrator would have to configure an external database reference as an enrichment and associate the database with a rule.

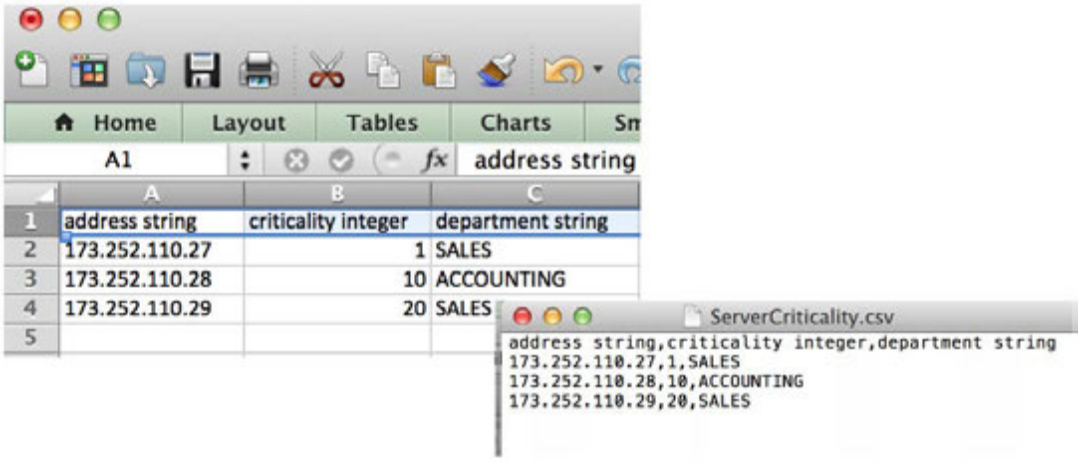
Prerequisites

The column name in the .CSV file cannot have whitespace characters.

For example *Last_Name* is correct, and *Last Name* is incorrect.

The .CSV file must begin with a header line that defines fields and types.
For example, *address string* would define the header field as *address*, and the type as *string*.

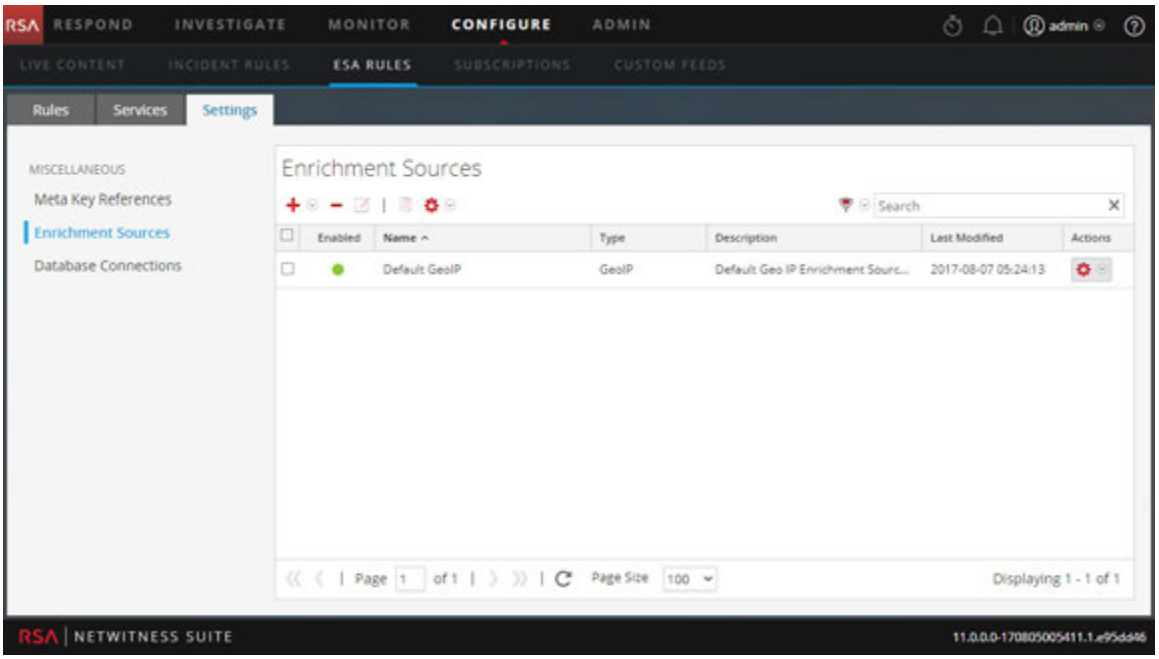
The following shows a valid .CSV file represented as a .CSV and as a table.



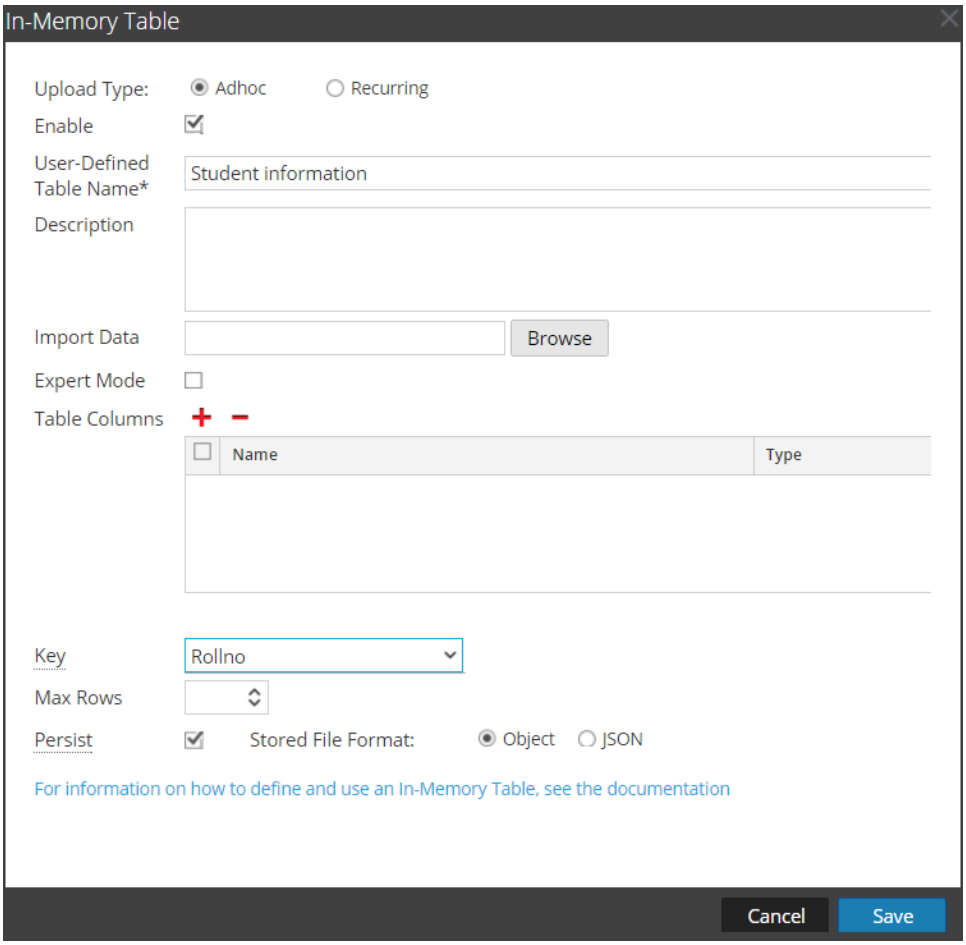
Procedures

Configure an Ad hoc In-Memory Table

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the ESA Rules tab open.
2. Click the **Settings** tab.
3. In the options panel, select **Enrichment Sources**.



4. In the **Enrichment Sources** section, click + > **In-Memory Table**.



5. Describe the in-memory table:

   a. Select **Ad hoc**.

   b. By default, **Enable** is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
   If you add an in-memory table to a rule but do not want alerts to be enriched, deselect the checkbox.

   c. In the **User-Defined Table Name** field, type a name, such as Student Information, for the in-memory table configuration.

   d. If you want to explain what the enrichment adds to an alert, type a **Description** such as:
   When an alert is grouped by Rollno, this enrichment adds student information, such as name and marks.

6. In the **Import Data** field, select the .CSV file that will feed data to the in-memory table.

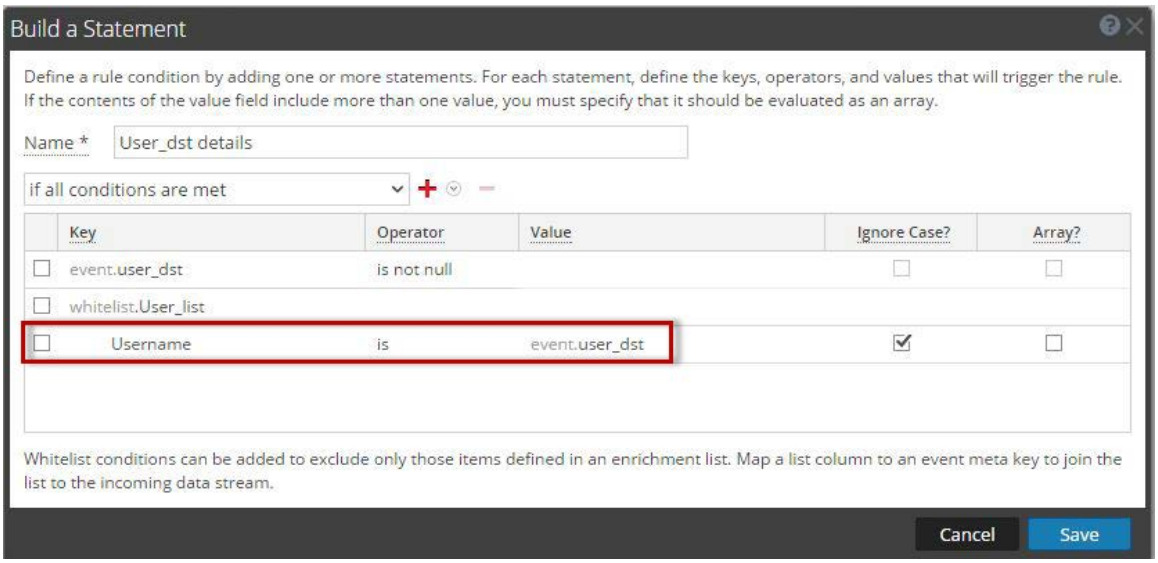
7. If you want to write an EPL query to define an advanced in-memory table configuration, select **Expert Mode**.
   The Table Columns are replaced by a **Query** field.
8. In the **Table Columns** section, click + to add columns to the in-memory table.
9. If a valid file is selected in the Import Data field, the columns populate automatically.

Note: If you selected Expert mode, a Query field is displayed instead of Table Columns.

10. In the **Key** drop-down menu, select the field to use as the default key to join incoming events with the in-memory table when using a CSV-based in-memory table as an enrichment. By default, the first column is selected. You can also later modify the key when you open the in-memory table in enrichment sources.
11. In **Max Rows** drop-down menu, select the number of maximum number of rows that can reside in the in-memory table at a particular instance.
12. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
13. In **Stored File Format** field, do one of the following:
    - Select **Object**, if you want to store the file in a binary format.
    - Select **JSON**, if you want to store the file in a text format.
      By default, **Object** is selected.
14. Click **Save**.
    The adhoc in-memory table is configured. You can add it to rule as an enrichment or part of the rule condition. See Add an Enrichment to a Rule.

When you add an in-memory table, you can add it to a rule as an enrichment or as a part of the rule condition. For example, the following rule uses an in-memory table as a part of the rule condition to create a whitelist, and it also uses an in-memory table of details in the user_dst file to enrich the alert that is displayed.

The rule shows the in-memory table as a whitelist rule condition:



Next, the alert is enriched with the User_list in-memory table:

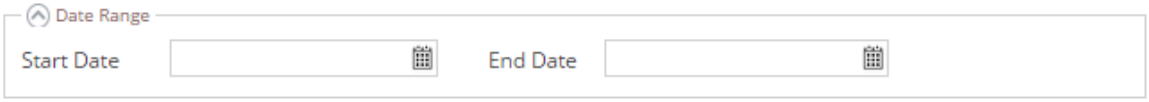
Therefore, the user_dst in-memory table is used to create a whitelist, and it is also used to enrich the data in the alert if the alert is triggered.

Add a Recurring in-Memory Table

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the ESA Rules tab open.
2. Click the **Settings** tab.
3. In the options panel, select **Enrichment Sources**.
4. Click > **In-Memory Table**.
5. Describe the in-memory table:
   a. Click **Recurring**.
   b. By default, **Enable** is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
   If you add an in-memory table to a rule but do not want alerts to be enriched, deselect the checkbox.
   c. In the **User-Defined Table Name** field, type a name, such as Student Information, for the in-memory table configuration.

d. If you want to explain what the enrichment adds to an alert, type a **Description** such as: When an alert is grouped by Rollno, this enrichment adds student information, such as name and marks.

6. Type the URL of the .CSV file that will feed data to the in-memory table. Click Verify to validate the link and populate the columns in the .CSV file. You can add or remove columns using the plus or minus button.
7. If the server is configured behind another server, select **Use Proxy**.
8. If the server requires logon credentials, select **Authenticated**
9. For **Recur Every**, indicate how frequently ESA must check for the most recent .CSV:
   a. Select Minute(s), Hour(s), Day(s), or Week.
   b. If you select Week, select a day of the week.
   c. Click **Date Range** to select a **Start Date** and **End Date** for the recurring schedule.



10. In the **Key** drop-down menu, select the field to use as the default key to join incoming events with the in-memory table when using a CSV-based in-memory table as an enrichment. By default, the first column is selected. You can also later modify the key when you open the in-memory table in enrichment sources.
11. In **Max Rows** drop-down menu, select the number of rows that can reside in the in-memory table at a particular instance.
12. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
13. In **Stored File Format** field, do one of the following:
    - Select **Object**, if you want to store the file in a binary format.
    - Select **JSON**, if you want to store the file in a text format.
      By default, **Object** is selected.
14. Click **Save**.
    The recurring in-memory table is configured. You can add it to rule as an enrichment or part of the rule condition. See Add an Enrichment to a Rule.

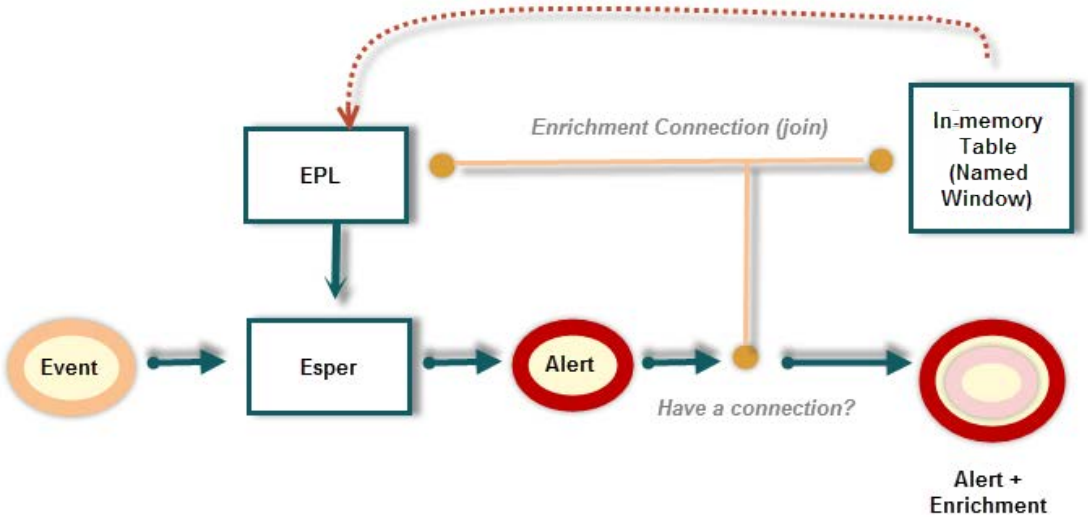
Configuring an Esper Query as an Enrichment Source

When you use "expert mode," you can create an enrichment source or named window based on an Esper query. This allows you to have more control over the content and create more dynamic content. When you do this, an EPL query constructs the named window to capture interesting state from event stream.

Workflow

The following shows the workflow for creating a query using a named window:

1. The event is sent to the Esper Engine.
2. An EPL query is generated.
3. An alert is triggered.
4. The query checks to see if there is a connection between the event and the Named Window.
5. If there is a connection, the query that populates the Named Window is run and populated.
6. The content from the Named Window is added to the alert content and sent or displayed (depending on your settings).



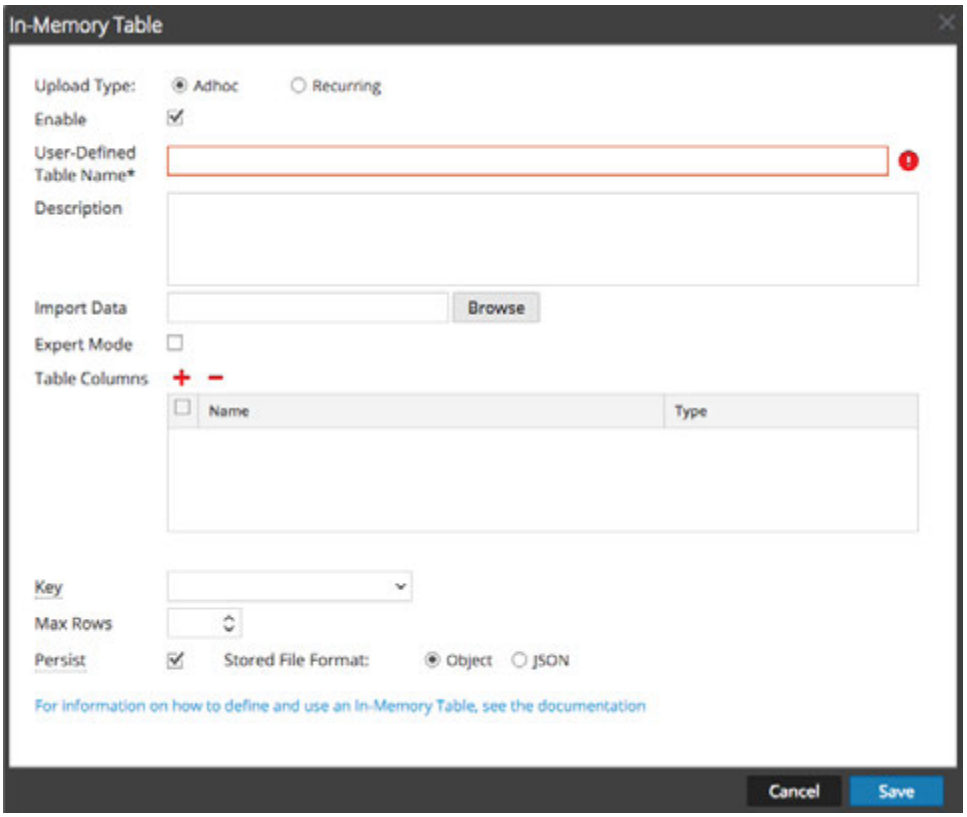
Prerequisites

- The meta used in the EPL statement must exist in the data.
- You must create well-formed EPL statements.

Procedure

Configure an In-Memory Table Using an EPL Query

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the Rules tab open.
2. Click the **Settings** tab.
3. In the options panel, select **Enrichment Sources**.
4. In the **Enrichment Sources** section, click + > **In-Memory Table**.



5. Select **Adhoc**.
   By default, Enable is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
6. In the **User-Defined Table Name** field, type a descriptive name to describe the in-memory table.
7. If you want to explain what the enrichment adds to an alert, enter information in the **Description** field.
   This description displays when you view the list of enrichments from the Enrichment Sources

view, so it's a good idea to enter a thorough description as a best practice. Doing this allows other users to understand the content of the enrichment without opening it to examine its contents.

8. Select **Expert Mode** to define an advanced in-memory table configuration by writing an EPL query.
   The Table Columns are replaced by a **Query** field.
9. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
10. Enter the EPL query in the **Query** field. The query should be well-formed, and it's a good idea to test it before entering it in the field.
11. Click **Save**.

Example

For example, you created a rule that searches for five failed attempted logins followed by a successful login. When that rule is triggered, you may want the notification to contain information about the last user logged into the system when this successful login occurred. To add this enrichment to the notification, you might choose to create a stream-based in-memory lookup table that is populated from incoming events to maintain a mapping of IP addresses to the last user logged in from that address. To do this, you create an enrichment using a query as your source.

Step 1: Create Your Rule

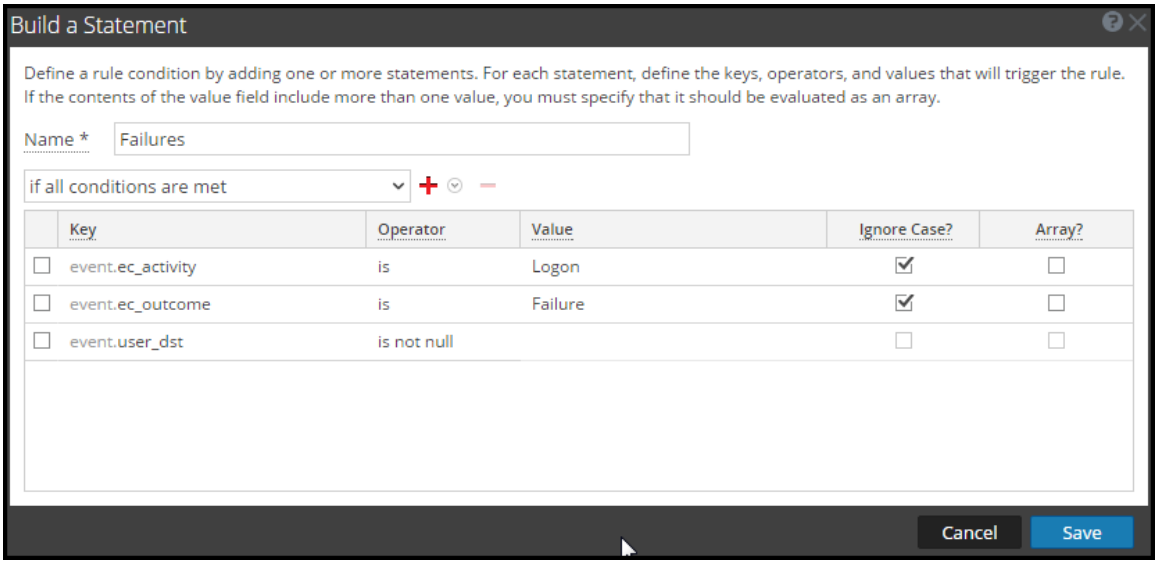
First, you need to create your correlation rule. In this case, you create failure and success rule conditions, and group by the ip_src.

Rule Condition	Description
Failures	This condition searches for five failed logins with a "followed by" connector, meaning that the condition (Failures) must be followed by the next condition (Success).
Success	This condition searches for one successful login.

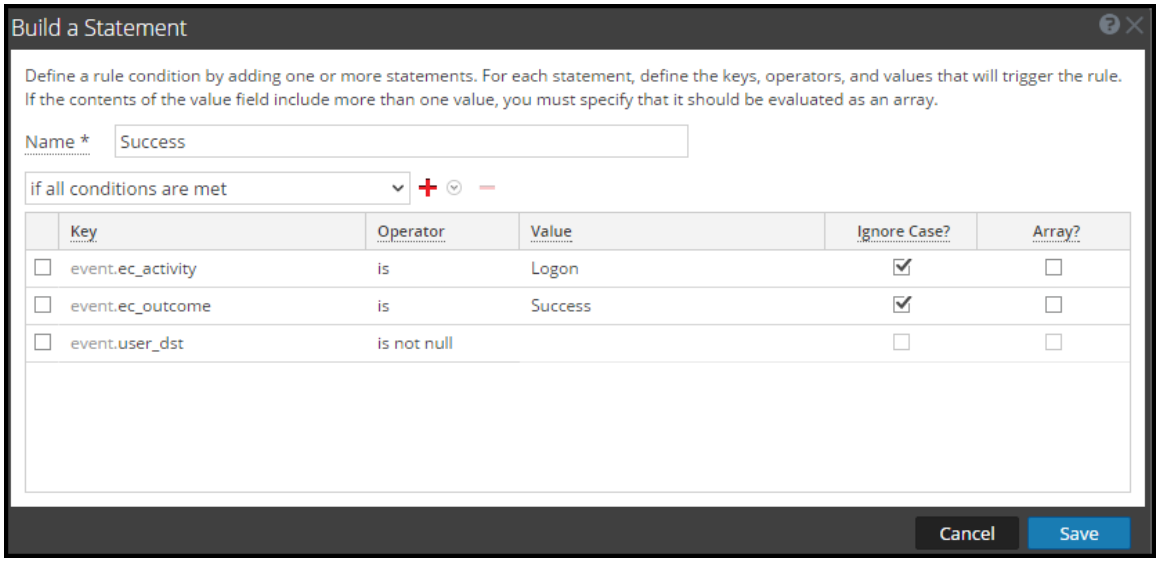
Rule Condition	Description
GroupBy: ip_src, device class	The GroupBy field ensures that all the previous conditions are grouped by the ip_srcand device class. This is important to the construction of the rule because the rule attempts to find a case where a user has attempted to log into the same destination account multiple times, and finally logged in successfully. Grouping by device class ensures that the user logged in from the same machine attempted to log into an account multiple times. The rule may give unexpected results if you do not group the results.
Occurs within 5 minutes	The time window for the events to occur is five minutes. If the events occur outside of this time window, the rule does not trigger.
Event Sequence: Strict	The event sequence is configured for a strict pattern match. This means that the pattern must match exactly as it is specifiedwith no intervening events.

For the rule conditions, you create the following statements:

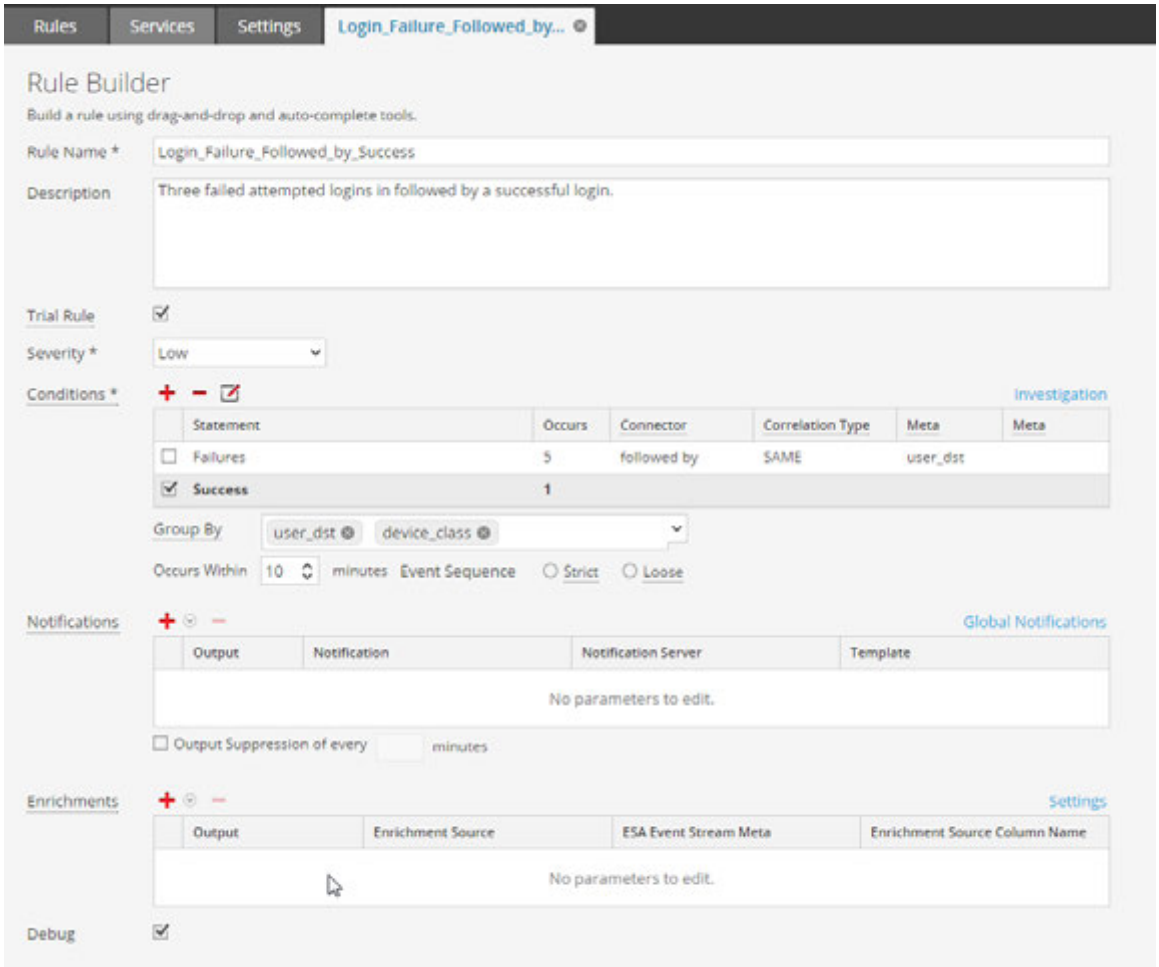
- The "Failures" statement searches for failed login attempts:



- The "Success" statement searches for one successful login:



- Combined, you have the following correlation rule:



Step 2: Create the Enrichment

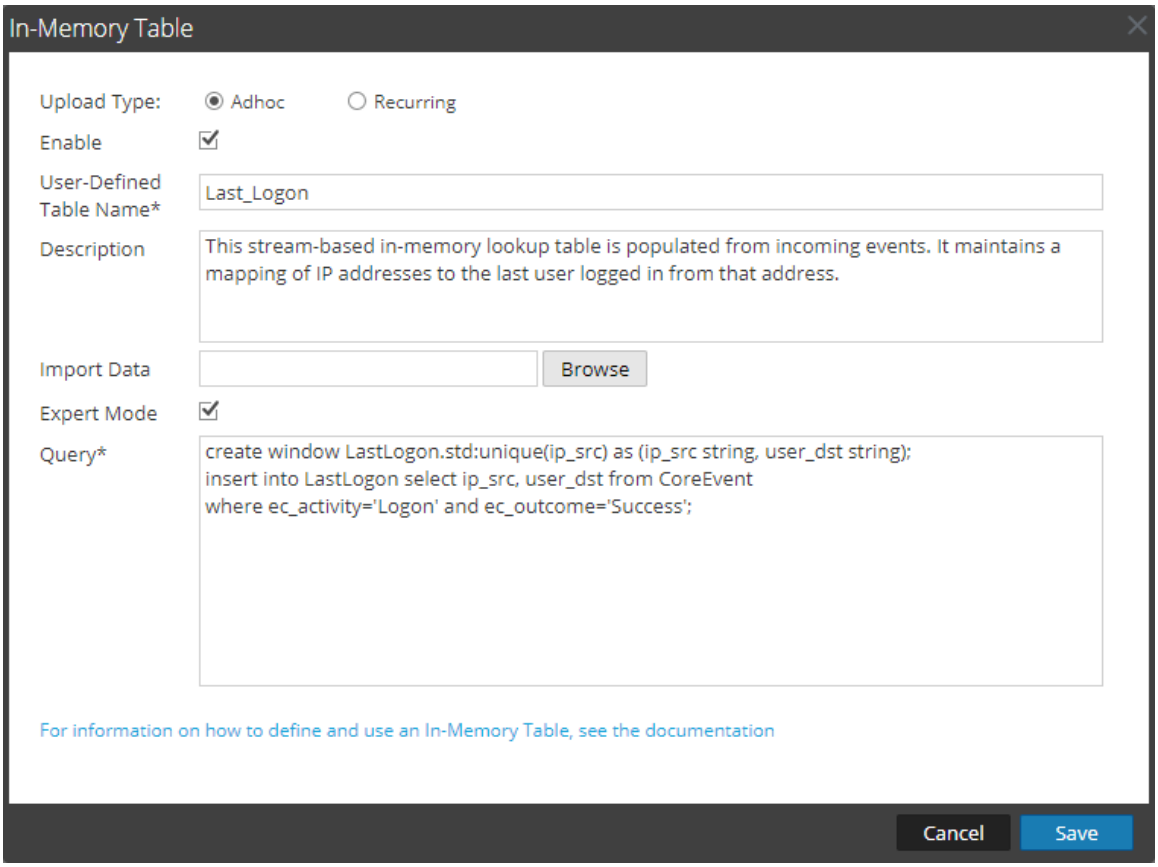
Now that you have created your rule, you need to create the enrichment to add to the notification output. Follow the steps above to create the enrichment, name it *Last_Logon*, and add the following query:

```
create window LastLogon.std:unique(ip_src) as (ip_src string, user_dst string);

insert into LastLogon select ip_src, user_dst from CoreEvent

where ec_activity='Logon' and ec_outcome='Success';
```

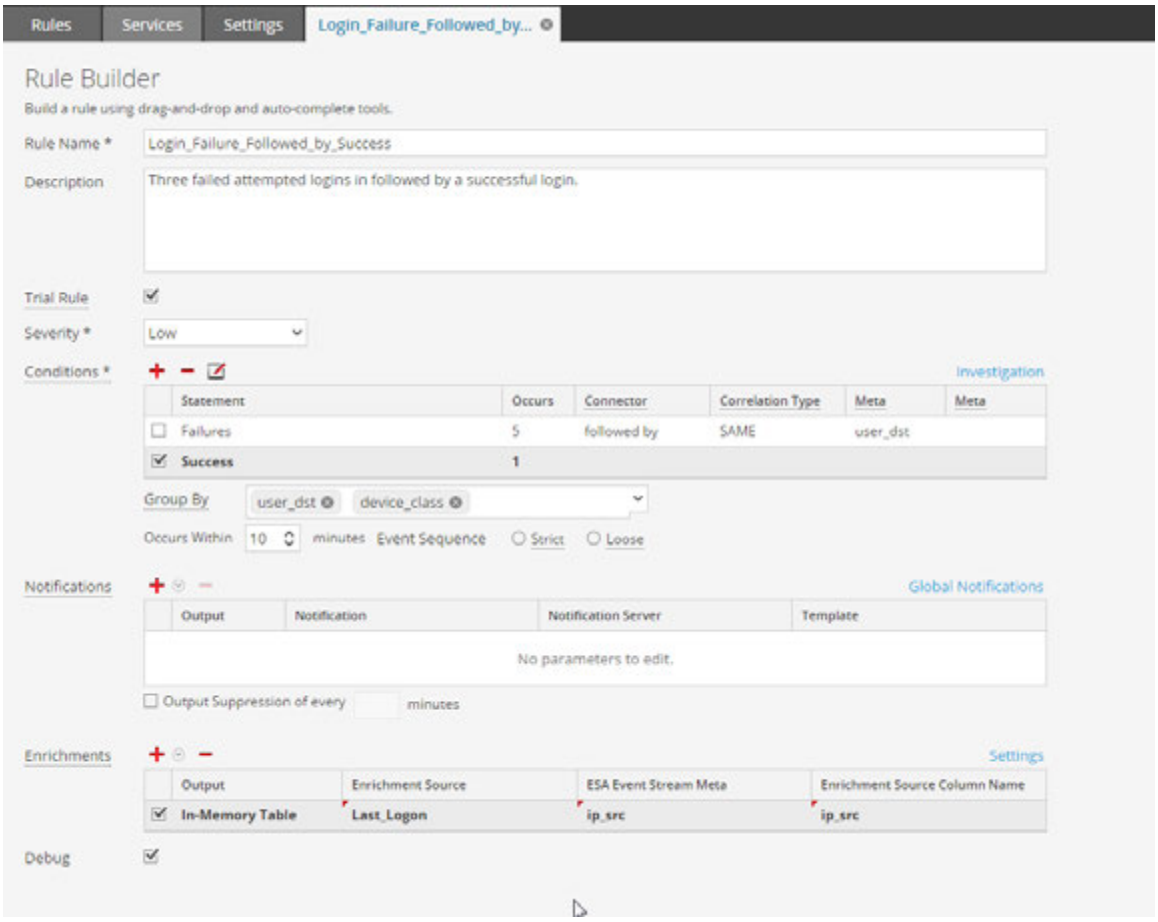
The enrichment should look like the following:



Step 3: Add the Enrichment to the Rule

Now that you have created your basic rule and your enrichment, you'll need to add the enrichment to the rule and join (or connect) the enrichment to the meta in the rule.

Open the Login_Failure_Followed_by_Success rule for editing.



Field	Enter	Description
Output	In-Memory Table	The In Memory Table option creates a Named Window, which can be populated with the EPL query data.
Enrichment Source	Last_Logon (the enrichment you created above).	This is the stream-based in-memory lookup table that is populated from incoming events to maintain a mapping of IP addresses to the last user logged in from that address.
ESA Event Stream Meta	ip_src	This is an event stream meta that you can join to the enrichment data you are populating. Essentially, ip_src is the join condition .
Enrichment Source Column Name	ip_src	This is the meta from the enrichment that you can join to the event stream data. It must be the same as join condition from the Event Stream Meta field.

Once you have added the enrichment, you can save the rule.

When the rule is triggered, the ESA runs the query in the enrichment and populates the Named Window with the data. If the data in the Named Window matches the join condition, the data is added to the output you can view in Email, SNMP, Syslog or Script, depending on how you configured notifications.

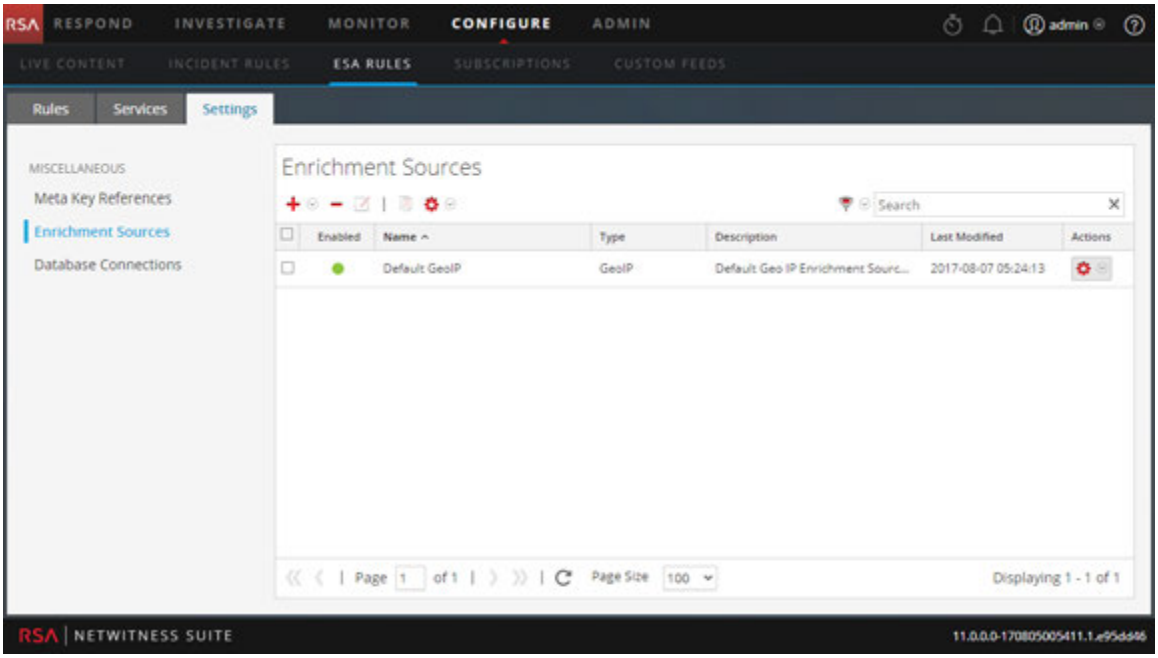
Configure Warehouse Analytics as an Enrichment Source

This topic provides instructions on how to configure RSA Warehouse Analytics as an enrichment source for ESA. Data analysts can leverage Warehouse Analytics data to analyze session and log data.

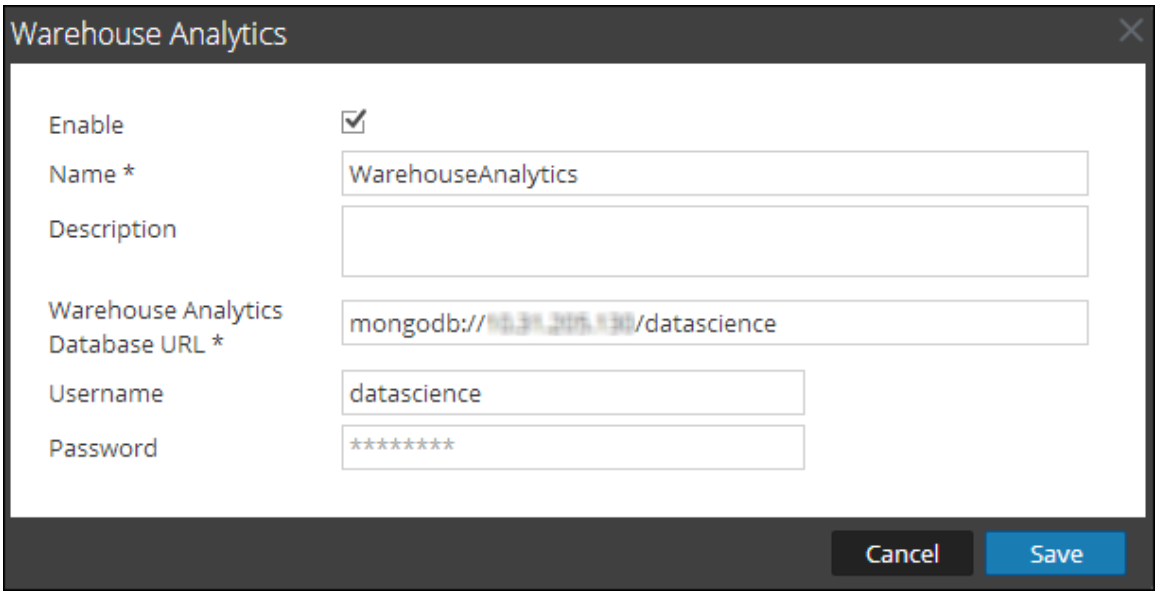
To configure Warehouse Analytics as an enrichment source:

1. Go to **CONFIGURE > ESA Rules > Settings** tab.
2. In the options panel, select **Enrichment Sources**.

   The Enrichment Sources panel is displayed.



3. From the + drop-down menu, select **Warehouse Analytics**.



4. Select **Enable** to enrich alerts with additional data. This is selected by default. If disabled, the alerts will not be enriched with additional data.
5. In the **Name** field, type a name to identify or label the Warehouse Analytics configuration.
6. In the **Description** field, type a brief description about the Warehouse Analytics configuration.
7. In the **Warehouse Analytics Database URL** field, type theMongoDb URL to the Warehouse Analytics database.
8. In the **Username** field, type the username to access the MongoDB.
9. In the **Password** field, type the password to access the MongoDB.
10. Click **Save**.

For more information, see Settings Tab.

Add an Enrichment to a Rule

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Adding an enrichment to a rule allows you to request for look ups into a variety of sources and include the results in the outgoing alerts, giving you a more detailed alert. This procedure requires role permissions for Administrator, DPO, and SOC Manager.

Procedure

To add an enrichment to a rule:

1. Go to **CONFIGURE > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   - Double-click a rule.
   - Select a rule and click  in the **Rule Library** toolbar.

   The Rule Builder panel is displayed in a new NetWitness Suite tab.
3. In the **Enrichments** section, click  and select any of the following enrichment types:
   - In-Memory Table
   - External DB Reference
   - Warehouse Analytics
   - GeoIP

   Note: If you us a GeoIP source, ipv4 is automatically populated, and is not editable.

   The enrichment types that you have selected are displayed in the table.
4. For the added enrichment type, perform the following:
   - In the **Output** column, select the type that you have configured.
   - In the **Enrichment Source** drop-down list, select the enrichment source defined.
   - In the **ESA Event Stream Meta** field, type the event stream meta key whose value will be used as one operand of join condition.

   - In the **Enrichment Source Column Name** field, type the enrichment source column name whose value will be used as another operand of the join condition.
5. Select **Debug**. This will add a @Audit('stream') annotation to the rule. This is useful when debugging the esper rules.
6. Click **Show Syntax** to test if the defined ESA rule is valid.
7. Click **Save**.

For details on parameters and their descriptions, see Rule Builder Tab.

Deploy Rules to Run on ESA

This topic explains how to select an ESA and the rules to run on it. Administrator, SOC Manager or DPO role permissions are required for all tasks in this section.

To create a deployment, you need to perform the steps described in Deployment Steps

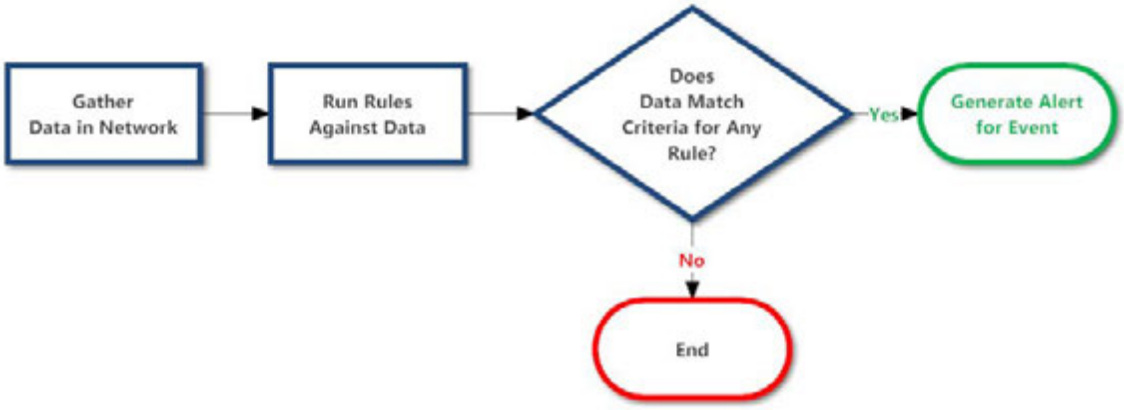
How Deployment Works

A deployment consists of an ESA service and a set of ESA rules. When you deploy rules, the ESA service runs them to detect suspicious or undesirable activity in your network. Each ESA rule detects a different event, such as when a user account is created and deleted within one hour.

The ESA service performs the following functions:

1. Gathers **data** in your network
2. Runs ESA **rules** against the data
3. Applies rule **criteria** to data
4. Generates an **alert** for the captured event

The following graphic shows this workflow:



In addition, you may want to perform other steps on your deployment, such as deleting an ESA service in your deployment, editing or deleting a rule from your deployment, editing or deleting a deployment, or showing updates to a deployment. For descriptions of these procedures, see Additional Deployment Procedures

Deployment Steps

This topic explains how to add a deployment, which includes an ESA service and a set of ESA rules. You can add a deployment to organize and manage ESA services and rules. Think of the deployment as a container for both components:

1. An ESA service
2. A set of ESA rules

For example, if you add a Spam Activity deployment it could include ESA London and a set of ESA rules to detect suspicious email activity.

To add a deployment, you need to complete the following procedures:

- Step 1. Add a Deployment
- Step 2. Add an ESA Service
- Step 3. Add and Deploy Rules

Step 1. Add a Deployment

Prerequisites

The following are required to add a deployment:

- The ESA service must be configured on the host. See "Configure ESA" in the *Event Stream Analysis (ESA) Configuration Guide*.
- Rules must be in the Rule Library. See Add Rules to the Rule Library.

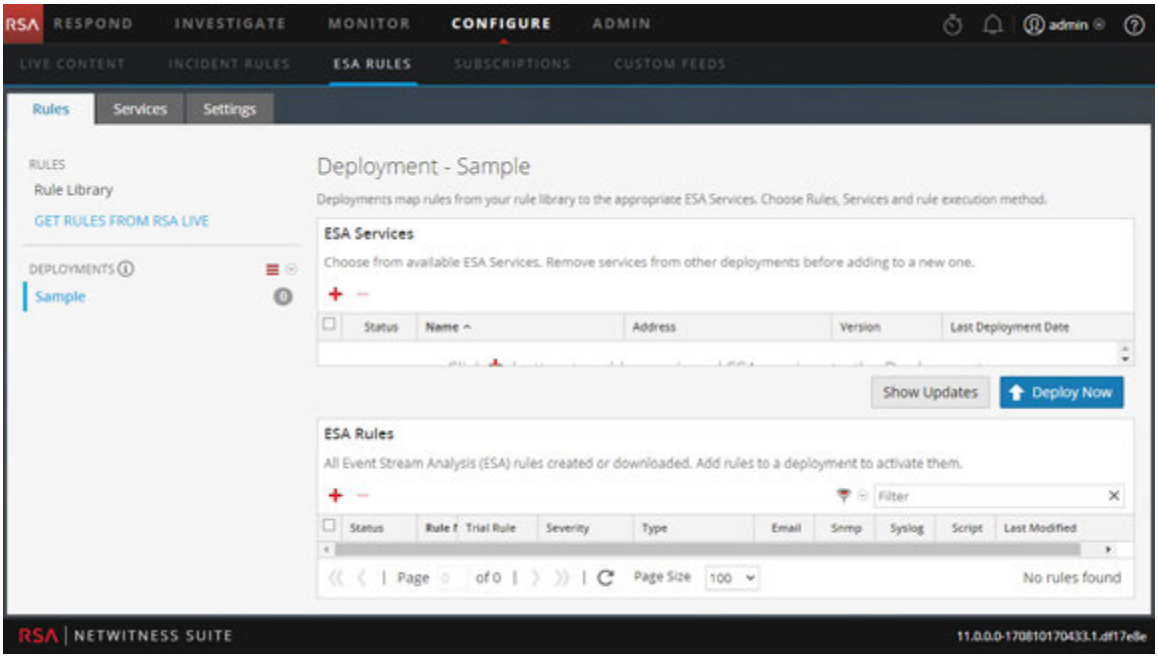
Procedure

To add a deployment:

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed.

2. In the options panel, next to Deployments, select  > **Add**.

   The Deployment view is displayed on the right.

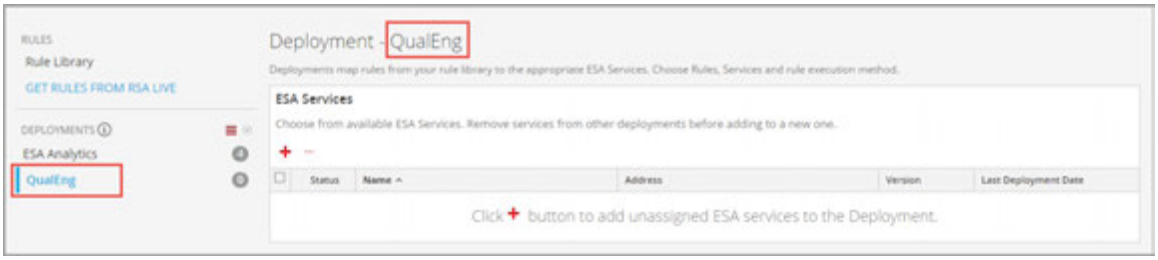


3. In the options panel, type a **name** for the deployment. The naming convention is up to you.

   For example, it could indicate the purpose or identify an owner.

4. Press **Enter**.

   The deployment is added.



Step 2. Add an ESA Service

The ESA service in a deployment gathers data in your network and runs ESA rules against the data. The goal is to capture events that match rule criteria, then generate an alert for the captured event.

You can add the same ESA to multiple deployments. For example, ESA London could be in the these deployments simultaneously:

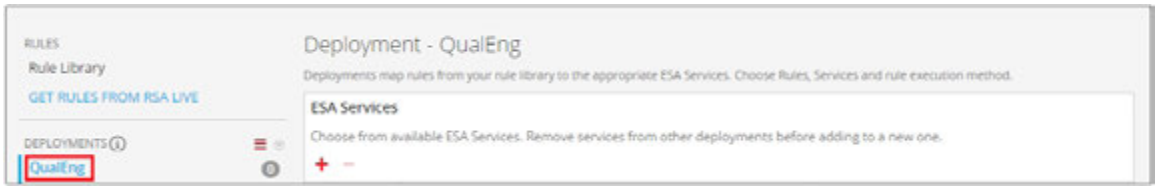
- Deployment EUR, which includes one set of ESA rules
- Deployment CORP, which includes another set of ESA rules

When you remove an ESA from a deployment, the rules are also removed from the ESA. For example, Deployment EUR could include ESA London and a set of 25 rules. If you remove ESA London from Deployment EUR, the 25 rules are also removed from ESA London. Consequently, if an ESA is not part of any deployment the ESA does not have any rules.

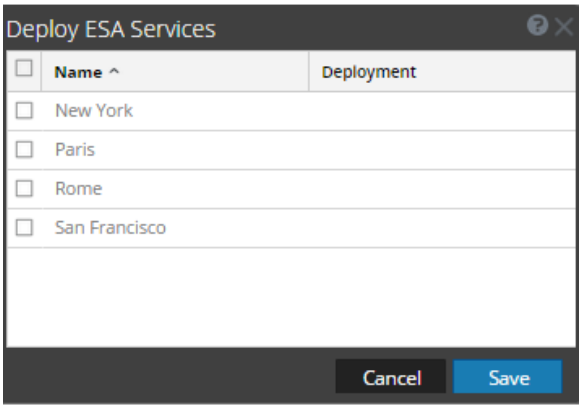
Procedure

To add an ESA service:

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed.
2. In the options panel, select a **deployment**:



3. In the **Deployment** view, click + in **ESA Services**.
   The Deploy ESA Services dialog lists each configured ESA.



4. Select an ESA and click **Save**.
   The Deployment view is displayed. The ESA is listed in the **ESA Services** section, with the status Added.

Step 3. Add and Deploy Rules

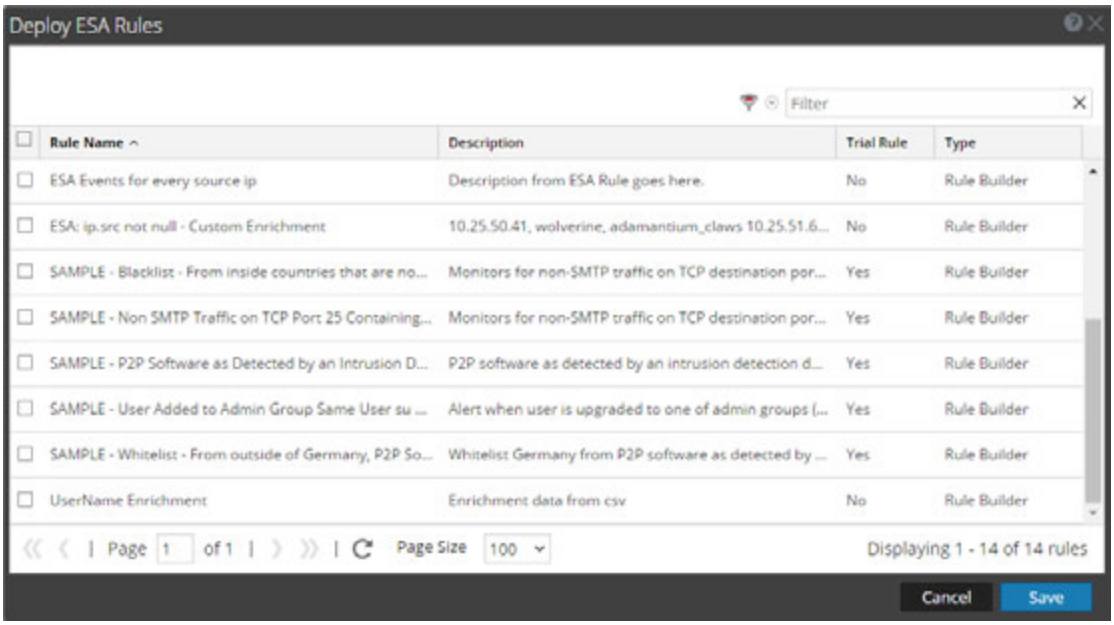
This topic explains how to add ESA rules to a deployment and then deploy the rules on ESA. Each ESA rule has unique criteria. The ESA rules in a deployment determine which events ESA captures, which in turn determine the alerts you receive.

For example, Deployment A includes ESA Paris and, among others, a rule to detect file transfer using a non-standard port. When ESA Paris detects a file transfer that matches the rule criteria, it captures the event and generates an alert for it. If you remove this rule from Deployment A, ESA will no longer generate an alert for such an occurrence.

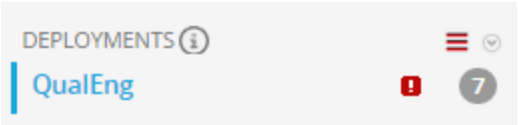
Procedure

To add and deploy rules:

1. Go to **Configure > ESA Rules**.
   The Rules tab is displayed.
2. In the options panel, select a deployment.
3. In the **Deployment** view, click + in **ESA Rules**.
   The Deploy ESA Rules dialog is displayed and shows each rule in your Rule Library:



4. Select rules and click **Save**.
   The Deployment view is displayed.
5. The rules are listed in the ESA Rules section.
   - In the Status column, **Added** is next to each new rule.
   - In the Deployments section, ! indicates there are updates to the deployment.
   - The total number of rules in the deployment is on the right.



6. Click **Deploy Now**.
   The ESA service runs the rule set.

Additional Deployment Procedures

In addition to deploying an ESA service and rules, you may want to perform other steps on your deployment, such as deleting an ESA service in your deployment, editing or deleting a rule from your deployment, editing or deleting a deployment, or showing updates to a deployment.

To perform these procedures, go to:

- Delete ESA Service in a Deployment
- Edit or Delete Rule in a Deployment
- Edit or Delete a Deployment
- Show Updates to a Deployment

Delete ESA Service in a Deployment

This topic provides instructions to delete an ESA service in a deployment. On a deployment with a service, you can edit the rules which are applied to the service and delete the service from the deployment.

Each of the following procedures starts in the Rules tab.

Procedure

To delete an ESA service:

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the options panel, under **Deployments**, select a deployment.
3. In the **ESA Services** panel, select a service and click in the toolbar.
   A confirmation dialog is displayed.
4. Click **Yes**.
   The service is deleted.

Edit or Delete Rule in a Deployment

On a deployment with rules, you can edit and delete rules to customize the deployment. Each of the following procedures starts in the Rules tab.

Procedures

Edit a Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the options panel, under Deployments, select a deployment.
3. In the **ESA Rules** panel, double-click a rule to open it in a new tab.
4. Modify the rule, then click **Apply**.
   The rule is saved.

Delete a Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the options panel, under **Deployments**, select a deployment.
3. In the **ESA Rules** panel, select a rule and click in the toolbar.
   A confirmation dialog is displayed.
4. Click **Yes**.
   The rule is deleted.

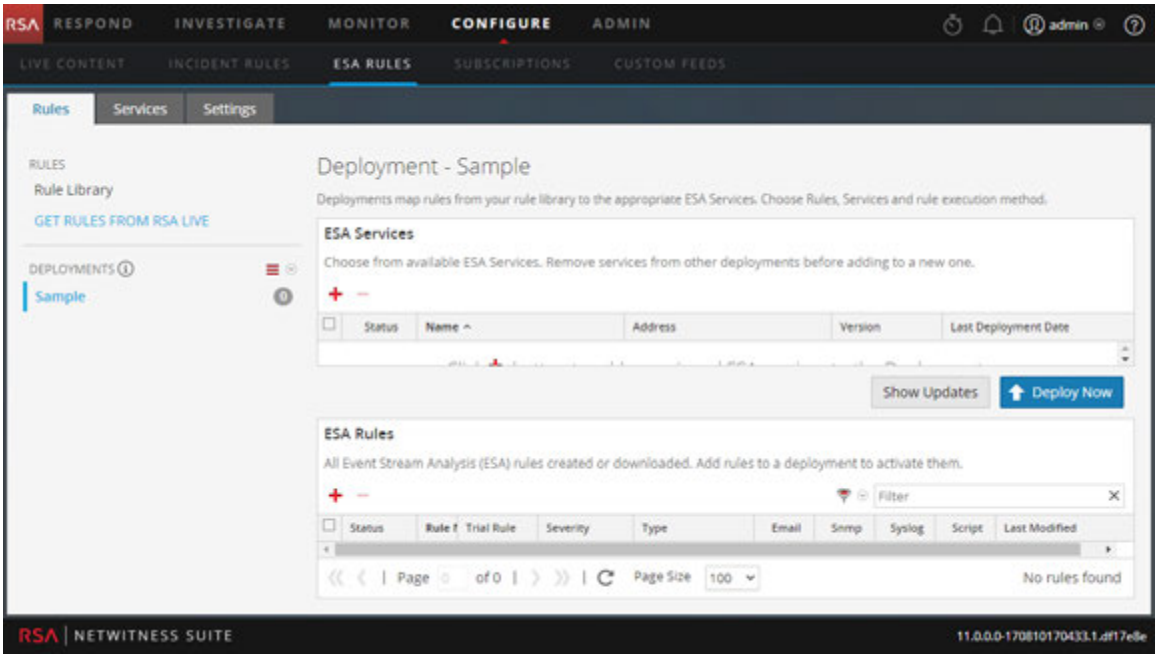
Edit or Delete a Deployment

This topic explains how NetWitness Suite forwards a correlation rule to each ESA service in a correlation group. In a correlation group, each ESA service must run the same set of rules. When you add a rule to a correlation group, NetWitness Suite forwards the rule to each ESA in the group.

To access the deployments:

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the Rules tab open.
2. In the options panel, under **Deployments**, select a deployment.

The Deployment view is displayed.



Edit a Deployment

1. In the options panel, under **Deployments**, select a deployment.

   The Deployment view is displayed.

2. Select > **Edit**.

   The deployment name is made available for editing.

Delete a Deployment

1. In the options panel, under **Deployments**, select a deployment.

   The Deployment view is displayed.

2. Select > **Delete**.

   A confirmation dialog is displayed.

3. Click **Yes**.

   The deployment is deleted.

Show Updates to a Deployment

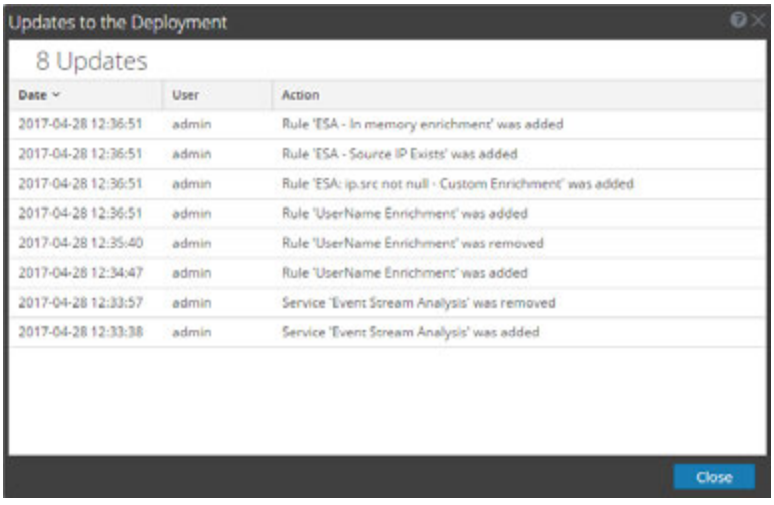
This topic explains how to show updates, such as adding or deleting rules, to a deployment. When you make a change to a deployment, the update icon ( ) appears next to the name of the deployment.

Procedure

To show the updates to a deployment:

1. Go to **CONFIGURE > ESA Rules.**
   The Rules tab is displayed.
2. In the options panel, under **Deployments** click **Show Updates** on the far right.

   The Updates to the Deployments dialog opens and shows the changes to the deployment.



3. Click **Close**.

View ESA Stats and Alerts

When the ESA generates alerts, you can view details about how the rules performed, such as statistics on the engine, rule, and alert, and you can also view information on which rules are enabled or disabled. For instructions on viewing ESA stats, see View Stats for ESA Service

When your ESA generates alerts, you can view the results in the Alerts Summary page. This enables you to see trends and understand both the volume and frequency of alerts. For instructions on viewing alerts, see View a Summary of Alerts

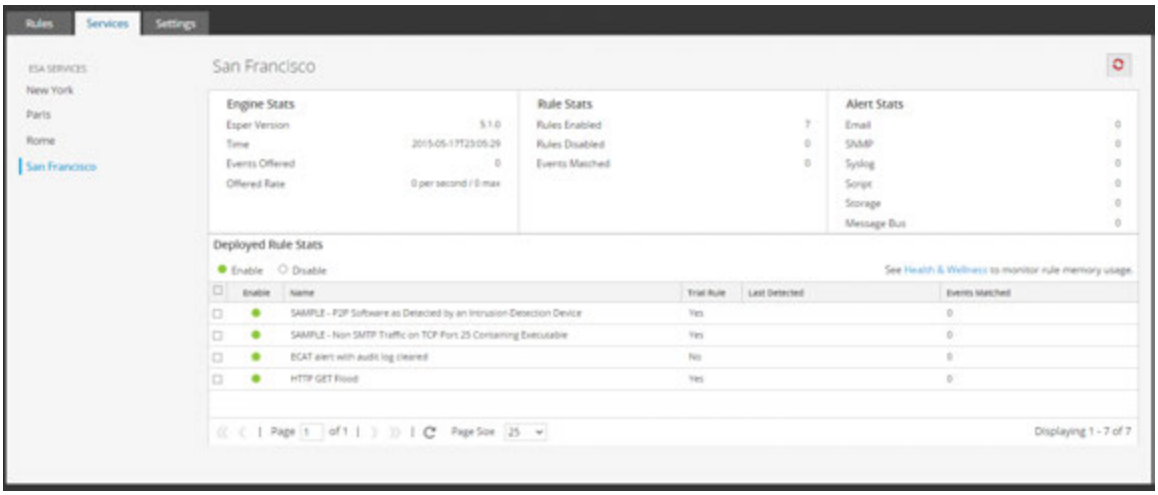
View Stats for ESA Service

This topic describes how to view the deployment stats for an ESA service. This procedure is useful when you are attempting to determine the effectiveness of a rule or troubleshoot a deployment.

Procedures

View ESA Stats

1. Go to **CONFIGURE > ESA Rules > Services** tab.
2. From the **ESA Services** list on the left, select a service.
   The deployment stats for the selected service are displayed.



3. Review the following sections of ESA stats.
   For a complete description of each statistic in each section, see Services Tab.

- **Engine Stats**
- **Rule Stats**
- **Alert Stats**

4. In the Deployed Rule Stats, review details about the rules deployed on the ESA.
   For a complete description of each column in each section, see Services Tab.
   - If the rule is enabled or disabled
   - What the rule name is
   - If the rule is running in Trial Rule mode
   - Last detected
   - Events matched
5. To get a snapshot of the rule memory, click **Health & Wellness**.

Enable or Disable Rules

1. In the **Deployed Rule Stats** panel, select a rule from the grid.
2. Click Enable to enable the rule, or click Disable to disable the rule.
   The Services tab is refreshed to show the changes, which take effect immediately.

Refresh the Statistics

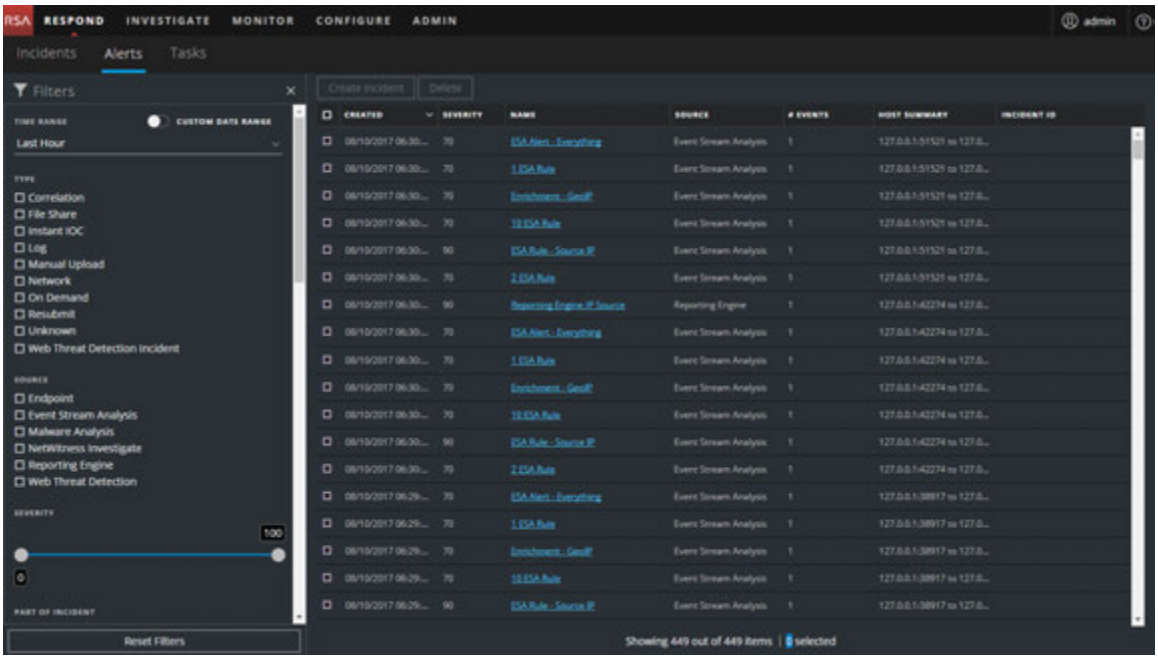
The Services tab does not update statistics automatically unless you enable or disable a rule. To ensure you view current statistics:

1. Click in the upper right corner to refresh the information.
2. View the updated information.

View a Summary of Alerts

In the RESPOND view, you can browse through various alerts from multiple sources. You can filter the alerts list to show only alerts of interest, such as by Alert Name, alert source, and a specific time range.

1. Go to **RESPOND > Alerts**.
   The Respond Alerts List view displays a list of all NetWitness Suite alerts.



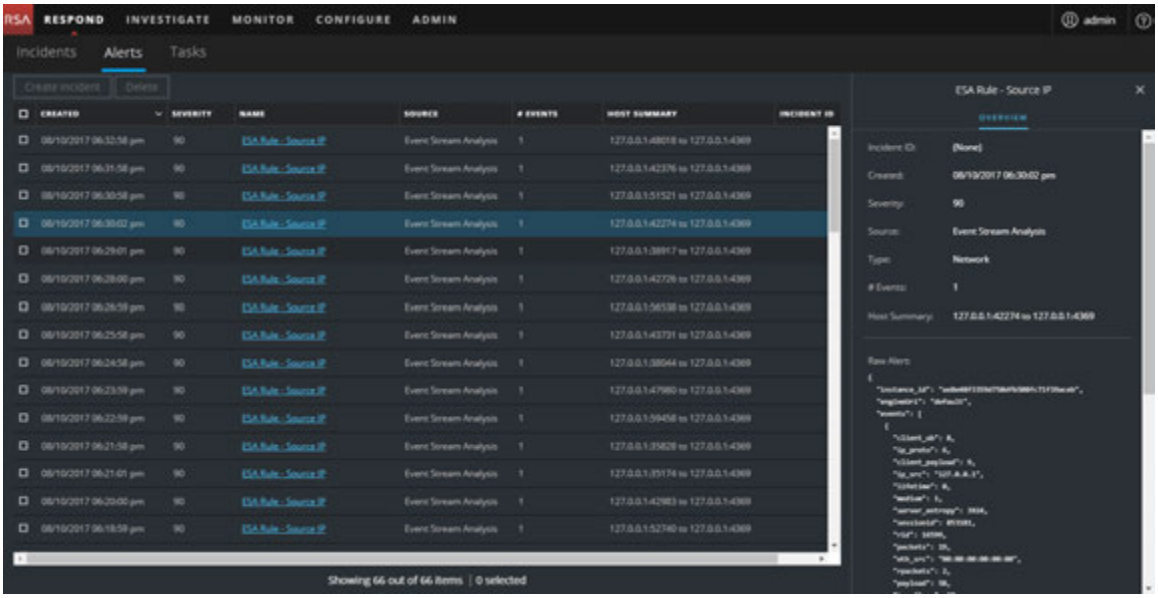
2. In the **Filters** panel on the left, you can filter the alerts list to view specific alerts for a specific time frame. For example, in the ALERT NAMES section, you can select an alert for an ESA rule, such as ESA Rule - Source IP, and leave the TIME FRAME set to Last Hour.

   The alerts list to the right shows a list of alerts that match your filter selection along with a count of the alerts at the bottom of the alerts list.

   The alerts list shows information about each of the alerts.

- **Created**: Displays the date and time when the alert was created in the source system.
- **Severity**: Displays the level of severity of the alert. The values are from 1 to 100.
- **Name**: Displays a basic description of the alert.
- **Source**: Displays the original source of the alert.
- **# of Events**: Indicates the number of events contained within an alert.
- **Host Summary**: Displays details of the host, like the host name from where the alert was triggered.
- **Incident ID**: Shows the incident ID of the alert. If there is no incident ID, the alert does not belong to an incident.

3. You can click on an alert in the list to open an **Overview** panel on the right where you can view raw alert metadata.



For more information about filtering alerts and viewing alert details, see the *NetWitness Respond User Guide*.

ESA Alert References

In the Alerts module, you configure and deploy ESA rules to get alerted about potential network threats.

These topics explain the user interface in the Alerts module.

New Advanced EPL Rule Tab

The Advanced EPL Rule tab enables you to define rule criteria with an Event Processing Language (EPL) query.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Define an Advanced EPL rule.	Add an Advanced EPL Rule
Content Expert	See examples of an Advanced EPL Rule.	Sample Advanced EPL Rules

Related Topics

- Add a Rule Builder Rule
- Enrichment Sources

Advanced EPL Rule

To access the Advanced EPL Rule tab:

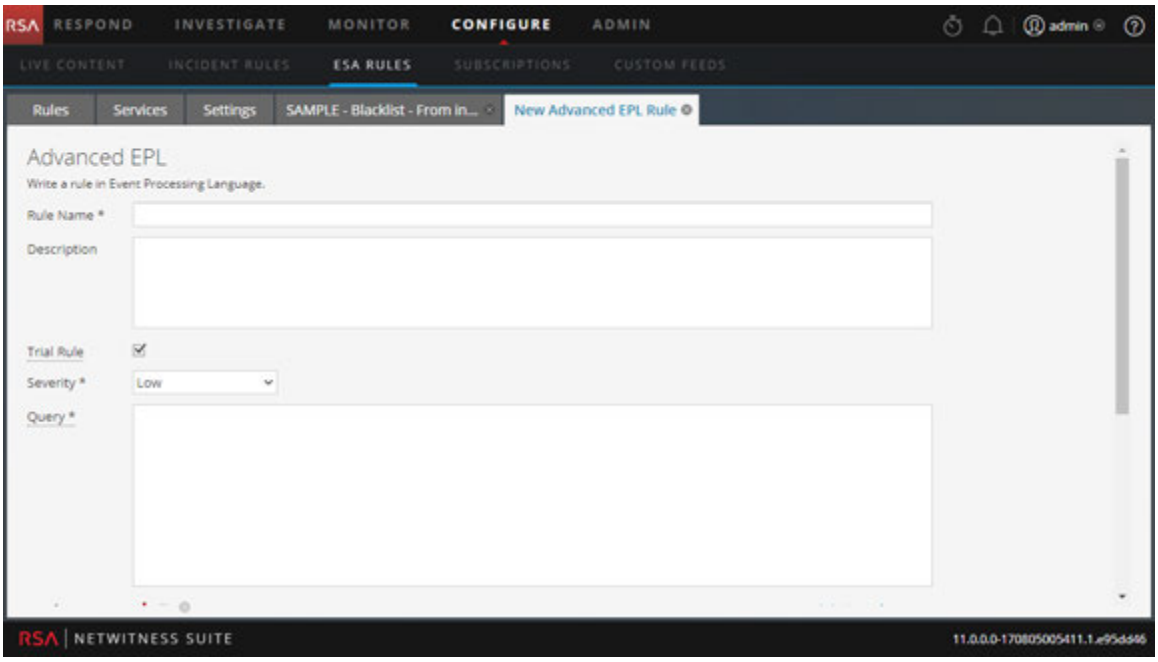
1. Go to **CONFIGURE > ESA Rules**.

   The Configure view is displayed with the Rules tab open by default.

2. In the **Rule Library** toolbar, select  **> Advanced EPL**.

   The Advanced EPL Rule tab is displayed.

Below is a screen shot of the Advanced EPL Rule tab.



The following table lists the parameters in the Advanced EPL Rule tab.

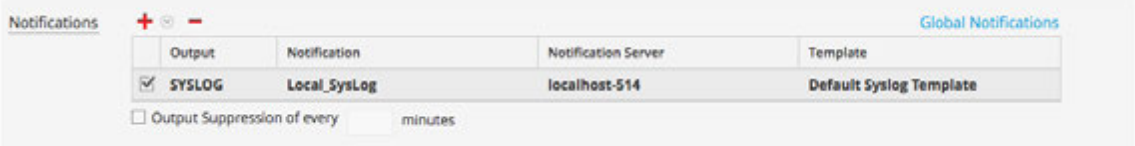
Parameters	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Severity	Threat level of alert triggered by the rule.
Query	EPL query that defines rule criteria.

Notifications

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.



Parameter	Description
+	To add an alert notification type.
−	To delete the selected alert notification type.
Output	Alert notification type. Options are: • Email • SNMP • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

Enrichments

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.
The following figure shows the Enrichments section.

Parameter	Description
+	To add an enrichment.

Parameter	Description
	To delete the selected enrichment.
Output	Enrichment source type. Options are: • In-Memory Table • External DB Reference • Warehouse Analytics • GeoIP
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition.

Build a Statement Dialog

The Build a Statement dialog allows you to construct a condition statement when creating a new Rule Builder rule.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Configure a rule statement.	Add an Advanced EPL Rule
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement

Related Topics

- Add a Rule Builder Rule

Build a Statement Dialog

To access the Build a Statement dialog:

1. Go to **CONFIGURE > ESA Rules**.

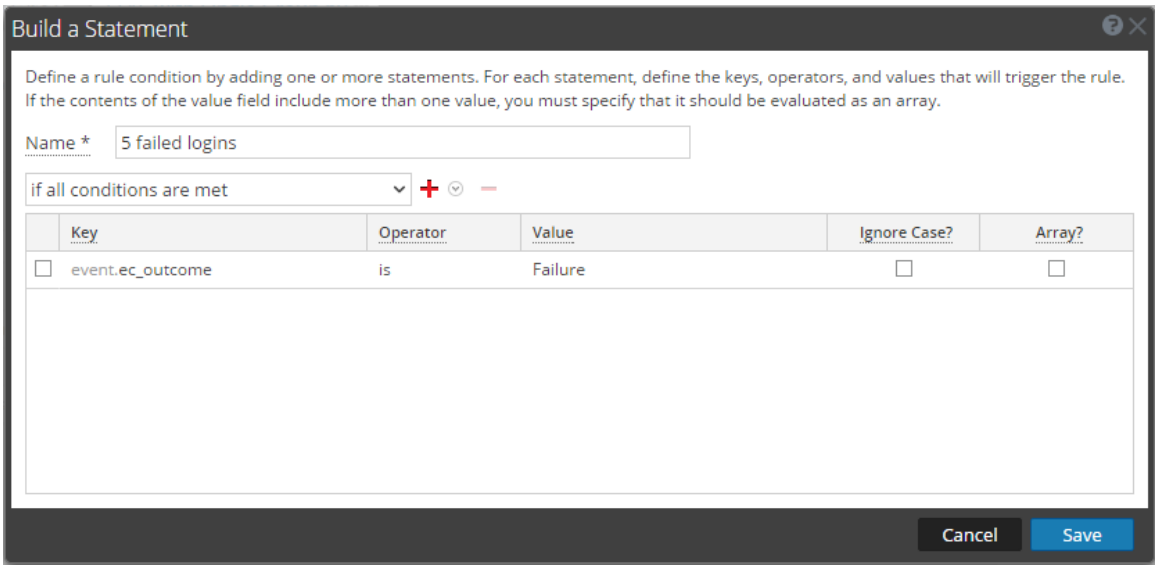
   The Configure ESA Rules view is displayed with the Rules tab open.

2. In the **Rule Library** toolbar, select  **> Rule Builder**.

   A New Rule tab is displayed..

3. In the **Conditions** section, click  .

   The Build a Statement dialog is displayed.



The following table describes the parameters in the Build a Statement dialog.

Parameter	Description
Name	Purpose of the statement.
Select	Conditions the rule requires. There are two options: • If all conditions are met • If any of these conditions are met
Key	Key for ESA to check in the rule statement.

Parameter	Description
Evaluation Type	Relationship between the meta key and value for the key: • is • is not • is not null • is greater than (>) • is greater than or equal to (>=) • is less than (<) • is less than or equal to (<=) • contains • not contains • begins with • ends with
Value	Value for ESA to look for in the key.
Ignore Case?	This field is designed for use with string and array of string values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN."
Array?	Choice to indicate if contents of Value field represent one value or multiple values: • Select the box to indicate multiple values. • Clear the box to indicate one value.
+	Add a statement. You can add a meta condition, whitelist condition, or blacklist condition.
−	Delete selected statement.
Save	Add statement to the Conditions section of the Rule Builder tab.

The following table shows the operators you can use in the Rule Builder:

Operator	Required Value	Usage	Example	Meaning
is	Singular string value	The meta key is equal to the *value* field.	***user_dst*** is John Doe.	***user_dst*** is equal to the string *"John Doe"*.
is	Array string value	The meta key is equal to one of the elements of the *value* field.	*user_dst* is John, Doe, Smith.	*user_dst* is equal either to the string *"John"* or to the string *"Doe"* or to the string *"Smith"* (Note, the spaces are stripped.).
is not	Singular string value	The meta key is not equal to the *value* field.	***size*** is not 200.	***size*** is not equal to the number 200 (size is a numeric value).
is not	Array string value	The meta key is not equal to any of the elements of the *value* field.	***size*** is not 200, 300, 400.	***size*** is equal neither to *200* nor to *300* nor to *400*.
is not null	N/A (looks for any value)	The meta key value is not null.	***user_dst*** is not null.	***user_dst*** is a meta that contains a value.
is greater than (>)	Number	The numeric value of the meta key is greater than the number in the *value* field.	***payload*** is greater than 7000.	***payload*** is a numeric value that is greater than 7000.
is greater than or equal to (>=)	Number	The numeric value of the meta key is greater than or equal to the number in the *value* field.	***payload*** is greater than or equal to 7000.	***payload*** is a numeric value that is greater than or equal to 7000.
is less than (<)	Number	The numeric value of the meta key is less than the number in the *value* field.	***ip_dstport*** is less than 1024.	***ip_dstport*** is a numeric value that is less than the numeric value 1024.
is less than or equal to (<=)	Number	The numeric value of the meta key is less than or equal to the number in the *value* field.	***ip_dstport*** is less than or equal to 1024.	***ip_dstport*** is a numeric value that is less than or equal to numeric value 1024.
contains	String	The *value* field is a substring of the meta key (This operator is only available for a string-valued meta key).	***ec_outcome*** contains failure.	***ec_outcome*** is a string that contains the substring *"failure"*.
not contains	String	The *value* field is not a substring of the meta key (This operator is only available for a string-valued meta key).	***ec_outcome*** not contains failure.	***ec_outcome*** is a string that does not contain the substring*"failure"*.

Operator	Required Value	Usage	Example	Meaning
begins with	String	The *value* field is the beginning of the meta key (This operator is only available for a string-valued meta key).	***ip_dst*** begins with 127.0.	***ip_dst*** is a string that starts with *"127.0"*.
ends with	String	The *value* field is the end of the meta key (This operator is only available for a string-valued meta key).	***user_dst*** ends with son.	***user_dst*** is a string that ends in*"son"*.

Note: Terms in ***bold italic*** are Meta that may not exist in all customer enviroments.

Deploy ESA Rules Dialog

The Deploy ESA Rules dialog enables you to filter and select rules to deploy to an ESA service.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Configure a deployment.	Step 1. Add a Deployment
Content Expert	Deploy a rule	Step 3. Add and Deploy Rules

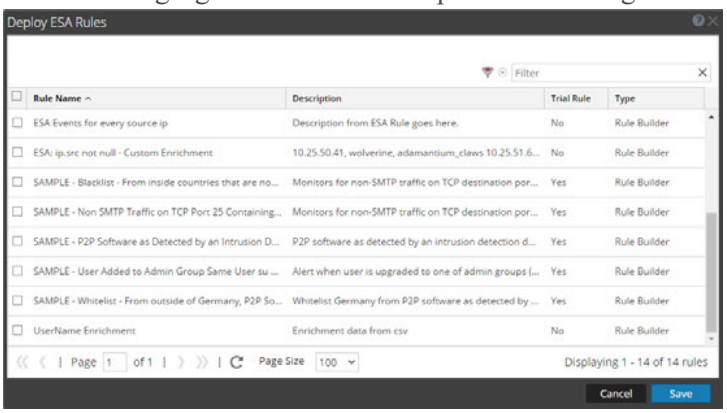
- Additional Deployment Procedures

Deploy ESA Rules Dialog

To access this dialog:

1. Go to **CONFIGURE** > **ESA Rules**.
   The Rules tab opens by default.
2. In the options panel, under the **Deployment** section, select or add a new deployment by clicking  > **Add**.
3. If you add a new deployment, type the name of the deployment in the box in the options panel.
4. In the **ESA Rules** panel, click  .
   The Deploy ESA Rules dialog is displayed.

The following figure shows an example of this dialog.



The following table describes the parameters of the Deploy ESA Rules dialog.

Parameters	Description
	Filters the list of rules based on severity and type. The text box beside this icon filters based on rule name.
Rule Name	Displays the name of the rule.
Description	Describes the rule.
Trial Rule	Indicates whether or not the rule is a trial rule.
Type	Indicates the type of rule: RSA Live ESA, Advanced EPL, or Rule Builder.

Deploy ESA Services Dialog

The Deploy ESA Services dialog displays all ESA services available to be added to a deployment.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Configure a deployment.	Step 1. Add a Deployment

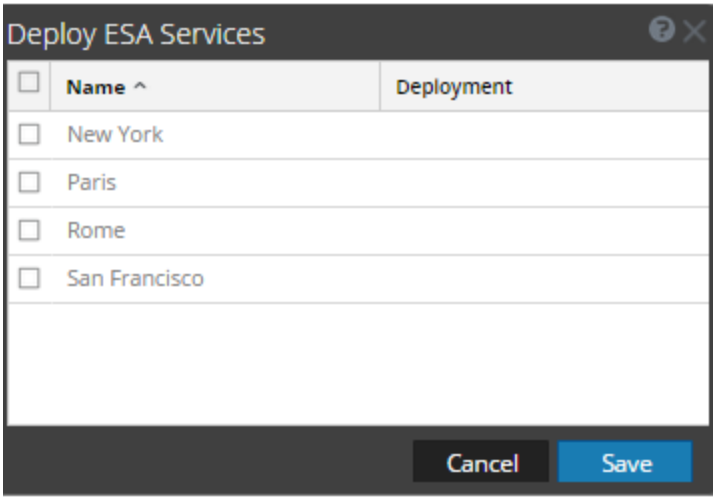
Deploy ESA Services Dialog

To access this dialog:

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab opens by default.
2. In the options panel, under the **Deployment** section, select or add a deployment.
3. In the **ESA Services** panel, click  .
   The Deploy ESA Services dialog is displayed.

The following figure is an example of this dialog.



The following table describes the parameters of the Deploy ESA Services dialog.

Parameters	Description
Name	Displays the name of configured ESA services.
Deployment	Displays the deployments to which the service has already been added.

Rule Builder Tab

The Rule Builder tab enables you to define a Rule Builder rule.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Define a Rule Builder rule.	Add a Rule Builder Rule
Content Expert	Define rule criteria.	Step 2. Build a Rule Statement
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement

Related Topics

- Add an Advanced EPL Rule

Rule Builder

To access the Rule Builder tab:

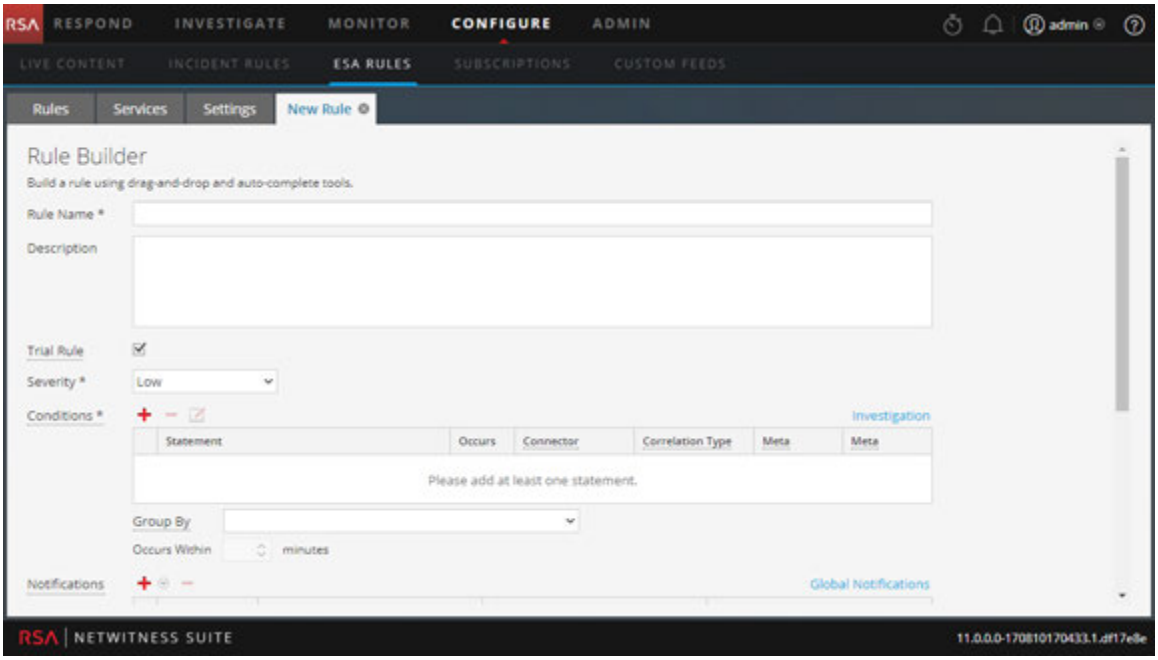
1. Go to **CONFIGURE** > **ESA Rules**.

   The Rules tab opens by default.

2. In the **Rule Library** toolbar, select  > **Rule Builder**.

   The Rule Builder tab is displayed.

The following figure shows the Rule Builder tab.



The following table lists the parameters in the Rule Builder tab.

Parameters	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Severity	Threat level of alert triggered by the rule.

The Rule Builder includes the following components:

- Conditions section
- Notifications section
- Enrichments section

Conditions Section

In the Conditions section of the Rule Builder tab, you define what the rule detects.

The following figure shows the Conditions section.

The following table lists the parameters of the Conditions section.

Parameter	Description
+	Add a statement.
−	Remove selected statement.
✎	Edit selected statement.
Statement	Logical group of conditions for one operation.
Occurs	Alert frequency if the condition is met. This specifies that there must be at least that many events that satisfy the criteria in order to trigger an alert. The time window in minutes binds the Occurs count.

Parameter	Description
Connector	Options to specify relationship among the statements: • followed by • not followed by • AND • OR The Connector joins two statements with AND, OR, followed by, or not followed by. When followed by is used, it specifies that there is a sequencing of those events. AND and OR build one large criteria. The followed by creates distinct criteria that occurs in sequence.
Correlation Type	**Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert.
Meta	Enter the meta condition if choosing a correlation type of SAME or JOIN (as described above).
Meta	Enter the second meta condition if choosing a correlation type of JOIN (as described above). For example, The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.
occurs within minutes	Time window within which the conditions must occur.

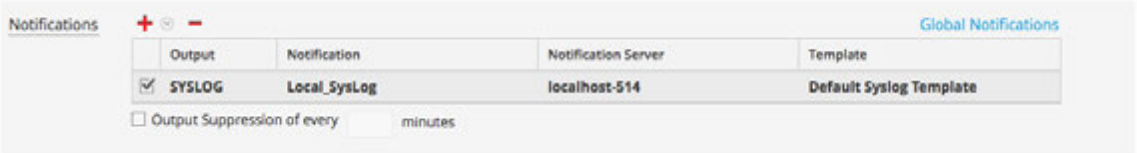
Parameter	Description
Event Sequence	Choose whether the pattern must follow a *strict* match or a *loose* match. If you specify a strict match, this means that the pattern must occur in the *exact* sequence you specified with no additional events occurring in between. For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.
Group By	Select the meta key by which to group results from the dropdown list. For example, suppose that there are three users; Joe, Jane, and John and you use the Group By meta, **user_dst** (user_dst is the meta field for the user destination account). The result will show events grouped under the user destination accounts, Joe, Jane, and John. You can also group by multiple keys. For example, you might want to group by user and machine to see if a user logged in from the same machine attempts to log into an account multiple times. To do this, you might group by device_class and user_dst.

Notifications

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.



Parameter	Description
+	To add an alert notification type.
−	To delete the selected alert notification.

Parameter	Description
Output	Alert notification type. Options are: • Email • SNMP • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

Enrichments

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.

The following figure shows the Enrichments section.

Parameter	Description
+	To add an enrichment.
−	To delete the selected enrichment.

Parameter	Description
Output	Enrichment source type. Options are: • In-Memory Table • External DB Reference • Warehouse Analytics • GeoIP
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition. For an in-memory table, If you configured a key when creating a .CSV-based enrichment, this column automatically populates with the selected key. However, you can change it if you like. For a GeoIP enrichment source, ipv4 is automatically selected.

Rules Tab

The Rules tab enables you use to manage ESA rules and deployments.

What do you want to do?

Role	I want to ...	Show me how

Related Topics

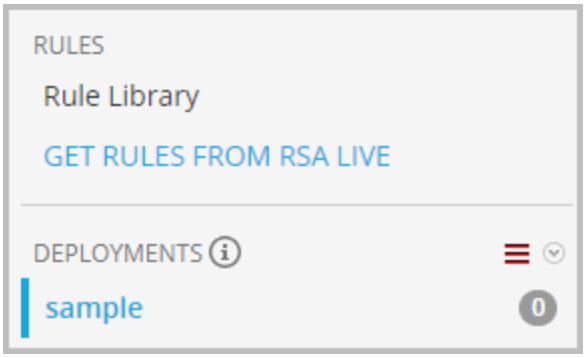
- Working with Rules

Options Panel

The following figure shows the options panel in the **Rules** tab.



There are two sections in the options panel: Rules and Deployments.

Rules Section

The Rules section contains two options. **Rule Library** is selected by default, and when it's selected, the Rule Library view is displayed within the tab. **Get Rules From RSA Live** navigates to the Live Search view, where you can search for rules.

Deployments Section

The Deployments section lists deployments and indicates whether there are updates to the deployments. From this section, deployments can be added, deleted, edited, and refreshed. Selecting a deployment from the list displays the Deployment panel within the tab. The following table describes the features of this section.

Feature	Description
	Displays a drop-down menu from which you can choose to add, edit, or delete a deployment. You can also refresh the list of deployments to see if there are any new updates to the list.
	Indicates whether there are any updates to the deployment.
	Indicates the number of rules in the deployment.

Rule Library Panel

The Rule Library panel allows you to manage rules.

What do you want to do?

Role	I want to ...	Show me how

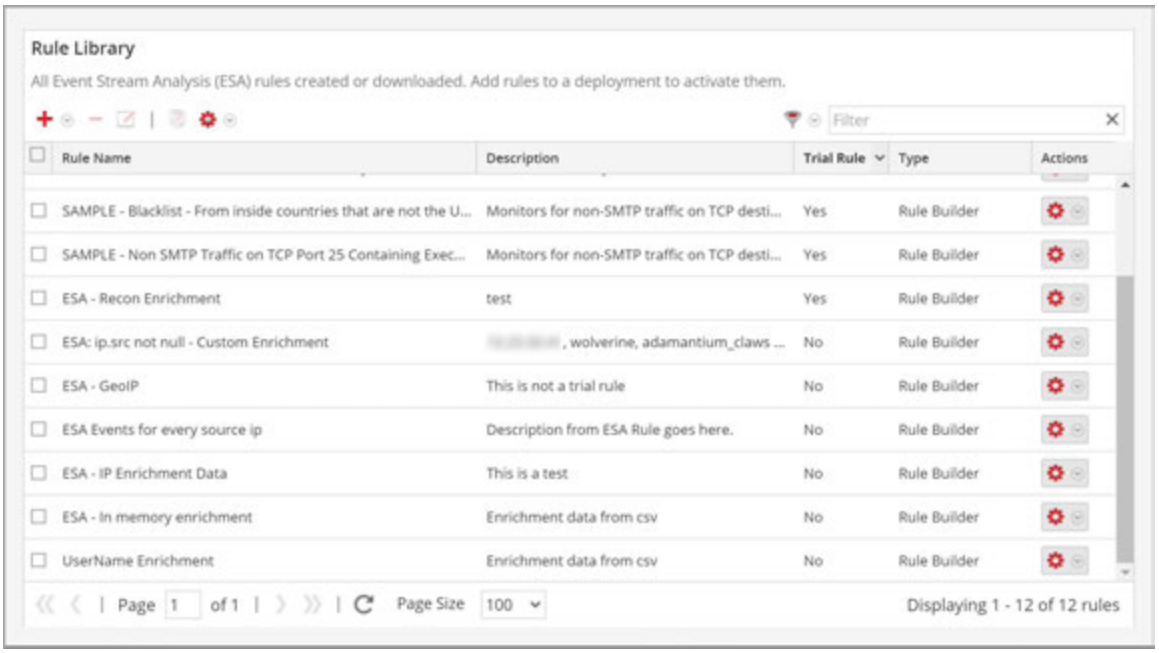
Related Topics

- Add an Advanced EPL Rule

Rule Library Panel

To access this view, go to **CONFIGURE > ESA Rules**. The Rules tab is displayed and the Rule Library panel is on the right.

The following figure shows the Rule Library panel.



The Rule Library panel includes the following components:

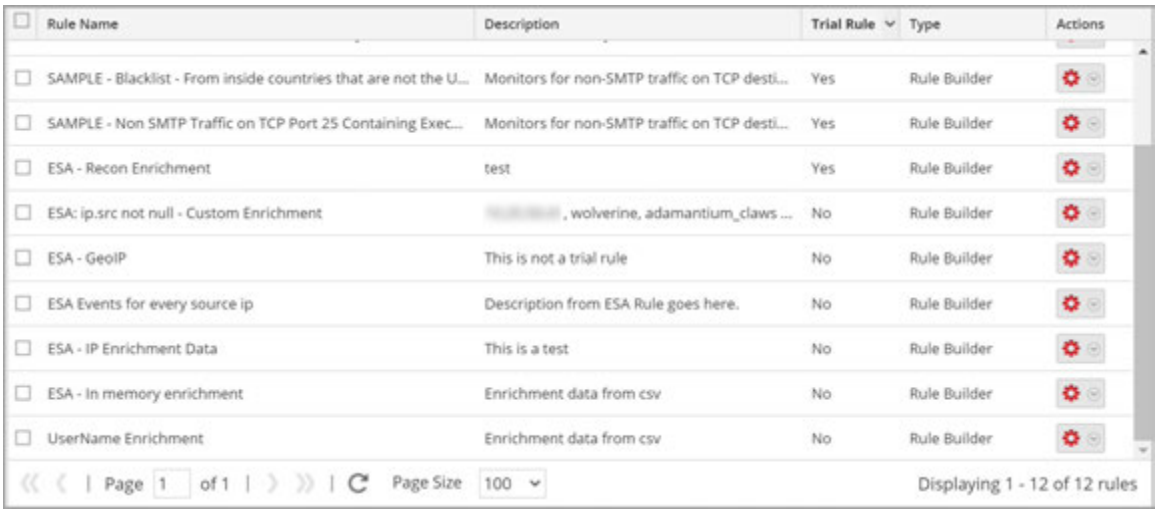
- Rule Library toolbar
- Rule Library list

Rule Library Toolbar

The Rule Library toolbar allows you to add, delete, edit, duplicate, filter, export, and import ESA rules. The following figure shows the icons for these actions.

Rule Library List

The following figure shows the Rule Library list.



The Rule Library list shows all the ESA rules that have been downloaded from RSA Live or created in the Advanced EPL and Rule Builder tabs. The following table lists the columns in the Rule Library list and their description.

Column	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Type	The type of rule.

Column	Description
Actions ()	Menu to delete, edit, duplicate, or export the selected rule.
Severity	Threat level of alert triggered by the rule.
Email	Indicates whether an alert notification for the rule is sent by email. This column is not visible by default.
Snmp	Indicates whether an alert notification for the rule is sent using SNMP. This column is not visible by default.
Syslog	Indicates whether an alert notification for the rule is sent using Syslog. This column is not visible by default.
Script	Indicates whether an alert notification for the rule executes a script. This column is not visible by default.
Last Modified	The date and time when the ESA rule was last modified. This column is not visible by default.

To display columns which aren't visible by default, hover over the title of a column and click the **v** on the right. This opens a drop-down menu in which you can sort the contents of the column or choose which columns you want to see in the Rule Library list.

Deployment Panel

This topic provides an overview of the Deployment panel. The Deployment panel enables you to create and configure the deployments. The Deployment panel includes the following sections:

- ESA Services
- ESA Rules

What do you want to do?

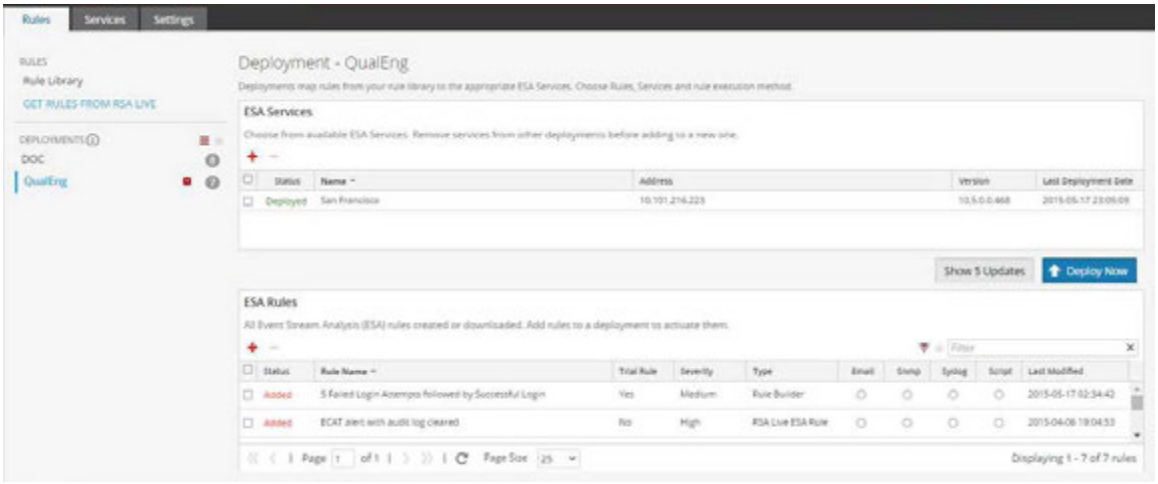
Role	I want to ...	Show me how
Content Expert	Add a deployment.	Deployment Steps
Content Expert	Manage deployments.	Additional Deployment Procedures

Related Topics

- View Stats for ESA Service

Deployment Panel

The following figure shows the Deployment panel.



ESA Services

Using the ESA Services section, you can manage each ESA service in the deployment.

In the ESA Services section, you can perform the following.

Task	Description

Task	Description
	Add an ESA service to the deployment.
	Remove the selected ESA service from the deployment.
Show Updates	Open the Updates to the Deployment dialog.
Deploy Now	Deploy current set of rules.

The following table lists the parameters of the ESA Services section.

Parameter	Description
Status	Indicates if the deployment status is **Added**, **Deployed**, **Updated**, or **Failed**.
Name	Name of the ESA service.
Address	IP address of the host where the ESA service is installed.
Version	Version of the ESA service.
Last Deployment Date	The date and time when the ESA service was last deployed.

ESA Rules

In the ESA Rules section, you manage rules in the deployment. This section lists all rules that are currently in the deployment.

In the **ESA Rules** section, you can perform the following.

Task	Description
	Open the Deploy ESA Rules dialog, where you can select a rule.
	Remove the selected ESA rules from the deployment.
	Filter the list of rules.

Task	Description
Filter	Search for a rule.

The following table lists the parameters of the ESA Rules section.

Parameter	Description
Status	Indicates the rule status: • Deployed - the rule is deployed. • Updated - the rule has been updated since the last deployment. • Added - the rule has been added since the last deployment. • Failed - the deployment failed.
Rule Name	Purpose of the ESA rule.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Severity	Threat level of alert triggered by the rule.
Output	The type of the ESA rule.
Email, SNMP, Syslog, Script	Indicates which notification types are used for alerts generated by the rules.
Last Modified	The date and time when the ESA rule was last modified.

Rule Syntax Dialog

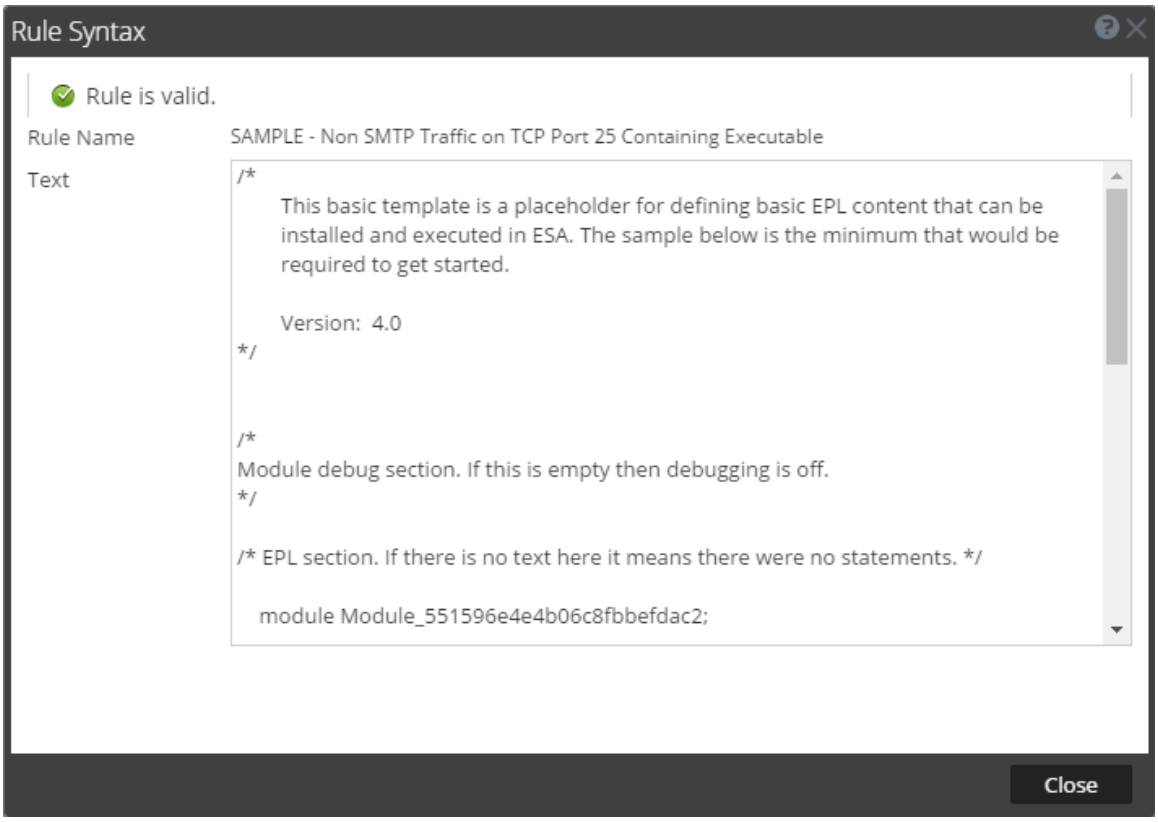
This topic describes the features of the Rule Syntax dialog. The Rule Syntax dialog displays the EPL syntax of conditions, statements, and debugging parameters, and provides a warning when the syntax is invalid.

Rule Syntax Dialog

To access this dialog:

1. Go to **CONFIGURE > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   a. Click + and select **Advanced EPL** or **Rule Builder**.
   b. Double-click an existing rule.
   c. Select an existing rule and click in the **Rule Library** toolbar.
   d. In the row of an existing rule, select > **Edit**.
   The new or existing rule is displayed in a new tab, available to edit.
3. Click **Show Syntax** at the bottom of the tab.

The following figure shows an example of the Rule Syntax dialog.



The following table describes the Rule Syntax dialog parameters.

Parameters	Description
Rule is valid or **Validation error in rule**	Indicates whether the rule syntax is valid or needs to be changed.
Rule Name	Displays the name of the rule.
Text	Displays the EPL syntax of conditions, statements, and debugging parameters if the rule is valid.

Services Tab

This topic provides an overview of the **CONFIGURE > ESA Rules > Services** tab. The Services tab provides details of the ESA services added to NetWitness Suite.

What do you want to do?

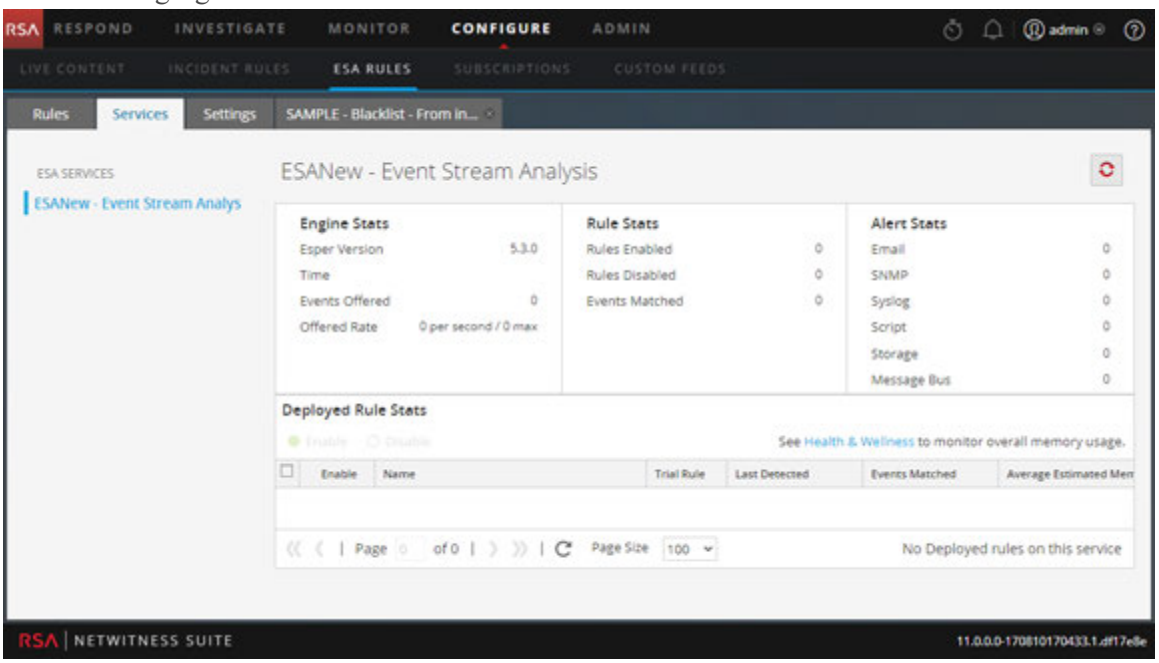
Services

The following figure shows the Services tab:



The Services tab has the following sections:

- ESA Services panel
- General Stats panel
- Deployed Rule Stats panel

ESA Services Panel

The ESA Services panel lists the name of each ESA service added to NetWitness Suite.

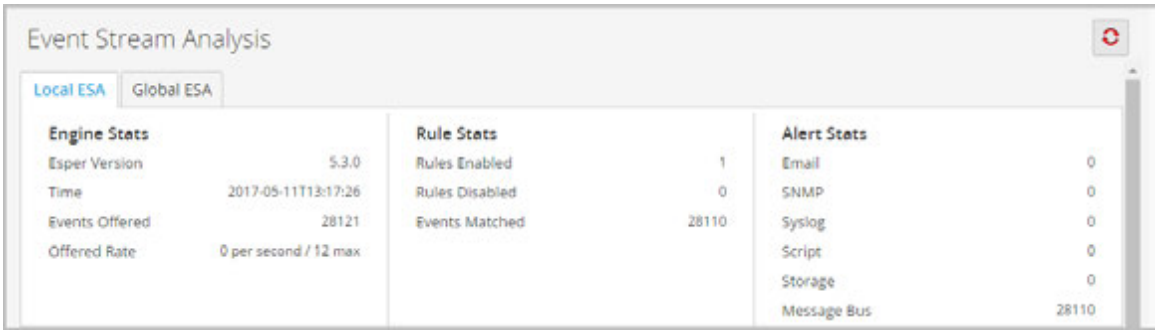
General Stats Panel

The General Stats panel provides information on the Esper engine, rules and alerts.

The General Stats panel contains the following sections:

- Engine Stats
- Rule Stats
- Alert Stats

The following figure shows the General Stats panel.



The table lists and describes the parameters in each section.

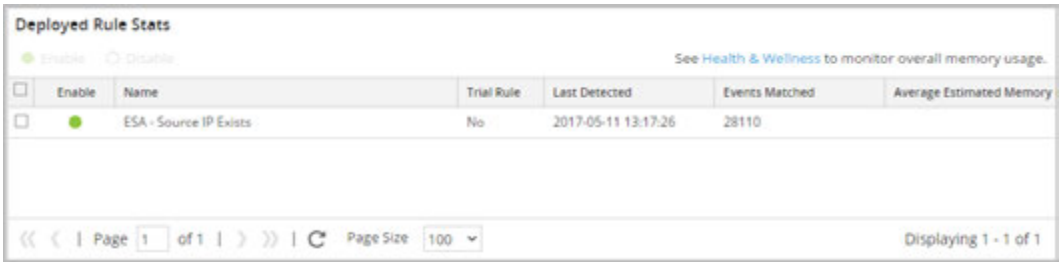
Sections	Parameter	Description
Engine Stats	Esper Version	Esper version running on the ESA service
	Time	Time when the last event was sent to Esper Engine
	Events Offered	Number of events analyzed by the ESA service since the last service start
	Offered Rate	Current events offered rate on the ESA service

Sections	Parameter	Description
Rule Stats	Rules Enabled	Number of rules enabled.
	Rules Disabled	Number of the rules disabled
	Events Matched	Total number of events matched to all rules on the ESA service
Alert Stats	Email	Number of email notifications sent by the ESA service
	SNMP	Number of SNMP notifications sent by the ESA service
	Syslog	Number of Syslog notifications sent by the ESA service
	Script	Number of Script notifications sent by the ESA service
	Storage	Total number of alerts stored in database
	Message Bus	Total number of alerts sent to the message bus

Deployed Rule Stats Panel

The Deployed Rule Stats panel provides details on the rules that are deployed on the ESA service.

The following figure shows the Deployed Rule Stats panel.



The table lists the various parameters in the view and their description.

Parameters	Description
	Indicates the rule is enabled. Enables a rule that was disabled.
	Indicates the rule is disabled. Disables a rule that was enabled.
Health & Wellness	Displays a snapshot of memory usage when trial rules get disabled
Enable	Indicates whether the rule is enabled or disabled. Green icon indicates rule is enabled. White icon indicates rule is disabled.
Name	Name of the ESA rule.
Trial Rule	Indicates if the rule is running in trial rule mode.
Last Detected	The last time alert was triggered for the rule.
Events Matched	The total number of events that matched the rule.

Settings Tab

This topic describes the components of the **CONFIGURE > ESA Rules > Settings** tab. In the Settings tab, you can perform the following tasks:

- View a list of meta keys
- Configure a data enrichment source
- Add a connection to an external database

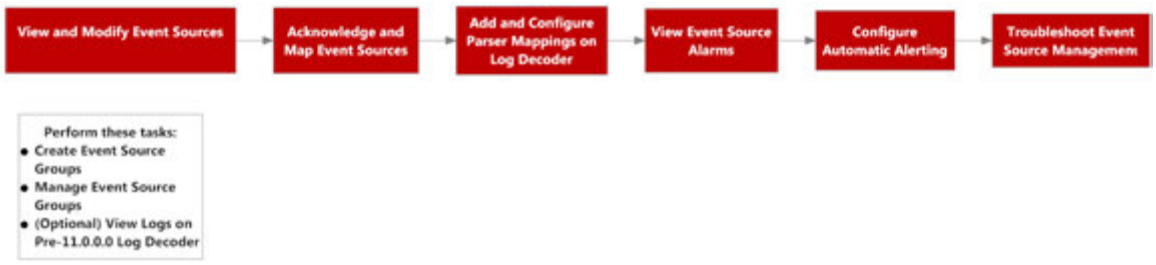
About Event Source Management

The Event Source module in NetWitness Suite provides an easy way to manage event sources and configure alerting policies for your event sources.

Workflow

This workflow shows the overall process for configuring event sources. It also shows where configuring alarms and alerts settings are located in the process.



Prerequisites

There are two permissions that affect Event Source Management:

- **View Event Sources** is needed for users to view event sources, their attributes, and their thresholds and policies.
- **Modify Event Sources** allows users to add, edit, and otherwise update event sources.

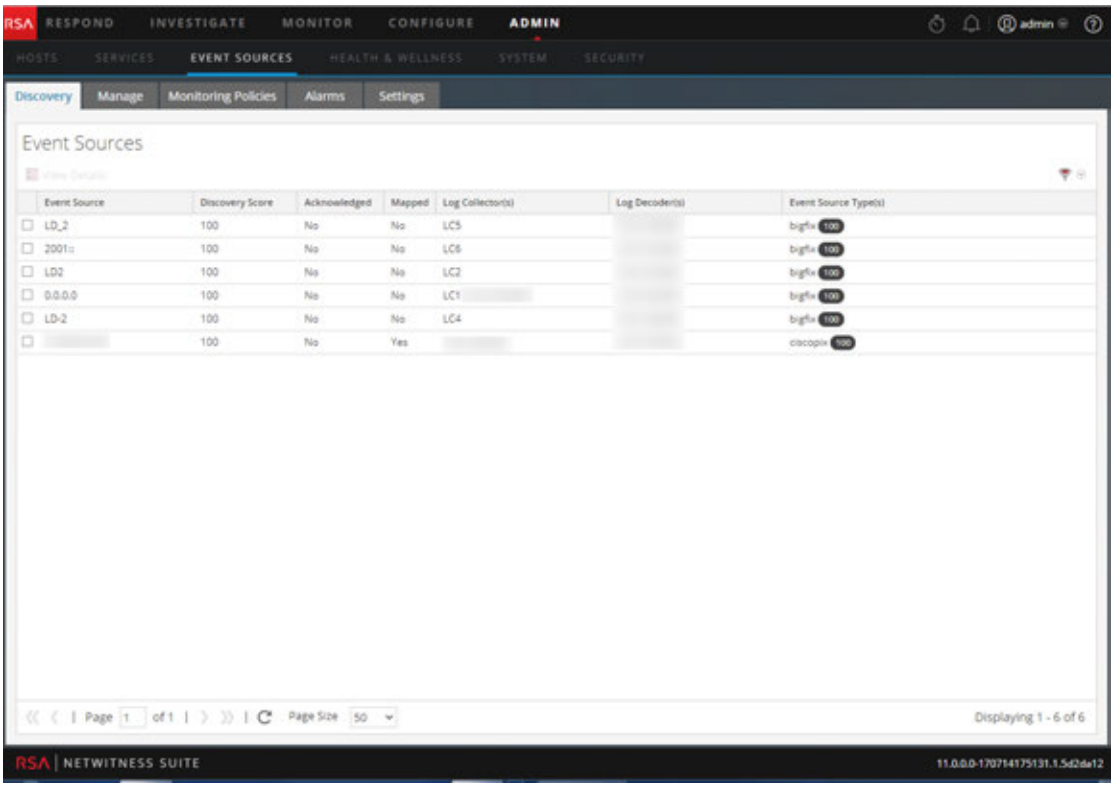
For details, see the following topics:

- The *Roles Tab* topic available in the **System Security and User Management** guide > **References** > **Administration Security View** > **Roles Tab**.
- The *Role Permissions* topic describes the built-in NetWitness Suite system roles, which control access to the user interface. Available in the **System Security and User Management** guide > **How Role-Based Access Control Works**.
- The *Manage Users with Roles and Permissions* topic describes how to manage users in NetWitness Suite, using roles and permissions. Available in the **System Security and User Management** guide > **Manage Users with Roles and Permissions**.

Navigate to Event Source Management

You can view the details about your existing event source groups by doing the following:

1. Go to **ADMIN> Event Sources**.



2. Click any of the following:

   - The **Discovery** tab. Use this tab to review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately.
   - The **Manage** tab. This tab provides the details for your existing event source groups.
   - The **Monitoring Policies** tab. Use this tab to view or edit your event source alerting configuration.
   - The **Alarms** tab. Use this tab to see the details of the alarms that have been generated. Alarms are generated when event sources exceed or fall below their set thresholds.
   - The **Settings** tab. Use this tab to view or change the behavior for automatic alerts.

Note: When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness Suite automatically adds the event source to the list. Additionally, if it matches the criteria for any existing group, it becomes part of that group.

How Alarms and Notifications Work

The Event Source module in NetWitness Suite displays alarms and sends notifications based on alarms that are triggered.

For alarms, consider the following:

Alarms are of two types: **automatic** (triggered when baselines are exceeded or not met) and **manual** (configured using thresholds).

- **Automatic**: If you turn on automatic alerts, the system reports alarms for **all** event sources that go above or below their normal baselines by the required amount. You can specify the over / under percentage on the Settings Tab.
- **Manual**: If you turn off automatic alerts, you receive alarms only for the event source groups for which you have specified—and enabled—policies (and thresholds).
- Alarms appear on the UI, in the Alarms Tab.

For notifications, consider the following:

- To receive manual notifications (via email, SNMP or Syslog):
  - Specify a policy for an event source group.
  - Set a high or low (or both) threshold.
  - Enable the policy.
- To receive automatic (baseline) notifications:
  - Baseline alerting must be on. This is turned on by default.
  - You must enable notifications from automatic monitoring. See Configuring Automatic Alerting for details.
  - The event source that triggers the alarm must be in a group that has a policy enabled.
- If you have automatic alerting turned o, and you have configured a policy and threshold for a group:
  - If the event source goes outside its baseline, you see an automatic alert and receive a notification.
  - If the event source goes outside its thresholds, you see a manual alert and receive a notification.
  - If both occur (threshold and baseline exceeded or not met), you receive two alarms (visible on the Alarms tab) and a notification that indicates both alarms. That notification will list

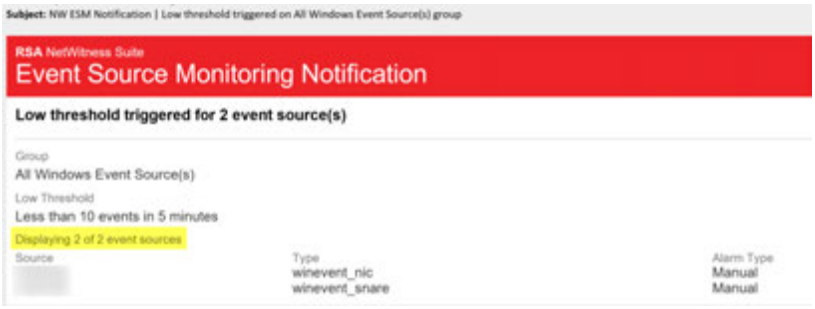
the event source that double alarmed twice; one listing indicating it was an automatic alarm.

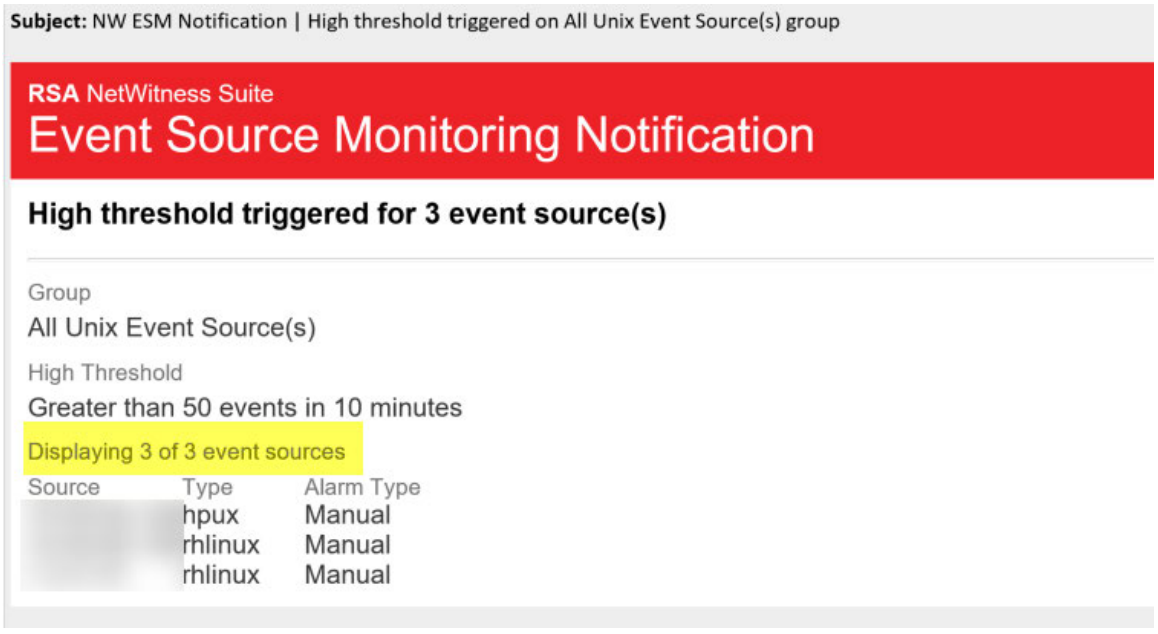
Large Email Notifications

If you have set up email notifications, keep in mind that the email can grow very large, depending on the number of event sources in the notification.

If the number of event sources in the alarmed state exceeds 10,000, then the email notification contains the details for only the first 10,000 and a total count. This is to ensure that the email is successfully delivered.

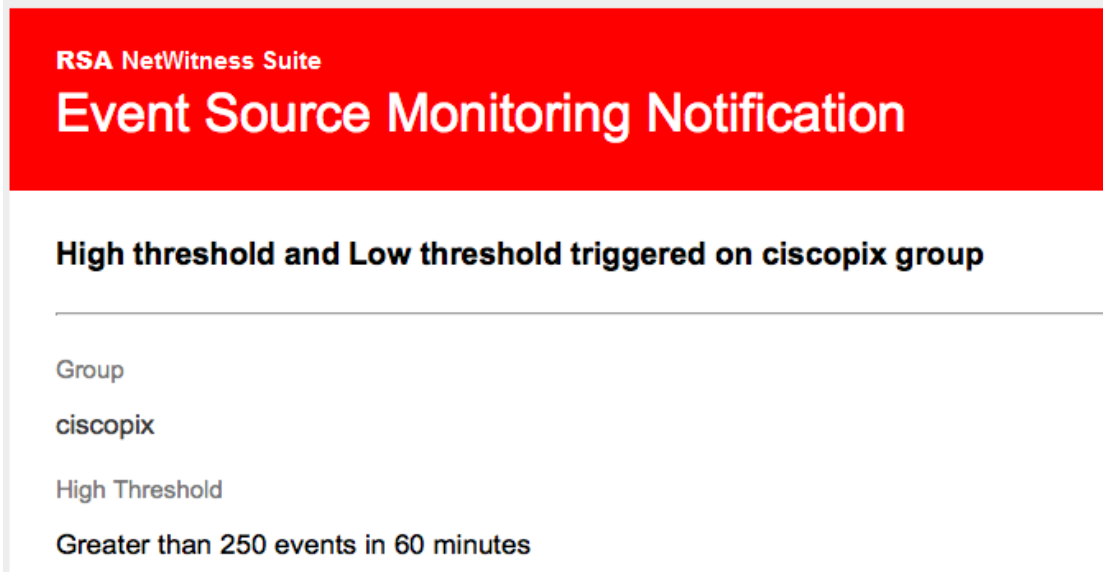
The following examples show a low threshold triggered for two event source groups and a high threshold triggered for three event source groups.





High and Low Thresholds Both Triggered

There may be occasions when both the high and low alarms are both triggered for a particular event source group. The easiest way to see when this happens is to read the email header, which clearly states when both thresholds are triggered, as shown in this image:



In this example, the header states, "High threshold and Low threshold triggered on ciscopix group." To see the details for the low threshold event sources, you may need to scroll down past hundreds, or even thousands, of the high threshold event sources.

Automatic Alerting

This topic describes automatic alerts, which are based on baseline settings.

Note: Automatic alerting, and all of the parameters that determine its behavior, are currently in Beta testing.

You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness Suite also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- Once you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.
- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time

(for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.

- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

Common Scenarios for Monitoring Policies

Typically, organizations monitor their event sources in "buckets" based on how critical or bush the event sources are. One typical example is as follows:

- There is a group of PCI devices, and it is critical to know if any of these devices stop sending messages (or send too few messages) within a half hour.
- There is a group of Windows devices, and it is useful to know if any of these devices stop sending messages after four hours.
- There is a group of quiet devices that do not typically send a lot of messages, but you would like to know if they do not send anything for 24 hours.

Many organizations may have a network that resembles this example. You may have more or different categories, but this example is used to discuss this feature.

You may have dozens or even hundreds of event source groups, and still only have a few groups for which you need to set thresholds and alerts.

Note: If an Event Source is a member of multiple groups that have alerting configured, it will only alert on the first matching group in the ordered list. (The Monitor Policies tab presents an ordered list of your groups.)

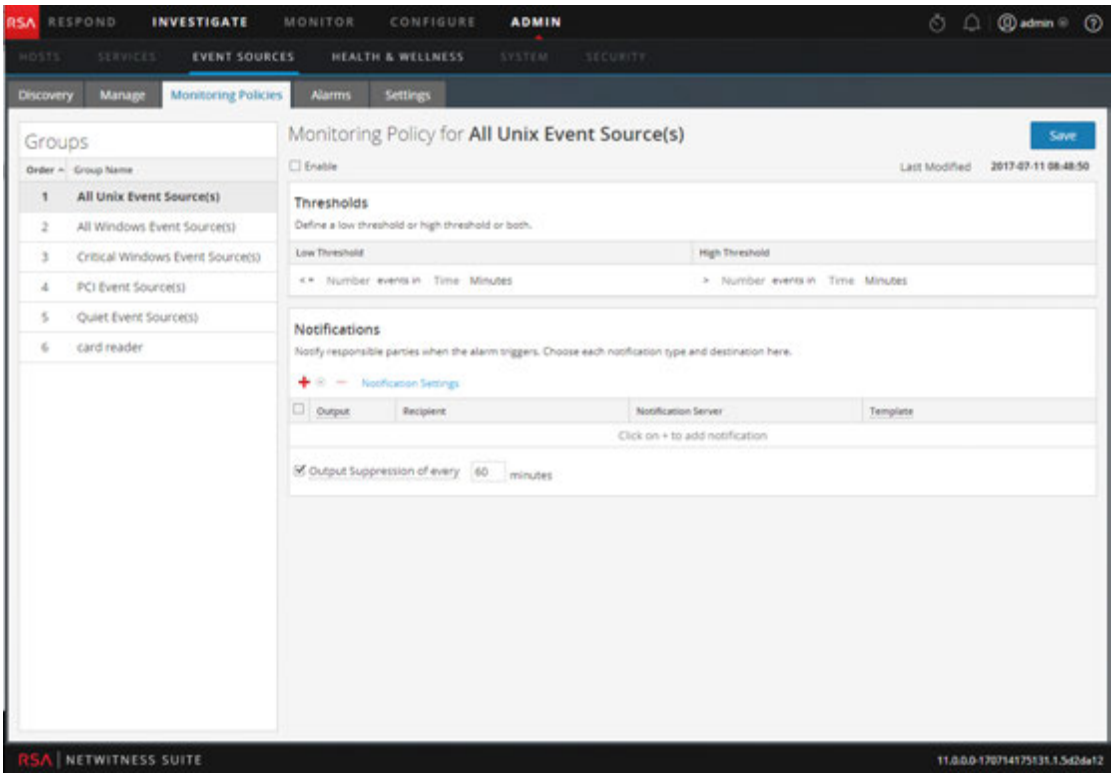
Ordering the Groups

Note: To change the order of the groups, drag and drop a group to its new location. The higher a group is listed, the higher the precedence for that group's thresholds: RSA NetWitness Suite checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list.

The first thing to keep in mind is how to order your groups on the Monitoring Policies page. Assuming that you have the three groups mentioned above, you should order them as follows:

1. Quiet event sources. Having this group first ensures that you will not get numerous false alerts.
2. High priority PCI event sources. The highest priority devices should be after the quiet devices

3. Windows event sources. The time range is longer (four hours versus a half hour) for these devices than for the PCI devices. Therefore, they should come after the PCI devices.
4. All event sources. Optionally, you could set thresholds for all devices as a catch-all. This ensures that your entire network is operating as expected. For the catch-all group, you do not need to specify any thresholds—you can use automatic alerting to generate alarms for the event sources in this group.



In the figure above, note the following:

- The groups are ordered as discussed in the previous section.
- The threshold for PCI devices is to alert if the number of messages coming in to NetWitness Suite is fewer than 10 messages in 30 minutes.
- A low threshold is defined, but not a high threshold. This is typical for many use cases.

After you have set up and ordered your groups and begun to receive alerts, you may need to adjust the order. Use these guidelines to help you adjust the ordering:

- If you receive more notifications than you need, you can move the group down in the order. Similarly, if you are getting too few notifications, move the group up towards the top.
- If you notice that one event source is creating more alerts than it should, you can move it to another group, or create a new group for that event source.

Managing Event Source Groups

Definitions

When dealing with event source groups in NetWitness Suite, note the following:

- An **event source** is essentially the combination of values for all of its attributes.
- An **event source group** is the set of event sources that match a set of criteria that are defined for that group.

For example, you might have the following groups:

- A group named **Windows Devices**, consisting of all the event source types associated with Microsoft Windows event sources (`winevent_nic`, `winevent_er`, and `winevent_snare`).
- A group named **Low Priority Services**, consisting of all services where the Priority attribute has been set lower than 5.
- A group named **U.S. Sales Servers**, where you gather event sources located in the U.S.A. and having an Organization attribute of Sales, Finance, or Marketing.

Manage Tab Details

The Manage tab in the Event Source module provides an easy way to manage event sources. In this tab, you can:

- Set up event source groups in a consistent way.
- Work with event source attributes in a consistent, straightforward manner.
- Easily search through your entire set of event sources.
- Bulk edit and update your event sources and event source groups.

You can view the details about your event source groups by doing the following:

1. Go to **ADMIN** > **Event Sources**.
2. Select the **Manage** panel to see the details for your existing event source groups.

Note: When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness Suite automatically adds the event source to the list. Additionally, if it matches the criteria for any existing groups, it becomes part of that group.

Default Groups

RSA NetWitness Suite has several default groups. You can customize these as required and use them as templates for creating new groups.

The default groups are as follows:

- All Event Sources
- All Unix Event Sources
- All Windows Event Sources
- Critical Windows Event Sources
- PCI Event Sources
- Quiet Event Sources

You can edit any of these groups to investigate the rules that define the groups.

Note: You cannot edit or delete the **All** event source group.

Creating Event Source Groups

Administrators must receive notifications when event sources are no longer being collected by NetWitness Suite. They need to be able to configure how long the event sources can be quiet (that is, not collect any log messages) before sending a notification based on different factors.

RSA NetWitness Suite provides event source groups so that you can group similarly important devices together. You can create groups based on attributes that you imported from your CMDB (configuration management database), or by manually choosing event sources to add to the group.

For example, these are some of the types of event source groups that you can create:

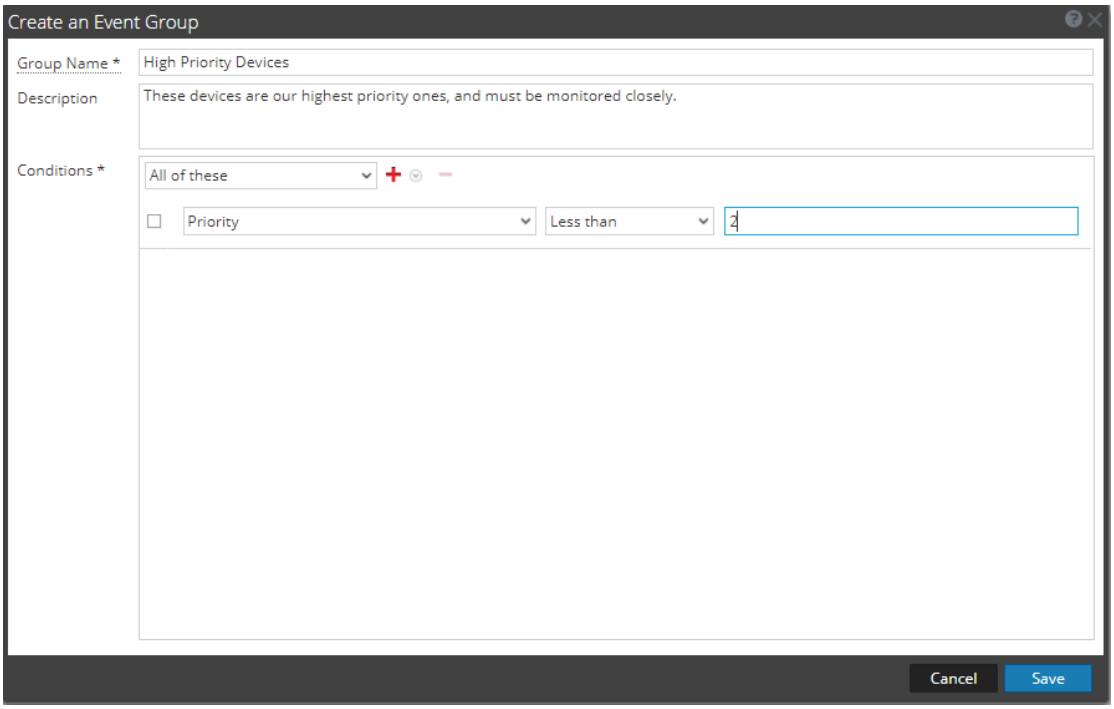
- PCI sources
- Windows Domain Controllers
- Quiet sources
- Finance Servers
- High Priority devices
- All Windows sources

Procedure

To create an Event Source group:

1. Go to **ADMIN** > **Event Sources**.
2. In the **Manage** panel, click + .

The Create an Event Group dialog is displayed.



3. Enter a Group Name.
4. Enter a Description.
5. Click + to add a condition. Continue adding conditions as necessary. For details on constructing conditions, see Create/Edit Group Form.
6. Click **Save**.

   The new group is listed in the **Manage** panel.

Examples

This section describes a simple example, and then discusses how to set up a more complex set of rules.

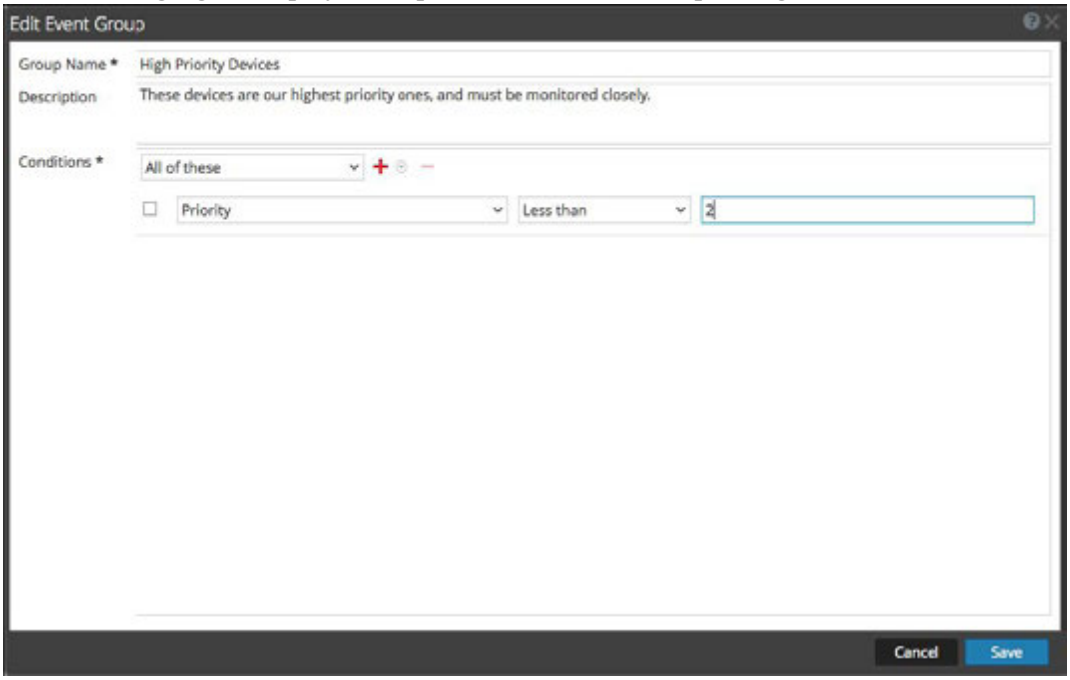
Simple Example

If you want to create an event source group that contains all of your high priority event sources, this example describes the necessary steps.

1. Go to **ADMIN > Event Sources**.
2. In the **Manage > Groups** panel, click + .
3. Enter **High Priority Devices** for the Group Name.

4. Enter a description, such as, "These devices are our highest priority ones, and must be monitored closely."
5. Leave **All of these** selected and click + to add a condition.
6. Select **Add condition** from the drop-down menu.
   a. Select an Attribute: **Priority**.
   b. Select an Operator: **Less than**.
   c. Enter a value: **2**.

   The following figure displays the updated Edit Event Group dialog.



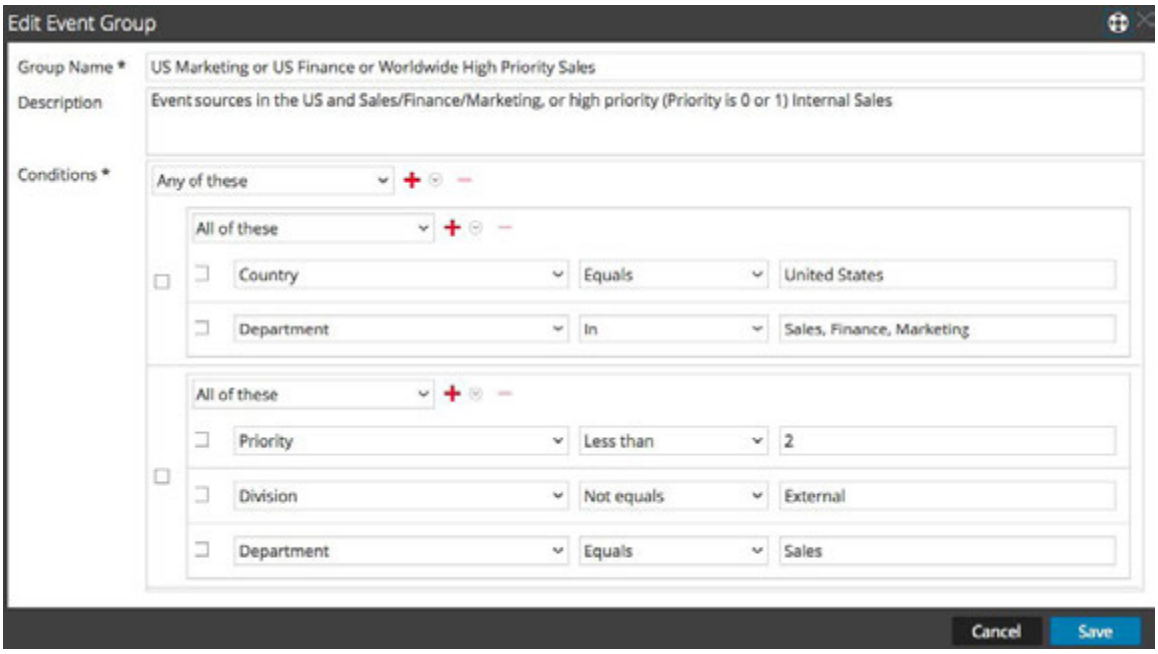
7. Click **Save**.

Complex Example

In this example, you want to create a fairly complex rule: match event sources that are in the United States, and in either the Sales, Finance, or Marketing departments. Also, match worldwide internal, high priority Sales event sources. High Priority is assumed to be where the priority is 1 or 0. Logically, the definition is as follows:

```
(Country=United States AND (Dept.=Sales OR Dept.=Finance OR
Dept.=Marketing))
 OR
 (Priority < 2 AND Division != External AND Dept.=Sales)
```

The following figure is an example of the criteria for creating such an Event Source Group.



Creating Event Source Group Form

The Create Event Source Group form is displayed when you are creating or editing an Event Source Group.

Parameters

The following table describes the fields on the Create/Edit an Event Group form.

Field	Description
Group Name	This field is required, and appears throughout the NetWitness Suite UI as the identifier for the group.
Description	An optional description to help describe the purpose or details for the group.

Field	Description
Tools 	The following items are available on the toolbar: • **Add (+)**: clicking the **Add** displays a menu where you can choose to add a condition or a group. • **Remove (−)**: removes the selected rule or group of rules from the list. When you add a new group, that has the effect of creating nested levels of conditions.
Conditions	Described below, in the **Rule Criteria** table.
Cancel / Save	**Cancel** and **Save** options are available in the form.

Rule Criteria

The rules that you specify determine the event sources that will become part of this event source group. A rule consists of the following:

- Grouping: how the rule interacts with other rules
- Attribute: which attribute the rule is matching against
- Operator: how the rule matches the attribute
- Value: the attribute value used for the rule

The following table provides details on these rule constructors.

Rule Constructor	Details
Grouping	You can group conditions, in order to create complex rules for an event source group. The following choices are available when grouping your rules: • **All of these**: logically equivalent to AND • **Any of these**: logically equivalent to OR • **None of these**: logically equivalent to NOT If you are creating a simple group, and specifying a single condition, you can leave the default value (**All of these**) selected.
Attribute	This contains a drop-down list, consisting of all event source attributes. The attributes are displayed by the section to which they belong. For example, all of the **Identification** attributes are displayed first, followed by the **Properties**, **Importance**, and so on.

Rule Constructor	Details

Operator	Choose from the following options:
	• **Equals**: matches the provided value
	• **Not equals**: returns event sources whose specified attribute not equal to the provided value
	• **In**: provide a list of values in comma separated format, and event sources that match any of the provided values are included. For example:
	`Where IP in 10.25.50.146, 10.25.50.248`
	This condition returns event sources that have either `10.25.50.146 or 10.25.50.248` as their IP attribute.
	• **Not in**: similar to **In**, except that it matches items whose attribute is not equal to any of the listed values.
	• **Like**: matches items that begin with the provided string. For example:
	`Where Event Source Type Like Apache`
	This condition returns event sources whose Event Source Type begins with `Apache`.
	• **Not like**: similar to **Like**, except that it matches items whose attribute does not begin with the provided string.
	• **Greater than**: matches items whose attribute is greater than the provided value. For example, if you specify Priority Greater than 5, the condition would match any item with a priority of 6 or higher.
	• **Less than**: similar to **Greater than**. Matches items whose attribute is less than the provided value.

Value	Enter a value or group of values. The value type depends on the attribute for the condition. For example, for IPv6, you need to specify a value in IPv6 format.

Acknowledging and Mapping Event Sources

Acknowledge Event Source Types

The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source from the view by default. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

To acknowledge that the discovered event source types are correct, do the following

- Select the Event Sources that you want to Acknowledge and click the **Acknowledge** button in the toolbar. Once the Event Sources are Acknowledged, they are no longer displayed in the Event Source Type(s) column.

Note: Acknowledged Event Sources are not displayed by default.

Map Event Source Types

When discovered event source types are not completely accurate, you can map the parsers to obtain additional information by doing the following:

- Select the Event Sources that you want to Map and click the **Map** button in the toolbar.

Note: Discovery scores for the mapped Event Sources are listed in the Event Source Type(s) column from the lowest to highest discovery scores. Discovery scores range from 0 (least confident) to 100 (most confident).

Viewing Logs from Pre-11.0.0.0 Log Decoder

NetWitness 11.0.0.0 added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0.0.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

To enable logs preview for a pre-11.0.0.0 Log Decoder, follow these steps on the Log Decoder:

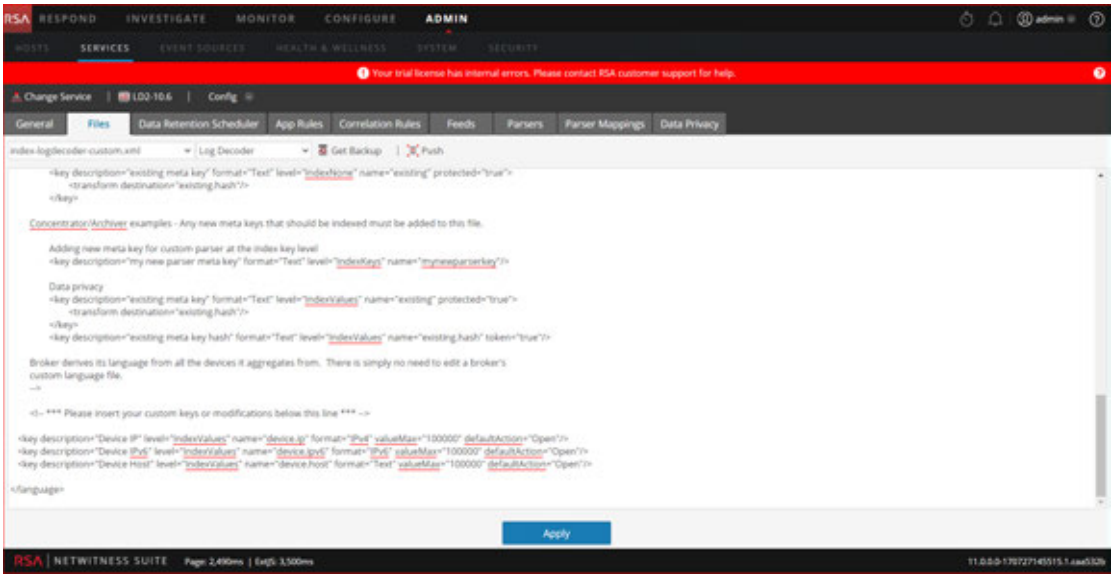
1. Go to **ADMIN > Services >** select a Log Decoder, then select  **> View > Config**.
2. Click **Files** tab, then select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):

```
<key description="Device IP" level="IndexValues" name="device.ip" format="IPv4"
valueMax="100000" defaultAction="Open"/>
```

```
<key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6"
valueMax="100000" defaultAction="Open"/>

<key description="Device Host" level="IndexValues" name="device.host" format="Text"
valueMax="100000" defaultAction="Open"/>
```

4. Click **Apply**.



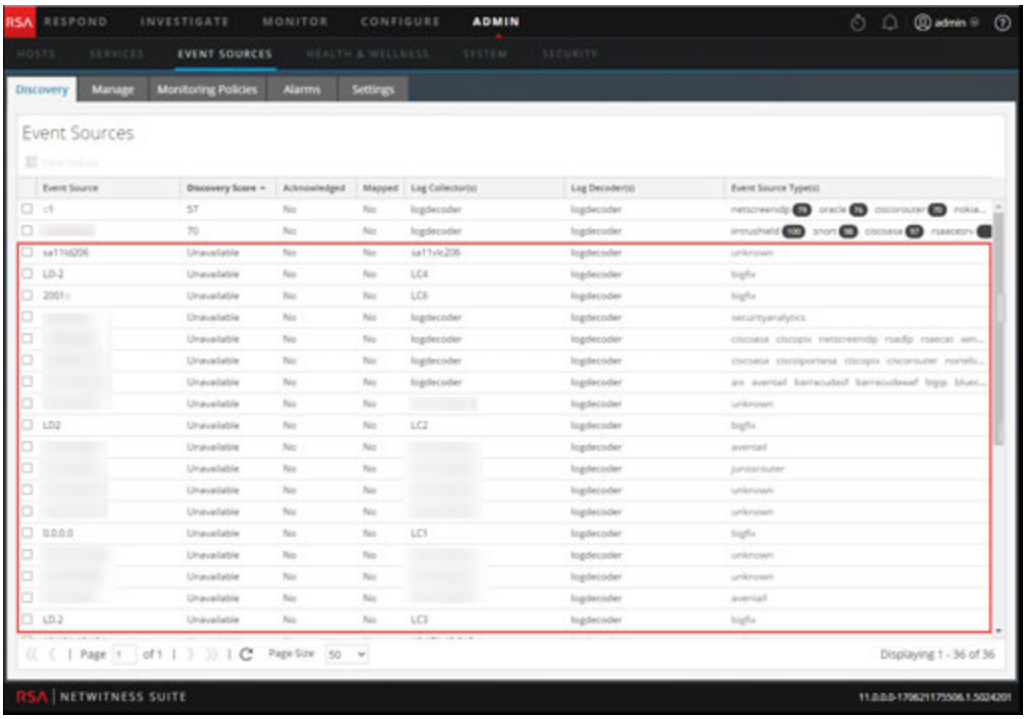
5. Restart the Log Decoder as follows.

   Select **Log Decoder > Explore > sys > Properties > shutdown**

This is an example of the **index-logdecoder-custom.xml** file.

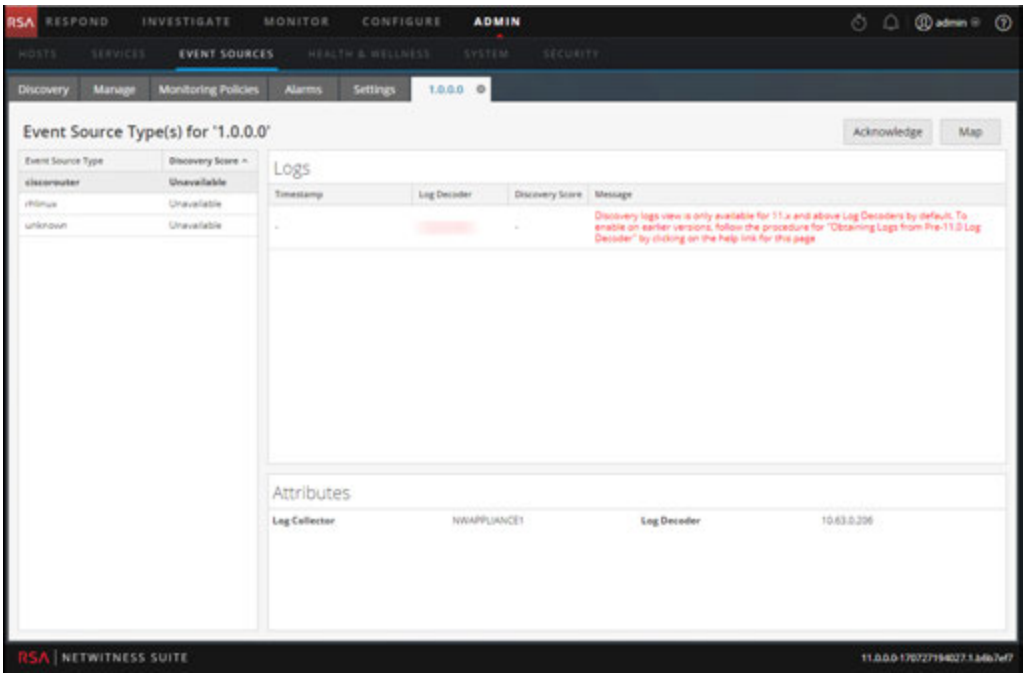
Note: Discovery Scores are only available for 11.0.0.0 and above Log Decoders. Discovery Scores for pre-11.0.0.0 Log Decoders display as Unavailable.

The following example displays the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0.0.0 Log Decoder.



Note: Device logs are only available for 11.0.0.0 and above Log Decoders.

The following example shows the message that displays in the displays in the Logs panel for a pre-11.0.0.0 Log Decoder.



Editing or Deleting Event Source Groups

You may occasionally need to remove an event source group. For example, if you close an office, and you had a group consisting of all the event sources in that office, you can remove the group, since none of those event sources will send information to NetWitness Suite.

Similarly, you may need to change some of the conditions that are used to populate the group.

Note: You cannot edit the event source group name. Once you create a group, that name exists as long as the group itself exists.

Edit an Event Source Group

1. Go to **ADMIN > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click  .

   The Edit Event Group dialog is displayed.
4. Modify any of the details, or add, edit or remove conditions as necessary.
5. Click **Save**.

Delete an Event Source Group

Note the following:

- You can delete any group except for the **All** group, which lists all configured event sources in the system.
- If you delete a group, the associated policy for that group also gets deleted automatically.
- If there are any event sources that belong **only** to the deleted group, they would no longer have a policy alarm associated with them. Remember that event sources can belong to multiple groups.
- Deleting a group has no effect on baseline alarms.

To delete an event source group:

1. Go to **ADMIN > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click .

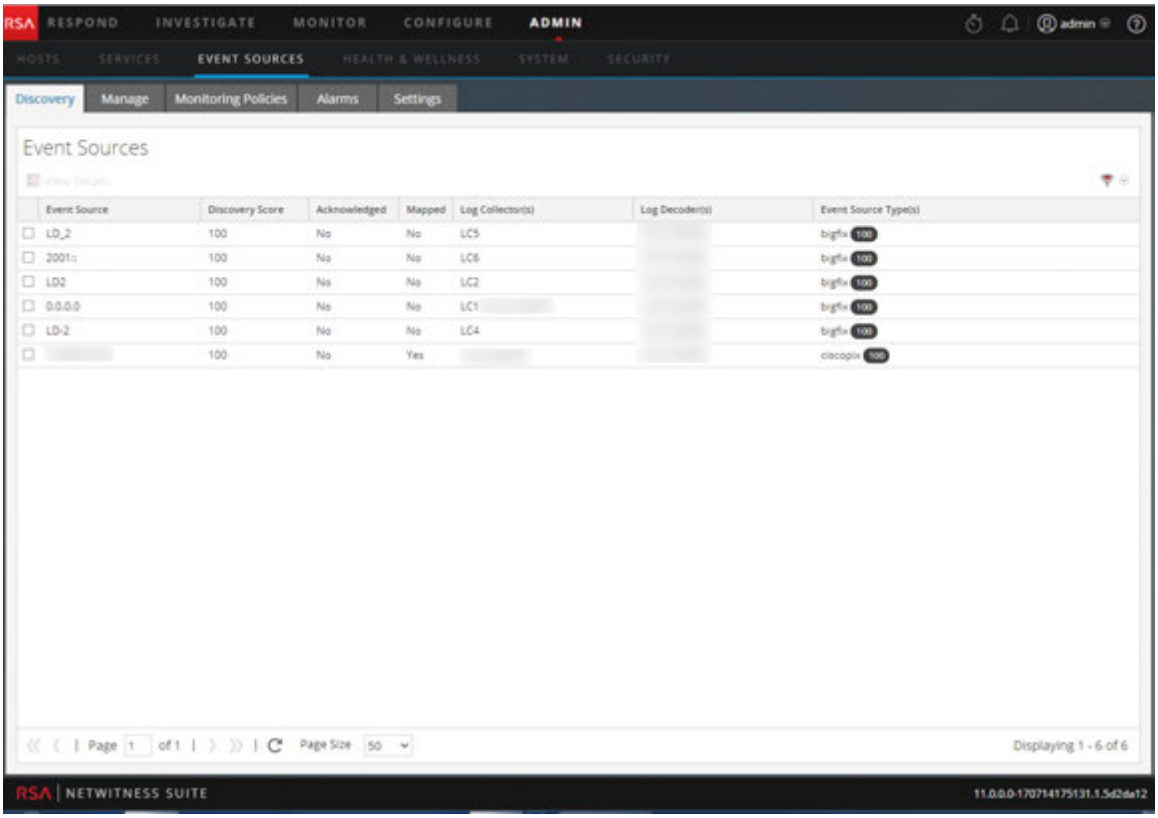
A confirmation dialog is displayed.

4. Click **Yes** to delete the group.

Creating an Event Source and Editing Attributes

You can organize your event sources into groups. You do this by entering values for various attributes for each event source. For example, for all of your high priority event sources, you could set the **Priority** to 1. You can see details about the available attributes on the Manage Event Source Tab.

The following figure shows an example of the Event Sources panel:



Event source attributes are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness Suite, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

Mandatory Attributes

The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you create an event source manually, you can enter these values. Once you save the event source, these values can no longer be changed.

Event sources can also be auto-discovered; any event source that sends messages to the Log Decoder will be added to the list of event sources. If you edit the attributes for an auto-discovered event source, you cannot edit any of these fields.

Note that not all of these fields are mandatory. To uniquely identify an event source, the following information is required:

- IP or IPv6 or Hostname, and
- Event Source Type

Additionally, RSA NetWitness Suite uses a hierarchy for IP, IPv6, and Hostname. The order is as follows:

1. IP
2. IPv6
3. Hostname

If you enter event sources manually, then you need to keep this order in mind, otherwise, you may end up with duplicates when messages are received from the event sources that you manually added.

All other attributes (such as Priority, Country, Company, Vendor, and so on) are optional.

Create an Event Source

1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, click + to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.
4. Enter or change the values for any attributes.
5. Click **Save**.

Update Attributes for an Event Source

1. Go to **ADMIN> Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, select an event source from the list.
4. In the **Event Sources** panel, click + to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.

5. Enter or change the values for any attributes, except for certain attributes that cannot be altered once entered.
6. Click **Save**

Bulk Editing Event Source Attributes

You can select multiple event sources, or an entire group, or even all event sources for bulk editing. For example, you might want to change the Priority or the Manager for a large number of your event sources.

Note: You cannot select individual event sources across displayed pages. For example, if you have a group with 225 event sources, and your Page Size is 50, you can only select event sources from the currently displayed 50 items.

If you want to edit items that span multiple pages, you can do the following:

- In the browser, increase the page size (the maximum is 500 entries on a single page). If your page size is small, you might be able to get all of your items on a single page.
- Create a new event source group that contains only the items that you want to bulk edit. Then, you can select all items for that group, rather than selecting individual items.
- Bulk edit incrementally. On the first page, select the items that you want to edit. Make your edits, then go to the next page and repeat the process, until you have made all of your changes.

Bulk Edit Attributes

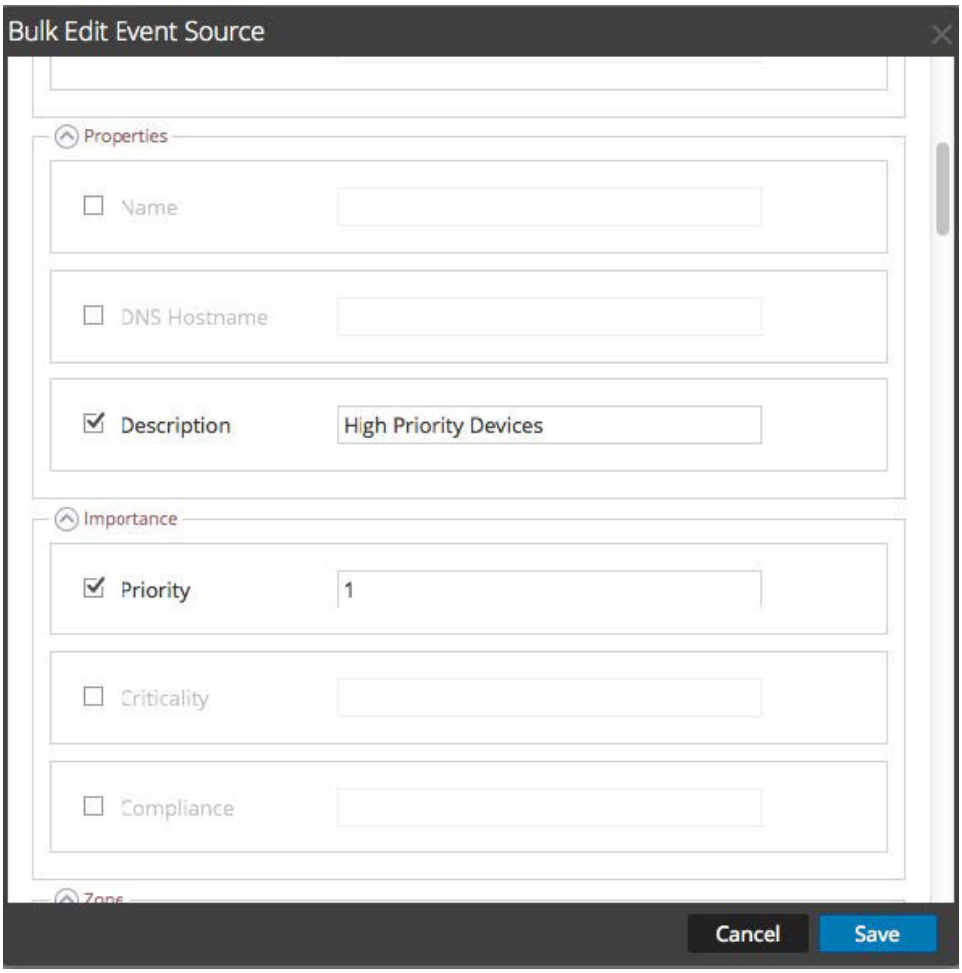
Note: Mandatory fields cannot be edited; IP, IPv6, Hostname, Event Source Type, Log Collector, and Log Decoder.

To bulk edit attributes for Event Sources:

1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.
3. Optionally, select an event source group.
4. In the **Event Sources** panel, select one or more event sources to edit.

   Note: To select all event sources, select the box next to the **Actions** column in the last (far-right) column of the list table.
5. Select the **Edit** icon from the menu bar.

The Bulk Edit Event Source dialog is displayed.



6. Enter values for any of the available attributes. In the screen shot above, the Name and Priority attributes have been updated.
7. When you have updated as many attributes as required, click **Save**.

Importing Event Sources

You can import event source attributes from a CSV-formatted file. To import information from a configuration management database (CMDB), a spreadsheet, or other type of file, first convert or save the information to a CSV file.

Note: The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you import an event source that includes a different value for any of these fields (when compared with the value in NetWitness Suite), the original value in NetWitness Suite will **not** be overwritten.

The imported attributes are associated with the matched Event Source and are available for use in rules to create Event Source Groups.

RSA NetWitness Suite treats the import file as the correct, complete record. This assumption leads to the following behaviors related to importing event source attributes:

- By default, when you import attributes, the system updates attributes for existing event sources only.
- If the event source exists in the import file, but not in NetWitness Suite, the attributes for that event source are ignored. That is, NetWitness Suite does **not** create a new event source for these attributes.
- If the event source exists in both the import file and NetWitness Suite, values for that event source are overwritten.
- If an attribute is blank in the import file, it clears the corresponding attribute in NetWitness Suite.
- If an attribute is not specified in the import file, then the corresponding attribute is ignored in NetWitness Suite (that is, it is **not** cleared).

Note: There is a difference between a blank attribute vs. one that is not specified at all. If an attribute is specified but blank, the assumption is that it is meant to be blank, and NetWitness Suite clears that attribute for the corresponding event source. However, if an attribute is not specified at all, it is assumed that no change is expected.

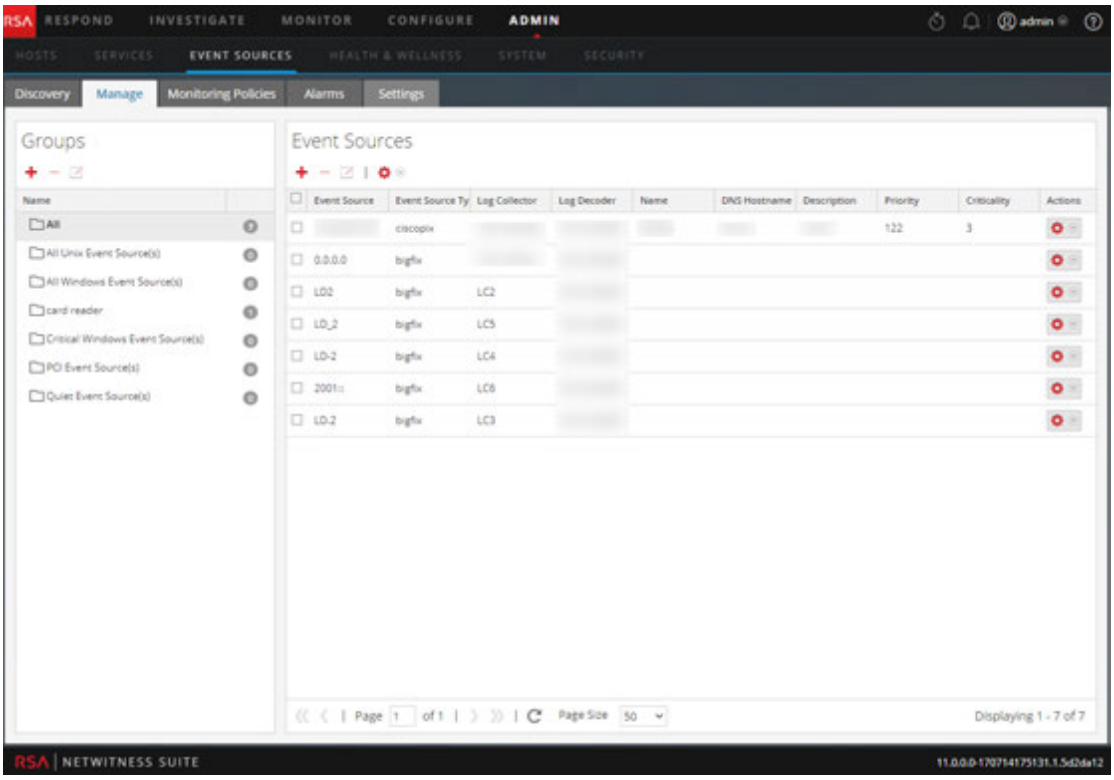
The above behaviors are the defaults—you can change the behavior as specified in the following procedure.

Import Event Source Attributes

To import Event Source attributes from a file:

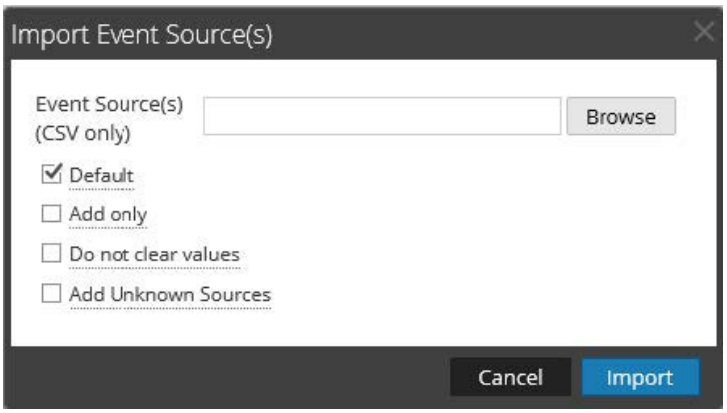
1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.

The Event Sources Manage tab is displayed.



3. From the Import/Export menu in the toolbar ( ), select **Import** (Import).

The Import Event Sources dialog is displayed.



4. Navigate to the import file, and select the appropriate boxes:
   - **Default**: The default behavior is described above.
   - **Add only**: Imports an attribute only if the corresponding field in NetWitness Suite is blank. Thus, no existing values will be overwritten.

- **Do not clear values**: Does not clear attribute values in NetWitness Suite for items in the import file that are blank.
- **Add Unknown Sources**: Adds new event sources based on items in the import file.

> **Note:** You can select multiple options.

5. Click **Import**.
6. Click **Yes** in the confirmation dialog to perform the import.

Troubleshooting the Import File

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Check the following:

- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:
  - IP or IPv6 or Hostname, and
  - Event Source Type
- The first line of the file must contain header names, and the names must match the names in NetWitness Suite. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Exporting Event Sources

You can export all or some of your event sources, along with their corresponding attributes, to a CSV file.

Note the following:

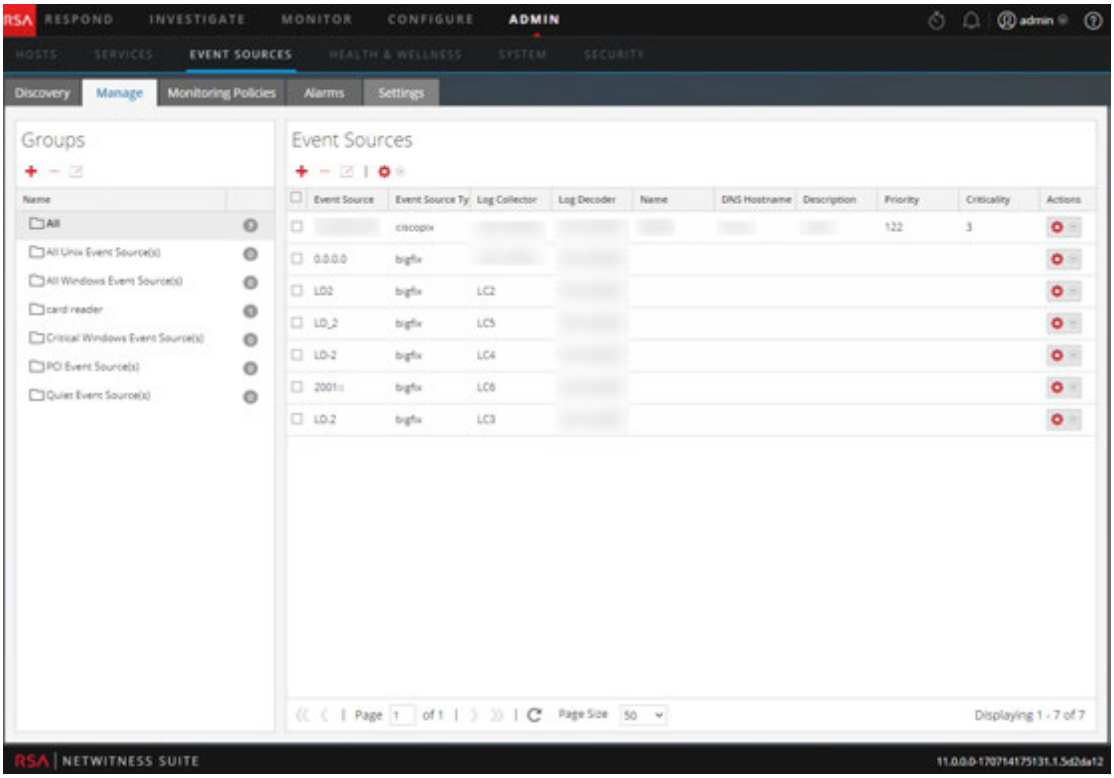
- The exported CSV includes all attribute columns.
- The exported CSV includes a header line at the top, listing each column name.
- You can export all entries in a group.
- You can export all entries (select the **All** group).
- You can select entries and export only those entries.

Export Event Sources

To export your Event Sources:

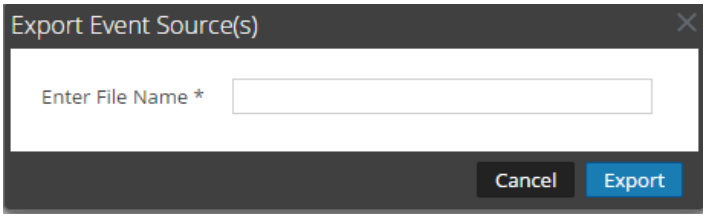
1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.



3. Select the group that contains the event sources to export.
4. Select as many event sources as you need. Alternatively, you can export the entire group: to export the entire group, you do not need to select any individual event sources.
5. From the Import/Export menu in the toolbar (), select **Export (.csv)** or **Export Group (.csv)**.

   The Export Event Sources dialog is displayed.



6. Enter a file name and click export.ddd

The event source attributes are saved to the file name you specified, in a CSV format.

Sorting Event Sources

The event sources panel displays attributes for the currently selected event source group. You can configure the list of attributes that are displayed, as well as sort the list on any of the displayed attributes.

Behavior

Note the following behaviors when sorting event sources:

- The entire list is sorted, not just the items displayed on the current page. (The navigation bar at the bottom of the page shows how many pages exist for this list of event sources.)
- The sort order is case sensitive. For any string column, if the values contains a mix of lower case and upper case, the upper case appears in the list before the lower case.

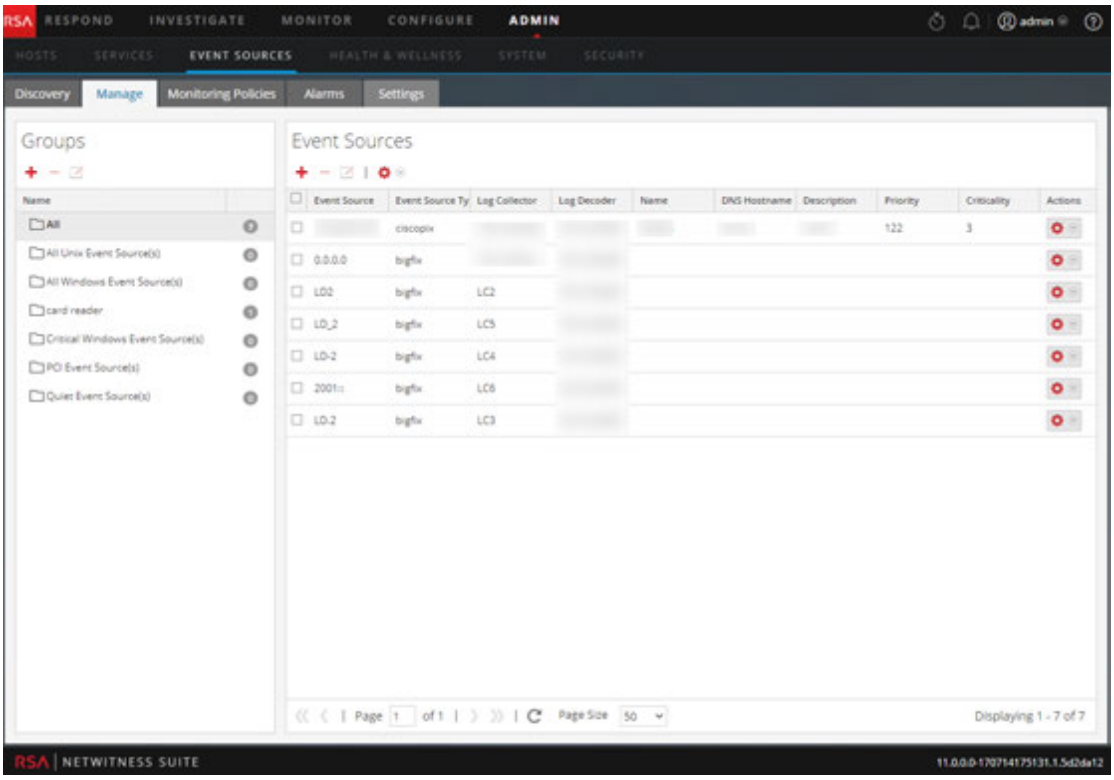
  For example, assume the Event Source Type column contains the following entries: BEDFORD, bangalore, Reston, London. The sort order would be as follows:

  - BEDFORD
  - bangalore
  - London
  - Reston

To sort your event sources:

1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.

The Event Sources Manage tab is displayed.



3. To sort a column, click + in the column header.

   The Sort Options drop-down menu is displayed.

4. Select the sort order that you want.

Monitoring Policies

Use the Monitoring Policies view to manage alert configuration for your event source groups.

You can create policies that alert on event source groups, by setting thresholds and notifications:

- Thresholds set ranges for frequency of log messages. You can specify a low threshold, a high threshold, or both.
- Notifications describe how and where to send alerts when thresholds are not met.
- You combine thresholds and notifications to create alerts based on the frequency you specify.
- If automatic alerting is enabled (it is by default), you can create and enable a policy ***without*** setting any thresholds. If you then turn on automatic notifications, notifications will be sent whenever an event source in the group is above or below its baseline by the specified amount.

For example, let's say that you have created an event source group that consists of all your Windows event sources based in the United Kingdom. You could specify a policy that alerts you whenever fewer than 1000 events per 30 minutes arrive.

Note: In addition to, or instead of setting up monitoring policies for your event source groups, you can Configuring Automatic Alerting to view alarms when the number of messages for an event source are outside of the normal bounds.

Configuring Event Source Group Alerts

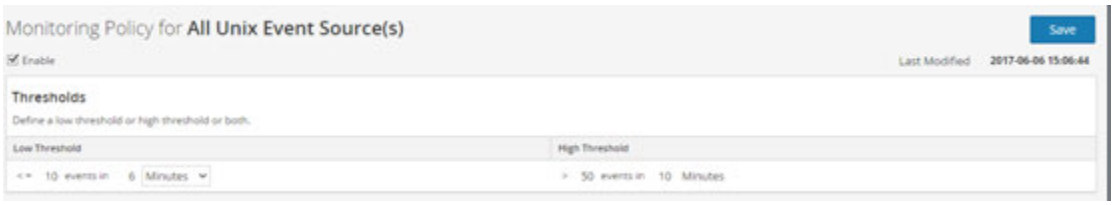
Each event source group can have its own alerting policy. This includes setting the thresholds for when to alert, and setting the notification type when an alert is triggered. This topic describes the steps involved in creating an alert policy for an event source group.

Procedures

Create an Alert Policy for an Event Source Group

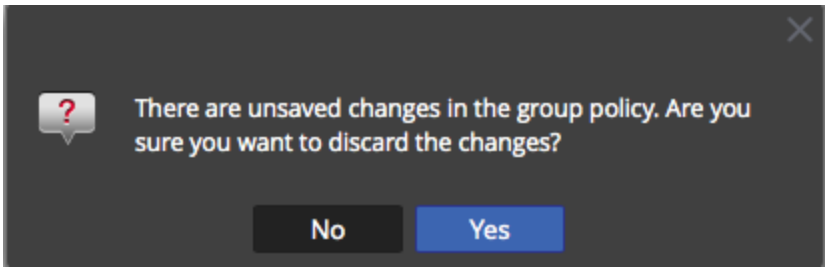
1. Go to **ADMIN > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Enter values for the Low Threshold and High Threshold fields.

   This is an example of alert thresholds.



5. Select **Enable** and click **Save** to enable the alert policy that you have configured.

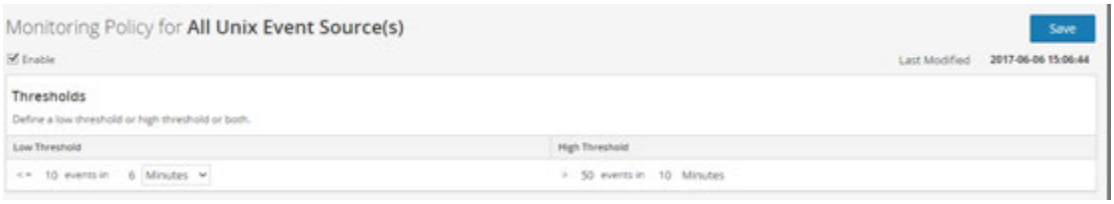
Note: If you make changes to a policy, and attempt to exit the page before you save your changes, an Unsaved Changes warning message is displayed:



Set and View the Thresholds for an Alert Policy

Every event source group is also an alert policy. Thresholds are part of an alert policy. You can set thresholds for each alert policy. For each policy, you can set a low threshold, a high threshold, or both. Additionally, you can enable a policy without setting any thresholds; this allows you to receive notifications based on automatic alerts. Automatic alerts are generated when the baseline for an event source is out of normal bounds.

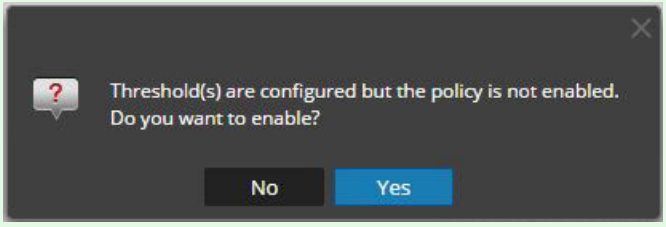
1. Go to **ADMIN > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
   Any thresholds set for the selected group are displayed in the **Thresholds** panel.



4. Edit the values in either the Low or High Threshold as follows:
   a. Enter the number of events for the threshold.
   b. Enter the number of minutes or hours for the threshold. The minimum value is 5 minutes.

   Note: For each threshold, you can set either the low values, the high values, or both.
5. Select **Enable** to enable alarms when thresholds are not met.

Note: If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy: ddd



For example, suppose you enter 10 and 30 for the values for the low threshold: `10 events in 30 minutes`, and 20 and 30 for the values for the high threshold: `20 events in 30 minutes`. This means that you expect between 10 to 20 events are logged in 30 minutes (for the selected event source group). That is, anything between the low and high threshold is considered normal, and does not trigger an alarm.

Note: Once you add a threshold for a policy, you cannot delete it. You can disable the policy, or set the low or high threshold to 0 events in 5 minutes. Five minutes is the minimum duration for a threshold.

Setting Up Notifications

This topic describes how to configure notifications for event source groups. Notifications are sent when thresholds are not met.

Notifications go hand-in-hand with Thresholds. Before you configure notifications, you should set up Thresholds for an event source group.

Note: After configuring the thresholds for an event source group, if you do not set any notifications, then even if an alarm is triggered, users are not notified. However, all alarms are visible on the Alarms Tab.

Prerequisites

Before you set up notifications for an event source group, you should review the available notification items:

- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP,

and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.

- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

Add Notifications for an event source group

To add notifications for an event source group:

1. Go to **ADMIN > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.

   Note: You should have already set a threshold for the group. If not, see Set and View the Thresholds for an Alert Policy to set a threshold, and then return to this procedure. Alternatively, if you have automatic alerting turned on, then you do not need to set thresholds for a policy. Automatic alarms generate notifications without the need to set thresholds.

4. In the Notifications panel, click +, and from the drop-down menu, select the type of notification you want to add:
   - Email
   - SNMP
   - Syslog

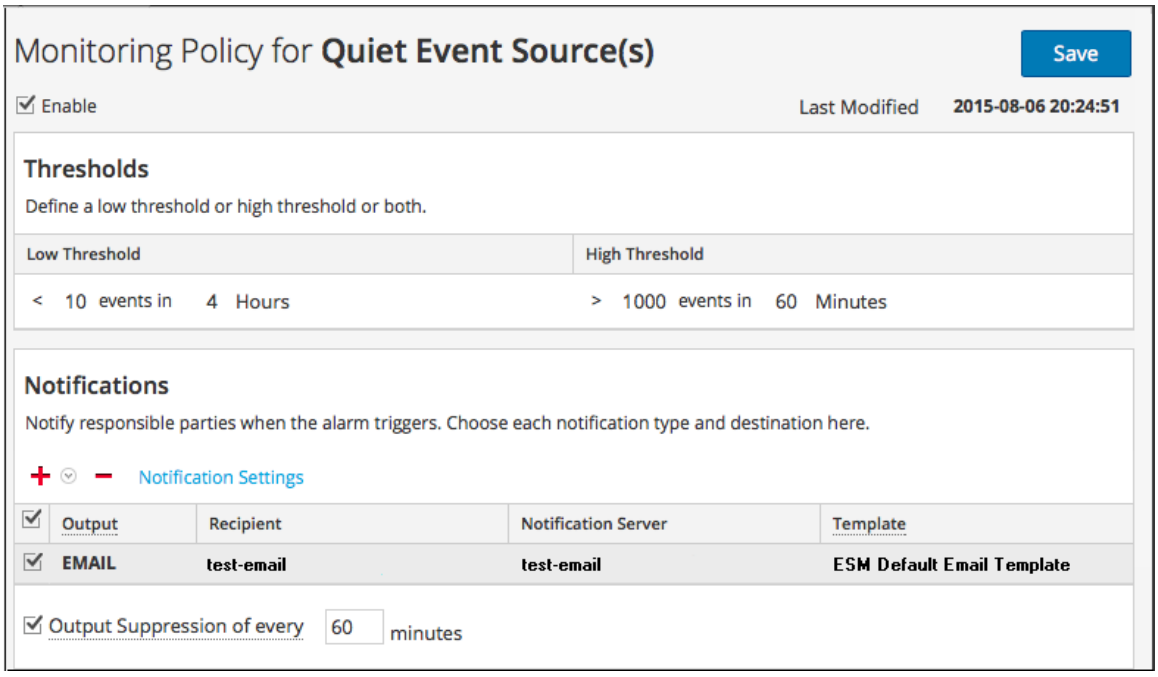
   Note: Default ESM (Event Source Monitoring) templates are provided for each type of notification.

5. Enter values for the Notification, Notification Server, and Template fields.
   a. For Notification, select from the list, or add a suitable notification type in **Notifications**, and then select it here.
   b. For the Server, select one from the list, or add a suitable server in **Notifications**, and then select it here.
   c. For Template, select an available template, or create a suitable template in **Notifications**, and then select it here.

> **Note:** If you need to add or edit one of these items, click **Notification Settings**. A new browser window opens on the **Administration > System > Global Notifications** page. Use this page to view or update the available Notification items.

6. Optionally, you can limit the rate of notifications for a policy.
   a. Select **Output Suppression** to enable setting a limit.
   b. Enter a value, in minutes, for the suppression rate. For example, if you enter **30**, notifications for this policy are limited to one notification every 30 minutes.
   c. Click **Save**.

Here is an example of a monitoring policy that contains a threshold and notification for an event source group.



Disabling Notifications

Notifications are sent when thresholds are not met. Additionally, automatic notifications are sent when baselines are not met. However, you may determine that you no longer require notifications for the event sources in a particular group. In this case, you can disable notifications for the event source group.

> **Note:** Even if you disable all notifications, the details for alarms are still visible on the Alarms Tab.

Prerequisites

You must have configured thresholds and notifications for an event source group, and enabled them. For automatic notifications, you must have selected **Enable Notifications From Automatic Monitoring** on the Alarms Tab

Disable Notifications

To disable notifications (both manual and automatic) for an event source group:

1. Go to **ADMIN> Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Click **Enable** to remove the check mark. Clearing this option means that notifications are not sent for this event source group, even if thresholds are not met or exceeded.
5. Additionally, you can remove all notifications. However, this is not required to stop the notifications.

Viewing Event Source Alarms

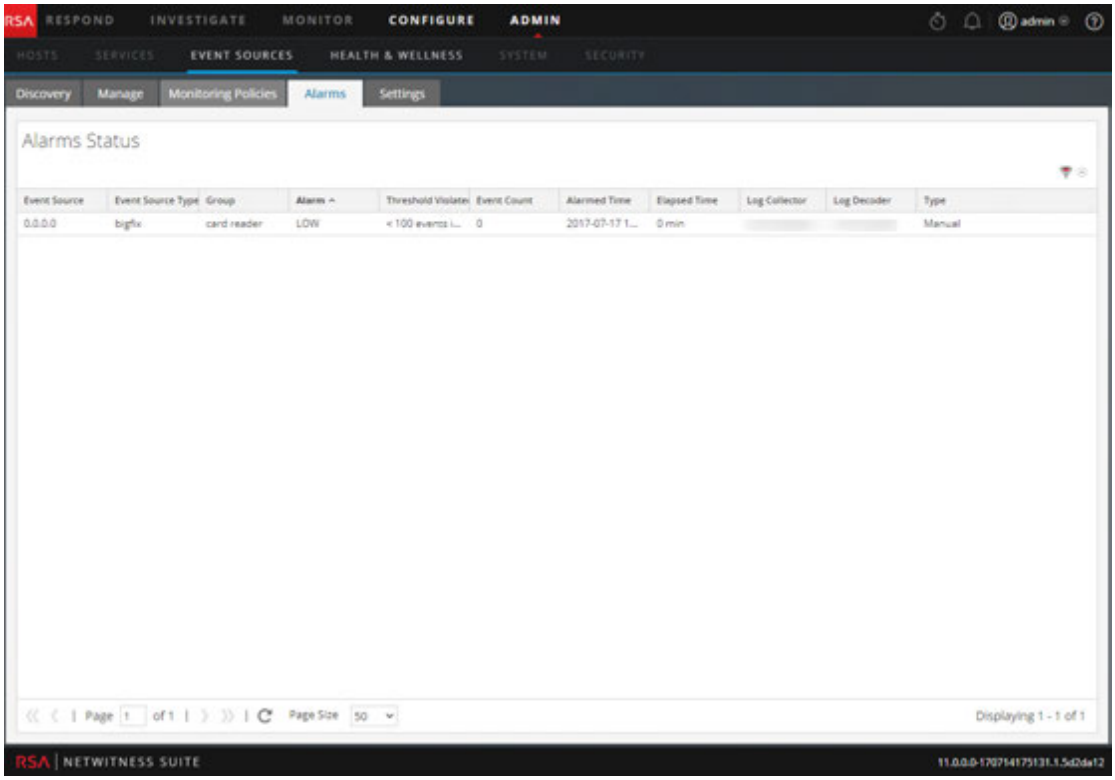
This topic describes how to view alarms for your event source groups. Once you have configured and set alerts, you can view all of the generated alarms in the **Alarms** tab of the **Event Sources** view.

Sort the Alarms Information

When you first access this view, the data is sorted by most recent alarm (the Alarmed time column). You can sort by any column.

1. Go to **ADMIN> Event Sources**.
2. Mouse over a column that you want to sort.
3. Click the Select the **Alarms** tab.
4. Mouse over the column that you want sorted, and click the ↓ icon.

   This is an example when you mouse over the Alarm column.



5. Select either **Sort Ascending** or **Sort Descending** to sort the column in the way you wish.

   The data is sorted across all pages.

Note: You can also sort by two columns. To do this, first sort by the secondary column, then sort by the primary column. For example, if you want to see all the HIGH alarms by their group order, first sort on **Group**, then sort on **Alarm**.

Filter Alarms by Type

You can also filter the alarms by their type: you can display only the Manual or Automatic (baseline) alarms. To filter by alarm type, select the filter icon on the right side of screen, in the heading area:

Select either Automatic or Manual:

- If you select Automatic, only the alerts based on baselines are displayed.
- If you select Manual, only the alarms for which you have set thresholds are displayed.

Configuring Automatic Alerting

Note: Automatic alerting, and it settings, are currently in Beta testing.

Prerequisites

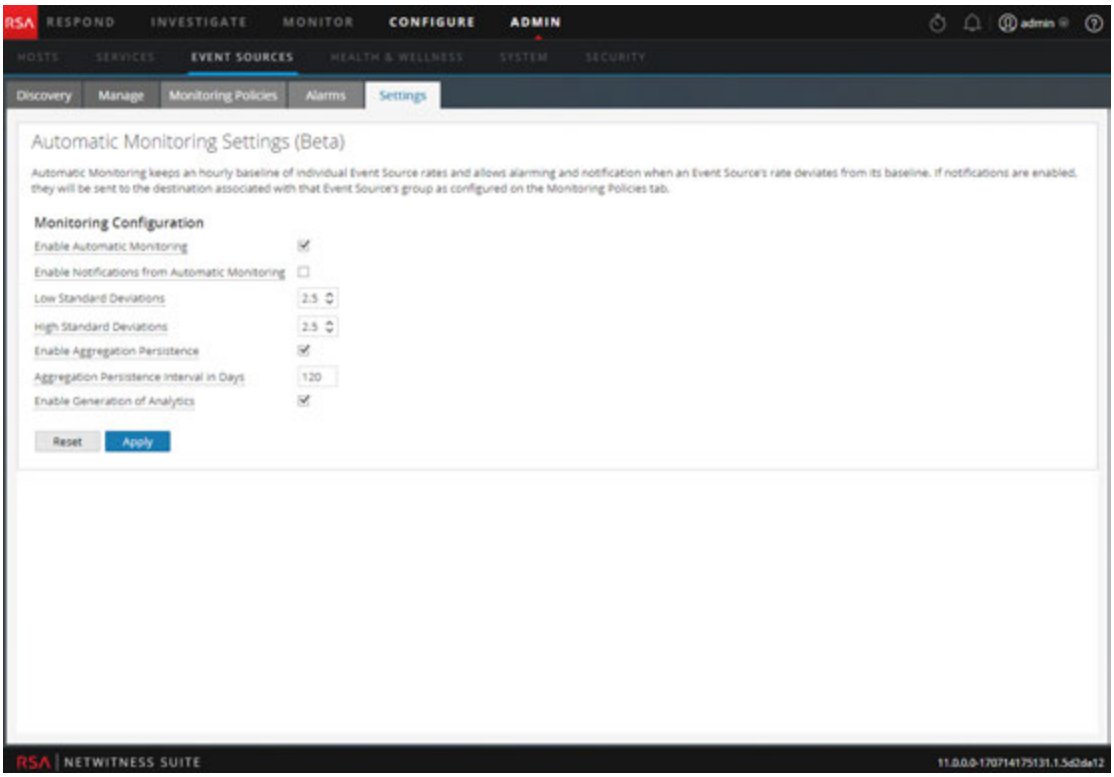
Before you set up notifications for an event source group, you should review the available notification items:

- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP, and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.
- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

To configure automatic alerting:

1. Go to **ADMIN > Event Sources**.
2. Select the **Settings** tab.

The Settings tab is displayed.



3. By default, automatic monitoring is turned on. To turn off automatic alerting, clear the **Enable Automatic Monitoring** option.
4. By default, notifications for automatic alerts is turned off. To turn on automatic notifications, select the **Enable Notifications From Automatic Monitoring** option.
5. Configure the parameters, based on your usage patterns:
   - **Low Standard Deviations**: standard deviations below which to receive alerts. Default is **2.0** (95% confidence).
   - **High Standard Deviations**: standard deviations above which to receive alerts. Default is **2.0** (95% confidence).

   Note: You can adjust the standard deviation settings in increments of 0.1 (one tenth) of a standard deviation. vvv
6. Click **Save** to close the dialog and save your settings.

Troubleshooting Event Source Management

Troubleshooting Topics:

Alarms and Notifications Issues

This topic describes how to address problems you may encounter with alarms or notifications.

Alarms

If you are not seeing alarms that you expect to see, make sure that you have configured all the necessary items, as discussed below.

Automatic Alarms

To see automatic alarms appear on the Alarms screen, the **Enable Automatic Monitoring** option must be selected.

This option is on the **Setting** tab (**ADMIN** > **Event Sources** > **Settings**), and is selected by default. However, at some point someone may have cleared this option.

Manual Alarms

To see manual alarms appear on the Alarms screen, all of the following conditions must be met:

- The event source must be part of a Group.
- The Group must have a policy with either a low or high (or both) threshold defined.
- The Group Policy must be enabled.

Notifications

If you are seeing alarms, but are not receiving the expected notifications, make sure that you have configured all the necessary items, as discussed below.

Also, make sure that you have correctly configured the Notification Servers and Notification Outputs. Much of the preliminary configuration for Notifications is done from **ADMIN > System > Global Notifications**. For details, see the **Global Notifications Panel** topic in the *System Configuration Guide*.

Automatic Notifications

To have the system send automatic notifications, all of the following conditions must be met:

- The **Enable Automatic Monitoring** option must be selected (this option is selected by default).
- The **Enable Notifications From Automatic Monitoring** option must be selected. This option is cleared by default, so you or someone in your organization must select it. Navigate to **ADMIN** > **Event Sources** > **Settings** to see this option.
- The event source that triggered the alarm must be in a group that has a policy enabled: note that no thresholds need to be set for automatic notifications.
- The policy must at least one notification configured (either email, SNMP or Syslog).

Manual Notifications

To have the system send manual notifications (that is, a notification which says that a manual alarm was triggered):

- The event source that triggered the alarm must be in a group that has a group policy enabled.
- There must be a threshold set for the policy.
- At least one notification has been configured for the policy.

Duplicate Log Messages

It is possible that you are collecting messages from the same event source on two or more Log Collectors. This topic describes the problem and ways to troubleshoot the issue.

Details

If the ESM aggregator detects the same events for the same event source on multiple Log Collectors, you receive a warning similar to the following:

```
2015-03-17 15:25:29,221 [pool-1-thread-6] WARN
com.rsa.smc.esm.groups.events.listeners.EsmStatEventListener -
 192.0.2.21-apache had a previous event only 0 seconds ago; likely
because it exists on multiple log collectors
```

This warning message means the `192.0.2.22-apache` event source is being collected by multiple hosts. You can see the list of hosts in the Log Collector column in the **Manage** tab in the Administration > Event Sources view.

Clean Up Duplicate Messages

1. Stop collectd on NetWitness Suite and Log Decoders:

   ```
   Service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness Suite:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.

   a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`.

   b. Click **decoder(*)** to view the properties for the decoder.

   c. In the Properties drop-down menu, select **reset**, then click **Send**.

4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.

Troubleshooting Feeds

The purpose of the feed generator is to generate a mapping of an event source to the list of groups to which it belongs.

If you have an event source from which you are collecting messages, and yet it is not displayed in the correct event source groups, then this topic provides background and information to help you track down the problem.

Details

The ESM Feed maps multiple keys to single value. It maps the DeviceAddress, Forwarder, and DeviceType attributes to groupName.

The purpose of the ESM feed is to enrich event source Meta with the groupName collected on the Log Decoder.

How it Works

The feed generator is scheduled to update every minute. However, it is triggered only if there are any changes (create, update, or delete) in event sources or groups.

It generates a single feed file with event source to group mapping, and pushes the same feed to all of the Log Decoders that are connected to NetWitness Suite.

Once the feed file is uploaded on the Log Decoders, for any new events, it enriches events Meta data with groupName, and appends this groupName to logstats.

Once the groupName is in logstats, the ESM Aggregator groups information and sends it to ESM. At this point, you should see the **Group Name** column under the **Event Source Monitoring** tab.

The entire process can take some time. Therefore, you may need to wait for several seconds after you add a new group or event source, before the Group name is displayed.

Note: If the event source type attribute changes when the feed is updated, NetWitness Suite adds a new logstats entry, rather than updating the existing one. Thus, there will be two different logstats entries in logdecoder. Previously existing messages would have been listed under the previous type, and all new messages are logged for the new event source type.

Feed File

The format of the feed file is as follows:

```
DeviceAddress, Forwarder, DeviceType, GroupName
```

The `DeviceAddress` is either `ipv4, ipv6`, or `hostname`, depending on which of these have been defined for the event source.

The following is a sample of the feed file:

```
"12.12.12.12","d6","NETFLOW","grp1"
"12.12.12.12","ld4","netflow","grp1"
"12.12.12.12","d6","netfow","grp1"
"0:E:507:E6:D4DB:E:59C:A","10.25.50.243","apache","Apac
hegrp"
"1.2.3.4","LCC","apache","Apachegrp"
"10.100.33.234","LC1","apache","Apachegrp"
"10.25.50.248","10.25.50.242","apache","Apachegrp"
"10.25.50.251","10.25.50.241","apache","Apachegrp"
"10.25.50.252","10.25.50.255","apache","Apachegrp"
"10.25.50.253","10.25.50.251","apache","Apachegrp"
"10.25.50.254","10.25.50.230","apache","Apachegrp"
"10.25.50.255","10.25.50.254","apache","Apachegrp"
"13.13.13.13","LC1","apache","Apachegrp"
"AB:F255:9:8:6C88:EEC:44CE:7",,"apache","Apachegrp"
"Appliance1234",,"apache","Apachegrp"
"CB:F255:9:8:6C88:EEC:44CE:7","10.25.50.253","apache","
Apachegrp"
```

Troubleshooting Feeds

You can check the following items to narrow down where the problem is occurring.

10.5 Log Decoders

Are your NetWitness Suite Log Decoders at version 10.5 or later? If not, you need to upgrade them. For NetWitness Suite version 10.6, feeds are sent only to version 10.5 and later Log Decoders.

Feed File Existence

Verify that the feeds ZIP archive exists in the following location:

`/opt/rsa/sms/esmfeed.zip`

Do not modify this file.

Group Meta Populated on LD

Verify that the group meta is populated on the Log Decoder. Navigate to the Log Decoder REST and check logstats:

`http://LogDecoderIP:50102/decoder?msg=logStats&force-content-type=text/plain`

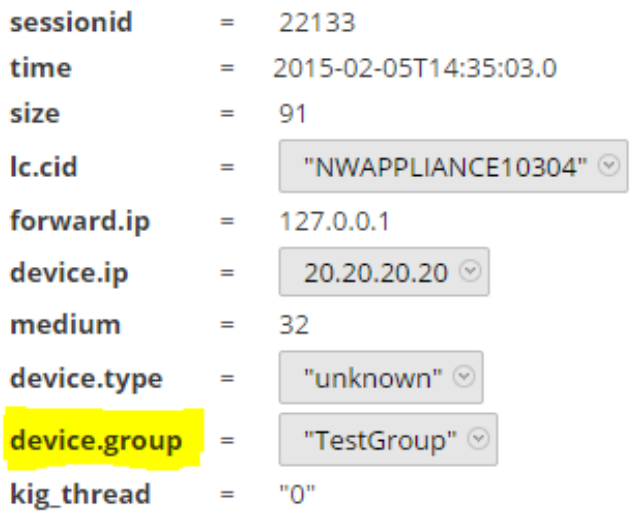
This is a sample logstats file with group information:

```
device=apache forwarder=NWAPPLIANCE10304 source=1.2.3.4
count=338 lastSeenTime=2015-Feb-04 22:30:19
lastUpdatedTime=2015-Feb-04 22:30:19
groups=IP1234Group,apacheGroup
device=apachetomcat forwarder=NWAPPLIANCE10304
source=5.6.7.8 count=1301 lastSeenTime=2015-Feb-04
22:30:19 lastUpdatedTime=2015-Feb-04 22:30:19
groups=AllOtherGroup,ApacheTomcatGroup
```

In the above text, the group information is bolded.

Device Group Meta on Concentrator

Verify that the **Device Group** meta exists on the Concentrator, and that events have values for the `device.group` field.



SMS Log File

Check the SMS log file in the following location to view informational and error messages: `/opt/rsa/sms/logs/sms.log`

The following are example *informational* messages:

```
Feed generator triggered...
Created CSV feed file.
Created zip feed file.
Pushed ESM Feed to LogDeocder : <logdecoder IP>
```

The following are example *error* messages:

```
 Error creating CSV File : <reason>Unable to push the
ESM Feed: Unable to create feed zip archive.
Failed to add Group in CSV: GroupName: <groupName> :
Error: <error>
Unable to push the ESM Feed: CSV file is empty, make
sure you have al-least on group with al-least one
eventsource.
Unable to push the ESM Feed: No LogDecoders found.
Unable to push the ESM Feed: Unable to push feed file
on LogDecoder-<logdecoderIP>Unable to push the ESM
Feed: admin@<logdecoderIP>:50002/decoder/parsers
received error: The zip archive
"/etc/netwitness/ng/upload/<esmfeedfileName>.zip" could
not be opened
Unable to push the ESM Feed: <reason>
```

Verify Logstats data is getting Read & Published by ESMReader & ESMAggregator

These are the steps to verify that logstats are collected by **collectd** and published to Event Source Management.

ESMReader

1. On Log Decoders add **debug "true"** flag in **/etc/collectd.d/NwLogDecoder_ESM.conf**:

```
#
# Copyright (c) 2014 RSA The Security Division of EMC
#
<Plugin generic_cpp>    PluginModulePath "/usr/lib64/collectd"
    debug "true"

    <Module "NgEsmReader" "all">
        port      "56002"
        ssl       "yes"
        keypath   "/var/lib/puppet/ssl/private_keys/d4c6dcd4-
6737-4838-a2f7-    ba7e9a165aae.pem"
        certpath  "/var/lib/puppet/ssl/certs/d4c6dcd4-6737-4838-
a2f7-   ba7e9a165aae.pem"
        interval  "600"
        query     "all"
        <stats>
        </stats>
    </Module>
    <Module "NgEsmReader" "update">
        port      "56002"
        ssl       "yes"
        keypath   "/var/lib/puppet/ssl/private_keys/d4c6dcd4-
6737-4838-a2f7-    ba7e9a165aae.pem"
        certpath  "/var/lib/puppet/ssl/certs/d4c6dcd4-6737-4838-
a2f7-   ba7e9a165aae.pem"
        interval  "60"
        query     "update"
        <stats>
        </stats>
    </Module>
</Plugin>
```

2. Run the command:

```
collectd service restart
```

3. Run the following command:

   ```
   tail –f /var/log/messages | grep collectd
   ```

   Verify that ESMReader is reading logstats and there are no errors. If there are any read issues, you will see errors similar to the following:

   ```
   Apr 29 18:47:45 NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_
   all: error getting ESM data for field "groups" from logstat
   device=checkpointfw1 forwarder=PSRTEST source=1.11.51.212. Reason:
   <reason>Apr 29 18:58:36 NWAPPLIANCE15788 collectd[14569]: DEBUG:
   NgEsmReader_update: error getting ESM data for field "forwarder" from
   logstat device=apachetomcat source=10.31.204.240. Reason: <reason>
   ```

ESMAggregator

1. On NetWitness Suite, uncomment the verbose flag in **/etc/collectd.d/ESMAggregator.conf**:

   ```
   # ESMAggregator module collectd.conf configuration file
   #
   # Copyright (c) 2014 RSA The Security Divsion of EMC
   #
   <Plugin generic_cpp>
   PluginModulePath "/usr/lib64/collectd"
   <Module "ESMAggregator">
           verbose 1
           interval "60"
           cache_save_interval "600"
           persistence_dir "/var/lib/netwitness/collectd"
   </Module>
   </Plugin>
   ```

2. Run the following:

   ```
   collectd service restart.
   ```

3. Run the following command:

   ```
   run "tail –f /var/log/messages | grep ESMA
   ```

   Look for ESMAggregator data and make sure your logstat entry is available in logs.

Sample output:

```
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator:
MetaData[0] logdecoder[0] = d4c6dcd4-6737-4838-a2f7-ba7e9a165aae
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator:
MetaData[1] logdecoder_utcLastUpdate[0] = 1425174451
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator:
```

```

MetaData[3] logdecoders = 767354a8-5e84-4317-bc6a-52e4f4d8bfff
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator:
MetaData[4] utcLastUpdate = 1425174470
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator:
Dispatching RRD stat NWAPPLIANCE15788/esma_rrd-cacheflowelff/esm_
counter-3.3.3.3 with a value of 1752 for
NWAPPLIANCE15788/cacheflowelff/esm_counter-3.3.3.3 aggregated from 1 log
```

Configure JMX Feed Generator Job Interval

Although the feed generation job is scheduled to execute every minute by default, you can change this by using **jconsole**, if necessary.

To change the feed generator job interval:

1. Open **jconsole** for the SMS service.
2. On the MBeans tab, navigate to **com.rsa.netwitness.sms** > **API** > **esmConfiguration** > **Attributes**.
3. Modify the value for the property **FeedGeneratorJobIntervalInMinutes**.

4. Go to **Operations** under the same navigation tree, an click **commit()**. This persists the new value in the corresponding json file under **/opt/rsa/sms/conf**, and uses the value if SMS is restarted.

Setting a new value reschedules the feed generator job for the new interval.

Import File Issues

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Check the following:

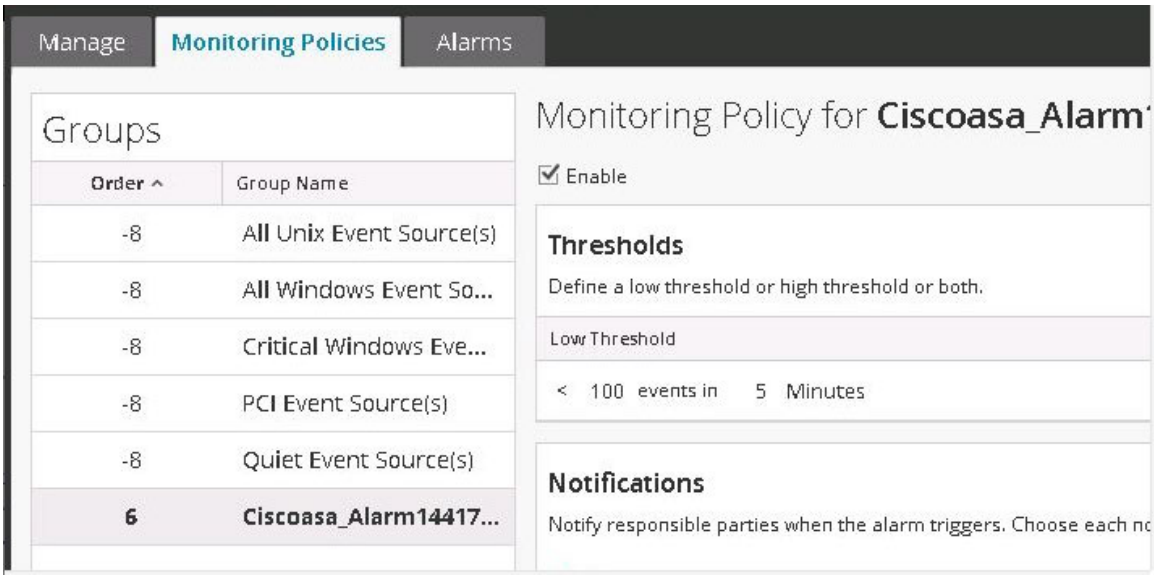
- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:
  - IP or IPv6 or Hostname, and
  - Event Source Type
- The first line of the file must contain header names, and the names must match the names in NetWitness Suite. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

Negative Policy Numbering

You may see negative numbers in the Order field in the Groups section of the Monitoring Polices tab. This topic describes a workaround to restore the correct numbering scheme for your policies.

Details

The following screen shows an example of the situation where the numbers of group policies become negative.



If you encounter this situation, drag and drop the top group (**All Unix Event Source(s)** in the above image) to after the last group (**Ciscoasa_Alarm14417**). This restores normal, ordinal numbering. You can then continue to drag and drop groups until you have them in their proper order for your organization.

Clean Up Duplicate Messages

1. Stop collectd on NetWitness Suite and Log Decoders:

   ```
   Service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness Suite:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.

   a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`

   b. Click **decoder(*)** to view the properties for the decoder.

   c. In the Properties drop-down menu, select **reset**, then click **Send**.

4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.

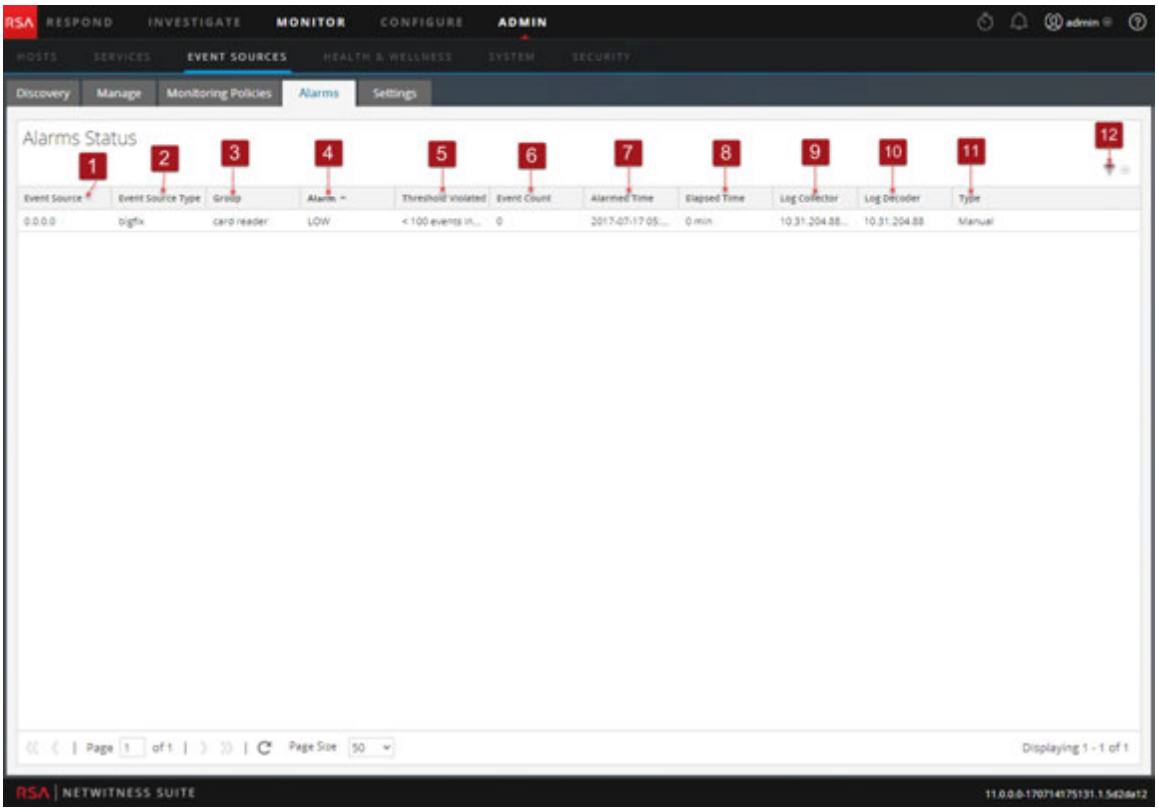
Viewing Event Source Alarms

Managing Event Source Groups

Quick Look

The Alarms tab presents the details for Event Sources that are currently in violation of a policy and threshold. Only Event Sources in violation of a policy appear in the list. Once the event source returns to a normal state, the corresponding alarm disappears from the list.

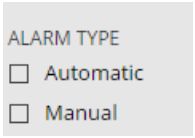


1	Displays the IP, IPv6, or Hostname of the event source that is alarmed.
2	Displays the type of the alarmed event source. For example, **winevent_nic** (for Microsoft Windows) or **rhlinux** (for Linux).
3	Displays the event source group that contains the event source for which the alarm has been triggered.
4	Displays the type of threshold that was triggered: **High** or **Low**
5	Displays the conditions of the threshold that was triggered. For example: `5,000,000 events in 5 minutes`
6	Displays the number of events in the threshold time period causing the alarm.
7	Displays the initial time the event source went into an alarmed state. **Note:** When you first access this view, the data is sorted by this column (most recent alarm first).
8	Displays the elapsed time since the event source entered an alarmed state.
9	Displays the Log Collector last collecting from this event source.
10	Displays the Log Decoder last receiving from this event source.

11 Displays the alarm type. Alarm type is either **Manual** or **Automatic**:

- **Manual**: these are alarms that violate the configured threshold policy.
- **Automatic**: these are alarms that deviate from the baseline for the alarmed event source.

12 Select the **Filter** icon to display the **Filter** menu:



Select either **Automatic** or **Manual**:

- If you select **Automatic**, only the alerts that are based on baselines are displayed.
- If you select **Manual**, only the alarms for which you have set thresholds are displayed.

Note: You can hide or show columns by right-clicking in the table header and choosing **Columns** from the drop-down menu. Select a column to display it, or clear the column to hide it.

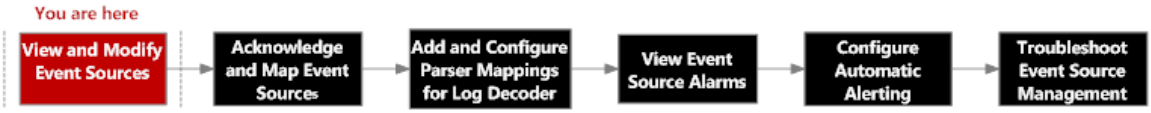
Discovery Tab

To access this tab, in the NetWitness ADMIN> Event Sources. The Discovery tab is displayed.

The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

Workflow

This workflow shows the overall process for configuring event sources.



What do you want to do?

Role	I want to...	Documentation
Administrator	Acknowledge that the discovered event source types are correct.	Acknowledging and Mapping Event Sources
Administrator	Map the parsers that should be used for an event source when the discovered types are not completely accurate.	Acknowledging and Mapping Event Sources

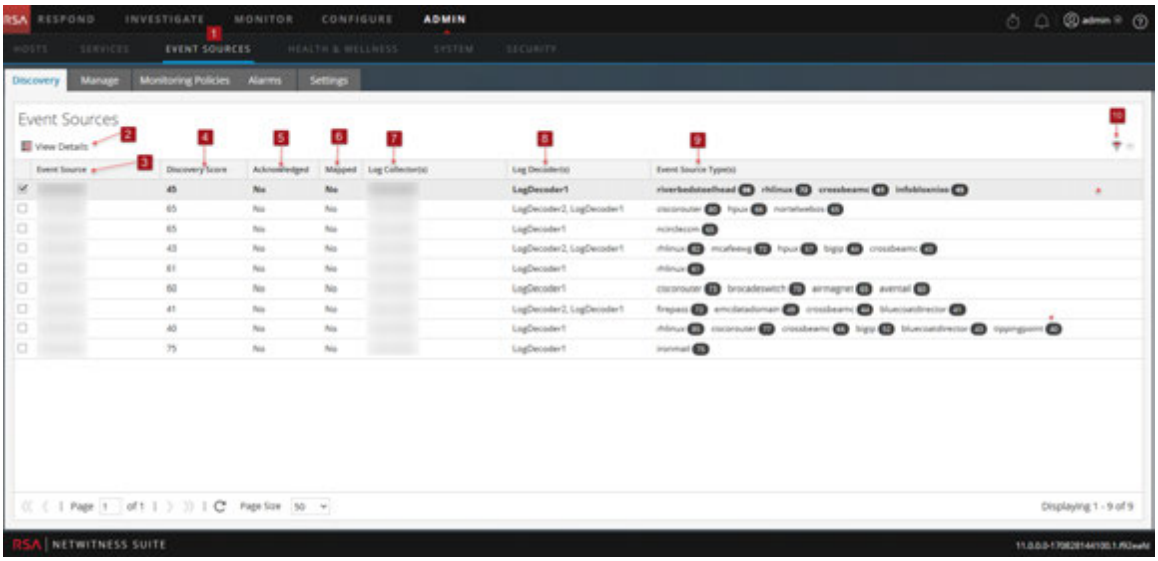
Manage Parser Mappings

Details View

Quick Look

The following example displays a list of addresses and their discovered Event Source types. The Event Source types display the Event Sources that have been discovered.

This is an example of the tab.



1	Displays the Event Source panel with the Discovery tab open.
2	View Details button to view details of the selected Event Source.
3	Displays the address of the selected Event Source.
4	Displays the discovery score of the selected Event Source.
5	Displays whether or not the selected Event Source has been acknowledged.
6	Displays whether or not the selected Event Source has been mapped to a corresponding Event Source type.
7	Displays the host names of the Log Collectors where the Event Sources are located.
8	Displays the host names of the Log Decoders where the Event sources are located.
9	Displays the discovered Event Source Types and their associated discovery scores.
10	Displays the Show Acknowledged and Show Mapped filter with options to acknowledge and map selected event sources.

Toolbar and Features

The Discovery tab contains the following features:

Field	Description
Tools 	The following item is available on the toolbar: **View Details**: Provides details on the selected Event Source.

Field	Description
Event Source	The IP, IPv6, or Hostname of the Event Source.
Discovery Score	Displays the overall discovery score associated with that particular address. Higher scores indicate better confidence. Discovery scores range from 0 (least confident) to 100 (most confident).
Acknowledged	Selections are either **Yes** (you have acknowledged the Event Source) or **No** (you have not acknowledged the Event Source).
Mapped	Selections are either **Yes** (you mapped the Event Source) or **No** (you have not mapped the Event Source).
Log Collector(s)	Log Collectors that have received logs from this Event Source address.
Log Decoder(s)	Log Decoders that have received logs from this Event Source address.
Event Source Type(s)	The parsed type(s) of the Event Source address and the corresponding Discovery Score for each type.

Note: Discovery Scores are only available for 11.0.0.0 and above Log Decoders. Discovery Scores for pre-11.0.0.0 Log Decoders display as Unavailable.

The following table describes the sorting order for discovery scores. To access the Sorting Order drop-down menu, click on the down arrow in the Event Sources column.

Field	Description
Sort Ascending	Sort the column by discovery score in ascending order.
Sort Descending	Sort the column by discovery score in descending order.

Field	Description
Columns	Used to hide or show one or more columns, as shown in the following example. 
Details View

The **Details** view allows you to see details about the Event Source, as well as viewing a sample of the logs identified for each type in order to verify their accuracy.

You can access the **Details** view in a couple of ways.

- From the Toolbar, click the **View Details** button. Or, you can
- Double-click on the Event Source you selected.

Workflow

This workflow shows the overall process for configuring event sources.

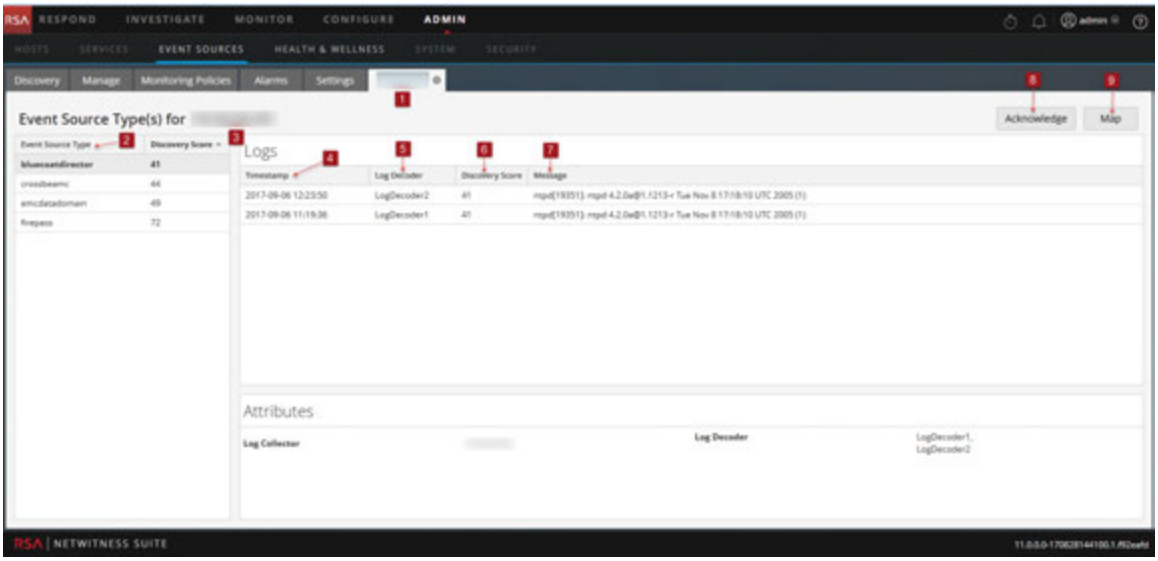
What do you want to do?

Role	I want to...	Documentation
Administrator	View logs for a 10.6 Log Decoder.	Viewing Logs from Pre-11.0.0.0 Log Decoder
Administrator	Acknowledge that all the discovered Event Source types are correct	Manage Parser Mappings
Administrator	Map selected Event Sources.	Manage Parser Mappings

Quick Look

The following example shows the discovery scores, event source types, logs, and attributes that correspond with the Event Source you selected in the Event Sources panel for a single Log Decoder.

Note: Device logs are only available for 11.0.0.0 and above Log Decoders.



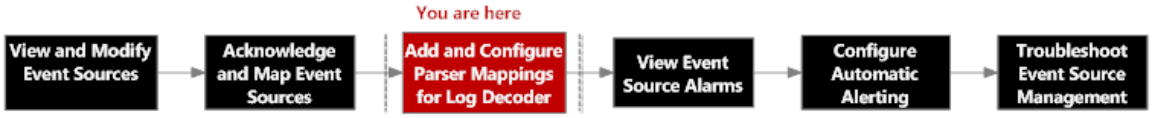
1	Displays the address of the selected Event Source.
2	Displays the type of the selected Event Source.
3	Displays the discovery score for the selected Event Source from least confident (0) to most confident (100).
4	Displays timestamps for the last few logs that have been parsed to the selected Event Source Type.
5	Displays the address of the Log Decoder that is parsing event sources.
6	Displays the discovery score of the corresponding log.
7	Displays logs for the selected Event Source type.
8	Allows you to acknowledge that all the discovered Event Source types are correct.
9	Allows you to set the appropriate parsers for selected Event Source addresses.
10	Displays the Event Source Management attributes for the selected Event Source Type.

Manage Parser Mappings

The **Manage Parser Mappings** dialog allows you to map the appropriate parsers for selected Event Source addresses. From the **Details** view, select the **Map** button.

Workflow

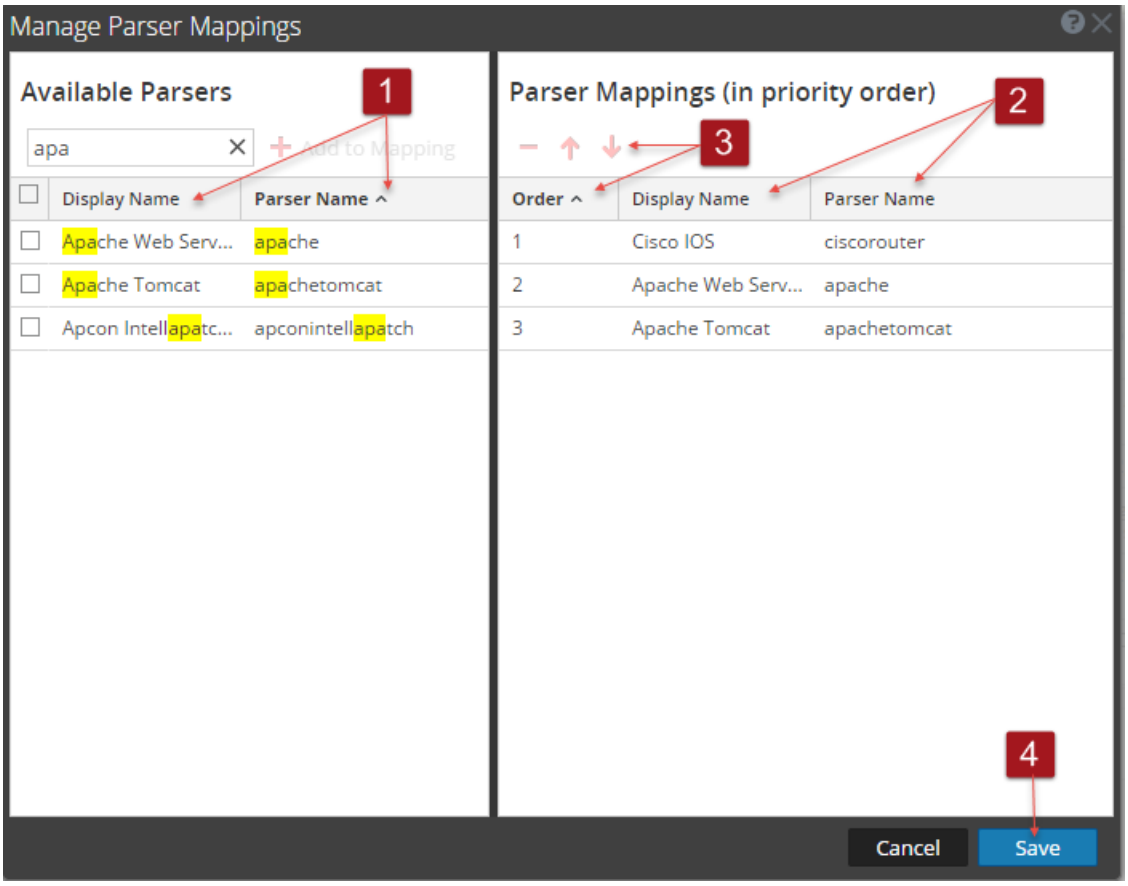
This workflow shows the overall process for configuring event sources.



What do you want to do?

Role	I want to...	Documentation
Administrator	Map parsers for selected Event Source addresses.	Details View

Quick Look



1	Displays all the available parsers that you can map based on the event sources that you selected from the **Discovery** view. Also displays the mappings that are already present in the Log Decoders for the selected event source or the parsers that have been discovered. To filter your available parsers, type the first few letters of the parser name that you want to map. Click the **Add to Mapping** button to add the parser to the parser mappings listed in the right panel. You need to select parsers before the **Add toMapping** button is enabled. Add the selected parser by clicking the **Add to Mapping** button in the right panel. You can rearrange the order of the parser mappings using the up and down arrow keys and you can also drag and drop selected parser mappings. You can select multiple mappings by pressing the **Ctrl** key.
2	Displays the names of the selected parsers that you want to map.
3	Displays the order of the selected parser mappings. You can delete parser mappings by selecting the minus sign ( ). Press the **Ctrl** key to select multiple mappings to perform group operations on them.
4	Click **Save** to save your mappings to all the Log Decoders. A pop-up message informs you that your mappings are successfully saved. When the window is closed, the banner

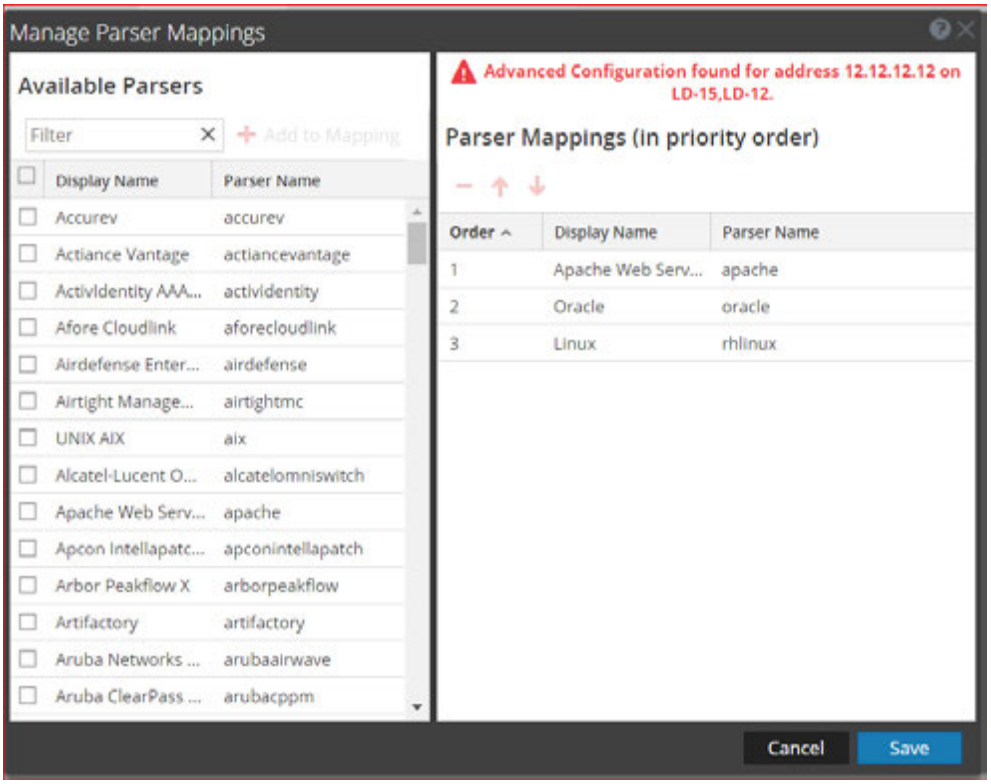
on the **Details** tab is updated to reflect the status. If mapped, the text displayed is **Mapped**.
Click **Cancel** to return to the **Details** tab.

Advanced Configuration

Mapping configurations with the Log Collector are not displayed in the Parser Mappings window. If the mapping is saved, it is saved for the corresponding IP address, not for the corresponding Log Collector entry. If no mappings are found for the corresponding IP address, the discovered event source types are displayed in the Parser Mappings window.

If advanced Log Decoder configurations are discovered, a message similar to the one below displays in the Manage Parser Mappings dialog.

Note: If you want to edit the advanced configuration, you need to navigate to the Log Decoder service's parser mappings configuration.



Create/Edit Group Form

This Create Event Source Group form is displayed when you are creating or editing an Event Source Group.

Creating Event Source Groups

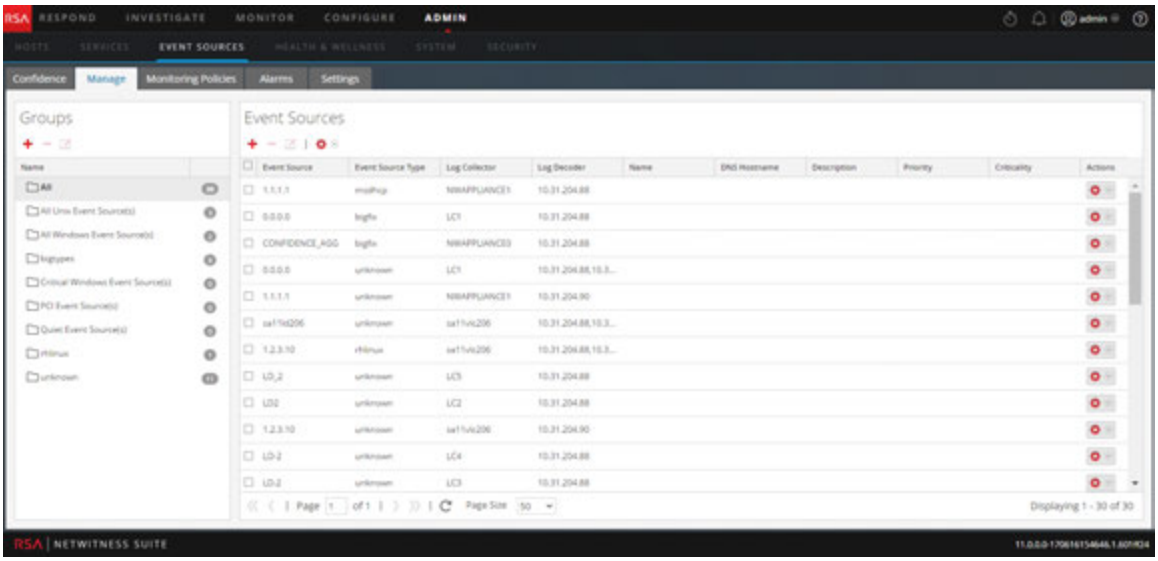
Managing Event Source Groups

Creating an Event Source and Editing Attributes

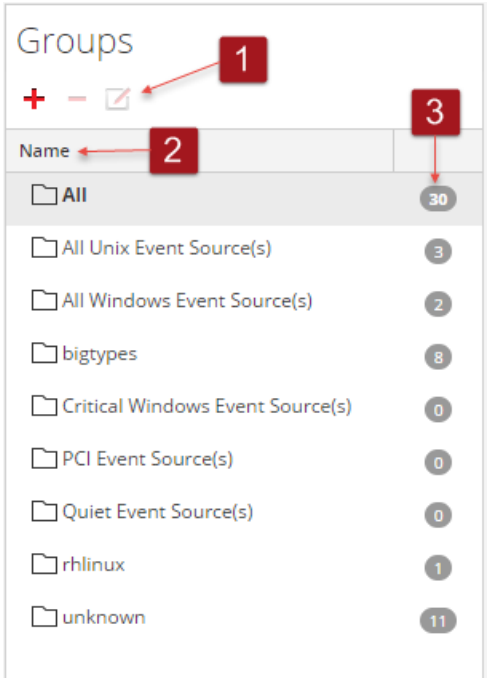
Quick Look

The Manage tab organizes event sources into groups, and displays attributes for each event source. The Manage tab consists of two panels, Groups and Event Sources.



Groups Panel

The Groups Panel lists the event source groups, as well as a count of the members for each group. To see all event sources, select **All** from the groups list. This is an example of the Groups panel.



1	Displays the standard NetWitness Suite icons for adding, removing, or editing groups.
2	Lists the identifier for each group in the Name column. You can use the group names to quickly identify some of the criteria used to form the group. For example, if you create a group that consists of Windows event sources for the Sales

organization, you could name the group **Windows Sales Sources**.

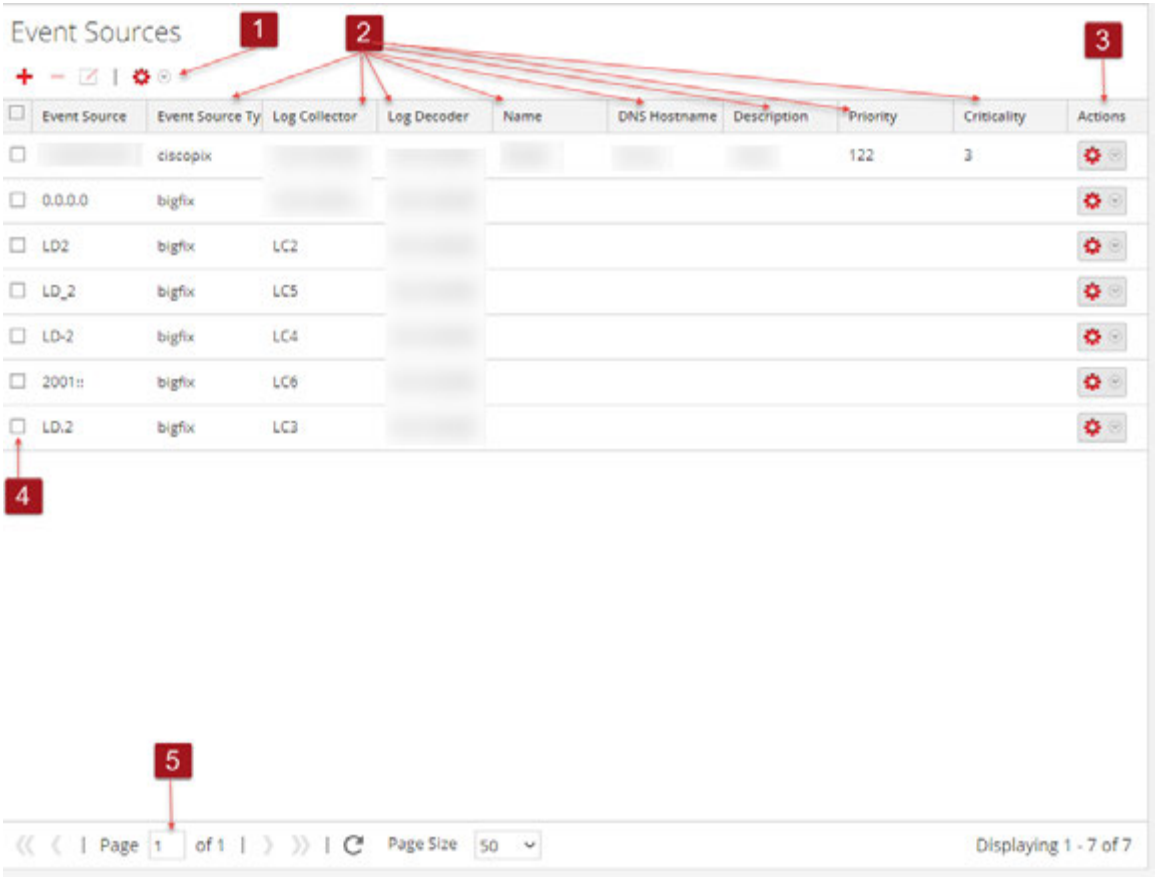
Note: The event source group name is not editable. Once you create a group, that name exists as long as the group itself.

3 The count for an event source group indicates the number of event sources in that group. That is, the number of event sources that match the criteria used to define the group.

Note: The count is not dynamically updated when new event sources are added. Thus, you may need to refresh to see an updated group count.

Event Sources Panel

The Event Sources panel displays the attributes for the event sources in the selected group. Or, if All is selected in the Groups panel, the Event Sources panel lists all event sources.



1	The toolbar contains the following tools:
	• **Add**: manually add an event source
	• **Remove**: remove an event source
	• **Edit**: Update attributes for an existing event source
	• **Import / Export** menu: Displays a menu with the following options:
	  • **Import**: Import event sources from a Content Management Database (CMDB), spreadsheet, or other tool.
	  • **Export**: Export selected event sources and their attributes in CSV format.
	  • **Export Group**: Export the entire group that is currently selected.

2	Columnar display of attributes. You can choose which attributes to display.
3	Actions: Shortcut menu for often-used commands: Edit, Delete, and Export.
4	Checkboxes: Select rows to use when performing tasks on multiple event sources, such as bulk editing.
5	Navigation Tools: At the bottom of the screen, there are items that help in navigating your group: • **Page *x* of *y***: indicates which page you are currently displaying, and how many total pages exist for this group. • <<, <, > and >>: click these icons to move between pages either one at a time (< and >) or to the first (<<) or last (>>) page. • **Page Size**: use this selector to choose your page size. • **Displaying *x* - *y* of *z***: quick check of which event sources are currently displayed out of the total number for the group.

Sorting

In the Event Sources panel, the list of items is presented in a sorted order. You can choose which column on which to sort. Note, however, that the sort order depends on capitalization.

For any string column, if the values contains a mix of lower case and upper case, the upper case appear in the list before the lower case values.

For example, assume the Event Source Type column contains the following entries: Netflow, APACHE, netwitnessspectrum, ciscoasa. The sort order would be as follows:

- APACHE
- Netflow
- ciscoasa
- netwitnessspectrum

Manage Event Source Tab

The Manage Event Source screen has several integrated components that present different perspectives of an event source.

- Show Event Source Details
- Add attribute values to an event source
- Remove attribute values for an event source

To view the Manage Event Source screen for an event source:

1. Go to **ADMIN> Event Sources**.
2. Select the **Manage** tab.
3. From the Event Sources pane, select an event source from the list and click + .

Workflow

This workflow shows the end-to-process for modifying, acknowledging, mapping, and configuring event sources, along with viewing and configuring event source alarms and alerts.

What do you want to do?

Role	I want to...	Documentation

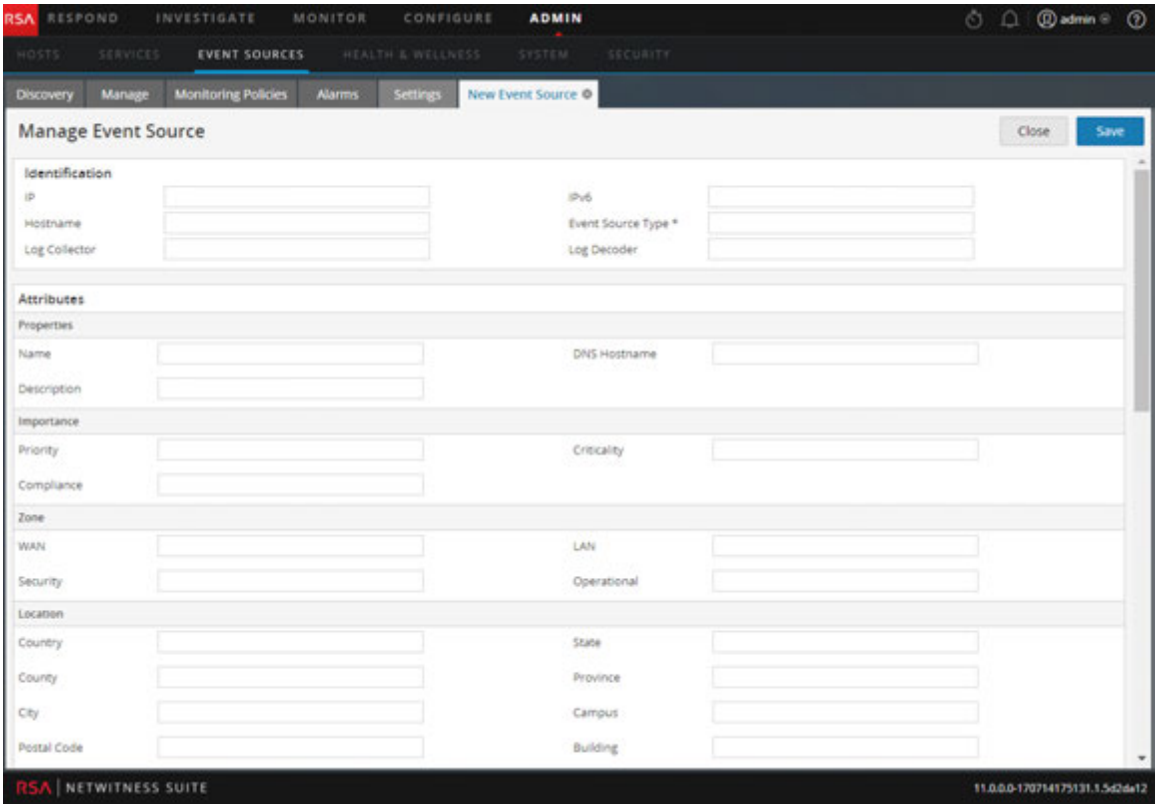
Related Topics

Creating an Event Source and Editing Attributes

Creating Event Source Groups

Quick Look

This is an example of the New Event Source tab:



This table describes event source attribute categories.

Attribute Section	Description
Identification	These attributes are the main attributes that collectively identify an event source. The following attributes are auto-populated, and cannot be changed while on this screen: • IP address • IPv6 value • Hostname • Event Source Type These attributes can be modified: • Log Collector • Log Decoder
Properties	These attributes provide the name and description. • Name • DNS Hostname • Description
Importance	These attributes can be used for grouping by priority. • Priority • Criticality • Compliance
Zone	These attributes can be used for grouping by zone. • WAN (Wide Area Network) • LAN (Local Area Network) • Security • Operational

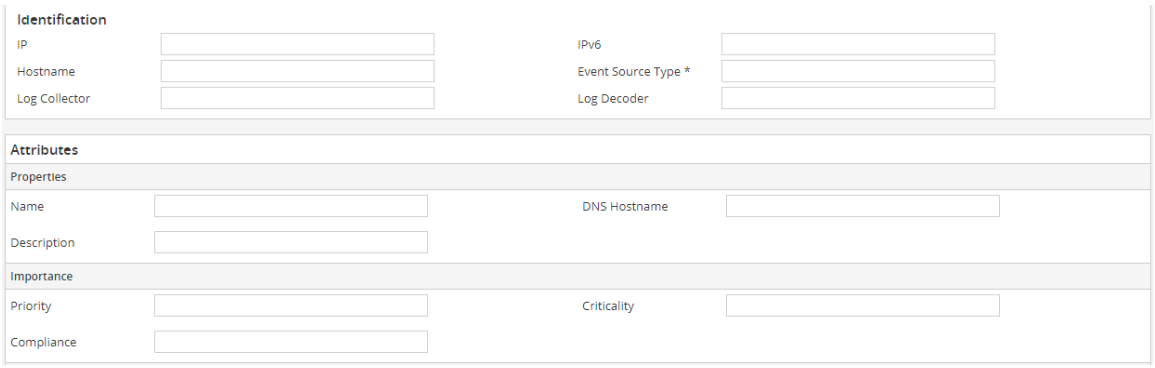
Attribute Section	Description
Location	These attributes can be used to group by the physical or geographical location. • Country • State • County • Province • City • Campus • Postal Code • Building • Floor • Room
Organization	These attributes can be used to group by organization, and also to provide contact information. • Company • Division • Business Unit • Department • Group • Contact • Contact Phone • Contact Ema
Owner	These attributes specify those responsible for the event source. • Manager • Primary Administrator • Backup Administrator

Attribute Section	Description
Physical	These attributes specify the physical properties for the event source. • Vendor • Serial Number • Asset Tag • Voltage • UPS Protected • Rack Height • Depth • BTU Output • Color
Function	These attributes can be used to group by function. • Primary Role • Sub Role 1 • Sub Role 2
System Information	These attributes specify system information. • Domain Name • System Name • Identifier • System Description
Custom	This section provides eight custom attributes, for any other attributes that your organization might need.

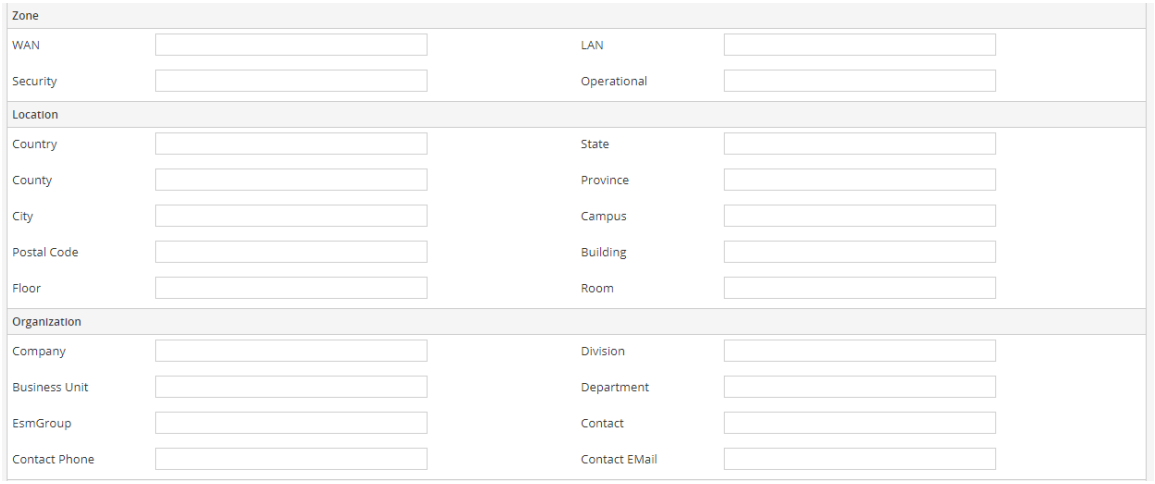
Features

The settings in the Manage Event Source tab are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness Suite, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

This figure shows an example of the **Identification**, **Properties**, and **Importance** sections.



This figure shows an example of the **Zone**, **Location**, and **Organization** sections.



Monitoring Policies Tab

The Monitoring Policies tab organizes thresholds by event source group.

To access this tab, go to **ADMIN > Event Sources**. The **Manage** tab is displayed. Select the **Monitoring Policies** tab.

Configuring Event Source Group Alerts

Setting Up Notifications

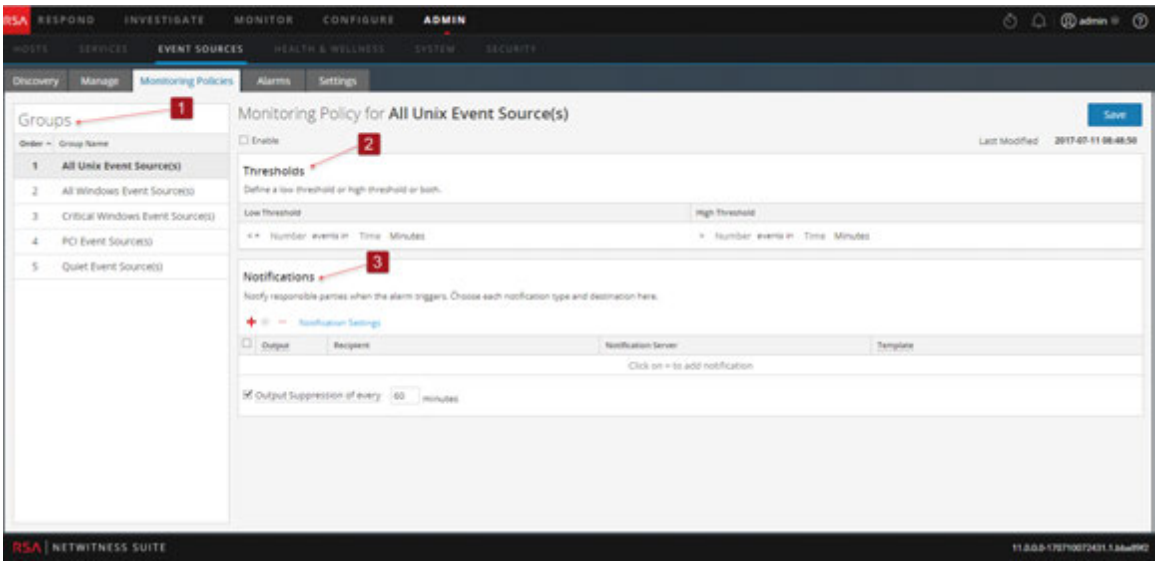
Disabling Notifications

Quick Look

The **Monitoring Policies** tab consists of three panels:

- Event Groups Panel
- Thresholds Panel
- Notifications Panel

This is an example of the **Monitoring Policies** tab.



1 Displays the Groups panel.

2 Displays the Thresholds panel.

3 Displays the Notifications panel.

Event Groups Panel

The group selected in this panel determines which thresholds appear in the Thresholds panel. You can define a set of thresholds for each event source group. Notice that the groups are listed in a specific order:

- Drag and drop groups to change the specified order.
- The higher a group is listed, the higher the precedence for that group's thresholds: RSA NetWitness Suite checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list

Thresholds Panel

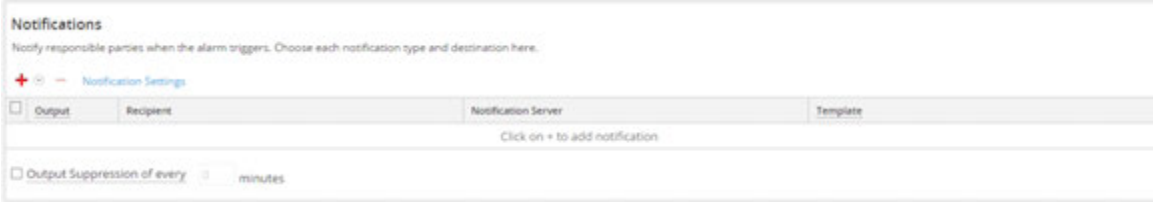
This is an example of the Thresholds panel for an event source group.

The Thresholds Panel contains the following features.

Feature	Description
Enable	The Enable checkbox designates whether or not the thresholds that you define for a group are enabled. If so, notifications are sent whenever the thresholds for that group are outside of the defined range. If not, then no monitoring of that event source group is occurring. **Note:** If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy. If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic notifications. See below for more details on the look of notifications.
Low number of events Low number of minutes or hours	This is the low end of the threshold. Enter the fewest number of events and the time range. If the event source group receives fewer messages than specified here, the threshold is not met, and notifications are sent.
High number of events High number of minutes or hours	Works similarly as for the low values: If more messages than specified here are received, the threshold is not met, and notifications are sent.
Last Modified date and time	This field indicates the last time and date that the thresholds were changed.
Save	Saves the changes you have made to the thresholds.

Notifications Panel

This is an example of the Notifications panel for an event source group.

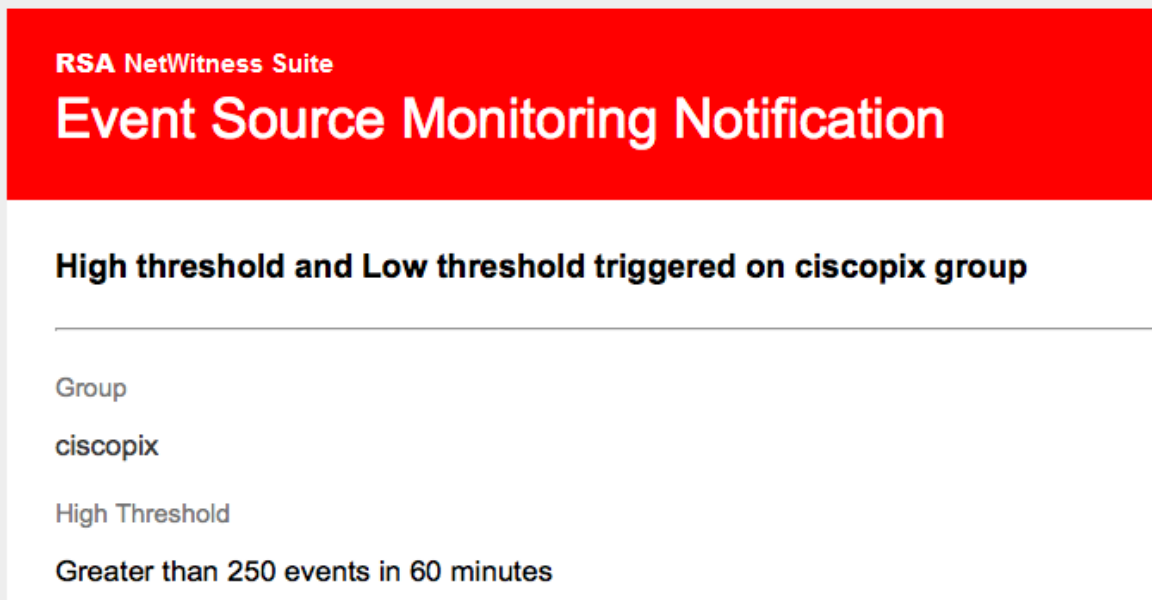


The following table describes the fields on the Notifications panel

Field	Description
Tools + -	The following items are available on the toolbar: • **Add (+)**: clicking the **Add** presents a menu where you can choose the type of the notification • **Remove (-)**: removes the selected row from the list.
Notification Settings	Clicking this link opens a new browser tab, and takes you to the **Admin** > **System** > **Notifications** page in NetWitness Suite.
Type	Displays the type of the notification that you have chosen. The available options are as follows: • Email • SNMP • Syslog
Notification	See the **Configure Notification Outputs** topic in the *System Configuration Guide* for more details.
Notification Server	See the **Configure Notification Servers** topic in the *System Configuration Guide* for more details
Template	For Event Source Management, RSA provides three out-of-the-box templates for notifications. You can use the following templates as delivered, or customize them based on the needs of your organization: • **Email template**: sends notifications to the specified email addresses. • **SNMP template**: sends notifications to the specified SNMP server • **Syslog** template: sends notifications to the specified Syslog server. See the **Configure /Templates for Notifications** topic in the *System Configuration Guide* for more details.

Field	Description
Output Suppression	Use this item to limit how often notifications are received for this policy, in case a lot of alerts are triggered in a short period of time.

The following are sample notifications, based on the supplied Templates.



- Email:

  For email notifications, the third column, **Alarm Type**, specifies whether the triggered alarm was based on a user threshold, or the baseline data being out of normal bounds. If you have automatic monitoring or notifications turned off, you will not receive any **Automatic** notifications. The same is true for Syslog and SNMP, except those notifications are formatted differently.

