Getting Started with NetWitness Suite

Overview

RSA NetWitness Suite is a powerful threat detection suite that enables Security Operation Centers (SOCs) to quickly locate, prioritize, and triage threats. NetWitness Suite helps you to isolate and remediate known threats as well as those that were previously unknown. It provides deep insight into packets and logs that provide you with an unparalleled view into your enterprise or business.

NetWitness Suite is more powerful than ever, but it is easier for Tier 1 Analysts to use because it automates the process of identifying and prioritizing suspicious threats. NetWitness Suite 10.6 users can still hunt for and locate threats in the same way they have done in the past using the Investigation view, which is still available.

Architecture

RSA NetWitness Suite is a distributed and modular system that enables highly flexible deployment architectures that scale with the needs of the organization. NetWitness Suite allows administrators to collect two types of data from the network infrastructure, packet data and log data. If NetWitness Endpoint 4.4 is installed and configured, endpoint event data is also collected. The key aspects of the architecture are:

- **Distributed Data Collection**. The **Decoder** ingests packet data while the **Log Decoder** ingests log data. Decoders parse and reconstructs all collected network traffic from Layers 2 - 7, or log and event data from hundreds of devices and event sources, including NetWitness Endpoint data (if installed and configured). The **Concentrator** indexes metadata extracted from network or log data and makes it available for enterprise-wide querying and real-time analytics while also facilitating reporting and alerting. The **Broker** aggregates data captured by other devices and event sources. Brokers aggregate data from configured Concentrators; Concentrators aggregate data from Decoders. Therefore, a Broker bridges the multiple real-time data stores held in the various Decoder/Concentrator pairs throughout the infrastructure.
- **Real-time Alerting**. The NetWitness Suite **Event Stream Analysis (ESA)** service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators. ESA uses an advanced Event Processing Language (EPL) that allows analysts to express filtering, aggregation, joins, pattern recognition and correlation across multiple disparate event streams. Event Stream Analysis helps to perform powerful incident detection and alerting.
- **Real-time Analytics** (Automatic analysis of events) The RSA Automated Threat Detection

functionality includes preconfigured ESA analytics modules for detecting Command and Control traffic.

- **NetWitness Server**. The NetWitness Server provides Reporting, Investigation, Administration, and other aspects of the user interface.
- **Capacity**. NetWitness Suite has a modular-capacity architecture enabled with direct-attached capacity (DACs) or storage area networks (SANs), that adapts to the organization's short-term investigation and longer-term analytic and data-retention needs.

The NetWitness Suite provides large deployment flexibility. You can design its architecture using as many as multiple dozens of physical hosts or a single physical host, based on the particulars of the customer's performance and security-related requirements. In addition, the entire NetWitness Suite system has been optimized to run on virtualized infrastructure.

The System Architecture comprises these major components: Decoders, Brokers, Concentrators, Archivers, ESA, and Warehouse Connectors. NetWitness Suite components can be used together as a system or can be used individually.

- In a security information and event management (SIEM) implementation, the base configuration requires these components: Log Decoder, Concentrator, Broker, Event Stream Analysis (ESA), and the NetWitness Server.
- In a forensics implementation, the base configuration requires these components: Decoder, Concentrator, Broker, ESA, and Malware Analysis. The Response-Server service is also required and is used to prioritize alerts..

The table provides a synopsis of each major component:

System Component	Description
Decoder / Log Decoder	• NetWitness Suite collects two types of data: packet data and log data. • Packet data, that is, network packets, are collected using the Decoder through the network tap or span port, which is typically determined to be an egress point on an organization's network. • A Log Decoder can collect four different log types - Syslog, ODBC, Windows eventing, and flat files. • Windows eventing refers to the Windows 2008 collection methodology and flat files can be obtained via SFTP. • Both types of Decoders ingest raw transactional data that is enriched, closed out, and aggregated to other NetWitness Suite components. • The process for ingesting and parsing transactional data is a dynamic and open framework.
Concentrator	• Provides index and query capability to NetWitness Collections. • Can optionally forward data to ESA.
Broker	• Distributes NetWitness Collection access across many Concentrators or Archivers, making the entire NetWitness Suite enterprise appear as a single collection.
Archiver	• The Archiver service enables long-term log archiving by indexing and compressing log data and sending it to archiving storage. • The archiving storage is optimized for long-term data retention, and compliance reporting. • Archiver stores raw logs and log meta data from Log Decoders for long term-retention, and it uses Direct-Attached Capacity (DAC) for storage. **Note:** Raw packets and packet meta data are not stored in the Archiver.

System Component	Description
Event Stream Analysis (ESA)	• The Event Stream Analysis service provides event stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators. • ESA uses advanced Event Processing Language that allows users to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. • ESA helps to perform powerful incident detection and alerting. • The RSA Automated Threat Detection functionality includes preconfigured ESA analytics modules for detecting Command and Control traffic.

Core Versus Downstream Components

In NetWitness Suite, the Core services ingest and parse data, generate metadata, and aggregate generated metadata with the raw data. The Core services are Decoder, Log Decoder, Concentrator, and Broker. Downstream systems use data stored on Core services for analytics; therefore, the operations of downstream services are dependent on Core services. The downstream systems are Archiver, ESA, Malware Analysis, Investigate, and Reporting.

Although the Core services can operate and provide a good analytics solution without the downstream systems, the downstream components provide additional analytics. ESA provides real-time correlation across sessions and events as well as between different types of events, such as log and packet data. Investigate provides the ability to drill into data, examine events and files, and reconstruct events in a safe environment. The Malware Analysis service provides real-time, automated inspection for malicious activity in network sessions and associated files.

Logging in to NetWitness Suite

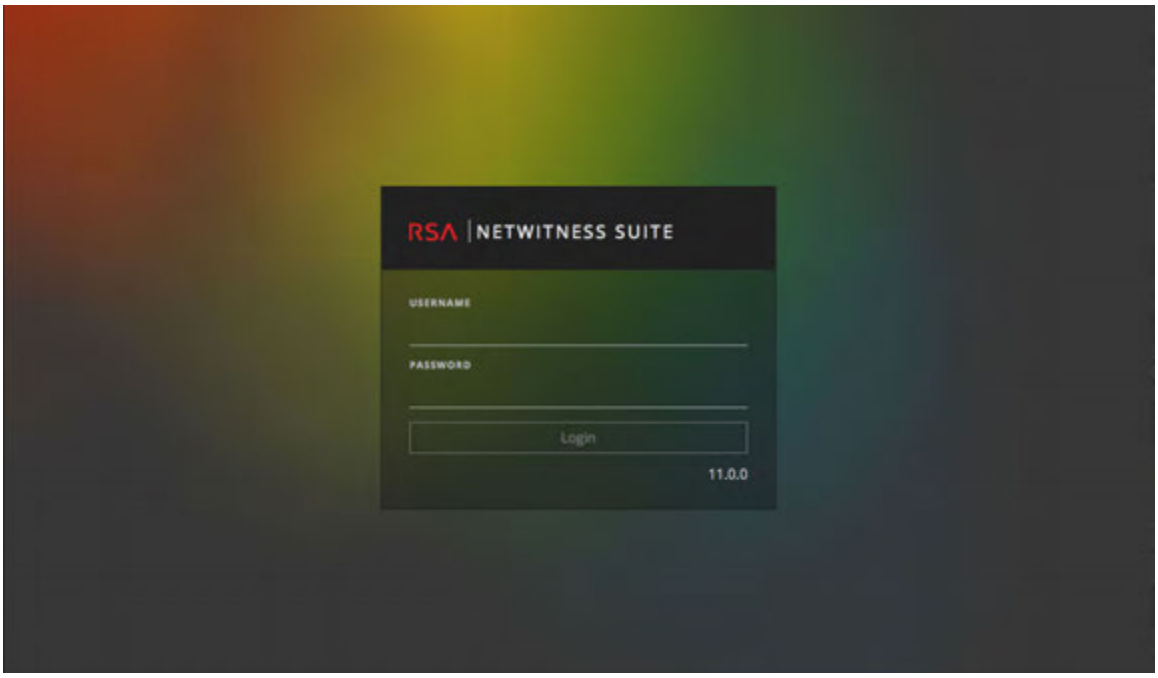
Logging in to NetWitness Suite can vary based on your environment. You may have an internal user account or an external user account. Internal user accounts are local to the NetWitness Suite and internal users can log in to NetWitness Suite and receive role-based permissions. External user accounts authenticate outside of the NetWitness Suite and are mapped to NetWitness Suite roles. If you are an external user and you cannot access NetWitness Suite or view the information that you need, contact your System Administrator. Your Administrator can assign the appropriate roles to your account.

1. Use an icon provided by your Administrator, or type the following in your web browser:

   `https://<hostname or IP address>/login`

   Where `<hostname or IP address>` is the hostname or IP address of your NetWitness server.

   The login screen is displayed.



2. Type your username and password, and then click **Login**.

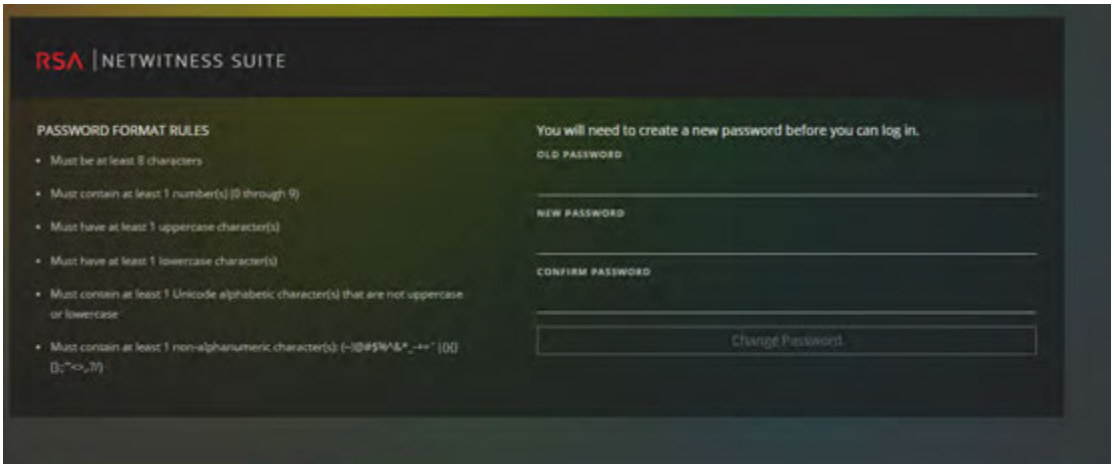
   If your login is successful, you will be logged in to the landing page specified in your user preferences.

If you are locked out:

If you try too many times to log in with an incorrect username or password, your account will lock. Contact your Administrator to unlock your account.

If you have a new account or your account is expired:

1. In the dialog to create a new password, enter your old password, type a new password, and confirm it. Password format rules (as defined by your system administrator) are provided on the left and your new password must conform to the indicated format rules.



2. Click **Change Password**.

If you do not have the appropriate access to NetWitness Suite:

If you are able to log in successfully, but you are not able to view the information that you need, it is possible that you need a user role assigned to your user account. Contact your Administrator for assistance.

Log Off NetWitness Suite

To log off from the Respond view:

1. In the main menu bar, select .
2. In the User Preferences, click **Sign Out**.

To log off from the all other views:

In the main menu bar, select > **Sign Out**.

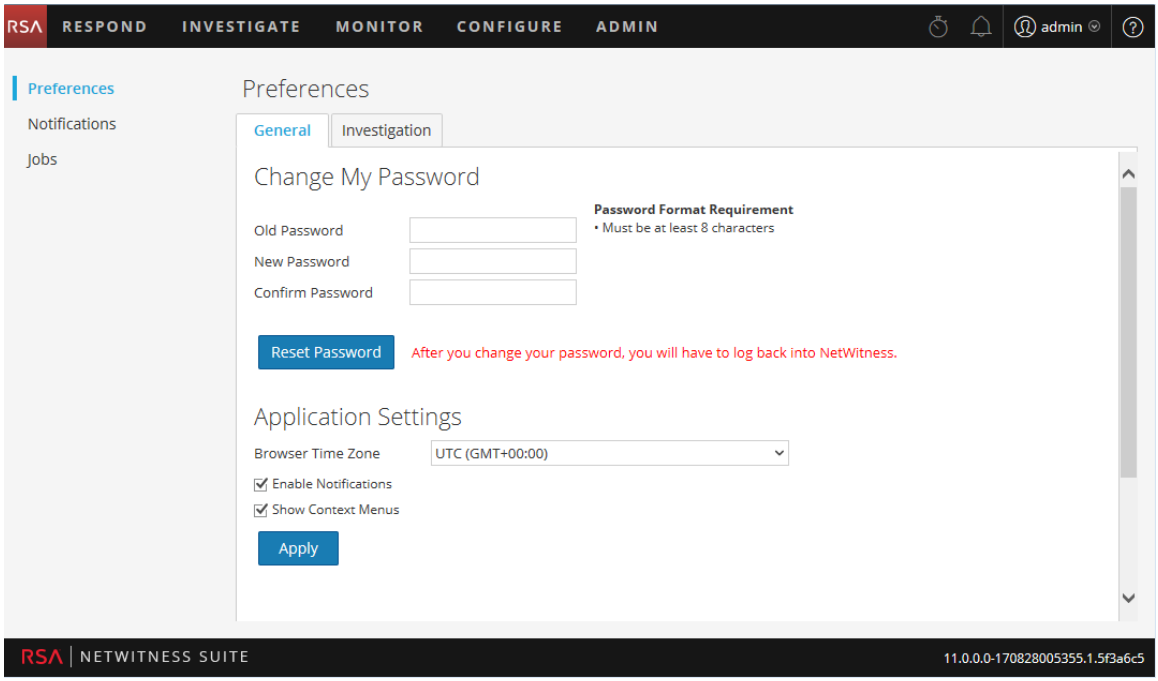
Changing Your Password

You can change the password that you use for NetWitness Suite authentication at any time in your user preferences. Your Administrator defines the appropriate password strength requirements for your NetWitness Suite password, such as minimum password length and minimum number of uppercase, lowercase, decimal, non-Latin alphabetic, and special characters. These requirements are then displayed when changing your password.

Note: When a Core service uses a trusted connection, you do not enter a password so no update is required for Core service accounts.

To change your password:

1. Do one of the following:
   - For most views, such as Investigate, Monitor, Configure, or Admin, select > **Profile**.
   - In the Respond view, select and in the User Preferences dialog click **Change my password**.



2. In the **Change My Password** section, enter the password that you used to authenticate to NetWitness Suite in the **Old Password** field.
3. In the **New Password** field, enter the password that you want to use for the next login.
4. In the **Confirm Password** field, retype the new password.
5. Click **Reset Password**.
   You will be logged out of NetWitness Suite for the changes to take effect. The new password becomes effective the next time you log in to NetWitness Suite.

Identify Your Role

The roles listed here are the typical roles or functions of a Security Operations Center (SOC). Determine the role or roles that you perform in the SOC. You can use these functions as a guide to decide how to set up and navigate NetWitness Suite so that you can efficiently perform your job tasks.

SOC Team

SOC Manager
(SOC Management and Reporting)

- Manage SOC Readiness
- Respond to Incidents
- Respond to Data Breaches

Data Privacy Officer

Monitor and protect privacy and sensitive information

Incident Reponder
(T1 Analyst)

- Respond to Incidents
- Remediate incidents

Threat Hunter
(T2/T3 Analyst)

- Hunt for threats
- Conduct forensic analysis
- Recommend issues for remediation
- Remediate issues

Content Expert
(Threat Intelligence)

- Investigate new threat intelligence
- Evaluate and create new feeds
- Create correlation rules to flag indicators of compromise

System Administrator

- Install and configure equipment and software.
- Manage user access
- Monitor and fine tune performance
- Backup and restore data
- Manage storage and archives
- Update software
- Create reports for regulatory compliance

NetWitness Suite Basic Navigation

The NetWitness Suite application is divided into five main functional areas, known as views, that are based on typical Security Operation Center (SOC) roles.

- **RESPOND**: This view is for Incident Responders, who can view a list of prioritized incidents to triage. These incidents come from sources such as ESA rules, NetWitness Endpoint, or ESA Analytics modules for Automated Threat Detection. You can also view all of the alerts received by NetWitness Suite here.
  For legacy 10.6 users, this view was known as the Incident Management view. The Alerts List in the Respond view replaces the ESA 10.6 Alerts > Summary view.
- **INVESTIGATE**: This view is primarily for advanced Threat Hunters, who prefer to manually hunt for threats using NetWitness Suite metadata, event analysis, and event reconstruction. Incident Responders also use this view to get details about events associated with an incident being investigated. Both Threat Hunters and Incident Responders can use the forensic event reconstruction and event analysis features in this view.
- **MONITOR**: This view is for all users. You can view dashboards and reports on different areas of interest depending on your user permissions. NetWitness Suite opens to this view by default.
  For legacy 10.6 users, this is the Dashboard view.
- **CONFIGURE**: This view is for Threat Intel (content) personnel, who configure data sources and inputs to NetWitness Suite. Threat Intel personnel use this area to download and manage Live content. They can also create and manage incident and ESA rules.
  For legacy 10.6 users, this view contains Live, Incidents > Configure, and Alerts > Configure from the previous version.

- **ADMIN**: This view is for System Administrators, who set up and maintain the overall application.

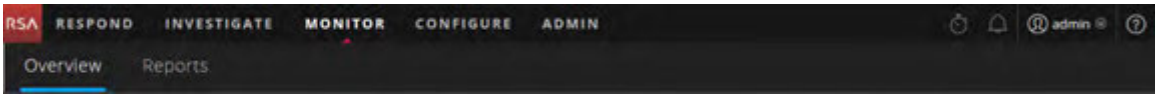
  For legacy 10.6 users, this is the Administration view less the sections added to the Configure view.

Accessing Main Views

The options that open each of the main views are listed at the top of the browser window. With the appropriate permissions, you can access any of these views at the top of every browser window at any time.

Secondary Menus

Some views have secondary menus with additional views that you can select, which vary according to the tasks that you can complete. The following example shows the MONITOR menu.



Additional Options

In addition to the main views, there are additional options at the top of the browser window that are common to the entire application.

The following table describes these common options:

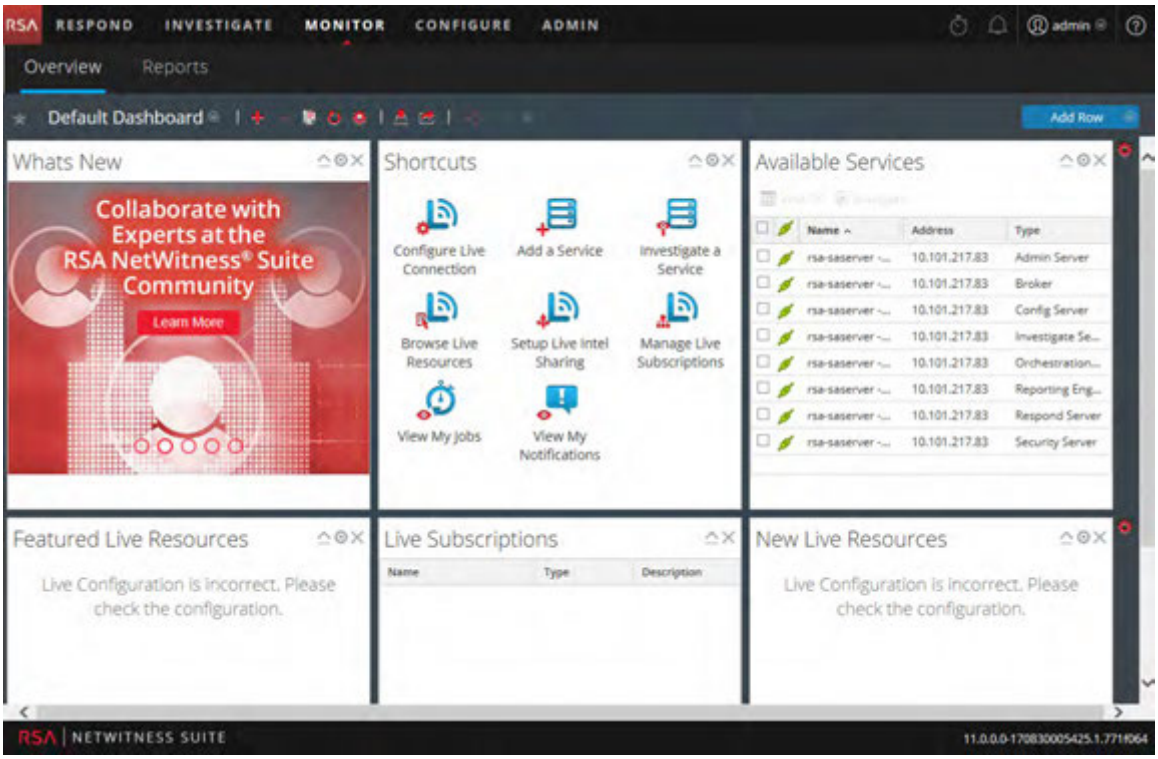
Common Option	Name	Description
	Jobs	In the INVESTIGATE, MONITOR, CONFIGURE, and ADMIN views, click this icon to view and manage your jobs in the Jobs tray. Jobs are on-demand or scheduled tasks that take some time to complete in the NetWitness Suite application.
	Notifications	Click this icon to view notifications from the application.
	User Preferences	Click this icon to view your available user preference options. You can manage your user preferences and log out of NetWitness Suite.
	User Profile	Click your user profile to view the available options. You can manage your user preferences, change your password, and log out of NetWitness Suite.
	Help	Click this icon to view NetWitness Suite help topics.

Main Views

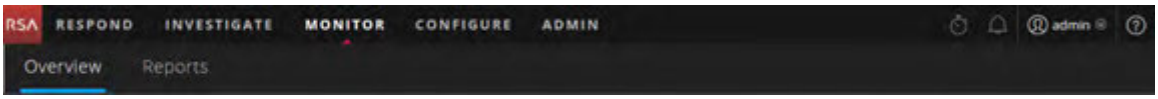
The following sections explain the main views.

MONITOR

The MONITOR view is the classic NetWitness Suite dashboard. Monitor offers preconfigured dashboards and reports that you can use or you can create your own.



MONITOR Menu



The MONITOR menu has the following options:

- **Overview**: The Overview view enables you to view and manage your dashboards. You can select the following preconfigured dashboards:
  - Default
  - Identity
  - Investigation
  - Operations - File Analysis
  - Operations - Logs
  - Operations - Network

- Operations - Protocol Analysis
- Overview
- RSA SecurID
- Threat - Hunting
- Threat - Intrusion
- Threat - Malware Indicators

For Legacy 10.6 users, this was the Dashboard view.

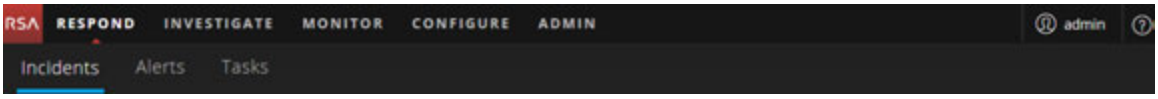
- **Reports**: The Reports view enables you to view and manage reports relevant to your SOC role according to your assigned permissions.

What can I do here?	Path	Show me how
Select a Dashboard	MONITOR > Overview	See Setting Up a Dashboard.
Create a Dashboard	MONITOR > Overview	See Setting Up a Dashboard.
Manage Dashboards	MONITOR > Overview	See Setting Up a Dashboard.
View a Report	MONITOR > Reports > View	See the *Reporting Guide*.
Manage Reports	MONITOR > Reports > Manage	See the *Reporting Guide*.

RESPOND

The Respond view presents analysts with a queue of incidents in severity order. When you take an incident from the queue, you receive relevant supporting data to help you investigate the incident. From there, you can determine the incident scope and escalate or remediate it as appropriate.

RESPOND Menu

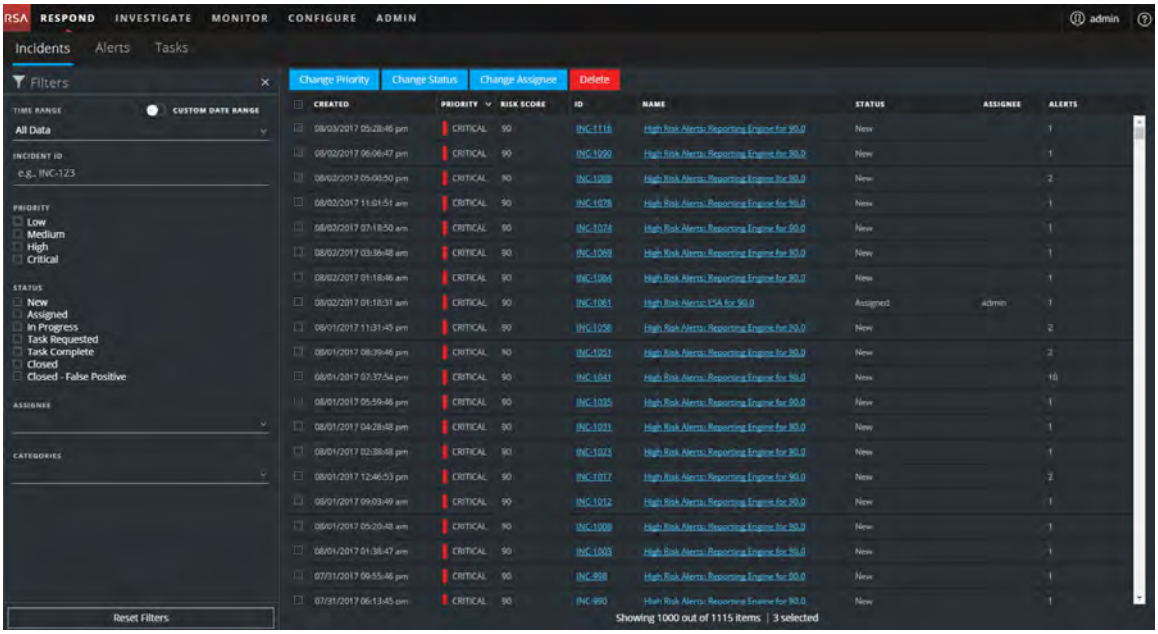


The RESPOND menu has the following options:

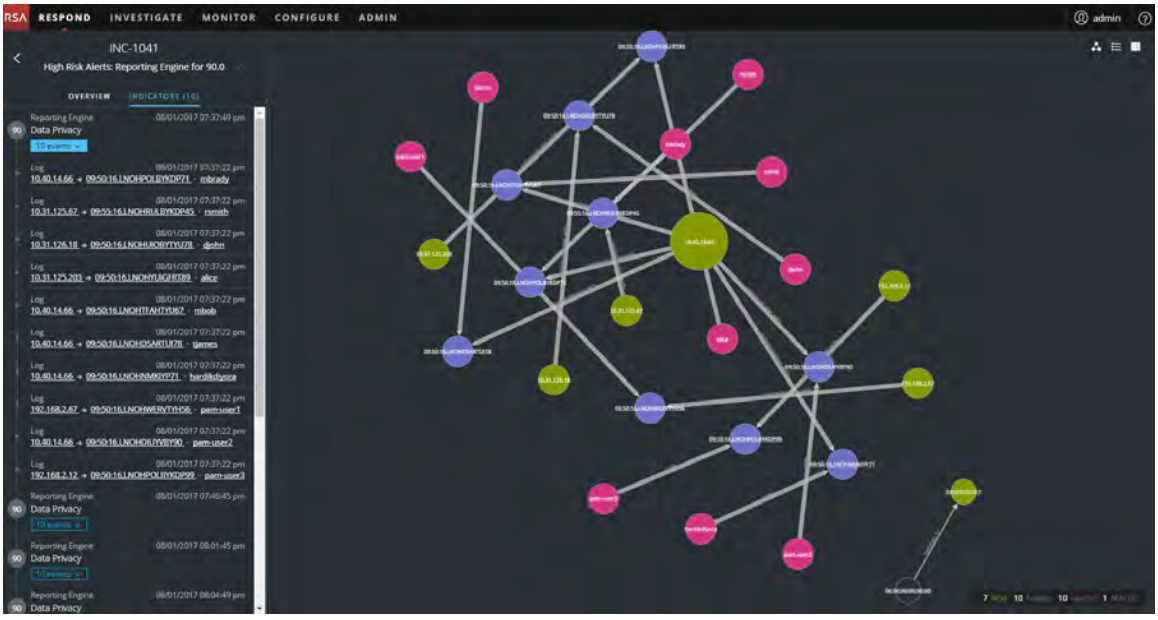
- **Incidents**: The Incidents List view contains a list of all incidents with basic information. The Incident Details view provides extensive details about the incident.

- **Alerts**: The Alerts List and Alert Details views provide information about all of the threat alerts and indicators received byNetWitness Suite in one location.
- **Tasks**: The Tasks List view enables you to create tasks and track them to completion.

The following figure shows the Respond view - Incident List view.



The following figure shows an example of the Respond view - Incident Details view.



When using NetWitness Suite as your case management tool, you can also case manage incidents from this view. New incidents appear at the top of the incident queue in priority order and incidents in progress are below the new incidents.

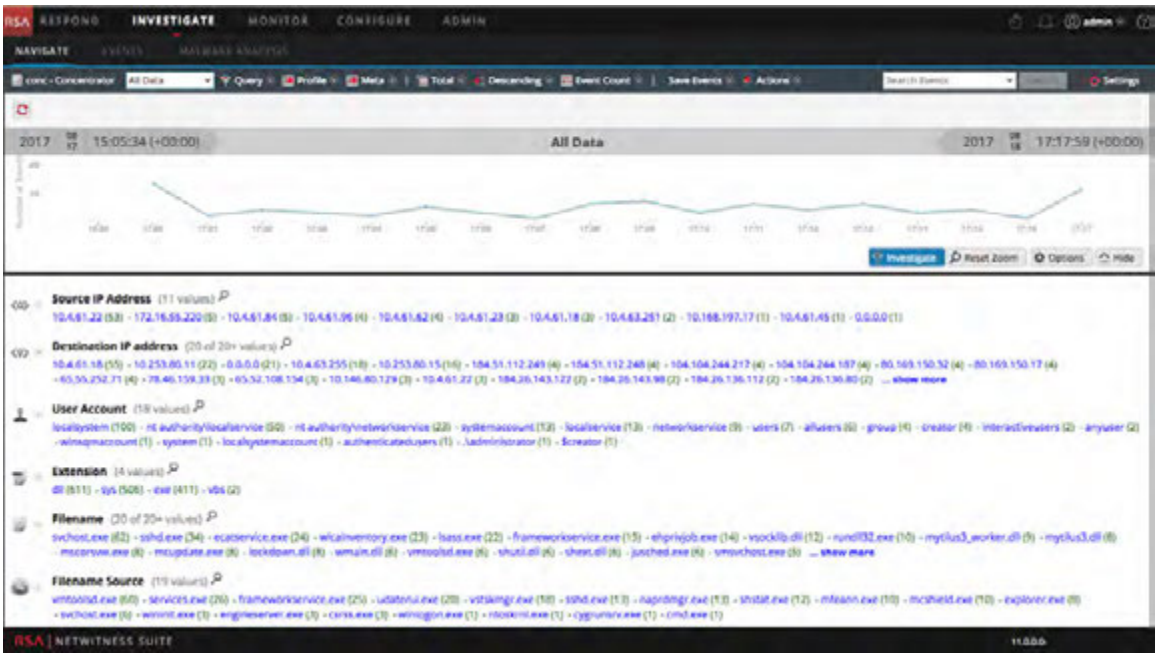
The following figure shows a high level Respond view workflow.

In the Respond view, analysts look at the prioritized list of incidents and determine which incidents require action. They click an incident for a clear picture of the incident with supporting details and they can investigate the incident further. Analysts can then determine how to respond to the threat, by escalating or remediating it.

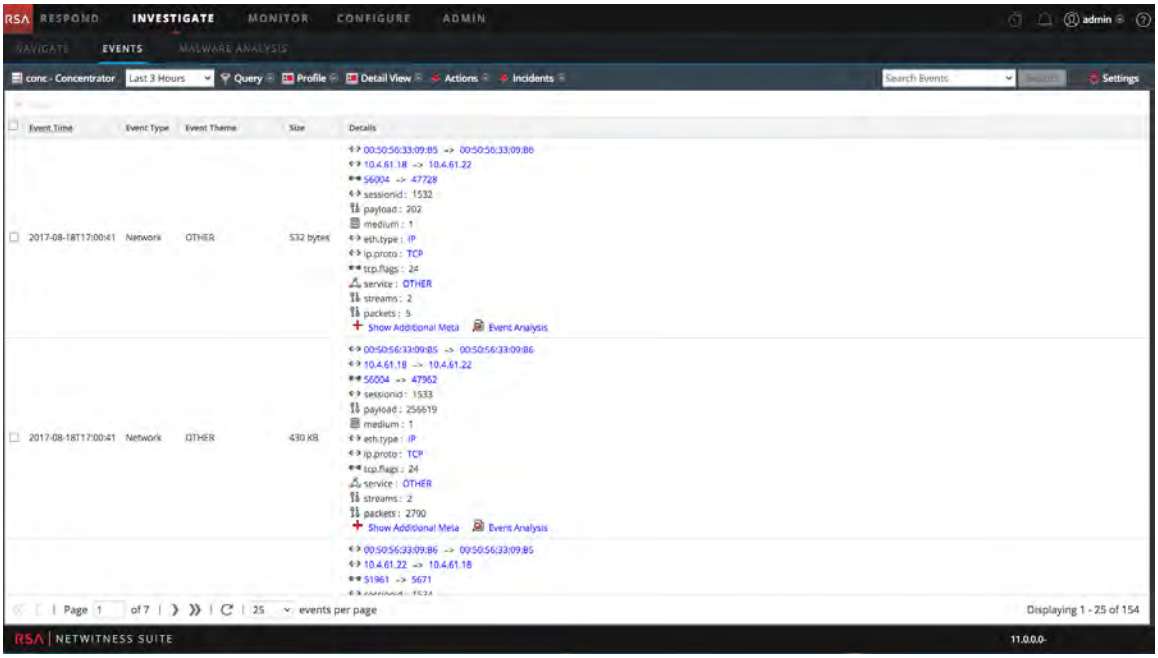
What can I do here?	Path	Show me how
View prioritized incident lists	RESPOND > Incidents (Incident List view)	See the *NetWitness Respond User Guide*.
Determine which incidents require action (Triage an incident)	RESPOND > Incidents (Incident Details view)	See the *NetWitness Respond User Guide*.
Investigate the incident	RESPOND > Incidents (Incident Details view)	See the *NetWitness Respond User Guide*. (You can also pivot to the Investigate view.)
Escalate or Remediate the Incident	RESPOND > Incidents (Incident Details view) and RESPOND > Tasks (Tasks List view)	See the *NetWitness Respond User Guide*.
Review Alerts	RESPOND > Alerts (Alerts List and Alert Details views)	See the *NetWitness Respond User Guide*.

INVESTIGATE

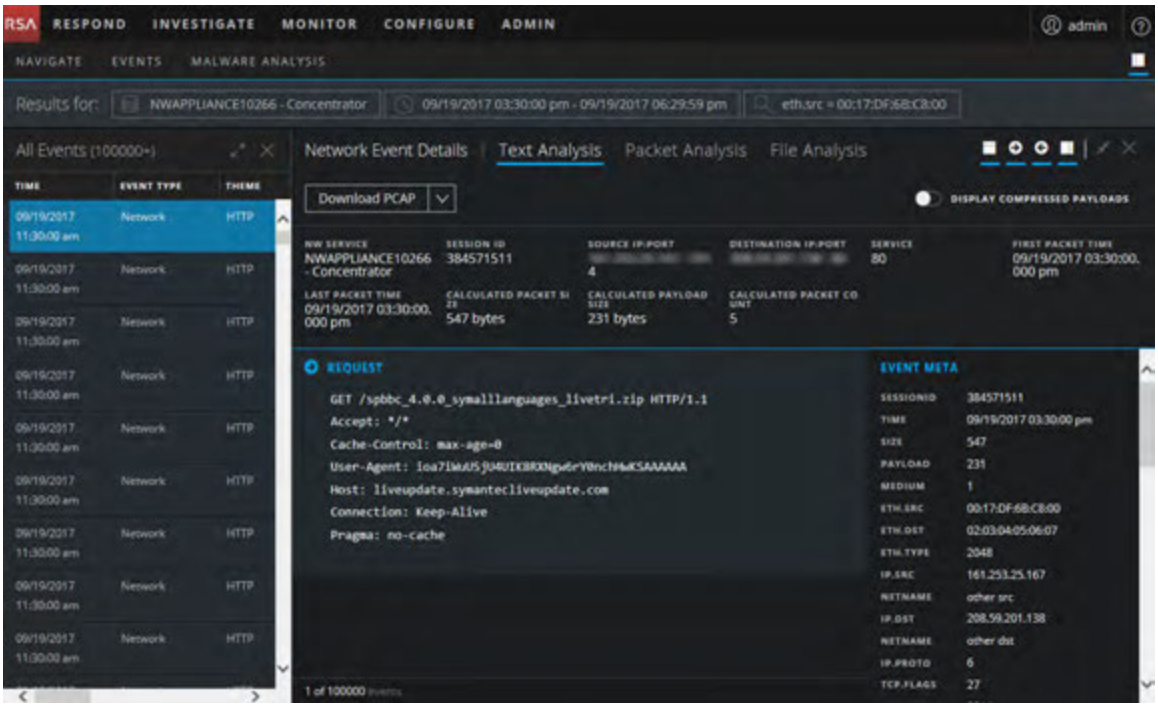
The Investigate view presents three different views into a set of data, allowing analysts to see metadata, events, and potential indicators of compromise. This figure illustrates one of the views, the Navigate view, showing all data on a Concentrator being investigated.



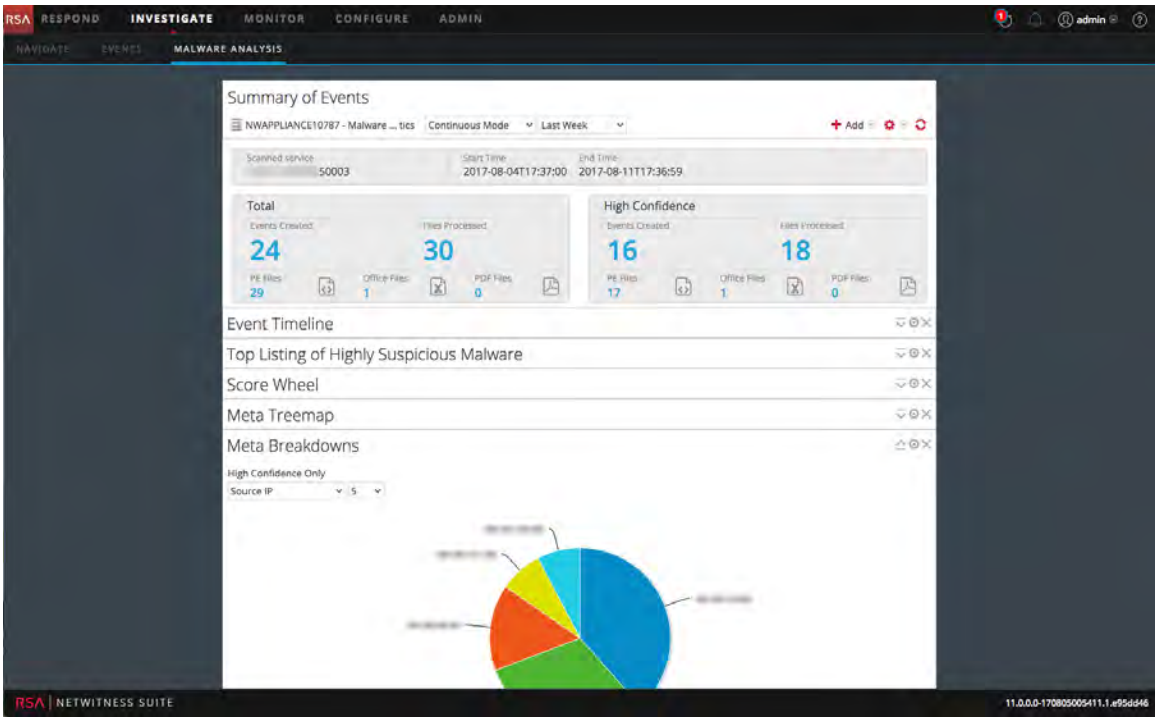
This is an example of the Events view.



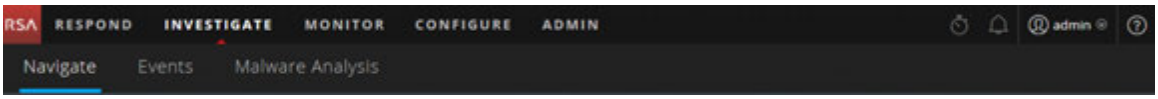
Clicking the **Event Analysis** link for a specific event on the Events view opens the Event Details view.



This is an example of the Malware Analysis Summary of Events.



INVESTIGATE Menu

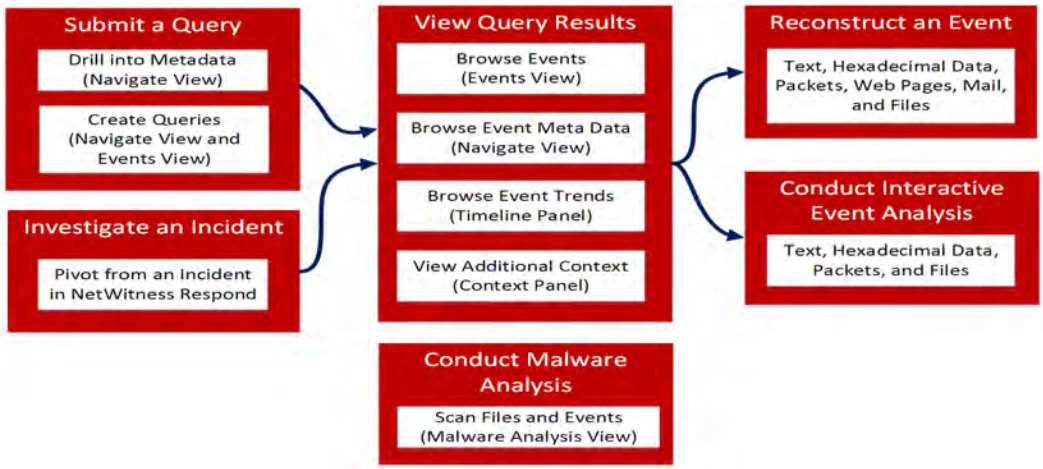


The INVESTIGATE menu has the following options:

- **Navigate**: The Navigate view provides a toolbar for filtering and querying data along with a view of the metadata and a timeline visualization. Analysts can drill into the data, open selected events in the Events view, and look up additional context from the Context Hub service.
- **Events view**: The Events view provides a toolbar to refine the data set and a list of events. Analysts can browse a simple list of events, a detailed list, and a log list. When an interesting event, is found, they can safely view a reconstruction of the event and conduct event analysis.
- **Malware Analysis**: The Malware Analysis view enables analysts to analyze certain types of file objects to assess the likelihood that a file is malicious. Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows PE, PDF, and MS Office) to assess the likelihood that a file is malicious. Using Malware Analysis, the malware analyst can prioritize the massive number of files captured in order to focus analysis efforts on the files that are most likely to be malicious.

To work in Investigate, analysts begin by running a query to select a subset of the collected data. Analysts can browse the data in the Navigate view, create their own queries, refine the filters, and control the way the metadata is ordered and displayed. Upon finding an event of interest, analysts explore and inspect the event details for suspicious or malicious activity. Refer to the *Investigation and Malware Analysis User Guide* for detailed information.

The following figure shows a high level workflow of the Investigate view.

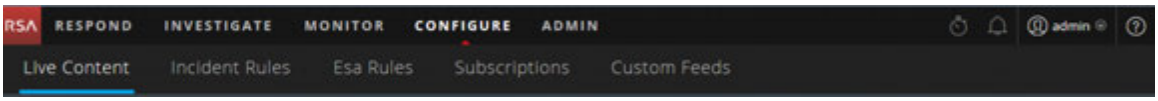


What can I do here?	Path	Show me how
Query and view meta keys and values found in a set of data	INVESTIGATE view	See "Conducting an Investigation" in the *Investigation and Malware Analysis User Guide*.
Examine, reconstruct, and analyze events	INVESTIGATE view	See "Examine Events" in the *Investigation and Malware Analysis User Guide*.
Look for file objects that may contain malicious code	INVESTIGATE view	See "Conduct Malware Analysis" in the *Investigation and Malware Analysis User Guide*.

CONFIGURE

The Configure view enables Threat Intel (content) personnel to configure data sources and inputs to NetWitness Suite in one convenient location.

CONFIGURE Menu



The CONFIGURE menu has the following options:

- **Live Content**: (Live Services) The Live Content view enables you to search for and subscribe to Live Services resources. Live Services is the component of the NetWitness Suite that manages communication and synchronization between NetWitness Suite services and a library of Live content available to RSA NetWitness Suite customers. You can view, search, deploy, and subscribe to content from the RSA Live Content Management System (CMS) to NetWitness Suite services and software. When you subscribe to a resource, you agree to receive updates on a regular basis from RSA Live Services.
  For Legacy 10.6 users, this was Live > Search.
- **Incident Rules**: The Incident Rules view enables you to create aggregation rules with various criteria to automatically create incidents. You can view prioritized incidents in the Respond view.
  For Legacy 10.6 users, this was Incidents > Configure.

- **ESA Rules**: The ESA Rules view enables you to manage the Event Stream Analysis (ESA) rules that specify criteria for problem behavior or threatening events in your network. When ESA detects a threat that matches the rule criteria, it generates an alert.
  You can create ESA rules yourself or download them from Live Services. The Rule Library shows all ESA rules created or downloaded. To activate rules, you have to add them to a deployment. Deployments map rules from your rule library to the appropriate ESA services.
  For Legacy 10.6 users, this was Alerts > Configure.
- **Subscriptions**: (Live Services) The Subscriptions view enables you manage the Live content that you subscribed to in the Live Content view. To set up Live Services on NetWitness Suite, you configure the connection and synchronization between the CMS server and NetWitness Suite.
  For Legacy 10.6 users, this was Live > Configure.
- **Custom Feeds**: (Live Services) The Custom Feeds view streamlines the task of creating and managing custom feeds, as well as populating the feeds to selected Decoders and Log Decoders. You can set up and maintain custom and identity feeds.
  NetWitness Suite uses feeds to create metadata based on externally defined metadata values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created.
  You can create custom feeds to provide extra metadata extraction, for example, to accommodate custom network applications.
  For Legacy 10.6 users, this was Live > Feeds.

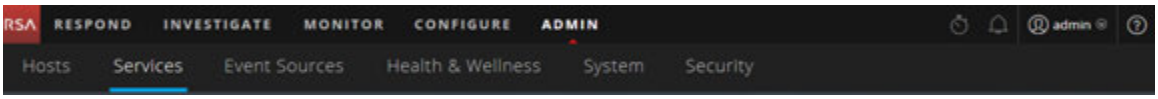
What can I do here?	Path	Show me how
Create a Live Services account.	RSA Live Registration Portal: https://cms.netwitness.com/registration/	See the *Live Services Management Guide*.
Find and deploy Live Services resources.	CONFIGURE > Live Content	See the *Live Services Management Guide*.
Create incidents automatically.	CONFIGURE > Incident Rules	See the *NetWitness Respond User Guide*.
Configure alerts.	CONFIGURE > ESA Rules	See the *Alerting Using ESA Guide*.

What can I do here?	Path	Show me how
Set up Live Services Services on NetWitness Suite	CONFIGURE > Subscription	See the *Live Services Management Guide*.
Set up and maintain custom and identity feeds.	CONFIGURE > Custom Feeds	See the *Live Services Management Guide*.

ADMIN

In the Admin view, Administrators can manage network hosts and services; monitor the health and Wellness of NetWitness Suite; and manage system-level security. They can also configure global system resources and manage event sources.

ADMIN Menu



The ADMIN menu has the following options:

- **Hosts**: The Hosts view is where you set up and maintain hosts. A host is the machine on which services run and a host can be a physical or virtual machine.
- **Services**: The Services view enables you to manage services, manage service users and roles, maintain service configuration files, and explore and edit service properties. A service performs a unique function, such as a Decoder service, which captures network data in packet form.
- **Event Sources**: The Event Sources view enables you to manage event sources and configure alerting policies for them. Organizations typically monitor event sources in groups based on the criticality of the event sources. You can create monitoring policies for each event source group and order them based on priority.
- **Health & Wellness**: The Health & Wellness view enables you to monitor the health of the NetWitness Suite hosts and services in your network environment.
- **System**: The System view enables you to set global NetWitness Suite configurations. You can configure global audit logging, email, system logging, jobs, RSA Live Services, URL integration, Investigation, Event Stream Analysis (ESA), ESA Analytics, and advanced

performance settings. In addition, you can manage NetWitness Suite versions and configure the local licensing server.

- **Security**: The Administration Security view provides the capability to manage user accounts, manage user roles, map external groups to NetWitness Suite roles, and modify other security-related system parameters. These apply to the NetWitness Suite system and are used in conjunction with the security settings for individual services.

What can I do here?	Path	Show me how
Manage hosts.	ADMIN > Hosts	See the *Host and Services Getting Started Guide*.
Manage services including managing service user access and security.	ADMIN > Services	See the *Host and Services Getting Started Guide*.
Manage event sources and configure alerting policies for them.	ADMIN > Event Sources	See the *Event Source Management Guide*.
Set up and monitor alarms for the hosts and services in your NetWitness Suite domain.	ADMIN > Health & Wellness > Alarm	See the *System Maintenance Guide*.
Monitor statistics for the NetWitness Suite hosts and the services running on the hosts.	ADMIN > Health & Wellness > Monitoring	See the *System Maintenance Guide*.
Create and apply policies to your hosts and services to help you maintain the health and wellness of your NetWitness Suite domain.	ADMIN > Health & Wellness > Policies	See the *System Maintenance Guide*.
Set global configurations for NetWitness Suite.	ADMIN > System	See the *System Configuration Guide*.

What can I do here?	Path	Show me how
Configure Global Audit Logging.	ADMIN > Systen > Global Auditing	See the *System Configuration Guide*.
Set up system security.	ADMIN > Security	See the *System Security and User Management Guide*.
Manage system users with roles and permissions.	ADMIN > Security	See the *System Security and User Management Guide*.

Setting up Your Default View by SOC Role

After logging in to NetWitness Suite, you can make navigating the application easier by setting up your default view based on your Security Operations (SOC) role. You set your default view, also known as a landing page, in your user preferences.

The following figure shows the main NetWitness Suite views.

- **Respond**: This view is for Incident Responders, who can view a list of incidents to triage and alerts. For legacy 10.6 users, this view was known as the Incident Management view and the Respond > Alerts view replaces the ESA 10.6 Alerts > Summary view .
  Respond is the default opening view. If you do not have permission to see the Respond view, you will have Monitor as your default view.
- **Investigate**: This view is for Threat Hunters, who investigate and hunt for advanced threats.
- **Monitor**: This view is for all users and it is the classic view for previous application versions. You can view dashboards and reports on different areas of interest depending on your user permissions. You have the option to select a preconfigured dashboard, import a dashboard, or create your own custom dashboard.
- **Configure**: This view is for Threat Intel (content) personnel, who configure data sources and inputs to NetWitness Suite. Threat Intel personnel use this area to download and manage Live content. They can also create and manage incident and ESA rules.
  For legacy 10.6 users, this view was Live, Incidents > Configure, and Alerts > Configure.
- **Admin**: This view is for System Administrators, who set up and maintain the overall application.

You can select any of the main NetWitness Suite views as your default view. In addition to the main views, NetWitness Suite has predefined dashboards that you can select in the Monitor view depending on the tasks you perform:

- Default Dashboard
- Identity Dashboard
- Operations - Logs Dashboard
- Operations - Network Dashboard
- Overview Dashboard

- Threat - Indicators Dashboard
- Threat - Intrusion Dashboard

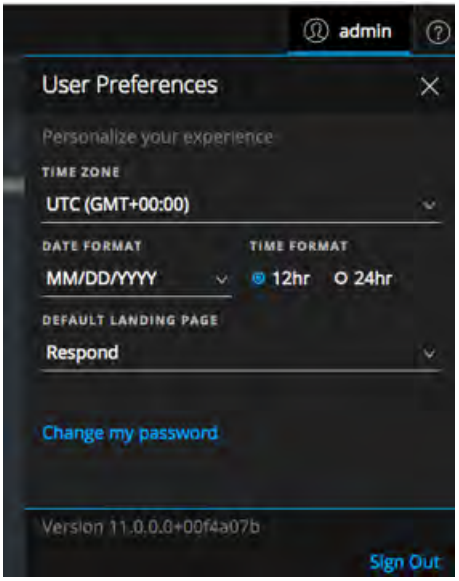
The following table shows typical SOC roles and the available views you can select as your landing page in your user preferences based on your SOC role. If you have more than one role, select the view that is most appropriate for you to start with when you log in to NetWitness Suite.

SOC Roles	Role Description	Consider this Default Landing Page
Incident Responder (Tier 1 Analyst)	Addresses incidents and alerts queued for them to review and mitigate	**RESPOND**
Threat Hunter (Tier 2/Tier 3 Analyst)	Investigates and hunts for advanced threats	**INVESTIGATE**
SOC Manager (SOC Management and Reporting)	Manages SOC readiness and responds to incidents and data breaches.	**MONITOR** (Dashboard is in the MONITOR view.) When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard.)
Content Expert (Threat Intelligence)	Configures data sources and inputs to NetWitness Suite.	**MONITOR** or **CONFIGURE** (Dashboard is in the MONITOR view. When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard. If you choose MONITOR as your default view, you can navigate to the CONFIGURE view from the main menu.)

SOC Roles	Role Description	Consider this Default Landing Page
Data Privacy Officer (DPO)	Similar to an Administrator, but a DPO monitors and protects privacy-sensitive information.	**MONITOR** (Dashboard is in the MONITOR view. When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard.)
System Administrator	Focuses on the configuration and stability of the overall application. Manages user access.	**ADMIN**

Setting Your Default View

1. (Respond view only) On the main menu bar, select  .
   The User Preferences dialog shows your current preferences.



2. In the **Default Landing Page** field, select the default view that you would like to see when you log in to NetWitness Suite. Use the above table to make your selection based on your SOC role. For example, if you are an Incident Responder, you can select **Respond** and if you are a Threat Hunter, you can select **Investigate**.
   Your preferences become effective immediately. You can change your default landing page at any time. For information on other preferences, see Setting User Preferences.
3. To verify that you can see the correct default view, click **Sign Out** to log out and then log back in to NetWitness Suite.

Basic Troubleshooting Tips for User Setup

The following table provides basic troubleshooting tips that may be helpful for user setup in NetWitness Suite.

Problem	Troubleshooting Tip
When I log in to NetWitness Suite, I see the wrong default view.	Verify that the correct default view is set in the Default Landing Page field in your user preferences. If you select the MONITOR view, you can select the predefined dashboard that is most appropriate for your SOC role. You can also import or create your own dashboard.
I see the correct view, but the metadata does not load.	Try using another browser. For example, if you are using Safari, try using Firefox or Chrome.
I am using Internet Explorer 10 and I get the following error: `The page can't be displayed.`	NetWitness Suite supports modern (or current) versions of the latest browsers. Try installing a newer browser version. If you cannot upgrade your browser, you can try enabling the TLS 1.2 protocol in your browser: Navigate to **Internet options > Advanced > Settings > Security**. In addition to your other protocols, ensure that the TLS 1.2 protocol is enabled. Click **Apply**. Reload the page.

Problem	Troubleshooting Tip
When I log in, I cannot see anything.	See your Administrator, you may need a user role assigned to your account or additional troubleshooting.
I can't see where to change my default landing page.	Go to the User Preferences in the Respond view or see your Administrator.

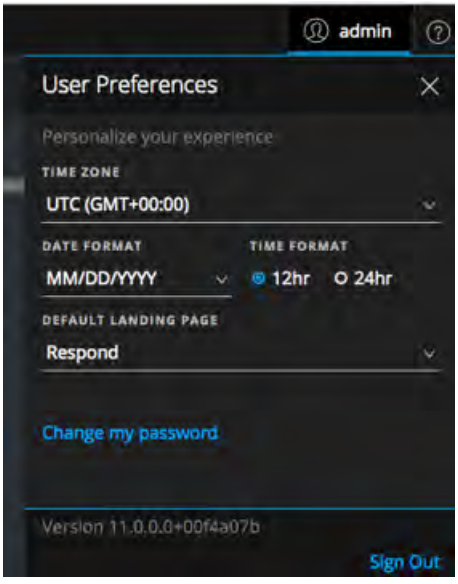
Setting User Preferences

You can view and manage your NetWitness Suite global application preferences from your user profile. Your global preference options vary depending on whether you access them from the new Respond view or other views, such as Monitor, Configure, Admin, and Investigate.
You can:

- Set the application time zone
- Set the application date and time format (Respond view only)
- Select your default starting location (Respond view only)
- Change your password (all views except Respond view) - See Changing Your Password for more information.
- Enable or disable notifications (all views except Respond view)
- Enable or disable context menus (all views except Respond view)

View Your User Preferences (Respond view)

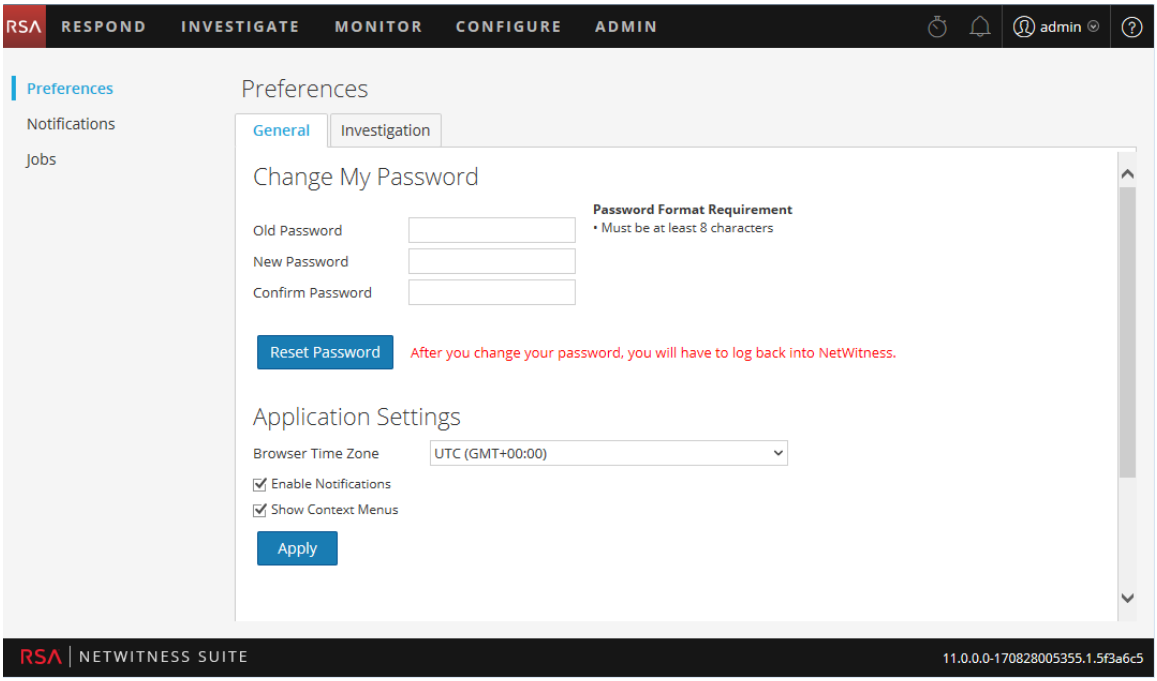
In the upper left corner of the NetWitness Suite browser window, select .
The User Preferences dialog shows your current preferences when accessed through the Respond view.



Any selections that you make become effective immediately.

View Your User Preferences (all views except Respond view)

For the following views: Investigate, Monitor, Configure, and Admin: In the upper left corner of the NetWitness Suite browser window, select > **Profile**.
The Preferences dialog shows your current preferences.



Set the Time Zone and Date and Time Format

You can change the time zone and the format of the date and time for your location.

Note: You can only change the date and time preferences for your location from the Respond view.

1. In the User Preferences dialog, select your localization preferences:
   a. **Time Zone**: Set the time zone to use in the NetWitness Suite.
   b. **(Respond view only) Date Format**: Set the format for the order of the display of the month (MM), day (DD), and year (YYYY). For example, the MM/DD/YYYY format shows the date as 05/11/2017.
   c. **(Respond view only) Time Format**: Set the time as 12-hour or 24-hour time. For example, 2:00 PM in 12-hour time is 14:00 in 24-hour time.

   Changes in the Respond view become effective immediately.
2. **(All views except Respond)** Click **Apply**.
   Your preferences become effective immediately.

Select the Default Starting Location

1. **(Respond view only)** Open the User Preferences dialog.
2. In the **Default Landing Page** field, select the opening view that you would like to see when you log in to NetWitness Suite. You can choose Respond, Investigate, Monitor, Configure, and Admin according to your user role. For example, you can choose Respond to go directly to the relevant section of the application for Incident Responders. See Setting up Your Default View by SOC Role to help you select the appropriate default view.
   This selection sets the default view for the entire application. Changes become effective immediately.

Enable or Disable System Notifications for Your User Account

(All views except Respond view) By default, NetWitness Suite system notifications are enabled when a new user account is created. You can disable and enable these notifications at any time.

1. In the Preferences dialog:
   - To enable notifications for your user account, select the **Enable Notifications** checkbox.
   - To disable notifications, clear the **Enable Notifications** checkbox.
2. Click **Apply**.
   Your preference becomes effective immediately.

Enable or Disable Context Menus for Your User Account

(All views except Respond view) By default, context menus are enabled when a new user account is created. Context menus provide additional functions for specific views when you right-click a view.

1. In the Preferences dialog:
   - To enable context menus for your user account, select the **Enable Context Menus** checkbox.
   - To disable context menus, clear the **Enable Context Menus** checkbox.
2. Click **Apply**.
   Your preference becomes effective immediately.

Note: Settings available on the Investigate tab in the Preferences dialog (for all views except Respond) are documented in the *Investigation and Malware Analysis User Guide*.

Managing Dashboards

A dashboard is a group of dashlets that give you the ability to view in one space, the key snapshots of the various components that you consider important. In NetWitness Suite, you can compose dashboards to obtain high-level information and metrics that portray the overall picture of a NetWitness Suite deployment, displaying only the information that is most relevant to the day-to-day operations.

By default, the NetWitness Suite default dashboard is displayed when you log in to NetWitness Suite, and it is populated with a few useful dashlets to get you started with your own customizations. The dashboards for all NetWitness Suite components are available to add to the default NetWitness Suite dashboard or a custom NetWitness Suite dashboard.

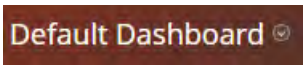
You can view dashboards and reports on different areas of interest depending on your user permissions. You have the option to select a preconfigured dashboard, import a dashboard, or create your own custom dashboard. The dashboards help you to quickly and easily view reports. You can configure your dashboards to display the information that supports your workflow. This topic explains the high-level tasks that can be done when you are setting up a dashboard.

Dashboard Basics

If the Monitor view is your default landing page following logging in to NetWitness Suite you will always see either the default dashboard or the currently configured dashboard immediately after completing the login process. To return to the dashboard from another NetWitness Suite component, go to **Monitor** > **Overview**.

Dashboard Title

The dashboard title reflects the currently active dashboard; for example, Default Dashboard.



Dashboard Selection List

You can access preconfigured and custom dashboards on the dashboard selection list. When you select a dashboard, its title is displayed below the NetWitness Suite toolbar.

A dashboard has:

- The dashboard toolbar
- The dashboard title and the dashboard selection list.

Dashboard Toolbar

The dashboard toolbar is available next to the title of the selected dashboard. The dashboard toolbar allows various operations on dashboards and dashlets.

Note: The Copy, Delete, Import, Export, Share, and Add Row options are disabled for preconfigured dashboards.

Option	Description
	Sets the selected dashboard as the Favorite.
	Displays the list of available dashboards from which you can make a selection.
	Displays the Create a Dashboard dialog, where you define or add a custom dashboard.

Option	Description
	Deletes a custom dashboard. The default dashboard cannot be deleted.
	Allows you to copy a dashboard.
	Displays the Manage Dashlet dialog.
	Exports a dashboard as a .zip file.
	Imports a dashboard as .zip or.cfg file.
	Allows you to share a dashboard with another user.
	Enables user to add rows and columns to the dashboard based on the requirement. Click the  icon in a row to add a dashlet.

The Default Dashboard

The default dashboard is configured to display specific dashlets in specific positions. The default dashboard serves as an example of dashboard composition and a starting point for customization.

- You can customize the information on the default dashboard by editing, adding, moving, maximizing, and deleting dashlets.
- After modifying the default dashboard, you can restore the default dashboard () to its original layout.
- The default dashboard cannot be deleted or shared.

Selecting a Preconfigured Dashboard

On installation of NetWitness Suite Suite, the following preconfigured dashboards are automatically activated and are available to you:

- Default
- Identity

- Investigation
- Operations - File Analysis
- Operations - Logs
- Operations - Network
- Operations - Protocol Analysis
- Overview
- RSA SecurID
- Threat - Hunting
- Threat - Malware Indicators
- Threat - Intrusion
- Threat - Malware Indicators

You cannot perform the following actions on a preconfigured dashboard:

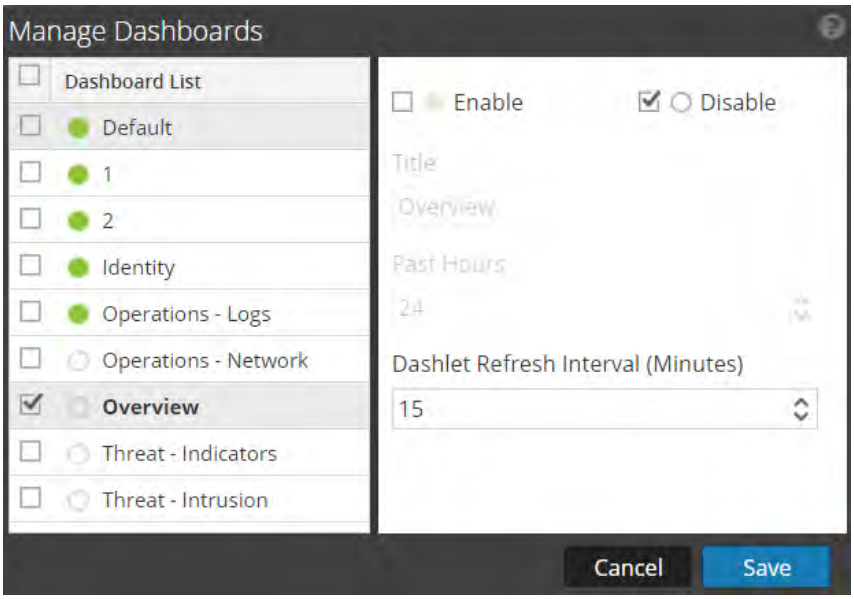
- Edit a dashboard
- Export a dashboard
- Share a dashboard
- Delete a dashboard

For more information on each Preconfigured dashboard, see the Dashboards Catalog in the RSA Content space on RSA Link.

Enabling or Disabling Dashboards

When you enable or disable a dashboard, all the dashlets within the dashboard are enabled or disabled along with the associated charts, unless they are used in any other dashboard.

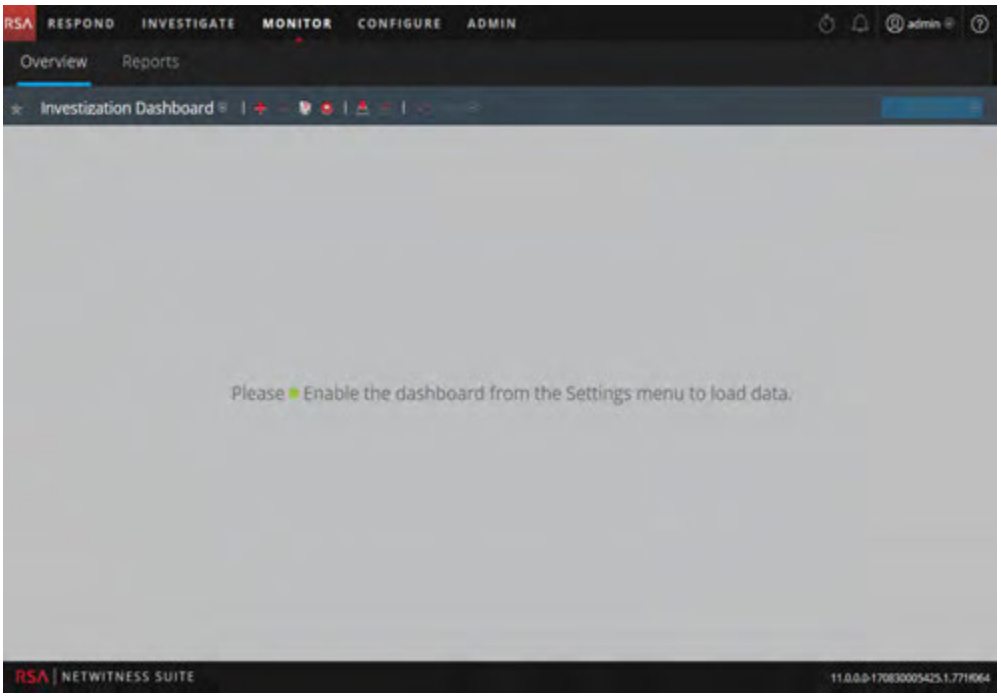
NetWitness Suite modules can display only those dashlets presented in the Manage Dashlet dialog. The main dashboard offers all NetWitness Suite dashlets. This is an example of currently available dashlets.



Name	Description
Dashboard List	Displays a list of the default, preconfigured, and custom dashboards.
Enable	Displays if the selected dashlet is enabled.
Disable	Displays if the selected dashlet is disabled.
Title	Displays the title of the selected dashlet and you can also rename the dashaboard.
Past Hours	Displays the time for which the data is collected.
Dashlet Refresh Intervals (Minutes)	Displays the refresh interval time of a dashlet.

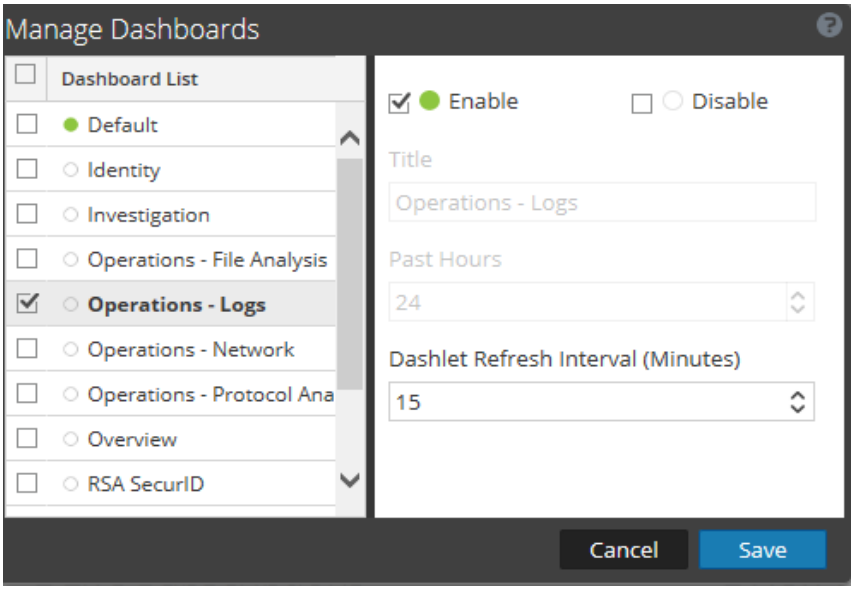
Enabling a Dashboard

If you select a dashboard that is not enabled, a masked screen is displayed.



To enable one or more dashboard(s):

1. Navigate to the dashboard to be enabled.
2. In the dashboard toolbar, click  .
3. Select the **Manage Dashboard** option.
   The Manage Dashboards dialog is displayed.



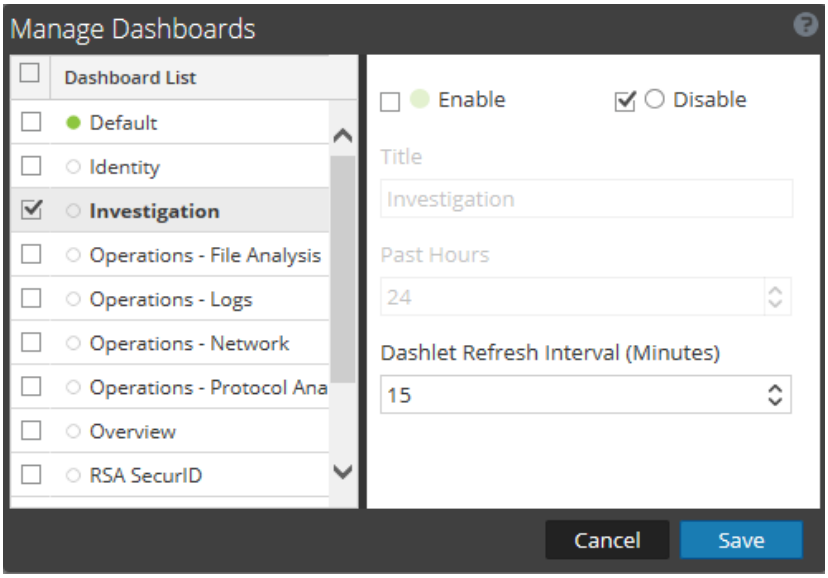
4. From the dashboard list, select the dashboard(s) to be enabled.

5. Click the **Enable** checkbox.
6. Click **Save**.

Disabling a Dashboard

To disable one or more dashboard(s):

1. Navigate to the dashboard to be disabled.
2. In the dashboard toolbar, click  .
3. Select the **Manage Dashboard** option.
   The Manage Dashboards dialog is displayed.



4. From the dashboard list, select the dashboard(s) to be disabled.
5. Click the **Disable** checkbox.
6. Click **Save**.

Setting a Dashboard as a Favorite

To customize the views in NetWitness Suite, you can set a preconfigured or custom dashboard as a Favorite. The NetWitness Suite dashboard, as the name suggests, offers all NetWitness Suite dashlets. The Favorite dialog sets a specific dashboard as your favorite dashboard and will be listed as favorite every time you log in to NetWitness Suite.

1. Navigate to any dashboard.
2. In the dashboard toolbar, click

If the favorite icon is red in color, it indicates that selected dashboard is set as a Favorite and is listed on top above the line.

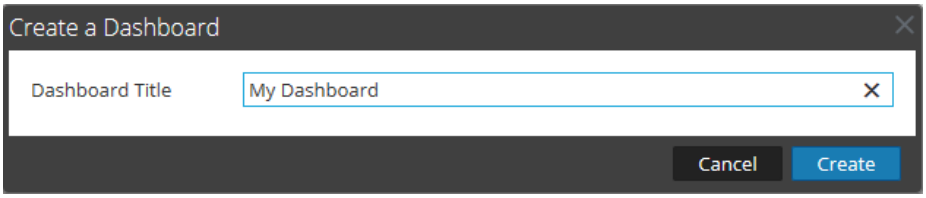
Creating Custom Dashboards

You can create custom dashboards to serve a particular purpose; for example, to represent a specific geographical or functional area of the network. Each custom dashboard is appended to the dashboard selection list.

To create a custom dashboard:

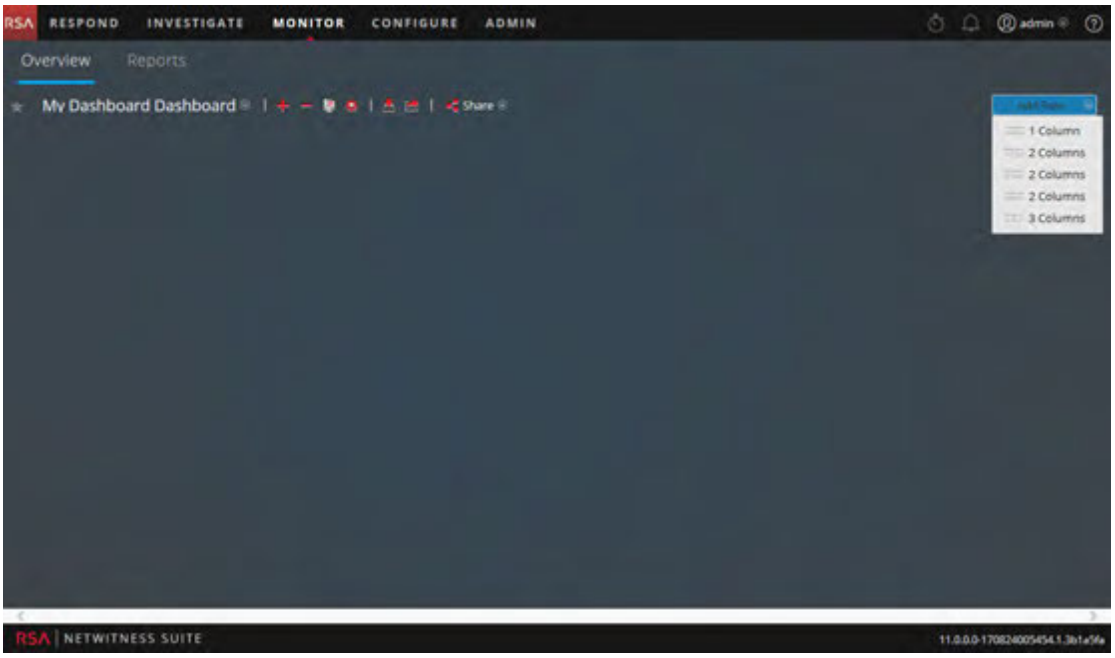
1. In the dashboard toolbar, click  .

   The Create a Dashboard dialog is displayed.



2. Enter a title for the new dashboard and click **Create**.

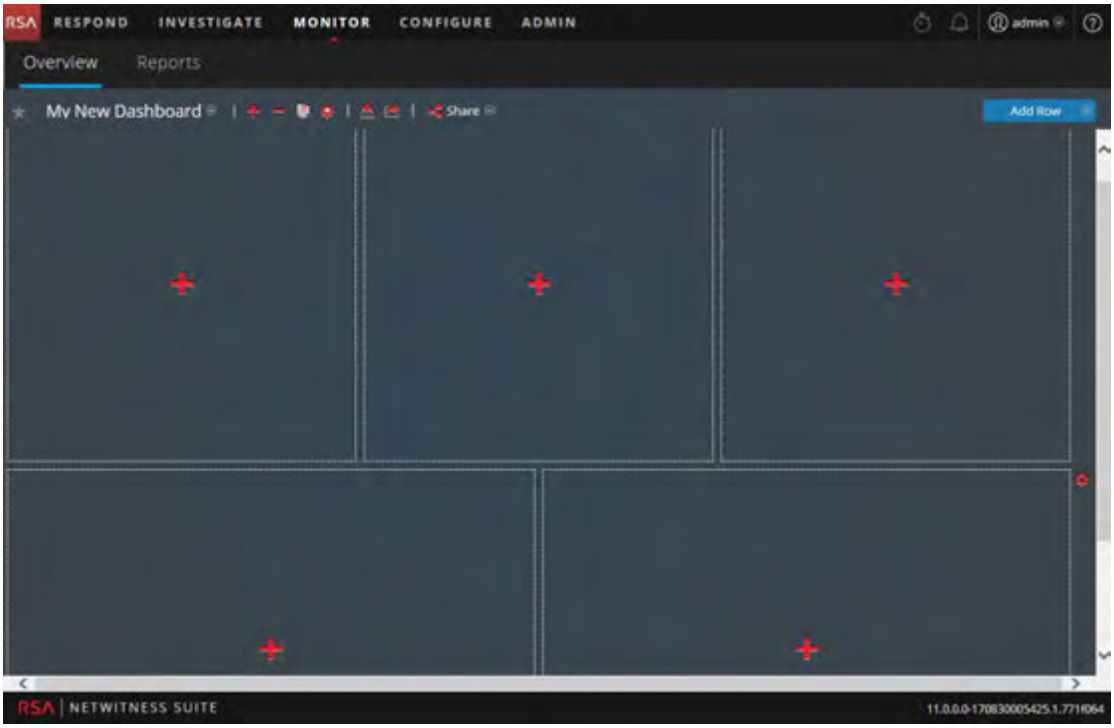
   The new dashboard is displayed as a blank screen.



3. Add rows to the dashboard, which can contain one or more columns, using the **Add Row** (

) control on the right side of the screen. Just click on the desired column

configuration in the drop-down list to add one row to the dashboard with the selected number of columns. Repeat the process to add more rows.



4. You can now add any desired dashlets to the dashboard by click the + in an empty placeholder in a row. For complete details on adding and managing dashlets, see Working with Dashlets.

Once custom dashboards are created, you can:

- Switch between dashboards by selecting an option from the dashboard selection list
- Delete any custom dashboard
- Import or export a dashboard

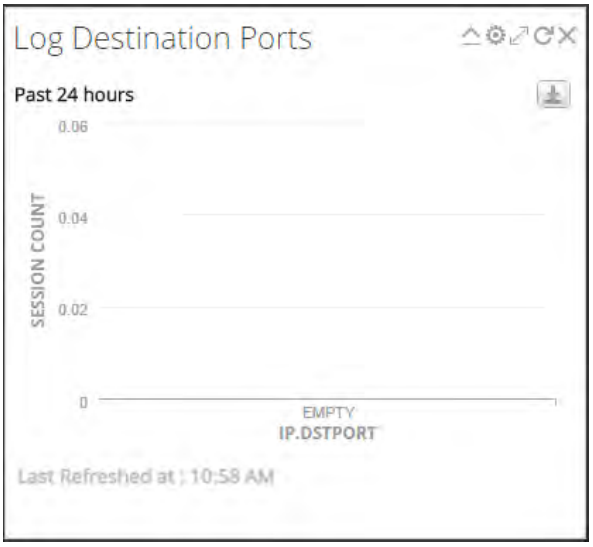
Each dashboard has:

- The dashboard toolbar
- The dashboard title and the dashboard selection list
- Zero or more dashlets

Working with Dashlets

NetWitness Suite uses dashlets to display focused subsets of system information, services, jobs, resources, subscriptions, rules, and other information.

The controls for a dashlet are in the title bar. All dashlets use a common set of controls, and only those that apply to the particular dashlet appear in the title bar of the dashlet.



The following table displays the description of each icon on the dashlet.

Icon	Name	Description
	Collapse vertically	Collapses the dashlet vertically so that only the title is visible.
	Expand vertically	Expands the dashlet to its original size.
	Reload	Reloads the dashlet.
	Settings	Displays configurable settings for the dashlet.
	Maximize	In some dashlets with content that does not fit horizontally within the width of the dashlet, maximizes a chart or a dashlet to full screen.
	Delete	Deletes the dashlet from the dashboard.
Last Refreshed at		Displays the time at which the data is polled from the related chart.

Icon	Name	Description
View More		When clicked, navigates to the corresponding dashboard which is linked to the main dashlet and displays more details. If you have not linked the dashboard to an existing dashlet, this link with not be available on the dashlet. To configure this option, click ⚙, and in the Dashboard Link field select a related dashboard view more details of the specific dashlet. **Note:** This feature is only available for the realtime chart dashlet and the preconfigured dashboards in NetWitness Suite 11.0 or later.

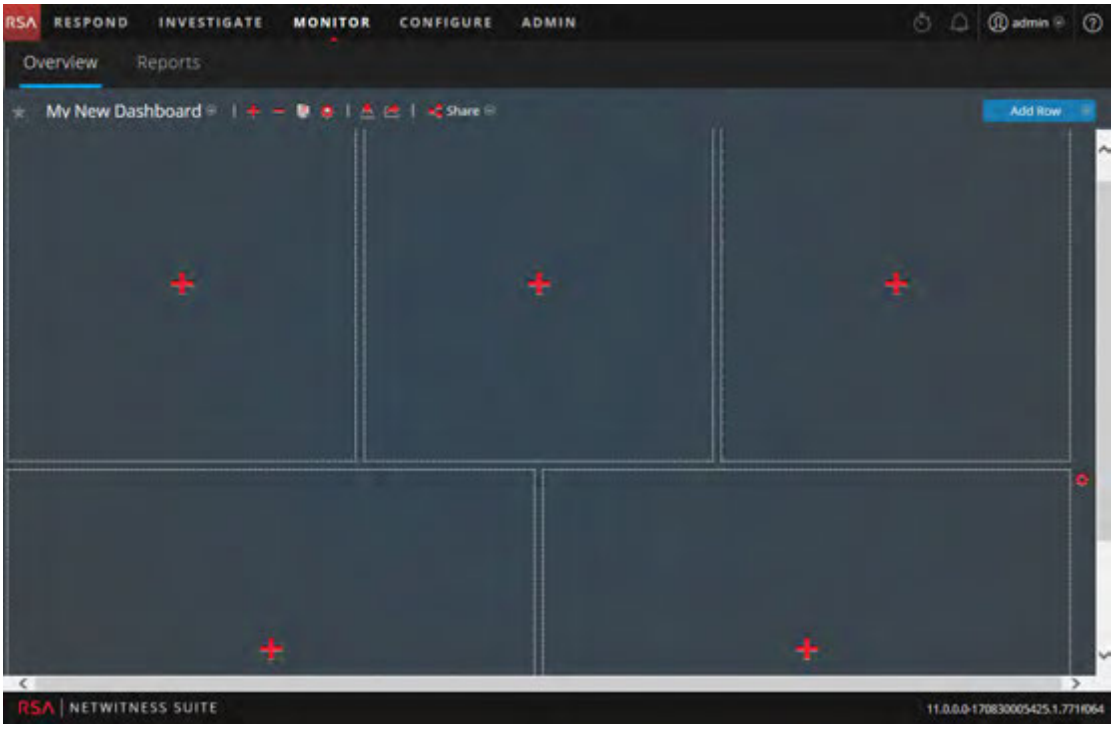
You can add dashlets to the default dashboard or construct a custom dashboard with your own useful set of dashlets to make your workflow more efficient.

Add a Dashlet

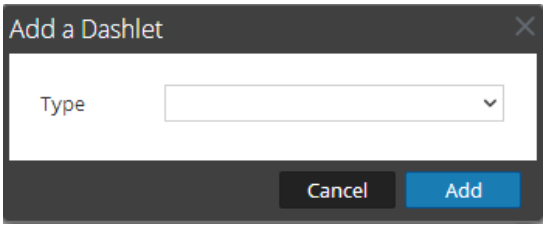
To customize the views in NetWitness Suite, you can add dashlets to a default dashboard or create custom dashboards. However, you cannot add dashlets to preconfigured dashboards.

To add a dashlet:

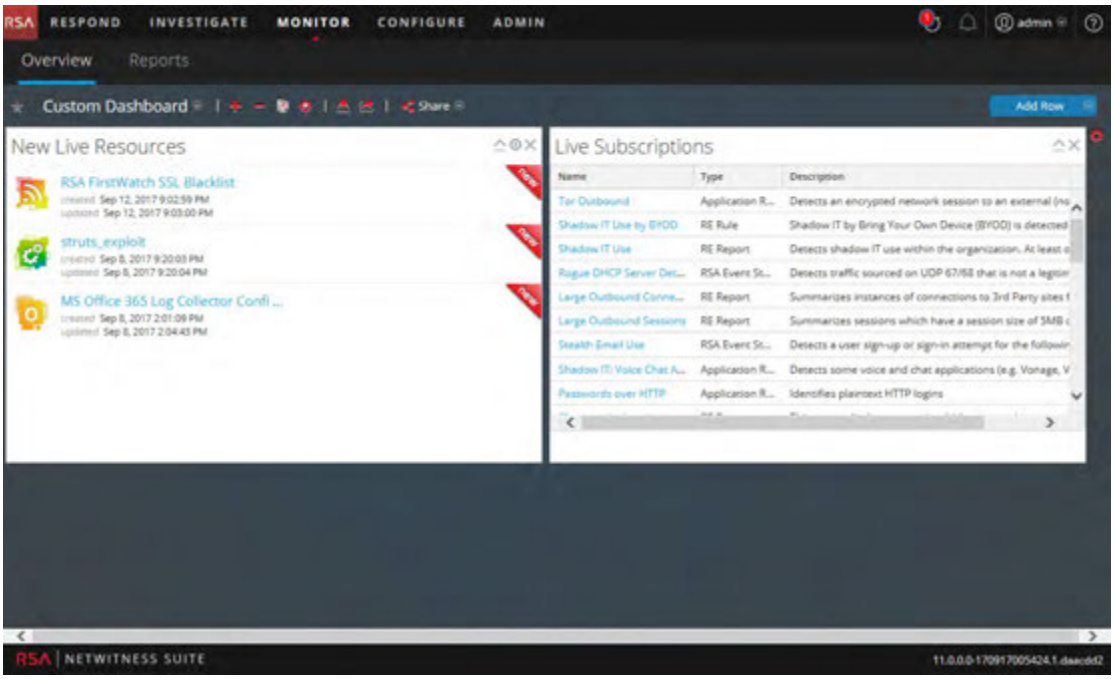
1. Navigate to any dashboard or create a new dashboard.



2. Click  on the placeholder where you want to add the dashlet.
   The Add a Dashlet dialog is displayed.



3. Click on the Dashlet **Type** selection list to view the available dashlets, and select the type of dashlet you want to add. Depending on the type of dashlet you are adding, some configurable fields will be displayed in the **Add a Dashlet** dialog.
4. Type a title for the dashlet. The title can include letters, numbers, special characters, and spaces.
5. If there are additional configurable fields for the dashlet, set appropriate values.
6. When all required fields have been configured, click **Add**.
   The dashlet is added to the dashboard in the selected placeholder and is automatically saved.



Edit Dashlet Properties

All preconfigured dashlets are read-only and their properties cannot be edited. Other dashlets are editable and allow users to customize some aspect of the data displayed in the dashlet. A dashlet with editable properties has a settings (⚙) option that displays all the editing options.

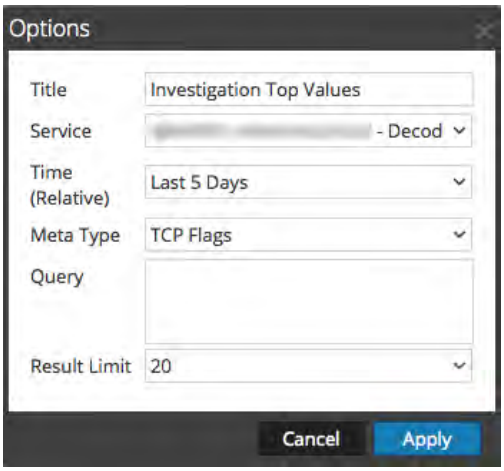
After the dashlets are added, you can drag and drop them and they can be swapped.

A dashlet without editable properties, such as the Live Subscriptions dashlet, does not display the settings option in the title bar. Many dashlets have an editable title where you can edit the following properties:

- Dashlet display title.
- Type of services to monitor; for example, you can monitor only Decoders, or you can monitor Decoders and Concentrators.

Other dashlets have parameters that you define to specify the kind and amount of information you want to see in the dashlet. For example, a Realtime Chart Dashlet has the settings option.

1. To display and modify the options for a dashlet, click settings ( ) in the dashlet title bar.
   The **Options** dialog is displayed.

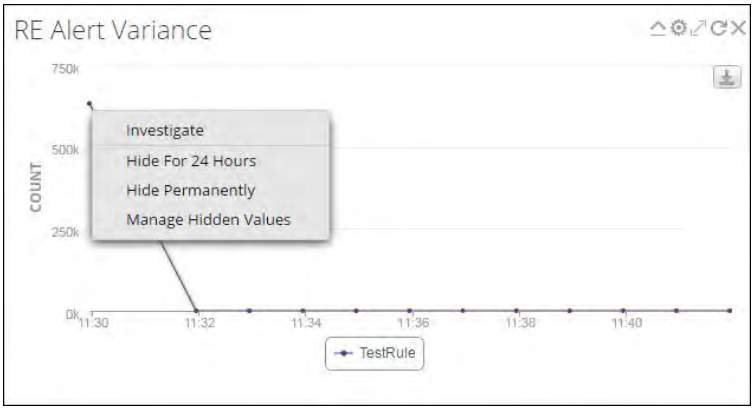


2. Edit any of the displayed properties. For example, in an Investigation Top Values dashlet, you can edit the Result Limit from 20 to 40.
3. Click **Apply**.

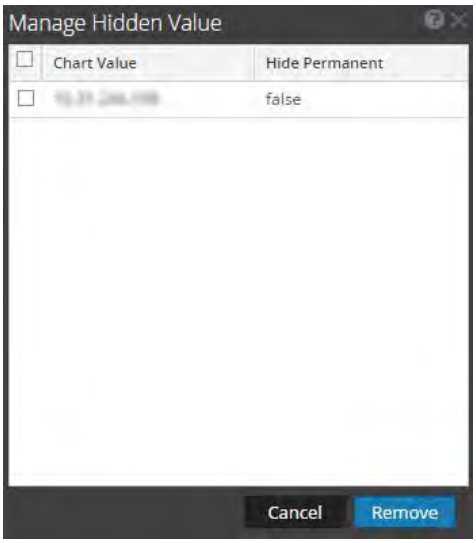
Some dashlets have configuration options to tailor the appearance or the contents of the dashlet. The following options are available for RE Top Alerts, RE Alert Variance, and RE Realtime Charts dashlets on left-click:

- **Hide For 24 Hours**: This option allows you to hide the selected value for the next 24 hours. After 24 hours, the data will automatically be displayed on the dashlet, if the value is configured and listed on top.
- **Hide Permanently**: This option allows you to hide the selected value permanently until you

add it back using the Manage Hidden Values option.



- **Manage Hidden Values**: This option displays a list of all the hidden values. You can select the checkbox for a value and click **Remove** to view the data back on the chart.



Note: The options to Hide for 24 Hours, Hide Permanently, and Manage Hidden Values are not available for Geomap charts.

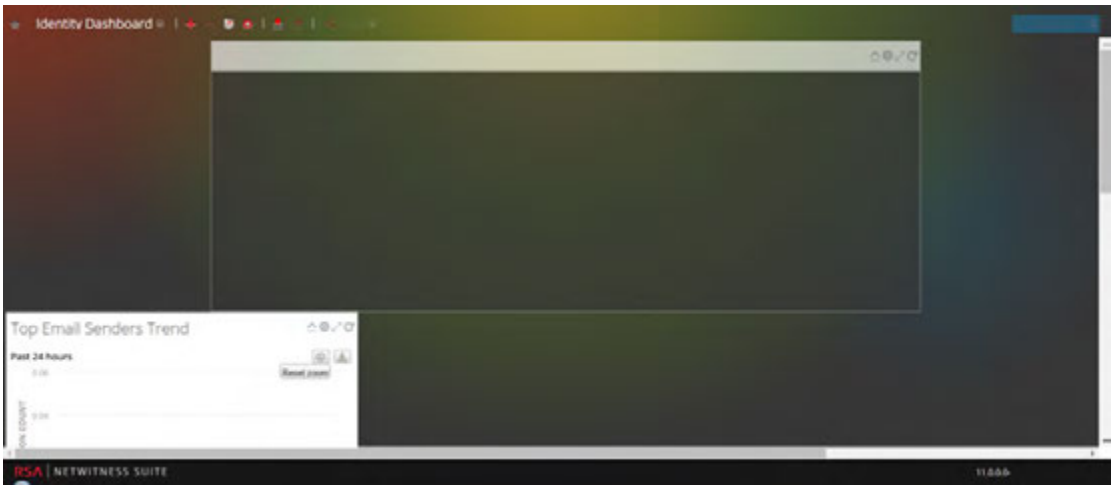
Note: When you edit a value in a preconfigured dashboard, it is a user-specific change. The changes made to a preconfigured dashboard will be applicable only to your dashboard and cannot be viewed by other users who use the same preconfigured dashboard. For example, if you hide a value in an overview dashboard, the change will be applicable only to your dashboard. If another user views the same overview dashboard, the value will still be displayed. The same applies to a custom dashboard. When you hide a value in the custom dashboard and share the same dashboard with another user, the values will still be displayed even though the dashboard is shared.

For more information on available dashlets, see the Dashboards Catalog in the RSA Content space on RSA Link.

Rearrange a Dashlet

You can arrange dashlets according to your preference by dragging and dropping them into a different order on the dashboard.

1. To move a dashlet, hover in the header of the dashlet that you want to move.
   The directional cursor ✣ appears over the dashlet. Click and hold in the header of the dashlet that you want to move.
2. Continue to hold the left mouse button and drag the window toward the new location.
   The figure below shows a dashlet as it is being re-arranged.



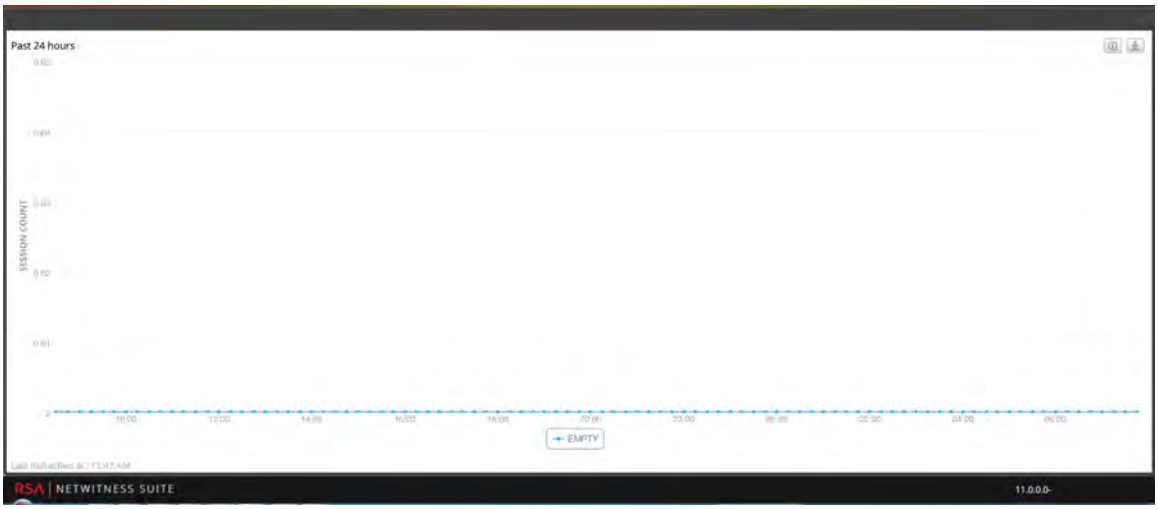
3. Release the mouse button when the dashlet is in the desired location.
   The dashlet that currently occupies that position moves down.

Maximize a Single Dashlet

This section explains how to open a dashlet on the entire area of the main NetWitness Suitedashboard with the same dashlet title. Dashlets that have a lot of columns or charts, for example some Reporting dashlets, are easier to view when maximized so that the entire contents is visible without scrolling.

To maximize a dashlet, click the maximize control icon in the dashlet title bar: ⤢. The dashlet is displayed on full screen.

To minimize a dashlet, click the same control icon in the dashlet title bar: ⤢. The dashlet is restored to previous size.



Delete a Dashlet

1. Click ✕ in the dashlet title bar:

   A confirmation pop-up is displayed to confirm if you want to delete the dashlet.

2. Click **Yes**, if you want to delete. The dashlet is removed from the dashboard.

   Click **No**, if you do not want to delete.

Note: After you remove the dashlet, the empty space is replaced by a placeholder where you can add another dashlet using the above Add a Dashlet procedure.

Importing and Exporting Dashboards

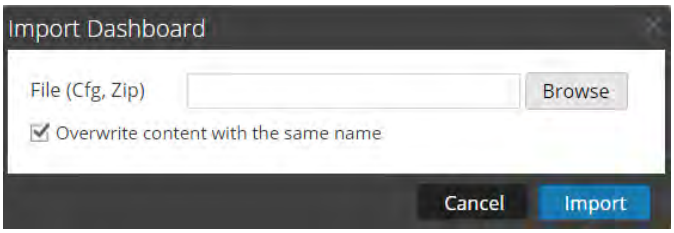
The ability to customize dashboards to changing circumstances and conditions could result in a large number of dashboards that are not needed on a daily basis. Rather than reinvent the wheel each time you want to recreate a particular custom dashboard, you can export your dashboards that are not currently in use. When you are ready to use a previously exported dashboard, import the dashboard into NetWitness Suite.

Import a Dashboard

Note: You can import the Reporter Realtime Charts dashboard and its related charts in different instances of the NetWitness Suite server and Reporting Engine from which it was exported.

1. In the dashboard toolbar, select **Import Dashboard** .

   The **Import Dashboard** dialog is displayed.



2. Browse to the dashboard file in the **Import Dashboard** dialog. You can import .cfg and .zip files.
3. Click **Import Dashboard**.
   The dashboard is displayed in NetWitness Suite

Note: If you import a dashboard from Security Analytics 10.6. x into NetWitness Suite11.0, the dashboard and the associated rules and charts must be imported separately. But when you import a dashboard from NetWitness Suite11.0 into NetWitness Suite, the dashboard and all the rules and charts associated with it, gets imported in .zip format.

Export a Dashboard

Exported dashboards are designed to work within the same NetWitness Suite instance. It is also possible to share your custom dashboards with other users in your organization, provided they have equivalent permissions.

To export a dashboard, you must have the dashboard open to access the Export Dashboard option under the Edit drop-down menu in the dashboard toolbar.

1. Navigate to the dashboard that you want to export. All existing dashboards appear in the drop-down **Dashboard Selection List** in the currently displayed dashboard.
2. Click Export Dashboard ( ) in the dashboard toolbar.
   The exported file is saved in the .zip format.

Note: The Export feature is not applicable for preconfigured dashboards.

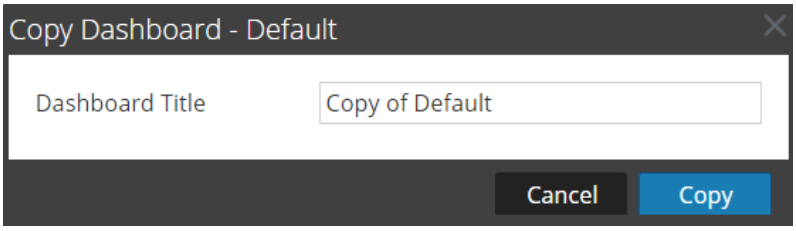
Copying a Dashboard

To customize the views in NetWitness Suite, you can copy dashboards to the NetWitness dashboard or a custom dashboard. The NetWitness Suite dashboard, as the name suggests, offers all NetWitness Suite dashlets. The Copy Dashboard dialog creates a duplicate dashboard, which can be customized. When you copy a dashboard, the default name will be prefixed with Copy of. For example, if the name of the original dashboard is XYZ, the default title of the copied dashboard will be Copy of XYZ.

To copy a dashboard:

1. Navigate to any dashboard
2. In the dashboard toolbar, click .

   The Copy Dashboard - Default dialog is displayed. The following screenshot is an example of copying a dashboard.



3. Enter the Dashboard Title.
4. Click **Copy**.

Sharing a Dashboard

In NetWitness Suite, as an Administrator you can share dashboards for viewing purposes with other roles such as Administrators, Analysts, Operators and so on. When you share a dashlet, the users can only view the dashboard, make dashboard as favorite, copy the dashboard, and export the dashboard. In case of other roles such as Analysts, Operators and so on, you can share the dashboard only with similar roles. For example, an analyst will be able to share a dashboard with other analysts only.

1. Navigate to any dashboard.
2. In the dashboard toolbar, click 

and select the checkbox of the role with whom you want to share the dashboard.

Note: If you do not want to share the dashboard, clear the checkbox of the role.

Managing Jobs

Inevitably, there are tasks, on-demand or scheduled, in NetWitness Suite that take a few minutes to be completed. The NetWitness Suite jobs system lets you begin a long-running task and continue using other parts of NetWitness Suite while the job is running. Not only can you monitor the progress of the task, but you can also receive notifications when the task has completed and whether the result was a success or failure.

While you are working in NetWitness Suite, you can open a quick view of your jobs from the NetWitness Suite toolbar. You can look anytime, but when a job status has changed, the Jobs icon () is flagged with the number of running jobs. Once all jobs are completed, that number disappears.

You can also see the jobs in these two views.

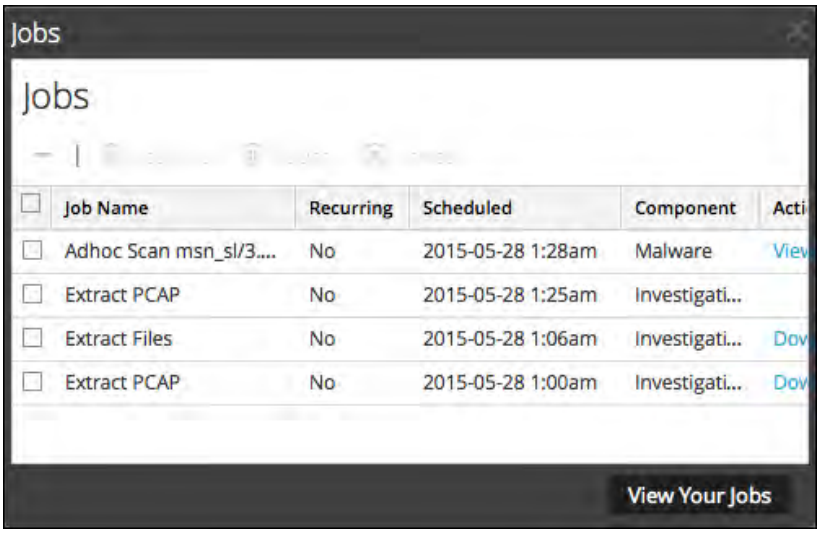
- In the Profile view, you see the same jobs in a full panel. These are only your jobs.
- In the System view, users with administrative privileges can view and manage all jobs for all users in a single jobs panel.

The structure of the jobs panel is the same in all views.

Display the Jobs Tray

In the NetWitness Suite toolbar, click the Jobs icon:  .

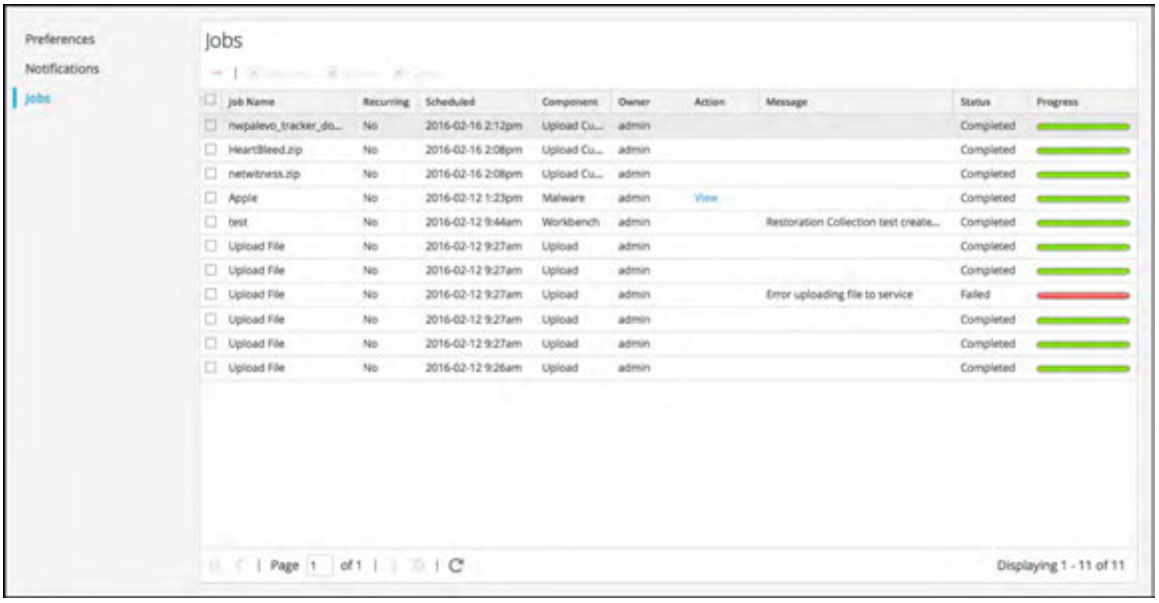
The Jobs Tray is displayed.



The Jobs Tray lists all jobs that you own, recurring and non-recurring, using a subset of the columns available in the Jobs panel. Otherwise the Jobs Tray and the Profile view > Jobs panel are the same. In the Administration System view, the Jobs panel lists information about all NetWitness Suite jobs for all users.

View Your Jobs in the Profile View > Jobs Panel

To see a larger view of your jobs, click **View Your Jobs**.
The Profile view > Jobs panel is displayed.



Pause and Resume Scheduled Execution of a Recurring Job

The Pause and Resume options apply only to recurring jobs. You can pause a recurring job that is running; however, it has no effect on that execution. The next execution (assuming the job is still paused) is skipped.

1. To stop the next execution of a recurring job, in any **Jobs panel**, select the job, and click **Pause**.

   The next execution of the job is skipped, and the schedule is paused until you click Resume.

2. To restart execution of paused recurring jobs, select the job and click **Resume**.

   The next execution of the job occurs as scheduled, and the schedule for the job resumes.

Cancel a Job

To cancel jobs that are executing or in the queue to execute:

1. In the **Jobs Tray** or either **Jobs** panel, select one or more jobs.
2. Click **Cancel**.

   A confirmation dialog is displayed.

3. Click **Yes**.

   The jobs are canceled, and the entries remain in the grid with a status of **canceled**.

   If you cancel a recurring job, it cancels that execution of the job. The next time the job is scheduled to run, it executes normally.

Delete a Job

Caution: When you delete a job, the job is instantly deleted from the grid. No confirmation dialog is offered. If you delete a recurring job, all future executions are removed as well.

Users can delete their own jobs before, during, or after execution. Users with the ADMIN role can delete any job. To delete jobs:

1. Select one or more jobs.
2. Click **Delete**.
3. The jobs are deleted from the grid.

Download a Job

When a job has the Download status in the Action column, you can download the result of the job. If you are working in the Investigation Module and extract the packet data for a session as a PCAP file or extract the payload files (for example, Word documents and images) from a session, a file is created. To download the file to your local system, click **Download**.

Viewing and Deleting Notifications

While you are working in NetWitness Suite, you can view recent system notifications without leaving the module in which you are working. You can open a quick view of notifications from the NetWitness Suite toolbar. You can look anytime, but when a new notification is received, the Notifications icon is flagged.

Examples of notifications include:

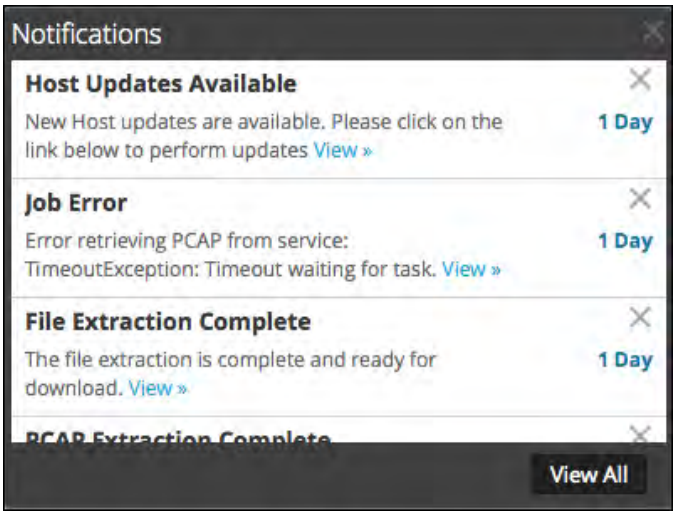
- A host upgrade completed.
- A parser push to decoders completed.
- A newer software version is available.

You can see all notifications in a full Notifications panel in these two views.

- In the Profile view, you see only your notifications.
- In the System view, users with administrative privileges can view and manage all notifications for all users in a single panel.

View Notifications

To display the Notifications tray, click the Notifications icon ( ).

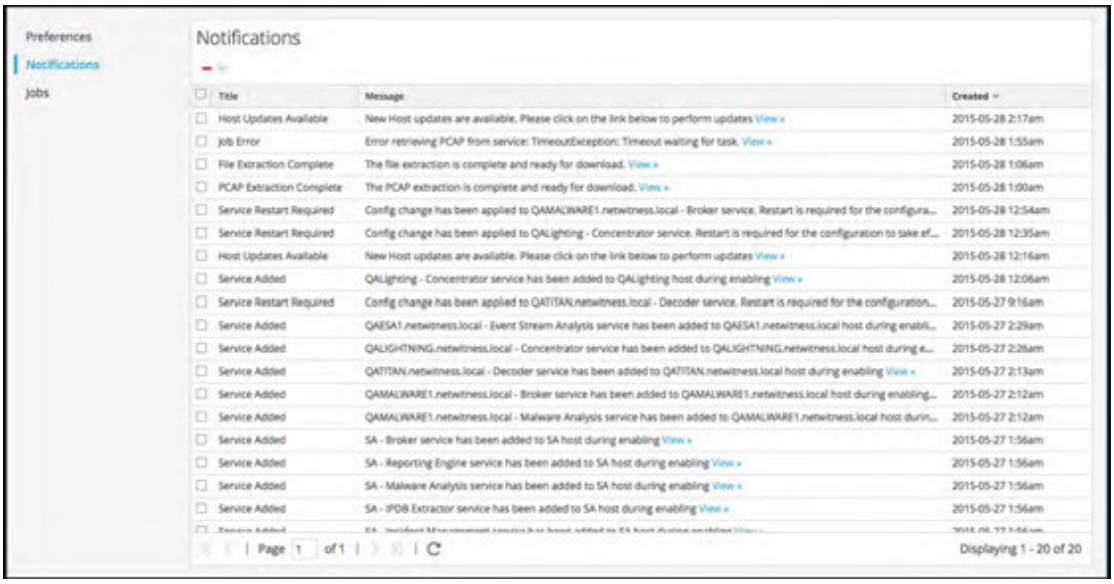


View All Notifications

To view all notifications, do one of the following:

1. Go to **Profile**, then in the options panel of the Profile view, select **Notifications.**
2. Go to **ADMIN > SYSTEM**, then in the options panel of the System view, select **Notifications**.
3. Click  to open the Notifications tray, then click **View All** in the Notifications tray.

   The Notifications panel is displayed. Here all notifications are displayed, and the format is different from the format of the Notifications Tray.



Delete Notification Records

To delete notification records:

1. In the **Profile Notifications** table, select the notifications that you want to delete.
2. Click  .

   The selected notifications are deleted from this table and from the Notifications Tray.

Viewing Help in the Application

There are different ways available to get help while using NetWitness Suite.You can use inline help, tooltips, and online help links.

View Inline Help

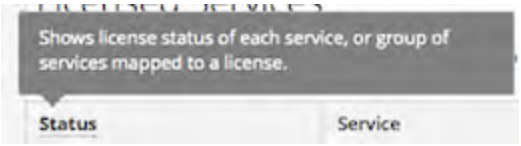
Inline help provides additional information about what to do in sections or fields that you are currently viewing in the NetWitness Suite user interface. To display inline help, hover over . The inline help shows a brief description of the element.

Inline help example:

View Tooltips

Tooltips are a quick way for you to see a description of the text or additional information about an action, field, or parameter. Tooltips appear as underlined text. To display the tooltip and see a brief description of the term, hover over the underlined text.

Tooltip example:



View Online Help

Online help links take you outside of NetWitness Suite to the RSA Link online documentation. This site has a complete documentation set for NetWitness Suite, and the links take you directly to the topic that describes the part of the user interface currently in view.

To view the online help topic for the current location, click in the NetWitness Suite toobar or in a dialog. The relevant help topic is displayed in a separate browser window. The topic describes the features and functions of the current view or dialog. From that topic, you can quickly navigate to the related procedures.

The following figure is an example of the online help icon in the NetWitness Suite toobar.

Finding Documents on RSA Link

The RSA NetWitness® Suite documentation is located on RSA Link, the RSA support portal and community. RSA Link brings all of your RSA resources together in one place. It includes advisories, product documentation, knowledge base articles, downloads, and training. To view a *Guided Tour of RSA Link*, see https://community.rsa.com/videos/21554.

Locate NetWitness Suite Documentation

NetWitness Suite Logs and Packets documentation is at the following link:
https://community.rsa.com/docs/DOC-40370

To navigate to NetWitness Suite Logs and Packets documentation:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS SUITE**.
2. On the RSA NetWitness Suite page, click **DOCUMENTATION** and select **RSA NETWITNESS LOGS AND PACKETS**.

To navigate to NetWitness Endpoint documentation:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS SUITE**.
2. On the RSA NetWitness Suite page, click **DOCUMENTATION** and select **RSA NETWITNESS ENDPOINT**.

Locate RSA Content

RSA Content is at the following link:
https://community.rsa.com/community/products/netwitness/rsa-content

To navigate to RSA Content:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS SUITE**.
2. On the RSA NetWitness Suite page, click **DOCUMENTATION** and select **ADDITIONAL RESOURCES** > **RSA CONTENT**.

Locate RSA Supported Event Sources

RSA Supported Event Sources are at the following link:
https://community.rsa.com/community/products/netwitness/parser-network/event-sources

To navigate to RSA Supported Event Sources:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS SUITE**.
2. On the RSA NetWitness Suite page, click **DOCUMENTATION** and select **ADDITIONAL RESOURCES** > **EVENT SOURCE CONFIGURATION**.

Locate Hardware Setup Guides

The Hardware Setup Guides are at the following link:
https://community.rsa.com/community/products/netwitness/hardware-setup-guides

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS SUITE**.
2. On the RSA NetWitness Suite page, click **DOCUMENTATION** and select **ADDITIONAL RESOURCES** > **HARDWARE SETUP GUIDES**..

Find Documents Using NetWitness Navigator

You can search for desired RSA NetWitness Suite documentation in RSA Link using the NetWitness Navigator tool.

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS SUITE**.
2. Under PRODUCT RESOURCES (right side of page) click **RSA NetWitness Navigator**.
3. Select desired search criteria from the available options. When searching for documentation, you should select **User Documentation** as the Content Type. Also, the Cost option is ignored for user documentation.
4. Click **VIEW RESULTS** to view a list of matching documents.
5. Click **RESET OPTIONS** to clear your previous search options.

Follow Content for Updates

You can follow pages or documents to be notified of changes.

1. Log in to RSA Link.
2. Navigate to a page or a document and in the top right corner select either **Follow** or **Actions** > **Follow**.

Send Your Feedback to RSA

Your feedback is very important to us and helps us to provide a better experience for our customers. Please send your suggestions to sahelpfeedback@rsa.com.

NetWitness Suite Getting Started References

The following section contains user interface reference information related to getting started with the NetWitness Suite application.

- User Preferences
- Notifications Panel and Notifications Tray
- Jobs Panel and Jobs Tray

User Preferences

To adjust NetWitness Suite to best fit your environment and work practices, you can set your own global application preferences. You can:

- Set your language and time zone
- Set the date and time formats (Respond view only)
- Select your default starting location (Respond view only)
- Change your password
- Enable notifications
- Enable context menus
- Change Investigate preferences - Described in the *Investigation and Malware Analysis User Guide*.

Your global preference options vary depending on whether you access them from the Respond view or other views, such as Investigate, Monitor, Configure, and Admin.

What do you want to do?

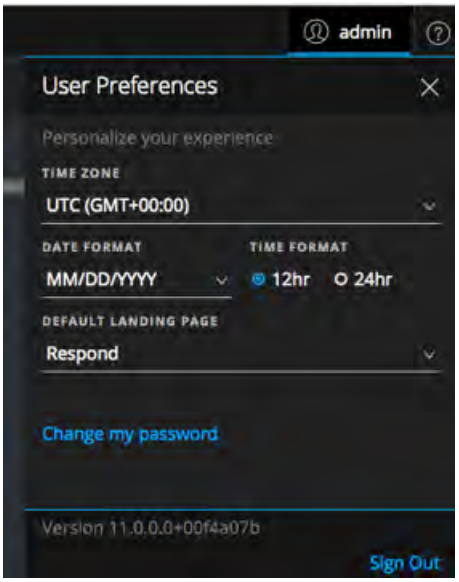
Role	I want to ...	Show me how
All	Change my Password	Change My Password
All	Choose my Default Landing Page	Setting up Your Default View by SOC Role
All	Set my User Preferences	Setting User Preferences

Related Topics

- NetWitness Suite Basic Navigation

User Preferences (Respond view)

To access your user preferences, click  .
The User Preferences dialog shows your current preferences and the NetWitness Suite version. The main menu bar shows the current time zone preference next to the user profile icon.



The following table describes the global application preference options that you can access from the Respond view.

Option	Description
Time Zone	Sets the time zone to use in NetWitness Suite.
Date Format	Sets the format for the order of the display of the month (MM), day (DD), and year (YYYY). For example, the MM/DD/YYYY format shows the date as 05/11/2017.
Time Format	Sets the time as 12-hour or 24-hour time. For example, 2:00 PM in 12-hour time is 14:00 in 24-hour time.
Default Landing Page	Enables you to select the default view when you log in to NetWitness Suite. You can choose Respond, Investigate, Monitor, Configure, and Admin according to your user role. For example, you can choose Respond to go directly to the relevant section of the application for Incident Responders. This selection sets the default view for the entire application.
Change my password	Opens the Preferences dialog where you can change your password.
Version	Shows the NetWitness Suite version.
Sign Out	Enables you to log out of NetWitness Suite.

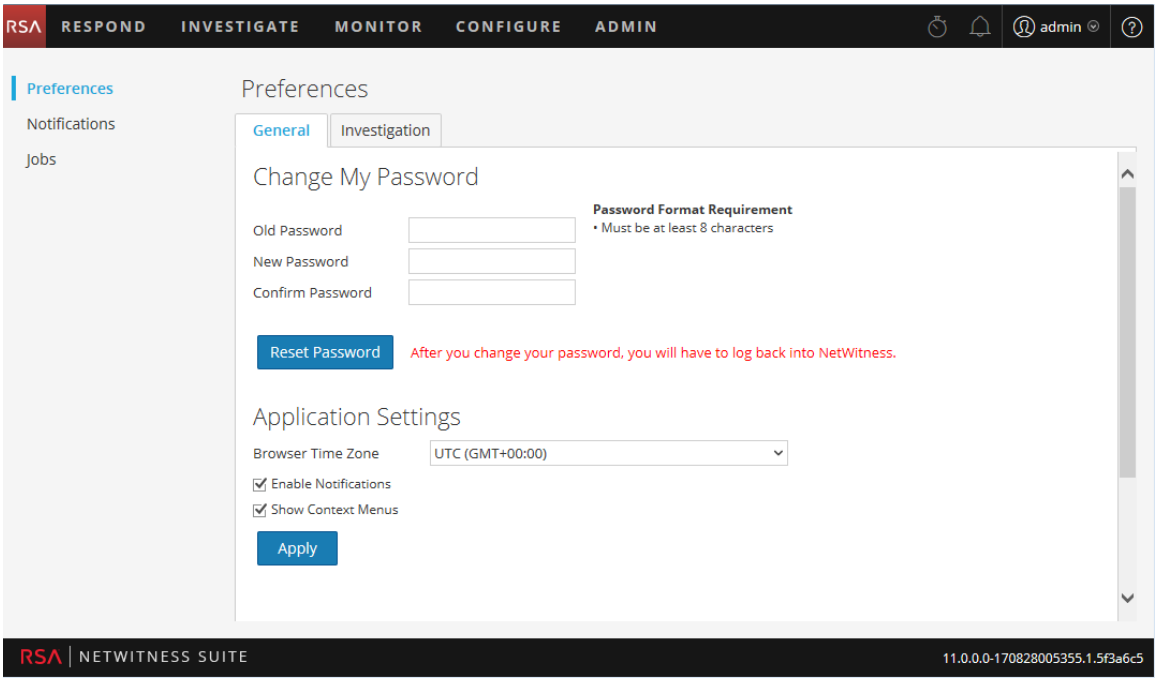
Any selections that you make become effective immediately.

Preferences

To access your user preferences, do one of the following:

- For most views, such as Investigate, Monitor, Configure, or Admin, go to > **Profile**.
- In the Respond view, select and in the User Preferences dialog click **Change my password**

  The Preferences dialog shows your current preferences.



The following tables describe the global application preference options that you can access from these views.

Change My Password

This section enables you to change your password. Your Administrator defines the appropriate password strength requirements for your NetWitness Suite password, such as minimum password length and minimum number of uppercase, lowercase, decimal, non-Latin alphabetic, and special characters. These requirements are then displayed when changing your password.

The following tables describes the options in the Change My Password section.

Option	Description
Old Password	Enter the password that you used to log in to NetWitness Suite.

Option	Description
New Password	Enter the password that you want to use for the next login.
Confirm Password	Retype the new password.
Reset Password	Updates your user profile with the new password. You will be logged out of NetWitness Suite for the changes to take effect. The new password becomes effective the next time you log in to NetWitness Suite. The password change is applied to your system login and to all NetWitness Suite services on which your account has been added.

If you changed your password, you will be logged out of NetWitness Suite for the changes to take effect. The new password becomes effective the next time you log in to NetWitness Suite.

Application Settings

The following tables describes the options in the Application Settings section.

Option	Description
Browser Time Zone	Sets the time zone to use in NetWitness Suite. Your time zone preference is displayed on the toolbar.
Enable Notifications	This checkbox enables and disables notifications for your user account. By default, NetWitness Suite system notifications are enabled when a new user account is created.
Enable Context Menus	This checkbox enables and disables context menus for your user account. By default, context menus are enabled when a new user account is created. Context menus provide additional functions for specific views when you right-click in a view.
Apply	Updates your preferences and applies the changes immediately.

Notifications Panel and Notifications Tray

NetWitness Suite provides system notifications to advise users about certain actions or conditions.

- A host upgrade completed.
- A parser push to decoders completed.
- A service went down (critical log of a certain type).
- A visualization completed.
- A report completed.
- A newer software version is available.

While you are working in NetWitness Suite, you can view recent system notifications without leaving the module in which you are working. You can open a quick view of notifications from the NetWitness Suite toolbar. You can look anytime, but when a new notification is received, the Notifications icon is flagged.

When you are viewing notifications in the Notifications tray, only recent notifications are displayed. You can view all notifications in a table format in the Profile view or in the System view. Procedures for viewing notifications are provided in Viewing and Deleting Notifications.

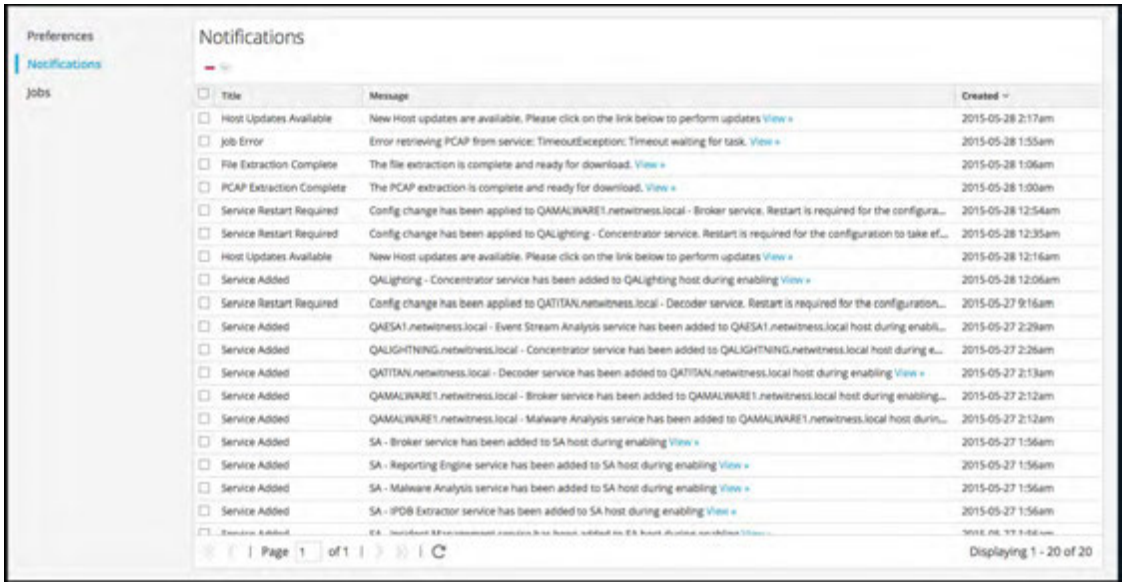
What do you want to do?

Role	I want to ...	Show me how
All	View all notifications	Viewing and Deleting Notifications
All	Delete notifications	Viewing and Deleting Notifications

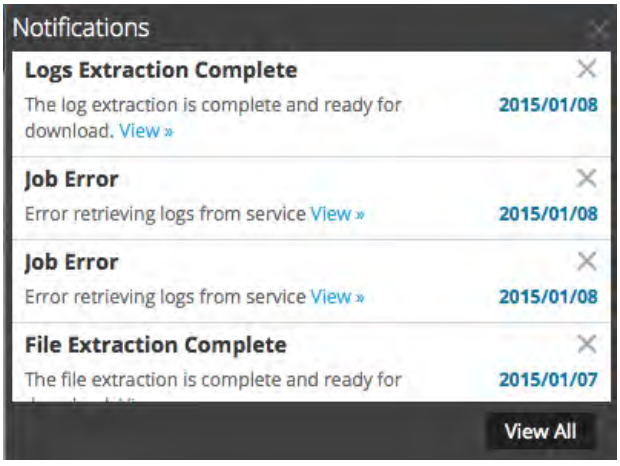
To access the Notifications panel, do one of the following:

- Go to **Profile**, then in the options panel of the Profile view, select **Notifications.**

- Go to **ADMIN > SYSTEM**, then in the options panel of the System view, select **Notifications**.



- Click , then click **View All** in the Notifications tray.



The Notifications panel and tray has a toolbar and a table. The Notification tray is a subset of the information in the Notifications panel. The following table describes the Notifications panel features.

Feature	Description
	Displays a drop-down menu where you can delete the selected notification records or all the notification records in the **Notifications** table and in the Notifications Tray.
Title	The title of the notification, for example, **File Extraction Complete**.
Message	The entire message, for example, **The file extraction is complete and ready for download.**
View	Some messages include a link that displays a view where you can take action. For example, if there is a file to download, clicking this link opens the Jobs panel, the view where you can download the file.
Created	The date and time the notification was created. In the Notifications Tray, this column is the number of days since the notification was created.
View All	Displays the Profile View Notifications table.

Jobs Panel and Jobs Tray

Jobs are started by various NetWitness Suite modules; for example, the Live module can download CMS resources, the Administration module can upload a feed to a service, and the Investigation module can analyze and reconstruct packets in packet capture files.

In the Administration System view, users in the ADMIN group can manage all NetWitness Suite jobs in the Jobs panel. Other non-administrative users can view their own jobs in the Profile view.

In addition, while working in NetWitness Suite, you can open a quick view of your jobs from the NetWitness Suite toolbar. When a job status has changed, the Jobs icon () is flagged with the number of running jobs. Once all jobs are completed, that number disappears.

In the Jobs panel, you can:

- View and sort the jobs
- Pause or resume a job
- Cancel a job

- Delete a job
- Download a job

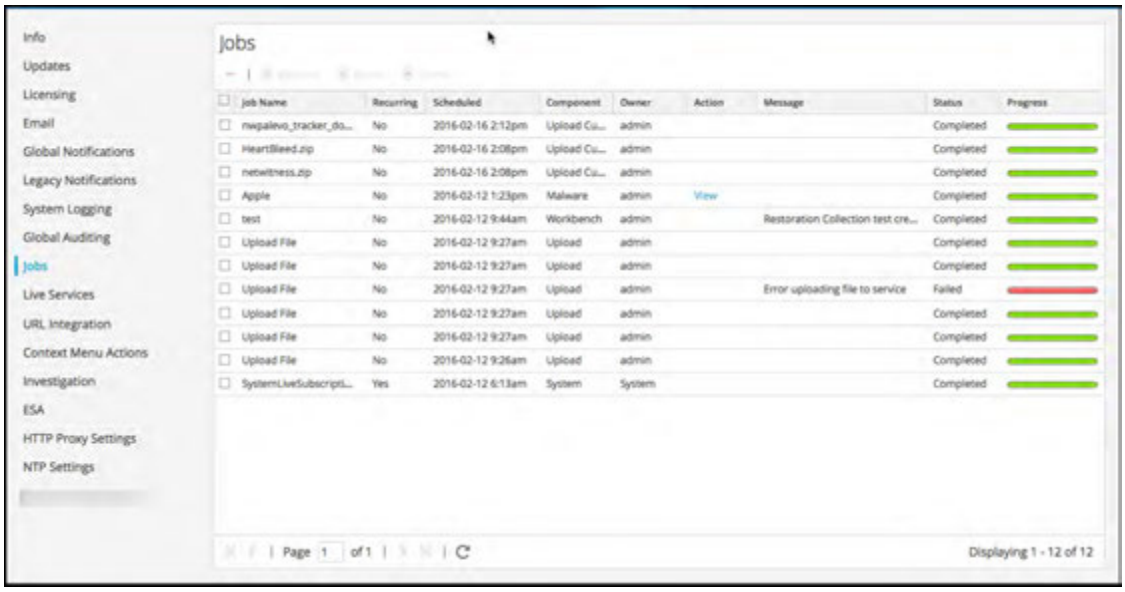
The structure of the jobs panel is the same in all views.

What do you want to do?

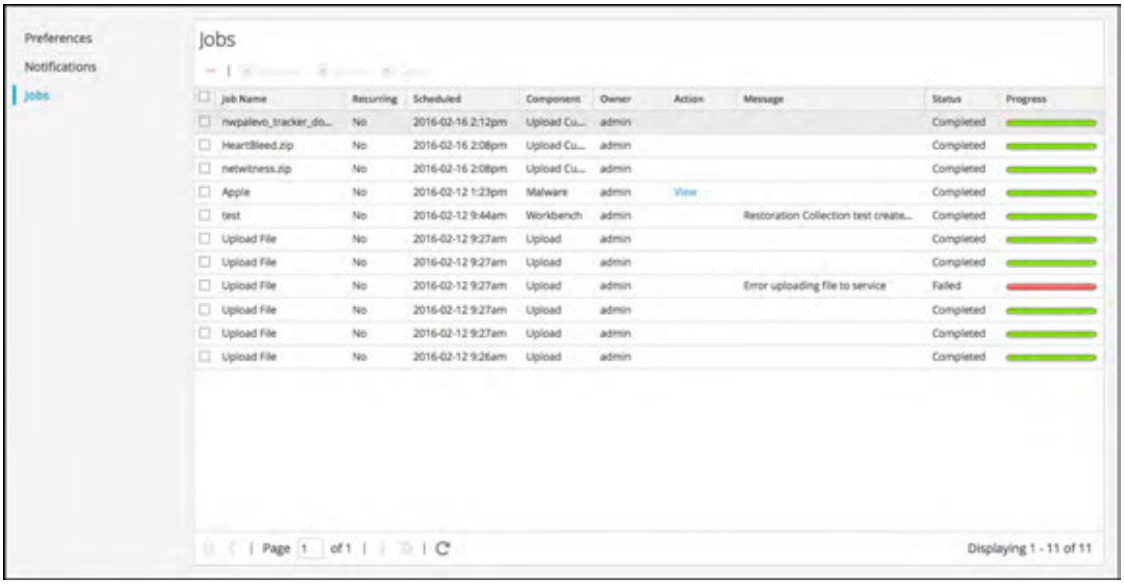
Role	I want to ...	Show me how
All	Pause and Resume a Scheduled Job	Managing Jobs
All	Cancel or Delete a Job	Managing Jobs
	Download a Job	Managing Jobs

To access the Jobs panel, do one of the following:

- Go to **ADMIN > SYSTEM**, and in the options panel, select **Jobs**.

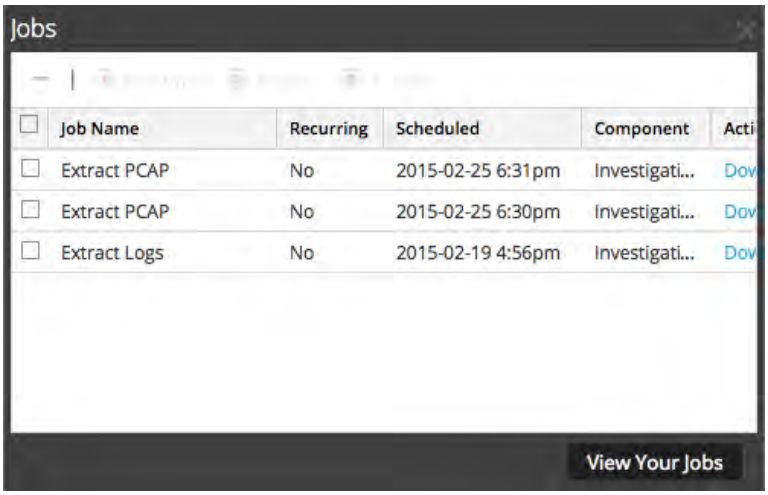


- Go to **Profile**, and in the options panel, select **Jobs**.



The Jobs panel organizes information about jobs into a grid. The columns present a job progress bar, the job name, an indication that the job is recurring or not recurring, the NetWitness Suite module that is controlling the job, the owner of the job, the status, any associated message, and a download button to allow downloading of a job's packet capture files or payload files.

To display the Jobs tray, click the **Jobs** icon .



The Jobs tray lists all jobs that you own, recurring and non-recurring, using a subset of the columns available in the **Jobs** panel. Otherwise the Jobs tray and the Profile View > Jobs panel are the same. In the Administration System view, the Jobs panel lists information about all NetWitness Suite jobs for all users.

The following table describes the options in the Jobs panel.

Feature	Description
	The Resume option applies only to recurring jobs that have been paused. When you resume a paused job, the next execution of the job executes as scheduled.
	The Pause option applies only to recurring jobs. When you pause a recurring job that is running, it has no effect on that execution. The next execution (assuming the job is still paused) is skipped.
	Cancels a recurring or non-recurring job. You can cancel a job while it is running. If you cancel a recurring job, it cancels that execution of the job. The next time the job is scheduled to run, it executes normally.
	Deletes a recurring or non-recurring job from the **Jobs** panel. When you delete a job, the job is instantly deleted from the Jobs panel. No confirmation dialog is offered. If you delete a recurring job, all future executions are removed as well.

The following table describes the Jobs tray and Jobs panel features.

Feature	Description
Selection box	Click in this box to select one or more jobs.
Progress	Shows the percentage complete for a job.
Job Name	Displays the name of the job; for example, **Extract Files** or **Upgrade Service**.
Recurring	Indicates whether the job is recurring or non-recurring. **Yes** = recurring, **No** = non-recurring.
Component	Indicates the component in which the job originated; for example, **Investigation** or **Administration**.
Owner	Indicates the owner of the job. The owner of the job is not included in the default **Jobs Tray**, because only the current user's jobs are displayed here. The column is available to add.

Feature	Description
Status	Indicates the status of the job. Common values for status are **Paused**, **Running**, **Canceled**, **Failed**, **Completed**, and other status values are possible.
Message	Displays additional information about the job; for example, **Extracting files** or **No sessions found.**
Action	Views job in the Investigation Malware Analysis view, or downloads job files for the job to the default **Downloads** directory on the local system. Only successfully completed jobs have the **View** link in the **Action** column. Only jobs that create a file have the **Download** link in the **Action** column.
View Your Jobs	Displays jobs in the **Profile View > Jobs panel.**
Scheduled	Indicates the date and time at which the job was scheduled to begin.

Access NwConsole and Help

RSA NetWitness Console, also known as NwConsole, is a multi-platform terminal application that provides powerful tools and command line access to Core services, such as Decoder, Log Decoder, Concentrator, Broker, and Archiver. While most users complete their tasks and investigations through the NetWitness Suite user interface, some advanced users, such as administrators and developers, require direct access to the services without going through the user interface. NwConsole enables you to enter commands from the command line or run multiple commands from a file.

This topic describes how to access NwConsole and to view the internal help within NwConsole.

Extensive help information is available within RSA Security Analytics console, also known as NwConsole. You can access this help from the Security Analytics command line.

Prerequisites

All NetWitness Suite appliances have theNwConsole application installed. You can also install it on Windows, Mac, and CentOS to connect and interact with a Core service.

NwConsole is available from the command line on a NetWitness Suite appliance. If you are accessing a Core appliance remotely, you need to have the RSA NetWitness Console application installed on a Windows, Mac, or CentOS machine. To obtain the RSA NetWitness Console application installer, contact RSA Customer Care.

Access NwConsole

To run NwConsole from the command line on a NetWitness Suite appliance or on a terminal emulator, at the <$> prompt, type `NwConsole` (Linux) or `nwconsole` (Windows). The actual command is `NwConsole`, but Windows is not case sensitive. RSA NetWitness Console is displayed as shown in the following example.

```
Last login: Thu Sep 24 14:00:42 on console
usxx<username>m1:~ <username>$ NwConsole
RSA NetWitness Suite Console 10.6.0.0.6105
Copyright 2001-2015, RSA Security Inc.  All Rights Reserved.

Type "help" for a list of commands or "man" for a list of manual pages.
>
```

View Help

NwConsole provides help on individual commands as well as help on specific topics.

Caution: To get the latest information, view the command and help topics within NwConsole.

View a List of Commands

To view a list of available commands and their descriptions, at the (>) prompt, type `help`. The following example shows a list of available commands.

```
> help
Local commands:
    avro2nwd      - Convert AVRO files to NWD files
    avrodump      - Display schema and contents of AVRO file (for debugging)
    blockspeed    - Tests various write block sizes to determine best setting
    compileflex   - Compile all flex parsers in a directory
    createflex    - Create a flex parser that matches tokens read from a file
    dbcheck       - Perform a database integrity check over one or more
                    session, meta, packet, log or stat db files
    diskspeed     - Measures the speed of the disk(s) mounted at a specified
                    directory
    echo          - Echos the passed in text to the terminal
    encryptparser - Encrypt all parsers in a directory
    feed          - Create and work with feed files
    fmanip        - Manipulate a file with XOR and check for embedded PEs
    hash          - Creates or verifies hashes of database files
    help          - Provides help information for recognized console commands
    history       - Displays, erases or executes a command in the command
                    history
    httpAggStats  - Tests HTTP aggregation and reports statistics as it
                    continues
    log           - Perform operations on a log database
    logParse      - Parse line delimited logs on stdin and post results to
                    stdout
    logfake       - Create a fake log pcap file
    lua           - Execute a lua script
    makec3        - Generate C3 Test Data
    makepcap      - Convert packet database files to pcap or log files
    man           - Displays a list of topics or opens a specific manual page
```

```
                  on a topic
    metaspeed     - Tests read performance over an existing meta db
    netbytes      - Display statistics on network interface utilization
    nwdstrip      - Convert full NWD file into just session and meta file
    pause         - Wait for user input when running a script file
    reindex       - reindex a collection
    sdk           - Execute SDK commands based on the C SDK library, type "sdk
                    help" for more information
    sleep         - Sleeps for the specified milliseconds
    timeout       - Globally change the timeout for waiting for a response from
                    a service
    tlogin        - Open a trusted SSL connection to an existing service
    topQuery      - Returns the top N longest running queries from the audit
                    log (either a file or from the log API)
    vslice        - Validate index slices

Remote commands (executed on the connected service, see "login"):
    login         - Connect to a remote service.  Once connected, type help to
                    see commands available for remote execution.

For detailed help, type "help <command>"
>
```

View Detailed Help on a Command

To view detailed information about a command, type `help <command>`. The following example shows help for the `logParse` command after typing `help logParse`.

```
For detailed help, type "help <command>"
> help logParse
Usage: logParse {in=<pathname>} {indir=<pathname>} [out=<pathname>]
                [content=<c2|c3>] [device=<device,[device...]>]
                [path=<log-parsers-config-path>] [metaonly] [srcaddr=<src
                address>] [srcaddrfile=<filename,IP Address>]
Parse line delimited logs on stdin and post results to stdout

    in          - The input source file. "in=stdin" means interactive typing of
                  log.
    indir       - The input source files parent directory
    out         - The output file or output file parent directory if input is
                  set by indir. If not specified, use stdout as output.
```

```
    content     - Content version, either c2 or c3. Default is c2.
    device      - Comma delimited device list specifying devices that is
                  enabled. Default enable all devices.
    path        - The logparsers configuration path. Default will find
                  configuration file like logdecoder.
    metaonly    - The output will only contains parsed meta, otherwise will
                  print log message after metas.
    srcaddr     - The source address of the all the logs
    srcaddrfile - The source address for logs in one input file, in the format
                  filename,ipaddress
>
```

View a List of Help Topics

To view a list of help topics, type `man`. The following example shows a list of help topics.

```
> man
List of topics:

    Introduction
    Connecting to a Service
    Monitoring Stats
    Feeds
    Converting Packet DB Files to PCAP
    Packets
    Verifying Database Hashes
    SDK Content
    SDK Content Examples
    Troubleshooting

Type "man <topic>" for help on a specific topic, partial matches are acceptable
>
```

View a Specific Help Topic

To view help about a specific topic, type `man <topic>`. The following example shows the Packets help topic after typing `man Packets`.

```
Type "man <topic>" for help on a specific topic, partial matches are acceptable
> man Packets
                                    Packets
```

```
=======

The *packets* command can be used to generate a pcap or log file based on a
list of Session IDs, a time period or a where clause.  The command is quite
flexible and can be used on any running service that has access to the raw
data from a downstream component.  Before running the command, you must first
*login* to a service and then change directory to the appropriate sdk node,
(e.g., "cd /sdk").  Unlike the *makepcap* command, which only works on the
local file system, this command is meant to be used on a remote service.

    login ...
    cd /sdk
    packets where="service=80 && time='2015-03-01 15:00:00'-'2015-03-01
    15:10:00'" pathname="/tmp/march-1.pcap"
Write 10 minutes of HTTP only packets from March 1st, to the file
/tmp/march-1.pcap.  All times are in UTC.

    packets time1="2015-04-01 12:30:00" time2="2015-04-01 12:35:00"
    pathname=/media/sdd1/packets.pcap.gz
Write all packets between the two times to a gzip compressed file at
/media/sdd1/packets.pcap.gz

    packets time1="2015-04-01 12:30:00" time2="2015-04-01 12:35:00"
    pathname=/media/sdd1/mylogs.log
Write all logs between the two times to a plaintext file at
/media/sdd1/mylogs.log.  Any pathname ending with .log indicates that the
format of the output file should be plaintext line-delimited logs.
>
```

Caution: To get the latest information, view the command and help topics within NwConsole.

Quit NwConsole

To exit the NwConsole application, type `quit` at the command line.

Basic Command Line Parameters and Editing

NwConsole is like a Swiss army knife; there are all kinds of tools buried underneath its command line interface. NwConsole is multi-platform; executables are available for CentOS (it already ships on appliances), Windows, and Mac.

Basic Command Line Parameters

Here are some basic command line parameters:

- To run a set of commands from a file:
  ```
  NwConsole -f /tmp/somefile.script
  ```
- To pass in a list of commands from the command line:
  ```
  NwConsole -c <command1> -c <command2> -c <command3>
  ```
  This is not necessarily recommended except for very simple scripts. The bash interpreter can make mincemeat out of quoted strings if you do not escape properly. If you are having non-obvious errors passing via command line, switch over to reading from a file to see if that fixes the issues.
- Normally, console exits after running commands passed via a file or command line, but if you want to keep the interactive prompt open after the commands are executed, pass `-i` on the command line.
- And of course, you can just run NwConsole and type the commands in the console window.

Line Editing

You can use the keys in the following table when editing a command.

Key	Descripton
Ctrl-U	Clears the current line
Ctrl-W	Deletes the word that the cursor is on
Ctrl-A	Moves the cursor to the beginning of the line
Ctrl-E	Moves the cursor to the end of the line
Up arrow	Displays the previously executed command

Key	Descripton
Down arrow	Displays the command executed after the current command (only valid if the up arrow has been pressed)
Left arrow	Moves the cursor to the previous character
Right arrow	Moves the cursor to the next character
Tab	Provides context sensitive completion of most commands and their parameters. The Tab key is very helpful for editing. For example, to view the *Connecting to a Service* help topic, at the command line, you can type `mancon` and then press the `Tab` key. NwConsole completes the command for you: `man Connecting to a Service` Press enter to run the command and view the topic.
`history`	Displays a numbered list of previous commands
`history execute=#`	Executes a previous command, which is also equivalent to typing `!#` For example, `!1` executes the previous command.
`history clear`	Clears all command history
`history erase=#`	Erases a specific command from the history buffer. History is automatically stored from one session to the next.

Connecting to a Service

To connect and then interact with a Security Analytics Core service (Decoder, Concentrator, Broker, Archiver, and so on), you must first issue the `login` command. You must have an account on that service. You can `type help` login at any time for more information. Here is the syntax of the `login` command:

```
login <hostname>:<port>[:ssl] <username> [password]
```

For example: **login 10.10.1.15:56005:ssl someuser**

If you do not include the password, it prompts you and does proper password masking.

If you have set up proper trust between NwConsole and the endpoint, you can use the `tlogin` command and avoid having to enter a password. Setting up trust is beyond the scope of this documentation, but it involves adding NwConsole's SSL cert to the endpoint via the `send /sys peerCert op=add --file-data=<pathname of cert>` command. You must first use a normal login with the proper permissions before you can add a peer cert for subsequent trusted logins.

Once connected, you can interact with the endpoint service through a virtual file system. Instead of files, what you are looking at are the nodes of that service. Some nodes are folders and have child nodes, forming a hierarchical structure. Each node serves a purpose and all of them support a subset of commands like `info` and `help`. The `help` message returns information about the commands each node supports. When you first log on, you are on the root node, which is the path `/`, just like a Linux or Mac system. To see a list of nodes under `/`, type the `ls` command.

All services have nodes like `sys` and `logs`. To interact with the **/logs** API, you can first send the `help` command to the **/logs** node. To do this, you must use the `send` message, which has this syntax:

```
Usage: send {node pathname} {message name} [name=value [name=value]]

            [--file-data=<pathname>] [--string-data=<text>] [--binary-data=<text>]
            [--output-pathname=<pathname>] [--output-append-pathname=<pathname>]
            [--output-format={text,json,xml,html}]
Sends a command to a remote pathname.  For remote help, use "send <pathname>help"
for details.

    pathname                - The node pathname to retrieve information on
    message                 - The command (message) to send
    parameters              - Zero or more name=value parameters for the command
    --file-data             - Loads data from a file and send as either a BINARY
                              message or as a PARAMS_BINARY message if other
```

```
                              parameters exist
   --string-data            - Sends text as a STRING message type
   --binary-data            - Send text as either a BINARY message type or as a
                              PARAMS_BINARY message type if other parameters
                              exist
   --output-pathname        - Writes the response output to the given pathname,
                              overwriting any existing file
   --output-append-pathname - Writes the response output to the given pathname,
                              will append output to an existing file
   --output-format          - Writes the response in one of the given formats,
                              the default is text
```

So, to send a `help` message, you would send this:

```
send /logs help
```

And your response would look something like this:

```
    description: A container node for other node types
    security.roles: everyone,logs.manage
    message.list: The list of supported messages for this node
    ls:  [depth:<uint32>] [options:<string>] [exclude:<string>]
    mon:  [depth:<uint32>] [options:<uint32>]
    pull:  [id1:<uint64>] [id2:<uint64>] [count:<uint32>] [timeFormat:<string>]
    info:
    help:  [msg:<string>] [op:<string>] [format:<string>]
    count:
    stopMon:
    download:  [id1:<uint64>] [id2:<uint64>] [time1:<date-time>] [time2:<date-
time>] op:<string>
  [logTypes:<string>] [match:<string>] [regex:<string>] [timeFormat:<string>]
[batchSize:<uint32>]
    timeRoll:  [timeCalc:<string>] [minutes:<uint32>] [hours:<uint32>]
[days:<uint32>] [date:<string>]
```

To get more information about a specific message or command, you can specify the `msg=<message name>` on the help command as a parameter. For example, look at the `pull` message help:

```
send /logs help msg=pull
```

```

    pull: Downloads N log entries
    security.roles: logs.manage
    parameters:
    id1 - <uint64, optional> The first log id number to retrieve, this is mutually
```

```
exclusive with id2
    id2 - <uint64, optional> The last log id number that will be sent, defaults to
most recent log
 message when id1 or id2 is not sent
    count - <uint32, optional, {range:1 to 10000}> The number of logs to pull
    timeFormat - <string, optional, {enum-one:posix|simple}> The time format used
in each log message,
 default is posix time (seconds since 1970)
```

The built in message help says that this command grabs the last N log entries if you leave off id1 and id2. To look at the last 10 log entries this service:

```
send /logs pull count=10 timeFormat=simple
```

Almost all of the commands on the service follow this simple format. The only commands that do not are the ones that require more complicated handshaking, like importing a PCAP to a Decoder. To import a PCAP, use the NwConsole `import` command, which takes care of the complicated communication channel handshaking.

Some parameters are specific to NwConsole's `send` command and are not actually sent to the service. You can use these parameters to change the output format of the response, write the response to a file, or read a file from the local machine and send it to the service. The local parameters to NwConsole's `send` command all start with two dashes --.

- `--output-format` — This parameter changes the normal output of the command from plain text to one of these types: JSON, XML, or HTML.
- `--output-pathname` — Instead of writing the output to the terminal, it writes it to the pathname specified (truncates any existing file).
- `--output-append-pathname` — This is the same as `--output-pathname` except that it appends the output to an existing file (or creates the file if it does not exist).
- `--file-data` — Reads in a file and uses it as the command payload. This is useful for commands like `/sys fileEdit`. The following example shows how you can send an updated **index-concentrator-custom.xml** file using NwConsole:

```
send /sys fileEdit op=put filename=index-concentrator-custom.xml --file-
data="/Users/user/Documents/index-concentrator-custom.xml"
```

- `--file-format` — When reading an input file with `--file-data`, this parameter forces NwConsole to interpret the file as a specific type of input. The allowed enumerations

are: `binary`, `params`, `param-list`, `string` and `params-binary`. As an example, to send a file of application rules (`*.nwr`) to a Decoder, you can use this command:

```
send /decoder/config/rules/application replace --file-
data=/path/rules.nwr --file-format=param-list
```

- `--string-data` — Sends the command payload as a string instead of a list of parameters.
- `--binary-data` — Sends the command payload as binary instead of a list of parameters.

Example Streaming Query to JSON file (could be a large result set):

```
send /sdk query size=0 query="select * where service=80 && time='2015-
03-05 13:00:00'-'2015-03-05 13:59:59'" --output-format=json --output-
pathname=/tmp/query.json
```

One thing to note about the send command is the fact that, by default, there is a timeout of 30 seconds waiting for a response. Some commands (like the query above) may take longer to receive results. To avoid a premature client-side timeout, you can use the `timeout [secs]` command to increase the wait. For instance, `timeout 600` would wait 10 minutes for a response before timing out. Once enacted, it takes effect for all subsequent commands.

To navigate around the virtual node hierarchy of the service, you can use the `cd` command like you would on any command shell. This covers the basics of connecting and interacting with a service. Once you are connected, the `help` command lists all the commands that you can use to interact with the endpoint. These commands do not display when you are not connected to an endpoint.

Monitoring Stats

You can use NwConsole to watch statistics (stats) change on a service in real time. However, be warned that this can result in a LOT of output. If you are not careful and monitor too many nodes, the screen scrolls by too quickly to be useful.

As a simple example, if you log on to a Decoder, you can monitor the capture rate in real time. To do this, issue these commands after connecting to a Decoder:

```
decoder/stats
```

```
mon capture.rate
```

That is all you need to do! Now, any time the capture rate changes, it outputs into the console window.

You can add another monitor:

```
mon capture.avg.size
```

Now it watches those two stats and outputs those values when they change. You may have noticed that as you tried to type the second command, the output from the original monitor was messing up your display. This is the problem with monitoring stats. It is not really meant for doing more than just watching the stats after the first command is entered.

However, you can stop the monitoring by typing `delmons` and pressing **Enter**. Just ignore the output while you type and it returns you to a proper command prompt. If you want to monitor many stats at once, you can just give the path of the parent stat folder and it monitors all of the stats underneath it. For instance, typing `mon /decoder/stats` or `mon .` (they are equivalent) monitors everything. Be prepared for a lot of output! Remember to enter `delmons` if it is scrolling too fast.

Useful Commands

The following NwConsole commands are useful when interacting with NetWitness Server Core services:

- **feed**: Enables you to create and work with feed files.
- **makepcap**: Converts Packet database (DB) files to PCAP.
- **packets**: Retrieves packets or logs from the logged in service.
- **hash**: Creates or verifies hashes of database files.

The following sections as well as the NwConsole help and topic information (man) pages, provide additional information.

Feeds

The `feed` command provides several utilities for creating and examining feed files. A feed file contains the definition and data of a single feed in a format that has been precompiled for efficient loading by a Decoder or Log Decoder. For a complete reference on feed definitions, see **Feed Definitions File** in the *Decoder and Log Decoder Configuration Guide*.

create

```
feed create <definitionfile> [-x <password>]
```

The `feed create` command generates feed files for each feed defined in a feed definition file. A definition file is an XML document that contains one or more definitions. Each feed definition specifies a data file and the structure of that data file. The resulting feed files will be created in the same directory as the definition file with the same name as the data file, but with the extension changed to **.feed** (for example, **datafile.csv** results in **datafile.feed**). Any existing files with the target name will be overwritten without a prompt.

```
$ ls
example-definition.xml    example-data.csv
$ NwConsole
RSA NetWitness Console 10.5.0.0.0
Copyright 2001-2015, RSA Security Inc.  All Rights Reserved.

Type "help" for a list of commands or "man" for a list of manual pages.
> feed create example-definition.xml
Creating feed Example Feed...
done.  2 entries, 0 invalid records
All feeds complete.
```

```
> quit
$ ls
example-definition.xml    example-data.feed    example-data.csv
$
```

Optionally, feed files can be obfuscated using the option `-x` followed by a password of at least 16 characters (no spaces). This will be applied to all feeds defined in the definition file. In addition to the feed file, a token file will be generated for each feed file. The token file must be deployed with the corresponding feed file.

```
feed create example-definition.xml -x 0123456789abcdef
```

stats

```
feed stats <feedfile>
```

The `feed stats` command provides summary information for an existing, un-obfuscated feed file. Specifying an obfuscated feed file will result in an error.

```
> feed stats example.feed
 Example Feed stats:
 version  : 0
 keys count  : 1
 values count: 2
 record count: 2
 meta key  : ip.src/ip.dst
 language keys:
 alert    Text
```

dump

```
feed dump <feedfile> <outfile>
```

The `feed dump` command generates a normalized, key-value pair listing of an un-obfuscated feed file. You can use the resulting file to validate a feed file or assist in determining which records were considered invalid when the feed was created. Specifying an obfuscated feed file will result in an error. If `outfile` exists, the command will abort without overwriting the existing file.

```
feed dump example.feed example-dump.txt
```

Converting Packet DB Files to PCAP

You can use the `makepcap` command to quickly convert any Packet DB file to a generic PCAP file, preserving the capture time order. This command offers many options (see `help makepcap`), but is easy to use. All it really needs is the Packet DB directory (via the `source=<pathname>` parameter) to get started.

Note: You must stop the Decoder or Archiver service before running this command. If you want to generate a PCAP while the service is running, see the `packets` command.

```
makepcap source=/var/netwitness/decoder/packetdb
```

This command converts every Packet DB file into a corresponding PCAP file in the same directory. If the disk is almost full, see the next command.

```
makepcap source=/var/netwitness/decoder/packetdb
dest=/media/usb/sde1
```

This command writes all of the output PCAPs to the directory at **/media/usb/sde1**.

```
makepcap source=/var/netwitness/decoder/packetdb
dest=/media/usb/sde1 filenum=4-6
```

This command only converts the files numbered 4 thru 6 and skips all other files. In other words, it converts the Packet DB files: **packet-000000004.nwpdb**, **packet-000000005.nwpdb**, and **packet-000000006.nwpdb**.

```
makepcap source=/var/netwitness/decoder/packetdb time1="2015-03-
01 14:00:00" time2="2015-03-02 07:30:00" fileType=pcapng
```

This command only extracts packets with a timestamp between March 1st, 2015 at 2 PM and March 2nd, 2015 before or on 7:30 AM. It writes the file as pcapng in the same directory as the source. All timestamps are UTC.

Packets

You can use the `packets` command to generate a PCAP or log file based on a list of Session IDs, a time period, or a where clause. This command is very flexible you can use it on any running service that has access to the raw data from a downstream component. Before running the command, you must first `login` to a service and then change directory to the appropriate sdk node (for example, `cd /sdk`). Unlike the `makepcap` command, which only works on the local file system, you use this command for a remote service.

```
login ...

cd /sdk

packets where="service=80 && time='2015-03-01 15:00:00'-'2015-03-01 15:10:00'"
pathname="/tmp/march-1.pcap"
```

This command writes 10 minutes of HTTP only packets from March 1st to the file **/tmp/march-1.pcap**. All times are in UTC.

```
packets time1="2015-04-01 12:30:00" time2="2015-04-01 12:35:00"
pathname=/media/sdd1/packets.pcap.gz
```

This command writes all packets between the two times to a GZIP compressed file at **/media/sdd1/packets.pcap.gz**.

```
packets time1="2015-04-01 12:30:00" time2="2015-04-01 12:35:00"
pathname=/media/sdd1/mylogs.log
```

This command writes all logs between the two times to a plaintext file at **/media/sdd1/mylogs.log**. Any pathname ending with **.log** indicates that the format of the output file should be plaintext line-delimited logs.

Verifying Database Hashes

By default, Archiver writes an XML file for every DB file that is written. This XML file ends with the extension **.hash** and contains a hash of the file along with other pertinent information. You can use the `hash` command to verify that the DB file has not been tampered with by reading the hash stored in the XML file and then rehashing the DB file to verify that the hash is valid.

```
hash op=verify
hashfile=/var/netwitness/archiver/database0/alldata/packetdb/pa
cket-000004880.nwpdb.hash
```

This command verifies that the Packet DB file **packet-000004880.nwpdb** still matches the hash in the XML file **packet-000004880.nwpdb.hash**. For proper security, the hash file should be stored somewhere else to prevent the XML file from being tampered with (like write once only media), but the hash command itself does not care where it is stored.

SDK Content Command

One of the powerful commands in NwConsole is `sdk content`. It contains numerous options to do just about anything, at least as far as extracting content from the NetWitness Suite Core stack. You can use it to create PCAP files, log files, or extract files out of network sessions (for example, grab all of the pictures from email sessions). It can append files, have a max size assigned before creating a new file, and automatically clean up files when the directory grows too large. It can run queries in the background to find new sessions. It breaks queries into manageable groups and performs those operations automatically. When the group is exhausted, it does a requery to get a new set of data for further operations. The list of options for the sdk content command is very extensive.

Because the command has so many options, this document provides examples of commands for different use cases.

Before you can run `sdk content`, there are a few commands (like logging into a service) that you need to run first. Here are some examples:

- First connect to a service:
  `sdk open nw://admin:netwitness@10.10.25.50:50005`
- If you need to connect over SSL, use the nws protocol:
  `sdk open nws://admin:netwitness@10.10.25.50:56005`
- Keep in mind that you are passing a URL and must URL encode it properly. If the password is `p@ssword`, the URL looks like this: `sdk open nw://admin:p%40ssword@10.10.25.50:50005`
  This also applies to username.
- Once you log in, you can set an output directory for the commands: `sdk output <some pathname>`
- For command line help, type: `sdk content`

Before you try some example commands, it is important to understand the `sessions` parameter. This parameter is very important and controls how much or how little data you want to grab (the where clause is also important). The sessions parameter is either a single session id or a range of session ids. All NetWitness Suite Core services work with session ids, which start at 1 and increase by 1 for every new session added to the service (network or log session). Session ids are 64-bit integers, so they can get quite large. To keep it simple, assume we have a Log Decoder that has ingested 1000 logs and parsed them. On the service, you now have 1000 sessions with session ids from 1 to 1000 (session id 0 is never valid). If you want to operate over all 1000 sessions, you pass sessions=1-1000. If you only want to operate over the last 100 sessions, you pass sessions=901-1000. Once the command finishes processing session 1000, it exits back to the console prompt.

Many times, however, we do not care about specific session ranges. We just want to run a query over all of them and process the sessions that match a query. Here are some shortcuts that simplify this:

- The letter `l` (lowercase L) means lower bound or the lowest session id.
- The letter `u` means the highest session id. In fact, it actually means the highest session id for future sessions as well. In other words, if you pass `sessions=l-u`, this special range means operate over all the current sessions in the system, but also do not quit processing, and as new sessions enter the system, process those, too. The command pauses and waits for new sessions once it reaches the last session on the service. To summarize, the command never exits and goes into continuous processing mode. It runs for days, months, or years, unless it is killed.
- If you do not want the command to run forever, you can pass `now` for the upper limit. This determines the last session id on the service at the time the command starts and processes all sessions until it reaches that session id. Once it reaches that session id, the command exits, regardless of how many sessions may have been added to the service since the command started. So, for the example Log Decoder, `sessions=200-now` starts processing at session 200 and goes all the way to session 1000 and quits. Even if another 1000 logs were added to the Log Decoder after the command started, it still exits after processing session 1000.
- The parameter `sessions=now-u` means start at the very last session and continue processing all new sessions that come in. It does not process any existing sessions (except the last one), only new sessions.

For example commands and what they do, type `man sdk content examples` or see SDK Content Command Examples.

SDK Content Command Examples

The first NwConsole sdk content command example below is simple and shows all of the commands that you need to enter. After that, the examples show only the `sdk content` commands. The first example creates a log file and grabs the first 1000 logs out of a Concentrator aggregating from a Log Decoder:

```
sdk open nw://admin:netwitness@myconcentrator.local:50005

sdk output /tmp

sdk content sessions=1-1000 render=logs append=mylogs.log
fileExt=.log
```

This script outputs 1000 logs (assuming sessions 1 thru 1000 exist on the service) to the file **/tmp/mylogs.log**. The logs are in a plain text format. The parameter `fileExt=.log` is necessary to indicate to the command that we want to output a log file.

```
sdk content sessions=1-1000 render=logs append=mylogs.log
fileExt=.log includeHeaders=true separator=","
```

This command grabs the same 1000 logs as above, but it parses the log header and extracts the log timestamp, forwarder, and other information, and puts them in a CSV formatted file.

Example CSV: 1422401778,10.250.142.64,10.25.50.66,hop04b-LC1,%MSISA-4: 81.136.243.248...

The timestamp is in Epoch time. The `includeHeaders` and `separator` parameters can only be used on NetWitness Suite installs 10.4.0.2 and later.

```
sdk content sessions=1-now render=logs append=mylogs.log
fileExt=.log includeHeaders=true separator=","
where="risk.info='nw35120'"
```

This command writes a log file across the current session range, but only logs that match `risk.info='nw35120'`. Keep in mind that when you add a where clause, it performs a query in the background to gather the session ids for export. The query should be run on a service with the proper fields indexed (which is typically a Broker or Concentrator). In this case, since you are querying the field `risk.info`, double-check the service where you run the command to make sure it is indexed at the value level (IndexValues, see index-concentrator.xml for examples). By default, most Decoders only have time indexed. If you use any field but time in the where clause, you need to move the query from the Decoder to a Concentrator, Broker, or Archiver with the proper index levels for the query. You can find more information on indexing and writing queries in the *NetWitness SuiteCore Database Tuning Guide*.

```
sdk content sessions=1-now render=logs append=mylogs.log
fileExt=.log includeHeaders=true separator=","
where="threat.category exists && time='2015-01-05 15:00:00'-
'2015-01-05 16:00:00'"
```

This command is the same as above, but it only searches for matching logs between 3 PM and 4 PM (UTC) on Jan 5, 2015 that have a meta key `threat.category`. Again, because this query has a field other than time in the where clause (`threat.category`), it should be run on a service with `threat.category` indexed at least at the `IndexKeys` level (the operators `exists` and `!exists` only require an index at the key level, although values work fine, too).

```
sdk content sessions=1-now render=logs append=mylogs
fileExt=.log where="event.source begins 'microsoft'"
maxFileSize=1gb
```

This command creates multiple log files, each one no larger than 1 GiB in size. It prepends the filenames with **mylogs** and appends them with the date-time of the first packet/log timestamp in the file. Some example filenames: **mylogs-1-2015-Jan-28T11_08_14.log**, **mylogs-2-2015-Jan-28T11_40_08.log** and **mylogs-3-2015-Jan-28T12_05_47.log**. On versions older than Security Analytics 10.5, the T separator between date and time is a space.

```
sdk content sessions=1-now render=pcap append=mypackets
where="service=80,21 && time='2015-01-28 10:00:00'-'2015-01-28
15:00:00'" splitMinutes=5 fileExt=.pcap
```

This command grabs all packets in between the five-hour time period for service types 80 and 21 and writes a PCAP file. Every 5 minutes, it starts a new PCAP file.

```
sdk content time1="2015-01-28 14:00:00" time2="2015-01-28
14:15:00" render=pcap append=mydecoder fileExt=.pcap
maxFileSize=512mb sessions=1-now
```

Pay attention to this command. Why? It works for both packets and logs and is *extremely fast*. The downside is that you get everything between the two time ranges and you cannot use a where clause. Again, it starts streaming everything back almost immediately and does not require a query to run first on the backend. Because everything is read using sequential I/O, it can completely saturate the network link between the server and client. It starts creating files prepended with **mydecoder** and splits to a new file once it reaches 512 MiBs in size.

```
sdk tailLogs
```

or (the equivalent command):

```
sdk content render=pcap console=true sessions=now-u
```

This is a fun little command. It actually uses `sdk content` behind the scenes. The purpose of this command is to view all incoming logs on a Log Decoder. That is it. It is very simple. As logs come into the Log Decoder (you can run it on a Broker or Concentrator, too), they are output on the console screen. It is a great way to see if the Log Decoder is capturing and what exactly is coming into the Log Decoder. This command runs in continuous mode. Do not use it if the Log Decoder is capturing at a high ingest rate (this command cannot keep up with it). However, it is helpful for verification or troubleshooting purposes.

```
sdk tailLogs where="device.id='ciscoasa'"
pathname=/mydir/anotherdir/mylogs
```

This command is the same as above, except it only outputs logs that match the where clause and instead of outputting to the console, it writes them to a set of log files under `/mydir/anotherdir` that do not grow larger than 1 GiB. Obviously, you can accomplish this with the `sdk content` command as well, but it is a little less typing with this command if you like the default behavior.

```
sdk content sessions=now-u render=pcap where="service=80"
append=web-traffic fileExt=.pcap maxFileSize=2gb
maxDirSize=100gb
```

This command starts writing PCAPs of all web traffic from the most recent session and all new incoming sessions that match service=80. It writes out PCAPs no larger than 2 GiBs and if all the PCAPs in the directory grow larger than 100 GiBs, then it deletes the oldest PCAPs until the directory is 10% smaller than the max size. Keep in mind that the directory size checking is not exact and it only checks every 15 minutes by default. You can adjust the number of minutes between checks by passing `cacheMinutes` as a parameter, but this only works with Security Analytics 10.5 and later.

```
sdk content sessions=79000-79999 render=nwd
append=content-%1%.nwd metaFormatFilename=did
```

This is a poor person's backup command. It grabs 1000 sessions and outputs the full content (sessions, meta, packets, or logs) to the NWD (NetWitness Data Format) format. NWD is a special format that can be re-imported to a Packet or Log Decoder without reparsing. So essentially, the original parsed session imports without changes. The timestamp does not change as well, so if it was originally parsed 6 months ago, the timestamp upon import will be retained as 6 months ago.

Note: Do not expect great performance with this command, especially with packets. Gathering the packets for a session involves a lot of random I/O and can drastically slow down the export. Logs do not suffer as much from this problem (only one log per session), but behind the scenes this command uses the /sdk content API and this is not a performance minded streaming API like /sdk packets. So again, do not expect great performance.

The `metaFormatFilename` parameter is very helpful in this command. If this command is run on a Concentrator with more than one service, the NWD filenames will be created with the `did` meta for each session (the %1% in the append parameter is substituted with the value of `did`). Each filename will indicate exactly which Decoder the data came from.

```
sdk content session=1-u where="service=80,139,25,110"
render=files maxDirSize=200mb cacheMinutes=10
```

This is another fun little command. It works very similar to our old Visualize product if you pair the output directory with something like Windows Explorer in Icon mode. It extracts files from all web, email, and SMB traffic. This includes all kinds of files, such as images, zip files, videos, PDFs, office documents, text files, executables, and audio files. If it extracts malware, your virus scanner will flag it. Do not worry, nothing will be executed by the command, so it does not infect the machine (unless you try to execute it yourself). However, it can be useful because if you do find malware, the filename indicates the session id where it was extracted. You can then query that session id and see what host the malware possibly infected and take action. You can filter what gets extracted with the parameters `includeFileTypes` or `excludeFileTypes` (see the command help). For instance, adding `excludeFileTypes=".exe;.dmg;.msi"` prevents executables and installers from being extracted. This command just runs nonstop extracting files from all existing and any new sessions. After the directory gets littered with more than 200 MiBs of files, it automatically starts cleaning up the files every 10 minutes.

Note: This command only makes sense for packet sessions, not logs.

```
sdk content session=1-now where="time='2015-01-27 12:00:00'-'2015-01-27 13:00:00'
&& (service=25,110,80)" subdirFileTypes="audio=.wav;.mp3;.aac;
video=.wmv;.flv;.mp4;.mpg;.swf; documents=.doc;.xls;.pdf;.txt;.htm;.html
images=.png;.gif;.jpg;.jpeg;.bmp;.tif;.tiff archive=.zip;.rar; other=*"
renameFileTypes=".download|.octet-stream|.program|.exe;.jpeg|.jpg" render=files
maxDirSize=500mb
```

This command extracts files from HTTP and email sessions from a one-hour period and then groups the extracted files into directories specified by the `subdirFileTypes` parameter. For instance, any extracted audio file with the extension .wav, .mp3 or .aac will be placed into the subdirectory audio, which will be created under the specified output directory. The same goes for all the other groups specified in that parameter. Some files will also be automatically renamed based on their file extension. This is handled by `renameFileTypes`. Any file with an extension .download, .octet-stream or .program will be renamed to .exe. Files with the extension .jpeg will be renamed .jpg. Once the top-level directory exceeds 500 MiBs, the oldest files get cleaned. This command stops at the last session at the time the command started.

```
sdk search session=1-now where="service=80,25,110" search="keyword='party' sp ci"
```

This command searches all packets and logs (the `sp` parameter) for the keyword `party`. If party is found anywhere in the packets or logs, it outputs the session id along with the text it found and the surrounding text for context. The where clause indicates that it only searches web and email traffic. The `ci` parameter means that it is a case insensitive search. You can substitute `regex` for `keyword` and it performs a regex search.

```
sdk search session=1-now search="keyword='checkpoint' sp ci" render=log
append=checkpoint-logs.log fileExt=.log
```

This is an interesting command example. It searches all logs (or it could be packets) for the keyword `checkpoint` and if that keyword is seen, it extracts the log to a file **checkpoint-logs.log**. There are all kinds of possibilities with this command. Essentially, when a hit is detected, it hands off the session to the content call. So any parameters you pass to `sdk search` that it does not recognize, it just passes along to the content call. This allows the full capabilities of the `sdk content` call, but only working on those sessions with content search hits. With great power comes great responsibility!

Commands Used for Troubleshooting

NwConsole provides the following commands that are helpful when troubleshooting Security Analytics:

- **whatIsWrong**: Provides a snapshot of a service's configuration, stats, and failure and warning logs for a specified past period of time.
- **dbcheck**: Performs consistency checking of database files.
- **topQuery**: Helps pinpoint queries that are taking an excessively long time to run.
- **netbytes**: Troubleshoots the network connections on the current host
- **netspeed**: Troubleshoots the connection between the host computer running NwConsole and the remote computer connected to it using the `login` command.

The following sections as well as the NwConsole help and topic information (man) pages, provide additional information.

whatIsWrong

When a service is not working correctly, the reason is usually somewhere in the logs that the service has written. You can use the `whatIsWrong` console command to obtain a snapshot of a service's configuration, stats, and failure and warning logs (with surrounding context logs) for a specified past period of time, which defaults to the previous seven days. You can save the results of running whatIsWrong into a specified plain text file. The output of this command can be a useful starting point to help determine what is currently wrong with a service.

To use the whatIsWrong console command, log on to the service to troubleshoot using the `login` command, and run the `whatIsWrong` command.

Hint: Use `help whatIsWrong` to see all of the available parameters, including the number of days/hours to look back for events, the pathname to store results, whether or not to append or overwrite the results file, and the delimiter to use for log fields. You can also limit the number of most recent logs used to find context, and you can specify how many context logs per warning/failure log to retrieve.

Whenever you receive a request for logs for a Core service, you should run the whatIsWrong command first and use the results collected as a starting point.

dbcheck

The `dbcheck` command is used to perform consistency checking of database files (session, meta, packets, logs, stats, and so on). This might be necessary when a service cannot start because of errors in the consistency of the database files. Normally a service would automatically recover and correct any consistency issues on startup, but there are times when this does not occur. When a service starts (like Decoder), it typically does not read or open most database files in order to start quickly. It assumes most files are in a consistent state and only does a cursory check of the most recently written files. If there are problems, `dbcheck` can perform those consistency checks, but ONLY if the service is not running.

Caution: Do not attempt to run this command while a service is running.

For example, you can check a single file:

```
dbcheck /var/netwitness/decoder/packetdb/packet-000000001.nwpdb
```

You can also use wildcards to check multiple files:

```
dbcheck /var/netwitness/decoder/metadb/meta-00000002*.nwmdb
```

topQuery

The `topQuery` command can help pinpoint queries that are taking an excessively long time to run. This command parses the audit logs of a service and returns the top N longest running queries for the specified time period.

The easiest way to run it is to log on to the service (usually a Broker or Concentrator) and type `topQuery`. The default behavior is to return the top 100 longest running queries for the last seven days.

Type `help topQuery` for the list of parameters. Here are some additional examples with explanations:

```
topQuery hours=12 top=10
```

This command returns the top 10 queries for the last 12 hours.

```
topQuery time1="2015-03-01 00:00:00" time2="2015-03-14 00:00:00"
```

This command returns the top 100 queries between March 1, 2015 and March 14, 2015. Times are in UTC, not local.

```
topQuery input=/var/log/messages output=/tmp/top20.txt top=20 user=sauser1
```

Instead of connecting to a service, it parses the syslog audit messages for the top 20 queries in the last 7 days, but only for queries executed by user sauser1. It writes the top 20 queries to /tmp/top20.txt instead of the console screen. The parameter user is a regex, so you can specify multiple usernames by writing something like `user="(sauser1|sauser2)"`.

netbytes

The `netbytes` command is very useful for troubleshooting the network connections on the current host. It displays continuous send and receive statistics for all network interfaces. Once executed, you must press **Ctrl-C** to exit this command, which also exits NwConsole.

netspeed

The `netspeed` command is used to troubleshoot the connection between the host computer running NwConsole and the remote computer connected to it through the `login` command. You must supply the amount of bytes to transfer and it will time the speed of the connection. The netspeed command is very useful for troubleshooting Aggregation performance issues that might be network related.

```
login somedecoder:50004 admin ...
```

```
netspeed transfer=4g
```

To troubleshoot the connection between a Concentrator and a Decoder, SSH into the Concentrator, run NwConsole, and then log on to the Decoder and run `netspeed`. The output from the command gives you an indication of the maximum network throughput. If it is much less than the standard 1 Gbps interface, it could indicate a network issue.

Virtual Host Setup Guide

This document provides instructions on the installation and configuration of RSA NetWitness® Suite hosts running in a virtual environment.

Basic Virtual Deployment

This topic contains general guidelines and requirements for deploying RSANetWitness Suite11.0.0.0 in a virtual environment.

Abbreviations Used in the Virtual Deployment Guide

Abbreviations	Description
CPU	Central Processing Unit
EPS	Events Per Second
VMware ESX	Enterprise-class, type-1 hypervisor, Supported versions - 6.5, 6.0 and 5.5
GB	Gigabyte. 1GB = 1,000,000,000 bytes
Gb	Gigbit. 1Gb = 1,000,000,000 bits.
Gbps	Gigabits per second or billions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
GHz	GigaHertz 1 GHz = 1,000,000,000 Hz
IOPS	Input/Output Operations Per Second
Mbps	Megabits per second or millions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
NAS	Network Attached Storage
OVF	Open Virtualization Format
OVA	Open Virtual Appliance. For purposes of this guide, OVA stands for Open Virtual Host.
RAM	Random Access Memory (also known as memory)
SAN	Storage Area Network
SSD/EFD HDD	Solid-State Drive/Enterprise Flash Drive Hard Disk Drive

Abbreviations	Description
SCSI	Small Computer System Interface
SCSI (SAS)	Point-to-point serial protocol that moves data to and from computer storage devices such as hard drives and tape drives.
vCPU	Virtual Central Processing Unit (also known as a virtual processor)
vRAM	Virtual Random Access Memory (also known as virtual memory)

Supported Virtual Hosts

You can install the following NetWitness Suite hosts in your virtual environment as a virtual host and inherit features that are provided by your virtual environment:

- NetWitness Server
- Event Stream Analysis - ESA Primary and ESA Secondary
- Archiver
- Broker
- Concentrator
- Log Decoder
- Malware Analysis
- Decoder
- Remote Log Collector

You must be familiar with the following VMware infrastructure concepts:

- VMware vCenter Server
- VMware ESXi
- Virtual machine

For information on VMware concepts, refer to the VMware product documentation.

The virtual hosts are provided as an OVA. You need to deploy the OVA file as a virtual machine in your virtual infrastructure.

Installation Media

Installation media are in the form of OVA packages, which are available for download and installation from Download Central (https://download.rsasecurity.com). As part of your order fulfillment, RSA gives you access to the OVA.

Virtual Environment Recommendations

The virtual hosts installed with the OVA packages have the same functionality as the NetWitness Suite hardware hosts. This means that when you implement virtual hosts, you must account for the back-end hardware. RSA recommends that you perform the following tasks when you set up your virtual environment.

- Based on resource requirements of the different components, follow best practices to use the system and dedicated storage appropriately.
- Make sure that back-end disk configurations provide a write speed of 10% greater than the required sustained capture and ingest rate for the deployment.
- For OVA, 32 GB RAM per host appliance is required.
- Build Concentrator directories for meta and index databases on the SSD/EFD HDD.
- If the database components are separate from the installed operating system (OS) components (that is, on a separate physical system), provide direct connectivity with either:
  - Two 8-Gbps Fiber Channel SAN ports per virtual host,
    or
  - 6-Gbps Serial Attached SCSI (SAS) connectivity.

Note: 1.) Currently, NetWitness Suite does not support Network Attached Storage (NAS) for Virtual deployments.
2.) The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8-Gbps Fiber Channel link to a SAN is insufficient to read and write packet data at 10 Gb. You must use multiple Fiber Channels when you configure to the connection from a **10G Decoder** to the SAN.

Virtual Host Recommended System Requirements

The following tables list the vCPU, vRAM, and Read and Write IOPS recommended requirements for the virtual hosts based on the EPS or capture rate for each component.

- Storage allocation is covered in Step 3 “Configure Databases to Accommodate NetWitness Suite”.
- vRAM and vCPU recommendations may vary depending on capture rates, configuration and content enabled.
- The recommendations were tested at ingest rates of up to 25,000 EPS for logs and two Gbps for packets, for non SSL.
- The vCPU specifications for all the components listed in the following tables are Intel Xeon CPU @2.59 Ghz.
- All ports are SSL tested at 15,000 EPS for logs and 1.5 Gbps for packets.

Note: The above recommended values might differ for 11.0.0.0 installation when you install and try the new features and enhancements.

Scenario One

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder, Concentrator, and Archiver.
- The Packet Stream included a Packet Decoder and Concentrator.
- The background load included hourly and daily reports.
- Charts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	6 or 15.60 GHz	32 GB	50	75
5,000	8 or 20.79 GHz	32 GB	100	100
7,500	10 or 25.99 GHz	32 GB	150	150

Packet Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	4 or 10.39 GHz	32 GB	50	150
100	4 or 10.39 GHz	32 GB	50	250

Mbps	CPU	Memory	Read IOPS	Write IOPS
250	4 or 10.39 GHz	32 GB	50	350

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	4 or 10.39 GHz	32 GB	300	1,800
5,000	4 or 10.39 GHz	32 GB	400	2,350
7,500	6 or 15.59 GHz	32 GB	500	4,500

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	4 or 10.39 GHz	32 GB	50	1,350
100	4 or 10.39 GHz	32 GB	100	1,700
250	4 or 10.39 GHz	32 GB	150	2,100

Achiver

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	4 or 10.39 GHz	32 GB	150	250
5,000	4 or 10.39 GHz	32 GB	150	250
7,500	6 or 15.59 GHz	32 GB	150	350

Scenario Two

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder, Concentrator, Warehouse Connector, and Archiver.
- The Packet Stream included a Packet Decoder, Concentrator, and Warehouse Connector.
- Event Stream Analysis was aggregating at 90K EPS from three Hybrid Concentrators.

- Incident Management was receiving alerts from the Reporting Engine and Event Stream Analysis.
- The background load Included reports, charts, alerts, investigation, and incident management.
- Alerts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	16 or 41.58 GHz	50 GB	300	50
15,000	20 or 51.98 GHz	60 GB	550	100

Packet Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	8 or 20.79 GHz	40 GB	150	200
1,000	12 or 31.18 GHz	50 GB	200	400
1,500	16 or 41.58 GHz	75 GB	200	500

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	10 or 25.99 GHz	50 GB	1,550 + 50	6,500
15,000	12 or 31.18 GHz	60 GB	1,200 + 400	7,600

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	12 or 31.18 GHz	50 GB	250	4,600
1,000	16 or 41.58 GHz	50 GB	550	5,500
1,500	24 or 62.38 GHz	75 GB	1,050	6,500

Warehouse Connector - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	8 or 20.79 GHz	30 GB	50	50
15,000	10 or 25.99 GHz	35 GB	50	50

Warehouse Connector - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	6 or 15.59 GHz	32 GB	50	50
1,000	6 or 15.59 GHz	32 GB	50	50
1,500	8 or 20.79 GHz	40 GB	50	50

Archiver - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	12 or 31.18 GHz	40 GB	1,300	700
15,000	14 or 36.38 GHz	45 GB	1,200	900

Event Stream Analysis with Context Hub

EPS	CPU	Memory	Read IOPS	Write IOPS
90,000	32 or 83.16 GHz	94 GB	50	50

NetWitness Server and Co-Located Components

The NetWitness Server, Jetty, Broker, Incident Management, and Reporting Engine are in the same location.

CPU	Memory	Read IOPS	Write IOPS
12 or 31.18 GHz	50 GB	100	350

Scenario Three

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder and Concentrator.
- The Packet stream included a Packet Decoder and the Concentrator.
- Event Stream Analysis was aggregating at 90K EPS from three Hybrid Concentrators.
- Incident Management was receiving alerts from the Reporting Engine and Event Stream Analysis.
- The background load Included hourly and daily reports.
- Charts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
25,000	32 or 83.16 GHz	75 GB	250	150

Packet Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
2,000	16 or 41.58 GHz	75 GB	50	650

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
25,000	16 or 41.58 GHz	75 GB	650	9,200

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
2,000	24 or 62.38 GHz	75 GB	150	7,050

Log Collector (Local and Remote)

The Remote Log Collector is a Log Collector service running on a remote host and the Remote Collector is deployed virtually.

EPS	CPU	Memory	Read IOPS	Write IOPS
15,000	8 or 20.79 GHz	8 GB	50	50
30,000	8 or 20.79 GHz	15 GB	100	100

Legacy Windows Collectors Sizing Guidelines

Refer to the *RSA NetWitness Suite Legacy Windows Collection Update & Installation* for sizing guidelines for the Legacy Windows Collector.

Install NetWitness Suite Virtual Host in Virtual Environment

Complete the following procedures according to their numbered sequence to install RSA NetWitness® Suite in a virtual environment.

Prerequisites

Make sure that you have:

- A VMware ESX Server that meets the requirements described in the above section. Supported versions are 6.5, 6.0, and 5.5.
- vSphere 4.1 Client or vSphere 5.0 Client installed to log on to the VMware ESX Server.
- Administrator rights to create the virtual machines on the VMware ESX Server.

Step 1. Deploy the Virtual Host

Complete the following steps to deploy the OVA file on the vCenter Server or ESX Server using the vSphere client.

Prerequisites

Make sure that you have:

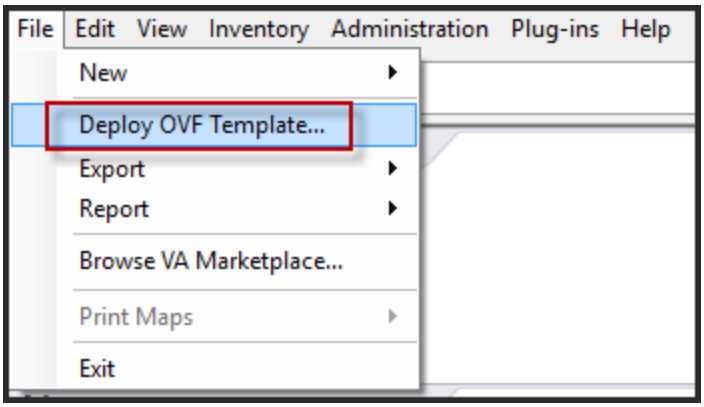
- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.
- The NetWitness Suite virtual host package file. (You download this package from Download Central (https://community.rsa.com).)

Procedure

Note: The following instructions illustrate an example of deploying an OVA host in the ESXi environment. The screens you see may be different from this example.