- SNMP trap:

```

Related Topics

Automatic Alerting

Setting Up Notifications

Disabling Notifications

Quick Look

You can set up policies and thresholds for your event source groups. You do this so that you can receive notifications when the thresholds are not met. NetWitness Suite also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

About Automatic Alerting

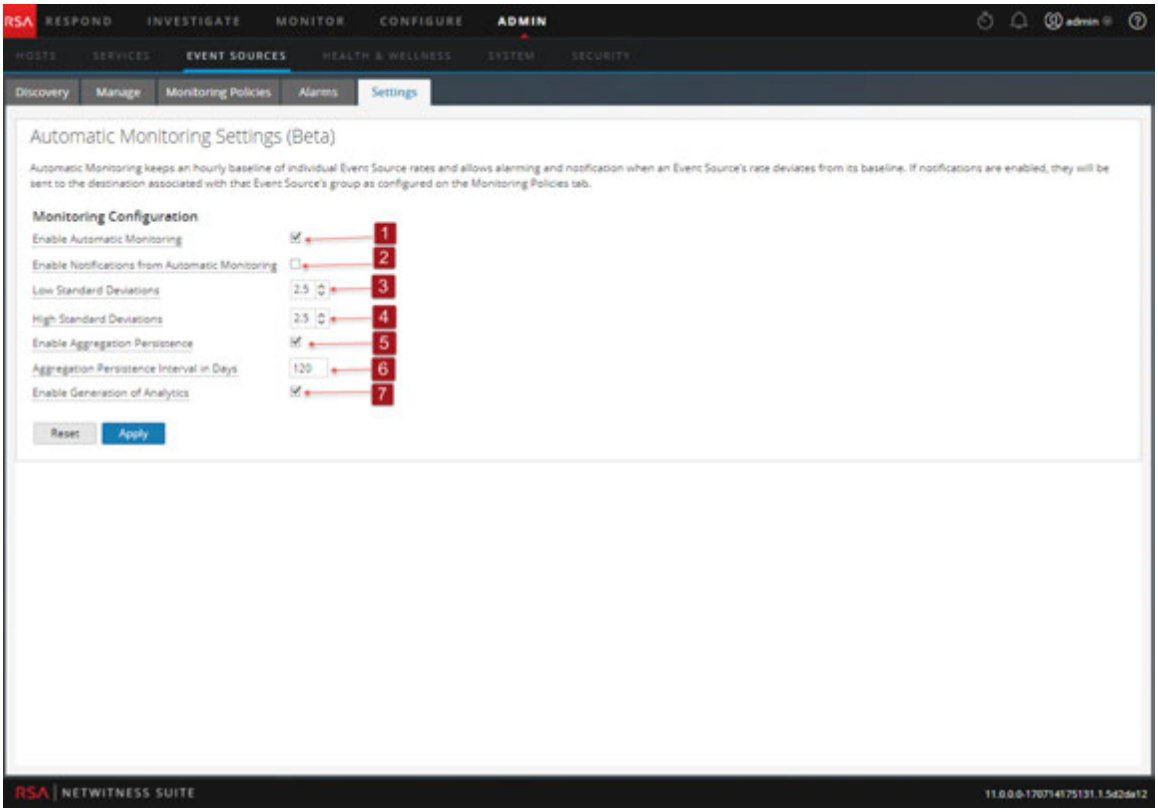
You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness Suite also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- Once you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.
- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time (for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.
- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

Note: Automatic alerting, and it settings, are currently in Beta testing.



1 Determines whether automatic alerting is on or off. By default, this option is selected

	(automatic alerting turned on)
2	Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered)
3	The standard deviations below which to receive alerts. Default is **2.0** (95% confidence)
4	The standard deviations above which to receive alerts. Default is **2.0** (95% confidence)
5	When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source. • **Enabled (default)**: one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source. • **Disabled**: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source
6	Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source
7	When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**. The data retained includes baseline value over time and the alerting history for each event source. Note, however, the event source address and type is anonymized, so only your event rate information is revealed. Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality
8	The **Reset** option discards any unsaved changes for all settings on the page.
9	Click **Apply** to save any changes you made to the values on the page.

Features

The Settings tab contains the following features.

Feature	Description
Enable Automatic Monitoring	Determines whether automatic alerting is on or off. By default, this option is selected (automatic alerting turned on)

Feature	Description
Enable Notifications From Automatic Monitoring	Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered)
Low Standard Deviations	The standard deviations below which to receive alerts. Default is **2.0** (95% confidence)
High Standard Deviations	The standard deviations above which to receive alerts. Default is **2.0** (95% confidence)
Enable Aggregation Persistence	When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source. • Enabled (default): one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source. • Disabled: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source
Aggregation Persistence Interval in Days	Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source
Enable Generation of Analytics	When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**. The data retained includes baseline value over time and the alerting history for each event source. Note, however, the event source address and type is anonymized, so only your event rate information is revealed. Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality

Feature	Description
Reset	This option discards any unsaved changes for all settings on the page.

How NetWitness Investigate Works

Investigate provides the data analysis capabilities in RSA NetWitness® Suite, so that analysts can analyze packet, log, and endpoint data and identify possible internal or external threats to security and the IP infrastructure.

Data and Metadata

RSA NetWitness Suite audits and monitors all traffic on a network. One type of service, a Decoder, ingests, parses, and stores the packets, logs, and endpoint data traversing the network. The configured parsers and feeds on the Decoder create metadata that analysts can use to investigate the ingested logs and packets. Another type of service, called a Concentrator, indexes and stores the metadata.

Analysts usually query the Concentrator to discover threats. The Concentrator handles queries, only going to the Decoder when a full reconstruction of sessions, endpoint events, or raw logs is required. ESA, Malware Analysis, and Reporting Engine also query the Concentrator, where they can quickly get all the pertinent metadata associated with an event and generate information on the event without having to go to each Decoder. In some special cases, analysts may query a Decoder.

Note: While a hybrid appliance can perform the Concentrator function, a separate Concentrator appliance is required for any large environment that needs greater bandwidth or events per second (EPS). The Concentrator appliance has storage layout that uses solid state drives for the index, which increases read performance.

Analysis Methods

Analysts can investigate captured data, open results from other NetWitness Suite views in Investigate, and import data from other collection sources. During the course of an investigation, analysts can move seamlessly between the three views in Investigation: Navigate view, the Events view, and the Malware Analysis view.

Analysts use Investigate to hunt for events that drive the incident response workflow and to do strategic analysis after another tool has generated an event. An incident responder who is working on an incident in NetWitness Respond can open the incident in NetWitness Investigate and add events to the incident. A threat hunter who is working in NetWitness Investigate can add an event to an existing incident or create a new incident in NetWitness Respond. In both cases, the analyst drills or pivots into the metadata to filter the number of logs and packets and see suspicious events, while focusing on certain combinations of metadata that lead to an incident.

Note: Specific user roles and permissions are required for a user to conduct investigations and malware analysis in NetWitness Suite. If you cannot perform an analysis task or see a view, the administrator may need to adjust the roles and permissions configured for you.

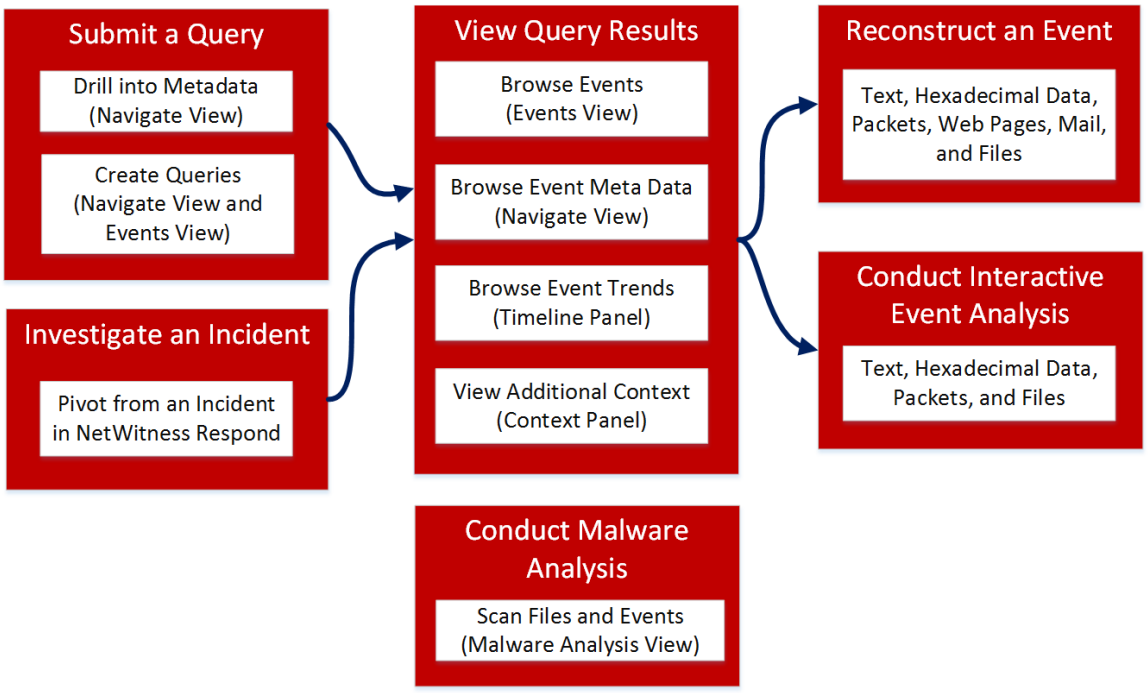
Triggers for an Investigation

These are a few examples of triggers for an investigation:

- You receive intelligence from a third party about a new active directory hack; you use that to run a search across all of your raw Active Directory log data for the last 24 hours.
- You are asked by the SOC manager to find any Pokemon Go malware due to its current popularity; you craft a query to look for an HTTP session using a specific user agent related to the malware he found on a security blog.
- An incident responder escalates a ticket that shows some odd indicators related to a host; you link to that host to find specific details.
- You are looking for the next zero day attack and pivoting through network metadata to find any abnormal automated sessions leaving the enterprise.
- You are asked by your SOC manager to find any information related to user `jarvis`, an employee just let go; you query against the past week for that username.

Workflow of an Investigation

This figure shows the general workflow of an investigation. In a typical day, an analyst goes through the steps in the general workflow in a circular fashion. You typically start by executing a query, then filter to a subset of events, reconstruct or analyze an event, and repeat to reconstruct or analyze another event. When you encounter an event that bears a closer look, you view the context around the event, and decide whether to create an incident or add the event to an incident. If you decide not to add the event to an incident, you run an other query to gain further insight, which starts again at the beginning of the workflow. If you find a file or event that potentially contains malware, you can do a Malware Analysis scan of the file or you can open Malware Analysis and start a scan of the service on which the event was seen.



After you enter a query or launch an investigation from NetWitness Respond, defined meta keys are queried and the contents of captured packets, logs, and endpoint events is displayed in the Navigate view.

Navigate View

This figure illustrates the Navigate view.

The Navigate view provides the capability to drill into and query data on a Broker, Concentrator, or Decoder, though investigating a Decoder is not typical. Every situation is unique in terms of the types of information the analyst is attempting to find. Investigation presents the contents of captured packets, logs, and endpoint events as a collection of extracted data in the Navigate view. The defined meta keys are queried, and values are returned along with the number of events. Clicking on a value at any given level, reveals the results in detail.

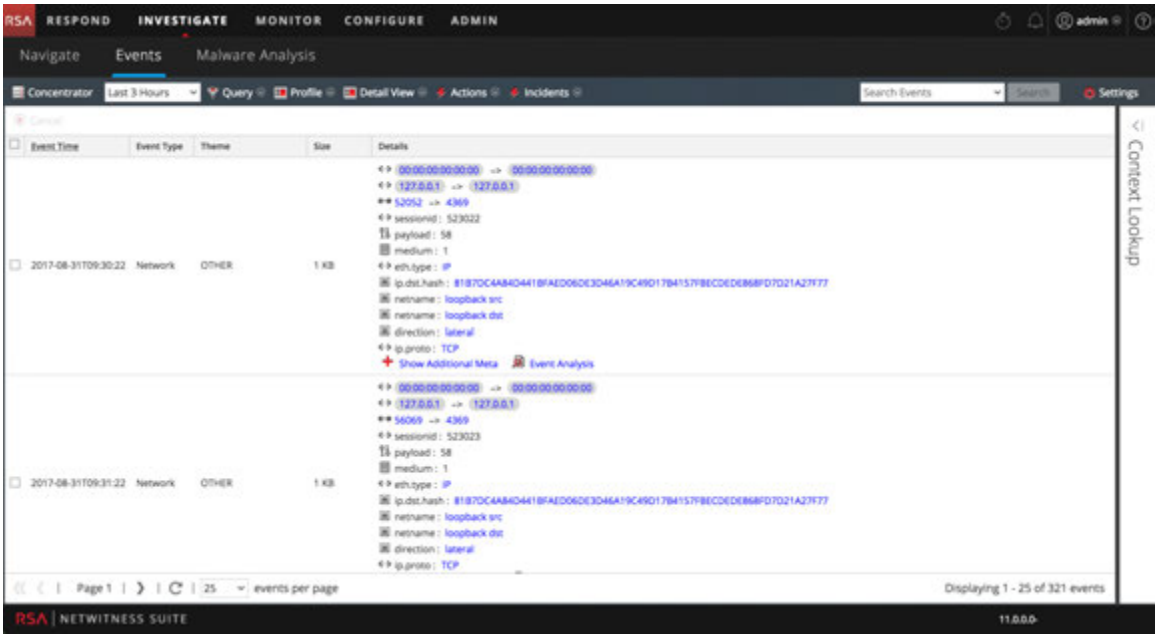
In the Navigate view, for certain configured meta keys, such as IP address, or hostname, you can search for additional context information around a value using the Context hub. The additional context may include incidents, alerts, and other sources where the value was mentioned.

For example, if there is a concern regarding suspicious traffic with foreign countries, the Destination Country meta key reveals all destinations and the frequency of the contact. Drilling into those values yields the specifics of the traffic, such as the IP address of the originator and the recipient. Checking other metadata can expose the nature of attachments exchanged between the two IP addresses.

The Navigate View also provides a sequential visualization of the data in a timeline. Here you can zoom in on a selected time period.

Events View

This figure illustrates the Events view.



The Events view provides a view of packet, log, and endpoint events in list form so that you can view events sequentially and reconstruct events safely. You can open the Events view for a meta value in a current drill point from the Navigate view. For analysts without sufficient privilege to navigate a service, the Events view is a standalone investigation view in which analysts can access a list of network, log, and endpoint events from a NetWitness Suite Core service without having to drill down through meta first.

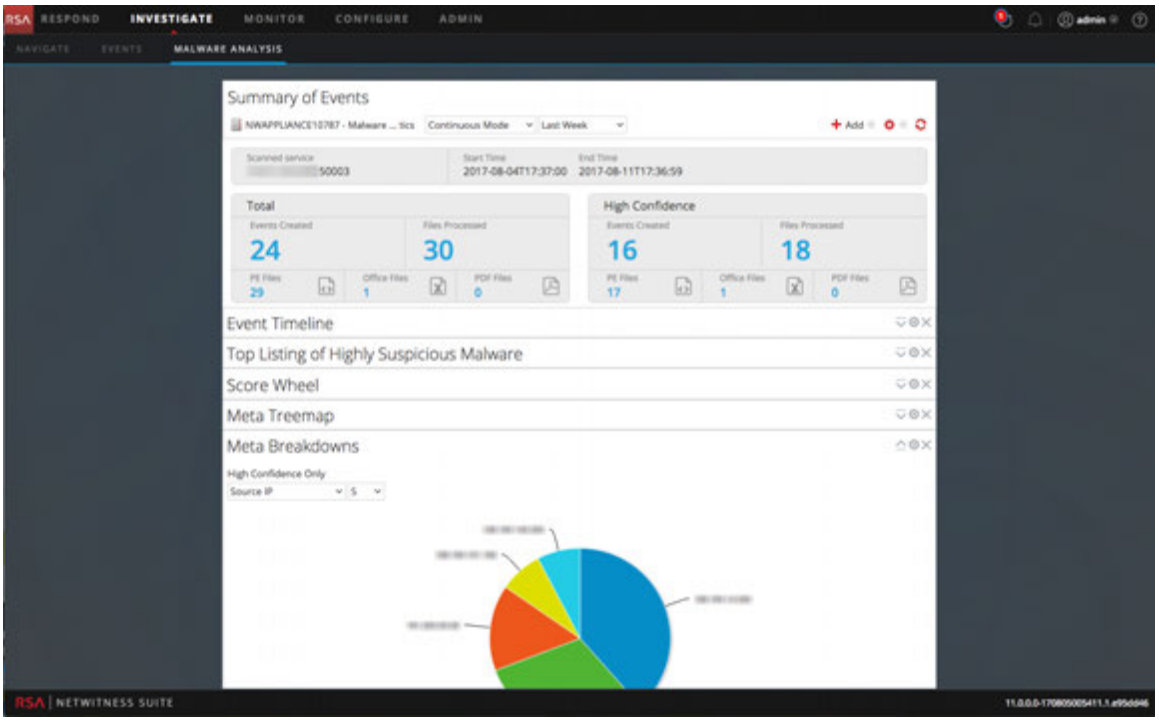
The Events view presents event information in three standard forms, a simple grid listing of events, a detailed listing of events, and a log view. In addition to the standard forms, you can create a custom column group of selected meta keys, then assign the custom column group to a custom profile for viewing the events list. Once created, custom column groups and profiles are selectable from a drop-down list.

In the Events view, you can:

- Reconstruct an event from the event list. Two reconstruction interfaces are accessible from the Events view: Event Reconstruction and Event Analysis.
- Use Investigation Profiles to tie together various Investigation settings into selectable sets, import and export Investigator meta groups, import and export Investigator column groups.
- Export events and associated files.
- Create an incident from an event, or edit an incident to add or remove events.

Malware Analysis View

This figure illustrates the Malware Analysis view



The Malware Analysis view provides a means to analyze certain types of file objects (for example, Windows portable executable (PE), PDF, and MS Office) to assess the likelihood that a file is malicious. You can open the Malware Analysis view directly or you can use a context menu action to Scan for Malware from a meta value in a current drill point from the Navigate view. The malware analyst can leverage the multilevel scoring modules to prioritize the massive number of files captured in order to focus analysis efforts on the files that are most likely to be malicious.

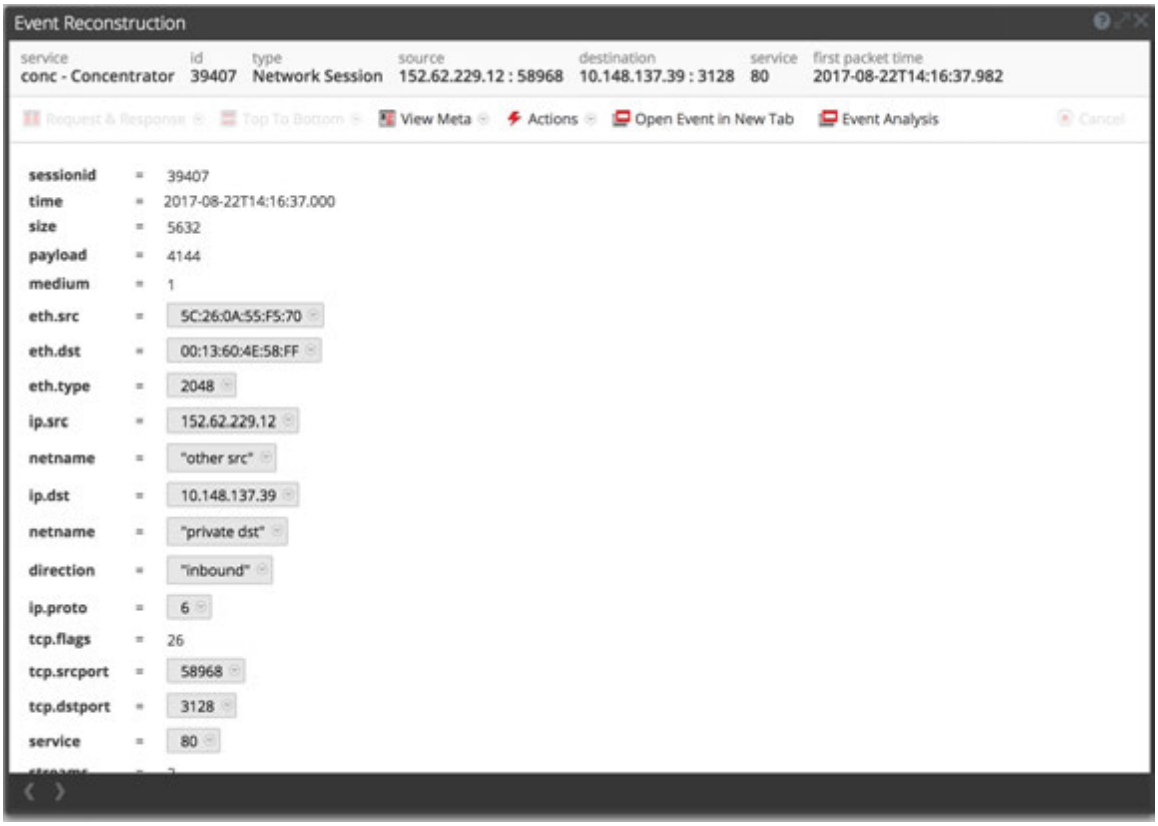
Contextual Information for an Event

From the Navigate view and the Event view, you can look up details about elements associated with an event (IP Address, User, Host, Domain, MAC Address, Filename, File hash) in the Context Hub. You can interact with the elements of an event to get further insight including related incidents, alerts, custom lists, Archer assets, active directory details, and NetWitness Endpoint IIOCs. From the Context Hub, you can click on a data point to return to the Navigate view.

Event Reconstruction and Event Analysis

When you discover an event that merits additional investigation, you can reconstruct an event safely in a form similar to its native form using Event Reconstruction or interactive Event Analysis. The rendering of events restricts the use of dynamic or active code that might be contained in the event to limit any adverse outcome to your system or browser. Cache is used to improve performance when viewing previously viewed events. Each analyst has a separate cache of reconstruction data, and you can only access reconstructed events in your own cache.

The Event Reconstruction opens in a window on top of the Events view. You can see the meta keys and meta values in a list form and page to view the next event in this form. Events can be reconstructed using different methods to suit the type of data: meta data, text, hexadecimal, packets, web, mail, files, or the best reconstruction selected automatically. You can export packet capture files, extract files, and export the meta values for the event. This figure is an example of the Event Reconstruction.



The Event Analysis view is an interactive tool to help analysts see the packets, text, or files in an event with visual cues for certain types of information. Depending on the type of reconstruction, for example, packets, text, or files, different information is relevant. When viewing files, you can export files in a zip archive to your local file system. You can download logs from the Text view, and export packets from the Packet view. This figure is an example of the Event Analysis view.

Malware Analysis Functions

NetWitness Suite Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows portable executable (PE), PDF, and MS Office) to assess the likelihood that a file is malicious.

Malware Analysis detects indicators of compromise using four distinct analysis methodologies:

- Network Session Analysis (network)
- Static File Analysis (static)
- Dynamic File Analysis (sandbox)
- Security Community Analysis (community)

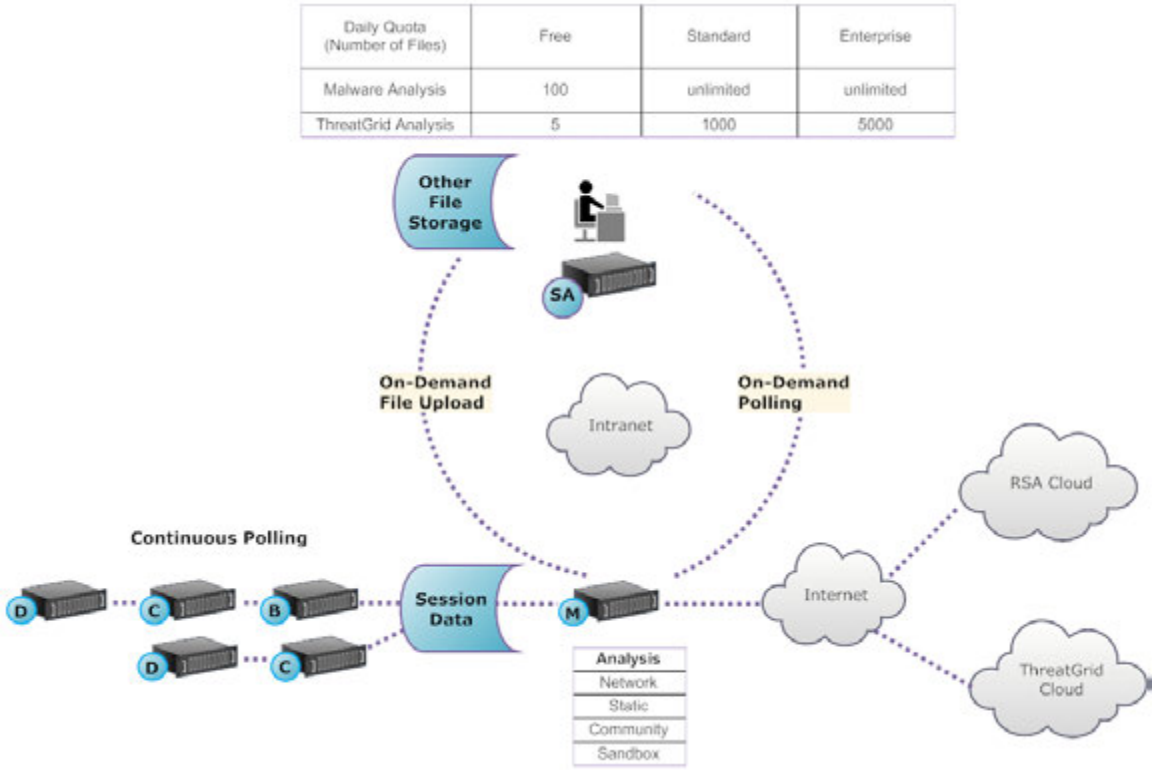
Each of the four distinct analysis methodologies is designed to compensate for inherent weaknesses in the others. For example, Dynamic File Analysis can compensate for Zero-Day attacks that are not detected during the Security Community Analysis phase. By avoiding malware analysis that strictly focuses on one methodology, the analyst is more likely to be shielded from false negative results.

In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language, which allows malware researchers to identify and classify malware samples. This allows IOC authors to add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live. These YARA-based IOCs in RSA Live will automatically be downloaded and activated on the subscribed host, to supplement the existing analysis that is performed in each analyzed file.

Malware Analysis also has features that support alerts for Incident Management.

Functional Description

This figure depicts the functional relationship between the Core services (the Decoder, Concentrator, and Broker), the Malware Analysis service, and the NetWitness Server.



The Malware Analysis service analyzes file objects using any combination of the following methods:

- **Continuous automatic polling of a Concentrator or Broker** to extract sessions identified by a parser as potentially carrying malware content.
- **On-demand polling of a Concentrator or Broker** to extract sessions identified by a malware analyst as potentially carrying malware content.
- **On-demand upload of files** from a user-specified folder.

When automatic polling of a Concentrator or Broker is enabled, the Malware Analysis service continuously extracts and prioritizes executable content, PDF documents, and Microsoft Office documents on your network, directly from data captured and analyzed by your Core service. Because the Malware Analysis service connects to a Concentrator or Broker to extract only those executable files that are flagged as possible malware, the process is both rapid and efficient. This process is continuous and does not require monitoring.

When on-demand polling of a Concentrator or Broker is chosen, the malware analyst uses Investigation to drill into captured data and choose sessions to be analyzed. The Malware Analysis service uses this information to automatically poll the Concentrator or Broker and to download the specified sessions for analysis.

On-demand upload of files provides a method for the analyst to review files captured external to the Core infrastructure. The malware chooses a folder location and identify one or more files to be uploaded and analyzed by Malware Analysis. These files are analyzed using the same methodology as files automatically extracted from network sessions.

Analysis Method

For the Network analysis, the Malware Analysis service looks for characteristics that seem to deviate from the norm, much as an analyst does. By looking at hundreds to thousands of characteristics and combining the results into a weighted scoring system, legitimate sessions that coincidentally have a few abnormal traits are dismissed, while the actual bad ones are highlighted. A user can learn patterns that indicate anomalous activity in the sessions as indicators that warrant further investigation, Indicators of Compromise.

The Malware Analysis service can perform Static analysis against suspicious objects it finds on the network and determine whether those objects contain malicious code. For Community analysis, new malware detected on the network is pushed to the RSA Cloud for checking against RSA's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. For Sandbox analysis, the services can also push data into major security, information and event management (SIEM) hosts (the ThreatGrid Cloud).

Malware Analysis has a unique method for analysis that is partnered with industry leaders and experts, so their technologies can enrich the Malware Analysis scoring system.

NetWitness Server Access to the Malware Analysis Service

The NetWitness Server is configured to connect to the Malware Analysis service and import tagged data for deeper analysis in Investigation. Access is based on three subscription levels.

- Free subscription: All NetWitness Suite customers have a free subscription, with a free trial key for ThreatGrid analysis. The Malware Analysis service is rate-limited to 100 file samples per day. The number of samples (within the set of files from above) submitted to the ThreatGrid Cloud for sandbox analysis is limited to 5 per day. If one network session had 100 files in it, customers would hit the rate limit after processing the one network session. If 100 files were manually uploaded, that would cause the rate limit to be reached.
- Standard subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 1000 per day.
- Enterprise subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 5000 per day.

Scoring Method

By default, the Indicators of Compromise (IOC) are tuned to reflect industry best practices. During analysis, the IOCs that trigger cause the score to move upward or downward to indicate the likelihood that the sample is malicious. The tuning of IOCs is exposed in NetWitness Suite so that the malware analyst can choose to override the assigned score or to disable an IOC from being evaluated. The analyst has the flexibility to either use the default tuning, or to completely customize the tuning to specific needs.

YARA-based IOCs are interleaved with the built-in IOCs within each built-in category and are not distinguished from native IOCs. When viewing IOCs in the Service Configuration view, administrators can select YARA from the Module selection list to see a list of YARA rules.

After a session is imported into NetWitness Suite, all of the viewing and analysis capabilities in Investigation are available to further analyze Indicators of Compromise. When viewed in Investigation, YARA IOCs are distinguished from the built-in native IOCs by the tag `Yara rule`.

Deployment

The Malware Analysis service is deployed as a separate RSA Malware Analysis host. The dedicated Malware Analysis host has an onboard Broker which connects to the Core infrastructure (either another Broker or a Concentrator). Prior to this connection, a collection of parsers and feeds must be added to the Decoders that are connected to the Concentrators and Brokers from which the Malware Analysis service pulls data. This allows suspicious data files to be marked for extraction. These files are `malware analysis` tagged content available through the RSA Live content management system.

Malware Scoring Modules

RSA NetWitness Suite Malware Analysis analyzes and scores sessions and the embedded files within these sessions by scoring four categories: Network, Static Analysis, Community, and Sandbox. Each category comprises many individual rules and checks that are used to calculate a score between 1-100. The higher the score, the more likely the session is to be malicious and worthy of more in-depth follow-on investigation.

Malware Analysis can facilitate a historical investigation into events leading up to a network alarm or incident. If you know that a certain type of activity is taking place on your network, you can select only the reports of interest to examine the content of data collections. You can also modify behavior for each scoring category based on the scoring category or the file type (Windows PE, PDF, and Microsoft Office).

Once you become familiar with data navigation methods, you can explore the data more completely through:

- Searching for specific types of information
- Reviewing specific content in detail.

Category scores for Network, Static Analysis, Community, and Sandbox are maintained and reported independently. When events are viewed based on the independent scores, as long as one category detects malware, it is evident in the Analysis section.

Network

The first category examines each core network session to determine if the delivery of the malware candidates was suspicious. For example, benign software being downloaded from a well-known safe site, using proper ports and protocols, is considered less suspicious than downloading software known to be malicious from a known dubious download site. Sample factors used in the scoring of this criteria set may include sessions that:

- Contain threat feed information
- Connect to well-known bad sites
- Connect to high-risk domains/countries (for example, .cc domain)
- Use well-known protocols on non-standard ports
- Contain obfuscated JavaScript

Static Analysis

The second category analyzes each file in the session for signs of obfuscation in order to predict the likelihood of the file behaving maliciously if allowed to run. For example, software that links to networking libraries is more likely to perform suspicious network activity. Sample factors used in the scoring of this criteria set may include:

- Files found to be XOR encoded
- Files found embedded within non-EXE formats (for example, PE file found embedded in a GIF format)
- Files linking to higher risk import libraries
- Files highly deviating from the PE Format

Community

The third category scores the session and files based on the collective knowledge of the security community. For example, files whose fingerprint/hash is already known to be good or bad by respected anti-virus (AV) vendors is scored accordingly. Files are also scored based on knowledge that a file was delivered from a site known to be good or bad by the security community.

Community scoring also indicates whether the AV on your network flagged the files as malicious. It does not indicate that the resident AV product acted to protect your system.

Sandbox

The fourth category examines the behavior of the software by actually running it in a sandbox environment. By running the software to watch its behavior, a score can be calculated by identifying well-known malicious activity. For example, software that configures itself to autostart on each reboot and make IRC connections would score higher than a file with no known bad behavior.

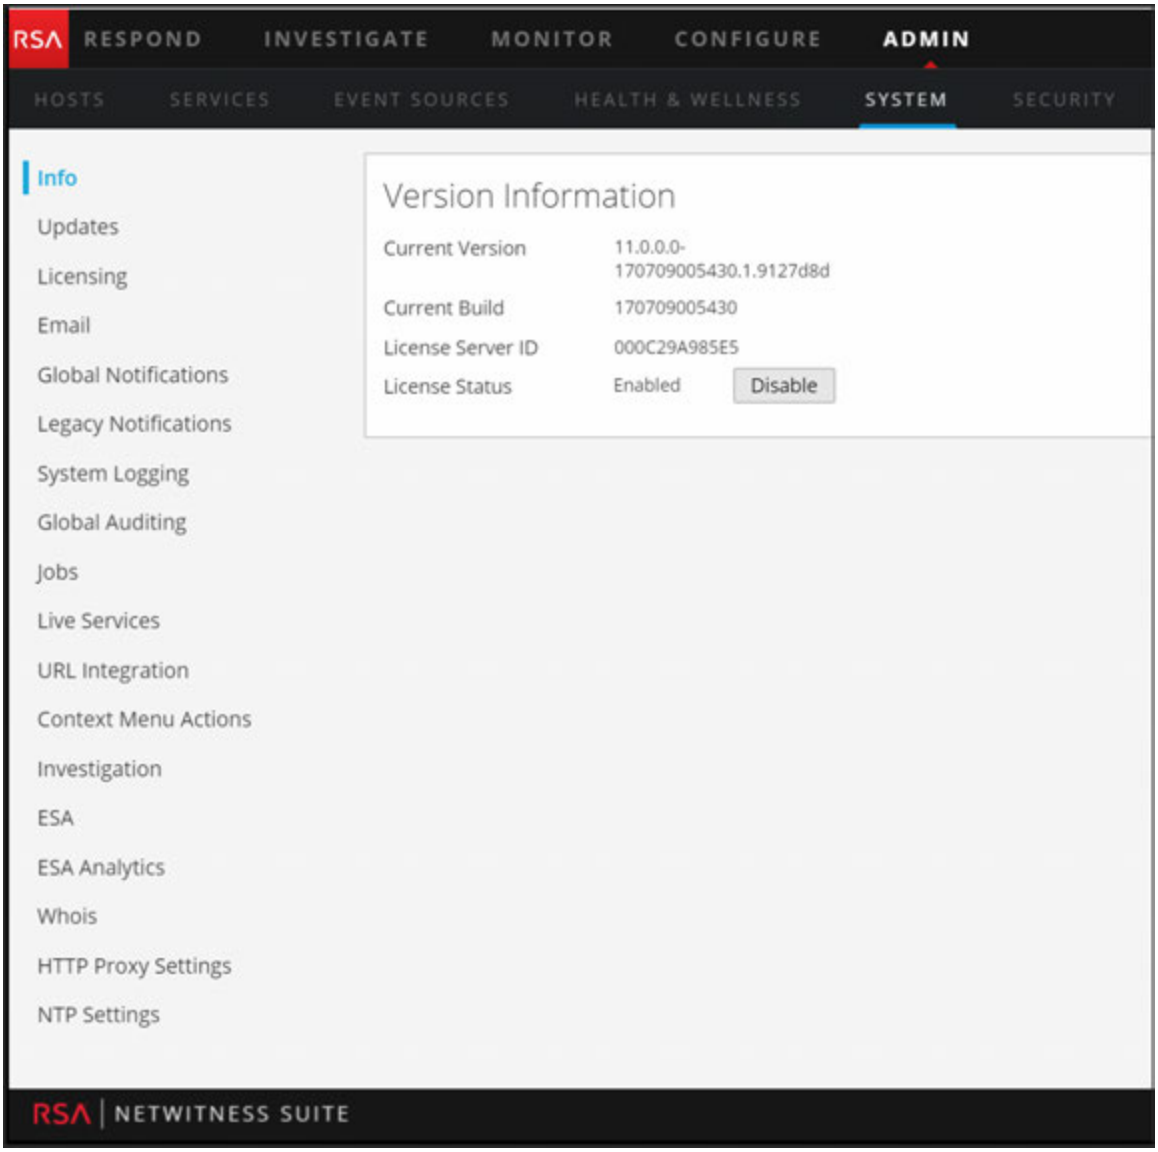
Roles and Permissions for Malware Analysts

This topic identifies the user roles and permissions required for a user to conduct malware analysis in NetWitness Suite. If you cannot perform an analysis task or see a view, the administrator may need to adjust the roles and permissions configured for you.

Required Roles and Permissions

RSA NetWitness Suite manages security by providing access to views and functions using both system permissions and permissions on individual services.

On the system level, the user needs to be assigned a system role, in the Administration > System view, that provides access to specific views and functions.



The default `Malware_Analysts` role in NetWitness Suite 11.0 is assigned all of the permissions listed below. If necessary, an Administrator can create a custom role with some combination of the following permissions:

- Access Investigation Module (required)
- Investigation - Navigate Events
- Investigation - Navigate Values
- Access Incident Module
- View and Manage Incidents
- View Malware Events (to view events)
- File Download (to download files from the Malware Analysis service)
- Initiate Malware Scan (to initiate a one-time service scan or one-time file upload)
- Dashlet permissions for convenience: Dashlet - Investigate Top Values Dashlet, Dashlet - Investigate Service List Dashlet, Dashlet - Investigate Jobs Dashlet, Dashlet - Investage Shortcuts Dashlet.

A use case for creating a custom role would be a Junior Malware Analyst role, with limited permissions that do not include the File Download permission.

On specific services, a malware analyst needs to be a member of the **Analysts** group, or to a group that has the two default permissions assigned to the Analyst group: **sdk.meta** and **sdk.content**. Users who have these permissions can use specific applications, run queries, and view content for purpose of analysis on the service.

Configuring Investigation Views and Preferences

Analysts can configure some aspects of NetWitness Suite Investigation views and behavior. You can customize the way that Investigation views appear, the types of information displayed, and factors that affect performance in returning results and reconstructing events. All configurable settings have default values that are effective in most deployments; however, analysts have the option to adjust these if necessary.

Analysts who conduct analysis using Investigation need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in Roles and Permissions for Malware Analysts.

These topics provide details:

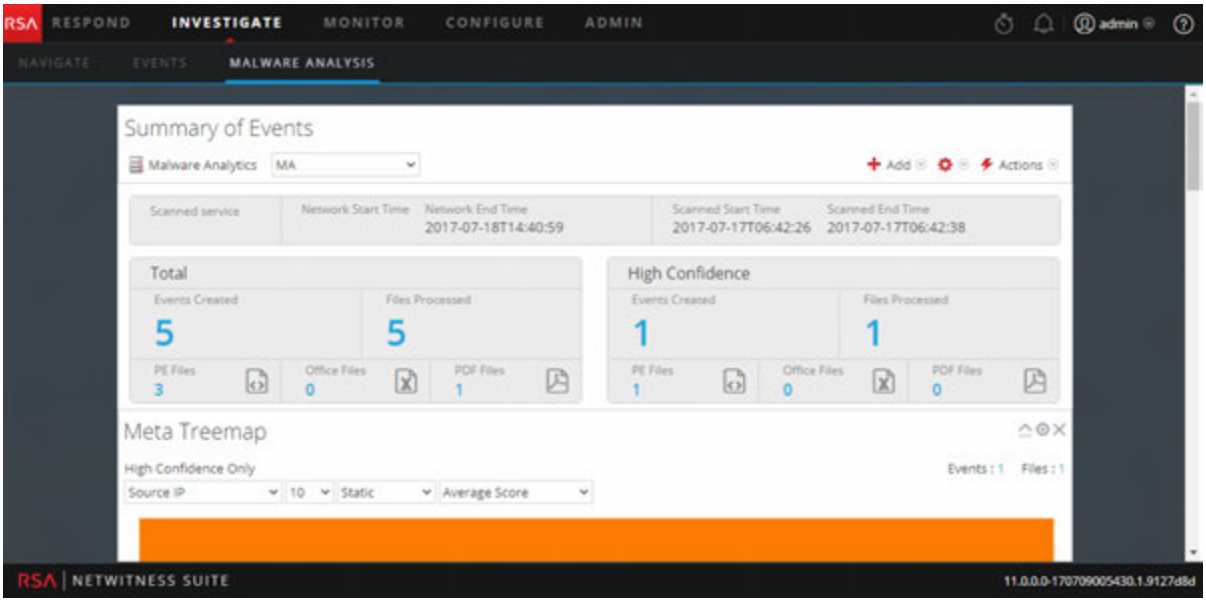
- Configure Navigate View and Events View
- Configure Malware Summary of Events View

Configure Malware Summary of Events View

The Summary of Events provides a summary of the scan being investigated, and below the summary are configurable dashlets such as visualization charts and listings. By default, the Summary of Events for a scan opens with the default dashlets displayed. You can customize the view by adding, modifying, and deleting default dashlets. The configured customization of dashlets persists through different scan investigations, and you can restore default dashlets at any time. The default dashlets are:

- Summary of Events (Fixed)
- Event Timeline
- Top Listing of Highly Suspicious Malware
- Meta Treemap
- Score Wheel
- Meta Breakdowns

The following figure is an example of the default Summary of Events.



The rest of this topic provides instructions for managing and configuring dashlets.

Add a Dashlet

You can add multiple copies of dashlets in the Malware Analysis Summary of Events. To add a dashlet:

1. In the toolbar, select **Add**.
   The drop-down list of dashlets is displayed. There are four visualization options: Score Wheel, Meta Treemap, Meta Breakdowns, and Event Timeline. The other three dashlets are the same dashlets available in the NetWitness Suite dashboard: Malware with high Confidence IOCs and High Scores, Top Listing of Highly Suspicious Malware, Top Listing of Possible Zero Day Malware. Details for these common dashlets are provided in "Dashlets" in the RSA Content for RSA NetWitness Suite.
2. Select a dashlet.
   The new dashlet is added as the last dashlet below the existing dashlets.
3. If the dashlet is a duplicate of an existing dashlet, change the name of the new dashlet so that it is unique.

Modify or Delete a Dashlet Using Toolbar Options

Each dashlet has a toolbar that offers options for modifying the dashlet. The visualization charts have the same configuration settings, while some of the other dashlets have different additional settings.

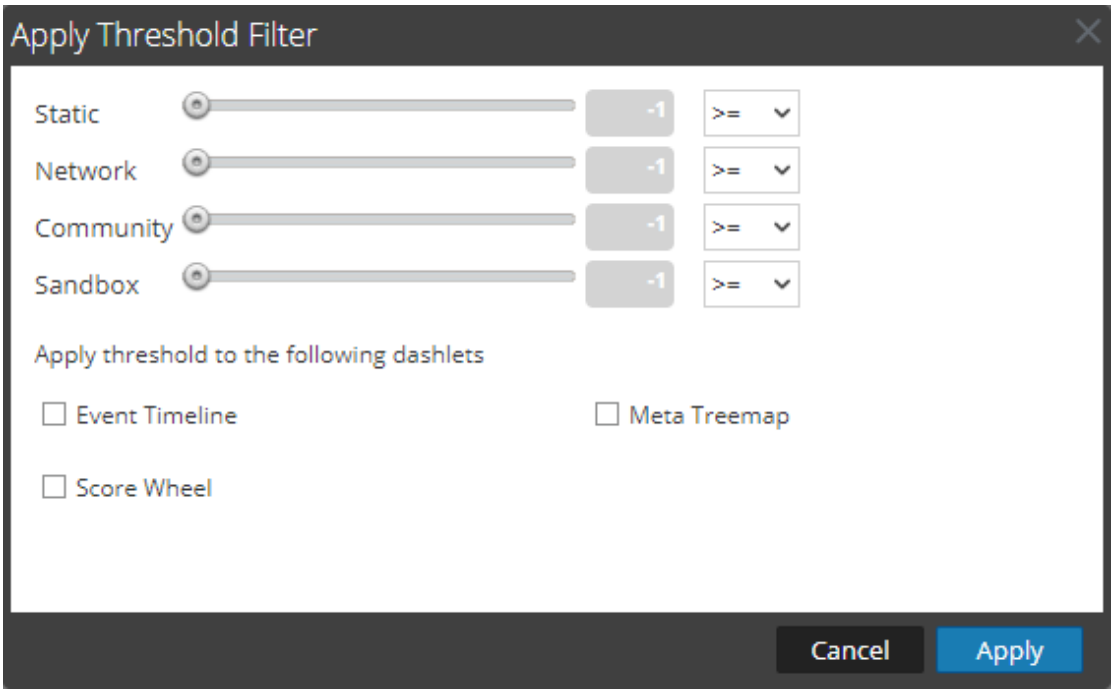
To use the toolbar options:

- To close a dashlet so that only the title bar is displayed, click .
- To open a dashlet that is closed, click .
- To display the configurable settings for a dashlet, click .
  The settings dialog for the dashlet is displayed.
- To delete a dashlet, click .

Apply Threshold Filter to Multiple Dashlets

Within dashlets, you can set a threshold to show only events equal to, above, or below a certain score in the four categories (Static, Network, Community, and Sandbox). This procedure sets the thresholds by dashlet type for these dashlets: Event Timeline, Score Wheel, and Meta Treemap. You can also set the threshold for individual dashlets.

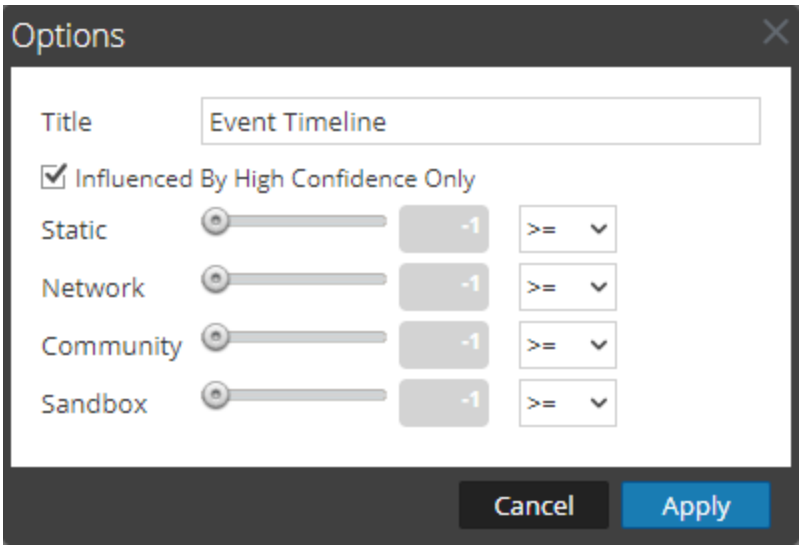
1. In the toolbar, select > **Apply Threshold Filter**.
   The Apply Threshold Filter dialog is displayed.



2. Select one or more dashlet types: Event Timeline, Score Wheel, and Meta Treemap.
3. Drag the corresponding slider or enter a numeric value, then select an operator in the drop-down list: =, >=, or <=.
4. Click **Apply**.
   The threshold filters are applied to the selected dashlet types in the Summary of Events.

Set Title and Category Options for a Dashlet

1. To display the configurable settings for a dashlet, click ⚙.
   The Options dialog for the dashlet is displayed.

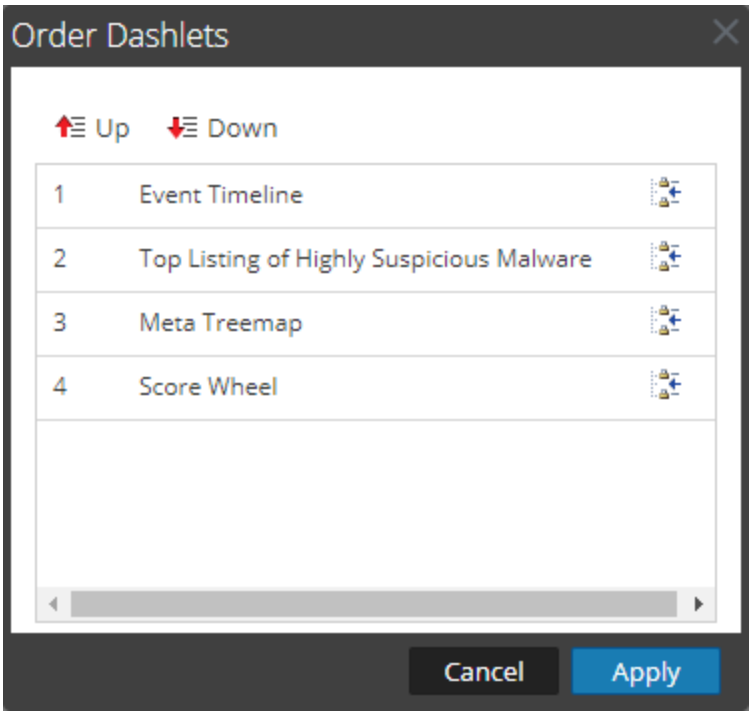


2. Type a new title for the dashlet in the **Title** field.
3. If you want to see only events that are influenced by a High Confidence tag, which means there is high confidence that the event contains harmful code, check the **Influenced By High Confidence Only** option.
4. If you want to see only events that were given a score above a certain score in the four categories (Static, Network, Community, and Sandbox), drag the corresponding slider or enter a numeric value, then select an operator in the drop-down list: =, >=, or <=.
5. Click **Apply**.
   The title and filters are applied to the dashlet.

Order Dashlets

To change the order of dashlets as they appear beneath the Summary of Events:

1. In the toolbar, select > **Order Dashlets**.
   The Order Dashlets dialog is displayed.



2. Select a dashlet that you want to move up or down, and click Up or Down.
3. When you are satisfied with the order, click **Apply**.
   The dialog closes and the order of dashlets below the Summary of Events is changed to match your choices.

Restore Default Dashlets

After you have added, modified, and arranged dashlets, you can revert to the default settings for dashlet display. To restore the default dashlets:

1. In the toolbar, select > **Restore Default Configuration**.
   A dialog requests confirmation that you want to restore the configuration.
2. Do one of the following:
   a. If you decide to keep the dashlet arrangement you have configured, click **No**.
   b. If you are sure that you want to restore the defaults, click **Yes**,
      The dashlet display reverts to the default display.

Configure Navigate View and Events View

Analysts can set preferences that affect performance and behavior of NetWitness Suite when analyzing data using the Investigate > Navigate view and Events view.

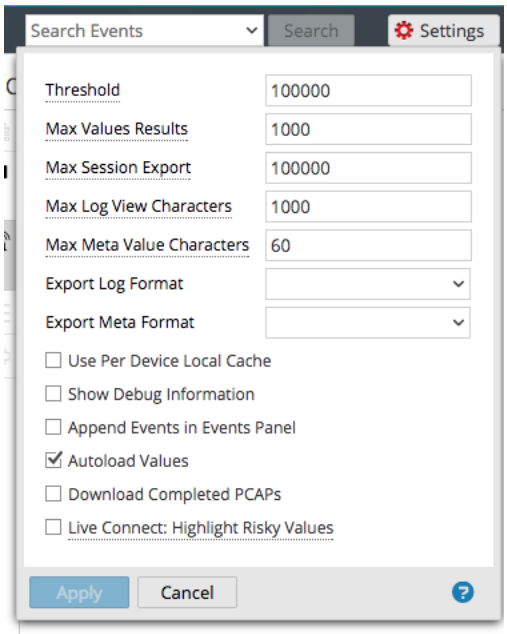
These settings are available in two places in NetWitness Suite, and changes made in either location are applied in the other view:

- Investigate view > Settings dialog and Search field for the Navigate view and the Events view.
- Profiles > Preferences panel > Investigations tab.

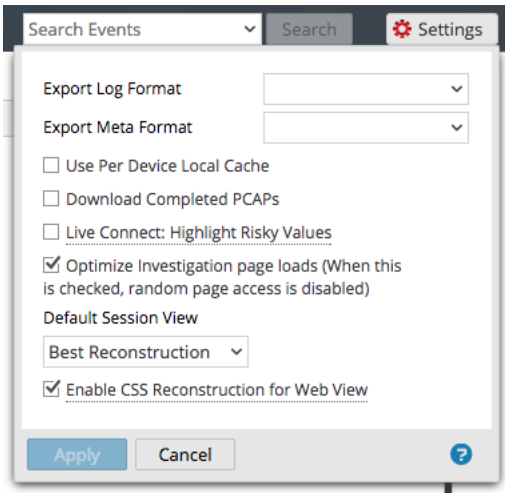
Access the Investigation Settings

To access the settings, do one of the following:

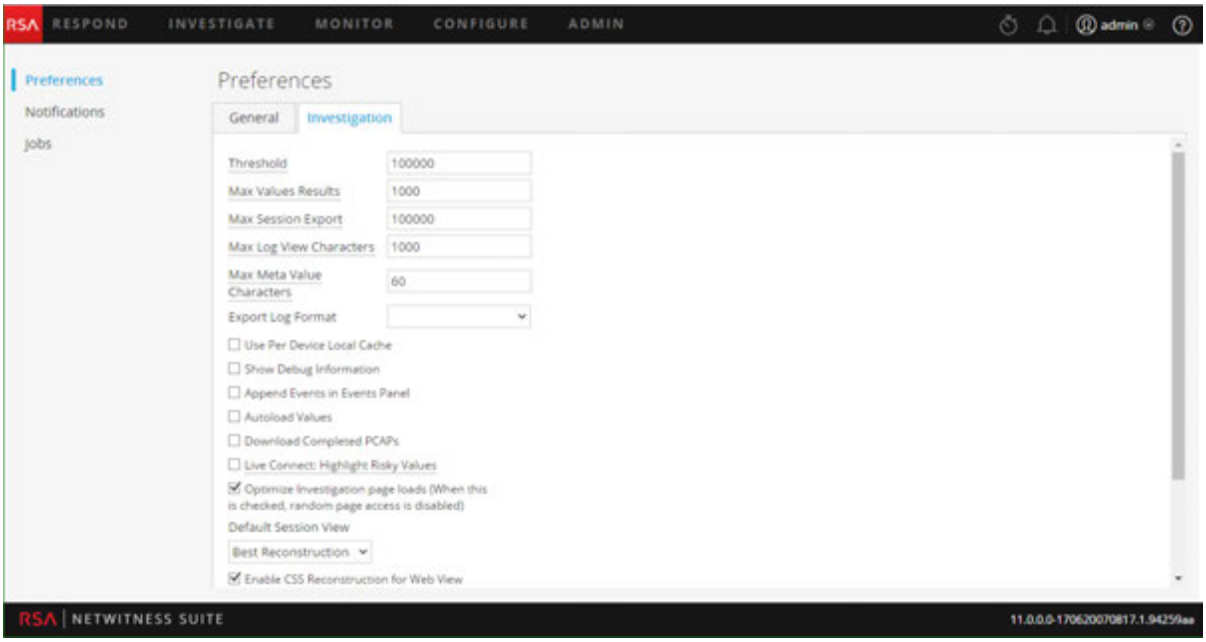
- In the **Navigate** view toolbar, select the **Settings** option.
  The Settings dialog for the Navigate view is displayed.



- In the **Events** view toolbar, select the **Settings** option.
  The Settings dialog for the Events view is displayed.



- In the top right corner of NetWitness Suite, select **Profile** from the user drop-down menu, and click **Preferences**. Click the **Investigation** tab.
  The Investigation tab is displayed.



Calibrate Navigate View Value Loading Parameters

Several Investigation settings influence the performance of NetWitness Suite when loading values in the Values panel. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations.

To adjust these settings:

1. Navigate to the **Investigation** tab or to the **Settings** dialog for the Navigate view.
2. Adjust the following parameters:

- Threshold: Set the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The default value is **100000**.
- Max Values Results: Set the maximum number of values to load in the Navigate View when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The default value is **1000**.
- Max Session Export: Specify the number of events that can be exported in a single PCAP or Log file.
- Max Log View Characters: Set the maximum number of characters to be displayed on **Investigation > Events > Log Text**. The default value is **1000**.
- Show Debug Information: If you want NetWitness Suite to display the `where` clause beneath the breadcrumb in the Navigate view and the elapsed load time for each aggregated service on a Broker, check this option. The default value is **Off.**
- Autoload Values: If you want NetWitness Suite to automatically load values for the selected service in the Navigate view, check this option. When not selected, NetWitness Suite displays a **Load Values** button, allowing the opportunity to modify options. The default value is **Off**.
- Live Connect: Highlight Risky IPs: If you want NetWitness Suite to highlight and display only IP addresses that are considered as risky by RSA community, check this option. When not selected, NetWitness Suite displays all IP addresses. By default, this option is not selected (**Off**).

3. Click **Apply**.

The settings become effective immediately and are visible the next time you load values.

Configure PCAP Download Behavior in Investigation

You can automate the downloading of extracted PCAPs in the Investigation module so that the browser downloads the extracted PCAP and opens it in the default application for opening PCAP files, such as Wireshark.

To configure this:

1. Ensure that an application that can open PCAPs is installed on your local file system and that the application is set as the default application to handle PCAP file formats.

2. Navigate to the **Investigation** tab or to the **Settings** dialog for the Navigate view or the Events view.
3. Check the **Download Completed PCAPs** option.
4. Click **Apply**.
   The setting becomes effective immediately.

Configure the Default Log Export Format in Investigation

You can export logs from Investigation in different formats. Available options are Text, XML, CSV, JSON. There is no built-in default value for the log export format. If you do not select a format here, NetWitness Suite displays a selection dialog when you invoke export of logs.

To select the format for exported logs:

1. Navigate to the **Investigation** tab or to the **Settings** dialog for the Navigate view.
2. Select one of the options from the **Export Log Format** drop-down menu.
3. Click **Apply**.
   The setting goes into effect immediately.

Configure the Default Meta Export Format in Investigation

You can export meta values from Investigation in different formats. Available options are Text, XML, CSV, JSON. There is no built-in default value for the meta export format. If you do not select a format here, NetWitness Suite displays a selection dialog when you invoke export of meta values.

To select the format for exported meta values:

1. Navigate to the **Investigation** tab or to the **Settings** dialog for the Navigate view.
2. Select one of the options from the **Export Meta Format** drop-down menu.
3. Click **Apply.**
   The setting goes into effect immediately.

Calibrate Events View Retrieval and Default Reconstruction

You can configure several parameters that control the how NetWitness Suite retrieves events and reconstructs events in the Events view. To do so:

1. Navigate to the **Investigation** tab or to the **Settings** dialog for the Events view.
2. Configure the following parameters.

- **Optimize Investigation page loads**: Set a paging option. When optimized, results are returned as quickly as possible, sacrificing the original ability to go to a specific page in the event list. Unchecking this box changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). The default value is **enabled**.
- **Append Events in Events Panel**: When this option is selected, the events displayed in the **Events Panel** are added incrementally.For example, each time you click the next page icon, the next increment of events is added, at first you see 1 to 25, then 1 to 50, then 1 to 75 and so on. This option is available only if the Optimize Investigation Page Loads option is enabled.
- **Default Session View:** Selects the default reconstruction type for the initial reconstruction in the Events view. The default value is **Best Reconstruction** in which events are reconstructed using the reconstruction method most appropriate to the event.

3. To activate the changes immediately, click **Apply**.

Enable or Disable Cascading Style Sheet Rendering in Web Content Reconstructions

Analysts can enable the use of cascading style sheets (CSS) when reconstructing web content. If enabled, the web reconstruction includes cascaded style sheet (CSS) styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for style sheets and images used in the target event. The option is enabled by default. Disable this option if there are problems viewing specific websites.

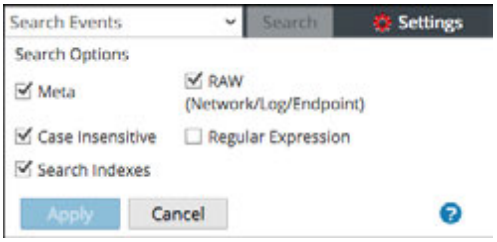
Note: The appearance of the reconstructed content may not match the original web page perfectly if related images and style sheets could not be found or were loaded from the web browser's cache. Also, any layout or styling that is performed dynamically via client side javascript will not render in the reconstruction because all client side javascript is removed for security purposes.

To enable or disable this option:

1. Navigate to the **Investigation** tab.
2. Click the **Enable CSS Reconstruction for Web View** checkbox.
3. Click **Apply**.
   The setting becomes effective immediately and is visible in the next web content reconstruction.

(Optional) Configure Search Options

1. Click in the **Search** field to display the Search Events drop-down menu.



2. Select one or more search options to apply to the search. Search for Text Patterns in the Investigate View provides detailed information about each option.
3. To save the search settings, click **Apply**.
   The preferences are saved and effective immediately.

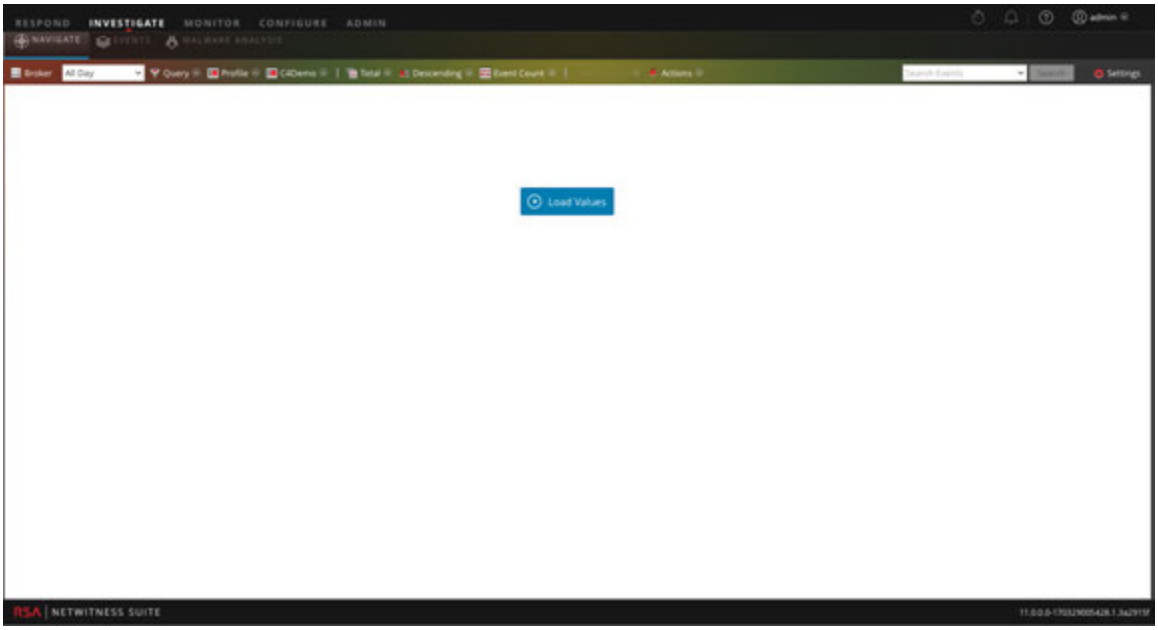
Conducting an Investigation

You can begin an investigation in several ways in NetWitness Suite; for detailed procedures see Beginning an Investigation of a Service or Collection. After you begin an investigation, there is no specific order in which to conduct the investigation. Instead, NetWitness Suite offers various methods of displaying the data, filtering the data, querying the data, acting on a drill point, and inspecting specific events.

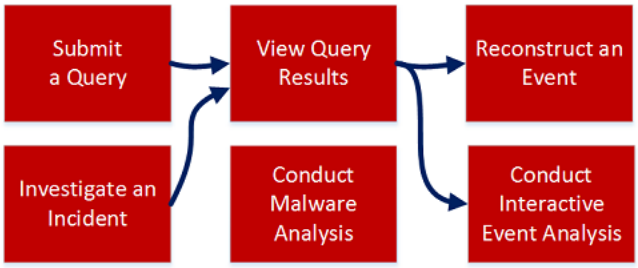
Analysts who use NetWitness Suite Investigation need to have the appropriate system roles and permissions set up for their user accounts. See Roles and Permissions for Malware Analysts. An administrator must configure roles and permissions.

Note: If you are investigating a 10.6 service from an 11.0 NetWitness Server, the download behavior varies for files, PCAPs, logs, payloads, and meta values. You may see an event payload on a 10.6 service to which you do not have permission, but you will not be able to download files or payloads.

To conduct an investigation, log in to NetWitness Suite, and go to INVESTIGATE. The Investigate view opens with the fields in which you select the service, time range, and an optional query for specific metadata. Select a service and click **LoadValues**.



These are the basic steps for conducting an investigation.



1. Submit a query or pivot to Investigate from a Respond entity (see Beginning an Investigation of a Service or Collection).
2. View query results in the Navigate view (see Refining Results Displayed in the Navigate View) and Events view (see Examining Events).
3. Reconstruct an Event (see Reconstruct an Event) or view the interactive Event Analysis of an event (see Analyze Events in the Event Analysis View).
4. Act on a drill point or an event (see Acting on a Drill Point in the Navigate View and Examining Events. For example, you can View Additional Context for a Data Point, Launch a Malware Analysis Scan from the Navigate View, or Add Events to an Incident for Response.

Beginning an Investigation of a Service or Collection

Analysts can begin an investigation of data on a NetWitness Suite service or collection, which results in the loading of values.

Note: Specific user roles and permissions are required for a user to conduct investigations in NetWitness Suite. If you cannot perform an analysis task or see a view, the administrator may need to adjust the roles and permissions configured for you.

To begin an investigation in NetWitness Suite, a service must be specified.

- NetWitness Suite opens the Navigate view with the user-specified default service selected.
- If no default service is currently specified and the service id is not in the URL, NetWitness Suite presents a dialog for selecting the service or collection to investigate.
- When a service has been selected manually or by default in the Navigate view, you can change the service or collection to investigate by selecting the service name in the toolbar. NetWitness Suite presents the dialog for selecting the service to investigate.

Note: The Archiver service does not appear in the Navigate view to minimize user experience of slow performance when performing investigations. The Archiver is available in the Events view for log exports and enhanced search capabilities.

With a service or collection selected, NetWitness Suite is ready to load data for the service or collection. Several settings in the Navigate View and Events View Settings dialog or the Profiles > Preferences panel > Investigations tab affect the loading process: Threshold, Max Values Results, Show Debug Information, Autoload Values, and Optimize Investigation page loads (see Configuring Investigation Views and Preferences).

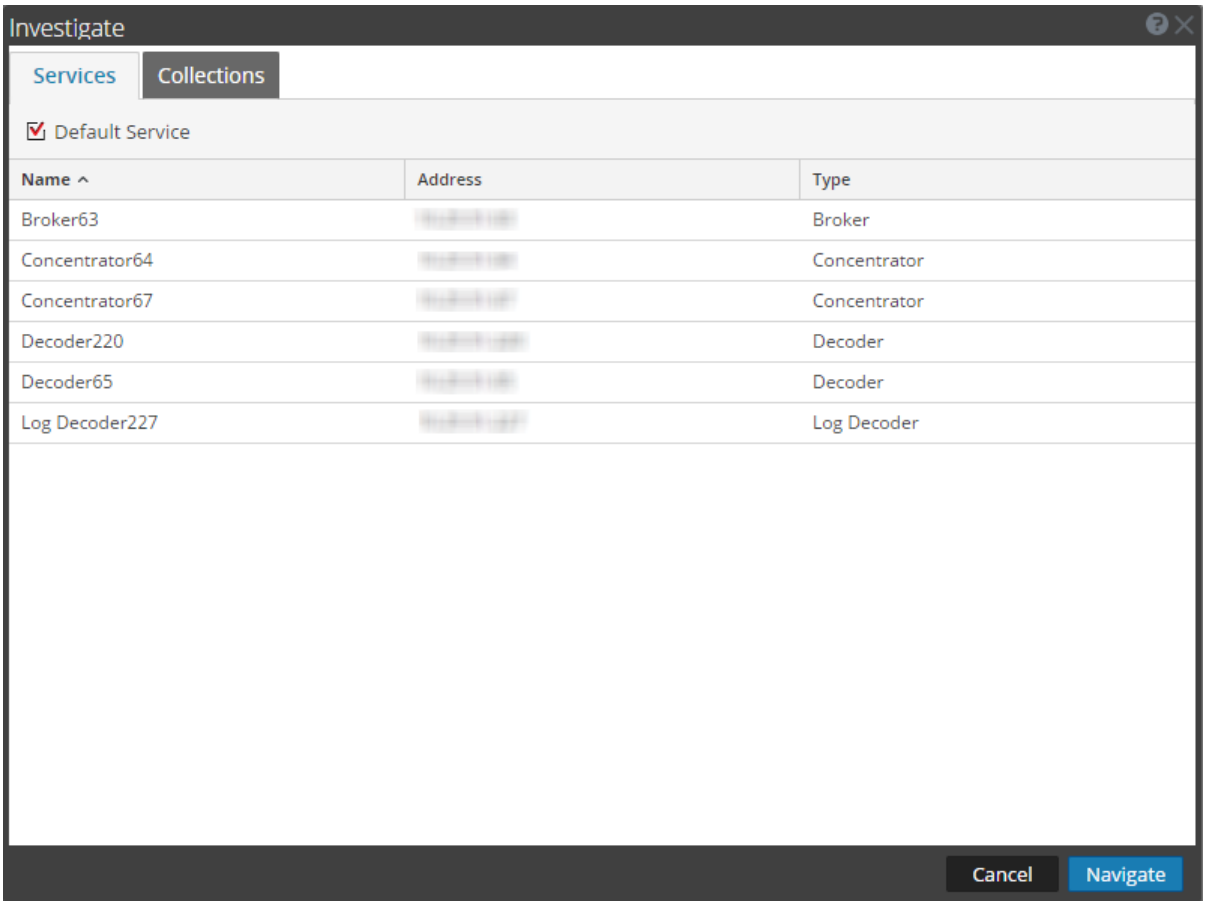
Note: If you specified Autoload Values, NetWitness Suite populates the data automatically. Otherwise, you must select the Load Values button. NetWitness Suite populates the meta data in the Navigate view Values panel and results become visible almost immediately.

The rest of this topic provides instructions for beginning the investigation of data on a service.

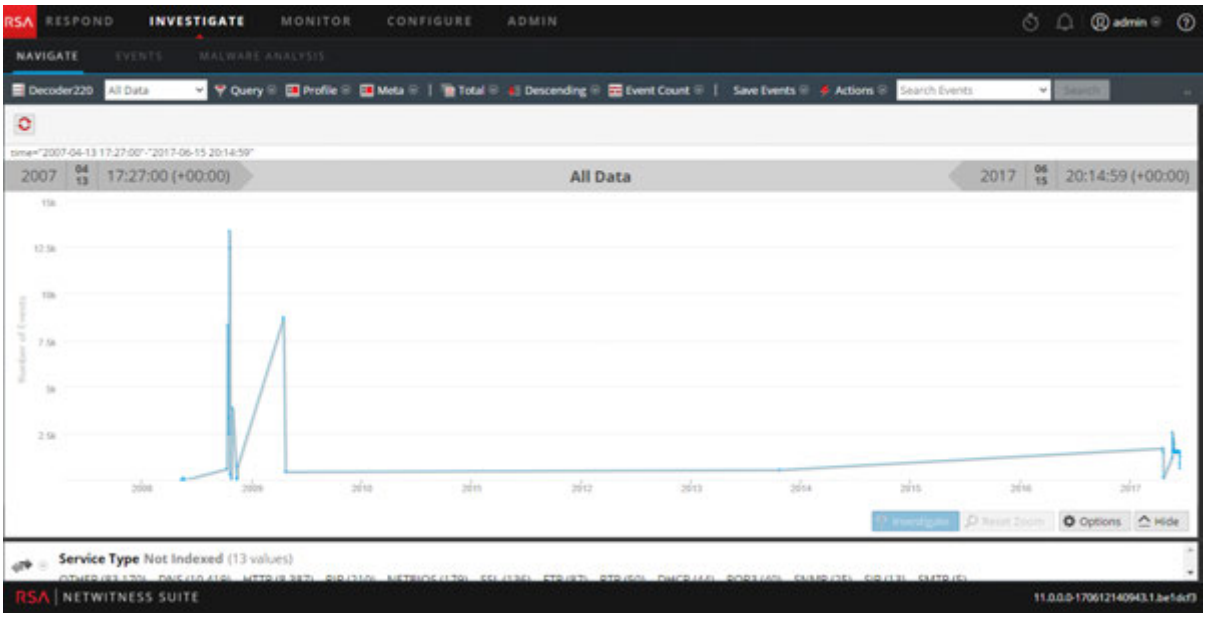
Note: Only users with the administrator role can create a collection, and only the creator of the collection is able to investigate a collection.

Begin an Investigation in the Navigate View (No Default Service)

1. Go to INVESTIGATE > **Navigate**.
   The Investigate dialog is displayed.



2. Double-click a service or select a service, usually a Concentrator, and click **Navigate**.
   The resulting panel displays the activity for the selected service.
3. If you want to modify investigation options before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query as described in Refining Results Displayed in the Navigate View. You can also modify options at any time during the investigation.
4. When ready, click Load Values.
   The data for the selected service begins loading.

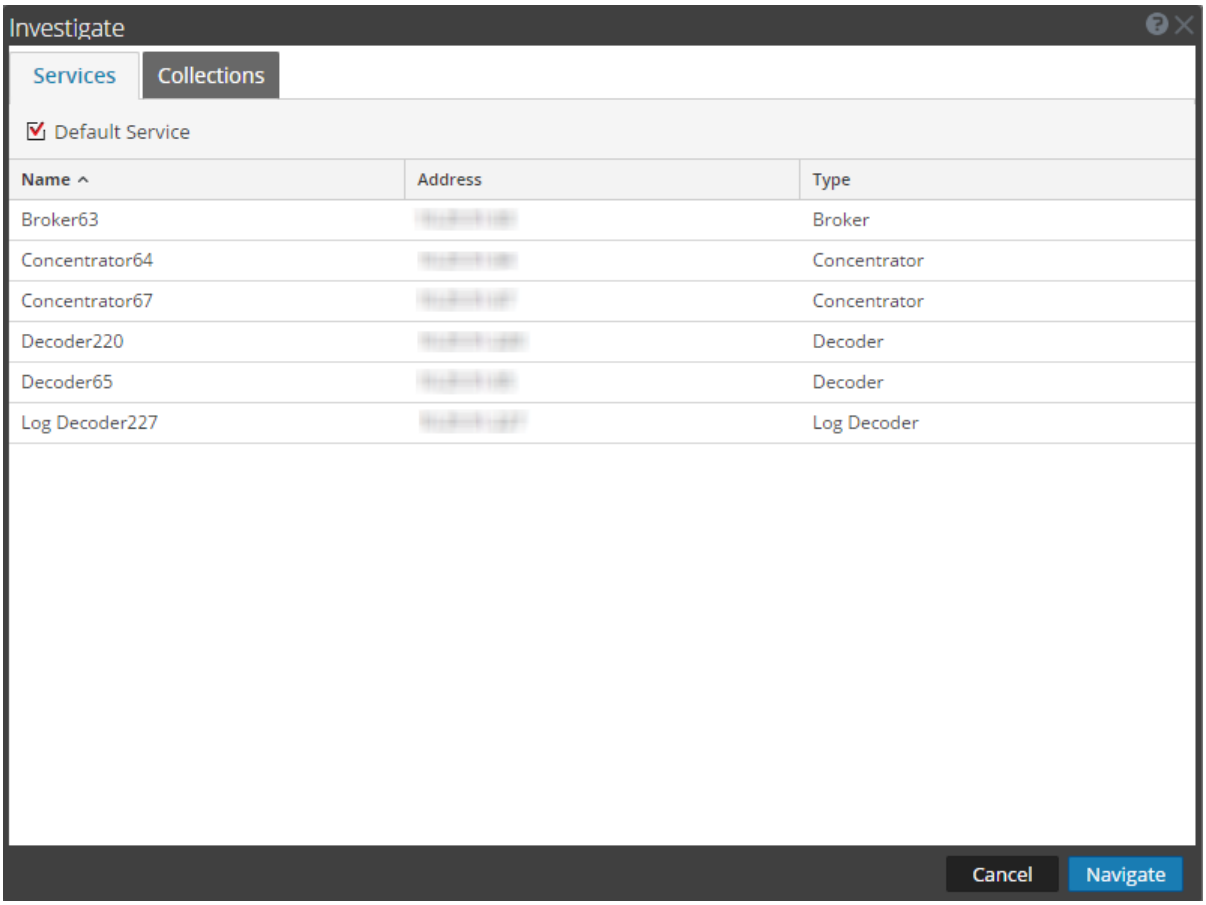


With the service selected and data loaded, you are ready to begin analyzing the data.

Set or Clear the Default Service

You can set the default service and clear the default service in the Investigate a Service dialog.

1. Click the service name in the toolbar.
   The Investigate dialog is displayed.



2. Select a service on the **Services** grid, and click Default Service.
   The service becomes the default, (indicated by **Default** in parentheses after the service name).

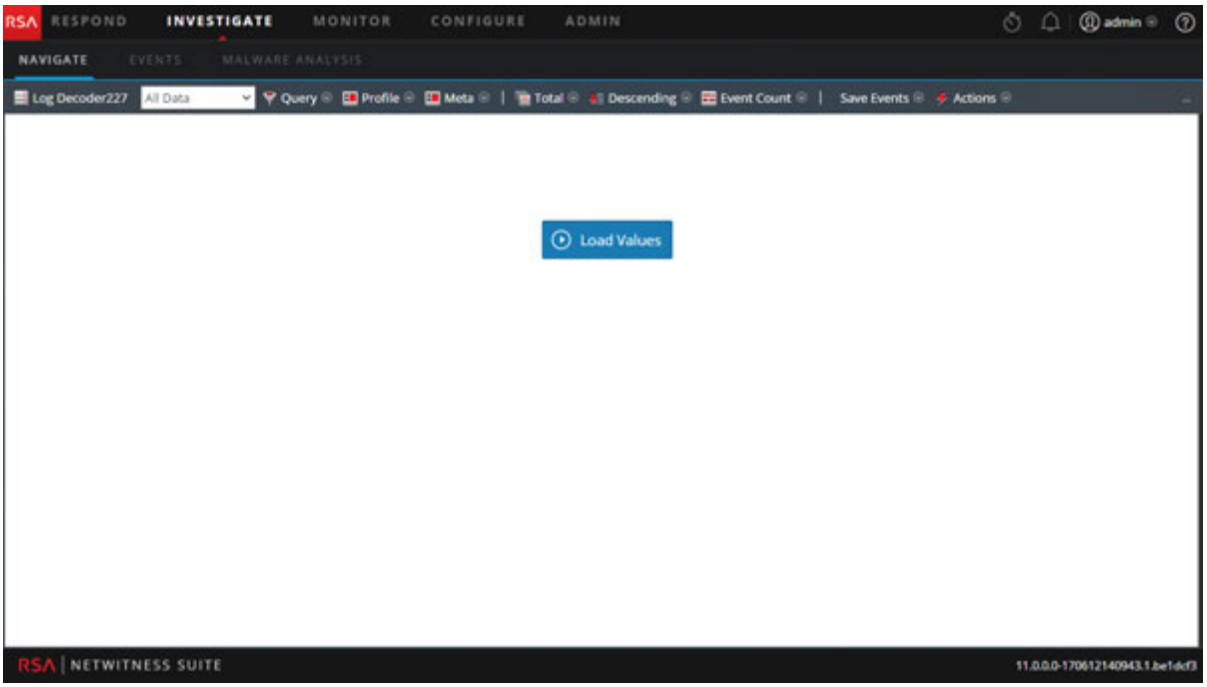
3. To clear the default service, select the default service in the grid, click Default Service, and click **Cancel** to close the dialog.
   No default service is set.

> **Note:** The Cancel button does not cancel your selection of the default service. It simply closes the dialog without navigating to the currently selected service in the grid. Setting a default service that is different from the service currently being investigated, does not refresh the Navigate view. You must explicitly select and Navigate to a different service.

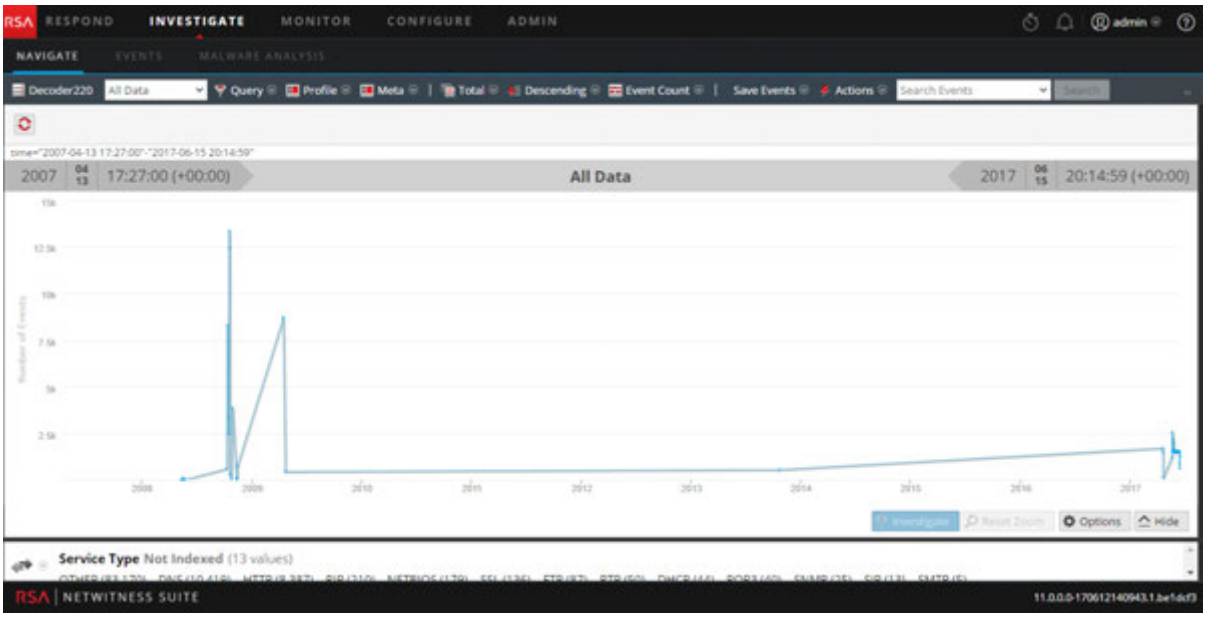
Begin an Investigation (Default Service Specified)

1. Go to **INVESTIGATE > Navigate**.
   If the Autoload Values setting is set to off, the Navigate view is displayed with the default

service selected, and ready to load data. If the Autoload Values setting is on, the values are loaded as shown in Step 3.



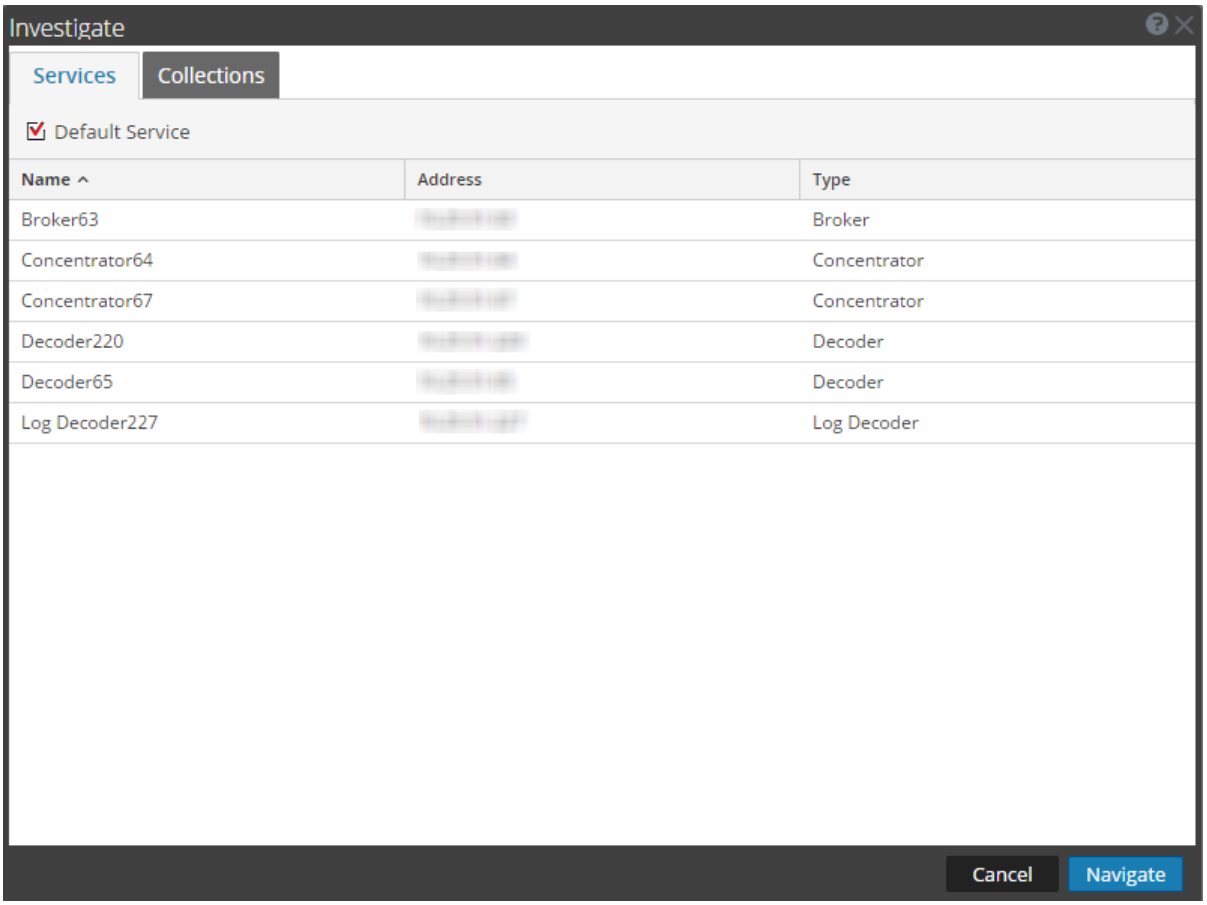
2. If you want to modify investigation options before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query.
3. When ready, click Load Values.
   The values for the service are loaded in accordance with the selected options.



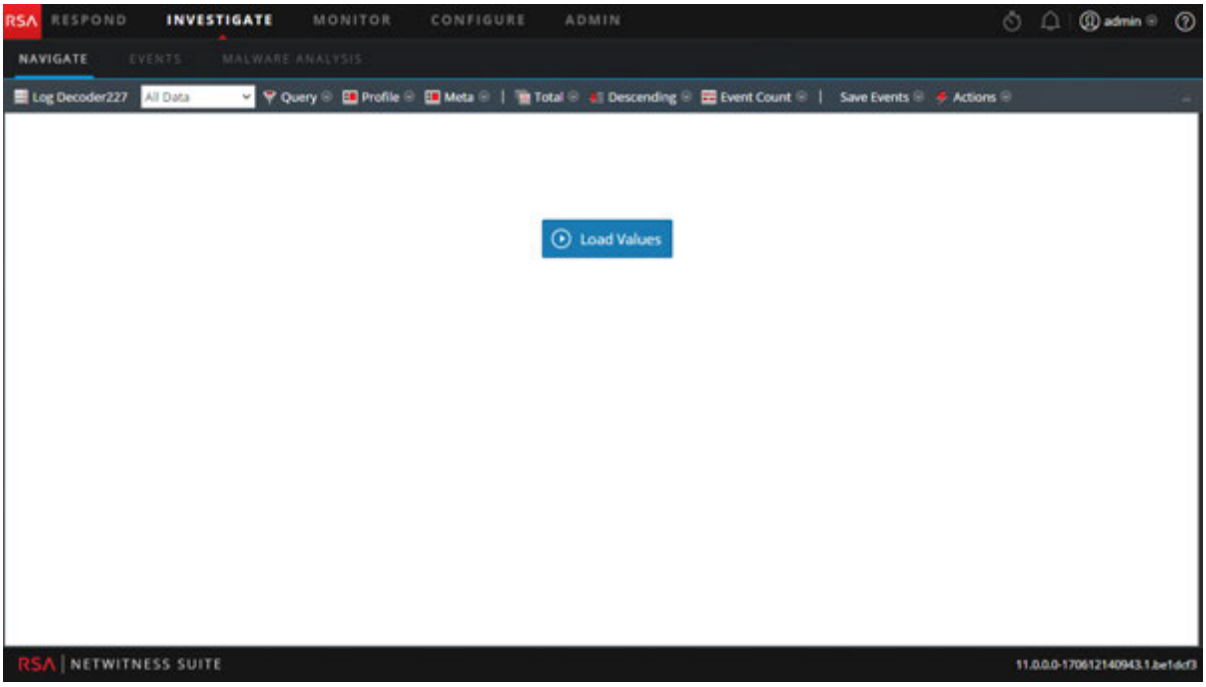
With the service selected and data loaded you are ready to begin analyzing the data.

Change the Service or Collection to Investigate

1. In the Navigate view, click the service name at the top of the options panel.
   The Investigate dialog is displayed.



2. Double-click a service or select a service and click **Navigate**. The resulting panel displays the activity for the selected service.
   If the Autoload Values setting is on, the values are loaded as shown in Step 3.
   Otherwise, the Navigate view is displayed with the default service selected, and data ready to load.



3. When ready, click 

.

   The values for the service begin loading in accordance with the selected options.

   With the service selected and data loaded you are ready to begin analyzing the data.

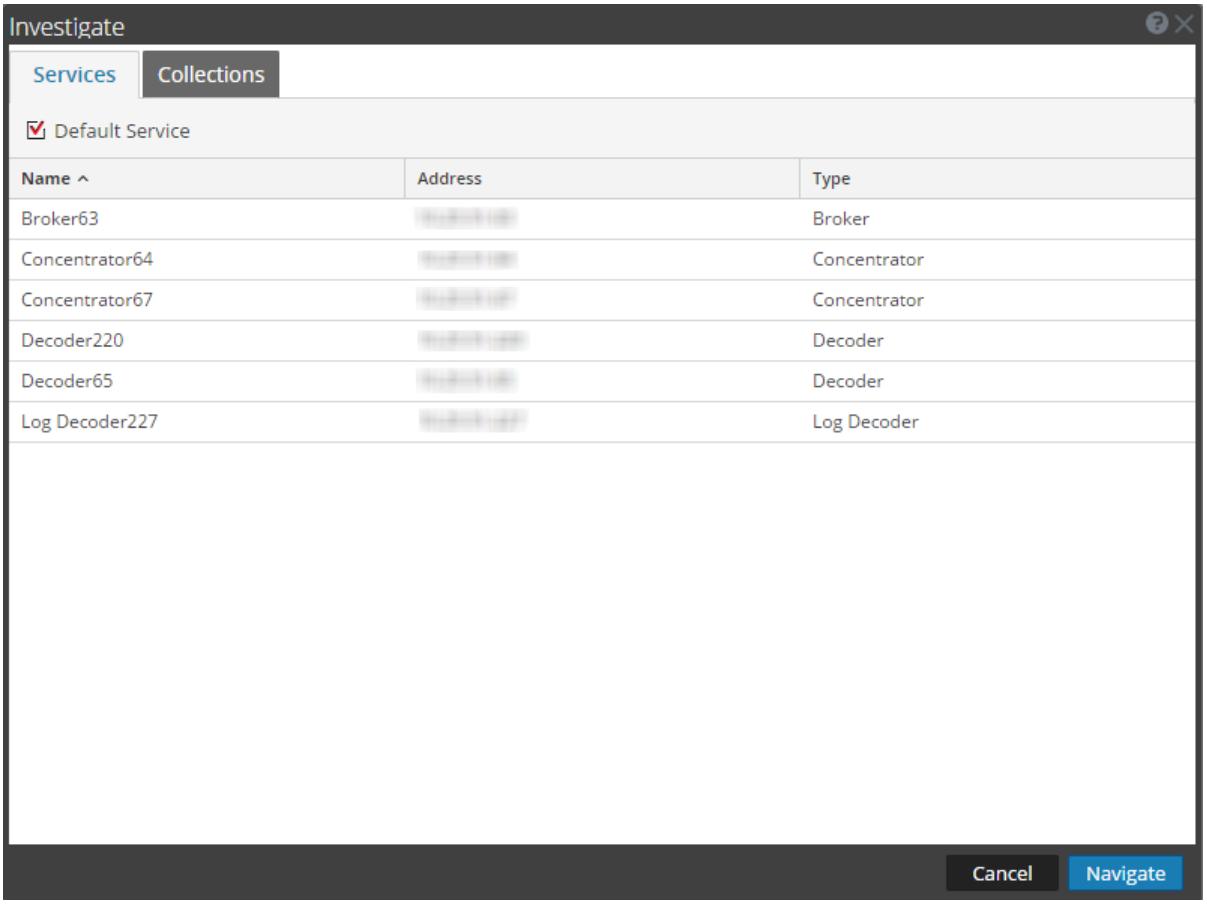
Investigate Workbench Restoration Collections

This procedure enables Administrators to select content from an existing collection to reprocess for further investigation. This applies to Decoders that use Workbench services.

Note: Only a user with administrative privileges can create a collection, and you can view only those collections that you created.

To reprocess data for further investigation:

1. Go to **INVESTIGATE > Navigate**.
   The Investigate dialog is displayed.



2. Select a workbench service and workbench name that you want to investigate.
3. Click **Navigate** to perform an investigation on your selected workbench service.
   Click **Cancel** to select a different workbench service to investigate.
   The Investigation view is displayed.
   With the collection selected and data loaded you are ready to begin analyzing the data.

Refining Results Displayed in the Navigate View

When conducting an investigation in NetWitness Suite, there are several methods available to refine the results displayed when meta key values are loaded in the Navigate view. Analysts can:

- Set the Time Range for an Investigation (Navigate view or Events view)
- Set the Quantification Method and Sort Sequence of Meta Key Results (Navigate view)
- Manage and Apply Default Meta Keys in an Investigation (Navigate view)
- Manage Meta Groups (Navigate view)
- Visualize Metadata as Parallel Coordinates(Navigate view)
- Use Investigation Profiles to Encapsulate Custom Views (Navigate view and Events view)

Manage Meta Groups

A meta group combines selected meta keys into a group to show only data in which the meta keys were found. In the Investigate > Navigate view, you can use meta groups to filter data displayed in an investigation. A fresh installation of NetWitness Suite includes out-of-the-box (OOTB) meta groups that RSA content developers have developed to help you find interesting data sets in Investigate. The OOTB meta groups are prefixed with RSA for identification and can be duplicated but cannot be edited or deleted. You can create your own groups and you can duplicate and edit an OOTB group to create a custom group.

With a meta group in effect during an investigation, the information in the Values panel shows only the meta keys in the selected group. When you open a Parallel Coordinates visualization, the meta keys in a group appear as axes from left to right. It may be useful to create two versions of each custom meta group; one for analysis of meta values and one for creating a parallel coordinates chart focusing on a smaller subset of the same use case.

Custom meta groups are visible to all users of a service and may be exported for import to any service, limited by the available meta keys for that service.

Note: When an administrator adds custom meta groups manually by editing the custom index file for a service, the new groups become available to Investigation after the service is restarted.

This section describes how to add, edit, import, export, and delete custom meta groups to be used during navigation on a specific service.

Out-of-the-Box Meta Groups

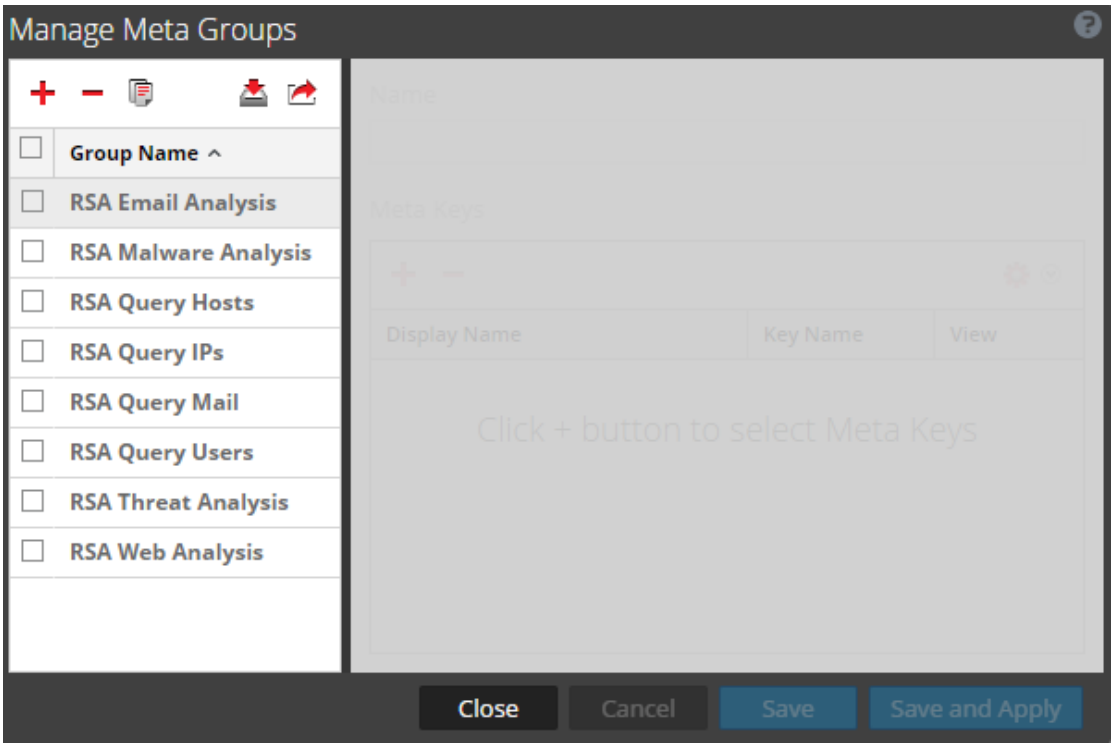
The OOTB meta groups a built-in to RSA NetWitness Suite. The default meta groups are useful to focus an investigation on common use cases and to support threat detection using the RSA Hunting Pack.

These are the OOTB meta groups:

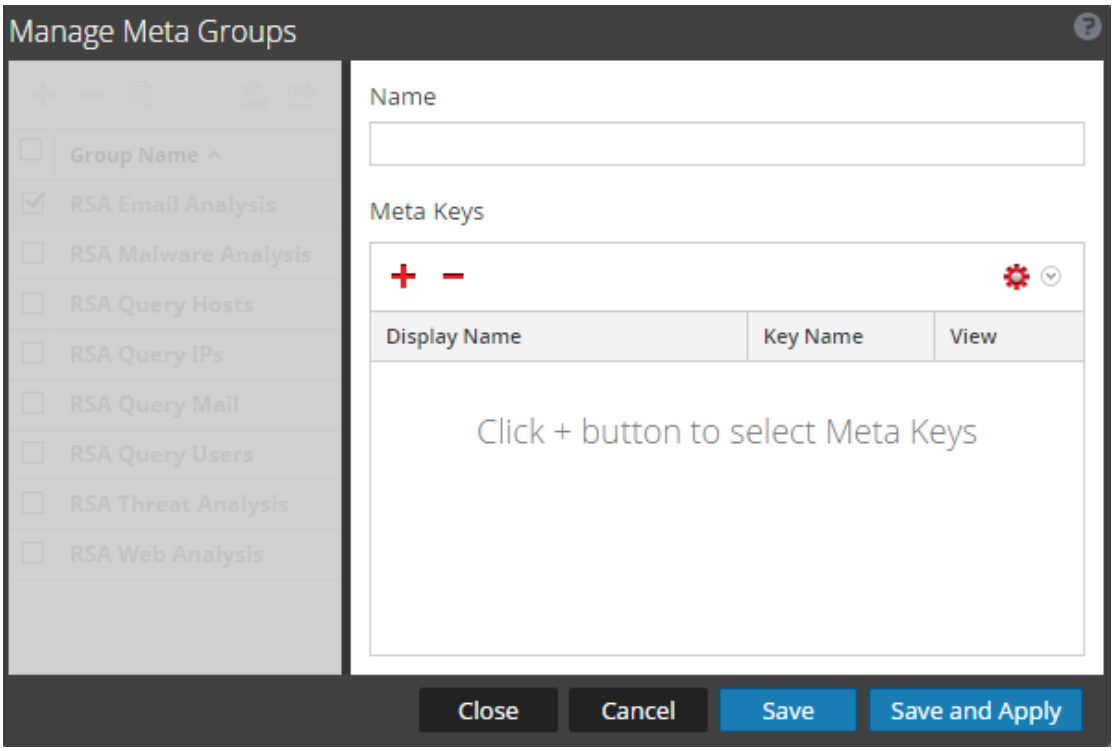
- RSA Email Analysis includes meta keys that outline email interactions.
- RSA Endpoint Analysis contains meta keys that provide insight on processes, files, users, and connections from NetWitness Endpoint (NWE) hosts.
- RSA Malware Analysis includes meta keys that mark indicators of compromise in files contained in events.
- RSA Outbound HTTP includes meta keys that provide insight into outbound web traffic.
- RSA Outbound SSL/TLS includes meta keys that focus on encrypted web traffic.
- RSA Query Hosts includes a meta keys that encompass all the meta keys to find hosts.
- RSA Query IPs includes meta keys that encompass all the meta keys to find IP addresses.
- RSA Query Mail includes meta keys that encompass all the meta keys to find email.
- RSA Query Users includes meta keys that encompass all the meta keys to find users.
- RSA Threat Analysis includes meta keys that mark potential threats in the data set.
- RSA Web Analysis includes meta keys that mark anomalies in web traffic.

Create a Meta Group and Add Meta Keys

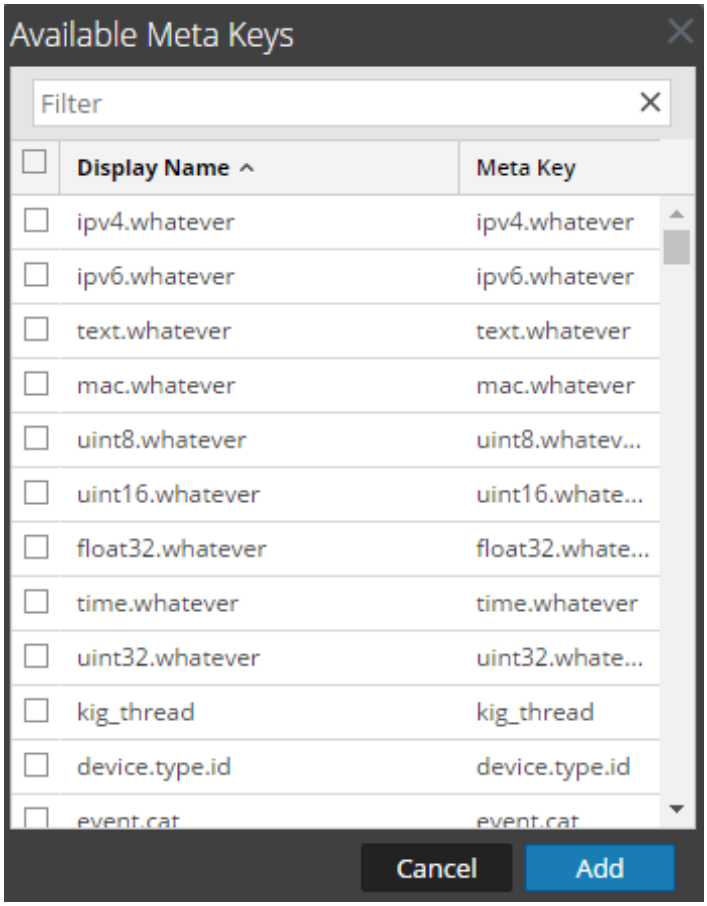
1. While investigating a service in the **Investigate > Navigate** view, select **Meta > Manage Meta Groups** in the toolbar.
   The Manage Meta Groups dialog is displayed. Initially only OOTB groups are configured for a service and listed under Group Name. If other custom groups have been configured, they are also listed under Group Name.



2. In the grid toolbar, click +.
   A new row is inserted at the top of the Meta Groups grid.
3. Type a name for the new meta group, and press **Enter**.
   The form to the right opens for editing.



4. (Optional) If you want to change the name of meta group, type a new value in the **Name** field.
5. In the **Meta Keys** toolbar, click **+**.
   The Available Meta Keys dialog is displayed, with keys in alphabetical order.



6. To filter the list of meta keys, type a word or phrase in the **Filter** field and select **Enter**. The list displays matching meta keys based on a case-insensitive search. Delete the filter text and press **Enter** to remove the filter.
7. To select meta keys to include in the meta group, click the checkboxes. To select all meta keys, click the checkbox in the title bar and click **Add**.
   The selected meta keys are added to the meta keys list.
8. (Optional) If you want to change the order in which the meta keys load and are listed in an investigation, click and drag one or more meta keys to a new position.
9. To finish creating the meta group do one of the following:
   a. To save the meta group, click **Save**.
      The group is created and available for use.

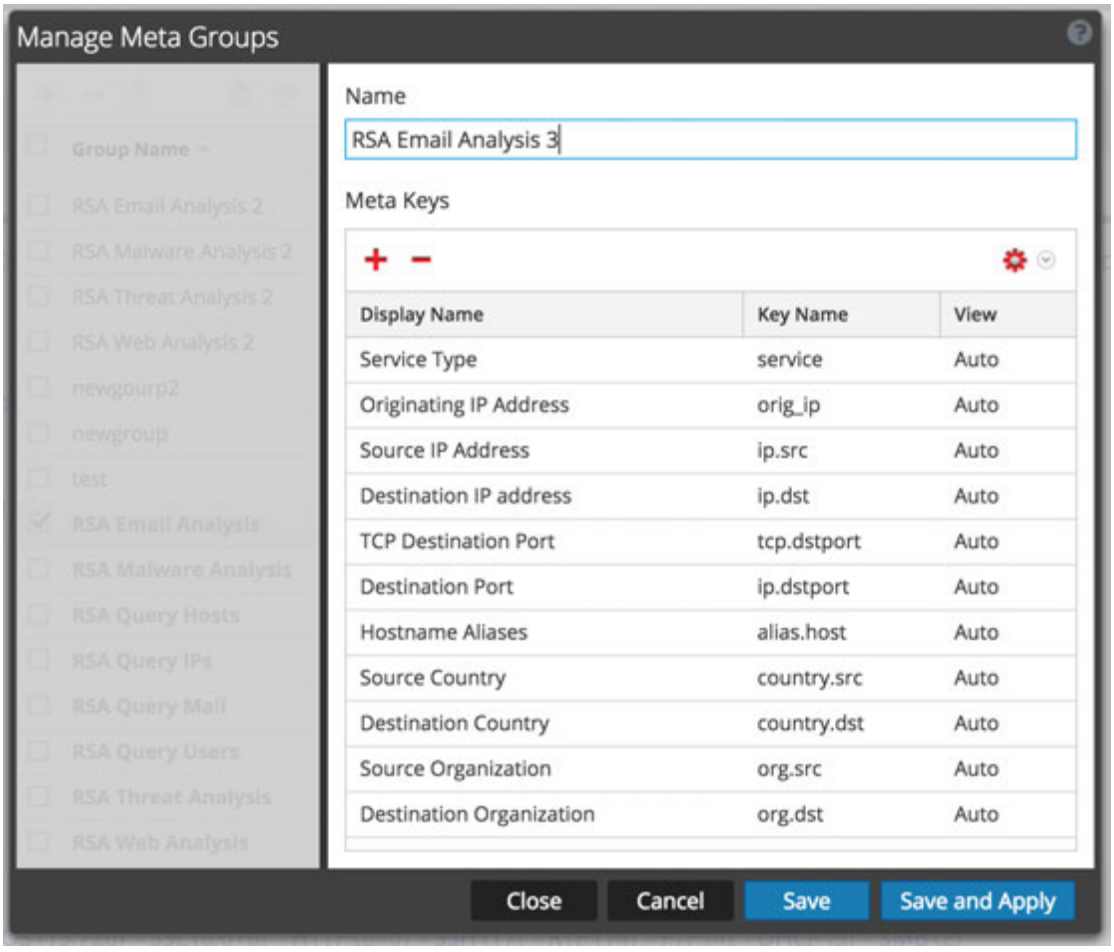
b. To save and apply the meta group to the current Investigation view, click **Save and Apply**.
   The group is created and applied immediately to the current Investigation view.

10. Click **Close**.

Duplicate and Edit an Out of the Box Meta Group

If you want to customize an OOTB meta group, you need to duplicate the group and then edit the duplicate.

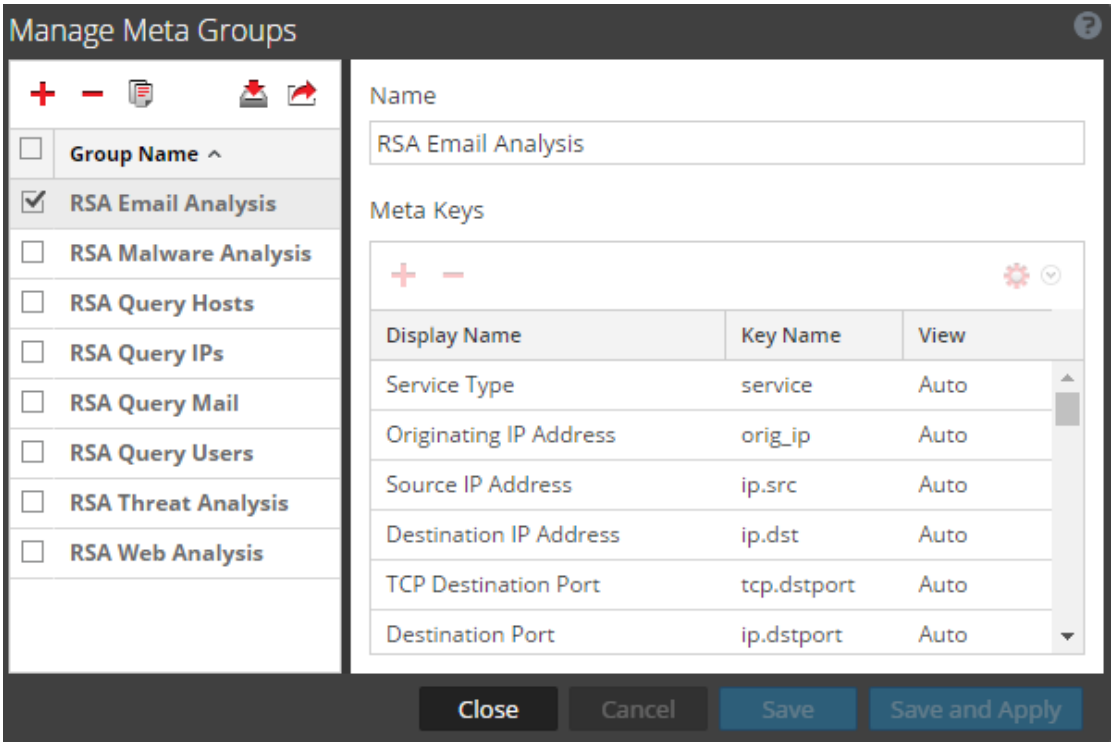
1. Select an OOTB meta group from the Meta Groups grid and click .
   The form to the right opens for editing with all of the meta keys as they are in the OOTB group.



2. Enter a name for the new group and continue editing as described in "Edit a Meta Group" below.

Edit a Meta Group

1. Select a group from the **Meta Groups** grid.
   The form to the right opens for editing.



2. (Optional) Edit the Name of the group.
3. (Optional) Add new meta keys, as described above in Create a Meta Group and Add Meta Keys.
4. (Optional) To set the order for the keys, drag and drop one or more keys.
5. (Optional) To change the initial view of a meta key, click and choose one of the possible views.
   When you modify the meta group, you cannot set the key to OPEN. If you change the default view for a group of meta keys to OPEN and some of the meta keys are non-indexed, the non-indexed meta keys revert to AUTO. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are CLOSED until opened manually.
   The value for the initial view is displayed in the View column.
6. To save, the changes, click **Save**.
7. To apply the changes to the current Navigation view, click **Save and Apply**.

Delete a Meta Group

1. In the **Meta Groups** grid, select the group to be removed.
2. Click −.

   A confirmation dialog provides an opportunity to cancel or complete the request.
3. Click **OK**.

   The meta group is deleted. When you close the window, if the deleted group was the currently applied meta group, it is removed and the default meta keys are used to build the view.

Export a Meta Group

User-defined meta groups are created on individual services. To make meta groups available to another service, you must export them to your local file system. To export one or more meta groups:

1. In the **Meta Groups** grid, select one or more groups to be exported.
2. Click .

   The selected groups are downloaded to your local file system as a **MetaGroups.jsn file**. Every download of meta groups has the same name with a numeral appended to avoid overwriting previous downloads.

Import a Meta Group

To make user-defined meta groups from another service available to the currently investigated service, you must import the `MetaGroups.jsn` file from the local file system. When you import meta groups into NetWitness Suite, NetWitness Suite displays an error message if any of the groups are already present. To import a group that is a duplicate, you must first delete the existing group. If you want to delete a meta group, it cannot be in use by a profile.

To import meta groups:

1. In the **Meta Groups** grid, select a file to import and click .

   The selection dialog is displayed.

2. Click **Browse** and navigate to the directory on your local file system where the downloaded `MetaGroups.jsn` files are stored. Select a file and click **Open**.
   The filename is displayed in the Upload File field.
3. Click **Upload**.
   The upload process begins, and a message indicates that the upload was successful. The meta groups are added to Meta Group grid. If the file is a duplicate of an existing meta group, a dialog tells you that the meta group already exists.

Manage and Apply Default Meta Keys in an Investigation

When analysts are conducting an investigation of captured data in Investigation, a default set of meta keys is loaded and displayed in a default sequence in the Navigate view > Values panel. The default content and sequence is based on the meta keys for the service being investigated. Analysts can specify the meta keys to display during navigation by selecting the default meta keys or by selecting a user-defined group of meta keys, which provides great flexibility to define meta keys. This can help to drill down more directly to the desired data and to reduce the load time by preventing the loading of meta that is not of interest in the current investigation.

If no custom meta groups are in effect, the Navigate view is displayed with the meta key visibility specified in the Default Meta Keys dialog. To optimize loading of meta keys in the Navigate view > Values panel, NetWitness Suite does not open non-indexed meta keys by default. When you open a non-indexed meta key in the Values view, NetWitness Suite begins loading values for that meta key. If the load time is excessive, the load of the meta key times out with a message. Title, values, and counts for non-indexed meta keys are not drillable in the Values panel. Additional labeling in Investigation identifies the non-indexed meta keys.

To select the meta keys to apply to your investigation, you can.

- Select the default meta keys.
- Select a user-defined set of meta keys, called a meta group.

Note: Once created, user-defined meta groups can be edited, deleted, exported for use on other services, and imported to the service you are investigation. All of these procedures are provided in a separate topic: Manage Meta Groups.

The Default Meta Keys dialog allows you to specify the default view and display sequence for meta keys during navigation in the Investigate > Navigate view for a specific service. For each key or for all keys, you can set the default view to:

- Hidden: Results for default meta key are hidden and are not available to load.
- Open: Results for default meta key are open with all values and counts displayed.
- Close: Results for default meta key are closed with only the meta name visible.

- Auto: The loading of default meta keys is controlled by the index level, which must be Indexed By Value.

When using the default meta keys, be aware that these can be modified for different services, and you may not be seeing the same set of default meta keys when navigating to a drill point on different services. If you do not see the expected data, you may need to change the initial view of the default meta keys.

When you change the initial state of default meta keys from within the Navigate view, the change persists for that service. When new keys are added to the custom index file for a Core service (for example, `concentrator-custom-index.xml` or `decoder-custom-index.xml`), the new keys are added to the default meta keys list. The changes made in the Navigate view apply only to the current service.

Use Default Meta Keys

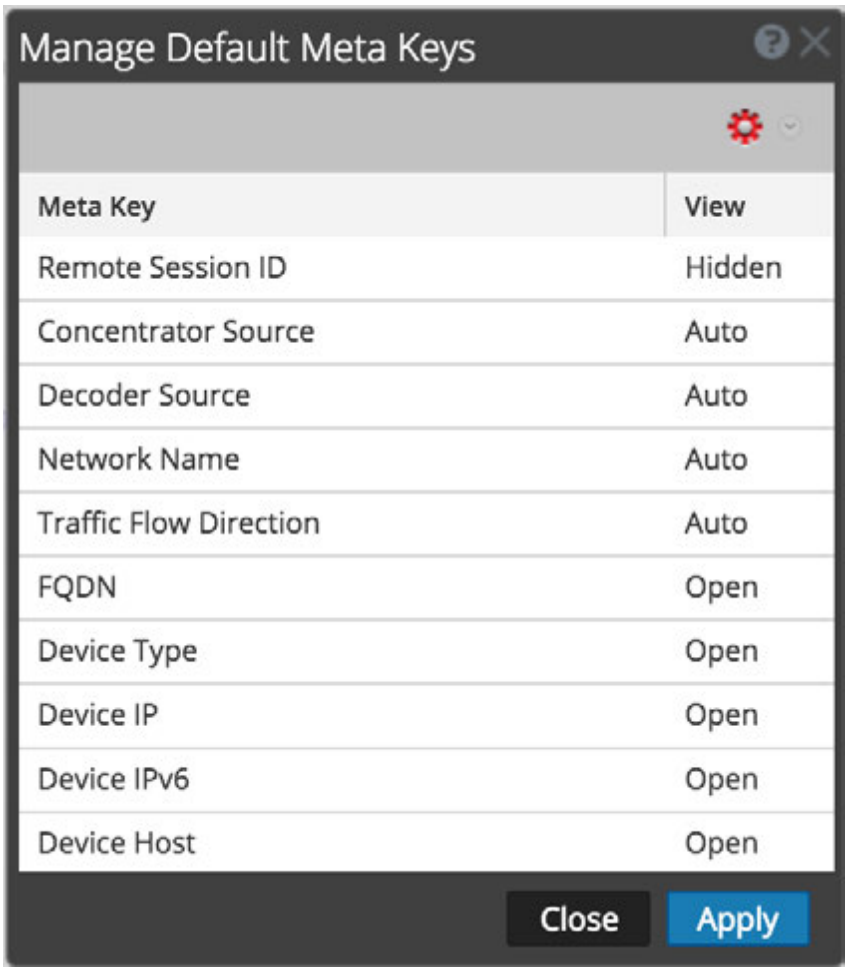
To specify that the initial Navigate view opens using default meta keys:

1. Go to INVESTIGATE **> Navigate.**
2. Select a service, and select **Navigate**.
3. In the **Meta** menu, select **Use Default Meta Keys**.
   If an investigation is already in progress, the data is reloaded in the current view and an icon highlights the selected option. If no data is loaded yet, the default meta keys are used for the next load.

Configure Default Meta Keys

To configure the default view of default meta keys in the Investigation > Navigate view:

1. In the **Navigate** view toolbar, select **Meta > Manage Default Meta Keys**.
   The Manage Default Meta Keys dialog is displayed with the list of available meta keys for the service.



2. (Optional) To change the order of the keys, select one or more keys, and drag the values up or down through the list of keys.
3. Do one of the following:
   - (Optional) To change the default view for all meta keys, make sure that no keys are selected and in the toolbar, select .
   - (Optional) To change the default view for one or more keys, select the keys and in the toolbar, select .

     A drop-down of possible initial views for all default meta keys is displayed.
   - (Optional) To revert to the default view for meta keys as specified in the service index file, make sure that no keys are selected and in the toolbar, select > **Auto**.

     When you modify the default meta keys for a non-indexed meta key, you cannot set the key to OPEN. If you change the default view for a group of meta keys to OPEN and some of the meta keys are non-indexed, the non-indexed meta keys revert to AUTO. As a

result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are CLOSED until opened manually.

4. Select one of the views.
5. To save the changes, click **Apply**.
   The meta keys displayed in the Navigate view are set to your specifications. If the default meta keys are hidden, values for the meta keys are not shown in the investigation at all. If the default meta keys are closed, the values for the meta keys are not loaded by default, but you can load individual meta keys manually in the Navigate view.

Search for Text Patterns in the Investigate View

You can search for text patterns withing the current set of events in both the Navigate view and the Events view. You can perform a keyword text search or do regex (Regular Expression) matching. . In the Navigate view, you can click a meta value, such as HTTP, to drill into the data and then enter a search string in the Search field to search for events within that subset of data. The search opens a tab in the Events view, brings your drill and time range forward, and shows your search results. You can also drill into the data using queries before starting a search. To execute the search, enter a search string in the Search box, and press **Enter** or click **Search**.

Keyword Text Search

The text search provides these capabilities:

- Each white space delimited word is ANDed, so that every word must be found, but the order or location position in relation to the other words is irrelevant. For example, if you search on `Mark Albert`, both Mark and Albert must be found in the session, but they need not be together or in any specific order.
- The word OR is special. If you search `Mark OR Albert`, either Mark or Albert must be found in the session to match; both are not required.
- You can mix or match implicit ANDs and ORs together in the search string. The explicit OR has higher precedence than the implicit (whitespace) AND. The following examples make the same logical statement, which requires that both the terms cheese and dumplings be present in a match and one of toaster bread:

  ```
  cheese toast OR bread dumplings
  cheese AND (toast OR bread) AND dumplings
  ```

- You can exclude words from search results using the - operator. For example, searching for `cheese -toast` would return any result that has the word cheese, unless the word toast is also present.
- The keyword search can match metadata stored in the following patterns:
  - **IPv4 and IPv6 addresses**. Any term that can be recognized as an IP address will be converted to the native metadata format so that it can be found in indexed metadata.
  - **IPv4 CIDR ranges**. You can use CIDR notation to locate IPv4 addresses within a range.
  - **Timestamps**. Timestamps are matched against the native time meta, and any additional time meta fields stored with the Time type.
  - **Numbers**. The search function will attempt to automatically identify decimal search terms and match them against numeric meta data fields.

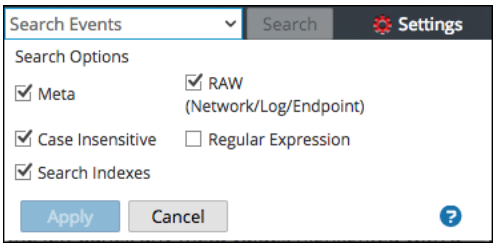
Options Controlling Search Behavior

To access the Search box and search options in the Navigate or Events views:

1. You can see the Search Events field in the toolbar.

Troubleshooting: If you cannot see the Search Events field in the toolbar, click  on the right side of the toolbar.

2. Click in the Search field to view the Search Options drop-down menu.



The options selected in this box change how the search is executed. The default search mode is to use the search indexes for text keywords within meta and raw.

Note: Because the Search Indexes checkbox is selected by default, the search returns results based on data that is indexed. If you want to search for a complete set of metadata or raw data, select those checkboxes and clear the Search Indexes checkbox. The search will take longer, but it will contain a more complete set of data.

The following table describes the Investigation search options.

Feature	Description
Search Indexes	Searches the indexes first, before scanning the meta data or any raw data. Searching the index is the fastest way to locate keywords within a large data set. The index search utilizes any relevant indexes present within your data collection. **Caution:** - The index search only returns results on indexed data. - Substring matches will not be located by index searches. If you require substring matches, clear this checkbox and use a non-index search mode.

Feature	Description
Meta	Searches the metadata. Your keyword or regex pattern will be matched against any parsed meta data.
RAW (Network/Log/Endpoint)	Searches the log or event text. Every event is decoded and content is searched for matches on the keyword or regex pattern. If you select all data with no filters on an Archiver, execution time may be excessive and a warning may be displayed. **Caution:** Searching raw network sessions causes sessions to be decoded, which is very time intensive. You may want to disable raw searches when looking at network-only collections.
Case Insensitive	Ignores case when searching.
Regular Expression	Searches using a Perl regular expression, rather than text. By default executes a text search. To execute a regular expression search, select the Regular Expression option. **Caution:** - Regular expression searches can be very slow. - When combining regular expressions and index search options, the regular expression pattern is matched against unique index values instead of meta values. This produces results faster, but it is not an exhaustive search of all the meta data or raw data.
Apply	Sets the default search options to apply to a search in the Navigate and Events views. This also updates your Investigation preferences in your Profile (Profile > Preferences > Investigation tab). The preferences are saved and effective immediately. You can select search options to use for a particular search without changing your default search preferences.

Regular Expression Search Syntax

A regular expression search uses Perl regular expression syntax, which is documented in detail in http://perldoc.perl.org/perlre.html.

Raw Text Keyword Search

The Log Decoder has the capability to create a raw text index for unparsed log events. This functionality creates metadata items that form a full-text index on downstream services such as Concentrators and Archivers. When you enable the Search Indexes option in your search preferences, your search automatically utilizes the text index. Note that the text index produces meta items that have a coarse granularity. For example, the default text indexer configuration truncates text terms. By comparing the index matches against raw data, the search engine will find accurate results for your search. However, you can improve search times by disabling the raw search checkbox. If you do so, results will be returned faster, but you may see false positive hits in your search results.

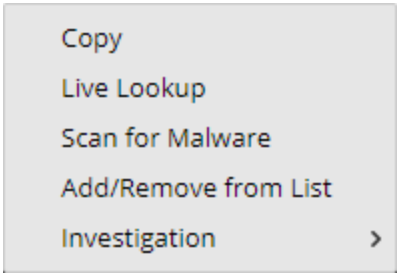
Search Examples

The following examples show searches from the Navigate and Events views.

Search in the Navigate View

To search within the currently displayed data in the Navigate view:

1. To drill into the data, click a meta value, such as HTTP, in the Navigate panel.



2. Type a search string in the Search field and press **Enter** or click **Search**.
3. To clear the search box and return to the normal Events view, click the **X** in the search box.

Search in the Events View

To search within the currently displayed data in the Events view:

1. Type a search string in the Search box, and press **Enter** or click **Search**.
   The search results are displayed in the Events view. Events that match the search criteria are displayed in the Event view grid. In the Details view and List view, matches are highlighted in the Details column. In addition, when searching RAW, matches are highlighted in the Log view Logs column.
2. If you want to narrow the search, change the query and time.
3. If you want to stop the search and return to the Events view, click **Cancel**.

Any results that are displayed remain.

4. To clear the search box and return to the normal Events view, click the **X** in the search box.

Set the Quantification Method and Sort Sequence of Meta Key Results

You can select the way results for each meta key are quantified and sequenced in the Investigate > Navigate view.

Each meta key section in the Investigate > Navigate view contains an ordered list of values showing each meta key value (Value) and its count (Total). You can specify whether:

- The results in each meta key section are sorted based on Value or Total.
- The results are sorted in ascending or descending order.
- The values shown for each meta key are quantified by number of packets (Packet Count), number of sessions or logs (Quantify by Event Count) or by the size of events (Quantify by Event Size).

Note: If you have both a log decoder and a packet decoder for which you are viewing the metadata, the calculation of what is actually being counted is dependent on the type of key. If you select to Quantify by Packet Count and are looking at logs, the Navigate view output is the same output as if you had selected Quantify by Event Count (see Navigate View for details).

This image shows the `Event Type` meta key presented in order by **Total** in **Descending** order. The value with the greatest count of matches is presented first. The value `failure audit` has 71 matches and is listed first. The value `logon` has only one match and is presented last. The quantification method is **Event Count**.

This image shows the `Event Type` meta keys presented in order by **Value** in **Descending** order. The value names are presented in alphabetical order starting at the end of the alphabet. The value `success audit` is listed first. The value `connect` is presented last. The quantification method is **Event Count**.

To select the quantification method of meta key count and ordering of meta key results displayed in the Navigate view:

1. In the toolbar, select **Event Count**, **Event Size**, or **Packet Count** and choose one of the quantification options in the drop-down menu. The label for the menu displays the selected

option.

The current view is reloaded according to your selection.

2. In the toolbar, select **Total** or **Value** and choose one of the ordering methods in the drop-down menu. The label for the menu displays the selected option.

The current view is reloaded according to your selection.

3. In the toolbar, select **Ascending** or **Descending** and choose one of the sort order options in the drop-down menu. The label for the menu displays the selected option.
The current view is reloaded according to your selection.

Set the Time Range for an Investigation

When conducting an investigation in the Investigate > Navigate view, the time range options limit the results returned. You can select:

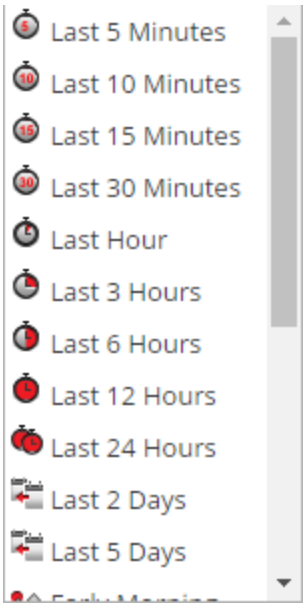
- A time range relative to the collection. Ranges relative to the collection are based on the last collection time for data.
- A time range relative to the calendar.
- A custom date range.
- All data.

The selected Date Range (type) is shown in the Navigate view tool bar as the Time Range label; by default the label is **Last 3 Hours**. The Time Range display shows the first and last timestamp for the date range being used for the metadata.

Note: Time range is based on the Time Zone configured in the Profile Preferences panel as described in "Setting User Preferences" in the *RSA NetWitness Suite Getting Started Guide*.

Select a Built-In Time Range for the Investigation

1. Click the **Time Range** option in the Navigate view toolbar. The default time range is for the **Last 3 Hours**, but a different value from the selection list, for example, **All Data** or **Last Hour,** may already be selected and used as the label in the options panel.
The Time Range selection list is displayed.



2. Do one of the following:
   - If you want to see all data, select **All Data**.
   - If you want to set a time range in minutes, hours, or days that is relative to the collection, select a value such as **Last 10 minutes**, **Last 3 Hours**, or **Last 5 days**.
   - If you want to set a time range relative to today, select **Yesterday**, **All Day**, or a part of the day such as **Early Morning**, **Morning**, **Afternoon**, or **Evening**.
   - If you want to set a unique date range, select **Custom** in the **Time Range** menu and follow the procedure below.
     The selected time range is applied to the current results in the Values panel.

Specify a Custom Time Range for an Investigation

1. Select **Custom** in the **Time Range** menu.
   Date selection options are displayed in the toolbar.

2. Within the time **Start Date** and **End Date** fields, do the following to specify the date and time:
   a. Click a date from the calendar.
   b. (Optional) Select the time from the Hour, Minute, Second fields or click **Now**. The time selection defaults to the current time of day.

Note: If you specify custom start or end times in seconds, the value for start time in seconds always defaults to :00, and the value for end time in seconds always defaults to :59. For example, if you are using time to drill down into an issue, the drill time is interpreted as "HH:MM:00 - HH:MM:59." Seconds display in this format in **Investigation** > **Navigate** functions.

3. To apply the range, click **Go**.

   The selected time range is applied to the current results in the Values panel.

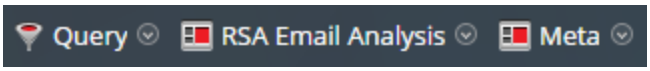
Use Investigation Profiles to Encapsulate Custom Views

Using profiles is a quick and easy way to customize which data is displayed in the Navigate view and the Events view. In the Manage Profiles dialog, you can use a profile to specify which meta groups and column groups are displayed by default, to append queries to an investigation, and to import or export profiles.

Note: Profiles are shared across users in the same NetWitness Suite network. If one user modifies or deletes a profile it has an affect on what is available to the other users.

If you have multiple profiles, you can switch between them to quickly change to the selected profile's preferences. If a profile is currently active, the title of the Profile menu is replaced with the profile name.

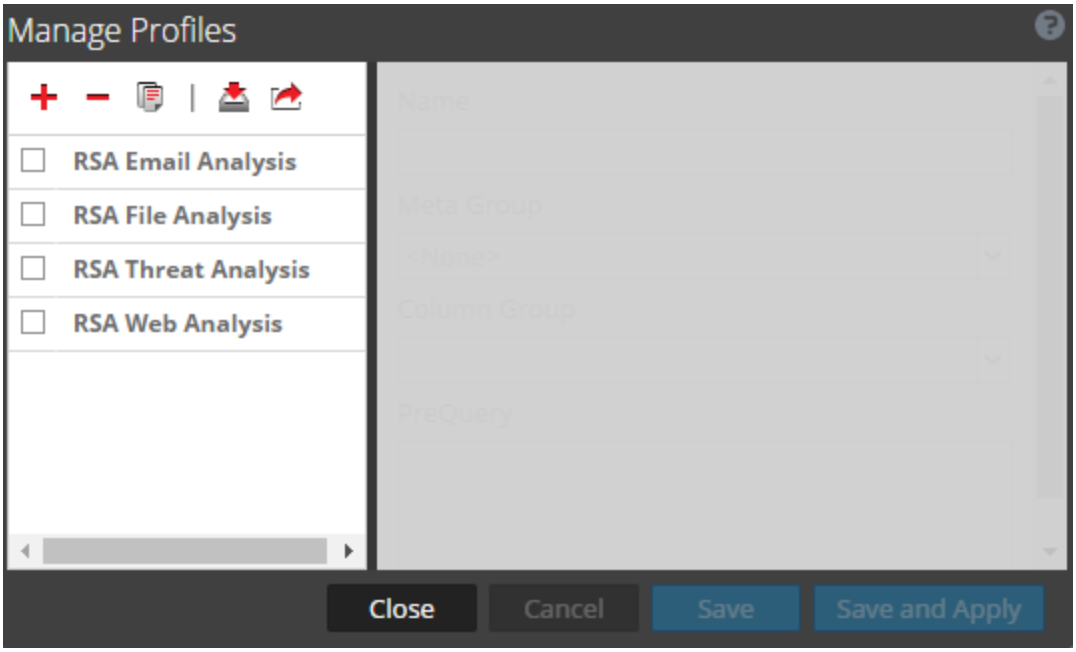
The following figure illustrates this in the Navigate view. The profile name is displayed between Query and Meta. In the Events view, the profile name is displayed between Query and View.



Navigate to the Manage Profiles Dialog

1. Go to **INVESTIGATE** > **Navigate** or INVESTIGATE > **Events**.
2. If the **Investigate** dialog is displayed, select a service and click **Navigate**.

3. In the toolbar, select **Profile > Manage Profiles**.
   The Manage Profiles dialog is displayed.



Create and Edit Profiles

1. In the **Manage Profiles** dialog, either select an existing profile by clicking the checkbox beside the name, or click + to create a new profile.
   The right panel is available.
2. Edit or enter the profile name by typing in the **Name** field. The name must be between 2 and 80 characters.
3. Select a meta group from the **Meta Group** drop-down list. You can add custom meta groups as described in Manage Meta Groups.
4. Select a column group for the **Column Group** drop-down list. You can add custom column groups as described in Manage Column Groups in the Events View.
5. Type queries to filter results in the **PreQuery** field. PreQuery follows the same syntax as the Query builder. The PreQuery in the figure uses a meta group called **crypto exists**.
6. Click **Save** to save the profile without using it, or click **Save and Apply** to save the profile and use it immediately.
   If you click **Save and Apply**, a confirmation dialog is displayed before setting the selected profile as active.

Change Active Profile

If you do not see enough results or the right results in the Navigate or Events views, you may have a profile active. If you do not want to use any profiles, you can click **Deactivate Profiles** in the **Profiles** drop-down menu.

To use a different profile:

1. In the **Navigate** or **Events** view toolbar, open the **Profiles** drop-down menu.
2. Hover over the **Profile** option to display a drop-down list of available profiles.
3. Select the profile you want to use.
   The profile settings are applied immediately.

If you want to change the active profile from the Manage Profile dialog:

1. In the **Navigate** or **Events** view toolbar, select **Profiles > Manage Profiles**.
   The Manage Profiles dialog is displayed.
2. Select a profile from the left panel and click **Save and Apply**.
   A confirmation dialog is displayed.
3. Click **Yes**.
   The profile settings are applied immediately.

Import Profiles

You can upload or import .jsn files that have been downloaded from another service.

1. In the **Manage Profiles** dialog, click in the left panel toolbar.
   The Profile Import dialog is displayed.
2. Click **Browse** or the **Upload File** field to select a file from your computer.
3. When the file is selected, click **Upload**.
   The profile is displayed in the left panel.

Download Profiles

Profiles are downloaded as .jsn files.

1. In the **Manage Profiles** dialog, select one or more profiles from the left panel.
2. In the left panel toolbar, click .
   The download begins immediately.

Visualize Metadata as Parallel Coordinates

Analysts can use the parallel coordinates visualization in the Navigate view to focus the investigation on combinations of meta keys and values that may indicate events are abnormal and worth investigation.

The parallel coordinates chart is a way of visualizing the current drill point in Investigation to examine more than two meta keys simultaneously. Visualizing multiple meta keys simultaneously can help in identifying security issues associated with multivariate patterns and comparisons, such as when individual meta keys and values may not be of concern, but combining them together may bring an abnormal pattern or relationship to light. Meta groups (see Manage Meta Groups) can be used effectively to define a collection of meta keys that you want to visualize as parallel coordinates.

Best Practices for Effective Parallel Coordinates Charts

To create effective parallel coordinates charts, follow these recommendations:

- Start from a drill point in the Navigate view rather than attempting to visualize all data.
- Limit the time range if necessary.
- Choose the smallest useful set of meta keys to display as axes.
- Specify the sequence of axes to highlight anomalies between the meta values as you follow a line across the chart.
- When you can identify a useful set of meta keys and sequence, create a custom meta group to use for future investigations. For example, you can create a custom meta group for Windows executable file types.
- Use the RSA out-of-the-box (OOTB) meta groups that are included in a new installation.
- Re-use and share custom meta groups by importing and exporting groups as .jsn files.
- It may be useful to create two versions of each custom meta group. One for analysis of meta values and one for creating a parallel coordinates chart focusing on a smaller subset of the same use case.

Note: When you import meta groups into NetWitness Suite, NetWitness Suite displays an error message if any of the groups are already present. To import a group that is a duplicate, you must first delete the existing group. If you want to delete a meta group, it cannot be in use by a profile.

To help build better parallel coordinates charts, several optimizations are included in NetWitness Suite.

- Analysts can specify that only sessions in which all meta keys exist are rendered in the chart.
- The administrator can increase the number of meta values rendered in the Parallel Coordinates Settings in the Administration System view.

RSA Meta Groups for Parallel Coordinates Use Cases

A set of predefined meta groups is included with NetWitness Suite. If you want to get the latest version, you can import the meta groups file, `MetaGroups_ootb_w_query.jsn`, in the Manage Meta Groups dialog. Some of the targeted activities that lend themselves well to Parallel Coordinates visualizations are:

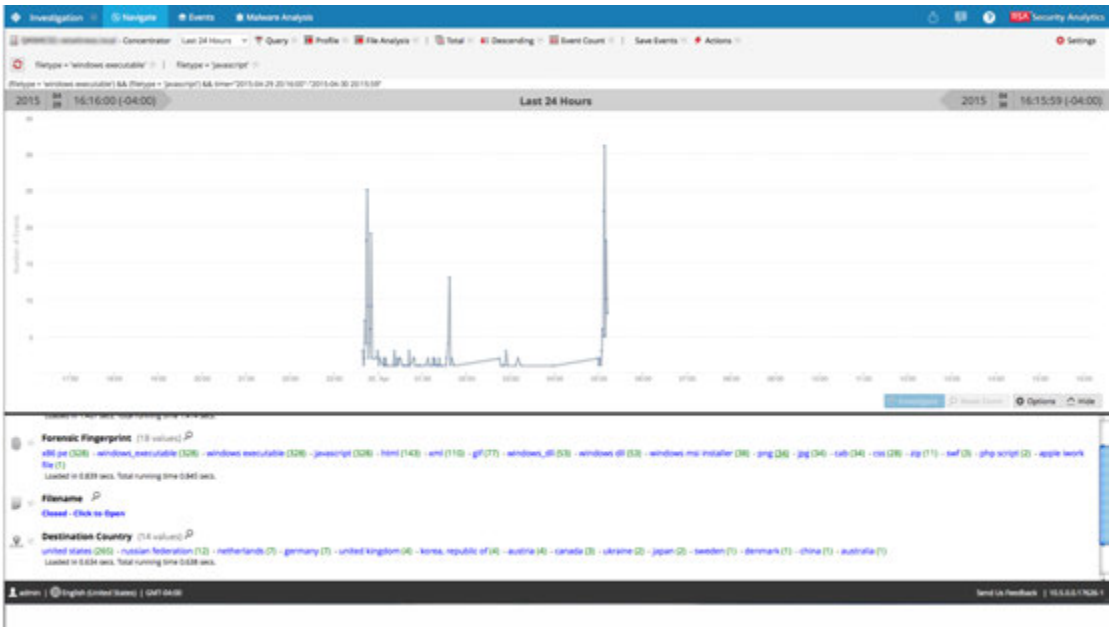
- Botnet Beaconing
- Covert Channels
- Email
- Encrypted Sessions
- Endpoint Analysis
- File Analysis
- Malware Analysis
- Outbound HTTP
- Outbound SSL/TLS
- SQL Injection Attacks
- Threat Analysis
- Web Analysis

View a Parallel Coordinates Visualization

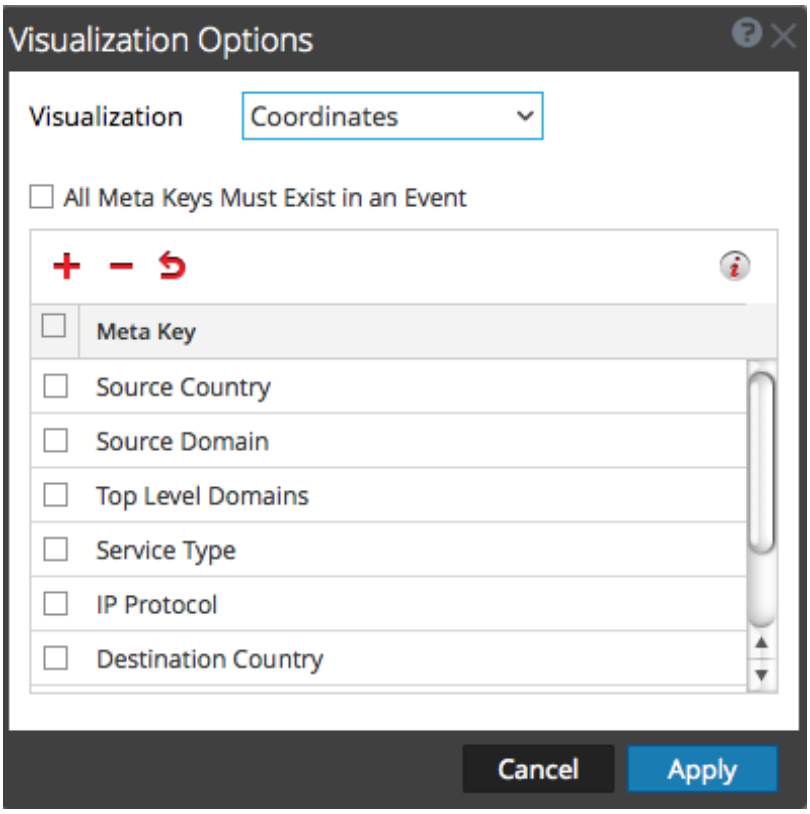
From an investigation in the Investigation > Navigate view:

1. If the Visualization panel above the Values panel is closed, select **Visualization**.
2. In the toolbar, select **Use Meta Group > File Analysis**.
3. In the **Values** panel, in the **Forensic Fingerprint** meta key, click `windows_executable` and then `javascript`, so that the breadcrumb reads `filetype = 'windows_executable' | filetype = 'javascript'`.

4. A default visualization for the current drill point is displayed as a timeline.



5. In the **Visualization** panel, select **Options**.
   The Visualization Options dialog is displayed.
6. In the **Visualization** drop-down list, select **Coordinates** and click **Apply**.

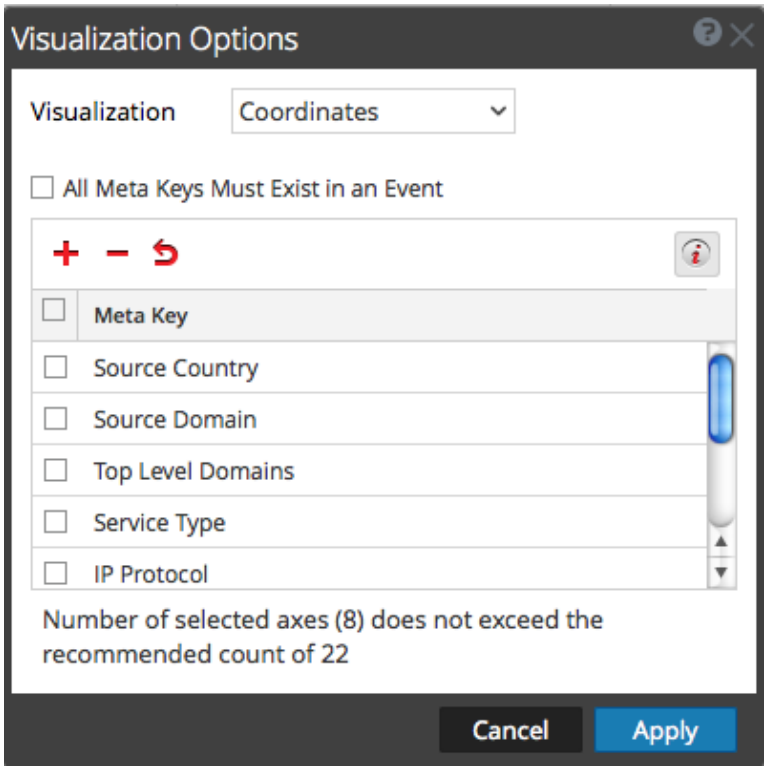


The visualization is loaded. In this example, 249 events are found and 199 unique paths are visualized.

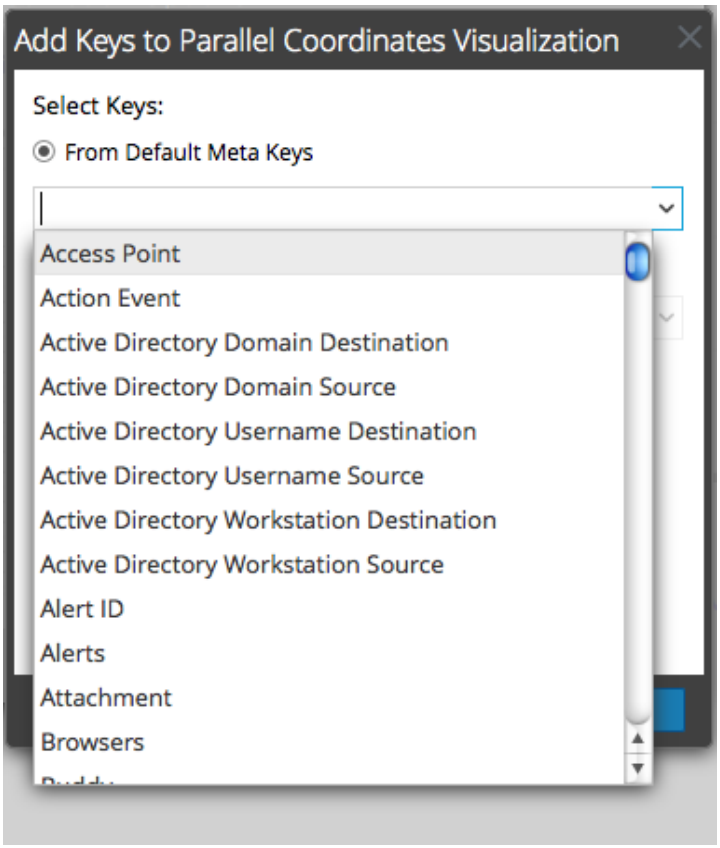
Select Meta Keys for a Parallel Coordinates Visualization

With a Parallel Coordinates visualization open, do the following:

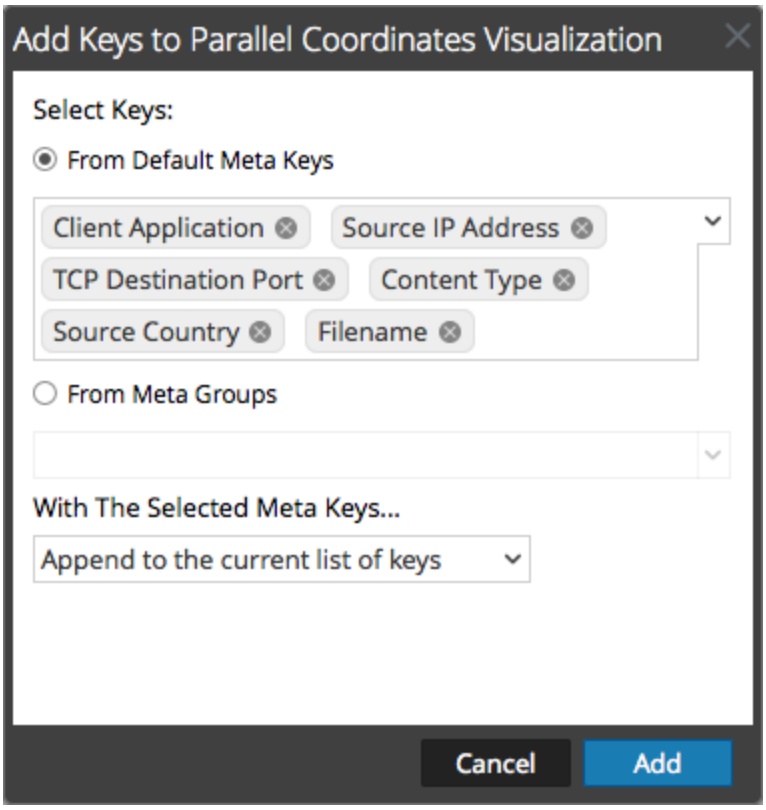
1. In the Visualization panel, select **Options**.
   The Visualization Options dialog is displayed. In the toolbar, click to display the recommended number of axes for a readable visualization. When a recommended count of keys is displayed, the count changes based on the browser size. If you make the browser window larger, the recommended count is increased.



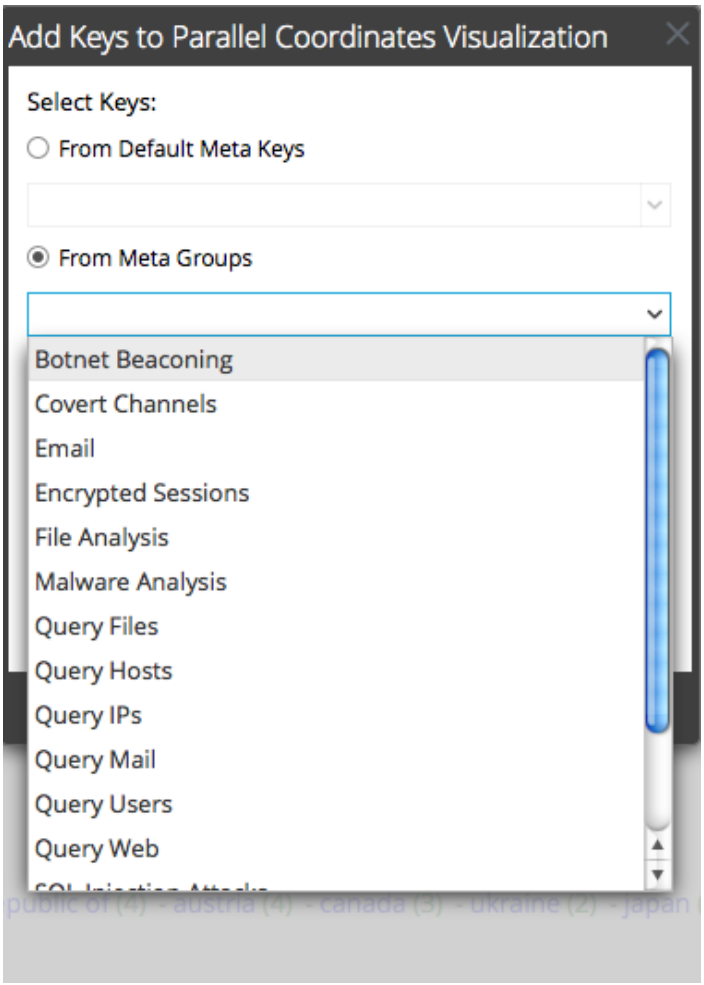
2. If you want to change the sequence of the meta keys, drag meta keys up or down to the desired sequence.
3. If you want to delete any meta keys, click in the selection box, and click .
   The meta keys are removed, but the change has not been applied.
4. If you want to revert to the previous state, click .
   Any meta keys you have deleted are restored and any changes that you made are removed.
5. If you want to select individual meta keys, click , select **From Default keys**, and in the drop-down list, select the meta keys.



The selected keys are listed.

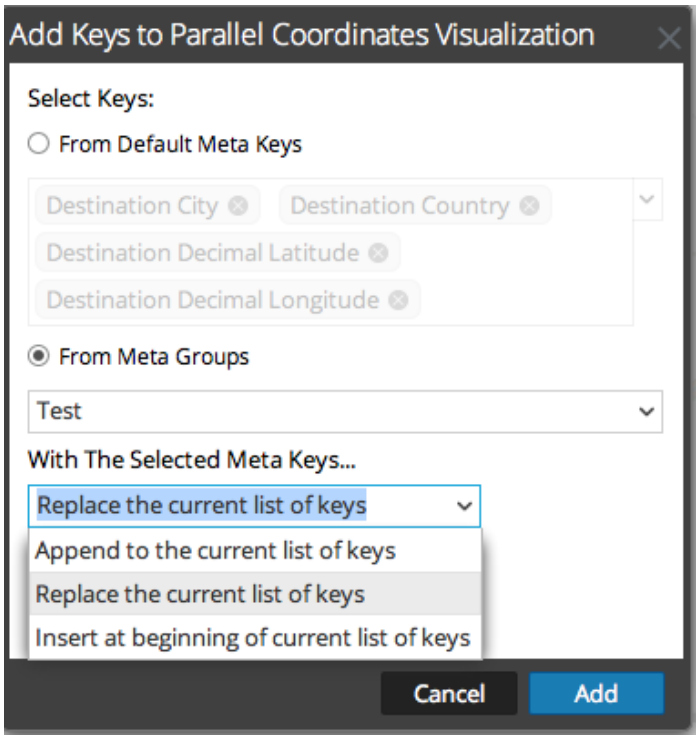


6. If you want to add all the keys in a meta group, you cannot add individual meta keys. Select **From Meta Groups**, and select a group from the drop-down list.



The selected meta groups are listed in the field.

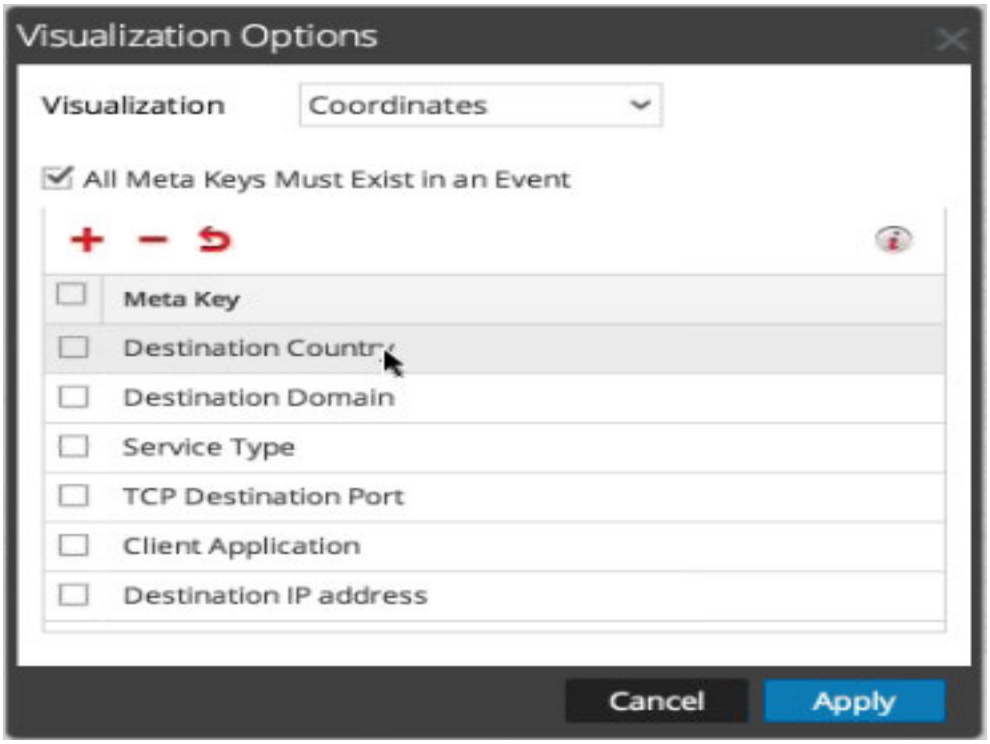
7. Select the method of adding the keys or groups: **Replace the current list of keys**, **Append to the current list of keys** (at the end), or **Insert at the beginning of current list of keys.**



8. To complete the procedure, click **Add**.
   The Visualization Options dialog is displayed with the meta keys or groups you selected.
9. To display the new visualization chart, click **Apply**.

Optimize a Parallel Coordinates Visualization

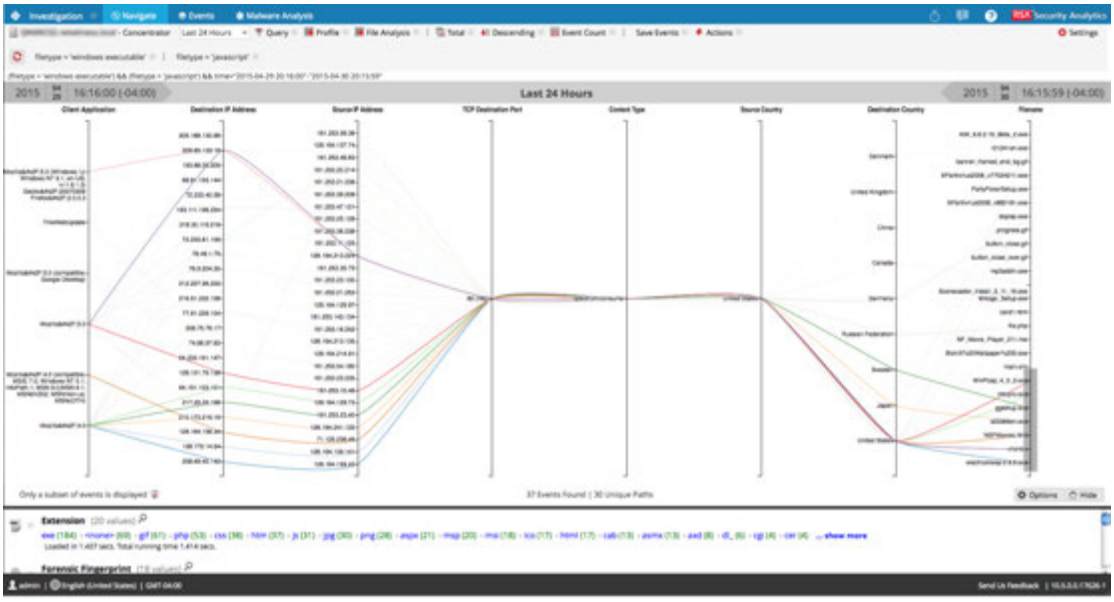
1. To optimize the visualization by removing events in which not all meta keys exist, select **Options.**



2. In the Visualization Options dialog, select **All Meta Keys Must Exist in an Event**. Click **Apply**.

   The resulting graph is more readable and useful and usually has fewer unique paths.

3. If you want to highlight a small set of points to see the path of the line from right to left, click on an axis. The cursor changes to cross hairs, which you can drag to select one or more values. When you let go of the mouse, the lines are highlighted. In the example below, the SSL service type is highlighted by a gray box.



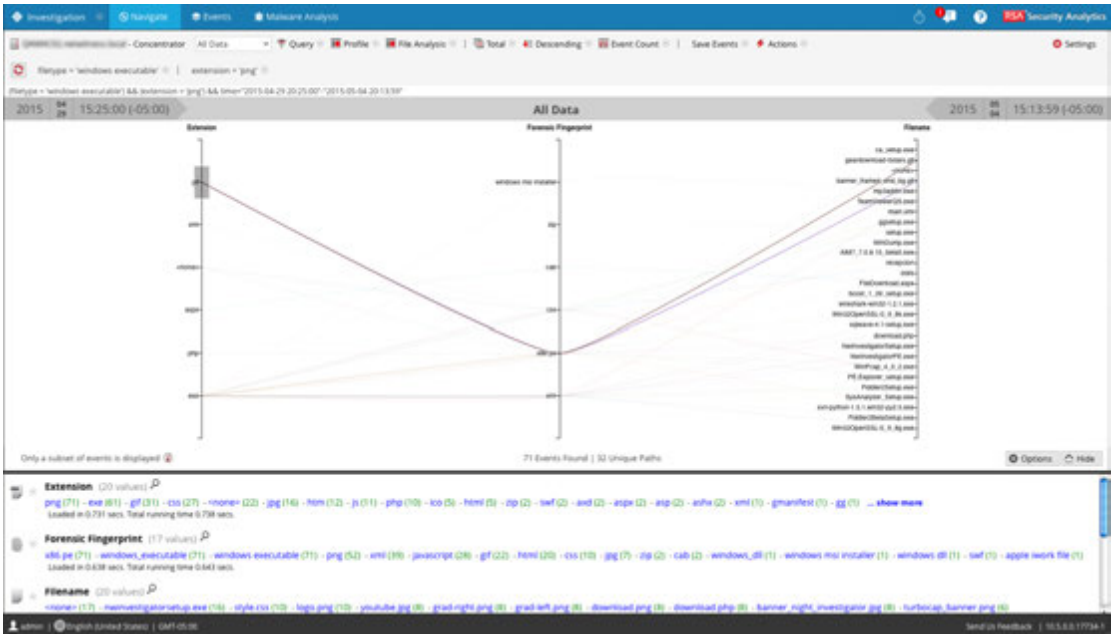
4. If you want to enlarge the visualization, drag the bottom edge of the panel down and drag the right edge of the browser window wider.

Sample Use Case

Below is an example of a parallel coordinates visualization of meta keys representing file metadata in a session. There are three meta keys or axes from left to right: Extensions, Forensic Fingerprint, and Filename with values listed along each axis. Values on the Extension axis show the file extension, and values on the Forensic fingerprint axis are windows executables. Normally the file type matches the expected forensics fingerprint; however, it is abnormal for a `gif` file type to be combined with the Windows executable fingerprint. The `gif` file type is selected to highlight the correlations of that file type, `x86pe` , and two filenames in the third axis so that an analyst can quickly identify the files that merit investigation.

To reach this view:

1. Order by Value and Sort in Ascending order.
2. Apply two filters (file type = 'windows executable' and extension = 'gif') in the Navigate view to limit the amount of data.
3. Configure a parallel coordinates chart by choosing three axes: `file extension`, `forensic fingerprint`, and `filename`.



Sample Visualization of a Large Data Set

This example of a parallel coordinates visualization applied to a larger set of data illustrates several messages that help analysts to understand what has been charted.

- To create a chart, NetWitness Suite begins scanning meta values and returning results. A typical time range could have up to 10,000,000 meta values. When the number of meta values returned reaches the Meta Values Result Limit, the chart is rendered even if NetWitness Suite has not scanned a number of meta values equal to the Meta Values Scan Limit.
- There is a fixed limit on the amount of data that can be rendered as a parallel coordinates chart. In NetWitness Suite 10.4 and prior, the limit is based on the number of axes times data values: 1000 x the number of axes to protect performance, but in NetWitness Suite 10.5 and above the administrator configures parallel coordinates limits as part of the Investigation settings In the Administration System view.

With a larger set of data, the parallel coordinates chart takes longer to process than the smaller set of data and meta keys. To preserve performance, NetWitness Suite renders the meta values from the Values panel below until the limits set by the Administrator are reached. An informational message tells you: **Only a subset of events is displayed.**

Of all the data visualized for 249 events, there were only 199 unique parallel coordinates paths. Some events are included though they do not include some of the meta keys; these are labeled **DNE** because the meta does not exist in the event.

Querying Data in the Navigate View

This topic describes the methods available to query data in the Investigation > Navigate view.

When conducting an investigation in NetWitness Suite, there are several methods available to query results and drill into an area of interest in the Navigate view. Analysts can:

- Create a Custom Query, rather than clicking through meta keys and values (Navigate and Events view)
- Drill into Data in the Navigate View Time Chart (Navigate view)
- Drill into Data in the Values Panel (Navigate view)
- View and Modify Queries Using URL Integration (Navigate and Events view)

Create a Custom Query

In the Investigate > Navigate view options panel, you can create a query rather than clicking through the meta keys and values to drill down into the meta data. The dialogs for creating a query offer syntax help with drop-down lists of applicable meta keys and operators. When viewing the drop-down list, you can expand and collapse each meta group to view or hide the individual meta keys in that group.

When you select a meta group, NetWitness Suite generates the complex query equal to a query with all of the meta keys in that group ORed together. So if a meta group contains `ip.src` and `ip.dst`, the query generated is `ip.src = <value> OR ip.dst = <value>`. If the meta group contains meta keys that have different meta value types, the value input is disabled and the query uses `exists` statements. For example, a meta group that contains `ip.src`, `ip.dst`, and `alias.host` includes meta keys that have different value types; `ip.src` and `ip.dst` are ip addresses and `alias.host` is text. The generated query is `ip.src exists OR ip.dst exists OR alias.host exists`.

A basic query is in the following form:

`<metakey> <operator> [<metavalue>]`

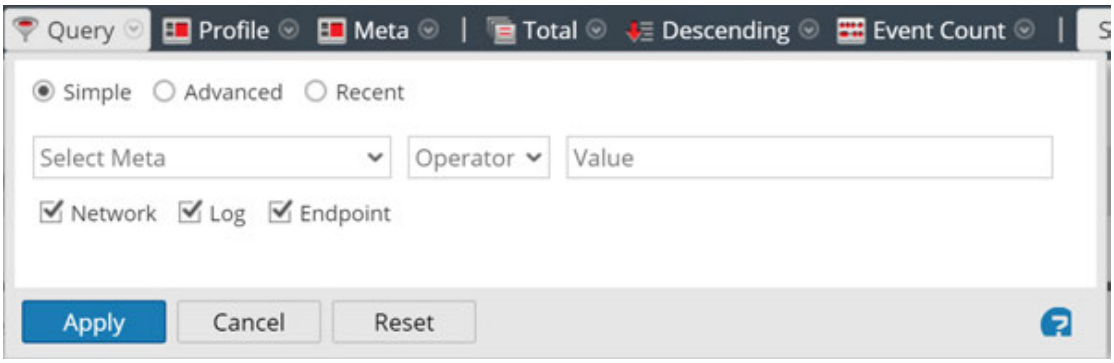
These are a few examples:

```
action exists
action = 'get'
alias.host = '10.25.55.115'
extension = 'exe'
orig_ip != "10.0.0.0" - "10.255.255.255"
```

Create a Query Using the Basic Method

When you create a query using the basic method, NetWitness Suite provides drop-down lists of meta and operators.

1. In the **Navigate view** toolbar, select **Query.**
   The Query dialog is displayed, with the Simple option selected.

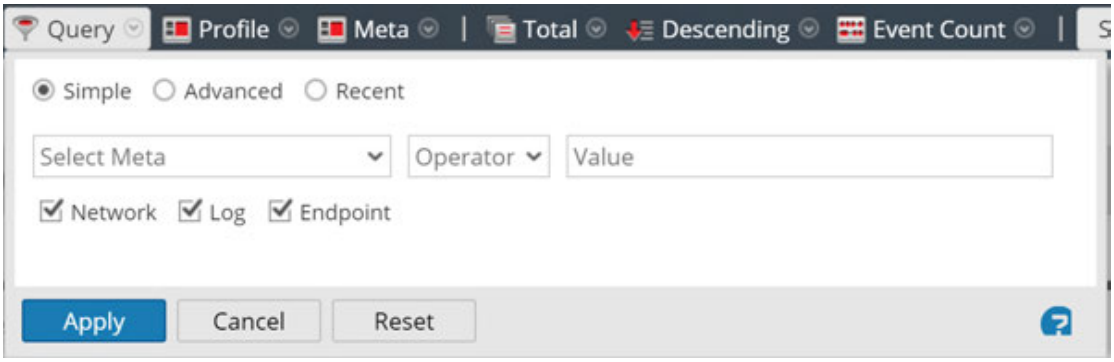


2. In the **Select Meta** field, click to display the drop-down list. The drop-down list has two sections: Meta Groups and All Meta.
3. Select a single meta key under **All Meta** or select a meta group under **Meta Groups**. You can also type in a meta key or meta group in the field.
4. In the **Operator** field, type an operator or click on the drop-down list to select a valid operator.
5. (Optional) If you selected an operator that requires a value, for example, begins, in the third field type the value for the meta key.
6. In the Network, Log, and Endpoint checkboxes, choose the type of data to query. Do one of the following:
   a. To limit the query to packets select **Network** and de-select **Log** and **Endpoint**.
   b. To limit the query to logs, select **Log** and de-select **Network** and **Endpoint**.
   c. To limit the query to endpoint events, select **Endpoint** and de-select **Network** and **Log**.
   d. To apply the query to packets, logs, and endpoints, select **Network**, **Log**, and **Endpoint**.
7. Do one of the following:
   a. Click **Apply**.
      The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.

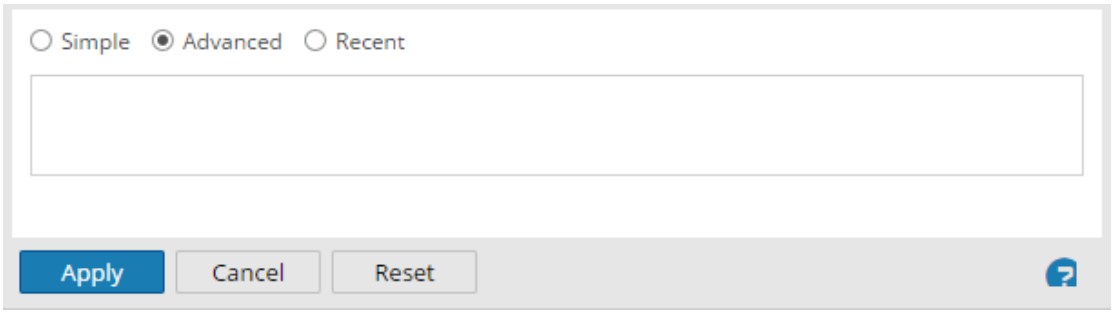
b. Click **Cancel**.
The window is closed and no changes are made to the view or current query.

Create a Query Using the Advanced Method

1. In the **Navigate view** toolbar, select **Query.**
The Query dialog is displayed.

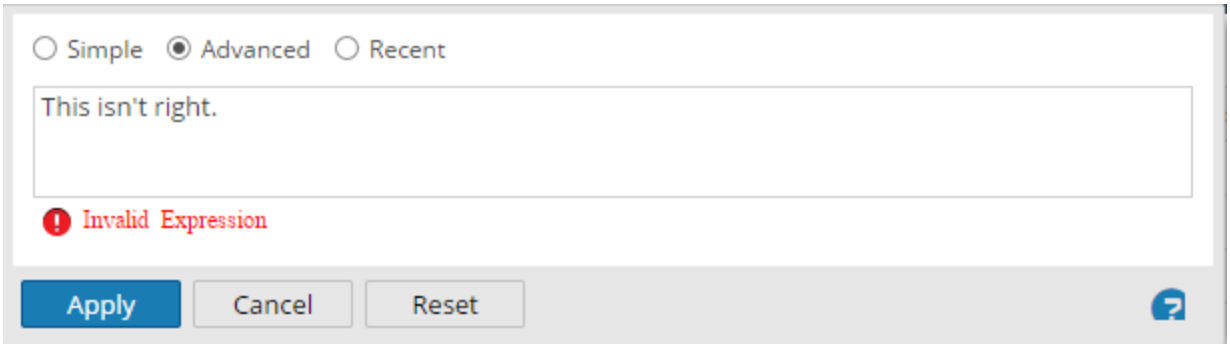


2. Select **Advanced**.
The advanced query field is displayed.



3. In the field, create a query, which can include the meta key, operator, and value. When you begin typing a meta key in the field a drop-down list of available meta keys for the selected service is displayed.
4. Select the meta key for your query.
The display is updated. If the expression is not yet complete, the status indicates that the query is invalid.
5. Continue with an operator, from the drop-down list, then a value if necessary. The display is updated as you continue to enter the query. If you enter an operator, such as **exists** or **!exists**, which does not use the value field, the value field is disabled and the invalid status is cleared. If you enter an operator, such as =, which requires the value field, the invalid status

remains until you enter a value. When the query is valid the invalid status is no longer displayed.

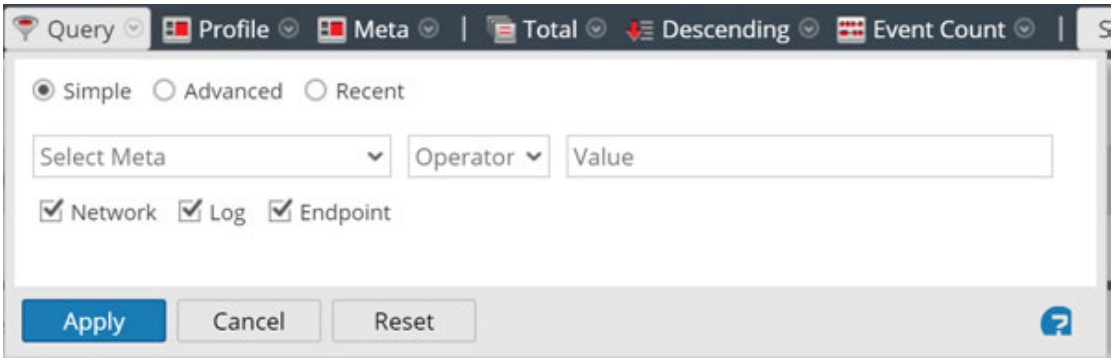


6. Do one of the following:
   - Click **Apply**.
     The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   - Click **Cancel**.
     The window is closed and no changes are made to the view or current query.

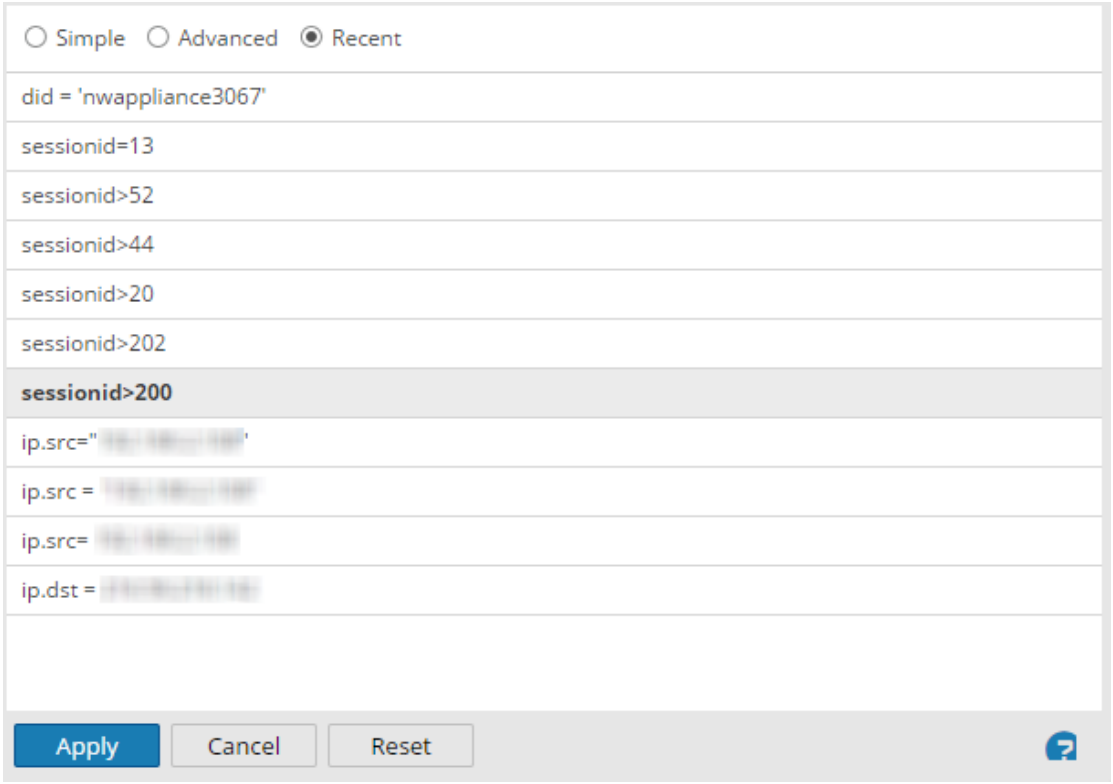
Apply a Recent Query

You can view recent queries and select one to apply to the current service being investigated. To select a recent query:

1. In the **Navigate view** toolbar, select **Query.**
   The Query dialog is displayed, with the Simple option selected.



2. Select the **Recent** option.
   The list of recent queries is displayed in the bottom portion of the dialog.

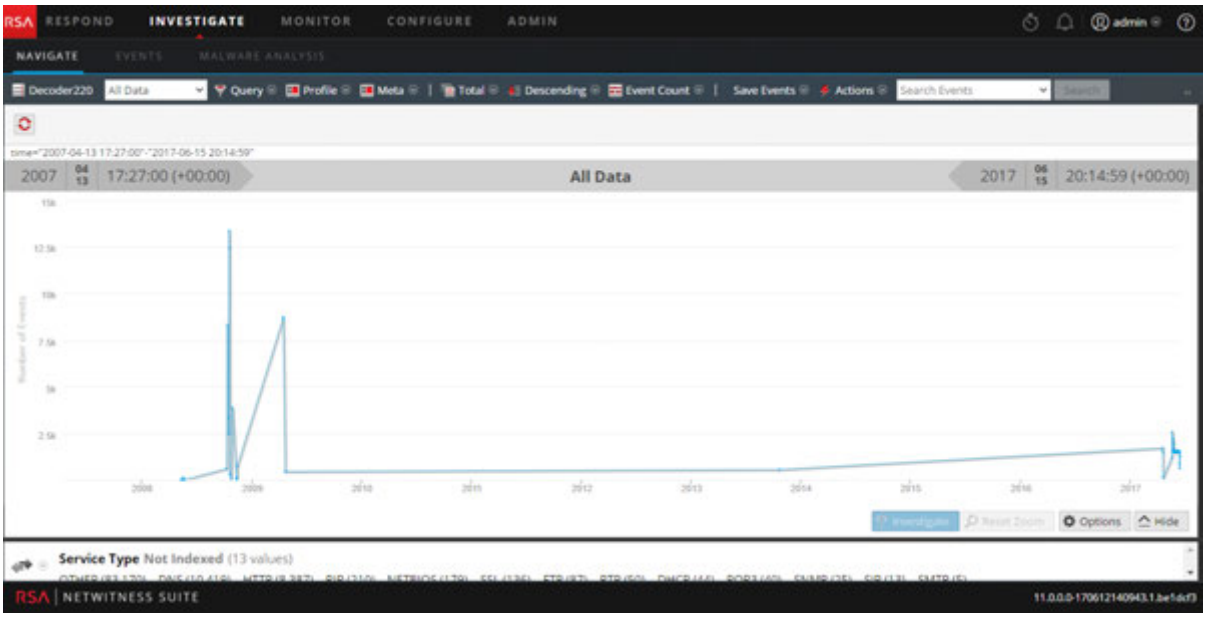


3. In the list of recent queries, click to select a query.
4. Do one of the following:
   - Double-click a query.
   - Select a query and click **Apply**.
     The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   - Click **Cancel**.
     The window is closed and no changes are made to the view or current query.

Drill into Data in the Navigate View Time Chart

The Time Chart visualization allows analysts to visualize activity over time. You can zoom into the data by selecting a time window then selecting the Investigate option. You can then reset the navigation to the time range that was in effect before zooming.

1. Go to **INVESTIGATE > Navigate**.
   The Time Chart for the current drill point and selected time range is displayed.



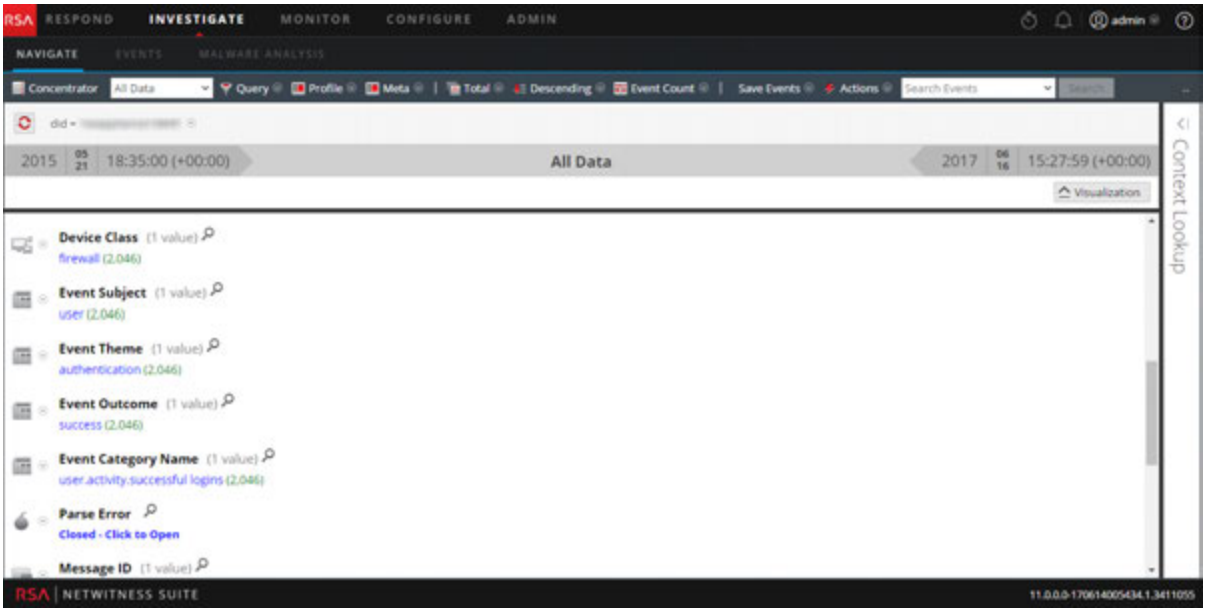
2. To highlight a period of time on the Time Chart, click over the desired time period and drag the mouse.
   The Time Chart is redrawn for the selected time range, however the meta values are unchanged.
3. To drill into the data for the selected time range, click **Investigate**.
   The URL is updated to reflect the time range override. and the Investigation options panel is updated to reflect the custom time range. The Time Chart is redrawn and the meta values are loaded for the selected time range.
4. To reset the Time Chart to original time range, click **Reset Zoom**.
   The URL is updated to reflect the original URL prior to zooming into the data, and the Investigation options panel is updated to reflect the time range selected before zoom. The Time Chart is redrawn for the selected time range and the meta values are loaded for that time range.

Drill into Data in the Values Panel

NetWitness Suite displays the activity and values for the selected service in the Investigation > Navigate view. To investigate data, analysts drill into data by clicking on a meta key or a meta value, which is treaty as a query. In the Values panel, each query is added to the breadcrumb data in the Values panel. This results in a breadcrumb at the top with a crumb for each query. You can edit the breadcrumb to insert or remove a query.

Drill into a Subset of the Metadata

1. Begin an investigation so that metadata is displayed in the Navigate view.



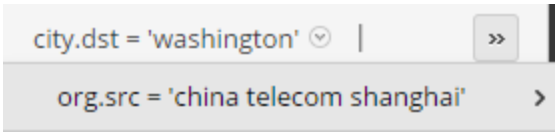
2. To drill down into the metadata, do any combination of the following:

   a. Click a **meta key**, for example, Source Country or Destination Country.

   b. Click a **meta value**, the blue text in the results. For example, Italy.

   Each time you click a meta key or meta value, the investigation query pivots to a narrowed focal point, or drill point, in the data. At each drill point, the Values panel is updated and the new drill point is displayed in the breadcrumb. Below is an example of the first breadcrumb.

   This is an example of a long breadcrumb that does not fit in the toolbar. The last query that fits is followed by a drop-down menu that lists additional queries. To select a drill point within the overflow, click the overflow icon and a query in the drop-down list.



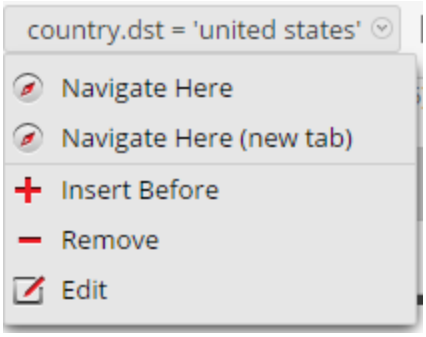
Add a Query in the Breadcrumb

In the breadcrumb, you can click any of the crumbs to display the Query menu. You can insert a new query before a crumb, and append a new query to the end of breadcrumb. After each edit in the breadcrumb, NetWitness Suite refreshes the results.

To add a query in the breadcrumb:

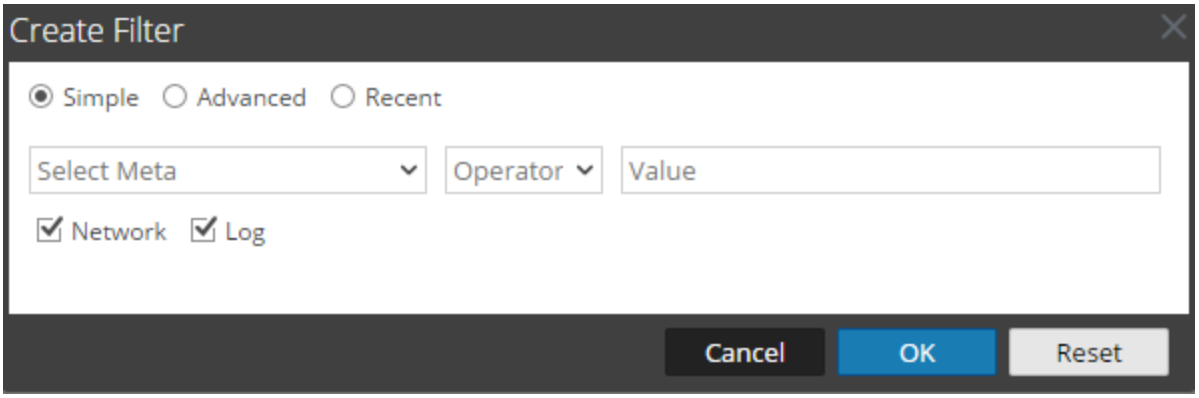
1. Click a crumb.

   The Breadcrumb menu is displayed.



2. To add a query in the breadcrumb, select **Append** or **Insert Before**.

   The Create Filter dialog is displayed.



3. Create the Query as described in Create a Custom Query.

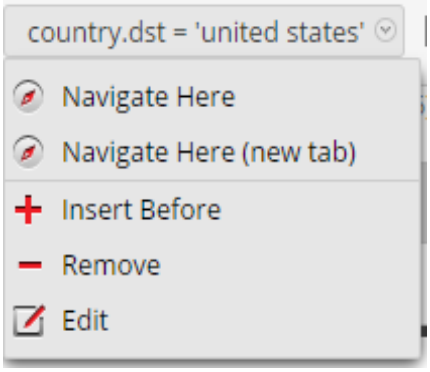
Edit a Query in the Breadcrumb

In the breadcrumb, you can click any of the crumbs to display the Query menu. You can delete a crumb and edit a query in a crumb. After each edit in the breadcrumb, NetWitness Suite refreshes the results.

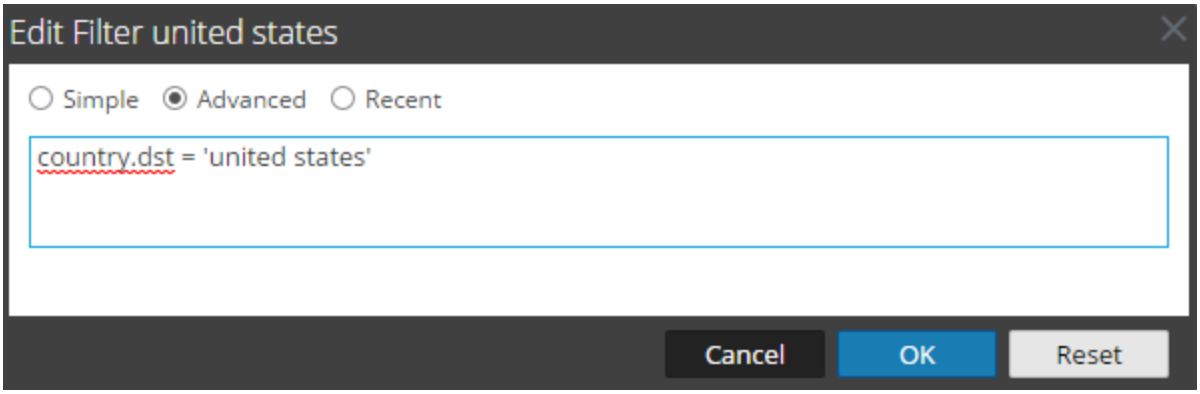
To work with queries in the breadcrumb:

1. Click a crumb.

   The Breadcrumb menu is displayed.



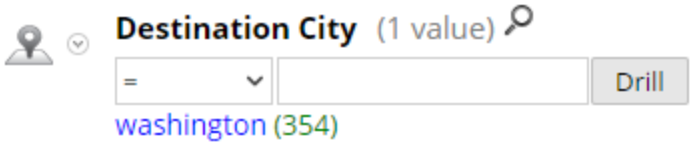
2. To edit a query in the breadcrumb, select **Edit**.
   The Create dialog is displayed with the selected query open for editing.



3. Edit the fields as described in Create a Custom Query.

Quick Search within a Meta Key

1. Move the mouse over a meta key section and click the magnifying glass.
   The Quick Search form, which contains a comparator and an optional operand for the search, is displayed.

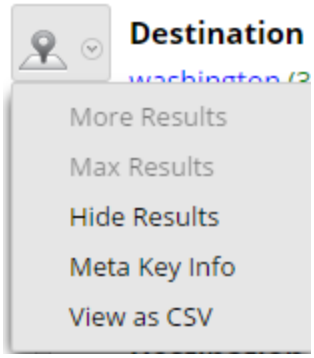


2. (Optional) If you want to close the search form, click the magnifying glass again.
3. Select the operation from the drop-down list on the left and type the text value to search for. Then click **Drill** to perform the execution.
   The metadata for that meta key is used to drill down in the current metadata.

View Meta Key Information in the Navigate View

To view details about a meta key, specifically the key name, index level set for displaying the meta key, and the default view set for the meta key:

1. Click the drop-down menu next to the meta key.



2. Select **Meta Key Info**.
   The Meta Key Info dialog is displayed.
3. When finished viewing, click ■.
4. (Optional) To view meta names found for the meta key as a comma-separated value list, click the drop-down menu next to the meta key and select **View as CSV**.
   The Showing Values in CSV Format dialog is displayed.
5. When finished viewing, click **Close**.
6. (Optional) If you want to hide the results for the meta key in the current drill point, click the drop-down menu next to the meta key and click **Hide Results**.

Display Events Associated with a Meta Value

The Events view provides additional details for an event in two different views: Events List and Detail View.

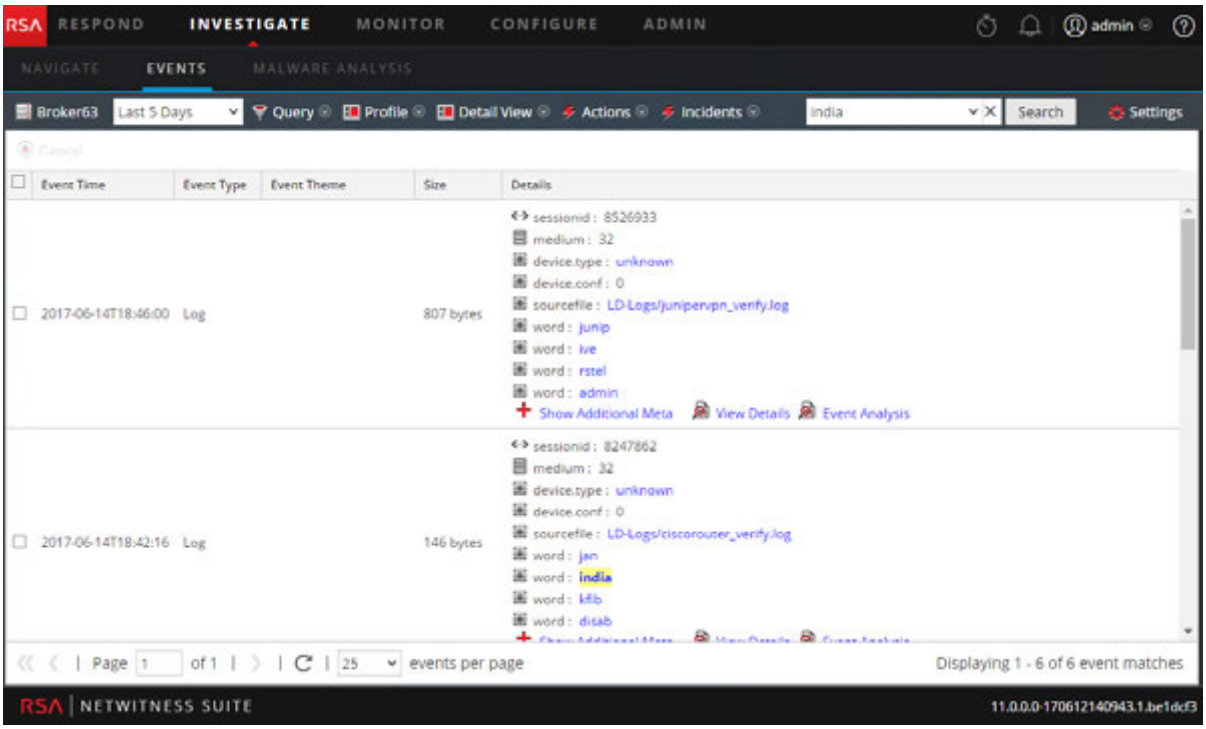
1. In the Navigate view, drill into metadata that is the focus of your investigation.
2. Click the count (the number in green) next to a blue meta value.
   The Events view corresponding to the current drill point is displayed.
   The operations that you can perform in the events view are described in Examining Events.

Search for Specific Events Associated with a Meta Value

1. In the Navigate view, drill into metadata that is the focus of your investigation (click a meta value or add a query).
2. Type a search string in the Search box and press **Enter** or click **Search**.
   You can also select and set your search mode preferences for your searches. See Search for

Text Patterns in the Investigate View for detailed search information.

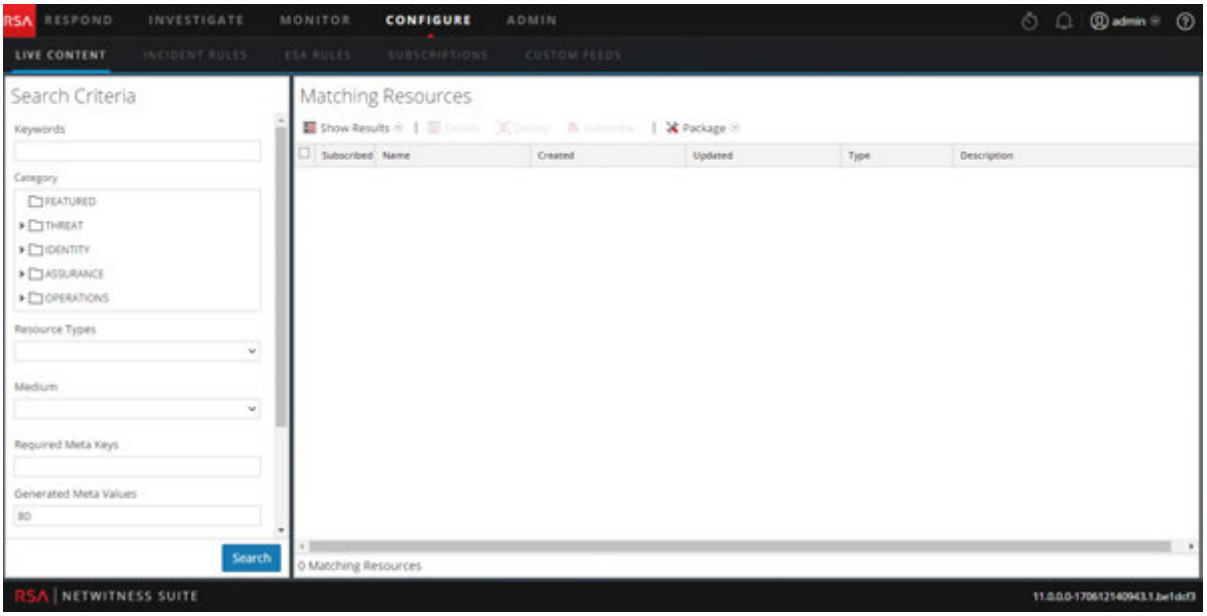
The Events view opens in a new tab and shows the search results. Your time range selection and drills (queries) carry forward to the Events view.



View a Selected Meta Value in Live

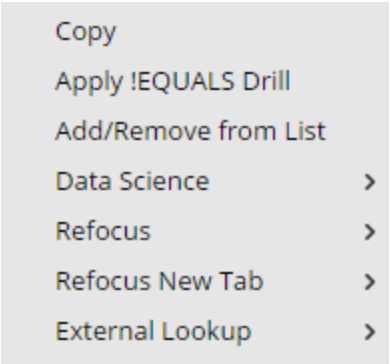
1. In the Navigate view, drill into metadata that is the focus of your investigation.
2. Right-click a meta value (the text in blue).
   The Meta Value drop-down menu is displayed.
3. To look up the meta value in NetWitness Suite Live, select **Live Lookup**.
   The Live Search view is displayed with the meta value entered in the Generated Meta

Value(s) field, and ready for a search.



Refocus the Investigation in a Drill Point

1. Right-click a meta value (the text in blue).
   The Meta Value drop-down menu is displayed.



2. Choose one of the refocus options.
   The drill is refocused according to your choice.

Look at a Specific Count in a New Tab

To view a count for a meta value in a new tab or view a Geomap of the locations for the selected meta value:

1. Right-click a count for a meta value (the green number following the blue meta value).
   The context menu is displayed.

2. (Optional) To open a separate investigation for the specific meta value, select **Open in New Tab**.
3. (Optional) to open a geomap showing the locations where the selected meta value originated, select **Geo-Map Locations in New Tab**.

View and Modify Queries Using URL Integration

Investigation includes an External URL Integration that facilitates integration with third-party products by allowing a search against the NetWitness Suite architecture. By using a query in a URI, you can pivot directly from any product that allows custom links, into a specific drill point in the Investigation view in NetWitness Suite. This integration provides an internal presentation of the user's query.

URL Integration allows the user to identify the service either by the host id or by the service and port, as defined in NetWitness Suite. If NetWitness Suite is unable to resolve the service, the analyst is redirected to the Navigation view, showing the Service selection dialog. Once the service is selected, the Navigation view is loaded with the drill point, defined by the query.

Service Id Known

When the ID of the service to use for investigation is known, the format for entering a URI using a URL-encoded query is:

http://<sa host:port>/investigation/<deviceId>/navigate/query/<encoded query>/date/<start date>/<enddate>

where

- <sa host: port> is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is needed only if access is configured over a non-standard port through a proxy.
- <deviceId> is the internal Service ID in the NetWitness Suite instance for the service to query against. The service ID can be represented only as an integer. You can see the relevant service ID from the URL when accessing the Investigation view within NetWitness Suite. This value changes based on the service being connected to for analysis.
- <encoded query> is the URL-encoded NetWitness Suite query. The length of query is limited by the HTML URL limitations.
- <start date> and <end date> define the date range for the query. The format is <yyyy-mm-dd>T<hh:mm:ss>Z. The start and end dates are required. If no date is provided then the user defaults for that service are used. Relative ranges (for example, Last Hour) are not supported. All times are run as UTC.
  For example:

```
http://localhost:9191/investigation/12/navigate/query/alias%20exists/
date/2012-09-01T00:00:00Z/2012-10-31T00:00:00Z
```

Host and Port Known

When the host and port of the service to use for investigation is known, the format for entering a URI using a URL-encoded query is:

```
http://<sa host:port>/investigation/<device
host:port>/navigate/query/<encoded query>/date/<start date>/<enddate>
```

where

- `<sa host: port>` is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is needed only if access is configured over a non-standard port through a proxy.
- **`<device host:port>`** is the host and port of a service defined in NetWitness Suite instance for the service to query against. NetWitness Suite attempts to resolve the host and port as a service ID defined in NetWitness Suite.
- `<encoded query>` is the URL-encoded NetWitness Suite query. The length of query is limited by the HTML URL limitations.
- `<start date> and <end date>` define the date range for the query. The format is `<yyyy-mm-dd>T<hh:mm:ss>Z`. The start and end dates are required. If no date is provided then the user defaults for that service are used. Relative ranges (for example, Last Hour) are not supported in this version. All times are run as UTC.
  For example:
  `http://localhost:9191/investigation/concentrator:50105/navigate/query/alias%20exists/date/2012-09-01T00:00:00Z/2012-10-31T00:00:00Z`

Examples

These are query Examples where the SA Server is 192.168.1.10 and the deviceID is identified as 2.

All activity on 03/12/2013 between 5:00 and 6:00 AM with a hostname registered

- Custom Pivot: `alias.host exists`
- `https://192.168.1.10/investigation/2/navigate/query/alias%2Ehost%20exists/date/2013-03-12T05:00:00Z/2013-03-12T06:00:00Z`

All activity on 3/12/2013 between 5:00 and 5:10 PM with http traffic to and from IP address 10.10.10.3

- Custom Pivot: `service=80 && (ip.src=10.10.10.3 || ip.dst=10.0.3.3)`
- Encoded Pivot Dissected:
  - `service=80 => service&3D80`
  - `ip.src=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3`
  - `ip.dst=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3`
  - `https://192.168.1.10/investigation/2/navigate/query/service%3D80%20%26%26%20%28ip%2Esrc%3D10%2E10%2E10%2E3%20%7C%7C%20ip%2Edst%3D10%2E10%2E10%2E3%29/date/2013-03-12T17:00:00Z/2013-03-12T17:10:00Z`

Additional Notes

Some values may not need to be encoded as part of the query. For example, commonly the IP src and dst is used for this integration point. If leveraging a third-party application for integration of this feature, it is possible to reference those without encoding applied.

Acting on a Drill Point in the Navigate View

This topic describes the actions available to analysts who want to send a drill point to some form of output or view the drill point from a different perspective in the Navigate view.

When conducting an investigation in NetWitness Suite, there are several actions available once a drill point has been reached in the Navigate view. Analysts can:

- Export a Drill Point (Navigate view and Events view)
- Print the Current Drill Point (Navigate view)
- Open the Events List for a meta value (Navigate view)
- Launch an External Lookup of a Meta Key (Navigate view)
- Launch a Malware Analysis Scan from the Navigate View
- View Additional Context for a Data Point (Navigate view and Events view)
- Manage Context Hub Lists and List Values in Investigate (Navigate view and Events view)
- Visualize the Current Drill Point in Informer (Navigate view)

Export a Drill Point

In NetWitness Suite Investigation, when you have the data for a drill point displayed in the Navigate view, you can:

- Extract files from a session and choose the type of files to extract: archives, audio BitTorrent, documents, executable, images, other, video, and web.
- Export the drillpoint as a packet capture (PCAP) file, a log file or a meta data file.

The details being exported are affected by both the time range and drill point at the time of exporting.

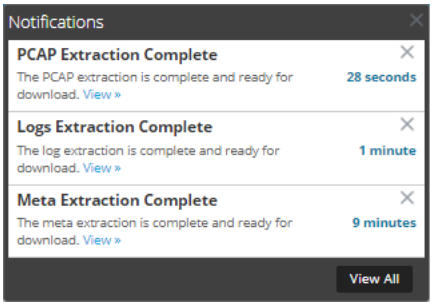
Note: When you export the drill point as a log file, only the log sessions are exported. The job queue message refers to the total number of sessions in the drill point rather than the number of logs. For example, if the drill point has 505 sessions and only five log sessions, the job queue message states that NetWitness Suite is extracting logs for 505 sessions.

To export a drill point from the Navigate view:

1. Conduct an investigation until you reach the desired drillpoint.
2. In the toolbar, select **Actions > Export** and select one of the export options: **PCAP**, **Logs**, or **Meta**.

The drill point is extracted, and a message advises that the job is scheduled. You can check the jobs page for the status.

3. When the scheduled file extraction is complete, it is displayed in the Job Notifications tray.



4. Click the **View** link in the Jobs tray sand download the specific extraction file requested.

Launch an External Lookup of a Meta Key

This topic provides instructions for using out-of-the-box Investigation plugins to launch an external lookup of specific meta keys using tools external to NetWitness Suite while investigating data in the Navigate view or Events view.

Analysts can use out-of-the-box NetWitness Suite Investigation external lookups to save time during investigations. The out-of-the-box lookups are available by right-clicking one of the these meta keys: IP address (`ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip`), `host (alias-host, domain.dst)`, `client`, and `file-hash`.

For all `IP` and `host` meta keys, the following lookups are built in to NetWitness Suite:

- Google Malware: Opens a Google Malware search in a new tab.
- McAfee SiteAdvisor: Opens a McAfee SiteAdvisor search in a new tab.
- BFK Passive DNS Collection: Opens a BFK Passive DNS collection search in a new tab
- CentralOps Whois for IPs and Hostnames: Opens a CentralOps Whois search for IPs and hostnames
- Malwaredomainlist.com Search: Opens a Malwaredomainlist.com search in a new tab
- Malwaredomains.com Search: Opens a Malwaredomains.com search for in a new tab
- Robtex IP Search: Opens a RobtexIP search in a new tab
- SamSpade Search: Opens a SamSpade search in a new tab
- ThreatExpert Search: Opens a ThreatExpert search in a new tab
- UrlVoid Search: Opens a UrlVoid Search in a new tab n a new tab

For the `file-hash` and `alias-host` meta keys, the Google lookup opens a Google search in a new tab.

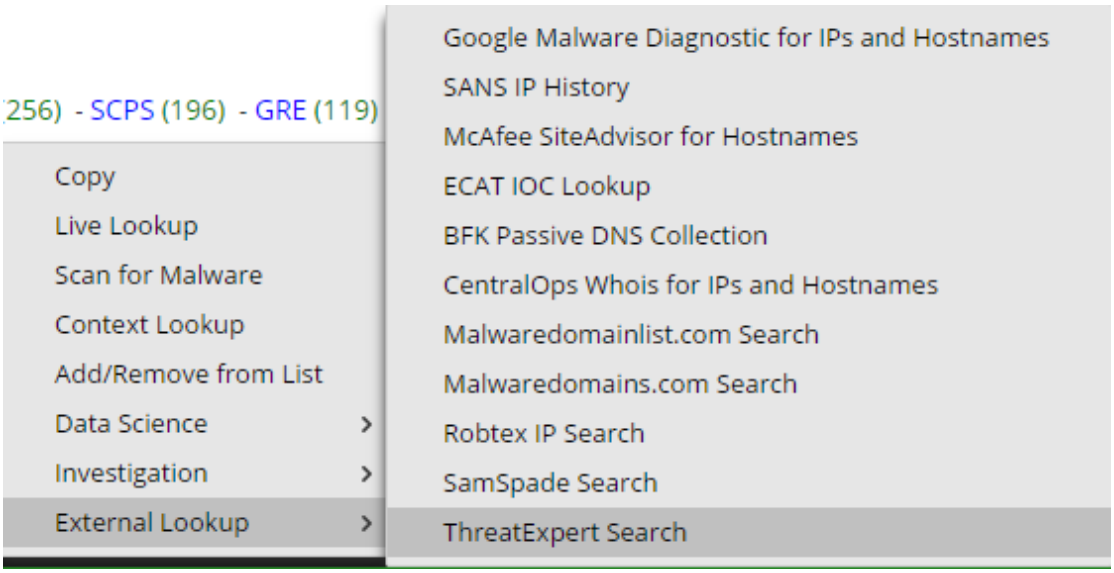
For the `client` meta key, the ECAT Lookup option opens an ECAT client in a new tab if the ECAT client is installed on the same system on which the browser is being used.

Administrators can add additional external lookups and other custom actions as described in "Add Custom Context Menu Actions" in the *System Configuration Guide*.

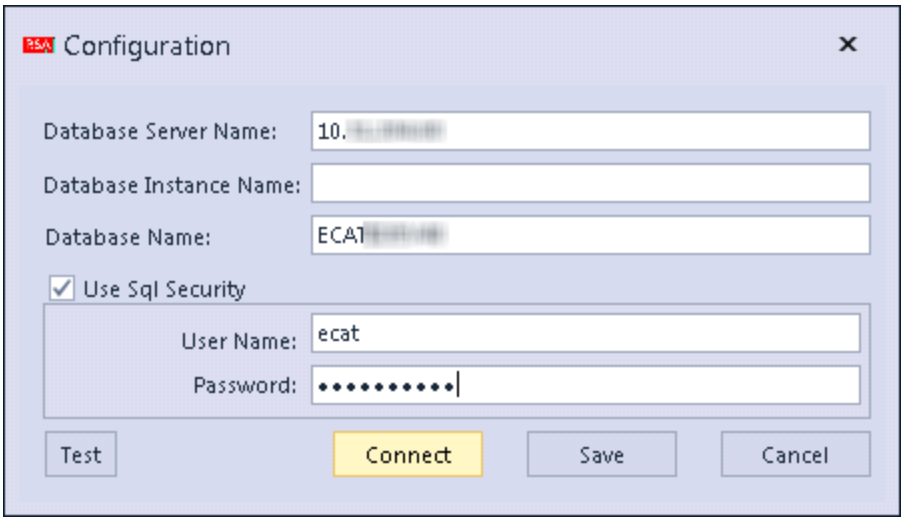
Launch an ECAT IOC Lookup

To launch an ECAT lookup of data from the Investigation > Navigate view:

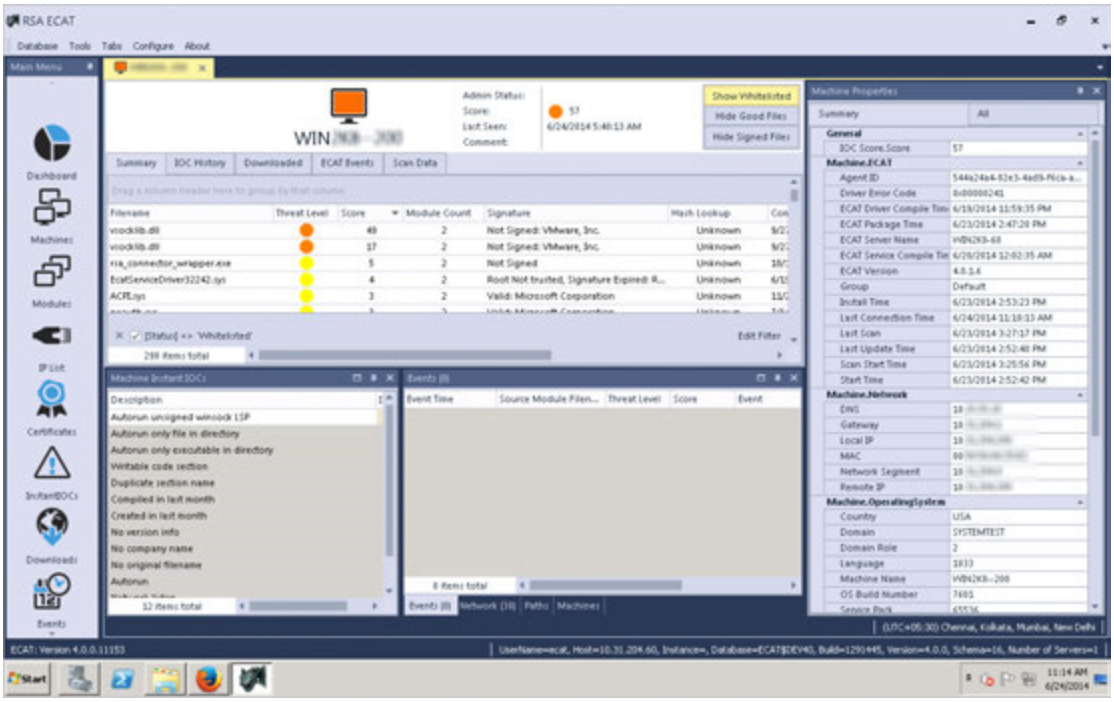
1. Right-click a meta value for one of the following meta keys: `ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip, alias-host, domain.dst, client.`
2. Select **External Lookup** in the context menu.
   A submenu of external lookup options is displayed.



3. Select **ECAT IOC Lookup**.
   A dialog asks you to choose an application.
4. Select ECAT and click **OK**.
   The RSA ECAT Configuration dialog is displayed.



5. Enter the user name and password required to log on to the ECAT client, and click **Connect.** The drill point opens in RSA ECAT.

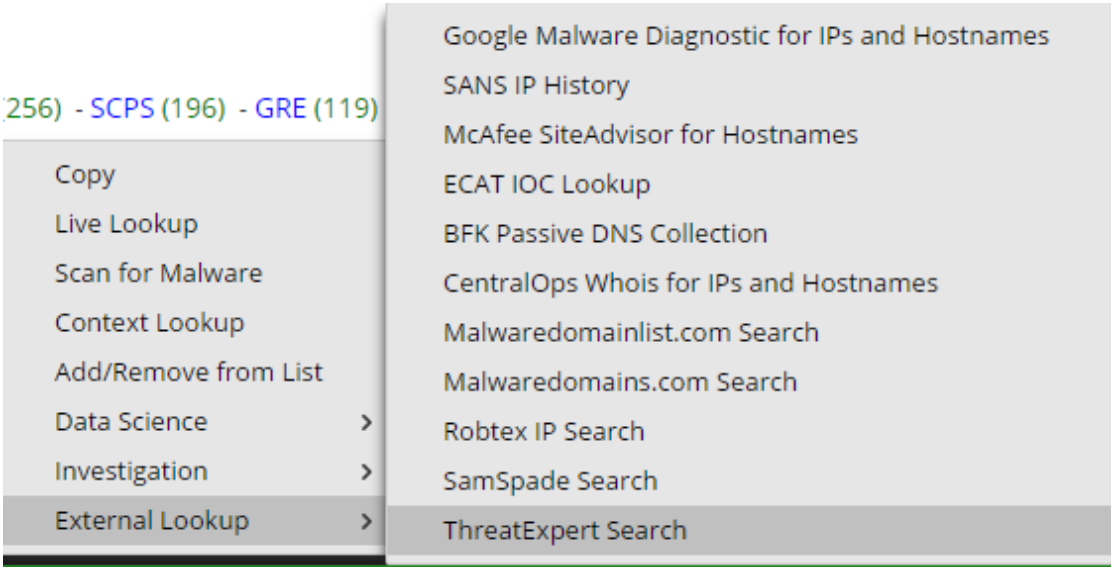


Lauch Other External Lookups

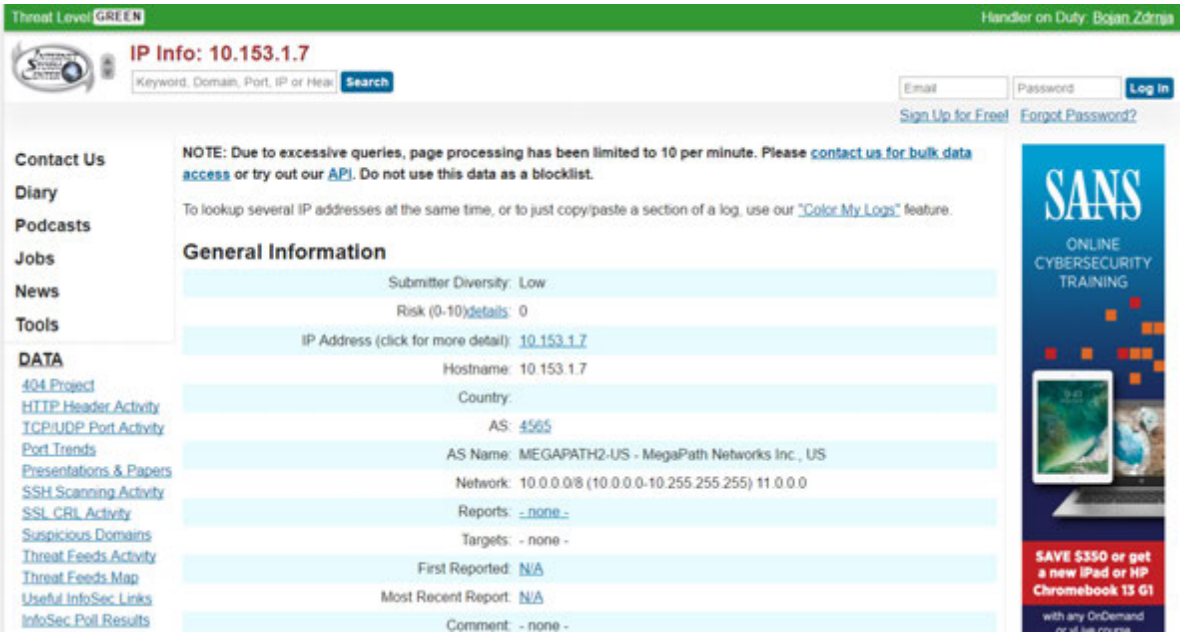
To launch an external lookup (other than ECAT IOC) of data from the Investigation > Navigate view:

1. Right-click a meta value for one of the following meta keys: `ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip, alias-host, domain.dst, client.`

2. Select **External Lookup** in the context menu.
   A submenu of external lookup options is displayed.



3. Select one of the lookup options.
   The selected meta value opens in the selected lookup, for example, if you selected SANS IP History, the drill point information is displayed in SANS Internet Storm Center.

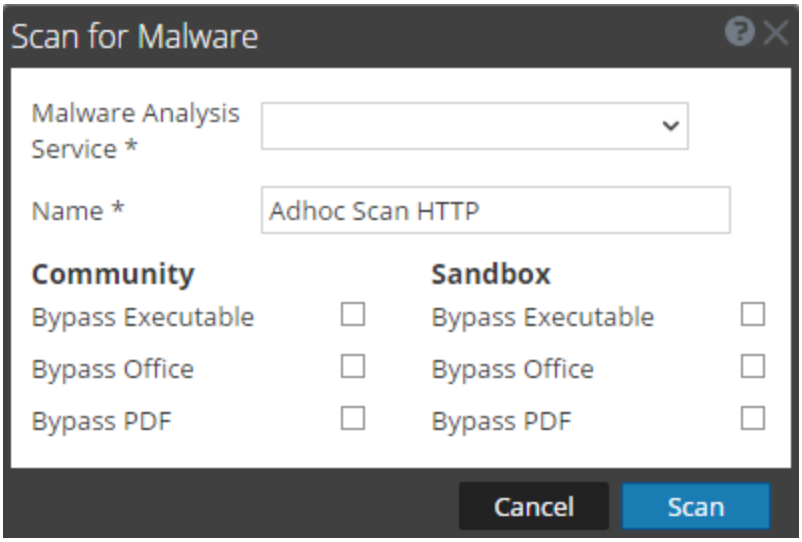


Launch a Malware Analysis Scan from the Navigate View

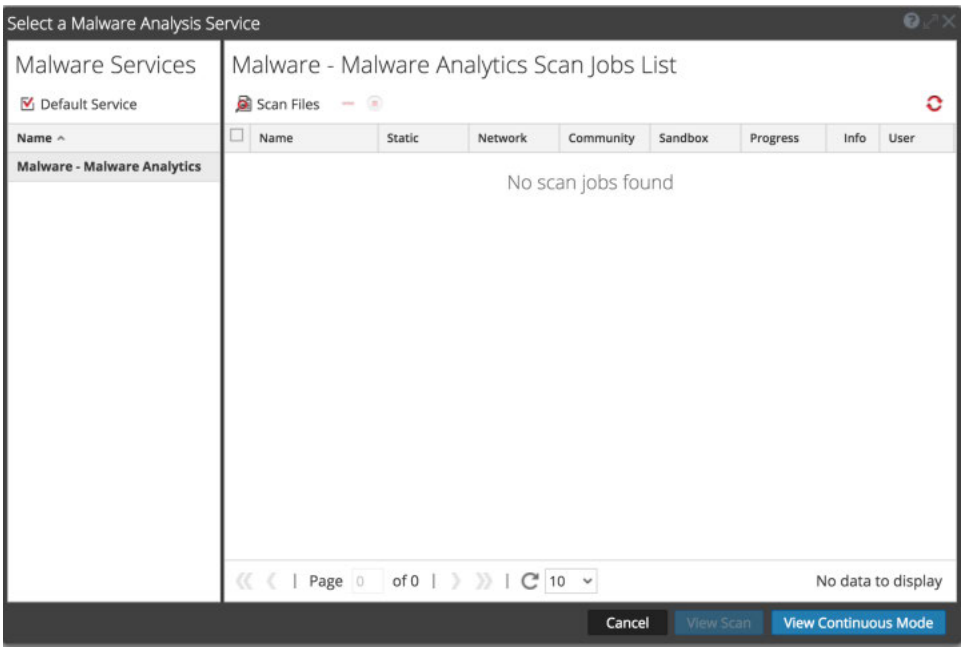
From within Investigation, analysts can launch an on-demand Malware Analysis scan by selecting a service and meta value, and choosing an option from the context menu. When polling is complete, the scanned data is available for malware analysis.

To launch a Malware Analysis scan of data from the Investigation > Navigate view:

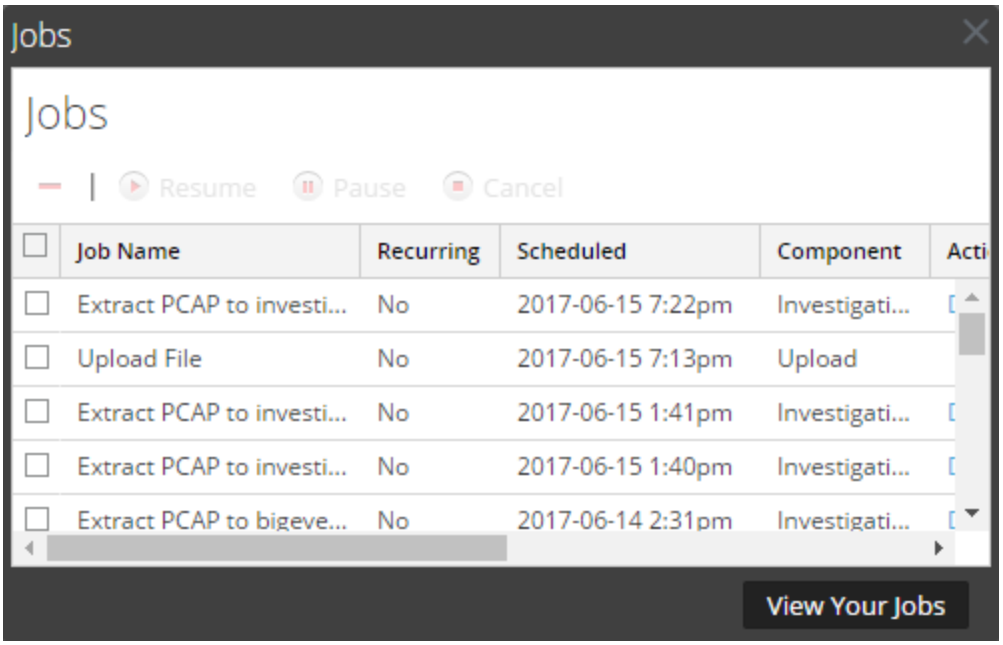
1. Right-click a meta value (for example, OTHER, DNS, or FTP) and select **Scan for Malware** in the context menu.
   The Scan for Malware dialog is displayed with a suggested name for the on-demand scan and no service selected.
2. In the Scan for Malware dialog, select a service to perform the scan, edit the name, and select the types of files to bypass under community and sandbox.



3. Click **Scan**.
   The scan request is added to the Scan Jobs List dashlet and the Jobs Tray. The bypass settings in this dialog override the default settings in the basic Malware Analysis configuration settings.
4. To view the jobs, do one of the following:
   a. Navigate to the Scan Jobs List in the Malware Analysis view or in the Unified dashboard. Double-click a scan to view the scan.



b. To view the job in the Jobs tray, click  in the NetWitness Suite toolbar. When the job is complete, scroll to the left and click **View**.



The Malware Summary of Events for the selected scan is displayed. The scan is also added to the list of available scans in the dialog for selecting scans in the Investigation > Malware tab.

Manage Context Hub Lists and List Values in Investigate

Analysts can add lists and list values for Context Hub enrichment in the Navigate view and the Events view. When the Context Hub service is enabled and configured, NetWitness Suite provides enrichment data from Incident Management, custom lists, and NetWitness Endpoint directly in the Navigate view and Events view. A visual cue highlights meta values for which enrichment data is available in the Investigation views, and you can click on the highlighted value to look up the contextual information and intelligence.

In addition, from the Values panel in the Navigate view and from the Events view, you can view lists, edit meta values in an existing list, or create a new list. When you add meta values to a list, you can investigate the meta values using the context lookup option.

Prerequisites

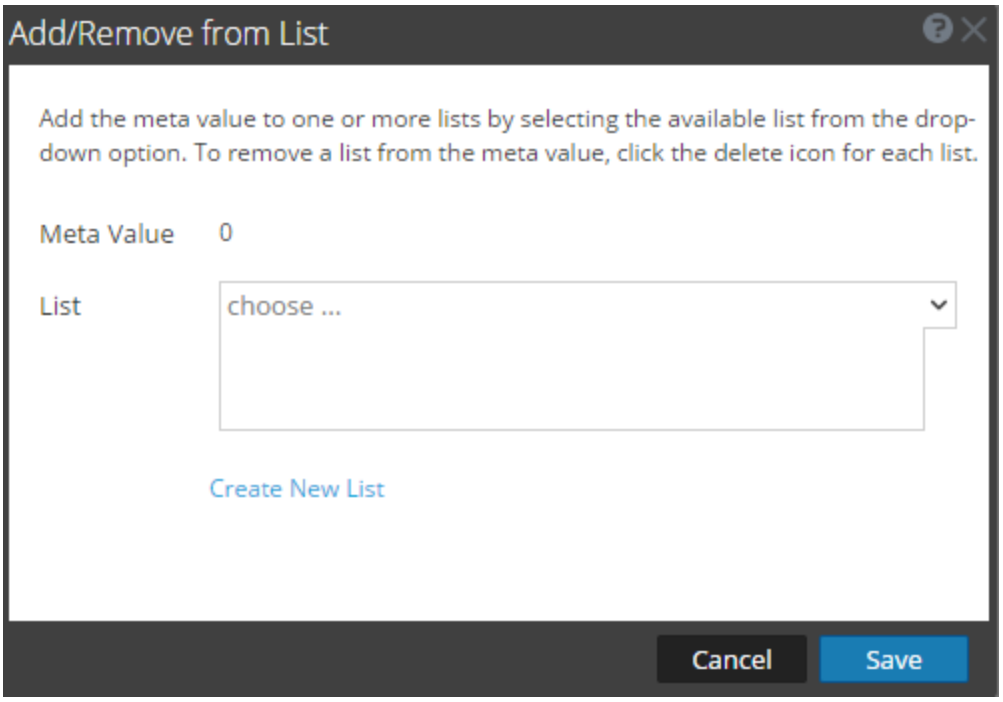
For an analyst to manage lists in Investigation, the administrator must:

- Enable the Context Hub service.
- Assign an analyst role with permission `Manage List from Investigation` to the user who will perform Context Lookup from Investigation views.
- Configure appropriate roles and permissions as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

Add Meta Values to an Existing List

To add meta value to an existing list in Context Hub:

1. While investigating a service in the **Navigate** view or the **Events** view, right-click a meta value (for example, values under Source IP, Destination IP, or Username) and select **Add/Remove from List** in the context menu.
   The Add/Remove from List dialog is displayed.



2. In the **List** field, select one or more lists from the drop-down option to which the meta value must be added.
3. Click **Save**.
   The meta value is added to the selected lists.

Remove a Meta Value from a Context Hub List in Investigation

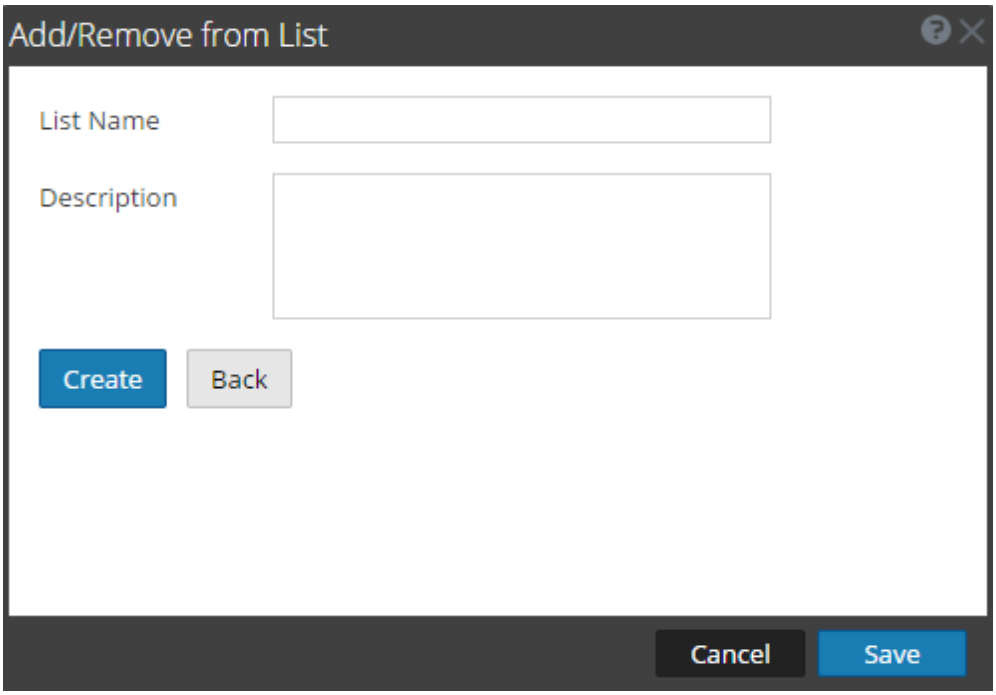
To remove a meta value from list:

1. In the **Add/Remove from List** dialog, in the **List** field, view the lists which include the meta value.
2. Click the delete icon (x) for each list that should not include the meta value.
3. Click **Save**.
   The meta value is removed from the deleted list.

Create a New List in Investigation

To create a Context Hub list in Investigation:

1. In the **Add/Remove from List** dialog, click **Create New List**.



2. In the **List Name** field, enter an unique name for the list.
3. In the **Description** field, enter the description of the list.
4. Click **Create** to create the list.
5. Click **Save** to add the meta value to the created list.
   These lists are considered as data sources for retrieving context information.

Open the Events List

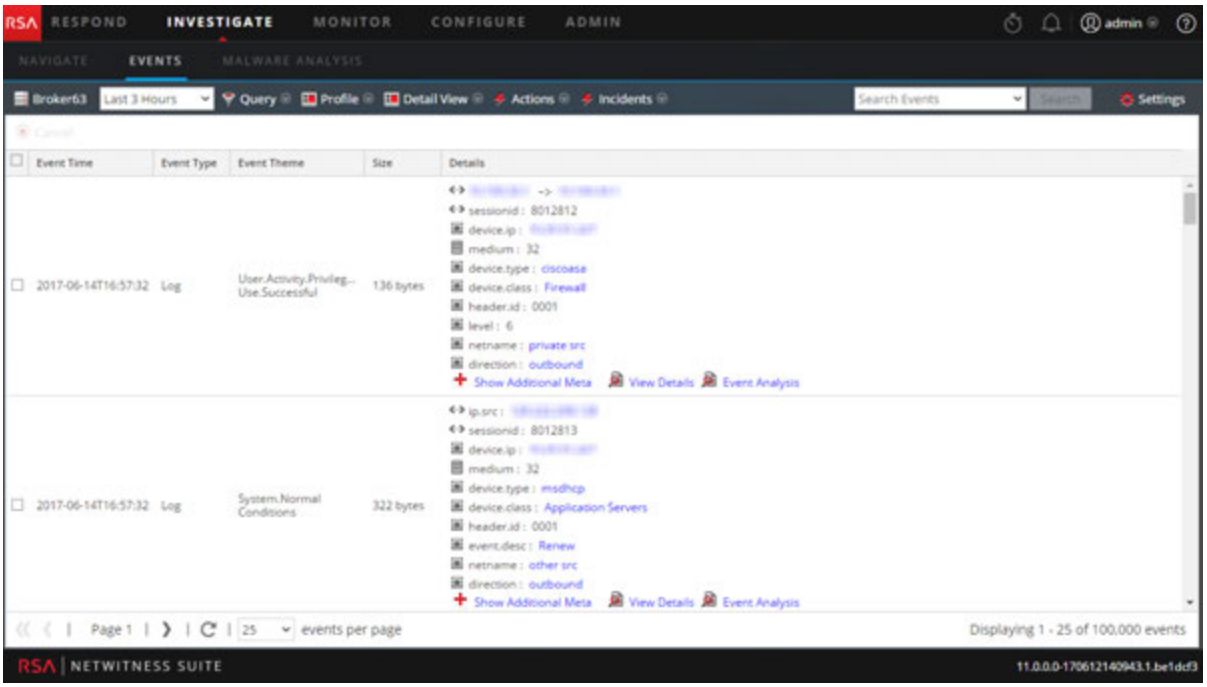
Analysts can view a list of events associated with a session in the Investigation > Events view.

To display events in the Events view do one of the following:

1. To use the default query for the default service, go to **Investigate** > **Events**.
   NetWitness Suite runs a default query on the last three hours for the default service (if one is set) or displays a dialog in which you can select a service and then runs the default query. The default query selects all events and the Events view displays events on the selected service, with the oldest events first.
2. To view events for a specific meta value, go to **Investigate > Navigate** and when events are loaded in the Values panel, click a meta value under a meta key (the value is in blue text). The Events view displays the events for the selected meta value.

The Events view provides three built-in presentations of event data: the Detail view, the List view, and the Log view.

This figure is an example of the Detail view.



You can use queries, the time range setting, and profiles to filter the events listed in the Events view. From any view type in Events view, you can extract files, export events, export logs, and open the Event Reconstruction panel by double-clicking an event. See Examining Events for detailed information about these capabilities.

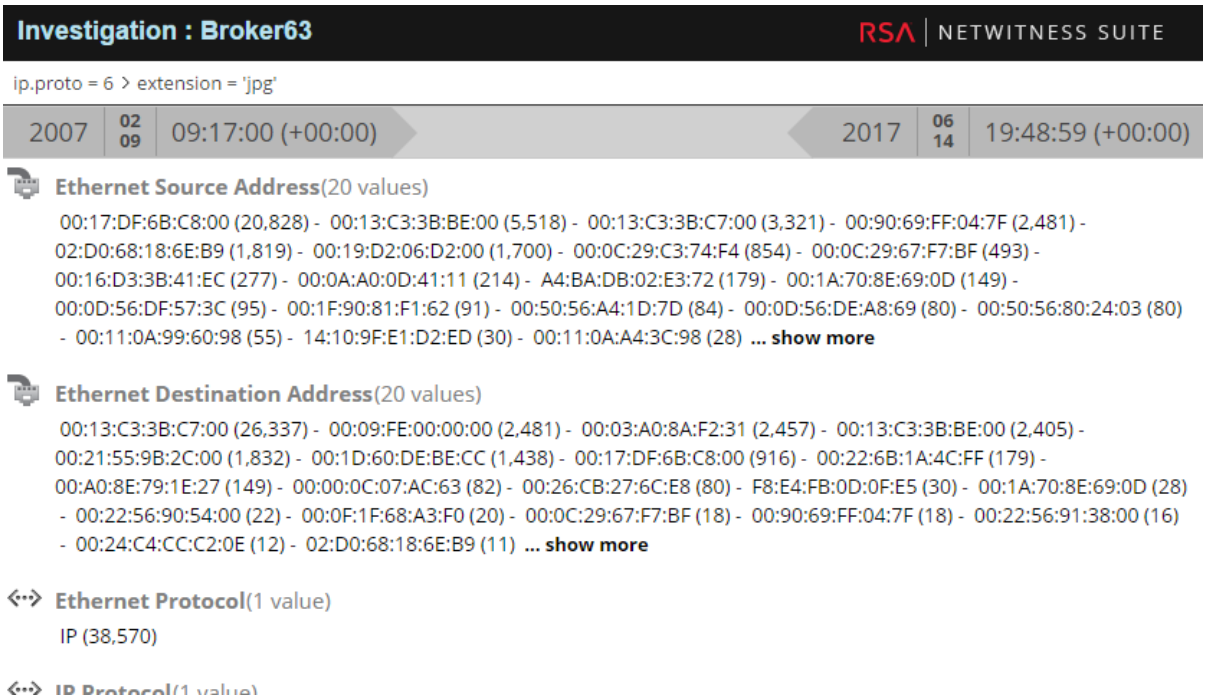
Print the Current Drill Point

In the Investigate > Navigate view, you can display the contents of the current drill point in printer friendly format in the browser window.

To display the current drill point in a print view:

1. With a drill point open in the **Investigate > Navigate** view, select **Actions > Print** in the toolbar.

   A new tab is created with the print view of the current drill point.



2. Use the print option in your browser to send the printable view to the printer.

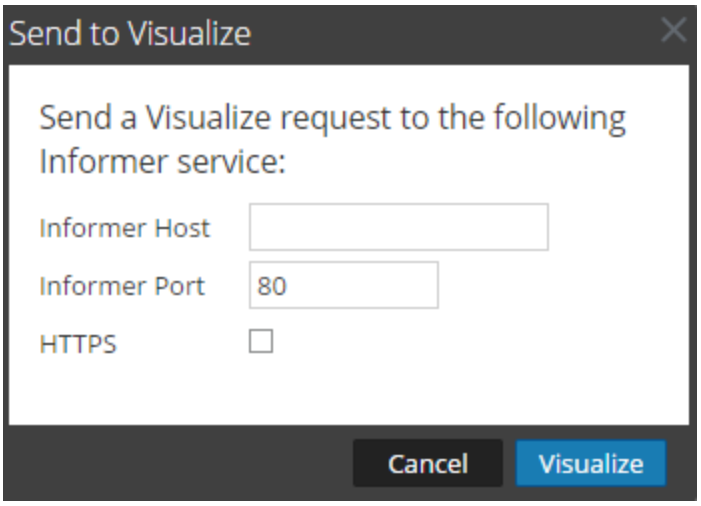
Visualize the Current Drill Point in Informer

This topic provides instructions for sending a drill point in the Investigate> Navigate view to an Informer visualization.

Informer must be installed in your network and accessible by the service being investigated. You need to supply the host name and the port used on the Informer host to communicate with NetWitness Suite.

To display a visualization in Informer of the current drill point:

1. With a drill point open in the Navigate view, click **Actions > Visualize**.
   The Send to Visualize dialog is displayed.



2. Type the Informer hostname or IP address, and verify the NetWitness Suite server port used to communicate with the Informer host.
3. (Optional) Select the HTTPS option if the Informer host uses secured communications.
4. Click **Visualize**.
   The visualization is displayed in a new tab.

View Additional Context for a Data Point

From an event reconstruction or Values panel in the Investigate view, you can look up details and intelligence about elements associated with an event in the Context Hub. The data from configured sources, such as RSA NetWitness Endpoint, can help you understand what is happening.

These elements, or entities, are identifiers, such as an IP address, a user name, a host name, a domain name, a file name or file hash. To look up external information about a given entity, NetWitness Suite uses the Context Hub. The Context Hub is a centralized service that aggregates data about entities from multiple configurable data sources. This data can extend your investigation with additional context beyond the immediate results of a specific query. For example, the Context Hub can tell you if a given entity has been mentioned in any incidents, alerts, feeds, or community intelligence publications.

When you right-click the entity in Investigate, the Context Hub queries the configured data sources for relevant information. The Context panel opens from the right side of the browser window. The Context panel is populated with the information from the Context Hub as it becomes available.

To perform another lookup, right-click on another entity, and the Context Panel is updated with that entity's information.

To close the Context Panel, click the ✕ in the Context Panel.

In the Context Lookup panel, you can view and explore individual data sources for further investigation. For example, when you click on a particular Incident's value, the specific incident details are displayed in the Incident Respond view.

For a detailed description of the information displayed for each data source on the Context Lookup panel, see Context Lookup Panel.

Before an analyst can view contextual information, the administrator must:

- Ensure that the Analyst has a role with the permission `Context Lookup` as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.
- Add the Context Hub service in RSA NetWitness Suite.
- Configure data sources for the Context Hub service as described in the *Context Hub Configuration Guide*.

Note: Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

To view information in the Context Summary panel:

1. In the Navigate view or the Events view, identify a meta value for which you want to view additional context and hover over the meta value.
   The **Context Highlights** panel is displayed with a quick summary of the type of context data is available for the data source: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, Feeds, and Live Connect.
2. Right-click a meta value , and click **Context Lookup** to open the Context Lookup panel.

   
   The Context Summary panel opens from the right side of the browser window. The Context Summary panel is populated with the information from the Context Hub as it becomes available.
3. To perform actions from the Context panel, click an entity such as IP address and right-click. The following options are available: Open Link in New tab, Query in Investigate, Copy Link, Paste, Google Lookup, Virus Total Lookup, and Query in Endpoint.

Examining Events

Analysts who are investigating data in the Investigate can view and reconstruct events associated with a session.

- Analysts who conduct analysis using NetWitness Suite Investigate, and have the appropriate system roles and permissions set up for their user accounts, can go from a Navigate view drill point to the Events view.
- Analysts who do not have access to the Navigate view or want to go directly to the Events view, can open sessions and examine the events that make up the session in the Investigation > Events view.
- Analysts can select queries from their "query history" window.

Separate topics describe methods of working in the Events view:

- Add Events to an Incident for Response
- Analyze Events in the Event Analysis View
- Combine Events from Split Sessions
- Export Events
- Filter and Search Results in the Events View
- Manage Column Groups in the Events View
- Reconstruct an Event

Filter and Search Results in the Events View

Analysts can filter the results in the Events view and, by searching for events or selecting the service on which to view events, set the time range, and query meta data.

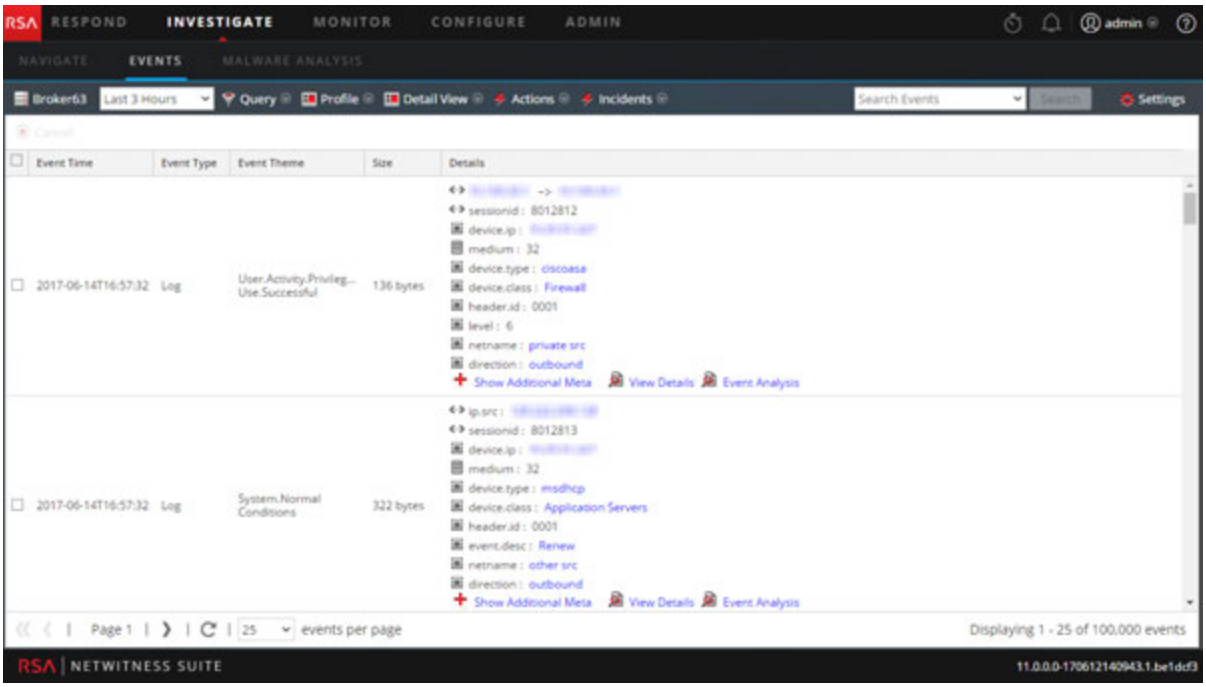
If you opened the Events view from a Navigate view drill point, the view opens to the Detail view of events by default. Analysts who do not have permissions to use the Navigate view can query services directly from the Events view. There are several configuration options to filter the information displayed in the Events view.

Note: When an Archiver is the currently selected service in the Events view and you are searching against a Broker or Concentrator, the search is slower than if searching against a Broker or Concentrator because the data on the Archiver is compressed and there is typically more data.

Filter Events Displayed in the Events View

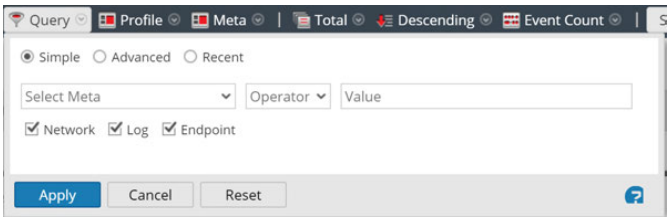
To filter the data displayed in the Events view:

1. In the **Investigate** view, select the **Events** view.
   The Events view is displayed.



2. To select a time range other than the default (**Last 3 Hours**), in the toolbar, click the time range field and select a value. For example, **Last Hour**.
   The Events view is refreshed with the selected time range.

3. To enter a query for the selected service and time range, in the toolbar, click **Query**.
   The Simple Query dialog is displayed.



4. If you want to enter a simple query using the auto-complete feature to select meta and operators, do one of the following:

   a. Click in the **Select Meta** field and select a meta key from the drop-down list.

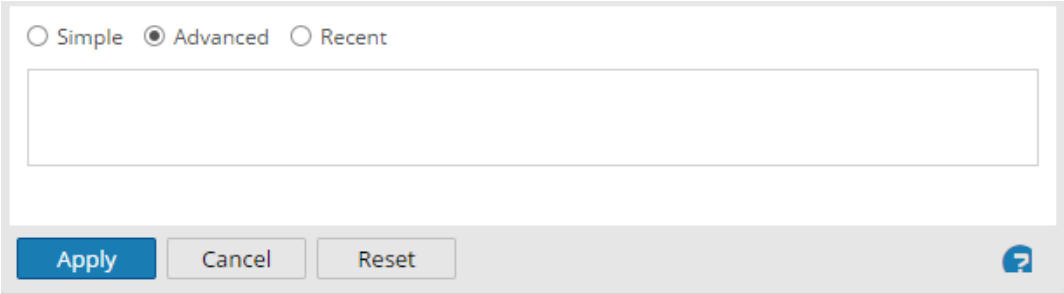
   b. Select an operator from the drop-down list in the **Operator** field.

c. Type a value to match in the **Value** field.

d. Select **Network, Log**, or **Endpoint** data, and click **Apply**.
The matching data is displayed in the Events view.

5. If you want to enter a more complex query based on your knowledge of the meta and operators:

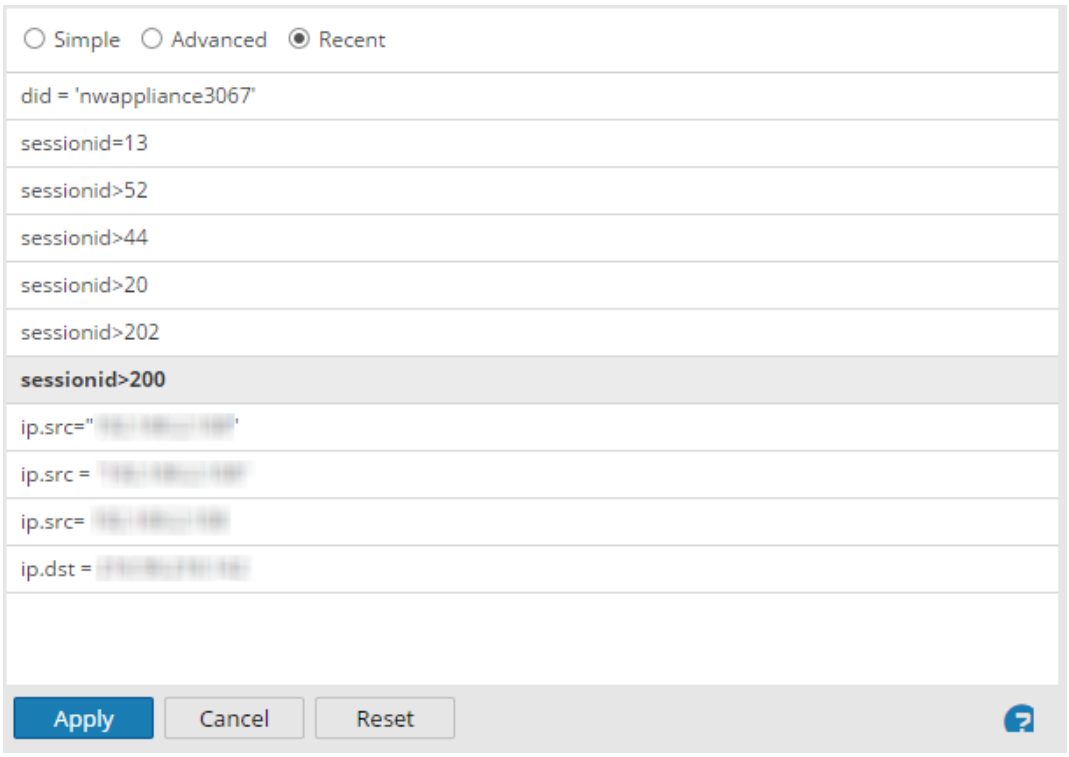
a. Click **Advanced**.
The Advanced Query dialog is displayed.



b. Type a query. As you type the query, beginning with the meta key, drop-down lists of available meta keys and operators are displayed. When finished, click **Apply**.

6. If you want to select a query from a list of recent queries:

a. Select **Recent**.
The Recent Query dialog is displayed.



b. Select a query and click **Apply**.
The matching results for the query are displayed in the Detail View in the Events view. The breadcrumb reflects the query.

c. In the breadcrumb, you can click any of the crumbs to display the Query menu. You can insert a new query before a crumb, and append a new query to the end of breadcrumb. After each edit in the breadcrumb, NetWitness Suite refreshes the results.

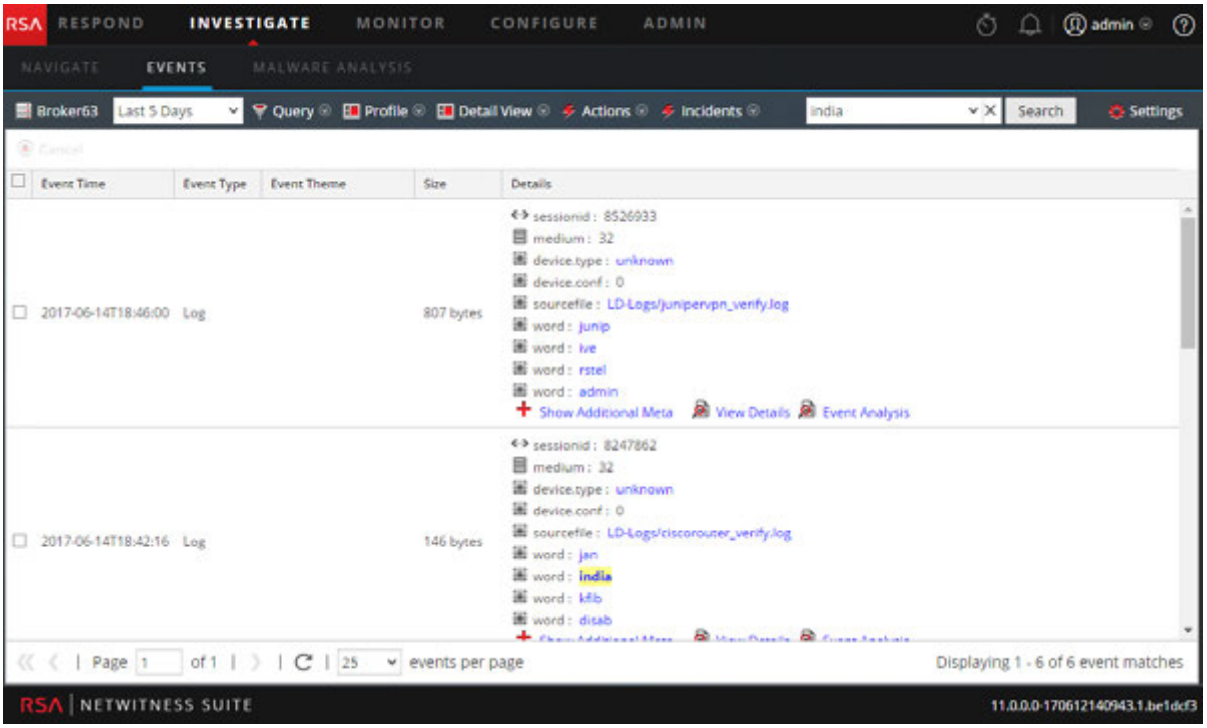
Search for Events in the Events View

You can search the currently displayed data in the Events view by entering a search string in the Search field. The search string can be a regex (Regular Expression) or it can be a simple text search. provides detailed information on these search types.

To search within the currently displayed data in the Events view:

1. To execute the search, place the cursor in the Search box, type a search string, and press **Enter** or click **Search**.
The search results are displayed in the Events view. Events that match the search criteria are displayed in the Event view grid. In the Details view and List view, matches are highlighted in the Details column. In addition, when searching RAW, matches are highlighted in the Log view Logs column. Below is an example of the search results for the search term **India** in the Events Detail view. Note that search matches are not highlighted in

any Event Reconstruction.



2. If you want to narrow the search, change the query and time as described above in Filter Events Displayed in the Events View.
3. If you want to stop the search and return to the Events view, click **Cancel**.
   Any results that are displayed remain.
4. To clear the search box and return to the normal Events view, click the **X** in the search box.

Combine Events from Split Sessions

Analysts can identify sessions that have been split due to session size in the Events view, and combine the fragmented sessions so that the complete session is viewable as a single query result in the Events view. When split sessions are recombined, a single packet export of the session in the Events view includes all of the session fragments.

Version 10.4 and earlier Decoders are configured with a default session size of 32 MB. When a session exceeds the 32 MB limit, the Decoder splits the session and all subsequent packets become part of a new session, fragmenting the actual network session across multiple Decoder sessions. Split sessions are parsed without the context that it is a fragment of the larger network session, sometimes resulting in session fragments with source and destination addresses and ports reversed and with unidentified application protocols. Another result of split sessions can be difficulty viewing all of the session fragments as a single query result or creating a single packet export of all the session fragments.

Decoder enhancements in NetWitness Suite 10.5 provide improved processing of fragmented sessions:

- Contextual fragment parsing.
- Session fragments highlighting.
- Finding session fragments.
- Exporting all packets to a single PCAP.

Contextual Fragment Parsing

In NetWitness Suite 10.5 and later, the Decoder completes session parsing before splitting the session based on the configured maximum session size (32 MB) or the configured timeout (60 seconds). When parsing is complete, the parsed results include the proper address directionality and application protocol, which are propagated to each subsequent session fragment to ensure consistency with the logical network session they represent.

Note: All of the necessary Decoder configuration changes are made when upgrading to 10.5. However, Find Session Fragments requires that the tcp and udp source port meta keys (tcp.srcport and udp.srcport) be fully indexed, which was not the default configuration prior to 10.5. This functionally limits the ability to find session fragments to sessions captured after the Decoder was upgraded to 10.5.

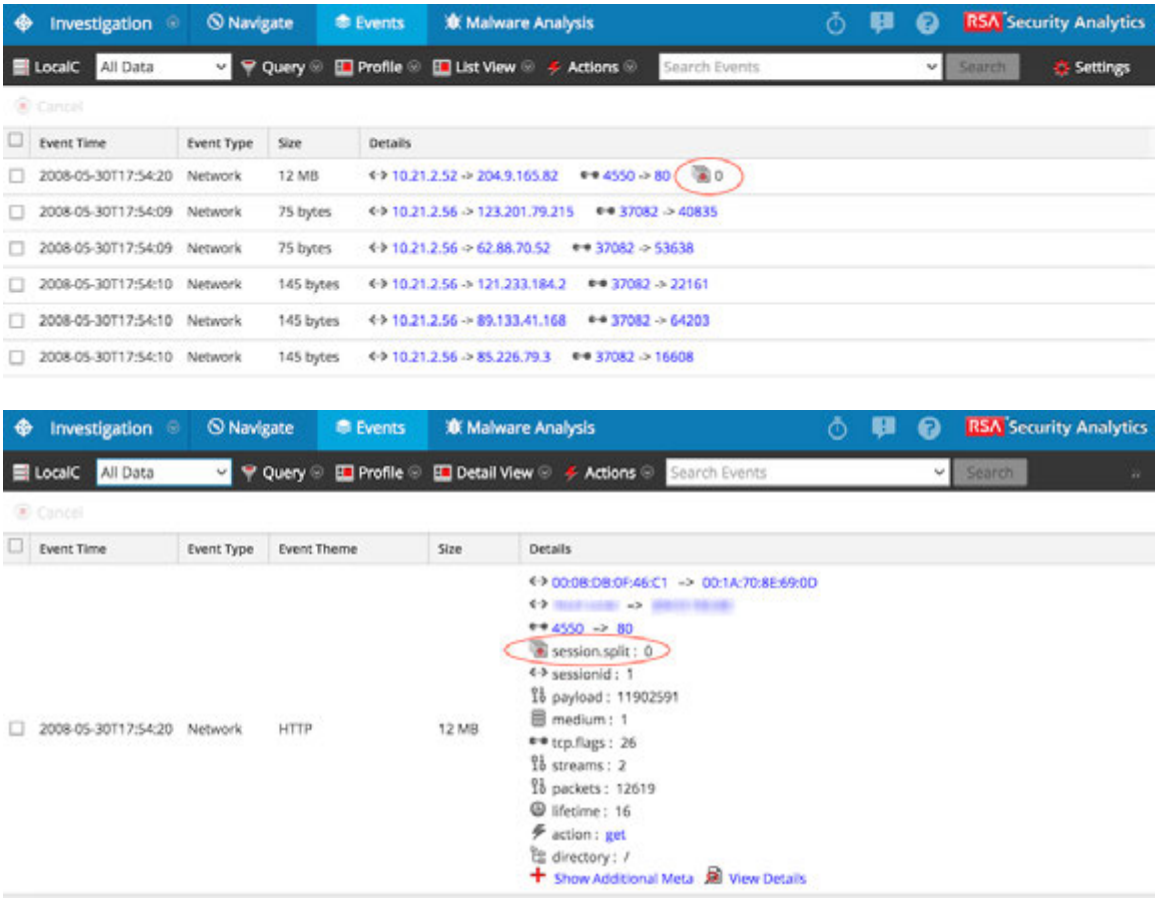
Session Fragments Highlighting

Each session fragment has an additional meta, `session.split`. The value of the `session.split` meta for a particular session fragment indicates how many fragments precede that fragment. When viewing sessions in the Events view, the `session.split` meta clearly identifies sessions that are fragments in the Events List view and the Events Detail view.

The session split happens when the configured Decoder `assembler.size.max` or `assembler.timeout.session` (latency between sessions) is reached. The earliest fragment is session 0 and sessions with a later time stamp are incrementally numbered 1, 2, 3, and so on. The `session.split` meta indicates the number of preceding sessions fragments; however, it does not always indicate that there are subsequent session fragments, even with a value of 0. It is also possible for the first fragment of the session to not have `session.split` meta if the session is parsed before exceeding the maximum session size.

Once you view the session fragments, you can determine the maximum session size or session timeout necessary for parsing to combine the split sessions into one again. For example, if you have four fragments at 32 MB, you need to configure your test Decoder (usually a virtual machine set up separate from main production service) with a maximum session size greater than 128 MB. The steps are the same to find all fragments based on a session timeout. The figures below show the Events List view and the Events Detail view with fragmented session information highlighted.

Note: A maximum session size of 12 MB was configured at the time the screen captures below were created.



The `session.split` metadata is always displayed immediately following the address and port metadata in the details view. It is never hidden as additional metadata.

These enhancements make it possible to quickly:

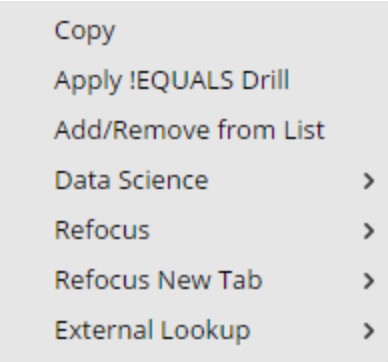
1. Identify sessions that are fragments of a network sessions.
2. View all of the session fragments of a network session given a single session fragment.
3. Export the packets for the entire network session as a single PCAP file.

Find and Combine Fragments

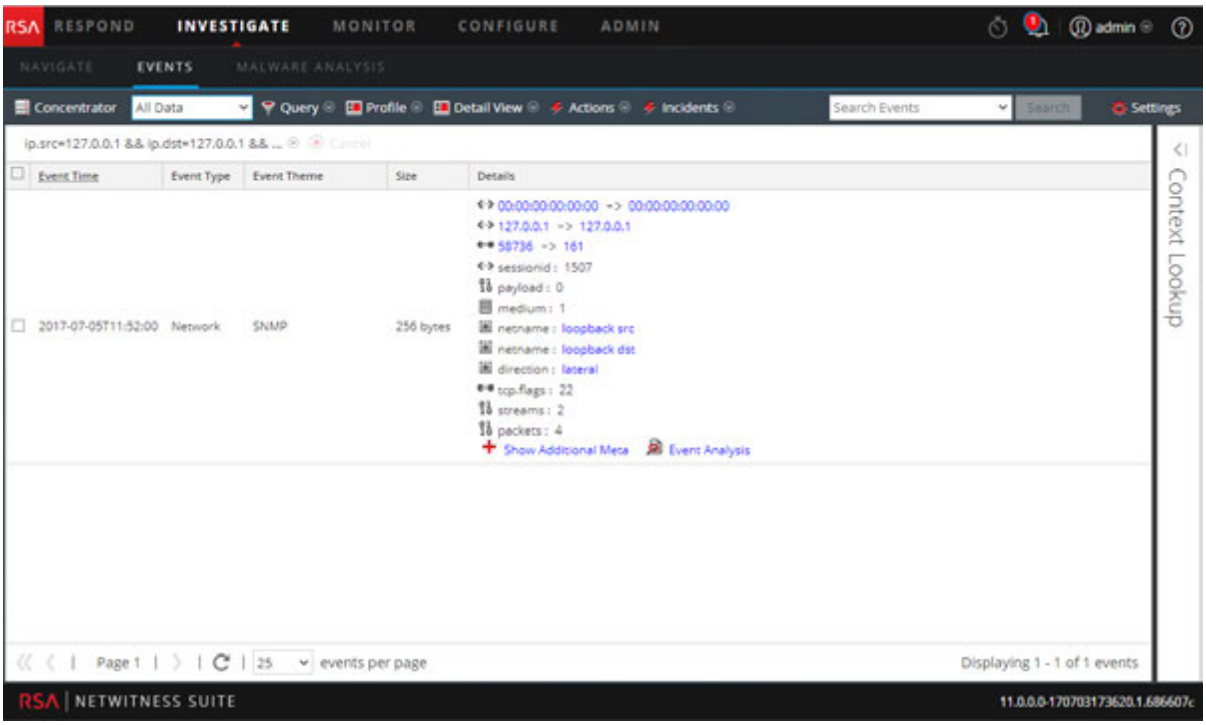
From within the Events view, you can find fragments of a session using the Refocus > Find Session Fragments context menu option. NetWitness Suite composes a query using the source and destination addresses and ports of the selected session and displays all sessions that match that query within the current time window.

To find session fragments:

1. In the **Investigation > Events** view, right-click any of the source and destination address and port values: `ip.src`, `ip.dst`, `ipv6.src`, `ipv6.dst`, `tcp.srcport`, `tcp.dstport`, `udp.srcport`, and `udp.dstport`) as well as `session.split` values.
   The context menu is displayed.



2. Select **Refocus > Find Session Fragments** or **Refocus New Tab > Find Session Fragments**.
   NetWitness Suite repopulates the Events list with session fragments for a single session within the current time range. Depending on the option you selected, the refocus replaces the current view or opens in a new tab. (All data is used in these examples but is not recommended on production systems).



3. If necessary, adjust the time range to include any session fragments that may precede or follow the current time window. You can tell that the time range needs to be expanded if the fragments occur near the time boundary, especially if the first visible fragment does not have a split value of 0 (or none). Alternately, inspecting the packets of the last visible session may lead you to believe that the session continues. Here is an example:
   a. If you are looking at fragments that are obviously not the first fragment, for example, 1, 2, 3, and 4 in time range 10:30 to 10:35, there should be a fragment 0. You can increase the time range to start earlier (for this example, 10:25) to find the additional fragment.
   b. If the session size of last fragment is close to maximum session size (12 MB in this example), look for additional fragments by increasing the time window to include a later time (for this example, 10:40).
      When all of the session fragments of a network session are included within a single Events list, the list can span multiple pages.
4. (Optional) To export the packets for every session fragment to a single PCAP file, select **Actions > Export All PCAP**.
   A message informs you that the PCAP is being downloaded. When download is complete, PCAP file includes the entire network session that was fragmented.

Manage Column Groups in the Events View

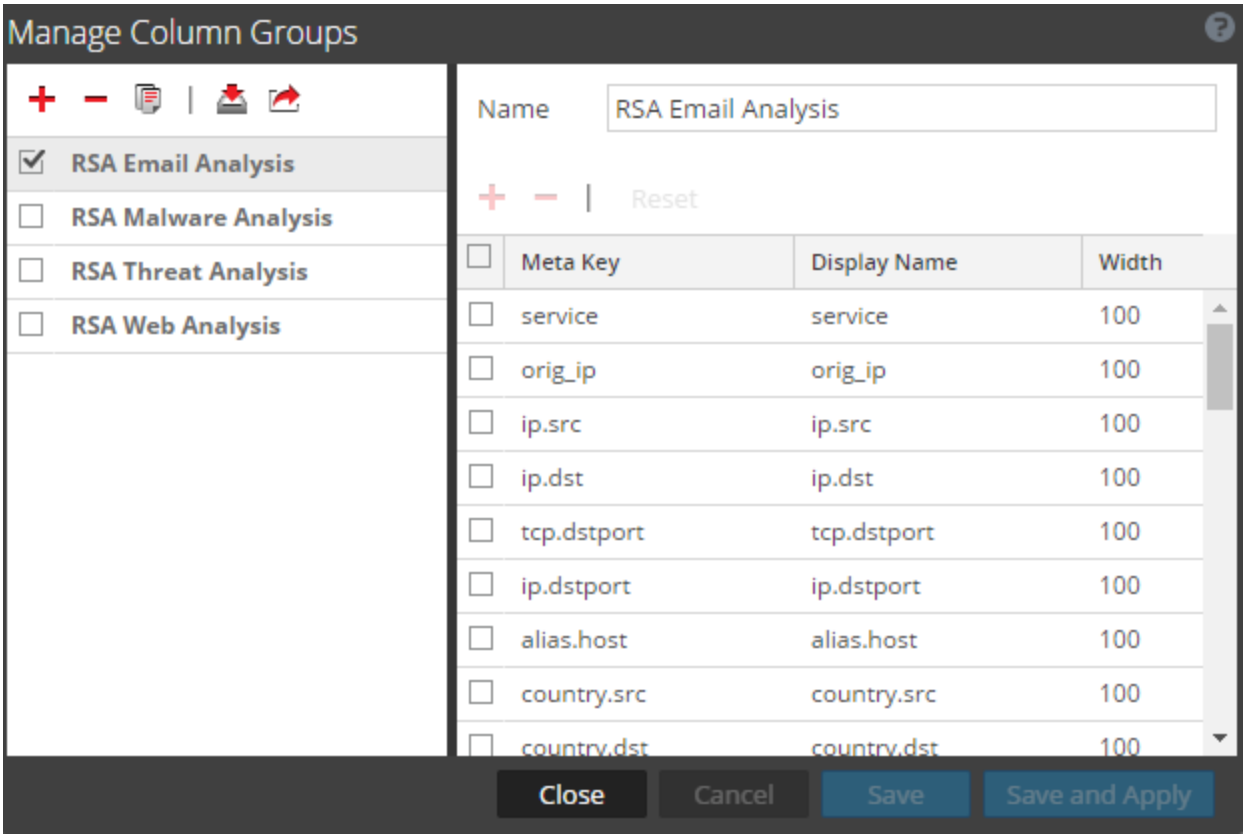
This topic provides instructions for an analyst to create and manage custom column groups for displaying data in the Events view.

When viewing a list of events in Events view, you can customize the way data is displayed by defining the meta to display in a column, the position of the column in the grid, and the default width of the column.

Note: Investigate profiles can include custom column groups. If a custom column group is used in a profile and you are viewing events in the Events view using a custom column group, you cannot change the view type (Detail, List, or Log).

Create Custom Column Group

1. In the **Investigate** view, select the **Events** view.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.
   The Manage Column Groups dialog is displayed.

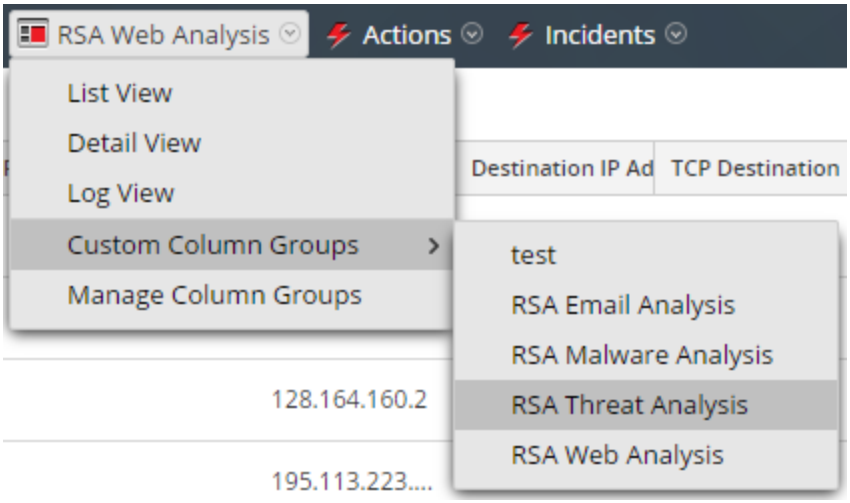


3. To add a new column group in the column group panel, click + and type the name of the new group in the resulting field.
4. The column definition panel opens on the right with the group name filled in. You can edit the group name.
5. To add a column to the group, click +, and click in the empty **Meta Key** field to display the **Meta Key** drop-down list.
6. Select a meta key field from the list, and repeat this step until the column set is complete.
7. (Optional) To delete a meta key from the column group, click −.
8. (Optional) To rearrange the sequence in which the columns appear in the Events list, drag meta keys to the desired position.
9. (Optional) To set the default width for a column, click in the corresponding value in the **Width** column, and type a new column width.
10. (Optional) To revert to the previous settings for the column group, and undo all of your changes, click **Reset**.

11. When ready to save, do one of the following:
    a. To save the edited column group and refresh the Events view with the column group settings, click **Save and Apply**.
    b. To save the edited column group without refreshing the Events view, click **Save**.

Select a Custom Column Group

1. With the Events view open, select **Custom Column Groups** in the **View** drop-down menu. The option name is the default value (Detail View or the current value).



2. Select one of the custom groups from the submenu.
   The Events view is refreshed to reflect the custom column group.

Reconstruct an Event

When viewing a list of events in Events view, you can safely create a reconstruction of the event in a readable form that matches the original. By default, the initial view of a reconstructed event is the most suitable format (Best Reconstruction); for example, web content is reconstructed as a web page; an IM conversation is displayed with both parts of the conversation. Each user can select a different default reconstruction in the Profile > Preferences view.

In the reconstruction, you can:

- Select event information to view. Possible values are: request data, response data, both request and response data.
- Select the reconstruction type: details, text, hex, packets, web, mail, or IM.
- Export raw logs.

- Export the event as a PCAP file.
- Extract any files available in the event.

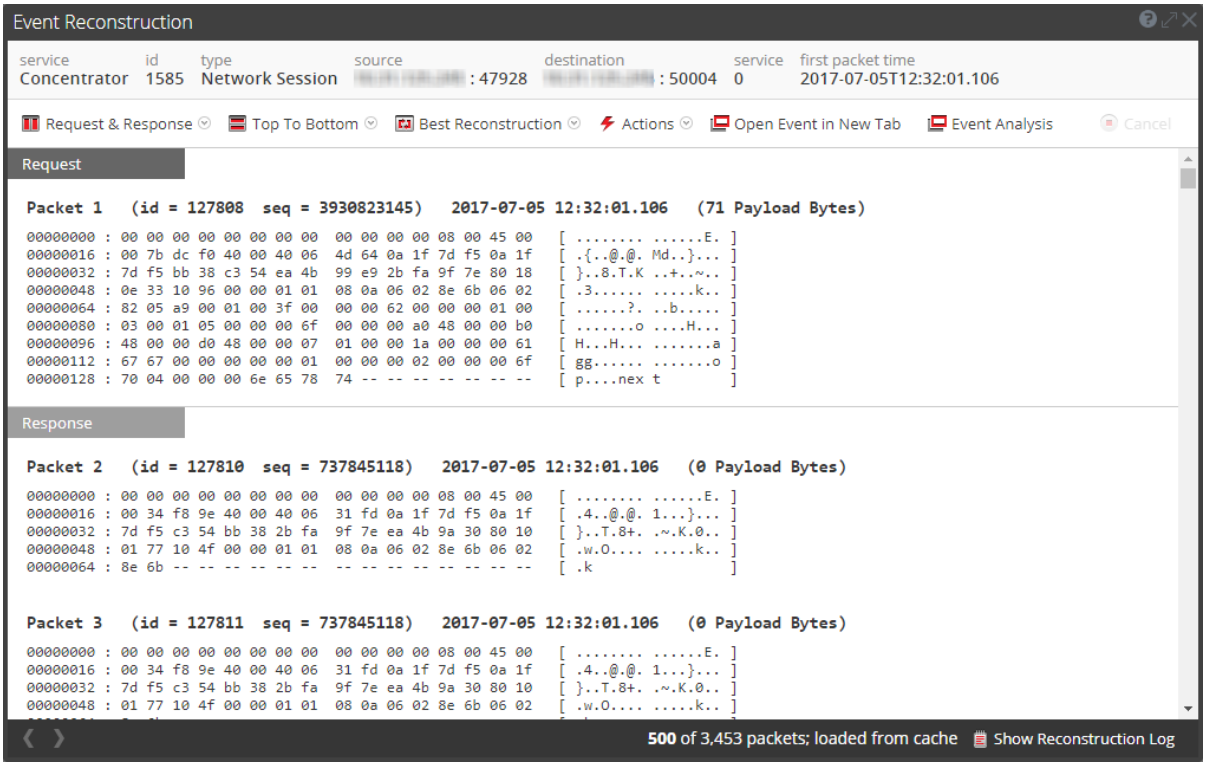
> **Caution:** Be careful when clicking a link to a file in the Reconstruction. If your system has an application associated with the file, or the browser is capable of opening them, and the attachments are malicious, they can negatively affect your system.

- Display the event in a separate window or tab (depending on your browser configuration).
- If you are viewing the reconstruction as a preview in the current view, you can page forward to the next event and back to the previous using the navigation buttons in the bottom left corner.

Note: Reconstruction Settings and Reconstruction Cache Settings allow an administrator to manage application performance for Investigation. As analysts reconstruct sessions that they are investigating, two situations can affect performance and results.
-Some events can be very large and contain many thousands of source packets. Reconstructing these types of sessions can degrade application performance.
- In some cases, the reconstruction cache can present incorrect content; for this reason, NetWitness Suite cleans cache that is older than a day every 24 hours. Between the daily cache cleanings, certain actions my result in stale cache being used for a reconstruction, and if the need arises, administrators can manually clear cache for one or more services that are connected to the current NetWitness Server.

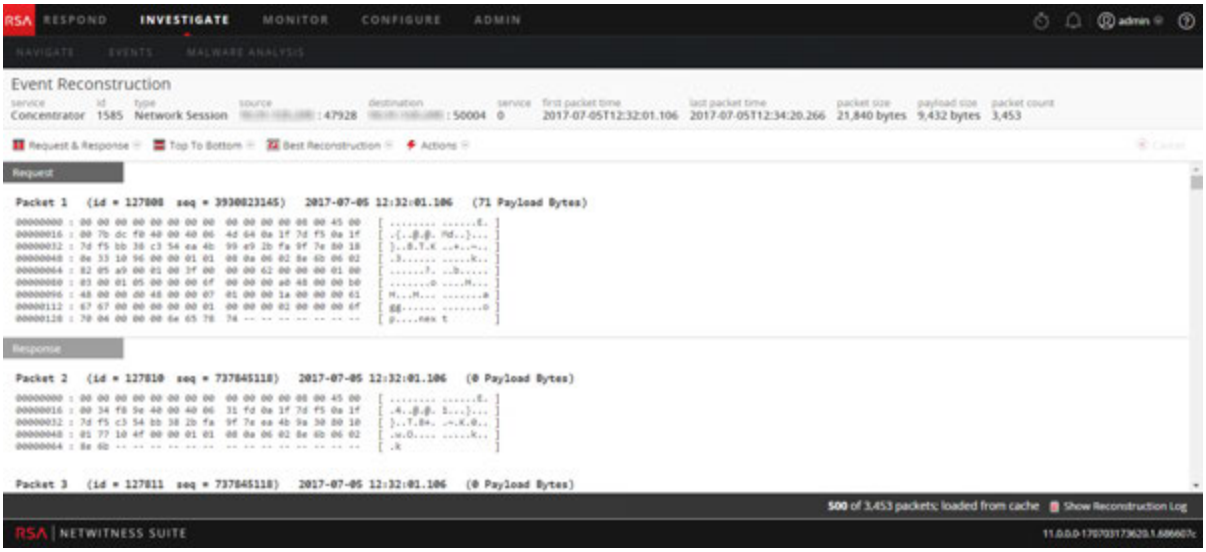
Reconstruct an Event

1. Open a drill point in the **Events** view.
2. To show all meta data, click 
.
3. To open an event reconstruction in the current view, select an event to reconstruct and select **Actions > View Event > Preview Inline**.
   The Event Reconstruction opens in a popup window in the same view. By default, NetWitness Suite displays the best reconstruction for the event determined by the event content or the reconstruction that you have selected in the Default Session View setting for Investigation. You can use the options in the Event Reconstruction toolbar to change the reconstruction method, view side-by-side results, export an event, open an email attachment, extract files, and open the event in a new tab. The toolbar options vary depending on the type of event being reconstructed (network event, log event, or endpoint event). This is an example of the reconstruction for a network event.



4. To preview a reconstruction of the next event, click  or to preview a reconstruction of the previous event, click  .
5. To open an event reconstruction in a new tab, do one of the following:
   a. In the **Events** view, select an event to reconstruct and select **Actions > View Event> Open in New Tab**.
   b. In the **Event Reconstruction** toolbar of previewed reconstruction, click **Open Event in New Tab** in the toolbar.

      The Event Reconstruction opens in a new tab.



View Side by Side or Top to Bottom

To select the way requests and responses for an event are displayed:

1. In the **Event Reconstruction** toolbar, click **Top to Bottom** or **Side by Side**.
2. In the drop-down menu, select the information you want to see in the event: **Side by Side** or **Top to Bottom.**
   The reconstruction is refreshed with the selected information.

Select Event Information to View

To select what event information to view:

1. In the **Event Reconstruction** toolbar, click **Request & Response**.
2. In the drop-down menu, select the information you want to see in the event: **Request & Response**, **Request**, or **Response**.
   The reconstruction is refreshed with the selected information.

Select Event Reconstruction Type

To select the reconstruction type for an event:

1. In the **Event Reconstruction** toolbar, click **Best Reconstruction**.
2. In the drop-down menu, select the reconstruction type to view: **meta**, **text**, **hex**, **packets**, **web**, **mail**, or **files**.
   The reconstruction is refreshed with the selected reconstruction type.

Open or Download an Email Attachment

When viewing a reconstruction of an email that has attachments, you can open supported file types or download the files to the local system.

Caution: Be careful when selecting file attachments. If your system has an application associated with the file attachments, or the browser is capable of opening them, and the attachments are malicious, they can negatively affect your system.

To open or download email attachments:

1. In the **Event Reconstruction** toolbar, select the **View** drop-down and select **View Mail**.
   The Event Reconstruction is displayed.
2. In the **Event Reconstruction** section of the email, click the Attachment.
   If the file type is supported by the browser, the attachment will open in a new tab.
   If the file type is not supported, the Download dialog is displayed so that you can download the attachment.

Export an Event as a PCAP File

The PCAP export option downloads the sessions for the current time range and drill point to a PCAP file. To export an event as a pcap file:

1. In the **Event Reconstruction** toolbar, click **Actions**.
2. Click **Export PCAP**.
3. A confirmation dialog is displayed.
4. Click **OK**.
   The job is scheduled and when complete the PCAP is downloaded to the local file system. In the Profile > Jobs tab, you can download the PCAP.

Extract Files from a Reconstructed Event

The Extract Files option extracts and downloads the files associated with the event. To extract files:

1. In the **Event Reconstruction** toolbar, click **Actions**.
2. Click **Extract Files**.
   The File Extraction dialog is displayed.
3. Select the types of files to extract, and click **OK**.
4. The job is scheduled and when complete the selected file types are downloaded to the local file system. In the Profile > Jobs tab, you can download the files.

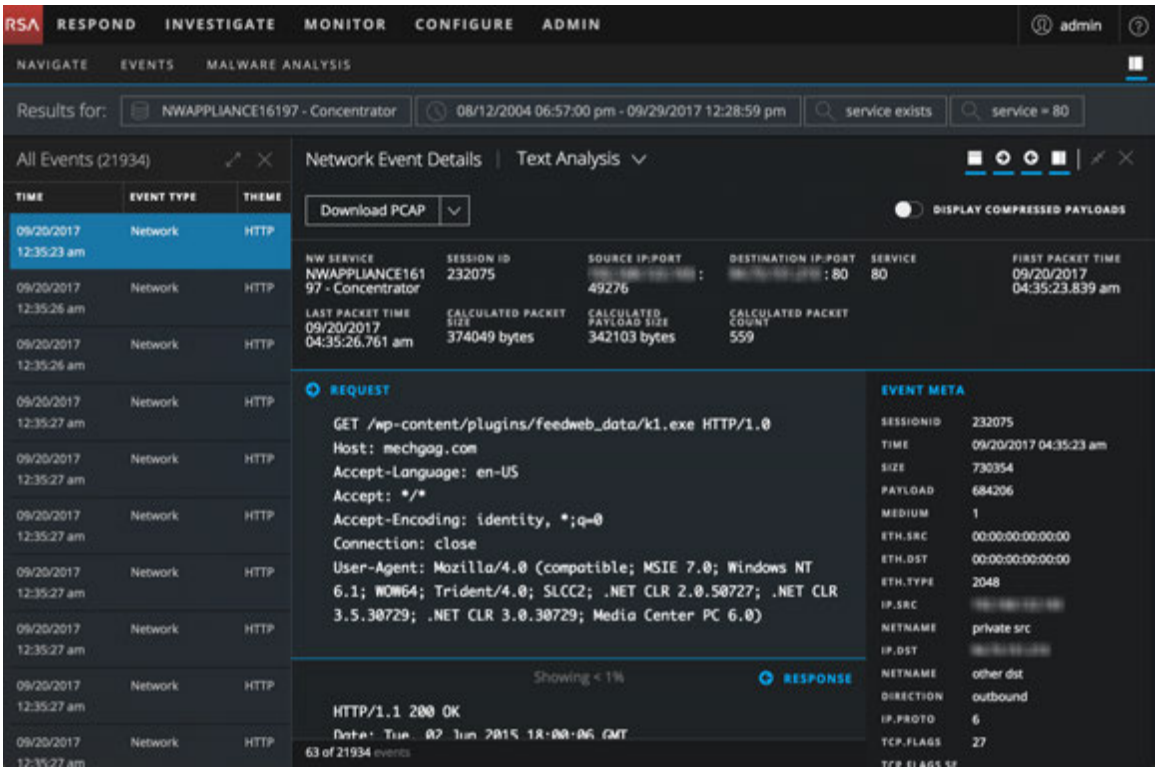
Analyze Events in the Event Analysis View

When hunting for possible threats in captured network data, you can drill into different points of interest in the data. If a particular session contains suspicious events, you can examine the list of events for the session and you can also safely view a reconstruction of the event with features that help to identify patterns. (See Examining Events for the different methods to access the Event Analysis view.) This chapter provides instructions for working in the Event Analysis view.

In the Event Analysis view, you can select the format for the reconstruction: Packet Analysis, File Analysis, or Text Analysis. When the `medium` meta key tags an event as a log event or endpoint event (query as `medium=32`), only the Text Analysis is available. The default reconstruction for network events is Text Analysis; however, for a network event the last reconstruction format that was open overrides the default.

This figure is an example of the Network Event Detail: Packet Analysis panel in a web browser window that is wide enough to display the reconstruction format options in a row.

When the browser window is too narrow to display all the view options horizontally, the options are presented in a drop-down list.



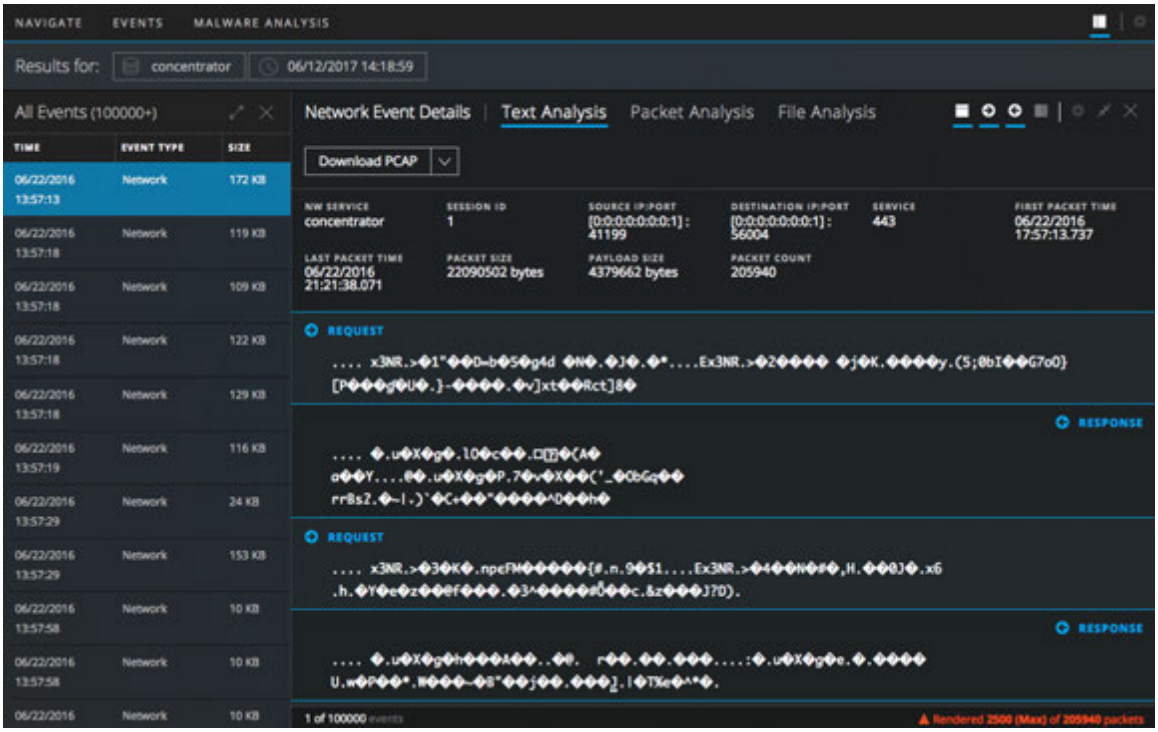
Within each type of analysis, many settings are available to enhance your analysis. If you change a setting, the setting is preserved between browser refreshes and logins within the same browser. These are the preserved settings:

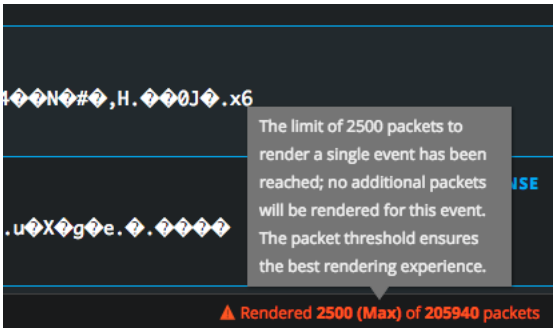
- The currently selected reconstruction: Text Analysis, Packet Analysis, or File Analysis.
- Whether the Event Meta panel is open or closed.
- Whether the Event header is open or closed.
- Whether the Request or Response, or both are displayed.
- Whether packet payloads are displayed in the Packet Analysis panel.
- Whether shaded bytes are displayed in the Packet Analysis panel.
- Whether other common file types are highlighted in the Packet Analysis panel.
- Whether compressed or uncompressed text is displayed in the Text Analysis panel.
- The text decode setting in the Text Analysis panel of a network event.

The Text Analysis Panel

You can view all types of events (network events, log events, and endpoint events) in their original text format in the Text Analysis panel.

The Text Analysis panel for some network events can be quite large. To ensure the best rendering, the number of packets that can be rendered in a single event is limited to 2500. If the Text Analysis panel is not showing all packets, the footer indicates that the limit of 2500 packets has been reached; no additional packets will be rendered for this event. This figure illustrates a reconstruction that has 205940 packets with only 2500 packets rendered; no more packets will be rendered for this reconstruction.





Note: Some network events have a large number of packets but very small payload. In this case, if the entire payload is contained within the first 2500 packets this meets the definition of showing all packets. No message indicating that you are not viewing all of the packets is displayed.

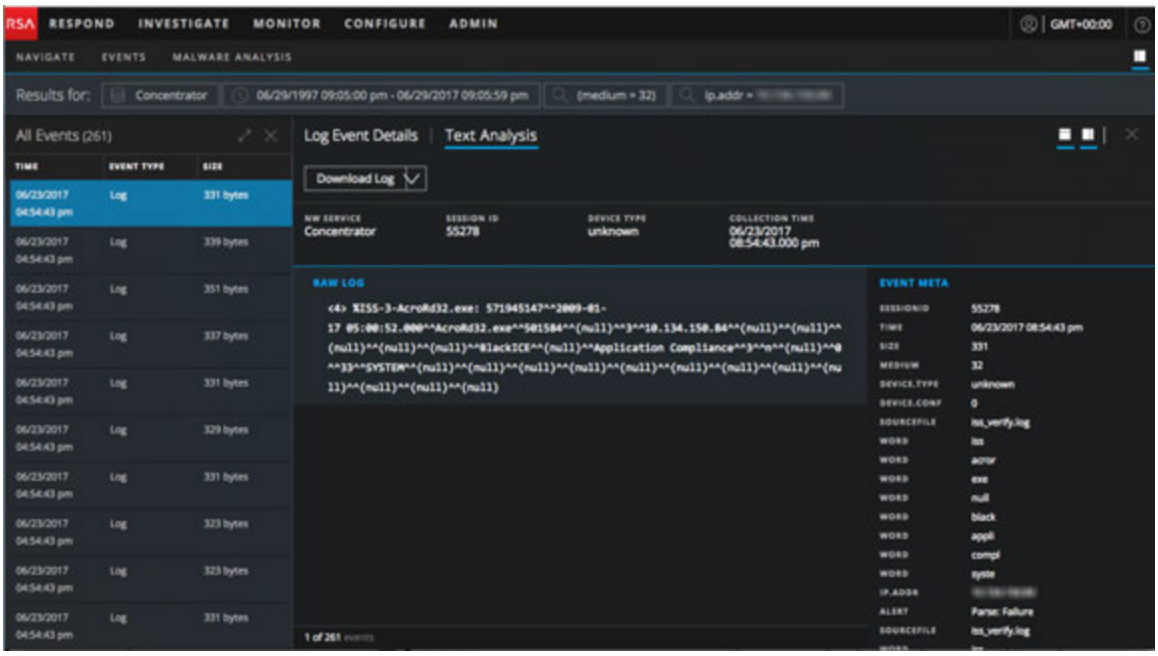
In the Text Analysis panel, network events, log events, and endpoint events are presented differently.

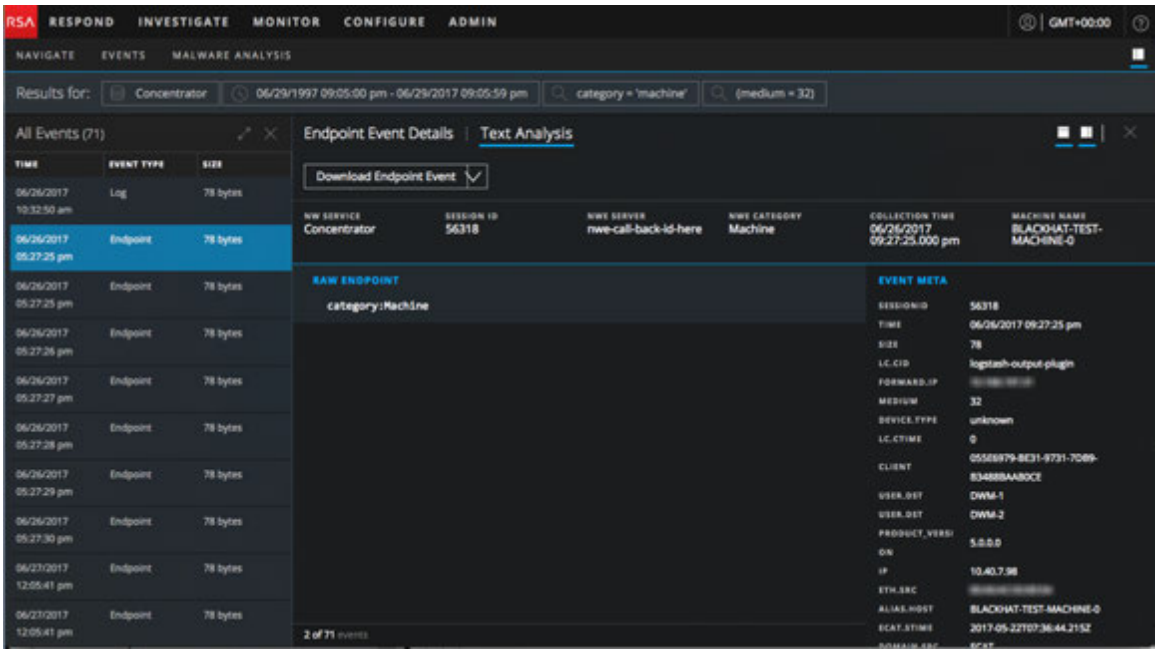
- For network events, Investigate provides the direction of the packet (Request or Response) and contents of each packet in text format. If you are reconstructing a network event, the Text Analysis panel is scrollable. When you scroll, the text identification information as well as the Request and Response labels remain visible rather than scrolling out of view.
- Log events (filter on `medium = 32` and `nwe.callback_id does not exist`) and endpoint events (filter on `medium = 32` and `nwe.callback_id exists`), have no request or response; only the raw event is displayed in the Text Analysis panel.

For each type of event (network, log, or endpoint), there are several differences:

- The Event header includes information relevant to each type of event
- There are different options for exporting.

Below is an example of the Text Analysis panel for each type of event, a network event, a log event, and an endpoint event.

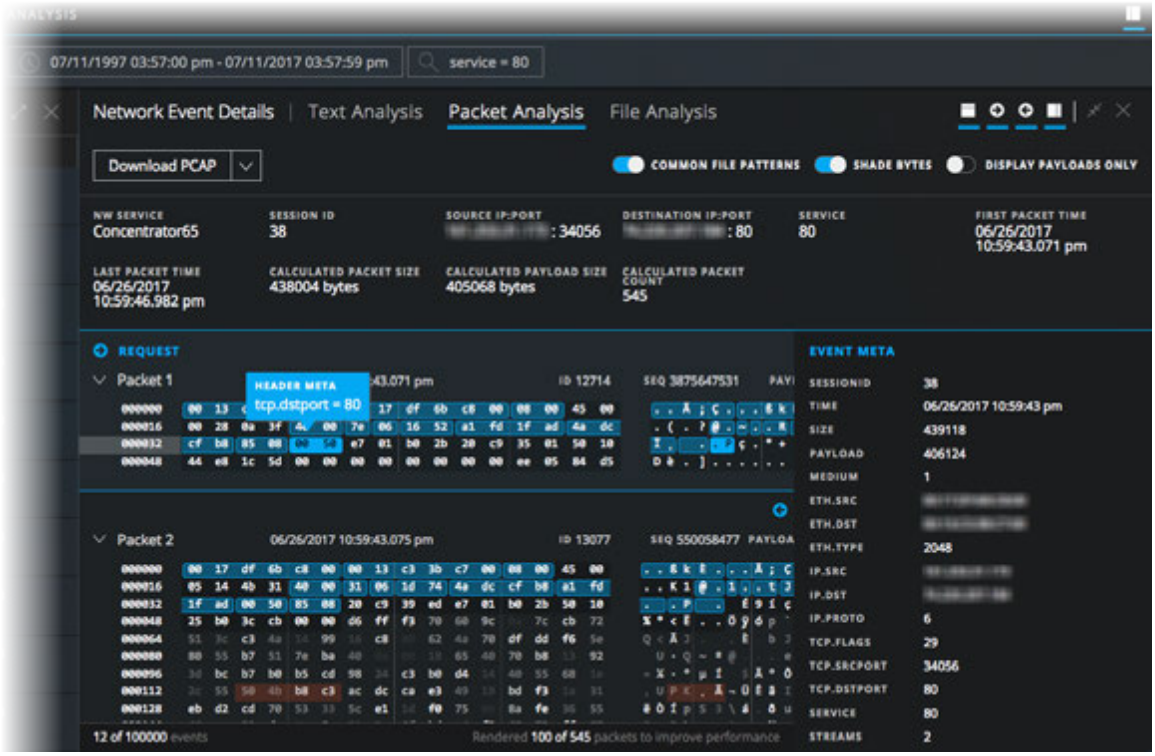




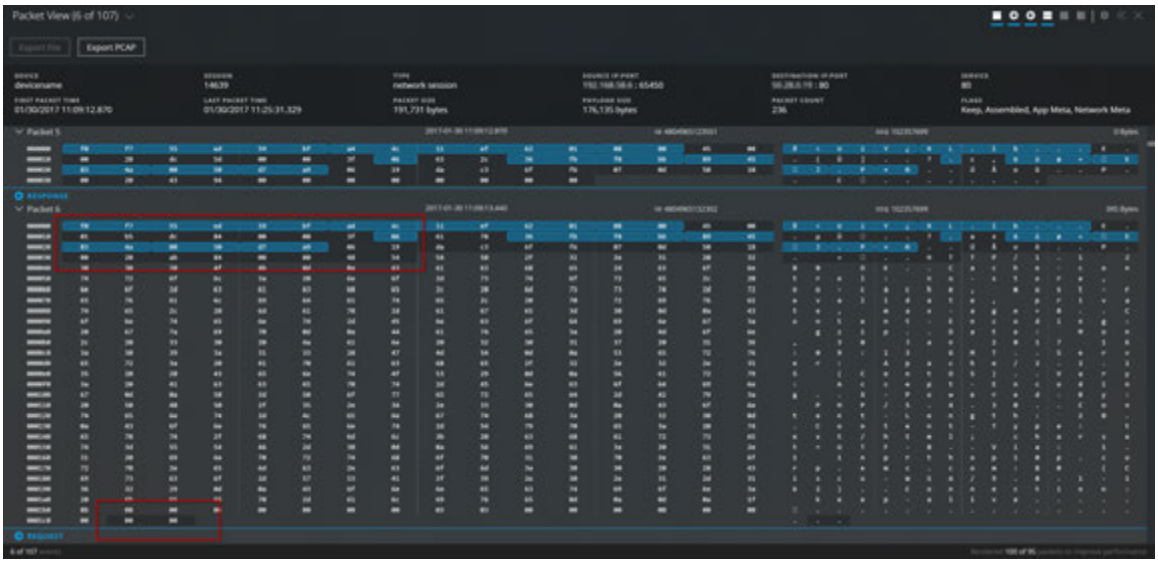
Note: The calculated packet count, calculated packet size, and calculated payload size in the Event header may be different than the same statistics in the Event Meta panel because the metadata is sometimes written before event parsing completes and may include packet duplicates.

The Packet Analysis Panel

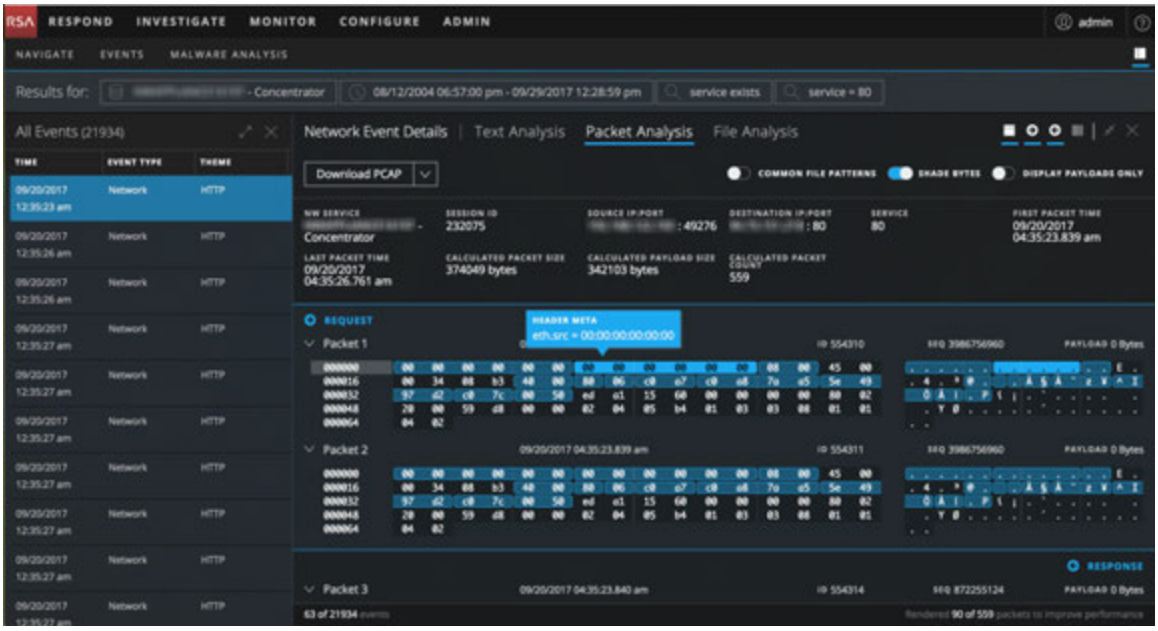
The Packet Analysis panel is for network events only. The Packet Analysis panel is scrollable, and the packet identification information as well as the Request and Response labels remain visible rather than scrolling out of view.



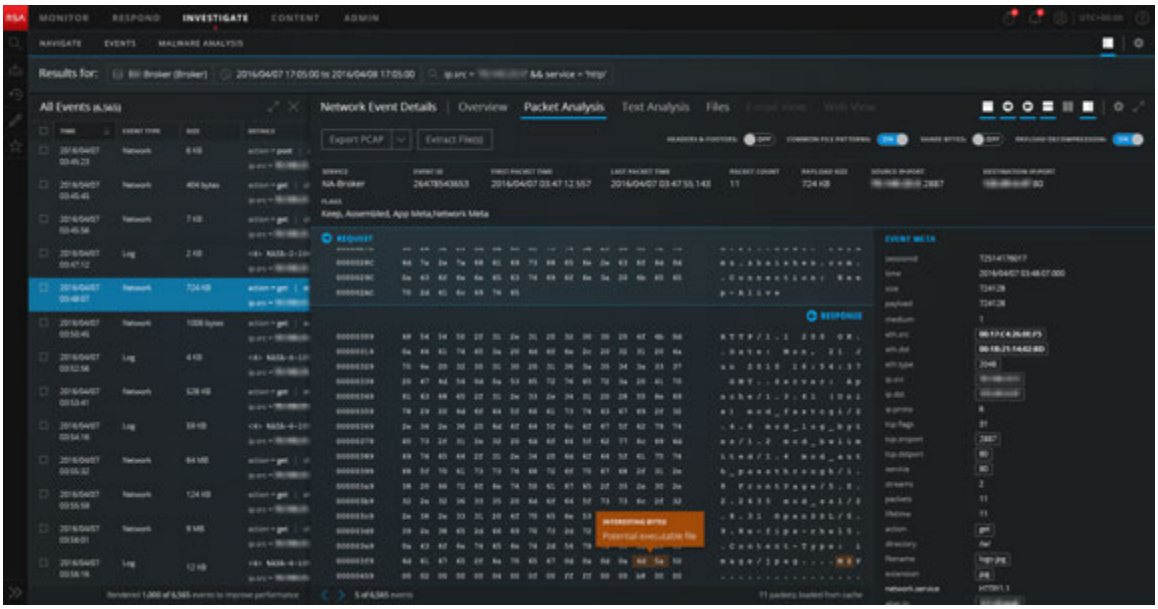
In the Packet Analysis panle, the headings provide the direction of the packet (Request or Response), the packet number, the packet start time, the packet ID and the sequence, and the payload size. All packets begin with a header, and some packets have a footer. Some packets have a payload. In the Packet Analysis, the header and footer have a darker background so that you can distinguish them from the payload of the packet. The darker background for the header and footer appears in both the hexadecimal and ASCII format.



The metadata in the hexadecimal and ASCII data is highlighted in blue; when you place the cursor over the highlighted metadata, the meta key/meta value information is displayed in a hover box.

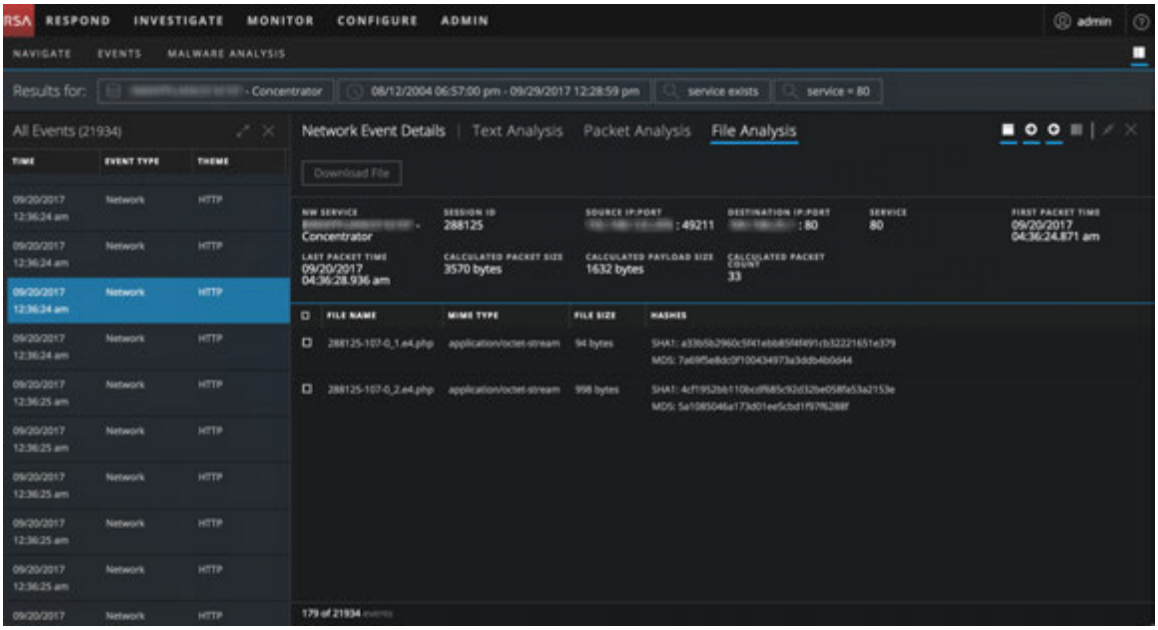


Common file signatures are highlighted with an orange background; when you place the cursor over the highlighted text, the description of the file type is displayed in a hover box.

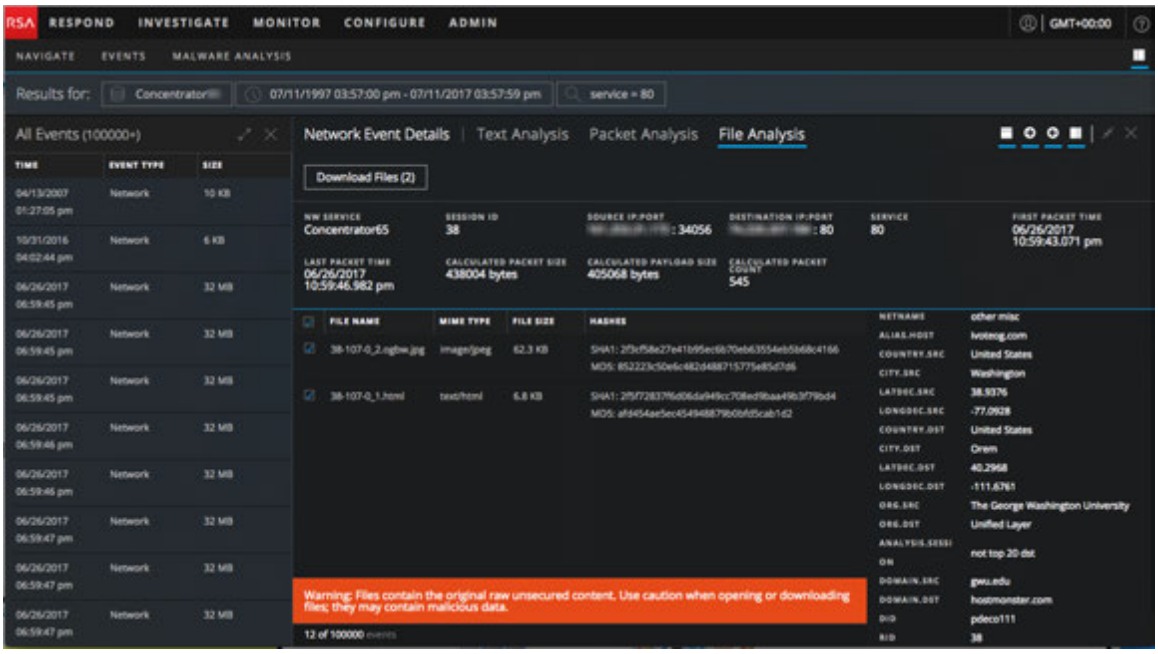


The File Analysis Panel

The File Analysis panel shows a list of files associated with the selected network event. This is an example of the File Analysis panel.



You can select one file, one or more files, or all files to export to your local file system. When files are selected, the Export Files button becomes active and reflects the number of files selected.



Caution: Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

Analytical Tools for Each Type of Event Analysis

The analytical tools in the Event Analysis view are designed to help analysts find the relevant information for different types of events (network event, log event, and endpoint event). This table lists the actions you can take by event type. The rest of this section provides procedures for performing the actions.

Action	Network Event	Log Event	Endpoint Event
View the Text Analysis panel	√	√	√
View the File Analysis panel	√		
View the Packet Analysis panel	√		
Open, close, and adjust the size of panels	√	√	√
Adjust the display of requests and responses	√		

Action	Network Event	Log Event	Endpoint Event
Show or hide the Event Header in the Text Analysis panel	√	√	√
Expand truncated text entries in the Text Analysis panel	√		
Switch between a compressed and decompressed view of payloads in the Text Analysis panel	√		
View highlighted bytes in the Packet Analysis panel	√		
Highlight common file types in the Packet Analysis panel	√		
Display only the payload in the Packet Analysis panel	√		
Shade bytes in the Packet Analysis panel when viewing payload only	√		
Perform URL and Base64 encoding and decoding in the Text Analysis panel	√		
View decompressed text for an HTTP network session in the Text Analysis panel	√		
View event metadata for an event in the Text Analysis panel	√	√	√
Download a network event (as a PCAP file, payload only, request only, or response only) in the Packet Analysis panel or the Text Analysis panel	√		
Export files from a network event in the File Analysis panel	√		
Download the file for a log event in the Text Analysis panel		√	

Action	Network Event	Log Event	Endpoint Event
Download the file for an Endpoint Event in the Text Analysis panel			√
Open the current Endpoint Event in NetWitness Endpoint panel			√

Select the Event Analysis Type

To select the event analysis type for an event, do one of the following:

1. In the **Event Analysis view** toolbar, click the analysis type menu in the top left corner.
2. In the drop-down menu, select the analysis type: **Packet Analysis, File Analysis**, or **Text Analysis**.
   The view is refreshed with the Packet Analysis panel, File Analysis panel, or Text Analysis panel open.

Note: The Packet Analysis panel is only available for network events.

Open, Close, and Adjust the Size of the Panels in the Event Analysis View

The Event Analysis view opens with the event list on the left, and the Network Details, Log Details, or Endpoint Details panel opens on the right. You can click an event in the event list to view a different reconstruction. Initially, the Network Details, Log Details, or Endpoint Details panel occupies 75% of the window width by default.

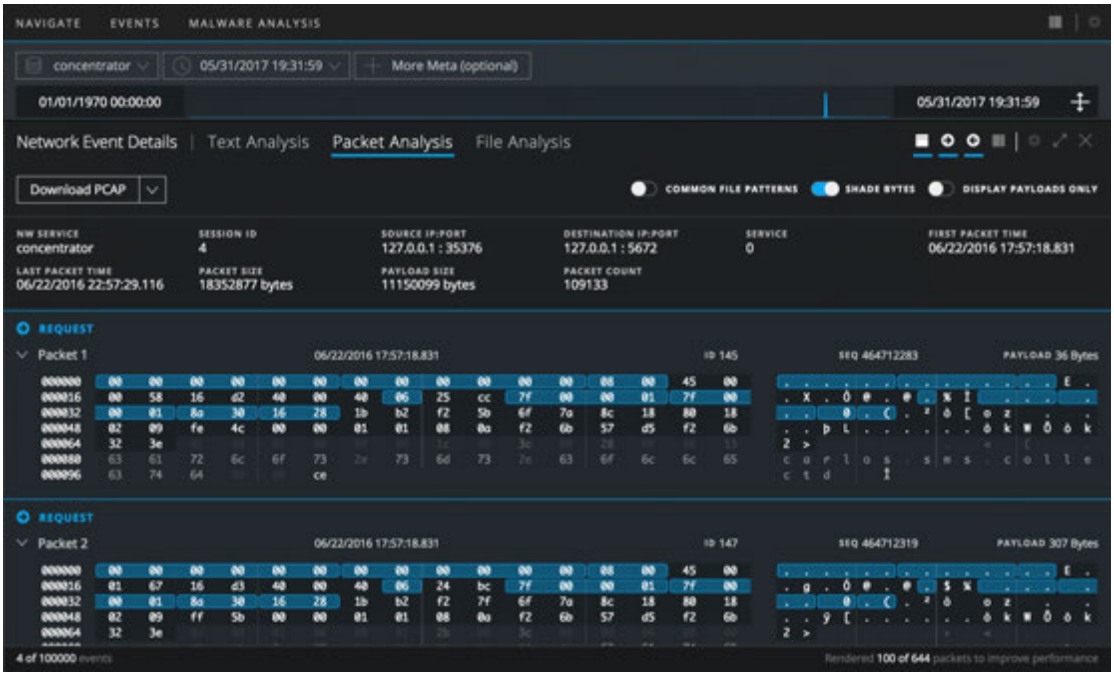
You can adjust the size ratio of the two panels to improve readability by expanding one of the panels, contracting one of the panels, and closing one of the panels. After closing either panel you can reopen it. The ratio you select persists until you change it or refresh the browser.

- To reopen the Events panel, click ◫ in the upper right corner.

To optimize your view:

1. To adjust the size ratio of the two panels, do any of the following:
   a. Click ◪ in the tool bar of the panel that you want to expand.
   b. Click ◪ in the tool bar of the panel that you want to contract.
2. To close either panel, restoring the open panel to its full width, click ■.
   This is an example of the reconstruction displayed using the full width of the browser

window.



3. To reopen the Events panel after closing, click ◫ in the top right corner of the Navigate view.
   The Events panel opens to the last state (25%:75% or 50%:50%).
4. To reopen the Event Details panel, click an event in the Events panel.

Adjust the Display of Requests and Responses

For Event types that have requests and responses in them, you can make several adjustments.

Note: If the analysis type does not have requests and responses, the option is not selectable. The File Analysis panel is an example of a reconstruction type without requests and responses. A reconstructed log event in the Text View is another example.

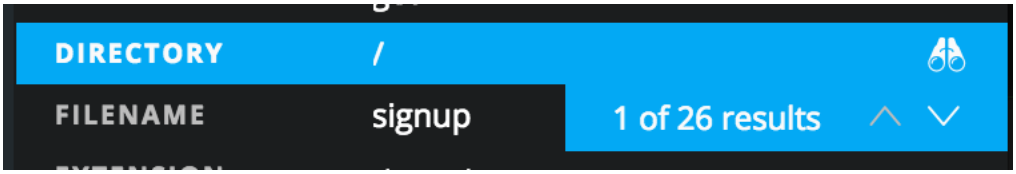
To select which side of the conversation to show--Request, Response, or both--click one or both of the direction icons.  . The reconstruction is refreshed with the selected information.

Note: If you do not see any data, you may have deselected both Request and Response. You must select one of the two to see data displayed.

View Event Metadata for an Event

When examining events in the Text Analysis panel, Packet Analysis panel, or File Analysis panel, you can click  to show the associated metadata in an adjacent panel, the Event Meta panel.

When viewing Text Analysis and the Event Meta panel, hovering over the meta key/meta value pairs reveals a pair of binoculars if the meta value is searchable in the raw text. This is an example of the binoculars icon when hovering over the **Directory** and / meta key/meta value pair.



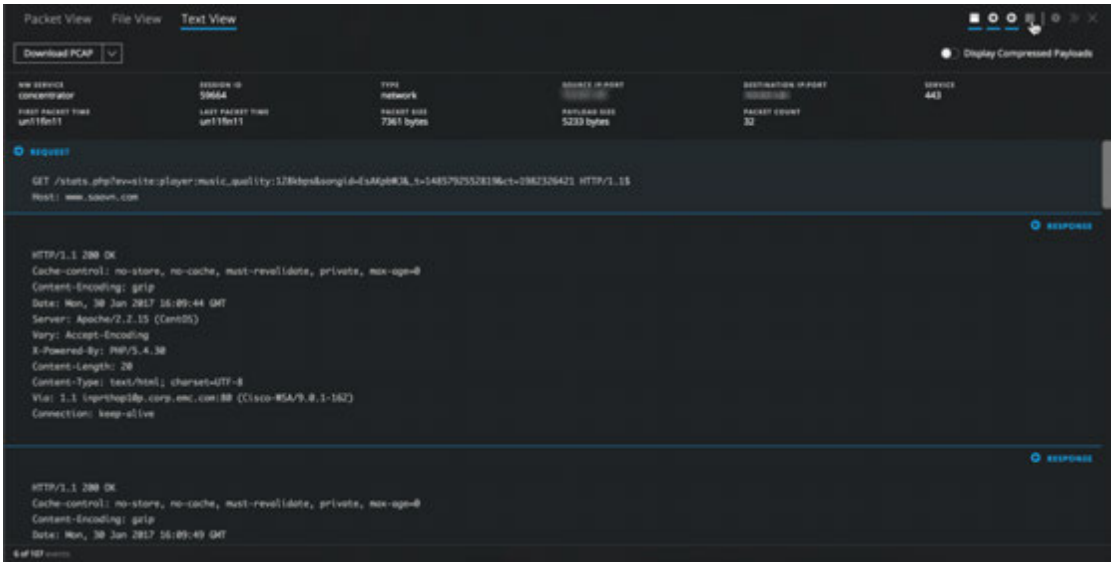
Clicking on the icon triggers a search for the meta key/meta value pair (case-insensitive) in the Text Analysis panel and each instance is highlighted. In the Event Meta panel, the highlighted row has a count of the results and a scroller that you can use to quickly find each result in the Text Analysis panel. You can view each highlighted location of the data that triggered generation of the meta key, going forward to view the next, and back to view the previous.

Only meta keys that have relevant values inside the RAW text are searchable. You can search only one meta key at a time. If the value is currently hidden due to truncation of a text entry with more than 3000 characters, the text entry is expanded to reveal the found meta value.

Clicking on the same meta key/meta value pair or a different meta key:value pair in the Event Meta panel removes the highlighting from the raw text. The highlighting is also removed if you close the Event Meta panel.

To search the raw text for meta values that triggered a meta key:

1. Open a network event in the Text Analysis panel.

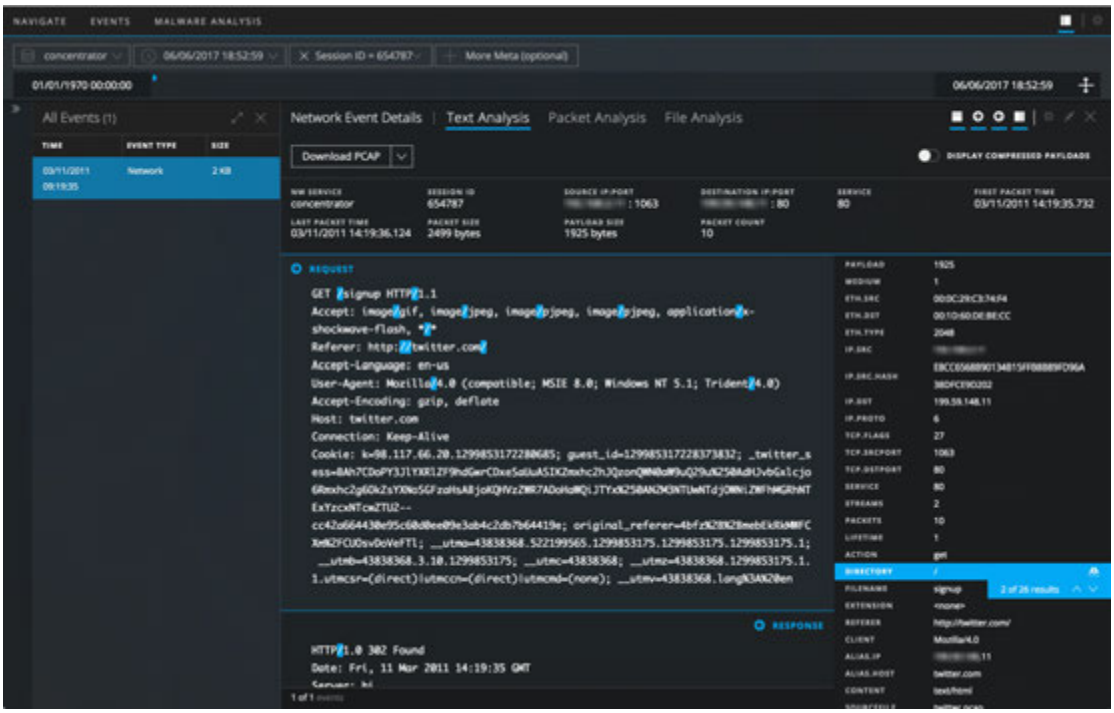


2. In the toolbar, click  to open the Event Meta panel. As you hover over the meta key:value pairs in the list, a binoculars icon identifies values that are searchable in the Text Analysis panel.

3. To search for the value in the raw text, click a row that has the binoculars icon, indicating it is searchable.

   If no relevant occurrence of the value is in the text, the value that you are searching for is highlighted in the Event Meta panel and nothing is highlighted in the Text Analysis panel.

   If one or more relevant instances of the value is found in the Text Analysis panel, each occurrence is highlighted. The value that you are searching for is highlighted in the Event Meta panel and the scroller is visible.



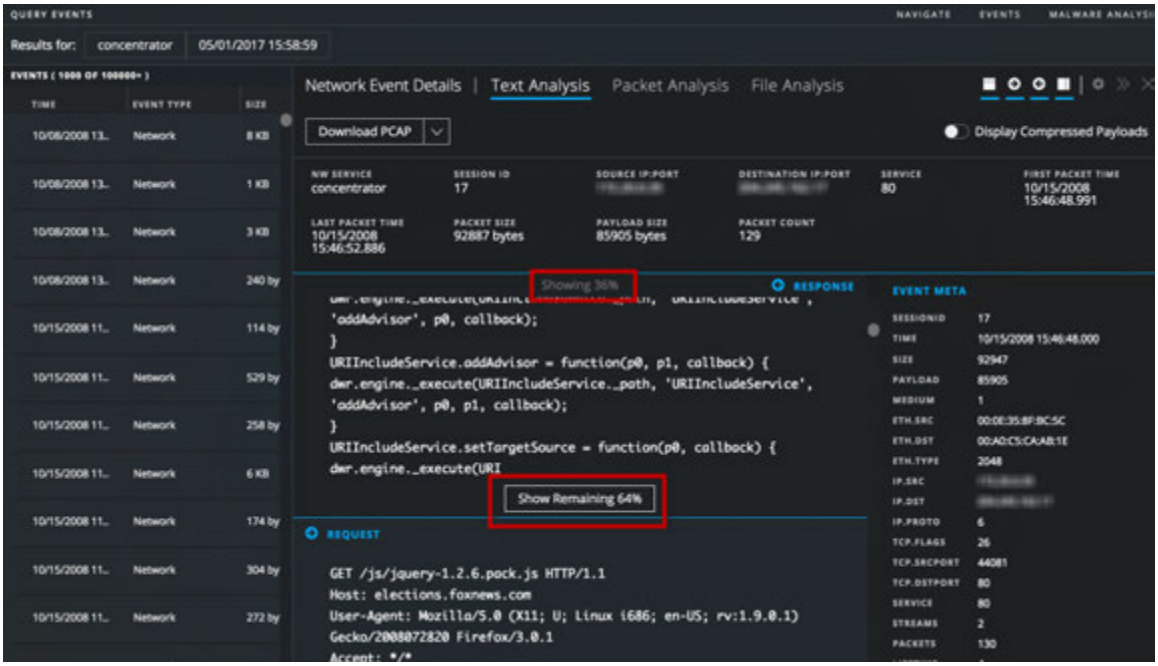
4. To remove the highlighting, close the Event Meta panel, click the same meta key/meta value pair in the Event Meta panel, or click a different meta key/meta value pair in the Event Meta panel.
   The highlighting is removed from the raw text.

Show or Hide the Event Header

To hide the Event Header in the Packet Analysis panel, Text Analysis panel, or File Analysis panel, providing more vertical space for the data, click  .

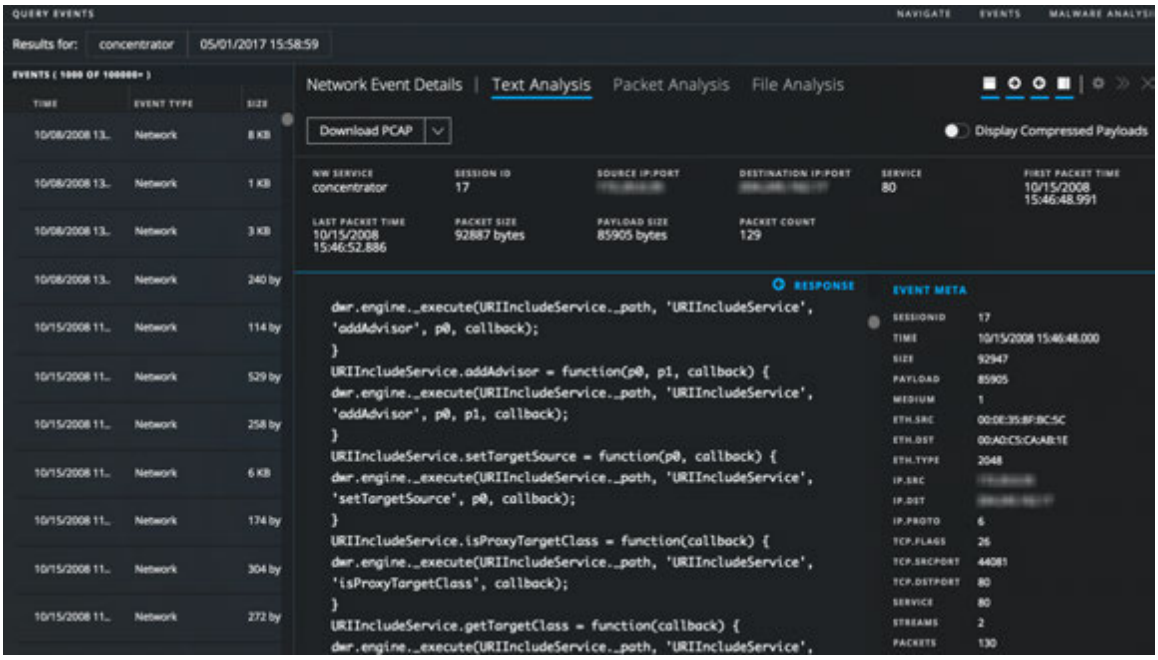
Expand Truncated Text Entries in the Text Analysis Panel

A reconstruction of a network event in the Text Analysis panel may include requests and responses of many hundred thousands of characters and scrolling through a long entry of more than 6000 characters that is not of interest can waste time. To improve the experience for analysts, all text entries that have more than 6000 characters are truncated to show only the first 2000 characters. This example shows an entry that has more than 2000 characters and a message in the header indicates the percentage of total characters that is being displayed.



.

You can see that 36% of the characters (the first 2000) are displayed, and click **Show Remaining 64%** to reveal the rest of the entry.



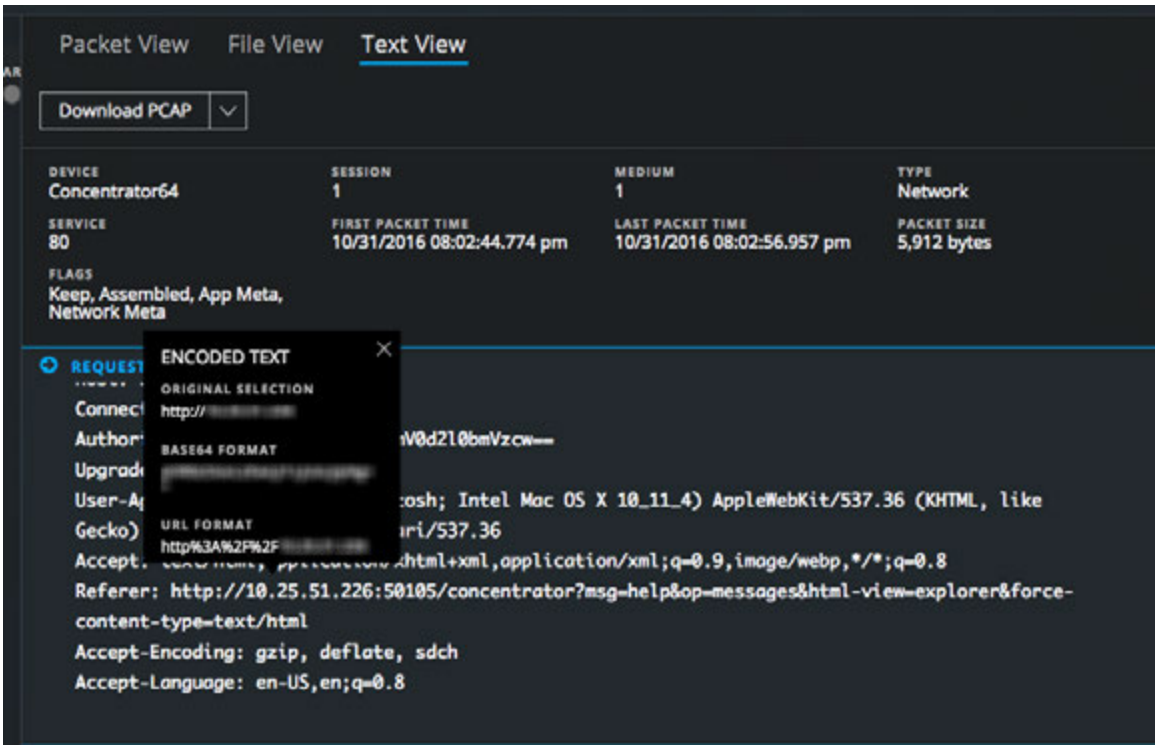
If you search for meta data seen in the Event Meta panel while text is truncated in the Text Analysis panel, the truncated text is searched. If the meta data exists inside hidden text, the text entry expands to reveal the text with the found meta data.

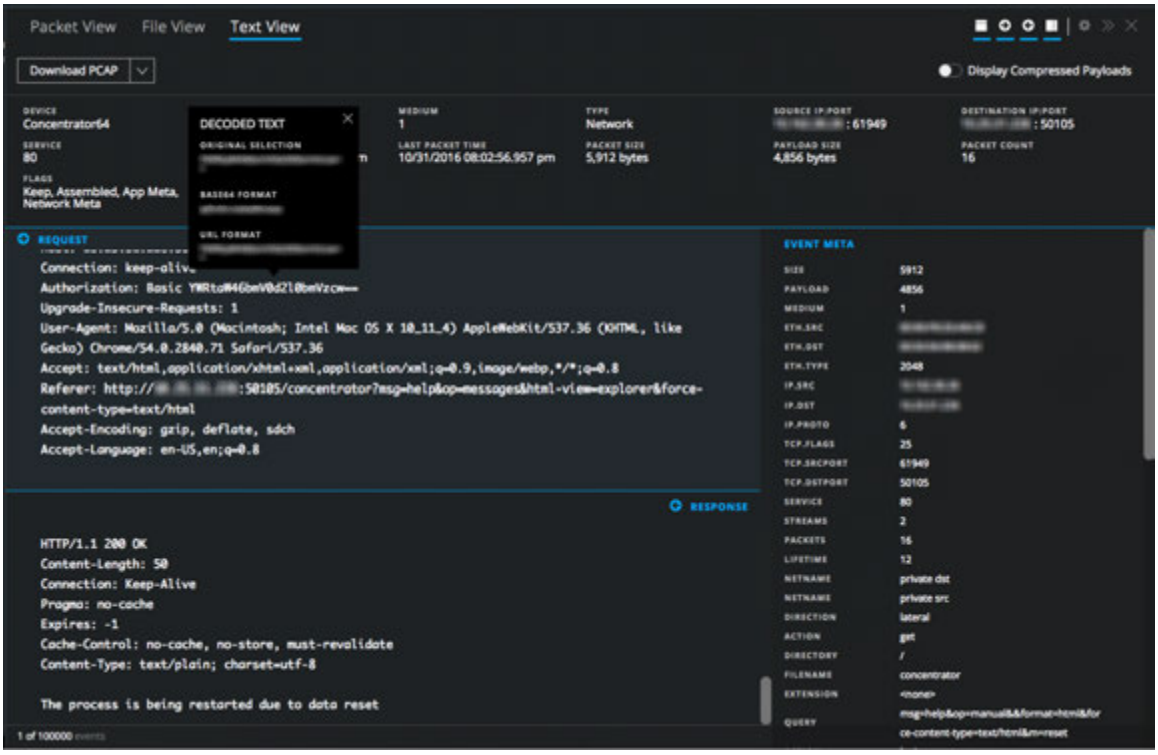
Perform URL and Base64 Encoding and Decoding in the Text Analysis Panel

If a network session being reconstructed in the Text Analysis panel contains Base64 or URL encoded strings, you can decode a string to better understand the session. If the session contains decoded strings for Base64 or URL, you can view a string in its encoded form in order to search for additional instances of the encoded text in other sessions.

When viewing any network session that contains encoded text in the Text Analysis panel, you can select a subset of the text within a single Request or Response to view in either encoded or decoded form. Depending on the content loaded on the Decoder, there may be additional metadata outlining that Base64 or URL encoded data is contained within the session.

Below are examples of a hover box that is displaying URL encoding and Base 64 encoded text.



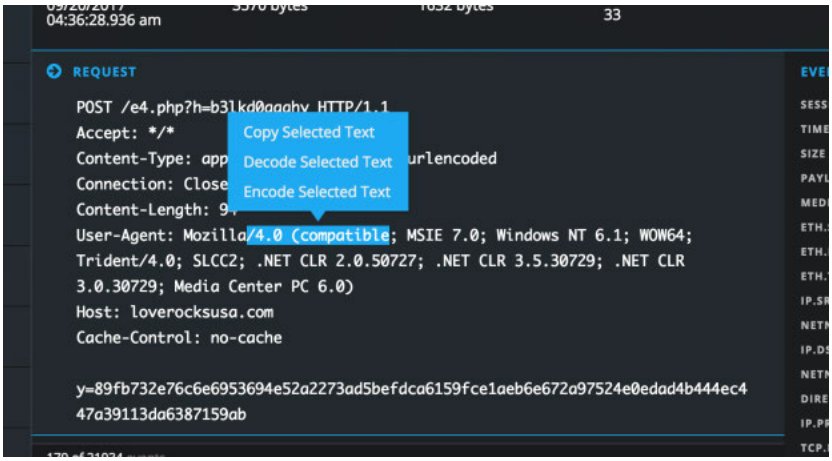


To perform encoding and decoding in the Text Analysis panel:

1. In the **Event Analysis view**, go to the Text Analysis panel of a session that contains encoded or decoded content.

2. To view some decoded text in encoded form, drag to select the text within a single Request or Response.

   A menu offers options to encode and decode.



3. Click **Encode Selected Text.**

   The encoded text is displayed in a hover box, which remains in place until you click the ✕, select different text in the Text Analysis panel, close the Events panel, select another event for reconstruction, or switch to a different reconstruction view.

   When a longer text is selected, the hover box is scrollable and large enough to fit the entire selected text as well as the decoded text.

4. If the session contains encoded text that you want to see in decoded form, drag to select the text within a single Request or Response.

   A menu offers options to encode and decode.

5. Click **Decode Selected Text.**
   The decoded text is displayed in a hover box, which remains in place until you click ■, select different text in the Text Analysis panel, close the Events panel, select another event for reconstruction, or switch to a different reconstruction view.
6. If you want to copy some text from the text reconstruction do one of the following:
   a. Drag to select some text, right-click, and select **Copy Selected Text** from the popup menu.

   b. Drag to select some text, then select either **Decode Selected Text** or **Encode Selected Text**. Within the popup, select the desired text and type **Control-C**.
   The selected text is copied to the clipboard and available to paste in a query.
7. When finished, click ■ to close the hover box.

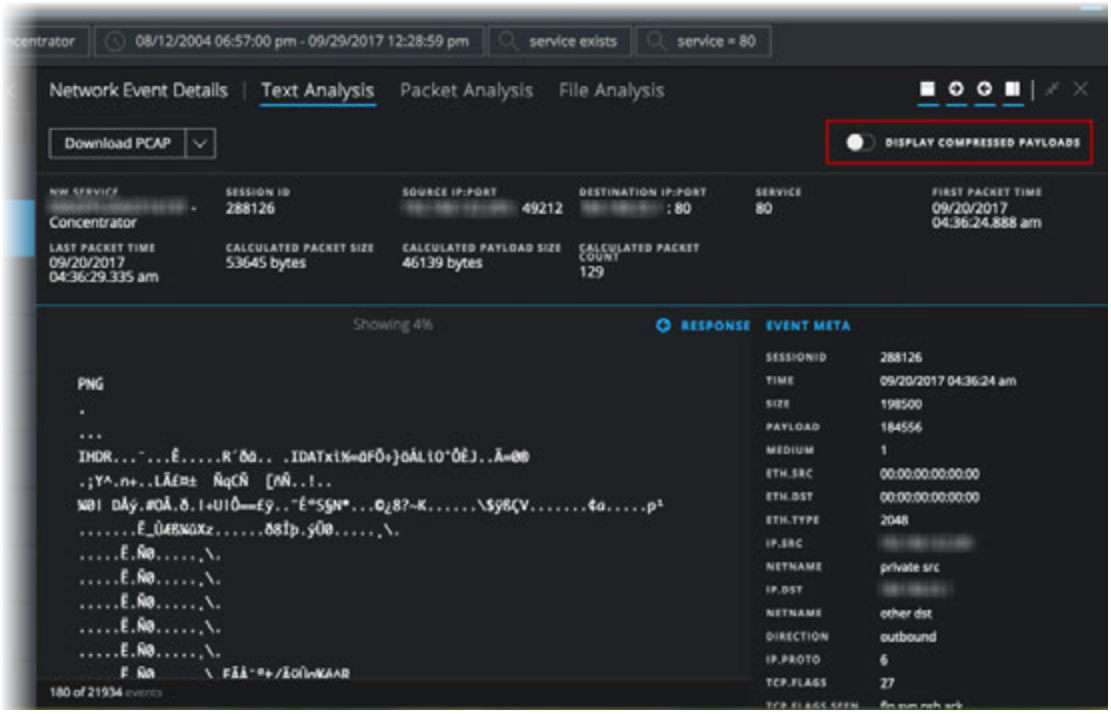
View Decompressed Text in an HTTP Network Session in the Text Analysis Panel

When the content of an HTTP network session is compressed and you are viewing the Text Analysis panel, NetWitness Suite displays decompressed content by default. This helps you to determine if there are any patterns and view the readable characters. You can switch between a compressed and decompressed view of compressed text.

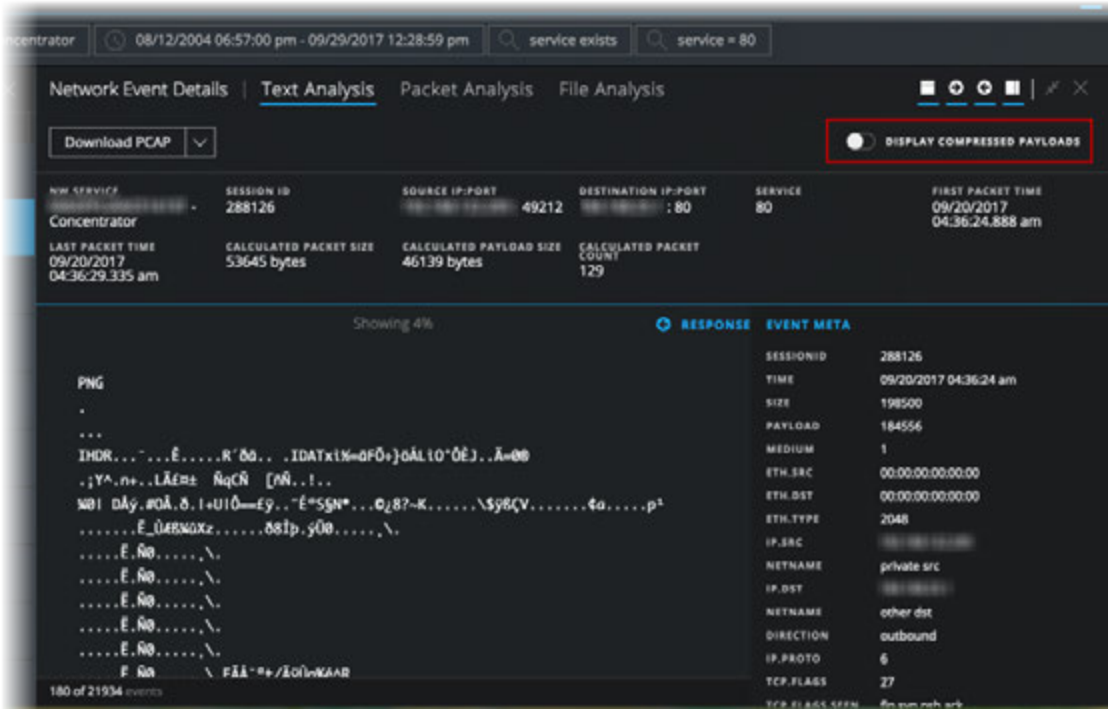
Note: Decompressed text is not available for the Packet Analysis panel, the File Analysis panel, non-HTTP network sessions, and log data.

The toggle for changing between compressed and decompressed text is only displayed in the Text Analysis panel, and is enabled only if there is compressed text content.

1. Open the Text Analysis panel of an HTTP session that contains compressed content.
   By default the session is reconstructed with the text decompressed, and above the reconstruction, is the **Display Compressed Payloads** toggle switch.



2. To view the same text in its compressed form, click the toggle switch.
   The view changes so that the compressed text is no longer readable, and the switch indicates the Display Compressed Packets is on.



3. To return to the view of decompressed text, click the switch again.

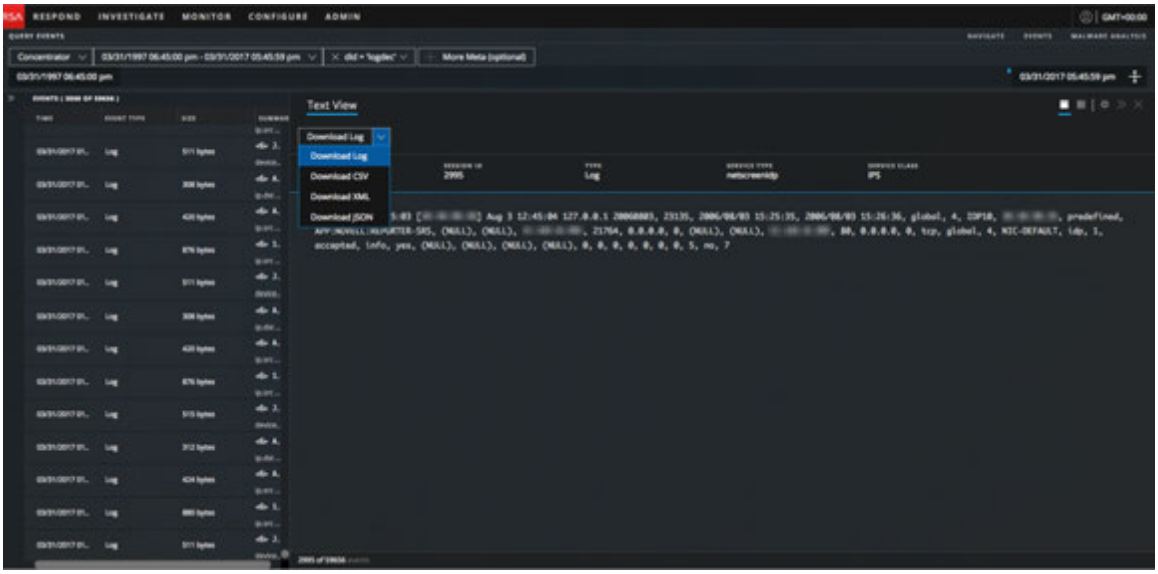
Download a Log in the Text Analysis Panel

When viewing a log reconstruction in the Text Analysis panel, you can download a log file in the following formats using options in the Download Log drop-down menu:

- Raw log (log) using the **Download Log** option
- Comma-separated values (CSV) using the **Download CSV** option
- Extensible Markup Language (XML) using the **Download XML** option
- JavaScript Object Notation (JSON) using the **Download JSON** option

Note: If you initiate a download and move away from the view while the log is being extracted and before the log starts to download, the log is not downloaded in your browser. A message notifies you that you can find the downloaded log in the job queue.

This is an example of a log reconstruction with the Download Log menu options displayed.



The downloaded log file contains the log and is named to help identify the service on which the log was collected, the session ID, and the file type.

Note: Long running or historically downloaded files are not downloadable.

This is an example of the filename for a raw log: **Concentrator_SID2.log**. The exported log file is named using the following convention:

```
<service-ID or host name>_SID<n>.<filetype>
```

where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.

- `SID<n>` is the session ID number.
- `<filetype>` identifies the format of the downloaded log. These are the possible log types: raw log, CSV, XML, and JSON. By default the format is a raw log.

Note: Some formats do not have time stamps or the device IP where the event was generated, so a log downloaded in CSV, XML, or JSON format has an extra value called `timestamp` along with the raw log content. The additional information inside the log is in this form: `Log timestamp="1490824512" source="10.4.30.65"`.

To download the log for a session:

1. In the Text Analysis panel of a log event, select one of the file formats for the downloaded log.
   -To download the log as a raw log (the default format), click **Download Log**.
   -To download the log in one of the other formats, click the downward arrow on the **Download Log** button, and select one of the file formats for the downloaded log.

   The log file is downloaded to your local file system in the format specified.

Download Network Data Files in the Text Analysis Panel or the Packet Analysis Panel

When viewing a reconstructed network event in the Packet Analysis panel or the Text Analysis panel, you can export network data files for further analysis. The download includes events for the current time range and drill point. You can download the data in these forms:

- The entire event as a packet capture (`*.pcap`) file using the **Download PCAP** option.
- The payload as a `*.payload` file using the **Download All Payloads** option.

- The request payload as a `*.payload1` file using the **Download Request Payload** option.
- The response payload as a `*.payload2` file using the **Download Response Payload** option.

This is an example of the filename for a PCAP file: `C01 - Concentrator_SID1697309.pcap`. The exported network data file is named using the following convention:

`<service-ID or host name>_SID<n>.<filetype>`

where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `<filetype>` is pcap, payload, payload1, or payload2.

The network data is downloaded directly into your browser if the download is quick. If the download takes longer due to network factors or file size, the file is downloaded in the background and the task is tracked in the Jobs queue. In this case, you can check your jobs in the queue and get the file when the download is complete.

Note: If you initiate a download and move away from the view while the file is being extracted and before the file starts to download, the file is not downloaded in your browser. A message notifies you that you can find the downloaded document in the job queue.

To export an event as a network data file:

1. Go to the Packet Analysis panel of a network event, and select one of the file formats for the downloaded file.

   -To download the event as a PCAP file (the default format), click **Download PCAP**.

   -To download the event in one of the other formats, click the downward arrow on the **Download PCAP** button, and select one of the file formats for the downloaded event data.

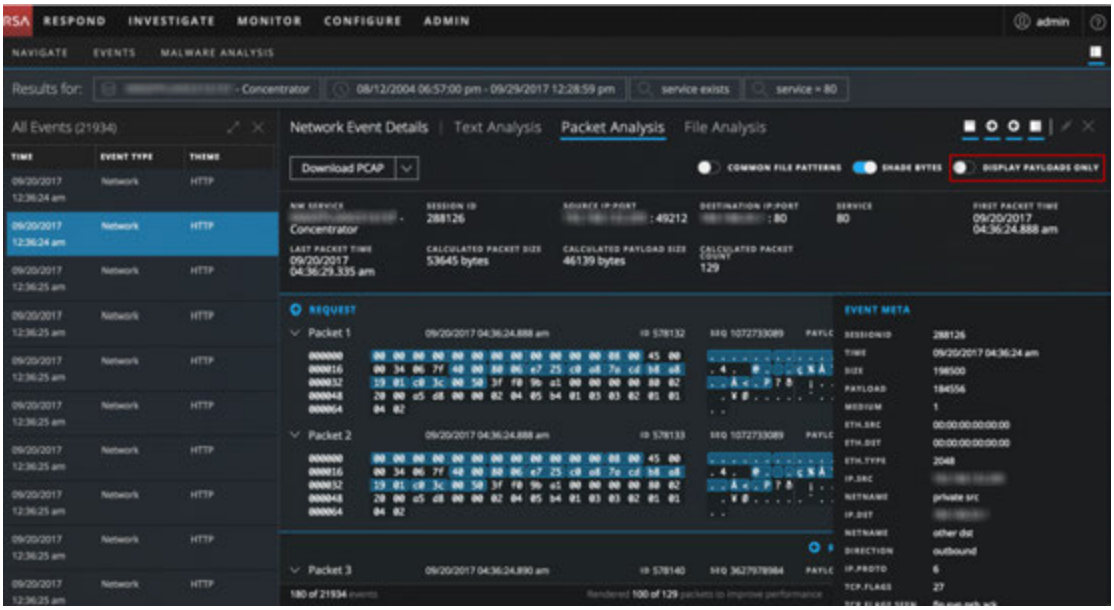
   
   The network data file is downloaded to your local file system in the format specified.

Use the Payload Only Option in the Packet Analysis Panel of a Network Session

When viewing a reconstruction of a network session in the Packet Analysis panel, you can choose to view only the main payload for each packet. By default, packet header and footer bytes are displayed for each packet. You can hide these by clicking the Display Payloads Only toggle switch. If you are viewing only the payload bytes, you can revert to the default setting by setting the Display Payloads Only toggle switch to on. This setting persists until you change it or refresh the browser.

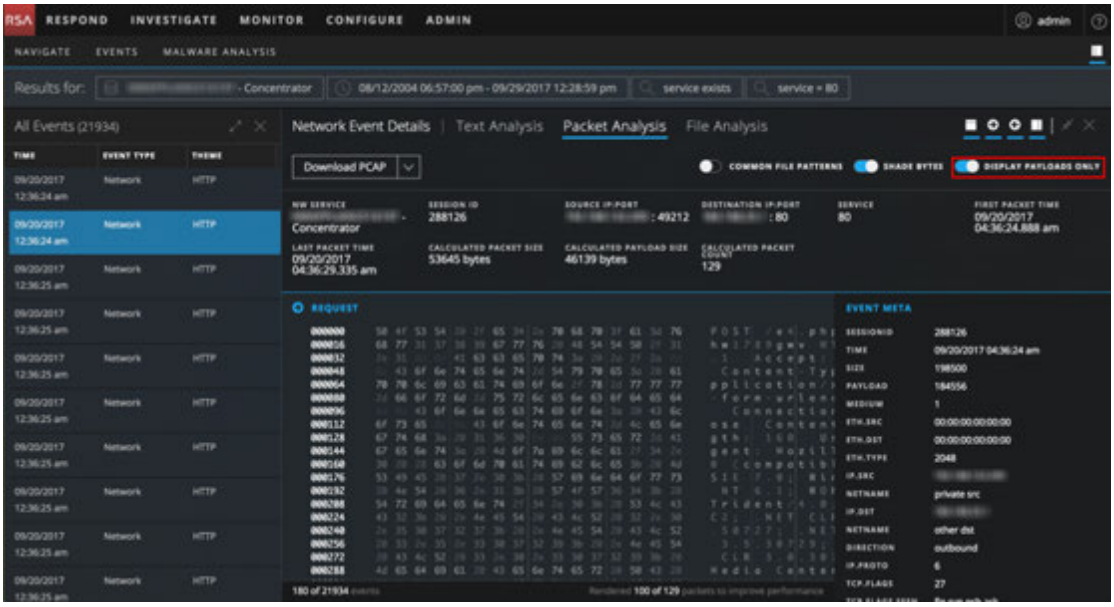
- With the Display Payloads Only option off, the number of packets, packet header, packet footer, and payload are displayed.
- With the Display Payloads Only option on, no packet header and footer bytes are displayed. Only the packet content of 16 hexadecimal bytes per line and the corresponding ASCII per line is displayed.

1. In the **Event Analysis** view, go to the Packet Analysis panel of a network session.
   By default the session is reconstructed with the packet header, footer, and payload displayed.



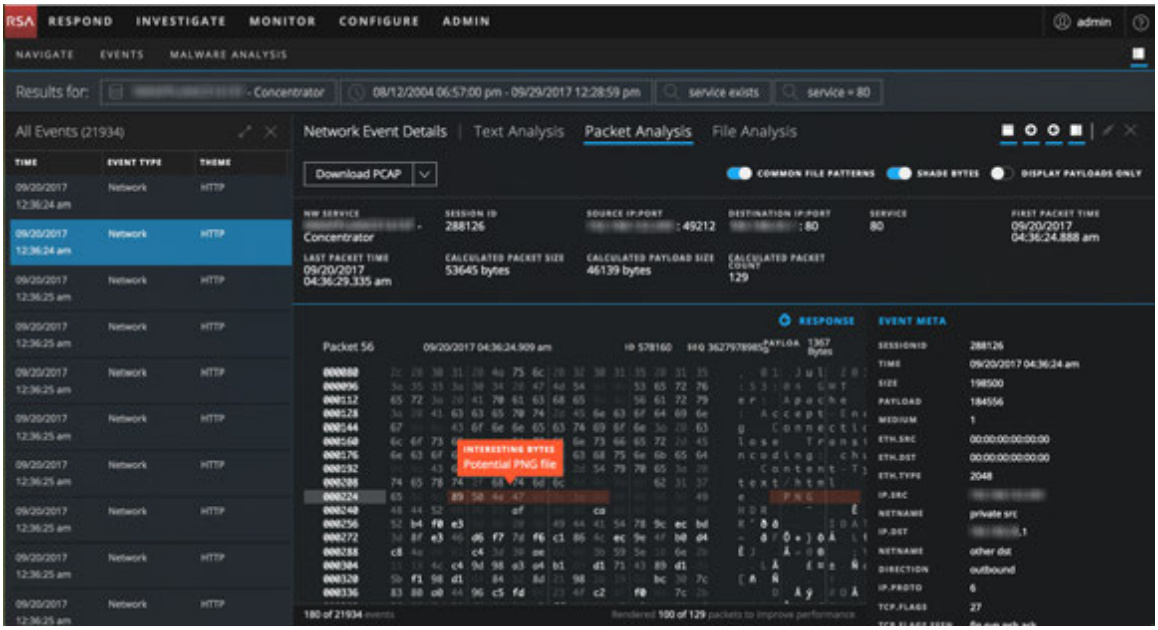
2. To change the view to show only the payload for each packet, click the **Display Payloads Only** toggle switch.
   The view changes to that only the payload is visible and contiguous same-side packets are

concatenated together to make the payload more readable and understandable.

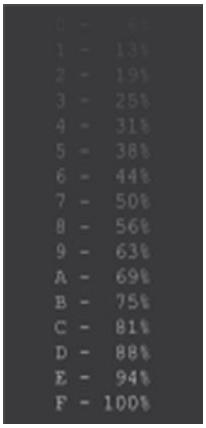


View Highlighted Bytes in the Packet Analysis Panel

When you first open a reconstruction in the Packet Analysis panel, the significant header bytes in each packet are highlighted in blue, and the payload bytes are distinguished using shading to help you understand the contents of the packet. This figure shows the default Packet Analysis with highlighting and byte shading.



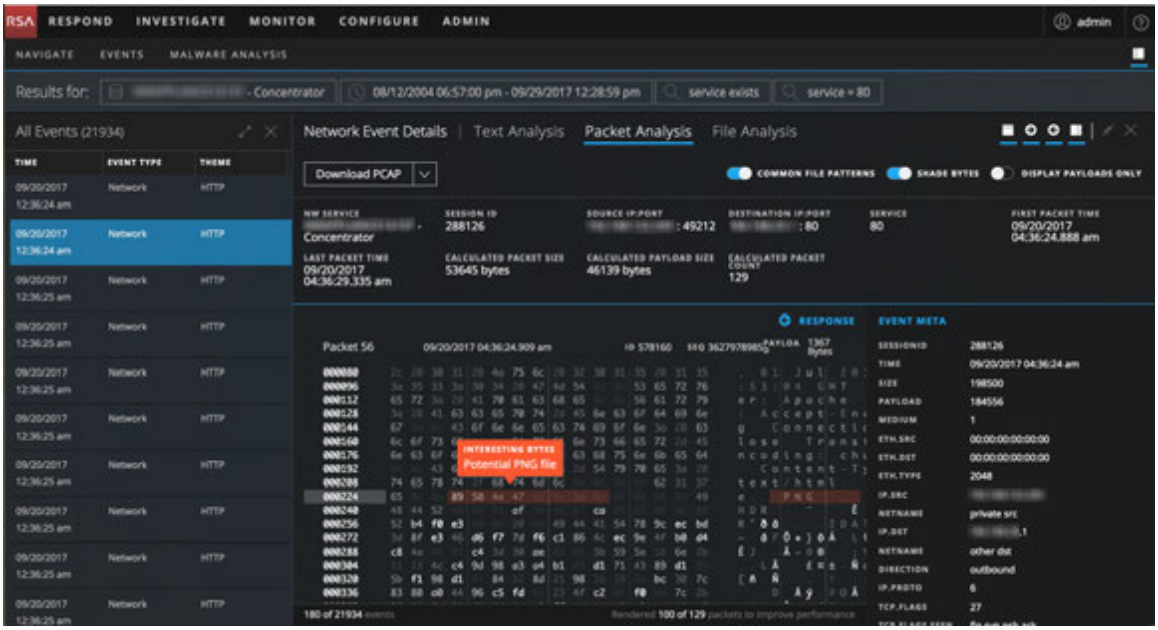
The Shade Bytes option adds shading to identify the different hexadecimal bytes (00 to FF) using degrees of highlighting. Bytes near the lower range are more transparent, and bytes near 255 are more opaque. Both hexadecimal and ASCII bytes are shaded. This is an example of the shading applied to each hexadecimal byte.



The Shade Bytes switch controls the shading of bytes. When you set Shade Bytes on or off, your setting persists until you change it or refresh the browser.

Highlight Common File Types in the Packet Analysis Panel

In the Packet Analysis panel, analysts can show or hide highlighting of certain common file types based on the file signature. When the Common File Patterns feature is turned on, the magic number bytes in the file signature are highlighted in the payload and you can hover over the highlighting to see the potential type of file. In this example, `89 50 4e 47` is highlighted in the hexadecimal payload and `PNG` is highlighted in the ASCII payload. When you hover over the highlighted bytes, the potential file type associated with the magic number is provided in a hover box.



These are the files types and corresponding magic numbers that are highlighted if present in the payload:

File Type	Hexadecimal Signature	ASCII Encoding
DOS Executable / Windows PE	4D 5A	MZ
Portable Network Graphics (PNG)	89 50 4E 47 0D 0A 1A 0A	PNG
JPEG	FF D8 FF	JPEG
JPEG/JFIF	4A 46 49 46	JFIF
JPEG/Exif	45 78 69 66	Exif
GIF	47 49 46 38 37 61	GIF87a
GIF	47 49 46 38 39 61	GIF89a
Non-portable Executable	5A 4D	ZM
BMP	42 4D	BM
PDF	25 50 44 46	%PDF
Old Office Document (doc, xls, ppt, msg, and other)	D0 CF 11 E0 A1 B1 1A E1	ÐÏ.à¡±.á
ZIP file formats and formats based on it, such as JAR, ODF, OOXML	50 4B	PK..
7-Zip File Format (7z)	37 7A BC AF 27 1C	7z¼¯'
Java Class File, Mach-O Fat Binary	CA FE BA BE	Êþº¾
Postscript	25 21 50 53	%!PS
Unix/Linux Shell script	23 21	#!
Executable and Linkable Format (ELF) executables	7F 45 4C 46	.ELF

To view common file signatures in the Packet Analysis panel:

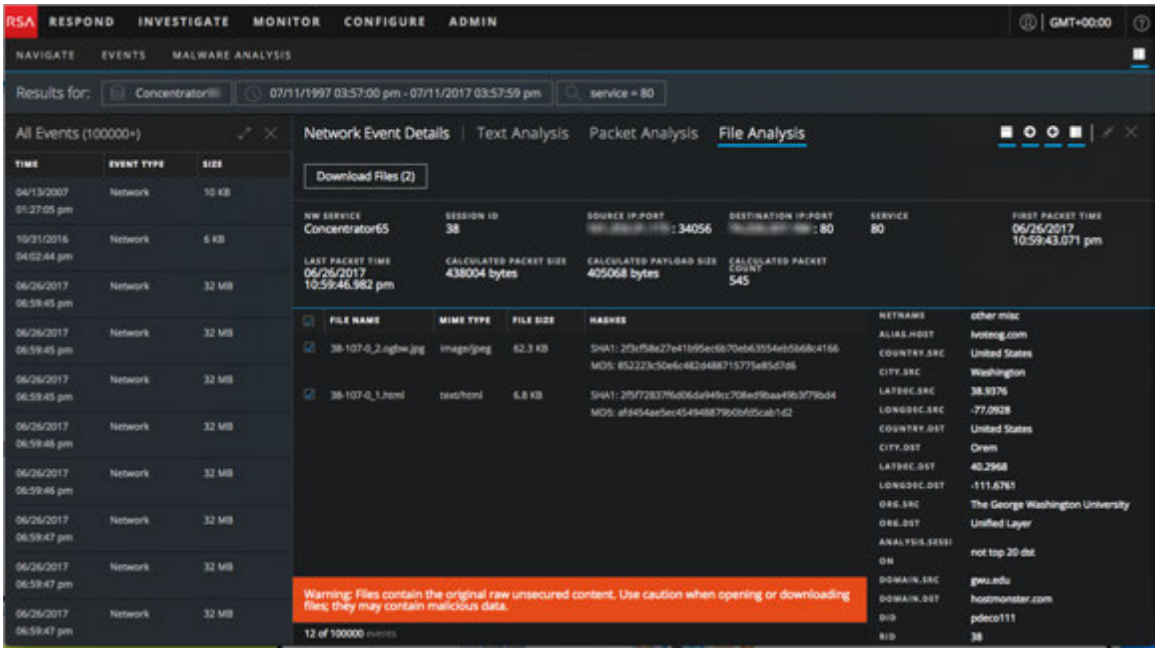
1. Navigate to Packet Analysis panel, and turn on the **Common File Patterns** option.
   If there is more then one highlight in view, all are shown.
2. To view the hover box, place the cursor over the highlighting.

Download Files from a Network Event in the File Analysis Panel

When viewing reconstructed network events that contain files in the File Analysis panel, you can select one file, one or more files, or all files to download to your local file system.

Note: If you initiate a download and move away from the view while the file is being extracted and before the file starts to download, the file is not downloaded in your browser. A message notifies you that you can find the downloaded file in the job queue.

When files are selected, the Download Files button becomes active and reflects the number of files selected.



Clicking the button exports the selected files as a password-protected zip archive. The password to open the exported archive is `netwitness`. Exporting the files in this form ensures that:

- The archive is not quarantined by antivirus software.
- Potentially malicious files are not automatically opened by the default application and executed.

This is an example of the filename for an archive: `C01 - Concentrator_SID1697309_FC1.zip`. The exported archive is named using the following convention:

`<service-ID or host name>_SID<n>_FC<n>.zip`

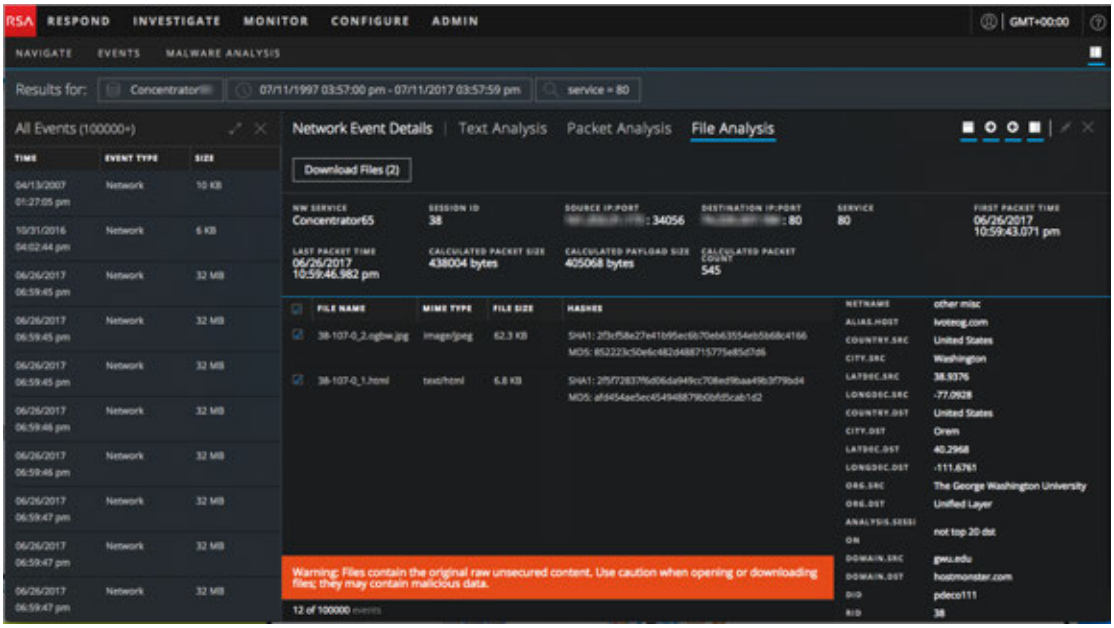
where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `FC<n>` is the file count or number of files in the archive.

Caution: Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

To export files in a reconstructed event:

1. In the **Event Analysis** view, go to the File Analysis panel of an event that contains files.



2. Click one or more files that you want to extract, and click **Download Files**.
   The job is scheduled and when complete the selected file are downloaded, in the form of a password-protected zip archive, to the local file system.
3. To open the archive on your local file system, enter the following password when prompted: `netwitness`.

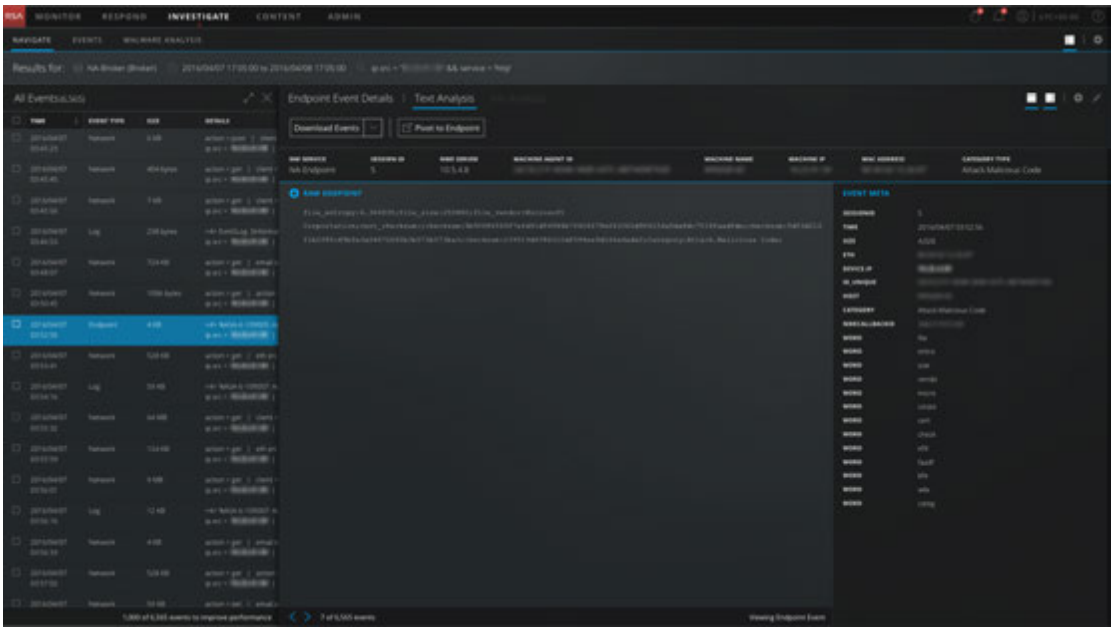
Open an Endpoint Event in the NetWitness Endpoint Application

When viewing an endpoint event in the Text Analysis panel, you can pivot to analyze the same event in NetWitness Endpoint.

Note: Version 4.4 of the NetWitness Endpoint Thick Client must be installed on the same server, the NWE meta keys must exist in the `table-map.xml` file on the Log Decoder, and the NWE meta keys must exist in the `index-concentrator-custom.xml` file. The NWE Thick Client is a Windows only application. Complete setup instructions are provided in the *NetWitness Endpoint User Guide* for Version 4.4.

To open an event in NetWitness Endpoint:

1. To search for endpoint events, select **Query** in the Navigate view tool bar.
2. In the **Query** dialog, select **Advanced**, and enter one of the following queries:
   `nwe.callback_id exists` or `device.type='nwendpoint'`
   Endpoint data is displayed in the Values panel.
3. Right-click an event, and select **Event Analysis** in the context menu.
   The Event Analysis opens with the selected event displayed in the Text Analysis.



4. In the Event Header click **Pivot to Endpoint.**
   A new browser tab with the url `ecatui://<id>` opens and the NWE Thick Client is launched .

Add Events to an Incident for Response

When conducting an investigation in the Events view, you can select one or more events and create an incident that is available for incident responders in Respond. You can also add events to an existing incident in Respond to which you have access.

Note: An administrator must configure the required roles and permissions as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

1. Navigate to the Events view using one of the methods described in Examining Events.
2. In the Events view, select one or more events, and then **Incidents > Create New Incident**.

3. Complete the information in the Create an Incident dialog.

   a. Select the severity, an integer between 1 and 100, with 100 being the most severe.
   b. Type a name for the incident and describe the incident in the **Summary** field.
   c. Select an assignee for the incident from the drop-down list. This list includes the built-in roles that have access to Respond as well as any custom roles that have been added to your system. For example, this list might include roles for admin, analyst, dpo, operator and roles for incident responsers.
   d. From the **Categories** drop-down list, select one of more categories of alerts that apply to this incident.
   e. From the **Priorities** drop-down list, select a category for the incident. For example, an incident may be critical, high, medium, or low priority.

f. Click **Save**.
The new incident is created and is available immediately in the incident queues for the selected role in Respond.

4. To add one or more events in the Events view to an incident, select one or more events, and then **Incidents > Add to Existing Incident**.
5. In the Add Events to an Incident dialog, select the severity, and select one or more incidents to which the events will be added. You can Search for an existing incident by Incident-ID or Incident Name. When ready, click **Add to Incident**.
The events are added to the selected incidents and updated in Respond.

Export Events

In the Events view, the Actions menu has an option to export events from the event being viewed to an archive.

Note: You can only export files that you have permission to view or access.

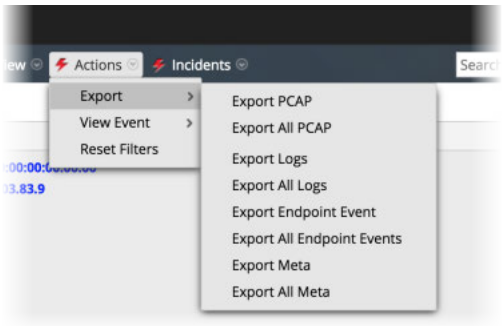
The export function queries the service for all sessions inside the selected time range and drill point to extract the content of each session. The details being exported are affected by both the time range and drill point at the time of exporting. In the File Extraction dialog, you can choose to export:

- PCAPs
- Logs
- NetWitness Endpoint event
- Meta values

The format of the exported archive: ZIP or GZIP file. After you send the request, a job is scheduled and you can track the job in in the Jobs tray. If there is an error retrieving the log or PCAP from the service, NetWitness Suite displays an error notification.

To extract files from an event:

1. While in the **Event view**, click an event.
2. Click **Actions > Export.**.



3. Select the export option.

   A message informs you that the PCAP is being downloaded.

Conducting Malware Analysis

Analysts can use the RSA NetWitness Suite Malware Analysis service to detect malware in selected data and files.

Analysts who conduct analyses using NetWitness Suite Malware Analysis need to have the appropriate system roles and permissions set up for their user accounts. See .Roles and Permissions for Malware Analysts.

The following procedures provide instructions for using Malware Analysis:

- Begin a Malware Analysis Investigation.
- Upload Files for Malware Analysis Scanning.
- Implement Custom YARA Content.
- Filter Dashlet Data in the Summary of Events View.
- Examine Scan Files and Events in List Form
- View Detailed Malware Analysis of an Event.

Begin a Malware Analysis Investigation

You can investigate data that has been scanned, flagged, and rated by Malware Analysis as containing Indicators of Compromise. This includes all types of Malware Analysis scans: continuous mode polling, on-demand polling, and on-demand uploaded files. Continuous mode polling must be enabled when the administrator configures basic settings for the Malware Analysis service.

NetWitness Suite provides several methods of launching a Malware Analysis investigation.

Fastest: Instant Launch from Malware Analysis Dashlets

The fastest way to begin a Malware Analysis investigation is an Instant launch from the NetWitness Suite Dashboard using one of the Malware Analysis dashlets that lists events or files that are likely to contain malware. The dashlets are described as part of the RSA NetWitness Content in Dashlets. From one of these dashlets, you can go directly to the Analysis Results for a specific event that has been listed as worthy of investigation:

- Top Listing of Highly Suspicious Malware
- Top Listing of Possible Zero Day Malware
- Malware with High Confidence IOCs and High Scores Dashlet

On-Demand Polling from a Meta Value in the Navigate View

You can initiate on-demand polling from within an investigation by right-clicking a meta value in the Navigate view, and choosing an option from the context menu. When polling is complete, the scanned data is available for malware analysis (see Launch a Malware Analysis Scan from the Navigate View).

Investigate a Specific RSA Service

You can also begin a Malware Analysis investigation of a service in the Investigate > Malware Analysis view. For Malware Analysis investigation on a service basis, a service must be specified in the Investigate > Malware Analysis view:Inve

1. Investigate opens the Malware Analysis view with the user-specified default service selected.
2. If no default service is currently specified, a dialog allows you to select the Malware Analysis service to investigate.
3. When a service has been selected in the Malware Analysis view, the Summary of Events for the selected service and continuous scan data for the service is displayed.

This topic provides instructions for all methods of launching a Malware Analysis investigation.

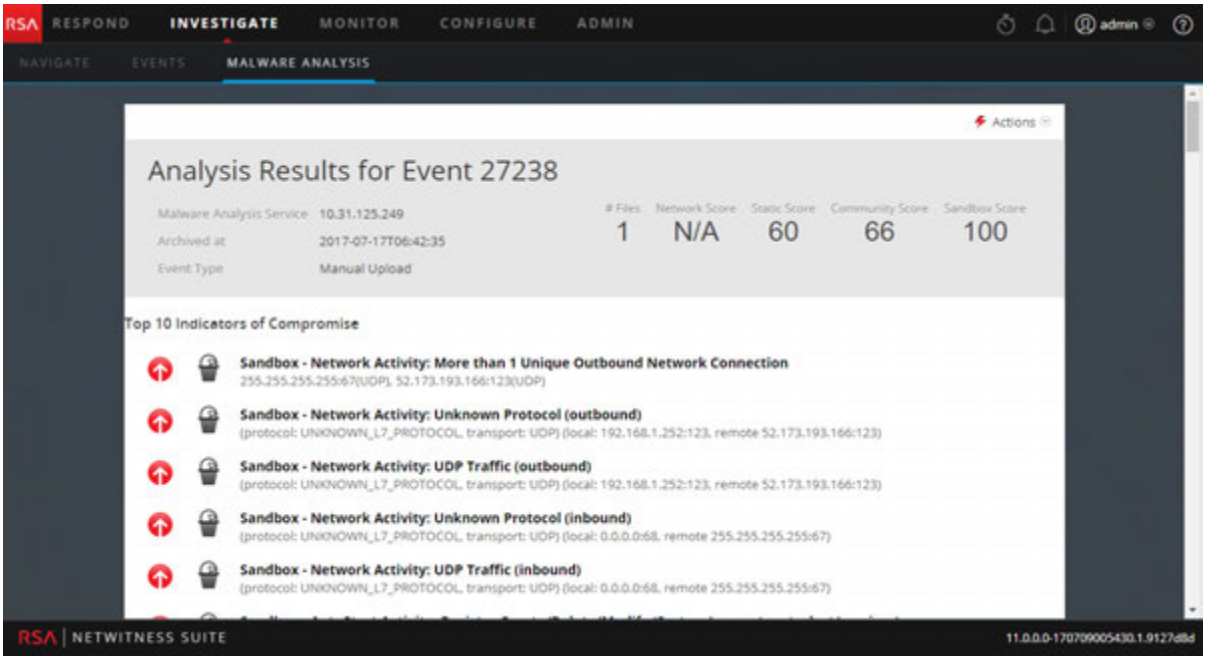
Launch a Malware Investigation from a Malware Analysis Dashlet

A prerequisite for this procedure is that one of the following dashlets must be visible in the NetWitness Suite dashboard or in the Malware Analysis view, and must be populated with listed events or files. If you do not see the dashlets, add them and configure the dashlets.

- Top Listing of Highly Suspicious Malware
- Top Listing of Possible Zero Day Malware
- Malware with High Confidence IOCs and High Scores Dashlet

To launch a Malware Analysis investigation from a dashlet:

1. Log in to NetWitness Suite and look for one of the above dashlets in the Monitor view or in the Malware Analysis view
2. In the dashlet, double-click an event or file for deeper analysis. A detailed analysis of the event in the Events List or the event with which the file in the File List is associated is displayed in the Malware Analysis view.



To learn more about configuring the Malware Analysis dashlets in the Monitor dashboard, see "Dashlets" in the *Getting Started with NetWitness Suite Guide*.

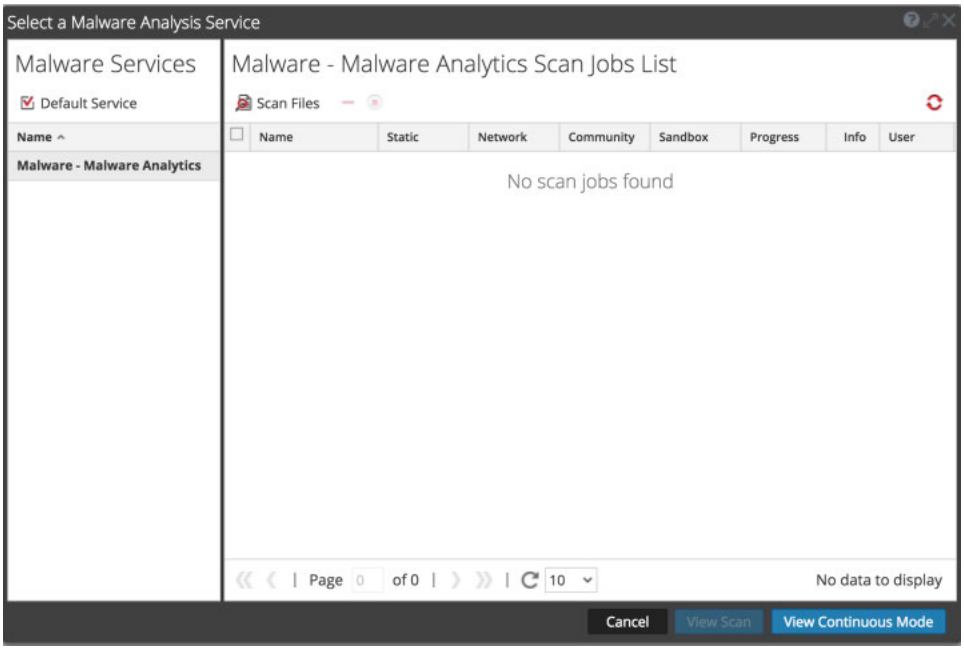
To learn about the ways you can configure and filter information in dashlets in the Malware Analysis view, refer to Filter Dashlet Data in the Summary of Events View.

To learn about the actions you can perform in the Analysis Results, refer to View Detailed Malware Analysis of an Event.

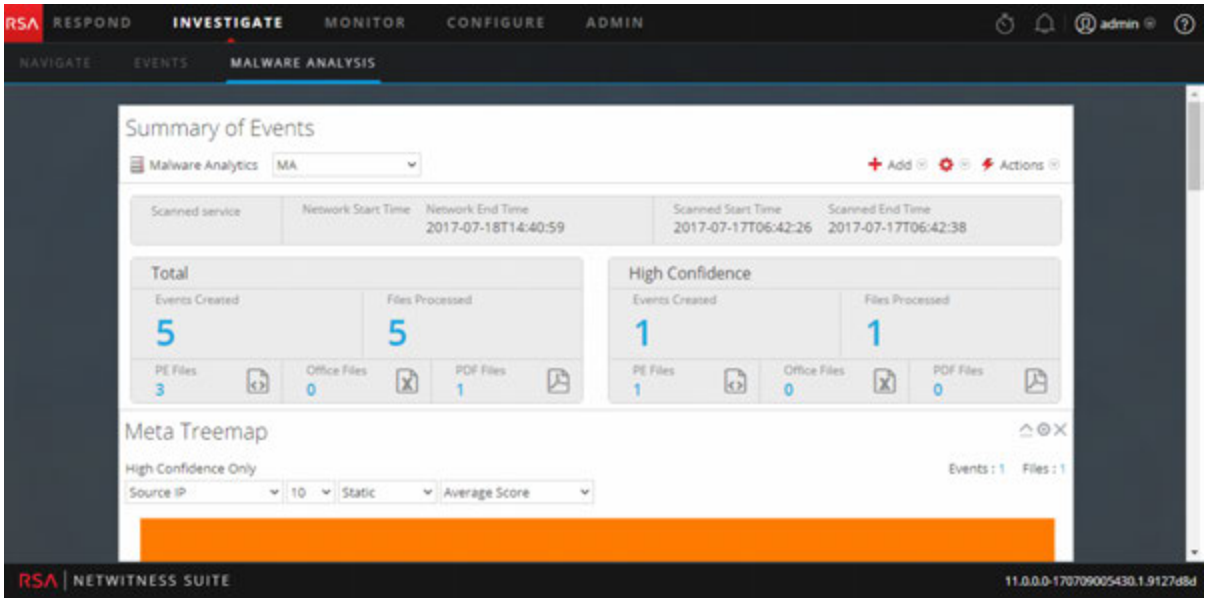
Begin a Malware Analysis Investigation (No Default Service)

To begin an investigation with no default service specified:

1. Select **Investigation > Malware Analysis**.
   The Select a Malware Analysis Service dialog is displayed, with available Malware Analysis hosts and services for the current user in the left panel and available scan jobs in the right panel. This scan jobs panel contains the same columns as the Malware Scan Jobs dashlet in the Unified dashboard. In addition, it has a toolbar and View options, which are described in Select a Malware Analysis Service Dialog.



2. In the list of Malware Analysis hosts, select a host and a list of scan jobs is displayed in the right panel. These jobs are created when you scan an event or a file (see Upload Files for Malware Analysis Scanning and Launch a Malware Analysis Scan from the Navigate View.
3. To begin analyzing a scan, do one of the following:
   a. Select a scan and click **View Scan**.
   b. Click **View Continuous Mode**.
      The Summary of Events for the selected scan is displayed with the default dashlets open. Each user can add, modify, and delete default dashlets, which persist through different scan investigations. Users can also restore default dashlets as described in Filter Dashlet Data in the Summary of Events View.



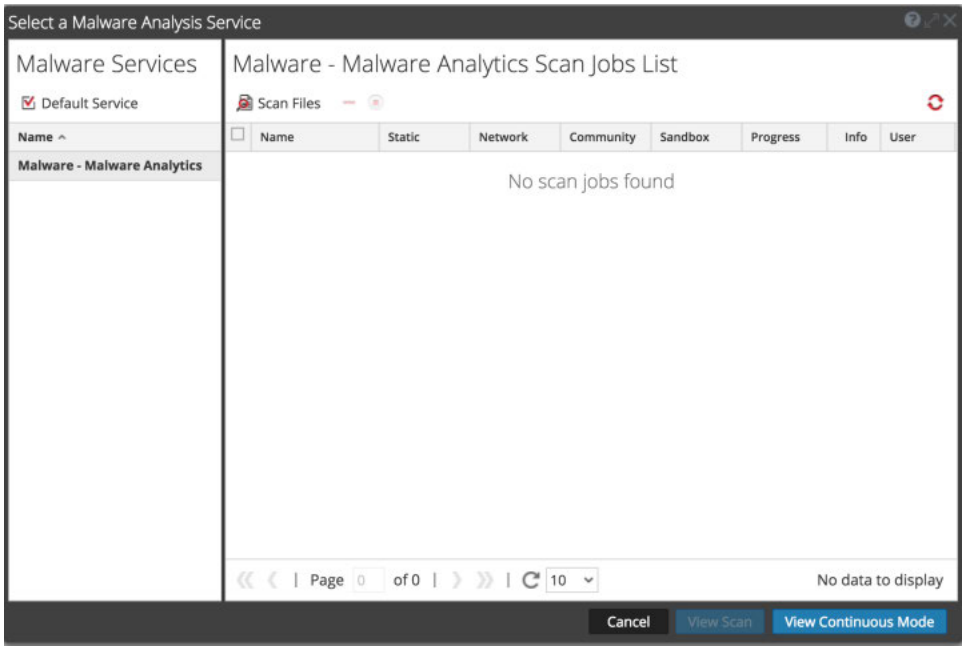
Set or Clear the Default Service

You can set the default service and clear the default service in the Select a Malware Analysis Service dialog.

To set a default service:

1. Click the service name in the Summary of Events toolbar.

   The Select a Malware Analysis Service dialog is displayed.



2. Select a service on the list of available Malware services, and click Default Service.

   The service becomes the default, (indicated by ☑ in front of the host name).

3. To clear the default service, select the default service in the grid, and click Default Service.

   No default service is set.

Upload and Scan Files

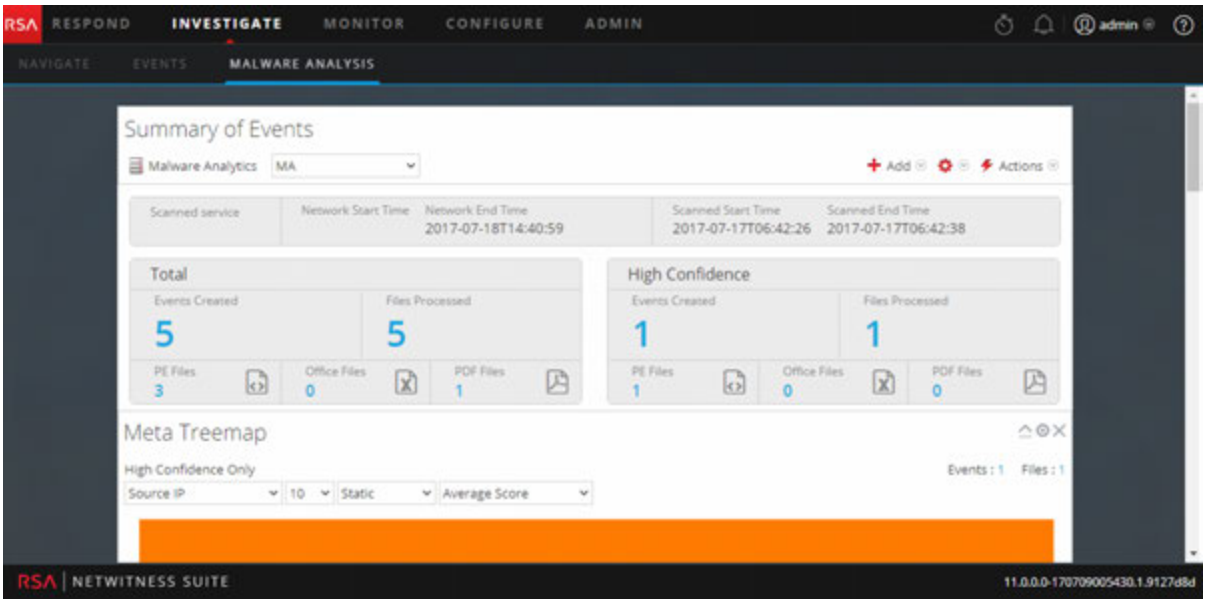
A Malware Analyst with permission to `Initiate Malware Analysis Scan` can upload files to scan using the Scan Files option in the Select a Malware Analysis Service dialog (see Upload Files for Malware Analysis Scanning. An administrator can upload packet capture files to a Decoder for Malware Analysis in the Services System view as described in "Upload Packet Capture File" in the *Decoder and Log Decoder Configuration Guide*.

Begin an Investigation (Default Service Specified)

To begin an investigation with a default service specified:

1. Select **Investigation > Malware Analysis**.

   The Summary of Events for a continuous scan of the selected service is displayed with the default dashlets open. Each user can add, modify, and delete default dashlets, which persist through different scan investigations. Users can also restore default dashlets as described in Filter Dashlet Data in the Summary of Events View.



Apply Time Parameters Filter for Results

You can apply a Threshold filter to refresh the results of the chosen dashlets.

1. To select a different time range, select either **Continuous Mode** or a different scan from the toolbar.
   The Malware Summary of Events for the selected scan is displayed.
2. To select a new time range for the scan, click in the range selection list in the toolbar. Ranges available are: Last 5 minutes, Last 10 minutes, Last 15 minutes, Last 30 minutes, Last Hour, Last 3 Hours, Last 6 Hours, Last 12 Hours, Last 24 Hours, Last 2 Days, Last 5 Days, Early Morning, Morning, Afternoon, Evening, All Day, Yesterday, This Week, Last Week, or Custom.

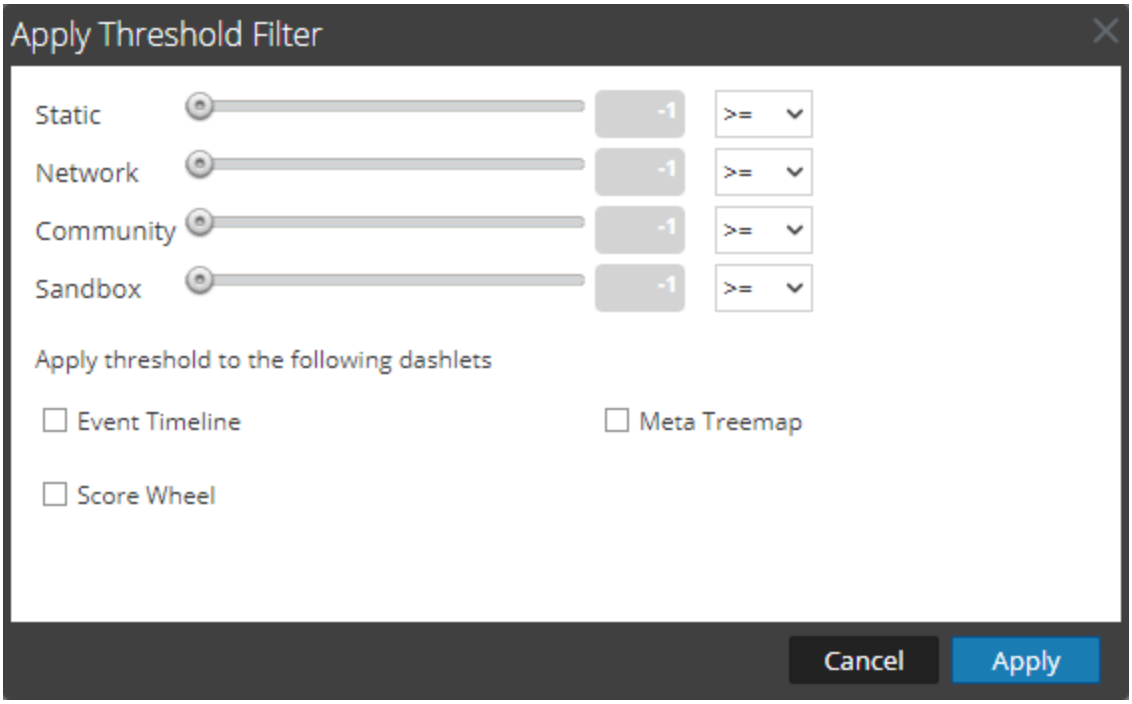
   The results are updated immediately.
3. To refresh a continuous mode scan with new data, click  .

Apply a Threshold Filter to Continuous Mode Results

You can apply a new threshold filter to an instance of the Malware with High Confidence IOCs and High Scores dashlet, the Meta Treemap dashlet, the Score Wheel dashlet, and the Event Timeline dashlet.

To customize the scoring applied to the scan, in the toolbar, do the following:

1. Select  **> Apply Threshold Filter.**
   The Apply Threshold Filter dialog is displayed.



2. If you want to limit the number of events displayed to events that were given a score above a certain number, do the following:
   a. Drag the slider in the Static, Network, Community, and Sandbox slider bars.
   b. To select the dashlets in which the thresholds apply, select the appropriate checkboxes.
   c. Click **Apply**.

Delete or Resubmit an On-Demand Scan with New Bypass Settings

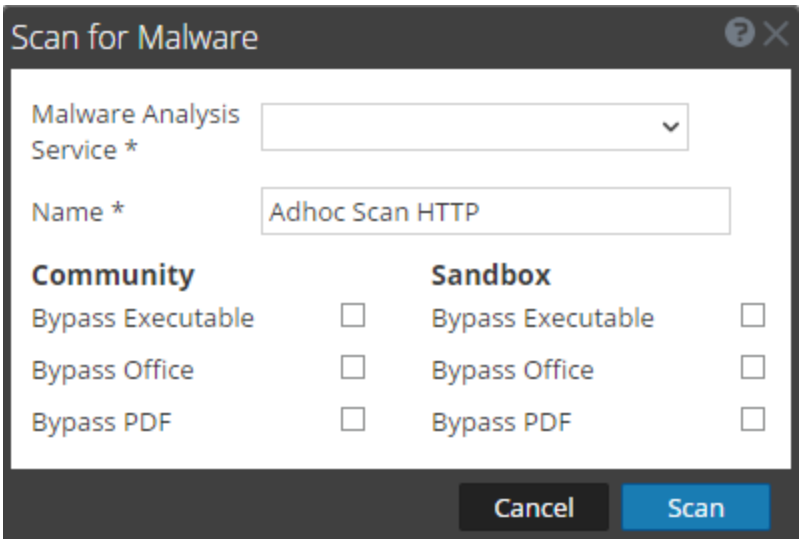
You can delete an on-demand scan or resubmit an on-demand scan with different bypass settings than those specified in the Service Configuration view for a Malware Analysis service.

To delete a scan while viewing an on-demand scan, do the following:

1. Select **Actions > Delete Scan**.
   A dialog asks for confirmation that you want to delete the scan.
2. Click **Yes**.
   The selected scan is deleted.

To apply different bypass settings to the current scan:

1. Select **Actions > Resubmit Scan**.
   The Scan for Malware dialog is displayed.



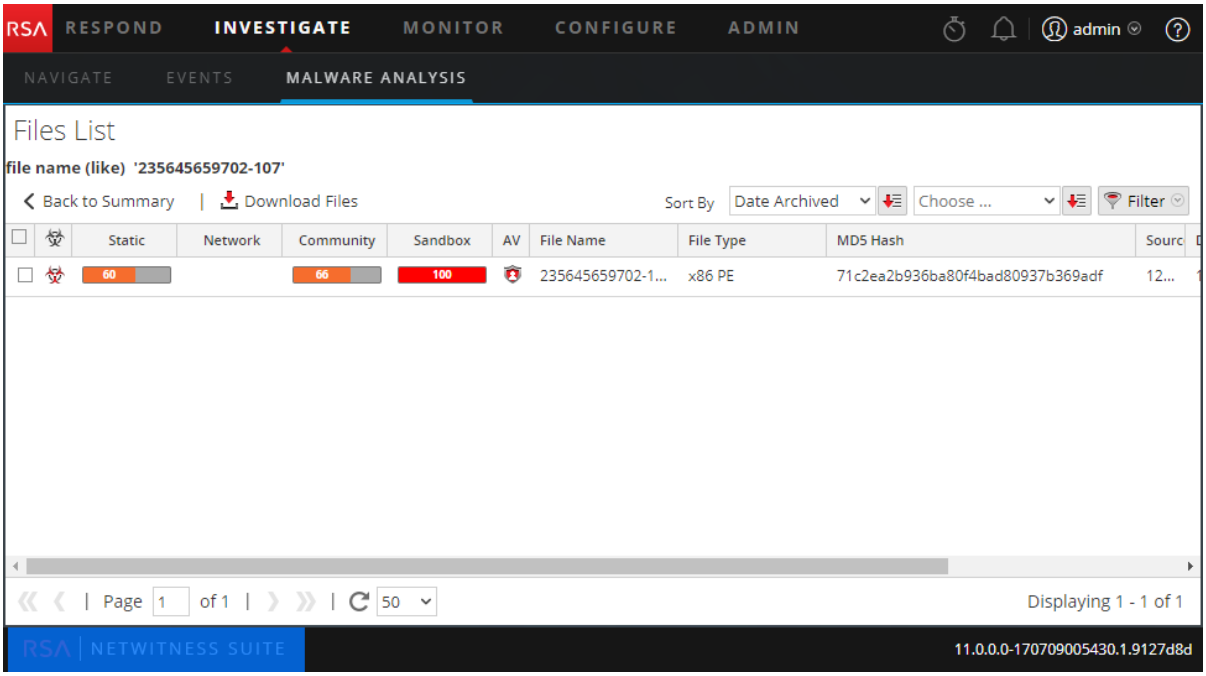
2. Select the bypass settings that you want to use on the new scan, and click **Scan**.
   Malware Analysis resets cache and resubmits the file for a new scan, and the scan jobs are added to the jobs queue.
3. When the job is complete, scroll to the left and select **View**.
   The Malware Summary of Events for the selected scan is displayed.

View the Files List

You can view a list of files for an event from the Malware Analysis Summary of Events and from each of the Visualization charts: Event Timeline, Meta Breakdowns, Meta Treemap, and Score Wheel.

To view the Files List, do one of the following:

- In the Summary of Events, click on the number of files in the **Total** row or the **High Confidence** row under **Files Processed**, **PE Files**, **Office Files**, or **PDF Files**. The Files List is displayed.
- In any visualization dashlet, click the number next to the **Files** field in the top right corner of the dashlet.
  The Files List for the selected drill point is displayed.



From the Files List, you can search for a file by filename or MD5 file hash, sort the list using two criteria and ascending or descending order, and download files as described in Examine Scan Files and Events in List Form.

To return to the Summary of Events, click **Back to Summary**.

View the Events List

From the Malware Analysis Summary of Events and from each of the visualization charts (Event Timeline, Meta Breakdowns, Meta Treemap, and Score Wheel), you can select events to view in the Events grid.

To view the Events List, do one of the following:

- In the Summary of Events, click the number of Events Created in the **Total** row or the **High Confidence** row. The Events List is displayed.
- In any visualization dashlet, click the number next to the Events field in the top right corner of the dashlet.

  The Events List for the selected time is displayed.

Implement Custom YARA Content

In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language that allows malware researchers to identify and classify malware samples. RSA makes built-in YARA-based Indicators of Compromise (IOCs) available in RSA Live; these are automatically downloaded and activated on subscribed hosts.

Customers with advanced skills and knowledge can add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live or placing YARA rules in a watched folder for the host to consume.

As malware and the threat landscape evolve, it is important to review and examine existing custom rules. Updates are often necessary to incorporate new detection methods. RSA also updates YARA rules in Live from time to time. To receive updates, you can subscribe to the RSA Blog and RSA Live at http://blogs.rsa.com/feed.

This document provides information to help customers implement custom YARA rules in Malware Analysis.

Prerequisites

The host on which you are adding custom rules must be configured to support authoring of YARA rules as described in "Enable Custom YARA Content" in the *Malware Analysis Configuration Guide*.

YARA Version and Resources

RSA Malware Analysis is packaged with YARA version 1.7 (rev:167). To find out the exact version, you can run `yara -v` on the Malware Analysis host as shown in this example:

```
[root@TESTHOST yara] # yara -v
 yara 1.7 (rev:167)
```

Meta Keys in YARA Rules

Malware Analysis is compliant with other sources of YARA rules, and it also consumes additional meta keys that are specific to Malware Analysis. Each YARA rule is equivalent to an Indicator of Compromise (IOC) within Malware Analysis. The example below illustrates the meta definitions in a rule:

```
meta:
 iocName = "FW.ecodedGenericCLSID"
        fileType = "WINDOWS_PE"
        score = 25
        ceiling = 100
        highConfidence = false
```

Meta Key	Description
iocName	(Required) This is the name that MA uses as the rule name. It is specific to Malware Analysis and is required to add the rule to the IOC list.
fileType	Specifies the files type. Possible values are: WINDOWS_PE, MS_OFFICE, and PDF. If not specified, the default value is WINDOWS_PE.
score	This value that is added to the static score if the YARA rule is triggered. If not specified, the default value is 10.
ceiling	This is the maximum amount that is added to the static scores when a rule is triggered multiple times in one session. For example, if each time a rule is triggered, 20 points are added to the static, and you do not want more that 40 points added when the rule is triggered more than two times, you can specify a ceiling of 40. If not specified, the default value is 100.
highConfidence	This sets the High Confidence flag, which is set on IOCs when there are high confidence indicators that malware is present. If not specified, the default file value is false.

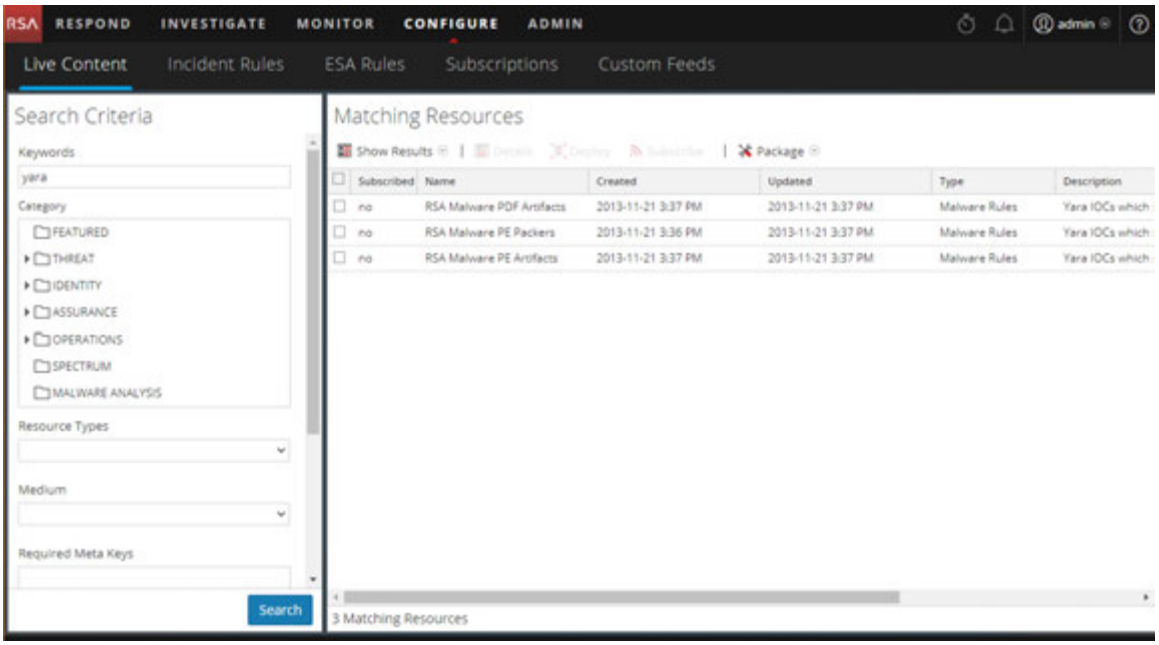
Note: Refer to the following URL for YARA resources: https://code.google.com/p/yara-project/downloads/list. NetWitness Suite uses YARA 1.7, not YARA 2.0.

YARA Content

RSA Live contains 3 sets of Yara rules:

- PE Packers
- PDF Artifacts
- PE Artifacts

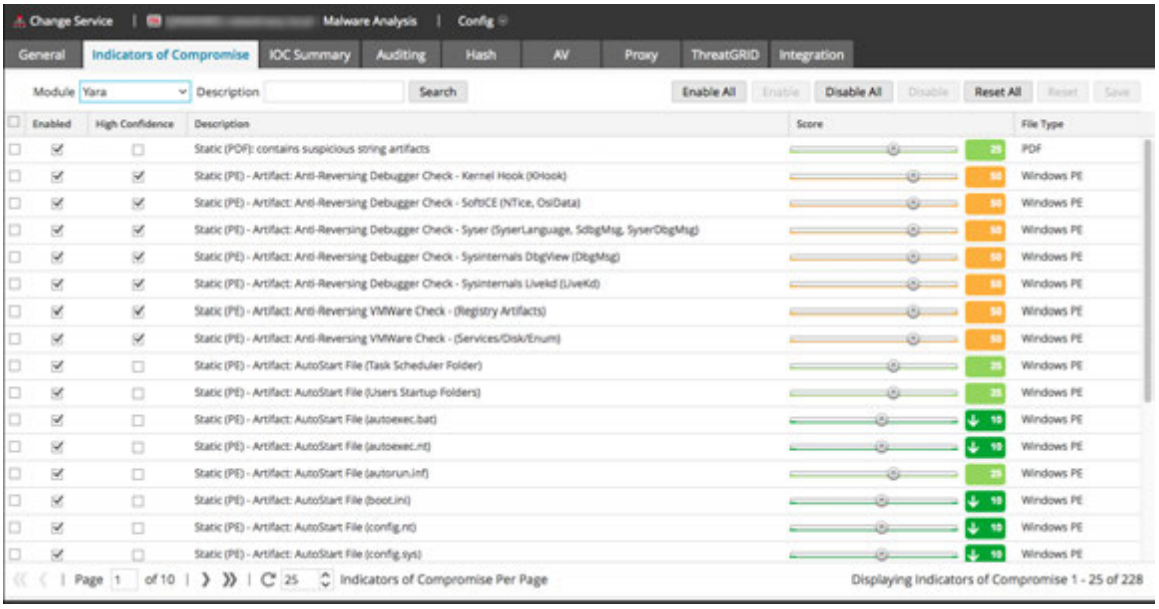
The following figure illustrates YARA content available as YARA rules in NetWitness Suite Live.



On the Malware Analysis host, the YARA rules reside in `/var/lib/rsamalware/spectrum/yara`, as shown in the example below.

```
[root@TESTHOST yara]# pwd
 /var/lib/rsamalware/spectrum/yara
 [root@TESTHOST yara]# ls *.yara
 rsa_mw_pdf_artifacts.yara rsa_mw_pe_artifacts.yara rsa_mw_pe_
packers.yara
```

The individual rules are listed as IOCs in the Malware Analysis Service Config view > Indicators of Compromise tab. To view them, use the Yara module as the filter. You can adjust the configuration of an individual in the same way that you configure other IOCs.



Add Custom YARA Rules

To introduce custom YARA rules from other sources:

1. To ensure that the YARA rules follows the correct format and syntax, use the YARA command to compile the YARA rule as shown in the following example. If the rule compiles with no errors, this indicates that the YARA rule has the correct syntax.

   ```
   [root@TESTHOST yara]# yara rsa_mw_pe_packers.yara dummy.txt
   [root@TESTHOST yara]#
   ```

2. Ensure that custom rules do not duplicate existing YARA rules from RSA or other sources. All YARA rules are in `/var/lib/rsamalware/spectrum/yara`.

3. Ensure that the meta keys that RSA supports are included to organize the YARA rules as part of the configurable IOCs, and name the file with the yara extension (<filename>.yara). For better organization, make sure that the `iocName` meta is included in the meta section as shown in the following example.

   Example:

   ```
   rule HEX_EXAMPLE
   {
       meta:
           author = "RSA"
           info = "HEX Detection"
          iocName = "Hex Example"
        strings:
           $hex1 = { E2 34 A1 C8 23 FB }
           $wide_string = "Ausov" wide ascii
        condition:
           $hex1 or $wide_string
   }
   ```

4. When ready, place the custom YARA file in the folder that the Malware Analysis service watches:

   `/var/lib/rsamalware/spectrum/yara/watch`

   The file is consumed within one minute.

   Once consumed, NetWitness Suite moves the file to the `processed` folder, and the new rule is added to the Malware Analysis Services Config view > Indicators of Compromise tab.

Examine Scan Files and Events in List Form

When viewing the Summary of Events in a Malware Analysis scan, you can click a file count or an event count to view the Files List or the Events List for the scan (see Begin a Malware Analysis Investigation). In the Files List and Events List, you can search for a file by filename or MD5 file hash, sort the list using two criteria and ascending or descending order, and download files. When you find an event or file of interest in the Events List or Files List, you can view many details about the event in the Event Details view.

For each event in the Events List, NetWitness Suite provides the following information:

- Flagged as a High Confidence event, which is considered likely to contain Indicators of Compromise.
- The numeric score for each scoring module: Static, Network, Community, and Sandbox.
- Antivirus vendor scores.
- The Influenced by customized rule flag.
- The date the event was archived.
- The session time.
- The MD5 hash filter.
- The number of files in the event.
- The source IP address of the event.
- The Identity.
- The destination IP address.
- The destination country.
- The name of the alias host.
- The event type, for example, Network.
- The service used by the event.
- The destination organization

For each file in the Files List, NetWitness Suite provides the following information:

- Flagged as a High Confidence event, which is considered likely to contain Indicators of Compromise.
- The numeric score for each scoring module: Static, Network, Community, and Sandbox.

- Antivirus vendor scores.
- The filename.
- The file type.
- The MD5 hash filter.
- The source IP address of the event that contained the file.
- The destination IP address.
- The date the event that contained the file was archived.
- The file size.

Sort the Files List or Events List

You can sort the Files List and Events List by column name in ascending and descending order. You can choose one or two columns.

To sort the list:

1. In the first **Sort By** drop-down list, choose a column name and sort direction:  for descending order or  for ascending order.
2. (Optional) In the second **Sort By** drop-down list, choose a column name, and sort direction,  for descending order or  for ascending order.

   The column titles reflect the selected sort order.

Filter the List by Filename or MD5 File Hash

You can filter the Files List and Events List by filename or file hash. With this feature, you can specify a limited subset of the original data based on the search criteria.

Note: When you perform a search, you search the scan that you are currently displaying, not all scans.

1. Click 
.

   The Filter dialog is displayed.
2. Enter a value in **File Name** or **MD5 Hash** and click **Filter**. The File Name and Hash field are not case sensitive. Wild card or regular expressions are not supported. The filter is based on exact matches. You can drag across a filename or hash to select from the Files list or Events list, then copy and paste it in the dialog.

3. Click **Filter**.
   Malware Analysis filters the list to display only files or events with the selected hash
4. To revert to the unfiltered list, click  . When the Filter dialog is displayed, click **Reset**.

Download Files from the Files List

NetWitness Suite lets you select and download files from the Files List or the Events List.

Caution: Use caution when downloading files from Malware Analysis; some files may contain harmful code. File Download is a specific permission that can be configured, refer to "Define Roles and Permissions for Malware Analysts" in the *Malware Analysis Configuration Guide* for more details.

To download files from the Files List or Events List:

1. In the **Files List** or **Events List**, select the checkbox next to one or more rows.
2. In the toolbar, select  .
   The Malware File Download dialog is displayed.
3. Do one of the following:
   a. If you decide not to download the file, click **Cancel**.
   b. If you want to download the file, select click the **Download** button.
      The file or files selected are downloaded in a zip archive with the name `Malware_Files.zip`.

Delete Events from the Scan

In the Events List, you select one or more events and delete them from the scan. This is useful for removing events that are not of interest.

To remove an event from the scan being viewed:

1. In the **Events List**, select one or more events.
2. In the toolbar, click  .
   NetWitness Suite asks for confirmation that you want to delete the events.
3. In the confirmation dialog, click **Yes**.
   The selected events are deleted.

Return to the Summary of Events

To leave the Files List or Events List and return to the Summary of Events, click **Back to Summary**.

Open the Detailed Analysis for an Event

While you examine events or files in the Files List or Events List, you can double-click any event or file to open a detailed analysis of the event in the Events List or the event with which the file in the Files List is associated (see View Detailed Malware Analysis of an Event).

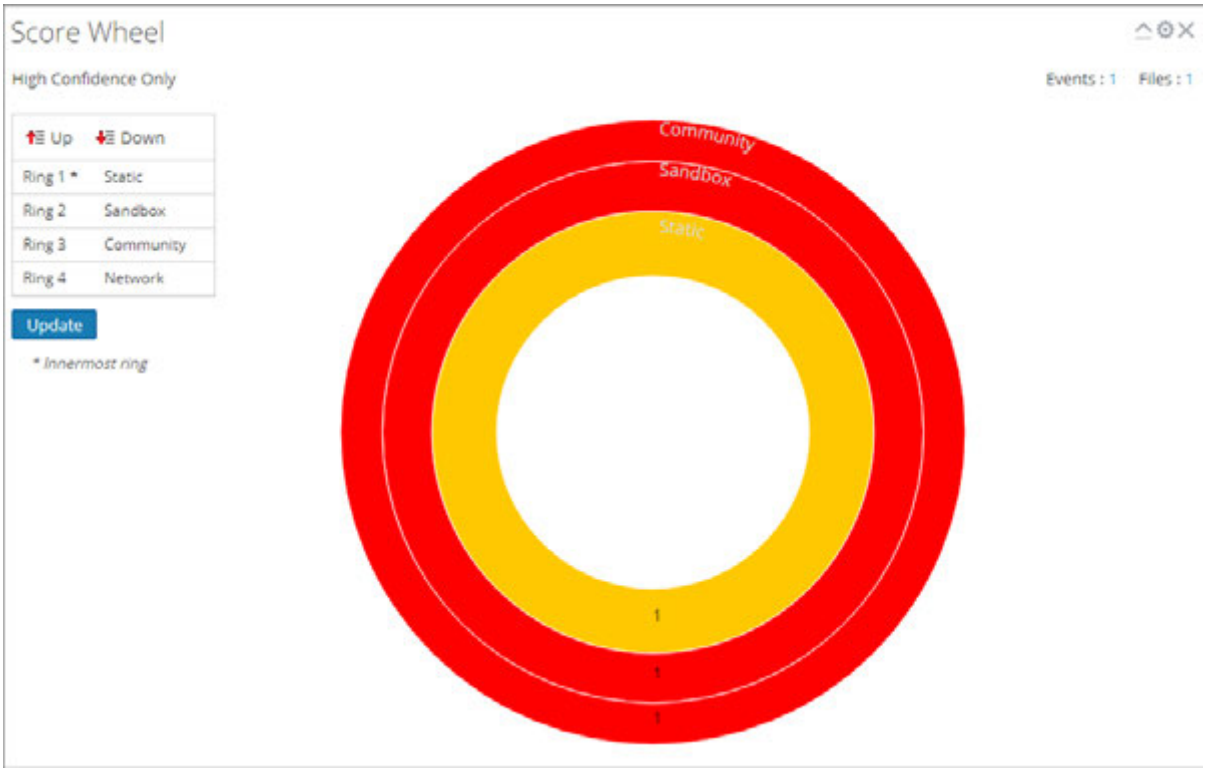
Filter Dashlet Data in the Summary of Events View

The Summary of Events provides a summary of the scan being investigated with selectable dashlets. The Summary of Events is fixed, but Analysts can configure each dashlet to filter out information and drill into the data.

The rest of this topic provides instructions for managing and configuring dashlets.

Configure the Score Wheel Dashlet

The Score Wheel is a high-level visualization of analyzed sessions that scored high, medium, or low in each of the scoring categories: Static, Network, Community, and Sandbox. The Score Wheel is a quick way to drill into sessions to review them. Each ring represents a different scoring category so that you can visually compare results by category.

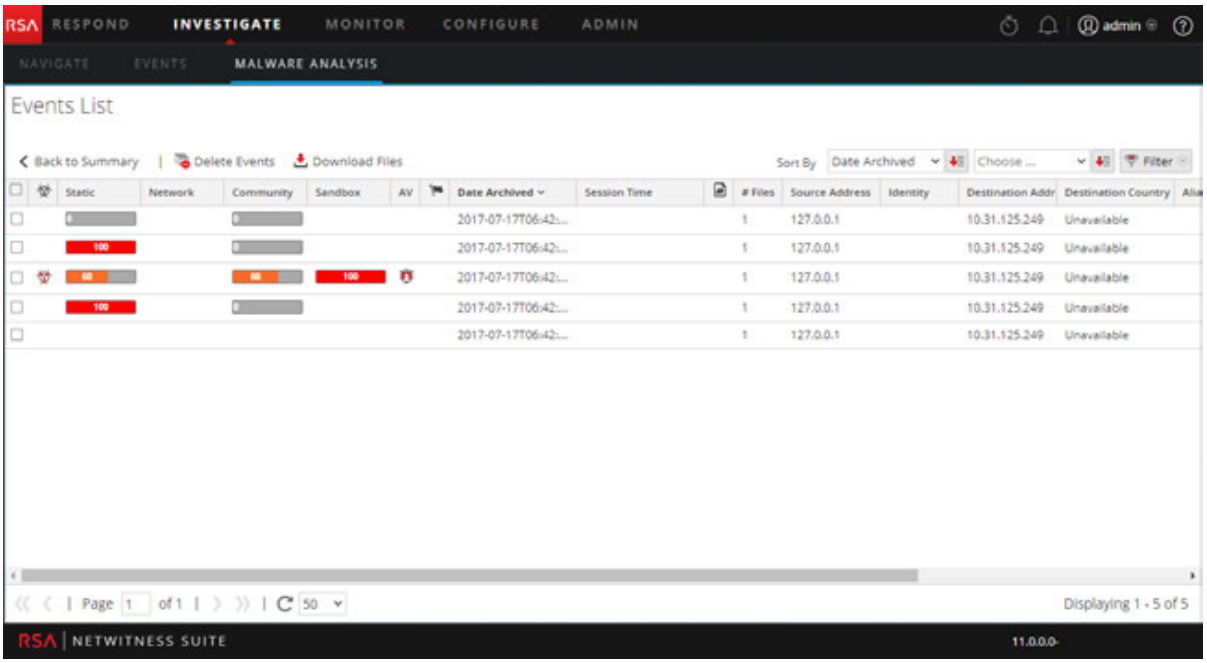


You can change the order of the rings to highlight indicators of compromise that were flagged in one category but not in another category. Comparing the same results in a different sequence of the rings provides visibility into additional vulnerabilities in a session, and you can drill into sessions of interest. The following examples show two possible use cases.

Zero-Day Candidates Example

This example shows how to drill into sessions that the Community did not flag as malicious, but all other scoring categories did. The resulting list of sessions highlights zero-day candidates.

1. Configure the Score Wheel rings in the following sequence:
   Community (innermost) > **Static** > **Network** > **Sandbox** (outermost)
2. Click the red slice in the outermost (Sandbox) ring that aligns with a green slice on the innermost ring (Community): green (innermost) -> **Static**: red -> **Network**: red -> **Sandbox**: red (outermost).



Malicious Sessions Example

This example shows how to drill into sessions in which all scoring categories identify the resulting list of sessions as malicious, indicating Malware Analysis has the most confidence that they are malware.

1. Configure the Score Wheel rings in the following sequence:
   Community (innermost) > **Static** > **Network** > **Sandbox** (outermost)
2. Click the red slice of the outermost (Sandbox) ring that aligns within a red slice on the innermost ring (Community): red (innermost) -> Static: red -> Network: red -> Sandbox: red (outermost).

Arrange the Ring Sequence by Scoring Module

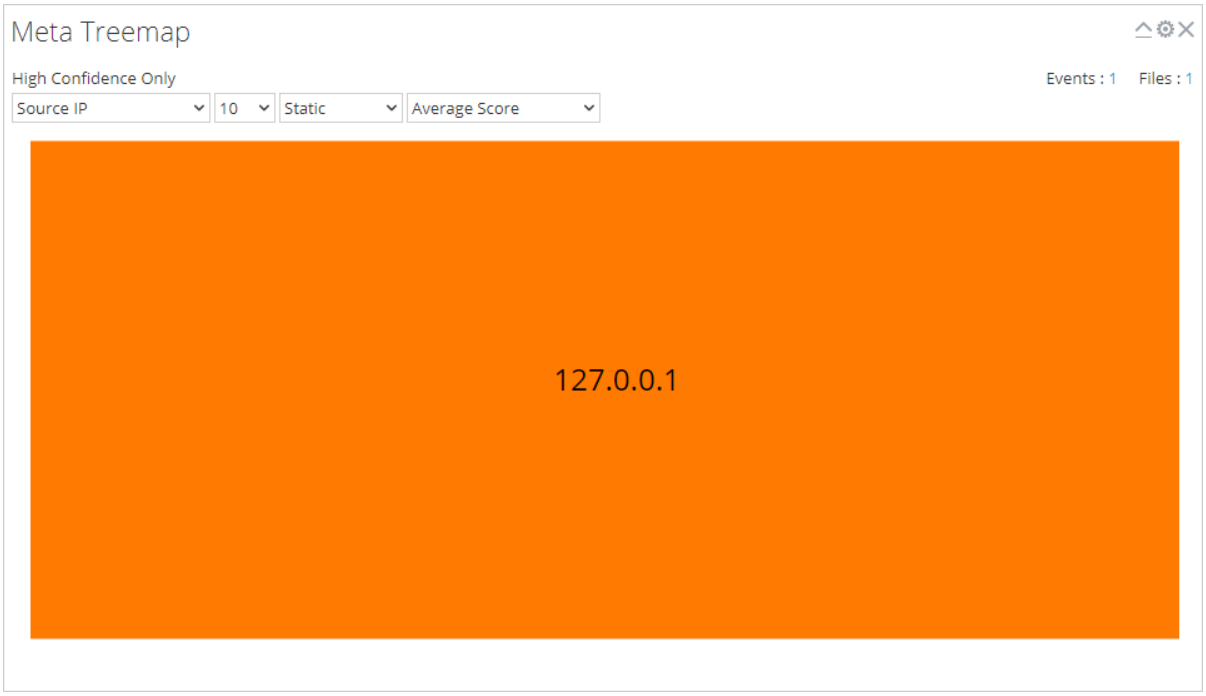
In the Score Wheel, you can arrange the sequence of the rings by scoring module. Initially, the sequence of rings from inside to outside is Static, Network, Community, and Sandbox.

To change the ring sequence:

1. Do one of the following:
   a. Click and drag each scoring module up or down.
   b. Select each scoring module and use the Up and Down buttons to move it.
2. When the ring sequence is the way you want it, click the **Update** button.
   The Score Wheel is refreshed with the new sequence.

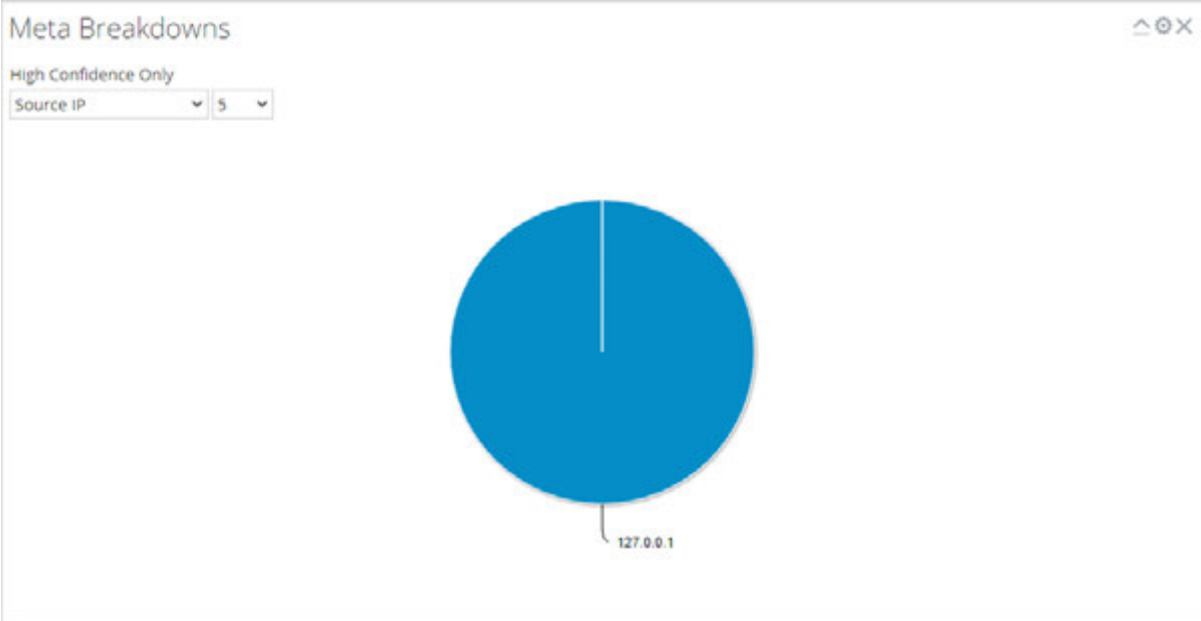
Configure the Meta Treemap Dashlet

In the Meta Treemap chart, you can visualize and filter meta breakdowns by meta type, count, and analysis type. Use the three selection lists to set the filter, and the Meta Treemap chart is refreshed immediately.



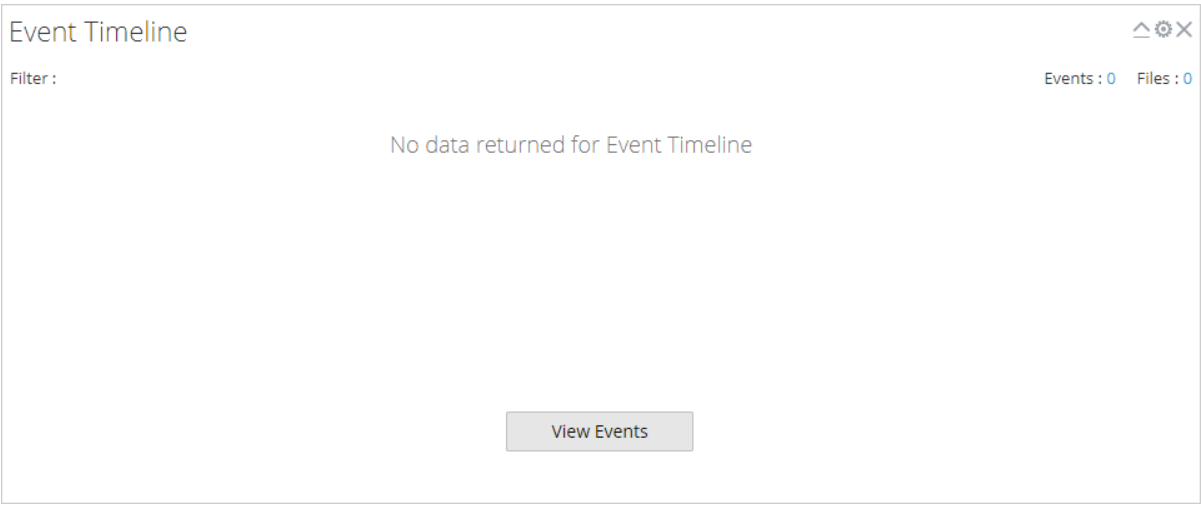
Configure the Meta Breakdowns Dashlet

The Meta Breakdowns dashlet is a visualization of values for a specific meta key in a pie chart. In the Meta Breakdowns chart, you can filter meta breakdowns by meta type and count. Use the two selection lists to set the filter, and the Meta Breakdowns chart is refreshed immediately.



Configure the Events Timeline Dashlet

The Events Timeline dashlet is a visualization of the events along a timeline. No additional filters are available for the Event Timeline.

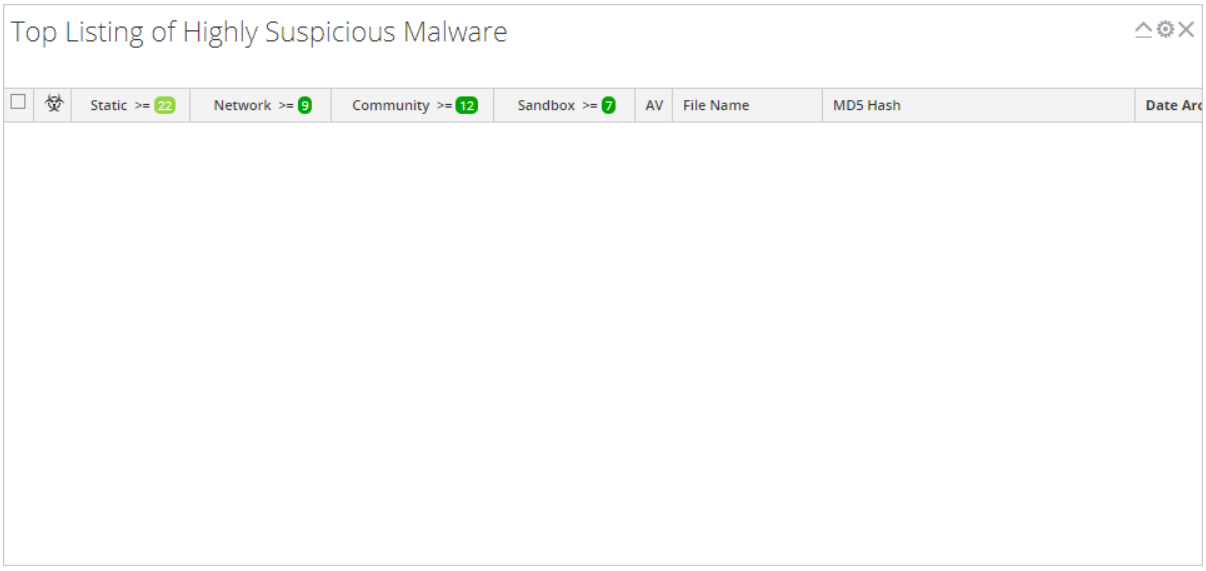


Open All Events in the Events List

From within the Event Timeline, you can open the entire list of events in the Events List. To do so, click View Events. This option is not the same as clicking the count next to Events, which is the same for all visualization charts and opens the current drill point in the Events List.

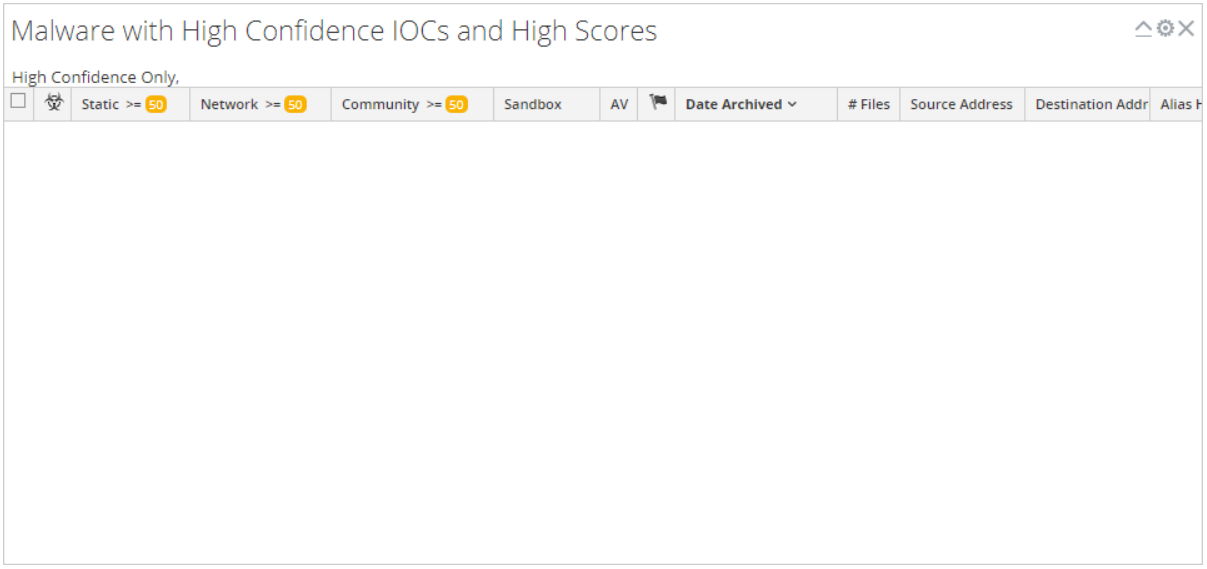
Configure the Top Listing of Highly Suspicious Malware Dashlet

The Top Listing of Highly Suspicious Malware Dashlet presents the Top 10 most suspicious events in the Events List or the Files List. This dashlet is also available in the Monitor dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets..



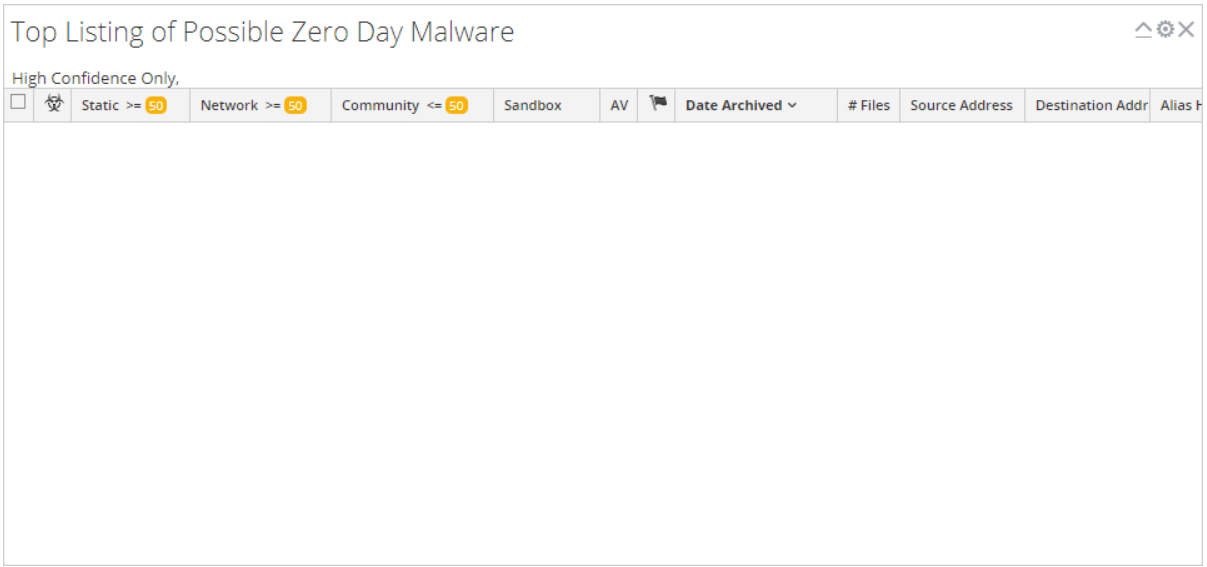
Configure the Malware with High Confidence IOCs and High Scores Dashlet

The Malware with High Confidence IOCs and High Scores dashlet presents Indicators of Compromise that have both high scores and high confidence that the events are likely to contain malware. The dashlet is also available in the Unified dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets..



Configure the Top Listing of Possible Zero Day Malware Dashlet

The Top Listing of Possible Zero Day Malware dashlet presents potential zero day events in the Events List or the Files List. The dashlet is also available in the Unified dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets.



Upload Files for Malware Analysis Scanning

There are two methods for analysts to upload files for Malware Analysis scanning.

A Malware Analyst with permission to Initiate Malware Analysis Scan can upload files to scan using the Scan Files option in the Select a Malware Analysis Service dialog.

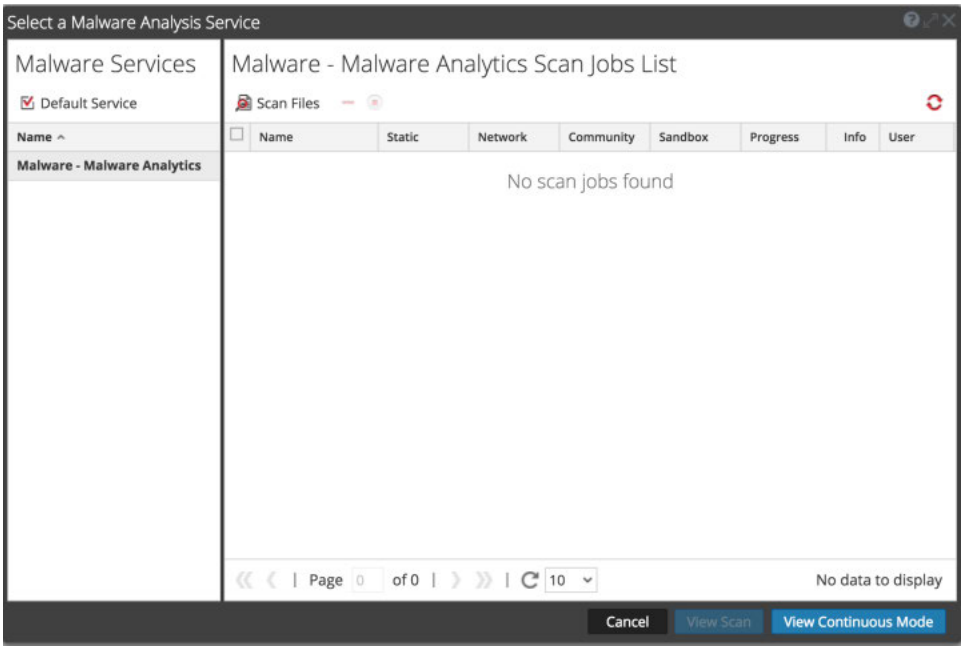
It is also possible to upload a file for scanning using a watched file share.

Upload Files Manually

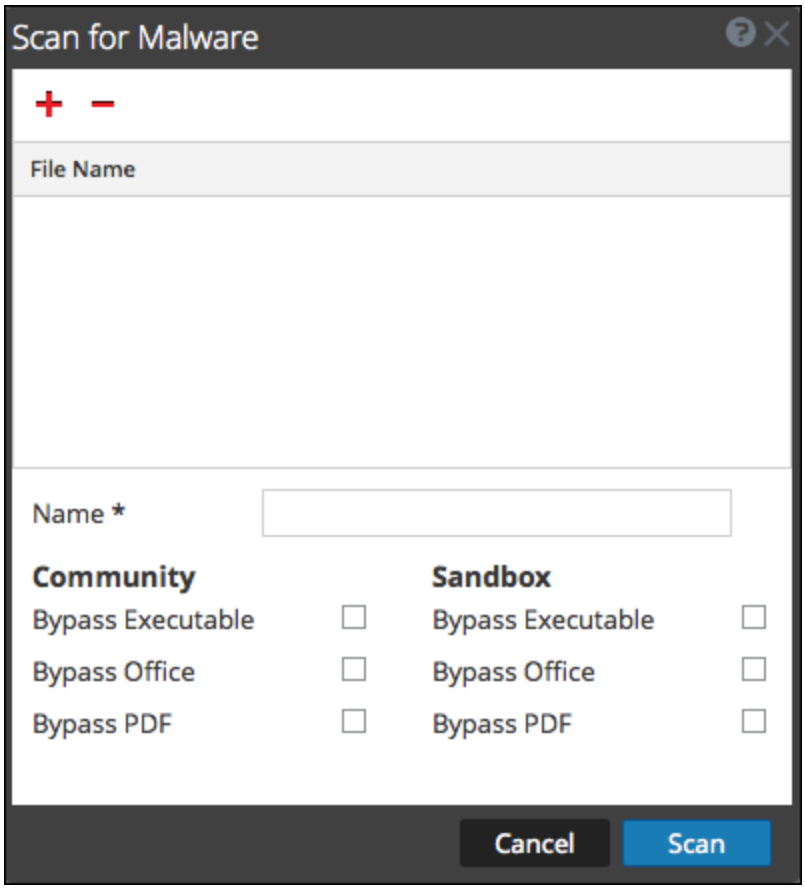
This topic provides instructions for initiating on-demand scanning of an uploaded file. When you upload a file for scanning, NetWitness Suite starts the upload job and adds it to the jobs queue. When the job is complete, you can view the scan in Malware Analysis.

To upload a file to scan:

1. Go to **INVESTIGATE > Malware Analysis**.
   The Select a Malware Analysis Service dialog is displayed, with available Malware Analysis hosts and services for the current user in the left panel.



2. Click **View Scan**.
   The Scan for Malware dialog is displayed.



3. Click +

   A view of the files system is displayed so that you can choose files to upload.

4. Select one or more files from the list and click **Open**.

   The file names are added. Malware Analysis escapes the filename characters before processing a file. The maximum number of filename characters after escaping is 200. If the filename is greater than 200 characters, Malware Analysis truncates the filename characters and displays the truncated filename in the NetWitness Suite user interface.

5. Continue adding and deleting files until you have a list of the files that you want to upload.

6. Name the scan and select the types of files to bypass. This is useful for a zip archive that contains different types of files, and overrides the default bypass settings.

7. Click **Scan**.

   The scan job is submitted and NetWitness Suite displays a confirmation message for successful submission. The scan request is added to the Scan Jobs List dashlet. The bypass settings in this dialog override the default settings in the basic Malware Analysis configuration settings.

8. The job is added to the Scan Jobs List in the Select a Malware Analysis Service dialog and in the Unified dashboard Scan Jobs List dashlet.
9. To view the scan when complete, double-click the scan.
   The Malware Summary of Events for the selected scan is displayed.

Upload Files from a Watched Folder

To upload files from a watched folder, you can drop files into a watched file share for Malware Analysis. Analysts can share YARA rules, hash files, and infected zip archives with Malware Analysis.

Malware Analysis watches a file share and automatically consumes files placed in specific folders in the file share. This feature is useful for:

- Bulk import of hash files from `/var/lib/rsamalware/spectrum/hashWatch`.
- Addition of custom-YARA rules to the Indicators of Compromise (IOC) list on the host from `/var/lib/rsamalware/spectrum/yara/watch`.
- Creation of on-demand scan jobs from a zip archive of infected zip files from `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`.

Analysts need to prepare the files for consumption in accordance with requirements, the file extension must be correct, and the file must be copied to the correct watched folder in the file share.

Import a Hash List

To import a hash list from the watched directory, the hash list must be in the specified format and must be sorted on md5. You can drop a file formatted into a folder (`/var/lib/rsamalware/spectrum/hashWatch`) on the Malware Analysis host, and it is automatically imported into the local hash database. This is described in "Configure Hash Filter" in the *Malware Analysis Configuration Guide*.

To import a hash list using the watched folder method:

1. Copy the hash lists that you want to import into the **`/var/lib/rsamalware/spectrum/hashWatch`** directory.
   NetWitness Suite Malware Analysis automatically watches this folder and processes files placed there.
   a. Malware Analysis adds every hash found in the hash lists to the hash filter.
   b. If there are processing errors, they are logged in: `/var/lib/rsamalware/spectrum/hashWatch/error`

c. Processed files are cataloged
here: `/var/lib/rsamalware/spectrum/hashWatch/processed`

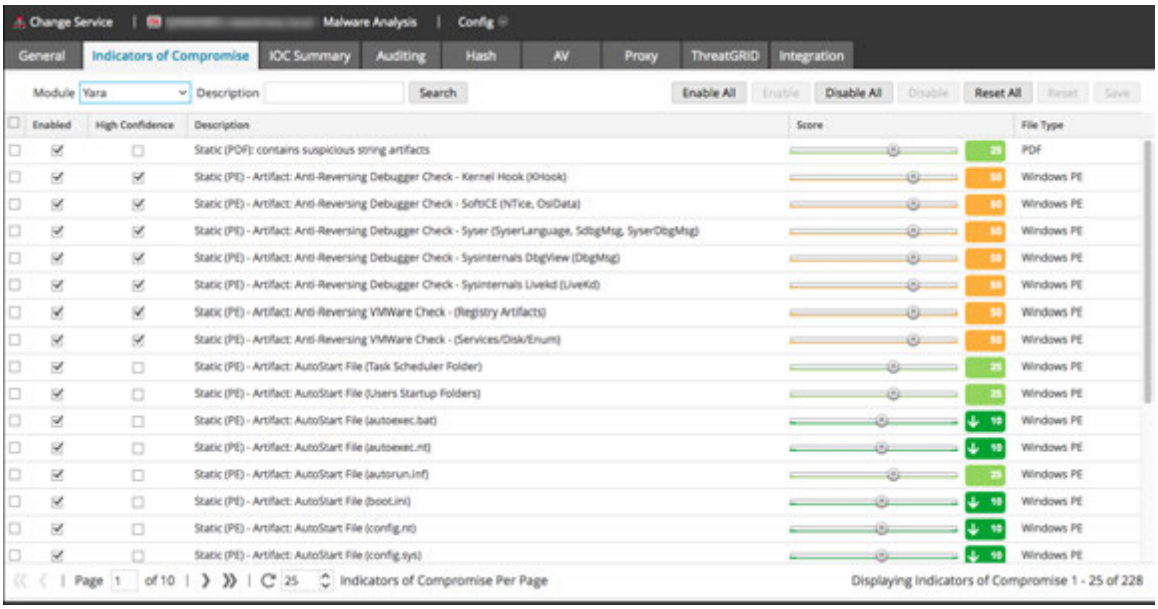
d. Processed files are not removed from the hashWatch directory.

2. After importing hashes in bulk, the System Administrator can use a cronjob to clean up old processed files.

Import YARA rules to the IOC List

Customers with advanced skills and knowledge can add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live or placing YARA rules in a watched folder for the host to consume. Implement Custom YARA Contentprovides complete information on the prerequisites for using custom YARA content and authoring rules.

When the rules are ready, place the custom YARA files in the folder that the Malware Analysis service watches:
`/var/lib/rsamalware/spectrum/yara/watch`
The file is consumed within one minute.
Once consumed, NetWitness Suite moves the file to the `processed` folder, and the new rule is added to the Malware Analysis Service Config view > Indicators of Compromise tab.



Import Files into the Scan Jobs List

When you obtain samples from perimeter security solutions and would like to perform further analysis on the files, you can zip the files and password protect the archive with `infected`, then add to the watched folder for consumption by Malware Analysis. This zipped archive is ready to be placed in the watched folder:
`/var/lib/rsamalware/spectrum/infectedZipWatch/watch`.

Note: The maximum size of the archive is 100 MB.

To analyze infected, password-protected zip files, Malware Analysis consumes archives place in a watched folder and creates an on-demand job that is added to the Scan Jobs List.

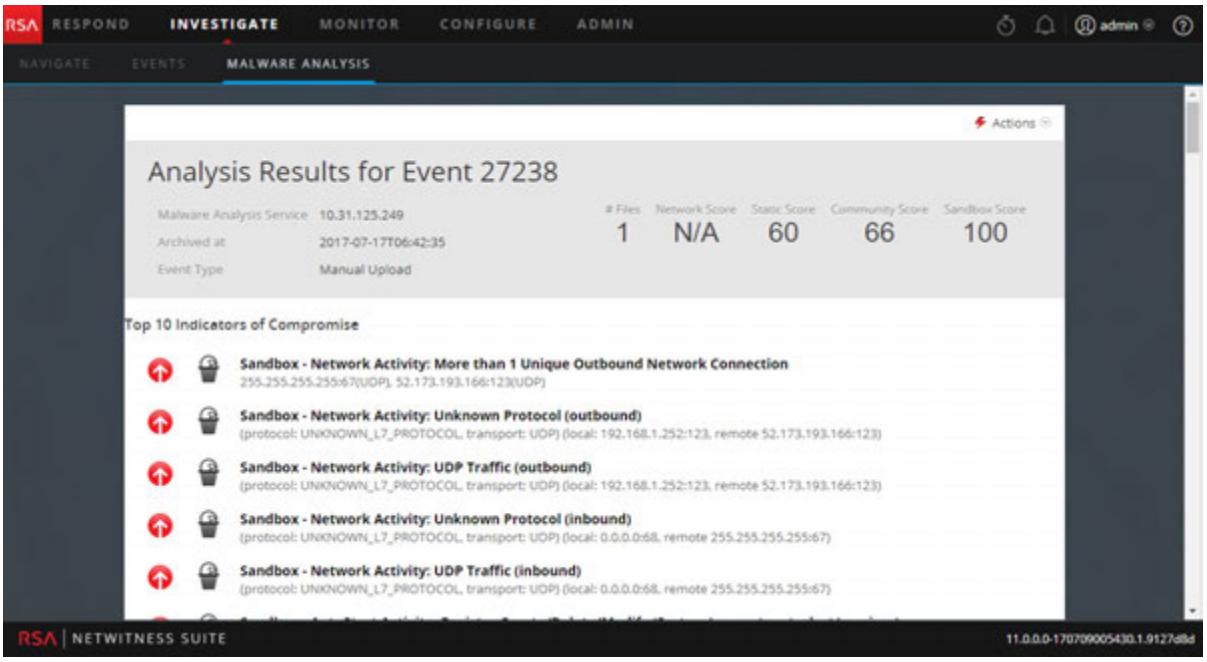
1. While logged on as administrator, place the files to be processed in a zip file with password `infected` at `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`
   In a minute or two Malware Analysis consumes the archive and creates an on-demand job in the Scan Jobs List. The scan job name is the name of the file, the user is **file share**, and the Event Type is 1. The archive is moved to `/var/lib/rsamalware/spectrum/infectedZipWatch/processed`
2. After the job is added to the Scan Job List, run a script or cronjob to clean up the zip file in `/var/lib/rsamalware/spectrum/infectedZipWatch/processed`.

View Detailed Malware Analysis of an Event

When viewing the list of individual events in a Malware Analysis scan in the Malware Analysis Events grid, you can double-click an event to view the detailed analysis results for the event.

View Malware Analysis Details for an Event

1. Start an investigation in the **Malware Analysis** tab.
   The Malware Summary of Events is displayed, and includes four charts, including the Event Timeline.
2. Do one of the following:
   a. To view all events in the Event Timeline, click the **View Events** button.
   b. Double-click data in the **Meta Breakdown**, **Meta Treemap Chart**, or **Score Wheel**.
   The Events List is displayed.
3. Double-click an event.
   The Analysis Results for the event are displayed.

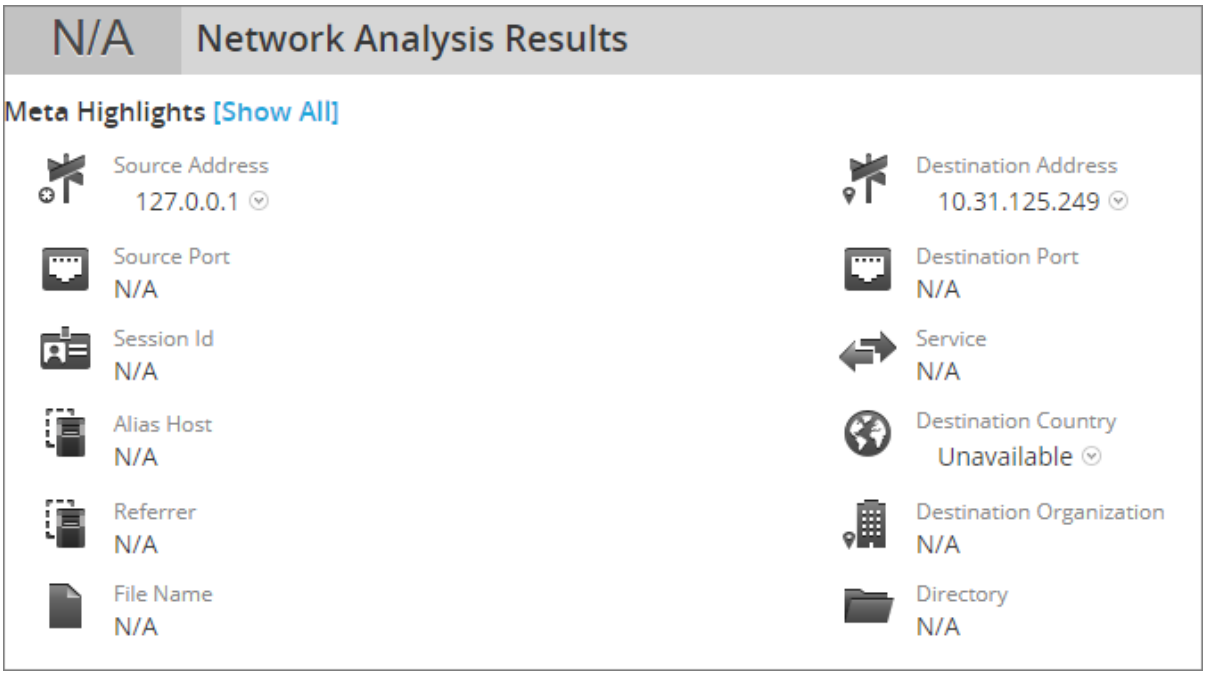


4. (Optional) If you want to delete an event, select **Actions > Delete Event**.
5. If you want to view a reconstruction of the network session, select **Actions > View Network Session**.
   The session opens in the Navigate view > Event Reconstruction.

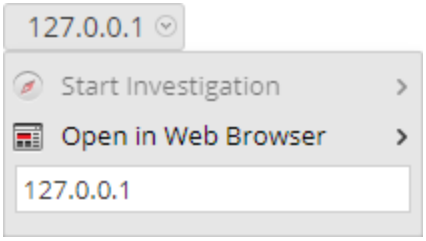
Pivot Network Analysis Results

You can pivot the Network Analysis Results in several ways:

1. Scroll down to the Network Analysis Results.



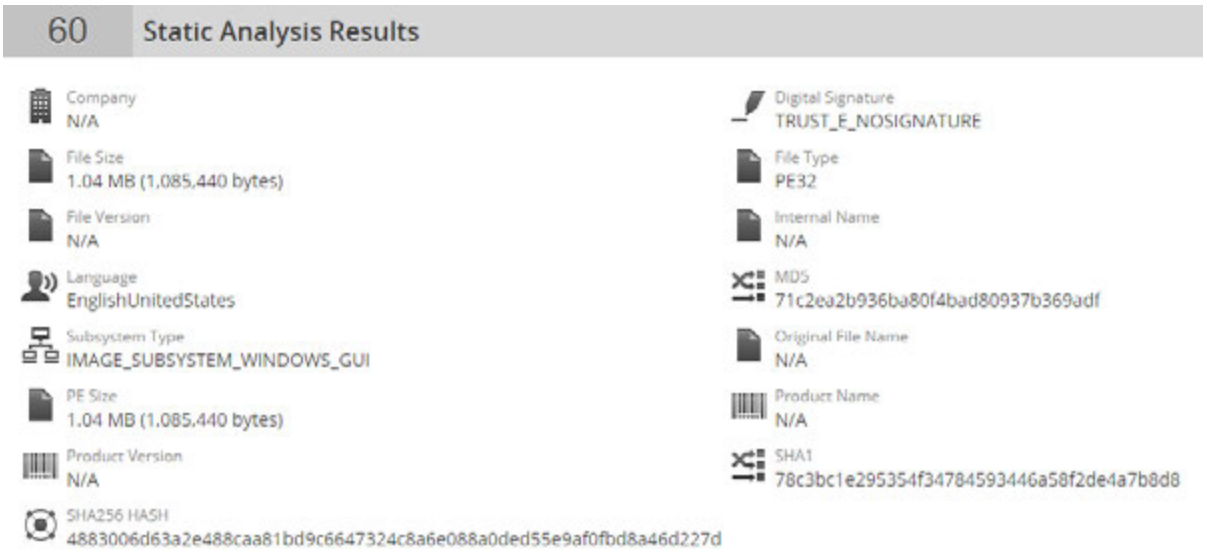
2. Hover over a meta value and left-click.
   The context menu is displayed.



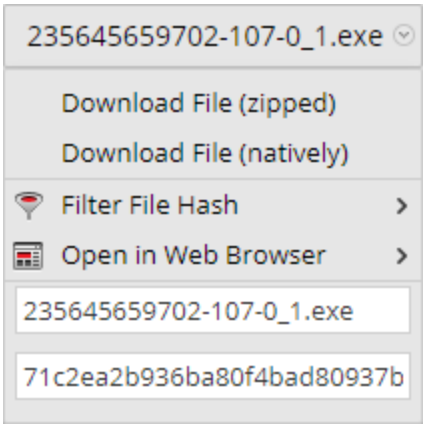
3. To view the selected meta value in the **Navigate** view, select **Start Investigation** and a time option.
4. To view the selected meta value in a browser, select **Open in Web Browser > Open in Google**.

Use File Actions in the Static Analysis Results

1. Scroll down to the Static Analysis Results.



2. If you want to download a file, select the file name and either **Download File (zipped)** or **Download File (natively)** in the drop-down menu. It is safer to download a file in zipped format.



3. If you want to mark the file as safe or unsafe in the hash list, select **Filter File Hash** and **Mark hash as good** or **Mark hash as bad**.

View Community Analysis Results Details

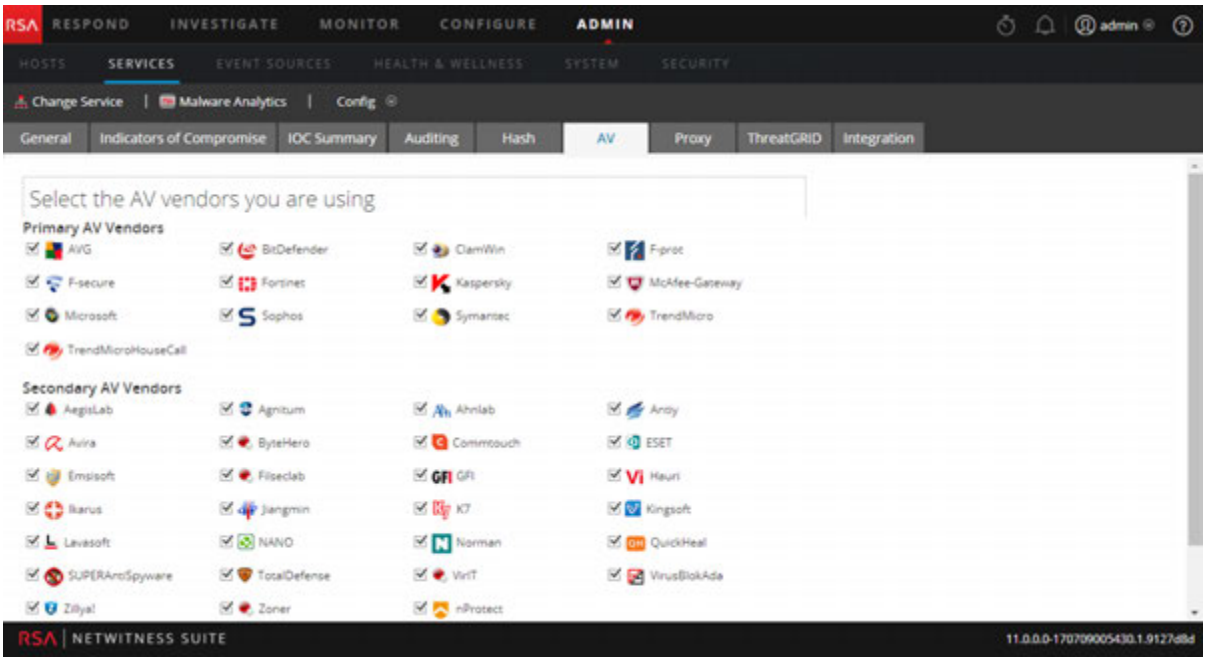
The Community Analysis Results summarizes results from the community, identifying Indicators of Compromise that were flagged as a risk or identified as good.

In addition, this view lists the results from Installed AV Vendors and Not Installed AV Vendors. You can compare results of the installed AV vendors that were configured for the current Malware Analysis service versus Community results. You can also see results from a list of AV vendors that are not configured as installed for the current Malware Analysis service.

Each row of AV vendor results includes the shield icon to show whether the IOC was discovered by a Primary ( ) or Secondary AV ( ) vendor in the community, the name of the Installed or Not Installed vendor, and the name of malware or risk detected by the community and AV vendor. If the AV vendor did not detect a risk, **-- Not detected --** is displayed instead of the name of the risk.

The Not Installed AV Vendors section is expandable to view all entries, but is collapsed by default to minimize the need to scroll. Clicking the + expands the list.

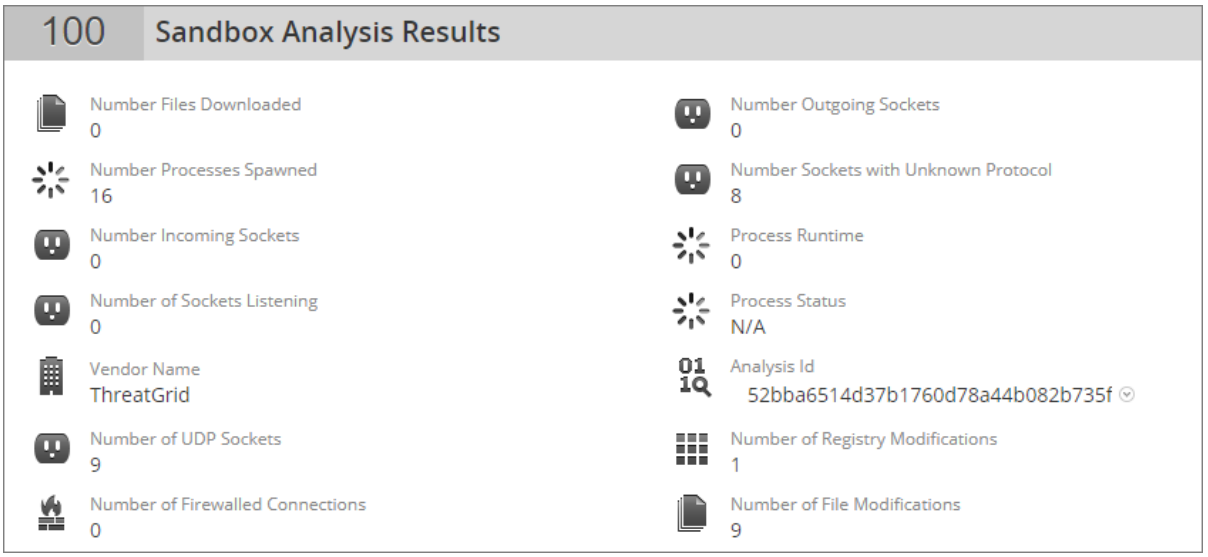
If no installed AV vendors have been configured for the current Malware Analysis service, the following message is displayed: No AV vendors were marked as installed. Please go to the Malware Analysis Service configuration page to identify installed AV vendors.



View Sandbox Analysis Results in the ThreatGrid User Interface

If you have registered with ThreatGrid, you can view the Sandbox results directly in ThreatGrid.

1. Scroll down to the Sandbox Analysis Results.



2. Click the **Analysis ID** and select **Open In ThreatGrid**.
   The analysis report in ThreatGrid is displayed.

Investigation Reference Materials

This section provides is intended to help you understand the purpose and application of NetWitness Investigate views. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

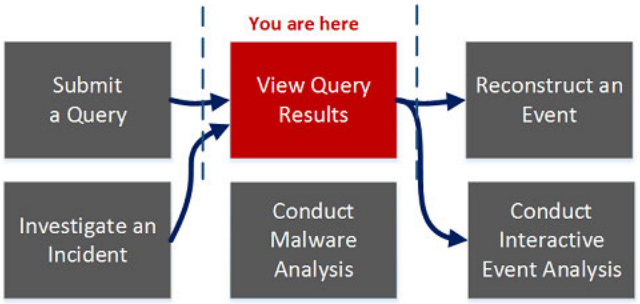
- Select a Malware Analysis Service Dialog
- Settings Dialog for Navigate View and Events View

Add Events to an Incident Dialog

In the Add Events to an Incident dialog, analysts can add alerts to an existing incident so that incident responders look at the associated events as part of an incident response.

To access this dialog while investigating a service in the Investigation > Events view, select **Incidents > Add to Existing Incident** from the toolbar.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	add one or more events to an existing incident or to a new incident*	Add Events to an Incident for Response
Threat Hunter	submit a query	Beginning an Investigation of a Service or Collection
Threat Hunter	view query results*	Conducting an Investigation
Threat Hunter	reconstruct an event	Reconstruct an Event
Threat Hunter	conduct interactive event analysis	Analyze Events in the Event Analysis View

User Role	I want to ...	Documentation
Incident Responder	investigate an incident	*NetWitness Respond User Guide*
Threat Hunter	conduct malware analysis	Conducting Malware Analysis

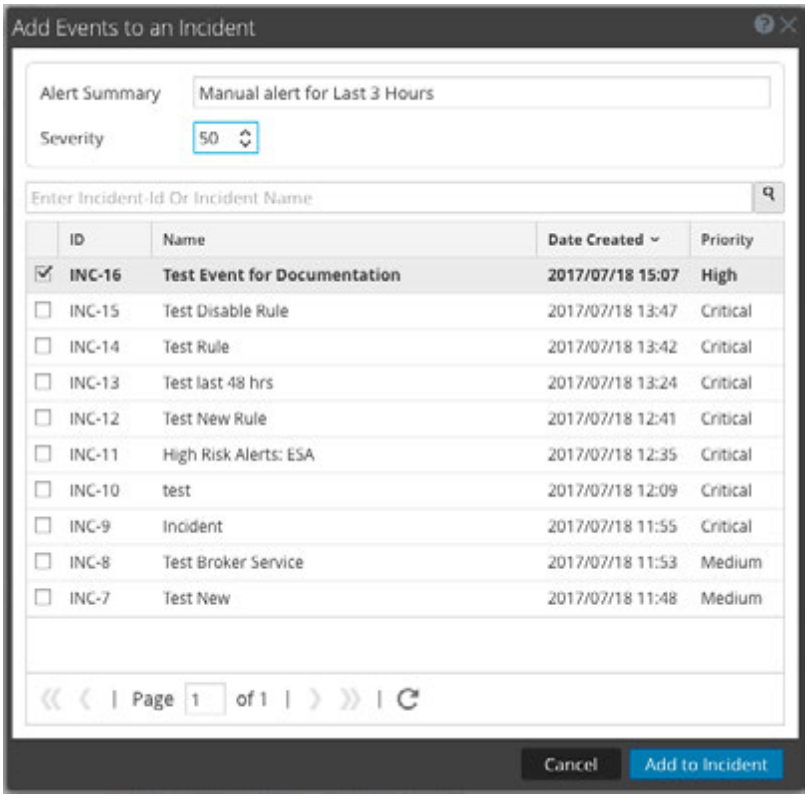
*You can perform this task in the current view.

Related Topics

- Examining Events
- Events View

Quick Look

The following figure is an example of the Add Events to an Incident dialog. The table describes the information and options in the Add Alerts to an Incident dialog .



Feature	Description
Alert Summary	The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident. The Severity field reflects the Severity of the selected alert, an integer between 1 and 100.
Search	Allows you to search for an existing event.
ID	The ID of the incident. You can sort IDs in ascending or descending order.
Name	The incident name. You can sort the Name in ascending or descending order.
Date Created	Displays the date and time the incident was created. You can sort the dates in ascending or descending order.
Priority	Displays the priority of the incident: either low or critical.
Cancel	Closes the dialog without saving changes.
Add to Incident	Adds the alerts to the incident. A dialog confirms that alerts are successfully added

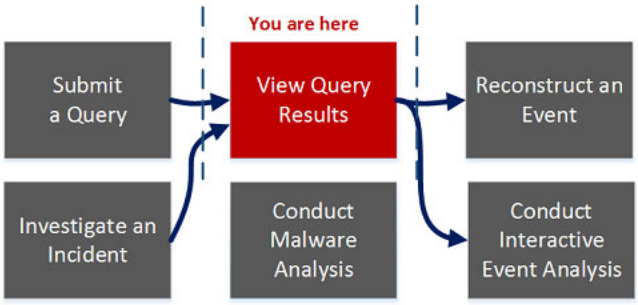
Add/Remove from List Dialog

When working in Investigate, you may find an IP address or user name that you want to watch in the Navigate view and the Events view. In the Add/Remove from List dialog, you can add meta values for the `Source IP`, `Destination IP`, or `Username` meta keys to an existing context hub list or you can create a new list containing the meta values. When you add meta values to a list, you can look up additional context on those meta values.

To display the dialog. right-click a meta value under `Source IP`, `Destination IP`, or `Username`) and select **Add/Remove from List** in the context menu.

Workflow

The following workflow diagram shows the high-level workflow for Investigate with the location of the current activity highlighted.



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	add meta values to a Context Hub List*	Manage Context Hub Lists and List Values in Investigate
Threat Hunter	create a Context Hub List*	Manage Context Hub Lists and List Values in Investigate
Threat Hunter	submit query	Beginning an Investigation of a Service or Collection
Threat Hunter	view query results	Conducting an Investigation

User Role	I want to ...	Documentation
Threat Hunter	reconstruct an event	Reconstruct an Event
Threat Hunter	analyze an event*	Analyze Events in the Event Analysis View
Incident Responder	investigate an incident	*NetWitness Respond User Guide*

Related Topics

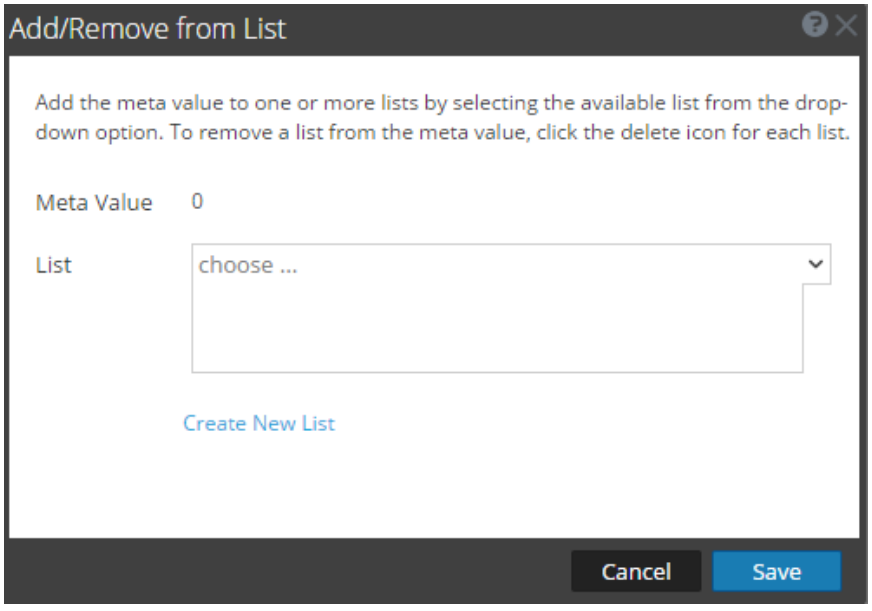
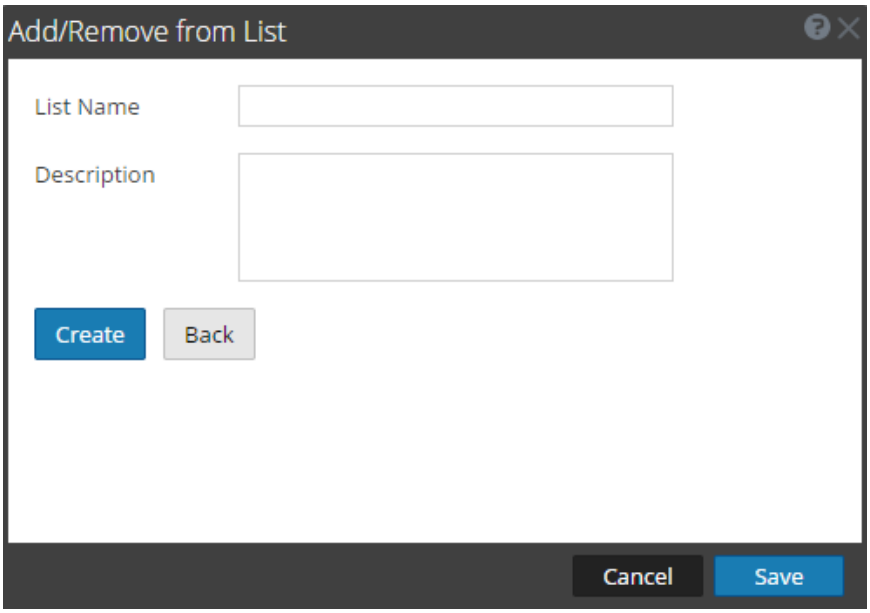
Quick Look

The following figure is an example of the dialog when initially opened.



The following figure shows the dialog when you select Create New List.



The following table describes the features of Add/Remove from List and Create New List dialogs.

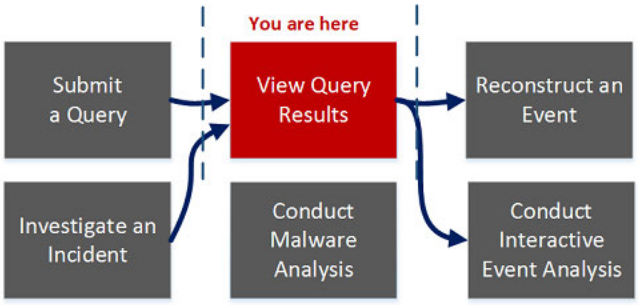
Feature	Description
Meta Value	The selected meta value to be added to the existing or new list.
List	The list to which the selected meta value must be added. A drop-down menu provides a list of available lists to which you can add the meta value.
Create New List	Opens a new dialog in which you can create a new list for the selected meta value.
List Name	The name of the new list.
Description	The description of the new list.
Create	Create a new list after entering the required fields.
Back	In the new list mode, cancels the new list creation and returns to the original dialog.
Cancel	Cancels the addition of the meta value to a list and closes the dialog.
Save	Saves the changes made to the lists and closes the dialog.

Context Lookup Panel

After an administrator configures the Context Hub service, you can view the contextual information for the meta values in the Navigate view and the Events view of the Investigate. The Context Hub service is pre-configured with default meta type and meta key mapping. For information about the mapping of the context hub meta value with investigation meta key, see "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*.

The Context Lookup panel is displayed on the right side of the Navigate view and Events view of the Investigation module. Meta values that have been added to a Context Hub list are highlighted in gray in the Navigate view Values panel. When you right-click a highlighted value and select **Context Lookup** in the resulting context menu, the lookup results are displayed in the Context Lookup panel for configured sources for the selected meta value. You can select a source in the Context Lookup panel icon bar to view the contextual information.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	investigate meta values*	View Additional Context for a Data Point
Threat Hunter	submit a query	Beginning an Investigation of a Service or Collection
Threat Hunter	view query results*	Conducting an Investigation
Threat Hunter	reconstruct an event	Reconstruct an Event

User Role	I want to ...	Documentation
Threat Hunter	conduct interactive event analysis	Analyze Events in the Event Analysis View
Incident Responder	investigate an incident	*NetWitness Respond User Guide*

*You can perform this task in the current view.

Related Topics

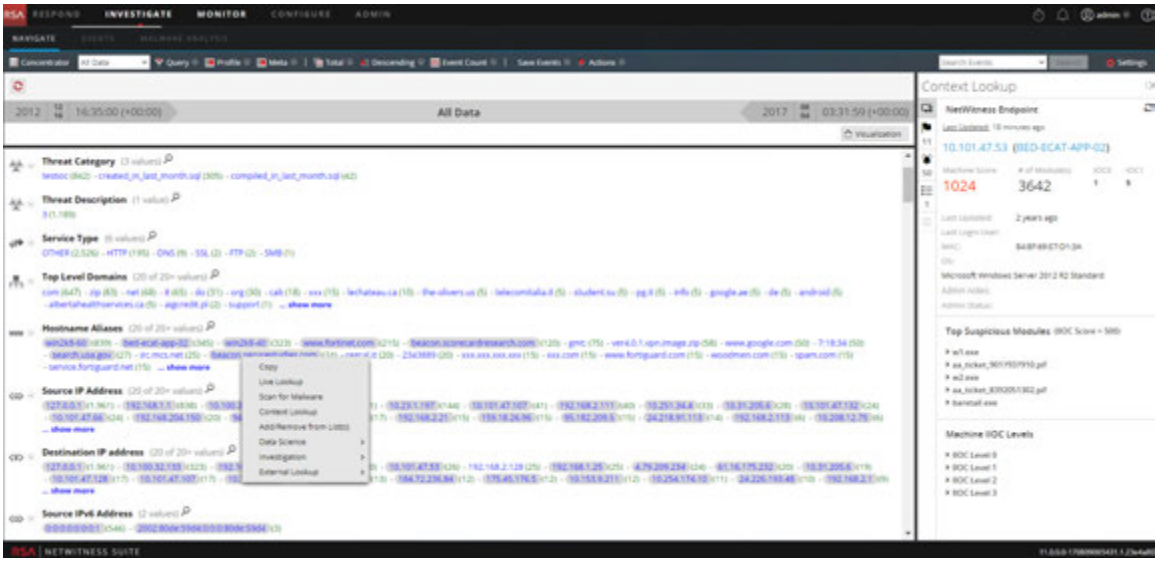
- View Additional Context for a Data Point

Quick Look

The following figure is an example of the Context Lookup panel, and controls and features are described in the table.



Feature	Description
Source Options Bar	Displays the icons for the available sources: Endpoint, Incidents, Alerts, and Lists.
Source Name	Displays the source name based on the selected icon: • Endpoint • INCIDENTS • ALERTS • LISTS
Sort	Provides a drop-down of sort options for the listed context information. Possible sort options are Severity - High to Low, Severity Low to High, Date - Oldest to Newest. and Date - Newest to Oldest. The sorting options vary by source type.
	Refreshes the lookup results.
n items (First n Results)	The footer provides a count of the total number of results, and the count of results currently displayed. For example, 50 Alerts (First 50 Alerts).

Lookup Results

The Context Lookup panel displays the following information when retrieving the context data from the configured sources.

Incidents

Incidents are displayed based on time first (Newest to Oldest) and then priority status. The following information is displayed for incident lookups:

- Incident Name and ID
- Priority status of the incidents
- Risk Score value of the incidents
- Date when the incident was created
- Status of the incident

- Assignee for the incident
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Time window: This is based on the value that is set for the "Query Last (Days)" field in the Configure Respond window. For details, see the "Configure Respond as a Data Source" topic in the *Context Hub Configuration Guide*.
- Sort: This drop-down field provides options to change the sorting of result based on time or priority.

Alerts

Alerts are displayed based on the Severity. ;The following information is displayed for alert lookups:

- Alert Name
- Severity value of the alerts
- Date when the alert was created
- Incident ID: This is the ID of the incident that the alert is associated with (If any).
- Sources: Event source name
- Number of events associated with the alert.
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Time window: This is based on the value that is set for the "Query Last (Days)" field in the Configure Respond window. For details, see the "Configure Respond as a Data Source" topic in the *Context Hub Configuration Guide*
- Sort: This drop-down field provides option to change the sorting of result based on time or priority.

Lists

The following information is displayed for list lookups.

- List Name
- Owner who created the list
- Created Date

- Last Updated Date
- Description of the list

Endpoint

The following information is displayed for Endpoint lookups.

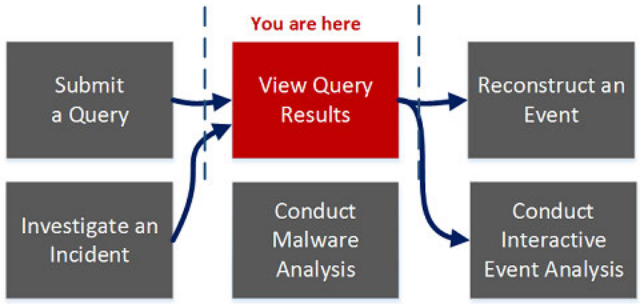
- Machine name and IP address of the machine.
  By clicking on the IP or Endpoint machine name, you will be navigated to Endpoint UI to perform further investigation.
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Machine Score: A machine IIOC score is aggregated based on the module scores.
- Number of modules: Number of active files for the selected machine.
- Last Updated: Indicates when the scan results were last updated in Endpoint database.
- Last Login User
- Machine MAC Address
- Operating System Version
- Admin Notes (if any)
- Admin Status (if any)
- Top Suspicious Modules (Modules that have an IIOC score > 500). This is based on the value set for "Minimum IIOC Score" field in the Configure Endpoint window. The default value for "Minimum IIOC Score" is 500.
- Machine IIOC Levels

Create an Incident Dialog

In the Create an Incident dialog, analysts can create an incident from selected events in the Events view. The incident is then available to incident responders working in Respond.

To access this dialog, while investigating a service in the Investigation > Events view, select **Incidents > Create New Incident** from the toolbar.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	create an Incident or add events to an incident*	Add Events to an Incident for Response
Threat Hunter	submit a query	Beginning an Investigation of a Service or Collection
Threat Hunter	view query results*	Conducting an Investigation
Threat Hunter	reconstruct an event	Reconstruct an Event
Threat Hunter	conduct interactive event analysis	Analyze Events in the Event Analysis View

User Role	I want to ...	Documentation
Incident Responder	investigate an incident	*NetWitness Respond User Guide*

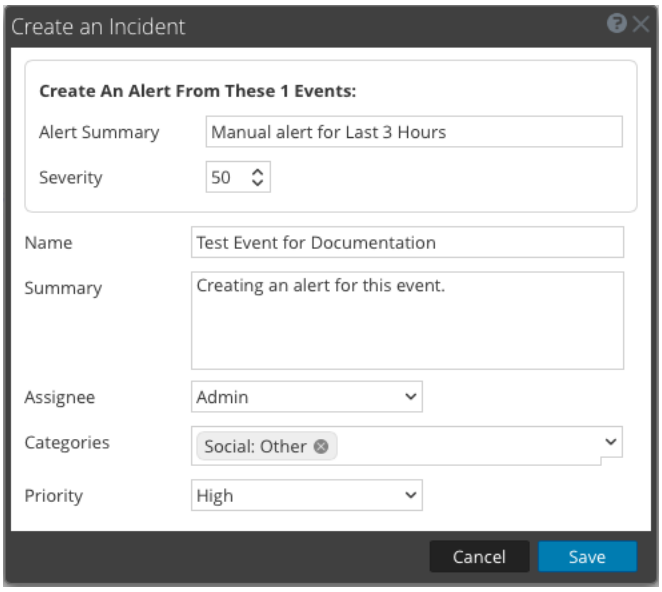
Quick Look

The following figure is an example of the Create an Incident Dialog, and the features are described in the table.



Feature	Description
Create Summary from These Events	The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident. The Severity field reflects the Severity of the selected alert, an integer between 1 and 100.

Feature	Description
Name	(Required) Specifies a name to identify the incident. In the example, the name is Sample Incident. You can provide a name that clearly identifies the nature of events that will be added to this incident
Summary	(Optional) Specifies a description for the incident. A good summary clearly identifies the incident for other analysts and responders.
Assignee	(Optional) Assigns the incident to a user in the SOC. Clicking Assignee opens a drop-down list showing the user names of SOC personnel who respond to incidents.
Categories	(Optional) Identifies categories of incidents. Clicking Categories, opens a drop-down list of Incident categories and subcategories. You can select one or more categories to which the incident belongs. Categories fall into these major groups: Environmental, Error, Hacking, Malware, Misuse, and Social.
Priority	Identifies the priority for the incident. Clicking Priority opens a drop-down list of priorities: Critical, High, Medium, or Low displayed in the drop-down list.
Cancel	Closes the dialog without saving changes.
Save	Saves the incident and closes the dialog. A message confirms that the incident was created successfully.

Event Analysis View

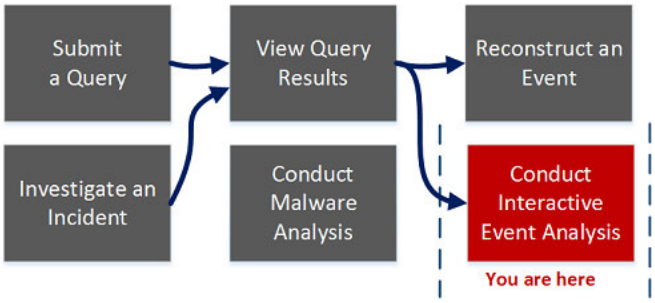
In the Event Analysis view, interactive features enhance your ability to find meaningful patterns in the data. This is an alternative to the static Event Reconstruction view. Analysts who are assigned a user role with access to the Event Analysis view can examine network, log, and endpoint events in the Event Analysis view. You can choose between this view or the Event Reconstruction view.

The Event Analysis view lists the events associated with the current drill point in the Navigate view in order by time. When you click an event, the Network Event Details, Log Event Details, or the Endpoint Event Details panel opens in the same browser window. Each type of event has one or more types of analysis: Text Analysis, Packet Analysis, and File Analysis.

To access this window, do one of the following:

- In the Events view with Detail View selected, click **Event Analysis** at the end of the event,
- In the Event Reconstruction toolbar, click **Event Analysis**.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	submit a query	Beginning an Investigation of a Service or Collection

- Event Analysis View - Text Analysis Panel
- Event Analysis View - File Analysis Panel

Quick Look

When you open a drill point in the Event Analysis view, the service being investigated counts the results of the initial query up to a limit of 100,000 events, and the first 1,000 events, packets ,logs, and endpoint events are loaded in the Event list panel. The columns in the Event list panel list the Event Time, Event Type (Network, Log, or Endpoint), Event Size, and Summary. You can:

- Scroll through the list and click **Load More** to see the next 100000 events.
- Drag the columns to rearrange the order.
- Make columns wider or narrower.
- View the event analysis of an event.

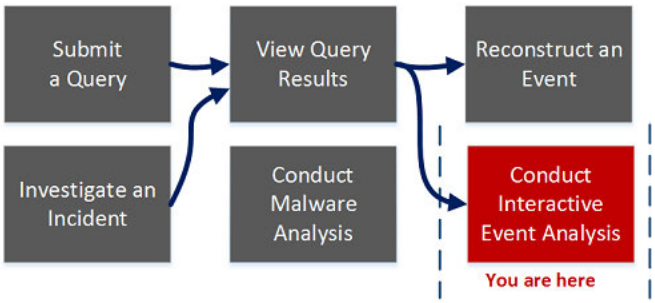
1	The read-only breadcrumb shows the query used to produce this data set. All queries are done in the Navigate view or the Events view.
2	This is a read-only list of events based on the query made in the Navigate or Events view. The Event list includes a count of the events. You can rearrange and resize columns. You can scroll to the bottom of the list, and load more events (see Analyze Events in the Event Analysis View).
3 and 8	Controls to change the size of the panel and close the panel.
4	The type of event being analyzed is reflected in the heading: Network Event Details, Log Event Details, or Endpoint Event Details. Each view is discussed in detail in Analyze Events in the Event Analysis View.
5	The types of analysis available for the event type. Network events can use all three types of analysis: text, packet, and file. Log and endpoint events use only text analysis.
6	These options vary for the different types of analysis. They are discussed in detail in Analyze Events in the Event Analysis View.
7	Controls to show or hide the Event Header, show or hide requests and responses, and open the Event Meta panel (12). These controls are described in Analyze Events in the Event Analysis View.

	 Click this icon to hide the Event Header or display it. Hiding the header allows more space for the packet list, reducing the amount of scrolling required to view more packets.  Click to display the Event Meta panel for the event in another panel.
9	Reopen the Event list panel or the Event Meta panel if you have closed it.
10	Event Header, which provides summary information about the event. This information is different for the different event types (packet, log, and endpoint).
11	The event data (sometimes called a payload for packets). The event data for a log event or endpoint event is typically a line of text from the raw log rather than request and response shown for a packet.
12	The Event Meta panel lists the meta keys and values found in the data. Some meta data are searchable; they have a binoculars icon, which you can click to see the associated data highlighted in the event data (see Analyze Events in the Event Analysis View.

Event Analysis View - File Analysis Panel

In the File Analysis panel (**Event Analysis > File Analysis),** you can safely view a list of files and download one or more files in an event that you found in the Navigate view or the Events view.

Workflow



What do you want to do?

User Role	I want to ...	Documentation

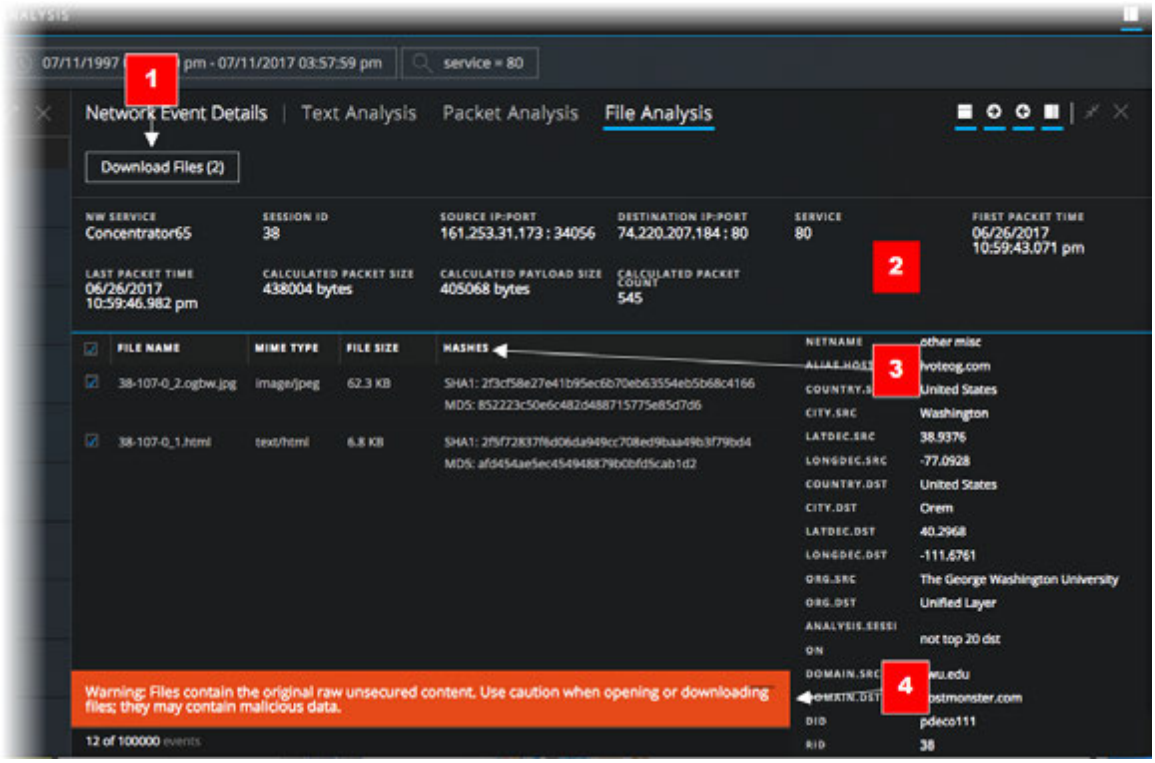
- Event Analysis View - Text Analysis Panel
- Event Analysis View - Packet Analysis Panel

Quick Look

The File Analysis panel displays a list of files associated with a network event. You can download files in this view.

Below is an example of a File Analysis.



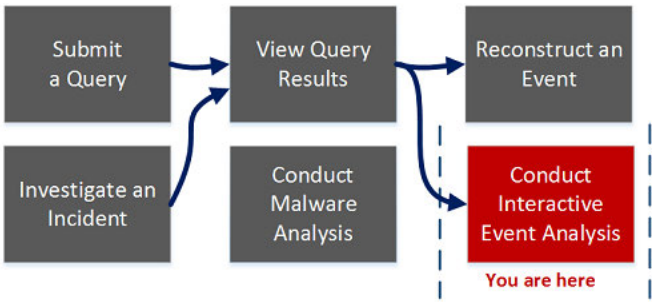
1 Click to download one or more selected files.

2	The Event Header displays summary information for the network event that contains the files.
3	Scrollable list of associated files that you can select and download.
4	Reminder that caution is necessary when downloading potentially malicious files.

Event Analysis View - Packet Analysis Panel

In the Packet Analysis panel (**Event Analysis > Packet Analysis),** you can safely view and interactively analyze the packets and payload of an event that you found in the Navigate view or the Events view.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	submit query	Beginning an Investigation of a Service or Collection

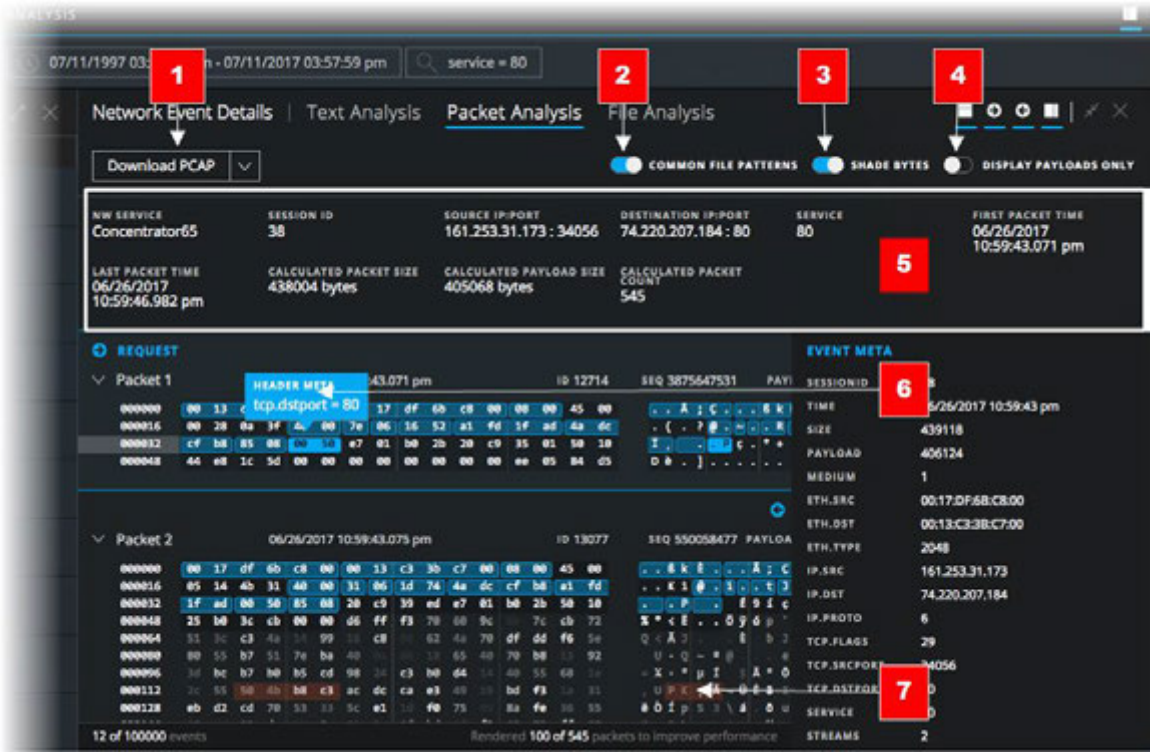
- Event Analysis View - File Analysis Panel

Quick Look

Only network events can be analyzed in the Packet Analysis panel. The Packet Analysis panel lists each packet in the event. For each packet, you can see the packet number, the direction (Request or Response), and the packet contents ascii format on the left, hexadecimal format in the middle, and text format on the right. The list of packets is scrollable. When you scroll, the packet or text identification information as well as the Request and Response labels remain visible rather than scrolling out of view.

Each packet is displayed with shading and highlighting to help identify common file patterns: significant header and payload bytes, hexadecimal and ascii bytes, and common file signatures. In addition, you can adjust the request/response display, and display or hide the packet summary.

Below is an example of ther Packet Analysis panel.



1	Options for exporting a network event. You can export a PCAP, all payloads, request payloads, or response payloads for deeper analysis and to share with others.
2	The option to identify common file signatures is activated by default. Common file signatures are highlighted in orange (7); hovering over the highlight reveals the file type.
3	The Shade Bytes option adds shading to identify the different hexadecimal bytes (00 to FF) using degrees of highlighting.
4	The option to display payloads only hides the packet headers, leaving more space for the payload.
5	The Event Header.
6	Significant bytes are highlighed in a blue background; as you move the cursor over the highlighting the meta data is displayed in a hover box. For example, **Header Meta ip.proto=6** is a tooltip for highlighted meta data in the hexadecimal and binary representation of the packet header.
7	Orange highlighting identifies a common file signature. Moving the mouse over the area displays the possible file type in a hover box.

Event Analysis View - Text Analysis Panel

In the Text Analysis panel (**Event Analysis > Text Analysis),** you can safely view and analyze the raw text payload of an event that you found in the Navigate view or the Events view. The Text Analysis panel includes features that can show decompressed or compressed text, expand truncated entries, perform URL and Base64 encoding and decoding, and download network events, logs, and endpoint events. The Text Analysis panel is available for all types of events: network, log, and endpoint.

Workflow

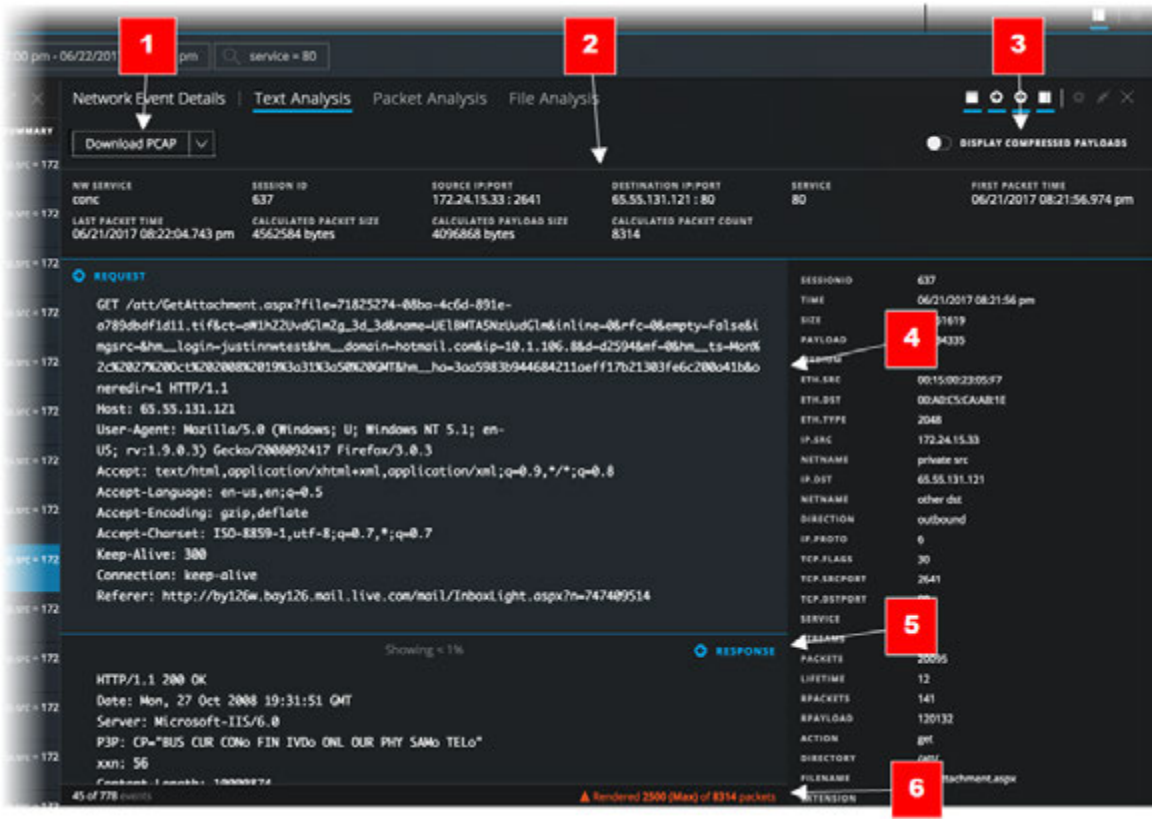
Related Topics

- How NetWitness Investigate Works
- Event Analysis View
- Event Analysis View - Packet Analysis Panel
- Event Analysis View - File Analysis Panel

Quick Look

The Event Analysis view displays the text of a single event in the Text Analysis panel. When you click an event in the Event list panel, the adjacent panel shows the Text Analysis. Only the raw log for log events and endpoint events is shown in the Text Analysis panel. For network events, the direction of the packet (Request or Response) and contents of each packet are provided in text format.



1	Options for exporting a log, a PCAP, or files for deeper analysis and to share with others. This download menu is for network data.
2	The event header information.
3	Click to view the network payload in compressed or decompressed form.
4	The payload for a network event includes requests and responses. This is the request side of the packet.
5	This is the response side of the packet. Only 1% of the response is displayed because it has been truncated to allow viewing of more packets. When you scroll down, you can click an option to display the rest of the payload.
6	This message is displayed when the threshold of 2500 packets is reached, a measure to optimize performance. Additional packets will not be displayed. You may want to download the event to view all of the packets.

Event Reconstruction View

The Event Reconstruction view provides a reconstruction of a selected event from the Events view. By default, NetWitness Suite displays the best reconstruction for the event determined by the event content, or the default reconstruction that you have selected in the Default Session View setting for Investigate. You can use the options in the Event Reconstruction toolbar to change the reconstruction method, view top-to-bottom or side-by-side results, select request and response views, export an event, export meta values, extract files, open an email attachment, and open the event in a new tab.

To access this view, do one of the following:

- In any Events view, double-click an event.
- In the Events view with Detail View selected, right-click **Event Analysis** at the end of the event, and select **Event Reconstruction.**
- In the Event Reconstruction toolbar of previewed reconstruction, click **Open Event in New Tab**.

Workflow

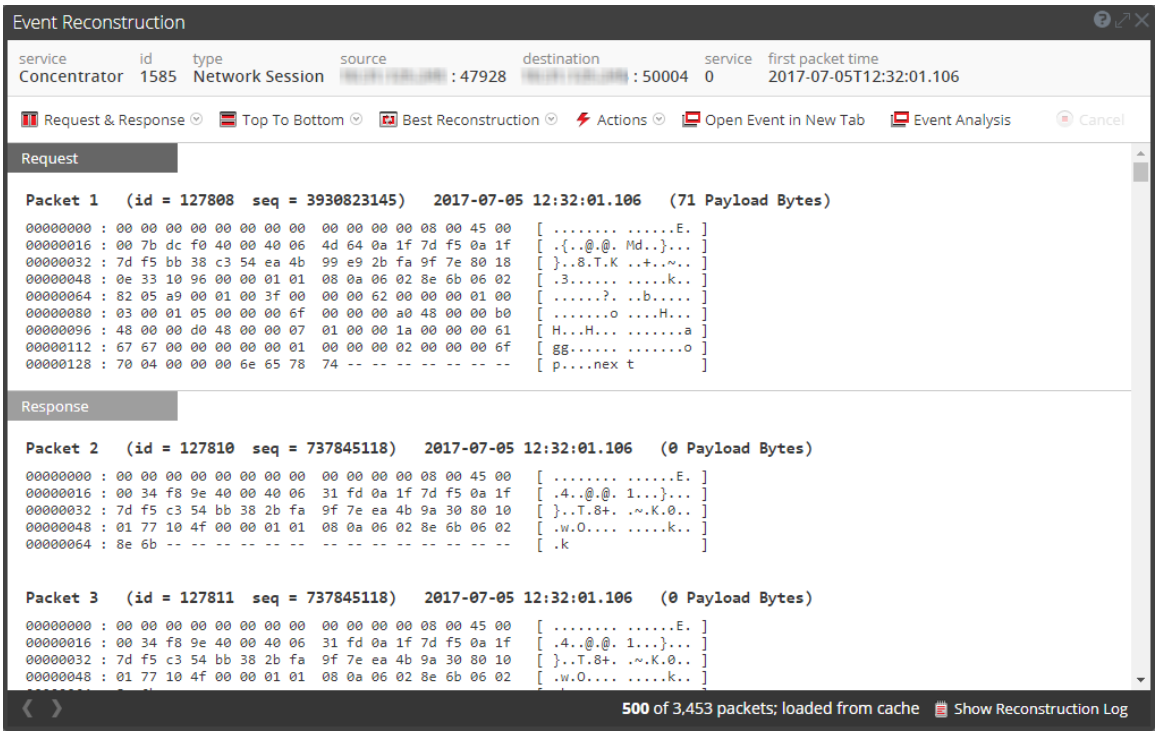
Quick Look

This figure is an example of the Event Reconstruction view. The following table describes the toolbar options.



Feature	Description
Request & Response	Displays a drop-down menu for selecting whether the view displays: • Request & Response • Request • Response
Organization	Displays a drop-down menu for selecting whether the information is displayed top to bottom or side by side.

Feature	Description
View	Displays a drop-down menu for selecting what information is displayed. By default, Best Reconstruction is selected. Other options are: • View Meta • View Text • View Hex • View Packets • View Web • View Mail • View Files
Actions	Displays a drop-down menu with the actions available in the Event Reconstruction view.
Open Event in New Tab	Opens the event in a new browser tab.

Beneath the toolbar is a list of meta keys and values. Some of the keys offer a drop-down menu with available actions.

The bar at the bottom of the view offers several options.

Feature	Description
	Displays the previous event.
	Displays the next event.
Show Reconstruction Log	Displays the reconstruction log at the bottom of the view. Once you click this button, it changes to Hide Reconstruction Log.

Events View

In the **Events view** a list of events associated with a session is available. There are two ways to display the Events view:

- Select **Investigate > Events.** NetWitness Suite runs a default query on the last three hours for the default service (if one is set) or displays a dialog in which you can select a service and then runs the default query. The default query selects all events and the Events view displays events on the selected service, with the oldest events first.
- From within the **Navigate** view, click an event. The Events view displays the events on the selected service based on the drill point in the Navigate view.

Related Topics

- How NetWitness Investigate Works
- Examining Events
- Navigate View

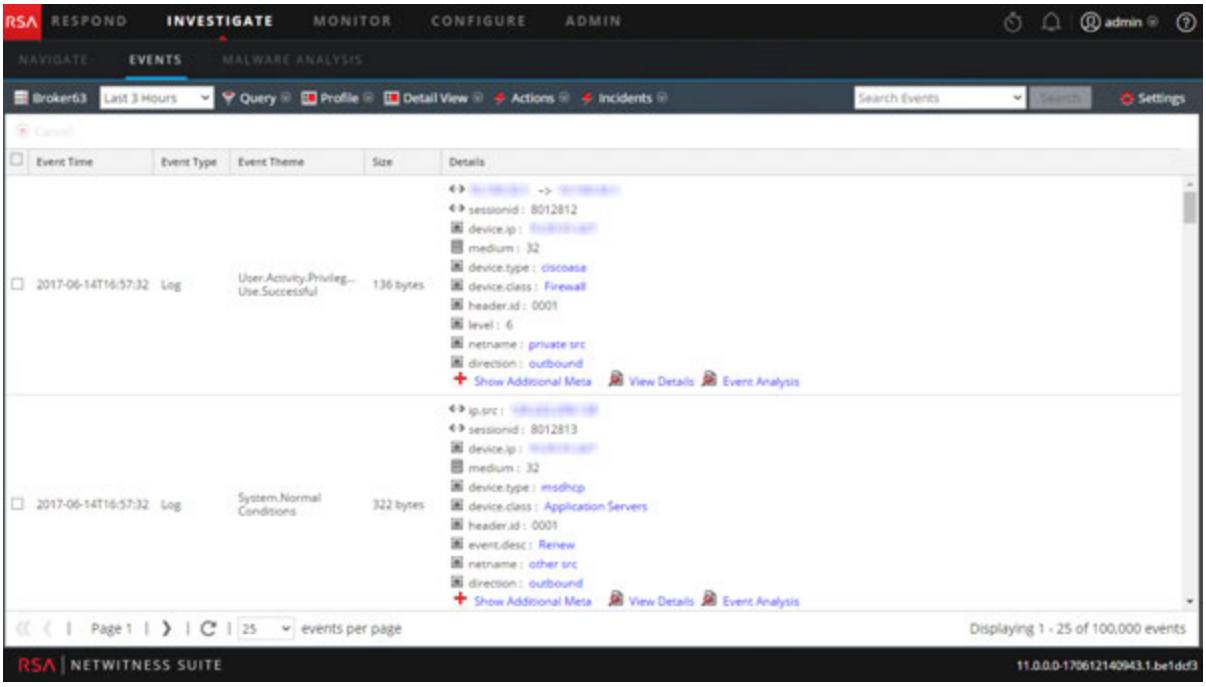
Quick Look

The Events view provides three built-in presentations of event data: the Detail view, the List view, and the Log view. The List view and Detail view are intended for viewing packet data events, and they provide more information for each event including the timestamp, event type, event theme, and size.

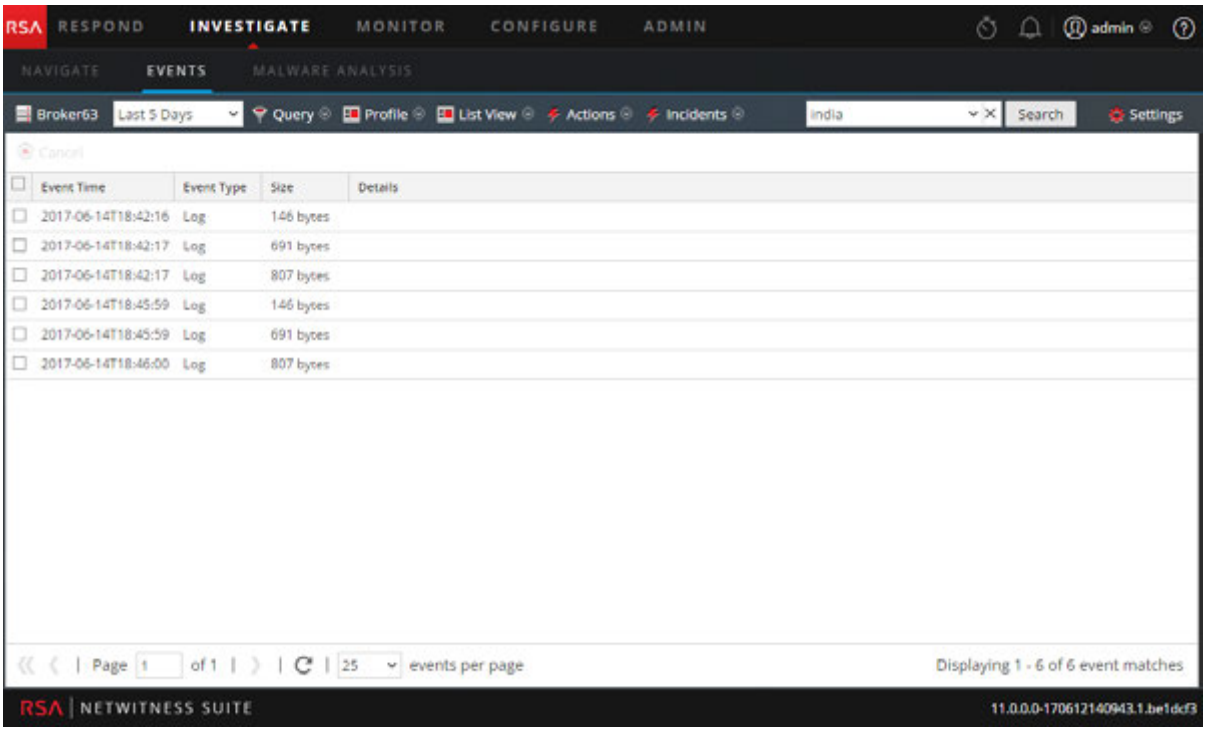
- The List View shows corresponding source and destination address and port information for events in summary form in a grid.
- The Detail View shows all metadata collected for the event in a paged view.
- The Log View is optimized for viewing log information, and provides more information for each log including the timestamp, event type, service type, service class, and the logs.

You can use queries, the time range setting, and profiles to filter the events listed in the Events view. From any view type in Events view, you can extract files; export events, logs, and meta values; open the Event Reconstruction panel, and open Event Analysis.

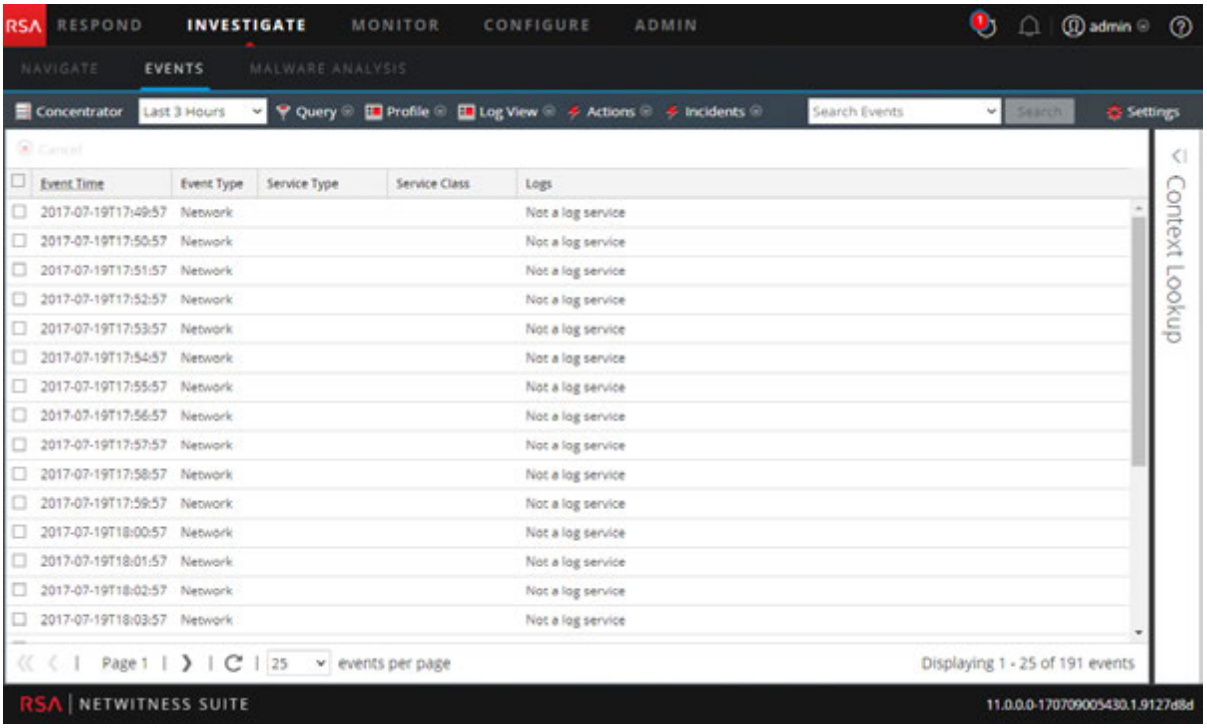
The following figure is an example of events in the Detail View. The Context Lookup panel is visible only if the Context Hub service is configured.



The following figure is an example of events in the List View.



The following figure is an example of the Log View.



Detailed Description

The Events view has a toolbar at the top with the following options.

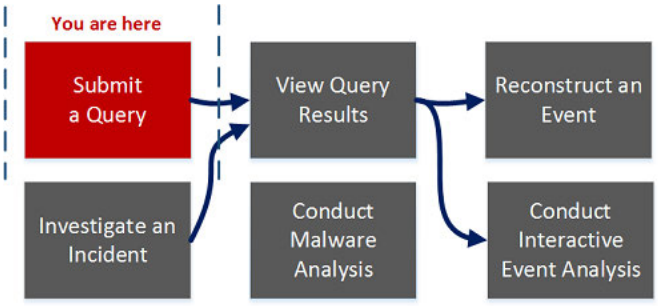
Feature	Description
Select Service	Displays the selected service name next to the icon. Opens the Select a Service dialog, in which you can select a service for which the event list is displayed.
Time Range	Displays a drop-down menu for selecting the time range to apply to the event list. You can choose one of the standard options or specify a custom time range.
Query	Displays the Create Filter dialog, in which you can enter a custom query directly instead of drilling down the data (see Create a Custom Query)
Profile	Displays the Use Profile menu; the currently selected profile is displayed in the toolbar. A profile allows you to manage and use profiles that can include custom meta groups, a default column group, and a beginning query. The Profiles apply to the Navigate view (meta groups and queries) and the Events view (column groups and queries).
View Type Drop-down	Displays a drop-down menu for selecting the event view type. • Detail View shows events in a paged format with detailed information for each event. • List view shows the events in grid form with a summary of each event in a separate row. • Log View shows a log-oriented events grid with a summary of each log in a separate row. • Custom Column Groups displays the event list using a column group selected from a drop-down list of custom column groups. • Manage Column Groups displays the dialog for creating and editing custom column groups.

Feature	Description
Actions	Displays a drop-down menu with actions in the Events view: • Extract Files, export events as a PCAP file, export logs, or export meta values. • View an event reconstruction in a popup window or in a new tab. • View Event Analysis • Reset all filters in the Events view.
Incidents	Create a new incident in Respond and add the selected events, or add selected events to an existing incident in Respond.
Search	Displays the Search Events options, which allow you to specify the export log and export meta value format with additional options explained in Search for Text Patterns in the Investigate View
Settings	Displays the Investigation settings for the Events view (which are also available in the Profile view) so that you can change Investigation settings without navigating away from the Events view. When you change a setting In the Events view the setting is also changed in the Profile view (see Configure Navigate View and Events View).

Investigate Dialog

In the Investigate dialog, analysts can select a service or a collection to investigate. The dialog is automatically displayed when you first go to the Navigate view or Events view and have not selected a default service to investigate. To access the dialog from a current investigation, select the current service name in the toolbar.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	set or change a default service*	Beginning an Investigation of a Service or Collection
Threat Hunter	investigate a service or collection*	Beginning an Investigation of a Service or Collection
Threat Hunter	submit a query	Beginning an Investigation of a Service or Collection
Threat Hunter	view query results	Conducting an Investigation
Threat Hunter	reconstruct an event	Reconstruct an Event

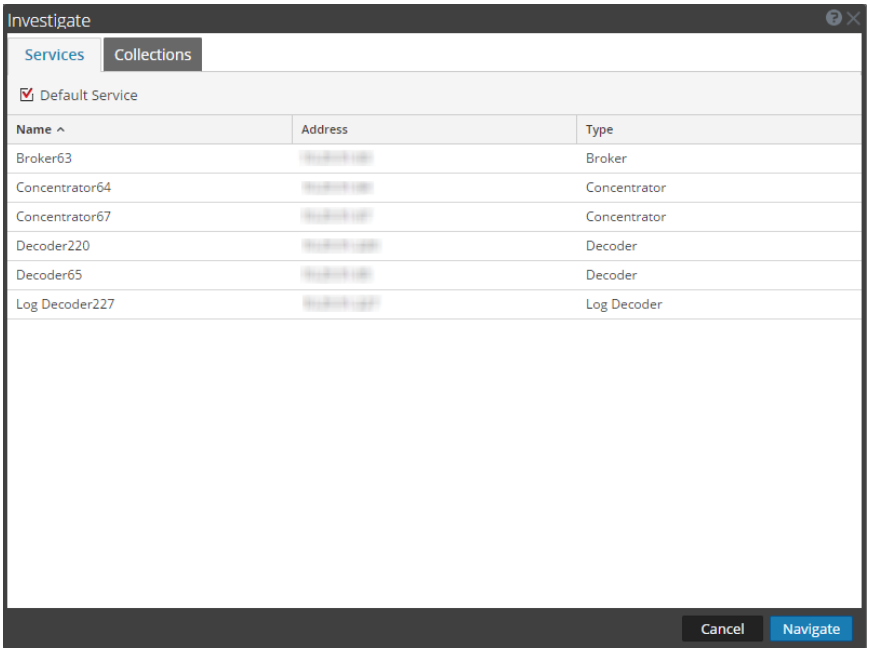
User Role	I want to ...	Documentation
Threat Hunter	conduct interactive event analysis	Analyze Events in the Event Analysis View
Incident Responder	investigate an incident	*NetWitness Respond User Guide*
Threat Hunter	conduct malware analysis	Conducting Malware Analysis

*You can perform this task in the current view.

Related Topics

- How NetWitness Investigate Works

Quick Look



The Investigate dialog has two tabs: Services and Collections.

Note: Collections are also known as workbench collections. You can only view workbench collections that you have created, and only administrators can create a workbench collection.

The Services tab includes a list of services available for investigation, and three buttons. All features are described in the following table.

Feature	Description
Default Service	Clicking this button sets or clears the default service to investigate. When a service has been set as the default service, the word (Default) is appended to the service name.
Name	The name of the service.
Address	The IP address of the service.
Type	The type of service.
Cancel	Closes the dialog.
Navigate	Opens the selected service in the Navigate or Events view.

The Collections tab has two buttons and two panels: Workbench and Collections.

The Workbench panel lists available Workbench services by name. After a Workbench service is selected, you can select a collection from the Collections panel.

The Collections panel lists available collections to investigate. After a collection is selected, you can click Navigate to view the collection.

The following table describes the features of the Collections panel.

Feature	Description
Name	The name of the collection.
Type	The type of collection.
Size	The size of the collection.
Data Type	The type of data within the collection.
Date Created	The date the collection was created.

Investigation Tab - User Preferences Panel

In the Profile view > Preferences panel > Investigation tab, users can set several preferences that affect the performance and behavior of NetWitness Suite when analyzing data, viewing events, and reconstructing events in Investigation. To access this tab, select > Profile. When the Profile view is displayed, select Preferences > Investigation tab. You can change user preferences at any time when you are working in NetWitness Suite.

What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	view and change user preferences for Investigate*	Configure Navigate View and Events View.
Threat Hunter	submit a query	Beginning an Investigation of a Service or Collection
Threat Hunter	view query results	Conducting an Investigation
Threat Hunter	reconstruct an event	Reconstruct an Event
Threat Hunter	conduct interactive event analysis	Analyze Events in the Event Analysis View
Incident Responder	investigate an incident	*NetWitness Respond User Guide*
Threat Hunter	conduct malware analysis	Conducting Malware Analysis

*You can perform this task in the current view.

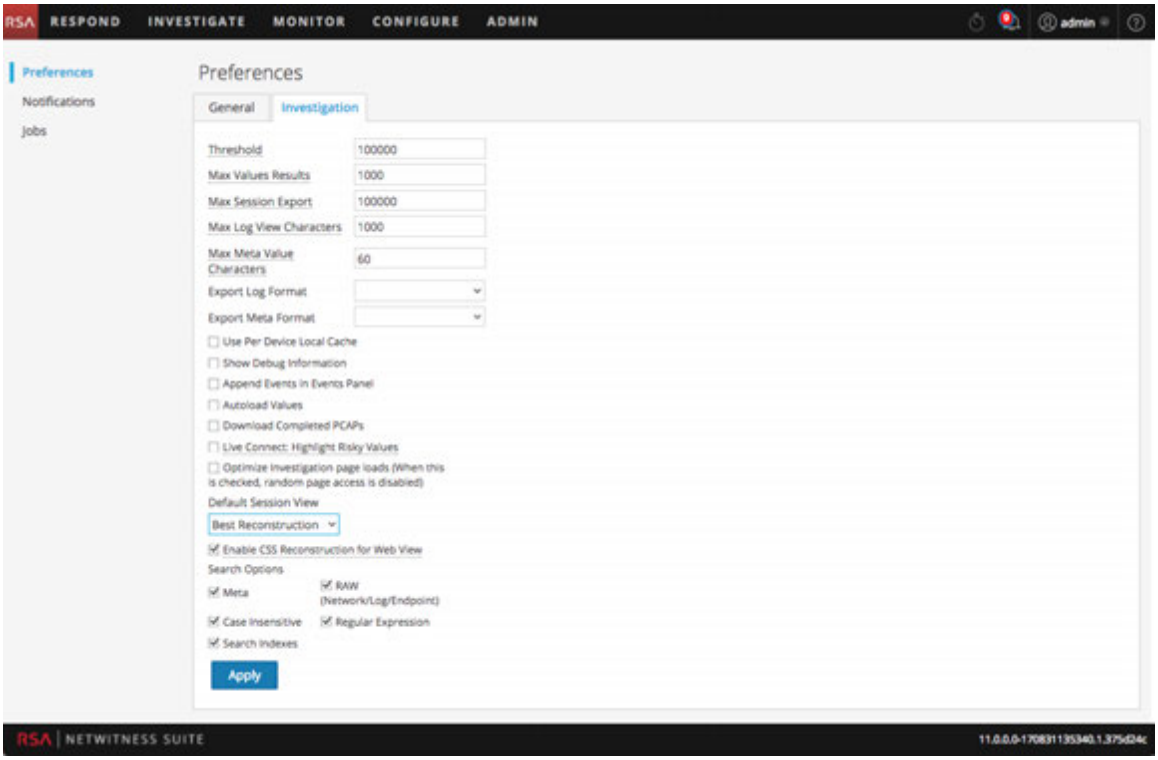
- Events View

Quick Look

This figure is an example of the Investigation tab, and the following table describes the Investigation preferences.



Feature	Description
Threshold	This setting controls the count shown for a Meta Key value in the Navigate view during the load. A higher threshold allows more accurate counts for a value. However, a higher threshold causes longer load times. When the threshold is reached, NetWitness Suite displays the count and the percentage of time used to reach the count in comparison to the time necessary to load all sessions with that value. For example, **(>100000 - 18%)** indicates that the threshold was set at 100000 and this load took only 18% of the time it would have taken with no threshold set. The default value is **100000**.
Max Values Results	This setting controls the maximum number of values to load in the Navigate View when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The default value is **1000**.
Max Session Export	This setting controls the maximum number of sessions that can be exported. The default value is **100000**.
Max Log View Characters	This setting controls the maximum number of characters to be displayed on **Investigation > Events > Log Text**. The default value is **1000**.
Export Log Format	This setting specifies the default format for exporting logs from Investigation. Available options are **Text**, **XML**, **CSV**, and **JSON**. There is no built-in default value for the log export format. If you do not select a format here, NetWitness Suite displays a selection dialog when you invoke export of logs. When you select one of the options from the Export Log Format drop-down menu and click Apply, the setting goes into effect immediately.

Feature	Description
Export Meta Format	This setting specifies the default format for exporting meta values from Investigation. Available options are Text, XML, CSV, and JSON. There is no built-in default value for the meta export format. If you do not select a format here, NetWitness Suite displays a selection dialog when you invoke export of meta. When you select one of the options from the Export Meta Format drop-down menu and click Apply, the setting goes into effect immediately.
Use Per Device Local Cache	
Show Debug Information	When this option is selected, NetWitness Suite displays the `where` clause beneath the breadcrumb in the Navigate view. For each meta value load, the load time is displayed. If the service is a Broker, then the elapsed time for each aggregated service is reported. The default value is **Off.**
Append Events in Events Panel	When this option is selected, the events displayed in the **Events Panel** are added incrementally rather than overwriting the currently displayed events. Each time you click the next page icon, the additional events are appended to the previous events; 1 -25, then 1 -50, then 1 -75 and so on. **Note:** This option is available, only if the Optimize Investigation Page Loads option is enabled
Autoload Values	When this option is selected, the service values are automatically loaded in the Navigate view. When not selected, NetWitness Suite displays a **Load Values** button, allowing the user the opportunity to modify the options. The default value is **Off**.
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in the Investigate so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP format.

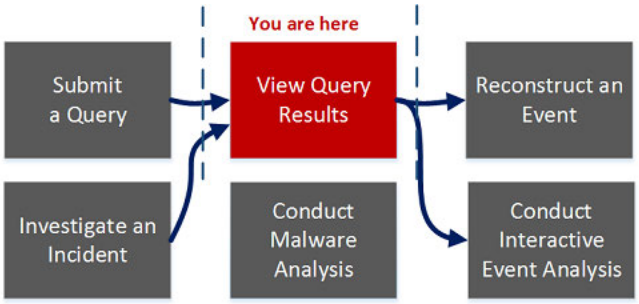
Feature	Description
Live Connect: Highlight Risky Values	
Optimize Investigation Page Loads	This option is enabled by default (checked) and controls how the Events view retrieves events. When optimized, results are returned as quickly as possible. This sacrifices the original ability to go to a specific page in the event list. Unchecking this box changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). Being able to go to any page in the list sacrifices some speed in returning the results due to additional overhead determining the events in advance.
Default Session View	This setting selects the default reconstruction type for the initial reconstruction view. By default events are reconstructed using the reconstruction type most appropriate to the event.
Enable CSS Reconstruction for Web View	This setting controls how web content reconstruction is performed. If enabled, the web reconstruction includes cascaded style sheet (CSS) styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for stylesheets and images used in the target event. The option is enabled by default. Uncheck this option if there are problems viewing specific websites. **Note:** The appearance of the reconstructed content may not match the original web page perfectly if related images and stylesheets could not be found or were loaded from the web browser's cache. Also, any layout or styling that is performed dynamically via client side javascript will not render in the reconstruction because all client side javascript is removed for security purposes.
Search Options	This setting sets the default search options to apply to a search in the Navigate and Events views. Search for Text Patterns in the Investigate View provides detailed information.

Feature	Description
Apply	Saves your preferences and puts them into effect immediately.

Manage Default Meta Keys Dialog

In the Manage Default Meta Keys dialog, analysts can specify the meta keys to be displayed during navigation for a specific service. This can help you find the desired data more quickly and prevents the loading of meta data that is not of interest. To access this dialog, in the **Navigate View** toolbar, select **Meta > Manage Default Meta Keys**.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	configure default meta keys for a service*	Manage and Apply Default Meta Keys in an Investigation.
Threat Hunter	submit query	Beginning an Investigation of a Service or Collection
Threat Hunter	view query results*	Conducting an Investigation
Threat Hunter	reconstruct an event	Reconstruct an Event
Threat Hunter	analyze an event	Analyze Events in the Event Analysis View
Threat Hunter	conduct malware analysis	Conducting Malware Analysis

User Role	I want to ...	Documentation
Incident Responder	investigate an incident	*NetWitness Respond User Guide*

*You can perform this task in the current view.

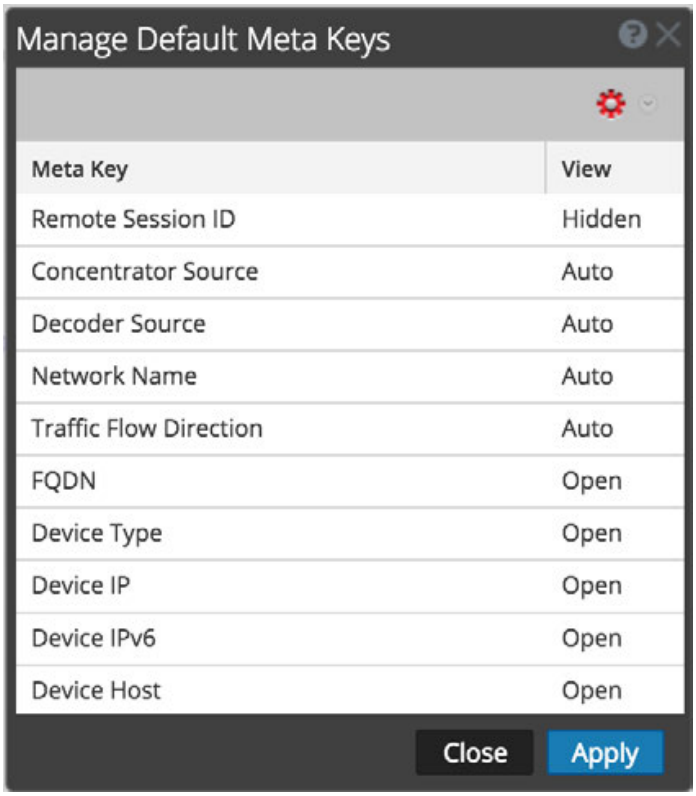
Quick Look

The following figure illustrates the Manage Default Meta Keys dialog, which has a list of meta keys, toolbar, Close button, and Apply button. In the list, you can view, sort, and manage default meta keys. If you click and drag meta keys, you can rearrange their order. The following table describes columns in the list.



Column	Description
Meta Key	This column displays the meta keys available for the service.

Column	Description
View	This column displays the type of view assigned to each meta key. By clicking on the view in each row, you can assign the meta key a different default view. There are four views: • Auto: Reverts to the default view for meta keys as specified in the service index file. • Close: The values of this meta key are closed by default, and can be opened manually. • Hidden: These meta keys are hidden by default, and are not shown in Investigation at all. • Open: The values of this meta key are displayed by default. When you modify the default meta keys for a non-indexed meta key, you cannot set the key to **Open**. If you change the default view for a group of meta keys to **Open** and some of the meta keys are non-indexed, the non-indexed meta keys revert to **Auto**. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are **Closed** until opened manually.

The following table describes the toolbar options and buttons.

Feature	Description
	Clicking the Actions menu allows you change the default view of all the meta keys. There are four views: • Auto: Reverts to the default view for meta keys as specified in the service index file. • Close: The values of this meta key are closed by default. • Hidden: The values of this meta key are hidden by default. • Open: The values of this meta key are displayed by default.
Close	Closes the dialog. Any unsaved changes are lost.
Apply	Applies the changes, and they become effective immediately.

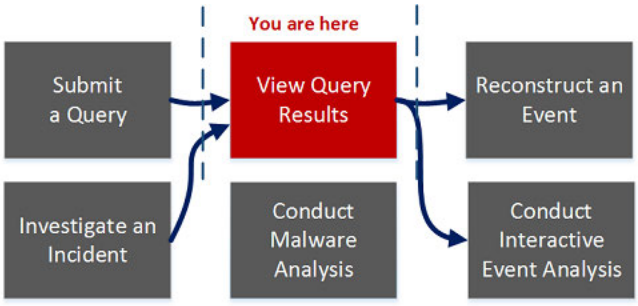
Malware Analysis Events List and Files List

The Malware Analysis Events List and Files List provide a detailed view of events or files. You can double-click on an event or file in either of the lists to display the Analysis Results view in a new browser tab.

To access this view, go to **INVESTIGATE > Malware Analysis** > **Select a Malware Analysis Service** dialog. Select a service from the left panel, then select a job from the right panel, and click **View Scan**. In the Summary of Events view do one of the following:

- In either the **Total** panel or the **High Confidence** panel, click the number in the **Events Created** section.
- If you want to view the Files List, click the number in the **Files Processed** section.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	view detailed malware analysis data for files or events*	Examine Scan Files and Events in List Form
Threat Hunter	submit query	Beginning an Investigation of a Service or Collection
Threat Hunter	view query results	Conducting an Investigation
Threat Hunter	reconstruct an event	Reconstruct an Event

User Role	I want to ...	Documentation
Threat Hunter	analyze an event	Analyze Events in the Event Analysis View
Threat Hunter	conduct malware analysis*	Conducting Malware Analysis
Incident Responder	investigate an incident	*NetWitness Respond User Guide*

*You can perform this task in the current view.

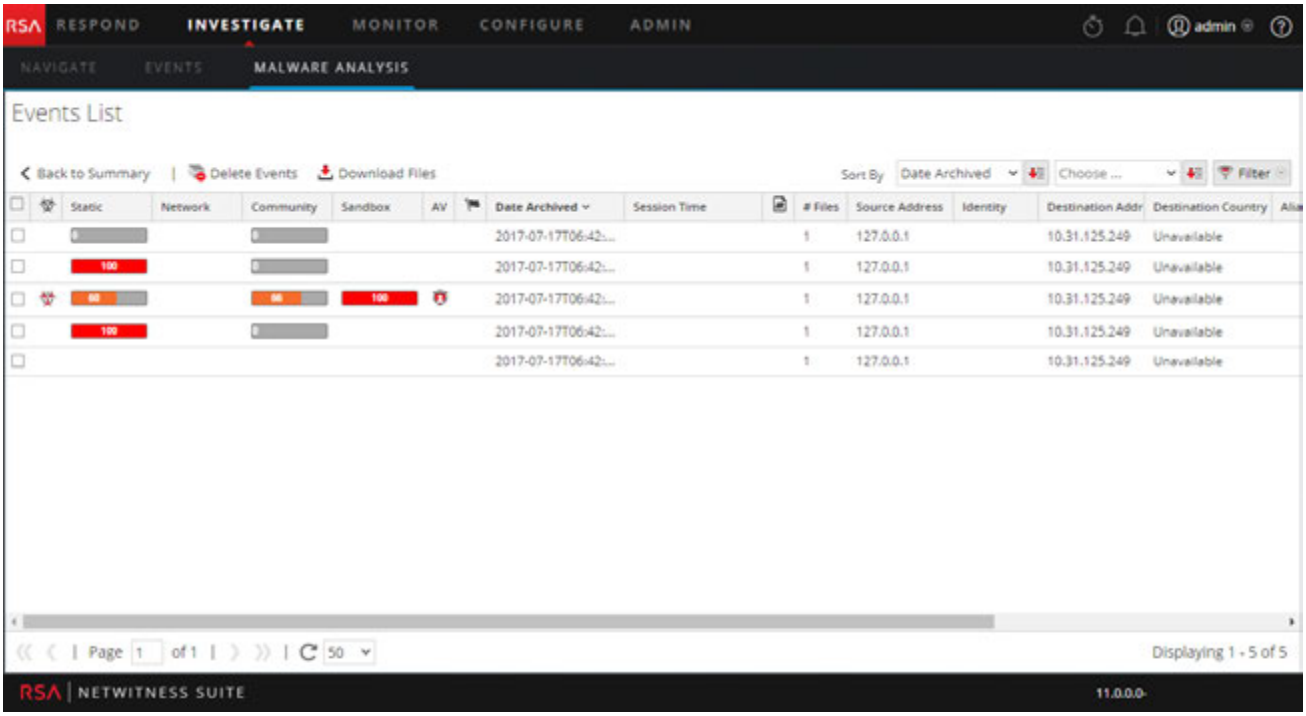
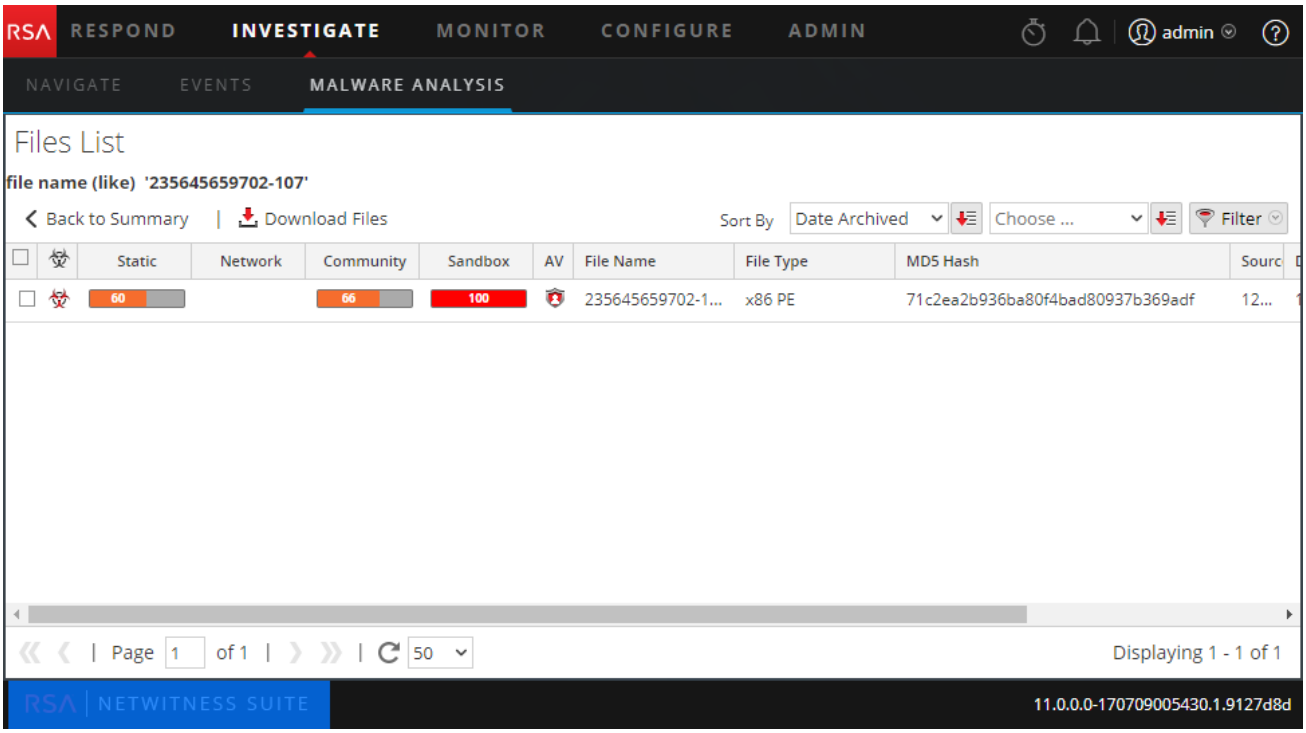
Quick Look

This is an example of the Events List view.



This is an example of the Files List view.



These are the features in the Events List toolbar, and the Files List toolbar is the same, except it has no option to delete events.

Feature	Description
Back to Summary	Returns to the Summary of Events view.
Delete Events	Removes the selected events from the current events list.
Download Files	Displays the Malware File Download dialog, which allows you to download available files.

Feature	Description
	Displays a drop-down menu from which you can decide how to sort the list. These are the options for sorting: • High Confidence • Static • Network • Community • Sandbox • AV • File Name • File Type • Hash • Date Archived • Size The button directly to the right of this drop-down indicates whether the list will be sorted by ascending or descending values.
	Displays a drop-down menu from which you can select a secondary sorting order. This menu includes an option forNetWitness Suite**None**, so selecting a secondary sorting order is not necessary.
	Displays a drop-down window in which you can filter the list by filename or MD5 Hash.

These are the features in the Events List.

Feature	Description
	Indicates whether the event is influenced by the high confidence flag.

Feature	Description
Static, Network, Community, Sandbox	Displays the scores for each scoring module.
AV	Indicates whether the AV flagged this event as suspicious.
	Indicates whether the event is influenced by a customized rule.
Date Archived	Displays the date and time the event was archived.
Session Time	Displays the time of the event's session.
	Indicates whether the hash value is marked as trusted.
# Files	Displays the number of files included in the event.
Source Address	Displays the address of the event source.
Identity	Displays the identity of the event source.
Destination Address	Displays the address of the event destination.
Destination Country	Displays the country of the event destination.
Alias Host	Displays the hostname of the alias.
Event Type	Displays the type of event. For example, Manual Upload.
Service	Displays the service on which the event occurred.
Destination Organization	Displays the organization of the destination.

These are the features in the Files List grid.

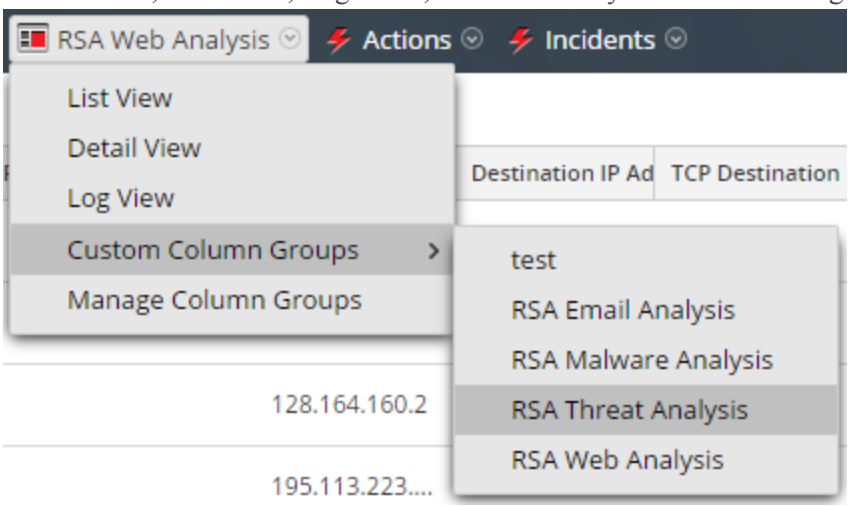
Feature	Description

Feature	Description
	Indicates whether the event is influenced by high confidence flag.
Static, Network, Community, Sandbox	Displays the scores for each scoring module.
AV	Indicates whether the AV flagged this event as suspicious.
File Name	Displays the name of the file.
File Type	Displays the type of the file (for example, PDF or x86 PE)
MD5 Hash	Displays the MD5 hash.
Source Address	Displays the address of the file source.
Destination Address	Displays the address of the file destination.
Date Archived	Displays the date and time the file was archived.
Size	Indicates the size of the file.

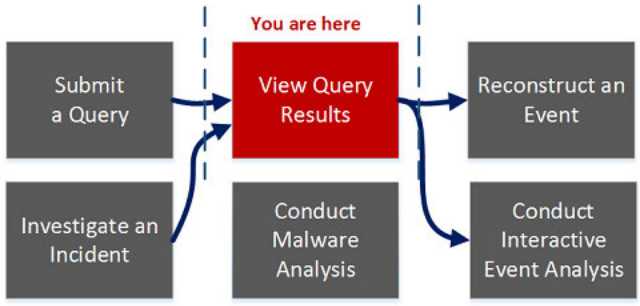
Manage Column Groups Dialog

You can customize the way data is displayed by defining the meta to display in a column, the position of the column in the grid, and the default width of the column. In the Manage Column Groups dialog, you can add, delete, import, export, and edit column groups to display specific meta keys. At fresh installation, out-of-the-box (OOTB) column groups are available for use in the Manage Column Groups dialog. The OOTB column groups are prefixed with RSA for identification and can be duplicated but cannot be edited or deleted. You can also create custom column groups.

To access this dialog, go to **INVESTIGATE > Events view** and in the View drop-down list select **Manage Column Groups**. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.



Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	column groups*	Manage Column Groups in the Events View.
Threat Hunter	submit query	Beginning an Investigation of a Service or Collection
Threat Hunter	view query results*	Conducting an Investigation
Threat Hunter	reconstruct an event	Reconstruct an Event
Threat Hunter	analyze an event	Analyze Events in the Event Analysis View
Threat Hunter	conduct malware analysis	Conducting Malware Analysis
Incident Responder	investigate an incident	*NetWitness Respond User Guide*

*You can perform this task in the current view.

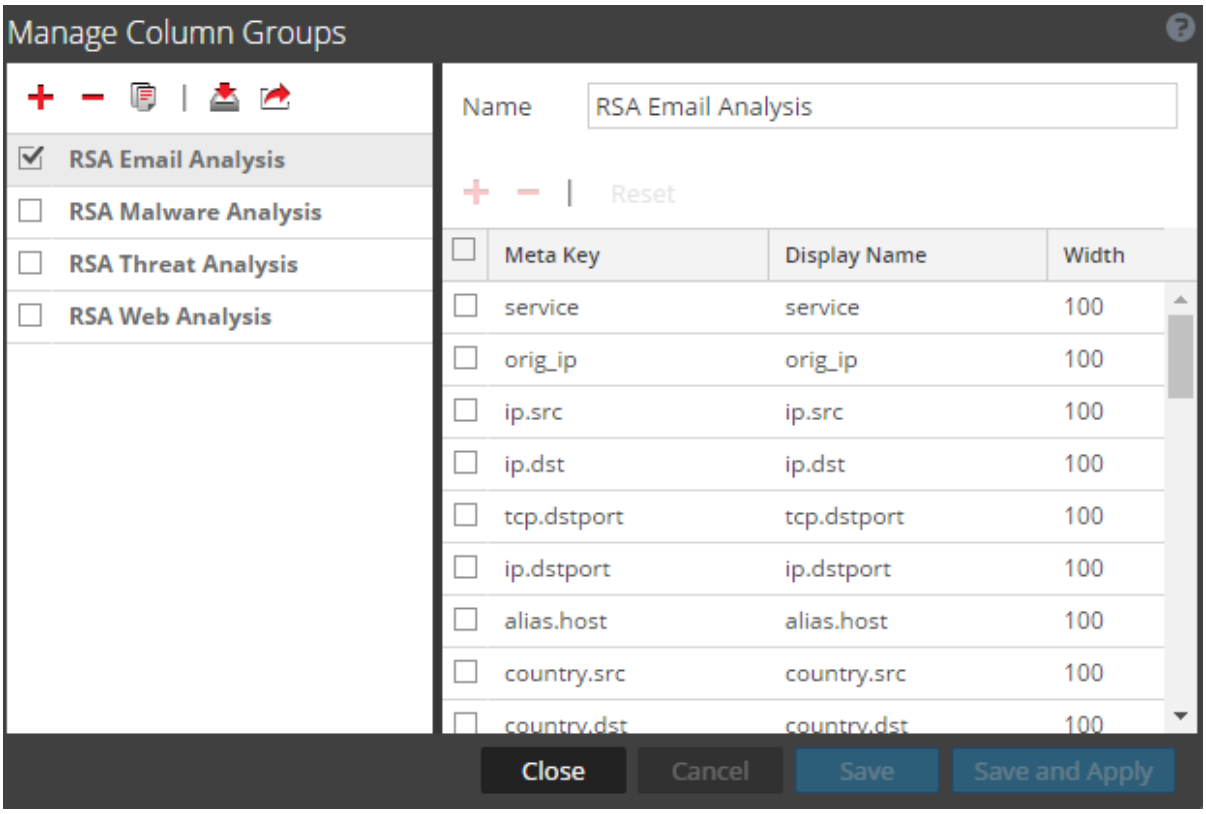
- How NetWitness Investigate Works

Quick Look



The Manage Column Groups dialog has two panels: Groups and Settings.

At the bottom of this dialog are four buttons: Close, Cancel, Save, and Save and Apply. The following table provides descriptions of these buttons.

Feature	Description
Close	Closes the dialog without saving.
Cancel	Cancels all unsaved changes.
Save	Saves all changes without closing the dialog.
Save and Apply	Saves and applies all changes immediately, closing the dialog.

Groups Panel

The left panel is the Groups panel. This is where you can add, delete, import, or export column groups. At the top of the panel is a toolbar which provides actions. Below the toolbar is a list of added column groups, where you can select one or more groups.

The following table lists the actions in the toolbar.

Action	Description
+	Adds a column group. Clicking this button highlights the Settings panel on the right, where you can name the column group and add or delete meta keys. At least one meta key is required to add a group.
−	Deletes a column group. A confirmation dialog is displayed before the selected group is deleted.
	Displays the Import Column Groups dialog, where you can select a file to upload.
	Exports one or more selected groups to your computer.

Settings Panel

The right panel is the Settings panel. This is where you can create and edit column groups. This panel contains the Name field, a toolbar, and a grid.

The following table describes the features of the Settings panel.

Feature	Description
Name	The name of the selected column group.
+	Adds a new row to the list of meta keys, where you can open a drop-down menu to select a new meta key.
−	Deletes one or more selected meta keys. Displays a confirmation dialog before deleting.
Reset	Returns column group to its most recently saved settings.
Meta Key	Lists the meta keys added to the selected column group.
Display Name	Lists the names of the meta keys as they will be displayed in the Events view.
Width	Specifies the width of each meta key's column. The width can be set between **10** and **1000**. The default width is **100**.

Manage Meta Groups Dialog

At fresh installation, OOTB meta groups are available in the Manage Meta Groups dialog. The OOTB meta groups are prefixed with RSA for identification and can be duplicated but cannot be edited or deleted. In the Manage Meta Groups dialog, you can add, delete, import, and export meta groups.

To access this dialog in the **Investigation > Navigate view** toolbar, select **Meta > Manage Meta Groups**

Workflow

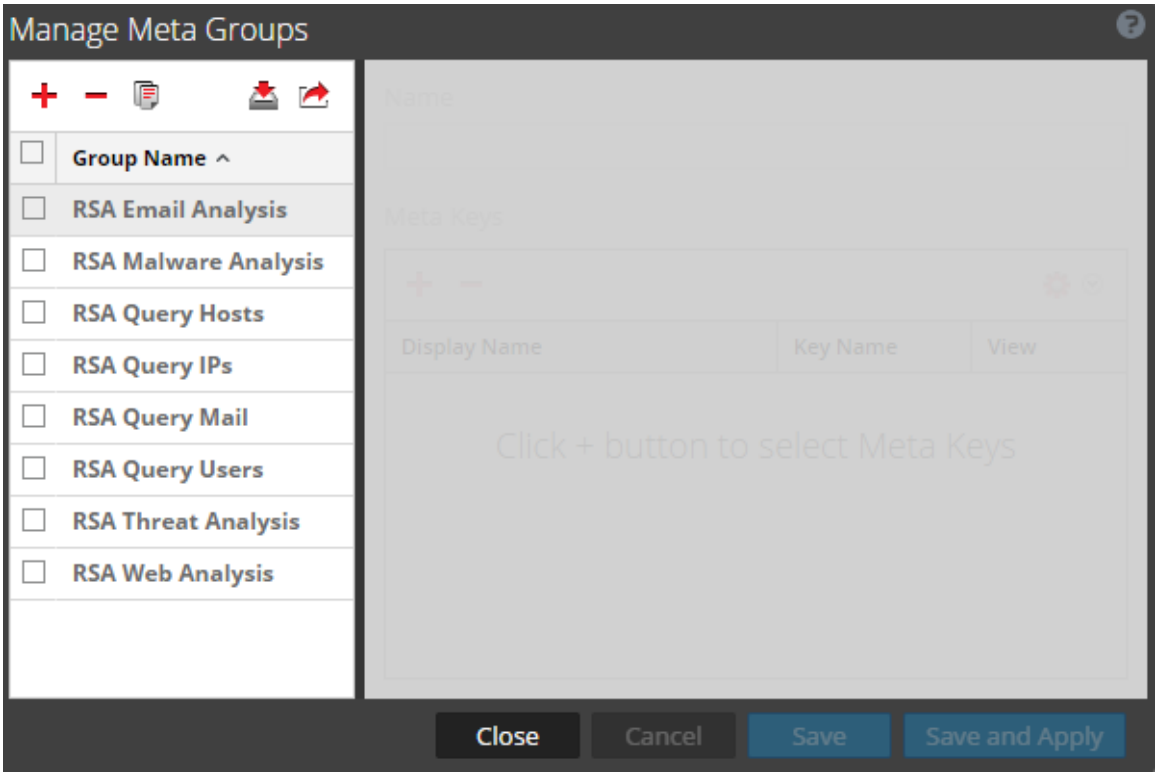
- Manage and Apply Default Meta Keys in an Investigation
- How NetWitness Investigate Works

Quick Look



The Manage Meta Groups dialog has two panels. The following table describes the buttons at the bottom of the dialog.

Feature	Description

Feature	Description
Close	Closes the dialog.
Cancel	Cancels all changes.
Save	Saves all changes.
Save and Apply	Saves and immediately applies all changes.

The Meta Groups panel is on the left side of the Manage Meta Groups dialog. This is where you can add, delete, import, and export meta groups.

The following table describes the features of the Meta Groups panel.

Feature	Description
+	Adds a meta group using the Settings panel on the right side of the Manage Meta Groups dialog.
−	Deletes the selected meta group. A confirmation dialog is displayed before the meta group is deleted.
	Displays the Meta Group Import dialog, where you can upload a file.
	Exports the selected meta group to your computer.
Group Name	Lists all meta group names.

The Settings panel is on the right side of the Manage Meta Groups dialog. This is where you create and edit meta groups. Below the Name field is the Meta Keys grid.

The following table describes the features of the Settings panel.

Feature	Description
Name	Displays the name of the selected meta group.
+	Displays the Available Meta Keys dialog, where you can select meta keys to add to the group.
−	Deletes the selected meta keys.

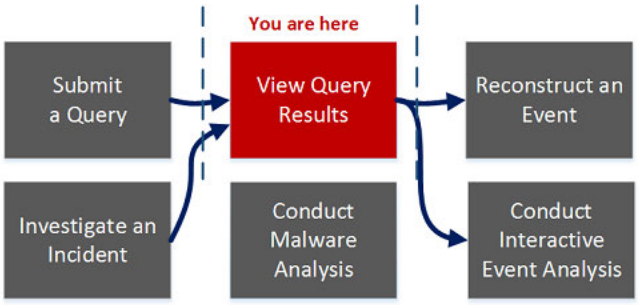
Feature	Description
	Displays a drop-down menu, where you can select the view for all meta keys. There are four options based on the possible values for the `defaultAction` property used to define a key in the custom index file for the service: • Hidden: These meta keys are hidden by default, and are not shown in Investigation at all. • Open: The values of this meta key are displayed by default. • Close: The values of this meta key are closed by default, and can be opened manually. • Auto: Reverts to the default view for meta keys as specified in the service index file.
Display Name	Indicates the name that is displayed for the key in Investigation views, and is defined by the `description` property for the key in the custom index file for the service..
Key Name	Indicates the `name` of the meta key as defined in the custom index file for the service.
View	Indicates which view the meta key is set to. You can change this by either: • Clicking **v** in the View column header, then selecting a view in order to change all meta key views. • Clicking a single meta key in the View column, then opening the drop-down menu in which all available views are displayed, in order to change an individual meta key view.

Manage Profiles Dialog

Profiles allow you to set up custom views in the Navigate view and the Events View. At fresh installation, OOTB profiles are available in the Manage Profiles dialog. The OOTB profile groups are prefixed with RSA for identification and can be duplicated but cannot be edited or deleted. In the Manage Profiles dialog, you can configure, add, delete, import, and export profiles.

To access this dialog in the **Investigation > Navigate** or **Events** view toolbar, select **Profile > Manage Profiles**.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	configure profiles*	Use Investigation Profiles to Encapsulate Custom Views.

User Role	I want to ...	Documentation
Threat Hunter	analyze an event	Analyze Events in the Event Analysis View
Threat Hunter	conduct malware analysis	Conducting Malware Analysis
Incident Responder	investigate an incident	*NetWitness Respond User Guide*

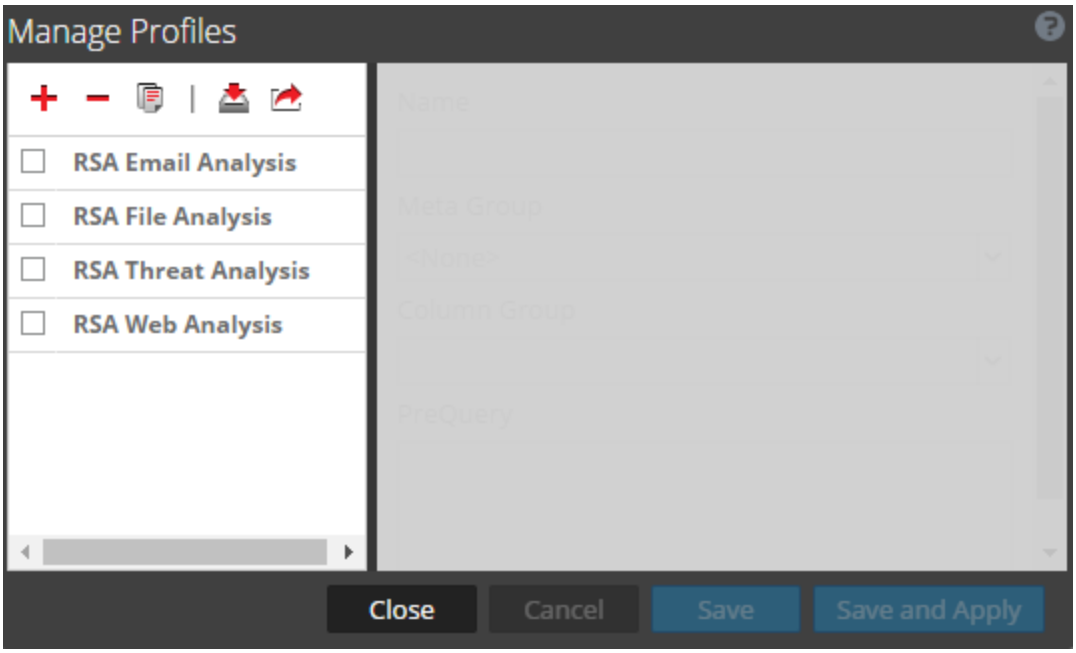
*You can perform this task in the current view.

Related Topics

- Manage Meta Groups
- How NetWitness Investigate Works

Quick Look

This is an example of the Manage Profiles dialog.



The Manage Profiles dialog has two panels. At the bottom of the dialog there is a row of buttons. The following table describes the buttons.

Field	Description
Close	Closes the dialog.
Cancel	Cancels all changes.
Save	Saves all changes.
Save and Apply	Saves and applies all changes immediately.

The Profile panel on the left side of the dialog displays available profiles and allows you to add, delete, import, and export profiles. The following table describes the fields in the Profile panel.

Field	Description
	Adds a new profile using the Settings panel on the right side of the Manage Profiles dialog.
	Deletes the selected profile. A confirmation dialog is displayed before the profile is deleted.
	Displays the Profile Import dialog, where you can upload a file.
	Exports the selected profile to your computer.
Profile Name	Lists all profile names.

The Settings panel on the right side of the dialog offers options to configure profiles. It can only be used when one profile is selected. The following table describes the fields in the Settings panel.

Feature	Description
Name	Displays the name of the profile.
Meta Group	Displays a drop-down menu listing available meta groups.

Feature	Description
Column Group	Displays a drop-down menu listing available column groups. Three groups are available by default: • List View • Detail View • Log View
PreQuery	Defines a limiting query for filtering Investigation results. This query is used when the associated profile is activated and the preQuery applies to any queries used in the Investigation Navigate and Events views. This is an example of a preQuery: `'service=80,25,110'`.

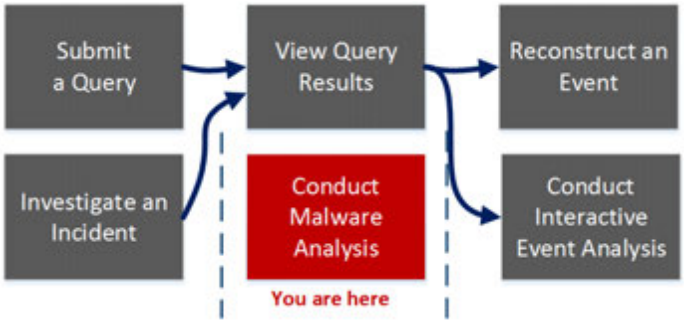
Malware Analysis View

In NetWitness Suite Investigate, the Malware Analysis view provides the user interface for conducting a malware analysis. The Malware Analysis view is in the form of a customizable dashboard, in which default dashlets in the initial view are based on the user role (Administration or Analyst) and user customizations. Initially, the Summary of Events dashlet is displayed in the Malware Analysis view. Additional dashlets present different visualizations of the events being viewed, and each representation is configurable to further refine your view as you search for Indicators of Compromise. The Malware Analysis dashlets available in the Dashboard are also available in the Malware view.

To access this view, select **INVESTIGATE > Malware Analysis.**

In Netwitness, select **Investigation > Malware Analysis**. If a default service has not been selected, the Select a Malware Analysis Service dialog is displayed. Select a service, then click **View Continuous Mode**.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	submit query	Beginning an Investigation of a Service or Collection
Threat Hunter	view query results	Conducting an Investigation
Threat Hunter	reconstruct an event	Reconstruct an Event

User Role	I want to ...	Documentation
Threat Hunter	analyze an event	Analyze Events in the Event Analysis View
Threat Hunter	conduct malware analysis*	Conducting Malware Analysis
Incident Responder	investigate an incident	*NetWitness Respond User Guide*

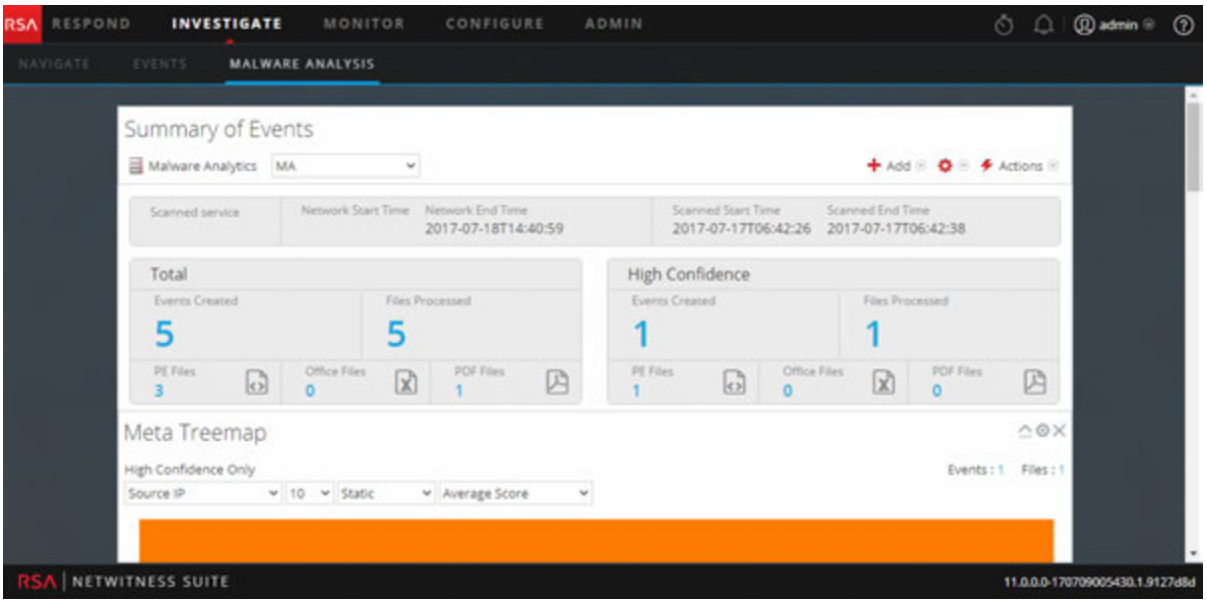
*You can perform this task in the current view.

Related Topics

- How NetWitness Investigate Works
- Launch a Malware Analysis Scan from the Navigate View

Quick Look

Below is an example of the Malware Analysis view.



The Malware Analysis view consists of the Summary of Events panel and four dashlets unique to this view. Each of the unique dashlets have identical Options dialogs. The Malware Analysis dashlets in the NetWitness Suite dashboard are also available, and are described in the Dashlets topic in the see the Dashlets topic in the RSA Content for the RSA NetWitness® Suite space.

Summary of Events Panel

In the Summary of Events panel, you can select the service, the scan mode, and the time range. In addition, you can select a data point and view the events associated with the event.

The following table describes all features in the Summary of Events panel.

Feature	Description
	Selects a service to display.
Scan Mode	Displays a drop-down list of available scan modes.
Time Range	Displays a drop-down list of time ranges to view events.
Start Date	When Time Range is set to custom, offers a calendar from which to choose the start date of the time range.
End Date	When Time Range is set to custom, offers a calendar from which to choose the end date of the time range.
	Displays a drop-down list of dashlets you can add to the view.
	Displays a drop-down list of actions you can perform in this view: • Restore Default Configuration • Order Dashlets • Apply Threshold Filter
	Refreshes the Malware Analysis view.

Options Dialog

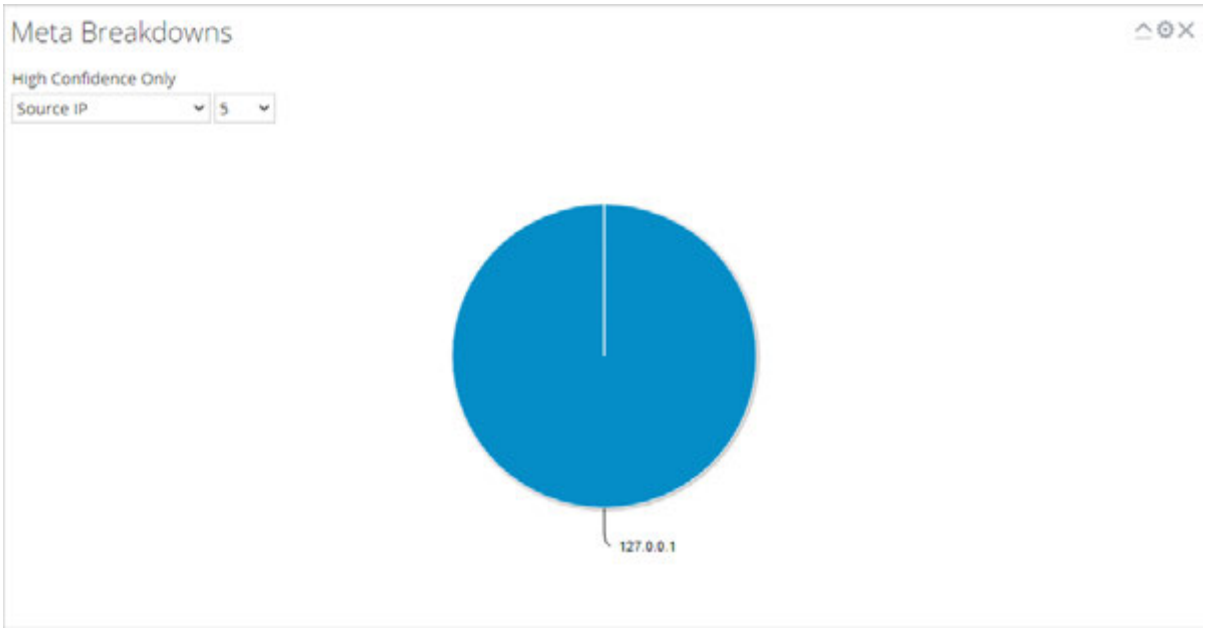
In the Options dialog, you can customize the results displayed in the dashlet. This dialog can be accessed by clicking the  icon in the top right corner of each dashlet. The following table describes the features of the Options dialog.

Feature	Description

Feature	Description
Title	Indicates whether the data shown is restricted to events flagged as high confidence or not. If the data is not restricted, this line will not be displayed.
Influenced By High Confidence Only	Indicates whether the data shown is restricted to events flagged as high confidence.
Static, Network, Community, Sandbox	Allows you to filter results based on the scores in the scoring modules.
Cancel	Closes the dialog without saving any changes.
Apply	Applies changes to the dashlet immediately and closes the dialog.

Meta Breakdowns

Meta Breakdowns presents events in the form of a pie chart, with each slice representing a meta value for the specified meta key. You can select the meta key and the count of meta values for that key to render in the chart, starting with the meta value having the most events. Hovering over an event displays the count.

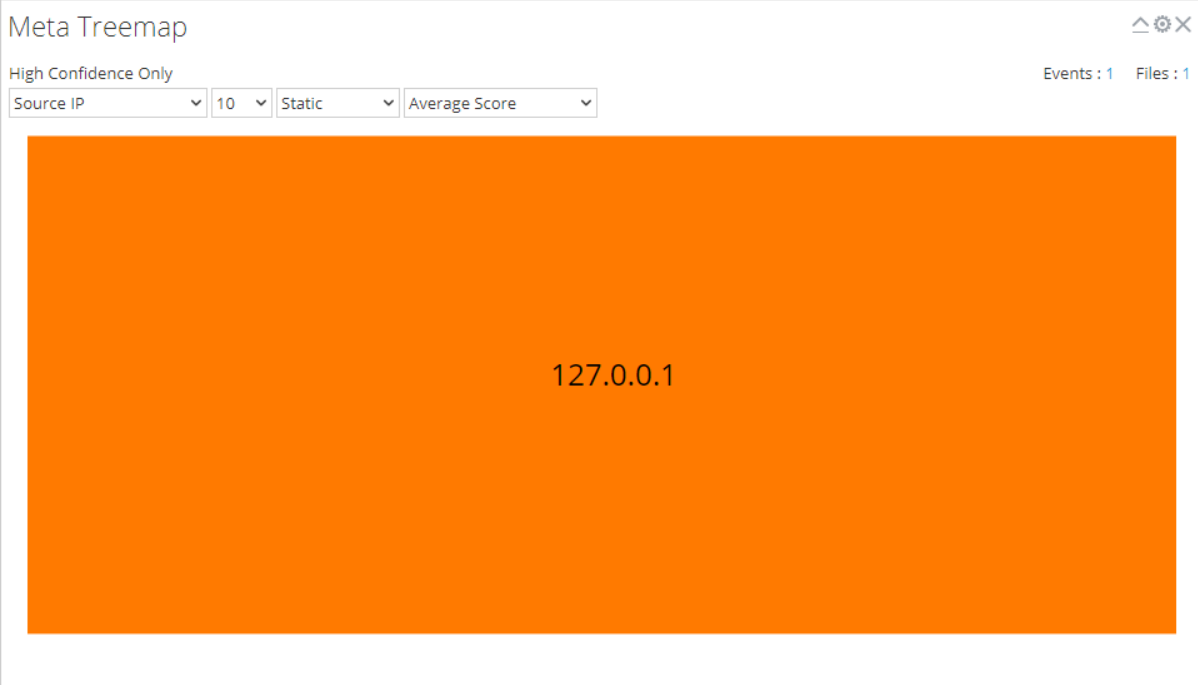


The following table describes the options in the Meta Breakdowns dashlet.

Feature	Description
High Confidence Only	Indicates whether the data shown is restricted to events flagged as high confidence or not. If the data is not restricted, this line will not be displayed.
Meta Key	Drop-down list of available meta keys.
Count	Drop-down list specifying how many of the top results are displayed.

Meta Treemap

Meta Treemap presents events in the form of a heat map. You can select the meta key and the count of meta values for that key to render in the chart, starting with the meta values having the most events. In addition, you can select the module that detected the meta value in the events: static, network community, or sandbox.



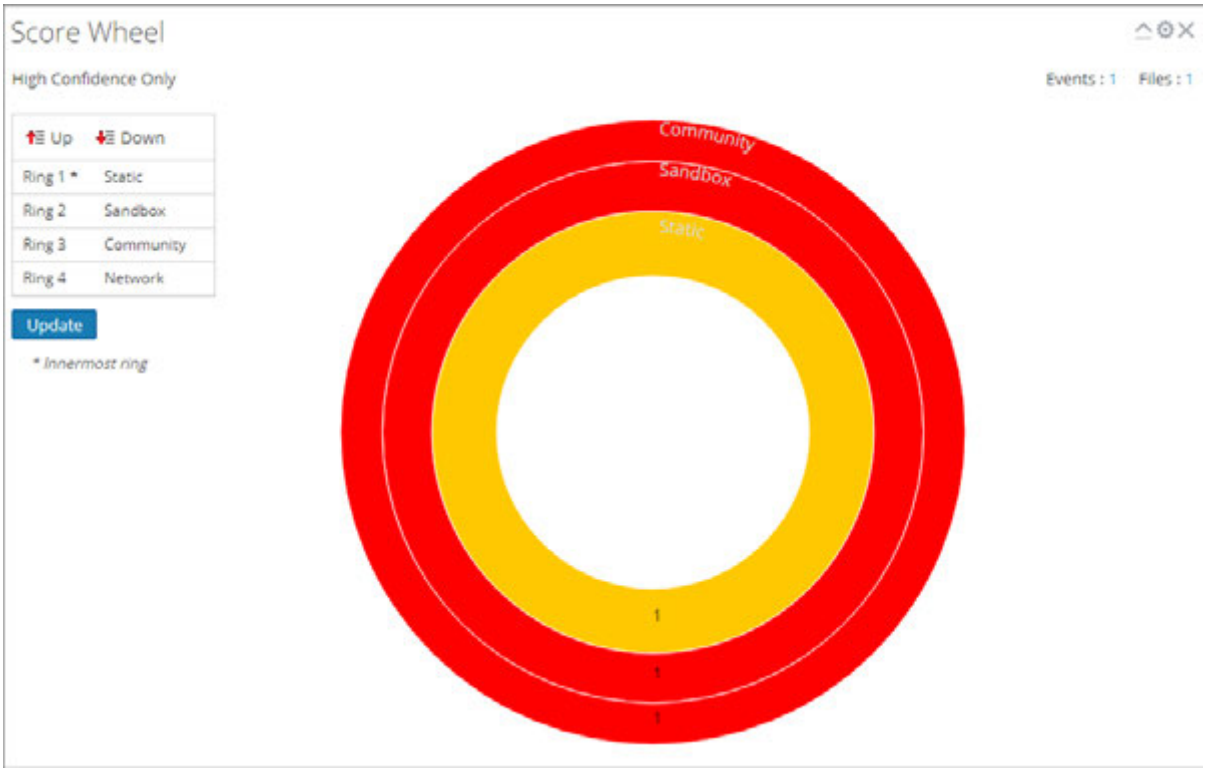
The following table describes the options in the Meta Treemap dashlet.

Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.

Feature	Description
Meta Key	Drop-down list of available meta keys to select as a filter.
Count	Drop-down list specifying how many of the top results are displayed.
Module	Drop-down list specifying which module results will be pulled from.
Value	Drop-down list specifying what information will be displayed when the mouse is hovering over a result (for example, Average Score).

Score Wheel

The Score Wheel offers a view of events as concentric rings with colors representing scores for events based on Indicators of Compromise and the scoring module. You can arrange the position of the rings using the Up and Down arrows to obtain a view that highlights events that were detected by one scoring module (red) and not detected by other scoring modules.

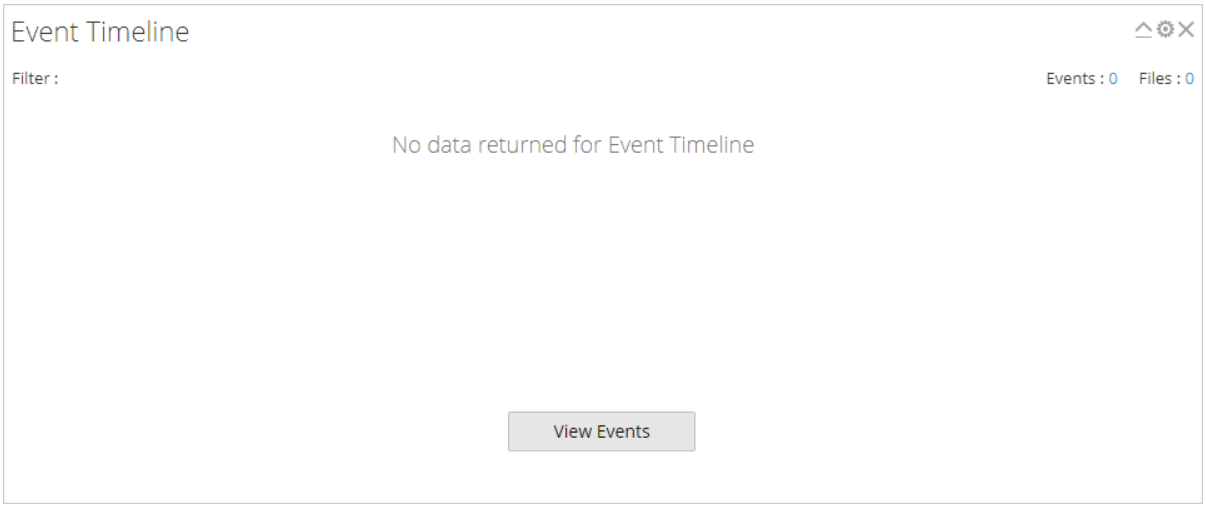


The following table describes the features of the Score Wheel dashlet.

Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.
Module Order grid	Displays the order of the rings in Score Wheel, Ring 1 being the innermost ring and Ring 4 being the outermost ring. You can click the **Up** and **Down** buttons to reorder the modules, then click **Update** to apply the changes.

Event Timeline

The Event Timeline offers a view of events organized by the time of occurrence in a bar graph. Clicking and dragging to select a time range within the chart zooms in on the selected time.



The following table describes the features of the Event Timeline dashlet.

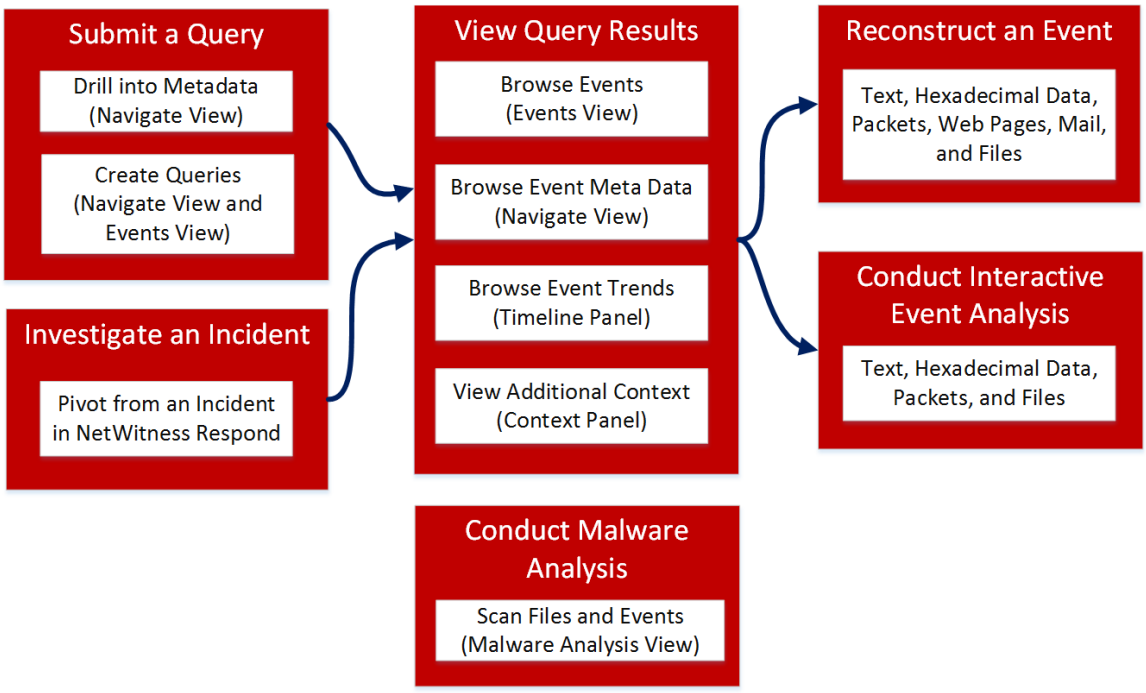
Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.
View Events	Displays the Investigation > Events view.

Navigate View

The Navigate view (**INVESTIGATE** > Navigate) is the primary entry point to NetWitness .Investigate. The Navigate view displays the activity and values for the selected service in accordance with the Investigation options set: profile, time range, meta group, and query. As analysts investigate events of interest, the meta keys and values are displayed.

Workflow

The workflow below depicts the high-level steps and subtasks for investigating events.



These are the tasks that you can perform in the Navigate view:

- Select a service to investigate and load data.
- View query results and filter by time range, profile, meta group.
- Sort the results and select a quantification method.
- Save events, go to an event using the event ID, visualize an event, and print the event.
- View additional contextual data for specific meta keys and values.
- Go to the Events view, where you can see a chronological list of events, reconstruct an event, and conduct an interactive analysis of an event. When viewing and analyzing events, you can export events, files, and logs to your local file system.

What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	submit a query or drill into the data set*	Querying Data in the Navigate View
Threat Hunter	set user preferences for Investigate*	Configuring Investigation Views and Preferences
Threat Hunter	refine query results*	Refining Results Displayed in the Navigate View
Threat Hunter	open a drillpoint in the Events view*	Open the Events List
Threat Hunter	visualize an event*	Drill into Data in the Navigate View Time Chart
Threat Hunter	export or print a drill point, launch an external lookup or Malware Analysis scan*	Acting on a Drill Point in the Navigate View
Threat Hunter	look up additional context of an event*	View Additional Context for a Data Point
Threat Hunter	view a reconstruction of an event	Reconstruct an Event
Threat Hunter	view interactive Event Analysis	Analyze Events in the Event Analysis View
Threat Hunter	Conduct Malware Analysis	Conducting Malware Analysis
Incident Responder	investigate an incident	*NetWitness Respond User Guide*

*You can perform this task in the current view.

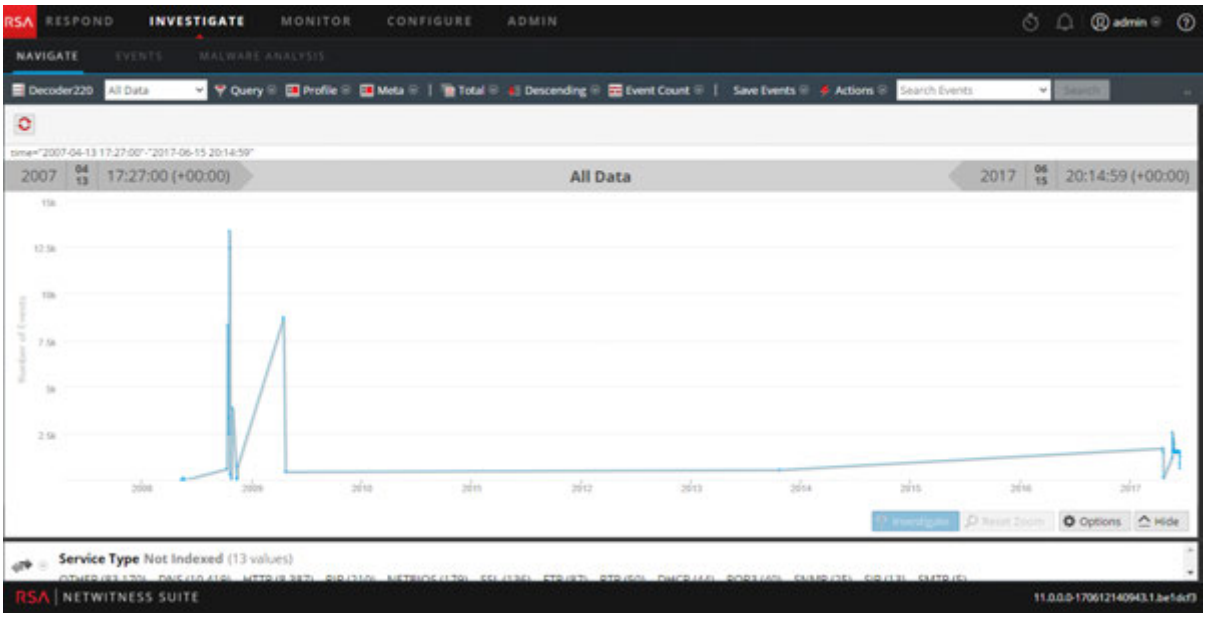
Quick Look



The Navigate view consists of these features:

- Toolbar
- Pause/reload button and breadcrumb
- Time banner
- Optional debug information.
- Collapsible Visualization panel
- Values panel
- Context Lookup panel
- Context menus

Toolbar

The toolbar provides a way to:

- Change the service being investigated.
- Control the range of data displayed: You can select use profiles, set a time range, use meta groups, and create queries to apply to the data.
- Set the quantification method and sorting method for data in the Values panel.
- Perform actions on the results. You can export and print results, navigate to an event for which you have an event ID, and pass a query to Informer.
- Configure Investigation settings without navigating away from the Investigation views.

Some of the toolbar options are labeled with the default value or the selected value rather than displaying the name of the option. For example, the time range option in the example above is labeled **Last 5 Minutes** to reflect the currently selected value. These are the toolbar options.

Option	Description
	Displays the selected service name next to the icon. Clicking the icon opens the Investigate a Service dialog, in which you can select a service to investigate and set the default service to investigate (see Beginning an Investigation of a Service or Collection). Changing the service does not cause a reload of the data.

Option	Description
Time Range	Displays the Time Range options; the currently selected option is displayed in the toolbar (see Set the Time Range for an Investigation). Possible choices are: • All Data • Last 5, 10, 15, or 30 Minutes • Last Hour, Last 3, 6, 12, or 24 Hours • Last 2 or 5 Days • Early Morning • Morning • Afternoon • Evening • All Day • Yesterday • This Week • Last Week • Custom **Note:** If you specify custom start or end times in seconds, the value for start time in seconds always defaults to :00, and the value for end time in seconds always defaults to :59. For example, if you are using time to drill down into an issue, the drill time will be interpreted as `HH:MM:00 - HH:MM:59`. Seconds display in this format in Investigation > Navigate functions.
Query	Displays the Query dialog, in which you can enter a custom query directly instead of drilling down the data. See Query Dialog for a description of the dialog.

Option	Description
Profile	Displays the Profile menu; the currently selected profile is displayed in the toolbar. A profile allows you to manage and use profiles that can include custom meta groups, a default column group, and a beginning query. The Profiles apply to the Navigate view (meta groups and queries) and the Events view (column groups and queries). See Use Investigation Profiles to Encapsulate Custom Views for more information.
Meta	Displays the Meta Group menu. You can use Default Meta Keys or a custom Meta Group. You also have the option to make changes to both group types (see Manage Meta Groups).
Sort Field	Displays the Sort Field menu; the currently selected option is displayed in the toolbar. The menu has two options: Order by Total and Order by Value. The Sort Field is a complement to the Sort Order option; the data for each meta key is ordered based on the total (green number) or the meta value (blue text) (see Set the Quantification Method and Sort Sequence of Meta Key Results).
Sort Order	Displays the Sort Order menu; the currently selected option is displayed in the toolbar. The menu has two options: Sort in Ascending Order and Sort in Descending. The Sort Order is a complement to the Sort Field option; the selected field for each meta key is ordered in ascending or descending order (see Set the Quantification Method and Sort Sequence of Meta Key Results)).

Option	Description
Quantification Method	Displays the Quantification Method menu; the currently selected option is displayed in the toolbar. The Quantification Method only applies to the meta key results in the Values panel. It does not apply to the timeline. The drop-down menu contains three options for calculating the quantity (green number in parentheses) for a meta value: Quantify by Event Count, Quantify by Event Size, and Quantify by Packet Count (see Set the Quantification Method and Sort Sequence of Meta Key Results)). These are applied differently depending on the type of data in view. For packet data: • Quantify by Event Count shows the number of sessions. • Quantify by Event Size shows the size in bytes. • Quantify by Packet Count shows the number of packets. For log data: • Quantify by Event Count shows the number of logs. • Quantify by Event Size shows the size in bytes. • Quantify by Packet Count shows the number of logs.
Save Events	Displays the Save Events menu, in which you can use options to: extract files associated with an event, export the current drill point as a PCAP file, and export the current drill point as a log file (see Export a Drill Point).
Actions	The Actions menu includes various actions (Visualize, Go To Event, and Print) that you can perform in the Navigate view (see Acting on a Drill Point in the Navigate View).

Option	Description
Search Events	Enables you to search for text patterns within the current set of events. If you click in the Search field, it shows a drop-down menu with search options. If you click Apply, it saves the selected options and also updates the search options in the Events view and the Investigations profile (see Search for Text Patterns in the Investigate View).
Settings	Displays the Investigation settings for the Navigate view (which are also editable in the Profile view) so that you can change Investigation settings without navigating away from the Navigate view. When you change a setting In the Navigate view the setting is also changed in the Profile view (see Configure Navigate View and Events View).

Pause/Reload Button and Breadcrumb

The breadcrumb tracks each query as you drill down through the metadata for the service. Each query is listed with a drop-down menu in a pipe separated string. The last point is the current point, also called the tip. The icon in front of the breadcrumb allows you to pause the loading of meta values and to reload meta values.

The breadcrumb does not include the service name and appears only if a query is in effect. If too many drill points exist for display, the overflow is shown as double angle brackets, >>, at the end of the breadcrumb.

Each drop-down menu in the breadcrumb is the same, with slight variation based on the position of the crumb.

The following table describes the controls and menu options in the breadcrumb.

Feature	Description
	Pause and Reload button. Controls the loading of data in the view. It has three possible functions: pause loading, continue loading, and reload.
Navigate Here	Opens the selected drill point in the current Values panel.
Navigate Here (new tab)	Opens the selected drill point in a new tab.

Feature	Description
Insert Before	Inserts a query before the current drill point. The Create Filter dialog opens and you can define a custom query to insert in the breadcrumb (see Create a Custom Query).
Append	Appends a query after the current drill point. The Create Filter dialog opens and you can define a custom query to append to the end of the breadcrumb (see Create a Custom Query).
Remove	Removes the selected drill point from the breadcrumb.
Edit	Opens the selected drill point in the Create Filter dialog so that you can edit the query.
>>	Clicking the angle brackets displays a drop-down menu of the breadcrumb overflow.

(Optional) Debug Information

If you have activated the Show Debug Information setting and the service you are navigating is a 10.4 or later Broker, NetWitness Suite displays the debug information beneath the breadcrumb.

The debug information is the `where` clause from the current query. The only time there is no `where` clause is when the time range is all data and there are no drill points. If the Broker has at least one aggregate service that is offline, the debug information also lists the offline service.

For example:

```
(attachment exists)&&(tcp.dstport = '80')&&(risk.info
exists)$$time='2014-05-04 18:50:00"-"2014-05-09 18:59:59(attachment
exists) && (tcp.dstport = '80') && (risk.info exists) && time="2014-05-
04 18:50:00"-"2014-05-09 18:50:59"
```

In addition, the time taken to load is displayed at the end of each meta key in the Values panel.

Time Banner

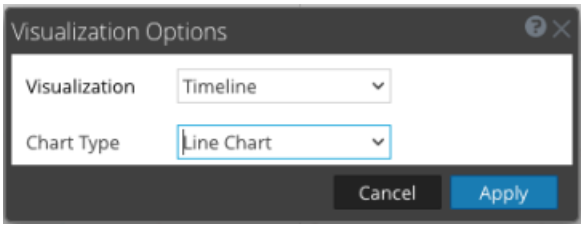
Just below the breadcrumb and debug information (if present), the time banner shows the time range used to create the chart.

Visualizations

At the top of the Navigate view is a visualization of the current drill point. You can use this to drill into data from the Visualization panel (see Drill into Data in the Navigate View Time Chart). You can show or hide the visualization, and choose one of the the visualization options: Timeline or Coordinates. The Visualization opens initially to the last saved Visualization.

Timeline Chart

The timeline is the count of the number of events that occur at a specific instance. The timeline provides event counts so that you can see if the number of events increases drastically at a given point in time. The timeline displays activity for the specified service and time range as a line chart or a bar chart based on your choice in the Options menu. The second figure illustrates a line chart and third figure illustrates a bar chart.



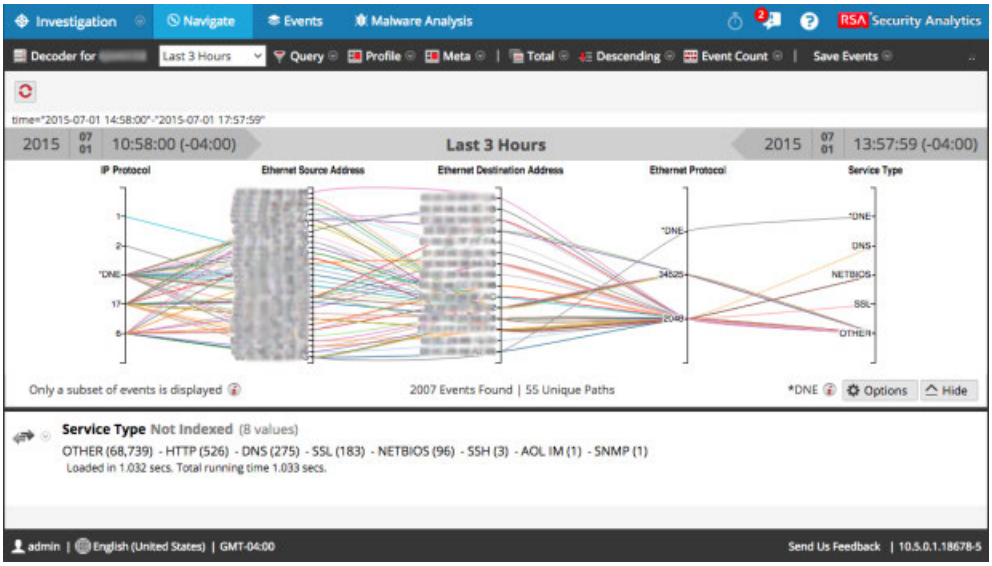
The timeline displays activity for the specified service and time range, as a line chart or a bar chart based on your choice in the Options menu.

Feature	Description
Number of Events (Timeline)	The Y axis of the chart based on thousands of events.
Time Line (Timeline)	The X axis of the chart based on the time the events occurred.
Event point (Timeline)	If you want to explore a specific section, simply select the range from the chart. The new time range will be reflected in the chart.

Feature	Description
Investigate (Timeline)	Displays the meta values for the selected subset.
Reset Zoom (Timeline)	To return to the original time range, click Reset Zoom.
Options	Displays the Visualization Options dialog. Data points can be displayed as a Line chart (default), a Bar chart, or Coordinates chart. When a chart type is select, the relevant options are displayed.
Hide	Collapses the chart.

Parallel Coordinates Chart

The Parallel Coordinates chart is one of the choices in the Options menu for visualizing the current drill point. With Coordinates selected in the Visualization Options dialog, you can select the meta data to be displayed (see Visualize Metadata as Parallel Coordinates).



Feature	Description
Axes	Each axis is a meta key. The number of meta keys affects the load time for the chart. All meta keys are loaded, but it there the number of events per meta key is limited.

Feature	Description
Lines	Lines represent events and they connect values on the axes to show the correlation between multiple meta keys.
Options	Displays the Visualization Options dialog. Data points can be displayed as a Line chart (default), a Bar chart, or Coordinates chart. When a chart type is select, the relevant options are displayed.
Only a subset of events is displayed.	This message is a notification that not all events in the values panel are drawn in the chart. Removing axes or filtering the data in the Values panel can help to display all events.
Events Found | Unique Paths	Displays the total number of events charted versus the number of unique paths charted. Setting the All Meta Keys Must Exist in an Event option redraws the chart so that it is more targeted and legible.
DNE	Indicates that there is no values for this meta key in the event.

In the Visualization Options dialog for Coordinates, you can select the meta keys to chart.

Feature	Description
Visualization selection	Displays a drop-down list of visualization types: Timeline and Coordinates
All Meta Keys Must Exist in an Event	Limits the data represented in the visualization to only those events that include all selected meta keys. This can result in a cleaner, more targeted visualization.
+	Displays the Add Keys to Parallel Coordinates Visualization dialog so that you can add axes to the visualization. This is useful if you are looking for relationships between the default meta keys and some additional ones.
−	Deletes the selected keys so that they do not appear as axes in the visualization. This can help to make the visualization less cluttered and allow for more data points to be included in the visualization.

Feature	Description
	Reverts to the default meta keys for visualization, which consist of all meta keys in the current drill point.
	Controls the display of additional information about the number of selected axes versus the recommended count. This helps to make you aware of possible performance improvements by removing axes.
Axes	Lists the meta keys selected as axes in the visualization.
Cancel	Cancels any changes made to the visualization options.
Apply	Saves the changes made to the visualization options and applies to the current visualization.

In the Add Keys to Parallel Coordinates Visualization dialog, you can select the meta keys or meta groups to use as axes the Parallel Coordinates visualization.

Feature	Description
Visualization selection	Select Keys: Two options for selecting meta keys are: • From Default Meta Keys • From Meta Groups Each option offers a drop-down list from which to select.
With the Selected Meta Keys...	The options for the method of adding meta keys allow you to: • Replace the current list of keys • Append to the current list of keys • Insert at beginning of the current list of keys
Cancel	Closes the dialog and does not add any keys.
Add	Closes the dialog and adds the selected keys as specified.

Values Panel

The major feature of the Navigate view is the Values panel, which you can use to analyze data (see Drill into Data in the Values Panel).

The default view is for the last 3 hours of collection, using the default meta keys and non-indexed meta keys closed. The meta keys within the meta groups are displayed in the order that NetWitness Suite queries the keys. As the data loads into the Values panel, NetWitness Suite is optimized to show partial results, loading progress, and service status as the data loads.

The loading behavior is determined by several configuration settings. The highest level settings are configured by the administrator for each user. These are:

- The maximum amount of time allowed for this user to run a query (Query Timeout).
- The limit at which NetWitness Suite stops counting the number of meta values in a sess (Session Threshold). If a threshold is set for a session, the Navigation view shows that the threshold was reached and the percentage of results loaded. Any session that does not show a percentage is accurate and was processed to completion. If there is a percentage, that reflects how much processing was completed. The percentage displayed is estimated by extrapolating from the value at the time processing finished, considering the amount of work remaining. Larger percentages are generally more accurate because they require less extrapolating
- The limit at which NetWitness Suite stops counting the number of meta values in a session (Session Threshold). If a threshold is set for a session, the Navigation view shows that the threshold was reached and the percentage of query time used to reach the threshold.

Note: The values for non-indexed meta keys take longer to load in the Values panel. To optimize loading, NetWitness Suite does not open non-indexed meta keys by default. Refer to Manage and Apply Default Meta Keys in an Investigation for a detailed description of non-indexed meta keys in Investigation.

When you have launched an investigation of a service, NetWitness Suite displays results in the Values panel.

1. NetWitness Suite loads meta keys and meta values in the Values panel. For each meta key load, the stages of load are:
    a. **Waiting to Be Loaded** or **Closed**. If Closed, no data for that key is loaded.
    b. **Loading**
        i. **Loading progress**: NetWitness Suite is receiving and displaying progress messages.
        ii. **Partial results**: NetWitness Suite is receiving values messages and partial results are displayed in the Values panel.
    c. **Load Complete**: All results are finished loading.
2. As each meta key load is completed, and final values are displayed, the next meta key is started. The number or values rendered for each meta key is specified by the Render

Threads value in the Investigation Preference settings. Loading continues until all keys to be loaded have finished.

3. If **Show Debug Information** is active and the service you are navigating is a 10.4 or later Broker, NetWitness Suite displays load time information beneath the values for each meta key and displays additional load details for the aggregated services. NetWitness Suite also displays the debug information beneath the breadcrumb.

Iterative results

Iterative results provide feedback on the status of queries within the interfaces to provide additional context for how long the data load will take and if any service data is missing. For example, if you are querying a Broker that is aggregating from two Concentrators, NetWitness Suite starts displaying the results from the first Concentrator as soon as it is available, even if the second Concentrator is still waiting for results.

Iterative results also include a notification that service data is missing because the service is unreachable.

Partial results

When partial values from the Core service are returned but not completed, a message at the end of the meta key listing shows the progress of values loaded. For example, Currently looking at 38 ip.src values 71% indicates that loading of values for the meta key is 71% complete.

Debug Information

If the Show Debug Information setting is in effect, a field at the end of the values displays the status for the different systems against which you are querying within NetWitness Suite. For example, when you are querying against a 10.4 broker pulling from multiple concentrators, NetWitness Suite displays the status of the query on each of the Concentrators, which provides insight into the relative speed of data loading from each of the Concentrators. Each service that participated in the query is listed with the total elapsed time for the query.

Each service that participated in the query is listed with the total elasped time for the query. In the example above, two services returned in 3.207 seconds, localhost:50005 took 2 seconds to return the results. In addition, the where clause of the query is displayed below the breadcrumb. You can copy this syntax directly into an application rule or Reporting where clause of a rule.

Load Complete

For each meta key, there is a list of values (blue text) and counts (green text) found in the current drill point. When you click a value to drill down into a subset of the currently selected data, the display is updated and the new drill point is recorded in the breadcrumb. You can specify the sorting and quantification methods for the values list using the option in the toolbar.

Note: Title, values, and counts for non-indexed meta keys are not drillable; the Values and counts are shown in black. Refer to Manage and Apply Default Meta Keys in an Investigation for a detailed description of non-indexed meta keys in Investigation.

Feature	Description
Meta Key	The name of the meta that is listed, for example, **Service Type** is a meta key.
Number of values rendered vs number of values available to load	The number or values rendered is specified by the Render Threads value in the Investigation Preference settings. In the example above, the meta key is **Service Type**, and 20 of 20+ values are currently displayed. You can display additional values by clicking **...show more**.
🔎	Clicking 🔎 on an indexed meta key opens the Search dialog in which you can enter a filter for the current meta key. The search function is not available for non-indexed meta keys, and is based on the actual meta value rather than the alias. Drilling in the Search dialog using aliases is not supported. NOTE: Check with your administrator to obtain a list of aliases used for a meta key in Investigation. When an alias is used, this search dialog does not provide results. Instead, you must query the meta key using the Right-click query capability or the Query dialog.
Offline Services: xxx.xxx.xxx.xxx:50004	Lists offline services queried by a 10.4 Broker.
Meta Count, for example (3)	The number of instances found for a particular meta in the session.
Meta Value, for example other src	The specific name associated with the found meta.

Feature	Description
...show more	If the number of meta values has been limited (for example, 20), clicking this displays additional meta values for the selected meta key.
Loaded in 0.418 secs. Total running time 0.434 secs. (localhost:50005 loaded in 1 secs....	Debug stats display load times based on the Show Debug Information setting.

Meta Key Context Menus

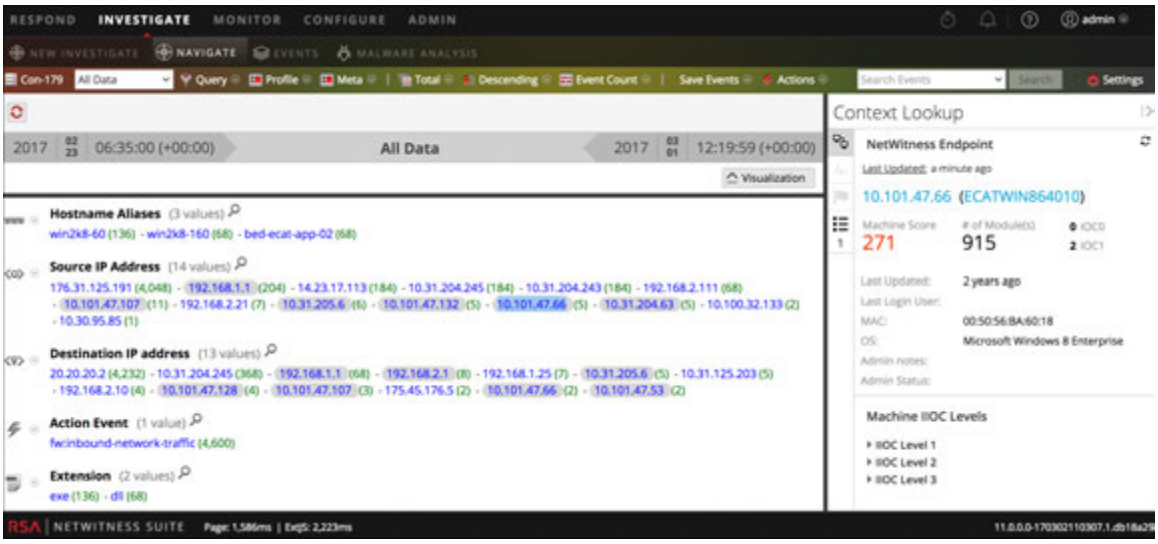
The Meta Keys in the Values panel have context menus. Next to each meta label, a drop-down arrow displays the options that can apply to that item. You can use these to change the way the results for the meta key are displayed in the current view. Changes made to meta keys are displayed in the current view during drill points persist until you refresh the page or select a new service in the Navigate view toolbar. Manage and Apply Default Meta Keys in an Investigation refresh reverts the current view of meta keys as defined in the Manage Default Meta Keys dialog (see Manage and Apply Default Meta Keys in an Investigation). If you have never made modifications in the Manage Default Meta Keys dialog, NetWitness Suite restores the default meta keys from the core service.

- More Results
- Max Results
- Hide Results
- Meta Key Info

Context Lookup Panel

The Navigate view and the Events view have a panel on the right side called the Context Lookup panel. The Context Lookup panel is displayed only if you have installed and configured the Context Hub service. For more information on configuring the Context Hub service, see the *Context Hub Configuration Guide*.

The Context Lookup panel displays relevant data when an analyst looks up contextual data for a meta value in the Values panel.

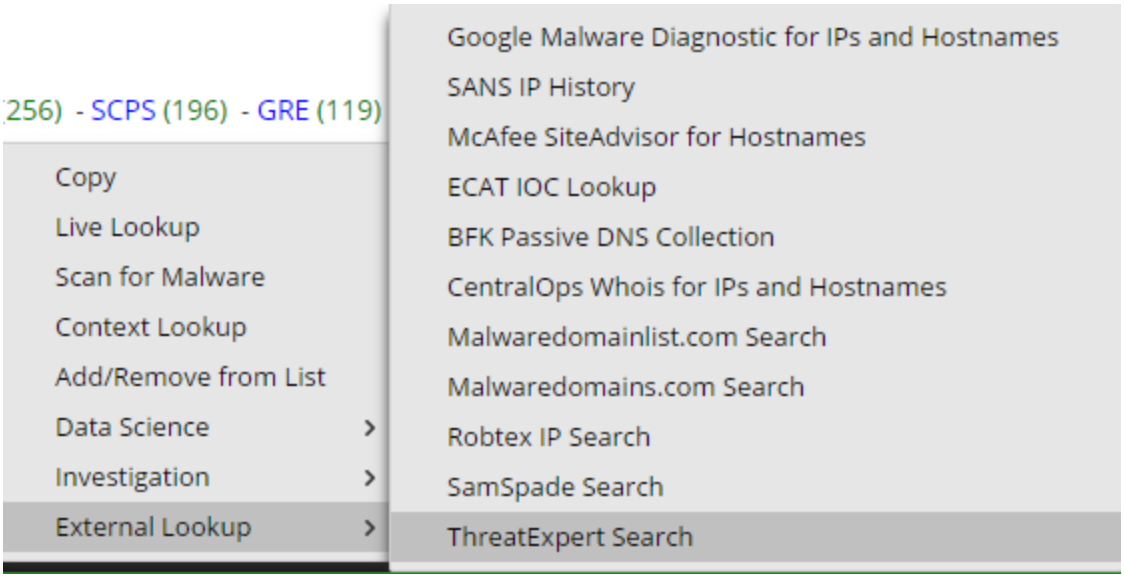


After the administrator configures the Context Hub service, you can view the contextual information for the meta values in the Navigate view and the Events view. For more information on configuring the Context Hub service, see the *Context Hub Configuration Guide*. For information about performing Context Lookup for meta values, see View Additional Context for a Data Point.

The Context Hub service is pre-configured with default meta type and meta key mapping. For information about the mapping of the context hub meta value with investigation meta key, see "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*

You can view the type of context data that is available for a highlighted meta value by hovering the mouse over a highlighted meta value. An inline indicator shows which type of context data is available for the meta: Endpoint, Incidents, Alerts, or Lists.

Right-clicking a meta value opens a menu with the context lookup option. The following figure illustrates the Context Lookup option when you right-click a meta value.



For meta keys such as IP, Host and Mac Address, the details of the values that are flagged are collected from Endpoint, Incident, Alerts, and Lists.

For meta keys such as File, File Hash, Domain, User, the details of the values that are flagged are collected from Incidents, Alerts, and Lists.

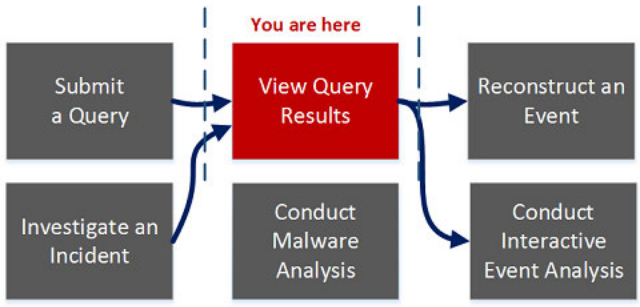
The data is displayed in the context panel, only if there is any data available .

For more information about the lookup results and contextual information for different data sources, see Context Lookup Panel.

Query Dialog

In the Navigate view or Events view, you can create a query rather than clicking through the meta keys and values to drill down into the meta data. The dialogs for creating a query offer syntax help with drop-down lists of applicable meta keys and operators. To access this dialog in the **Navigate** or **Events** view toolbar, select **Query**.

Workflow



What do you want to do?

User Role	I want to ...	Documentation

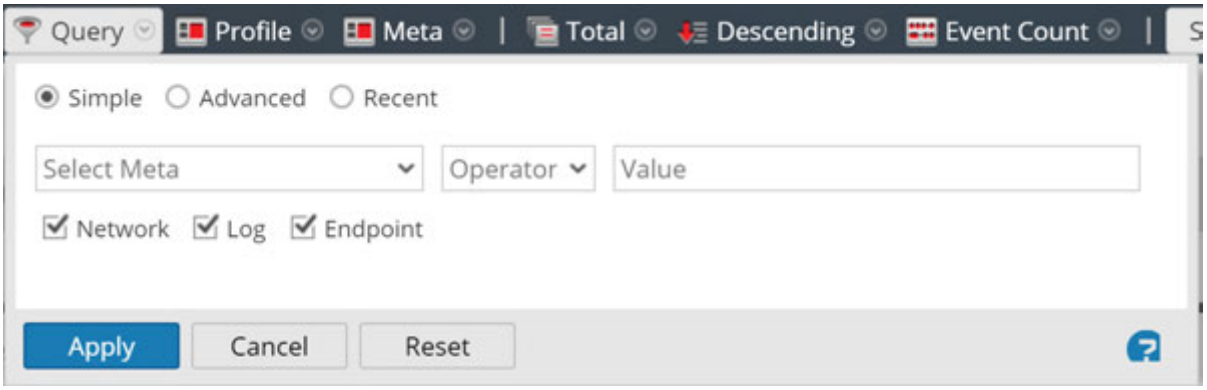
Related Topics

- How NetWitness Investigate Works

Quick Look

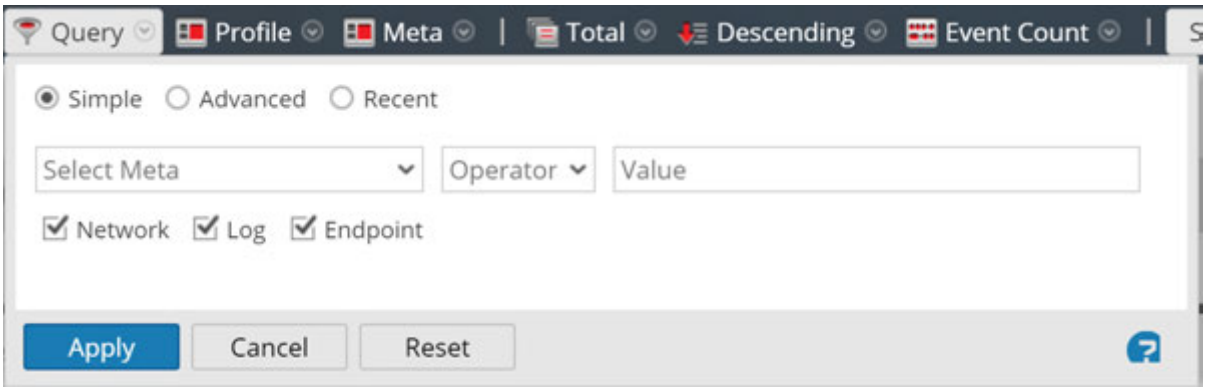


The Query dialog has three views:

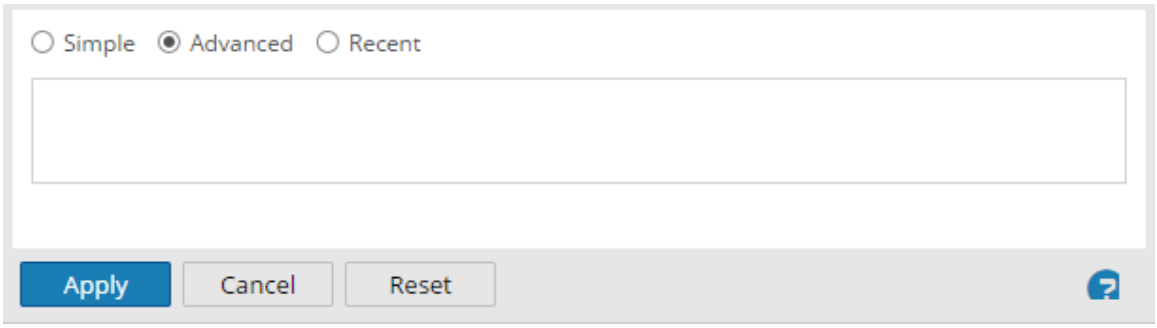
- Simple
- Advanced
- Recent

In the Simple view, you can create a query using the options displayed in the dialog. In the Advanced view, you can create a query without guidance. In the Recent view, you can select a query from a drop-down list of recent queries.

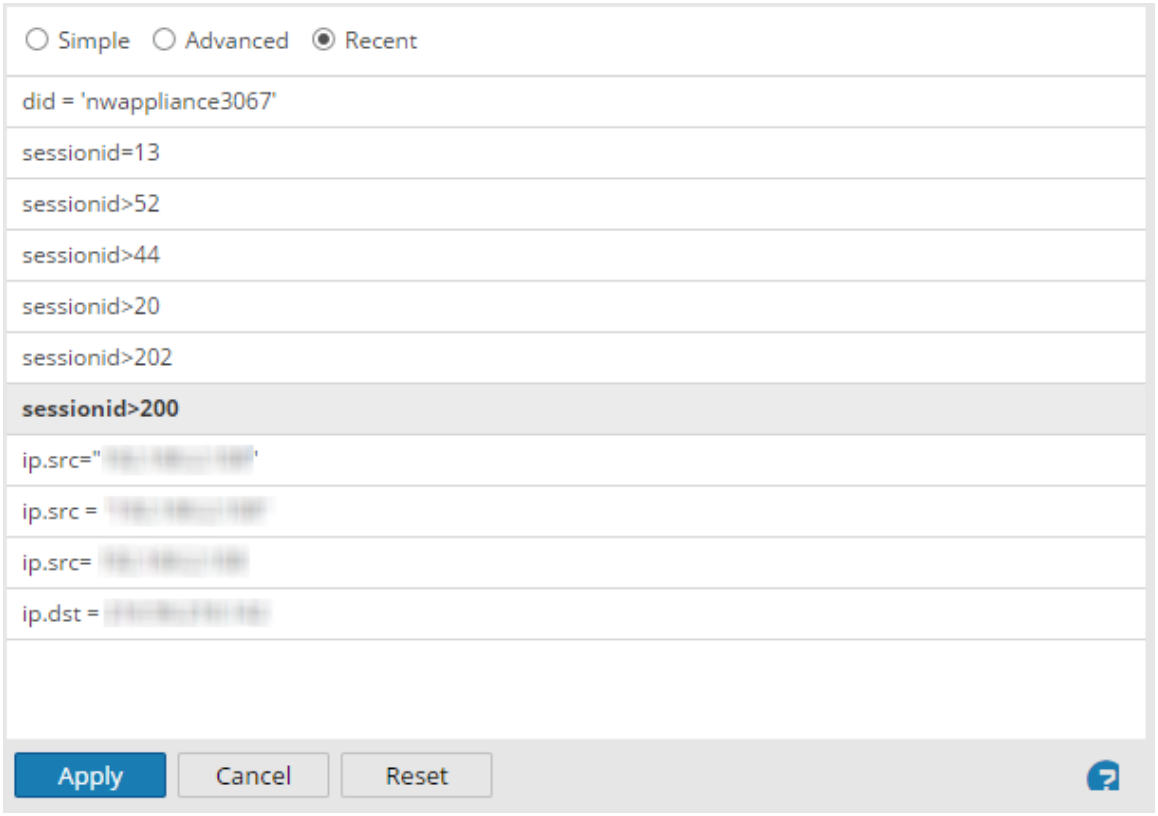
Simple View



Advanced View



Recent View



The following table describes features of the Query dialogs.

Feature	Description
Select Meta	Displays a drop-down list of meta groups.
Operator	Displays a drop-down list of operators (=,NetWitness Suite!=,NetWitness Suiteexists,NetWitness Suite!exists)
Value	Allows you to enter a value to complete the query.
Network	Limits the query to packets if Log is not selected.
Log	Limits the query to logs if Network is not selected.

Feature	Description
Query box	Allows you to enter a query in the Advanced view. When you begin typing, a drop-down list of available meta keys for the service is displayed, then a drop-down of operators is displayed as you type. If the expression currently entered in the query box is invalid, a warning appears near the box. When the query is valid, the warning is removed.
Query list	Allows you to select a query from a list of recent queries in the Recent view. Double-clicking a query automatically applies it.
Apply	Applies the new query to the current Investigation view.
Cancel	Closes the dialog without applying changes.
Reset	Resets all fields.

Scan For Malware Dialog

In the Scan for Malware dialog, Malware Analysis analysts can upload files to investigate in Malware Analysis.

To access this dialog go to the **Malware Analysis** view. In the **Select a Malware Analysis Service** dialog, select a service in the left panel, then click Scan Files in the right panel.

Workflow

- Launch a Malware Analysis Scan from the Navigate View

Quick Look

The Select a Malware Analysis Service dialog has a Malware Services panel on the left and a Scan Jobs List on the right. The Scan Jobs List panel has a toolbar, list, and buttons to view scans.

The Malware Services panel is a list of services available for malware analysis. In this panel, you can select the service to investigate and you set a default service using the Default Service icon. When you select a service, the available scan jobs for that service are listed in the Scan Jobs list.

These are the features in the Scan Jobs List toolbar.

Feature	Description
Scan Files	Displays the Scan for Malware dialog, in which you can upload a file to the service for scanning.
Delete scan job ( )	Deletes one or more selected scan jobs, NetWitness Suite displays a confirmation dialog before deleting scan jobs.
Cancel scan job ( )	Pauses or continues one or more scan jobs.
Refresh ( )	Refreshes the list of scan jobs.

These are the columns in the Scan Jobs list. This list is also available in the Malware Scan Jobs dashlet.

Feature	Description
Name	Displays the name of the job.
Static, Network, Community, Sandbox	Filters the results based on the scores for each scoring module.
Progress	Displays the current progress made on the job. • Green: The job is finished. • Black: The job is in progress. • Red: An error occurred.
Info	Provides additional information. Displays the query for the job. If the job is not complete, it also displays more detailed description of the status.
User	Displays the name of the user who created the job.
Events	Counts the number of events for the job.
Dropped	Counts the number of files/events in the job that were dropped because the scores are below their configured threshold.

Feature	Description
Event Type	Displays the type of job: Manual Upload, On Demand, or Resubmit.
Scheduled	Displays the date and time when the job was executed.

These are the available actions in the dialog.

Feature	Description
Cancel button	Cancels the selected scan job.
View Scan button	Displays the Summary of Events for the selected scan with the default dashlets displayed.
View Continuous Mode button	Displays the Summary of Events for the selected scan with the default dashlets displayed.

Settings Dialog for Navigate View and Events View

The settings in the Navigate view and Events view Settings dialogs are a subset of the Investigation settings made in the Profiles > Preferences panel > Investigations tab. By providing the settings within the Investigation view, NetWitness Suite saves time for analysts. If you change a setting here, the same setting is changed in the Profiles view, and if you change a setting in the Profiles view, the same setting is changed here.

To access this dialog, go to the **Navigate** or **Events** view, and select the **Settings** option in the toolbar.

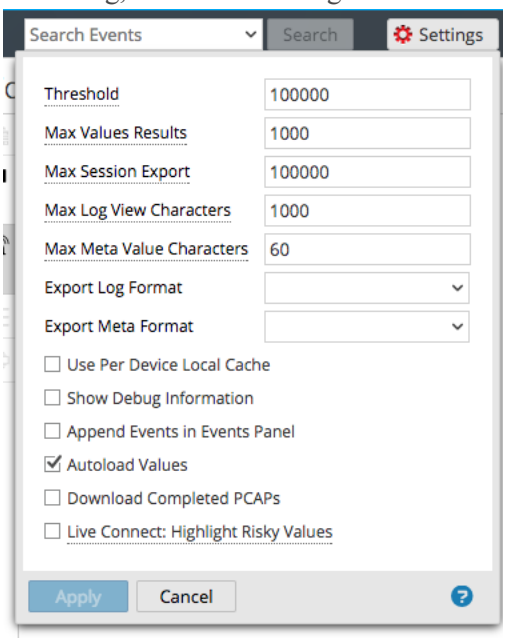
Related Topics

- How NetWitness Investigate Works

Quick Look

The Settings dialogs in the Navigate view and Events view have several features in common.

Several Investigation settings in the Navigate view influence the performance of when loading values in the Values panel. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. The image below is an example of the dialog, and the following table describes the features.

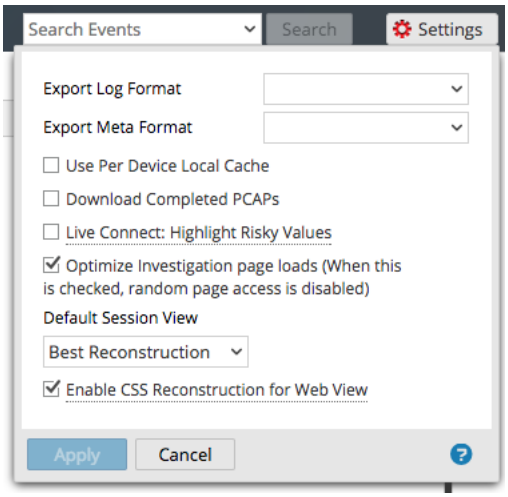


Feature	Description
Threshold	Sets the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The default value is **100000**.
Max Values Results	Sets the maximum number of values to load in the Navigate View when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The default value is **1000**.
Max Session Export	Sets the maximum number of sessions able to be exported. The default value is **100000**.
Export Log Format	Sets the file format of exported logs. There are four formats available: • Text • SML • CSV • JSON
Export Meta Format	Sets the file format of exported meta values. There are four formats available: • Text • SML • CSV • JSON
Use Per Device Local Cache	When unchecked, Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If checked, Investigate uses the data from local cache.
Show Debug Information	This option controls the display of the `where` clause beneath the breadcrumb in the Navigate view and the elapsed load time for each aggregated service on a Broker. When checked the debug information is displayed. The default value is **Off** (unchecked)**.**

Feature	Description
Append Events in Event Panel	This option affects paging in the Events panel. When checked, the next group of events is appended to the already displayed events. When unchecked, the previous page of events is replaced by the next page. The default value is **Off** (unchecked)
Autoload Values	This option controls automati loading of values for the selected service in the Navigate view. When checked, values are automatically loaded when you select a service to investigate. When not checked, Investigate displays a **Load Values** button, allowing the opportunity to modify options. The default value is **Off**.
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in the Investigation module so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP form.
Live Connect: Highlight Risky IPs	If this option is unchecked, all the meta values that have context available in Live Connect are highlighted in the Navigate view Values panel. If the option is checked, among the values that have context in Live Connect, only those values deemed Risky/Suspicious/Unsafe by the community are highlighted. By default this option is unchecked (**Off**).
Apply	Applies the settings immediately and they are visible the next time you load values. The same changes are also applied in the Profiles view.
Cancel	Cancels the editing operation and closes the dialog, leaving the settings unchanged.

Events View Settings Dialog

The following image is an example of the Settings dialog for the Events view, and the following table describes the features.



Feature	Description
Export Log Format	Sets the file format of exported logs. There are four formats available: • Text • SML • CSV • JSON
Export Meta Format	Sets the file format of exported meta values. There are four formats available: • Text • SML • CSV • JSON
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in the Investigation module so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP form.

Feature	Description
Live Connect: Highlight Risky IPs	When checked, Investigate uses a filter to fetch only IP addresses that are considered as risky by RSA community. When not selected, NetWitness Suite displays all IP addresses. By default, this option is not selected (**Off**).
Optimize Investigation page loads	Sets a paging option. When optimized, results are returned as quickly as possible, sacrificing the original ability to go to a specific page in the event list. Unchecking this box changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). The default value is **enabled**.
Default Session View	Selects the default reconstruction type for the initial reconstruction in the Events view. The default value is **Best Reconstruction** in which events are reconstructed using the reconstruction method most appropriate to the event.
Enable CSS Reconstruction for Web View	This setting controls how web content reconstruction is performed. If enabled, the web reconstruction includes cascaded style sheet (CSS) styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for style sheets and images used in the target event. The option is enabled by default. Uncheck this option if there are problems viewing specific websites.
Apply	Applies the settings immediately and they are visible the next time you view events. The same changes are also applied in the Profiles view.
Cancel	Cancels the editing operation and closes the dialog, leaving the settings unchanged.

NetWitness Respond Process

NetWitness Suite Respond collects alerts from multiple sources and provides the ability to group them logically and start an Incident Respond workflow to investigate and remediate the security issues raised. NetWitness Suite Respond enables you to configure rules that aggregate Alerts into Incidents. Alerts will be normalized by the system to a common format to provide users with a consistent view for the rule criteria regardless of the data source. You can build query criteria based on the alert data with the ability to query on fields that are common as well as specific to data sources.

The rule engine allows you to group similar alerts together into an Incident so that the investigation and remediation workflow can be shared across a set of similar alerts. You can create rules that can group alerts into incidents depending on a common value they share for one or two attributes (for example, source hostname) or if they are reported within a limited time window (for example, alerts that are within four hours of each other).

If an alert matches a rule, an incident is created using the criteria. As new alerts are ingested, if an existing Incident was already created that matched those criteria, and that incident is not "in progress" yet, the new alerts will continue to be added to the same incident. If there is no existing incident for the grouped value (for example, the specific hostname) or the time window, a new incident will be created and the alert will be added to it.

You can have multiple aggregation rules. The rules can either group alerts into Incidents or suppress alerts from being matched by any rule, hence the rules are ranked top-to-bottom and only the first rule to match an incoming alert is used to include that alert in an incident. The Incidents provide a context for the alerts, provide tools to record the investigation status, and track the progress of associated tasks.

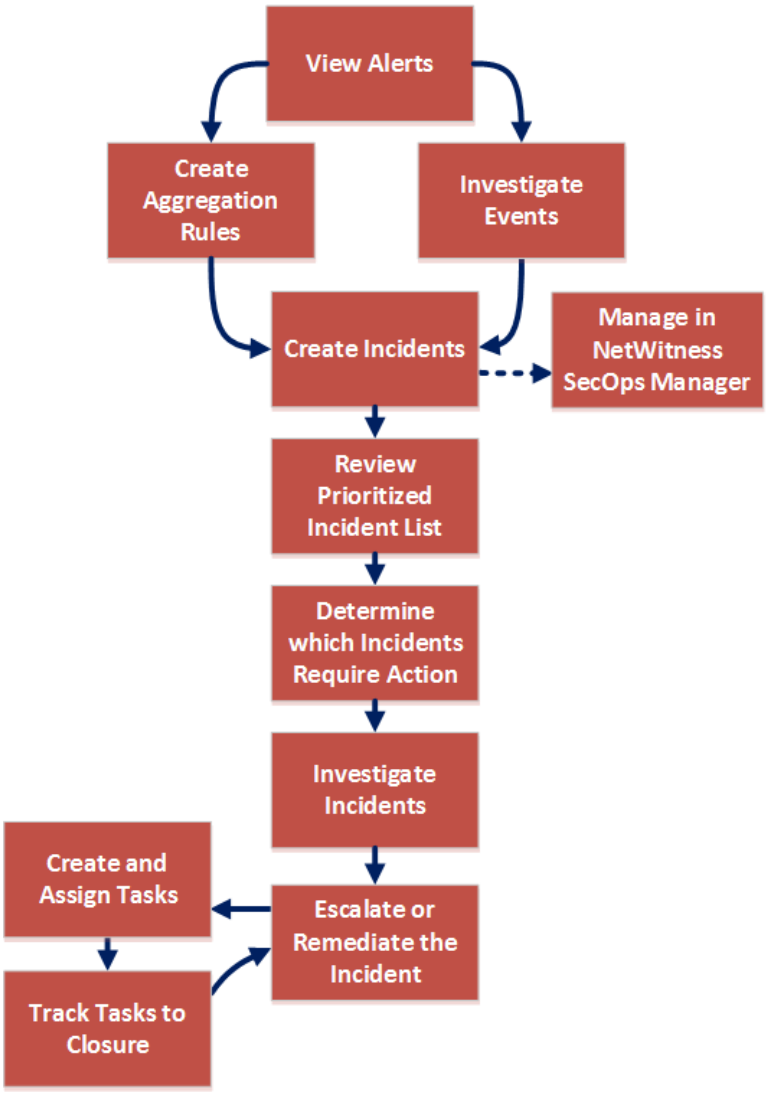
The stages in the NetWitness Respond process are:

- Review Alerts
- Create Incidents
- Respond to Incidents:
  - Review Prioritized Incident List
  - Determine which Incidents Require Action
  - Investigate Incidents
  - Escalate or Remediate the Incident (This includes creating and assigning tasks as well as tracking tasks to closure.)

You also have the option of managing incidents in NetWitness SecOps Manager instead of NetWitness Respond.

NetWitness Respond Workflow

The following figure shows the high-level NetWitness Respond workflow process.



Responding to Incidents

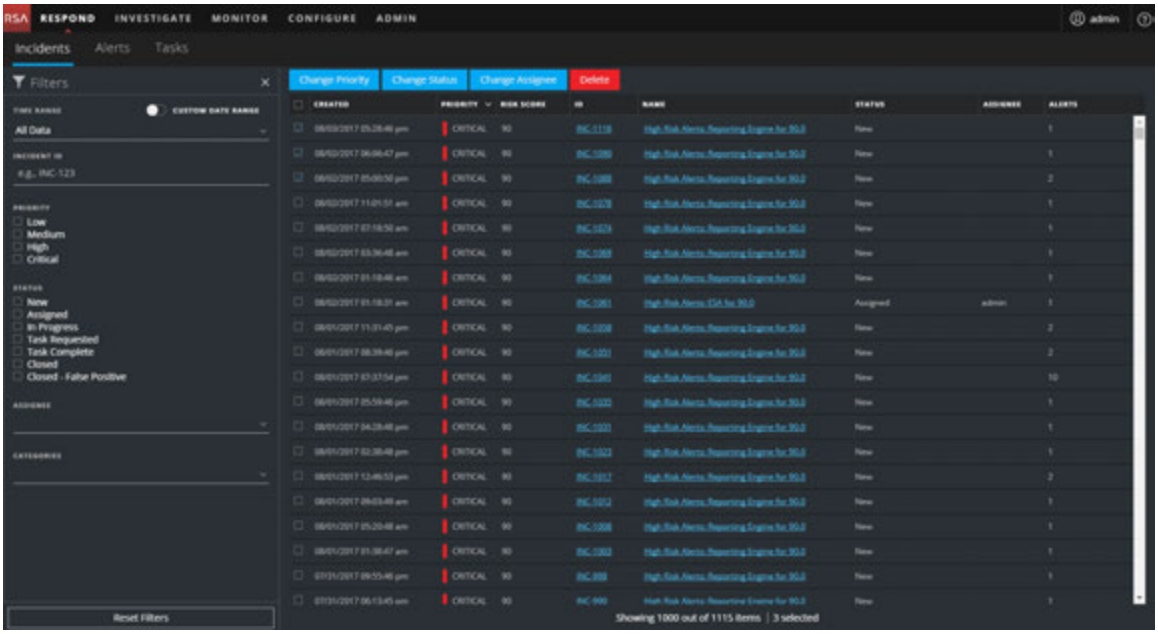
The **Respond** view is designed to help you quickly identify the ongoing issues in your network and work with other Analysts to quickly solve the issues.

The Respond view presents Incident Responders with a queue of incidents in severity order. When you take an incident from the queue, you receive relevant supporting data to help you investigate the incident. This enables you to determine the incident scope so you can escalate or remediate it as appropriate.

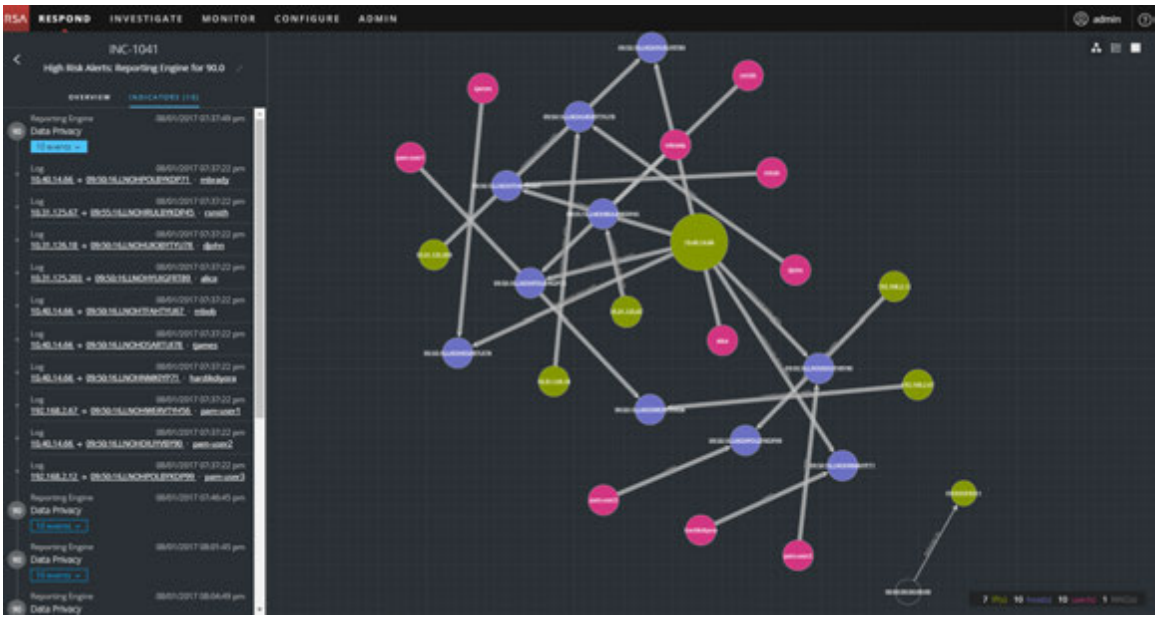
Within the Respond view, you can see Incidents, Alerts, and Tasks:

- **Incidents**: Enables you to respond to and manage incidents from start to finish.
- **Alerts**: Enables you to manage alerts from all sources received by NetWitness Suite and create incidents from selected alerts.
- **Tasks**: Enables you to view and manage the complete list of tasks created for all incidents.

If you navigate to RESPOND > Incidents, you can see the Incidents List view and from there you can access the Incident Details view for a selected incident. These are the main views that you use to respond to incidents. The following figure shows the list of prioritized incidents in the **Incidents List** view.



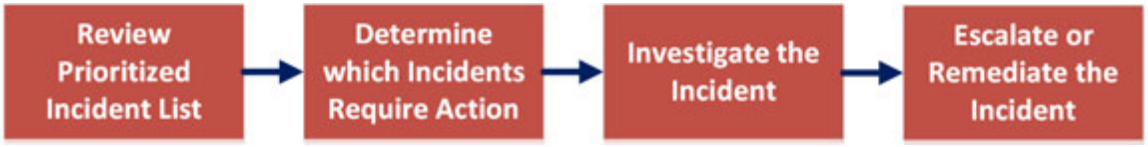
The next figure shows an example of details available in the **Incident Details** view.



The Respond view is designed to make it easy to evaluate incidents, contextualize that data, collaborate with other analysts, and pivot to a deep-dive investigation as needed.

Responding to Incidents Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness Suite.



First, you review the list of prioritized incidents, which shows basic information about each incident, and determine which incidents require action. You can click a link in an incident to get a clearer picture of the incident with supporting details in the Incident Details view. From there, you can further investigate the incident. You can then determine how to respond to the incident, by escalating or remediating it.

These are the basic steps for responding to an incident:

1. Review Prioritized Incident List
2. Determine which Incidents Require Action
3. Investigate the Incident
4. Escalate or Remediate the Incident

Review Prioritized Incident List

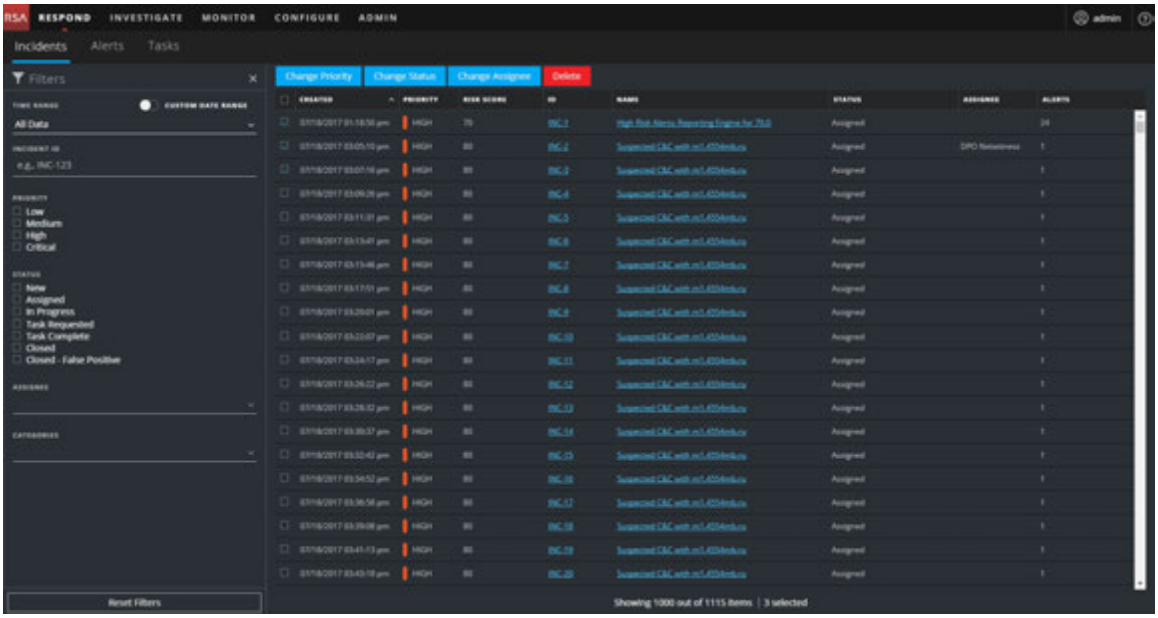
In the Respond view, you can view the list of prioritized incidents. The incident list shows both active and closed incidents.

View the Incidents List

After logging in to NetWitness Suite, most Incident Responders see the Respond view, which is set as the default view. If you have a different initial view, you can navigate to the Respond view.

1. Log in to NetWitness Suite.

   The Respond view shows the list of incidents, also referred to as the Incident List view.



2. If you do not see the incidents list in the Respond view, go to **RESPOND > Incidents**.
3. Scroll through the incidents list, which shows basic information about each incident as described in the following table.

Column	Description
CREATED	Shows the creation date of the incident.

Column	Description
PRIORITY	Shows the incident priority. Priority can be Critical, High, Medium or Low. The Priority is color coded, where red indicates a **Critical** incident, orange represents a **High** risk incident, yellow indicates a **Medium** risk incident, and green represents a **Low** risk incident. For example: 
RISK SCORE	Shows the incident risk score. The risk score indicates the risk of the incident as calculated via an algorithm and is between 0-100. 100 is the highest risk score.
ID	Shows the automatically created incident number. Each incident is assigned a unique number that you can use to track the incident.
NAME	Shows the incident name. The incident name is derived from the rule used to trigger the incident. Click the link to go to the Incident Details view for the selected incident.
STATUS	Shows the incident status. The status can be: **New**, **Assigned**, **In Progress**, **Task Requested**, **Task Complete, Closed**, and **Closed- False Positive**.
ASSIGNEE	Shows the team member currently assigned to the incident.
ALERTS	Shows the number of alerts associated with the incident. An incident may include many alerts. A large number of alerts might mean that you are experiencing a large-scale attack.

At the bottom of the list, you can see the number of incidents on the current page, the total number of incidents, and the number selected. For example: **Showing 1000 out of 1115 items | 3 selected**. The maximum number of incidents that you can view at one time is 1,000.

Filter the Incident List

The number of incidents in the Incidents List view can be very large, making it difficult to locate particular incidents. The Filter enables you to specify those incidents that you would like to view. You can also choose the timeframe when those incidents occurred. For example, you may want to view all of the new critical incidents created within the last hour.

1. Verify that the Filters panel appears to the left of the incidents list. If you do not see the Filters panel, in the Incident List view toolbar, click , which opens the Filters panel.

2. In the Filters panel, select one or more options to filter the incidents list:

   - **TIME RANGE**: You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the incidents. For example, if you select Last Hour, you will see incidents that were created within the last 60 minutes.
   - **CUSTOM DATE RANGE**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar.

   - **INCIDENT ID**: Type the Incident ID for an incident you would like to locate, for example INC-1050.

- **PRIORITY**: Select the priorities that you would like to view.
- **STATUS**: Select one or more incident statuses. For example, select Closed - False Positive to view only false positive incidents, which were initially identified as suspicious, but then they were later found to be safe.
- **ASSIGNEE**: Select the assignee or assignees of the incidents that you would like to view. For example, if you only want to view the incidents assigned to Cale or Stanley, select Cale and Stanley from the Assignee drop-down list. If you want to view incidents regardless of the assignee, do not make a selection under Assignee.
- **CATEGORIES**: Select one or more categories from the drop-down list. For example, if you only want to view incidents classified with the Backdoor or Privilege abuse categories, select Backdoor and Privilege abuse.

The incidents list shows a list of incidents that meet your selection criteria. You can see the number of incidents in your filtered list at the bottom of the incident list.

3. Click ✕ to close the Filters panel and return to the Incidents List view, which now shows your filtered incidents.

Remove My Filters from the Incident List View

NetWitness Suite remembers your filter selections in the Incident List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of incidents that you expect to see or you want to view all of the incidents in your incident list, you can reset your filters.

1. In the Incident List view toolbar, click ▼.
   The Filters panel appears to the left of the incidents list.
2. At the bottom of the Filters panel, click **Reset Filters**.

View My Incidents

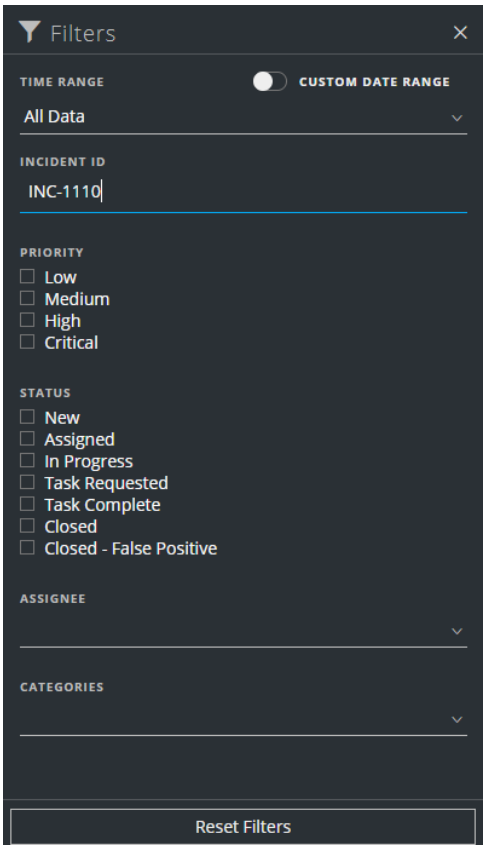
You can view your incidents by filtering the incidents by your username.

1. If you cannot see the Filter panel, in the Incident List view toolbar, click ▼.
2. In the Filter panel, under ASSIGNEE, select your username from the drop-down list.
   The incidents list shows the incidents that are assigned to you.

Find an Incident

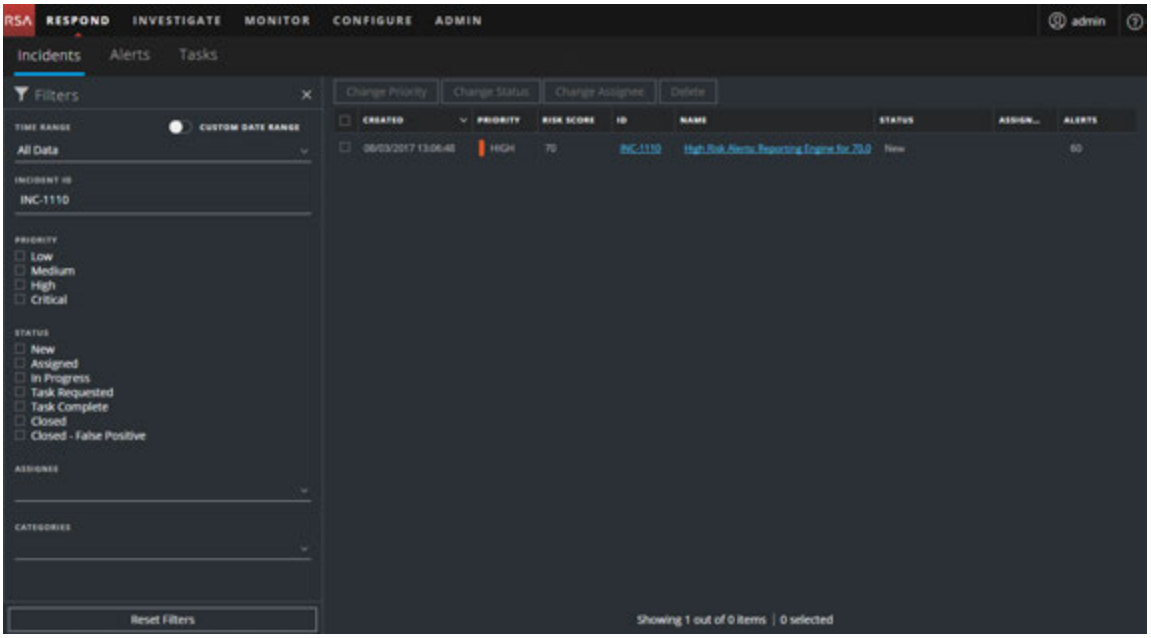
If you know the Incident ID, you can quickly locate an incident using the Filter. For example, you may want to locate a specific incident out of thousands of incidents.

1. Go to **RESPOND > Incidents**.
   The Filters panel appears to the left of the incidents list. If you do not see the Filters panel, in the Incident Lists view toolbar, click , which opens the Filters panel.



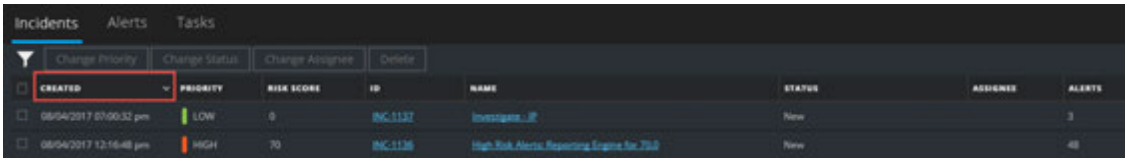
2. In the INCIDENT ID field, type the INCIDENT ID for an incident that you would like to locate, for example INC-1110.

The specified incident appears in your incident list. If you do not see any results, try resetting your filters.



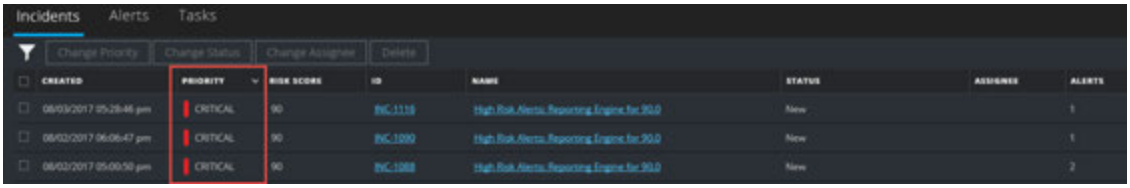
Sort the Incidents List

The default sort for the incidents list is by Created date in descending order (newest on the top).

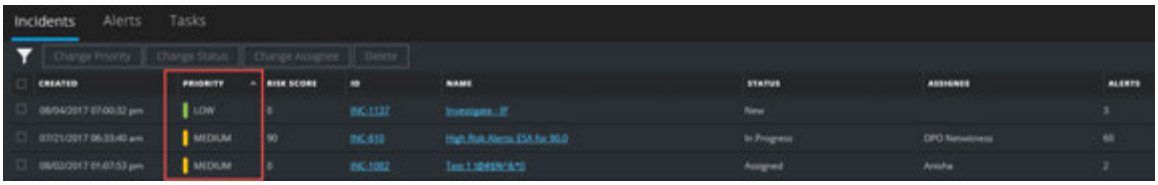


You change the sort order of the incidents list by clicking a column in the list.

For example, to prioritize the incidents, you can sort your view by the Priority column. To do this, hover over the Priority column and click the down arrow ■. The incident list sorts by Priority in descending order (highest priority on top), as shown in the following figure.

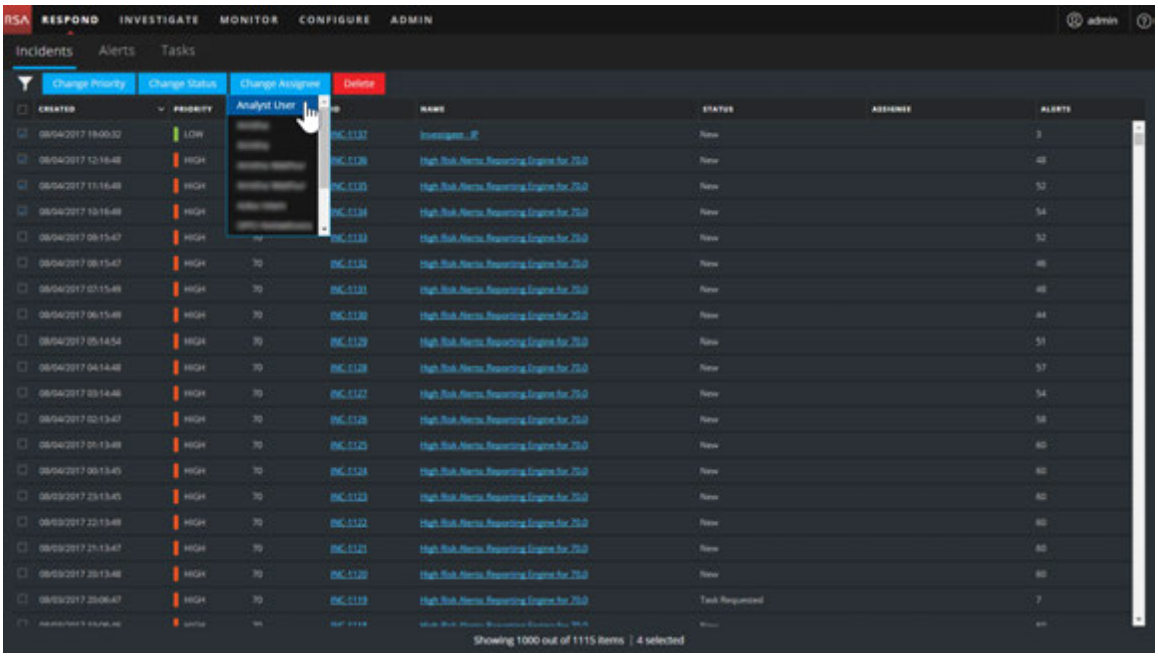


To sort by Priority in ascending order (lowest priority on top), click the up arrow ■. as shown in the following figure.

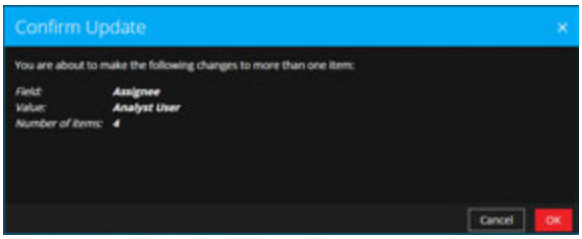


Assign Incidents to Myself

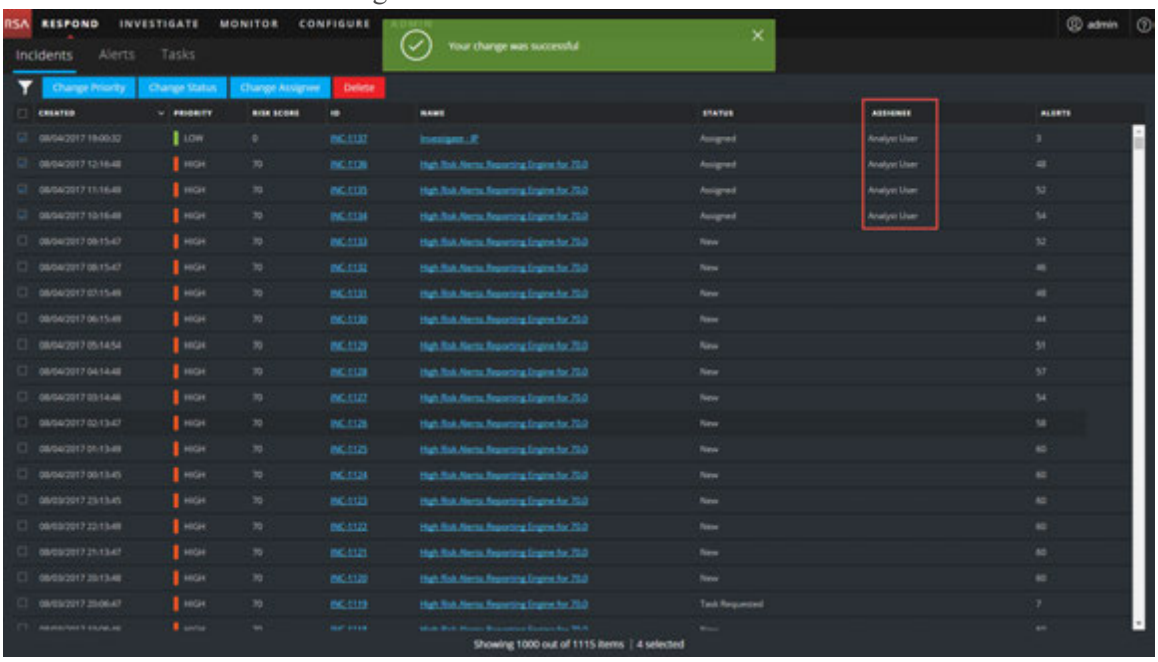
1. In the Incident List view, select one or more incidents that you want to assign to yourself.
2. Click **Change Assignee** and select your username from the drop-down list.



3. If you selected more than one incident, in the Confirm Update dialog, click **OK**.

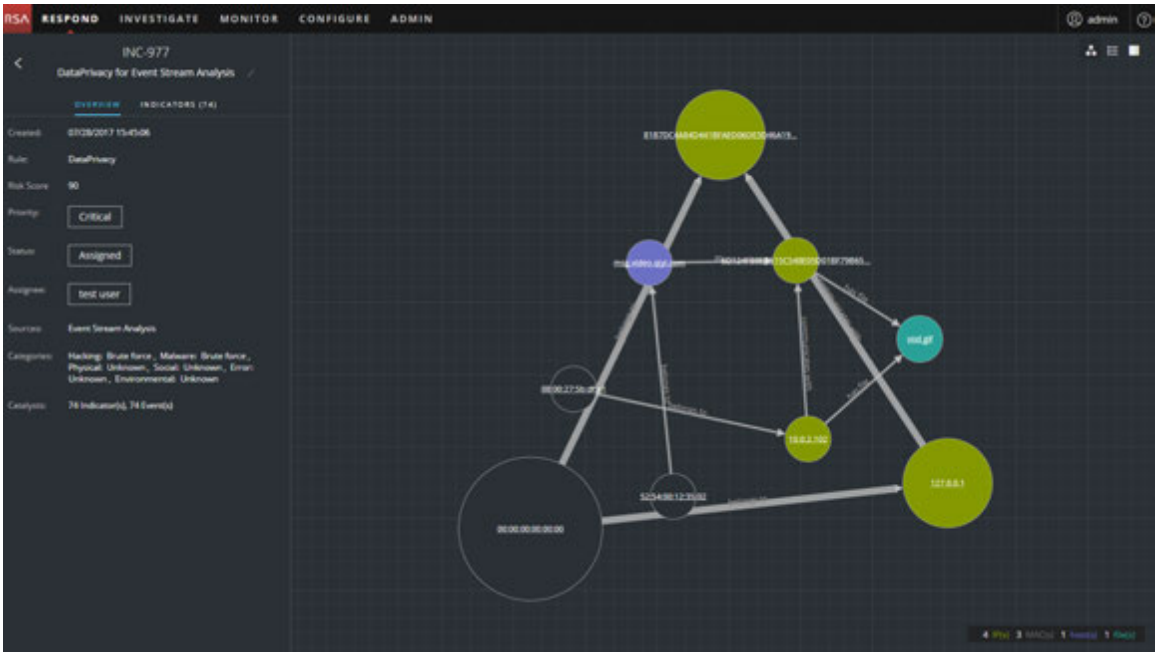


You will see a successful change notification.



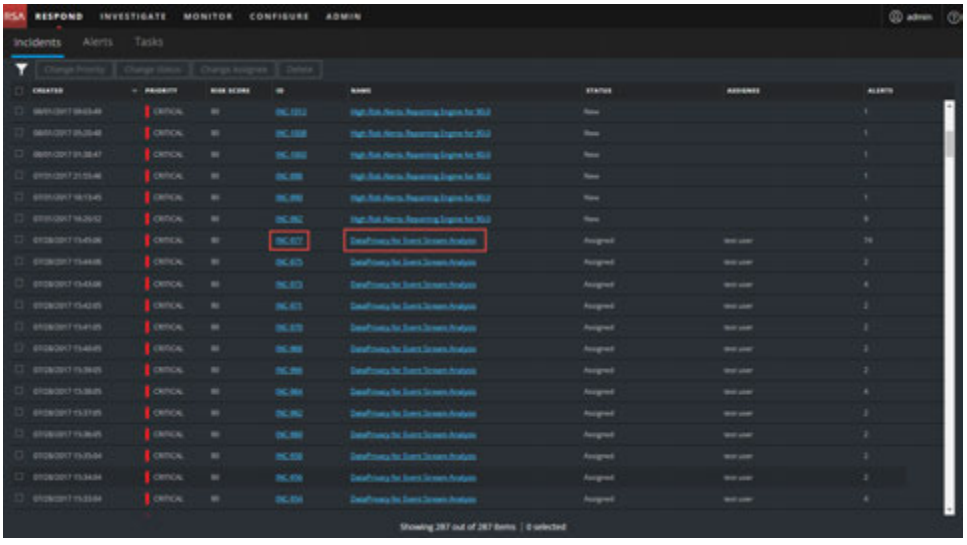
Determine which Incidents Require Action

Once you get the general information about the incident from the Incident List view, you can go to the Incident Details view for more information to determine the action required.

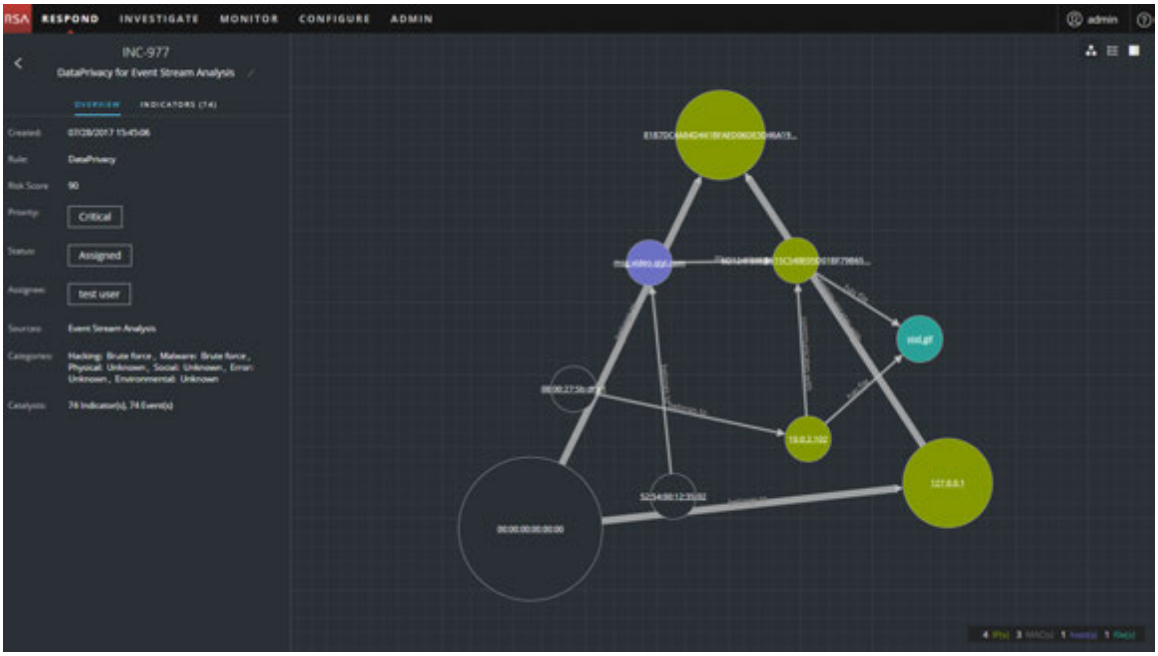


View Incident Details

To view details for an incident, in the Incidents List view, choose an incident to view and then click the link in the ID or NAME column for that incident.



The Incident Details view for the selected incident appears with the Overview panel and Nodal Graph in view.



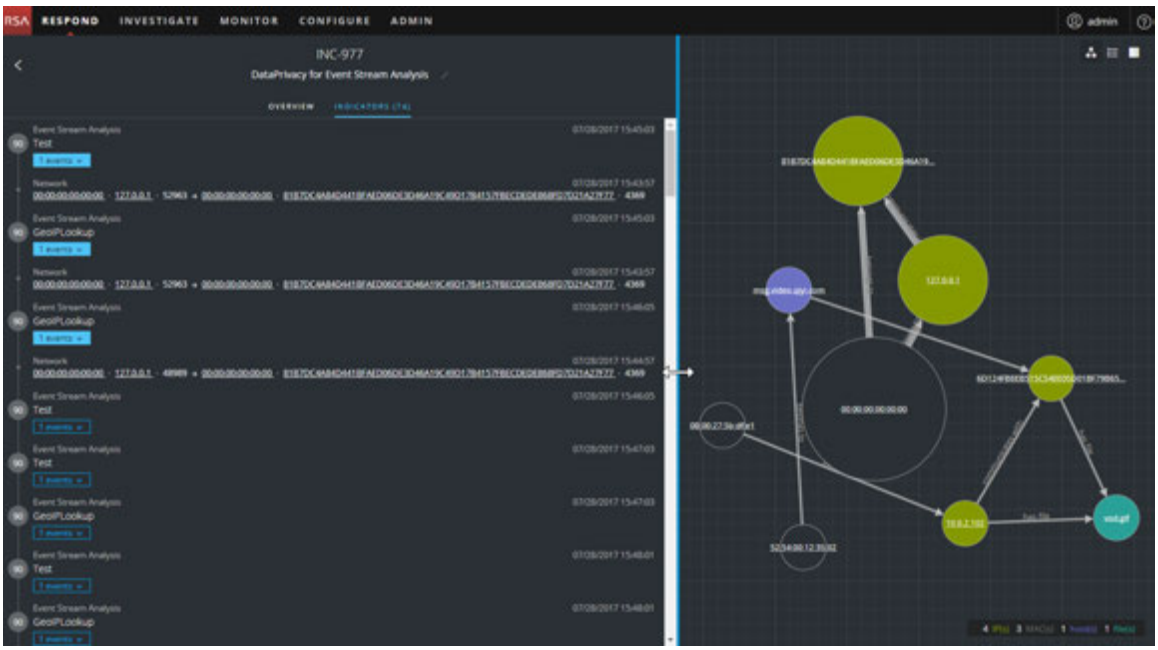
The Incident Details view has the following panels:

- **OVERVIEW**: The incident overview panel contains high-level summary information about the incident, such as the score, priority, alerts, and status. You have the option to change the incident Priority, Status, and Assignee.
- **INDICATORS**: The Indicators panel contains a chronological listing of indicators. ***Indicators*** are alerts, such as an ESA alert or a NetWitness Endpoint alert. This listing helps you to connect indicators and notable data. For example, an IP address connected to a command and communication ESA alert might also have triggered a NetWitness Endpoint alert or other suspicious activities.
- **Nodal Graph**: The nodal graph is an interactive graph that shows the relationship between the entities involved in the incident. An *Entity* is a specified piece of meta, such as IP address, MAC address, user, host, domain, file name, or file hash.
- **Events**: The Events panel, also known as the Events table, lists the events associated with the incident. It also shows event source and destination information along with additional information depending on the event type. You can click an event in the list to view the detailed data for that event.
- **JOURNAL**: The Journal panel enables you to access the Journal for the selected incident, which allows you to communicate and collaborate with other analysts. You can post notes to

a journal, add Investigation Milestone tags (Reconnassance, Delivery, Exploitation, Installation, Command and control), and view the history of activity on your incident.

- **TASKS**: The Tasks panel shows all of the tasks that have been created for the incident. You can also create additional tasks from here.
- **RELATED**: The Related Indicators panel enables you to search the NetWitness Suite alerts database to find alerts that are related to this incident. You can also add related alerts that you find to the incident.

To view more information in the left-side panel without scrolling, you can hover over the right edge and drag the line to resize the panel as shown in the following figure:



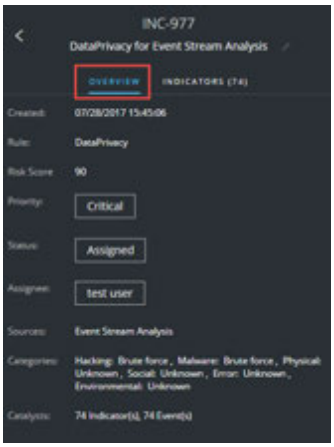
View Basic Summary Information about the Incident

You can view basic summary information about an incident in the Overview panel.

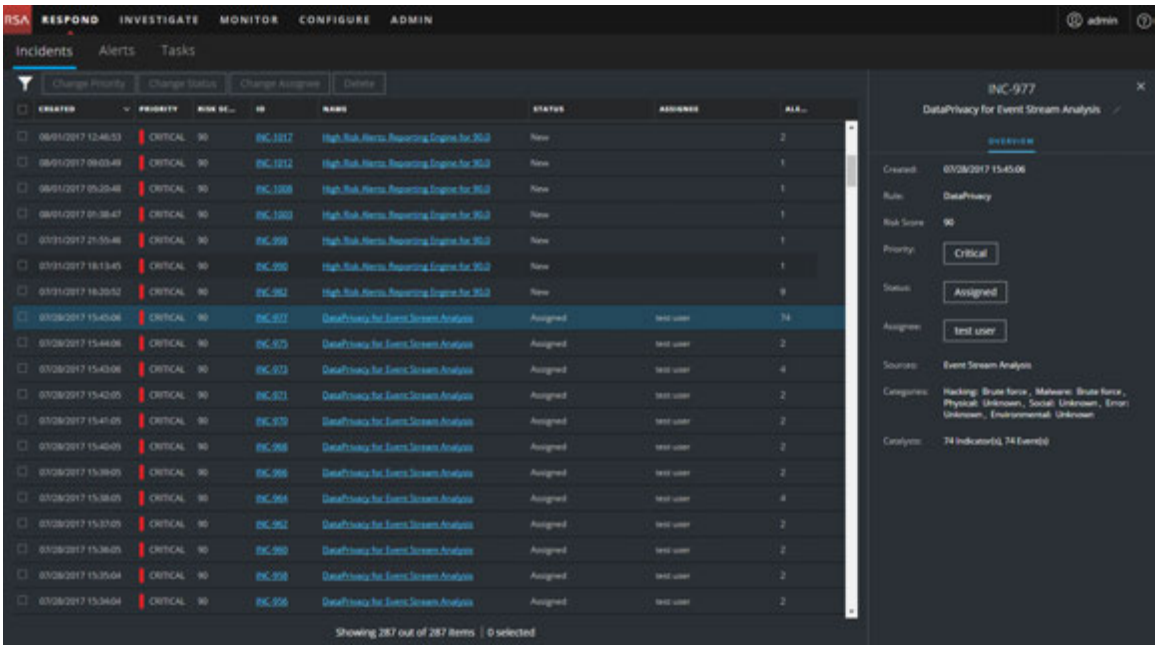
Above the Overview panel, you can see the following information:

- **Incident ID**: This is an automatically created unique ID assigned to the incident.
- **Name**: The incident name is derived from the rule used to trigger the incident.

To view the Overview panel from the Incident Details view, select **OVERVIEW** in the left panel.



To view the Overiew panel from the Incidents List view, click an incident in the list. The Overview panel appears on the right.



The Overview panel contains basic summary information about the selected incident:

- **Created**: Shows the creation date and time of the incident.
- **Rule / By**: Shows the name of the rule that created the incident or the name of the person who created the incident.
- **Risk Score**: Indicates the risk of the incident as calculated via an algorithm and is between 0-100. 100 is the highest risk score.
- **Priority**: Shows the incident priority. Priority can be Critical, High, Medium or Low.

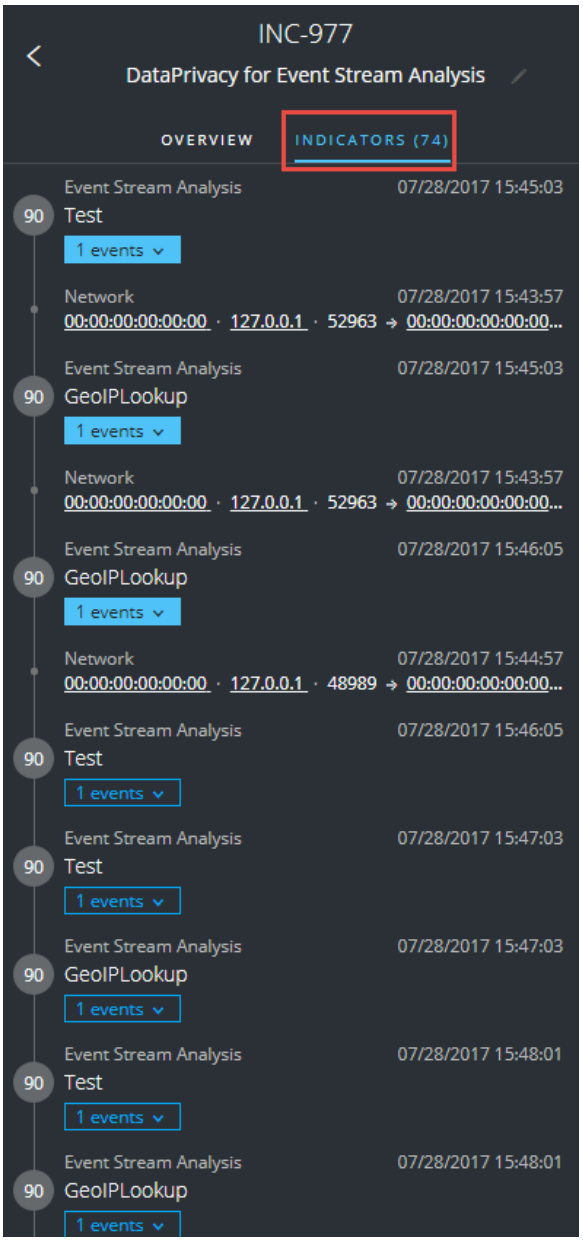
- **Status**: Shows the incident status. The status can be New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed - False Positive. After you create a task, the status changes to Task Requested.
- **Assignee**: Shows the team member currently assigned to the incident.
- **Sources**: Indicates the data sources used to locate the suspicious activity.
- **Categories**: Shows the categories of the incident events.
- **Catalysts**: Shows the count of indicators that gave rise to the incident.

View the Indicators and Enrichments

Note: *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert.

You can find indicators, events, and enrichments on the Indicators panel. The Indicators panel is a Chronological listing of indicators that helps you to find enrichments and events related to the triggering indicator. For example, an indicator might be a Command and Control alert, a NetWitness Endpoint alert, a Suspicious Domain (C2) alert, or an alert from an Event Stream Analysis (ESA) rule. The Indicators panel helps you to aggregate and order these indicators (alerts) from different systems so that you can see how they are related and also help you develop a timeline of a given attack.

To view the Indicators panel, in the left panel of the Incident Details view, select **INDICATORS**.



Indicators are alerts, such as an ESA alert or a NetWitness Endpoint alert. This listing helps you to connect indicators and notable data. For example, indicators can show the data found by your rules. In the Indicators panel, the risk score for an indicator is shown within a solid-colored circle.

Data source information is shown below the names of the indicators. You can also see the creation date and time of the indicator and the number of events in the indicator. When data is available, you can see the number of enrichments. You can click the event and enrichment buttons to view the details.

View and Study the Events

You can view and study the events associated with the incident from the Events panel. It shows information about the events, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

There are two types of events:

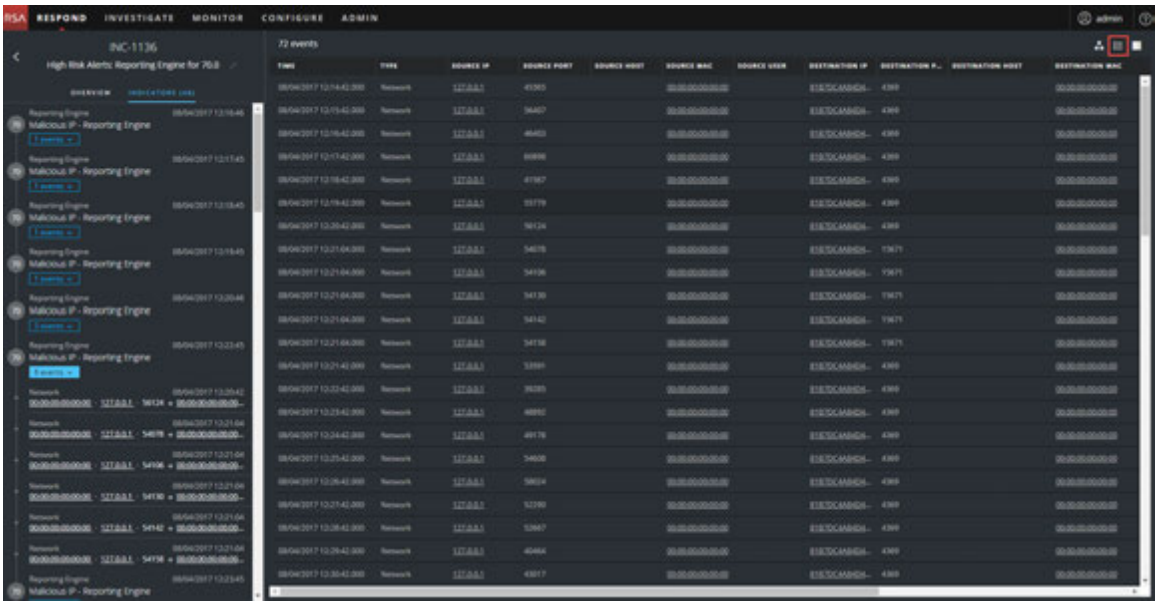
- A transaction between two machines (a Source and a Destination)
- An anomaly detected on a single machine (a Detector)

Some events will only have a Detector. For example, NetWitness Endpoint finds malware on your machine. Other events will have a Source and Destination. For example, packet data shows communication between your machine and a Command and Control (C2) domain.

You can drill further into an event to get detailed data about the event.

To view and study the events:

1. To view the Events panel, in the Incident Details view toolbar, click .

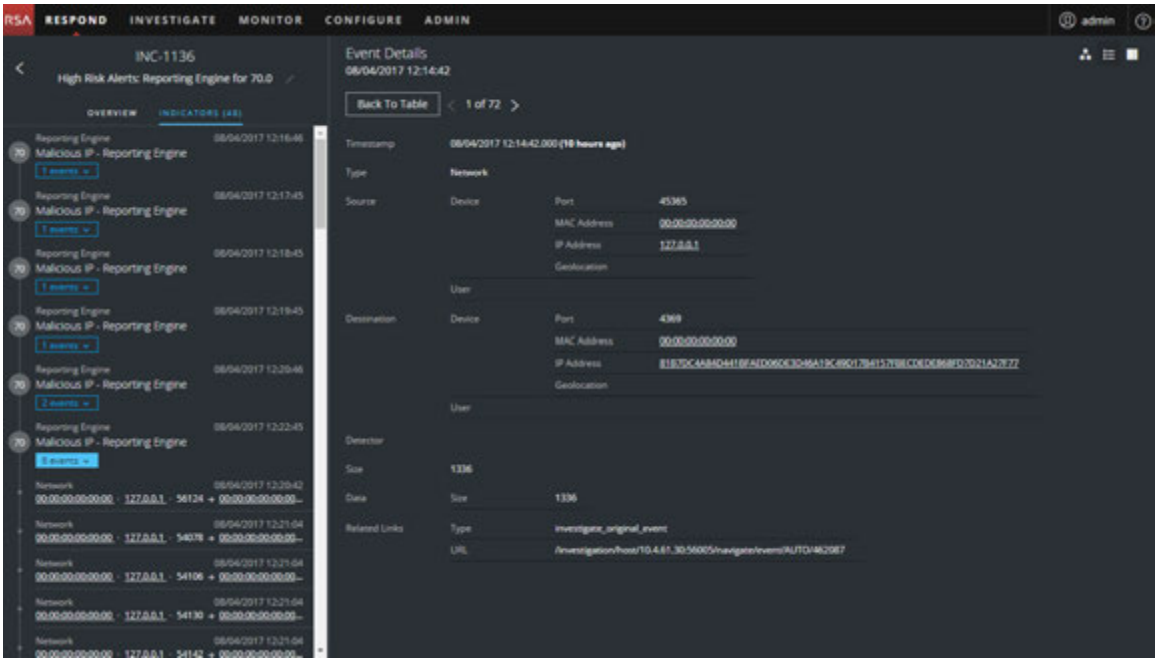


The Events panel shows a list of information about each event as shown in the following table.

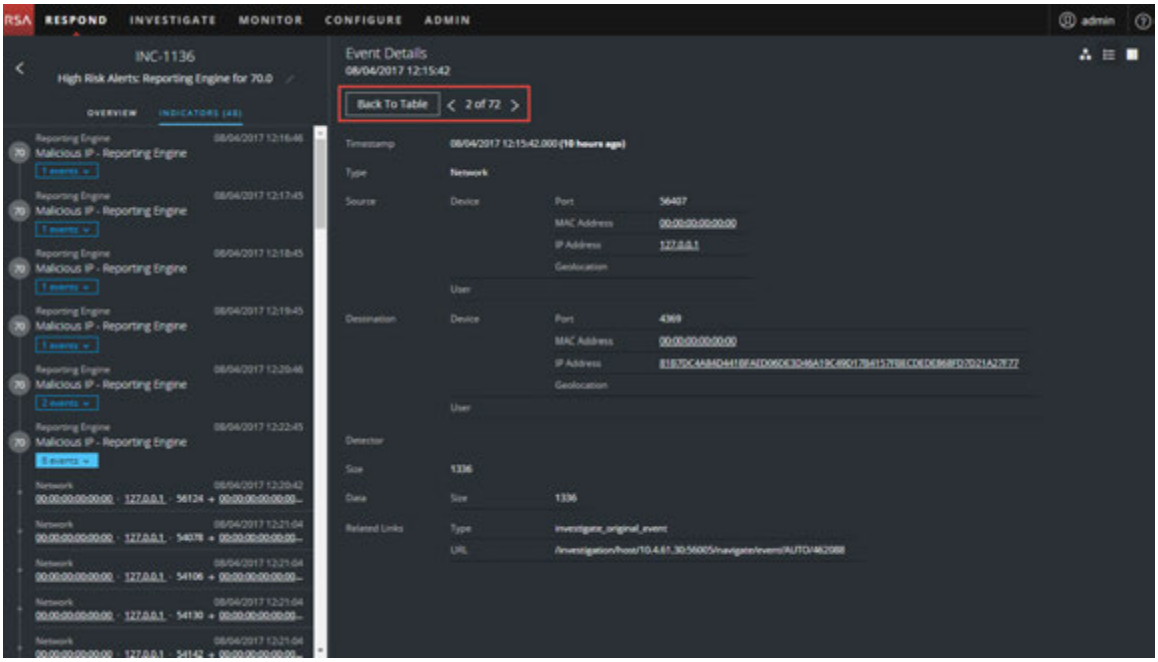
Column	Description
TIME	Shows the time the event occurred.
TYPE	Shows the type of alert, such as Log and Network.
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
SOURCE PORT	Shows the source port of the transaction. The source and destination ports can be on the same IP address.
SOURCE HOST	Shows the source host where the event took place.
SOURCE MAC	Shows the MAC address of the source machine.
SOURCE USER	Shows the user of the source machine.
DESTINATION IP	Shows the destination IP address if there was a transaction between two machines
DESTINATION PORT	Shows the destination port of the transaction. The source and destination ports can be on the same IP address.
DESTINATION HOST	Shows the destination host where the event took place.
DESTINATION MAC	Shows the MAC address of the destination machine.
DESTINATION USER	Shows the user of the destination machine.
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected.
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.

If there is only one event in the list, you will see the event details for that event instead of a list.

2. Click an event in the Events list to view the Event details.
   This example shows the event details for the first event in the list.



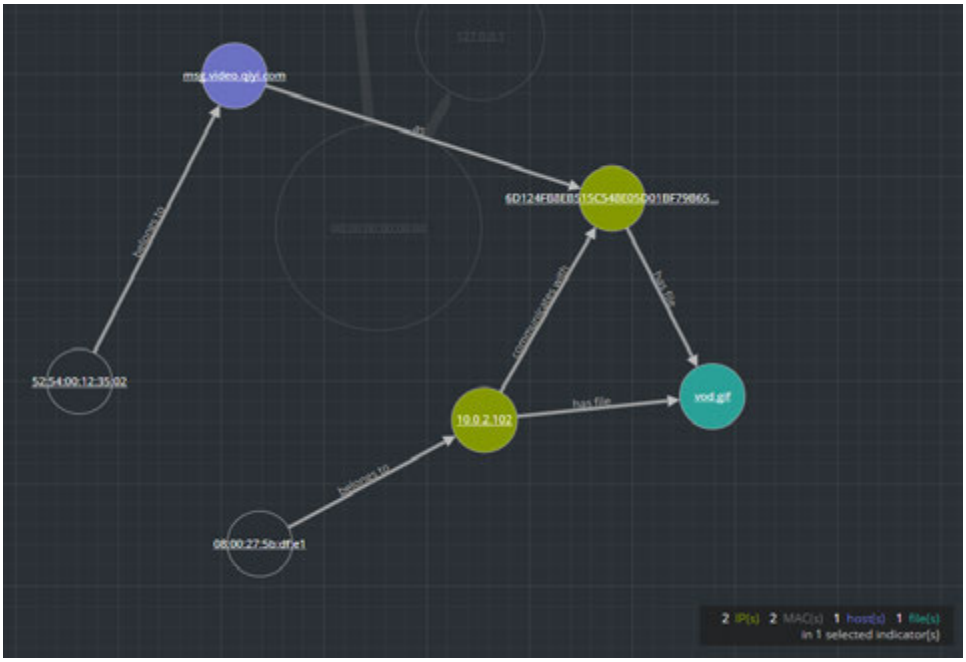
3. Use the Event Details navigation to view details for additional events.
   This example shows the second event in the list.



View and Study the Entities Involved in the Events

An *Entity* is either an IP address, MAC address, user, host, domain, file name, or file hash. The nodal graph is an interactive graph that you can move around to get a better understanding of how the entities involved in the events relate to each other. The nodal graphs look different depending on the type of event, the number of machines involved, whether the machines are associated with users, and if there are files associated with the event.

The following figure shows an example nodal graph with six nodes.



If you look closely at the nodal graph, you can see circles that represent nodes. A nodal graph can contain one or more of the following types of nodes:

- **IP address** (If the event is a detected anomaly, you can see a Detector IP. If the event is a transaction, you can see a Destination IP and a Source IP.)
- **MAC address** (You may see a MAC address for each type of IP address.)
- **User** (If the machine is associated with a user, you can see a user node.)
- **Host**
- **Domain**
- **Filename** (If the event involves files, you can see a filename.)
- **File Hash** (If the event involves files, you may see a file hash.)

The legend at the bottom of the nodal graph shows the number of nodes of each type and the color coding of the nodes.

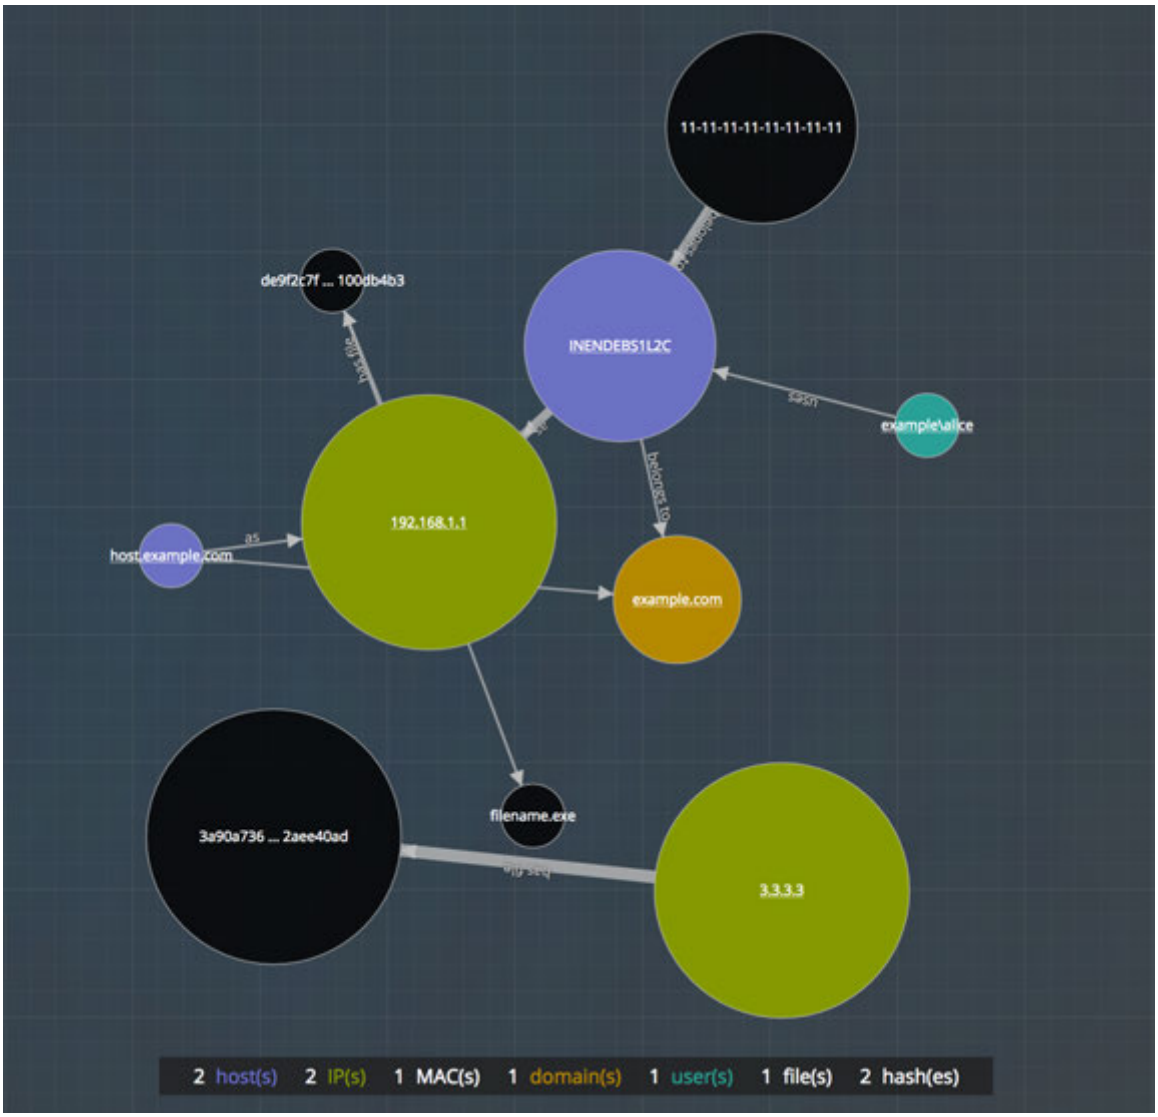
You can click any node and drag it to reposition it.

The arrows between the nodes provide additional information about the entity relationships:

- **Communicates with**: An arrow between a Source machine node (IP address or MAC address) and a Destination machine node labeled with "communicates with" shows the direction of the communication.
- **As**: An arrow between nodes labeled with "as" provides additional information about the IP address that the arrow points to. In the above example, there is an arrow from the host node circle that points to a hashed IP address node that is labeled with "as". This indicates that the name on the host node circle is the hostname of that IP address and is not a different entity.
- **Has file**: An Arrow between a machine node (IP address, MAC address, or Host) and a file hash node labeled with "has" indicates that the IP address has that file.
- **Uses**: An arrow between a User node and a machine node (IP address, MAC address, or Host) labeled with "uses" shows the machine that the user was using during the event.
- **Is named**: An arrow from a File Hash node to a File Name node labeled with "is named" indicates that the file hash corresponds to a file with that name.
- **Belongs to**: An arrow between two nodes labeled with "belongs to" indicates that they pertain to the same node. For example, an arrow between a MAC address and a Host labeled with "belongs to" indicates that it is the MAC address for the host.

Larger line size arrows indicate more communication between the nodes. Larger nodes (circles) indicate more activity than smaller nodes. The larger nodes are the most common entities mentioned in the events.

The following nodal graph example has ten nodes.



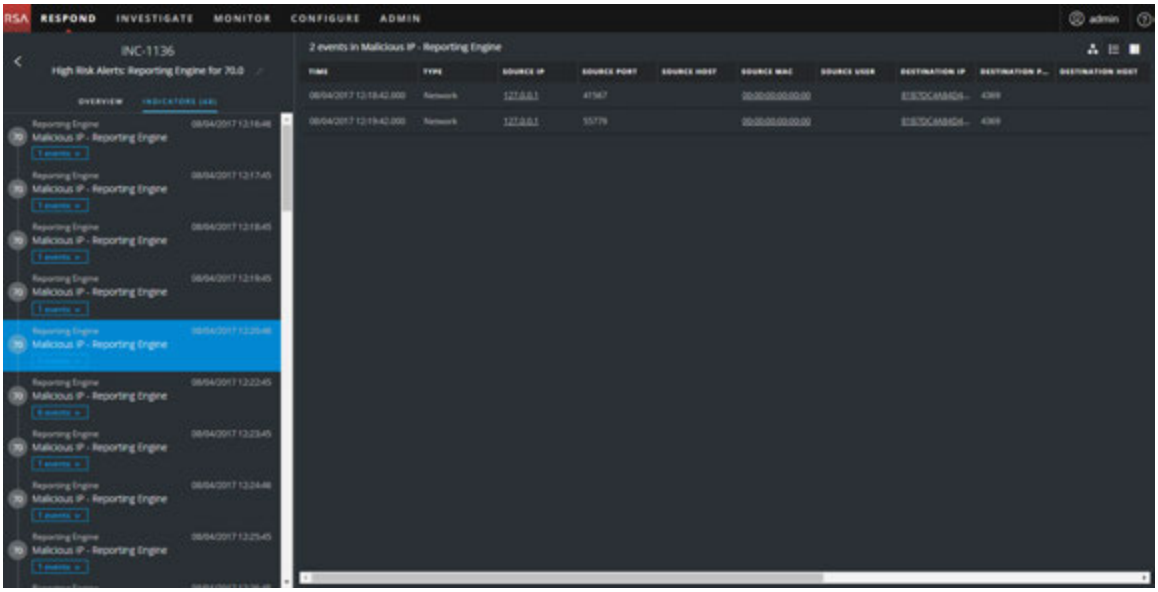
In this example, notice that there are two IP nodes that have a lot of activity. They both have files, but they do not communicate with each other. The IP address at the top (192.168.1.1) represents one machine with two hostnames (host.example.com and INENDEBS1L2C) in the example.com domain. The MAC address of the machine is 11-11-11-11-11-11-11-11-11-11and Alice uses it.

Filter the Data in the Incident Details View

You can click indicators in the Indicators panel to filter what you can see in the nodal graph and the Events list.

If you select an indicator to filter the nodal graph, data that is not part of your selection is dimmed, but it is still in view as shown in the following figure.

If you select an indicator to filter the events list, only the events for that indicator are shown in the list. The following figure shows an indicator selected that contains two events. The filtered Events list shows those two events.



If you select an indicator to filter the events list and there is only one event for that indicator, you can see the event details for that event as shown in the following figure.

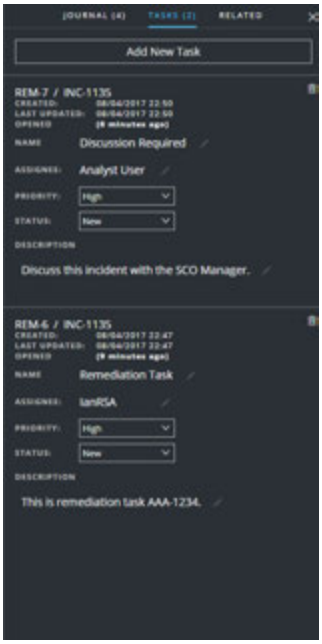
View the Tasks associated with an Incident

Threat responders and other analysts can create tasks for an incident and track those tasks to completion. This can be very helpful, for example, when you require actions on incidents from teams outside of your security operations. You can view the tasks associated with an incident in the Incident Details view.

1. Go to **RESPOND > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident to go to the Incidents Details view.
3. In the Incident Details view toolbar, click ▣.
   The Journal panel opens.
4. Click the **TASKS** tab.
   The Tasks panel shows all of the tasks for the incident.



For more information about tasks, see Tasks List View, View All Incident Tasks, and Create a Task.

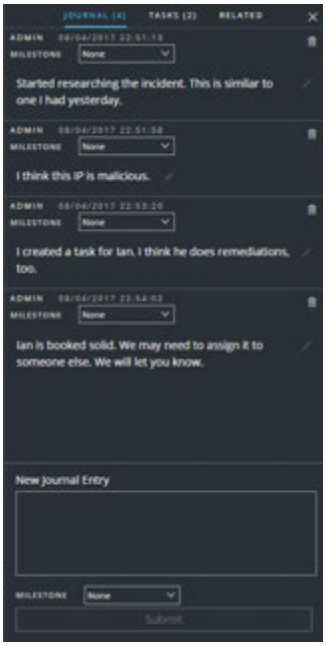
View Incident Notes

The incident Journal enables you to view the history of activity on your incident. You can view journal entries from other analysts and also communicate and collaborate with them.

1. Go to **RESPOND > Incidents** and locate the incident that you want to view in the Incidents List.

2. Click the link in the **ID** or **NAME** field of the incident to go to the Incidents Details view.
3. In the Incident Details view toolbar, click .

   The Journal panel shows all of the journal entries for the incident.



Find Related Indicators

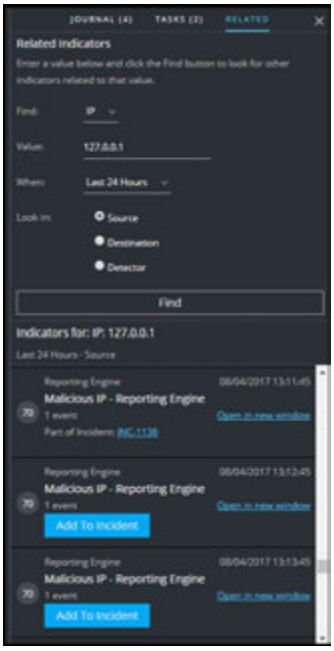
Related Indicators are alerts that were not originally part of the selected incident, but they are related in some way to the incident. The relationship may or may not be obvious. For example, related indicators can involve one or more entities from the incident, but they can also be related due to some intelligence outside of NetWitness Suite.

In the Incident Details view Related panel, you can search for an entity (such as IP, MAC, Host, Domain, User, Filename, or Hash) in other alerts outside of the current incident.

1. Go to **RESPOND > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident to go to the Incidents Details view.
3. In the Incident Details view toolbar, click .

   The Journal panel opens on the right.

4. Click the **RELATED** tab.



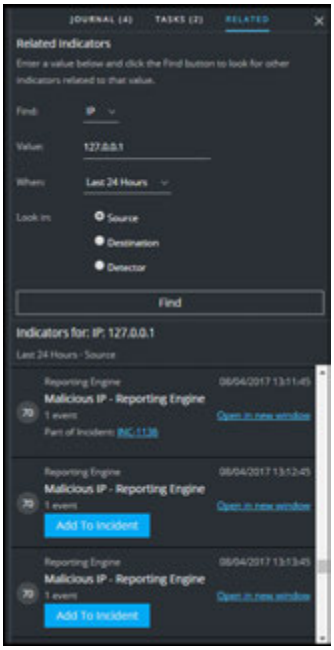
5. In the **Related Indicators** panel, enter your search criteria:
   - **Find**: Select the entity that you would like to locate in the alerts. For example, IP.
   - **Value**: Type the value of the entity. For example, type the actual IP address of the entity.
   - **When**: Select a time range to search for the alerts. For example, Last 24 hours.
   - **Look In**: Specify the type of entity to search:
     Source - The source machine in a transaction between two machines.
     Destination - The destination machine in a transaction between two machines.
     Detector - A single machine where an anomaly was detected.
     Domain - This option is available when you select Domain in the Find field.

     For example, select Source to look for alerts where a certain IP address acted as the source device. You may want to do separate searches for each type of device: Source, Destination, and Detector.
6. Click **Find**.
   A list of related indicators (alerts) appear below the **Find** button in the **Indicators for** section. If an alert is not part of another incident, you can click the **Add to Incident** button to add the related indicator (alert) to the current incident. See Add Related Indicators to the Incident below.

Add Related Indicators to the Incident

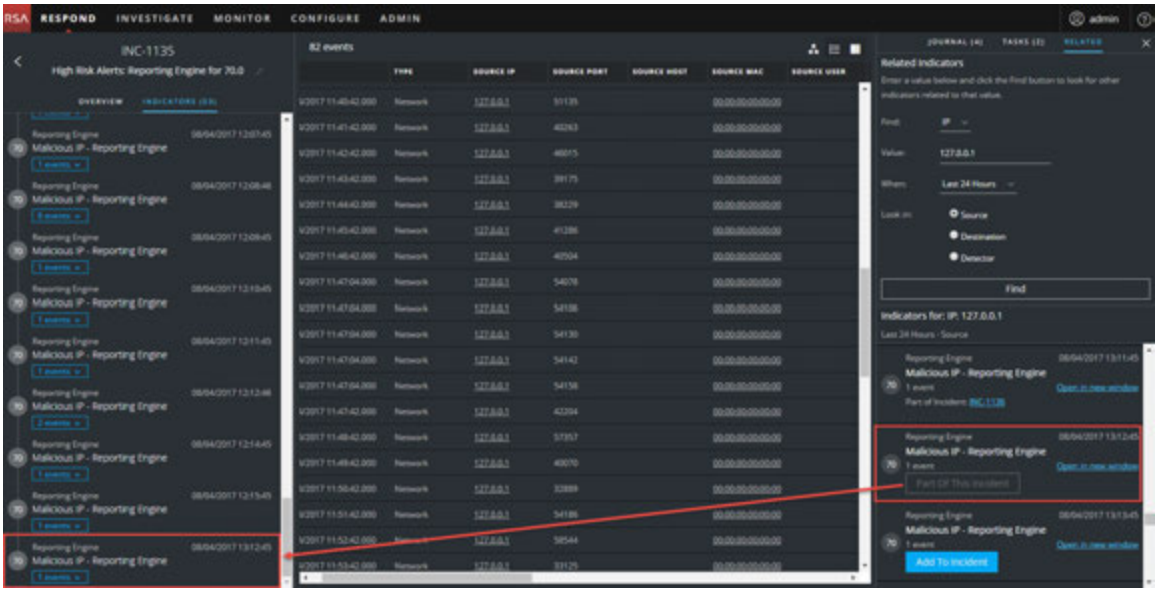
You can add related indicators (alerts) to the current incident from Related Indicators panel. An indicator that is already part of an incident cannot be part of another incident. In the search results, if an alert is not already part of an incident, it has an **Add to Incident** button.

1. In the **RELATED** (Related Indicators) panel, do a search to find related indicators. See Find Related Indicators above.



2. Review the alerts in the search results. The **Indicators for** section (below the Find button) lists the related indicators (alerts).
3. To inspect the details of an alert before adding it as a related indicator to the incident, you can click the **Open in New Window** link to view the alert details for that indicator.
4. For each alert that you want to add to the current incident as a related indicator, click the **Add to Incident** button.
   The selected related indicator adds to the Indicators panel on the left. The button in the

Related Indicators panel on the right now shows **Part of This Incident**.



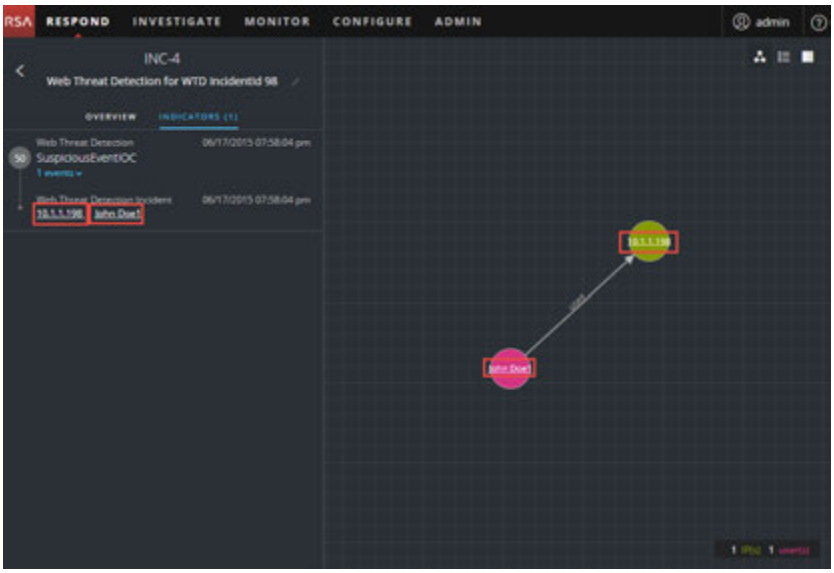
Investigate the Incident

To further investigate an incident within the Incident Details view, you can find links that take you to additional contextual information about the incident when it is available. This additional context can help you understand additional technical context and business context about a specific entity in the incident. It can also provide additional information that you may want to research to ensure that you understand the full scope of the incident.

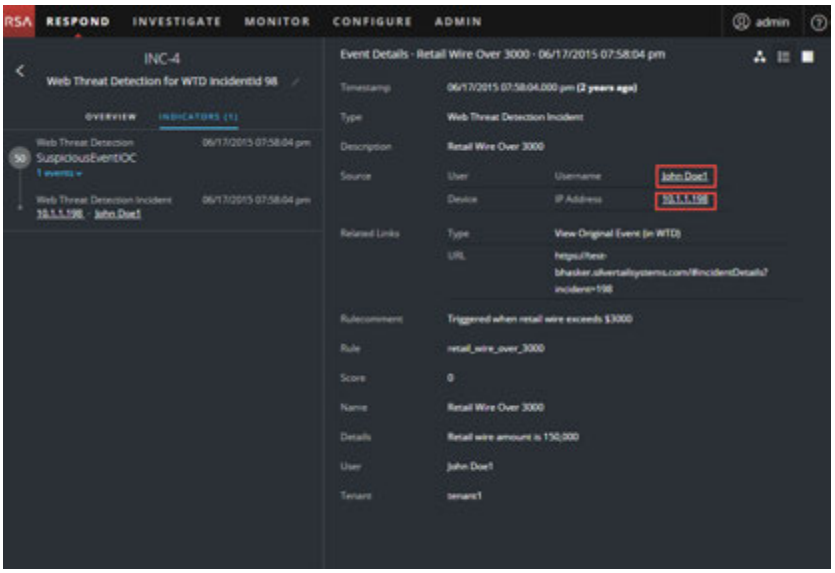
View Contextual Information

In the Indicators panel, Events List panel, Event Details panel, or the Nodal Graph, you can see underlined entities. If an entity is underlined, NetWitness Suite is populating information about that entity type in the Context Hub. There may be additional information available about that entity in the Context Hub.

The following figure shows underlined entities in the Indicators panel and the Nodal Graph.



The following figure shows underlined entities in the Event Details panel.



The Context Hub is preconfigured with meta fields mapped to the entities. NetWitness Respond and Investigatie use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, RSA recommends that when mapping meta keys in the **ADMIN > SYSTEM > Investigations > Context Lookup** tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, ip.address is a meta key and ip_address is not a meta key (it is a field in the MongoDB).

To view contextual information:

1. In the Indicators panel, Events List, Event Details, or the Nodal Graph, hover over an underlined entity.

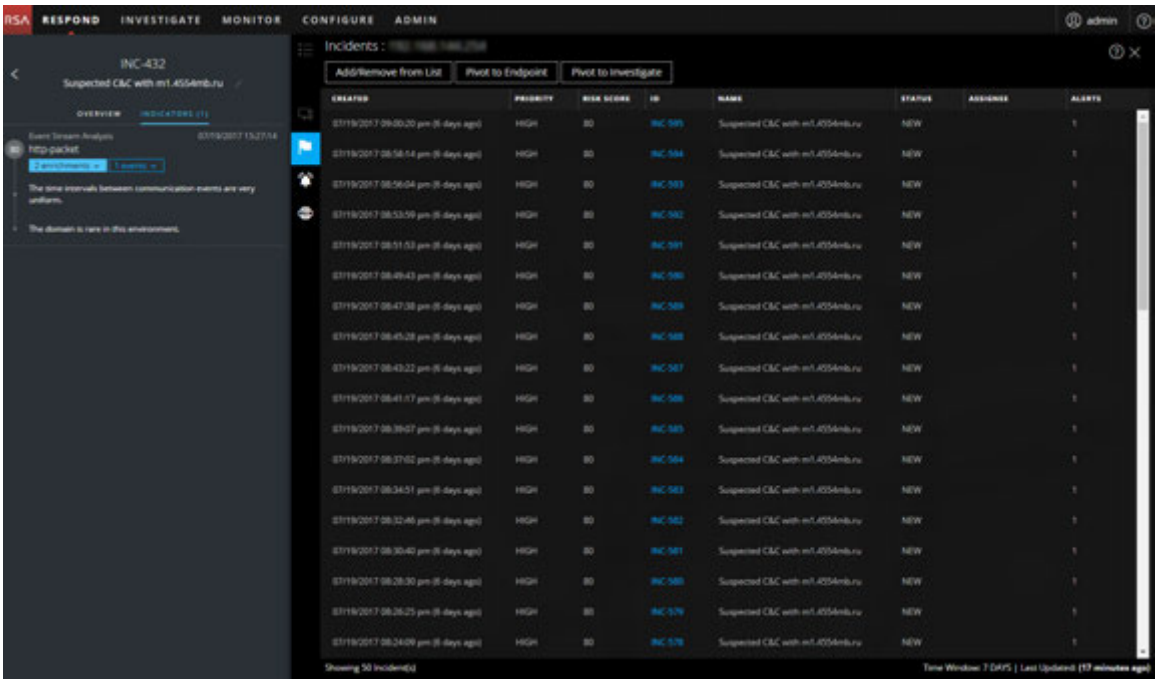
   A context tooltip appears with a quick summary of the type of context data that is available for the selected entity.

   The context tooltip has two sections: Context Highlights and Actions.

The information in the **Context Highlights** section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint, and Live Connect. Depending on your data, you may be able to click these items for more information. The above example shows 430 related incidents, 665 alerts, 0 lists, and no information in NetWitness Endpoint or Live Connect that mentions the IP address entity, 192.168.144.254.

The **Actions** section lists the available actions. In the above example, the Pivot to Investigate, Pivot to Endpoint, and Add/Remove from List options are available. For more information, see Pivot to Investigate, Pivot to NetWitness Endpoint, and Add an Entity to a Whitelist.

2. To see more details about the selected entity, click the **View Context** button.
   The Context Lookup panel opens and shows all of the information related to the entity.
   The following example shows contextual information for a selected source IP address. It lists all of the incidents that mention the IP address.



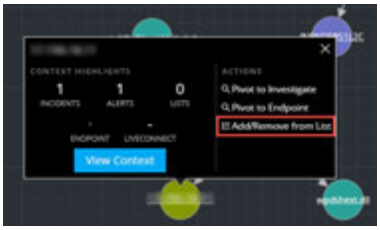
To understand the different views within the Context Hub Lookup panel, see Context Lookup Panel - Respond View .

Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

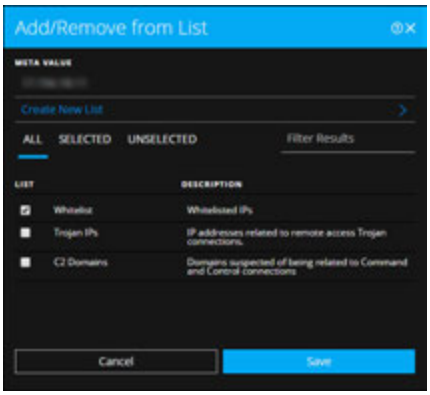
1. In the Indicators panel, Events List, Event Details, or the Nodal Graph, hover over the underlined entity that you would like to add to a Context Hub list.

   A context tooltip appears showing the available actions.



2. In the **ACTIONS** section of the tooltip, click **Add/Remove from List**.

   The Add/Remove from List dialog shows the available lists.



3. Select one or more lists and click **Save**.

   The entity appears on the selected lists.

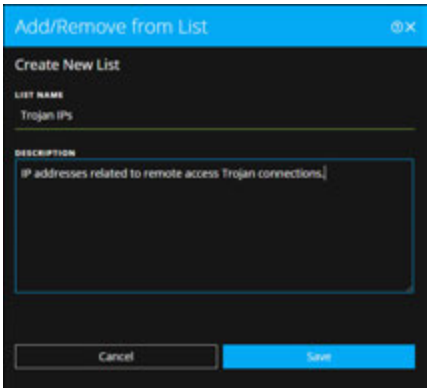
   Add/Remove from List Dialog provides additional information.

Create a List

You can create lists in Context Hub from the Respond view. In addition to using lists to whitelist and blacklist entities, you can use lists to monitor entities for abnormal behavior. For example, to improve the visibility of a suspicious IP address and Domain under investigation, you may want to include them in two separate lists. One list could be for domains suspected of being related to command and control connections, and another list could be for IP addresses related to remote access Trojan connections. You can then identify indicators of compromise using these lists.

To create a list in Context Hub:

1. In the Indicators panel, Events List, Event Details, or the Nodal Graph, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip appears showing the available actions.
2. In the **ACTIONS** section of the tooltip, click **Add/Remove from List**.
3. In the Add/Remove from List dialog, click **Create New List**.



4. Type a unique **List NAME** for the list. The list name is not case sensitive.
5. (Optional) Type a **DESCRIPTION** for the list.
   Analysts with the appropriate permissions can also export lists in CSV format to send to other analysts for further tracking and analysis. The *Context Hub Configuration Guide* provides additional information.

Pivot to NetWitness Endpoint

If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.

1. In the Indicators panel, Events List, Event Details, or the Nodal Graph, hover over any underlined entity to access a context tooltip.
2. In the **ACTIONS** section of the tooltip, select **Pivot to Endpoint**.
   The NetWitness Endpoint application opens outside of your web browser.

For more information, see the *NetWitness Endpoint User Guide*.

Pivot to Investigate

For a more thorough investigation of the incident, you can access the Investigate view.

1. In the Indicators panel, Events List, Event Details, or the Nodal Graph, hover over any underlined entity to access a context tooltip.
2. In the **ACTIONS** section of the tooltip, select **Pivot to Investigate**.
   The Investigate Navigate view opens, which enables you to perform a deeper dive investigation.

For more information, see the *Investigation and Malware Analysis User Guide*.

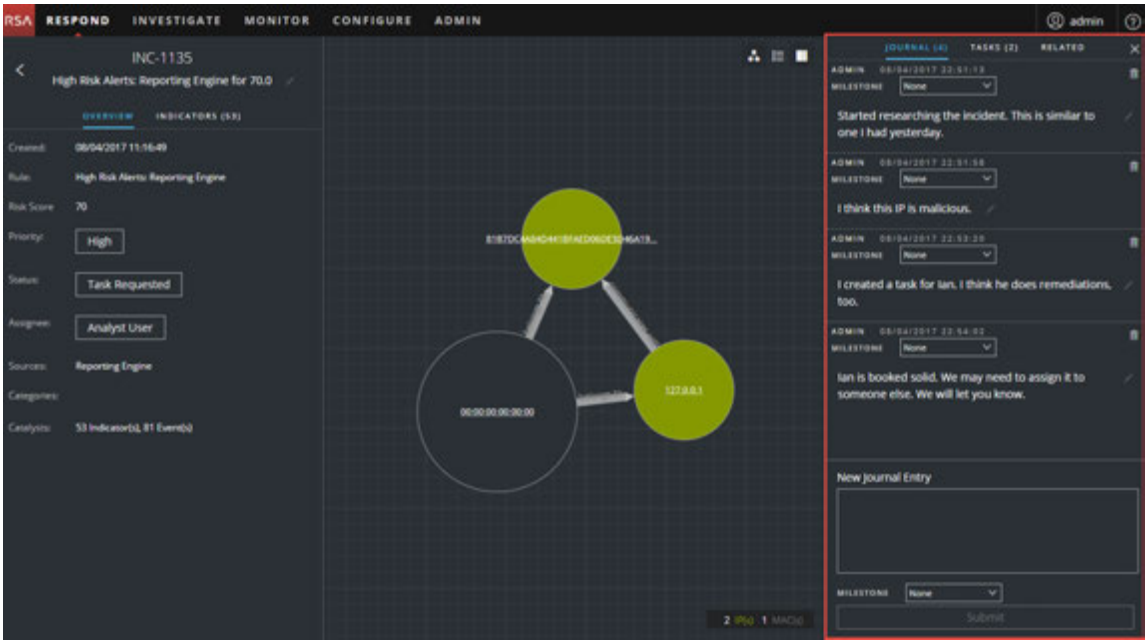
Document Steps Taken Outside of NetWitness

The journal shows notes added by analysts and it enables you to collaborate with your peers. You can post notes to a journal, add Investigation Milestone tags (Reconnassance, Delivery, Exploitation, Installation, Command and control), and view the history of activity on your incident.

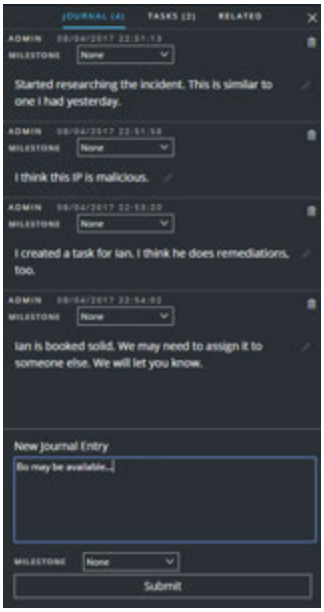
View the Journal Entries for an Incident

In the Incident Details view toolbar, click ■ .

The Journal appears on the right side of the Incident Details view.



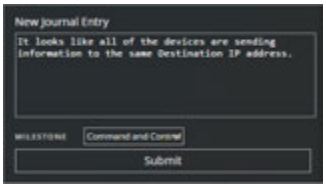
The Journal shows the history of activity on an incident. For each journal entry, you can see the author and time of the entry.



Add a Note

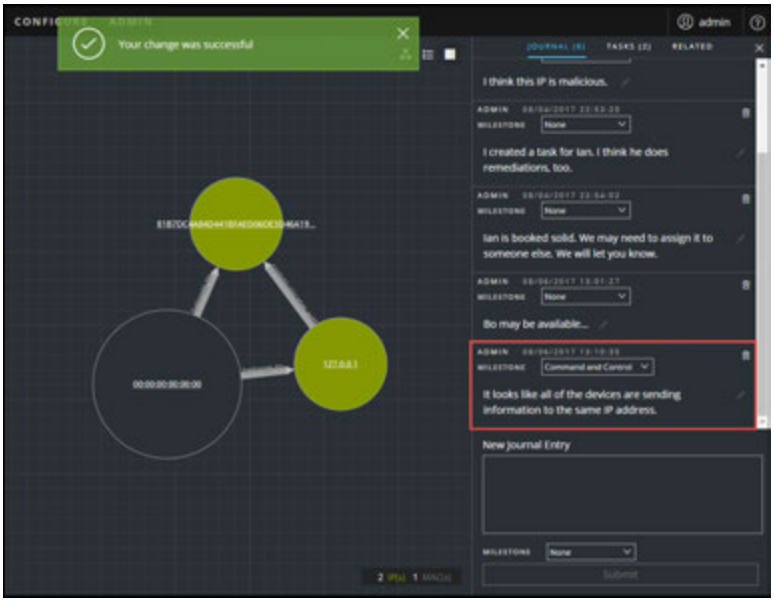
Typically, you will want to add a note to allow another analyst to understand the incident, or add a note for posterity so that your investigative steps are documented.

1. At the bottom of the Journal panel, type your note in the **New Journal Entry** box.



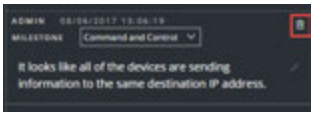
2. (Optional) Select an Investigation Milestone from the drop-down list (Reconnassance, Delivery, Exploitation, Installation, Command and Control, Action On Objective, Containment, Eradication, and Closure).

3. After you finish your note, click, **Submit**.
   Your new journal entry appears in the Journal.



Delete a Note

1. In the Journal panel, locate the journal entry that you would like to delete.
2. Click the trash can (delete) icon next to the journal entry.



3. In the confirmation dialog that appears, click **OK** to confirm that you want to delete the journal entry. This action cannot be reversed.

Escalate or Remediate the Incident

You may want to assign incidents to another Analyst or change the status and priority of an incident as you gather more information about it. This is useful if, for example, you upgrade the priority of an incident from **medium** to **high** after determining that the incident is major breach.

Update an Incident

You can update an incident from several places. You can change the priority, status, or assignee from the Incident List view and the Incident Details view. For example, if you are an Analyst, you may want to assign yourself a case from the Incident List view if you see that it is related to another case you are working on. If you are an SOC Manager or an Administrator, you may want to view unassigned incidents from the Incident List view and assign the incidents as they come in. SOC Managers and Administrators can do bulk updates of the priority, status, or assignee instead of updating them one incident at a time.

From the Details view, you might want to change the status to In Progress once you begin working on an incident, and then update it to Closed or Closed - False Positive after you resolve the issue. Or you might change the priority of the incident to Medium or High as you determine the details of the case.

Change Incident Status

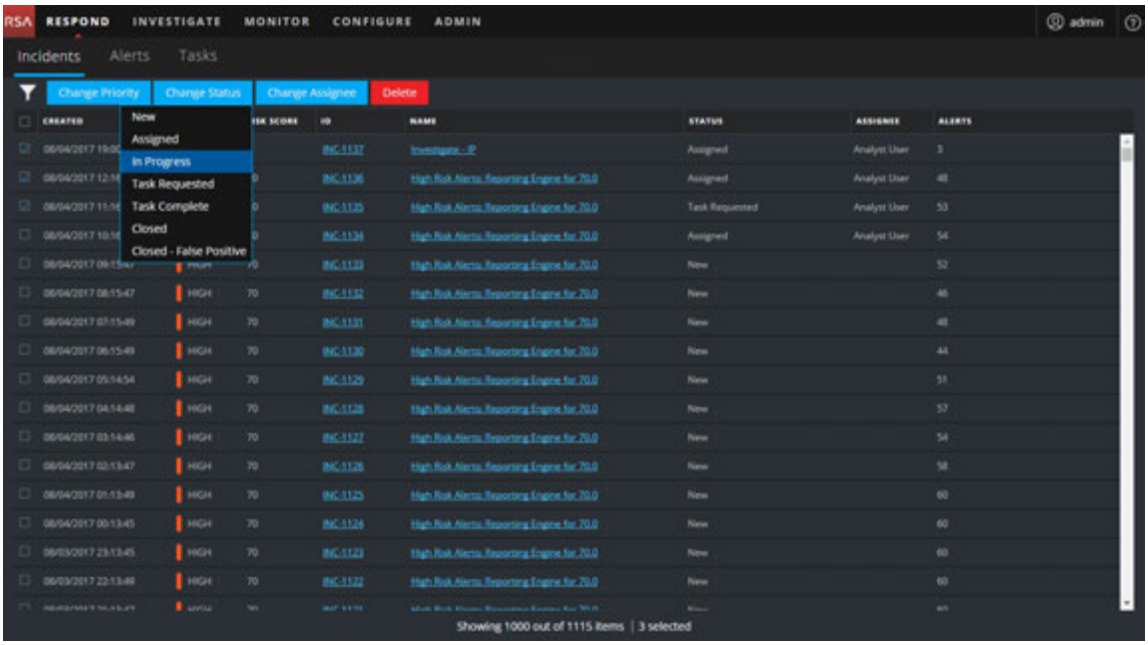
When an incident first appears in the incident list, it has an initial status of New. You can update the status as you complete your work on the incident. The following statuses are available:

- New
- Assigned
- In Progress
- Task Requested
- Task Complete
- Closed
- Closed - False Positive

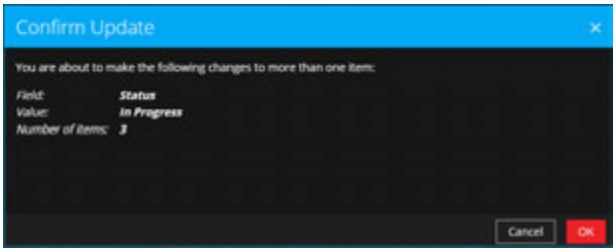
To update the status of multiple incidents:

1. In the Incidents List view, select one or more incidents that you would like to change. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears incidents list footer.

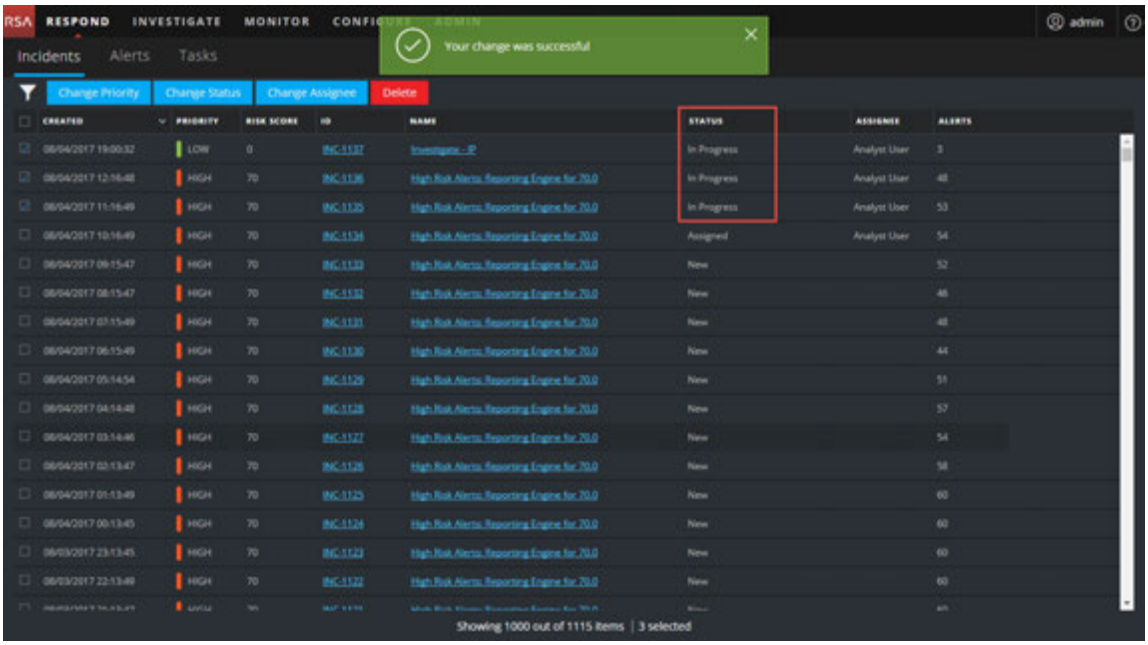
2. Click **Change Status** and select a status from the drop-down list. In this example, the current status is Assigned, but the Analyst would like to change it to In Progress for the selected incidents.



3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.

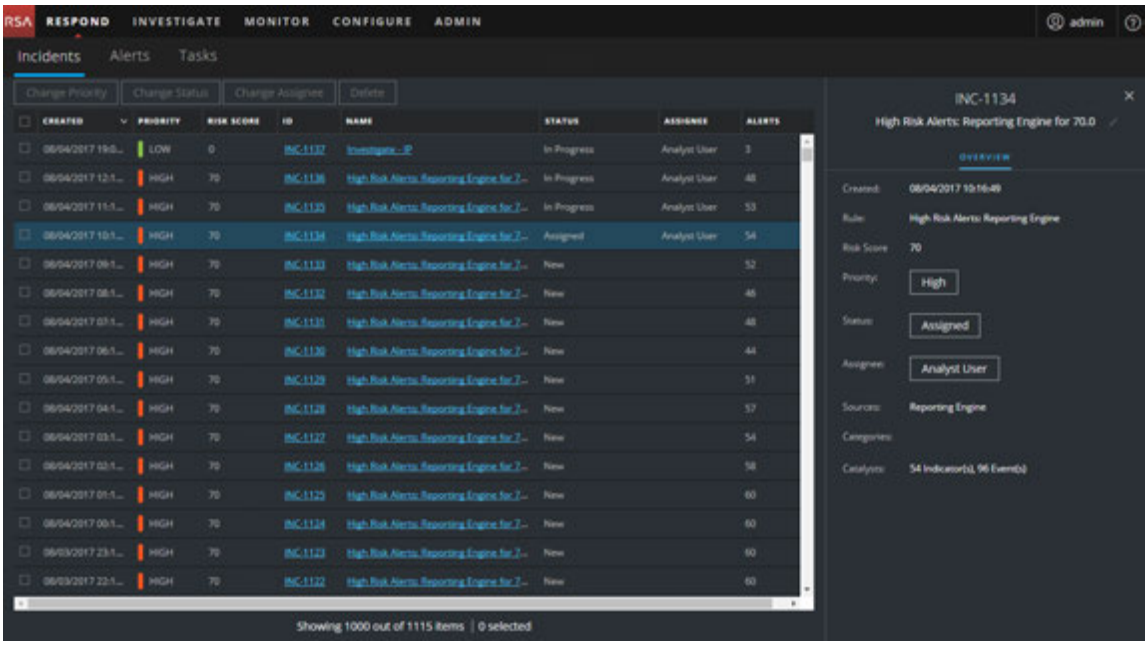


You will see a successful change notification. In this example, the status of the updated incidents now show In Progress.

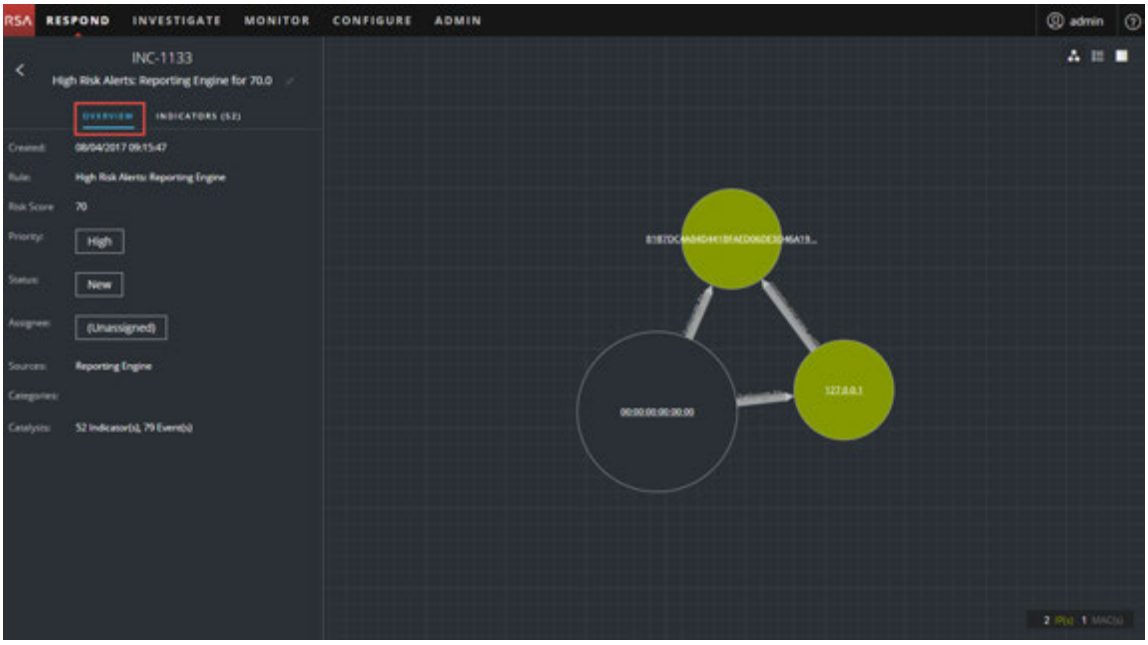


To change the status of a single incident from the Overview panel:

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click an incident that needs a status update.

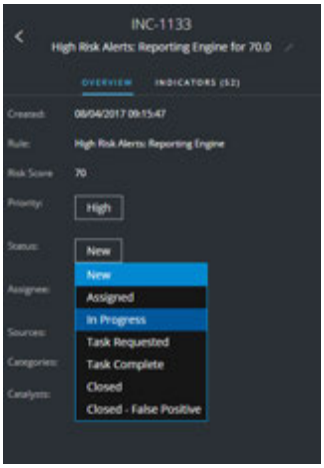


- From the Incident Details view, click the **OVERVIEW** tab.



In the Overview panel, the Status button shows the current status of the incident.

2. Click the **Status** button and select a status from the drop-down list.



You will see a successful change notification.

Change Incident Priority

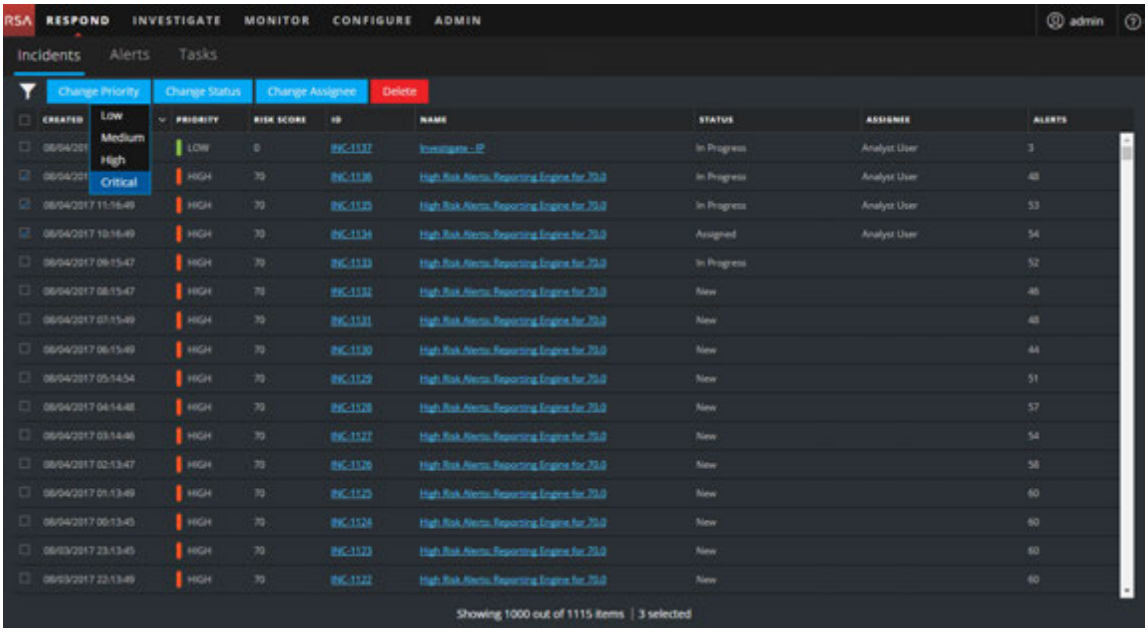
The incident list is sorted by Priority by default. You can update the priority as you study the details of the case. The following priorities are available:

- Critical
- High
- Medium
- Low

Note: You cannot change the priority of a closed incident.

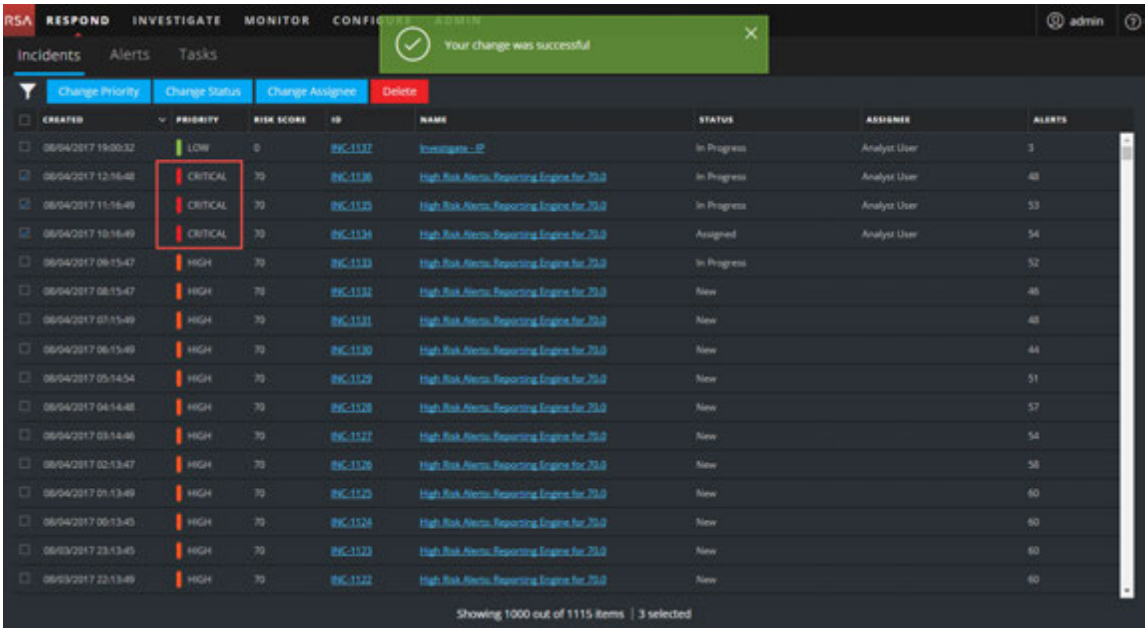
To update the priority of multiple incidents:

1. In the Incidents List view, select one or more incidents that you would like to change. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Priority** and select a priority from the drop-down list. In this example, the current priority is High, but the Analyst would like to change it to Critical for the selected incidents.



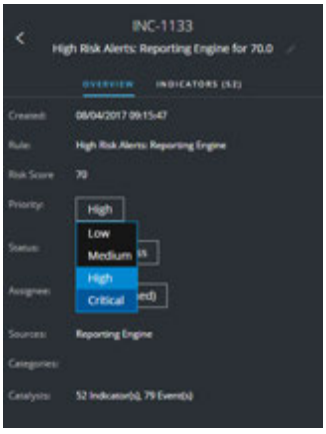
3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.
   You will see a successful change notification. In this example, the status of the updated

incidents now show Critical.



To change the priority of a single incident from the Overview panel

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click an incident that needs a priority update.
   - From the Incident Details view, click the **OVERVIEW** tab.
     In the Overview panel, the Priority button shows the current priority of the incident.
2. Click the **Priority** button and select a status from the drop-down list.



You will see a successful change notification. The Priority button changes to show the new incident priority.

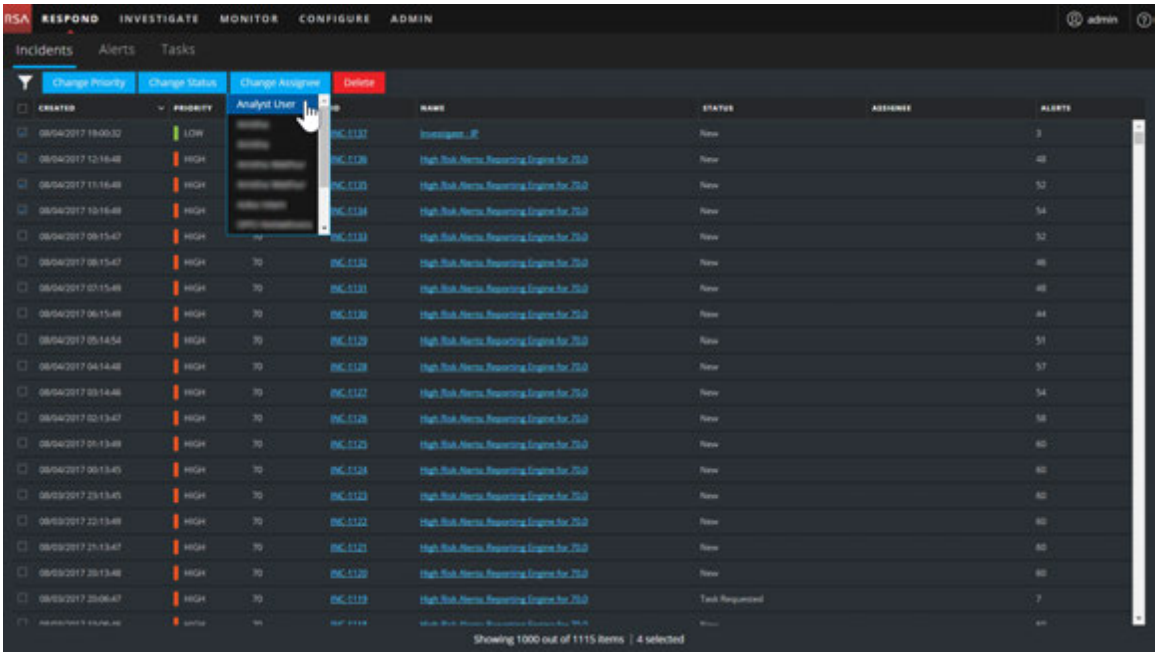
Assign incidents to other Analysts

You can assign incidents to other Analysts in the same way as you assign incidents to yourself. SOC Managers and Administrators can assign multiple incidents to a user at the same time.

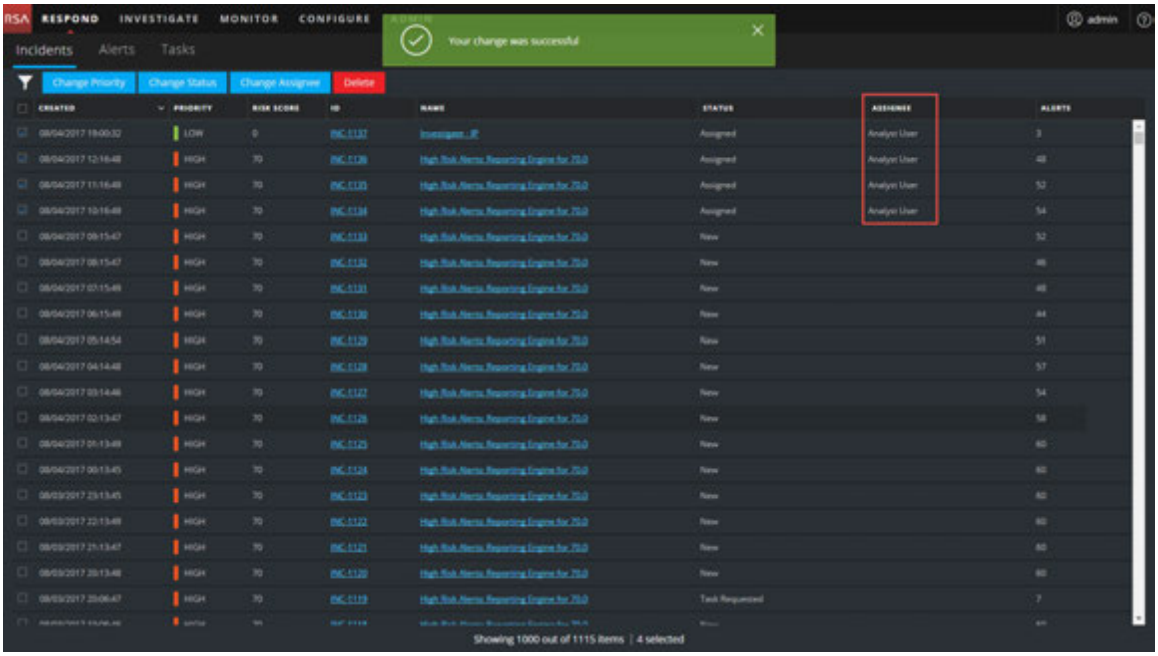
Note: You cannot change the assignee of a closed incident.

To assign multiple incidents to a user:

1. In the Incidents List view, select the incidents that you would like to assign to a user. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Assignee** and select a user from the drop-down list. In this example, the incidents are unassigned, but they should be assigned to an Analyst.

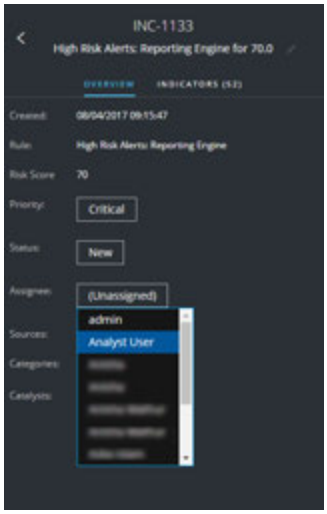


3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.
   You will see a successful change notification. The assignee changes to the selected user.



To assign a user to an incident from the Overview panel:

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click an incident that needs a priority update.
   - From the Incident Details view, click the **OVERVIEW** tab.
     In the Overview panel, the Priority button shows the current priority of the incident. In the following example, the Assignee button has a current status of Unassigned.



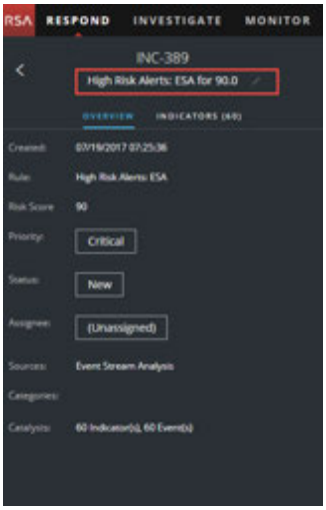
2. Click the **Assignee** button and select a user from the drop-down list.
   You will see a successful change notification. The Assignee button changes to show the assigned user.

Rename an Incident

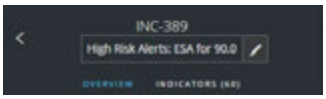
You can rename an incident from the Overview panel in the Incidents List view and the Incident Details view. For example, you may want to rename an incident to provide clarification about the issue, especially if multiple incidents have the same name.

1. Go to **RESPOND > Incidents**.
2. To open the Overview panel, do one of the following:
   - From the Incidents List view, click an incident that needs a name change.
     The Overview panel opens.
   - From the Incident Details view, go to the **OVERVIEW** panel.
     In the header above the Overview panel , you can see the Incident ID and the incident

name.



3. Click the incident name in the header to open a text editor.

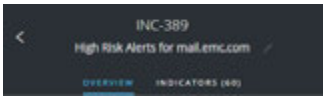


4. Type a new name for the incident in the text editor and click the check mark to confirm the change.

For example, you can change "High Risk Alerts: ESA for 90.0" to "Alerts for mail.emc.com" for more clarification.

You will see a successful change notification.

The incident name field shows the new name.

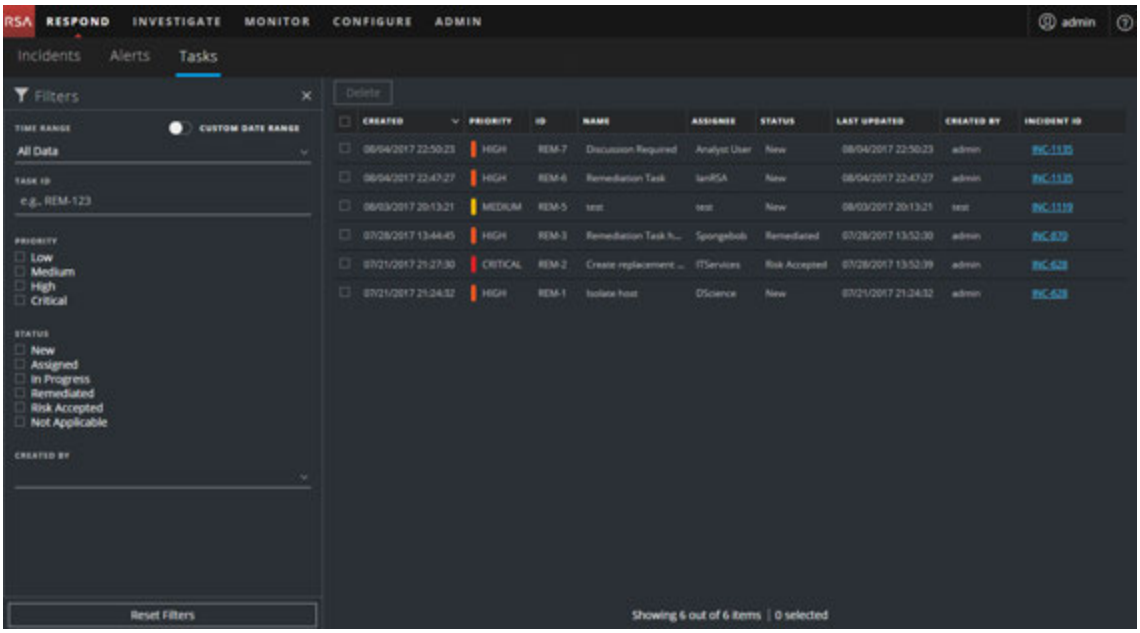


View All Incident Tasks

When additional work is required for an incident, you can create tasks for the incident and track the progress on those tasks. This is helpful, for example, when the work being done is outside security operations or you make a request for a computer reimage. In the Tasks List view, you can manage and track the tasks,to closure.

1. Go to **RESPOND > Tasks**.

   The Tasks List view displays a list of all incident tasks.



2. Scroll through the tasks list, which shows basic information about each task as described in the following table.

Column	Description
CREATED	Displays the date when the task was created.
PRIORITY	Displays the priority assigned to the task. The priority can be any of the following: Critical, High, Medium, or Low. The Priority is also color coded, where red indicates **Critical**, orange represents **High** risk, yellow indicates **Medium** risk, and green represents **Low** risk as shown in the following figure: 
ID	Displays the task ID.
NAME	Displays the task name.
ASSIGNEE	Displays the name of the user assigned to the task.

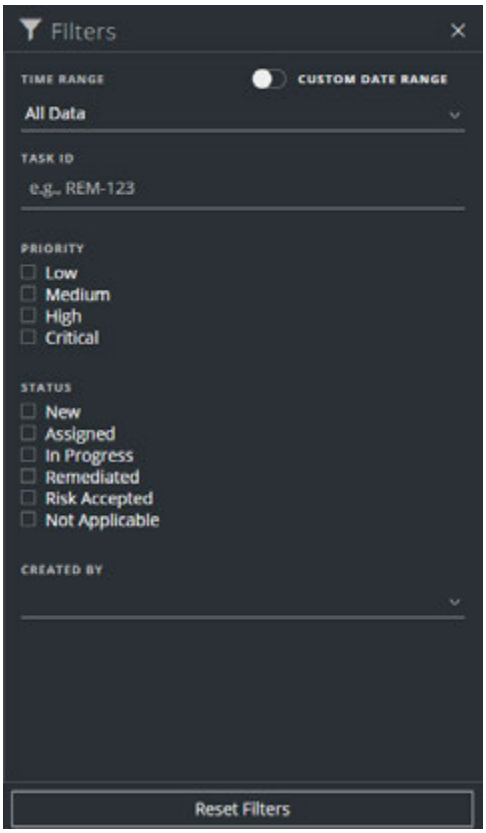
Column	Description
STATUS	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
LAST UPDATED	Displays the date and time when the task was last updated.
CREATED BY	Displays the user who created the task.
INCIDENT ID	Displays the incident ID for which the task was created. Click the ID to display the details of the incident.

At the bottom of the list, you can see the number of tasks on the current page, the total number of tasks, and the number of tasks selected. For example: **Showing 6 out of 6 items | 2 selected**.

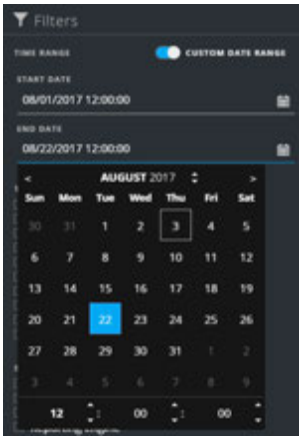
Filter the Tasks List

The number of tasks in the Tasks List can be very large, making it difficult to locate particular tasks. The Filter enables you to specify those tasks that you would like to view, such as tasks created within the last 7 days. You can also search for a specific task.

1. Go to **RESPOND > Tasks**.
   The Filters panel appears to the left of the Tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.



2. In the Filters panel, select one or more options to filter the incidents list:
   - **TIME RANGE**: You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the tasks. For example, if you select Last Hour, you will see tasks that were created within the last 60 minutes.
   - **CUSTOM DATE RANGE**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of CUSTOM DATE RANGE to view the Start Date and End Date fields. Select the dates and times from the calendar.



- **TASK ID**: Type the Task ID for a task that you would like to locate, for example REM-123.
- **PRIORITY**: Select the priorities that you would like to view.
- **STATUS**: Select one or more incident statuses. For example, select Remediated to view completed remediation tasks.
- **CREATED BY**: Select the user who created the tasks that you would like to view. For example, if you only want to view the tasks created by Edwardo, select Edwardo from the CREATED BY drop-down list. If you want to view tasks regardless of the person who created the task, do not make a selection under CREATED BY.

The Tasks List shows a list of tasks that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the tasks list.
For example: **Showing 6 out of 6 items**

3. If you want to close the Filters panel, click **X**. Your filters remain in place until you remove them.

Remove My Filters from the Tasks List

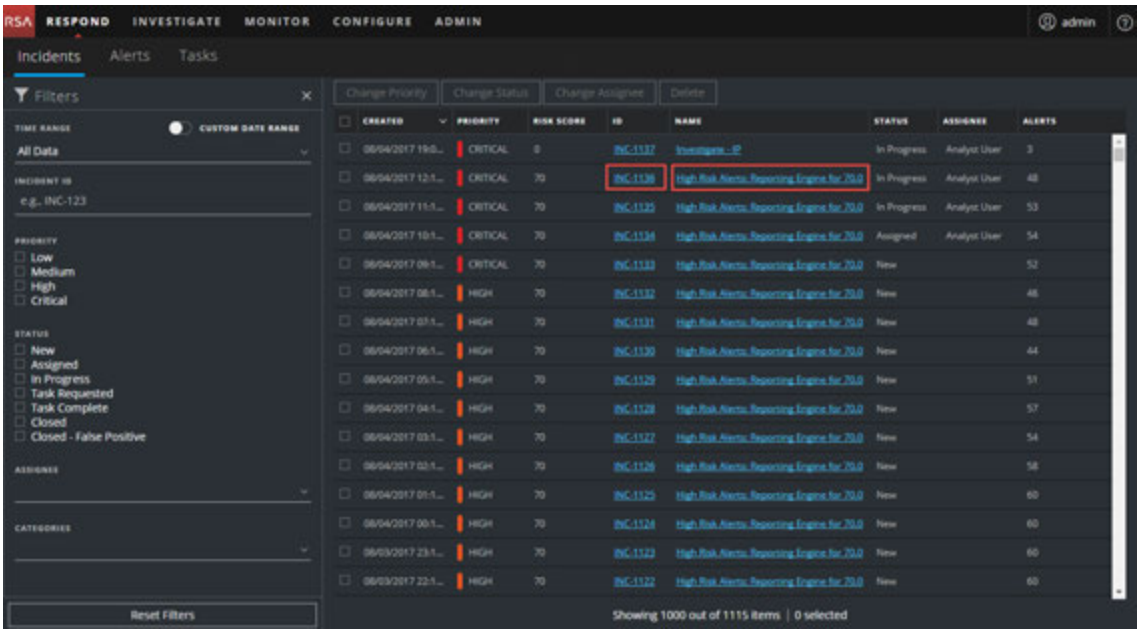
NetWitness Suite remembers your filter selections in the Tasks Listview. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of tasks that you expect to see or you want to view all of the tasks in your tasks list, you can reset your filters.

1. Go to **RESPOND > Tasks**.
   The Filters panel appears to the left of the tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.
2. At the bottom of the Filters panel, click **Reset Filters**.

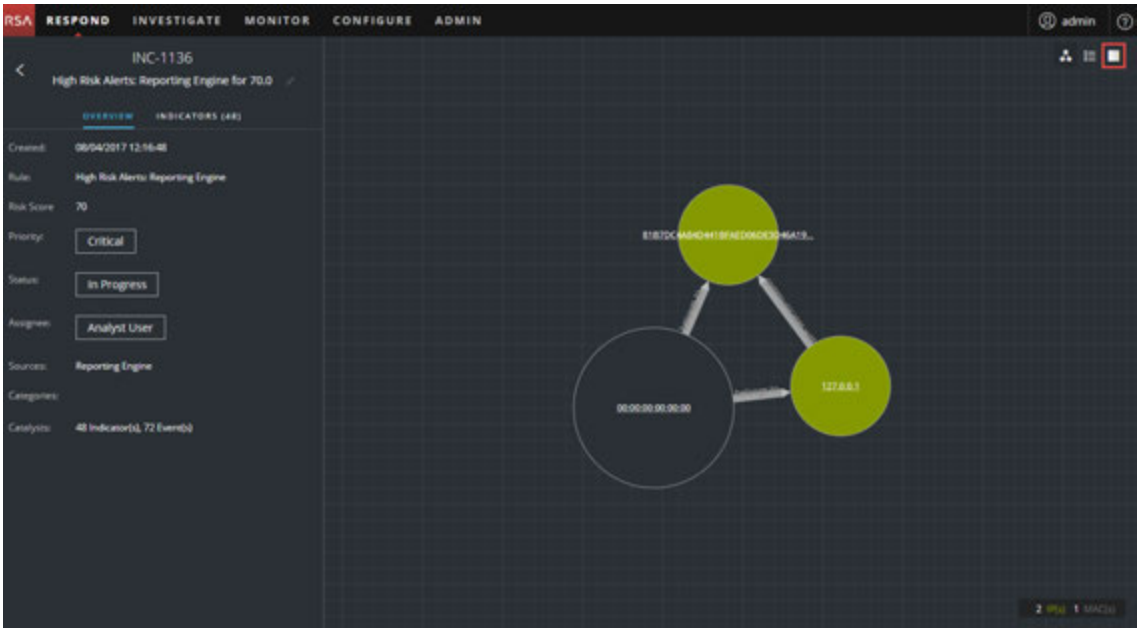
Create a Task

After you investigate an incident and know more about it, you can create a task, assign it to a user, and track it to closure. You create tasks from the Incident Details view.

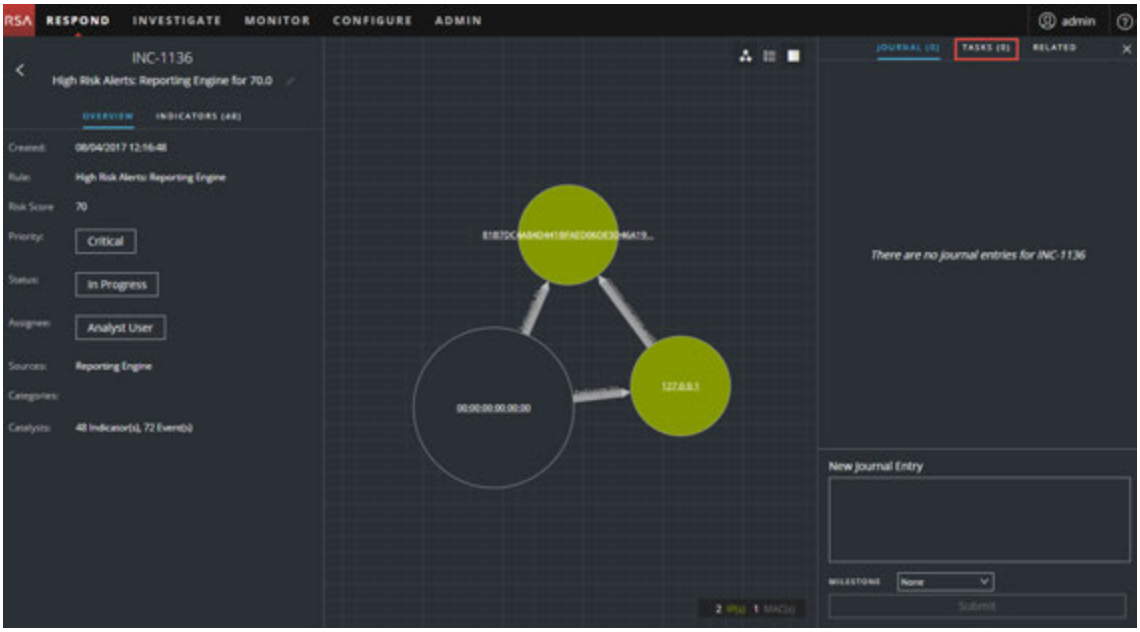
1. Go to **RESPOND > Incidents**.
   The Incidents List view displays a list of all incidents.



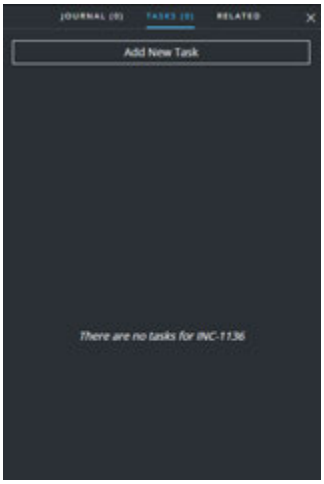
2. Locate the incident that needs a task and click the link in the **ID** or **NAME** field.
   The Incident Details view opens.



3. In the toolbar at the top right of the Incident Details view, select ▣.
   The Journal panel opens.



4. Select the **TASKS** tab.



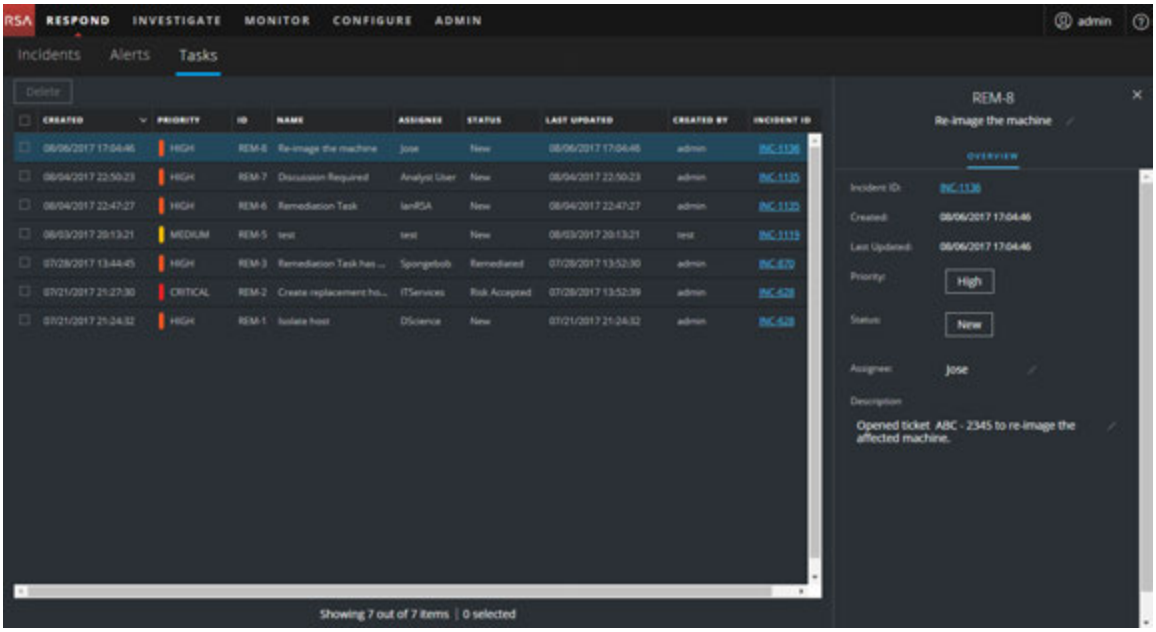
5. In the Tasks panel, click **Add New Task.**
   You will see the new task fields.

If the incident is in a closed state (Closed or Closed - False Positive), the Add New Task button is disabled.

6. Provide the following information:
   - **Name** - Name of the task. For example: Re-image the machine.
   - **Description** - (Optional) Type information that describes the task. You may want to include any applicable reference numbers.
   - **Assignee** - (Optional) Type the username of the user to whom the task is to be assigned.
   - **Priority** - Click the priority button and select a priority for the tasks from the drop-down list: Low, Medium, High, or Critical.
7. Click **Save**.
   You will see a confirmation that your change was successful. The incident status changes to **Task Requested**. The task appears in the Tasks panel for this incident.

It also appears in the Tasks list (RESPOND > Tasks), which shows a list of all incident

tasks.

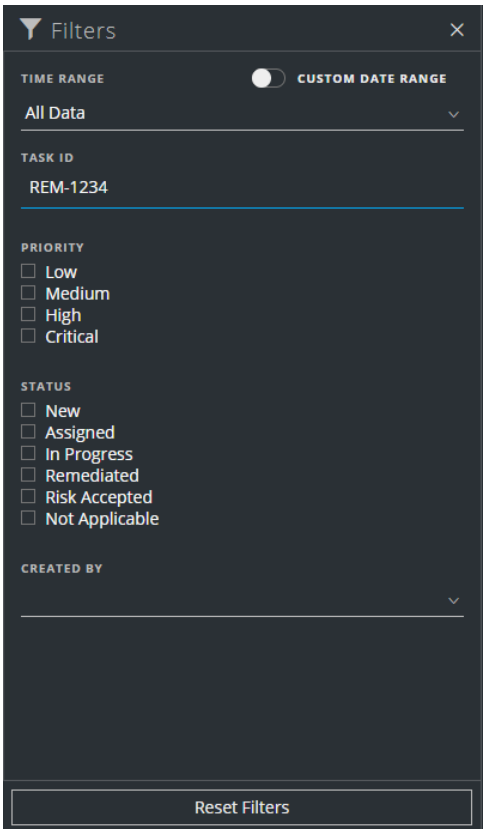


Note: If you do not see the status change, you may need to refresh your internet browser.

Find a Task

If you know the Task ID, you can quickly locate a task using the Filter. For example, you may want to locate a specific task out of thousands of tasks.

1. Go to **RESPOND > Tasks**.
   The Filters panel appears to the left of the Tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.



2. In the TASK ID field, type the Task ID for a task that you would like to locate, for example REM-1234.

   The specified task appears in your task list. If you do not see any results, try resetting your filters.

Modify a Task

You can modify a task from within an incident and from the Tasks list. For example, you may want to show the status of the task as In Progress and add some additional information to the task. If the task is in a closed state (Not Applicable, Risk Accepted, or Remediated), you cannot modify the Priority or Assignee.

To modify a Task from within an incident:

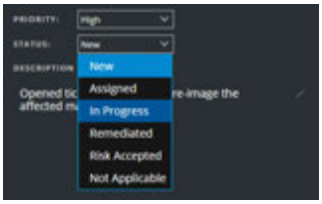
1. Go to **RESPOND > Incidents**.
   The Incidents List view displays a list of all incidents.
2. Locate the incident that needs a task update and click the link in the **ID** or **NAME** field.
   The Incident Details view opens.
3. In the toolbar at the top right of the view, select ▣.

   The Journal panel opens.

4. Select the **TASKS** tab.
5. In the Tasks panel, a pencil icon indicates a text field that you can change. A button indicates that there is a drop-down list to make a selection.

6. You can modify any of the following fields:
   - **NAME** - Click the current task name to open a text editor.

     
     Click the check mark to confirm the change. For example, you can change "Re-image the machine" to "Re-image the machine ASAP."
   - **ASSIGNEE** - Click (Unassigned) or the name of the previous assignee to open a text editor. Type the username of the user to whom the task is to be assigned.
     Click the check mark to confirm the change.
   - **PRIORITY** - Click the Priority button and select a priority for the task from the drop-down list: Low, Medium, High, or Critical.
   - **STATUS** - Click the Status button and select a status for the task from the drop-down list: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. For example, you can change the status to In Progress.

- **DESCRIPTION** - Click the text underneath the description to open a text editor.

  Modify the text and click the check mark to confirm the change.

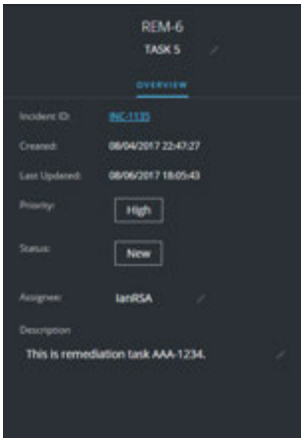
For each change that you make, you will see a confirmation that your change was successful.

To modify a Task from the Tasks list:

1. Go to **RESPOND > Tasks**.
   The Tasks List view displays a list of all incident tasks.
2. In the Tasks list, click the task that you want to update.
   The Task Overview panel appears to the right of the tasks list.

  In the Task Overview panel, a pencil icon indicates a text field that you can change. A

button indicates that there is a drop-down list to make a selection.



3. You can modify any of the following fields:

- **<Task Name>** - At the top of the Task Overview panel, below the Task ID, click the current task name to open a text editor.

  
  Click the check mark to confirm the change. For example, you can change TASK 5 to TASK 6.

- **Priority** - Click the Priority button and select a priority for the task from the drop-down list: Low, Medium, High, or Critical.
- **Status** - Click the Status button and select a status for the task from the drop-down list: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
- **Assignee** - Click (Unassigned) or the name of the previous assignee to open a text editor. Type the username of the user to whom the task is to be assigned.

  
  Click the check mark to confirm the change.

- **Description** - Click the text underneath the description to open a text editor.

  Modify the text and click the check mark to confirm the change.

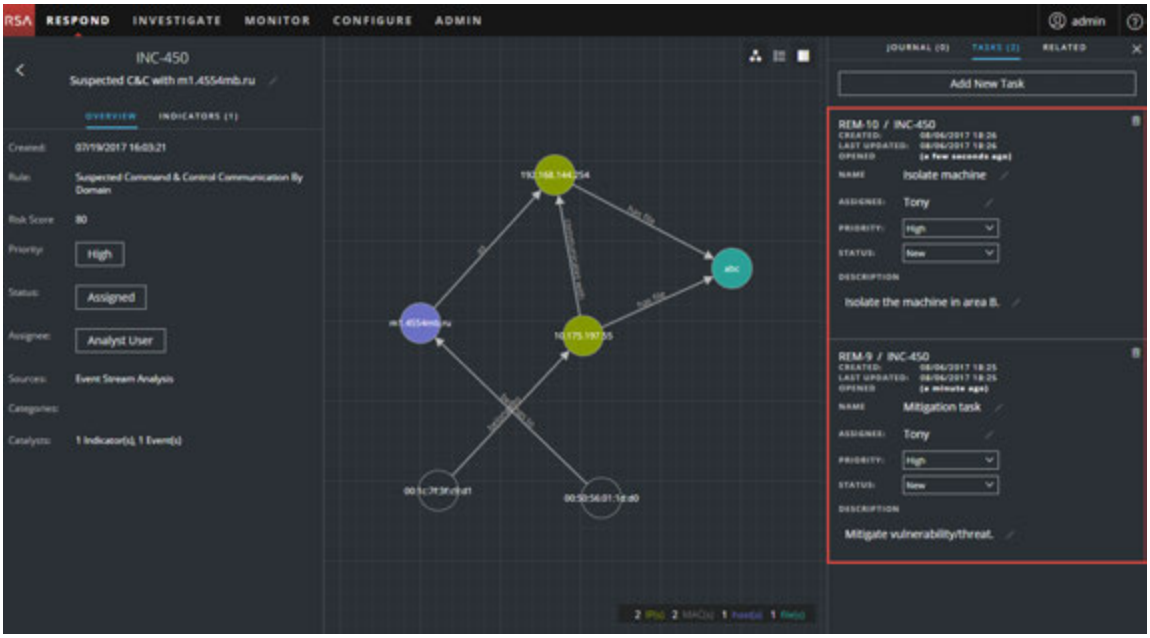
For each change that you make, you will see a confirmation that your change was successful.

Delete a Task

You can delete a task, if, for example, you created it in error or you find that it is not needed. You can delete a task from within an incident and also from the Tasks List view. In the Tasks List view, you can delete multiple tasks at the same time.

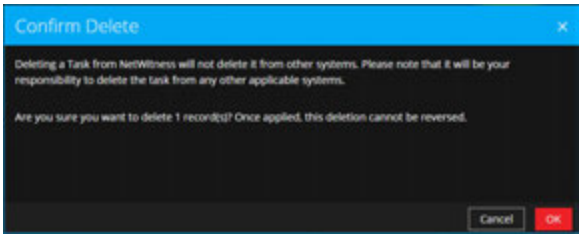
To Delete a Task from within an incident:

1. Go to **RESPOND > Incidents**.
   The Incidents List view displays a list of all incidents.
2. Locate the incident that needs a task update and click the link in the **ID** or **NAME** field.
   The Incident Details view opens.
3. In the toolbar at the top right of the view, select ▣.
   The Journal panel opens.
4. Select the TASKS tab.
5. In the Tasks panel, you can see the tasks created for the incident.



6. Click to the right of the task that you want to delete.

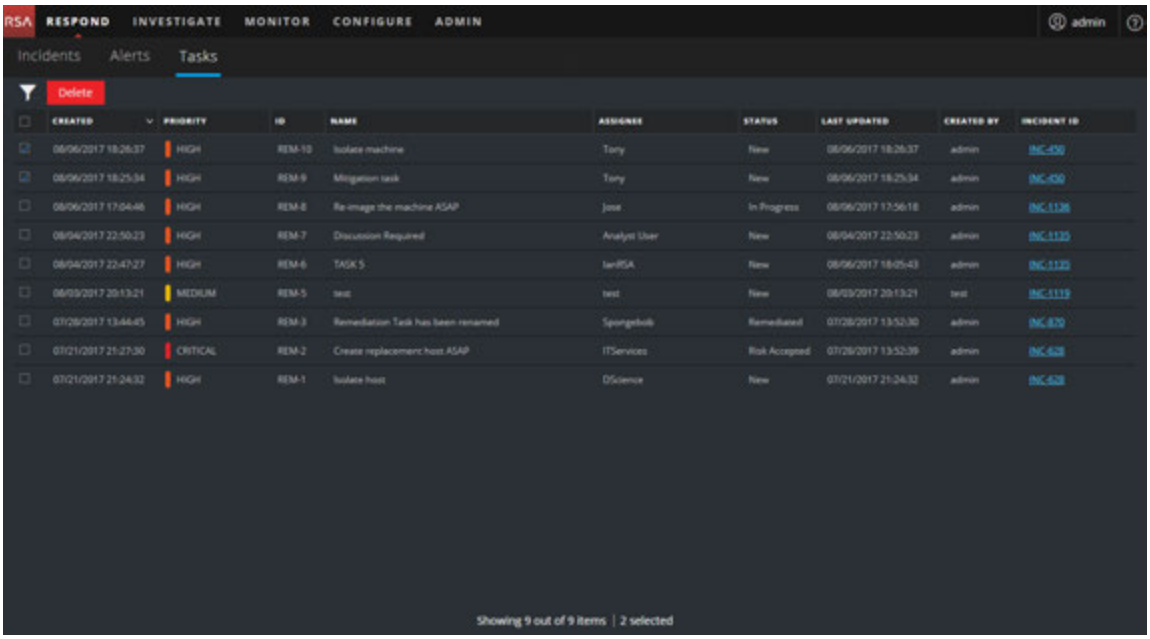
7. Confirm that you want to delete the task and click **OK**.



The task is deleted from NetWitness Suite. Deleting tasks from NetWitness Suite does not delete them from other systems.

To Delete Tasks from the Tasks List:

1. Go to **RESPOND > Tasks**.
   The Tasks List view displays a list of all incident tasks.
2. In the Tasks list, select the tasks that you want to delete and click **Delete**.



3. Confirm that you want to delete the tasks and click **OK**.

   The tasks are deleted from NetWitness Suite. Deleting tasks from NetWitness Suite does not delete them from other systems.

Close an Incident

When you have arrived at a solution after investigating an incident and remediating it, you close the incident.

1. Go to **RESPOND > Incidents**.
2. In the Incident List view, select the incident that you want to close and click **Change Status**.
3. Select **Closed** from the drop-down list.
   You will see a successful change notification. The incident is now closed. You cannot change the priority or assignee of a closed incident.

Note: You can also close an incident in the Overview panel. You can close multiple incidents at the same time in the Incident List view. Change Incident Status provides additional details.

Reviewing Alerts

NetWitness Suite enables you to view a consolidated list of threat alerts generated from multiple sources in one location. You can find these alerts in the RESPOND > Alerts view. The source of the alerts can be ESA correlation rules, ESA Analytics, NetWitness Endpoint, Malware Analysis, Reporting Engine, as well as many others. You can see the original source of the alerts, the alert severity, and additional alert details.

Note: ESA correlation rule alerts can ONLY be found in the RESPOND > Alerts view.

To better manage a large number of alerts, you have the ability to filter the alerts list based criteria that you specify, such as severity, time range, and alert source. For example, you may want to filter the alerts to only show those alerts with a severity between 90 and 100 that are not already part of an incident. You can then select a group of alerts to create an incident or add to an existing incident.

You can perform the following procedures to review and manage alerts:

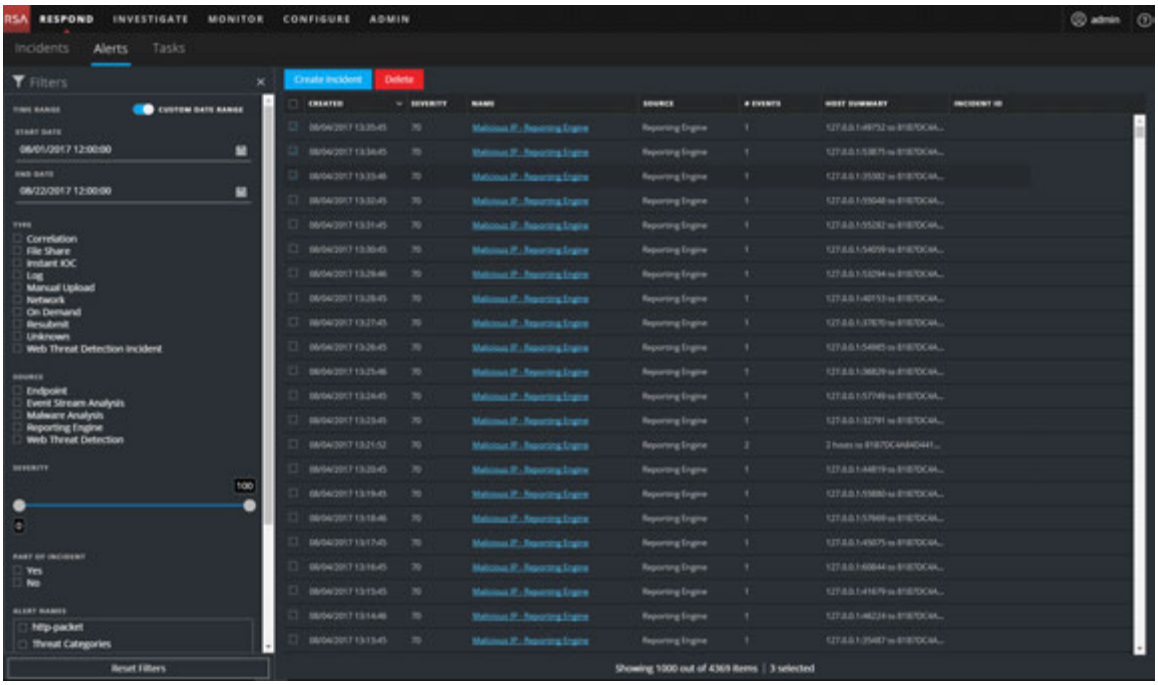
- View Alerts
- Filter the Alerts List
- Remove My Filters from the Alerts List
- View Alert Summary Information
- View Event Details for an Alert
- Investigate Events
- Create an Incident Manually
- Reviewing Alerts
- Delete Alerts

View Alerts

In the Alerts List view you can browse through various alerts from multiple sources, filter them, and group them to create incidents. This procedure shows you how to access the alerts list.

1. Go to **RESPOND > Alerts**.

   The Alerts List view displays a list of all NetWitness Suite alerts.



2. Scroll through the alerts list, which shows basic information about each alert as described in the following table.

Column	Description
CREATED	Displays the date and time when the alert was recorded in the source system.
SEVERITY	Displays the level of severity of the alert. The values are from 1 through 100.
NAME	Displays a basic description of the alert.
SOURCE	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, Event Stream Analysis (ESA Correlation Rules), ESA Analytics, Reporting Engine, Web Threat Detection, and many others.
# EVENTS	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.

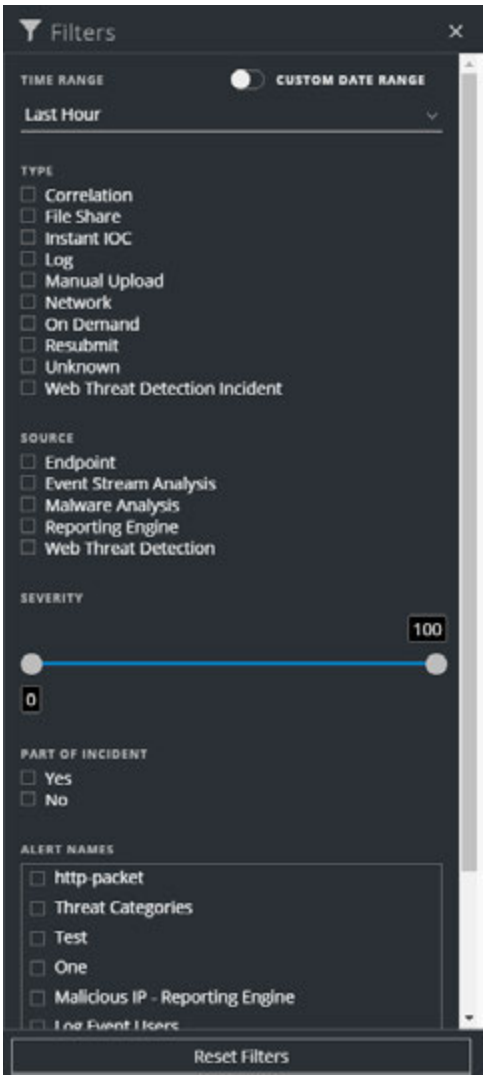
Column	Description
HOST SUMMARY	Displays details of the host like the host name from where the alert was triggered. The details may include information about the source and destination hosts in an Alert. Some alerts may describe events across more than one host .
INCIDENT ID	Shows the Incident ID of the alert. If there is no incident ID, the alert does not belong to any incident and you can create an incident to include this alert or the alert can be added to an existing incident.

At the bottom of the list, you can see the number of alerts on the current page and the total number of alerts. For example: **Showing 377 out of 377 items**

Filter the Alerts List

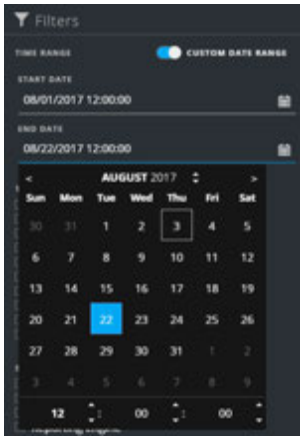
The number of alerts in the Alerts List can be very large, making it difficult to locate particular alerts. The Filter enables you to view the alerts you want to see, for example, alerts from a particular source, alerts of a particular severity, alerts that are not part of an incident, and so on.

1. Go to **RESPOND > Alerts**.
   The Filters panel appears to the left of the Alerts list. If you do not see the Filters panel, in the Alerts List view toolbar, click , which opens the Filters panel.



2. In the Filters panel, select one or more options to filter the alerts list:
   - **TIME RANGE**: You can select a specific time period from the Time Range drop-down list. The time range is based on the date that the alerts were received. For example, if you select Last Hour, you will see alerts that were received within the last 60 minutes.
   - **CUSTOM DATE RANGE**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of CUSTOM DATE RANGE to view the Start Date and End Date fields. Select the dates and times from the

calendar.



- **TYPE**: Select the type of events in the alert to view, for example, logs, network sessions, and so on.
- **SOURCE**: Select one or more sources to view alerts triggered by the selected sources. For example, to view NetWitness Endpoint alerts only, select Endpoint as the source.
- **SEVERITY**: Select the the level of severity of the alerts to view. The values are from 1 through 100. For example, to concentrate on the highest severity alerts first, you may want to view only those alerts with a severity from 90 to 100.
- **PART OF INCIDENT**:To view only alerts that are not part of an incident, select **No**. To view only alerts that are part of an incident, select **Yes**. For example, when you are ready to create an incident from a group of alerts, you can select No to view only those alerts that are not currently part of an incident.
- **ALERT NAMES**: Select the name of the alert to view. You can use this filter to search for all alerts generated by a specific rule or source, for example, Malicious IP - Reporting Engine.

The Alerts List shows a list of alerts that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the alerts list.
For example: **Showing 30 out of 30 items**

3. If you want to close the Filters panel, click **X**. Your filters remain in place until you remove them.

Remove My Filters from the Alerts List

NetWitness Suite remembers your filter selections in the Alerts List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of alerts that you expect to see or you want to view all of the alerts in your alerts list, you can reset your filters.

1. Go to **RESPOND > Alerts**.

   The Filters panel appears to the left of the alerts list. If you do not see the Filters panel, in the Alerts List view toolbar, click , which opens the Filters panel.

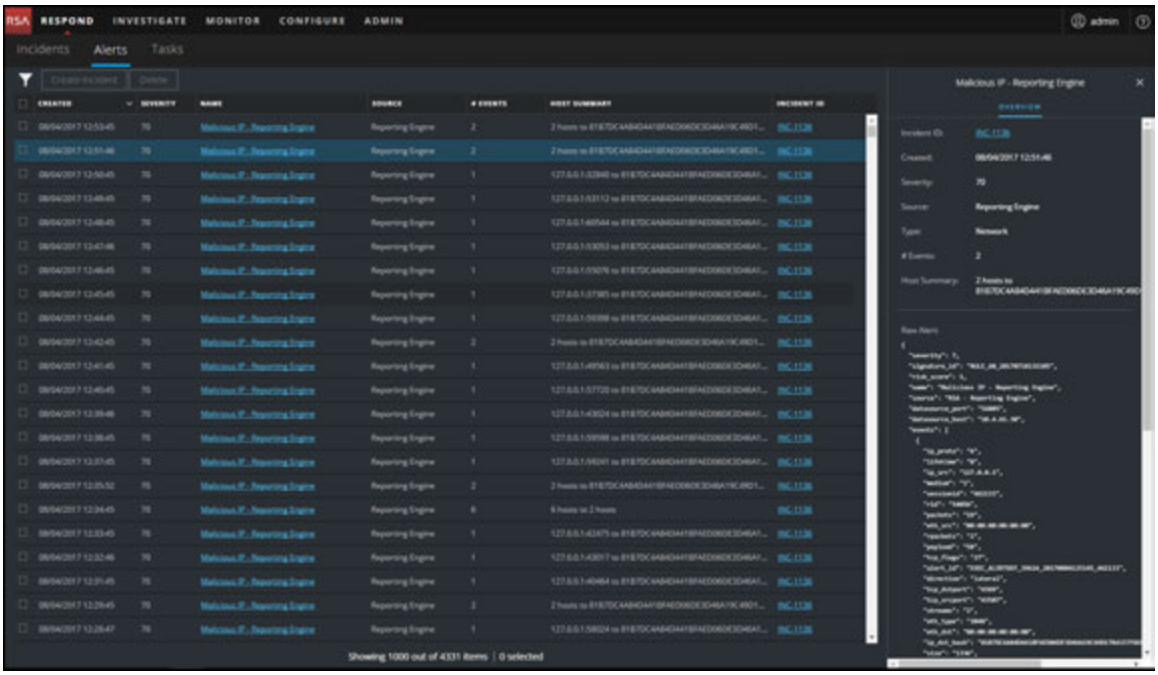
2. At the bottom of the Filters panel, click **Reset Filters**.

View Alert Summary Information

In addition to viewing basic information about an alert, you can also view raw alert metadata in the Overview panel.

1. In the Alerts list, click the alert that you want to view.

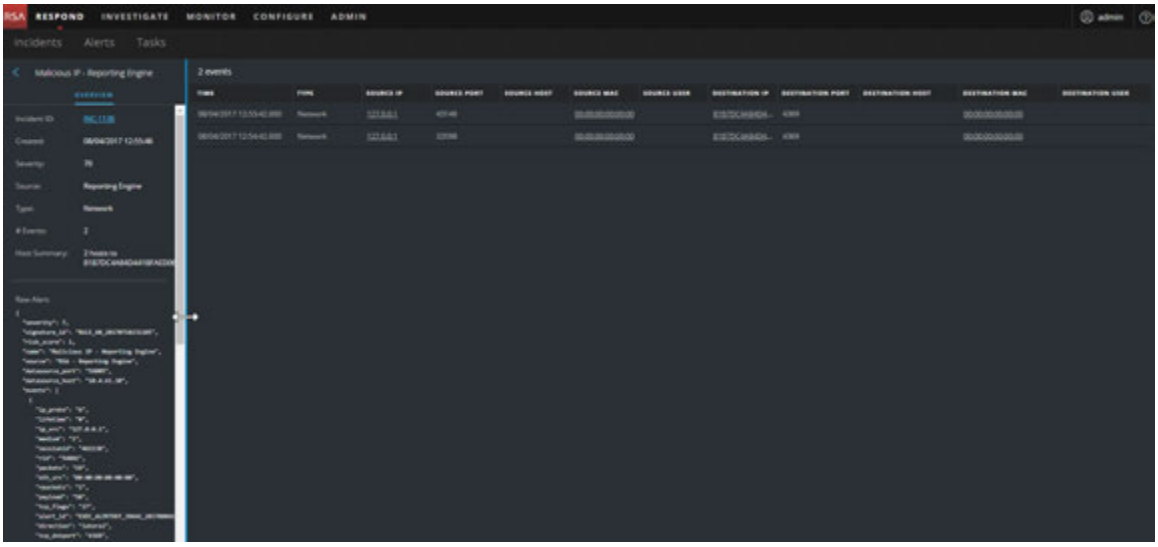
   The Alert Overview panel appears to the right of the Alerts list.



2. In the Raw Alert section, you can scroll to view the raw alert metadata.

View Event Details for an Alert

After you review the general information about the alert in the Alerts List view, you can go to the Alert Details view for more detailed information to determine the action required. An alert contains one or more events. In the Alert Details view, you can drill down into an alert to get additional event details and further investigate the alert. The following figure shows an example of the Alert Details view.



The Overview panel on the left has the same information for an alert as the Overview panel in the Alerts List view.

The Events panel on the right shows information about the events in the alert, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

There are two types of events:

- A transaction between two machines (a Source and a Destination)
- An anomaly detected on a single machine (a Detector)

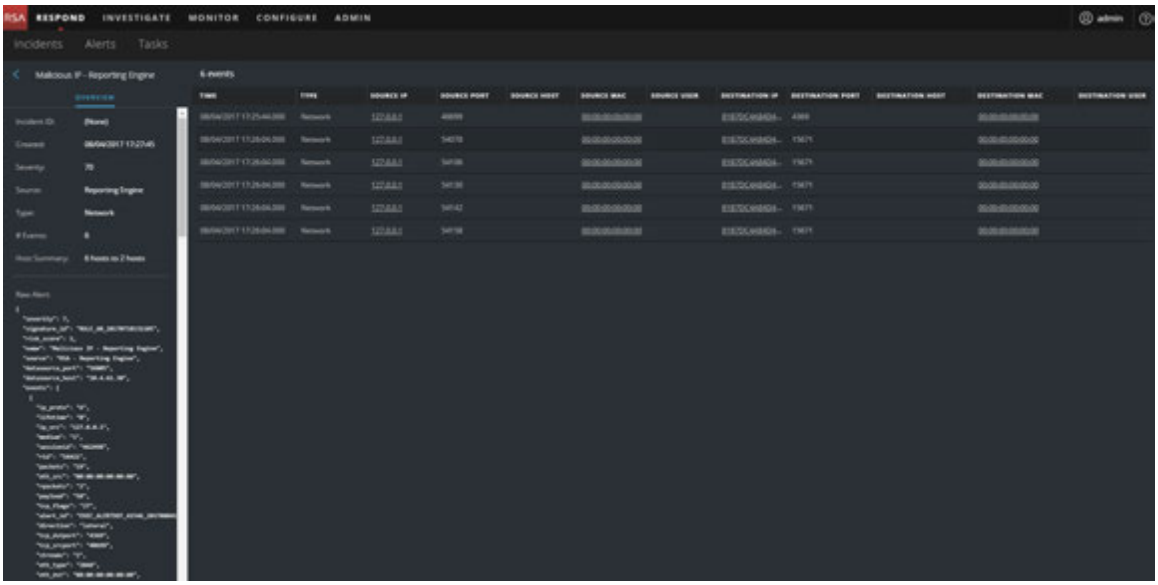
Some events will only have a Detector. For example, NetWitness Endpoint finds malware on your machine. Other events will have a Source and Destination. For example, packet data shows communication between your machine and a Command and Control (C2) domain.

You can drill further into an event to get detailed data about the event.

To View the Event Details for an Alert:

1. To view event details for an alert, in the Alerts List view, choose an alert to view and then click the link in the NAME column for that alert.

   The Alerts Details view shows the Overview panel on the left and the Events panel on the right.

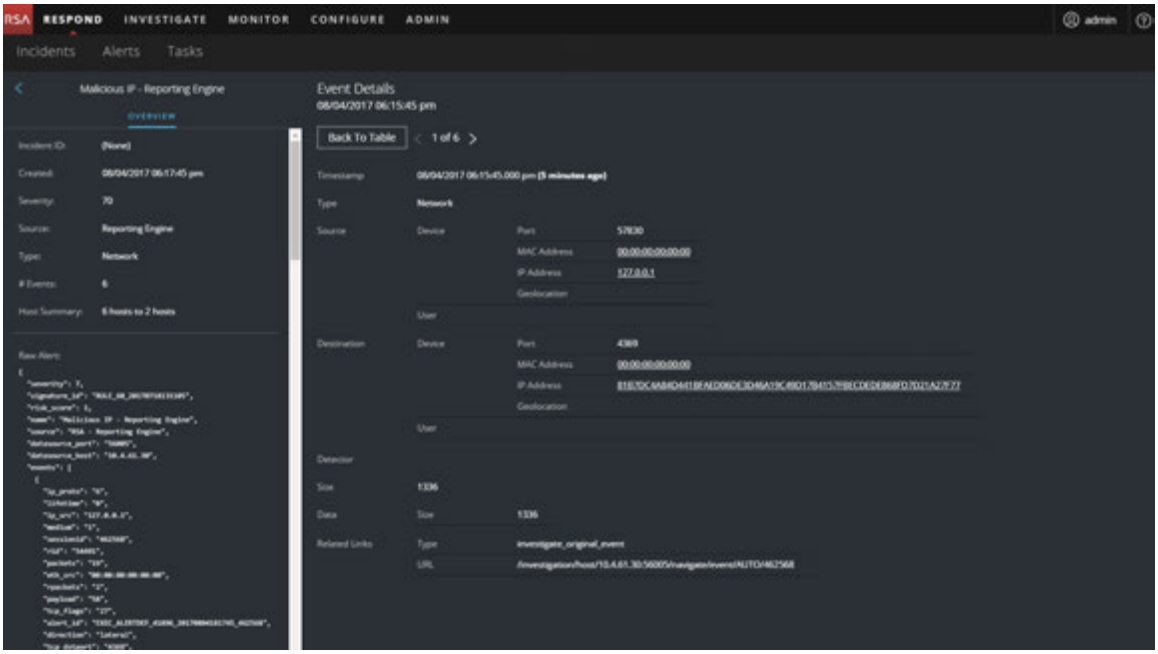


The Events panel shows a list of events with information about each event. The following table shows some of the columns that can appear in the Events List (Events Table).

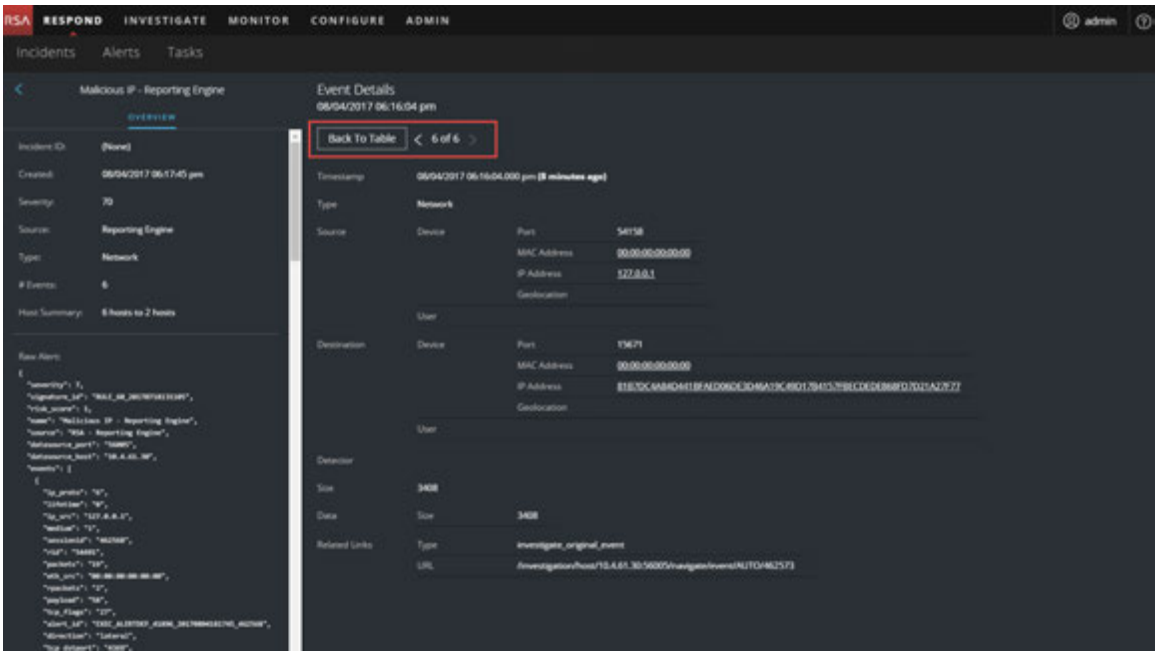
Column	Description
TIME	Shows the time the event occurred.
TYPE	Shows the type of alert, such as Log and Network.
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
DESTINATION IP	Shows the destination IP address if there was a transaction between two machines
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected.
SOURCE USER	Shows the user of the source machine.
DESTINATION USER	Shows the user of the destination machine.
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.

If there is only one event in the list, you will see the event details for that event instead of a list.

2. Click an event in the Events list to view the Event details.
   This example shows the event details for the first event in the list.



3. Use the page navigation to the right of the Back To Table button to view other events. This example shows the event details for the last event in the list.



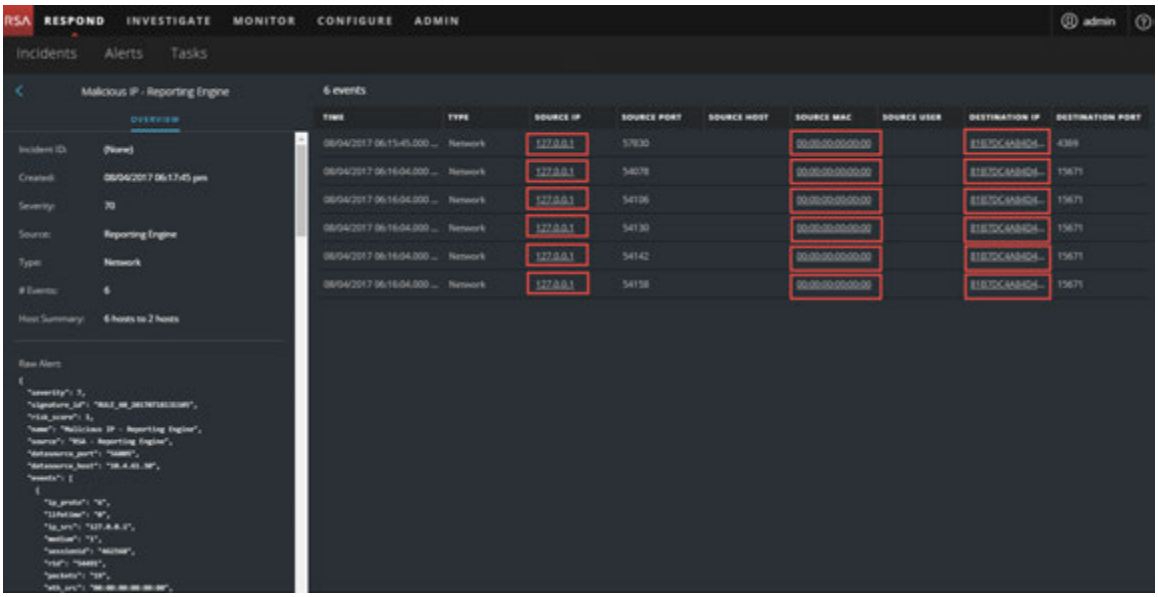
See Alert Details View for detailed information about the event data listed in the Alert Details panel.

Investigate Events

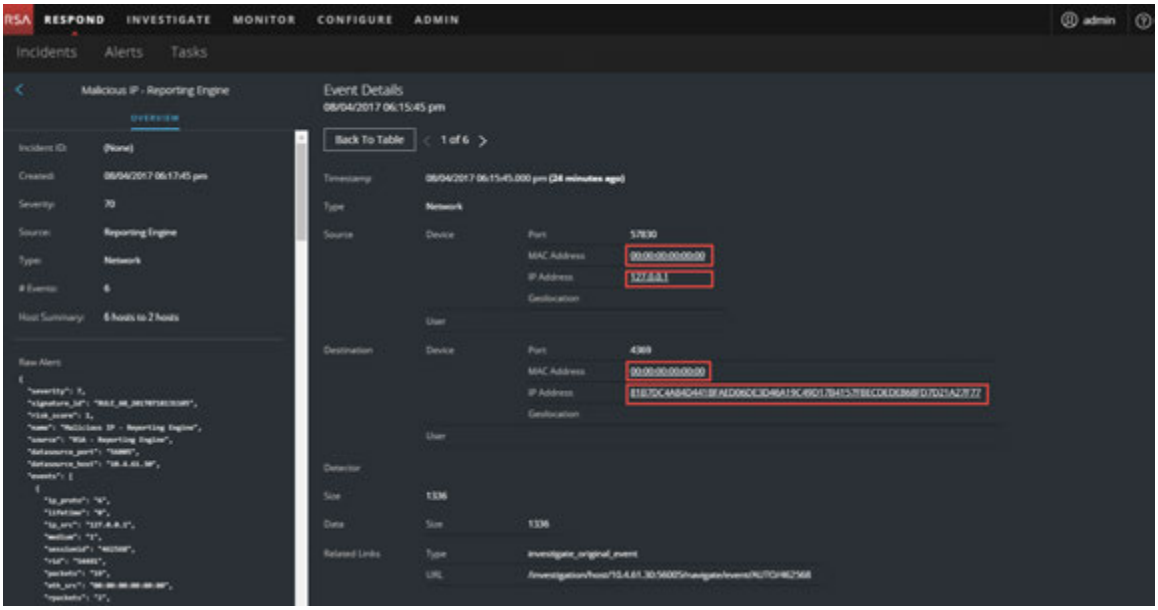
To further investigate the events, you can find links that take you to additional contextual information. From there, you have options available depending on your selection.

View Contextual Information

In the Alert Details view, you can see underlined entities in the Events panel. An underlined entity is considered an entity in the Context Hub and has additional contextual information available. The following figure shows underlined entities in the Events list.



The following figure shows underlined entities in the Events Details.



The Context Hub is preconfigured with meta fields mapped to the entities. NetWitness Respond and Investigation use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, RSA recommends that when mapping meta keys in the **ADMIN > SYSTEM > Investigations > Context Lookup** tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, ip.address is a meta key and ip_address is not a meta key (it is a field in the MongoDB).

To View Contextual Information:

1. In the Alert Details view Events List or Event Details, hover over an underlined entity.
   A context tooltip appears with a quick summary of the type of context data that is available for the selected entity.

   The context tooltip has two sections: Context Highlights and Actions.

   The information in the **Context Highlights** section helps you to determine the actions that you would like to take. It shows the number of related alerts and incidents. Depending on

your data, you may be able to click these numbered items for more information. The above example shows 238 related incidents, and 8,755 related alerts, and 1 related context hub list.

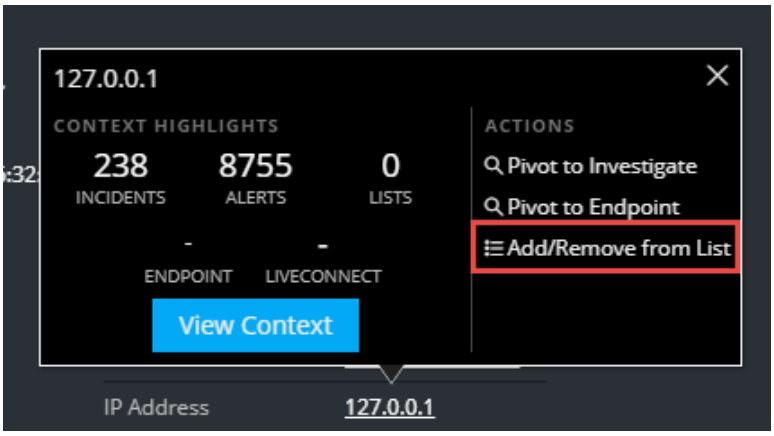
The **Actions** section lists the available actions. In the above example, the Pivot to Investigate, Pivot to Endpoint, and Add/Remove From List options are available.

2. To see more details about the selected entity, click the **View Context** button.
   The Context panel opens and shows all of the information related to the entity.
   Context Lookup Panel - Respond View provides additional information.

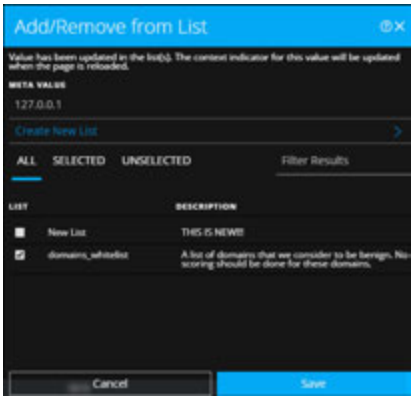
Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Alert Details view Events List or Event Details, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip appears showing the available actions.



2. In the **Actions** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove From List dialog shows the available lists.



3. Select one or more lists and click **Save**.
   The entity appears on the selected lists.
   Add/Remove from List Dialog provides additional information.

Create a Whitelist

You can create a whitelist in the Context Hub in the same way as you would create it in the Incident Details view, see Create a List.

Pivot to NetWitness Endpoint

If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.

1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.
2. In the **ACTIONS** section of the tooltip, select **Pivot to Endpoint**.
   The NetWitness Endpoint application opens outside of your web browser.

For more information, see the *NetWitness Endpoint User Guide*.

Pivot to Investigation

For a more thorough investigation of the incident, you can access the Investigate view.

1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.
2. In the **ACTIONS** section of the tooltip, select **Pivot to Investigate**.
   The Investigate Navigate view opens, which enables you to perform a deeper dive investigation.

For more information, see the *Investigation and Malware Analysis User Guide*.

Create an Incident Manually

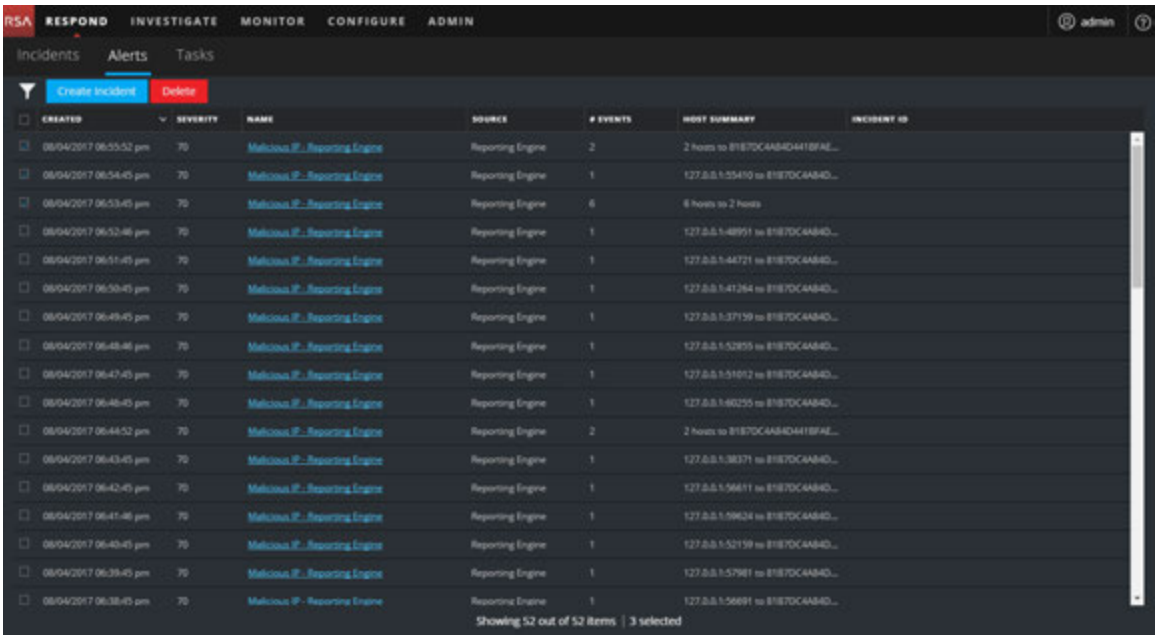
You can create incidents manually from alerts in the Alerts List view. The alerts that you select cannot be part of another incident. Incidents created manually from alerts default to Low priority, but you can change the priority after you create it. You cannot add categories to manually created incidents.

Note: Incidents can be created manually or automatically. An Alert can only be associated with one Incident. You can create aggregation rules to analyze the alerts collected and group them into incidents depending on which rules they match. For details, see the "Create an Aggregation Rule for Alerts" topic in the *NetWitness Respond Configuration Guide*.

To Create an Incident Manually:

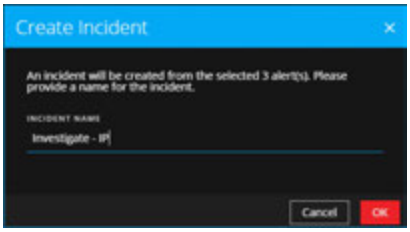
1. Go to **RESPOND > Alerts**.
2. Select one or more alerts in the Alerts List.

   Note: Selecting alerts that do not have incident IDs enable the **Create Incident** button. If the alert is already part of an incident, the button is disabled. You can filter alerts that are not part of an incident by selecting the option **PART OF INCIDENT** as **No** in the Filters panel.



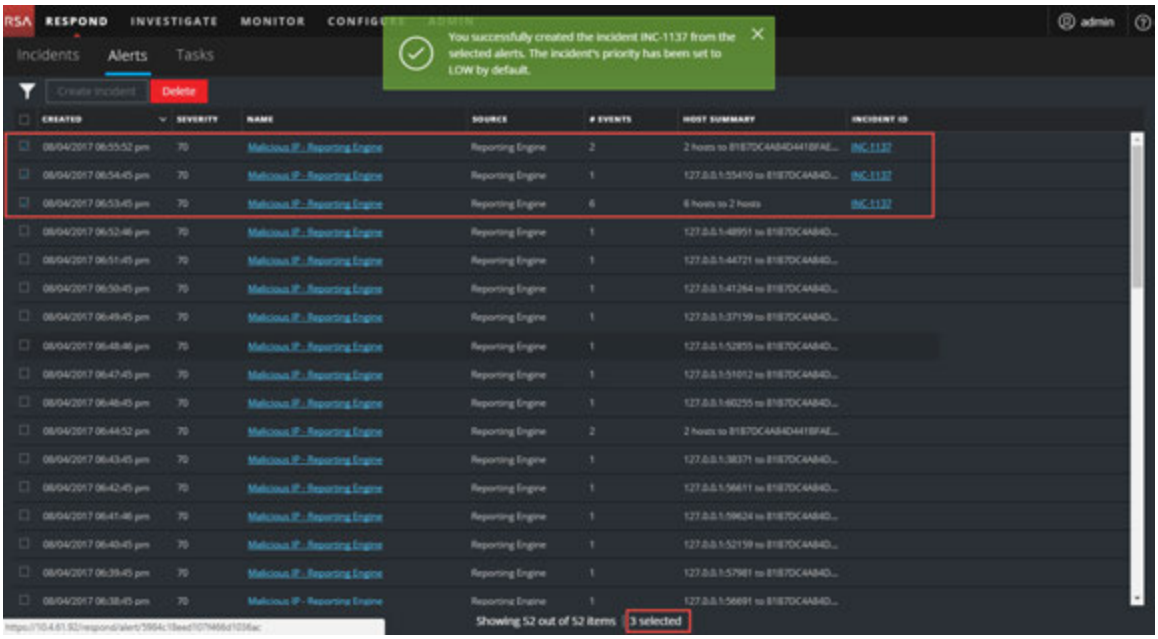
3. Click **Create Incident**.

   The **Create Incident** dialog is displayed.



4. In the **INCIDENT NAME** field, type a name to identify the incident. For example, Investigate - IP.

5. Click **OK**.



You will see a confirmation message that an incident was created from the selected alerts. The new incident ID appears as a link in the INCIDENT ID column of the selected alerts. If you click the link, it takes you to the Incident Details view for that incident, where you can update information, such as changing Priority from low to high.

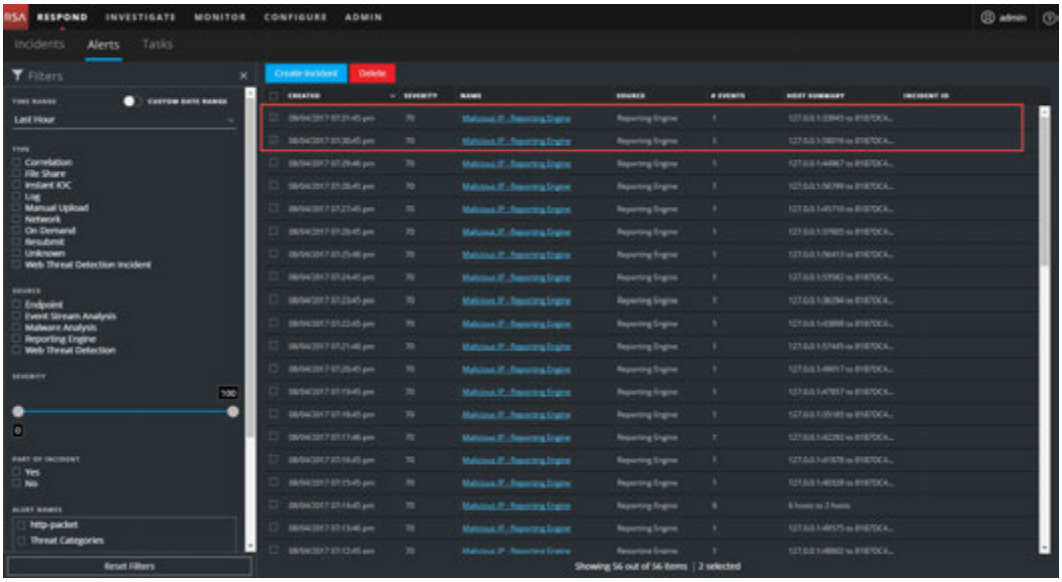
Delete Alerts

Users with the appropriate permissions, such as Administrators and Data Privacy Officers, can delete alerts. This procedure is helpful when you want to remove unnecessary or non-relevant alerts. Deleting these alerts frees up disk space.

1. Go to **RESPOND > Alerts**.

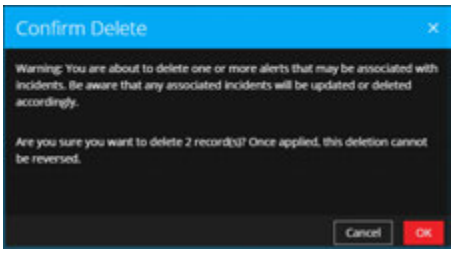
   The Alerts List view displays a list of all NetWitness Suite alerts.

2. In the Alerts list, select the alerts that you want to delete and click **Delete**.



If you do not have permission to delete alerts, you will not see the Delete button.

3. Confirm that you want to delete the alerts and click **OK**.



The alerts are deleted from NetWitness Suite. If a deleted alert is the only alert in an incident, the incident is also deleted. If the deleted alert is not the only alert in an incident, the incident is updated to reflect the deletion.

NetWitness Respond Reference Information

The Respond view user interface provides access to NetWitness Respond functions. This topic contains descriptions of the user interfaces as well as other reference information to help users understand the functions of NetWitness Respond.

Topics

Incidents List View

The Incidents List view (RESPOND > Incidents) shows Incident Responders and other Analysts a prioritized results list of incidents created from various sources. For example, your results list could show incidents created from ESA rules, NetWitness Endpoint, or ESA Analytics modules for Automated Threat Detection, such as C2 for packets or logs. From the Incidents List view, you have easy access to the information that you need to quickly triage and manage incidents through completion.

Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness Suite.

In the Incidents List view, you can review the list of prioritized incidents, which shows basic information about each incident. You can also change the assignee, priority, and status of the incidents. Because the results can be large in the incidents list, you have the option to filter those incidents by time range, incident ID, custom date range, priority, status, assignee, and categories.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts, and SOC Manager	View prioritized incidents*	Review Prioritized Incident List
Incident Responders, Analysts, and SOC Manager	Filter and sort the incident list*	Filter the Incident List
Incident Responders, Analysts	View my incidents*	View My Incidents
Incident Responders, Analysts	Assign incidents to myself*	Assign Incidents to Myself
Incident Responders, Analysts, and SOC Manager	Find Incidents*	Find an Incident
Incident Responders, Analysts, and SOC Manager	Update an incident.*	Escalate or Remediate the Incident
Incident Responders, Analysts	View incident details.	Determine which Incidents Require Action
Incident Responders, Analysts	Further Investigate an incident.	Investigate the Incident
Incident Responders, Analysts, and SOC Manager	Create a task.	Escalate or Remediate the Incident

*You can complete these tasks here (that is in the Incidents List view).

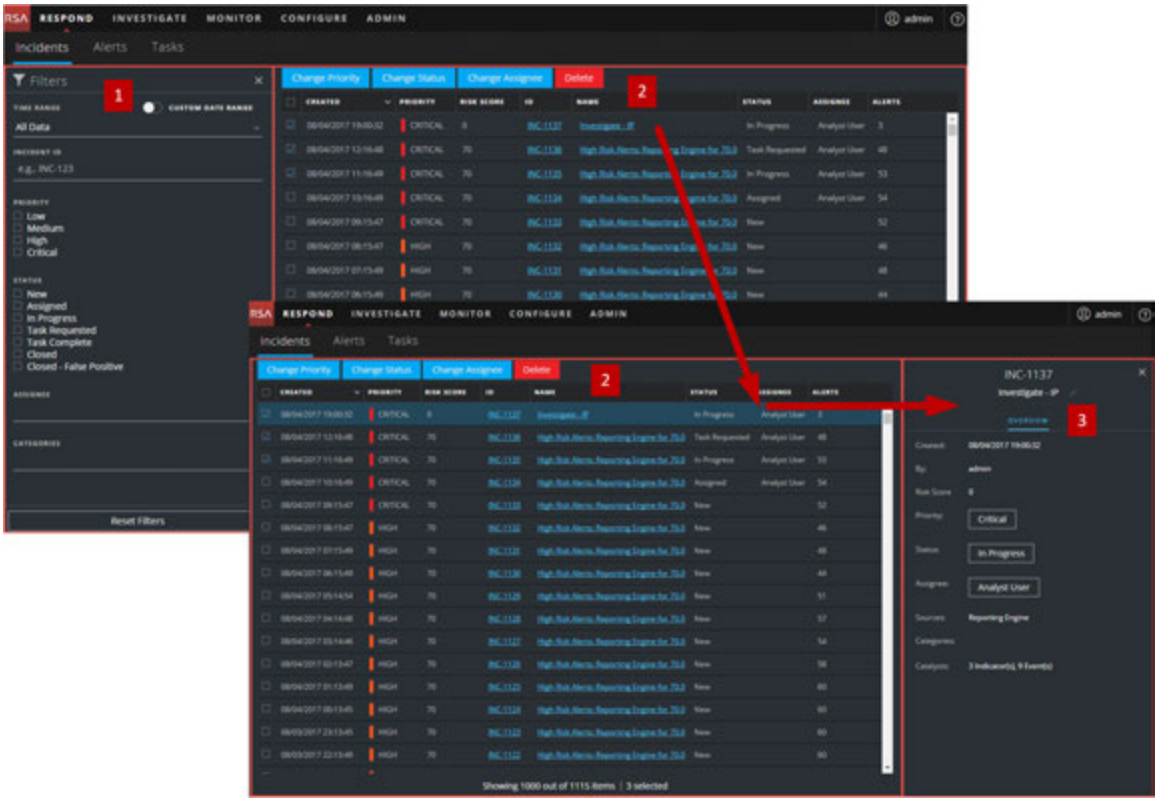
Quick Look

The following example shows the initial Incidents List view with the Filter panel. You can open the Overview panel for an incident by clicking an incident in the Incident List.



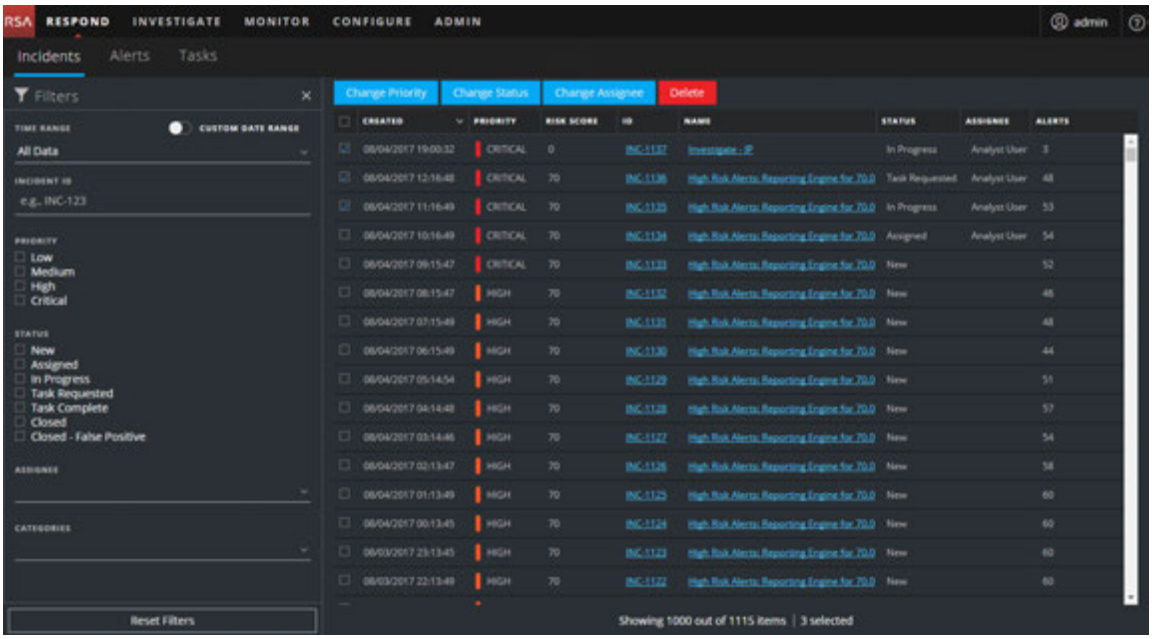
1. Filters Panel
2. Incidents List
3. Overview Panel

You can go directly to the Incident Details view from the Incidents List by clicking the hyperlinked ID or NAME. The Overview panel is also available in the Incident Details view. For more information about the Incidents Details view, see Incident Details View.

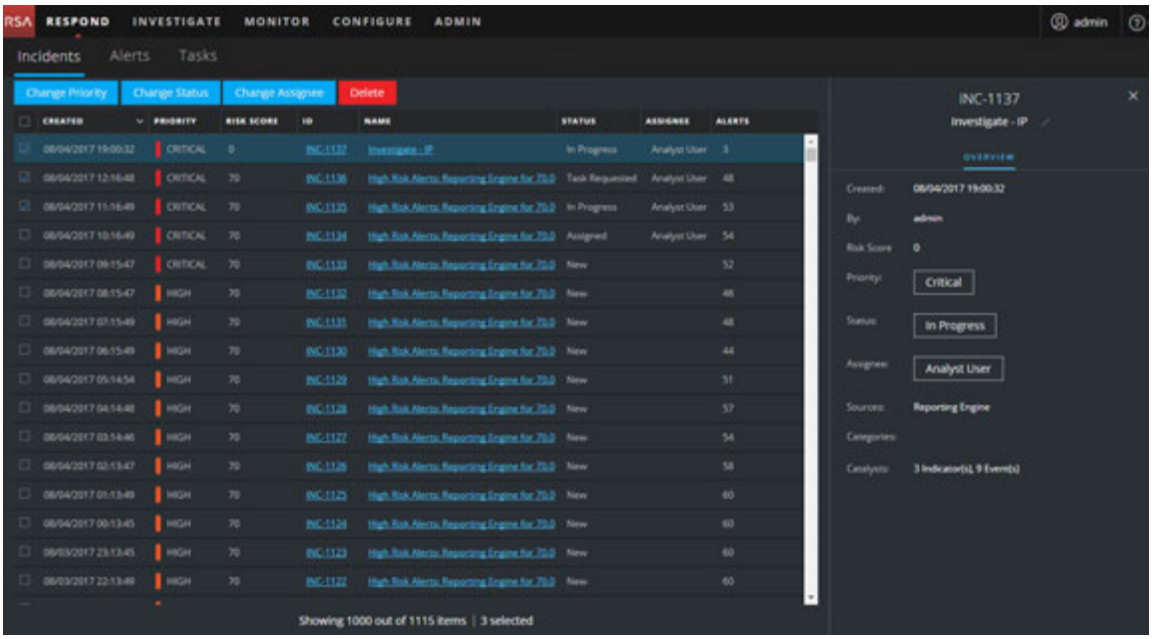
Incidents List View

To access the Incidents List view, go to **RESPOND > Incidents**. The Incidents List view displays a list of all incidents. The Incidents List view consists of a Filters panel, an Incidents List, and an Incidents Overview panel.

The following figure shows the Filter Panel on the left and the Incidents List on the right.



The following figure shows the Incidents List on the left and the Incidents Overview panel on the right.



Incidents List

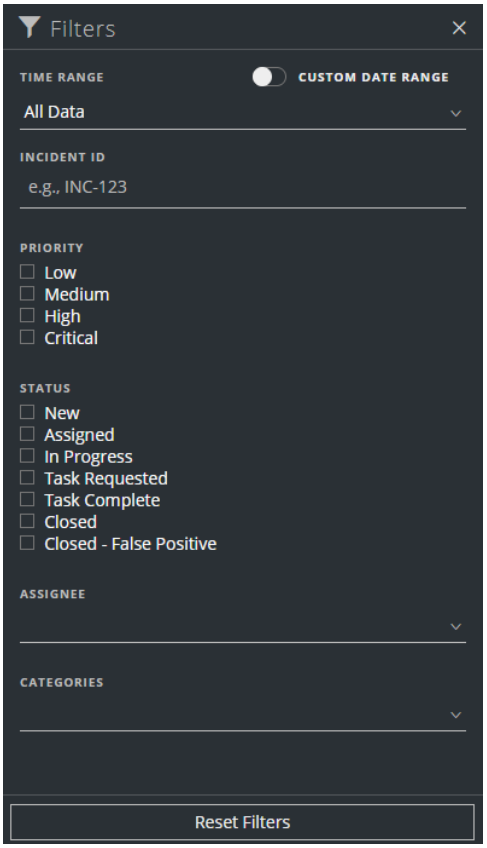
The Incidents List shows a list of all of the prioritized incidents. You can filter this list to show only incidents of interest.

Column	Description
CREATED	Shows the creation date of the incident.
PRIORITY	Shows the incident priority. Priority can be Critical, High, Medium or Low. The Priority is color coded, where red indicates a **Critical** incident, orange represents a **High** risk incident, yellow indicates a **Medium** risk incident, and green represents a **Low** risk incident. For example: 
RISK SCORE	Shows the incident risk score. The risk score indicates the risk of the incident as calculated via an algorithm and is between 0-100. 100 is the highest risk score.
ID	Shows the automatically created incident number. Each incident is assigned a unique number that you can use to track the incident.
NAME	Shows the incident name. The incident name is derived from the rule used to trigger the incident. Click the link to go to the Incident Details view for the selected incident.
STATUS	Shows the incident status. The status can be: New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed-False Positive.
ASSIGNEE	Shows the team member currently assigned to the incident.
ALERTS	Shows the number of alerts associated with the incident. An incident may include many alerts. A large number of alerts might mean that you are experiencing a large-scale attack.

At the bottom of the list, you can see the number of incidents on the current page, the total number of incidents, and the number of incidents selected. For example: **Showing 1000 out of 2517 items | 2 selected**. The maximum number of incidents that you can view at one time is 1,000.

Filters Panel

The following figure shows the filters available in the Filters panel.



The Filters panel, on the left of the Incidents List view, has options that you can use to filter the incidents list. When you navigate away from the Filters panel, the Incidents List view retains your filter selections.

Option	Description
TIME RANGE	You can select a specific time period from the Time Range drop-down list. The time range is based on the received date of the alerts. For example, if you select Last Hour, you will see alerts that were received within the last 60 minutes.
CUSTOM DATE RANGE	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. INCIDENT ID	You can type the Incident ID for an incident you would like to locate, for example INC-1050.
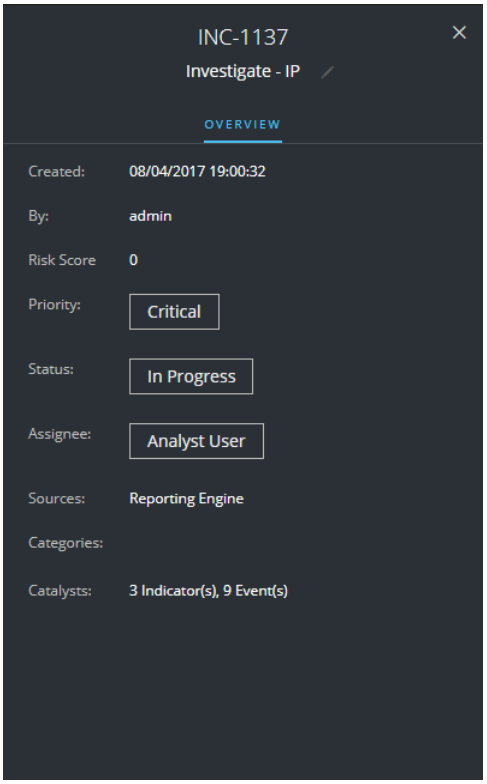
PRIORITY	Select the priorities that you would like to view.
STATUS	Select one or more incident statuses. For example, select Closed - False Positive to view only false positive incidents, which were initially identified as suspicious, but then they were later found to be safe.
ASSIGNEE	Select the assignee or assignees of the incidents that you would like to view. For example, if you only want to view the incidents assigned to Cale or Stanley, select Cale and Stanley from the Assignee drop-down list. If you want to view incidents regardless of the assignee, do not make a selection under Assignee.

Option	Description
CATEGORIES	Select one or more categories from the drop-down list. For example, if you only want to view incidents classified with the Backdoor or Privilege abuse categories, select Backdoor and Privilege abuse.
Reset Filters	Removes your filter selections.

Overview Panel

The Overview panel shows basic summary information about a selected incident. From the Incidents List, you can click an incident to access the Overview panel. The Overview panel in the Incident Details view contains the same information.



The following table lists the fields displayed in the Incident Overview panel.

Field	Description
<Incident ID>	Displays the Incident ID.
<Incident Name>	Displays the name of the incident. You can click the incident name to change it. For example, rules can create many incidents with the same name. You can change the incident names to be more specific.
Created	Shows the creation date and time of the incident.
Rule / By	Shows the name of the rule that created the incident or the name of the person who created the incident.
RiskScore	Indicates the risk of the incident as calculated via an algorithm and is between 0-100. 100 is the highest risk score.
Priority	Shows the incident priority. Priority can be Critical, High, Medium or Low. To change the priority, you can click the Priority button and select a new priority from the drop-down list.
Status	Shows the incident status. The status can be New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed - False Positive. To change the status, you can click the Status button and select a new status from the drop-down list.
Assignee	Shows the team member currently assigned to the incident. To change the assignee you can click the Assignee button and select a new assignee from the drop-down list.
Sources	Displays the data sources used to locate the suspicious activity.
Categories	Displays the categories of the incident events.
Catalysts	Displays the count of indicators that gave rise to the incident.

Toolbar Actions

This table lists the toolbar actions available in the Incidents List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the alerts that you would like to see in the Alerts List.
	Closes the panel.
Change Priority button	Allows you to change the Priority of one or more selected incidents in the Incidents List.
Change Status button	Allows you to change the Status of one or more selected incidents.
Change Assignee button	Allows you to change the Assignee of one or more selected incidents.
Delete button	Allows you to delete the selected incidents if you have the appropriate permissions, such as an Administrator or Data Privacy Officer.

Incident Details View

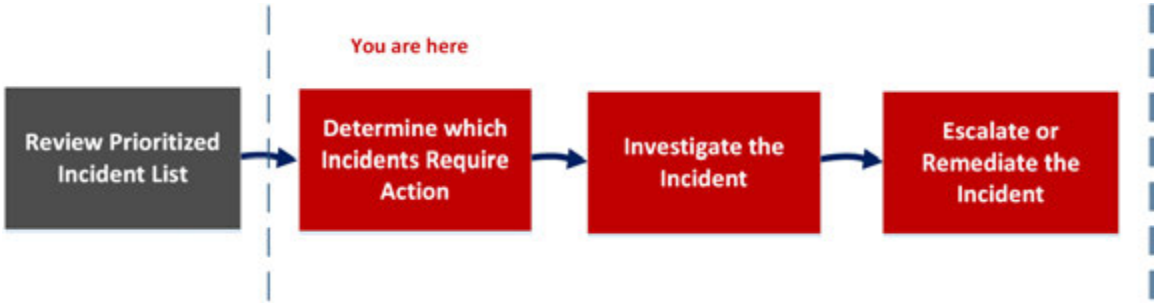
In the Incident Details view (RESPOND > Incidents > click an ID or NAME hyperlink in the Incidents List), you can view and access extensive incident details. The Incident Details view contains multiple panels that provide the following benefits:

- **Overview**: View an incident summary and update the incident.
- **Indicators**: View the indicators (alerts) involved in the incident, the events within those alerts, and available enrichment information.
- **Nodal Graph**: Visualize the size and interactions between entities (IP address, MAC address, user, host, domain, file name, or file hash).
- **Events Datasheet**: Study the events associated with the incident.
- **Journal**: Add notes and collaborate with other analysts.
- **Tasks**: Create incident tasks and track them to closure.
- **Related Indicators**: View indicators (alerts) that are related to the incident and add them to the incident if they are not associated with an incident.

You can also filter the data in the Incident Details view to study indicators and entities of interest.

Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness Suite.



In the Incident Details view, you can use the extensive information provided about the incidents to determine which incidents require action. You also have the tools and information to investigate the incident, and then escalate or remediate it.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts, and SOC Manager	View prioritized incidents, filter and sort the incident list, find incidents, view my incidents, and assign incidents to myself.	Review Prioritized Incident List
Incident Responders, Analysts	View incident details.*	View Incident Details
Incident Responders, Analysts	View alerts and enrichments.*	View the Indicators and Enrichments
Incident Responders, Analysts	View events.*	View and Study the Events
Incident Responders, Analysts	View a graph of the entities involved in the events.*	View and Study the Entities Involved in the Events
Incident Responders, Analysts	Filter the incident data.*	Filter the Data in the Incident Details View
Incident Responders, Analysts	View and add incident notes.*	View Incident Notes and Document Steps Taken Outside of NetWitness
Incident Responders, Analysts	View and create tasks.*	View the Tasks associated with an Incident and Create a Task
Incident Responders, Analysts	Add related alerts and add them to the incident.*	Find Related Indicators and Add Related Indicators to the Incident
Incident Responders, Analysts	View contextual information about an incident from Context Hub.*	View Contextual Information

Role	I want to ...	Show me how
Incident Responders, Analysts	Reduce false positives by adding an entity to the whitelist.*	Add an Entity to a Whitelist
Incident Responders, Analysts	Pivot to Investigation.*	Pivot to Investigate
Incident Responders, Analysts	Pivot to NetWitness Endpoint.*	Pivot to NetWitness Endpoint
Incident Responders, Analysts	Update or close an incident.*	Update an Incident and Close an Incident
Incident Responders, Analysts, and SOC Manager	View all tasks.	Escalate or Remediate the Incident
Incident Responders, Analysts, and SOC Manager	Bulk update incidents and tasks.	Escalate or Remediate the Incident

*You can complete these tasks here (that is in the Incident Details view).

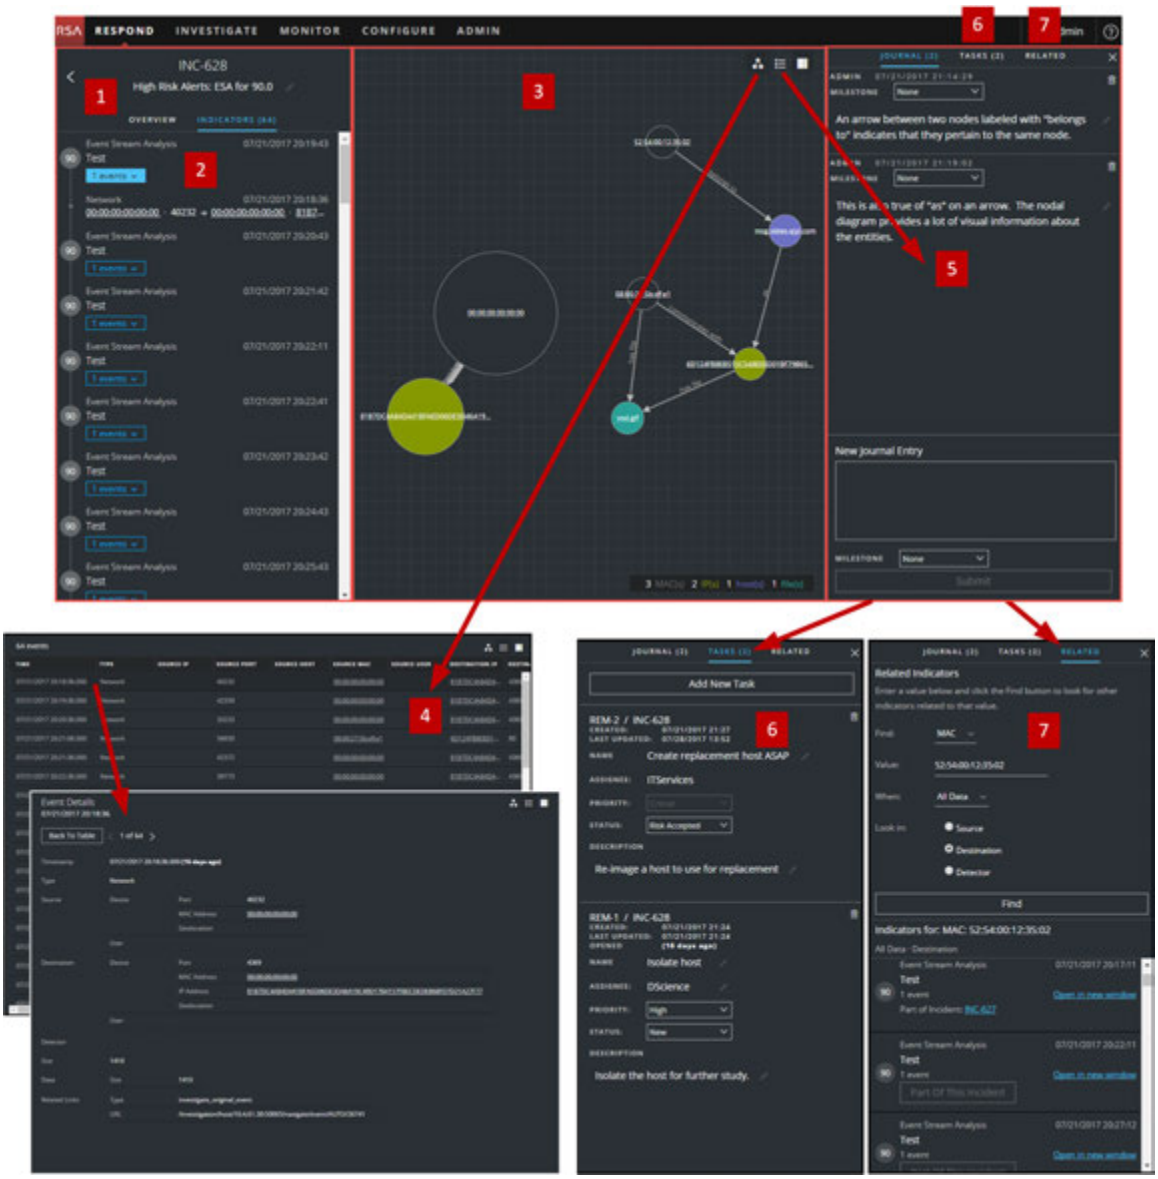
Quick Look

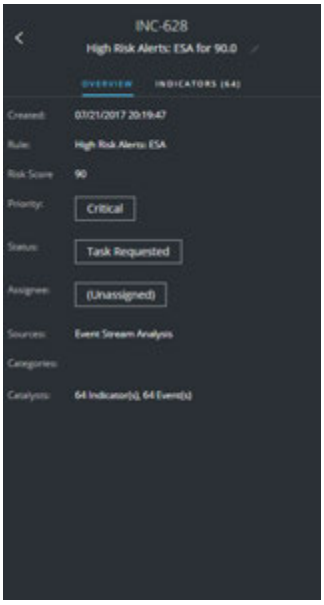
The following example shows the locations of the Incident Details view panels.



1	Overview Panel (Click the OVERVIEW tab to view it.)
2	Indicators Panel
3	Nodal Graph
4	Events Datasheet (Click an event in the Events List to view Event Details.).
5	Journal Panel
6	Tasks Panel (Click the TASKS tab to view it.)
7	Related Indicators Panel (Click the RELATED tab to view it.)

Overview Panel

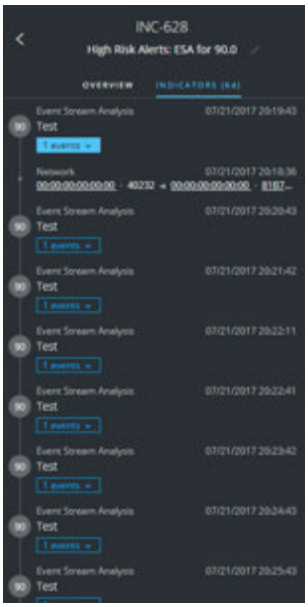
The Overview panel shows basic summary information about a selected incident. It also allows you to change the incident name and update the incident priority, status, and assignee. The Overview panel in the Incidents List view contains the same information. The Incidents List view Overview Panel topic provides details.



Indicators Panel

The Indicators panel contains a chronological listing of indicators. *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert. (This is different than a timeline, which provides a visual representation of the timing of the events in the incident). This listing helps you to connect indicators and notable data. For example, an IP address connected to a command and communication ESA alert might also have triggered a NetWitness Endpoint alert or other suspicious activities.

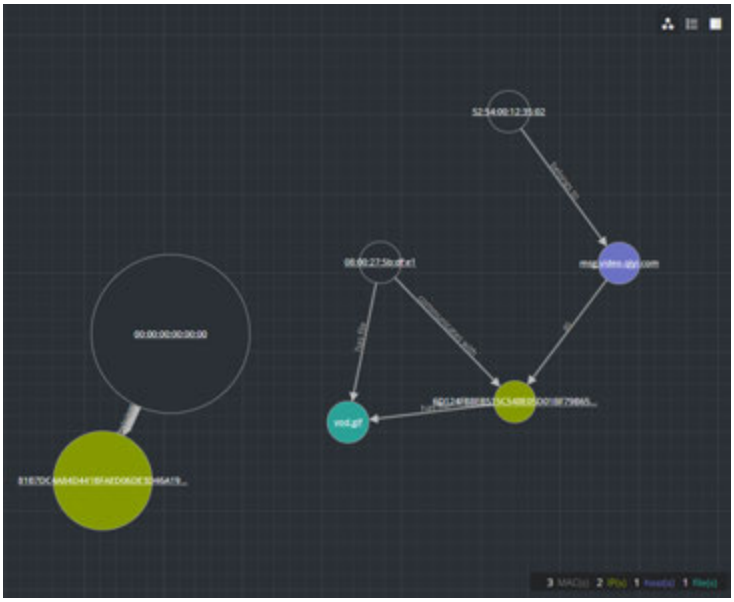
To view the Indicators panel, in the left panel of the Incident Details view, select **INDICATORS**.



Data source information is shown below the names of the indicators. You can also see the creation date and time of the indicator and the number of events in the indicator.

Nodal Graph

The nodal graph is an interactive graph that shows the entities involved in the incident. An *Entity* is a specified piece of meta, such as IP address, MAC address, user, host, domain, file name, or file hash.



Nodes

In the nodal graph, circles represent nodes. The following table describes the nodal graph node types.

Node	Description
IP address	If the event is a detected anomaly, you can see a Detector IP. If the event is a transaction, you can see a Destination IP and a Source IP.
MAC address	You may see a MAC address for each type of IP address.
User	If the machine is associated with a user, you can see a user node.
Host	A host can be physical equipment or a virtual machine, designated by a Fully Qualified Domain Name (FQDN) or IP address, on which any service is installed.
Domain	
Filename	If the event involves files, you can see a filename.
File Hash	If the event involves files, you may see a file hash.

The legend at the bottom of the nodal graph shows the number of nodes of each type and the color coding of the nodes. It also helps you to locate the entities when the values, such as the IP addresses, are hashed.

You can click any node and drag it to reposition it.

Arrows

The arrows between the nodes provide additional information about the entity relationships. The following table describes the nodal graph arrow types.

Arrow	Description
Communicates with	An arrow between a Source machine node (IP address or MAC address) and a Destination machine node labeled with "communicates with" shows the direction of the communication.

Arrow	Description
As	An arrow between nodes labeled with "as" provides additional information about the IP address that the arrow points to. For example, if there is an arrow from the host node circle that points to an IP address node that is labeled with "as", it indicates that the name on the host node circle is the hostname of that IP address and is not a different entity.
Has file	An Arrow between a machine node (IP address, MAC address, or Host) and a file hash node labeled with "has" indicates that the IP address has that file.
Uses	An arrow between a User node and a machine node (IP address, MAC address, or Host) labeled with "uses" shows the machine that the user was using during the event.
Is named	An arrow from a File Hash node to a File Name node labeled with "is named" indicates that the file hash corresponds to a file with that name.
Belongs to	An arrow between two nodes labeled with "belongs to" indicates that they pertain to the same node. For example, an arrow between a MAC address and a Host labeled with "belongs to" indicates that it is the MAC address of the host.

Larger line size arrows indicate more communication between the nodes. Larger nodes (circles) indicate more activity than smaller nodes. The larger nodes are the most common entities mentioned in the events.

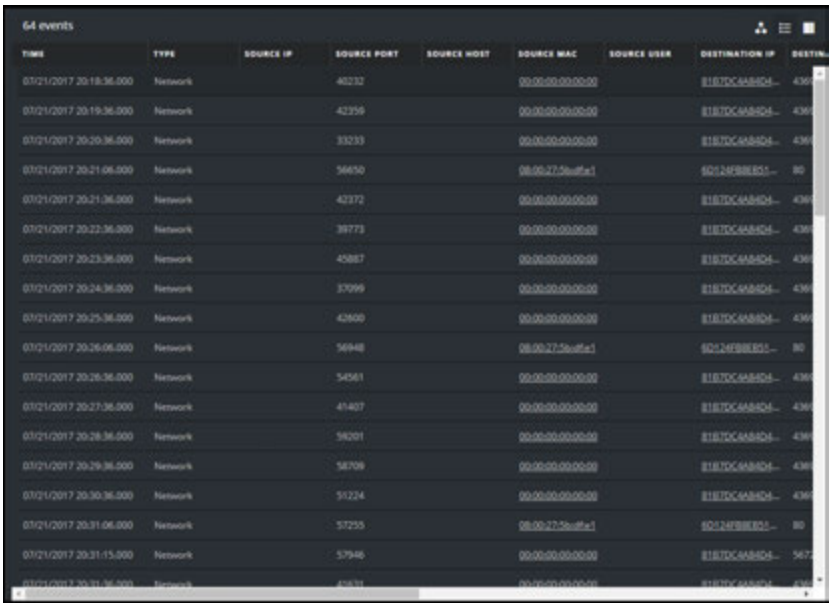
Events Datasheet

The Events datasheet shows the events associated with the incident. It shows information about the events, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

The Events datasheet shows an Events List for multiple events or Event Details for a single event.

Events List

The following figure shows the Events List.



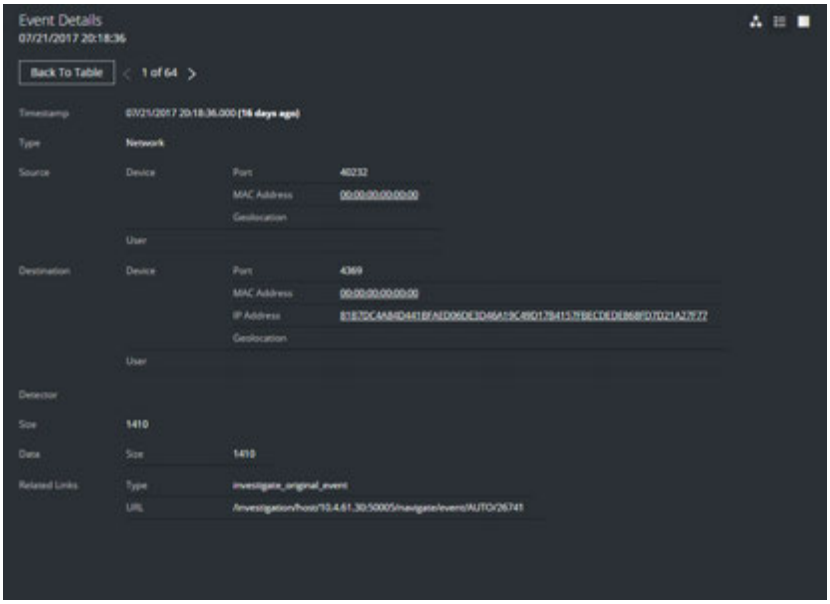
The following table describes the columns in the Events list.

Column	Description
TIME	Shows the time the event occurred.
TYPE	Shows the type of alert, such as Log and Network.
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
SOURCE PORT	Shows the source port of the transaction. The source and destination ports can be on the same IP address.
SOURCE HOST	Shows the destination host where the event took place.
SOURCE MAC	Shows the MAC address of the source machine.
SOURCE USER	Shows the user of the source machine.
DESTINATION IP	Shows the destination IP address if there was a transaction between two machines
DESTINATION PORT	Shows the destination port of the transaction. The source and destination ports can be on the same IP address.

Column	Description
DESTINATION HOST	Shows the HOST name of the destination machine.
DESTINATION MAC	Shows the MAC address of the destination machine.
DESTINATION USER	Shows the user of the destination machine.
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected.
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.

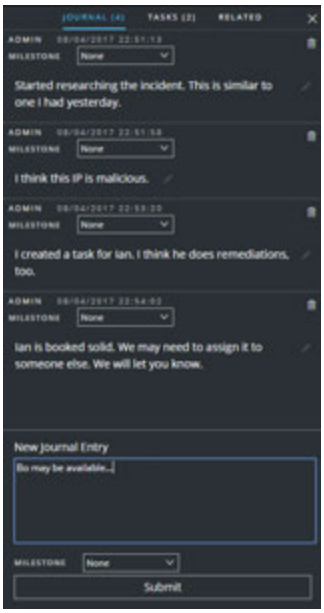
Event Details

To view the event details, you click an event in the event list. If there is only one event in the list, you will see the event details for that event instead of a list.



Journal Panel

The incident Journal shows the history of activity on your incident.



The following table describes the New Journal Entry options.

Field	Description
New Journal Entry	Type your note in the field.
Milestone	(Optional) Select a milestone, if applicable. This field is used to track significant events for the incident.
Submit button	Click submit to add an entry to the journal. You journal entry will be visible to anyone who views the incident.

Tasks Panel

In the Tasks panel, you can manage and track the incident tasks to closure.

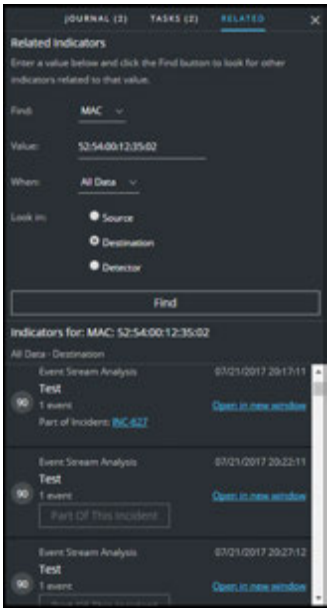
The following table describes the Task fields.

Field	Description
<Task ID / <Incident ID>	The autogenerated Task ID / The incident associated with the task.
CREATED	The created date of the task.
LAST UPDATED	The date that the task was last modified.
OPENED	The time that passed since the task was opened. For example, 3 minutes ago or 2 days ago.
NAME	The name of the task. For example: Re-image the machine. You can click this field to edit it.
ASSIGNEE	The username of the user assigned to the task. You can click this field to edit it.
PRIORITY	The priority of the task: Low, Medium, High, or Critical. You can click the priority button and select a new priority for the task from the drop-down list.

Field	Description
STATUS	The status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. You can click the status button and select a new status for the task from the drop-down list.
DESCRIPTION	Type information that describes the task. You may want to include any applicable reference numbers. You can click this field to edit it.

Related Indicators Panel

The Related Indicators panel enables you to search the NetWitness Suite alerts database to find alerts that are related to this incident. You can add alerts that you find to the incident if they are not already associated with an incident.



The following table describes the fields in the search section at the top of the panel.

Field	Description
Find	Select the entity that you would like to locate in the alerts. For example, IP.
Value	Type the value of the entity. For example, type the actual IP address of the entity.
When	Select a time range to search for the alerts. For example, Last 24 hours.

Field	Description
Look in	Specify the type of entity to search: • **Source**: The source machine in a transaction between two machines. • **Destination**: The destination machine in a transaction between two machines. • **Detector**: A single machine where an anomaly was detected. • **Domain**: This option is available when you select Domain in the Find field. For example, select Source to look for alerts where a certain IP address acted as the source device. You may want to do separate searches for each type of device: Source, Destination, and Detector.
Find button	Initiates the search. A list of related indicators appear below the **Find** button in the **Indicators for** section.

The following table describes the options in the **Indicators for** (results) section at the bottom of the panel.

Option	Description
Indicators For:	Shows the search results.
Open in new window link	Shows alert details for the indicator.
Add To Incident button	Adds the related indicator to the incident. The related indicator adds to the Indicators panel.
Part Of This Incident button	Shows that the indicator is already part of the incident.

Toolbar Actions

Option	Description
	(Back to Incidents) Enables you to navigate back to the Incidents List view.
	Closes the panel.

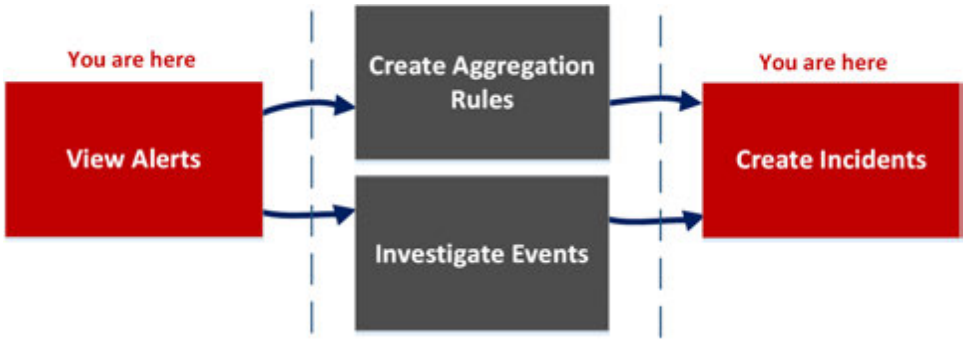
Option	Description
	Deletes the entry, such as a journal entry or task.
Priority button	(In the Overview panel) Allows you to change the Priority of one or more selected incidents in the Incidents List.
Status button	(In the Overview panel) Allows you to change the Status of one or more selected incidents.
Assignee button	(In the Overview panel) Allows you to change the Assignee of one or more selected incidents.
 (View: Graph)	Enables you to view the Nodal Graph.
 (View: Datasheet)	Enables you to view the Events datasheet, which can appear as an Events List for multiple events or Event Details for a single event.
 (Journal, Tasks, and Related)	Enables you to view the Journal, Tasks, and Related Indicators panels.

Alerts List View

The Alerts List view (RESPOND > Alerts) enables you to view all of the threat alerts and indicators received by NetWitness Suite in one location. This can include alerts received from ESA Correlation Rules, ESA Analytics, Malware Analysis, Reporting Engine, NetWitness Endpoint, as well as many others. In the Alerts List view you can browse through various alerts, filter them, and group them to create incidents.

Workflow

This workflow shows the high-level process that Analysts use to review alerts and create incidents.



In the Alerts List view, you can review a list of alerts from all sources received by NetWitness Suite. After that, you can investigate those alerts further and create incidents from the alerts or you can create aggregation rules to create incidents.

Note: You can use NetWitness Suite Automated Threat Detection to create incidents without manually creating rules.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts	View all alerts in NetWitness Suite.*	View Alerts
Incident Responders, Analysts	Filter alerts.*	Filter the Alerts List

Role	I want to ...	Show me how
Incident Responders, Analysts	View alert overview information and raw alert metadata.*	View Alert Summary Information
Incident Responders, Analysts	Create incidents from alerts.*	Create an Incident Manually
Administrators, Data Privacy Officers	Delete alerts.*	Delete Alerts
SOC Managers, Administrators	Create aggregation Rules.	See "Create an Aggregation Rule for Alerts" in the *NetWitness Respond Configuration Guide*.
Incident Responders, Analysts	Investigate the events in an alert.	View Event Details for an Alert and Investigate Events
Incident Responders, Analysts	Add alerts to an existing incident.	Add Related Indicators to the Incident

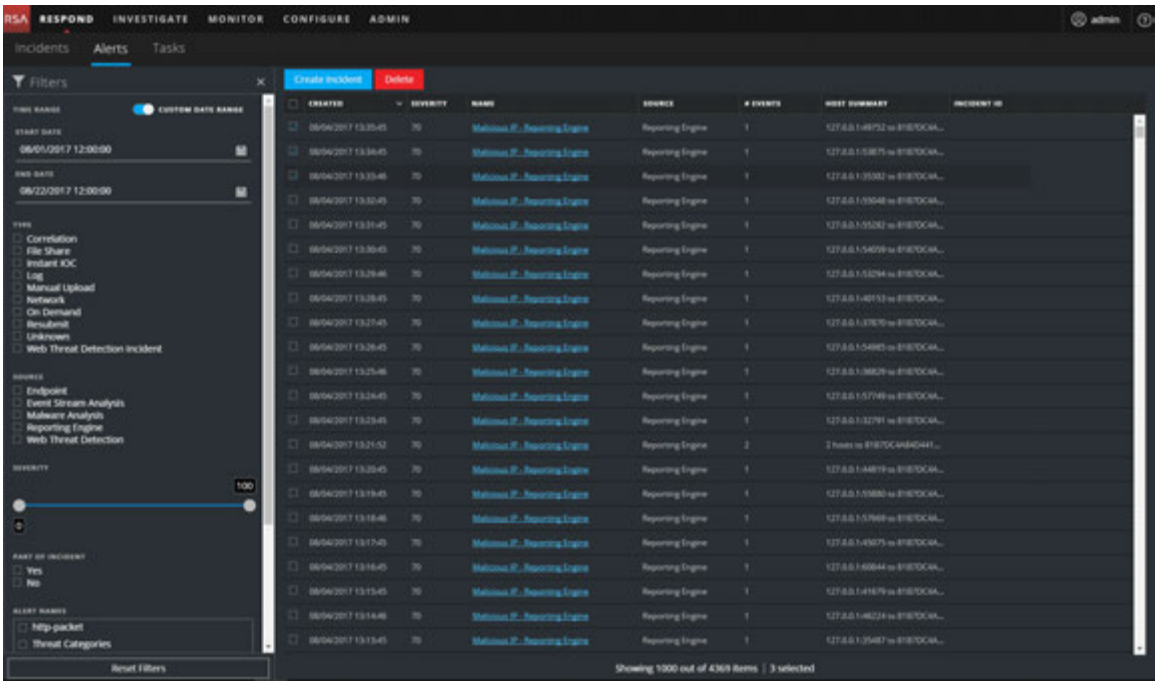
*You can complete these tasks here (that is in the Alerts List view).

Related Topics

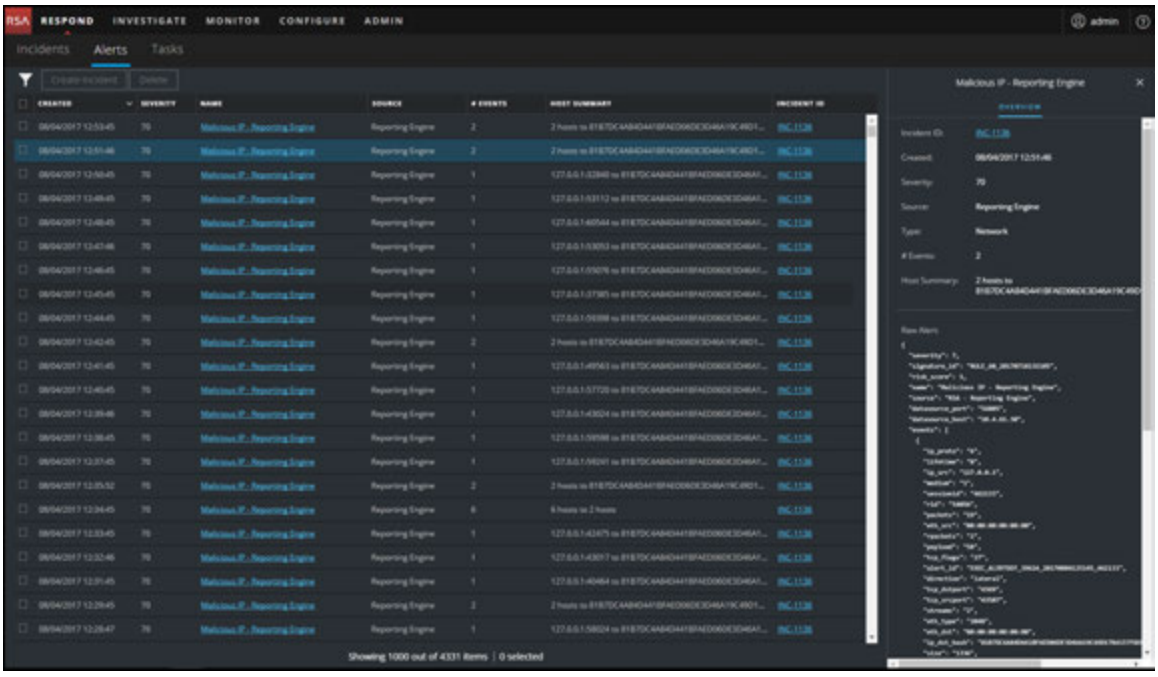
- Alert Details View
- Reviewing Alerts

Alerts List View

To access the Alerts List view, go to **RESPOND > Alerts**. The Alerts List view displays a list of all alerts and indicators received by the Respond Server database in NetWitness Suite. The following figure shows the Filters panel on the left.

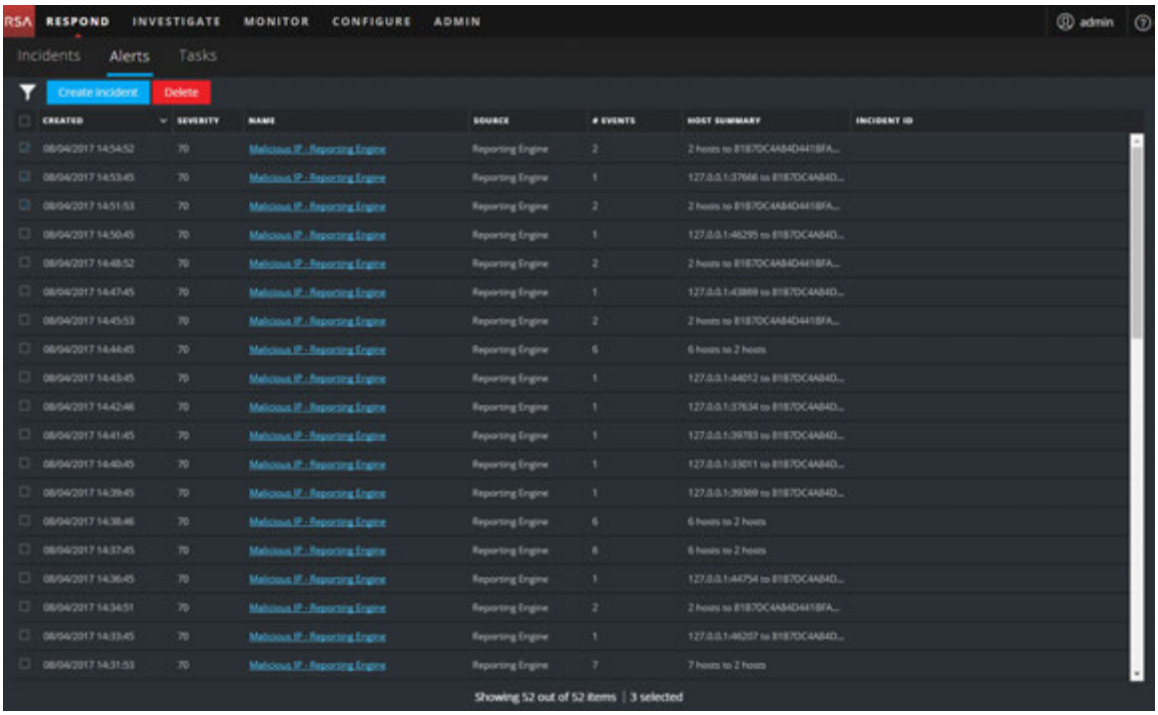


The Alerts List view consists of a Filters panel, an Alerts List, and an Alert Overview panel. You can click an alert in the Alerts list to view the Alert Overview panel on the right.



Alerts List

The Alerts List shows all of the alerts in NetWitness Suite. You can filter this list to only show alerts of interest.



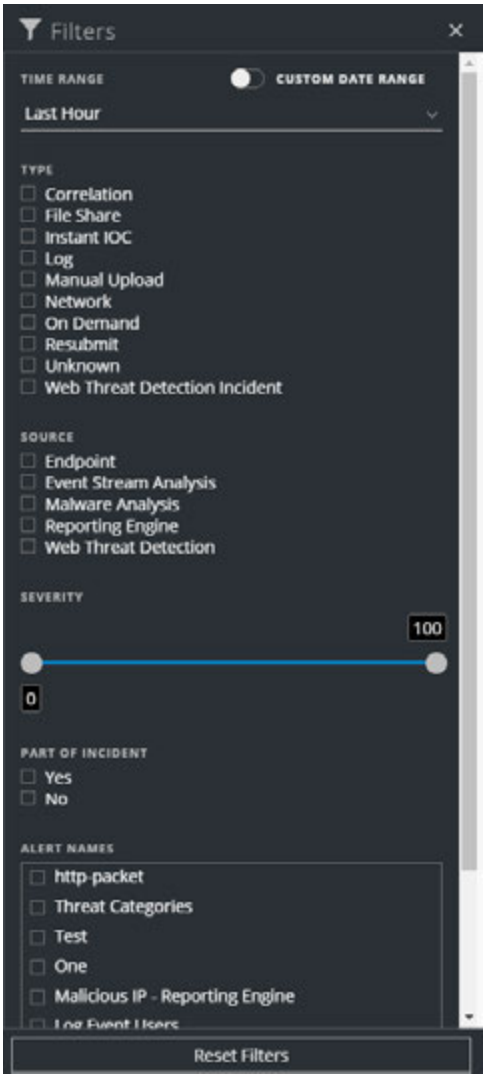
Column	Description
	Enables you to select one or more alerts to delete. Users with the appropriate permissions, such as Administrators and Data Privacy Officers, can delete alerts.
CREATED	Displays the date and time when the alert was recorded in the source system.
SEVERITY	Displays the level of severity of the alert. The values are from 1 through 100.
NAME	Displays a basic description of the alert.
SOURCE	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, ESA correlation rules, ESA Analytics, Reporting Engine, and many others.
# EVENTS	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.

Column	Description
HOST SUMMARY	Displays details of the host like the host name from where the alert was triggered. The details may include information about the source and destination hosts in an Alert. Some alerts may describe events across more than one host .
INCIDENT ID	Shows the Incident ID of the alert. If there is no incident ID, the alert does not belong to any incident and you can create an incident to include this alert or the alert can be added to an existing incident.

At the bottom of the list, you can see the number of alerts on the current page, the total number of alerts, and the number of alerts selected. For example: **Showing 377 out of 377 items | 3 selected**

Filters Panel

The following figure shows the filters available in the Filters panel.



The Filters panel, on the left of the Alerts List view, has options that you can use to filter the alerts list. When you navigate away from the Filters panel, the Alerts List view retains your filter selections.

Option	Description
TIME RANGE	You can select a specific time period from the Time Range drop-down list. The time range is based on the received date of the alerts. For example, if you select Last Hour, you will see alerts that were received within the last 60 minutes.
CUSTOM DATE RANGE	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. TYPE	Indicates the type of events in the alert, for example, logs, network sessions, and so on.
SOURCE	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, Event Stream Analysis (ESA Correlation Rules), ESA Analytics, Reporting Engine, Web Threat Detection, and many others.
SEVERITY	Displays the level of severity of the alert. The values are from 1 through 100.

Option	Description
PART OF INCIDENT	Categorizes alerts on whether or not they are associated with an incident. Select **Yes** to view alerts that are part of an incident. Select **No** to view alerts that are not part of an incident. For example, before you create incidents from alerts, you may want to select No to view only those alerts that are not already part of an incident.
ALERT NAMES	Shows the name of the alert. You can use this filter to search for all alerts generated by a specific rule or source, for example, Malicious IP - Reporting Engine.
Reset Filters	Removes your filter selections.

The Alerts List shows a list of alerts that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the alerts list. For example: **Showing 30 out of 30 items**

Overview Panel

The Overview panel shows basic summary information about a selected alert and raw alert metadata. The Overview panel in the Alert Details view contains the same information, but in the Alerts Details view, you can expand the panel to view more information.

The following table lists the fields displayed in the Alert Overview panel.

Field	Description
<Alert Name>	Displays the name of the alert.
Incident ID	Displays the Incident ID associated with the alert. You can click the incident ID link to go to the Incident Details view of the associated incident. If there is no incident ID, the alert does not belong to an incident. You can create an incident for this alert or you can add it to an incident.
Created	Displays the date and time when the alert was created.
Severity	Displays the level of severity of the alert. The values are from 1 through 100.
Source	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, ESA correlation rules, ESA Analytics, Reporting Engine, and many others.
Type	Indicates the type of events in the alert, for example, logs, network sessions, and so on.
# Events	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.
Raw Alert	Shows the raw alert metadata.

Toolbar Actions

This table lists the toolbar actions available in the Alerts List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the alerts that you would like to see in the Alerts List.
	Closes the panel.
Create Incident button	Enables you to create incidents from alerts. The alerts cannot be part of an incident. To get a list of alerts without incidents, you can filter the Alerts List, In the PART OF INCIDENT section, select No.
Delete button	Allows you to delete alerts.

Alert Details View

In the Alert Details view (RESPOND >Alerts > click a NAME hyperlink in the Alerts List), you can view summary information about an alert, such as the source of the alert, the number of events within the alert, and whether it is part of an incident. You can also view detailed information about the events within the alert as well as the event metadata.

Workflow

This workflow shows the high-level process that Analysts use to review alerts and create incidents.

After reviewing the alerts list, in the Alert Details view, you can investigate those alerts further and create incidents from the alerts. In the CONFIGURE > INCIDENT RULES view, you can create aggregation rules to create incidents.

Note: You can also use NetWitness Suite Automated Threat Detection to create incidents without manually creating rules.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts	View all alerts in NetWitness Suite.	View Alerts
SOC Managers, Administrators	Create aggregation Rules.	See "Create an Aggregation Rule for Alerts" in the *NetWitness Respond Configuration Guide*.

Role	I want to ...	Show me how
Incident Responders, Analysts	View a list of events in the alert.*	View Event Details for an Alert
Incident Responders, Analysts	View event metadata for each event in the alert.*	View Event Details for an Alert
Incident Responders, Analysts	Further investigate the events in the alert.*	Investigate Events
Incident Responders, Analysts	Add alerts to an existing incident.	Add Related Indicators to the Incident
Incident Responders, Analysts	Create incidents from alerts.	Create an Incident Manually
Data Privacy Officers, Administrators	Delete alerts.	Delete Alerts

*You can complete these tasks here (that is in the Alerts Details view).

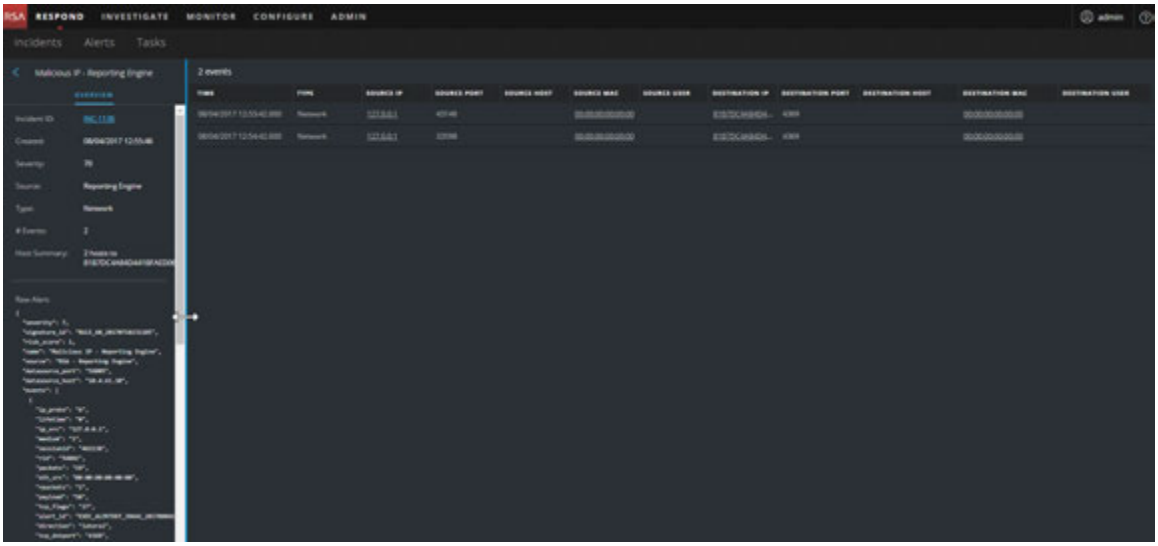
Alert Details View

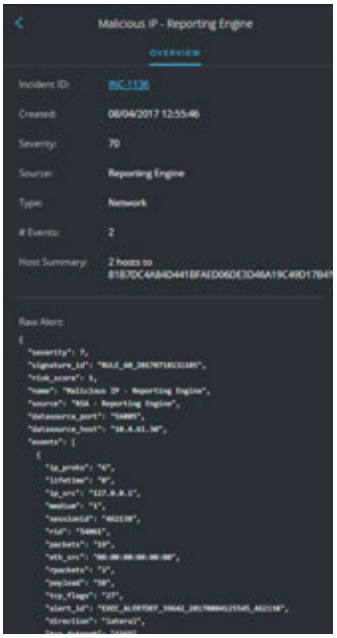
1. To access the Alert Details view, go to **RESPOND > Alerts**.
2. In the Alerts list, choose an alert to view and then click the link in the NAME column for that alert.
   The Alert Details view has an Overview panel on the left and the Events panel on the right.

You can resize the panels to show more information as shown in the following figure.



Overview Panel

The Overview panel shows basic summary information about a selected alert. The Overview panel on the Alerts List view contains the same information. The Alerts List view Overview Panel topic provides details.

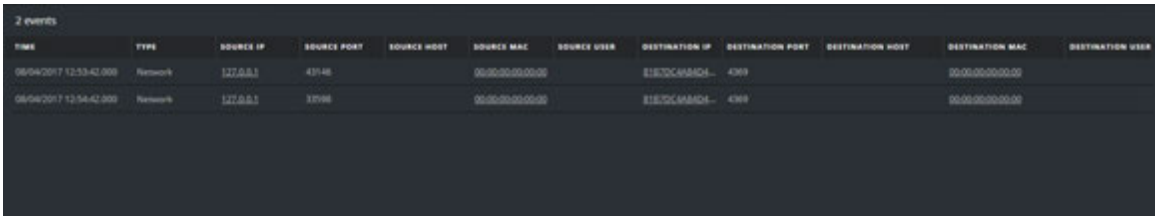


Events Panel

The Events panel can show an Events List if there is more than one event in the alert. If there is only one event in the alert, or you click an event in the Events List, you can see Event Details in the Events panel.

Events List

The Events List for a selected alert shows all of the events contained in that alert.

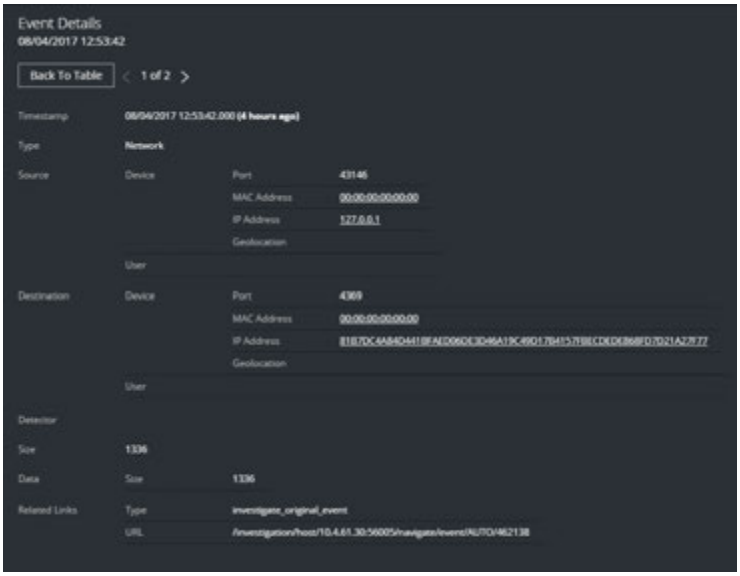


The following table lists some of the columns shown in the Events List, which provide a summary of the listed events.

Column	Description
TIME	Shows the time the event occurred.
TYPE	Shows the type of alert, such as Log and Network.
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
DESTINATION IP	Shows the destination IP address if there was a transaction between two machines.
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected.
SOURCE USER	Shows the user of the source machine.
DESTINATION USER	Shows the user of the destination machine.
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.

Event Details

The Event Details in the Events panel shows the event metadata for each event in the alert.



Event Metadata

The following table lists some event metadata sections and subsections shown in the first two columns in the Event Details. This is not an extensive list.

Section	Subsection	Description
Data		Shows information about the data involved with the event, such as the files involved. There may be 0 or more per event.
	Filename	Shows the file name if a file is involved with the event.
	Hash	Shows a hash of the file contents, for example, MD5 or SHA1.
	Size	Shows the size of the transmission or file involved with the event.
Description		Displays a general description of the event.
Destination		Shows the destination device and user.
	Device	Shows information about the destination device. See Event Source or Destination Device Attributes below.

Section	Subsection	Description
	User	Shows information about the user or users of the destinationSee Event Source or Destination User Attributes below.
Detector		Shows the host or software product that detected the issue. This is most relevant for malware scanners and logs
	Device Class	Shows the device class of the product that detected the alert.
	IP Address	Shows the IP address of the product that detected the alert.
	Product Name	Shows the name of the product that detected the alert.
Domain		Shows the domain associated with the event.
Enrichment		Shows available enrichment information.
Related Links		If available, it shows a link back to the user interface (UI) of the source product.
	Type	Shows the type of event, such as investigate_original_event.
	URL	Shows the URL link back to the UI of the source product.
Size		Shows the size of the transmission or file involved.
Source		Shows the source device and user.
	Device	Shows information about the source machine. See Event Source or Destination Device Attributes below.
	User	Shows information about the user or users of the source machine. See Event Source or Destination User Attributes below.
Timestamp		Shows the time that the event occurred.
Type		Shows the type of the alert, such as log, network, correlation, Resubmit, Manual Upload, On Demand, File Share, or Instant IOC.

Event Source or Destination Device Attributes

The following table lists attributes for an event source or destination device that can be shown in the Events Details.

Name	Description
Asset Type	Displays the type of device, for example, desktop, laptop, server, network equipment, tablet, and so on.
BusinessUnit	Shows the business unit associated with the .
Compliance Rating	Shows the compliance rating of the device. It can be Low, Medium, or High.
Criticality	Shows how critical the device is to the business (business criticality).
Facility	Shows the location of the device.
Geolocation	Shows the geographic location for the host. It can contain the following attibutes: city, country, latitude, longitude, organization, and domain.
IP Address	Shows the IP address of the device.
MAC Address	Shows the MAC address of the device.
Netbios Name	Shows the NetBIOS name for the device.
Port	Displays the TCP port, UDP port, or the IP Src port (the first one available) used to connect to and from the host.

Event Source or Destination User Attributes

The following table lists attributes for an an event source or destination user that can be shown in the Events Details.

Attribute Name	Description
AD Domain	Shows the Active Directory domain.

Attribute Name	Description
AD Username	Shows the Active Directory username.
Email Address	Shows the email address of the user.
Username	Shows a general name if you do not know the source of the username, such as UNIX or a username in a particular system.

Toolbar Actions

This table lists the toolbar actions available in the Alert Details view.

Option	Description
	(Back to Alerts) Enables you to navigate back to the Alerts List .view.
	Click the arrows to navigate through the event meta details for each event in the alert. The numbers, such as "1 of 2" show the number of the event that you are currently viewing. Click **Back to Table** to go back to the Events List view, which is also known as the Events Table.

Tasks List View

After investigating incidents, in the Tasks List view (RESPOND > Tasks), you can create and track incident tasks. For example, you can create remediation tasks when you require actions on incidents from teams outside of your security operations. You can reference external ticket numbers within the tasks and then track those tasks to completion. You can also modify and delete tasks as required, depending on your user permissions.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts	View tasks	View All Incident Tasks and View the Tasks associated with an Incident
Incident Responders, Analysts	Filter tasks.	Filter the Tasks List
Incident Responders, Analysts	Create a task.	Create a Task
Incident Responders, Analysts	Find and modify tasks.	Find a Task and Modify a Task
Incident Responders, Analysts	Close a task (Change the Status to Remediated, Risk Accepted, or Not Applicable).	Modify a Task
Incident Responders, Analysts, SOC Managers	Delete a task.	Delete a Task

Related Topics

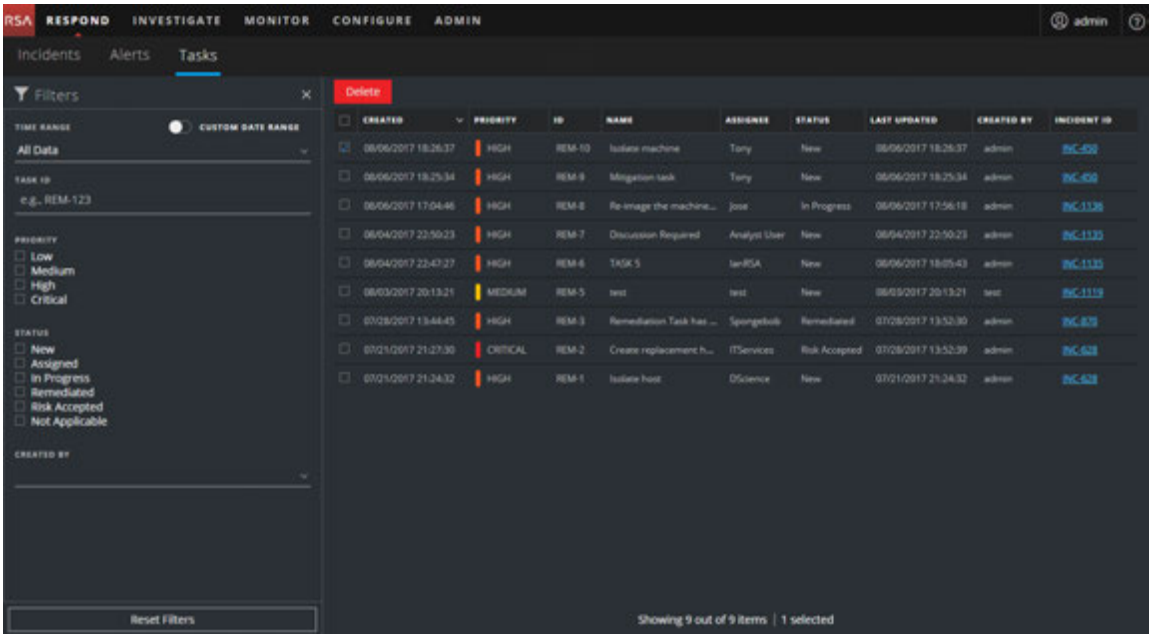
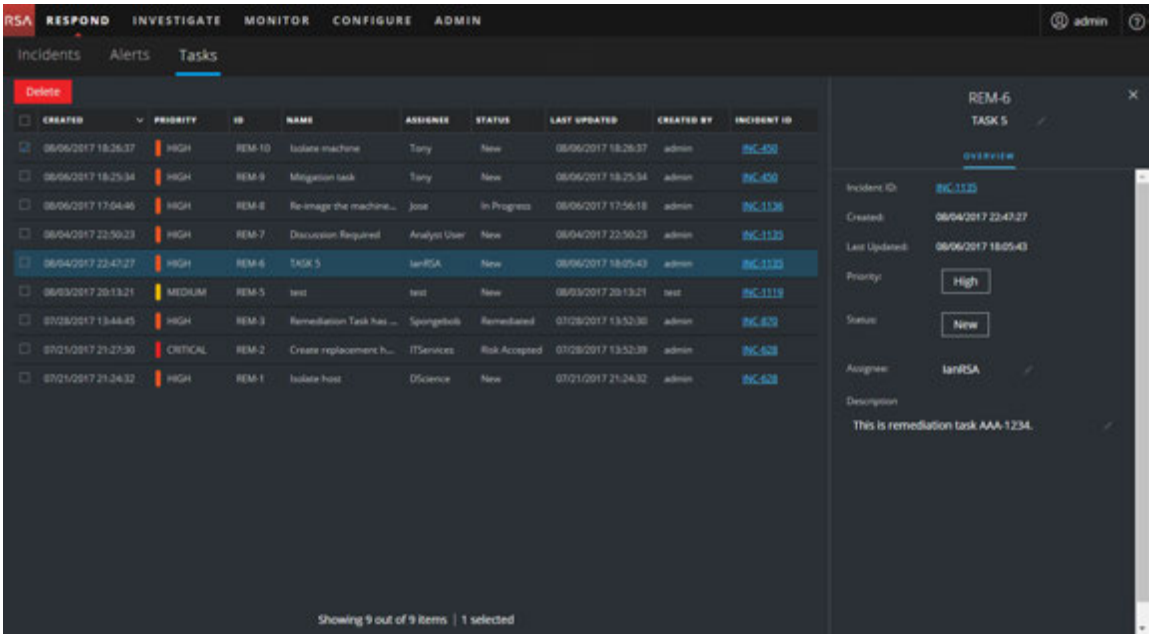
- Escalate or Remediate the Incident

Tasks List

To access the Tasks List view, go to **RESPOND > Tasks**. The Tasks List view displays a list of all incident tasks.



The Tasks List view consists of a Filters panel, a Tasks List, and a Task Overview panel. The following figure shows the Tasks List and the Overview panel.



Tasks List

The Tasks List shows all of the incident tasks. You can filter this list to show only tasks of interest.

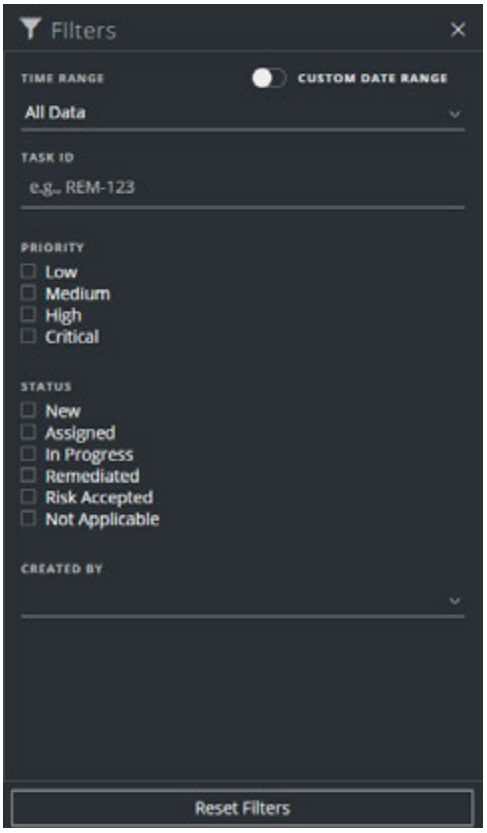
Column	Description
	Enables you to select one or more tasks to modify or delete. Users with the appropriate permissions can make bulk updates and delete tasks, such as SOC Managers. For example, an SOC Manager may want to assign multiple tasks to a user at the same time.
CREATED	Displays the date when the task was created.
PRIORITY	Displays the priority assigned to the task. The priority can be any of the following: Critical, High, Medium, or Low. The Priority is also color coded, where red indicates **Critical**, orange represents **High** risk, yellow indicates **Medium** risk, and green represents **Low** risk as shown in the following figure: 
ID	Displays the task ID.
NAME	Displays the task name.
ASSIGNEE	Displays the name of the user assigned to the task.
STATUS	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
LAST UPDATED	Displays the date and time when the task was last updated.
CREATED BY	Displays the user who created the task.

Column	Description
INCIDENT ID	Displays the incident ID for which the task was created. Click the ID to display the details of the incident.

At the bottom of the list, you can see the number of tasks on the current page and the total number of tasks. For example: **Showing 23 out of 23 items**

Filters Panel

The following figure shows the filters available in the Filters panel.



The Filters panel, on the left of the Tasks List view, has options that you can use to filter the incident tasks.

Option	Description
TIME RANGE	You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the tasks. For example, if you select Last Hour, you will see tasks that were created within the last 60 minutes.
CUSTOM DATE RANGE	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. TASK ID	You can type the Task ID for a task that you would like to locate, for example REM-123.
PRIORITY	You can select the priorities that you would like to view. If you make one or more selections, the Tasks list shows only those tasks with the selected priorities. For example: If you select Critical, the Tasks list shows only the tasks with a priority set to Critical.
STATUS	You can select the statuses that you would like to view. If you make one or more selections, the Tasks list shows only those tasks with the selected statuses. For example: If you select Assigned, the Tasks panel shows only the tasks that are assigned to users.

Option	Description
CREATED BY	You can select the user who created the tasks that you would like to view. For example, if you only want to view the tasks created by Edwardo, select Edwardo from the CREATED BY drop-down list. If you want to view tasks regardless of the person who created the task, do not make a selection under CREATED BY.
Reset Filters	Removes your filter selections.

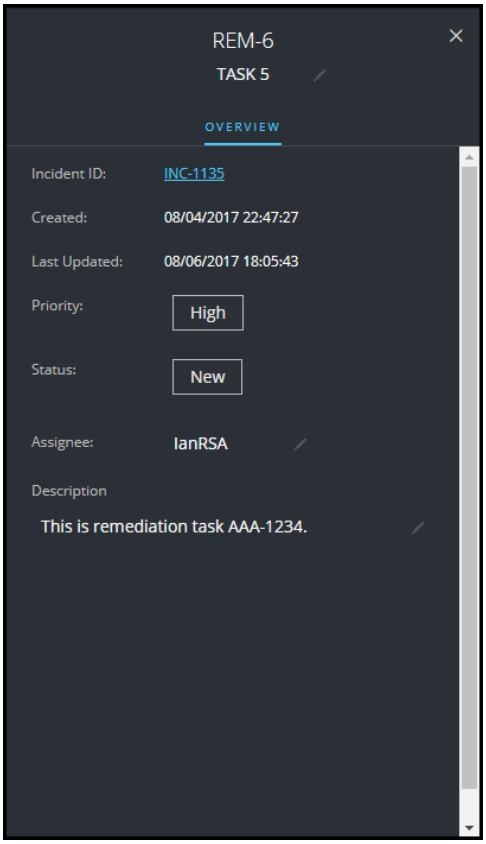
The Tasks List shows a list of tasks that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the tasks list. For example: **Showing 18 out of 18 items**

Task Overview Panel

To access the Task Overview panel:

1. Go to **RESPOND > Tasks**.

2. In the Task list, click the task that you want to view.
   The Task Overview panel appears to the right of the Tasks list.



The following table lists the fields displayed in the Task Overview panel.

Field	Description
<Task ID>	Displays the automatically assigned task ID.
<Task Name>	Displays the task name. This is an editable field. To change the task name, you can click the current task name to open a text editor. For example, you can change a task name from "Reimage a Laptop" to "Reimage a Server".
Incident ID	Displays the Incident ID for which the task was created. Click the ID to display the details of the Incident.
Created	Displays details about the date and time when the task was created.

Field	Description
Last Updated	Displays the date and time when the task was last updated.
Priority	Displays the priority of the task: Low, Medium, High, or Critical. To change the priority, you can click the priority button and select a priority for the task from the drop-down list.
Status	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. To change the status, you can click the status button and select a status for the task from the drop-down list.
Assignee	Displays the user assigned to the task. To change the user assigned to the task, you can click (Unassigned) or the name of the previous assignee to open a text editor.
Description	Shows task details. To modify the description, you can click the text underneath the description to open a text editor.

Toolbar Actions

This table lists the toolbar actions available in the Tasks List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the tasks that you would like to see in the Tasks List.
	Closes the panel.
Delete button	Allows you to delete the selected tasks.

Add/Remove from List Dialog

The Add/Remove from List dialog allows you to add or remove an entity or meta value to an existing list or create a new list. For example, when you look up an IP address and you find it suspicious or interesting, you can add it to a relevant list, which has been added a data source. This improves the visibility of the suspicious IP addresses. You can also add entities or meta values to different lists. For example, you can add them to one list for suspected domains related to command and control connections and to another list for Trojan connections IP addresses related to remote access. If a list is not available, you can create a list. You can also remove the entity or meta value from a list.

Note: From the Add/Remove from List dialog, you can only add or remove entities or meta values from single column lists added as a datasource, not multi-column lists. And when you edit a list or a value in a list from the nodal view or the context lookup view, ensure to refresh the web page to view the updated data.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts	Add an entity to a list.	From the Incident Details view, see Add an Entity to a Whitelist. From the Alert Details view, Add an Entity to a Whitelist.
Incident Responders, Analysts	Create a whitelist, blacklist, or other list.	Create a List
Administrators	Add a Context Hub list as a data source.	See "Configure Lists as a Data Source" in the *Context Hub Configuration Guide*.
Administrators	Import or export a list for Context Hub.	See "Import or Export Lists for Context Hub" in the *Context Hub Configuration Guide*.

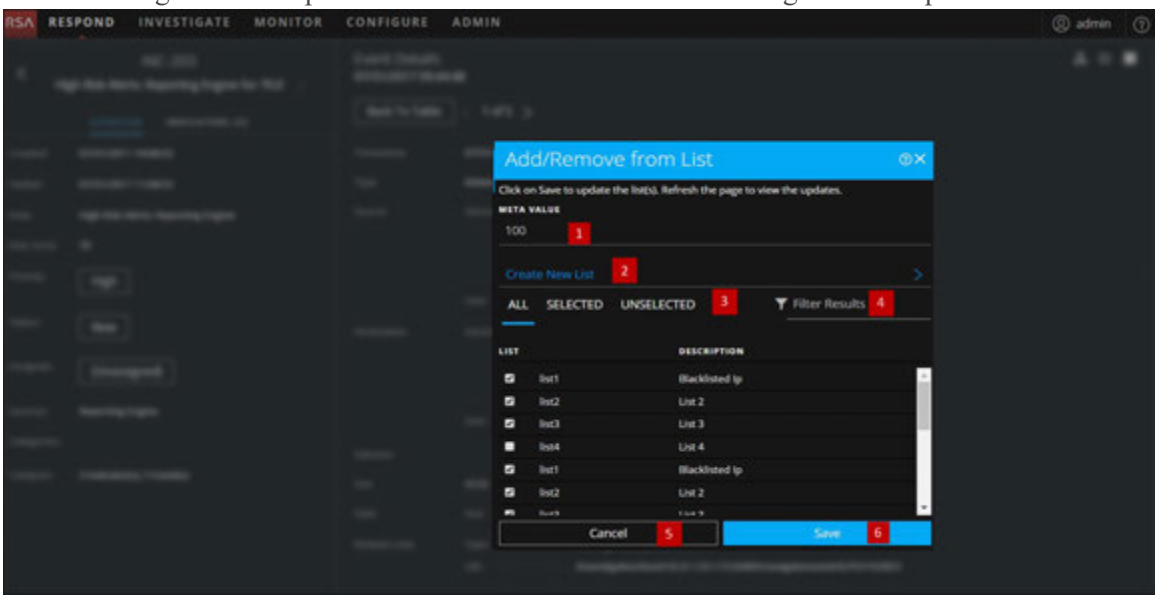
Related Topics

- Investigate the Incident
- Reviewing Alerts
- View Contextual Information (Incident Details view)
- View Contextual Information (Alert Details view)

Note: You cannot delete a list, but you can delete values within a list.

Quick Look

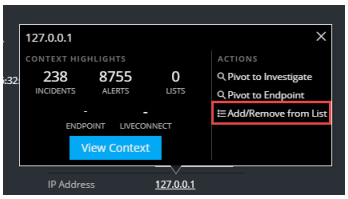
The following is an example of the **Add/Remove from List** dialog in the Respond view.



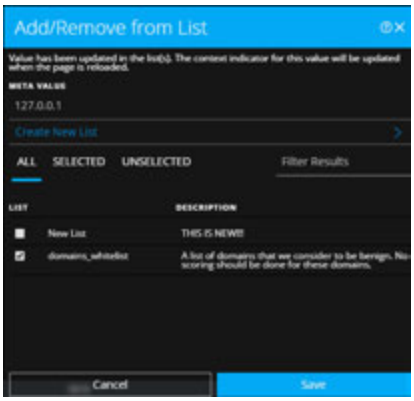
1. Entities or meta values to be added or removed.
2. Create a new list using the selected meta.
3. Select any of the tabs: All, Selected, or Unselected.
4. Search using the list name or description.
5. Cancel the action.
6. Save to update lists or create a new list.

Add/Remove from List

To access the Add/Remove from List dialog, in the Incident Details view or the Alert Details view, hover over the underlined entity that you would like to add or remove from a Context Hub list. A context tooltip appears showing the available actions.



In the Actions section of the tooltip, click Add/Remove from List. The Add/Remove From List dialog shows the available lists.



The following table shows the options in the Add/Remove from List dialog.

Option	Description
META VALUE	Displays the selected entity or meta value that needs to be added to or removed from one or more lists. You can also a create a new list using the selected value.
Create New List	When clicked, it displays a dialog to create a new list using the selected meta value.
ALL	Shows all of the available Context Hub lists. The lists that contain the selected entity or meta value are selected. Select a checkbox to add an entity or meta value to a list. Clear a checkbox to remove it from the list.
SELECTED	Shows only the lists that contain the selected entity or meta value. (All lists are selected.)
UNSELECTED	Shows only the lists that do not contain the selected entity or meta value. (All lists are unselected.)
Filter Results	Enter the name or description of a specific list to search from multiple lists.
LIST	Displays the name of all the lists.

Option	Description
DESCRIPTION	Displays information about the selected list. The description that you provide when creating a list appears in this dialog. For example: This list contains all of the blacklisted IP addresses.
Cancel	Cancels the operation.
Save	Saves the changes.

Context Lookup Panel - Respond View

The Context Hub service brings together contextual information from several data sources into the Respond view so that analysts can make better decisions during their analysis and take appropriate action. Seeing the entities, meta values, and contextual information in a single interface helps analysts to prioritize and identify areas of interest. For example, recently created incidents and alerts from the Respond view involving a given entity or meta value will be displayed when the analyst queries for additional information for that entity or meta value. The Context Lookup panel displays contextual information for the selected entities or meta values such as IP address, User, Host, Domain, File Name, or File Hash. The data available depends on the configured sources in the Context Hub.

The Context Lookup panel displays the contextual information based on the data available on the configured sources in the Context Hub.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts, Threat Hunters	Navigate to the Context Lookup panel.	From the Incident Details view, see View Contextual Information . From the Alert Details view, see View Contextual Information .
Incident Responders, Analysts, Threat Hunters	Understand the information in the Context Lookup panel for a selected entity.	See the information in this topic.
Administrator	Configure Data Sources for Context Hub.	See "Configure Data Sources for Context Hub" in the *Context Hub Configuration Guide*.
Administrator	Configure Context Hub settings.	See "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.

Related Topics

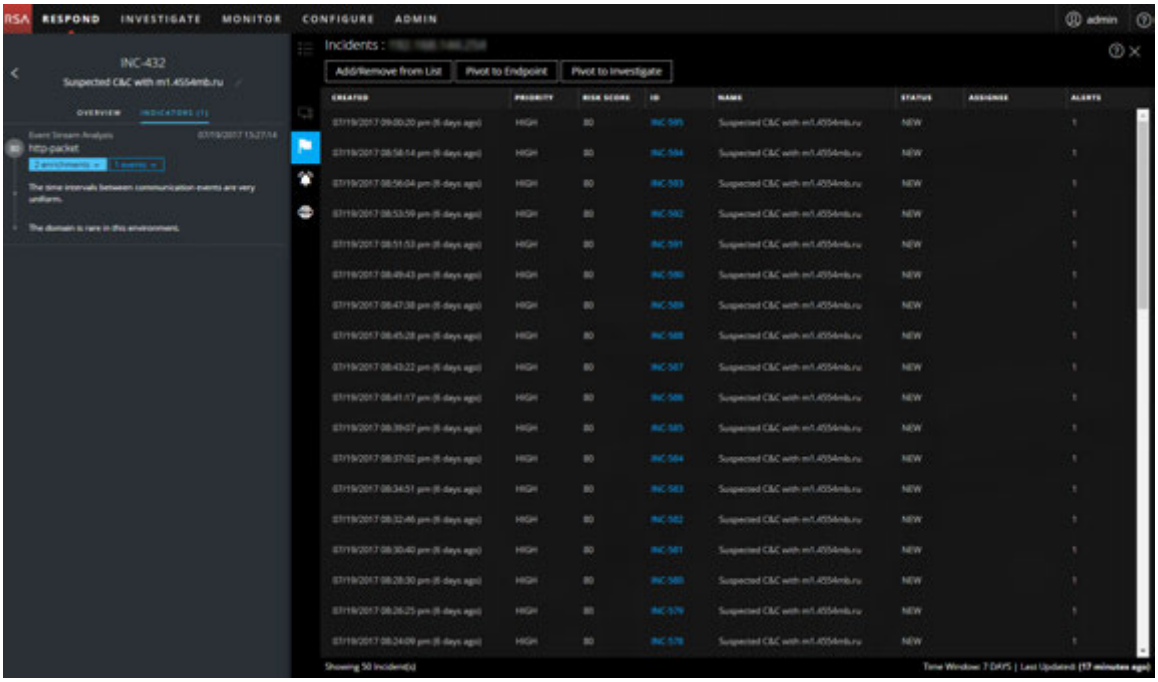
- Reviewing Alerts

Contextual Information Displayed in the Context Lookup Panel

The contextual information or query results displayed in the Context Lookup panel depends on the selected entity and the associated data sources.

The Context Lookup panel has separate tabs for each of the data sources. The List data source tab is the first in the context panel followed by Archer, Endpoint, Incidents, Alerts and Live Connect.

The following figure displays the Context Lookup panel for a selected entity in the Incident Details view. The Context Lookup panel Incidents tab is in view.



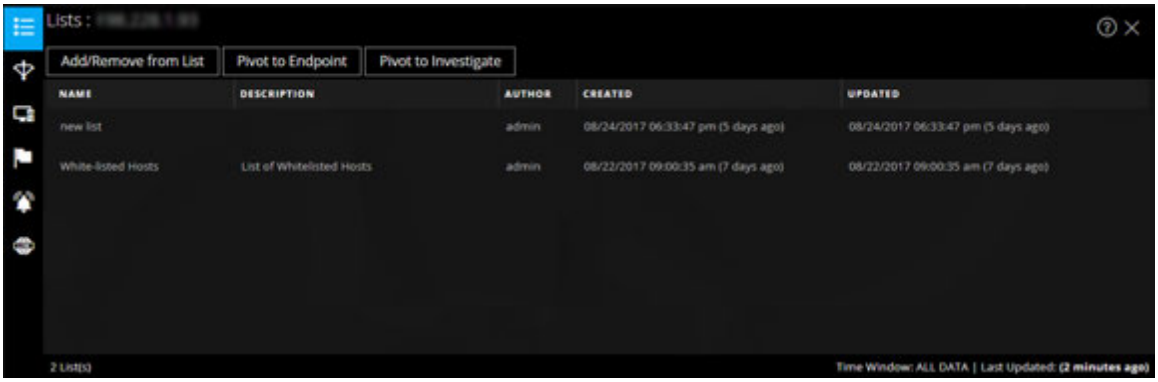
The following table describes the data available on each tab and the supported entities.

Tab	Description	Supported Entities
(Lists)	Displays all of the list data associated with the selected entity or meta value. The result is sorted by the last updated list.	All entities
(Archer)	Displays asset information along with criticality ratings using the Archer data source.	IP and Host
(Active Directory)	Displays all user information for the selected user.	User

Tab	Description	Supported Entities
(NetWitness Endpoint)	Displays the NetWitness Endpoint data source information for the selected entity or meta value, which includes the Machines, Modules, and IIOC levels. Modules are by highest IOC score to lowest IIOC score and IIOC levels are sorted by highest IOC levels to lowest IOC levels.	IP, MAC address, and Host
(Incidents)	Displays the list of incidents associated with the selected entity or meta value. The result is sorted by newest incidents to oldest incidents.	All entities
(Alerts)	Displays the list of alerts associated with the selected entity or meta value. The result is sorted by newest alerts to oldest alerts.	All entities
(Live Connect)	Displays information related to Live Connect.	IP, Domain, and Filehash

Lists

The Context Lookup panel for Lists shows one or more lists associated with the selected entity or meta value. The following figure is an example of the Context Panel for Lists.

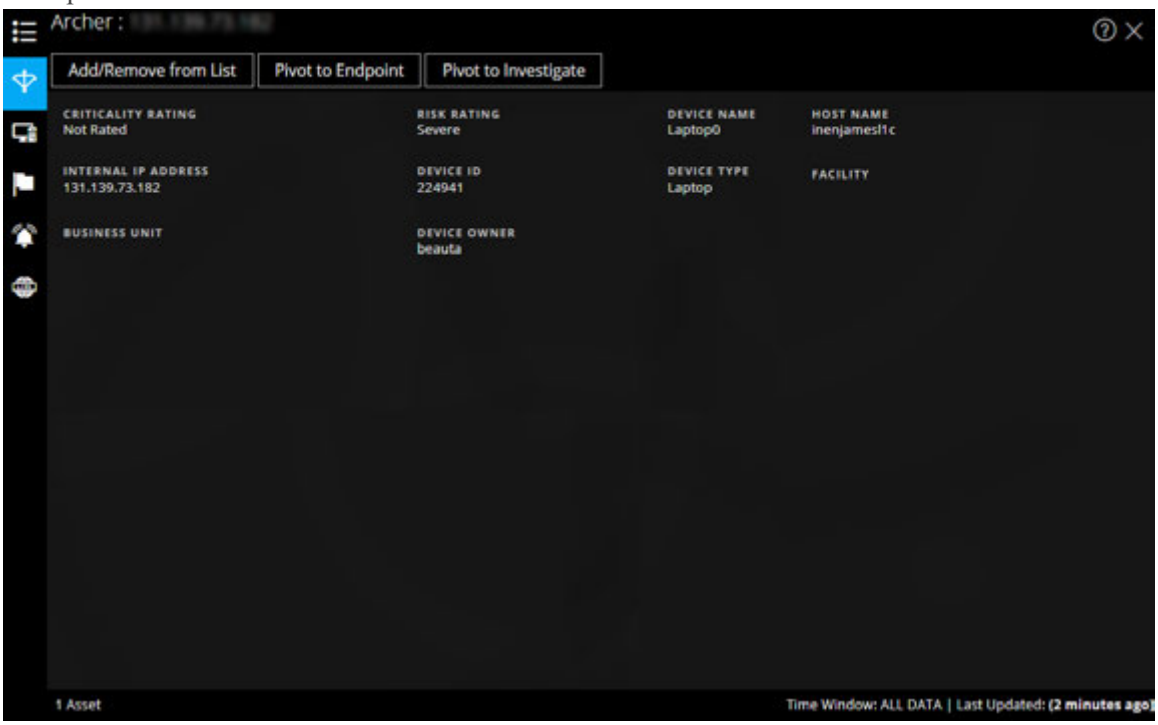


The following information is displayed for Lists.

Field	Description
Name	The name of the list (defined while creating the list).
Description	The description of the list (defined while creating the list).
Author	The owner who created the list.
Created	The date when the list was created.
Updated	The date when the list was last updated or modifed.
Count	The number of lists in which the selected entity or meta value is available.
Time Window	This is based on the value that is set for the "Query Last" field in the Configure Responses dialog. By default, all Lists data is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Archer

The Context Lookup panel for Archer displays asset information along with criticality ratings using the Archer data source for IP and Host entities and meta values. The following figure is an example of the Context Panel for Archer.



The following information is displayed for Archer.

Field	Description
Criticality Rating	Displays the device operational Criticality based on the applications it supports. The criticality ratings can be set as Not Rated, Low, Medium-Low, Medium, Medium-High, or High .
Device ID	Displays the automatically populated value that uniquely identifies the record across all applications within the system.
Device Name	Displays the unique name of the device.
Device Owner	Displays the owner(s) of the device who is responsible for the device and receives read and update rights of the record.
Host Name	Displays the host name of the device.

Field	Description
Facilities	Provides links to records in the Facilities application that are related to this device.
Business Unit	Provides links to records in the Business Unit application that are related to this device.
Risk Rating	Calculates the risk rating for the device based on the most recent assessment and the average risk rating of facilities using the device. The risk rating can be set as Severe, High, Medium, Low, or Minimal.
Type	Displays the device type such as Server, laptop, desktop etc.
IP Address	Displays the primary internal IP address of the device.
Count	Displays the number of assets available.
Time Window	This is based on the value that is set for the "Query Last" field in the Configure Responses Dialog. By default, all data for Archer is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Active Directory

The following figure is an example of a Context Panel for Active Directory.

The Context Lookup panel for Active Directory displays all the related information, incidents, and alerts for a user. You can perform a look up using the following formats:

- userPrincipalName
- Domain\UserName
- sAMAccountName

If the user exists in multi-domain or multi-forest, all the related context information is displayed for the specific user.

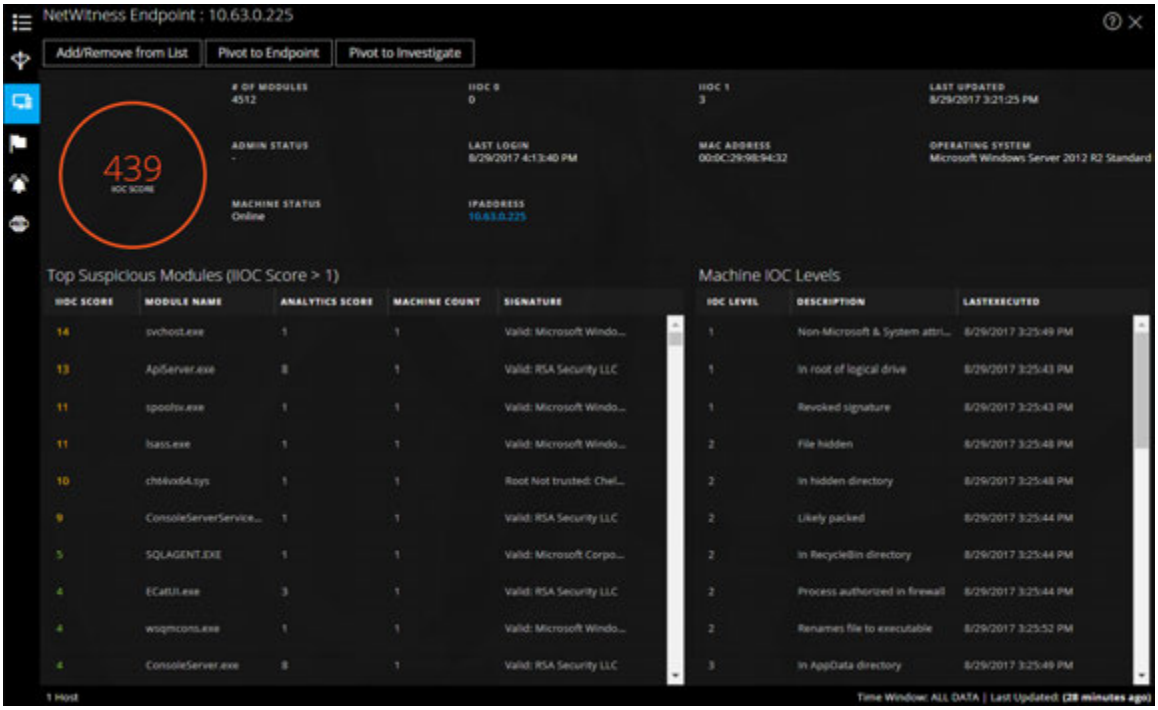
The following information is displayed for Active Directory.

Field	Description
Display Name	Displays the name of the specific user.
Employee ID	Displays the employee ID of the specific user.
Phone	Displays the phone number of the specific user.
Email	Displays the email ID of the specific user.
AD User ID	Displays the unique identification of the specific user within an organization.
Job Title	Displays the designation of the specific user.
Manager	Displays the manager's name of the
Groups	Displays the list of groups the specific user is a member.
Company	Displays the name of the company the specific user belongs to.
Department	Displays the department name within the organization that the specific user belongs to.
Location	Displays the location of the specific user.
Last Logon	Displays the time when the specific user logged into to the system only if the Global Catalogue is defined.
Last Logon TimeStamp	Displays the time when the specific user logged into to the system.
Distinguished Name	Displays the unique name assigned to the user.
Count	Displays the number of users.

Field	Description
Time Window	This is based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, all data for Active Directory is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

NetWitness Endpoint

The following information is displayed in the Context Lookup panel for NetWitness Endpoint.



The following information is displayed for IIOC.

Field	Description
# Of Modules	Displays the number modules that are looked up.
Admin Status	Displays the admin status (if any).
Last Updated	Displays the time when the data was last refreshed.
Last Login	Displays the time when the user last logged in.
MAC Address	Machine MAC Address.

Field	Description
Operating System	Version of the Operating System used by the NetWitness Endpoint machine.
Machine Status	Displays if the looked you module is Online, Offline, Active, or Inacive.
IP Address	Displays the IP address of the specific Module.

The following information is displayed for Modules.

Field	Description
IIOC Score	A machine IIOC score is an aggregated score based on the module scores. This is based on the value set for "Minimum IIOC Score" field in the Context Hub Data Source Settings The default value for "Minimum IIOC Score" is 500. See the "Configure Context Hub Data Source Settings" topic in the *Context Hub Configuration Guide*.
Module Name	Name of the module that is looked up.
Analystic Score	Number of active files for the selected machine.
Machine Count	Indicates when the scan results were last updated in NetWitness Endpoint database.
Signature	Indicates if the file is signed or unsigned, valid or invalid, and provides signatory information. For example, Google, Apple, and so on.

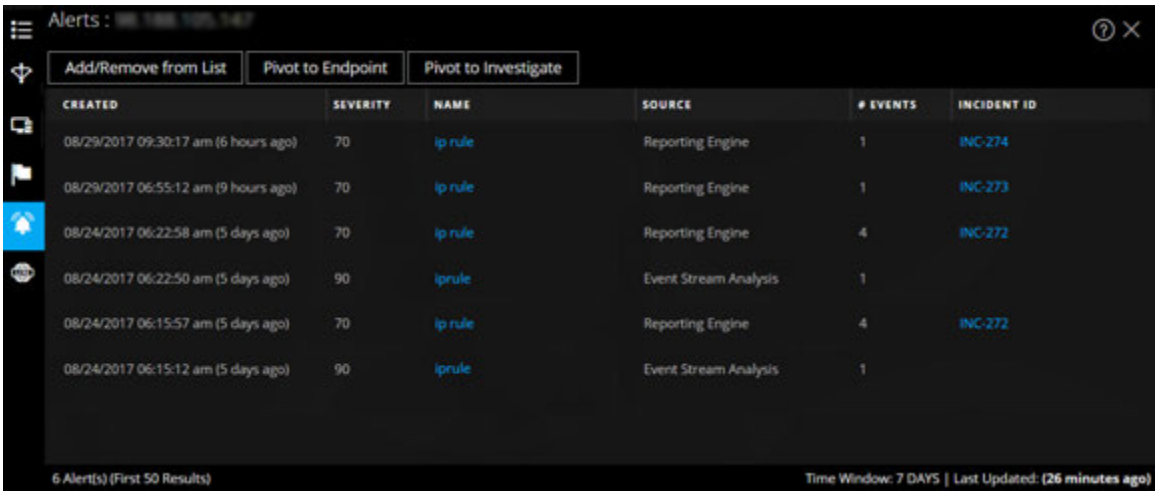
The following information is displayed for Machines.

Field	Description
IOC Levels	Displays the IOC levels.
Description	Displays the description for he IOC level if available.
Last executed	Displays the time when the action was executed.
Count	Displays the number of hosts that are looked up.

Field	Description
Time Window	This is based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, all data for NetWitness Endpointis fetched.
Last Updated	Indicates when the scan results were last updated in NetWitness Endpoint database.

Alerts

The following figure is an example of Context Panel for Alerts that is displayed based on time first (Newest to Oldest) and then severity.



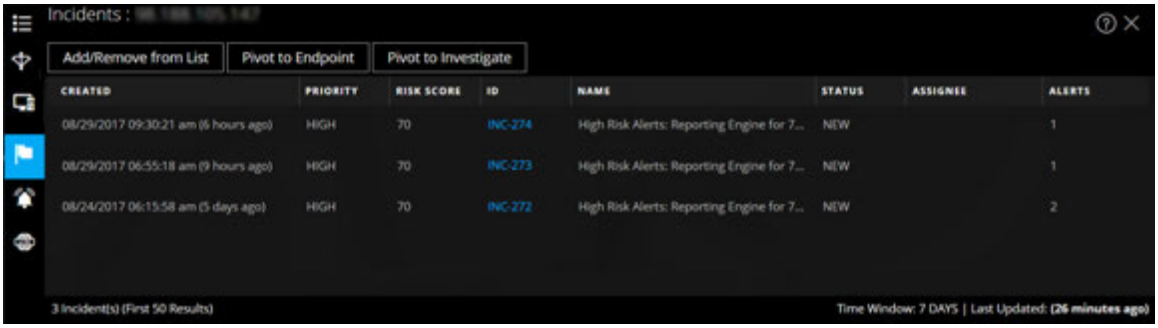
The following information is displayed in the Context Lookup panel for Alerts.

Field	Description
Created	Date and time when the alert was created.
Severity	Severity value of the alerts
Name	Name of the Alert. Click the name to view the details of a specific alert.
Source	Alert source name from where the alert is triggered.
#Events	Number of events associated with the alert.

Field	Description
Incident ID	This is the ID of the incident that the alert is associated with (If any). Click the ID tto view the details of a specific alert.
Count	Displays the number of alerts. By default only the first 100 alerts are displayed. For more information on how configure the settings, see the "Configure Context Hub Data Source Settings" topic in the *Context Hub Configuration Guide*.
Time Window	This is based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	Indicates when contextual data was last fetched from data source.

Incidents

The following figure is an example of the Context Panel for Incidents, which is based on time first (Newest to Oldest) and then priority status.



The following information is displayed in the Context Lookup panel for Incidents.

Field	Description
Created	Date when the incident was created
Priority	Priority status of the incidents
Risk Score	Risk score of the incidents
ID	Incident ID of the incident and on clicking displays further details about the incident
Name	Incident Name

Field	Description
Status	Status of the incident
Assignee	Current owner of the incident
Alerts	Number of alerts associated with the incident
Count	Displays the number of incidents. By default only the first 100 alerts are displayed. For more information on how configure the settings, see the "Configure Context Hub Data Source Settings" topic in the *Context Hub Configuration Guide*.
Time Window	This is based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	Indicates when contextual data was last fetched from data source.

The Live Connect Panel displays the following information:

- Review Status
- Live Connect Risk Assessment
- Risk Indicators
- Community Activity
- WHOIS
- Related Files, Domains, and IPs
- Identity
- Certificate Information

The following information is displayed in the Context Lookup panel for Live Connect.

Field	Description
Review Status	Displays the review status of the selected Live Connect entity (IP, file, or domain) based on the analyst activity. This gives the visibility of the analyst activity within an organization. **Status** Below are the types of status: • **New:** If lookup results for an IP address is viewed for the first time within the organization. • **Viewed:** If any analyst within the organization has already viewed the lookup results for an IP address. • **Marked as Safe:** If any analyst within the organization has already viewed the lookup results and marked the IP address as safe. • **Marked as Risky:** If any analyst within the organization has already viewed the lookup results and marked the IP address as risky.

Field	Description
Risk Assessment	Displays the risk assessment for the selected Live Connect entity (IP, file, or domain) based on the Live Connect analysis and analyst feedback. The Risk Assessment categories are: • **Safe:** The Live Connect entity is considered to be safe. • **Unknown:** Live Connect does not have enough information about this entity to calculate the risk. • **High Risk**: Marked as "High Risk" based on the analysis and risk reasons provided by the community. The entities marked as "High Risk" requires immediate attention. • **Suspicious**: Marked as "Suspicious" based on the analysis and risk reasons provided by the community. The analysis indicates potentially threatening activity that requires action. • **Unsafe:** Marked as "Suspicious" based on the analysis and risk reasons provided by the community. The entity is rated as High Risk, Suspicious, or Unsafe and displays the associated risk reasons accordingly.

Field	Description
Risk Assessment Feedback	Risk Assessment Feedback allows the analyst to submit threat intelligence feedback about an entity to the Live Connect server. • **Analyst Skill Level** Below are the Analyst skill level options: ◦ **Tier 1** - Analysts at this level generally define procedures for remediation, and decide if an incident should be escalated to other areas in a SOC (Security Operation center). This is the default value. ◦ **Tier 2** - Analysts investigates incidents, and captures intelligence from investigation to feedback into the various work flows in a SOC. ◦ **Tier 3** - Analysts who shares the investigation results to the SOC organization. They generally manage incidents and have a wide breadth and depth in the skills and tools necessary for incident response. **Note:** While creating a new user for NetWitness Suite (Analyst), an administrator should be able to identify the user as Tier 1, Tier 2, or Tier 3 Analyst. • **Risk Confirmation** - The risk confirmation for the selected Live Connect entity (IP, file, or domain). The Risk confirmation categories are: ◦ **Safe**: The Live Connect entity is considered to be safe. ◦ **Unknown**: The analyst does not have enough information to provide a risk confirmation ◦ **High Risk**: Marked as "High Risk" based on the analysis and risk reasons provided by the community. The entities marked as "High Risk" requires immediate attention. ◦ **Suspicious**: Marked as "Suspicious" based on the analysis and risk reasons provided by the community. The analysis indicates potentially threatening activity that requires action. ◦ **Unsafe**: Marked as "Unsafe" based on the analysis and risk reasons provided by the community. • **Confidence Level** - The confidence level of an analyst in providing feedback for the Live Connect entity. The confidence level categories are: ◦ High

Field	Description
	◦ Medium ◦ Low. • **Risk Indicator Tags** - Allows you to select a tag category based on the analysis. Community Activity	Community activities such as: • Date first seen in the community. • Time since the IP/File/Domain was seen for the first time (Current time - First seen time). **Trending Community Activity:** If the IP address is known within the RSA community, a graphical representation of the community activity trend is displayed for the following: • Users (in %) who have viewed the IP address in the Live Connect community over time. • Users (in %) who submitted feedback for the IP address. • Users (in %) who marked the IP address as unsafe over time.

Field	Description
Risk Indicators	Risk Indicators are highlighted based on the tags that are assigned by the community to the entities (IPs, Files, or Domains).  The tags are categorized as given below: • Reconnaisance • Delivery • Command and Control • Lateral Movement • Privilege Escalation • Packaging and Exfiltration These tags are samples and vary based on the inputs received from the community on the Live Connect server. The analyst can choose the appropriate risk indicator tags while providing the review feedback. A highlighted tag indicates that the selected entity is associated with that particular category and tag. Clicking a highlighted tag displays the description of the tag.

Field	Description
Identity	Provides the following identity information for the selected entity or meta value: For IP address: • Autonomous System Number (ASN) • Prefix • Country Code and Country Name • Registrant (Organization) • Date For File Hash: • File Name • File Size • MD5 • SH1 • SH256 • Compile Time • Mime Type For Domain: • Domain Name • Associated IP Address
Certificate Information	Provides the following certificate information for the selected file hash: • Certificate Issuer • Validity of the Certificate • Signature Algorithm • Certificate Serial Number

Field	Description
WHO IS Information	The **WHO IS** information provides the ownership details for a given domain.  The following information of the domain owner is displayed: • Created Date • Updated Date • Expired Date • Type (Registration Type) • Name • Organization • Address with Postal code • Country • Phone • Fax • Email

Field	Description
Related Files	Related Files are displayed for entity types IP and Domain. A list of known associated files are displayed along with the following information: • Live Connect Risk Rating (Safe, Risky, or Unknown) • File Name • MD5 • Compile Time and Date • API Function Import Hash • Mime Type
Related Domains	Related Domains are displayed for entity types IP and Files. A list of known associated domains are displayed along with the following information: • Live Connect Risk Rating (Safe, Risky, or Unknown) • Domain Name • Country Name • Registered Date • Expired Date • Registrant Email address

Field	Description
Related IPs	Related IPs are displayed for entity types Domain and Files. A list of known associated IPs are displayed along with the following information: • Live Connect Risk Rating (Safe, Risky, or Unknown) • IP Address • Domain Name • Country Code and Country Name • Country Name • Registered Date • Expired Date • Registrant Email address

Reporting Overview

Reporting is a collection of data as a result of monitoring the network traffic, which can be used for further analysis. In NetWitness Suite you can run a report against NetWitness Suite Database core services to identify the network activities. For example, if you want to identify the Top Source Countries and Destination Countries, or top Threat and Risk trends that help monitor any changes to the normal categories or monitor the users and services that may potentially have malicious activities etc.

The reporting typically consist of: Reports and Charts. You can report on the log and packet data collected, and customize the reports and charts to enhance the visual appearance. You can create real-time reports for historical data. You can create charts and dashlets, that can be added in the real-time chart dashlets as well.

Reporting Engine

Reporting relies on the Reporting Engine to provide data for the reports, alerts and charts. Hence, you must configure the Reporting Engine as a service to NetWitness Suite before you can generate the reports. You must also specify the data source in the Reporting Engine from which the data is extracted.

The data that you can report or alert depends on the configuration of Reporting Engine and the data sources that you specify as part of the rule definition.

Note: Make sure you have access to the components in the Reporting.

Note: Make sure you have access to the required data sources. Only privileged users with access to sensitive information have the permission to certain data sources. To manage access control to data sources, see the "Add a Role and Assign Permissions for Warehouse Analytics" topic in the *Warehouse Analytics Guide*. However, for the existing reports, alerts and charts, if the user role or permissions are modified for the data sources, then it is not applicable unless you manually update the permissions.

Note: Reporting is accessible based on the role based access, defined for the user.

Report

A report is a combination of rules and other formatting objects such as headers and HTML-formatted notes that describe and identify data pertaining to a particular area of interest. Reports are defined and managed in the Build Report page and can be scheduled to run on an adhoc or timely basis. Once a report is run, results are stored centrally and can be automatically sent over email, SFTP, URL, and NFS to users, viewed via the NetWitness Suite web interface, downloaded as PDF and CSV files.

A report consists of the following:

Property	Description	Example
Report Name **Note:** For **Name** field, the icon to extend the column size is not displayed at the end of the column field. You have to hover the mouse a little to the left side to see the icon for extending the column.	Used to identify the report to schedule them at a later time.	Report1
Text	Pre-defined text fields used within a report to make the report more meaningful to the user.	Header1, Comment
Rules	The rules (queries) used to create a report.	select user.dst where ip.src = 10.10.10.1

Note: In the Reporting user interface, the displayed date or time is always according to the user-selected time zone profile.

Rule

A rule is the basic and essential building block in the Reporting. You must create a rule which can be used in a Report, Chart or Alert.

A rule represents a unique query that detects and summarizes the requested information within a collection of network data.

The rule syntax is very similar to that of Standard Query Language (SQL) where you can use the select clause, where clause, sort and group options and limits for the result set. A rule consists of the following:

Property	Description	Example
Name	The name of the rule.	Windows System Account Activity

Property	Description	Example
Select	List of meta types that are returned in the result set. The list of meta types is provided in the Meta Library. Meta Library in the Rule Builder is continually synchronized with the index configuration of the NetWitness Suite host to which NetWitness Suite is connected. The number of meta types that this property can represent depends on how the rule is to be sorted. If the Sort by property is 'None' or non-aggregate, a rule can have more than one select field, for example, for each match, include the ip.src, ip.dst, size, time in the rule result. If a rule is set to be sorted, either by session count, session size, or packet size, then there can only be one field on which to select.	
Where	A clause that is the base query for the rule.	`alert='cleartext_ftp_passwords'`
Then (Rule Actions)	A series of functions that manipulate the original result set of a rule in order to make the output in a report more meaningful or add additional functionality other than querying and displaying data.	`lookup_and_add ('username','ip.src',10);`

Property	Description	Example
Sort By	Determines how the data in the result set is sorted. The various possibilities are: • Total • Value • Column Name	Total
Limit	Designates how large a result set can be for the given rule. Users must note that if a result set is sorted by count or size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.	20

Note: In the User Interface (UI), the date or time displayed depends on the time zone selected by the user.

Rule Types

There are different rule types in the Reporting. Rule types designate the source of data for the report rule. Following are the rule types:

Rule Type	Description
NetWitness Database (**NetWitness DB**)	The NetWitness database extracts the meta from a Reporting Engine configured to use a Concentrator, Broker and Archiver as the data sources and provides the meta for rules.
Warehouse Database (**Warehouse DB**)	The Warehouse database, also referred to as the RSA NetWitness Warehouse, warehouses large volumes of data. The Warehouse is designed so that you can retrieve large volumes of data easily and efficiently. The Warehouse also extracts the meta from the Reporting Engine.

Rule Type	Description
Respond Database (**Respond DB**)	The Respond database reports on alerts and incidents. The Respond database contain alerts and incidents generated from different services and you can create a report on those alerts and incidents.

Note: In the User Interface (UI), the date or time displayed depends on the time zone selected by the user.

List

A list is a variable that refers to a series of comma-separated values (CSV). You can insert a list into a rule or use it as an argument to a rule action. Lists can act as placeholders for other values, which you can populate and update as needed.

You can create, manage and view lists that can be used to define rules for Reporting and Alerting.

Lists cannot be empty or have duplicate or blank values.

Note: If you are defining a report with a rule which has lookup_and_add in the **Then** clause and direct the report output to a list, the list is not populated with the result.
For example, if you create a rule with ip.src in the **Select** clause and lookup_and_add ('ip.dst','ip.src', 10) in the **Then** clause, the report displays the result, but if you have redirected the output to a list, the list will be empty

Chart

Chart is a tabular or grid representation of data. It consists of the following:

Property	Description	Example
Chart Name	Identifies the chart.	Chart1
Rule Basis	Identifies the rule path chosen from the folder hierarchy.	

Any NetWitness Suite DB rule in the Reporting Engine system which is not sorted by none can be used to instantly create a chart. In NetWitness Suite, the chart interval can be adjusted from the chart definition panel itself. Each time a chart runs, it stores its result data locally in the Reporting Engine, so that it can be reviewed in either the Dashboard View or Chart View without any performance considerations.

Note: In the Reporting user interface, the output for the field where Date and Time are displayed is always according to the user-selected time zone profile.

Note: The Reporting Engine (RE) will automatically check for the available disk space before you execute a Rule, Report, Chart and Alert. If the RE disk space (in percentage) is less than the minimum disk space threshold (default value is 5), the RE will stop the current execution and an error message 'Available disk space of Reporting engine home is <5%, please clean up the space to proceed further' is displayed. Additionally, you may also configure the minimum disk space threshold by using the following path: **RE>Explore>com.rsa.soc.re>Configuration>CommonConfig>minDiskSpaceThreshold**.

Reporting Guidelines

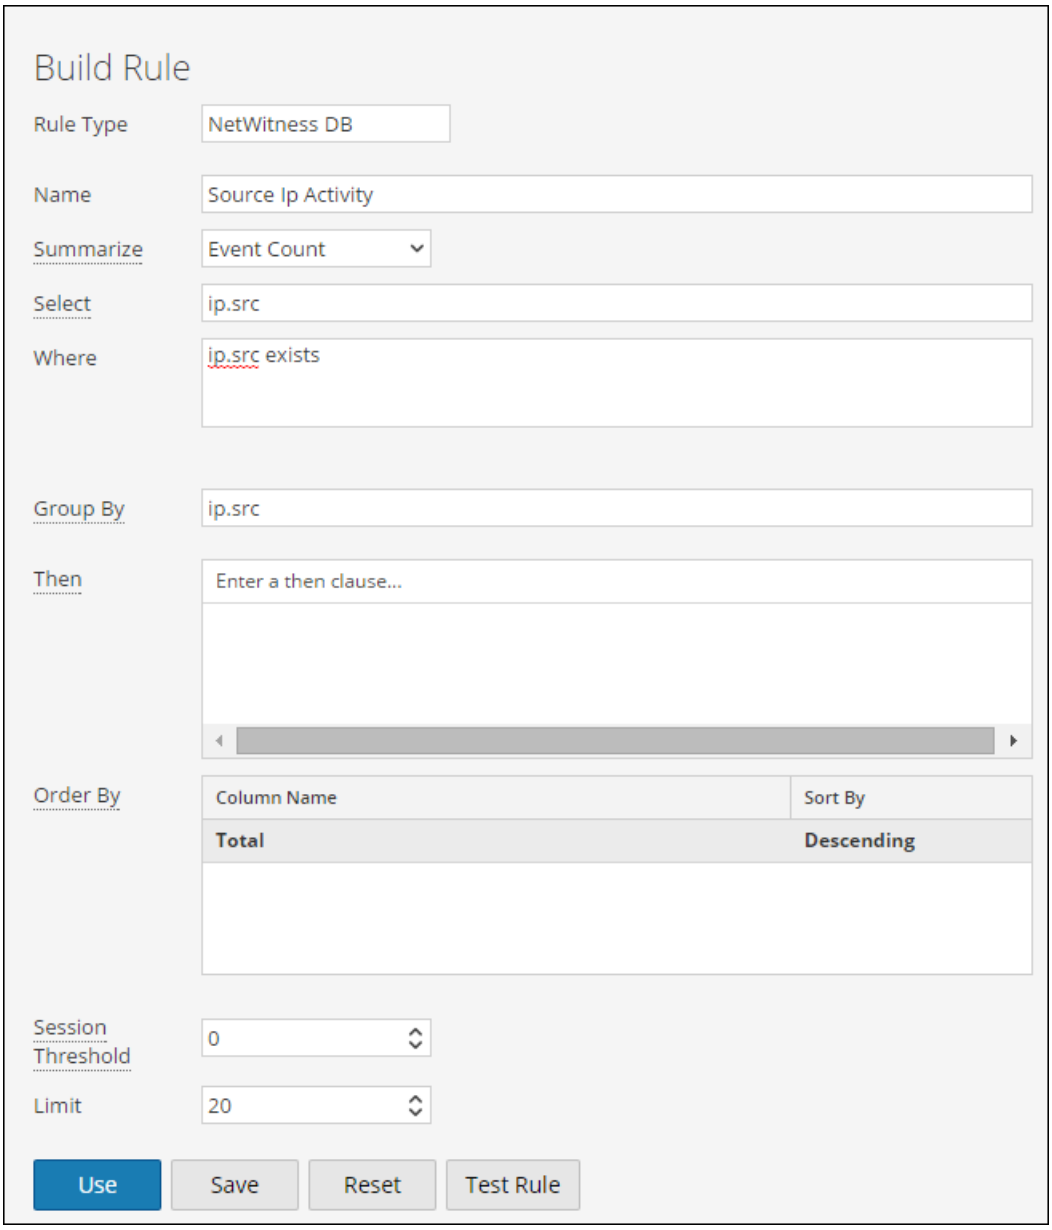
This section lists the RSA recommended guidelines to enhance the execution time of your reporting entities such as rules, reports, alerts, charts, and lists. The guidelines are provided for the following:

- NWDB Rules
- Timeout Configuration for NWDB Rules
- Lookup and Add rule action
- List value Reports

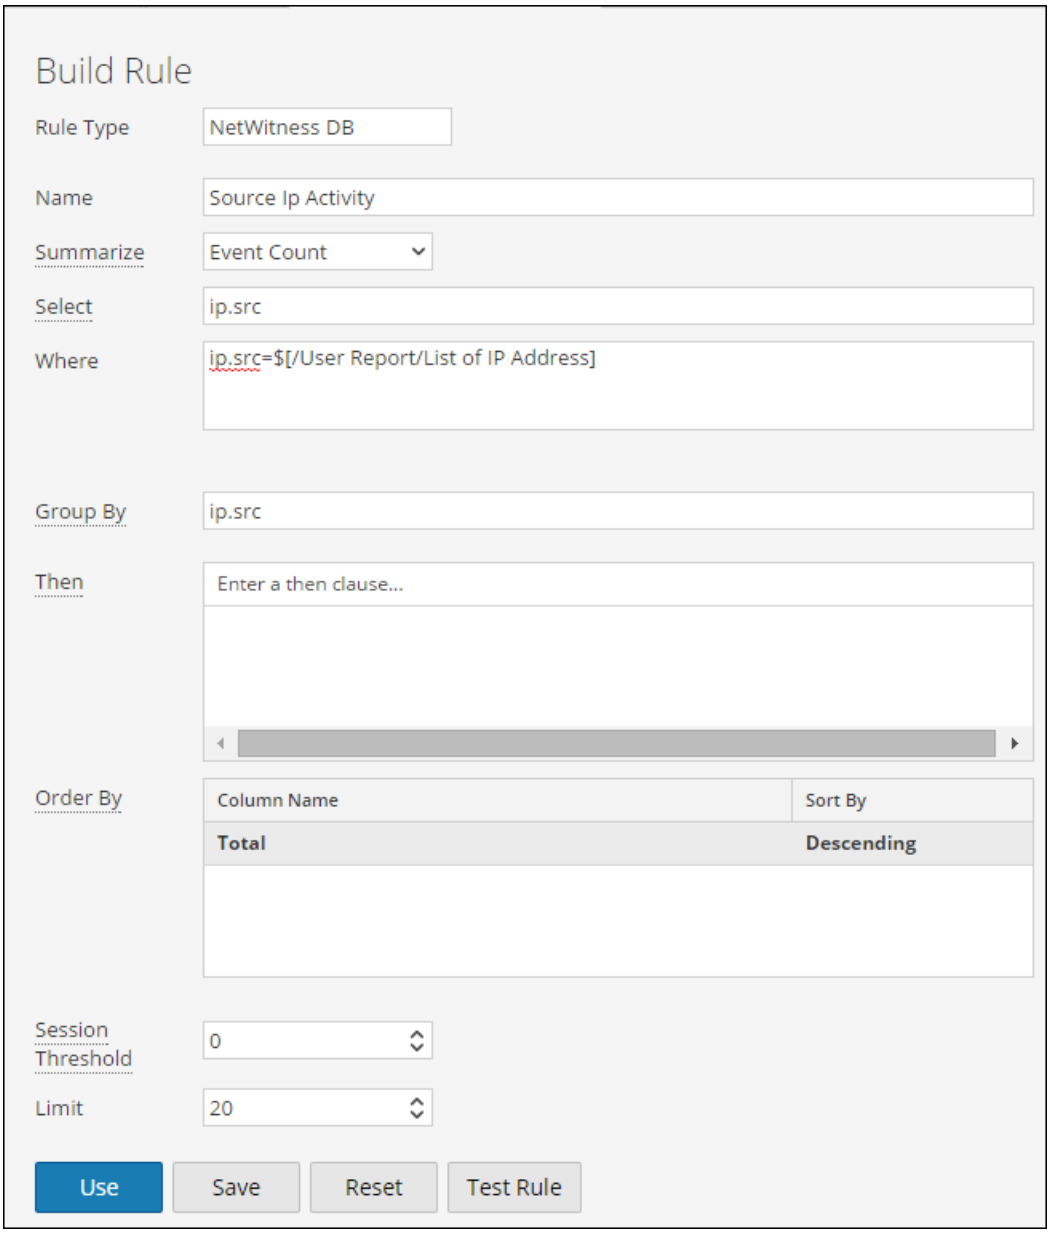
NWDB Rules

If the reporting entities such as report, alert, or chart contain NWDB rules (in most cases where the query contains Group By) takes a long time to execute, you may do the following:

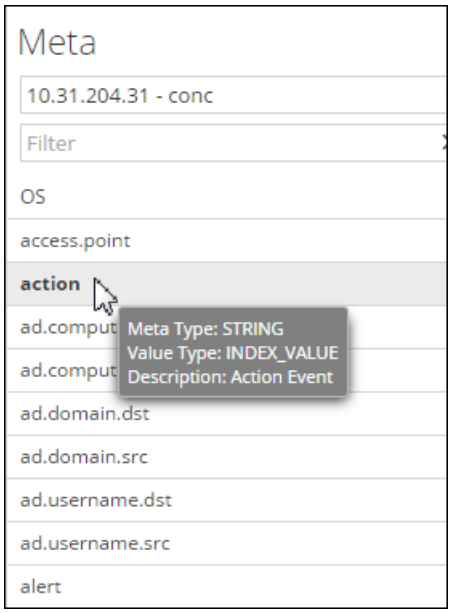
1. Refine the Where clause:
   You may limit the number of sessions scanned by using or refining the Where clause (especially when you use the Group By option). For example, consider the following rule.



If you use a Where clause as mentioned above, the number of sessions aggregated is huge. To avoid this, you can filter only required sessions by specifying the list of IP addresses or creating a List (list of IP Address) that contains relevant IP addresses.



2. Using indexed Meta keys in the Where clause:
   To understand if the Meta is indexed or not, mouse hover the Meta key. If the Value Type is INDEX_VALUE, then the Meta is indexed. The Value Type is INDEX_KEY or INDEX_NONE if the Meta is not indexed.
   Below is a snapshot of a Meta key that is indexed.



3. Configure the Timeout option:
   If the query is taking a long time and fails due to timeout issues, you can configure the timeout for the NWDB rule executions. For more information, see below section Timeout Configuration for NWDB Rules.
4. Schedule the queries to run at different times:
   If multiple query aggregates are concurrently executed and timeout occurs, you may schedule the queries to run at different times without much overlap.

Timeout Configuration for NWDB Rules

Note: It is a good practice to check the statistics of the Reporting Engine and the NWDB data sources before you make any changes to the configuration. For more information, see the "Monitor Service Details" topic for Reporting Engine and "Monitor System Statistics" topic in the in the *System Maintenance Guide*.

If NWDB rule execution fails due to timeout, you may get the following errors on the View a Report page:

- Reporting Engine timeout error
  - “Data source ‘`10.31.x.x Concentrator`' did not respond within the configured time `30` minutes for the ‘`/sdk/values`' request.”

- NWDB timeout error
  - "Error occurred while fetching data from source '`10.31.x.x Concentrator`'. `{Timeout message from NWDB}`"

  In such cases, you may do the following:

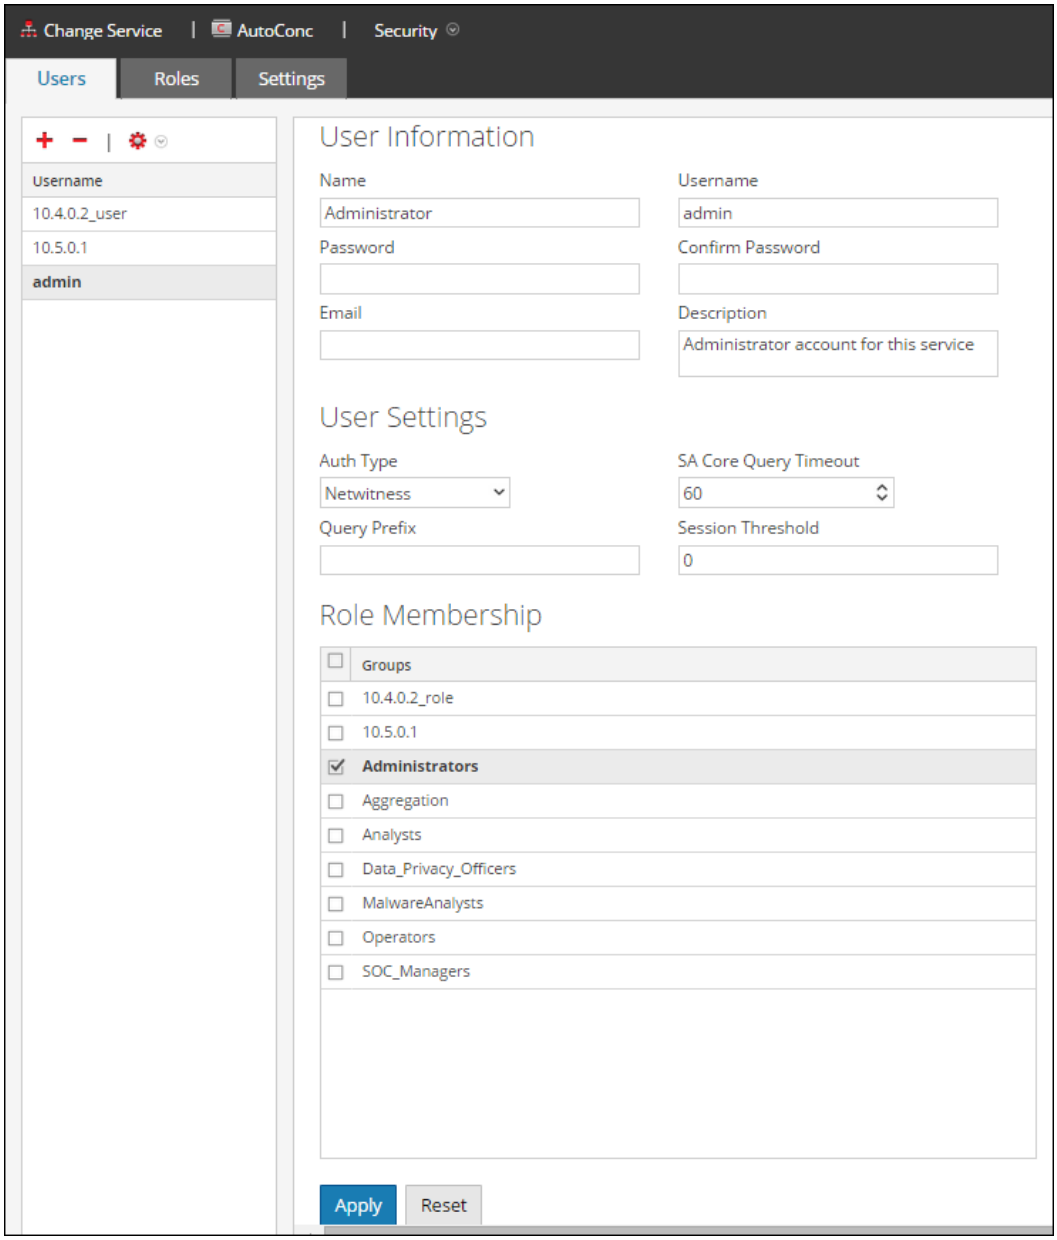
  - Reporting Engine timeout

    In case of Reporting Engine timeout, you may set the timeout to a longer duration so the long running queries can be executed. For more information on setting the `NWDB Queries Time Out` and `NWDB Info Queries Time Out` option for the Reporting Engine, see "Step 2. Configure Reporting Engine Settings" topic in the *Reporting Engine Configuration Guide*. RSA recommends you set the `NWDB Query Time Out` to zero minutes (implies no timeout) and `NWDB Info Queries Time Out` to 60 minutes.
  - NWDB timeout

    In case of NWDB timeout, you may need to configure the `query.level.timeout` and `max.concurrent.queries` parameters for the NWDB data source based on the recommendations in the *Core Database Tuning Guide* to fine tune the queries.

    The following figure is an example of Explorer view where you can set the parameters

for NWDB data source.



- Schedule Reports at different times

  If the NWDB core devices are heavily utilized, you may schedule the reports to run at different times without overlap.

- Split the Report

  If you have many rules in a Report, split the report into multiple reports with each report containing logical set of rules. If you have multiple rules, all rules will begin to

execute at the same time based on available threads, therefore you may group the rules logically into separate reports.

LookupAndAdd Rule Action

If a rule that consists of single or multiple `lookup_and_add` rule actions, takes a long time to execute the report, it is because each of the rule action triggers multiple lookup queries on the NWDB data source resulting in longer execution time.

To improve the report execution time, you may do the following:

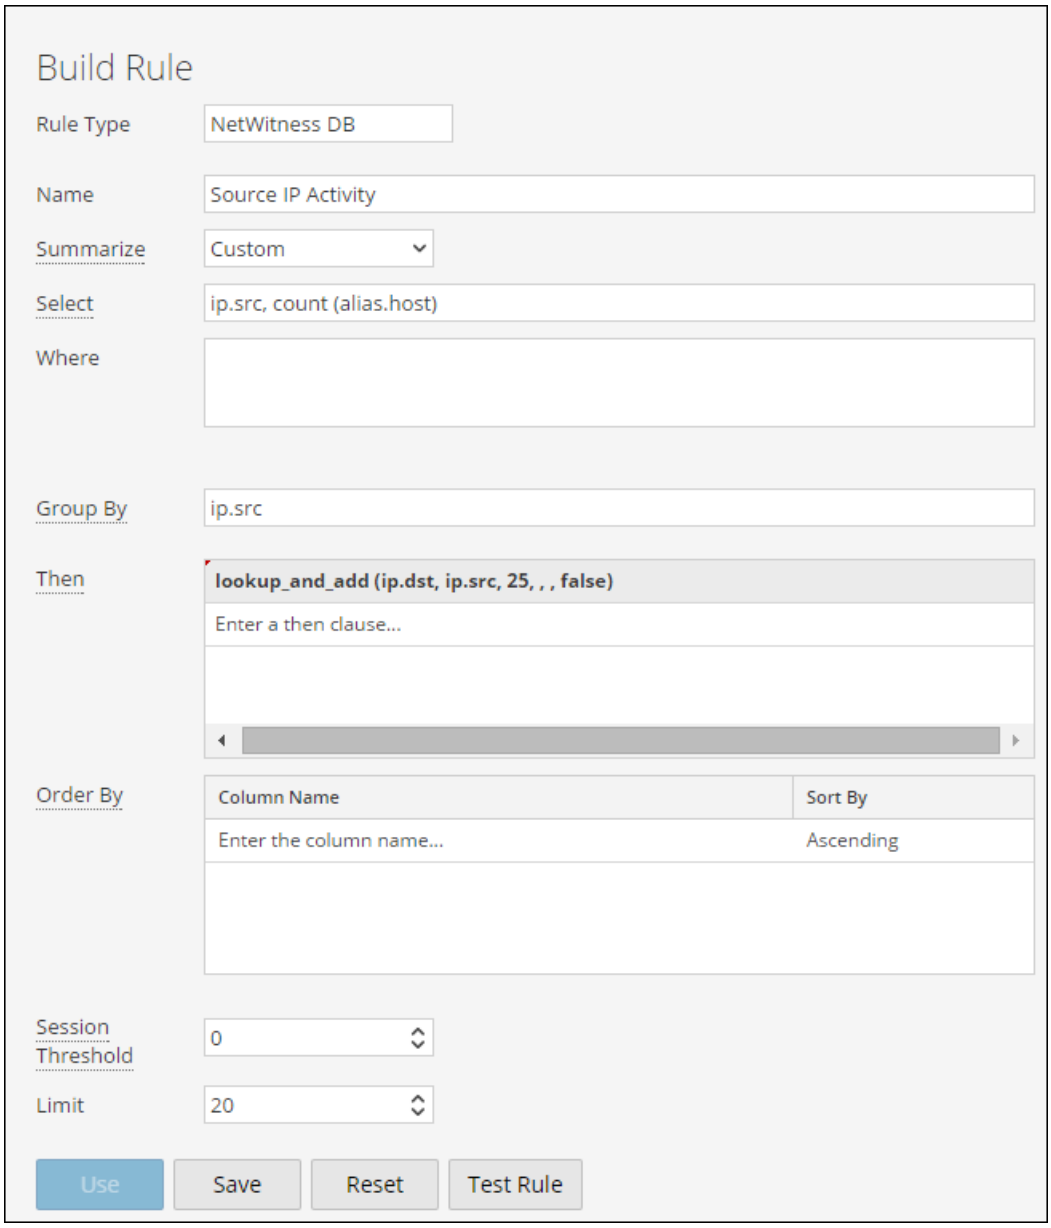
- Refine the Where clause in the following:
  - Rule that contains the `lookup_and_add` rule action
  - `lookup_and_add` rule action
- Set Limits

  You must set appropriate limits for the rule and rule actions. If the limit is high it will result in many queries being triggered and hence the report will take a long time to execute.
- Set the boolean aggregate parameter

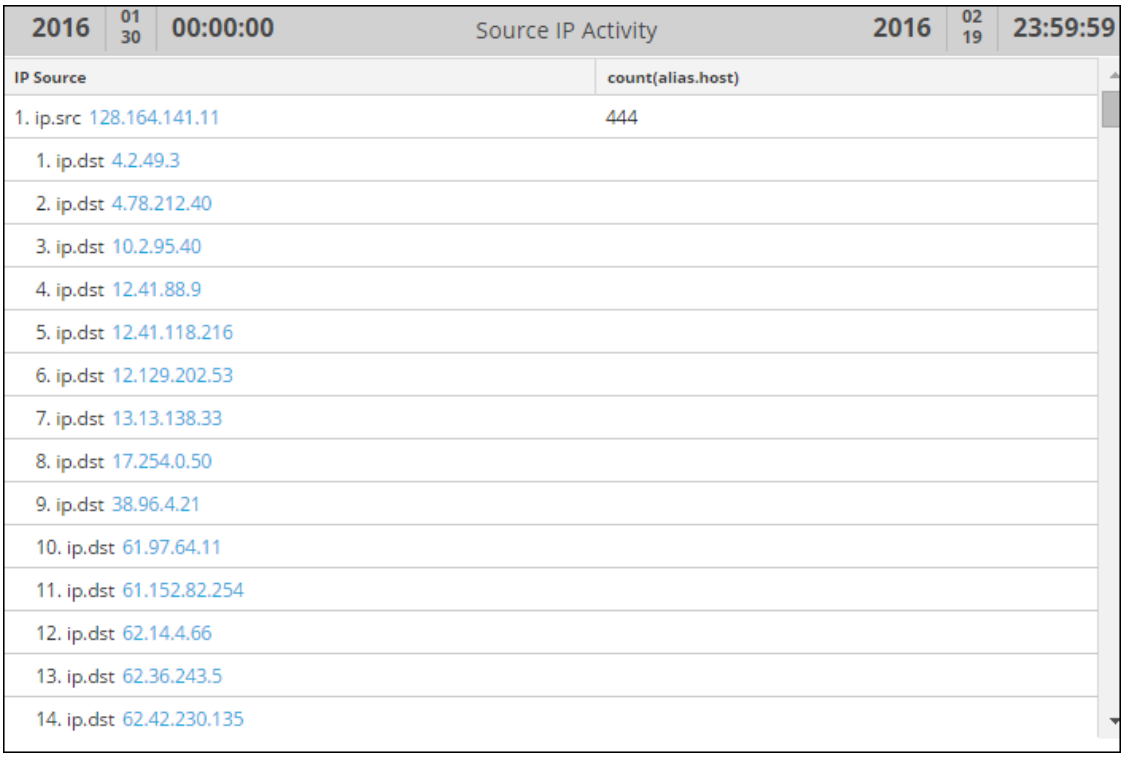
  If you do not want the aggregate value such as `sum(meta), count(meta)` etc. for the lookup values, set the boolean aggregate parameter to false in the `lookup_and_add` rule action. For more information, see the NWDB Rule Syntax section in Rule Syntax .