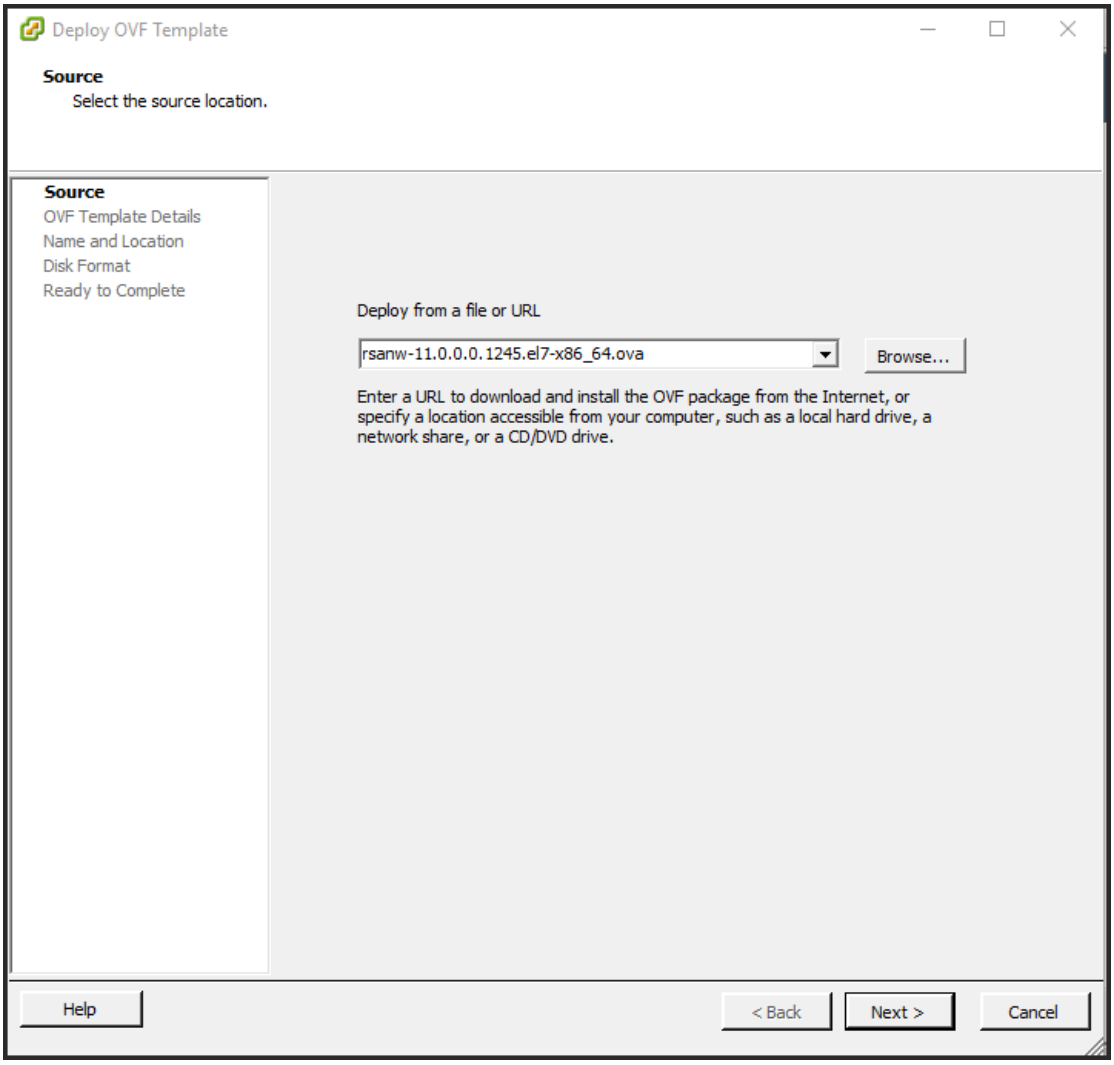
To deploy the OVA host:

1. Log on to the ESXi environment.
2. In the **File** drop-down, select **Deploy OVF Template**.

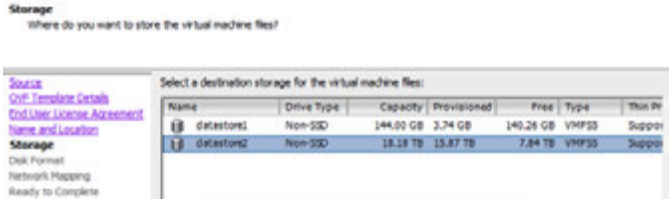


3. The Deploy OVF Template dialog is displayed. In the **Deploy OVF Template** dialog, select the OVF for the host that you want to deploy in the virtual environment (for example, **V11.0**

GOLD\OVFImge\v11_SA_OVF\nwreuax_OVF11.ovf), and click **Next**.



4. The Name and Location dialog is displayed. The designated name does not reflect the server hostname. The name displayed is useful for inventory reference from within ESXi.
5. Make a note of the name, and click **Next**.
   Storage Options are displayed.

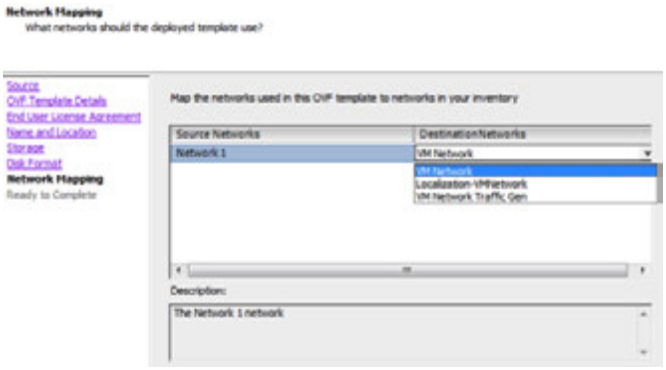


6. For Storage options, designate the datastore location for the virtual host.

Note: This location is for the host operating system (OS) exclusively. It does not have to be the same datastore needed to set up and configure additional volumes for the NetWitness Suite databases on certain hosts (covered in the following sections).

7. Click **Next**.

   The Network Mapping options are displayed.



8. Leave the default values, and click **Next**.

   Note: If you want to configure Network Mapping now, you can select options, but RSA recommends that you keep the default values and configure network mapping after you configure the OVA. You configure the OVA in Step 4: Configure Host-Specific Parameters.

   A status window showing deployment status is displayed.

   After the process is complete, the new OVA is presented in the designated resource pool visible on ESXi from within vSphere. At this point, the core virtual host is installed, but is still not configured.

Step 2. Configure the Network and Install RSA NetWitness Suite

Complete the following steps to configure the network of the Virtual Appliance.

Prerequisites

Make sure that you have:

- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.

Procedure

Perform the following steps for all virtual hosts to get them on your network.

Review Open Firewall Ports

Review the ***Network Architecture and Ports*** topic in the ***Deployment Guide*** in the NetWitness Suite help so that you can configure NetWitness Suite services and your firewalls.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

There are two main tasks that you must complete in the order shown to install NetWitness Suite 11.0.0.0

Installation Tasks

Task 1 - Install 11.0.0.0 on the NetWitness Server (Node 0)

Task 2 - Install 11.0.0.0 on Other NetWitness Suite Components (Node x's)

Task 1- Install 11.0.0.0 on the NetWitness Server (Node 0)

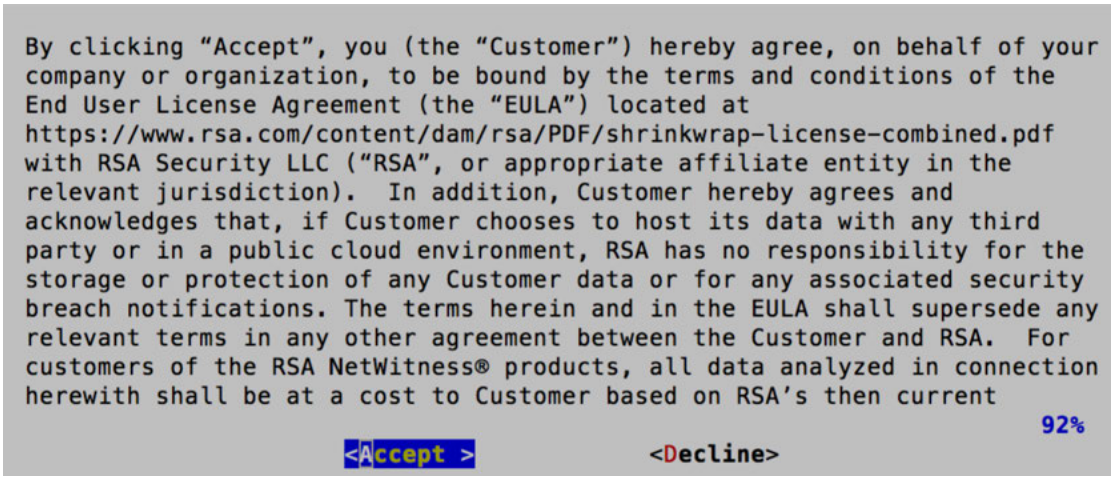
On the host you have deployed for the NW Server (node 0), this task installs:

- The 11.0.0.0 NW Server environmental platform.
- The NW Server components (that is, Admin, Config, Orchestration, Service Management, and Security services).
- A repository with the RPM files required to install the other functional components or services.

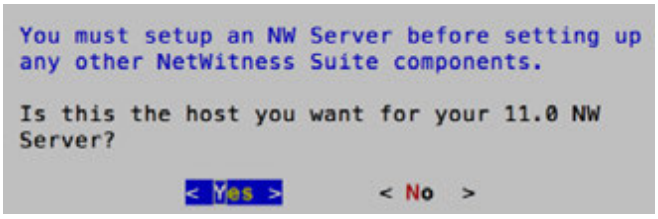
1. Deploy your 11.0.0.0 environment:
   a. Provision hosts.
   b. Configure storage.
   c. Set up firewalls.

2. Run the `nwsetup-tui` command. This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as <Yes>, <No>, <OK>, and <Cancel>. Press Enter to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see Task 1. Re-Configure DNS Servers Post 11.0.0.0 in Post Installation Tasks.
If you do not specify DNS Servers during `nwsetup-tui` , you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Suite Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



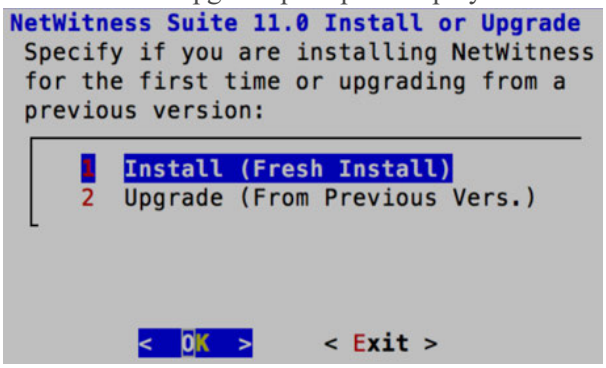
3. Tab to **Accept** and press Enter.
The "Is this the NW Server" prompt is displayed.



4. Tab to **Yes** and press Enter.
Choose **No** if you already installed 11.0.0.0 on the NW Server.

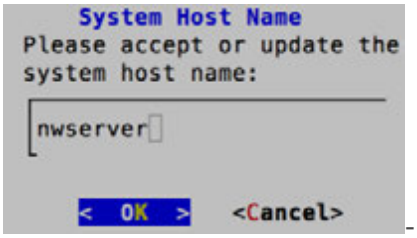
Caution: If you choose the wrong host for the NW Server and complete the Setup, you must start the Setup Program (step 3) and complete all the subsequent steps to correct this error.

The Install or Upgrade prompt is displayed.



5. Press Enter (Install is selected by default).

   The "Host Name" prompt is displayed.



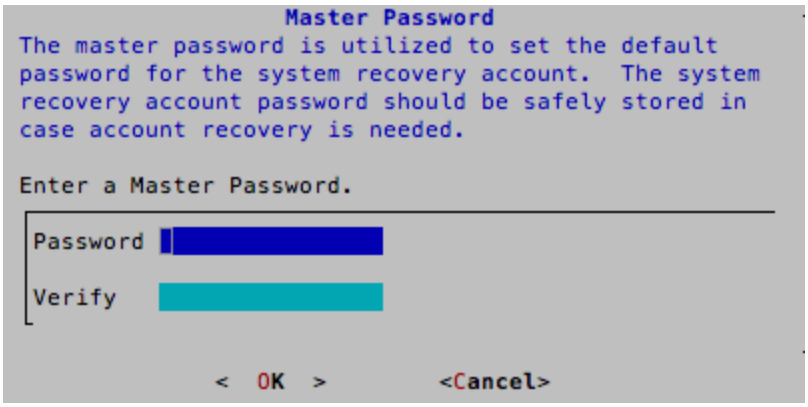
6. Press Enter if want to keep this name. If not edit the host name, Tab to **OK**, and press Enter to change it.

   The "Master Password prompt" is displayed.

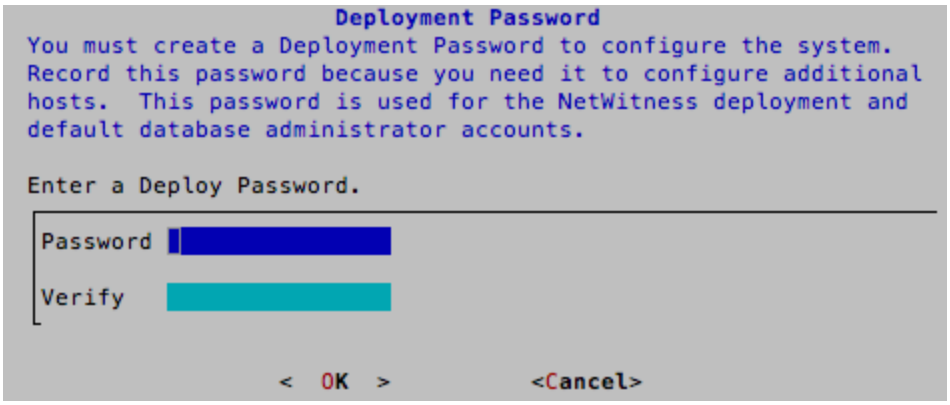
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols : ! @ # % ^ , +
   - Numbers :0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

   No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ , ; : . < > -).



7. Down arrow to **Password** and type it in, down arrow to **Verify** and retype the password, Tab to **OK**, and press Enter.
   The "Deployment Password" prompt is displayed.



8. Down arrow to **Password** and type it in, down arrow to **Verify** and retype the password, Tab to **OK**, and press Enter.

Conditional prompts:

- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

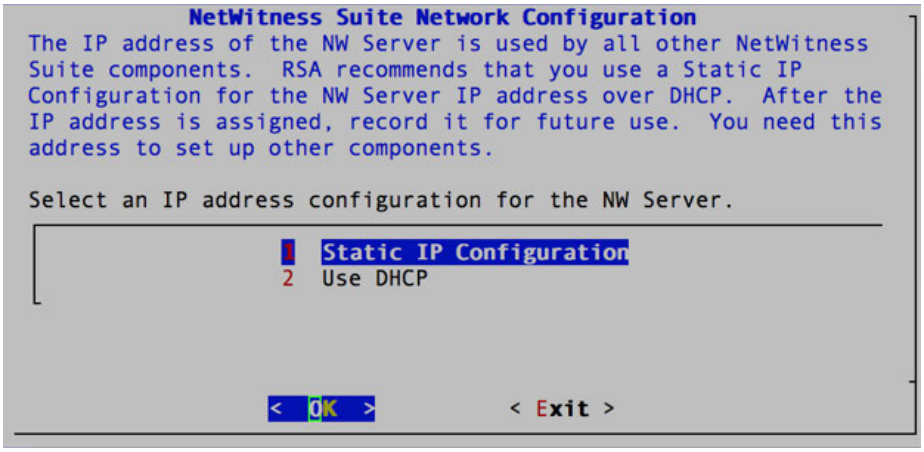
  Press Enter if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press Enter If you want to change the IP configuration found on the host.

- If you are using an SSH connection, the following warning is displayed.

  Press Enter to close warning prompt.

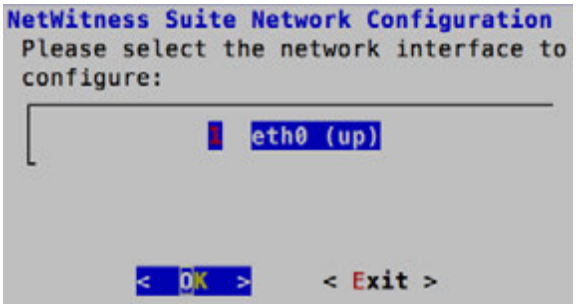
If the Setup Program found an IP configuration and you chose to use it, the Update Repository prompt is displayed. Go to step 12 to and complete the installation.

If no IP configuration was found or if you chose to change the existing IP configuration, the Network Configuration prompt is displayed.



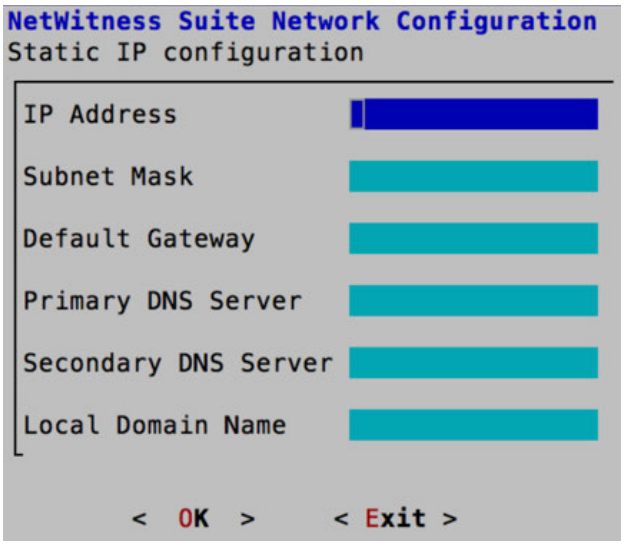
9. Tab to **OK** and press Enter to use **Static IP**.
   If you want to use **DHCP**, down arrow to 2 Use DHCP and press Enter.

The Network Configuration prompt is displayed.



10. Down arrow to the network interface you want, Tab to **OK**, and press Enter. If you do not want to continue, Tab to **Exit**

The Static IP Configuration prompt is displayed.



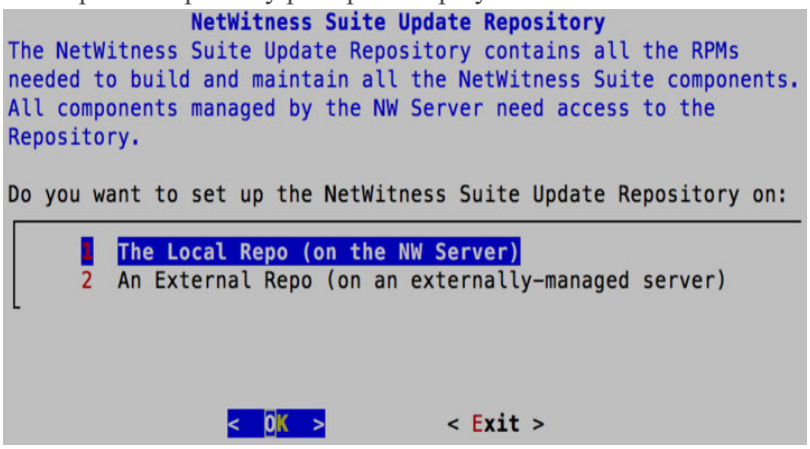
11. Type the configuration values (using the down arrow to move from field to field), Tab to **OK**, and press Enter.

If you do not complete all the required fields, an All fields are required error message is displayed (**Primary DNS Server**, **Secondary DNS Server**, and **Local Domain Name** fields are not required.)

If you use the wrong syntax or character length for any of the fields, an Invalid *field-name* error message is displayed.

Caution: If you select DNS Server, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

The Update Repository prompt is displayed.



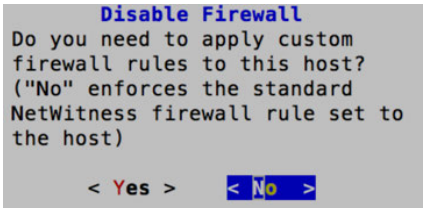
12. Press Enter to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, Tab to **OK**, and press Enter.

    - If you select **1 The Local Repo (on the NW Server)** the setup program makes sure that you have the appropriate media attached to the host (that is, a build stick or DVD) from which it can retrieve the Install or Update the hosts to NetWitness Suite 11.0.0.0. If the program cannot find the attached media, you receive the following prompt.

    - If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access RSA updates and CentOS updates.

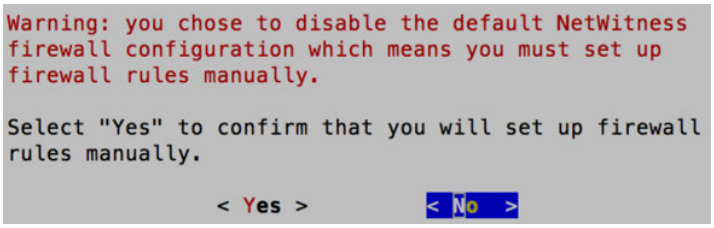
      Enter the base URL of the NetWitness Suite external repo and click **OK.** The Start Install prompt is displayed.

The Disable firewall prompt is displayed.



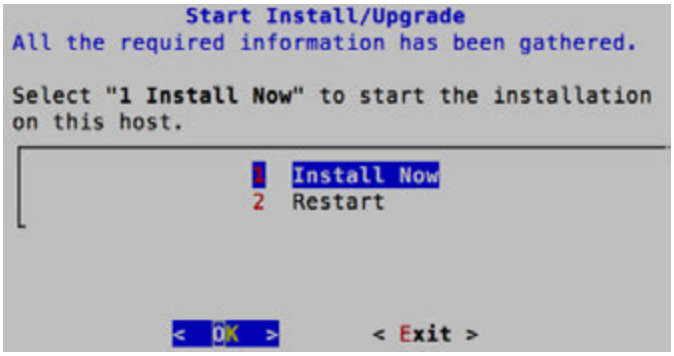
13. To:

- Apply the standard firewall configuration, press Enter.
- Disable the standard configuration, Tab to **Yes** and press Enter.
  The disable firewall configuration confirmation prompt is displayed.



Tab to **Yes** and press Enter to confirm (press Enter to use standard firewall configuration).

The Start Install prompt is displayed.



14. Press Enter to install 11.0.0.0 on the NW Server.
    When "Installation complete" is displayed, you have installed the 11.0.0.0 NW Server on this host.

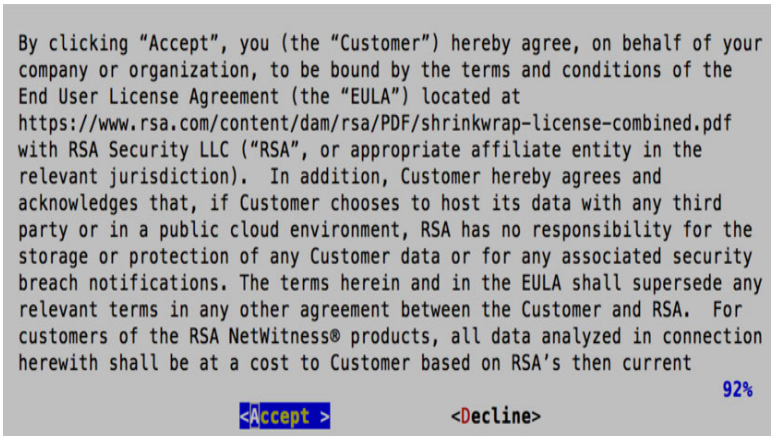
Task 2 - Install 11.0 on Other NetWitness SuiteComponents (Node x's)

For a functional service host (node x) this task:

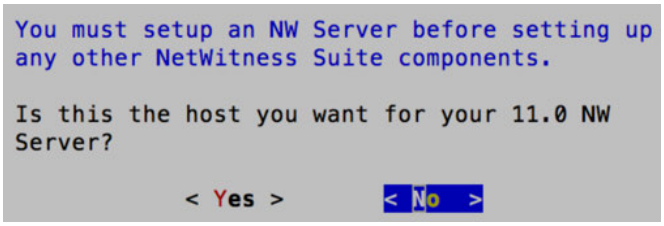
- Installs the 11.0.0.0 environmental platform.
- Applies the 1 RPM files to the service from the NW Server Update Repository.

1. Attach the build stick to the host.
   See the "RSA NetWitness® Suite Build Stick" for instructions on how to create a build stick.
2. Install the CentOS7 as the host Operating System (OS) .
   See Appendix A. Install CentOS7 on the Host for instructions.
3. Run the `nwsetup-tui` command to set up the host..
   This initiates the Setup program and the EULA is displayed.

   Note: If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see Re-Configure DNS Servers Post 11.0.0.0.
   If you do not specify DNS Servers during `nwsetup-tui` , you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Suite Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).

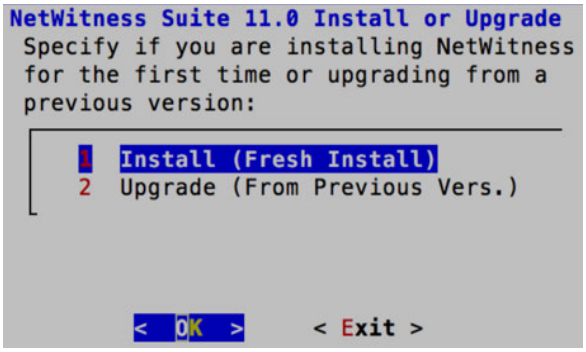
   


4. Tab to **Accept** and press Enter.
   The "Is this the NW Server" prompt is displayed.

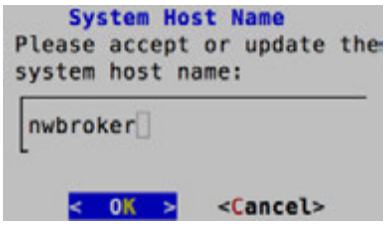
5. Press Enter (No).

   The Install or Upgrade prompt is displayed.



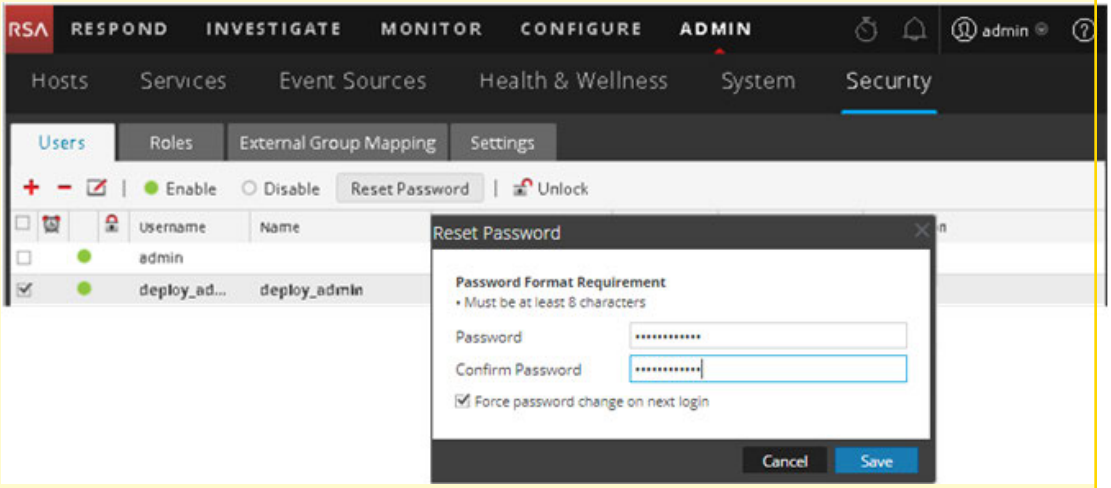
6. Press Enter (Install is selected by default).

   The "Host Name" prompt is displayed.



7. Press Enter if want to keep this name. If not edit the host name, Tab to **OK**, and press Enter to change it.

Caution:
Scenario 1
After you upgrade the NW Server to 11.0.0.0, if you change the **deploy_admin** user password in the NetWitness Suite User Interface (**ADMIN**>**Security** >Select **deploy-admin - Reset password**),

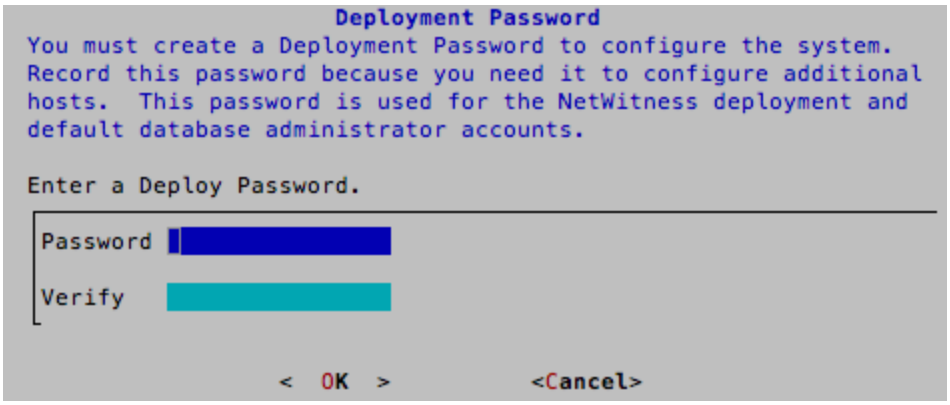


you must:
1. SSH to the NW Server host.
2. Run the `(/opt/rsa/saTools/bin/set-deploy-admin-password` script.
3. Use the new password when upgrading any new non-NW Server hosts.

Scenario 2
After you upgrade the NW Server and upgrade any number of non-NW Server hosts to 11.0.0.0, if you change the **deploy_admin** user password in the NetWitness Suite User Interface, you must:

1. Run `(/opt/rsa/saTools/bin/set-deploy-admin-password` script on all non-NW Server hosts in your deployment.
2. Write down the password because you may need to refer to it later in the installation.

The "Deployment Password" prompt is displayed.



Note: You must use the same deployment password that you used when you upgraded the NW Server.

8. Down arrow to **Password** and type it in, down arrow to **Verify** and retype the password, Tab to **OK**, and press Enter.

   Conditional prompts:

   - If the Setup program finds a valid IP address for this host, the following prompt is displayed.

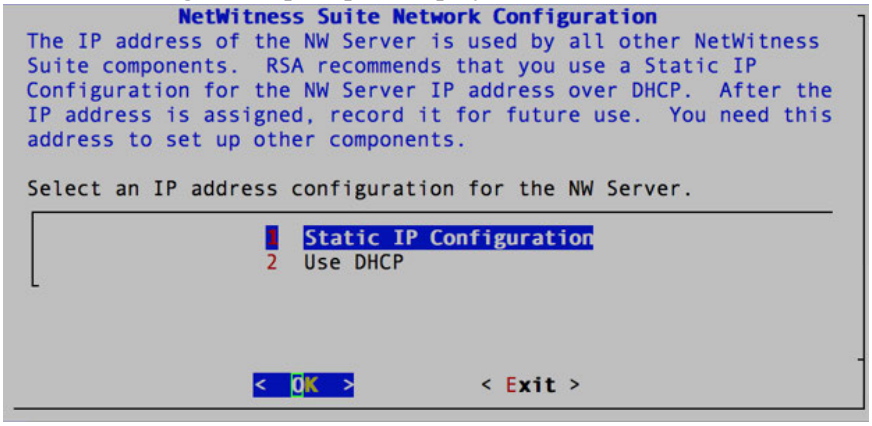
     
     Press Enter if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press Enter If you want to change the IP configuration found on the host.

   - If you are using an SSH connection, the following warning is displayed.

     
     Press Enter to close warning prompt.

   If the Setup Program found an IP configuration and you chose to use it, the Update Repository prompt is displayed. Go to step 11 to and complete the installation.

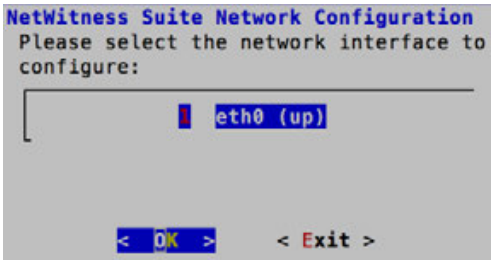
   If no IP configuration was found or If you chose to change the existing IP configuration, the Network Configuration prompt is displayed.

9. Tab to OK and press Enter to use **Static IP**.

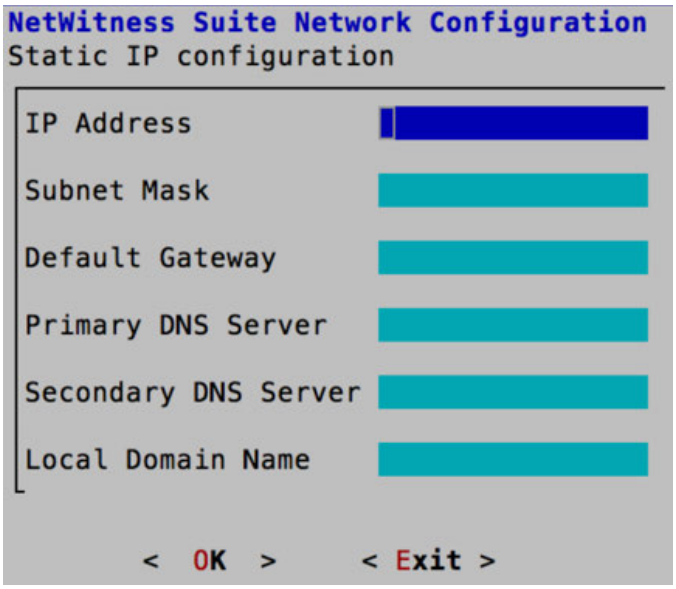
   If you want to use **DHCP**, down arrow to 2 Use DHCP and press Enter.

The Network Configuration prompt is displayed.



10. Down arrow to the network interface you want, Tab to **OK**, and press Enter. If you do not want to continue, Tab to **Exit**

    The Static IP Configuration prompt is displayed.



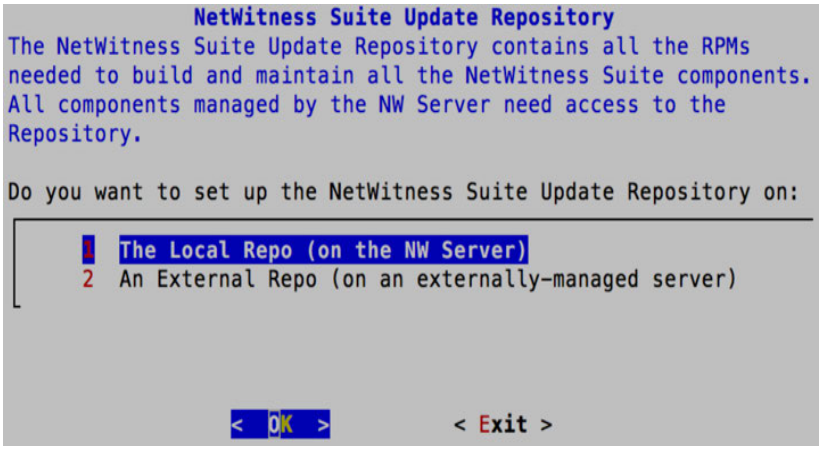
11. Type the configuration values (using the down arrow to move from field to field), Tab to **OK**, and press Enter.

    If you do not complete all the required fields, an All fields are required error message is a displayed (Primary DNS Server, Secondary DNS Server, and Local Domain Name fields aren't required.)

    If you use the wrong syntax or character length for any of the fields, an Invalid *field-name* error message is displayed.

    Caution: If you select DNS Server, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

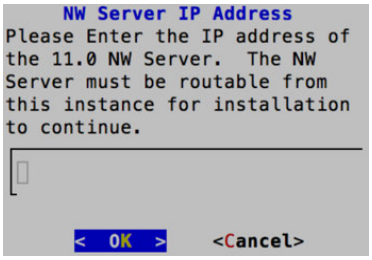
The Update Repository prompt is displayed.
Select the same repo you selected when you upgraded the NW Server Host for all hosts.



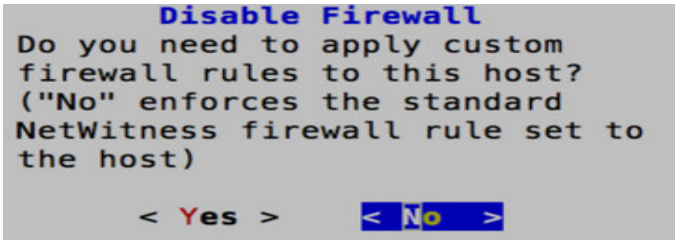
12. Press Enter to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, Tab to **OK**, and pres Enter.

    - If you select **1 The Local Repo (on the NW Server)** the setup program makes sure that you have the appropriate media attached to the host (that is, a build stick or DVD) from which it can retrieve the Install or Update the hosts to NetWitness Suite 11.0.0.0.
    - If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access RSA updates and CentOS updates.

    Enter the base URL of the NetWitness Suite external repo and click **OK.**
    The NW Server IP Address prompt is displayed.



13. Type the NW Server IP address. Tab to **OK**, and press Enter.
    The Disable firewall prompt is displayed.

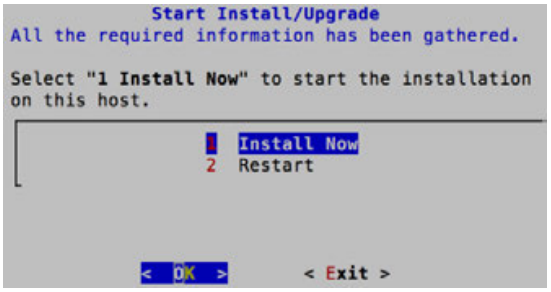


14. To:

    - Apply the standard firewall configuration, press Enter.
    - Disable the standard configuration, Tab to **Yes** and press Enter.
      The disable firewall configuration confirmation prompt is displayed.

      Tab to **Yes** and press Enter to confirm (press Enter to use standard firewall configuration).

    The Start Install prompt is displayed.



15. Press Enter to install 11.0.0.0 on the NW Server.
    When "Installation complete" is displayed, you have a generic (x node) host with an operating system compatible with NetWitness Suite 11.0.0.0.
16. Install a component service on the x node host.
    a. Click **ADMIN** > **Hosts**.
       The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

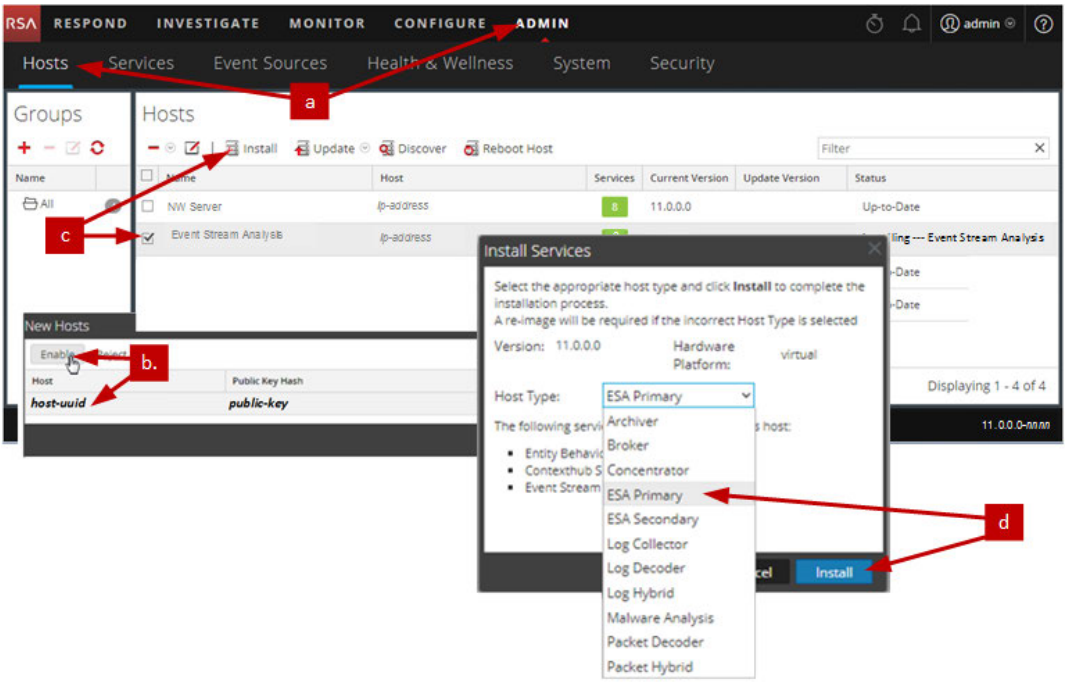
Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

b. Select a non-NW Server host from the **Hosts** view.

c. Click on the host in the **New Hosts** dialog and click **Enable**.
The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

d. Select that host (for example, **Event Stream Analysis**) and click Install
The **Install Services** dialog is displayed.

e. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



You have completed the installation of the non-NW Server host in NetWitness Suite.

17. Complete steps 1 through 15 for the rest of the NetWitness Suite non-NW Server components.

Step 3. Configure Databases to Accommodate NetWitness Suite

When you deploy databases from OVA, the initial database space allocation may not be adequate to support NetWitness Server. You need to review the status of the datastores after initial deployment and expand them.

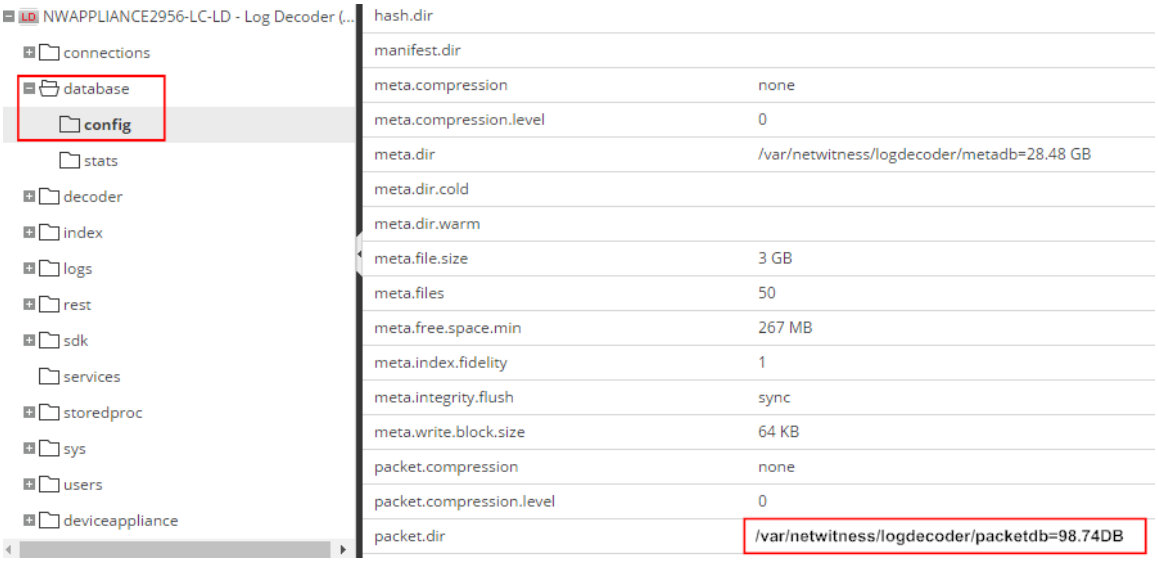
Task 1. Review Initial Datastore Configuration

Review the datastore configuration after initial deployment to determine if you have enough

drive space to accommodate the needs of your enterprise. As an example, this topic reviews the datastore configuration of the PacketDB on the Log Decoder host after you first deploy it from an Open Virtualization Archive (OVA) file.

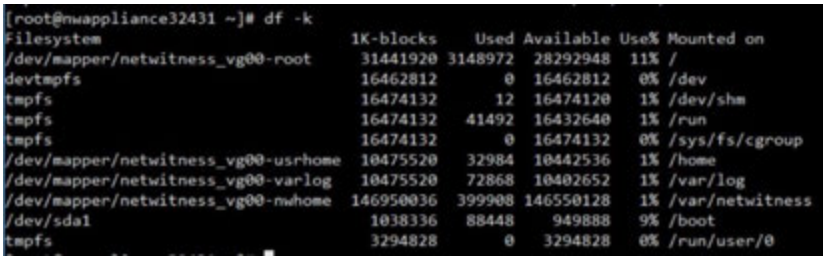
Initial Space Allocated to PacketDB

The allocated space for the PacketDB is very small (about 98 GB). The following NetWitness Suite Explore view example shows the size of the PacketDB after you initially deploy it from OVA.



Initial Database Size

By default, the database size is set to 95% of the size of file system on which the database resides. SSH to the Log Decoder host and enter the `df -k` command string to view the files system and its size. The following output is an example of the information that this command strings returns.



PacketDB Mount Point

The database is mounted on the `packetdb` logical volume in `netwitness_vg00` volume group. `netwitness_vg00` and this is where you start your expansion planning for the file system.

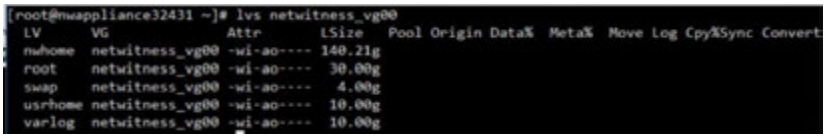
Initial Status of netwitness_vg00

Complete the following steps to review the status of `netwitness_vg00`.

1. SSH to the Log Decoder host.
2. Enter the `lvs` (Logical Volumes Show) command string to determine which logical volumes are grouped in `netwitness_vg00`.

   `[root@nwappliance32431 ~}# lvs netwitness_vg00.`

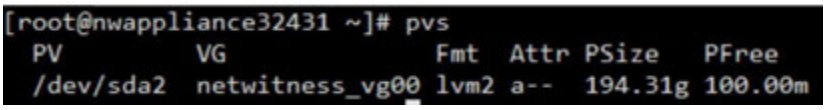
   The following output is an example of the information that this command strings returns.



3. Enter the pvs (Physical Volumes Show) command string to determine which physical volumes belong to a specific group.

   `[root@nwappliance32431 ~}# pvs`

   The following output is an example of the information that this command strings returns.



4. Enter the `vgs` (Volume Groups Show) command string to display the total size of specific volume group.

   `[root@nwappliance32431 ~}# vgs`

   The following output is an example of the information that this command strings returns.

Task 2. Review Optimal Datastore Space Configuration

You need to review the datastore space configuration options for the different hosts to get the optimal performance from your virtual NetWitness Suite deployment. Datastores are required for virtual host configuration, and the correct size is dependent on the host.

Note: (1.) Refer to the "**Optimization Techniques**" topic in the RSA NetWitness SuiteCore Database Tuning Guide for recommendations on how to optimize datastore space. (2.) Contact Customer Care for assistance in configuring your virtual drives and using the Sizing & Scoping Calculator.

Virtual Drive Space Ratios

The following table provides optimal configurations for packet and log hosts. Additional partitioning and sizing examples for both packet capture and log ingest environments are provided at the end of this topic.

Decoder			
Persistent Datastores	**Cache Datastore**		
PacketDB	**SessionDB**	**MetaDB**	**Index**
100% as calculated by Sizing & Scoping Calculator	6 GB per 100Mb/s of traffic sustained provides 4 hours cache	60 GB per 100Mb/s of traffic sustained provides 4 hours cache	3 GB per 100Mb/s of traffic sustained provides 4 hours cache

Concentrator		
Persistent Datastores	**Cache Datastores**	
MetaDB	**SessionDB** **Index**	**Index**
Calculated as 10% of the PacketDB required for a 1:1 retention ratio	30 GB per 1TB of PacketDB for standard multi protocol network deployments as seen at typical internet gateways	5% of the calculated MetaDB on the Concentrator. Preferred High Speed Spindles or SSD for fast access

Log Decoder			
Persistent Datastores	Cache Datastores		
PacketDB	SessionDB	MetaDB	Index
100% as calculated by Sizing & Scoping Calculator	1 GB per 1000 EPS of traffic sustained provides 8 hours cache	20 GB per 1000 EPS of traffic sustained provides 8 hours cache	0.5 GB per 1000 EPS of traffic sustained provides 4 hours cache

Log Concentrator		
Persistent Datastores	**Cache Datastores**	
MetaDB	**SessionDB Index**	**Index**
Calculated as 100% of the PacketDB required for a 1:1 retention ratio	3 GB per 1000 EPS of sustained traffic per day of retention	5% of the calculated MetaDB on the Concentrator. Preferred High Speed Spindles or SSD for fast access

Task 3. Add New Volume and Extend Existing File Systems

After reviewing your initial datastore configuration, you may determine that you need to add a new volume. This topic uses a Virtual Packet/Log Decoder host as an example.

Complete these tasks in the following order.

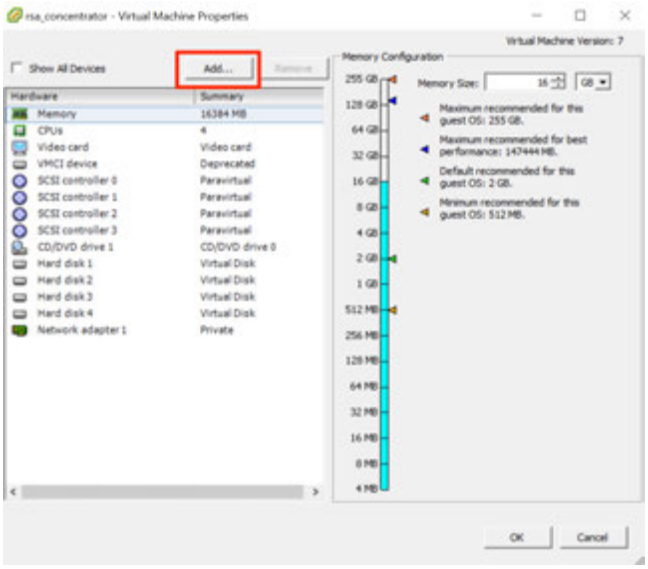
1. Add New Disk
2. Create New Volumes on the New Disk
3. Create LVM Physical Volume on New Partition
4. Extend Volume Group with Physical Volume
5. Expand the File System
6. Start the Services
7. Make Sure the Services Are Running
8. Reconfigure LogDecoder Parameters

Add New Disk

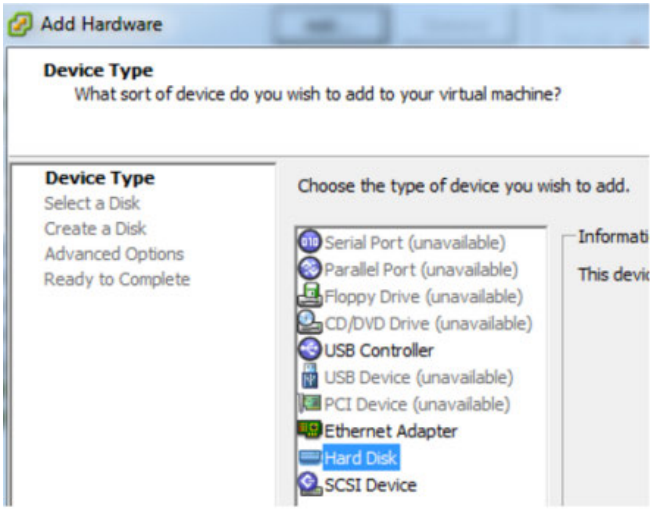
This procedure shows you how to add a new 100GB disk on the same datastore.

Note: The procedure to add a disk on different datastore is similar to the procedure shown here.

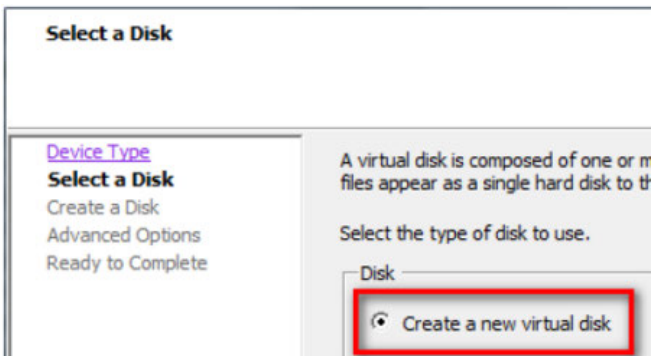
1. Shut down the machine, edit **Virtual Machine Properties**, click **Hardware** tab, and click **Add**.



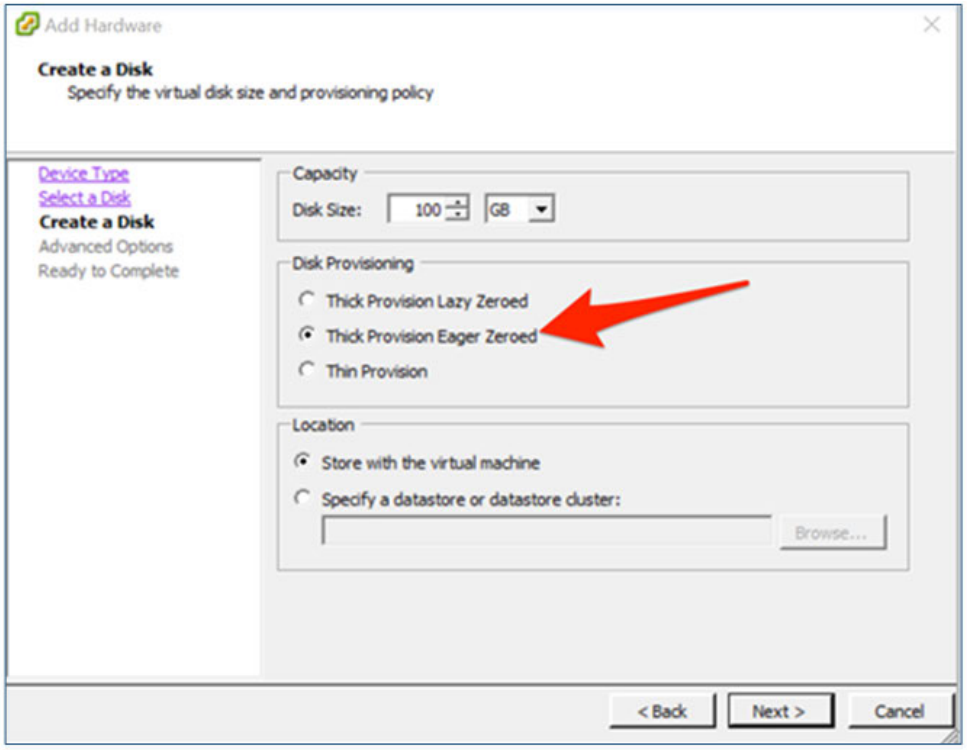
2. Select **Hard Disk** as the device type.



3. Select **Create a new virtual disk**.

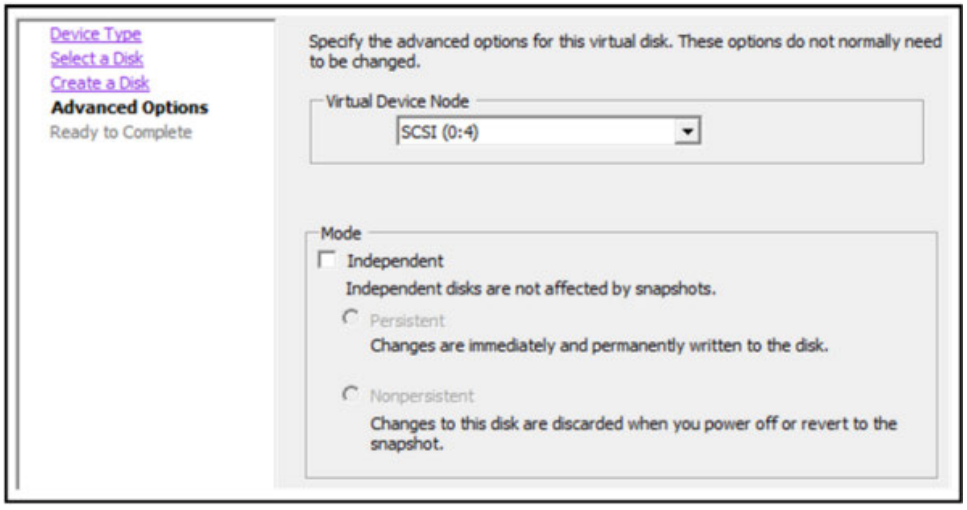


4. Choose the size of the new disk and where you want to create it (on the same datastore or a different datastore).



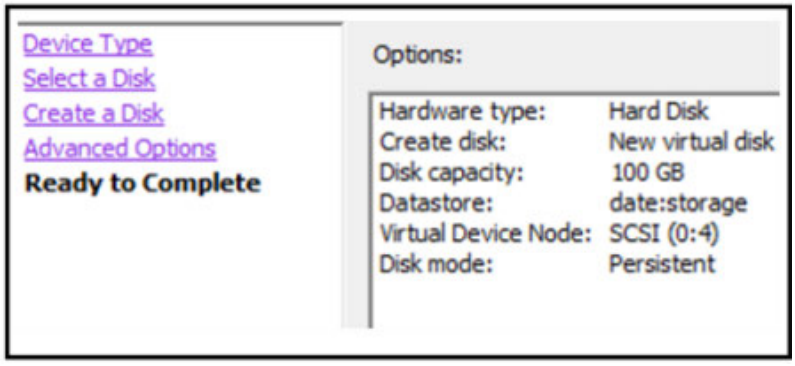
Caution: Allocate all the space for performance reasons.

5. Approve the proposed Virtual Device Node.



Note: The Virtual Device Node can vary, but it is pertinent to `/dev/sdX` mappings.

6. Confirm the settings.



7. Start virtual machine.
8. SSH to the machine.
9. Restart the machine and enter the following command.

   `lsblk`

   The following output is displayed showing the new disk.

```
[root@NWAPPLIANCE2599 database]# lsblk
NAME                          MAJ:MIN RM   SIZE RO TYPE MOUNTPOINT
fd0                             2:0    1     4K  0 disk

sde                             8:64   0    10G  0 disk
sr0                            11:0    1  1024M  0 rom
[root@NWAPPLIANCE2599 database]#
```

Note: 1.) You receive an **unknown partition table** error because the new disk has not been initialized. 2.) The **sd 2:0:4:0** pertains to the **SCSI:0:4** Virtual Device Node that appeared when you added the new device. 3.) The new disk device is **sde** (or `/dev/sde`).

10. Enter the following command string to stop the service.

    `root@LogDecoderGM ~] # service nwlogcollector stop; service nwlogdecoder stop`.

    This procedure uses the Log Decoder as an example.

    If you wanted to stop services on a Concentrator, you would enter:

    `service nwconcentrator stop`

    If you wanted to stop services on a Packet Decoder, you would enter:

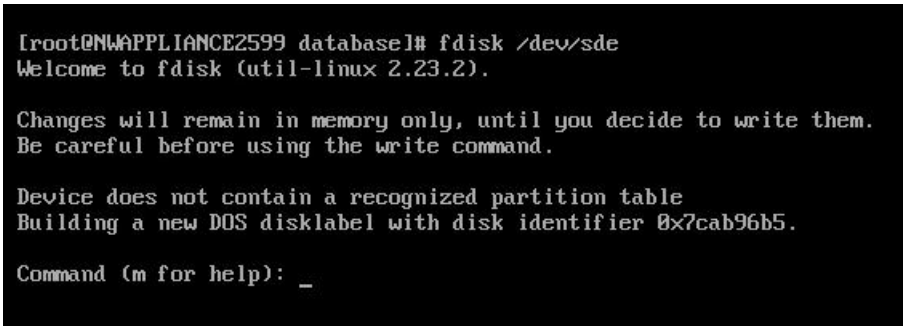
    `service nwdecoder stop`

Create Volumes on New Disk

1. SSH to the LogDecoder host.
2. Create a partition on the new disk and change its type to Linux LVM.

   `[root@NWAPPLIANCE2599 ~]# fdisk /dev/sde`

   The following information and prompt is displayed.



3. Type `p`.

   The following information is displayed.

```
Command (m for help): p

Disk /dev/sde: 10.7 GB, 10737418240 bytes, 20971520 sectors
Units = sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk label type: dos
Disk identifier: 0x2a0cf37b

   Device Boot      Start         End      Blocks   Id  System

Command (m for help):
```

The default partition type is **Linux (83)**. You need to change it to Linux **LVM (8e)**.

4. Type `n`.

   The following prompt is displayed.

```
Command (m for help): n
Partition type:
   p   primary (0 primary, 0 extended, 4 free)
   e   extended
Select (default p): p
Partition number (1-4, default 1): 1
First sector (2048-20971519, default 2048):
Using default value 2048
Last sector, +sectors or +size{K,M,G} (2048-20971519, default 20971519):
Using default value 20971519
Partition 1 of type Linux and of size 10 GiB is set

Command (m for help): _
```

Partition 1 of type Linux and of size 10 GB is set

1. At the `Command m for help:` prompt type `t`.

   The following information and prompt is displayed.

```
Command (m for help): t
Selected partition 1
Hex code (type L to list all codes): 8e
Changed type of partition 'Linux' to 'Linux LVM'

Command (m for help):
```

2. Type `8e`.

   The following information and prompt is displayed.

```
Changed system type of partition 1 to 8e (Linux LVM).

Command (m for help):
```

3. Type `p`.

The following information is displayed.

```
Command (m for help): p

Disk /dev/sde: 10.7 GB, 10737418240 bytes, 20971520 sectors
Units = sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk label type: dos
Disk identifier: 0x2a0cf37b

   Device Boot      Start         End      Blocks   Id  System
/dev/sde1            2048    20971519    10484736   8e  Linux LVM

Command (m for help):
```

4. At `Command (m for help):` prompt type `w`.

   The new partition table is written to the disk and fdisk quits to root shell.

```
Command (m for help): w
The partition table has been altered!

Calling ioctl() to re-read partition table.
[ 9838.504920]  sde: sde1
Syncing disks.
[root@NWAPPLIANCE2599 database]# _
```

   The new `/dev/sde1` partition is created on the new disk.

5. Complete one of the following steps to verify that the new partition exists.

   - Type `dmesg | tail`.

     The following information is displayed.

```
[root@NWAPPLIANCE2599 database]# dmesg | tail
[  773.090059] XFS (dm-2): Mounting V4 Filesystem
[  773.214176] XFS (dm-2): Ending clean mount
[  785.595678] XFS (dm-3): Mounting V4 Filesystem
[  785.758078] XFS (dm-3): Ending clean mount
[  802.874171] XFS (dm-4): Mounting V4 Filesystem
[  803.028083] XFS (dm-4): Starting recovery (logdev: internal)
[  803.041709] XFS (dm-4): Ending recovery (logdev: internal)
[  813.249001] XFS (dm-5): Mounting V4 Filesystem
[  813.439422] XFS (dm-5): Ending clean mount
[ 9838.504920]  sde: sde1
[root@NWAPPLIANCE2599 database]#
```

   - Type `fdisk /dev/sde`.
   - Type `p`.

The following information is displayed.

```
[root@NWAPPLIANCE2599 database]# fdisk /dev/sde
Welcome to fdisk (util-linux 2.23.2).

Changes will remain in memory only, until you decide to write them.
Be careful before using the write command.

Command (m for help): p

Disk /dev/sde: 10.7 GB, 10737418240 bytes, 20971520 sectors
Units = sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk label type: dos
Disk identifier: 0x2a0cf37b

   Device Boot      Start         End      Blocks   Id  System
/dev/sde1            2048    20971519    10484736   8e  Linux LVM

Command (m for help): _
```

Create LVM Physical Volume on New Partition

1. SSH to the LogDecoder host.
2. Enter the following command string to create a Logical Volume Manager (LVM) physical volume on the new partition.

   ```
   [root@LogDecoderGM ~]# pvcreate /dev/sdel
   ```

3. The following information is displayed.

```
[root@NWAPPLIANCE2599 database]# pvcreate /dev/sde1
  Physical volume "/dev/sde1" successfully created.
[root@NWAPPLIANCE2599 database]#
```

Extend Volume Group with Physical Volume

1. SSH to the LogDecoder host.
2. Enter the following command string to create a Logical Volume Manager (LVM) physical volume on the new partition.

   ```
   [root@LogDecoderGM ~]# pvs
   ```

   The following information is displayed.

```
[root@NWAPPLIANCE2599 database]# pvs
  PV         VG              Fmt  Attr PSize   PFree
  /dev/sda2  netwitness_vg00 lvm2 a--  194.31g 100.00m
  /dev/sdb1  VolGroup00      lvm2 a--   48.00g      0
  /dev/sdc1  VolGroup01      lvm2 a--  104.00g      0
  /dev/sdd1  VolGroup01      lvm2 a--  168.00g      0
  /dev/sde1                  lvm2 ---   10.00g  10.00g
[root@NWAPPLIANCE2599 database]#
```

`netwitness_vg00` consists of `/dev/sdc1`and `/dev/sdd1` physical volumes (PV), and LVM system. Note that the new`/dev/sde1` volume has 10GB of free space.

3. To add the physical volume to `netwitness_vg00`.

   a. Enter `vgextend netwitness_vg00 /dev/sde1`.

      The following information is displayed.

      ```
      Volume group "netwitness_vg00" successfully extended
      ```

   b. Enter pvs.

      The following information is displayed.

      The volume was added to `netwitness_vg00`, but it has not been extended yet (you still have 10GB of free space). There are several Logical Volumes in `netwitness_vg00`, in this example involves the PacketDB.

4. To extend the PacketDB logical volume so that it uses all of the 10GB of free space.

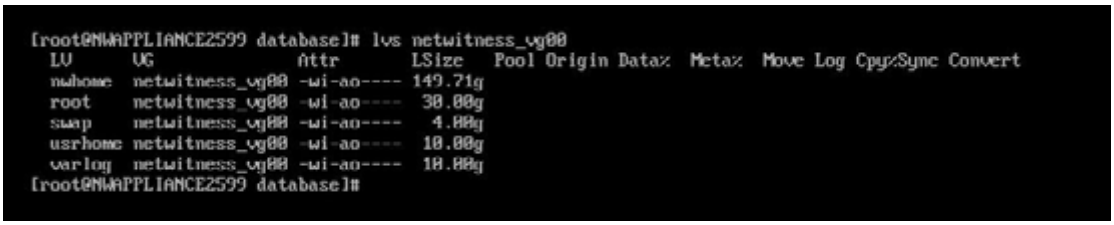
   a. Enter `lvs netwitness_vg00`.
   The following information is displayed

   b. Enter `lvextend -L+9.5G /dev/netwitness_vg00/nwhome`.

      The following information is displayed.

   b. Enter`lvs netwitness_vg00`.

      The following information is displayed.



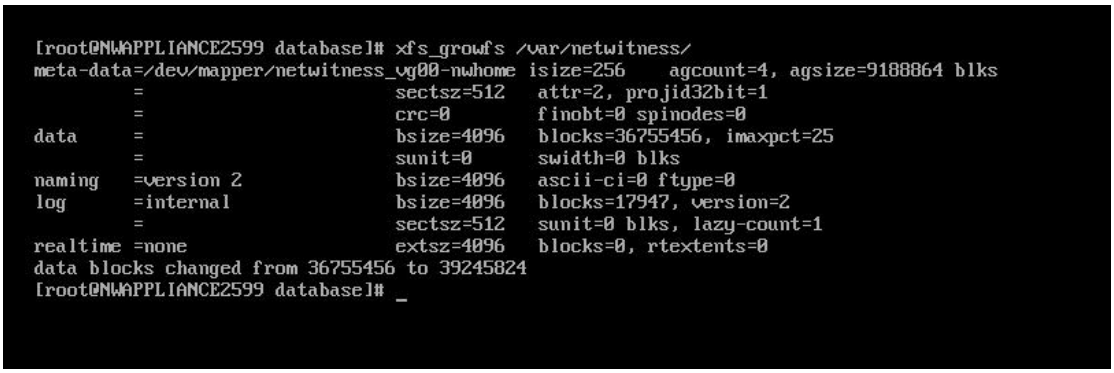
The `packetdb` Logical Volume has been expanded to 149.71 GB, but the `/var/netwitness` filesystem still has 140.21 GB.

Expand the File System

1. SSH to the LogDecoder host.
2. Enter the following command string to create a Logical Volume Manager (LVM) physical volume on the new partition.

   ```
   [root@LogDecoderGM ~]# xfs_growfs /var/netwitness/
   ```

   The following information is displayed.



Start Services

Enter the following command string to start the services on the LogDecoder host.

```
[root@LogDecoderGM ~]# service nwlogcollector start; service
nwlogdecoder start
```

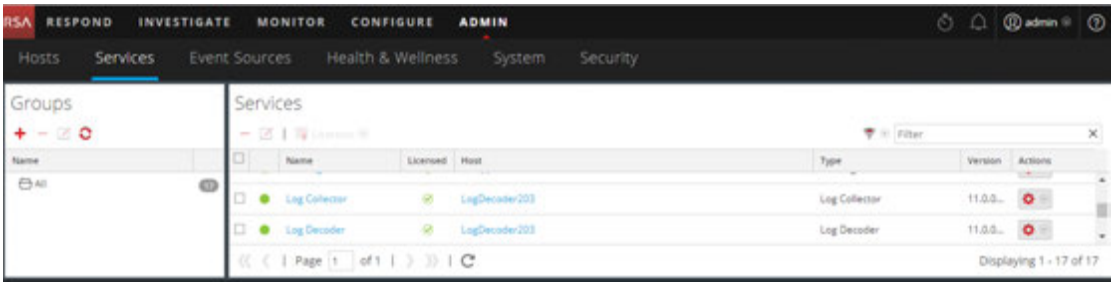
The following information is displayed.

```
nwlogcollector start/running, process 4069
nwlogdecoder start/running, process 4069
```

Make Sure that the Services Are Running

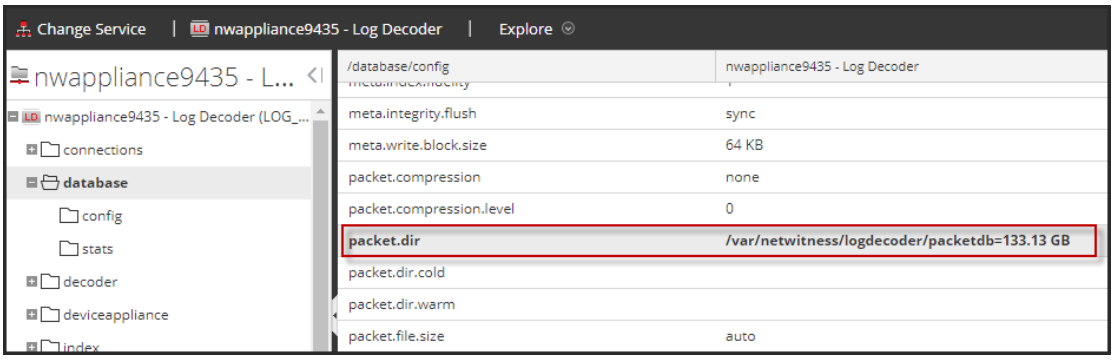
1. Log on to NetWitness Suite.
2. Click **Administration** > **Services**.

3. Make sure that the Log Collector and Log Decoder services are running.



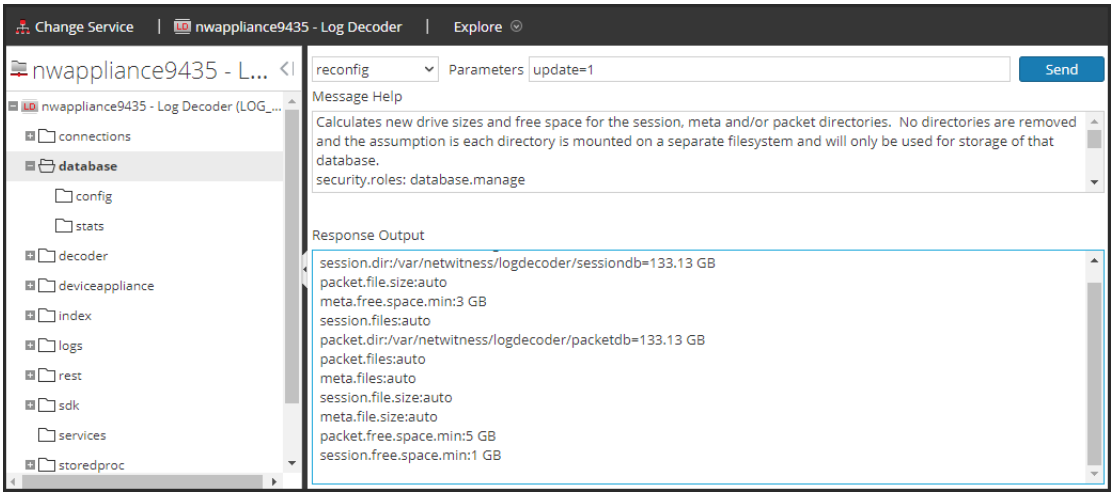
Reconfigure Log Decoder Parameters

1. Log on to NetWitness Suite.
2. Click **Administration** > **Services**.
3. Select the LogDecoder service.
4. Under actions, select View > Explore.
5. Click `database > config > packet.dir`.

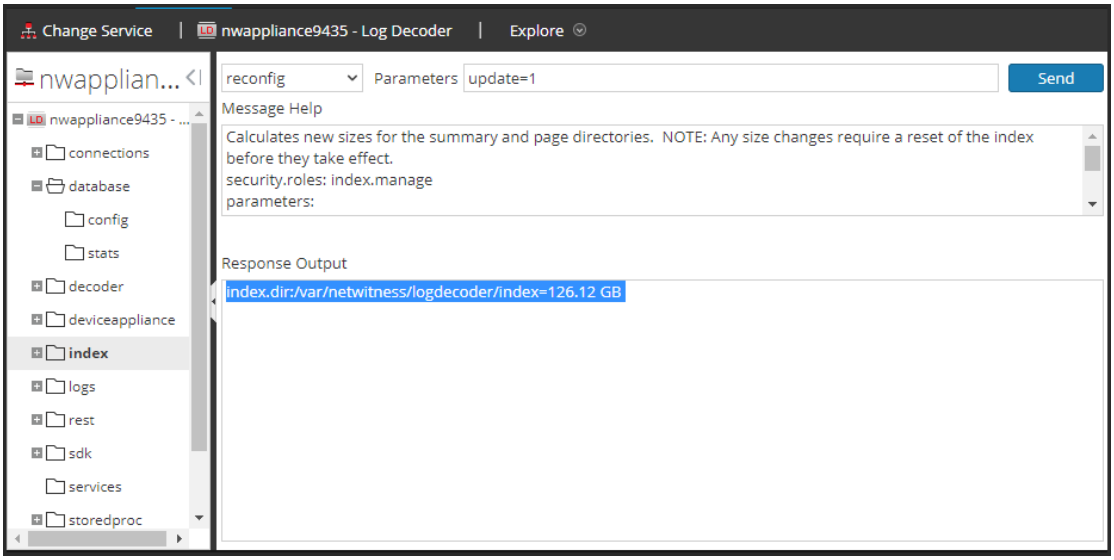


6. Right-click `database`, click **Properties**, select the **reconfig** command, specify **update=1** in **Parameters**, and click **Send**.

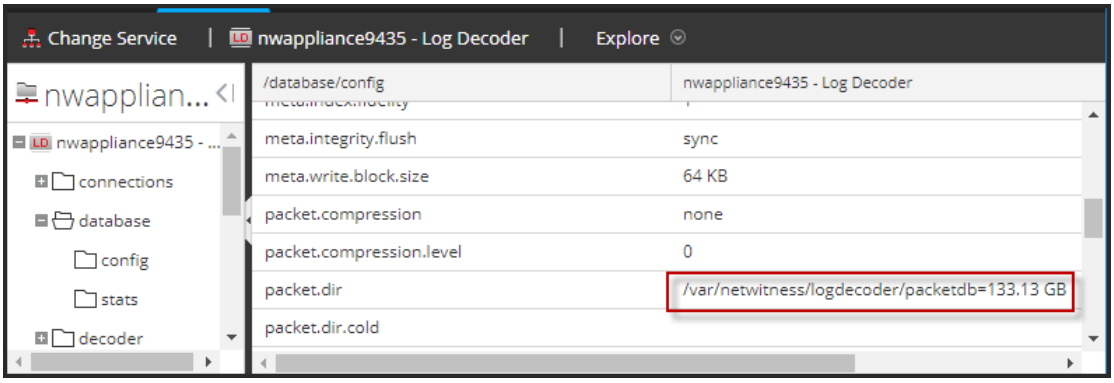
The `packetdb`parameter value changed from 98.74 GB to 133.13 GB.



7. Right-click `index`, click **Properties**, select the **reconfig** command, specify **update=1** in **Parameters**, and click **Send**.



8. Close the Properties dialog to return to the Explore view. The `packet.dir` parameter value is now 133.13 GB (95% of 203 GB).



Step 4. Configure Host-Specific Parameters

Certain application-specific parameters are required to configure log ingest and packet capture in the Virtual Environment.

Configure Log Ingest in the Virtual Environment

Log ingest is easily accomplished by sending the logs to the IP address you have specified for the Decoder. The Decoder's management interface allows you to then select the proper interface to listen for traffic on if it has not already selected it by default.

Configure Packet Capture in the Virtual Environment

There are two options for capturing packets in a VMWare environment. The first is setting your vSwitch in promiscuous mode and the second is to use a third-party Virtual Tap.

Set a vSwitch to Promiscuous Mode

The option of putting a switch whether virtual or physical into promiscuous mode, also described as a SPAN port (Cisco services) and port mirroring, is not without limitations. Whether virtual or physical, depending on the amount and type of traffic being copied, packet capture can easily lead to over subscription of the port, which equates to packet loss. Taps, being either physical or virtual, are designed and intended for loss less 100% capture of the intended traffic.

Promiscuous mode is disabled by default, and should not be turned on unless specifically required. Software running inside a virtual machine may be able to monitor any and all traffic moving across a vSwitch if it is allowed to enter promiscuous mode as well as causing packet loss due to over subscription of the port..

To configure a portgroup or virtual switch to allow promiscuous mode:

1. Log on to the ESXi/ESX host or vCenter Server using the vSphere Client.
2. Select the ESXi/ESX host in the inventory.
3. Select the **Configuration** tab.
4. In the **Hardware** section, click **Networking**.
5. Select **Properties** of the virtual switch for which you want to enable promiscuous mode.
6. Select the virtual switch or portgroup you want to modify, and click **Edit**.
7. Click the **Security** tab. In the **Promiscuous Mode** drop-down menu, select **Accept**.

Use of a Third-Party Virtual Tap

Installation methods of a virtual tap vary depending on the vendor. Please refer to the documentation from your vendor for installation instructions. Virtual taps are typically easy to integrate, and the user interface of the tap simplifies the selection and type of traffic to be copied.

Virtual taps encapsulate the captured traffic in a GRE tunnel. Depending on the type you choose, either of these scenarios may apply:

- An external host is required to terminate the tunnel, and the external host directs the traffic to the Decoder interface.
- The tunnel send traffic directly to the Decoder interface, where NetWitness Suite handles the de-encapsulation of the traffic.

RSA NETWITNESS® SUITE

AWS Deployment Guide

for Version 11.0.0.0

AWS Deployment Overview

Before you can deploy RSA NetWitness® Suite in the Amazon Web Services (AWS) you need to:

- Understand the requirements of your enterprise.
- Know the scope of a NetWitness Suite deployment.

When you are ready to begin deployment:

- Make sure that you have a NetWitness Suite "Throughput" license.
- For packet capture in AWS, you can purchase either of the following Third-Party solutions. If you engage one of these third-parities, they will assign an account representative and a professional services engineer to you who will work closely with RSA staff.
  - Gigamon® GigVUE 5.0
  - f5BIG-IP 12.1.0

AWS Environment Recommendations

AWS instances have the same functionality as the NetWitness Suite hardware hosts. RSA recommends that you perform the following tasks when you set up your AWS environment.

- Based on the resource requirements of the different components, follow best practices to use the system and dedicated storage Elastic Block Store (EBS) Volumes appropriately.
- Make sure that compute capacity provides a write speed of 10% greater than the required sustained capture and ingest rate for the deployment.
- Build Concentrator directory for index database on the Provisioned IOPS SSD.

Abbreviations and Other Terminology Used in this Guide

Abbreviations	Description
AMI	Amazon Machine Image
AWS	Amazon Web Services
BYOL	Bring your own licensing

Abbreviations	Description
CPU	Central Processing Unit
Dedicated Instance	AWS Dedicated Instances run in a VPC on hardware that is dedicated to a single customer. Dedicated instances are physically isolated at the host hardware level from instances that belong to other AWS accounts. Dedicated instances may share hardware with other instances from the same AWS account that are not Dedicated instances. Refer to the AWS "Amazon EC2 Dedicated Instance" documentation (https://aws.amazon.com/ec2/purchasing-options/dedicated-instances/) for more information on dedicated instances.
EBS Optimization	An Amazon EBS–optimized instance uses an optimized configuration stack and provides additional, dedicated capacity for Amazon EBS I/O. This optimization provides the best performance for your EBS volumes by minimizing contention between Amazon EBS I/O and other traffic from your instance. Refer to the AWS "Amazon EBS–Optimized Instances" documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSOptimized.html) for more information on EBS-optimized instances.
EBS Volume	Elastic Block Store (EBS) volume is a highly available and reliable storage volume that you can attach to any running instance that is in the same Availability Zone. Refer to the AWS "Amazon EBS Volumes" documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumes.html) for more information on EBS Volumes.
EC2 instance	Virtual server in AWS Elastic Compute Cloud (EC2) for running applications on the AWS infrastructure. See also **Instance**.

Abbreviations	Description
Enhanced Networking Enabled	Enhanced networking provides higher bandwidth, higher packet-per-second performance, and consistently lower inter-instance latencies. If your packets-per-second rate appears to have reached its ceiling, you should consider moving to enhanced networking because you have likely reached the upper thresholds of the virtual machine network interface (VIF) driver. Refer to the AWS "How do I enable and configure enhanced networking on my EC2 instances" documentation (https://aws.amazon.com/premiumsupport/knowledge-center/enable-configure-enhanced-networking/) for more information on enhanced networking.
EPS	Events Per Second
GB	Gigabyte. 1GB = 1,000,000,000 bytes
Gb	Gigbit. 1Gb = 1,000,000,000 bits.
Gbps	Gigabits per second or billions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
GHz	GigaHertz 1 GHz = 1,000,000,000 Hz
HDD	Hard Disk Drive
Instance	A virtual host in the AWS (that is, virtual machine or server in the AWS infrastructure on which you run services or applications). See also **EC2 Instance**.
Instance Type	Specifies the required CPU and RAM for an instance. Refer to the AWS "Amazon EC2 Instance Types" documentation (https://aws.amazon.com/ec2/instance-types/) for more information on instance types.
IOPS	Input/Output Operations Per Second

Abbreviations	Description
Mbps	Megabits per second or millions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
On-Premise	On-premise hosts are installed and run on computers on the premises (in the building) of the organization using the hosts, rather than in the AWS.
PPS	Packets Per Second
RAM	Random Access Memory (also known as memory)
Security Group	Set of firewall rules. See the "Network Architecture and Ports" documentation in RSA Link (https://community.rsa.com/docs/) for a comprehensive list of the ports you must set up for all NetWitness Suite components.
SSD	Solid-State Drive
Tag	A meaningful identifier for AWS instance.
Tap Vendor	Network Tapping Vendor
vCPU	Virtual Central Processing Unit (also known as a virtual processor)
VM	Virtual Machine
VPC	Virtual Public Cloud
vRAM	Virtual Random Access Memory (also known as virtual memory)

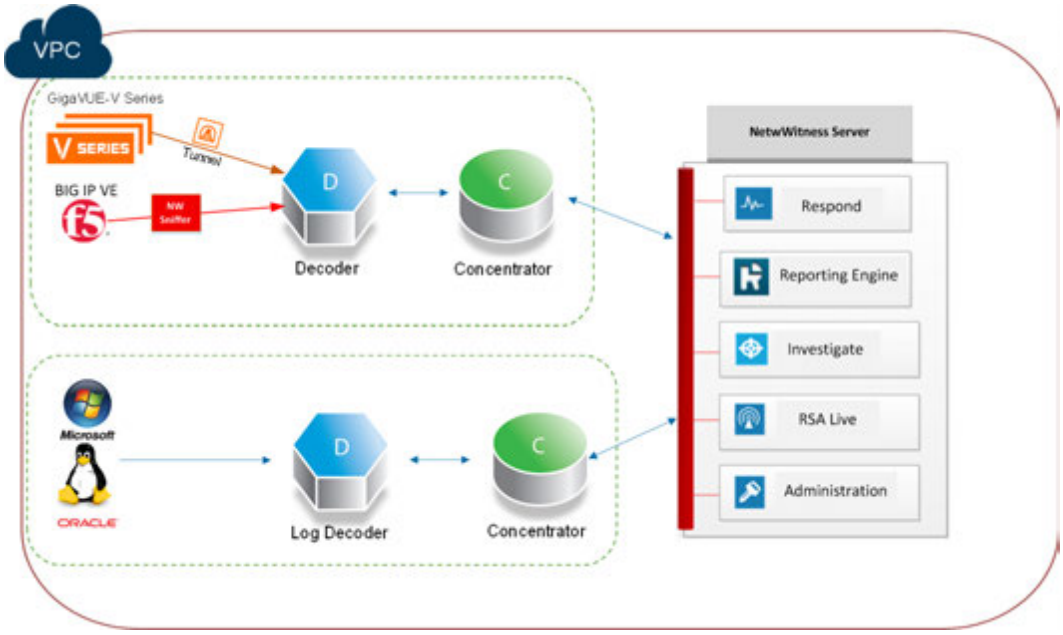
AWS Deployment Scenarios

The following diagrams illustrate some common AWS deployment scenarios. In the diagrams, the:

- **GigaVUE Series** (Gigamon® Solution) is an agent-based solution that uses **Tunneling** (implemented by the NetWitness Suite administrator) to facilitate packet data capture in AWS.
- **BIG-IP** (f5® Solution) is a load balancing solution that uses a Packet Decoder acting as a sniffer (customized by the NetWitness Suite administrator) to facilitate packet capture in AWS.
- **Decoder** collects packet data. The **Decoder** captures, parses, and reconstructs all network traffic from Layers 2 – 7.
- **Log Decoder** collects logs. The **Log Decoder** collects log events from hundreds of devices and event sources.
- **Concentrator** indexes metadata extracted from network or log data and makes it available for enterprise-wide querying and real-time analytics while facilitating reporting and alerting.
- NetWitness Server hosts **Respond**, **Reporting**, **Investigate**, **Live Content Management**, **Administration** and other aspects of the user interface.

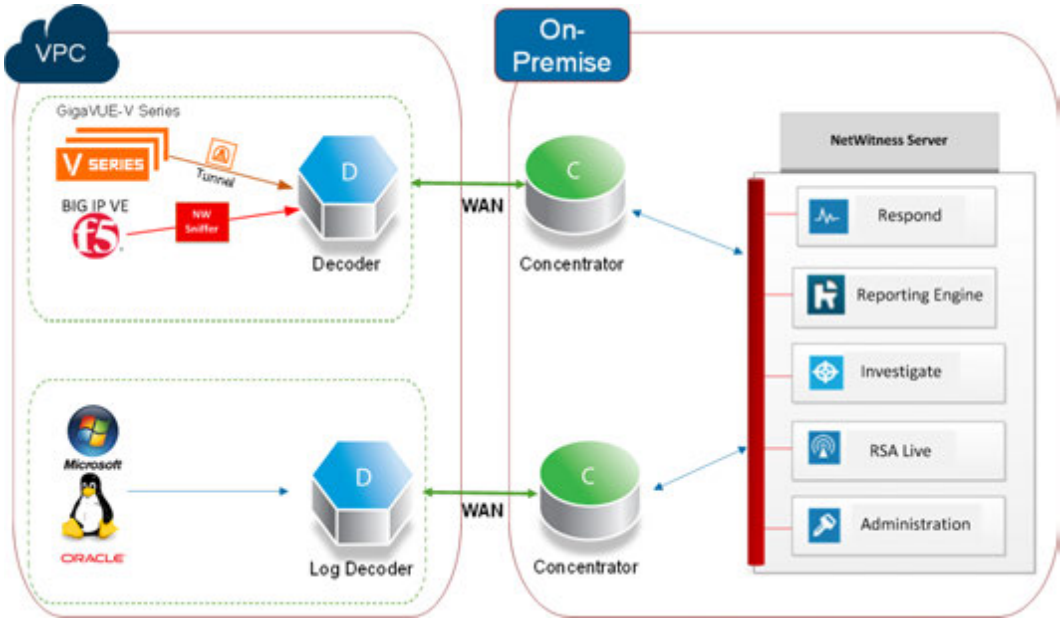
Full NetWitness Suite Stack VPC Visibility (Packet Solution)

This diagram shows all NetWitness Suite components (full stack) deployed in AWS.



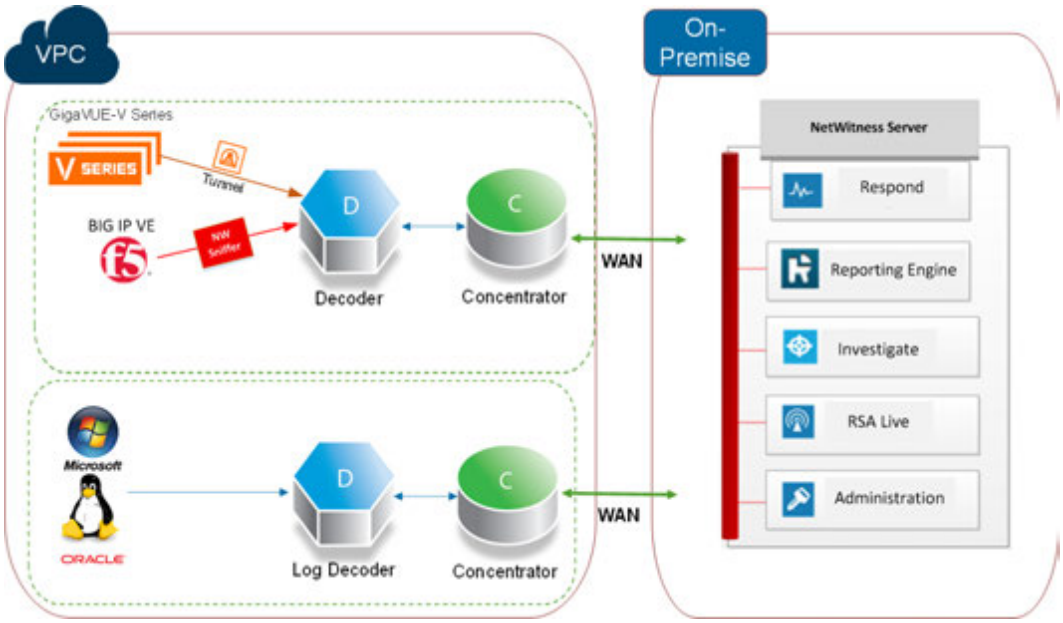
Hybrid Deployment - Decoder and Log Decoder (Packet Solution)

This diagram shows the Decoder and Log Decoder deployed in AWS with all other NetWitness Suite components deployed on your premises.



Hybrid Deployment - Decoder, Log Decoder, and Concentrator (Packet Solution)

This diagram shows the Decoder, Log Decoder, and the Concentrator deployed in AWS with all other NetWitness Suite components deployed on your premises.



Prerequisites

You need the following items before you begin the integration process:

- Access to AWS console
- Network rout-able (and proper AWS Security Groups) for the containers to transfer data to the NetWitness Suite Decoder.

Supported Services

RSA provides the following NetWitness Suite services.

- NetWitness Server
- Archiver
- Broker
- Concentrator

- Event Stream Analysis
- Log Decoder
- Decoder
- Remote Log Collector

AWS Deployment

This topic contains the rules and high-level tasks you must follow to deploy RSA NetWitness® Suite components in the AWS.

Rules

You must adhere to the following rules when deploying NetWitness Suite in AWS.

- SSH to the NetWitness Suite instance at least once after deployment to initialize the system.
- Before you enable the out-of-the-box (OOTB) dashboards, set the default data source in Reporting Engine configuration page.
- If you reboot the Packet Decoder instance, the tunnel is not retained. Create the tunnel on Packet Decoder again and restart the decoder service.
- Always use private IP addresses when you provision AWS NetWitness Suite instances.

Note: If you assign a public IP to the Netwitness Server Host, update the /etc/nginx/conf.d/nginx.conf configuration file as follows:

```
location /nwrpmrepo
{
alias /var/lib/netwitness/common/repo;
index index.html index.htm;
allow <Subnet-Gateway>/Subnet mask ;
#example
# allow 10.0.0.1/25;
deny all;
autoindex on;
}
```

Checklist

Step	Description	√
1	Establish AWS Environment	
2	Find NetWitness Suite AMIs	
3	Launch an Instance and Configure a Host	
4	Configure Hosts (Instances) in NetWitness Suite	

Step	Description	√
5	Configure Packet Capture	

Establish AWS Environment

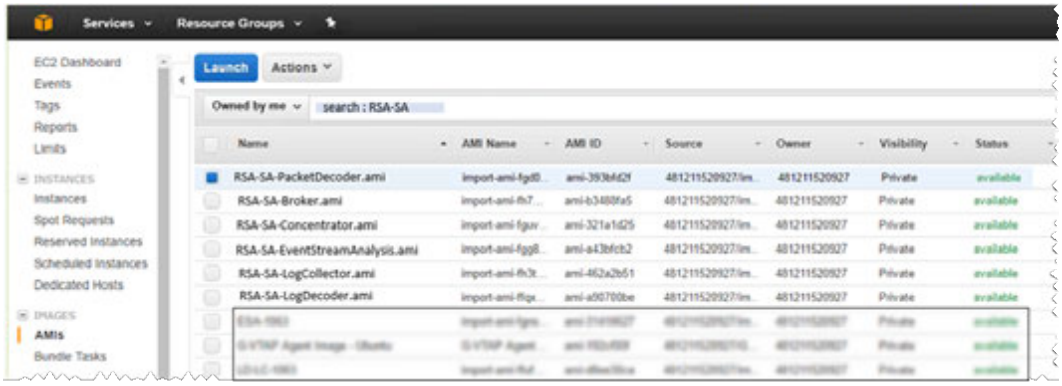
1. Make sure that you have an AWS environment with the capacity to meet or exceed the NetWitness Suite performance guidelines described in AWS Instance Configuration Recommendations .
2. Go to Find NetWitness Suite AMIs.

Find NetWitness Suite AMIs

Search for NW- AMI files within the Public/Shared/Community repository. Use "RSANW" for a key word to search for the AMI files.

Note: Refer to the AWS **Finding Shared AMIs** documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/usingsharedamis-finding.html) for additional instructions.

1. Open the Amazon EC2 console (New Subscriber Account) at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose AMIs.
3. In the first filter, choose Public images.
4. Type "RSANW" in the search field to find the NetWitness Suite AMIs.



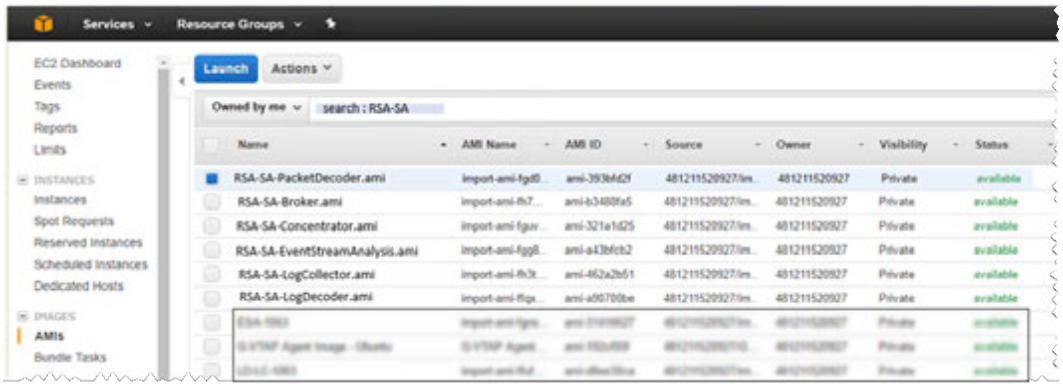
Note: Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) to obtain access to the **RSANW-11.0.0.0.1245-Full-01**.

5. Go to Launch an Instance and Configure a Host.

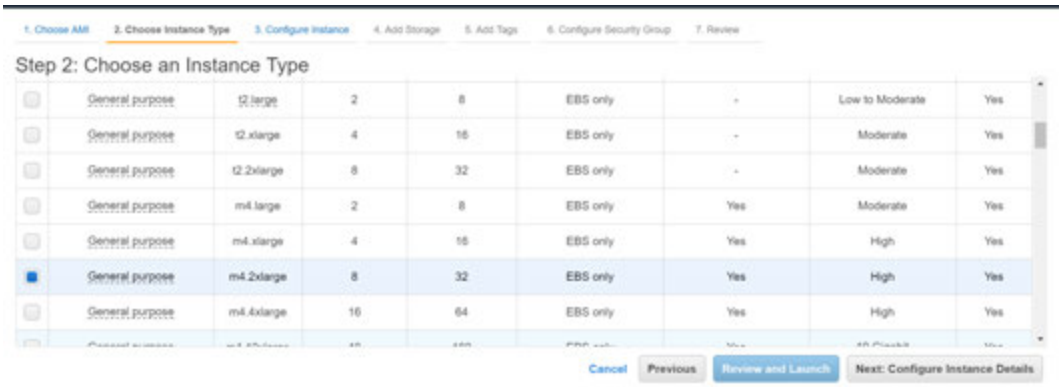
Launch an Instance and Configure a Host

Note: Refer to the AWS "Launching an Instance" documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/launching-instance.html) for additional instructions.