  ```
  lookup_and_add(string select, string field, int limit, boolean
  inherit, string extraWhere, boolean aggregate)
  ```

  Consider the rule with lookup_and_add rule action:



The output is displayed:

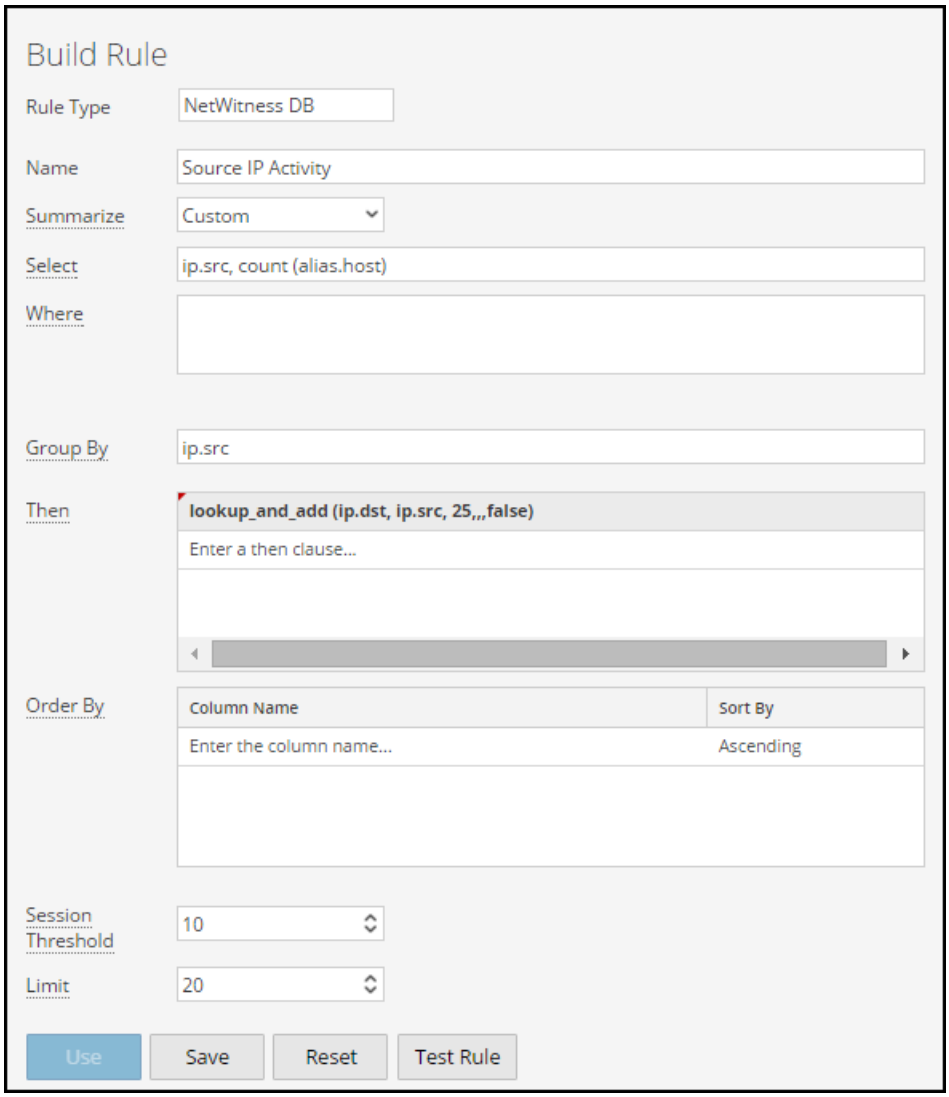


- Each `lookup_and_add` rule action triggers by default two concurrent lookup queries on the data source. RSA recommends that you retain the default setting, however if you want to increase the value you may want to ensure the value of `Max # of Concurrent LookupAndAdd Queries` parameter in Reporting Engine is less than the `Max Concurrent Queries` value in the NWDB data source configuration.

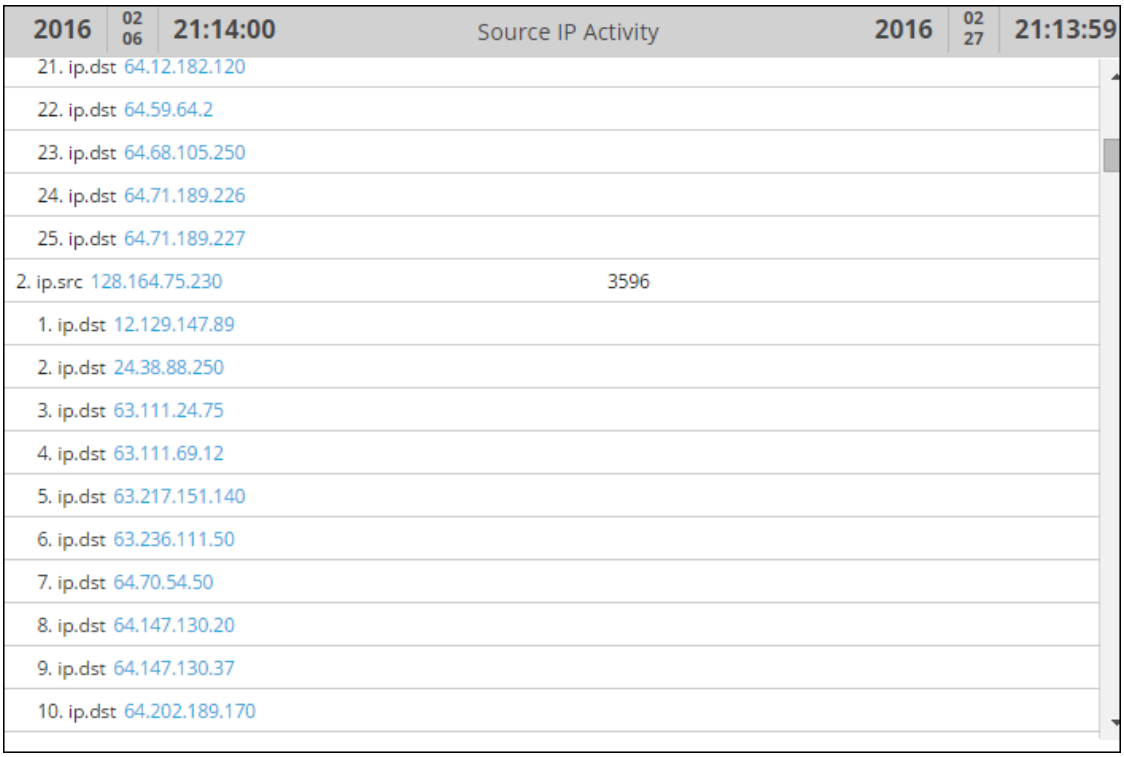
  If the NWDB data source is shared across other services, then you may retain a low value for the `Max # of Concurrent LookupAndAdd Queries` parameter in Reporting Engine as increasing it will impact the queries from other services. For more information, see "Reporting Engine General Tab" topic in *Reporting Engine Configuration Guide*.

- If you are interested only in unique values and not accurate aggregates, then set the `Session Threshold` to a non-zero value for the NWDB rule. For more information, see Create a Rule Using NetWitness Data Source section in Configure a Rule. The higher the value, the longer is the rule execution. If the value is set to zero it will take a longer time but will provide accurate aggregates.

  Consider a rule with lookup_and_add rule action and Session Threshold set to 10.



The output is displayed:



List Value Reports

Use a Refined List:

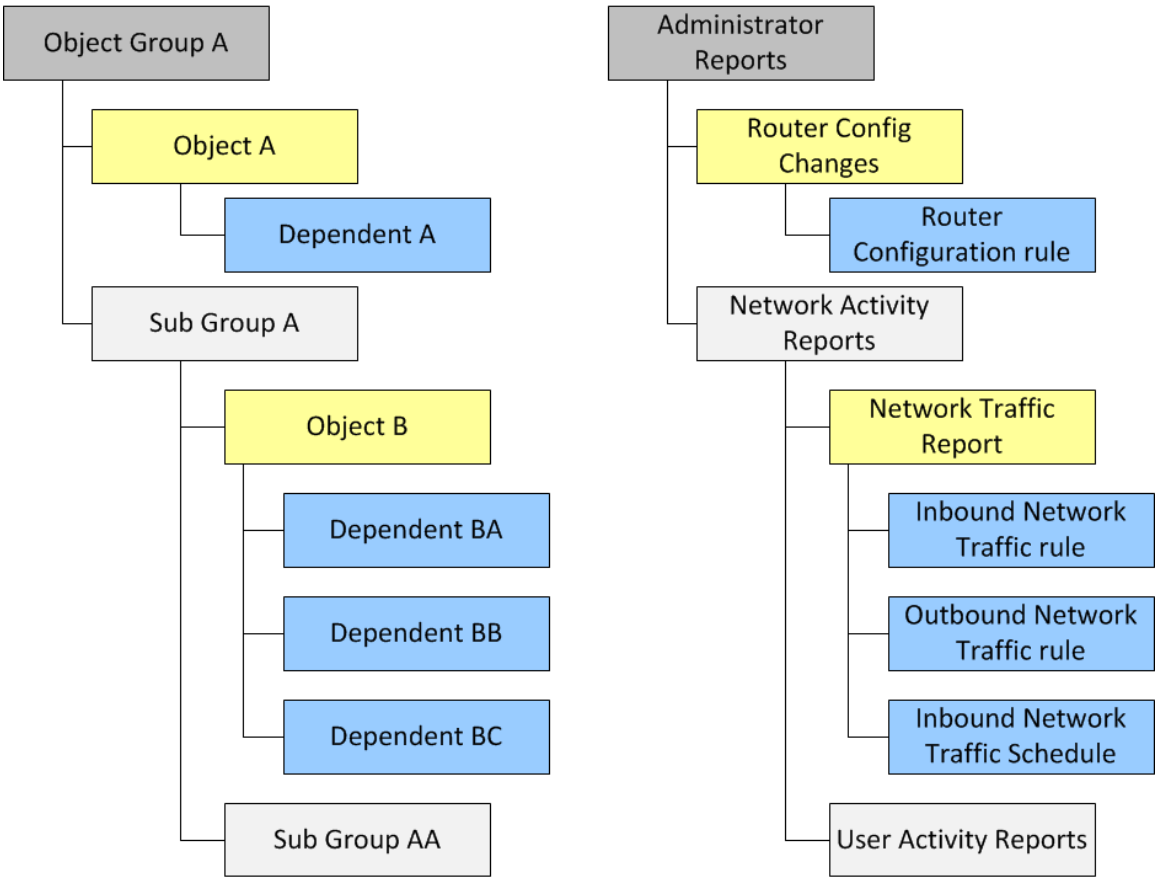
In case of List value reports (for any data source type), individual reports will be generated for each value in the list. Therefore, more the number of values in the list the longer the reports will take to execute. Hence, you must use a refined list to generate such reports.

Access Control for Reporting

Reporting Module provides you the option to set up access control for all the components in the module. In NetWitness Suite, you can define different roles and specify the access control for each of the role from the System Security module. You can define the access control to be provided for the Reporting module for each role. For more information, see "Step 1: Review the Pre-Configured NetWitness Suite Roles" and "Step 2: (Optional) Add a Role and Assign Permission" topics in the *System Security and User Management Guide*.

In the Reports module, you can modify the role permissions or access to the following Reporting objects:

The Following is an example of the hierarchy of the object groups, objects and dependents. This is an illustration of the Report Groups and Reports hierarchy.



Report Groups and Reports Hierarchy

Permission for Object Groups

- You must have the Read & Write permission to set the permissions for the Object Group, Objects, or Dependents. The dependents with “No Access” permission are grayed out and dependents with “Read-Only” permission are indicated with an icon.
- When you set the permission for the Object Group, the Objects and Dependents in the Object Group do not inherit the permission automatically. You must select the "Apply these permissions to sub-groups and <Objects> in this group" option to achieve this. For example, if you do not want Operators roles to access reports in Report Group A, then you must set the permission on Group A to No access for the Operator role and select the "Apply these permissions to sub-groups and Reports in this group" option.
- When you set the permissions for the Object Group and select the "Apply these permissions to sub-groups and <Objects> in this group" option, the dependents such as rules or schedules in the objects do not inherit the permissions automatically. You must use the "Apply Read-only permission to Rules in the <Object>" option to apply the permission to the rules.

- When you set the permissions for the Objects, you must ensure that the Objects in hierarchy should always have a permission that is less than or equal to the one above in the hierarchy for the permission to be applied. For example, if the reports in a Report Group have Read & Write permission and you apply a Read-Only or No Access permission at the Report Group level and select the "Apply these permissions to sub-groups and Reports in this group" option, then the permission on the rules will remain unchanged.
- The permissions are cascaded from top to down in the hierarchy and not vice-versa. For example, if you apply a permission to a rule, it does not change the permission of the Report that contains the rule.

Permission for Objects or Dependents

- You must have the Read & Write permission to set the permissions for the Objects or Dependents.
- You can specify the permission for multiple objects at once instead of setting the permission for each object.
- When you set the permission for the Object, the dependents in the Object do not inherit the permission automatically. You must select the "Apply Read-only permission to Rules in the <Object>" option to achieve this.

When you apply the permission to dependents the permission is applied based on the existing permission for the role. For example, consider an Analyst and a Operator with the following permissions for the different dependents (Report A object has Rule AA, Rule AB, and Rule AC as dependents).

Object or Dependent	Analyst	Operator
Report A	Read & Write	No Access
Rule AA	Read & Write	No Access
Rule AB	Read and Write	Read and Write
Rule AC	Read-only	No Access

When the Analyst applies a Read & Write permission for the Operator role and selects the option "Apply Read-only permission to Rules in the <Object>", then the permissions will be set for the different dependents as follows:

Modify the Permissions

- **Group Level:** Set the permissions at the Object Group level and for all the object and entities in the Group. For example, if you have 80 reports in the Administrators Reports group and you do not want anyone except the Administrator to add or modify these reports, you can set the permission for all the other roles at the group level to Read-Only and select the option to apply it to all the reports and sub-groups in the report group.
- **Multiple Objects:** Select multiple objects and specify the access for all the selected objects. For example, if you have 10 reports in the Network Traffic sub group with sensitive information that you do not want anyone to access, select the 10 reports and then set the permission for all the roles as "No Access".
- **Single Object:** Select only the object and specify the permission. For example, select the Network Traffic Report and specify the Read-Write permission for the Security Analyst role or select the Login Failure Alert and specify the Read-Write permission for a Security Analyst role.

Object or Dependent	Operator (Before Permission is applied)	Operator (After Permission is applied)
Report A	No Access	Read & Write
Rule AA	No Access	Read-only
Rule AB	Read and Write	Read & Write
Rule AC	No Access	Read-only

Roles and Permissions for Reporting Module

Although NetWitness Suite has five pre-configured roles, you can add custom roles. For example, in addition to the pre-configured Analysts role, you can add custom roles for AnalystsEurope and AnalystsAsia.

Role	Permission
Administrators	Full system access
Operators	Access to configurations but not to data
Analysts	Access to data but not to configurations
SOC_Managers	Same access as Analysts and an additional permission to handle incidents

Role	Permission
Malware_Analysts	Access to malware events only

Depending on the user role, you can set the following access permissions to access the Reporting module components (Rules, Reports, Charts, Alerts, Lists):

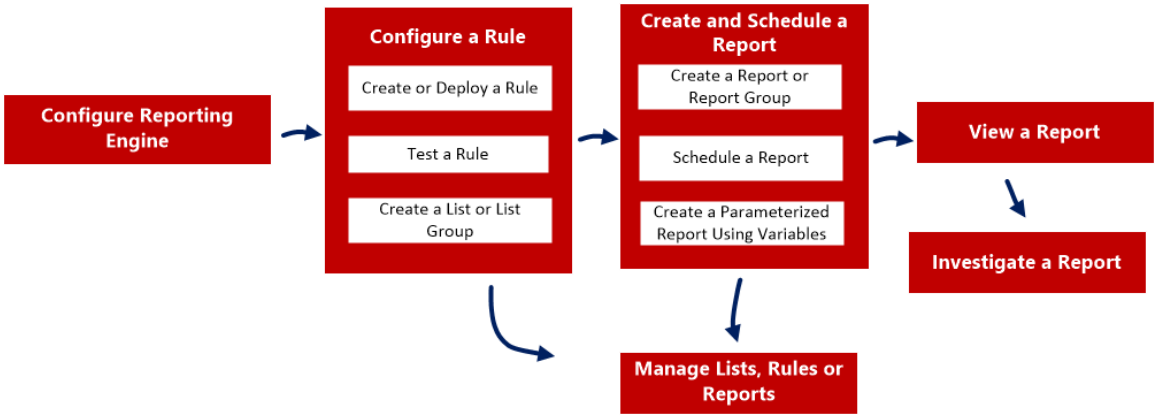
- Create
- Delete
- Export
- Manage
- View

Note: You must enable all these permissions for a user role to be able to define, delete, manage and view each of the Reporting modules. You must also have appropriate permissions for the data source to be listed, while defining the reports, charts, or alerts. For more information, see "Configure Data sources Permissions" topic in the *Reporting Engine Configuration Guide*.

For a detailed list of permissions and how to add a role and assign permissions, see "Role Permissions" and "Step 2. (Optional) Add a Role and Assign Permissions" topics in the *System Security and User Management Guide*.

Configure and Generate a Report

This figure is an overview of the entire process of configuring and generating a report.



To configure and generate a report, perform the following tasks:

1. Configure Reporting Engine - You must configure the Reporting Engine before you can configure and generate a report. You must also specify the data source in the Reporting Engine from which the data is extracted. For more information on how to configure Reporting Engine, see "Configure Reporting Engine" topic in the *Reporting Configuration Guide*.
2. Configure a Rule
3. Create and Schedule a Report
4. View a Report
5. Investigate a Report
6. Manage Lists, Rules or Reports

Configure a Rule

You can create a new rule or deploy an existing rule from the Live Services which can be used in a report. You can use different conditions to refine the data or information in the data sources such as :

- Select clause
- Where clause
- Group By
- Order By and so on

For example, you can write a rule to view the top 20 web addresses that the users visit daily.

You can create different type of rules using different data sources. Based on your requirements you can select any of the following options to create a rule:

- Create a Rule Using NetWitness Data Source
- Create a Rule Using Warehouse Data Source
- Create a Rule Using Respond Data Source

You can also use a list in a rule to refine a search result from the data source. Once a rule is created you can test a rule to see the results returned by the rule.

Create a Rule Group

To create a rule group or rule sub-group, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Do one of the following.
   - To define a rule group:
     a. In the Rule Groups Panel, click  .
        The new rule group is added to the Rule Groups panel.
     b. Enter the name for the rule group and press ENTER.

- To add a rule sub-group:
  a. In the Rule Groups panel, select the rule group to which you want to add a sub-group.
  b. Click +.
     The new rule sub-group is added to the rule group.
  c. Enter the name for the rule sub-group and press ENTER.

Create a Rule Using NetWitness Data Source

You can create a rule to fetch data or events from a NetWitness data source. The same procedure is used to define a rule to fetch data or events from an Archiver data source.

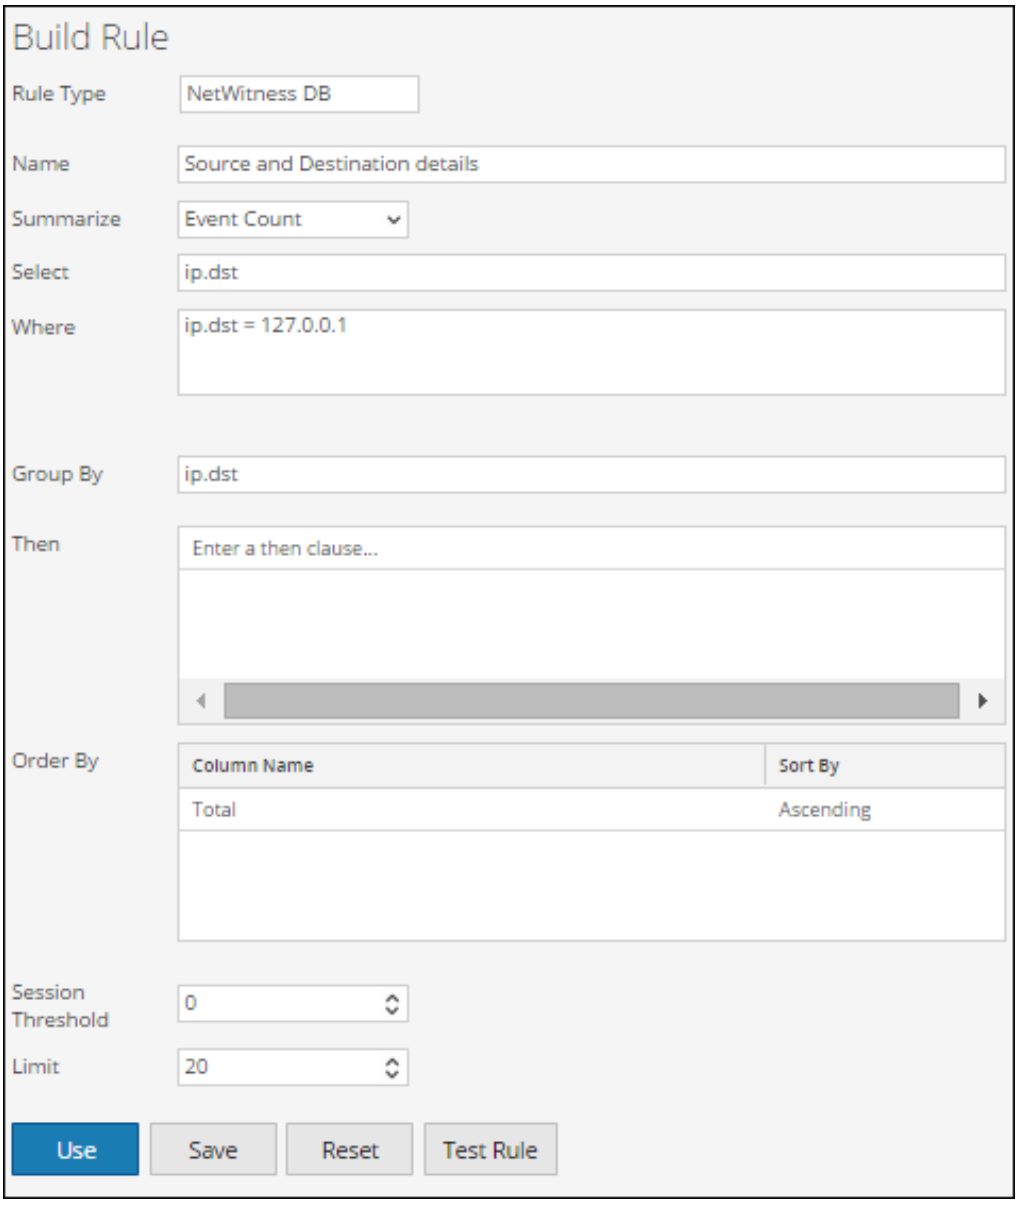
The Archiver data source can be added in the Services Config View of the Reporting Engine. For more information, see "(Optional) Add Archiver as a Data Source to Reporting Engine" topic in *Archiver Configuration Guide*.

Prerequisites

Make sure that you understand how custom meta keys are created using custom feeds. For more information, see "Create Custom Meta Keys using Custom Feed" topic in *Decoder and Log Decoder Configuration Guide*.

To create a rule to fetch data or events from a NetWitness Data Source, perform the following:

1. Select **MONITOR**> **Reports**.
   The Manage tab is displayed.
2. In the Rule toolbar, click + > **NetWitnessDB**.
   The Build Rule view tab is displayed.



3. In the **Rule Type** field, **NetWitness DB** is selected by default.
4. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.
5. The **Summarize** field determines the type of summarization or aggregation for the rule. Based on the type of rule to be defined, you must select one of the following:
   - To define a **Non-Aggregate** rule without any grouping, select: **None**
   - To define an **Aggregate** rule with special aggregation like the collection (sessions/events/packets) related aggregates, select one of the following:

- Event Count
- Packet Count
- Session Size

- To define an **Aggregate** rule with meta values and custom aggregates like sum(), count(), and so on, select: **Custom**

  Choosing 'Custom' in the **Summarize** field enables you to define aggregate function of your choice in the *Select* clause. For example, select ip.src, countdistinct(ip.dst), distinct (ip.dst). The supported aggregate functions are:

  - sum (<meta>)
  - count(<meta>)
  - countdistinct(<meta>)
  - min(<meta>)
  - max(<meta>)
  - avg(<meta>)
  - first(<meta>)
  - last(<meta>)
  - len(<meta>)
  - distinct(<meta>)

  For more detailed information about Aggregate and Non-aggregate rule, see NWDB Rule Syntax section in Rule Syntax .

6. In the **Select** field, enter a meta or select a meta from the list of available meta types provided in the Meta Library. For more information, see "Meta Panel" in Build Rule View. The meta name to fetch raw log is raw. raw can only be used in the **Select** field. It cannot be used in the **Where** and **Then** fields. Multiple aggregate functions are supported for Custom aggregate rule in the **Select** field.

   Note: In earlier versions of NetWitness Suite, only one aggregate function was supported for Custom aggregate rule in the **Select** clause. From now, multiple aggregate functions are supported in the **Select** clause. For example, Select: *ip.src, username, service, distinct (country.src), sum(payload)*.

7. In the **Alias** field, enter the alias name for columns used in the Select clause.
8. In the **Where** field, enter a meta or select a meta from the list of available meta types and use the operators to construct the Where clause for the base query criteria.

9. The **Group By** field is a read-only field which gets populated with meta that are defined in the Select clause. For a Non-Aggregate function, this field is not visible. A maximum of six meta are supported in the **Group By** field.

   Note: In earlier versions of NetWitness Suite, only one meta was supported for Custom aggregate rule in the **Group By** clause. From now, a maximum of six meta are supported in the **Group By** clause.

10. In the **Then** field, enter the rule actions that manipulate the original result set of a rule in order to make the output in a report more concrete or add additional functionality other than querying data and displaying it, for example, creating a feed from the results. For a complete list of available rule actions, see "NWDB Rule Syntax" in Rule Syntax .

    Note: When a rule is executed for an Archiver data source, it is recommended not to use query intensive rule actions such as lookup_and_add() and show_whats_new().

11. In the **Order By** field, perform the following:

    a. In the **Column Name** column, enter the name of the columns by which you want to sort the results. By default, the value is empty. The value gets populated based on the value selected in the **Summarize** field.

       - For Summarize 'None', if no **Order By** is selected, then by default it is ordered by session or collection time.
       - For other Summarize values, the default sorting is based on the first 'group by' meta selected when no 'order by' is defined. For Event Count, Packet Count, and Session size, the accepted values are Total and Value.

    b. In the **Sort by** column, select one of the following ways to sort the results:

       - Ascending Order
       - Descending Order

12. In the **Session Threshold** field, enter the optimization setting to stop scanning the matching sessions for each possible unique value for the selected meta. The threshold is an integer between 0 (default) and 2147483647.

    Note: This is applicable to only NWDB Aggregate rules. If the default value is specified, all the matching sessions will be scanned and the accurate value will be returned. A higher session threshold allows accurate counts for a value. However, this causes longer rule execution time. For example, consider you set the Session Threshold as 1000 for ip.src. If there are 5000 matching sessions then for a particular ip.src value which is present in more than 1000 sessions, NWDB stops the scan after 1000 sessions and returns the extrapolated aggregate value. This optimizes the query execution time. If the value is present in less than 1000 sessions, then the actual value is returned.

13. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by event count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.
14. Click **Save**.

Note: Unlike parsed meta, raw logs are fetched from decoders. When both raw log and parsed meta are queried in a single rule, due to different retention periods, parsed meta might be available and raw logs missing in the same session. So the result will have parsed meta values and empty raw value for those sessions. For example, for the rule "Select **ip.src**, **ip.dst**, **service**, **username**, **raw**", the parsed meta might be populated and the **raw** meta remains empty for a few sessions.

Create a Rule Using Warehouse Data Source

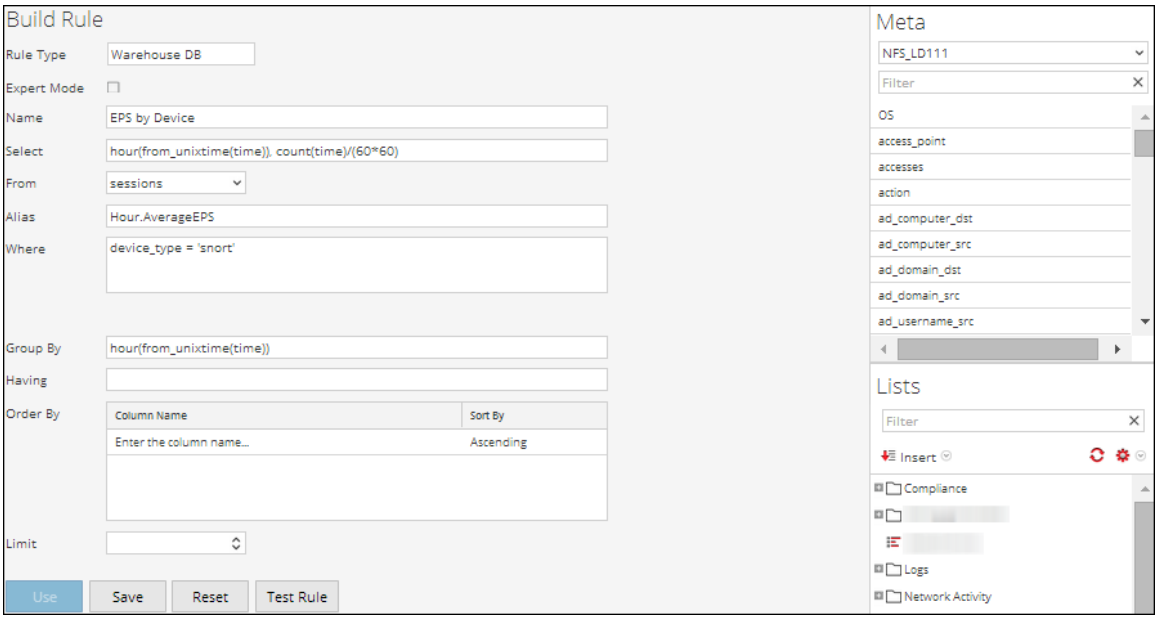
You can create a rule to fetch data or events from a Warehouse event source. You can define the rules in two modes:

- Default Mode
- Expert Mode

Default Mode

In Default Mode, you can create rules containing simple SQL like HIVE queries that contain clauses like Select, Where, Group By, and Having. By default, you can create rules to query sessions or raw logs. For more information on Simple query syntax and examples, see Warehouse DB Simple Rules Syntax.

The following figure is an example of the **Build Rule view** that displays when you select **Warehouse DB** for **Rule Type** without the Expert Mode selected.

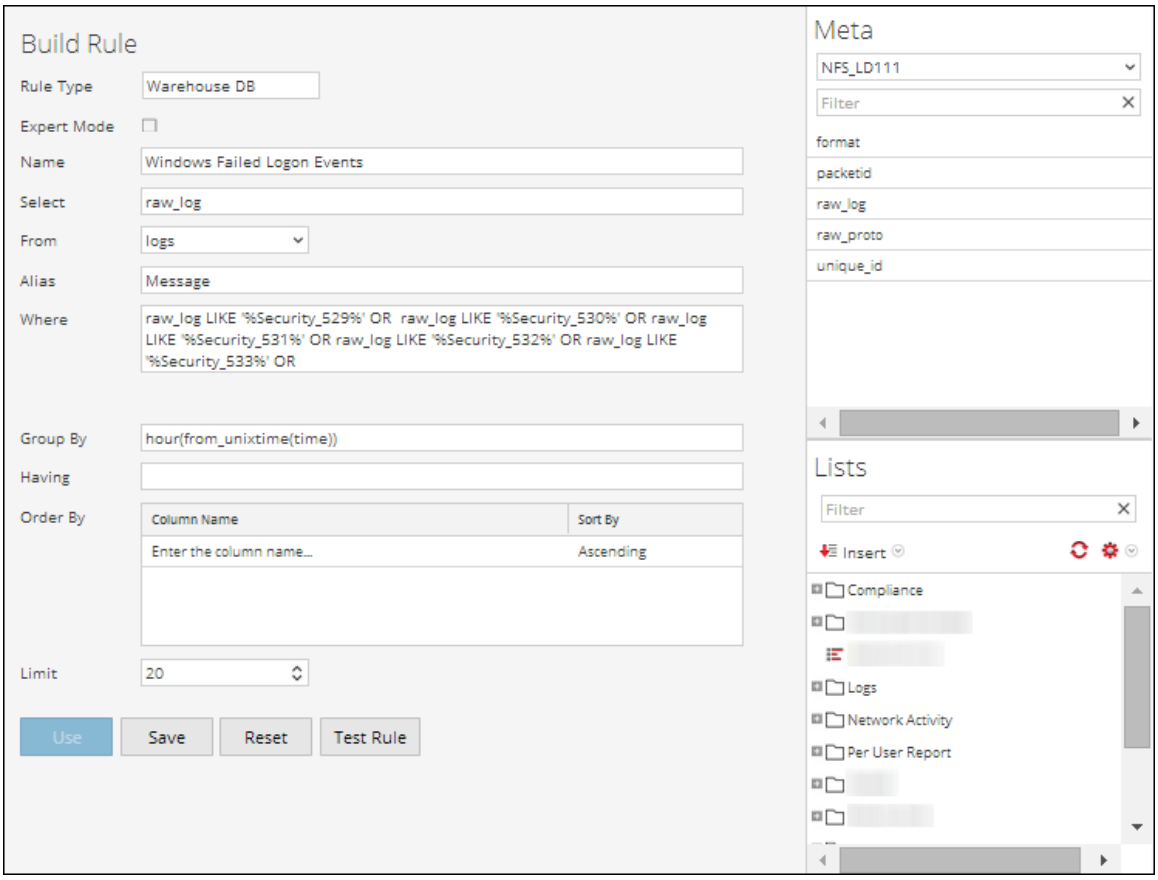


Querying Raw Logs

The raw log format is used in the select or where clause to query for raw logs.

Note: The time range that you can specify in your query is a day (24 hours). If you have specified a time range less than a day in your query, the result set contains data of at least a day (24 hours).

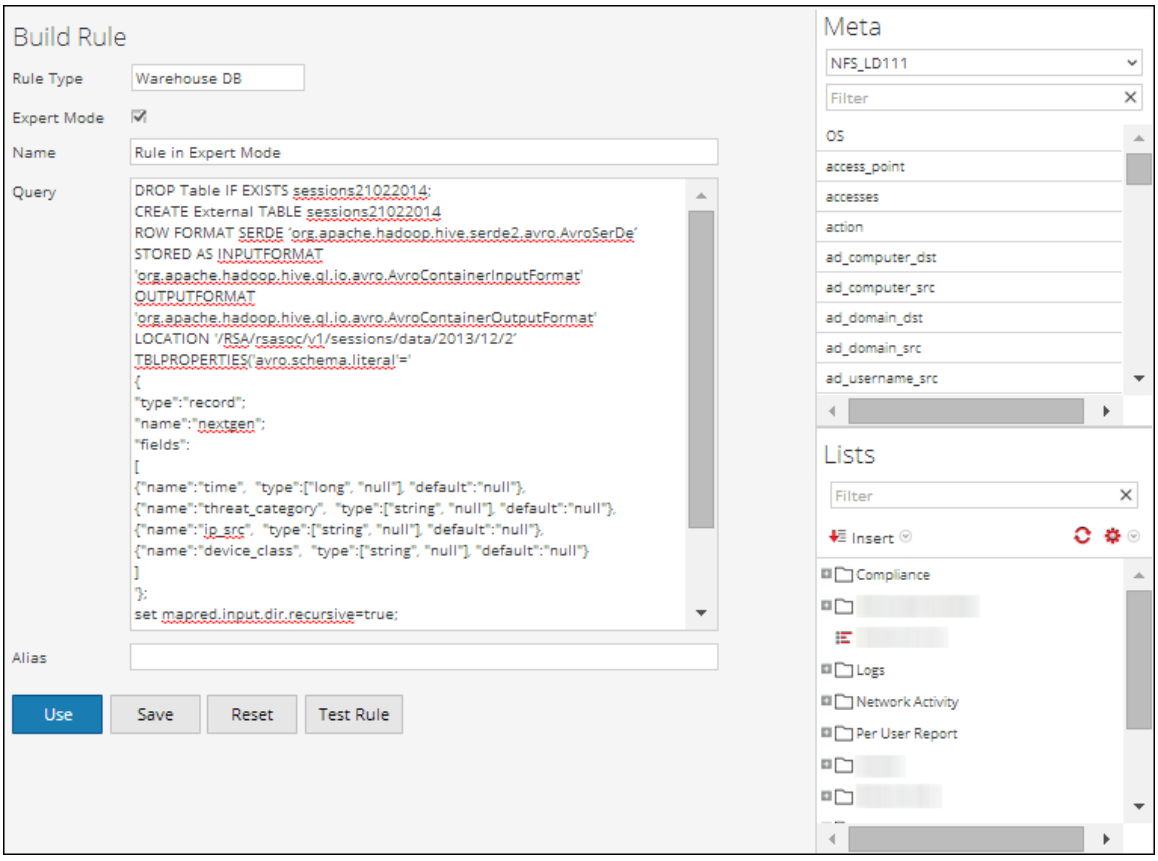
The following figure is an example of the **Build Rule view** that displays when you select **Warehouse DB** for **Rule Type** and create a rule for querying raw logs.



Expert Mode

Advanced rules are defined using complex HIVE queries created using the clauses DROP, CREATE, and so on. Unlike simple rules, we always insert the results into a table. For more information on Advanced HIVE query language, see *HIVE language manual*.

The following figure is an example of the **Build Rule view** that displays when you select **Warehouse DB** for **Rule Type** with Expert Mode selected.



If you want to generate a report for a specific time range, you need to manually define the time range in the query using the following two variables:

- ${report_starttime} - The starting time of the range in seconds.
- ${report_endtime} - The ending time of the range in seconds.

For example, **SELECT col1, col2 FROM custom_table WHERE timecol >= ${report_starttime} AND timecol <= ${report_endtime};**

Note: By default, Reporting Engine treats `${keyword}` as a variable. If you want to specify HIVE variables, you must mention the complete syntax of a variable. For example, `${hiveconf:hive.exec.scratchdir}`.

Prerequisites

Make sure that you understand how custom meta keys are created using custom feeds. For more information, see "Create Custom Meta Keys using Custom Feed" topic in *Host and Services Configuration Guide*.

To create a rule to fetch data or events from a Warehouse data source, perform the following:

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. In the Rule toolbar, click + > **Warehouse DB.**

   The Build Rule view is displayed.

3. In the **Rule Type** field, **Warehouse DB** is selected by default.

   If you are defining the rule in Default mode, perform the following:

   a. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.

   b. In the **Select** field, enter a meta or select the meta from the drop-down or select a meta from the list of available meta types provided in the Meta Panel. For more information, see " Meta Panel" in Build Rule View.

   c. In the **From** drop-down menu, select one of the following:

      - Session
      - Logs

   d. In the **Alias** field, enter the alias name for columns used in the Select clause.

   e. In the **Where** field, enter a meta or select a meta from the list of available meta types provided in the Meta Panel. The Where clause provides the base query criteria for the rule.

   f. In the **Group By** field, enter the meta selected in the Select clause, so that the result set is grouped based on the meta.

   g. In the **Having** field, enter the criteria to filter the result set for aggregated queries.

   h. In the **Order By** field, perform the following:

      1. In the **Column Name** column, enter the name of the columns by which you want to group the results.
      2. In the **Sort by** column, select one of the following ways to sort the results:

         - Ascending Order
         - Descending Order

   i. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by session count, packet count, or session size, the limit

represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.

j. Click **Save**.

4. If you are defining the rule in Expert mode, select the **Expert Mode** checkbox and perform the following:

   a. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.

   b. In the **Query** field, enter the Hive query statement to query the data source.

   c. In the **Alias** field, enter the alias name for columns used in the Select clause.

   d. Click **Save**.

Create a Rule Using Respond Data Source

You can create a rule to fetch incidents or alerts from a Respond data source.

Prerequisites

Make sure that you:

- Ensure Reporting Engine service is up and running.
- Ensure the Incident Management service is up and running. For more information, see "Configure a Database for the Respond Server Service" topic in *NetWitness Respond Configuration Guide*.
- (Optional) Ensure the Event Stream Analysis service is up and running. For more information, see "Step 2. Configure Advanced Settings for an ESA Service" topic in *ESA Configuration Guide*.
- (Optional) Ensure the Malware Analysis service is up and running. For more information, see "(Optional) Configure Auditing on Malware Analysis Host" topic in *Malware Configuration Guide*.

Note: You need to configure any one of the services (Event Stream Analysis, Reporting Engine, Malware Analysis, or Endpoint) based on your requirement and the type of alerts or incidents you want to generate.

To create a rule to fetch data or events from a Respond Data Source, perform the following:

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. In the Rule toolbar, click + > **RESPOND**.

   The Build Rule view tab is displayed.

3. In the **Rule Type** field, Respond is selected by default.

4. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and incident reports.

5. The **Summarize** field determines the type of summarization or aggregation for the rule. Based on the type of rule to be defined, you must select one of the following:

   - To define a **Non-Aggregate** rule without any grouping, select **None**
   - To define an **Aggregate** rule with meta values and custom aggregates select **Custom**

     Choosing 'Custom' in the **Summarize** field enables you to define aggregate function of your choice in the *Select* clause based on the report type you have selected.

     For more detailed information about Aggregate and Non-aggregate rule, see Rule Syntax .

6. In the **From** field, based on the type of report output to be displayed, you must select one of the following:

   - Alert
   - Incident

7. In the **Select**field, enter a meta or select a meta from the list of available meta types provided in the Meta Library. For more information, see "Meta Panel" in Build Rule View. It cannot be used in the **Where** field. Multiple aggregate functions are supported for Custom aggregate rule in the **Select** field.

   For example, the supported aggregate functions for alert are:

   - alert_host_summary
   - alert.name
   - alert.numEvents
   - alert.severity
   - alert.source
   - alert.timestamp

- incidentCreated
- incidentId
- receivedTime

For example, the supported aggregate functions for incident are:

- categories
- created
- priority
- riskScore
- sealed
- status

For more detailed information about Aggregate and Non-aggregate rule, see Rule Syntax .

8. In the **Alias** field, enter the alias name for columns used in the Select clause.
9. In the **Where** field, enter a meta or select a meta from the list of available meta types and use the operators to construct the Where clause for the base query criteria.
10. The **Group By** field is a read-only field which gets populated with meta that are defined in the Select clause. For a Non-Aggregate function, this field is not visible. A maximum of six meta are supported in the **Group By** field.
11. In the **Order By** field, perform the following:
    a. In the **Column Name** column, enter the name of the columns by which you want to sort the results. By default, the value is empty.
    b. In the **Sort by** column, select one of the following ways to sort the results:
       - Ascending Order
       - Descending Order
12. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.
13. Click **Save**.

Deploy a Rule

In RSA NetWitness Suite you can deploy the selected rules on the service (for example, Reporting Engine), using the Deployment Wizard.

Prerequisites

Make sure that:

- The services on which you deploy a rule is up and running.
- The Live Services is configured.

To deploy a rule, perform the following:

1. Select **CONFIGURE > LIVE CONTENT**.
2. In the **Search Criteria** panel, search Live resources (for example, search for the **Application Rule** resource Type).
3. In the **Matching Resources** panel, select **Show Results > Grid**.
4. Select the checkbox to the left or the rules that you want to deploy.
5. In the **Matching Resources** toolbar, click 

.
6. Click **Next**.
7. Select the service on which you to deploy a rule (For example, Reporting Engine) and click **Next**.
8. Click **Deploy**.
   The rule is deployed successfully.

Use Meta Aliases for Reporting

When you refer to meta data in Reports and Charts, you can only view aliases for the meta names. These aliases makes them more understandable to a broader audience.

You can only use the pre-defined aliases for the meta but cannot modify these values.

You cannot provide alias values for any meta in the WHERE clause because NetWitness Suite uses the WHERE clause to fetch data from the data source (for example, in the Concentrator) and data sources do not support aliases. In other words, you cannot provide the alias value **HTTP** for the HTTP port # 80.

Note: * You cannot create aliases for meta other than the ones that have existing aliases by Reporting Engine. Also, the format of the aliases cannot be changed.
* Aliases are not supported for Alerts and CSV reports.

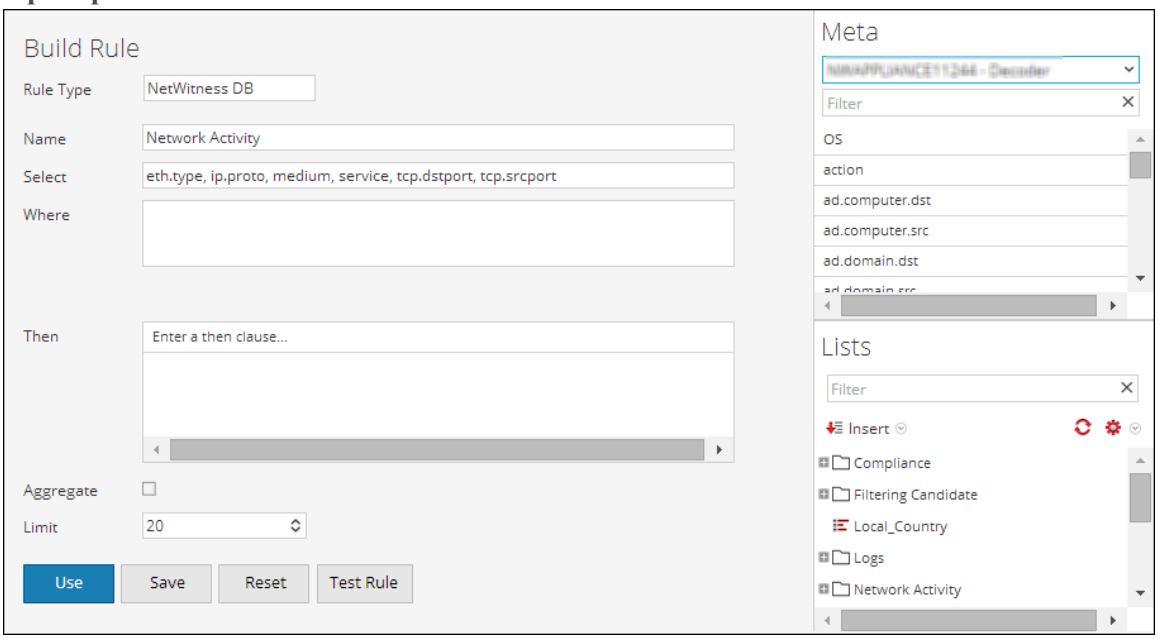
To use alias in a rule, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the Rule List panel, do one of the following:

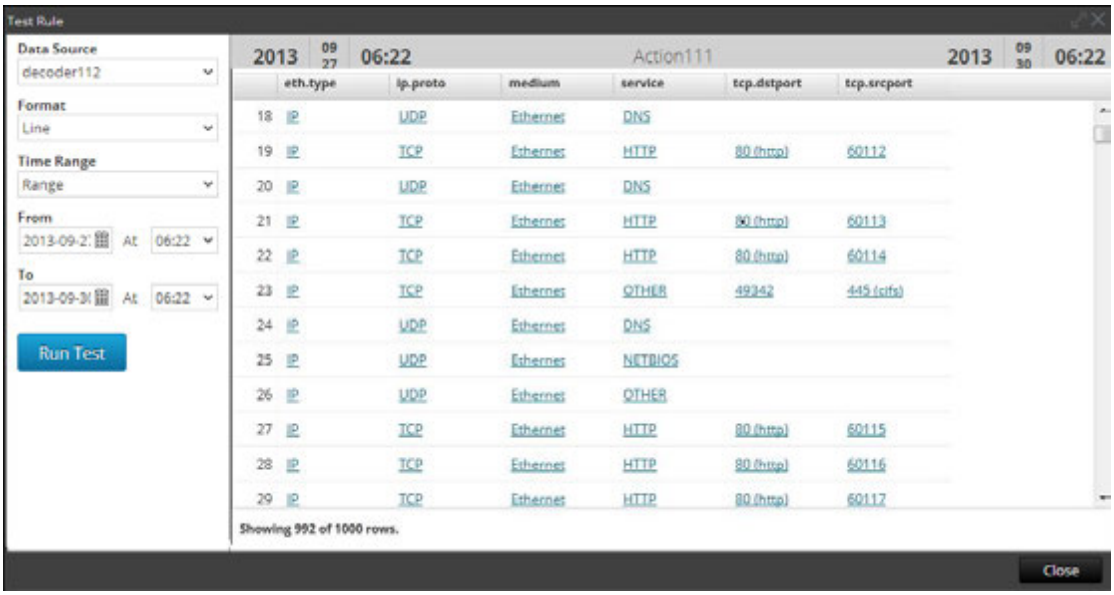
- Select a rule and click in the Rules toolbar.
- Click > **Edit**.

3. Specify the meta with aliases in the **Select** field.

The following example specifies the **eth.type**, **ip.proto**, **medium**, **service**, **tcp.dstport**, and **tcp.srcport** meta in the Select field.



4. Click **Test Rule**.
   The following example displays the results under the **eth.type**, **ip.proto**, **medium**, **service**, **tcp.dstport**, and **tcp.srcport** alias columns that were specified in the **Select** field of the rule.



RSA-Supplied Alias Definitions

The alias files in this section are examples only and are based on current alias definitions in the Reporting Engine. NetWitness Suite cannot modify these definitions in the Reporting Engine depending on the changes in the concentrator xml file. Since any changes in the Concentrator xml file are not reflected in the Reporting Engine.

The details of different meta are explained in each of the **meta.aliases**.

Test a Rule

You can test a rule based on the time range and the data source selected.

To test a rule, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.

2. In the Rule List panel, do one of the following:
   - Select a rule and click in the Rules toolbar.
   - Click > **Edit**.

     The Build Rule view tab is displayed.
3. Click **Test Rule**.

   The Test Rule view is displayed.

> **Note:** When you click **Test Rule**, the rule is not saved. You have to click **Save**in the Build Rule view to save the rule.

4. From the **Data Source** drop-down list, select a data source.

   You must select the appropriate data source for the rule defined.
5. From the **Format** drop-down list, select the format in which you want the result displayed.
6. From the **Time Range** drop-down list, select one of the following.
   - **Past** -To specify number of years, days, weeks, months, days or hours.
   - **Range** - To specify a date range and time period.

     > **Note:** In the User Interface (UI), the date or time displayed depends on the time zone profile selected by the user.
7. **X-Axis** and **Y-Axis** are used to specify the meta to be plotted in charts.

   In **X-Axis**, the Meta for the 'Group by' rule is displayed. In **Y-Axis**, the aggregate functions

used in the rule are displayed.

Note: Sum, Count, Countdistinct and Average are the supported aggregate functions for rule. By default, for Custom Rules with multiple 'Group by', you can select only the first meta in **X-Axis**.

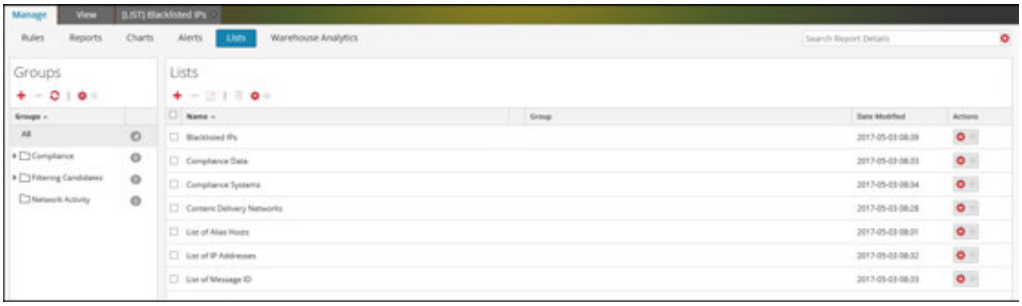
8. Click **Run Test** to execute the rule.
   The rule data (if any) for the selected time range is displayed.

Create a Lists or List Group

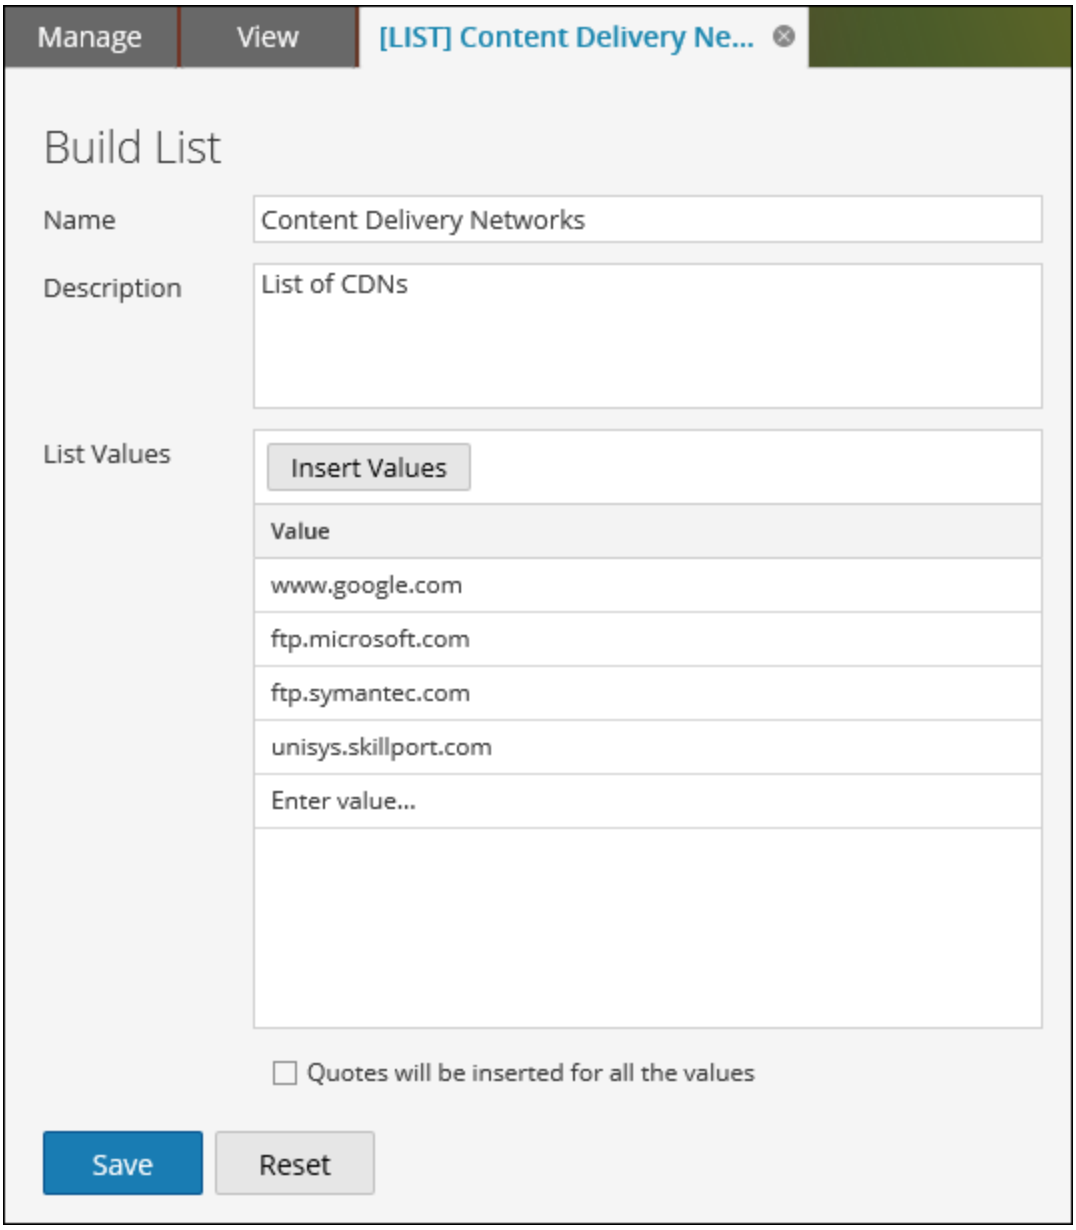
To create a list, perform the following:

Lists can be added within a group or in the root folder.

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.
   The List view is displayed.



3. In the **List** toolbar, click +.
   The Build List view tab is displayed.

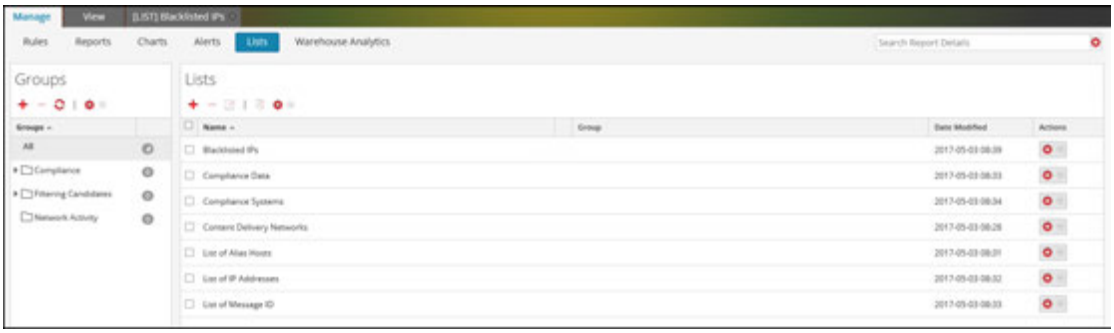


4. In the **Name** field, enter a unique name for the list.
5. In the **Description** field, enter a description for the list.
6. In the **List Values** field, do one of the following:
   - Click **Insert** and enter the values separated by commas. You can paste a list of values from a file or other lists.
   - In the **Value** column, enter the values.
7. If you want quotes to be inserted directly for the values at runtime, select **Quotes will be inserted for all the values**.

8. Click **Save**.

To create a list group, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.
   The List view is displayed.



3. Do the following:
   - To create a list group
     1. In the List Groups panel, click + .
        A new list group is added to the List Groups panel.

     2. Enter the name for the list group and press ENTER.
   - To create a list subgroup:
     1. In the List Groups panel, select the list group to which you want to add a subgroup.
     2. Click +.

A new list subgroup is added to the list group.

3. Enter the name for the list subgroup and press ENTER.

Create and Schedule a Report

You can create a simple or complex report and configure its execution properties by scheduling a report. A report can include multiple rules and you can schedule different time range to execute the same report. For example, depending on your requirement, you can schedule a report to run daily, weekly or monthly.

When you run a report, the results are stored in Reporting Engine.

After you generate a report, you can perform the following:

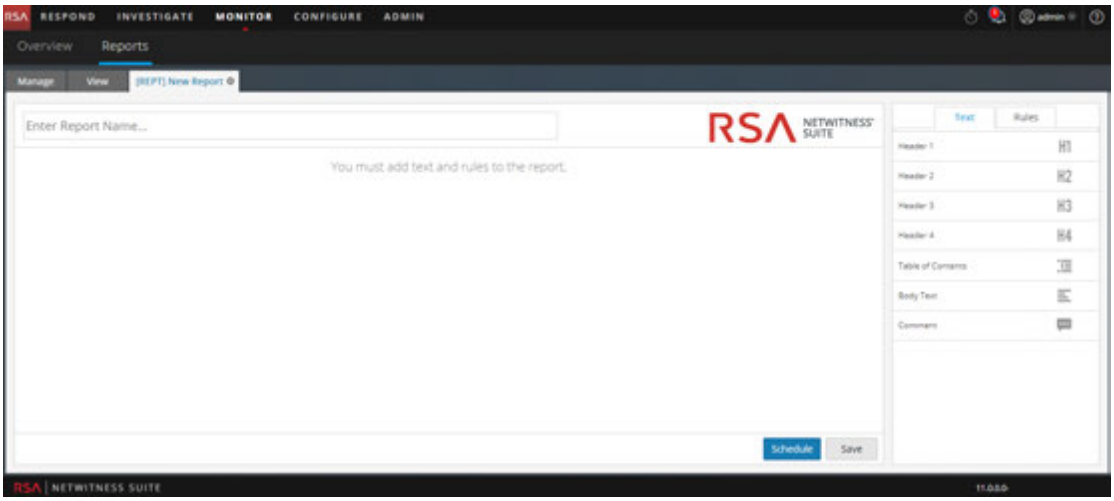
- Send the reports by email to other users by configuring the output actions. You can also configure the output actions before generating a report.
- Download the reports as PDF or Comma-Separated Values (CSV) format files.

Note: The cancel operation is not supported for Respond Reports.

Create a Report or Report Group

To create a report to a group or sub-group, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Reports** toolbar, click + .
   The Build Report tab is displayed.



4. Enter the name of the report.
5. Drag and drop the text and rules to the report.

   Note: The text entered is optional and you may need this option only when you want to display user-defined headers or content.

6. Click **Save**.

   A confirmation message that the report is saved successfully is displayed.

To create a group to the default folder or add sub-groups under a report group, perform the following:

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report Groups** panel, click +.

   A default group is added in the Report Groups panel.

4. Enter the name of the new group.
5. Press **Enter**.

   The group is added to the Report Groups panel.

Schedule a Report

Note: When you schedule a Warehouse report, you can use a supported task scheduler to allocate specific resources in a cluster for the scheduled job. For more information on supported task schedulers, see Task Scheduler for Warehouse Reporting.

To schedule a report, perform the following:

1. Select **MONITOR** > **Reports**.

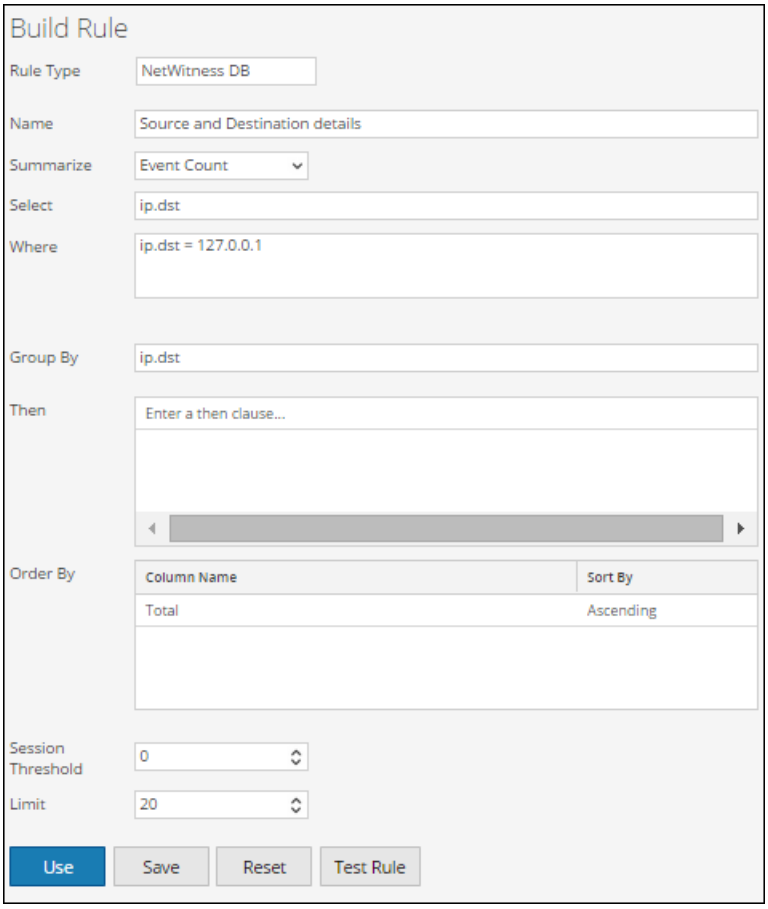
   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Build Rule** page, click + to create a rule.
4. Click **Save**.

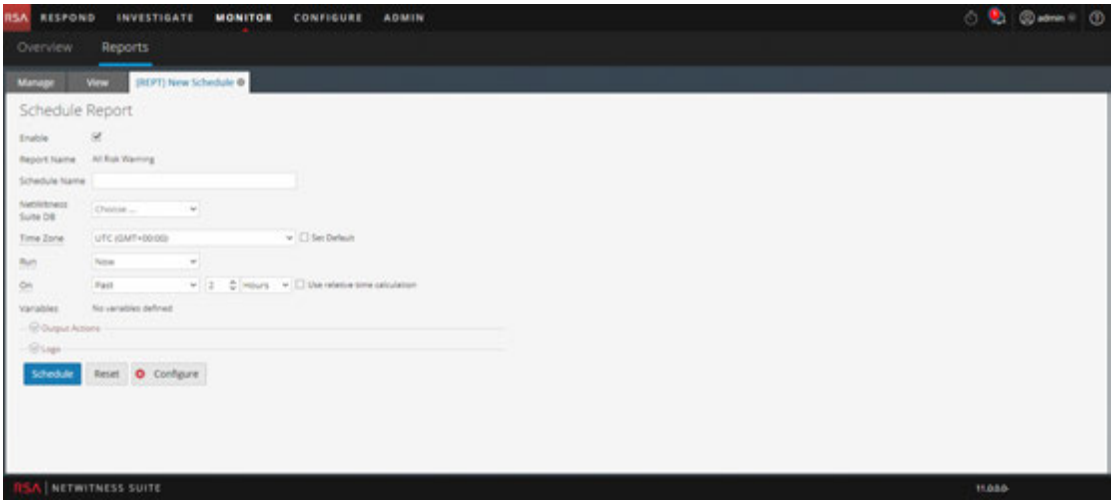
5. Click **Use**.



6. Select the **New report** or **Existing Report**.
7. Select a report group and click **Select**.
8. Enter the Report name and select the rule.

9. Click **Schedule**.

   The Schedule Report view is displayed.



> **Note:** If you provide another user with access permissions to a report, you must also provide permissions for the report group, the rules used in the report, and the rule groups otherwise an error message is displayed.

8. To execute the reports as per the schedule, select the **Enable** checkbox.
9. In the **Schedule Name** field, enter a name for the schedule report configuration.
10. From the Data Source field, select the data source.

> **Note:** If the data source is not listed, then ensure you have **Read**permissions set for the data source. This is applicable for NWDB, Respond and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in *Reporting Engine Configuration Guide*.

11. (Optional) From the **Warehouse Resource Pool** drop-down, select the pools or queues available in the cluster to schedule the report to run on either the pool or queue. This drop-down is available only if you select a Warehouse DB report.

> **Note:** All the queues or pools you specified in the Explore page for the Reporting Engine are listed. If no pools or queues are configured in the Explorer page, this drop-down is disabled and the jobs are submitted to the clusters without any a queue or pool name.

> **Note:** If the pool or queue configured in the report schedule is removed from the Cluster, then in the Capacity Scheduler, the queue name remains undefined. However, in the Fair Scheduler, the specified pool name will be created using the property mapred.fairscheduler.allow.undeclared.pool.

12. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format. This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).
13. From the **Run** field, select the type of run schedule. (For example, Now or Hourly).
    Depending on the type of run schedule, do either of the following:
    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.

Note: While scheduling a report, if you select **Past** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.

For information on how to generate a report with variables, see Create a Parameterized Report Using Variable.

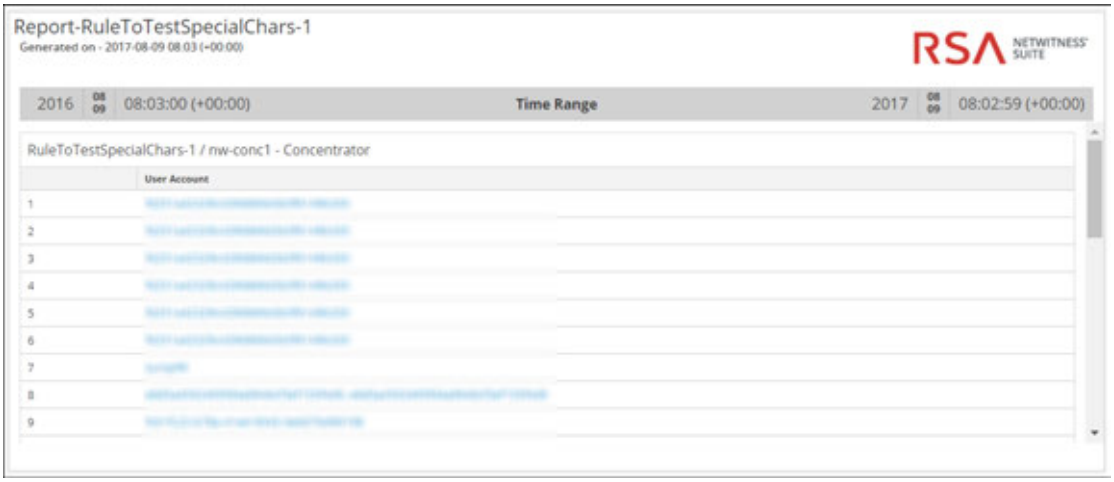
14. (Optional) In the **Output Actions** panel, do the following:
    a. Enter the email address and subject.
    b. Edit the body of the message for the report.
    c. Select the format of the attachment.
    d. Enter a value for the CSV and Multi-value delimiters.
    e. (Optional) In the Other Options field, do the following:
        i. Click  and select SFTP, URL, or Network Share output action.
        A row gets added with the selected output action.
        ii. Select the appropriate options to send the report in PDF or CSV format, or both to the RE configured SFTP, or URL, or Network Share output action.
15. (Optional) To add a list in the Dynamic List panel, see Generate a List from the Scheduled Report.

16. (Optional) To choose a logo in the Logo panel, see *Manage and Select a Report Logo* section in Manage Lists, Rules or Reports .

    Note: If you do not specify a logo, the default RSA logo will be used.

17. Click **Schedule**.

    The scheduled report executes as scheduled and provides the configured outputs.



After you create and Schedule a report, you can perform any of the following tasks:

1. You can notify the email recipient when the report execution completes and send reports in PDF and CSV formats as attachments in the email.
2. You can generate a list based on the scheduled report and view them in the **Lists**module.
3. You can send a scheduled report in PDF or CSV format, or both to the RE configured SFTP location, or URL, or Network Share.
4. You can change the default logo and view them in the scheduled report.
5. You can modify the NetWitness Suite Reporting Engine config details, by navigating to the Reporting Engine General Tab. See the "Reporting Engine General Tab" topic in the *Reporting Engine General Tab*.

Examples

When you schedule reports in the Schedule Report view, by default, the results for the **Past** option are presented based on the user specified time zone. The following examples provide a clear picture on what results to expect when you select **Hours**, **Days**, **Weeks**, **Months**, or **Years** for the **Past** option based on the absolute or relative duration.

Note: By default, the relative duration checkbox is de-selected. This implies that the results for the **Past** option are presented based on the absolute duration.

- **Based on Absolute duration** - Absolute Duration allows a report to be scheduled at an absolute time with respect to the current time, excluding the seconds and considering the time interval as a whole. For example, 12.00pm is the absolute time with respect to the current time (12.45 pm).
  - Hours - Suppose that you select Hours and specify one hour. If the current user specified time is 4.20PM, the report is generated for the time range, 3.00PM to 4.00PM.
  - Days - Suppose that you select Days and specify one day. If the current date is August 27, 2014 and the current user specified time is 10.15AM, the report is generated for the range: August 26, 2014, 12.00AM to August 27, 2014, 12.00AM.
  - Weeks - Suppose that you select Weeks and specify one week. If the current date is August 27, 2014 2.30PM and the day is Wednesday, the report is generated for the range: Saturday, August 16, 2014, 12.00AM to Saturday, August 23, 2014, 12.00AM.
  - Months - Suppose that you select Months and specify one month. If the current date is August 27, 2014 2.30PM, the report is generated for the range:
    July 01, 2014, 12.00AM to July 31, 2014, 12.00AM.
  - Years - Suppose that you select Years and specify one year.If the current date is August 27, 2014 2.30PM, the report is generated for the range:
    January 01, 2013, 12.00AM to December 31, 2013, 12.00AM.
- **Based on Relative duration** - Relative Duration allows a report to be scheduled at a time relative to the current time which might vary based on the current time. For example, 12.45 pm is the relative time with respect to the current time (12.45 pm).
  - Hours - Suppose that you select Hours and specify one hour. If the current user specified time is 4.20PM, the report is generated for the time range, 3.20PM to 4.20PM.
  - Days - Suppose that you select Days and specify one day. If the current date is August 27, 2014 and the current user specified time is 10.15AM, the report is generated for the range: August 26, 2014, 10.15AM to August 27, 2014, 10.15AM.
  - Weeks - Suppose that you select Weeks and specify one week. If the current date is August 27, 2014 12.30PM and the day is Wednesday, the report is generated for the range: Thursday, August 21, 2014 12.30PM to Wednesday, August 27, 2014 12.30PM.
  - Months - Suppose that you select Months and specify one month. If the current date is August 27, 2014, 2.30PM the report is generated for the range:
    July 27, 2014 2.30PM to August 27, 2014 2.30PM.

- Years - Suppose that you select Years and specify one year.If the current date is August 27, 2014 2.30PM, the report is generated for the range: August 27, 2013 2.30PM to August 27, 2014 2.30PM.

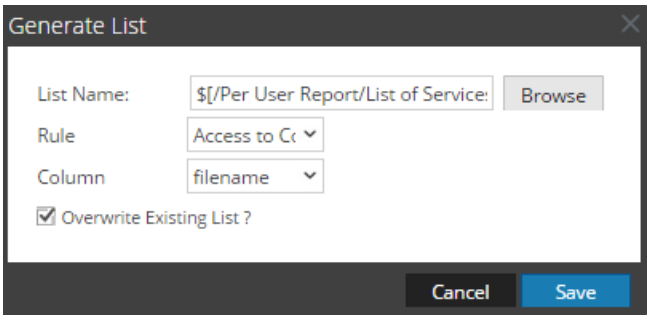
Additional Procedures

Generate a List from the Scheduled Report

You can generate a list from the output of the scheduled report. Make sure that your lists are created in NetWitness Suite prior to generating a list to schedule a report.

To generate a list from the Build Report view, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, select a report and click  > **Schedule Report**.
   The Schedule a Report view tab is displayed.
4. In the **Dynamic List** panel, click  .
   The Generate List dialog box opens.
5. Click **Browse**.
   The List Selection panel is displayed.
6. Choose a list item and click **Select**.
   The list name gets populated in the List Name field.
7. Select a valid rule to filter the report results further based on the rule definition.
8. Select a value for the **Column** field.
   The column forms the values for the list that gets created.
9. If you want to overwrite the existing list, select the **Overwrite Existing List?** checkbox.
10. Click **Save**.
    The list name gets populated in the Generate List panel.



11. (Optional) Select a list from the Generate List panel and click to delete the selected list.
12. (Optional) Select a list from the Generate List panel and click to edit the list details.

Create a Parameterized Report Using Variable

You use variables for reporting in the RSA NetWitness Suite Reporting module. Parameterized reporting allows you to specify values dynamically at runtime without changing the rule definition so you can view the results based on a particular value. You can achieve parameterize reporting by using variables in the query or rule. For information on adding a rule, see Configure a Rule. At runtime, you can enter the value for the variable or select the value from the list based on which the result set is displayed.

The syntax to specify the variable is as follows:

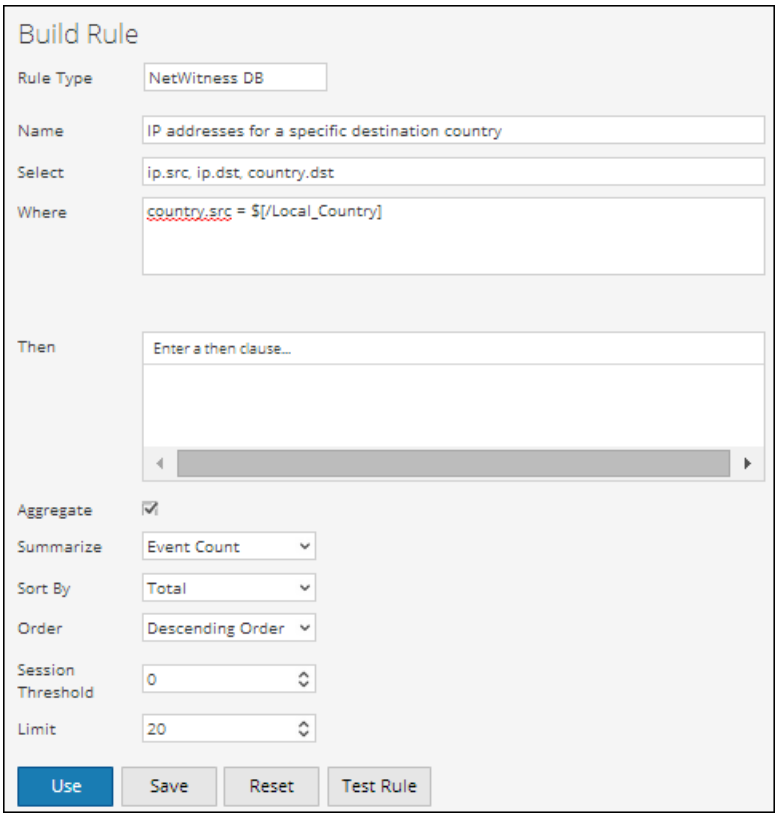
Description	Examples of Supported Syntax
Insert `$` before a variable. Enclose a variable within braces.	`columnname=${<variable>}`

The syntax to define the variable is the same for NetWitness DB, IPDB and Warehouse DB data sources. When you assign the value of the variable in a Run Configuration, you must enclose the value within single quotes: `'<value>'`.

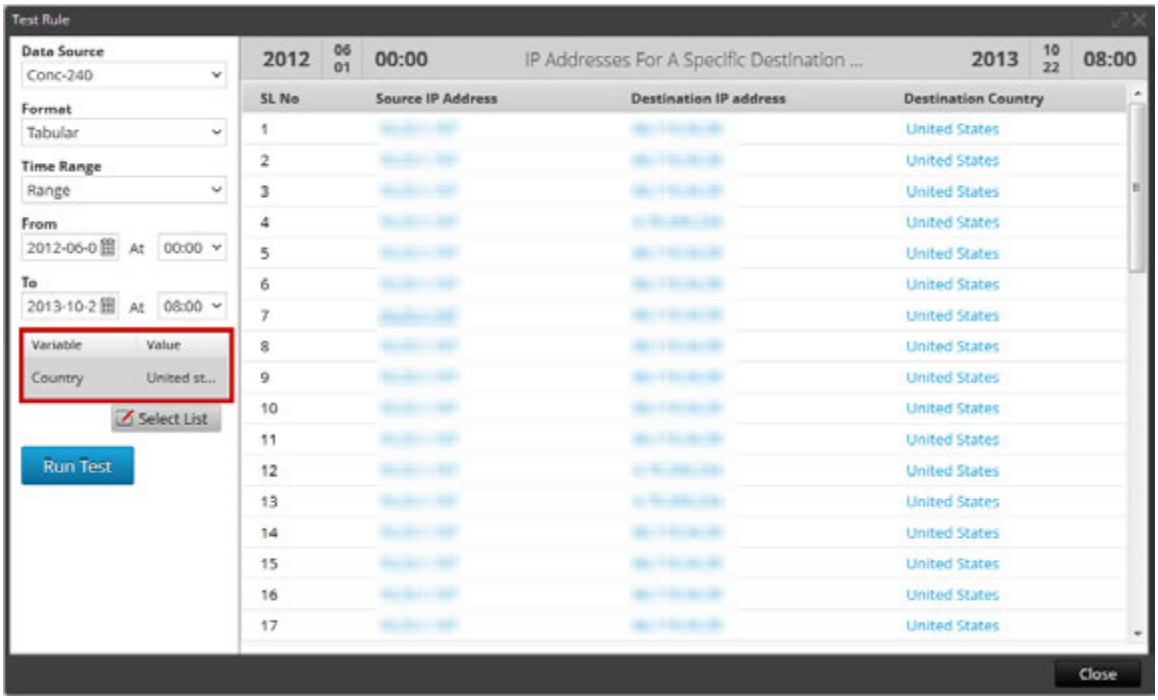
Some examples where a variable can be used are provided in this section.

View Source IP Addresses for a Specific Destination Country

The following is an example of a NetWitness DB rule to view the source and destination ip addresses for a specific destination country. Here the value for source country is defined as a variable `${local_country}`.



At runtime, you are prompted to enter the value for the variable. The figure below shows the `local_Country` variable where you can enter the value. If you enter the value as **United states**, all the source and destination ip addresses with destination country as United states are listed.



You can use the above rule to schedule a report. You can schedule two types of reports:

- Report with Dynamic Variables
- Iterative Report

Report with Dynamic Variables

Dynamic variables allows the user to specify the values for a variable defined in a rule while scheduling a report.

To schedule a report with Dynamic Variable, perform the following:

1. Select **MONITOR** > Reports.

   The Manage tab is displayed.

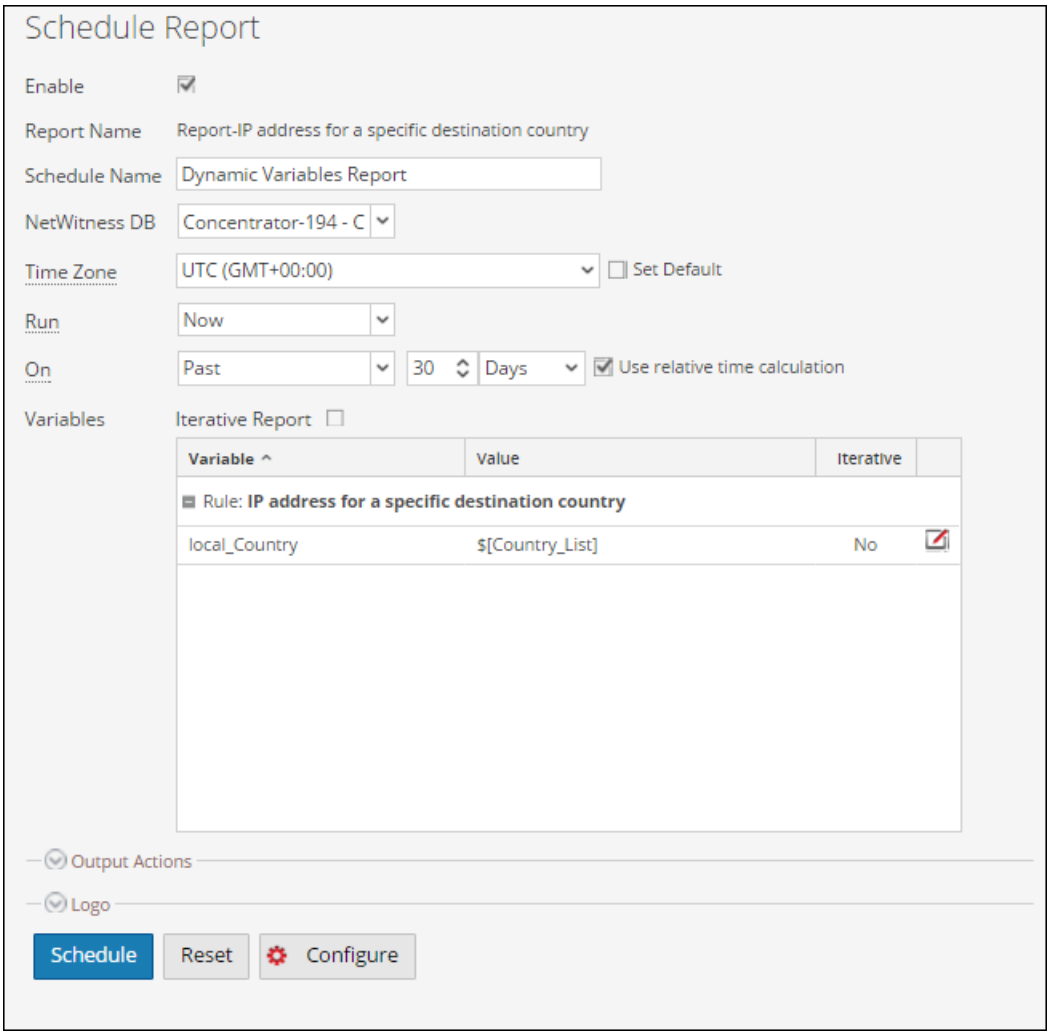
2. Click **Reports**.

   The Report view is displayed.

3. On the **Build Report** page, click + to create a report.

4. Add the rule which has the user defined variable from the Rules tab.

5. Click **Schedule**.
   The Schedule Report view tab is displayed.



6. To execute the reports as per the schedule, select the **Enable** checkbox.
7. In the **Schedule Name** field, enter a name for the schedule report configuration.
8. From the **Data Source** field, select the data source.

   Note: If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in the *Reporting Engine Configuration Guide*.

9. (Optional) From the **Warehouse Resource Pool** drop-down, select the pools or queues available in the cluster to schedule the report to run on either the pool or queue. This drop-down is available only if you select a Warehouse DB report.

   Note: All the queues or pools you specified in the Explore page for the Reporting Engine are listed. If no pools or queues are configured in the Explorer page, this drop-down is disabled and the jobs are submitted to the clusters without any a queue or pool name.

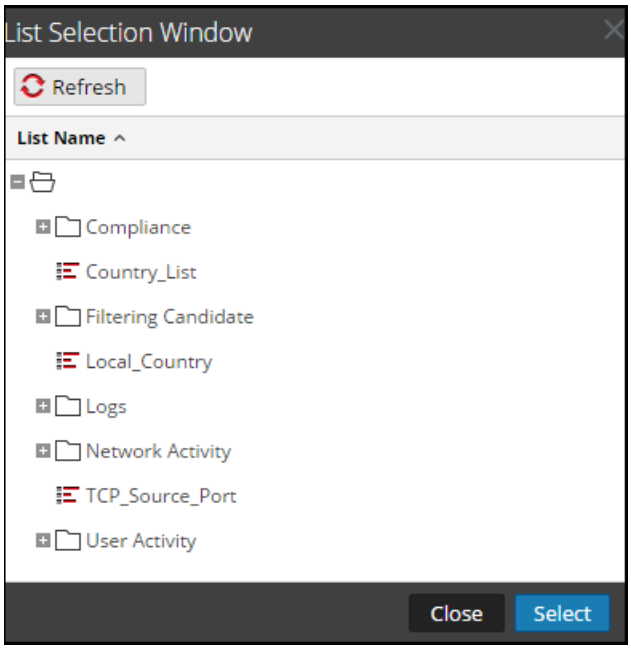
Note: If the pool or queue configured in the report schedule is removed from the Cluster, then in the Capacity Scheduler, the queue name remains undefined. However, in the Fair Scheduler, the specified pool name will be created using the property `mapred.fairscheduler.allow.undeclared.pool`.

10. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format.This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).
11. From the **Run** field, select the type of run schedule. (For example, Now or Hourly). Depending on the type of run schedule, do either of the following:
    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a time value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.

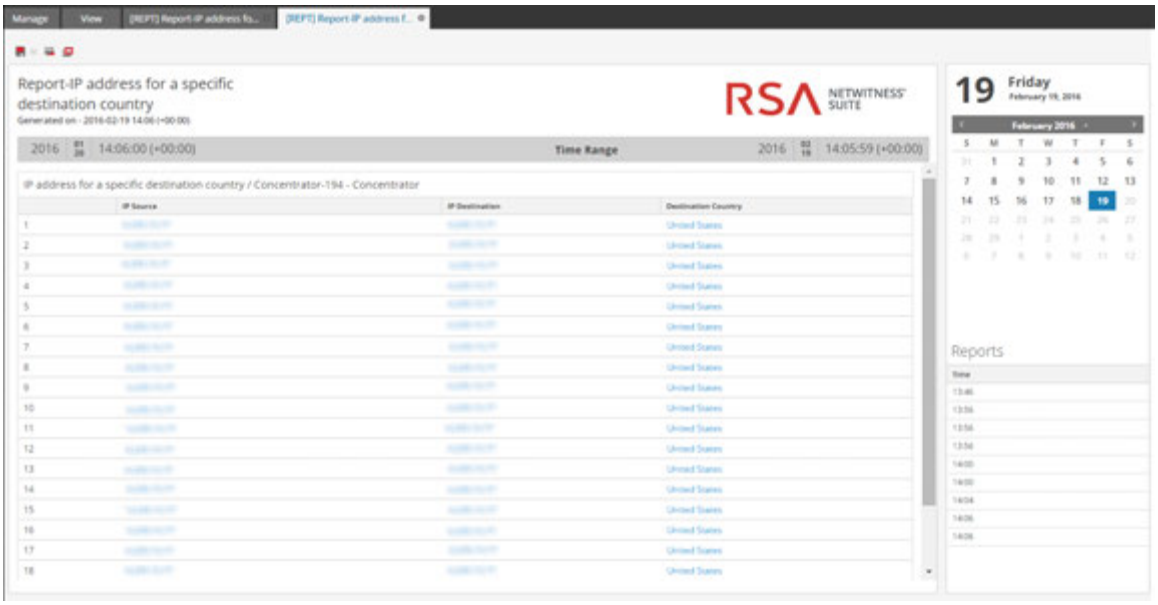
Note: While scheduling a report, if you select **Paste** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.

12. In the variables field, click  .
13. Do one of the following:

- Enter the value for the variable, or
- Choose the list value for the variable.

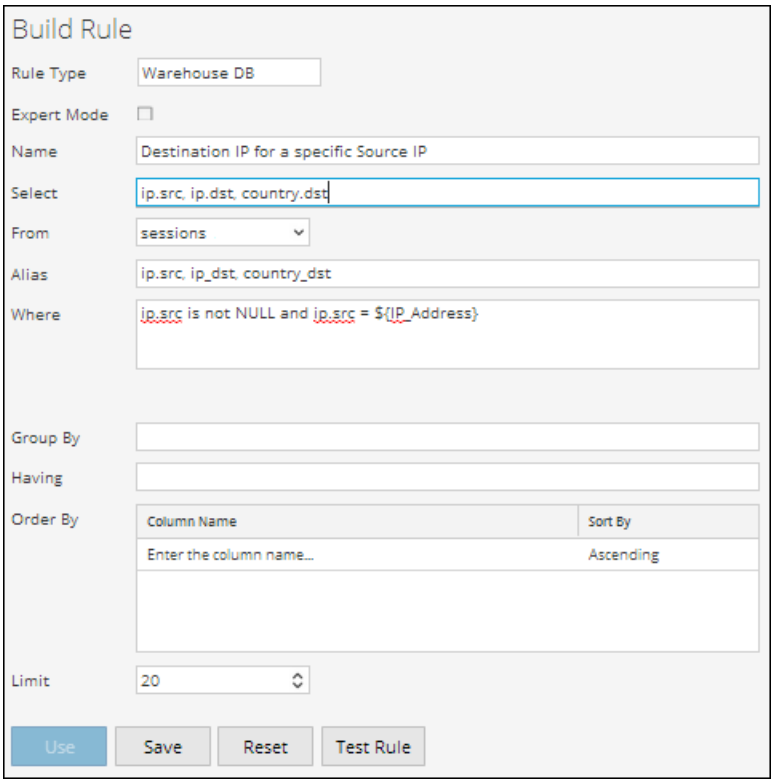


14. Click **Select**.
15. Click **Schedule**.
    The scheduled report executes as scheduled and provides the configured outputs.

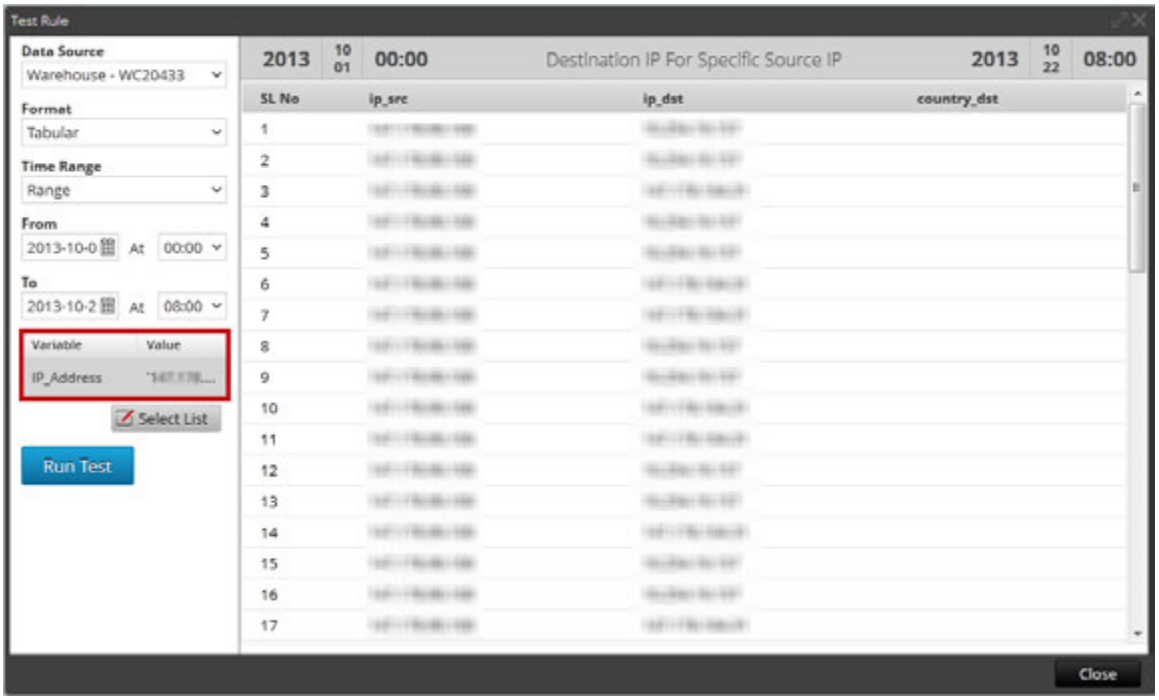


View All Destination IP Addresses for a Source IP Address

The following is an example of a Warehouse rule to view all the destination IP addresses for a specific source IP. The source IP address `ip_src` is defined as a variable `${IP_Address}`.

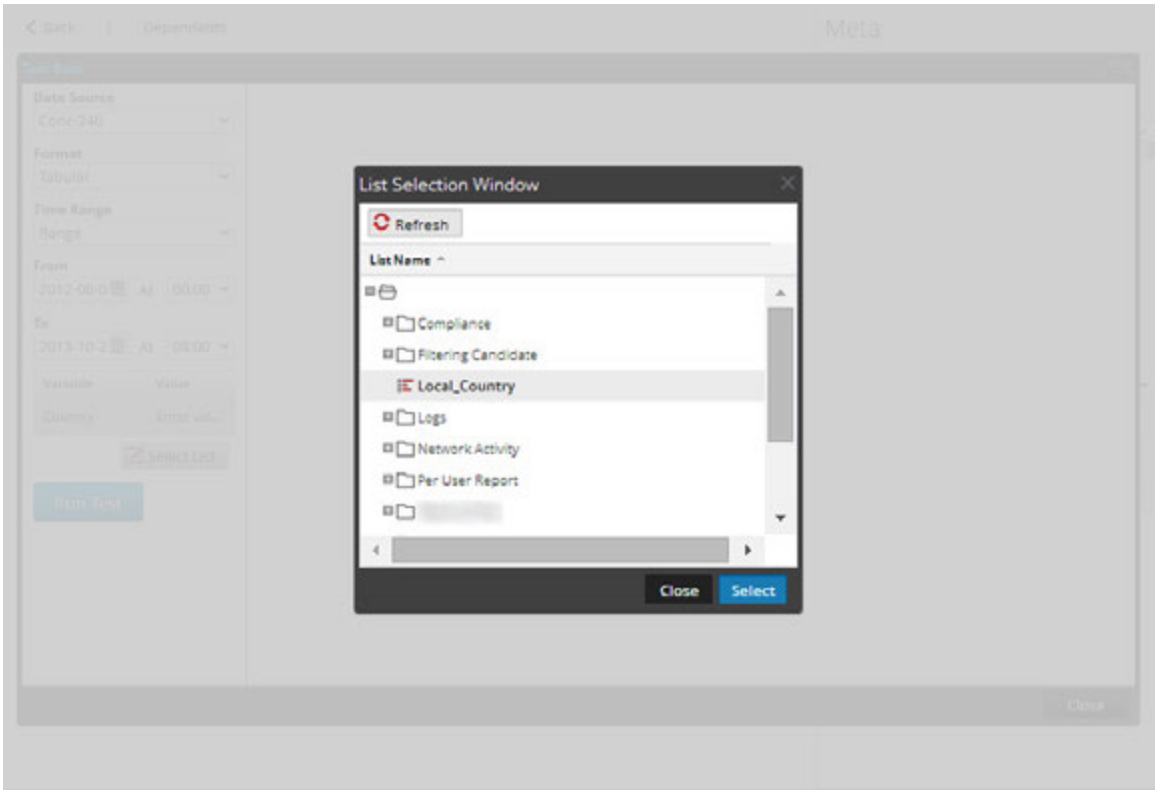


At runtime, you are prompted to enter the source IP address. The figure below shows the `IP_Address` variable, and you can enter a valid source IP address. All the destination IP addresses with the specified source IP are listed.



Associate a Variable to a List of Values

You can associate the variable to a list. For example, you can create a list called `Local_Country` and enter all the country names as values. You can select the list `Local_Country` as the value for the variable `Local_Country`. At Run Configuration, the `Local_Country` list is populated and you can select the country based on which results are displayed.



Iterative Report

An iterative report generates a report for every value in the list.

To schedule an iterative report, perform the following:

1. Select **MONITOR** > Reports.

   The Manage tab is displayed.

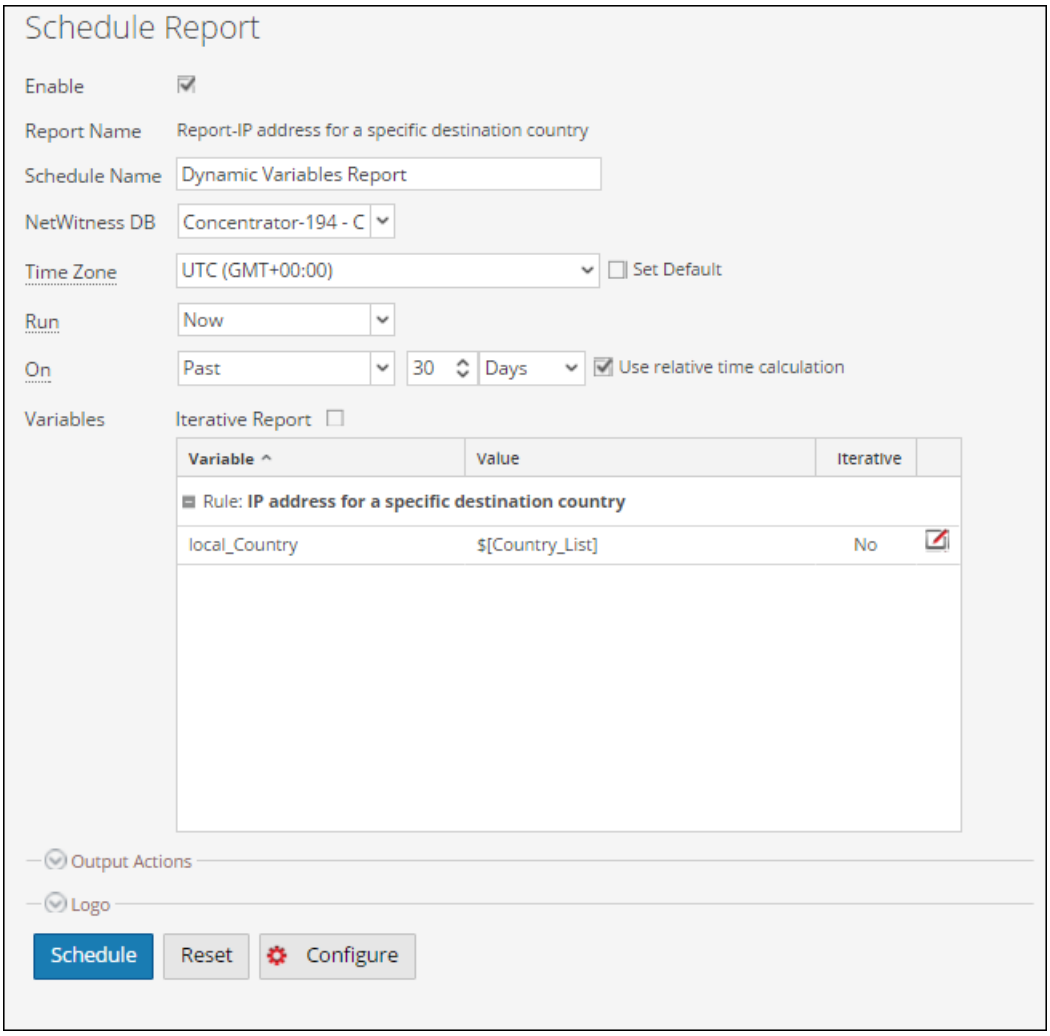
2. Click **Reports**.

   The Report view is displayed.

3. On the **Build Report** page, click + to create a report.

4. Add the rule which has the user defined variable from the Rules tab.

5. Click **Schedule**.
   The Schedule Report view tab is displayed.



6. To execute the reports as per the schedule, select the **Enable** checkbox.
7. In the **Schedule Name** field, enter a name for the schedule report configuration.
8. From the **Data Source** field, select the data source.

   Note: If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in the *Reporting Engine Configuration Guide*.

9. (Optional) From the **Warehouse Resource Pool** drop-down, select the pools or queues available in the cluster to schedule the report to run on either the pool or queue. This drop-down is available only if you select a Warehouse DB report.

   Note: All the queues or pools you specified in the Explore page for the Reporting Engine are listed. If no pools or queues are configured in the Explorer page, this drop-down is disabled and the jobs are submitted to the clusters without any a queue or pool name.

Note: If the pool or queue configured in the report schedule is removed from the Cluster, then in the Capacity Scheduler, the queue name remains undefined. However, in the Fair Scheduler, the specified pool name will be created using the property `mapred.fairscheduler.allow.undeclared.pool`.

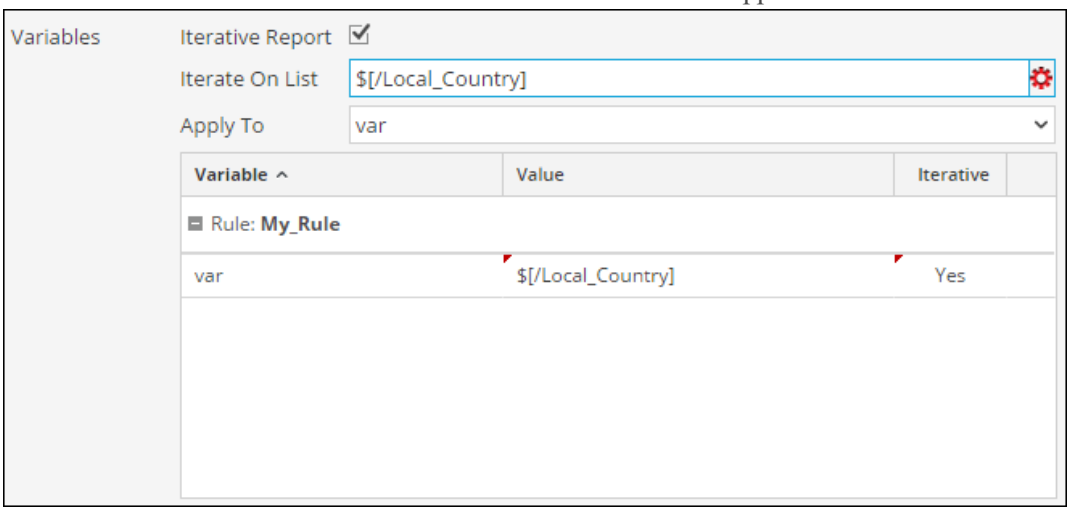
10. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format.This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).
11. From the **Run** field, select the type of run schedule. (For example, Now or Hourly). Depending on the type of run schedule, do either of the following:
    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a time value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.

    Note: While scheduling a report, if you select **Paste** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.
12. In the variables field, do the following:
    a. To run iterative reports, select the **Iterative Report** checkbox.
    b. To Iterate on List value, click  .

       The List Selection Window opens.
    c. Choose a list and click **Select**.

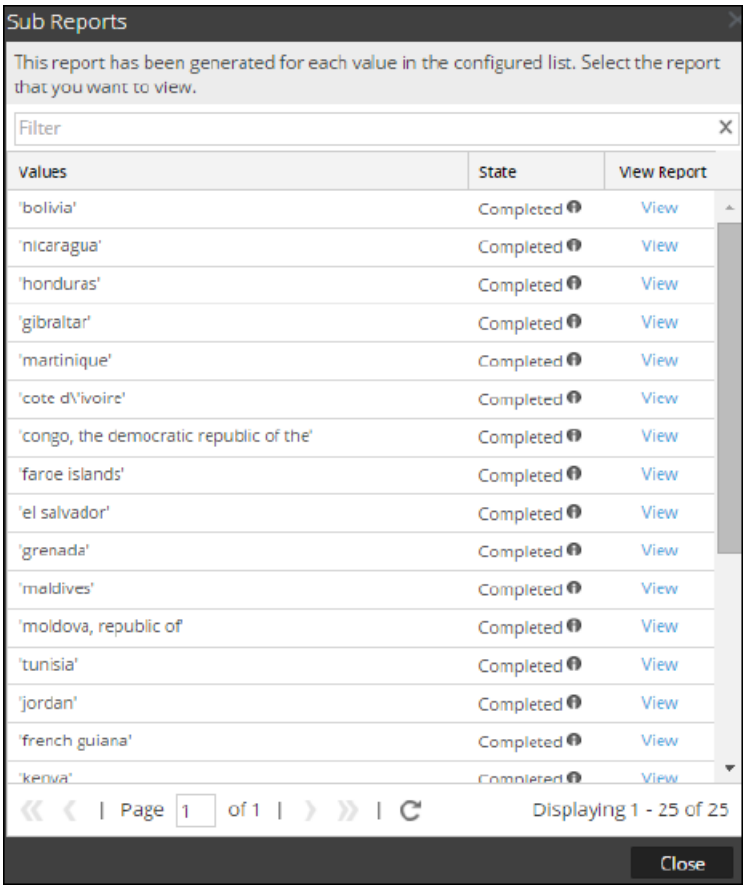
       The list item selected gets added to the **Iterate on List** field.

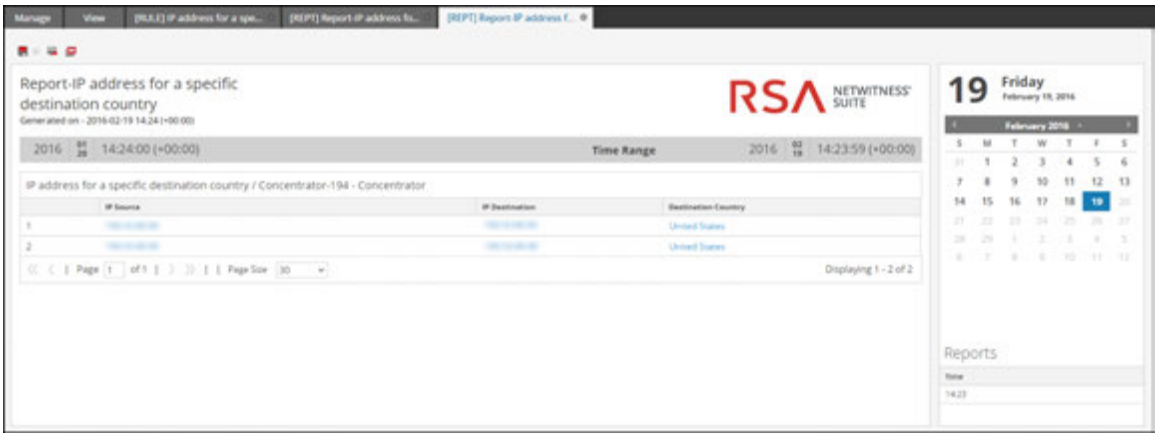
d. Select the variable on which the selected list value has to be applied.



13. Click **Schedule**.
The scheduled report executes as scheduled and provides the configured outputs.

The following figure shows the Iterative Report view.





Create a Report Using a Rule

You can create a report using a rule. When you create a report using a rule, a default report is created with this single rule. You can further edit the report to add more rules.

To create a report using a rule, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Do one of the following:
   - You can create a report using a rule when you create or edit the rule. Perform the following:
     a. In the **Build Rule** view, click **Use**.
        The Use Rule dialog is displayed.
     b. Click **Report**.
     c. Select **New Report** or **Existing Report** based on your requirement.
     d. Click **Select**.
   - Select a rule in the Rule List panel and click  in the Rule toolbar. From the drop-down menu, select **Use** > **Report**.
   - In the Rule List panel and click  > **Create Report**.

Note: Custom rules can be used to create a Report and If you select the view for the rule as "Area" or "Pie", a window pops up for **X-Axis** and **Y-Axis** inputs. By default, you can select only the first meta in **X-Axis**.

View a Report

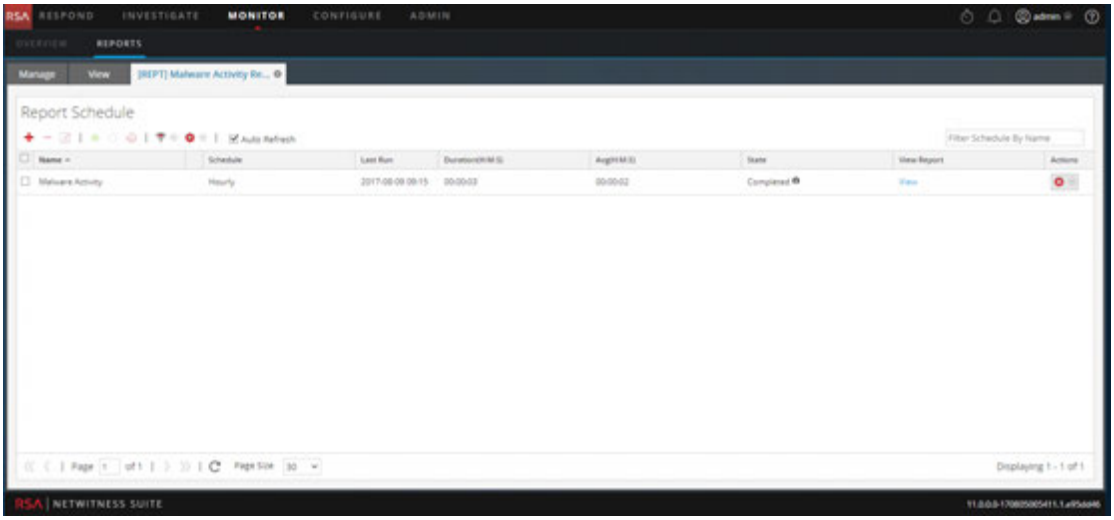
You can view a report or list of all reports. You can also view the scheduled reports to know the state of the scheduled report. If the scheduled report is in a stop or disable state, you can start or enable the scheduled report.

After you view a report, you can perform any of the following tasks:

1. You can print, save, email and view reports on full screen.
2. You can also select a date from the calendar to view a list of successfully run reports for the chosen date.

To view a report, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, click  > **View Scheduled Reports**.
4. Click the **#Schedules** column.
   The Schedule Reports view tab is displayed with the status of each of the scheduled report.



5. Select a scheduled report and click **View**.
   One of the following is displayed:

- The selected report.
- The Sub reports panel for a scheduled report having 'Iterative' selected.

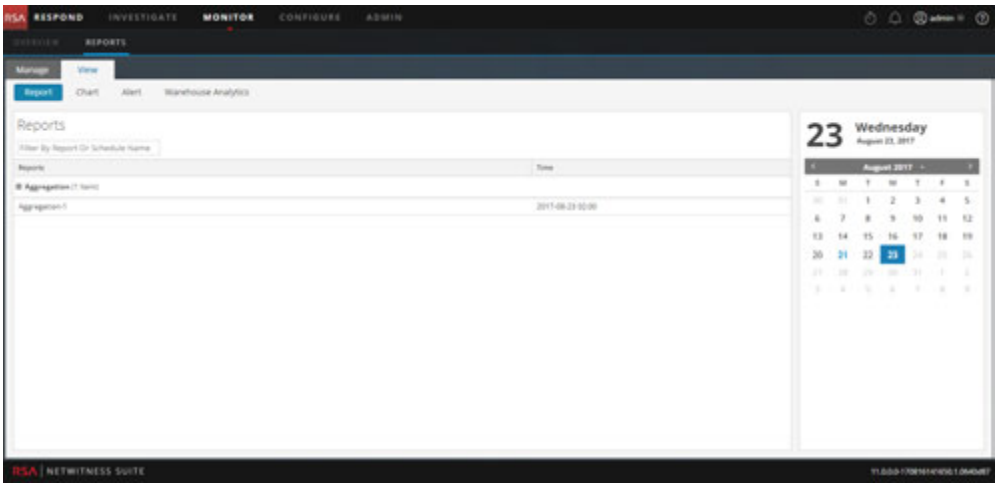
For each value in the configured list a report is displayed.

> **Note:** If the report status is partial or complete, the "last run timestamp" and the "last run (seconds)" are updated. However, the average time taken to run the report is updated only when the report status is complete and not when it is partial.

To view a list of all reports, perform the following:

1. Select **MONITOR** > **Reports**.
   The **Manage** tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report** panel, click **View All Reports**.
   A list of reports along with their schedule name and time are displayed on the View tab.

   > **Note:** If no list is displayed, select a date from the calendar to view a list of reports for that date.



4. You can select a scheduled report and print, save as PDF/CSV, send email notifications, or view it on full screen.

Investigate a Report

You can investigate a report by directly navigating to the Investigation View from the report. With the Investigate a report option, you can investigate each event mentioned in the report.

To investigate a report, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report** toolbar, click **View All Reports**.
   The View All Reports tab is displayed.

   Note: If no reports are displayed in the View All Reports, select a date for which you want to display the reports.
4. Double-click the report name to view the report details.
   The Report details screen is displayed.

   You can click on the session analysis to investigate on the report.

Note: If you want to manually copy the result data and use it for investigation, make sure that the binary values are prefixed with 'hex:'.

Manage Lists, Rules or Reports

You can set access control, delete, edit, import, or export a list, rule or report.

Manage a List

Access Control for a List and List Group

You can set up the access permissions for the user roles to manage lists or list groups. The Reporting provides access control at the list and list group level. Only a user who has the right set of permissions can perform the tasks in the Reporting. The access control is managed by the administrator from the **ADMIN > Security > Roles** tab.

As an administrator you must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

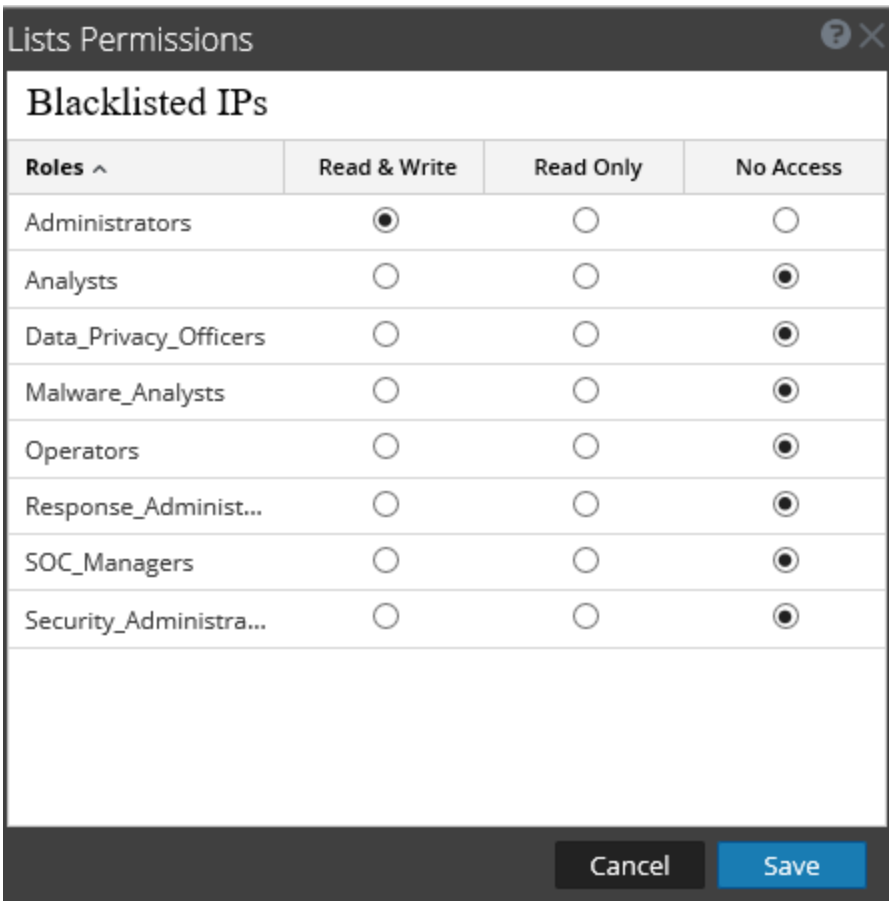
Lists or list groups can be assigned to a specific set of user roles. When users log into NetWitness Suite, they can access only those lists to which they belong. Users who belong to a user role with the **Read & Write** access permission have full access rights on the lists. Further, the access can be strengthened so that lists are accessed only by those who have the **Read Only** access.

Note: You must have **Read Only** permission for a list group to view the lists within that group.

For example, if you want **Security Analysts** to have access to all the lists in a list group, you can set the permission **Read & Write** at the list group level. And, if you do not want the **Operator** role to have access to a specific set of lists in a list group, you can set the permission **No Access** at the list group level.

At the list or list group level, you can set the following access permissions for the user roles in NetWitness Suite. For more information, see List View:

- Read & Write
- Read Only
- No Access



The following table lists the columns in the Lists Permissions panel:

Column	Description
Roles	Describes roles of the users logged into the NetWitness Suite user interface.
Read & Write	Allows users to access, view, edit, delete, import, and export lists on the Lists view. Users can also change the permission on the rule.
Read Only	Allows users to only access and view the list on the lists view.
No Access	Doesn't allow users to access or view the lists.

Access Control for a List

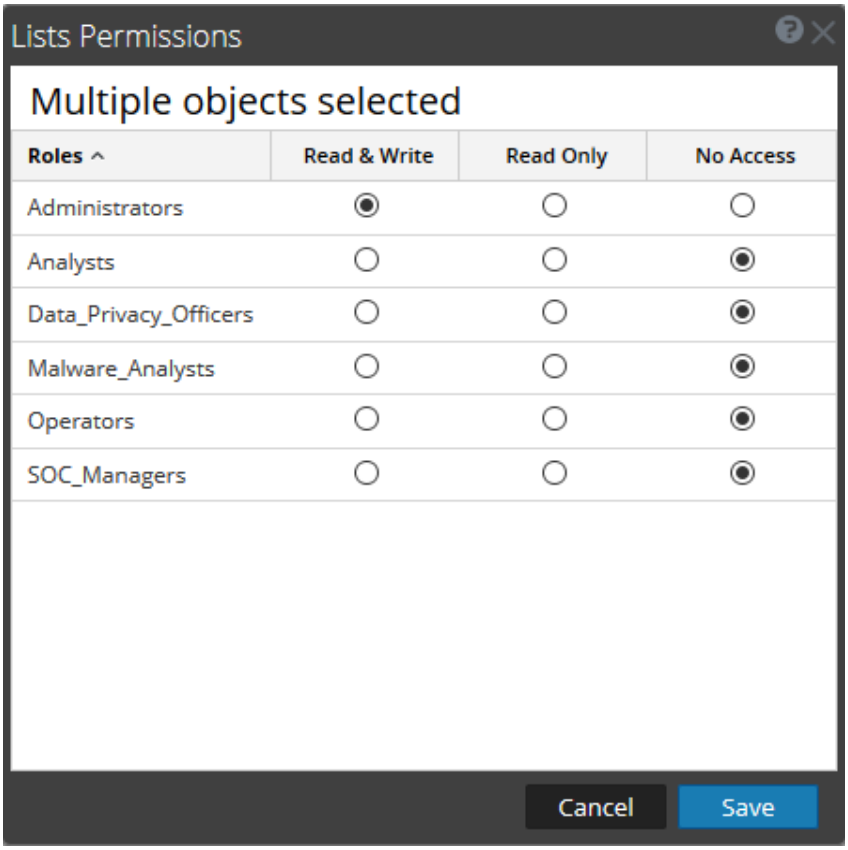
To change the list permissions, you must select a list and set access permissions using the List Permissions panel.

If you want to change the access permission for a specific user role, you must set it at the list level. Except for administrators, the default permission set for all the other user roles is **No Access** before applying job permissions.

Access Control Multiple Lists

You can select multiple lists at once and set access permissions using the Lists Permissions Panel. The access permission that you choose is applied to all the selected lists.

Note: The * beside the role name indicates that other permissions are available for the user role. If you want to change the access permission for the required user role, select the user role and change the access permission.



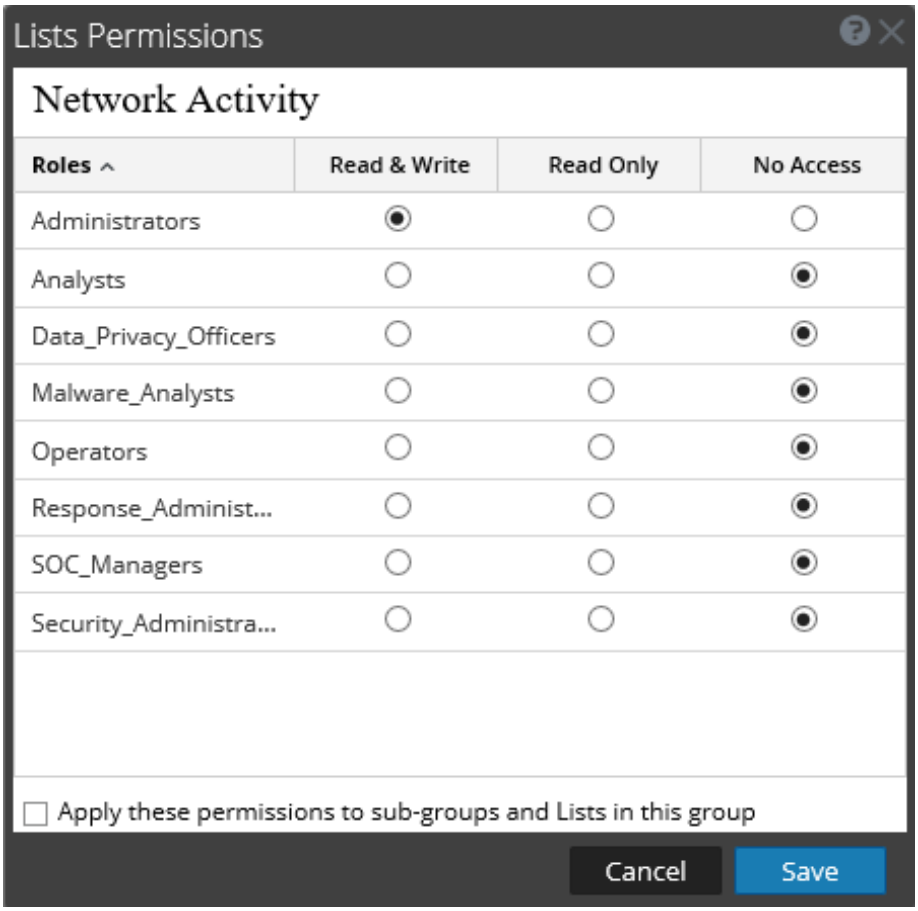
Note: If a user (other than ADMIN) creates a list, ADMIN cannot access that list.

Access Control for a List Group

To change the list group permissions, you must select a list group and set access permissions using the Lists Permissions panel.

If you want to change the access permission for a specific user role, you must set it at the list group level. Except for administrators, the default permission set for all the other user roles is **No Access** before applying job permissions.

You can also apply permissions to subgroups and lists in the group by selecting the checkbox.



The following scenarios describe defining permissions for list groups or subgroups and lists in the groups:

- Scenario 1: Permissions applied to list group or subgroup based on the user role.

  Each of the levels will have a permission set depending on the user role. For example, if a list group is assigned the role of Security Analyst, permissions are set to Read & Write for the list group.

- Scenario 2: Permissions applied to subgroups and lists in the group.

  The access permissions that you set can be applied to subgroups and child objects of this group. Permission at the list group level will be inherited by the subgroups and lists in the group.

Role (Analysts)	Permissions applied to list group or subgroup based on the user role	Permissions applied to subgroup and lists in the group
Group	Read & Write	Read & Write

Role (Analysts)	Permissions applied to list group or subgroup based on the user role	Permissions applied to subgroup and lists in the group
Subgroup	Read	Read & Write - Inherited
Lists	Read	Read & Write - Inherited

Access permission for a list or list group

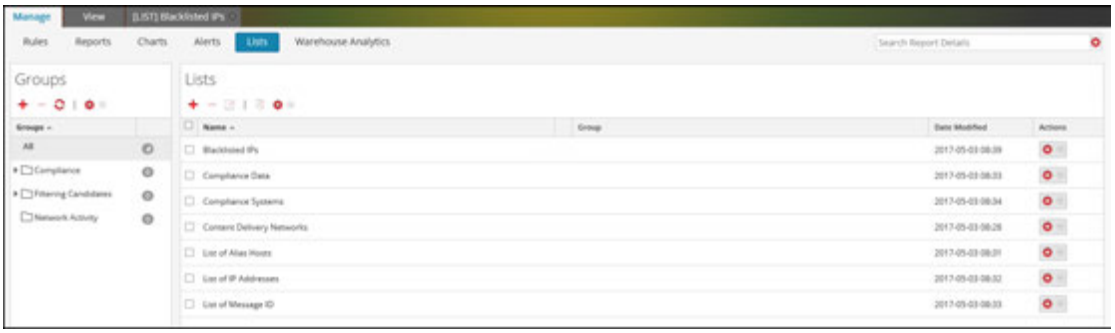
Ensure that you have at least **Read & Write** access permission so that you can set access permissions for lists or list groups.

To set access permission for a list, perform the following:

1. Select **MONITOR** > **Reports**.

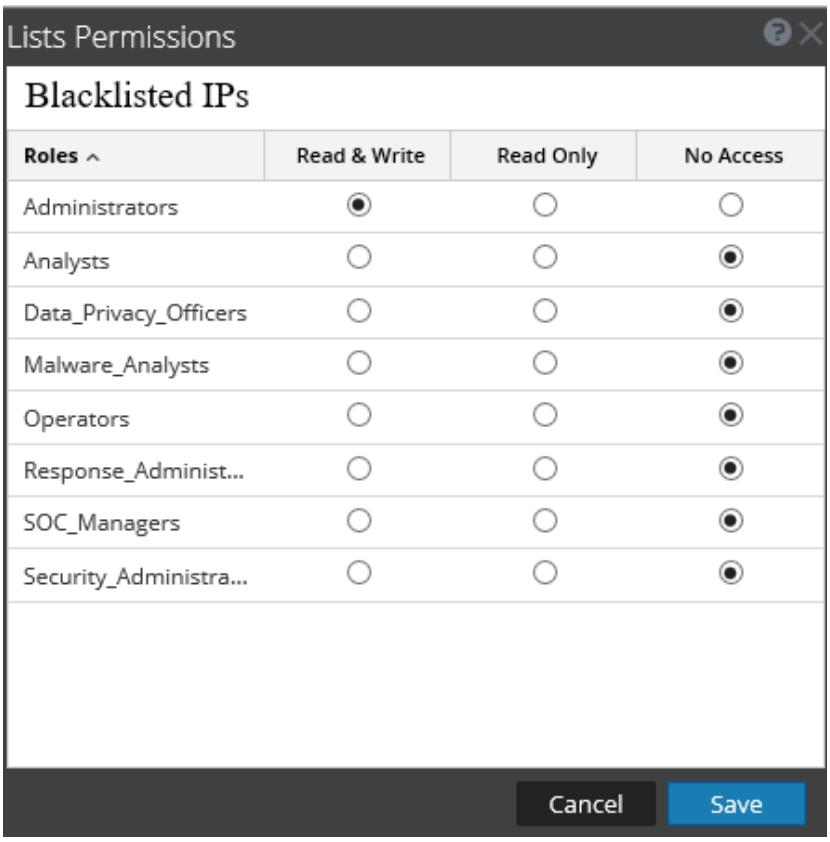
   The Manage tab is displayed.

2. Click **Lists**.
   The List view is displayed.



3. In the **List View** panel, select a list.

4. Click  > **Permissions** in the List toolbar.
   The List Permissions dialog is displayed.



5. Select the appropriate access permission for each of the user roles and click **Save**.

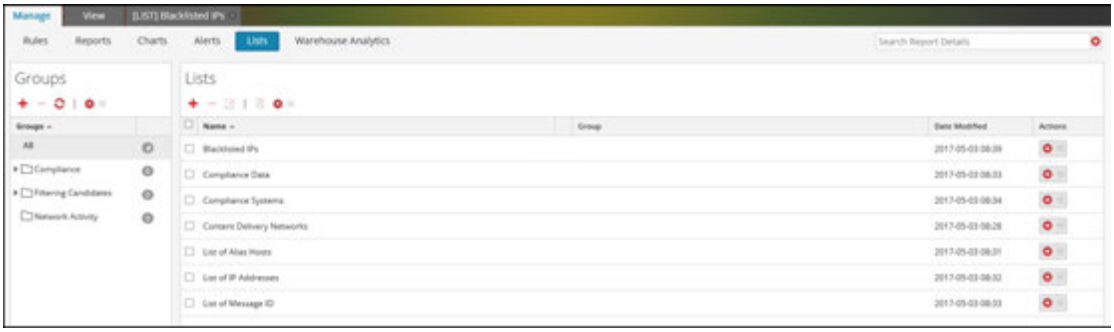
   A confirmation message that the permission is successfully set for the selected list is displayed.

To set access control for a list group, perform the following:

1. Select **MONITOR** > **Reports**.

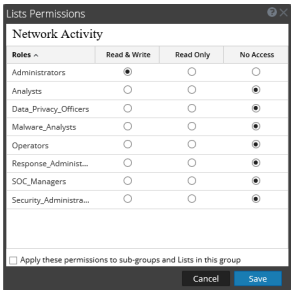
   The Manage tab is displayed.

2. Click **Lists**.
   The List view is displayed.



3. In the **List Groups** panel, select a list group.

4. Click  > **Permissions**.
   The List Permissions dialog is displayed.



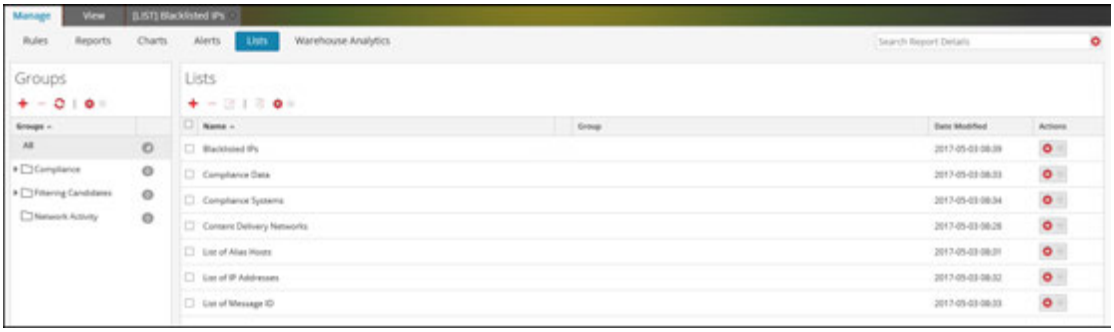
5. (Optional) Select the appropriate checkbox to apply these permissions to subgroups and child objects of this group.
6. Click **Save**.

   A confirmation message that the permission is successfully set for the selected list group is displayed.

Edit a List

To edit a list, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.
   The List view is displayed.



3. In the **List View** panel, select a list that you want to edit and do one of the following.
   - Click  in the List toolbar.
   - In the List View panel, click  > **Edit**.

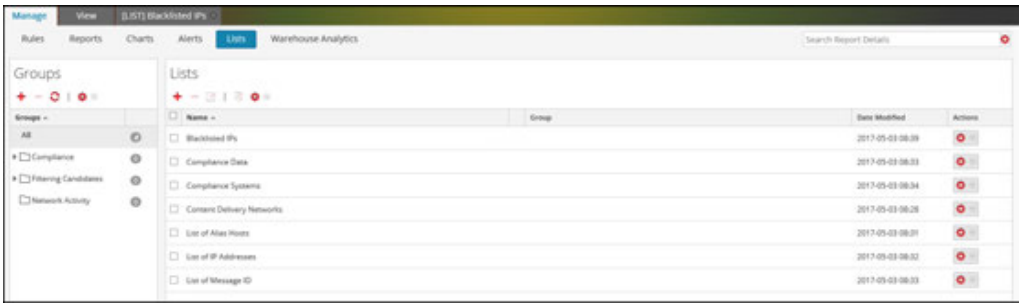
Note: You can only edit one list at a time.

4. Modify the required fields and add new values to the list.
5. Click **Save**.
   A confirmation message that the list is saved successfully is displayed.

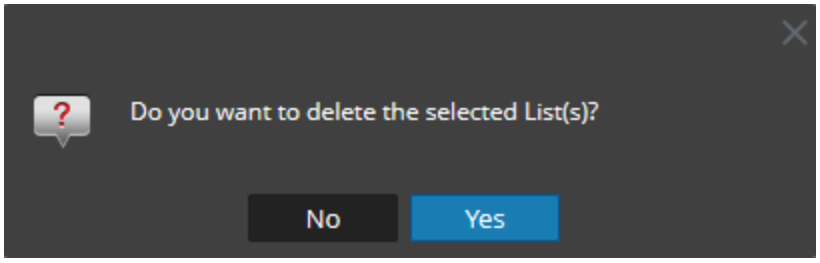
Delete a List or List Group

To delete a list, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.
   The List view is displayed.



3. In the **List View** panel, do one of the following:
   - Select a list or multiple lists that you want to delete and click in the **Lists** toolbar.
   - In the **Actions** column, click > **Delete**.
     A confirmation dialog is displayed.

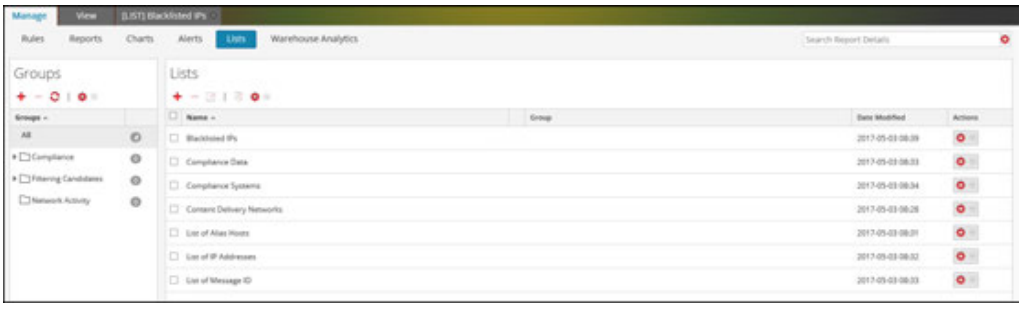


Note: Before you delete a list, make sure that the list is not associated with any rule.

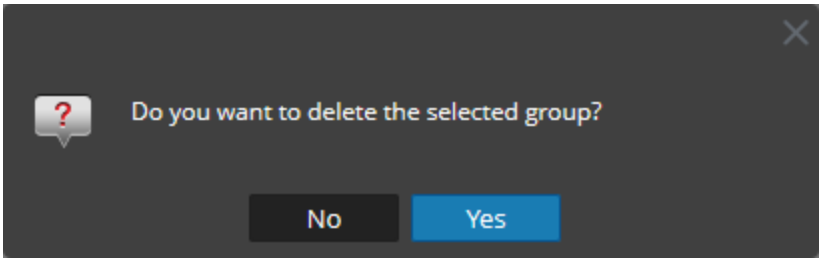
4. Click **Yes** to delete the list.
   A confirmation message that the list is deleted is displayed and the selected list is deleted from the List View panel.

To delete a list group, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.
   The List view is displayed.



3. In the **List Groups** panel, select the group and click .
   A confirmation dialog is displayed.



Caution: If you delete a group, all subgroups and lists in that group are deleted.

4. Click **Yes** to delete the selected group.

Note: If you try to delete a list group that has lists referenced in a rule or an alert, a warning message that **Lists are referenced in a rule** is displayed.

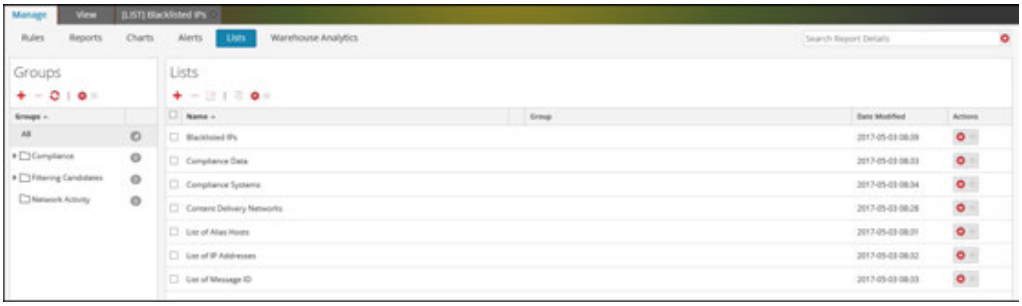
Duplicate a List

To duplicate a list, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.



3. In the **List View** panel, select a list that you want to duplicate.

   Note: You can only duplicate one list at a time.

4. In the **List** toolbar, click  .

Export a List or List Group

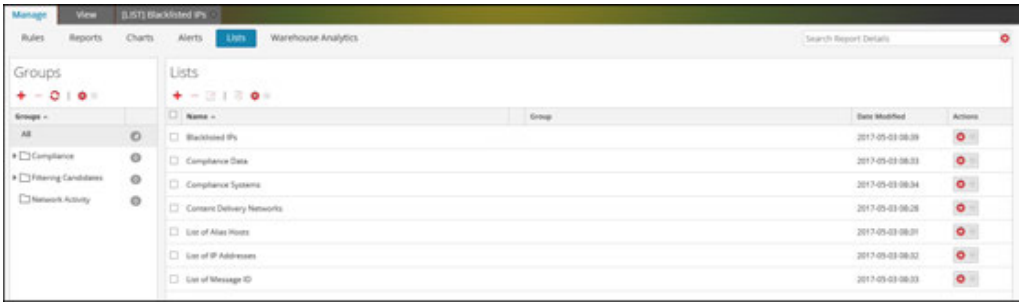
To export a list, perform the following:

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.



3. In the **List View** panel, do one of the following:

   - Select a list and click  > **Export** in the List toolbar.
   - In **Actions** column, click  > **Export**

   You can export multiple lists at a time. To select multiple lists, select the checkbox of the lists to be exported. A browser-specific export dialog may be displayed allowing you to open

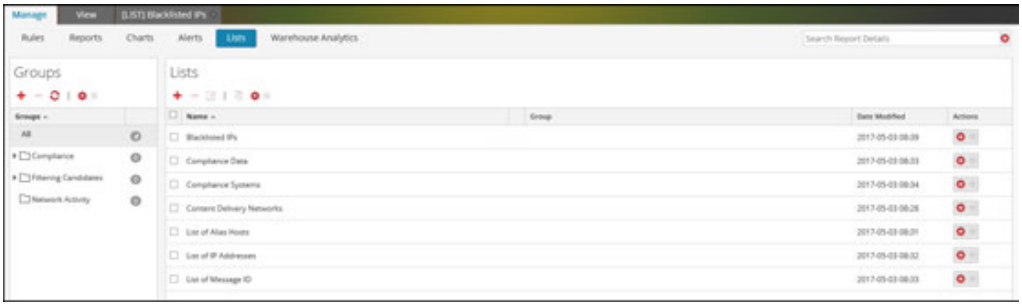
or save the file.

Note: You can export only one list at a time.

To export a list group, perform the following:

You can export selected list groups to an external file that can be later imported to NetWitness Suite. If nothing is selected in the List Library panel, the entire list tree is exported. When you export, the result is a single export file in binary format.

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.
   The List view is displayed.



3. In the **List Groups** panel, select the list group containing the lists which you want to export.
4. Click  > **Export**.
   You can export multiple list groups at a time. To select multiple list groups, press and hold the CTRL button and select the list groups to be exported. The exported file is saved to the local drive.

Import a List or List Group

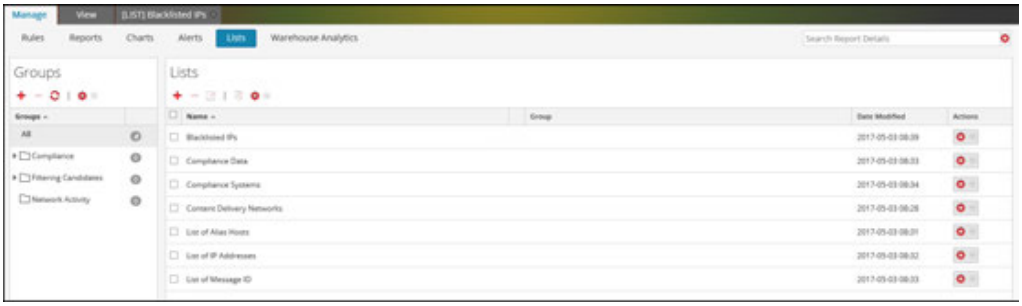
To import a list, perform the following:

You can import lists from instances of NetWitness Suite into the list tree in the List View panel. Lists must be in a valid binary file exported from a NetWitness Suite instance.

1. Select **MONITOR**> **Reports**.
   The Manage tab is displayed.

2. Click **Lists**.

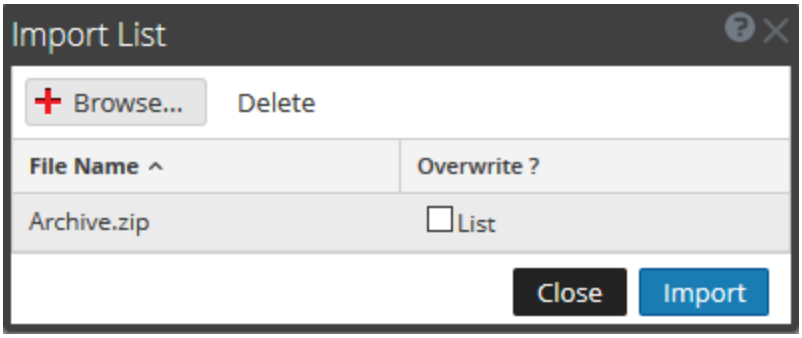
   The List view is displayed.



3. In the **List** toolbar, click  > **Import**.

   The Import List dialog box is displayed. You can import multiple lists at a time. To select multiple lists, press and hold the CTRL button and select the lists to be imported.

4. Click **Browse** and select archived file containing the lists.



5. Click **Import**.

Note: During the import process, if a duplicate list exists and you do not select the overwrite option, the list is imported and no message about duplicate lists is displayed.

To import a list group, perform the following:

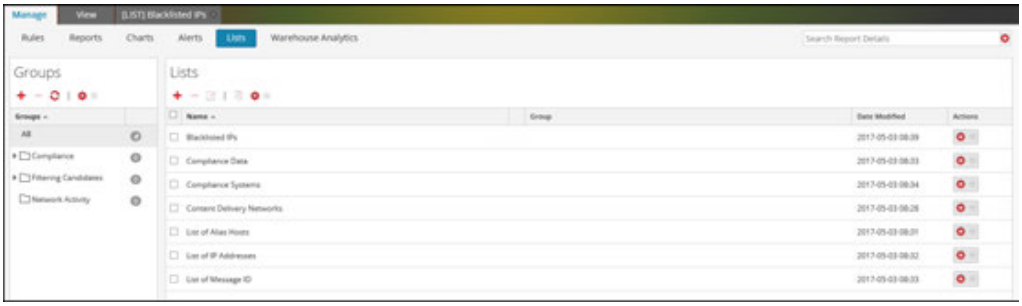
You can import list groups from instances of NetWitness Suite into the list tree in the List Groups panel. Lists must be in a valid binary file exported from a NetWitness Suite instance.

1. Select **MONITOR**> **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.



3. In the **List Groups** panel, click  > **Import**.

   The Import List dialog box is displayed.

4. Click **Browse** and select archived file containing the list groups.

   You can import multiple list groups at a time. To select multiple list groups, press and hold the CTRL button and select the list groups to be imported.

5. Click **Import**.

Note: During the import process, if a duplicate list group exists and you do not select the overwrite option, the list group is imported and no message about duplicate list group is displayed.

Manage a Rule

Access Control for a Rule and Rule Group

To set access permissions the user will have depending on the user role to manage a rule or rule group. The Reporting provides access control at the rule and rule group level. Only a user who has the right set of permissions can perform the tasks in the Reporting. The access control is managed by the administrator from the **ADMIN > Security > Roles** tab.

When creating users and user roles, the administrator must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

Rules or Rule Groups can be tied to a specific set of user roles so that when a user logs into NetWitness Suite, the only rules they can access are rules accessible to the group to which the user belongs. Users that belong to a user role with the ‘Read & Write’ access permission have full access rights on the rule. Further, the access can be tightened so that rules are accessed only by those who have the ‘Read Only’ access.

Note: You must at least have ‘Read Only’ permission on a group to view the rules within that group.

At the rule level, you can set the following access permissions for the user roles:

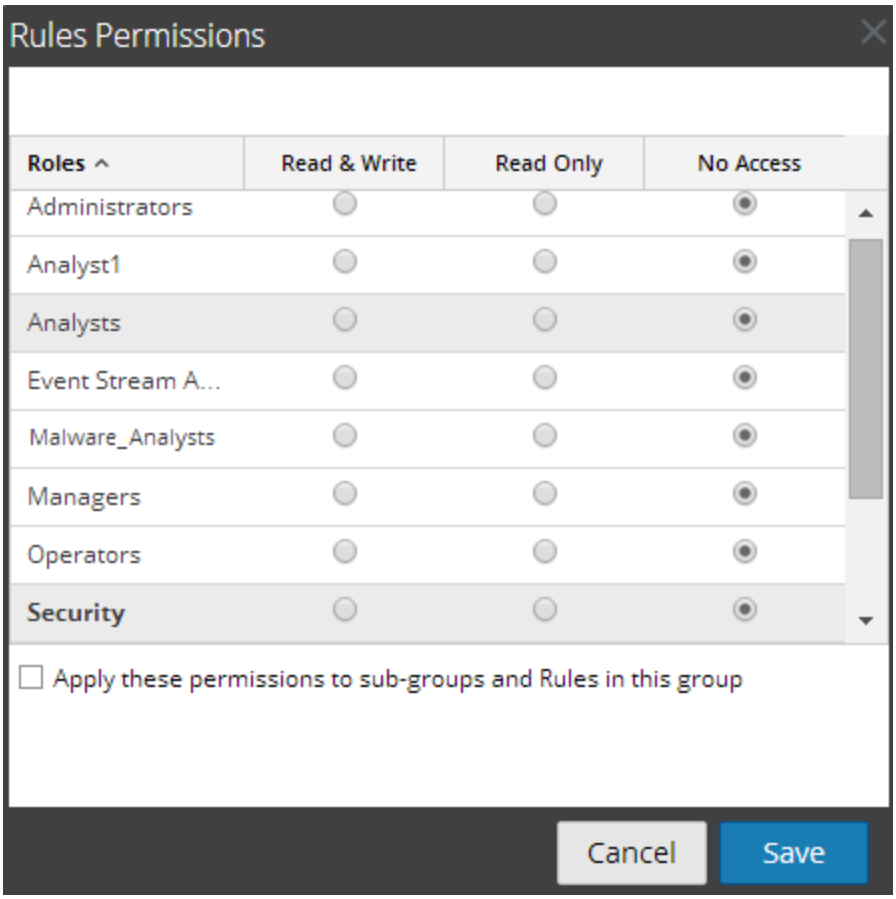
- Read & Write
- Read Only
- No Access

Suppose, you want the **Security Analysts** to have access to all the rules in a Rule Group, you can set the permission '**Read & Write**' at the Rule Group level. And, if you do not want the **Operator** role to have access to a specific set of rules in a rule group, you can set the permission '**No Access**' at the Rule Group level. The permission is set only for the rule group but not the rules or subgroups in the Rule Group.

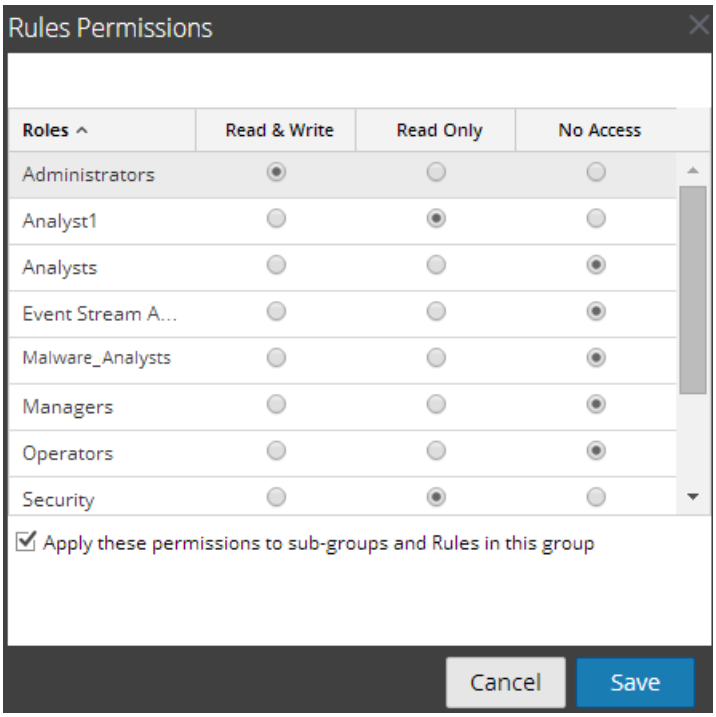
Access Control for a Rule Group

When you want to change the rule group permissions, you must select a rule group and set access permissions using the Rule Permissions panel.

Before applying rule group permissions, the default permission set for all the user roles is 'No Access' permission, and the checkboxes are deselected.



If you want to change the access permission for a specific user role, you must set these at the rule group level, as shown in the figure. Suppose, you want the **Administrators** to have access to all the rules in a Rule Group, you can set the permission '**Read & Write**' in the Rule Group Permissions panel.



You can also apply permissions to subgroups and rules in the group by selecting the checkbox.

The two scenarios are explained in brief:

- Scenario 1: Permissions applied to Rule Group/ Sub Group/ Rules based on the user role.
- Scenario 2: Permissions applied to Sub Group and Rules in the Group.

Role (Analysts)	Permissions applied to Rule Group/ Sub Group/ Rules based on the user role	Permissions applied to Sub group and Rules in the Group
Group	**Read & Write**	**Read & Write**
Sub Group	**Read**	**Read & Write - Inherited**
Rules	**Read**	**Read & Write - Inherited**

The access permissions that you set can be applied to subgroups and child objects of this group.

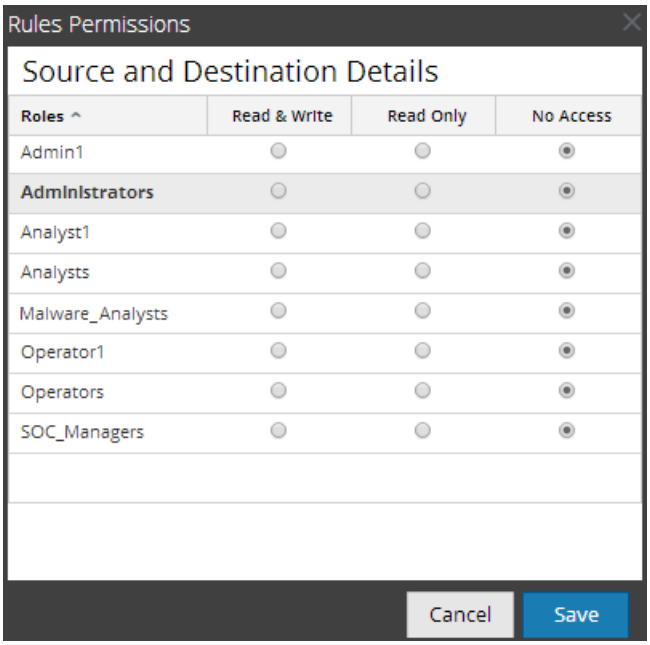
The Rule Group will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** rule group.

For scenario 1, each of the levels will have a permission set depending on the user role. For scenario 2, the permission at the Rule Group level will be inherited by the Sub Group and Rules in the Group.

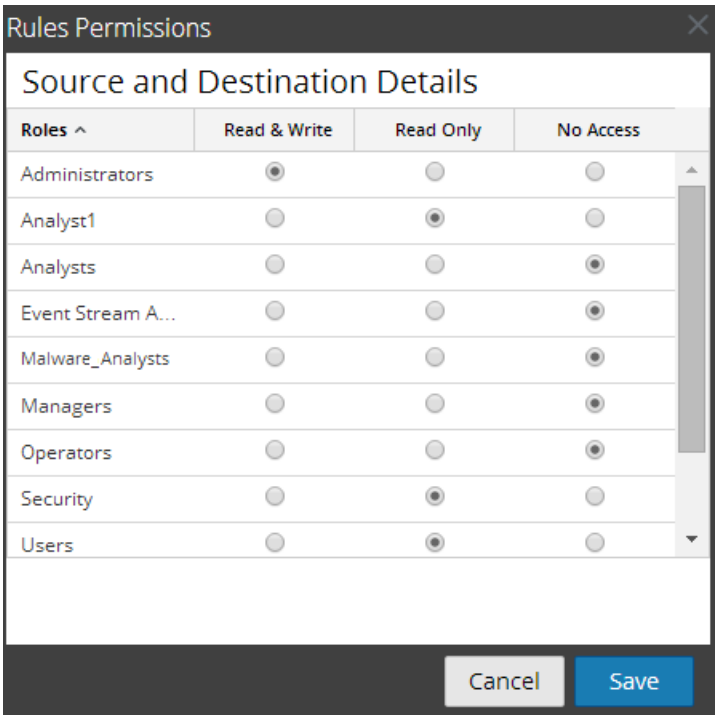
Access Control for a Rule

When you want to change the rule permissions, you must select a rule and set their access permissions using the Rule Permissions panel.

Before applying the Rule permissions, the default permission set for all the user roles is 'No Access' permission and the checkbox is deselected.



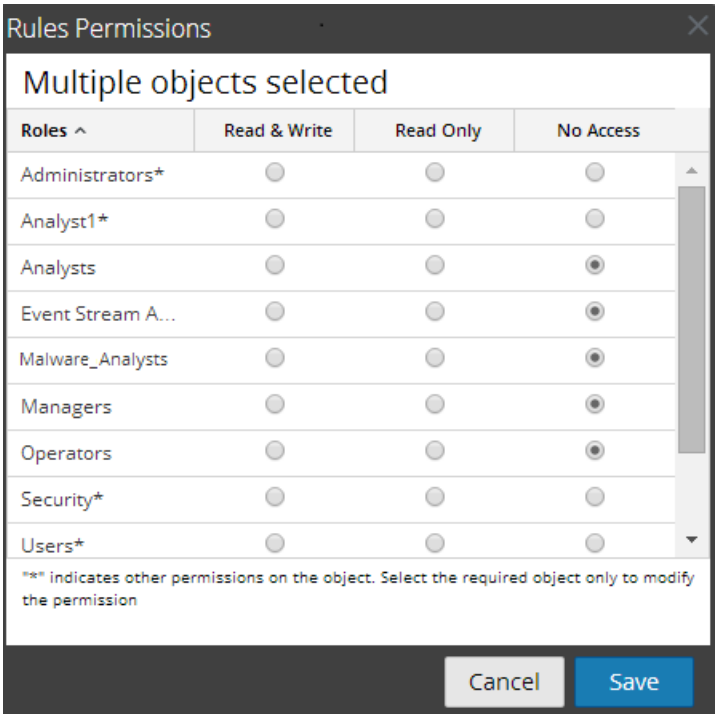
If you want to change the access permission for a specific user role, you must set these at the rule level, as shown in the figure. Suppose, you want the **Administrators** to have access to a specific rule, you can set the permission '**Read & Write**' in the Rule Permissions panel.



Access Control for a Rule When Multiple Rules are Selected

When you want to change permissions of multiple rules, you can select multiple rules at a time and set their access permissions using the Rules Permissions Panel. The access permission that you choose will be applied to all the selected rules.

Note: The '*' besides the role name indicates the other permissions available on the user role. If you want to change the access permission for the required user role, select the user role and change the access permission.



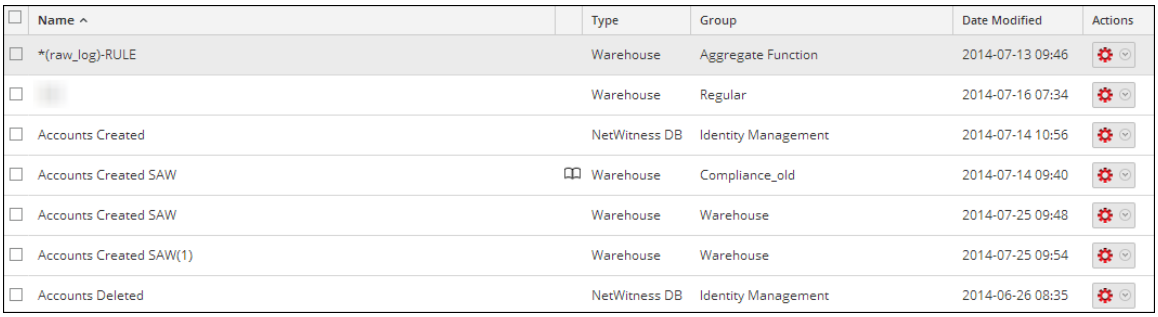
Login as a specific user and view the access details

When you login to the NetWitness Suite UI as a user having 'Read access' permission, all the rules will be denoted with the symbol (📖) and when you click on the symbol the 'Read Only' callout is displayed on the Rules List panel.

When you login to the NetWitness Suite

UI as a user not having 'Read & Write' access permission on a Rule, all the rules will be denoted with the symbol (👁‍🗨) and the rules appear grayed out on the Rules List panel.

The following figure shows the Rules List panel when logged in with minimal 'Read & Write' access permission.



Name	Type	Group	Date Modified	Actions
*(raw_log)-RULE	Warehouse	Aggregate Function	2014-07-13 09:46	
[redacted]	Warehouse	Regular	2014-07-16 07:34	
Accounts Created	NetWitness DB	Identity Management	2014-07-14 10:56	
Accounts Created SAW	Warehouse	Compliance_old	2014-07-14 09:40	
Accounts Created SAW	Warehouse	Warehouse	2014-07-25 09:48	
Accounts Created SAW(1)	Warehouse	Warehouse	2014-07-25 09:54	
Accounts Deleted	NetWitness DB	Identity Management	2014-06-26 08:35	

Note: If a user (other than administrator) creates a rule, ADMIN cannot access that rule.

Tabular Listing

The following table lists the columns in the Rules Permissions panel:

Column	Description
Roles	The role of the user logged into the NetWitness Suite user interface.
Read & Write	The user can access, view, edit, delete, import, and export rules on the Rules view. The user can also change the permission on the rule.
Read Only	The user can only access and view the rule on the Rules view
No Access	The user cannot access or view the rule for which this permission is set.

Set Access Control for a Rule

You can set access control for a rule. The Reporting Engine provides access control at the rule level. Only a user who has the right set of permissions can perform tasks on the rule. The administrator when creating users and roles must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

At the rule level, you can set the following access permissions for the user roles in NetWitness Suite:

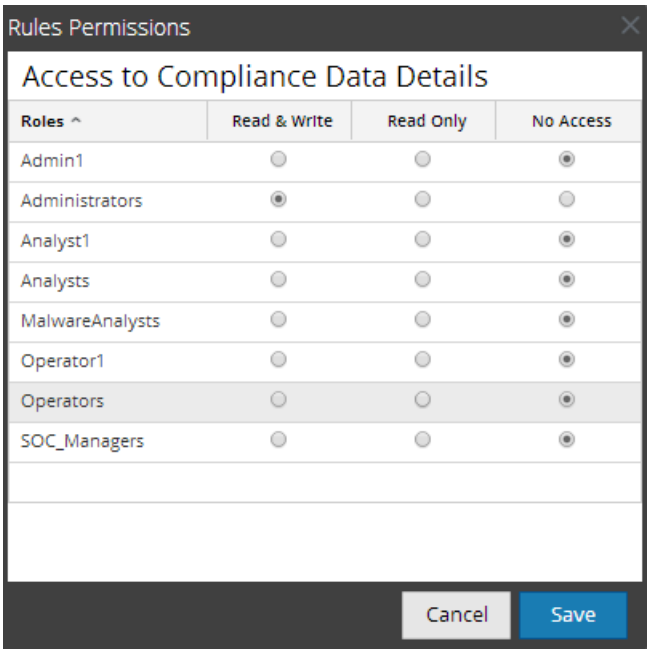
- Read & Write – View or edit the rules in the rule group.
- Read Only – View the rules in the rule group.
- No Access – Cannot view or edit the rules in the rule group.

Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a rule.

To set access control for a rule, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the **Rules** list panel, select the rule.
3. Click  > **Permissions** in the Rule toolbar.
   The **Rules Permissions** dialog is displayed.



4. Select the following appropriate access permission for the user role and click **Save**.
   - Read & Write
   - Read Only
   - No Access

Set Access Control for a Rule Group

You can set access control at the rule group level. Only a user who has the right set of permissions can perform the tasks on the rule. The administrator when creating users and roles must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

At the rule group level, you can set the following access permissions for the user roles in NetWitness Suite:

- Read & Write – View or edit the rules in the rule group.
- Read Only – View the rules in the rule group.
- No Access – Cannot view or edit the rule in the rule groups.

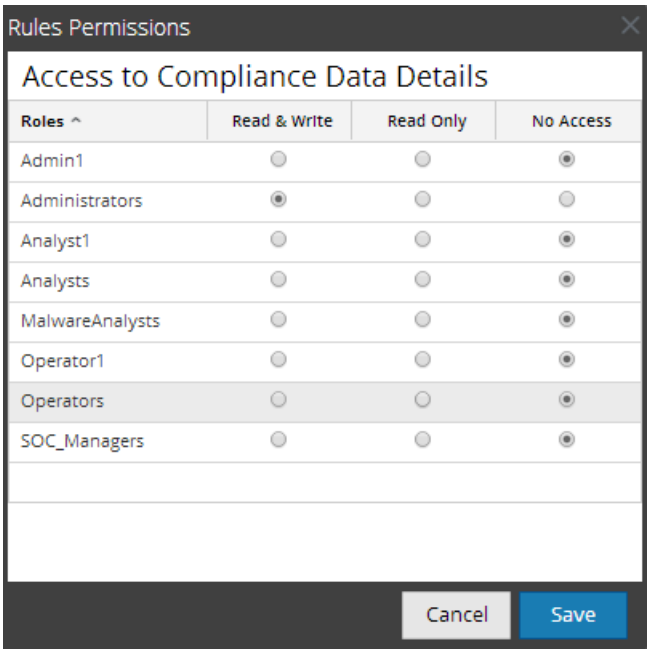
Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a rule group.

To set access control for a rule group, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the **Rule Groups** panel, select the rule group and do one of the following:
   - Click  and select **Permissions**.
   - Right-click the selected rule group and select **Permissions**.

   The **Rules Permissions** dialog is displayed.



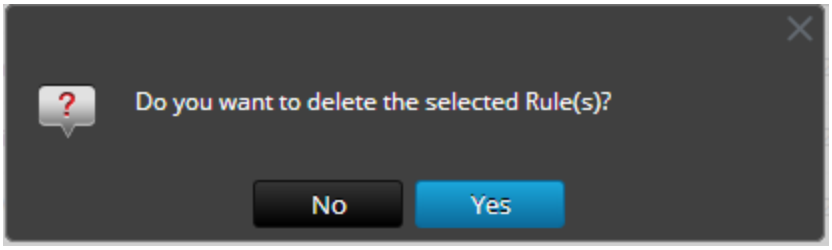
3. (Optional) Select the appropriate checkbox to apply these permissions to subgroups and child objects of this group.

4. Click **Save**.
   A confirmation message that permission is successfully set for the selected rule group is displayed.

Delete a Rule or Rule Group

To delete a rule, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the **Rules** panel, do one of the following.
   - Select a rule and click − in the Rule toolbar.
   - Click ⚙ > **Delete**.
     A confirmation dialog is displayed.

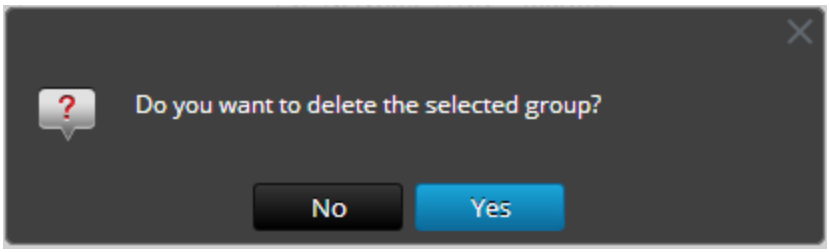


Note: If a rule is being used in a report, a warning that the rule is in use and cannot be deleted is displayed.

3. Click **Yes**to delete the rule.
   A confirmation message that the rule is deleted successfully is displayed and the selected rule is deleted from the Rule List panel.

To delete a rule group, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the **Rule Groups** panel, select the rule group that you want to delete.
3. Click −.
   A confirmation dialog is displayed.



Note: If any one of the rules in the group is being used in reports, a warning that the rule is in use and cannot be deleted is displayed.

4. Click **Yes**to delete the group.

   A confirmation message that the group is deleted successfully is displayed and the selected group is deleted from the Rule Groups panel.

Duplicate a Rule

To duplicate a rule, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the **Rules** list panel, select a rule that you want to duplicate.
3. In the Rule toolbar, click .

Edit a Rule

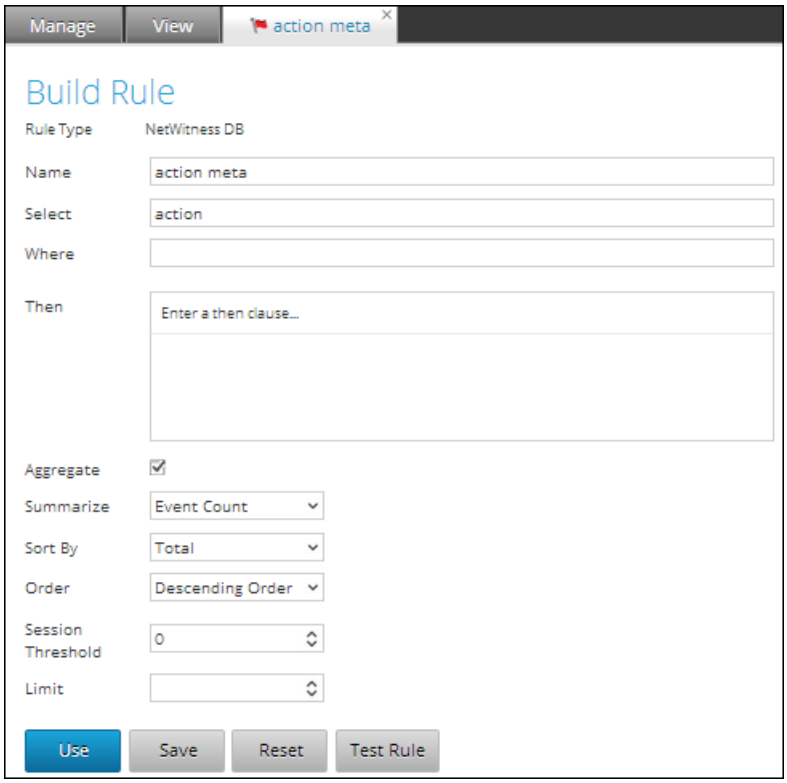
Prerequisites

To edit a rule, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the **Rules** list panel, do one of the following:
   - Select a rule and click in the Rule toolbar.

- Click  > **Edit**.

  The Build Rule view tab is displayed.



Note: If a rule is edited, the updated rule definition is applied to the Reports, Charts, and Alerts where the rule is included.

3. Modify the required fields.
4. Click **Save**.

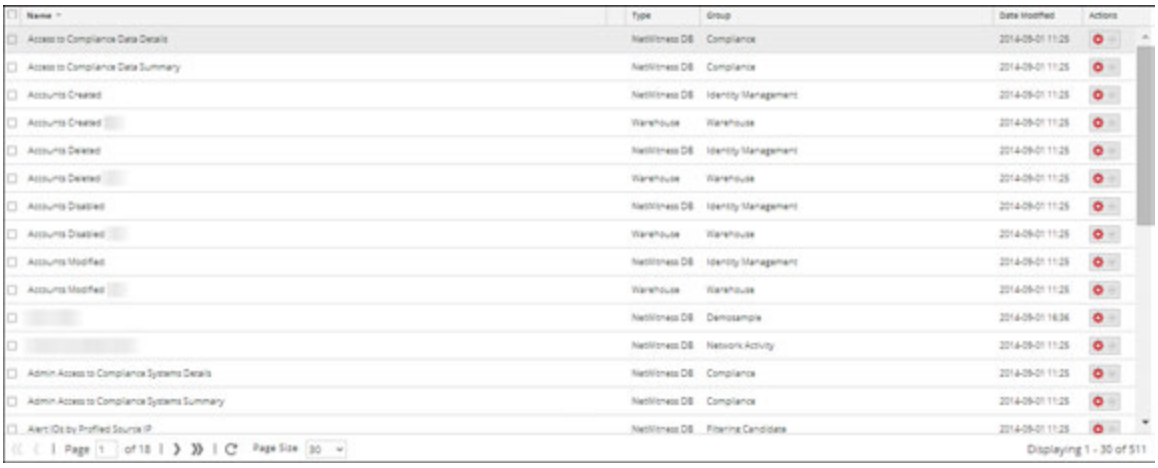
   A confirmation message that the rule is saved successfully is displayed.

When you edit a rule, ensure to re-select the Rule for which you want the Chart to be generated, so that the edited rule is applied. If you do not re-select the Rule and attempt to save or test the rule, the rule is saved and a warning message is displayed.

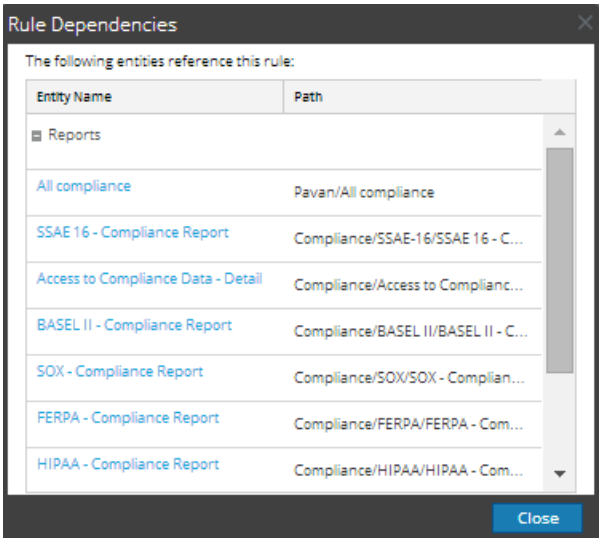
View Dependents of a Rule

You can view dependents of a rule. You must traverse a rule list, select a rule for which you want to identify the dependency over a report, chart, or alert.

The following figure shows the Rule View where you select the rule 'Access to Compliance Data Details'.



The following figure shows the dependency of the rule over alerts and reports.



The following table lists the various columns in the Rule Dependencies dialog and their description.

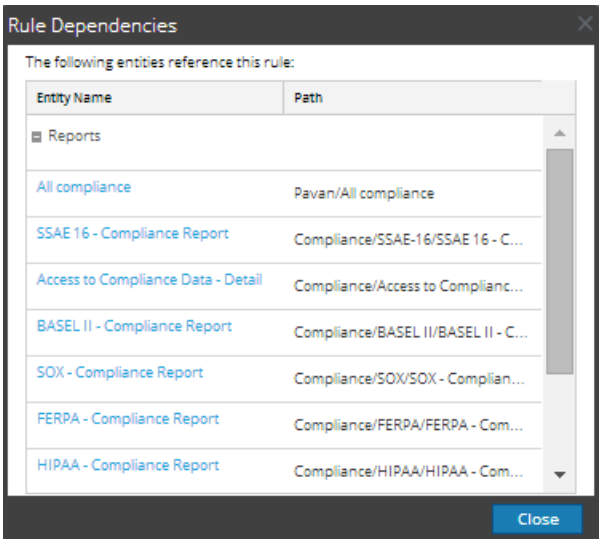
Column	Description
Entity Name	The name of the entity referencing the rule.
Path	The path where the entity is located in the user interface.

To view dependents of a rule, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Rules**.
   The Rule view is displayed.

3. In the **Rule List** panel, click > **Dependents**.

   The Rule Dependencies dialog is displayed.



Export a Rule or Rule Group

Prerequisites

Make sure that you have rules in the rule group.

To export a rule, perform the following:

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. In the **Rules** list panel, do one of the following:

   - Select a rule and click > **Export** in the Rule toolbar.
   - Click > **Export**.

   A browser-specific export dialog may be displayed, allowing you to open or save the file. You can export multiple rules at a time. To select multiple rule, press and hold the CTRL button and select the rules to be exported.

Note: If you want to export multiple rules, you can do that only by exporting rule groups.

To export a rule group, perform the following :

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. In the **Rule Groups** panel, select the rule group containing the rules which you want to export.

   You can export multiple rules groups at a time. To select multiple rule groups, press and hold the CTRL button and select the rules groups to be exported.

3. Click  > **Export**.

   A browser-specific export dialog may be displayed allowing you to open or save the file.

Manage a Report

Access Control for a Report or Report Group

This section covers the access permissions the user has depending on the user role to manage a report and report group. The Reporting provides access control at the report and report group level. The user who has the right set of permissions can only perform the tasks in reporting module. The access control is managed by the administrator from the **ADMIN > Security > Roles** tab.

When creating users and user roles, the administrator must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

Reports and Report Groups can be tied to a specific set of user roles so that when a user logs into NetWitness Suite, the reports with the access rights for the specific user role can be viewed. Users that belong to a user role with the 'Read & Write' access permission can define reports. Further, the access can be tightened so that reports are accessed only by those who have the 'Read Only' access.

Note: You must have 'Read Only' permission for a group to view the reports within that group.

At the report level, you can set the following access permissions for the user roles in NetWitness Suite:

- Read & Write
- Read Only
- No Access

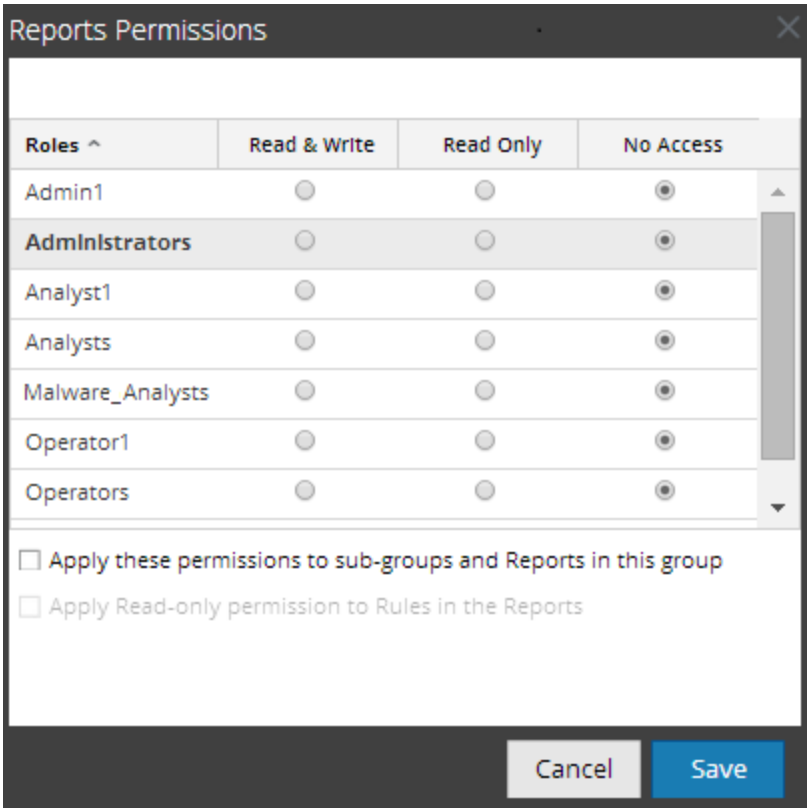
Suppose, you want the NetWitness Suite to have access to all the reports in a Report Group, you can set the permission '**Read & Write**' at the Report Group level. And, if you do not want the **Operator** role to have access to a specific set of reports in a report group, you can set the permission '**No Access**' at the Report Group level.

The permission is set only for the report group but not the reports, rules, or subgroups in the Report Group.

Access Control for a Report Group

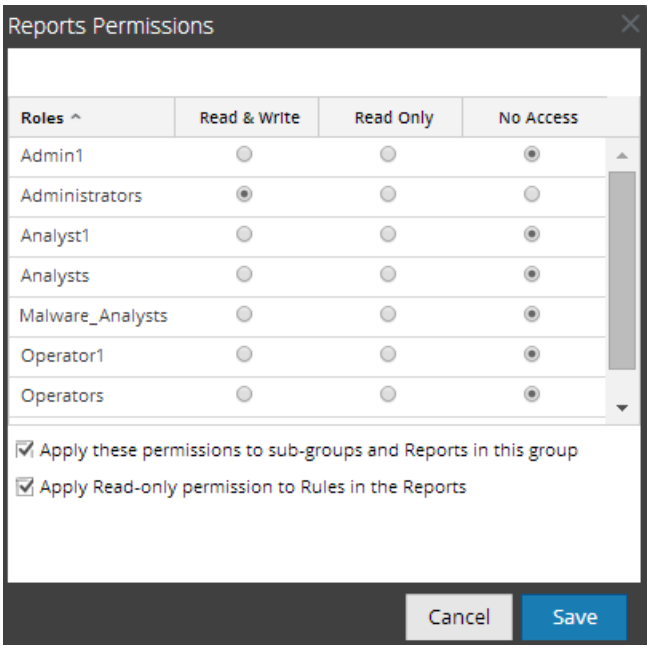
When you want to change the report group permissions, you must select a report group and set access permissions using the Reports Permissions panel.

Before applying report group permissions, the default permission set for all the user roles is 'No Access', except for Administrators, as shown in the figure.



If you want to change the access permission for a specific user role, you must set these at the report group level, as shown in the figure. <suppose,>Administrators to have access to all the reports in a Report Group, you can set the permission '**Read & Write**' in the Report Group Permissions panel.

You can also apply permissions to subgroups and reports in the group, as well as apply read-only permission to rules in the reports by selecting the appropriate checkboxes, as shown in the figure.



The three scenarios are explained in brief:

- Scenario 1: Permissions applied to Report Group/ Sub Group/ Report based on the user role.
- Scenario 2: Permissions applied to Sub Group and Report in the Group.
- Scenario 3: Read-only permission applied to Rules in the Report.

	Role (Analyst)	Permissions applied to Report Group/ Sub Group/ Report based on the user role	Permissions applied to Sub group and Report in the Group	Permission (Read-only) applied to Rules in the Report
Group	Read & Write	**Read & Write**	**Read & Write**	Read & Write

Sub Group	Read	**Read**	**Read & Write - Inherited**	Read & Write
Report	Read	**Read**	**Read & Write - Inherited**	Read & Write
Rules	Read	**Read**	Read	**Read**

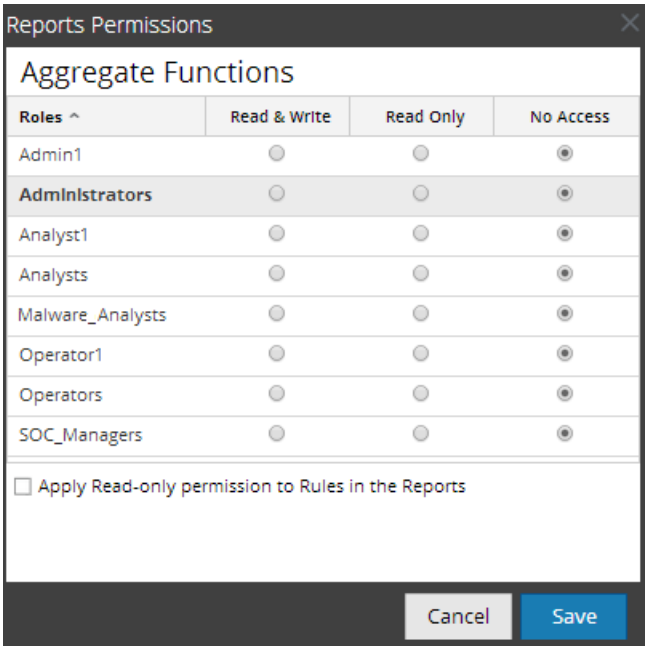
The Report Group will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** report group.

For scenario 1, each of the levels has a permission set depending on the user role. For scenario 2, the permission at the Report Group level (Read & Write) is inherited by the Sub Group and Reports in the Group. For scenario 3, the Read permission is set for the Rules except that the permission set for the rules cannot be higher than the permissions set for the Report Group.

Access Control for a Report

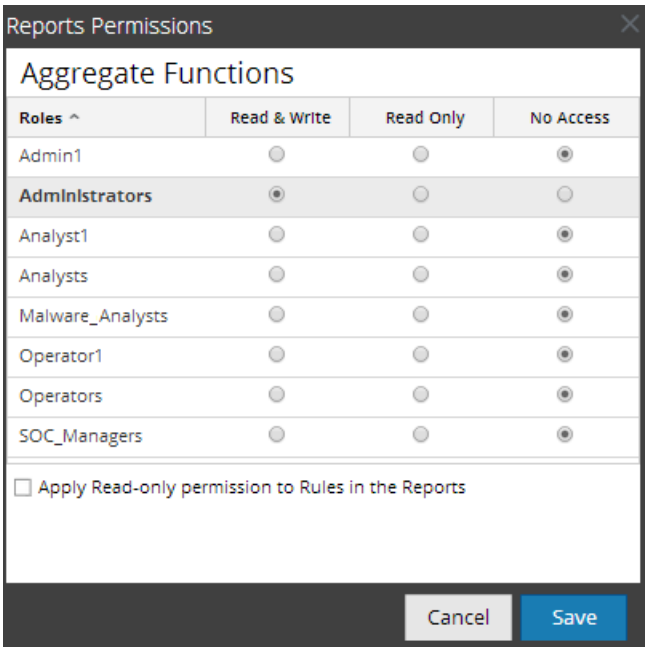
When you want to change the report permissions, you must select a report and set their access permissions using the Report Permissions panel.

Before applying the Report permissions, the default permission set for all the user roles is 'No Access' permission and the checkbox is unchecked, as shown in the figure.



If you want to change the access permission for a specific user role, you must set these at the report level, as shown in the figure. Suppose, you want the **Administrators** to have access to a specific report, you can set the permission '**Read & Write**' in the Report Permissions panel.

You can apply read-only permission to rules in the reports by selecting the checkbox, as shown in the figure.



The two scenarios are explained in brief:

- Scenario 1: Permissions applied to Report Group/ Sub Group/ Report/ Rules.
- Scenario 2: Read-only permission applied to Rules in the Report.

	Role (Analysts)	Permissions applied to Report Group/ Sub Group/ Report/ Rules based on the user role	Permission (Read-only) applied to Rules in the Report
Group	Read & Write	**Read & Write**	Read & Write
Sub Group	Read	**Read**	Read & Write
Report	Read	**Read**	Read & Write
Rules	Read	**Read**	**Read**

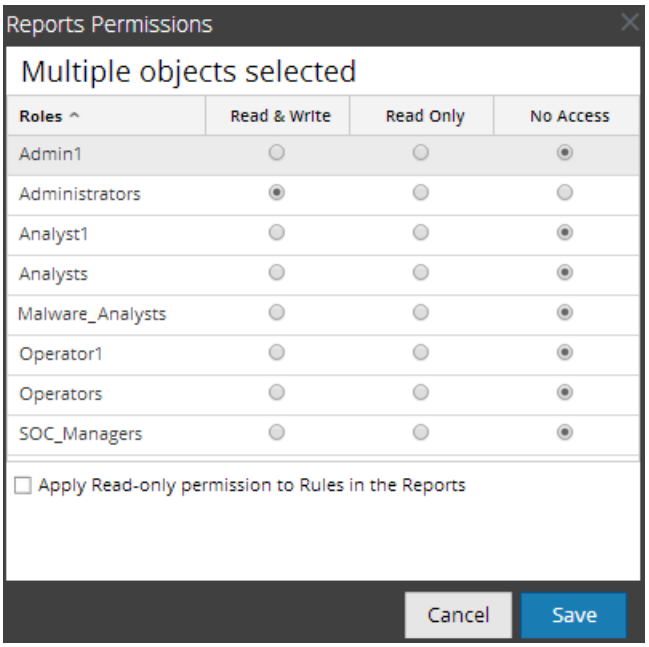
The Report will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** reports.

For scenario 1, each of the levels has a permission set based on the user role. For scenario 2, the Read permission is set for the Rules except that the permission for the rules cannot be higher than the permission for the Reports.

Note: If the permission for the rules is higher than the permission for the Reports then the permission is be applied. For example, if you set the permissions for the Report Group as **No Access** and then specify the option *Apply Read-only permission to Rules in the Reports*, then the read-only permission is not set for the rules.

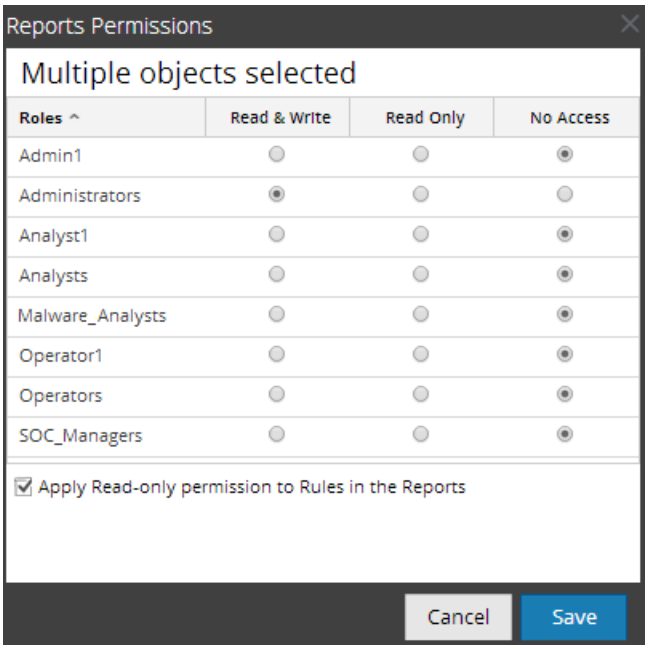
Access Control for a Report When Multiple Reports are Selected

When you want to change permissions of multiple reports, you must select several reports and set their access permissions using the Report Permissions panel. The access permission that you choose is applied to all the selected reports.



Access Control for a Report When Multiple Reports with several rules are Selected

When you want to change permissions when multiple reports with several rules are selected, you must select the checkbox in the Report Permissions panel, as shown in the figure. The read-only access permission is applied to all the rules of the selected reports, provided that the permission of the rules are lower than the permission of the reports.

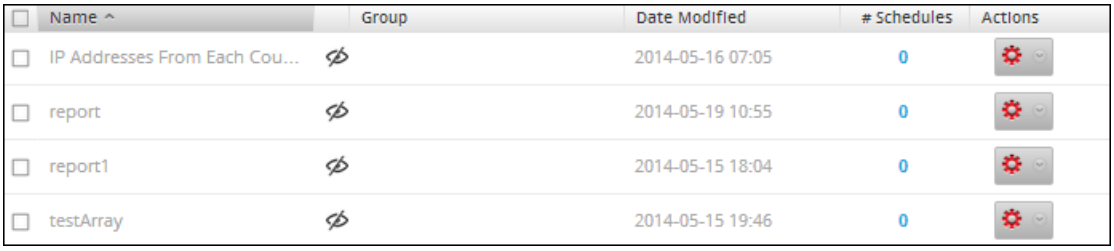


Login as a specific user and view the access details

When you login to the NetWitness Suite UI as a user having 'Read access' permission, all the reports is denoted with the symbol (📖) and when you click on the symbol the 'Read Only' callout is displayed on the Report List panel.

When you login to the NetWitness Suite UI as a user not having 'Read & Write' access permission on a Report, all the reports are denoted with the symbol (👁‍🗨) and the reports appear grayed out on the Report List panel.

The following figure shows the Report List panel when logged in with minimal 'Read & Write' access permission.



Note: If a User (other than the super user) creates a report there will be no access to that report for the super user.

Tabular Listing

The following table lists the various columns in the Reports Permissions Panel:

Column	Description
Roles	The role of the user logged into the NetWitness Suite UI.
Read & Write	The user can access, view, edit, import, export, and delete the report on the Reports view. The user can also change the permission on the report.
Read Only	The user can only access and view the report on the Reports view.
No Access	The user cannot access or view the report for which this permission is set.
Apply these permissions to subgroups and Reports in this group	Select the checkbox to apply the selected permissions to the report group, subgroups in the group and reports in the group. **Note:** This checkbox is populated only when you set access permissions for a Report Group.
Apply Read-only permission to Rules in the Reports	Select the checkbox to automatically apply permissions to the rules in the reports.

Set Access Control for a Report

Prerequisites

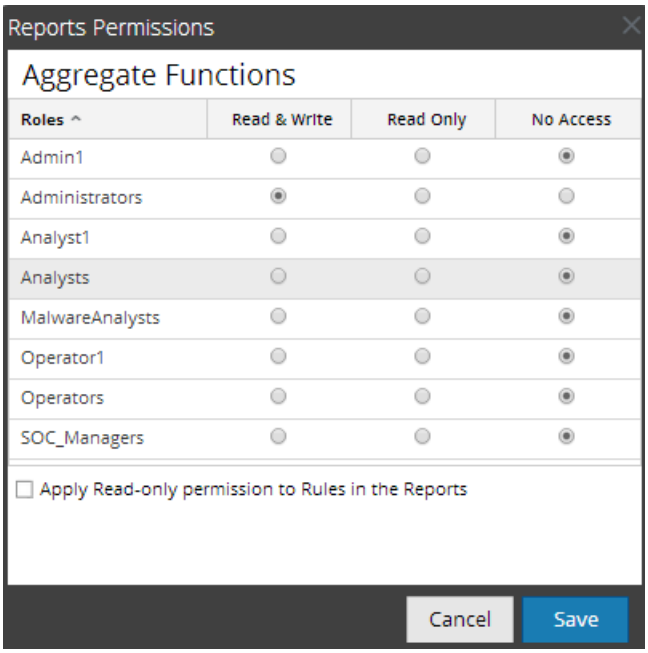
Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a report.

To set access permissions for a report, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, select a report.

4. Click > **Permissions**.

   The Reports Permissions dialog is displayed.



5. Based on the user role, select the appropriate buttons.
6. (Optional) Select the checkbox, if you want to provide read access permission to rules in the reports.

Note: On selecting the check box, all dependent rules are given READ access permission, provided the permissions for the report is higher compared to the permissions of the rules.

6. Click **Save**.

   A confirmation message that the permission is set for the selected report is displayed.

Set Access Control for a Report Group

Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a report group.

To set access permissions for a Report Group, perform the following:

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

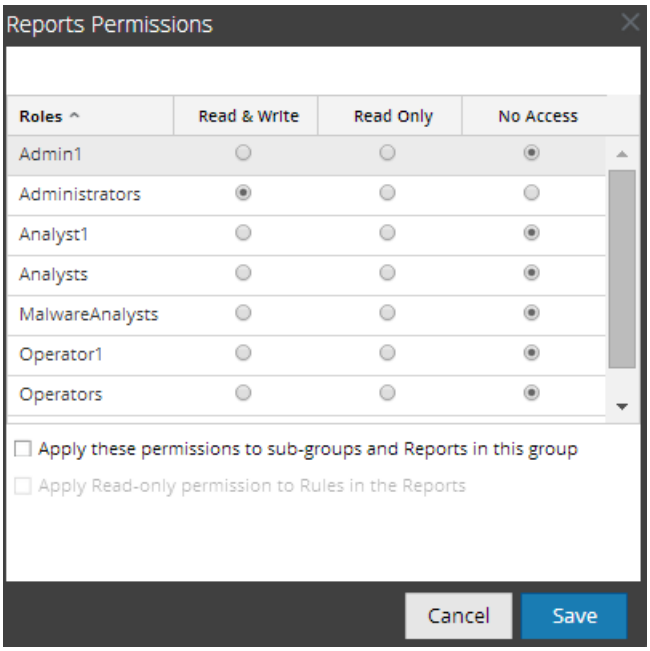
2. Click **Reports**.

   The Report view is displayed.

3. In the **Report Groups** panel, select or right-click on a report group.

4. Click > **Permissions**.

   The Reports Permissions dialog box is displayed.



4. Based on the user role, select the appropriate buttons.
5. (Optional) Select the appropriate checkbox to apply the selected permissions to subgroups and reports in the group.
6. (Optional) Select the appropriate checkbox to provide read access permission to rules in the reports.

Note: On selecting the check box, all dependent rules is given READ access permission, provided the permissions for the report is higher compared to the permissions of the rules.

7. Click **Save**.

   A confirmation message that the permission is successfully set for the selected report group is displayed.

Delete a Report or Report Group

To delete reports in a group or subgroup from the Report List panel:

1. Select **MONITOR** > **Reports**.

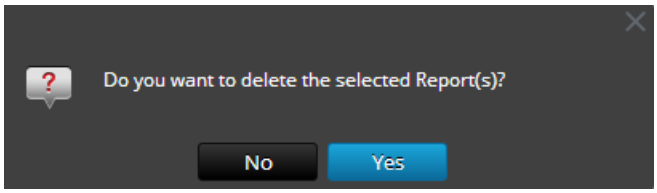
   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report List** panel, do one of the following:
   - Select the reports and click −.
   - Click ⚙ > **Delete**.

   A confirmation dialog is displayed.



4. Click **Yes** to delete the report.

   A confirmation message that the report is deleted successfully is displayed and the selected report is deleted from the Report List panel.

Delete a Report Group

Prerequisites

Make sure that you have no reports associated with the report group.

To delete report groups in the default folder or subgroups under a report group, perform the following:

1. Select **MONITOR** > **Reports**.

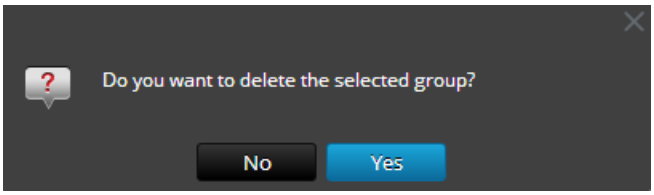
   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report Groups** panel, select the report group and click −.

   A confirmation dialog is displayed.



4. Click **Yes** to delete the group.

   A confirmation message that the group is deleted successfully is displayed and the selected group is deleted from the Report Groups panel.

Duplicate a Report

You can duplicate a report to schedule multiple report for the same report. The duplicated report is displayed in the Reports List panel with suffixes. For example, Report (1).

Generally, the duplicate option is used in two scenarios:

- You want to make a copy of the report, to move the same report to another group.
- You want to retain most of the configuration settings for an object but modify few of these settings.

  For example, when you have a complex query in a rule or several rules in a report, it is very much appropriate to use the duplicate option.

To duplicate an existing report, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.s
   The Report view is displayed.
3. In the **Report List** panel, select a report that you want to duplicate and click  .
   The report is saved successfully and added to the Report list.

You can move the duplicated report to another group.

Edit a Report

To edit reports in a group or subgroup from the Report List panel, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, do one of the following:
   - Select a report and click  .
   - Click  > **Edit**.

   The Build Report view tab is displayed.

4. Modify the text and add more rules to the report (if required).
5. Click **Save**.
   A confirmation message that the report is saved successfully is displayed.

Refresh a Report Group or Report List

You can refresh a report group or reports to view the re-arrangement of groups or reports.

To refresh a report group or reports, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. Do the following to move the group or reports to a new location:
   - In the **Report Groups** panel, drag and drop the group.
   - In the **Reports List** panel, drag and drop the reports to the desired group in the Report Groups panel.
     The report group or reports are moved to the new location.
4. Do the following to refresh a group or report list:
   - In the **Report Groups** panel, click .
     The report group gets refreshed.
   - In the **Report List** panel, click .
     The Report list gets refreshed.

Edit a Scheduled Report

To edit a scheduled report from the Scheduled Reports List panel, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, select a report and click  > **View Scheduled Reports**.
   The View Scheduled Reports tab is displayed.
4. In the **Scheduled Reports List** panel, do one of the following:
   - Select a report and click  .
   - Select a report and click  > **Edit Schedule**.

The Schedule Report tab is displayed.

5. In the Schedule Report tab, do the following:
   a. In the **Schedule Name** field, modify the name for the schedule report configuration.
   b. To execute the reports as per the schedule, select the **Enable** checkbox.
   c. From the **Data Source** field, select the datasource.

   Note: If the data source is not listed, ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in the *Reporting Engine Configuration Guide*.

6. (Optional) From the **Warehouse Resource Pool** drop-down, select the pool or queue for the report.

   Note: The **Warehouse Resource Pool** drop- down is displayed only if the Warehouse Rule is selected. If no pools or queues are entered for the Reporting Engine, this field is disabled.

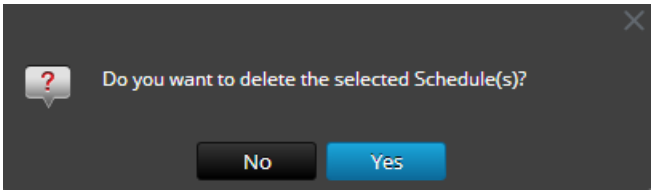
7. From the **Run** field, select the type of run schedule. (For example, Now or Hourly).
8. Select the date range to run the query based on absolute duration or select the **Use relative time duration** checkbox to run the query based on relative duration.
9. (Optional) In the Output Actions panel, do the following:
   i. Type the email address and subject.
   ii. Edit the body of the message for the report.
   iii. Select the format of the attachment.
   iv. Type a value for the CSV and Multivalue delimiters.
10. (Optional) In the Other Options field, do the following:
    i. Click  > **SFTP** or **URL** or **Network Share**. Based on the selected option, a row gets added in the Other options field.
    ii. Select the appropriate options to send the report in PDF or CSV format to the configured SFTP, URL or Network Share.
11. (Optional) To add a list in the Dynamic List panel, see Generate a List from the Scheduled Report section in Create and Schedule a Report.
12. (Optional) To choose another logo in the Logo panel, see Manage and Select a Report Logo section.

    Note: If you do not specify a logo, the default RSA logo is used.

13. Click **Schedule**.
    The scheduled report executes as scheduled and provides the configured outputs.

Delete a Scheduled Report

To delete a scheduled report from the Scheduled Reports List panel, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report** toolbar, click **View All Schedules**.
   View Scheduled Reports is displayed.
4. In the **Scheduled Reports List** panel, select the report.
5. Click  >**Delete Schedule**.
   A confirmation dialog is displayed.
   


6. Click **Yes** to delete the scheduled report.
   A confirmation message that the scheduled report is deleted successfully is displayed and the selected schedule is deleted from the Scheduled Reports List panel.

Export a Report

You can export the selected reports to an external file that can be later imported to another NetWitness Suite environment.

Prerequisites

Make sure that you have reports in the report group.

To export selected reports in the Report Groups panel to an external file, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.

3. In the **Report List** panel, do one of the following:
   - Select a report and click > **Export**.
   - Click > **Export**.

   You can export multiple reports at a time. To select multiple reports, check the checkbox of the report to be exported. The exported file is saved to the local drive in an archived format.

Open CSV files with Unicode characters in MS Excel

To open downloaded CSV files containing Unicode characters in MS Excel, follow these steps:

1. Download and save the CSV file.
2. Open Microsoft Excel and navigate to the **Data** tab.
3. Click on **From Text** menu item; find the CSV file that you downloaded and click **Import**.
   The Text Import Wizard is displayed.
4. Select **Delimited**or **Fixed Width** data type from the **Original data type** radio button.
5. Click **File origin**drop down list and select **65001: Unicode (UTF-8)** and click **Next**.
6. Select the delimiter that was used in the file that you imported and click **Next**.
7. Select the data format for each column of data that you want to import and click **Finish**.
   The correct output is displayed in an MS Excel sheet.

Export a Report Group

You can export a selected report groups to an external file that can be later imported to another NetWitness Suite environment.

Prerequisites

Make sure that you have reports in the Report Group.

To export selected report groups in the Report Groups panel to an external file, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report Groups** panel, select a report group and click and select one of the following:

- **Export** - This selection exports a report in a .zip file.
- **Export as Text** - This selection exports all the content from the Reporting Engine in a .zip file which contains the data in text format.

You can export multiple report groups at a time. To select multiple report groups, press and hold the CTRL button and select the report groups to be exported. The exported file is saved to the local drive.

Import a Report or Report Group

You can import a group containing subgroups and reports from other instances of NetWitness Suite into Report Groups panel. Reports must be in a valid binary file that was exported from another NetWitness Suite instance.
During the import process, you select the binary file and specify whether existing reports with the same name must be overwritten or not by the reports contained in the binary import file.

- If you choose to overwrite, all duplicate rules, lists and reports are overwritten by the contents of the binary import file.
- If you choose not to overwrite, and a duplicate rule, list or report exists in the target folder, the import fails and display a message about duplicate reports.

You cannot import reports to a specific report group. The imported files are stored in the **All**root folder.

Prerequisites

Make sure that you have the reports or report groups exported from other instances of NetWitness Suite.

To import groups containing subgroups and reports from other instances of NetWitness Suite into Report Groups panel, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report Groups** panel, select a folder to import the file.
4. Do one of the following:
   - In the **Report Groups** panel, click  > **Import** to import a group.
   - In the **Report** toolbar, click  > **Import** to import a report.
     The Import Report dialog is displayed. You can import multiple reports and report groups

at a time. To select multiple reports or report groups, press and hold the CTRL button and select the reports or report groups to be imported.

5. Click **Browse** to select the binary file.
   NetWitness Suite provides a file system view of the files.
6. Locate the binary file and click **Open**.
   The file gets added to the Import Report list.
7. (Optional) To overwrite any existing rule in the library with an identically named rule in the binary file when importing, check the **Rule** checkbox. If you do not select the Overwrite option, and an identical rule is encountered in the binary file, the binary file is imported and no error message is displayed.
8. (Optional) To overwrite any existing list in the library with an identically named list in the binary file, check the **List** checkbox. If you do not select the Overwrite option, and an identical list is encountered in the binary file, the binary file is imported and no error message is displayed.
9. (Optional) To overwrite any existing report in the library with an identically named report in the binary file when importing, check the **Report** checkbox. If you do not select the Overwrite option, and an identical report is encountered in the binary file, the binary file is imported and no error message is displayed.
10. Click **Import** to import the binary file.

Enable or Disable a Scheduled Report

To enable or disable a scheduled report from the Scheduled Reports List panel, perform the following:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, select a report and click  > **View Scheduled Reports**.
   View Scheduled Reports is displayed.
4. Select a report from the Scheduled Reports List panel.

5. Click  > **Enable**.

   The state of the report is changed to 'Running', if the report is scheduled to run immediately.

6. Click  > **Disable**.

   The state of the report is changed to 'Inactive'.

Start or Stop a Scheduled Report

To start or stop a scheduled report, perform the following:

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report List** panel, select a report and click  > **View Scheduled Reports**.

   The View Scheduled Reports view is displayed.

4. Select a report from the Scheduled Reports List panel.

5. Click  > **Start**.

   The state of the report is changed to 'Running', if the report is scheduled to run immediately.

6. Click  > **Stop**.

   The state of the report is changed to 'Completed'.

View an Execution History of a Scheduled Report

You can view the execution history of a scheduled report. You can view the history of a scheduled report that is run. You can view the history based on the following criteria:

- Number of past schedules executed
- Start date and end date for the date range

You can view the details such as how many times the scheduled report was executed, the time of execution (seconds), execution state. You can also view the report generated on a full screen.

To view the execution history of a scheduled report, perform the following:

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, do one of the following:
   - Click  > **View Scheduled Reports**.
   - Click the **#Schedules** column.
     The Schedule Reports view tab is displayed with the status of each of the scheduled report.
4. Do one of the following:
   - Select a scheduled report and click  > **Execution History**.
   - Select a scheduled report and click  .
     The Execution History view is displayed.

   Note: By default, you can view 10 number of execution history of a scheduled report. The execution history shown depends on the Retain Report History Configuration set on the **General**tab of the **ADMIN > Services > Reporting Engine Config**view.
   For example, if you set the Retain Report History Configuration to 100 days, the data displayed on the Execution History view. is the past 100 days execution history details considering the current date information.
5. From the **Get history by:** field, select the type of history to be fetched. (For example, Past or Range (Specific))
6. In the **Count** field, enter the number of executions to be displayed.
7. Click **Show History**.
   The execution history of the scheduled report is displayed.

Manage and Select a Report Logo

Prerequisites

Make sure that you have the Reporting Engine service defined prior to managing a logo.

Manage Report Logos

To manage logos, perform the following:

1. Select **ADMIN** > **Services**.
   The Services view is displayed.
2. In the **Services List** panel, select an Reporting Engine service and click **View** > **Config**.

The services config view is displayed.

3. Select the **Manage Logos** tab.

   All the available logos are displayed.

Add a Logo

To add a logo, perform the following:

1. In the **Manage Logos** tab, click +.

   A file browser opens where you can choose the file from the local drive.

2. Select the logo and click **Select**.

   The selected logo gets added to the Manage Logos section.

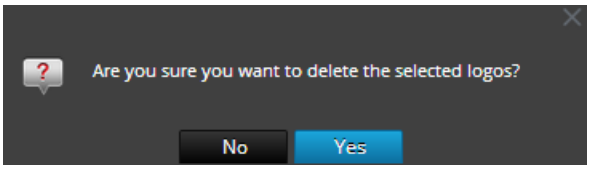
Delete a Logo

To delete a logo, perform the following:

1. In the **Manage Logos** tab, do one of the following:

   - Select the logo and click − .
   - Perform (Ctrl+click) to select multiple logos and click −.

   A confirmation dialog is displayed.



2. If you want to delete the logo, click **Yes**.

   The selected logo is deleted from the Manage Logos section.

Set Default Logo

To set a default logo, perform the following:

In the **Manage Logos** tab, select a logo and click Set default.

The chosen logo is set as the default logo for the RE service.

Select a Logo

To select a logo, perform the following:

1. Select **ADMIN** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

The Report view is displayed.

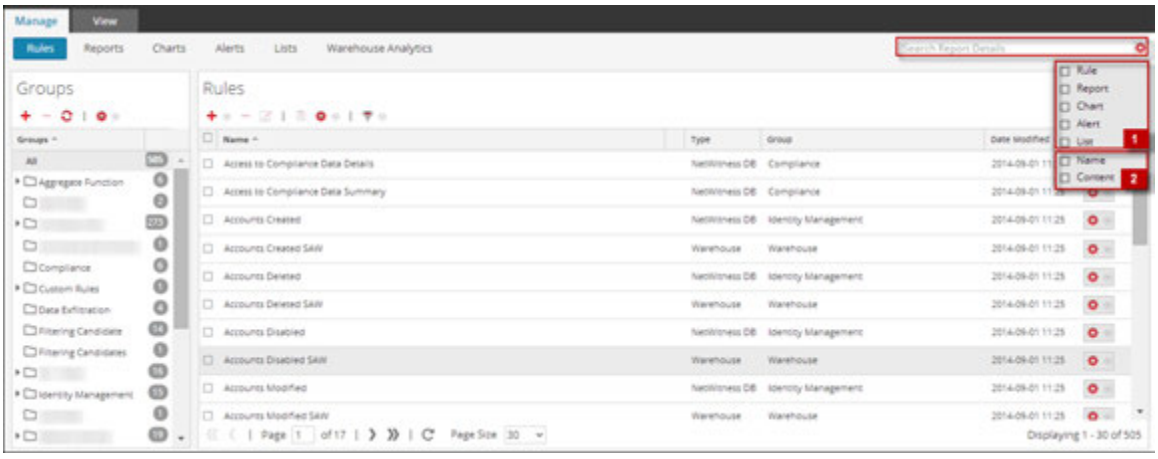
3. In the **Report List** panel, select a report.
4. Click > **View Scheduled Reports**.
   The View scheduled reports view tab is displayed.
5. Select a scheduled report and click > **Edit Schedule**.
   The Schedule a Report view tab is displayed.
6. In the Logo panel, click **Change Logo**.
   The Change a Logo dialog box is displayed.
7. Do one of the following:
   - Click **Upload new logo** to upload another logo.
   - Select a logo from the list.
8. Click **Select**.
   The selected logo is available on the Logo panel.

Search Reporting Details

This section provides instructions on how to perform a keyword search on name and content for each of the Reporting components. You can perform a keyword search on name and content for each of the Reporting components (Rule/Report/Chart/Alert/List) on the Reporting UI.

Note: You cannot search based on date and numeric values.

The following figure shows the search parameters available in the Reporting Module:



The following are the search parameters available on the Reporting UI:

1. Search for entities (rule, report, chart, alert, list).
2. Search for the entities based on either the name or content.

Note: Searches are case insensitive. For example, Completed is equivalent to completed.

Prerequisites

In the Reporting Module, you can perform a keyword search based on the name and content (definition). In this context, content implies definition of each of the reporting components. For instance, the value defined in the rule, report, report schedule, chart, and alert panel. You can also prioritize your search by selecting either or all of the components: Rule, Report, Chart, Alert, or List.

Note: You cannot search based on the List values and list path stored in schedule definition panel.

For example, to search for the rule name (ExpertRule), you must select **Rule, Name, and Content** in the **filtering options** drop-down to view all the rule names that matched the search. You can similarly search for a report, chart, alert, or list definition.

To search for reporting details from the Manage tab, perform the following:

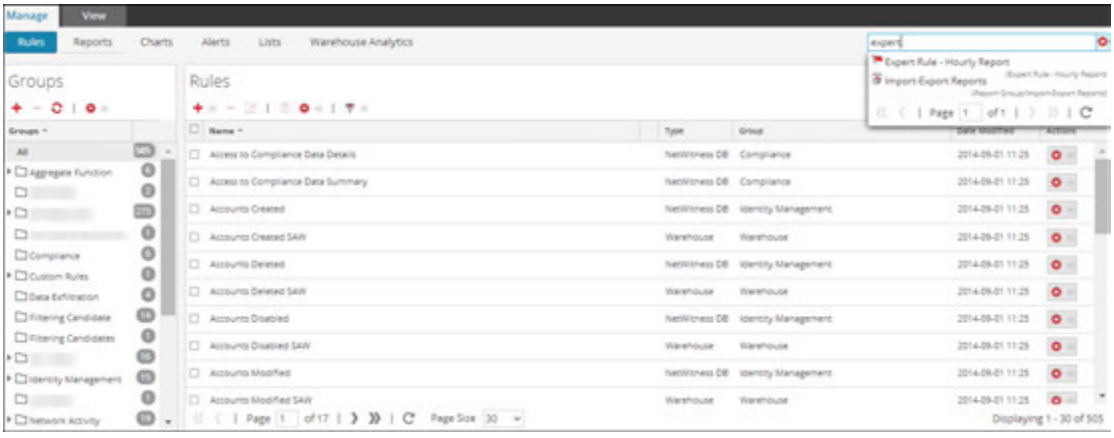
1. Select **MONITOR** > **Reports**.

   The **Manage** tab is displayed.

2. Click  and select the appropriate criteria to search.

3. In the **Search** field, enter the text to be searched.

   The search drop-down list is displayed:

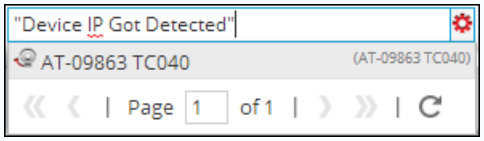


Search Syntax and Different Types of Search

The following table explains the search syntax and the possible searches that can be performed on the Reporting UI.

Search Types	Description
Word or phrase based search	**Word Based Search**: To search for a word such as "action" or "meta", you must enter the word in the search box. The following figure shows the search results for the text **action**.  **Phrase based search:** A Phrase is a group of words surrounded by double quotes such as "action meta". To search for a phrase, you must enclose phrases in double-quotes in the search box. The following figure shows the search results for the phrase "action meta". 
Search Types	Description
Wildcard Search (Single/ Multiple/ Special Character Search) The question mark "**?**" symbol is used to perform a single character wild card search and asterisk "*" symbol is used to perform multiple character wildcard search.	**Single character search:** The single character wildcard search looks for terms that match with the single character replaced. For example, to search for "Expert" or "Export" you can use the search syntax: Exp?rt The following figure shows the search results for the wildcard character **Exp?rt**.  **Multiple character search:** Multiple character wildcard search looks for 0 or more characters. For example, to search for Expert, or Experts, you can use the search syntax: Expert* The following figure shows the search results for the wildcard multiple character **Expert***.  **Special character search:**

Search Types	Description
	Certain punctuation and special characters are ignored during search (@#$%^&*(){}"~=+-[]\?|!:,.). For example, a search for action-login will be interpreted during search as "action" "login", that is, if rules exist with name "action-login" and "action@login" and search string is "action-login", the search result will return both the rules. 
Search Types	Description
Search based on name or content	**Search based on name:** When you want to search based on the name of a report, select **Report**and **Name**box from the filtering options drop-down. For example, to search for the report name "Report With Multiple Rules", you can use the search syntax: "Access to Compliance Data" **Note:** When you search for a report, it implies you can search for the report schedules as well. The search result will return the report containing the specific name.  **Search based on content:** When you want to search for the content within an alert, say alert description, select **Alert** and **Content** box from the filtering options drop-down. For example, to search for the alert description "Device IP Got Detected", you can use the search syntax: "Device IP Got Detected"  The search will return the result having the specific content.

Search Types	Description
	


Troubleshooting

This section provides troubleshooting instructions for issues faced when using the Reporting module in NetWitness Suite.

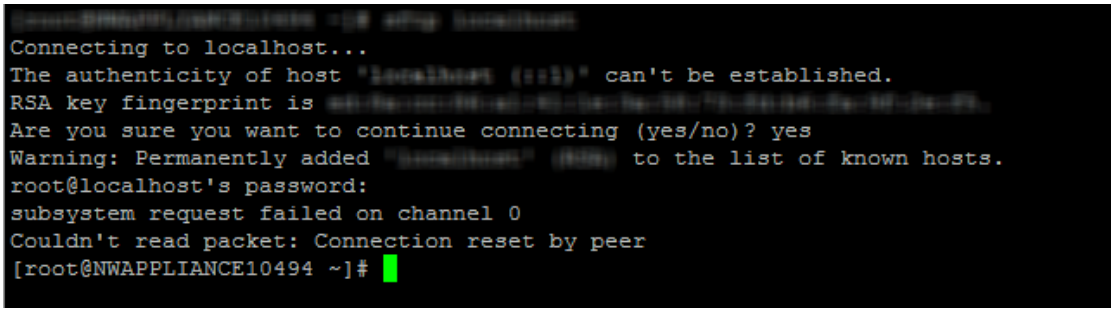
Troubleshooting Issues Before Configuring SFTP Server

Procedure

Try the following steps if you face any issues with configured Linux SFTP server:

1. If the Report Output Action for the configured SFTP fails, you must SSH to the SFTP server and try to connect locally to check if SFTP is working fine.

   Connect to SFTP server:

2. If the Local connection fails, open the file **sshd_config> vi /etc/ssh/sshd_config.**
3. Check for the entry in the file:

   ```
   # override default of no subsystems
   Subsystem sftp /usr/libexec/openssh/sftp-server
   ```

4. If this entry does not exist, add the two lines mentioned in Step 3 at the bottom of the file and **Save** it.
5. Restart service from **SSH > service sshd restart**.
6. Retry the SFTP connection now.
7. Make sure SFTP port is not blocked by SA server appliance firewall. Update iptables rules to allow sftp port

Definitions:

Strict parser: Strict parser (non-deprecated) expects the query syntax to be type correct.
For all text meta type use quotes for example, username = ‘user1’.
For all IP Addresses, Ethernet Addresses, and Numeric meta types do not use quotes for example, service = 80 &&
ip.src = 192.168.1.1.
For date and time meta types,
If the date and time format is 'YYYY-MM-DD HH:MM:SS‘, use quotes.
If the date and time format is 1448034064 (number of seconds since EPOCH (Jan 1, 1970)), do no use quotes.
The reporting queries will be parsed using the strict parser when the configuration value of /sdk/config/query.parse is **strict**in NWDB core services.

Non Strict parser: Non strict parser (deprecated) does not expect the query syntax to be type correct .i.e the values for text and numeric meta types can be quoted or unquoted regardless of the meta type.

For example, username is a string meta type, hence its values can be quoted or unquoted. So, both the syntax username = ‘user1’ and username = user are valid.

The reporting queries will be parsed using the non strict parser when the configuration value of /sdk/config/query.parse is **deprecated**in NWDB core services.

Note: The NWDB rule where clause is appropriately quoted if the syntax has an invalid quote. For example, in case of an invalid meta, or missing separator, the status and the errormessage is updated appropriately.

Appendix

This section provides detailed information about the supported aggregate functions, rule syntax, advanced rules query syntax in Reporting and task scheduler for Warehouse Reporting.

Rule Syntax

This section describes the different rule syntax supported in the Reporting Engine.

NWDB Rule Syntax

The NWDB rule is one of the rule syntax supported in the Reporting Engine. To enhance the execution time of your reporting entities, see "Reporting Guidelines" section in Reporting Overview.

A Rule is a function that manipulates the result set of a rule in order to make the output in a report more meaningful or add additional functionality to a rule other than querying data and displaying it. Any combination of these rule actions can be used to create unique and interesting representations of the information collected by NetWitness Suite.

The Reporting Engine supports the following categories of NWDB data source rule syntax:

- **select** clause
  - Non-Aggregate Rule
  - Aggregate Rule
- **alias**
- **where** clause
- **where** clause Operators
- **then** clause
- **Limit** field
- Rule Actions
- Rule Operators

Select Clause

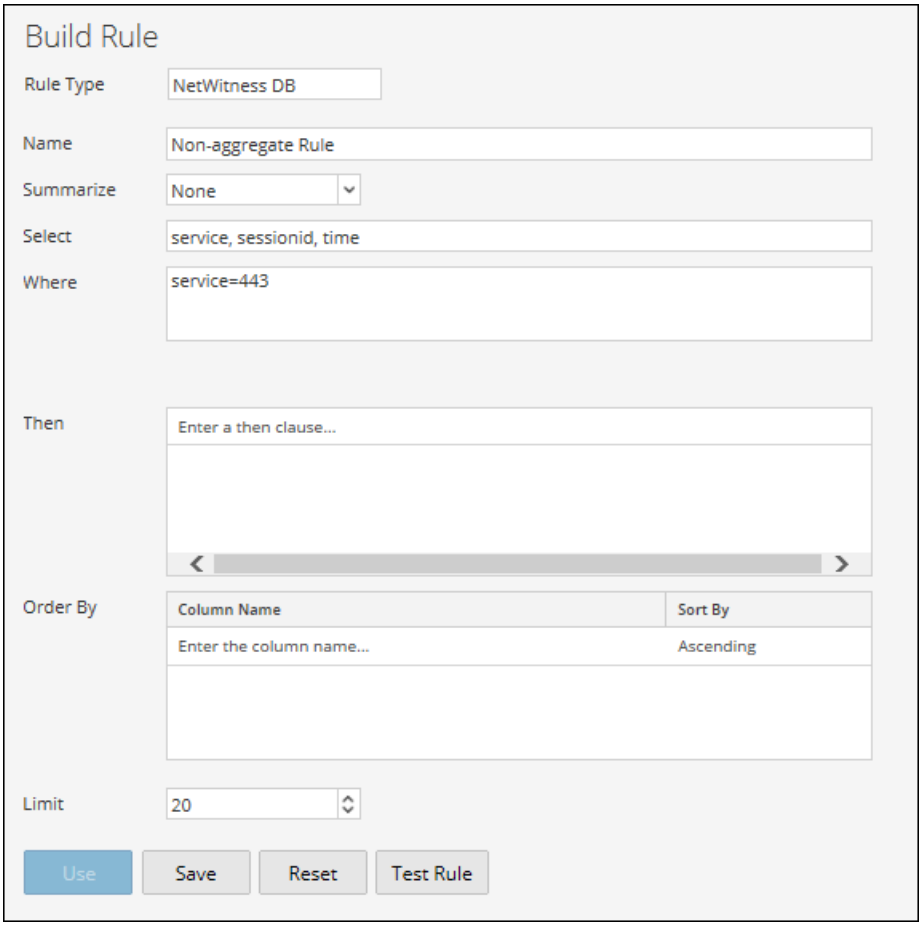
The select clause is a comma separated list of values. For example: select sessionid,time,service.

There are two types of select clause for NWDB Rule:

- Non-aggregate rule
- Aggregate rule

Non-Aggregate Rule

When you want to define a rule without any grouping, choose 'None' in the Summarize field. In a non-aggregate rule, you can select any number of metas in the *Select* clause. For example, select service, sessionid, time.

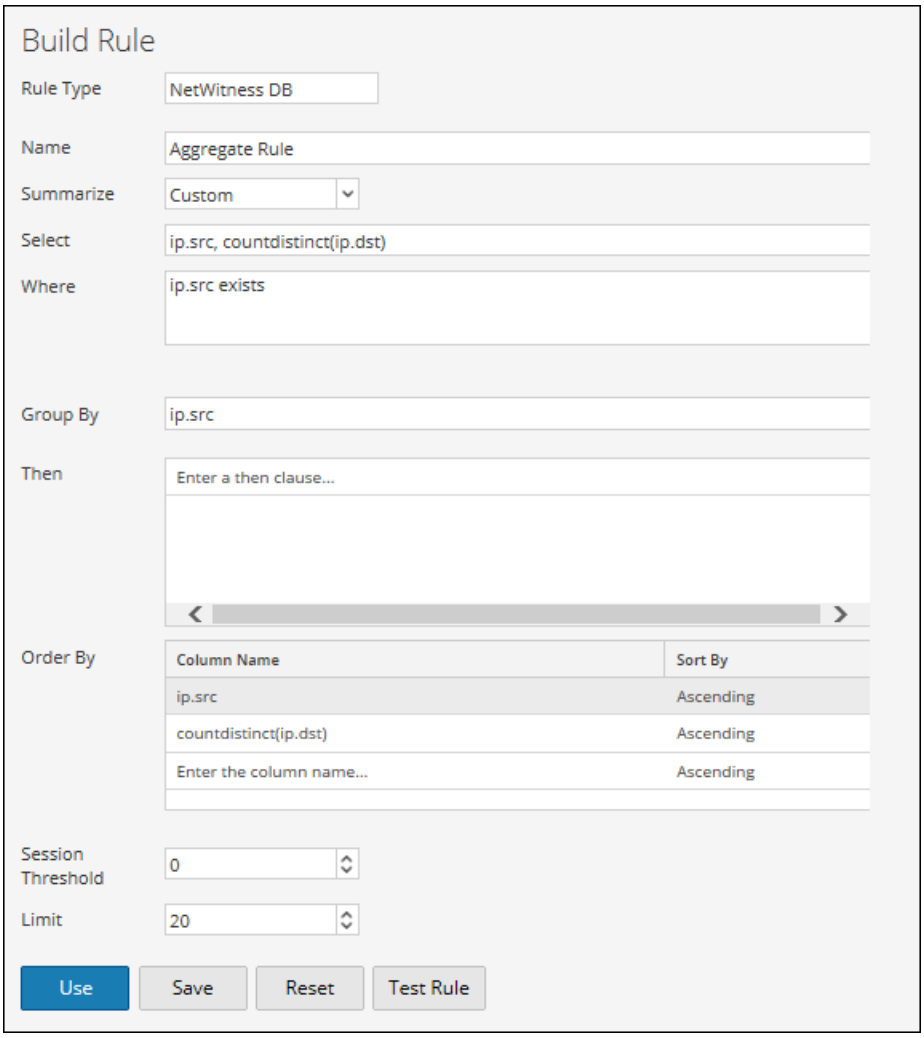


Aggregate Rule

When you want to query for a specific meta and its associated aggregate value then you must use the Aggregate rule. To get an aggregate, you must choose either of the three metas (Event Count, Packet Count, Session Size) or choose 'Custom' in the **Summarize** field to include an aggregate function in the *Select* clause. For example, select ip.src, sum (ip.dst). When Custom aggregate rule is enabled, the following fields are populated in the user interface:

- Group By
- Order By
- Session Threshold

The following figure shows the Build Rule view for Aggregate Rule.



There are two types of aggregate values that can be queried:

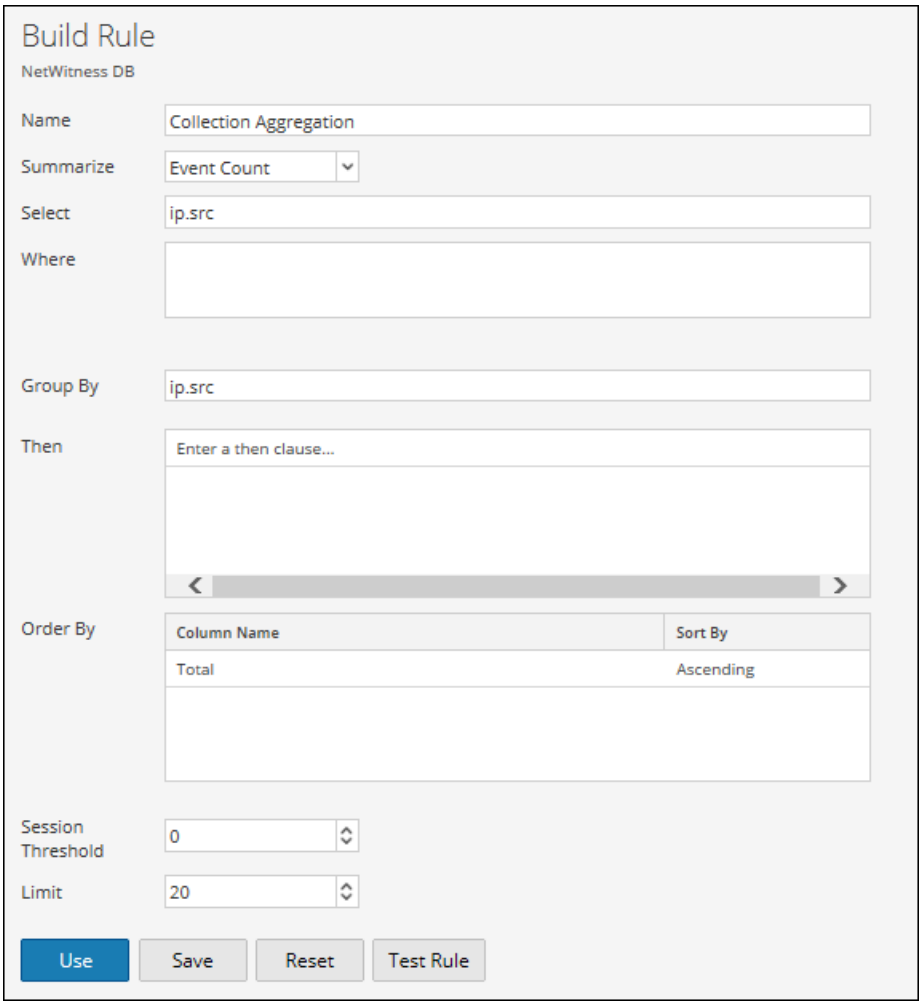
- Collection aggregation
- Meta aggregation

Collection Aggregation

With collection aggregation, you can get aggregates related to Event, Session or Packets. The following values can be queried in a collection aggregation:

- **Event Count**: The total count of events.
- **Packet Count**: The total count of packets.
- **Session Size**: The total session size.

These options are listed in 'Summarize' field and any one of them can be selected in a rule. For example, choose any of the Collection aggregates (Event Count or Packet Count or Session Size) in the 'Summarize' field and select ip.src.



Meta aggregation

With meta aggregation, you can get aggregates of meta values. The following are the supported meta aggregate functions:

- sum(meta)
- count(meta)
- countdistinct(meta)
- min(meta)
- max(meta)
- avg(meta)
- first(meta)
- last(meta)

- len(meta)
- distinct(meta)

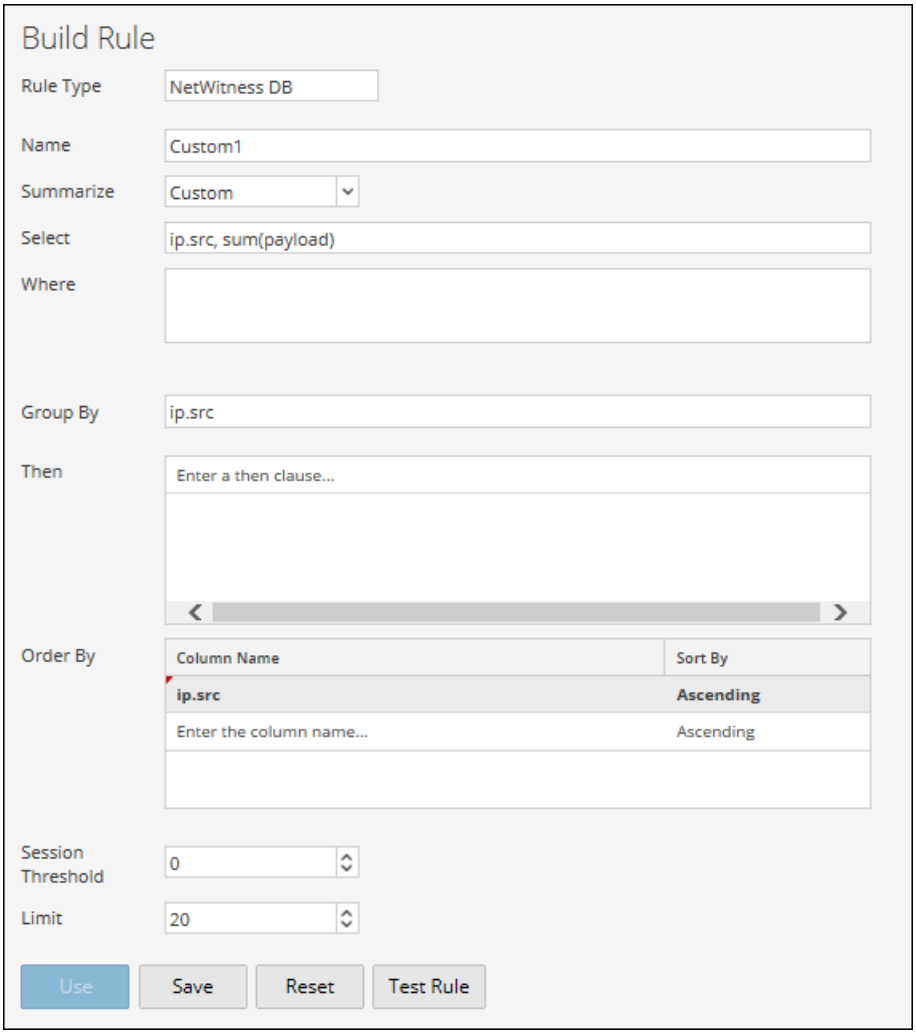
Supported Meta Aggregate Functions

The NWDB service supports the following meta aggregate functions and syntax in this release.

Syntax	Function
sum (<meta>)	The sum of all meta values. For example, if you provide the field sum(payload) in the select clause, the resultset is the sum of payload size. **Note:** The meta field chosen for the sum aggregate function must be of numeric data type.
count (<meta>)	The total number of meta fields that would be returned. For example, if you provide the field count(ip.dst) in the select clause, the resultset is the number of times an ip.dst value is returned.
countdistinct (<meta>)	The total number of distinct meta fields that would be returned.For example, if you provide the field countdistinct(ip.dst) in the select clause, the resultset is the number of times a distinct ip.dst value is returned.
min (<meta>)	The minimum of all meta values. For example, if you provide the field min(payload) in the select clause, the resultset is the min of payload size.
max (<meta>)	The maximum of all meta values. For example, if you provide the field max(payload) in the select clause, the resultset is the max of payload size.
avg (<meta>)	The average of all meta values. For example, if you provide the field avg(payload) in the select clause, the resultset is the avg of payload size. **Note:** The meta field chosen for the avg aggregate function must be of numeric data type.
first (<meta>)	The first occurrence of the meta value. For example, if you provide the field first(ip.src) in the select clause, the resultset is the first occurrence of ip.src for that group.

Syntax	Function
last (<meta>)	The last occurrence of the meta value. For example, if you provide the field last(ip.src) in the select clause, the resultset is the last occurrence of ip.src for that group.
len(<meta>)	Converts all field values to a UInt32 length instead of returning the actual value. This length is the number of bytes to store the actual value, not the length of the structure stored in the meta database. For instance, the meta value "NetWitness" returns a length of 10. All IPv4 fields, like ip.src, returns 4 bytes.
distinct (<meta>)	The distinct values of the meta. For example, if you provide the field distinct(ip.src) in the select clause, the resultset is all the distinct ip.src for that group.

You must select 'Custom' in 'Summarize' field and provide the meta and the meta aggregate functions in the select clause.



Note: Meta aggregate functions cannot be used in a WHERE clause and the rule actions like min_threshold/max_threshold can be used to filter aggregate functions. It is advised to use a more refined WHERE clause to get a better rule performance while using 'group by'.

Aggregate Query for Multiple Meta

To execute aggregate query for multiple Meta, follow these steps:

1. Select **MONITOR** > **Reports**.

   The Manage tab is highlighted and the **Rules** view is displayed.

2. In the Rule toolbar, click + > **NetWitnessDB**.

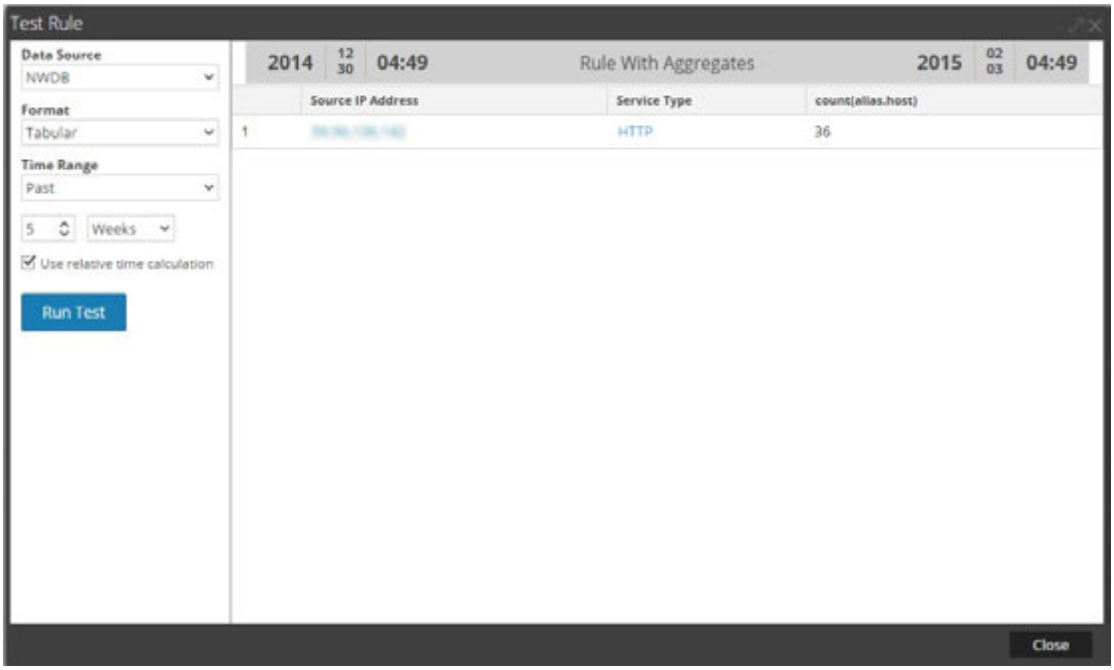
   For example, enter the following meta in the fields highlighted below:

SELECT: ip.src, service, count(alias.host)
ALIAS: Source IP Address, Service Type, count(alias.host)
WHERE: ip.src = 59.96.136.142

Note: In the alias field you can enter a name for columns used in the select clause. If you do not specify the alias for one of the field in the select clause, then the default description will be used. For example, if the select clause has Field1,Field2,Field3,Field4, and alias has only Field1, ,Field3,Field4, then for Field2 a default description is used.

3. Click the **Test Rule** button at the bottom of the screen.

   The Test Rule page is displayed.



Summarize

Summarize determines the type of summarization or aggregation for the rule.

Name	Config Value
Summarize	To query metas without any custom grouping, select: • **None**: The data is grouped by session in this case. To get collection (sessions/events/packets) related aggregates, select either of the following: • **EventCount**: The total count of events. • **Packet Count**: The total count of packets. • **Session size**: The total session size. To get meta based aggregates, select: • **Custom**: This indicates that expected meta aggregate function is defined in rule select clause.

Order By

Order By determines how to sort the result set.

Name	Configuration Value
Column Name	The **Column Name** is the name of the columns by which you want to sort the results. By default, the value is empty. When you click on a column, the value gets populated based on the Summarize field. • For 'None' and 'Custom', the value gets populated based on the entries made in the Select field. You can select from this list or add custom name. • For Event Count, Packet Count and Session size, accepted values are Total and Value. • Total - sort by aggregate value • Value - sort by group by meta
Sort By	**Sort By** determines the order in which you want to sort the results. The following are the values: • Ascending Order • Descending Order

Session Threshold

The session threshold is the optimization setting to stop scanning the matching sessions for each possible
unique value for the selected meta.The threshold is an integer between 0 (default) and 2147483647. The threshold 0 scans for all matching sessions.

Note: If you provide a non-zero value (a value higher than zero), the aggregate results are inaccurate. This can be used only when you are interested in unique values and not aggregate values.

Supported where Clause

Syntax	Description
where <field1> [<field-operator>] < value1>,<value2>,<value3-value4> <logic-operator> <field2>,and so on	The where clause is a comma separated list of language field values and ranges that is used by NwValues function. In the where clause, string values have to be enclosed within single quotes. For example, where username = 'admin' && service = 22.
where <field1> [<field-operator>] <List1>	You can use a list in the where clause if you have multiple values to report on. For example, where ip.src exists && alias.host exists && alias.host contains $[User Reports/List of Alias Host]. When you use the list you must specify in the format $[<path>/<List name>].

In the where clause, make sure the syntax is correct based on the meta type.
For example,
For all text meta type use quotes for example, username = ‘user1’.
For all IP Addresses, Ethernet Addresses, and Numeric meta types do not use quotes for example, service = 80 && ip.src = 192.168.1.1.
For date and time meta types, if the date and time format is 'YYYY-MM-DD HH:MM:SS‘, use quotes.
If the date and time format is 1448034064 (number of seconds since EPOCH (Jan 1, 1970)), do no use quotes.

Note: If list is used in the rule, make sure that the list values are quoted or unquoted based on the type of the meta used. Checking the **Quotes will be inserted for all the values** checkbox in list definition page (for more information see, Create Lists or List Groups section in Configure a Rule) would quote all the list values.

Supported where Clause Operators

Syntax	Description
=	Returns results where the field is equal to any provided value. For example, tcp.dstport = 21-25,110 returns session with TCP destination ports of 21, 22, 23, 24, 25, or 110.
!=	Returns results for fields that do not match the values specified. For example, eth.type !=0x0800 returns sessions outside of hex value (decimal value of 2048) that is all non-IP based protocols.
begins	Checks for a value at the beginning of a text or binary field.
contains	Searches a text or binary value for a partial match.
ends	Checks for a value at the end of a text or binary field.
exists	If the field value exists, regardless of value, the operation evaluates to true.
!exists	If the field value does not exist, the operation evaluates to true.
length	Evaluates the length of the field. For example, username length 20-u returns any username that is 20 or more characters long.
regex	Performs a regular expression search against text or binary values.
not	Not operator is used to negate a clause or condition. For example, (not(user.dst ends "$")) will not display values for user destination.

Supported then Clause

Syntax	Description
then <rule action>	The then clause contains a rule action that manipulates the original result set of a rule in order to make the output in a report more concrete or add additional functionality other than querying data and displaying it. For example, dedup (filename).

Limit field

This indicates the limit to be put on the query while fetching data from the database. If a result set is sorted by event
count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not
sorted, the first N values are returned.

Rule Actions

The NWDB data source rule syntax supports the following rule actions:

- dedup
- filter_on
- filter_out
- lookup_and_add
- max_threshold
- min_threshold
- regex
- sum_count
- sum_values
- show_whats_new

dedup (string field)

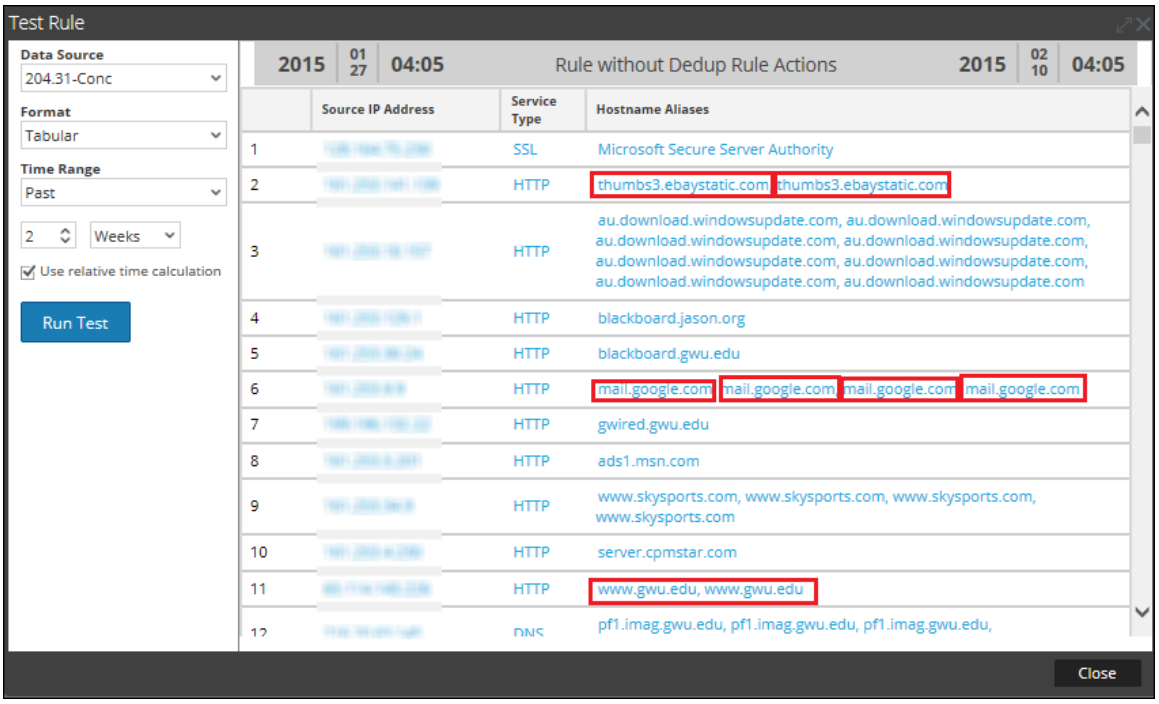
dedup removes the duplicate entries in an unsorted result set and displays only pertinent data. The dedup rule action removes duplicate entries of a specific field in the report, so that only the first occurrence of that value is listed in the report.

Note: The dedup rule action cannot be used with an aggregate rule.

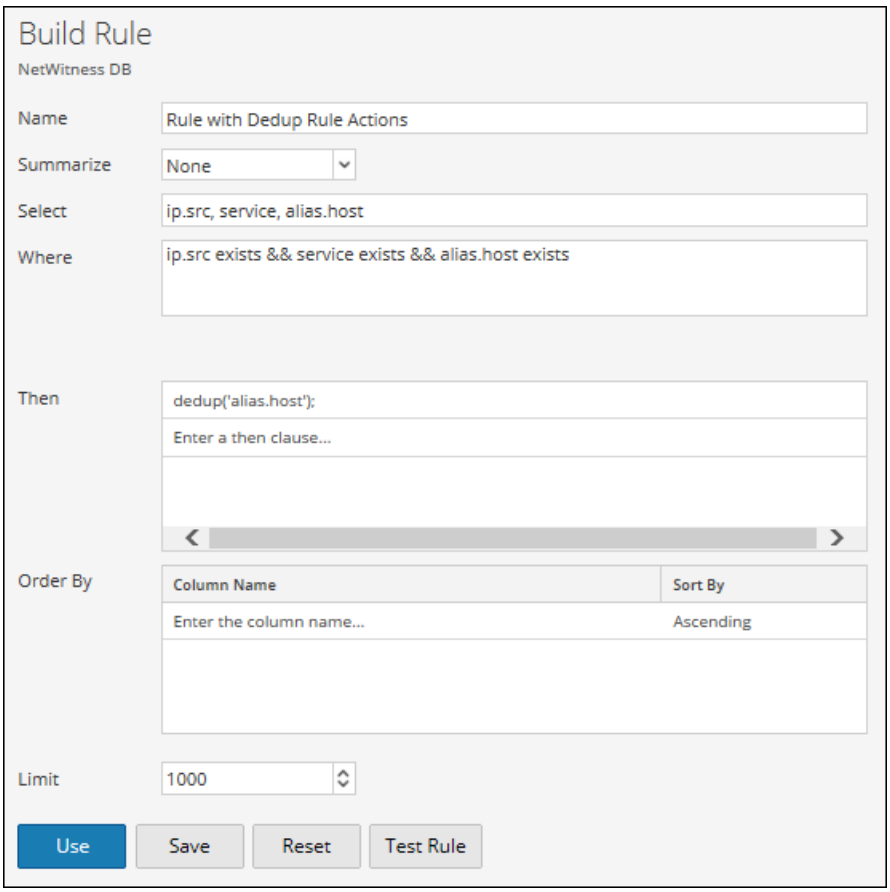
For example, the meta data generated by an individual session is often repetitive, especially when you have sessions with a lot of DNS lookups or web sessions that access the same host multiple times for various resources (such as, javascript, css). To remove the duplicate entries of the host, you can use the dedup rule action.

Example:

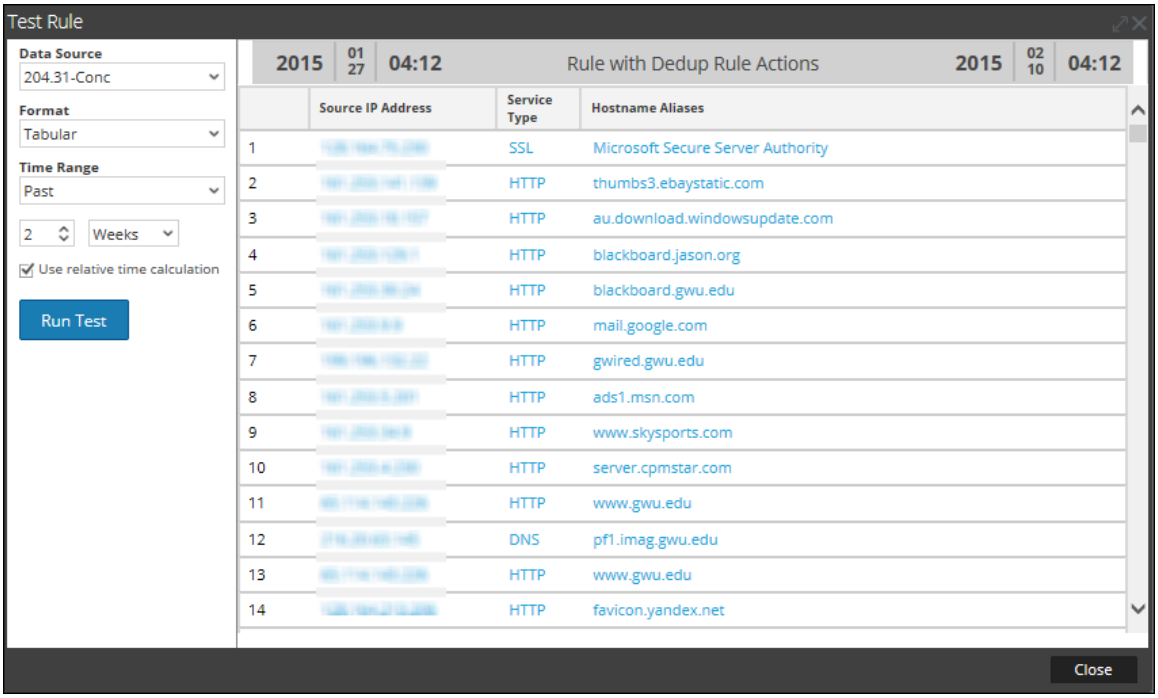
The following example is a lengthy result set that can be trimmed by removing the duplicate values in the same session.



The following figure shows the use of dedup rule action to remove the duplicate entries from the result set.



The duplicate value for each entry in the rule result set is reduced to one value.



filter_on (string filter, string field, bool matchExact)

`filter_on` removes values that do not contain the `filter` criteria from the result set. If the result set contains multiple fields, you must select a specific field to which the filter is applied. To add additional results to a single result set, include function such as lookup_and_add.

The matchExact parameter determines if the match is an exact match or contains a match.

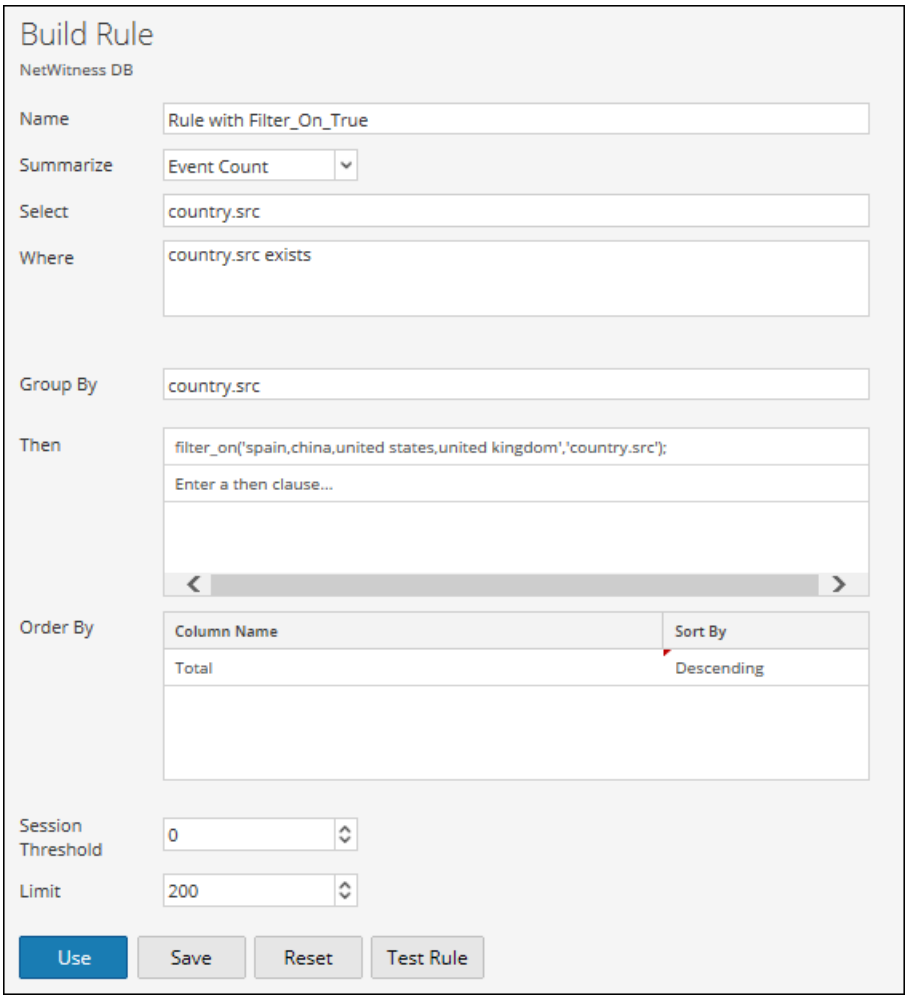
- If matchExact is set to `false`, any value that contains the filter text is considered a match.
- If matchExact is set to `true`, only values that match the provided filter text is included in the result set.

Note: Unless the matchExact parameter is specified, the default behavior of the rule action is to match exactly the text specified in the filter parameter. To specify that results containing the filter text must be kept in the result set, users must set the matchExact parameter to false.

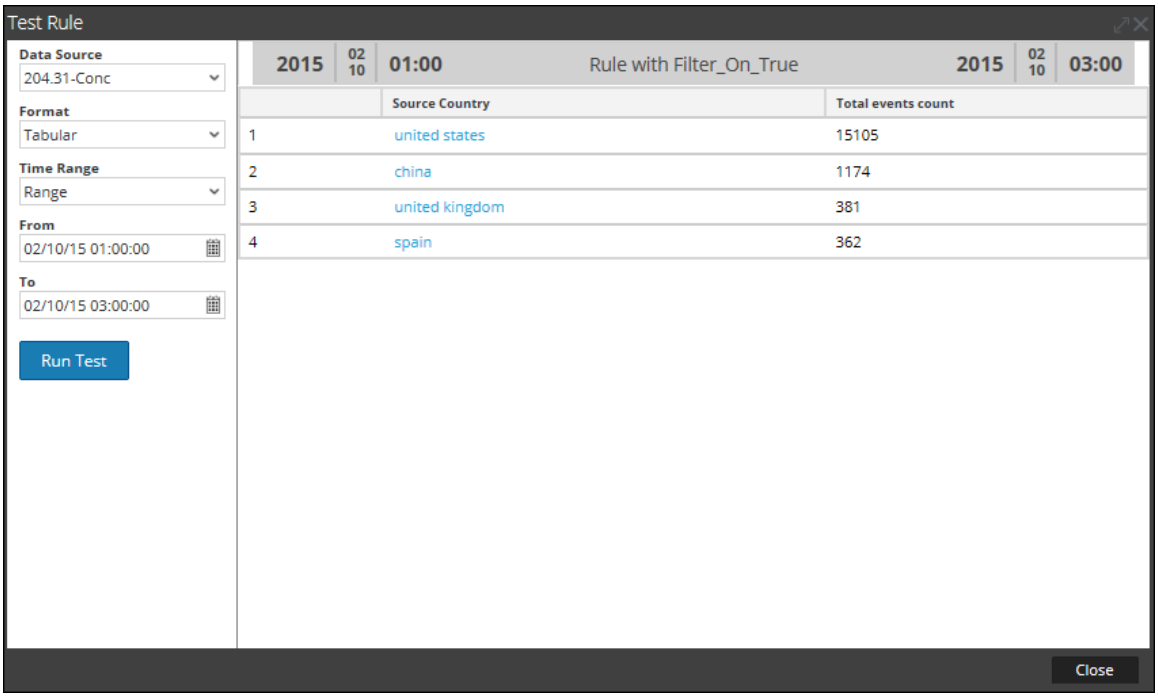
Example:

The following figure displays the list of countries and their event count.

The following figure shows a filter_on rule action to filter out countries except Spain, China, United States and United Kingdom from the result set.



The following figure shows the output with the filter_on rule action.



Another way of filtering out the entries from the result set is to create a list of variables which you want to filter out. For example, you can create a list with United Kingdom, France and Germany as values in the list. You can use this list in the rule action to get the same result set. For example, if you create a list called COUNTRY_LIST, you can use the list as follows:

```
filter_on ('$COUNTRY_LIST', 'country.src', 'false');
```

```
filter_out (string filter, string field)
```

```
filter_out (string filter, string field, bool matchExact)
```

filter_out removes the values that contain the *filter* criteria from the result set. If the result set contains multiple fields, you must select a specific field to which the filter is applied (for example, you can use a lookup_and_add to add results to a single result set).

The matchExact parameter determines if the match is an exact match or contains a match.

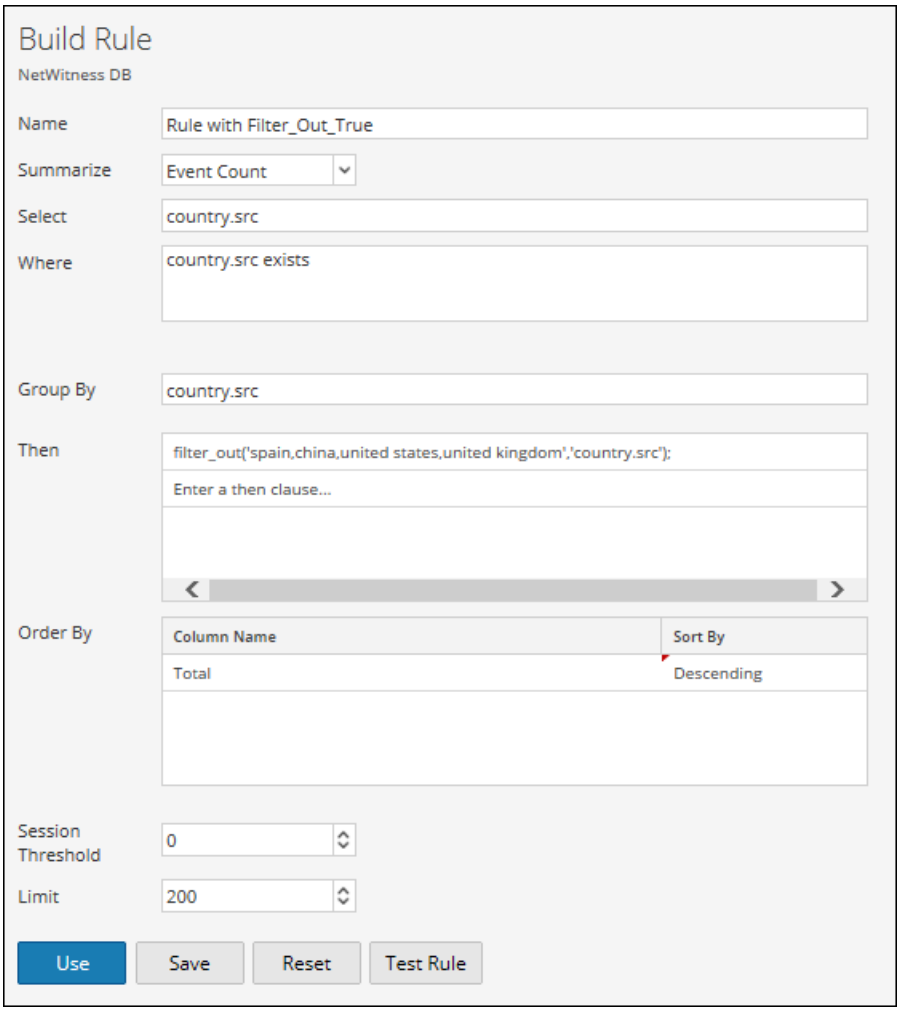
- If matchExact is set to false, any value that contains the filter text is considered a match.
- If matchExact is set to true, only values that match the provided filter text is excluded from the result set.

Note: Unless the `matchExact` parameter is specified, the default behavior of the rule action is to match exactly the text specified in the filter parameter. To specify that results containing the filter text must be removed from the result set, users must set the `matchExact` parameter to false.

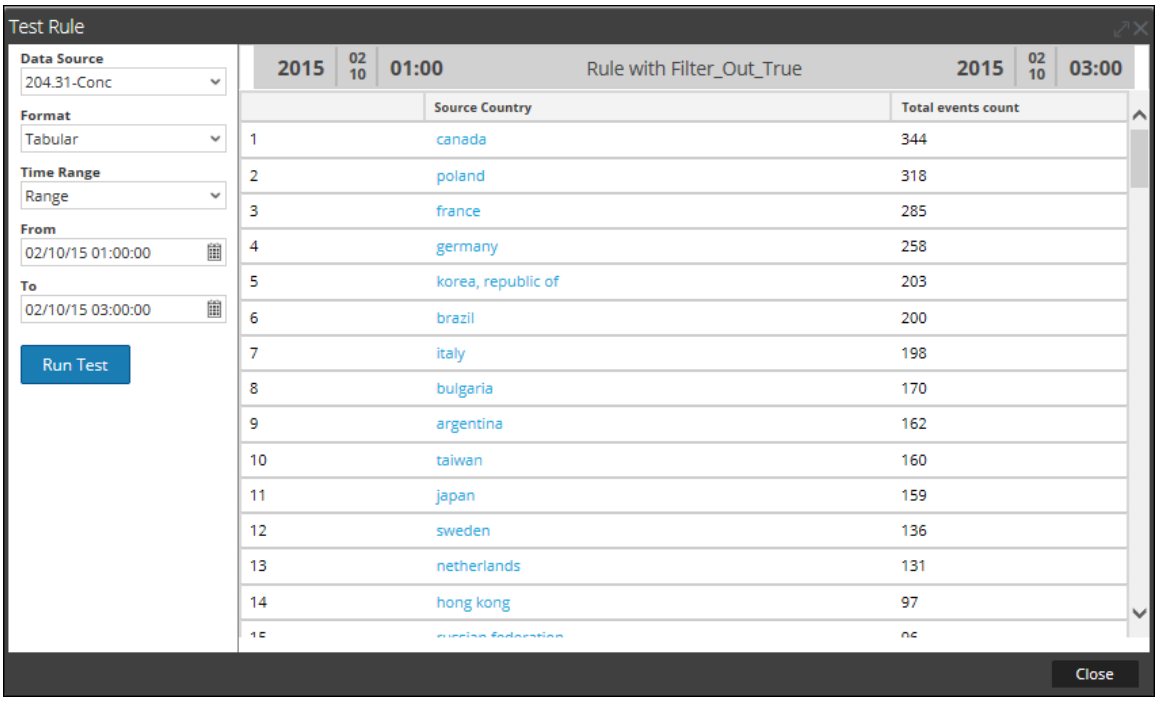
Example:

The following figure displays the list of countries and their event count.

The following figure shows the filter_out rule action to remove the event count for Spain, China, United States and United Kingdom from the result set.



The following figure shows the output with the filter_out rule action.



```
lookup_and_add (string select, string field)

lookup_and_add (string select, string field, int limit)

lookup_and_add (string select, string field, int limit, boolean inherit)

lookup_and_add (string select, string field, int limit, boolean inherit,
string extraWhere)

lookup_and_add(string select, string field, int limit, boolean inherit,
string extraWhere, boolean aggregate)
```

This rule action iterates through a list of values in a result set and lookup additional meta data to further describe the relationships between various elements in a result set.

Note: The lookup_and_add rule action can be used only with an aggregate rule.

The first parameter, select, designates the type of meta data that must be added to elements of the result set. The second parameter, field, specifies where in the result set the append must apply to. Also, a limit can be applied to avoid crowding the result set with a large result set.

By default, subsequent queries to the SDK will inherit the where clause of the parent rule. To use a unique where clause, you can specify a boolean value in the fourth parameter as false and in the fifth parameter you can specify a different where clause.

Note: If you are using a unique where clause in your query, make sure that you use a single quote (') for enclosing arguments and double quotes (") for string values.

Now, with the addition of **Custom** summarization and **Group By** feature, the result can be achieved even without having lookup_and_add rule action. The new rule syntax with groupby displays the result in a flat structure which is better than the earlier rule syntax without groupby Hence it is recommended to manually edit/update rules with lookup_and_add rule action and use groupby clause wherever it is applicable.

Note: Lookup_And_Add rule action is supported only if the SELECT clause has one meta and aggregate function.

For example, see below scenarios: In Example **2a**, lookup_and_add rule action is used. Instead of using lookup_and_add rule action, the same result can be achieved by using **Custom** summarization and **Group By** feature. See Example **2b** below.

But, lookup_and_add rule action is still supported for NWDB rules on the following conditions:

- All versions of NWDB rules with Summarization as Event Count, Packet Count, or Session Size.
- For Custom summarization, the lookup_and_add rule must have only one group by meta with only one aggregate function where the aggregate function must be either sum() or count().

Note: It is not supported for “Summarize-None”.

For example, lookup_and_add rule action can be used for the following rules:

- select ip.src, sum(size) group by ip.src
- select ip.src, count(filename) group by ip.src

It cannot be used for the following rules:

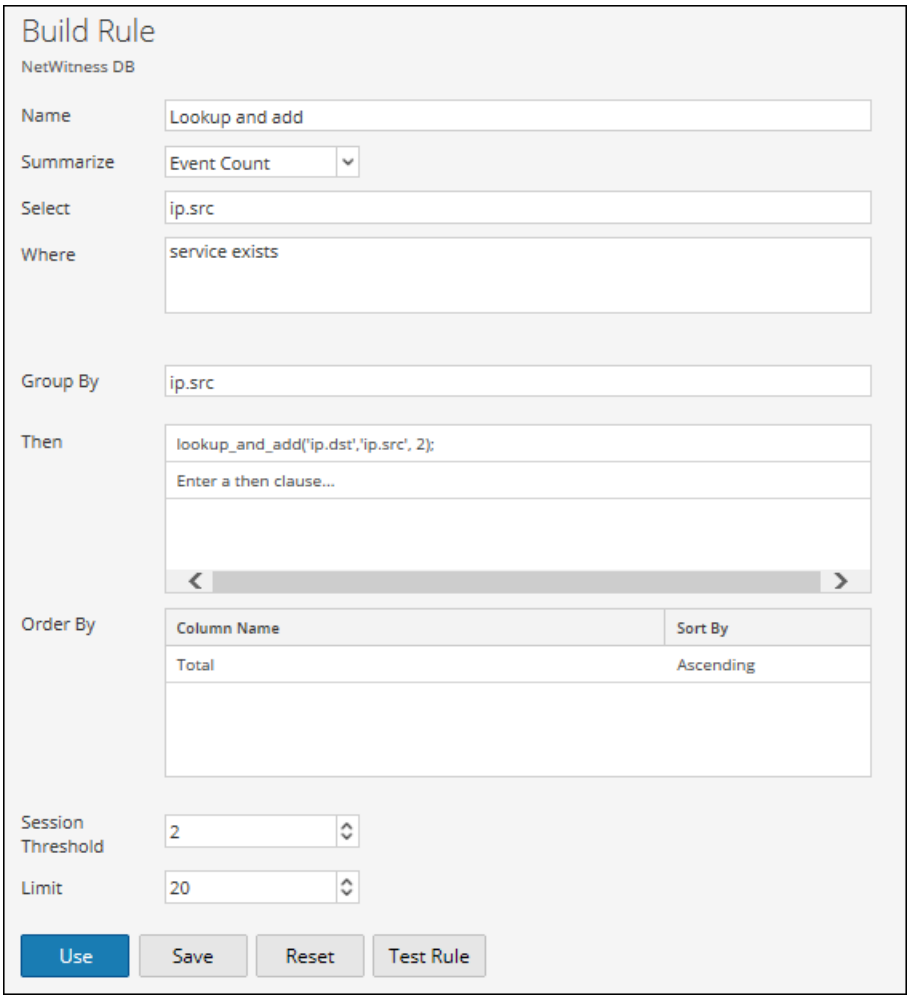
- select ip.src, sum(size),count(filename) group by ip.src
- select ip.src, sum(size),avg(size) group by ip.src
- select ip.src,ip.dst count(filename) group by ip.src,ip.dst

Examples:

1. lookup_and_add('ip.dst','ip.src', 2);

This rule action would iterate through each ip.src in the initial result set and lookup the top two destination IP addresses with each ip.src.

The following figure shows the rule definition.

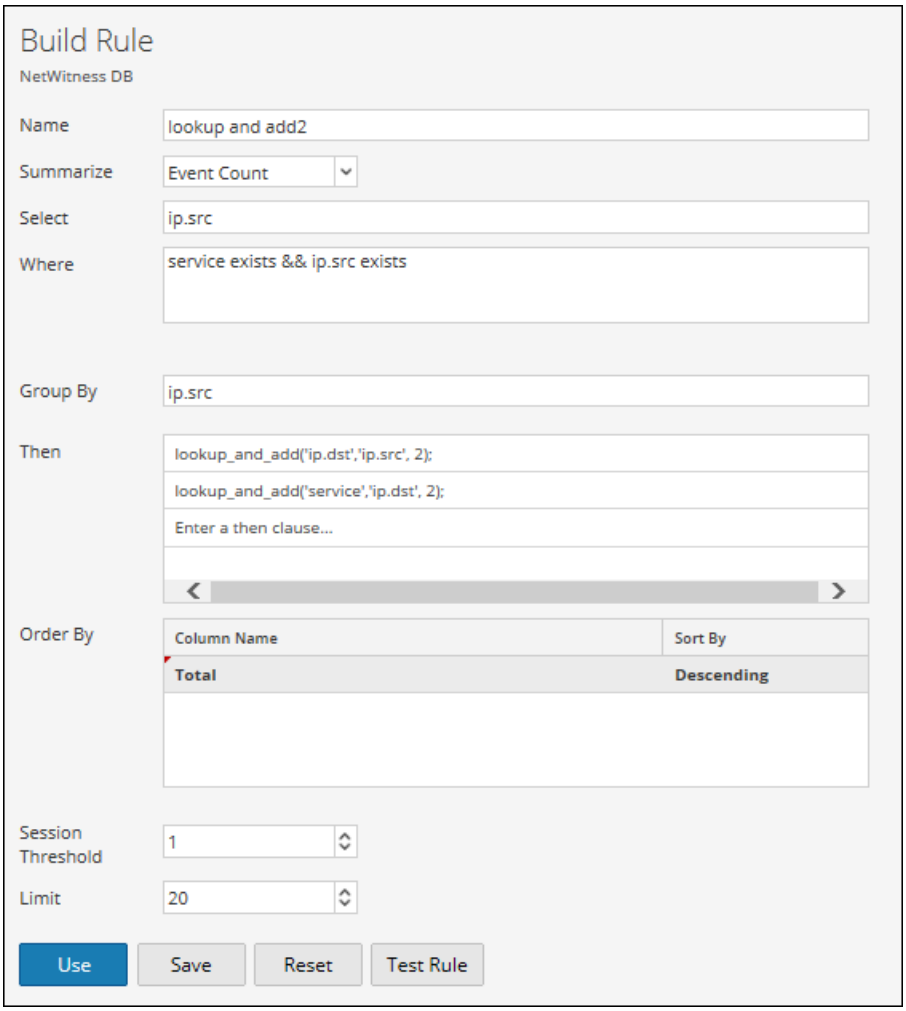


The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src.

2a. lookup_and_add('ip.dst','ip.src', 2); lookup_and_add('service','ip.src', 3);

This rule action would iterate through each ip.src in the initial result set and lookup the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.

The following figure shows the rule definition.



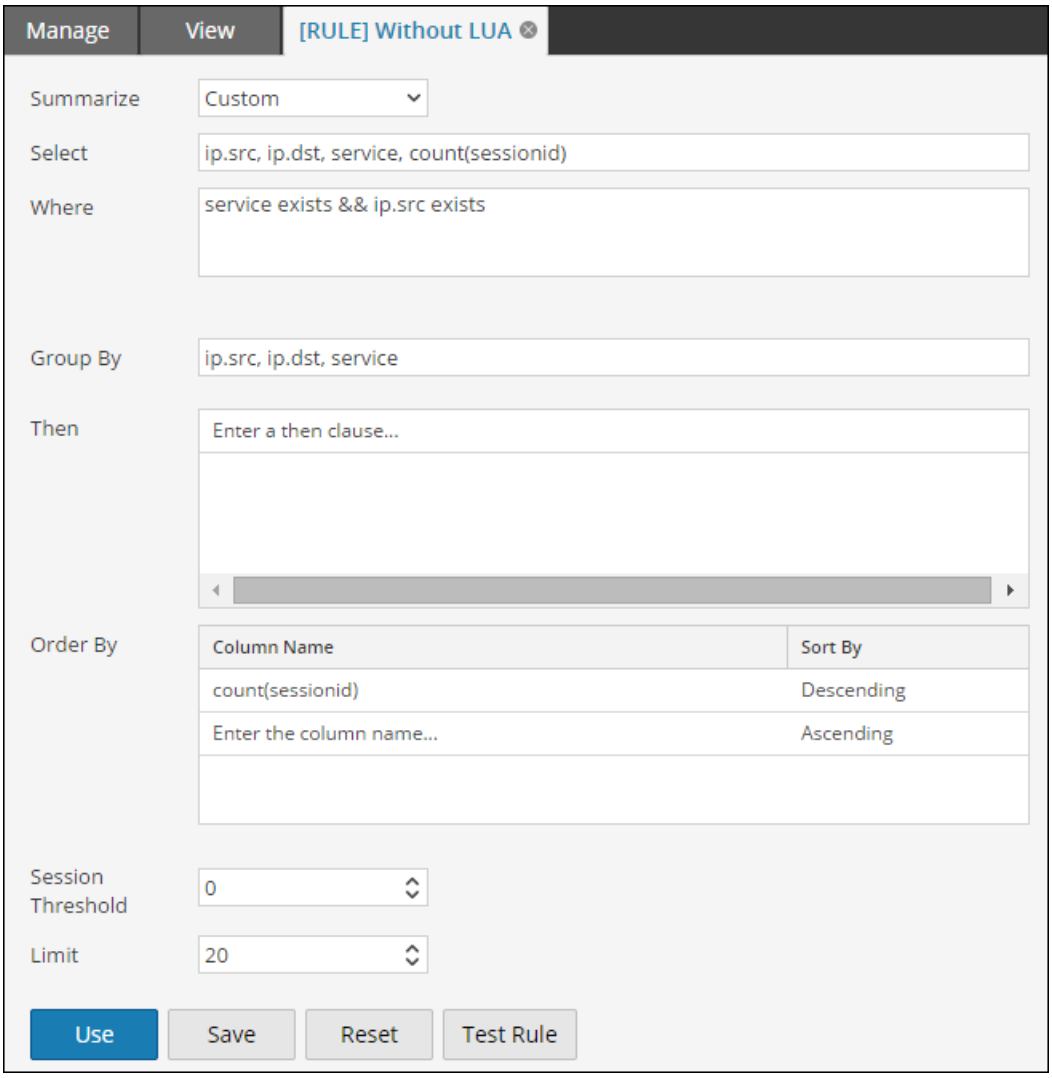
The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.

You can make the query as complex as you want by selecting different fields in the result set and by appending to different parts. For example, you may want to know what files each source IP had touched. However, because the parent rule has a WHERE clause of service = 6667 and the default behavior of this rule action is to append to the original WHERE clause, it becomes necessary to override the parent WHERE clause. The easiest way to understand this concept is to look at the previous lookup_and_add call lookup_and_add('ip.dst','ip.src',2). The actual query that is sent to the server is SELECT ip.dst WHERE service = 6667 &&ip.src = 206.42.199.194. In order to force the WHERE clause to override the service = 6667 portion of the WHERE clause (inherited from the parent rule), the user can specify a 4th parameter of false as shown in example 3.

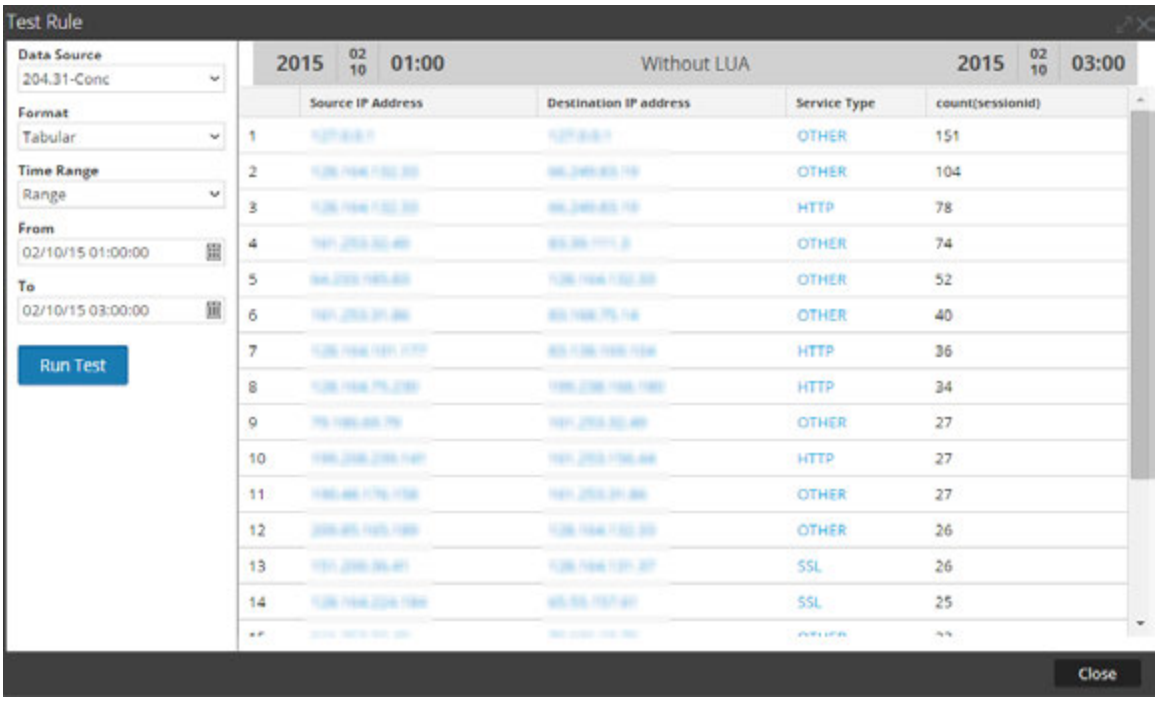
2b. Without Lookup_and_add Rule

This rule uses the Custom summarization and Group By feature to sort the results.

The following figure shows the rule definition.



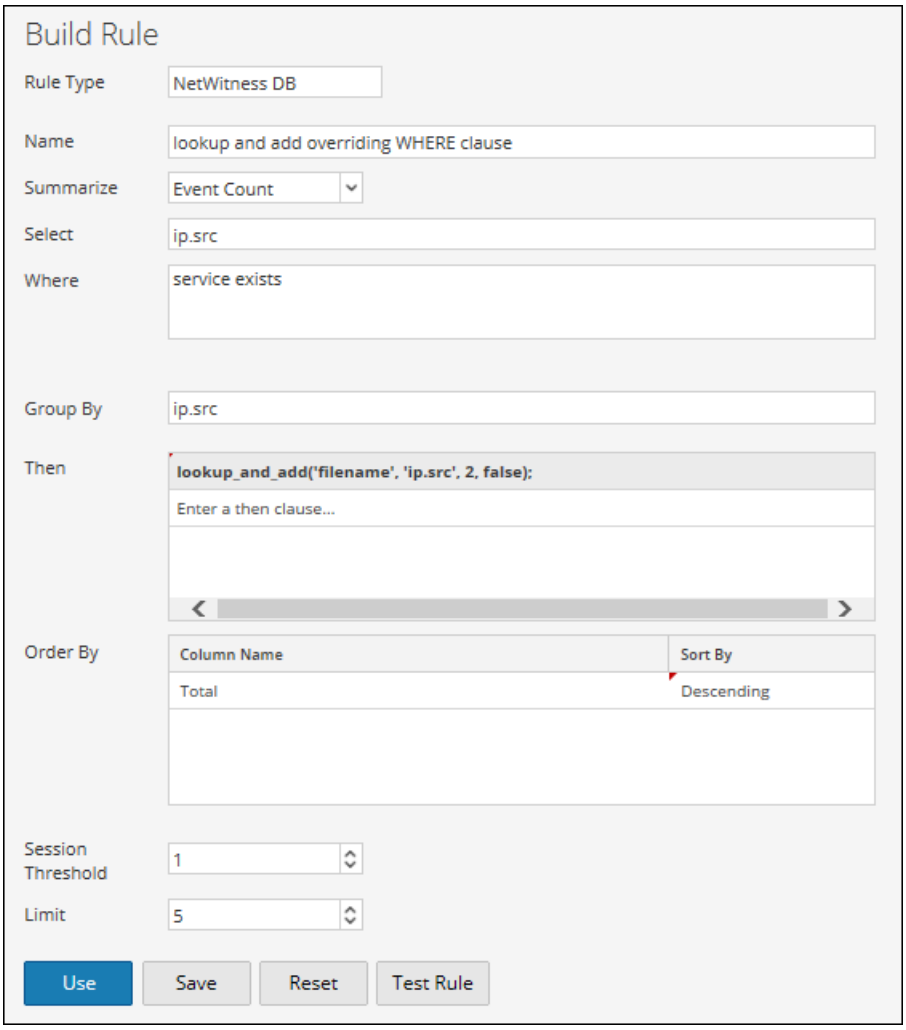
The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.



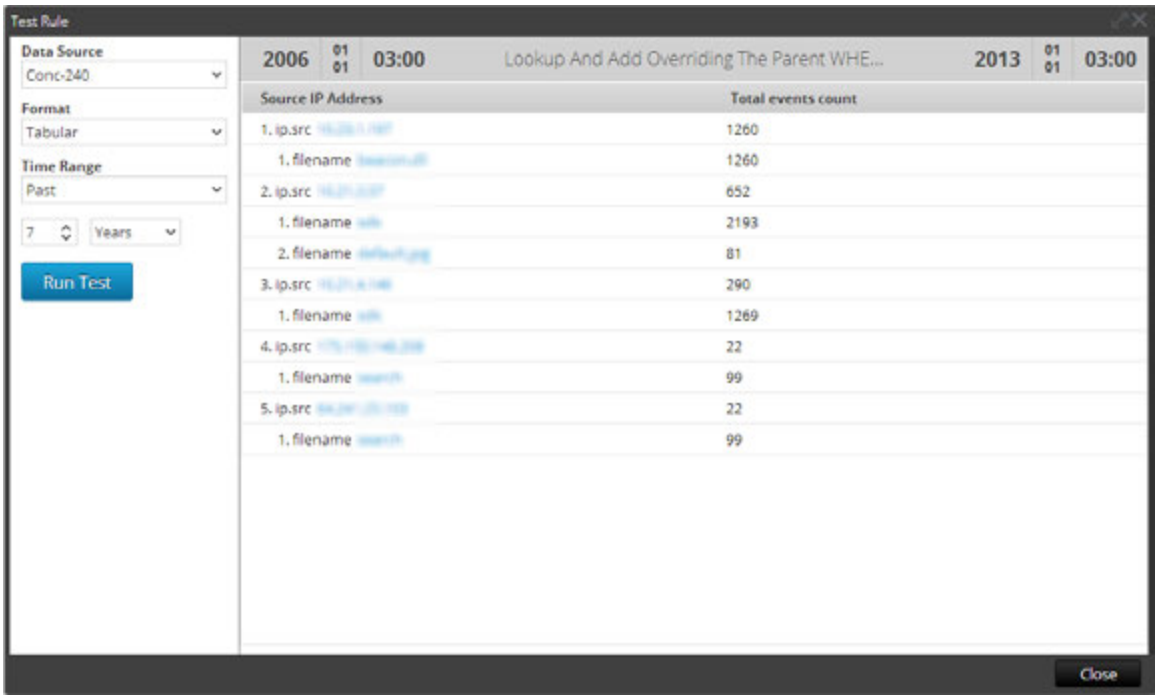
3. lookup_and_add('filename', 'ip.src', 2, false);

This call would issue a query to the server, like `SELECT filename WHERE ip.src = 90.0.0.142` rather than `SELECT filename WHERE service = 6667' && ip.src = 90.0.0.142` because you have specified the rule action to ignore the initial `WHERE` clause of the parent rule.

The following figure shows the rule definition.



The following figure shows the result set.

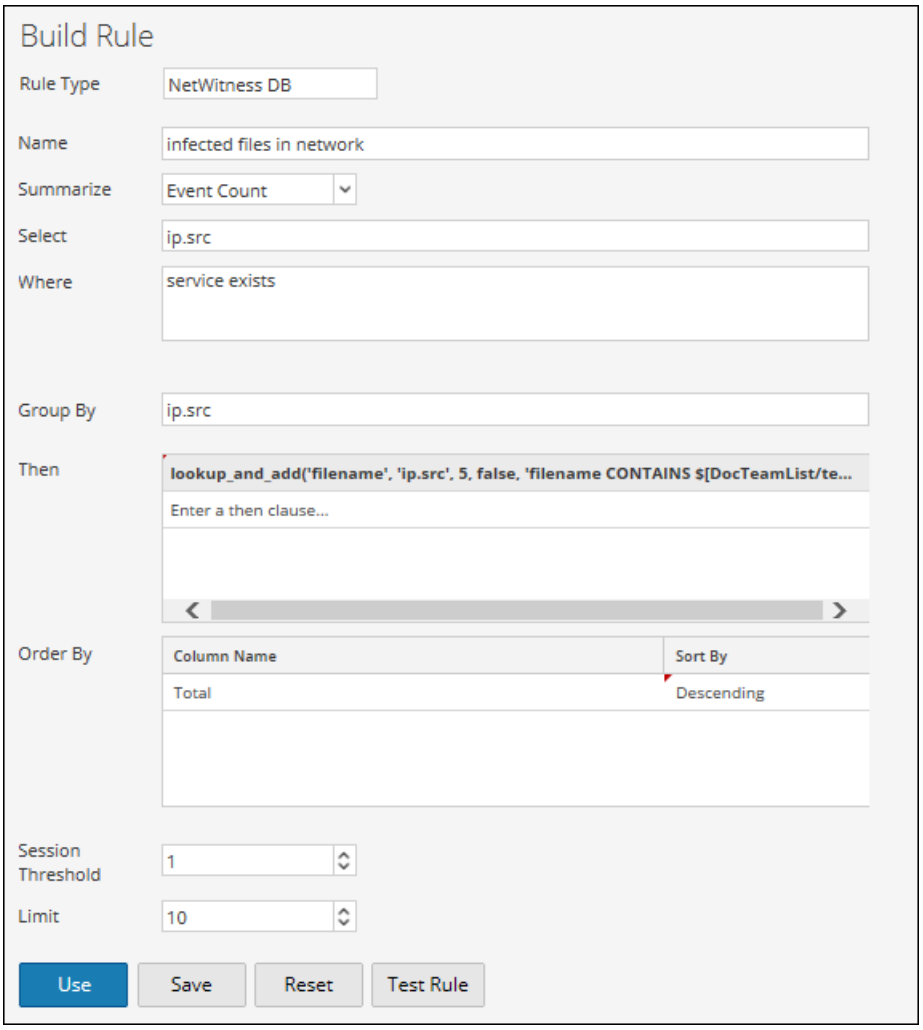


The test list is in a group name netwitness, you can access that list with the following syntax.

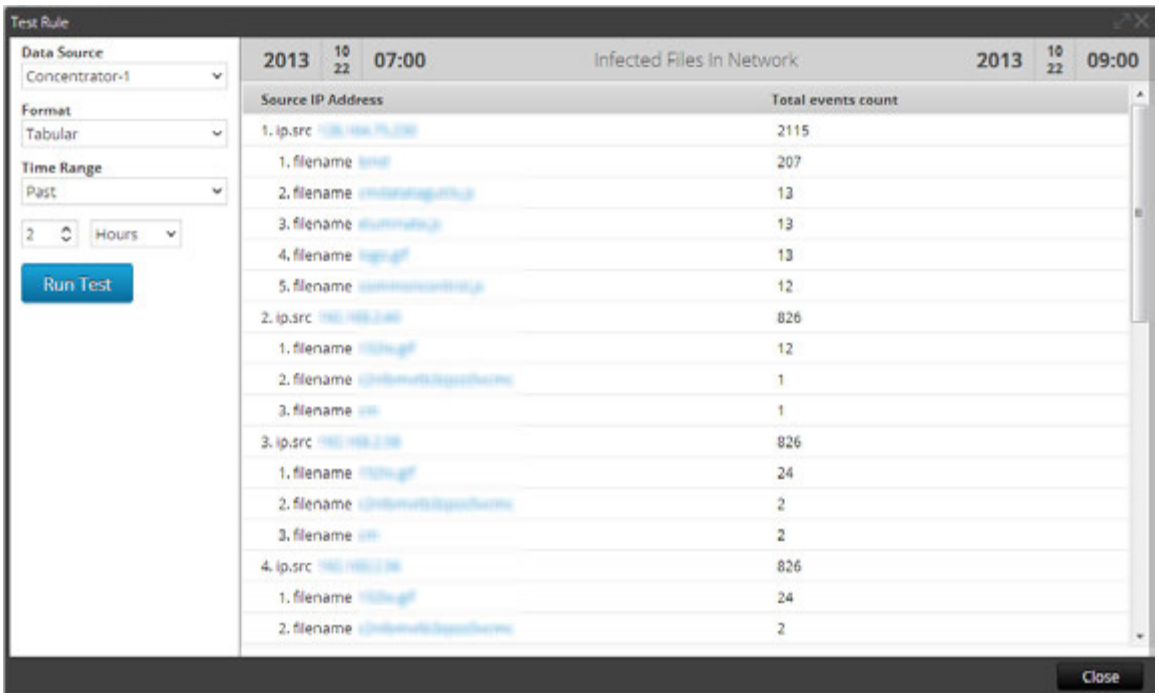
You can even narrow down these appended results even further to only include filenames that have .gif as filename extension by using the fifth parameter in the rule action. The fifth parameter allows you to specify additional WHERE clause criteria. The files with .gif filename extension would be stored in the **test** list within a group named **DocTeamList**. You can access this list with the following syntax: threat.source = $[DocTeamList/test]
This can be referenced in the extra where clause parameter in the following manner:

4. lookup_and_add('filename', 'ip.src', 5, false, 'filename CONTAINS $[DocTeamList/test]');

The following figure shows the rule definition.



The following figure shows the result set.

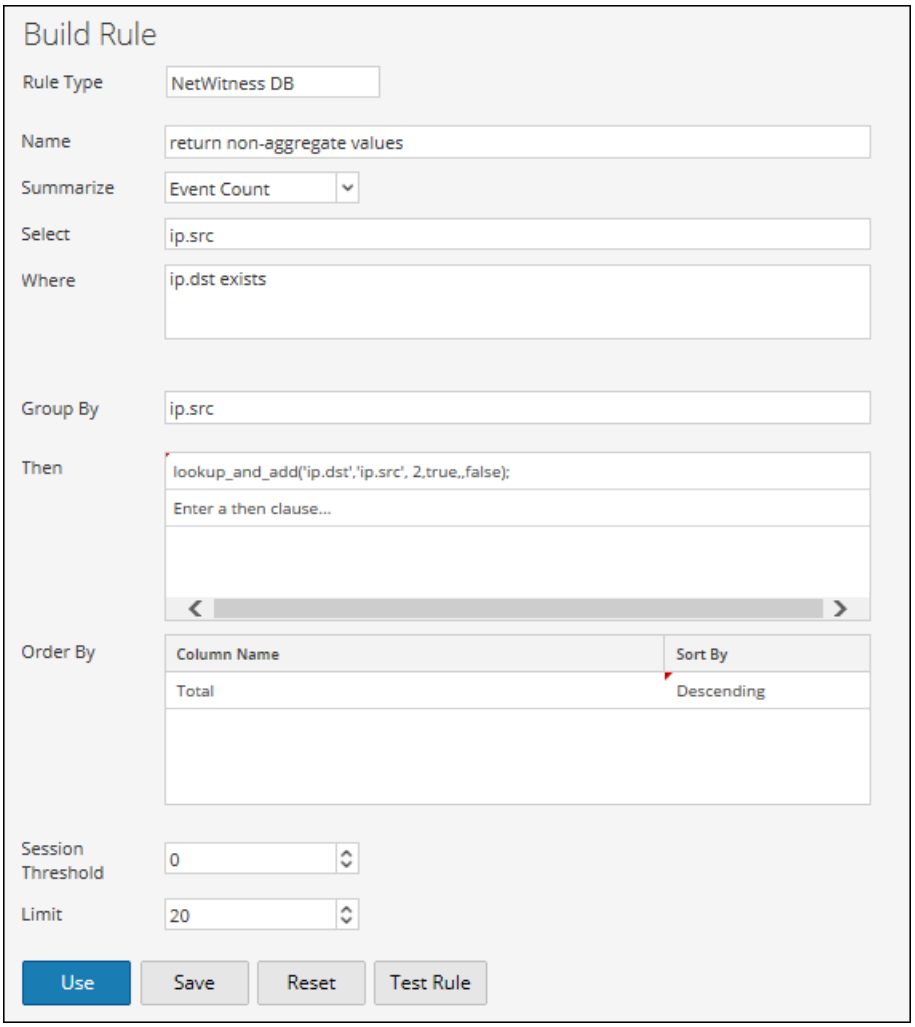


5. lookup_and_add('ip.dst','ip.src', 2,true,,false);

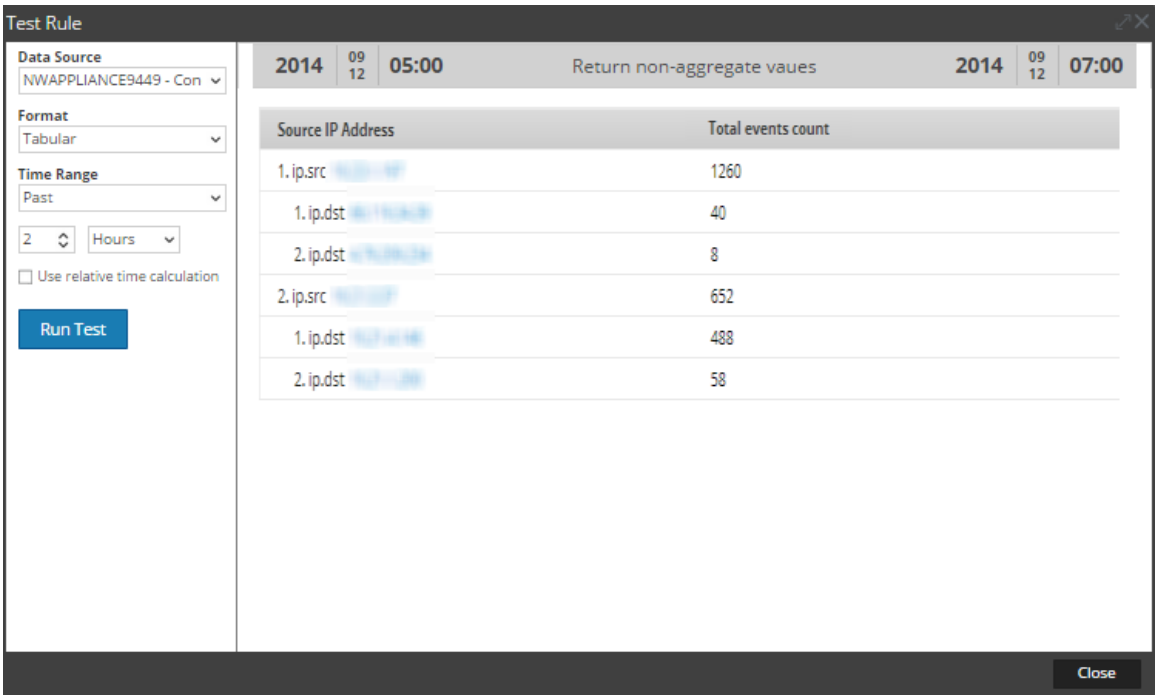
This rule action would iterate through each ip.src in the initial result set and lookup the top two destination IP addresses with each ip.src. The 'aggregate' parameter is set to 'false', this implies that aggregates would be skipped for lookup values and hence the lookup query executions will complete faster.

Note:
The default value for 'aggregate' is 'true'. When 'aggregate' is set to 'false', Reporting Engine passes threshold=1, Sort by='value' and Order=Ascending to NWDB to make lookup queries run faster.
. You must set the 'aggregate' to false, when rule contains aggregate functions or when the rule is run against a wide time range. This helps the rule to complete the execution faster.

The following figure shows the rule definition.



The following figure shows the result set.



```
max_threshold (string quantity)
```

```
max_threshold (string quantity, string field)
```

max_threshold removes any results with a quantity that is larger than the maximum threshold quantity from a result set. The quantity can either be in terms of count or size and it is relative to the sorting options of the parent rule. This means that if you sort a rule by size, the rule action expects you to specify the parameter in bytes (you can append KB, MB, GB, TB to the parameter to make size conversion easier).

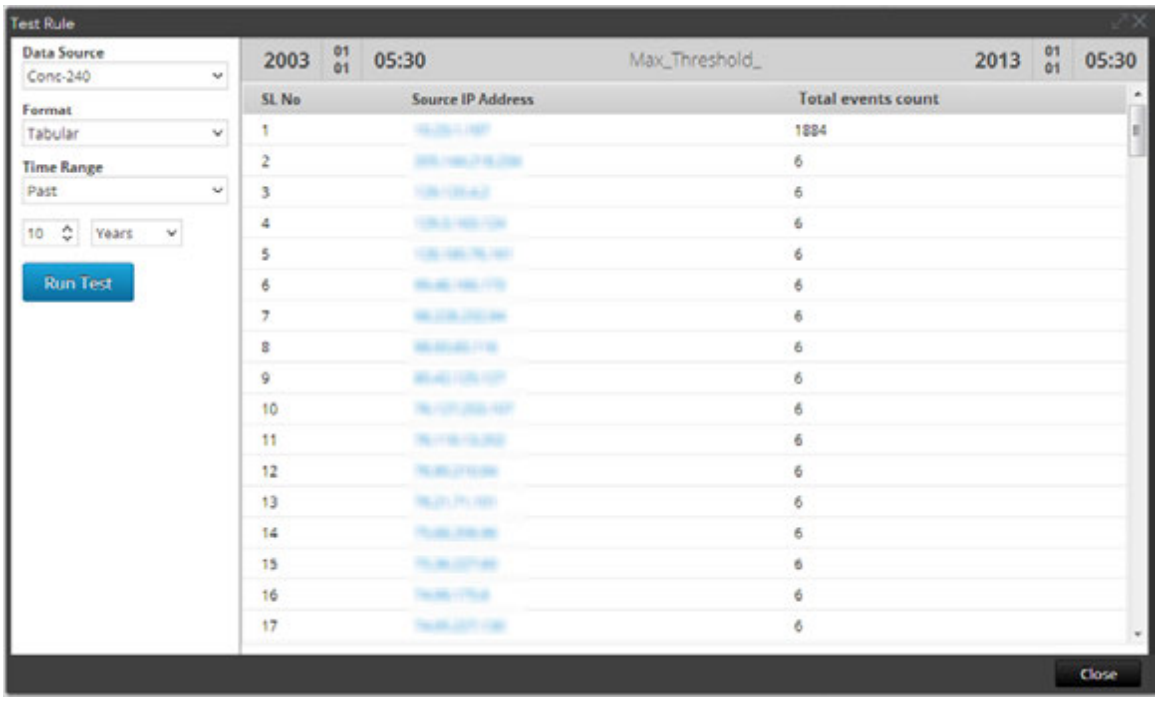
max_threshold rule can also be used to filter values based on the aggregate function values. Use the syntax based on the type of summarization used in the rule as below:

- max_threshold(String quantity): Can be used to filter Event Count, Packet Count, and Session Size.
- max_threshold(String quantity, String field): Can be used to filter values of Custom aggregates or any metas.

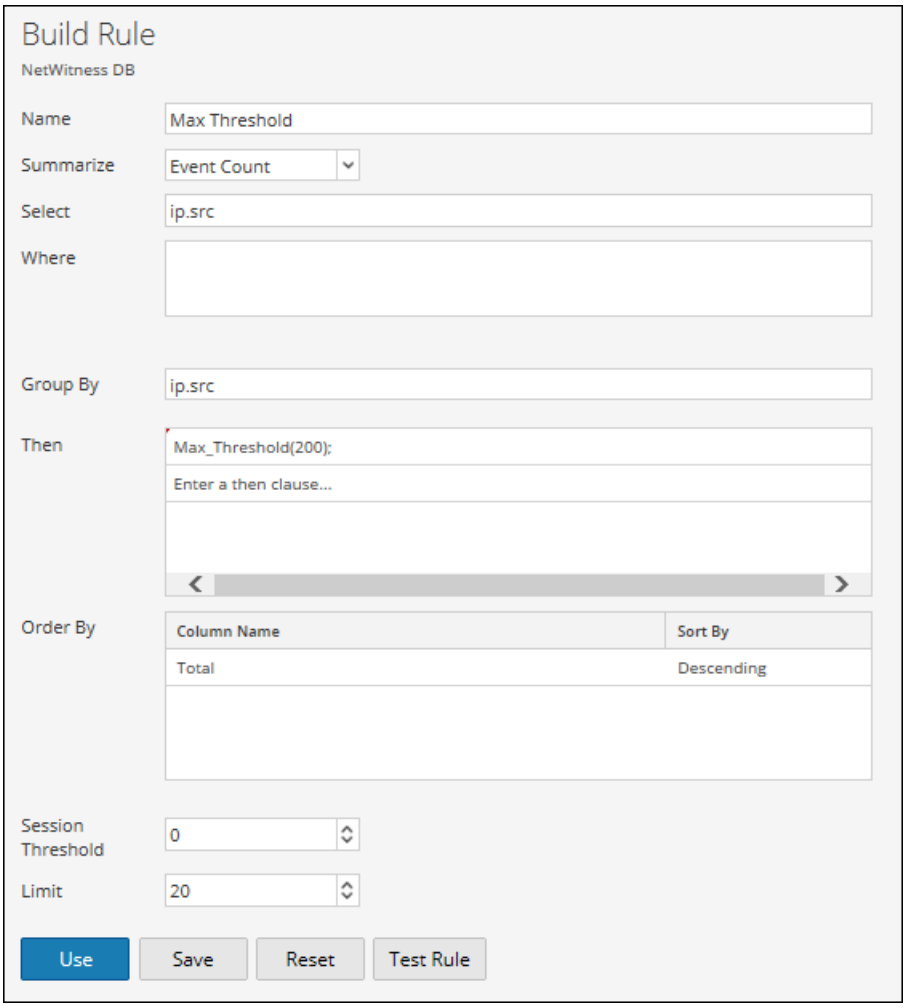
Examples:

1. max_threshold(200);

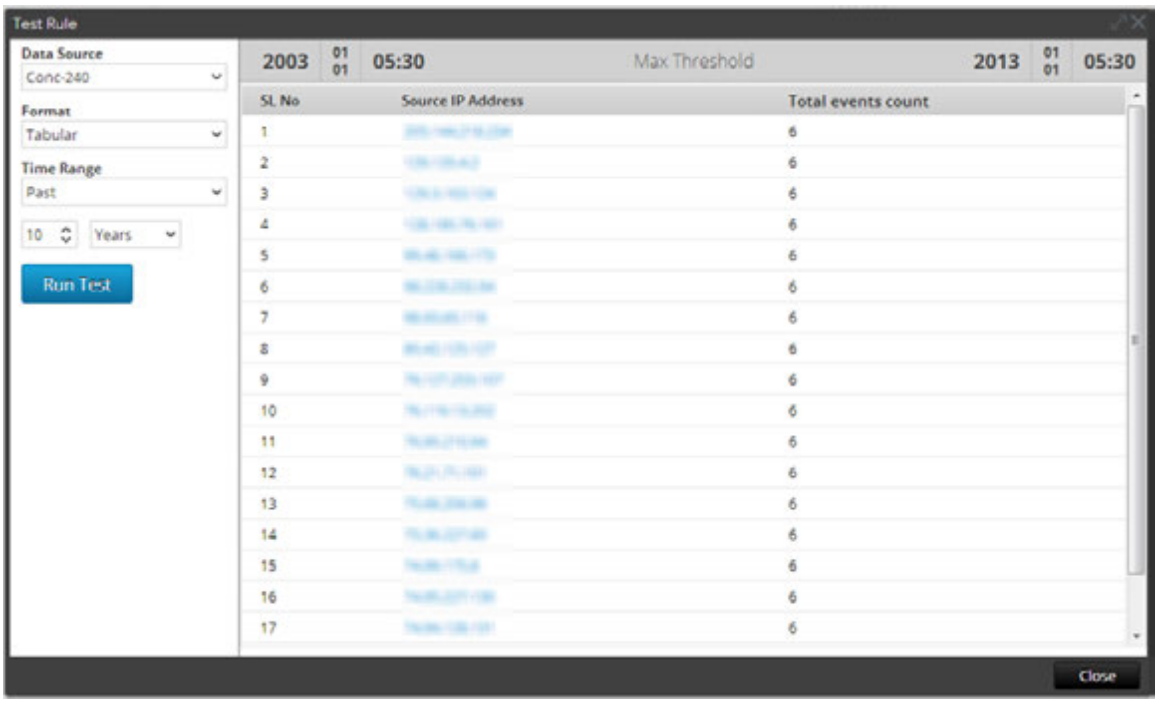
The following figure shows the result without the max_threshold argument. The output results have event counts exceeding 200.



The following figure shows a the max_threshold rule action that puts a limit of 200 bytes on the output. Any output having more than 200 bytes of data are not listed.

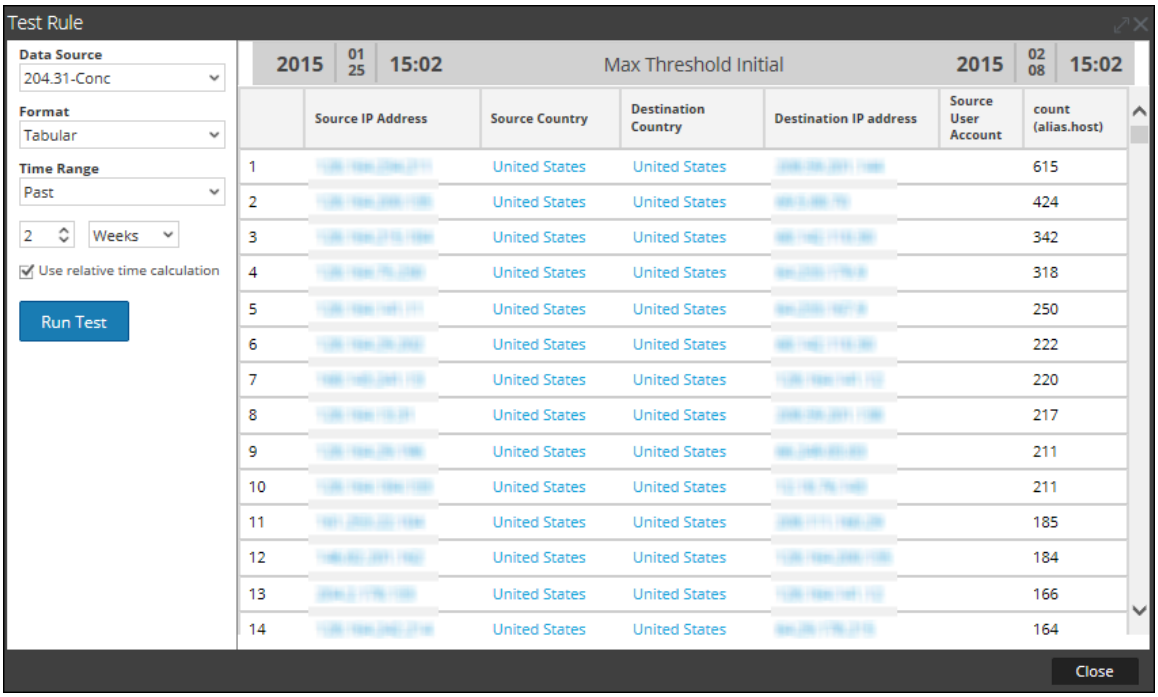


The following figure shows the result when the max_threshold rule action is applied. The result numbered 1 in the above screen capture is removed from the result.

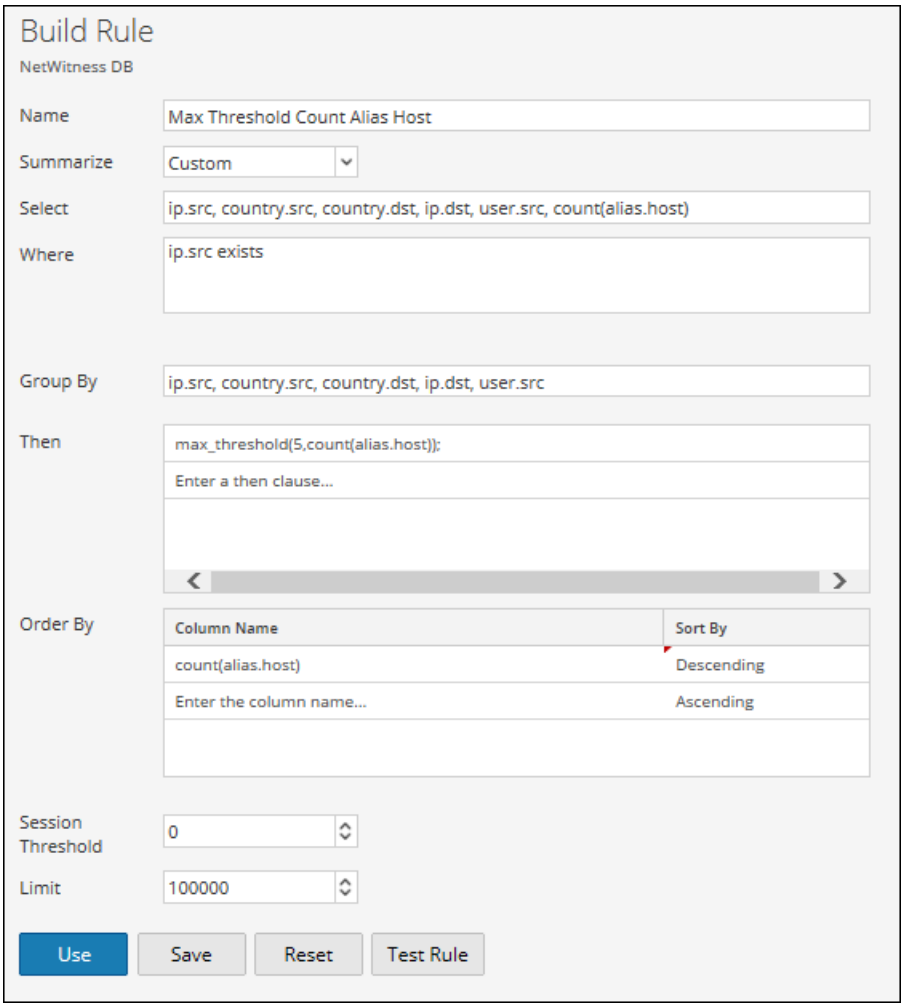


2. max_threshold(5,count(alias.host));

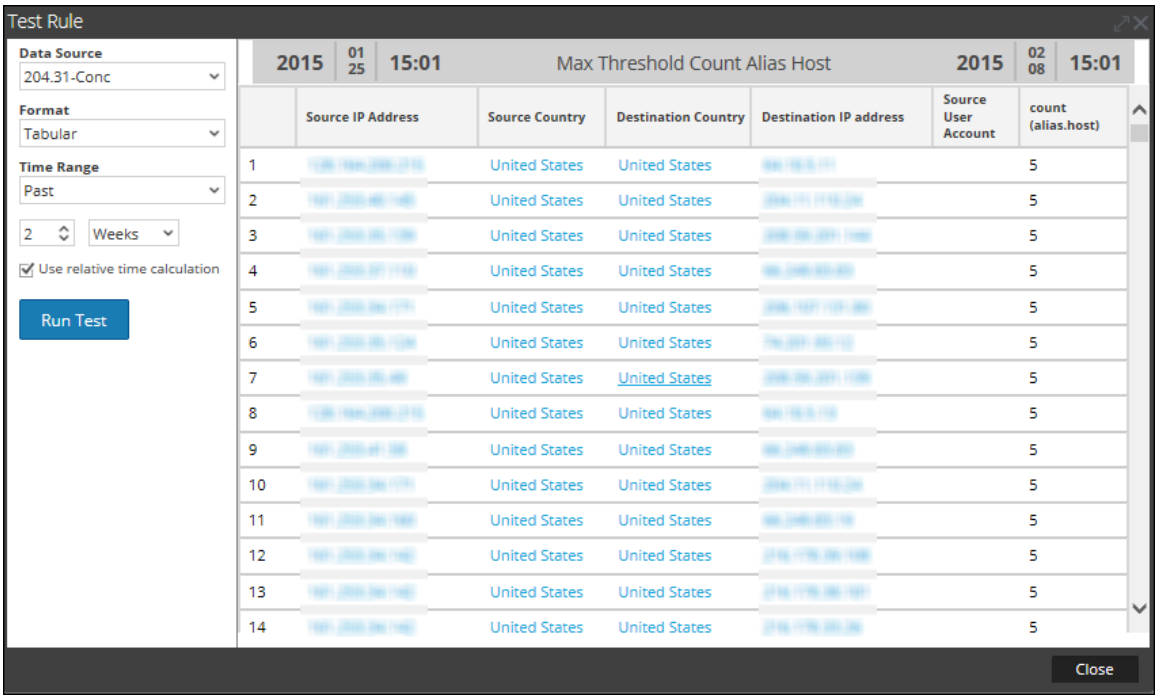
The following figure shows the result without the max_threshold argument. The output results have count of alias.host exceeding 5.



The following figure shows a the max_threshold rule action that puts a limit of 5 on the output. Any output having value more than 5 is not listed.



The following figure shows the result when the max_threshold rule action is applied. Any output having value more than 5 is removed from the result.



min_threshold (string quantity)

min_threshold removes results with a quantity that is smaller than the minimum threshold quantity from a result set. The quantity can either be in terms of count or size and it is relative to the sorting options of the parent rule. This means that if you sort a rule by size, the rule action expects you to specify the parameter in bytes (you can append KB, MB, GB, TB to the parameter to make size conversion easier).

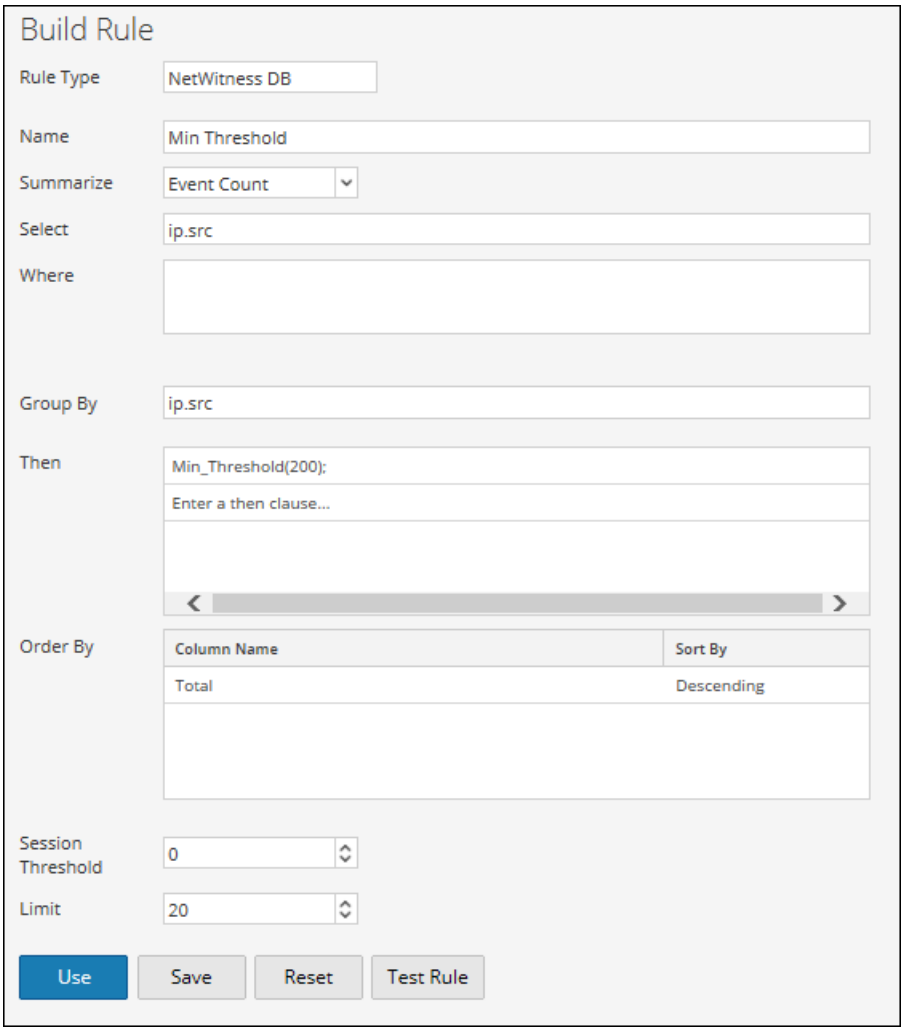
min_threshold rule can also be used to filter values based on the aggregate function values. Use the syntax based on the type of summarization used in the rule as below:

- min_threshold(String quantity): Can be used to filter Event Count, Packet Count, and Session Size.
- min_threshold(String quantity, String field): Can be used to filter values of Custom aggregates or any metas.

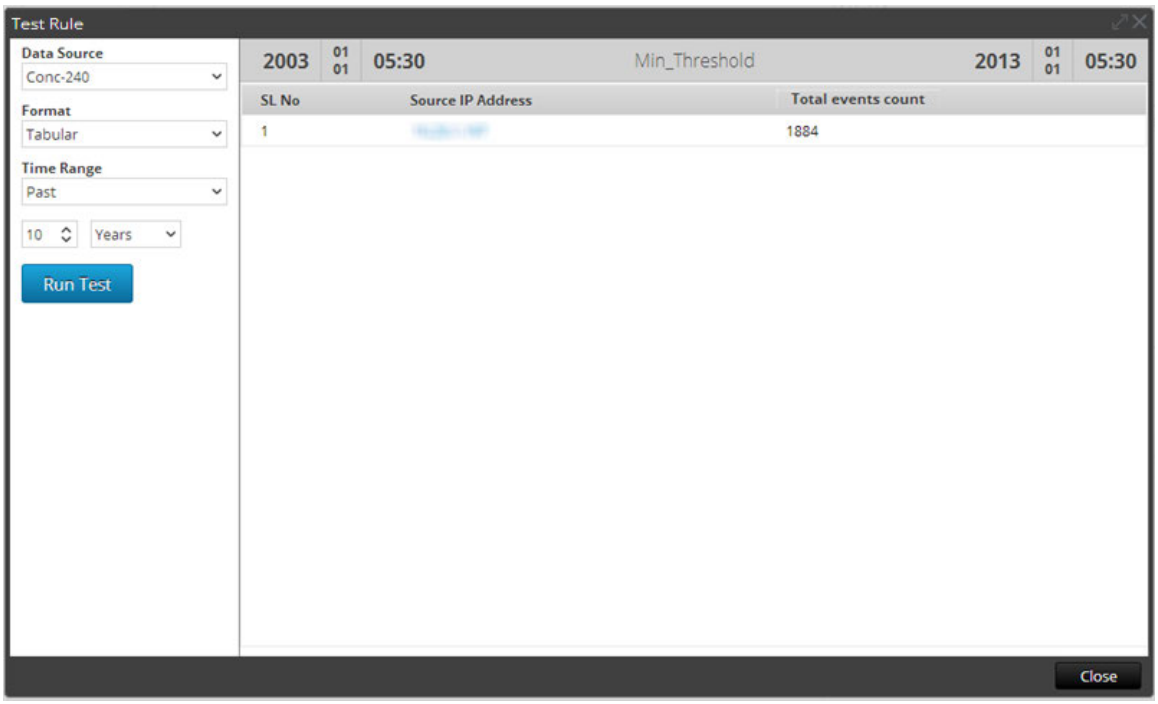
Examples:

1. min_threshold(200);

The following figure shows a sample of the min_threshold query.



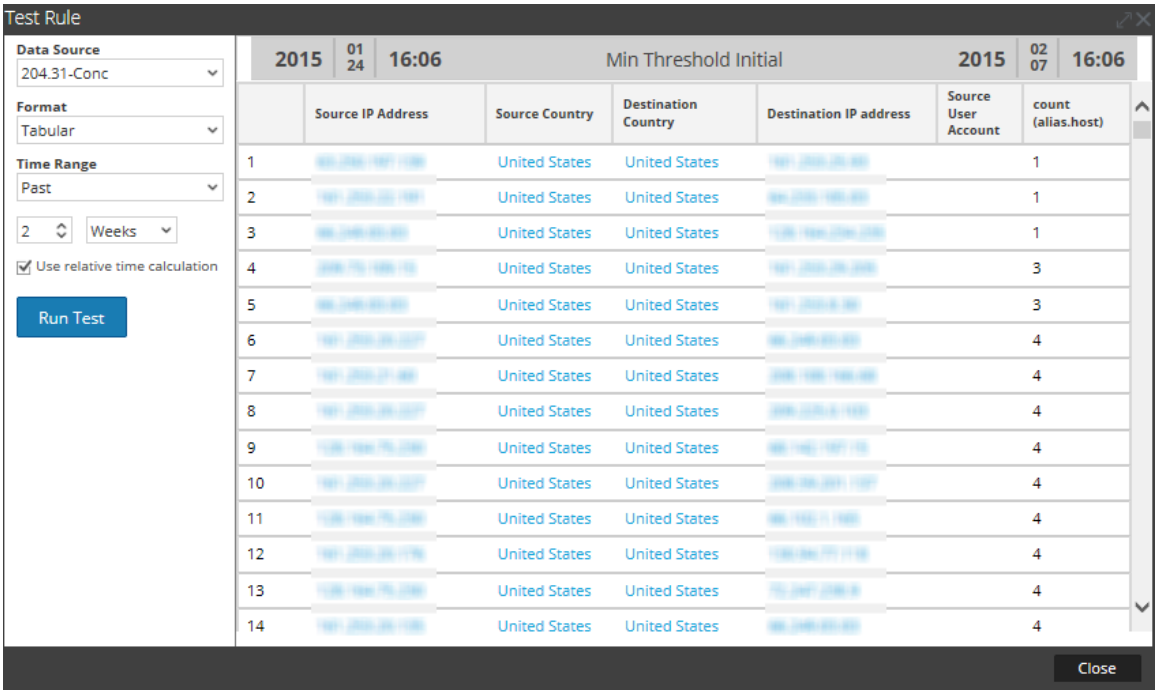
The above figure puts a limit of 200 bytes on the output. Any output having less than 200 bytes of data is not listed. The output with the min_threshold rule action is applied.



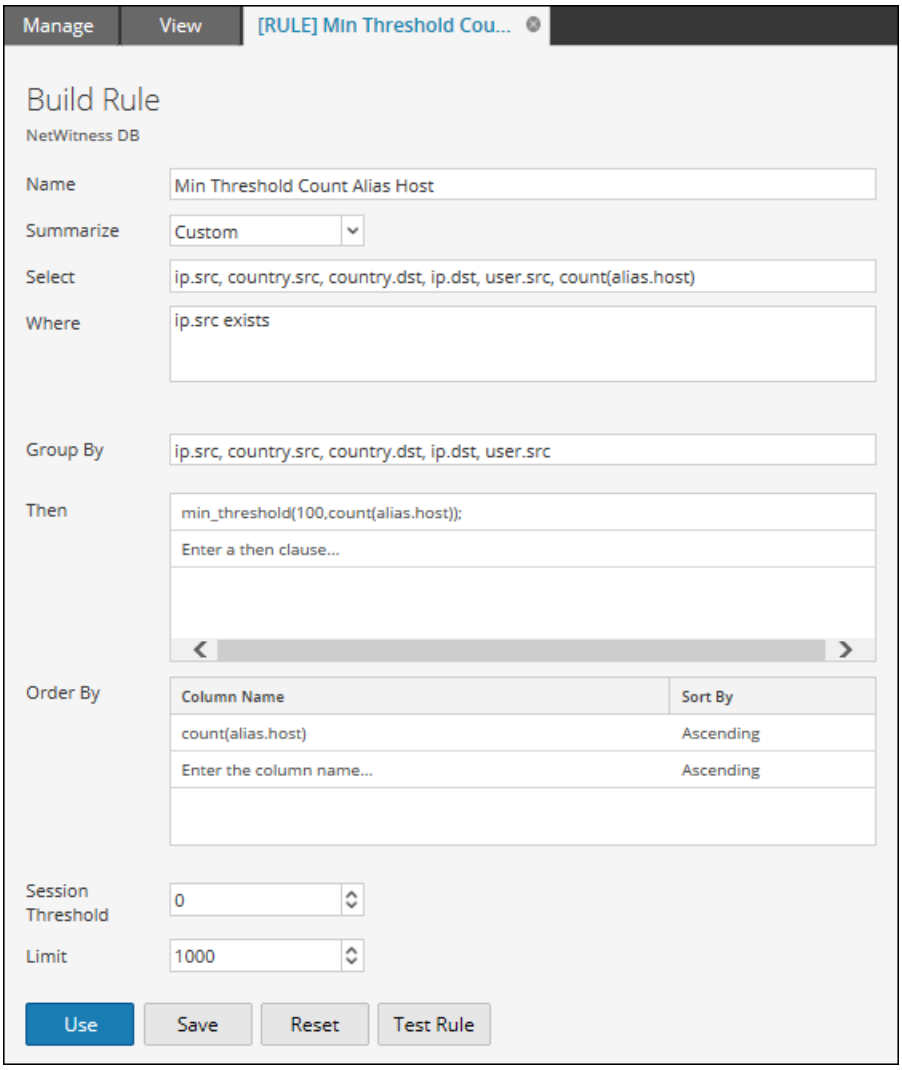
As shown, all the values are greater than 200 bytes.

2. min_threshold(100,count(alias.host));

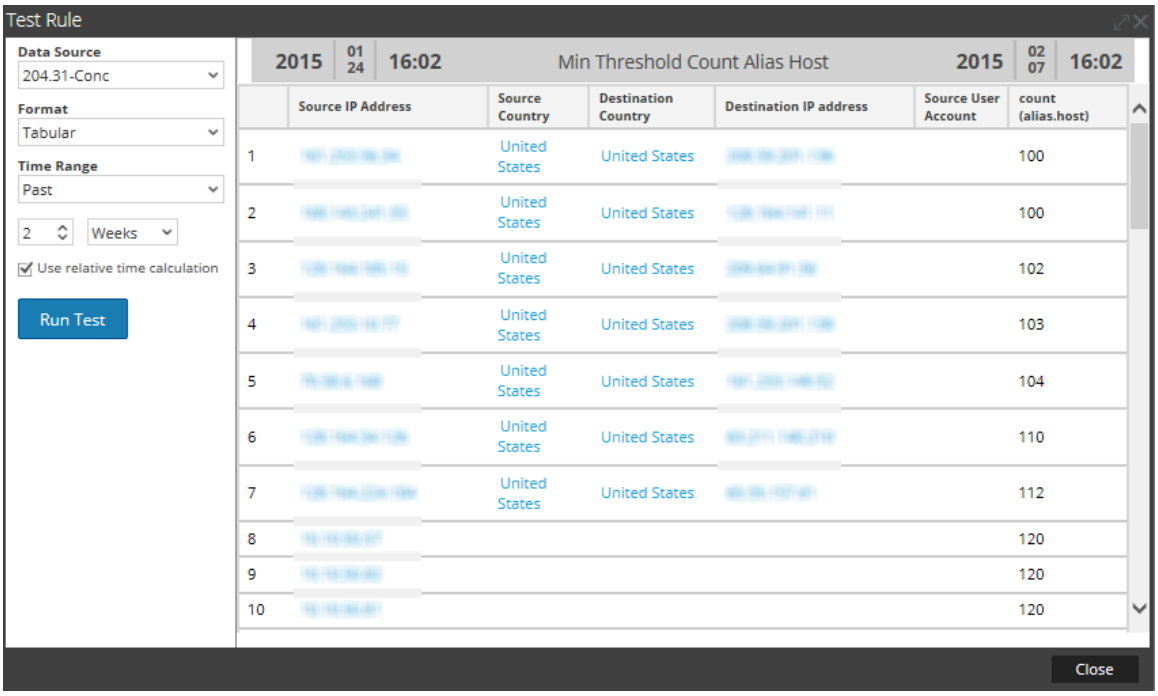
The following figure shows the result without the min_threshold argument. The output results have count of alias.host below 100.



The following figure shows a the min_threshold rule action that sets the minimum limit of 100 on the output. Any output having data less than 100 is not listed.



The following figure shows the result when the min_threshold rule action is applied. Any output having data less than 100 is removed from the result.



regex (string regex, string field)

The regex rule action applies regular expression to the result set. The following is the format of the regex rule action:

regex(regular_expression, meta_name)

Where:

- regular_expression - Regular expression to match the value of the meta.
- meta_name - Meta or field name on which the regex has to be applied.

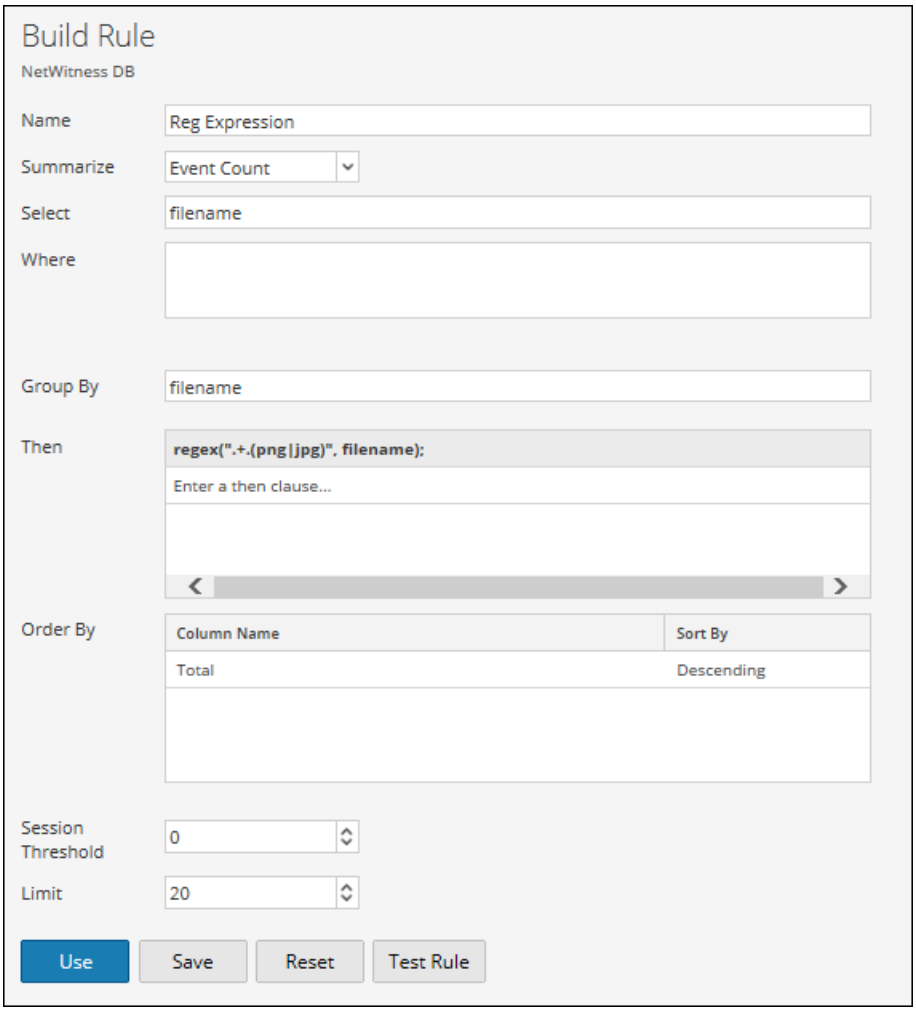
For a comprehensive list of supported regex patterns, refer to http://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html.

Sample regex rule action:

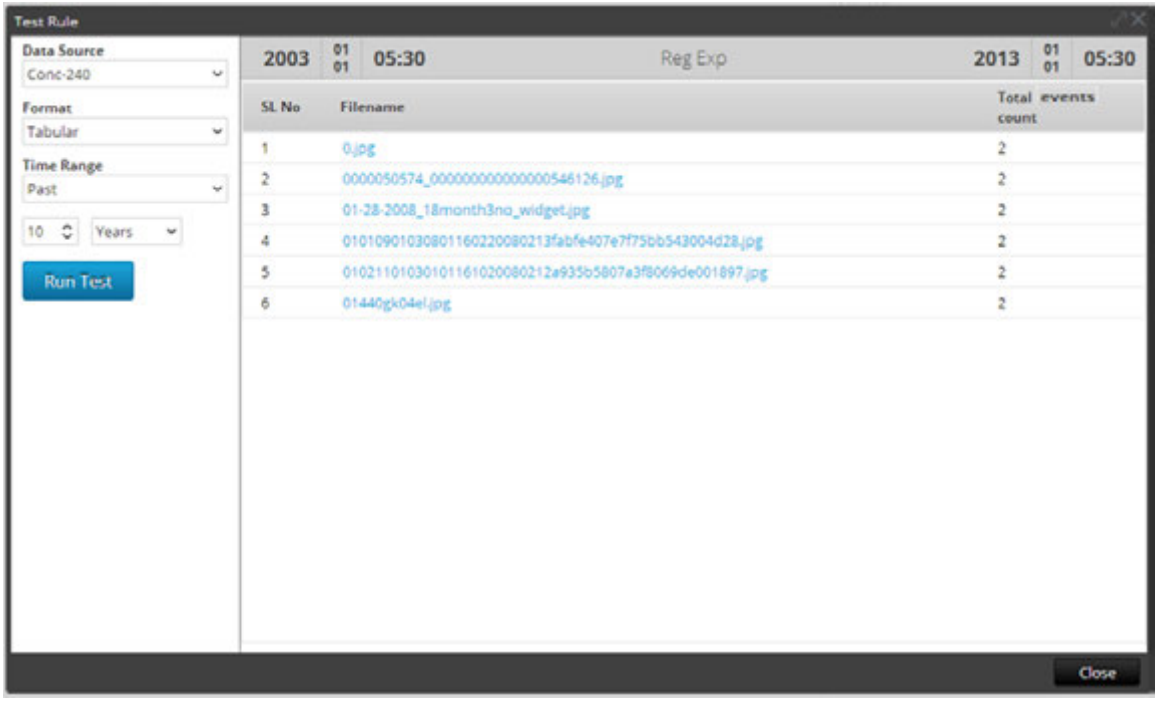
If you want to list filenames of all the PNG and JPEG format files from various sessions, you can write a rule with the following regex rule action:

regex(".+.(png|jpg)", filename);

The following figure shows the rule.



The output with the regex rule action applied is shown in the following figure.

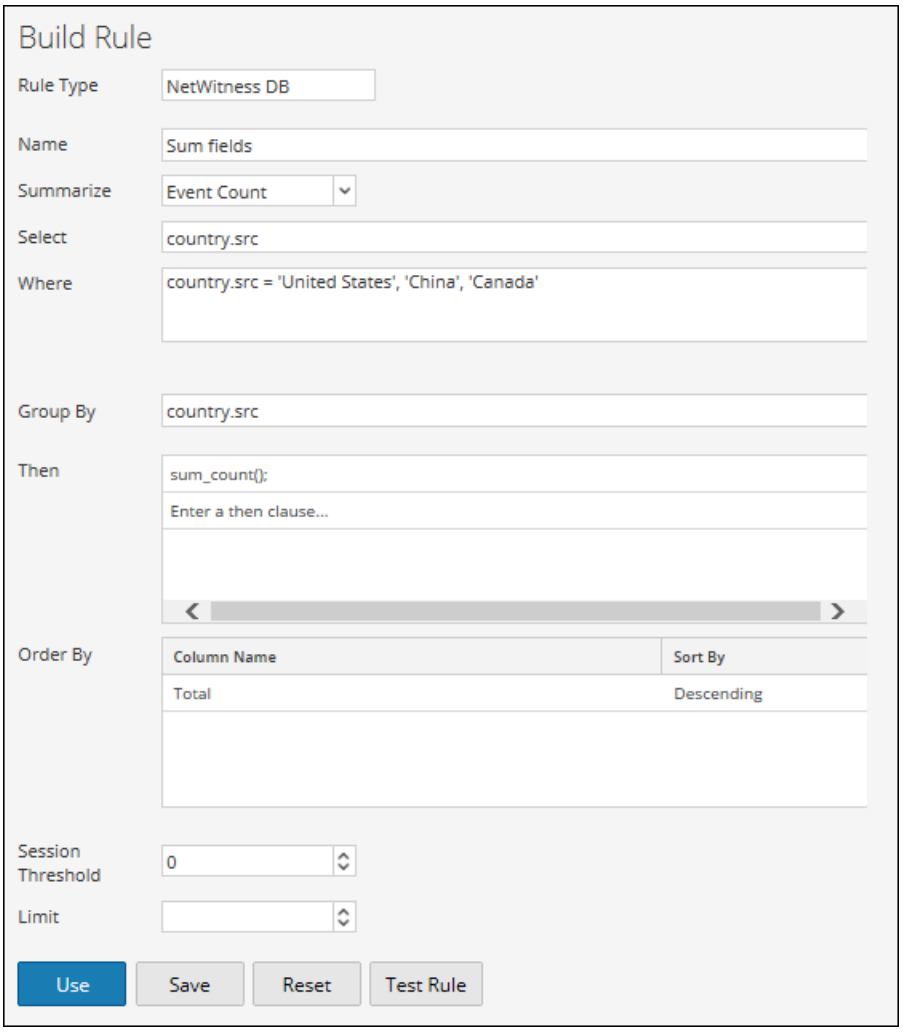


`sum_count()`

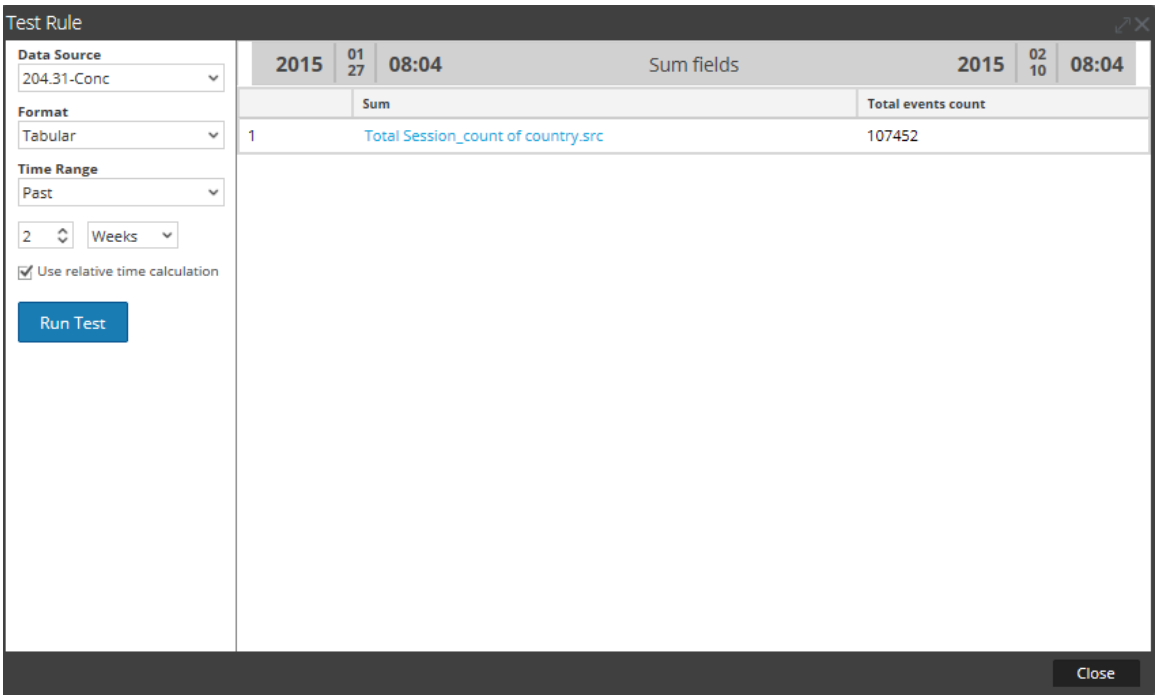
Totals the quantifiers for a given result set. For example, calling a sum_count() for a rule that is sorted by event count totals the size of all values in the result set and displays the total in place of the result set.

Example:

The following figure shows the sum_count() rule action.



With sum_count() rule action, the output shows the total size of all the event counts.

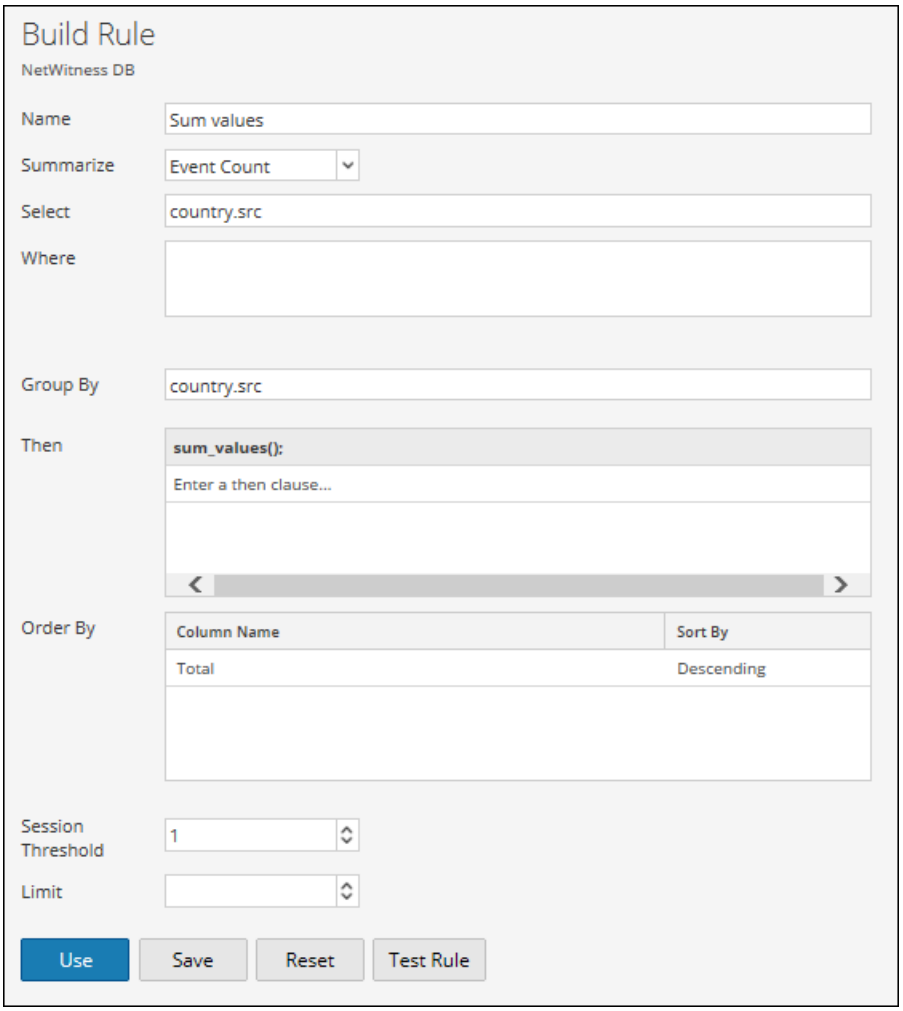


`sum_values()`

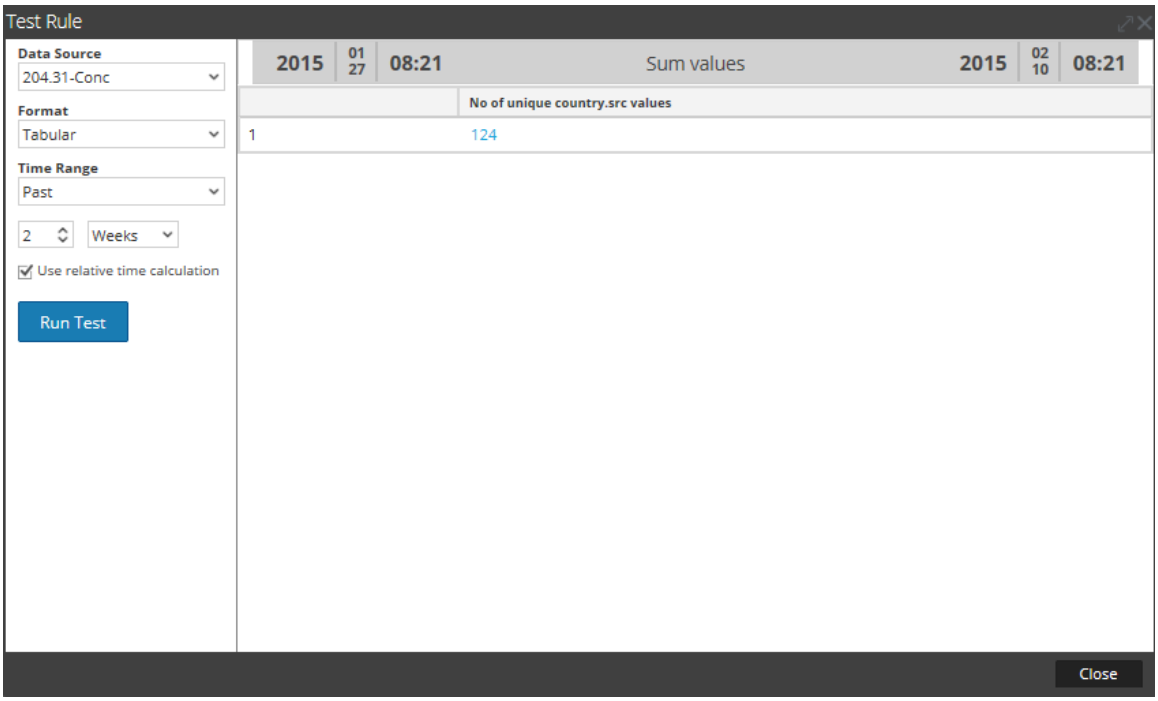
Totals the number of values for a given result set. Use this action to display how many matches exists for a given rule.

Example:

The following figure shows the sum_values() rule action.



The following figure shows the result with sum_values rule action.



show_whats_new()

The show_whats_new() rule action takes any result in a result set and filters out any value that is available in the NetWitness meta database prior to the time frame of the currently running report. When a report is run, NetWitness Suite determines the ID of the first session in the time range of the report. If a value in a result set has a first session id that is greater than the first session id of the report time frame, it did not exist in the NetWitness meta database prior to the report being run and so is new to the NetWitness system relative to the time frame of the report.

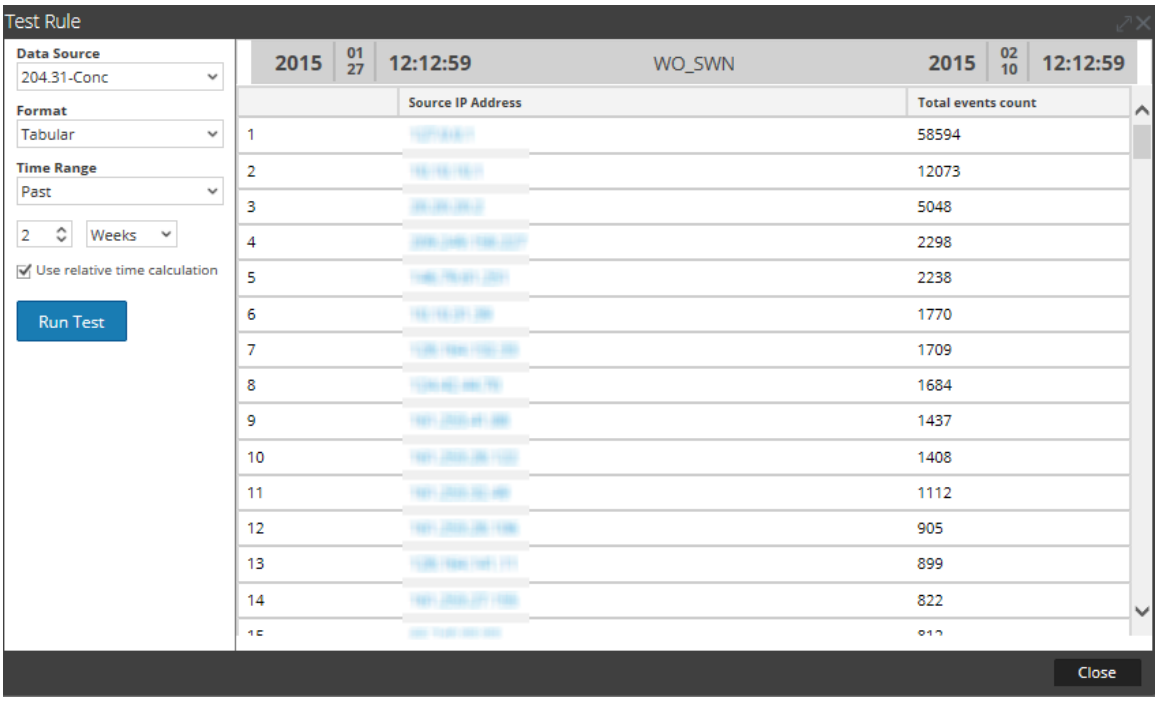
The show_whats_new() rule action is also supported for Custom Aggregate Rule. When multiple meta's are selected in the Custom rule, the first meta is considered for filtering out the old values. See Example 2 below to understand how this rule action is used for Custom Aggregate Rule.

Note: The show_whats_new() rule action can be used only with an aggregate rule.

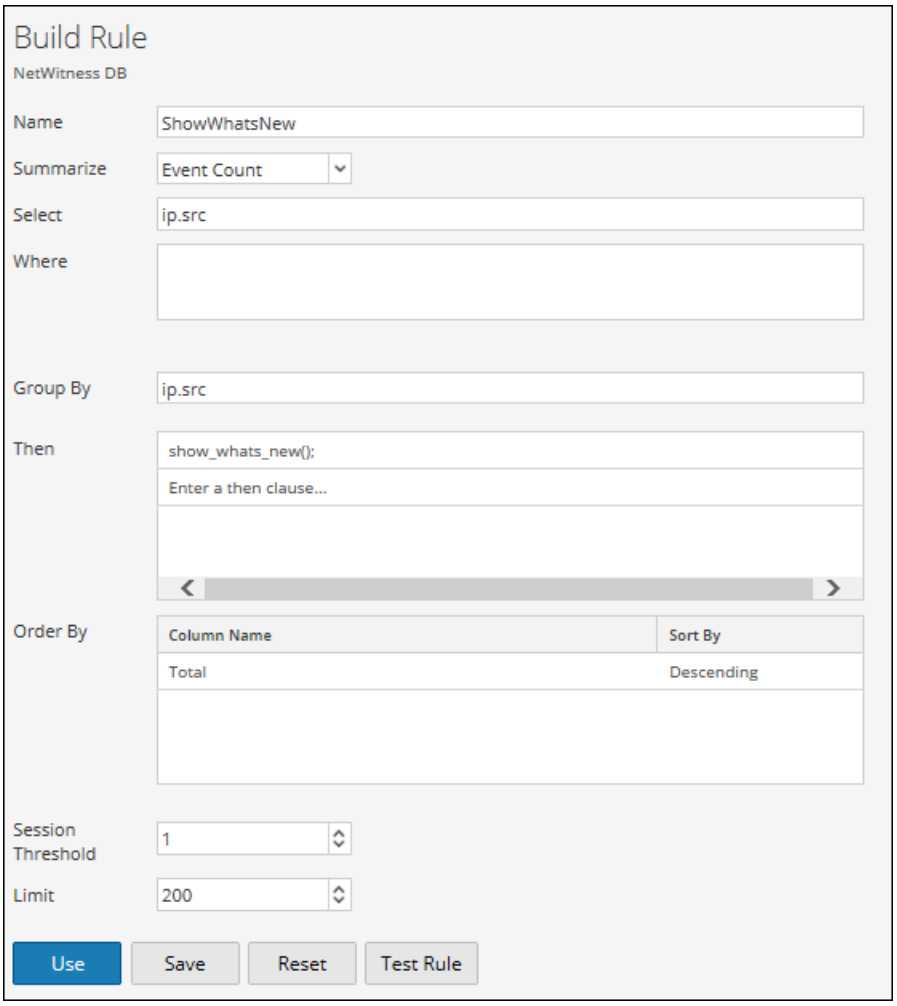
Examples:

1. show_whats_new() for aggregate rule with Event Count

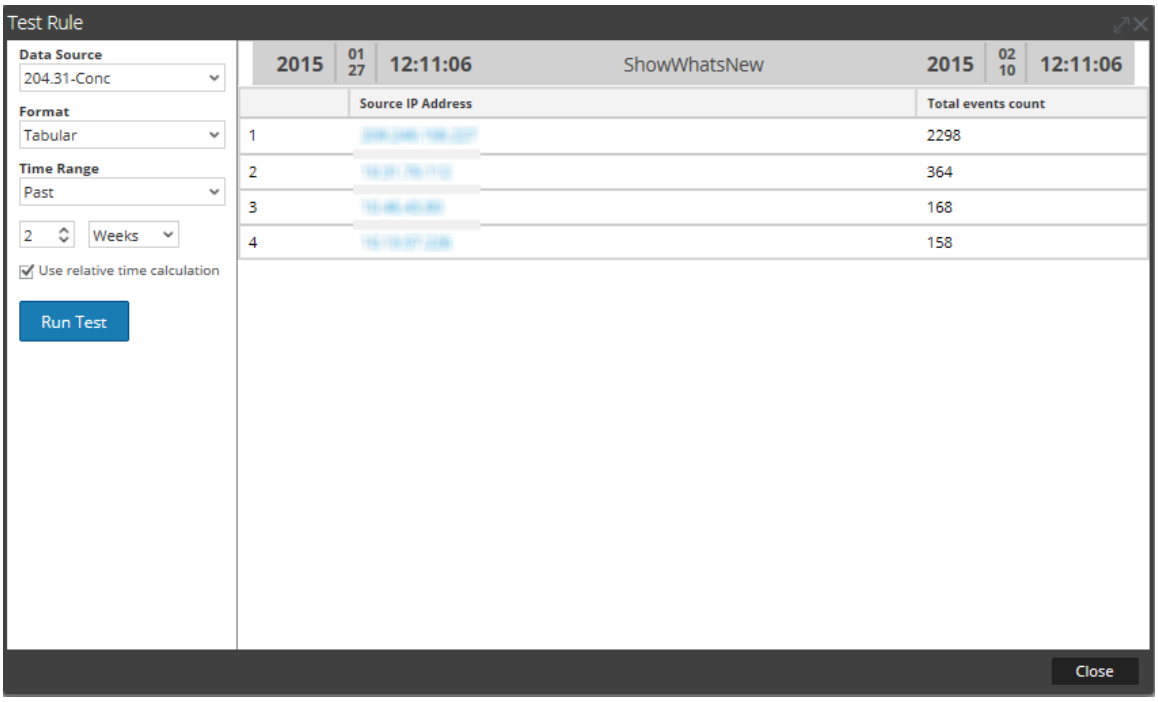
In the following example, all the Source IP Addresses available for the past two weeks are listed.



The following figure shows the use of the show_whats_new rule action to list only the new entries for the past two weeks.

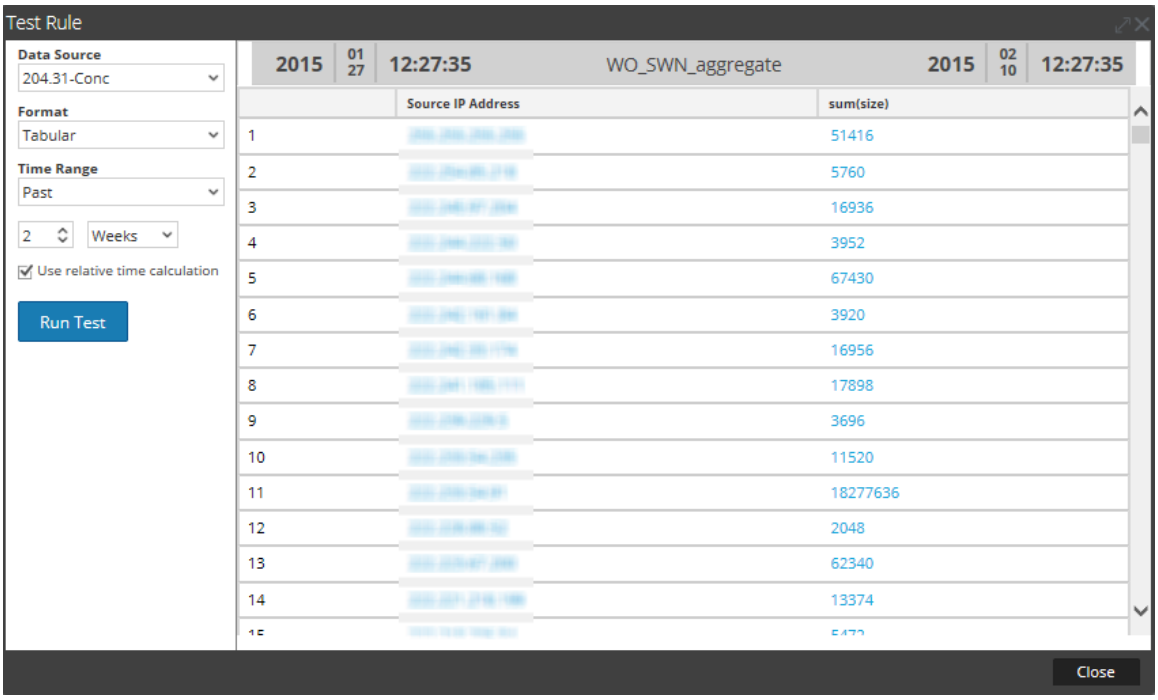


The following figure lists the new entries for the past two weeks.

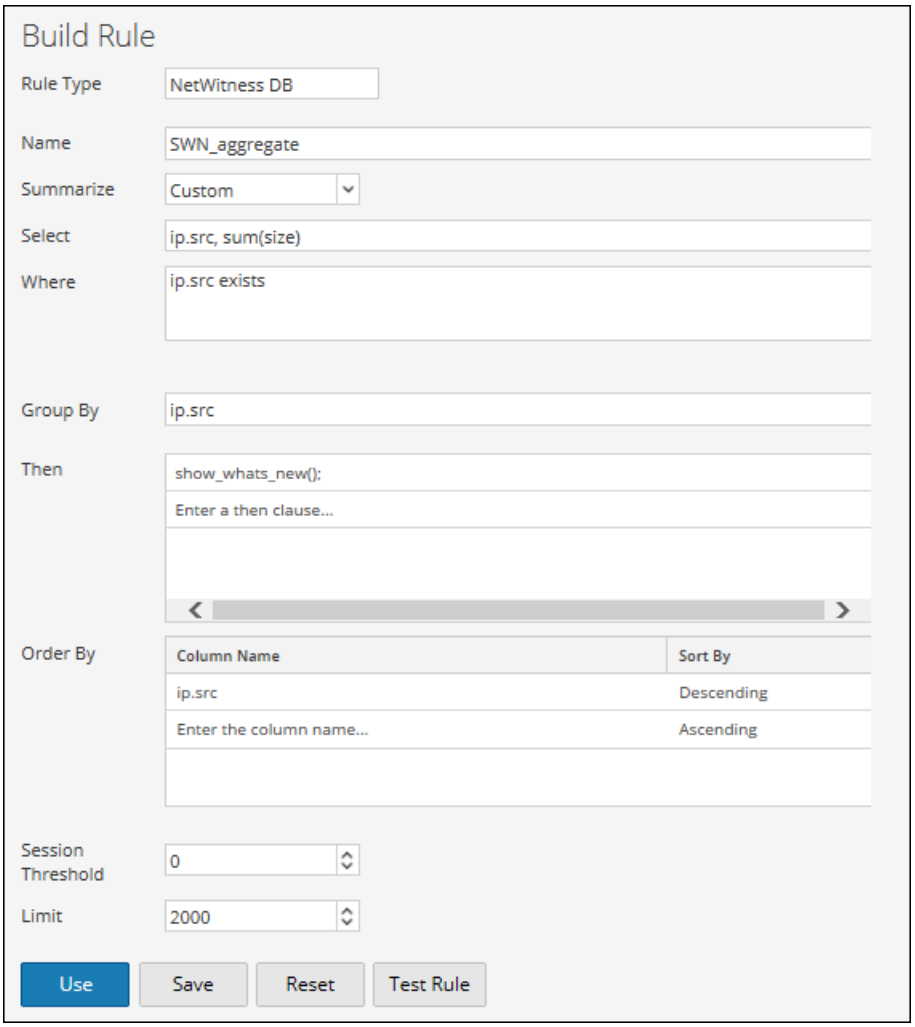


2. show_whats_new() for Custom aggregate rule

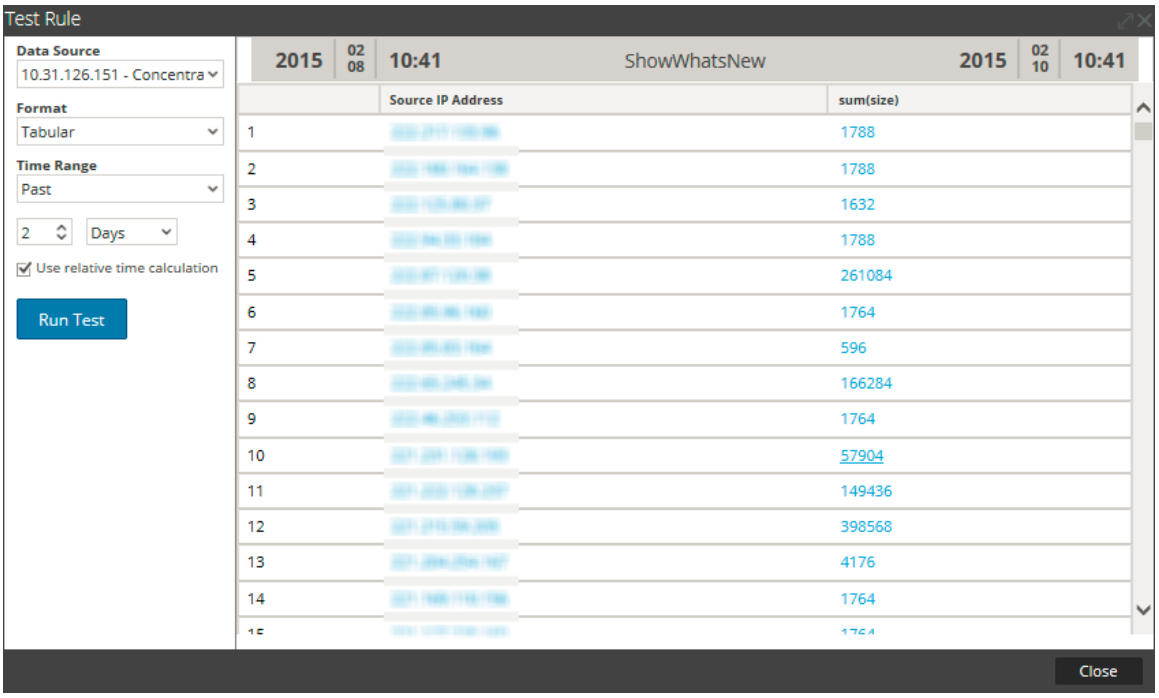
In the following example, all the Source IP Addresses available for the past two weeks are listed.



The following figure shows the use of the show_whats_new rule action to list only the new entries for the past two weeks.



The following figure lists the new entries of Source IP Addresses for the past two weeks.



The power of this feature is that it doesn't matter when the report is run in identifying values that are new to NetWitness. The caveat with this feature is that if a data reset occurs, you will lose your data. However, it is easy to baseline a system and identify changes and new items without a tremendous amount of strain on the system (depending on the size of your result set).

Supported Rule Operators

The NWDB Reporting Engine data source rule syntax supports a subset of rule operators that are supported by NetWitness Suite.

Syntax	Description
*	Use an asterisk (*) as the sole operator in a rule to select all traffic.
=	Equals operator
!=	Does not equal operator
&&	Logical AND operator
||	Logical OR operator
-u	Upper boundary. For example, **tcp.port = 40000-u** selects all TCP ports above 40000.

Syntax	Description
l-	Lower boundary. For example, **tcp.port = l-40000** selects all TCP ports below 40000.
-	The dash (-) operator only applies to numeric values. Separate the lower and upper boundaries of the range with a dash (-). For example, **tcp.port = 25-443** selects all TCP ports between 25 and 443.

Sample Supported Queries

Respond Rule Syntax

The supported rule syntax for the RESPOND service through descriptions and examples of supported and unsupported syntax. There is a finite set of syntax that you can use to construct rules for reports using the RESPOND service in this release.

The Reporting Engine supports the following categories of RESPOND data source rule syntax:

- **select** clause
  - Non-Aggregate Rule
  - Aggregate Rule
- **alias**
- **where** clause
- **where** clause Operators
- Group By
- Order By
- **Limit** field

Note: List is not supported in Respond Data source rules.

Select Clause

The select clause is a comma separated list of values. For example: select alert.severity, alert.name, count(*).

There are two types of select clause for RESPOND Rule:

- Non-aggregate rule
- Aggregate rule

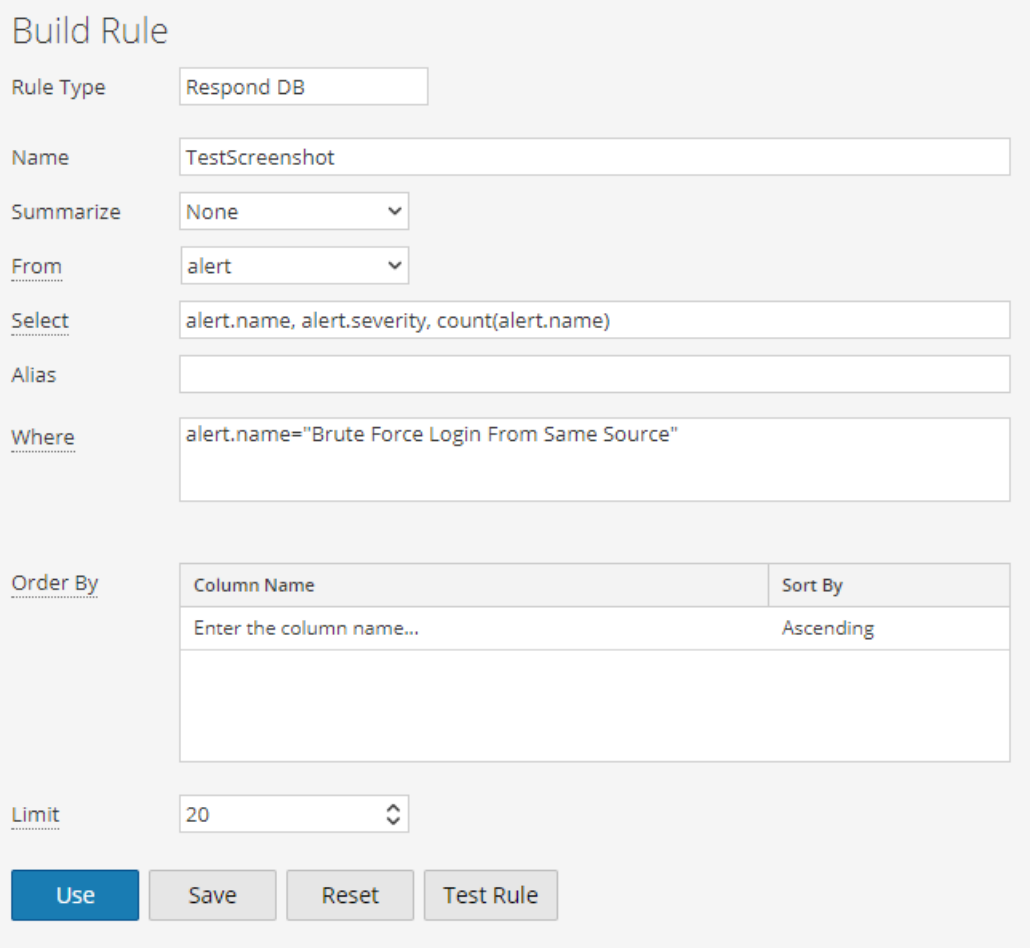
Non-Aggregate Rule

When you want to define a rule without any grouping, choose 'None' in the Summarize field. In a non-aggregate rule, you can select any number of metas in the *Select* clause. For example, select alert.severity, alert.name.

Aggregate Rule

When you want to query for a specific meta and its associated aggregate value then you must use the Aggregate rule. To get an aggregate, you must choose 'Custom' in the **Summarize** field to include an aggregate function in the *Select* clause. For example, select alert.severity, alert.name, count(*).

The following figure shows the Build Rule view for Aggregate Rule.



Supported Aggregate Functions

The rules on RESPOND service supports the following aggregate functions and syntax.

- count
- max
- min
- sum
- avg

Note: The aggregate functions must be added in the end of a select clause for aggregate query. For example, alert.name, alert.severity, sum(alert.numEvents). By default, a maximum of 10,000 rows results are fetched and this can be configured using the **rsa.response.query.QueryProperties**.

Examples of select Clause Syntax

The following table provides examples of the select Clause Syntax.

Examples	Descriptions
select *column1* , *column2* ,*column3*,...,*columnN*	Select specific metas from an RESPOND Data Source (You must separate each column with a comma.).

Examples of Supported Select Queries

select alert.name, alert.numEvents, count(alert.numEvents)

select alert.severity, avg(alert.severity)

select alert.timestamp, incidentCreated where alert.timestamp >= 1475658011

Summarize

Summarize determines the type of summarization or aggregation for the rule.

Name	Config Value
Summarize	To query metas without any custom grouping, select: • **None**: To get meta based aggregates, select: • **Custom**: This indicates that expected meta aggregate function is defined in rule select clause.

Alias

Some meta names may not be descriptive, in this case description can be added in the the alias field to make column names more readable. For example, **SELECT**: alert.severity, alert.name, count(*)
ALIAS: Alert Severity, Alert Name

In the alias field you can enter a name for columns used in the select clause. If you do not specify the alias for one of the field in the select clause, then the default description will be used. For example, if the select clause has Field1,Field2,Field3,Field4, and alias has only Field1, ,Field3,Field4, then for Field2 a default description is used.

Where Clause

The where clause is a language field values and ranges that is used by RESPOND function. In the where clause, string values have to be enclosed within single quotes.

Examples	Descriptions
alert.host summary ='(Primary) Link status "Down" on interface INTNAME.'	For TEXT or string type data, enclose the string or text in single or double quote. If there is any special character such as an apostrophe within the data then you need to add an additional single or double quotes. For example, alert.name = 'top alerts from Cote d''Ivoire'.
alert.timestamp >= 1475658011	For Date and Time (date/timestamp data type columns), use the EPOCH syntax.

Supported Where Clause Operators

Operator	Syntax
= (equals)	*column1* = '*value*'
!= (does not equal)	*column1* != '*value*'
>	*column1* > '*value*'
>=	*column1* >= '*value*'
<	*column1* < '*value*'
<=	*column1* <= '*value*'

Group By

Syntax	Function
group by : alert.severity, alert.timestamp, incidentCreated **Note:** Group by field is enabled for Aggregate queries and are not editable.	RESPOND picks the metas for Group By field from the selected Select clause automatically.

Order By

Order By determines how to sort the result set and is not case sensitive.

Name	Configuration Value
Column Name	The Column Name is the name of the columns by which you want to sort the results. By default, the value is empty. When you click on a column, the value gets populated based on the Summarize field. • order by alert.name asc • order by incidentCreated desc • order by count(numEvents) • order by status
Sort By	Sort By determines the order in which you want to sort the results such as ascending or descending. **Note:** For all queries, it is mandatory for you to select the order by field.

Limit field

This indicates the limit to be put on the query while fetching data from the database. If a result set is sorted by event
count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not
sorted, the first N values are returned.

Warehouse DB Simple Rules Syntax

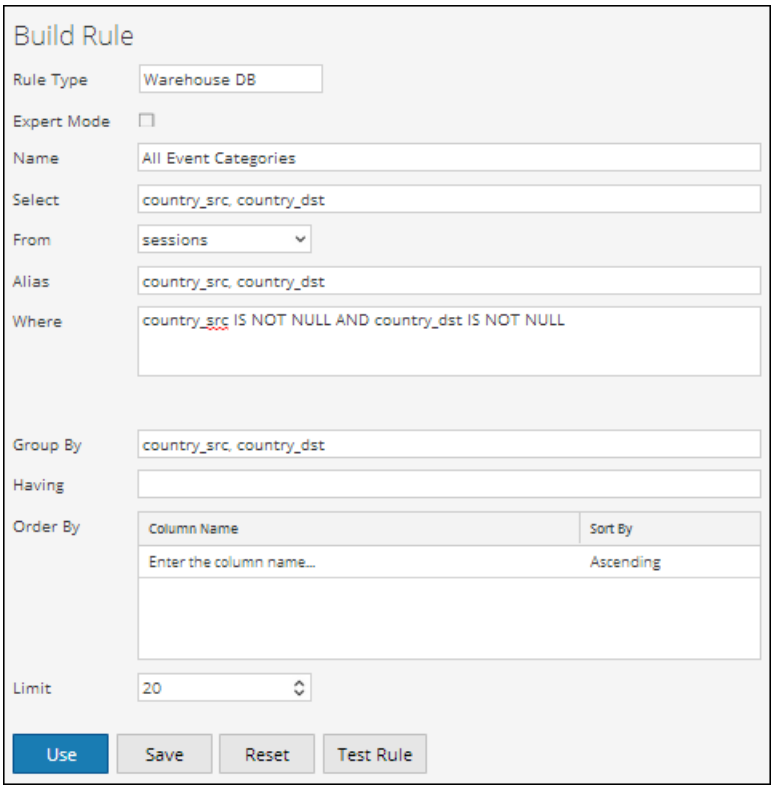
The section explains the simple rules query syntax and examples.

The following examples illustrate simple rules in the default mode:

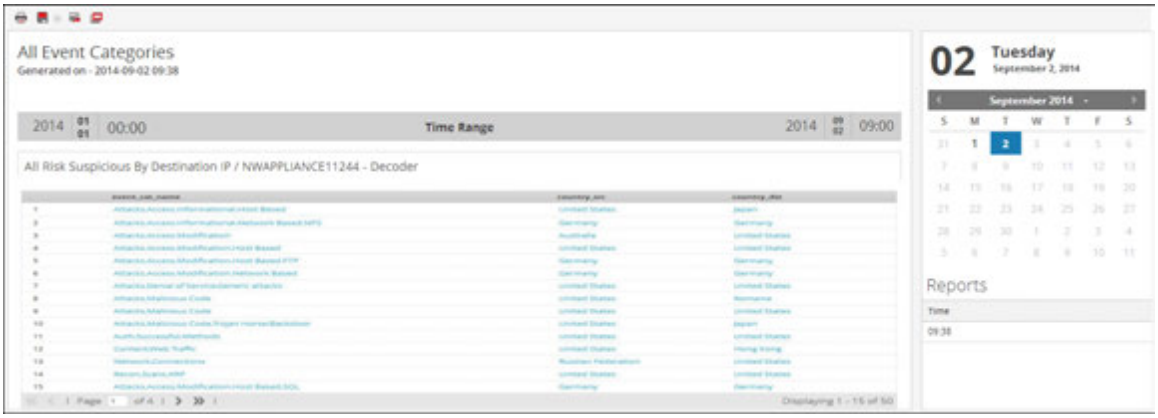
- All Event Categories Report
- Attacks Event Categories Report
- Source: China Event Categories Report
- IP Source and Destination Event Categories Report
- by Time Threat Categories Report
- Array Query Report
- Raw Log Query Report

All Event Categories Report

This rule fetches all event categories, source country, and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table, that is, **country_src** for the source country, and **country_dst** for the destination country.

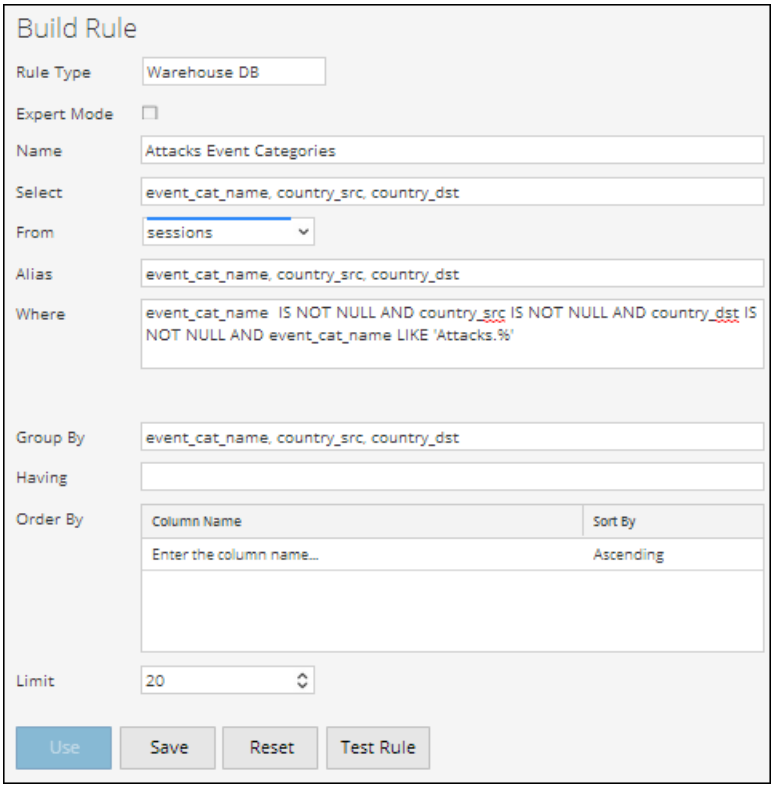


The following figure shows the result set of the All Event Categories rule.

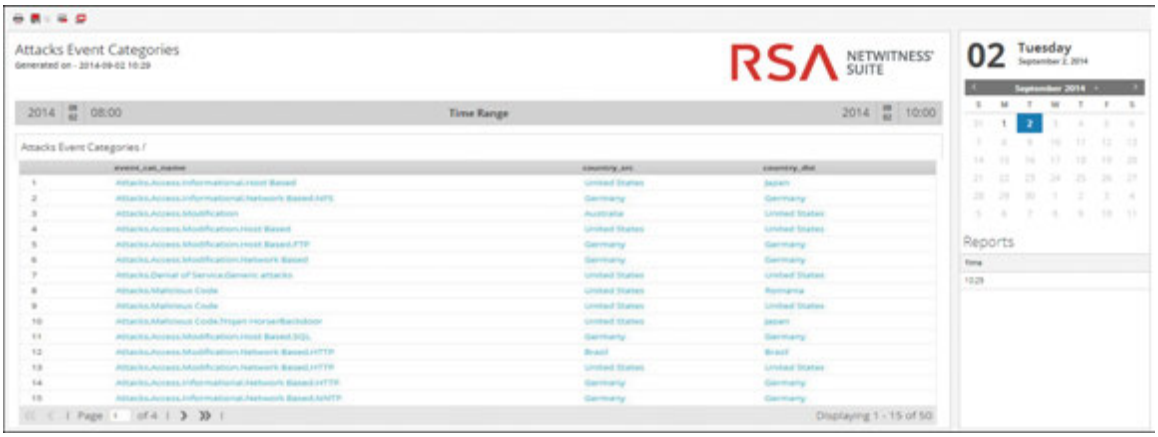


Attacks Event Categories Report

This rule fetches the event categories, source country, and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table and selecting only those columns whose event category name like 'Attacks.%'.

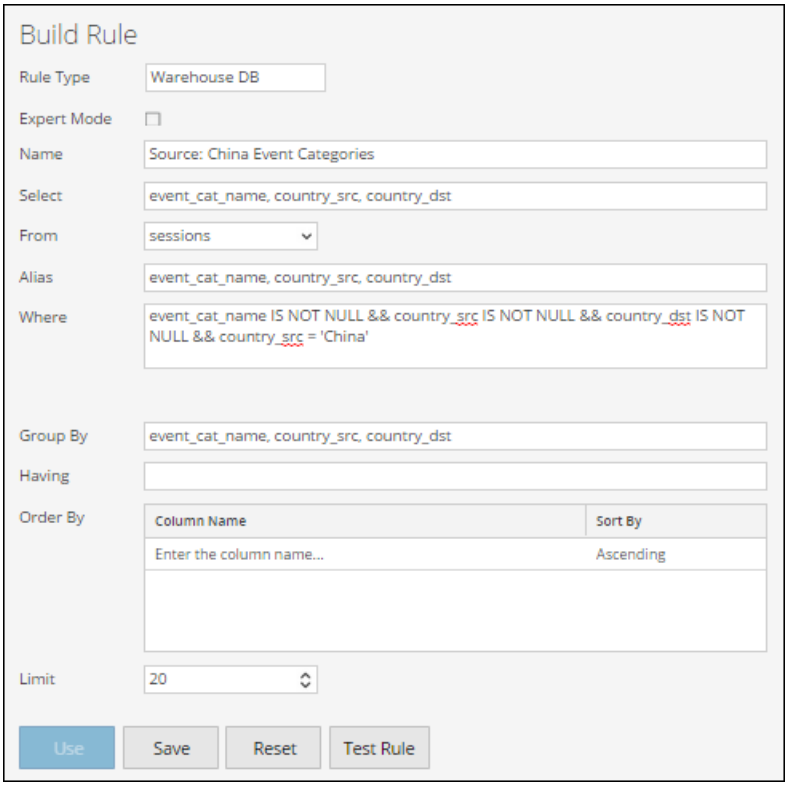


The following figure shows the result set of the Attacks Event Categories rule.

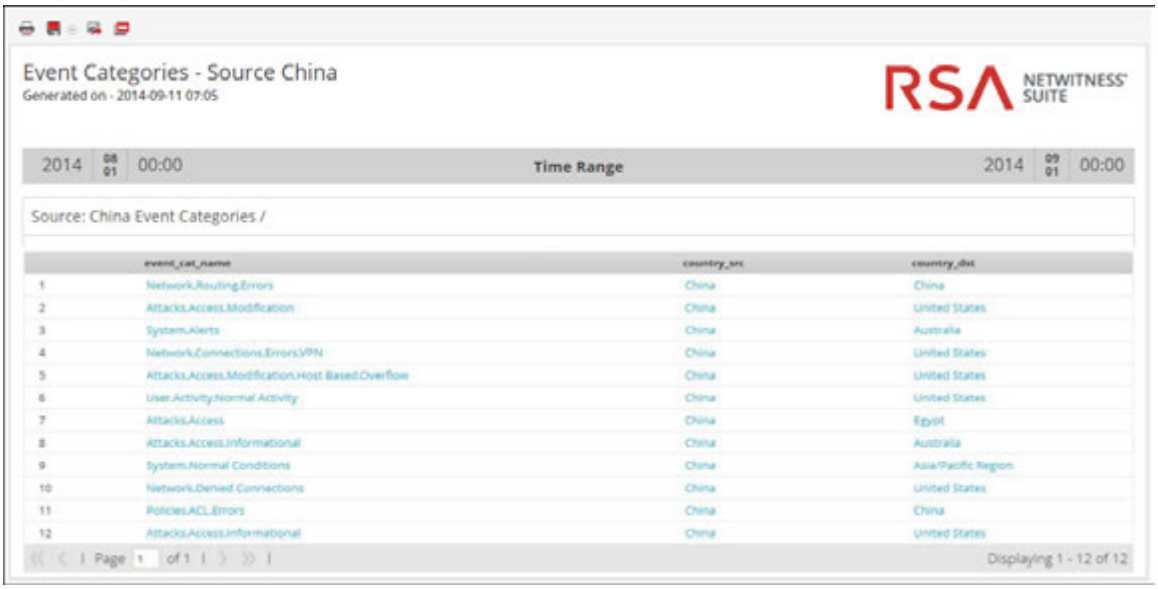


Source: China Event Categories Report

This rule fetches the event categories, source country, and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table and selecting only those columns whose source country is 'China'.

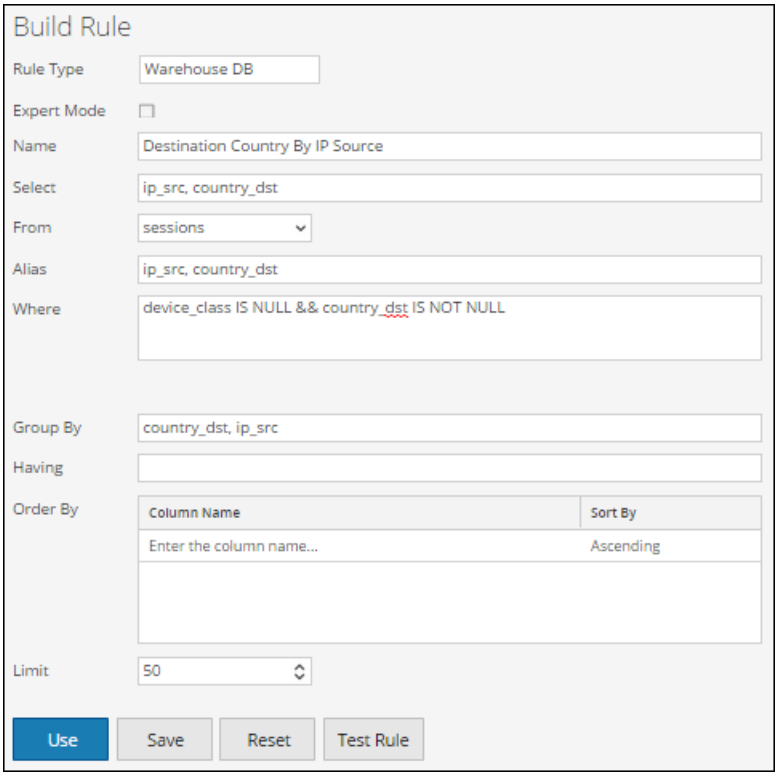


The following figure shows the result set of the Source: China Event Categories rule.

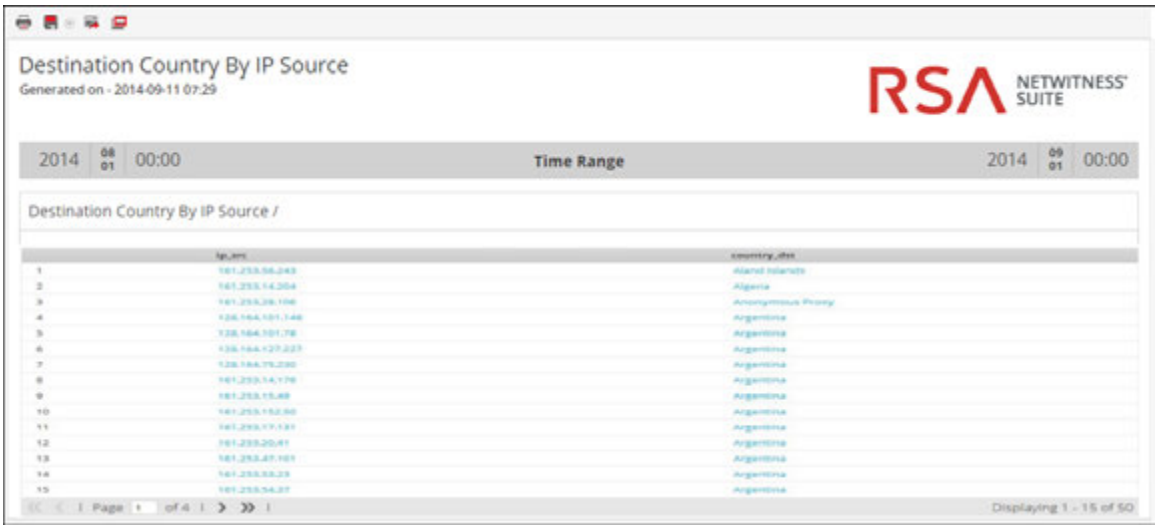


IP Source and Destination Event Categories Report

This rule fetches the IP address of source and destination country from the **sessions** table by defining alias names (temporary column names) for each of the fields to be fetched from the table and selecting only those columns whose destination country is NOT NULL.

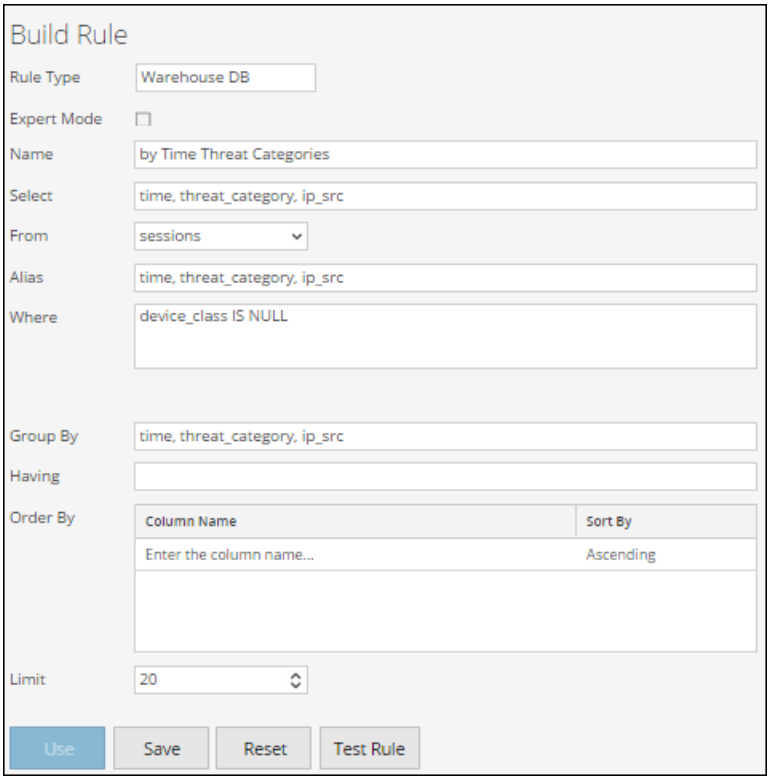


The following figure shows the result set of the IP Source and Destination Event Categories rule.



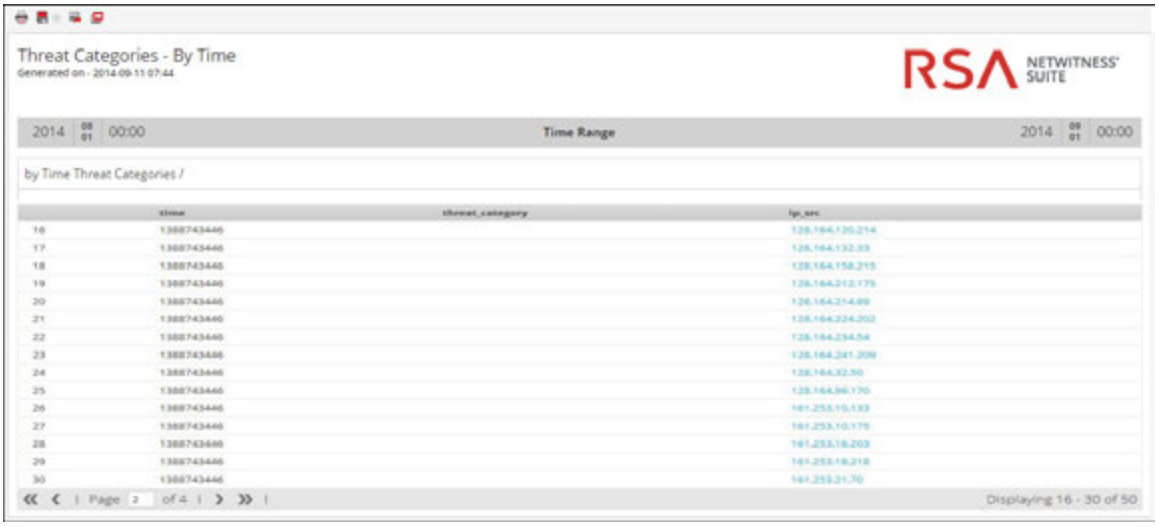
by Time Threat Categories Report

This rule fetches the threat category events, the time the log or event was ingested into Log Decoder/Decoder, and the source IP addresses from the **sessions**table by defining alias names (temporary column names) for each of these fields to be fetched from the table.



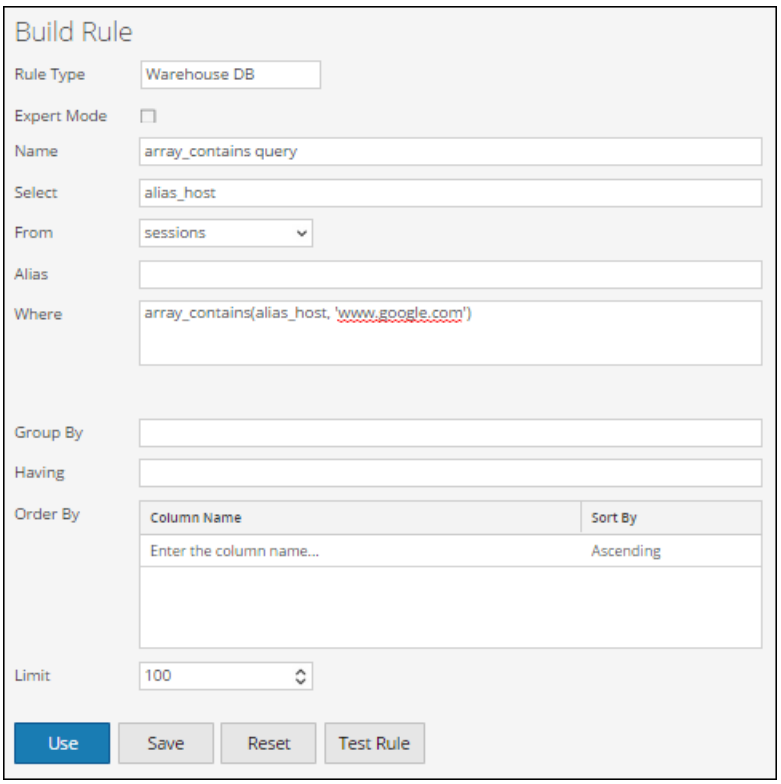
The following figure shows the result set of the by Time Threat Categories rule. The time displayed in the time field is the UNIX time (For example, 1388743446).

Note: In the “Select” clause the syntax would be “UNIX time” to convert to UTC time in report. For example, you can use the Epoch time converter tool to convert UNIX time (1388743446) to UTC (Coordinated Universal Time) (1/3/2014 3:34:06 PM).

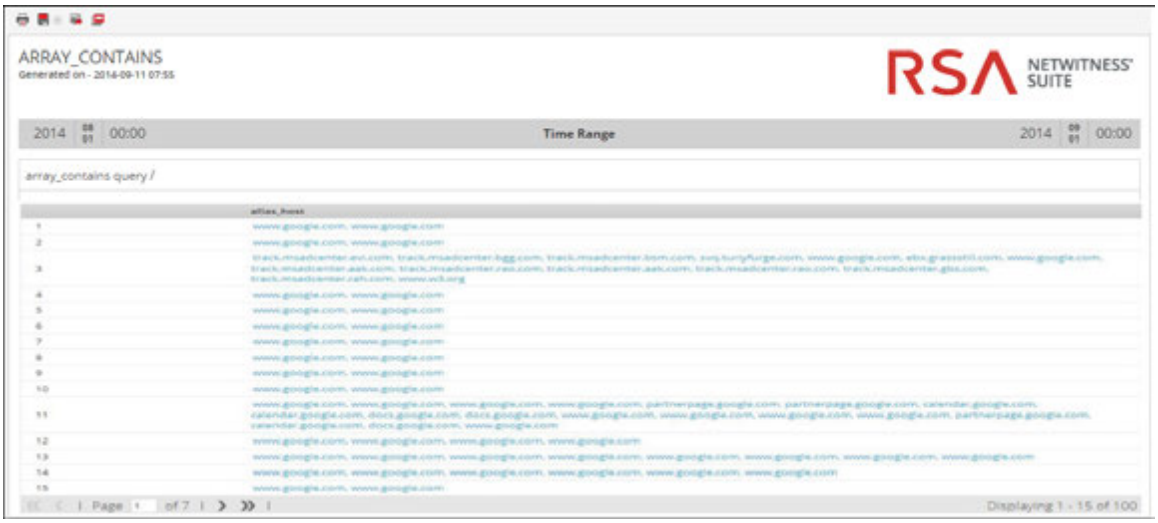


Array Query Report

This rule fetches an array of alias host names from the **sessions** table which contains the value 'www.google.com'.



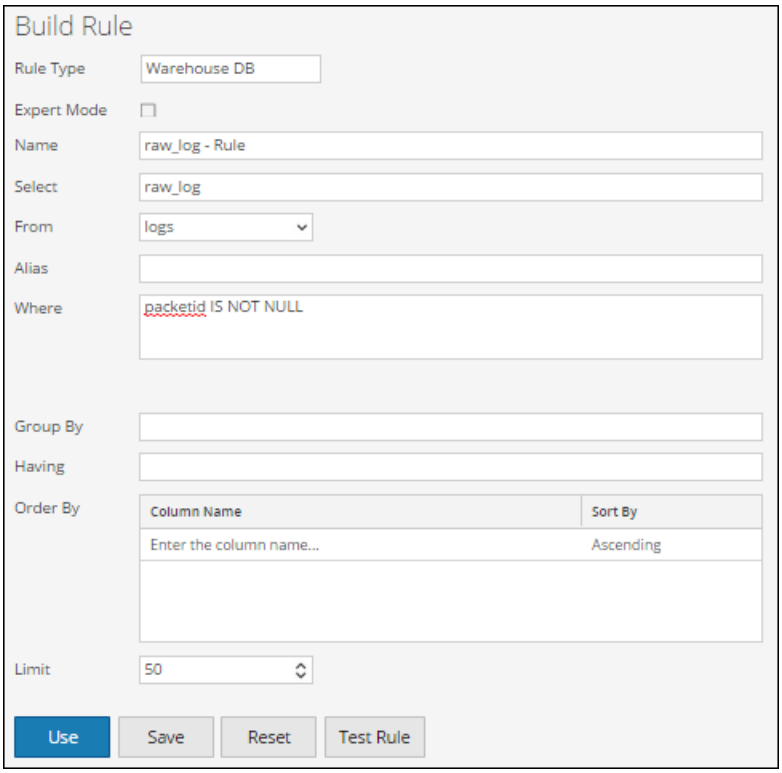
The following figure shows the result set for querying an array from sessions.



Raw Log Query Report

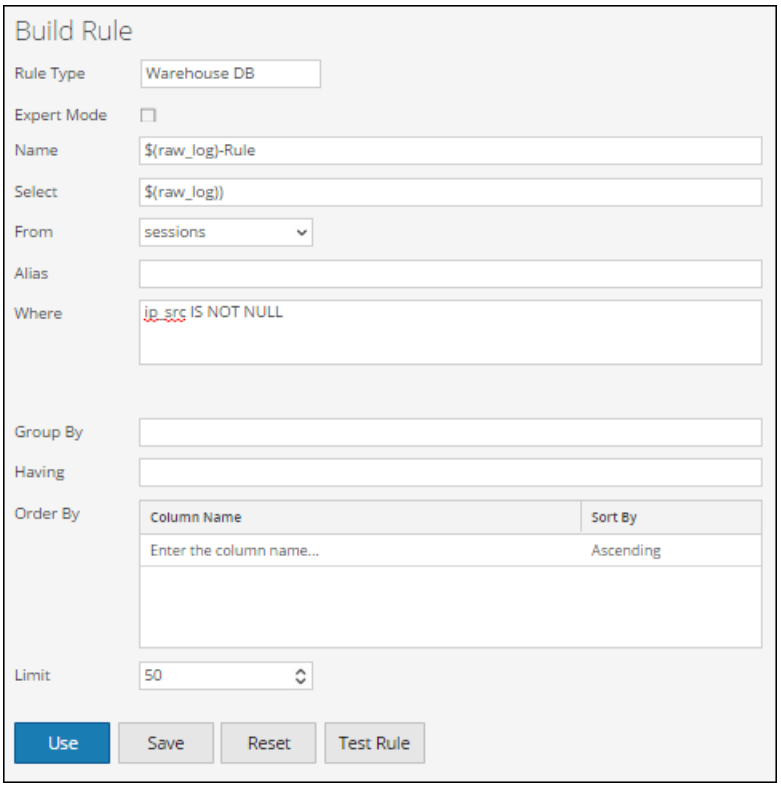
Raw logs can be queried either from the logs or sessions table.

This rule uses **raw_log** as a meta for querying raw log from logs whose packet ID is NOT NULL.

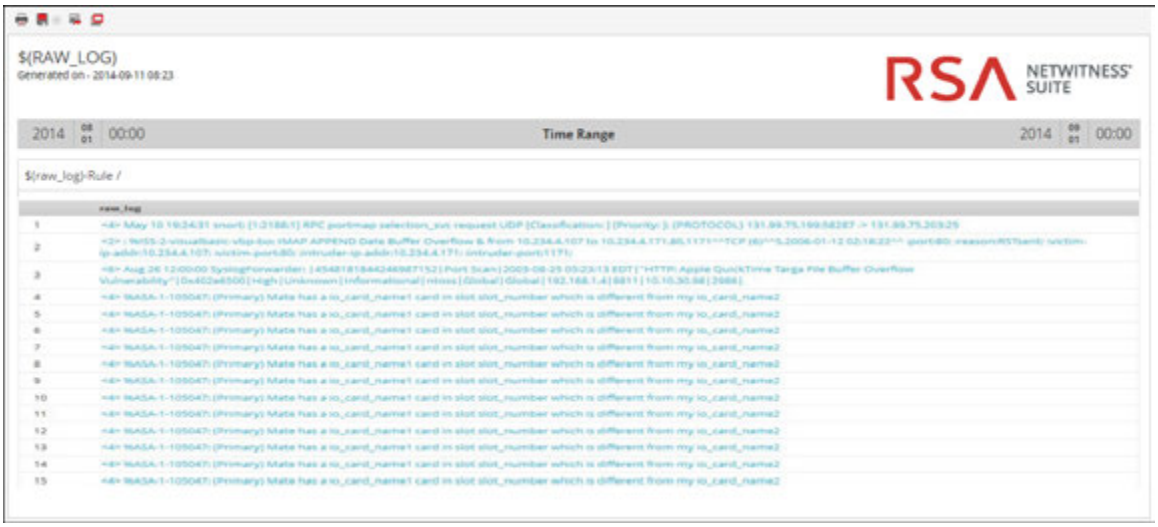


The following figure shows the result set for querying raw logs from logs.

This rule uses **${raw_log}** as a meta for querying raw log from sessions whose source IP address is NOT NULL.



The following figure shows the result set for querying raw logs from sessions.



$(RAW_LOG)

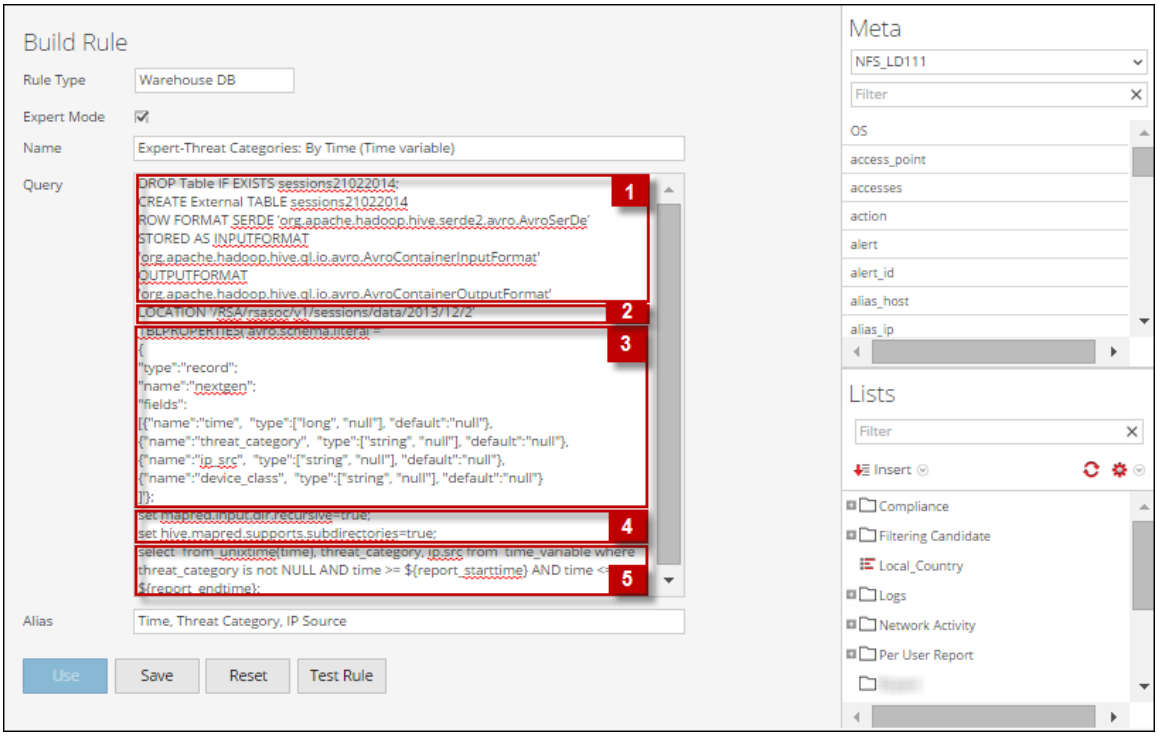
Warehouse DB Advanced Rules Syntax

The section explains the advanced rules query syntax and examples.

General Syntax of an Advanced Rule

The following figure shows how to define an advanced query.



The following syntax is an example of an advanced query:

```
DROP Table IF EXISTS sessions21022014;

CREATE External TABLE sessions21022014

ROW FORMAT SERDE ‘org.apache.hadoop.hive.serde2.avro.AvroSerDe’

STORED AS INPUTFORMAT

'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
 OUTPUTFORMAT
'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat'

LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12/2’

TBLPROPERTIES('avro.schema.literal'='
 {

"type":"record";

"name":"nextgen";
```

```
"fields":
 [
 {"name":"time",  "type":["long", "null"], "default":"null"},
{"name":"threat_category",  "type":["string", "null"],
"default":"null"},
{"name":"ip_src",  "type":["string", "null"], "default":"null"},
{"name":"device_class",  "type":["string", "null"], "default":"null"}
 ]
 '};
set mapred.input.dir.recursive=true;
 set hive.mapred.supports.subdirectories=true;
```

select `from_unixtime(time), threat_category, ip.src` from `time_variable` where `threat_category` is not `NULL` and `time >= ${report_starttime}` and `time <= ${report_endtime};`

Note: Reporting Engine treats a line beginning with <hyphen> <hyphen> as a comment in Expert Warehouse Rule.
For example,

```
set mapred.input.dir.recursive=true;
-- This is an Expert comment
 set hive.mapred.supports.subdirectories=true;
```

The general syntax of an advanced query is as explained below:

1. Drop and create an external table, and then format the row:

   Firstly, we drop the table, if the table already exists and create an external table **sessions21022014**

   ```
   DROP TABLE IF EXISTS sessions21022014
    CREATE EXTERNAL TABLE sessions21022014
   ```

   Note: You must create an external table only if you are using an other table. For example, if you are using an other table apart from**sessions21022014** then you must drop the table and create an external table.

   Then, specify the row format as Avro.SerDe interface to instruct HIVE as to how a record is to be processed. Avro.SerDe allows you to read or write Avro data as HIVE tables and store them as input format and output format.

   ```
   ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.Avro.SerDe'
    STORED AS INPUTFORMAT
   'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
    OUTPUTFORMAT
   'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat'
   ```

2. Specify the HDFS location:

   Secondly, you must specify the HDFS

location '/RSA/rsasoc/v1/sessions/data/2013/12/2' from where the data is queried before executing the HIVE statements.The location parameter specifies the data to be fetched depending on the date input provided. This is a variable parameter hence you can fetch values depending on the date entered.

3. Define the table schema:
   Thirdly, you define the table schema by defining columns with a specific data type and default value as 'null'.

```
TBLPROPERTIES('avro.schema.literal'='
 {"type":"record";
 "name":"nextgen";
 "fields":
 [
 {"name":"ip_src",  "type":["string", "null"], "default":"null"}
 ]
 '};
```

4. Import data from directory which contains sub directories:
   Then, you must enable HIVE to recursively scan all sub-directories and fetch all the data from all sub-directories.

```
set mapred.input.dir.recursive=true;
 set hive.mapred.supports.subdirectories=true;
```

5. Fetch data from the HIVE table:
   Once you execute all the above statements, you can query the database with the HIVE query **select** clause to fetch the data from the HIVE table.

The following examples illustrate advanced rules in the expert mode:

- Hourly, daily, weekly, and monthly report
- Table partition based on location report
- Join logs and sessions based on unique_id report
- List report
- Parameterized report
- Partition based table with multiple locations
- Automated partition using custom function (10.5.1 onwards)

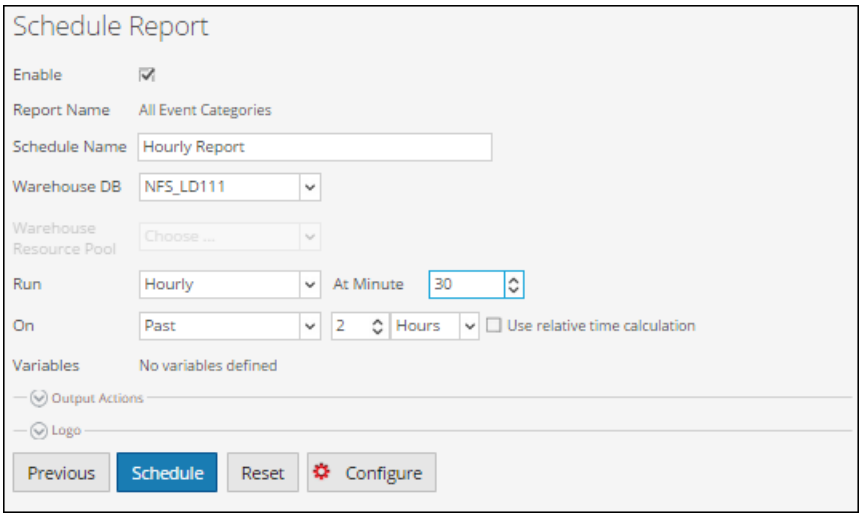
Hourly, Daily, Weekly, and Monthly Report

In these example rules, you can create various reports for December 02, 2013 (as in the below figure). The date variable in the LOCATION statement can be altered, depending on which you can create an hourly, daily, weekly, and monthly report.

Hourly Report

In this example rule, you can create an houly report for December 02, 2013. The LOCATION statement can be altered to generate an hourly report.

LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12/2' - the date input (2013/12/2) indicates year/month/day. The entire data for 02 December, 2013 is retrieved using this location statement.

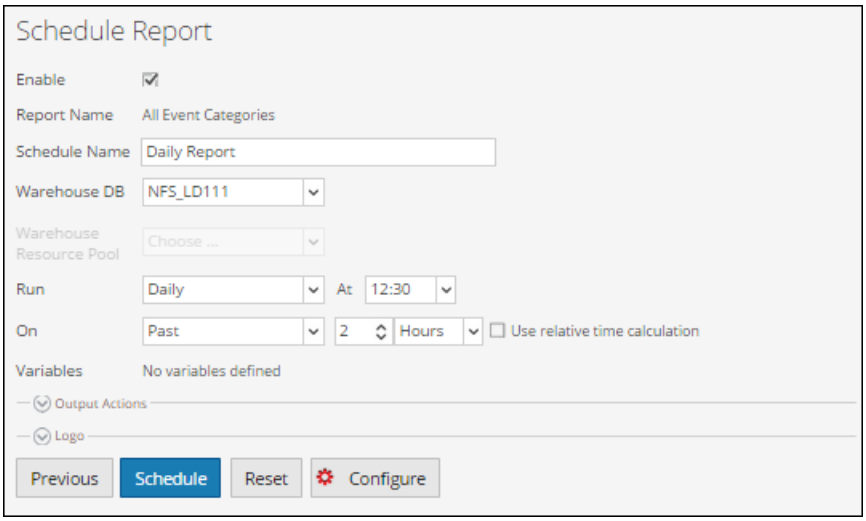


The result set of this query would be an hourly report.

Daily Report

In this example rule, you can create a daily report for December 2013. The LOCATION statement can be altered to generate a daily report.

LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12' - the date input (2013/12) indicates year/month. The entire data for December, 2013 is retrieved using this location statement.

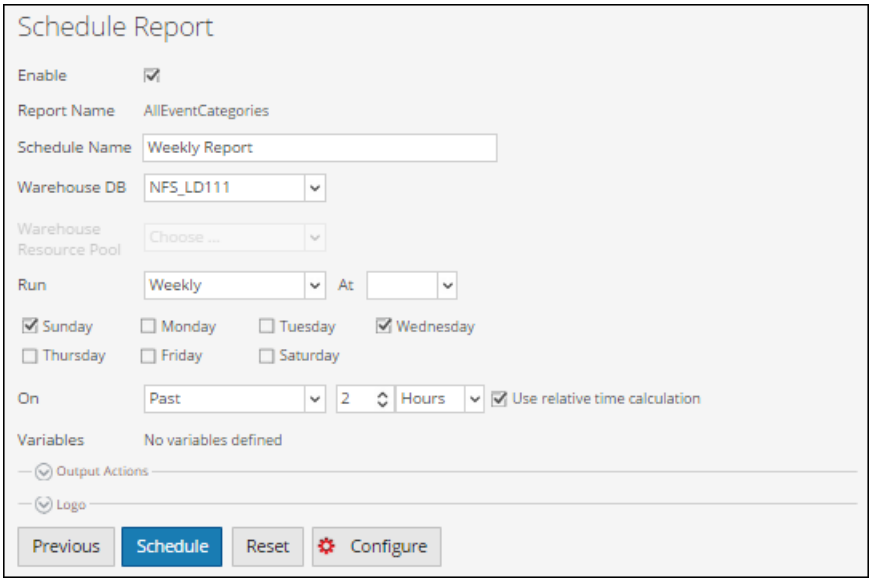


The resultset of this query would be a daily report.

Weekly Report

In this example rule, you can create a weekly report for December 2013. The LOCATION statement can be altered to generate a weekly report.

LOCATION '/RSA/rsasoc/v1/sessions/data/2013/12' - the date input (2013/12) indicates year/month. The entire data for December, 2013 is retrieved using this location statement.

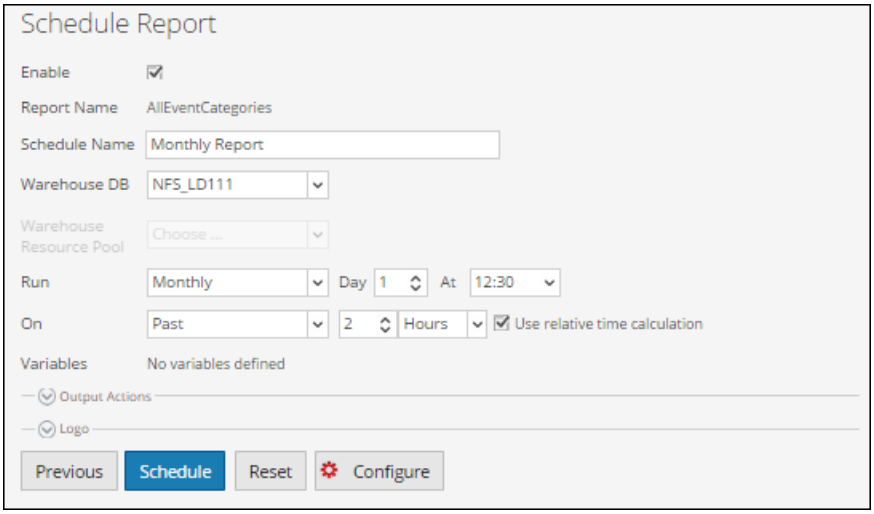


The result set of this query would be a weekly report.

Monthly Report

In this example rule, you can create a monthly report for the year 2013. The LOCATION statement can be altered to generate a monthly report.

LOCATION '/RSA/rsasoc/v1/sessions/data/2013' - the date input (2013) indicates year. The entire data for the year 2013 is retrieved using this location statement.



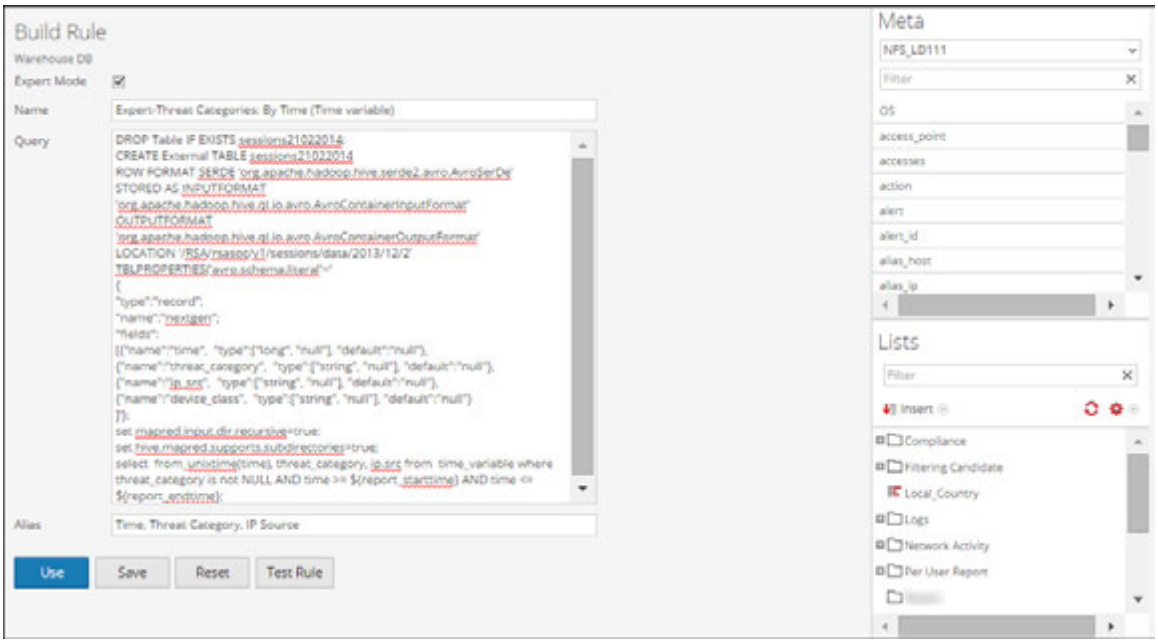
The result set of this query would be a monthly report.

For more information on LOCATION definition, see **Specify the HDFS location** in the **General Syntax of an Advanced Rule** section.

You must perform the following steps in sequence to view the resultset of an advanced rule:

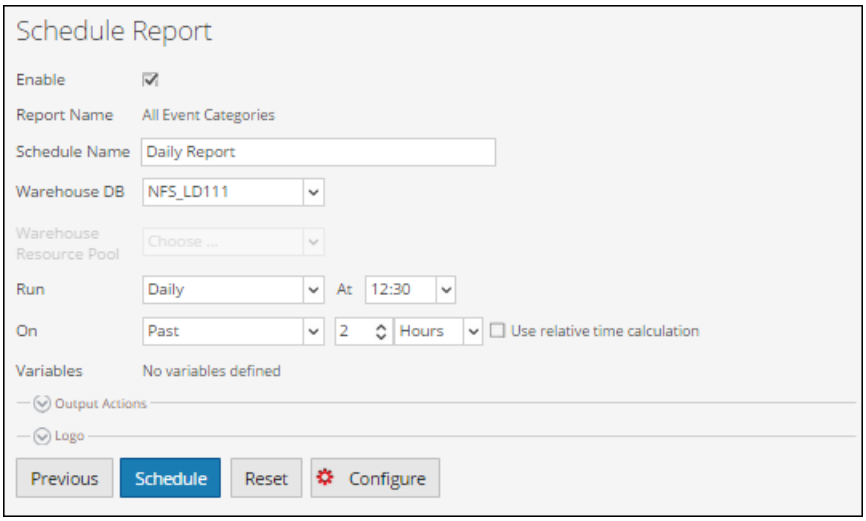
1. Define an Advanced Rule
2. Add an advanced rule to a Report
3. Schedule a Report
4. View a scheduled Report

The following figure shows how to define an advanced rule.



The following figure shows how to add an advanced rule to a report (For example, **AllEventCategories**).

The following figure shows how to schedule a daily report.



If you want to generate a report for a specific time range, you need to manually define the time range in the query using the following two variables:

`${report_starttime} - The starting time of the range in seconds.`
`${report_endtime} - The ending time of the range in seconds.`

For example, `SELECT from_unixtime(time), threat_category, ip.src FROM time_variable WHERE threat_category is not NULL AND time >= ${report_starttime} AND time <= ${report_endtime};`

The following figure shows the result set of scheduling a daily report.

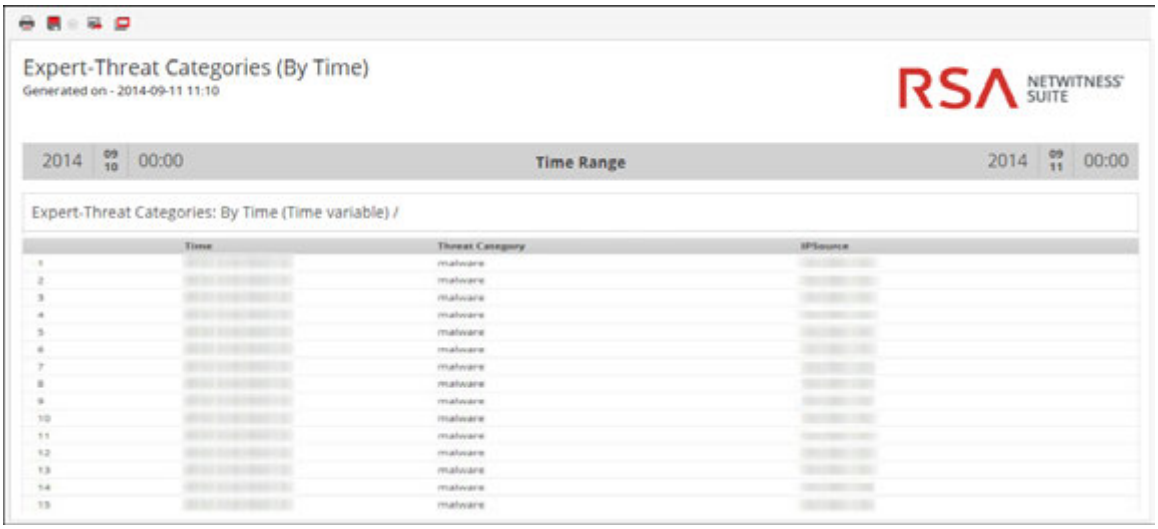


Table Partition Based on Location Report

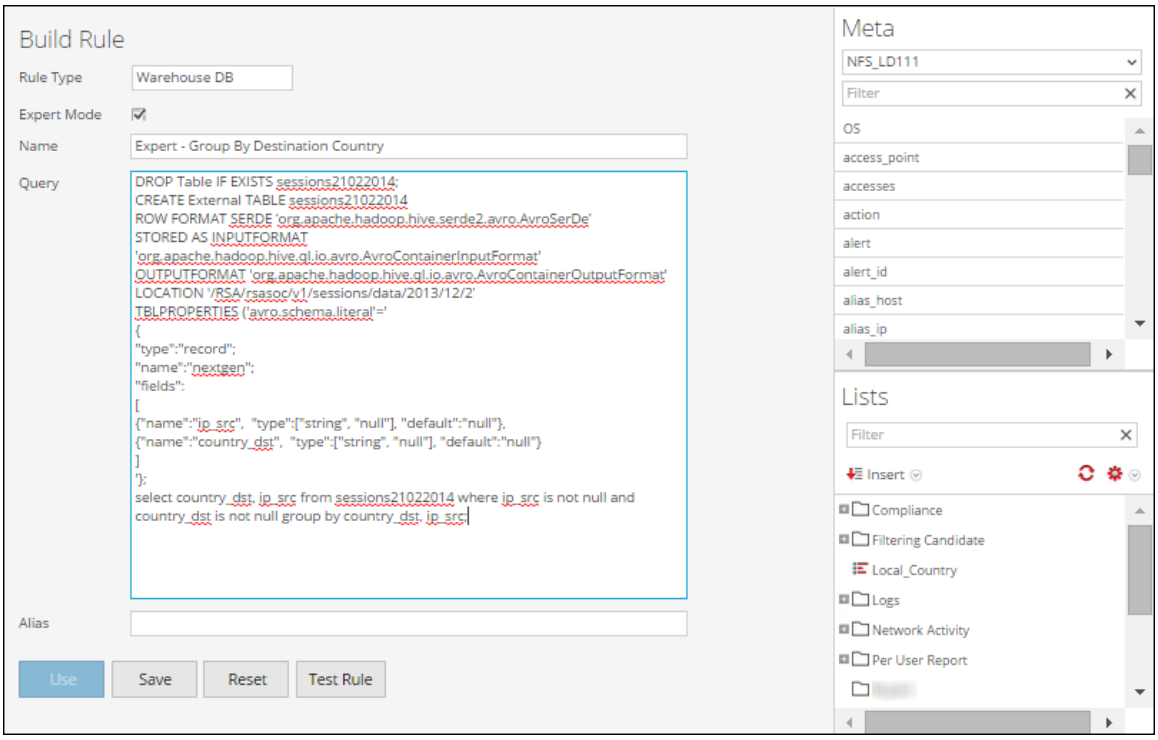
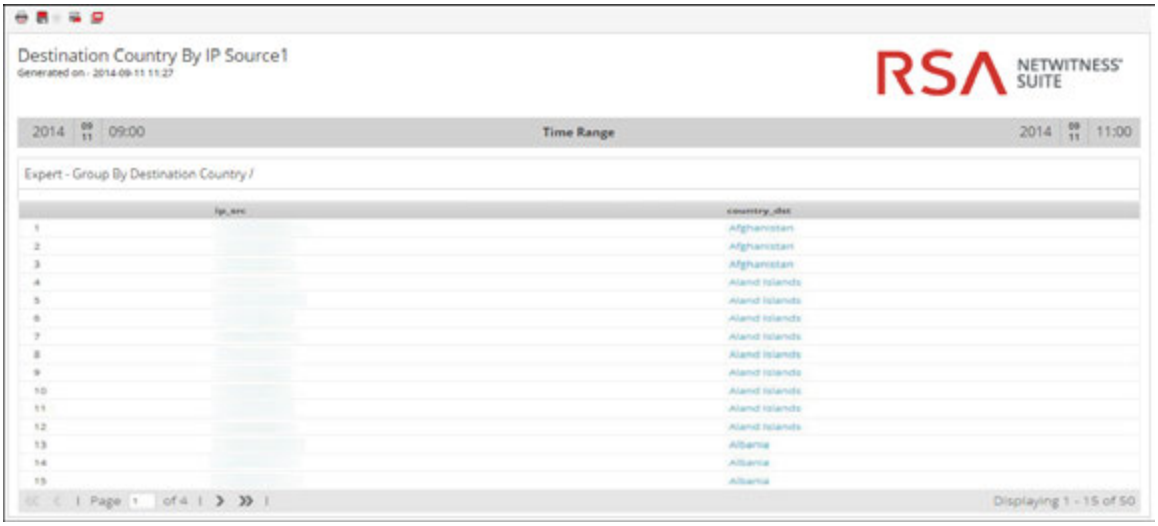
In this example rule, you can create a table partition based on location. Each table can have one or more partition keys which determines how the data is stored. For example, a country_dst of type STRING and an ip_src of type STRING. Each unique value of the partition keys defines a partition of the table.

In the example provided, we execute a HIVE query to fetch destination country and IP address of source from the sessions05032014 table and group the result set by these fields.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see "General Syntax of an Advanced Rule" section.



The following figure shows the result set of creating a table partition based on location report.

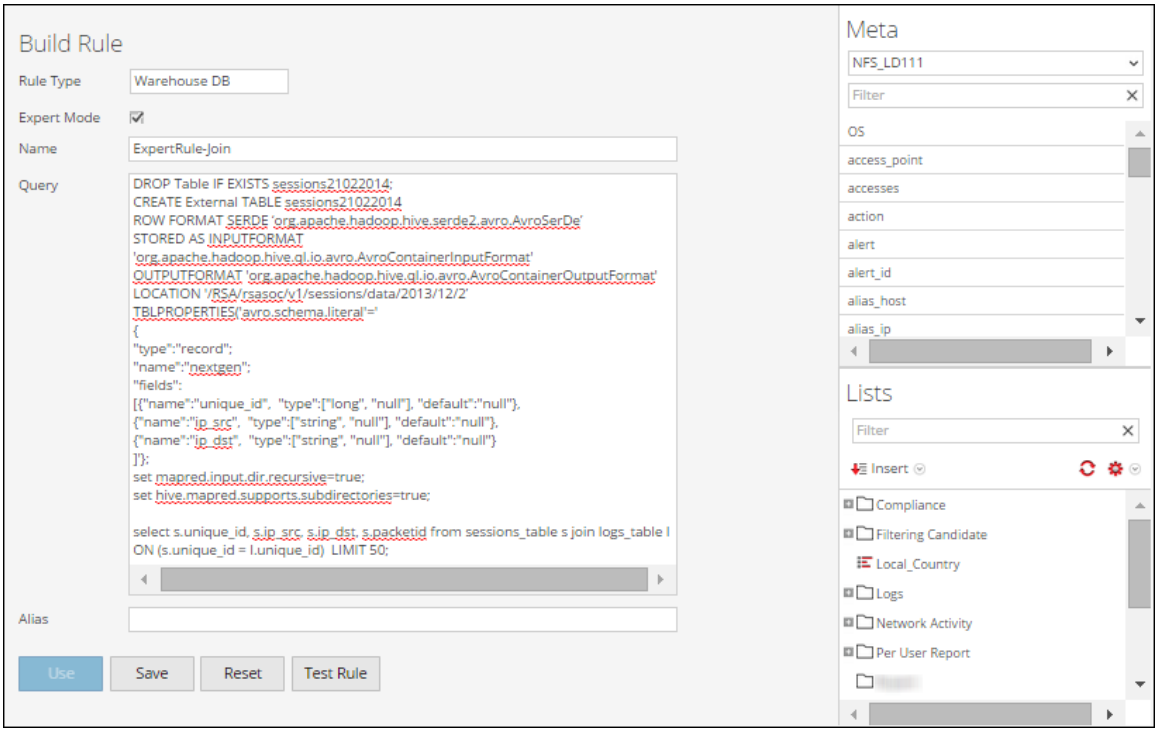


Join Logs and Sessions Based on unique_id Report

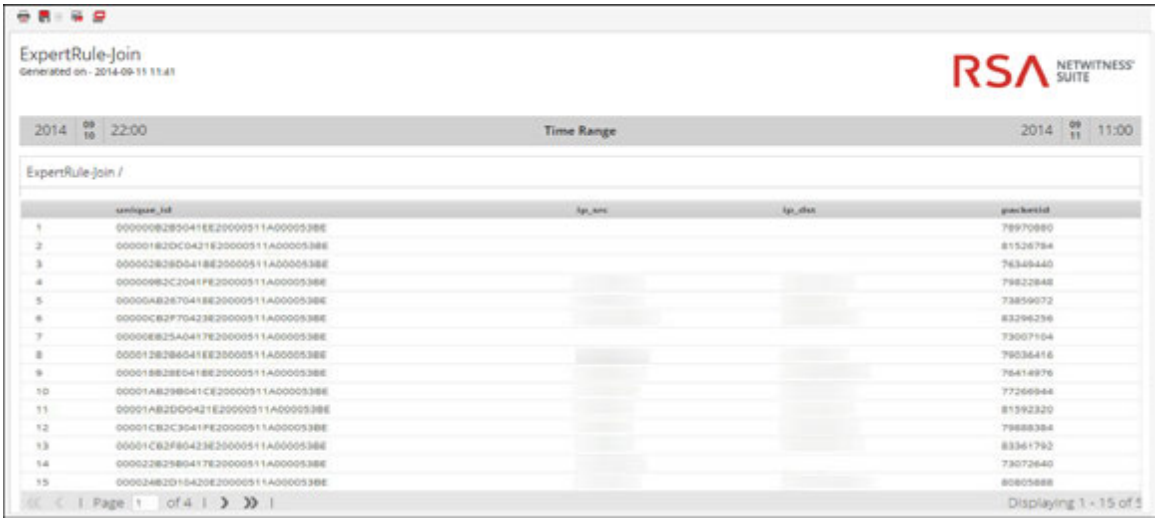
In this example rule, you can create a rule to join logs and sessions table to fetch unique_id, IP address of source and destination, and packet ID based on unique_id.

In the example provided, we execute a HIVE query to fetch certain fields from both the sessions_table and logs_table by performing a join based on the 'unique_id' field.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see the **General Syntax of an Advanced Rule** section.



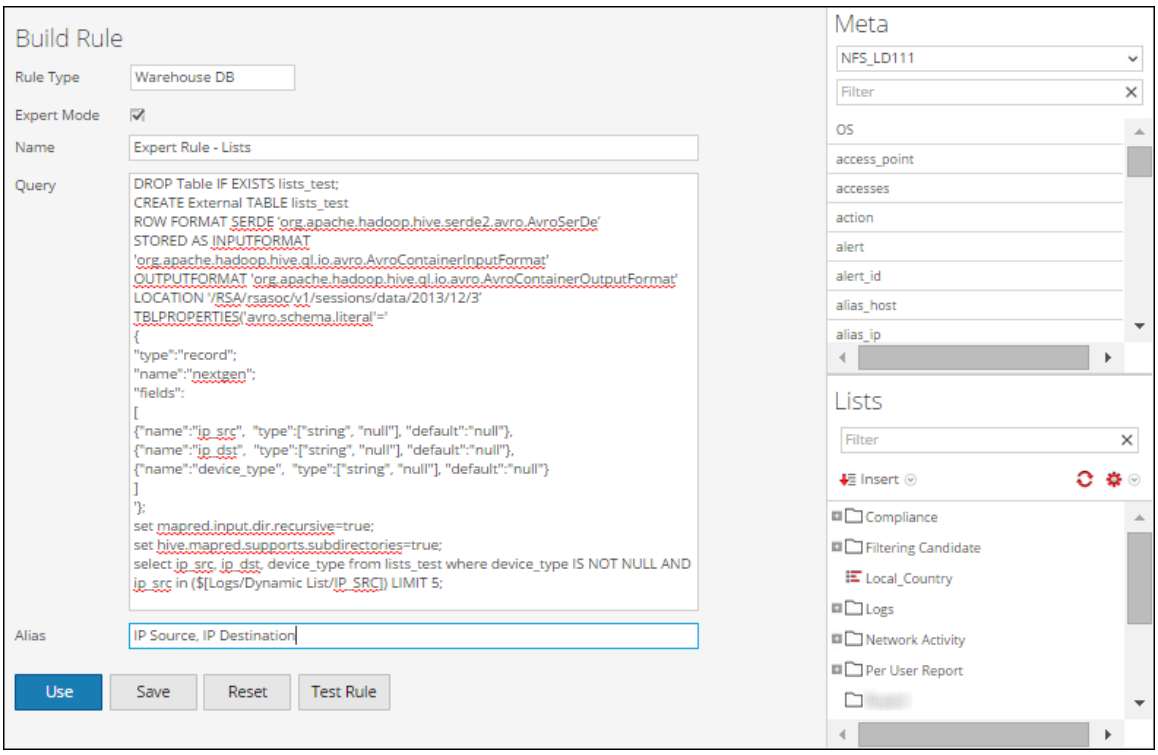
The following figure shows the result set of joining logs and sessions table based on unique_id.



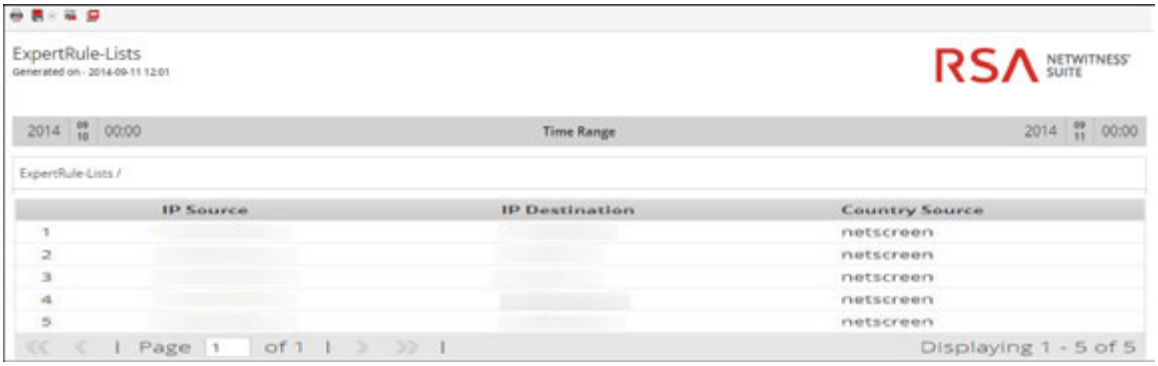
List Report

In this example rule, you can create a List report to fetch IP address of source and destination, and device type from the **lists_test** table where device type is not null and IP address of source is fetched from the appropriate event list.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see the **General Syntax of an Advanced Rule** section.



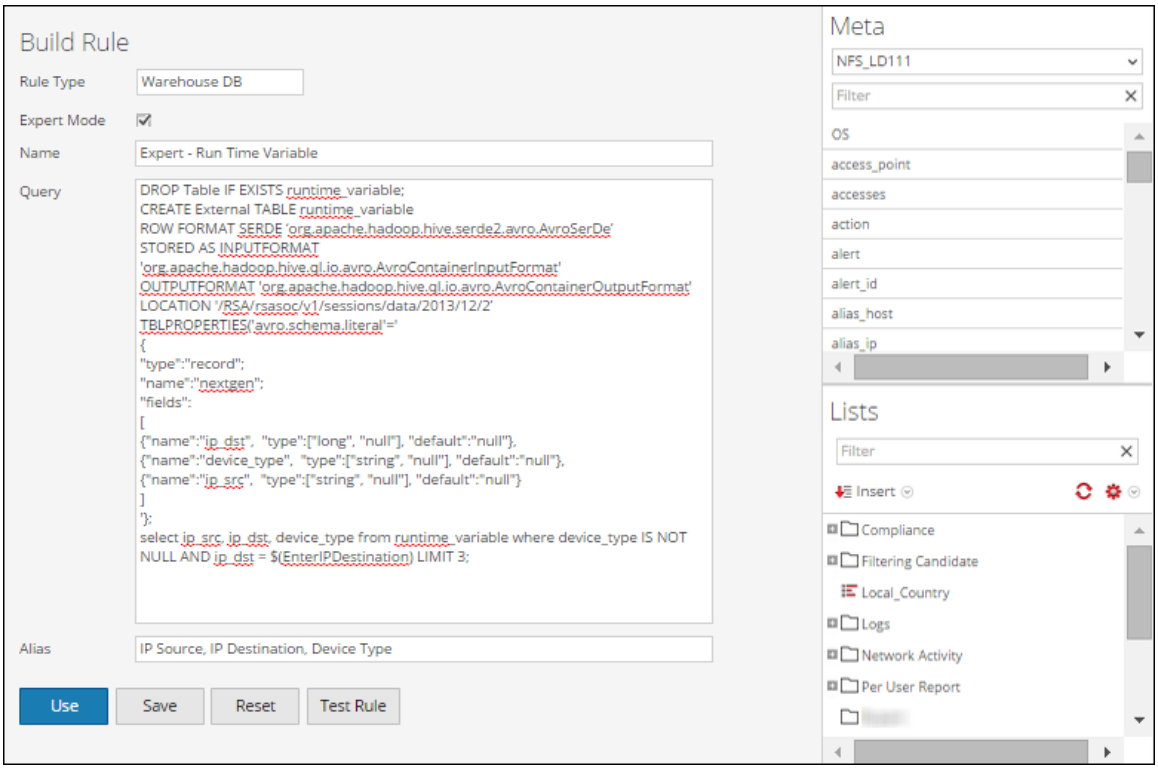
The following figure shows the result set of executing a list report.



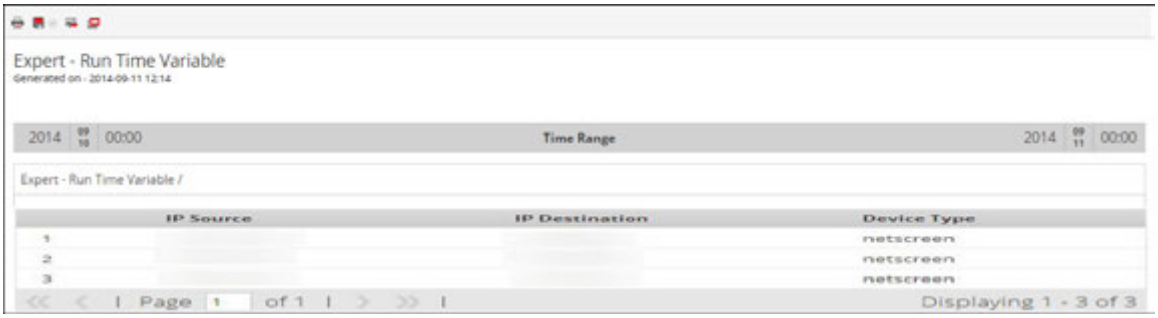
Parameterized Report

In this example rule, you can create a rule to fetch IP addresses of source and destination, and device type from the **runtime_variable** table based on the specified run time variable `${EnterIPDestination}`. At run time, you are prompted to enter a value for the IP address of destination ip_dst. Based on the value entered, the result set is displayed.

This rule provides information about the table created, row formatted, location (directory path) for avro data files in Warehouse, and returns a result set as per the HIVE query to indicate that the query returned a result set. For more information on these statements, see the **General Syntax of an Advanced Rule** section.



The following figure shows the result set of executing a parameterized report.



Partition Based Table with Multiple Locations

The following is an example of partition based table with multiple locations:

```
set mapred.input.dir.recursive=true;
 set hive.mapred.supports.subdirectories=true;
 DROP TABLE IF EXISTS AVRO_COUNT;
 CREATE EXTERNAL TABLE AVRO_COUNT
 PARTITIONED BY (partition_id int)
 ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.AvroSerDe'
 WITH SERDEPROPERTIES (
 'avro.schema.literal'='{
 "name": "my_record", "type": "record",
 "fields": [
 {"name":"sessionid", "type":["null", "long"], "default" :
null},
 {"name":"time", "type":["null", "long"], "default" : null}
 ]}'
 )
 STORED AS
 INPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
 OUTPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=0) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/8';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=1) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/9';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=2) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/10/';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=3) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/11/';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=4) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/12/';
 SELECT COUNT(*) as TOTAL FROM AVRO_COUNT WHERE time >=
${report_starttime} AND time
 <= ${report_endtime};
```

The partition based table with multiple location is as explained below:

1. Enable HIVE to recursively scan all sub-directories and read all the data from the sub-directories.

   ```
   set mapred.input.dir.recursive=true;
    set hive.mapred.supports.subdirectories=true;
   ```

2. Drop and create an external table, and then format the rows:

   ```
   DROP TABLE IF EXISTS AVRO_COUNT;
    CREATE EXTERNAL TABLE AVRO_COUNT
    PARTITIONED BY (partition_id int)
   ```

```
 ROW FORMAT SERDE
'org.apache.hadoop.hive.serde2.avro.AvroSerDe'
 WITH SERDEPROPERTIES (
 'avro.schema.literal'='{
 "name": "my_record", "type": "record",
 "fields": [
 {"name":"sessionid", "type":["null", "long"], "default" :
null},
 {"name":"time", "type":["null", "long"], "default" : null}
 ]}'
 )
 STORED AS
 INPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
 OUTPUTFORMAT

'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputForma
t';
```

Note: You must create an external table only if you are using any other table. For example, if you are using any other table apart from **AVRO_COUNT** then you must drop the table and create an external table.

Note: Points to remember when you create a table:
- Dropping a 'non-external' table deletes the data.
- The table is partitioned on a single column called partition_id and this is the standard column for Reporting Engine.
- The default value of any column is null as the AVRO file may not contain the specified column.
- The column names should be in the lowercase as HIVE is case insensitive but AVRO is case sensitive.
- You must specify **avro.schema.literal** in the *SERDEPROPERTIES* .

For more information on the rule syntax, refer to *Apache HIVE*.

3. Add partitions:

Once you define a table, you must specify the HDFS locations from where the data needs to be queried before you execute the HIVE statements.The location parameter specifies the data to be fetched depending on the specified date. The data is spread across multiple locations or directories in HDFS. For each location you need to add a partition with unique

values assigned to the partition column. The locations can be any directory in the HDFS

```
ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=0) LOCATION
'/rsasoc/v1/sessions/data/2015/07/22/8';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=1)
LOCATION '/rsasoc/v1/sessions/data/2015/07/22/9';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=2)
LOCATION '/rsasoc/v1/sessions/data/2015/07/22/10/';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=3)
LOCATION '/rsasoc/v1/sessions/data/2015/07/22/11/';
 ALTER TABLE AVRO_COUNT ADD PARTITION(partition_id=4)
LOCATION '/rsasoc/v1/sessions/data/2015/07/22/12/';
```

Note: HIVE reads each file in these locations as AVRO. Incase if there is a non-AVRO file available in one of these locations then the query may fail.

4. Run the query

```
SELECT COUNT(*) as TOTAL FROM AVRO_COUNT WHERE time >=
${report_starttime} AND time
 <= ${report_endtime};
```

When a table is created, you can execute specific queries to filter the data. For example, after you create the table you can filter the data as shown in the below examples:

Sessions with a specific Source IP Address:

```
SELECT * FROM AVRO_COUNT WHERE time >= ${report_starttime}
AND time <= ${report_endtime}  AND ip_src = '127.0.0.1';
```

Group by based on user destination:

```
SELECT * FROM AVRO_COUNT WHERE time >= ${report_starttime}
AND time <= ${report_endtime}  GROUP BY usr_dst;
```

Automated Partition using Custom function

In 10.5.1, you can use the custom function to automate the addition of partitions to a user defined table in the expert mode.

General syntax

```
RE WH CUSTOM ADDPARTITIONS(table, namespace, rollup, [starttime,
endtime])
```

The following table describes the custom function syntax:

S.No	Name	Description
1	table	The table name for which the partition has to be added.
2	namespace	The namespace can be sessions or logs.
3	rollup	This value determines the level of directory path to be included in partitions. The value can be HOUR, DAY, or MINUTE. If Warehouse Connector is configured for Day rollup, setting this value as HOUR produces ZERO results. The number and location of each partition is based on time range used to run the rule and the rollup value.
4	(Optional) starttime, endtime	To generate partitions for a specific time range other than the time range mentioned in the rule, you must specify the starttime and endtime in **Epoch Seconds**. **Note:** Expressions are not supported for the starttime and endtime.

The custom function is invoked when Reporting Engine executes the rule either during test rule or scheduled report. While running a expert rule, whenever Reporting Engine identifies the function declaration, it extracts the required arguments and insert *n* number of ADD PARTITION HiveQL statements and executes them on the Hive Server.

The location and directory structure is determined by the argument passed in the rule and the Hive datasource configuration in Reporting Engine. The number of partitions depends on the rollup specified and the time range used while executing the rule. For example, with the rollup as HOUR and the time range as PAST 2 Days results in 48 partitions for 48 Hours while with the rollup as DAY, Reporting Engine creates 2 partitions, one for each day.

The partition query is generated by the Syntax Template as set in Reporting Engine's Hive Configuration attribute AlterTableTemplate.

Note: By default, this function starts adding partitions to a table with partition id from 0 to N-1. Hence this requires that the table must be partitioned by single integer column named partition id.

The following is an example of automated partition using custom function:

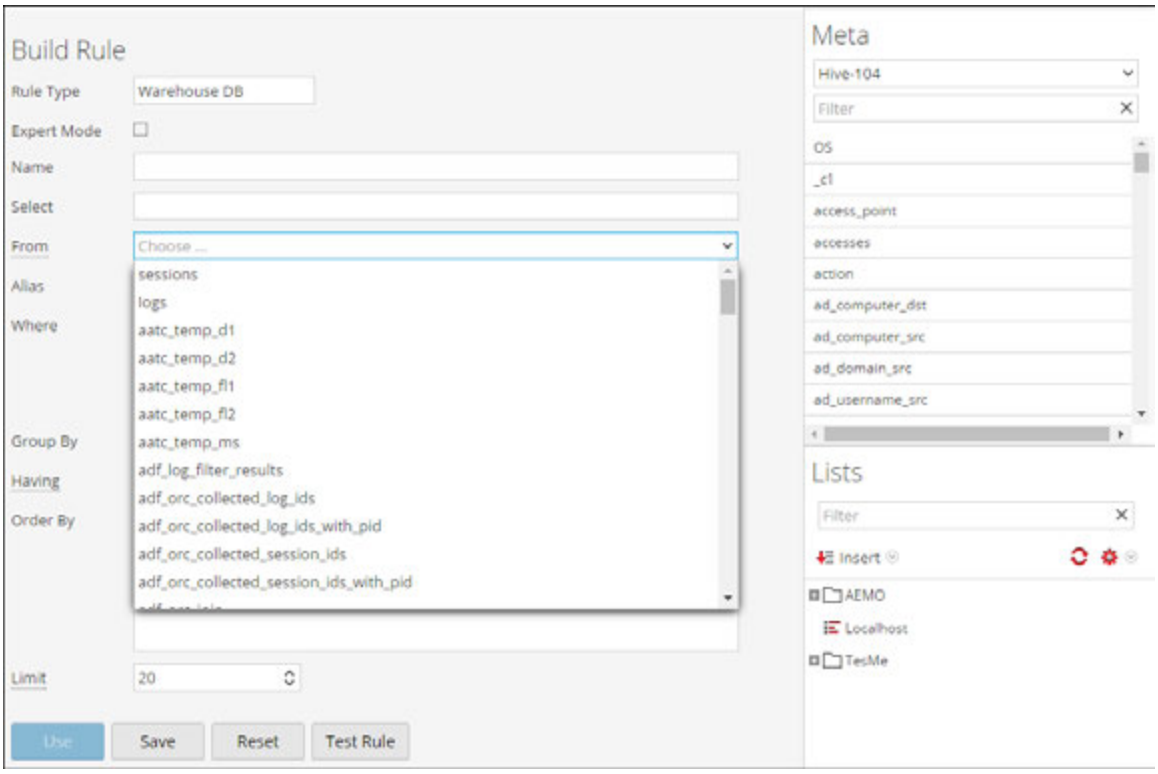
```
 set mapred.input.dir.recursive=true;
 set hive.mapred.supports.subdirectories=true;
 DROP TABLE IF EXISTS AVRO_COUNT;

CREATE EXTERNAL TABLE AVRO_COUNT
 PARTITIONED BY (partition_id int)
 ROW FORMAT SERDE 'org.apache.hadoop.hive.serde2.avro.AvroSerDe'
 WITH SERDEPROPERTIES (
 'avro.schema.literal'='{
  "name": "my_record", "type": "record",
  "fields": [
  {"name":"sessionid", "type":["null", "long"], "default" :
null}
  ,{"name":"time", "type":[ "null" , "long"], "default" : null}
  ,{"name":"unique_id", "type":["null", "string"], "default" :
null}
  ]}'
 )
 STORED AS
 INPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerInputFormat'
 OUTPUTFORMAT
 'org.apache.hadoop.hive.ql.io.avro.AvroContainerOutputFormat';

RE_WH_CUSTOM_ADDPARTITIONS(AVRO_COUNT, 'sessions', 'DAY');
 SELECT COUNT(*) as TotalSessions FROM AVRO_COUNT
 WHERE time >= ${report_starttime} AND time <= ${report_
endtime};
```

Creating Custom Tables Report

In 10.6.1, you can use and create Custom Tables on the Hive Server. Reporting Engine supports running queries on user defined tables and the ability to create a new table from a Single Rule output. When this feature is enabled in the Warehouse Rule Builder UI, user can see a list of custom tables available in Hive Server.



To enable this feature set **customTablesEnabled** to **TRUE** by navigating to **Reporting Engine -> Explore ->Hive Config**.

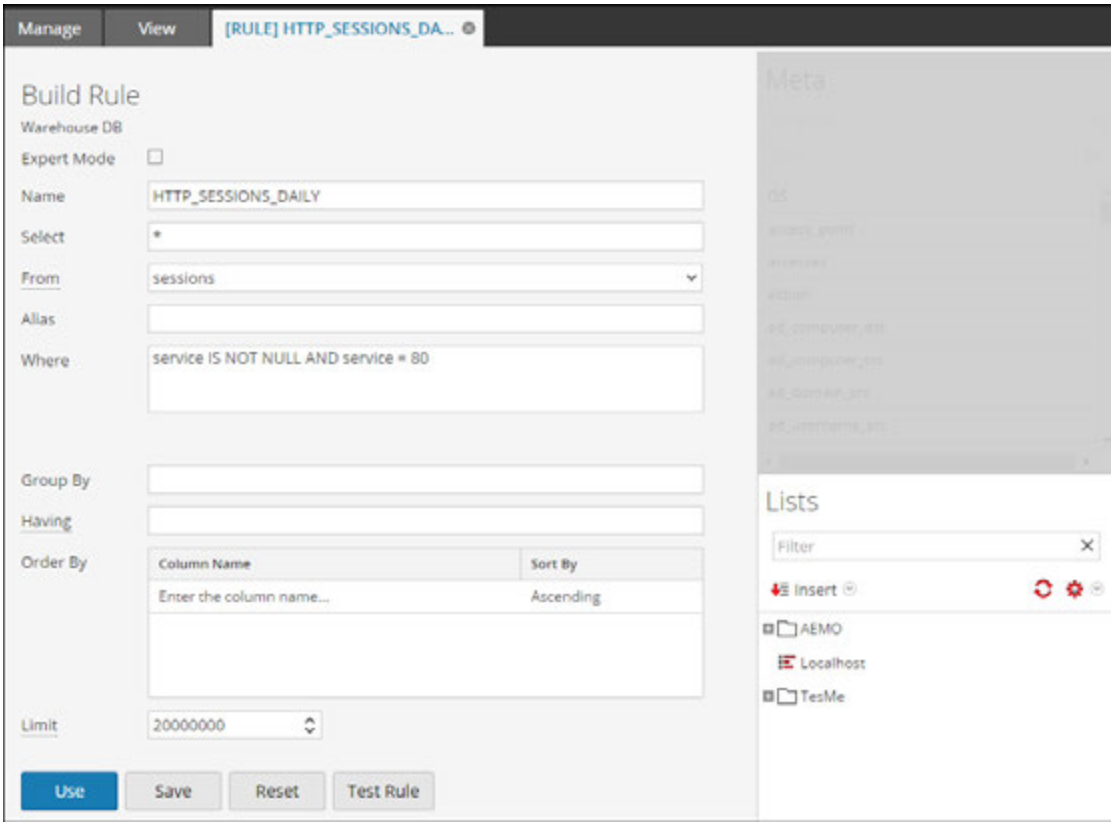
Creating Custom Table from Regular Rules

To schedule a report which contains a single SAW rule, a new text input with a **Warehouse CTAS Name** is added.The user can now specify a Custom Table name that will be created out of the output of the rule in Report.

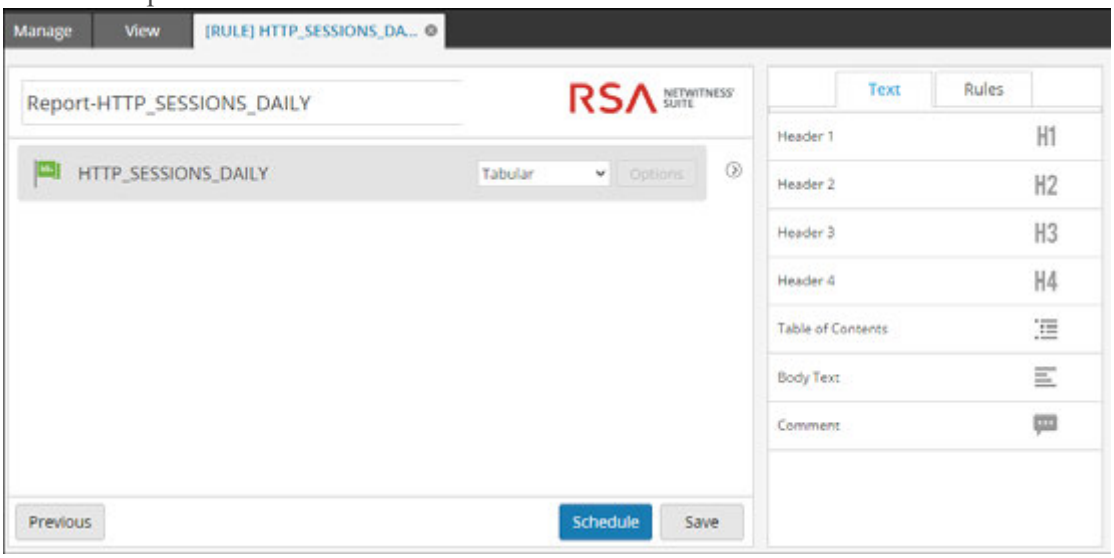
Note: This feature is available only if the Report contains a single SAW rule on the Schedule page. Otherwise, this option is hidden.

The process to use the feature is explained below:

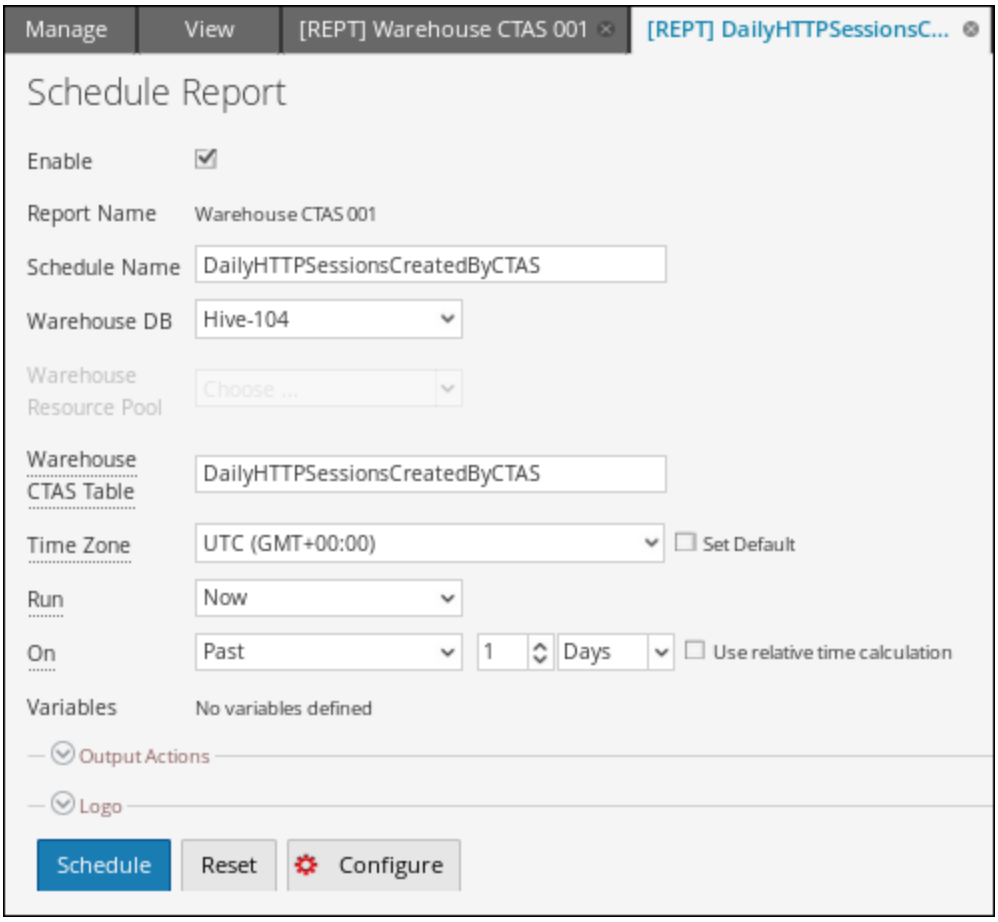
1. Create a rule to filter with data in SAW.



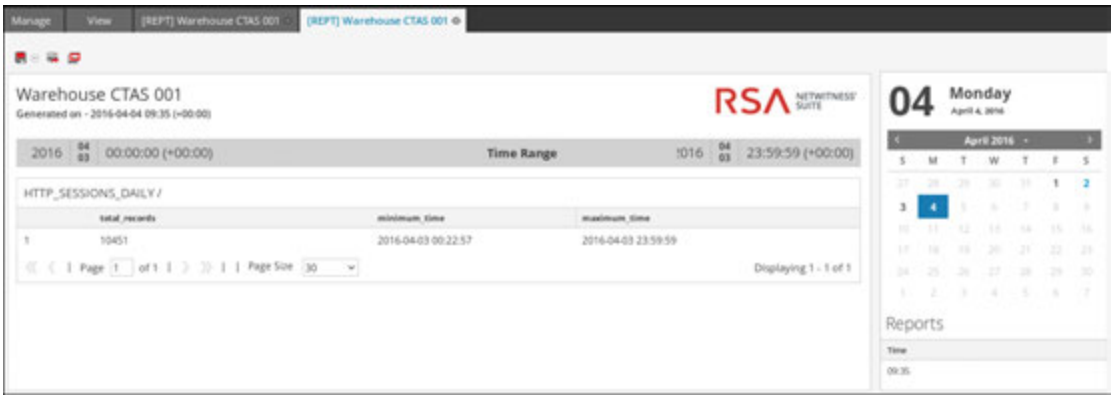
2. Create a Report with the above rule.



3. Create a Schedule and enter the CTAS Table Name.



4. Run the Report and Reporting Engine will create the Result Summary as below for the Schedule.



5. On the next schema refresh or restart of Reporting Engine, the CTAS Table is listed.

Task Scheduler for Warehouse Reporting

A task scheduler in a Hadoop cluster schedules the jobs consisting of tasks, and allocates specific resources to each job running in a cluster. By default, the task scheduler allocates equal number of resources to all the jobs. For example, if 10 jobs are running they will share resources of the cluster equally. However, you can configure the task scheduler to control the execution of the jobs such that one job runs faster than others by allocating more resources (pools or queues) to the job. This helps you prioritize to run a few reports over others.

Features

NetWitness Suite supports two task schedulers:

- Fair Scheduler (`org.apache.hadoop.mapred.FairScheduler`)
- Capacity Scheduler (`org.apache.hadoop.mapred.CapacityTaskScheduler`)

Fair Scheduler

This scheduler divides the total capacity of the cluster into logical pools. You can submit a job to any one of these pools. All the jobs submitted to a pool share the resources allocated to the pool only. Once a pool has free resources, the freed resources are given to other pools with jobs running. For example, a fair scheduler has 100% resources with two pools namely Pool A and Pool B which share the total resources at 40% and 60% respectively. If Pool A has four jobs running, it allocates 10% resources to each job. When the four jobs are completed, the freed resources are allocated to Pool B.

Note: You can configure a pool to run more than one job in parallel.

Capacity Scheduler

This scheduler divides the total capacity of the cluster into queues. Each queue is allocated a pre-configured share of the total capacity. A job may be submitted to any of these queues. If more than one job is submitted to the same queue, the jobs will be executed sequentially. For example, if a capacity scheduler has 100% resources with three queues namely the Default, Low and High and they share the total resources at 20%, 30% and 50% respectively. If Default has two jobs D1 and D2, Low has three jobs L1, L2 and L3, and High has four jobs H1, H2, H3 and H4, these jobs are executed in their respective queues sequentially. If the jobs in a queue are completed, the freed resources will not be distributed to other queues.

Query Aggregates

This section explains the supported aggregate functions.

Supported Aggregate Functions

The following table lists the supported Aggregate Functions.

Aggregate Function	Description	Input data types	Output data types
count	Returns the count of meta values, which includes duplicate values as well.	Numeric	Numeric
countdistinct	Returns the total number of distinct or unique values.	Numeric	Numeric
distinct	Returns all the unique values.	Any	Any
first	Returns the first occurrence of the meta value.	Any	Same as input
last	Returns the last occurrence of the meta value.	Any	Same as input
sum	Returns a sum of all non-NULL values of metaKey in a group.	Numeric	Numeric
avg (Average)	Returns the average value of all non-NULL values of the metaKey within a group.	Numeric	Numeric
min (Minimum)	Returns the minimum for all values of metaKey in each group. This value is based on order by field.	Any	Any
max (Maximum)	Returns the maximum for all values of metaKey in each group. The maximum value is the value that is returned by order by field.	Any	Any

Aggregate Function	Description	Input data types	Output data types
length	Returns the length of the values of metakey. This is called a "scalar function" in SQL.	Any	Numeric

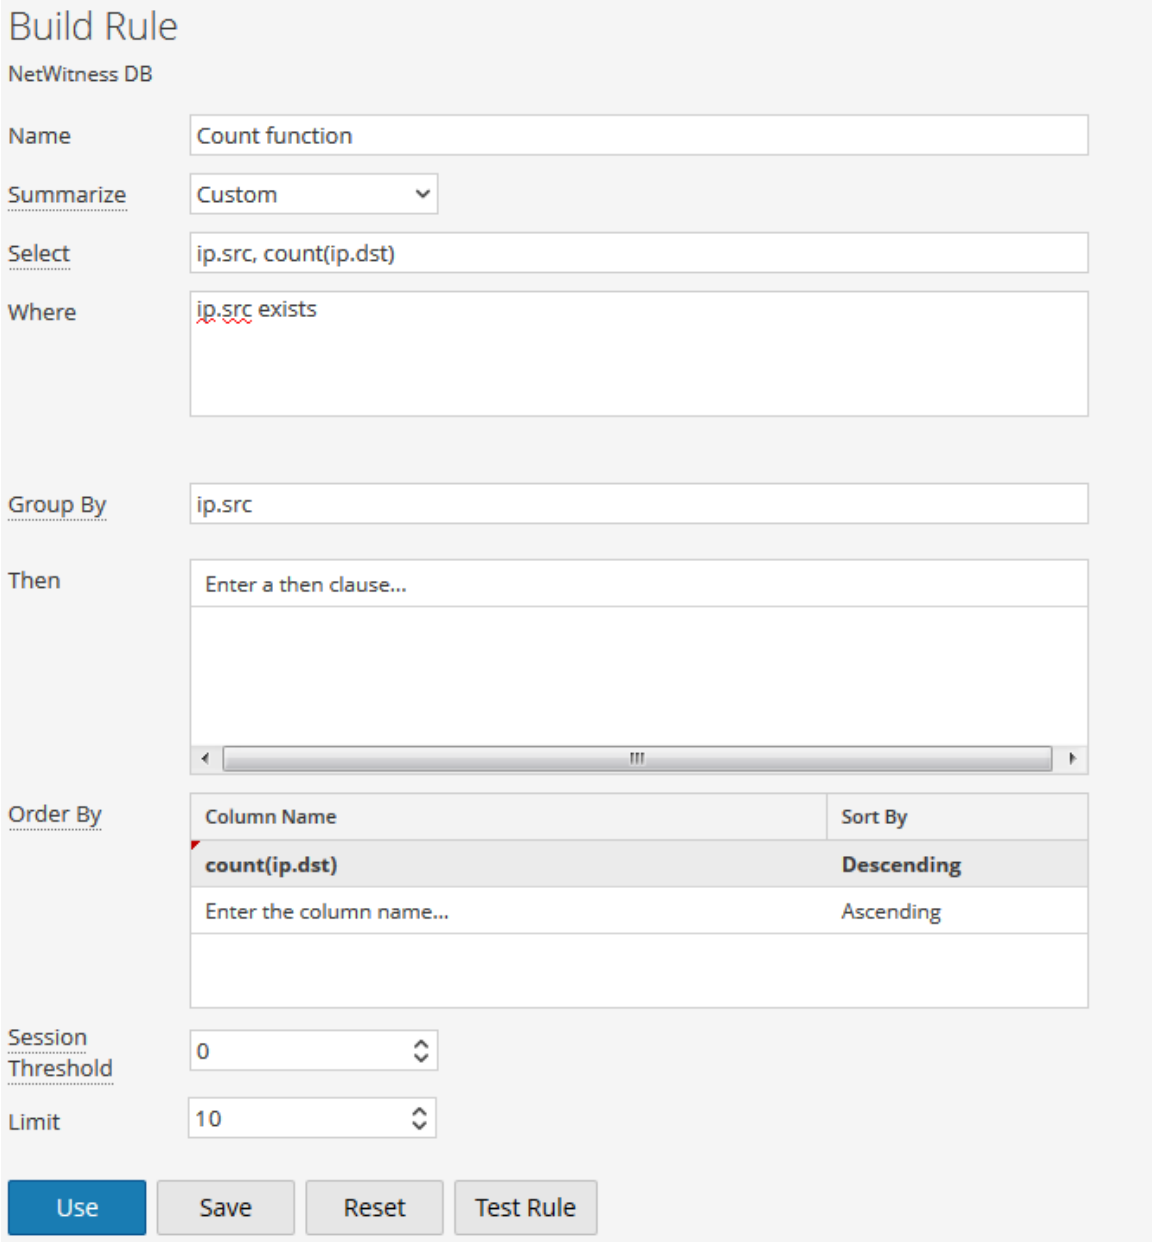
Examples of Queries and Results per Function

Count

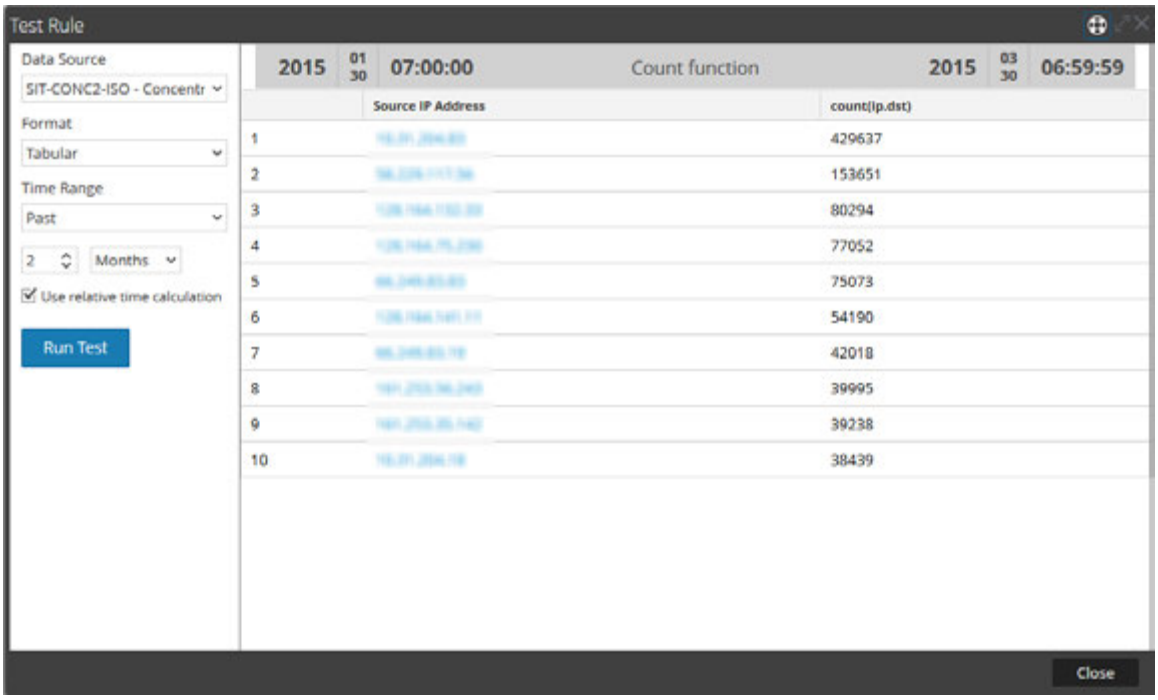
This function returns the number of values for a specified meta key, that exclude null values but include duplicate ones. .

Example

The following figure shows a sample query for count function used for the destination IP and the respective source IP.



The following figure shows the result for the above query.



Here, for each unique ip.src (source IP), the page returns the total number or count of ip.dst (destination IP) values, which include the duplicate values as well.

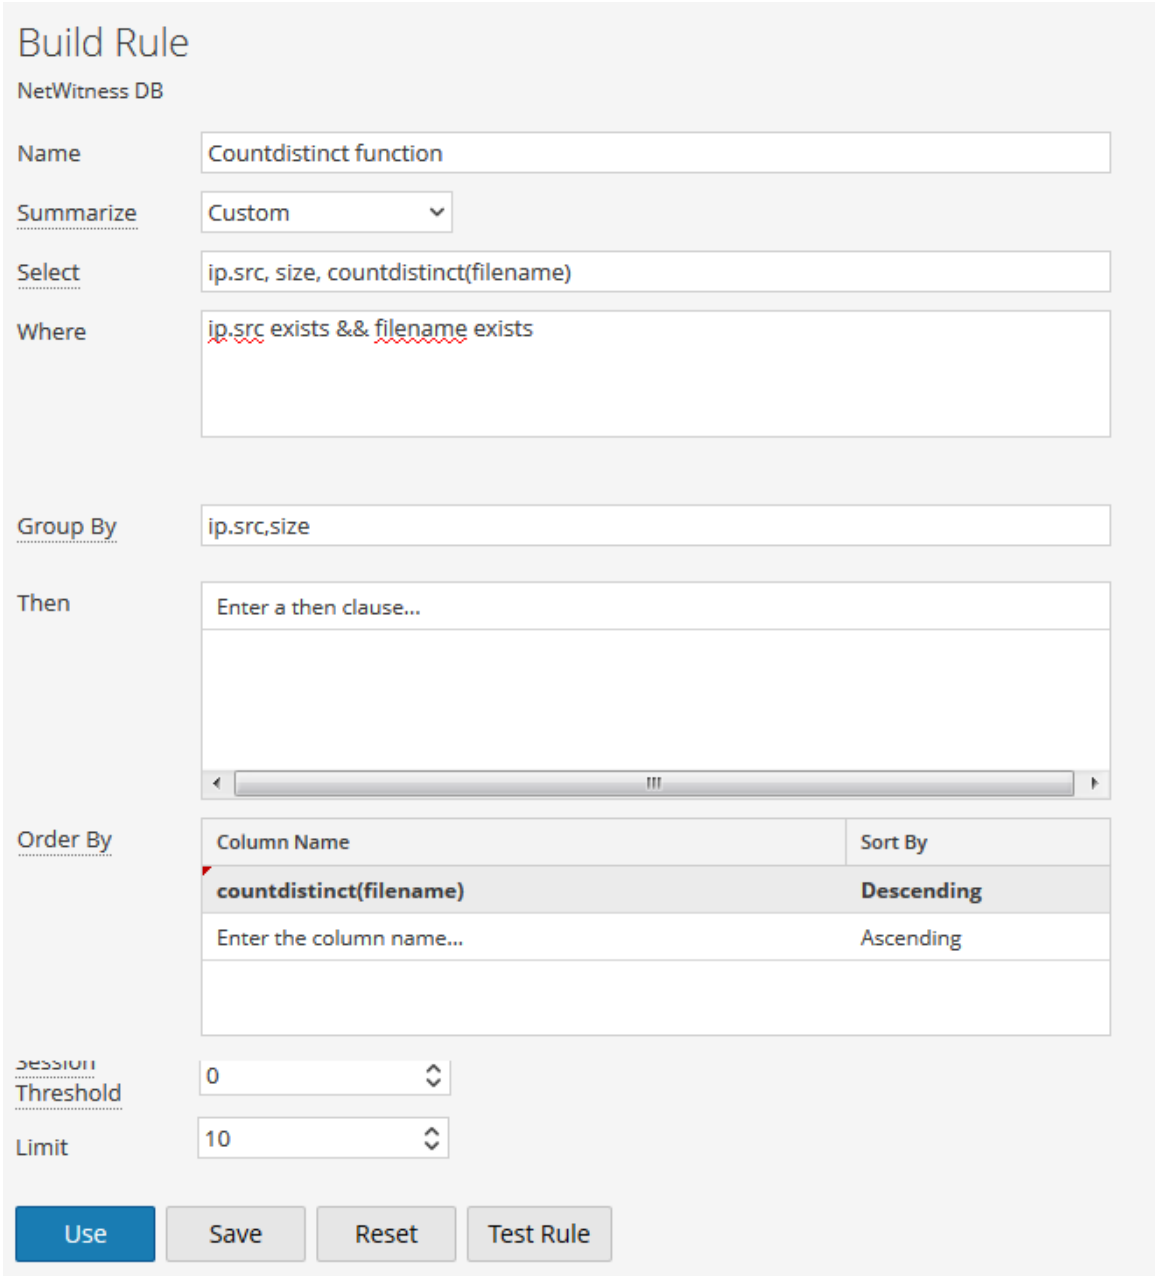
Note: If your RSA NetWitness Suite is currently on 10.5 or newer version and any of the NetWitness Suite Core devices are on 10.3 or 10.4 versions, then some of the aggregate functions may display unexpected errors. However, aggregate functions such as sum() and count() are supported in 10.4 version.

Countdistinct

The countdistinct function returns the count of unique or distinct values for the metakey. In other words, countdistinct function can be used to retrieve a number of distinct values for the specified metakey.

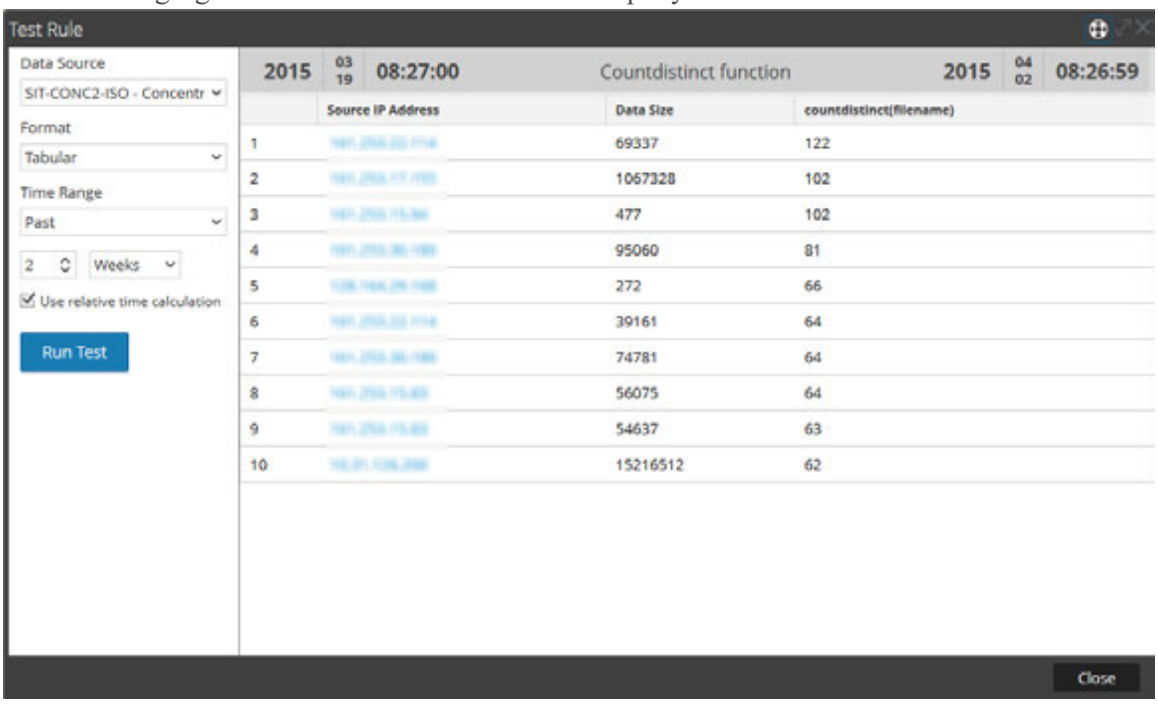
The following figure shows a sample query where the countdistinct function is used along with IP source (ip.src) and data size(size).

Example



Build Rule
NetWitness DB
Name
Countdistinct function
Summarize
Custom
Select
ip.src, size, countdistinct(filename)
Where
ip.src exists && filename exists
Group By
ip.src,size
Then
Enter a then clause...
Order By
Column Name
Sort By
countdistinct(filename)
Descending
Enter the column name...
Ascending
Threshold
0
Limit
10
Use
Save
Reset
Test Rule

The following figure shows the result for the above query.



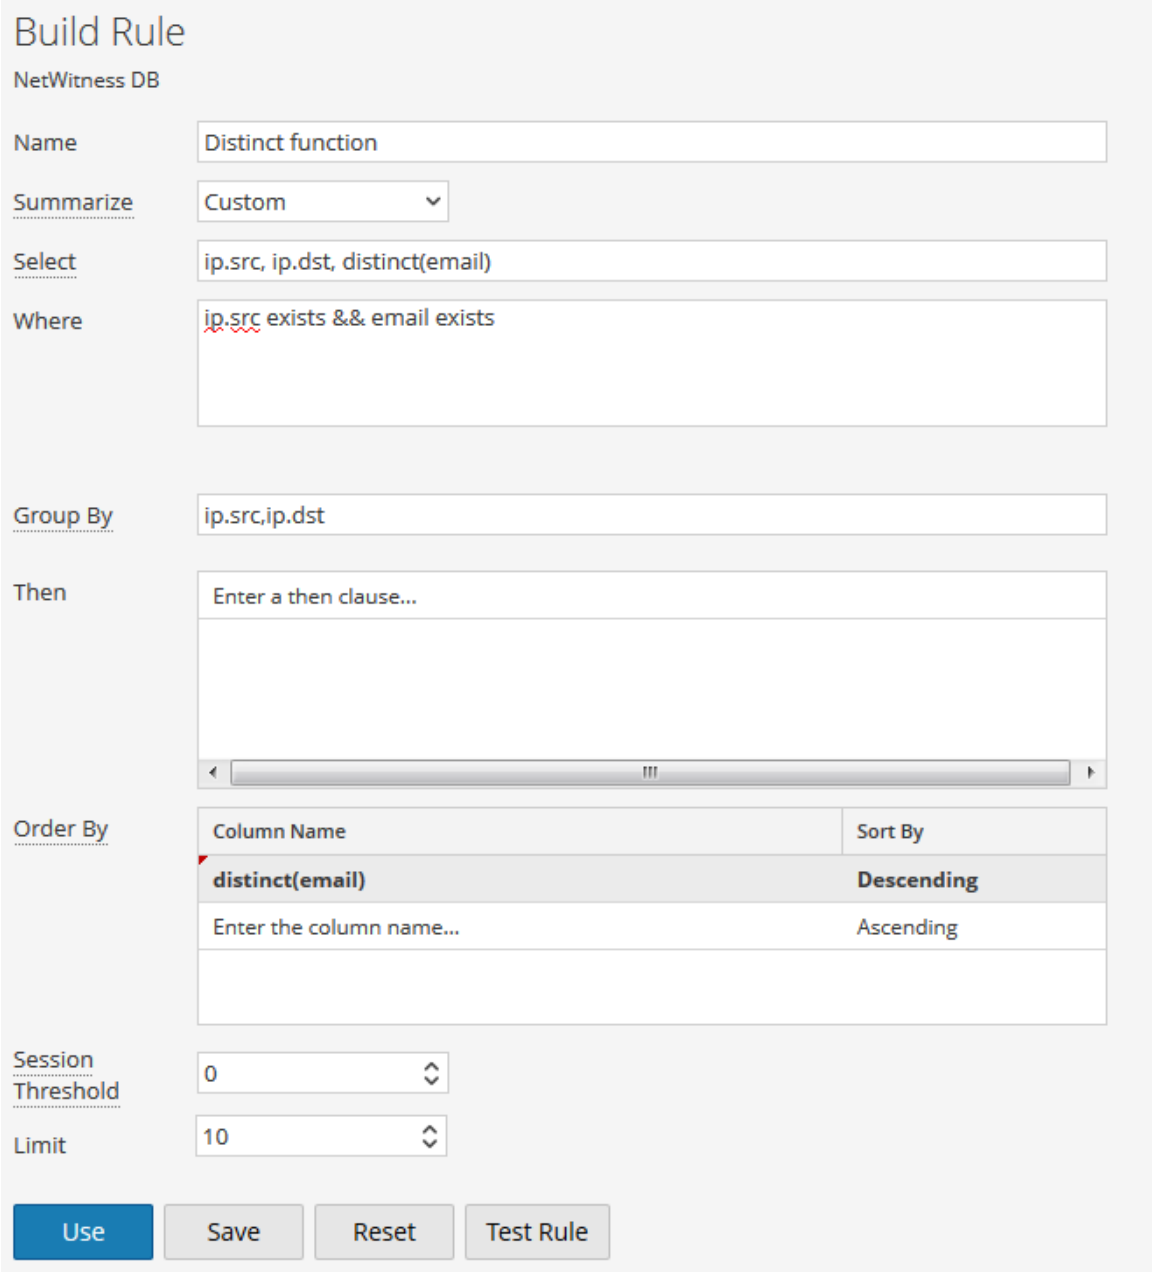
Here, the page displays the data size along with the total number or count of distinct filenames from the respective IP source. Unlike the count function, the countdistinct excludes the duplicate values from the result.

Distinct

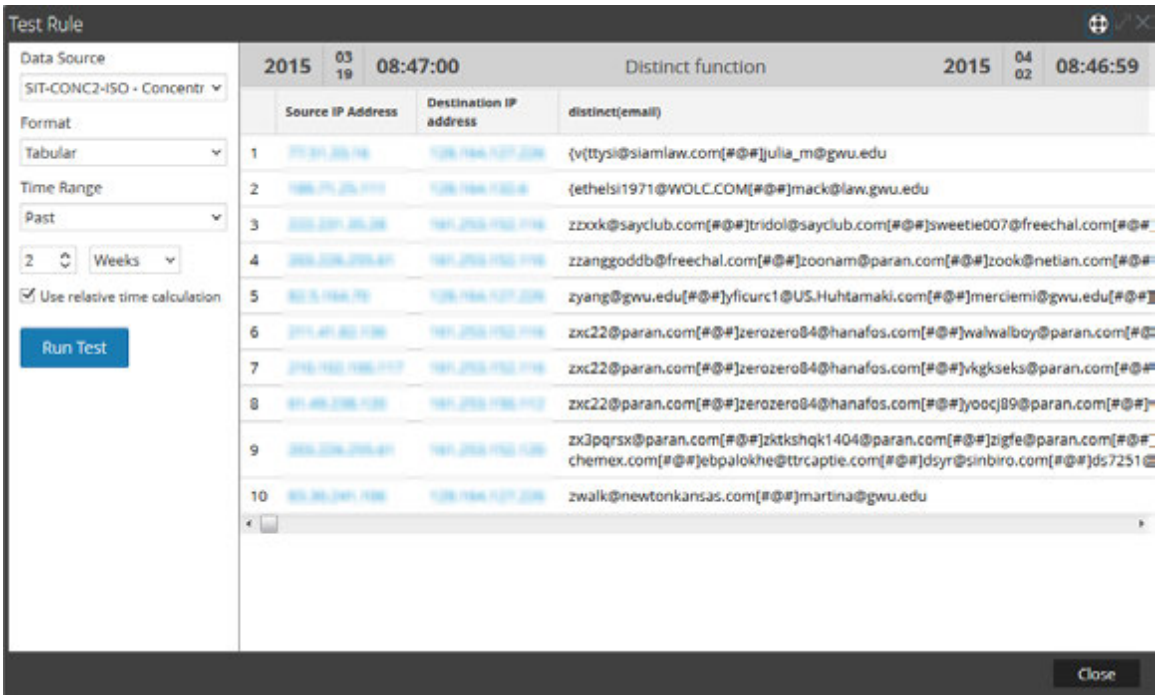
This function returns all the unique or distinct values of the metakey.

Example

The following figure shows a sample query for distinct function used to retrieve e-mails, between various source and destination IP (ip.dst).



The following figure shows the result for the above query.



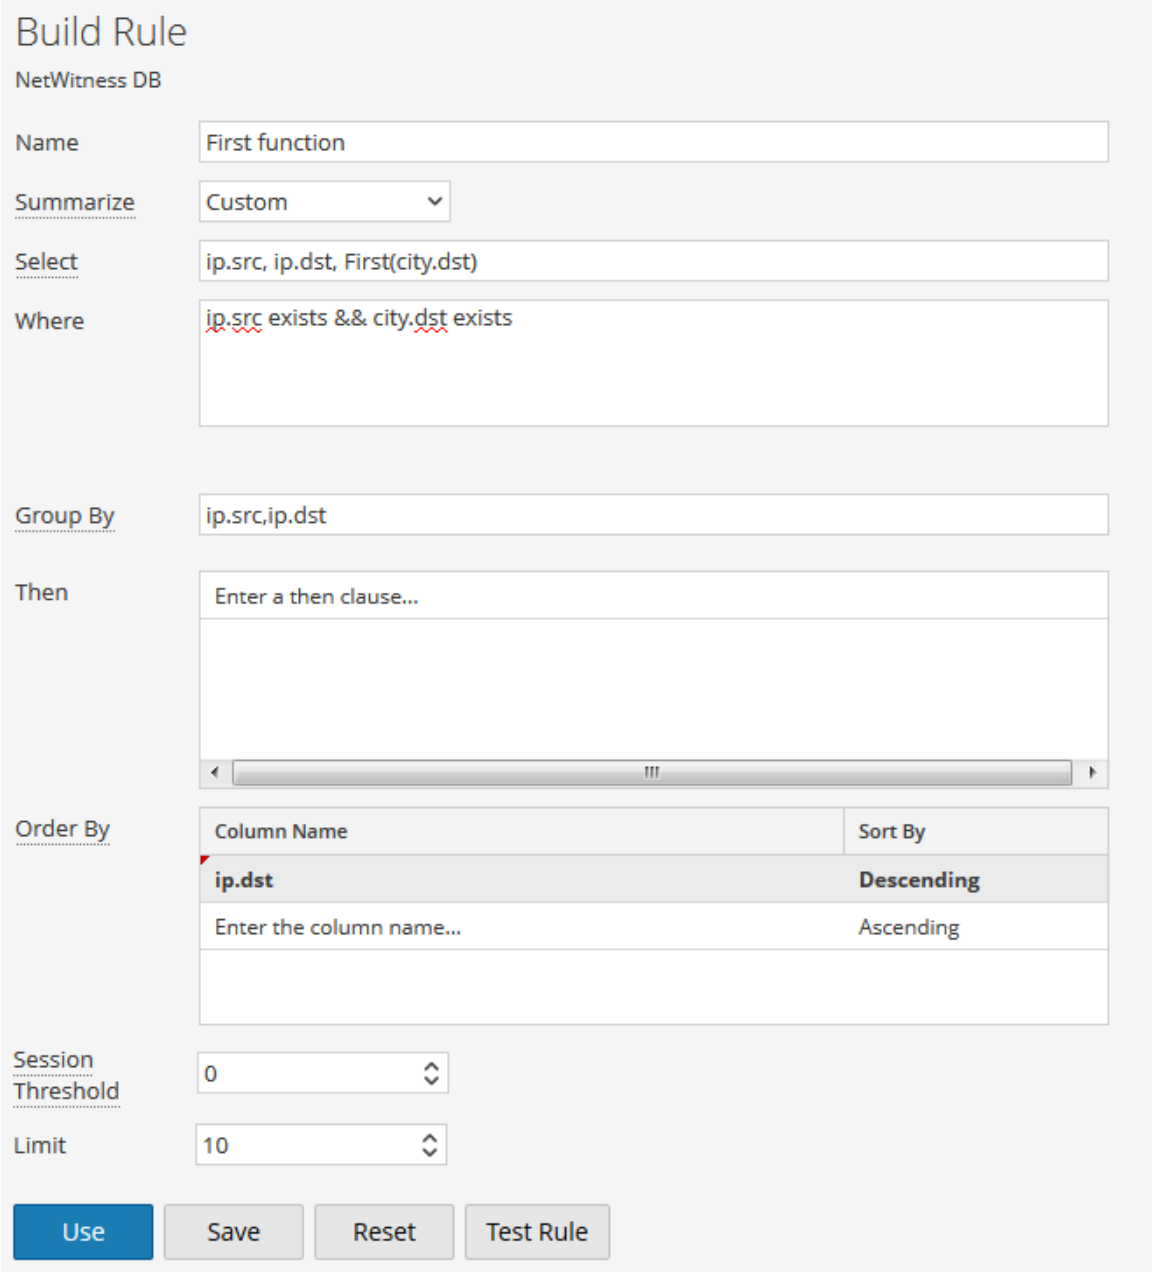
Here, the page displays the list of unique e-mails that were exchanged between the respective IP source and destination.

First

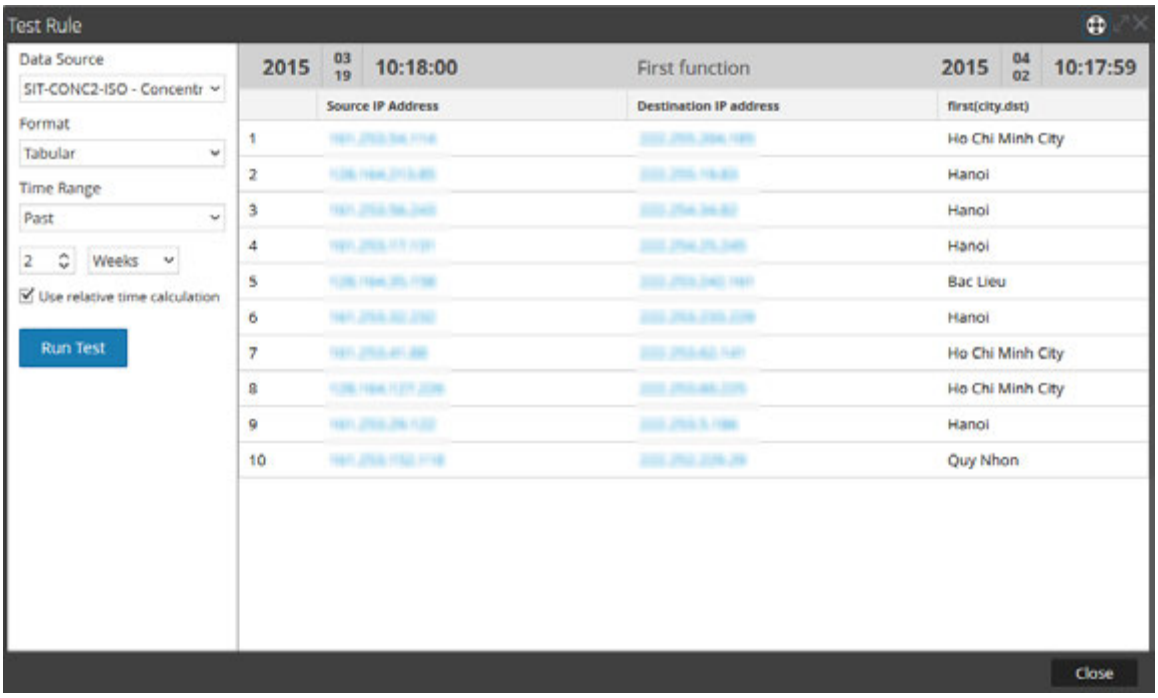
This function is used to retrieve the first value from an ordered sequence of values for a specified metakey.

Example

The following figure shows a sample query for first function used to retrieve the first destination city name.



The following figure shows the result for the above query.



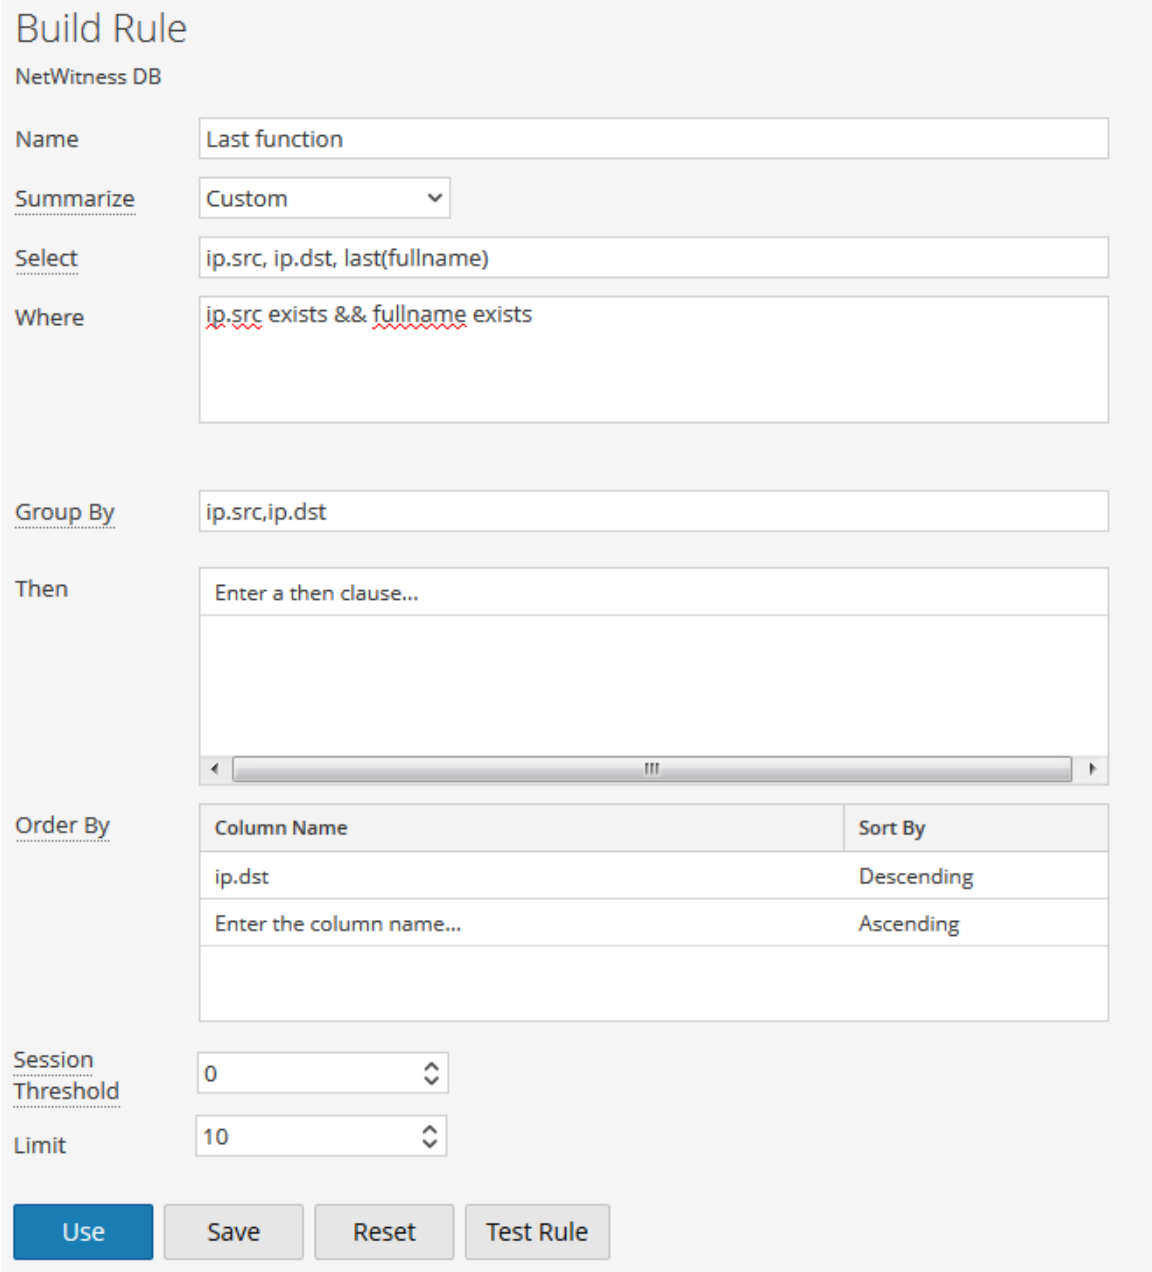
Here, the page displays the the first destination city for the corresponding source and destination IP. You can use the first function to isolate a particular value from a search result.

Last

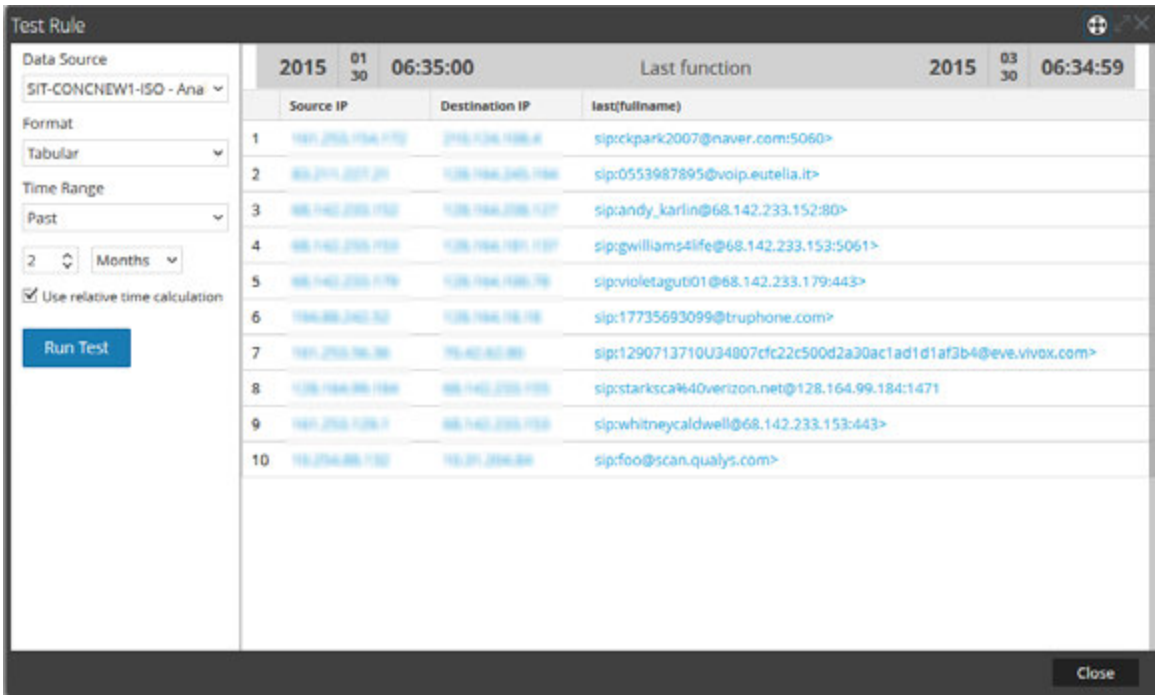
This function is used to retrieve the last value from an ordered sequence of values for a specified metakey.

Example

The following figure shows a sample query for last function used to retrieve the most recent user name.



The following figure shows the result for the above query.



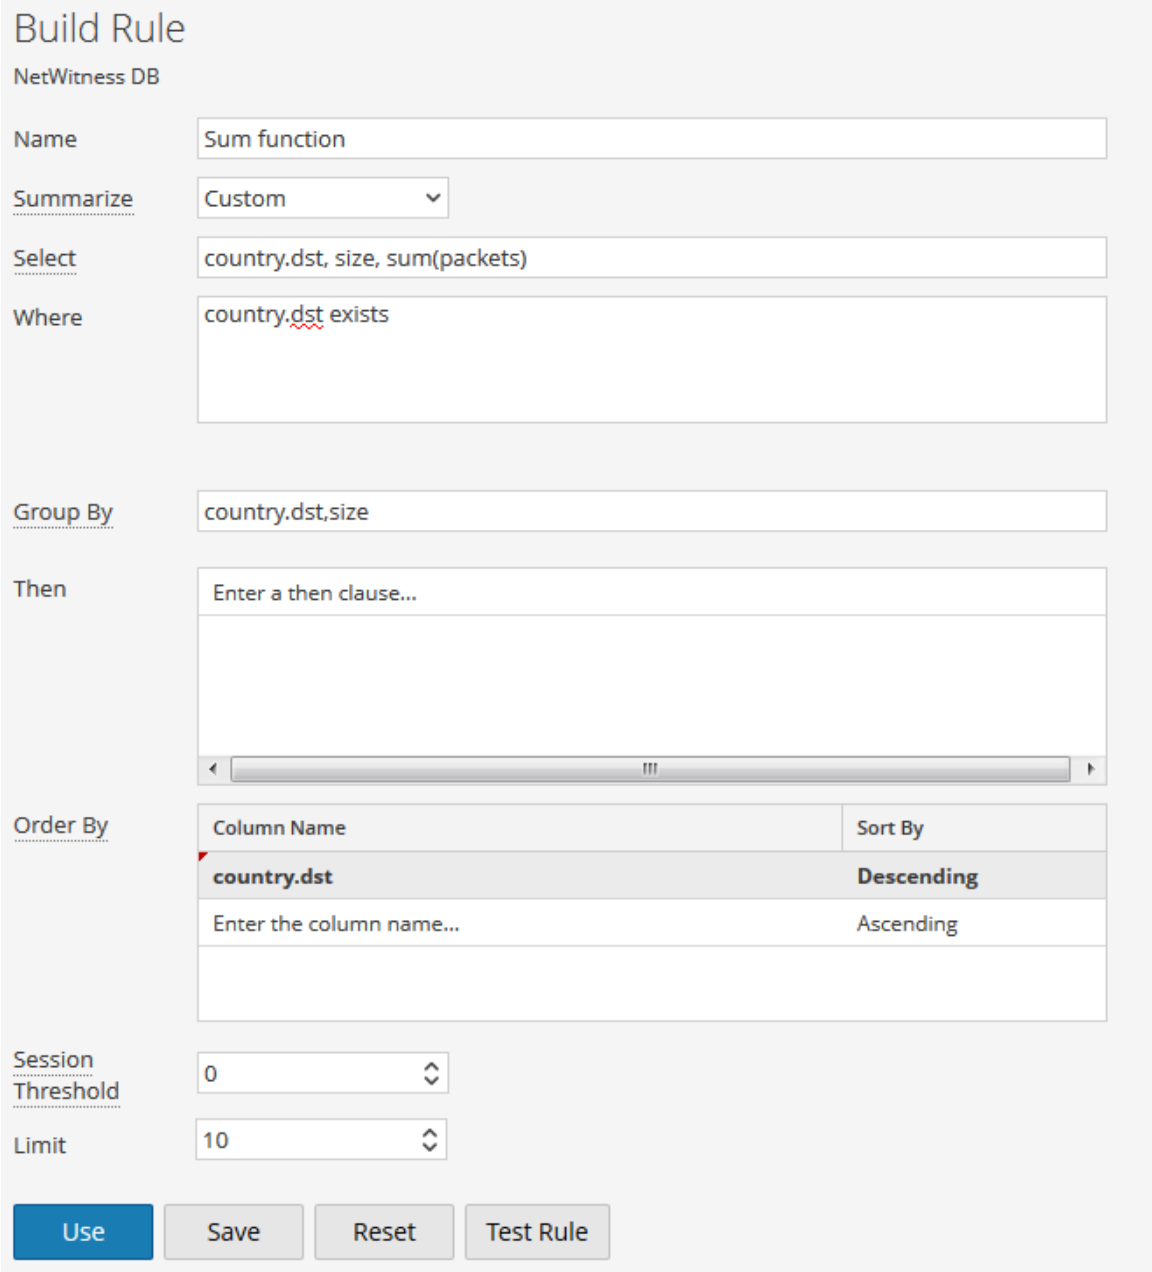
Here, the page displays the list of most recent or last usernames in full, that were exchanged between the source and destination IP.

Sum

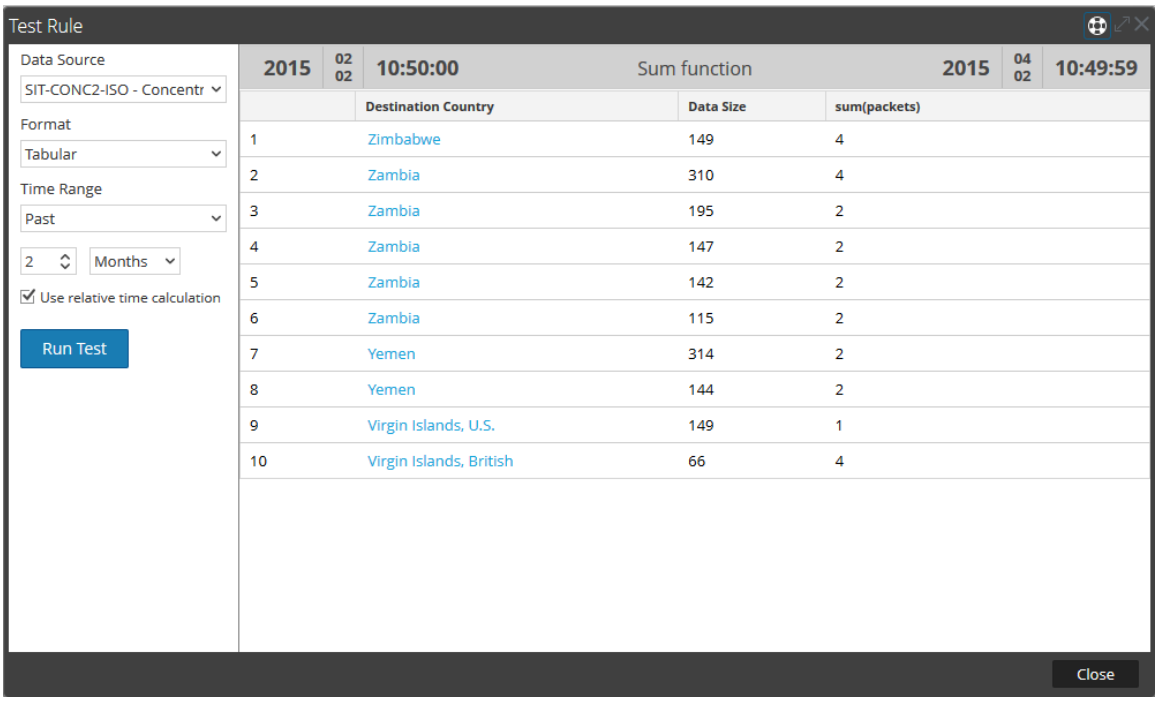
This function returns the total of the non-NULL values of the metaKey within a group.

Example

The following figure shows the query for the Sum function used for packets.



The following figure shows the result of the above query.



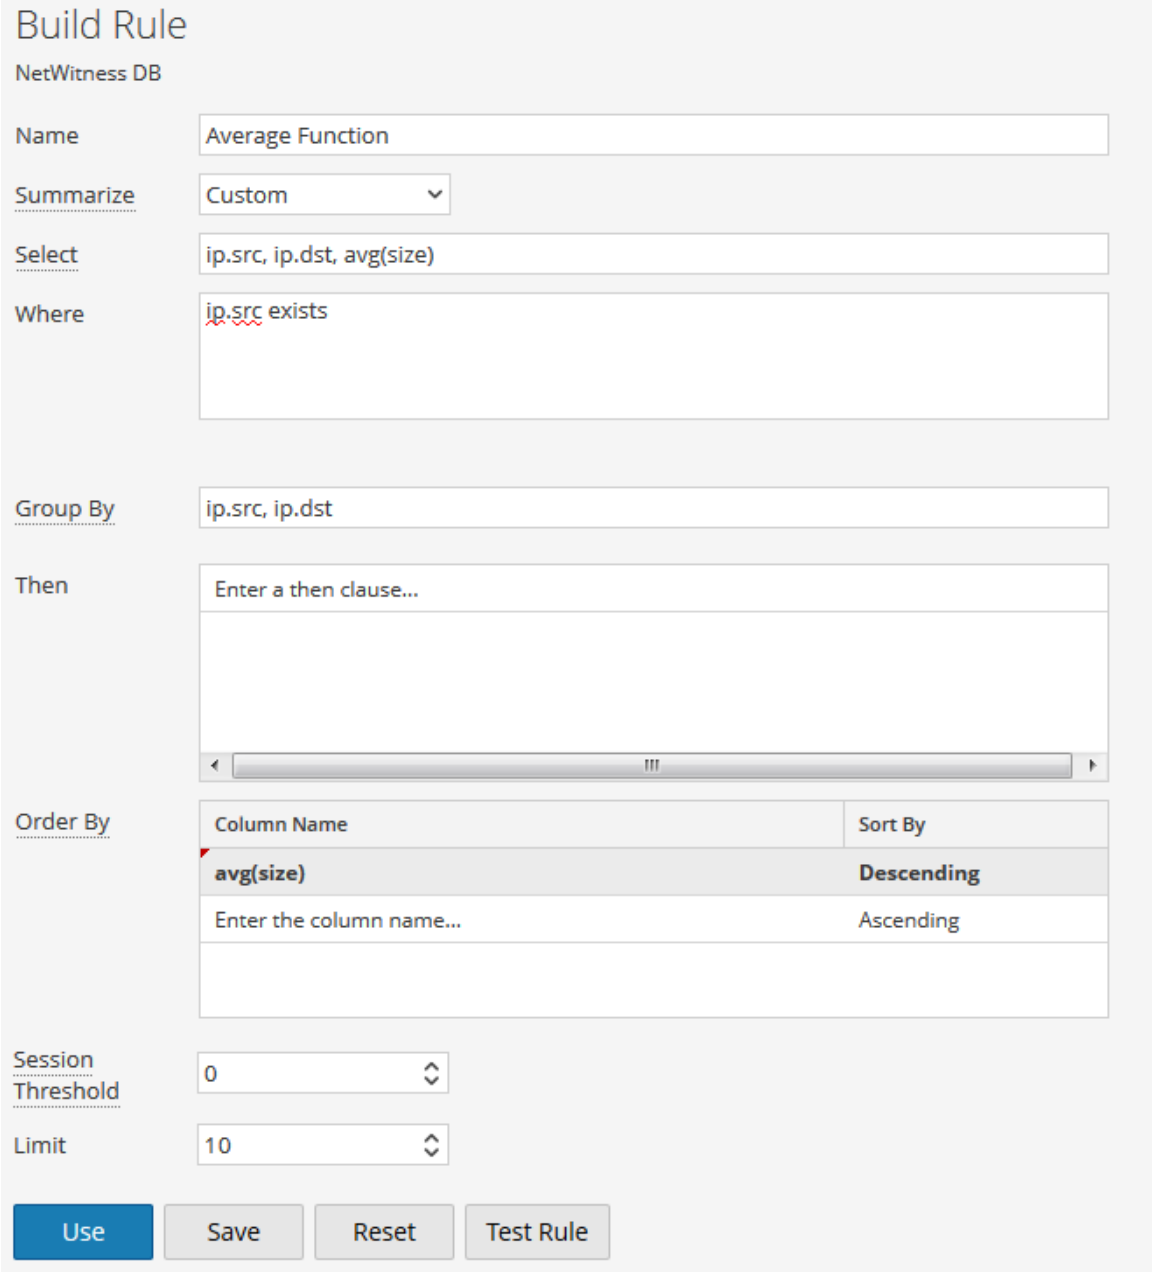
Here the page displays the total or sum of the packets along with the size of the data for the respective destination country.

Avg

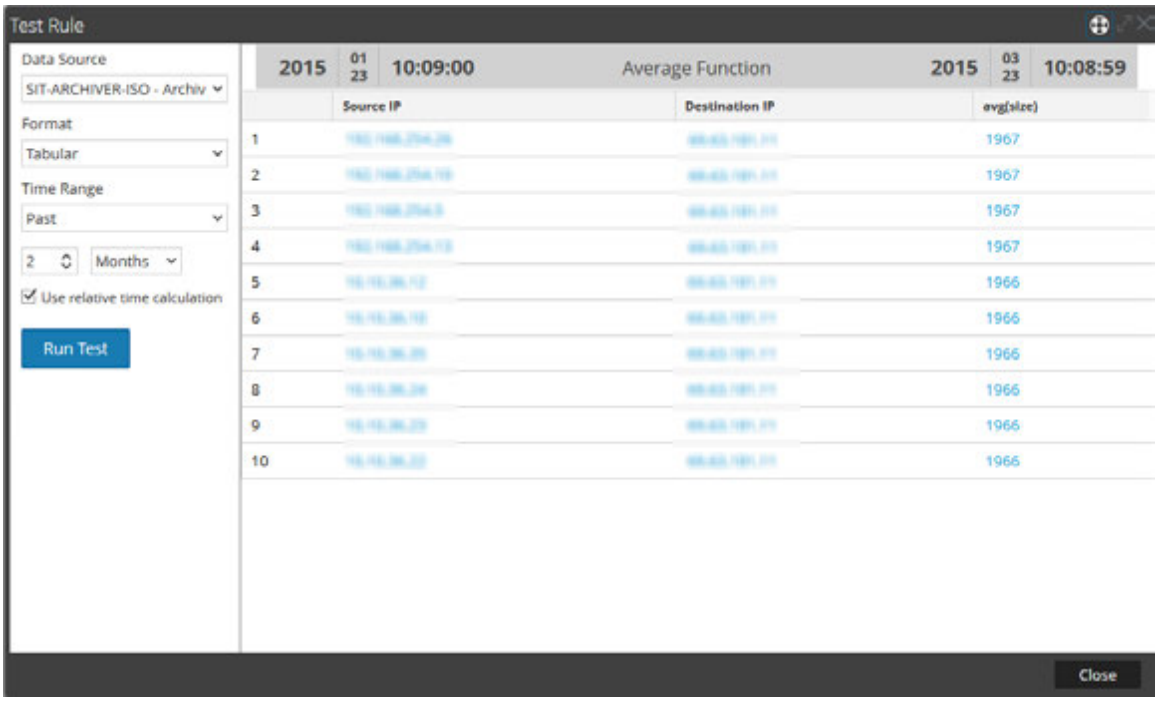
The average function returns the average of non-NULL values of the meta within a group.

Example

The following figure shows a sample query for average data size transmitted between a source and destination IP.



The following figure shows the result for the above query.



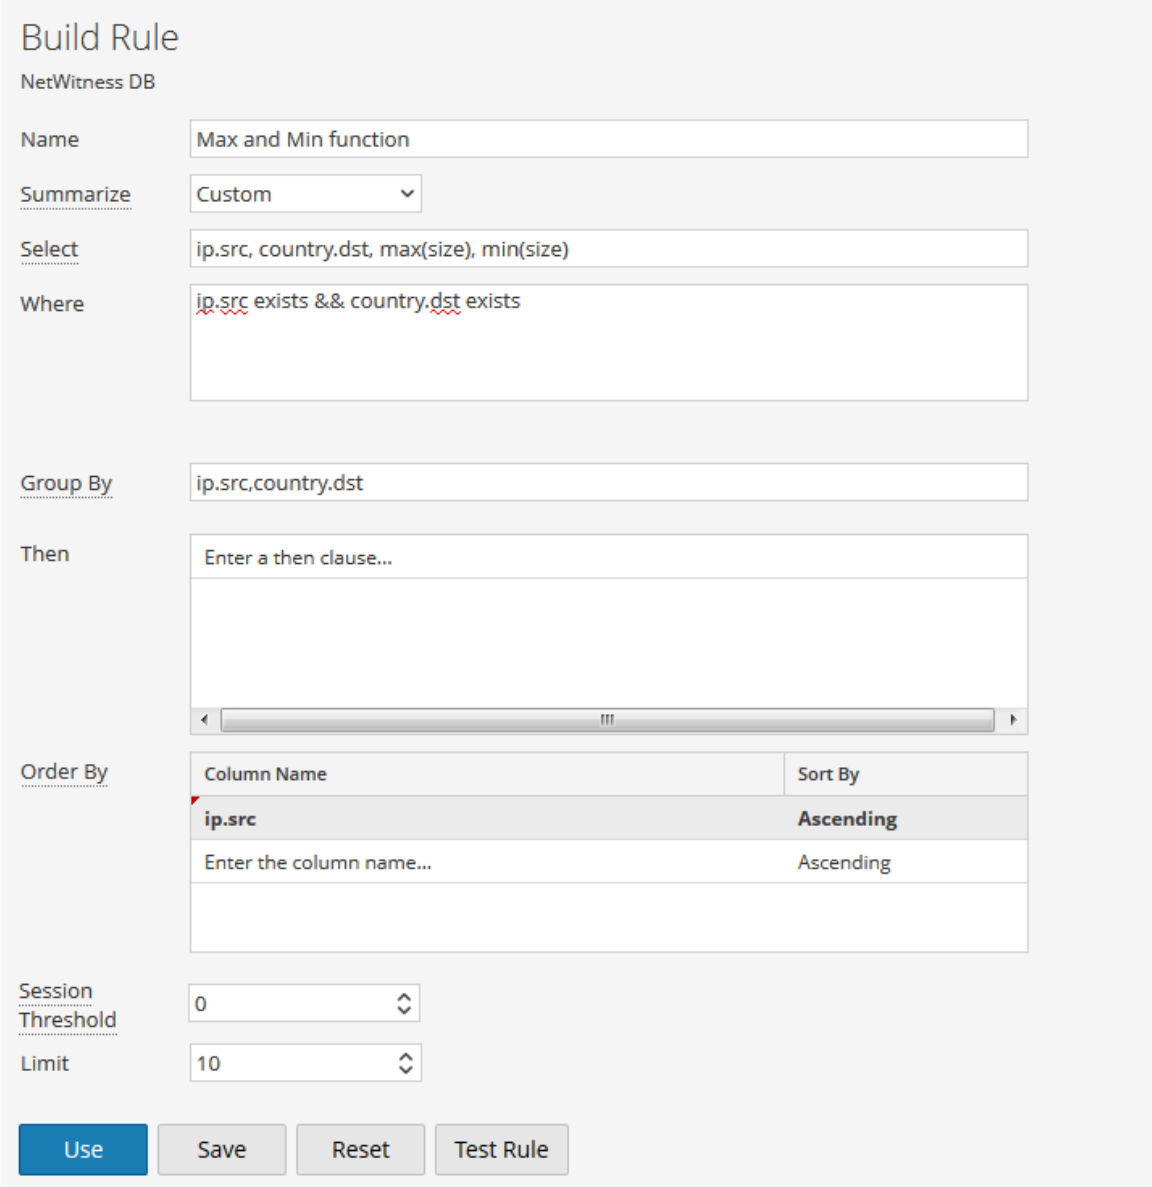
Here, the page displays the average size of data exchanged between source and destination IP:

Max and Min

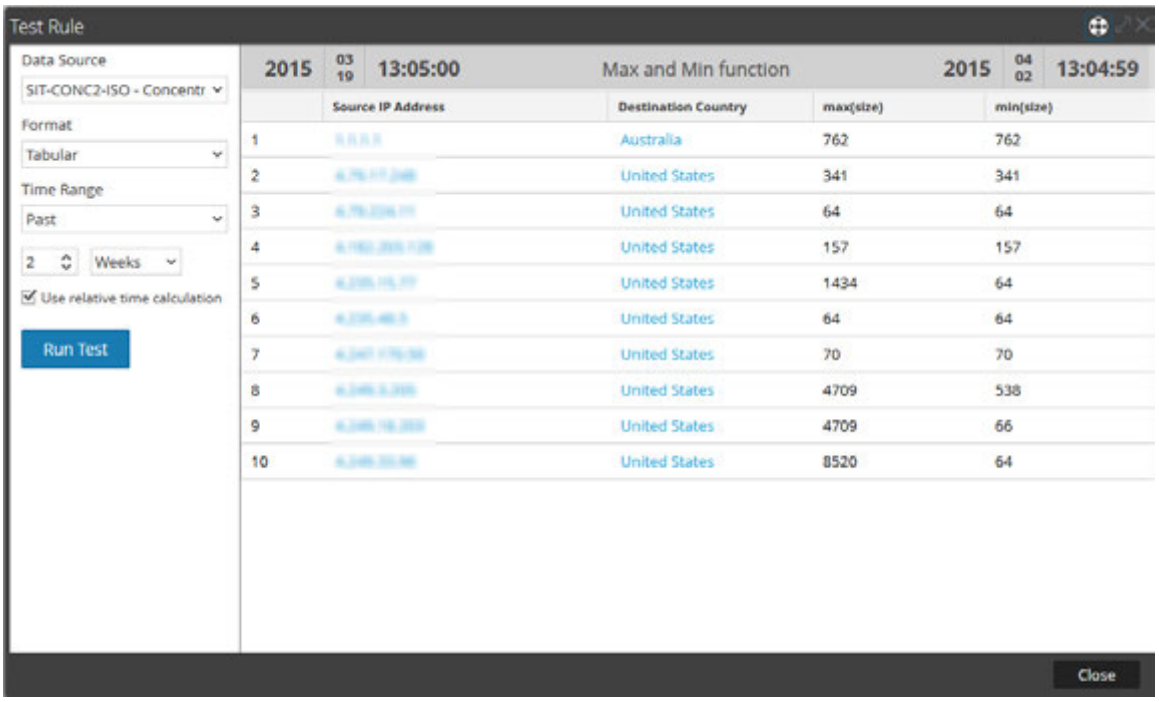
Max and Min functions provide the maximum and minimum for given values of a meta respectively.

The following figure shows a sample query for max and min functions for various data sizes, for source IP and destination country.

Example



The following figure shows the result for the above query.



Here, the page displays the max(size) and min(size) columns, along with the list of source IP and destination country. The max(size) column lists the maximum data sizes exchanged while the min(size) column lists the minimum data sizes that were exchanged.

Filter aggregate meta results with Max_threshold

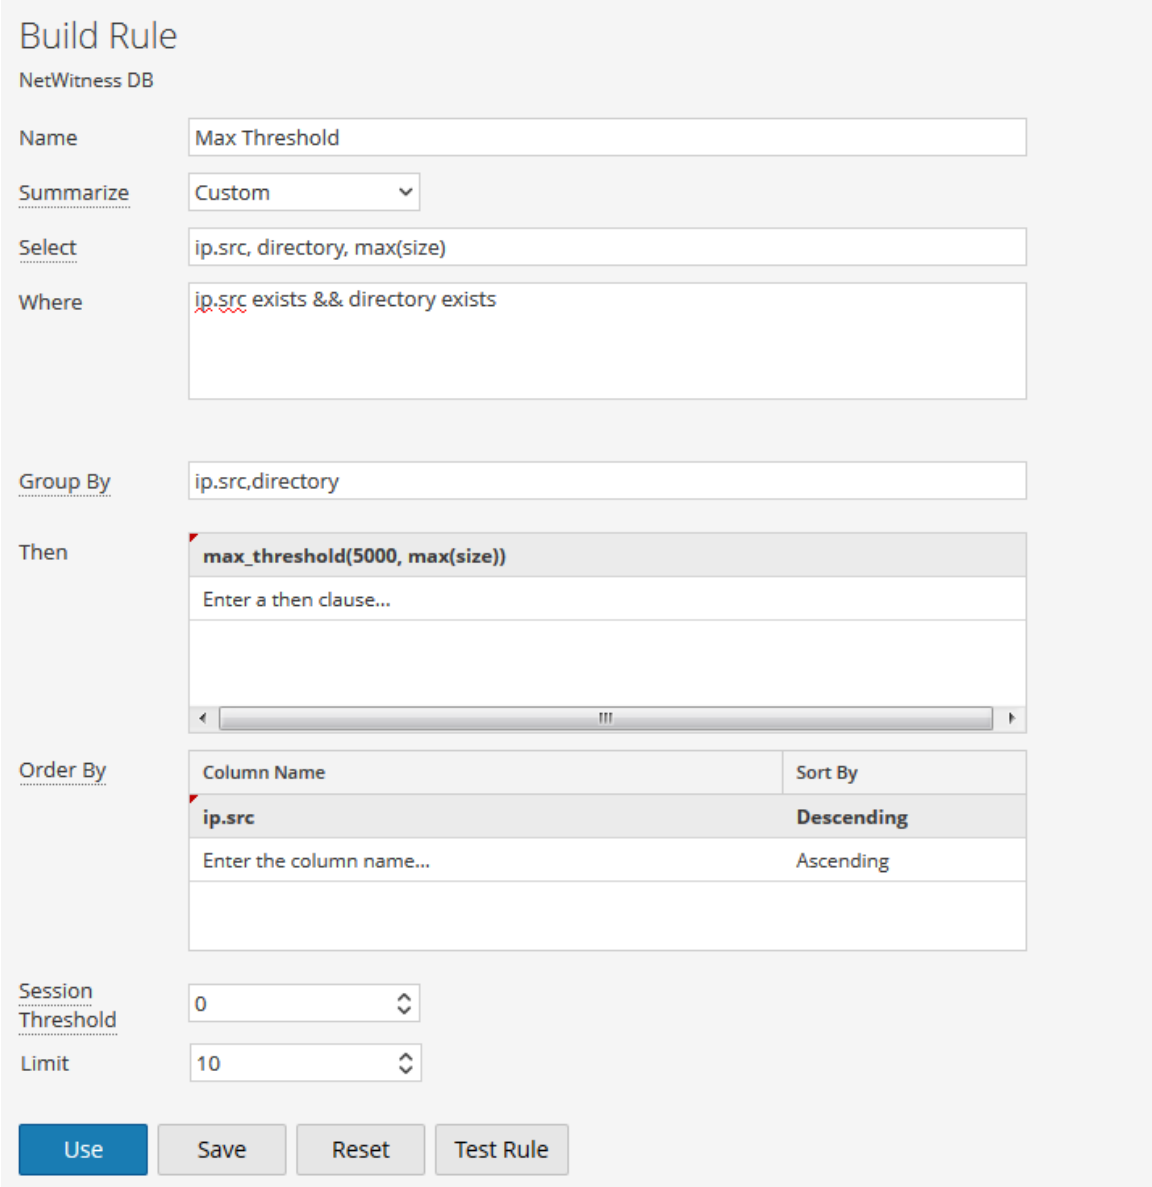
You can further filter the results of any function by using the threshold rule action.

Example

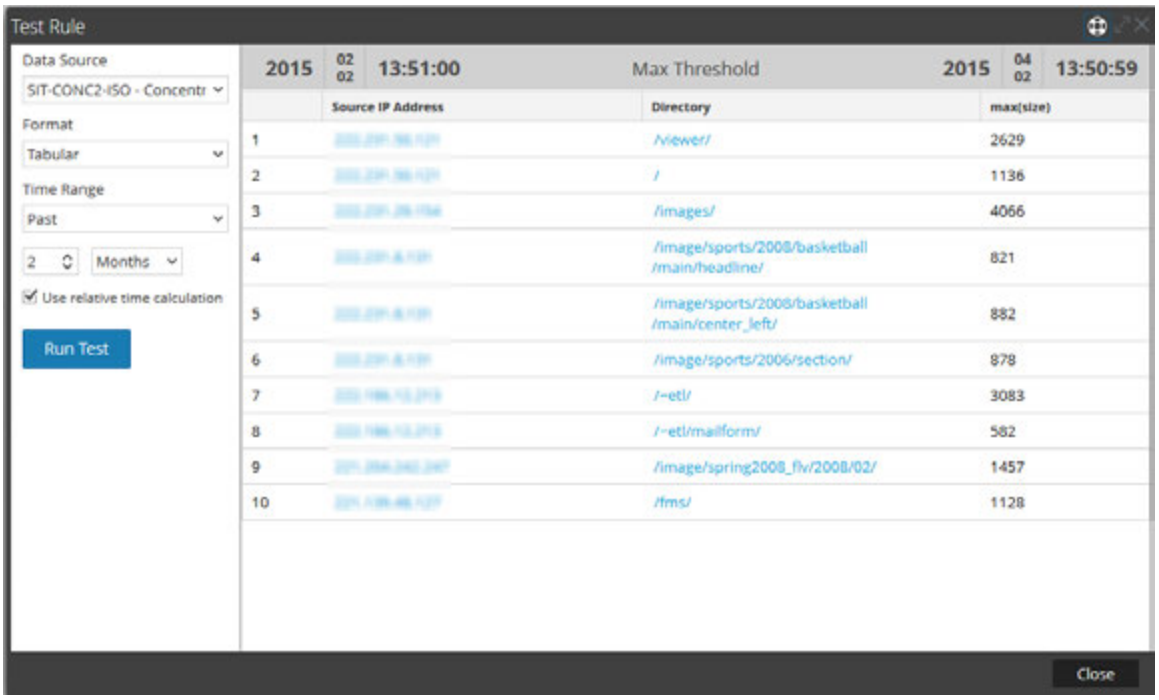
Following is a sample query for max_threshold used along with the Max function in the **Then** field is:

max_threshold(5000,max(size))

The following figure shows the Build Rule screen for the above query.



Here the max_threshold is applied for data size with an upper limit of 5000. The following figure shows the result.



Here, the result page displays the max(size) column, that lists the data sizes lesser than 5000 as this is the maximum threshold in the query, along with the corresponding IP source and the respective directory.

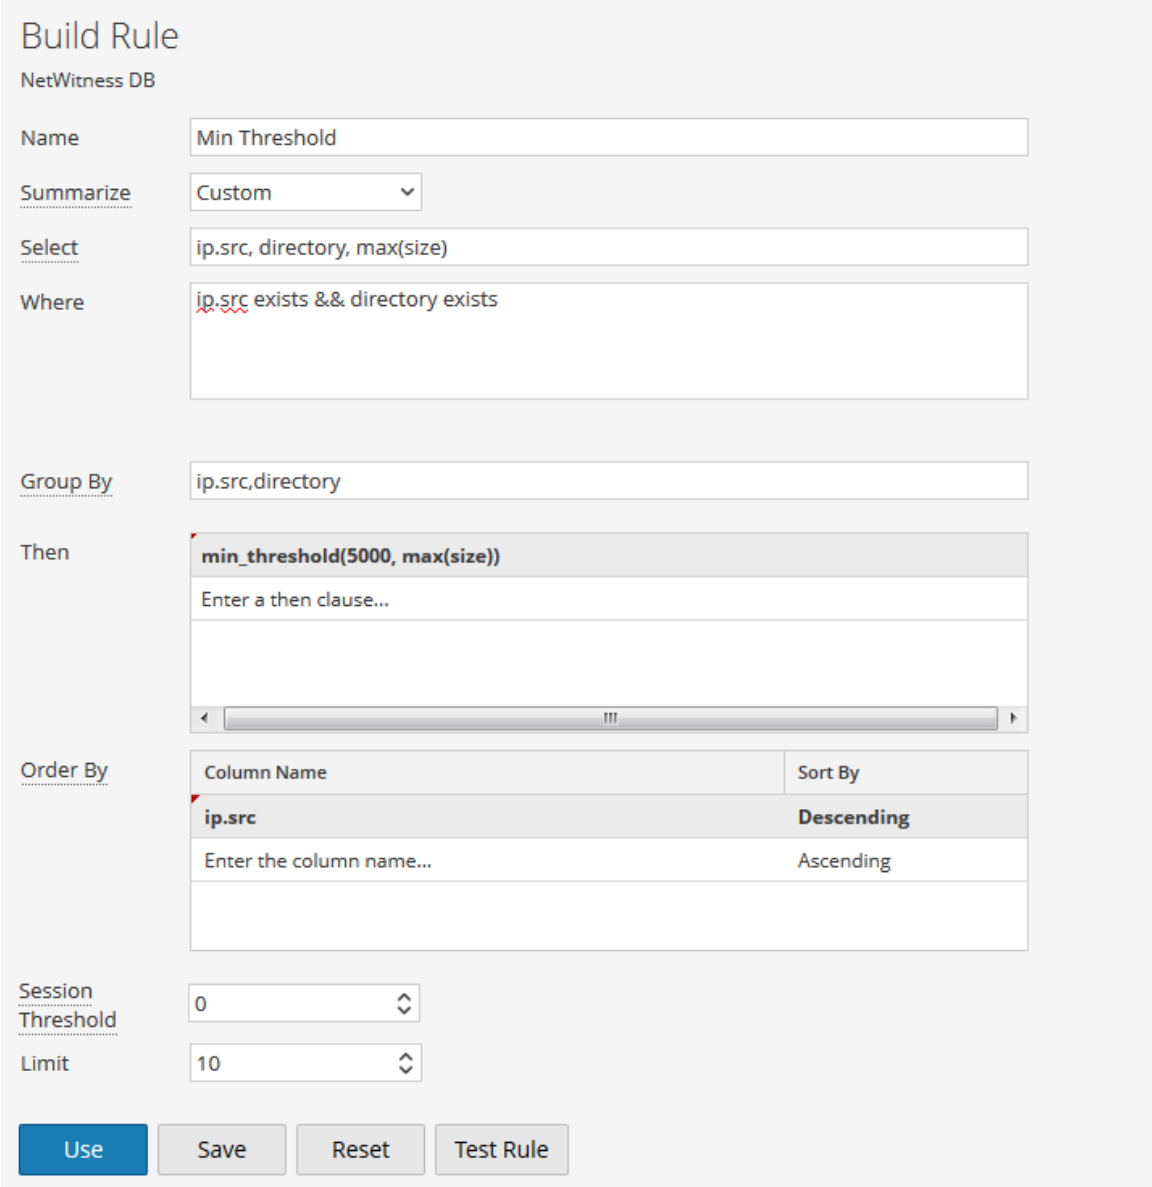
Filter aggregate meta results withMin_threshold

Similarly, min_threshold is used to filter the results for any function. A similar scenario as max_ threshold is considered to explain this.

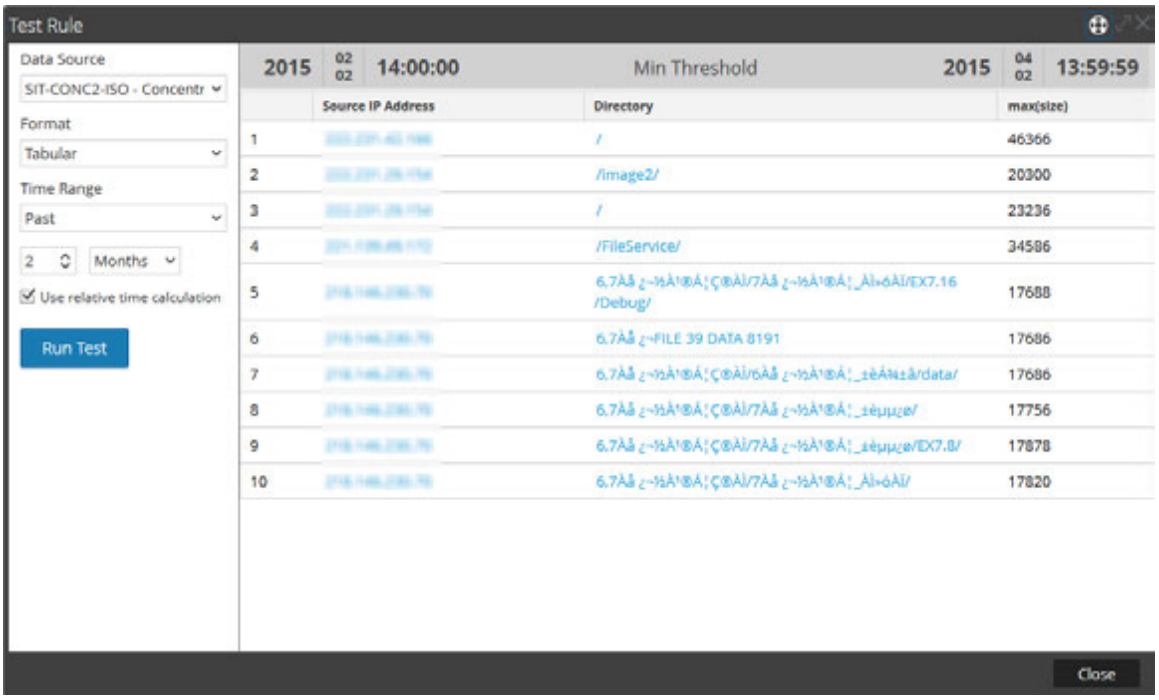
Example

Query for min_threshold used along with the Max function in the **Then** field is:
min_threshold(5000,max(size))

The following figure shows the Build Rule screen for the above query.



Here the min_threshold is applied for data size with a lower limit of 5000. The following figure shows the result.



Here, the result page displays the max(size) column, that lists the data sizes greater than 5000 as this is the minimum threshold in the query, along with the corresponding IP source and the respective directory.

Note: Max_threshold and Min_threshold rule actions are common across all the functions, and can be used along with the other queries in the **Then** field to retrieve the respective output.

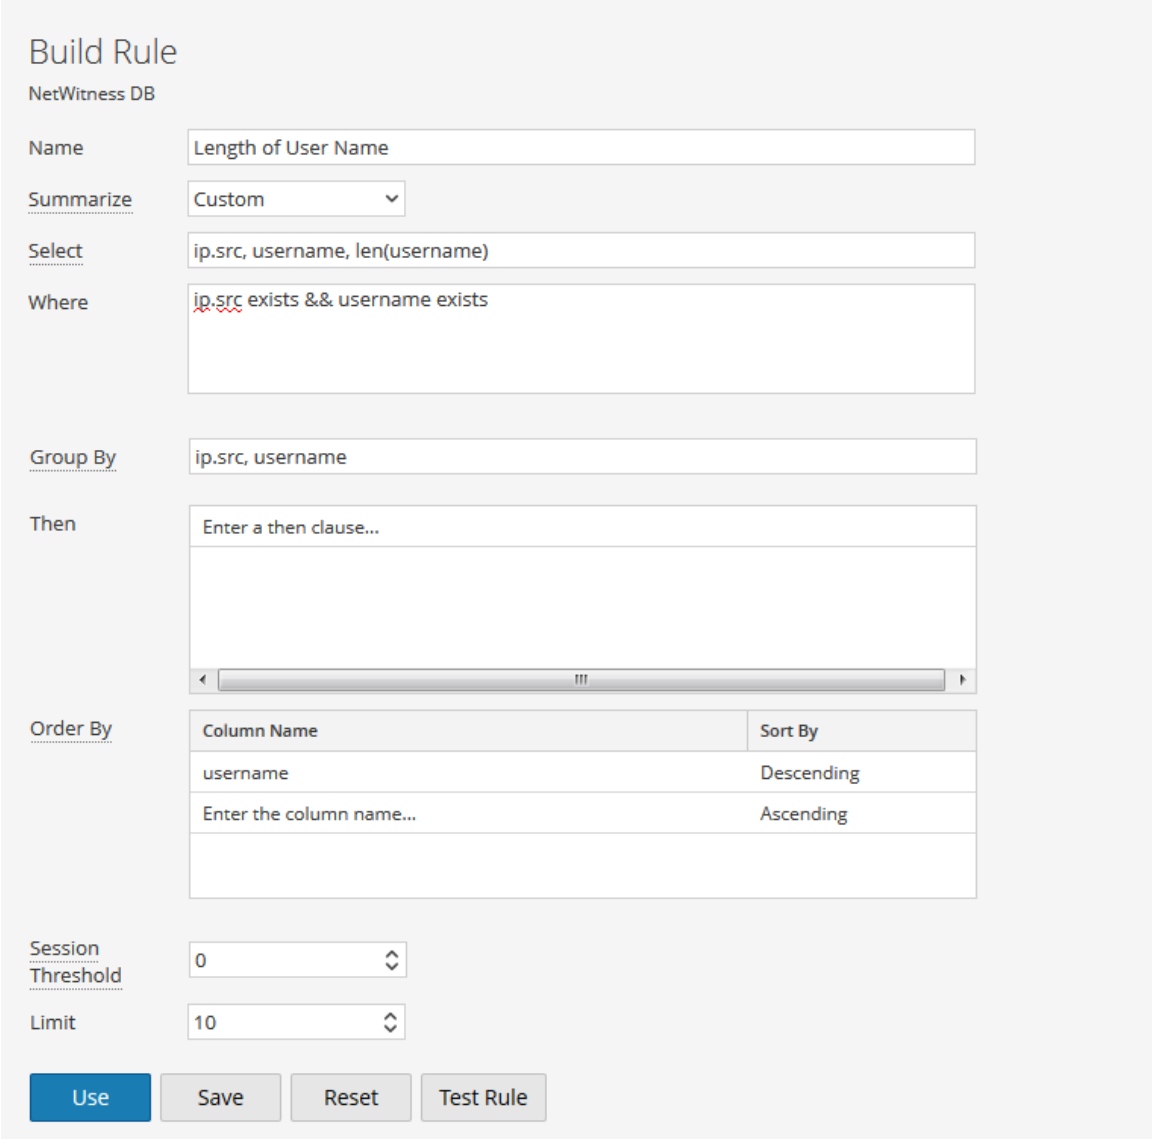
Length

This function returns the length of a meta value. In other words, Length function returns the number of bytes used to store the actual value.

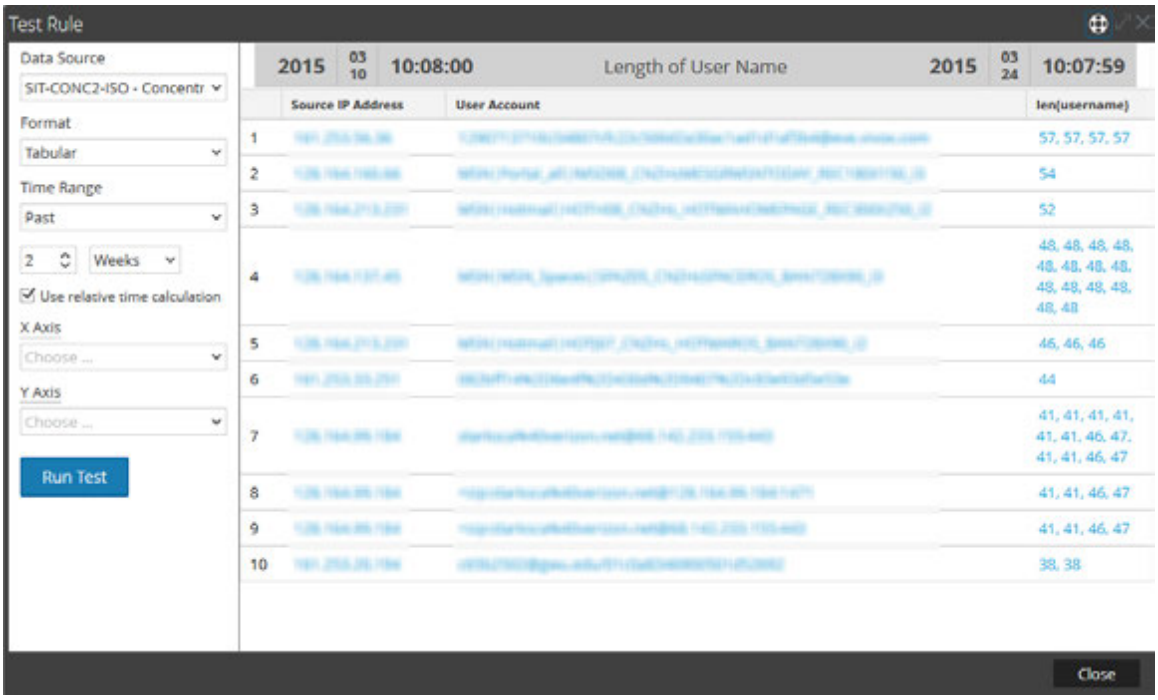
For instance, for the value "Analytics" it returns the length as 9. Similarly, for an IPv4 ip.src, it returns 4 (representing 4 bytes).

Example

The following figure shows a sample query for the length function used for usernames.



The following figure shows the result for the above query.



Here, the page displays the length of the usernames associated with the user account and their respective source IP.

Additional Information

When you query for aggregates (E.g. sum(size)) with **Group By** on a meta which has multiple values in a session, then the session with multiple values is accounted for aggregate calculation for each value of that meta.

Example

When you query for the Count aggregate function with Group By on Alias.host and if the column has multiple values in a session, then the session is counted for each occurrence, including the duplicate values.

Consider the following table.

SessionID	Alias.host	Ip.src	Size
1	host-a, host-b, host-a	a	10
2	host-b, host-c, host-a, host-c	c	20
3	host-b, host-c, host-d	b	30
4	host-c, host-a	a	40

In the above table, alias.host for **host-a** and **host-c** has duplicate values listed for a single session. Let us consider the following query:

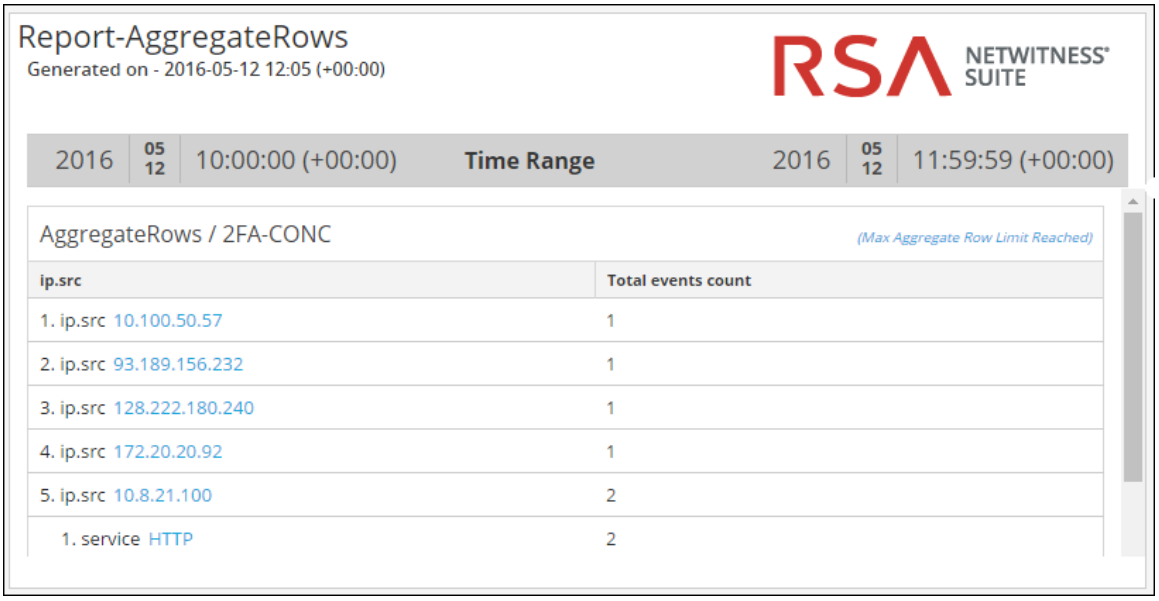
Select : alias.host, count(ip.src), sum(size)
Group By : alias.host

Here, **host-a** and **host-c** are present in 3 sessions and they are duplicated for two different sessions. However, the output is as shown below.

Alias.host	count(Ip.src)	Sum (size)
host-a	4	80
host-b	3	60
host-c	4	110
host-d	1	30

Output table shows that the count for **host-a** and **host-c** is 4. This is because for each alias.host value, the entire session is considered. Similarly to calculate sum (size), the same sessions are considered for each alias.host value.

In the report output if the number of rows has reached **NWDB maximum aggregate rows** defined in RE configuration, then a message **Max Aggregate Row Limit Reached** is displayed to indicate that there is more information to be displayed. The default limit is 1000, and you can change this value as per your requirement, in the Reporting Engine Configuration page .



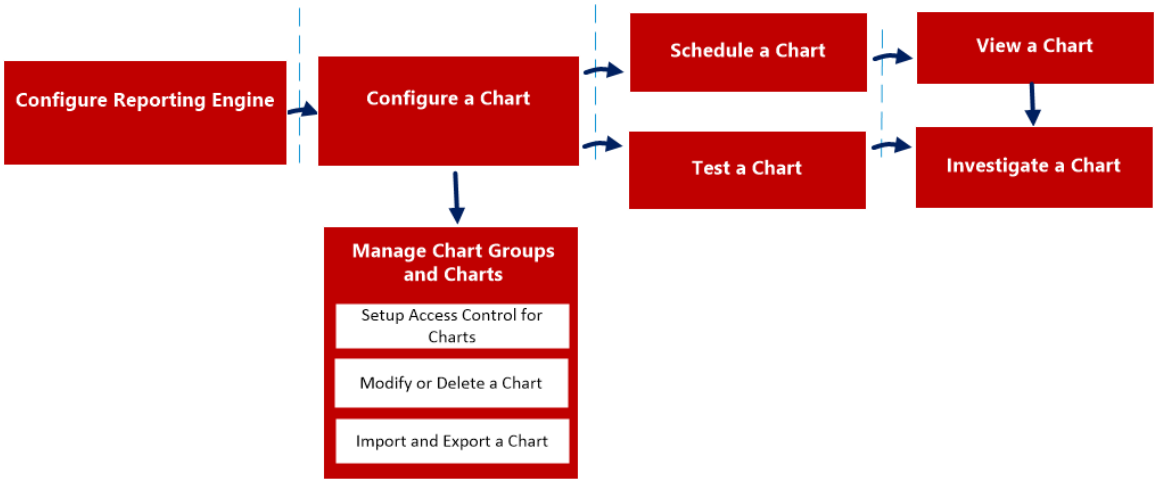
Configure and Generate a Chart

Chart is a graphical visualization of data. You can view different kinds of charts, including multiple types of plot, line, bar, and area charts.

Any NWDB rule in the Reporting Engine system which is not sorted by none can be used to instantly create a chart. For more information on 'How to create an NWDB rule', see Configure a Rule.

The chart interval can be adjusted from the chart definition panel itself. Every time a chart is executed, it stores its result data locally in the Reporting Engine, so that it can be reviewed in either the Dashboard View or Chart View without any performance considerations.

The following is an overview of the entire process of configuring and generating a chart.



To configure and generate a chart, perform the following:

1. Configure Reporting Engine
2. Configure an NWDB rule
3. Configure a Chart
4. Schedule a Chart
5. View a Chart
6. Test a Chart
7. Investigate a Chart
8. Manage a Chart Group and Chart

Configure Reporting Engine

You must configure the Reporting Engine before you can configure and generate a chart. You must also specify the data source in the Reporting Engine from which the data is extracted. For more information on how to configure a Reporting Engine, see **Configure Reporting Engine** topic in *Reporting Engine Configuration Guide*.

Configure an NWDB Rule

The NetWitness rule which is not sorted by none is used to create a chart. The NetWitness database extracts the meta from the Reporting Engine and provides the meta for rules. These rules are an essential building block in managing a chart.

Note: If the rule contains the lookup_and_add, sum_count, or sum_values rule actions, the associated chart will not contain data.

Configure a Chart

You can configure a chart using the NWDB rules.

Schedule a Chart

After a chart is defined with the required components, you can configure its execution properties by scheduling a chart. Here, you can quickly view, add, and edit the schedule details for a chart.

View a Chart

You can view the scheduled charts in the Chart View.

Test a Chart

You can run the test on a chart and view all the chart details based on the selected time range.

Access Control for a Chart

The Reporting Module provides access control at the chart level. Only a user who has the right set of permissions can perform the tasks in Reporting module. The access control is managed by the administrator from the **Administration > Security > Roles** tab.

When you create users and user roles, ensure that the roles that you create for specific tasks have access to all the necessary permissions. This could require permissions at several levels of the role hierarchy.

Charts can be tied to a specific set of user roles so that when a user logs into NetWitness, the charts with the access rights for the specific user role can be viewed. Users that belong to a user role with the 'Read & Write' access permission can define charts. Further, the access can be tightened so that charts are accessed only by those who have the 'Read Only' access.

At the chart level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write
- Read Only
- No Access

To change the access permission for a specific user role, you must set the permission at the chart level. For example, for **Administrators** to have access to a specific chart, you could set the permission 'Read & Write' in the Charts Permissions dialog.

You can apply read-only permission to rules in the charts by selecting the checkbox.

Two scenarios that describe how to set access control are explained here:

- Scenario 1: Permissions applied to Chart Group/ Subgroup/ Chart/ Rules based on the user role.
- Scenario 2: Read-only permission applied to Rules in the Chart.

	Role (Analyst)	Permissions applied to chart group, subgroup, chart or rules based on the user role	Permissions (Read-only) applied to rules in the chart
Group	Read & Write	Read & Write	Read & Write
Subgroup	Read	Read	Read & Write
Chart	Read	Read	Read & Write
Rules	Read	Read	Read

The chart is assigned the role of a **Security Analyst** and permissions are set to 'Read & Write' charts.

For scenario 1, each of the levels has a permission set based on the user role. For scenario 2, the Read permission is set for the rules except that the permission for the rules cannot be higher than the permission for the charts.

Note: If the permission for the rules is higher than the permission for the chart, the permission is not applied. For example, if you set the permissions for the Report Group as **No Access** and specify the option *Apply Read-only permission to Rules in the Reports*, the read-only permission is not set for the rules.

Access Control for a Chart When Multiple Charts are Selected

To change permissions for multiple charts, you must select several charts and set their access permissions using the Charts Permissions panel. The access permission that you choose is applied to all the selected charts.

Access Control for a Chart When Multiple Charts with Several Rules are Selected

To change access permissions for a specific user role when multiple charts with several rules are selected, select the checkbox in the Charts Permissions panel.

The read-only access permission is applied to all the rules of the selected charts, provided that the permission of the rules are lower than the permission of the charts.

Note: If a user (other than the super user) creates a chart, the super user cannot access that chart.

Access Control for a Chart Group

To change chart group permissions, select a chart group and set the access permissions using the Charts Permissions panel. Before chart group permissions are applied, the default permission set for all the user roles is 'No Access'.

To change the access permission for a specific user role, set the permission at the chart group level. For example, for administrators to have access to all the charts in a Chart Group, set the permission 'Read & Write' in the Charts Group Permissions panel.

You can also apply permissions to subgroups and charts in the group, and apply read-only permission to rules in the charts by selecting the appropriate checkboxes.

Three scenarios that describe how to set access control are explained here:

- Scenario 1: Permissions applied to chart groups, subgroups, or charts based on user roles.
- Scenario 2: Permissions applied to subgroups and charts in the group.
- Scenario 3: Read-only permission applied to rules in the chart.

	Role (Analyst)	Permissions applied to chart groups, subgroups, or charts based on user roles	Permissions applied to subgroups and charts in the group	Permissions (Read-only) applied to rules in the chart
Group	Read & Write	Read & Write	Read & Write	Read & Write
Subgroup	Read	Read	Read & Write - Inherited	Read & Write
Chart	Read	Read	Read & Write - Inherited	Read & Write
Rules	Read	Read	Read	**Read**

The chart group is assigned the role of a **Security Analyst** and permissions are set to 'Read & Write'.

For scenario 1, each of the levels will have a permission set depending on the user role.

For scenario 2, the permission at the chart group level will be inherited by the subgroup and by charts in the group.

For scenario 3, the Read permission is set for the rules. However, the permission set for the rules cannot be higher than the permissions set for the chart group.

The following table lists the columns in the Charts Permissions panel:

Column	Description
Roles	The role of the user logged into the NetWitness UI.
Read & Write	The user can access, view, edit, import, export, and delete the chart in the Charts view. The user can also change the permission for the chart.
Read Only	The user can only access and view charts on the Charts view.

Column	Description
No Access	The user cannot access or view charts for which this permission is set.
☐ Apply these permissions to sub-groups and Charts in this group	Select the checkbox to apply the selected permissions to the chart group, subgroups in the group and charts in the group. **Note:** This checkbox is populated only when you set access permissions for a Chart Group.
☐ Apply Read-only permission to Rules in the Charts	Select the checkbox to automatically apply permissions to the rules in the charts.

Configure a Chart

After a chart is defined with the NetWitness rules with NWDB as the data source, you can configure its execution properties.

Create a Chart Group

To add groups to the default folder or to add subgroups under a chart group:

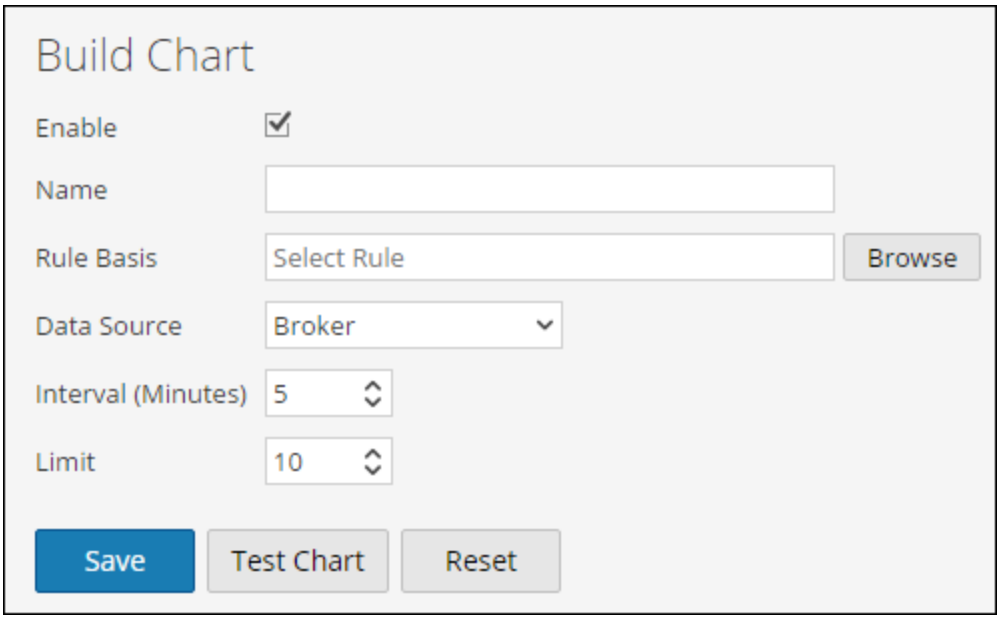
1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart Groups** panel, click +.
   A default group is added in the Chart Groups panel.
4. Enter the name of the new group.
5. Press **Enter**.
   The group is added to the Chart Groups panel.

Create a Chart

To add charts to a group or subgroup:

1. Go to **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts** to display the Chart view.

3. In the **Chart** toolbar, click +.
   The Build Chart tab is displayed.



4. Enter the name of the chart.
5. For the Reporting Engine to collect the data and generate chart results, select the **Enable** checkbox.
6. In the Rule Basis field, do the following:
   a. Click **Browse**. The Add Rule dialog box is displayed.
   b. Navigate the Rule tree and select a rule.
   c. Click **Select**.
7. The Rule appears in the Rule Basis field.
8. Select the data source from the **Data Source** drop-down list.

   Note: If the default data source is configured in the Reporting Engine, then the data source is displayed by default on the Build Chart page. If the data source is not displayed, ensure you have Read permissions set for the data source. This is applicable for NWDB and Warehouse data sources. For more information, see the **Configure Data Source Permissions** topic in the *Host and Services Configuration Guide*.

9. (Optional) To modify the Interval value, click the up or down arrow.
   The Interval value is the interval in minutes at which the rule which forms the basis of the chart is run to collect data.
10. Select the **Limit** value to limit the number of records to be displayed.

11. **X-Axis** and **Y-Axis** are used to specify the meta to be plotted in charts.
    In the **X-Axis**, the meta for the 'Group by' rule is displayed. In the **Y-Axis**, the aggregate functions used in the rule are displayed.

    Note: Sum, Count, Countdistinct and Average are the supported aggregate functions for chart. By default, for Custom Rules with multiple 'Group by', you can select only the first meta in **X-Axis**.

12. Click **Save**.
    A confirmation message that the chart is saved successfully is displayed.

Schedule a Chart

You must schedule a chart to further investigate on the chart details.

By enabling a chart, the chart executes as scheduled and provides the configured output with the state of the chart changed to ‘Scheduled’.

To schedule a chart:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart List** panel, select a chart or several charts that display ○ in the **Enabled** column.
4. Click ●.
   A confirmation message indicates that the chart(s) state is changed successfully.

View a Chart

After you view a chart, you can perform the following:

1. You can print, save, email and view charts on full screen.
2. You can also select a date from the calendar to view a list of successfully run charts for the chosen date.

To view a chart:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart List** panel, do one of the following:
   - Select a chart and click  > **View**.
   - Select a chart and click **View** from the View Chart column.
     The View Chart view tab is displayed.
4. In **Chart Options**, do the following:
   a. Select the **Time Range**.

   > **Note:** When you select the Time Range option, you can select a pre-set time range such as last hour, last 3 hours and the Last N Days...or you can customize the selection by choosing Last N Days or Custom. If you select Last N Days option, you can view the historical data for a maximum of 15 days. If you select the Custom option, you can select a start date and end date to view the data for the selected date range.

   b. Select the **Series**, either **Chart Values over Time** or **Chart with Totals**.
   When you select **Chart Values over Time**, the chart displays the change in values for the selected time. When you select **Chart with Totals**, the chart displays a total for each aggregate value for the selected time.
   c. Select **Items to Plot** to define the number of events to view on the chart.
   d. From the **Chart Type** drop-down list, select the chart type.
   e. Click **Reload** to reload the selected chart.
   If there is a delay in retrieving the historical data for the selected time range, a message is displayed.

After the chart is generated, a notification is displayed in the notification tray available in the NetWitness toolbar. For more information on the NetWitness toolbar, see the **Browser Window** topic in the *NetWitness Getting Started Guide*.

View all Charts List

To view a list of all the charts:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart** toolbar, click **View All Charts**.
   All the executed charts for the selected date are displayed in a new tab.

   Note:
   * If no list is displayed, you can select a date from the calendar to view a list of charts.
   * If you want to view a specific chart, enter the chart name in the search criteria.
4. Click the chart name to view the chart details for that date.

Test a Chart

You can test a chart in the **Test a Chart** view.

To test a chart:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. Do one of the following:
   - In the **Chart** toolbar, click  .
   - In the **Chart** panel, double-click a chart or select a chart and click  .
   - In the **Chart List** panel, click  > **Edit**.
     The Build Chart view tab is displayed.
4. Click **Test Chart** to view the chart.
   The View Chart view tab is displayed.
5. Select the **From** and **To** date ranges.
6. Select the **Series**, either **Time Series** or **Summary**.
7. From the **Chart Type** drop-down list, select the chart type.
8. Click **Run Test** to run the test.
   The chart data (if any) for the selected time range is displayed.

Investigate a Chart

You can investigate the chart by navigating directly to the Investigation module from the chart.

To investigate a chart:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart** toolbar, click **View All Charts**.
   All the executed charts for the selected date from the **Chart Options** panel are displayed on a new tab.
4. Click the chart name to view the chart details such as the time at which the chart is executed and the default data source used for the chart execution.
5. Do one of the following:
   - Click a data point on the chart to investigate.
   - In the toolbar, click **Investigate** to investigate for the entire time range.

Manage a Chart Group and Chart

You can manage chart groups and charts using the following procedures.

Manage a Chart Group

Depending on the access permissions set for the user role, you can modify or delete, import or export, drag and drop a chart, or refresh a chart group.

Modify a Chart Group

To modify a chart group in the default folder or subgroups under a chart group:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart Groups** panel, select the chart group to modify.
   The selected chart group is modified and can be viewed on the Chart Groups panel.

Delete a Chart Group

To delete a chart group in the default folder or subgroups under a chart group:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart Groups** panel, select the group and click .
   A confirmation dialog asks for confirmation that you want to delete the selected group.
4. Click **Yes** to delete the group.
   The selected group is deleted from the Chart Groups panel.

Import a Chart Group

To import chart groups from other instances of NetWitness Suite:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. From the **Chart Groups** panel, select a folder to import the file.

4. Do one of the following:
   - In the Chart Groups panel, click  > **Import**.

     The **Import Chart** dialog box is displayed. You can import multiple chart groups at the same time. To select multiple chart groups, press and hold the CTRL button and select the chart groups to be imported.
5. Click **Browse** to select the binary file.
   NetWitness provides a file system view of the files.
6. Locate the binary file and click **Open**.
   The file is added to the Import Chart list.
7. (Optional) To overwrite any existing rule in the library with an identically named rule in the binary file when importing, select the **Rule** checkbox. If you do not select the Overwrite option, and an identical rule is encountered in the binary file, the binary file is imported and no error message is displayed.
8. (Optional) To overwrite any existing list in the library with an identically named list in the binary file, select the **List** checkbox. If you do not select the Overwrite option, and an identical list is encountered in the binary file, the binary file is imported and no error message is displayed.
9. (Optional) To overwrite any existing chart in the library with an identically named chart in the binary file when importing, select the **Chart** checkbox. If you do not select the Overwrite option and an identical chart is encountered in the binary file, the binary file is imported and no error message is displayed.
10. Click **Import** to import the binary file.

Export a Chart Group

To export selected chart groups:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart Groups** panel, select a chart group and click  and do one of the following:

- **Export** - This selection exports a chart in a .zip file.
- **Export as Text** - This selection exports all the content from the Reporting Engine in a .zip file which contains the data in text format.

You can export multiple chart groups at the same time. To select multiple chart groups, press and hold the CTRL button and select the chart groups to be exported. The exported file is saved to the local drive.

Drag and Drop Chart to a Group

To drag and drop a chart from the Charts List panel to a group in the Charts Groups panel:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. Select a chart from the **Chart List** panel and drag and drop the chart to a group in the **Chart Groups** panel.
   The chart is copied to the group in the Chart Groups panel.

Refresh a Chart Group

To refresh chart groups:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart Groups** panel, drag and drop the group.
   The chart group is moved to the new location.
4. In the **Chart Groups** panel, Click  .
   The chart group is refreshed.

Manage a Chart

Depending on the access permissions set for the user role, you can modify or delete, duplicate, import and export, enable or disable charts, search for existing charts, and refresh a chart list.

Access Control for a Chart

To set access permissions for a chart:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart List** panel, select a chart.
4. Click  > **Permissions**.
   The Charts Permissions dialog box is displayed.
5. Based on the user role, select the appropriate buttons.
6. (Optional) Select the checkbox if you want to provide read access permission to dependent rules.

   Note: On selecting the check box, all dependent rules with No access permission are granted a READ access permission.

6. Click **Save**.
   A confirmation message that the permission is successfully set for the selected chart is displayed.

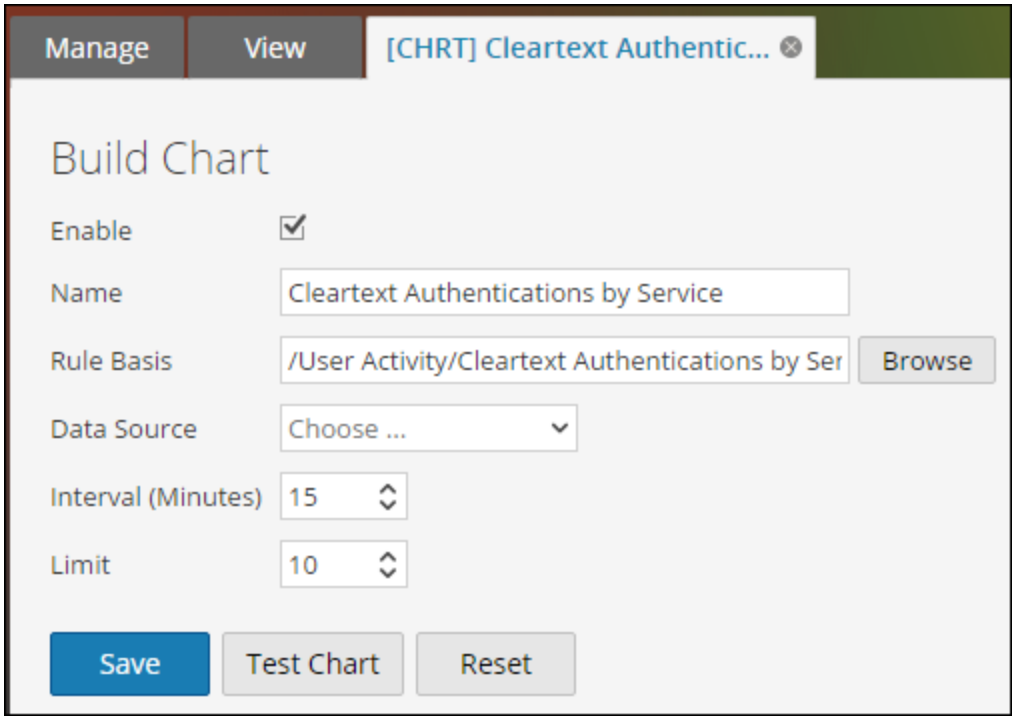
Modify a Chart

To modify a chart in a group or subgroup:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart List** panel, do one of the following:
   - Double-click a chart or select a chart and click  .

- Select a chart and click  > **Edit**.

  The Build Chart view tab is displayed.



4. Modify the name of the chart.
5. For the Reporting Engine to collect the data and generate chart results, select the **Enable** checkbox.
6. (Optional) In the **Rule Basis** field, do the following:
   a. Click **Browse**.
      The Add Rule dialog is displayed.
   b. Navigate the Rule tree and select a rule.
   c. Click **Select**.
      The Rule appears in the Rule Basis field.
7. Select the data source from the **Data Source** drop-down list.

   Note: If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data sources. For more information, see the **Configure Data Source Permissions** topic in the *Host and Services Configuration Guide*.

8. (Optional) To modify the Interval value, click the up or down arrows.
9. Select the limit value to limit the number of records to be displayed.
10. Click **Save**.
    A confirmation message that the chart is modified successfully is displayed.

Delete a Chart

To delete a chart in a group or subgroup:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart List** panel, do one of the following:
   - Select the charts and click .
   - Click > **Delete**.
     A confirmation message asks if you want to delete the selected chart.
4. Click **Yes** to delete the chart.
   A confirmation message that the chart is deleted successfully is displayed and the selected chart is deleted from the Chart List panel.

Duplicate a Chart

To duplicate an existing chart:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. From the **Chart List** panel, select a chart to be duplicated.
4. In the **Chart** toolbar, click .
   The chart is duplicated and gets added to the Chart List panel.

Import a Chart

To import charts from other instances of NetWitness:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.

2. Click **Charts**.
   The Chart view is displayed.
3. From the **Chart Groups** panel, select a folder from which to import the file.
4. Do one of the following:
   - In the Chart toolbar, click  > **Import**.
     The **Import Chart** dialog box is displayed. You can import multiple charts at the same time. To select multiple charts, press and hold the CTRL button and select the charts to be imported.
5. Click **Browse** to select the binary file.
   NetWitness provides a file system view of the files.
6. Locate the binary file and click **Open**.
   The file is added to the Import Chart list.
7. (Optional) To overwrite any existing rule in the library with an identically named rule in the binary file when importing, select the **Rule** checkbox. If you do not select the Overwrite option, and an identical rule is encountered in the binary file, the binary file is imported and no error message is displayed.
8. (Optional) To overwrite any existing list in the library with an identically named list in the binary file, select the **List** checkbox. If you do not select the Overwrite option, and an identical list is encountered in the binary file, the binary file is imported and no error message is displayed.
9. (Optional) To overwrite any existing chart in the library with an identically named chart in the binary file when importing, select the **Chart** checkbox. If you do not select the Overwrite option and an identical chart is encountered in the binary file, the binary file is imported and no error message is displayed.
10. Click **Import** to import the binary file.

Export a Chart

To export selected charts to an external file:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.

3. In the **Chart List** panel, select a chart and click  and do one of the following:
   - **Export** - This selection exports a chart in a .zip file.
   - **Export as Text** - This selection exports a chart from the Reporting Engine in a .zip file which contains the data in text format.

   You can export multiple charts at the same time. To select multiple charts, select the checkboxes of the charts to be exported. The exported file is saved to the local drive.

Enable a Chart

To enable a chart:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart List** panel, select a chart or several charts that display ○ in the **Enabled** column.
4. Click ●.
   A confirmation message indicates that the chart(s) state is changed successfully.

Disable a Chart

To disable a chart:

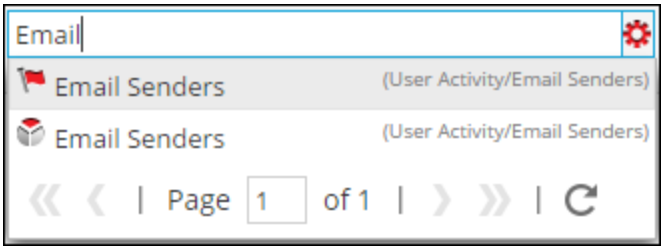
1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart List** panel, select a chart or several charts that display ● in the **Enabled** column.
4. Click ○.
   A confirmation message indicates that the chart(s) status is changed successfully.

Search an Existing Chart

To search for an existing chart:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.

2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart** toolbar, enter text in the Search text box.
4. Click > **Chart**.
   The charts with the substring in their name are displayed in the search drop-down list.



Refresh a Chart

To refresh charts:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Charts**.
   The Chart view is displayed.
3. In the **Chart List** panel, drag and drop the charts to the desired group in the Chart Groups panel.
   The charts are moved to the new location.
4. Do the following:
   - In the **Chart List** panel, click .
   - In the **Chart Toolbar** panel, select **Auto Refresh**.
     The Chart list is refreshed.

Alerting Overview

Alerts can be used to generate timely insights about current security issues, vulnerabilities, and exploits. For example, when a malicious email is sent from a compromised account, you would need an alert that automatically notifies you when such an event occurs.

The following concepts of alerting will help you understand more about alert rules, conditions, notifications, and templates.

Alert Rules

Alert rules specify the logic for alert generation. Alert rules allow you to set up threshold limits and define how to be notified if these limits are exceeded. For example, you may set up a rule to be alerted if the CPU usage remains abnormally high for 5 minutes or more.

Alert Definitions

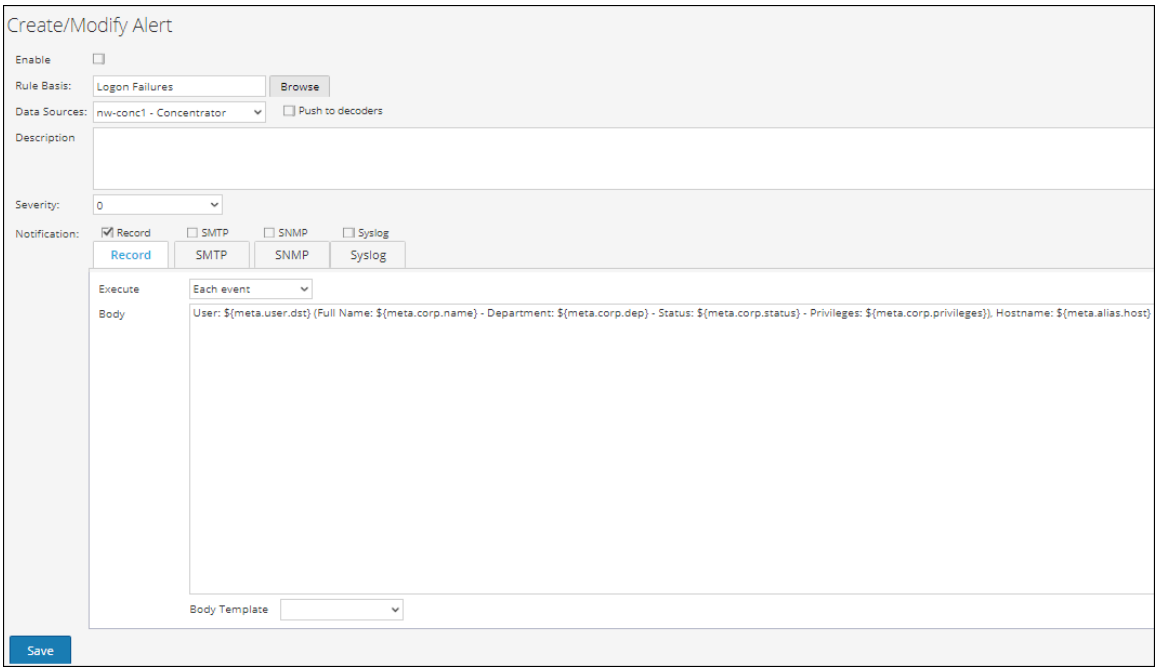
The alert definition is similar to defining rules for reports. These rules must be defined based on your use case. Alert definitions are made by selecting the alert rules you define in the Build Rule view. You select this rule while defining an alert.

Note: You can only alert using rules defined for NetWitness data source.

Once an alert is created, this data is collected from the Reporting Engine and displayed on the user interface.

Once an alert is defined, you can schedule the alert to run every minute (by default), or run at the present time, or run at the near future.

Note: In the NetWitness user interface, wherever Date and Time is displayed, it is always according to the user selected time zone profile.



Alert Notifications

The following are the components required to configure alert notifications:

- Notification server – Notification Server is used to send alert notifications. For example, SMTP mail server. Once you configure a notification server, you can add it to a rule. When the rule triggers an alert, the rule will use that server to send alert notifications.
- Notifications – Alert outputs, which can be email, SMTP, SNMP, and Syslog.
- Templates – The pre-defined format of an alert message.

When ever the rule condition is encountered, alerts get generated based on the severity level and notifies the user depending on the notification method set for that specific alert. The following are the various notification methods:

- Email/ SMTP: Simple Mail Transfer Protocol (SMTP) sends alert emails for system activity. Email alerts can be sent to their intended recipients by selecting SMTP as notification type.
- SNMP: Simple Network Management Protocol (SNMP) sends alerts to multiple computers for SNMP traps. SNMP alerts can be sent to other computers by selecting SNMP as notification type.
- Syslog: Syslog alerts generate notifications from Syslog messages. Syslog alerts can be sent by selecting Syslog as notification type.

Alerts can be configured to notify events that require attention, or as mechanisms to take automated actions based on conditions configured in an alert. An alert is sent when conditions within the entity have met the criteria selected for the alert. The notification criteria determines when and at what frequency the alert is generated.

Alert Templates

Alert templates are pre-defined format for an alert message. You can use these templates to create alerts.

Access Control for Alerting

Depending on the user role, the user is provided with specific set of access permissions in order to manage an alert. The Administrator manages the access rights provided to each user role from the **Administration > Security > Roles** tab. You can set access permissions for the user roles to manage an alert. The Reporting module provides access control at the alert level.

Note: Reporting Engine Alert permissions are prefixed with 'RE' to distinguish them from Event Streaming Analysis (ESA).

When you create users and user roles, ensure that the roles that you create for specific tasks have access to all the necessary permissions. This could require permissions at several levels of the role hierarchy.

Alerts can be combined with a specific set of user roles so that when a user logs into NetWitness, the only alerts they can access are alerts accessible by the role to which the user belongs. Users that belong to a user role with the '**Read & Write**' access permission can define alerts. The access can further be tightened so that the alerts are accessed only by those who have the '**Read Only**' access.

At the alert level, you can set the following access permissions for the user roles in NetWitness:

- Read & Write
- Read Only
- No Access

Note: Before applying the Alert permissions, the default permission set for all the user roles is '**No Access**' permission and the checkbox is unchecked.

If you want to change the access permission for a specific user role, you must set it at the alert level. Except for administrators, the default permission set for all the other user roles is '**No Access**' permission.

The two scenarios are explained in brief:

- Scenario 1: Permissions applied to alert/ rules based on the user role.
- Scenario 2: Read-only permission applied to rules in the Alert.

	Role (Analysts)	Permissions applied to Alert/ Rules based on the user role	Permission (Read-only) applied to Rules in the Alert
Alert	**Read & Write**	**Read & Write**	**Read & Write**
Rules	**Read**	**Read**	**Read**

The Alert is assigned the role of a Security Analyst and permissions are set to **Read & Write** alerts.

For scenario 1, each of the levels has a permission set based on the user role. For scenario 2, the **Read** permission is set for the Rules except that the permission for the rules must not be higher than the permission for the Alerts.

If the permission for the rules is higher than the permission for the Alerts, the permission is not applied. For example, if you set the permissions for the Alert as **No Access** and then specify the option *Apply Read-only permission to Rules in the Alerts*, the read-only permission is not set for the rules.

Access Control for an Alert When Multiple Alerts are Selected

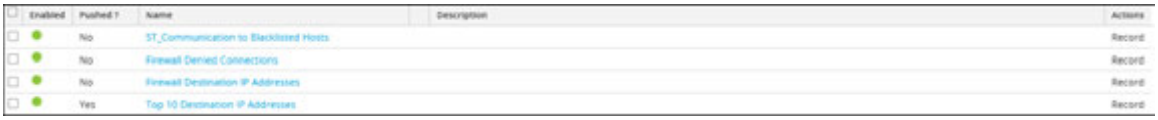
When you want to change permissions of multiple alerts, you must select several alerts and set their access permissions using the Alert Permissions panel. The access permission that you choose is applied to all the selected alerts.

Login as a specific user and view the access details

When you login to the NetWitness UI as a user having **Read** access permission, all the alerts will be denoted with the symbol (📖) and when you click on the symbol the 'Read Only' callout is displayed on the Alert List panel.

When you login to the NetWitness UI as a user not having **Read & Write** access permission on an Alert, all the alerts will be denoted with the symbol (👁‍🗨) and the alerts appear grayed out on the Alert List panel.

The following figure shows the Alert List panel when logged in with minimal **Read & Write** access permission.

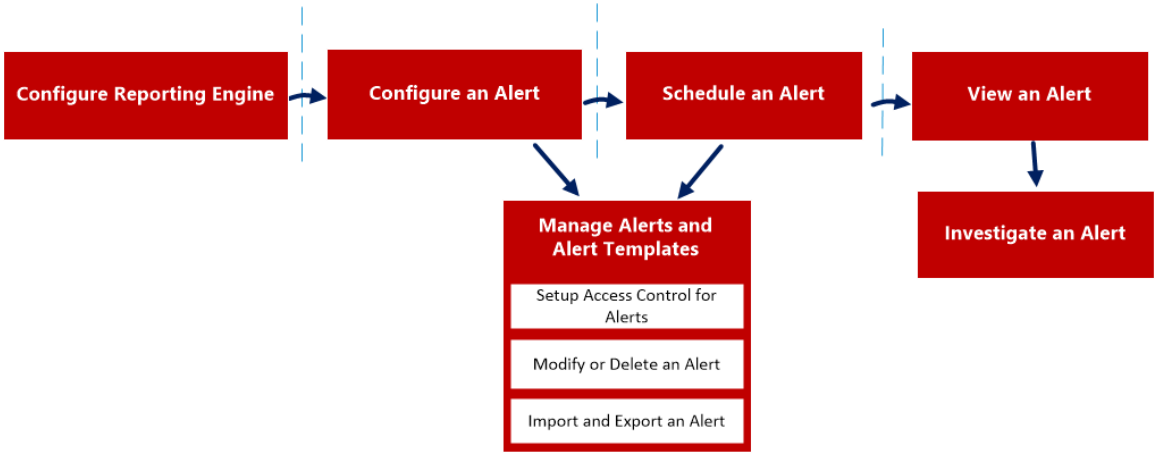


Note: If a user (other than ADMIN) creates an alert, ADMIN cannot access that alert.

The following table lists the various columns in the Alert Permissions panel:

Column	Description
Roles	The role of the user logged into the NetWitness user interface.
Read & Write	The user can access, view, edit, import, export, and delete the alert on the Alerts page. The user can also change the permission on the alert.
Read Only	The user can only access and view the alert on the Alerts page.
No Access	The user cannot access or view the alert for which this permission is set.
Apply Read-only permission to Rules in the Alerts	The user can automatically apply permissions to the rules in the alerts.

The following is an overview of the entire process of alerting:



To configure and generate an alert on Reporting Engine, perform the following:

1. Configure Reporting Engine
2. Configure an Alert
3. Schedule an Alert
4. View an Alert

5. Investigate an Alert
6. Manage an Alert and Alert Template

Configure Reporting Engine

Ensure that:

- You have Decoders that are connected to the Concentrator added to the Reporting Engine for the selected data source, before creating an alert rule.
- You have installed and configured a Syslog server that supports TCP/TLS in your environment. For example, WinSyslog. You can configure the Reporting Engine to send Syslog messages over TCP with Transport Layer Security (TLS) when an alert is triggered.

To configure the Reporting Engine to send Syslog alerts over TCP with Transport Layer Security (TLS):

1. Obtain the required certificates.
2. Append the CA certificate to the ca.pem file on the NetWitness server.
3. Configure the Syslog server to accept messages from client machines.
4. Configure the delivery of alert messages in the NetWitness UI.

Task 1: Obtain the required certificates

To generate certificates for configuring Reporting Engine to send Syslog messages over TCP with TLS:

1. Generate a Certifying Authority (CA) certificate. For more information, see http://www.rsyslog.com/doc/tls_cert_ca.html.

Note: You can ignore this step if you already have a CA running in your environment.

2. Generate a key pair for the Syslog server. For more information, see http://www.rsyslog.com/doc/tls_cert_machine.html.

Note: You can ignore this step if you have already configured security for the Syslog server using the key and certificates generated by the same CA.

Task 2: Append the CA certificate to the ca.pem file on the NetWitness Server

To append an existing CA certificate to the ca.pem file:

1. Manually append the contents of the CA certificate that you generated to the **/etc/pki/CA/certs/ca.pem** file.

2. Run the following command on the NetWitness server to have the certificate populate to the Truststore:

```
keytool -import -file /etc/pki/CA/certs/ca.pem -keystore cacerts
```

Task 3: Configure the Syslog Server to accept messages from client machines

To configure the Syslog server to accept messages from client machines that have the same CA certificates:

1. Copy the following files to your secure TCP server target location:
   - ca_cert.pem
   - server_cert.pem
   - server_key.pem

   Where:

   ca_cert.pem - is the CA certificate

   server_cert.pem - is the server certificate

   server_key.pem - is the server key

   For more information, see the documentation specific to your Syslog server. If you are using rsyslog, refer to http://www.rsyslog.com/doc/tls_cert_server.html.

Task 4: Configure the delivery of alert messages in NetWitness

Configure Reporting Engine to send Syslog messages over TCP with Transport Layer Security (TLS) when an alert is triggered by enabling **SECURE_TCP** in the **Output Actions** tab for the Reporting Engine service in the Reporting Engine Services Config View. For more information, see the **Reporting Engine Output Actions** topic in the *Host and Services Configuration Guide*.

Configure an Alert

You can configure an alert by setting up alert notifications and adding a notification method to a rule.

Note: Only Administrators can set up these notifications.

To configure an alert:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** toolbar, click  .
   The Create/Modify Alert panel is displayed.
4. Click **Enable** to enable the alert.
5. In the **Rule Basis** field:
   a. Click **Browse**.
      The Lookup Rule Basis dialog box is displayed.
   b. Navigate the Rule tree and select a rule.
   c. Click **OK**.
      The Rule name is displayed in the Rule Basis field.
6. From the **Data Sources** drop-down list, select a data source.

   Note: If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse Connector data sources. For more information, see **Configure Data Source Permissions** topic in the *Host and Services Configuration Guide*.
7. Select the **Push to decoders** checkbox for the Reporting Engine to send the rule to the Decoder.
8. (Optional) Enter an alert description in the **Description** field.
9. From the **Severity** drop-down list, select the severity level.
10. In the **Notification** field:
    a. Select the appropriate notification.
       The selected notification tab is displayed in the Create/Modify Alert dialog box.

b. (Optional) Deselect the notification to disable the notification tab.

c. Define an action in one of the **Notification** tabs:

   i. In the **Record** tab field:

      a. From the **Execute** drop-down list, select the frequency for recording an alert.

      b. Enter the RECORD message. You can create a new message or select a template in the **Body Template** field and modify the template here.

      c. (Optional) If templates have been defined, select a template for the RECORD message that you can use as is or modify.

   ii. In the **SMTP** tab field:

      a. From the **Execute** drop-down list, select a value to identify the number of times to send an email message for the alert.

      b. Enter an email address or comma-separated list of email addresses to send this alert.

      c. Enter the subject of the email message.

      d. Enter the body of the message. You can create a new message or select a template in the **Body Template** field and modify the template here.

   iii. In the **SNMP** tab field:

      a. From the **Execute** drop-down list, select a value to identify the number of times that you want to send an SNMP message for the alert.

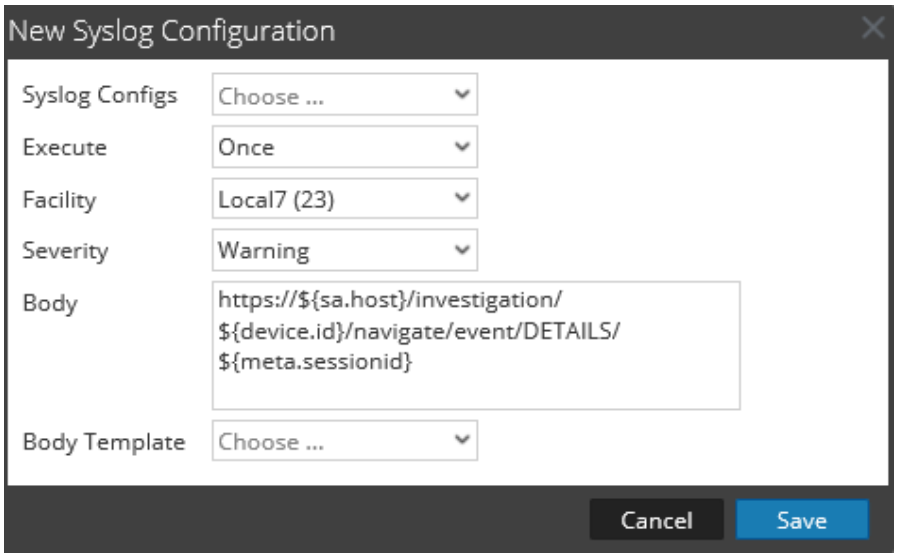
      b. Enter the SNMP message. You can create a new message or select a template in the **Body Template** field and modify the template here.

   iv. In the **Syslog** tab field:

      Note: You can configure Multiple Syslog servers on the Syslog Configuration panel. For more information, see **Reporting Engine Output Actions** topic in the *Host and Services Configuration Guide*.

      a. Click  .

         The New Syslog Configuration dialog box is displayed.



b. From the **Syslog Configs** drop-down list, select a value for the syslog configuration.

c. From the **Execute** drop-down list, select a value to identify the number of times to send a Syslog message for the alert.

d. From the **Facility** drop-down list, select the facility.

e. From the **Severity** drop-down list, select the severity level.

f. Enter the Syslog message. You can create a new message or select a template in the **Body Template** field and modify the template here.

> **Note:** If you want to add a metakey, specify the same in the format: ${meta.metakey}. For example, ${meta.ip.dst}.

g. Click **Save**.
The Syslog configuration gets added to the alert.

11. Click **Create**.
NetWitness creates an alert with a confirmation message that the alert is saved successfully. NetWitness generates the alert and executes the output actions every minute.

Schedule an Alert

You must schedule an alert to search for events on a regular schedule.

To schedule an alert:

1. Select **Monitor**> **Reports** to view the Manage tab.
2. Click **Alerts** to open the Alert view.
3. Select an alert to schedule.
4. On the **Alert** toolbar, click **Enable**.
   The selected alert is scheduled.

View an Alert

You can view an alert or a list of all alerts.

You can view the alerts triggered and investigate any alert in the Investigation module and customize these views to show alerts for a specific period of time, and set the maximum number of alerts displayed in a single page.

To view an alert:

1. Select **Monitor**> **Reports** to view the Manage tab.
2. Click **Alerts** to open the Alert view.
3. On the **Alert** toolbar, click **View Alerts**.
   The View Alerts view is displayed.

Investigate an Alert

You can investigate every alert that is triggered on the Alert View. For more detailed investigation on a particular alert, you can view the alert on the Investigation module.

To investigate an alert:

1. In the **Alert** section toolbar, click **View Alerts** to navigate to the View Alerts view.
2. Do one of the following:
   - Click the  button against the alert you want to investigate.

     The Investigation module displays the details of the first session that registered the match for the given alert for immediate analysis.
   - Click on the alert name of the alert you want to investigate.

     The Investigation module displays all matches for that particular alert for the hour surrounding the registered alert.

Manage an Alert and Alert Template

You can manage alerts, scheduled alerts, and alert templates using the following procedures.

Manage an Alert

Depending on the access permissions set for the user role, you can modify or delete, import and export, enable or disable alerts, view or refresh an alert list.

Access Control for an Alert When a Single Alert is Selected

To set access permissions for an alert:

1. Select **Monitor> Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the Alert List panel, select an alert.
4. Click > **Permissions**.
   The Alert Permissions dialog box is displayed.
5. Based on the user role, select the appropriate options.
6. (Optional) Select the checkbox if you want to automatically provide read access permission to dependent rules.

Note: When the check box is selected, all dependent rules with the No access permission will be given the READ access permission.

7. Click **Save**.
   A confirmation message that the permission is successfully set for the selected alert is displayed.

Access Control for an Alert When Multiple Alerts are Selected

To change permissions of multiple alerts:

1. In the Alert List panel, select all the alerts whose permissions must be set.
2. Click > **Permissions**.
   The Alert Permissions dialog box is displayed.
3. Select the permission to set for the respective user role.

4. Click **Save**.

   A confirmation message that the permission is successfully set for all the selected alerts is displayed.

Edit an Alert

For example, if you want to be notified about the alert over an email on a different Email ID, you will have to modify the alert notification section with the new Email ID details to be reverted over an email when an alert is generated. Additionally, you can also modify the alert description and alert notification in the Create or Modify Alert panel.

To edit an alert:

1. Select **Monitor**> **Reports**.

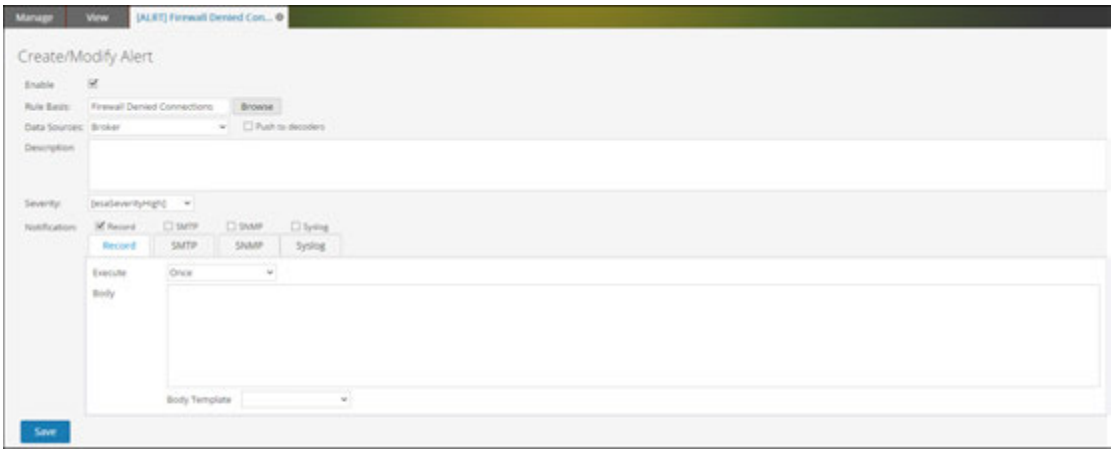
   The Manage tab is displayed.

2. Click **Alerts**.

   The Alert view is displayed.

3. In the **Alert List** panel, select an alert and click .

   The Create or Modify Alert tab is displayed.



4. In the **Rule Basis** field, navigate the rule tree and select another rule.
   The Rule name is displayed in the Rule Basis field.

5. (Optional) Select a data source from the **Data Sources** drop-down list.

   Note: If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see **Configure Data Source Permissions** topic in the *Host and Services Configuration Guide*.

6. (Optional) Modify the alert description in the **Description** field.

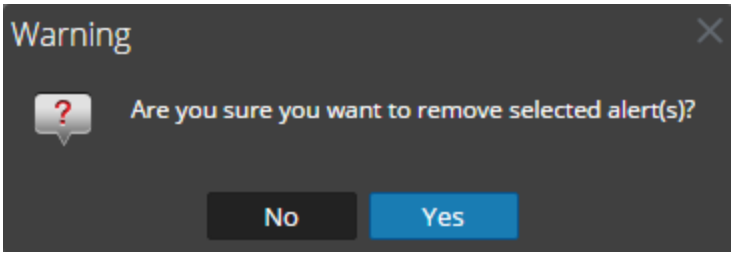
7. Modify the appropriate **Notification** tabs – **RECORD**, **SMTP**, **SNMP**, and **Syslog**.

8. Click **Save**.
   A confirmation message that the alert is modified successfully is displayed.

Delete an Alert

To delete an alert:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert List** panel, select the alert and click .
   A warning dialog asks for confirmation that you want to remove the selected alerts.



4. Click **Yes** to delete the alert.
   A confirmation message that the alert is deleted successfully is displayed and the selected alert is deleted from the Alert List panel.

Import an Alert

To import an alert from other instances of NetWitness in the Alerts List panel:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** toolbar, click > **Import**.
   The Import Alert dialog box is displayed.
4. Click **Browse** to select the binary file.
   NetWitness provides a file system view of the files. You can import multiple alerts at a time. To select multiple alerts, select the checkbox of the alert to be imported.
5. Locate the binary file, and click **Open**.
   The file is added to the Import Alert list.

6. (Optional) To overwrite any existing alert in the library with an identically named alert in the binary file when importing, select the Alert checkbox. If you do not select the Overwrite option, and an identical alert is encountered in the binary file, the binary file is imported and no error message is displayed.
7. Click **Import** to import the binary file.

Export an Alert

To export an alert to an external file that can be later imported to NetWitness:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert List** panel, select an alert and click and do one of the following:
   - **Export** - This selection exports an alert in a .zip file.
   - **Export as Text** - This selection exports all the content from the Reporting Engine in a .zip file which contains the data in text format.
     You can export multiple alerts at a time. To select multiple alerts, check the checkbox of the alert to be exported.
4. Click > **Export**.
   The exported binary file is saved to the local drive.

Enable an Alert

To enable an alert:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert List** panel, select the alert that displays in the **Enabled** column.
4. Click Enable.
   A confirmation message shows that the change to the alert(s) state was successful.

Disable an Alert

To disable an alert:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.

2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert List** panel, select the alert that displays in the **Enabled** column.
4. Click Disable.
   A confirmation message shows that the alert(s) status is changed successfully.

View an Alert List

To view an alert list:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** toolbar, click **View Alerts**.
   The View Alerts view tab is displayed.
4. Select the last number of days from the drop-down list.
5. Enter a value for the **Max no of alerts**.
   The alerts list is displayed based on the chosen filter value.

Refresh an Alert List

To refresh the list of alerts:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. From the Alert toolbar, click to refresh the alerts list.
   The Alert List panel is refreshed.

Manage a Scheduled Alert

You can enable or disable a scheduled alert, and view all scheduled alerts.

Enable a Scheduled Alert

To enable a scheduled alert:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click View Schedule.
   The View Alerts Schedule view tab is displayed.
4. In the **Alerts Schedule List** panel, select the scheduled alert (s) to be enabled.
5. Click .
   A confirmation message indicates that the alert(s) status is changed successfully and the alert is now available in the Alert List panel.

Disable a Scheduled Alert

To disable a scheduled alert:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click View Schedule.
   The View Alerts Schedule view tab is displayed.
4. In the **Alerts Schedule List** panel, select the scheduled alert (s) to be disabled.
5. Click .
   A confirmation message indicates that the alert(s) status is changed successfully and the alert is now available in the Alert List panel.

View all Alerts Scheduled

To view all the alerts scheduled:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.

3. In the **Alert** toolbar, click **View Schedule**.
   The View Alerts Schedule view is displayed with a list of all the scheduled alerts.

Manage an Alert Template

You can modify or delete an alert template, and view all alert templates.

Edit an Alert Template

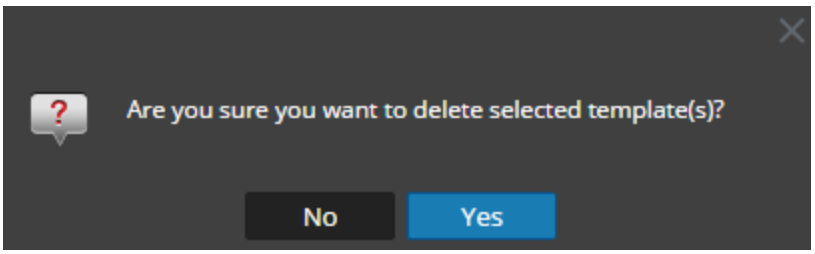
To edit an alert template:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click Template.
   The Template view is displayed.
4. In the **Template List** panel, select a template and click .
   The Create/Modify Template dialog box is displayed.
5. Click **Save**.
   A confirmation message that the template is modified successfully is displayed.

Delete an Alert Template

To delete an alert template:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. Click Template.
   The Template view tab is displayed.
4. In the **Template List** panel, select a template and click .
   A confirmation dialog is displayed.



5. Click **Yes** to delete the template.
   A confirmation message that the template is deleted successfully is displayed.

View all Alert Templates

To view all alert template messages:

1. Select **Monitor**> **Reports**.
   The Manage tab is displayed.
2. Click **Alerts**.
   The Alert view is displayed.
3. In the **Alert** toolbar, click **Template**.
   The Template view tab is displayed with a list of templates.

Reporting Reference

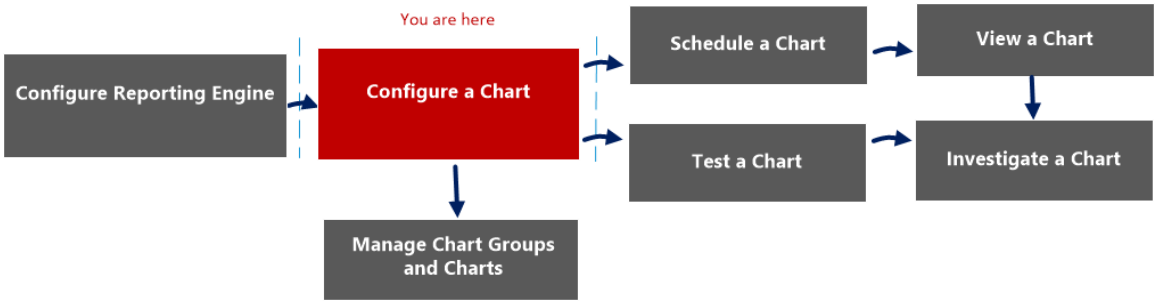
This section provides information about the Reporting user interface. You can look at your place in the workflow for creating and generating a report with NetWitness Suite, get a quick look at the important features, and follow links to the detailed concepts and procedures.

Build Chart View

In the Build Chart view, you can define and test a chart. You build a chart by assigning a name and then selecting a rule to include.

Note: Only the Netwitness DB rules can be used in charts.

Workflow



What do you want to do?

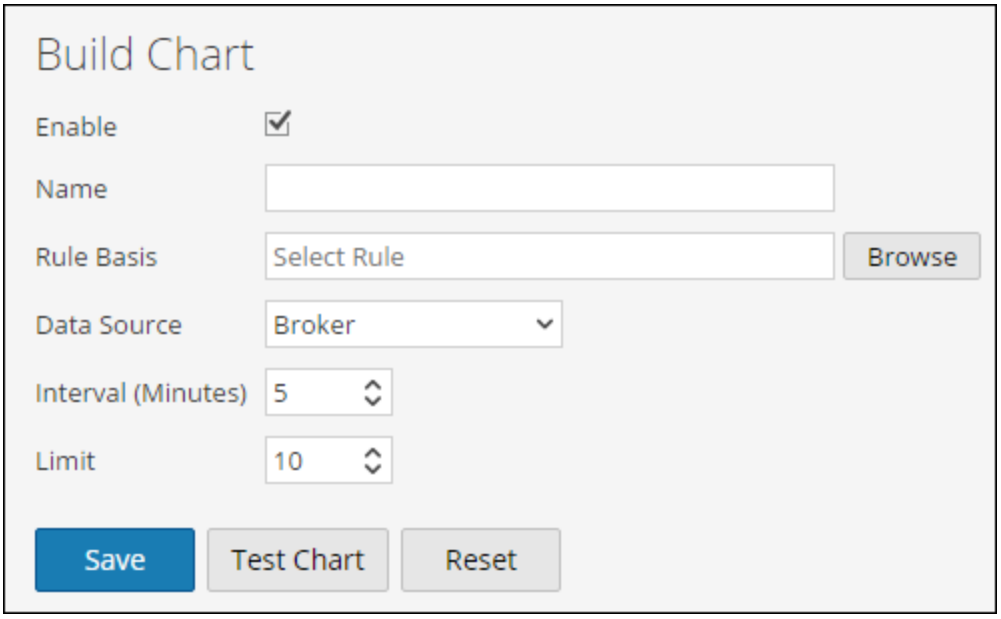
Related Topics

- Configure and Generate a Chart
- Configure a Chart

Quick View

The following figure is an example of the Build Chart view.



The following table describes the features in the Build Chart view.

Field	Description
Enable	Specifies if the Reporting Engine must collect the data and generate chart results. If the **Enable** checkbox is not selected, the results are not rendered.
Chart Name	Identifies the name of the chart.
Rule Basis	Displays the Add Rules dialog box from which you select a rule that is the basis of a chart. The rule that you select must be a rule which is not sorted by none.

Field	Description
Data Source	If the default data source is configured in the Reporting Engine, the data source is displayed on the Build Chart page. If a chart is configured to run on any other data source, that data source is displayed on the Build Chart page instead of the default data source. The Reporting module works with the following data sources: • Broker • Concentrator • Decoder • Log Decoder • Log Collector
Interval (Minutes)	The chart data refresh interval in minutes.
Limit	The number of records for which a chart is generated.
Save	Saves a chart to the database.
Test Chart	Plots a test chart based on the chart definition.
Reset	Resets the chart details.

Build List View

In the Build List view, you can enter or import values to create a list and save or reset the values. You can use lists when you are writing reporting rules to simplify the process of specifying values in the rule.

Workflow

This workflow shows the procedure to define lists or list groups. You can set access control at the list or list group level so that only users with specific roles can access the lists.

You must ensure that Reporting Engine is configured on NetWitness Suite.

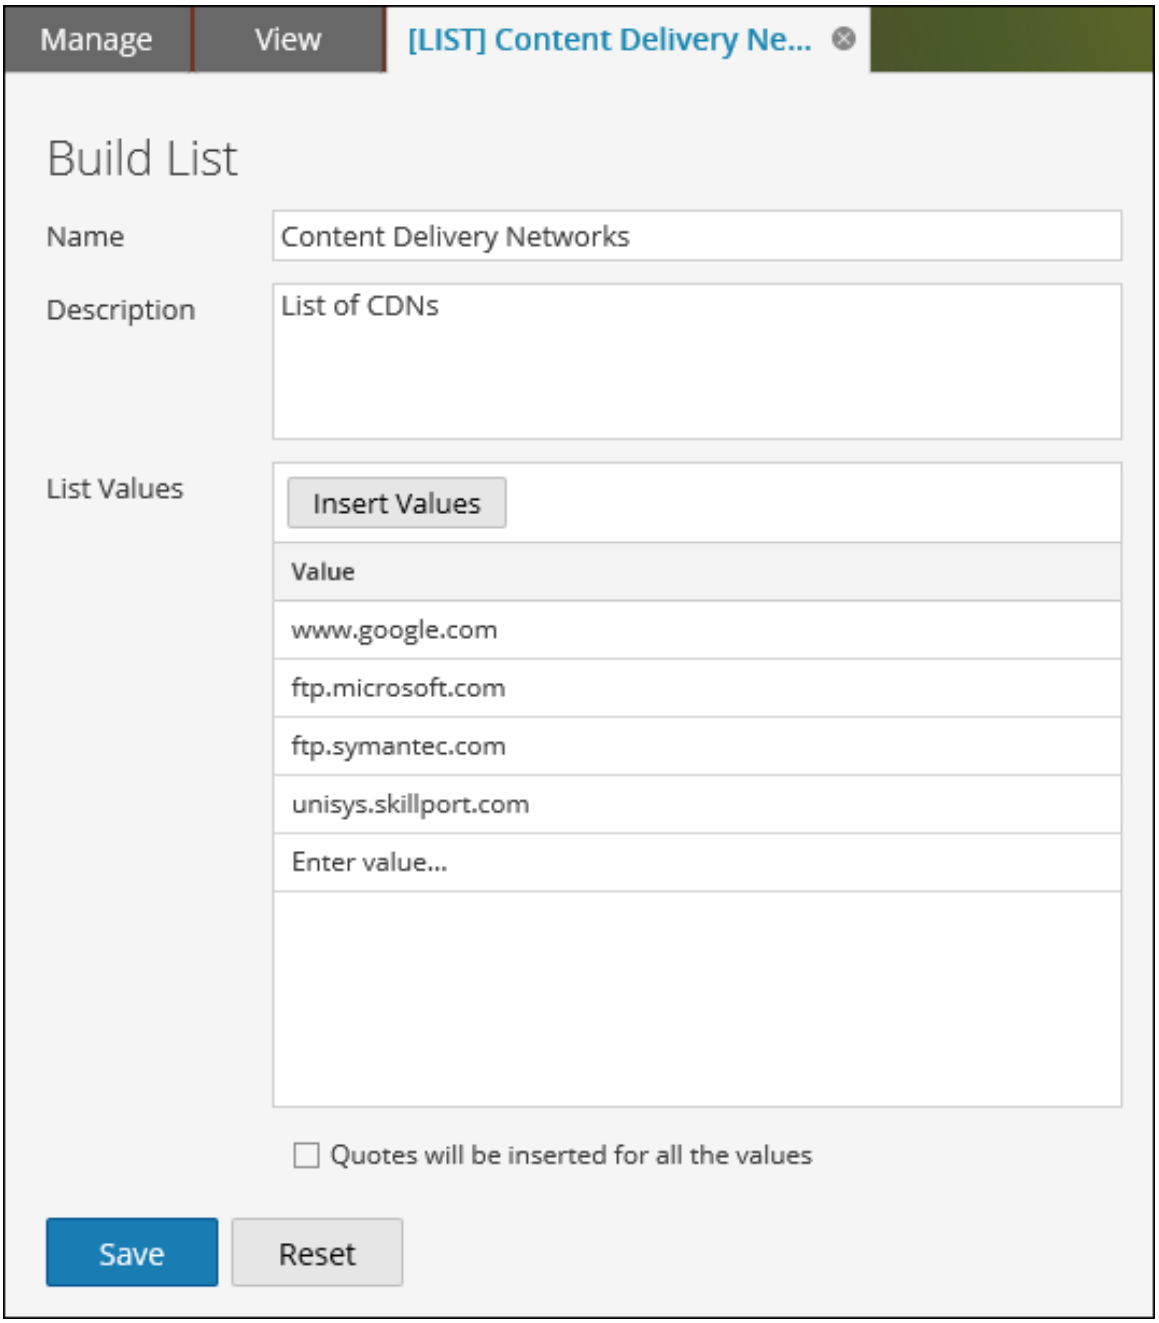
Quick View

The following figure shows the Build List View.



To access this view

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The Lists view is displayed.

3. In the **Lists** toolbar, click  .

   The Build List tab is displayed.

The following table describes the features in the Build List view.

Feature	Description
Name	Identifies and labels the list.
Description	Provides a short description for the list.
List Values	Provides the grid of values associated with selected list from the List Library panel. You can import these values from a file or list. You can also enter values manually.
Quotes will be inserted for all the values	Automatically includes quotes for the values at runtime if checkbox is selected. If the checkbox is not selected and if a value in the list contains a comma, then that value has to be enclosed within single quotes. Each list value for an IPDB rule must be enclosed within single quotes. This syntax does not apply to list values for an NWDB rule.
Save	Saves the rule which can be used to create a report, a chart or an alert.
Reset	Deletes all the information from the fields.

Build Report View

In the Build Report view, you can create a report, add text and rules, and schedule a report.

Workflow

This workflow shows the procedure to create and schedule a report.

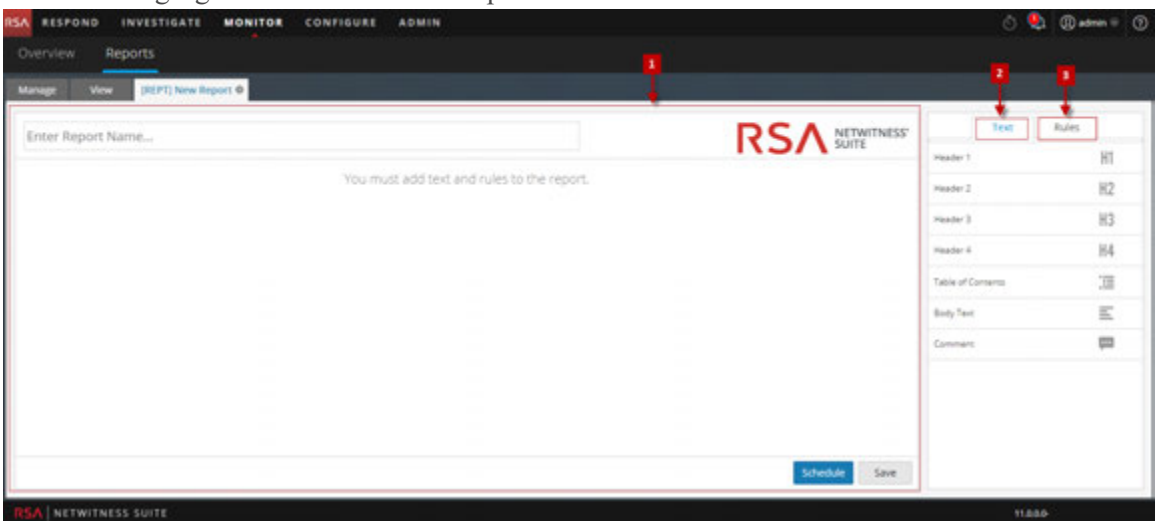
- Create and Schedule a Report
- View a Report
- Investigate a Report
- Manage Lists, Rules or Reports
- Report View
- Scheduled Reports View
- Reports Permissions Dialog

Quick View

The following figure shows the Build Report View.



To access this view

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Reports view is displayed.

3. In the **Reports** toolbar, click + .

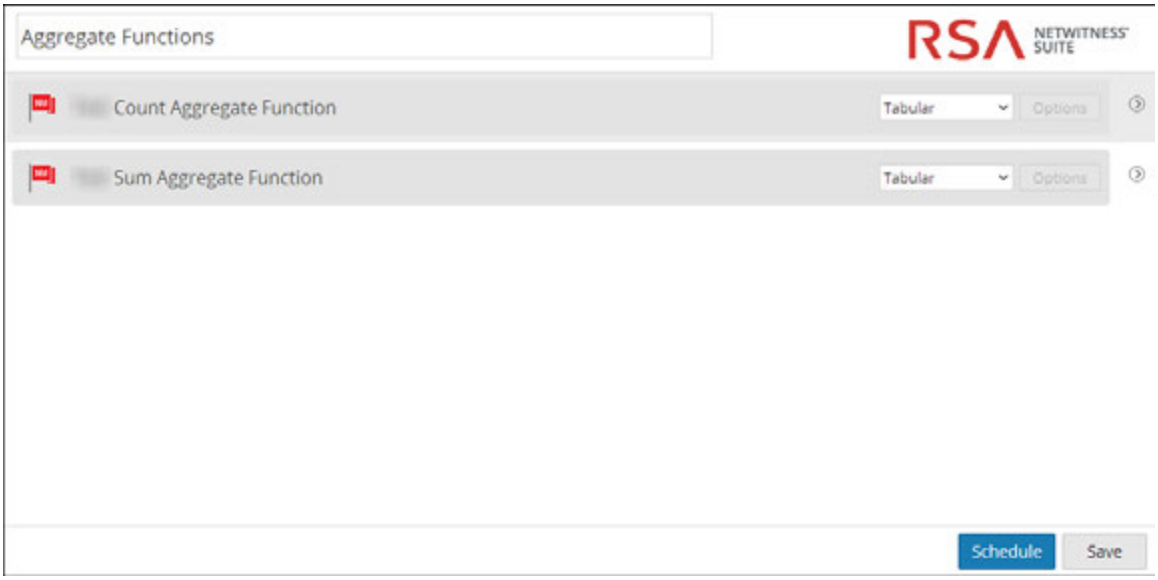
   The Build Report tab is displayed.

The Build Report view consists of the following panels:

1. Report Panel
2. Text Panel
3. Rules Panel

Report Panel

The Report panel allows you to create a report by assigning a name to the report. The content in a report depends on the items selected from the Text and Rules panels.



When you add rules to a report, you can change the output format of these rules either to tabular, area, line or pie by clicking the ⌄ button.

The following table lists the features of the Report Panel and the description.

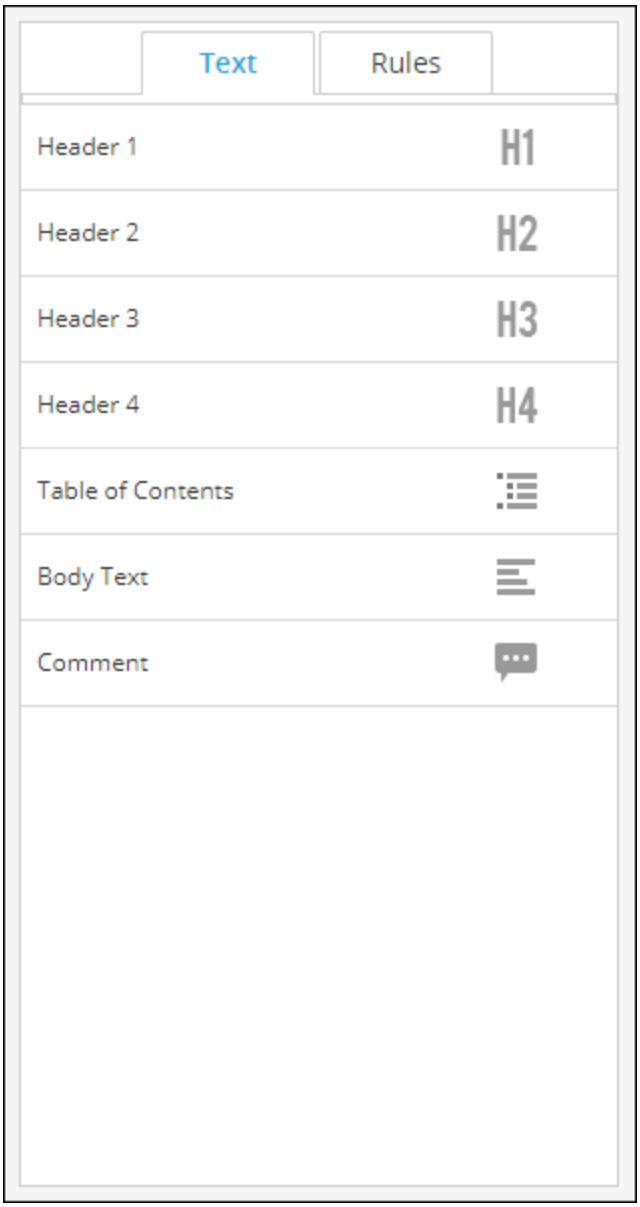
Feature	Description
Name	This field allows you enter the name of the report.
Options	This field allows you to select the output format of the report such as Tabular, Area, Bar, Bubble, Column, Line, Pie, Step Line, Step Area, Spline Area and Spline.
Schedule	Clicking this option generates the report.

Feature	Description
Save	Clicking this option saves the report.

Text Panel

The Text panel consists of a list of text elements that add to the look and feel of the report. You can use these text elements to format the report.

- To add more structure to reports, you can use these headers defined in the Text panel to indent up to four levels. This allows you to identify specific sections in a report that can be included in the Table of Contents for easy navigation in the report result.
- To add headers to the Report panel, drag and drop H1, H2, H3, or H4 onto the Report pane based on the desired level of indentation.



The following table lists the text elements used to format a report:

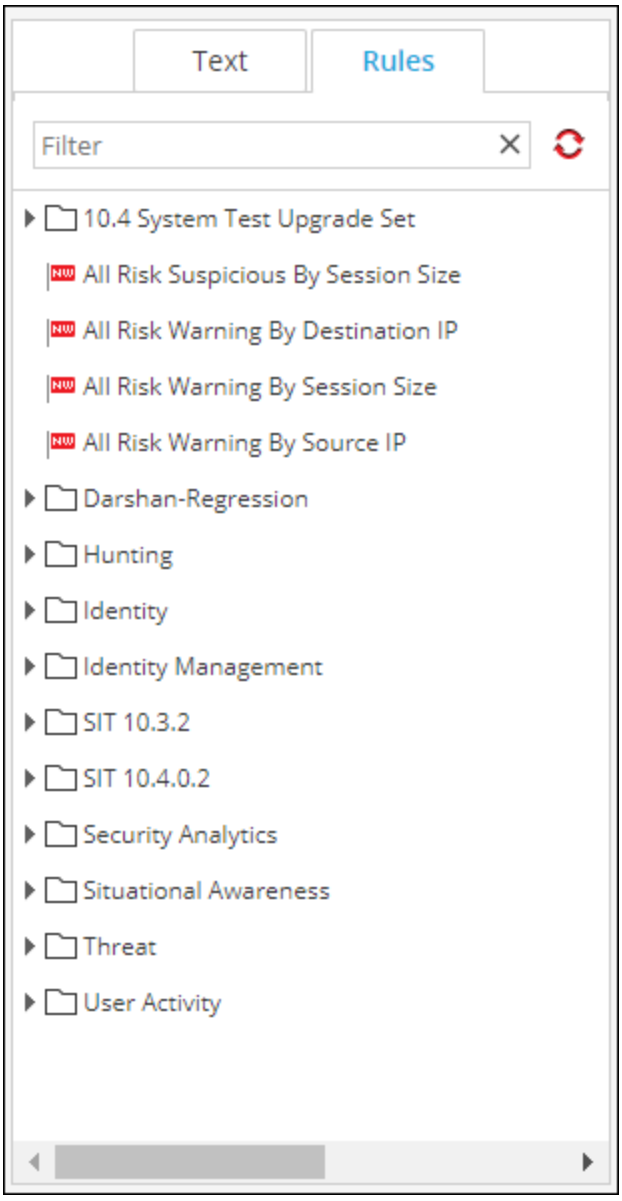
Text Elements	Description
Header 1 H1	The Header 1 element adds a first-level heading to the report definition.
Header 2 H2	The Header 2 element adds a second-level heading to the report definition.

Text Elements	Description
Header 3 	The Header 3 element adds a third-level heading to the report definition.
Header 4 	The Header 4 element adds a fourth-level heading to the report definition.
Table of Contents 	The Table of Contents adds table of contents to the report definition.
Body Text 	The Body Text element adds body text to the report definition.
Comment 	The Comment element adds comments to the report definition. **Note:** The Comment element is not displayed when you view all the reports.

Rules Panel

The Rules panel consists of a list of rules that are defined in the Rules. From the rules list, you can drag and drop rules onto the Report panel to associate those rules with the report.

You can search for a specific rule using search text box provided in the Rules panel.



Text
Rules
Filter
10.4 System Test Upgrade Set
All Risk Suspicious By Session Size
All Risk Warning By Destination IP
All Risk Warning By Session Size
All Risk Warning By Source IP
Darshan-Regression
Hunting
Identity
Identity Management
SIT 10.3.2
SIT 10.4.0.2
Security Analytics
Situational Awareness
Threat
User Activity

Build Rule View

The Build Rule view explains the actions and associated procedures that you can perform under Rules.

Workflow

This workflow shows the procedure to create or deploy a rule.

What do you want to do?

Role	I want to ...	Show me how
Administrator / Analyst	Configure Reporting Engine	For more information, see "Step 3: Configure Reporting Engine Data Sources" topic in the *Reporting Engine Configuration Guide*

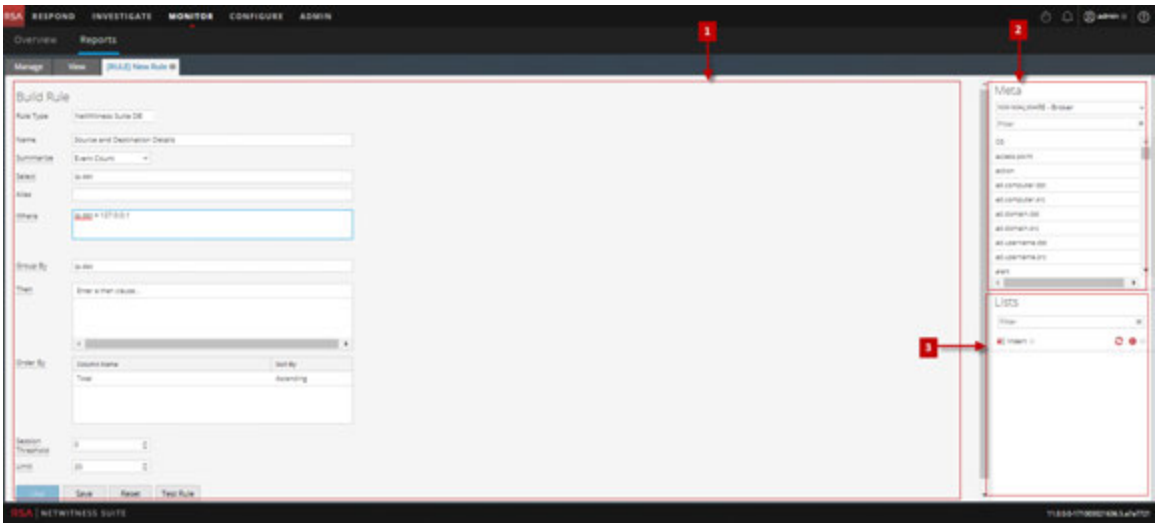
Administrator / Analyst	Create and Schedule a Report	Create and Schedule a Report
Administrator / Analyst	View a report or list of all reports	View a Report
Administrator / Analyst	Investigate a Report	Investigate a Report
Administrator / Analyst	Manage/Access Control for lists, Rules or Reports	Manage Lists, Rules or Reports

*You can complete these tasks here.

Related Topics

- Configure a Rule
- Manage Lists, Rules or Reports
- Rule Permissions Dialog
- Rule View

Quick View



To access the Build Rule view:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the Rule toolbar, click + > **NetWitnessDB**.
   The Build Rule view tab is displayed

Features

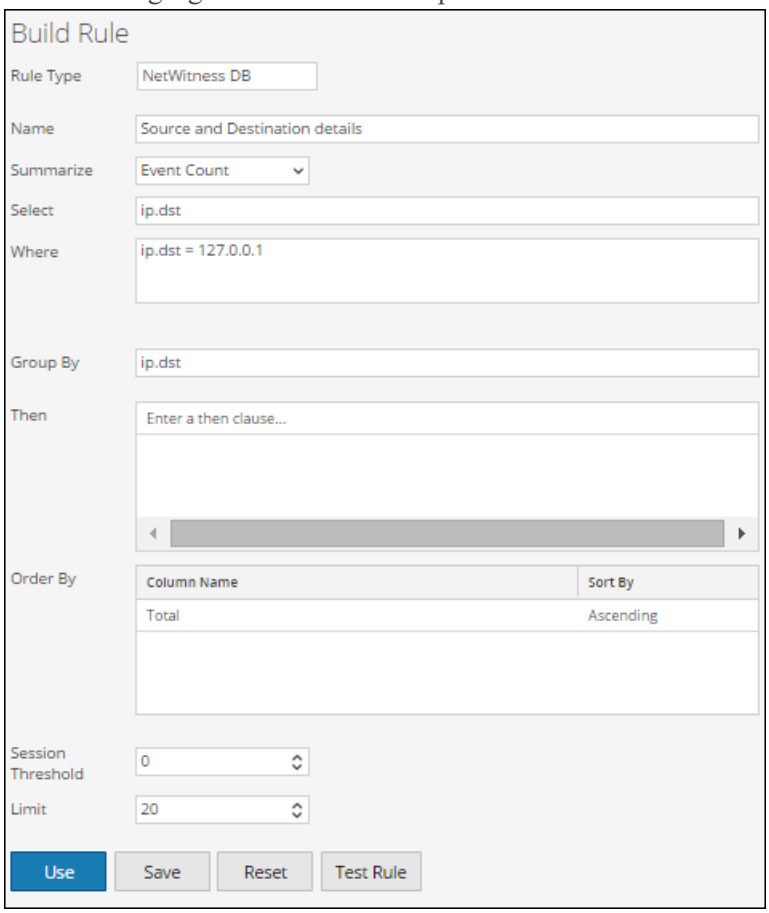
The Build Rule view includes the following panels.

1	Rule panel
2	Meta panel
3	Lists panel

Rule Panel

The Rule panel allows you to create a rule for the selected database type.

The following figure shows the Rule panel.



The following table describes the features in the Rule panel.

Feature	Description
Rule Type	A drop-down list of supported database types for which you can create rules. The options are: Netwitness DB, IPDB, and Warehouse DB.
Name	The name of the rule that you are creating or editing.
Summarize	A drop-down list of summarize options. The options are: None, Event Count, Packet Count, Session Count and Custom.
Select	The meta key for which you need the aggregate values; for example, ip.dest.
Where	A Where clause that defines the conditions that trigger the rule execution; for example, ip.dest = 127.0.0.1.

Feature	Description
Group By	The grouping method for the results. For example, specifying ip.dest produces a report in which like ip.dest values are grouped.
Then	A Then clause that defines the rule actions for additional processing on the output.
Order By	The sequencing method used to show results. For example, specifying Order By the value in the Total column, Ascending, produces a report in which the results are sorted in ascending order based on the value in the Total column.
Session Threshold	A selection list for the session threshold, which specifies maximum number of sessions that should be processed for aggregate functions.
Limit	A selection list for the maximum number of result rows to be fetched.
Use	Clicking Use enables you to use the Rule to generate a Report, Alert of Chart.
Save	Clicking Save saves the rule that you are editing and the Build Rule panel remains open. Before testing a rule, you must save it if you want to keep your changes.
Reset	Clicking Reset clears all the field information .
Test Rule	Clicking test rule opens the Test Rule dialog.

Test Rule Dialog

To access the Test Rule view:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the Rule List panel, do one of the following:
   - Select a rule and click  in the Rules toolbar.
   - Click  > **Edit**.
     The Build Rule view tab is displayed.

3. Click **Test Rule**.

   The Test Rule view is displayed.

The following table describes the features in the Test Rule Dialog.

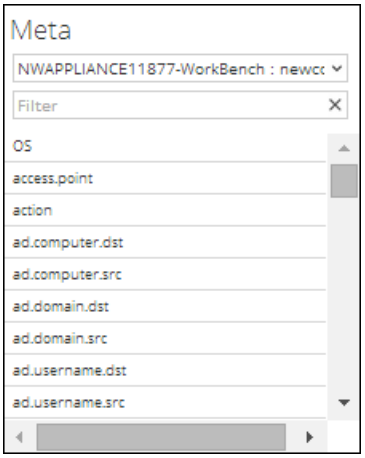
Feature	Description
Data Source	A drop-down list of data sources for the type of rule you are testing. Possible data sources are: Concentrator, Broker, Decoder or Log Decoder.
Format	A drop-down list of the formats for displaying results for the rule. Possible formats are: Tabular, Area, Bar, Bubble, Column, Line, Pie, Step Line, Step Area, Spline Area, and Spline.

Feature	Description
Time Range	A drop-down list of time range specification methods. • Selecting Past allows you to specify a number of years, months, days, weeks, or hours. For example, Hours, Days, Weeks, Months, or Years. • Selecting Range allows you to specify a date range and time period. For example, start date to end date. In the user interface, the date or time displayed depends on the time zone profile selected by the user.
Use relative time calculation	Selecting this option calculates the time range relative to the current time.
X Axis	X-Axis and Y-Axis specify the metadata to be plotted in charts. In the X-Axis drop-down list, the meta types for the `Group by` setting in the rule are listed. You can select multiple meta types when the rule has a single `Group by` setting. For Custom Rules with multiple `Group by` values, you can select only the first meta type for the X-Axis.
Y Axis	In the Y-Axis drop-down list, the aggregate functions used in the rule are listed. Sum, Count, Countdistinct and Average are the supported aggregate functions for rules. You can select one or more aggregate functions.
Run Test	Clicking Run Test executes a test of the rule last saved in the Rule Builder dialog. When the test is complete, the rule data (if any) for the selected time range is displayed.

Meta Panel

The Meta panel provides a list of available meta types that you can use to build the rule. You can use the meta types in the Select, Where, and Then clauses. The Reporting Engine maintains an active list of the available meta names by continuously synchronizing with the data source to which it is connected.

The following figure displays the Meta panel.



The following table describes the features in the Meta panel.

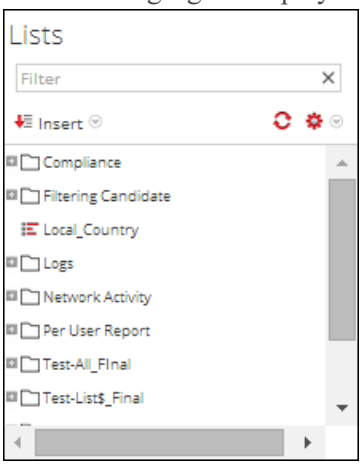
Operation	Description
Choose	Based on the rule type that you have selected, the available data sources are displayed in the drop-down list of the Meta panel. Select the required data source. The available meta types for the data source are displayed. Select a meta.
Filter	Filter the meta for a specific meta value.

Lists Panel

A List is a placeholder for a set of values that you can use in a meta or a variable. For example, you can define a list with all the whitelisted event source IP addresses. Once the List is defined then you can use the List name in the rule. This provides the flexibility of adding, modifying, and deleting the list values.

The Lists panel is a collection of Lists. The Reporting Engine maintains an active list of the available list names by continuously synchronizing with the collection to which it is connected.

The following figure displays the Lists panel.



The following table describes the features in the Lists panel.

Operation	Description
	Import or Export a list.
	Refresh the Lists.
	If you select the **NetWitness DB** rule type, the options Where and Then are displayed. Insert the list in the Where or Then clause in the rule.
	If you select the **Warehouse DB** rule type, the option Where is displayed. Insert the list in the Where clause in the rule.

Chart Permissions Dialog

In the Chart Permissions dialog, you can manage access permissions for user roles at the chart and chart group level. Only a user with the 'Read & Write' permission can configure the chart in the Reporting module.

Workflow

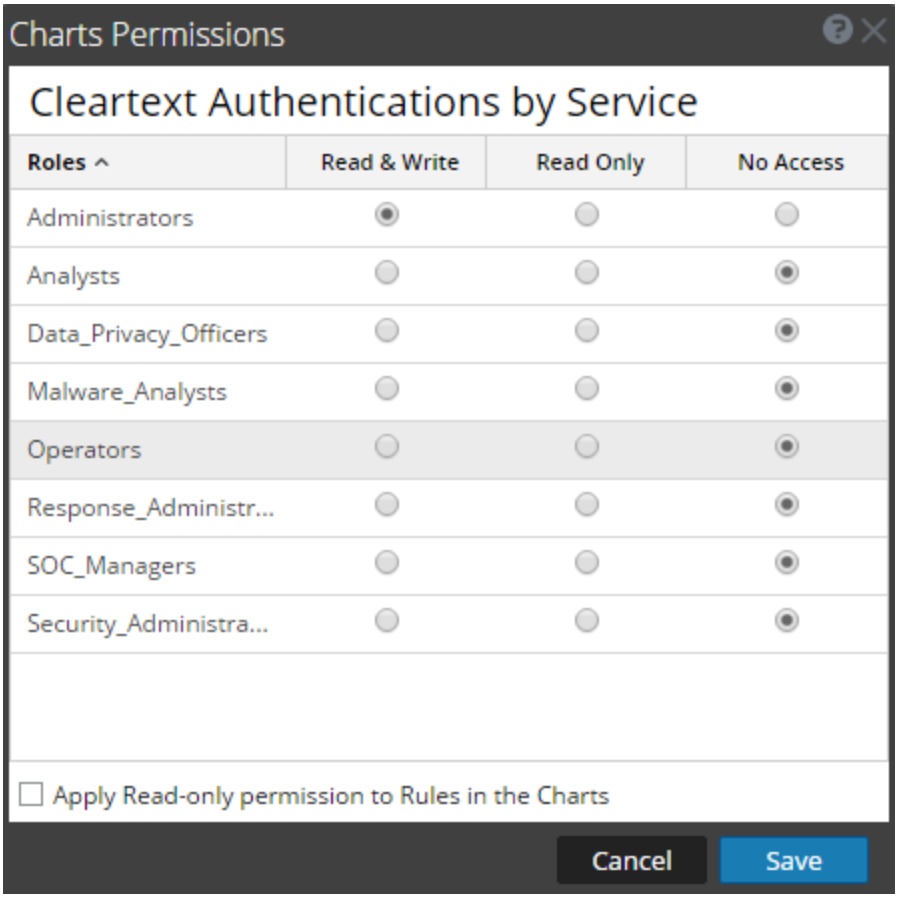
Quick View

The Chart permissions dialog allows you to set chart permissions depending on the user role.

The following figure is an example with the important features labeled.



1. Click **Monitor**> **Reports** to view the Manage tab.
2. Click **Charts** to open the Chart view.
3. In the **Chart List** panel, select a report and click > **Permissions**. The Chart Permissions dialog box is displayed.
4. Based on the user role, select the appropriate options.
5. (Optional) Select the checkbox if you want to automatically provide read access permission to dependent rules.
6. Click **Save**.

The following table lists the columns in the Charts Permission dialog.

Column	Description
Roles	Displays all the user roles in the NetWitness user interface.
Read & Write	Allows you to apply 'Read&Write' access to the chart.
Read Only	Allows you to apply only 'Read' access to the chart.
No Access	By selecting this permission, you cannot access or view the chart.
☐ Apply these permissions to sub-groups and Charts in this group	Allows you to apply permissions to the chart group, subgroups in the group and charts in the group. **Note:** This checkbox is populated only when you set access permissions for a Chart Group.
☐ Apply Read-only permission to Rules in the Charts	Allows you to automatically apply permissions to the rules in the charts.
Cancel	Cancels all the changes made to the permissions.
Save	Saves the selection and provides access to the role based on the selection.

Chart View

In the Chart View, you can see the available charts and groups in a grid format and also schedule them by enabling the charts.

Workflow

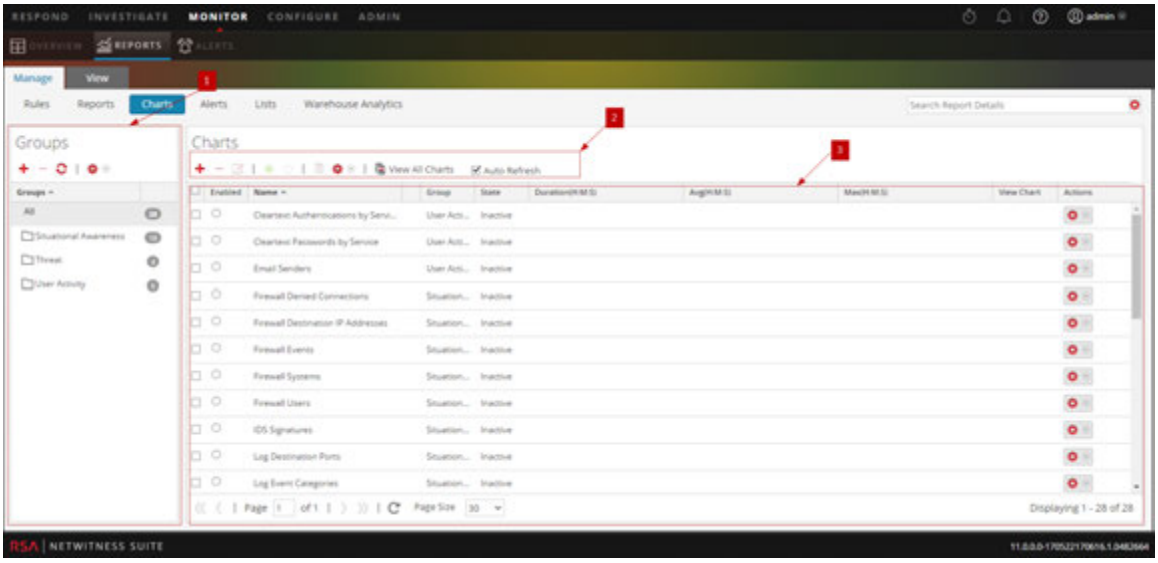
Quick View

The following figure is an example with the important features labeled.

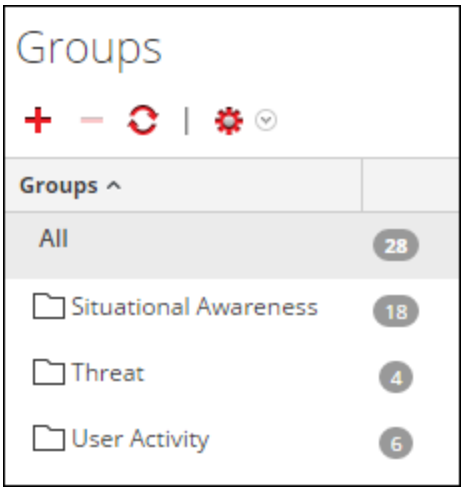


The Chart view includes the following panels:

1	Chart Groups panel
2	Chart toolbar
3	Chart View panel

Chart Groups Panel

The Chart Groups panel allows you to organize charts in a group. You can create a group, add charts to the group and move charts among groups. The following figure shows the Chart Groups panel.



The Charts Groups Panel includes the following options:

Feature	Description
+	Adds a new chart to the Reporting module.
−	Deletes one or more selected charts.
	Edits a chart.
	Refreshes the view.
	Provides the following options: Import, Export and Permissions.

Chart Toolbar

The Charts toolbar allows you to add, modify, delete, duplicate, activate, deactivate, import and export a chart. You can also set access permissions for charts in a group.

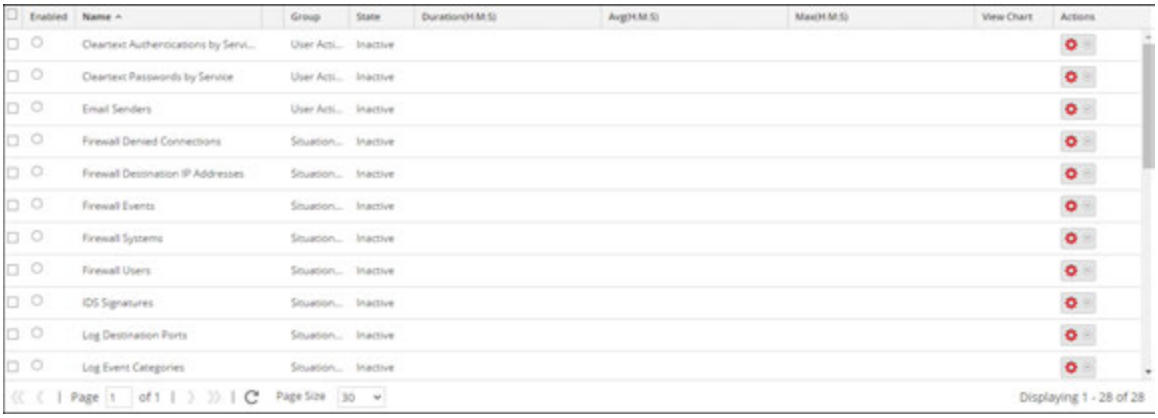
The Chart toolbar includes the following options:

Feature	Description
+	Adds a new chart to the Reporting module.
−	Deletes one or more selected charts.

Feature	Description
	Edit charts.
	Enables the selected charts.
	Disables the selected charts.
	Creates a duplicate copy of the selected chart.
	Provides the following options: Import, Export, Export as Text and Permissions.
View All Charts	Displays all the executed charts.
Auto Refresh	Automatically refreshes the charts list.

Chart View Panel

The Chart View Panel presents all the charts in a tabular or grid format.



The following table lists the columns in the Chart View panel and their description.

Feature	Description
Enabled	- The chart is enabled. - The chart is disabled.
Name	The name of the chart.
Group	The Chart Group to which the chart belongs.

Feature	Description
State	The state of the chart: • Queued • Completed • Failed
Duration (H:M:S)	The time taken to execute the latest chart.
Avg (H:M:S)	The average time taken to run the chart.
Max (H:M:S)	The maximum time taken to run the chart.
View Chart	A hyperlink that redirects to the View a Chart panel.
	The actions menu has the following options: Enable, Disable, View, Delete, Edit, and Export.

Execution History Panel

The Execution History panel allows you to fetch and display history details.

Workflow

This workflow shows the procedure to view report or report groups.

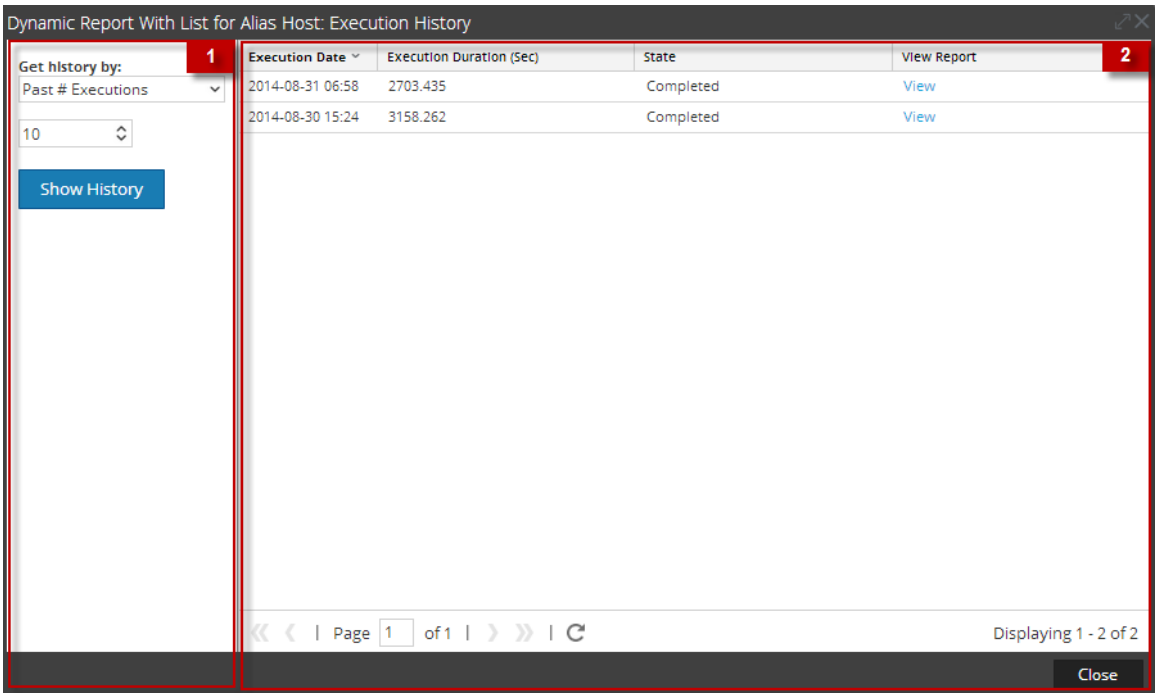
Quick View

The following figure is an example of the Execution History view.



Features

The View Execution History has the following panels:

1. Execution History Options panel
2. Execution History Output panel

To access this view:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the Rule List panel, do one of the following:
   - Hover the mouse over a report and click  > **View Scheduled Reports**.
   - Click **#Schedules** column.
     The Schedule Reports view is displayed with the status of each of the scheduled report.
3. Select a scheduled report and do one of the following:
   - Click  > **Execution History**.
   - Click  from the Scheduled Reports Toolbar Panel.

Execution History Options Panel

The Execution History Options panel allows you to fetch the history details based on either past n number of scheduled reports or a specific date range.

The following table lists the operations in the Execution History Options panel:

Operation	Description
Get history by:	This is the criteria to view the execution history: • **Past # Executions**: The past n number of scheduled reports. By default this option is displayed. • **Range (specific)**: The start date and end date for the date range. **Note:** The **From** and **To** field is populated in the NetWitness Suite UI only when you select 'Range (Specific)' from the **Get history by** list.
From	The start date for the date range.

Operation	Description
To	The end date for the date range.
Count	The number of execution history of the scheduled report to be displayed.
Show History	Shows the history details based on the selected criteria.

Execution History Output Panel

The Execution History Output panel displays the history details with the execution date, execution duration (seconds), state of the scheduled report, and a link to view the report.

The following table lists the various columns in the Execution History Output panel:

Column	Description
Execution Date	The date on which the scheduled report was executed. By default, the execution date is in descending order.
Execution Duration (Sec)	The time duration taken to execute the scheduled report.

Column	Description
State	The state of the scheduled report: • Scheduled: If a report is scheduled to run on an hourly, daily, weekly, monthly, or later time, the state of the report is displayed as scheduled, for the first run. • Queued: If a report is still waiting to get executed, the state of the report is displayed as queued. • Running: If the report schedule is in progress, the state of the report is displayed as running. • Partial: If in a report with several rules, a single rule execution failed or an output action failed or creation of PDF/CSV failed, the state of the report is displayed as partial. For example, consider a report with five rules and four rules are executed successfully and one fails, then the state is displayed as Partial. • Failed: If in a report with several rules, all the rule schedule executions failed, the state of the report is displayed as failed. • Completed: If a report schedule is successfully executed, the state of the report is displayed as completed. • Canceled: When cancel request is completed, the state of the report is displayed as canceled. • Inactive: If a report schedule is disabled, the state of the report is displayed as Inactive. • Not available: If the report schedule executed information is not available, the state of the report is displayed as not available.
View Report	The hyperlink to View a Report on full screen.
Close	Closes the execution history view.

Generate List Panel

The Generate List dialog allows you to generate and customize a list.

Workflow

This workflow shows the procedure to create and schedule a report.

What do you want to do?

Role	I want to ...	Show me how

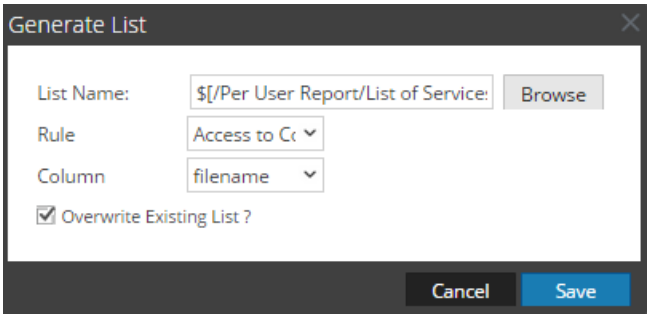
Quick View

The following figure is an example of the Generate List dialog.



To access this view:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, select a report and click > **Schedule Report**.
   The Schedule a Report view tab is displayed.
4. In the **Dynamic List** panel, click .
   The Generate List dialog is displayed.

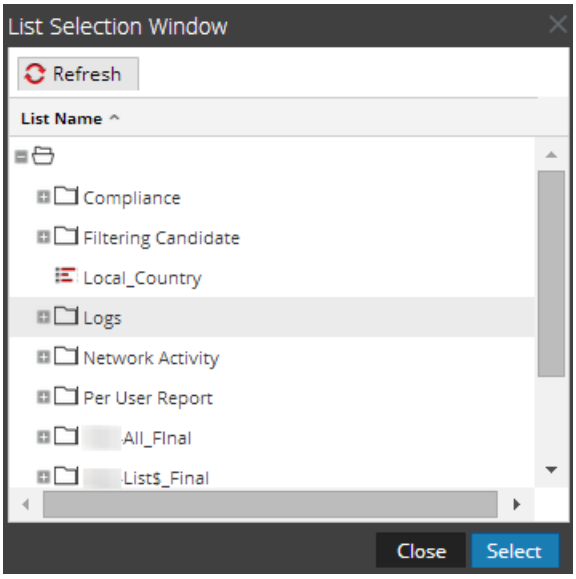
Features

The following table lists the features in the Generate List dialog.

Field	Description
List Name	The name of the list chosen from the List Selection panel.

Field	Description
Browse	Click this button to select a list from the List Selection Window dialog.
Rule	Select a rule to be used to create the list.
Column	Select a value for the column.
Overwrite Existing List?	Overwrites the existing list.
Save	Adds the desired list to the Generate List panel of the Schedule Report view.

The List Selection Window dialog consists of lists that are defined in the Lists panel. Here, you can select a list to associate it with the report. The following figure shows the dialog.



Import Chart Dialog

In the Import Chart dialog, you can import charts containing subgroups and charts from other instances of NetWitness into the Chart Groups panel. Charts must be in a valid binary file that was exported from another NetWitness instance.

Workflow

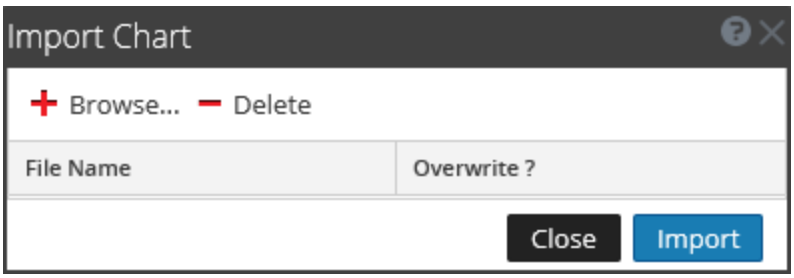
Quick View

This dialog displays differently when you use it to import groups containing subgroups and charts from other instances of NetWitness into the Chart Groups panel.

The following figure is an example of the Import Chart dialog.



1. Click **Monitor**> **Reports** to view the Manage tab.
2. Click **Charts** to open the Chart view.
3. In the **Chart Groups** panel, select a folder to import the file.
4. In the Chart Groups panel or Chart toolbar, click > **Import** to import the file.

The following table describes the features in the Import Chart dialog.

Feature	Description
Browse	Displays a view of the local file system so that you can select the chart to be imported.
Delete	Deletes an imported report from the list of imported charts.

Feature	Description
File Name	Displays a list of chart files that will be imported to your Charts module when you click Import.
Overwrite?	Allows you to select the option to overwrite an existing version of the chart you are importing. If you do not select the Overwrite option, a duplicate file is imported and no error message is displayed.
Close	Closes the dialog. If you have charts to select for import, but have not clicked Import. The charts are not imported, and are not saved in this dialog.
Import	Imports the selected charts to your Charts module.

Import Report Dialog

In Import Report dialog, you can import groups containing subgroups and reports from other instances of NetWitness Suite into Report Groups panel. Reports must be in a valid binary file that was exported from another NetWitness Suite instance.

Workflow

This workflow shows the procedure to manage reports or report groups.

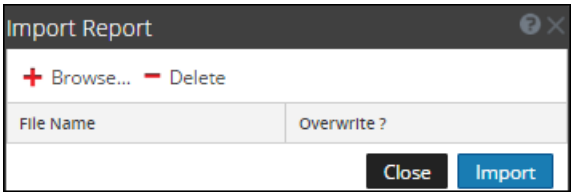
Quick View



To access the Import Report dialog:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report Groups** panel, select a folder to import the file.

4. Do one of the following:
   - In the **Report Groups** panel, click  > **Import** to import a group.
   - In the **Report** toolbar, click  > **Import** to import a report.

The following table lists the features of the Import Report dialog.

Feature	Description
Browse	This option displays a view of the local file system so that you can select the report to be imported.
Delete	This option deletes an imported report from the list of imported reports.
File Name	Displays a list of report files that will be imported to your Reports module when you click Import.
Overwrite?	Allows you to select the option to overwrite an existing version of the report you are importing. If you do not select the Overwrite option, a duplicate file is imported and no error message is displayed.
Close	This option closes the dialog. If you select a report and not clicked Import. The reports are not imported, and are not saved in this dialog.
Import	This option imports the selected reports to your Reports module.

Investigate a Chart View

In the Investigate a Chart view, you can view and investigate chart details. There are options for filtering and sorting the information in the chart, as well as options for the type of chart, the number of items to chart, and charting values or totals. When viewing a chart, you can open the charted sessions in the Investigation module and save the chart as a PDF.

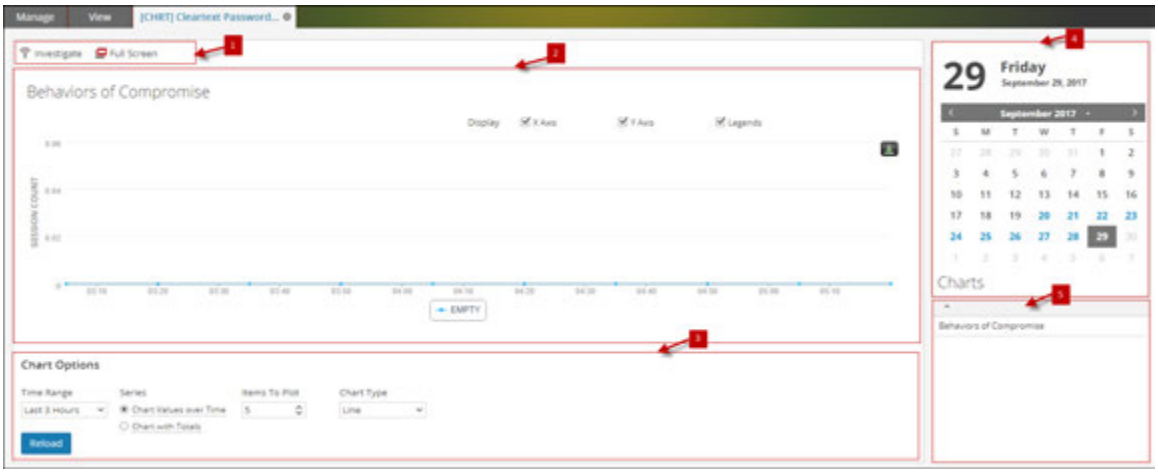
Quick View

The following figure is an example with the important features labeled.



The View a Chart panel includes the following panels:

1. Chart toolbar
2. Chart Output panel
3. Chart Calendar panel
4. Chart Options panel
5. Chart Executed list

Chart Toolbar

The Chart toolbar has options that allow you to investigate, and view the chart on another screen.

The following table lists the options in the Chart toolbar.

Operation	Description
Investigate	Investigates the chart details.
Full Screen	Displays the chart on a full screen.

Lists Permissions Dialog

In the Lists Permissions dialog, you can manage access permissions for a user role at the list or list group level. Only a user with **Read and Write** permission can configure the list in the Reporting Module.

Workflow

This workflow shows the procedure to manage lists or list groups. You can set access control at the list or list group level so that only users with specific roles can access the lists. You can use lists to define rules for generating reports, charts and alerts.

You must ensure that Reporting Engine is configured on NetWitness Suite.

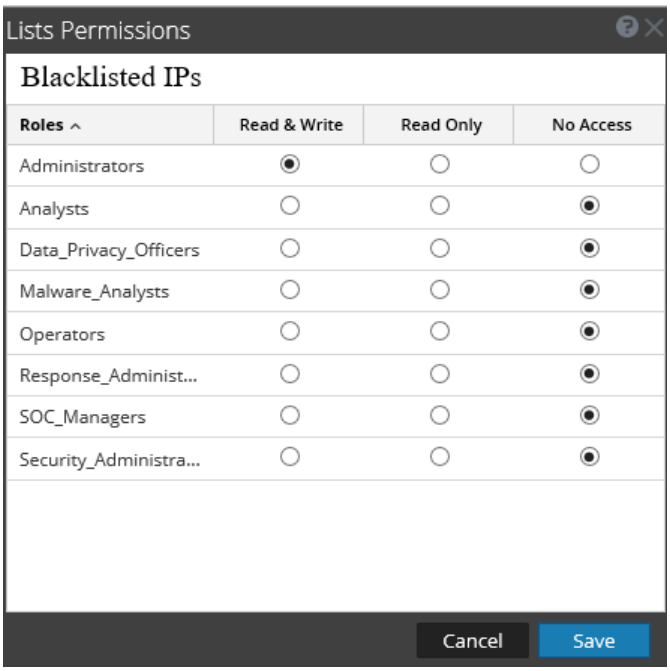
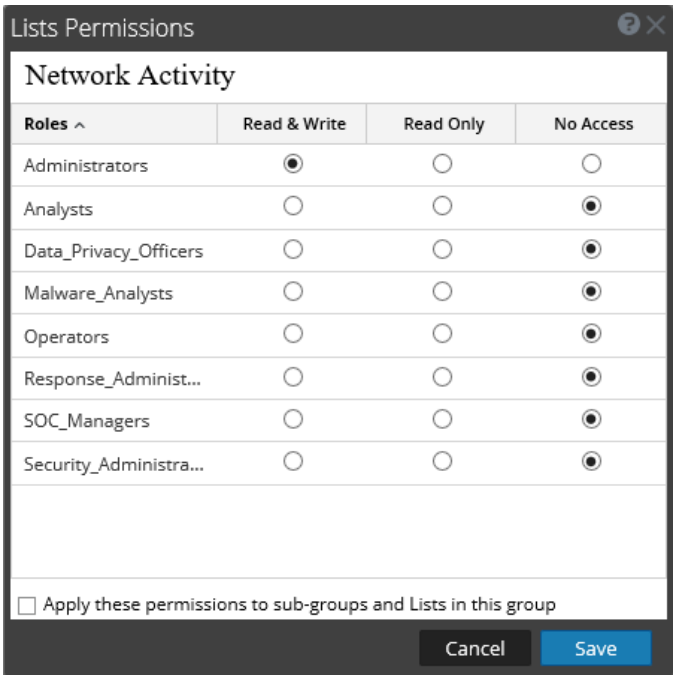
Quick View

The following figures are examples of the Lists Permissions dialog and List Group Permission dialog:





To access this view

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.
   The Lists view is displayed.
3. In the **Lists** view, select a report.
4. In the **Lists** toolbar, click > **Permissions**.
   The Reports Permissions dialog is displayed.

The following table describes the features in the Lists Permissions dialog:

Feature	Description
Roles	Describes roles of the users logged into the NetWitness Suite user interface.
Read & Write	Allows users to access, view, edit, delete, import, and export lists on the Lists view. Users can also change the permission on the rule.
Read Only	Allows users to only access and view the list on the lists view.

Feature	Description
No Access	Doesn't allow users to access or view the lists.
Apply these permissions to subgroups and lists in this groups	Automatically applies permissions to the subgroups and lists in the groups, if checkbox is selected.
Cancel	Cancels all the changes made to the permissions.
Save	Saves the selections and provides access to the roles based on the selections.

List View

In the List view you can see available lists and groups in a grid.

Workflow

This workflow shows the procedure to define lists or list groups. You can set access control at the list or list group level so that only users with specific roles can access the lists. You can use lists to define rules for generating reports, charts and alerts.

You must ensure that Reporting Engine is configured on NetWitness Suite.

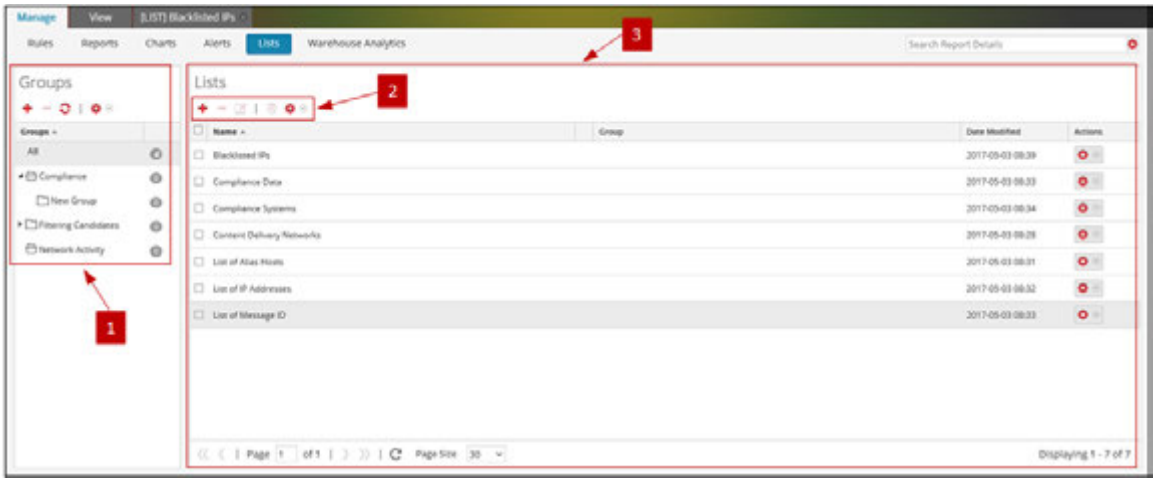
Quick View

The following figure shows the List view.



To access this view

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The Lists view is displayed.

The List view includes the following panels:

1 List Groups panel

2 List toolbar

3 List View panel

List Groups Panel

The List Groups panel provides a list of groups used to organize lists and has a toolbar that allows you to create and manage the groups.

Feature	Description
	Allows users to add a new group to the Reporting module.
	Allows users to delete groups.
	Refreshes the view.
	Allows users to access following options: Import, Export and Permissions.

You can perform the following actions using the List Groups panel.

- Refresh lists in a group.
- Move lists between different groups. You can move a list from one group to another by dragging and dropping the list in the required group.
- Create list groups.
- Delete list groups.
- Import list groups.
- Export list groups.
- Set access control for list groups.

List Toolbar

Feature	Description
	Allows user to add a new list to the Reporting module.
	Allows user to delete one or more selected lists.

Feature	Description
	Allows user to edit lists.
	Creates a duplicate copy of the selected list.
	Allows user to access the following options: Import, Export and Permissions.

List View Panel

The List View panel displays all the lists defined in a tabular format.

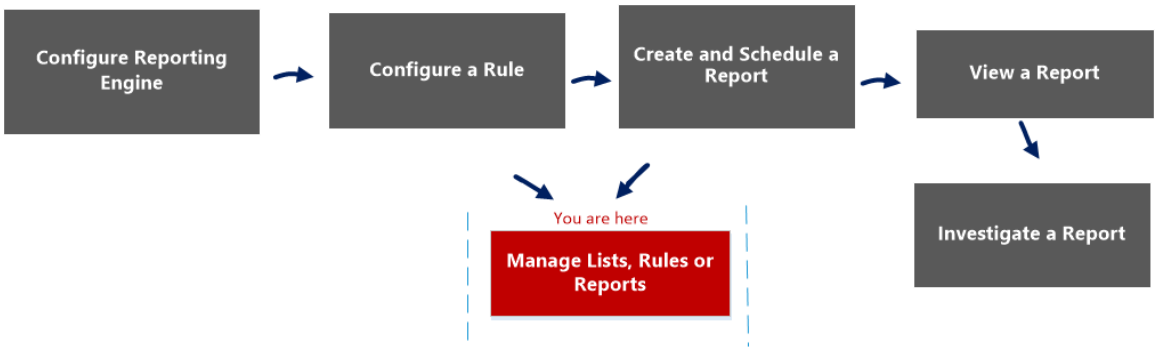
Column	Description
Name	Displays the name of the list. **Note:** For **Name** field, the icon to extend the column size is not displayed at the end of the column field. You have to hover the mouse a little to the left side to see the icon for extending the column.
Group	Displays the list group to which the list belongs.
Date Modified	Displays the date and time when the list was modified.

Reports Permissions Dialog

In the Reports Permissions dialog, the users with 'Read & Write' access permission can configure permissions.

Workflow

This workflow shows the procedure to manage reports or report groups.



What do you want to do?

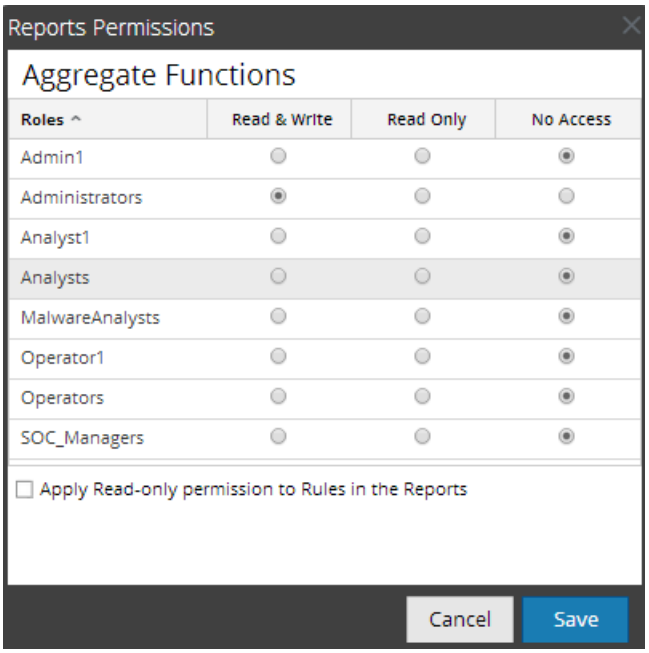
Quick View



To display the Reports Permissions dialog:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.

3. In the **Report List** panel, select a report.
4. Click  > **Permissions**.

   The Reports Permissions dialog is displayed.

Note: When you select the check box, all dependent rules are given READ access permission, provided the permissions for the report is higher compared to the permissions of the rules.

The following table describes the features in the Reports Permissions dialog.

Feature	Description
Roles	Displays all the roles who can get access to the permissions.
Read&Write	Allows you to get Read&Write access to the Rules in the Reports.
Read Only	Allows you to get Read Only permissions to the Rules in the Reports.
No Access	If you select this option, you will not get permission to the Rules in the Reports.
Apply Read-only permissions to Rules in the Reports	Allows to set Read Only permissions to the Rules in the Reports for all the roles .
Cancel	This option cancels all the changes made to the permissions.
Save	This option saves the selections and provides access to the roles based on the selections.

Report View

In the Report view, you can create and manage the report or report groups.

Workflow

This workflow shows the procedure to create and schedule a report.

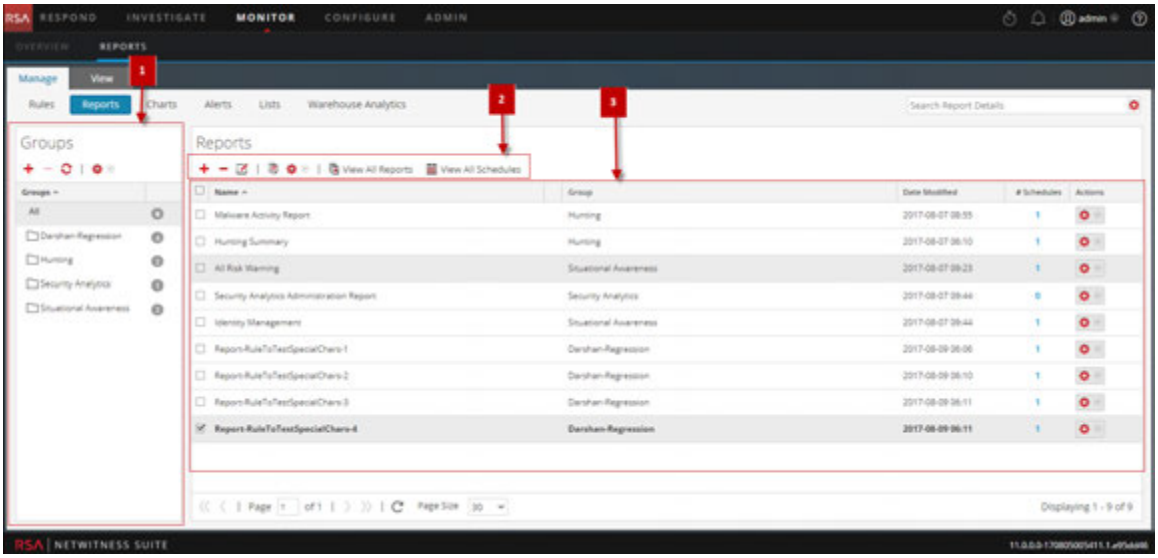
- Configure a Rule
- Create and Schedule a Report
- View a Report
- Investigate a Report
- Manage Lists, Rules or Reports
- Build Report View
- Import Report Dialog
- Scheduled Reports View
- Reports Permissions Dialog

Quick View



To access this view:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Reports view is displayed.

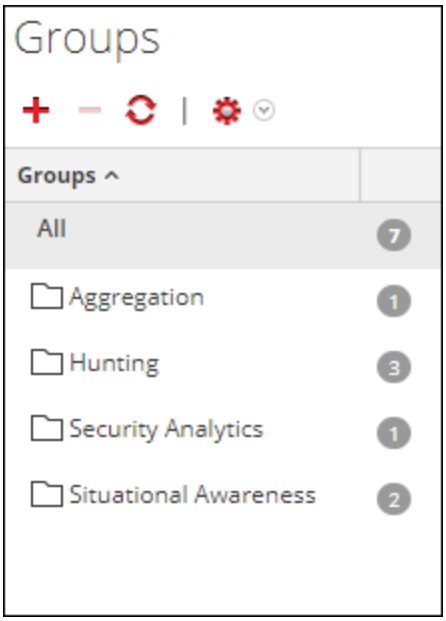
Features

The Report view includes the following sections:

1. Report Groups panel
2. Report toolbar
3. Report List panel

Report Groups Panel

The Report Groups panel allows you to organize reports in a group. You can create a report group, add reports to the group, and move reports among groups. You can view all reports by selecting All option under the Groups column.



Feature	Description
+	This option allows you to add a new report to the Reporting module.
−	This option allows you to delete one or more selected report.
↻	This option refreshes the view.
⚙	The actions menu has the following options: Import, Export and Permissions.

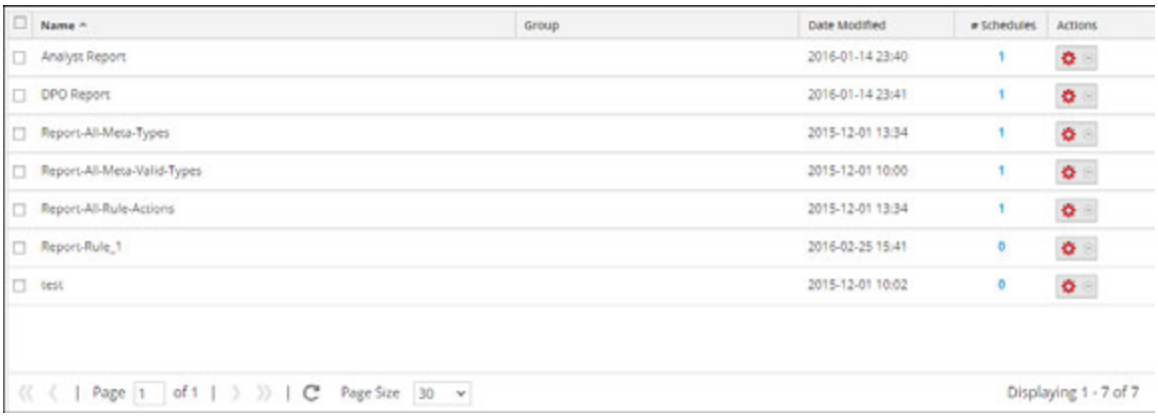
Reports Toolbar

The Reports toolbar allows you to add, modify, delete, duplicate, import and export reports. You can also set access permissions for a report in a group.

Feature	Description
	This option allows you to add a new report to the Reporting module.
	This option allows you to delete one or more selected reports.
	This option allows you to edit a chart.
	This option creates a duplicate copy of the selected report.
	The actions menu has the following options: Import, Export , Export as Text and Permissions.
	This option allows you to view a list of reports along with their schedule name and time.
	This option allows you to view all the scheduled reports.

Report List Panel

The Report List panel lists all the reports in a tabular format.



The following table describes the columns in the Report List panel.

Column	Description
Name	The name of the report.
Group	The Report Group to which the report belongs.
Date Modified	The date and time when the report was modified.
#Schedules	The count indicates the number of schedules created for a report.
Actions	The actions menu has the following options: Schedule Report, View Scheduled Reports, Delete, Edit, and Export.

Rule Permissions Dialog

The Reporting module provides access control at the rule level. Only a user who has the right set of permissions can perform tasks on the rule. When creating user roles, the administrator must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

Workflow

This workflow shows the procedure to manage rule or rule groups.

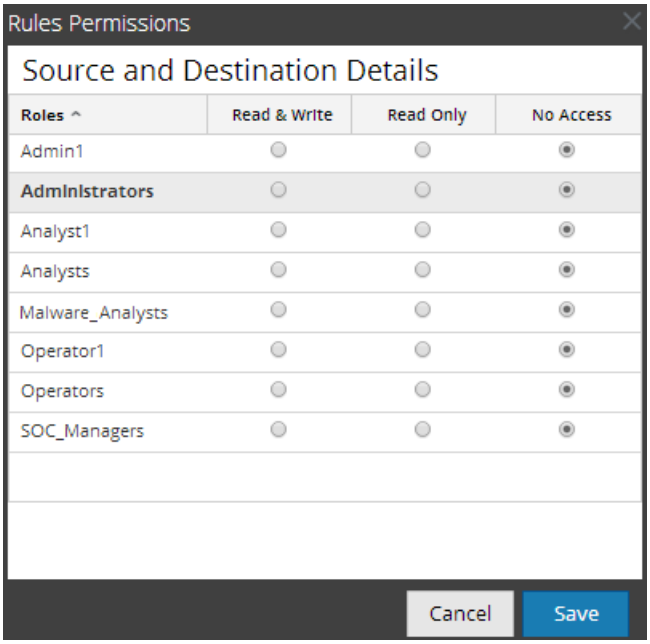
Related Topics

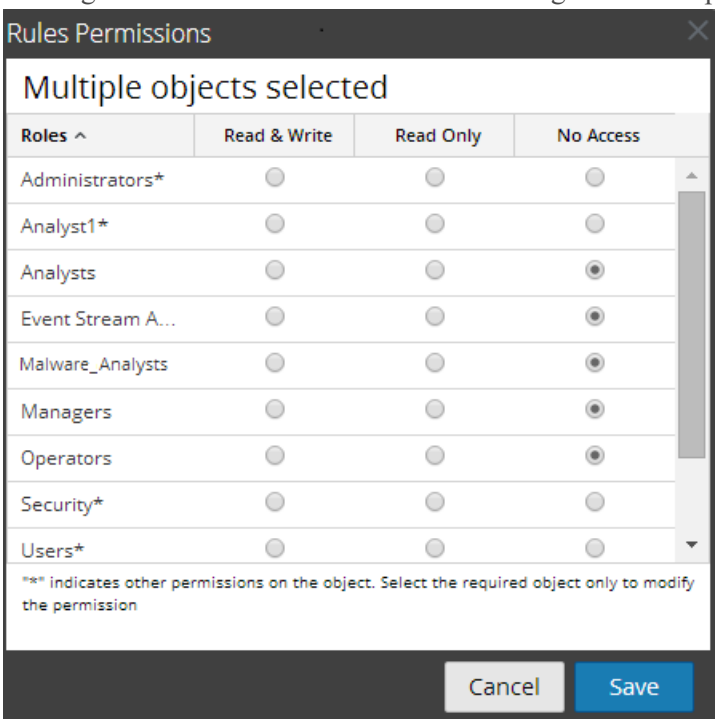
- Configure a Rule
- Manage Lists, Rules or Reports
- Rule View

Quick View

This figure shows the Rules Permissions dialog for a single rule.



This figure shows the Rules Permissions dialog when multiple rules are selected.



The dialog has a different appearance for rule groups versus rules. To access the dialog:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the **Rules** list panel, select one or more rules or a rule group.
3. Click  > **Permissions** in the toolbar.
   The Rules Permissions dialog is displayed.

Feature	Description
Roles column	Lists the NetWitness Suite user roles, both built-in and custom roles. Each user who is logged in to NetWitness Suite has user roles assigned. When multiple rules are selected, the asterisk beside the role name, for example, `Security*`, indicates there are other permissions available on that user role. To change the other permissions, you must select the user role and change the access permission.

Feature	Description
Read & Write column	When the checkbox in this column is selected, the corresponding user role has permission to view, edit, delete, import, and export rules in the Rules view. The user can also change the permission on the rule.
Read Only column	When the checkbox in this column is selected, the corresponding user role has permission to view the rules in the rule group.
No Access column	When the checkbox in this column is selected, the corresponding user role cannot view or edit the rules in the rule group. Before applying rule permissions, this is the default permission set for all the user roles though the checkbox is unchecked.
Apply these permissions to sub-groups and Rules in this group checkbox	When checked, NetWitness Suite applies permissions to sub-groups and rules in the group.
Cancel option	Clicking Cancel closes the dialog without saving any changes made.
Save option	Clicking Save closes the dialog and updates the rule group permissions for user roles. If specified, the access permissions are applied to subgroups and child objects of this group. When multiple rules are selected, the access permission is applied to all the selected rules.

Rule View

The Rule view is the user interface for managing rules.

Workflow

This workflow shows the procedure to define rule or rule groups.

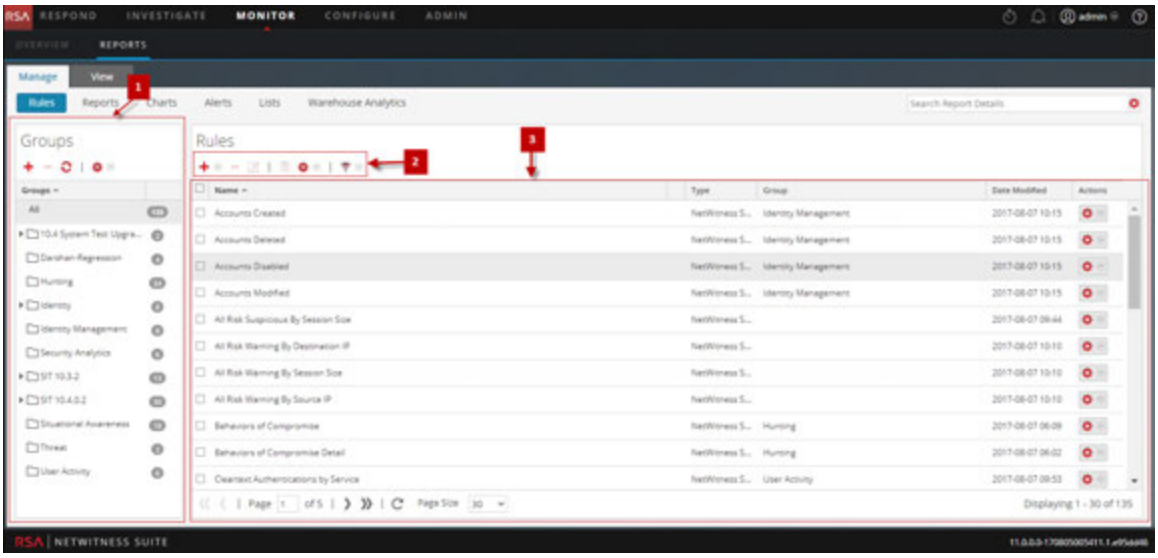
Quick View



To access the Rules view:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Rules**.

   The Rules view is displayed.

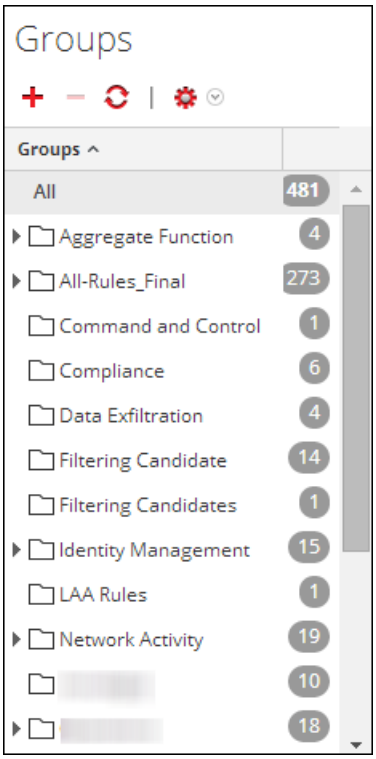
The Rule view includes the following panels.

1	Rule Groups
2	Rules List
3	Rule Toolbar

Rule Groups Panel

The Rule Groups panel allows you to organize rules into groups using the options in the toolbar. You can create groups and sub-groups and add rules to them. You can also group and move rules between different groups.

The following figure shows the groups in the Rule Groups panel:



The following table describes the features in the Rule Groups Panel.

Feature	Description
+	This option allows you to add a new rule group to the Reporting module.
−	This option allows you to delete one or more rule groups.
	This option refreshes the rule group list.
	The actions menu has the following options: Import, Export and Permissions.
All	Displays a list of all the rule groups.

Rule Toolbar

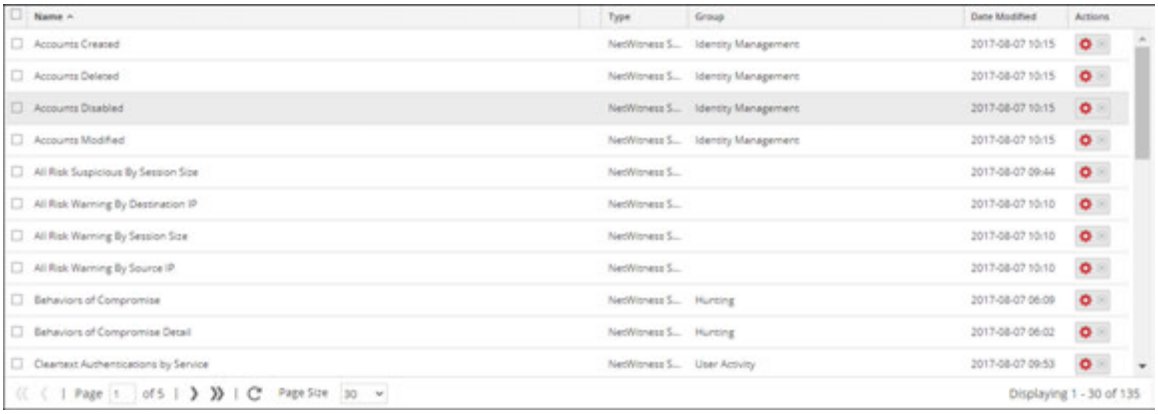
The Rule toolbar allows you to add, delete, edit, and duplicate a rule. The following figure shows the toolbar.

The following table describes the features in the Rule Toolbar

Feature	Description
	This option allows you to add a new rule to the Reporting module.
	This option allows you to delete one or more selected rules.
	This option allows you to edit a rule.
	This option allows you to duplicate a rule.
	The actions menu has the following options: Use, Import, Export and Permissions.
	This option allows you to select the rule type.

Rule List Panel

The following figure shows the list of rules in the Rule List panel.



The following table describes the features in the Rule List Panel.

Feature	Description
Name	Displays the name of the rule that you are created or edited. **Note:** For the **Name** field, the icon to extend the column size is not displayed at the end of the column field. You have to hover the mouse a little to the left side to see the icon for extending the column.
Type	Displays the supported database type for the rule you created.

Feature	Description
Group	Displays the values which are grouped.
Date Modified	Displays the date when the rule was last modified.
Actions	Displays the actions menu has the following options: Create Alert, Create Chart, Create Report, Delete, Edit, Export, and Dependents.

Select a Logo Dialog

In the Select a Logo dialog, you can upload a new logo that is not available in Reporting Engine Services Config view or choose an existing logo from the Reporting Engine Services Config view.

Workflow

This workflow shows the procedure to manage reports or report groups.

Related Topics

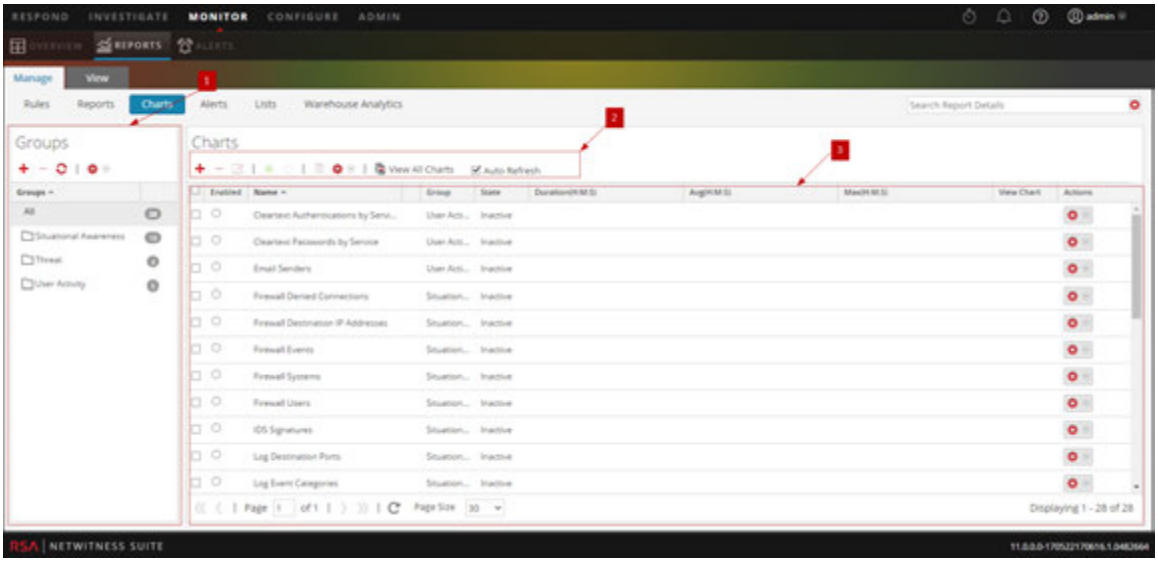
- Configure and Generate a Chart
- Configure a Chart
- Schedule a Chart

Quick View

The following figure shows the Schedule a Chart view.



The Schedule a Chart view includes the following panels:

1	Chart Groups panel
2	Chart toolbar
3	Chart View panel

Chart Toolbar

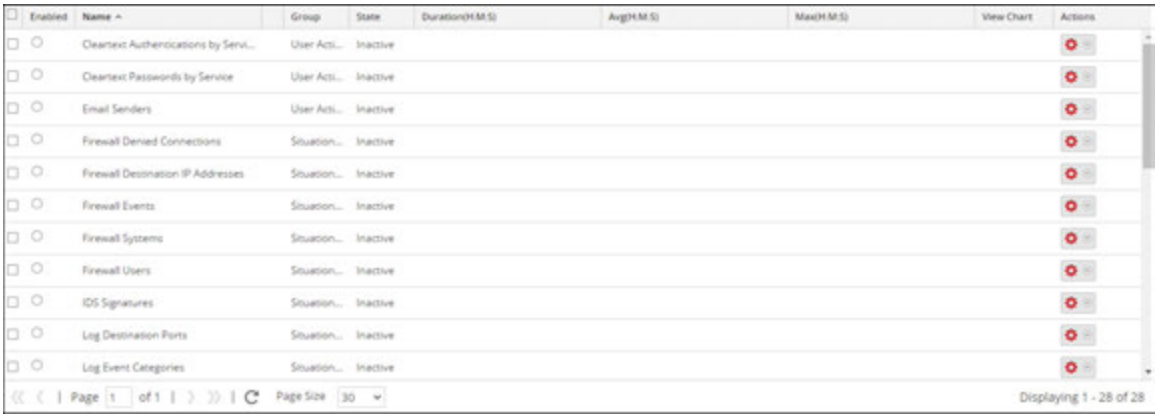
The Charts toolbar allows you to add, modify, delete, duplicate, enable, disable, import and export a chart. You can also set access permissions for charts in a group.

The Chart toolbar includes the following options:

Feature	Description
	Adds a new chart to the Reporting module.
	Deletes one or more selected charts.
	Edit charts.
	Enables the selected charts.
	Disables the selected charts.
	Creates a duplicate copy of the selected chart.
	Provides the following options: Import, Export, Export as Text and Permissions.
View All Charts	Displays all the executed charts.
Auto Refresh	Automatically refreshes the charts list.

Chart View Panel

The Chart View Panel presents all the charts in a tabular or grid format.



The following table lists the columns in the Chart View panel and their description.

Feature	Description
Enabled	● - The chart is enabled. ○ - The chart is disabled.
Name	The name of the chart.
Group	The Chart Group to which the chart belongs.
State	The state of the chart: • Queued • Completed • Failed
Duration (H:M:S)	The time taken to execute the latest chart.
Avg (H:M:S)	The average time taken to run the chart.
Max (H:M:S)	The maximum time taken to run the chart.
View Chart	A hyperlink that redirects to the View a Chart panel.
	The actions menu has the following options: Enable, Disable, View, Delete, Edit, and Export.

Schedule Report Panel

The Schedule Report panel allows you to schedule a customized report. Prior to scheduling a report, you can create a dynamic list (with the overwrite option selected) with services added. For more information, see Generate a List from the Scheduled Report section in Create and Schedule a Report. Then use the list to generate a report with details in the report like services and host names.

Workflow

This workflow shows the procedure to create and schedule a report.

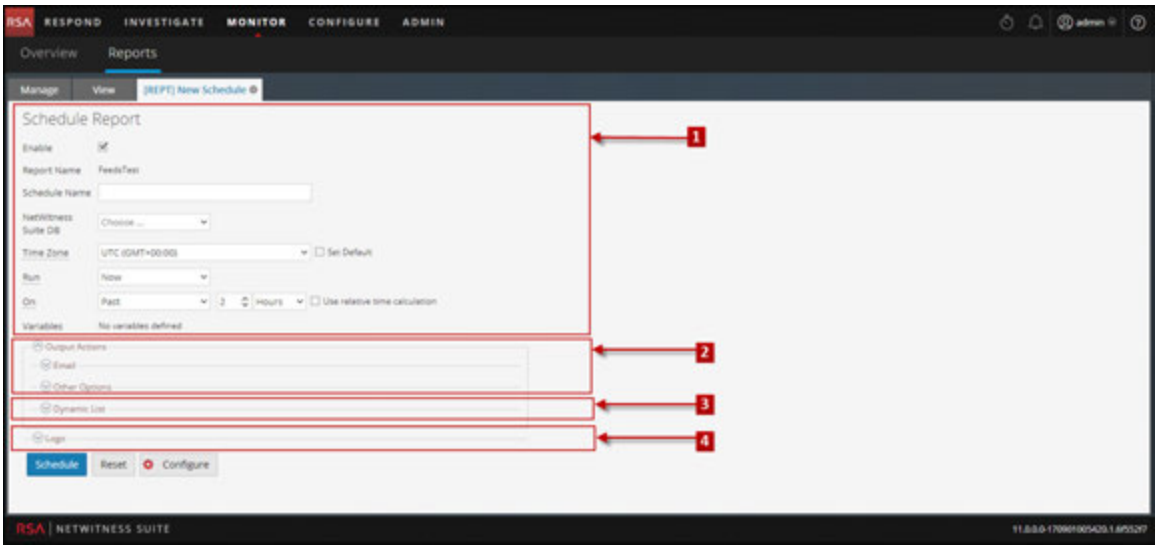
- Scheduled Reports View

Quick View



To access this view:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.

2. Click **Reports**.
   The Reports view is displayed.
3. In the **Report List** panel, click  > **Schedule Report**.

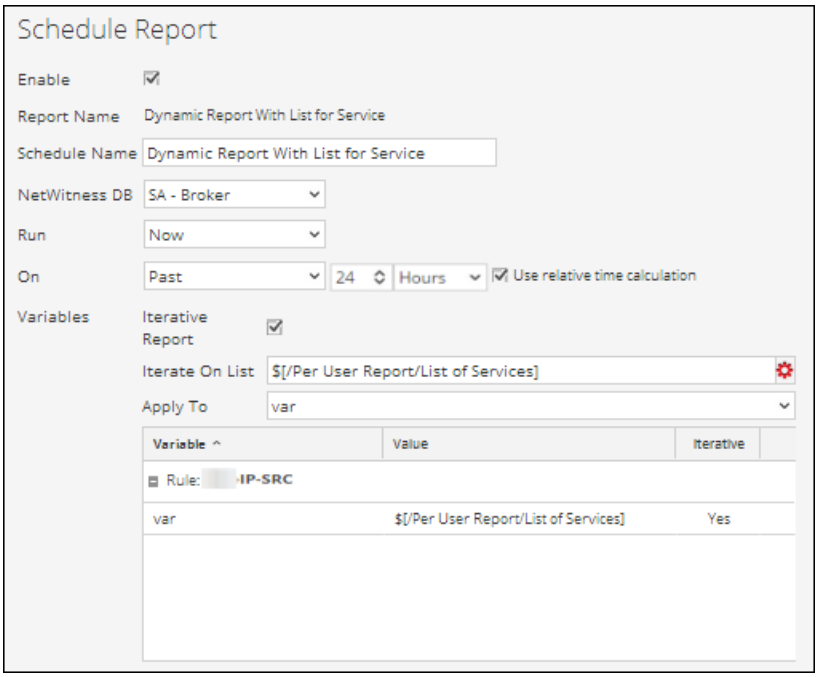
Features

The Schedule Report view consists of the following panels:

1	Schedule Report View
2	Output Actions Panel
3	Dynamic List Panel
4	Logo Panel

Schedule Report View

The Schedule Report view allows you to schedule reports.



The following table lists the fields in the Schedule Report panel.

Field	Description
Enable	Enables the report schedules and runs the report.
Report Name	The name of the report.

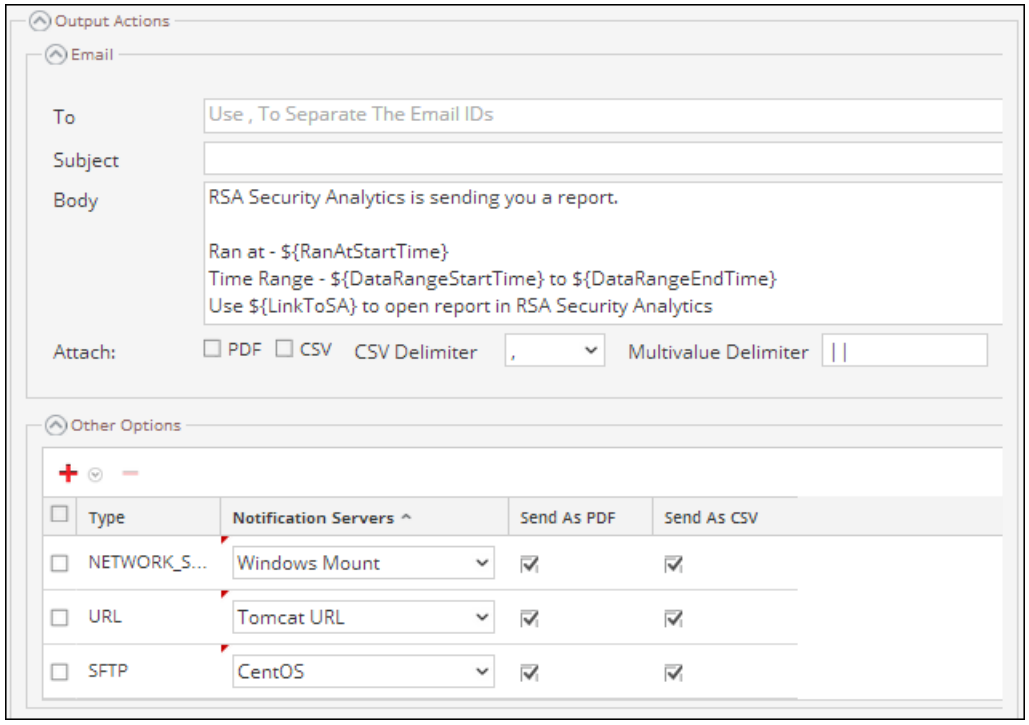
Field	Description
Schedule Name	The name of the scheduled report configuration.
NetWitness DB	The database can be NWDB, IPDB, and Warehouse DB depending on the type of database that you selected in the rule definition. If the report has rules of NWDB, IPDB, and Warehouse DB types, all the database types or rule types are displayed.
Warehouse Resource Pool	If the report has rules of Warehouse DB, the Warehouse Resource Pool drop-down is displayed to select the pools or queues available in the cluster. If no pools or queues are entered for the Reporting engine, this field is disabled. For more information, see "Step 5: Configure Task Scheduler for a Reporting Engine" topic in the *Host and Services Configuration Guide*.
Run	Provides the type of schedule for the run configuration: • Ad-hoc execution • Hourly execution • Daily execution • Weekly execution • Monthly execution
On	The data range on which the query is run.
Use relative time calculation	Uses the relative time duration to schedule a report.
Iterative Report	Select the checkbox to schedule a report for the selected list value.

Field	Description
Iterate on List 	Click this button to navigate to the List Selection panel and select a list. The following figure displays this panel:  The List Selection panel is a collection of Lists. The Reporting Engine maintains an active list of the available list names by continuously synchronizing with the collection to which it is connected.
Apply To	Apply list values on the selected variable.
Variables	Displays the rule variables along with their associated values and the iterative properties included in the report. **Note:** Depending on the rule chosen while creating a report, you can view dynamic variables defined for the rule in the **Variables**field of the Schedule Report panel. For example, Test-Country is the rule having the dynamic variable var.
Schedule	Schedules the report.
Reset	Resets the scheduled report.

Field	Description
Configure	Allows you to alter the Reporting Engine configuration details on the "Reporting Engine General Tab" topic in the *Host and Services Configuration Guide*. **Note:** This button is visible on the Schedule Report panel only when you have the 'Manage Device' access permissions on the Reporting module.

Output Actions Panel

The Output Actions panel specifies output actions to notify the email recipient when the report execution completes and also sends reports in PDF and CSV formats as attachments in the email, based on your selection.



The following table lists the fields in the Output Actions panel.

Field	Description
To	A comma-separated list of email addresses to receive the output.
Subject	The subject entered in the mail.

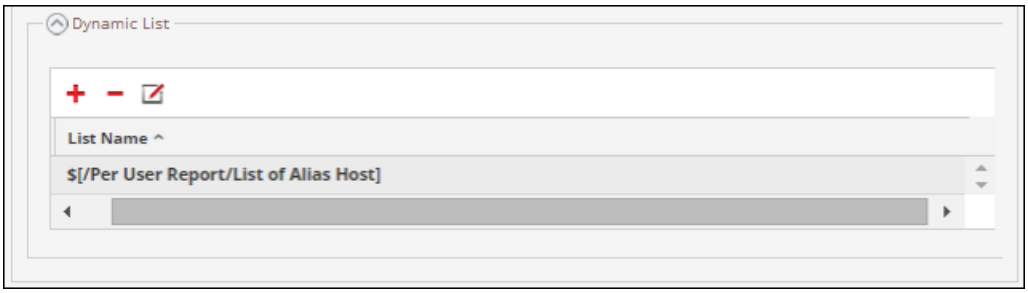
Field	Description
Body	The body of the email. By default, the body field is populated with pre-defined text that has certain variables that will add meta appropriate to the generated report. In the Reporting Engine, these variables are replaced with actual values. • `${RanAtStartTime}` : The Start time of the report. • `${DataRangeStartTime}` : The Start time of the data time range. • `${DataRangeEndTime}` : The End time of the data time range. • `${LinkToSA}` : The link to the NetWitness SuiteHost from the email which in turn opens the report in NetWitness Suite interface. • `${ReportName}` : The name of the report. • `${DataSource}` : The name of the data source.
Attach:	The output format in which the report is attached to the email, such as PDF or CSV as configured in the Schedule Report dialog.

Field	Description
CSV Delimiter	The default CSV delimiter is comma (,). If the CSV content contains a comma, you must identify a unique separator so the content is stored in its original form. For example, if msg is a column in the report to be saved as CSV and the msg content is as follows: `ASA-SSM-CSC-20 Module in slot 1," application reloading ""CSC SSM""," version ""6.2.1599.0"" CSC SSM scan services are reloading because of a pattern file or configuration update` The above content will be included in three columns due to the commas (,). To avoid this, you must specify a different delimiter such as a pipe line character "|". **Note:** To import the CSV file into Microsoft Excel, use the Data > From Text option in the Excel application. When you import the CSV file you must specify the file type of the file being imported as Delimited and use the same delimiter that you specify to generate the CSV file.
Multivalue Delimiter	The data in multivalued fields are separated by the multivalue delimiter. The default Multivalue delimiter is two pipe line characters (||).
Other Options	You can select an SFTP, URL, or Network Share location configured in ((RE}} and then send the report either in PDF or CSV format based on the requirement.
	Select this option to send the report to the SFTP, URL or Network Share location configured in the Reporting Engine Services Config view.
Type	The type of output action chosen. For example, SFTP, URL or Network Share.

Field	Description
Output Actions	Select the SFTP, URL or Network Share name configured in the Reporting Engine Services Config view.
Send as PDF / Send as CSV	Select these options to send the report either in PDF or CSV format, or both to the configured Notification Server (SFTP, URL or Network Share).

Dynamic List Panel

The Dynamic List panel populates the lists created and you can add, edit or delete the list. The list is generated based on the scheduled report which can be viewed in the Lists view.



The following table lists the operations in the Generate List panel.

Operation	Description
+	Adds a new list to the report.
−	Deletes all the lists added to the report.
✎	Displays the Generate List dialog.
List Name	The name of the list chosen from the List Selection panel. For more information on the List Selection panel, see Generate List Panel.

Logo Panel

The Logo panel populates the default logo from the Select a Logo panel. For more information on choosing a logo from this panel, see Manage and Select a Report Logo section in Manage Lists, Rules or Reports.

You can set the default logo for a Reporting Engine. This is the logo that is used in the generated reports. For more information on choosing a logo, see Select a Logo Dialog.

Note: If you have not selected any logo then the default RSA logo is used on the report. The option **Save as PDF** for the previously executed reports does not support a new customer logo. It displays the default RSA Logo, if the customer logo must be displayed in the Schedule a Report view.

Scheduled Reports View

The Scheduled Reports view allows you to create, view and manage scheduled reports.

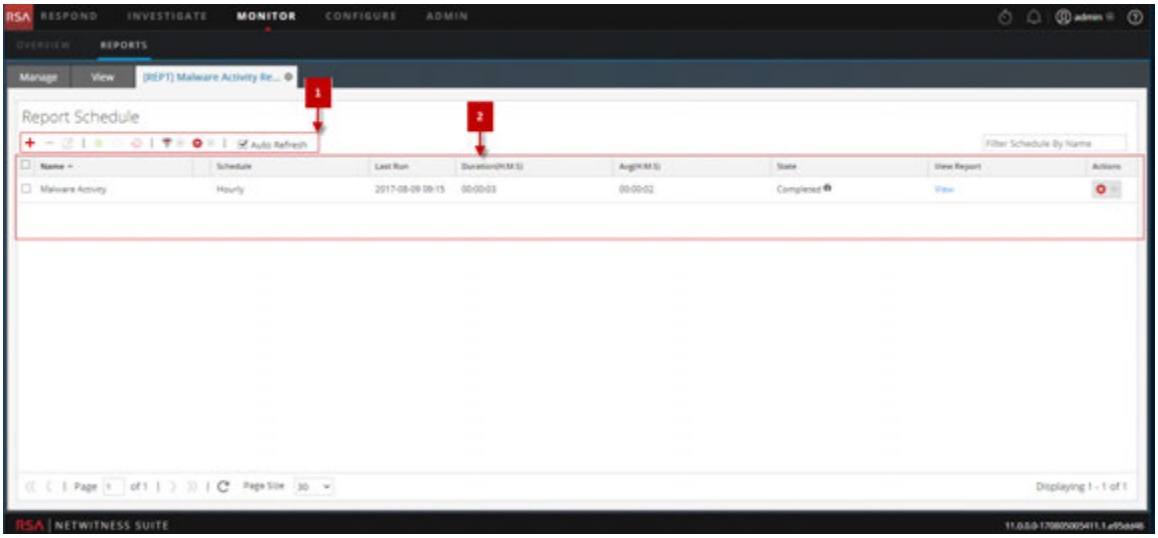
- Create and Schedule a Report
- Manage Lists, Rules or Reports
- Build Report View
- Report View
- Schedule Report Panel
- Reports Permissions Dialog

Quick View



To access this view:

1. Select **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report List** panel, do one of the following:

   - Click  > **View Scheduled Reports**.
   - Click the **#Schedules** column.

Features

The View Scheduled Reports has the following features:

1 Report ScheduleToolbar

2 Report Schedule List panel

Report ScheduleToolbar

The Scheduled Reports has options to add, modify and delete the scheduled report as well as options to enable or disable the selected run configuration.

The following table lists the operations in the Scheduled Reports toolbar.

Operation	Description
	Create a new report schedule.
	Delete the selected report schedule.
	Edit the selected report schedule. **Note:** Double-click on a desired report schedule to edit it.
	Enables the selected report schedule.
	Disables the selected report schedule.
	View the history of the scheduled report.
	Filter schedules based on the type of schedule. (For example, AdHoc)
	Allows you to set permissions for the selected scheduled report.

Operation	Description
	Automatically refreshes the scheduled reports list.
	Searches schedules based on the schedule name.

Report Schedule List Panel

The Scheduled Reports List panel lists the scheduled reports in a tabular format.

The following table lists the columns in the Scheduled Reports List panel:

Column	Description
Name	The name of the scheduled report.
Schedule	The type of schedule for the run configuration: • Ad-hoc execution • Hourly execution • Daily execution • Weekly execution • Monthly execution
Last Run	Displays the last time the report was run.
Duration(H:M:S)	Displays the time taken for last execution of the report
Avg(H:M:S)	Displays the average time taken to run the report.

Column	Description
State	Indicates the state of the scheduled report. • Scheduled: If a report is scheduled to run on an hourly, daily, weekly, monthly, or later time, the state of the report is displayed as scheduled, for the first run. • Queued: If a report is still waiting to get executed, the state of the report is displayed as queued. • Running: If the report schedule is in progress, the state of the report is displayed as running. • Partial: If in a report with several rules, a single rule execution failed or an output action failed or creation of PDF/CSV failed, the state of the report is displayed as partial. For example, consider a report with five rules and four rules are executed successfully and one fails, then the state is

Column	Description
	displayed as Partial. • Failed: If in a report with several rules, all the rule schedule executions failed, the state of the report is displayed as failed. • Completed: If a report schedule is successfully executed, the state of the report is displayed as completed. • Canceled: When cancel request is completed, the state of the report is displayed as canceled. **Note:** Cancel option may not work for Warehouse Analytics jobs. You must kill the job manually. Following are the steps to kill the job: **For MapR**: 1. Get the Jobid from job logs. 2. Login to jobtracker UI and search for Jobid to kill under "Running Jobs". Sample URL: http://<job-tracker-host>:50030/jobtracker.jsp

Column	Description
	3. Kill the Jobid: • Select Jobid under "Running Jobs" and click Kill Selected Jobs. (or) • Click on Jobid link, scroll down and click Kill this job link. • Inactive: If a report schedule is disabled, the state of the report is displayed as Inactive. • Not available: If the report schedule executed information is not available, the state of the report is displayed as not available.

Column	Description
	Click to view the rule execution information and output action information. This pop-up notifies the status of multiple rules in a report and the time taken for its execution. **Note:** You can view the rule execution and output action information for a scheduled report having the state **Completed**, **Running**, **Partial** or **Failed**. By default, the Output Actions for Completed Report on Reporting Engine Config page is set to enable, to receive an email when the report status is completed. To receive an email for **Failed** or **Partial** reports, you must disable this option.
View Report	Click to view the rule execution information on the View a Report Panel. You can view the rule execution information for a scheduled report having the state 'running' as well.

Test a Chart View

In the Test a Chart view, you can view and test the charts.

- Test a Chart

Quick View

The following figure is an example with the important features labeled.

The Test a Chart view consists of the following panels:

1	Chart toolbar
2	Chart Output panel
3	Chart Options panel

Chart Toolbar

The Charts toolbar allows you to investigate on a particular chart and change the screen to full screen.

Feature	Description
Investigate	Investigates further on the selected chart.
Full Screen	Displays the chart in full screen.

Chart Output Panel

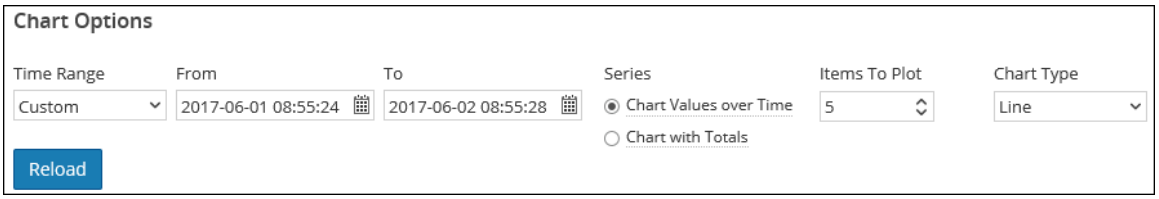
The Chart Output panel displays the information in a chart format for the selected time chart options.

The following table lists the features in the Test a Chart View and their descriptions.

Feature	Description
Display	Allows you select the values that needs to be displayed and have the following options: X Axis, Y Axis and Legends.
X Axis	Displays the session count.
Y Axis	Displays the actual output.
Legends	Displays the list of variables appearing in the chart.

Chart Options Panel

The following figure shows the Chart Options panel, which displays the time range, series, and chart type fields to configure the chart display.



The following table lists the fields in the Charts Options panel and the descriptions.

Feature	Description
Time Range	The default time range is Last 3 Hours. However, you can select a different value from the drop-down list, for example, Last Hour, or Last 6 Hours which are the preset values. Or you can customize by selecting Last N Days or the Custom option.
From	The start date and time. (only for custom options).
To	The end date and time. (only for custom options).
Series	The series field provides you with two options: • Chart Values over Time: Renders the chart for the entire time range selected. • Chart with Totals: Renders the summary of data for the selected date range.

Feature	Description
Items to Plot	The maximum number of events the user wants to view on the chart.
Chart Type	The type of chart to be rendered either area, bar, column, line, step line, step area, spline area or spline.

View a Chart Panel

In the View a Chart panel, you can view and manage charts. There are options for filtering and sorting the information in the chart, as well as options for the type of chart, the number of items to chart, and charting values or totals. When viewing a chart, you can open the charted sessions in the Investigation module and save the chart as a PDF.

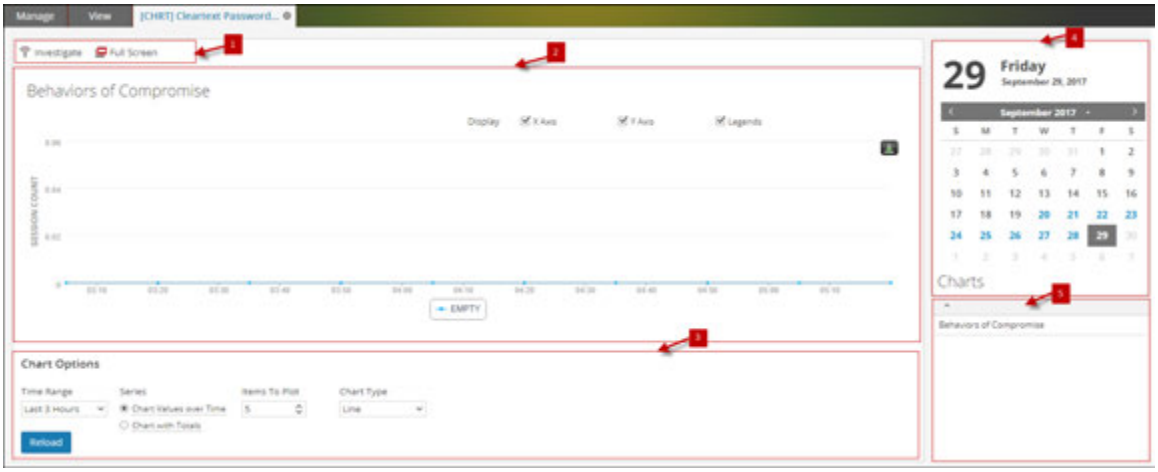
Quick View

The following figure is an example with the important features labeled.



The View a Chart panel includes the following panels:

1	Chart toolbar
2	Chart Output panel
3	Chart Calendar panel
4	Chart Options panel
5	Chart Executed list

Chart Toolbar

The Chart toolbar has options that allow you to investigate, and view the chart on another screen.

The following table lists the options in the Chart toolbar.

Operation	Description
Investigate	Investigates the chart details.
Full Screen	Displays the chart on a full screen.

Chart Output Panel

The Chart Output panel displays the chart with sortBy on the Y-axis, time on the X-axis and legends.

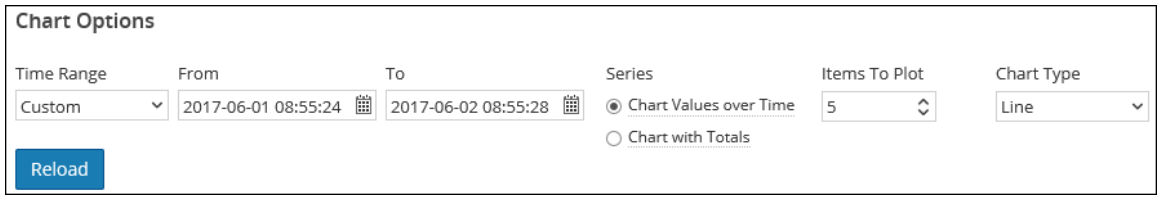
Note: You can save the chart as PDF using the icon on the Chart Output panel.

Chart Calendar Panel

The Chart Calendar panel is the default calendar with which you can filter the list of charts depending on the date you select from the Calendar, as shown in the following figure.

Chart Options Panel

The Chart Options panel displays the time range, series, and chart type fields to configure the chart is displayed.



The following table lists the fields in the Chart Options panel.

Field	Description
Time Range	The default time range is Last 3 Hours. However, you can select a different value from the drop-down list, for example, Last Hour, or Last 6 Hours which are the preset values. Or you can customize by selecting Last N Days or the Custom option. **Note:** The time range selected by you for a chart will be saved. When you open the same chart the next time, the time range that is saved will be displayed. This behavior is not applicable for the custom option.
From	The start date and time. (only for custom options)
To	The end date and time. (only for custom options)
Series	The series field provides the user with two options: • Chart Values over Time: Renders the chart for the entire time range selected. • Chart with Totals: Renders the summary of data for the selected date range.
Items to Plot	The maximum number of events the user wants to view on the chart.
Chart Type	The type of chart to be rendered. Either area, bar, column, line, step line, step area, spline area or spline.

Chart Executed List Panel

The Chart Executed List panel displays all the executions for a particular chart for the selected date. Double-clicking on any chart execution loads the chart on the Chart Output panel. By default, the last executed chart is displayed in the Chart Output panel.

View All Charts View

In the View All Charts view, you can display, print, save and email charts.

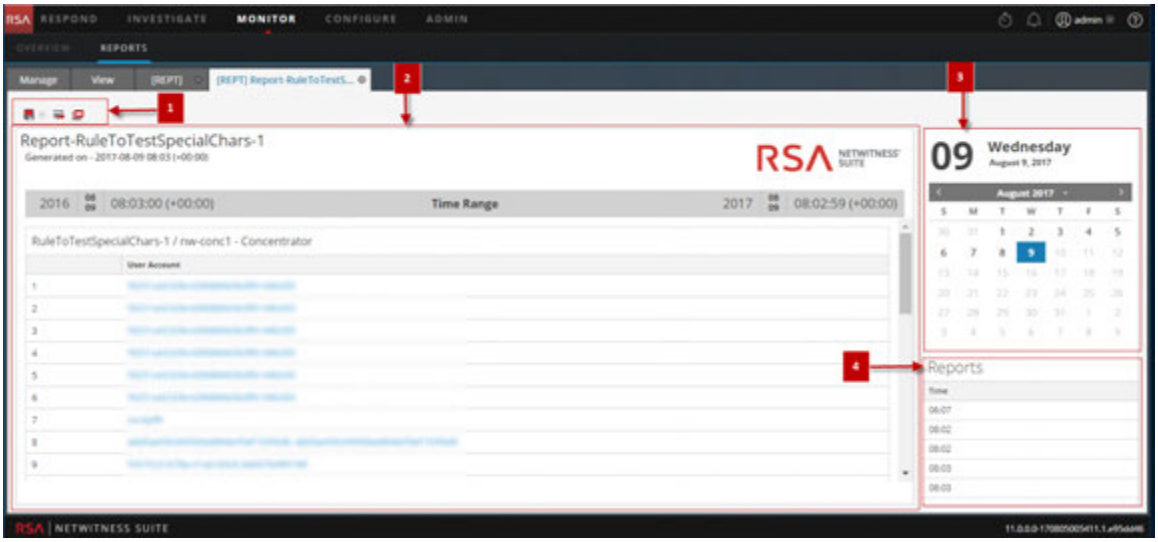
- Report View

Quick View



To access this view:

1. Select **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.

3. In the **Report List** panel, do one of the following:
   - Click  >**View Scheduled Reports**.
   - Click the **#Schedules** column.
     The Report Schedule view is displayed.
4. Click **View** .

Features

The View a Report panel has the following sections.

1	Reports Toolbar
2	Reports Output panel
3	Reports Calendar panel
4	Reports Time panel

Reports Toolbar

The Reports toolbar allows you to print, save, email, and view reports on full screen.

Note: The Reporting Engine is responsible for generating PDF and CSV output of the reports based on the report definition. The size of the PDF files for a report must not exceed 50,000 cells.

The following table lists the options in the Reports toolbar.

Operation	Description
	Prints the generated report.

Operation	Description
	Saves the report as a PDF and a CSV file. **Note:** The **Save As PDF** option is not available for a large report. If you are generating a PDF for a report and it takes a longer time than expected, you get a warning message stating **PDF generation is in progress, please try after some time**. When you click download as a CSV file, the Select Rule to download dialog is displayed. You must select a rule from this dialog to download the rule result in a CSV file. If the file generation takes a while, you can click on the **Notify me** option to be notified once the PDF or CSV is generated. Once the PDF or CSV is generated, you can view the Notifications for the status.
	Emails the report with the PDF or CSV attachment.
	Opens the generated report on a new window.

Reports Output View

The Reports Output panel view the report with the report schedule name, report generated time and the actual report with the selected rule variables.

Feature	Description

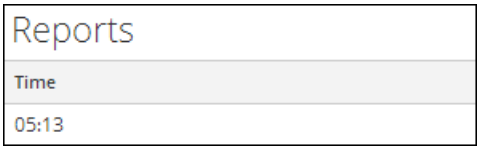
Name	This field displays the name of the scheduled report.
Time	This field displays the time when the report is generated.
Report	This field displays the details report with the selected rule variables.

Reports Calendar View

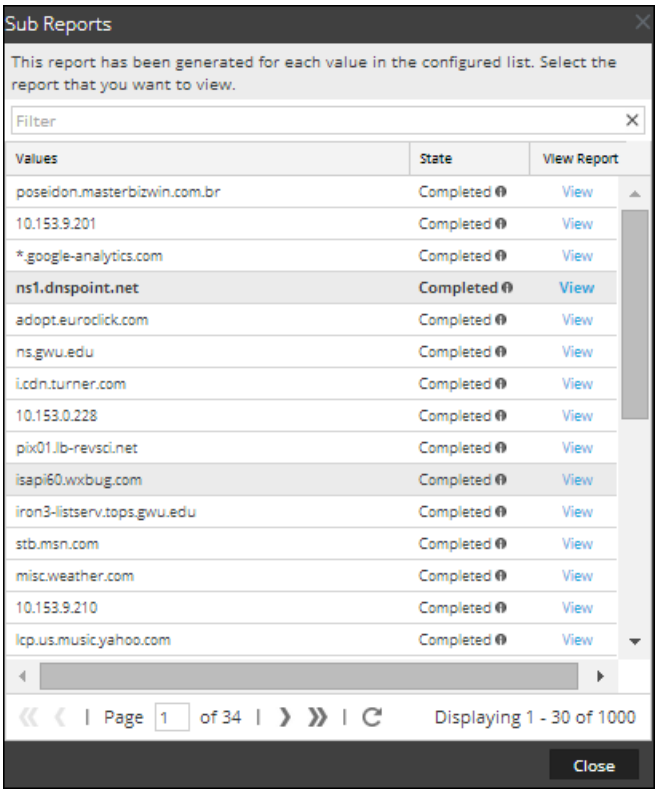
The Reports Calendar view is used to select a date from the Calendar. Based on the date you select, the list of successfully run reports for the date is displayed.

Reports Time View

The Reports Time view displays the time when the report was actually run.



When you click **View** on the scheduled report having **Iterative** selected, the **Sub Reports** panel is displayed. For each value in the configured list a report is generated.



The following table lists the columns in the Sub Reports panel.

Column	Description
Values	The List values chosen for a dynamic variable from the List Selection panel.

Column	Description
State	Indicates the state of the scheduled report for each of the list values. • Partial: If in a report with several rules, a single rule execution failed or an output action failed or creation of PDF/CSV failed, the state of the report is displayed as partial. For example, consider a report with five rules and four rules are executed successfully and one fails, then the state is displayed as Partial. • Failed: If in a report with several rules, all the rule executions failed, the state of the report is displayed as failed. • Completed: If a report is successfully executed, the state of the report is displayed as completed.
View	Clicking on any of the report schedules or sub reports listed and then **View** displays the desired report. **Note:** You can view the completed rules on the **View a Report** page even when the report is 'running'.

View All Reports View

In the View All Reports view, you can display, print, save and email reports.

Workflow

This workflow shows the procedure view a report or list of all reports.

   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.

3. In the **Report** panel, click **View All Reports**.
   The Reports panel is displayed, clicking on any of the reports listed allows you to view the report.

Features

The View All Reports panel has the following features.

1. Reports Toolbar
2. Reports Output panel
3. Reports Calendar panel

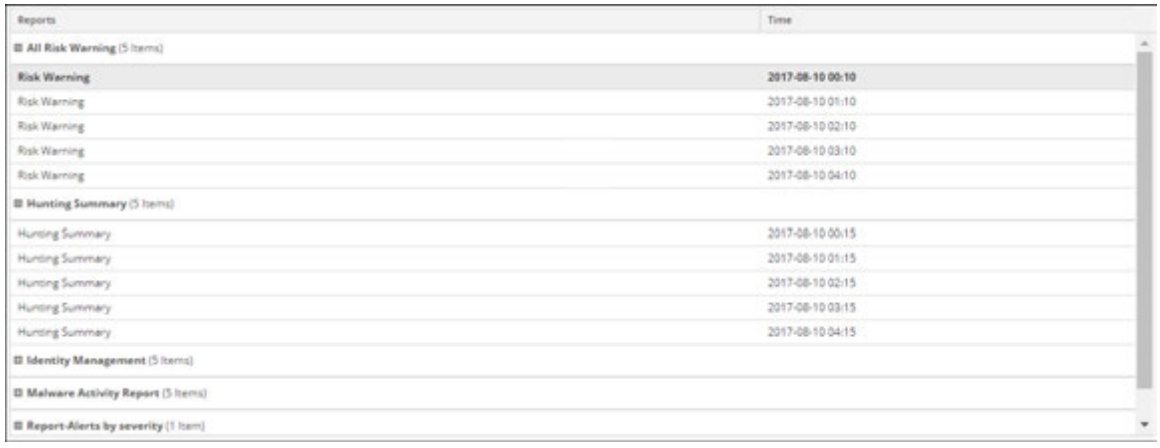
Reports Toolbar

The following table lists the options in the View All Reports toolbar:

Operation	Description
Filter By Report Or Schedule Name	Searches schedules based on the report name or schedule name for a selected calendar day.

Reports Output Panel

The Reports Output panel displays the report with the report schedule name and report generated time.



Feature	Description
Reports	This field displays the detailed report with the selected rule variables.

Time	This field displays the time when the report is generated.

Reports Calendar View

The Reports Calendar view is used to select a date from the Calendar. Based on the date you select, the list of successfully run reports for the date is displayed.

Alerting References

The Reporting module user interface provides access to NetWitness alerts. This topic contains descriptions of the user interface as well as other reference information to help users manage Alerts.

Alert List View

The Alert List view allows you to import, export, manage, and add alerts.

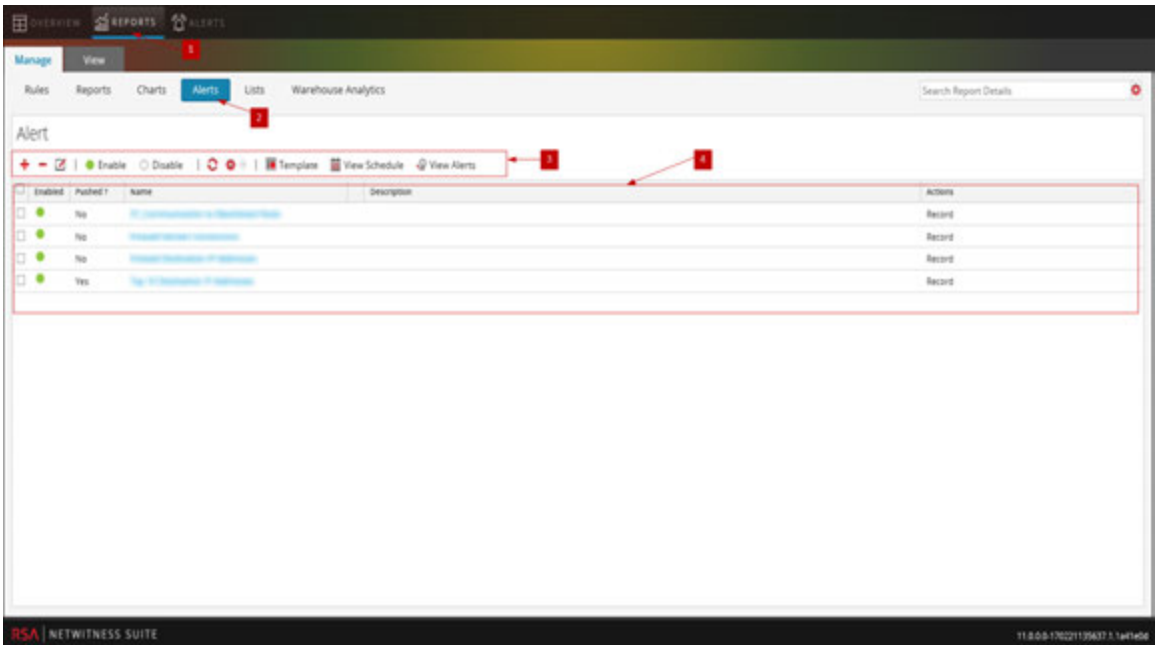
Manage an Alert and Alert Template

Quick View

The following figure is an example with the important features labeled.



1	Click **Monitor**> **Reports** to view the Manage tab.
2	Click **Alerts** to open the Alert view.
3	The Alert toolbar allows you to add, modify, delete, enable, disable, refresh, import, and export an alert. Using this toolbar, you can also set access permissions for the selected alert.
4	The Alert List panel lists all the alerts in a tabular format.

The Alerts List view has the following panels:

- Alert Toolbar
- Alert List

Alert Toolbar

The Alert toolbar panel has the following features:

Feature	Description
+	Adds a new alert to the Reporting module.

Feature	Description
	Deletes one or more selected alerts.
	Edits an alert.
Enable	Enables the selected alerts.
Disable	Disables the selected alerts.
	Refreshes the view.
	Enables the following options: Import, Export and Permissions.

Alert List

The Alert List panel lists all the alerts in a tabular format. The following table lists the columns in the Alert List panel and their descriptions.

Feature	Description
Enabled	Displays the state of the alert: • Enabled - the alert is active and fires based on the rule assigned to it. • Disabled - the alert is not active.
Pushed?	Indicates whether the alert is sent to Decoders or Log Decoders: • Yes - Alert is pushed to Decoders or Log Decoders. • No - Alert is not pushed to Decoders or Log Decoders.
Name	Identifies the name of the alert. Clicking the alert name displays the rule on which this alert is based in the Define Rules panel.
Description	Indicates the alert description.

Feature	Description
Actions	Indicates the action the system takes when the alert fires. The different available action types are: • Record • SMTP • SNMP • Syslog

Alert Permissions Dialog

In the Alert Permissions dialog, the users with 'Read & Write' access permission can set access permissions for an alert to configure permissions in the Alert Permissions dialog.

Workflow

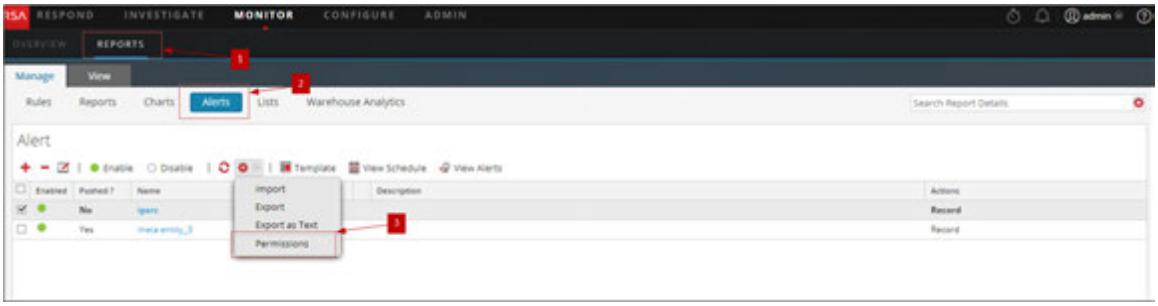
Investigate an Alert

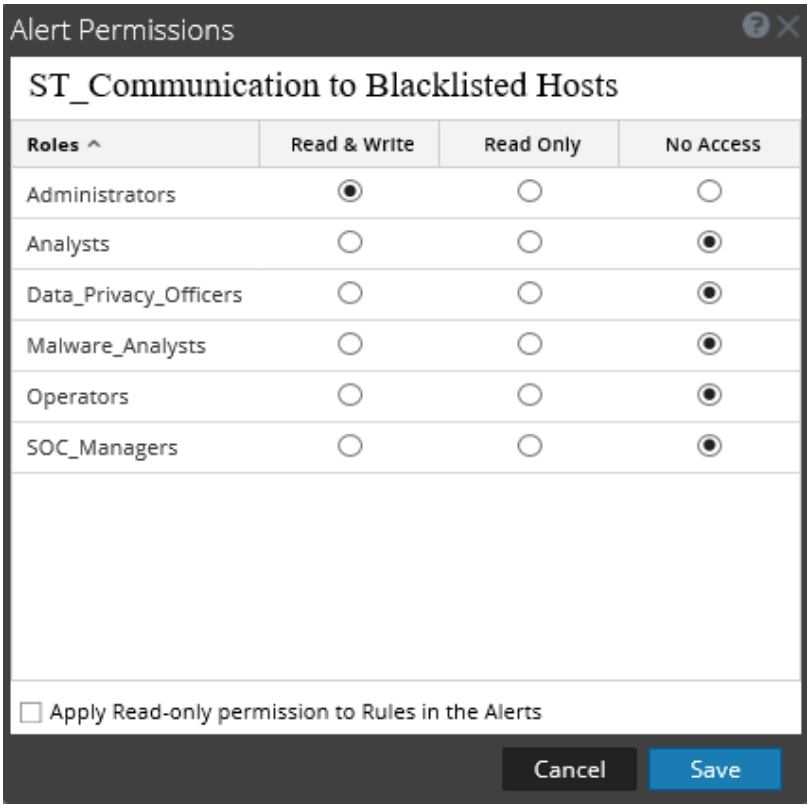
Manage an Alert and Alert Template

Quick View

The Alert permissions dialog allows you to set alert permissions depending on the user role.

The following figure is an example with the important features labeled.





1. Click **Monitor**> **Reports** to view the Manage tab.
2. Click **Alerts** to open the Alert view.
3. Click > **Permissions**. The Alert Permissions dialog box is displayed.

4 Based on the user role, select the appropriate options.

5 (Optional) Select the checkbox if you want to automatically provide read access permission to dependent rules.

6 Click **Save**.

Note: If a User (other than a super user) creates an alert, super users will not be able to access the alert.

The following table lists the columns in the Alert Permissions dialog.

Column	Description
Roles	Displays all the user roles in the NetWitness user interface.
Read & Write	Allows you to apply 'Read&Write' access to the alert.
Read Only	Allows you to apply only 'Read' access to the alert.
No Access	By selecting this permission, you cannot access or view the alert.
Apply Read-only permission to Rules in the Alerts	Allows you to automatically apply permissions to the rules in the alerts.
Cancel	Cancels all the changes made to the permissions.
Save	Saves the selection and provides access to the role based on the selection.

Alert Schedules View

In the Alert Schedules view, you can view all the alerts scheduled. Alternately, you can also disable the scheduled alerts.

Workflow

The following workflow shows the tasks involved in creating or modifying an alert.

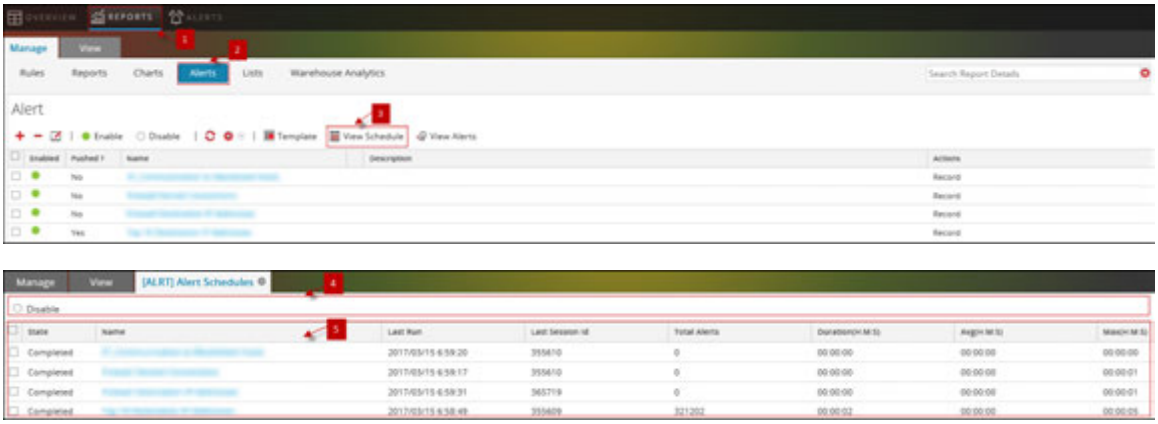
Alerting Overview

Configure an Alert

Quick View

The following example shows you how to access the Alert Schedules view dialog.



1. Click **Monitor**> **Reports** to view the Manage tab.
2. Click **Alerts** to open the Alert view.
3. Click **View Schedule** to open the View Alerts Schedule view.
4. The Alerts Schedule toolbar allows you to modify the state of the scheduled alert.
5. The Alerts Schedule List panel lists only the Enabled alerts in a tabular format.

Features

The different panels on the Alert Schedules View dialog are:

- Alerts schedule toolbar panel
- Alerts schedule list panel

Alerts Schedule Toolbar Panel

In the Alerts Schedule Toolbar panel, the Disable icon disables the selected alert. When schedule alerts are no longer needed or are determined to be ineffective, you can disable them so that they are no longer executed. You can select one of more alerts to disable. When an alert is disabled, it is removed from the scheduled alerts list so that you cannot view it here, and it will not execute again unless you manually execute the alert or set up a new schedule for it.

Alerts Schedule List Panel

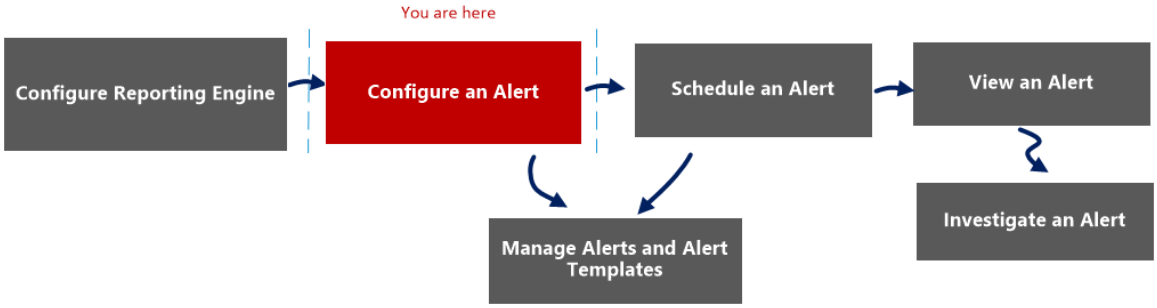
The following table lists the columns in the Alerts Schedule List panel and their description.

Column	Description
State	The state of the scheduled alert: • Completed • Failed
Name	The name of the scheduled alert.
Last Run {#time}	The last time the scheduled alert was run.
Last Session Id	The Session Id of the last scheduled alert.
Total Alerts	The total number of event occurrences.
Duration	The time taken to run the scheduled alert.
Avg (s)	The average time taken to run the scheduled alert.
Max (s)	The maximum time taken to run the scheduled alert.

Create or Modify Alert Panel

The Create or Modify alert panel is a panel in the Alert List view. This panel allows you to create or modify an alert as per the requirement.

Workflow



What do you want to do?

Role	I want to...	Documentation
Administrator/ Analyst	Configure Reporting Engine	Configure Reporting Engine

Administrator/ Analyst	Manage an alert and alert template	Manage an Alert and Alert Template

*You can complete these tasks here.

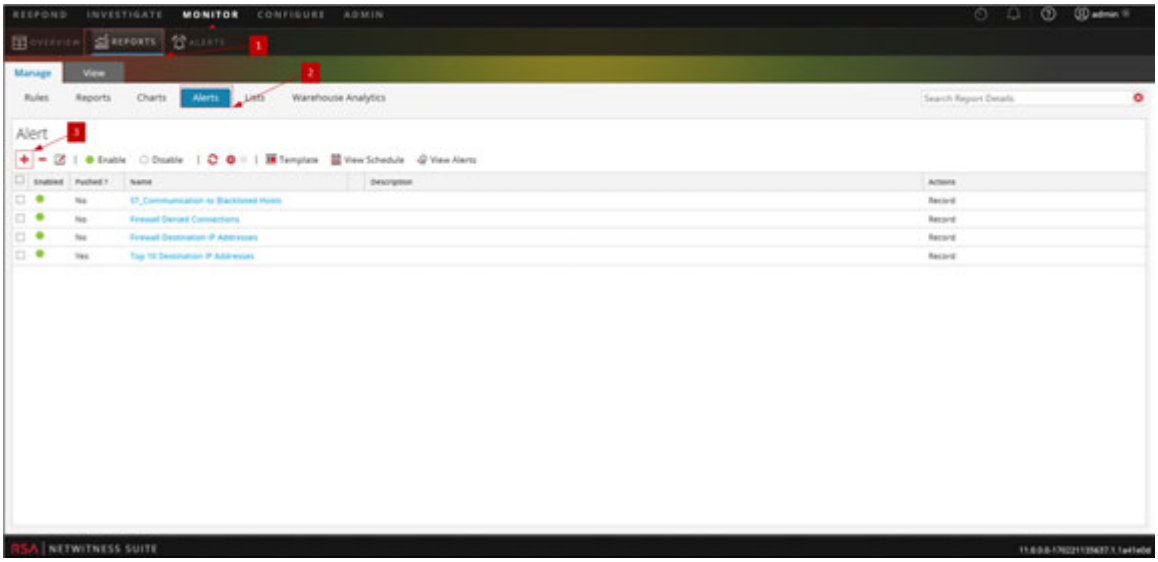
Related Topics

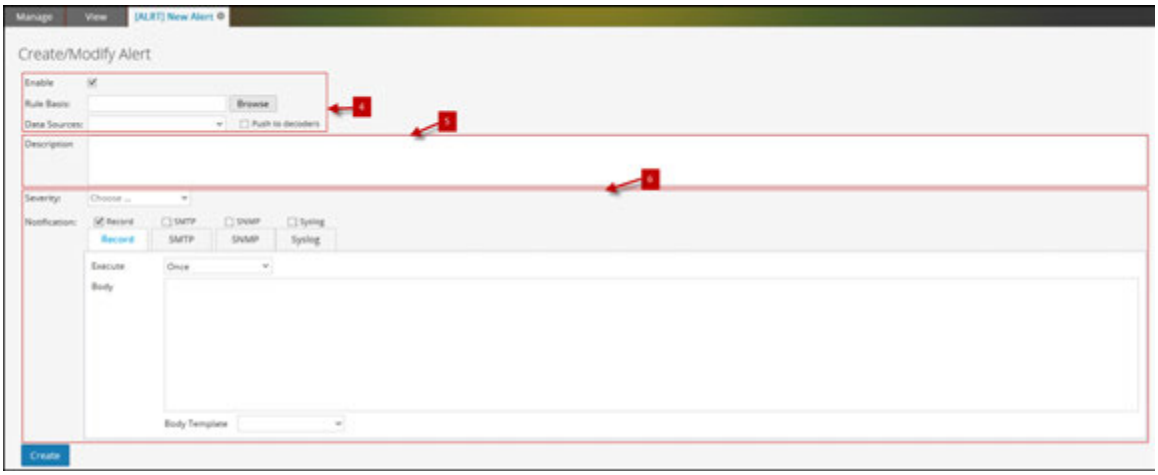
Alerting Overview

Configure an Alert

Quick View

The following figure is an example with the important features labeled.





1	Click **Monitor**> **Reports** to view the Manage tab.
2	Click **Alerts** to open the Alert view.
3	Click + to navigate to the Create or Modify Alert panel.
4	Enable the alert, navigate the rule, and select a data source to alert.
5	Enter a brief description of an alert.
6	Define the alert notification methods(RECORD, SMTP, SNMP, Syslog) to alert, when an alert condition is matched.

The Create or Modify Alert panel has the following sections:

- Alert Definition
- Alert Description
- Alert Notification

Alert Definition

The following table describes the fields in the Alert Definition:

Field	Description
Enable	• **Enable** activates the alert. The alert executes and sends output actions every minute (by default) when the alert conditions are met. • **Disable** deactivates the alert. The alert does not execute and does not send any output actions.
Rule Basis	Click **Browse** to display the Rules Library panel from which you select the rule that is the basis of this alert. You must select a rule that has a unique 'where' clause for an alert.
Data Sources	Specifies the data source for the alert.
Push to decoders	Pushes the ‘where’ clause of the alert rule to Decoders connected to the selected NWDB data source. This is the recommended option used to create RE alerts, as the alert conditions are checked on the Decoder itself and the alert queries will be comparatively faster in NWDB. If you deselect this option, the alert rule ‘where’ clause will be queried against the selected NWDB data source. Based on the complexity and metas in the ‘where’ clause of the rule, the alert queries might take more time to process in NWDB. **Note:** NetWitness does not send rules to the Decoder automatically.

Alert Description

The following table describes the fields in the Alert Description:

Field	Description
Description	Describes the alert.

Field	Description
Create	Creates the alert. (This option is displayed when you create an alert.)
Save	Saves the changes made to the alert. (This option is displayed when you modify an alert.)

Alert Notification

The Alert Notification allows you to define the notification action NetWitness takes when an alert is generated, for example, recording or sending the alert using one of the defined output actions. The output actions are Simple Mail Transfer Protocol (SMTP), Simple Network Management Protocol (SNMP), or Syslog message.

The Notification contains the default Record tab, which you use to create an alert. The icon beside the Record tab allows you to select the notification type from the drop-down list for the output to specify for the alert: SMTP, SNMP, or Syslog.

Depending on the selected notification type, the Notification section is populated with predefined text that contains variables that add Meta that is appropriate for the alert. In the Reporting Engine, these variables are replaced with actual values. The following table lists the variables and their descriptions.

Variable	Description
`${meta.<metakey>}`	The meta key value. **Note:** If the <metakey> did not fetch any value, an empty string("") is printed. By default, Reporting Engine displays all the repeated values for a meta key. If you do not want the meta values to repeat in the Alert output, enable the "removeRepeatedMetaValue" option by navigating to **Configuration > Alert Configuration** available for the Reporting Engine in the **Services - Configuration > Explore** view. For example, in an HTTP Session the value for the action is displayed as get, get, put, put, post, get. When this option is enabled, the value is displayed as get, put, post.

Variable	Description
`${meta.time}` / `${meta.time:<time_format>}`	`${meta.time}` - The session time is printed in "yyyy-MMM-dd HH:mm:ss" format. `${meta.time:<time_format>}` - The session time is printed in the user-defined custom time format. For example, `${meta.time:dd-MM-yyyy HH:mm:ss}`. For more information on the supported time formats, see http://docs.oracle.com/javase/7/docs/api/java/text/SimpleDateFormat.html **Note:** If the time format provided by the user is invalid, the default time format will be used. The default time format is "yyyy-MMM-dd HH:mm:ss".
`${name}`	The alert name defined in Reporting Engine.
`${count}`	The number of times an alert is detected in a given time frame. (By default, it is one minute)
`${nw.host}`	The NetWitness host name as configured in Reporting Engine.
`${device.id}`	The NetWitness device ID of the data source.

The Alert Notification has four tabs:

- **Record Tab**
- **SMTP Tab**
- **SNMP Tab**
- **Syslog Tab**

Record Tab

Use the Record tab to define the frequency for recording an alert and the message to generate when an alert is generated.

The following table lists the fields in the Record tab and their description.

Field	Description
Execute	The frequency for recording an alert. • **Once** - Record the alert only once based on the alert interval no matter how often the alert is generated. NetWitness records the number of times the alert has actually generated during that interval in the log file so that analysts know how many times the alert registered a match over a given day. • **Each Event** - Record the alert each time as it generates. If an alert generates unlimited number of times during a day, that alert is often treated as noise and can be ignored, except in case of alerts that require continuous monitoring such as network configuration changes and DDOS attacks. **Note:** Select **Each Event** setting from the **Execute** drop-down list for SNMP and Syslog output actions.
Body	The body of the message.
Body Template	(Optional) If templates have been defined, select a template for the alert message.

SMTP Tab

The SMTP tab allows you to define the SMTP (email) output for this alert.

The following table lists the fields in the SMTP tab and their description.

Field	Description
Execute	The frequency to send an email message for the alert. • **Once** - Sends only one email for an interval, if an alert generates in that interval, irrespective of how many alerts generated. • **Each Event** - Send an email with the alert for every event in which the rule criteria are met.
To	The email addresses to which to send this alert.
Subject	The subject of the email message.
Body	The body of the message.
Body Template	(Optional) If templates have been defined, select a template for the SMTP message that you can use as is or modify.

SNMP Tab

The SNMP tab allows you to define the SNMP output for the alert.

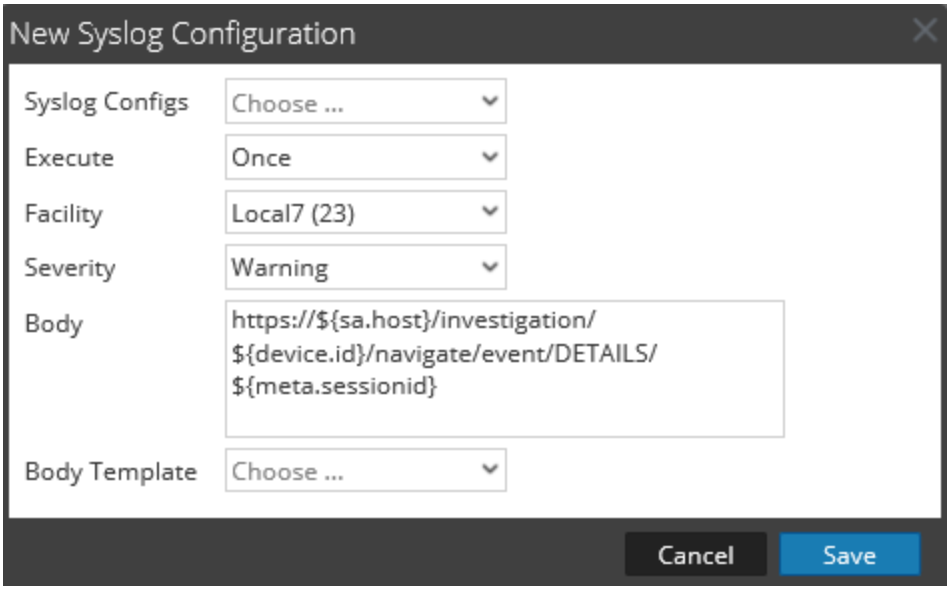
The following table lists the various fields in the SNMP tab and their description.

Field	Description
Execute	The frequency to send an SNMP output for an alert. • **Once** - Sends an SNMP message along with an email for an interval, if an alert generates in that interval, irrespective of how many alerts generated. • **Each Event** - Sends an SNMP message with the alert for every event in which the rule criteria are met.
Body	The body of the message.
Body Template	(Optional) If templates have been defined, select a template for the SNMP message to use as is or modify.

Syslog Tab

The Syslog tab allows you to define the Syslog message output for this alert.

Click + to add Syslog configuration to an alert. The New Syslog Configuration dialog box is displayed:



The following table describes the fields in the New Syslog Configuration dialog:

Field	Description
Syslog Configs	The Syslog configuration of the Device Config view located at the Syslog Configuration panel .
Execute	The number of times that you want to send a Syslog output for the alert. • **Once** - Sends a Syslog output along with an email for an interval, an alert generates in that interval, irrespective of how many alerts generated. • **Each Event** - Sends a Syslog output with the alert for every event in which the rule criteria are met.

Field	Description
Facility	The type of program logging the message. Examples for the type of programs are Syslog, Daemon, Mail, and Kernel.
Severity	The severity level of the alert that generated. • Emergency • Alert • Critical • Error • Warning • Notice • Informational • Debug
Body	The body of the message.
Body Template	(Optional) If templates have been defined, select a template for the Syslog message to use as is or modify.

Investigate an Alert View

In the Investigate an Alert view, you can view and investigate alert details. When investigating an alert, you can open the sessions in the Investigation module for further investigation.

Alerting Overview

Configure an Alert

Schedule an Alert

Quick View

The following figure is an example with the important features labeled.

1. Click **Monitor**> **Reports** to view the Manage tab.
2. Click **Alerts** to open the Alert view.
3. Click **View Schedule**to view all the alerts scheduled.
4. The Alerts schedule toolbar allows you to disable the scheduled alert.
5. The Alerts schedule list allows you to view the scheduled alert details.

The View Alerts Schedule view includes the following panels:

1. Alerts Schedule toolbar
2. Alerts Schedule list

Alert Schedule Toolbar

The Alerts Schedule Toolbar panel allows you to modify the state of the scheduled alert.

Feature	Description
Disable	Clicking **Disable** disables the selected alert. When schedule alerts are no longer needed or are determined to be ineffective, you can disable them so that they are no longer executed. You can select one of more alerts to disable. When an alert is disabled, it is removed from the scheduled alerts list so that you can't view it here, and it will not execute again unless you manually execute the alert or set up a new schedule for it.

Alert Schedule List Panel

The Alerts Schedule List panel lists only the Enabled alerts in a tabular format. The following table lists the columns in the Alerts Schedule List panel and their description.

Feature	Description
State	The state of the scheduled alert: • Completed • Failed
Name	The name of the scheduled alert.
Last Run {#time}	The last time the scheduled alert was run.
Last Session Id	The Session Id of the last scheduled alert.
Total Alerts	The total number of event occurrences.
Duration	The time taken to run the scheduled alert.
Avg (s)	The average time taken to run the scheduled alert.
Max (s)	The maximum time taken to run the scheduled alert.

View Alerts View

In the View Alerts view, you can view all the alerts. Also, you can also customize the view to show alerts for a specific period of time, and set the maximum number of alerts displayed in a single page.

RSA Archer Integration

Administrators can integrate RSA NetWitness Suite with RSA NetWitness Security Operations (SecOps) Manager to send alerts and incidents from NetWitness Suite to Archer for incident management and remediation. This guide provides a high-level workflow for configuring this integration.

Note: When you upgrade from Security Analytics 10.6.4 to NetWitness Suite 11.0, the Archer SecOps integration is no longer valid and must be re-configured.

The following table list the NetWitness Suite 11.0 integration options with NetWitness SecOps Manager Version 1.3.1.2.

NetWitness SecOps Manager Version	NetWitness Suite 11.0 Integration	Reference
1.3.1.2	Event Stream Analysis (ESA)	For more information, see "Configure Event Stream Analysis for Integration with Archer SecOps" section.
1.3.1.2	Reporting Engine (RE)	For more information, see "Configure Reporting Engine for Integration with Archer SecOps" section.
1.3.1.2	Respond	For more information, see "Configure Respond for Integration with Archer SecOps 1.3.1.2" section.
1.3.1.2	Archer Feeds	For more information, see "RSA Archer Feeds" section.

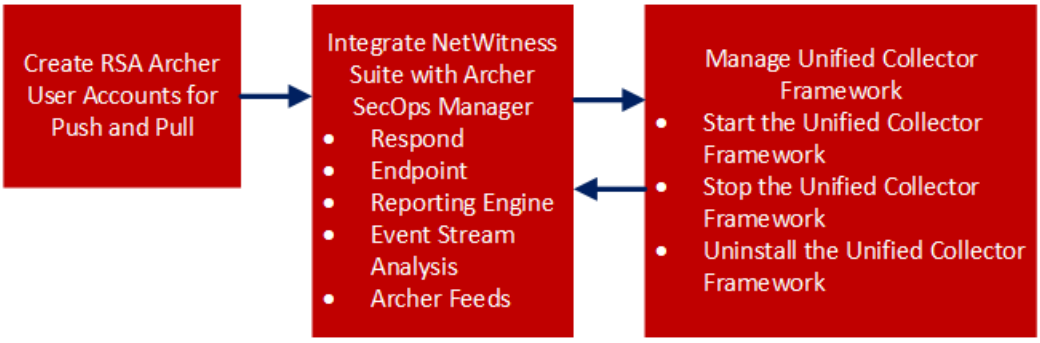
Configure NetWitness to Work With Archer

The RSA NetWitness SecOps Manager solution enables you to aggregate all actionable security alerts, allowing you to become more effective, proactive, and targeted in your incident response and SOC management. For more information on RSA NetWitness SecOps capabilities, see RSA Archer documentation on the RSA Archer Community or on the RSA Archer Exchange Community.

The version of RSA Archer determines how NetWitness Suite will be integrated. See the *SecOps Installation Guide* for Archer platforms supported.

NetWitness SecOps Manager 1.3.1.2 integrates with NetWitness Suite using the RSA UCF (Unified Collector Framework) which comprises of Security Anlaytics Incident Management (IM) integration service and SecOps Watchdog service.

This figure represents the flow of NetWitness Suite 11.0 integration with NetWitness SecOps Manager 1.3.1.2.



Create RSA Archer User Accounts for Push and Pull

You must create a user account for the web service client to transfer data to the RSA Archer GRC Platform.

You require two RSA Archer user accounts to avoid conflicts while sending and receiving data from RSA NetWitness Suite.

To create a user account for push and pull, perform the following:

1. On RSA Archer UI, click **Administration** > **Access Control** > **Users** > **Add New**.
2. In the **First Name** and **Last Name** fields, enter a name that indicates that the UCF uses this account to push data into RSA Archer GRC. For example, UCF User, Push.

   Note: When configuring the Pull account, enter a name that indicates that the UCF uses this account to pull data from RSA Archer GRC. For example, UCF User, Pull.
3. (Optional) Enter a user name for the new user account.

Note: If you do not specify a user name, the RSA Archer GRC Platform creates the user name from the first and last name entered when you save the new user account.

4. In the **Contact Information** section, in the **Email** field, enter an email address to associate with the new user account
5. In the **Localization** section, change the time zone to (UTC) Coordinated Universal Time.

Note: The UCF uses UTC time to baseline all the time-related calculations.

6. In the **Account Maintenance** section, enter and confirm a new password for the new user account.

Note: Make a note of the user name and password for the new user account that you just created. You need to enter these credentials when you set up the UCF to communicate with the RSA Archer GRC Platform through the web service client.

7. Clear the Force Password Change On **Next Sign-In** option.
8. In the **Security Parameter** field, select the security parameter that you want to use for this user.

Note: If you assign a default security parameter with a password change interval of 90 days, you also must update the user account password stored in the SA IM integration service every 90 days. To avoid this, you can optionally create a new security parameter for the SA IM integration service user account and set the password change interval to the maximum value allowed by your corporate standards.

9. Click the **Groups** tab, and perform the following:
   a. In the **Groups** section, click **Lookup**.
   b. In the **Available Groups** window, expand Groups.
   c. Scroll down and select SOC: Solution Administrator and EM: Read Only.
   d. Click **OK**.
10. Click **Apply**, then click **Save**.
11. If the machine language and regional settings of your RSA Archer GRC system are set to anything other than English-US, perform the following:
    a. Open the user account you just created, and in the **Localization** section, in the Locale field, select **English (United States)**, and click **Save**.
    b. On the Windows system hosting your RSA Archer GRC Platform, open Internet Information Services (IIS) Manager.

c. Expand your RSA Archer GRC site, click **.Net Globalization**, in both the **Culture** and **UI Culture** fields, select **English (United States)**, and click **Apply**.

d. Restart your RSA Archer GRC site.

12. Repeat steps 1 – 11 to create a second user account for the UCF to pull data from RSA Archer GRC.

Integrate NetWitness Suite With Archer SecOps Manager

You have to configure the system integration settings to manage incident workflow in RSA NetWitness SecOps Manager.

For information on how to configure system integration settings to manage incident workflow in RSA Archer Security Operations, see the "Configure Integration Setting to Manage Incidents in RSA Archer Security Operations" topic in the *NetWitness Respond Guide*.

RSA Unified Collector Framework (UCF)

RSA NetWitness Suite integrates with RSA Archer SecOps Manager 1.3.1.2 using the RSA Unified Collector Framework (UCF). The RSA Unified Collector Framework (UCF) integrates with all supported SIEM tools and the RSA NetWitness SecOps Manager solution. When integrating the RSA NetWitness Suite Respond, you can can manage the incident workflow in the NetWitness Suite Respond and allow analysts the option to escalate remediation tasks and open data breaches for management and remediation in the RSA Archer Security Operations Management solution. And, the Unified Collector Framework transports remediation tasks (created as Findings), data breaches, or both.

Note:
• You must configure the same option in both RSA NetWitness Suite and the Unified Collector Framework.
• Integration of the RSA NetWitness Respond module with Reporting Engine or Event Stream Analysis can result in duplicate events and incidents created in RSA Archer SecOps Manager.

UCF supports multiple SIEM tools connections at the same time, such as supporting NetWitness Suite Reporting Engine, HP ArcSight, and NetWitness Suite Respond. However, different instances of the same SIEM tool are not supported, such as two NetWitness Suite servers connected to the same UCF.

Prerequisites

- Install RSA_Archer_Security_Operations_Management package on Archer. See RSA Archer documentation RSA Archer Community or on the Content Tab

at https://community.emc.com/community/connect/grc_ecosystem/rsa_archer_exchange.

- Install NetWitness SecOps Manager.
- Ensure you have NetWitness Suite 11.0 as it is compatible with NetWitness SecOps Manager 1.3.1.2.
- Ensure that the Respond is configured in RSA NetWitness Suite.

The RSA Unified Collector Framework (UCF) allows you to integrate your RSA Archer Security Operations Manager system with the following:

- NetWitness Suite Respond
- NetWitness Suite Reporting Engine
- NetWitness Suite Event Stream Analysis
- Archer Feeds

Configure Respond for Integration with Archer SecOps

To configure Respond for Archer SecOps, perform the following in NetWitness Suite:

Step 1: Select the Mode for NetWitness Suite Respond

1. Select **ADMIN > Services > Respond > Explore**.
2. Navigate to `Respond/Aggregation/export`.
3. Enable `archer-secops-integration-enabled` field to **true**.
4. Restart Respond service.

Step 2: Configure NetWitness Suite Respond to forward alerts to UCF

1. Navigate to `C:\Program Files\RSA\SA IM integration service\cert-tool\certs` in Secops middleware box.
2. Copy both `keystore.cert.pem` and `rootcastore.cert.pem` from certs folder(to import folder of NW-server)

   ```
   cp rootcastore.crt.pem /etc/pki/nw/trust/import