1. Select an instance from the grid (for example, **RSA-NW-Concentrator-11.0.0.0-01**) and click **Launch**.



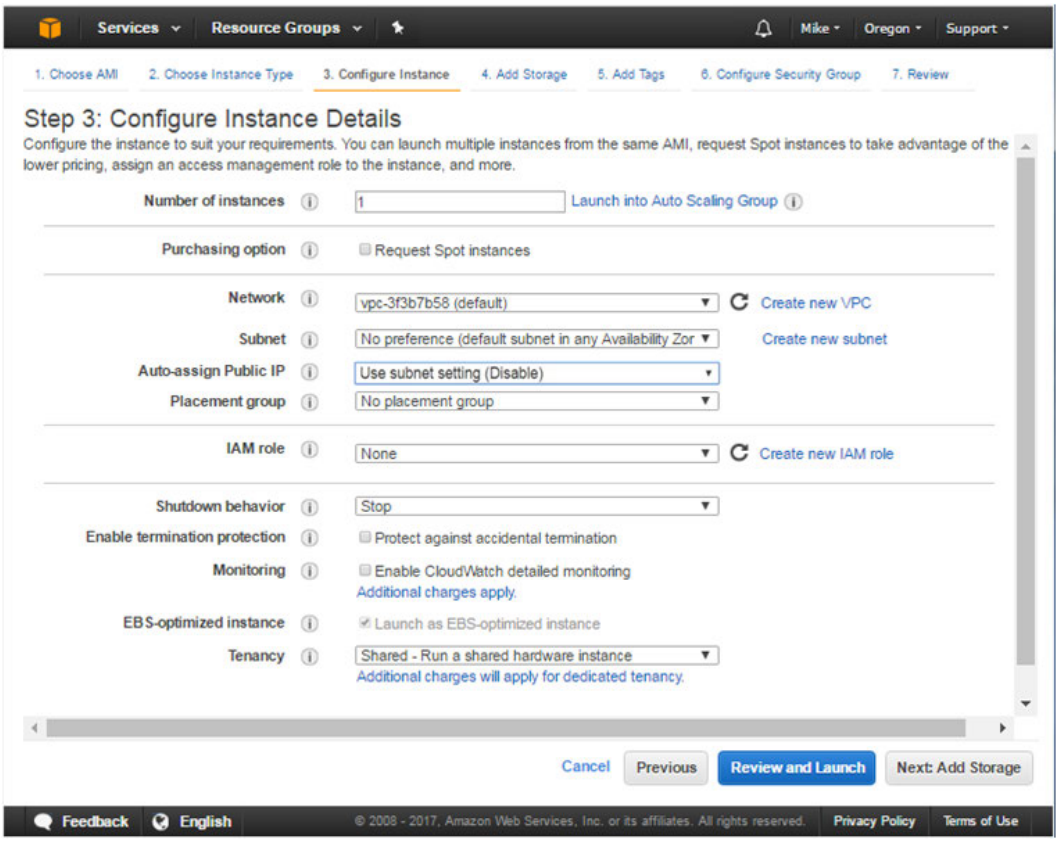
2. Choose the RAM and CPUs by selecting instance type.
   Refer to AWS Instance Configuration Recommendations for guidelines on how to configure the EC2 Instance based on the requirements of the NetWitness Suite component (that is, service) for which you are launching an instance. The following example has the **m4.2xlarge** instance type selected with **8** CPUs and **32** GB of RAM.



3. Click **Next: Configure Instance Details** at the bottom right of the **Step 2: Choose an Instance Type** page.

   The **Step 3. Configure Instance Details** page is displayed.

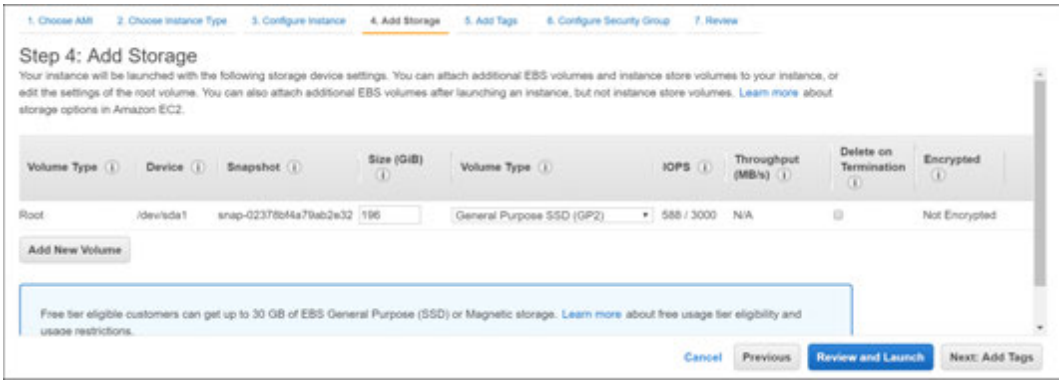
   For NetWitness Suite, the subnet and VPC are defaulted to the values in the following example.



4. Click **Next: Add Storage** at the bottom right of the **Step 3: Configure Instance Details** page.

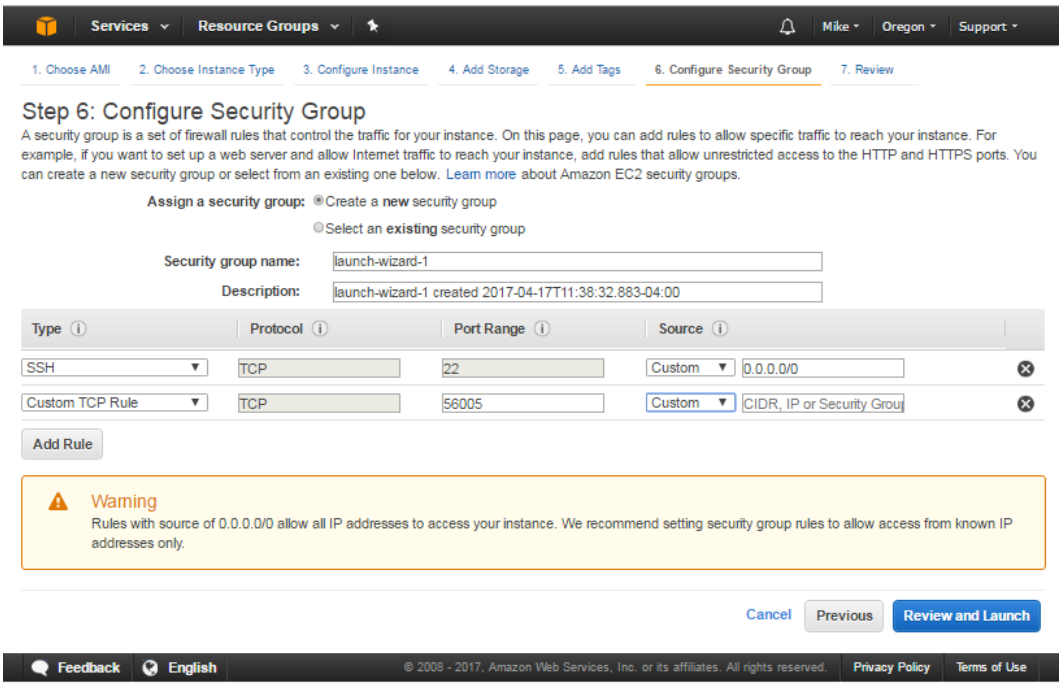
   The **Step 4. Add Storage** page is displayed.

Refer to AWS Instance Configuration Recommendations for guidelines on how to configure storage based on based on the requirements of the NetWitness Suite component (that is, service) for which you are launching an instance.



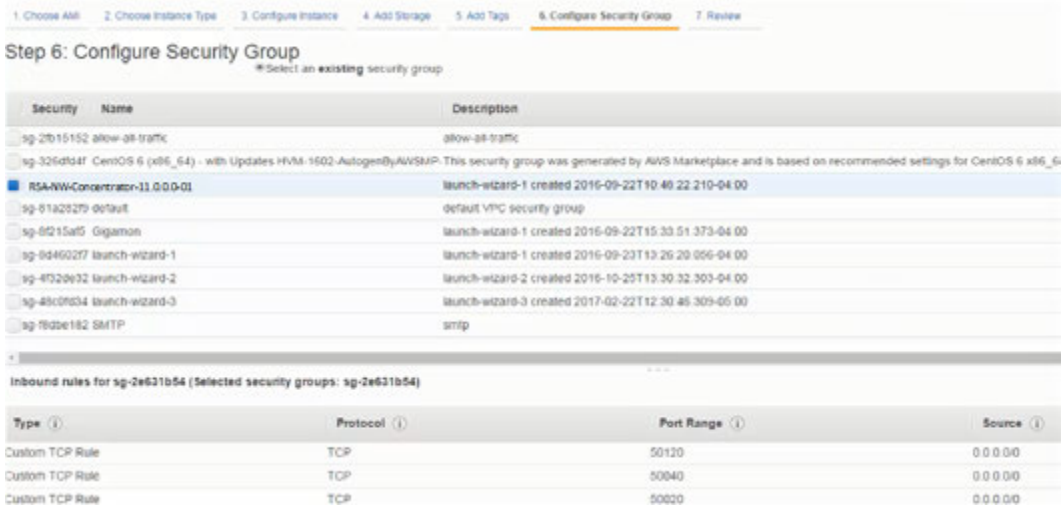
5. Click **Next: Add Tags** at the bottom right of the **Step 4: Add Storage** page.
   The **Step 5. Add Tags** page is displayed. Enter the name of your Instance.
6. Click **Next: Configure Security Group** at the bottom right of the **Step 5: Add Tags** page.
   The **Step 6. Configure Security Group** page is displayed.
   a. Select the "Create a **new** security group" radio button.
   b. Create a rule that opens all the firewall for the NetWitness Suite component.
      You must configure the security group correctly to configure the instance (host) from the NetWitness Suite) User Interface and SSH to it.

      Note: See the "Network Architecture and Ports" documentation in RSA Link (https://community.rsa.com/docs/DOC-83050) for a comprehensive list of the ports you must set up for all NetWitness Suite components..

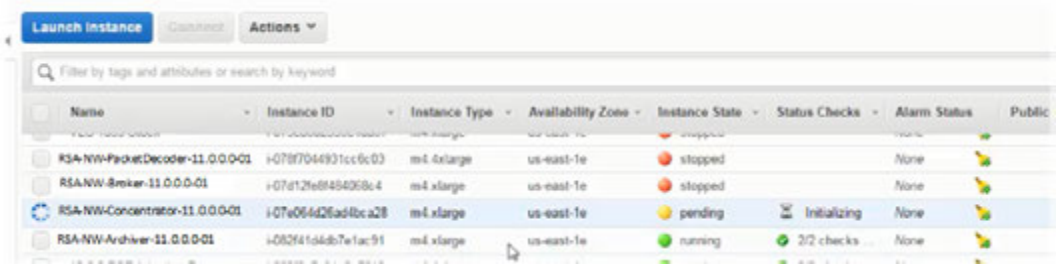


Note: After you configure a Security Group, you can change it at any time.

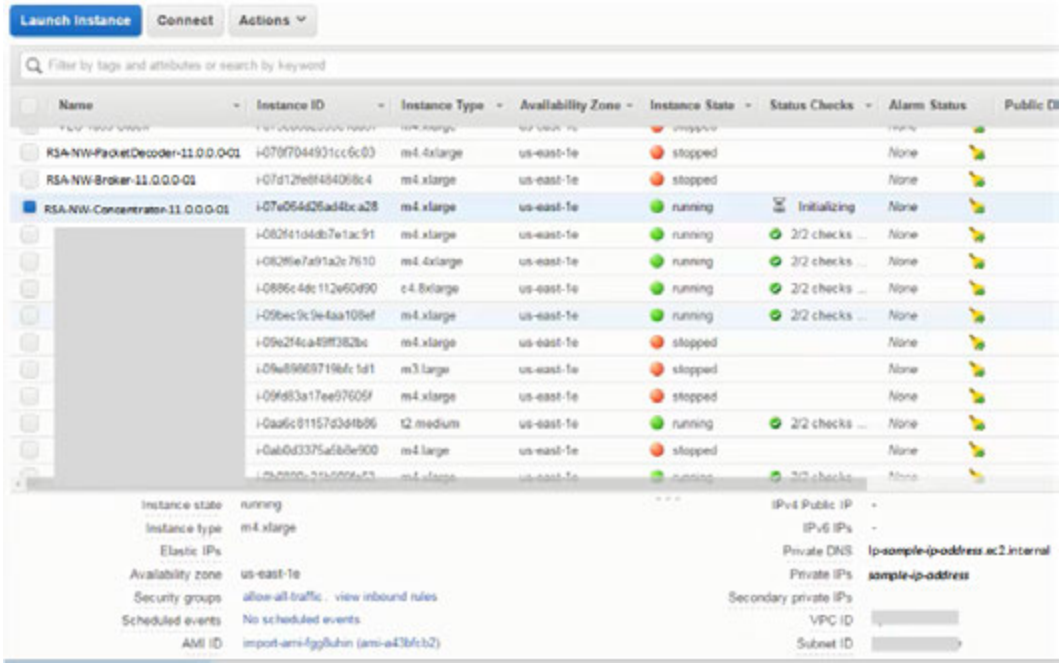
7. Click **Review and Launch** at the bottom right of the **Step 6: Configure Security Group** page.
   The **Step 7. Review Instance Launch** page is displayed.
8. Click **Launch** at the bottom right of the **Step 7. Review Instance Launch** page.
   The **Select an existing key pair or create a new key pair** dialog is displayed.
9. Choose **Proceed without key pair**.
10. Click **Launch Instance**.
    AWS displays the following information as it builds the Instance.



11. Click **View Instances**.
12. Select **Instances** in the left navigation panel to review all instances that AWS is initializing (for example, the **NW-Concentrator**) .



The IP Address for the new **RSA-NW-Concentrator-11.0.0.0-01** host is ***sample-ip-address***.



13. SSH to newly-created instance using the default NetWitness Suite credentials.
14. Go to Configure Hosts (Instances) in NetWitness Suite.

Installation Tasks

Task 1 - Install 11.0.0.0 on the NetWitness Server (NW Server) Host

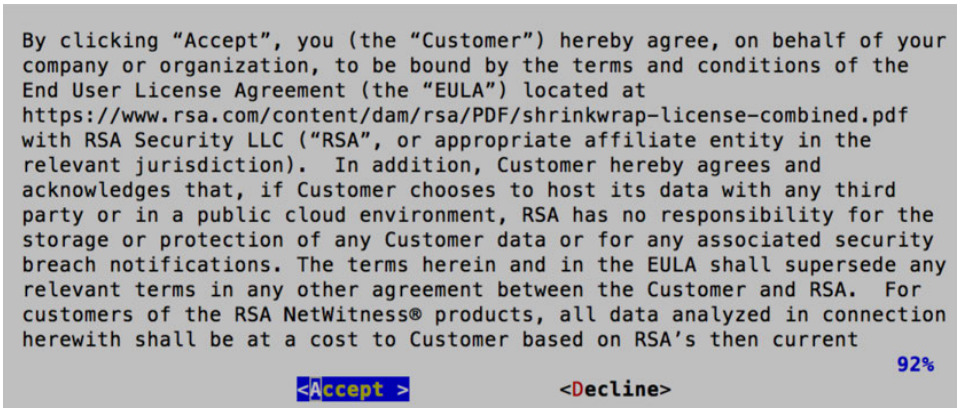
Note: You can perform this task for RSANW-11.0.0.0.1245-Full-01 instance.

1. Run the `nwsetup-tui` command to set up the host.

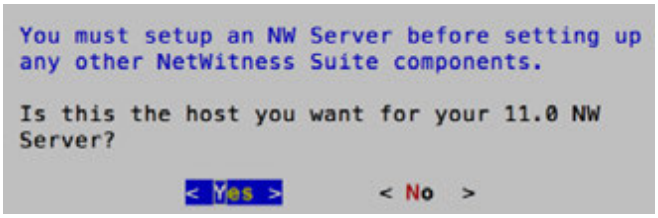
This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see Post Installation Tasks.
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Suite Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).

2. Tab to **Accept** and press **Enter**.



3. The "Is this the NW Server" prompt is displayed.



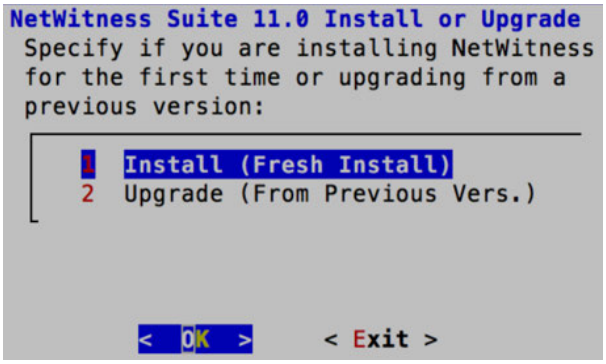
Tab to **Yes** and press **Enter**.

Choose **No** if you already installed 11.0.0.0 on the NW Server.

Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete all the subsequent steps to correct this error.

4. Press **Enter** (Install is selected by default).

   The Install or Upgrade prompt is displayed.



5. The "Host Name" prompt is displayed.

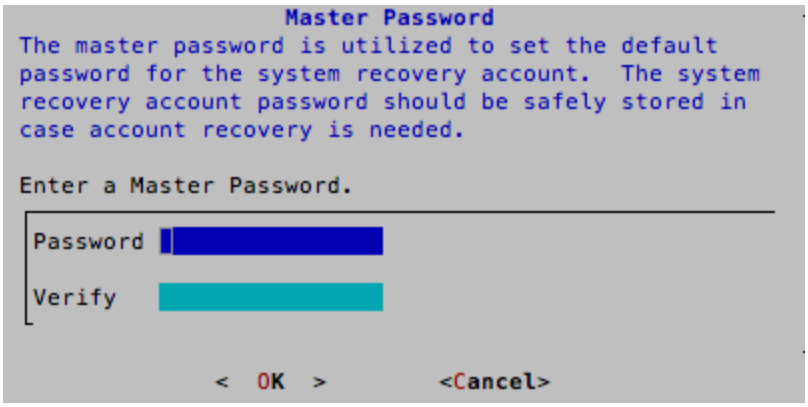
   Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.

   The "Master Password prompt" is displayed.

6. The following list of characters are supported for Master Password and Deployment Password:

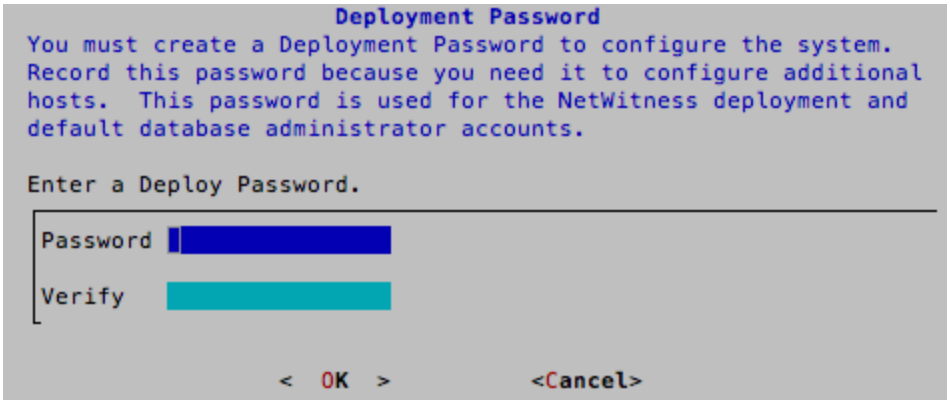
   - Symbols : ! @ # % ^ +
   - Numbers :0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

   No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ , ; : . < > -).



Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

7. The "Deployment Password" prompt is displayed.



Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

8. If:

- The Setup program finds a valid IP address for this host, the following prompt is displayed.

  Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** If you want to change the IP configuration found on the host.

- You are using an SSH connection, the following warning is displayed.

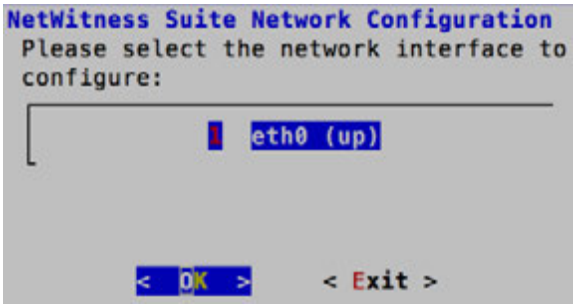
  Press **Enter** to close warning prompt.

- The Setup Program found an IP configuration and you chose to use it, the Update Repository prompt is displayed. Go to step 12 to and complete the installation.

- The Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the Network Configuration prompt is displayed.

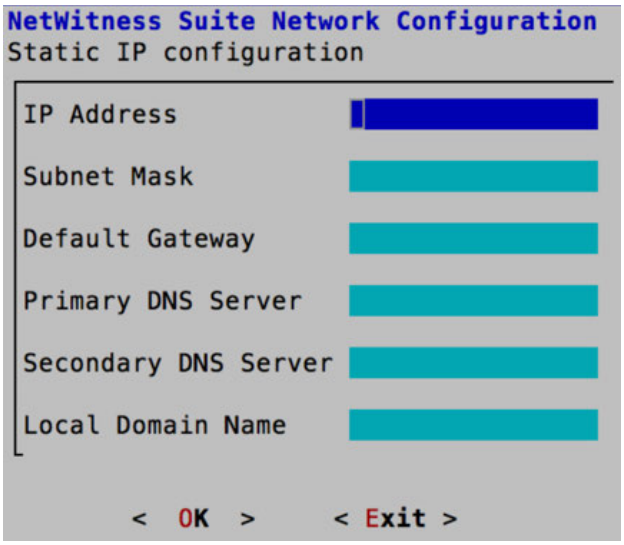
  Tab to **OK** and press **Enter** to use **Static IP**.
  If you want to use **DHCP**, down arrow to 2 Use DHCP and press **Enter**.

9. The Network Configuration prompt is displayed.



Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**

10. The Static IP Configuration prompt is displayed.



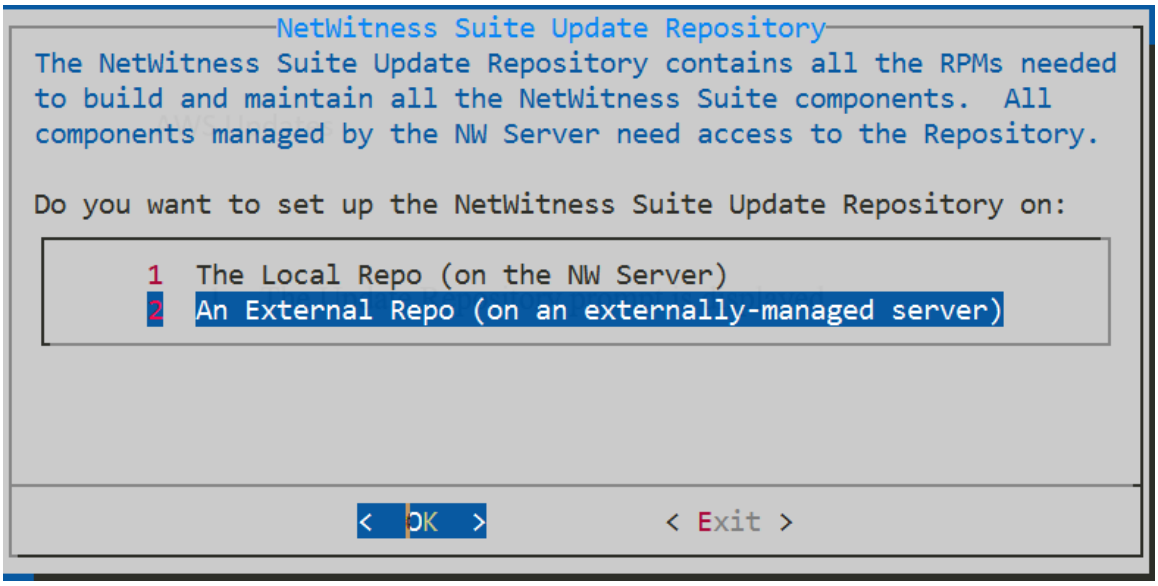
Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**.

If you do not complete all the required fields, an All fields are required error message is displayed (**Primary DNS Server**, **Secondary DNS Server**, and **Local Domain Name** fields are not required.)

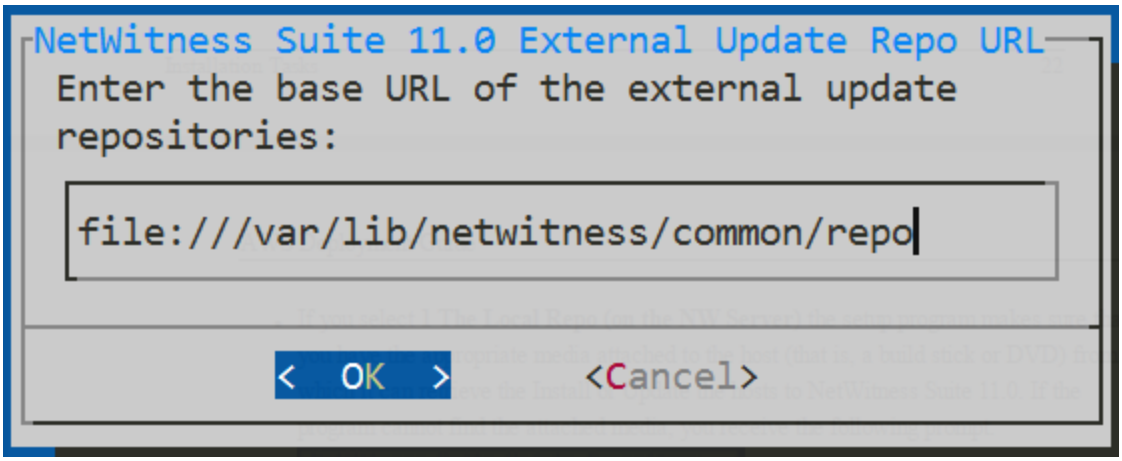
If you use the wrong syntax or character length for any of the fields, an Invalid *field-name* error message is displayed.

Caution: If you select DNS Server, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

11. The Update Repository prompt is displayed.



Select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL.



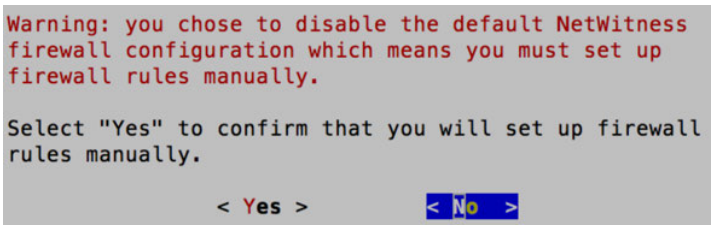
Use the default URL of the NetWitness Suite external repo and click **OK**.

12. Apply the standard firewall configuration, press **Enter**.

    - Disable the standard configuration, tab to **Yes** and press **Enter**.

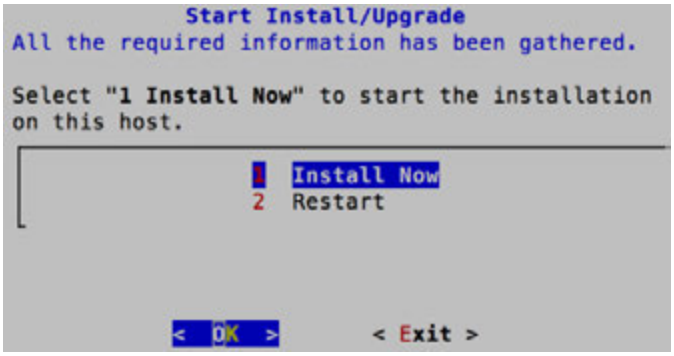
      The Disable firewall prompt is displayed.

      
      The disable firewall configuration confirmation prompt is displayed.



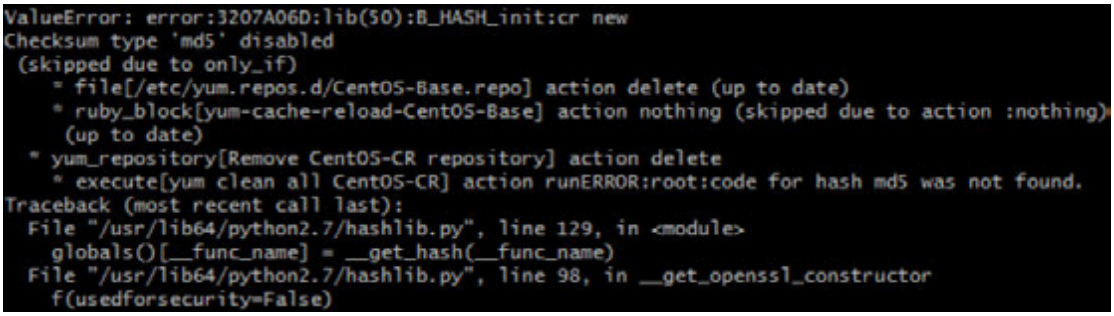
Tab to **Yes** and press **Enter** to confirm (press **Enter** to use standard firewall configuration).

13. Press **Enter** to install 11.0.0.0 on the NW Server.
    The Start Install prompt is displayed.



When "Installation complete" is displayed, you have installed the 11.0.0.0 NW Server on this host.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



Task 2 - Install 11.0.0.0 on Other Component Hosts

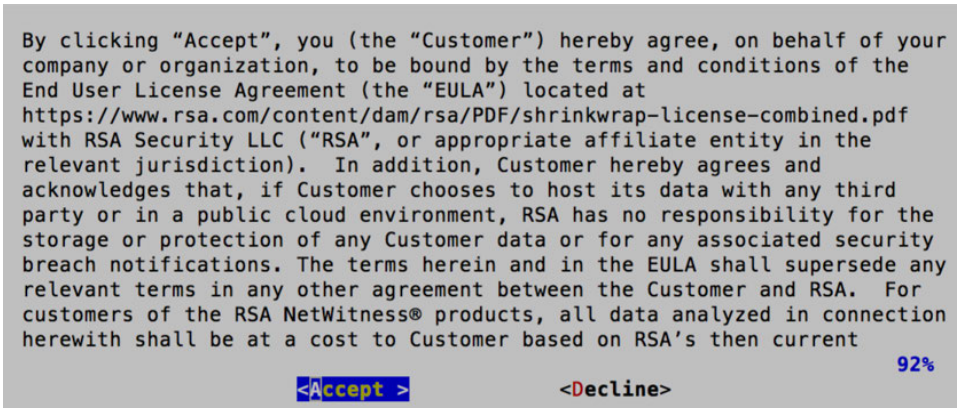
Note: You can perform this task for RSANW-11.0.0.0.1245-Lite-01 instance.

1. Run the `nwsetup-tui` command to set up the host.

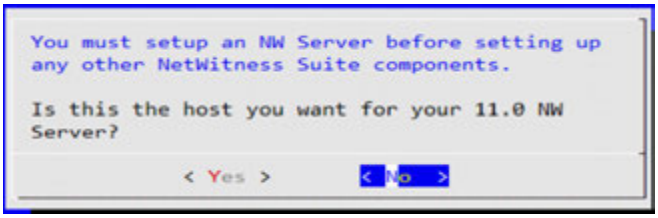
This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see in Post Installation Tasks.
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Suite Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).

2. Tab to **Accept** and press **Enter**.



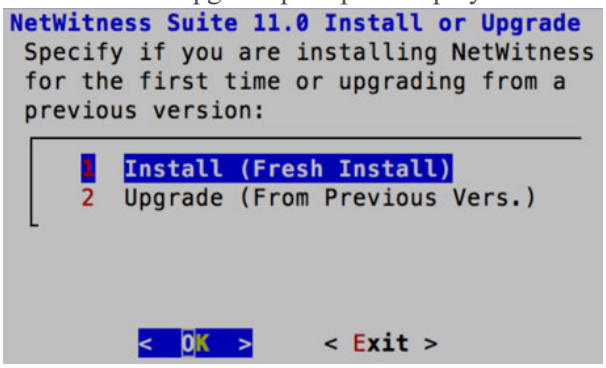
3. The "Is this the NW Server" prompt is displayed.



Tab to **No** and press **Enter**.

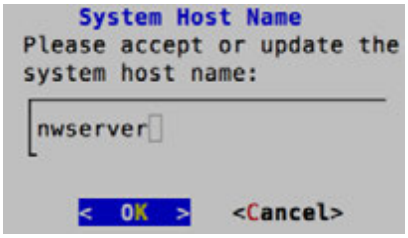
Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete all the subsequent steps to correct this error.

4. The Install or Upgrade prompt is displayed.



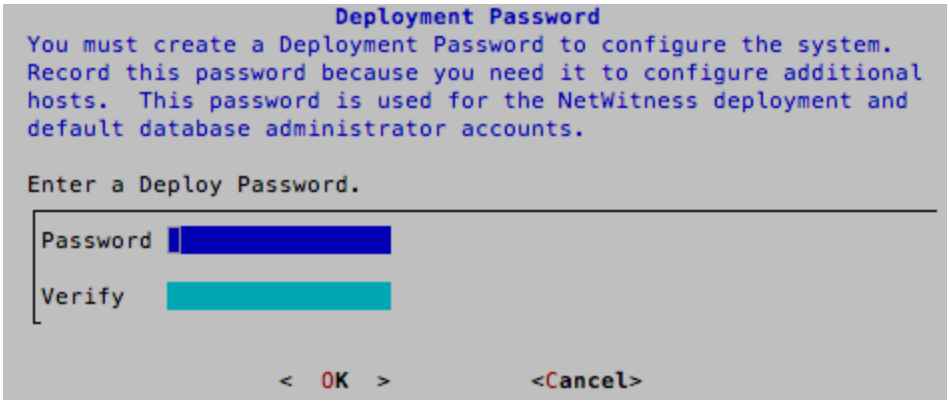
Press **Enter** (Install is selected by default).

5. The "Host Name" prompt is displayed.



Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.

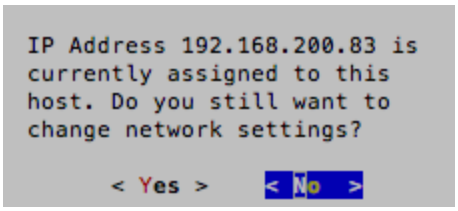
6. The "Deployment Password" prompt is displayed.



Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

7. If:

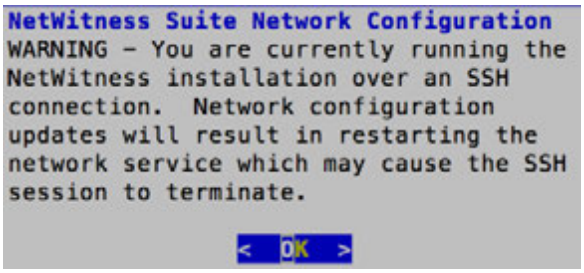
The Setup program finds a valid IP address for this host, the following prompt is displayed.



Press **Enter** if you want to use this IP and avoid changing your network settings.

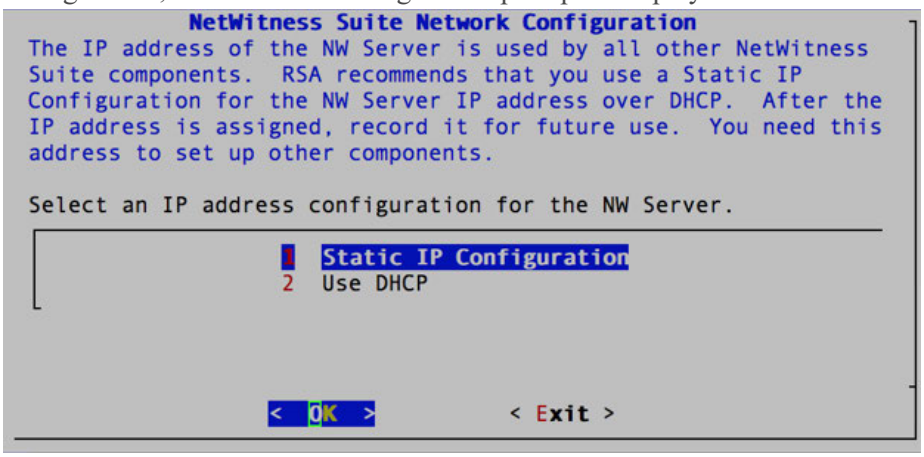
Tab to **Yes** and press **Enter** If you want to change the IP configuration found on the host.

You are using an SSH connection, the following warning is displayed.



Press **Enter** to close warning prompt. The Setup Program found an IP configuration and you chose to use it, the Update Repository prompt is displayed. Go to step 12 to and complete the installation.

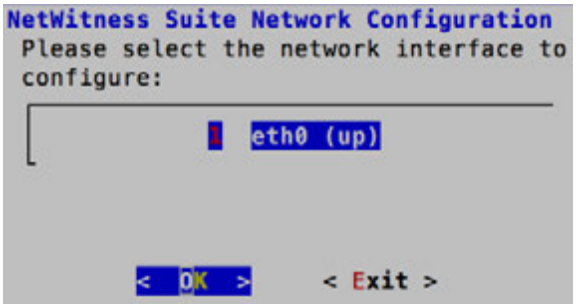
The Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the Network Configuration prompt is displayed.



Tab to **OK** and press **Enter** to use **Static IP**.

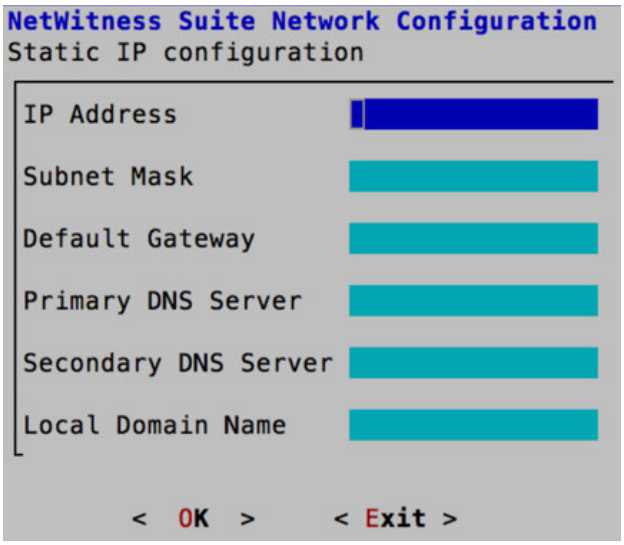
If you want to use **DHCP**, down arrow to 2 Use DHCP and press **Enter**.

8. The Network Configuration prompt is displayed.



Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.

9. The Static IP Configuration prompt is displayed.

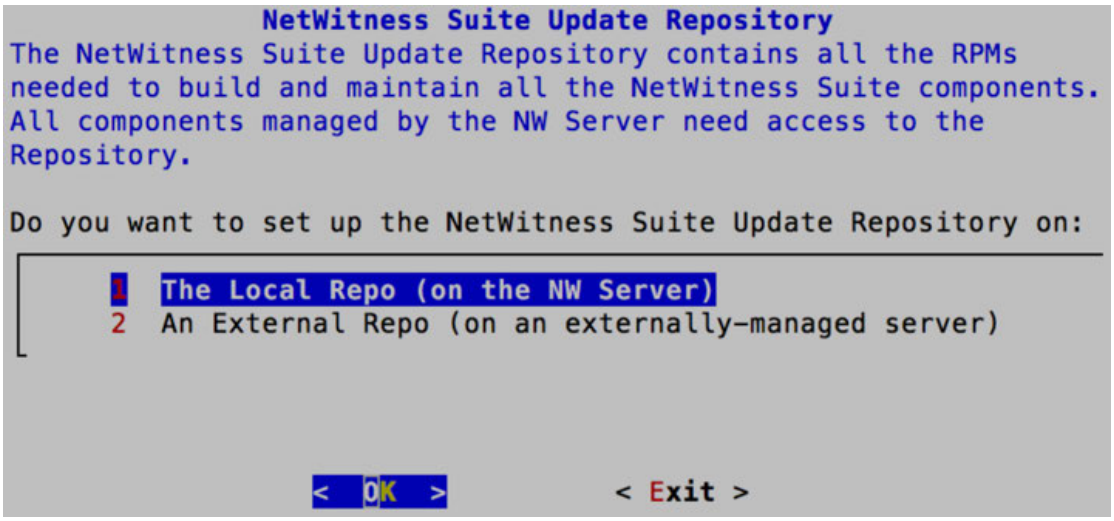


Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**.

10. If you do not complete all the required fields, an All fields are required error message is displayed (**Primary DNS Server**, **Secondary DNS Server**, and **Local Domain Name** fields are not required.)
    If you use the wrong syntax or character length for any of the fields, an Invalid *field-name* error message is displayed.

    Caution: If you select DNS Server, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

11. The Update Repository prompt is displayed.



Press **Enter** to choose the **Local Repo** on the NW Server.

12. To:

    - Apply the standard firewall configuration, press **Enter**.
    - Disable the standard configuration, tab to **Yes** and press **Enter**.

      The Disable firewall prompt is displayed.

      The disable firewall configuration confirmation prompt is displayed.

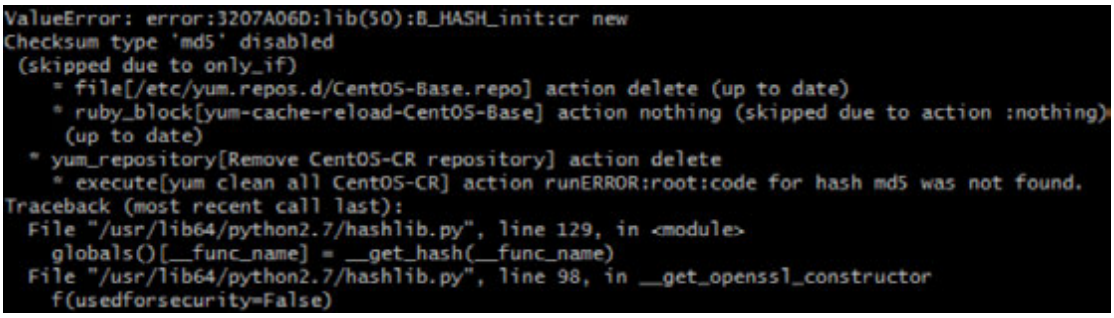
      Tab to **Yes** and press **Enter** to confirm (press **Enter** to use standard firewall configuration).

13. The Start Install prompt is displayed.

    Press **Enter** to install 11.0 on the NW Server.

    When "Installation complete" is displayed, you have installed the 11.0.0.0 NW Server on this host.

> **Note:** Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



Configure Hosts (Instances) in NetWitness Suite

Configure individual hosts and services as described in RSA NetWitness® Suite *Host and Services Configuration Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

Note: After you successfully launch an instance, AWS assigns a default hostname to it. See the "Change the Name and Hostname of a Host" documentation in RSA Link (https://community.rsa.com) for instructions on changing a hostname.

Configure Packet Capture

You can integrate either of the following Third-Party solutions with the Packet Decoder to capture packets in the AWS cloud:

- Gigamon® GigaVUE
- f5® BIG-IP

Integrate Gigamon GigaVUE with the Packet Decoder

There are two main tasks to configure the Gigamon® third-party Tap vendor packet capture solution:

Task 1. Integrate the Gigamon® solution.

Task 2. Configure a tunnel on Packet Decoder.

Task 1. Integrate the Gigamon Solution

Gigamon® Visibility Platform on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on the Gigamon® solution refer to the "Gigamon® Visibility Platform for AWS Data Sheet" (https://www.gigamon.com/sites/default/files/resources/datasheet/ds-gigamon-visibility-platform-for-aws-4095.pdf).

For deployment details refer to the "Gigamon® Visibility Platform for AWS Getting Started Guide" (https://www.gigamon.com/sites/default/files/resources/deployment-guide/dg-visibility-platform-for-aws-getting-started-guide-4111.pdf).

After the “Monitoring Session” is deployed within the Gigamon GigaVUE-FM, you can configure the Packet Decoder Tunnel.

Task 2. Configure Tunnel on the Packet Decoder

1. SSH to the Decoder.
2. Submit the following command strings.

```
$ sudo ip link add tun0 type gretap local any remote <ip_address_of_
VSERIES_NODE_TUNNEL_INTERFACE> ttl 255

$ sudo ip link set tun0 up mtu <MTU-SIZE>

$ sudo ifconfig (to verify if the tunnel tun0 is being listed in the
list of interfaces)

$ sudo lsmod | grep gre ( to make sure if the below kernel modules
are running:

ip_gre 18245 0

ip_tunnel 25216 1)

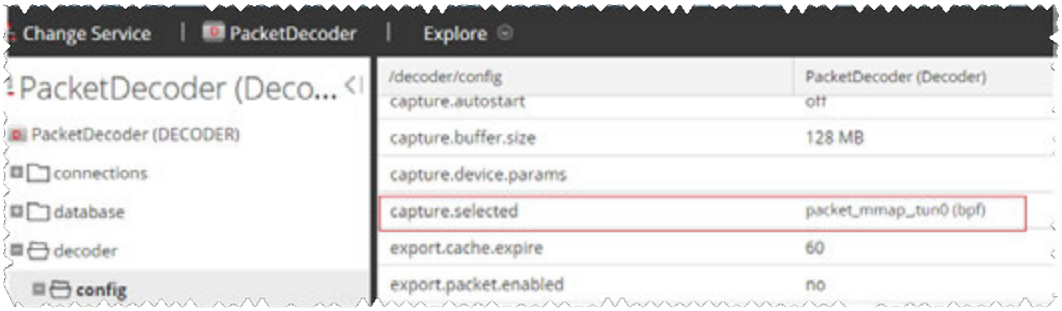
If they are not running then execute the below commands to enable the
modules

$ sudo modprobe act_mirred

$ sudo modprobe ip_gre
```

3. Create a firewall rule in the Packet Decoder to allow traffic through the tunnel.
   a. Open the `iptables` file.
      `vi /etc/sysconfig/iptables`
   b. Append the line `-A INPUT -p gre -j ACCEPT` before the `commit` statement
   c. Restart `iptables` by executing the following commands.
      `service iptables restart`
4. Set the interface in the Packet Decoder.
   a. Log in NetWitness Suite, select the `decoder/config` node in Explorer view for the Packet Decoder service.

b. Set the `capture.selected = packet_mmap_,tun0`.



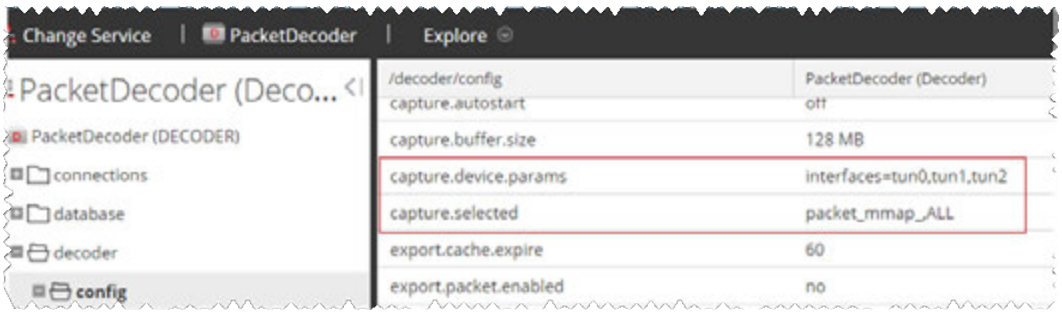
5. (Conditional) - If you have multiple tunnels on the Packet Decoder.

   a. Restart Decoder service after you create the tunnel in Packet Decoder.

   b. Log in to NetWitness Suite, select the `decoder/config` node in Explorer view for the Packet Decoder service, and set the following parameters.

   capture.device.params = interfaces=tun0,tun1,tun2

   capture.selected = packet_mmap_,All



6. Restart decoder service.

   ```
   $ sudo restart nwdecoder
   ```

   The user should be all set to capture the network traffic in Decoder.

Complete the following steps to create a new project and get your project key.

Integrate f5® BIG-IP with the Packet Decoder

IG-IP Virtual Edition (VE) is an inline virtual server and load balancer. A common use case would be for the f5® box to be a virtual web server that presents a single IP address / host name that manages requests to a pool of web servers in the cloud.

All traffic to RSA NetWitness® Suite flows through the f5® BIG-IP VE virtual server.

The virtual server functions of the BIG-IP clone all traffic to a designated computer by re-writing mac addresses and loading them into a subnet shared with the destination sniffer. This guide describes how to set up the Decoder as the sniffer.

f5® BIG-IP VE Deployment Information

f5® BIG-IP VE on AWS will be available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on this solution refer to the f5® BIG-IP DNS Data Sheet (https://www.f5.com/pdf/products/big-ip-dns-datasheet.pdf).

Task 1: Set Up a BIG-IP VE Virtual Server Instance

Set up a BIG-IP VE Virtual Server Instance according to the instructions in the "BIG-IP Virtual Edition 12.1.0 and Amazon Web Services: Multi-NIC Manual" (https://support.f5.com/kb/en-us/products/big-ip_ltm/manuals/product/bigip-ve-multi-nic-setup-amazon-ec2-12-1-0.html). Complete all the steps through the last steps, "Creating a virtual server."

This virtual server performs packet capture. You may need to create multiple virtual servers to depending on your volume.

As part of creating the virtual server, you must have at least one server in your NetWitness Suite domain to handle the traffic routed by the virtual server (for example, you can create another instance in AWS to host the internal server).

Task 2: Create a Clone Pool

1. Make sure that your Decoder has a network interface on the same subnet as one of the network interfaces on the BIG-IP VE instance.
   The clone pool sends packets to the Decoder by rewriting MAC addresses and sending them out a network interface. MAC address rewriting can be used to route packets to another subnet.
2. Set up the clone pool within the BIG-IP VE virtual server according to the instructions in "K13392: Configuring the BIG-IP system to send traffic to an intrusion detection system (11.x - 13.x)" article (https://support.f5.com/kb/en-us/solutions/public/13000/300/sol13392.html).
   This document explains how to create the clone pool, and how to make an existing virtual server copy traffic to the clone pool. In this case, we will place the Decoder instance in the clone pool.

Guidelines

The following guidelines will help you to configure packet capture correctly using BIG-IP VE.

- The Decoder instance must have its own IP address on one of the same subnets as BIG-IP VE. BIG-IP uses that IP address to identify the Decoder as being part of the clone pool.

- When adding the Decoder instance to the clone pool, BIG-IP asks for a port number in addition to the IP address. This port number does not matter for the cloned traffic. The Decoder will receive all the cloned traffic, regardless of what port number was used here.
- By default, the AWS subnet shared by the Decoder and BIG-IP VE will not allow the cloned traffic to travel from the BIG-IP VE interface to the Decoder interface. You must disable the **`source/dest. check`** on both the Decoder and BIG-IP VE network interfaces in AWS.
- The Decoder instance must have a single network interface, eth0, by default. The Decoder captures traffic on this interface, but it may also receive administrative traffic on this interface. RSA recommends using network rules to filter out ssh and nwdecoder traffic from the capture stream. These are ports 22 (ssh) and 50004/56004 (nwdecoder).

Troubleshooting Tips

There are areas to troubleshoot if packets are not being accepted by the Decoder.

- Make sure that the BIG-IP VE is sending the packets out of the correct interface.
  The BIG-IP VE instance contains tcpdump. Use it to verify the cloned packets are being sent out the expected interface. If they are not, there is a problem in the setup of the clone pool or the virtual server.
- Make sure that the Decoder is receiving packets.
  The Decoder has `tcpdump` installed on it. Use it to verify that the Decoder is receiving packets. If the Decoder is not capturing packets, make sure that
  - The AWS **`source/dest. check`** is turned off.
  - The Decoder is on the same subnet as the interface the BIG-IP VE is using to clone packets.

AWS Instance Configuration Recommendations

Note: These recommendations were qualified for RSA Security Analytics version 10.6.3. These recommendations can be used as a baseline for 11.0.0.0 and adjusted as needed.

Note: For a description of terms and abbreviations used in this topic, refer to Abbreviations and Other Terminology Used in this Guide.

This topic contains the minimum AWS instance configuration settings recommended for the RSA NetWitness® Suite virtual stack components.

- EC2 Instance:
  - Minimum instance type - **m4-2xlarge** is the minimum instance type required for any NetWitness Suite component AMI so that it can function.
  - Instance type adjustments -you must adjust instance types according to your ingestion rate, content and parsers, dashboard reports, scheduled reports, investigations, and active users.
  - Recommended settings - the recommended settings in the SA component instance tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS and 1.5 Gbps were used.
    - All the components were integrated.
    - The Log stream included a Log Decoder, Concentrator, and Archiver.
    - The Packet Stream included a Packet Decoder and Concentrator.
    - Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load included reports, charts, alerts, investigation, and respond.
- EBS Volumes (Storage)

  Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance on how to increase the number of volumes based on your storage requirements using the RSA Sizing & Scoping Calculator.

  Note: The Concentrator index volume must be allocated on Provisioned IOPS SSD.

  - Index
  - Meta

- Session
- Packet

Azure Deployment Guide

Before you can deploy RSA NetWitness® Suite in Azure you need to:

- Understand the requirements of your enterprise.
- Know the scope of a NetWitness Suite deployment.

When you are ready to begin deployment:

- Make sure that you have a NetWitness Suite "Throughput" license.
- Use Chrome for your browser (Internet Explorer is not supported).

Azure Environment Recommendations

Azure instances have the same functionality as the NetWitness Suite hardware hosts. RSA recommends that you perform the following tasks when you set up your Azure environment.

- Based on the resource requirements of the different components, follow best practices to use the system and dedicated storage appropriately.
- Build Concentrator directory for index database on SSD.

Abbreviations and Other Terminology Used in this Guide

Abbreviations	Description
Azure	Azure is Microsoft's public cloud computing platform. It provides a range of cloud services, including those for compute, analytics, storage and networking. You can pick and choose from these services to develop and scale new applications, or run existing applications, in the public cloud.
BYOL	Bring your own licensing
CPU	Central Processing Unit
EPS	Events Per Second
GB	Gigabyte. 1GB = 1,000,000,000 bytes

Abbreviations	Description
Gb	Gigbit. 1Gb = 1,000,000,000 bits.
Gbps	Gigabits per second or billions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
GHz	GigaHertz 1 GHz = 1,000,000,000 Hz
HDD	Hard Disk Drive
IOPS	Input/Output Operations Per Second
Mbps	Megabits per second or millions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
On-Premise	On-premise hosts are installed and run on computers on the premises (in the building) of the organization using the hosts, rather than in the Azure.
RAM	Random Access Memory (also known as memory)
Security	Set of firewall rules. Refer to Deployment: Network Architecture and Ports (https://community.rsa.com/docs/) for a comprehensive list of the ports you must set up for all NetWitness Suite components.
SSD	Solid-State Drive
vCPU	Virtual Central Processing Unit (also known as a virtual processor)
VHD	Virtual Hard Disk
VM	Virtual Machine
vRAM	Virtual Random Access Memory. This is the memory for a virtual machine.

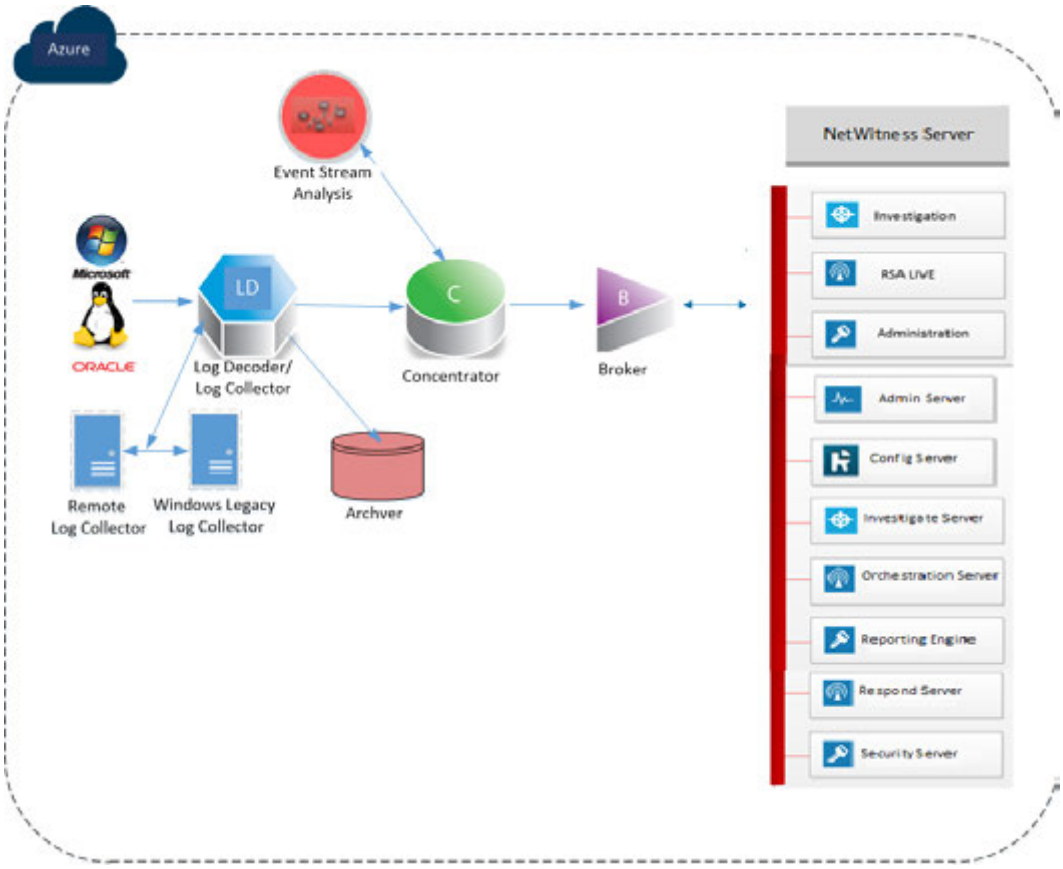
Azure Deployment Scenarios

The following diagrams illustrate some common Azure deployment scenarios. In the diagrams, the:

- **Log Decoder** receives logs collected by the Log Collector. The Log Collector collects log events from hundreds of devices and event sources.
- **Concentrator** indexes metadata extracted from network or log data and makes it available for enterprise-wide querying and real-time analytics while facilitating reporting and alerting.
- NetWitness Server hosts **Respond**, **Reporting Engine**, **Investigate**, **RSA Live**, **Administration** and other aspects of the user interface.

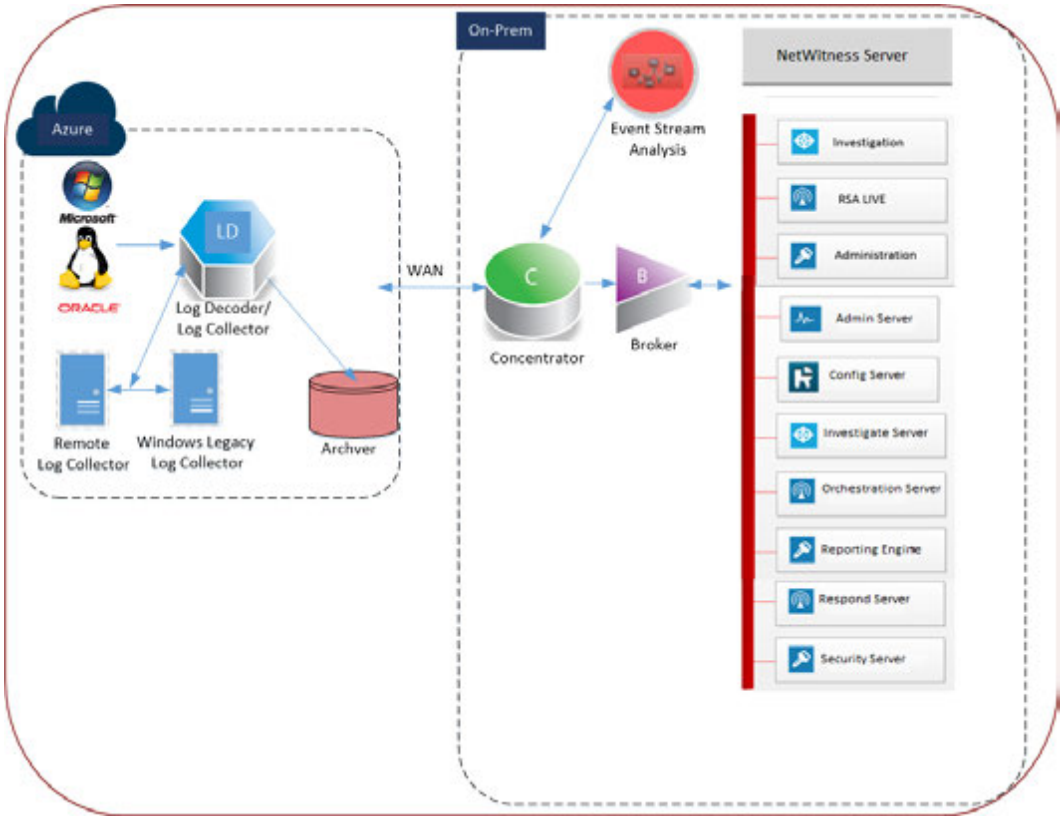
Full NetWitness Suite Stack Azure Visibility

This diagram shows all NetWitness Suite components (full stack) deployed in Azure.



Hybrid Deployment - Log Decoder

This diagram shows the Log Decoder and Archiver deployed in Azure with all other NetWitness Suite components deployed on your premises.



Supported Services

RSA provides the following NetWitness Suite services.

- NetWitness Server
- Admin Server
- Config Server
- Investigate Server
- Orchestration Server
- Reporting Engine
- Respond Server
- Security Server

- Archiver
- Broker
- Concentrator
- Event Stream Analysis
- Log Decoder
- Remote Log Collector

Azure VM Configuration Recommendations

Note: These recommendations were qualified for RSA Security Analytics 10.6.4. These recommendations can be used as a baseline for 11.0.0.0 and adjusted as needed.

Note: For a description of terms and abbreviations used in this topic, refer to Abbreviations and Other Terminology Used in this Guide.

This topic contains the minimum Azure VM configuration settings recommended for the NetWitness Suite (NW) virtual stack components.

- VM:
  - The recommended settings in the NetWitness Suite component VM tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS were used.
    - All the components were integrated.
    - The Log stream included a Log Decoder, Concentrator, and Archiver.
    - Incident Management was receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load included reports, charts, alerts, investigation, and incident management.
- VHD (Storage)
  Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance on how to increase the number of volumes based on your the storage requirements using the RSA Sizing & Scoping Calculator.

  Note: For higher EPS rates, the Concentrator index volume must be allocated SSDs.

VM Sizing			
Component	**EPS**	**Compute**	**VM Size**
Archiver	15,000	No of CPU: 16 Memory: 112 GB	Standard D14 v2

VM Sizing			
Component	**EPS**	**Compute**	**VM Size**
Broker	15,000	No of CPU: 4 Memory: 14 GB	Standard DS3 v2
Concentrator	15,000	No of CPU: 16 Memory: 112 GB	Standard DS14 v2
ESA and Context Hub	15,000	No of CPU: 20 Memory: 140 GB	Standard D15 v2
Log Collector	15,000 NON SSL	No of CPU: 8 Memory: 16 GB	Standard F8
Log Decoder	15,000	No of CPU: 16 Memory: 112 GB	Standard D14 v2
NW Server*	15,000	No of CPU: 16 Memory: 112 GB	Standard D14 v2

*Reporting Engine, Respond, and Health & Wellness can be co-located on NetWitness Server host.

Azure Deployment Rules and Checklist

This topic contains the rules and high-level tasks provides you must follow to deploy RSA NetWitness® Suite components in the Azure.

Rules

You must adhere to the following rules when deploying NetWitness Suite in Azure.

- Always use private IP addresses when you provision Azure NetWitness SuiteVMs.
- Before you enable the out-of-the-box (OOTB) dashboards, set the default data source in Reporting Engine configuration page.

Checklist

Step	Description	√
1.	Step 1. Deploy NW Server Host in Azure	
2.	Step 2. Deploy Component Core Services in Azure	
3.	Step 4. Configure Hosts (Instances) in NetWitness Suite	

Step 1. Deploy NW Server Host in Azure

Complete the following tasks to deploy a NetWitness Server (NW Server) on a virtual machine (VM) in the Azure Cloud environment.

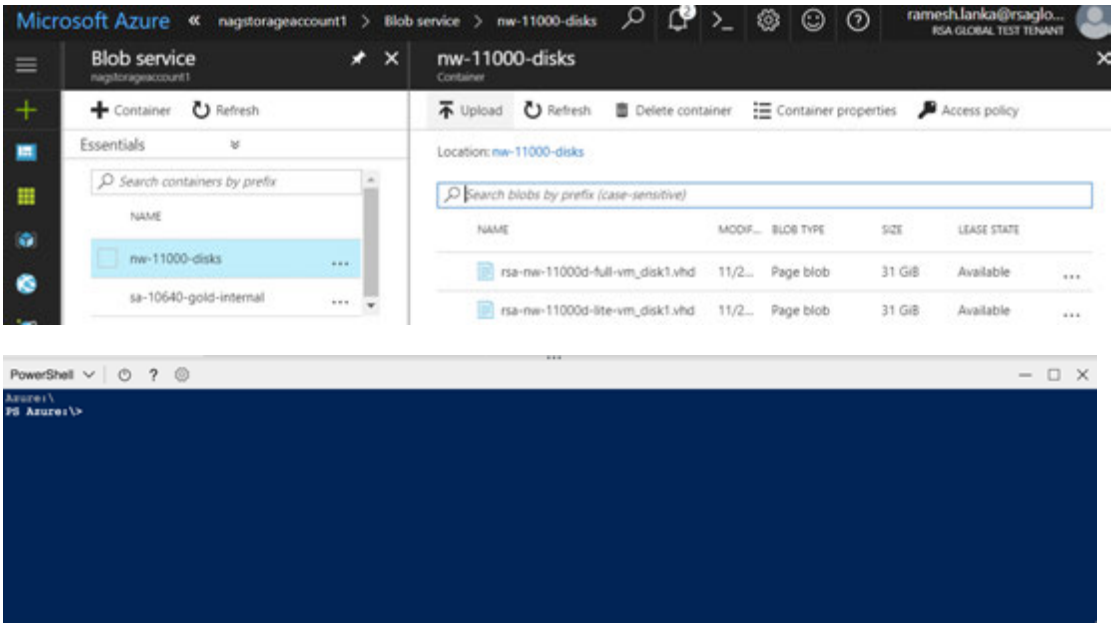
Note: It is not mandatory to deploy the SA Server in the Azure Cloud environment to deploy other components (see Azure Deployment Scenarios).

- Task 1. - Upload NW Server VHDs
- Task 2. - Create NW Server Image
- Task 3. - Create Virtual Machine (VM)

Task 1. - Upload NW Server VHDs

Complete the following steps to upload NW Server VHDs to Azure.

1. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) to open a support case requesting the NW Server VHDs. A valid throughput license will be required.
2. Customer Support will update the case with VHD URI's.
3. Via the Azure Portal, open the Powershell CLI.



- You'll need a storage account, blob service and container setup. This is where the VHD's will be copied to. After these are in place, you can execute the following command within the Azure Portal Powershell CLI.

  For example:

  ```
  az storage blob copy start --account-name customerstorageacct --destination-container nwserver --destination-blob rsa-nw-11000d-full-vm_disk1.vhd --source-uri 'https://netwitnessazure.blob.core.windows.net/nwvhdstore/rsa-nw-11000d-full-vm_disk1.vhd?sv=2017-04-17&ss=b&srt=co&sp=rl&se=2017-11-30T16:40:02Z&st=2017-11-30T08:40:02Z&spr=https&sig=tBETVk9y%2BpTFNjAsgulzirXK99MVRt18GNRBSEsx97k%3D'"
  ```

  The highlighted flags in the above command will need to be updated. The above command will copy the vhd. Since, there are two vhds, lite and full, we need to upload twice.

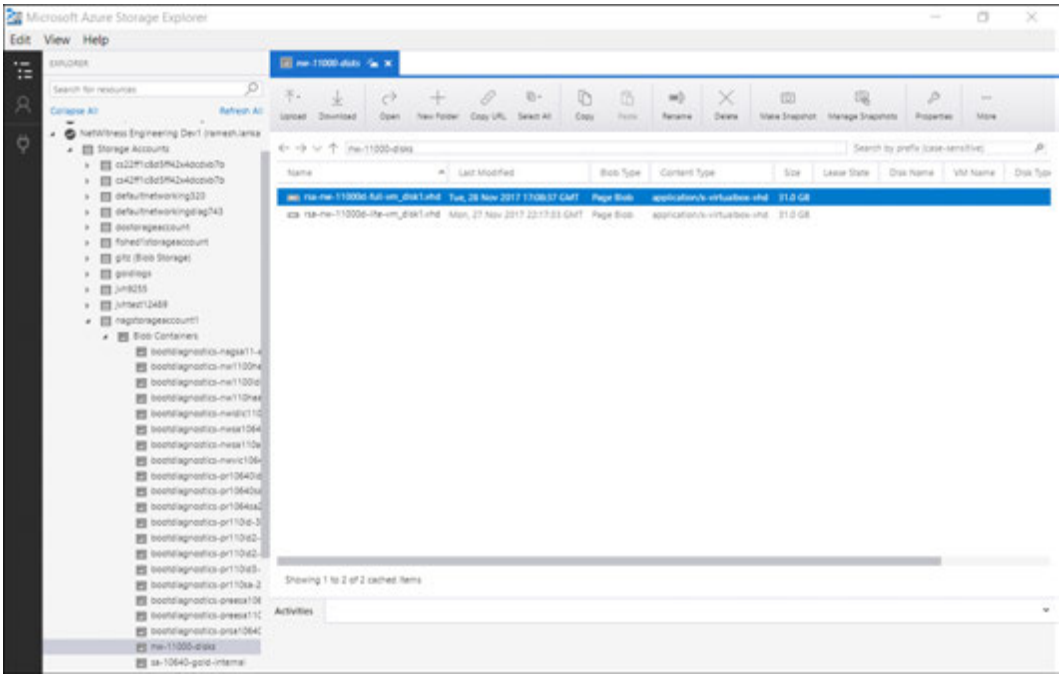
  --account-name: Storage account name.

- --destination-container: The container name.

- --destination-blob: Name of the destination blob or NW Server VHD. If the exists, it will be overwritten.
- --source-uri: A SAS Token URI will be provided within the RSA Customer Support case.

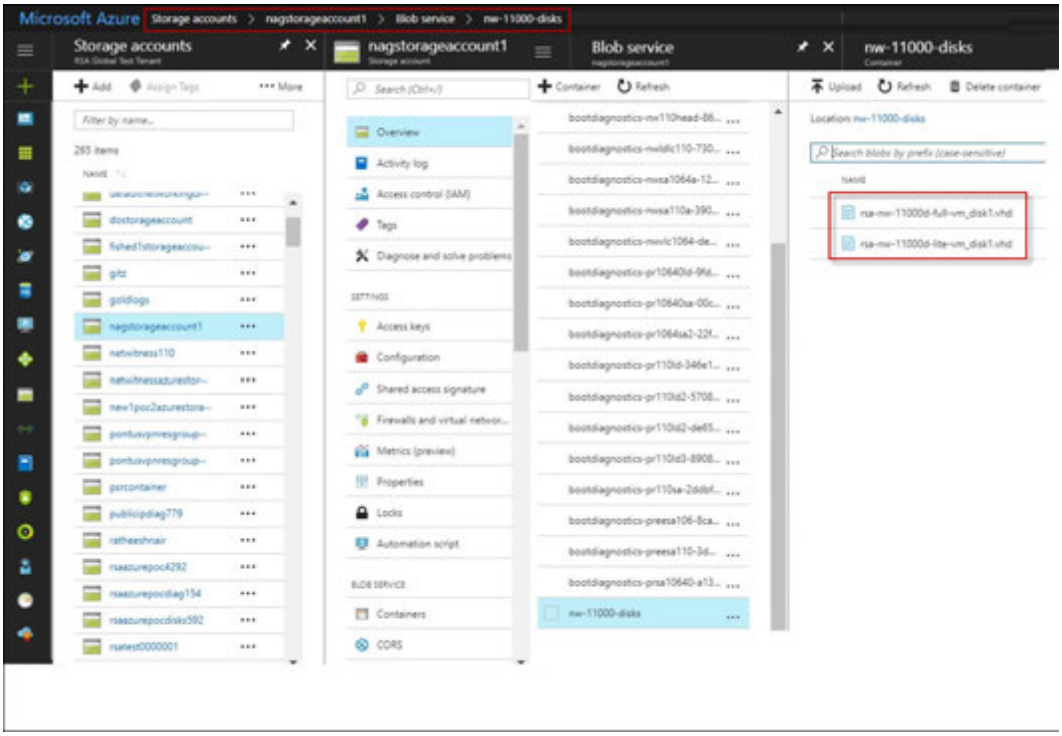
4. Once the VHD's are successfully copied. You'll need to create an image and VM.
5. Verify that all the NW Server VHDs are uploaded in to the Azure Cloud.

Note: Alternatively, you can use the Microsoft Azure Storage Explorer windows utility (http://storageexplorer.com/) to verify that all the VHDs from the following location subscription exist. This utility helps you manage the contents your storage.



a. Log in to the Azure portal (https://portal.azure.com).

b. In the right panel, click **Storage accounts** > **netwitnessazurestorage1** > **Blob service** > **nwazurevhdstore**.



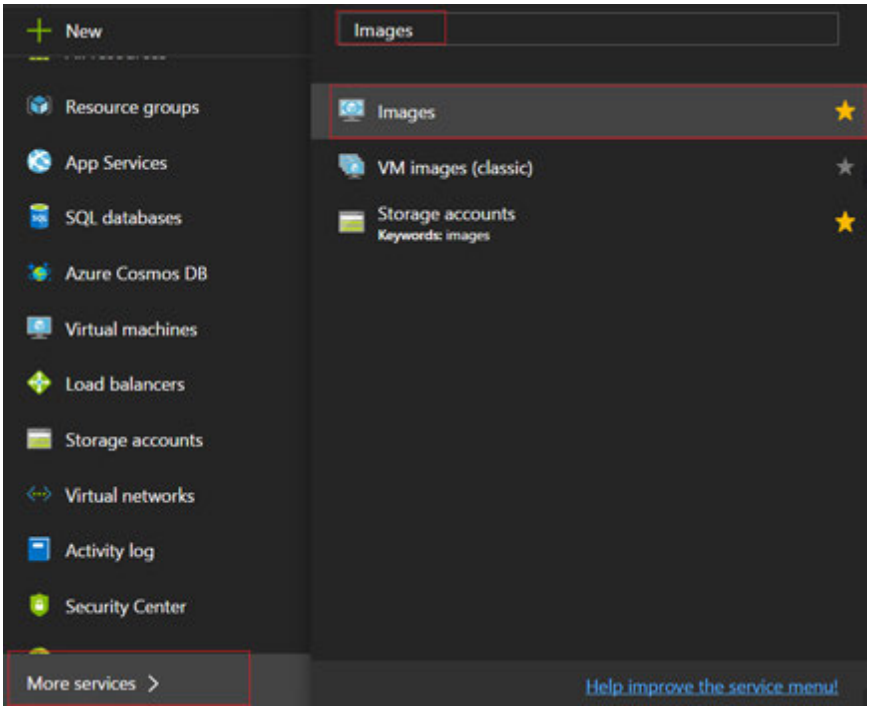
6. (Optional) In the Azure Explorer, go to the **NetWitness** group > **Storage Accounts** > **netwitnessazurestorage1**) > **Blob Containers** > **nwazurevhdstore**). The following screen shot shows you an example of the contents of a storage container.

Task 2. - Create NW Server Image

Complete the following steps to create an NW Server image in Azure from upload VHDs.

1. Log in to https://portal.azure.com.
2. In the left panel, click **More Services** and filter by Images.

3. Click **Images**.



4. Create and configure the Image.

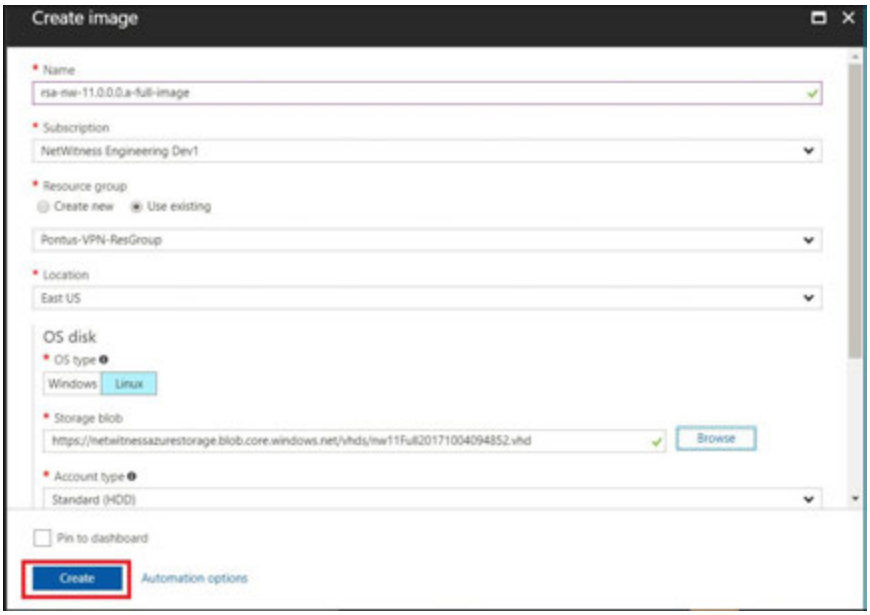
   a. Click **Add**.

   b. Enter an Image Name, select the correct Resource Group, select a valid Location, and set the OS Disk to Linux.

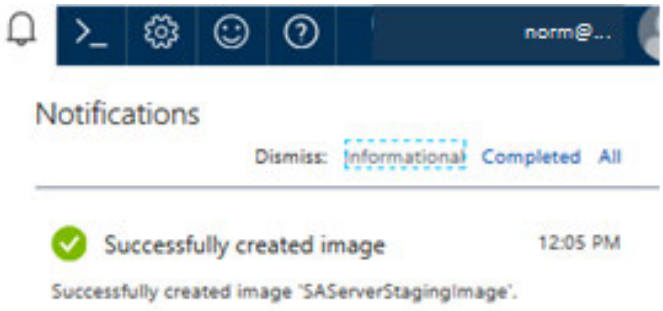
   In the **Storage blob**, browse to where VHDs are uploaded.

c. Select **https://netwitnessazurestorage.blob.core.windows.net/nwvhdstore/SA-Server-11.0.0.0-03-Gold-disk1.vhd** in the **OS disk Storage blob** field.

d. Make sure that **Standard (HDD)** is selected for **Account Type**.
The following screen shot illustrates a completed **Create Image** view.



e. Click **Create** to create the Image.
The following confirmation is displayed when the image is created.



Task 3. Create Virtual Machine (VM)

Complete the following steps to create a VM in Azure using the SA Server image.

1. Go to **Images** and click **Create VM**.

   The **1 Basics - Configure basic settings** section is in focus.

2. Define values for all of the fields.

   a. In the **Name** field, enter a user-defined name (for example, **NWServer1100**).

   b. In the **VM disk type** field, select **HDD** from the drop-down list.

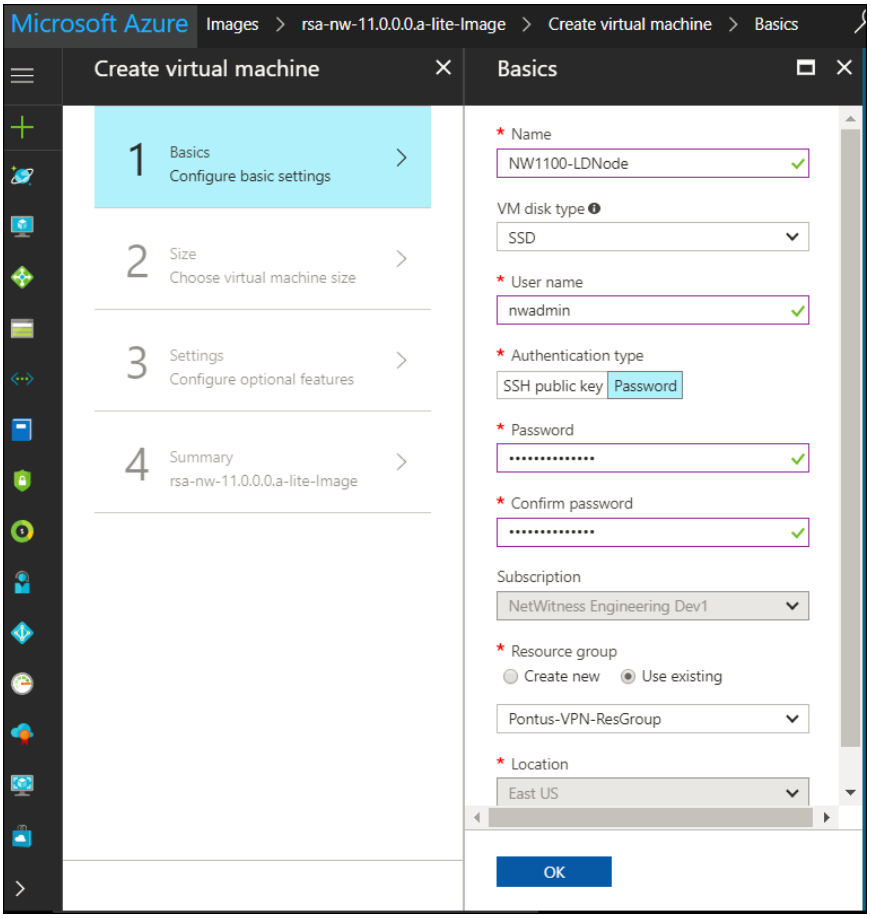
   > **Caution:** The username and password that you define is used to login to the system as a non-administrator user. Do not use the root user (the login does not have superuser permissions). You must change the root password the first time that you log in to the VM by executing the `su passwd root` command. This is a critical step and should not be missed. You cannot use `root` for a username (Azure-specific).

   c. In the **User name** field, enter a valid username.

   d. In the **Authentication type** field, click **Password** and enter a strong password that is a combination of lowercase, uppercase, numeral and a symbol (for example, **Netwitness@123**).

   e. Make sure that the values selected in the **Subscription**, **Resource group and Location** fields are correct.

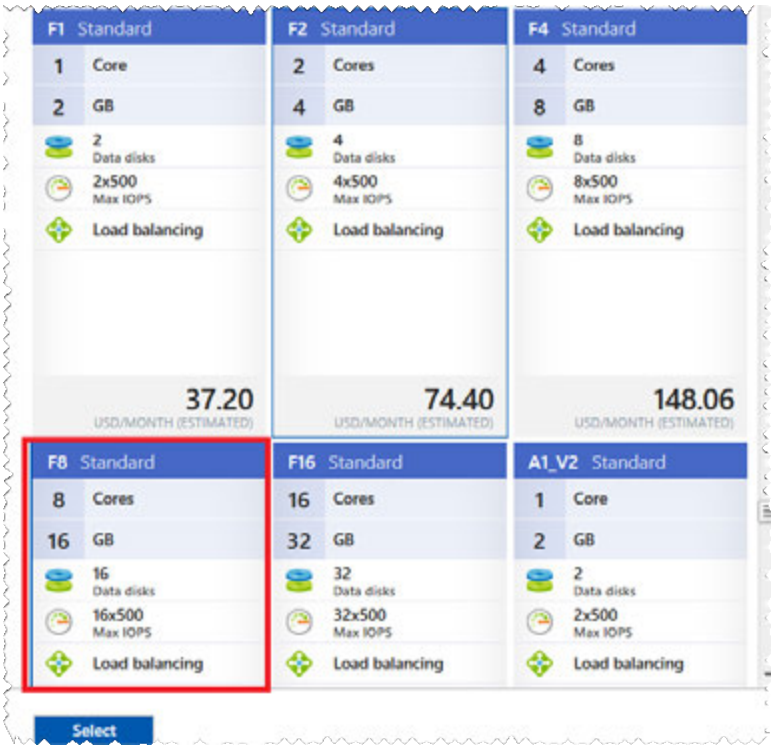
f. Click **OK**.



The **2 Size - Choose virtual machine size** section is in focus.

3. Click ***size-required-based-on-capacity*** (for example, **F8 Standard**), and click **Select**.

Note: Sizing is based upon the capacity requirements of your enterprize (see Azure VM Configuration Recommendations for RSA VM size recommendations based on log capture rates. The minimum size RSA recommends for the SA Server is **F8 Standard**.



The **3 Settings – Configure optional features** section is in focus.

4. Click and define the fields.

   a. In the **Storage** field, make sure that **Use manage disks** is set to **Yes**.

   b. In the **Network** field, select:

   - A valid **Virtual network** and **Subnet**.

   - **None** for the **Public IP address**.
     RSA recommends **None** for the **Public IP address** (this is not mandatory). You can assign a public IP address, but it countermands Best Practices to assign a public IP to something that is based in the Azure cloud.

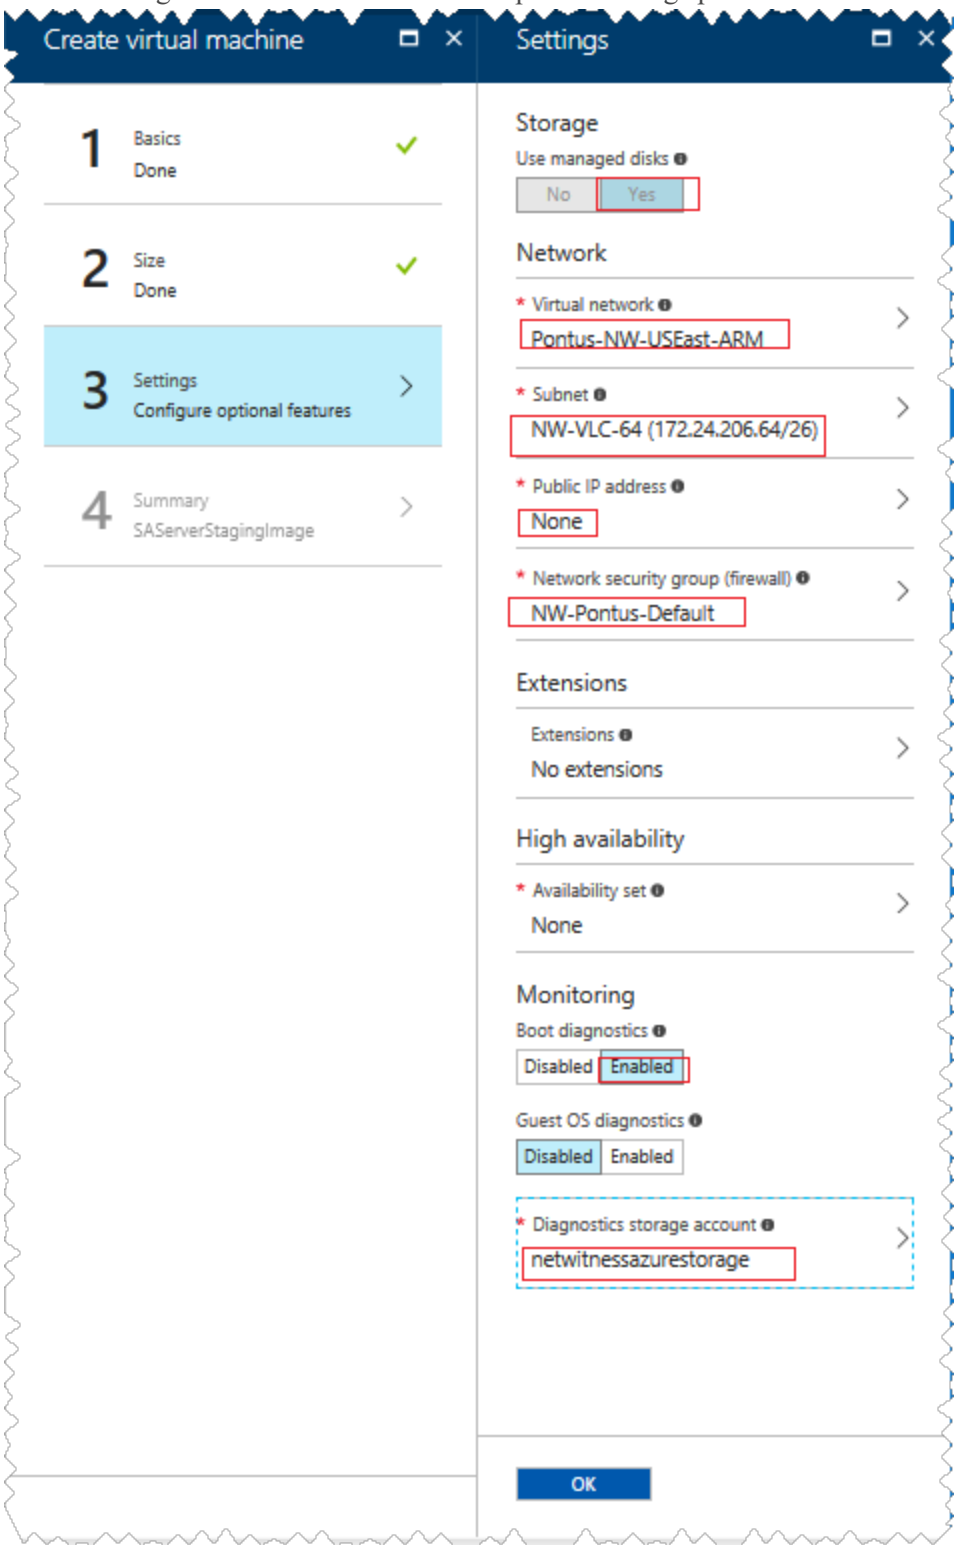
   - A valid **Network security group**.
     For information on Network security groups, see the Microsoft Azure documentation

(https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg).

c. In the Monitoring field, select:

- **Enabled** for **Boot Diagnostics**
- **Enabled** for **Guest OS diagnostics**
- a valid **Diagnostics storage account**

The following screen shot illustrates a completed Settings panel.



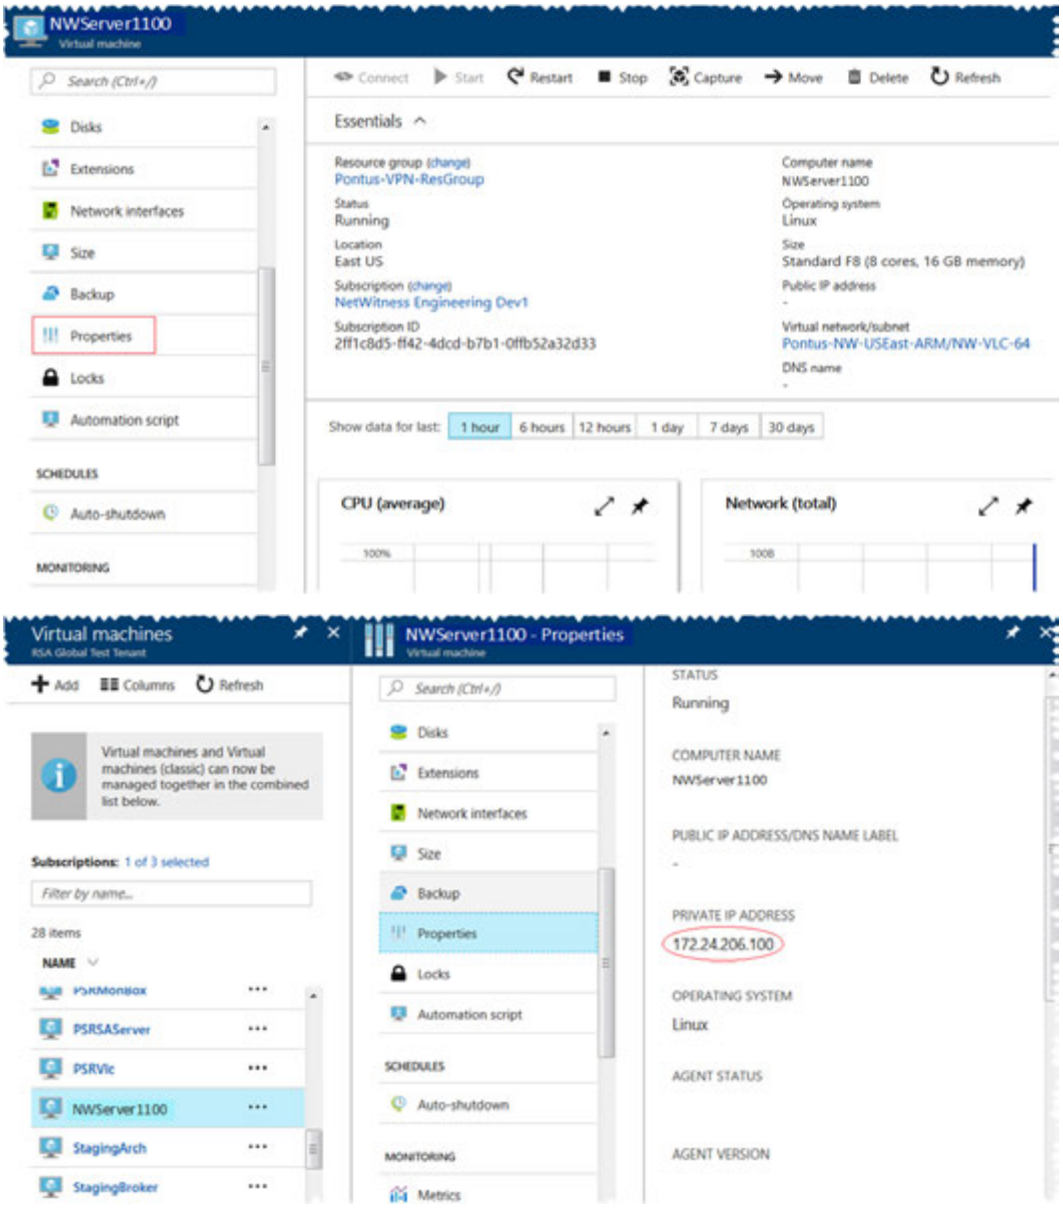
d. Click **OK**.

The **4 Summary – SAServerStagingImage** section is in focus.

5. Verify that the Validation passed, and click **OK**.

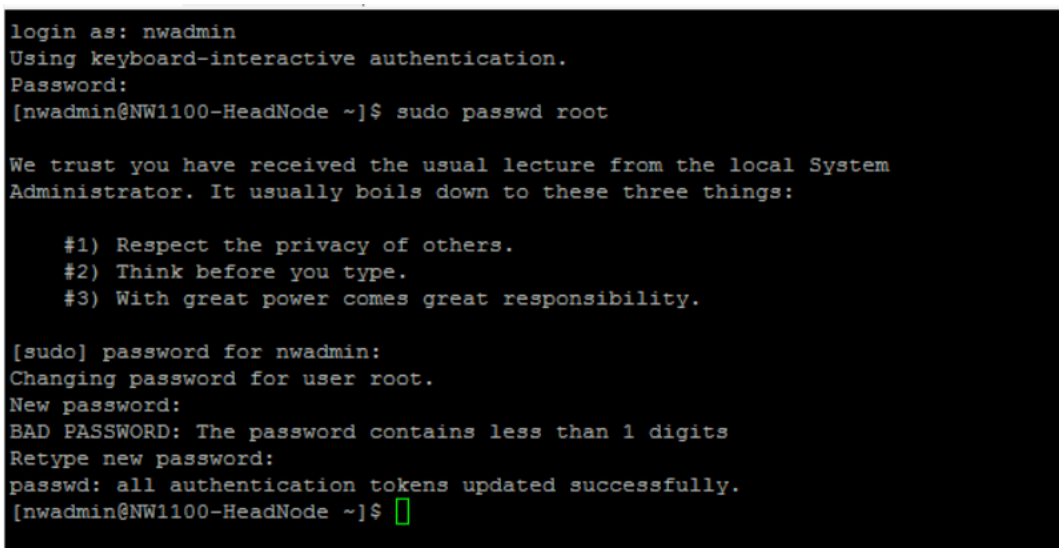
You know that the NW Server VM Deployment is successful when you see the VM status as **Running**.