   cp keystore.crt.pem /etc/pki/nw/trust/import
   ```

   Note: Before you copy the files from UCF to NetWitness Admin server, examine the files to remove any blank lines and save them.
3. SSH to NW-server box

a. Run the update-admin-node command
`orchestration-cli-client --update-admin-node`

b. Restart the RabbitMQ service

```
service rabbitmq-server restart
```

c. Create user archer and set permissions for the virtual host '`/rsa/system`'

```
rabbitmqctl add_user archer archer

rabbitmqctl clear_password archer

rabbitmqctl set_permissions -p /rsa/system archer ".*" ".*" ".*"
```

Step 3: Forward Alerts to the NetWitness Suite Respond

- **To forward NetWitness Suite Event Stream Analysis alerts to NetWitness Respond, perform the following:**

  a. Select **ADMIN > Services > ESA** service.

  b. Select an Event Stream Analysis service and click  **> View > Config**.

  c. Click the **Advanced** tab.

  d. Ensure that the **Forward Alerts on Message Bus** checkbox is selected by default. If not, select the **Forward Alerts on Message Bus** checkbox and click **Apply**.

- **To forward NetWitness Suite Reporting Engine alerts to NetWitness Respond, perform the following:**

  a. Select **ADMIN > Services > Reporting Engine** service.

  b. Click  **> View > Config** for the Reporting Engine service.

  c. Click the **General** tab.

  d. In the **System Configuration section**, select the **Forward Alerts to Respond** checkbox and click **Apply**.

- **To forward NetWitness Suite Malware Analysis alerts to NetWitness Respond, perform the following:**

  a. Select **ADMIN > Services > Malware Analysis** service

  b. Click  > **View** > **Config** for the Malware Analysis service.

  c. Click the **Auditing** tab.

  d. In the **Respond Alerting** section, verify that the **Enabled Config Value** checkbox is selected. If the checkbox is not selected, select the checkbox, and click **Apply**.

Step 4: Forward Endpoint Alerts to the NetWitness Suite Respond

RSA Endpoint alerts can be sent to RSA Archer GRC through NetWitness Respond. For more information on how to Configure NetWitness Endpoint Alerts via Message Bus. See "Configure NetWitness Endpoint Alerts via Message Bus" topic in *NetWitness Endpoint Integration Guide*.

Step 5: Aggregate Alerts into Incidents

Alerts coming into NetWitness Respond can be automatically aggregated into incidents and forwarded to RSA Archer Security Operations Management. Aggregation rules are automatically run every minute and aggregate the alerts into incidents based on the match conditions and grouping options selected. For more information on aggregating alerts, see the "Configure Alert Sources to Display Alerts in Respond" topic in the *NetWitness Respond Configuration Guide*.

To configure alert aggregation:

1. Select **CONFIGURE > Incident Rules**.
2. To enable the rules provided out of the box, perform the following:
   a. Double-click the rule.
   b. Select **Enabled**.
   c. Click **Save**.
   d. Repeat steps a-c for each rule.
3. To add a new rule, do the following:
   a. Click +.
   b. Select **Enabled**.
   c. Complete the following fields:
      - Rule Name
      - Action
      - Match Conditions
      - Grouping Options
      - Incident Options
      - Priority
      - Notifications
4. Click **Save**.

Configure Endpoints in RSA Unified Collector Framework

Endpoints provide the connection details required for the UCF to reach both your RSA NetWitness Suite and RSA Archer GRC systems.

Note: Some endpoints are necessary to use different integrations. The following list shows the mandatory endpoints.

Mandatory Endpoint Integration

- Archer Push endpoint
- Archer Pull endpoint
- Mode selection: SecOps or Non SecOps mode.

Note:
• If Non SecOps mode is selected, incidents are managed in NetWitness Suite Respond instead of RSA Archer Security Operations Management.
• You must configure the port depending on the protocol (TCP, UDP, or secure TCP).
• Ensure the certificate subject name for your RSA Archer GRC server matches the hostname.

Procedure

1. On the UCF system, open the Connection Manager, as follows:
   a. Open a command prompt.
   b. Change directories to `<install_dir>\SA IM integration service\data-collector`.
   c. Enter:
   ```
   runConnectionManager.bat
   ```
2. In the **Connection Manager**, enter **1** for Add Endpoint.
3. Add an endpoint for pushing data to RSA Archer Security Operations Management, as follows:
   a. Enter the number for Archer.

      Note: SSL must be enabled to add the RSA Archer endpoints.

   b. For the endpoint name, enter **push**.
   c. Enter the URL of your RSA Archer GRC system.
   d. Enter the instance name of your RSA Archer GRC system.

e. Enter the user name of the user account you created to push data into your RSA Archer GRC system.

f. Enter the password for the user account you created to push data into your RSA Archer GRC system, and confirm the password.

g. When asked whether this account is used for pulling data, enter **False**.

4. Add an endpoint for pulling data from RSA Archer Security Operations Management, as follows:

a. Enter the number for Archer.

> **Note:** SSL must be enabled to add the RSA Archer endpoints.

b. For the endpoint name, enter **pull**.

c. Enter the URL of your RSA Archer GRC system.

d. Enter the instance name of your RSA Archer GRC system.

e. Enter the user name of the user account you created to pull data from your RSA Archer GRC system.

f. Enter the password for the user account you created to pull data from your RSA Archer system, and confirm the password.

g. When asked whether this account is used for pulling data, enter **True**.

5. Add an endpoint for RSA NetWitness Suite

- For RESPOND

a. Enter the number for Security Analytics IM.

b. Enter a name for the endpoint.

c. Enter the SA Host IP address.

d. For SA Messaging Port, enter **5671**.

e. Enter the target queue for remediation tasks. Selecting All processes both the RSA Archer Integration (GRC) and IT Helpdesk (Operations).

f. To not automatically add certificates to the NetWitness Suite trust store, perform the following:
Enter **No**.

g. In UCF connection manager, select the mode, as follows:

i. Enter the number for Mode Selection.

ii. Select one of the following options:

- Manage incident workflow in RSA NetWitness Suite.
- Manage incident workflow exclusively in RSA Archer Security Operations Management.

- For Reporting Engine and Event Stream Analysis

a. To use third-party integrations, add the Syslog Server Endpoint, as follows:

i. Enter the number for Syslog Server Endpoint.

ii. Enter the following:

- User defined name
- SSL Configured TCP port number

  Note: Defaults to 1515. If you do not want to host the Syslog server in this mode, enter **0**.

- TCP port number - Enter the TCP port if the Syslog client sends the Syslog message in TCP mode.

  Note: Defaults to 1514. If you do not want to host the Syslog server in this mode, enter **0**.

- UDP port number - Enter the UDP port if the Syslog client sends the Syslog message in UDP mode.

  Note: Defaults to 514. If you do not want to host the Syslog server in this mode, enter **0**.

By default, the Syslog server will run in the above three modes, unless it is disabled by entering **0**.

b. To test the Syslog client, enter the number for Test Syslog Client. Use the Test Syslog client with the files from `<install_dir>\SA IM integration service\config\mapping\test-files\`.

6. In the Connection Manager, enter **5** to test each endpoint.

Configure Reporting Engine for Integration with NetWitness SecOps Manager

To configure Syslog Output Action for the Reporting Engine, perform the following:

1. Select **ADMIN > Services**.
2. Select your Reporting Engine Service, and click  **View** > **Config**.
3. Click the **Output Actions** tab.
4. In the **NetWitness Suite Configuration** section, in the **Host Name** field, enter the host name or IP address of your Reporting Engine server.
5. In the **Syslog Configuration** section, add the Syslog Configuration as follows:
   a. In the **Server Name** field, enter the hostname of the UCF.
   b. In the **Server Port** field, enter the port that you selected in the UCF Syslog configuration.
   c. In the **Protocol** field, select the transport protocol.

   Note: If you select Secure TCP, SSL must be configured.
6. Click **Save**.

To Configure NetWitness Suite Reporting Engine SSL for Secure Syslog Server:

If the Syslog server is configured with Secure TCP, configure the SSL.

1. Copy the certificate `keystore.crt.der` from the UCF machine to NetWitness Suite server box at `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.131-2.b11.el7_3.x86_64/jre/lib/security`
2. Run the following command:

   ```
   keytool -import -file keystore.crt.der -alias ucf-syslog -keystore /etc/pki/nw/trust/truststore.jks -storepass changeit
   ```

   Note: Do not copy and paste the above code. Type it in to avoid errors.
3. Enable **ServerCertificateValidationEnabled** to **true:**
   - Navigate to **ADMIN** > **Service**.
   - Click  > **View > Explore** of the Reporting Engine service .

- Expand **com.rsa.soc.re** > **Configuration** > **SSLContextConfiguration**.
- Expand **sslContextConfiguration** and set **ServerCertificateValidationEnabled** to **true**.

4. Restart the Reporting Engine service.

To Configure Rules in NetWitness Suite:

1. Click **MONITOR >Reports > Manage**.
   The Manage tab is displayed.
2. In **Rule Groups** panel, click +.
3. Enter a name for the new group.
4. Select the group you created, and in the Rule toolbar, click +.
5. In the **Rule Type** field, select NetWitness DB.
6. Enter a name for the rule.
7. Enter values in the **Select** and **Where** fields based on the rule that you want to create.

   Note: Add the Syslog configuration with the Syslog name set above.

8. Click **Save**.

Note: To see the same number of alerts in the Reporting Engine and RSA Archer GRC, ensure that you've selected Once for execute in both the Syslog and Record tabs.

To Add Alert Templates for the Reporting Engine in NetWitness Suite:

The UCF syslog configuration comes with out-of-the-box alert templates that you can use when you create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your RSA Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_Templates`

1. Click **MONITOR > Reports > Manage > Alerts**.
2. Click the **Template** tab.
3. Click +.

Note: After you copy the template in the Create/Modify Template window, make sure to replace `cs25=${sa.host} cs25Label=sahost` to `cs25=${nw.host} cs25Label=nwhost`.

1. In the **Name** field, enter a name for the alert template.
2. In the **Message** field, enter the alert message.
3. Click **Create**.
4. Repeat steps 3 to 6 for each alert template that you want to add.

To Configure Alerts in NetWitness Suite:

In RSA NetWitness Suite Reporting Engine, an alert is a rule that you can schedule to run on a continuous basis and log its findings to several different alerting outputs.

1. Click **MONITOR > Reports > Manage > Alerts**.
2. Click ✚.
3. Select **Enable**.
4. Select the rule you created.
5. Select **Push to Decoders**.

   Note: If you do not enter a value in this field, the link in the RSA Archer Security Alerts application to RSA NetWitness Suite will not work.
6. From the Data Sources list, select your data source.
7. In the **Notification** section, select **Syslog**.
8. Click ✚.
9. Complete the Syslog configuration fields.
10. In the **Body Template** field, select the template that you want to use for this Syslog alert.
11. Click **Save**.

Configure Event Stream Analysis for Integration with Archer SecOps

To Configure Event Stream Analysis Syslog Notification Settings in NetWitness Suite:

1. Click **ADMIN** > **System** > **Global Notifications**.
2. Click the **Output** tab.
3. Define and enable an Event Stream Analysis Syslog notification.
4. Click the **Servers** tab.
5. Define and enable a Syslog notification server.
6. In the Syslog Server Configuration section, enter the following:

Field Description:

- Name - Specify the custom name
- Server IP (Hostname) - Specify the hostname or IP Address of the system on which you installed the UCF.
- Port - Specify the port number on which you want the UCF to listen for.
- Facility - Specify the Syslog facility
- Protocol - Select the protocol.

7. Click **Save**.

To Configure NetWitness Suite Event Stream Analysis SSL for Secure Syslog Server:

If the Syslog server is configured with Secure TCP, configure the SSL.

1. Select **ADMIN > Services**.
2. Select the Event Stream Analysis service. Go to **Explore > Configuration > SSL** .
3. Set **ServerCertificateValidationEnabled** to **true.**
4. Copy the `rootcastore.cert.pem` from UCF machine to Event Stream Analysis server to `/etc/pki/ca-trust/source/anchors`.
5. Run the following command:

   ```
   update-ca-trust
   ```

6. Restart the Event Stream Analysis server.

To Add Event Stream Analysis Alert Templates

The UCF syslog configuration comes with out-of-the-box alert templates that you can use when you create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your RSA Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_`

`Templates\SecOps_SA_ESA_templates.txt`

1. Select **ADMIN > System > Global Notifications**.
2. Click the **Templates** tab.
3. Click +.
4. In the **Template Type** field, select Event Stream Analysis.
5. In the **Name** field, enter the name for the template.

6. (Optional) In the **Description** field, enter a brief description for the template.
7. In the **Template** field, enter the alert message.
8. Click **Save**.
9. Repeat steps 3 – 8 for each alert template that you want to add.

To Create Event Stream Analysis Rules

1. Click **CONFIGURE** > **ESA Rules**.
2. In the **Rule Library**, click ✚.
3. Select **Rule Builder**.
4. In the **Rule Name** field, enter a name for the rule.
5. In the **Description** field, enter a description for the rule.
6. Select the **Severity**.
7. In the **Condition** section, do the following:
   a. Click ✚ to build a statement.
   b. Enter a name, select a condition type, and add meta data/value pairs for your statement.
   c. Click **Save**.
   d. Repeat steps a – c until you have built all your statements for the rule.
8. In the **Notifications** section, select **Syslog**.
9. Select the notification, Syslog server, and template that were created previously.
10. Click **Save** and **Close**.
11. Click **Configure** > **Deployments**.
12. Click ✚ for Event Stream Analysis services section.
13. Select the Event Stream Analysis Service.
14. Click **Deploy Now**.
15. In the **Event Stream Analysis Rules** section, click ✚ to choose the Event Stream Analysis Rule that you created, and click **Deploy Now**.

RSA Archer Feeds

By default, only the IP Address and Criticality Rating fields in the RSA Archer Devices application are fed into RSA NetWitness Suite by the SA IM Integration Service. You can customize the Enterprise Management plug-in to include the Business Unit and Facility fields that are cross-referenced in the Devices application in the feed. For more details, see Archer documentation at https://community.emc.com/community/connect/grc_ecosystem/rsa archer or https://community.emc.com/community/connect/grc_ecosystem/rsa_archer_exchange.

Note: If you plan to feed Business Unit and Facility information from your RSA Archer GRC Platform into Live, you must also add keys for these fields to the index-concentrator-custom.xml file.

Update the Concentrator and Decoder Services

The SA IM Integration Service in NetWitness SecOps manager manages the files for a custom feed and deposits these files in a local folder that you specify when you configure the Enterprise Management Endpoint. The Live module of RSA NetWitness Suite retrieves the feed files from this folder. Live then pushes the feed to the Decoders, which start creating metadata based on captured network traffic and the feed definition. To make each Concentrator aware of the new metadata created by the Decoders, you must edit the `index-concentrator-custom.xml`, `index-logdecoder-custom.xml`, and `index-decoder-custom.xml files`.

1. Select **ADMIN > Services**.
2. Select your Concentrator, and select  > **View > Config**.
3. Click the **Files** tab.
4. From the drop-down list, select index-concentrator-custom.xml. Do one of the following:
   - If content already exists in the file, add a key for the new meta data element as follows:

     ```
     <key description="Criticality" format="Text" level="IndexValues"
     name="criticality" defaultAction="Open"/>
     ```

     Note: Do not copy and paste code. Type it in to avoid errors.
   - If the file is blank, add the following content:

     ```
     <?xml version="1.0" encoding="utf-8"?>
     <language level="IndexNone" defaultAction="Auto">
     <key description="Criticality" format="Text" level="IndexValues"
     name="criticality" defaultAction="Open"/>
     </language>
     ```
5. Click **Apply**.
6. To add multiple devices, do the following:

a. Click **Push**.

b. Select the devices to which you want to push this file.

c. Click **OK**.

7. Repeat steps 1-7 for the Log Decoders and Index Decoders, using index-logdecoder-custom.xml and index-decoder-custom.xml.

8. Restart the Concentrator and Decoder services.

Add the RSA Archer Enterprise Management Endpoint in the UCF

1. In the UCF connection manager, select the mode, as follows:

   a. Enter the number for Mode Selection.

   b. Select one of the following options:

   - Manage incident workflow in RSA NetWitness Suite.
   - Manage incident workflow exclusively in RSA Archer Security Operations Management.

2. Add the RSA Archer Enterprise Management Endpoint, as follows:

   a. Enter the number for Enterprise Management.

   b. Complete the fields in the table below.

Field	Description
Endpoint Name	Optional endpoint name.
Web Server Port	Defaults to 9090. Can be configured to host the web server url. The URL with the port number should be provided as the URL in NetWitness Suite live feed: http://hostname:port/archer/sa/feed
Criticality	Criticality of the assets to be pulled from RSA Archer GRC. If **false**, pull assets with any criticality. If **true**, pull assets with only high criticality. To configure this manually, edit the em.criticality property in the collector-config properties file to provide a comma-separated list of criticalities: LOW, MEDIUM, HIGH.

Field	Description
Feed Directory	Directory where the assets CSV file from RSA Archer GRC are saved. **Note:** The directory path provided must exist.
Web Server Username	Username for authenticating to the EM web server. **Note:** This is provided while configuring the NetWitness Suitelive feed.
Web Server Password	Password for authenticating to the EM web server. **Note:** This is provided while configuring the NetWitness Suite live feed.
SSL Mode	Defaults to No. If **No**, the URL uses `http mode: http://hostname:port/archer/sa/feed` If you have not updated the host file, see "Update the RSA NetWitness Suite Host File" section. **Note:** NetWitness Suite currently does not support Archer recurring feeds in SSL mode.

Update the RSA NetWitness Suite Host File

1. Edit the host file on the NetWitness Suite server at the following location: vi /etc/hosts
2. Enter the following for the UCF host IP address:

   ```
   <ucf-host-ip> <ucf-host-name>
   ```

3. Restart NetWitness Suite server by running the following command:

   ```
   service jetty restart
   ```

4. While configuring the NetWitness Suite live feed, enter the hostname for the URL instead of the IP address and the port number configured for Enterprise Management endpoint in the UCF:

   ```
   http: //<ucf-host-name> : <EM_Port>/archer/sa/feed.
   ```

5. Verify that the connection works.

Create a Recurring Feed Task

In order for RSA NetWitness Suite to download feed files from the NetWitness Respond Integration Service and push the feeds to Decoders, you must create a recurring feed task and define the feed settings.

Note: For RSA Archer SecOps 1.2: In order for RSA NetWitness Suite to download feed files from your RCF machine and push the feeds to Decoders, you must create a recurring feed task and define the feed settings. The procedure is similar to RSA Archer SecOps 1.3, with a few exceptions. See documentation on the RSA Archer Exchange Community for details.

1. Select **CONFIGURE > Custom Feeds**.
2. In the Feeds view, Click +.
3. Select **Custom Feed**, and click **Next**.
4. Select **Recurring**.
5. Enter a name for the feed.
6. In the URL field, enter the following:

   `http://ucf_hostname/archer/sa/feed`

   where *`http :ucf_hostname_or_ip:port`* is the address of your NetWitness Respond Integration Service system. For example: `http://10.10.10.10:9090` .

   Note: If the Respond is running in SSL mode, the hostname must be used in the URL.
7. Select **Authenticated**.
8. In the **User Name** and **Password** fields, enter the credentials of the user account you created for RSA NetWitness Suite to use to access files on the NetWitness Respond Integration Service system.
9. Define the recurrence interval for the feed.
10. In the **Date Range** section, define a start and end date for the feed, and click **Next.**
11. Select each Decoder to which you want to push this feed, and click **Next**.
12. In the **Type** field, ensure that IP is selected.
13. In the **Index Column** field, select 1.
14. In the second column, set the Key value to criticality, and click **Next**.
15. Review your feed configuration details, and click **Finish**.

Manage Unified Collector Framework

This section provides additional tasks for configuring and managing the RSA Unified Collector Framework (UCF) for Archer SecOps 1.3.1.2 Integration.

Start the RSA Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Select RSA Unified Collector Framework.
3. Click **Start**.

Stop the RSA Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Stop the RSA SecOps WatchDog Service.

   Note: If you do not stop the Watchdog service, the Watchdog service starts the NetWitness Respond Service before intended.

3. Select RSA Unified Collector Framework.
4. Click **Stop**.

Note: If the service takes too long to shutdown, use the Task Manager to end the RSASAIMDCService.

Uninstall the RSA Unified Collector Framework

1. Click **Control Panel** > **Programs and Features**.
2. Select **RSA Unified Collector Framework**.
3. Click **Uninstall**.

Troubleshoot RSA Archer Integration

This section provides resolutions to common problems that you may encounter while configuring Archer SecOps 1.3.1.2 with NetWitness Suite Respond.

Setting the CA Truststore

Problem: After adding the endpoint for NetWitness Suite Respond, the CA truststore fails to set.

Resolution:

1. Ensure that the SSH credentials for the NetWitness Suite host are valid.
2. If the credentials are correct, but the error still occurs, manually copy certificates.

Remediation Tasks in RSA Archer Security Operations Manager

Problem: Remediation Tasks being pushed to the operations queue through the UCF are not appearing in RSA Archer Security Operations Management as Findings.

Resolution:

1. Open the Connection Manager:
    - Open a command prompt
    - `Change directories to <install_dir>\SA IM integration service\data-collector.`
    - `Type: runConnectionManager.bat`
2. Enter 2 to edit endpoint.
3. Enter 3 to NetWitness Suite Respond.
4. Ensure the Target Queue is set to All or Operations.

Errors between RSA NetWitness Suite and RSA Unified Collector Framework

Problem: In the `<install_dir>\SA IM integration service\logs\collector.log`, there are SSL errors between RSA NetWitness Suite and RSA Unified Collector Framework.

Resolution:

1. Verify that the SSL certificates are valid.

   Note: NetWitness Suite Respond certificates are valid for two years.

2. If your certificates are expired, regenerate and copy the expired certificates.

To regenerate and copy the certificates, do the following:

1. In Command Prompt, go to `<install_dir>\SA IM integration service\data-collector`.
2. Enter: `runConnectionManager.bat`
3. Enter the number for Regenerate SA IM Integration Service Certificate.
4. In the NetWitness Suite Respond endpoint, in Connection Manager, enter the number for Edit Endpoint.
5. Enter Yes to copy the certificates automatically to the NetWitness Suite trust store.

Note: If certificates fail to copy, manually copy the certificates.

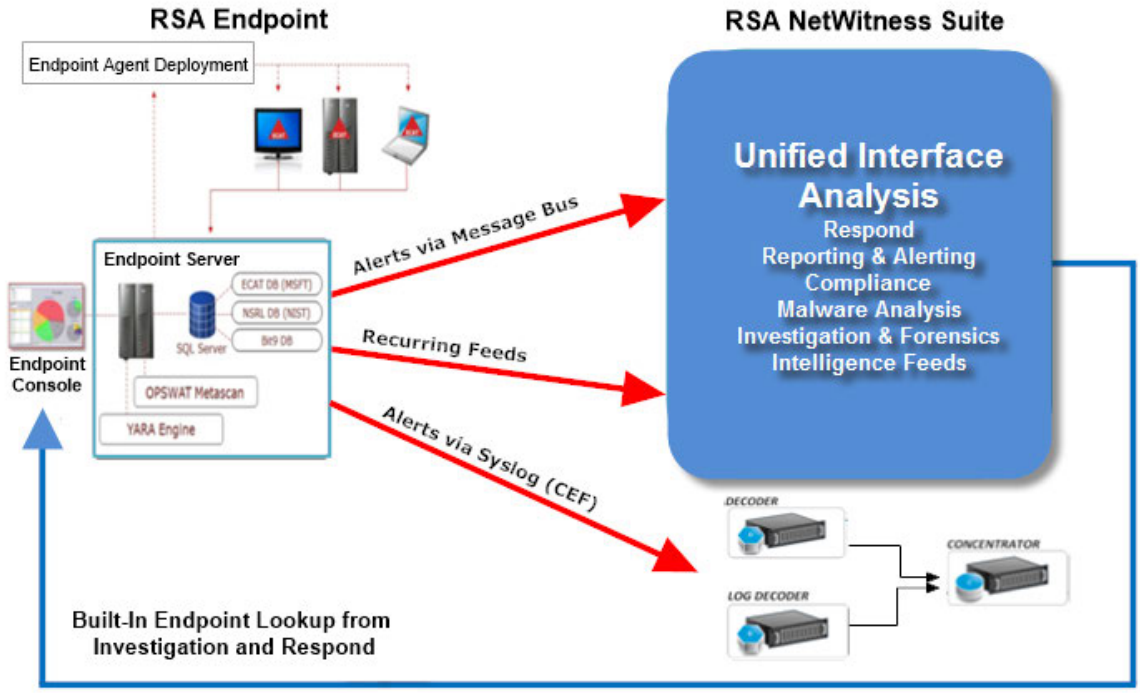
RSA NetWitness Endpoint Integration

RSA customers who are using RSA NetWitness Endpoint 4.3.0.4, 4.3.0.5, or 4.4 can integrate NetWitness Endpoint and RSA NetWitness Suite in several different ways. This guide is for RSA NetWitness Suite version 11.0.

Integration Options



Built-in NetWitness Endpoint Lookup

With the RSA NetWitness Endpoint user interface (UI) installed on the same machine where the analyst is using a browser to access NetWitness Suite, the built-in NetWitness Endpoint Lookup from NetWitness Suite Investigation and NetWitness Suite Respond provides right-click access to the NetWitness Endpoint console server for the following meta keys: IP address (ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip), host (alias-host, domain.dst), client, and file-hash. These are described in the "Launch an External Lookup of a Meta Key" topic in *Investigation and Malware Analysis User Guide* and the "View Alerts" topic in *NetWitness Respond User Guide*.

NetWitness Suite configuration is not required for endpoint lookup when you are using one of the built-in parsers, NetWitness Endpoint or CEF, and you have not customized the default meta keys used when loading metadata in Investigation. For more information, see "Manage and Apply Default Meta Keys in an Investigation" topic in the *Investigation and Malware Analysis User Guide*.

Note: The exception occurs if you customize NetWitness Suite by editing the display setting for the default meta keys in Investigation, add meta keys to the table-map-custom.xml file, or customize NetWitness Endpoint feeds. Some configuration is required to add the custom meta keys to the context menu NetWitness Endpoint Lookup in the **ADMIN** > **System** view as described in the "Add Custom Context Menu Actions" topic in the *System Configuration Guide*.

Integration Methods

With an RSA NetWitness Endpoint 4.3.0.4, 4.3.0.5, or 4.4 console server installed on a Windows host and proper configuration of NetWitness Endpoint and NetWitness Suite by an administrator, three additional integrations of NetWitness Endpoint analysis data are possible.

The following are the RSA NetWitness Endpoint integration methods:

- Configure Endpoint Alerts via Message Bus
- Configure Contextual Data from Endpoint via Recurring Feed
- Configure Endpoint Alerts via Syslog into a Log Decoder

Endpoint alerts via message bus into NetWitness Respond. This integration provides the capability for forwarding Endpoint alerts to Respond via message bus.

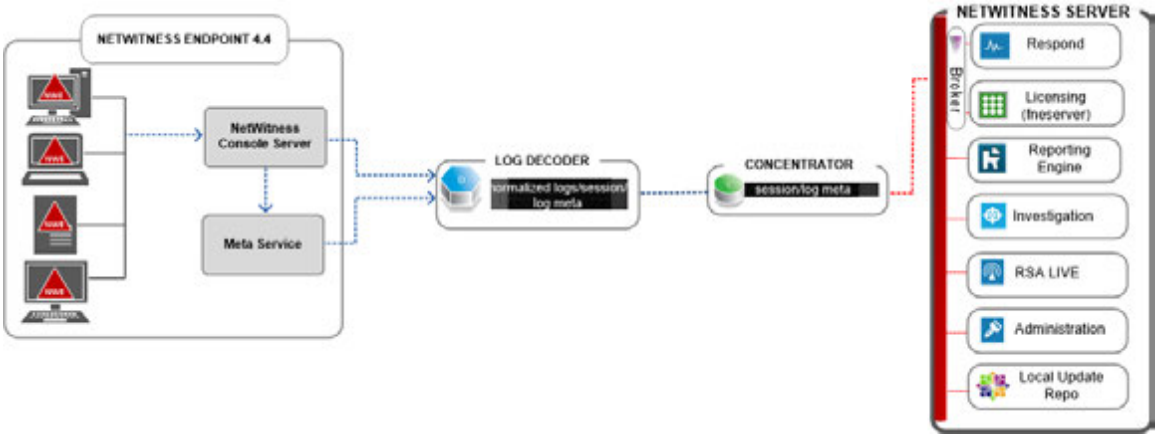
Contextual data from Endpoint via a NetWitness Suite Live recurring feed. This integration can enrich the session displayed in NetWitness Suite Investigation with contextual information; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data.

NetWitness Endpoint alerts via Syslog (CEF) into NetWitness Suite Log Decoders. This integration provides the capability to forward Endpoint events via Syslog and to correlate the events with other log or packet metadata in the NetWitness Suite ecosystem.

NetWitness Endpoint Meta Integration

The NetWitness Endpoint Meta Integration with RSA NetWitness Suite offers customers that have both products a way to more easily take advantage of their products in a single user interface. The following diagram illustrates how NetWitness Endpoint integrates with the NetWitness Suite. The NetWitness Endpoint metadata is collected and published from all machines where NetWitness Endpoint agents are deployed, and then sent to the NetWitness Suite Log Decoder.

The meta can then be viewed in the associated NetWitness Suite Concentrator and also in NetWitness Suite Investigate.



NetWitness Endpoint Alerts and Indicators of Compromise

NetWitness Endpoint IIOC (Instant Indicator of Compromise) is a database query that NetWitness Endpoint runs on collected NetWitness Endpoint scan data to determine the presence of potential malware on scanned hosts. RSA NetWitness Endpoint 4.1.2 or later ships with IOCs that users can enable and mark as alertable. RSA NetWitness Endpoint runs IOC queries regularly on new scan data, which is collected and stored in the database. If the IOC query is satisfied, this indicates a potential indicator of compromise, and the event can be reported to a user or sent to an external system as an alert.

Possible types of alerts are:

- Machine alert: This alert indicates that the machine in question is suspicious.
- Module alert: This alert indicates that a module, such as a file, a DLL, or an executable, is suspicious. It contains details about the module in question.
- Event alert: This alert represents any other suspicious activity detected by NetWitness Endpoint that does not fall into the above categories.

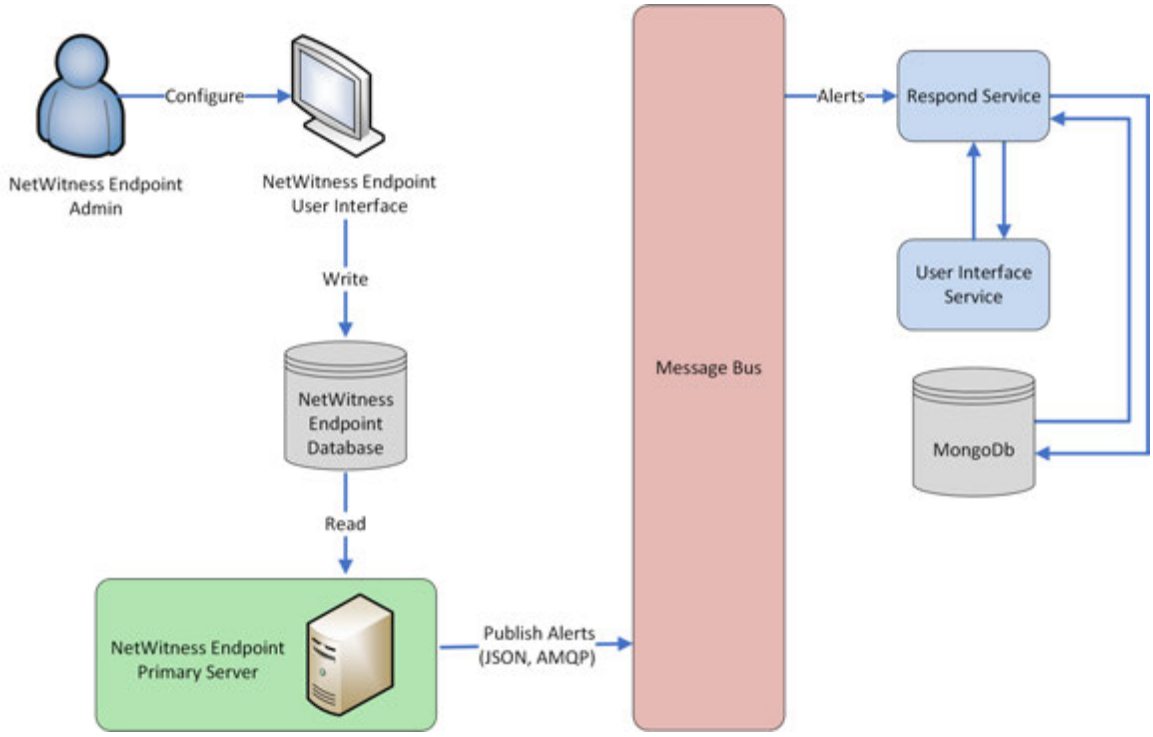
Each of these alert types can be sent to NetWitness Suite.

Configure NetWitness Endpoint Alerts via Message Bus

This procedure is required to integrate NetWitness Endpoint with NetWitness Suite so that the NetWitness Endpoint alerts are picked up by the Respond component of NetWitness Suite and displayed in the **RESPOND > Alerts** view.

Note: RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, or 4.4 for NetWitness Respond integration. For more information, see the "RSA NetWitness Suite Integration" topic in the *NetWitness Endpoint User Guide*.

The diagram below represents the flow of NetWitness Endpoint alerts to the Respond Incident List view of NetWitness Suite and its display in the **RESPOND > Alerts** view.



Prerequisites

Ensure that you have the following:

- The Respond service is installed and running on NetWitness Suite 11.0.
- NetWitness Endpoint 4.3.0.4, 4.3.0.5, or 4.4 is installed and running.

Configure NetWitness Endpoint to Forward NetWitness Endpoint Alerts

To configure NetWitness Endpoint to send alerts over the message bus to the NetWitness Suite user interface:

1. In the NetWitness Endpoint user interface, click **Configure > Monitoring and External Components**.

   The **External Components Configuration** dialog is displayed.

   1. From the components listed, select **Incident Message Broker** and click + to add a new IM broker.

2. Enter the following fields:

   a. **Instance Name**: Enter a unique name to identify the IM broker.

   b. **Server Hostname/IP address**: Enter the Host DNS or IP address of the IM broker (NetWitness Server).

   c. **Port number**: The default port is 5671.

3. Click **Save**.

4. Navigate to the **ConsoleServer.exe.config** file in **C:\Program Files\RSA\ECAT\Server**.

5. Modify the virtual host configurations in the file as follows:
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Suite11.0, the virtual host is "/rsa/system". For version 10.6.x and below, the virtual host is "/rsa/sa".

6. Restart the API Server and Console Server.

7. To set up SSL for Respond Alerts, perform the following steps on the NetWitness Endpoint primary console server to set the SSL communications:

   a. Export the NetWitness Endpoint CA certificate to .CER format (Base-64 encoded X.509) from the personal certificate store of the local computer (without selecting the private key).

   b. Generate a client certificate for NetWitness Endpoint using the NetWitness Endpoint CA certificate. (You MUST set the CN name to ecat.)

   ```
   makecert -pe -n "CN=ecat" -len 2048 -ss my -sr LocalMachine -a
   sha1 -sky exchange -eku 1.3.6.1.5.5.7.3.2 -in "NweCA" -is MY -ir
   LocalMachine -sp "Microsoft RSA SChannel Cryptographic Provider" -
   cy end -sy 12 client.cer
   ```

   Note: In the above code sample, if you upgraded to Endpoint version 4.3 from a previous version and did not generate new certificates, you should substitute "EcatCA" for "NweCA".

   c. Make a note of the thumbprint of the client certificate generated in step b. Enter the thumbprint value of the client certificate in the IMBrokerClientCertificateThumbprint section of the ConsoleServer.Exe.Config file as shown.

   ```
   <add key="IMBrokerClientCertificateThumbprint"
   value="896df0efacf0c976d955d5300ba0073383c83abc"/>
   ```

8. On the NetWitness Server, copy the NetWitness Endpoint CA certificate file in .CER format into the import folder:
   `/etc/pki/nw/trust/import`

9. Issue the following command to initiate the necessary Chef run:
   `orchestration-cli-client --update-admin-node`
   This appends all of those certificates into the truststore.

10. Restart the RabbitMQ server:
    `systemctl restart rabbitmq-server`
    The NetWitness Endpoint account should automatically be available on RabbitMQ.

11. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NetWitness Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Troubleshooting

This section suggests how to resolve problems you may encounter when you configure NetWitness Endpoint alerts via Message Bus.

Known Issues	Solutions
Orchestration fails on admin node.	You must copy and paste the content of EcatCA certificate in `/etc/rabbitmq/ssl/truststore.pem` and restart the Rabbitmq service.

Configure Contextual Data from NetWitness Endpoint via Recurring Feed

You can configure RSA NetWitness Endpoint data in RSA NetWitness Suite to provide contextual data from NetWitness Endpoint to Decoder and Log Decoder sessions. This configuration adds contextual meta values in addition to the instant IOC alerts that can be used to build correlations to other metadata in the NetWitness Suite ecosystem.

Administrators can configure NetWitness Suite to consume system scan contextual data from NetWitness Endpoint via a NetWitness Suite Live recurring feed. This integration can enrich the session from a Decoder or Log Decoder with contextual information displayed in NetWitness Suite Investigation; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data into sessions from a Decoder or Log Decoder.

Note: Although this feature is targeted for customers with a packet Decoder, a recurring feed can also be implemented in Log Decoders.

Caution: In environments with many NetWitness Endpoint hosts, use of this recurring feed may result in decreased performance on the NetWitness Suite ingest devices (Decoder and Log Decoder).

Prerequisites

- Version 4.3.0.4, 4.3.0.5, or 4.4 NetWitness Endpoint Console server and NetWitness Server Version 10.4 and above installed.
- Version 11.0 RSA Decoder and Concentrator connected to the NetWitness Server in the network.

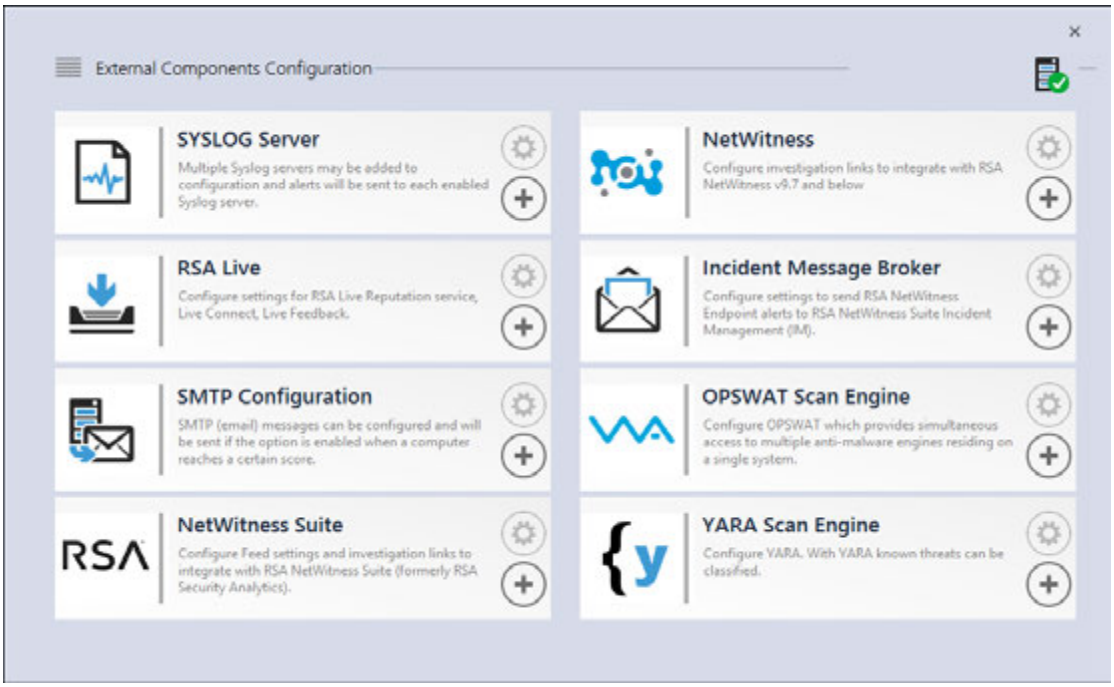
To Configure Contextual Data from NetWitness Endpoint via Recurring Feed, perform the following:

1. Enable the NetWitness Endpoint Feed for NetWitness Suite in the NetWitness Endpoint User Interface.
2. Export the NetWitness Endpoint CA Certificate from the NetWitness Endpoint Console server and Import it into NetWitness Suite trust store.
3. Configure the NetWitness Suite Concentrator service to define which meta keys are indexed.
4. Create a recurring feed in NetWitness Suite Live.

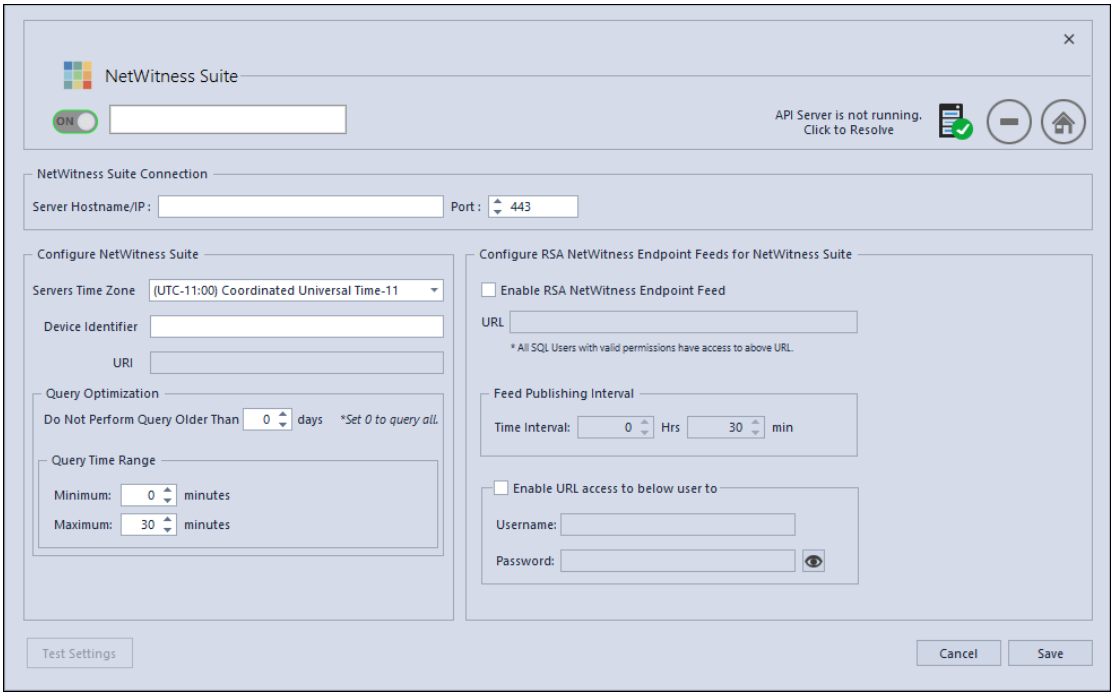
Enable the NetWitness Endpoint Feed for NetWitness Suite

1. In the NetWitness Endpoint user interface, create SQL user in NetWitness Endpoint:
   a. Open the NetWitness Endpoint user interface and log on using the proper credentials.
   b. From the menu bar, select **Configure > Manage Users and Roles**, right-click in the pane, and select **create sql user**.
   The Create a new SQL User dialog is displayed.

   c. Enter the **Login Name** and **Password** and click **Create**.
2. From the menu bar, select **Configure > Monitoring External Components**.
   The External Components Configuration dialog is displayed.



3. In NetWitness Suite, click +.
   The NetWitness Suite dialog is displayed.



4. In the **NetWitness Suite** panel, in **On**, enter the name to identify the NetWitness Suite component.

5. In the **NetWitness Suite Connection** panel, perform the following.
   a. In the **Server Hostname/IP** field, enter the host name or IP address of the NetWitness Server.
   b. In the **Port** field, enter the port number. By default port number is 443.
6. In the **Configure NetWitness Suite** panel, perform the following:
   a. In the **Servers Time Zone** field, select the time zone for the component from the drop-down list.
   b. In the **Device Identifier** field, enter the NetWitness Suite concentrator device ID.

   Note: You can find the Device Identifier in NetWitness Suite when you look up a Concentrator or Broker in **Investigation > Navigate >***<Concentrator or Broker Name>*. The Device Identifier is the number in the URL after "investigation." For example, in the URL `https://<IP address>investigation/319/navigate/values`, the Device Identifier is **319**.

   The **URI** field is populated when you click **Save**.
7. In the **Query Optimization** panel, in the **Do Not Perform Query Older Than** field, enter the number of days to limit the query period. Enter **0** if you want to discard this feature.
8. In the **Query Time Range** panel, perform the following:
   a. In the **Minimum** field, enter the number of minutes for the minimum query time range. This value is used to automatically increase the time range submitted to NetWitness Suite. This ensures that a query returns a positive response if the NetWitness Endpoint Agent's reported time is slightly different than NetWitness Endpoint's time.
   b. In the **Maximum** field, enter the number of minutes to limit the time range. This value is used to automatically limit the time range submitted to NetWitness Suite, so that a query does not overload the NetWitness Server.
9. In the **Configure RSA NetWitness Endpoint Feeds for NetWitness Suite** panel, perform the following:
   a. Select **Enable RSA NetWitness Endpoint Feed**.
   b. In the **URL** field, enter the SQL **Username** and **Password** (configured in step 1) to access the location of the feed.
      The **URL** field is populated when you click **Save**.
   c. Enter the time interval for the frequency at which feeds are published.

10. In the **Feed Publishing Interval** panel, in the **Time Interval** field, select the time interval in **hrs** and **mins** for the frequency at which feeds are published.
11. In the **Enable URL access to below user to** panel, enter the **Username** and **Password** of the NetWitness Endpoint user.
12. Click **Save**.
    A feed is created.

Export the NetWitness Endpoint SSL Certificate

Note: This procedure works only for NetWitness Suite 10.5 and above because Java 8 support was added for 10.5. If you are using an earlier version of NetWitness Suite, refer to the applicable version of this guide.

To export the NetWitness Endpoint CA certificate from the NetWitness Endpoint Console server and copy it to the NetWitness Suite host:

1. Log on to the NetWitness Endpoint Console.
2. Open **MMC**.
3. Add a certificate snap-in for **Computer account**.
4. Export the certificate named **`EcatCA`**.
   a. Export without a private key.
   b. Export in DER encoded binary X.509 (`.CER`) format.
   c. Name it **`EcatCA.cer`**.
5. Copy the NetWitness Endpoint CA certificate to the NetWitness Suite host:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5 or 4.4 fresh installation:
     `scp NweCA.cer root@<sa-machine>:.`
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5:
     `scp EcatCA.cer root@<sa-machine>:.`
6. To import the NetWitness Endpoint CA certificate into the NetWitness Suite Trusted store, perform the following:
   a. Check the Java version installed on your NetWitness Suite using the following command:
      `java -version`
      The openjdk version is displayed. For example, openjdk version "`1.8.0_71`"
   b. To set the JDK parameter, navigate to java directory. Enter the following commands:

- `JDK=/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.141-1.b16.el7_3.x86_64/jre/`
- For NetWitness Endpoint fresh installation:
  `$JDK/bin/keytool -import -v -trustcacerts -alias nweca -file ~/NweCA.cer -keystore $JDK/lib/security/cacerts -storepass changeit`
- For NetWitness Endpoint upgraded from previous version:
  `$JDK/bin/keytool -import -v -trustcacerts -alias ecatca -file ~/EcatCA.cer -keystore $JDK/lib/security/cacerts -storepass changeit`

When prompted for certificate update confirmation, enter **Yes**.

7. On the NetWitness Suite host, do one of the following:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, or 4.4 fresh installation, edit **`/etc/hosts`** to map the IP address of the NetWitness Endpoint Console server to the name **NweServerCertificate** by adding the following line to the file:
     `<ip-address-ecat-cs> NweServerCertificate`
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, edit **`/etc/hosts`** to map the IP address of the upgraded NetWitness Endpoint Console server to the name **`ecatserverexported`** by adding the following line to the file:
     `<ip-address-ecat-cs> ecatserverexported`
8. To restart NetWitness Suite, enter the following command:
   `service jetty restart`

Configure the NetWitness Suite Concentrator Service

1. Log on to NetWitness Suite and go to **ADMIN > Services**.
2. Select a Concentrator from the list and select **View > Config.**
3. Select the **Files** tab, and from the **Files to Edit** drop-down menu, select **index-concentrator-custom.xml**.
4. Add the following NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them. The following lines are examples; make sure the values match your configuration and the column names you included in the feed definition, where:
   description is the name of the meta key you want to display in NetWitness Suite

Investigation.

level is "IndexValues"

name matches the column name of the CSV file that NetWitness Suite uses while defining the recurring feed (see the table in *Configure the Recuring Custom Feed Task in NetWitness Suite* below).

```
<key description="Gateway" format="Text" level="IndexValues" name="gateway" valueMax="250000" defaultAction="Open"/>
<key description="Risk Number" format="Float64" level="IndexValues" name="risk.num" valueMax="250000" defaultAction="Open"/>
<key description="Strans Addr" format="Text" level="IndexValues" name="stransaddr" valueMax="250000" defaultAction="Open"/>
<key description="Domain" format="Text" level="IndexValues" name="domain" valueMax="250000" defaultAction="Open"/>
<key description="User Account" format="Text" level="IndexValues" name="username" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Connectiontime" format="Text" level="IndexValues" name="ecat.ctime" valueMax="250000" defaultAction="Open"/>
<key description="Ecat Scantime" format="Text" level="IndexValues" name="ecat.stime" valueMax="250000" defaultAction="Open"/>
```

5. Restart the Concentrator to activate the custom key updates.

Configure the Recurring Custom Feed Task in NetWitness Suite

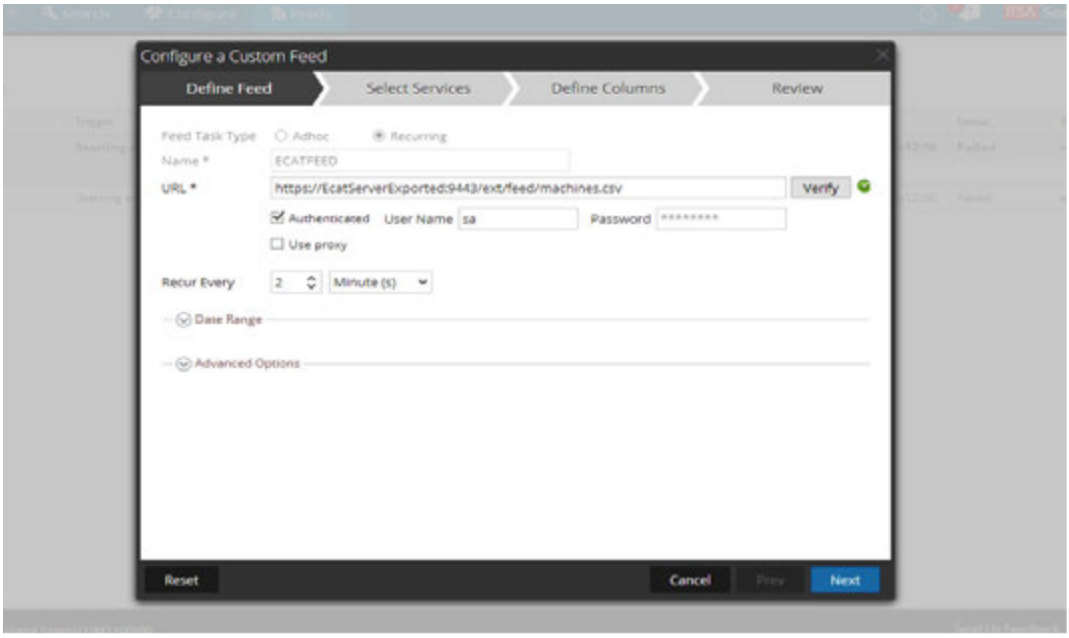
1. Log on to NetWitness Suite and go to **CONFIGURE > Custom Feeds**.
   The Feeds view is displayed.
2. In the toolbar, click  .
   The Setup Feed dialog is displayed.
3. In the Setup Feed dialog, select **Custom Feed** and click **Next**.
   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.
4. In the **Define Feed**, perform the following:
   a. In the **Feed Task Type** field, select **Recurring**.
   b. In the **Name** field, enter the name of the feed. For example, EndpointFeed.
   c. In the **URL** field, enter the URL with the hostname of the Windows server on which NetWitness Endpoint is installed:

- For NetWitness Endpoint 4.3.0.4, 4.3.0.5 or 4.4 fresh installation, use the URL **`https://NweServerCertificate:9443/api/v2/feed/machines.csv.`**
- For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, use the URL **`https://ecatserverexported:9443/api/v2/feed/machines.csv.`**

d. Enable the checkbox **Authenticated** and enter the username and password as noted in *Enable the ECAT Feed* above.

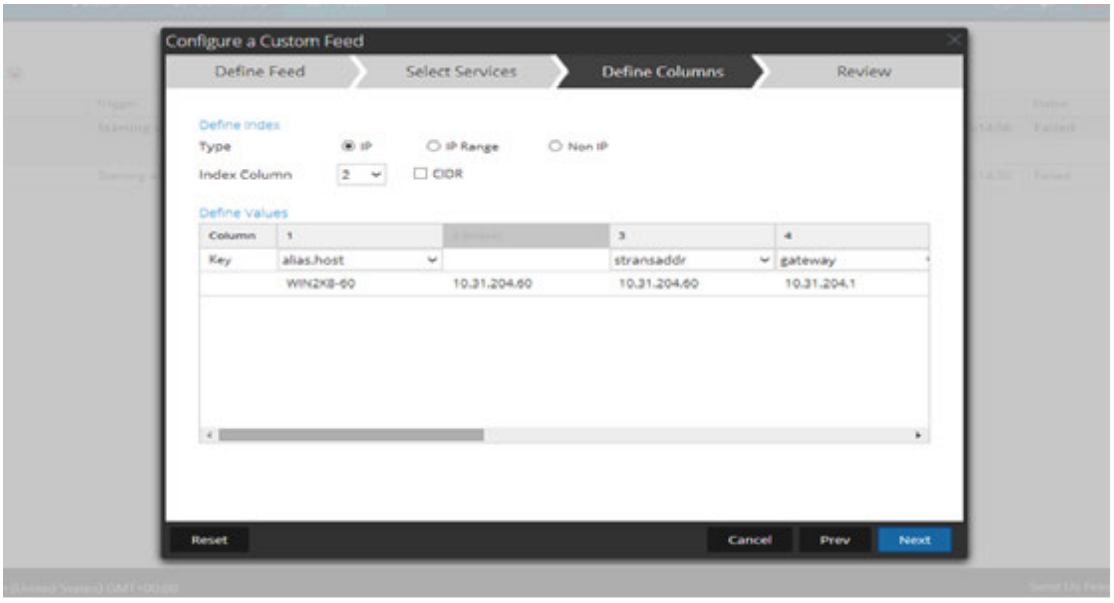
e. Click **Verify** to check if NetWitness Suite can reach the web resource.

f. Define the schedule and click **Next**.



5. In the **Select Services** tab, select the Decoder or groups to consume the feed. Click **Next**.

6. In the **Define Columns** tab, enter the column names as shown in the table below and save the feed.

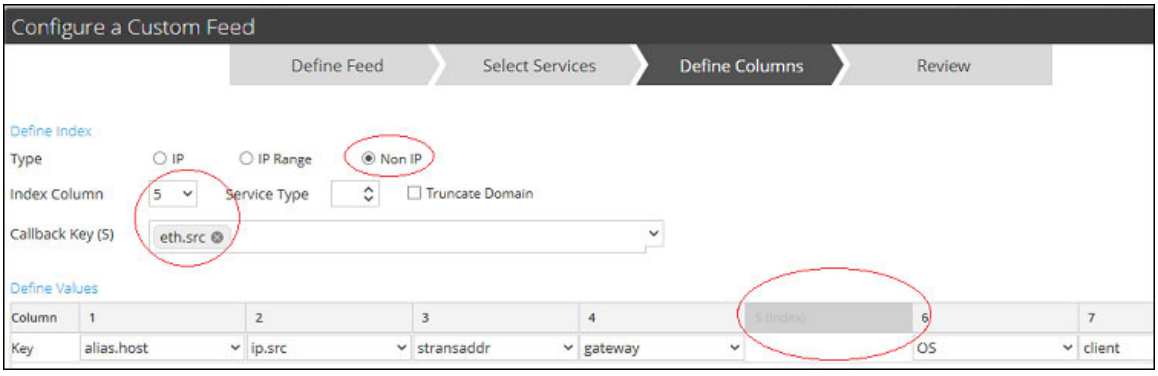


The following table shows the columns in the CSV file for the NetWitness Endpoint feed.

Column	Name	Description	Column Name in NetWitness Suite (Meta Key Name)
1	MachineName	Host name of the Windows agent	alias.host
2	LocalIp	IPv4 address	IP type (indexed column)
3	RemoteIp	Far end IP as seen by the router	stransaddr
4	GatewayIp	IP of the gateway	gateway
5	MacAddress	MAC address	eth.src
6	OperatingSystem	Operating system used by the Windows Agent	OS

Column	Name	Description	Column Name in NetWitness Suite (Meta Key Name)
7	AgentID	Agent ID of the host (unique ID assigned to the agent)	client
8	ConnectionUTCTime	Last time when the agent connected to NetWitness Endpoint server	ecat.ctime
9	Source Domain	Domain	domain.src
10	ScanUTC time	Last time when the agent was scanned	ecat.stime
11	UserName	Username of the client machine	username
12	Machine Score	Score of the agent indicating the suspicious level	risk.num

Note: In the table, the recommended index setting is LocalIp. However, if the LocalIp for NetWitness Endpoint Agent PC is allocated by a DHCP Server and the DHCP lease has expired, and if the IP is then re-allocated to another PC, the metadata created by the feed will be incorrect. To avoid this risk, use the machine name or the Mac address instead of the localIP address as the Feed's index. For example, to use a Mac address, you could enter the values as shown in the following figure.



Result

When viewing feed data in NetWitness Suite, upon a match of the indexed value (ip.src), meta data is populated in Investigation, Reporting, and Alerting Interfaces.

Configure Endpoint Alerts via Syslog into a Log Decoder

You can configure the use of RSA NetWitness Endpoint data in RSA NetWitness Suite to provide NetWitness Endpoint alerts via Syslog into Log Decoder sessions. This generates metadata that is used by NetWitness Suite Investigation, Alerts, and Reporting Engine.

For NetWitness Suite networks that are consuming logs, this integration of NetWitness Endpoint with NetWitness Suite pushes NetWitness Endpoint events to the Log Decoder via common event format (CEF) syslog messages and generates metadata that is used by NetWitness Suite Investigation, Alerts, and Reporting Engine. The use case for this integration is SIEM Integration to allow centralized event management, correlation of NetWitness Endpoint events with other Log Decoder data, NetWitness Suite reporting on NetWitness Endpoint events, and NetWitness Suite alerting of NetWitness Endpoint events.

Prerequisites

The following are required for this integration:

- Version 4.3.0.4, 4.3.0.5, or 4.4 NetWitness Endpoint UI.
- NetWitness Server Version 11.0 is installed.
- Version 10.4 or later RSA Log Decoder and Concentrator connected to the NetWitness Server in the network.
- Port UDP- 514 or TCP - 1514 open from NetWitness Endpoint server to Log Decoder in the firewall.

Procedure

1. Deploy the required parser (CEF or rsaecat) to the Log Decoder as described in the "Manage Live Resources" topic in *Live Services Management*. After you deploy the parser, make sure the parser is enabled. For more information, see Services Config View - General Tab.

Note: Use only one of these parsers. When the CEF parser is deployed, it supersedes the NetWitness Endpoint parser, and all CEF messages into NetWitness Suite are processed by the CEF parser. Enabling both parsers is an unnecessary burden on performance.

2. Configure NetWitness Endpoint to send syslog output to NetWitness Suite and generate NetWitness Endpoint alerts to the Log Decoder.

3. (Optional) Edit the table mapping in `table-map-custom.xml` and the `index-concentrator-custom.xml` to add fields based on user preferences for metadata to be mapped to NetWitness Suite.

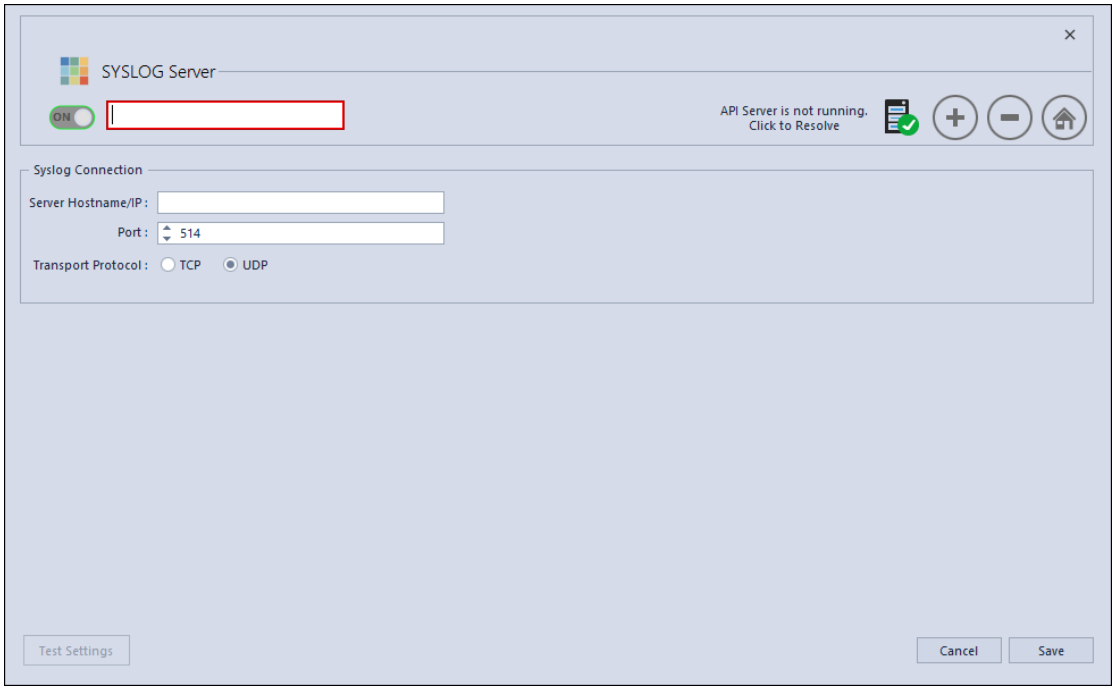
Configure NetWitness Endpoint to Send Syslog Output to NetWitness Suite

To add the Log Decoder as a Syslog external component and generate NetWitness Endpoint alerts to the Log Decoder:

1. Open the NetWitness Endpoint user interface and log on using the proper credentials.
2. From the menu bar, select **Configure > Monitoring and External Components**.

   The External Components Configuration dialog is displayed.
3. In **SYSLOG Server**, click ✚.

   The SYSLOG Server dialog is displayed.

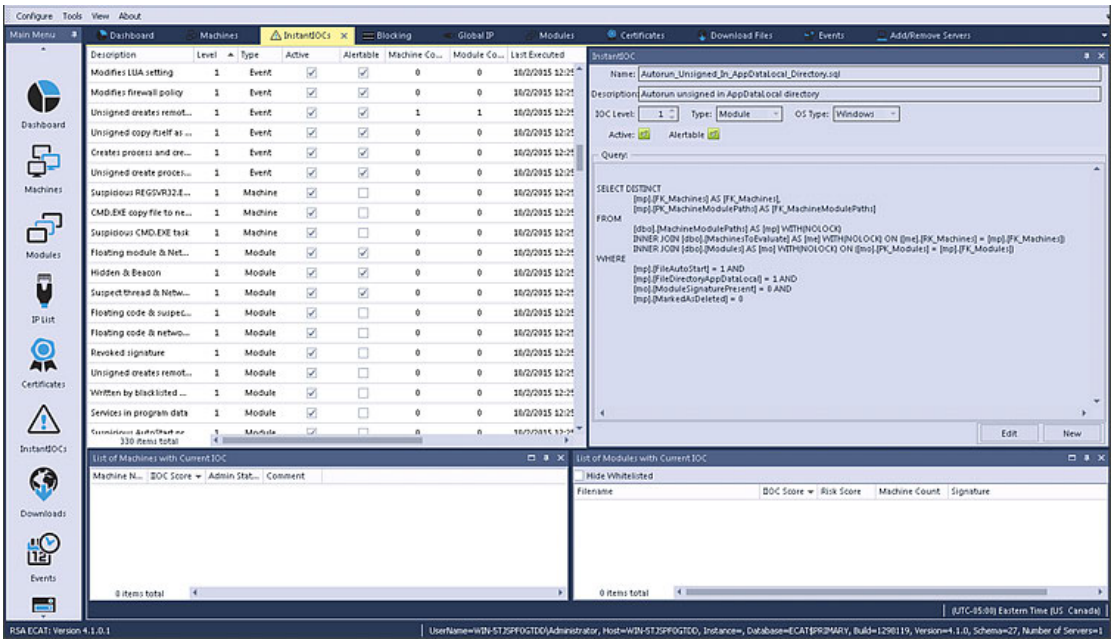


4. In the **NetWitness Suite** panel, in **On**, enter the descriptive name for the Log Decoder.
5. In the **Syslog Connection** panel, perform the following to enable Syslog messaging:

   Server Hostname/IP = The hostname DNS or IP address of the RSA Log Decoder
   Port = 514

Transport Protocol = Select **UDP** or **TCP** as appropriate for your Syslog server for the transport protocol.

6. Click **Save**.
7. Open the **InstantIOCs** window in the NetWitness Endpoint UI and, in the **Alertable** column, click to enable each IIOC for which you want alerts sent to the Log Decoder.



When the instant IOCs are triggered, Syslog alerts from the NetWitness Endpoint server are sent to the Log Decoder. Log Decoder alerts are then aggregated to the Concentrator. These events are injected into the Concentrator as metadata.

Edit the Table Mapping in table-map-custom.xml

In the default RSA table-map.xml provided by RSA, the meta keys in the `table-map.xml` file are set to `Transient`. In order to view the meta keys in Investigation, the keys must be set to `None`. To make changes to the mapping, you must add the entries to the `table-map-custom.xml` on the Log Decoder.

This is the list of meta keys in `table-map.xml`.

NetWitness Endpoint Fields	NetWitness Suite Mapping	Transient in NetWitness Suite
agentid	client	No
CEF Header Hostname Field	alias.host	No

NetWitness Endpoint Fields	NetWitness Suite Mapping	Transient in NetWitness Suite
CEF Header Product Version	version	Yes
CEF Header Product Name	Product	Yes
CEF Header Severity	severity	Yes
CEF Header Signature ID	event.type	No
CEF Header Signature Name	event.desc	No
destinationDnsDomain	ddomain	Yes
deviceDnsDomain	domain	Yes
dhost	host.dst	No
dst	ip.dst	No
end	endtime	Yes
fileHash	checksum	Yes
fname	filename	No
fsize	filename.size	Yes
gatewayip	gateway	Yes
instantIOCLevel	threat.desc	No
instantIOCName	threat.category	No
machineOU	dn	Yes
machineScore	risk.num	No
md5sum	checksum	Yes
os	OS	Yes

NetWitness Endpoint Fields	NetWitness Suite Mapping	Transient in NetWitness Suite
port	ip.dstport	No
protocol	protocol	Yes
Raw Message	msg	Yes
remoteip	stransaddr	Yes
rt	alias.host	No
sha256sum	checksum	Yes
shost	host.src	No
smac	eth.src	Yes
src	ip.src	No
start	starttime	Yes
suser	user.dst	No
timezone	timezone	Yes
totalreceived	rbytes	Yes
totalsent	bytes.src	No
useragent	user.agent	No
userOU	org	Yes

The following seven keys are not in `table-map.xml`; to use these keys in NetWitness Suite you need to add them to `table-map-custom.xml`, and set the flags to `None`.

NetWitness Endpoint Fields	NetWitness Suite Mapping	Transient in NetWitness Suite
moduleScore	cs.modulescore	Yes

NetWitness Endpoint Fields	NetWitness Suite Mapping	Transient in NetWitness Suite
moduleSignature	cs.modulesign	Yes
Target module	cs.targetmodule	Yes
YARA result	cs.yararesult	Yes
Source module	cs.sourcemodule	Yes
OPSWATResult	cs.opswatresult	Yes
ReputationResult	cs.represult	Yes

Here are the entries to be added to the `table-map-custom.xml` if required.

```
<mapping envisionName="cs_represult" nwName="cs.represult" flags="None"
envisionDisplayName="ReputationResult"/>
 <mapping envisionName="cs_modulescore" nwName="cs.modulescore" format="Int32"
flags="None" envisionDisplayName="ModuleScore"/>
 <mapping envisionName="cs_modulesign" nwName="cs.modulesign" flags="None"
envisionDisplayName="ModuleSignature"/>
 <mapping envisionName="cs_opswatresult" nwName="cs.opswatresult" flags="None"
envisionDisplayName="OpswatResult"/>
 <mapping envisionName="cs_sourcemodule" nwName="cs.sourcemodule" flags="None"
envisionDisplayName="SourceModule"/>
 <mapping envisionName="cs_targetmodule" nwName="cs.targetmodule" flags="None"
envisionDisplayName="TargetModule"/>
 <mapping envisionName="cs_yararesult" nwName="cs.yararesult" flags="None"
envisionDisplayName="YaraResult"/>
```

Note: Restart the Log Decoder or reload the log parsers for the changes to take effect.

Configure the NetWitness Suite Concentrator Service

1. Log on to NetWitness Suite and go to **ADMIN** > **Services**.
    1. Select a Concentrator from the list and select **View > Config.**
2. Select the **Files** tab, and from the **Files to Edit** drop-down list, select **index-concentrator-custom.xml**.
3. Add the NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them.
4. Restart the Concentrator.

5. To add the Concentrator as a data source in the Reporting Engine, in the **ADMIN** > **Services** view, select the Reporting Engine and Select **View> Config > Sources.** NetWitness Endpoint meta is populated in Reporting Engine, and you can run reports by selecting the appropriate meta keys.

Example

Note: The following lines are examples; make sure the values match your configuration and the column names you included in the feed definition, where:
description is the name of the meta key you want to display in NetWitness Suite Investigation.
level is "IndexValues"
name is the NetWitness Endpoint meta key name from the table below

```
<language>
<key description="Product" format="Text" level="IndexValues" name="product"
valueMax="250000" defaultAction="Open"/>
 <key description="Severity" format="Text" level="IndexValues" name="severity"
valueMax="250000" defaultAction="Open"/>
 <key description="Destination Dns Domain" format="Text" level="IndexValues"
name="ddomain" valueMax="250000" defaultAction="Open"/>
 <key description="Domain" format="Text" level="IndexValues" name="domain"
valueMax="250000" defaultAction="Open"/>
 <key description="Destination Host" format="Text" level="IndexValues"
name="host.dst" valueMax="250000" defaultAction="Open"/>
 <key description="End Time" format="TimeT" level="IndexValues" name="endtime"
valueMax="250000" defaultAction="Open"/>
 <key description="Checksum" format="Text" level="IndexValues" name="checksum"
valueMax="250000" defaultAction="Open"/>
 <key description="Filename Size" format="Int64" level="IndexValues"
name="filename.size" valueMax="250000" defaultAction="Open"/>
 <key description="Gateway" format="Text" level="IndexValues" name="gateway"
valueMax="250000" defaultAction="Open"/>
 <key description="Distinguished Name" format="Text" level="IndexValues" name="dn"
valueMax="250000" defaultAction="Open"/>
 <key description="Risk Number" format="Float64" level="IndexValues"
name="risk.num" valueMax="250000" defaultAction="Open"/>
 <key description="ReputationResult" format="Text" level="IndexValues"
name="cs.represult" valueMax="250000" defaultAction="Open"/>
 <key description="Module Score" format="Text" level="IndexValues"
name="cs.modulescore" valueMax="250000" defaultAction="Open"/>
 <key description="Module Sign" format="Text" level="IndexValues"
name="cs.modulesign" valueMax="250000" defaultAction="Open"/>
 <key description="opswat result" format="Text" level="IndexValues"
name="cs.opswatresult" valueMax="250000" defaultAction="Open"/>
 <key description="source module" format="Text" level="IndexValues"
name="cs.sourcemodule" valueMax="250000" defaultAction="Open"/>
 <key description="Target Module" format="Text" level="IndexValues"
name="cs.targetmodule" valueMax="250000" defaultAction="Open"/>
 <key description="yara result" format="Text" level="IndexValues"
```

```
name="cs.yararesult" valueMax="250000" defaultAction="Open"/>
 <key description="Protocol" format="Text" level="IndexValues" name="protocol"
valueMax="250000" defaultAction="Open"/>
 <key description="Event Time" format="TimeT" level="IndexValues"
name="event.time" valueMax="250000" defaultAction="Open"/>
 <key description="Source Host" format="Text" level="IndexValues" name="host.src"
valueMax="250000" defaultAction="Open"/>
 <key description="Start Time" format="TimeT" level="IndexValues" name="starttime"
valueMax="250000" defaultAction="Open"/>
 <key description="Timezone" format="Text" level="IndexValues" name="timezone"
valueMax="250000" defaultAction="Open"/>
 <key description="Received Bytes" format="UInt64" level="IndexValues"
name="rbytes" valueMax="250000" defaultAction="Open"/>
 <key description="Agent User" format="Text" level="IndexValues" name="user.agent"
valueMax="250000" defaultAction="Open"/>
 <key description="Source Bytes" format="UInt64" level="IndexValues"
name="bytes.src" valueMax="250000" defaultAction="Open"/>
 <key description="Strans Address" format="Text" level="IndexValues"
name="stransaddr" valueMax="250000" defaultAction="Open"/>
 </language>
```

Result

Analysts can:

- Create NetWitness Suite alerts based on NetWitness Endpoint events by configuring NetWitness Endpoint events as an enrichment source.
- Create ESA rules using NetWitness Endpoint meta as described in the "Add Rules to the Rules Library" topic in the *Alerting Using ESA Guide*.
- Report on NetWitness Endpoint events using NetWitness Endpoint meta as described in the "Configure a Rule" topic in the *Reporting Guide*.
- View NetWitness Endpoint alerts in NetWitness Respond as described in the "View Alerts" topic in *NetWitness Respond User Guide*.
- View NetWitness Endpoint meta keys in Investigation along with standard NetWitness Suite core meta keys as described in the "Conduct an Investigation" topic in *Investigation and Malware Analysis User Guide*.

RSA NETWITNESS® SUITE

Upgrade Guides and Release Notes

for Version 11.0.0.0

11.0.0.0 Update Checklist
Physical Host

Task	Description	√
Prepare for Upgrade		
1.	Download **RSANW-11.0-PhysUpgradeGde1.1.pdf** from RSA Link and review it.	
2.	Carefully read the sections on Event Stream Analysis (ESA) Upgrade Considerations, User Attribute and Role Changes Affecting Investigate.	
3.	Be aware of the hardware, deployments, services, and features not supported in 11.0.	
4.	(Conditional) if you have Active Directory users configured in 10.6.4.x, complete one of the following options to address a known issue: • Apply the 10.6.4.2 patch before you back up your data for the 11.0 upgrade. • If you failed to apply the 10.6.4.2 patch, you can apply the 11.0.0.1 patch immediately after you upgrade to 11.0.	
5.	Perform the upgrade preparation tasks for the features you use. **Caution:** Make sure that you implement and test the new ports so that upgrade does not fail due to missing ports.	
7.	Create CentOS 6 external host to save backup tar files.	
8.	Download the `nw-backup-v3.0.zip` file from RSA Link (https://community.rsa.com/docs/DOC-81514) to external host.	
9.	Execute `get-all-systems.sh` and `ssh-propagate.sh` script from external host.	
10.	Preserve a copy of the `get-all-systems-master` file for future reference.	
11.	Execute `nw-backup.sh` in `TEST` mode to evaluate the space requirements from external host (for example: `nw-backup -t -l -D`).	
12.	Review the back up options for `nw-backup.sh` by displaying the help menu (`nw-backup.sh -h`) .	

11.0.0.0 Update Checklist
Physical Host

Task	Description	√
Phase 1 - Upgrade SA Server, ESA, Malware Analysis, and Broker/Concentrator Hosts		
13.	Update the contents of the `all-systems` so they consist of SA, ESA's, MA and Broker/Concentrator backup data.	
14.	Reset the Mongo Database admin password to 'netwitness' if it contains special characters .	
15.	Execute `nw-backup.sh` with `-u` flag for all Phase 1 hosts and confirm that it completes with no errors.	
16.	If your environment has multiple ESA appliances, designate a primary ESA (Where the Context Hub service is running) and copy `mongodb.tar.gz.*` files from the secondary ESAs to designated primary ESA default backup path.	
16.	Confirm that backup tar files are saved locally and remotely.	
17	Attach media (that is Build Stick or DVD ISO) to the SA Server host. See **RSANW-11.0-BuildStickInstr1.1.pdf** for instructions on how to get ISO and prepare it. **Caution:** You must use the build stick labeled “OEMDRV”.	
18.	Create base image on the host from the attached media.	
19.	Upgrade the host to 11.0 by running the `nwsetup-tui` program on the host.	
20.	Repeat steps 17., 18., and 19 on the: a. ESA Primary host (and other ESA hosts if you have any). b. Malware Analysis host. c. Broker or Concentrator host.	
21.	Install the ESA, Malware Analysis, and Broker or Concentrator services in the NetWitness 11.0 User Interface.	

Task	Description	√
Phase 2 - Upgrade All Other Hosts		
22.	Update the contents of the `all-systems` so they consist of Phase 2 host backup data.	
23.	Execute `nw-backup.sh` in `TEST` mode to evaluate the space requirements from external host (for example: `nw-backup -t -l -D`).	
24.	Execute `nw-backup.sh` with `-u` flag for all Phase 2 hosts and confirm that it completes with no errors.	
25.	Confirm that backup tar files are saved locally and remotely.	
26.	For all other hosts: a. Attach media (that is Build Stick or DVD ISO) to the SA Server host. See **RSANW-11.0-BuildStickInstr1.1.pdf** for instructions on how to get ISO and prepare it. b. Create base image on the host from the attached media. c. Upgrade the 10.6.4.x host to 11.0 by running the `nwsetup-tui` program on the host. d. Install the host service in the NetWitness 11.0 User Interface:	
Preform Post Upgrade Adjustments		
27.	Perform the post upgrade tasks for the features you use.	
28.	(Conditional) if you have Active Directory users configured in 10.6.4.x and you did not apply he 10.6.4.2 patch, you can apply the 11.0.0.1 patch immediately after you upgrade to 11.0.

Contents

Introduction

The instructions in this guide apply to the upgrade of AWS for RSA NetWitness Suite 10.6.4.x to 11.0.0.0 exclusively. See the *RSA NetWitness Suite Physical Host Upgrade Guide* for instructions on how to upgrade your 10.6.4.x physical hosts to 11.0. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents. This document assumes that the appliances are in AWS cloud.

NetWitness Suite 11.0 is a major release that affects all products in the NetWitness Suite suite. The components of the suite are the NetWitness Server (NW Server), Archiver, Broker, Concentrator, Context Hub, Decoder, Entity Behavior Analytics, Event Stream Analysis, Investigate, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Response, and Workbench.

CentOS6 to CentOS7 Upgrade

NetWitness Suite 11.0 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.0 platform environment has been improved greatly to accommodate current and future physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Suite 11.0 Upgrade Path

The supported Upgrade path for RSA NetWitness® Suite 11.0 is Security Analytics 10.6.4.x. If you are running a version of NetWitness Suite that is prior to 10.6.4.x, you must update to 10.6.4.x before you can upgrade to 11.0. See the *RSA Security Analytics 10.6.4 Update Guide* (https://community.rsa.com/docs/DOC-79055) on RSA Link.

Caution: There is a known issue if you have Active Directory users configured in 10.6.4.x. You have two options to address this issue:
• Apply the 10.6.4.2 patch before you back up your data for the 11.0 upgrade.

Hardware, Deployments, Services, and Features Not Supported in 11.0

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.0.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- IPDB service
- Malware Analysis service co-located on the SA Server (Upgrade of Malware Analysis Enterprise is supported in 11.0.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.0, your custom policy is not present. In its place, there is the out-of-the-box Context hub Server Monitoring Policy in the user interface, which is specific for version 11.0.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Suite 11.0, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.0, ESA sends all alerts to a central Alert system. The local mongo storage in ESA 10.6.4.x has been removed.

Caution: If you do not use Incident Management in 10.6.4.x, carefully consider whether or not to upgrade to version 11.0.

The following guidelines should help you determine whether or not to upgrade your ESA hosts to 11.0.

In your 10.6.4.x deployment, if you have:

- One ESA host, with or without Incident Management configured, upgrade to 11.0.
- Multiple ESA hosts configured to use Incident Management – The system will continue to aggregate alerts centrally. If the system is correctly sized and operating as intended in 10.6.4.x, you can upgrade to version 11.0.
- Multiple ESA hosts without configuration to use Incident Management and you are connecting to individual ESA hosts to view alerts, do not upgrade to version 11.0.

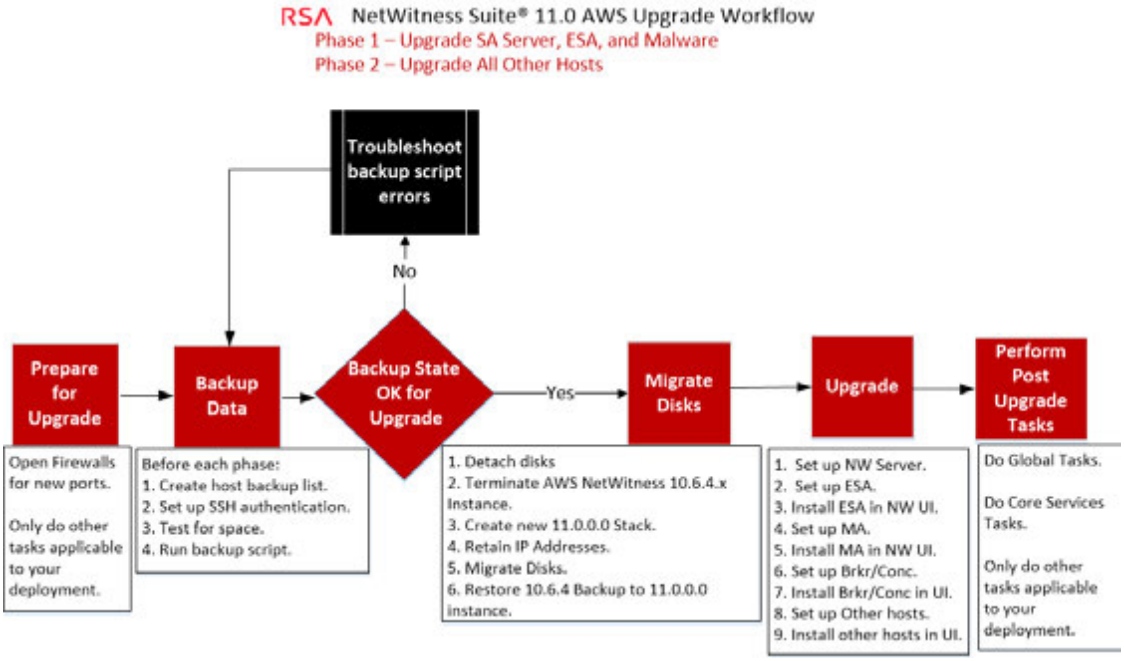
Note: If you did not use Incident Management in 10.6.4.x, you cannot view the 10.6.4.x ESA alerts in the 11.0 Respond component without running a migration script. Use the ESA Alert Migration script to migrate these alerts to the location in 11.0 that will allow Respond to view them. See the *ESA Alert Migration Instructions for 10.6.4.x to 11.0* knowledge base article (https://community.rsa.com/docs/DOC-81680) in RSA Link for instructions on how to run this script.

User Attribute and Role Changes Affecting Investigate

The following changes affect how NetWitness Suite 11.0 handles user and role attributes in the Investigate component.

- User Attributes
  When you upgrade to 11.0, the user attributes (query prefix, session timeout, and query threshold) available in SA 10.6.4.x no longer exist. The same attributes are available at the role level for use.
- User and Role Attributes (Query Prefix) is not applicable to Investigate Event Analysis. The user and role attributes, most importantly the query prefix, do not apply to the new Investigate Event Analysis. Any user can modify the URL in browser to access data that should be

restricted from viewing even when query prefix is applied.



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Suite 11.0.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness Suite 11.0. These tasks are organized by the following categories.

- Global
- Reporting Engine
- Respond and Incident Management

Global

You must complete these tasks regardless of how you deploy NetWitness Suite and which components you use.

Task 1 - Review Core Ports and Open Firewall Ports

The following table lists new ports in 11.0.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

All NetWitness Suite core ports are listed in the "Network Architecture and Ports" topic in the *RSA NetWitness® Suite Deployment Guide* in case you need to reconfigure NetWitness Suite services and firewalls. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 2 - Record Your 10.6.4.x `admin user` Password

Record your 10.6.4.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of `/etc/fstab` File

Copy the `/etc/fstab` file from all VMs to your local machine (backup host or remote machine).

Note: You need this file to restore a VM with external storage mounts.

Reporting Engine

(Conditional) Task 4 - Unlink External Storage

If the Reporting Engine has external storage [such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports] you must perform the follow steps to unlink the storage.

In these steps:

- `/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
- `/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Respond and Incident Management

(Conditional) Task 5 – Disable Incident Management Data Retention

Complete the following procedure to disable Incident Management data retention jobs in 10.6.4.x

1. Log in to RSA Security Analytics 10.6.4.x.
2. Go to **Incident Management** > **Configure** > **Retention Scheduler**.
3. Uncheck the **Enable data retention scheduler** checkbox and click **Apply**.

Backup Instructions

Backing up your configuration data for all your hosts from 10.6.4.x is the first step in upgrading from 10.6.4.x releases to 11.0.0.0.

Note: It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directory will be automatically restored during the upgrade process. After upgrading to 11.0.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types

Caution: 1) These services are not supported in the 10.6.4.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the NetWitness Server
- Standalone Warehouse Connector

2) There is a known issue if you have Active Directory users configured in 10.6.4.x. You have two options to address this issue:
• Apply the 10.6.4.2 patch before you back up your data for the 11.0 upgrade.
• If you failed to apply the 10.6.4.2 patch, you can apply the 11.0.0.1 patch immediately after you upgrade to 11.0.

The following types of hosts can be backed up and are automatically restored during the upgrade process:

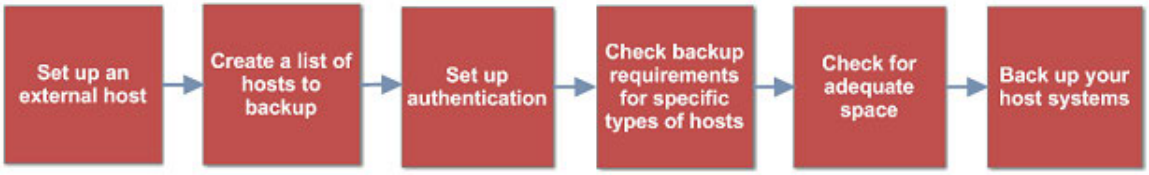
- **NetWitness Server** (may include Malware Analysis, NetWitness Respond, Health and Wellness, and Reporting Engine)
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and NetWitness Respond database)
- **Concentrator**
- **Log Decoder**
- **Packet Decoder**
- **Virtual Log Collector**

The following types of files are automatically backed up but must be restored manually after the upgrade process:

- PAM configuration files: For information about restoring the PAM configuration files, refer to "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.0.0.0", in the "Global" section of the Post Upgrade Tasks.
- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the `/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see "(Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of Post Upgrade Tasks.

Note: If you have problems during the backup or upgrade processes and you lose data, you can recover the data and start the process again. For information about recovering lost data, see "Recover Data After System Failure" in the *System Maintenance Guide*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



The following sections describe each of these tasks:

- Task 1 - Set up an External Host for Backing up Files
- Task 2 - Create a List of Hosts to Back up
- Task 3 - Set up Authentication Between Backup and Target Hosts
- Task 4 - Check for Backup Requirements for Specific Types of Hosts
- Task 5 - Check for Adequate Space for the Backup
- Task 6 - Back up Your Host Systems
- Post Backup Tasks

Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running Centos 6 with connectivity through SSH to the NetWitness Suite stack of hosts.

Ensure that the host names for the systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

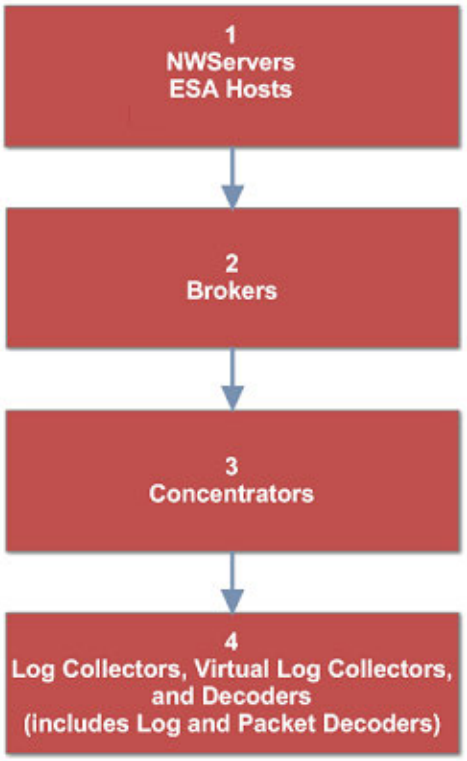
There are several scripts that you run during the backup process. You must download the zip file that contains the scripts (`nw-backup-v3.0.zip`) from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Click the **RSA NetWitness Logs & Packets 11.0 Backup Script (nw-backup-v3.0.sh)** link and extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your NetWitness Servers and host systems to be backed up.
- `ssh-propagate.sh`: Automates sharing keys between the systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.

Note: The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of the hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to ensure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference and then manually editing the `all-systems` file to contain specific hosts.

To generate the `all-systems` and the `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:
   ```
   chmod u+x get-all-systems.sh
   ```
2. At the root level, run the `get-all-systems.sh` script:
   ```
   ./get-all-systems.sh <IP-Address-of-NetWitness-Admin-Server>
   ```
   You will be prompted for the password for each host system once per host.

This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nw-backup/`.

3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.
4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up.

> **Note:** If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-
a48e558cec3e,10.6.4.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-
8ea837074bd0,10.6.4.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.4.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.4.0
packetdecoder,my-nw-packetdecoder,10.0.0.7,a8f2f574-3dd0-4b65-9cf7-
d8141b78a192,10.6.4.0
vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.4.0
broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-
c56ccfb0f737,10.6.4.0
```

And here is an example of an `all-systems` file based on the `all-systems-master-copy` file that could be used in the first backup session:

```
saserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-
a48e558cec3e,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.4.0
```

Troubleshooting Information

- Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location. Follow these recommendations:

  - Do not edit the `all-systems-master-copy` file.
  - If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure to remove pre-existing entries from the file so that the file contains only those hosts that are currently being backed up.
    For more information, see Post Backup Tasks.

- If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.

- The `get-all-systems.sh` script generates a list of hosts that were defined in the NetWitness Suite user interface. Ensure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to NetWitness Suite, you use the NetWitness Suite user interface to ensure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.

- At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the NetWitness Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence of those systems, that their services are all running, and that they are properly communicating with the NetWitness Server. (Any Windows Legacy Collectors or AWS Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)
- If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the man page for `ssh-agent`.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:
   `chmod u+x ssh-propagate.sh`
2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:
   `ssh-propagate.sh <path-to-all-systems-file>`
3. You are prompted for the password once per host, but you will not need to enter it repeatedly later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types:

1. On the NetWitness Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.0.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the NetWitness Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   `openssl x509 -inform der -in certificate.cer -out certificate.pem`
   Convert a PEM file to DER

```
openssl x509 -outform der -in certificate.pem -out certificate.der
```

Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)

```
openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in
certificate.crt -certfile CACert.crt
```

Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM

```
openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes
```

> **Note:** Add the following qualifier to the command string to:
> `-nocerts` convert private keys exclusively.
> `-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Decoder, Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to Appendix B. Stopping and Restarting Data Capture and Aggregation

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

> **Caution:** This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after upgrade.
- If you set the password for `logcollector` user for RabbitMQ , you must know the password so you can set it again after the upgrade.

Prepare LCs and VLCs for Upgrade

1. SSH to the Log Collector.
2. Submit the following command string.
   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```
   This command:

- Stops the Puppet Agent service.
- Disables the file collection accounts ("sftp" and all users in the group "upload") used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgrade to 11.0.0.0.
- Stops all the collection protocols in the Log Collector service.
- Saves the list of Plugin accounts and RabbitMQ accounts.
- Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.
- Waits until the Log Collector queues are empty.
- Stops the Log Collector service.
- Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting

For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint: List RabbitMQ Usernames and Passwords

On the 10.6.4.x host, on the NetWitness Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.0.0.0 upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to *Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL* in Post Upgrade Tasks.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The event source documentation contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in `/root/vsftpd/` directory in 10.6.4.x, this material area will be backed up and restored. **If the material was in another location, you must back it up and restore it manually.**
- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.4.x, it is backed up and restored.

Task 5 - Check for Adequate Space for the Backup

You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to ensure that you provide adequate space for the backup so that the backup captures all your data.

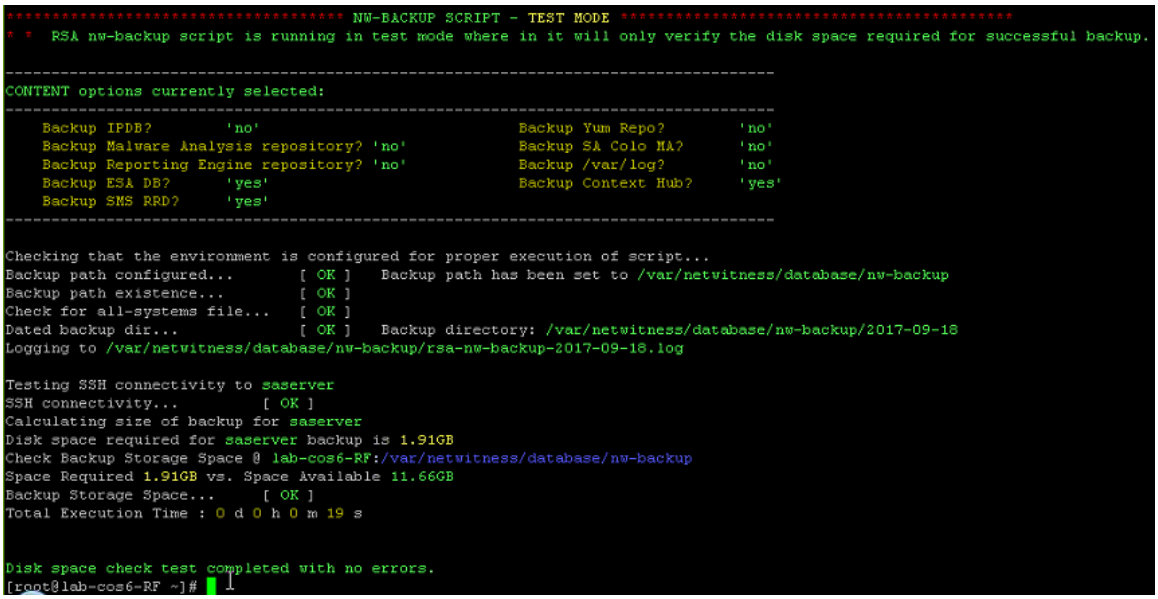
To check for adequate disk space:

1. Make the backup script executable by running the following command:
   ```
   chmod u+x nw-backup.sh
   ```
2. Run the following command at the root directory level:
   ```
   ./nw-backup.sh -t
   ```
   The output displays the amount of disk space that is required for the backup.

   Note: The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the `-d` option by using `-D`. Using the `-D` option will show how much

space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the `-D` option will throw an error. If you want to know how much space is available on the target host, you must run the `df -h` command on the host.

The following figure shows an example of the output from using the `-t` option.



Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the `nw-backup.sh` script using the `-u` option. This option is required for upgrading to 11.0.0.0.

Note: The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage:

`./nw-backup.sh [-u -t -d -D -u -l -x -e <external-mnt> -b <backup file path>`

General Options

`-u : This option is required for upgrading to 11.0. Enables the upgrade flag to run backup for upgrading to 11.0. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)`

-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)

-D : enables disk space check in 'full' mode (estimate of space using compressed data, ~10X slower). Default: (no)

-l : stores backup content locally on each host (automatically set if -u is used). Default: (no)

-e <path to mount point> : copies backup files of all devices onto an external mount point. Default: (/mnt/external_backup)

-x : move all backup files to an external mount point. Default: (no) -COPY

-b <path to write backups> : path to the location for storing backup files on a backup server. **For upgrading to 11.0, please use the default location!** Default: (/var/netwitness/database/nw-backup)

Note: Do **not** change the backup path in upgrade (-u) mode.

Advanced Content Selection Options

-c : back up Colocated Malware Analysis on SA servers. Default: (no)

-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)

-m : back up Malware Analysis File Repository. Default: (no)

-r : back up Reporting Engine Report Repository (automatically set if -u is used). Default: (no)

-v : back up system logs (/var/log). Default: (no)

-y : back up YUM Web Server & RPM Repository. Default: (no)

-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)

-C : If set: DISABLES back up of Context-Hub configuration and database. Default: (not-set)

-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)

Test Options

-t : performs script test run for disk space check only. Services are not stopped and excludes execution of backup. Can be combined with (-d) or (-D) and other flags. Default: (-t)

For example, the command:
`./nw-backup.sh`
would run the backup with options as set in the Header of the script itself.
OR, the command:
`./nw-backup.sh -ue /mnt/external_backup`
would run a normal backup using the backup path defined in the script, with the following options:

```
-u : enables the upgrade flag to run backup for upgrading to 11.0. It
also enables disk space check (-d), backing up reporting engine reports
(-r) and stores backup content locally (-l). Default: (no)

-e : Copy the backup files to external mount point, mounted on
/mnt/external_backup

For Help: ./nw-backup.sh -h
```

When you run the script, the following text is displayed at the top of the script:

```
Caution: RSA nw-backup script backs up configuration files, data, and
logs on the options provided in the script. It tars the content, with
options to store the backup files on the backup server, move or copy
them to external storage on a mount point (USB/NFS/SMB), or SCP them
back to the target host.
This backup script has been qualified on the following versions of
Security Analytics:
10.6.3.x and 10.6.4.x
Use of this script on any other versions of the product may not give
expected results and may not be supported by RSA Customer
Service.Note: All non-RSA custom files, scripts, Cronjobs and other
important files should be placed in /root, /home/'user', OR /etc to be
included in the backup.
```

To run the backup script to back up your hosts:

1. Ensure that the `all-systems` file contains only the hosts to back up. For information, see Task 2 - Create a List of Hosts to Back up.
2. Make the backup script executable by running the following command:
   ```
   chmod u+x nw-backup.sh
   ```
3. Begin the backup process by running the following command at the root directory level:
   ```
   ./nw-backup.sh -u <additional options as needed>
   ```

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.0.0.0.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   ```
   rsa-nw-backup-2017-03-15.log
   ```
4. When the backup has completed, to ensure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:
   ```
   tar -tzvf hostname-ip-address-backup.tar.gz
   ```
   The following archive files are created:

   For all hosts:

<hostname-IPaddress>-root.tar.gz
<hostname-IPaddress>-backup.tar.gz
tar checksum files
<hostname-IPaddress>-network.info.txt
For NetWitness Servers:
<hostname-IPaddress>-root.tar.gz
<hostname-IPaddress>-backup.tar.gz
<hostname-IPaddress>-mongodb.tar.gz
tar checksum files
<hostname-IPaddress>-network.info.txt
For ESA Hosts:
<hostname-IPaddress>-root.tar.gz
<hostname-IPaddress>-backup.tar.gz
<hostname-IPaddress>-mongodb.tar.gz
<hostname-IPaddress>-controldata-mongodb.tar.gz
tar checksum files
<hostname-IPaddress>-network.info.txt

The archived files are located in the /var/netwitness/database/nw-backup directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the all-systems File and the Backup Tar files

Make copies of the all-systems file, the all-systems-master-copy file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the NetWitness Server (specifically the Admin service) to 11.0.0.0.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.0.0.0 upgrade process. Before you begin the upgrade process, you must ensure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- all-systems
- all-systems-master-copy

- appliance_info
- service_info
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

In addition to the files listed above, the following files will be generated on NetWitness Server and ESA hosts:

- <*hostname*>-<*host IP address*>-mongodb.tar.gz
- <*hostname*>-<*host IP address*>-mongodb.tar.gz.sha256

The backup script will also generate the following controldata-mongodb.tar.gz files.

Note: The backup script copies the following files from all ESA hosts to the NetWitness Server host's backup path .

- <esa hostname>-<esa hostip>-controldata-mongodb.tar.gz
- <esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256

Task 3 - (Conditional) For Multiple ESA Hosts, Copy mongodb tar files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the /opt/rsa/database/nw-backup/ directory on the Primary ESA host system (the host that has the ContextHub service running on it) :

- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.0.0.0, ensure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

There should be note here mentioning default backup path locations for that user knows where to go and check these files.

Note: The default paths for backup files are:
- NetWitness Server hosts:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`
- Malware hosts: `/var/lib/rsamalware/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256`

Required Files for ESA Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Required Files for All Other Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

Note: The following files are located in the `<hostname>-<host-IP-address>-backup.tar.gz` tar on all hosts:
`appliance_info`
`service_info`

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
`BUPATH=/opt/rsa/database/nw-backup` for the ESA Correlation Engine
`BUPATH=/var/lib/rsamalware/nw-backup` for the Malware Service
`BUPATH=/var/netwitness/database/nw-backup` for all other services
Restore locations:
`BUPATH/restore/etc/sysconfig` for Iptable rules
`BUPATH/restore/etc/sysconfig` for NAT configurations
`BUPATH/restore/etc` for Crontab entries
`BUPATH/restore/etc` for User Accounts (users are located in the `passwd` file, and groups are located in the `group` file. These are not restored during the upgrade process but can be restored manually.
`BUPATH/restore/etc/ntp.conf` for NTP configurations (must be restored using the NetWitness Suite UI)

Migrate Disk Drives from 10.6.4.x to 11.0

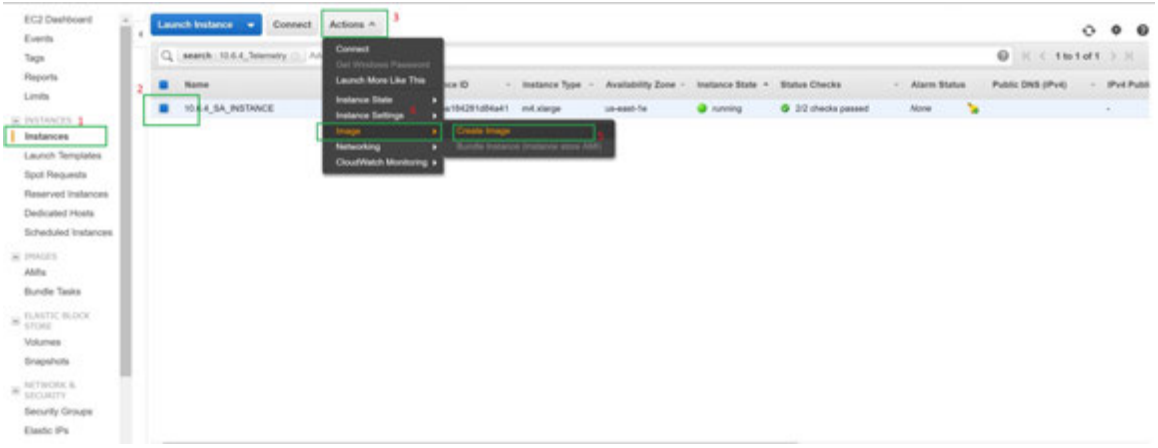
These instructions tell you how to upgrade virtual hosts from 10.6.4.x to 11.0.

Caution: 1.) Run the backup immediately before you upgrade hosts for each phase so that the data is not out-dated.
2.) This guide applies to AWS host upgrades exclusively. If have physical and virtual hosts in your deployment, see the *RSA NetWitness® Suite 11.0 Physical Host Upgrade Instructions* for the steps you must complete to upgrade physical hosts. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

There are five tasks you must complete to migrate from 10.6.4.x to 11.0:

Task 1 - Backup the 10.6.4.x EC2 appliance

Select the 10.6.4.x EC2 Instance and navigate to Actions. Click Image and then select Create Image.



(Optional)Task 2 - Run the backup script to take backup data of 10.6.4.x instance

Note: If you have not taken a backup of the 10.6.4.x instance, follow these steps, otherwise skip to Task 3 - Stop the instances and detach volumes from 10.6.4.x instances.

If the stack contains LogCollector then prepare **Log Collector** for the migration:

1. Navigate to `/opt/rsa/nwlogcollector/nwtools/` and run the below command:

```
sh prepare-for-migrate.sh --prepare
```

2. Download backup scripts from GitHub: https://github.rsa.lab.emc.com/asoc/nw-backup (maintenance-11.0) and place it anywhere in a computer running an RPM-based Linux distribution (RHEL or CentOS for example) with a large amount of free hard drive space. In many cases the SA server will suffice. Now, navigate to `scripts` directory inside '`nw-backup-master`' and run the following commands:

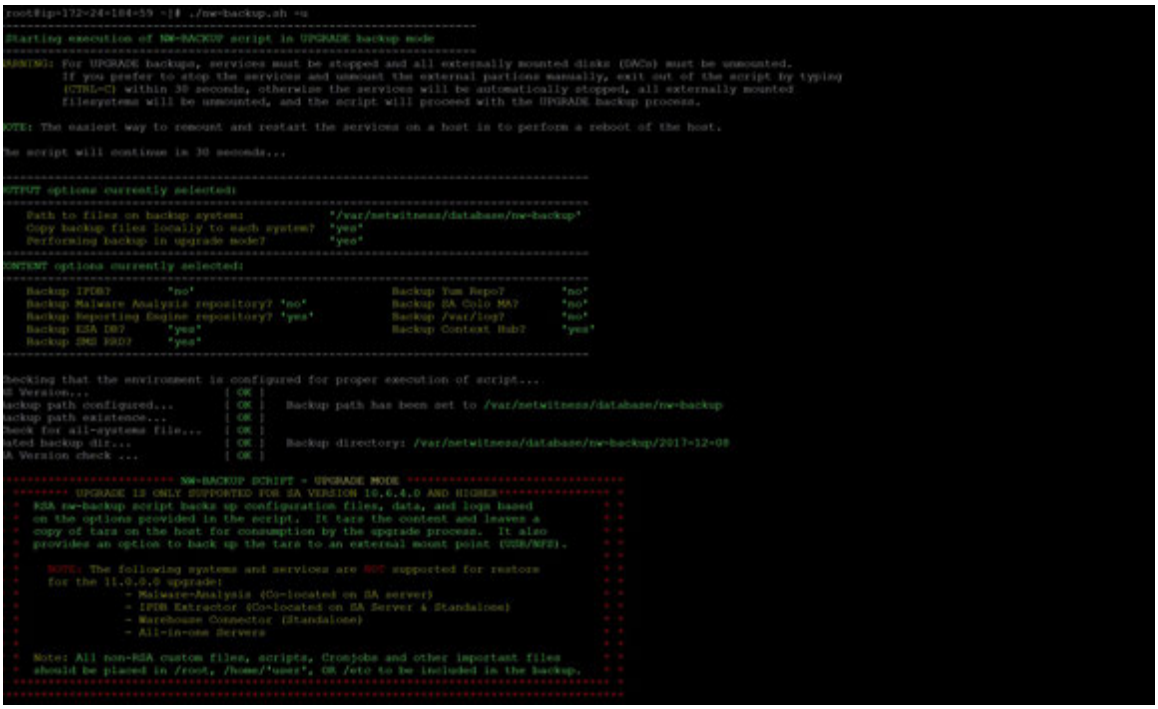
```
./get-all-systems.sh <SA server-IP>
```

```
./ssh-propagate.sh <path-to-backup-directory/all-systems>
```

```
./nw-backup.sh -u
```

Its safe to copy a backup of the tar balls created at `/var/netwitness/database`, in some safe location (not mandatory).

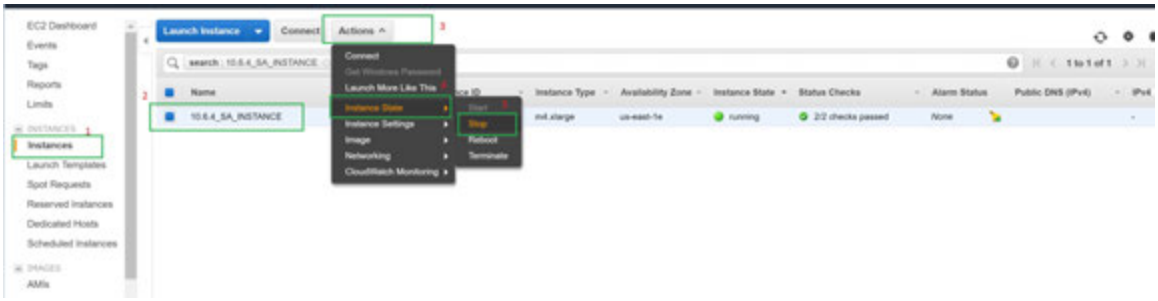
Before starting the restore process, if you have ESA deployment then copy the files `<hostname>-<IP>-controldata-mongodb.tar.gz` & `<hostname>-<IP>-controldata-mongodb.tar.gz.sha256` from the location `/opt/rsa/database/nw-backup` of ESA VM to `/var/netwitness/database/nw-backup/` of SA VM.



Task 3 - Stop the instances and detach volumes from 10.6.4.x instances

Note: If detach fails, do a forced detach on the volume.

Select the 10.6.4.x EC2 instance and navigate to Actions and then click Stop.



Click on Volumes and then select the 10.6.4.x instance volumes to detach Actions and then select Detach Volume.

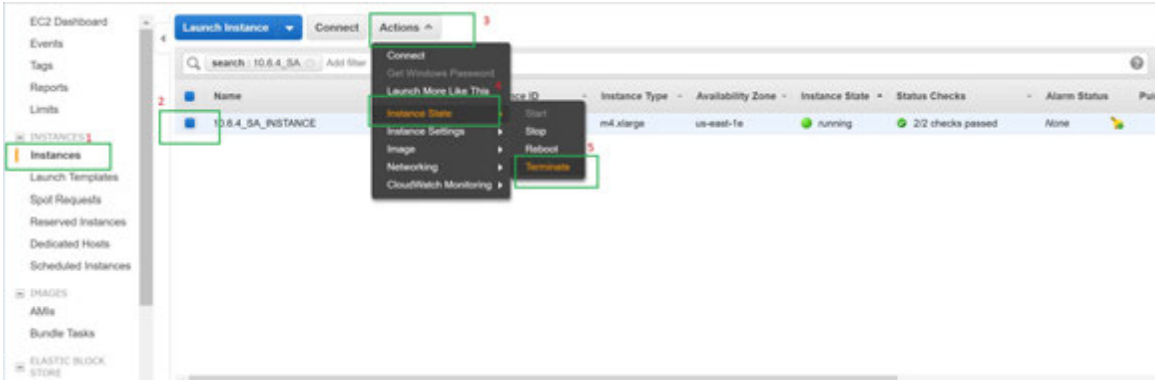
1 to 4 of 4

Task 4 - Note the IP addresses of 10.6.4.x instances and then terminate the EC2 instances

Note: Termination is required to free the IP address.

1. Click on Instances and then select the Instance.
2. Click Actions and navigate to Instance State.
3. Click Terminate

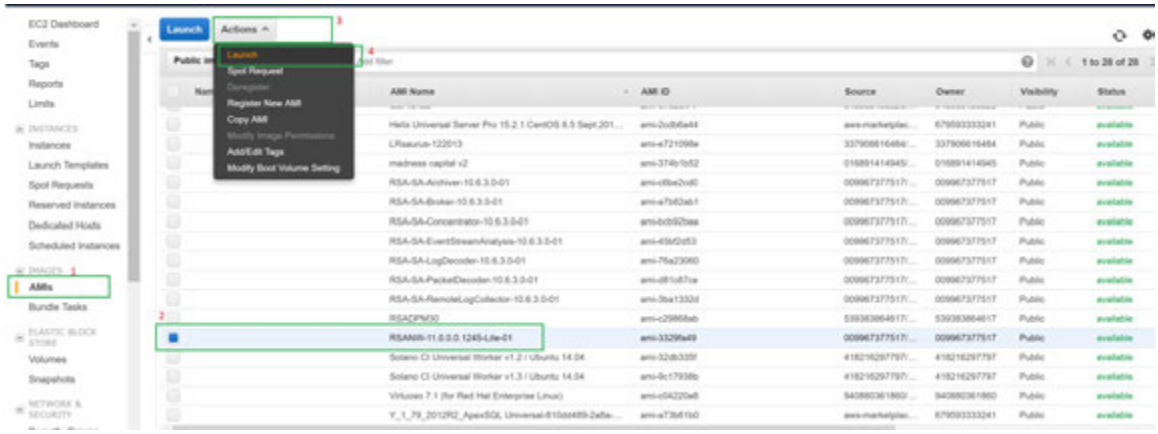


Task 5 - (IP retention) Create 11.0 instances using 11.0 AMI.

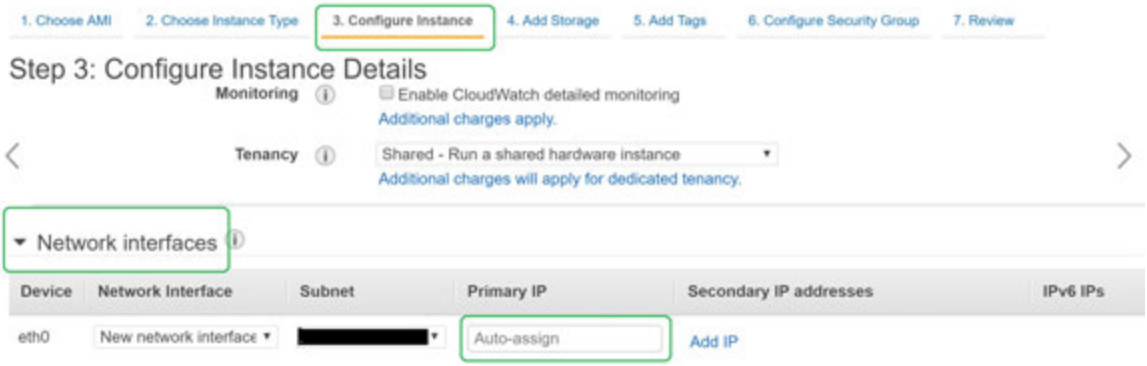
1. During the creation of EC2 instance, provide the IP address from task4. Click on AMIs and select 11.0 AMI.

Note: Refer to the *AWS Deployment Guide for version 11.0* for installing RSA NetWitness Suite11.0.0.0

2. Click Actions and then click Launch.



3. Assign the retained IP for the appropriate instances (IP retention). For example, If 10.6.4.xSA instance IP is 172.24.184.63 . Then assign the same IP(172.24.184.63) for 11.0 Instance.



Note: To deploy components other than NW, select the image(RSANW-11.0.0.0.1245-Lite-01) which is available under community AMIs section.

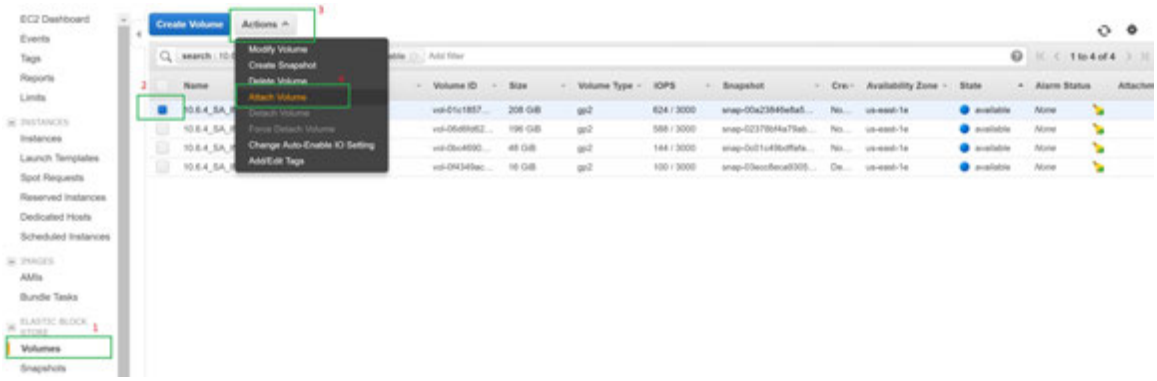
Task 6 - Attach volumes to the corresponding 11.0 instance

After NW 11.0 instance is deployed, stop the 11.0 instance and attach the available 10.6.4.x volumes (except the 'OS disk') to 11.0 instances.

1. Click on Volumes.

2. Select the 10.6.4.x instance volume to attach.

3. Click Actions and then select Attach Volume.



4. Enter the 11.0 instance ID to which the volume has to be attached.

5. Power ON all the 11.0 instances once all the disks are attached.

Task 7 - Restore backup data in 10.6.4.x to 11.0 Instances (Data Restoration)

Execute the following steps for copying the backup data on SA, LD/LC, PD, Concentrator, Archiver, Broker:

1. Create a directory under `/tmp/` by the name `nwhome`.
2. Mount `VolGroup00-nwhome` on `/tmp/nwhome/` and make sure `/var/netwitness/database/` directory is present.

```
mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

3. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`
4. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`

```
umount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

Follow these steps for **ESA**:

1. Create a directory under `/tmp/` by the name `apps`.
2. Mount `VolGroup01-apps` temporarily on `/tmp/apps/`

```
mount /dev/mapper/VolGroup01-apps /tmp/apps/
```

3. Copy `nw-backup` directory from here to `/var/netwitness`

```
cp /tmp/apps/database/nw-backup /var/netwitness
```

4. Unmount `VolGroup01-apps` from `/tmp/apps/`

umount /dev/mapper/VolGroup01-apps /tmp/apps

Add the following entries in `/etc/fstab` for `mounts`:(Disk Mounting)

For SA:

/dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/ xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup02-redb /var/netwitness/database/ xfs defaults,noatime,nosuid 1 2

For LogDecoder/LogCollector:

/dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder ext4 defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb xfs defaults,noatime,nosuid 1 2

For PacketDecoder:

dev/mapper/VolGroup01-decoroot /var/netwitness/decoder ext4 defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-sessiondb /var/netwitness/decoder/sessiondb xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-index /var/netwitness/decoder/index xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-metadb /var/netwitness/decoder/metadb xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-packetdb /var/netwitness/decoder/packetdb xfs defaults,noatime,nosuid 1 2

For Concentrator:

/dev/mapper/VolGroup01-concroot /var/netwitness/concentrator ext4 defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-sessiondb /var/netwitness/concentrator/sessiondb xfs defaults,nosuid,noatime 1 2

/dev/mapper/VolGroup01-index /var/netwitness/concentrator/index xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb xfs defaults,noatime,nosuid 1 2

For Archiver:

/dev/mapper/VolGroup01-archiver /var/netwitness/archiver xfs defaults,nosuid,noatime 1 2

/dev/mapper/VolGroup02-workbench /var/netwitness/workbench xfs defaults,nosuid,noatime 1 2

For Broker:

/dev/mapper/VolGroup01-broker /var/netwitness/broker xfs defaults,nosuid,noatime 1 2

Task 8 - Restart the Appliance and run nwsetup-tui script.

Note: Please provide appropriate host names for all the 11.0 instances after launching. (for 10.6.4.x instance names refer all-systems-master-copy file, which contains 10.6.4.x instance names with IP address)

Execute the command to set the hostname: `hostnamectl set-hostname <hostname>`

Login to SA Sever CLI and run `nwsetup-tui` script for rest of the process completion.

Run 'nwsetup-cli' on rest of the components for Bootstrap and Orchestration. For more information, refer to the Set Up Virtual Hosts in 11.0 section.

Set Up Virtual Hosts in 11.0

There two phases to set up your 11.0 virtual stack that you must complete in the order shown.

- Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.4.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.0 and they will not be available until the warm up completes.

- Phase 2 - Set Up The Rest of the Component Hosts

Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

Task 1 - Set Up 11.0 NetWitness Server

Follow the instructions under Set Up 11.0 NW Server Host.

Task 2 - Setup 11.0 ESA

Caution: If you had C2 modules enabled in 10.6.4.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.0 and they will not be available until the warm up completes.

Follow the instructions under Set Up 11.0 Non-NW Server Host to set up your ESA hosts.

1. Set up your primary ESA host through the Setup program and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, set it up through the Setup program and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Set Up 11.0 Malware Analysis

Follow the instructions under Set Up 11.0 Non-NW Server Host.

Task 4 - Set Up 11.0 Broker or Concentrator

Follow the instructions under Set Up 11.0 Non-NW Server Host.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.0 NW Server cannot communicate with 10.6.4.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Set Up The Rest of the Component Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Decoder and Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Set Up 11.0 Non-NW Server Host.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in the *Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh* in the **Backup Instructions**.
2. Stop data capture on the Log Decoder.
3. Complete the steps in Set Up 11.0 Non-NW Server Host.
4. Restart data capture on Log Decoder.

   Note: After you upgrade, you will restart log collection after completing the Task 11 - Reset Stable System Values for Log Collector after Upgrade in the **Post Upgrade Tasks**

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described in the *Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh*.
2. Back up your 10.6.4.x VLC by editing the `all-systems` file on host where you performed the backup.
   a. Make sure your `all-systems` file contents has this information before you perform this step.
   `vlc,<host-name>,<IP-address>,<UUID>,10.6.4.0`

b. Run the following command to create backup.

```
./nw-backup.sh -u
```

See Backup Instructions for detailed procedures on how to back up the host.

3. Make sure the backup host contains the VLC backup in the following format.

```
<hostname>-<IPaddress>-root.tar.gz
<hostname>-<IPaddress>-root.tar.gz.sha256
<hostname>-<IPaddress>-backup.tar.gz
<hostname>-<IPaddress>-backup.tar.gz.sha256
<hostname-IPaddress>-network.info.txt
all-systems-master-copy
```

4. Power off the 10.6.4.x VLC so that a new 11.0 VM can be created with the same network configuration.
5. Deploy a fresh Non-NW Server host using the 11.0 NetWitness Suite ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.4.x VLC.
This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.4.x VLC backup file.

Note: Make sure IPv6 is disabled.

a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings. Contents of `ifcfg-eth0` should be as follows.

```
TYPE=Ethernet
DEFROUTE=yes
NAME=eth0
UUID=<uuid>
DEVICE=eth0
DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
BOOTPROTO=static
IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
NM_CONTROLLED=no
ONBOOT=yes
```

b. Submit the following command string.

```
systemctl restart network.service
```

8. Create the backup directory.

```
# mkdir -p /var/netwitness/database/nw-backup/
```

9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new VLC in the `/var/netwitness/database/nw-backup` directory.
10. Complete the steps 2 through 12 inclusive in Set Up 11.0 Non-SA Server Host for the rest of the NetWitness Suite components . Make sure that you select **Log Collector** for the service in step 12.

Set Up 11.0 NW Server Host

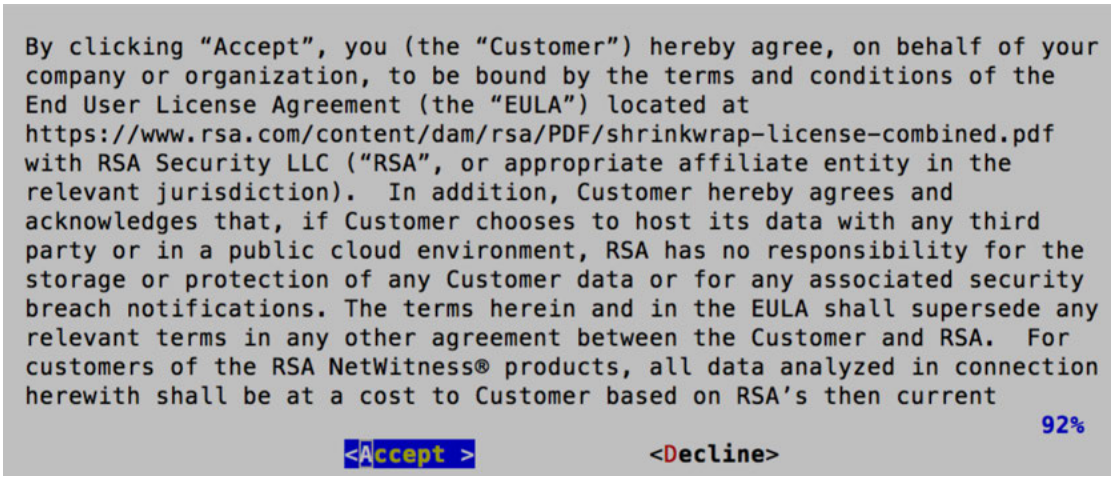
Make sure that you have backed up 10.6.4.x data for the SA Server host. **You must follow the instructions in** Backup Instructions **to back up the host.**

Caution: Run the backup immediately before upgrading the SA Server to 11.0 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.0.

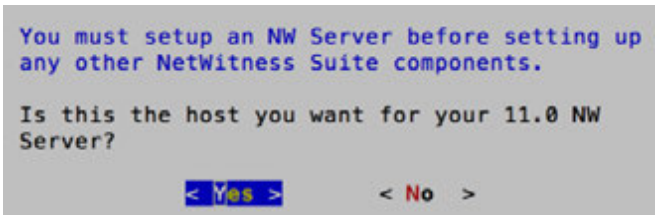
Complete the following steps to set up the 11.0 NW Server host.

1. Power on the NW Server VM and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

   Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press the Enter key to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use access the host.

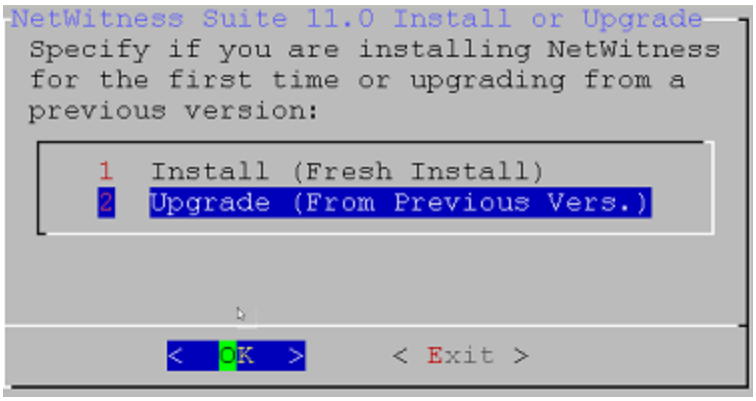
   


2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

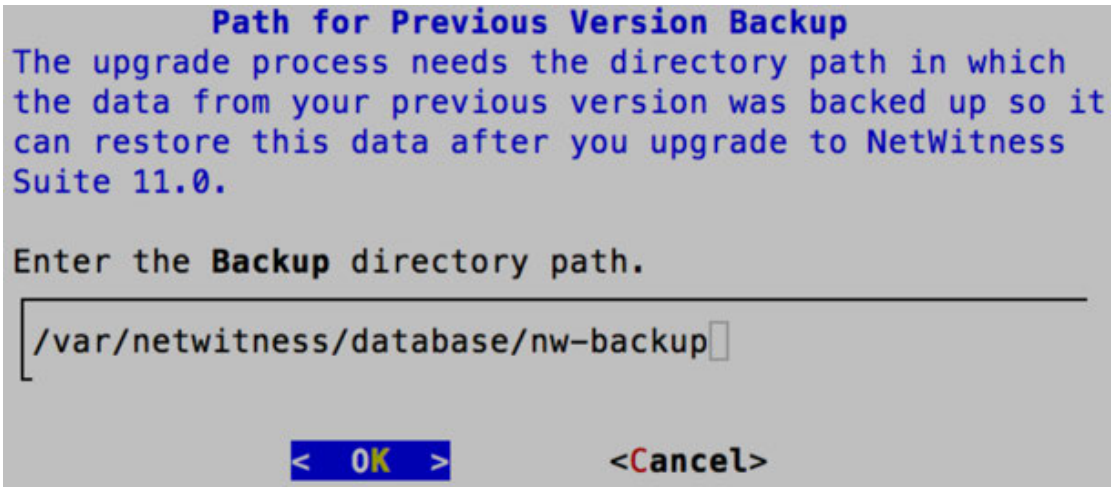


Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.0 NW Server Host to correct this error.

3. Tab to **Yes** and press **Enter**.
   Choose No if you already upgraded the NW Server to 11.0.
   The Install or Upgrade prompt is displayed.



4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.
   The backup path prompt is displayed.

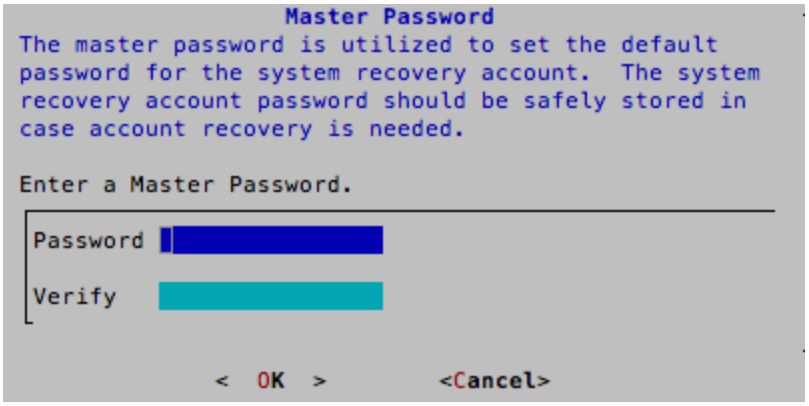


5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Master Password prompt is displayed.

The following list of characters are supported for Master Password and Deployment Password:

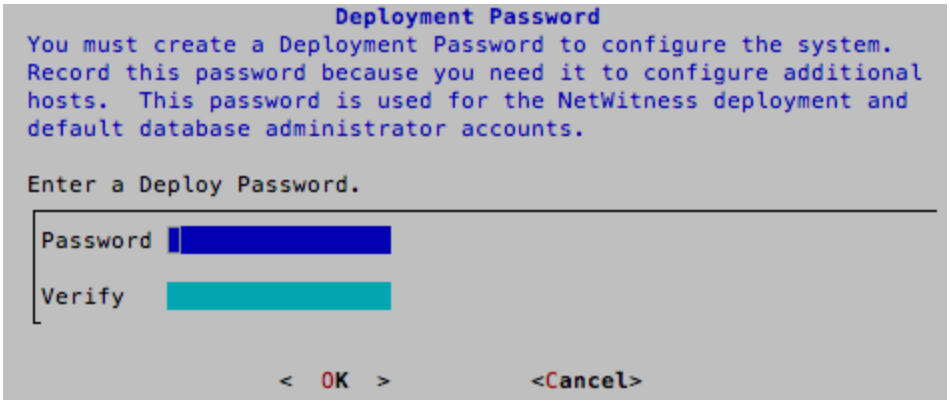
- Symbols : ! @ # % ^ +
- Numbers :0-9
- Lowercase Characters : a-z
- Uppercase Characters : A-Z

No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ , ; : . < > -).



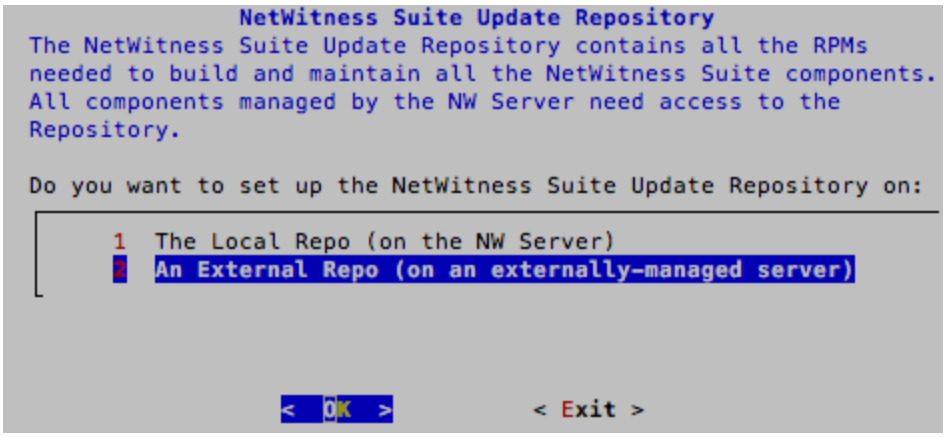
6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   The Deployment Password prompt is displayed.



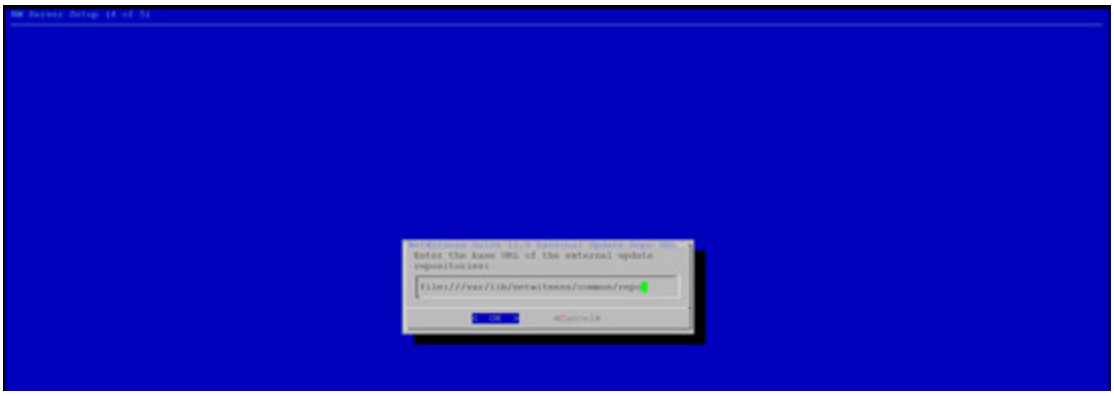
7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   The Update Repo prompt is displayed.



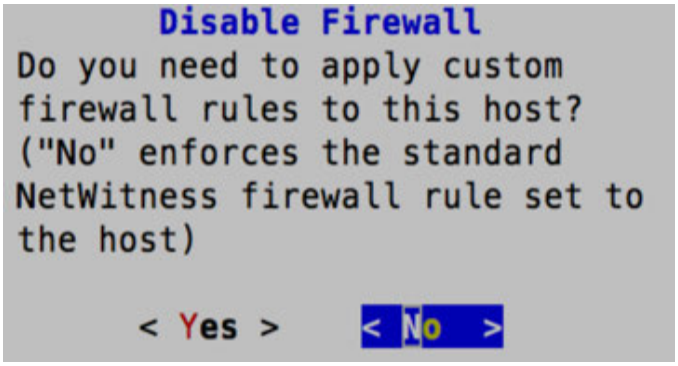
You must use the same repo that you used for the NW Server hosts for all hosts.

8. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL.



See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *RSA NetWitness Suite 11.0 Hosts and Services Getting Started Guide* for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

9. Enter the base URL of the NetWitness Suite external repo and click **OK**.
   The disable or use standard firewall configuration prompt is displayed.



10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

    - If you select Yes, confirm your selection.

    
    - If you select No, the standard firewall configuration is applied.

    The start upgrade prompt is displayed.

11. Select 1 **Upgrade Now**, tab to **OK**, and press Enter.

    When "Installation complete" is displayed, you have upgraded the 10.6.4.x SA Server to the 11.0 NW Server.

    Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

```
ValueError: error:3207A06D:lib(50):B_HASH_init:cr new
Checksum type 'md5' disabled

```

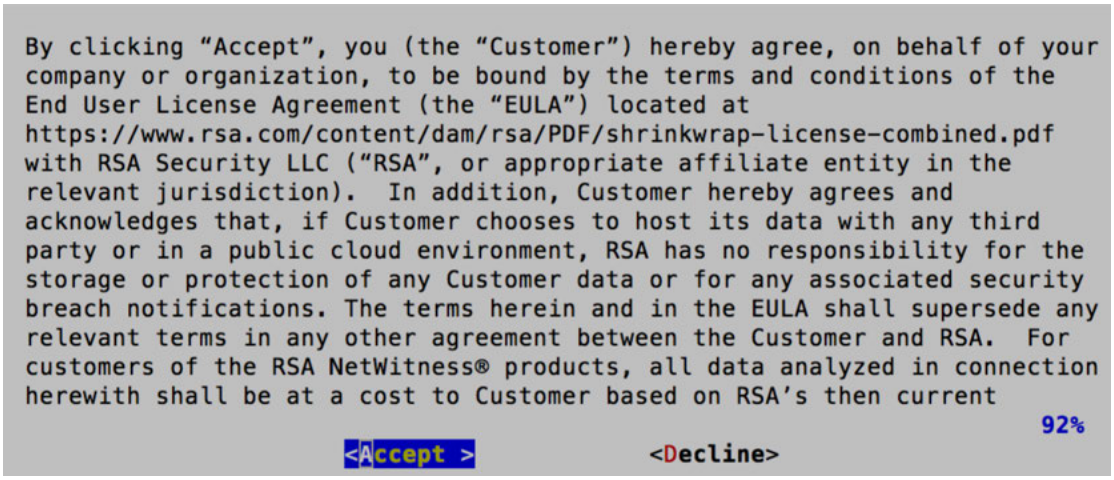
Set Up 11.0 Non-NW Server Host

Make sure that you Back up your 10.6.4.x data for the host. **You must follow the instructions in** Backup Instructions **to back up the host.**

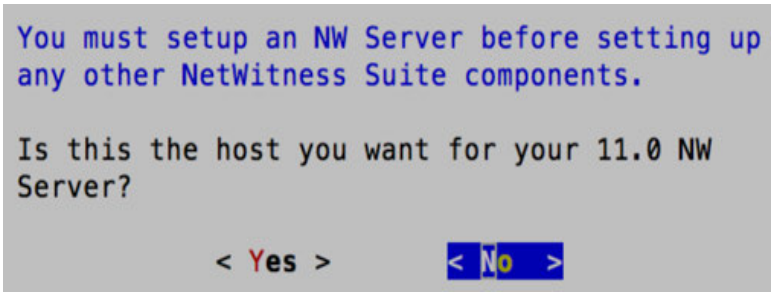
Caution: Run the backup immediately before upgrading the host to 11.0 so that the data is as recent as possible.

Complete the following steps to set up an 11.0 Non-NW Server host.

1. **Power On** the non-NW Server VM and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

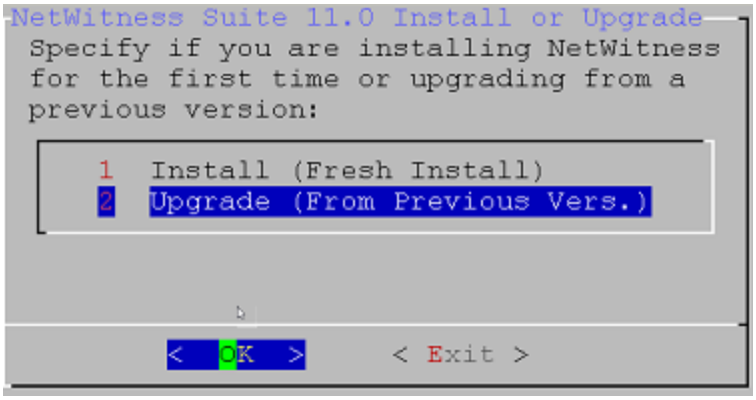


2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

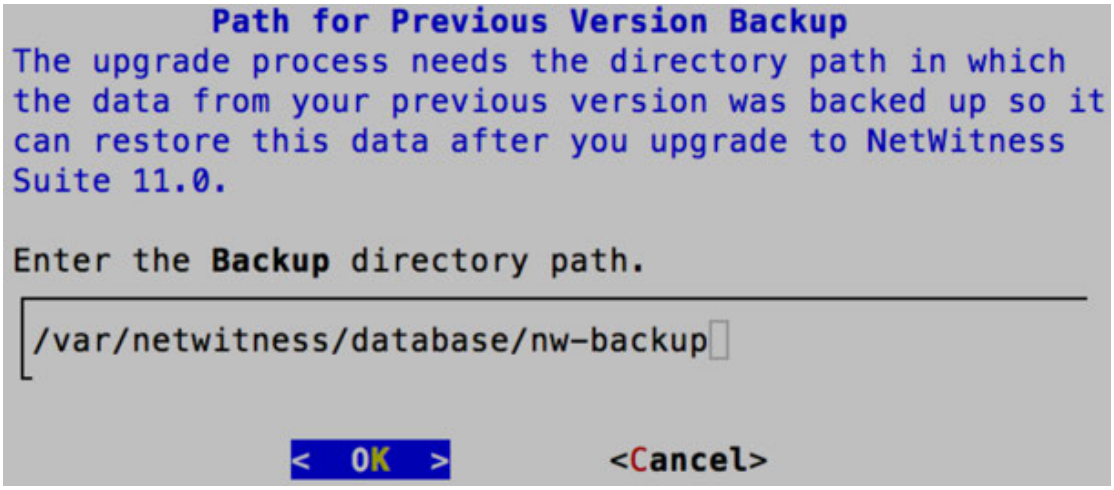


Caution: If you choose the wrong the host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.0 NW Server Host to correct this error.

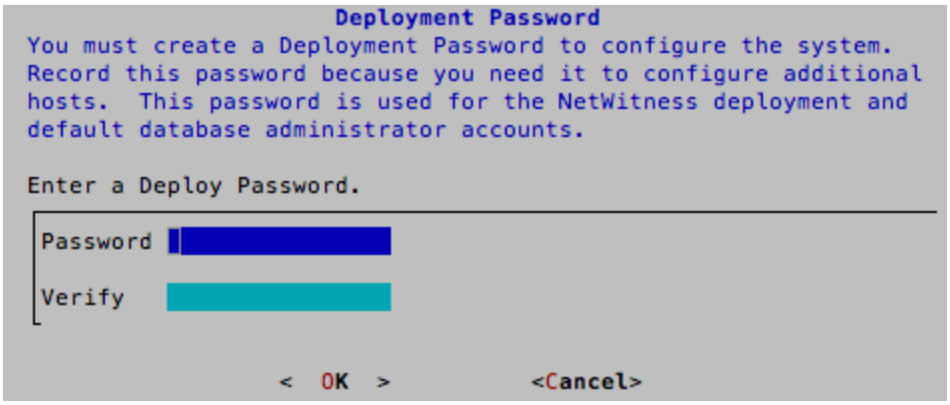
3. Tab to **No** and press **Enter**.
   The Install or Upgrade prompt is displayed.



4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.
   The backup path prompt is displayed.

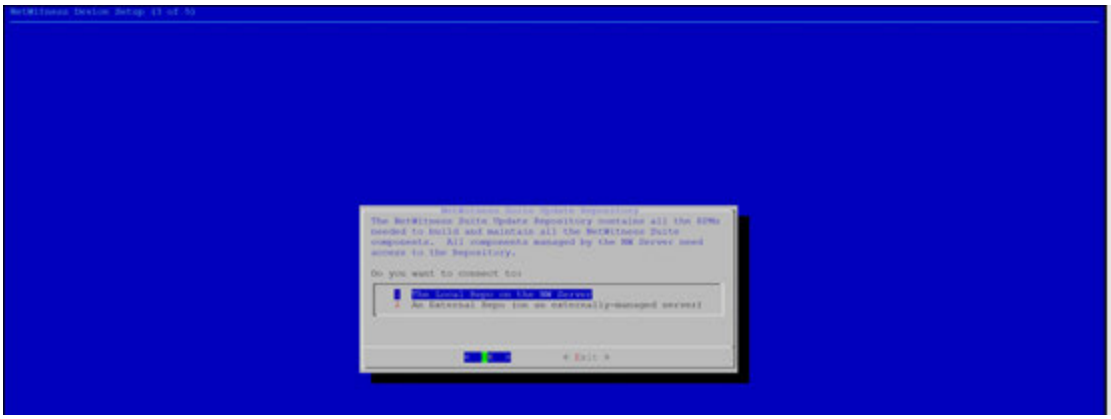


5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Deployment Password prompt is displayed.

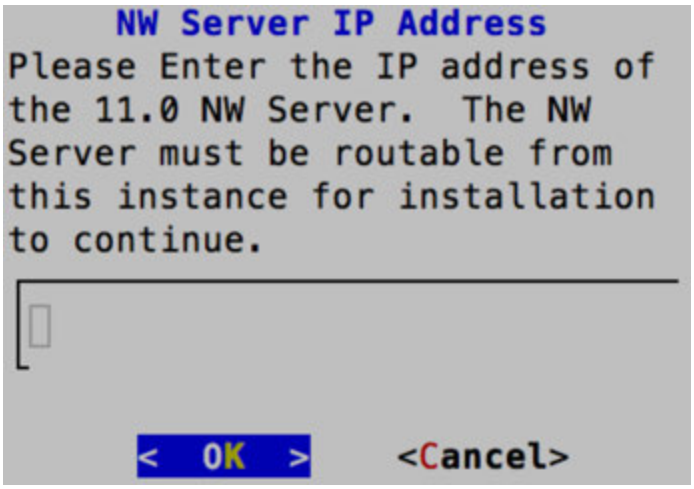


Note: You must use the same deployment password that you used when you upgraded the NW Server.

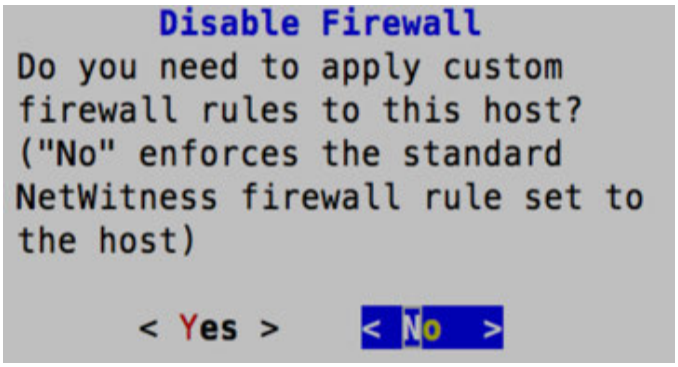
6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   The Update Repo prompt is displayed.



7. Use the down and up arrows to select **1 The Local Repo on the NW Server**, tab to **OK**, and press **Enter**.
8. The NW Server IP Address is displayed.



9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.
   The disable or use standard firewall configuration prompt is displayed.



10. Tab to **No**, and press Enter to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

    - If you select **Yes**, confirm your selection.

    - If you select **No**, the standard firewall configuration is applied.

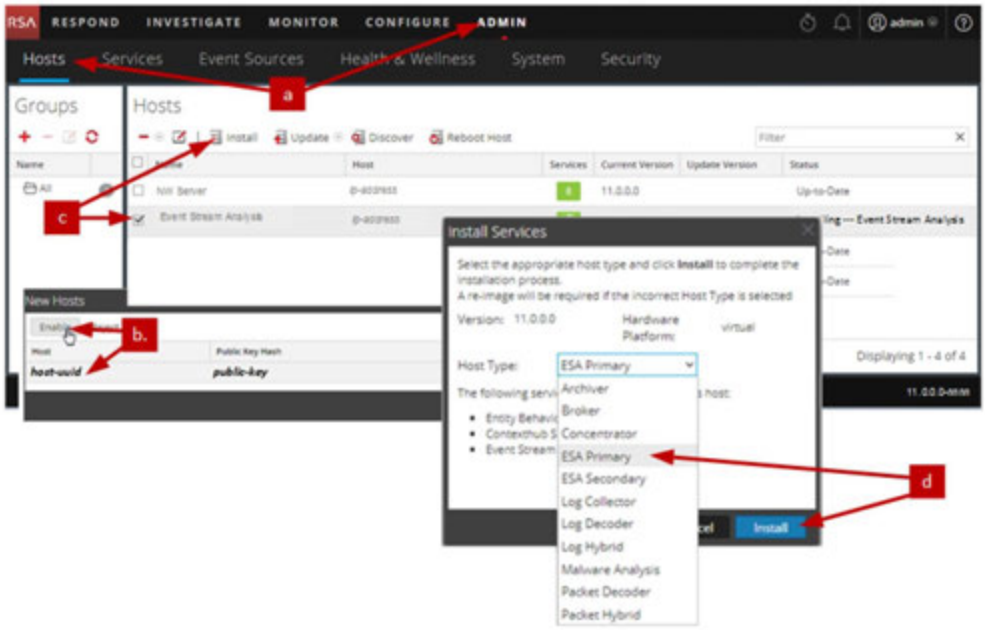
The start upgrade prompt is displayed.

11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.
    When "Installation complete" is displayed, you have upgraded the host to the 11.0.

Once 'nwsetup-cli' script ran successfully on all the components, follow the below steps to complete NW 11.0 Upgrade/Migration:

1. Log into NetWitness Suite. (Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Suite Login screen)
2. Click ADMIN > Hosts. The New Hosts dialog is displayed with the Hosts view grayed out in the background. Note: If the New Hosts dialog is not displayed, click Discover in the Hosts view toolbar.
3. Click on the host in the New Hosts dialog and click Enable. The New Hosts dialog closes and the host is displayed in the Hosts view.
4. Select that host (for example, Event Stream Analysis) and click The Install Services dialog is displayed.

e. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness 11.0 Legacy Windows Collection Guide* on RSA Link (https://community.rsa.com/docs/DOC-75593) for details about how to install or update Legacy Windows collection.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

This topic contains the tasks you must complete after you upgrade your hosts from 10.6.4.x to 11.0. These tasks are organized by the following categories.

- Global
- NetWitness Endpoint
  RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, and 4.4 only for NetWitness Suite 11.0.
- Event Stream Analysis
- Log Collection
- Reporting Engine
- Respond
- NetWitness SecOps Manager
- Security

Global Tasks

Task 1 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.0 before you remove the backup-related files from the local directories on your 11.0 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.0, you must remove:

- the backup files from the local directories on the hosts.
- all the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`

Host	Backup Path	Restore Path
Event Stream Analysis	/opt/rsa/database/nw-backup	/var/netwitness/database/nw-backup/restore
NW Server	/var/netwitness/database/nw-backup	/var/netwitness/restore
All Other Hosts	/var/netwitness/database/nw-backup	/var/netwitness/database/nw-backup/restore

Task 2 - Restore NTP Servers

You must use the NetWitness Suite 11.0 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *RSA NetWitness® Suite 11.0 System Configuration Guide* for detailed instructions on how to add NTP servers. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 3 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Suite licenses. Refer to "Step 1. Register the NetWitness Server" in the *RSA NetWitness Suite Licensing Management Guide* for instructions on how to re-download licenses. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

(Conditional) Task 5 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create a user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   ```
   /etc/sysconfig/iptables
   /etc/sysconfig/ip6tables
   ```
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 6 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.4.

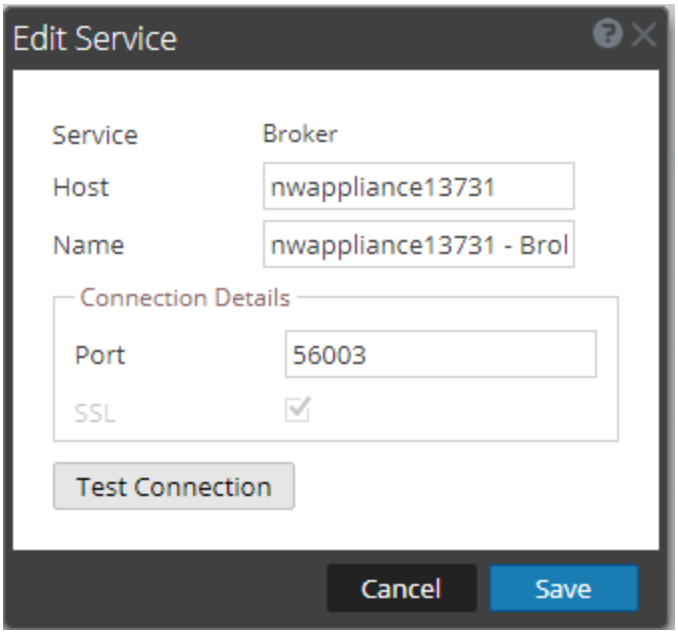
NetWitness Suite 11.0 cannot communicate with the core services for these customers because they are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to NetWitness Suite
2. Go to **ADMIN** > **Services**.
3. Select each core service and change there ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005
Decoder	50004	56004
Log Decoder	50002	56002

4. Click (Edit) from the **Services** view toolbar.
   The Edit Service dialog is displayed.

5. Change the port from Non-SSL to SSL as shown in the table and click **Save**(for example, change the Broker port from 50003 to 56003).



NetWitness Endpoint

Task 7 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Suite 11.0, the virtual host is `/rsa/system`. For 10.6.4.x and earlier versions, the virtual host is `/rsa/sa`.

2. Restart the API Server and Console Server.
3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.

6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Event Stream Analysis Tasks (ESA)

Task 8 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.4.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.0.

1. Log in to NetWitness Suite 11.0
2. Click **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Packets and C2 for Logs, require a whitelist named "**domains_whitelist**".
3. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Click **ADMIN**> **Services**, select the Context Hub service, in the action commands () drop-down menu, click **View** > **Config** > **Lists** tab).
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *NetWitness Suite Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *NetWitness Suite ESA Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 9 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL

If you integrate with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.4.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Suite by logging into the host and running the following `rabbitmqctl` command.
   ```
   > rabbitmqctl add_user <username> <password>
   ```
   For example:

```
> rabbitmqctl add_user wtd-incidents incidents
```

2. Set permissions for users by running the following command (use the username from step 1):
   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*",
   ".*"
   ```
   For example:
   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*",
   ".*", ".*"
   ```

Task 10 - Enable Threat - Malware Indicators Dashboard

In 11.0.0, the 10.6.4.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.4.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.0.
2. Set datasource for new dashlets.
   See "Dashlets" in the RSA Link (https://community.rsa.com/docs/DOC-81463).

Log Collection

Task 11 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.0 to ensure that all collection protocols resume normal operation.

Reset Stable System Values for the Lockbox

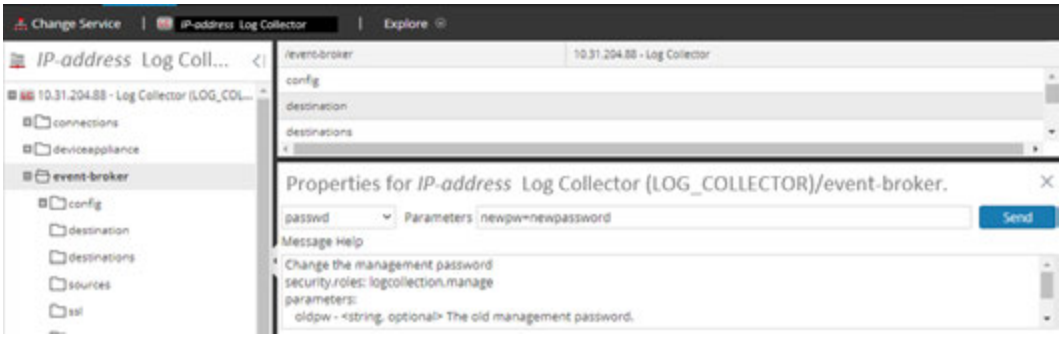
The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *RSA NetWitness® SuiteLog Collection Configuration Guide* for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Update Log Collector Service RabbitMQ User Account Password

If the logcollector service RabbitMQ user account password was changed, you must reenter it after the 11.0 upgrade.

1. Log in to NetWitness Suite.
2. Click **ADMIN > Services**.
3. Select the Log Collector service.
4. Click  (Actions) > **View** > **Explore**.
5. Right click `event-broker` > **Properties**.

6. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



(Optional for Upgrades from 10.6.4.x with FIPS enabled for Log Collectors, Log Decoders and Packet Decoders) Task 12 - Enable FIPS Mode

FIPS is enabled on all services except Log Collector Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder. For information about how to enable FIPS for these services, see the "Sys Maintenance: Activate or Deactivate FIPS" topic in the *RSA NetWitness® SuiteSystem Maintenance Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Reporting Engine

Task 13 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the back up you made prior to the upgrade. The Backup script backs up the 10.6.4.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.0.

1. SSH to the NW Server host.
2. Export the CA certificates.
   ```
   keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file
   ```
3. Copy the CA pem into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 14 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *RSA NetWitness® Suite Reporting Engine Configuration Guide* for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Respond

Task 15 - Restore Respond Service Custom Keys

In 10.6.4.x, if you added custom key for use in the groupBy clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.

   This directory is where the `alert_rules.json` file is restored from the 10.6.4.x backup.

2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.0.

   This is the new file for 11.0.

3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 16 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.0 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.4.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.4.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.4.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Suite 11.0 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.4.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

(Conditional) Task 17 - Enable Disabled 10.6.4.x Incident Management Data Retention

Complete the following procedure to enable the Incident Management data retention jobs you disabled prior to upgrade.

1. Log in to RSA NetWitness® Suite.
2. Go to **ADMIN** > **Services** and select the **Respond server**.
3. Click the  (Actions), **View** > **Explore**.
4. Go to the `respond/dataretention` node.
5. Set the `enable` parameter to `true`.

(Conditional) Task 18 - Restore Custom Analysts Roles

If you had custom analyst roles in 10.6.4.x, you must reinstate them in 11.0. See *Adding Roles and Assigning Permissions for the Roles* in the *RSA NetWitness Suite Warehouse Analytics Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

NetWitness SecOps Manager

Task 19 -Reconfigure NW SecOps Manager Integration

For information on how to reconfigure NW SecOps for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

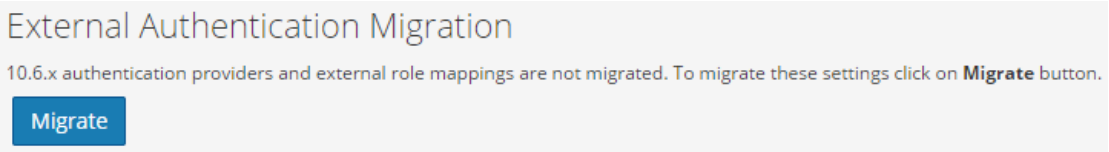
Security

Task 20 - Migrate Active Directory (AD)

The first time you log into the NetWitness Suite 11.0 User Interface, you must click on the Migrate button to complete the migration of AD.

Caution: If you did not upgrade from 10.6.4.2, you must apply the 11.0.0.1 patch immediately before you first log into NetWitness Suite 11.0 and migrate Active Directory. You do not need to apply the 11.0.0.1 patch if you upgraded to 11.0 from 10.6.4.2.

1. Log in to NetWitness Suite with your `admin user` credentials.
2. Click **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 21 - Modify Migrated AD Configuration to Upload Certificate

If the you used a self-signed certificate in Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.4.x, you must modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

Complete the following procedure to modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

1. Log in to NetWitness Suite.
2. Click **ADMIN** > **Security** and click the **Settings** tab.
3. Under **Active Directory Settings**, select an AD configuration and click  .

   The Edit Configuration dialog is displayed.
4. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
5. Click **Save**.

Task 22. Address Authentication Failure in 11.0

Users cannot log in to NetWitness Suite User Interface after you upgrade to 11.0 because the Interface cannot retrieve user account information from MongoDB.

- Apply the 11.0.0.1 patch to fix this issue immediately after you upgrade to 11.0.

Task 23 - Reconfigure Pluggable Authentication Module (PAM) in 11.0

You must reconfigure PAM after you upgrade to 11.0. See "Configure PAM Login Capability" in the *RSA NetWitness® Suite System Security and User Management Guide*for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

You can refer to your 10.6.4.x PAM configuration files in the **/etc** directory in the your 10.6.4.x backup data for guidance.

Appendix A. Troubleshooting

This section describes problems that you may encounter during the upgrade with solutions. In most cases, NetWitness Suite creates log messages when it encounters these problems.

Note: If you cannot resolve any upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294) .

This section has troubleshooting documentation for the following services, features, and processes.

- 11.0 Setup Program (`nwsetup-tui`)
- Backup
- Event Stream Analysis
- General
- Log Collector Service (`nwlogcollector`)
- NW Server
- Reporting Engine

11.0 Setup Program (`nwsetup-tui`)

Problem	Host Setup Program (`nwsetup-tui`) exits and creates the following error message in `/var/log/netwitness/bootstrap/launch/security-server/security-server.log`:
	`<yyyy-mm-dd hh:mm:ss,nnn> [ main] ERROR SystemOperation|Service startup failed. Running in safe mode org.h2.jdbc.JdbcSQLException: The database is read only [90097-193]`
	`at org.h2.message.DbException.getJdbcSQLException(DbException.java:345) ...`
	`at org.springframework.jdbc.datasource.AbstractDriverBasedDataSource.getConnection(AbstractDriverBasedDataSource.java:159)`
	`at com.rsa.asoc.security.upgrade.legacy.MigrationDatabase.<init>(MigrationDatabase.java:113)`

Cause	The H2 database needs write permission to complete the host setup.

Solution	From the NW Server command line, provide write permission to `H2.db`, restart the NW Server, and restart nwsetup-tui Setup Program.
	`chmod o+w /var/lib/netwitness/uax/db/platform.h2.db`
	`systemctl restart rsa-nw-security-server.service`
	`nwsetup-tui`

Backup (`nw-backup` script)

Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA mongo admin password back to the original default of 'netwitness' before running backup. See "ESA Config: Change MongoDB Password for admin Account" the the *RSA NetWitness® Suite Event Stream Analysis Configuration Guide. Go to the* Master Table of Contents *for Version 11.0 to find NetWitness Suite 11.0 documents.*

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.0 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESAPrimary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA .
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

General

Logs referred to in this section are posted to `/var/log/install/install.log` on the NW Server Host.

Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health.AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Suite sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service using below command. `systemctl restart rsa-sms`

Message	`<timestamp> <host>: SMS_PostInstall: INFO: Free disk space on /opt is nGB` `<timestamp> <host>: SMS_PostInstall: WARN: Disk space check failed on /opt. The available disk space nGB is less than the recommended minimum disk space of 10GB.`
Cause	Low or insufficient disk space allocated for the SMS service.
Solution	RSA recommends that you provide a minimum of 10 GB of disk space for the SMS service to run optimally.

Problem	After you run the Setup Program for a non-NW Server host, you must go in to the UI, enable the host, and install the service on the host from the Hosts View. If you see "Install error View Details" in the **Status** column of the Hosts view, the host lost connectivity due to network issues.
Solution	Re-install the service on the host from the Hosts view.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Suite and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Message	*timestamp* `NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	(Conditional) If you use a Log Collector Lockbox, log in to NetWitness Suite and configure the Lockbox as described in the"Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents..

Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Suite and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the sa.log. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.4 to 11.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Message	`<timestamp> : Available free space in /home/rsasoc/rsa/soc/reporting-engine [ existing-GB ] is less than the required space [ required-GB ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Appendix B. Stopping and Restarting Data Capture and Aggregation

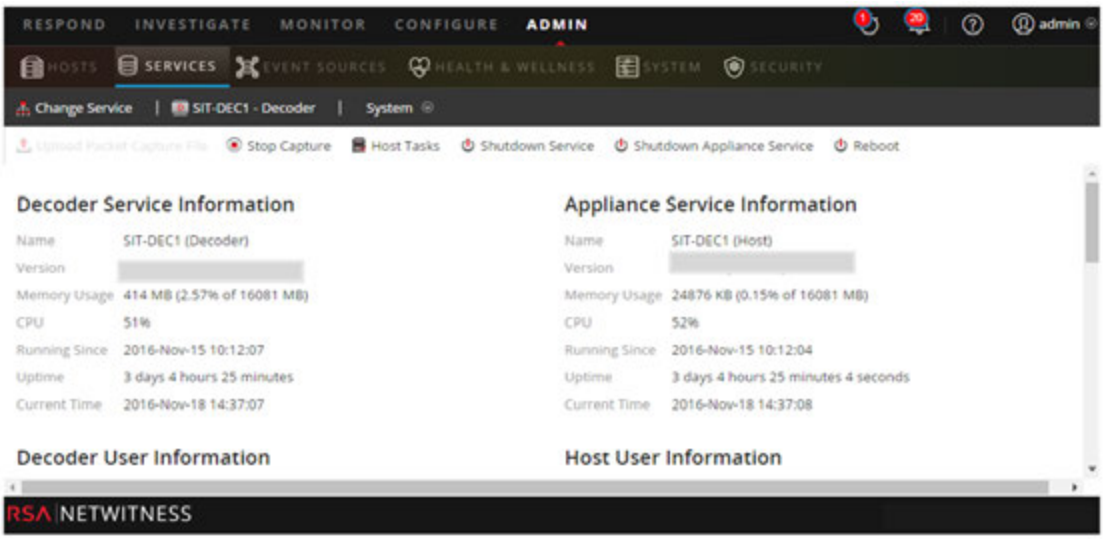
RSA recommends that you stop packet and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.0. If you do this, you must restart packet and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Packet Capture

To stop packet capture:

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

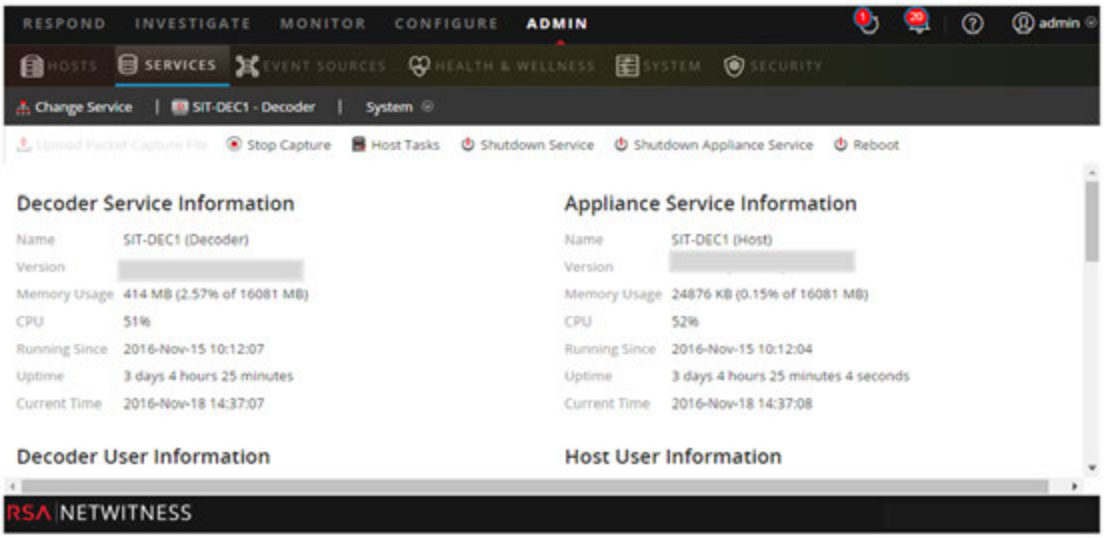
.

Stop Log Capture

To stop log capture:

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.



3. Under  (actions), select **View** > **System**.

4. In the toolbar, click 

.

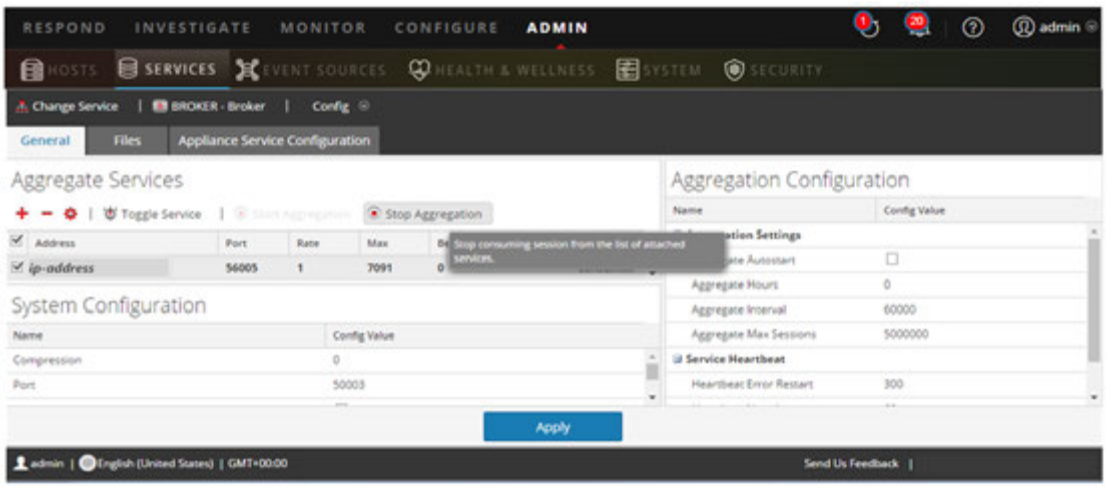
Stop Aggregation

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.

2. Select the **Broker** service.

3. Under  (actions), select **View** > **Config**.

4. The **General** tab is displayed.



5. Under **Aggregated Services** click 

.

Start Data Capture and Aggregation

Restart packet and log capture and aggregation after updating to 11.0.

Start Packet Capture

To start packet capture:

1. In the **NetWitness Suite** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

.

Start Log Capture

To start log capture:

1. In the **NetWitness Suite** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

.

Start Aggregation

During the upgrade from 10.6.4 .x to 11.0, the Broker Service is restarted and this automatically starts aggregation.

Contents

Introduction

The instructions in this guide apply to the upgrade of Azure for RSA NetWitness Suite 10.6.4.x to 11.0.0.0 exclusively. See the *RSA NetWitness Suite Physical Host Upgrade Guide* for instructions on how to upgrade your 10.6.4.x physical hosts to 11.0. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents. This document assumes that the appliances are in Azure cloud.

NetWitness Suite 11.0 is a major release that affects all products in the NetWitness Suite suite. The components of the suite are the NetWitness Server (NW Server), Archiver, Broker, Concentrator, Context Hub, Decoder, Entity Behavior Analytics, Event Stream Analysis, Investigate, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Response, and Workbench.

CentOS6 to CentOS7 Upgrade

NetWitness Suite 11.0 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.0 platform environment has been improved greatly to accommodate current and future physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Suite 11.0 Upgrade Path

The supported Upgrade path for RSA NetWitness® Suite 11.0 is Security Analytics 10.6.4.x. If you are running a version of NetWitness Suite that is prior to 10.6.4.x, you must update to 10.6.4.x before you can upgrade to 11.0. See the *RSA Security Analytics 10.6.4 Update Guide* (https://community.rsa.com/docs/DOC-79055) on RSA Link.

Caution: There is a known issue if you have Active Directory users configured in 10.6.4.x. You have two options to address this issue:
• Apply the 10.6.4.2 patch before you back up your data for the 11.0 upgrade.
• If you failed to apply the 10.6.4.2 patch, you can apply the 11.0.0.1 patch immediately after you upgrade to 11.0.

Hardware, Deployments, Services, and Features Not Supported in 11.0

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.0.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- IPDB service
- Malware Analysis service co-located on the SA Server (Upgrade of Malware Analysis Enterprise is supported in 11.0.)
- Standalone Warehouse Connector service (Upgrade of a co-located Warehouse Connector is supported in 11.0.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.0, your custom policy is not present. In its place, there is the out-of-the-box Context hub Server Monitoring Policy in the user interface, which is specific for version 11.0.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Suite 11.0, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.0, ESA sends all alerts to a central Alert system. The local mongo storage in ESA 10.6.4.x has been removed.

Caution: If you do not use Incident Management in 10.6.4.x, carefully consider whether or not to upgrade to version 11.0.

The following guidelines should help you determine whether or not to upgrade your ESA hosts to 11.0.

In your 10.6.4.x deployment, if you have:

- One ESA host, with or without Incident Management configured, upgrade to 11.0.
- Multiple ESA hosts configured to use Incident Management – The system will continue to aggregate alerts centrally. If the system is correctly sized and operating as intended in 10.6.4.x, you can upgrade to version 11.0.
- Multiple ESA hosts without configuration to use Incident Management and you are connecting to individual ESA hosts to view alerts, do not upgrade to version 11.0.

Note: If you did not use Incident Management in 10.6.4.x, you cannot view the 10.6.4.x ESA alerts in the 11.0 Respond component without running a migration script. Use the ESA Alert Migration script to migrate these alerts to the location in 11.0 that will allow Respond to view them. See the *ESA Alert Migration Instructions for 10.6.4.x to 11.0* knowledge base article (https://community.rsa.com/docs/DOC-81680) in RSA Link for instructions on how to run this script.

User Attribute and Role Changes Affecting Investigate

The following changes affect how NetWitness Suite 11.0 handles user and role attributes in the Investigate component.

- User Attributes
  When you upgrade to 11.0, the user attributes (query prefix, session timeout, and query threshold) available in SA 10.6.4.x no longer exist. The same attributes are available at the role level for use.
  As a workaround, if you used the user attributes to restrict user access, apply the RSA NetWitness® Suite 11.0.0.1 patch immediately after you upgrade to 11.0.0.0.
- User and Role Attributes (Query Prefix) is not applicable to Investigate Event Analysis. The user and role attributes, most importantly the query prefix, do not apply to the new Investigate Event Analysis. Any user can modify the URL in browser to access data that should be

restricted from viewing even when query prefix is applied.
As a workaround, apply the RSA NetWitness® Suite 11.0.0.1 patch immediately after you upgrade to 11.0.0.0.

Caution: If you configured user or role attributes in 10.6.4.x, including query prefix, apply the RSA NetWitness® Suite 11.0.0.1 patch immediately after you upgrade to 11.0.0.0. After applying this patch, complete the patch instructions to apply additional security controls.

Upgrade Phases

RSA recommends that you stagger host upgrades as described in this section. The update to CentOS7 and the need of a physical or iDRAC access cause the 11.0 upgrade to take more time than most upgrades.

Caution: If you stagger the upgrade, you:
• must upgrade the hosts in Phase 1 first, in the order shown.
• may not have all the features operational until you update your entire deployment.
• will not have service administrative features available until you upgrade all the hosts in your deployment.

Phase 1

You perform Phase 1 first and you must upgrade the hosts in the following order:

1. Security Analytics Server host
2. Event Stream Analysis hosts
3. Broker hosts (if you do not have a Broker, upgrade your Concentrator hosts)
   The 11.0 NW Server cannot communicate with 10.6.4.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2

Upgrade the rest of your hosts.

In Phase 2, (other than Log Collection hosts with downstream event destinations) there is no technical reason to upgrade your hosts in the following order. RSA recommends that you follow the order in Phase 2 to reduce:

- functionality loss during investigation.
- downtime that results in the loss of packet and log capture.

1. Concentrator hosts
2. Archiver hosts
3. Log Collection hosts - Log Collectors on Log Decoder hosts (LDs), Virtual Log Collectors (VLCs) and Legacy Windows Collectors (LWCs)
   Before you upgrade a log collection host , you must prepare it for the upgrade. Part of this preparation ensures that no event data remains in the queues. This requires you to keep the downstream destinations of event data (Log Collectors, Virtual Log Collectors and Log Decoders) up and functioning properly.

   If you have event data destinations downstream from the Log Decoder, you must prepare and upgrade log collectors in the following order.

   a. LDs (one LD at a time)

   b. VLCs and LWCs

   If you do not have event data destinations downstream from the Log Decoder, you can prepare and upgrade multiple LDs, VLCs, and LWCs together.
4. All other hosts

See "Running in Mixed Mode" under "The Basics" in the RSA 11.0 *NetWitness SuiteHosts and Services Getting Started Guide* for:

- Functionality gaps encountered while running in this mode.
- Examples of staggered upgrades.

Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Investigate in Mixed Mode

Mixed mode occurs when some services are upgraded to 11.0 and some are still on 10.6.x. This happens when you upgrade to 11.0 in phases.

Note: You must follow the host upgrade sequence as shown in Upgrade Phases to ensure complete Investigate functionality. The 11.0 Investigate server is installed when you upgrade the SA Server, but Broker hosts need to be upgraded to 11.0 to access the Event Analysis View.

After you upgrade all services to 11.0, when an analyst conducts an investigation, Role-Based Access Control (RBAC) of downloads works consistently to limit access to restricted data.

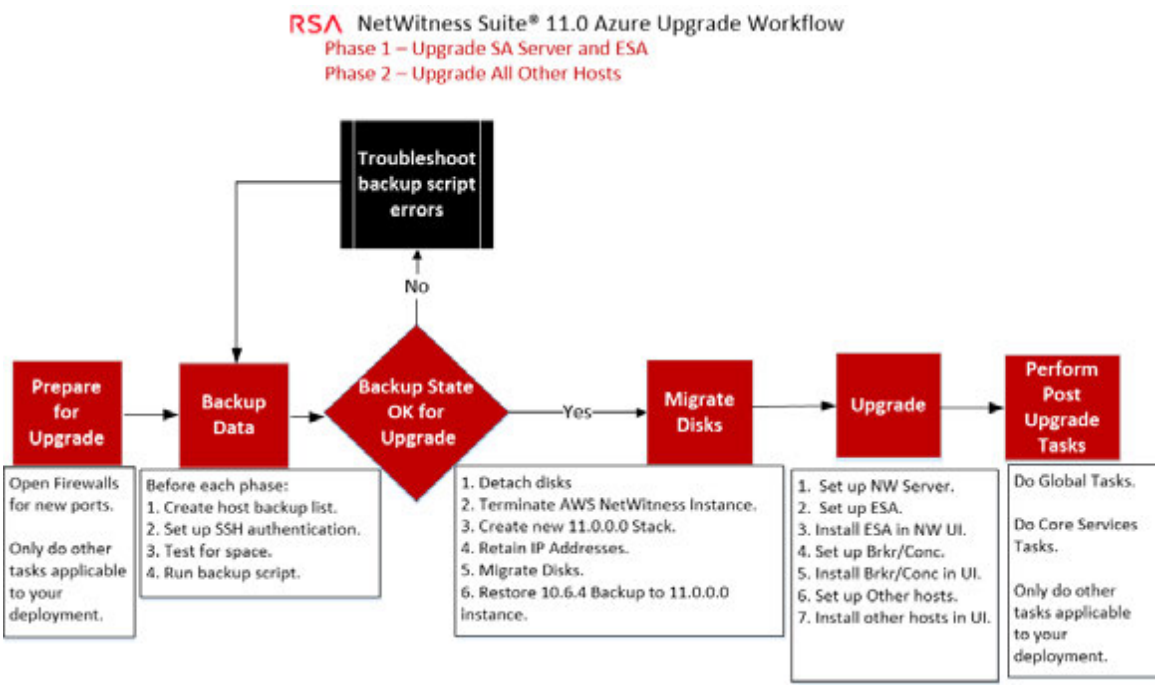
In mixed mode (that is, some services are upgraded to 11.0 and some are still on 10.6.x), when an analyst conducts an investigation, RBAC is not applied uniformly to viewing and downloads.

If the `sdk.packets` setting has not been disabled on the 10.6.x services, analysts with SDK meta and roles permissions in place to restrict viewing and reconstructing an event's content can download the PCAP of an event that has content restrictions. Other types of downloads appear to download, then generate errors due to insufficient permissions, and the data is still protected.

During a phased update, you can disable the `sdk.packets` setting on 10.6.x services to limit the analyst from downloading any PCAPs or logs during mixed mode. After you update all services to 11.0, RBAC works consistently across all services.

This table identifies what you can see and download in Investigate when your NW Server is on version 11.0 connected to services at a lower version.

Connecting Service Version	Affected View	User Role	Can See	Can Download Successfully	Can Download with Errors
11.0 Broker -> 10.x Concentrator	Events View	Analyst		PCAP	File archive is downloaded but cannot unzip
	Event Reconstruction View	Analyst		PCAP	File archive is downloaded but cannot unzip
	Event Analysis View	Analyst		PCAP	Error Retrieving Payload from Service for Payload, Request Payload, Response Payload
	Event Reconstruction View	Admin			Files archive is downloaded but cannot unzip
11.0 Broker -> 11.0 Concentrator	Event Reconstruction View	Analyst and Data Privacy Officer	RBAC permitted items		Files archive is downloaded but cannot unzip PCAPs and logs are downloaded as zero bytes
	Event Reconstruction View				



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Suite 11.0.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness Suite 11.0. These tasks are organized by the following categories.

- Global
- Reporting Engine
- Respond and Incident Management

Global

You must complete these tasks regardless of how you deploy NetWitness Suite and which components you use.

Task 1 - Review Core Ports and Open Firewall Ports

The following table lists new ports in 11.0.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

All NetWitness Suite core ports are listed in the "Network Architecture and Ports" topic in the *RSA NetWitness® Suite Deployment Guide* in case you need to reconfigure NetWitness Suite services and firewalls. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 2 - Record Your 10.6.4.x `admin user` Password

Record your 10.6.4.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of `/etc/fstab` File

Copy the `/etc/fstab` file from all VMs to your local machine (backup host or remote machine).

Note: You need this file to restore a VM with external storage mounts.

Reporting Engine

(Conditional) Task 4 - Unlink External Storage

If the Reporting Engine has external storage [such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports] you must perform the follow steps to unlink the storage.

In these steps:

- `/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
- `/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Respond and Incident Management

(Conditional) Task 5 – Disable Incident Management Data Retention

Complete the following procedure to disable Incident Management data retention jobs in 10.6.4.x

1. Log in to RSA Security Analytics 10.6.4.x.
2. Go to **Incident Management** > **Configure** > **Retention Scheduler**.
3. Uncheck the **Enable data retention scheduler** checkbox and click **Apply**.

Backup Instructions

Backing up your configuration data for all your hosts from 10.6.4.x is the first step in upgrading from 10.6.4.x releases to 11.0.0.0.

Note: It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directory will be automatically restored during the upgrade process. After upgrading to 11.0.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types

Caution: 1) These services are not supported in the 10.6.4.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the NetWitness Server
- Standalone Warehouse Connector

2) There is a known issue if you have Active Directory users configured in 10.6.4.x. You have two options to address this issue:
• Apply the 10.6.4.2 patch before you back up your data for the 11.0 upgrade.
• If you failed to apply the 10.6.4.2 patch, you can apply the 11.0.0.1 patch immediately after you upgrade to 11.0.

The following types of hosts can be backed up and are automatically restored during the upgrade process:

- **NetWitness Server** (may include Malware Analysis, NetWitness Respond, Health and Wellness, and Reporting Engine)
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and NetWitness Respond database)
- **Concentrator**
- **Log Decoder** (including Local LogCollector and Warehouse Connector, if installed)
- **Virtual Log Collector**

The following types of files are automatically backed up but must be restored manually after the upgrade process:

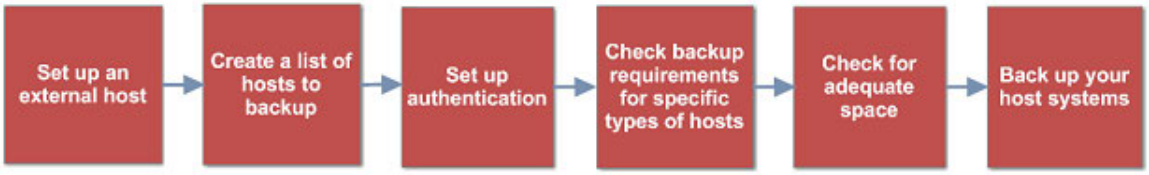
- PAM configuration files: For information about restoring the PAM configuration files, refer to "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.0.0.0", in the "Global"

section of the Post Upgrade Tasks.

- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the `/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see "(Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of Post Upgrade Tasks.

Note: If you have problems during the backup or upgrade processes and you lose data, you can recover the data and start the process again. For information about recovering lost data, see "Recover Data After System Failure" in the *System Maintenance Guide*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



The following sections describe each of these tasks:

- Task 1 - Set up an External Host for Backing up Files
- Task 2 - Create a List of Hosts to Back up
- Task 3 - Set up Authentication Between Backup and Target Hosts
- Task 4 - Check for Backup Requirements for Specific Types of Hosts
- Task 5 - Check for Adequate Space for the Backup
- Task 6 - Back up Your Host Systems
- Post Backup Tasks

Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running Centos 6 with connectivity through SSH to the NetWitness Suite stack of hosts.

Ensure that the host names for the systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

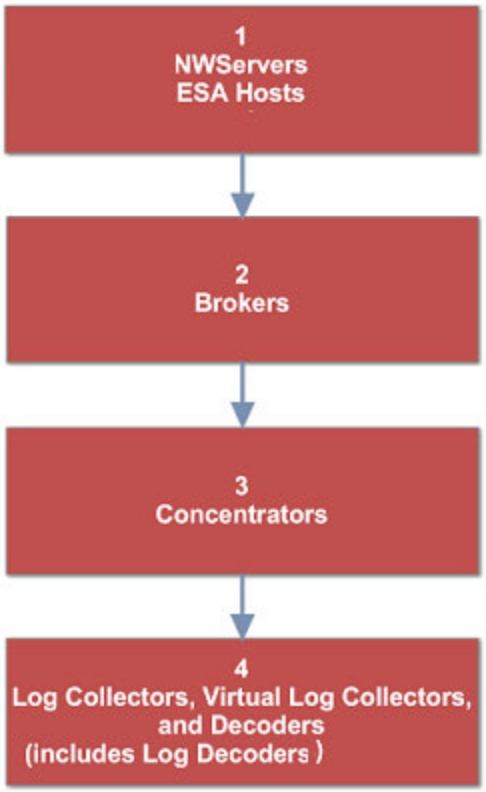
There are several scripts that you run during the backup process. You must download the zip file that contains the scripts (`nw-backup-v3.0.zip`) from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Click the **RSA NetWitness Logs & Packets 11.0 Backup Script (nw-backup-v3.0.sh)** link and extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your NetWitness Servers and host systems to be backed up.
- `ssh-propagate.sh`: Automates sharing keys between the systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.

Note: The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of the hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to ensure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference and then manually editing the `all-systems` file to contain specific hosts.

To generate the `all-systems` and the `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:
   `chmod u+x get-all-systems.sh`
2. At the root level, run the `get-all-systems.sh` script:
   `./get-all-systems.sh <IP-Address-of-NetWitness-Admin-Server>`
   You will be prompted for the password for each host system once per host.

This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nw-backup/`.

3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.
4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up.

> **Note:** If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-
a48e558cec3e,10.6.4.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-
8ea837074bd0,10.6.4.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.4.0
vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.4.0
broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-
c56ccfb0f737,10.6.4.0
```

And here is an example of an `all-systems` file based on the `all-systems-master-copy` file that could be used in the first backup session:

```
saserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-
a48e558cec3e,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
```

Troubleshooting Information

- Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location. Follow these recommendations:
  - Do not edit the `all-systems-master-copy` file.
  - If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure to remove pre-existing entries from the file so that the file contains only those hosts that are currently being backed up.
    For more information, see Post Backup Tasks.

- If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.
- The `get-all-systems.sh` script generates a list of hosts that were defined in the NetWitness Suite user interface. Ensure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to NetWitness Suite, you use the NetWitness Suite user interface to ensure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.
- At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the NetWitness Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence of those systems, that their services are all running, and that they are properly communicating with the NetWitness Server. (Any Windows Legacy Collectors or Azure Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)
- If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the man page for `ssh-agent`.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:
   `chmod u+x ssh-propagate.sh`
2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:
   `ssh-propagate.sh <path-to-all-systems-file>`
3. You are prompted for the password once per host, but you will not need to enter it repeatedly later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types:

1. On the NetWitness Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.0.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the NetWitness Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   `openssl x509 -inform der -in certificate.cer -out certificate.pem`
   Convert a PEM file to DER

```
openssl x509 -outform der -in certificate.pem -out certificate.der
```

Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)

```
openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in
certificate.crt -certfile CACert.crt
```

Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM

```
openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes
```

> **Note:** Add the following qualifier to the command string to:
> `-nocerts` convert private keys exclusively.
> `-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to Appendix B. Stopping and Restarting Data Capture and Aggregation

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

> **Caution:** This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after upgrade.
- If you set the password for `logcollector` user for RabbitMQ , you must know the password so you can set it again after the upgrade.

Prepare LCs and VLCs for Upgrade

1. SSH to the Log Collector.
2. Submit the following command string.
   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```
   This command:

- Stops the Puppet Agent service.
- Disables the file collection accounts ("sftp" and all users in the group "upload") used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgrade to 11.0.0.0.
- Stops all the collection protocols in the Log Collector service.
- Saves the list of Plugin accounts and RabbitMQ accounts.
- Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.
- Waits until the Log Collector queues are empty.
- Stops the Log Collector service.
- Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting

For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint: List RabbitMQ Usernames and Passwords

On the 10.6.4.x host, on the NetWitness Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.0.0.0 upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to *Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL* in Post Upgrade Tasks.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The event source documentation contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in `/root/vsftpd/` directory in 10.6.4.x, this material area will be backed up and restored. **If the material was in another location, you must back it up and restore it manually.**
- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.4.x, it is backed up and restored.

Task 5 - Check for Adequate Space for the Backup

You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to ensure that you provide adequate space for the backup so that the backup captures all your data.

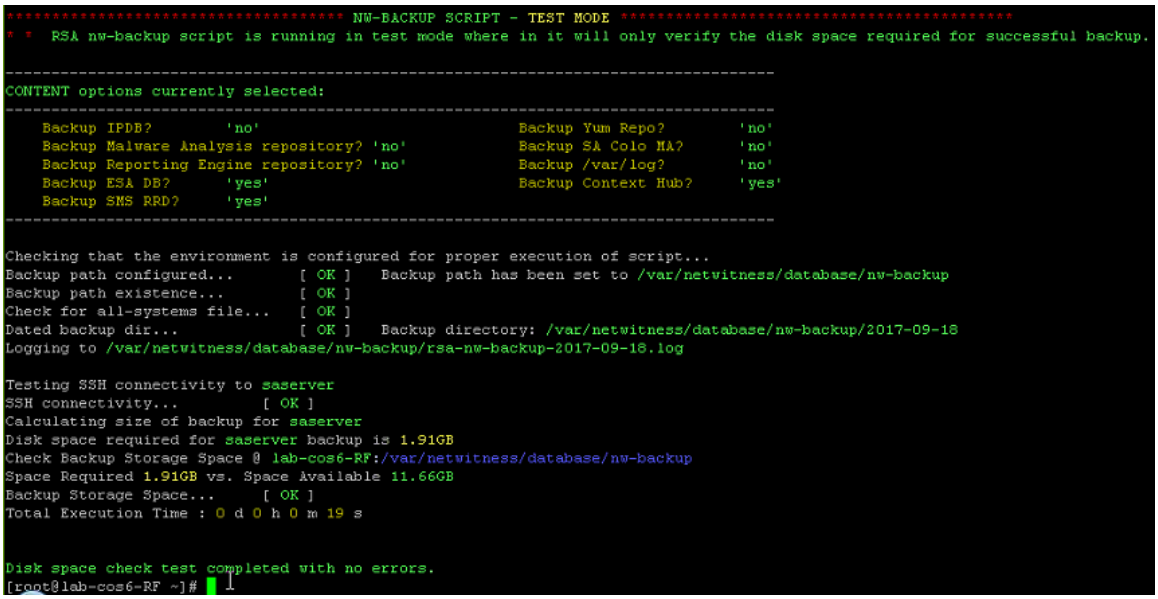
To check for adequate disk space:

1. Make the backup script executable by running the following command:
   ```
   chmod u+x nw-backup.sh
   ```
2. Run the following command at the root directory level:
   ```
   ./nw-backup.sh -t
   ```
   The output displays the amount of disk space that is required for the backup.

   Note: The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the `-d` option by using `-D`. Using the `-D` option will show how much

space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the `-D` option will throw an error. If you want to know how much space is available on the target host, you must run the `df -h` command on the host.

The following figure shows an example of the output from using the `-t` option.



Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the `nw-backup.sh` script using the `-u` option. This option is required for upgrading to 11.0.0.0.

Note: The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage:

`./nw-backup.sh [-u -t -d -D -u -l -x -e <external-mnt> -b <backup file path>`

General Options

`-u : This option is required for upgrading to 11.0. Enables the upgrade flag to run backup for upgrading to 11.0. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)`

-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)

-D : enables disk space check in 'full' mode (estimate of space using compressed data, ~10X slower). Default: (no)

-l : stores backup content locally on each host (automatically set if -u is used). Default: (no)

-e <path to mount point> : copies backup files of all devices onto an external mount point. Default: (/mnt/external_backup)

-x : move all backup files to an external mount point. Default: (no) -COPY

-b <path to write backups> : path to the location for storing backup files on a backup server. **For upgrading to 11.0, please use the default location!** Default: (/var/netwitness/database/nw-backup)

Note: Do **not** change the backup path in upgrade (-u) mode.

Advanced Content Selection Options

-c : back up Colocated Malware Analysis on SA servers. Default: (no)

-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)

-m : back up Malware Analysis File Repository. Default: (no)

-r : back up Reporting Engine Report Repository (automatically set if -u is used). Default: (no)

-v : back up system logs (/var/log). Default: (no)

-y : back up YUM Web Server & RPM Repository. Default: (no)

-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)

-C : If set: DISABLES back up of Context-Hub configuration and database. Default: (not-set)

-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)

Test Options

-t : performs script test run for disk space check only. Services are not stopped and excludes execution of backup. Can be combined with (-d) or (-D) and other flags. Default: (-t)

For example, the command:
`./nw-backup.sh`
would run the backup with options as set in the Header of the script itself.
OR, the command:
`./nw-backup.sh -ue /mnt/external_backup`
would run a normal backup using the backup path defined in the script, with the following options:

```
-u : enables the upgrade flag to run backup for upgrading to 11.0. It
also enables disk space check (-d), backing up reporting engine reports
(-r) and stores backup content locally (-l). Default: (no)

-e : Copy the backup files to external mount point, mounted on
/mnt/external_backup

For Help: ./nw-backup.sh -h
```

When you run the script, the following text is displayed at the top of the script:

```
Caution: RSA nw-backup script backs up configuration files, data, and
logs on the options provided in the script. It tars the content, with
options to store the backup files on the backup server, move or copy
them to external storage on a mount point (USB/NFS/SMB), or SCP them
back to the target host.
This backup script has been qualified on the following versions of
Security Analytics:
10.6.3.x and 10.6.4.x
Use of this script on any other versions of the product may not give
expected results and may not be supported by RSA Customer
Service.Note: All non-RSA custom files, scripts, Cronjobs and other
important files should be placed in /root, /home/'user', OR /etc to be
included in the backup.
```

To run the backup script to back up your hosts:

1. Ensure that the `all-systems` file contains only the hosts to back up. For information, see Task 2 - Create a List of Hosts to Back up.
2. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
3. Begin the backup process by running the following command at the root directory level:
   `./nw-backup.sh -u <additional options as needed>`

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.0.0.0.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   `rsa-nw-backup-2017-03-15.log`
4. When the backup has completed, to ensure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:

   `tar -tzvf hostname-ip-address-backup.tar.gz`

   The following archive files are created:

   For all hosts:

<hostname-IPaddress>-root.tar.gz

<hostname-IPaddress>-backup.tar.gz

tar checksum files

<hostname-IPaddress>-network.info.txt

For NetWitness Servers:

<hostname-IPaddress>-root.tar.gz

<hostname-IPaddress>-backup.tar.gz

<hostname-IPaddress>-mongodb.tar.gz

tar checksum files

<hostname-IPaddress>-network.info.txt

For ESA Hosts:

<hostname-IPaddress>-root.tar.gz

<hostname-IPaddress>-backup.tar.gz

<hostname-IPaddress>-mongodb.tar.gz

<hostname-IPaddress>-controldata-mongodb.tar.gz

tar checksum files

<hostname-IPaddress>-network.info.txt

The archived files are located in the /var/netwitness/database/nw-backup directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the all-systems File and the Backup Tar files

Make copies of the all-systems file, the all-systems-master-copy file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the NetWitness Server (specifically the Admin service) to 11.0.0.0.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.0.0.0 upgrade process. Before you begin the upgrade process, you must ensure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- all-systems
- all-systems-master-copy

- appliance_info
- service_info
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

In addition to the files listed above, the following files will be generated on NetWitness Server and ESA hosts:

- <*hostname*>-<*host IP address*>-mongodb.tar.gz
- <*hostname*>-<*host IP address*>-mongodb.tar.gz.sha256

The backup script will also generate the following controldata-mongodb.tar.gz files.

Note: The backup script copies the following files from all ESA hosts to the NetWitness Server host's backup path .

- <esa hostname>-<esa hostip>-controldata-mongodb.tar.gz
- <esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256

Task 3 - (Conditional) For Multiple ESA Hosts, Copy `mongodb tar` files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the /opt/rsa/database/nw-backup/ directory on the Primary ESA host system (the host that has the ContextHub service running on it) :

- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.0.0.0, ensure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

There should be note here mentioning default backup path locations for that user knows where to go and check these files.

Note: The default paths for backup files are:
- NetWitness Server hosts:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256`

Required Files for ESA Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Required Files for All Other Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

Note: The following files are located in the `<hostname>-<host-IP-address>-backup.tar.gz` tar on all hosts:
`appliance_info`
`service_info`

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
`BUPATH=/opt/rsa/database/nw-backup` for the ESA Correlation Engine
`BUPATH=/var/lib/rsamalware/nw-backup` for the Malware Service
`BUPATH=/var/netwitness/database/nw-backup` for all other services
Restore locations:
`BUPATH/restore/etc/sysconfig` for Iptable rules
`BUPATH/restore/etc/sysconfig` for NAT configurations
`BUPATH/restore/etc` for Crontab entries
`BUPATH/restore/etc` for User Accounts (users are located in the `passwd` file, and groups are located in the `group` file. These are not restored during the upgrade process but can be restored manually.
`BUPATH/restore/etc/ntp.conf` for NTP configurations (must be restored using the NetWitness Suite UI)

Migrate Disk Drives from 10.6.4.x to 11.0

These instructions tell you how to upgrade Azure NetWitness VMs from 10.6.4.x to 11.0.0.0 on Azure Cloud Platform.

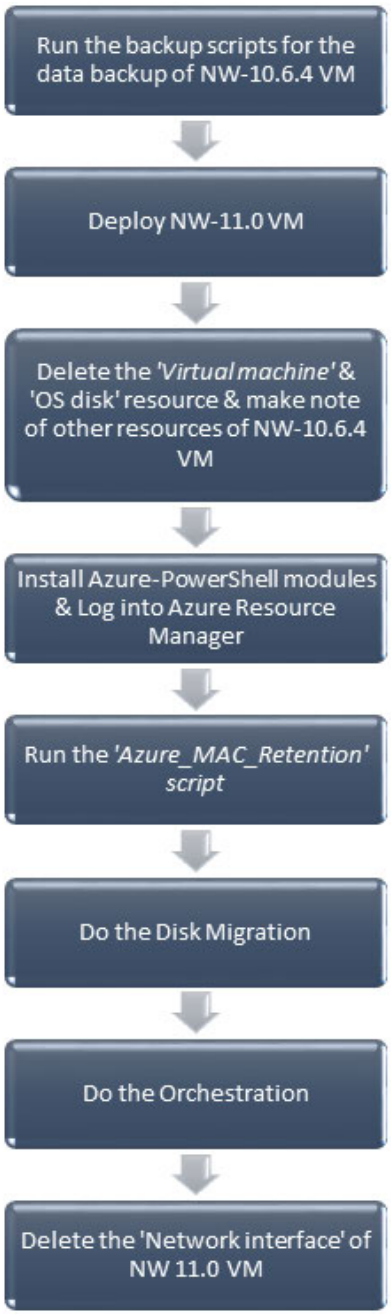
Prerequisites:

- Download and install the latest version of Azure PowerShell from https://github.com/Azure/azure-powershell/releases on a Windows machine.
- Upload the same latest version of Azure modules in automation account. [https://docs.microsoft.com/en-us/azure/automation/automation-update-azure-modules]

Note: Azure PowerShell 4.4.1 was used for qualification.

Note: Both versions of VMs must be on the same Virtual Network and Resource Group for the migration.

Caution: 1) You cannot perform the migration if you have a snapshot for your VM.
2). Run the backup immediately before you upgrade hosts for each phase so that the data is not out-dated.
3.) This guide applies to virtual host upgrades exclusively. If have physical and virtual hosts in your deployment, see the *RSA NetWitness® Suite 11.0 Physical Host Upgrade Instructions* for the steps you must complete to upgrade physical hosts. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.



Complete the following tasks to migrate your Virtual Machine (VM) deployment disk drives from 10.6.4.x to 11.0:

Task 1 - Deploy NW 11.0 VM

Task 2 - Delete Virtual Machine and OS disk resource of NW 10.6.4 VM

Task 3 - Install Azure PowerShell modules on a local Windows machine

Task 4 - IP Retention: Run the PowerShell script

Task 5 - Perform Disk Migration

Task 6 - Data Restoration

Task 1 - Deploy NW 11.0 VM

1. Deploy NW 11.0 VMs. [Refer to the Azure deployment guide for v 11.0.0.0.
2. Power OFF all the NW 10.6.4 and 11.0 VMs.
3. In the Azure Portal, navigate to Virtual machines.
4. Click on the <Name_of_the_VM>.
5. Click Overview and then click Stop.

Task 2 - Delete Virtual Machine and OS disk resource of NW 10.6.4 VM

Note the other resources like Data disks and Network Interface.

1. Delete the ‘Virtual machine’ and the 'OS disk' (usually disk1 of VM) resource of NW 10.6.4 VM and make a note of these Network interface and Data disks.

Note: Delete only these 2 resources and retain all other resources of NW 10.6.4 VMs like 'Network interface', 'Network security group' and 'Data disks') and make a note of these 'Network interface' and 'Data disks'.

2. In the Azure Portal, navigate to All resources. Select the Name_of_NW_10.6.4_VM.
3. Click Delete.

Azure now supports additional premium disk sizes: 32 GiB (P4), 64 GiB (P6), 2048 GiB (P40), and 4095 GiB (P60). Disks created be
15, 2017 retain their existing performance and billing rates.
Azure now supports premium disk size 256 GiB (P15). Managed disks (<=256 GiB) created before October 1, 2017 will retain the
P20 tier performance and billing rates.

Task 3 - Install Azure PowerShell modules on a local Windows machine

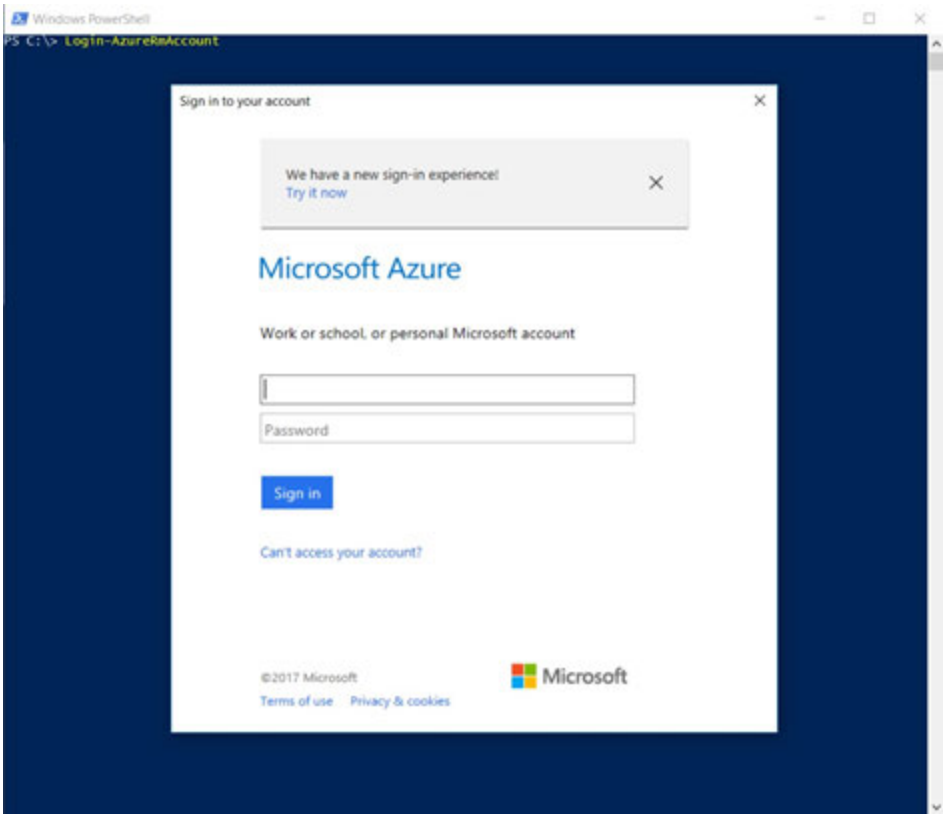
Install the Azure PowerShell modules on a local Windows machine and Login to Azure Resource Manager

Navigate to Azure PowerShell on the Windows machine where you have installed the Azure PowerShell modules and log in to Azure Resource Manager using the below command

Note: Make sure you have followed the steps mentioned in the Prerequisites section above before executing the below command.

```
Login-AzureRmAccount
```

Login using the Azure credentials in the window that appears.



Task 4 - IP Retention: Run the PowerShell script

Run the PowerShell script for MAC retention for all NW Components. MAC address and IP retention:

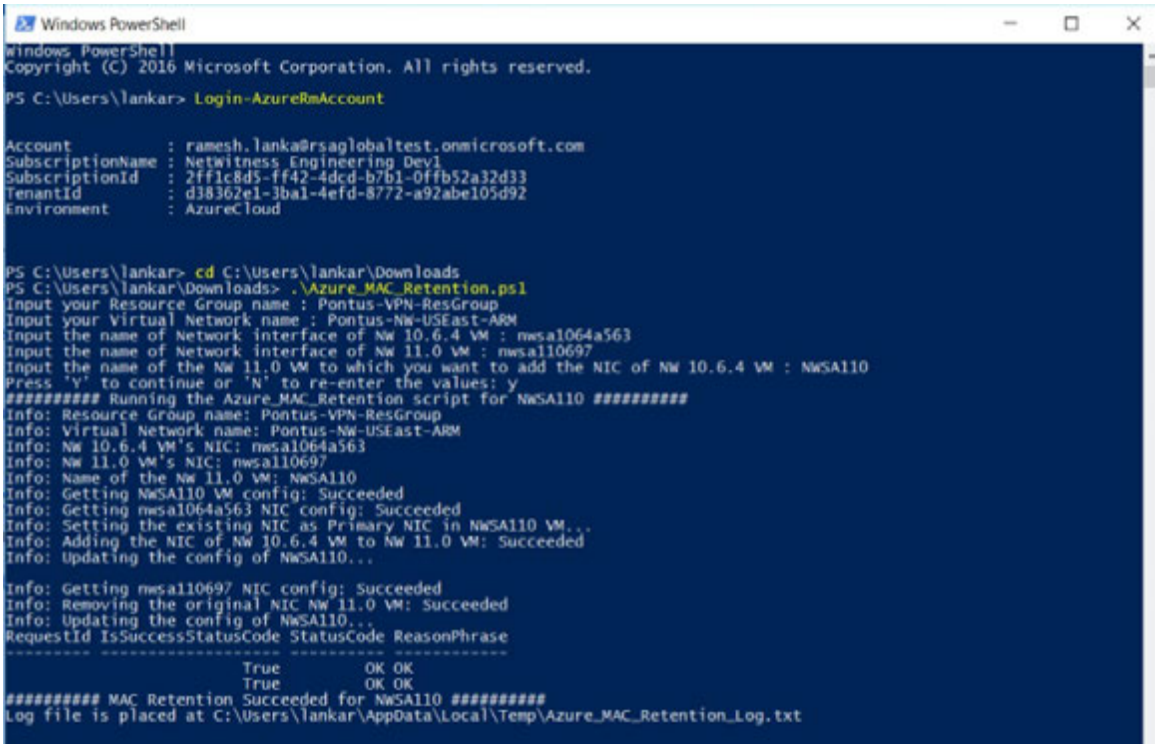
MAC address and IP are bound to the 'Network interface' resource of a VM.

The Azure portal doesn't allow us to

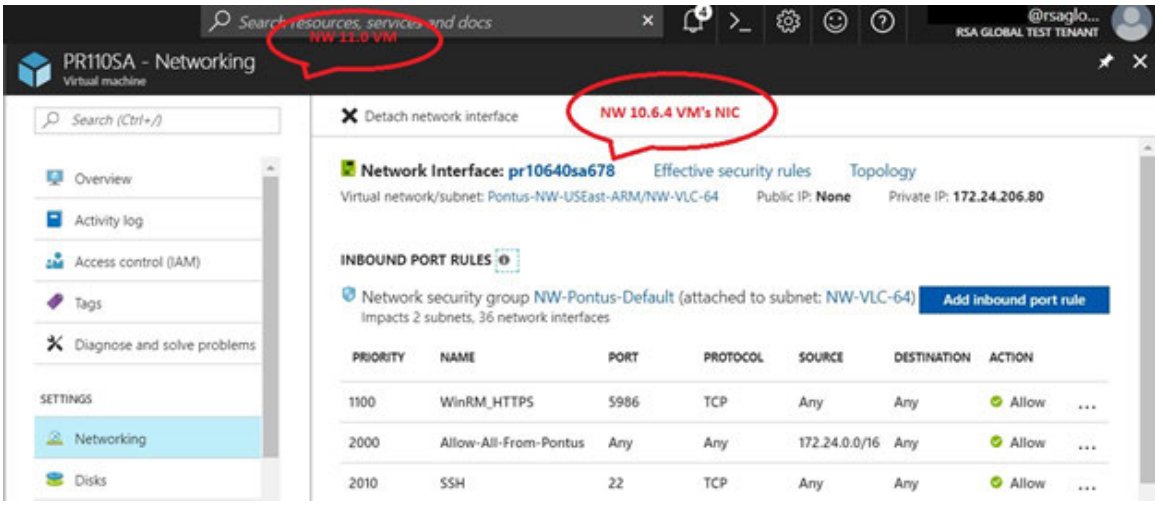
- Specify an existing network interface to add when creating the VM
- Create a VM with multiple network interfaces
- Specify a name for the network interface (the portal creates the network interface with a default name)

This can be achieved using the Azure PowerShell. [https://docs.microsoft.com/en-us/azure/virtual-network/virtual-network-network-interface-vm]

Click Azure_MAC_Retention.ps1 to download and run the script by providing the requested parameters on the Windows machine installed with Azure PowerShell to retain the 'Network interface' from NW 10.6.4 VM to 11.0 VM.



You should be able to see NW 10.6.4 VM's NIC attached to 11.0 VM under 'Networking' settings after successful execution of the script.

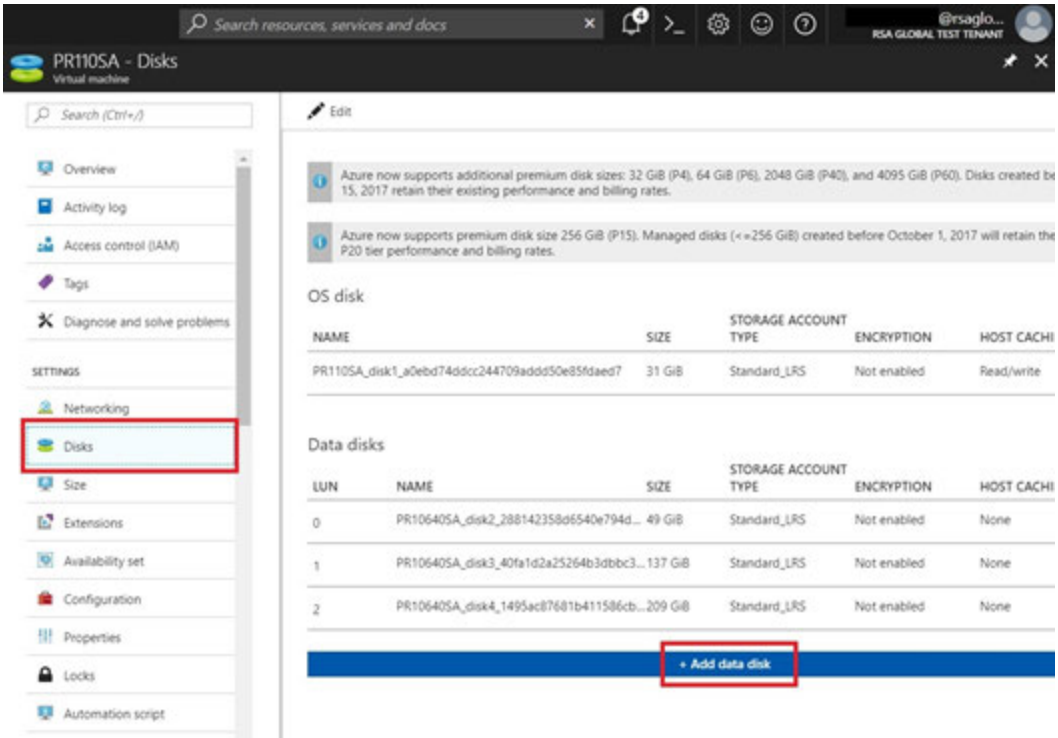


Task 5 - Perform Disk Migration

Add all the disks (except the 'OS disk') of NW 10.6.4 VM to the corresponding NW 11.0 VM under the ‘Disks’ settings.

In Azure Portal, navigate to Virtual machines and then Name_of_the_11.0_VM. Click **Disks** and then click + **Add data disk**. Select all disks of corresponding NW-10.6.4 VM which you had noted down earlier in the dropdown list that appears.

Click **Save**.



Power ON the NW 11.0 VM and login with the credentials provided during VM deployment and set the root password as netwitness.

Task 6 - Data Restoration

Copy NW 10.6.4 VM's backed up data (nw-backup) to NW 11.0 VM.

Note: Do the Data Restoration for SA Server first followed by other components

For SA, LD/LC, Virtual Log Collector, Concentrator, Archiver, Broker:

1. Create a directory under `/tmp/` by the name `nwhome`.
2. Mount `VolGroup00-nwhome` on `/tmp/nwhome/`.

```
mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

3. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`

```
cp -R /tmp/nwhome/* /var/netwitness/
```

4. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`

```
umount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

For ESA:

1. Create a directory under `/tmp/` by the name apps.
2. Mount `VolGroup01-apps` temporarily on `/tmp/apps/`

```
mount /dev/mapper/VolGroup01-apps /tmp/apps/
```

3. Copy `nw-backup` directory from here to `/var/netwitness`

```
cp /tmp/apps/database/nw-backup /var/netwitness
```

4. Unmount `VolGroup01-apps` from `/tmp/apps/`

```
umount /dev/mapper/VolGroup01-apps /tmp/apps/
```

Perform disk mounting by running the below commands:

For NW Server:

```
mount /dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/
mount /dev/mapper/VolGroup02-redb /var/netwitness/database/
```

Add below entries for these mounts in `/etc/fstab`:

```
/dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/ xfs defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup02-redb /var/netwitness/database/ xfs defaults,noatime,nosuid 1 2
```

For LogDecoder/LogCollector:

```
mount /dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder
mount /dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index
```

mount /dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb

mount /dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb

mount /dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector

mount /dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb

Add below entries for these mounts in `/etc/fstab`:

/dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder ext4 defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb xfs defaults,noatime,nosuid 1 2

For Virtual LogCollector:

mount /dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector

Add below entry for these mounts in `/etc/fstab`:

```
/dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs
defaults,noatime,nosuid 1 2
```

For Concentrator:

mount /dev/mapper/VolGroup01-concroot /var/netwitness/concentrator

mount /dev/mapper/VolGroup01-sessiondb /var/netwitness/concentrator/sessiondb

mount /dev/mapper/VolGroup01-index /var/netwitness/concentrator/index

mount /dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb

Add below entries for these mounts in `/etc/fstab`:

/dev/mapper/VolGroup01-concroot /var/netwitness/concentrator ext4 defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-sessiondb /var/netwitness/concentrator/sessiondb xfs defaults,nosuid,noatime 1 2

/dev/mapper/VolGroup01-index /var/netwitness/concentrator/index xfs defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb xfs defaults,noatime,nosuid 1 2

For Archiver:

mount /dev/mapper/VolGroup01-archiver /var/netwitness/archiver

mount /dev/mapper/VolGroup02-workbench /var/netwitness/workbench

Add below entries for these mounts in `/etc/fstab`:

/dev/mapper/VolGroup01-archiver /var/netwitness/archiver xfs defaults,nosuid,noatime 1 2

/dev/mapper/VolGroup02-workbench /var/netwitness/workbench xfs defaults,nosuid,noatime 1 2

For Broker:

mount /dev/mapper/VolGroup01-broker /var/netwitness/broker

Add below entry for these mounts in `/etc/fstab`:

```
/dev/mapper/VolGroup01-broker /var/netwitness/broker xfs
defaults,nosuid,noatime 1 2
```

Task 7 - Delete all NW 11.0 Deployment 'Network interface' Resources

1. In Azure Portal, go to All resources.
2. Click on <Name_of_NW_11.0_Network_interface> and select Delete.

Set Up Virtual Hosts in 11.0

There two phases to set up your 11.0 virtual stack that you must complete in the order shown.

- Phase 1 - Set Up NW Server, Event Stream Analysis, and Broker or Concentrator Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.4.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.0 and they will not be available until the warm up completes.

- Phase 2 - Set Up The Rest of the Component Hosts

Phase 1 - Set Up NW Server, Event Stream Analysis, and Broker or Concentrator Hosts

Task 1 - Set Up 11.0 NetWitness Server

Follow the instructions under Set Up 11.0 NW Server Host.

Task 2 - Setup 11.0 ESA

Caution: If you had C2 modules enabled in 10.6.4.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.0 and they will not be available until the warm up completes.

Follow the instructions under Set Up 11.0 Non-NW Server Host to set up your ESA hosts.

1. Set up your primary ESA host through the Setup program and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, set it up through the Setup program and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Set Up 11.0 Broker or Concentrator

Follow the instructions under Set Up 11.0 Non-NW Server Host.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.0 NW Server cannot communicate with 10.6.4.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Set Up The Rest of the Component Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Set Up 11.0 Non-NW Server Host.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in the *Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh* in the **Backup Instructions**.
2. Stop data capture on the Log Decoder.
3. Complete the steps in Set Up 11.0 Non-NW Server Host.
4. Restart data capture on Log Decoder.

Note: After you upgrade, you will restart log collection after completing the Task 11 - Reset Stable System Values for Log Collector after Upgrade in the **Post Upgrade Tasks**

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described in the *Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh*.
2. Back up your 10.6.4.x VLC by editing the `all-systems` file on host where you performed the backup.
   a. Make sure your `all-systems` file contents has this information before you perform this step.
   `vlc,<host-name>,<IP-address>,<UUID>,10.6.4.0`
   b. Run the following command to create backup.

```
./nw-backup.sh -u
```

See Backup Instructions for detailed procedures on how to back up the host.

3. Make sure the backup host contains the VLC backup in the following format.

```
<hostname>-<IPaddress>-root.tar.gz
<hostname>-<IPaddress>-root.tar.gz.sha256
<hostname>-<IPaddress>-backup.tar.gz
<hostname>-<IPaddress>-backup.tar.gz.sha256
<hostname-IPaddress>-network.info.txt
all-systems-master-copy
```

4. Power off the 10.6.4.x VLC so that a new 11.0 VM can be created with the same network configuration.
5. Deploy a fresh Non-NW Server host using the 11.0 NetWitness Suite ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.4.x VLC.
   This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.4.x VLC backup file.

   Note: Make sure IPv6 is disabled.

   a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings. Contents of `ifcfg-eth0` should be as follows.

```
TYPE=Ethernet
DEFROUTE=yes
NAME=eth0
UUID=<uuid>
DEVICE=eth0
DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
BOOTPROTO=static
IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
NM_CONTROLLED=no
ONBOOT=yes
```

   b. Submit the following command string.

```
systemctl restart network.service
```

8. Create the backup directory.