6. Click **Properties** to view the **IP Address** details.



7. SSH to the VM using the username that you specified in Step 2d of Task 3 and reset the **root** password. Use the `su passwd root` command string to reset the root password as shown

in the following screen shot.



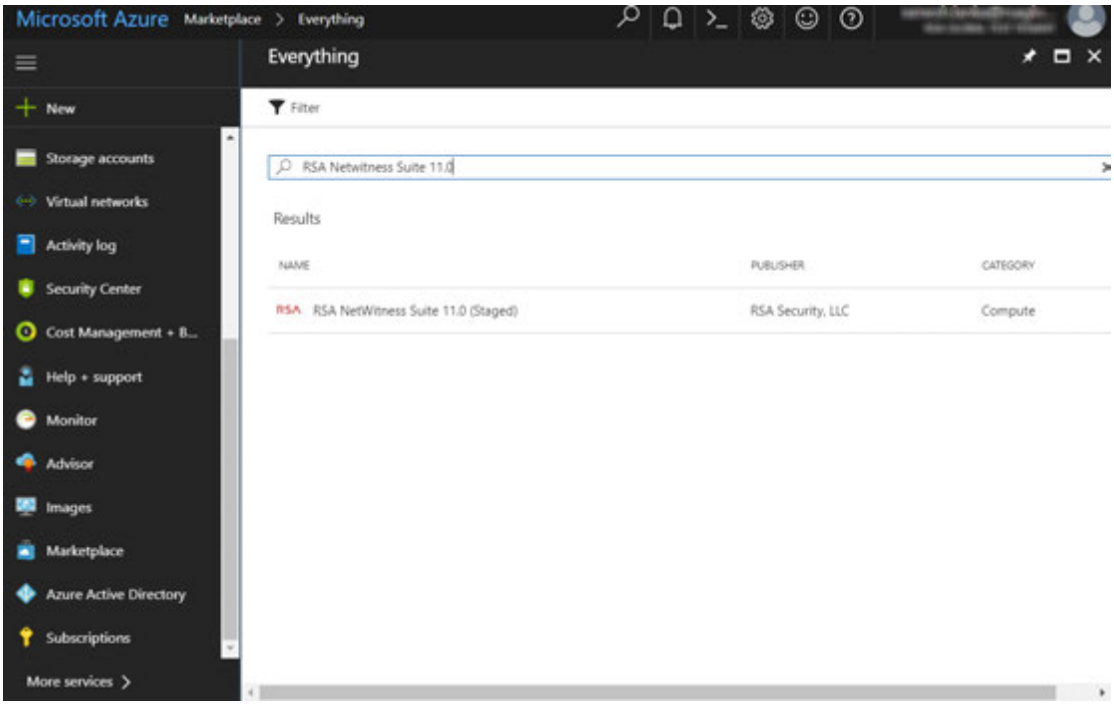
8. Close the current SSH session and open a new SSH session with **root** as the username and the password created in the previous step.

Note: Step 8 is a critical, one-time step for a new deployment. If you do not complete this step, the Security Analytics User Interface will not load.

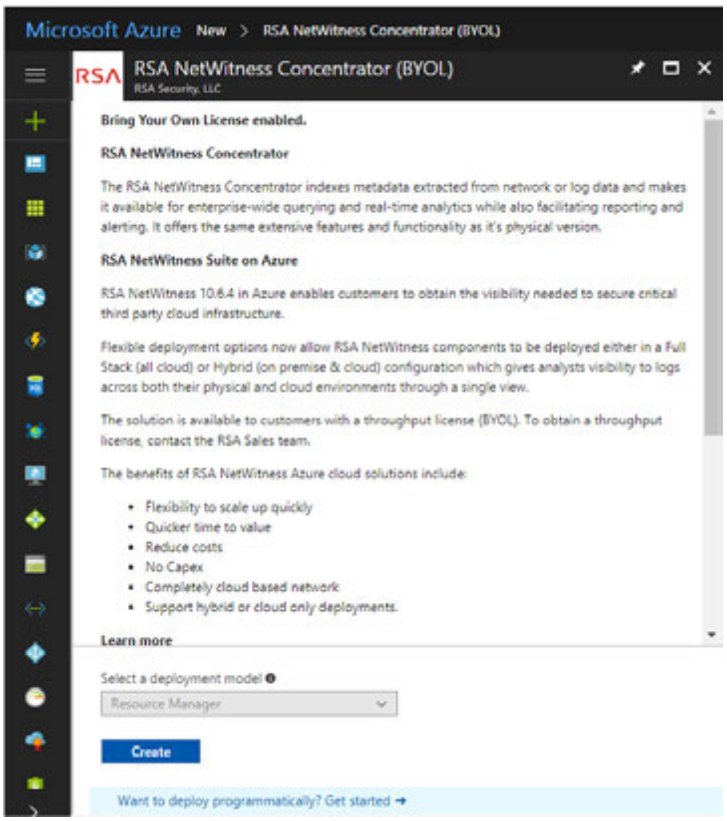
Step 2. Deploy Component Core Services in Azure

Complete the following procedure to configure core RSA NetWitness® Suite component services on a virtual machines (VMs) in the Azure Cloud environment.

1. Go to azuremarketplace.microsoft.com and sign in with your credentials.
2. Search for RSA.



3. Click RSA NetWitness® Suite core service (for example, **RSA NetWitness Concentrator**) and click **Create**.



The **Create virtual machine** wizard is displayed with the **1 Basics** section is in focus.

4. Complete Basics.

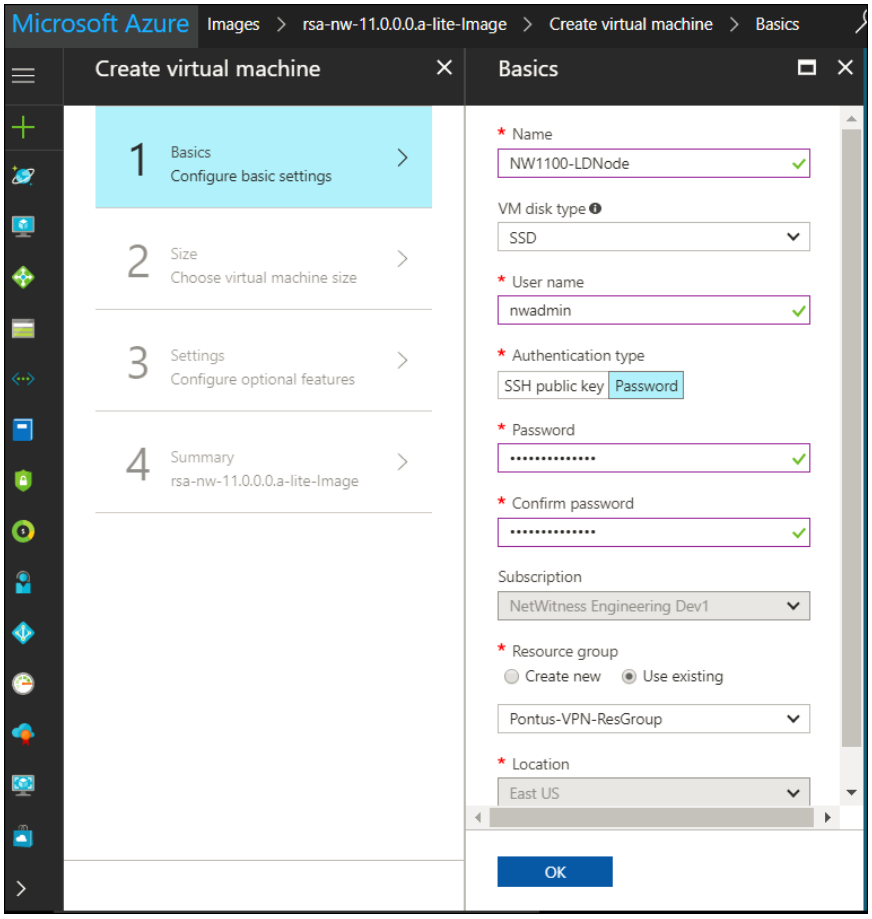
   a. Specify a VM **Name** (for example, **Concentrator**).

   b. Select **SSD** for the **VM disk type**of the Concentrator. Select HDD for all other components.
   Solid State Disk (SSD) performs better than a Hard Drive (HDD).

   c. Select **Password** for **Authentication type**.

   d. Enter your credentials (that is **User name** and **Password**) and **Confirm Password**.

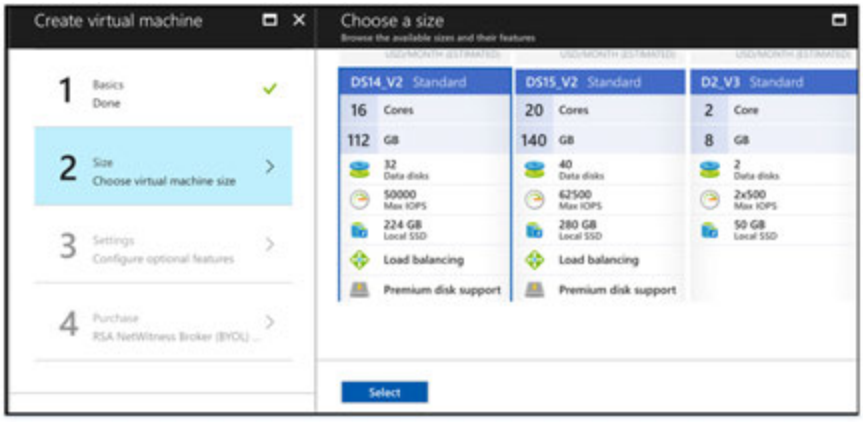
e. Click **OK**.



Azure validates your **Basic** specifications and the **2 Size** section is in focus.

5. Click on the appropriate VM size (for example, **Standard DS14 v2** for the Concentrator) for the service and click **Select** for a VM **Size**.

   See Azure VM Configuration Recommendations for the VM sizes RSA recommends for each service.



Azure validates your **Size** specifications and the **3 Settings** section is in focus.

6. Specify **Settings**.

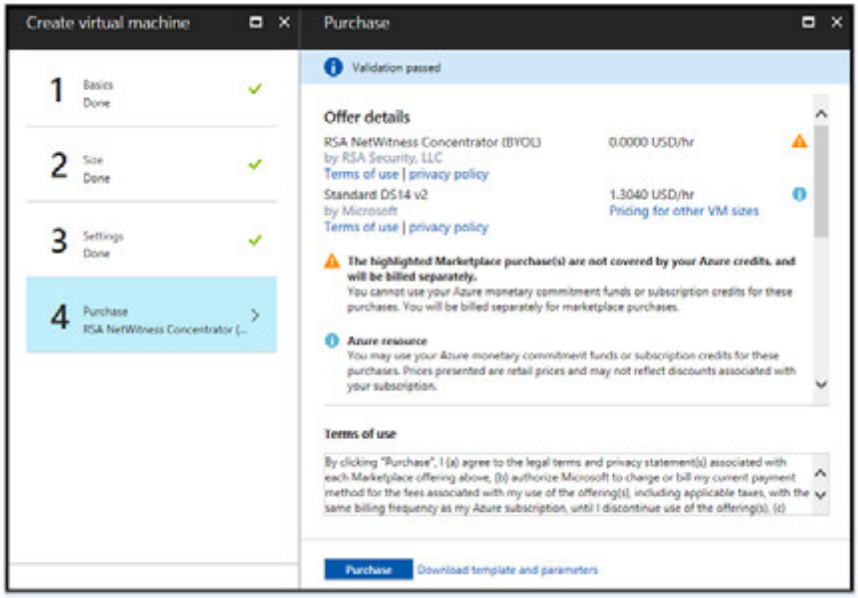
   a. In the **Storage** field, make sure **Use manage disks** is set to **Yes** .

   b. Under **Network**:

   - Adjust **Virtual network**, **Subnet** and **Public IP address** according to the requirements of your network.
   - Specify a valid **Network security group**.
     For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg). Refer to Deployment: Network Architecture and Ports (https://community.rsa.com/docs/83063) for a comprehensive list of the ports you must set up for all RSA NetWitness® Suite components.

   c. Click **OK**.

Azure validates your VM and the **4 Purchase** section is in focus.



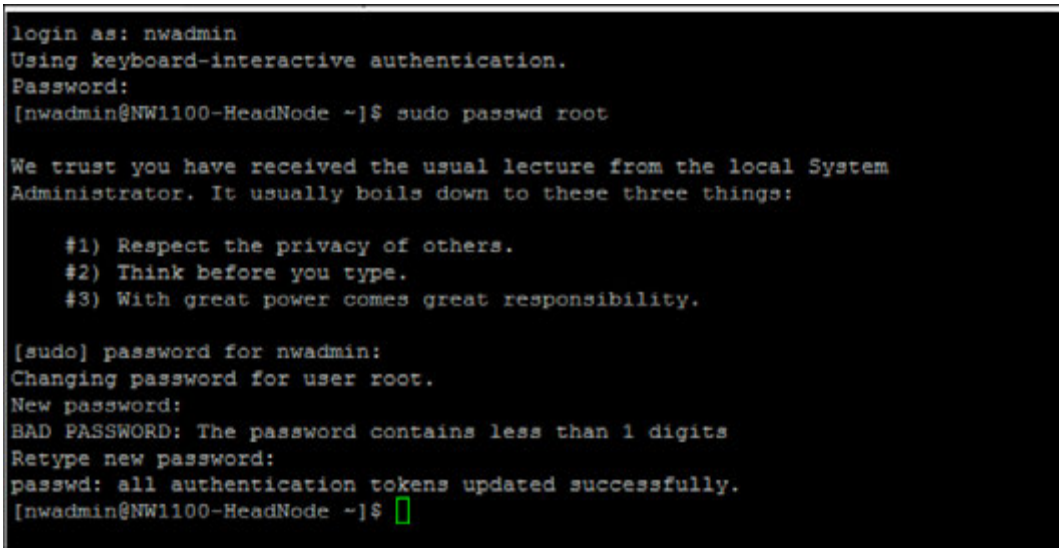
7. Click **Purchase** to create the core RSA Security Analytics component service (for example, **Concentrator**) VM in Azure.
8. Configure the host VM in RSA NetWitness® Suite 11.0.0.
   See Step 3. Configure Host VMs in RSA NetWitness® Suite for instructions.
9. Repeat steps 1 through 8 inclusive for the rest of the core RSA Security Analytics component services.

Step 3. Configure Host VMs in RSA NetWitness® Suite

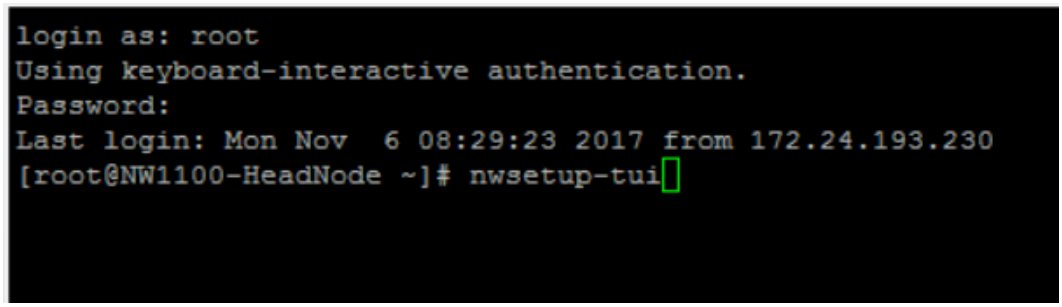
Configure individual hosts and services as described in RSA NetWitness® Suite *Host and Services Configuration Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

Note: After you successfully create a VM, Azure assigns a default hostname to it. Refer to "Change the Name and Hostname of a Host" (https://community.rsa.com/docs/DOC-74112) in the RSA NetWitness® Suite help for instructions on changing a hostname.

1. SSH to the host using the credentials you specified in the **1 Basics** section of the **Create VM** wizard when you created the VM in Azure (in item 4d of Step 2. Deploy Component Core Services in Azure).
2. Reset the password for **root**.

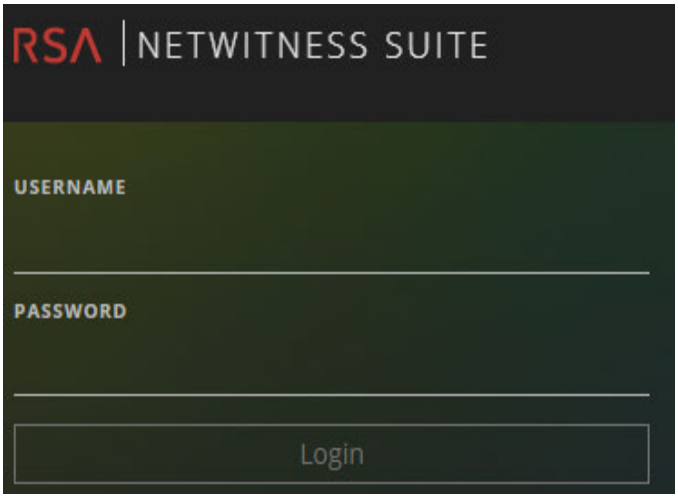


3. SSH to the host using **root** for username and the password created in the previous step and provide NetWitness Suite an IP for provisioning.



Refer to the Installation Tasks section and the Configure Hosts (Instances) section in the *AWS Deployment Guide for RSA NetWitness 11.0.0.0*.

4. Log in to RSA NetWitness Suite.



5. Go to **Administration** > **Hosts**.
   The **New Hosts** dialog is displayed with the host VMs that you created in Azure.
6. Select the hosts that you want to enable.
   The **Enable** menu option becomes active.
7. Click **Enable**.

8. Select the host you enabled.
9. Click Install and select the component you deployed in Azure (for example, Event Stream Analysis). For more information, see the *Hosts and Services Getting Started Guide for Version 11.0.0.0*.

NetWitness Suite Deployment

This guide describes the basic requirements of a NetWitness Suite deployment and outlines optional scenarios to address needs of your enterprise. You can use distributed networks to install Brokers, Concentrator, Decoders, and Log Decoders in diverse geographical locations before the NetWitness Server is installed and brought online. Even in small networks, planning can ensure that all goes smoothly when you are ready to bring the hosts online.

Note: This document refers to several additional documents available on RSA Link. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

There are many factors you must consider before you deploy NetWitness Suite. The following items are just some of these factors. You need to estimate growth and storage requirements when you consider these factors.

- The size of your enterprise (that is, the number of locations and people that will use NetWitness Suite.
- The volume of packets and logs you need to process.
- The performance each NetWitness Suite user role needs to do their jobs effectively.
- The prevention of downtime (that is, how to avoid a single point of failure).
- The environment in which you plan to run NetWitness Suite
  - RSA Appliances (software running on hardware supplied by RSA)
    See the *RSA NetWitness® Suite Physical Host Installation Guide* for detailed instructions on how to deploy RSA Appliances.
  - Software Only provided by RSA:
    - On-Premises (On-Prem) Virtual Hosts
    - VCloud:
      - Amazon Web Services (AWS)
      - Azure

Basic Deployment Process

Before you can deploy NetWitness Suite you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness Suite deployment.

Process

The components and topology of a NetWitness Suite network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

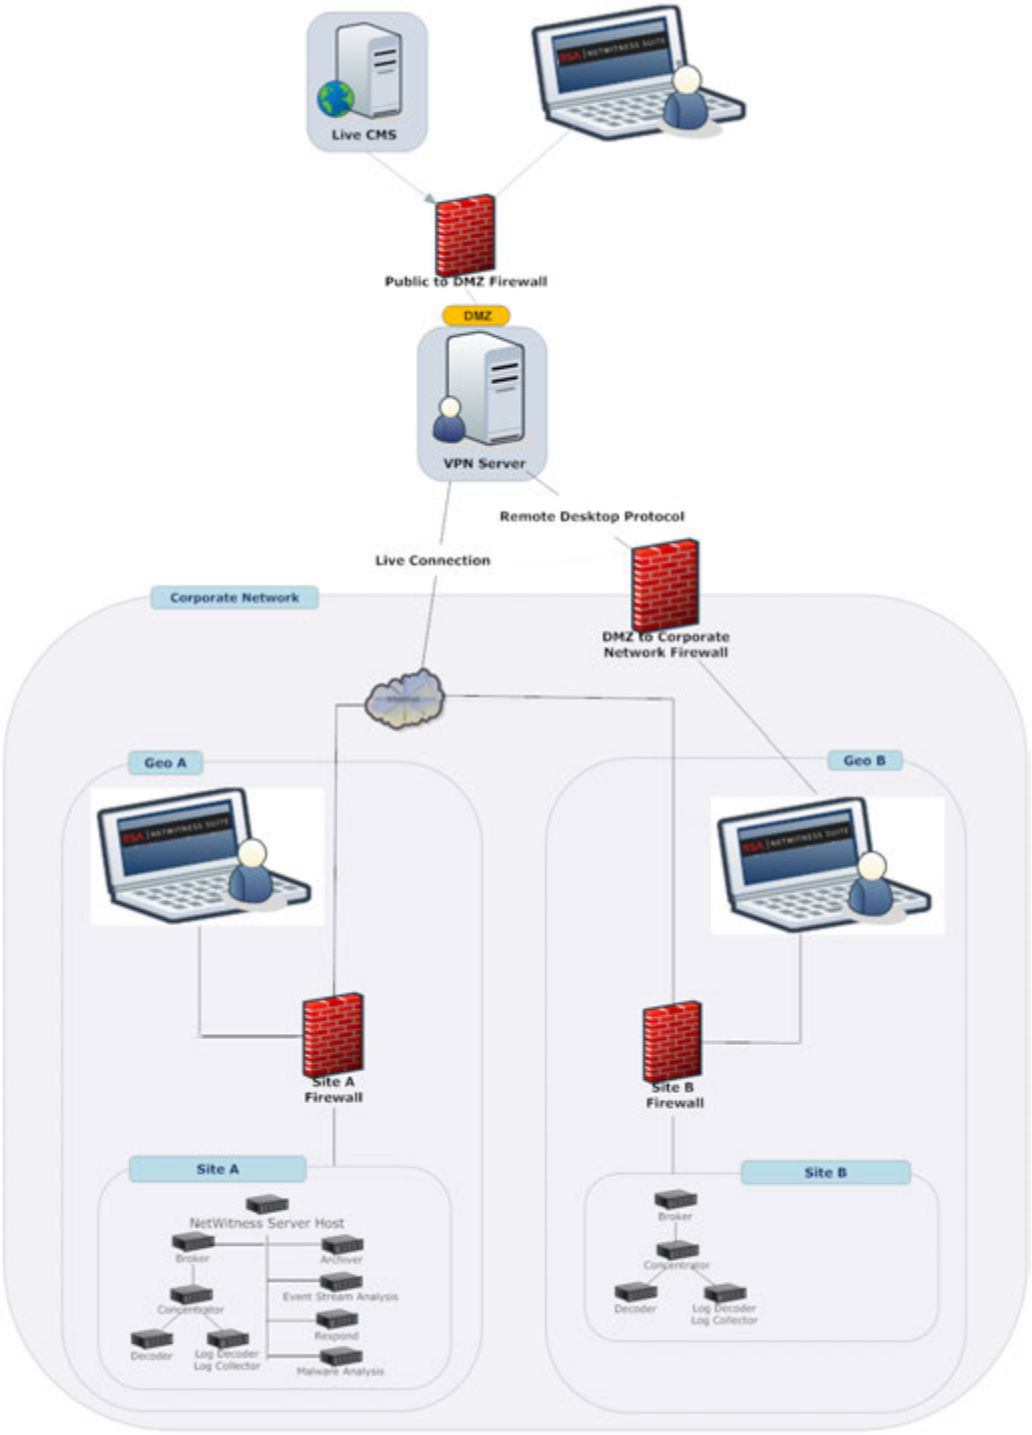
When ready to begin deployment, the general sequence is:

- For RSA Appliances:
  1. Install appliances and connect to the network as described in the RSA NetWitness® Suite Hardware Setup Guides and the *RSA NetWitness® Suite Physical Host Installation Guide* .
  2. Set up licensing for NetWitness Suite as described in the *RSA NetWitness® Suite Licensing Guide*.
  3. Configure individual appliances and services as described in *RSA NetWitness® Suite Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.
- For On-Prem virtual hosts, follow the instructions in the *RSA NetWitness® Suite Virtual Host Setup Guide*.
- For AWS, follow the instructions in the *RSA NetWitness® Suite AWS Deployment Guide*.
- For Azure, follow the instructions in the *RSA NetWitness® Suite Azure Deployment Guide*.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *RSA NetWitness Suite Host and Services Getting Started Guide*.

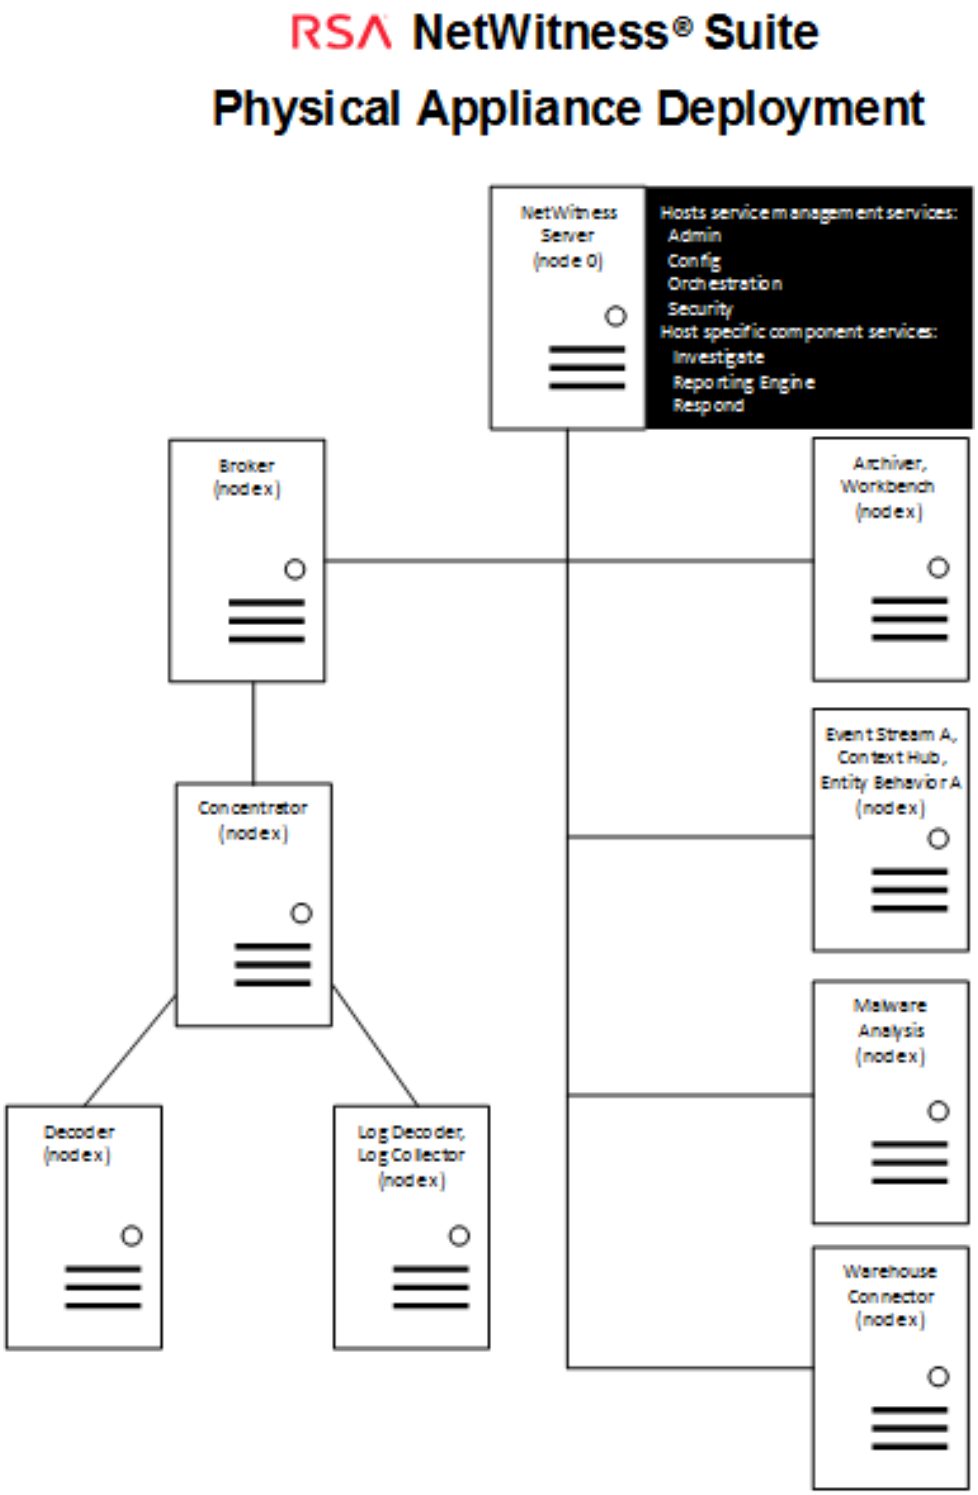
NetWitness Suite Deployment Diagram

The following diagram illustrates a basic, multi-site NetWitness Suite Deployment.

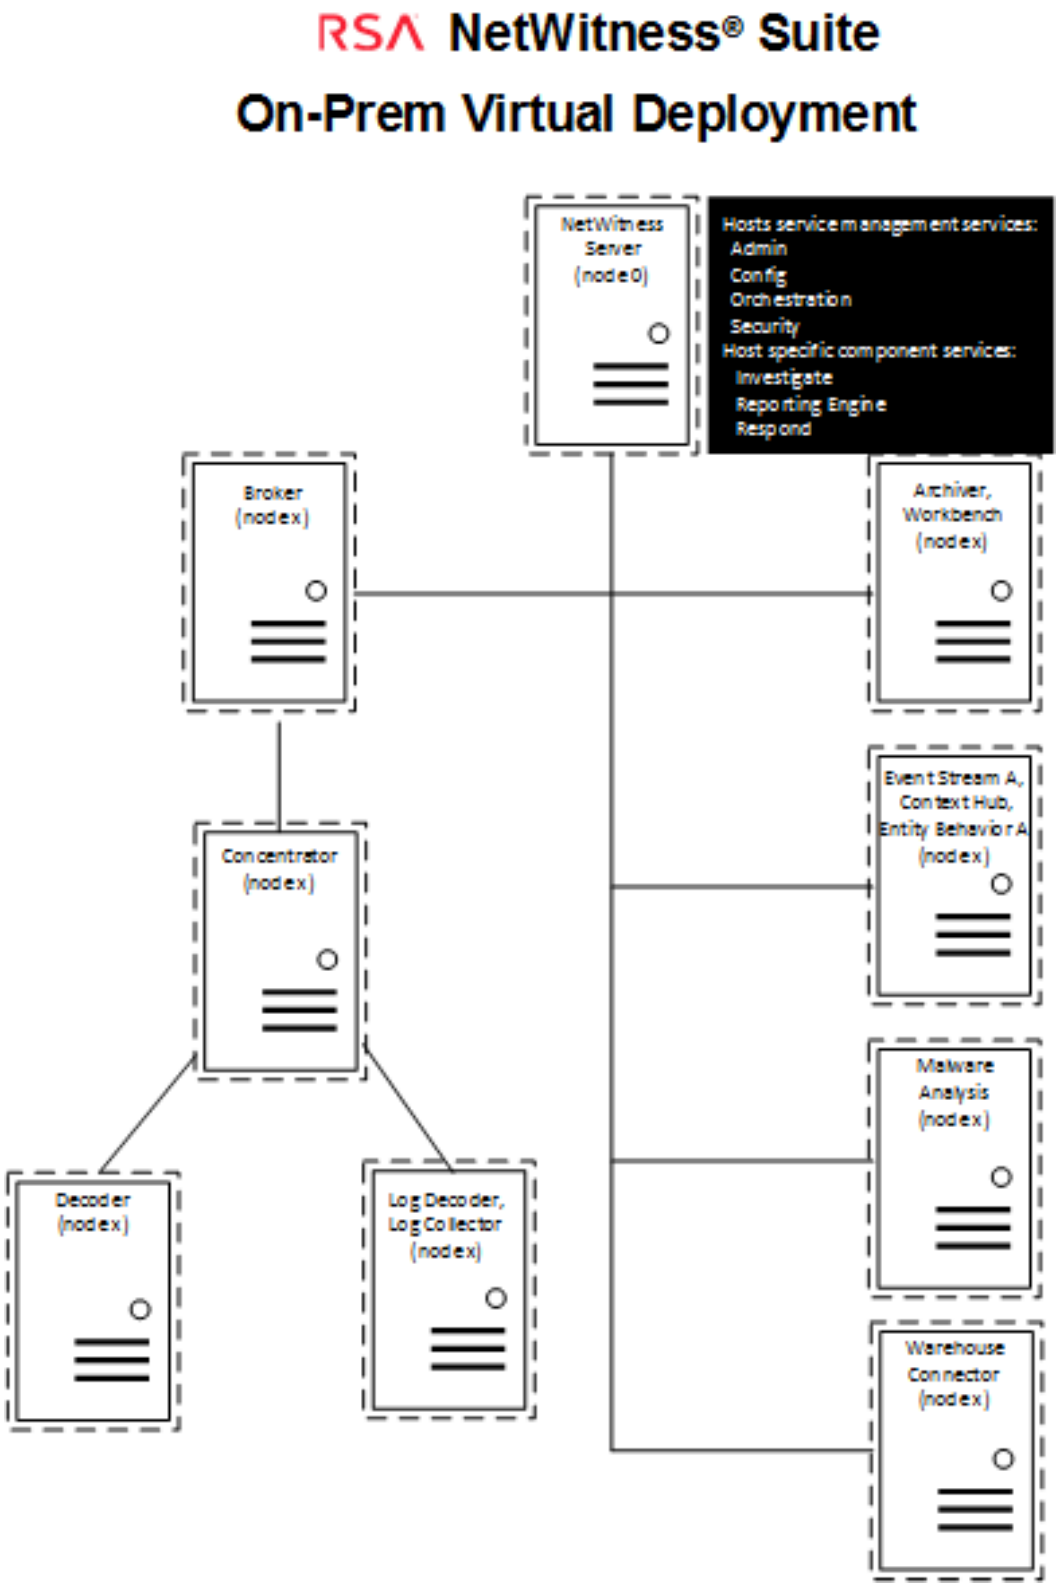


RSA Physical Appliance Environment

The following diagram illustrates a basic NetWitness Suite deployment hosted on RSA hardware.



The following diagram illustrates a basic NetWitness Suite deployment hosted virtually. See the RSA NetWitness® Suite On-Prem Virtual Host Setup Guide for details.



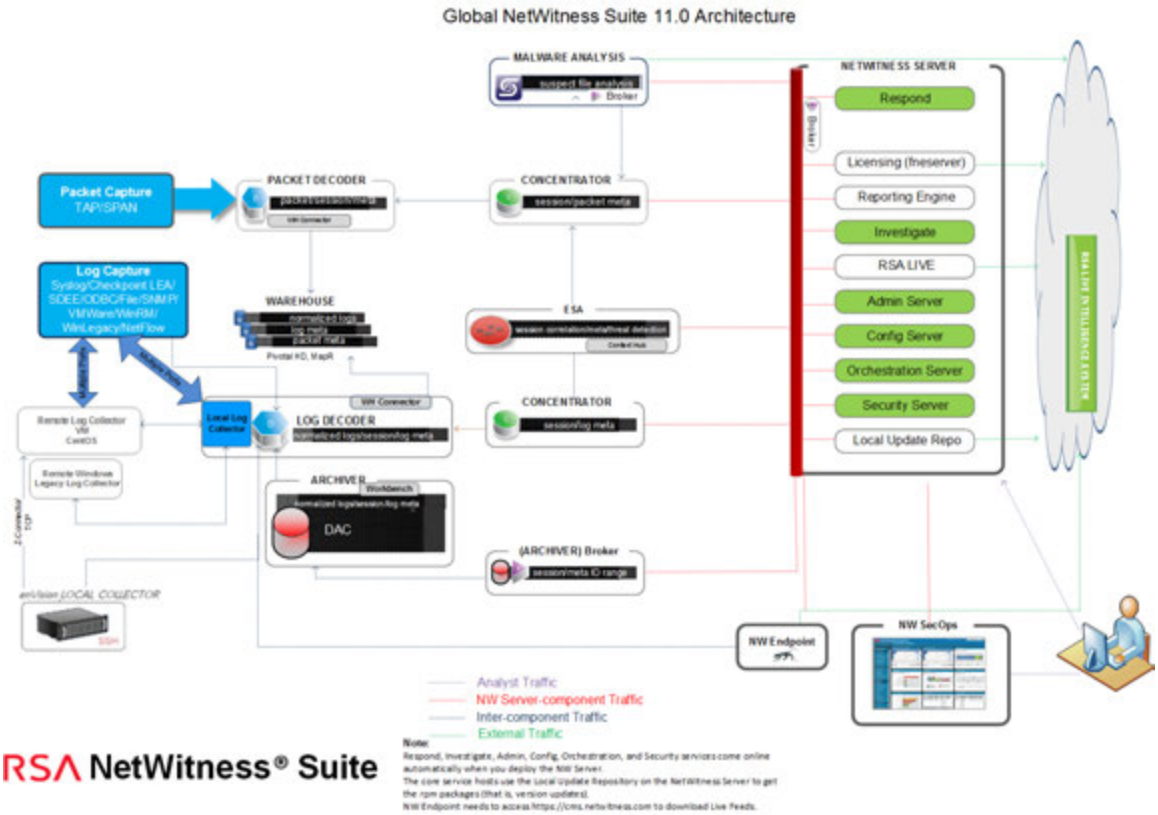
Deployment: Network Architecture and Ports

Refer to the following diagram and port table to ensure that all the relevant ports are opened for components in your NetWitness Suite deployment to communicate with each other.

NetWitness Suite Network Architecture Diagram

The following diagram illustrates the NetWitness Suite network architecture including all of its component products.

Note: NetWitness Suite core hosts must be able to communicate with the NetWitness Server (Primary Server in a multiple server deployment) through UDP port 123 for Network Time Protocol (NTP) time synchronization.



Comprehensive List of NetWitness Suite Host and Service Ports

Note: 1.) For ports used in event collection through the NetWitness Logs, see the **The Basics** in the *Log Collection Deployment Guide*.

This section contains the port specifications for the following hosts.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	NW Server	TCP 443, 80	nginx - NetWitness UI
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
Admin Workstation	NW Server	TCP 22	SSH
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	UDP 123	NTP
NW Hosts	NW Server	TCP 27017	MongoDB
NW Server	NW Server	UDP 123	NTP
NW Server	NFS Server	TCP 111 2049 UDP 111 204	iDRAC Installations

Archiver Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Archiver	TCP 15671	RabbitMQ Management UI

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Archiver	TCP 22	SSH
NW Server	Archiver	TCP 56008 (SSL), 50008 (Non-SSL), 50108 (REST)	Archiver Application Ports
NW Server	Archiver	TCP 56006 (SSL), 50006 (Non-SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Archiver	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	Archiver	TCP 514, 6514, 56007 (SSL), 50007 (Non-SSL), 50107 (REST), UDP 514	Workbench Application Ports
Archiver	NFS Server	TCP 111 2049 UDP 111 204	iDRAC Installations

Broker Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Broker	TCP 15671	RabbitMQ Management UI
Admin Workstation	Broker	TCP 22	SSH
NW Server	Broker	TCP 56003 (SSL), 50003 (Non-SSL), 50103 (REST)	Broker Application Ports
NW Server	Broker	TCP 56006 (SSL), 50006 (Non-SSL), 50106 (REST)	NetWitness Appliance Ports

Source Host	Destination Host	Destination Ports	Comments
NW Server	Broker	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Broker	NW Server	TCP 111 2049 UDP 111 2049	iDRAC Installations

Concentrator Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Concentrator	TCP 15671	RabbitMQ Management UI
Admin Workstation	Concentrator	TCP 22	SSH
NW Server	Concentrator	TCP 56005 (SSL), 50005 (Non-SSL), 50105 (REST)	Concentrator Application Ports
NW Server	Concentrator	TCP 56006 (SSL), 50006 (Non-SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Concentrator	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Concentrator	NFS Server	TCP 111 2049 UDP 111 204	iDRAC Installations

Event Stream Analysis (ESA) Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	ESA	TCP 15671	RabbitMQ Management UI

Source Host	Destination Host	Destination Ports	Comments

Site Requirements and Safety

Make sure that you read this topic thoroughly and observe all warnings and precautions prior to installing or maintaining your RSA devices.

Intended Application Uses

This product was evaluated as Information Technology Equipment (ITE) that may be installed in offices, schools, computer rooms, and similar indoor commercial type locations. This device is not intended for any connection to an outdoor type cable.

Service

There are no user-serviceable components inside of this device. Please contact Customer Care in the event of a malfunction. In a fault condition, high temperatures may arise inside the system causing an alarm signal. In the event of the alarm signal, immediately disconnect the device from the power source and contact Customer Care. Further operation of the device will be unsafe and may cause personal injury or property damage.

Safety Information

Site Selection

The system is designed to operate in a typical office environment. Choose a site that is:

- Clean, dry, and free of airborne particles (other than normal room dust).
- Well-ventilated and away from sources of heat, including direct sunlight and
- radiators.
- Away from sources of vibration or physical shock.
- Isolated from strong electromagnetic fields produced by electrical devices.
- In regions that are susceptible to electrical storms, we recommend you plug your system into a surge suppressor.
- Provided with a properly grounded wall outlet.
- Provided with sufficient space to access the power supply cords, because they serve as the product's main power disconnect.

Equipment Handling Practices

Reduce the risk of personal injury or equipment damage by:

- Conforming to local occupational health and safety requirements when moving and lifting equipment.
- Using mechanical assistance or other suitable assistance when moving and lifting equipment.
- Reducing the weight for easier handling by removing any easily detachable components.

Power and Electrical Warnings

Caution: The power button, indicated by the standby power marking, DOES NOT completely turn off the system AC power; 5V standby power is active whenever the system is plugged in. To remove power from system, you must unplug the AC power cord(s) from the wall outlet.

- Do not attempt to modify or use an AC power cord if it is not the exact type required. A separate AC cord is required for each system power supply.
- This product contains no user-serviceable parts. Do not open the system.
- When replacing a hot-plug power supply, unplug the power cord to the power supply being replaced before removing it from the server.

Rack Mount Warnings

- The equipment rack must be anchored to an unmovable support to prevent it from tipping when a server or piece of equipment is extended from it. The equipment rack must be installed according to the rack manufacturer's instructions.
- Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.
- Extend only one piece of equipment from the rack at a time.
- To avoid risk of potential electric shock, a proper safety ground must be implemented for the rack and each piece of equipment installed in it.

Cooling and Air Flow

Installation of the equipment should be such that the amount of air flow required for safe operation of the equipment is not compromised.

Antenna Placement

This equipment should be installed and operated with a minimum distance of 7cm between the radiator and your body. The antennas used for this transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

Configure Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

RSA Group Aggregation Deployment Recommendations

RSA recommends the following deployment for Group Aggregation.

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

Advantages of Using Group Aggregation

Group Aggregation:

- Increases the speed of Security Analytics queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.

Data Ingest
Data Ingest

You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated session between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10000 the services would divide the session between themselves as illustrated in the following table.

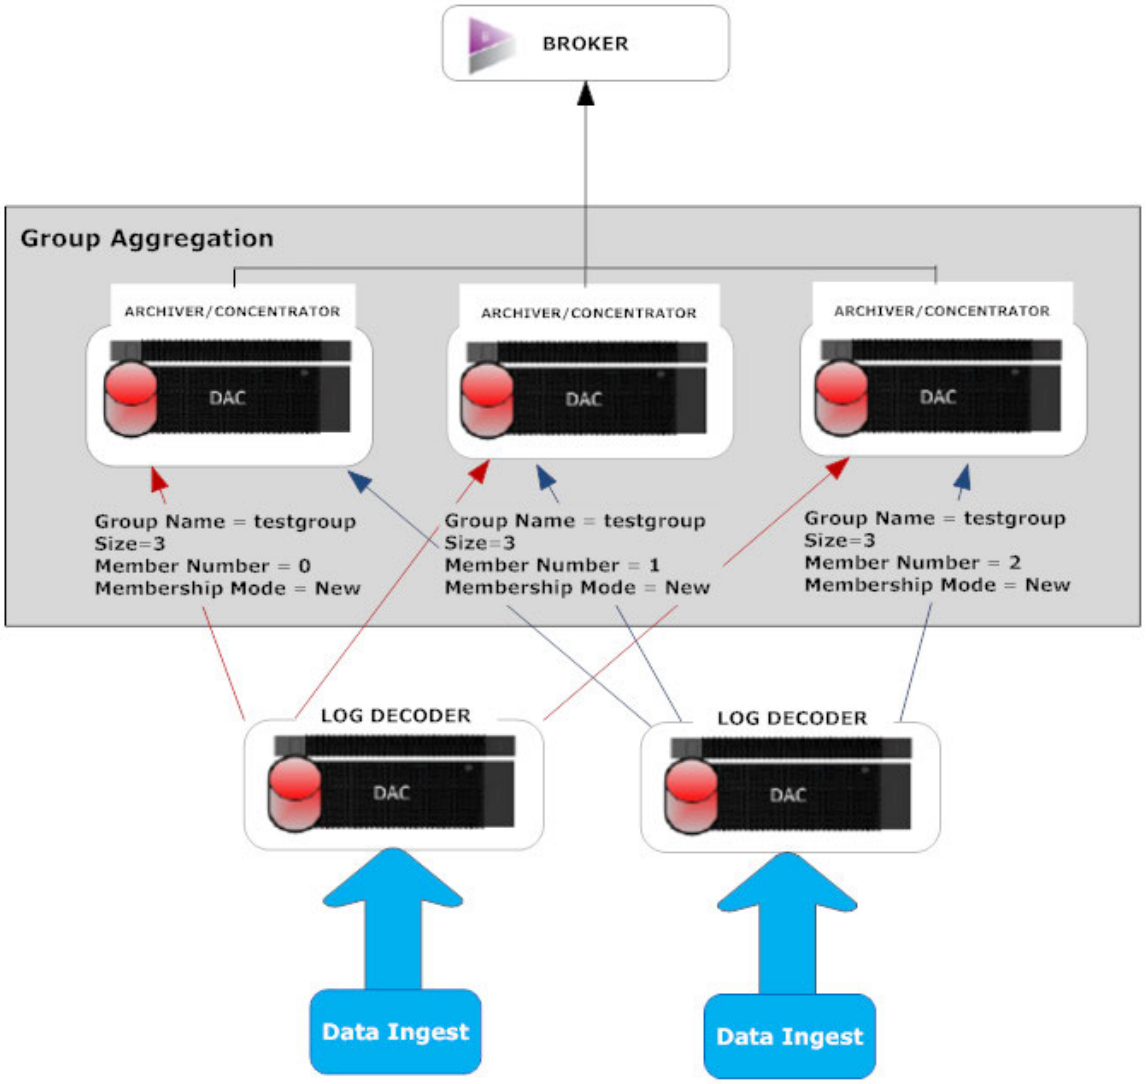
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

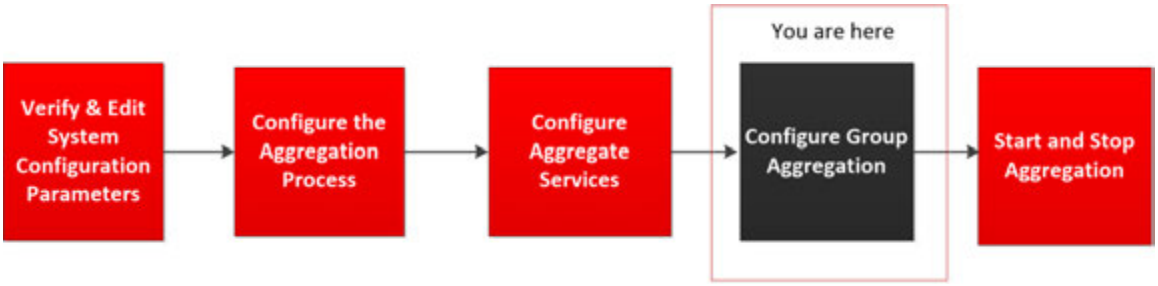
Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrators services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.

Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: New and Replace. New: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. Replace: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from. **Note:** This parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.



Set up Group Aggregation

Complete the following procedure to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.
2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:

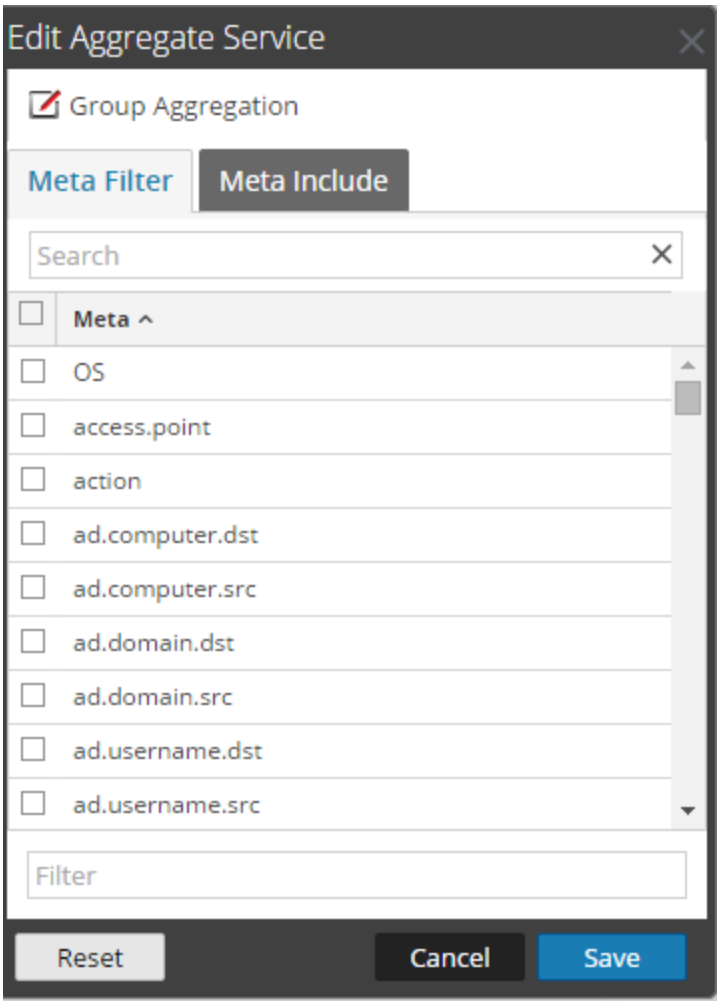
a. In the **main menu**, select **ADMIN > Services**.

b. Select the Archiver or Concentrator service, and in the **Actions** column, select **View > Config**.
The Device Config view of the Archiver or Concentrator is displayed.

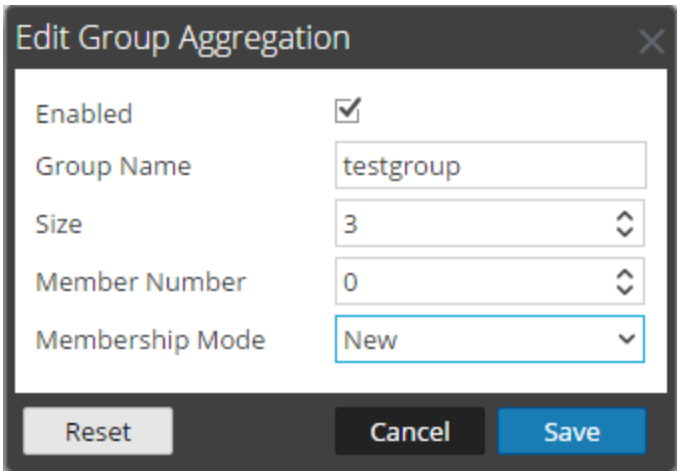
c. Under **Aggregate Services** section, select the Log Decoder device.

d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

e. Click .
The **Edit Aggregate Service** dialog is displayed.



f. Click Group Aggregation.
The **Edit Group Aggregation** dialog is displayed.



g. Select the **Enabled** checkbox and set the following parameters:

   In the **Group Name** field, type the group name.
   In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
   In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
   In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

i. In the Device Config View page, click **Apply**.

j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.

Hosts and Services Basics

This guide gives administrators the standard procedures for adding and configuring hosts and services in NetWitness Suite. After introducing you to the basic purpose of hosts and services and how they function within in the NetWitness Suite network, this guide covers:

- The tasks you must complete to set up hosts and services in your network
- Additional procedures that you complete based on the long-term and daily, operational needs of your enterprise
- Reference topics that describe the user interface

What Is a Host

A host is the machine on which a service runs and a host can be a physical or virtual machine.

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plugin to enable or disable, according to the function of the host.

You must configure the following Core services first:

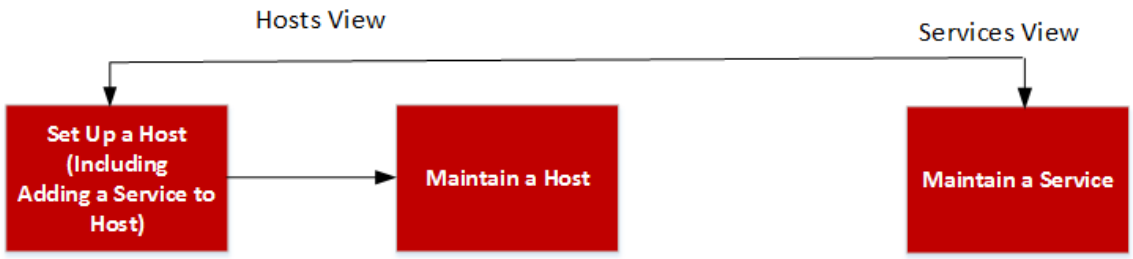
- Decoder
- Concentrator
- Broker
- Log Decoder

All the services are listed below and each service except the Log Collector has its own guide or shares a guide in the *Host and Services Configuration Guides*. The Log Collector has its own set of configuration guides to handle the configuration for all the supported event collection protocols. For Log Collector information, see *Log Collection Guides*.

- Archiver
- Broker
- Concentrator
- Context Hub
- Decoder
- Event Stream Analysis

- Event Stream Analytics
- Investigate
- Log Collector
- Log Decoder
- Malware Analysis
- Reporting Engine
- Respond
- Warehouse Connector
- Workbench

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.



Setting Up a Host

You use the Host view to add a host to NetWitness Suite. See Step 1. Deploy a Host for detailed instructions.

Maintaining Hosts

You use the main Host view to add, edit, delete, and perform other maintenance tasks for the hosts in your deployment. You use the Task List dialog to perform tasks relating to a host and its communications with the network. See Hosts and Services Procedures for detailed instructions.

After your initial implementation of NetWitness Suite, the major task you perform from the Host view is updating your NetWitness Suite deployment to a new version.

Update Version Naming Convention

You use the Hosts view to apply the latest version updates from your Local Update Repository (see the **Manage NetWitness Suite Updates** topic in *System Maintenance* for more information on your Local Update Repository). You must understand the update version naming convention to know which version you want to apply to the host. The naming convention is ***major-release.minor-release.service-pack.patch***. For example, if you choose 11.6.1.2, you would be applying the following version to the host.

- 11 = major release
- 6 = minor release
- 1 = service pack
- 2 = patch

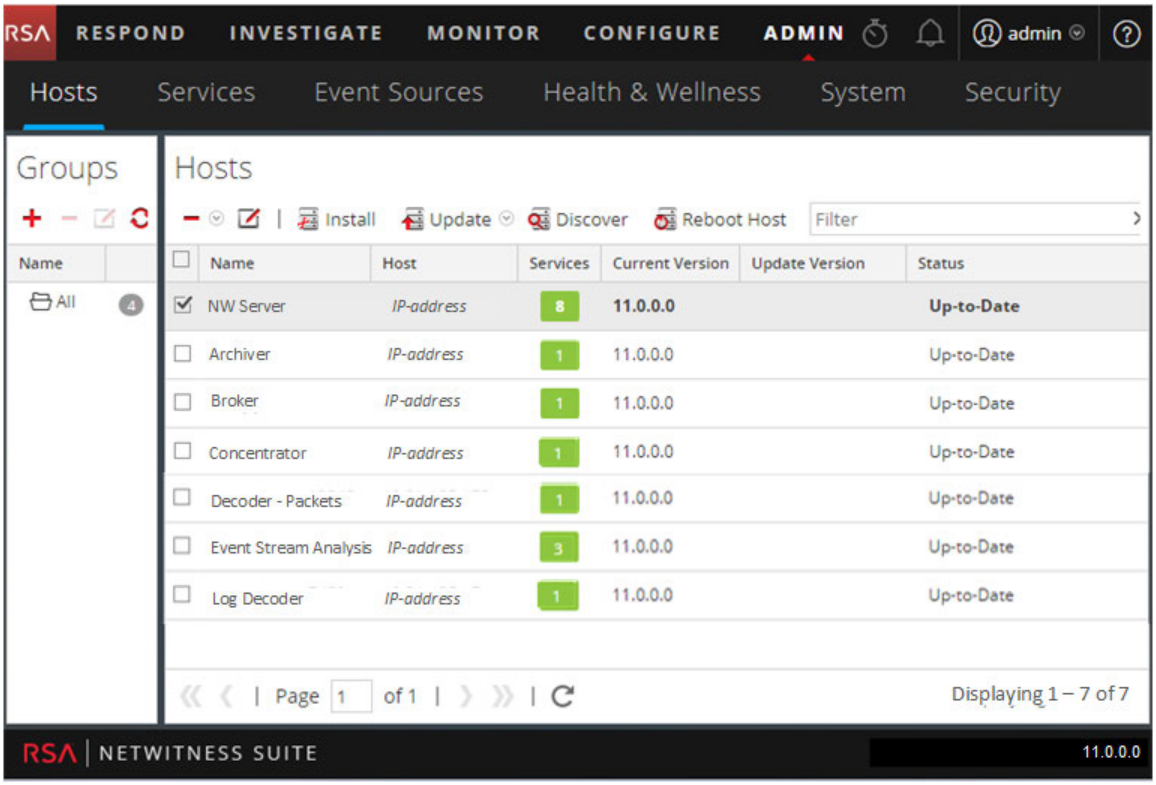
NetWitness Suite supports multiple versions in your deployment. The NetWitness Server (NW Server Host) is updated first and all other hosts must have the same or earlier version as the NW Server Host.

Note: You must update the NW Server Host first and that all other hosts have the same or earlier version as the NW Server Host.

In the following example of a multiple version deployment:

- Version updates currently available in your Local Update Repository are 11.0.2.0 and 11.0.1.0 for the Broker, LC/LD, and Log Decoder hosts.
- The NW Server Host and all the other hosts are currently updated to 11.0.2.0.

This means that you have the option to update the Broker, LC/LD, and Log Decoder hosts to 11.0.2.0 or 11.0.2.0.



Maintaining Services

You use the Services view to add, edit, delete, monitor, and perform other maintenance tasks for the services in your deployment. See Hosts and Services Procedures for detailed instructions.

Services Implemented with the NetWitness Server

The services in the following table are implemented when you deploy the NW Server to support:

- the expansion of physical and virtual deployment platforms and improvements to host and service maintenance.
- improvements to the Investigate and Respond functionality.

Caution: You do not need to configure these services to deploy NetWitness Suite. RSA recommends that you monitor the operating status of these services using Health-and-Wellness. Do not attempt to modify the parameters in the Explore view without contacting Customer Support (https://community.rsa.com/docs/DOC-1294).

Service	Purpose
Admin	The NetWitness Suite Administration Server (**Admin server**) is the back-end service for administrative tasks in the NetWitness Suite User Interface (UI). It abstracts authentication, global preferences management, and authorization support for the UI. The **Admin server** requires the **Config server** and the **Security server** to be online to perform its role.
Config	The NetWitness Suite Configuration Server (**Config server**) stores and manages configuration sets. A configuration set is any logical configuration group that is managed independently. The **Config server** facilitates the sharing of properties among services, provides configuration backup and restore facilities, and tracks changes to properties.
Investigate	Co-located on NW Server host with the **Admin server**, **Config server**, **Orchestration server**, **Respond server**, and **Security server**.
Orchestration	Internal, system management service that runs on the NW Server to provision, install, and configure all services in your NetWitness Suite deployment.
Respond	Co-located on NW Server host with the **Admin server**, **Config server**, **Investigate server**, **Orchestration server**, and **Security server**.

Service	Purpose
Security	The NetWitness Suite Security Server (**Security server**) manages the security infrastructure of a NetWitness Suite deployment. It handles the following security-related concerns. • Users and the authentication accounts • Role Based Access Control (RBAC) • Deployment PKI infrastructure A NetWitness Suite deployment has users with authentication accounts. Independent of how you verify the identity of the analyst (for example, Active Directory), NetWitness Suite must maintain user state that is not provided by all authentication providers (for example, last login time, failed login attempts, and roles). The concept of a user is separate from the identify associated with the user and the **Security server** maintains these as separate User and Account entities. In addition to the out of the box local NetWitness accounts available to all NetWitness deployments, the server supports external authentication providers. The **Security server** also implements RBAC by managing Role and Permission entities. Permissions can be assigned to roles and roles to users. Together these enable a flexible authorization policy for the deployment. The server also manages generation of cryptographically secure tokens that encode the applicable authorization for a user. These tokens form the basis for deployment wide authorization.

Running in Mixed Mode

Functionality Gaps Encountered During in Staggered Updates

If you stagger the update, you:

- Will not have service administrative features available until you update all the hosts in your deployment.
- May be without data capture for a period of time.

Examples of Staggered Updates

In the following examples, all the hosts are on 11.1.0.x and you want to stagger the host updates to version 11.1.1.0.

Example 1. Multiple Decoders and Concentrators, Alternative 1

In this example, the 11.1.0.x deployment includes 1 NW Server host, 2 Decoder hosts, 2 Concentrator hosts, 1 Archiver host, 1 Broker host, 1 Event Stream Analysis host, and 1 Malware Analysis host.

You must complete Phase 1 first and update the hosts in the order listed for Phase 1.

RSA recommends that you update the Phase 2 hosts in the order listed for Phase 1

Phase 1 - session 1

1. Update the Security Analytics Server host.
2. Update Event Stream Analysis host.
3. Update Malware Analysis host.
4. Broker or Concentrator host.

Phase 2 - session 2

1. Update 2 Decoder hosts.
2. Update 2 Concentrator hosts and Archiver host.

Phase 2 - session 3

1. Update all other hosts.

Example 2. Multiple Decoders and Concentrators, Alternative 2

In this example, the 11.1.0.x deployment includes 1 NW Server host, 2 Decoder hosts, 2 Concentrator hosts, 1 Broker host, 1 Event Stream Analysis host, and 1 Malware Analysis host. RSA recommends that you update the Phase 2 hosts the following sequence (you must complete Phase 1 first and update the hosts in the order listed).

Phase 1 - session 1

1. Update the Security Analytics Server host.
2. Update Event Stream Analysis host.
3. Update Malware Analysis host.
4. Update Broker host.

Phase 2 - session 2

1. Update 1 Decoder host and 1 Concentrator host.

   Time elapses during which NetWitness Suite processes a significant amount of data.

Phase 2 - session 3

1. Update 1 Decoder host, 1 Concentrator host, and the Broker host.
2. Log Decoders

Update all Log Decoder hosts before you update Virtual Log Collectors

3. Update all other hosts.

Example 3. Multiple Regions

In this example, the 11.1.0.x deployment includes 1 NW Server host, 1 Event Stream Analysis host, 1 Malware Analysis host, 4 Decoder hosts, 4 Concentrator hosts, 2 Broker hosts, (2 sites, each with 2 Decoders, 2 Concentrators, and 1 Broker).

Phase 1 - Update Site 1

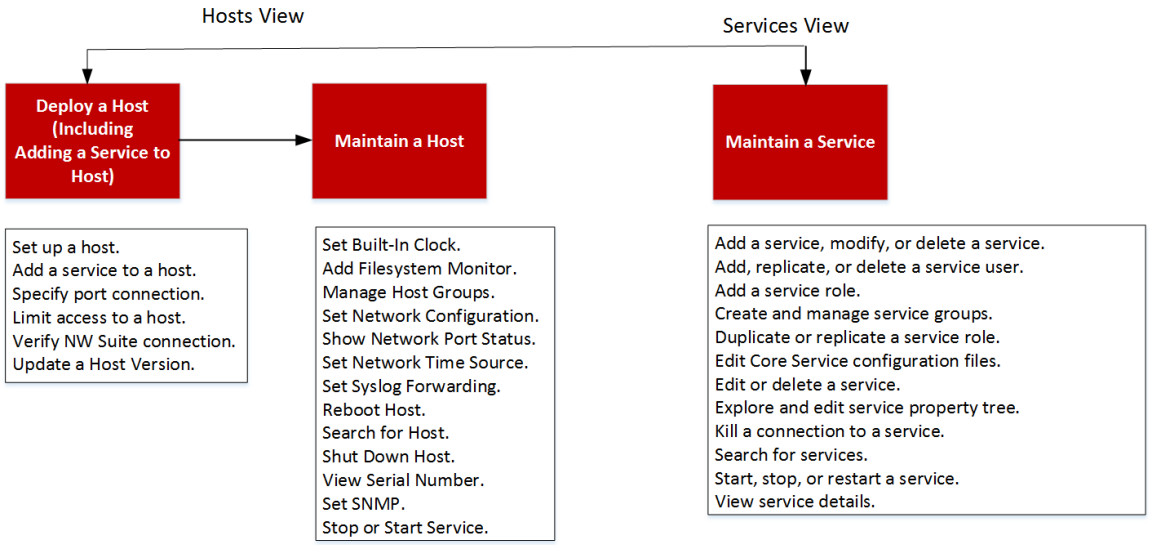
1. Update the NW Server host.
2. Update the Event Stream Analysis host.
3. Update the Malware Analysis host.
4. Update 1 Broker host, 2 Decoder hosts, and 2 Concentrator hosts.
5. Update all other hosts.

Phase 2 - Update Site 2

1. Update Broker hosts.
2. Update 2 Decoder hosts.
3. Update 2 Concentrator hosts.
4. Update all other hosts.

Hosts and Services Procedures

Every service requires a host. After you set up a host, you can assign services to and from this host to other hosts in your NetWitness Suite deployment.



High-Level Task	Description
Set Up a Host	Complete the following tasks in the order shown to set up a host. Step 1. Deploy a host. Step 2. Install a service on a host. Step 3. Review SSL Ports for Trusted Connections. Step 4. Manage access to a service.

High-Level Task	Description

Maintain a Host - Basics	The following maintenance tasks are not required and are shown in alphabetical order.
	• Apply version updates to a host.
	  • Populate Local Update Repository
	  • Set Up an External Repository with RSA and OS Updates
	• Create and manage host groups.
	• Search for hosts.
	• Set network configuration.
	• Set network time source.
	• Show network port status.
	• Show serial number.
	• Shut down a host.
	• Stop and start a service on a host.

High-Level Task	Description
Maintain a Host from the Host Task List Dialog	You use the Host Task List dialog to manage tasks that relate to a host and its communications with the network. Several service and host configuration options are available for Core hosts. • Execute a task from the Host Task List. • Add and delete a Filesystem monitor. • Reboot a host. • Set host built-in clock. • Set network configuration. • Set network time source. • Set SNMP. • Set Syslog forwarding. • Show network port status. • Show serial number. • Shut down host. • Stop and start a service on a host.

High-Level Task	Description
Maintain a Service	The following procedures describe how to maintain services. • Add, replicate or delete a service user. • Add a service user role. • Change a service user password. • Create and manage service groups. • Duplicate or replicate a service role. • Edit core service configuration files. • Edit or delete a service. • Explore and edit service property tree. • Kill a connection to a service. • Search for services. • Start, stop or restart a service. • View service details.

Step 1. Deploy a Host

1. Deploy a host.
   You can deploy a physical host (RSA Appliance), virtual host on-prem, a virtual in AWS, or a virtual host in Azure. See the following guides for instructions on how to deploy hosts.
   - *RSA NetWitness® Suite Physical Host Deployment Guide*
   - *RSA NetWitness® Suite Virtual Host Deployment Guide*
   - *RSA NetWitness® Suite AWS Deployment Guide*
   - *RSA NetWitness® Suite Azure Deployment Guide*
2. Go to **Administration** > **Hosts**.
   The **New Hosts** dialog is displayed with the hosts that you deployed.
3. Select the hosts that you want to enable.
   The **Enable** menu option becomes active.

4. Click **Enable**.

5. Select the host you enabled.
   The host is displayed in the Hosts view. At this point, you can install a service on the host.

Step 2. Install a Service on a Host

Each service is modeled as a plug-in to enable or disable according to the function of the host.

Prerequisites

Equipment, which can be physical or virtual, must be installed: NetWitness Server, Broker, Concentrator, Decoder, Log Decoder, Archiver, Warehouse, Malware Analysis server, or Event Stream Analysis server.

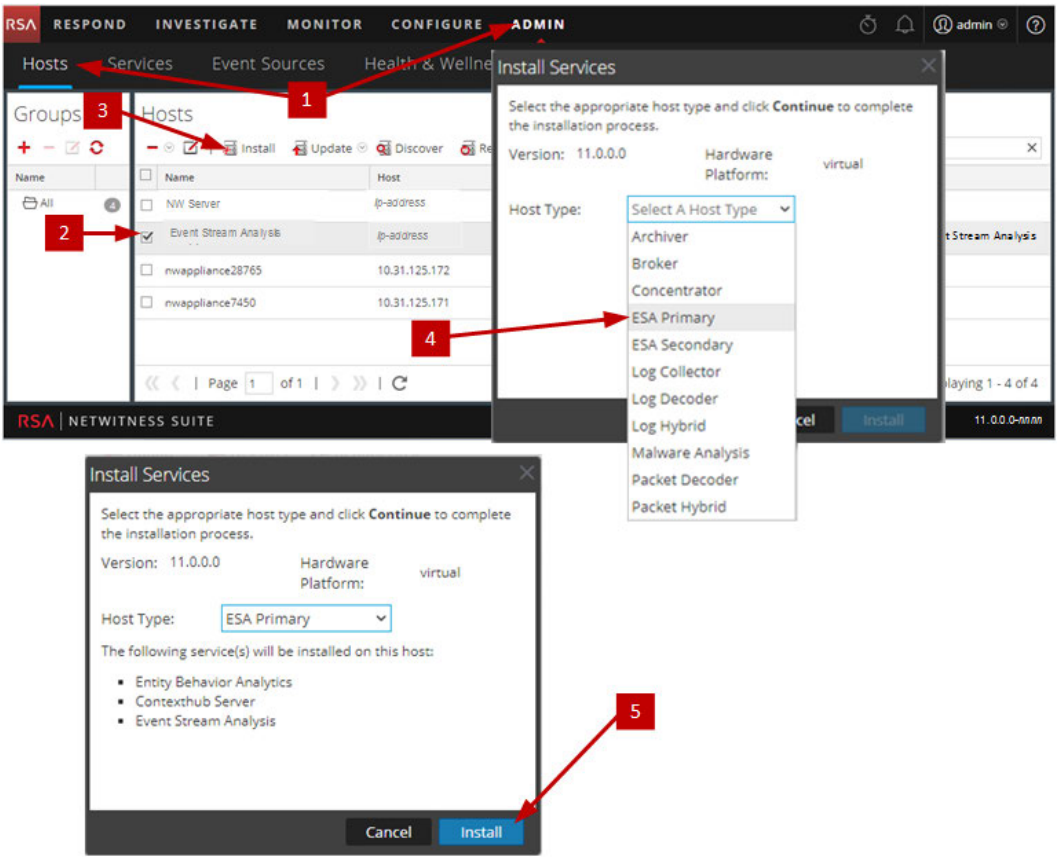
Procedure

Perform the following steps to add a Service to a Host:

1. In NetWitness Suite, go to **ADMIN** > **Hosts**.
   The **Hosts** view is displayed.
2. Select the host on which you want to install the service.
3. Click 
(Install Icon) in the toolbar.
   The **Install Services** dialog is displayed.
4. Select a service from the **Host Type** drop-down list (for example, **ESA Primary**).
   The 

(Install command button) becomes active in **Install Services** dialog.

5. Click Install (Install command button).



Step 3. Review SSL Ports for Trusted Connections

To support trusted connections each core service has two ports, an unencrypted non-SSL port and an encrypted SSL port. Trusted connections require the encrypted SSL port.

Prerequisite

To establish a trusted connection, each NetWitness Suite Core service must be upgraded to 10.4 or later. Trusted connections are not backwards compatible with NetWitness Suite Core 10.3.x or earlier.

Encrypted SSL Ports

When you install or upgrade to 10.4 or later, trusted connections are established by default with two settings:

1. SSL is enabled.
2. The core service is connected to an encrypted SSL port.

Each NetWitness Suite Core service has two ports:

- Unencrypted **non-SSL port**
  Example: Archiver 50008
- Encrypted **SSL port**
  Example: Archiver 56008

The SSL port is the non-SSL port + 6000.

The following table lists all NetWitness Suite services with their respective ports and shows that each core service has two ports. All port numbers listed are TCP.

Service	Unencrypted Non-SSL Port	Encrypted SSL Port
Archiver	50008	56008
Broker	50003	56003
Concentrator	50005	56005
Context Hub	N/A	50022
Decoder (Packets)	50004	56004
Event Stream Analysis	N/A	50030
Log Collector	50001	56001
Log Decoder	50002	56002
Malware Analysis	N/A	60007
Warehouse Connector	50020	56020
Workbench	50007	56007

Step 4. Manage Access to a Service

In a trusted connection, a service explicitly trusts the NW Server to manage and authenticate users. With this trust, services in **ADMIN > Services** no longer require credentials to be defined for every NetWitness Suite Core service. Instead, users who have been authenticated by the server can access the service without entering another password.

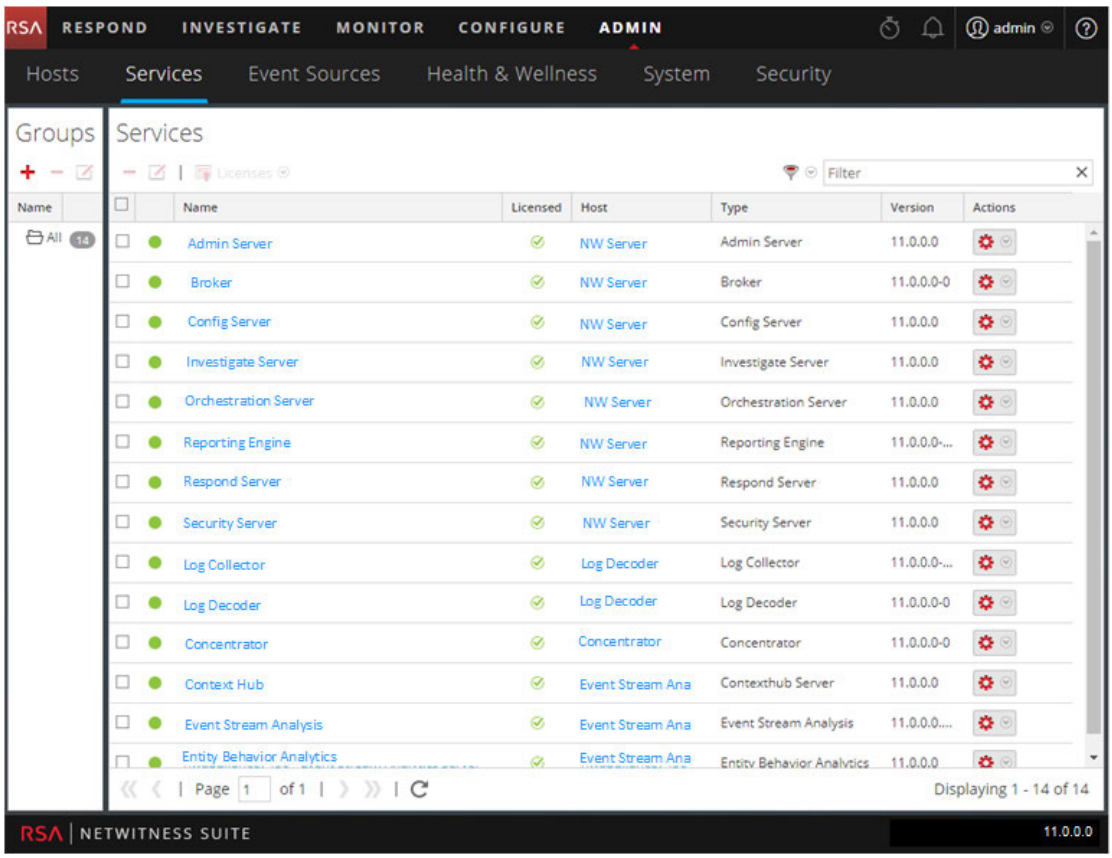
Test a Trusted Connection

PREREQUISITES

1. A role must be assigned to the user.
   For details, see **Add a User and Assign a Role** topic in the *System Security and User Management Guide*.
2. The user must:
   - Log on to NetWitness Suite to be authenticated by the server
   - Have access to the service

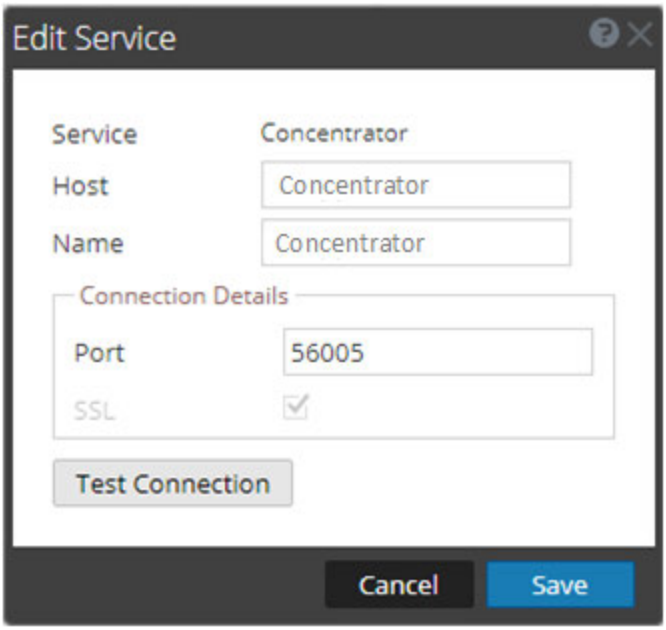
PROCEDURE

1. In NetWitness Suite, go to **ADMIN > Services**.
   The Services view is displayed.



2. Select the service (for example, a Concentrator) to test and click .

   The **Edit Service** dialog is displayed.



3. If you did a fresh 11.0.0.0 install, the port is correct. No action is required in the **Port** field. Go to the next step.
   If you upgraded to 11.0.0.0 or have a mixed environment of a 11.0.0.0 server and 10.3 hosts, you must update the **Port** by deselecting and re-selecting **SSL**. Then, the **Port** number changes to the encrypted SSL port for the service.
4. Remove the **Username** to test the connection without credentials.
5. Click **Test Connection**.

   The message **Test connection successful** confirms the trusted connection is established. The previously authenticated user can access the service without typing a username and password on the service.
6. Click **Save**.

Apply Version Updates to a Host

There are two method you can use to apply version updates to a host.

- Apply updates from the Host view (Web Access)
- Apply update from the command line (No Web Access)

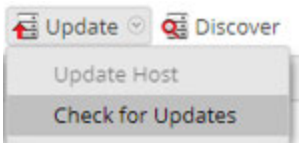
Apply Updates from the Hosts View (Web Access)

The Hosts view displays the software version updates available in your Local Update Repository and you choose and apply the updates you want from the Host view.

This procedure tells you how to update a host to a new version of NetWitness Suite.

Note: When you update the NetWitness Server host (also referred to as the NW Server host), NetWitness Suite backs up the System Management Service (SMS) configuration files (excluding the `wrapper.conf` file) from the `/opt/rsa/sms/conf` directory to`/opt/rsa/sms/conf_%timestamp%` directory. This is a precautionary measure for the rare occasion when you may need to restore the SMS configuration from backup. To do this, replace the files in the `/opt/rsa/sms/conf` directory with the files backed up to the `/opt/rsa/sms/conf_%timestamp%` directory after the update.

1. Log in to NetWitness Suite.
2. Make sure that the Local Update Repo is populated.
   See Populate Local Update Repo for instructions.
3. Go to **ADMIN > HOSTS**.
4. (Conditional) Check for the latest updates.

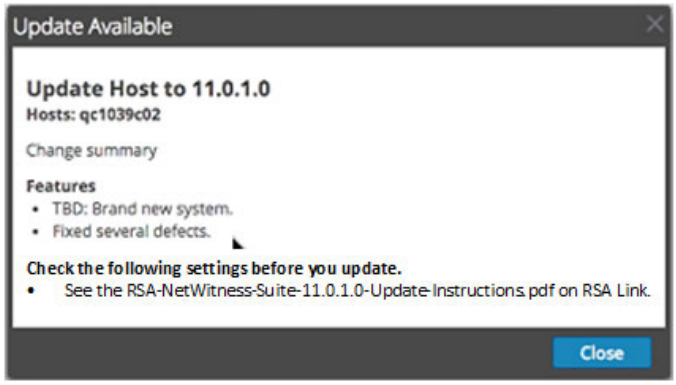


5. Select a host or hosts.
   You must update the NW Server to latest version first. You can update the other hosts in any sequence you prefer, but RSA recommends that you follow the guidelines in Running in Mixed Mode.
   Update Available is displayed in the **Status** column if you have an version update in your Local Update Repository for the selected hosts.
6. Select the version you want to apply from the **Update Version** column.

   If you:

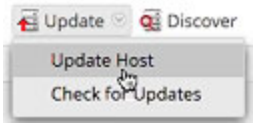
   - Want to update more than one host to that version, select the checkbox to the left of the hosts. Only currently supported update versions are listed.

- Want to view a dialog with the major features in the update and information on the updates click the information icon ( ) to the right of the update version number. The following is an example of this dialog.

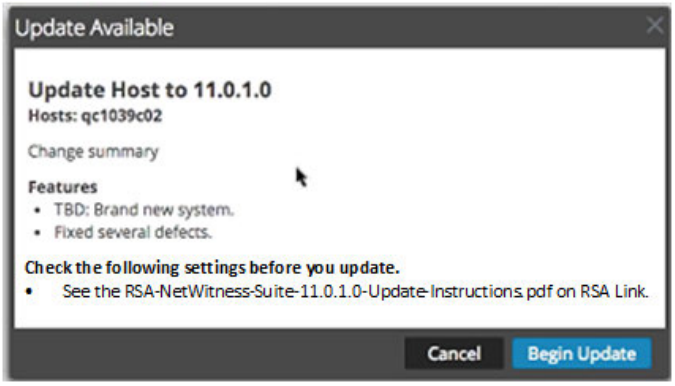


- Cannot find the version you want, select **Update > Check for Updates** to check the repository for any available updates. If an update is available, the message "New updates are available" is displayed and the **Status** column updates automatically to show Update Available. By default, only supported updates for the selected host are displayed.

7. Click **Update > Update Host** from the toolbar.



A dialog is displayed with information on the selected update. Click **Begin Update**.



The **Status** column tells you what is happening in each of the following stages of the update:

- Stage 1 - **Downloading update packages** - downloads the repository artifacts applicable to the services on the host you chose.
- Stage 2 - **Configuring update packages** - configures update files in to correct format.
- Stage 3 - **Update in progress** - updates host to new version.

See Troubleshooting Version Updates if you encounter an error when updating a host to a new version.

After the host is updated, NetWitness Suite prompts you to **Reboot Host**.

8. Click **Reboot Host** from the toolbar.
   NetWitness Suite shows the status as **Rebooting...** until the host comes back online. After the host comes back online, the **Status** shows **Up-to-Date**. Contact Customer Care if the host does not come back online.

Note: If you have DISA STIG enabled, opening Core Services can take approximately 5 to 10 minutes. This delay is caused by the generating of new certificates.

Apply Updates from the Command Line (No Web Access)

If your RSA NetWitness Suite deployment does not have Web access, complete the following procedure to apply a version update.

Note: In the following procedure, 11.0.1.0 is the version used as an example in the code strings of any 11.0 version.

1. Download `.zip` update package for the version you want (for example, `netwitness-11.0.1.0.zip`) from RSA Link (https://community.rsa.com/) > NetWitness Suite > RSA NetWitness Logs and Packets Downloadsto a local directory.

   Note: In command line, if there are multiple updates available for a host and you want to skip an earlier update, you must download the interim updates too. For example, the host is running 11.0.0.1 and the 11.0.0.2 and 11.0.0.3 updates are available for that host. If you want to update directly to 11.0.0.3, you must:
   1. Download both 11.0.0.2 and 11.0.0.3.
   2. Initialize to 11.0.0.3.
   3. Apply the 11.0.0.3 update to the host.
   You do not need to apply 11.0.0.2 update if you set up 11.0.0.2 and 11.0.0.3 in the stage directory before you run the initialization.

2. Transfer the `.zip` update package file to a local directory on the to the NW Server host.
3. SSH to the NW Server host.
4. Make a `tmp/upgrade/<version>` staging directory for the version you want (for example, `tmp/upgrade/11.0.1.0`).
   ```
   mkdir -p /tmp/upgrade/11.0.1.0
   ```
5. Change the directory to the staging directory.
   ```
   cd /tmp/upgrade/11.0.1.0
   ```
6. Directly unzip the file from the local directory to the staging directory.

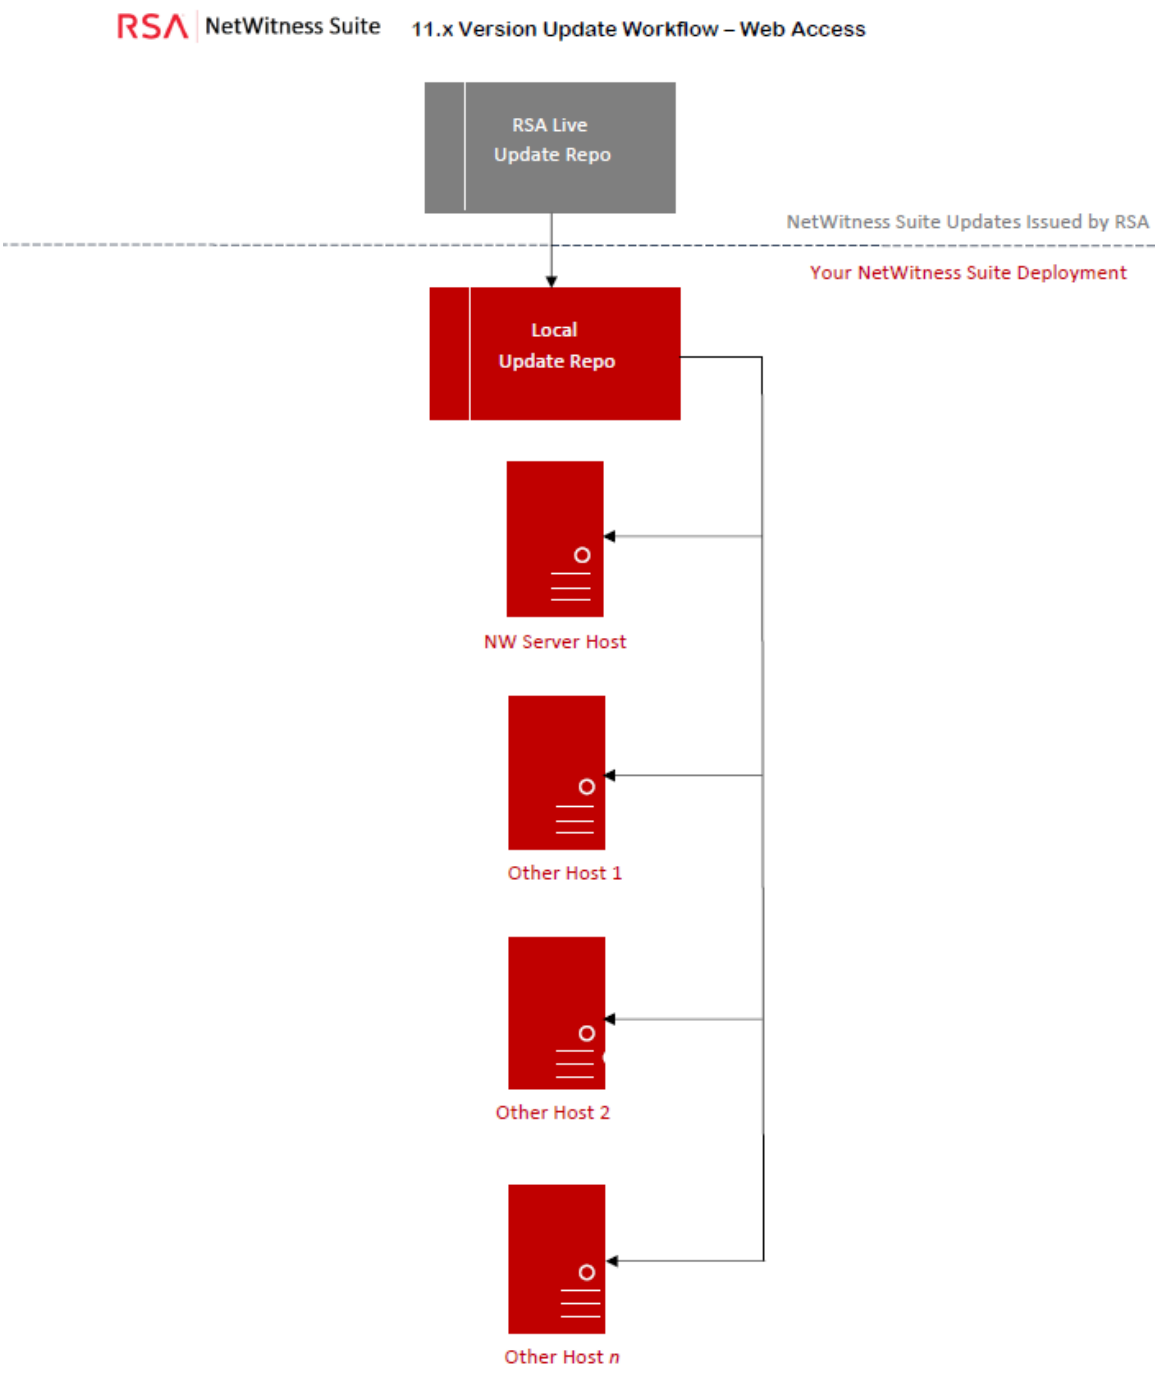
```
unzip <local directory>/netwitness-11.0.1.0.zip
```

Note: If you copied the `.zip` file to the created staging directory to unzip. Make sure that you delete the initial `.zip` file you copied to the staging location, after you extract it.

7. Initialize the update on the NW Server.
8. Apply the update to the NW Server.
   ```
   upgrade-cli-client --init --version 11.0.1.0 --stage-dir
   /tmp/upgrade/
   ```
9. Restart the NW Server.
10. Apply update to each non-NW Server host.
    ```
    upgrade-cli-client --upgrade --host-addr <non-NW Server IP address> -
    -version 11.0.1.0
    ```
    The update is complete when the polling is completed.
11. Restart the host.
    You can verify the version applied to the host with the following command:
    ```
    upgrade-cli-client --list
    ```

Populate Local Update Repository

The following diagram illustrates how you obtain versions updates if your NetWitness Suite deployment has Web Access. See Apply Updates from Command Line if your NetWitness Suite deployment does not have Web Access.



Note: When you make the initial connection with the Live Update Repository, you will be accessing all the CentOS 7 system packages and the RSA Production packages. This download of over 2.5GB of data will take an indeterminate amount of time depending on your Security Analytics Server's Internet connection and the traffic of the RSA Repository. It is NOT mandatory to use the Live Update Repository.

To connect to the Live Update Repository, Navigate to the **ADMIN >SYSTEM** view, select **Live** in the options panel and ensure that credentials are configured (**Connection** light should be green). If it is not green, click **Sign In** and connect.

Note: If you need to use proxy to reach out to the Live Update Repository, you can configure the Proxy Host, Proxy Username, and Proxy Password. Refer to ***Configure Proxy for NetWitness Suite*** in the ***NetWitness Suite*** **System Configuration Guide** in the help on RSA Link (https://community.rsa.com/).

Set Up an External Repository with RSA and OS Updates

Complete the following procedure to set up an external repository (Repo).

1. Log in to the web server host
2. Create the `ziprepo` directory to host the NW repository (`netwitness-11.0.0.0.zip`) under `web-root` of the web server. For example, /var/netwitness is the web-root, submit the following command string.
   ```
   mkdir /var/netwitness/ziprepo
   ```
3. Create the 11.0.0.0 directory under `/var/netwitness/ziprepo`.
   ```
   mkdir /var/netwitness/ziprepo/11.0.0.0
   ```
4. Create the `OS` and `RSA` directories under `/var/netwitness/ziprepo/11.0.0.0`.
   ```
   mkdir /var/netwitness/ziprepo/11.0.0.0/OS
   mkdir /var/netwitness/ziprepo/11.0.0.0/RSA
   ```
5. Unzip the `netwitness-11.0.0.0.zip` file into the `/var/netwitness/ziprepo/11.0.0.0`directory.
   ```
   unzip netwitness-11.0.0.0.zip -d /var/netwitness/ziprepo/11.0.0.0
   ```
   Unzipping `netwitness-11.0.0.0.zip` results in two zip files (`OS-11.0.0.0.zip` and `RSA-11.0.0.0.zip`)and some other files.
6. Unzip the:
   a. `OS-11.0.0.0.zip` into the `/var/netwitness/ziprepo/11.0.0.0/OS` directory.
      ```
      unzip /var/netwitness/ziprepo/11.0.0.0/OS-11.0.0.0.zip -d
      /var/netwitness/ziprepo/11.0.0.0/OS
      ```
      The following example illustrates how the Operating System (OS) file structure will appear after you unzip the file.

The external url for the repo is `http://<web server IP address>/ziprepo`.

7. Use the `http://<web server IP address>/ziprepo` in response to **Enter the base URL of the external update repositories** prompt from NW 11.0 Setup program (nwsetup-tui) prompt.

Create and Manage Host Groups

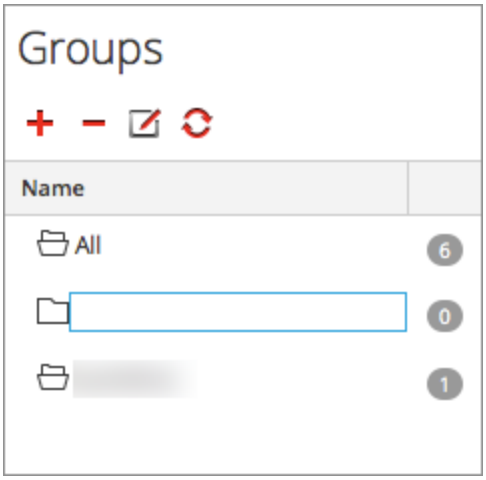
The Hosts view provides options for creating and managing groups of hosts. The Groups panel toolbar includes options for creating, editing, and deleting host groups. Once groups are created, you can drag individual hosts from the Hosts panel into a group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A host may belong to more than one group. Here are some examples of possible groupings:

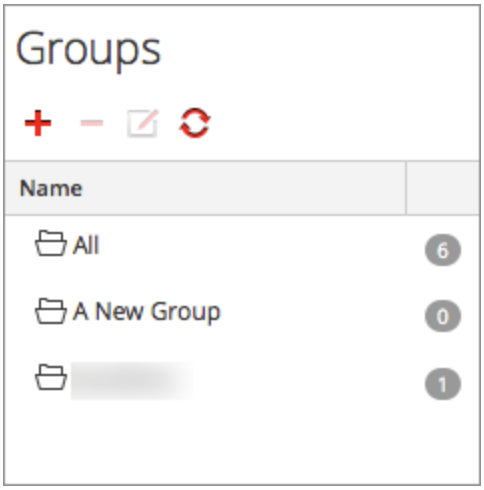
- Group different host types to make it easier to configure and monitor all Brokers, Decoders, or Concentrators.
- Group hosts that are part of the same data flow; for example, a Broker, and all associated Concentrators and Decoders.
- Group hosts according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected hosts are easily identifiable.