```
# mkdir -p /var/netwitness/database/nw-backup/
```

9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new VLC in the `/var/netwitness/database/nw-backup` directory.
10. Complete the steps 2 through 12 inclusive in Set Up 11.0 Non-SA Server Host for the rest of the NetWitness Suite components . Make sure that you select **Log Collector** for the service in step 12.

Set Up 11.0 NW Server Host

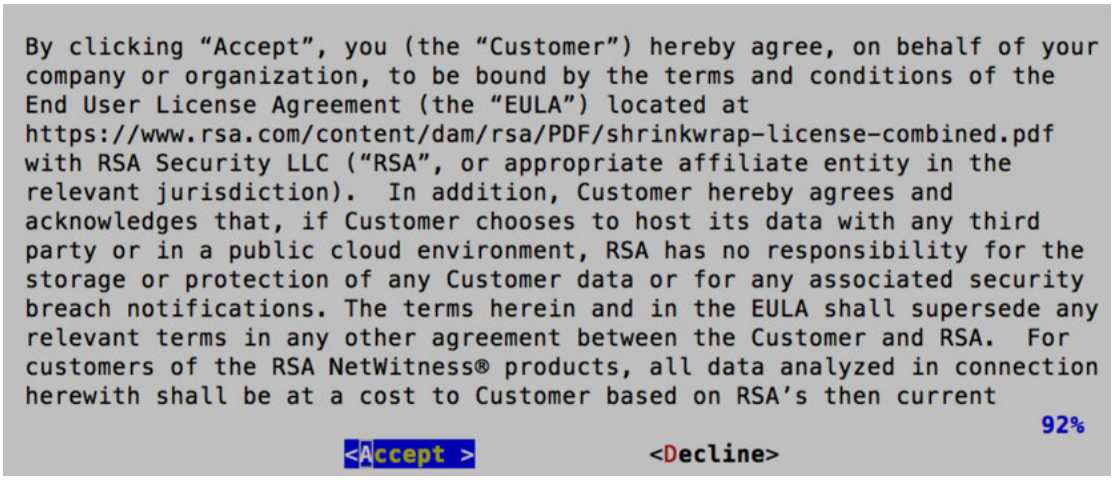
Make sure that you have backed up 10.6.4.x data for the SA Server host. **You must follow the instructions in** Backup Instructions **to back up the host.**

Caution: Run the backup immediately before upgrading the SA Server to 11.0 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.0.

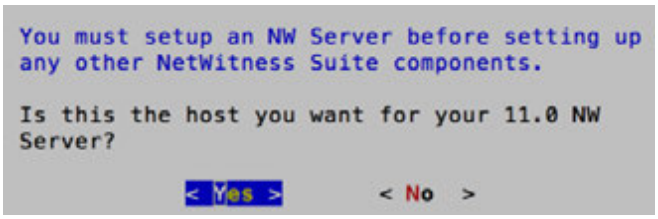
Complete the following steps to set up the 11.0 NW Server host.

1. Power on the NW Server VM and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

   Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press the Enter key to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use access the host.

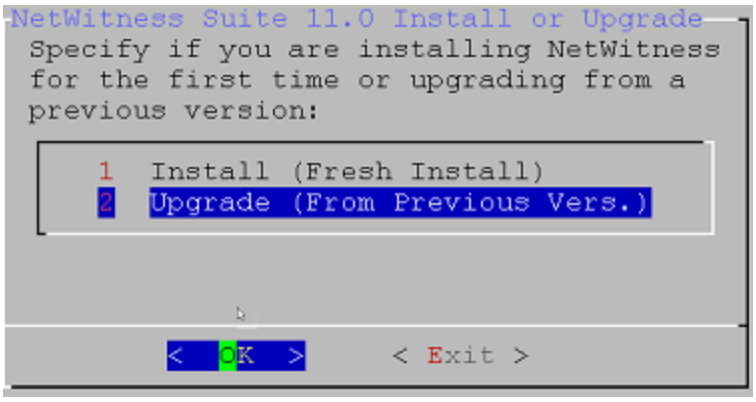
   


2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

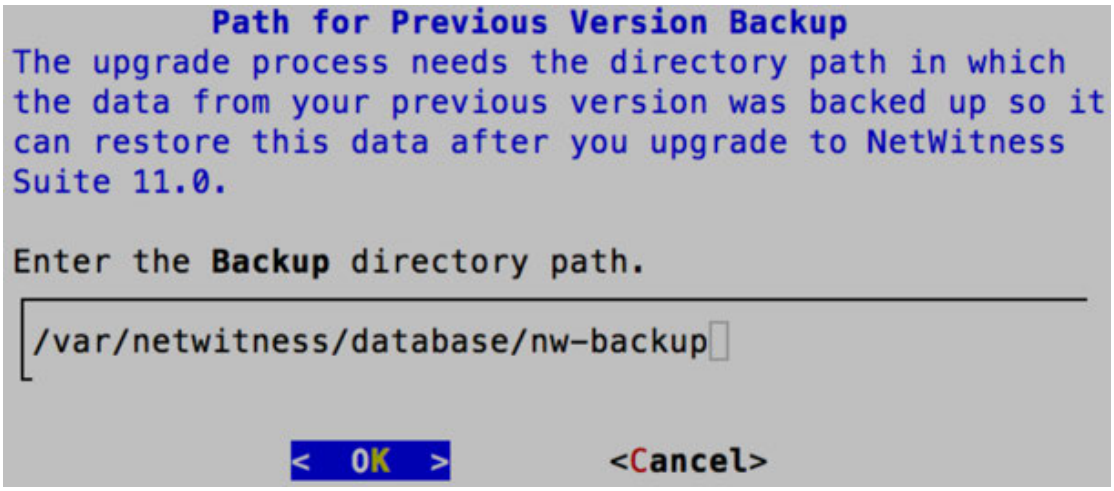


Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.0 NW Server Host to correct this error.

3. Tab to **Yes** and press **Enter**.
   Choose No if you already upgraded the NW Server to 11.0.
   The Install or Upgrade prompt is displayed.



4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.
   The backup path prompt is displayed.

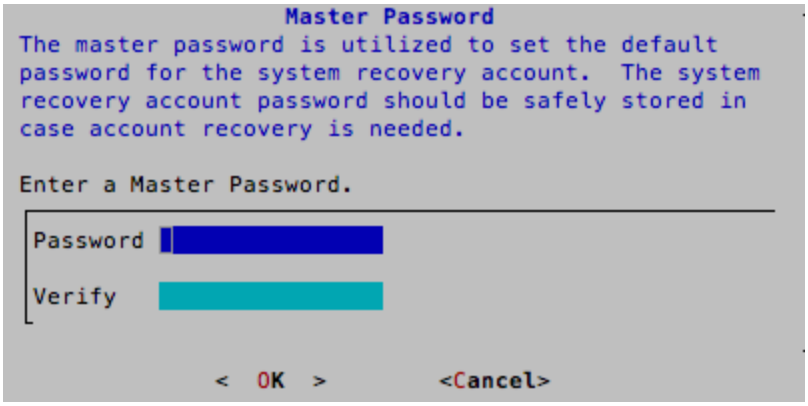


5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Master Password prompt is displayed.

The following list of characters are supported for Master Password and Deployment Password:

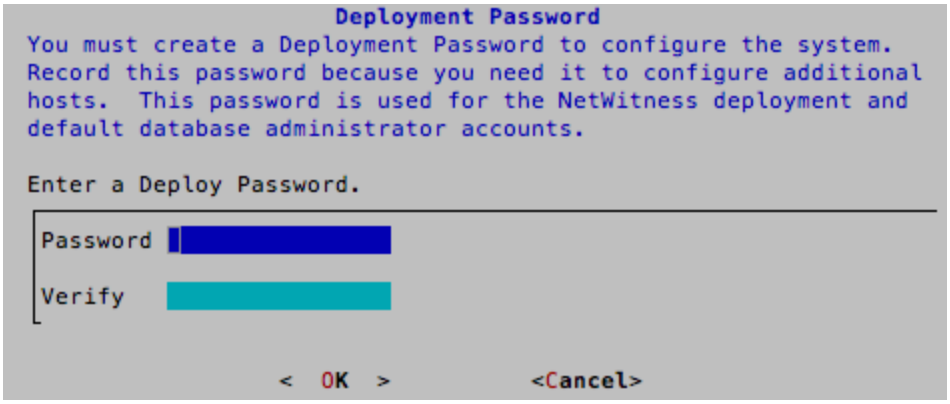
- Symbols : ! @ # % ^ +
- Numbers :0-9
- Lowercase Characters : a-z
- Uppercase Characters : A-Z

No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ , ; : . < > -).



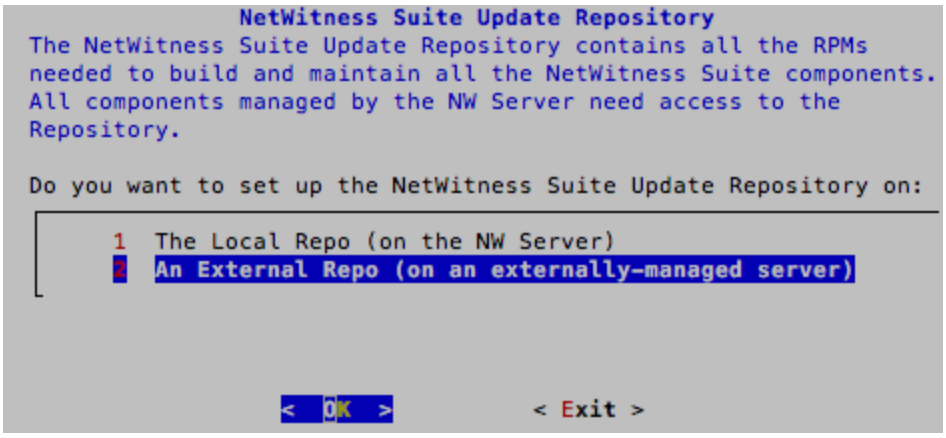
6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   The Deployment Password prompt is displayed.



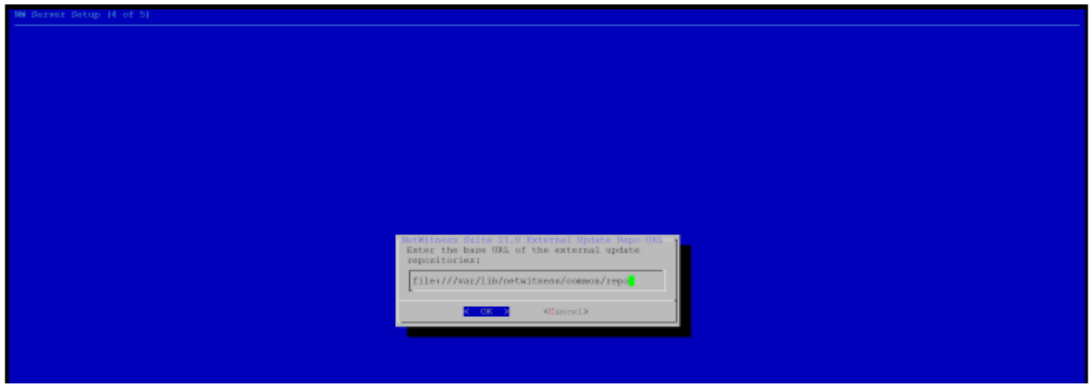
7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   The Update Repo prompt is displayed.



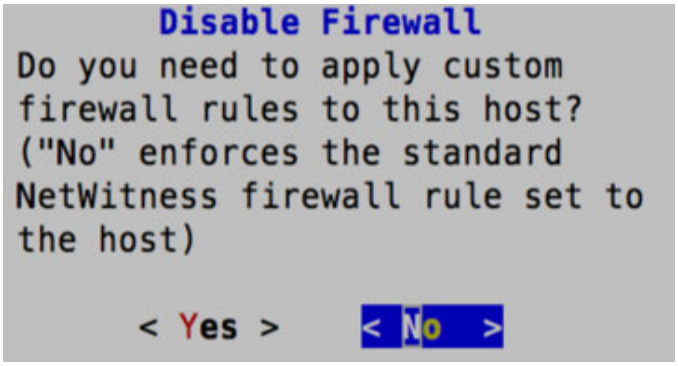
You must use the same repo that you used for the NW Server hosts for all hosts.

8. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL.



See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *RSA NetWitness Suite 11.0 Hosts and Services Getting Started Guide* for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

9. Enter the base URL of the NetWitness Suite external repo and click **OK**.
   The disable or use standard firewall configuration prompt is displayed.



10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

    - If you select Yes, confirm your selection.

    
    - If you select No, the standard firewall configuration is applied.

    The start upgrade prompt is displayed.

11. Select 1 **Upgrade Now**, tab to **OK**, and press Enter.

    When "Installation complete" is displayed, you have upgraded the 10.6.4.x SA Server to the 11.0 NW Server.

    Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

```
ValueError: error:3207A06D:lib(50):B_HASH_init:cr new
Checksum type 'md5' disabled
 (skipped due to only_if)
    * file[/etc/yum.repos.d/CentOS-Base.repo] action delete (up to date)

    f(usedforsecurity=False)
```

Set Up 11.0 Non-NW Server Host

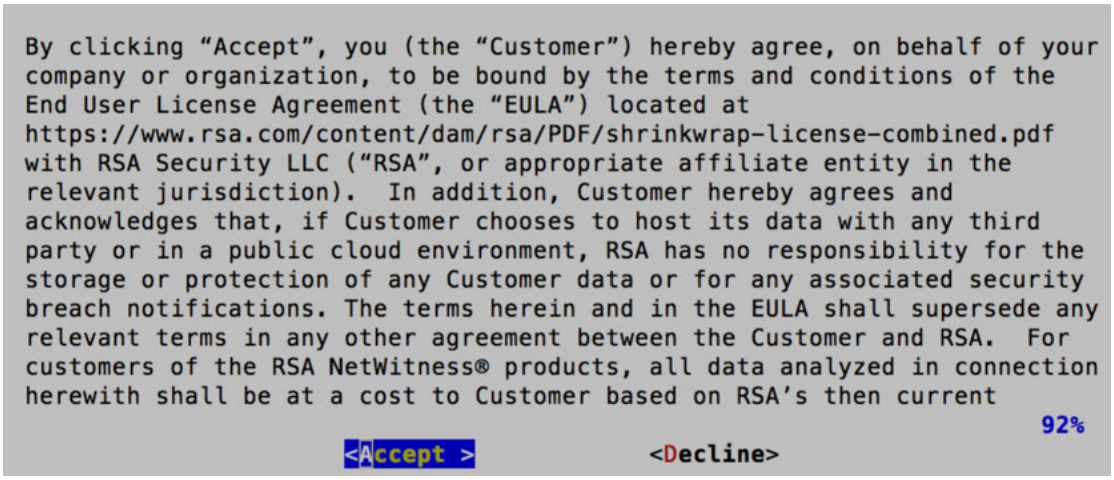
Make sure that you Back up your 10.6.4.x data for the host. **You must follow the instructions in** Backup Instructions **to back up the host.**

Caution: Run the backup immediately before upgrading the host to 11.0 so that the data is as recent as possible.

Complete the following steps to set up an 11.0 Non-NW Server host.

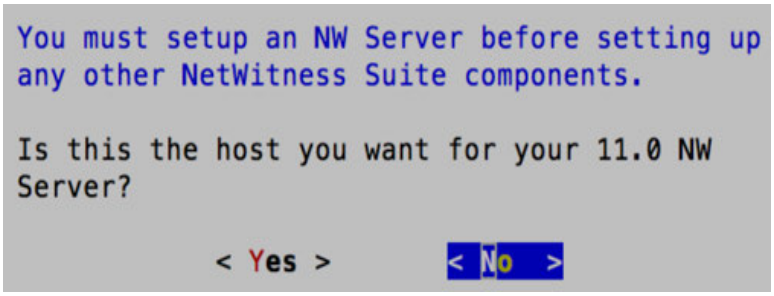
1. **Power On** the non-NW Server VM and run the `nwsetup-tui` command.

   This initiates the Setup program and the EULA is displayed.



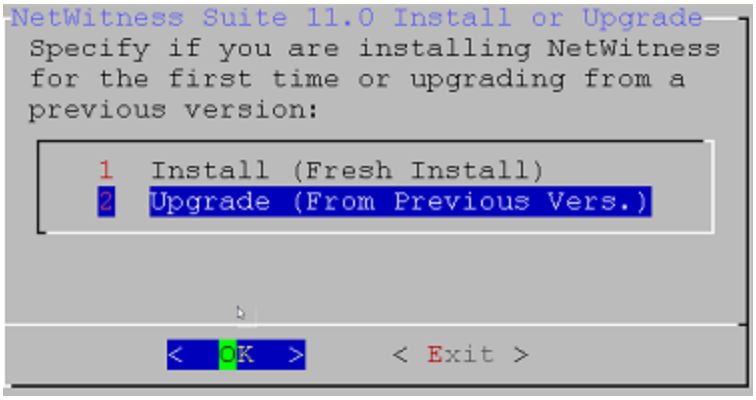
2. Tab to **Accept** and press **Enter**.

   The "Is this the NW Server" prompt is displayed.

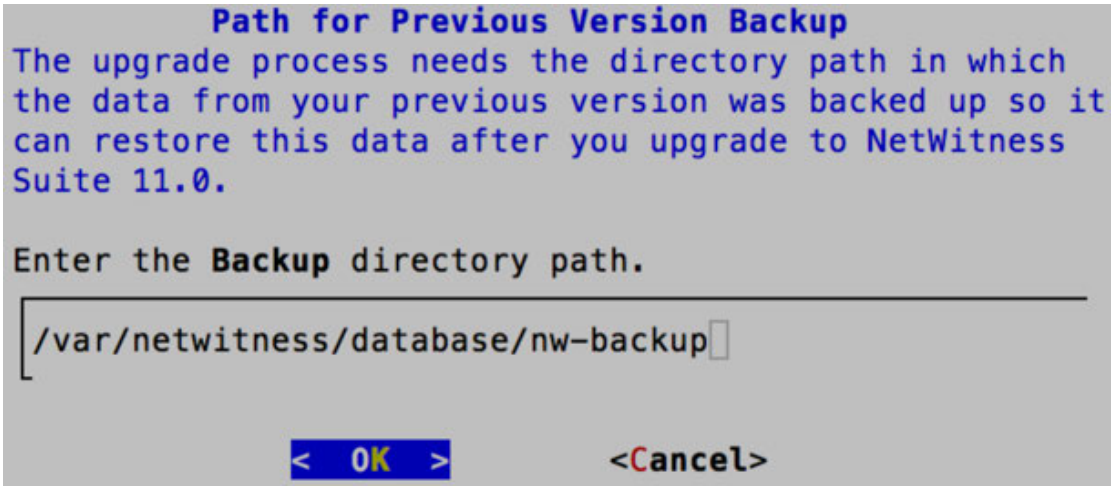


Caution: If you choose the wrong the host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.0 NW Server Host to correct this error.

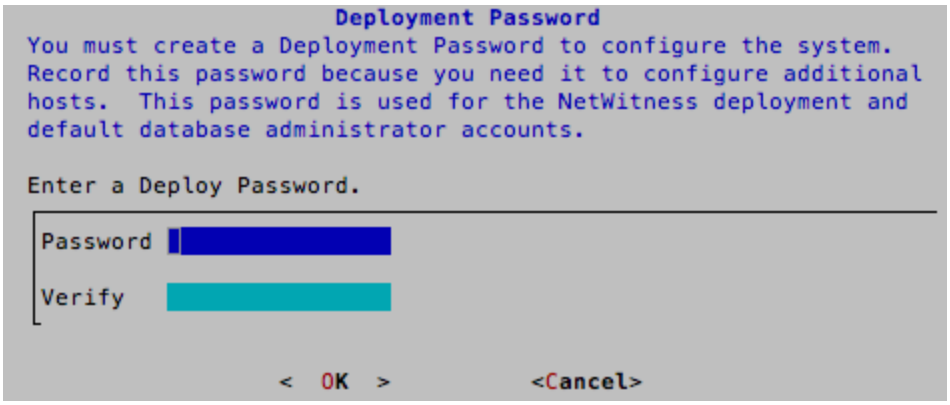
3. Tab to **No** and press **Enter**.
   The Install or Upgrade prompt is displayed.



4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.
   The backup path prompt is displayed.



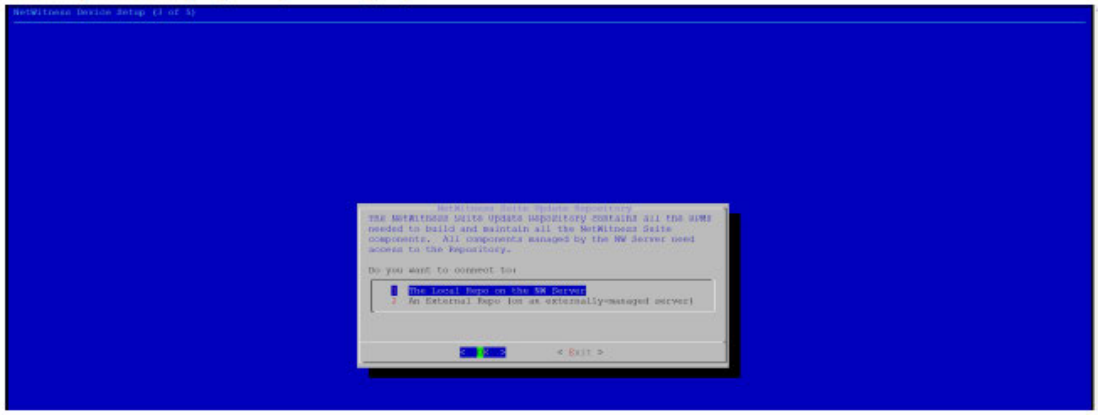
5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Deployment Password prompt is displayed.



Note: You must use the same deployment password that you used when you upgraded the NW Server.

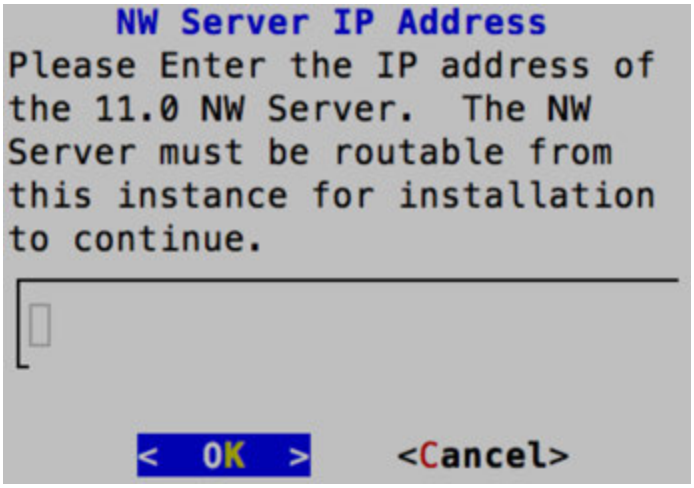
6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   The Update Repo prompt is displayed.

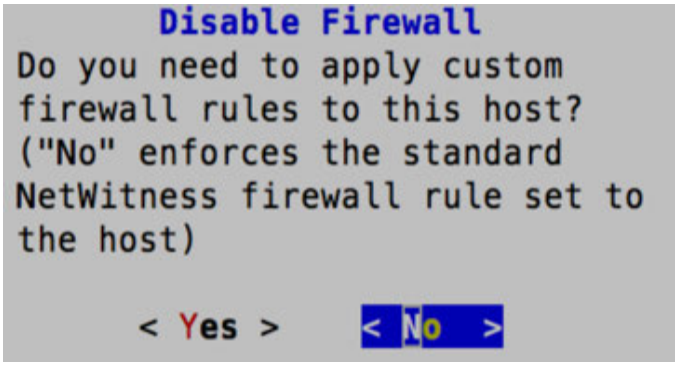


7. Use the down and up arrows to select the **2 The Local Repo (on the NW Server)**, tab to **OK**, and press **Enter**.

8. Enter the base URL of the NetWitness Suite external repo and click **OK**.
   The NW Server IP Address is displayed.



9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.
   The disable or use standard firewall configuration prompt is displayed.



10. Tab to **No**, and press Enter to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

    - If you select **Yes**, confirm your selection.

    - If you select **No**, the standard firewall configuration is applied.

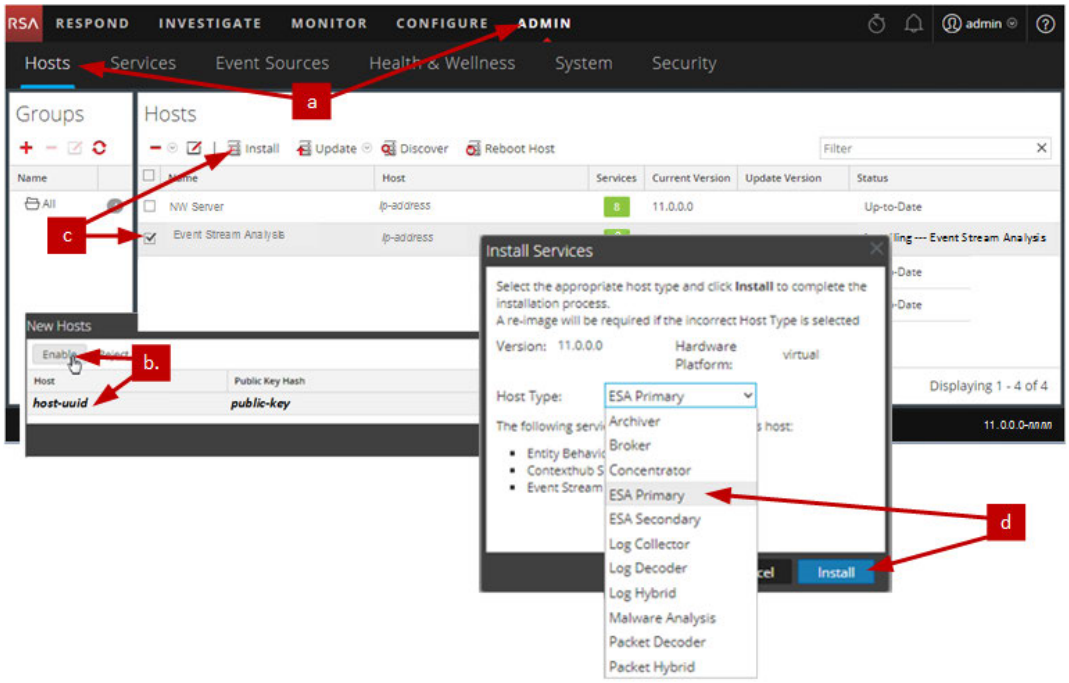
The start upgrade prompt is displayed.

11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.
    When "Installation complete" is displayed, you have upgraded the host to the 11.0.
12. Install the service on this host:
    a. Log into NetWitness Suite.
       Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Suite Login screen
    b. Click **ADMIN** > **Hosts**.
       The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

       Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    c. Click on the host in the **New Hosts** dialog and click **Enable**.
       The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.
    d. Select that host (for example, **Event Stream Analysis**) and click Install
       The **Install Services** dialog is displayed.

e. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



You have completed the upgrade of the non-NW Server host in NetWitness Suite

Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness 11.0 Legacy Windows Collection Guide* on RSA Link (https://community.rsa.com/docs/DOC-75593) for details about how to install or update Legacy Windows collection.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

This topic contains the tasks you must complete after you upgrade your hosts from 10.6.4.x to 11.0. These tasks are organized by the following categories.

- Global
- NetWitness Endpoint
  RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, and 4.4 only for NetWitness Suite 11.0.
- Event Stream Analysis
- Log Collection
- Reporting Engine
- Respond
- NetWitness SecOps Manager
- Security

Global Tasks

Task 1 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.0 before you remove the backup-related files from the local directories on your 11.0 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.0, you must remove:

- the backup files from the local directories on the hosts.
- all the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`

Host	Backup Path	Restore Path
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

Task 2 - Restore NTP Servers

You must use the NetWitness Suite 11.0 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *RSA NetWitness® Suite 11.0 System Configuration Guide* for detailed instructions on how to add NTP servers. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 3 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Suite licenses. Refer to "Step 1. Register the NetWitness Server" in the *RSA NetWitness Suite Licensing Management Guide* for instructions on how to re-download licenses. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 4 - Remap Virtual NW Server License to 10.6.4.x MAC Address

If you are upgrading a Security Analytics server running on a virtual machine, change the 11.0 NW Server virtual host to the 10.6.4.x MAC address to retain licensing. Refer to "Licensing: Step 1. Register the NetWitness Server" in the *RSA NetWitness Suite Licensing Management Guide* for instructions on remapping a license to a new MAC address." Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

(Conditional) Task 5 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create a user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   `/etc/sysconfig/iptables`
   `/etc/sysconfig/ip6tables`
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 6 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.4.

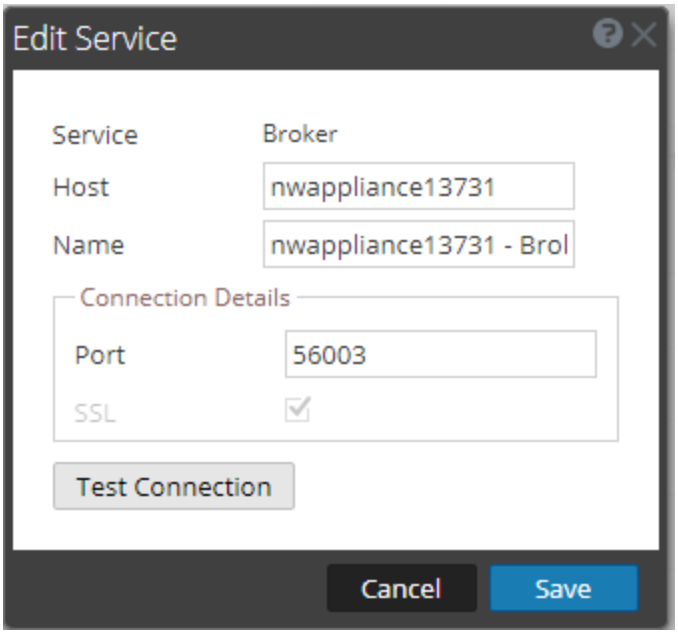
NetWitness Suite 11.0 cannot communicate with the core services for these customers because they are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to NetWitness Suite
2. Go to **ADMIN** > **Services**.
3. Select each core service and change there ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005

Service	Non-SSL	SSL
Decoder	50004	56004
Log Decoder	50002	56002

4. Click (Edit) from the **Services** view toolbar.
   The Edit Service dialog is displayed.
5. Change the port from Non-SSL to SSL as shown in the table and click **Save**(for example, change the Broker port from 50003 to 56003).



NetWitness Endpoint

Task 7 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Suite 11.0, the virtual host is `/rsa/system`. For 10.6.4.x and earlier versions, the virtual host is `/rsa/sa`.
2. Restart the API Server and Console Server.

3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.
6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Event Stream Analysis Tasks (ESA)

Task 8 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.4.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.0.

1. Log in to NetWitness Suite 11.0
2. Click **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Packets and C2 for Logs, require a whitelist named "**domains_whitelist**".
3. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Click **ADMIN**> **Services**, select the Context Hub service, in the action commands () drop-down menu, click **View** > **Config** > **Lists** tab).
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *NetWitness Suite Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *NetWitness Suite ESA Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 9 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL

If you integrate with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.4.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Suite by logging into the host and running the following `rabbitmqctl` command.

   ```
   > rabbitmqctl add_user <username> <password>
   ```

   For example:

   ```
   > rabbitmqctl add_user wtd-incidents incidents
   ```

2. Set permissions for users by running the following command (use the username from step 1):

   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*", ".*"
   ```

   For example:

   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*", ".*", ".*"
   ```

Task 10 - Enable Threat - Malware Indicators Dashboard

In 11.0.0, the 10.6.4.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.4.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.0.
2. Set datasource for new dashlets.

   See "Dashlets" in the RSA Link (https://community.rsa.com/docs/DOC-81463).

Log Collection

Task 11 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.0 to ensure that all collection protocols resume normal operation.

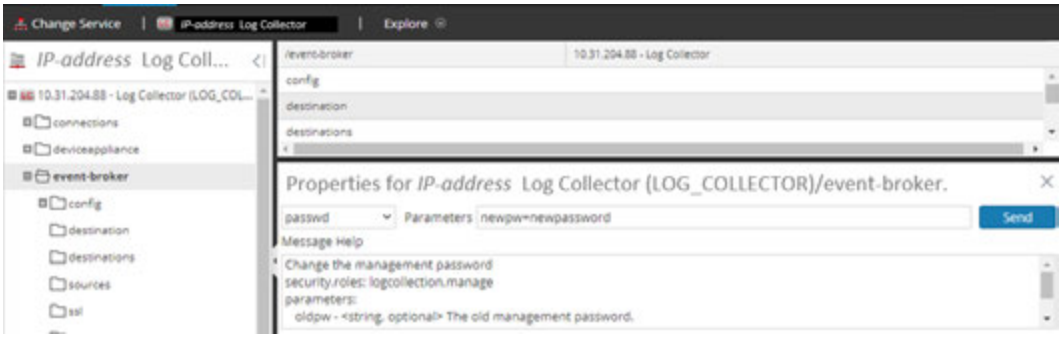
Reset Stable System Values for the Lockbox

The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *RSA NetWitness® SuiteLog Collection Configuration Guide* for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Update Log Collector Service RabbitMQ User Account Password

If the logcollector service RabbitMQ user account password was changed, you must reenter it after the 11.0 upgrade.

1. Log in to NetWitness Suite.
2. Click **ADMIN > Services**.
3. Select the Log Collector service.
4. Click  (Actions) > **View** > **Explore**.
5. Right click `event-broker` > **Properties**.
6. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



(Optional for Upgrades from 10.6.4.x with FIPS enabled for Log Collectors, Log Decoders and Packet Decoders) Task 12 - Enable FIPS Mode

FIPS is enabled on all services except Log Collector Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder. For information about how to enable FIPS for these services, see the "Sys Maintenance: Activate or Deactivate FIPS" topic in the *RSA NetWitness® SuiteSystem Maintenance Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Reporting Engine

Task 13 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the back up you made prior to the upgrade. The Backup script backs up the 10.6.4.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.0.

1. SSH to the NW Server host.
2. Export the CA certificates.
   `keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file`
3. Copy the CA pem into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 14 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *RSA NetWitness® Suite Reporting Engine Configuration Guide* for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Respond

Task 15 - Restore Respond Service Custom Keys

In 10.6.4.x, if you added custom key for use in the groupBy clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.
   This directory is where the `alert_rules.json` file is restored from the 10.6.4.x backup.
2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.0.
   This is the new file for 11.0.
3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 16 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.0 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.4.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.4.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.4.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Suite 11.0 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.4.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

(Conditional) Task 17 - Enable Disabled 10.6.4.x Incident Management Data Retention

Complete the following procedure to enable the Incident Management data retention jobs you disabled prior to upgrade.

1. Log in to RSA NetWitness® Suite.
2. Go to **ADMIN** > **Services** and select the **Respond server**.
3. Click the  (Actions), **View** > **Explore**.
4. Go to the `respond/dataretention` node.
5. Set the `enable` parameter to `true`.

(Conditional) Task 18 - Restore Custom Analysts Roles

If you had custom analyst roles in 10.6.4.x, you must reinstate them in 11.0. See *Adding Roles and Assigning Permissions for the Roles* in the *RSA NetWitness Suite Warehouse Analytics Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

NetWitness SecOps Manager

Task 19 -Reconfigure NW SecOps Manager Integration

For information on how to reconfigure NW SecOps for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

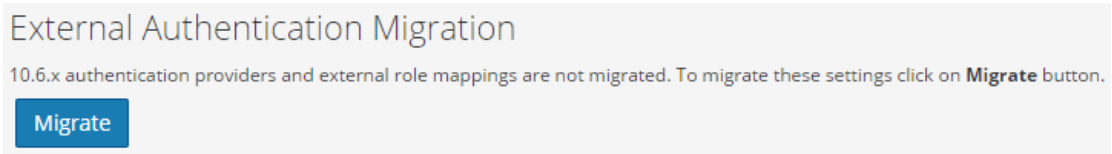
Security

Task 20 - Migrate Active Directory (AD)

The first time you log into the NetWitness Suite 11.0 User Interface, you must click on the Migrate button to complete the migration of AD.

Caution: If you did not upgrade from 10.6.4.2, you must apply the 11.0.0.1 patch immediately before you first log into NetWitness Suite 11.0 and migrate Active Directory. You do not need to apply the 11.0.0.1 patch if you upgraded to 11.0 from 10.6.4.2.

1. Log in to NetWitness Suite with your `admin user` credentials.
2. Click **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 21 - Modify Migrated AD Configuration to Upload Certificate

If the you used a self-signed certificate in Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.4.x, you must modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

Complete the following procedure to modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

1. Log in to NetWitness Suite.
2. Click **ADMIN** > **Security** and click the **Settings** tab.
3. Under **Active Directory Settings**, select an AD configuration and click  .
   The Edit Configuration dialog is displayed.
4. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
5. Click **Save**.

Task 22. Address Authentication Failure in 11.0

Users cannot log in to NetWitness Suite User Interface after you upgrade to 11.0 because the Interface cannot retrieve user account information from MongoDB.

- Apply the 11.0.0.1 patch to fix this issue immediately after you upgrade to 11.0.

Task 23 - Reconfigure Pluggable Authentication Module (PAM) in 11.0

You must reconfigure PAM after you upgrade to 11.0. See "Configure PAM Login Capability" in the *RSA NetWitness® Suite System Security and User Management Guide*for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

You can refer to your 10.6.4.x PAM configuration files in the **/etc** directory in the your 10.6.4.x backup data for guidance.

Appendix A. Troubleshooting

This section describes problems that you may encounter during the upgrade with solutions. In most cases, NetWitness Suite creates log messages when it encounters these problems.

Note: If you cannot resolve any upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294) .

This section has troubleshooting documentation for the following services, features, and processes.

- 11.0 Setup Program (`nwsetup-tui`)
- Backup
- Event Stream Analysis
- General
- Log Collector Service (`nwlogcollector`)
- NW Server
- Reporting Engine

11.0 Setup Program (`nwsetup-tui`)

Problem	Host Setup Program (`nwsetup-tui`) exits and creates the following error message in `/var/log/netwitness/bootstrap/launch/security-server/security-server.log`:
	`<yyyy-mm-dd hh:mm:ss,nnn> [ main] ERROR SystemOperation|Service startup failed. Running in safe mode org.h2.jdbc.JdbcSQLException: The database is read only [90097-193]`
	`at org.h2.message.DbException.getJdbcSQLException(DbException.java:345) ...`
	`at org.springframework.jdbc.datasource.AbstractDriverBasedDataSource.getConnection (AbstractDriverBasedDataSource.java:159)`
	`at com.rsa.asoc.security.upgrade.legacy.MigrationDatabase.<init>(MigrationDatabase.java:113)`

Cause	The H2 database needs write permission to complete the host setup.

Solution	From the NW Server command line, provide write permission to `H2.db`, restart the NW Server, and restart nwsetup-tui Setup Program.
	`chmod o+w /var/lib/netwitness/uax/db/platform.h2.db`
	`systemctl restart rsa-nw-security-server.service`
	`nwsetup-tui`

Backup (`nw-backup` script)

Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA mongo admin password back to the original default of 'netwitness' before running backup. See "ESA Config: Change MongoDB Password for admin Account" the the *RSA NetWitness® Suite Event Stream Analysis Configuration Guide. Go to the* Master Table of Contents *for Version 11.0 to find NetWitness Suite 11.0 documents.*

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.0 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESAPrimary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA .
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

General

Logs referred to in this section are posted to `/var/log/install/install.log` on the NW Server Host.

Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health.AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Suite sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service using below command. `systemctl restart rsa-sms`

Message	`<timestamp> <host>: SMS_PostInstall: INFO: Free disk space on /opt is nGB` `<timestamp> <host>: SMS_PostInstall: WARN: Disk space check failed on /opt. The available disk space nGB is less than the recommended minimum disk space of 10GB.`
Cause	Low or insufficient disk space allocated for the SMS service.
Solution	RSA recommends that you provide a minimum of 10 GB of disk space for the SMS service to run optimally.

Problem	After you run the Setup Program for a non-NW Server host, you must go in to the UI, enable the host, and install the service on the host from the Hosts View. If you see "Install error View Details" in the **Status** column of the Hosts view, the host lost connectivity due to network issues.
Solution	Re-install the service on the host from the Hosts view.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Suite and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Message	*`timestamp`* `NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	(Conditional) If you use a Log Collector Lockbox, log in to NetWitness Suite and configure the Lockbox as described in the"Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents..

Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Suite and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the sa.log. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.4 to 11.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Message	`<timestamp> : Available free space in /home/rsasoc/rsa/soc/reporting-engine [ existing-GB ] is less than the required space [ required-GB ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Appendix B. Stopping and Restarting Data Capture and Aggregation

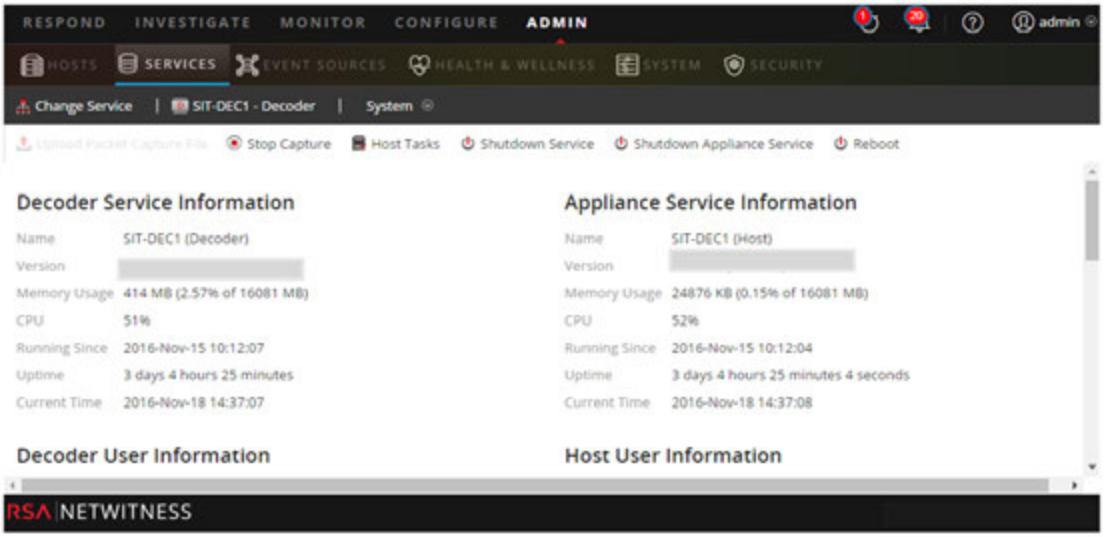
RSA recommends that you stop packet and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.0. If you do this, you must restart packet and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Packet Capture

To stop packet capture:

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

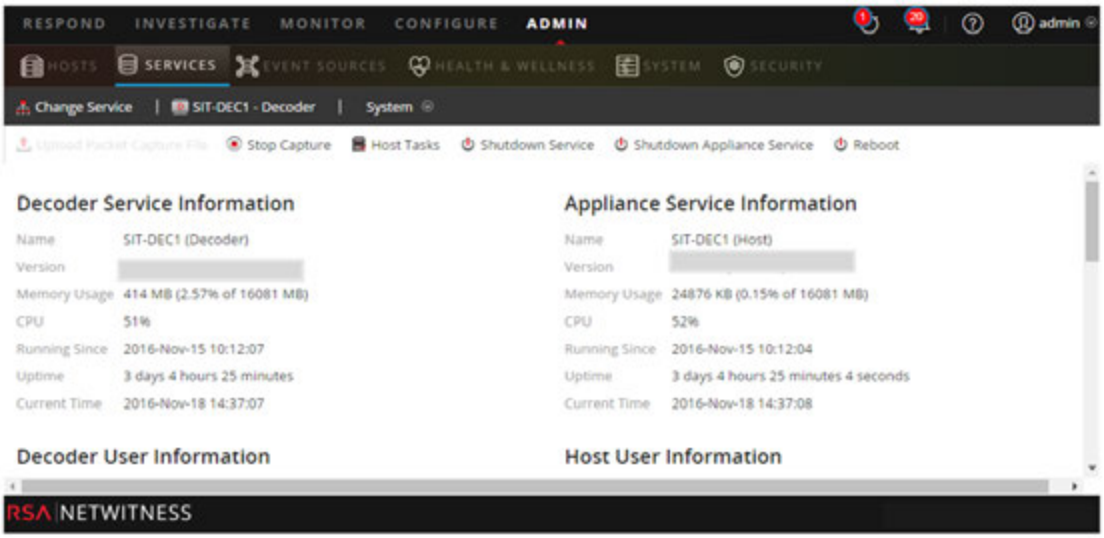
.

Stop Log Capture

To stop log capture:

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.



3. Under  (actions), select **View** > **System**.

4. In the toolbar, click 

.

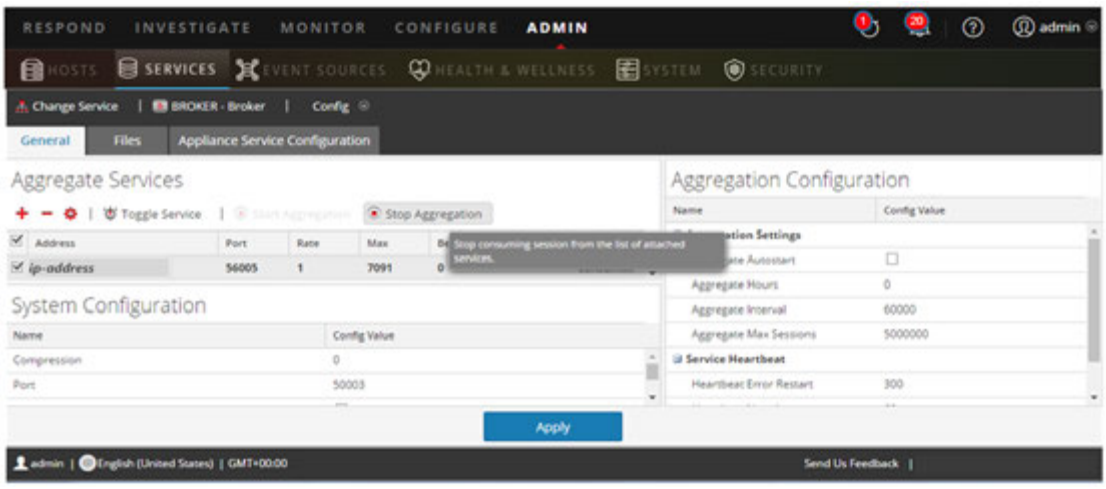
Stop Aggregation

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.

2. Select the **Broker** service.

3. Under  (actions), select **View** > **Config**.

4. The **General** tab is displayed.



5. Under **Aggregated Services** click 

.

Start Data Capture and Aggregation

Restart packet and log capture and aggregation after updating to 11.0.

Start Packet Capture

To start packet capture:

1. In the **NetWitness Suite** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 
.

Start Log Capture

To start log capture:

1. In the **NetWitness Suite** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 
.

Start Aggregation

During the upgrade from 10.6.4 .x to 11.0, the Broker Service is restarted and this automatically starts aggregation.

Revision History

Revision	Date	Description	Author
1.0	16-Oct-17	Release to Operations	IDD
1.1	25-Oct-17	Changes for: • " Active Directory" and "User Attribute and Role Changes Affecting Investigate" workarounds to refer to the 10.6.4.2 and 11.0.0.1 patches. • Authentication Failure in 11.0.	IDD

RSA NETWITNESS® SUITE

Physical Host Upgrade Guide

for Version 11.0

Contents

Introduction

The instructions in this guide apply to the upgrade of physical hosts to RSA NetWitness® Suite 11.0 exclusively. See the RSA NetWitness® Suite *Virtual Host Upgrade Guide* for instructions on how to upgrade you 10.6.4.x virtual hosts to 11.0.

NetWitness Suite 11.0 is a major release that affects all products in the NetWitness Suite suite. The components of the suite are the NetWitness Server (NW Server), Archiver, Broker, Concentrator, Context Hub, Decoder, Entity Behavior Analytics, Event Stream Analysis, Hybrid, Investigate, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Response, Warehouse Connector, and Workbench.

CentOS6 to CentOS7 Upgrade

NetWitness Suite 11.0 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.0 platform environment has been improved greatly to accommodate current and future physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Suite 11.0 Upgrade Path

The supported Upgrade path for RSA NetWitness® Suite 11.0 is Security Analytics 10.6.4.x.If you are running a version of NetWitness Suite that is prior to 10.6.4.x, you must update to 10.6.4.x before you can upgrade to 11.0. See the *RSA Security Analytics 10.6.4 Update Guide* (https://community.rsa.com/docs/DOC-79055) on RSA Link.

Caution: There is a known issue if you have Active Directory users configured in 10.6.4.x. You have two options to address this issue:
• Apply the 10.6.4.2 patch before you back up your data for the 11.0 upgrade.
• If you failed to apply the 10.6.4.2 patch, you can apply the 11.0.0.1 patch immediately after you upgrade to 11.0.

Supported Host Upgrade Path

You must upgrade a host to the same host type:

- Same Series RSA Physical Appliance to Same Series RSA Physical Appliance (that is, Series 4 to Series 4, Series 5 to Series 5).
  RSA does not support third-party physical hosts in 11.0.
- On-Prem Virtual to On-Prem Virtual

Caution: The 11.0 upgrade does not support mixed-platform upgrades (for example, it does not support physical to virtual.

Hardware, Deployments, Services, and Features Not Supported in 11.0

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.0.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- Hosts Deployed in AWS (You can deploy AWS hosts in 11.0, but you cannot upgrade AWS hosts deployed in 10.6.4.x.)
- Hosts Deployed in Azure (You can deploy Azure hosts in 11.0, but you cannot upgrade Azure hosts deployed in 10.6.4.x.)

- IPDB service
- Malware Analysis service co-located on the SA Server (Upgrade of Malware Analysis Enterprise is supported in 11.0.)
- Standalone Warehouse Connector service (Upgrade of a co-located Warehouse Connector is supported in 11.0.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.0, your custom policy is not present. In its place, there is the out-of-the-box Context hub Server Monitoring Policy in the user interface, which is specific for version 11.0.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Suite 11.0, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.0, ESA sends all alerts to a central Alert system. The local mongo storage in ESA 10.6.4.x has been removed.

Caution: If you do not use Incident Management in 10.6.4.x, carefully consider whether or not to upgrade to version 11.0.

The following guidelines should help you determine whether or not to upgrade your ESA hosts to 11.0.

In your 10.6.4.x deployment, if you have:

- One ESA host, with or without Incident Management configured, upgrade to 11.0.
- Multiple ESA hosts configured to use Incident Management – The system will continue to aggregate alerts centrally. If the system is correctly sized and operating as intended in 10.6.4.x, you can upgrade to version 11.0.
- Multiple ESA hosts without configuration to use Incident Management and you are connecting to individual ESA hosts to view alerts, do not upgrade to version 11.0.

Note: If you did not use Incident Management in 10.6.4.x, you cannot view the 10.6.4.x ESA alerts in the 11.0 Respond component without running a migration script. Use the ESA Alert Migration script to migrate these alerts to the location in 11.0 that will allow Respond to view them. See the *ESA Alert Migration Instructions for 10.6.4.x to 11.0* knowledge base article (https://community.rsa.com/docs/DOC-81680) in RSA Link for instructions on how to run this script.

User Attribute and Role Changes Affecting Investigate

The following changes affect how NetWitness Suite 11.0 handles user and role attributes in the Investigate component.

- User Attributes
  When you upgrade to 11.0, the user attributes (query prefix, session timeout, and query threshold) available in SA 10.6.4.x no longer exist. The same attributes are available at the role level for use.
  As a workaround, if you used the user attributes to restrict user access, apply the RSA NetWitness® Suite 11.0.0.1 patch immediately after you upgrade to 11.0.0.0.
- User and Role Attributes (Query Prefix) is not applicable to Investigate Event Analysis. The user and role attributes, most importantly the query prefix, do not apply to the new Investigate Event Analysis. Any user can modify the URL in browser to access data that should be restricted from viewing even when query prefix is applied.
  As a workaround, apply the RSA NetWitness® Suite 11.0.0.1 patch immediately after you upgrade to 11.0.0.0.

Caution: If you configured user or role attributes in 10.6.4.x, including query prefix, apply the RSA NetWitness® Suite 11.0.0.1 patch immediately after you upgrade to 11.0.0.0. After applying this patch, complete the patch instructions to apply additional security controls.

Upgrade Phases

RSA recommends that you stagger host upgrades as described in this section. The update to CentOS7 and the need of a physical or iDRAC access cause the 11.0 upgrade to take more time than most upgrades.

Caution: If you stagger the upgrade, you:
• must upgrade the hosts in Phase 1 first, in the order shown.
• may not have all the features operational until you update your entire deployment.
• will not have service administrative features available until you upgrade all the hosts in your deployment.

Phase 1

You perform Phase 1 first and you must upgrade the hosts in the following order:

1. Security Analytics Server host
2. Event Stream Analysis hosts
3. Malware Analysis hosts
4. Broker hosts (if you do not have a Broker, upgrade your Concentrator hosts)
   The 11.0 NW Server cannot communicate with 10.6.4.x core services for the new

Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2

Upgrade the rest of your hosts.

In Phase 2, (other than Log Collection hosts with downstream event destinations) there is no technical reason to upgrade your hosts in the following order. RSA recommends that you follow the order in Phase 2 to reduce:

- functionality loss during investigation.
- downtime that results in the loss of packet and log capture.

1. Decoder hosts
2. Concentrator hosts
3. Archiver hosts
4. Log Collection hosts - Log Collectors on Log Decoder hosts (LDs), Virtual Log Collectors (VLCs) and Legacy Windows Collectors (LWCs)
   Before you upgrade a log collection host , you must prepare it for the upgrade. Part of this preparation ensures that no event data remains in the queues. This requires you to keep the downstream destinations of event data (Log Collectors, Virtual Log Collectors and Log Decoders) up and functioning properly.

   If you have event data destinations downstream from the Log Decoder, you must prepare and upgrade log collectors in the following order.

   a. LDs (one LD at a time)

   b. VLCs and LWCs

   If you do not have event data destinations downstream from the Log Decoder, you can prepare and upgrade multiple LDs, VLCs, and LWCs together.
5. All other hosts

See "Running in Mixed Mode" under "The Basics" in the RSA 11.0 *NetWitness Suite Hosts and Services Getting Started Guide* for:

- Functionality gaps encountered while running in this mode.
- Examples of staggered upgrades.

Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Investigate in Mixed Mode

Mixed mode occurs when some services are upgraded to 11.0 and some are still on 10.6.x. This happens when you upgrade to 11.0 in phases.

Note: You must follow the host upgrade sequence as shown in Upgrade Phases to ensure complete Investigate functionality. The 11.0 Investigate server is installed when you upgrade the SA Server, but Broker hosts need to be upgraded to 11.0 to access the Event Analysis View.

After you upgrade all services to 11.0, when an analyst conducts an investigation, Role-Based Access Control (RBAC) of downloads works consistently to limit access to restricted data.

In mixed mode (that is, some services are upgraded to 11.0 and some are still on 10.6.x), when an analyst conducts an investigation, RBAC is not applied uniformly to viewing and downloads.

If the `sdk.packets` setting has not been disabled on the 10.6.x services, analysts with SDK meta and roles permissions in place to restrict viewing and reconstructing an event's content can download the PCAP of an event that has content restrictions. Other types of downloads appear to download, then generate errors due to insufficient permissions, and the data is still protected.

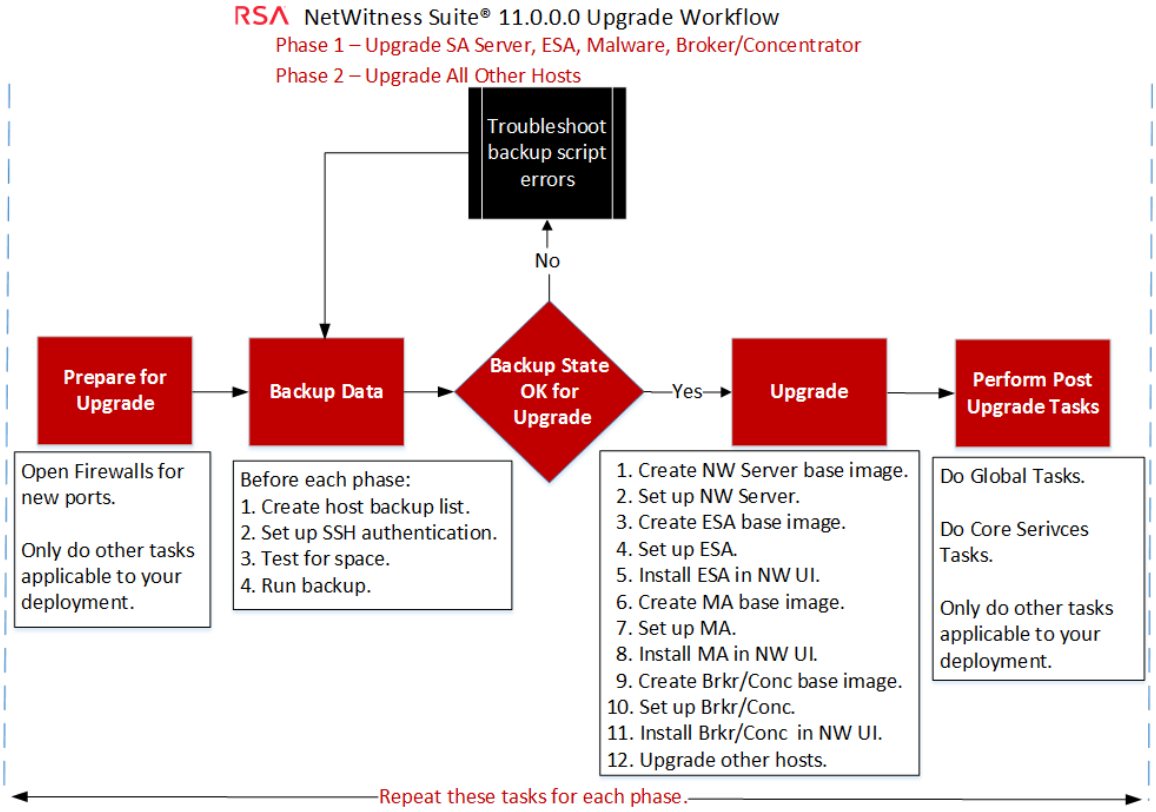
During a phased update, you can disable the `sdk.packets` setting on 10.6.x services to limit the analyst from downloading any PCAPs or logs during mixed mode. After you update all services to 11.0, RBAC works consistently across all services.

This table identifies what you can see and download in Investigate when your NW Server is on version 11.0 connected to services at a lower version.

Connecting Service Version	Affected View	User Role	Can See	Can Download Successfully	Can Download with Errors
11.0 Broker -> 10.x Concentrator -> 10.x Packet Decoder/Log Decoder	Events View	Analyst		PCAP	File archive is downloaded but cannot unzip
	Event Reconstruction View	Analyst		PCAP	File archive is downloaded but cannot unzip
	Event Analysis View	Analyst		PCAP	Error Retrieving Payload from Service for Payload, Request Payload, Response Payload
	Event Reconstruction View	Admin			Files archive is downloaded but cannot unzip
11.0 Broker -> 11.0 Concentrator ->11.0 Decoder/Log Decoder	Event Reconstruction View	Analyst and Data Privacy Officer	RBAC permitted items		Files archive is downloaded but cannot unzip PCAPs and logs are downloaded as zero bytes
	Event Reconstruction View				

Upgrade Workflow

The following diagram illustrates the RSA NetWitness® Suite 11.0 upgrade workflow. The 11.0 Upgrade is a two-phase process. You repeat the following workflow for each phase of the upgrade.



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Suite 11.0.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness Suite 11.0. These tasks are organized by the following categories.

- Global
- Reporting Engine
- Respond and Incident Management
- Warehouse Connector

Global

You must complete these tasks regardless of how you deploy NetWitness Suite and which components you use.

Task 1 - Review Core Ports and Open Firewall Ports

The following tables lists new ports in 11.0.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

All NetWitness Suite core ports are listed in the "Network Architecture and Ports" topic in the *RSA NetWitness® Suite Deployment Guide* in case you need to reconfigure NetWitness Suite services and firewalls. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 2 - Record Your 10.6.4.x `admin user` Password

Record your 10.6.4.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of the `/etc/fstab` File

Copy the `/etc/fstab` file from all the VMs and into your local machine (backup host or remote machine).

Note: You need this file to restore a VM with external storage mounts.

Reporting Engine

(Conditional) Task 4 - Unlink External Storage

If the Reporting Engine has external storage [such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports] you must perform the follow steps to unlink the storage.

In these steps:

- `/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
- `/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Respond and Incident Management

(Conditional) Task 5 - Disable Incident Management Data Retention

Complete the following procedure to disable Incident Management data retention jobs in 10.6.4.x

1. Log in to RSA Security Analytics 10.6.4.x.
2. Go to **Incident Management** > **Configure** > **Retention Scheduler**.
3. Uncheck the **Enable data retention scheduler** checkbox and click **Apply**.

Warehouse Connector

(Conditional) Task 6 - Copy `keytab` files in `root` or `etc` Directory Stored in Other Directory

Copy the `keytab` files in the `root` or `etc` directory if it is stored in some other directory.

1. Record the absolute path of NFS mount directory and the `keytab` file.
   You need this information to restore the Warehouse Connector after upgrade.
2. Unmount the NFS directory.
   a. SSH to the Warehouse Connector and log in with `root` credentials.
   b. Submit the following commands to unmount the NFS directory.
   ```
   umount <NFS-absolute-path>
   ```

Backup Instructions

Backing up your configuration data for all your hosts from 10.6.4.x is the first step in upgrading from 10.6.4.x releases to 11.0.0.0.

Note: It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directory will be automatically restored during the upgrade process. After upgrading to 11.0.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types

Caution: 1) These services are not supported in the 10.6.4.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the NetWitness Server
- Standalone Warehouse Connector

2) There is a known issue if you have Active Directory users configured in 10.6.4.x. You have two options to address this issue:
• Apply the 10.6.4.2 patch before you back up your data for the 11.0 upgrade.
• If you failed to apply the 10.6.4.2 patch, you can apply the 11.0.0.1 patch immediately after you upgrade to 11.0.

The following types of hosts can be backed up and are automatically restored during the upgrade process:

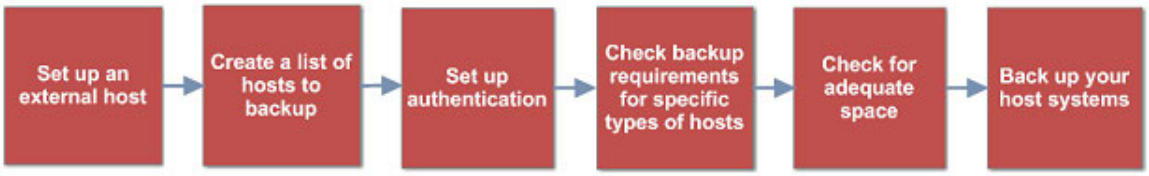
- **NetWitness Server** (may include Malware Analysis, NetWitness Respond, Health and Wellness, and Reporting Engine)
- **Malware Analysis** (standalone)
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and NetWitness Respond database)
- **Concentrator**
- **Log Decoder** (including Local LogCollector and Warehouse Connector, if installed)
- **Log Hybrid**
- **Packet Decoder** (including Warehouse Connector, if installed)
- **Packet Hybrid**
- **Virtual Log Collector**

The following types of files are automatically backed up but must be restored manually after the upgrade process:

- PAM configuration files: For information about restoring the PAM configuration files, refer to "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.0.0.0", in the "Global" section of the Post Upgrade Tasks.
- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the `/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see "(Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of Post Upgrade Tasks.

Note: If you have problems during the backup or upgrade processes and you lose data, you can recover the data and start the process again. For information about recovering lost data, see "Recover Data After System Failure" in the *System Maintenance Guide*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



The following sections describe each of these tasks:

- Task 1 - Set up an External Host for Backing up Files
- Task 2 - Create a List of Hosts to Back up
- Task 3 - Set up Authentication Between Backup and Target Hosts
- Task 4 - Check for Backup Requirements for Specific Types of Hosts
- Task 5 - Check for Adequate Space for the Backup
- Task 6 - Back up Your Host Systems
- Post Backup Tasks

Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running Centos 6 with connectivity through SSH to the NetWitness Suite stack of hosts.

Ensure that the host names for the systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

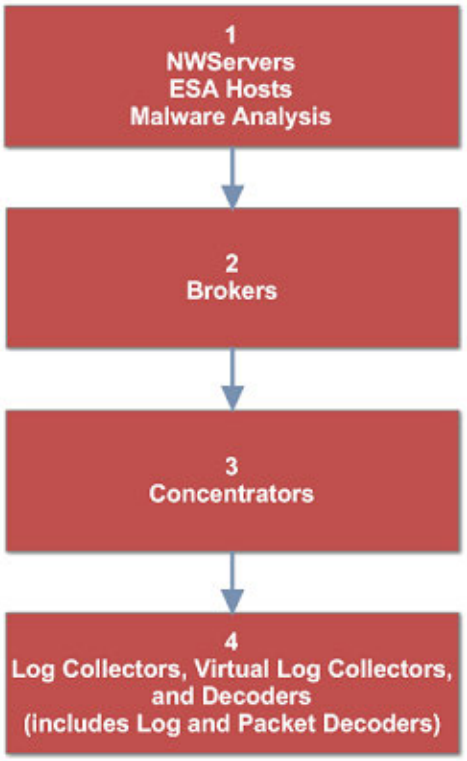
There are several scripts that you run during the backup process. You must download the zip file that contains the scripts (`nw-backup-v3.0.zip`) from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Click the **RSA NetWitness Logs & Packets 11.0 Backup Script (nw-backup-v3.0.sh)** link and extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your NetWitness Servers and host systems to be backed up.
- `ssh-propagate.sh`: Automates sharing keys between the systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.

Note: The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of the hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to ensure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference and then manually editing the `all-systems` file to contain specific hosts.

To generate the `all-systems` and the `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:
   ```
   chmod u+x get-all-systems.sh
   ```
2. At the root level, run the `get-all-systems.sh` script:
   ```
   ./get-all-systems.sh <IP-Address-of-NetWitness-Admin-Server>
   ```
   You will be prompted for the password for each host system once per host.

This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nwbackup/`.

3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.
4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up.

> **Note:** If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-
a48e558cec3e,10.6.4.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-
8ea837074bd0,10.6.4.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.4.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.4.0
packetdecoder,my-nw-packetdecoder,10.0.0.7,a8f2f574-3dd0-4b65-9cf7-
d8141b78a192,10.6.4.0
vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.4.0
broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-
c56ccfb0f737,10.6.4.0
```

And here is an example of an `all-systems` file based on the `all-systems-master-copy` file that could be used in the first backup session:

```
saserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-
a48e558cec3e,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.4.0
```

Troubleshooting Information

- Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location. Follow these recommendations:

  - Do not edit the `all-systems-master-copy` file.
  - If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure to remove pre-existing entries from the file so that the file contains only those hosts that are currently being backed up.
    For more information, see Post Backup Tasks.

- If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.

- The `get-all-systems.sh` script generates a list of hosts that were defined in the NetWitness Suite user interface. Ensure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to NetWitness Suite, you use the NetWitness Suite user interface to ensure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.

- At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the NetWitness Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence of those systems, that their services are all running, and that they are properly communicating with the NetWitness Server. (Any Windows Legacy Collectors or AWS Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)
- If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the man page for `ssh-agent`.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:
   `chmod u+x ssh-propagate.sh`
2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:
   `ssh-propagate.sh <path-to-all-systems-file>`
3. You are prompted for the password once per host, but you will not need to enter it repeatedly later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types:

1. On the NetWitness Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.0.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the NetWitness Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   `openssl x509 -inform der -in certificate.cer -out certificate.pem`
   Convert a PEM file to DER

```
openssl x509 -outform der -in certificate.pem -out certificate.der
```

Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)

```
openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in
certificate.crt -certfile CACert.crt
```

Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM

```
openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes
```

> **Note:** Add the following qualifier to the command string to:
> `-nocerts` convert private keys exclusively.
> `-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Decoder, Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to Appendix B. Stopping and Restarting Data Capture and Aggregation

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

> **Caution:** This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after upgrade.
- If you set the password for `logcollector` user for RabbitMQ , you must know the password so you can set it again after the upgrade.

Prepare LCs and VLCs for Upgrade

1. SSH to the Log Collector.
2. Submit the following command string.
   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```
   This command:

- Stops the Puppet Agent service.
- Disables the file collection accounts ("sftp" and all users in the group "upload") used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgrade to 11.0.0.0.
- Stops all the collection protocols in the Log Collector service.
- Saves the list of Plugin accounts and RabbitMQ accounts.
- Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.
- Waits until the Log Collector queues are empty.
- Stops the Log Collector service.
- Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting.

For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint: List RabbitMQ Usernames and Passwords

On the 10.6.4.x host, on the NetWitness Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.0.0.0 upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to *Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL* in Post Upgrade Tasks.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The event source documentation contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in `/root/vsftpd/` directory in 10.6.4.x, this material area will be backed up and restored. **If the material was in another location, you must back it up and restore it manually.**
- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.4.x, it is backed up and restored.

Task 5 - Check for Adequate Space for the Backup

You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to ensure that you provide adequate space for the backup so that the backup captures all your data.

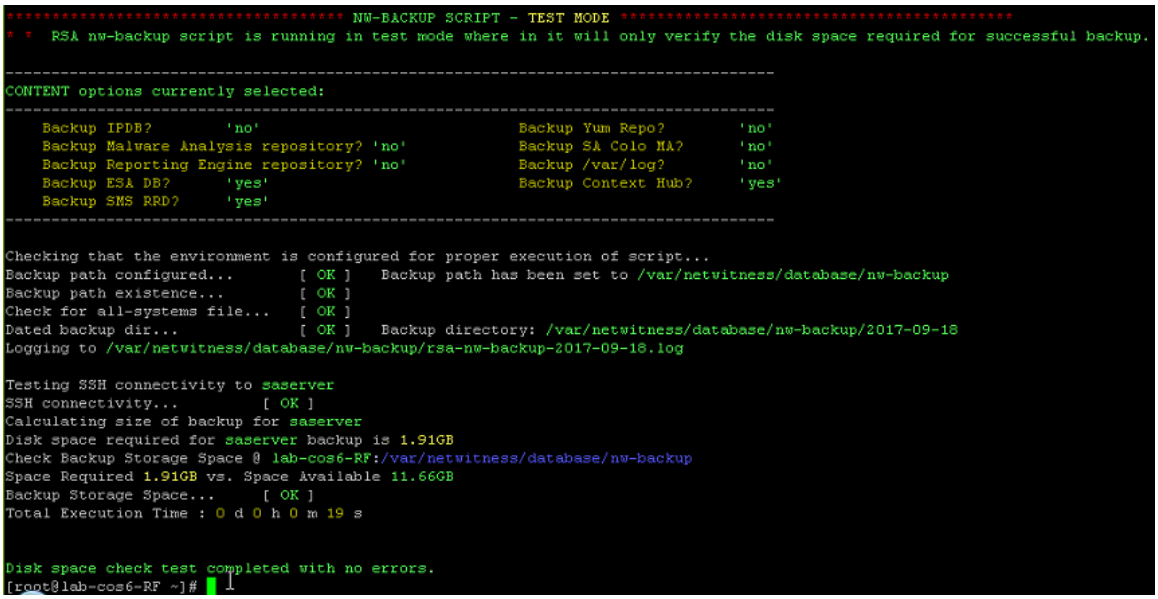
To check for adequate disk space:

1. Make the backup script executable by running the following command:
   ```
   chmod u+x nw-backup.sh
   ```
2. Run the following command at the root directory level:
   ```
   ./nw-backup.sh -t
   ```
   The output displays the amount of disk space that is required for the backup.

   Note: The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the `-d` option by using `-D`. Using the `-D` option will show how much

space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the `-D` option will throw an error. If you want to know how much space is available on the target host, you must run the `df -h` command on the host.

The following figure shows an example of the output from using the `-t` option.



Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the `nw-backup.sh` script using the `-u` option. This option is required for upgrading to 11.0.0.0.

Note: The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage:

```
./nw-backup.sh [-u -t -d -D -u -l -x -e <external-mnt> -b <backup file path>
```

General Options

`-u : This option is required for upgrading to 11.0. Enables the upgrade flag to run backup for upgrading to 11.0. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)`

-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)

-D : enables disk space check in 'full' mode (estimate of space using compressed data, ~10X slower). Default: (no)

-l : stores backup content locally on each host (automatically set if -u is used). Default: (no)

-e <path to mount point> : copies backup files of all devices onto an external mount point. Default: (/mnt/external_backup)

-x : move all backup files to an external mount point. Default: (no) -COPY

-b <path to write backups> : path to the location for storing backup files on a backup server. **For upgrading to 11.0, please use the default location!** Default: (/var/netwitness/database/nw-backup)

Note: Do **not** change the backup path in upgrade (-u) mode.

Advanced Content Selection Options

-c : back up Colocated Malware Analysis on SA servers. Default: (no)

-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)

-m : back up Malware Analysis File Repository. Default: (no)

-r : back up Reporting Engine Report Repository (automatically set if -u is used). Default: (no)

-v : back up system logs (/var/log). Default: (no)

-y : back up YUM Web Server & RPM Repository. Default: (no)

-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)

-C : If set: DISABLES back up of Context-Hub configuration and database. Default: (not-set)

-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)

Test Options

-t : performs script test run for disk space check only. Services are not stopped and excludes execution of backup. Can be combined with (-d) or (-D) and other flags. Default: (-t)

For example, the command:
`./nw-backup.sh`
would run the backup with options as set in the Header of the script itself.
OR, the command:
`./nw-backup.sh -ue /mnt/external_backup`
would run a normal backup using the backup path defined in the script, with the following options:

```
-u : enables the upgrade flag to run backup for upgrading to 11.0. It
also enables disk space check (-d), backing up reporting engine reports
(-r) and stores backup content locally (-l). Default: (no)

-e : Copy the backup files to external mount point, mounted on
/mnt/external_backup

For Help: ./nw-backup.sh -h
```

When you run the script, the following text is displayed at the top of the script:

```
Caution: RSA nw-backup script backs up configuration files, data, and
logs on the options provided in the script. It tars the content, with
options to store the backup files on the backup server, move or copy
them to external storage on a mount point (USB/NFS/SMB), or SCP them
back to the target host.
This backup script has been qualified on the following versions of
Security Analytics:
10.6.3.x and 10.6.4.x
Use of this script on any other versions of the product may not give
expected results and may not be supported by RSA Customer
Service.Note: All non-RSA custom files, scripts, Cronjobs and other
important files should be placed in /root, /home/'user', OR /etc to be
included in the backup.
```

To run the backup script to back up your hosts:

1. Ensure that the `all-systems` file contains only the hosts to back up. For information, see Task 2 - Create a List of Hosts to Back up.
2. Make the backup script executable by running the following command:
   ```
   chmod u+x nw-backup.sh
   ```
3. Begin the backup process by running the following command at the root directory level:
   ```
   ./nw-backup.sh -u <additional options as needed>
   ```

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.0.0.0.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   ```
   rsa-nw-backup-2017-03-15.log
   ```
4. When the backup has completed, to ensure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:
   ```
   tar -tzvf hostname-ip-address-backup.tar.gz
   ```
   The following archive files are created:

   For all hosts:

<hostname-IPaddress>-root.tar.gz

<hostname-IPaddress>-backup.tar.gz

tar checksum files

<hostname-IPaddress>-network.info.txt

For NetWitness Servers:

<hostname-IPaddress>-root.tar.gz

<hostname-IPaddress>-backup.tar.gz

<hostname-IPaddress>-mongodb.tar.gz

tar checksum files

<hostname-IPaddress>-network.info.txt

For ESA Hosts:

<hostname-IPaddress>-root.tar.gz

<hostname-IPaddress>-backup.tar.gz

<hostname-IPaddress>-mongodb.tar.gz

<hostname-IPaddress>-controldata-mongodb.tar.gz

tar checksum files

<hostname-IPaddress>-network.info.txt

The archived files are located in the /var/netwitness/database/nw-backup directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the all-systems File and the Backup Tar files

Make copies of the all-systems file, the all-systems-master-copy file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the NetWitness Server (specifically the Admin service) to 11.0.0.0.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.0.0.0 upgrade process. Before you begin the upgrade process, you must ensure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- all-systems
- all-systems-master-copy

- appliance_info
- service_info
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

In addition to the files listed above, the following files will be generated on NetWitness Server and ESA hosts:

- <*hostname*>-<*host IP address*>-mongodb.tar.gz
- <*hostname*>-<*host IP address*>-mongodb.tar.gz.sha256

The backup script will also generate the following controldata-mongodb.tar.gz files.

Note: The backup script copies the following files from all ESA hosts to the NetWitness Server host's backup path .

- <esa hostname>-<esa hostip>-controldata-mongodb.tar.gz
- <esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256

Task 3 - (Conditional) For Multiple ESA Hosts, Copy mongodb tar files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the /opt/rsa/database/nw-backup/ directory on the Primary ESA host system (the host that has the ContextHub service running on it) :

- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.0.0.0, ensure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

There should be note here mentioning default backup path locations for that user knows where to go and check these files.

Note: The default paths for backup files are:
- NetWitness Server hosts:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`
- Malware hosts: `/var/lib/rsamalware/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256`

Required Files for ESA Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Required Files for All Other Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

Note: The following files are located in the `<hostname>-<host-IP-address>-backup.tar.gz` tar on all hosts:
`appliance_info`
`service_info`

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
`BUPATH=/opt/rsa/database/nw-backup` for the ESA Correlation Engine
`BUPATH=/var/lib/rsamalware/nw-backup` for the Malware Service
`BUPATH=/var/netwitness/database/nw-backup` for all other services
Restore locations:
`BUPATH/restore/etc/sysconfig` for Iptable rules
`BUPATH/restore/etc/sysconfig` for NAT configurations
`BUPATH/restore/etc` for Crontab entries
`BUPATH/restore/etc` for User Accounts (users are located in the `passwd` file, and groups are located in the `group` file. These are not restored during the upgrade process but can be restored manually.
`BUPATH/restore/etc/ntp.conf` for NTP configurations (must be restored using the NetWitness Suite UI)

Upgrade Tasks

This topic contains the tasks you must complete to upgrade Security Analytics 10.6.4.x to NetWitness Suite 11.0.

Caution: 1.) Make sure that you backed up your Security Analytics 10.6.4.x data before attempting to upgrade to NetWitness Suite 11.0.
2). Run the backup immediately before upgrading the hosts for each phase so that the data to avoid restoring stale data.
3.) This guide applies to physical host upgrades exclusively. If have both physical and virtual hosts in your deployment, see the *RSA NetWitness® Suite 11.0 Virtual Host Upgrade Guide* for the steps to upgrade virtual hosts. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

There two phases that you must complete in the order shown.

- Phase 1 -Upgrade SA Server, Event Stream Analysis (ESA), and Malware Analysis Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.4.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.0 and they will not be available until the warm up completes.

- Phase 2 -Upgrade All Other Hosts

Phase 1 -Upgrade SA Server, Event Stream Analysis, Malware Analysis Hosts, and Broker or Concentrator

Task 1 - Upgrade the 10.6.4.x SA Server to 11.0 NW Server

Follow the instructions under Upgrade 10.6.4.x SA Server Host to 11.0 NW Server Host.

Task 2 - Upgrade 10.6.4.x ESA to 11.0

Caution: If you had C2 modules enabled in 10.6.4.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.0 and they will not be available until the warm up completes.

Follow the instructions under Upgrade a 10.6.4.x non-SA Server Host to 11.0 to upgrade your ESA hosts.

1. Create the base image on your primary ESA host, set it up through the Setup program, and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, create the base image on your secondary ESA host, set it up through the Setup program, and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Upgrade 10.6.4.x Malware Analysis to 11.0

Follow the instructions under Upgrade a 10.6.4.x non-SA Server Host to 11.0.

Task 4 - Upgrade 10.6.4.x Broker or 10.6.4.x Concentrator to 11.0

Follow the instructions under Upgrade a 10.6.4.x non-SA Server Host to 11.0.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.0 NW Server cannot communicate with 10.6.4.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Upgrade All Other Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Decoder and Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Upgrade Non-NW Server Host to 11.0.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in the Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh.
2. Stop data capture on the Log Decoder.

3. Complete the steps in Upgrade Non-NW Server Host to 11.0.
4. Restart data capture on Log Decoder.

Note: After you upgrade, you will restart log collection after completing the Task 10 - Reset Stable System Values for Log Collector after Upgrade in the **Post Upgrade Tasks**.

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described the Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh.
2. Back up your 10.6.4.x VLC by editing the `all-systems` file on host where you performed the backup.
   a. Make sure your `all-systems` file contents has this information before you perform this step.
   `vlc,<host-name>,<IP-address>,<UUID>,10.6.4.0`
   b. Run the following command to create backup.
   `./nw-backup.sh -u`
   See Backup Instructions for detailed procedures on how to back up the host.
3. Make sure the backup host contains the VLC backup in the following format.
   `<hostname>-<IPaddress>-root.tar.gz`
   `<hostname>-<IPaddress>-root.tar.gz.sha256`
   `<hostname>-<IPaddress>-backup.tar.gz`
   `<hostname>-<IPaddress>-backup.tar.gz.sha256`
   `<hostname-IPaddress>-network.info.txt`
   `all-systems-master-copy`
4. Power off the 10.6.4.x VLC so that a new 11.0 VM can be created with the same network configuration.
5. Deploy a fresh NetWitness 11.0 Non-NW Server host using the 11.0 NetWitness Suite ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.4 VLC.
   This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.4 VLC backup file.

   Note: Make sure IPv6 is disabled.

   a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings. Contents of `ifcfg-eth0` should be as follows.
   `TYPE=Ethernet`

```
DEFROUTE=yes
NAME=eth0
UUID=<uuid>
DEVICE=eth0
DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
BOOTPROTO=static
IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
NM_CONTROLLED=no
ONBOOT=yes
```

b. Submit the following command string.

```
systemctl restart network.service
```

8. Create the backup directory.

```
# mkdir -p /var/netwitness/database/nw-backup/
```

9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new VLC in the `/var/netwitness/database/nw-backup` directory.
10. Complete the steps 2 through 12 inclusive in Upgrade a 10.6.4.x non-SA Server Host to 11.0 for the rest of the NetWitness Suite components . Make sure that you select **Log Collector** for the service in step 12.

All Other 10.6.4.x Hosts to 11.0

Follow the instructions under Upgrade a 10.6.4.x non-SA Server Host to 11.0.

Upgrade the 10.6.4.x SA Server Host to the 11.0 NW Server Host

Make sure that you have backed up 10.6.4.x data for the SA Server host. **You must follow the instructions in** Backup Instructions **to back up the host.**

Caution: Run the backup immediately before upgrading the SA Server to 11.0 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.0.

Complete the following steps to upgrade the 10.6.4.x SA Server host to the 11.0 NW Server host.

1. Create a base image on the host.

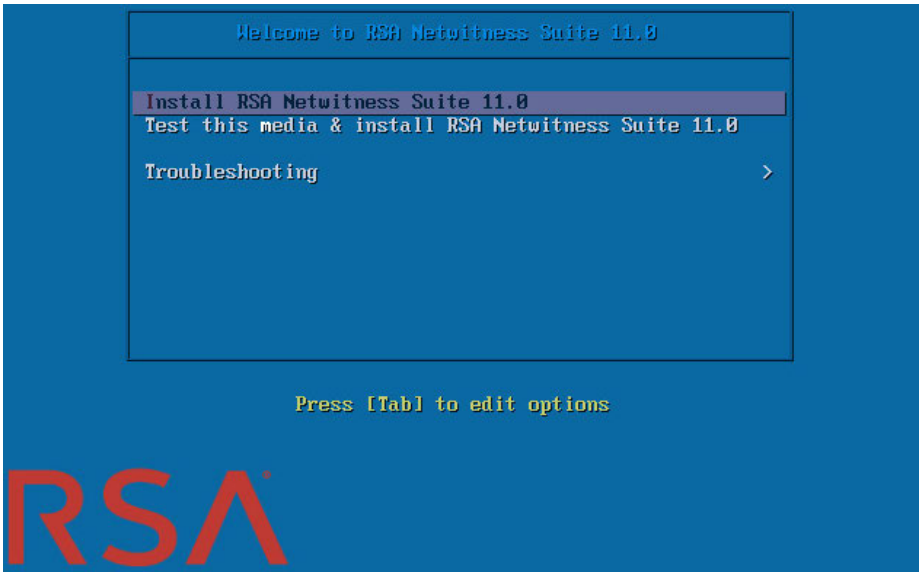
a. Attach media (that is Build Stick or DVD ISO) to the host.
See the *RSA NetWitness Suite 11.0 Build Stick Instructions* for more information.

- Hypervisor installs - use either the DVD or USB ISO images.
- Physical media - use the DVD ISO to create a bootable optical disk using user provided imaging software or the USB ISO to create bootable flash drive media using the Universal Netboot Installer (UNetbootin) or another suitable imaging tool. See the *RSA NetWitness® Suite Build Stick Instructions* for information on how to create a build stick from the USB ISO. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.
- iDRAC installations - the virtual media type is:
  - **Virtual Floppy** for mapped flash drives.
  - **Virtual CD** for mapped optical media devices or ISO files.

b. Log in to the host with and reboot it.

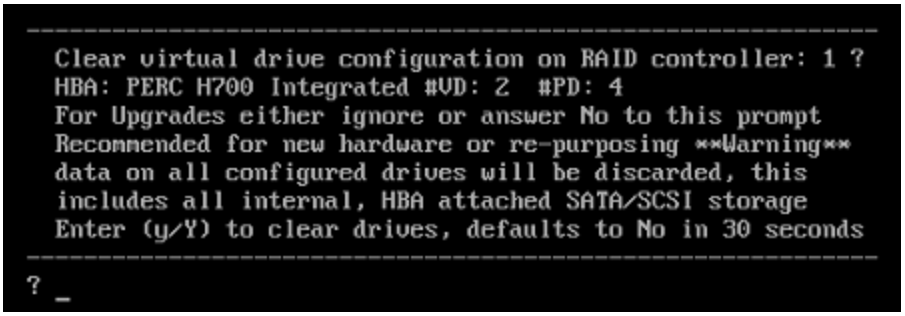
```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```

c. Select **F11 (boot menu)** during reboot to select a boot device and boot to the connected media.
After some system checks during booting, the following **Welcome to RSA NetWitness® Suite 11.0** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.



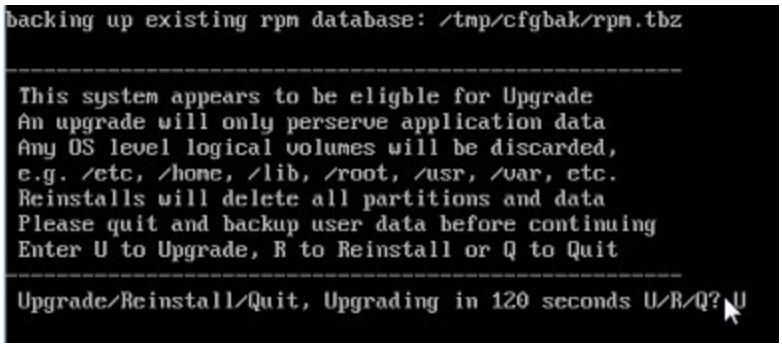
d. Select **Install RSA Netwitness Suite 11.0** (default selection) and press **Enter**.
The Operating System installation runs and stops at the **Enter (y/Y) to clear drives**

prompt that asks you to format the drives.



e. Press **Enter** to continue.

The default action is No, so if you ignore the prompt and it will select No in 30 seconds and will not clear the drives. The **Upgrade/Reinstall/Quit(U/Q/R?** prompt is displayed.

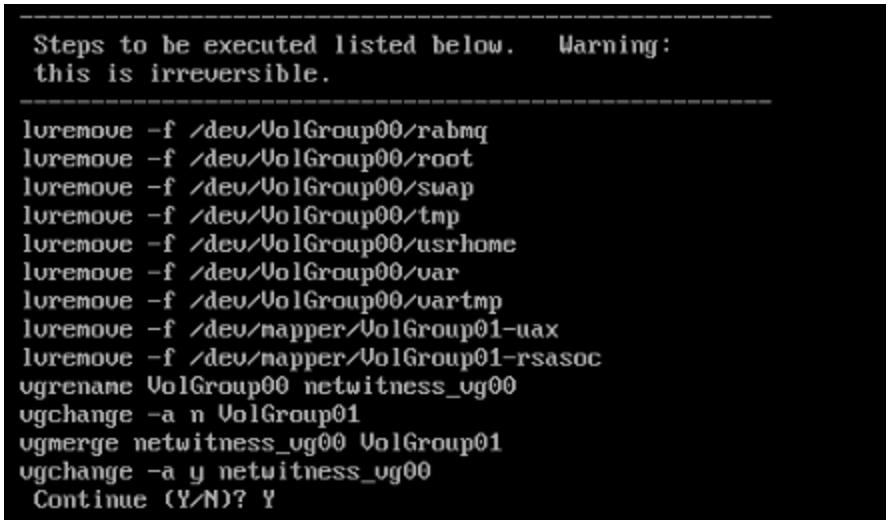


f. Type **U** to upgrade the host.

If you ignore the prompt, it will select U in 120 seconds.

It takes a few minutes for CentOS7 components to install. The installation program displays the components as they are installed, which varies depending on the appliance. When CentOS7 installation is complete, the following **Continue (Y/N)?** prompt is

displayed.



g. Type **Y** and press **Enter** to confirm that you want to upgrade this host.
The old operating system is about to be removed. Continue (Y/N)? warning is displayed.

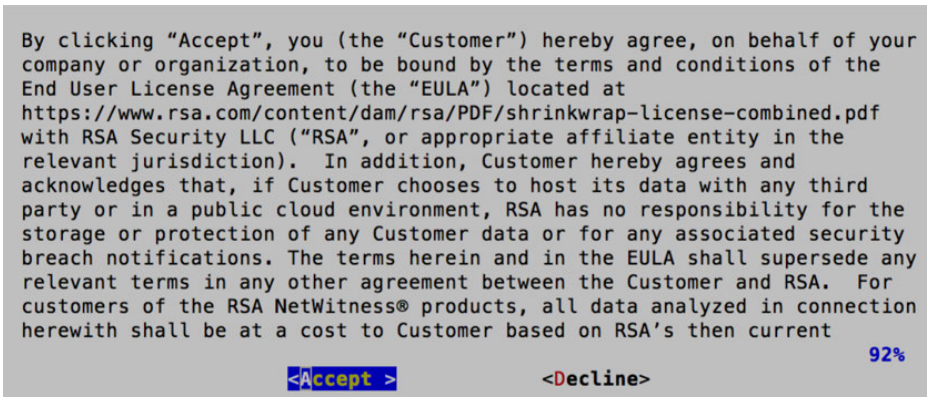
h. Type **Y** and press **Enter** to confirm that you want to replace the operating system.
When the host is upgraded to CentOS7, the host automatically reboots and prompts you to log in.

Caution: Do not reboot the attached media (that is, the Build Stick or DVD ISO).

i. Log in to the host with the root credentials.

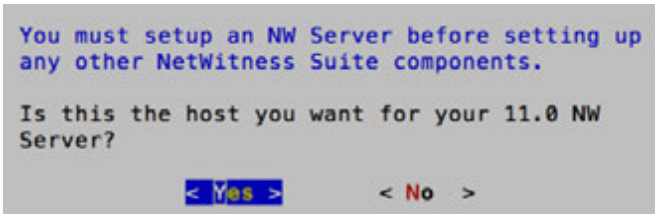
2. Run the `nwsetup-tui` command to set up the host.
This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.



3. Tab to **Accept** and press **Enter**.

   The "Is this the NW Server" prompt is displayed.

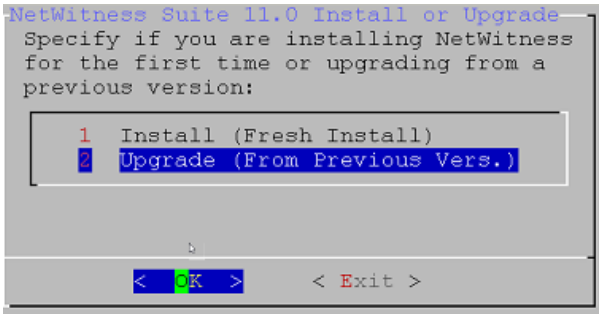


Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must restart the step up program and complete the all the steps (steps 2 through 11) to correct this error.

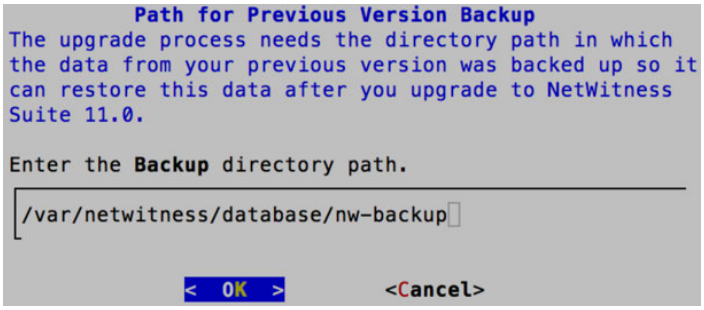
4. Tab to **Yes** and press **Enter**.

   Choose **No** if you already upgraded the NW Server to 11.0.

   The Install or Upgrade prompt is displayed.



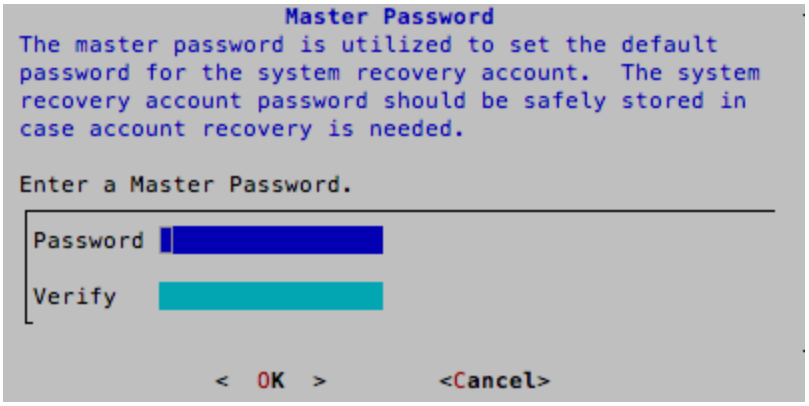
5. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.
   The backup path prompt is displayed.



6. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Master Password prompt is displayed.
   The following list of characters are supported for Master Password and Deployment Password:

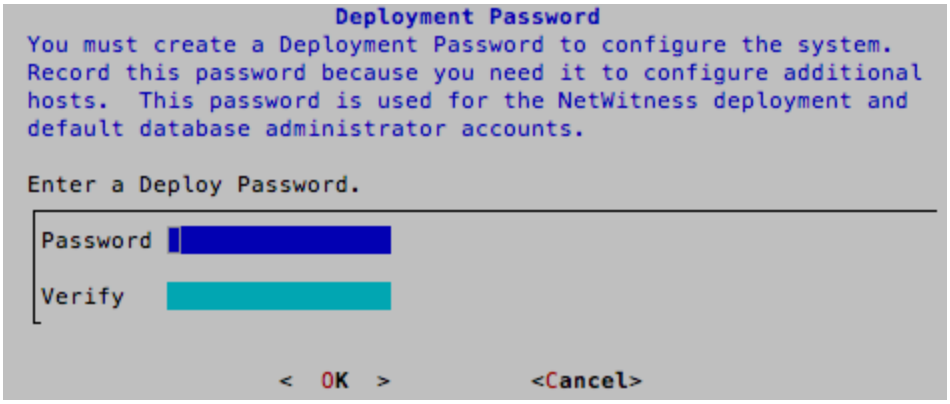
   - Symbols : ! @ # % ^ +
   - Numbers :0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

   No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ , ; : . < > -).



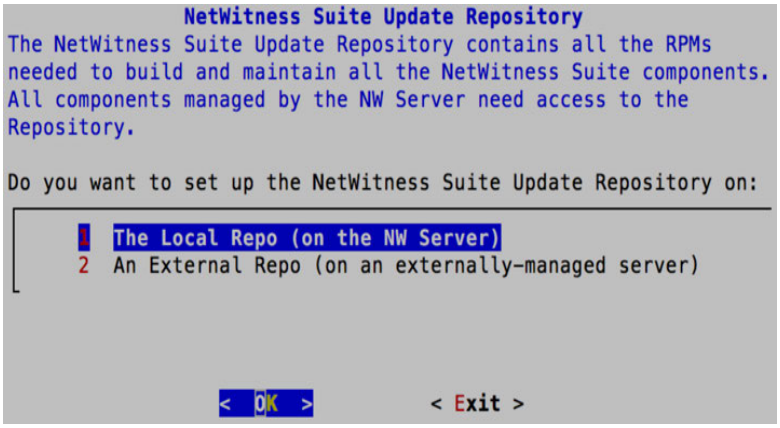
7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

The Deployment Password prompt is displayed.



8. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   The Update Repo prompt is displayed.



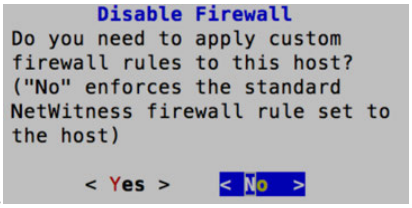
9. Use the down and up arrows to select the location from which you want to apply version updates to your hosts, tab to **OK**, and press **Enter**.

   - If you select **1 The Local Repo (on the NW Server)** the setup program makes sure that you have the appropriate media attached to the host (that is, a build stick or DVD) from which it can retrieve the Install or Update the hosts to NetWitness Suite 11.0. If the program cannot find the attached media, you receive the following prompt.

- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access RSA updates and CentOS updates.

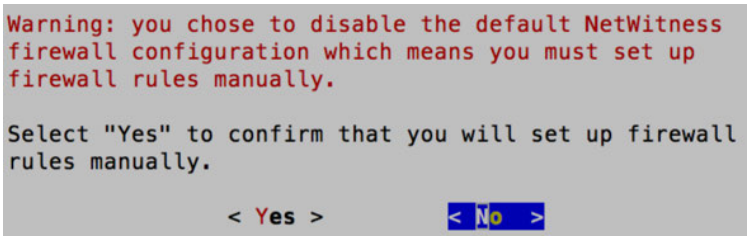
  Enter the base URL of the NetWitness Suite external repo and click **OK**.

The disable or use standard firewall configuration prompt is displayed.



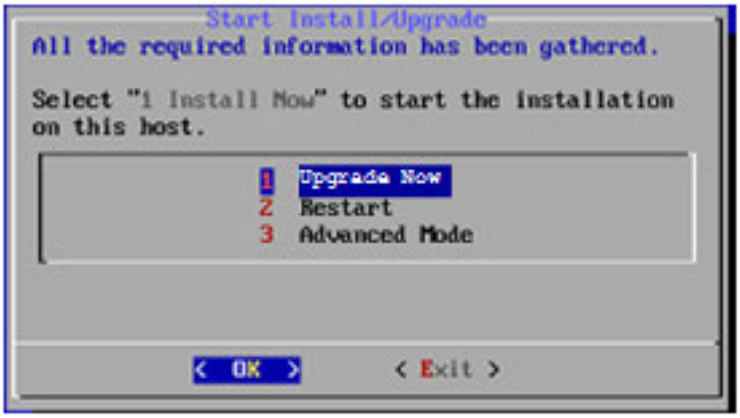
10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

- If you select Yes, confirm your selection.



- If you select No, the standard firewall configuration is applied.

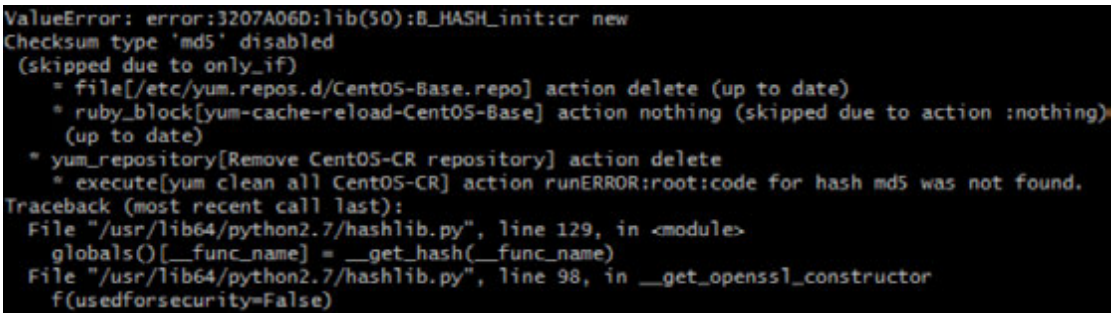
The start upgrade prompt is displayed.



11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.
    When "Installation complete" is displayed, you have upgraded the 10.6.4.x SA Server to the

11.0 NW Server.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



Upgrade a 10.6.4.x non-SA Server Host to 11.0.

Make sure that you backed up 10.6.4.x data for the host. **You must follow the instructions in** Backup Instructions **to back up the host.**

Caution: Run the backup immediately before upgrading the host to 11.0 so that the data is as recent as possible.

Complete the following steps to upgrade a 10.6.4.x non-SA Server Host to 11.0.

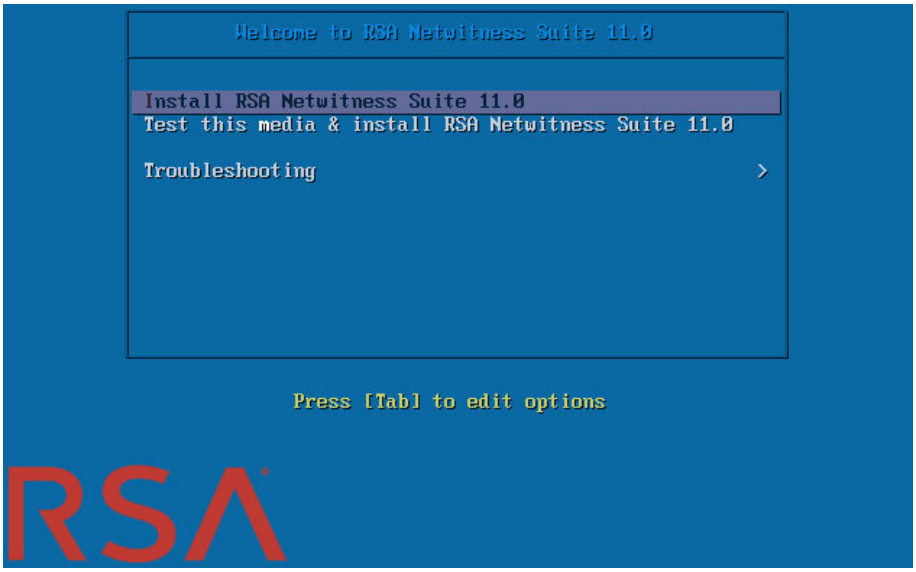
1. Create a base image on the host.
   a. Attach media (that is Build Stick or DVD ISO) to the host.
   See the *RSA NetWitness Suite 11.0 Build Stick Instructions* for more information.
      - Hypervisor installs - use either the DVD or USB ISO images.
      - Physical media - use the DVD ISO to create a bootable optical disk using user provided imaging software or the USB ISO to create bootable flash drive media using the Universal Netboot Installer (UNetbootin) or another suitable imaging tool. See the *RSA NetWitness® Suite Build Stick Instructions* for information on how to create a build stick from the USB ISO. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO files.

b. Log in to the host and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```

c. Select **F11 (boot menu)** during reboot to select a boot device and boot to the connected media.

After some system checks during booting, the following **Welcome to RSA NetWitness® Suite 11.0** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.



d. Select **Install RSA Netwitness Suite 11.0** (default selection) and press **Enter**.

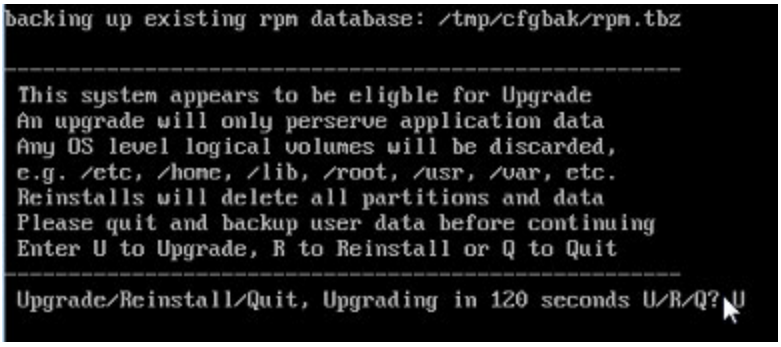
The Operating System installation runs and stops at the **Enter (y/Y) to clear drives** prompt that asks you to format the drives.

```
Clear virtual drive configuration on RAID controller: 1 ?
HBA: PERC H700 Integrated #VD: 2  #PD: 4
For Upgrades either ignore or answer No to this prompt
Recommended for new hardware or re-purposing **Warning**
data on all configured drives will be discarded, this
includes all internal, HBA attached SATA/SCSI storage
Enter (y/Y) to clear drives, defaults to No in 30 seconds
? _
```

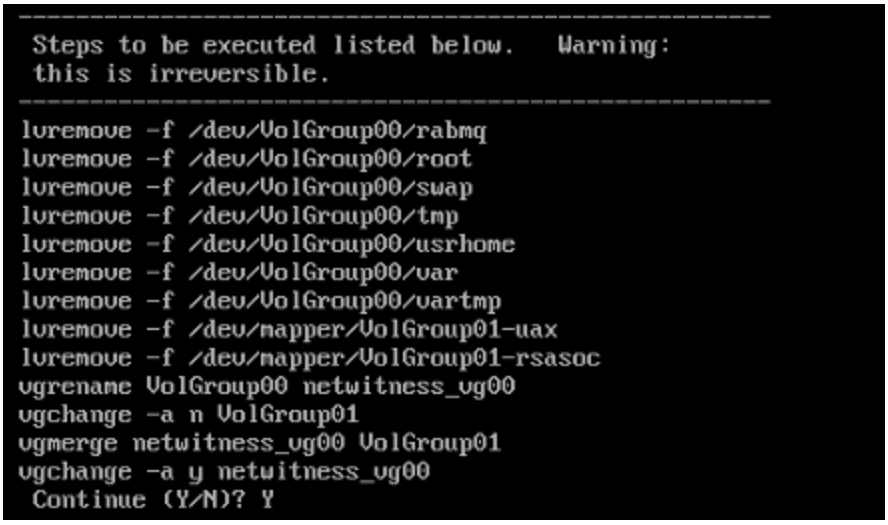
e. Press **Enter** to continue.

The default action is **No**, so if you ignore the prompt and it will select **No** in 30 seconds and will not clear the drives. The **Upgrade/Reinstall/Quit (U/R/Q?)** prompt is

displayed.



f. Type **U** to upgrade the host.
If you ignore the prompt, it will select **U** in 120 seconds.
It takes a few minutes for CentOS7 components to install. The installation program displays the components as they are installed which varies depending on the appliance. When CentOS7 installation is complete, the following **Continue (Y/N)?** prompt is displayed.



g. Type **Y** and press **Enter** to confirm that you want to upgrade this host.
The old operating system is about to be removed. Continue (Y/N)? warning is displayed.

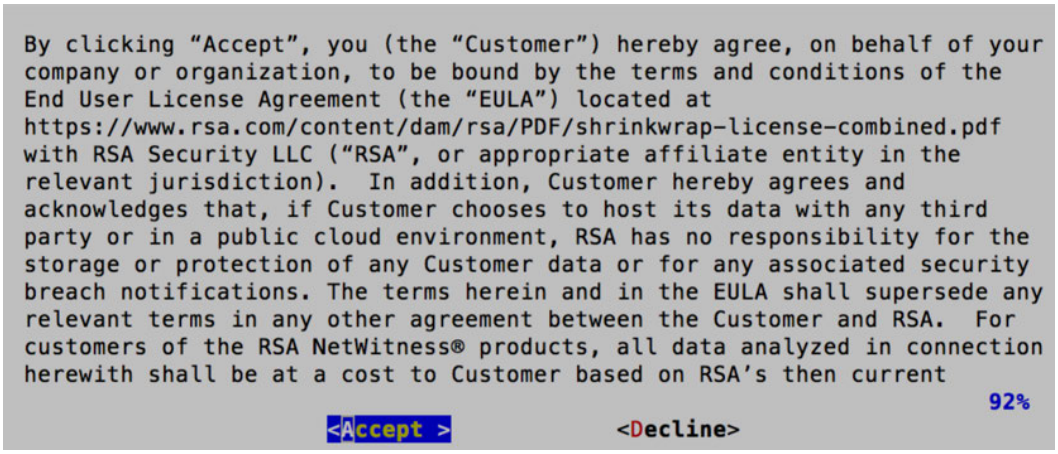
h. Type **Y** and press **Enter** to confirm that you want to replace the operating system.
When the host is upgraded to CentOS7, the host automatically reboots and prompts you to log in.

Caution: Do not reboot the attached media (that is the Build Stick or DVD ISO).

i. Log in to the host with the root credentials.

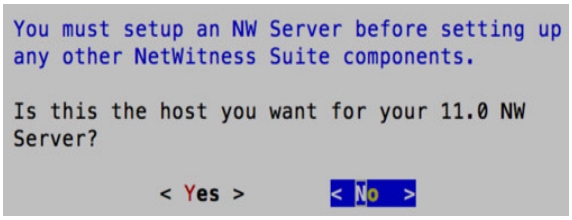
2. Run the `nwsetup-tui` command to set up the host.

   This initiates the Setup program and the EULA is displayed.



3. Tab to **Accept** and press **Enter**.

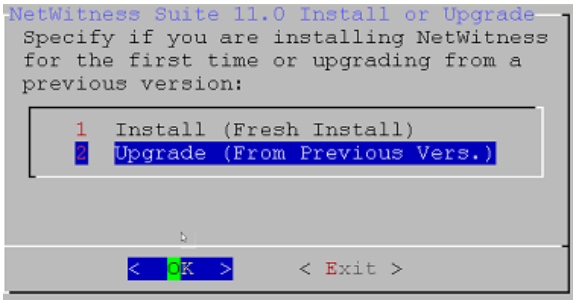
   The "Is this the NW Server" prompt is displayed.



Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must restart the step up program and complete the all the steps (steps 2 through 11) of Upgrade the 10.6.4.x SA Server Host to the 11.0 NW Server Host to correct this error.

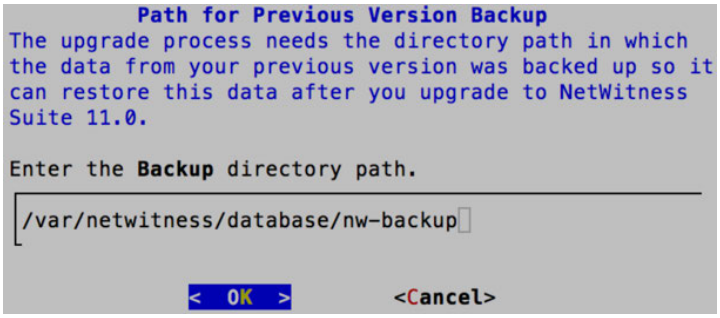
4. Tab to **No** and press **Enter**.

   The Install or Upgrade prompt is displayed.



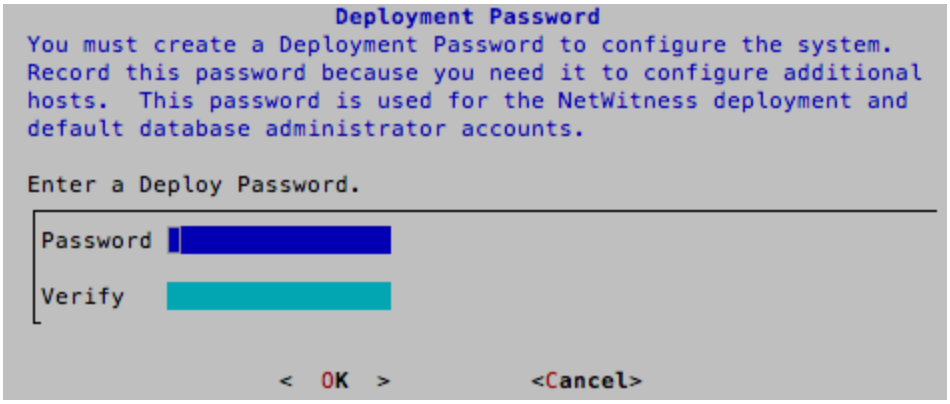
5. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.

   The backup path prompt is displayed.



6. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.

   The Deployment Password prompt is displayed.

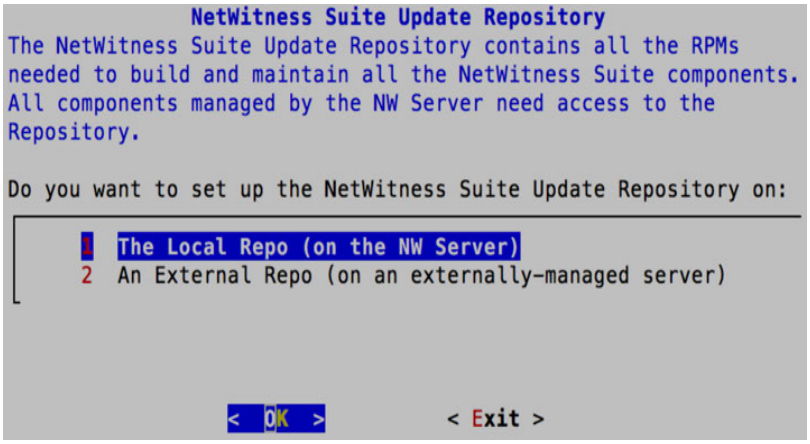


> **Note:** You must use the same deployment password that you used when you upgraded the NW Server.

7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   The Update Repo prompt is displayed.

Select the same repo you selected when you upgraded the NW Server Host for all hosts.

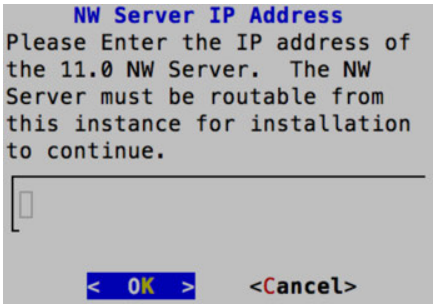


8. Use the down and up arrows to select the location from which you want to apply version updates to your hosts, tab to **OK**, and press **Enter**.

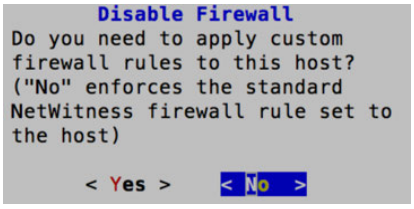
   - If you select **1 The Local Repo (on the NW Server)** the setup program makes sure that you have the appropriate media attached to the host (that is, a build stick or DVD) from which it can retrieve the Install or Update the hosts to NetWitness Suite 11.0.

   - If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access RSA updates and CentOS updates. Enter the base URL of the NetWitness Suite external repo and click **OK**.

   The NW Server IP Address is displayed.



9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.
   The disable or use standard firewall configuration prompt is displayed.

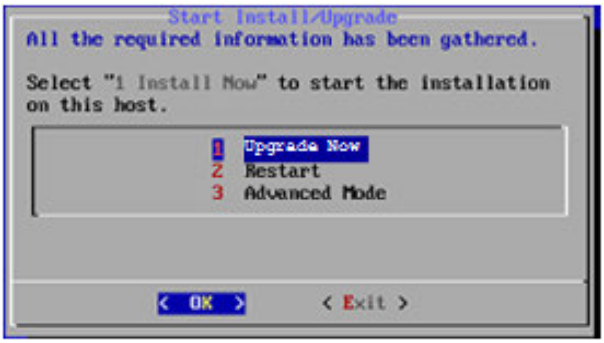


10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

    - If you select **Yes**, confirm your selection.

      
    - If you select **No**, the standard firewall configuration is applied.

    The start upgrade prompt is displayed.

11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.
    When "Installation complete" is displayed, you have upgraded the host to the 11.0.

12. Install the service on this host:

    a. Log into NetWitness Suite.
       Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Suite Login screen.

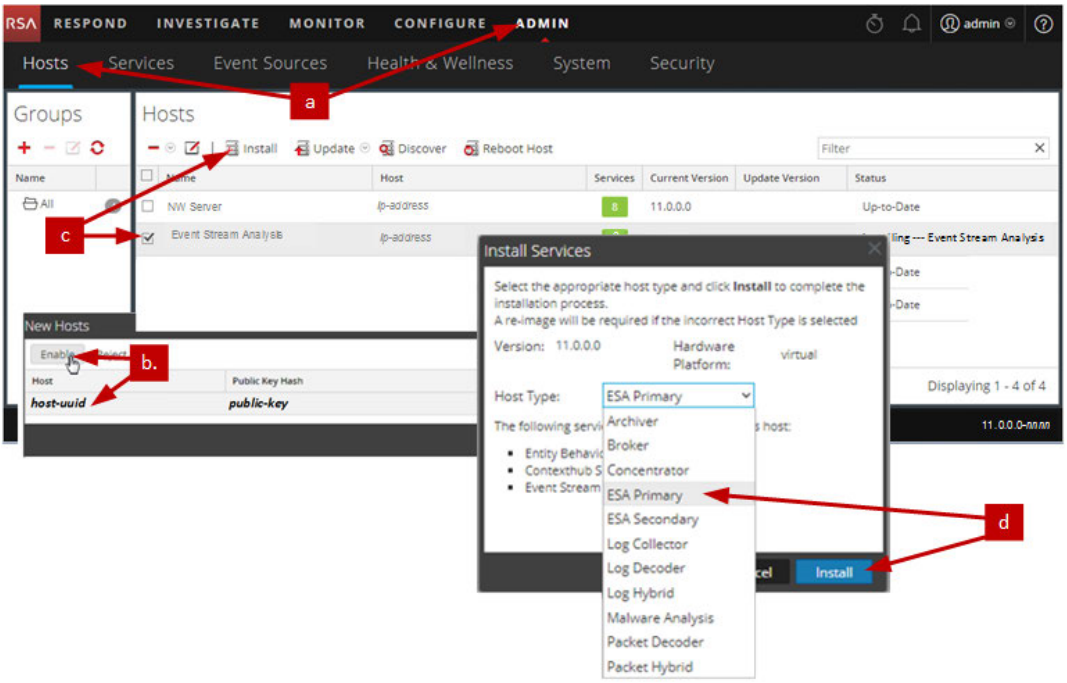
    b. Click **ADMIN** > **Hosts**.
       The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

       Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    c. Click on the host in the **New Hosts** dialog and click **Enable**.
       The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

    d. Select that host (for example, **Event Stream Analysis**) and click Install
       The **Install Services** dialog is displayed.

e. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



You have completed the upgrade of the non-NW Server host in NetWitness Suite.

Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness 11.0 Legacy Windows Collection Guide* on RSA Link (https://community.rsa.com/docs/DOC-75593) for details about how to install or update Legacy Windows collection.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

This topic contains the tasks you must complete after you upgrade your hosts from 10.6.4.x to 11.0. These tasks are organized by the following categories.

- Global
- NetWitness Endpoint
  RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, and 4.4 only for NetWitness Suite 11.0.
- Event Stream Analysis
- Log Collection
- Reporting Engine
- Respond
- NetWitness SecOps Manager
- Security
- Warehouse Connector
- Hardware-Related Tasks

Global Tasks

Task 1 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.0 before you remove the backup-related files from the local directories on your 11.0 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.0, you must remove:

- the backup files from the local directories on the hosts.
- all the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Malware	/var/lib/rsamlware/nw-backup	/var/netwitness/malware_analytics_server/nw-backup/restore
Event Stream Analysis	/opt/rsa/database/nw-backup	/var/netwitness/database/nw-backup/restore
NW Server	/var/netwitness/database/nw-backup	/var/netwitness/restore
All Other Hosts	/var/netwitness/database/nw-backup	/var/netwitness/database/nw-backup/restore

Task 2 - Restore NTP Servers

You must use the NetWitness Suite 11.0 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *RSA NetWitness® Suite 11.0 System Configuration Guide* for detailed instructions on how to add NTP servers. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 3 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Suite licenses. Refer to "Step 1. Register the NetWitness Server" in the *RSA NetWitness Suite Licensing Management Guide* for instructions on how to re-download licenses. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

(Conditional) Task 4 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create a user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   ```
   /etc/sysconfig/iptables
   /etc/sysconfig/ip6tables
   ```
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 5 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.4.x.

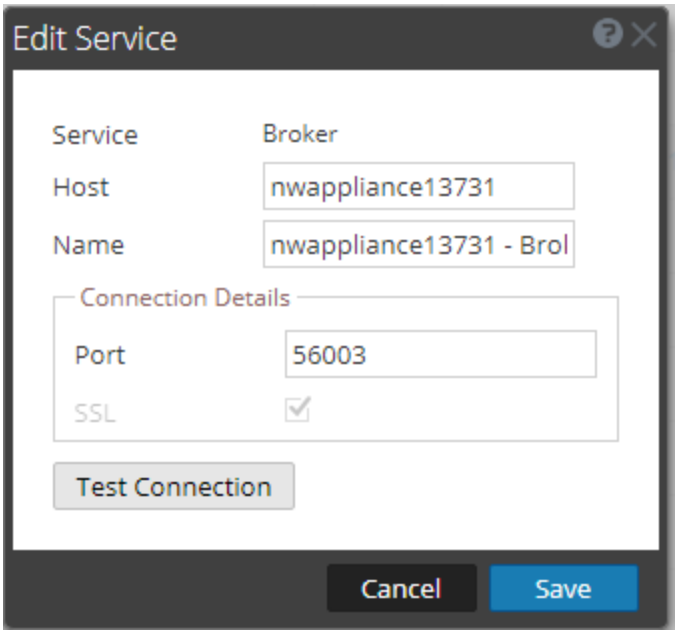
NetWitness Suite 11.0 cannot communicate with the core services for these customers because they are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to NetWitness Suite
2. Go to **ADMIN** > **Services**.
3. Select each core service and change there ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005
Decoder	50004	56004
Log Decoder	50002	56002

4. Click (Edit) from the SERVICES view toolbar.
   The Edit Srvice dialog is displayed.

5. Change the port from Non-SSL to SSL as shown in the table and click **Save**(for example, change the Broker port from 50003 to 56003).



NetWitness Endpoint

Task 6 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Suite 11.0, the virtual host is `/rsa/system`. For 10.6.4.x and earlier versions, the virtual host is `/rsa/sa`.

2. Restart the API Server and Console Server.
3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.

6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Event Stream Analysis Tasks (ESA)

Task 7 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.4.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.0.

1. Log in to NetWitness Suite 11.0
2. Click **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Packets and C2 for Logs, require a whitelist named "**domains_whitelist**".
3. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Click **ADMIN**> **Services**, select the Context Hub service, in the action commands () drop-down menu, click **View** > **Config** > **Lists** tab).
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *NetWitness Suite Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *NetWitness Suite ESA Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 8 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL

If you integrate with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.4.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Suite by logging into the host and running the following `rabbitmqctl` command.
   ```
   > rabbitmqctl add_user <username> <password>
   ```
   For example:

```
> rabbitmqctl add_user wtd-incidents incidents
```

2. Set permissions for users by running the following command (use the username from step 1):
   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*",
   ".*"
   ```
   For example:
   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*",
   ".*", ".*"
   ```

Task 9 - Enable Threat - Malware Indicators Dashboard

In 11.0.0, the 10.6.4.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.4.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.0.
2. Set datasource for new dashlets.
   See "Dashlets" in the RSA Link (https://community.rsa.com/docs/DOC-81463).

Log Collection

Task 10 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.0 to ensure that all collection protocols resume normal operation.

Reset Stable System Values for the Lockbox

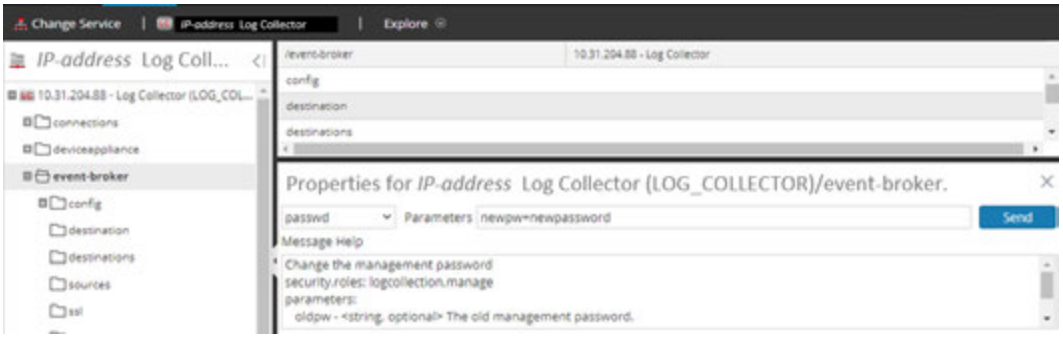
The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *RSA NetWitness® SuiteLog Collection Configuration Guide* for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Update Log Collector Service RabbitMQ User Account Password

If the logcollector service RabbitMQ user account password was changed, you must reenter it after the 11.0 upgrade.

1. Log in to NetWitness Suite.
2. Click **ADMIN** > **Services**.
3. Select the Log Collector service.
4. Click  (Actions) > **View** > **Explore**.
5. Right click `event-broker` > **Properties** .

6. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



(Optional for Upgrades from 10.6.4.x with FIPS enabled for Log Collectors, Log Decoders and Packet Decoders) Task 11 - Enable FIPS Mode

FIPS is enabled on all services except Log Collector Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder. For information about how to enable FIPS for these services, see the "Sys Maintenance: Activate or Deactivate FIPS" topic in the *RSA NetWitness® SuiteSystem Maintenance Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Reporting Engine

Task 12 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the back up you made prior to the upgrade. The Backup script backs up the 10.6.4.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.0.

1. SSH to the NW Server host.
2. Export the CA certificates.
   ```
   keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file
   ```
3. Copy the CA pem into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 13 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *RSA NetWitness® Suite Reporting Engine Configuration Guide* for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Respond

Task 14 - Restore Respond Service Custom Keys

In 10.6.4.x, if you added custom key for use in the **groupBy** clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.

   This directory is where the `alert_rules.json` file is restored from the 10.6.4.x backup.

2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.0.

   This is the new file for 11.0.

3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 15 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.0 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.4.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.4.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.4.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Suite 11.0 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.4.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

(Conditional) Task 16 - Enable Disabled 10.6.4.x Incident Management Data Retention

Complete the following procedure to enable the Incident Management data retention jobs you disabled prior to upgrade.

1. Log in to RSA NetWitness® Suite.
2. Go to **ADMIN** > **Services** and select the **Respond server**.
3. Click the  (Actions), **View** > **Explore**.
4. Go to the `respond/dataretention` node.
5. Set the `enable` parameter to `true`.

(Conditional) Task 17 - Restore Custom Analysts Roles

If you had custom analyst roles in 10.6.4.x, you must reinstate them in 11.0. See *Adding Roles and Assigning Permissions for the Roles* in the *RSA NetWitness Suite Warehouse Analytics Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

NetWitness SecOps Manager

Task 18 - Reconfigure NW SecOps Manager Integration

For information on how to reconfigure NW SecOps for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

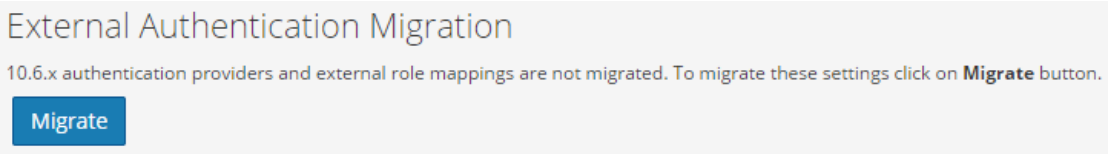
Security

Task 19 - Migrate Active Directory (AD)

Caution: If you did not upgrade from 10.6.4.2, you must apply the 11.0.0.1 patch immediately before you first log into NetWitness Suite 11.0 and migrate Active Directory. You do not need to apply the 11.0.0.1 patch if you upgraded to 11.0 from 10.6.4.2.

The first time you log into the NetWitness Suite 11.0 User Interface, you must click on the Migrate button to complete the migration of AD.

1. Log in to NetWitness Suite with your `admin user` credentials.
2. Click **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 20 - Modify Migrated AD Configuration to Upload Certificate

If the you used a self-signed certificate in Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.4.x, you must modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

Complete the following procedure to modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

1. Log in to NetWitness Suite.
2. Click **ADMIN** > **Security** and click the **Settings** tab.
3. Under **Active Directory Settings**, select an AD configuration and click  .
   The Edit Configuration dialog is displayed.
4. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
5. Click **Save**.

Task 21. Address Authentication Failure in 11.0

Users cannot log in to NetWitness Suite User Interface after you upgrade to 11.0 because the Interface cannot retrieve user account information from MongoDB.

- Apply the 11.0.0.1 patch to fix this issue immediately after you upgrade to 11.0.

Task 22 - Reconfigure Pluggable Authentication Module (PAM) in 11.0

You must reconfigure PAM after you upgrade to 11.0. See "Configure PAM Login Capability" in the *RSA NetWitness® Suite System Security and User Management Guide*for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

You can refer to your 10.6.4.x PAM configuration files in the **/etc** directory in the your 10.6.4.x backup data for guidance.

Warehouse Connector

Task 23 - Restore `keytab` Files, Mount NFS, Install Service

1. Restore the `keytab` files from `<backup-path>/restore` directory.
2. Restore the Kerberos Realm Configuration from the `<backup-path>/restore/etc/krb5.conf` into `/etc/krb5.conf`.
3. (Conditional) If you perform the upgrade from a Non - FIPS environment and the `isCheckValidationRequired` parameter is not enabled in the destination, to configure the SFTP destination:
   a. SSH to the Warehouse Connector host and submit the following commands:
   ```
   cd /root/.ssh/
    mv id_dsa id_dsa.old
   OWB_FORCE_FIPS_MODE_OFF=1 openssl pkcs8 -topk8 -v2 des3 -in id_
   ```

```
dsa.old -out id_dsa
```

You are prompted for the pass phrase.

b. Enter the Encryption password.

c. Run the following command.

```
chmod 600 id_dsa
```

4. Install the Warehouse Connector.
See the *NetWitness Suite Warehouse Connector Configuration Guide* for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 24 - Refresh Warehouse Connector Lockbox and Start Stream

Note: If the streams have auto start turned on in 10.6.4.x, there will be a small delay before you will see the Warehouse Connector service in the NetWitness Suite User Interface.

1. Refresh the Lockbox of Warehouse Connector.
2. SSH to the Warehouse Connector and log in with root credentials.
3. Restart the service.

```
service nwwarehouseconnector restart
```

4. (Conditional) If the auto start was not enabled in 10.6.4.x, you must start the stream manually after the service restarts.

(Conditional) Task 25 - For Warehouse Connector with Log Collector Service, Edit the sshd_config File

If you have a Warehouse Connector service installed with a Log Collector, perform the following steps ensure that both services function correctly:

1. In the `/etc/ssh/sshd_config` file, comment the following line:
   ```
   #Subsystem sftp /usr/libexec/openssh/sftp-server
   ```
2. Add the following sections to the file:

   ```
   # SFTP server settings added for NwLogCollector
   StrictModes no

   Subsystem sftp internal-sftp

   Match User sftp
        AllowTCPForwarding no
        PasswordAuthentication no
        X11Forwarding no
        ForceCommand internal-sftp
        ChrootDirectory /var/lib/logcollector

   Match Group uploads
        ChrootDirectory /var/lib/logcollector/upload_chroot
        X11Forwarding no
        AllowTcpForwarding no
        PasswordAuthentication no
   ```

3. Make sure that the `sshd` file contents are similar to the following example:

   ```
   # Accept locale-related environment variables
   AcceptEnv LANG LC_CTYPE LC_NUMERIC LC_TIME LC_COLLATE LC_MONETARY LC_
   MESSAGES
   AcceptEnv LC_PAPER LC_NAME LC_ADDRESS LC_TELEPHONE LC_MEASUREMENT
   AcceptEnv LC_IDENTIFICATION LC_ALL LANGUAGE
   AcceptEnv XMODIFIERS

   # override default of no subsystems
   #Subsystem sftp /usr/libexec/openssh/sftp-server

   # Example of overriding settings on a per-user basis
   #Match User anoncvs
   #      X11Forwarding no
   #      AllowTcpForwarding no
   #      PermitTTY no
   #      ForceCommand cvs server
   ```

```
#disabled CBC mode cipher encryption and MD5 or 96-bit MAC algorithms

Ciphers aes128-ctr,aes192-ctr,aes256-ctr
MACs hmac-sha1,hmac-sha2-256,hmac-sha2-512

# SFTP server settings added for NwLogCollector
StrictModes no

Subsystem sftp internal-sftp

Match User sftp
     AllowTCPForwarding no
     PasswordAuthentication no
     X11Forwarding no
     ForceCommand internal-sftp
     ChrootDirectory /var/lib/logcollector

Match Group uploads
     ChrootDirectory /var/lib/logcollector/upload_chroot
     X11Forwarding no
     AllowTcpForwarding no
     PasswordAuthentication no
```

4. Save the file, and restart the sshd service by running the following command:

   ```
   systemctl restart sshd
   ```

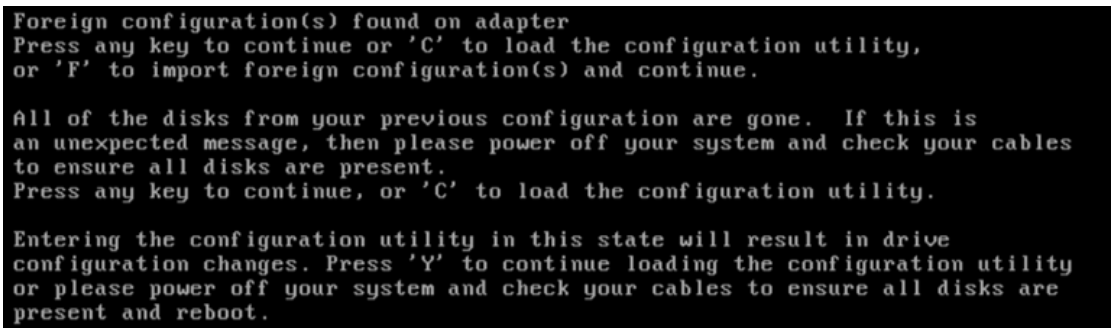
Hardware Related Tasks

(Conditional) Task 26 - Import Foreign Config for Series 4 Appliance with External Storage

If you upgrade a host with a external storage (for example, a DAC) to 11.0 and try to restart the appliance, the system may recognize it as having a foreign configuration. If you receive this error, complete the following steps.

1. Restart the appliance with external storage.

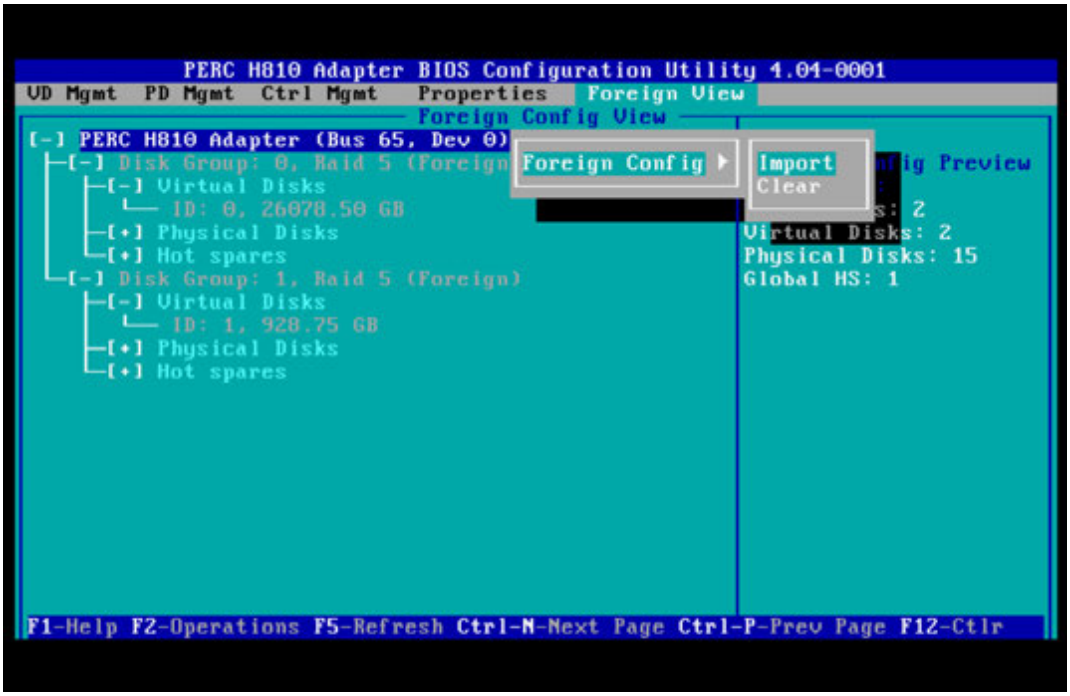
   The following messages are displayed.



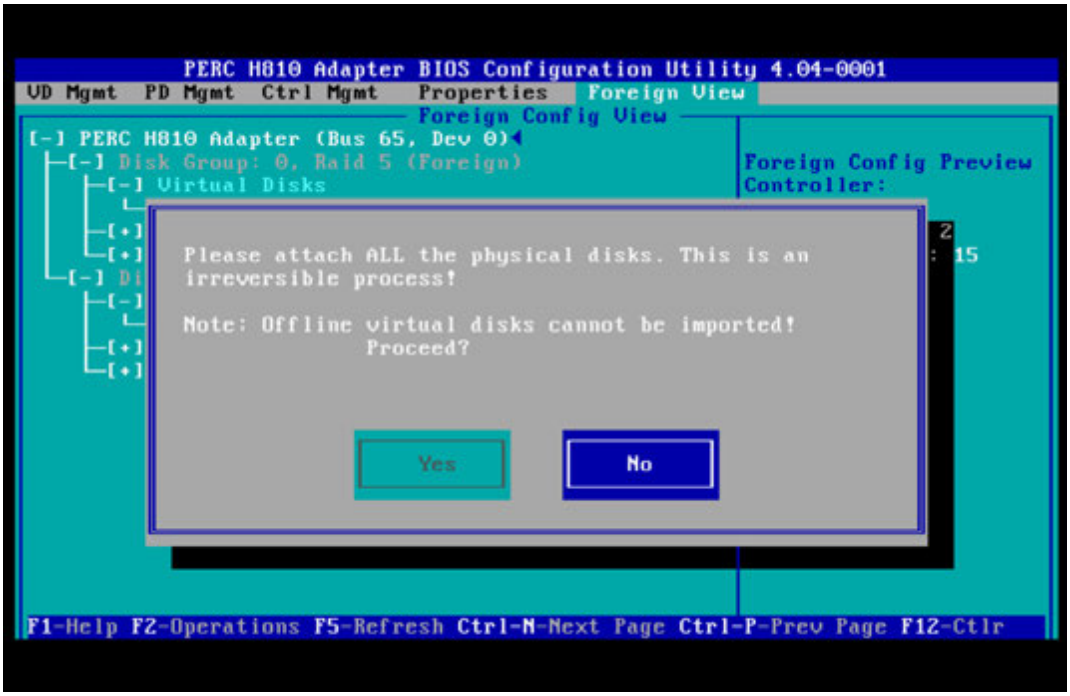
2. Press the **F** key and restart the appliance.
   If this successfully imports the configuration and restarts the appliance, you are finished. If it does not work, go to step 3.
3. Press **C** to start the Configuration utility.
   a. Select the **PERC H8x0 Adapter**.

   b. Highlight the top row [for example, **PERC H810 Adapter (Bus 65, Dev 0)**].
   c. Select **Foreign View** from the menu bar.

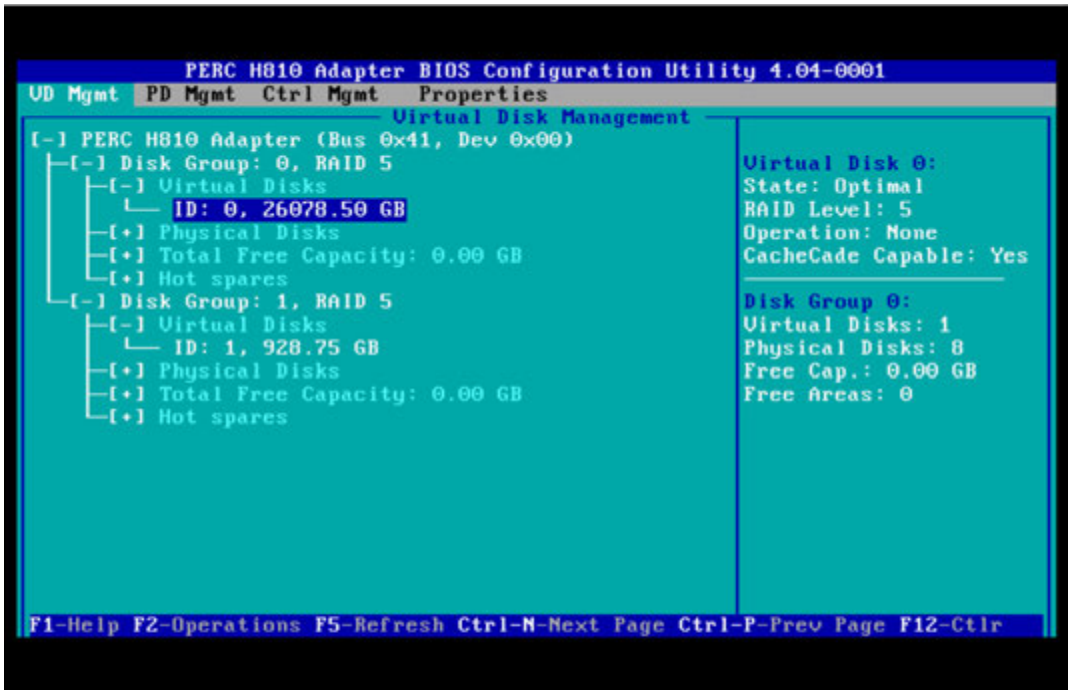
d. Press **F2** to display the **Foreign Config** drop down menu and select **Import**.



e. Select **Yes** to confirm that you want to import the foreign config.

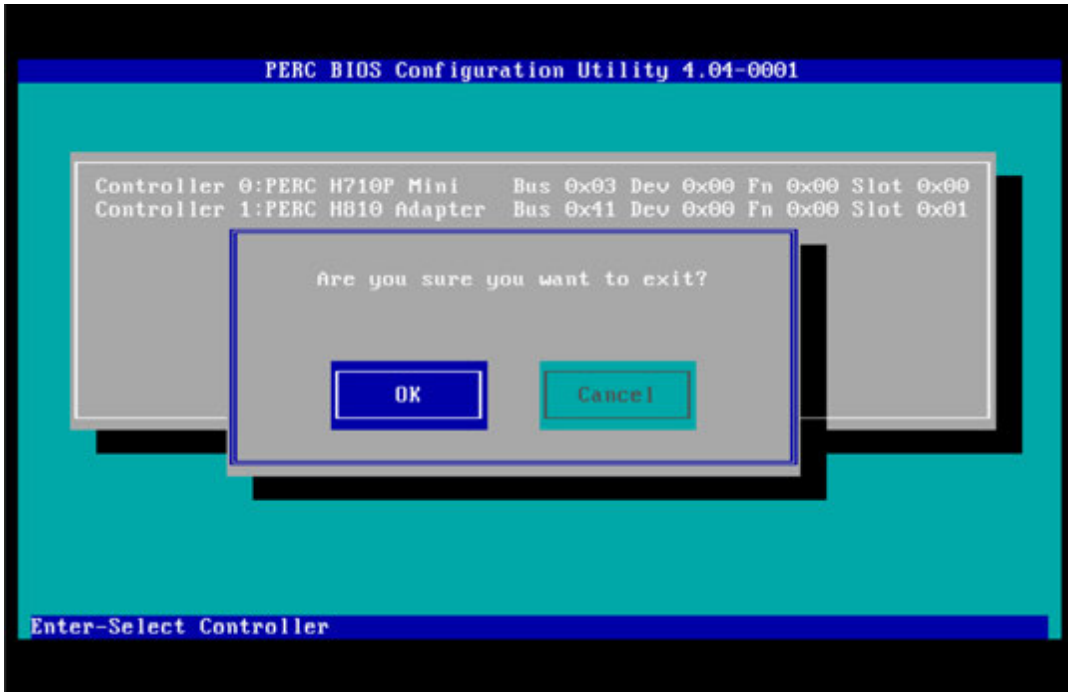


f. Verify that there are no more foreign configs present on the system.



g. Press the **Esc** key to exit.

h. Select **Yes** to confirm that you want to exit.



4. Press **Ctrl-Alt-Delete** to restart (reboot) the appliance.

Caution: If the foreign config fails, Contact Customer Support (https://community.rsa.com/docs/DOC-1294).

(Conditional) Task 27 - Restore Files for 10G Decoder

If you use the 10G Decoder hardware driver and you customized the `/etc/init.d/pf_ring` script to use MTU from the `/etc/pf_ring/mtu.conf` file, you must restore `mtu.conf` and `pf_ring` files from the `../etc/init/pfring_bkup` directory.

1. Restore the `pf_ring` file to /etc/init.d/ directory in 11.0.
   `/etc/init.d/pf_ring`
2. Restore the `mtu.conf` file to `/etc/pf_ring/` directory in 11.0.
   `/etc/pf_ring/mtu.conf`

Appendix A. Troubleshooting

This section describes problems that you may encounter during the upgrade with solutions. In most cases, NetWitness Suite creates log messages when it encounters these problems.

Note: If you cannot resolve any upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294) .

This section has troubleshooting documentation for the following services, features, and processes.

- 11.0 Setup Program (`nwsetup-tui`)
- Backup
- Event Stream Analysis
- General
- Log Collector Service (`nwlogcollector`)
- NW Server
- Reporting Engine

11.0 Setup Program (`nwsetup-tui`)

Problem	Host Setup Program (`nwsetup-tui`) exits and creates the following error message in `/var/log/netwitness/bootstrap/launch/security-server/security-server.log`:
	`<yyyy-mm-dd hh:mm:ss,nnn> [ main] ERROR SystemOperation|Service startup failed. Running in safe mode org.h2.jdbc.JdbcSQLException: The database is read only [90097-193]`
	`at org.h2.message.DbException.getJdbcSQLException(DbException.java:345) ...`
	`at org.springframework.jdbc.datasource.AbstractDriverBasedDataSource.getConnection (AbstractDriverBasedDataSource.java:159)`
	`at com.rsa.asoc.security.upgrade.legacy.MigrationDatabase.<init>(MigrationDatabase.java:113)`

Cause	The H2 database needs write permission to complete the host setup.

Solution	From the NW Server command line, provide write permission to `H2.db`, restart the NW Server, and restart nwsetup-tui Setup Program.
	`chmod o+w /var/lib/netwitness/uax/db/platform.h2.db`
	`systemctl restart rsa-nw-security-server.service`
	`nwsetup-tui`

Backup (`nw-backup` script)

Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA mongo admin password back to the original default of 'netwitness' before running backup. See "ESA Config: Change MongoDB Password for admin Account" the the *RSA NetWitness® Suite Event Stream Analysis Configuration Guide. Go to the* Master Table of Contents *for Version 11.0 to find NetWitness Suite 11.0 documents.*

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.0 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESAPrimary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA .
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

General

Logs referred to in this section are posted to `/var/log/install/install.log` on the NW Server Host.

Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health.AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Suite sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service using below command. `systemctl restart rsa-sms`

Message	`<timestamp> <host>: SMS_PostInstall: INFO: Free disk space on /opt is nGB` `<timestamp> <host>: SMS_PostInstall: WARN: Disk space check failed on /opt. The available disk space nGB is less than the recommended minimum disk space of 10GB.`
Cause	Low or insufficient disk space allocated for the SMS service.
Solution	RSA recommends that you provide a minimum of 10 GB of disk space for the SMS service to run optimally.

Problem	After you run the Setup Program for a non-NW Server host, you must go in to the UI, enable the host, and install the service on the host from the Hosts View. If you see "Install error View Details" in the **Status** column of the Hosts view, the host lost connectivity due to network issues.
Solution	Re-install the service on the host from the Hosts view.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Suite and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Message	*`timestamp`* `NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	(Conditional) If you use a Log Collector Lockbox, log in to NetWitness Suite and configure the Lockbox as described in the"Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents..

Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Suite and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the sa.log. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.4 to 11.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Message	`<timestamp> : Available free space in /home/rsasoc/rsa/soc/reporting-engine [ existing-GB ] is less than the required space [ required-GB ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Appendix B. Stopping and Restarting Data Capture and Aggregation

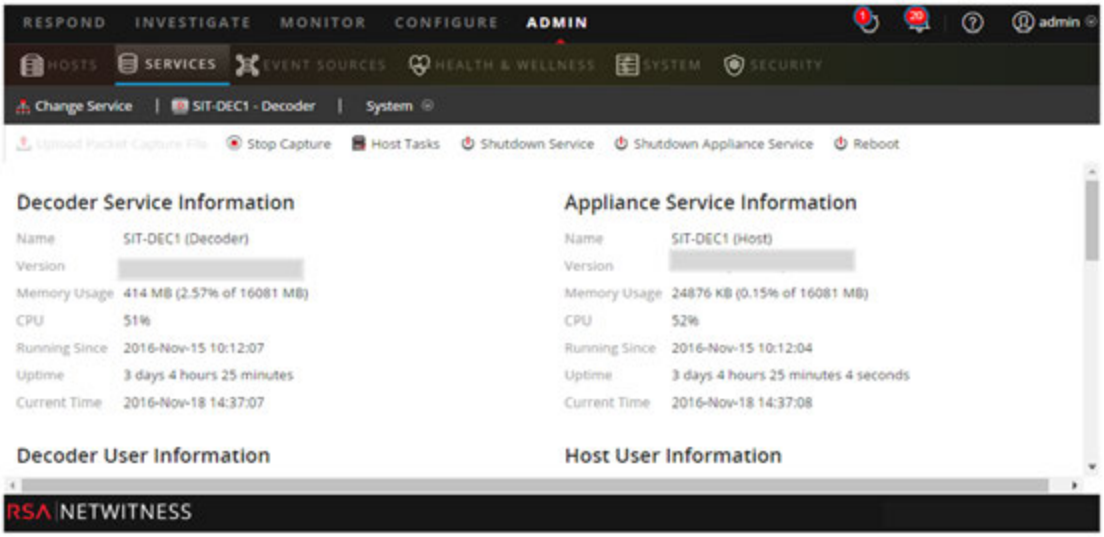
RSA recommends that you stop packet and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.0. If you do this, you must restart packet and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Packet Capture

To stop packet capture:

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

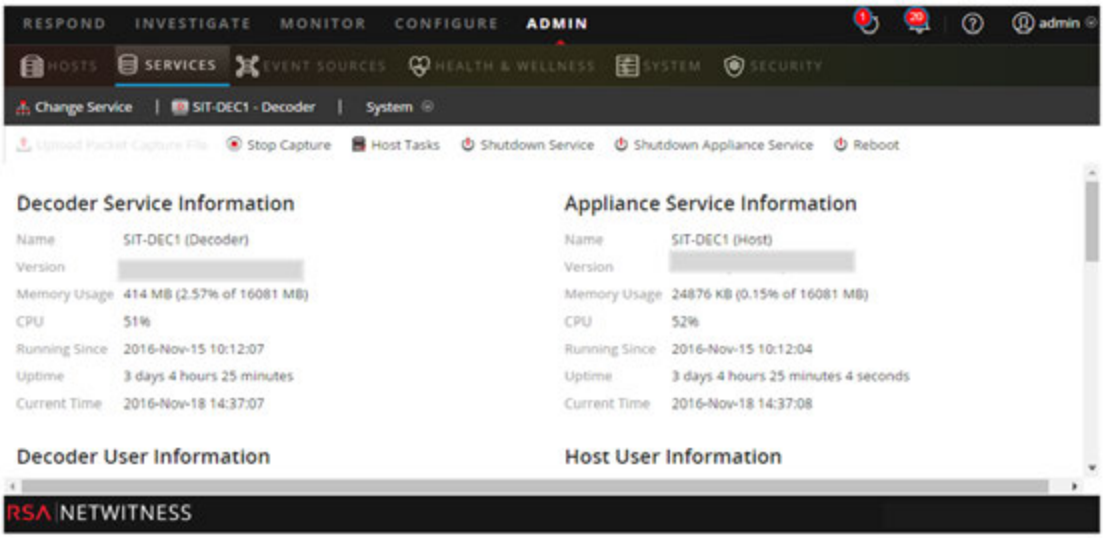
.

Stop Log Capture

To stop log capture:

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.



3. Under  (actions), select **View** > **System**.

4. In the toolbar, click 

.

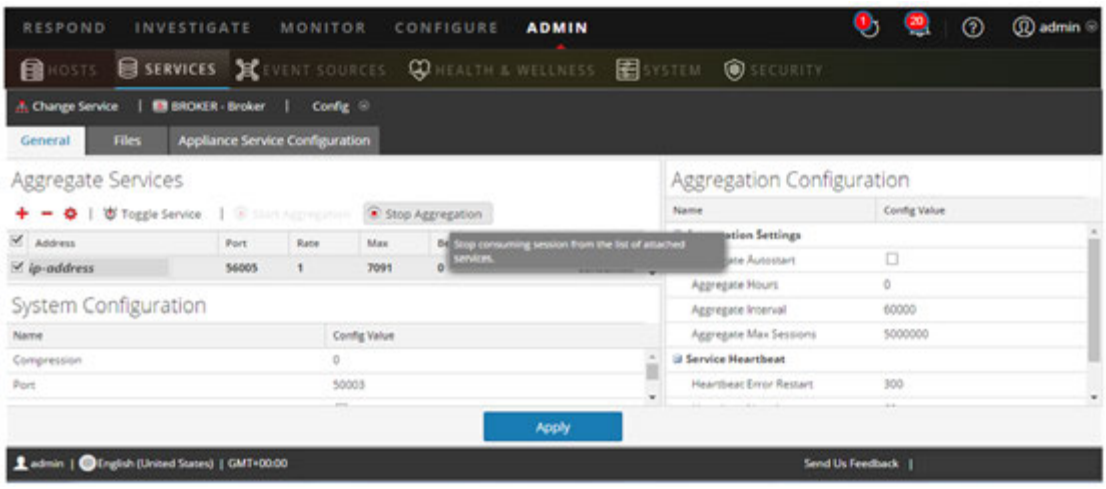
Stop Aggregation

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.

2. Select the **Broker** service.

3. Under  (actions), select **View** > **Config**.

4. The **General** tab is displayed.



5. Under **Aggregated Services** click 

.

Start Data Capture and Aggregation

Restart packet and log capture and aggregation after updating to 11.0.

Start Packet Capture

To start packet capture:

1. In the **NetWitness Suite** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click  .

Start Log Capture

To start log capture:

1. In the **NetWitness Suite** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click  .

Start Aggregation

During the upgrade from 10.6.4 .x to 11.0, the Broker Service is restarted and this automatically starts aggregation.

Revision History

Revision	Date	Description	Author
1.0	16-Oct-17	Release to Operations	IDD
1.1	25-Oct-17	Changes for: • " Active Directory" and "User Attribute and Role Changes Affecting Investigate" workarounds to refer to the 10.6.4.2 and 11.0.0.1 patches. • Authentication Failure in 11.0.	IDD

October 2017

Contents

Introduction

The instructions in this guide apply to the upgrade of virtual hosts to RAS NetWitness Suite11.0 exclusively. See the *RSA NetWitness Suite Physical Host Upgrade Guide* for instructions on how to upgrade your 10.6.4.x physical hosts to 11.0. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

NetWitness Suite 11.0 is a major release that affects all products in the NetWitness Suite suite. The components of the suite are the NetWitness Server (NW Server), Archiver, Broker, Concentrator, Context Hub, Decoder, Entity Behavior Analytics, Event Stream Analysis, Hybrid, Investigate, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Response, Warehouse Connector, and Workbench.

CentOS6 to CentOS7 Upgrade

NetWitness Suite 11.0 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.0 platform environment has been improved greatly to accommodate current and future physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Suite 11.0 Upgrade Path

The supported Upgrade path for RSA NetWitness® Suite 11.0 is Security Analytics 10.6.4.x.If you are running a version of NetWitness Suite that is prior to 10.6.4.x, you must update to 10.6.4.x before you can upgrade to 11.0. See the *RSA Security Analytics 10.6.4 Update Guide* (https://community.rsa.com/docs/DOC-79055) on RSA Link.

Caution: There is a known issue if you have Active Directory users configured in 10.6.4.x. You have two options to address this issue:
• Apply the 10.6.4.2 patch before you back up your data for the 11.0 upgrade.
• If you failed to apply the 10.6.4.2 patch, you can apply the 11.0.0.1 patch immediately after you upgrade to 11.0.

Supported Host Upgrade Path

You must upgrade a host to the same host type:

- Same Series RSA Physical Appliance to Same Series RSA Physical Appliance (that is, Series 4 to Series 4, Series 5 to Series 5).
  RSA does not support third-party physical hosts in 11.0.
- On-Prem Virtual to On-Prem Virtual

Caution: The 11.0 upgrade does not support mixed-platform upgrades (for example, it does not support physical to virtual.

Hardware, Deployments, Services, and Features Not Supported in 11.0

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.0.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- Hosts Deployed in AWS (You can deploy AWS hosts in 11.0, but you cannot upgrade AWS hosts deployed in 10.6.4.x.)
- Hosts Deployed in Azure (You can deploy Azure hosts in 11.0, but you cannot upgrade Azure hosts deployed in 10.6.4.x.)

- IPDB service
- Malware Analysis service co-located on the SA Server (Upgrade of Malware Analysis Enterprise is supported in 11.0.)
- Standalone Warehouse Connector service (Upgrade of a co-located Warehouse Connector is supported in 11.0.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.0, your custom policy is not present. In its place, there is the out-of-the-box Context hub Server Monitoring Policy in the user interface, which is specific for version 11.0.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Suite 11.0, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.0, ESA sends all alerts to a central Alert system. The local mongo storage in ESA 10.6.4.x has been removed.

Caution: If you do not use Incident Management in 10.6.4.x, carefully consider whether or not to upgrade to version 11.0.

The following guidelines should help you determine whether or not to upgrade your ESA hosts to 11.0.

In your 10.6.4.x deployment, if you have:

- One ESA host, with or without Incident Management configured, upgrade to 11.0.
- Multiple ESA hosts configured to use Incident Management – The system will continue to aggregate alerts centrally. If the system is correctly sized and operating as intended in 10.6.4.x, you can upgrade to version 11.0.
- Multiple ESA hosts without configuration to use Incident Management and you are connecting to individual ESA hosts to view alerts, do not upgrade to version 11.0.

Note: If you did not use Incident Management in 10.6.4.x, you cannot view the 10.6.4.x ESA alerts in the 11.0 Respond component without running a migration script. Use the ESA Alert Migration script to migrate these alerts to the location in 11.0 that will allow Respond to view them. See the *ESA Alert Migration Instructions for 10.6.4.x to 11.0* knowledge base article (https://community.rsa.com/docs/DOC-81680) in RSA Link for instructions on how to run this script.

User Attribute and Role Changes Affecting Investigate

The following changes affect how NetWitness Suite 11.0 handles user and role attributes in the Investigate component.

- User Attributes
  When you upgrade to 11.0, the user attributes (query prefix, session timeout, and query threshold) available in SA 10.6.4.x no longer exist. The same attributes are available at the role level for use.
  As a workaround, if you used the user attributes to restrict user access, apply the RSA NetWitness® Suite 11.0.0.1 patch immediately after you upgrade to 11.0.0.0.
- User and Role Attributes (Query Prefix) is not applicable to Investigate Event Analysis. The user and role attributes, most importantly the query prefix, do not apply to the new Investigate Event Analysis. Any user can modify the URL in browser to access data that should be restricted from viewing even when query prefix is applied.
  As a workaround, apply the RSA NetWitness® Suite 11.0.0.1 patch immediately after you upgrade to 11.0.0.0.

Caution: If you configured user or role attributes in 10.6.4.x, including query prefix, apply the RSA NetWitness® Suite 11.0.0.1 patch immediately after you upgrade to 11.0.0.0. After applying this patch, complete the patch instructions to apply additional security controls.

Upgrade Phases

RSA recommends that you stagger host upgrades as described in this section. The update to CentOS7 and the need of a physical or iDRAC access cause the 11.0 upgrade to take more time than most upgrades.

Caution: If you stagger the upgrade, you:
• must upgrade the hosts in Phase 1 first, in the order shown.
• may not have all the features operational until you update your entire deployment.
• will not have service administrative features available until you upgrade all the hosts in your deployment.

Phase 1

You perform Phase 1 first and you must upgrade the hosts in the following order:

1. Security Analytics Server host
2. Event Stream Analysis hosts
3. Malware Analysis hosts
4. Broker hosts (if you do not have a Broker, upgrade your Concentrator hosts)
   The 11.0 NW Server cannot communicate with 10.6.4.x core services for the new

Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2

Upgrade the rest of your hosts.

In Phase 2, (other than Log Collection hosts with downstream event destinations) there is no technical reason to upgrade your hosts in the following order. RSA recommends that you follow the order in Phase 2 to reduce:

- functionality loss during investigation.
- downtime that results in the loss of packet and log capture.

1. Decoder hosts
2. Concentrator hosts
3. Archiver hosts
4. Log Collection hosts - Log Collectors on Log Decoder hosts (LDs), Virtual Log Collectors (VLCs) and Legacy Windows Collectors (LWCs)
   Before you upgrade a log collection host , you must prepare it for the upgrade. Part of this preparation ensures that no event data remains in the queues. This requires you to keep the downstream destinations of event data (Log Collectors, Virtual Log Collectors and Log Decoders) up and functioning properly.

   If you have event data destinations downstream from the Log Decoder, you must prepare and upgrade log collectors in the following order.

   a. LDs (one LD at a time)
   b. VLCs and LWCs

   If you do not have event data destinations downstream from the Log Decoder, you can prepare and upgrade multiple LDs, VLCs, and LWCs together.
5. All other hosts

See "Running in Mixed Mode" under "The Basics" in the RSA 11.0 *NetWitness Suite Hosts and Services Getting Started Guide* for:

- Functionality gaps encountered while running in this mode.
- Examples of staggered upgrades.

Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Investigate in Mixed Mode

Mixed mode occurs when some services are upgraded to 11.0 and some are still on 10.6.x. This happens when you upgrade to 11.0 in phases.

Note: You must follow the host upgrade sequence as shown in Upgrade Phases to ensure complete Investigate functionality. The 11.0 Investigate server is installed when you upgrade the SA Server, but Broker hosts need to be upgraded to 11.0 to access the Event Analysis View.

After you upgrade all services to 11.0, when an analyst conducts an investigation, Role-Based Access Control (RBAC) of downloads works consistently to limit access to restricted data.

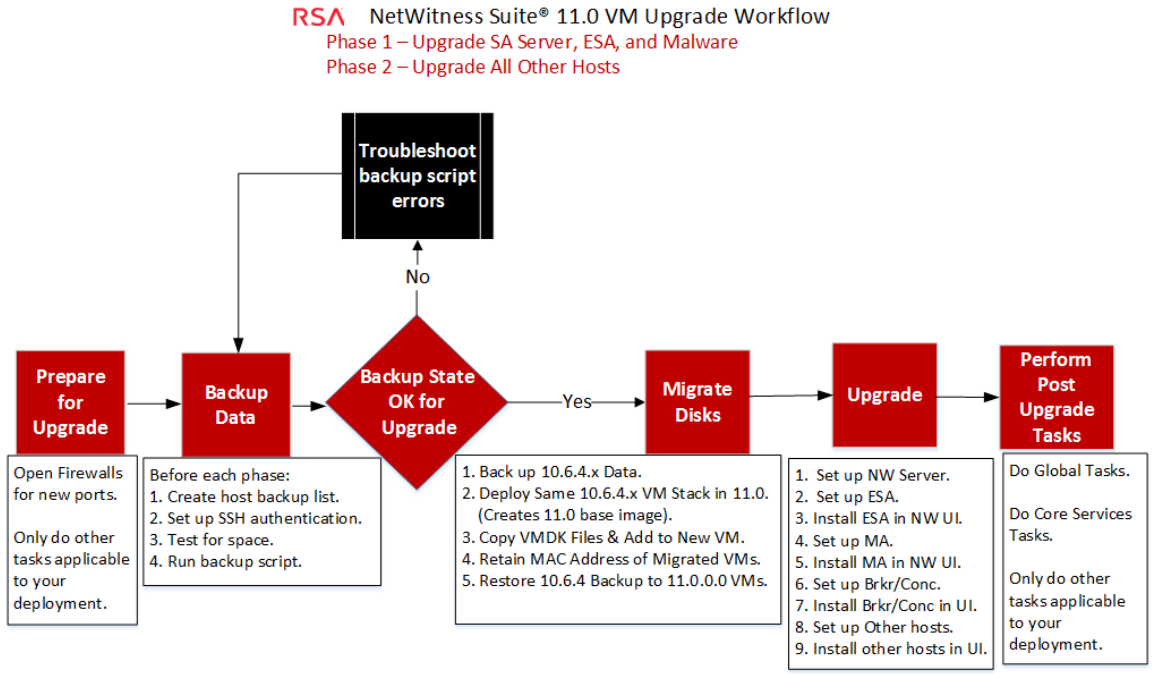
In mixed mode (that is, some services are upgraded to 11.0 and some are still on 10.6.x), when an analyst conducts an investigation, RBAC is not applied uniformly to viewing and downloads.

If the `sdk.packets` setting has not been disabled on the 10.6.x services, analysts with SDK meta and roles permissions in place to restrict viewing and reconstructing an event's content can download the PCAP of an event that has content restrictions. Other types of downloads appear to download, then generate errors due to insufficient permissions, and the data is still protected.

During a phased update, you can disable the `sdk.packets` setting on 10.6.x services to limit the analyst from downloading any PCAPs or logs during mixed mode. After you update all services to 11.0, RBAC works consistently across all services.

This table identifies what you can see and download in Investigate when your NW Server is on version 11.0 connected to services at a lower version.

Connecting Service Version	Affected View	User Role	Can See	Can Download Successfully	Can Download with Errors
11.0 Broker -> 10.x Concentrator -> 10.x Packet Decoder/Log Decoder	Events View	Analyst		PCAP	File archive is downloaded but cannot unzip
	Event Reconstruction View	Analyst		PCAP	File archive is downloaded but cannot unzip
	Event Analysis View	Analyst		PCAP	Error Retrieving Payload from Service for Payload, Request Payload, Response Payload
	Event Reconstruction View	Admin			Files archive is downloaded but cannot unzip
11.0 Broker -> 11.0 Concentrator ->11.0 Decoder/Log Decoder	Event Reconstruction View	Analyst and Data Privacy Officer	RBAC permitted items		Files archive is downloaded but cannot unzip PCAPs and logs are downloaded as zero bytes
	Event Reconstruction View				



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Suite 11.0.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness Suite 11.0. These tasks are organized by the following categories.

- Global
- Reporting Engine
- Respond and Incident Management

Global

You must complete these tasks regardless of how you deploy NetWitness Suite and which components you use.

Task 1 - Review Core Ports and Open Firewall Ports

The following table lists new ports in 11.0.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

All NetWitness Suite core ports are listed in the "Network Architecture and Ports" topic in the *RSA NetWitness® Suite Deployment Guide* in case you need to reconfigure NetWitness Suite services and firewalls. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 2 - Record Your 10.6.4.x `admin user` Password

Record your 10.6.4.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of `/etc/fstab` File

Copy the `/etc/fstab` file from all VMs to your local machine (backup host or remote machine).

Note: You need this file to restore a VM with external storage mounts.

Reporting Engine

(Conditional) Task 4 - Unlink External Storage

If the Reporting Engine has external storage [such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports] you must perform the follow steps to unlink the storage.

In these steps:

- `/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
- `/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Respond and Incident Management

(Conditional) Task 5 – Disable Incident Management Data Retention

Complete the following procedure to disable Incident Management data retention jobs in 10.6.4.x

1. Log in to RSA Security Analytics 10.6.4.x.
2. Go to **Incident Management** > **Configure** > **Retention Scheduler**.
3. Uncheck the **Enable data retention scheduler** checkbox and click **Apply**.

Backup Instructions

Backing up your configuration data for all your hosts from 10.6.4.x is the first step in upgrading from 10.6.4.x releases to 11.0.0.0.

Note: It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directory will be automatically restored during the upgrade process. After upgrading to 11.0.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types

Caution: 1) These services are not supported in the 10.6.4.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the NetWitness Server
- Standalone Warehouse Connector

2) There is a known issue if you have Active Directory users configured in 10.6.4.x. You have two options to address this issue:
• Apply the 10.6.4.2 patch before you back up your data for the 11.0 upgrade.
• If you failed to apply the 10.6.4.2 patch, you can apply the 11.0.0.1 patch immediately after you upgrade to 11.0.

The following types of hosts can be backed up and are automatically restored during the upgrade process:

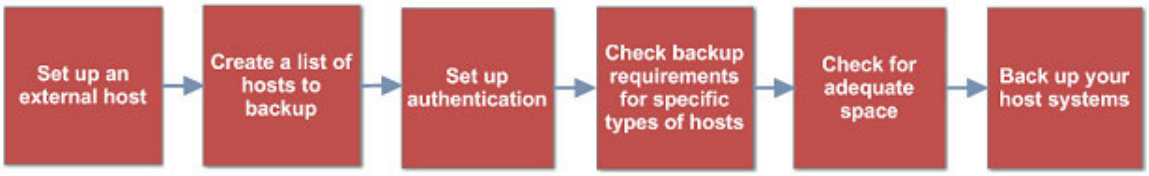
- **NetWitness Server** (may include Malware Analysis, NetWitness Respond, Health and Wellness, and Reporting Engine)
- **Malware Analysis** (standalone)
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and NetWitness Respond database)
- **Concentrator**
- **Log Decoder** (including Local LogCollector and Warehouse Connector, if installed)
- **Log Hybrid**
- **Packet Decoder** (including Warehouse Connector, if installed)
- **Packet Hybrid**
- **Virtual Log Collector**

The following types of files are automatically backed up but must be restored manually after the upgrade process:

- PAM configuration files: For information about restoring the PAM configuration files, refer to "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.0.0.0", in the "Global" section of the Post Upgrade Tasks.
- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the `/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see "(Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of Post Upgrade Tasks.

Note: If you have problems during the backup or upgrade processes and you lose data, you can recover the data and start the process again. For information about recovering lost data, see "Recover Data After System Failure" in the *System Maintenance Guide*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



The following sections describe each of these tasks:

- Task 1 - Set up an External Host for Backing up Files
- Task 2 - Create a List of Hosts to Back up
- Task 3 - Set up Authentication Between Backup and Target Hosts
- Task 4 - Check for Backup Requirements for Specific Types of Hosts
- Task 5 - Check for Adequate Space for the Backup
- Task 6 - Back up Your Host Systems
- Post Backup Tasks

Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running Centos 6 with connectivity through SSH to the NetWitness Suite stack of hosts.

Ensure that the host names for the systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

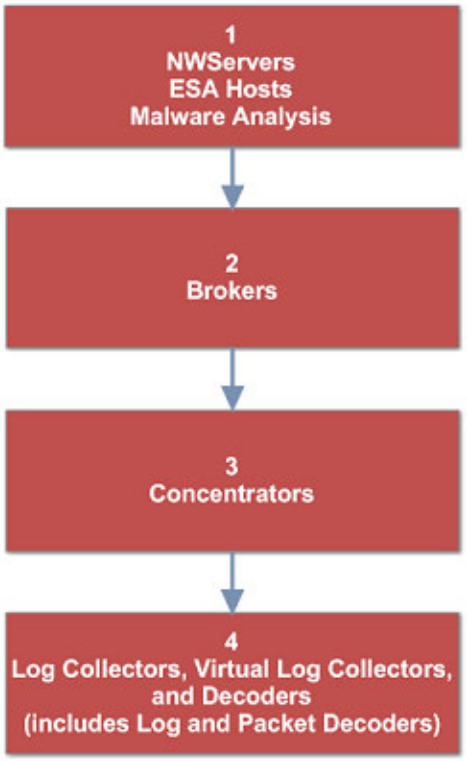
There are several scripts that you run during the backup process. You must download the zip file that contains the scripts (`nw-backup-v3.0.zip`) from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Click the **RSA NetWitness Logs & Packets 11.0 Backup Script (nw-backup-v3.0.sh)** link and extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your NetWitness Servers and host systems to be backed up.
- `ssh-propagate.sh`: Automates sharing keys between the systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.

Note: The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of the hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to ensure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference and then manually editing the `all-systems` file to contain specific hosts.

To generate the `all-systems` and the `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:
   ```
   chmod u+x get-all-systems.sh
   ```
2. At the root level, run the `get-all-systems.sh` script:
   ```
   ./get-all-systems.sh <IP-Address-of-NetWitness-Admin-Server>
   ```
   You will be prompted for the password for each host system once per host.

This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nwbackup/`.

3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.
4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up.

> **Note:** If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-
a48e558cec3e,10.6.4.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-
8ea837074bd0,10.6.4.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.4.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.4.0
packetdecoder,my-nw-packetdecoder,10.0.0.7,a8f2f574-3dd0-4b65-9cf7-
d8141b78a192,10.6.4.0
vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.4.0
broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-
c56ccfb0f737,10.6.4.0
```

And here is an example of an `all-systems` file based on the `all-systems-master-copy` file that could be used in the first backup session:

```
saserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-
a48e558cec3e,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.4.0
```

Troubleshooting Information

- Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location. Follow these recommendations:

  - Do not edit the `all-systems-master-copy` file.
  - If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure to remove pre-existing entries from the file so that the file contains only those hosts that are currently being backed up.
    For more information, see Post Backup Tasks.

- If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.

- The `get-all-systems.sh` script generates a list of hosts that were defined in the NetWitness Suite user interface. Ensure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to NetWitness Suite, you use the NetWitness Suite user interface to ensure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.

- At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the NetWitness Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence of those systems, that their services are all running, and that they are properly communicating with the NetWitness Server. (Any Windows Legacy Collectors or AWS Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)
- If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the man page for `ssh-agent`.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:
   `chmod u+x ssh-propagate.sh`
2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:
   `ssh-propagate.sh <path-to-all-systems-file>`
3. You are prompted for the password once per host, but you will not need to enter it repeatedly later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types:

1. On the NetWitness Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.0.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the NetWitness Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   `openssl x509 -inform der -in certificate.cer -out certificate.pem`
   Convert a PEM file to DER

```
openssl x509 -outform der -in certificate.pem -out certificate.der
```

Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)

```
openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in
certificate.crt -certfile CACert.crt
```

Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM

```
openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes
```

> **Note:** Add the following qualifier to the command string to:
> `-nocerts` convert private keys exclusively.
> `-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Decoder, Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to Appendix B. Stopping and Restarting Data Capture and Aggregation

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

> **Caution:** This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after upgrade.
- If you set the password for `logcollector` user for RabbitMQ , you must know the password so you can set it again after the upgrade.

Prepare LCs and VLCs for Upgrade

1. SSH to the Log Collector.
2. Submit the following command string.
   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```
   This command:

- Stops the Puppet Agent service.
- Disables the file collection accounts ("sftp" and all users in the group "upload") used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgrade to 11.0.0.0.
- Stops all the collection protocols in the Log Collector service.
- Saves the list of Plugin accounts and RabbitMQ accounts.
- Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.
- Waits until the Log Collector queues are empty.
- Stops the Log Collector service.
- Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting

For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint: List RabbitMQ Usernames and Passwords

On the 10.6.4.x host, on the NetWitness Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.0.0.0 upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to *Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL* in Post Upgrade Tasks.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The event source documentation contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in `/root/vsftpd/` directory in 10.6.4.x, this material area will be backed up and restored. **If the material was in another location, you must back it up and restore it manually.**
- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.4.x, it is backed up and restored.

Task 5 - Check for Adequate Space for the Backup

You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to ensure that you provide adequate space for the backup so that the backup captures all your data.

To check for adequate disk space:

1. Make the backup script executable by running the following command:
   ```
   chmod u+x nw-backup.sh
   ```
2. Run the following command at the root directory level:
   ```
   ./nw-backup.sh -t
   ```
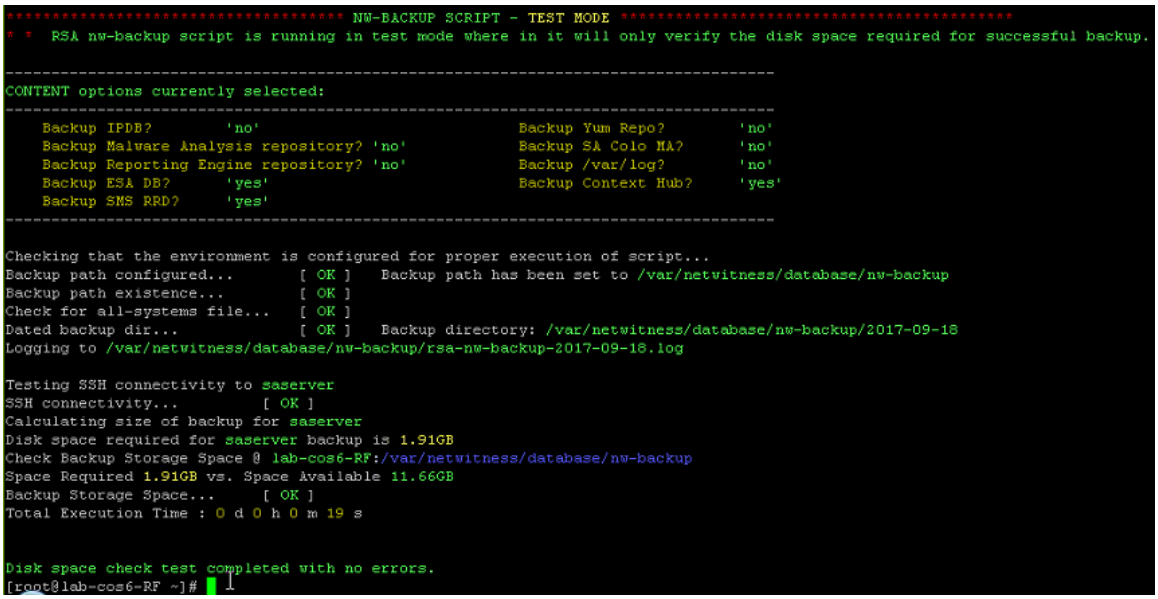
   The output displays the amount of disk space that is required for the backup.

   Note: The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the `-d` option by using `-D`. Using the `-D` option will show how much

space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the `-D` option will throw an error. If you want to know how much space is available on the target host, you must run the `df -h` command on the host.

The following figure shows an example of the output from using the `-t` option.



Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the `nw-backup.sh` script using the `-u` option. This option is required for upgrading to 11.0.0.0.

Note: The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage:

`./nw-backup.sh [-u -t -d -D -u -l -x -e <external-mnt> -b <backup file path>`

General Options

`-u : This option is required for upgrading to 11.0. Enables the upgrade flag to run backup for upgrading to 11.0. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)`

-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)

-D : enables disk space check in 'full' mode (estimate of space using compressed data, ~10X slower). Default: (no)

-l : stores backup content locally on each host (automatically set if -u is used). Default: (no)

-e <path to mount point> : copies backup files of all devices onto an external mount point. Default: (/mnt/external_backup)

-x : move all backup files to an external mount point. Default: (no) -COPY

-b <path to write backups> : path to the location for storing backup files on a backup server. **For upgrading to 11.0, please use the default location!** Default: (/var/netwitness/database/nw-backup)

Note: Do **not** change the backup path in upgrade (-u) mode.

Advanced Content Selection Options

-c : back up Colocated Malware Analysis on SA servers. Default: (no)

-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)

-m : back up Malware Analysis File Repository. Default: (no)

-r : back up Reporting Engine Report Repository (automatically set if -u is used). Default: (no)

-v : back up system logs (/var/log). Default: (no)

-y : back up YUM Web Server & RPM Repository. Default: (no)

-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)

-C : If set: DISABLES back up of Context-Hub configuration and database. Default: (not-set)

-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)

Test Options

-t : performs script test run for disk space check only. Services are not stopped and excludes execution of backup. Can be combined with (-d) or (-D) and other flags. Default: (-t)

For example, the command:
`./nw-backup.sh`
would run the backup with options as set in the Header of the script itself.
OR, the command:
`./nw-backup.sh -ue /mnt/external_backup`
would run a normal backup using the backup path defined in the script, with the following options:

```
-u : enables the upgrade flag to run backup for upgrading to 11.0. It
also enables disk space check (-d), backing up reporting engine reports
(-r) and stores backup content locally (-l). Default: (no)

-e : Copy the backup files to external mount point, mounted on
/mnt/external_backup

For Help: ./nw-backup.sh -h
```

When you run the script, the following text is displayed at the top of the script:

Caution:
```
RSA nw-backup script backs up configuration files, data, and
logs on the options provided in the script. It tars the content, with
options to store the backup files on the backup server, move or copy
them to external storage on a mount point (USB/NFS/SMB), or SCP them
back to the target host.
This backup script has been qualified on the following versions of
Security Analytics:
10.6.3.x and 10.6.4.x
Use of this script on any other versions of the product may not give
expected results and may not be supported by RSA Customer
Service.Note: All non-RSA custom files, scripts, Cronjobs and other
important files should be placed in /root, /home/'user', OR /etc to be
included in the backup.
```

To run the backup script to back up your hosts:

1. Ensure that the `all-systems` file contains only the hosts to back up. For information, see Task 2 - Create a List of Hosts to Back up.
2. Make the backup script executable by running the following command:
   ```
   chmod u+x nw-backup.sh
   ```
3. Begin the backup process by running the following command at the root directory level:
   ```
   ./nw-backup.sh -u <additional options as needed>
   ```

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.0.0.0.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   ```
   rsa-nw-backup-2017-03-15.log
   ```
4. When the backup has completed, to ensure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:
   ```
   tar -tzvf hostname-ip-address-backup.tar.gz
   ```
   The following archive files are created:

   For all hosts:

<hostname-IPaddress>-root.tar.gz

<hostname-IPaddress>-backup.tar.gz

tar checksum files

<hostname-IPaddress>-network.info.txt

For NetWitness Servers:

<hostname-IPaddress>-root.tar.gz

<hostname-IPaddress>-backup.tar.gz

<hostname-IPaddress>-mongodb.tar.gz

tar checksum files

<hostname-IPaddress>-network.info.txt

For ESA Hosts:

<hostname-IPaddress>-root.tar.gz

<hostname-IPaddress>-backup.tar.gz

<hostname-IPaddress>-mongodb.tar.gz

<hostname-IPaddress>-controldata-mongodb.tar.gz

tar checksum files

<hostname-IPaddress>-network.info.txt

The archived files are located in the /var/netwitness/database/nw-backup directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the all-systems File and the Backup Tar files

Make copies of the all-systems file, the all-systems-master-copy file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the NetWitness Server (specifically the Admin service) to 11.0.0.0.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.0.0.0 upgrade process. Before you begin the upgrade process, you must ensure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- all-systems
- all-systems-master-copy

- appliance_info
- service_info
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

In addition to the files listed above, the following files will be generated on NetWitness Server and ESA hosts:

- <*hostname*>-<*host IP address*>-mongodb.tar.gz
- <*hostname*>-<*host IP address*>-mongodb.tar.gz.sha256

The backup script will also generate the following controldata-mongodb.tar.gz files.

Note: The backup script copies the following files from all ESA hosts to the NetWitness Server host's backup path .

- <esa hostname>-<esa hostip>-controldata-mongodb.tar.gz
- <esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256

Task 3 - (Conditional) For Multiple ESA Hosts, Copy mongodb tar files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the /opt/rsa/database/nw-backup/ directory on the Primary ESA host system (the host that has the ContextHub service running on it) :

- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.0.0.0, ensure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

There should be note here mentioning default backup path locations for that user knows where to go and check these files.

Note: The default paths for backup files are:
- NetWitness Server hosts:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`
- Malware hosts: `/var/lib/rsamalware/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256`

Required Files for ESA Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Required Files for All Other Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

Note: The following files are located in the `<hostname>-<host-IP-address>-backup.tar.gz` tar on all hosts:
`appliance_info`
`service_info`

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
`BUPATH=/opt/rsa/database/nw-backup` for the ESA Correlation Engine
`BUPATH=/var/lib/rsamalware/nw-backup` for the Malware Service
`BUPATH=/var/netwitness/database/nw-backup` for all other services
Restore locations:
`BUPATH/restore/etc/sysconfig` for Iptable rules
`BUPATH/restore/etc/sysconfig` for NAT configurations
`BUPATH/restore/etc` for Crontab entries
`BUPATH/restore/etc` for User Accounts (users are located in the `passwd` file, and groups are located in the `group` file. These are not restored during the upgrade process but can be restored manually.
`BUPATH/restore/etc/ntp.conf` for NTP configurations (must be restored using the NetWitness Suite UI)

Migrate Disk Drives from 10.6.4.x to 11.0

These instructions tell you how to upgrade virtual hosts from 10.6.4.x to 11.0.

Caution: 1) You cannot perform the migration if you have a snapshot for your VM.
2). Run the backup immediately before you upgrade hosts for each phase so that the data is not out-dated.
3.) This guide applies to virtual host upgrades exclusively. If have both physical and virtual hosts in your deployment, see the *RSA NetWitness® Suite 11.0 Physical Host Upgrade Instructions* for the steps you must complete to upgrade physical hosts. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Note: The machines must be in VMware ESX.

There are five tasks you must complete to migrate your Virtual Machine (VM) deployment disk drives from 10.6.4.x to 11.0:

Task 1 - Back up data in your 10.6.4.x VMs.

Task 2 - Deploy the same VM Stack in 11.0 as you have in 10.6.4.x.

Task 3 - Copy the VMDK Files and add them as a hard disk to the new VMs.

Task 4 - Retain MAC address of upgraded VMs.

Task 5 - Restore backup data in 10.6.4.x to 11.0 VMs.

Task 1 - Back Up Data in 10.6.4.x VMs

1. Prepare Log Collector for the migration:
   a. Log in to the Log Collector using root credentials.
   b. Go to the `/opt/rsa/nwlogcollector/nwtools/` directory and run the following command.
      `sh prepare-for-migrate.sh --prepare`
      See Virtual Log Collector Host (VLC) for detailed instructions on how to upgrade the VLC.
2. Download the `.zip` file that contains the 10.6.4.x backup scripts from RSA Link (https://community.rsa.com/docs/DOC-81514) to the external backup host.

   Note: You must set up an external host to use for backing up files. The host must be running CentOS 6 with connectivity through SSH to the NetWitness Suite stack of hosts.

3. Run the following commands from the `nw-backup/scripts` directory.
   `./get-all-systems.sh <SA-IP>`
   `./ssh-propagate.sh <path-to-backup-directory/all-systems>`
   `./nw-backup.sh -u`
   (if you have a Malware VM, substitute `-m -u`for `-u` in this command string (for example, `./nw-backup.sh -m -u`).

Task 2 - Deploy Same 10.6.4.x VM Stack in 11.0

You must set up the same virtual host stack in 11.0 that you had in 10.6.4.x. See the *RSA NetWitness® Suite 11.0 Virtual Host Setup Guide* for instructions.Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

The following steps are the high-level steps on how to deploy an OVA host in the ESXi environment.

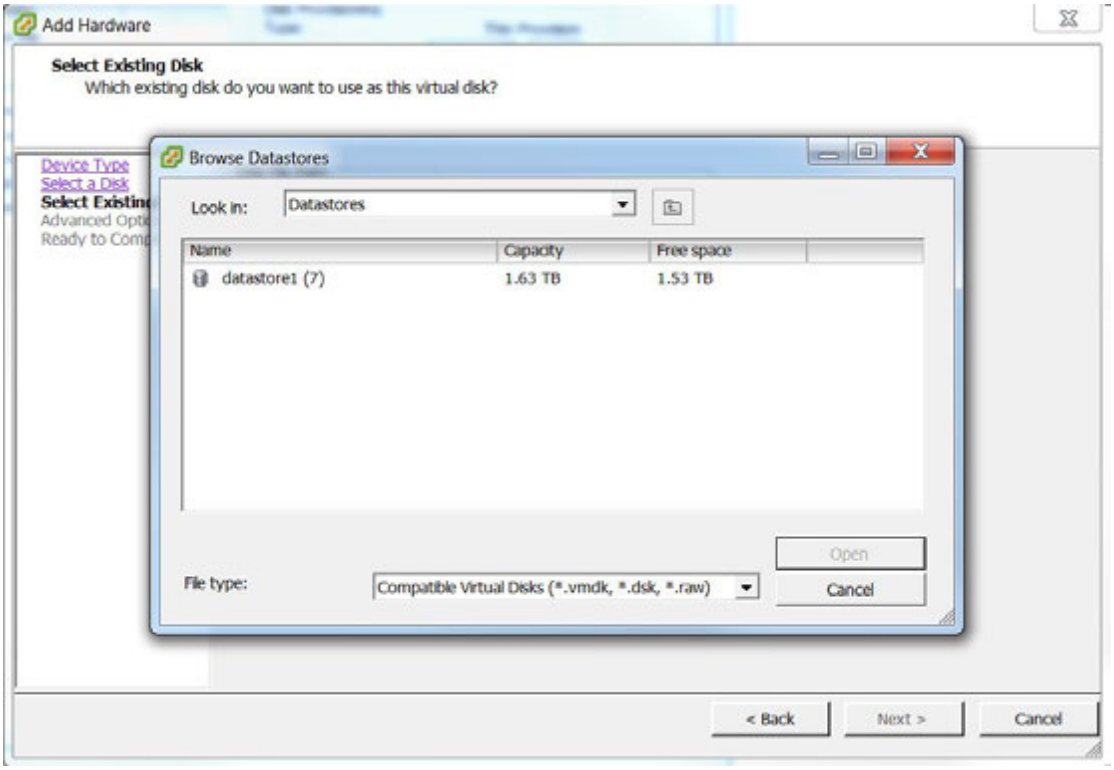
Download the 11.0 OVA (**rsanw-11.0.0.0.1245.el7-x86_64.ova**), from RSA Link Download Central to a local directory.

1. Log on to the ESXi environment.
2. In the **File** drop-down, select **Deploy OVF Template**.
   The Deploy OVA Template dialog is displayed.
3. Browse your local directory for the 11.0 OVAs you downloaded in step 1.
4. Select the **rsanw-11.0.0.0.1245.el7-x86_64.ova** to deploy in the virtual environment , and click **Next**.

5. Select the appropriate Configuration for the VM and click **Next**.
6. Power on the VM, go to Console, and log in to the machine.
   The VM now has the 11.0 base image required to run the Setup Program (that is, `nwsetup-tui`).

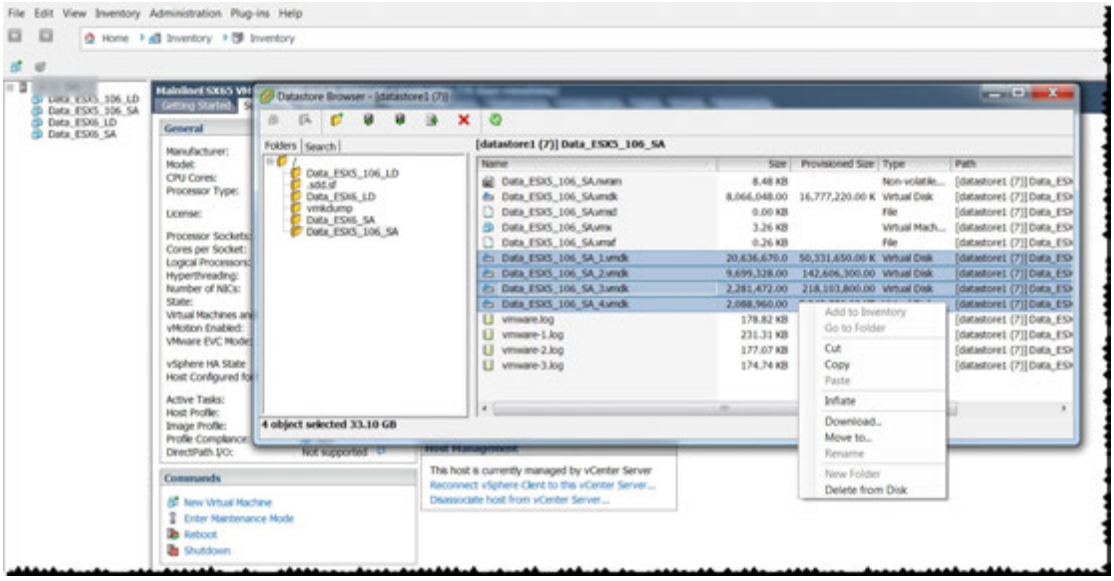
Task 3 - Copy VMDK Files and Add Them as Hard Disk to New VMs

1. Power off both the 10.6.4.x and 11.0 VMs.
2. Go to the desired ESX server, click the **Configuration** tab > **Storage**.
3. Right-click the required datastore and click **Browse Datastore**.



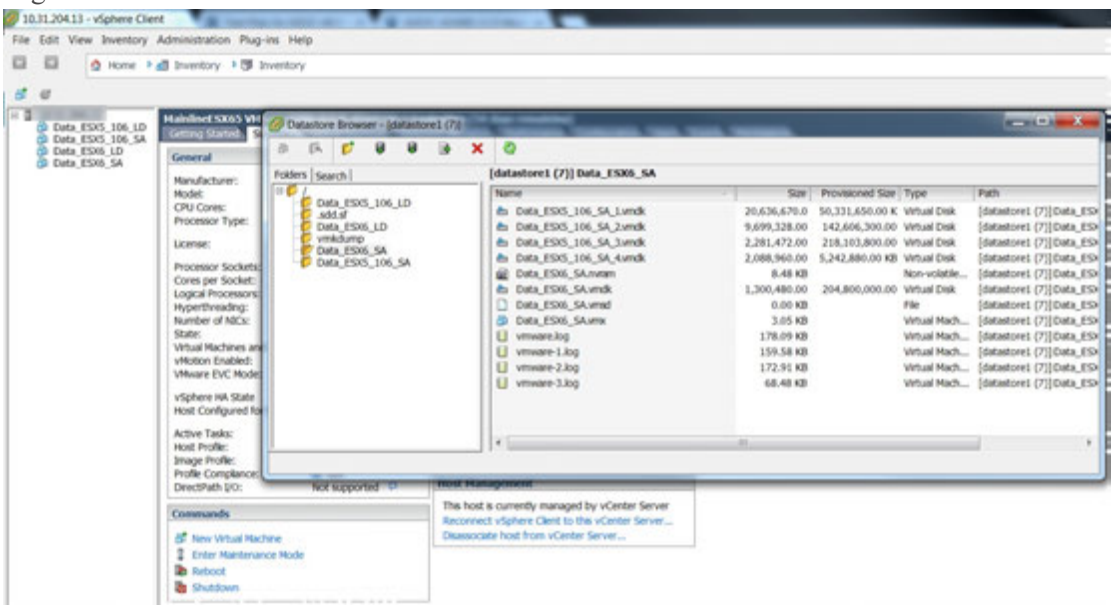
4. Navigate to the existing 10.6.4.x VM in the datastore.
5. Select all the VMDK files in the datastore, right-click, and click **Copy**.

> **Caution:** Do not copy the base VMDK file (for example, `Data_106_SA`) because it contains CentOS6.
>
> You must copy all the numbered VMDK files. For example, if the 10.6.4.x VM name is `Data_106_SA`, you would copy all the `Data_106_SA_1`, `Data_106_SA_2`, `Data_106_SA_3`, etc files.



6. Navigate to the new 11.0 VM in the datastore.

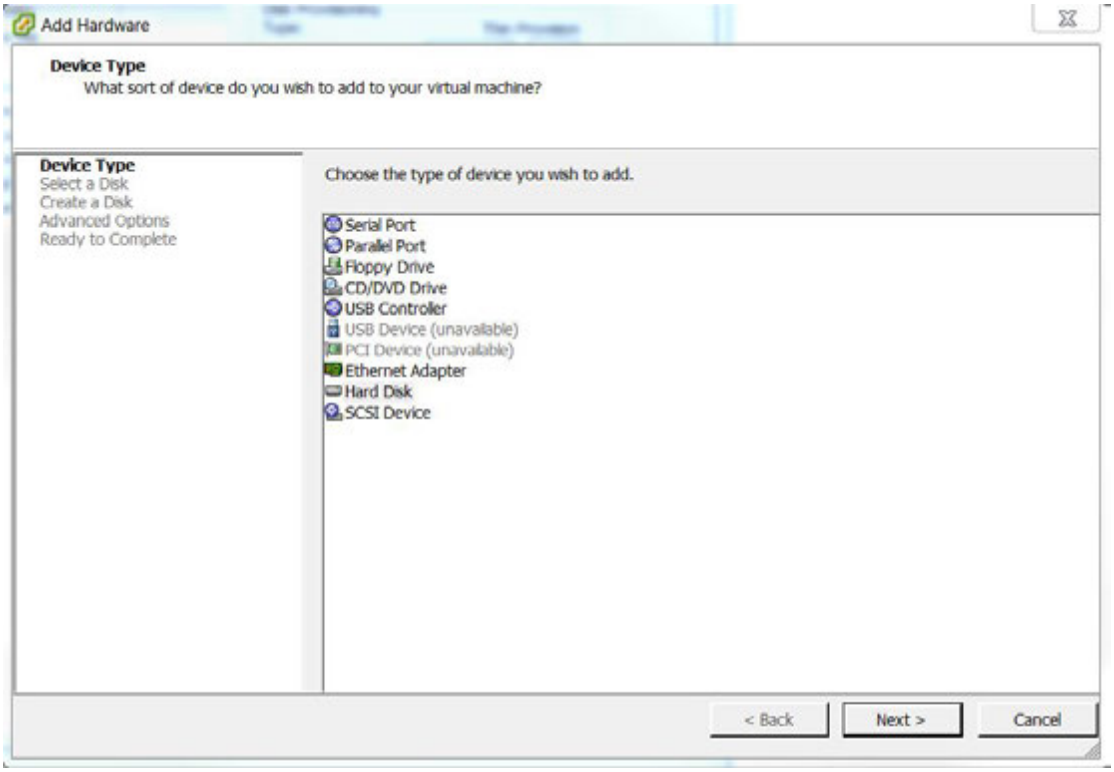
7. Right-click and click **Paste**.



Note: You must wait until all the VMDK files from the previous VM are completely copied into the datastore of the new VM.

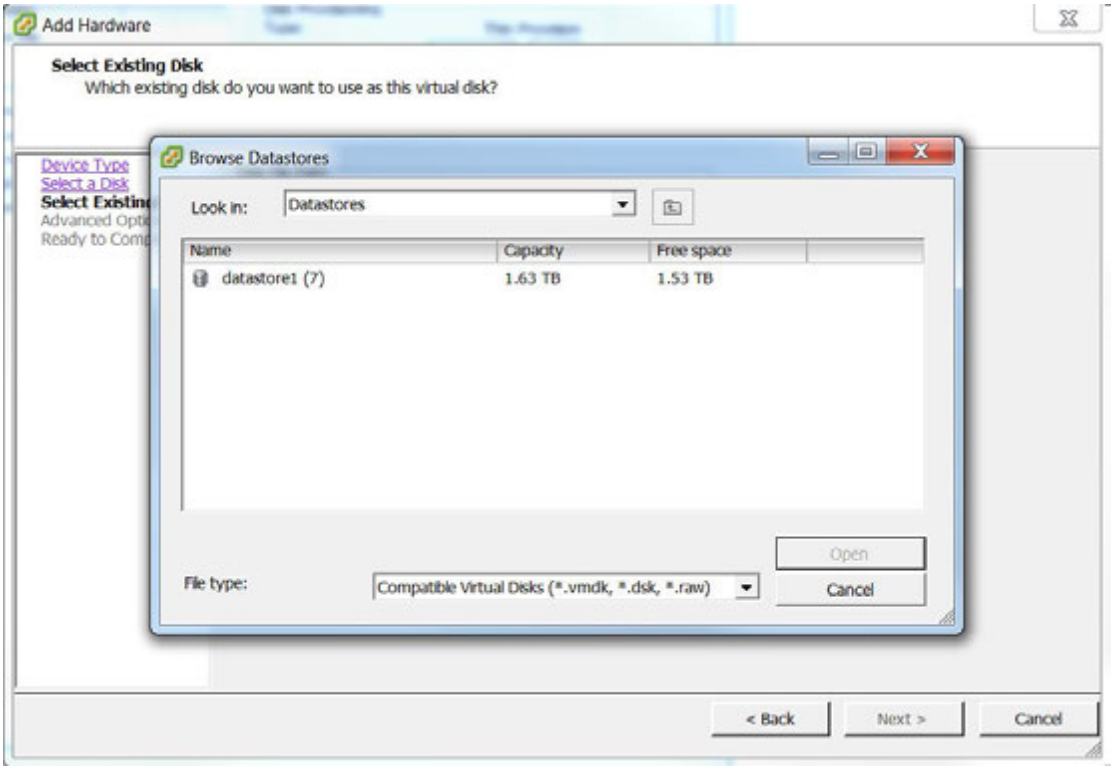
8. Select the 11.0 VM, click **Edit Settings** > **Add**.

9. In the dialog box, click **HardDisk** > **Next**.

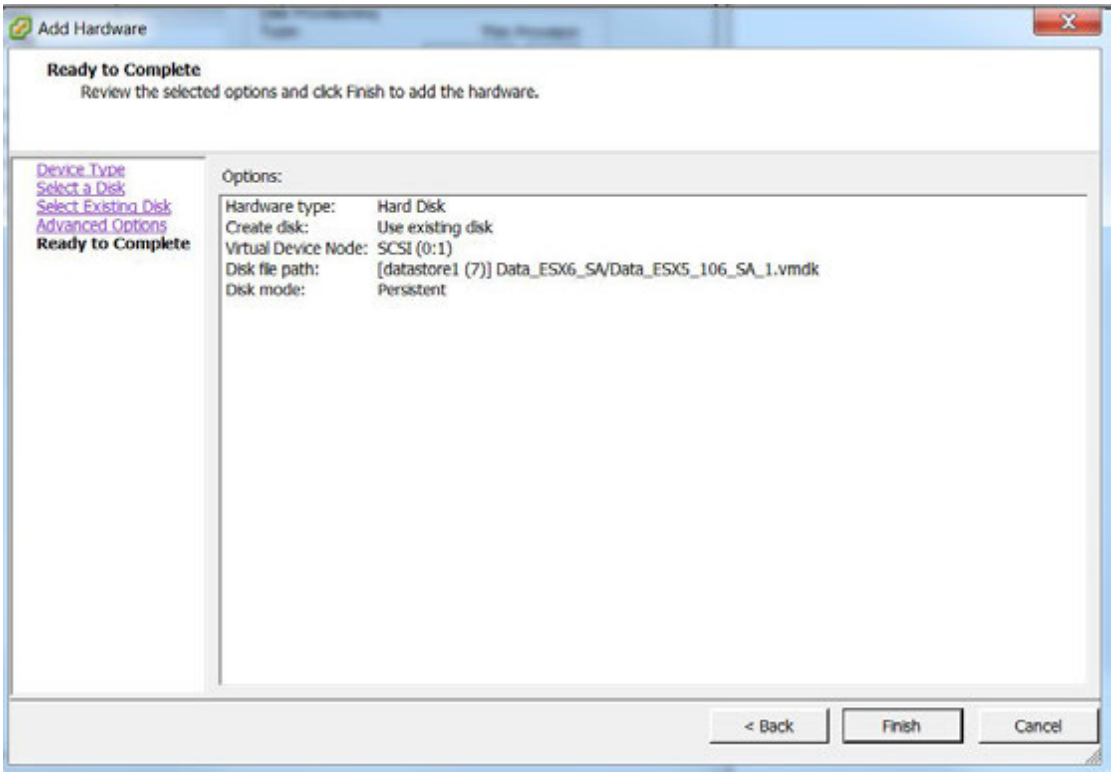


10. Click **Already existing hard disk** > **Next**.

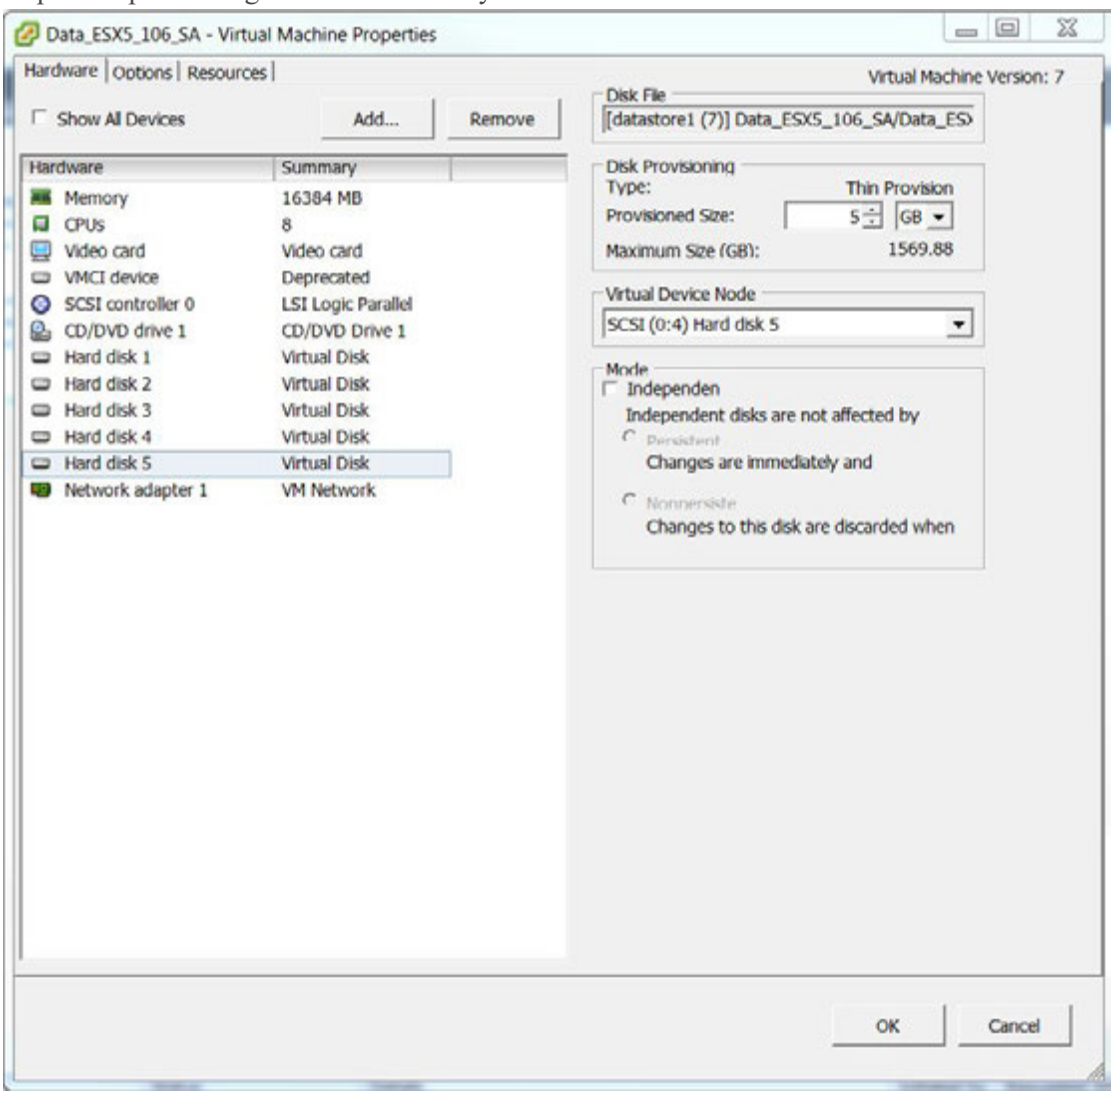
11. Click **Browse** and browse to the datastore location to which you copied the vmdk files.



12. Select the VMDK file from the 11.0 VM that you want to add as a disk.



13. Repeat steps 8 through 12 for each disk you want to add.



Task 4 - Retain MAC Address of Upgraded SA Server VM

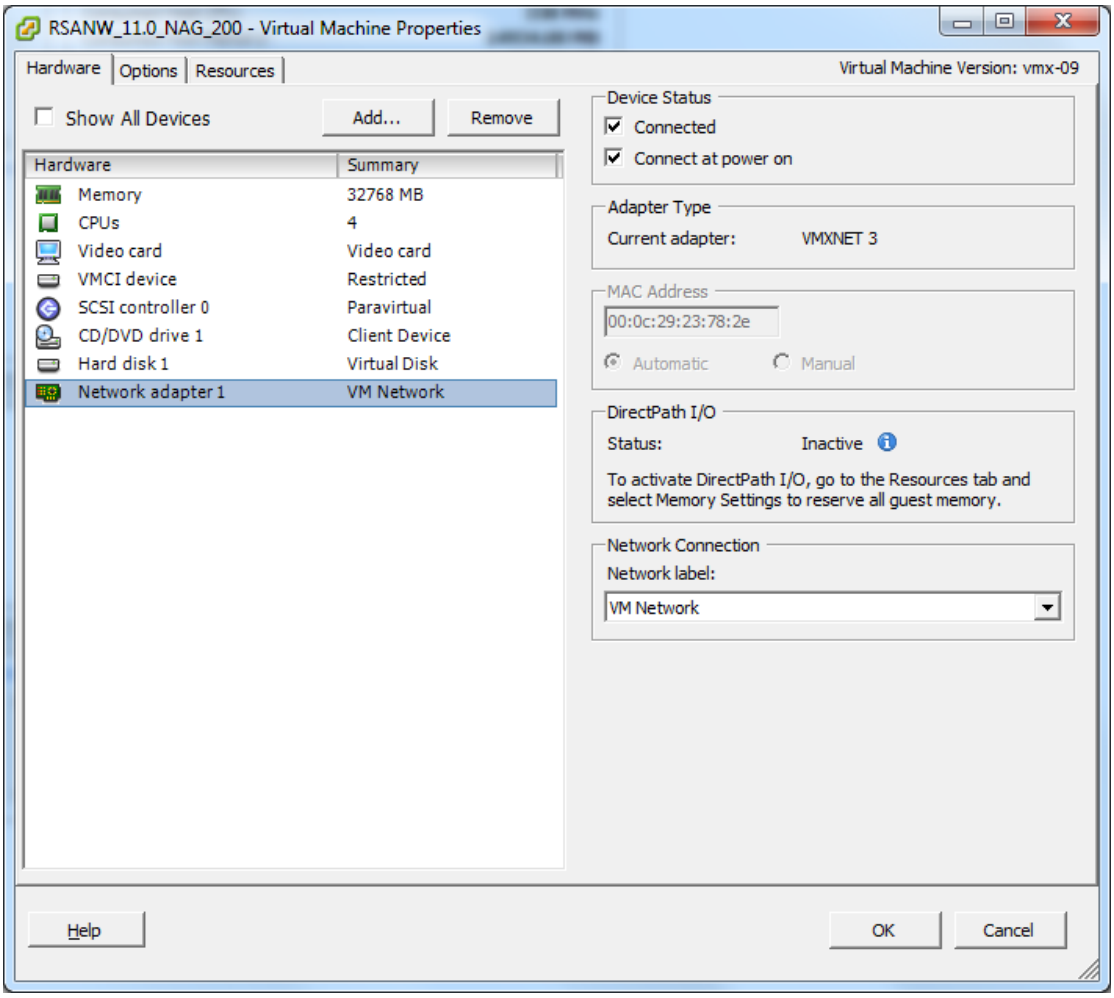
To retain the MAC address of migrated Security Analytics (SA) Server Virtual Machine (VM):

Note: These steps apply to the SA Server VM (created with "Automatic" MAC address assignment selected) to the 11.0 NetWitness Server. For VMs with a Static MAC address, you can change the MAC address by going to Edit Settings for a VM and typing in the MAC address.

1. Log in to vCenter server.

   Note: The supported versions of vCenter is 5.5 through 6.5 inclusive.

2. (Conditional) If they are powered on, **Power Off** both VMs (NetWitness 10.6.4.x and 11.0).
3. Click **Summary** tab, right-click **Datastore** and browse for the datastore location.
4. Go to the VM folder and download the `.vmx` file of 10.6.4.x and 11.0 to the local repository. By default, the VM generated with the MAC address is created in the format (as shown in the below figure).



Note: 00:0c:29:XX:YY:ZZ – 00:0c:29 is the unique identifier for an automatically generated MAC address. **00:50:56:XX:YY:ZZ – 00:50:56** is the unique identifier for a static or manually generated MAC address. This is valid only if the vCenter is not deployed. If vCenter is deployed, this MAC address denotes the unique identifier for an automatically generated MAC address.

5. Using a text editor, copy the `uuid.location` and `ethernet0.generatedAddress` values from 10.6.4.x **.vmx** file into the 11.0 **.vmx** file.

   Note: If you deployed the 10.6.4.x stack on the ESX server directly (not through VCenter), you must copy the value for `uuid.bios` in addition to `uuid.location` and `ethernet0.generatedAddress` from 10.6.4.x **.vmx** file into the 11.0 **.vmx** file.

6. Remove both the 10.6.4.x and the 11.0 VMs from inventory.

   a. Navigate to the vCenter server.

   b. Right-click both the 10.6.4.x and the 11.0 VMs.

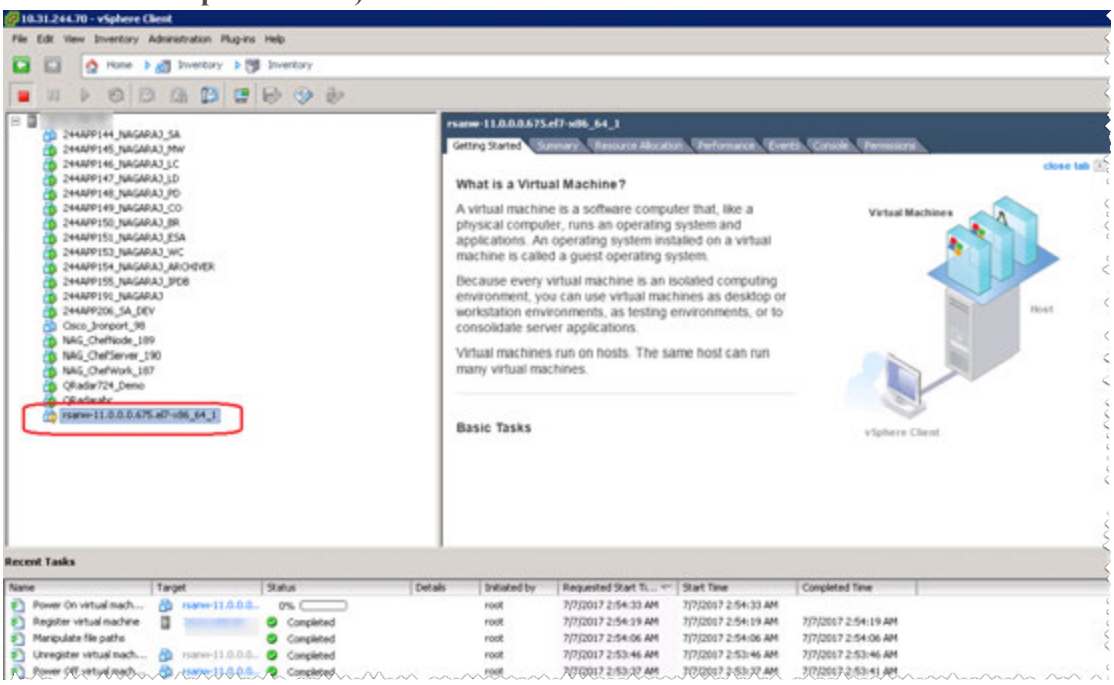
c. Select Remove from Inventory.

7. Upload the modified 11.0 **.vmx** file to the datastore location by replacing it with the existing **.vmx** file.

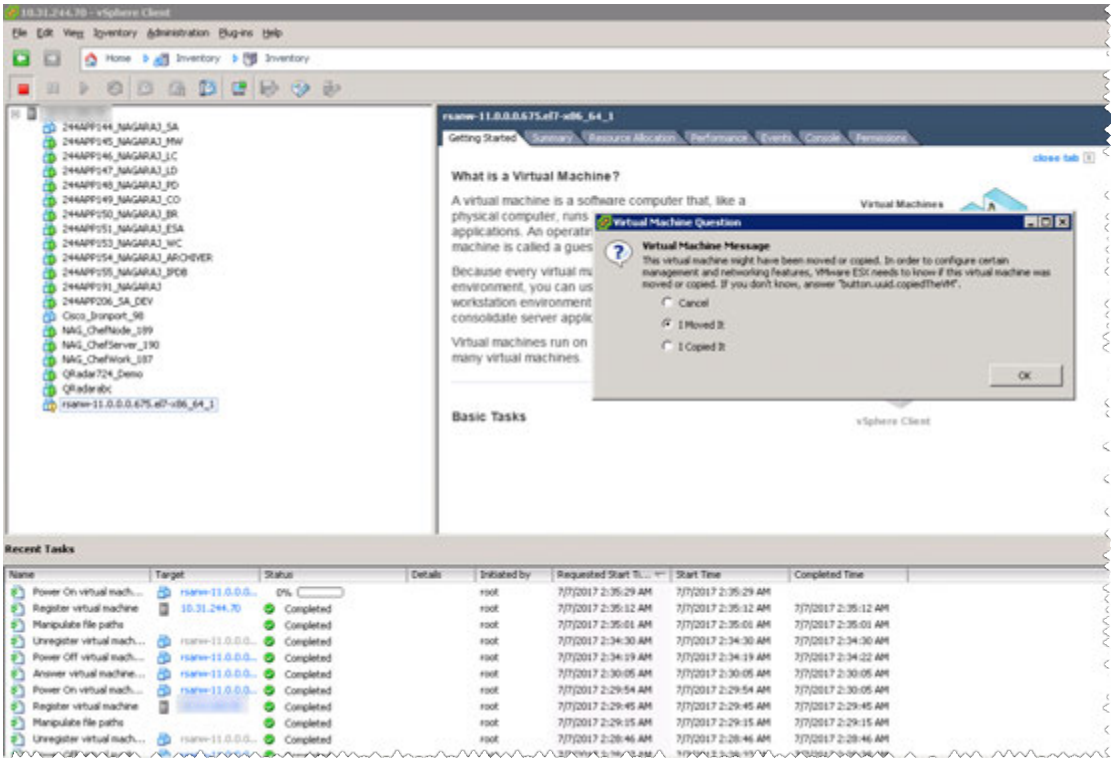
8. From the datastore, right- click the 11.0 **.vmx** file and select Add to Inventory.

9. Navigate to the vCenter server and **Power On** the VM.
The following message is displayed.
The virtual machine might have been moved or copied. In order to configure certain management and networking features, VMware ESX needs to know if this virtual machine was moved or copied. If you don't know, answer

"button.uuid.copiedTheVM)."



10. Right-click the VM and select **Guest** > **Answer Question**.
    The following figure is displayed.



11. Select **I Moved It**.
12. Click **OK**.
    The MAC address is retained to the MAC address from 10.6.4.x to 11.0.

Task 5 - Restore Backup Data in 10.6.4.x to 11.0 VMs

Power Off both 10.6.4.x and 11.0 VMs.

1. Log in to the vCenter server.
2. Copy the VMDK files from the 10.6.4.x to 11.0 VMs in the datastore.
   See Task 3 - Copy VMDK Files and Add As Hard Disk to New VM for detailed instructions.
3. Add all copied VMDKs as new hard disks on 11.0 machine with the existing VMDKs.
4. Change the MAC address of 11.0 VM to that of 10.6.4.x VM.
   See Task 4 - Retain MAC Address of Migrated VMs for detailed instructions.
5. Power on the 11.0 VMs.

6. Copy backed-up data from the `nw-backup` directory to the 11.0 VMs.

   - For the NW Server (SA Server in 10.6.4.x):

     Note: See Virtual Log Collector Host (VLC) for detailed instructions on how to upgrade the VLC.

     a. Create the `nwhome` directory under `/tmp`.

     b. Mount `VolGroup00-nwhome` on `/tmp/nwhome/`.
     ```
     mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
     ```

     c. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`.
     ```
     cp -r /tmp/nwhome/* /var/netwitness/
     ```

     d. Mount `VolGroup02-redb` on `/var/netwitness/database`.
     ```
     mount /dev/mapper/VolGroup02-redb /var/netwitness/database/
     ```

     Note: Make sure that the `/var/netwitness/database/nw-backupdirectory` exists with backup tarballs of the appliance.

     e. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`.
     ```
     umount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
     ```

   - For the Archiver, Broker, Concentrator, Log Decoder/Log Collector, and Packet Decoder:

     Note: If your 10.6.4.x Decoder or Log Decoder had multiple network interfaces:
     1. **Power Off** the 11.0 VM 11.0 Decoder or Log Decoder VM.
     2. Go to **Edit Settings** for the VM and add the required number of Ethernet Adapters.
     3. Power on the VM.
     4. Add the ethernet adapters before restoring the backup data.

     a. Create the `nwhome` directory under `/tmp`.

     b. Create a temporary mount `VolGroup00-nwhome` on `/tmp/nwhome/`.
     ```
     mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
     ```

     c. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`.
     ```
     cp -r /tmp/nwhome/* /var/netwitness/
     ```

     d. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`.
     ```
     umount /tmp/nwhome
     ```

   - For Malware Enterprise (Co-located Malware Not Supported in 11.0 Upgrade):

     a. Create the `apps` directory under `/tmp/`.

     b. Create a temporary mount `VolGroup01-apps` on `/tmp/apps/`.
     ```
     mount /dev/mapper/VolGroup01-apps /tmp/apps/
     ```

c. Copy the `nw-backup` directory to `/var/netwitness/`.
```
cp -r /tmp/apps/nw-backup /var/netwitness
```

d. Unmount `VolGroup01-apps` from `/tmp/apps/`.
```
umount /tmp/apps
```

- For Event Stream Analysis:

a. Create the `apps` directory under `/tmp/`

b. Create a temporary mount `VolGroup01-apps` on `/tmp/apps/`.
```
mount /dev/mapper/VolGroup01-apps /tmp/apps/
```

c. Copy the `nw-backup` directory to `/var/netwitness`.
```
cp -r /tmp/apps/database/nw-backup /var/netwitness
```

d. Unmount `VolGroup01-apps` from `/tmp/apps/`.
```
umount /tmp/apps
```

7. Mount the disks.

Note: If you have configured any external mount points on the VMs in the stack for any of the following directories, re-mount the external mount points in place of the following mounts.

- For the NW Server:
```
mount /dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/
mount /dev/mapper/VolGroup02-redb /var/netwitness/database/
```

Note: Make sure that the `/var/netwitness/database/nw-backup` directory exists with backup tarballs of the appliance.

- For the Log Decoder/Log Collector:

Note: The following mounts are not required for the Virtual Log Collector.

```
mount /dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder
mount /dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index
mount /dev/mapper/VolGroup01-sessiondb
/var/netwitness/logdecoder/sessiondb
mount /dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb
mount /dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector
mount /dev/mapper/VolGroup01-packetdb
/var/netwitness/logdecoder/packetdb
```

- For the Packet Decoder:
```
mount /dev/mapper/VolGroup01-decoroot /var/netwitness/decoder
mount /dev/mapper/VolGroup01-sessiondb
```

```
/var/netwitness/decoder/sessiondb
mount /dev/mapper/VolGroup01-index /var/netwitness/decoder/index
mount /dev/mapper/VolGroup01-metadb /var/netwitness/decoder/metadb
mount /dev/mapper/VolGroup01-packetdb
/var/netwitness/decoder/packetdb
```

- For the Concentrator:

```
mount /dev/mapper/VolGroup01-concroot /var/netwitness/concentrator
mount /dev/mapper/VolGroup01-sessiondb
/var/netwitness/concentrator/sessiondb
mount /dev/mapper/VolGroup01-index /var/netwitness/concentrator/index
mount /dev/mapper/VolGroup01-metadb
/var/netwitness/concentrator/metadb
```

- For the Archiver:

```
mount /dev/mapper/VolGroup01-archiver /var/netwitness/archiver
mount /dev/mapper/VolGroup02-workbench /var/netwitness/workbench
```

- For the Broker:

```
mount /dev/mapper/VolGroup01-broker /var/netwitness/broker
```

8. Add the following mount entries to `/etc/fstab`.

   - For the NW Server:

   ```
   /dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/ xfs
   defaults,noatime,nosuid 1 2
   /dev/mapper/VolGroup02-redb /var/netwitness/database/ xfs
   defaults,noatime,nosuid 1 2
   ```

   - For the Log Decoder/Log Collector:

   Note: The following mounts are not required for the Virtual Log Collector.

   ```
   /dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder ext4
   defaults,noatime,nosuid 1 2
   /dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index xfs
   ```

```
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-sessiondb
/var/netwitness/logdecoder/sessiondb xfs defaults,noatime,nosuid 1
2
/dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb
xfs defaults,noatime,nosuid 1 2
```

- For the Packet Decoder:

```
/dev/mapper/VolGroup01-decoroot /var/netwitness/decoder ext4
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-sessiondb /var/netwitness/decoder/sessiondb
xfs defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-index /var/netwitness/decoder/index xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-metadb /var/netwitness/decoder/metadb xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-packetdb /var/netwitness/decoder/packetdb
xfs defaults,noatime,nosuid 1 2
```

- For the Concentrator:

```
/dev/mapper/VolGroup01-concroot /var/netwitness/concentrator ext4
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-sessiondb
/var/netwitness/concentrator/sessiondb xfs defaults,nosuid,noatime
1 2
/dev/mapper/VolGroup01-index /var/netwitness/concentrator/index xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb
xfs defaults,noatime,nosuid 1 2
```

- For the Archiver:

```
/dev/mapper/VolGroup01-archiver /var/netwitness/archiver xfs
defaults,nosuid,noatime 1 2
/dev/mapper/VolGroup02-workbench /var/netwitness/workbench xfs
defaults,nosuid,noatime 1 2
```

- For the Broker:

```
/dev/mapper/VolGroup01-broker /var/netwitness/broker xfs
defaults,nosuid,noatime 1 2
```

Set Up Virtual Hosts in 11.0

There two phases to set up your 11.0 virtual stack that you must complete in the order shown.

- Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.4.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.0 and they will not be available until the warm up completes.

- Phase 2 - Set Up The Rest of the Component Hosts

Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

Task 1 - Set Up 11.0 NetWitness Server

Follow the instructions under Set Up 11.0 NW Server Host.

Task 2 - Setup 11.0 ESA

Caution: If you had C2 modules enabled in 10.6.4.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.0 and they will not be available until the warm up completes.

Follow the instructions under Set Up 11.0 Non-NW Server Host to set up your ESA hosts.

1. Set up your primary ESA host through the Setup program and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, set it up through the Setup program and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Set Up 11.0 Malware Analysis

Follow the instructions under Set Up 11.0 Non-NW Server Host.

Task 4 - Set Up 11.0 Broker or Concentrator

Follow the instructions under Set Up 11.0 Non-NW Server Host.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.0 NW Server cannot communicate with 10.6.4.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Set Up The Rest of the Component Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Decoder and Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Set Up 11.0 Non-NW Server Host.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in the *Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh* in the **Backup Instructions**.
2. Stop data capture on the Log Decoder.
3. Complete the steps in Set Up 11.0 Non-NW Server Host.
4. Restart data capture on Log Decoder.

Note: After you upgrade, you will restart log collection after completing the Task 11 - Reset Stable System Values for Log Collector after Upgrade in the **Post Upgrade Tasks**

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described in the *Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh*.
2. Back up your 10.6.4.x VLC by editing the `all-systems` file on host where you performed the backup.
   a. Make sure your `all-systems` file contents has this information before you perform this step.
   `vlc,<host-name>,<IP-address>,<UUID>,10.6.4.0`

b. Run the following command to create backup.

```
./nw-backup.sh -u
```

See Backup Instructions for detailed procedures on how to back up the host.

3. Make sure the backup host contains the VLC backup in the following format.

```
<hostname>-<IPaddress>-root.tar.gz
<hostname>-<IPaddress>-root.tar.gz.sha256
<hostname>-<IPaddress>-backup.tar.gz
<hostname>-<IPaddress>-backup.tar.gz.sha256
<hostname-IPaddress>-network.info.txt
all-systems-master-copy
```

4. Power off the 10.6.4.x VLC so that a new 11.0 VM can be created with the same network configuration.
5. Deploy a fresh Non-NW Server host using the 11.0 NetWitness Suite ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.4.x VLC.
This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.4.x VLC backup file.

Note: Make sure IPv6 is disabled.

a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings. Contents of `ifcfg-eth0` should be as follows.

```
TYPE=Ethernet
DEFROUTE=yes
NAME=eth0
UUID=<uuid>
DEVICE=eth0
DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
BOOTPROTO=static
IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
NM_CONTROLLED=no
ONBOOT=yes
```

b. Submit the following command string.

```
systemctl restart network.service
```

8. Create the backup directory.

```
# mkdir -p /var/netwitness/database/nw-backup/
```

9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new VLC in the `/var/netwitness/database/nw-backup` directory.
10. Complete the steps 2 through 12 inclusive in Set Up 11.0 Non-SA Server Host for the rest of the NetWitness Suite components . Make sure that you select **Log Collector** for the service in step 12.

Set Up 11.0 NW Server Host

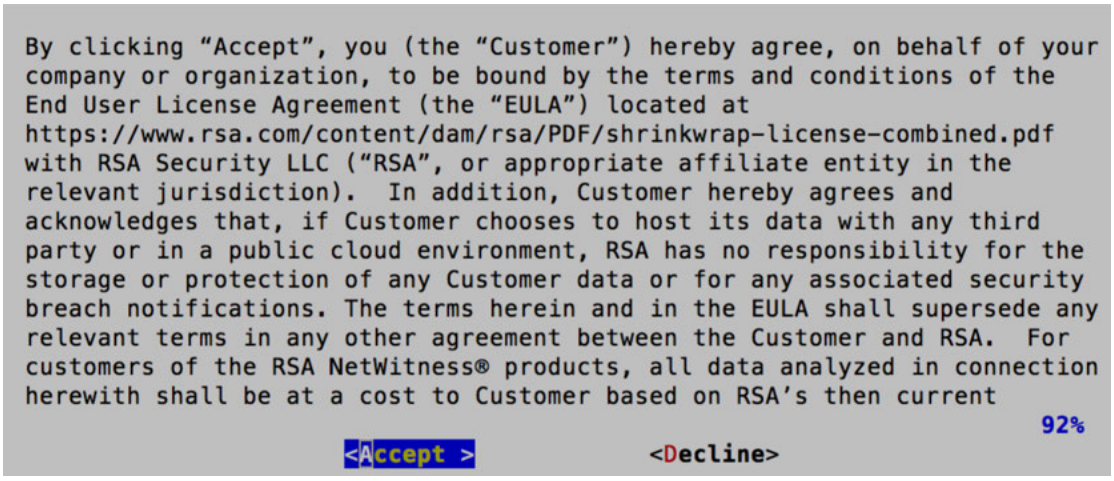
Make sure that you have backed up 10.6.4.x data for the SA Server host. **You must follow the instructions in** Backup Instructions **to back up the host.**

Caution: Run the backup immediately before upgrading the SA Server to 11.0 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.0.

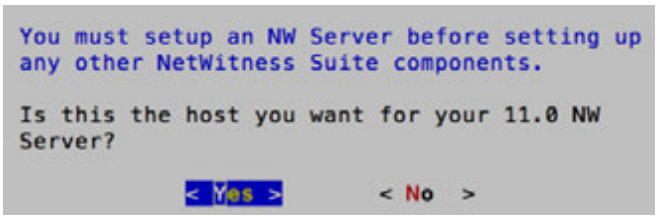
Complete the following steps to set up the 11.0 NW Server host.

1. Power on the NW Server VM and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

   Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press the Enter key to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use access the host.

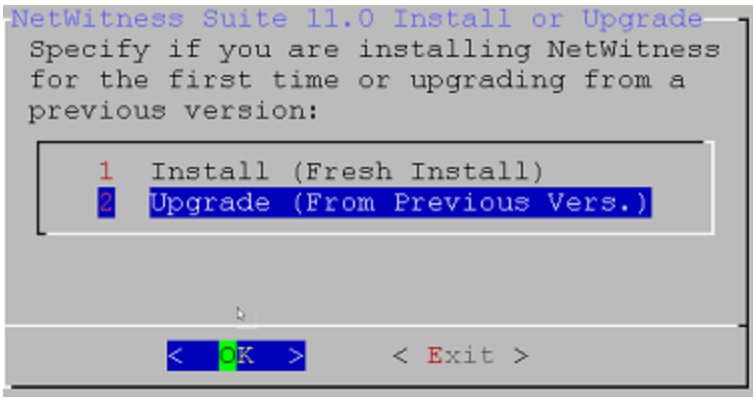
   


2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

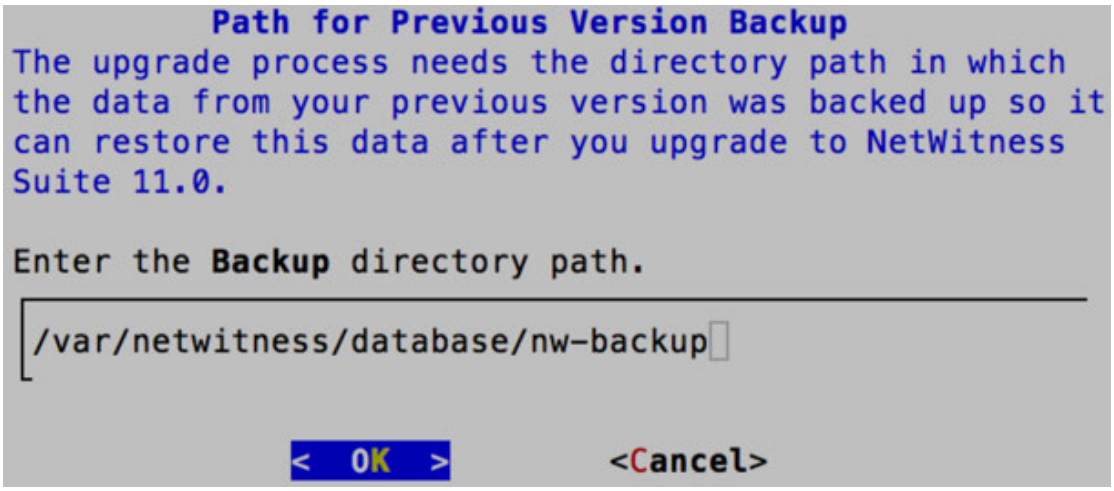


Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.0 NW Server Host to correct this error.

3. Tab to **Yes** and press **Enter**.
   Choose No if you already upgraded the NW Server to 11.0.
   The Install or Upgrade prompt is displayed.



4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.
   The backup path prompt is displayed.

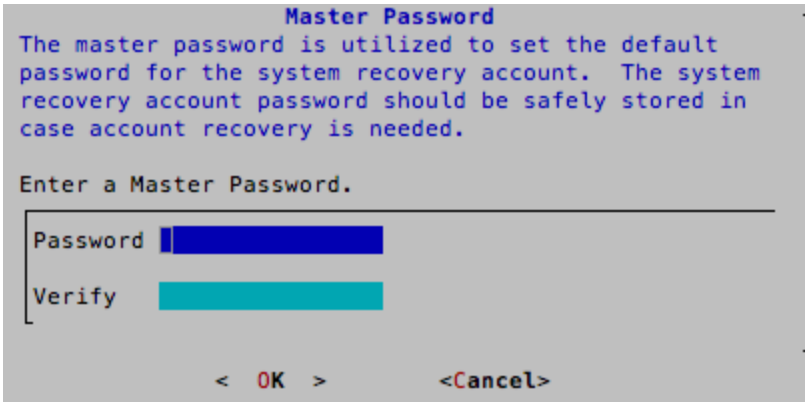


5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Master Password prompt is displayed.

The following list of characters are supported for Master Password and Deployment Password:

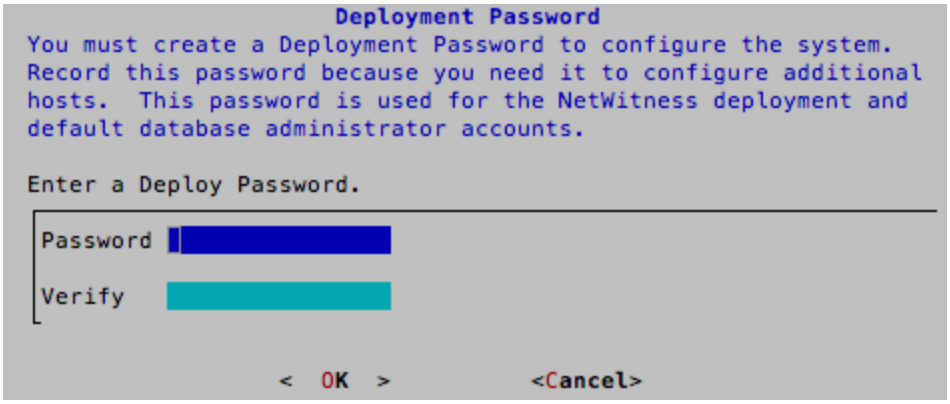
- Symbols : ! @ # % ^ +
- Numbers :0-9
- Lowercase Characters : a-z
- Uppercase Characters : A-Z

No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ , ; : . < > -).



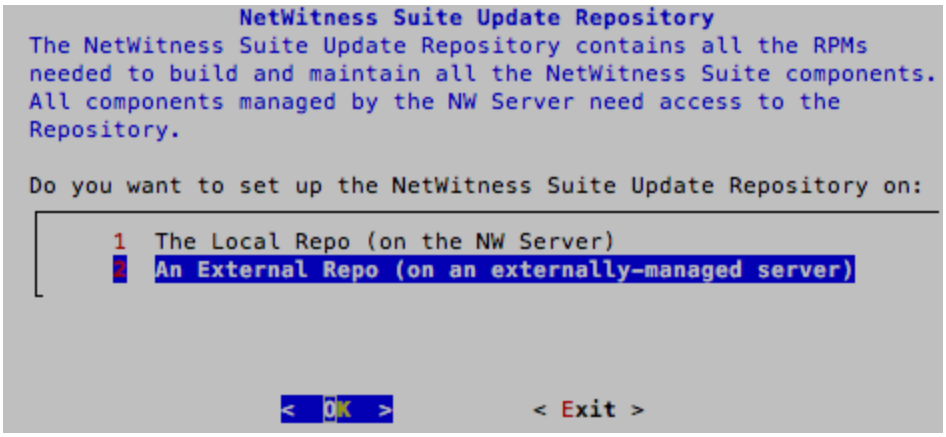
6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   The Deployment Password prompt is displayed.



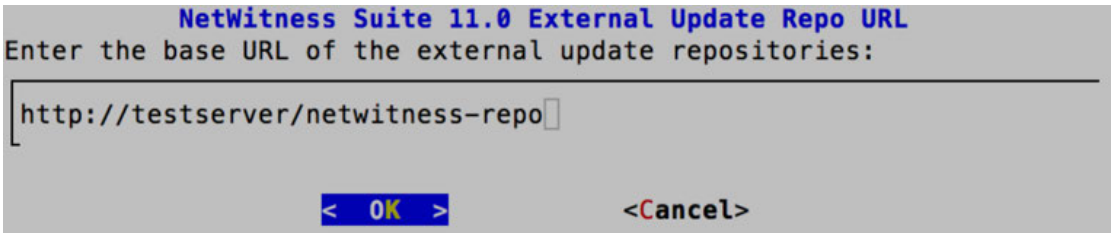
7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   The Update Repo prompt is displayed.

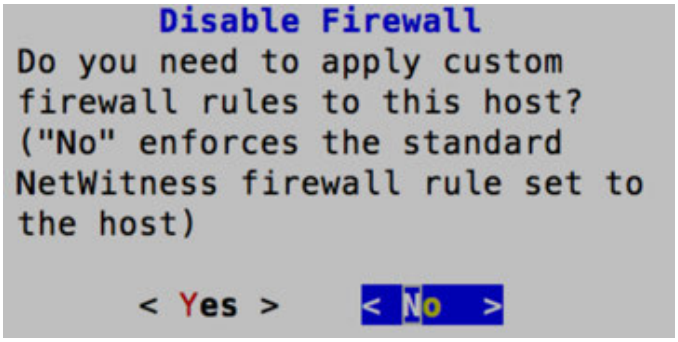


You must use the same repo that you used for the NW Server hosts for all hosts.

8. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL.

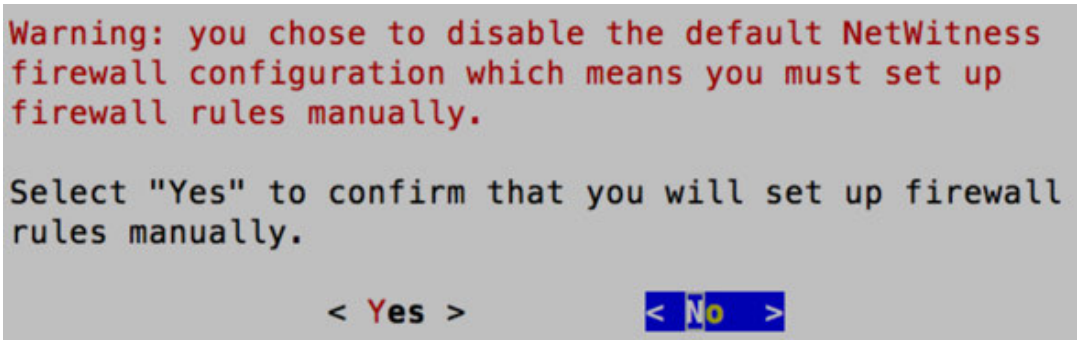


9. Enter the base URL of the NetWitness Suite external repo and click **OK**.
   The disable or use standard firewall configuration prompt is displayed.



10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

- If you select Yes, confirm your selection.



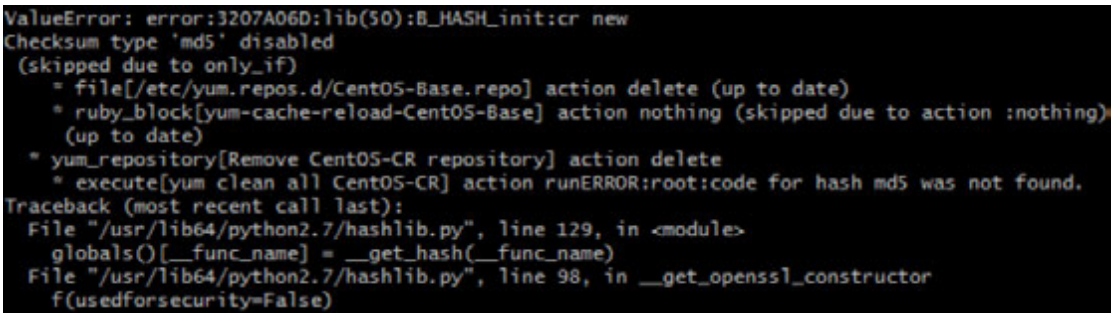
- If you select No, the standard firewall configuration is applied.

The start upgrade prompt is displayed.

11. Select 1 **Upgrade Now**, tab to **OK**, and press Enter.

    When "Installation complete" is displayed, you have upgraded the 10.6.4.x SA Server to the 11.0 NW Server.

> **Note:** Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



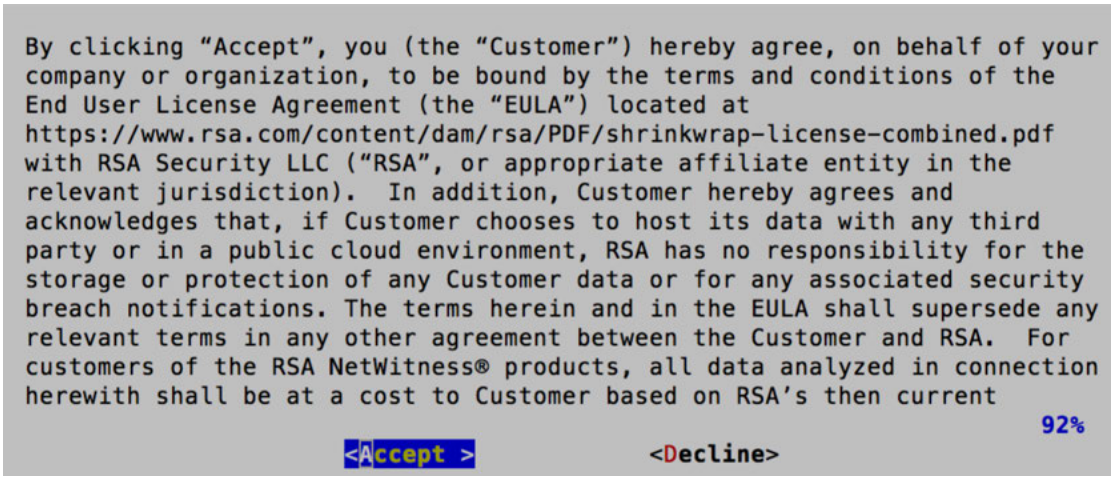
Set Up 11.0 Non-NW Server Host

Make sure that you Back up your 10.6.4.x data for the host. **You must follow the instructions in** Backup Instructions **to back up the host.**

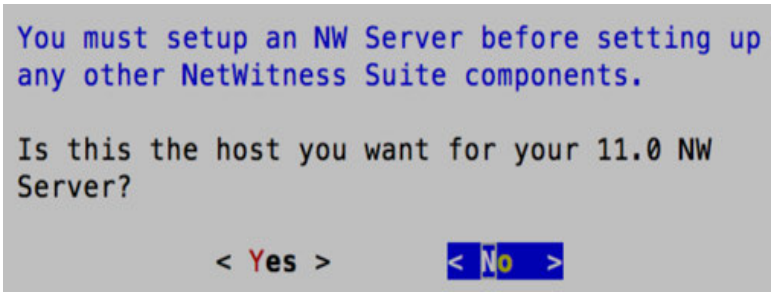
Caution: Run the backup immediately before upgrading the host to 11.0 so that the data is as recent as possible.

Complete the following steps to set up an 11.0 Non-NW Server host.

1. **Power On** the non-NW Server VM and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.



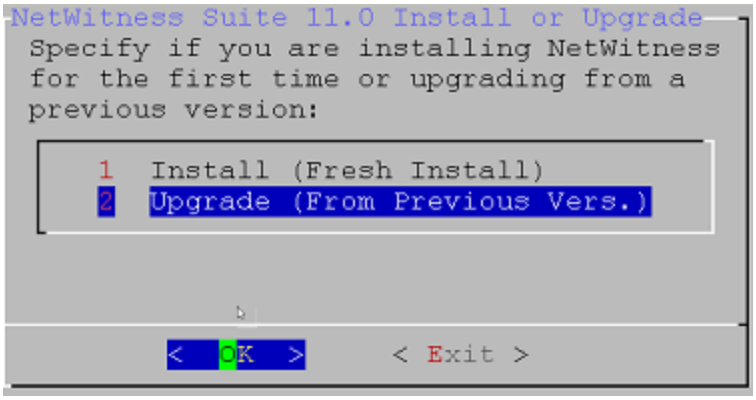
2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.



Caution: If you choose the wrong the host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.0 NW Server Host to correct this error.

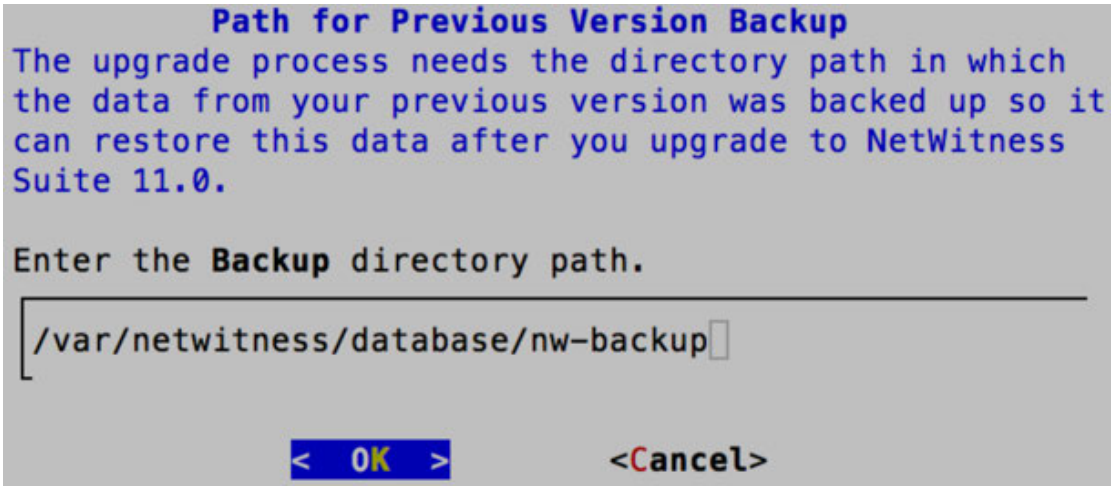
3. Tab to **No** and press **Enter**.

   The Install or Upgrade prompt is displayed.



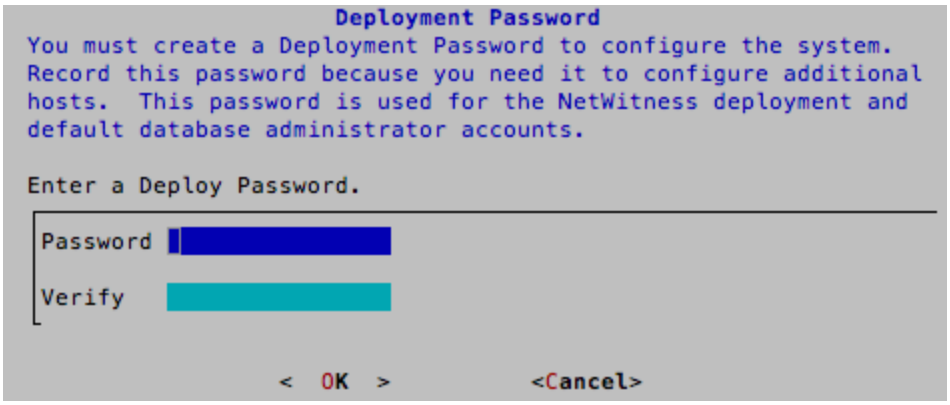
4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.

   The backup path prompt is displayed.



5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.

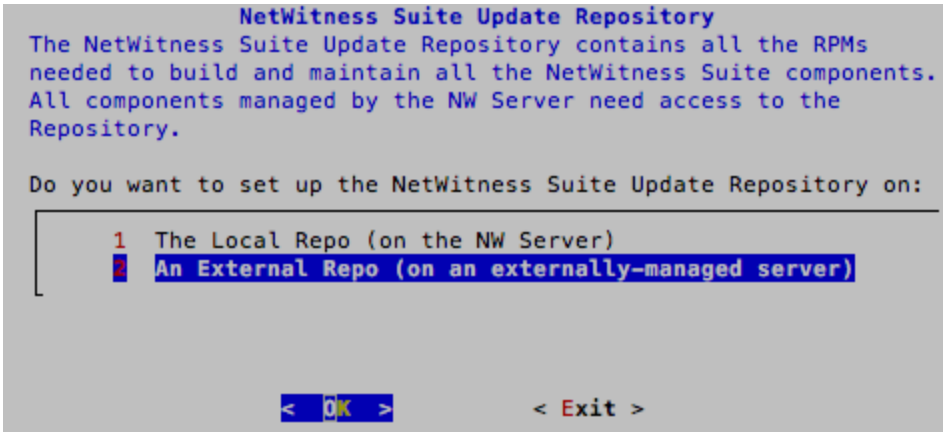
   The Deployment Password prompt is displayed.



Note: You must use the same deployment password that you used when you upgraded the NW Server.

6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

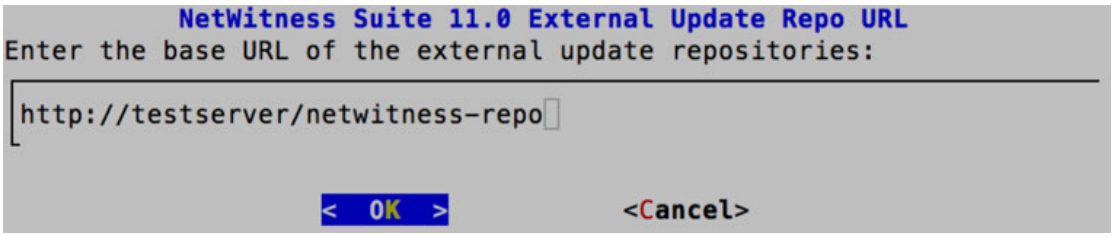
   The Update Repo prompt is displayed.



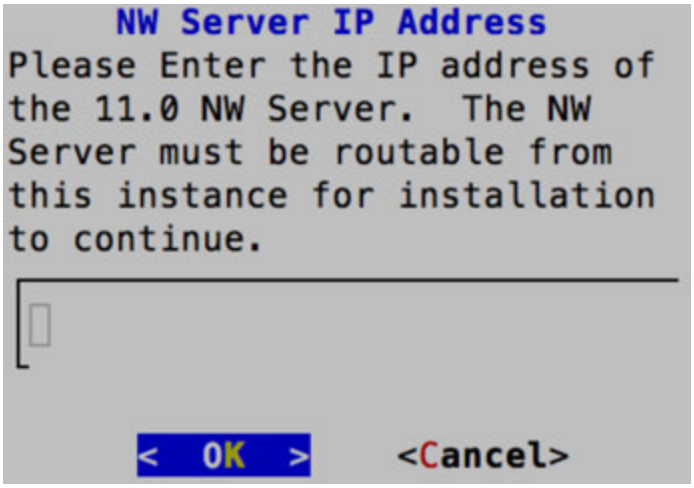
7. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, tab to **OK**, and press **Enter**.

   The UI prompts you for a URL.

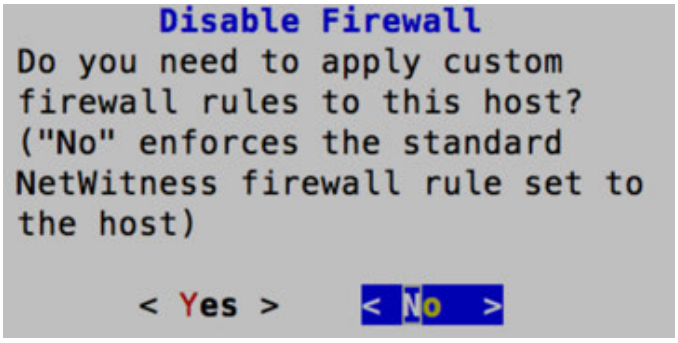
   The repositories give you access RSA updates and CentOS updates.



8. Enter the base URL of the NetWitness Suite external repo and click **OK**.
   The NW Server IP Address is displayed.



9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.
   The disable or use standard firewall configuration prompt is displayed.



10. Tab to **No**, and press Enter to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

    - If you select **Yes**, confirm your selection.

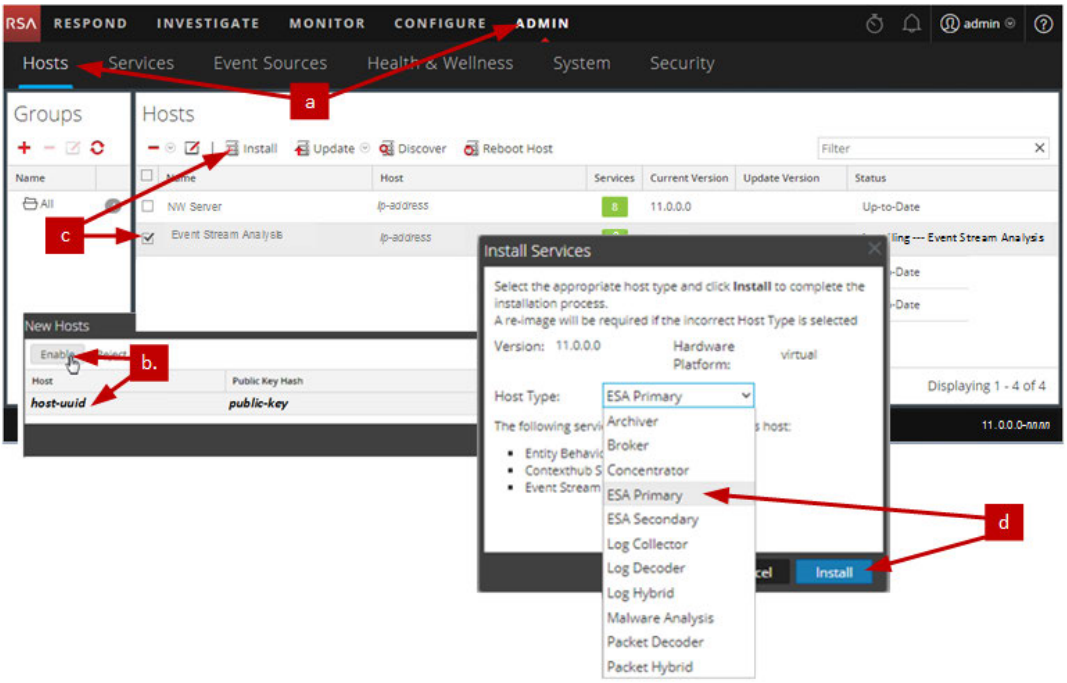
    - If you select **No**, the standard firewall configuration is applied.

The start upgrade prompt is displayed.

11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.
    When "Installation complete" is displayed, you have upgraded the host to the 11.0.
12. Install the service on this host:
    a. Log into NetWitness Suite.
       Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Suite Login screen
    b. Click **ADMIN** > **Hosts**.
       The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

       Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.
    c. Click on the host in the **New Hosts** dialog and click **Enable**.
       The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.
    d. Select that host (for example, **Event Stream Analysis**) and click Install
       The **Install Services** dialog is displayed.

e. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



You have completed the upgrade of the non-NW Server host in NetWitness Suite

Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness 11.0 Legacy Windows Collection Guide* on RSA Link (https://community.rsa.com/docs/DOC-75593) for details about how to install or update Legacy Windows collection.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

This topic contains the tasks you must complete after you upgrade your hosts from 10.6.4.x to 11.0. These tasks are organized by the following categories.

- Global
- NetWitness Endpoint
  RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, and 4.4 only for NetWitness Suite 11.0.
- Event Stream Analysis
- Log Collection
- Reporting Engine
- Respond
- NetWitness SecOps Manager
- Security

Global Tasks

Task 1 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.0 before you remove the backup-related files from the local directories on your 11.0 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.0, you must remove:

- the backup files from the local directories on the hosts.
- all the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`

Host	Backup Path	Restore Path
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

Task 2 - Restore NTP Servers

You must use the NetWitness Suite 11.0 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *RSA NetWitness® Suite 11.0 System Configuration Guide* for detailed instructions on how to add NTP servers. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 3 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Suite licenses. Refer to "Step 1. Register the NetWitness Server" in the *RSA NetWitness Suite Licensing Management Guide* for instructions on how to re-download licenses. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 4 - Remap Virtual NW Server License to 10.6.4.x MAC Address

If you are upgrading a Security Analytics server running on a virtual machine, change the 11.0 NW Server virtual host to the 10.6.4.x MAC address to retain licensing. Refer to "Licensing: Step 1. Register the NetWitness Server" in the *RSA NetWitness Suite Licensing Management Guide* for instructions on remapping a license to a new MAC address." Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

(Conditional) Task 5 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create a user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   `/etc/sysconfig/iptables`
   `/etc/sysconfig/ip6tables`
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 6 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.4.

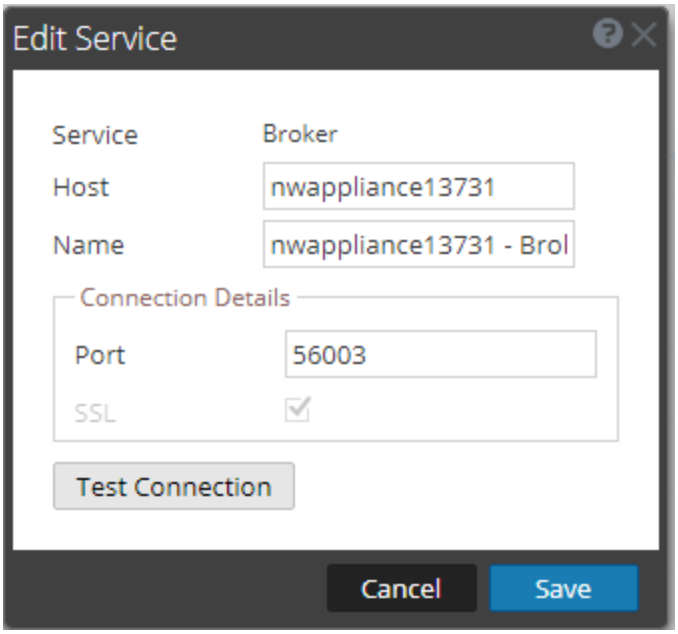
NetWitness Suite 11.0 cannot communicate with the core services for these customers because they are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to NetWitness Suite
2. Go to **ADMIN** > **Services**.
3. Select each core service and change there ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005

Service	Non-SSL	SSL
Decoder	50004	56004
Log Decoder	50002	56002

4. Click (Edit) from the **Services** view toolbar.
   The Edit Service dialog is displayed.
5. Change the port from Non-SSL to SSL as shown in the table and click **Save**(for example, change the Broker port from 50003 to 56003).



NetWitness Endpoint

Task 7 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Suite 11.0, the virtual host is `/rsa/system`. For 10.6.4.x and earlier versions, the virtual host is `/rsa/sa`.
2. Restart the API Server and Console Server.

3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.
6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Event Stream Analysis Tasks (ESA)

Task 8 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.4.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.0.

1. Log in to NetWitness Suite 11.0
2. Click **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Packets and C2 for Logs, require a whitelist named "**domains_whitelist**".
3. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Click **ADMIN**> **Services**, select the Context Hub service, in the action commands () drop-down menu, click **View** > **Config** > **Lists** tab).
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *NetWitness Suite Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *NetWitness Suite ESA Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Task 9 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL

If you integrate with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.4.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Suite by logging into the host and running the following `rabbitmqctl` command.

   ```
   > rabbitmqctl add_user <username> <password>
   ```

   For example:

   ```
   > rabbitmqctl add_user wtd-incidents incidents
   ```

2. Set permissions for users by running the following command (use the username from step 1):

   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*", ".*"
   ```

   For example:

   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*", ".*", ".*"
   ```

Task 10 - Enable Threat - Malware Indicators Dashboard

In 11.0.0, the 10.6.4.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.4.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.0.
2. Set datasource for new dashlets.

   See "Dashlets" in the RSA Link (https://community.rsa.com/docs/DOC-81463).

Log Collection

Task 11 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.0 to ensure that all collection protocols resume normal operation.

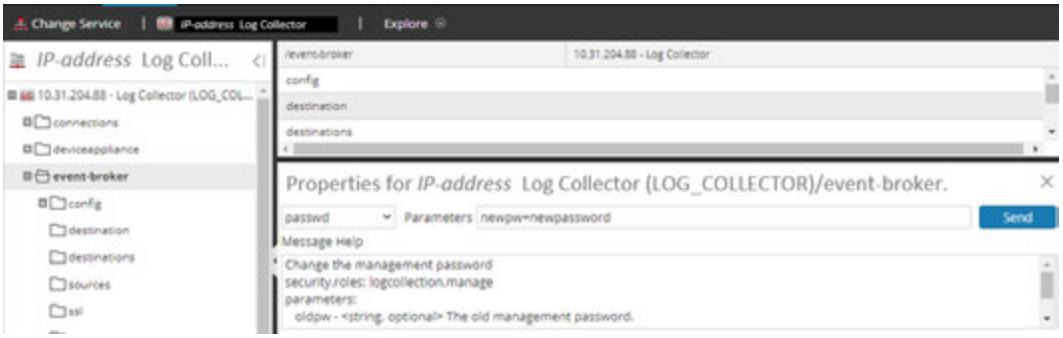
Reset Stable System Values for the Lockbox

The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *RSA NetWitness® SuiteLog Collection Configuration Guide* for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Update Log Collector Service RabbitMQ User Account Password

If the logcollector service RabbitMQ user account password was changed, you must reenter it after the 11.0 upgrade.

1. Log in to NetWitness Suite.
2. Click **ADMIN > Services**.
3. Select the Log Collector service.
4. Click  (Actions) > **View** > **Explore**.
5. Right click `event-broker` > **Properties**.
6. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



(Optional for Upgrades from 10.6.4.x with FIPS enabled for Log Collectors, Log Decoders and Packet Decoders) Task 12 - Enable FIPS Mode

FIPS is enabled on all services except Log Collector Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder. For information about how to enable FIPS for these services, see the "Sys Maintenance: Activate or Deactivate FIPS" topic in the *RSA NetWitness® SuiteSystem Maintenance Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Reporting Engine

Task 13 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the back up you made prior to the upgrade. The Backup script backs up the 10.6.4.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.0.

1. SSH to the NW Server host.
2. Export the CA certificates.
   `keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file`
3. Copy the CA pem into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 14 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *RSA NetWitness® Suite Reporting Engine Configuration Guide* for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Respond

Task 15 - Restore Respond Service Custom Keys

In 10.6.4.x, if you added custom key for use in the groupBy clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.
   This directory is where the `alert_rules.json` file is restored from the 10.6.4.x backup.
2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.0.
   This is the new file for 11.0.
3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 16 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.0 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.4.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.4.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.4.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Suite 11.0 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.4.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

(Conditional) Task 17 - Enable Disabled 10.6.4.x Incident Management Data Retention

Complete the following procedure to enable the Incident Management data retention jobs you disabled prior to upgrade.

1. Log in to RSA NetWitness® Suite.
2. Go to **ADMIN** > **Services** and select the **Respond server**.
3. Click the  (Actions), **View** > **Explore**.
4. Go to the `respond/dataretention` node.
5. Set the `enable` parameter to `true`.

(Conditional) Task 18 - Restore Custom Analysts Roles

If you had custom analyst roles in 10.6.4.x, you must reinstate them in 11.0. See *Adding Roles and Assigning Permissions for the Roles* in the *RSA NetWitness Suite Warehouse Analytics Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

NetWitness SecOps Manager

Task 19 -Reconfigure NW SecOps Manager Integration

For information on how to reconfigure NW SecOps for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

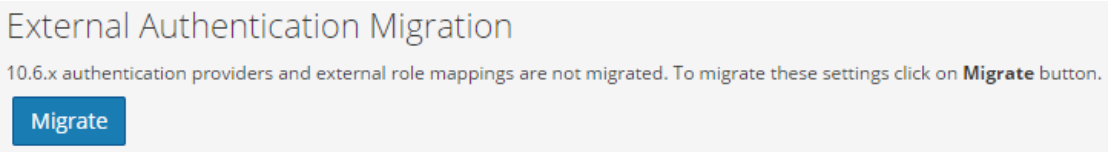
Security

Task 20 - Migrate Active Directory (AD)

The first time you log into the NetWitness Suite 11.0 User Interface, you must click on the Migrate button to complete the migration of AD.

Caution: If you did not upgrade from 10.6.4.2, you must apply the 11.0.0.1 patch immediately before you first log into NetWitness Suite 11.0 and migrate Active Directory. You do not need to apply the 11.0.0.1 patch if you upgraded to 11.0 from 10.6.4.2.

1. Log in to NetWitness Suite with your `admin user` credentials.
2. Click **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 21 - Modify Migrated AD Configuration to Upload Certificate

If the you used a self-signed certificate in Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.4.x, you must modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

Complete the following procedure to modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

1. Log in to NetWitness Suite.
2. Click **ADMIN** > **Security** and click the **Settings** tab.
3. Under **Active Directory Settings**, select an AD configuration and click  .

   The Edit Configuration dialog is displayed.
4. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
5. Click **Save**.

Task 22. Address Authentication Failure in 11.0

Users cannot log in to NetWitness Suite User Interface after you upgrade to 11.0 because the Interface cannot retrieve user account information from MongoDB.

- Apply the 11.0.0.1 patch to fix this issue immediately after you upgrade to 11.0.

Task 23 - Reconfigure Pluggable Authentication Module (PAM) in 11.0

You must reconfigure PAM after you upgrade to 11.0. See "Configure PAM Login Capability" in the *RSA NetWitness® Suite System Security and User Management Guide*for instructions. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

You can refer to your 10.6.4.x PAM configuration files in the **/etc** directory in the your 10.6.4.x backup data for guidance.

Appendix A. Troubleshooting

This section describes problems that you may encounter during the upgrade with solutions. In most cases, NetWitness Suite creates log messages when it encounters these problems.

Note: If you cannot resolve any upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294) .

This section has troubleshooting documentation for the following services, features, and processes.

- 11.0 Setup Program (`nwsetup-tui`)
- Backup
- Event Stream Analysis
- General
- Log Collector Service (`nwlogcollector`)
- NW Server
- Reporting Engine

11.0 Setup Program (`nwsetup-tui`)

Problem	Host Setup Program (`nwsetup-tui`) exits and creates the following error message in `/var/log/netwitness/bootstrap/launch/security-server/security-server.log`:
	`<yyyy-mm-dd hh:mm:ss,nnn> [ main] ERROR SystemOperation|Service startup failed. Running in safe mode org.h2.jdbc.JdbcSQLException: The database is read only [90097-193]`
	`at org.h2.message.DbException.getJdbcSQLException(DbException.java:345) ...`
	`at org.springframework.jdbc.datasource.AbstractDriverBasedDataSource.getConnection(AbstractDriverBasedDataSource.java:159)`
	`at com.rsa.asoc.security.upgrade.legacy.MigrationDatabase.<init>(MigrationDatabase.java:113)`

Cause	The H2 database needs write permission to complete the host setup.

Solution	From the NW Server command line, provide write permission to `H2.db`, restart the NW Server, and restart nwsetup-tui Setup Program.
	`chmod o+w /var/lib/netwitness/uax/db/platform.h2.db`
	`systemctl restart rsa-nw-security-server.service`
	`nwsetup-tui`

Backup (`nw-backup` script)

Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA mongo admin password back to the original default of 'netwitness' before running backup. See "ESA Config: Change MongoDB Password for admin Account" the the *RSA NetWitness® Suite Event Stream Analysis Configuration Guide. Go to the* Master Table of Contents *for Version 11.0 to find NetWitness Suite 11.0 documents.*

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.0 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESAPrimary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA .
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

General

Logs referred to in this section are posted to `/var/log/install/install.log` on the NW Server Host.

Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health.AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Suite sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service using below command. `systemctl restart rsa-sms`

Message	`<timestamp> <host>: SMS_PostInstall: INFO: Free disk space on /opt is nGB` `<timestamp> <host>: SMS_PostInstall: WARN: Disk space check failed on /opt. The available disk space nGB is less than the recommended minimum disk space of 10GB.`
Cause	Low or insufficient disk space allocated for the SMS service.
Solution	RSA recommends that you provide a minimum of 10 GB of disk space for the SMS service to run optimally.

Problem	After you run the Setup Program for a non-NW Server host, you must go in to the UI, enable the host, and install the service on the host from the Hosts View. If you see "Install error View Details" in the **Status** column of the Hosts view, the host lost connectivity due to network issues.
Solution	Re-install the service on the host from the Hosts view.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Suite and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Message	*timestamp* `NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	(Conditional) If you use a Log Collector Lockbox, log in to NetWitness Suite and configure the Lockbox as described in the"Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents..

Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Suite and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the sa.log. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.4 to 11.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Message	`<timestamp> : Available free space in /home/rsasoc/rsa/soc/reporting-engine [ existing-GB ] is less than the required space [ required-GB ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Appendix B. Stopping and Restarting Data Capture and Aggregation

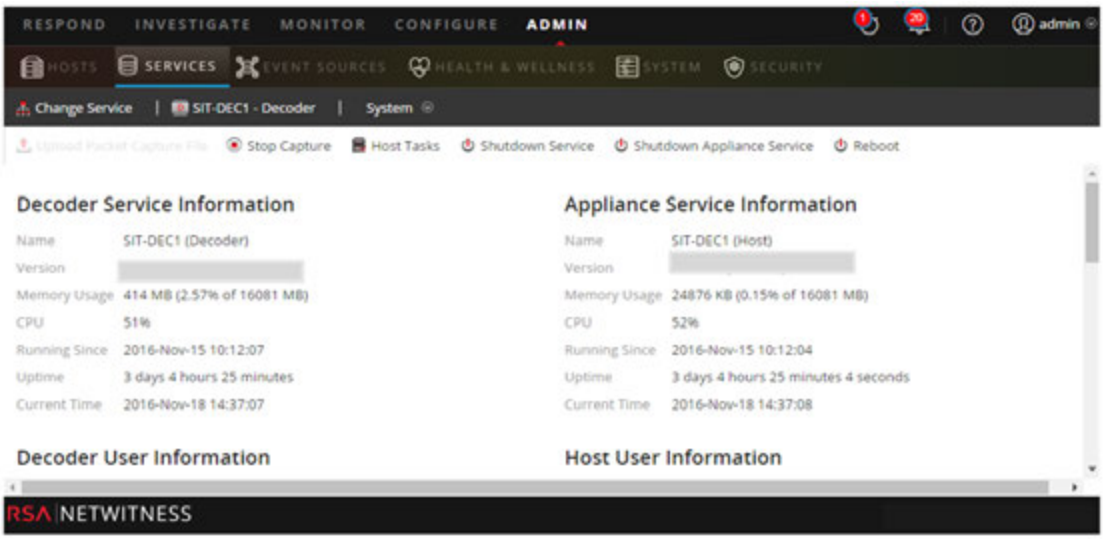
RSA recommends that you stop packet and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.0. If you do this, you must restart packet and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Packet Capture

To stop packet capture:

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

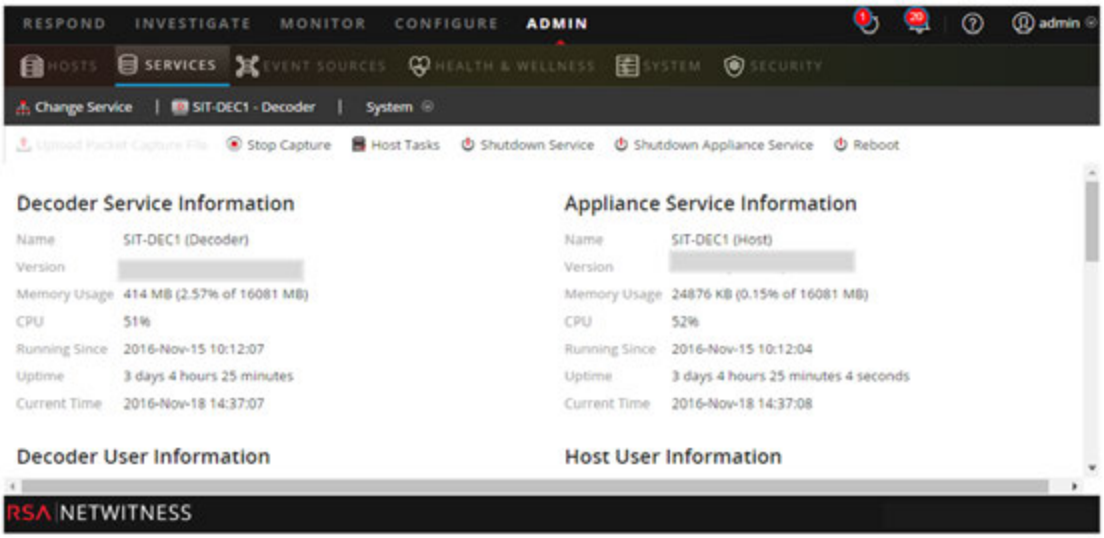
.

Stop Log Capture

To stop log capture:

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.



3. Under  (actions), select **View** > **System**.

4. In the toolbar, click 

.

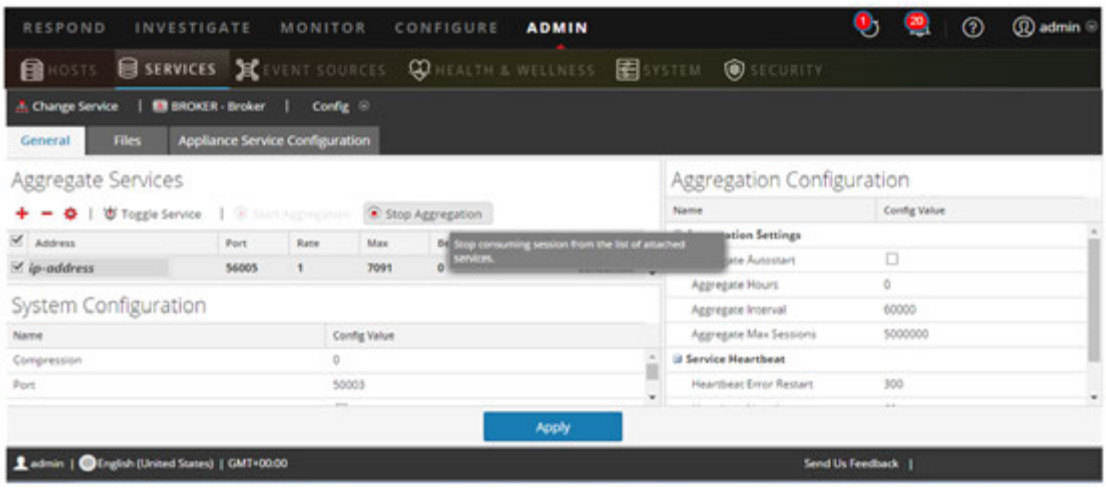
Stop Aggregation

1. Log in to NetWitness Suite and go to **ADMIN** > **Services**.

2. Select the **Broker** service.

3. Under  (actions), select **View** > **Config**.

4. The **General** tab is displayed.



5. Under **Aggregated Services** click 

.

Start Data Capture and Aggregation

Restart packet and log capture and aggregation after updating to 11.0.

Start Packet Capture

To start packet capture:

1. In the **NetWitness Suite** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

.

Start Log Capture

To start log capture:

1. In the **NetWitness Suite** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

.

Start Aggregation

During the upgrade from 10.6.4 .x to 11.0, the Broker Service is restarted and this automatically starts aggregation.

Revision History

Revision	Date	Description	Author
1.0	16-Oct-17	Release to Operations	IDD
1.1	25-Oct-17	Changes for: • " Active Directory" and "User Attribute and Role Changes Affecting Investigate" workarounds to refer to the 10.6.4.2 and 11.0.0.1 patches. • Authentication Failure in 11.0.	IDD

RSA NETWITNESS® SUITE

Release Notes

for Version 11.0.0.0

License Agreement

This software and the associated documentation are proprietary and confidential to EMC, are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability.

This software is subject to change without notice and should not be construed as a commitment by EMC.

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on RSA Link. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

EMC believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

Contents

Introduction

This document lists what's new and changed in RSA NetWitness Suite 11.0.0.0, as well as workarounds for known issues. Read this document before deploying or upgrading RSA NetWitness Suite 11.0.0.0.

RSA NetWitness Suite 11.0.0.0 incorporates some of the core features of classic Security Analytics as well as advanced threat detection tools to enable Analysts at all levels to discover and respond to security threats.

What's New

RSA NetWitness Suite 11.0.0.0 delivers significant improvements to the Analyst's workflow along with features that makes hunting easier for Analysts at all experience levels. Administrators benefit from enhanced support, and simplified services and hosts maintenance features. The Netwitness Suite 11.0.0.0 includes the following new features and enhancements.

User Interface

Navigation based on Roles. The User Interface (UI) is divided into five major functional areas: Respond, Investigate, Monitor, Configure, and Admin, to align with typical Security Operation Center roles. The interface is updated to be more modern and improve the workflow for Analysts and Threat Hunters. For more information on the new navigation and important tips for becoming familiar with NetWitness Suite 11.0.0.0, see the *NetWitness Suite Getting Started Guide*.

Respond

- **Improved Analyst Experience**. NetWitness Suite 11.0.0.0 provides a new way to manage incidents. Respond replaces Incident Management from version 10.6. For more information on Respond, see the *NetWitness Respond User Guide*.
- **New Respond view**. The Respond view helps Analysts and Incident Responders to understand the entire scope of an incident and triage those incidents quickly and efficiently.
- **Consolidated Alerts**. Analysts can view all the threat alerts received by the RSA NetWitness Suite in one location. This can include alerts such as ESA Correlation Rules, ESA Automated Threat Detection, Malware Analytics, and Reporting Alerts.
- **Prioritized Incidents List**. The Incidents List presents Analysts with a queue of incidents in severity order to triage.
- **Add Related Indicators On Demand**. Analysts can find Related Indicators and add them to an incident.
- **Track Incident Tasks to Completion**. Analysts can create tasks within incidents and manage all tasks from a central location.
- **Collaborate with other Analysts**. Analysts can post notes and review the history of activity on an incident.

- **Consolidated Incident Storyline**. A chronological listing of Indicators (alerts) shows events and enrichments from multiple data sources.
- **Interactive Nodal Graph Showing Entity Relationships**. You can drill into host or user details and pivot to Investigate view to perform a deeper-dive investigation.
- **On-Demand Contextual Information in the Respond view**. Analysts can reduce the time required for detection and response using contextual information from data sources such as Lists, RSA Archer, Active Directory, RSA NetWitness Endpoint, Alerts, Incidents, and Live Connect. Analysts can hover over underlined entities to view context tooltips. These tooltips show a quick summary of the type of contextual data available for the selected entity and provide links to further investigative actions. You can also access a context lookup panel that shows more detailed contextual information for the selected entity.

Investigate

- **Endpoint Data Visibility**. When NetWitness Suite is configured to consume data from RSA NetWitness Endpoint, Analysts can view the endpoint data in Investigate. With this enhancement, three types of events (network, log, and endpoint) are exposed in Investigate, and all events can be investigated in the same way. For more information, see the *Investigate and Malware Analysis User Guide*.
- **Event Analysis**. The Event Analysis capability provides more ways for Analysts to analyze events when reconstructing an event as a Text, Packet, or File Analysis. For more information, refer to "Analyze Events in the Event Analysis View" in the *Investigate and Malware Analysis User Guide*.
- **Packet Analysis Capabilities**.
  - Attributes in the packet header and footer in the hexadecimal and ASCII are highlighted in blue; when you place the cursor over a highlighted attribute, additional information is displayed in a hover box.
  - Common file signatures are highlighted with an orange background; when you place the cursor over the highlighted text, the description of the potential file type signature is displayed in a hover box.
  - There are four options for downloading: the event as a PCAP, all payloads, request payloads only, and response payloads only.

  - Shading of characters in the packet payload to differentiate the hexadecimal characters to help the analyst find patterns.
  - Ability to view payloads only by removing the packet headers and footers from the rendering of the event.
- **Text Analysis Capabilities**.
  - Ability to download a log event or endpoint event in multiple formats.
  - View URL and Base64 encoding and decoding in a hover box when text is selected. You can also copy the selected text.
  - View compressed or uncompressed text for an HTTP network session.
  - Highlight the meta key/meta value pairs (case-insensitive) in the Text Analysis.
- **File Analysis Capabilities**. When downloading files, the files are exported as a password-protected zip archive. The default password is `netwitness`. Exporting the files in this form ensures that the archive is not quarantined by antivirus software. In addition, potentially malicious files are not automatically opened by the default application and executed.

Reporting

- **Default Datasource for Charts**. The charts run on a default data source if the data source is not specified. By default, all pre-configured dashboards also run on the default data source unless the data source is specified.
- **Reporting on RespondDB**. You can run and view reports on Respond data for better visibility during the detection process. All key alert and incident data are available in the Respond view for reporting.
- **Autocorrect NWDB Rule Syntax**. The NWDB core parsers use a Strict parser (expects the query syntax to be quoted appropriately) which enables strict validation of NWDB rule syntax. For a seamless upgrade experience, the rules with invalid syntax are auto-corrected during the first execution post an upgrade. For more information, see the *Reporting Guide for Version 11.0*.

Dashboards

- **New Pre-configured Dashboards (OOTB)**. The pre-configured dashboards provide immediate value to SOC Managers, Analysts, and System Admins and are available as part of Netwitness installation. The following pre-configured dashboards have been introduced in this release:
  - Investigation
  - Operations - File Analysis
  - Operations - Protocol Analysis
  - Threat - Malware Indicators
- **Enhanced functionality for Dashboards**. Administrators can create and manage dashboards with ease using the intuitive UI:
  - You can link Investigation Top Values and Realtime Chart Dashlets with a related dashboard to view detailed information. A View More option is available on the selected dashlet. For more information, see the *Netwitness Suite Getting Started Guide*.
  - Add a dashlet as a Geo Map Chart for a quick view of the geographical location. The network status and traffic is displayed. Geo Map charts features include zoom in, zoom out, and exporting the chart.
  - Customize the look of the dashboard by adding, deleting, and reorganizing dashlets.
  - Enable or disable individual dashlets based on your requirement.
  - Filter Chart Values from Dashboard for 24 hours or permanently, if the Analyst wants to hide some obvious values for a specific time to focus on the rest of the values.
  - Set up dashboard layout by selecting the available dashlet widths (1/2,1/3,2/3,1).
  - Manage dashboards by configuring the entire dashboard, change the past hours and refresh interval settings.
  - View past hours and last refreshed information for reporter chart dashlet.
  - Export or Import dashboards with the dependent entities into a .zip format to avoid separate import or export of dependents.

Live

- **Support for TAXII Server**. The TAXII server is supported to ingest STIX formatted threat information in NetWitness Suite. The following TAXII servers are qualified for the NetWitness Suite:
  - Hail a TAXII
  - Anomali Limo
  - Soltra Edge
  - OpenTAXII
- **SSL Enabled Server**. You can enable SSL/TLS handshake for TAXII and REST servers.
- **Automatic Cleanup of TAXII Data**. You can specify an expiration period, in the Remove STIX data older than field, so the STIX packages pulled from the TAXII server older than the specified days is deleted from the MongoDB. This limits the number of stale indicators in the Netwitness Suite.
- **Improved Category Interface**. You can browse through the categories of content available via Live to see what content is available based on use case. For more information, see *Live Services Management Guide*.

Event Stream Analysis and ESA Analytics

- **Added a new ESA Analytics service (ESA Analytics Server)**. There are now two services that can run on an ESA host:
  - Event Stream Analysis (ESA Correlation Rules)
  - Event Stream Analytics Server (ESA Analytics). The ESA Analytics service is used for Automatic Threat Detection. For more information on automatically detecting advanced threats, see the *NetWitness Suite Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *ESA Configuration Guide*.
- **Preconfigured ESA Analytics modules do not require knowledge of ESA Rules**. Automated Threat Detection currently has two modules available: Command and Control (C2) for Packets and C2 for Logs.

- **Map all of your ESA Analytics modules to Concentrator data sources from one central location (ADMIN > System)**. ESA Analytics modules are configured at the system level, so you can better manage deployments and updates of your module mappings.
- **Alerts are now located in the Respond view (RESPOND > Alerts)**. The Respond view Alerts List shows all of the threat alerts and indicators received by NetWitness Suite. You can filter the Alerts List by the "Event Stream Analysis" source type to view only ESA alerts. For 10.6 users, the Alerts > Summary view is no longer available.
- **Added a new User Interface to configure the Whois Lookup service (ADMIN > System > Whois)**. Analysts should configure the Whois Lookup service in the NetWitness Suite user interface and not in the Explore view. After Whois is configured, it is available for all of your ESA Analytics modules.
- **ESA external data source connections now require TLSv1.2**. For security reasons, internal and external connections in NetWitness Suite 11.0.0.0 require TLSv1.2. If you are using an external data source such as MS SQL-Server, MongoDB, MySQL, or Postgres for your enrichment data (Configure > ESA Rules > Settings), ensure that your data source server is TLSv1.2 compliant.

Core Services

- **New Services**. The following services have been introduced in NetWitness Suite 11.0.0.0, for more information see the *Hosts and Services Guide*:
  - **Admin Server**. The NetWitness Administration Server is the backend service for administrative tasks in the NetWitness User Interface (UI). It abstracts authentication, global preferences management, and authorization support for the UI.
  - **Configuration Server**. The NetWitness Configuration Server is responsible for storing and manipulating collections of configuration. A collection of configuration is any logical grouping of configuration that is intended to be managed independently.
  - **Orchestration Server**. The NetWitness Orchestration Server is responsible for provisioning, installing, and configuring all services that make-up a NetWitness deployment. It serves to abstract the platform deployment logic from the NetWitness servi11ces themselves.
  - **Security Server**. The NetWitness Security Server manages the security infrastructure of a NetWitness deployment. It is responsible for all security related concerns

including:

- Users and the authentication accounts
- Role based access control
- Deployment PKI infrastructure

- **Investigate Server**. The NetWitness Investigate server is responsible for investigation.
- **Respond Server**. The Respond Server replaces the Incident Management service.

- **Decryption of incoming packets to a Decoder**. The `sslKeys` command supports uploading private encryption keys to a Decoder to decrypt incoming packets before the parsing step so that enabled parsers will see the unencrypted packet payload and create meta data accordingly. For more information, see *Decoder and Log Decoder Configuration Guide*.
- **Enhanced Parser Options**: `decoder/parsers/config/parsers.option`. This config node is a series of StringParams, where the parser is given a list of options as name = "value" pairs. The new config node is available to the native Entropy parser and to Lua parsers. For more information, see the *Core Database Tuning Guide*.
- **Parsers that no longer provide value removed from the Decoder**. The older built-in parsers described below have been removed from Decoders.
  - These native parsers were removed from Decoders because they no longer provide value: LotusNotes, MSN, SAMETIME, YMSG, AIM, Net2Phone, YCHAT, and WEBMAIL.
  - The native AIM parsers have been removed because AIM_Lua covers that functionality.
  - The WebMail parser has been removed because it is no longer relevant and WebMail is encrypted; there is no Lua replacement. The function of the WebMail parser was to scrape the HTML from gmail, yahoo, and hotmail, and pull out interesting meta. The vendors of these WebMail applications change their HTML so often, that the parser serves no useful purpose.
- **New Native Entropy Parser**. The Entropy Analyzer parses all network sessions natively at the Decoder to calculate the Entropy-related features. The result is several numbers that give insight into whether traffic has been encrypted or compressed, or conforms to an expected byte distribution. Entropy is a measurement of the randomness of data. A high value for either the entropy of a request or response would indicate that the traffic is likely encrypted or compressed and that a network session is attempting to conceal information.

For more information, see "Configuring the Native Entropy Parser" in the *Decoder and Log Decoder Configuration Guide*.

- **Background Reindexing of the database while the Core service is online**. Under normal operation, changes made to the index configuration are only applied to new data that enters the collection. Rebuilding the index over all the data in the collection is a time-consuming process, because it requires all of the meta database storage to be read from disk. Starting in version 11.0.0.0, it is possible to rebuild the index while the Core service is online. Version 11.0.0.0 services will rebuild indexes in the background whenever the service detects that part of the session and meta databases are unindexed. For more information, see the *Core Database Tuning Guide*.
- **Validation of service index configuration files prior to save or restart**. Strict checking of the index files to validate all elements and attributes is done when the files are saved and when the service is started. When you attempt to save an index configuration file that is not properly formed, it will be rejected; a message is displayed in the user interface and the file will not be saved. Strict checking also occurs when a service is started. However, to prevent upgrade problems from 10.x, errors will be logged as warnings. If you try to edit an index file with logged warnings from the user interface, saving the index file will be denied until the problems are fixed.
- **New Content CPU utilization statistics.** Starting with this release, the Decoder provides CPU utilization statistics for all the installed content. The new CPU utilization monitors reveal how much CPU time is used by parsers, feeds, application rules, and lexical scanning. The statistics are visible as Stat nodes in the service tree from the Explorer view when `/decoder/parsers/config/detailed.stats` is enabled and the Decoder is capturing the stats. Each piece of content is accounted as a single percentage value (0-100) regardless of the number of parse threads running. The percentage represents an average of the CPU utilization for the content across all threads.
- **Improved RBAC capability**. In RSA Security Analytics 10.6, Role-Based Access Control (RBAC) for the `/sdk packets` command was either on or off, per user. Restricted users usually had access removed, so pcap generation from Investigation was not allowed even for sessions that did not have restrictions. In RSA NetWitness Suite 11.0.0.0, RBAC just works for packets. Sessions that are restricted will just be skipped during pcap generation in Investigate. Sessions that are allowed will have packets returned. For more information on RBAC, see the *System Security and User Management Guide*.

- **New ability to analyze compressed web sessions**. Decoders can do additional parsing on HTTP sessions with the Lua parser language. Lua parsers can request decompression of individual instances of compression in an HTTP session. This is similar capability provided with previous Flex parsers.
- **Improved expiry handling for query timeouts**. Changed the default expiry behavior for all RESTful queries to unlimited so that the normal query cancel mechanics handle expiry. With REST API session expiration removed, the expiry submitted by the `query.timeout` setting in the user session will be the determining factor for query timeouts.
- **Decoder capture of VLANs on multiple network interfaces using packet_mmap**. Added the ability to select any subset of the capture interfaces by adding configuration to the configuration parameter `/decoder/config/capture.device.params` For more information, see "Configure Capture Settings" in the *Decoder and Log Decoder Configuration Guide*.
- **Packet Capture from F5 BIG-IP VE in AWS**. When deploying a Decoder for cloud network capture, the administrator can configure Decoders to ingest network data from the AWS cloud infrastructure using F5 BIG-IP Virtual Edition.
- **Meta Key comparison in application rules**. Application rules in Decoders can compare values for different meta keys in a session. Meta keys can now be used on the right-hand side of binary operators. Supported operators include the relational operators (`=, !=,<, <=, >, >=`) as well as `contains`, `begins`, `ends`, `count`, `ucount`, and `length`. For more information, see "Capture Rule Syntax" in the *Decoder and Log Decoder Configuration Guide*.
- **Rule and query language improvement for relative time ranges**. Relative time points allow a `where` clause to reference a value at some fixed offset, relative to the earliest or latest time meta items seen in the collection. For more information on query syntax changes, see the *Core Database Tuning Guide*.
- **Enhanced Log Text Indexing**. The base level of log parsing is defined so that the text of all unparsed logs is scanned for these key entity items even when no parser is enabled: syslog timestamp, RFC 3339 timestamp, IP addresses, email addresses, URL components, and domain names. Anything that can be reasonably identified as these types of data is automatically tagged with the appropriate meta item.
- **Ability to reconstruct the network stream from multiple sessions**. Improves the combination of split sessions. The Decoder keeps track of the network stream for as long as it has memory resources to do so. Thus, when more packets arrive on the same network stream, the Decoder adds split meta items to the subsequent sessions. Using a combination of the split meta and the stream key, it is possible to reconstruct the network stream from

multiple sessions.

Security

- Added support for Intermediary Certificate Authorities.
- Enhanced Security Posture
- FIPS is enabled by default on all services except Log Collector and Log Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder.
- FIPS 140-2 Certified Cryptographic Modules are enabled for all services that perform cryptographic operations. For the following services, although the FIPS Cryptographic Module is leveraged, the use of FIPS cipher suites is not being enforced:
  - NTP: UPD Port 123
  - TCP: SSH Port 22
  - TCP: Salt API Loopback Port 8000
  - CollectD
  - Log Collector
  - Log Decoder

  Note: By default, core devices that were not in FIPS-enforcing mode in 10.6.4 will not be in FIPS enforcing mode in 11.0.0.0 after an upgrade. This affects the Log Decoder, Log Collector, and Packet Decoder services.

Platform

- **Simplified 10G Decoder setup**. You can install the Decoder and pfring RPMs separately and in any order. The order in which the RPMs are installed does not matter. The Decoder can locate the 10G adapter and start capture.

Administration

- **Improved the performance and scalability** of NetWitness Suite with the following enhancements:

  - Faster host and service provisioning.
  - External YUM repository capability which provides the ability to install software quickly.
  - 3rd Party and NW services were decoupled to provide scale-out options in future releases.
- **Simplified the process of creating and maintaining services and hosts**. Added the capability to provision hosts simultaneously from either the command line or the UI.
- **Added support for externally managed YUM repositories**. Support for YUM repositories that are externally managed.

Log Parsing

Event Source Discovery. Event Source Discovery improves log parsing accuracy and provides a workflow for finding and remediating event sources not discovered completely or correctly that includes:

- Single, centralized list of all event sources
- Details for each event source
  - Types of event sources type discovered
  - Likelihood that the event source type was identified correctly
  - Enables Administrators to find problematic event sources
- Details for each event source and type
  - Logs for each event source type
  - Imported or set attributes
  - Enables Administrator to determine if event source is correct
- Ability to acknowledge or set correct event source types
- Manage Parser Mappings dialog enables Administrators to centrally map appropriate parsers for selected IP addresses.

Context Hub

- **Introduced New Data Sources**
  - **RSA Archer**. Asset criticality data from RSA Archer is used to prioritize security events based on the business impact and to mitigate the most damaging threats. The Analyst can act based on the criticality rating. For more information, see the *Context Hub*

Configuration Guide.

- **Active Directory**. Identity information from Active directory is used by an Analyst to accelerate detection and response for a selected user. This information can be used for further investigation on a user.
- **Multi-Column Lists**. Analysts can view the contextual information when a list is configured as a data source. For example, if the Analyst has a list of blacklisted IP addresses, it can be configured as a single-column to multi-column list data source. After which the contextual data for the imported data can be retrieved and viewed in the Respond and Investigate views. Based on this further actions can be performed.

- **Inline context indicator**. A quick summary of contextual data for an analyst to select meta for further investigation in the Nodal and Events view of the Respond View. This option is available when a user hovers the mouse pointer over the specific meta. It further allows the Analyst to Pivot to Investigate, Pivot to Endpoint and to Add/Remove from list.
- **Context Lookup Panel**. Contextual information for the configured data sources is displayed for the Analysts to perform further investigative actions.
- **Domain and File Hash Lookup**. An Analyst can lookup to find domains and file hashes, within Context Hub, in addition to the IP addresses to get expanded context across a number of indicator types during an investigation.
- **Risk Indicator Tags**. In addition to Live Connect lookup, the Analyst can get expanded risk information (Risk Assessment and Risk Reason). This includes how risky an indicator is as well as the reason for the current rating. Additionally, new attributes are available for each of the indicator type:
  - IP Address
    - Identity (ASN, registered country and organization)
    - Related files and domains
  - Domain
    - Identity (WHOIS information: registrant name, organization, address, email, etc.)
    - Related IP addresses and files
  - File Hash
    - Identity (file name, size, description, MD5, SHA1, and last modified date/time)
    - Certificate information (issuer, start and expiration date, signature information, subject,

etc.)

- Related IP addresses and domains

- **Live Connect Risk Assessment feedback**. An Analyst can provide feedback based on their tier level, confidence and risk indicators. Also, they can provide expanded feedback about an indicator in the Live Connect. The feedback consists of: Risk Indicator Tags (context about why an indicator is suspicious), Confidence, Risk Status, and Analyst Tier (to provide context on how an indicator was discovered or triaged). For more information, see NetWitness Respond User Guide.

Upgrade Notes

The following upgrade paths are supported for RSA NetWitness Suite 11.0.0.0:

- RSA NetWitness Suite 10.6.4.x to 11.0.0.0

For more information on upgrading to 11.0.0.0, see the update instructions in the Product Documentation section.

Fixed Issues

This section lists issues fixed since the last major release.

Server Fixes

Tracking Number	Description
SATCE-1477/ASOC-24080	CEF Parser toggling settings are cleared when changing parser settings on the UI
SACE-7121/ASOC-30636	Custom feeds with CSV content are not matching meta values, and quotes are not displayed correctly.

Health & Wellness Fixes

Tracking Number	Description
ASOC-9225	Page Not Displayed error during log in using IE 10 Browser
SACE-6720	All Filters are removed on the Monitoring page

Log Collector Fixes

Tracking Number	Description
SAENG-2476	Repeated error messages are shown if the domain name is not resolvable from the LWCS box
ASOC-9586	Inaccurate Message Generated for AWS Collection Error
ASOC-26826	File collection filter configuration is not working

Event Stream Analysis Fixes

Tracking Number	Description
ASOC-6633	Trial rules configuration: Out-of-Bound values are capped

Core Fixes

Core Services include Broker, Concentrator, Decoder, and Log Decoder.

Tracking Number	Description
ASOC-18044	Metacallback feeds do not support ranged indices (IP range or CIDR)

Features Not Supported

The following tables provide information on features no longer supported in RSA NetWitness Suite 11.0.0.0 or later releases.

Features Not Supported in 11.0.0.0 or later releases

No.	Feature	Notes
1	Malware Colo	Malware co-located is not supported in 11.0.0.0 and later releases. Malware Analysis is supported using a standalone Malware Analysis.
2	All-In-One (AIO) Deployment	All-in-one deployment is not supported. Fresh Install AIO has been removed.
3	Standalone Warehouse Connector on Decoders	Warehouse Connector is not installed on Decoders and Log Decoders by default. Warehouse Connector should be installed and configured after the Decoder is configured.
4	Administration Features	1. Forgot my password. 2. Email Notification to user when password expires. 3. Changing the Login banner is not supported. 4. Test/Search AD user.
5.	Pivotal	Pivotal is not supported. HortonWorks support is provided.

Features Available in Future Releases

The following features are not available in 11.0.0.0 and will be available in future release.

No.	Feature	Notes
1	IPDB Reporting	IPDB Extractor service is not supported in 11.0.0.0 and will be available in later releases.
2	STIG	If you have a STIG hardened host, you cannot upgrade to 11.0.0.0 as the backup scripts do not support that.
3	Multiple Security Analytics Server (NetWitness Server) support	Multiple server deployment is not supported.
4	PKI Authentication	PKI Authentication feature is not available in 11.0.0.0
5	Warehouse Analytics	Warehouse Analytics is not supported for 11.0.0.0 and will be available in later releases.

Known Issues

This section describes issues that remain unresolved in this release. Wherever a workaround or fix is available, it is noted or referenced in detail.

Known Issues During Upgrade to 11.0.0.0

The following known issues occur during upgrade from 10.6.x to 11.0.0.0:

After upgrade from 10.6.4.x to 11.0.0.0, offline licenses are not retained.

Tracking Number: ASOC-41757

Problem: Even if you upload a new response bin file from Download Central, offline licenses still don't work. Though old files are restored in `/var/lib/fneserver`, the licenses still remain deactivated.

Workaround: Perform the following steps to restore the licenses:

1. Generate a new response bin file from Download Central.
2. Log in to Netwitness Server 11.0.0.0 (AdminServer).
3. Move ra* files (3 files) out of `/var/lib/fneserver/`
4. Log in to RSA NetWitness 11.0.0.0 UI with admin user credentials and navigate to Admin > System >Licensing Overview tab.
5. Under Licensing actions, click Refresh licenses.
6. Now, upload the response file received from Download Central under Admin > System > Licensing > Settings Tab > Upload Response.

Note: Upgrade using Online mode (RSA Netwitness Suite 11.0.0.0 connected to the Internet) works successfully and all licenses are restored after upgrade to 11.0.0.0

User or Role Attributes to restrict data access through query prefix is not supported

Tracking Number: ASOC-42734

Problem: If you configured user or role attributes to restrict access to data through query prefix in 10.6.4.x, and upgrade to 11.0, it does not work..

Workaround: You must apply RSA NetWitness Suite 11.0.0.1 patch to address this configuration.

After you upgrade to 11.0, users configured with Active Directory will not be able to log in to Netwitness Suite UI

Tracking Number: ASOC-42738

Problem: If you have Active Directory users configured for external user logins in 10.6.4.1 or earlier, and upgrade to 11.0, these users will not be able to log in to Netwitness Suite UI.

Workaround: Perform one of the following steps:

- Apply the 10.6.4.2 patch before you upgrade to 11.0.0.0.
- If for some reason, the 10.6.4.2 patch is not applied, apply the 11.0.0.1 patch and then perform the External Authentication Migration.

User login failure

Tracking Number: ASOC-43523

Problem: Users cannot log in to NetWitness Suite UI on installation of 11.0.0.0 or upgrade to 11.0.0.0. This is because the user interface cannot retrieve user account information from MongoDB.

Workaround: You must apply RSA NetWitness Suite 11.0.0.1 patch.

After you upgrade to 11.0.0.0, new event sources cannot be added in a mix mode deployment.

Tracking Number: ASOC-41867

Problem:After you upgrade to 11.0.0.0 and connect to 10.6.4 Log Collectors, test connections fail on the Edit UI. This is because the UI converts the collection Start Date value (int) into string date format "1970-01-01 00:00:00". You will continue to collect events from the existing event source but will not be able to add a new event source. However, in case of Bulk test connection, all values are directly fetched from REST interface and "Test connection" is successfully passed.

Workaround: Use the REST interface to add a new event source in a mix mode.

FIPS is disabled by default for the Log Collector Service

Tracking Number: ASOC-41841

Problem: FIPS is disabled by default for the Log Collector service, even if FIPS was enabled in 10.6.4.

Note: Even if FIPS is enabled in 10.6.4, it becomes disabled post-migration

Workaround: To enable FIPS on the Log collector service, perform the following steps:

1. Stop the Log Collector service.
2. Open the `/etc/systemd/system/nwlogcollector.service.d/nwlogcollector-opts-managed.conf` file.
3. Change the value of the following variable to **off** as described here:

   ```
   Environment="OWB_ALLOW_NON_FIPS=on"
   ```
   to
   ```
   Environment="OWB_ALLOW_NON_FIPS=off"
   ```

4. Reload the system daemon by running `systemctl daemon-reload` command.
5. Restart the Log Collector service.
6. Set the FIPS mode for the Log Collector service on the UI:

   Note: This step is not required in case of upgrade, if FIPS was enabled on 10.6.4.

   a. Go to ADMIN > Services.

   b. Select the Log Collector service and go to View > Config.

   c. In SSL FIPS Mode, select the checkbox under Config Value and click **Apply**.

   Note: To enable Log Decoder and Packet Decoder, in `/sys/config` set `ssl.fips` to ON and restart the service.

The investigation links are disabled for static charts

Tracking Number: ASOC-42136

Problem: The investigation link is disabled for the static chart (the result of the report is in chart format) which has the datasource as NetWitness Suite-Broker (This service is available by default).

Workaround: There are two workarounds for this issue:

- The rules that have the result in static chart can be viewed in Tabular format and the investigation works as expected.
- Or you can perform the following steps to fix the issue:
  1. Delete and add the NetWitness Suite-Broker again as the datasource to Reporting Engine with the same name.
  2. If the reports with static chart are scheduled reports, then in the next run, the investigation link will work as expected.
  3. If the report is an Adhoc report then, then re-run the report for getting the investigation links.

Install Error on UI post-orchestration of Warehouse Connector or update from 11.0 to 11.0.0.1 for Log Collector/ Log Decoder instance

Problem: On a Log Collector/Log Decoder instance, when WC is orchestrated or if its updated from 11.0 to 11.0.0.1, the status may get displayed as failed on the console and an install error is displayed on UI.

Workaround: For instructions on how to fix this issue, refer to this knowledge base article: https://community.rsa.com/docs/DOC-84635.

Warehouse Connector is not installed on Decoders

Problem: The Warehouse Connector is not installed on the Decoders by default.

Workaround: If, after an upgrade there is a need to re-establish a Warehouse connection, a utility is provided to reinstall the service. The utility is deployed during the bootstrap phase. To install Warehouse Connector, you must run the following command and specify the host by ID (--host-id), name (--host-name), or address (--host-addr). The latest available version will be installed by default unless a specific version is specified with --version. To install the Warehouse Connector on a host, run the following command on the Admin server:

[root]warehouse-installer --host-id <*uuid of the host*>

Details about the command:

Location: /usr/bin

Utility Name: warehouse-installer

Usage:

[root@nw11pds5 bin]# warehouse-installer --help

Warehouse Connector Installer

warehouse-installer [options]

Install options:

--host-id <id> Specify host to install (by ID)

--host-name <name> Specify host to install (by name)

--host-addr <address> Specify host to install (by address)

--version <#.#.#.#> Install version (defaults to latest)

General options:

-v, --verbose Enable verbose output

Meta keys for investigation and hunting added to default Concentrator index file.

Tracking Number: ASOC-22338, ASOC-22895, ASOC-19406

Problem: If you have added the following meta keys as custom to your index-concentrator-custom.xml file, they may be removed post-upgrade and are present now a standard meta keys within the index-concentrator.xml file. The meta keys are: direction, netname, ioc, eoc, boc, analysis.file, analysis.session, analysis.service, inv.category, inv.context.

Workaround: Remove the listed keys from the index-concentrator-custom.xml file.

Duplicate dashboards for threat indicators.

Tracking Number: ASOC-41701

Problem: The dashboard, Threat–Indicators, was updated to report against new Hunting meta keys and renamed to Threat–Malware Indicators. On upgrade, both will appear in the UI instead of the old being replaced.

Workaround: Enable the Threat–Malware Indicators report charts and dashboard and disable the old Threat–Indicators dashboard.

On upgrade, the Health and Wellness custom policies for Context Hub Server are not available.

Tracking Number: ASOC-41826

Problem: When you upgrade to Netwitness Suite 11.0.0.0, the Health and Wellness custom policies configured for Context Hub server will not be available.

Workaround: You must define these custom policies in 11.0.0.0

On upgrade to 11.0, collections created from a 10.4 Workbench display blank Date Range and Date Created values

Tracking Number: ASOC-9035

Problem: Any collections created from a 10.4 Workbench displays blank Date Range and Date Created values after upgrading to 11.0.0.0.

Workaround: None.

On upgrade, the Geo-map dashlet cannot be created using a pre-configured (OOTB) chart.

Tracking Number: ASOC-41896

Problem: When you upgrade to Netwitness Suite 11.0.0.0, the Geo-map dashlet cannot be created using a pre-configured (OOTB) chart. This happens if a custom dashboard uses a Geo-map dashlet, which is created using a pre-configured (OOTB) chart.

Workaround: The data source must be manually updated for that OOTB chart that is required to be used in the dashlet with Geo-map. Or, create a new chart using the same pre-configured (OOTB) rule and use the new chart in the dashlet with Geo-map.

Warehouse Connector Service shows SSL FIPS is disabled.

Tracking Number: ASOC-41930

Problem: When you upgrade from 10.6.x non-FIPS setup to 11.0.0.0, though the Warehouse Connector service is running on FIPS the UI shows SSL FIPS is disabled.

Workaround: Check the SSL FIPS on the Config page (UI) and restart the Warehouse Connector service.

Context Hub

OutOfMemoryError in the Context Hub service

Tracking Number: ASOC-41664

Problem: The Context Hub service runs into OutOfMemoryError and becomes unresponsive, if a large number of TAXII feeds are configured to fetch data.

Workaround: Restart the Context Hub service and make sure that the time range you select to fetch TAXII feeds from the TAXII server is not more than 6 months. If the issue persist even after updating the time range, see the Troubleshooting topic in the *Live Services Management Guide*.

The Pivot to Investigate option on the Respond view does not navigate to the correct link.

Tracking Number: ASOC-40944

Problem: Everytime you stop and restart the RabbitMQ server, the Pivot to Investigate option available on the respond screen, is not visible. And the context panel for Pivot to Investigate reopens the same page.

Workaround:Restart the jetty service on the Netwitness Server, login to the Netwitness Server Host and enter the service jetty restart command.

Increasing the limit settings for Alerts and Incidents leads to lookup error.

Tracking Number: ASOC-40246

Problem: By default, the limit settings to view number of Alerts and Incidents is set to 50. If the limit is increased and you view the lookup error then it is due to large number of Incidents and Alerts. This happens due to an internal database restriction.

Workaround:To limit and view Alerts and Incidents to 50.

Single-column and multi-column lists added from the Data Source tab are not supported for Add to a list and Remove from list.

Tracking Number: ASOC-37998

Problem: When you do a lookup on a specific context meta in the Investigation or Events or Respond view, the list names displayed are the ones which have matching values.

When you right-click on specific meta and select the Add or Remove list option, the single-column and multi-column list names added from the data source tab will not be displayed. It will only display the lists added from the UI using the List tab.

Workaround: You need to manually add the values which were added from the Data Source tab to the specific CSV file. So that, next time when the scheduler runs, the values from the updated CSV file will be available in the specific lists.

Empty list imported

Tracking Number: ASOC-34187

Problem: When you import a list with missing quotes such as “172.16.0.0, the list is saved without any data. This is because of the Apache bug (CSV-141), does not parse the CSV file with incorrect format.

Workaround: Import a list with correct quotes. For example, “172.16.0.0”, “host.mycompany.com” and so on.

SSL handshake with RSA Archer certificate fails while adding it as a data source

Tracking Number: ASOC-32654

Problem: When you try to add RSA Archer as a data source using valid credentials, the test connection fails (ARCHER-37085). This happens when the 'Trust all Certificates' option is unchecked and you try to upload an RSA Archer trust certificate.

Workaround: Select the ‘Trust All Certificates’ checkbox and do not upload a certificate.

General Platform Issues

NetWitness Suite User Interface may become unresponsive

Tracking Number: SACE-7751

Problem: The NetWitness Suite UI may become unresponsive when the system is trying to read large volume Live Connect logs.

Workaround: This issue can be temporarily resolved by restarting jettysrv.

Issue with meta export

Tracking Number: SACE-8116

Problem: Although the export works, if there are more than one meta value in a session, the current capability will only export one of the meta values. For example, if you have a session with 100 alias.host meta values, only one value is exported.

Workaround: None.

User selects to extract meta, but no data is downloaded

Tracking Number: ASOC-35600

Problem: If you select to export meta for an event, the export file is downloaded and saved with specified file name, but there is no data contained in the downloaded file.

Workaround: None.

Empty popup dialog is returned in NW UI for invalid STIX file

Tracking Number: ASOC-36138

Problem: If you try to upload an invalid STIX file, an error message should be displayed but instead an empty popup dialog is returned.

Workaround: None.

Log export always exports in Log format

Tracking Number: ASOC-38270

Problem: In the Investigation UI, if you select to Extract Log(s) from the NetWitness Server, the log will always be exported in “Log” format.

Workaround: None.

General Application Issues

NetWitness Suite UI classic pages fail to load when the system is under heavy usage

Tracking Number: ASOC-41999

Problem: NetWitness Suite UI classic pages will fail to load when the system is under heavy usage with "`OutOfMemoryError: Metaspace`" error.

Workaround: Change "`-XX:MaxMetaspaceSize=256m`" to "`-XX:MaxMetaspaceSize=512m`" in `/etc/default/jetty` file on Admin Node. After the changes are saved restart the jetty service (`systemctl restart jetty`).

Entitlements

Metered license does not flip back to an in compliance immediately when there are no services attached to that Metered license

Tracking Number: ASOC-9078

Problem: As an example, if there is a Metered license available for a Log Decoder and you have one Log Decoder listed under it, the following conditions may occur:

- You are over your entitled usage and marked as out of compliance.
- You decide to move the Log Decoder into an available service-based license.
- Your Metered license has no service under it.
- Your Metered license flips back to an in-compliance state after seven days.

Workaround: None.

Aggregate usage report gets generated whenever one service is attached to a license and "All" is selected while exporting usage stats

Tracking Number: ASOC-10079

Problem: For any license type (All/Metered/Service-based), the aggregate PDF/CSV file should get generated only when there is more than one service listed under any license type.

Workaround: None.

Respond

When upgrading, the Aggregation rule for C2 alerts Group By condition is incorrect

Tracking Number: ASOC-41934

Problem: When upgrading 11.0.0.0, the C2 aggregation rule used by Automated Threat Detection has a different Group By condition value.

Workaround: After upgrading to 11.0.0.0, edit the "Suspected Command & Control Communication By Domain" aggregation rule and change the Group By condition to "Domain." (To do this, go to CONFIGURE > Incident Rules > Aggregation Rules and double-click the Suspected Command & Control Communication Rule to edit it.) This will aggregate the alerts and incidents will be created for "Suspected C&C".

Unable to Create an Incident using 1000 alerts

Tracking Number: ASOC-41855

Problem: When you try to manually create an incident with more than 400 alerts selected in the Alerts List view, you may experience problems.

Workaround: Do not select more than 400 alerts when you create an incident.

Respond Administrator cannot query Investigate or view Live dashlets in the Dashboard

Tracking Number: ASOC-40749

Problem: The Respond_Administrator role does not have permission to query Investigate. This is necessary so that the Respond Administrator can pivot to Investigate or create incidents from events. The Respond_Administrator Role also does not have the Live: Access Live Module permission, which is required to view Live dashlets in the dashboard.

Workaround:

1. Manually create the Respond_Administrator role on the Core services. To do this, go to ADMIN > Services, select a Core service, and then in the Actions drop-down list, select View > Security > Roles Tab. Click + to add the Respond_Administrator role. Add the following permissions to the Respond_Administrator role:

- sdk.content
- sdk.meta
- sdk.packets
- storedproc.execute

Replicate the Respond_Administrator role to other Core services that may be used by the users.

2. In the ADMIN > Security > Role tab, add the Live: Access Live Module permission to the Respond_Administrator role.

When the metered or service based license is mapped, the licensed days and the start date are incorrectly displayed.

Tracking Number: ASOC-26334

Problem: When the metered or service based license is mapped, the licensed days and the start date are incorrectly displayed on the user interface (UI). This occurs due to an issue with the licensing system and if/when a new license is mapped. However, the correct data (licensed days and the start date) is reflected in the UI after few days.

Workaround: None.

Malware event File name with Korean characters is not shown properly in the Respond view

Tracking Number: ASOC-40159

Problem: If there are Korean characters in an alert that is received from Malware Analysis they will not be displayed correctly in the Respond view.

Workaround: None.

Unable to query domain in source/destination.device.geolocation

Tracking Number: ASOC-39938

Problem: Geo-location that comes from ESA Correlation Rules is not available in the Incident Details view Related Indicators panel. (To access the Related Indicators panel, Go to RESPOND > Incidents and in the Incidents List, click the ID or NAME link of the incident. In the Incident Details view toolbar, click the Journal, Task, and Related icon. The Journal is displayed on the right. Click the RELATED tab.)

Workaround: None. This is a new functionality, so it is just data that is not searchable.

Security Analytics Incident Management link in the NetWitness SecOps Manager 1.3.1.2 is not valid in NetWitness Suite 11.0.0.0

Tracking Number: ASOC-41891

Problem: NetWitness Suite 11.0.0.0 will only work with NetWitness SecOps Manager 1.3.1.2. However, the Security Analytics Incident Management link in the NetWitness SecOps Manager 1.3.1.2 is navigating to the legacy Security Analytics Incident Management page, which is not valid in NetWitness Suite 11.0.0.0.

Workaround: None.

Incidents and Tasks are still available when RSA NetWitness SecOps Manager integration is enabled

Tracking Number: ASOC-39886

Problem: After enabling NetWitness SecOps Manager integration in the Respond Server service, all incidents are managed in NetWitness SecOps Manager. In previous versions, when SecOps was enabled, incidents and remediation tasks were hidden. In NetWitness Suite 11.0.0.0, users are still able to access incidents and tasks in the Respond view (RESPOND > Incidents and RESPOND > Tasks). They are also not prevented from creating incidents in NetWitness Suite. If they create incidents from the Respond Alert List view (RESPOND > Alerts) or from Investigate, those incidents will not go to NetWitness SecOps Manager.

Workaround: If you enabled SecOps Manager integration in the Respond Server service, do not use the following in the Respond view: Incidents List view, Incident Details view, and Tasks List view. Also, do not create incidents from the Respond Alerts List view or from Investigate.

For migrated incidents, the event count always shows as 0 in the Overview panel

Tracking Number: ASOC-38026

Problem: In the Incidents Overview panel Catalysts field, the number of events for migrated incidents always shows as 0 (zero). This is expected behavior in NetWitness Suite 11.0.0.0 (To access the Overview panel, go to Respond > Incidents. If you click an incident in the Incidents List, the Overview panel appears to the right. If you click a link in the ID or NAME field in the Incidents List, the Incident Details view opens with the Overview panel on the left.)

Workaround: None.

Unable to Pivot to Investigate on all username, filename, and domain values when multiple values are present.

Tracking Number: ASOC-37997

Problem: If username fields contain commas that do not represent delimiters between values, you may not be able to pivot to Investigate on certain meta if there is more than one value in the field.

Workaround: You can query or pivot on other data, or manually investigate the meta. You can still access the meta through Investigate.

In memory table enrichment info is not displayed for ESA alerts

Tracking Number: ASOC-37533

Problem: You cannot view custom enrichments for ESA Correlation Rules in the Respond Alerts view.

Workaround: None.

DOMAIN and HOST metas do not display correctly in the Respond view

Tracking Number: ASOC-37232

Problem: Domain and Host metas may be incorrectly labeled in the Respond Incidents Details view when alias.host contains different types of data. The Domain field behavior is inconsistent and it may be populated with hostnames.

Workaround: None. Multiple types of information will continue to exist in the Domain field.

After upgrade, unable to filter incidents using the Assignee field

Tracking Number: ASOC-36973

Problem: After upgrading incidents from 10.6.x to 11.0.0.0, Analysts are not able to filter the migrated incidents using the Assignee field (RESPOND > Incidents - Filter panel).

Workaround: None.

Respond - Create Incidents from Alerts in the Respond Alert List view

Tracking Number: ASOC-35811

Problem: When you manually create an incident from alerts in the Respond Alert List view (RESPOND > Alerts) in 11.0.0.0, you just have the minimum functionality to create an incident from alerts. You can only provide a name for the incident and the priority defaults to Low. When manually creating an incident, you do not have additional options, such as adding a Priority, Assignee, or Category.

Workaround: You can update additional fields by manually editing the incident after you create it, such as changing the priority from Low to High. However, you cannot add a category to an incident.

Whitelist Domains while closing Incidents as False Positive

Tracking Number: ASOC-25135

Problem: In 10.6.x, if a Suspected C&C Incident was marked as "Closed - False Positive" , an entry was made to the "Whitelisted Domains" list from context hub. There should be a similar functionality in the Respond view.

Workaround: Analysts can manually add domains to a whitelist in the Respond view. The *NetWitness Respond User Guide* provides procedures.

Integration Settings for SecOps Manager should be exposed in the User Interface

Tracking Number: ASOC-25127

Problem: The Integration settings for sending all incidents to RSA NetWitness SecOps Manager should be exposed in the user interface.

Workaround: The user interface for partial RSA NetWitness SecOps Manager integration was removed in 11.0.0.0. Administrators can complete the integration from the Explorer view for the Respond Server service.

Incidents are not flagged when a user manually adds alerts to an existing incident.

Tracking Number: ASOC-16640

Problem: Investigation values are not highlighted when alerts in Respond have manually been added to an incident. Alerts that are dynamically added to an incident will get highlighted.

Workaround: None.

Log Collector

DPO Role missing on Log Collector

Tracking Number: ASOC-7937

Problem: The new Data Privacy Officer role does not exist on the Log Collector.

Workaround: None.

Checkpoint collection not working with error "peer ended the session"

Tracking Number: ASOC-8351

Problem: The checkpoint collection is not working and the logs show the error: **peer ended the session**

Workaround: To resolve this issue:

1. Make a backup and then remove the checkpoint position file (**/var/netwitness/logcollector/runtime/checkpoint/eventsources/checkpoint.CP_Security.xml**).
2. Restart the service to regenerate the file.
3. (Optional) If the **Max Idle Time Poll** is set to 0, set it to 5.

Throttle Remote Collector to Local Collector Bandwidth Error

Tracking Number: ASOC-16717

Problem: Bandwidth throttling configuration changes to control the rate that the Remote Collector sends event data to a Local Collector do not persist after a reboot.

The `set-shoveltransfer-limit.sh` script is used to set the bandwidth throttle for event data transferred from a remote collector to local collector. The script uses both iptables rules and linux kernel traffic shaping filters to control the upload bandwidth used by the RabbitMQ port on transfers to an upstream collector. The script works correctly when executed, but fails to persist the traffic shaping filter values once the appliance is rebooted.

Workaround: Add the script execution to the `/etc/rc.local` on the remote collector, as shown in the following example:
`"/opt/netwitness/bin/set-shovel-transfer-limit.sh -s -r 4096kbit"`

Investigation

User and role attributes is not enforced in the new Investigate Event Analysis workflows.

Tracking Number: ASOC-42735

Problem: NetWitness Suite 11.0 does not enforce user and role attributes in the new Investigate Event Analysis workflows.

Workaround*:* You must apply the RSA NetWitness Suite 11.0.0.1 patch to address this configuration.

In a mixed mode environment, an Analyst with insufficient permissions can download PCAPs and logs from a 10.6.x service in the Investigate > Event Analysis View, but not files or payloads.

Tracking Number: ASOC-41697, ASOC-41698

Problem: Role-Based Access Control (RBAC) on the 11.0.0.0 NW Server is not applied uniformly to downloads when investigating 10.6.x services. If the sdk.packets setting has not been disabled, Analysts with SDK Meta and roles permission in place to restrict viewing and reconstructing event content can download the PCAP and log of an event that has content restrictions. Other types of downloads appear to download, then generate errors due to insufficient permissions, and the data is still protected.

Workaround: Disable the sdk.packets setting on 10.6.x services to limit the analyst from downloading any PCAPs or logs during phased upgrade. When the upgrade of all services is complete, the RBAC experience will be consistent across all services. See the "Upgrade Tasks" section in the *Physical Host Upgrade Guide* for details.

In a mixed mode environment the Event Reconstruction View > File View displays the word "terminated" instead of the list of files.

Tracking Number: ASOC-41703

Problem: The first time an admin user reconstructs an event of service=other and .raw file, the word "terminated" may be displayed in the Event Reconstruction view instead of the .raw file.

Workaround: Go to another event in the Events view and come back to this event, or clear the services cache to see the proper result. Alternatively, the admin user can view the file in the Event Analysis View. The issue occurs only during upgrade while in mixed mode, so the best workaround is to finish upgrading connected services to NW 11.0.0.0. See the "Upgrade Tasks" section in the *Physical Host Upgrade Guide* for details.

In a mixed mode network and in an all 11.0.0.0 network, an analyst with content restrictions appears to be able to download restricted content, but is unable to unzip the downloaded file archive due to the zip file not having the restricted content.

Tracking Number: ASOC-41698, ASOC-41696

Problem: When a user who does not have permissions to the content downloads files, the content restriction applied using RBAC is upheld, but the user experience is not consistent with the user experience for other types of downloads with insufficient permissions. This is seen in an all 11.0.0.0 environment and a mixed mode 11.0.0.0/10.6x. environment. An analyst whose permissions restrict viewing content in the Event Reconstruction View can download restricted content on connected 10.6.x services. The analyst can export restricted files as Zip or GZip, and the Job Queue shows a successful download. However, the file is downloaded as Zip or tar format, and the archive fails to unzip, instead creating a copy as 'cpgz'.

Workaround: None. When the upgrade of all services is complete, the RBAC experience will be consistent across all services. See the "Upgrade Tasks" section in the Physical Host Upgrade Guide for details.

Right-click action in the Log View does not launch Event Reconstruction or Event Analysis when you click on a Logs column that wraps to more than one row.

Tracking Number: ASOC-37989

Problem: In the Log View of an event, the right-click action to launch Event Reconstruction or Event Analysis is not available when the Logs column in the Log View wraps to more then one row.

Workaround: Analysts can right click in another column that is not word wrapped on same event row.

In Event Analysis, the Rendered Packets message is not displayed for events with a small payload but large number of packets.

Tracking Number: ASOC-37348

Problem: When an event has more that 2500 packets, a message should be displayed at the bottom of the results to show the count of rendered packets. This message is not displayed for events with 2500 or more packets and a very small payload because the entire payload can be displayed in the view.

Workaround: None.

PCAP and payload download issues in Event Analysis view in a Mixed Mode Environment

Tracking Number: ASOC-37309

Problem: The Event Analysis workflow requires all services to be running 11.0.0.0. If the NW Server, Broker, and Concentrator are running 11.0.0.0, and the Decoders are running 10.6.x, the admin user will not be able to download files, logs, PCAPs, and payloads.

Workaround: Download files from Event Reconstruction.

When viewing a file archive in the Event Analysis - File Analysis panel, the individual filenames in the archive are not displayed.

Tracking Number: ASOC-35607

Problem: You can see the archive, but not the filenames contained in the archive.

Workaround: View the event in Investigate Event Reconstruction view files to see the individual filenames.

Parallel Coordinate visualization is not displaying special characters correctly

Tracking Number: ASOC-9346

Problem: When configuring meta key content type as one of the meta for the axis, if the meta value contains any special characters, the values do not display correctly.

Workaround: None.

Workbench

Tracking Number: ASOC-6859

Problem: An empty collection is seen in the Collections tab if the workbench service stops or restarts during restoration process

Workaround: None.

Data range is not displayed for collection if workbench service or Jettysrv is restarted while restoration is in process

Tracking Number: ASOC-6822

Problem: The date range is not displayed for a collection if the workbench service or Jettysrv is restarted while the restoration is in process.

Workaround: None.

Live

The status of STIX feed progress bar is incomplete.

Tracking Number: ASOC-40642

Problem: Sometimes, the status of the progress bar for some of the STIX feeds are incomplete even if the feeds are successfully pushed to the Decoder(s).

Workaround: None.

Malware Analysis

Users with Analyst role are not able to run the on-demand malware scan

Tracking Number: ASOC-5425

Problem: A user who has the Analyst role has access to the Investigation and Malware Analysis modules. But when the user tries to run the on-demand Malware Analysis scan from the Investigation screen, it fails with an invalid username error. The job gets submitted but fails because of the credentials.

Workaround: None.

If the Core device is not configured with IP address, the View Network Session option is disabled for Malware Analysis events

Tracking Number: ASOC-5571

Problem: Due to the new service ID and changes to the ASG, Malware Analysis is not showing the View Network Session option from the Malware Event Summary. It looks like the device ID is coming as null.

Workaround: None.

Event Stream Analysis

Deployment (called Synchronization in 10.4 and earlier) fails if you deploy this rule from RSA Live: No Log Traffic detected from device in given time frame

Tracking Number: SAENG-5888

Problem: Deployment, formerly called synchronization, fails for rule "No Log Traffic detected from device in given time frame" deployed from Live. This issue is not observed if you deploy the rules from Live on a 10.4 setup and do the synchronization. The issue is observed if you update your system from a pre-10.4 where the rules are deployed from Live with incorrect Module IDs.

Workaround: Delete the rules with incorrect Module ID's and redeploy them from Live.

Case-sensitive sorting is not working properly in ESA All Rules grid

Tracking Number: SAENG-3605

Problem: When rule names begin with lower and upper case letters, the sort does not work properly in the Rule Name column of ESA All Rules grid. For example, "Rule 1" is not followed by "rule 2" when you sort by name.

Workaround: None.

Cannot set ESA compression level as in other appliances

Tracking Number: ASOC-26481

Problem: Administrators cannot set the compression level in ESA like they can with other appliances, even using the Explorer view.

Workaround: Delete the Concentrator source from ESA and add it again so that the compression level changes are reflected:

1. Remove the Concentrator data source from ESA. (Go to ADMIN > Services, select the Event Stream Analysis service, and from the actions menu select View > Config. On the Config view Data Sources tab, remove the Concentrator data source.)
2. Set compression level in ESA. (Go to the Explore view, and in the node list, navigate to Workflow/Source/nextgenAggregationSource and set the CompressionLevel.)
3. Add the Concentrator Data Source again to ESA. (Return to the Config view Data Sources tab and add the Concentrator data source.)

Event Stream Analysis service becomes unresponsive when using Query-based aggregation for automated threat detection for Logs

Tracking Number: ASOC-25174

Problem: Event Stream Analysis may become unresponsive due to heavy resource usage, and the configuration for the wrapper may need to be adjusted.

Workaround: You may need to change the ping time settings in the `wrapper.conf` file. Perform the following:

1. Go to **Administration > Services > Event Stream Analysis> Explorer** and navigate to the `/opt/rsa/esa/conf/` folder.
2. Change the settings to the following values:
   `wrapper.ping.timeout=300`
3. Add the following lines at the end of the file:
   `wrapper.restart.delay=40`
   `wrapper.ping.timeout.action=RESTART`
4. Restart the Event Stream Analysis service.

ESA Displays Warning For Array Operators

Tracking number: ASOC-14157

Problem: When writing an advanced rule, array operators, such as anyOf, fails. For example:

```
SELECT * FROM
Event(
alias_host.anyOf(i => i.length()>50)
);
```

results in an error similar to the following:

Logger name: com.espertech.esper.epl.enummethod.dot.PropertyExprEvaluatorScalarArray

Thread: pipeline-sessions-0

Level : WARN

Message : Expected array-type input from property 'alias_host' but received class java.util.Vector

Workaround: To do a fuzzy comparison, first convert the array to a string. For example:

SELECT * from Event **(cast(alias_host, string)**LIKE '%TESTHOST%');

Note: If you used array operators in EPL developed in versions 10.5, 10.5.0.1, and 10.6, you will need to modify the EPL to use the above workaround.

Forwarding rule name is not updated when advanced rule name changes

Tracking number: ASOC-9585

Problem: For a cross-site deployment, when you change the name of an advanced rule, the forwarding rule does not change along with the name change for the advanced rule. This can result in an orphaned rule which can continue to forward events.

Workaround: To rename a cross-site advance rule, create a new rule and delete the old one.

Deployment fails if the server that hosts an external database goes down

Tracking Number: ASOC-9011

Problem: You configure a database connection to use the database as an enrichment source for a rule. A reference to the data base is deployed on every ESA, even if the ESA does not deploy any rules that use the database. If the server that hosts the database goes down, any new deployment will fail.

Workaround: Restart the server that hosts the database.

Trial rules configuration: Out-of-Bound Values are Capped

Tracking Number: ASOC-6633

Problem: When configuring parameters for trial rules, you can configure the following values:

- **MemoryCheckPeriod**: Defines the polling interval to check the ESA memory consumption.
- **MemoryThresholdForTrialRules**: Defines the threshold value; when reached, all trial rules will be disabled.

  If you configure these parameters with out-of-bound values, the values are capped to the system's minimum or maximum values rather than the values defined in the parameters.

Workaround: None.

Reporting Engine

Some compliance reports cannot be deployed from Live

Tracking Number: SAENG-1334

Problem: If the dependencies of certain compliance reports in Live are not deployed prior to the reports themselves, deployment of those fails.

Workaround: Retry the deployment. If the problem persists, try to deploy the rule or list dependencies first and then deploy the reports.

Some Reporting Alerts can fail or be delayed if the RabbitMQ connection is blocked

Tracking Number: SAENG-5329

Problem: If the **Forward Alerts to Respond** option is enabled and RabbitMQ connections to the Respond Server are blocked, some of the Reporting Engine threads can be blocked.

Workaround: Disable the **Forward Alerts to Respond** option until the RabbitMQ broker in the NetWitness Suite server at the Respond, has started and can accept the connections.

Updates to connection parameters on the Service page do not reflect on the Reporting Data sources

Tracking Number: ASOC-8149

Problem: If there are any changes or updates to service names, ports or parameters on the service page, they are not propagated to the corresponding data sources added in the Reporting Engine.

Workaround: Add data sources with modified service and use them. Additionally, if the names of the existing services are modified, the corresponding schedules must be updated in Reporting.

Cannot Navigate to Investigation from the NWDB reports if the connection parameters on the Service page are updated

Tracking Number: ASOC-8575

Problem: The Investigation link for the meta values of the executed reports is not displayed on the NWDB results page.

Workaround: None. To be fixed in the future release.

Updates to connection parameters on the Service page do not reflect on the Reporting Data sources

Tracking Number: ASOC-8149

Problem: If there are any changes or updates to service names, ports or parameters on the service page, they are not propagated to the corresponding data sources added in the Reporting Engine.

Workaround: Add data sources with modified service and use them. Additionally, if the names of the existing services are modified, the corresponding schedules must be updated in Reporting.

Reporting

Categories meta for incident collection is not supported.

Tracking Number: ASOC-40851

Problem: When using the Categories meta for incident collection, the results rendered are in an incorrect format. Hence this meta is not supported and you cannot use the categories meta in either select clause or where clause. Also, it is not available in the list of metas for selection in the Rule Builder page.

Workaround: None.

When querying on the Respond DB, empty rows are displayed.

Tracking Number: ASOC-37846

Problem: When querying on the Respond DB, and if the data is not available for the requested columns, then empty rows are displayed on the UI.

Workaround: None.

Chart with totals displays incorrect data.

Tracking Number: ASOC-37958

Problem: Chart with totals displays incorrect data when total numbers of values are higher than the chart limit. For example, if the number values that are retrieved is 16, the number of values that get displayed on the chart may be only the first 10.

Workaround: None.

Hide and Investigate options are not supported in Google Chrome and Mozilla Firefox browsers on Windows 10 operating system.

Tracking Number: ASOC-37590

Problem: If you are using Chrome or Firefox browsers on a Windows 10 operating system, and click on a chart data point, the hide and investigate options are not displayed. However, these options are available using the Internet Explorer browser.

Workaround: Disable the touch feature on Chrome and Firefox browsers. To disable this option in Chrome use the following procedure:

1. Navigate to - chrome://flags/ on Chrome or Firefox Browser.
2. Select the "Disable" option for "Touch Events API" flag.
3. Relaunch the browser.

To disable this option in Firefox, use the following procedure:

1. Navigate to - "about:config".
2. Click on "I accept the risk".
3. Search for the "Preference Name" - "dom.w3c_touch_events.enabled".
4. Update the "Value" column to 0.
5. Relaunch the browser.

Test Rule results with large data are not displayed in Internet Explorer 10

Tracking Number: SAENG-3926

Problem: When you click the **Test Rule** multiple times in quick succession, results with large input data may not displayed in Internet Explorer 10.

Workaround: If this issue occurs, try one of the following steps:

- Close the Test Rule window on Internet Explorer 10 and run the test again.
- Use other browsers like Chrome or Mozilla Firefox to test the rule execution.

Dynamic Lists cannot be added when editing a report schedule from the View All Schedules page

Tracking Number: SAENG-5837

Problem: You cannot add a dynamic list from the Edit option on the 'View All Schedules' page to an existing schedule.

Workaround: Edit the schedule from the Report Schedule page to add a dynamic list.

Administration

Configuration audit event captured by NetWitness Suite lacks context of which service was changed

Tracking Number: ASOC-8889

Problem: The NetWitness Suite server does not capture the applicable target service for configuration changes in audit events.

Workaround: None.

Excessive audit logs are logged when accessing NetWitness Suite UI pages/ importing/ exporting/ login/ logout`

Tracking Number: ASOC-8916

Problem: NetWitness Suite creates an excessive amount of audit logs when NetWitness Suite users log on, log out, import, export, and access pages from the NetWitness Suite user interface.

Workaround: None.

Audit Logs: SA_SERVER is not capturing the value for queryString

Tracking Number: ASOC-8994

Problem: When changing file contents of a NetWitness Suite service, the NetWitness Suite server audit logs do not indicate which file the user changed.

Workaround: None.

Password expiry email lacks source information

Tracking Number: ASOC-9187

Problem: The password expiry email sent by the NetWitness Suite server does not mention the name or URL of the NetWitness Suite server that sent the email. If there are multiple NetWitness Suite servers, you may not know where to go to update your password.

Workaround: None.

Audit logs do not report the page (name) accessed when user tries to access NetWitness Suite pages where the user does not have permissions

Tracking Number: ASOC-9323

Problem: When a user tries to access NetWitness Suite user interface pages without the necessary permissions, the audit logs do not capture the page names accessed by the user.

Workaround: None.

Event Source Management

Renaming the Log Collector or Log Decoder hostname is not reflected in Event Source Manage View

Tracking Number: ASOC-9235

Problem: On the **Administration > Host** page, if you edit the Log Collector or Log Decoder appliance "name," then the change will not be reflected on the **Administration > Event Sources > Manage** page in the Log Collector or Log Decoder columns.

Workaround: Once you update a name from the Host page perform the following steps:

1. SSH to the NetWitness Suite appliance.
2. Restart the SMS service by running this command: service rsa-sms restart.
3. On the NetWitness Suite UI, wait for the **Event Source Manage** page to come back up, then delete the event sources with the old Log Collector or Log Decoder names.

If you are collecting events from deleted event sources, then they are automatically added back to the Event Source Manage page with the new Log Collector or Log Decoder name.

Core Services

The SSL FIPS Mode checkbox in the Services Config view should be disabled for Brokers, Concentrators, and Archivers, because changing the checkbox value does not turn off FIPS enforcement for the service.

Tracking Number: ASOC-41902

Problem: In 11.0.0.0 the Broker, Concentrator, and Archiver are always FIPS enforced and the administrator does not have the option to toggle between between FIPS and Non-FIPS. The admin can use the SSL FIPS Mode checkbox to toggle FIPS mode on and off on a Log Decoder, Packet Decoder, or Log Collector.

Workaround: None.

Broker System roles do not show the custom meta keys defined in Concentrator

Tracking Number: ASOC-6749

Problem: If any custom meta keys are defined, the same meta keys should show up in the Broker, too. But the Broker system roles are not showing the custom meta.

Workaround: You can copy the Concentrator Language file and the custom index file (if it exists) to the Broker to add the SDK meta key roles to the system roles.

Custom Feed configuration- Advanced Option XML file invalid error for multi metacallback.

Tracking Number: ASOC-40867

Problem: Netwitness Suite does not support uploading feeds for the xmls where there are more than one callback.

Workaround: The Adhoc Feed can be uploaded using NwConsole, or using the REST URL of the decoder directly. This is not applicable for Recurring Feed.

Ability to Create Source and Destination IP-Based Feeds Using CIDR or Range

Tracking Number: SATCE-628

Problem: When creating a source and destination based feed on a Log Decoder, it only populates the source meta key. You cannot use a range-based or CIDR feed. You must list every single IP address.

Workaround: Create two different feeds using IP addresses and you can use CIDR in these feeds.

Product Documentation

The following documentation is provided with this release.

Document	Location
RSA NetWitness Suite 11.0 Online Documentation	https://community.rsa.com/community/products/netwitness/110
RSA NetWitness Suite 11.0 Upgrade Instructions	https://community.rsa.com/community/products/netwitness/110
RSA NetWitness Suite 11.0 Upgrade Checklist	https://community.rsa.com/community/products/netwitness/110
RSA NetWitness Suite Hardware Setup Guides	https://community.rsa.com/community/products/netwitness/hardware-setup-guides
RSA Content for RSA NetWitness Suite	https://community.rsa.com/community/products/netwitness/rsa-content

Contacting Customer Care

Use the following contact information if you have any questions or need assistance.

RSA SecurCare	https://knowledge.rsasecurity.com
Phone	1-800-995-5095, option 3
International Contacts	http://www.emc.com/support/rsa/contact/phone-numbers.htm
Email	nwsupport@rsa.com
Community	https://community.rsa.com/community/rsa-customer-support
Basic Support	Technical Support for your technical issues is available from 8 AM to 5 PM your local time, Monday through Friday.
Enhanced Support	Technical Support is available by phone 24 x 7 x 365 for Severity 1 and Severity 2 issues only.

Preparing to Contact Customer Care

When you contact Customer Care, you should be at your computer. Be prepared to give the following information:

- The version number of the RSA NetWitness Suite product or application you are using.
- The type of hardware you are using.