Create a Group

1. Select **ADMIN** > **Hosts**.
   The Hosts view is displayed.
2. In the **Groups** panel toolbar, click +.
   A field for the new group opens with a blinking cursor.



3. Type the name of the new group in the field (for example, **A New Group**) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the number of hosts in that group.



Change the Name of a Group

1. In the Hosts view **Groups** panel, double-click the group name or select the group and click .
   The name field opens with a blinking cursor.

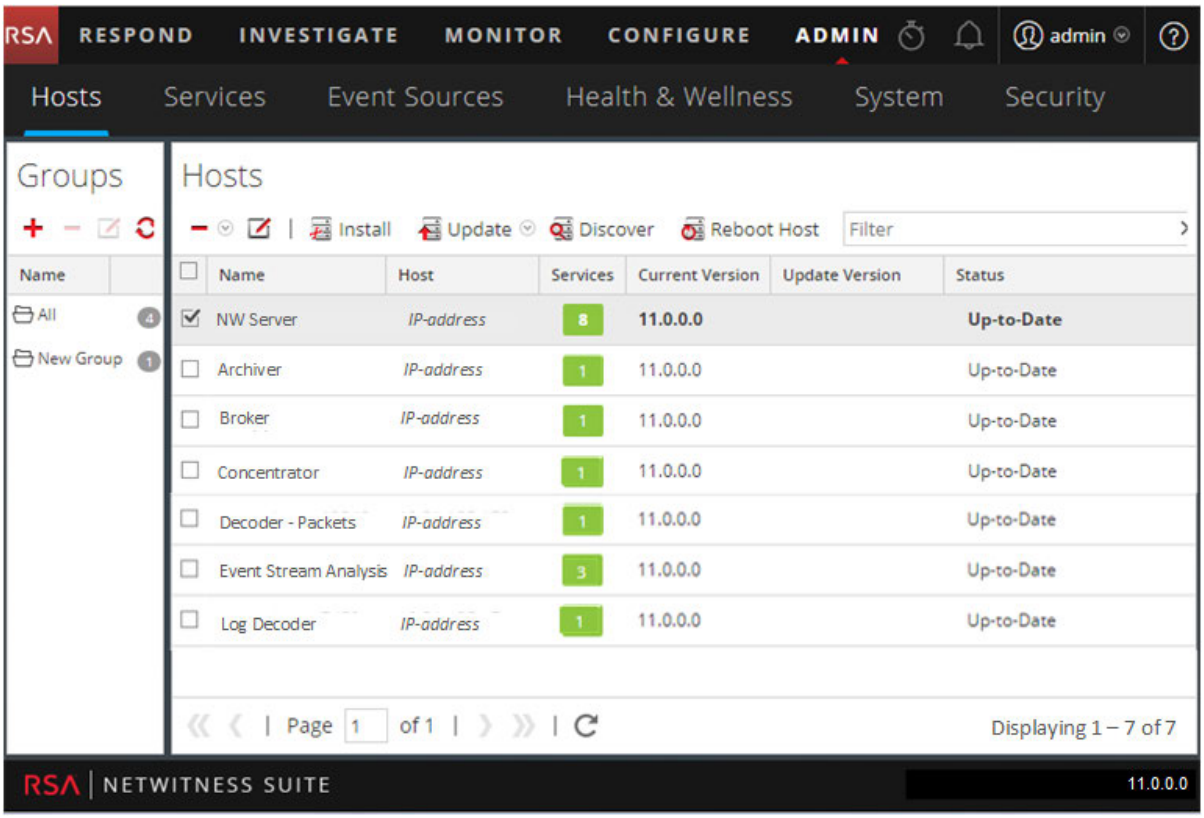
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

Add a Host to a Group

In the Hosts view **Hosts** panel, select a host and drag the host to a group folder in the Groups panel.
The host is added to the group.

View the Hosts in a Group

To view the hosts in a group, click the group in the **Groups panel**.
The **Hosts panel** lists the hosts in that group.

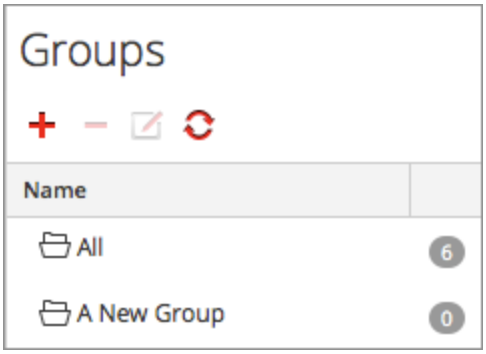


Remove a Host from a Group

1. In the Hosts view **Groups panel**, select the group that contains the host that you want to remove. The hosts in that group appear in the Hosts panel.
2. In the **Hosts panel**, select one or more hosts that you want to remove from the group, and in the toolbar, select > **Remove fromGroup**.
   The selected hosts are removed from the group, but are not removed from the NetWitness

Suite user interface. The number of hosts in the group, which is listed near the group name, decreases by the number of hosts removed from the group. The **All** group contains the hosts that were removed from the group.

In the following example, the host group called **A New Group** does not contain any hosts, since the host in that group was removed.



Delete a Group

1. In the Hosts view **Groups panel**, select the group that you want to delete.
2. Click .

   The selected group is removed from the Groups panel. The hosts that were in the group are not removed from the NetWitness Suite user interface. The **All** group contains the hosts from the deleted group.

Search for Hosts

You can search for hosts from a list of hosts in the Hosts view. The Hosts view enables you quickly filter the list of hosts by Name and Host. It is possible to have numerous NetWitness Suite hosts in use for various purposes. Instead of scrolling through the host list, you can quickly filter the host list to locate the hosts that you want to administer.

In the Services view, you can search for a service and quickly find the host that runs that service.

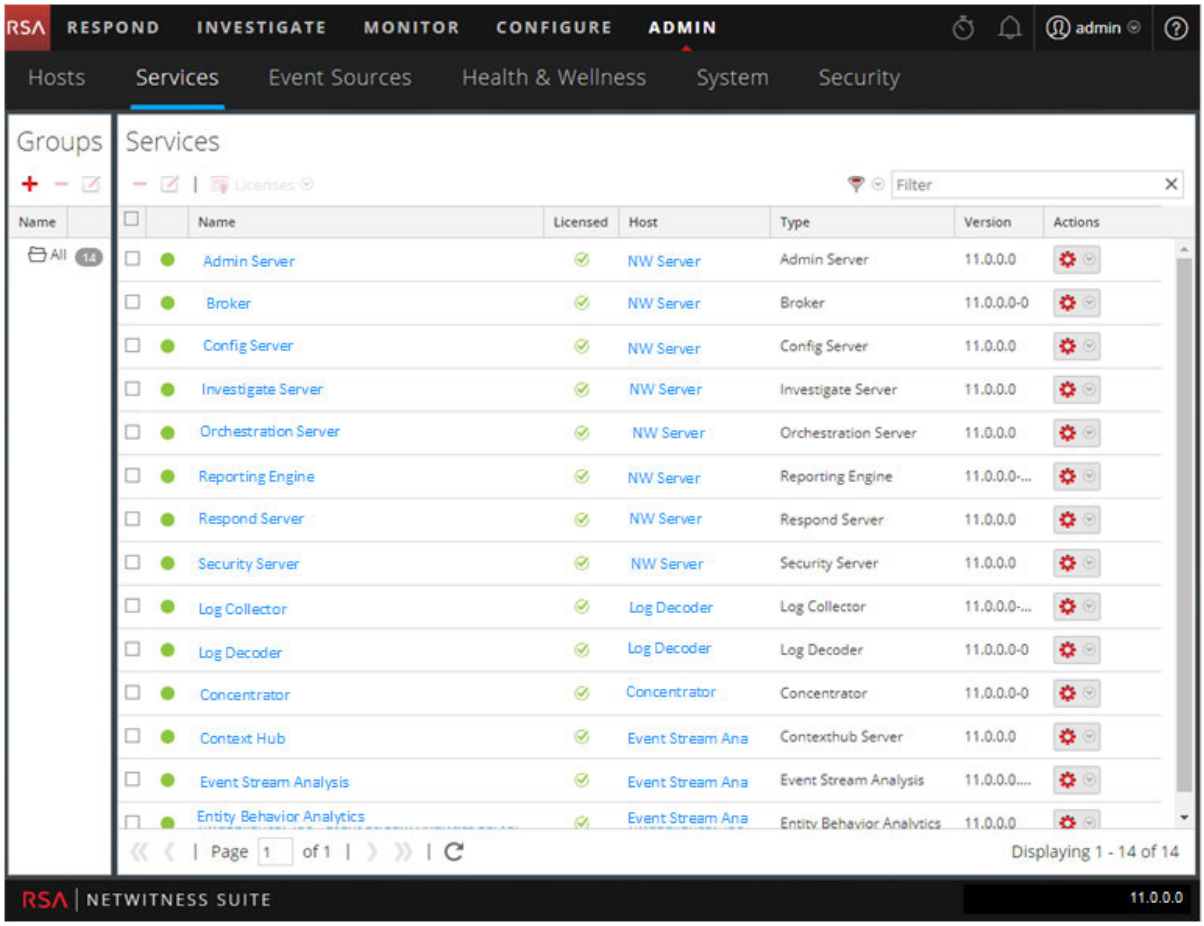
Search for a Host

1. Select **ADMIN** > **Hosts**.
2. In the **Hosts Panel** toolbar, type a host **Name** or **Hostname** in the **Filter** field.

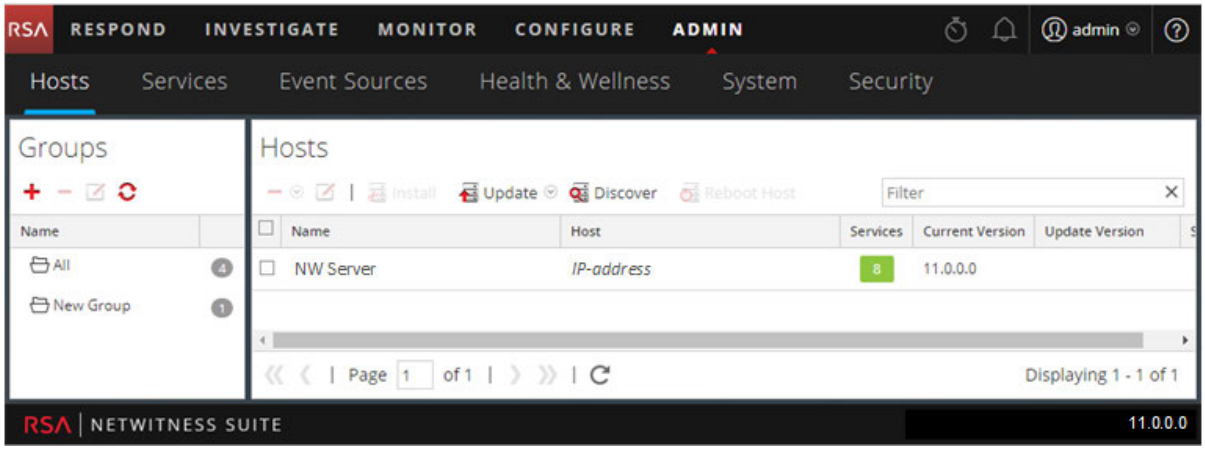
   
   The Hosts panel lists the hosts that match the names entered in the Filter field.

Find the Host that Runs a Service

1. Select **ADMIN > Services**.
2. In the Services view, select a service. The associated host is listed in the **Host** column for that service.



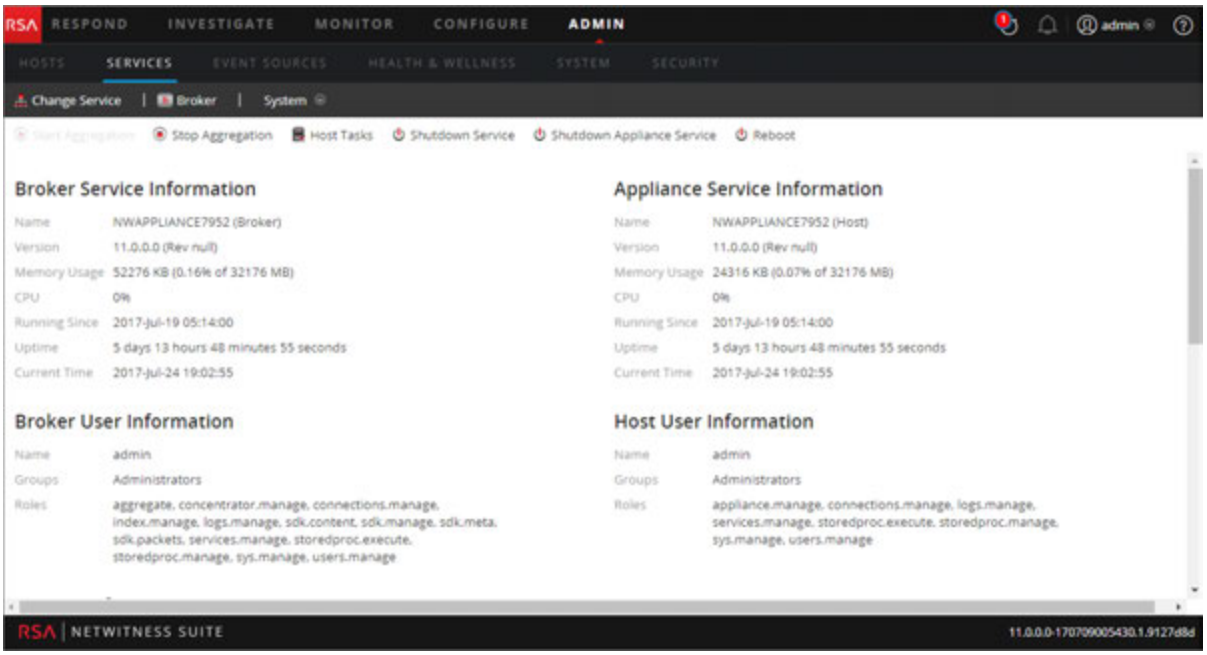
3. To administer the host in the Hosts view, click the link in the **Host** column for that service.
   The host associated with the selected service is displayed in the Hosts view.



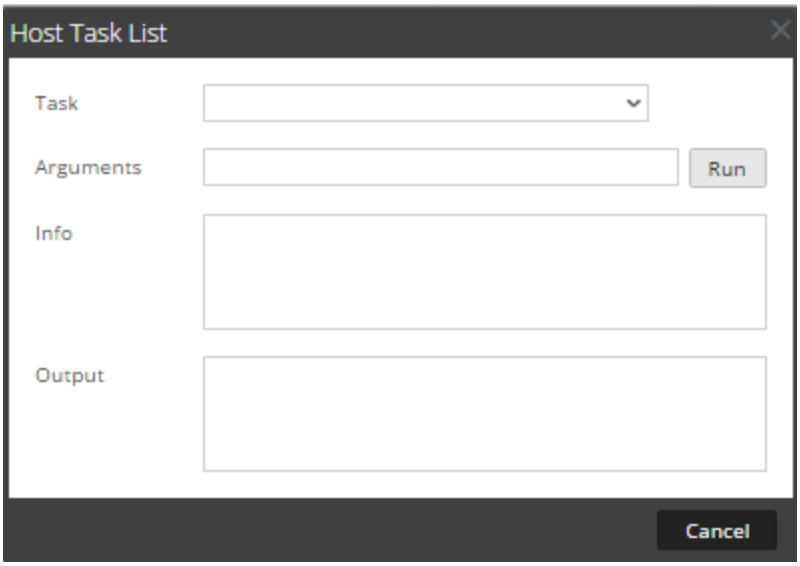
Execute a Task From the Host Task List

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.

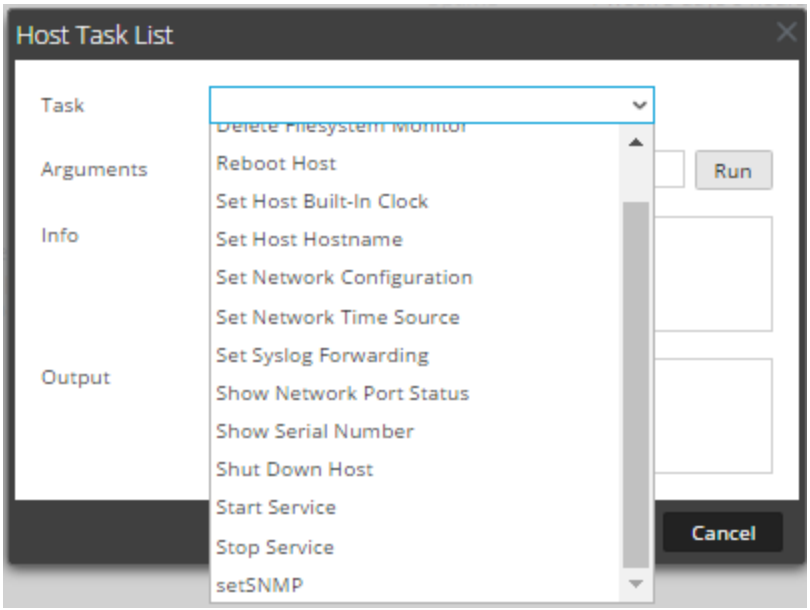
Note: The Admin, Config, Orchestration, Security, Investigate, and Respond services do have access to the System view. They only have access to the Explore view.
The System view for the service is displayed.



3. In the **Services System** view toolbar, click Host Tasks.



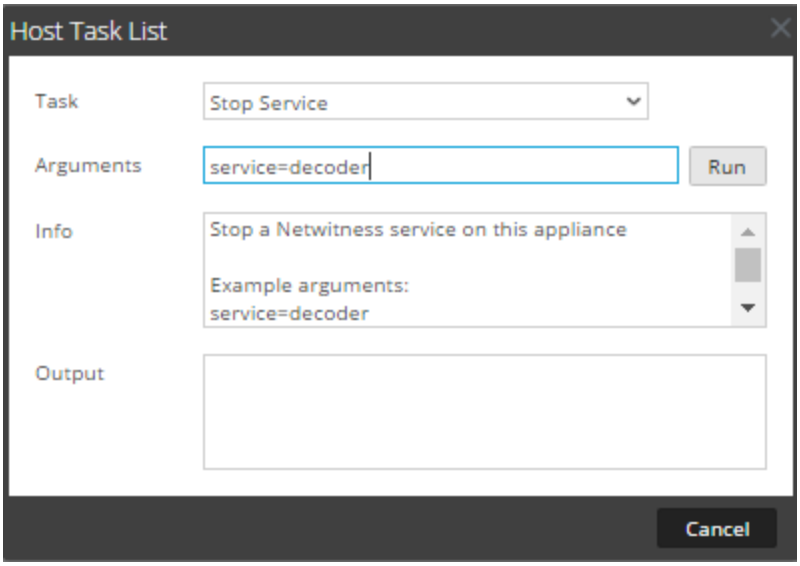
4. In the **Host Task List,** click in the **Task** field to display a drop-down list of tasks that run on a host.



5. Select a task; for example, click **Stop Service**.

   The task is displayed in the **Task** field and task description, example arguments, security

roles, and parameters are displayed in the **Info** area.



6. Type arguments if necessary and click **Run**.
   The command executes and the result is displayed in the **Output** section.

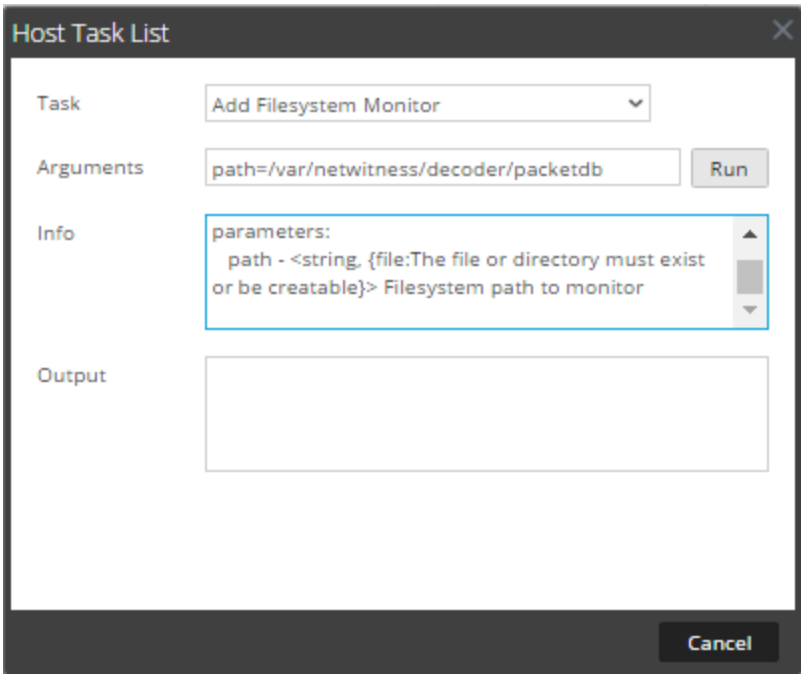
Add and Delete a Filesystem Monitor

When you want a service to monitor traffic on a specific file system, you can select the service and then specify the path. Security Analytics adds a filesystem monitor. Once a file system monitor is added to a service, the service continues to monitor traffic on that path until the file system monitor is deleted.

Configure the Filesystem Monitor

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Add Filesystem Monitor**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.

5. To identify the file system to monitor, type the path in the **Arguments** field. For example:
   path=/var/netwitness/decoder/packetdb

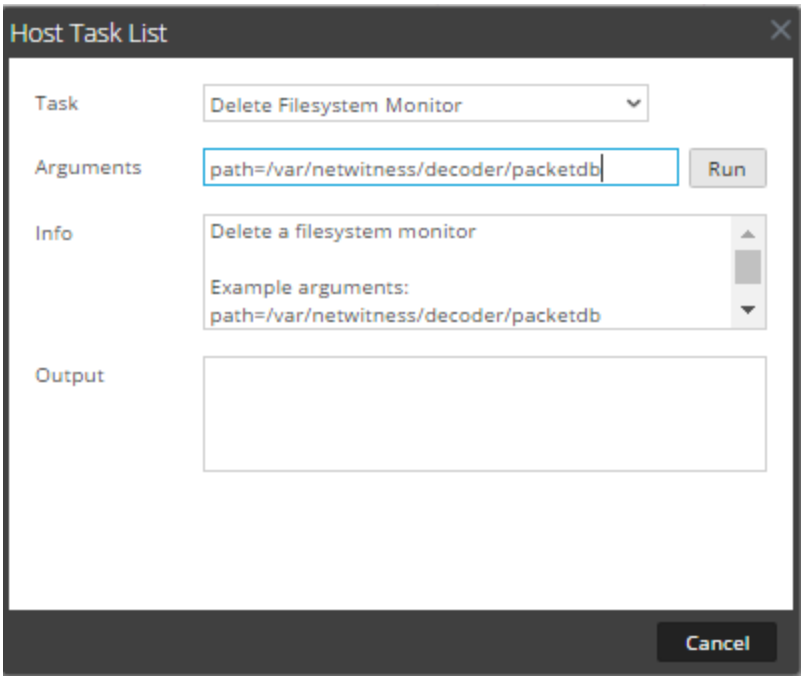


6. Click **Run**.
   The result is displayed in the **Output** area. The service begins to monitor the file system and continues to monitor it until you delete the filesystem monitor.

Delete a Filesystem Monitor

1. Navigate to the **Host Task List** dialog.
2. In the **Host Task List**, select **Delete Filesystem Monitor**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.
3. To identify the filesystem to stop monitoring, type the path in the **Arguments** field. For example:

path=/var/netwitness/decoder/packetdb



4. Click **Run**.
   The result is displayed in the **Output** area. The service stops monitoring the file system.

Reboot a Host

Under certain conditions it is necessary to reboot a host; for example, after installing a software upgrade. This procedure uses a Host Task List message to shut down and restart a host.

Security Analytics also offers other options for shutting down a host:

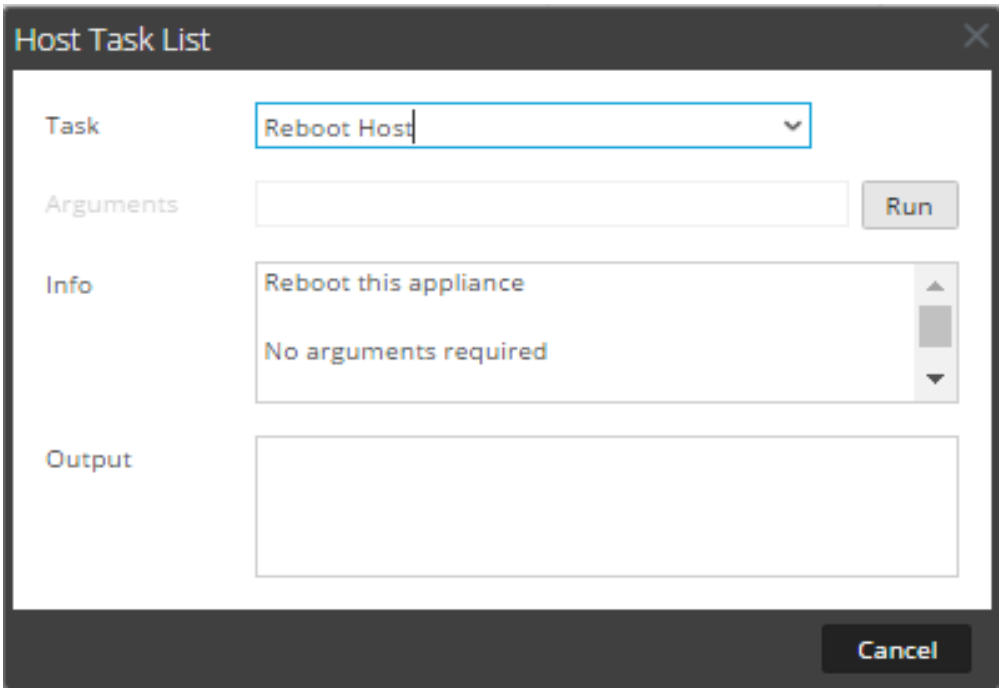
- To shut down and restart a host through an attached service, go to the Hosts view from a service in the Services view (see Search for Hosts) and then follow the *Shut Down and Restart a Host from the Hosts View* procedure below.
- To shut down the physical host without restarting, see Shut Down Host.

Shut Down and Restart a Host from the Hosts View

1. Select **ADMIN** > **Hosts**.
2. In the **Hosts** panel, select a host.
3. Select 
from the toolbar.

Shut Down and Restart a Host from the Host Task List

1. Select **ADMIN** > **Services**.
2. In the **Services** panel, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Reboot Host** in the **Task** field.
   No arguments are required.



5. Click **Run**.
   The host is rebooted and the result is displayed in the **Output** area.

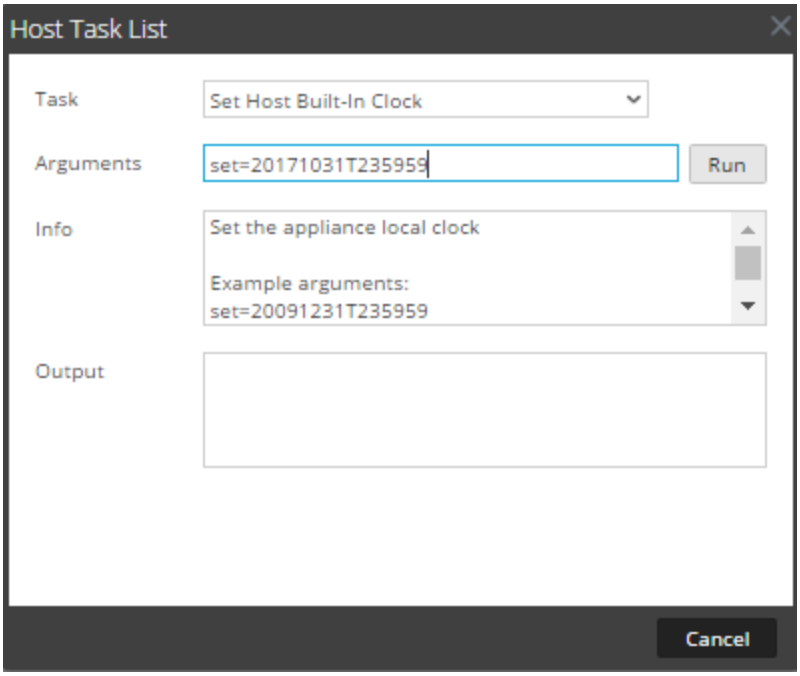
Set Host Built-In Clock

After a shutdown or battery failure, it may be necessary to set the local clock on a host. The Set Host Built-In Clock task resets the clock time.

Set the Time on the Local Clock

1. Select **ADMIN** > **Services**.
2. In the **Services** grid, select a service and > **View** > **System**.
   The System view for the service is displayed.

3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Set Host Built-In Clock**. Help for the task is displayed in the **Info** area.
5. Enter the date and time arguments in the **Arguments** field; for example, to specify October 31, 2017 at 11:59:59 PM, type:
   set=20171031T235959



6. Click **Run**.
   The clock is set to the specified time and a message is displayed in the **Output** area.

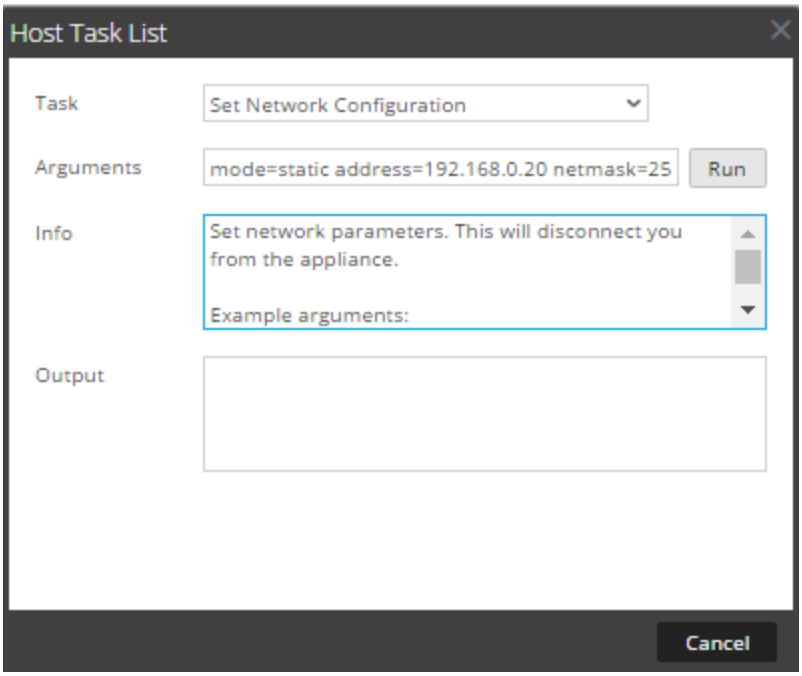
Set Network Configuration

When a configured Core host needs its address changed, you can set a new network address, subnet mask, and gateway for the host using the **Set Network Configuration** message in the **Host Task List**.

Caution: The change goes into effect immediately, and the host is disconnected from Security Analytics. You must then add the host to Security Analytics again using the new network address.

Specify the Network Address for a Host

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View System**.
   The System view for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Set Network Configuration**.
   The task is displayed in the **Task** field and help is displayed in the **Info** area.
5. Enter the arguments in the **Arguments** field. For example:
   mode=static address=192.168.0.20 netmask=255.255.255.0 gateway=192.168.0.1



6. Click **Run.**
   The task executes and the result is displayed in the **Output** area. The host is disconnected from Security Analytics. You must add the host again with the new address.

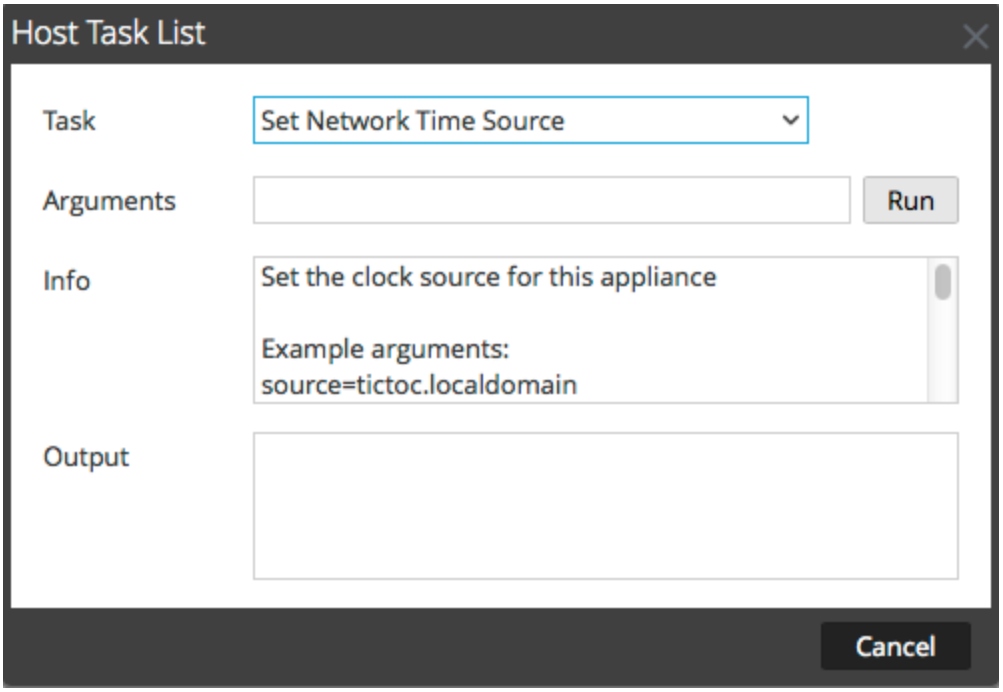
Note: If the mode is DHCP, there may be no way to determine the new address. You may have to connect to the host directly to determine the new address.

Set Network Time Source

When setting the clock source for a host, set the hostname or address of an NTP server to be the network clock source for the host. If the host is using a local clock source, you must specify **local** here to allow **Set the Local Clock Source** to be effective.

Specify the Network Clock Source

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click **View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Set Network Time Source**.



5. Do one of the following:
   - Type the hostname or address of the NTP server to serve as the clock source for this host; for example: **source=tictoc.localdomain**
   - If you want to use the host clock as a clock source, type: **source=local**
6. Click **Run**.
   The clock source is set and a message is displayed in the **Output** area.

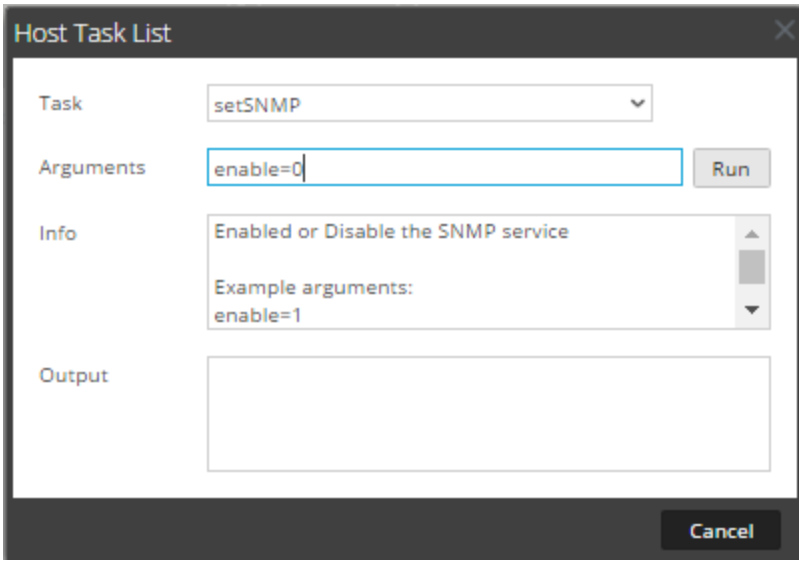
Note: If you specified a NTP clock source of **local**, the host clock serves as the clock source and the time is configured using Set Host Built-In Clock.

Set SNMP

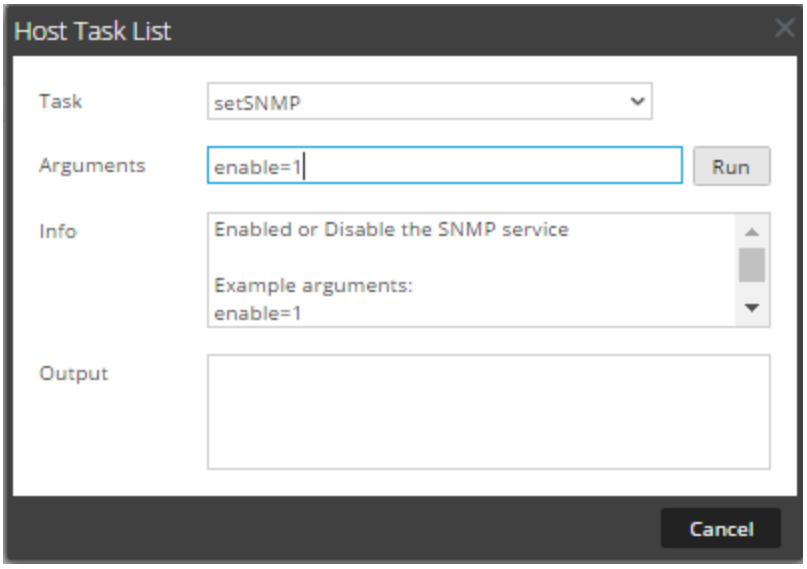
Set SNMP in the Host Task List enables or disables the SNMP service on a host. In order for a host to receive SNMP notifications, the SNMP service needs to be enabled. If you are not using SNMP for NetWitness Suite notifications, it is not necessary to enable the service.

Toggle SNMP Service on the Host

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **setSNMP**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.
5. Do one of the following:
   - If you want to disable the service, type **enable=0** in the **Arguments** field.



- If you want to enable the service, type **enable=1** in the **Arguments** field.



6. Click **Run**.
   The result is displayed in the **Output** area.

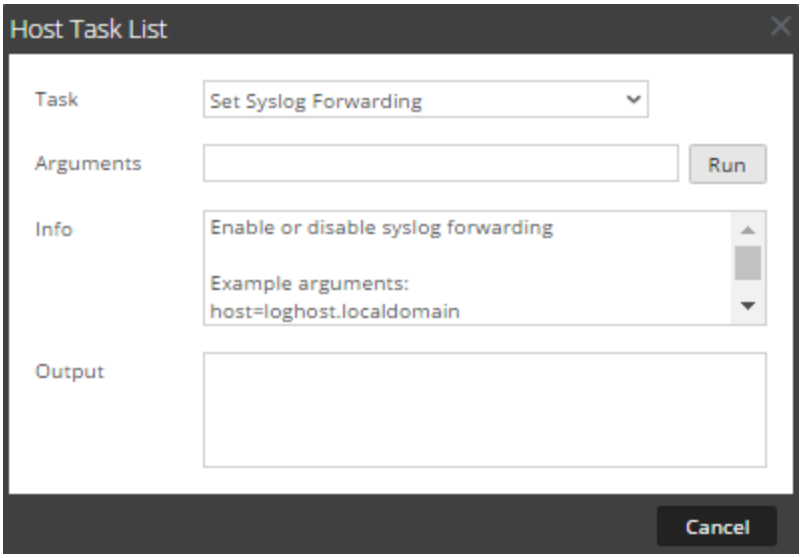
Set Syslog Forwarding

You can configure Syslog forwarding to forward the operating system logs of your NetWitness Suite Hosts to a remote syslog server. You can use the Set Syslog Forwarding task in the Host Task List to enable or disable syslog forwarding.

Set Up and Start Syslog Forwarding

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.

4. In the **Host Task List**, select **Set Syslog Forwarding**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.



5. In the **Arguments** field, do any one of the following.
   - To enable syslog forwarding, specify any one of the following formats:
     - **host=<loghost>.<localdomain>** (for example, host=syslogserver.local).
     - **host=<loghost>.<localdomain>:<port>** (for example, host=syslogserver.local:514).
     - **host=<IP>** (for example, host=10.31.244.244).
     - **host=<IP>:<port>** (for example, host=10.31.244.244:514).
       The following table lists the parameters used to enable syslog forwarding and its descriptions.

Parameter	Description
loghost	The host name of the remote syslog server.
localdomain	The domain of the remote syslog server.
port	IP address of the remote syslog server.
IP	The port number on which the remote syslog server receives a syslog messages.

   - To disable syslog forwarding, type **host=disable**.

6. Click **Run**.
   The result is displayed in the **Output** area.

Once syslog forwarding is enabled or disabled, the `/etc/rsyslog.conf` file is updated automatically to enable or disable syslog forwarding to the remote syslog destination and the syslog service is restarted.

If you enable syslog forwarding, the logs from the configured service are forwarded to the defined syslog server and continues forwarding until disabled.

Note: You can now log in to the remote syslog server and verify if the messages are being received from the NetWitness Suite services configured for syslog forwarding.

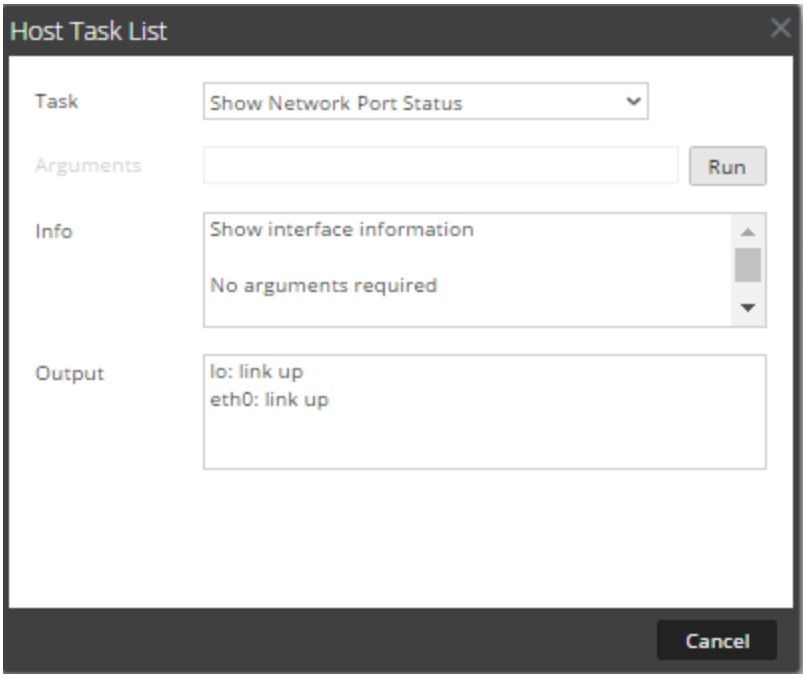
Show Network Port Status

The Show Network Port Status task in the Host Task List gives you the status of all configured ports on the host.

Display the Network Port Status

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and > **View**> **System**.
   The System view for the selected service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Show Network Port Status**.
   The task is displayed in the **Task** field, and information about the task is displayed in the **Info** area.

5. To execute the task, click **Run**.
   The status for each port on the host is displayed in the **Output** area.



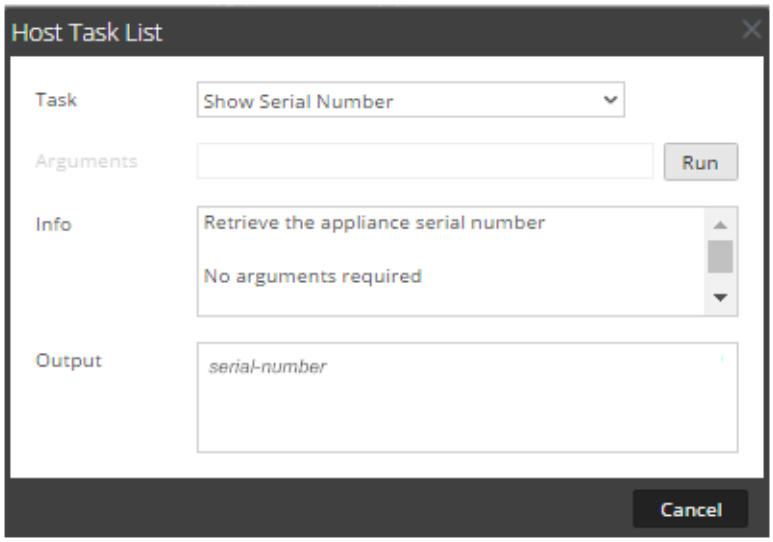
Show Serial Number

The Show Serial Number task in the Host Task List gives you the serial number of a host.

Show the Serial Number

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Show Serial Number**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.

5. No arguments are required for this task. Click **Run**.
   The serial number of the selected host is displayed in the **Output** area.



Shut Down Host

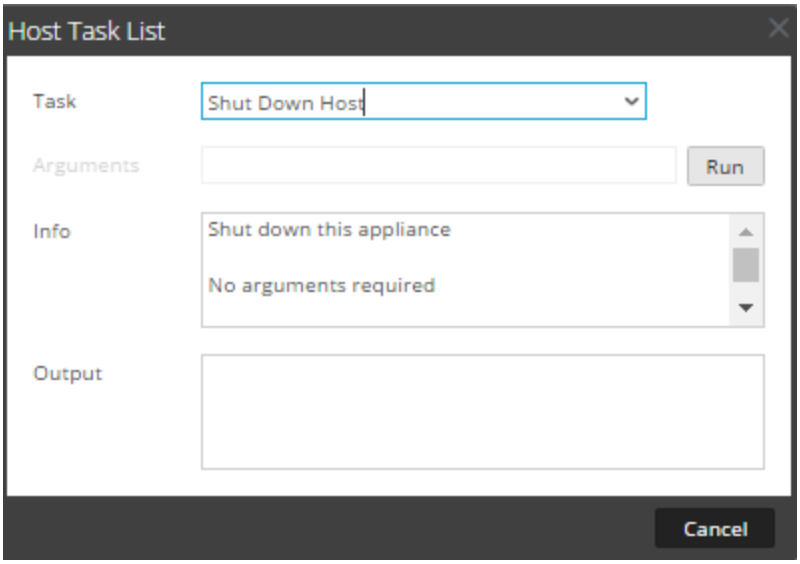
Under certain circumstances; for example, a hardware upgrade or an extended power outage that exceeds backup power capacity, it may be necessary to shut down a physical host. When you shut down a host, all services running on the host are stopped and the physical host turns off.

The physical host does not restart automatically; instead the power switch must be used to restart the host. Once the physical host restarts, the host and services are configured to restart automatically.

Reboot a Host to start and stop a host without shutting down the host.

Shut Down the Host

1. In the Host Task List dialog, select **Shut Down Host** in the **Task** field.



2. To execute the task, click **Run**.
   The host shuts down, and the host turns off.

Stop and Start a Service on a Host

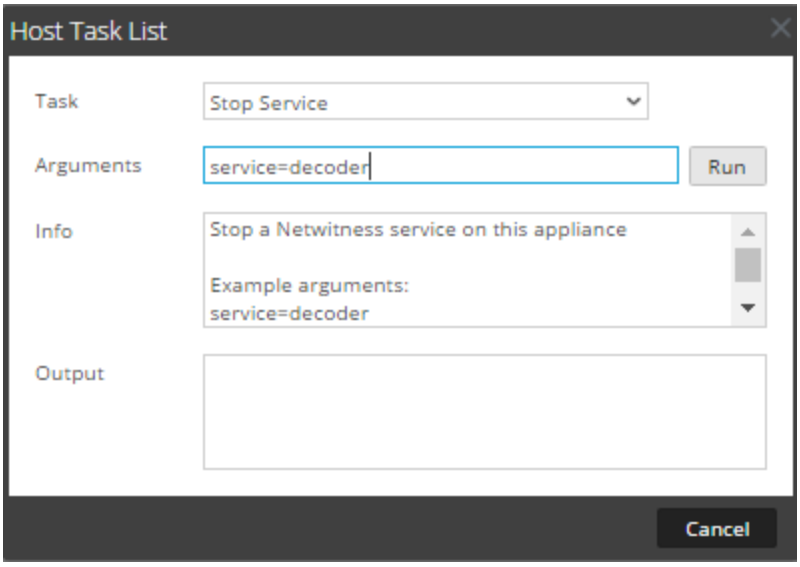
The Host Task List has two options for stopping and starting a service on a host. When you stop a service using the **Stop Service** message, all processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically. This is the same as the **Shutdown Service** option in the Services System view.

If a service does not restart automatically after being stopped, you can restart it manually using the **Start Service** message.

Stop a Service on a Host

1. Select **ADMIN** > **Services**.
2. In the **Services** grid, select a service and click > **View**> **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Stop Service**.
   The task is displayed in the **Task** field, and information about the task is displayed in the **info** area.

5. Specify the service (decoder, concentrator, broker, logdecoder, logcollector) to stop in the **Arguments** field; for example, **service=decoder**.

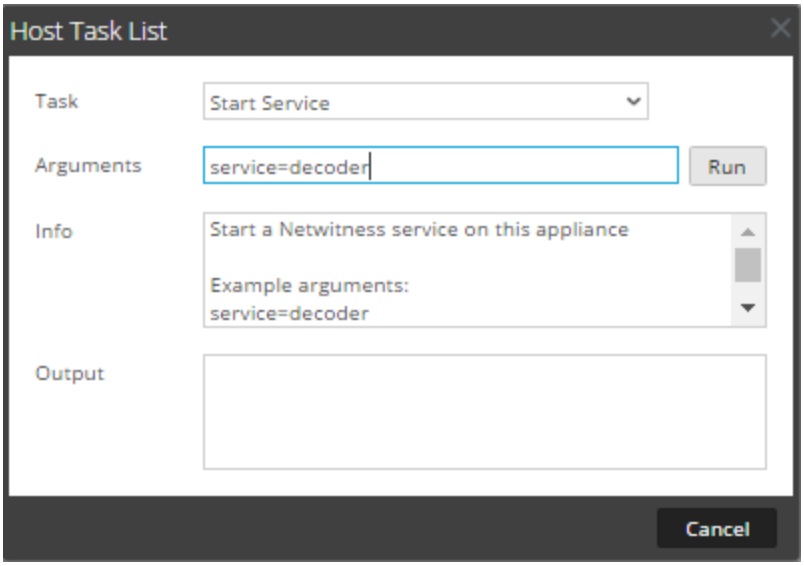


6. To execute the task, click **Run**.
   The service stops and the status is displayed in the **Output** area. All processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically.

Start a Service on a Host

1. In the **Host Task List**, select **Start Service** from the Task drop-down menu.
   The task is displayed in the **Task** field, and information about the task is displayed in the **info** area.
2. Specify the service (decoder, concentrator, broker, logdecoder, logcollector) to start in the **Arguments** field; for example,

service=decoder



3. To execute the task, click **Run**.
   The service starts and the status is displayed on the **Output** area.

Add, Replicate or Delete a Service User

You must add a user to a service for:

- Aggregation
- Accessing the service with the:
  - Thick client
  - REST API

Note: This topic does not apply to users who access services through the user interface on NetWitness Server. You must add those users to the system, not a service. For details, see the **Set Up a User** topic in *System Security and User Management*.

For each service user, you can:

- Configure user authentication and query handling properties for the service
- Make the user a member of a role, which has a set of permissions the user receives
- Replicate the user account to other services
- Change the service user password on selected services

Change a Service User Password provides instructions for changing the service user password across services.

Replication and Migration Considerations

When replicating a user from a NetWitness Suite 10.5 or later service to a NetWitness Suite 10.4 service, Query Timeout migrates to Query Level based on the closest level. For example, if a user has a Query Timeout of 15 minutes, the user gets a Query Level of 3 after the migration. If a user has a Query Timeout of 35 minutes, the user gets a Query Level of 2 after the migration. If a user has a Query Timeout of 45 minutes, the user gets a Query Level of 2 after the migration.

When migrating or replicating a user from a NetWitness Suite 10.4 service to a NetWitness Suite 10.5 or later service, Query Level migrates to Query Timeout based on the following definitions:

- Query Level 1 = 60 minutes
- Query Level 2 = 40 minutes
- Query Level 3 = 20 minutes

Procedures

ACCESS THE SECURITY VIEW

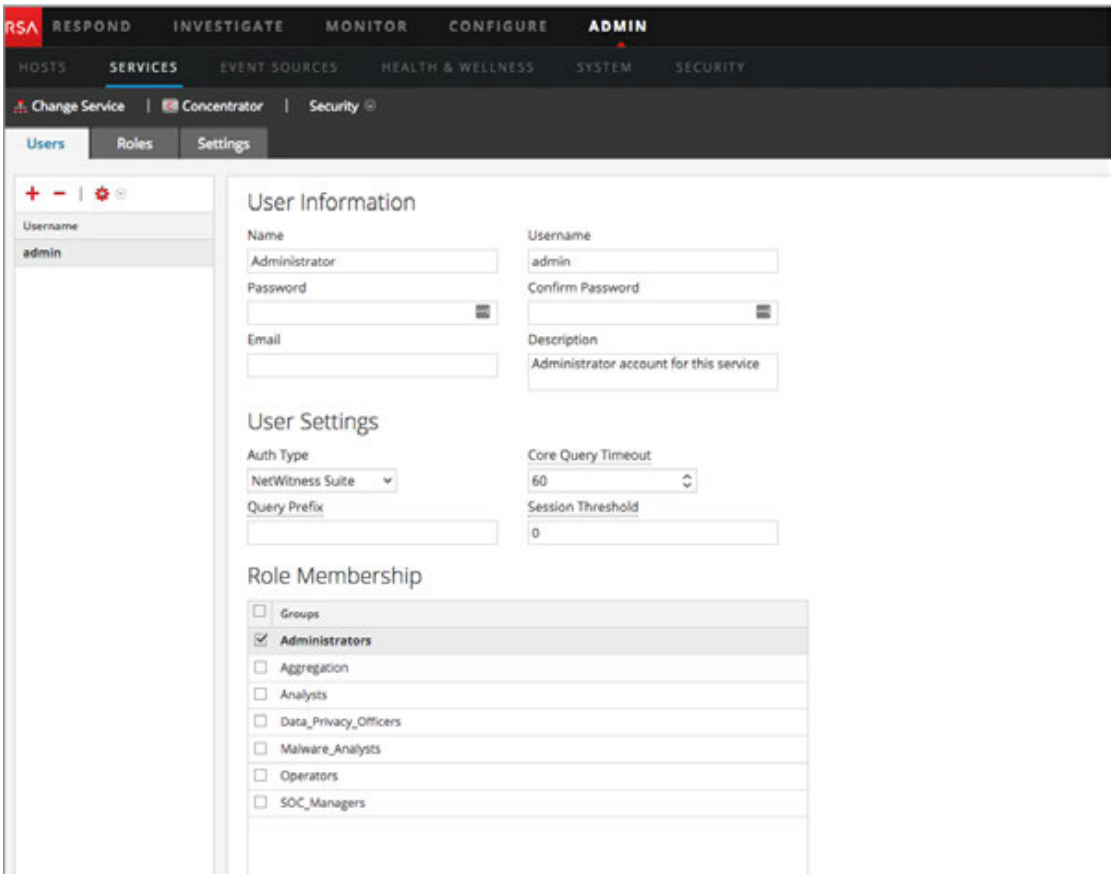
Each of the following procedures starts in the Services Security view.

To navigate to the Services Security view:

1. In NetWitness Suite, go to **ADMIN > Services**.

2. Select a service, then click  > **View** > **Security**.

   The Security view for the selected service is displayed with the Users tab open.



Note: For NetWitness Suite 10.4 and earlier service versions, in the User Settings section, the **Query Level** field is displayed instead of **Core Query timeout**.

ADD A SERVICE USER

1. On the **Users** tab, click +.
2. Type the Username to access the service, then press **Enter**.
   The User Information section displays the Username and the rest of the fields are available for editing.
3. Type the password for logging on to the service in the **Password** and **Confirm Password** fields.
4. (Optional) Provide additional information:
   - **Name** for logging on to NetWitness Suite
   - **Email** address

- **Description** of the user

5. In the User Settings section, select the following information:
   - **Authentication Type**
     - If NetWitness Suite authenticates the user, select NetWitness.
     - If Active Directory or PAM is configured on NetWitness Server to authenticate the user, select External.

Note: In 10.4 and later, trusted connections make it unnecessary to configure external user accounts on the service. All external configuration is centralized on NetWitness Server.

   - **Core Query Timeout** is the maximum number of minutes a user can run a query on the service. This field applies to NetWitness Suite 10.5 and later service versions and does not appear for 10.4 and earlier versions.

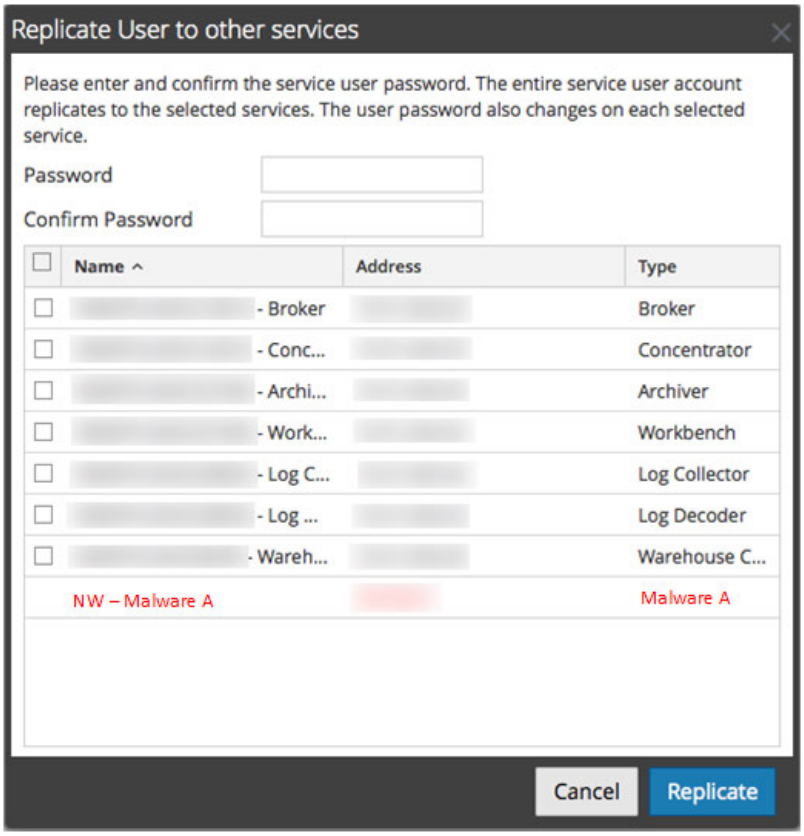
6. (Optional) Specify additional query criteria:
   - **Query Prefix** filters queries. Type a prefix to restrict results the user sees.
   - **Session Threshold** controls how the service scans meta values to determine session counts. Any meta value with a session count that is above the threshold stops its determination of the true session count.

7. In the **Role Membership** section, select each role to assign to the user. When a user is a member of a role on a service, the user has the permissions assigned to the role.
8. To activate the new service user, click **Apply**.

The user is added to the service immediately.

REPLICATE A USER TO OTHER SERVICES

1. In the Users tab, select a user and click > **Replicate**.
   The Replicate Users to Other Services dialog is displayed.



2. Enter the user's **password** and confirm the password.
3. Select each service to which you are replicating the user.
4. Click **Replicate**.

The user account is added to each selected service.

DELETE A SERVICE USER

1. On the **Users** tab, select the **Username** and click .

   NetWitness Suite requests confirmation that you want to delete the selected user.
2. To confirm, click **Yes**.

The user is deleted from the service immediately.

Add a Service User Role

There are pre-configured roles in NetWitness Suite that are installed on the server and on each service. You can also add custom roles. The following table lists the pre-configured system roles and their permissions.

Role	Permission
Administrators	Full system access
Operators	Access to configurations but not to meta and session content
Analysts	Access to meta and session content but not to configurations
SOC_ Managers	Same access as Analysts plus additional permission to handle incidents
Malware_ Analysts	Access to malware events and to meta and session content
Data_Privacy_ Officers	Access to meta and session content as well as configuration options that manage obfuscation and viewing of sensitive data within the system (see Data Privacy Management).

You must add a service role when you have added a:

- **Service** user or users that requires a new set of permissions.
- **Custom role on NetWitness Server** because trusted connections require that the same custom role exists both on the server and on each service the custom role will access. The names must be identical. For example, if you add a Junior Analysts role on the server then you must add a Junior Analysts role on each service the role will access. For more information, see the **Add a Role and Assign Permissions** topic in *System Security and User Management*.

There is also a pre-configured **Aggregation** service role. Aggregation Role and Service User Roles and Permissions provide additional information.

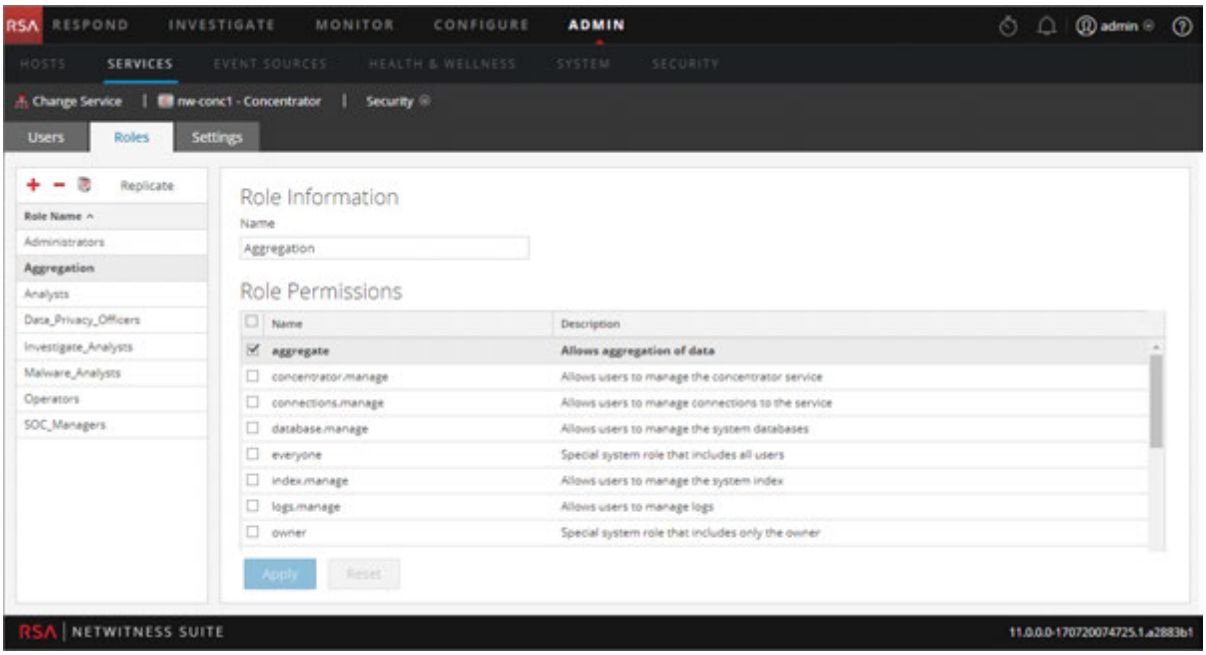
Procedure

To add a service user role and assign permissions to it:

1. In NetWitness Suite, go to **ADMIN > Services**.
2. Select a service, then  **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.

3. Select the **Roles** tab and click +.

   The Services Security view is displayed and five pre-configured roles are already listed.



4. Click +, type the **Role Name** and press **Enter**.

   The Role Name is displayed above a list of **Role Permissions**.

5. Select each permission the role will have on the service.

6. Click **Apply**.

The role is added to the service immediately. You can add service users to it in the **Users** tab.

Change a Service User Password

This procedure allows Administrators to change the password of a service user and replicate the new password to all Core services with that user account defined. It replicates only the password change to the Core services selected and does not replicate the entire user account. Administrators can also change the password of the **admin** account on the Core services.

Note: The Change Password option does not apply to external users.

To change the password of a service user:

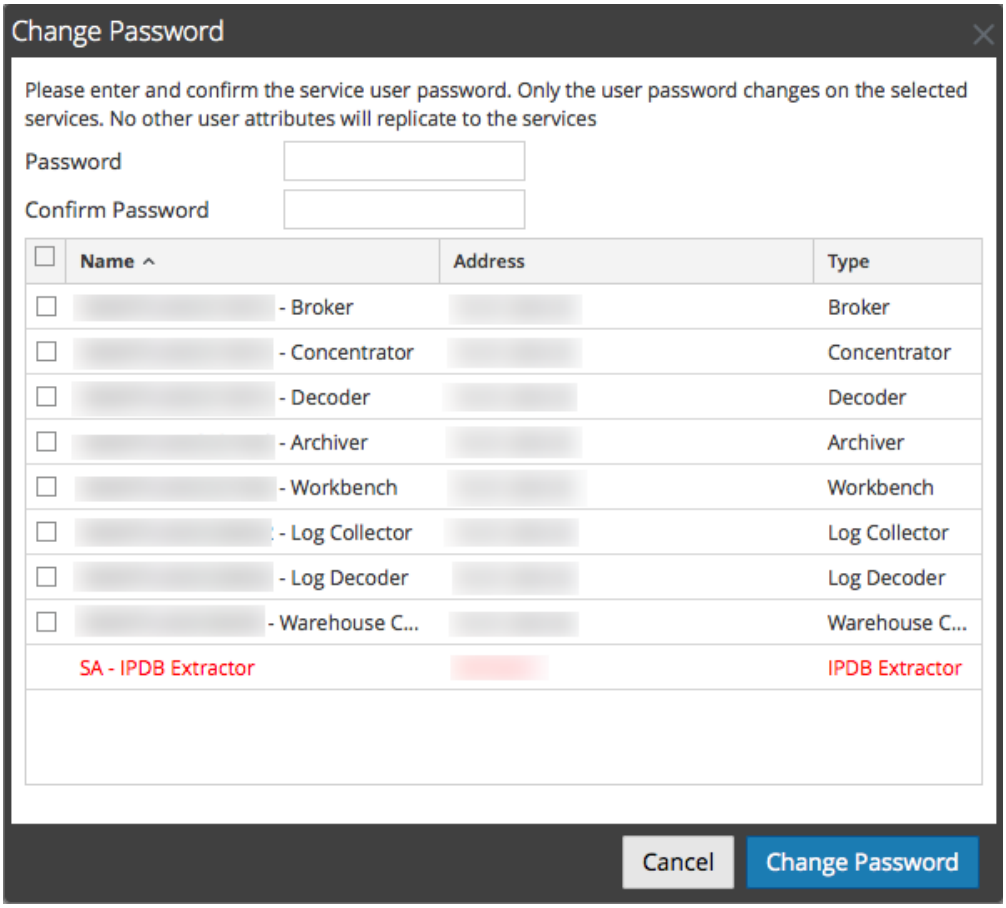
1. In NetWitness Suite, go to **ADMIN > Services**.

   The Administration Services view is displayed.

2. Select a service, then click  **> View > Security**.

   The Security view for the selected services is displayed.

3. In the **Users** tab, select a user and select **Change Password** from the actions icon.
   The **Change Password** dialog is displayed.



4. Type a new password for the user and confirm the password.
5. Select the services where you want the user password to change.
6. Click **Change Password**.
   The status of the password change on the selected services is displayed.

Create and Manage Service Groups

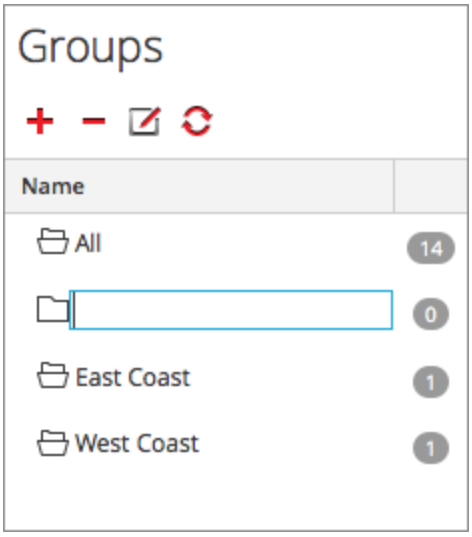
The Administration Services view provides options for creating and managing groups of services. The Services panel toolbar includes options for creating, editing, and deleting service groups. Once groups are created, you can drag individual services from the Services panel into a group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A service may belong to more than one group. Here are some examples of possible groupings.

- Group different service types to make it easier to configure and monitor all Brokers, Decoders, or Concentrators.
- Group services that are part of the same data flow; for example, a Broker, and all associated Concentrators and Decoders.
- Group services according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected services are easily identifiable.

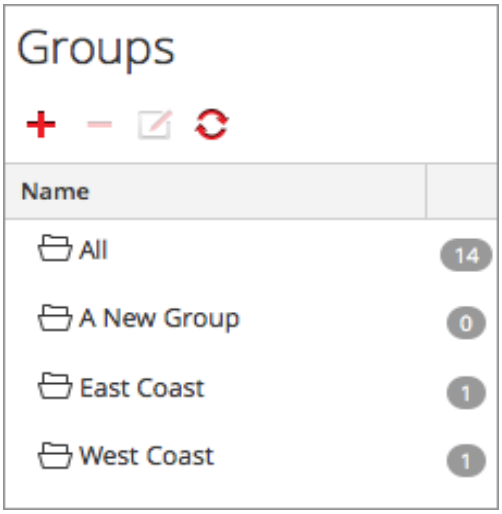
Create a Group

1. In NetWitness Suite, go to **ADMIN** > **Services**.
   The Administration Services view is displayed.
2. In the **Groups** panel toolbar, click +.
   A field for the new group opens with a blinking cursor.



3. Type the name of the new group in the field (for example, **A New Group**) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the

number of services in that group.



Change the Name of a Group

1. In the **Services** view **Groups** panel, double-click the group name or select the group and click . The name field opens with a blinking cursor.
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

Add a Service to a Group

In the Services view **Services** panel, select a service and drag the service to a group folder in the groups panel; for example,**Log Collectors**.
The service is added to the group.

View the Services in a Group

To view the services in a group, click the group in the **Groups** panel.

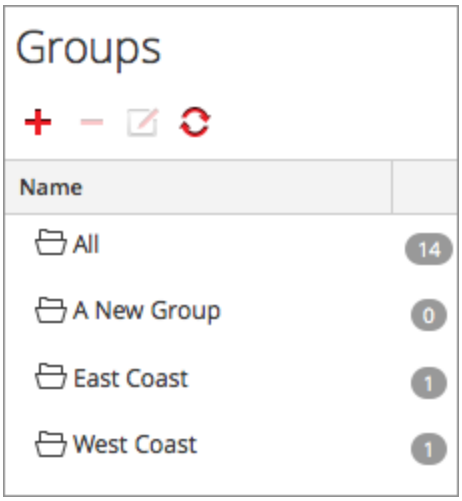
The **Services** panel lists the services in that group.

Remove a Service from a Group

1. In the Services view **Groups** panel, select the group that contains the service that you want to remove. The services in that group appear in the Services panel.
2. In the **Services** panel, select one or more services that you want to remove from the group, and in the toolbar, select > **Remove from Group**.
   The selected services are removed from the group, but are not removed from the NetWitness Suite user interface. The number of services in the group, which is listed near the group

name, decreases by the number of services removed from the group. The **All** group contains the services that were removed from the group.

In the following example, the service group called **A New Group** does not contain any services, since the service in that group was removed.



Delete a Group

1. In the Services view **Groups** panel, select the group that you want to delete.
2. Click −.

   The selected group is removed from the Groups panel. The services that were in the group are not removed from the NetWitness Suite user interface. The **All** group contains the services from the deleted group.

Duplicate or Replicate a Service Role

An efficient way to add a new service role is to duplicate a similar role, save it with a new name and revise the permissions that are already assigned. For example, you could duplicate the Analysts role. Then, save it as **JuniorAnalysts** and modify the permissions.

The quick way to add an existing role to other services is to replicate the role. For example, you could replicate the **JuniorAnalysts** role that exists on a broker to a concentrator and log decoder.

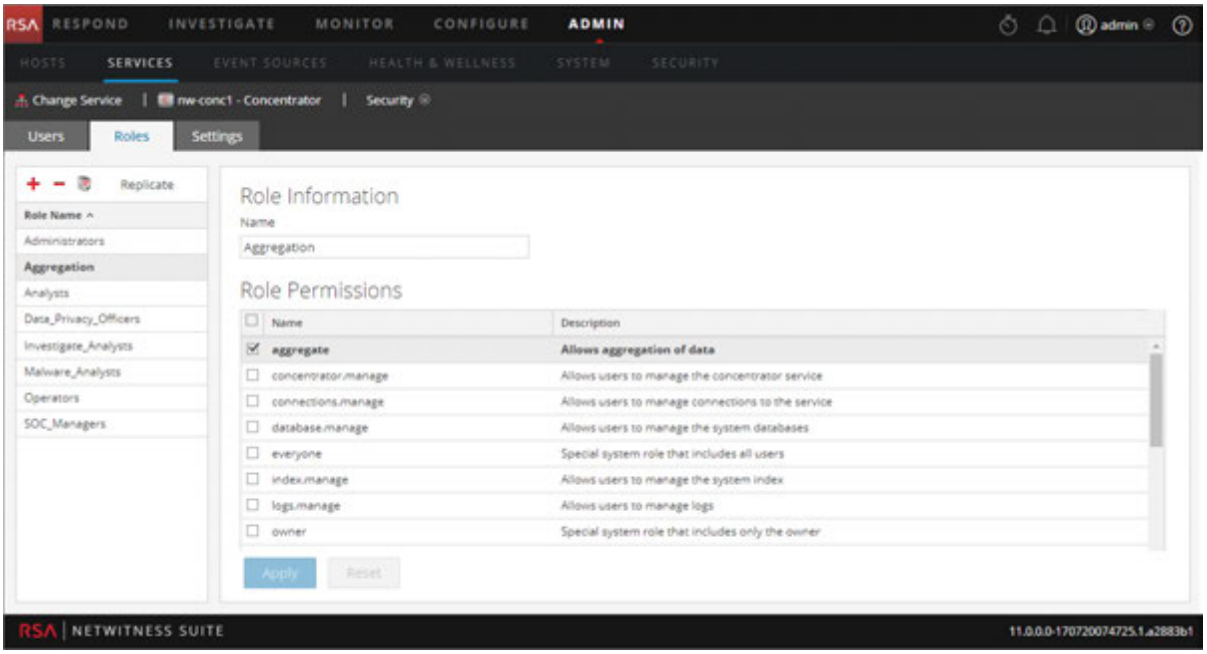
Each of the following procedures starts in the Services Security view.

To navigate to the Services Security view:

1. In NetWitness Suite, go to **ADMIN > Services**.
2. Select a service, then click  **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.
3. Select the **Roles** tab.

Duplicate a Service Role

1. In the Roles tab, select the role you want to duplicate.



2. Click  **Duplicate Role.**
3. Type a new name and click **Apply**.
4. Select the new role.
5. In the **Role Permissions** section, select or deselect permissions to modify what the new role can do.

The duplicated role is added to the service immediately.

Replicate a Role

1. In the **Roles** tab, select the role you want to replicate and click **Replicate**.
2. In the **Replicate Role to Other Services** dialog, select each service on which to add the

role.

3. Click **Replicate**.

The replicated role is added to each selected service immediately.

Edit Core Service Configuration Files

The service configuration files--for Decoder, Log Decoder, Broker, Concentrator, Archiver, and Workbench services -- are editable as text files. In the Service Config view > Files tab, you can:

- View and edit a service configuration file that the NetWitness Suite system is currently using.
- Retrieve and restore the latest backup of the file you are editing.
- Push the open file to other services.
- Save changes made to a file.

The files available to edit vary depending upon the type of service being configured. The files that are common to all Core services are:

- The service index file.
- The netwitness file.
- The crash reporter file.
- The scheduler file.

In addition the Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter.

Note: The default values in these configuration files are generally good for the most common situations; however, some editing is necessary for optional services, such as the crash reporter or scheduler. Only administrators with a good understanding of the networks and the factors that affect the way services collect and parse data should make changes to these files in the Files tab.

For more detail on service configuration parameters, see Service Configuration Settings.

Edit a Service Configuration File

To edit a file:

1. In NetWitness Suite, go to **ADMIN > Services**.
2. In the Services grid, select a service.

3. Select  > **View** > **Config**.

   The Service Config view is displayed with the General tab open.

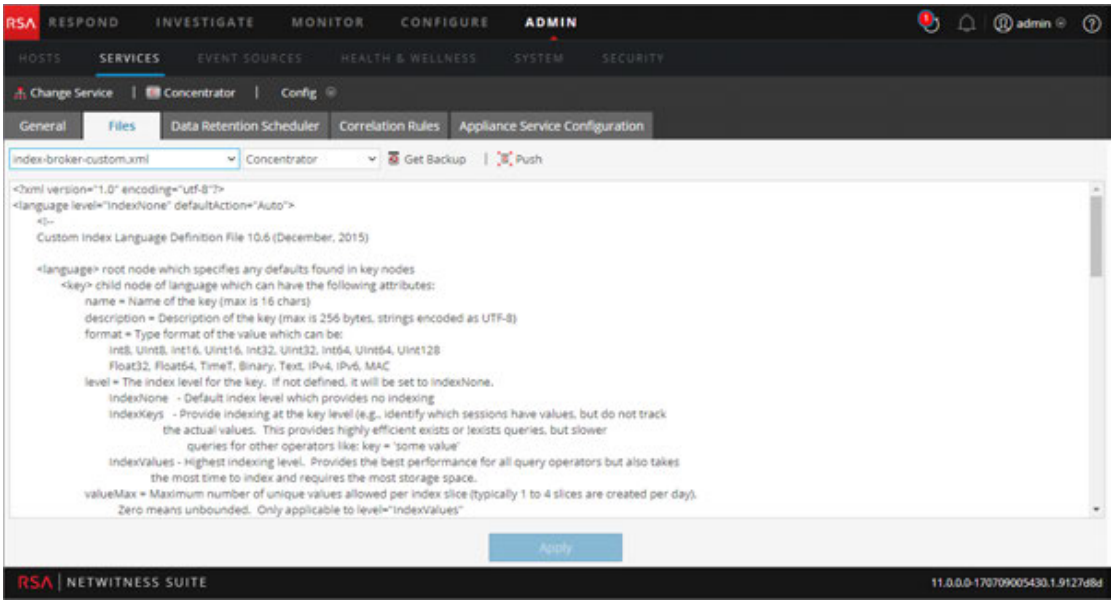
4. Click the **Files** tab.

   The selected service, such as Concentrator, appears in the drop-down list on the right.

5. (Optional) To edit a file for the host instead of the service, select **Host** in the drop-down list.

6. Choose a file from the **Please Select A File To Edit** drop-down list.

   The file content is displayed in edit mode.



7. Edit the file and click **Apply**.

The current file is overwritten and a backup file is created. The changes go into effect after the service is restarted.

Revert to a Backup Version of a Service Configuration File

After you make changes to a configuration file, save the file, and restart the service, a backup file is available. To revert to a backup of a configuration file:

1. Select a configuration file by completing steps 1-6 of the **Edit Service Configuration Files** procedure at the beginning of this topic.

2. Click  .

   The backup file opens in the text editor.

3. To revert to the backup version, click **Save**.

The changes go into effect after the service is restarted.

Push a Configuration File to Other Services

Once you have edited a service configuration file, you can push the same configuration to other services of the same type.

1. Select a configuration file by completing steps 1-6 of the **Edit a Service Configuration File** procedure at the beginning of this topic.
2. Click 

. The Select Services dialog is displayed.
3. Select each service to push the configuration file on it.
   Each service must be the same type as the one you selected in the Services view.

   Caution: If you decide not to push the configuration file, click **Cancel**.
4. To push the configuration file to all selected services, click **OK**.

The configuration file is pushed to all selected services.

CONFIGURE THE TASK SCHEDULER

Scheduler File

You can edit the **scheduler** file that in the Service Config view > Files tab. This file configures the built-in task scheduler for a service. The task scheduler can automatically send messages at predefined intervals or specific times of the day.

Scheduler Task Syntax

A task line in the scheduler file consists of the following syntax, where **<Value>** has no spaces:

```
<ParamName>=<Value>
```

if **<Value>** has any spaces, this is the syntax:

```
<ParamName>="<Value>"
```

In each task line, these guidelines apply:

- Parameter **time** or one of the interval parameters (**seconds**, **minutes** or **hours**) is required.
- Escape special characters with a \ (backslash).

Task Line Parameters

The following task line parameters are accepted by the scheduler.

Syntax	Description
daysOfWeek: <string, optional, {enum-any:sun|mon|tue|wed|thu|fri|sat|all}>	The days of week to execute a task. The default value is **all**.

Syntax	Description
deleteOnFinish: <bool, optional>	Delete the task when it has successfully finished.
hours: <uint32, optional, {range:1 to 8760}>	The number of hours between executions.
logOutput: <string, optional>	Output the response to log using the specified module name.
minutes: <uint32, optional, {range:1 to 525948}>	The number of minutes between executions.
msg: <string>	The message to send the node.
params: <string, optional>	The parameters for the message.
pathname: <string>	The path of the node that receives the message.
seconds: <uint32, optional, {range:1 to 31556926}>	The number of seconds between executions.
time: <string>	The time of execution in HH::MM:SS format (local time of this server).
timesToRun: <uint32, optional>	How many times to run since service start, **0** = means unlimited (default).

Messages

The following are the message strings to use in the Task Scheduler **msg** parameter.

Message	Description
addInter	Add a task to run at a defined interval. For example, this message runs the **/index save** command every 6 hours: addInter hours=6 pathname=/index msg=save

Message	Description
addMil	Add a task to run at a specific time of day or even day(s) of the week. For example, this message runs the **/index save** command at 1AM every business day: addMil time= 01:00:00 pathname=/index msg=save daysOfWeek=mon,tue,wed,thu,fri
delSched	Deletes an existing scheduled task. The **id** parameter of the task must be retrieved from the print message.
print	Prints all scheduled tasks.
replace	Assign all scheduled tasks in one message, deleting any existing tasks.
save	Tell a node to save

Sample Task Line

The following example task line in the scheduler file downloads the feeds package file (**feeds.zip**) to the selected Decoder every 120 minutes from the feeds host server:

```
minutes=120 pathname=/parsers msg=feed params="type\=wget
file\=http://feedshost/nwlive/feeds.zip"
```

EDIT A SERVICE INDEX FILE

This topic provides important information and guidelines for configuring service custom index files, which are editable in the Service Config view > Files tab.

The index file, along with other configuration files, controls operation of each Core service. Accessing the index file through the Service Config view in NetWitness Suite opens the file in a text editor, where you can edit the file.

Note: Only Administrators with a thorough and comprehensive understanding of Core service configuration are qualified to make changes to an index file, which is one of the central configuration files for the appliance service. Changes made should be consistent across all Core services. Invalid entries or a misconfigured file can prevent the system from starting and can require the assistance of RSA Support to bring the system back into a working state.

These are the index files:

- `index-broker.xml`, and `index-brokercustom.xml`
- `index-concentrator.xml`, and `index-concentrator-custom.xml`

- index-decoder.xml, and index-decodercustom.xml
- index-logdecoder.xml, and index-logdecodercustom.xml
- index-archiver.xml, and index-archiver-custom.xml
- index-workbench.xml, and index-workbench-custom.xml

Index and Custom Index Files

All customer-specific index changes are made in **index-<service>-custom.xml**. This file overrides any settings in index-<service>.xml, which is solely controlled by RSA.

Note: Customers using NetWitness Suite versions prior to 10.1 had to customize index files by editing and saving the index file, and this method relied on NetWitness Suite creating a backup of the current index file upon restart of the service. Using this process, the current file is overwritten and a backup file is created. The toolbar option provides a way to revert to a backup version of the index file.
During software upgrades, index-<service>.xml is not preserved, as it is overwritten by any changes made by the RSA content team. However, a backup is made in the same directory and named index-<service>.xml.rpm_pre_save. The index-<service>.xml.rpm_pre_save file can be referenced if needed to create the customer-specific **index-<service>-custom.xml** file, which needs to be done only once. Going forward, the new system allows RSA to make index changes without modifying existing customer specific changes.

The custom index file, **index-<service>-custom.xml,** allows creation of custom definitions or overrides of your own language keys that are not overwritten during the upgrade process.

- Keys that are defined in index-<service>-custom.xml replace the definitions found in index-<service>.xml.
- Keys that are added to index-<service>custom.xml and not found in index-<service>.xml are added to the language as a new key.

Some common applications for editing the index file are:

- To add new custom meta keys to add new fields to the NetWitness Suite user interface.
- To configure protected meta keys as part of a data privacy solution as described in the *Data Privacy Management* guide.
- To adjust the NetWitness Suite Core database query performance as described in the *NetWitness Suite Core Database Tuning Guide*.

Note: For NetWitness Suite 10.1 and above, there is no need to edit the Broker custom index file, except for data privacy deployment scenarios and system roles. The Broker automatically merges the keys of all aggregate services to create a comprehensive language. The fallback language defined in `index-broker.xml` and **`indexbroker-custom.xml`** is used if there are no services or if all services are offline.

Caution: Never set the index level to `IndexKeys` or `IndexValues` on a Decoder if you have a Concentrator or Archiver aggregating from the Decoder. The index partition size is too small to support any indexing beyond the default `time` meta key.

ENABLE CRASH REPORTER SERVICE

The Crash Reporter is an optional service for NetWitness Suite services. When activated for any of the core services, the Crash Reporter automatically generates a package of information to be used for diagnosing and solving the problem that resulted in the service failure. The package is automatically sent to RSA for analysis. The results are forwarded to RSA support for any further action.

The information package sent to RSA does not contain captured data. This information package consists of the following information:

- Stack trace
- Logs
- Configuration settings
- Software version
- CPU information
- Installed RPMs
- Disk geometry

The Crash Reporter crash analysis can be activated for any Core product.

The crashreporter.cfg File

One of the files available for editing in the Service Config view > Files tab is **crashreporter.cfg**, the Crash Reporter Client Server configuration file.

This file is used by the script that checks, updates, and builds crash reports on the host. The list of products to monitor can include Decoders, Concentrators, hosts, and Brokers.

This table lists the settings for the **crashreporter.cfg** file.

Setting	Description
applicationlist=decoder, concentrator, host	Define the list of products to monitor.
sitedir=/var/crashreporter	Location of the site directory for the report.
webdir=/usr/share/crashreporter/Web	Location of the web directory.
devdir=/var/crashreporter/Dev	Location of the development directory.
datadir=/var/crashreporter/data	Location of the directory storing data files.
perldir=/usr/share/crashreporter/perl	Location of the perl files.
bindir=/usr/share/crashreporter/bin	Location of the binary executables.
libdir=/usr/share/crashreporter/lib	Location of the binary libraries.
cfgdir=/etc/crashreporter	Location of the configuration files.
logdir=/var/log/crashreporter	Location of the log files.
scriptdir=/usr/share/crashreporter/scripts	Location of the directory containing scripts.
workdir=/var/crashreporter/work	Location of the process work directory.
sqldir=/var/crashreporter/sql	Location where created sql files are placed.

Setting	Description
reportdir=/var/crashreporter/reports	Location where temporary reports are created.
packagedir=/var/crashreporter/packages	Location of the created package files.
gdbconfig=/etc/crashreporter/crashreporter.gdb	Location of the gdb configuration file.
corewaittime=30	Define the number of seconds to wait after finding a core in order to determine if the core is still being written.
cyclewaittime=10	Define the number of minutes to wait between search cycles
deletecores=1	Specify if the core files should be deleted after report. 0 = No 1 = Yes **NOTE:** Until the core file is deleted, it is reported each time crashreporter is restarted.

Setting	Description
deletereportdir=1	Specify if the report directory should be deleted after the report. Useful in order to view core reports on box. 0 = No 1 = Yes **NOTE:** If not deleted, the directory will be included in each subsequent package.
debug=1	Specify whether debugging messages are turned on or off in the **crashreporter** logging output. 0 = No 1 = Yes
posturl=https://www.netwitnesslive.com/crash...ter/submit.php	Define the webserver post url.
postpackages=0	Specify if the packages should be posted to the webserver. 0 = No 1 = Yes

Setting	Description
deletepackages=1	Specify if packages should be deleted after they are posted to webserver. 0 = No 1 = Yes

Configure the Crash Reporter Service

To configure the Crash Reporter service:

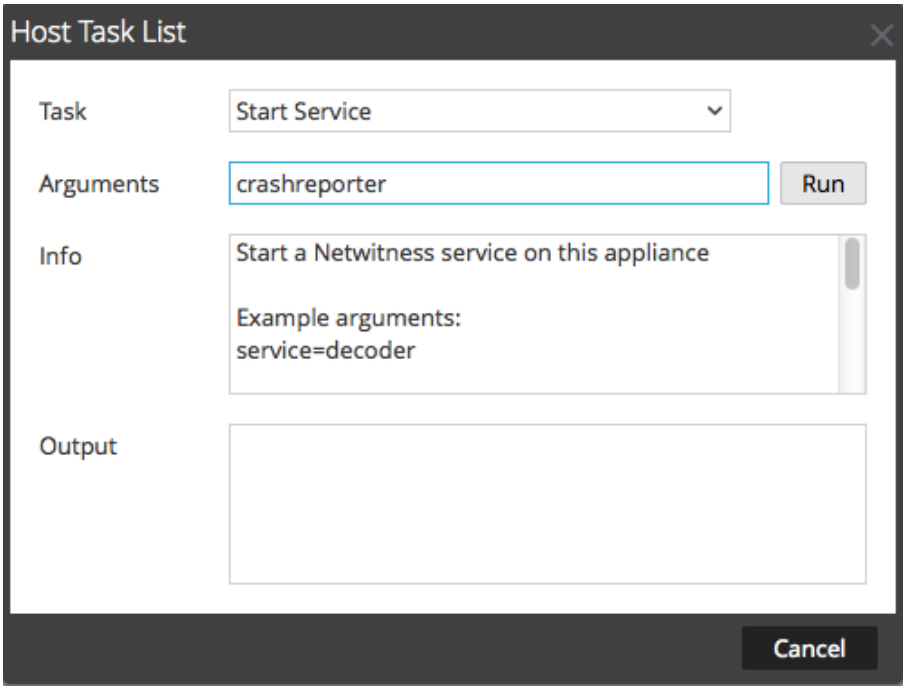
1. Select **ADMIN > Services**.
2. Select a service then click  **> View > Config**.
3. Select the **Files** tab.
4. Edit **crashreporter.cfg**.
5. Click **Save**.
6. To display the Service System view, select **Config > System**.
7. To restart the service, click  .
   The service shuts down and restarts.

Start and Stop the Crash Reporter Service

To start the Crash Reporter Service:

1. Select **ADMIN > Services**.
2. Select a service and click  **> View > System**.
3. In the toolbar, click  .
   The Host Task List is displayed.
4. In the Task drop-down list, select **Start Service**.

5. In the Arguments field, type **crashreporter**, then click **Run**.



The Crash Reporter service is activated and remains active until you stop it.

To stop the Crash Reporter service, select **Stop Service** from the Task drop-down list.

MAINTAIN THE TABLE MAP FILES

The table mapping file provided by RSA, `table-map.xml`, is a very significant part of the Log Decoder. It is a meta definition file which also maps the keys used in a log parser to the keys in the metadb.

Do not edit the `table-map.xml` file. If you want to make changes to the table-map, make them in the `table-map-custom.xml` file. The latest `table-map.xml` file is available on Live and RSA updates it as required. If you make changes to the `table-map.xml` file, they can be overwritten during an upgrade of service or content.

In the `table-map.xml`, some meta keys are set to `Transient` and some are set to `None`. To store and index a specific meta key, the key must be set to `None`. To make changes to the mapping, you need to create a copy of the file named `table-map-custom.xml` on the Log Decoder and set the meta keys to `None`.

For meta key indexing:

- When a key is marked as `None` in the `table-map.xml` file in the Log Decoder, it is indexed.
- When a key is marked as `Transient` in the **`table-map.xml`** file in the Log Decoder, it is not indexed. To index the key, copy the entry to the `table-map-custom.xml` file and change the keyword `flags="Transient"` to `flags="None"`.

- If a key does not exist in the `table-map.xml` file, add an entry to the `table-map-custom.xml` file in the Log Decoder.

Caution: Do not update the `table-map.xml` file because an upgrade can overwrite it. Add all of the changes that you want to make to the **`table-map-custom.xml`** file.

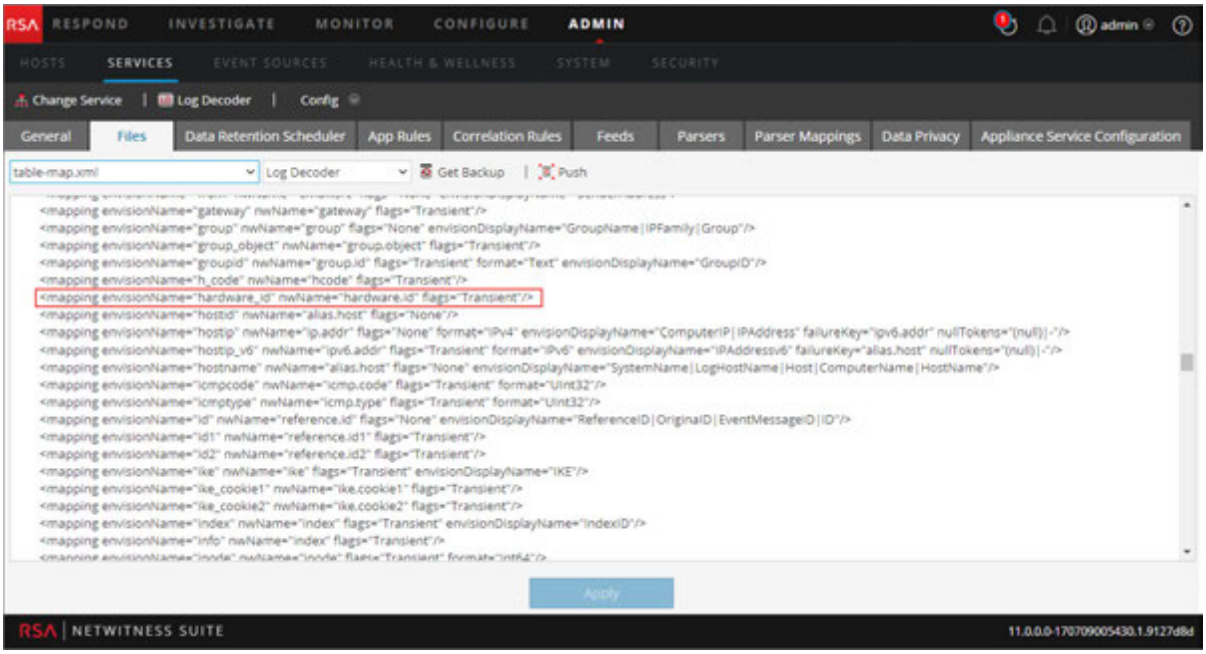
Prerequisites

If you do not have a `table-map-custom.xml` file on the Log Decoder, create a copy of `table-map.xml` and rename it to `table-map-custom.xml`.

Procedure

To verify and update the table mapping file:

1. Go to **ADMIN** > **Services**.
2. In the Services grid, select a Log Decoder and click > **View** > **Config**.
3. Click the **Files** tab and select the **`table-map.xml`** file.



4. Verify that the flags keywords are set correctly to either `Transient` or `None`.
5. If you need to change an entry, do not change the `table-map.xml` file. Instead, copy the entry, select the `table-map-custom.xml` file, find the entry in the `table-map-custom.xml` file and change the flags keyword from `Transient` to `None`.
   For example, the following entry for the `hardware.id` meta key in the `table-map.xml` file is not indexed and the flags keyword shows as `Transient`:
   `<mapping envisionName="hardware_id" nwName="hardware.id"`

flags="Transient"/>

To index the `hardware.id` meta key, change the flags keyword from `Transient` to `None` in the `table-map-custom.xml`:

```
<mapping envisionName="hardware_id" nwName="hardware.id"
flags="None"/>
```

6. If an entry does not exist in the `table-map.xml` file, add an entry to the `table-map-custom.xml` file.
7. After making your changes to the `table-map-custom.xml` file, click **Apply**.

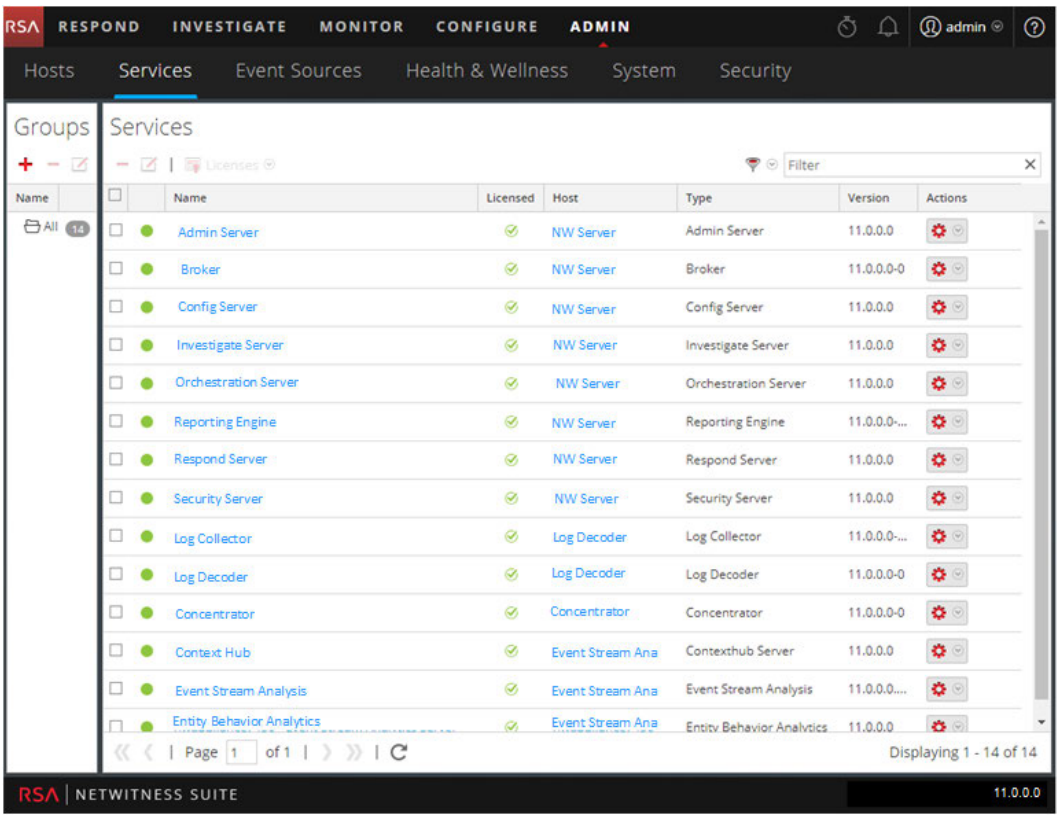
Caution: Before changing the table mapping files, carefully consider the effect of changing the index from `Transient` to `None` since it can impact the available storage and performance of the Log Decoder. For this reason, only certain meta keys are indexed out of the box. Use the `table-map-custom.xml` file for different use cases.

Edit or Delete a Service

You can edit service settings, such as changing the host name or port number, or delete a service that you no longer need.

Each of the following procedures starts in the Services view.

To navigate to the Services view, in NetWitness Suite, go to **ADMIN > Services**.

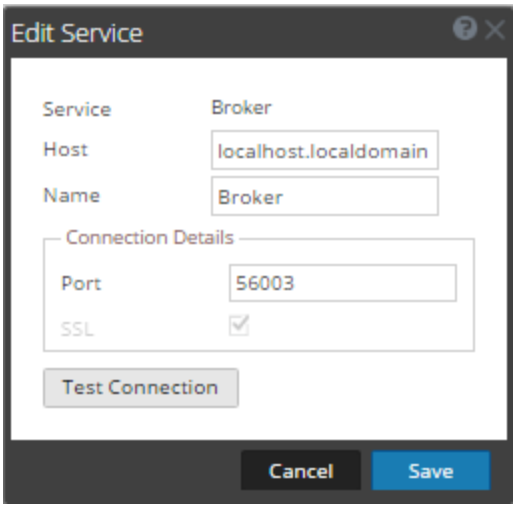


Procedures

EDIT A SERVICE

1. In the Services view, select a service and click  or  > **Edit**.

   The **Edit Service** dialog is displayed. It shows only the fields that apply to the selected service.



2. Edit the service details by changing any of the following fields:
   - **Name**
   - **Port** - Each core service has two ports, SSL and non-SSL. For trusted connections, you must use the SSL port.
   - **SSL** - For trusted connections, you must use SSL.
   - **Username** and **Password** - Use these credentials to test the connection to a service.
     a. If you use a trusted connection, delete the username.
        If you do not use a trusted connection, type a username and password.
     b. Click **Test Connection**.
3. (Optional) If the service requires a license select Entitle Service. This option is displayed only for services that require a license.
4. Click **Save**.

The changes take effect immediately.

DELETE A SERVICE

1. In the Services view, select one or more services and click or  > **Delete**.
2. A dialog requests confirmation. To delete the service, click **Yes**.

The deleted service is no longer available to NetWitness Suite modules.

Explore and Edit Service Property Tree

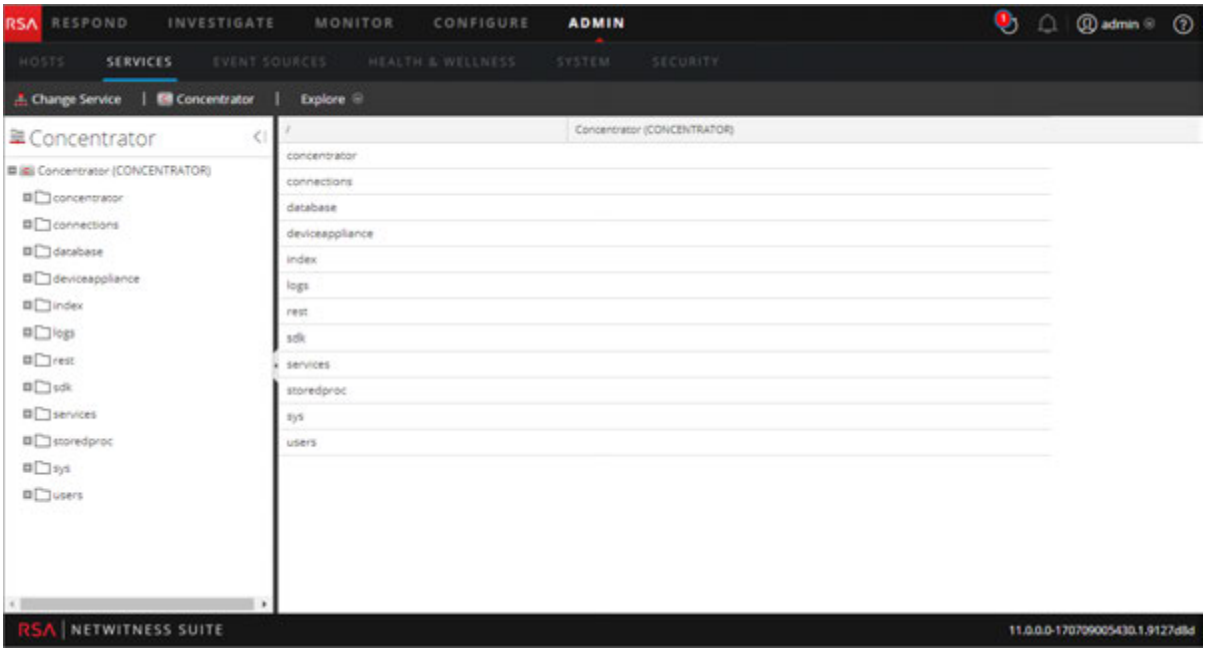
You have advanced access and control of service functionality in the Services Explore view, which consists of two parts. The Node list displays service functionality in a tree structure of folders. The Monitor panel displays properties of the folder or file selected in the Nodes list.

Each of the following procedures starts in the Explore view.

To navigate to the Explore view:

1. In NetWitness Suite, go to **ADMIN > Services**.
2. Select a service, then select  > **View > Explore**.
   The Explore view is displayed. The Node list is on the left and the Monitor panel is on the

right.



Procedures

DISPLAY OR EDIT A SERVICE PROPERTY

To display a service property:

1. Right-click a file in the Node list or Monitor panel.
2. Click **Properties**.

To edit the value of a service property:

1. In the **Monitor** panel, select an editable property value.
2. Type a new value.

SEND A MESSAGE TO A NODE

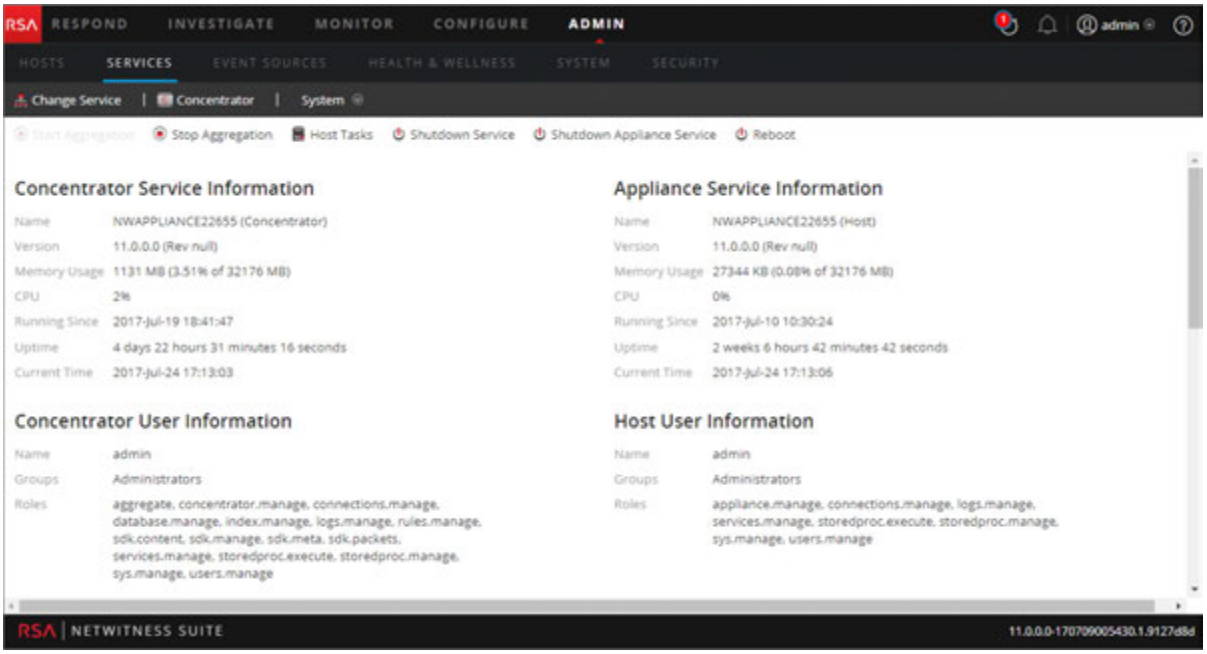
1. In the Properties Dialog select a **message type**. Options vary according to the file selected in the Node list.
   A description of the selected message type is displayed in the **Message Help** field.
2. (Optional) If the message requires them, type the **Parameters**.
3. Click **Send**.
   The value or format is displayed in the **Response Output** field.

Kill a Connection to a Service

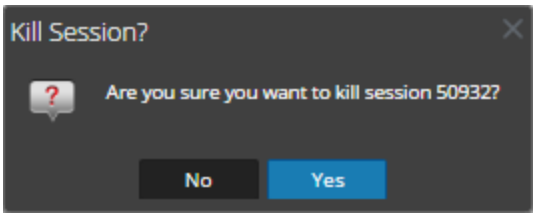
You can view sessions that are running on a service in the Service System view. From within the list of sessions, you can end the session and end active queries in a session.

End a Session on a Service

1. In NetWitness Suite, go to **ADMIN > Services**.
   The Admin Services view is displayed.
2. Select a service, and select  **> View > System**.
   The Service System view is displayed.



3. In the **Session Information**grid at the bottom, click a ***session-number***.
   The following confirmation dialog is displayed.

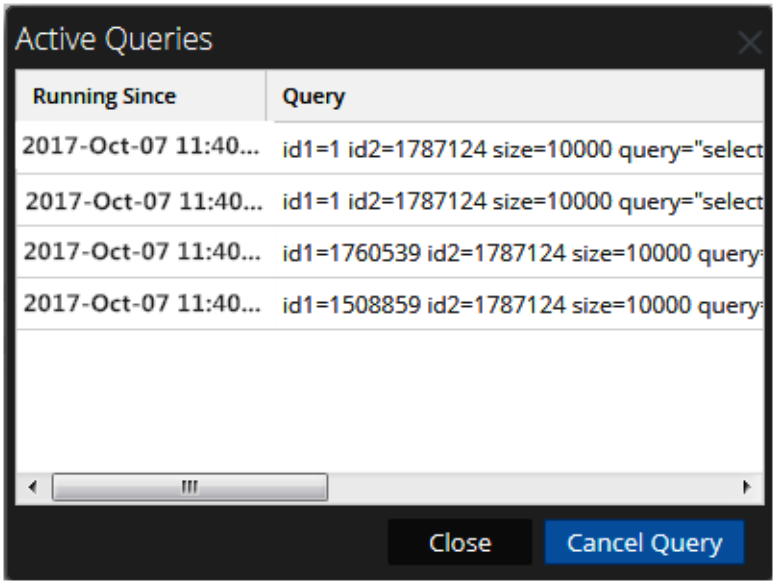


4. Click **Yes**.

The session ends and is removed from the grid.

End an Active Query in a Session

1. Scroll down to the **Sessions** grid.
2. In the **Active Queries** column, click a non-zero count of active queries for a session. You cannot click on it if there are 0 active queries.
   The Active Queries dialog is displayed.



3. Select a query and click **Cancel Query**.
   The query stops and the Active Queries column is updated.

Search for Services

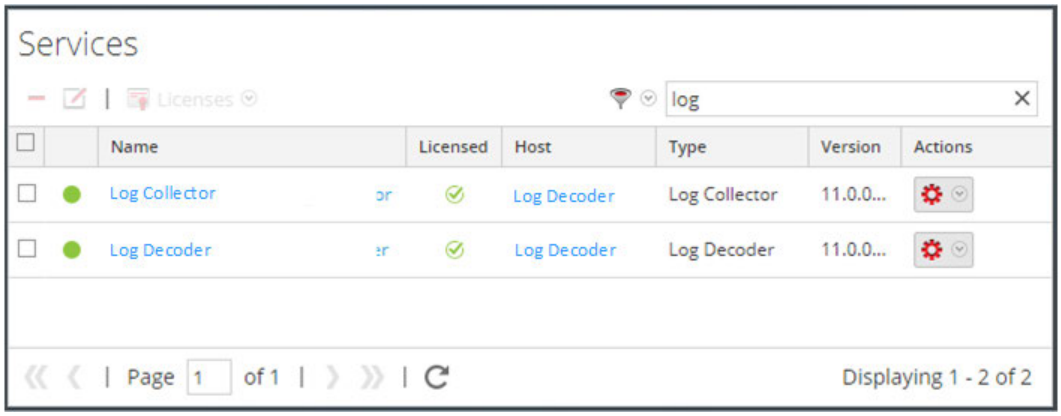
You can search for services from the list of services in the Services view. The Services view enables you quickly filter the list of services by Name, Host, and Service Type. You can use the Filter drop-down menu and the Filter field separately or at the same time to filter the Services view.

In addition to being able to locate the services for a host in the Services view, you can also quickly find the services that run on a host in the Hosts view.

Search for a Service

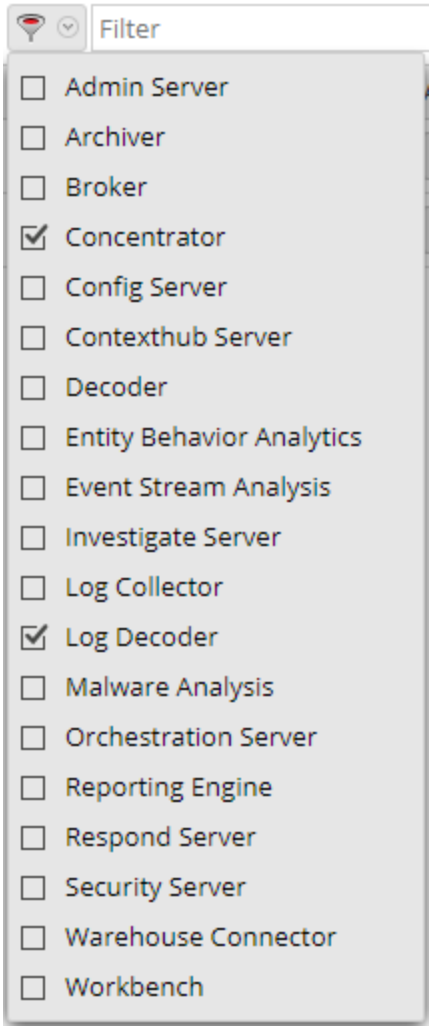
1. In NetWitness Suite, go to **ADMIN> Services**.
2. In the **Services** panel toolbar, type a service **Name** or **Host** in the **Filter** field.

The Services panel lists the services that match the names entered in the Filter field. The following example shows the search results after starting to type **log** in the filter field.

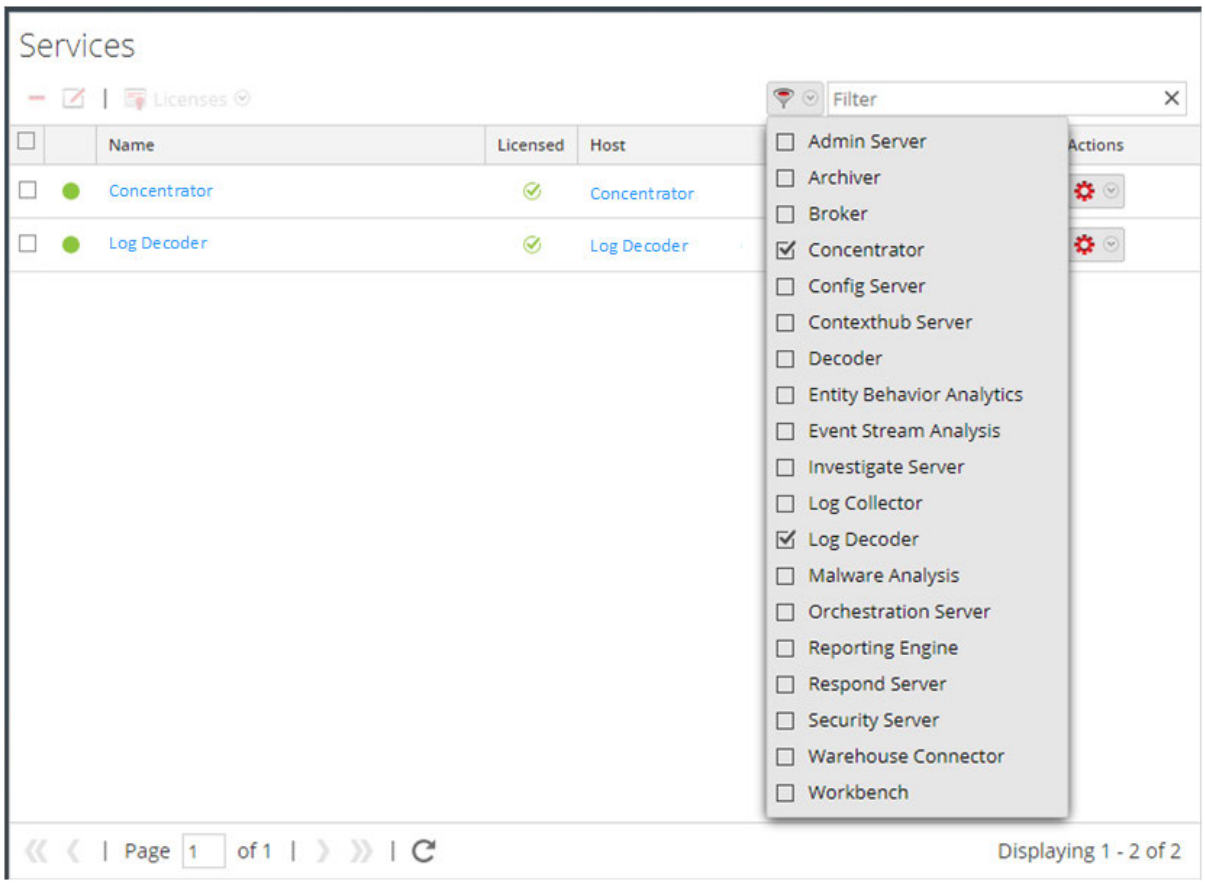


Filter Services by Type

1. In NetWitness Suite, go to **ADMIN > Services**.
2. In the Services view, click  and select the service types that you would like to appear in the Services view.



The selected service types appear in the Services view. The following example shows the Services view filtered for Concentrator and Log Decoder.

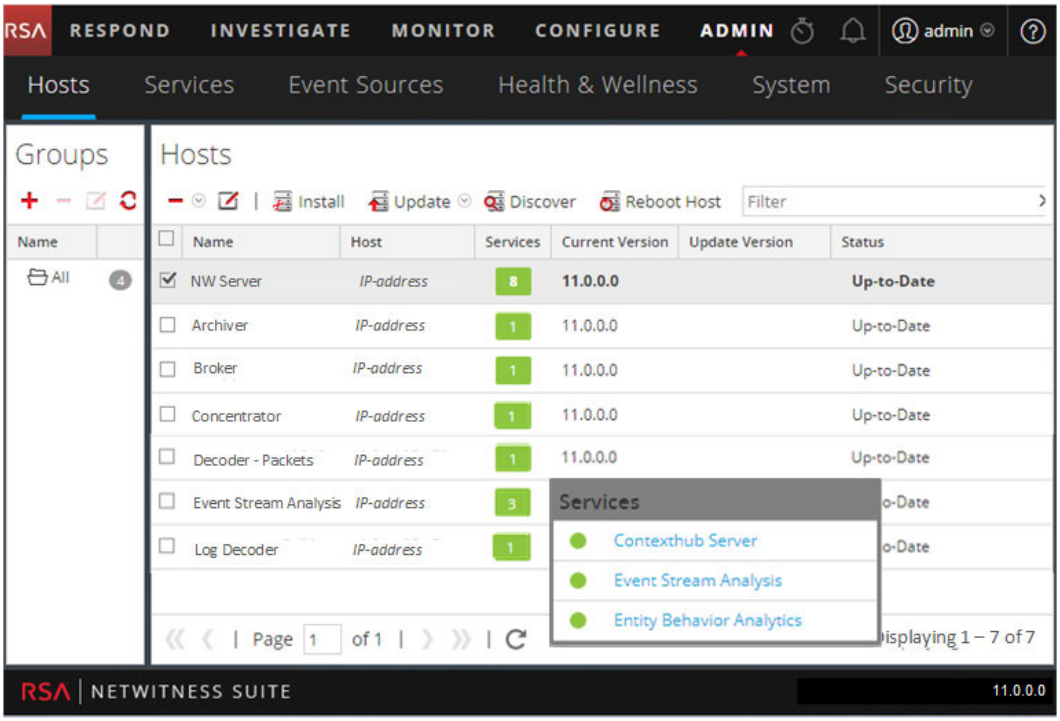


Find the Services on a Host

In addition to being able to locate the services for a host in the Services view, you can also quickly find the services that run on a host in the Hosts view.

1. In NetWitness Suite, go to **ADMIN > Hosts**.
2. In the Hosts view, select a host and click the box that contains a number (the number of services) in the **Services** column.
   A list of the services on the selected host is displayed.

In the following example, a list of three services on the selected host are listed after clicking the box containing the number 3.



3. You can click the service links to view the services in the Services view.

Start, Stop or Restart a Service

These procedures apply to core services only.

Each of the following procedures starts in the Services view. In NetWitness Suite, go to **ADMIN > Services**.

Start a Service

Select a service and click  > **Start**.

Stop a Service

When you stop a service, all of its processes stop and active users are disconnected from it.

To stop a service:

1. Select a service and click  > **Stop**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

Restart a Service

Occasionally, you have to restart a service for changes to take effect. When you change a parameter that requires a restart, NetWitness Suite displays a message.

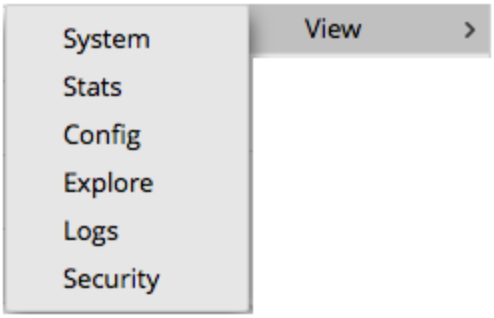
To restart a service:

1. Select a service and click  > **Restart**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

The service stops, then restarts automatically.

View Service Details

You can view and edit information about services using options in the View menu for a service.



Purpose of Each Service View

Each view displays a functional piece of a service and is described in detail in its own section:

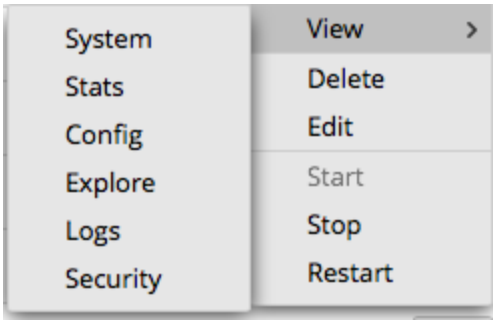
- System View shows a summary of service, appliance service, host user, license, and session information.
- Services Stats View provides a way to monitor service operations and status.
- Services Config View is for configuring all aspects of a service.
- Services Explore View is for viewing and editing host and service configurations.
- System Logging Panel shows service logs that you can search.
- Services Security View is a way to add Security Analytics Core user accounts for aggregation, thick client users, and REST API users.

Access a Service View

To access a view for a service:

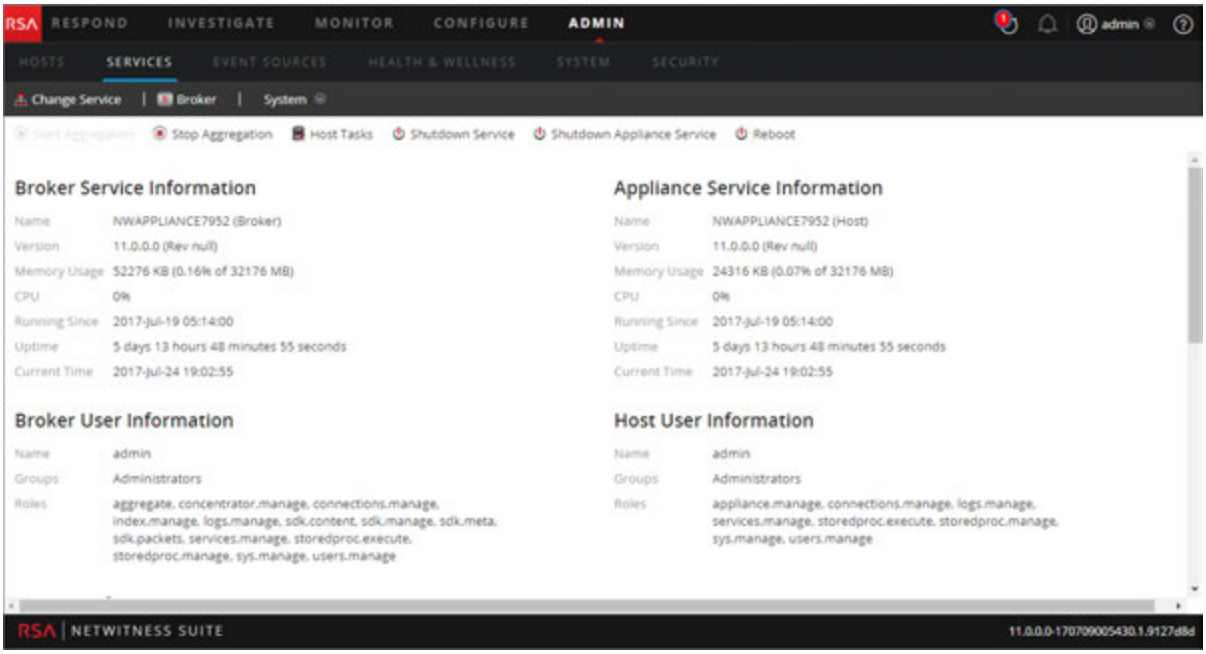
1. In NetWitness Suite, go to **ADMIN > Services**.
2. Select a service and click  **> View**.

   The View menu is displayed.



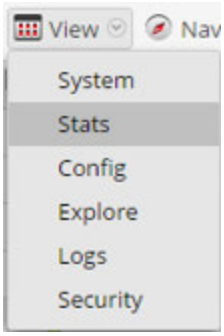
3. From the options on the left, select a view.

   This is a System view for a Broker.



4. Use the toolbar to navigate:

   a. Click **Change Service** to select another service.
      The **Administrate Service** dialog is displayed.
   b. Select the checkbox to the left of the service that you want.
   c. Select the view that you want for the service you selected in the View drop-down menu.



The new view (for example Stats) is displayed for the service you selected.

Hosts and Services Views References

This topic is a reference for features in the NetWitness Suite ADMIN user interface.

This topic describes features available in the NetWitness Suite Admin user interface. The Admin module pulls NetWitness Suite Admin activities into a single view to monitor and manage hosts (appliances), services, tasks, and security.

Topics

Hosts View

You set up and maintain the physical or virtual machine on which NetWitness Suite services run in the **Hosts** view.

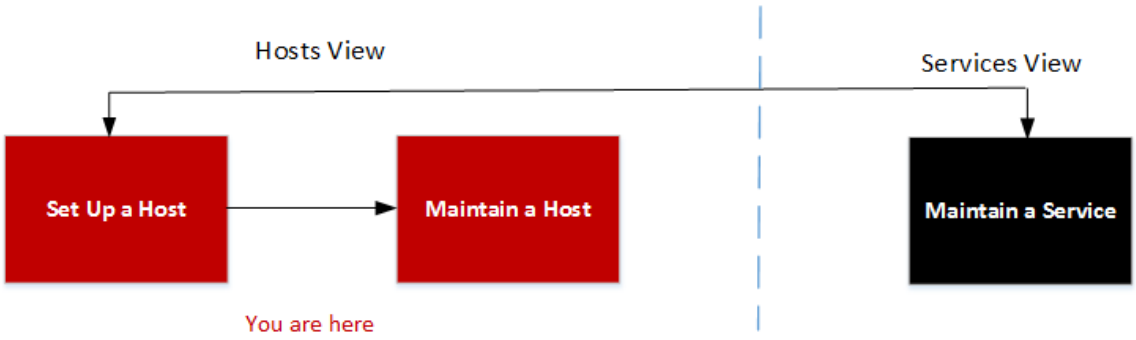
A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the following Core services first:

Core	Other	Other	Other
Decoder	Log Decoder	Context Hub	Reporting Engine
Concentrator	Archiver	Log Collector	Warehouse Connector
Broker	Event Stream Analysis	Malware Analysis	Workbench

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.

Workflow

This workflow shows the procedures you complete to set up a host, maintain a host, and update the host with new NetWitness Suite versions. Setting up a host is the first task in this workflow. The hosts with core services are set up out of the box. After that, you can set up additional hosts to enhance your NetWitness Suite deployment. The other two tasks, maintaining a host and updating versions for a host, are performed when required and do not have a specific order of completion.

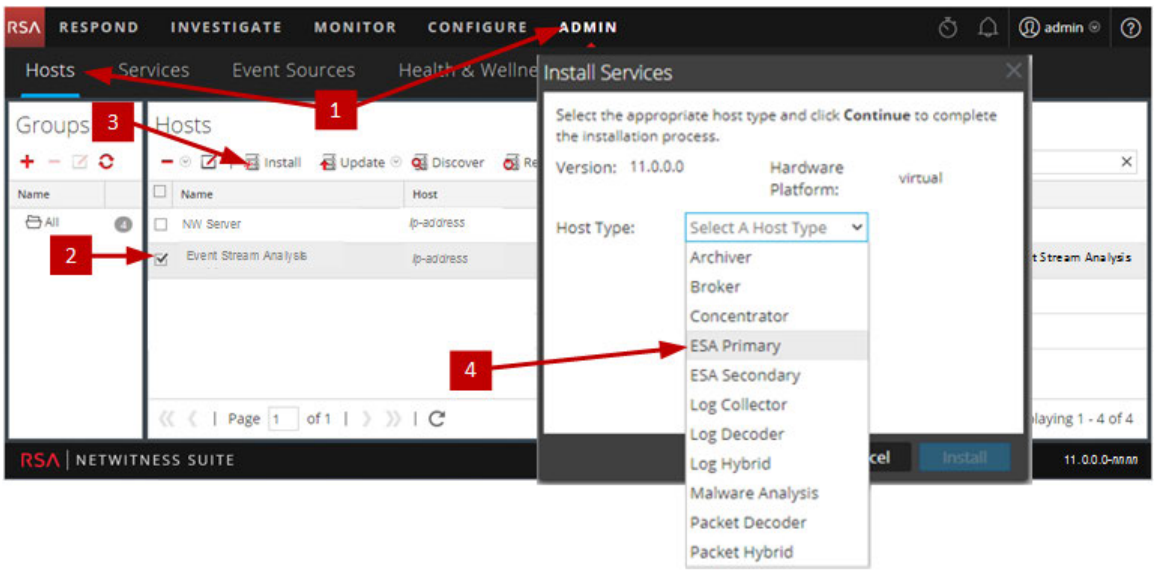


What do you want to do?

See Hosts and Services Procedures for detailed instructions of the following tasks.

Role	I want to ...
Administrator	Setup up a host.
Administrator	Maintain a host.
Administrator	Apply version updates to a host.

Quick Look



The following example shows you how to set up a host.

1. Select ADMIN > Hosts.
2. Select the host you deployed (for example, **Event Stream Analysis**).
3. Click Install (Install icon).
4. Select the service to install from the **Install Services** dialog (for example, **ESA Primary**).

Hosts Panel Toolbar

The Hosts view toolbar contains the tools that you use to maintain the hosts in your NetWitness Suite deployment.

In NetWitness Suite, go to **Admin** > **Hosts** to access the Hosts view. The Hosts panel toolbar is at the top of the Hosts grid in the Hosts view.

Features

The following table describes the features of the Hosts panel toolbar.

Features	Description
	**Remove From Group**: If the host is part of a host group, you can remove the host from the group.
	Open the Edit Host dialog in which you edits a host or service identification and basic communication settings. This dialog has the same features as the Add Host dialog. Related procedure: Step 1. Deploy a Host
Install	Opens the Instal Services dialog from which you can install a service on a deployed host.
Update	• **Update** - Updates the host or hosts you have selected with the version you select in the **Update Version** column. • **Check for Updates** - Checks the Local Update Repo for the latest updates available from RSA.
Discover	Most of the time, the Discovery function completes automatically and you do not need to click the Discover button. For a fresh installation, click Discover to access the Provision dialog box so you can complete the provisioning phase. After the provisioning phase, NetWitness Suite automatically discovers services running on the host and you do not need to click Discover. For a fresh installation, click **Discover** to access the **Provision** dialog box so you can complete the provisioning phase. After the provisioning phase, NetWitness Suite automatically discovers services running on the host.
Reboot Host	Restart the host.
Install	Installs a NetWitness Suite component (service) on the selected host.
Filter	Filter hosts by Name or Host.

Groups Panel Toolbar

The Groups panel toolbar provides options for managing groups of hosts. Use the toolbar to create, edit, and delete groups. After you create a group, you can drag individual hosts from the Hosts panel into that group.

Use groups may to organize hosts by function, geography, project, or any other organization principle that is useful. A host may belong to more than one group.

In NetWitness Suite, go to **ADMIN > Hosts**. The Groups panel toolbar is at the top of the Groups grid in the Hosts view.

The Groups panel provides a way to create logical groups of hosts. Once hosts are grouped, it is easier to perform operations on multiple hosts by interacting with each host in a group rather than individual hosts from an non-grouped list.

Note: In NetWitness Live, groups can subscribe to resources while individual hosts can not.

The Groups panel consists of a grid populated with a list of defined host groups and the Groups Panel Toolbar.

Column	Description
	Displays a new row in the Group grid in which you enter the name of a new group.
	Asks for confirmation that you want to delete the group or host. You can confirm or cancel the deletion.
	Opens the name field in a row of the Group grid so that you can type a new name for an existing group.
	Refreshes the selected group.
Name	The name of the host group. Click the group name in the Groups panel to list the hosts in that group on the Hosts panel.
<Blank>	Indicates the number of hosts in the group. Click the number of hosts in the group on Groups panel to list the hosts in that group on the Hosts panel.

Services View

You set up and maintain the NetWitness Suite services run in the **Services** view. With the Services view, you can:

- Quickly search for and locate a specific service or type of service, such as Log Decoder or Warehouse Connector
- Use shortcuts to get to administration tasks
- Add, edit, and remove services
- Manage licensing and view the license status of a service (licensed or unlicensed)
- Sort Services by Name and Host
- Filter services by Type and by Name and Host
- Start, stop, and restart services

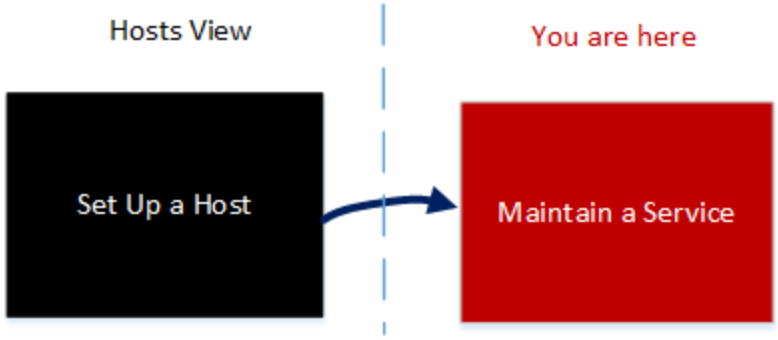
A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the following Core services first:

Core	Other	Other	Other
Decoder	Archiver	Log Collector	Workbench
Concentrator	Event Stream Analysis	Malware Analysis	
Broker	Context Hub	Reporting Engine	
Log Decoder	Incident Management	Warehouse Connector	

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.

Workflow

This workflow shows the procedures you complete to set up and maintain a service. Adding a service to a host is the first task in this workflow. The hosts with core services are set up out of the box. After that, you can set up additional services on hosts to enhance your NetWitness Suite deployment.



What do you want to do?

See Hosts and Services Procedures for detailed instructions of the following tasks.

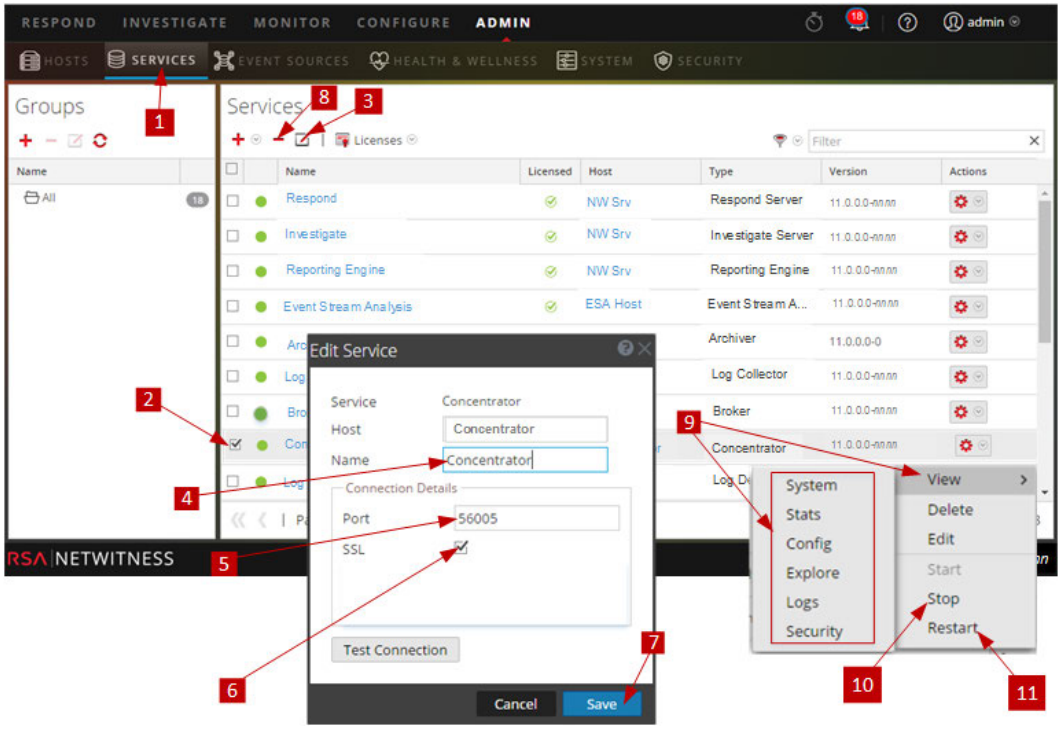
Role	I want to ...
Administrator	Maintain a service.
Administrator	Set up a host.

Related Topics

- Best Practices
- Troubleshoot Host Updates

Quick Look

The following example shows you how to maintain a service.



Select a Service.

1	Go to **ADMIN** > **Services** view.
2	Click the checkbox to the left of the service you want to select.

Edit the Service Name and Connection.

3	Click (Alternatively, select Edit from the (Action drop-down menu).
4	Edit the **Host** name.
5	Edit the service **Name**.
6	Edit the **Port** number.
7	Deselect or select SSL communication connection.
8	Click **Test Connection** .

Delete a Service.

9	**Select a Service** and click the delete icon.

View Service Statistics and Configure Parameters

10 Perform the following steps to view service statistics and configure a service parameters.

a. **Select a Service** and click the actions icon.

b. Click **View** and select:

- **System** to:
  - View current high-level information about the service and its host.
  - Access the System View toolbar.
- **Stats** to view detailed service statistics.
- **Config** to view and configure service parameters.
- **Explore** to view and configure service parameters in the NetWitness Suite Explore view.
- **Logs** to view log messages issued by the service.

10 **Select a Service**, click the actions icon, and click **Stop** a service that is running.

11 **Select a Service**, click the actions icon, and click **Restart** to restart a stopped service.

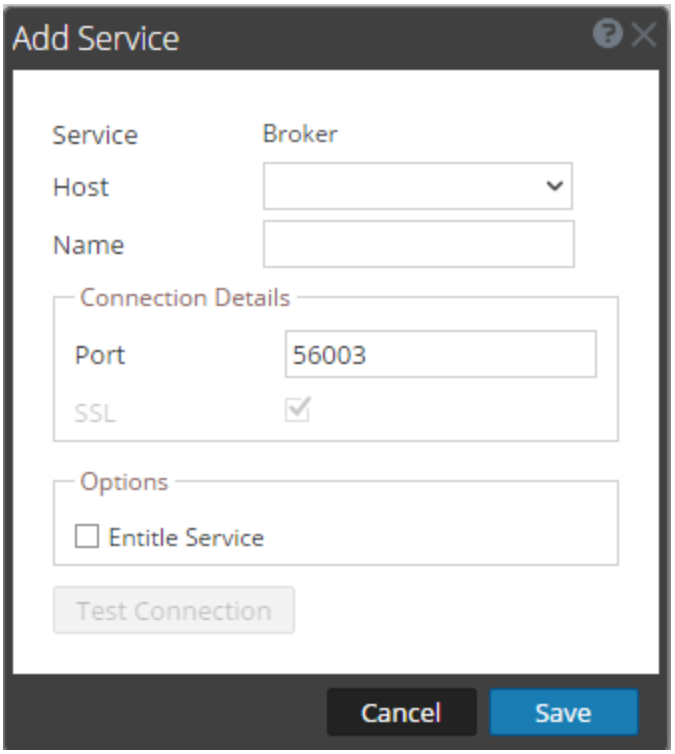
Add Service or Edit Service Dialog

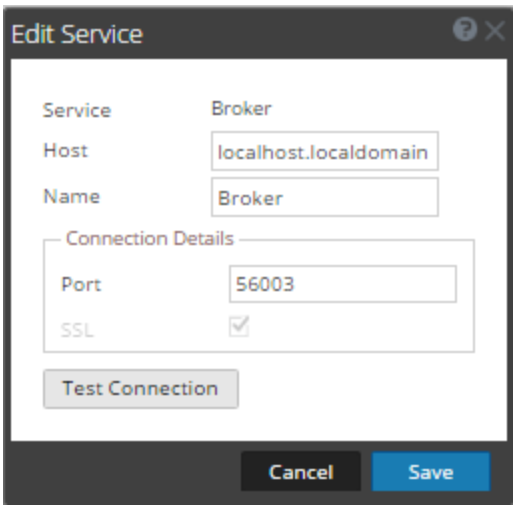
This topic introduces the Add Service or Edit Service dialogs accessible from the ADMIN Services view (ADMIN > Services).

NetWitness Suite services are automatically discovered in NetWitness Suite. You can manually add a service using the Add Service dialog to make services available to NetWitness Suite modules.

To access the Add Service dialog, navigate to the **ADMIN Services** view, and select **Add** in the **Services panel** toolbar.



You can use the Edit Service dialog to modify services. The Edit Service dialog is similar to the Add Service dialog. To access the Edit Service dialog, go to **ADMIN > Services** and select **Edit** ( ) in the **Services** panel toolbar.



Procedures related to services are described in Hosts and Services Procedures.

Features

This table describes the features of the Add Service or Edit Service dialogs.

Field or Option	Description
Service	Displays the service type. You can add the following services: Archiver, Broker, Concentrator, Decoder, Event Stream Analysis, Incident Management, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, and Workbench.
Host	Specifies the host on which the service resides.
Name	Specifies the name used to identify the service; for example, **Broker**. An understandable naming convention can make administrative tasks easier. Some administrators find it convenient to use the hostname or IP address (specified in the **Host** field) for the **Name** as well.

Field or Option	Description
Port	Specifies the port used to communicate with this service. The default port based on the selected service type in the **Service** field is autofilled here. If you select **SSL** below, this port becomes an SSL port. If you do not select **SSL**, it becomes a non-SSL port. You can customize this port by opening a firewall for the port that you add. For information on ports, see the **Network Architecture and Ports** topic in the *Deployment Guide*.
SSL	Indicates that NetWitness Suite uses SSL for communications with this service.
Username	Specifies the user name used to log in to this service. The default username is **admin**.
Password	Specifies the password used to log in to this service. The default password is **netwitness**.
Entitle Service	(Optional) Assigns licenses from the local license server (LLS) to selected services. For more information, see the **View Current Entitlements** topic in the *Licensing Guide*.
Test Connection	Clicking this button tests the connection of a service that you are adding.
Save	Clicking this button saves the new service.
Cancel	Clicking this button closes the Add Service or Edit Service dialog. If you do not save the service before closing the dialog, the service is not added or edited.

Groups Panel Toolbar

This topic introduces the features and options in **ADMIN > Services** view > **Groups** panel toolbar.

The Groups panel toolbar provides options for managing groups of services. The toolbar includes options for creating, editing, and deleting groups. Once groups are created, you can drag individual services from the Services panel into a group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A service may belong to more than one group.

To access the Services view, in **NetWitness Suite**, go to **ADMIN > Services.** The Groups panel toolbar is at the top of the Groups grid in the Services view.

Features

This table describes toolbar features.

Option	Description
	Displays a new row in the Group grid in which you enter the name of a new group.
	Asks for confirmation that you want to delete the group or service. You can confirm or cancel the deletion.
	Opens the name field in a row of the Group grid so that you can type a new name for an existing group.
	Refreshes the selected group.

Services Panel Toolbar

This topic introduces the options in Service panel toolbar for adding, removing, editing, and licensing services. You can also filter the services listed in the Services Panel.

The Services panel toolbar has options for adding, removing, editing, and licensing services. You can filter the listed services based on and one or more service types, service name, and host.

To access the Administration Services view, in **NetWitness Suite**, go to **ADMIN > Services.** The Services panel toolbar is at the top of the Services grid in the Services view.

Features

The table describes the features of the Services panel toolbar.

Feature	Description
	Adds a service for this instance of RSA NetWitness Suite to manage (see Step 2. Install a Service on a Host).
	Deletes a service from this instance of NetWitness Suite (see Edit or Delete a Service).
	Edits service identification and basic communication settings.

Feature	Description
	• Entitle Service: Assigns licenses from the local license server (LLS) to selected services (see the **Overview Tab** topic in the *Licensing Guide*). • Deactivate: Not used in NetWitness Suite 10.6. • Reclaim: Reclaims a deactivated license from LLS for the selected service. • Reset: Not used in NetWitness Suite 10.6. • Upload Trial: Not used in NetWitness Suite 10.6.
	Filters the services listed in Services view. In the Filter drop-down menu, you can filter the services by one or more selected service types. In this example, when you select Concentrator and Decoder, only the Concentrator and Decoder services appear in the Services view. In the Filter field, you can filter the services by Name and Host. You can use the Filter drop-down menu and the Filter field at the same time to filter the services listed in the Services view.

Services Config View

This topic introduces the features and functions of the Services Config view.

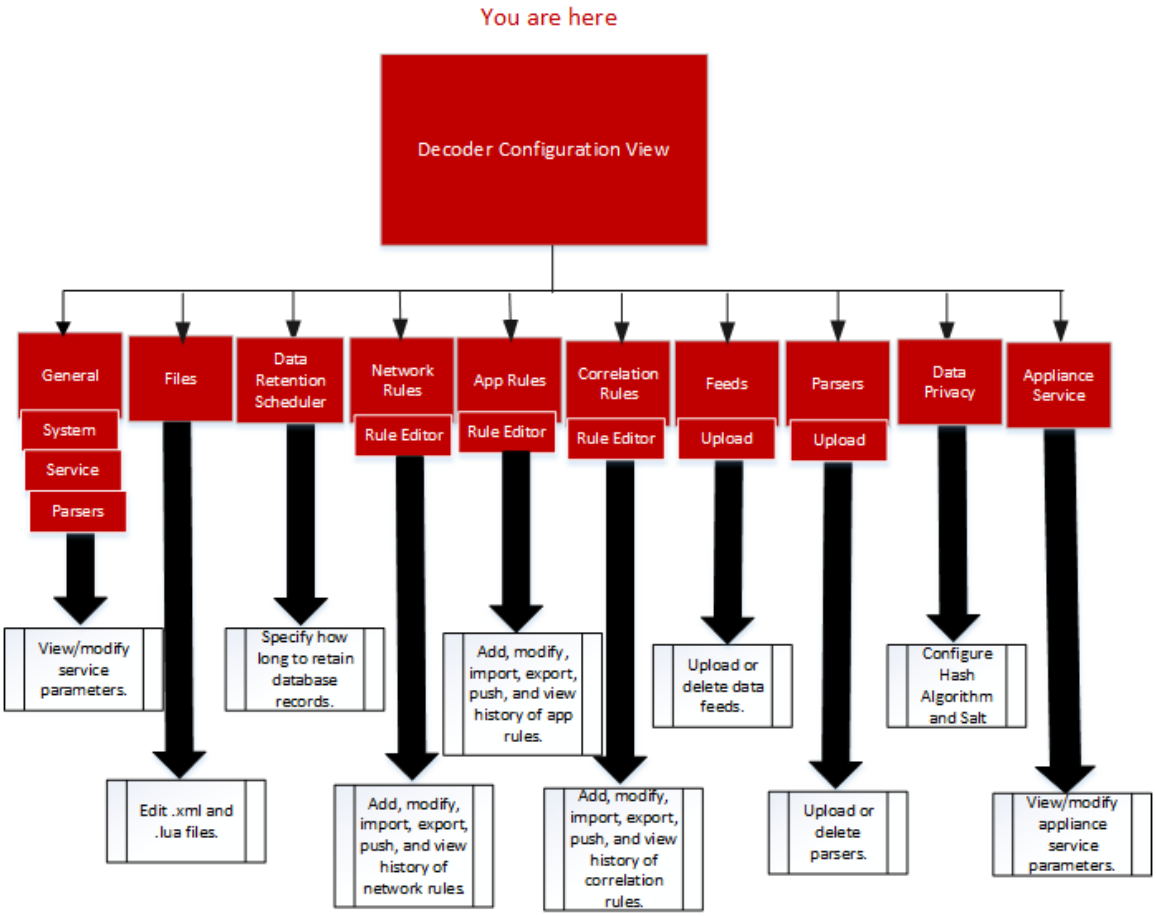
The Services Config view is one of the views available from the **Services** > Actions () menu. It provides a user interface for configuring all aspects of a Core service or NetWitness Suite service.

The configuration options in the Services Config view are organized as tabs, with each tab providing a view of a set of related parameters. Unlike the Services Explore view, which offers direct access to all configuration files for a service, these tabs present the most commonly modified parameters of service configuration in a user-friendly view.

Due to configuration requirements for different services; each type of service has variations in available tabs and configuration parameters in this view. Individual topics describe configuration parameters that are specific to a host (Brokers and Concentrators, Decoders and Log Decoders) or service (for example, Reporting Engine, Log Collector, and Warehouse Connector).

Workflows

The following workflow shows the configuration tasks for the Decoder service as an example of this view. See the Configuration Guides individual services (for example for the *RSA NetWitness® SuiteBroker and Concentrator Configuration Guide*) for details on their **ADMIN > Services > Config** Views.

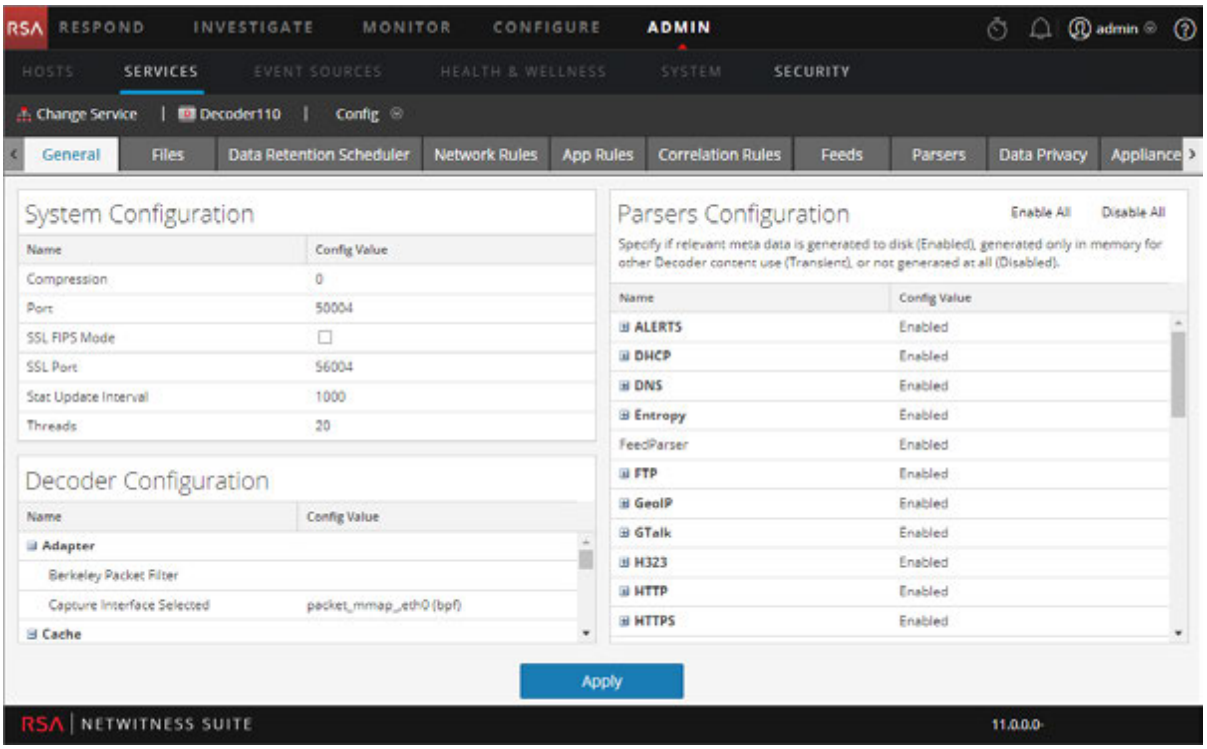


To access the Services Config view:

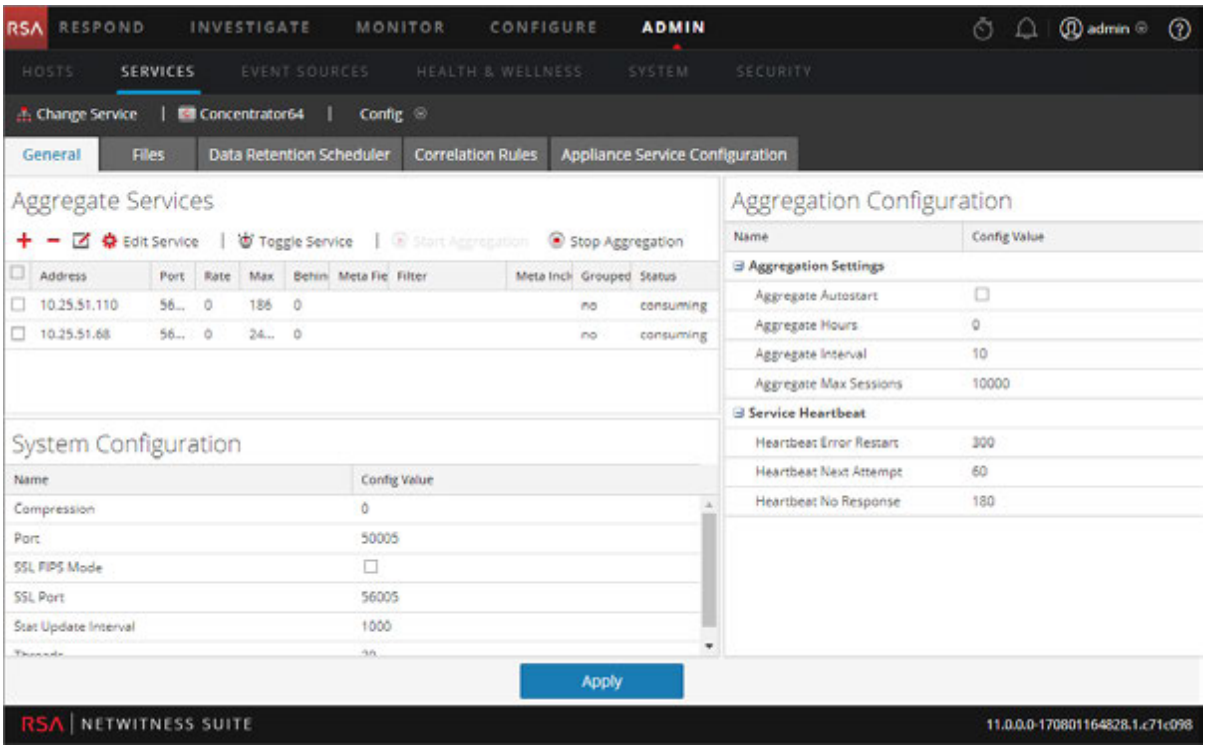
1. In **NetWitness Suite**, go to **ADMIN > Services**.
   The Administration Services view is displayed.
2. Select a service and select  **>View > Config**.
   Services Config view for the selected service is displayed.

Quick Look

This is an example of the Services Config view for a Decoder.



This is an example of the Services Config view for a Concentrator.



Topics

- Topic

- Edit a Service Configuration File

Appliance Service Configuration Tab

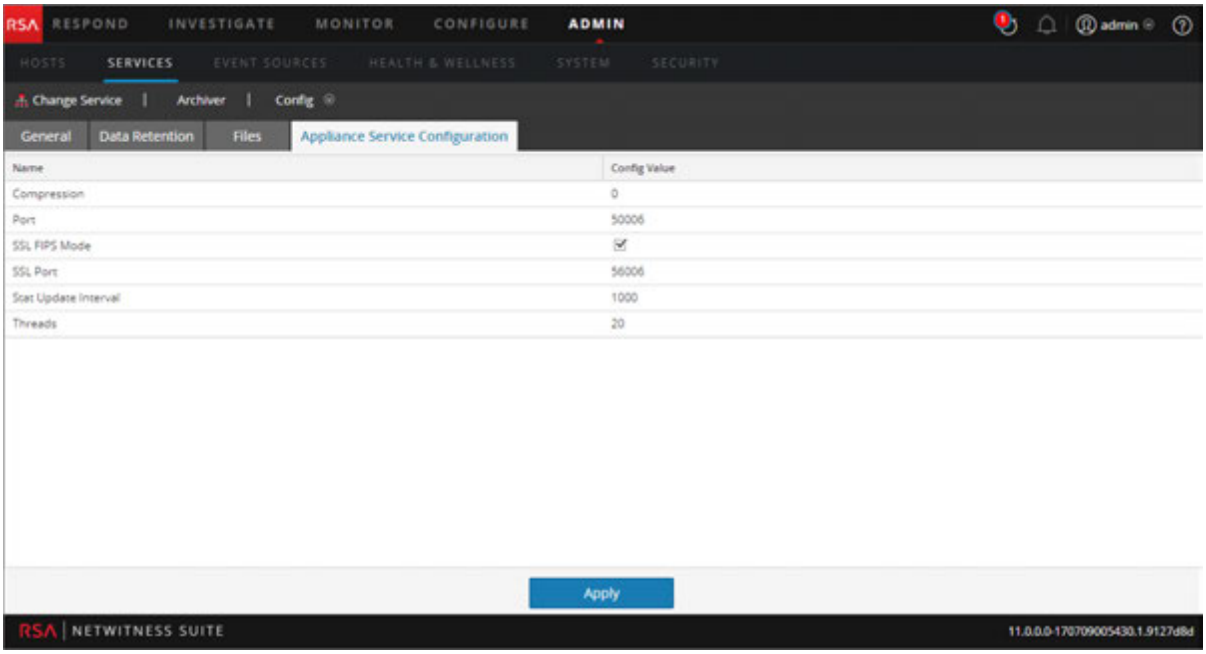
This topic lists and describes the available the configuration parameters for the NetWitness Suite Core Appliance service. The NetWitness Suite Core Appliance service provides hardware monitoring on legacy NetWitness hardware.

The Configuration view for the Archiver, Broker, Concentrator, Decoder, Log Collector, or Log Decoder service has an Appliance Service Configuration tab.

To access the Appliance Service Configuration tab:

1. In **NetWitness Suite**, go to **ADMIN > Services**.
   The Administration Services view is displayed.
2. Select a service and select  **>View > Config**.
   Services Config view for the Archiver service is displayed.
3. Click the **Appliance Service Configuration** tab.

This is an example of the Appliance Service Configuration tab for an Archiver.



Name	Description of Configuration Value	When Changes Take Effect
Compression	Compresses a message when it reaches the positive number (in bytes) that you specify.	The next time you connect to this service.
Port	Unencrypted listening port. **0** indicates that the port is disabled.	Upon restart of the service.
SSL FIPS Mode	One of the parameters you need to enable or disable Federal Information Processing Standards (FIPS). Refer to "Activate or Deactivate FIPS" in the RSA NetWitness® Suite System Maintenance Guide for detailed instructions.	Upon restart of the service.
SSL Port	SSL (Secure Sockets Layer) listening port. **0** indicates that the port is disabled. SSL is the standard security technology for establishing an encrypted link between a web server and a browser. This link ensures that all data passed between the web server and browsers remain private and integral.	Upon restart of the service.
Stat Update Interval	How often (in milliseconds) the system updates statistic nodes for monitoring Health and Wellness.	Immediately.
Threads	Threads in thread pool required to used to handle requests. The **Threads** parameter works with the **Polling Interval** parameter for event and log threads.	Immediately.

Topic

Appliance Service Configuration Parameters

Data Retention Scheduler Tab

This topic describes the configurable options in the Data Retention Scheduler tab for Decoder, Log Decoder, and Concentrator.

In the Data Retention Scheduler tab, you can define the criteria for removing database records from primary storage on Decoder, Log Decoder, and Concentrator services, and schedule the timing for checking the threshold.

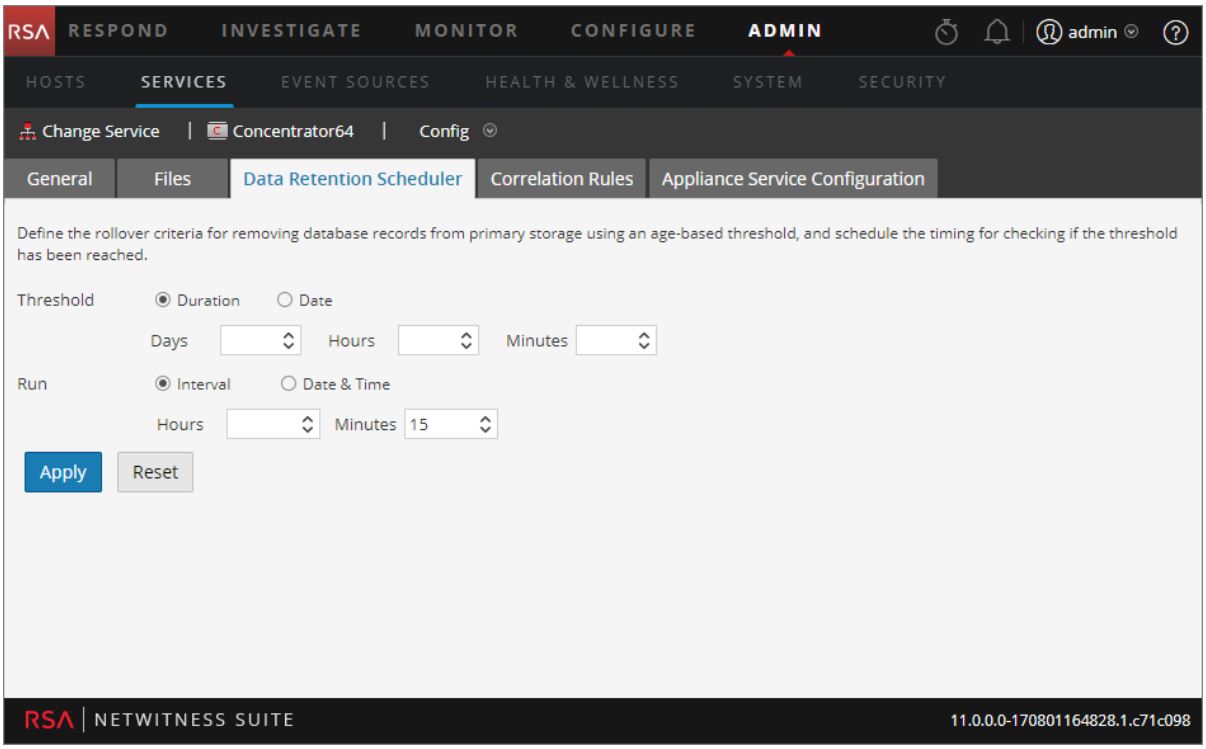
For information on the Data Retention tab for Archiver, see the **Data Retention Tab - Archiver** topic in the *Archiver Configuration Guide*.

Note: If additional customization is necessary, it can be done using the Scheduler under the Files tab in the Services Config view. For example, if more storage is available to save the RAW data versus the meta, it may make more sense to use Capacity as the threshold and to set different thresholds per database (meta versus packet).

To access the Data Retention Scheduler tab:

1. In **NetWitness Suite**, go to **ADMIN > Services**.
2. Select a Decoder, Log Decoder, or Concentrator, and then select  **> View > Config**.
3. In the **Services Config** view for the service, click the **Data Retention Scheduler** tab.

The following figure illustrates the parameters in the Data Retention Scheduler tab for a Concentrator.



Features

The Data Retention Scheduler tab has sections to specify Threshold settings and Run settings. The following table lists the parameters supported for data retention configuration.

Parameter	Description
Threshold	The threshold is based on the age of the data, the amount of time the data has been stored or the date on which the data was stored. The date is from the database file, not from the actual session time. • **Duration**: The duration of time that data can be stored before removal. Specifies the number of days (365 maximum), hours (24 maximum), and minutes (60 maximum) that have elapsed since the time stamp on the data. • **Date**: The removal of data based on the date of the timestamp. Specifies the monthly date and time in the **Calendar** and **Time** fields.
Run	The schedule for running the job that checks rollover criteria. • **Interval**: Schedule the database check to occur at a regular interval. Specifies the **Hours** and **Minutes** between the scheduled checks. • **Date and Time**: Schedule the database check to occur at a regular day and time. Specifies the day from the drop-down list and the system clock time in `hh:mm:ss` format. Possible values for day are **Everyday**, **Weekdays**, **Weekends**, and **Custom**, where **Custom** allows you to select one or more specific days of the week.
Apply	Overwrites any previous schedule for this service and applies the new settings immediately. **Caution:** Once these settings have been applied and the threshold is met, the old data will be deleted from the database and no longer accessible.
Reset	Resets the schedule to the last applied state.

Files Tab

This topic describes the service configuration files that are visible in the Services Config view > Files tab.

The Files tab in the Services Config view is the user interface for editing service configuration files—Decoders, Log Decoders, Brokers, Archivers, and Concentrators—as text files.

The files available to edit vary depending upon the type of service being configured. The files that are common to all Core services are:

- The service index file.
- The netwitness file.
- The crash reporter file.
- The scheduler file.
- The feed definitions file.

In addition, the Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter.

Note: The default values in these configuration files are generally good for the most common situations; however, some editing is necessary for optional services, such as the crash reporter or scheduler. Only administrators with a good understanding of the networks and the factors that affect the way services collect and parse data should make changes to these files in the Files Tab.

More detail on the service configuration parameters is available in the Service Configuration Settings.

To access the Files tab:

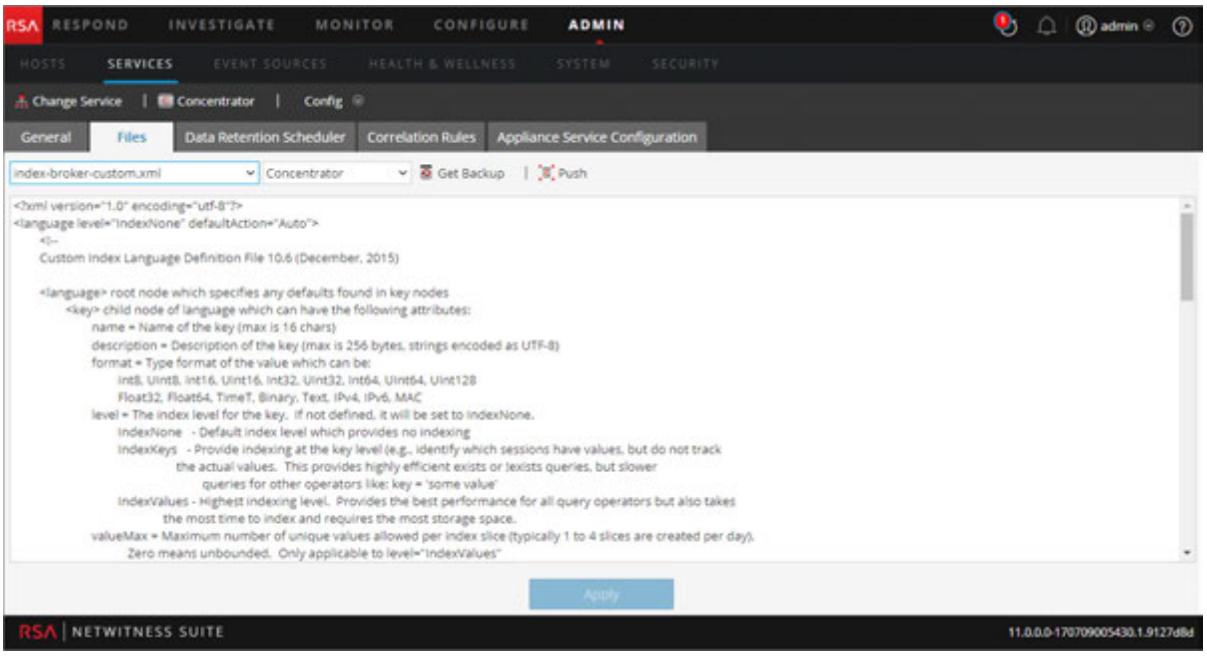
1. In **NetWitness Suite**, go to **ADMIN > Services**.
2. Select a service and select  **> View > Config**.

   The Services Config view is displayed with the **General** tab open.
3. Click the **Files** tab.

Role	I want to ...
Administrator	Edit a Service Configuration file.

Edit a Service Configuration File

This is an example of the Files tab.



Files Tab Toolbar

The Files tab has a toolbar and an edit window. This is an example of the toolbar.

These are the features of the Files tab toolbar.

Feature	Description
File drop-down list	Displays a list of files that the system is currently using. When you select a file, the text of the file is displayed in the text edit window. In the text window, you can edit the file and save the changes, or create alternate files to use.
Service / Host drop-down list	Displays the service type and host. You can open a file from either the service or the host for editing.
	Retrieves the latest backup of the current file, which can prove useful when you have made changes and want to go back to the previous version of the file. The backup does not replace the current file unless you click **Save**.

Feature	Description
	Displays a dialog in which you can select services of the same type and push the currently viewed file to the services.
Apply	Overwrites the current file, creates a backup file.

Services Explore View

This topic introduces the features of NetWitness Suite Services Explore view, a powerful and flexible user interface for viewing and editing host and service configurations.

The Services Explore View offers advanced access and control of all NetWitness Suite hosts and services. All services expose their functionality through a tree-like series of nodes, similar to the Windows Explorer view of your file system. Here you can:

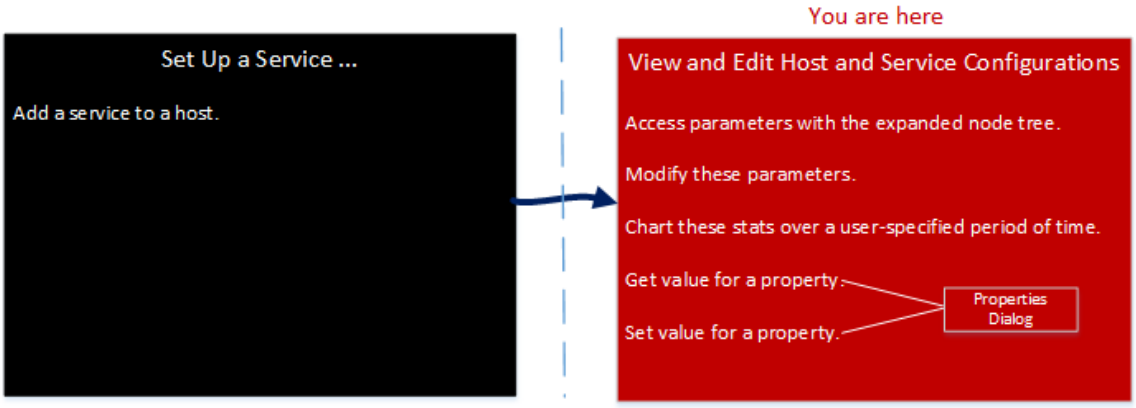
- View a directory tree showing common files for all selected services.
- Navigate down through the directory to a file.
- Open the same file for each service, and display the contents side by side.
- Select an entry in the file and edit the value.
- Apply a property value from one service to other services.

The Services Explore View can also display a Properties dialog, a simple interface for viewing properties of any node in the system and sending messages to the node, shown in the figure below.

Caution: A good understanding of the nodes and parameters is required when editing in this view. Incorrect settings can cause performance problems.

Workflow

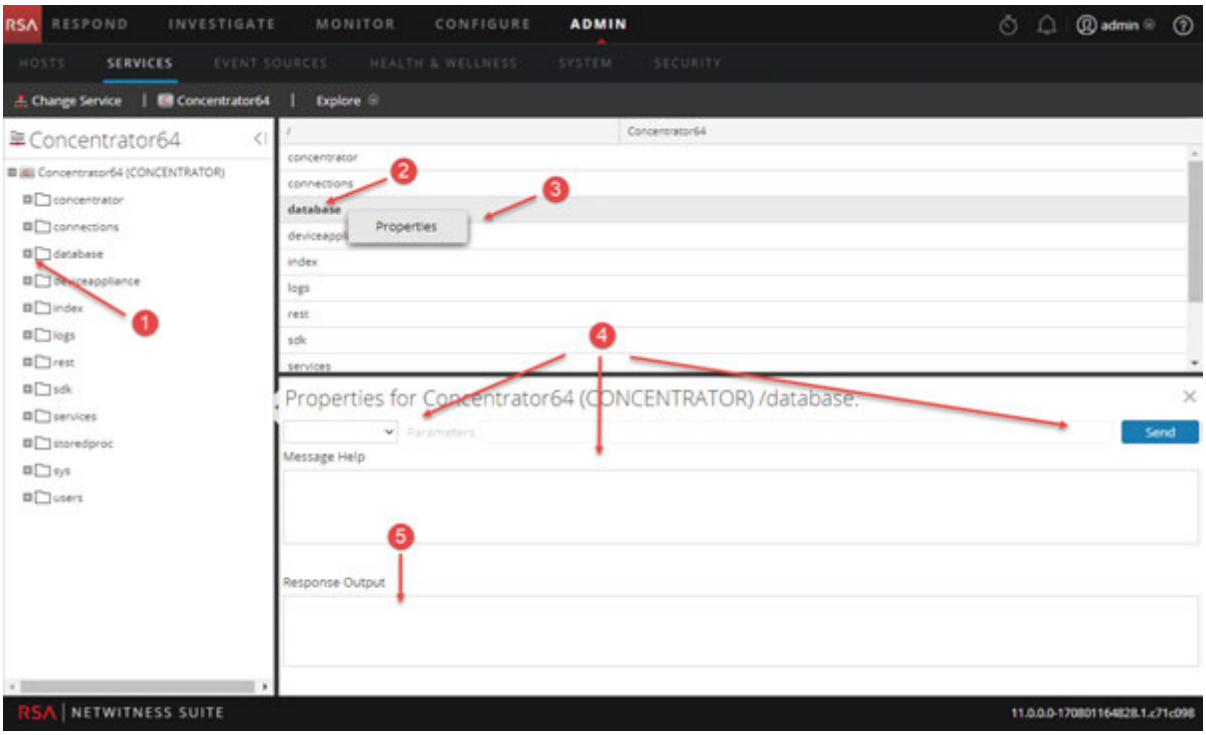
This workflow shows the tasks you perform from the Explore view.



Quick Look

To access the Services Explore view:

1. In **NetWitness Suite**, go to **ADMIN > Services**.
2. Select a service and select > **View** > **Explore**.



1	Expand the node to display its parameter categories.
2	Click a property (for example, **meta.dir**) to select it.
3	Right-click a node or category and click **Properties** to display the Properties dialog.
4	Perform an operation on a node or category: a. Select a command from the drop-down list. b. Enter a command string (if required). c. Click **Send**.
5	Review the output.

Features

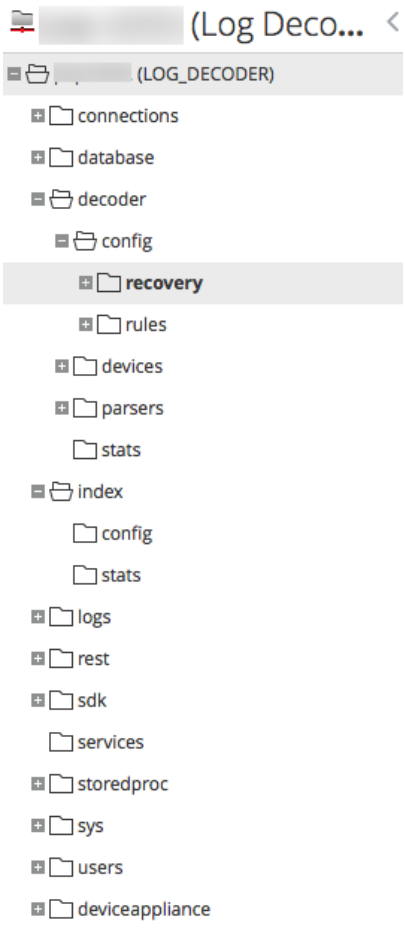
The **Services Explore View** has two main panels:

- The Node list
- The Monitor panel

You can access the Properties of any file by right-clicking the file and selecting Properties.

The Node List

The Node list displays the services as a tree-like series of nodes and folders. The levels in the Node list expand and collapse to display the full hierarchy.



Each root folder is named based on the functionality it exposes. For instance, the **/connections** folder shows all connected IP addresses. Underneath each **IP/Port** are two folders, **sessions** and **stats**.

- The **sessions** folder displays all authenticated user sessions originating from the IP/Port.
- The **stats** folder displays values, such as the number of messages sent/received, bytes sent/received, and others, set by the service. These are not editable.

Selecting any folder in the tree view displays its children in the **Monitor** panel. Every node in the tree is actively monitored, so when a statistic or configuration node changes value, it is immediately reflected in the tree and monitor panel.

The Monitor Panel

The **Monitor** panel displays properties and values for a selected node (such as **index**) and a child folder (such as **config**). There are two ways to edit values:

- Clicking the value and typing a new value
- Sending a **set** message in the Properties dialog

/Index/Config	[redacted] (Concentrator)
index.dir	/var/netwitness/concentrator/index=7.08 GB
index.dir.cold	
index.dir.warm	
page.compression	huffhybrid
save.session.count	0

Topics

- Features
- Log Decoder Service Configuration Parameters

Properties Dialog

This topic explains how to send messages to a system node in the Services Explore view > Properties dialog.

The Properties dialog opens below the Monitor panel when you select Properties from the context menu. The Properties dialog provides a user-friendly messaging tool for communication with system nodes. This is useful for getting and setting values for a property for multiple services.

All nodes support the help message, which contains:

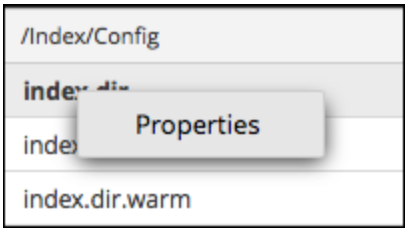
- A description of the node.
- The list of supported messages with a corresponding description.
- Security roles needed to access the messages.

The available messages vary according to the service and root folder. Many of these messages are also accessible as options with a NetWitness Suite dashboard or view.

To access the Properties dialog:

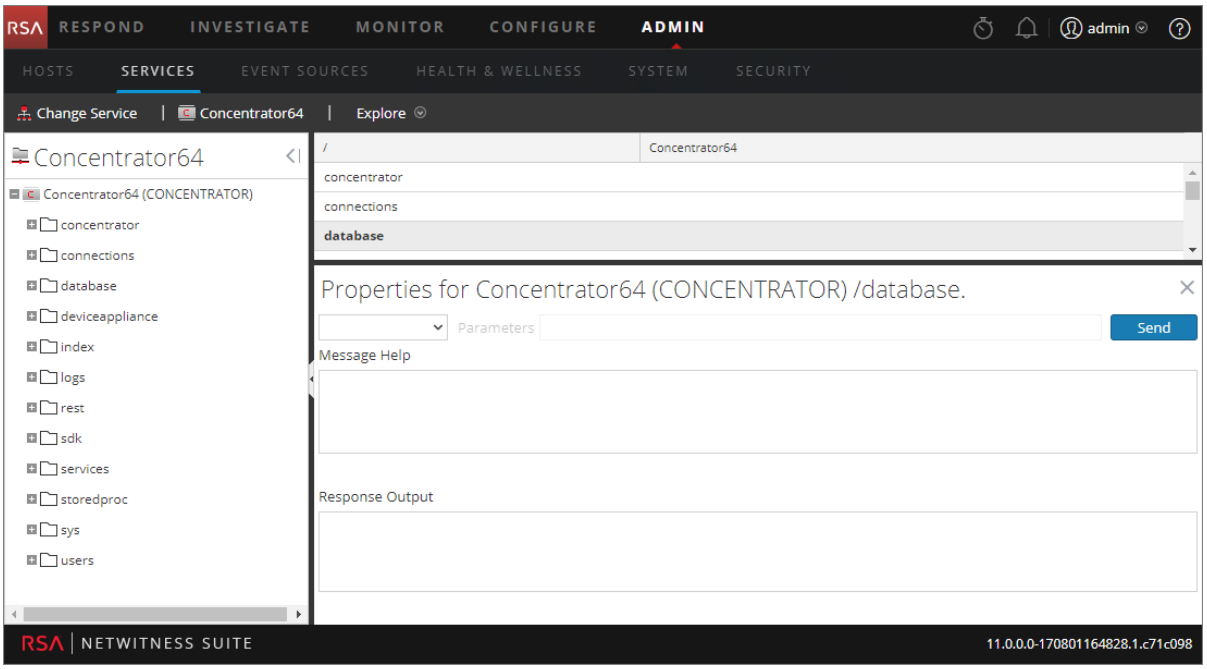
1. In **NetWitness Suite**, go to **ADMIN > Services**.
2. Select a service and select  **> View > Explore**.
3. In the **Node** list, select a file.

4. In the **Monitor** panel, right-click a property and select **Properties**.



The Properties dialog is displayed. You can also right-click any file in the Node list to display the Properties dialog.

The following example shows the Properties dialog with help for a message (**info**) displayed.



Features

The Properties dialog has the following features.

Feature	Description
Message drop-down list	Lists all available messages for the current node. Select a message to send the node.
Parameters input field	Type the message parameters in this field.
Send button	Sends the message to the node.

Feature	Description
Message Help	Displays help text for the current message.
Response Output	Displays the response to a message or output from a message.

Services Logs View

This topic introduces the Services Logs view.

The Services Logs view provides the ability to view and search the logs for a specific service. The Services Logs view is identical to the System Logging Panel with two exceptions:

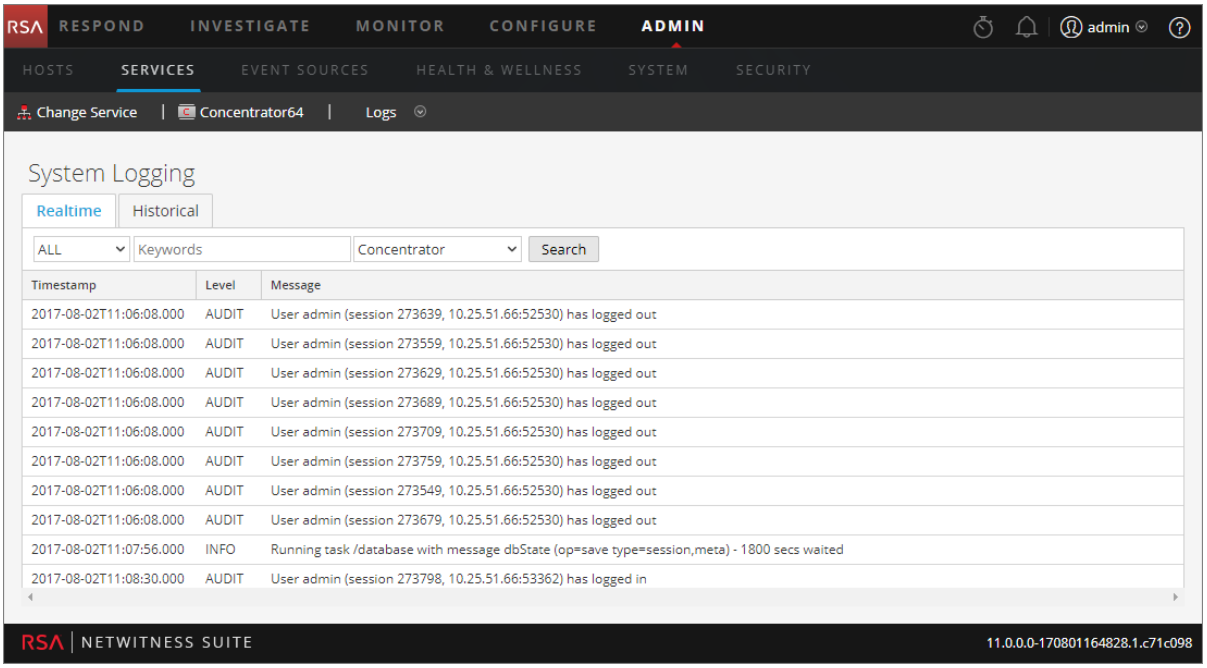
- The Services Logs view has an additional filter to select messages for the service or host.
- The System Logging panel has an additional tab for Settings.

Refer to System Logging Panel for a complete description of NetWitness Suite logging features.

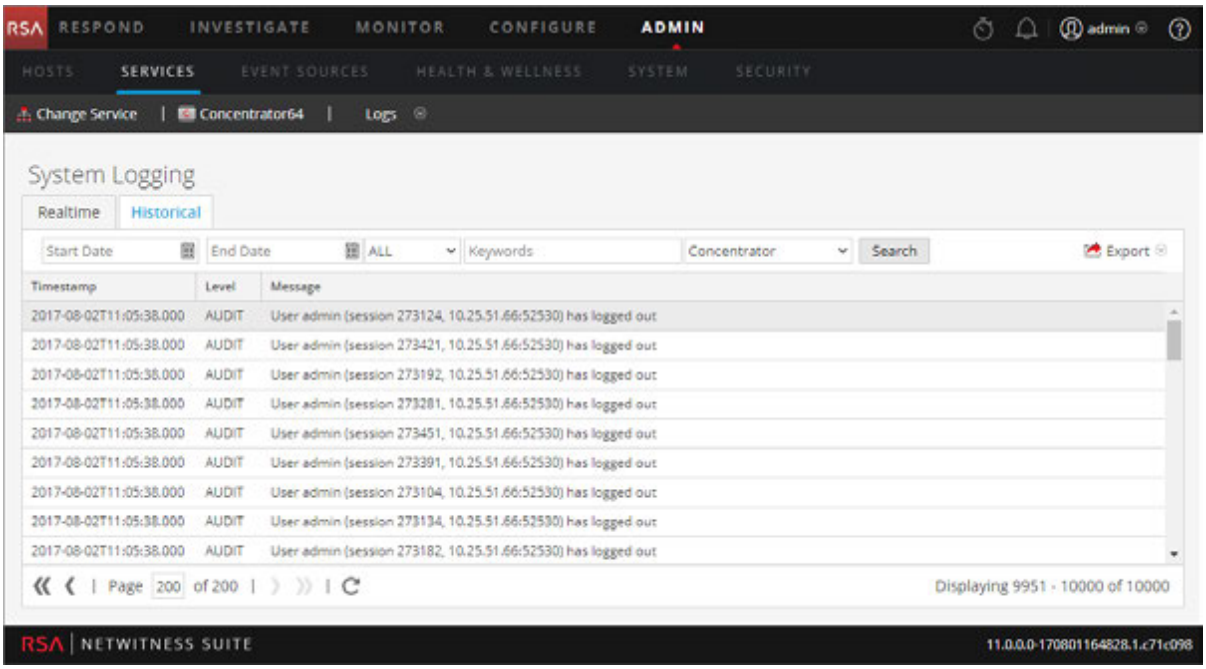
To view a service log:

1. In **NetWitness Suite**, go to **ADMIN > Services**.
2. Select a service and select  **>View > Logs**.

The following figure shows the Services Logs view Realtime tab.



The following figure shows the Services Logs view Historical tab.



Features

The System Logging Panel has the following tabs, and the logging functions are described as part of system maintenance (see **Monitor Health and Wellness of Security Analytics** in the *System Maintenance* guide).

Feature	Description
Realtime tab	This is the monitor mode of the service log.
Historical tab	This is a searchable view of the service log.

Services Security View

This topic provides an overview of service security management in the Services Security view.

In NetWitness Suite, each service has a separate configuration of users, roles, and role permissions, which are managed in the Services Security view.

To access service information and perform service operations through NetWitness Suite, a user must belong to a role that has permissions on that service. For 10.4 or later NetWitness Suite Core services that utilize trusted connections, it is no longer necessary to create NetWitness Suite Core user accounts for users that log on through the web client. You only need to create NetWitness Suite Core user accounts for aggregation, thick client users, and REST API users.

Note: Only the default admin user in NetWitness Suite is created by default on all services. As a prerequisite to managing service security, the default admin user account must be present in the NetWitness Suite Administration > Services view. For every other user, you must configure access to each particular service through NetWitness Suite.

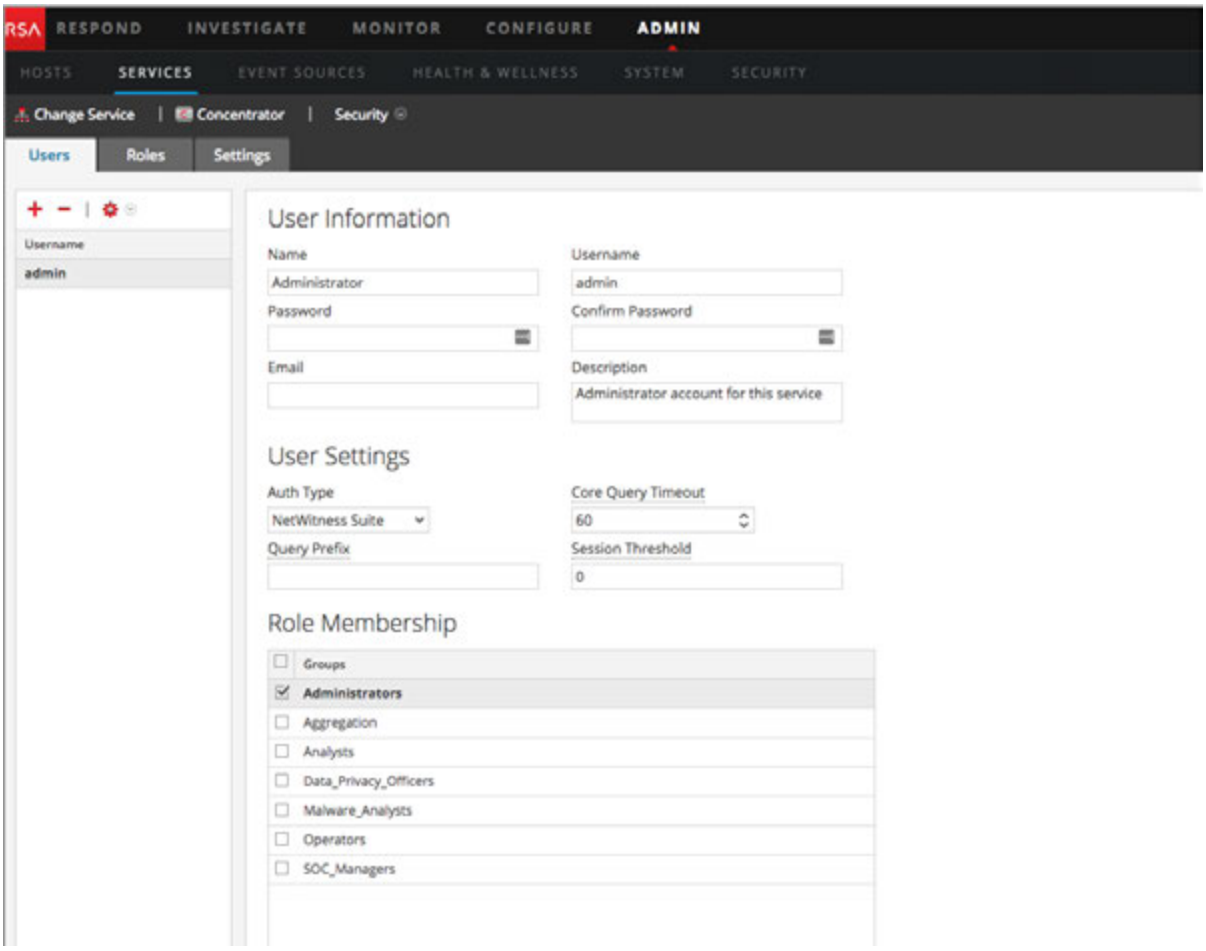
Procedures related to this tab are described in Hosts and Services Procedures.

To access the Services Security view:

1. In **NetWitness Suite**, go to **ADMIN > Services.**

2. Select a service and select  > **View** > **Security**.

   The Services Security view for the selected service is displayed.



Features

The Services Security view has three tabs, Users tab, Roles tab, and Settings tab.

Roles and Service Access

Primary considerations in configuring service security are defining the roles and assigning users to the roles. The Service Security view separates these two functions into the Users tab and the Roles tab.

- In the Roles tab, you can create roles and assign permissions to the roles for a selected service.
- In the Users tab, you can add a user, edit user settings, change the user password, and edit the role membership of the user for a selected service. Although you select a single service in the Services Security view, you can apply the settings for one service to other services.

Topics

Roles Tab

This topic introduces the features of the Services Security View > Roles Tab.

The **Roles** tab enables you to create roles and assign permissions. Each role can have different permissions for different services. For example, the Analysts role can have different role permissions based on the selected service.

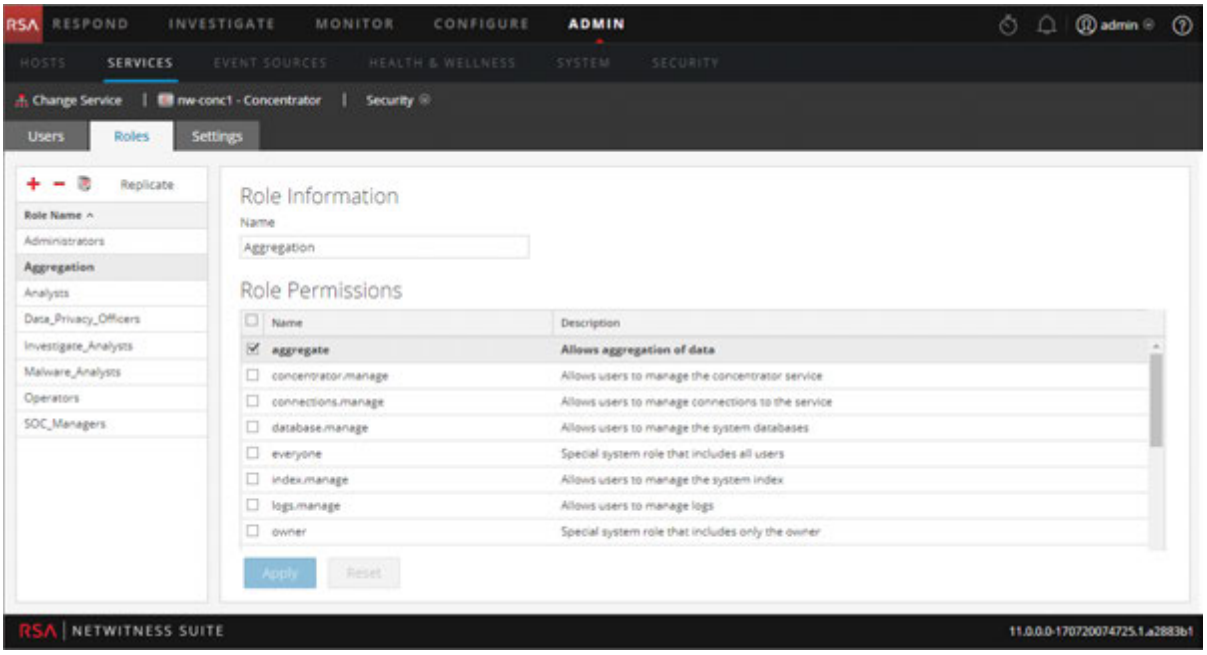
Before you can add users to roles, you need to define user roles, usually by function, and assign permissions to the roles.

Procedures related to this tab are described in Hosts and Services Procedures.

To display the **Services Security View > Roles** tab:

1. In **NetWitness Suite**, go to **ADMIN > Services.**
2. Select a service to which you want to add a user, and select  **> View > Security**.
3. Select the **Roles** tab.

The following figure shows the Roles tab in the Services Security view.



Features

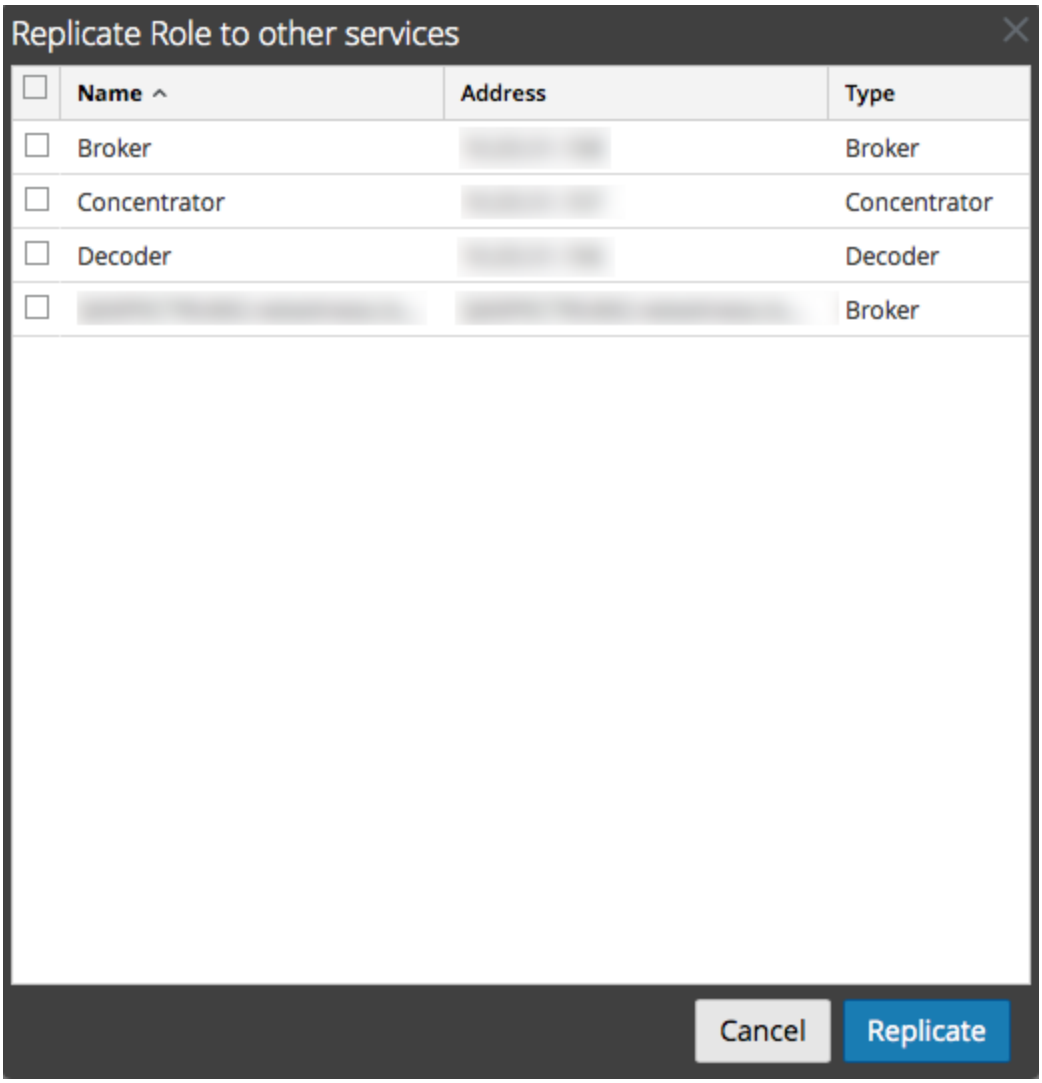
The Roles tab has a **Role Name** panel on the left. Selecting a role name shows the **Role Information** panel for the selected role on the right.

Role Name Panel

The **Role Name** panel has the following features.

Feature	Description
	Adds a new group to the current service.
	Deletes the selected group from the current service.
	Copies a role and its assigned permissions to a new role. The name of the new role must be unique. For example, you can copy the **Analysts** role and create another role with a new name, such as **Analyst_Managers**.
Replicate	Pushes a role and its assigned permissions to other services. After you select a role and click **Replicate**, the **Replicate Role to other services** dialog is displayed. In the dialog, you can select the services where you want to replicate the role.

The following figure shows the **Replicate Role to other services** dialog.



Role Information and Permissions Panel

The **Role Information and Permissions** panel defines role permissions.

There are two buttons:

- The **Apply** button saves the changes made in the Role Permissions panel and they become effective immediately.
- If you have not saved changes in the Role Permissions panel, the **Reset** button resets all fields and settings to their values before editing.

Service User Roles and Permissions

This topic describes the pre-configured service user roles and permissions.

The Services Security view Roles tab enables you to create service user roles and assign permissions. You can also use the pre-configured roles included with NetWitness Suite to assign user permissions.

Service User Roles

NetWitness Suite has the following pre-configured service user roles.

Role	Assigned Permissions	Personnel/Account
Administrators	All permissions	NetWitness Suite System Administrator
Aggregation	aggregate sdk.content sdk.meta sdk.packets	You can use this role to create an Aggregation account. This role provides the minimum permissions necessary to perform aggregation of data. It is only available on NetWitness Suite 10.5 and later services.
Analysts, Malware_ Analysts, and SOC_ Managers	sdk.meta sdk.content sdk.packets storedproc.execute	Users can use specific applications, run queries and view content for purposes of analysis.
Data_Privacy_ Officers	sys.manage users.manage sdk.meta sdk.content sdk.packets sdk.manage logs.manage database.manage index.manage dpo.manage	Data Privacy Officer Data Privacy Officers have the dpo.manage permission on Decoders and Log Decoders.

Role	Assigned Permissions	Personnel/Account
Operators	sys.manage services.manage connections.manage users.manage logs.manage parsers.manage rules.manage database.manage index.manage sdk.manage decoder.manage archiver.manage concentrator.manage storedproc.manage	Operators are responsible for the daily operation of the services.

Service User Permissions

There are many permissions that you can assign a service role in NetWitness Suite. Users can have different permissions on each service, depending on their role assignments and the permissions selected for each role. This table describes the permissions that you can assign to a role.

Permission	Definition
sys.manage	Allows the user to edit the service configuration settings.
services.manage	Allows the user to manage connections to other services.
connections.manage	Allows the user to manage connections to the service.
users.manage	Allows the user to create individual users and user roles and specify user permissions.
aggregate	Allows the user to perform aggregation of data.

Permission	Definition
sdk.meta	Allows the user to run queries in the Investigation and Reporting applications and to view the metadata returned by the query.
sdk.content	Allows the user to access raw packets and logs from any client application (Investigations and Reporting).
sdk.packets	Allows users to access raw packets and logs from any client application.
appliance.manage	Allows the user to manage the appliance (host) tasks. This permission is required by the Appliance service.
decoder. manage	Allows the user to edit the configuration settings for the Decoder service.
concentrator.manage	Allows the user to edit the configuration settings for the Concentrator/Broker service.
logs.manage	Allows the user to view the service logs and edit the logging configuration settings for the specified service.
parsers.manage	Allows the user to manage all attributes under the parsers node.
rules.manage	Allows the user to add and delete all rules.
database.manage	Allows the user to set database locations, sizes, and the various configuration settings for the session, meta and/or packet/log databases.
index.manage	Allows the user to manage all index-related attributes.
sdk.manage	Allows the user to view and set all SDK configuration items.
storedproc.execute	Allows the user to execute a Lua stored procedure.
storedproc.manage	Allows the user to manage Lua stored procedures.
archiver.manage	Allows the user to modify the Archiver configuration.

Permission	Definition
dpo.manage	Allows the user to manage the transform configuration and the applicable keys.

Aggregation Role

This topic describes the Aggregation role and permissions that allow service users to perform aggregation.

The Aggregation role is a service user role intended only for aggregation of data. It has the minimum role permissions required to do aggregation:

- aggregate
- sdk.meta
- sdk.packets
- sdk.content

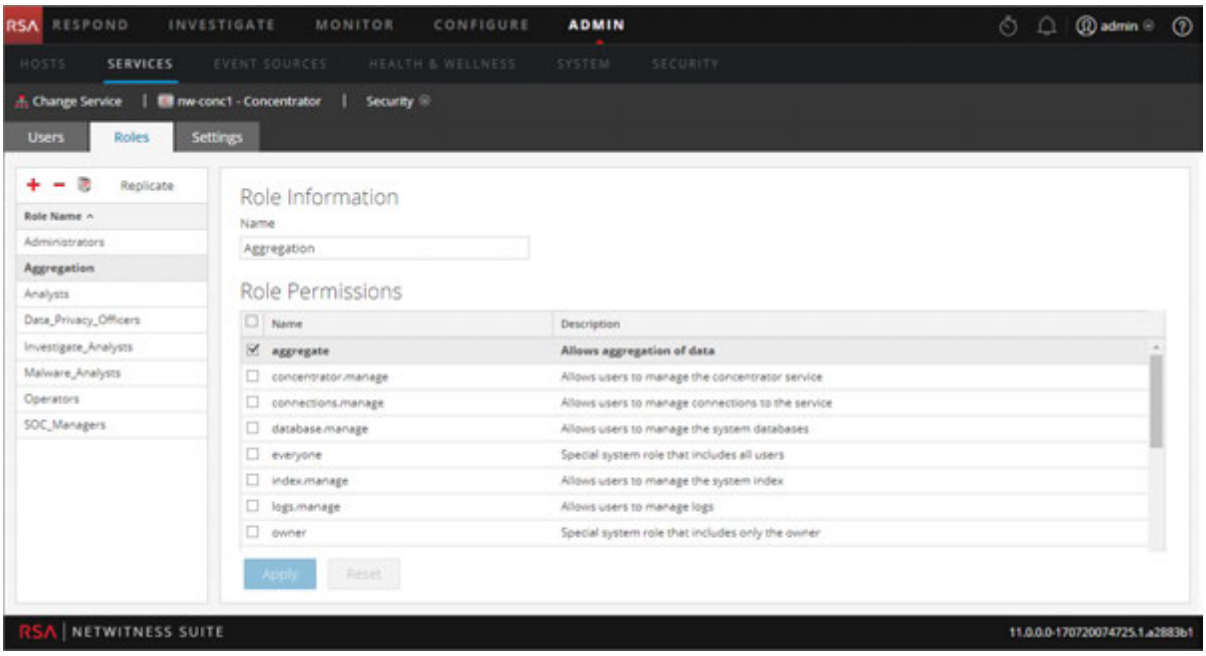
The Aggregation role is available only on NetWitness Suite 10.5 and later services and it can be used for an aggregation account. Members of this role or service users with these permissions can perform aggregation on Decoders, Concentrators, Archivers, and Brokers. The **aggregate** permission allows service users to perform aggregation of sessions and metadata along with raw packets and logs.

You can still use the decoder.manage, concentrator.manage, and archiver.manage permissions, but the Aggregation role permissions allow aggregation only and prevent the other available operations.

You access the service roles from the ADMIN > Services (select a service) > Actions > View > Security > Roles tab.

Procedures related to roles are described in Hosts and Services Procedures. Service User Roles and Permissions provides detailed information on the pre-configured roles.

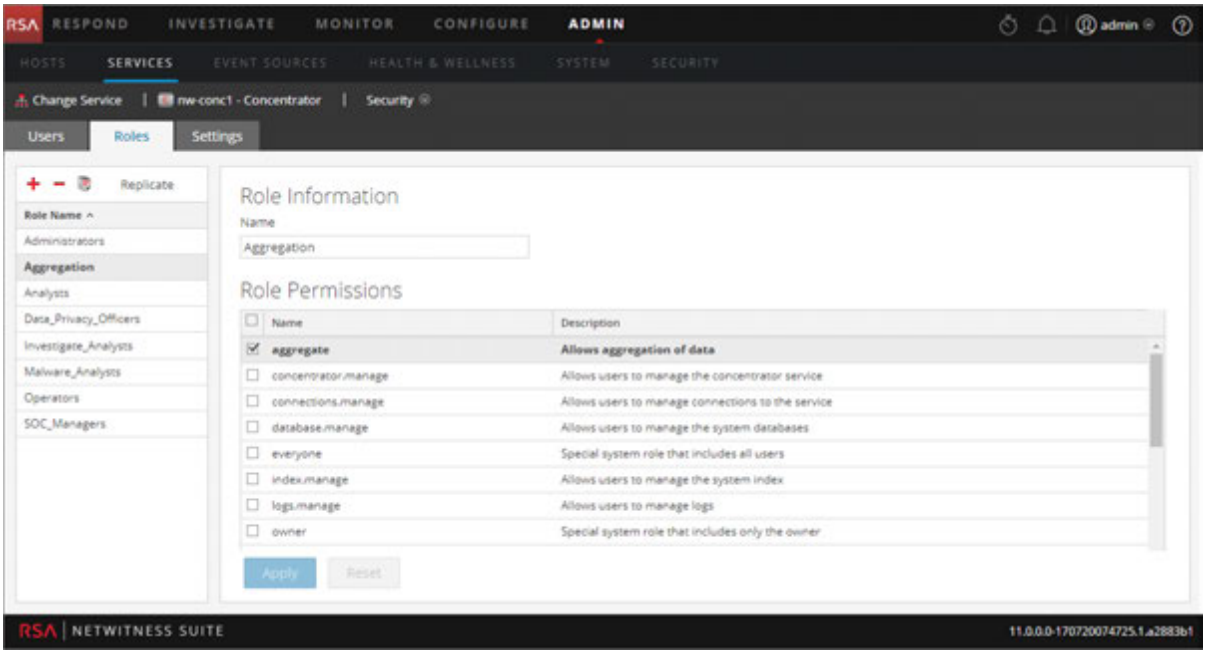
The following figure shows the permissions in the Aggregation role.



Settings Tab

This topic describes the features of the Services Security view > Settings tab.

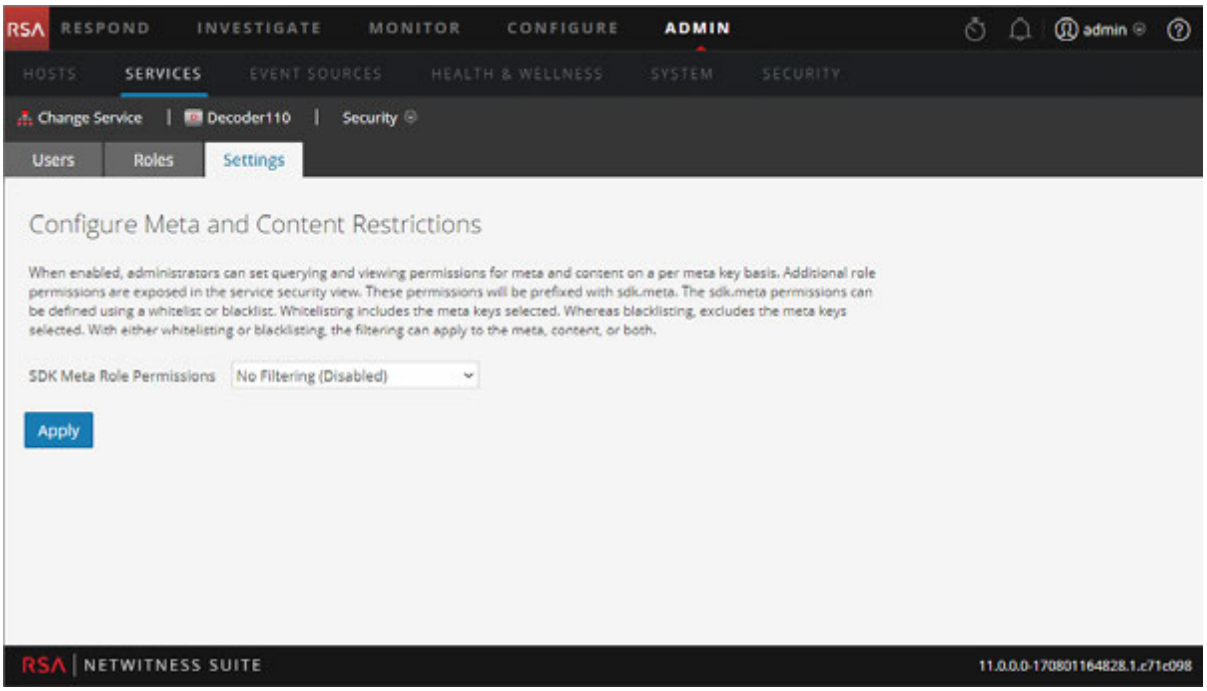
In the Services Security view Settings tab, Administrators can enable and configure system roles that define permissions on a per meta key basis for individual Brokers, Concentrators, Decoders, and Log Decoders. Configuring this feature adds configurable meta keys to the Services Security view > Roles tab so that individual meta keys can be applied to specific roles on a specific service. The following figure illustrates this.



This configuration is generally part of a data privacy plan implemented to ensure that specific types of content consumed or aggregated by a service are kept secure by limiting visibility of the meta data and content to privileged users (see *Data Privacy Management*).

To display the tab:

1. In **NetWitness Suite**, go to **ADMIN > Services**.
2. In the **Services** grid, select a Decoder or Log Decoder service, click  **> View > Security,** and click the **Settings** tab.



Features

The tab includes two features.

Feature	Description
SDK Meta Role Permissions field	Provides option for disabling or configuring meta key and content restrictions. The filtering options are described.
Apply button	Applies the selected configuration immediately. If not disabled, the meta keys are added to the Roles tab so they can be applied to specific roles.

SDK Meta Role Permissions Options

The following table lists the filtering options available in the SDK Meta Role Permissions selection list, and the numeric values used to disable (0) and the types of filtering (1 through 6).

Note: There is no need to know the numeric value unless configuring meta and content visibility manually in the system.roles node.

system.roles Node Value	Settings Tab Option	Description
0	No Filtering (Disabled)	System roles that define permissions on a per meta key basis are disabled.
1	Whitelist meta and content	Meta and content for the specified SDK meta roles are white listed, or visible to users assigned the system role.
2	Whitelist only meta	Meta for the specified SDK meta roles is white listed, or visible to users assigned the system role.
3	Whitelist only content	Content for the specified SDK meta roles is white listed, or visible to users assigned the system role.
4	Blacklist meta and content	Meta and content for the specified SDK meta roles are black listed, or not visible to users assigned the system role.
5	Blacklist only meta	Meta for the specified SDK meta roles is black listed, or not visible to users assigned the system role.
6	Blacklist only content	Content for the specified SDK meta roles is black listed, or not visible to users assigned the system role.

Users Tab

This topic explains the features of the Services Security view > Users tab.

In the Services Security view, the Users tab enables you to configure the following for a service:

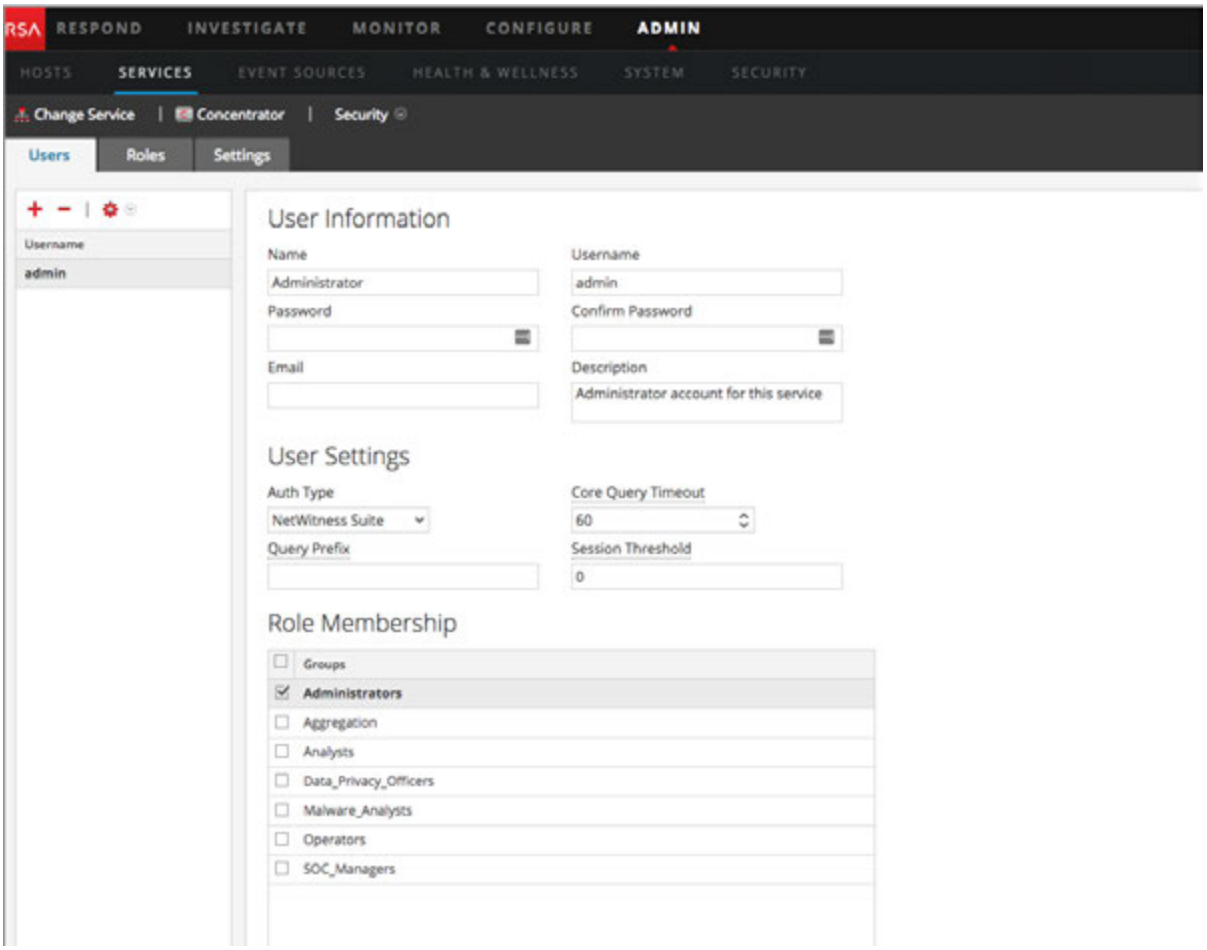
- Add user accounts.
- Change service user passwords.
- Configure user authentication properties and query handling properties for the service.
- Specify the user role membership, which specifies the roles that the user belongs to on the selected service.

Note: For 10.4 or later NetWitness Suite Core services that utilize trusted connections, it is no longer necessary to create NetWitness Suite Core user accounts for users that log on through the web client. You only need to create NetWitness Suite Core user accounts for aggregation, thick client users, and REST API users.

Procedures related to this tab are described in Hosts and Services Procedures.

To access the Services Security view > Users tab:

1. In **NetWitness Suite**, go to **ADMIN > Services.**
2. Select a service to which you want to add a user, and select  **> View > Security**.



Features

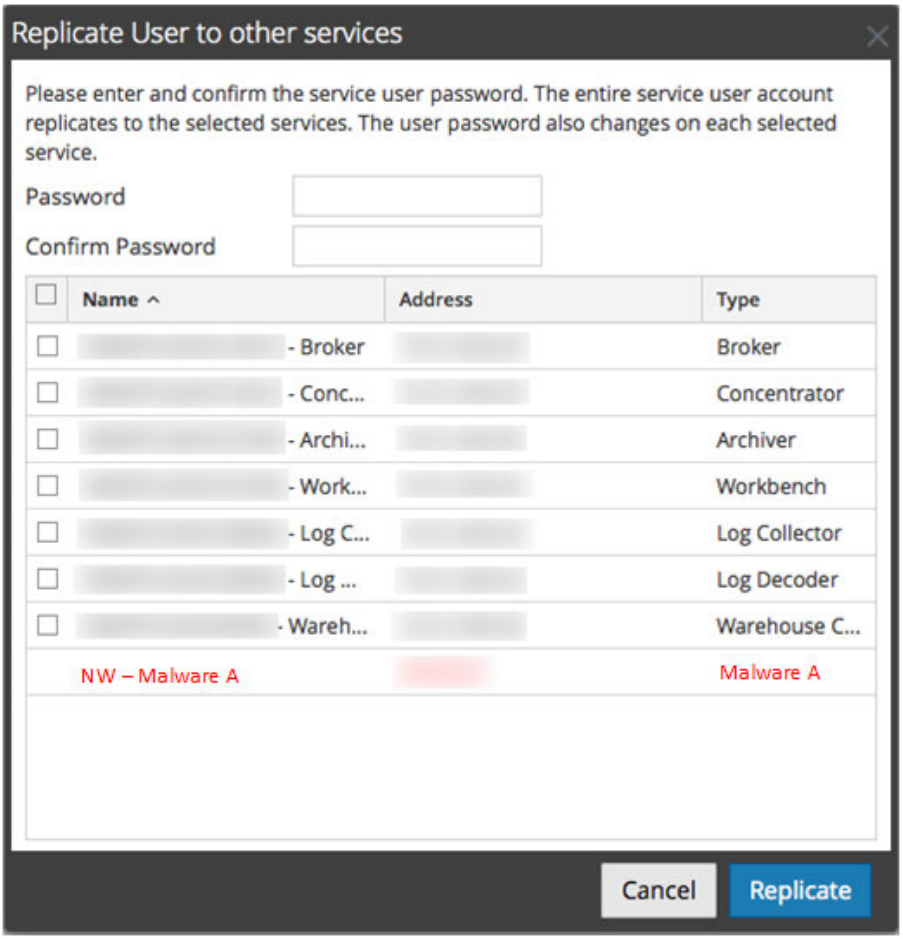
The Users tab has a User List panel on the left. Selecting a username makes the User Definition panel on the right available.

User List Panel

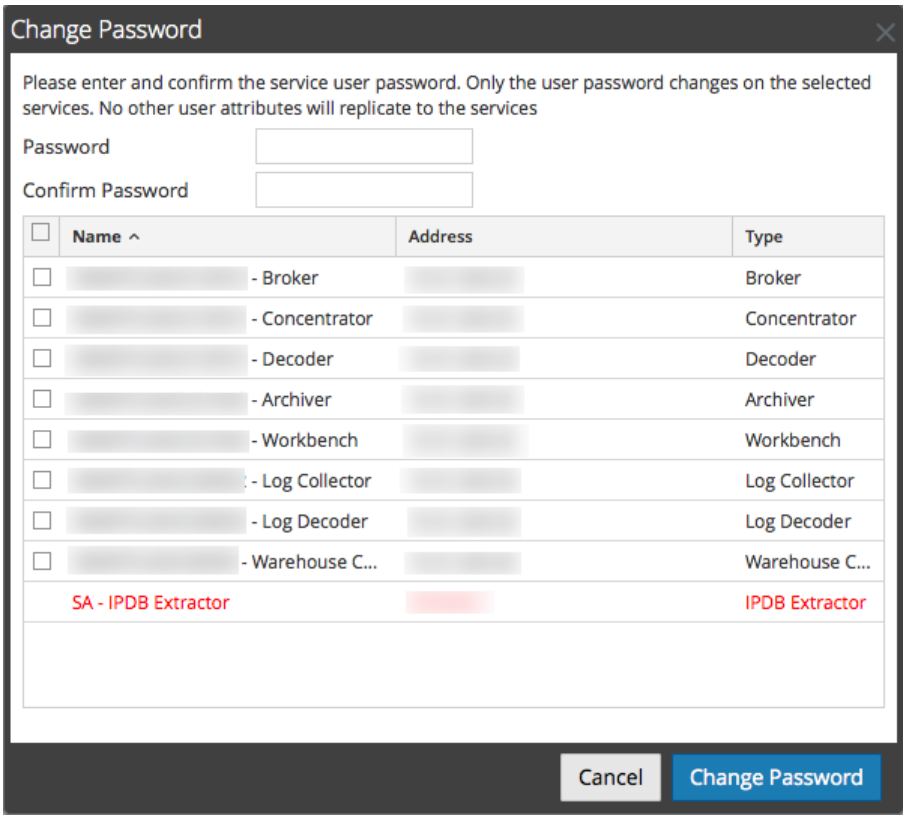
The User List panel has the following features.

Feature	Description
	Adds a new user to the current service.
	Deletes the selected users from the service.
	Performs one of the following actions on the selected service user account: • **Replicate:** Replicates the entire service user account to selected services. • **Change Password:** Changes the password of a service user and replicates the new password to Core services with that user account defined. The Change Password option replicates only the password change to the Core services selected and does not replicate the entire user account.
Username	The user names for all user accounts that access the service. The username must be one used to log on to NetWitness Suite.

The following figure shows the **Replicate User to other services** dialog.



The following figure shows the **Change Password** dialog.



User Definition Panel

The User Definition panel has three sections:

- User Information identifies the user as created in the Administration Security view.
- User Settings define parameters that apply to this user's access to the service.
- Role Membership defines user roles to which the user belongs.

There are two buttons:

- The **Save** button saves the changes made in the User Definition panel, and they become effective immediately.
- If you have not saved changes in the User Definition panel, the **Reset** button resets all fields and settings to their values before editing.

User Information

The User Information section has the following features.

Field	Description
Name	The name of the user.

Field	Description
Username	The username that this user enters to log on to the service. This is the NetWitness Suite username generated when the administrator added the user and the associated credentials in the **Administration Security** view (Administration > Security).
Password (and **Confirm Password**)	The password that the user enters to log on to the service. This is the NetWitness Suite password generated when the administrator added the user and the associated credentials in the **Administration Security** view. The NetWitness Suite account password and the service password must match in order to allow the user to connect to the service through NetWitness Suite.
Email	(Optional) The user's email address.
Description	(Optional) A general description field to describe this user.

User Settings

The User Settings section has the following features.

Field	Description
Auth Type	The authentication scheme for this user. The product line supports internal and external authentication. • **Netwitness** specifies internal authentication, and is enabled by default. In this mode, all users must authenticate with the user account and passwords that are generated when the administrator uses the NetWitness Suite Administration Security view (Administration > Security) to create the user and their associated credentials. • **External** specifies that authentication is enabled through the host interface with PAM (Pluggable Authentication Modules). For more information, see the **Configure PAM Login Capability** topic in the *System Security and User Management* guide.
Query Prefix	(Optional) Always append the query syntax to all queries by this user. For example, adding the query prefix **email != 'ceo@company.com'** prevents those email results from showing up in the sessions.

Field	Description
SA Core Query Timeout	**Note:** This field applies to NetWitness Suite 10.5 and later service versions and does not appear for 10.4 and earlier service versions. NetWitness Suite 10.4 and earlier services use Query Level instead of SA Core Query Timeout. Specifies the maximum number of minutes a user can run a query on the service. If this value is set to zero (0), the query timeout is not enforced for the user on the service. When replicating a user from a NetWitness Suite 10.5 or later service to a NetWitness Suite 10.4 service, Query Timeout migrates to Query Level based on the closest level. For example, if a user has a Query Timeout of 15 minutes, the user gets a Query Level of 3 after the migration. If a user has a Query Timeout of 35 minutes, the user gets a Query Level of 2 after the migration. If a user has a Query Timeout of 45 minutes, the user gets a Query Level of 2 after the migration.
Session Threshold	(Optional) Controls the behavior of the application when scanning meta values to determine session counts. Any meta value with a session count that is above the set threshold stops its determination of the true session count when the threshold is reached. If a threshold is set for a session, the Navigation view shows that the threshold was reached and the percentage of query time used to reach the threshold.

Role Membership

The Role Membership section shows the roles that a user is a member of for the selected service.

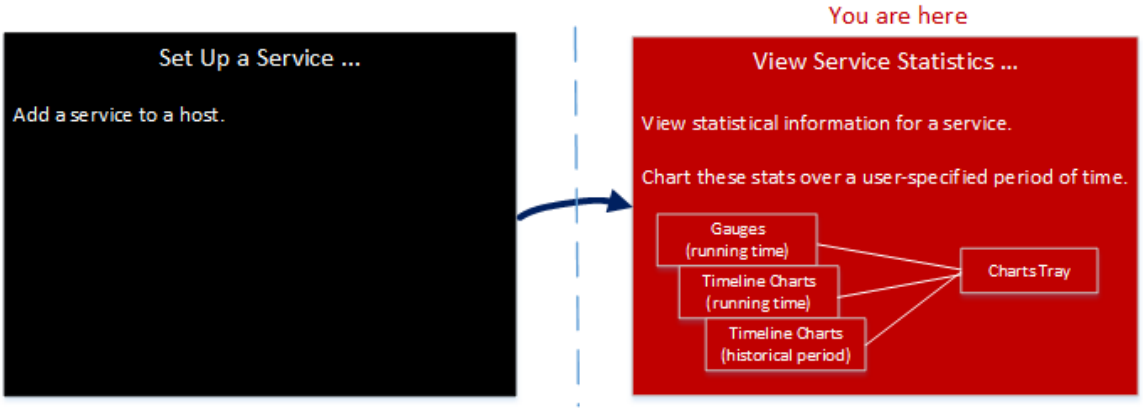
Services Stats View

This topic describes the features available in NetWitness Suite Services Stats view.

The Services Stats view provides a way to monitor the status and operations of a service. This view displays key statistics, service system information, and host system information for a service. In addition, more than 80 statistics are available for viewing as gauges and in timeline charts. In historical timeline charts, only statistics for session size, sessions, and packets are viewable.

Workflow

This workflow shows the tasks you perform from the Stats view.

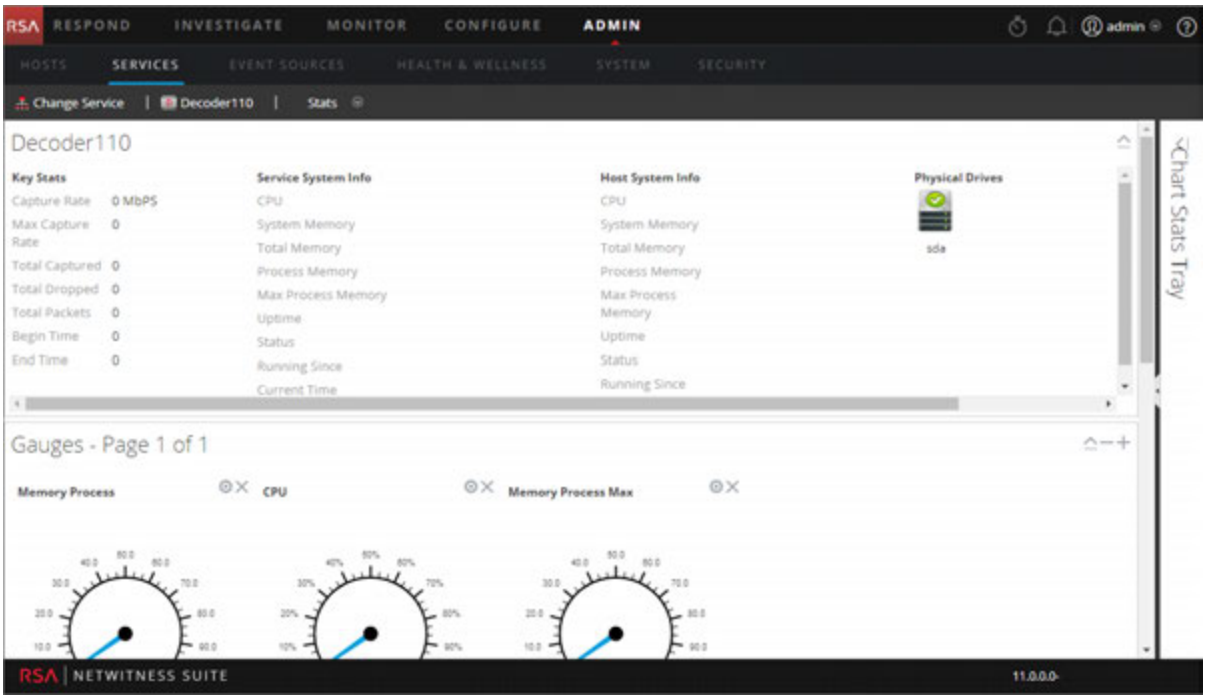


In the Stats view, you can customize the monitored statistics for individual services.

The following example shows you how to use the Stats view for a Decoder. The Stats view for all the services provide you with the same information for each service.

To access the Service Stats view:

1. In **NetWitness Suite** , go to **ADMIN > Services**.
   The Services view is displayed.
2. Select a service and select  **> View > Stats**.



Features

Although different statistics are available for different types of services, certain elements are common to the Services Stats view for any Core service:

- Summary Stats section
- Gauges section
- Timelines section
- Historical Timelines section
- Chart Stats Tray

Summary Stats Section

The Summary Stats section is at the top of the default view, and has no editable fields.

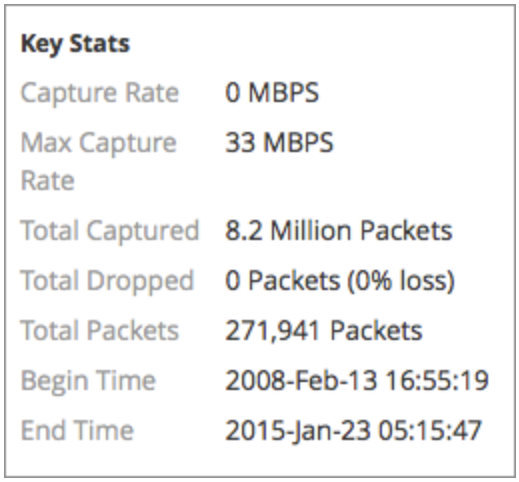
There are five panels in the Summary Stats section. The **Key Stats** panel displays different statistics for different types of services. The remaining panels in the Summary Stats section are the same for all types of services.

Key Stats

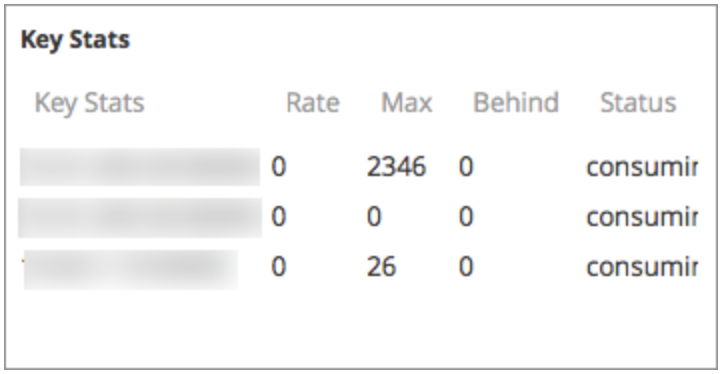
The Key Stats panel displays different statistics for different types of services.

- For a Decoder or Log Decoder, key statistics include capture statistics, such as capture rate, total packets or logs captured, total packets or logs dropped, the data capture begin time and

end time.

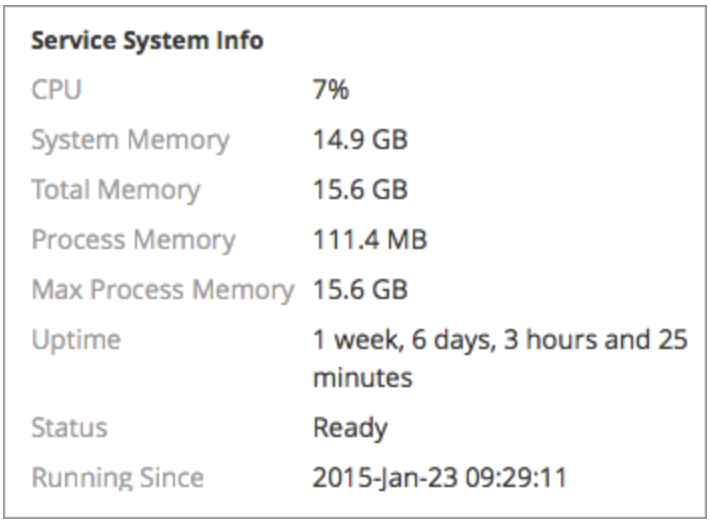


- A Broker or Concentrator aggregates data from multiple services. Therefore, the key statistics for all aggregate services are presented in a grid. The columns in the grid provide the service name, the capture rate, the maximum capture rate, the number of session behind (that need to be aggregated), and the service status.



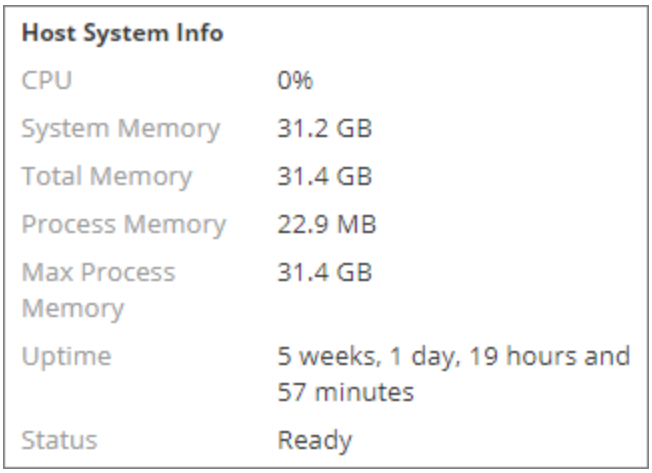
Service System Info

The Service System Info panel includes the percentage of CPU used by the service, the memory usage statistics (system, total, process, and maximum process), service uptime, status, running since time, and the current time.



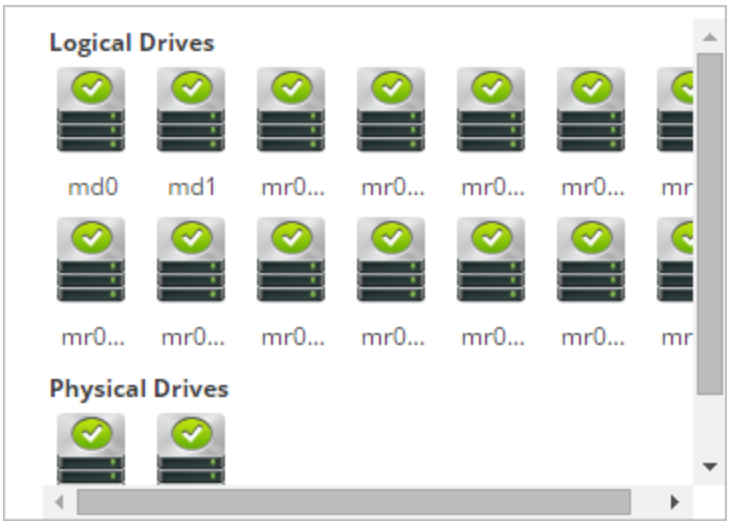
Service System Info	
CPU	7%
System Memory	14.9 GB
Total Memory	15.6 GB
Process Memory	111.4 MB
Max Process Memory	15.6 GB
Uptime	1 week, 6 days, 3 hours and 25 minutes
Status	Ready
Running Since	2015-Jan-23 09:29:11

Host System Info includes percentage of CPU used by the host, the memory usage statistics (system, total, process, and maximum), host uptime, status, running since time, and the current time.



Host System Info	
CPU	0%
System Memory	31.2 GB
Total Memory	31.4 GB
Process Memory	22.9 MB
Max Process Memory	31.4 GB
Uptime	5 weeks, 1 day, 19 hours and 57 minutes
Status	Ready

Logical Drives and **Physical Drives** are shown with an icon for the drive name and state. Drive types used in the names and the drive status options are listed below.



Drive Types and Status

Drive Type	Description	Comment	Status Options
sd	SCSI block device	Directly connected SAS, SATA MegaRAID volumes	OK (green) FAIL (red)
ld	MegaRAID Logical Volume	Defined in BIOS or with MegaCLI tool	OK (green) DEGRADED (yellow) BUILDING (yellow) FAIL (red)
pd	MegaRAID Physical Disks	Not directly exposed to Linux	OK (green) FAIL (red)
md	Linux software RAID Volume		OK (green) DEGRADED (yellow) BUILDING (yellow) FAIL (red)

Gauges

The Gauges section in the Stats View presents statistics in the form of analog gauges. See Features for details on configuring gauges.

Timelines

Timeline charts display the selected statistics in a running timeline with focus on the current time. This is the same for all types of services, and only the display name of the timeline is editable. See Timeline Charts for details on configuring timelines.

Historical Timelines

Historical timeline charts display statistics for session size, sessions, and packets in a historical timeline. This is the same for all types of services, and has an editable display name, begin date, and end date. See Timeline Charts for details on configuring timelines.

Note: Historical Timeline charts is being deprecated for Log Collector, Virtual Log Collector (VLC) and Windows Legacy Collector services.

Chart Stats Tray

The Chart Stats Tray lists all available statistics for the selected service type. Different services have different statistics to monitor. See Components for a detailed description.

Topics

- Components
- Features
- Timeline Charts

Chart Stats Tray

This topic describes the Chart Stats Tray in the Services Stats view.

In the Services Stats view, the Chart Stats Tray provides a way to customize the monitored statistics for individual services. The Chart Stats Tray lists all available statistics for the service. The number of statistics varies according to the type of service being monitored. Any statistic in the Chart Stats Tray can be displayed in a gauge or a timeline chart. Only statistics for session size, sessions, and packets are viewable in historical timeline charts.

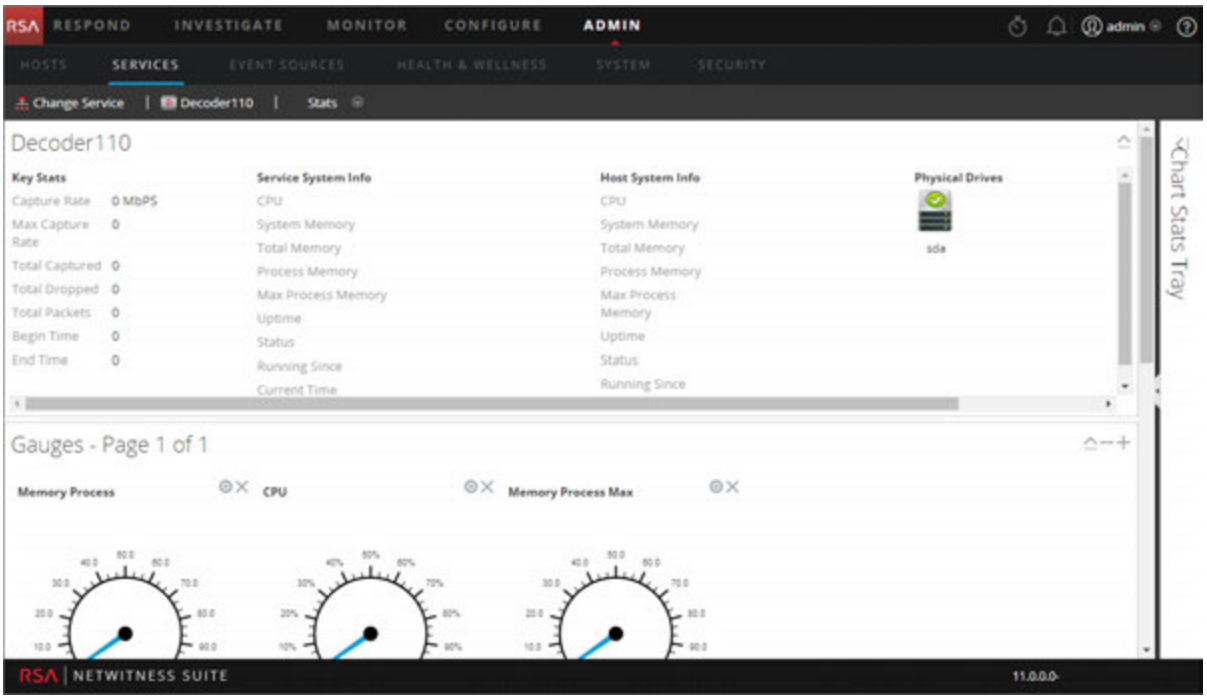
To access the Services Stats view:

1. In the **NetWitness Suite**menu, select **ADMIN > Services**.
   The Administration Services view is displayed.
2. Select a service and select  **> View > Stats.**

The Chart Stats Tray is on the right side.

3. If the tray is collapsed, click <| to view the list of available statistics.

The following example shows the Services Stats view for a Decoder. The Chart Stats Tray is collapsed.



Components

The Chart Stats Tray has different statistics for different types of services. In the example above, 111 statistics are available for the Decoder. The following table describes features of the Chart Stat Tray.

Feature	Description
<|	Click to expand the panel horizontally.
|>	Click to collapse the panel horizontally.
Search	Type a search term in the field and press **RETURN**. Statistics that match are displayed with the matching word highlighted.
«	Click to go to the first page.

Feature	Description
❮	Click to go to the previous page.
ge 5 of 2	Type a page number in the Page field.
❯	Click to go to the next page.
❯❯	Click to go to the last page.
↻	Click to refresh the view.
s 1 - 12 of	Displays the range of statistics being displayed. The total number statistics varies by service type.

Gauges

This topic introduces the features of the Gauges section in the Services Stats view.

The Gauges section of the Services Stats view presents statistics in the form of an analog gauge. You can drag any statistic available in the Chart Stats Tray to the Gauges section. The properties of each individual gauge are editable; all gauges have an editable title and some have additional editable properties.

To access the Services Stats view:

1. In the **NetWitness Suite**menu, select **ADMIN > Services**
   The Administration Services view is displayed.
2. Select a service and select  **> View > Stats**.
   The Services Stats view includes the Gauges section.

The following figure shows the default gauges in the Services Stats view for a Log Decoder.

Features

The default gauges show these statistics:

- Process memory use
- CPU use
- Maximum process memory used

The controls in the Gauges title bar and in each gauge are the standard dashlet controls.

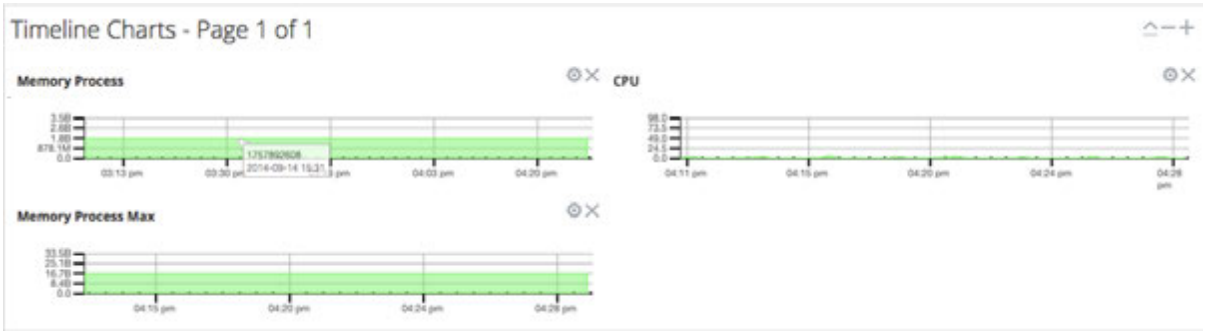
- In the Gauges title bar, you can collapse and expand the section and page forward or back.
- In each gauge, you can edit properties ( ) and delete ( ) the gauge.

Timeline Charts

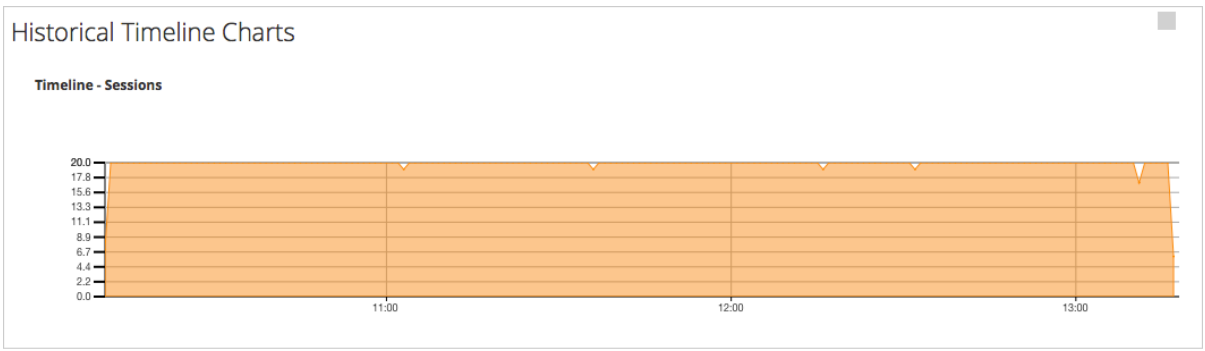
This topic describes the features of the timeline charts in the Services Stats view.

Timeline charts display statistics in a running timeline. The Services Stats view includes two types of timelines: current time and historical. You can drag any statistic available in the Chart Stats Tray to the Timeline Charts section. Only statistics for session size, sessions, and packets are viewable in historical timeline charts. The properties of an individual timeline chart are editable; all timeline charts have an editable title and some have additional editable properties.

The following figure is an example of a current timeline showing the value and timestamp of a data point.



The following figure is an example of a historical timeline chart.



The default current timeline charts show these statistics:

- Memory Process
- CPU
- Memory Process Max

The historical time charts show these statistics:

- Sessions
- Packets
- Session Size

The controls in the Timeline Charts title bar and in each timeline are the standard dashlet controls.

- In the Timeline Charts title bar, you can collapse and expand the section and page forward or back.
- In each timeline, you can edit Properties ( ) and delete ( ) the timeline.
- Hovering over a data point in the chart, displays the value and timestamp for the selected point.

System View

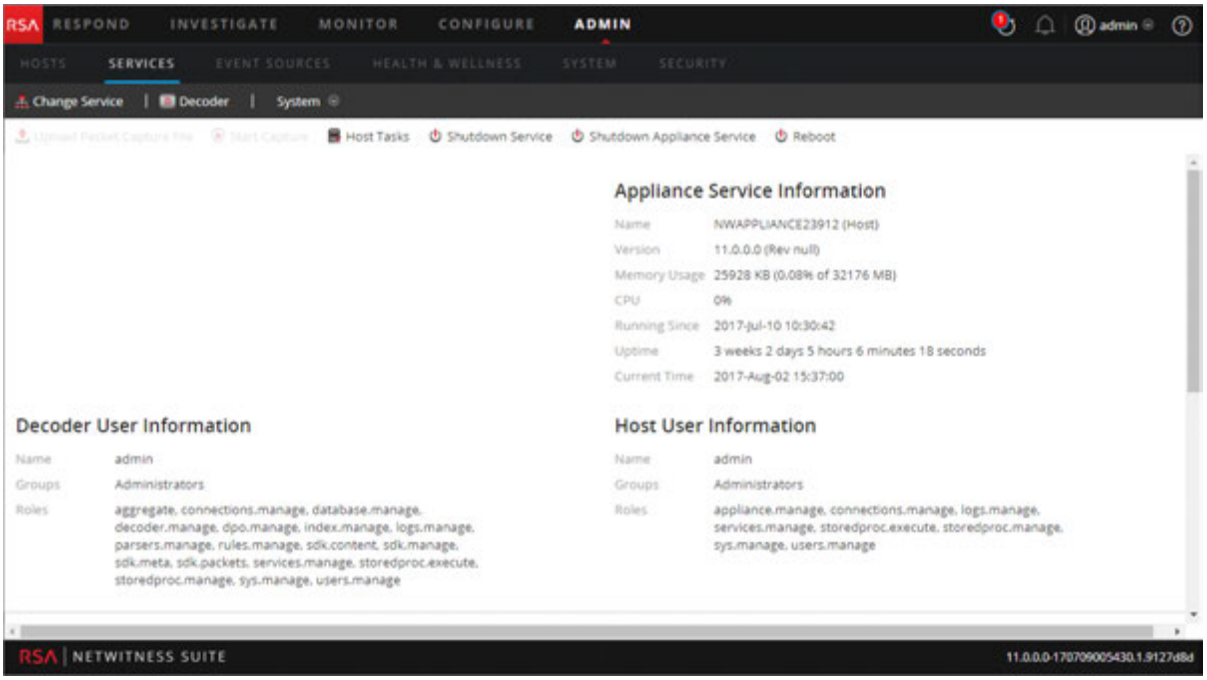
This topic introduces features in the System view using the Decoder and Log Decoder as an example. See the Configuration Guides individual services (for example for the *RSA NetWitness® SuiteBroker and Concentrator Configuration Guide*) for details on their **ADMIN > Services > System** Views.

A Log Decoder is a special type of Decoder, and is configured and managed in a similar way to a Decoder. Therefore, most of the information in this section refers to both types of Decoders. Differences for Log Decoders are noted.

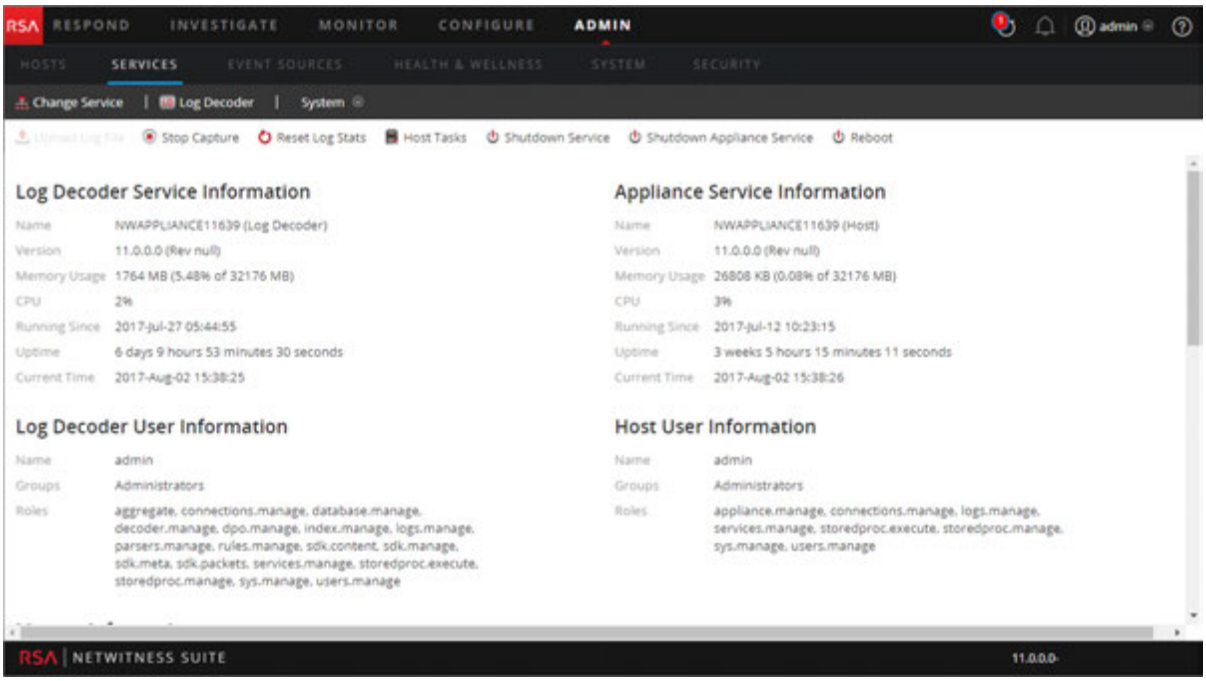
To access the Services System view for a Decoder:

1. In **NetWitness Suite** , go to **ADMIN > Services**.
   The Services view is displayed.
2. Select a service and select  **> View> System**.

The following figure shows an example of the Services System view for a Decoder.



The following figure shows the Services System view for a Log Decoder.



Features

Services Info Toolbar

The following toolbars show the options specific to Log Decoders and Decoders.

In addition to the common options in the Services System view toolbar, you can start and stop capture of packets or logs. The upload file options are different for the standard Decoder (packet capture file) and the Log Decoder (log file).

Action	Description
Upload Packet Capture File	Displays a dialog that provides a way to select a packet capture (.pcap) file for upload to the selected Decoder. For more information, see the **Upload Packet Capture File** topic in the *Decoder and Log Decoder Configuration Guide*. **Note:** This option does not apply to Log Decoders.

Action	Description
Upload Log File	Displays a dialog that provides a way to select a log (.log) file for upload to the selected Log Decoder. For more information, see the **Upload Log File to a Log Decoder** topic in the *Decoder and Log Decoder Configuration Guide*.
Start/Stop Capture	Starts packet capture on the selected Decoder. When packet capture is in progress, the option in the toolbar changes to Stop Capture, and the option to upload a file is unavailable.

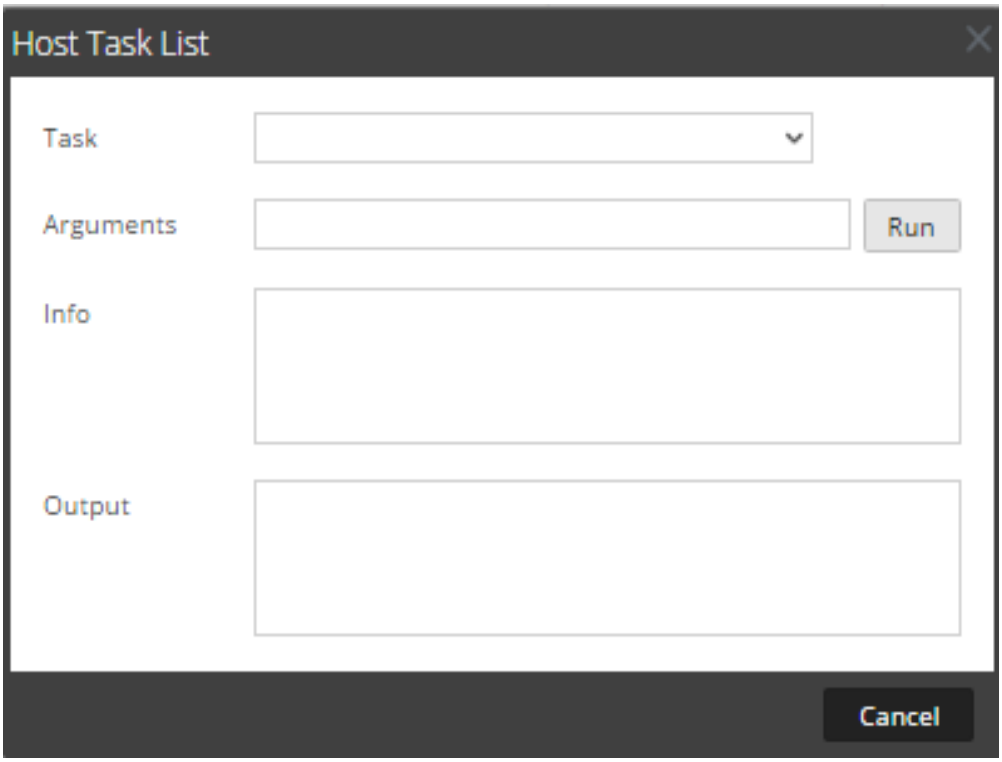
Host Task List Dialog

This topic introduces the Services System view > Host Task List dialog.

In the RSA NetWitness Suite Services System view, you can use the Host Tasks option to manage tasks that relate to a host and its communications with the network. Several service and host configuration options are available for Core services.

To access the Host Tasks dialog:

1. In **NetWitness Suite** , select **ADMIN >Services**.
2. Select a service and select  > **View> System**.
   The System View for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.
   The Host Task List dialog is displayed. The **Task** list offers a list of supported messages for the associated host.



Features

The table below describes the dialog features.

Field	Description
Task	An entry field in which you type or select a message for a Core host. When you click in this field a drop-down list of available host tasks is displayed.
Arguments	An entry field in which you enter the arguments, if any, for the message.
Run	Executes the task and arguments in the entry fields.
Info	Information about the message purpose and syntax.
Output	The output or result of an executed task.
Cancel	Closes the Host Task list dialog.

Host Task Selection List

These tasks are displayed as a drop-down list in the Task field. The available options are regulated by the security role required to execute the option.

Task	Description
Add Filesystem Monitor	Starts monitoring the storage services attached to the specified filesystem (see Add and Delete a Filesystem Monitor.
Delete Filesystem Monitor	Stops monitoring the storage services attached to the specified filesystem.
Reboot Host	Shuts down and restarts the host (see Reboot a Host).
Set Host Built-in Clock	Sets the host local clock (see Set Host Built-In Clock).
Set Host Hostname	This method of changing the hostname is deprecated in NetWitness Suite 10.6; replaced by the procedure described in Hosts and Services Procedures

Task	Description
Set Network Configuration	Sets network address parameters (see Set Network Configuration).
Set Network Time Source	Sets the clock source for this host (see Set Network Time Source).
Set Syslog Forwarding	Enables or disables syslog forwarding from a remote server to the selected service (see Set Syslog Forwarding).
Show Network Port Status	Shows the network interface information for a host (see Show Network Port Status).
Show Serial Number	Gets the host serial number (see Show Serial Number).
Shut Down Host	Shuts down the physical host and the host remains off (see Shut Down Host).
Start Service	Starts a service on this host (see Start, Stop or Restart a Service).
Stop Service	Stops a service on this host.
setSNMP	Enables or disables the SNMP service on a host (see Set SNMP).

Service Configuration Settings

This topic introduces the available service configuration settings for RSA NetWitness Suite Core services.

NetWitness Suite Core services include Brokers, Concentrators, Decoders, Log Decoders, Archivers, and the Appliance service. The service configuration parameters listed in these tables constitute all viewable and configurable parameters. Some parameters are configurable in various parts of the NetWitness Suite user interface and others are viewable or configurable only on the Services Explore view.

Appliance Service Configuration Parameters

This topic lists and describes the available the configuration parameters for the NetWitness Suite Core Appliance service.

The NetWitness Suite Core Appliance service provides hardware monitoring on legacy NetWitness hardware.

This table describes the Appliance Configuration parameters.

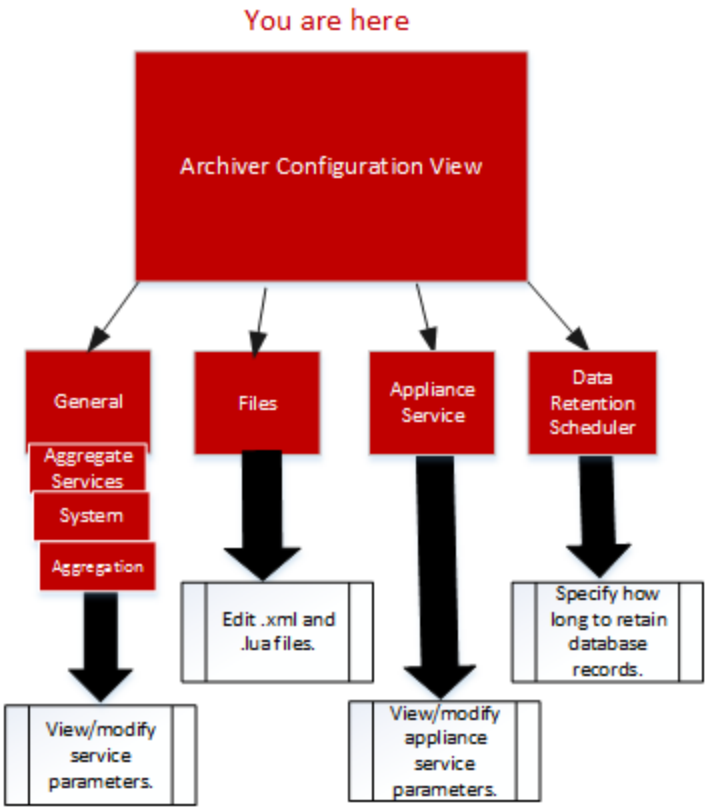
Appliance Parameter Field	Description
Logs	/logs/config, see Core Service Logging Configuration Parameters
REST	/rest/config, see REST Interface Configuration Parameters
Services	/services/<service name>/config, see Core Service-to-Service Configuration Parameters
System	/sys/config, see Core Service System Configuration Parameters

Archiver Service Configuration View

This topic lists and describes the available configuration settings for NetWitness Suite Archivers.

Workflow

The following workflow show the configuration tasks for the Archiver service.



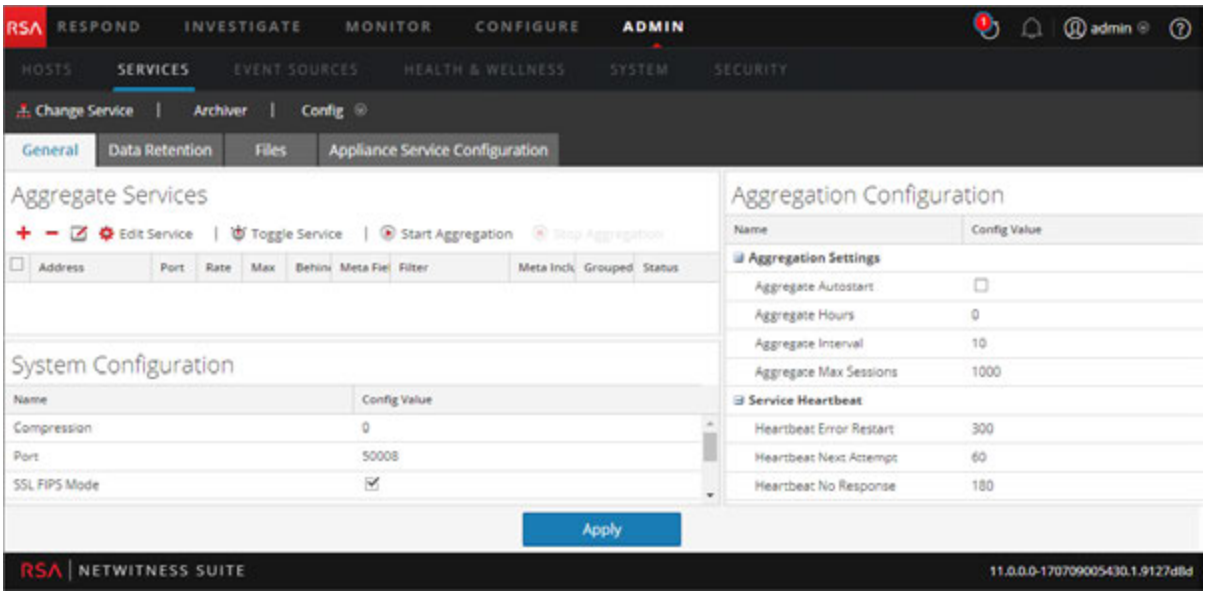
Role	I want to ...
Administrator	Configure Meta Filters for Aggregation. Refer to "(Optional) Configure Meta Filters for Aggregation" in the *RSA NetWitness Suite Archiver Configuration Guide* for instructions.
Administrator	Configure Group Aggregation. Refer to "Configure Group Aggregation" in the *RSA NetWitness Suite Deployment Guide* for instructions.

Quick Look

To access the Services Config view:

1. In **NetWitness Suite**, select **ADMIN > Services**.
   The Admin Services view is displayed.
2. Select an Archiver service and select  **>View > Config**.
   Services Config view for the Archiver service is displayed.

This is an example of the Services Config view for an Archiver.



Broker Service Configuration Parameters

This topic lists and describes the configuration parameters for NetWitness Suite Brokers.

This table lists and describes the Broker configuration parameters.

Broker Parameter Field	Description
Broker	/broker/config refer to Aggregation Configuration Parameters
aggregate.interval.behind	Minimum number of milliseconds before another round of aggregation is requested when the broker is behind. Change takes effect immediately.
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness SuiteCore Services Database Tuning Guide*
Index	/index/config
index.dir	The directory where the broker device mapping files are stored. Change takes effect on service restart.
language.filename	The index language specification (XML) that is loaded on startup. Change requires service restart.

Broker Parameter Field	Description
Logs	/logs/config refer to Core Service Logging Configuration Parameters
REST	/rest/config refer to REST Interface Configuration Parameters
SDK	/sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Suite Core Services Database Tuning Guide* and NetWitness Suite Core Service system.roles Modes
Services	/services/<service name>/config refer to Core Service-to-Service Configuration Parameters
System	/sys/config refer to Core Service System Configuration Parameters

Aggregation Configuration Parameters

This topic lists and describes the available configuration parameters that are common to services that perform aggregation, such as NetWitness Suite Concentrators and Archivers.

This table lists and describes the parameters that control aggregation on an aggregating service.

Configuration Path	/concentrator/config or /archiver/config
aggregate.autostart	Automatically restarts aggregation after a service restart, if enabled. Change takes effect immediately.
aggregate.buffer.size	Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact query performance. Change takes effect after aggregation restart.
aggregate.crc	If enabled, all aggregation streams will be CRC validated. Change takes effect immediately.
aggregate.hours	Displays the maximum number of hours behind a service will be allowed to start aggregation. Change takes effect immediately.

Configuration Path	/concentrator/config or /archiver/config
aggregate.interval	Lists the minimum number of milliseconds before another round of aggregation is requested. Change takes effect immediately.
aggregate.meta.page.factor	Lists the allocated number meta pages per session used for aggregation. Change takes effect on service restart.
aggregate.meta.perpage	Lists the allocated number of meta stored on one page of data. Change takes effect on service restart.
aggregate.precache	Determines if the concentrator will precache the next round of aggregation for upstream services. Can improve aggregation performance but could impact query performance. Change takes effect immediately.
aggregate.sessions.max	Lists the number of sessions to aggregate on each round. Change takes effect after aggregation restart.
aggregate.sessions.perpage	Lists the number of sessions stored on one page of data. Change takes effect on service restart.
aggregate.time.window	Displays the maximum +/- time window, in seconds, that all services must be inside before another round of aggregation is requested. Zero turns off time window. Change takes effect immediately.
consume.mode	Determines if the concentrator can only aggregate locally or over a network, based on licensing restrictions. Change takes effect on service restart.
export.enabled	Allows export of session data, if enabled. Change takes effect on service restart.
export.expire.minutes	Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately.

Configuration Path	/concentrator/config or /archiver/config
export.format	Determines the file format used during data export. Change takes effect on service restart.
export.local.path	Displays the local location to cache exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.meta.fields	Determines which meta fields are exported. Comma list of fields. Star means all fields. Star plus field list means all fields BUT listed fields. Just field list says just include those fields. Change takes effect immediately.
export.remote.path	Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.rollup	Determines the rollup interval for export files. Change takes effect on service restart.
export.session.max	Displays the maximum sessions per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.size.max	Displays the maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.usage.max	Displays the maximum percentage of cache space used before stopping aggregation. Zero is no limit. Change takes effect immediately.
heartbeat.error	Lists the number of seconds to wait after a service error before attempting a service reconnect. Change takes effect immediately.

Configuration Path	/concentrator/config or /archiver/config
heartbeat.interval	Lists the number of milliseconds between heartbeat service checks. Change takes effect immediately.
heartbeat.next.attempt	Lists the number of seconds to wait before attempting a service reconnect. Change takes effect immediately.
heartbeat.no.response	Lists the number of seconds to wait before taking unresponsive service offline. Change takes effect immediately.

Concentrator Service Configuration Parameters

This topic lists and describes the available configuration parameters for NetWitness Suite Concentrators.

This table lists and describes the Concentrator configuration parameters .

Concentrator Parameter Field	Description
Concentrator	/concentrator/config refer to Aggregation Configuration Parameters
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness Suite Core Database Tuning Guide*
Index	/index/config refer to the **Index Configuration Nodes** topic in the *NetWitness Suite Core Database Tuning Guide*
Logs	/logs/config refer to Core Service Logging Configuration Parameters
REST	/rest/config refer to REST Interface Configuration Parameters
SDK	sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Suite Core Database Tuning Guide*and NetWitness Suite Core Service system.roles Modes
Services	/services/<service name>/config refer to Core Service-to-Service Configuration Parameters

Concentrator Parameter Field	Description
System	/sys/config refer to Core Service System Configuration Parameters

Core Service Logging Configuration Parameters

This topic lists and describes the logging configuration parameters for all NetWitness Suite Core services.

Logging configuration is the same on all NetWitness Suite Core services.

The following table describes the logging configuration parameters:

Logs Configuration Folder	/logs/config
log.dir	Displays the directory where the log database is stored. Optional assigned max size (=#) is in MBs. Change takes effect on service restart.
log.levels	Controls what types of log messages are stored (comma separated). Module specific settings are defined like this: <Module>=[debug|info|audit|warning|failure|all|none]. Change takes effect immediately.
log.snmp.agent	Sets a remote SNMP Trap Receiving agent.
snmp.trap.version	Sets the SNMP version to be used for gets and traps (2c or 3).
snmpv3.engine.boots	Displays the SNMPv3 engine boots count. This field auto-increments on startup and should not normally need to be set by the user.

Logs Configuration Folder	/logs/config
snmpv3.engine.id	Sets the SNMPv3 engine ID, which is 10-64 hexadecimal digit number optionally preceded by 0x. You can add suffix values at the end of the engine ID for each of the SA Core services running on the same host. For example, if the generated Engine ID for the SA Core host is 0x1234512345, you can set the Engine ID for the Decoder service as 0x123451234501 and set 0x123451234504 for the Appliance service.
snmpv3.trap.auth.local.key	Sets the SNMPv3 Trap Authentication Local Key, which is a 16 or 20 hexadecimal digit number (depending on which authentication protocol is used) preceded by 0x. For MD5, the key is 16 hexadecimal digits, while SHA uses 20 hexadecimal digits. You can use any desired algorithm to generate the local keys. It is recommended that a generation method involving randomness be used as opposed to selecting key values manually.
snmpv3.trap.auth.protocol	Displays the SNMPv3 Trap Authentication Protocol (none, MD5 or SHA).
snmpv3.trap.priv.local.key	Sets the SNMPv3 Trap Privacy Local Key, which is a 16 hexadecimal digit number preceded by 0x.
snmpv3.trap.priv.protocol	Displays the SNMPv3 Trap Privacy Protocol (none or AES).
snmpv3.trap.security.level	Displays the SNMPv3 Trap Security Level, which indicates whether authentication and privacy are used or not. Possible values are noAuthNoPriv, authNoPriv or authPriv.
snmpv3.trap.security.name	Sets the SNMPv3 Trap Security Name used during SNMPv3 trap authentication.

Logs Configuration Folder	/logs/config
syslog.size.max	Displays the maximum size of a log sent to syslog (some syslog daemons have issues with very large messages). Zero means no limit. Change takes effect immediately.

Core Service-to-Service Configuration Parameters

This topic lists and describes the configuration parameters that control how a Core service connects to another Core service. For example, when a Concentrator connects to a decoder, the parameters of that connection are controlled by these settings.

Whenever a Core service establishes a connection to another Core service, the service that acts as the **client** creates a new sub-folder in the /services folder of the configuration tree. The name of the sub-folder corresponds to the name of the service and has the form `host:port`. For example, the service connection folder for a Concentrator connection to a Decoder could be `/services/reston-va-decoder:50004`. Inside each service connection folder, there is a `config` sub-folder that holds configurable parameters.

The following table describes the Service Configuration parameters:

Services	/services/host:port/config
allow.nonssl.to.ssl	Allows a non-SSL connection to connect to a SSL service, when set to true. Otherwise, if false, non-secure to secure connections will be denied. Change takes effect immediately.
compression	Displays a config node that determines if data is compressed before sending. A positive value determines the number of bytes that need to be sent before it will be compressed. Zero means no compression.
crc.checksum	Displays a config node that determines if data streams are validated with a CRC checksum. A positive value determines the number of bytes that need to be sent before it will be CRC validated. Zero means no CRC validation.
ssl	Displays a config node that enables or disables SSL encryption on the connection.

Core Service System Configuration Parameters

This topic lists and describes the configuration parameters that are common to all NetWitness Suite Core services.

The following table lists and describes the System configuration parameters:

System Configuration Folder	/sys/config
compression	Displays the minimum amount of bytes before a message is compressed, when set to a positive value. Zero means no compression for any message. Change takes effect on subsequent connections.
crc.checksum	Displays the minimum bytes before a message is sent over the network with a CRC checksum (to be validated by the client), when set to a positive value. Zero means no CRC checksum validation with any message. Change takes effect on subsequent connections.
drives	Displays drives to monitor for usage stats. Change takes effect on service restart.
port	Displays the port this service will listen on. Change takes effect on service restart.
scheduler	Displays the folder for scheduled tasks.
service.name.override	Displays an optional service name used by upstream services for aggregation in lieu of hostname.
ssl	Encrypts all traffic using SSL, if enabled. Change takes effect on service restart.
stat.compression	Compresses stats as they are written to the database, if enabled. Change takes effect on service restart.

System Configuration Folder	/sys/config
stat.dir	Displays the directory where the historical stats database is stored (separate multiple dirs with semicolon). Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
stat.exclude	Lists stat pathnames to be excluded from the stat database. The following wildcards are permitted: ? match any single character, * match zero or more characters to delimiter /, ** match zero or more characters including delimiter. Change takes effect immediately.
stat.interval	Determines how often (in milliseconds) statistic nodes are updated in the system. Change takes effect immediately.
threads	Lists the number of threads in the thread pool to handle incoming requests. Change takes effect immediately.

Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for NetWitness Suite Decoders.

This table lists and describes the Decoder configuration parameters.

Decoder Parameter Field	Description
Decoder	/decoder/config refer to Decoder and Log Decoder Configuration Parameters
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness Suite Core Database Tuning Guide*
Index	/index/config refer to the **Index Configuration Nodes** topic in the *NetWitness Suite Core Database Tuning Guide*

Decoder Parameter Field	Description
Logs	/logs/config refer to Core Service Logging Configuration Parameters
REST	/rest/config refer to REST Interface Configuration Parameters
SDK	/sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Suite Core Database Tuning Guide*and NetWitness Suite Core Service system.roles Modes
System	/sys/config refer to Core Service System Configuration Parameters

Decoder and Log Decoder Configuration Parameters

This topic lists and describes the configuration parameters that are identical on both packet decoder and log decoder services.

Decoder Configuration Settings

This table lists and describes the Decoder and Log Decoder shared configuration parameters.

Decoder Configuration Path	/decoder/config
aggregate.buffer.size	Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact capture performance. Change takes effect after capture restart.
aggregate.precache	Determines if the decoder will precache the next round of aggregation for upstream services. Can improve aggregation performance but could impact capture performance. Change takes effect immediately.
assembler.pool.ratio	Displays the percentage of pool pages that assembler manages and uses for the assembly process. Change takes effect on service restart.

Decoder Configuration Path	/decoder/config
assembler.session.flush	Flushes sessions when they are complete (1) or flushes sessions when they are parsed (2). Change takes effect on service restart.
assembler.session.pool	Lists the number of entries in the session pool. Change takes effect on service restart.
assembler.size.max	Lists the maximum size that a session will obtain. A setting of 0 removes the session size limit. Change takes effect immediately.
assembler.size.min	Lists the minimum size that a session must be before persisting. Change takes effect immediately.
assembler.timeout.packet	Lists the number of seconds before packets are timed out. Change takes effect immediately.
assembler.timeout.session	Lists the number of seconds before sessions are timed out. Change takes effect immediately.
assembler.voting.weights	Displays the weights used to determine which session stream is marked client and server. Change takes effect immediately.
capture.autostart	Determines if capture begins automatically when the service starts. Change takes effect on service restart.
capture.buffer.size	Displays capture memory buffer allocation size (default unit is MB). Change takes effect on service restart.

Decoder Configuration Path	/decoder/config
capture.device.params	Displays capture service specific parameters. Change takes effect on service restart. The parameters understood by this field are specific to the currently selected capture device. If any of the parameters are not recognized by the current capture device, they are ignored. On Log Decoders, there is only the Log Events capture device. It accepts some optional parameters. • **use-envision-time**: If this is set to 1, the time meta for each event will be imported from the Log Collector stream. If this is 0 or not set, the imported event time will be stored in the event.time meta. • **port**: This parameter can be set to a numeric value to override the default syslog port listener, 514.
capture.selected	Displays current capture service and interface. Change takes effect immediately.
export.expire.minutes	Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately.
export.packet.enabled	Allows export of packet data, if enabled. Change takes effect on service restart.
export.packet.local.path	Displays the local location to cache packet exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.packet.max	Displays the maximum packets per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.

Decoder Configuration Path	/decoder/config
export.packet.remote.path	Lists the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.packet.size.max	Displays the packet maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.rollup	Determines the rollup interval for export files. Change takes effect on service restart.
export.session.enabled	Allows export of session data, if enabled. Change takes effect on service restart.
export.session.format	Determines the file format used during session export. Change takes effect on service restart.
export.session.local.path	Displays the local location to cache session exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.session.max	Displays the maximum sessions per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.session.meta.fields	Determines which meta fields are exported. Comma list of fields. Star means all fields. Star plus field list means all fields BUT listed fields. Just field list says just include those fields. Change takes effect immediately.
export.session.remote.path	Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.session.size.max	Lists the session maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.

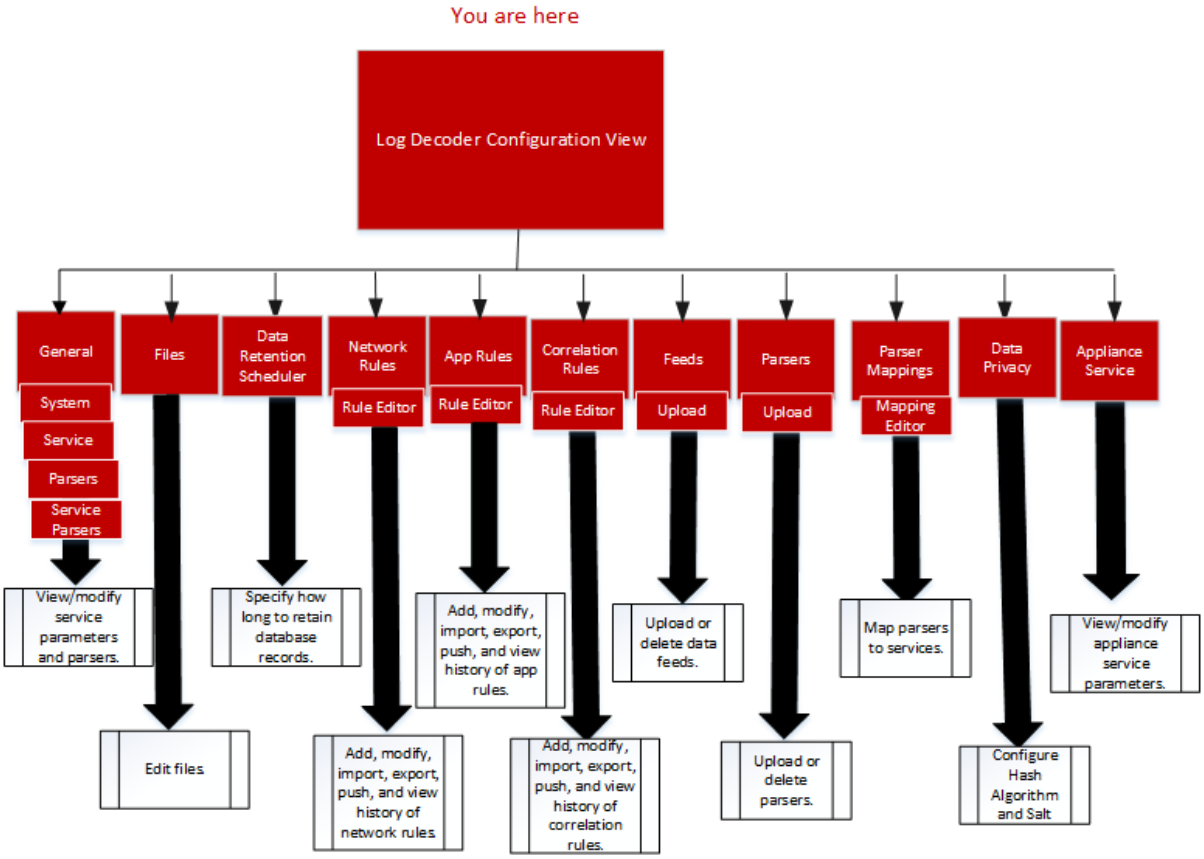
Decoder Configuration Path	/decoder/config
export.usage.max	Lists the session maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
parse.threads	Lists the number of parse threads to use for session parsing. Zero means let server decide. Change takes effect on service restart.
pool.packet.page.size	Displays the size of a packet page (default is KB). Change takes effect on service restart.
pool.packet.pages	Lists the number of packet pages decoder will allocate and use. Change takes effect on service restart.
pool.session.page.size	Displays the size of a session page (default is KB). Change takes effect on service restart.
pool.session.pages	Lists the number of session pages decoder will allocate and use. Change takes effect on service restart.

Log Decoder Service Configuration View

This topic lists and describes the configuration settings for NetWitness Suite Concentrators.

Workflow

The following workflow show the configuration tasks for the Log Decoder service.



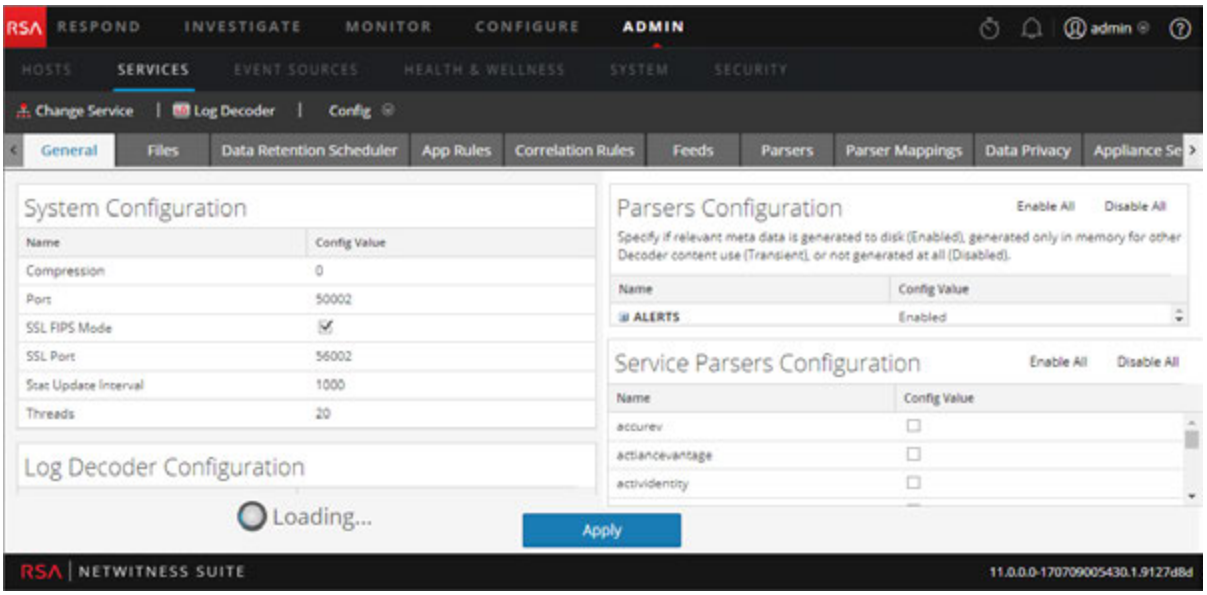
Role	I want to ...
Administrator	Configure Group Aggregation.

Quick Look

To access the Services Config view:

1. In **NetWitness Suite**, select **ADMIN > Services**.
   The Admin Services view is displayed.
2. Select a Log Decoder service and select  **>View > Config**.
   Services Config view for the Log Decoder service is displayed.

This is an example of the Services Config view for a Log Decoder.



Topics

Log Collector Configuration Parameters Interface

Log Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for RSA NetWitness Suite Log Decoders.

Log Decoder Configuration Settings

This table lists and describes the Log Decoder configuration settings.

Log Decoder Setting Field	Description
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness Suite Core Database Tuning Guide*.
Decoder	/decoder/config refer to Decoder and Log Decoder Configuration Parameters
Index	/index/config refer to the **Index Configuration Nodes** topic in the *NetWitness Suite Core Database Tuning Guide*.
Logs	/logs/config refer to Core Service Logging Configuration.
REST	/rest/config refer to REST Interface Configuration

Log Decoder Setting Field	Description
SDK	/sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Suite Core Database Tuning Guide*and Core Service system.role Modes.
System	/sys/config refer to Core Service System Configuration.

Log Tokenizer Configuration Settings

The log decoder has a set of configuration items that control how the automatic log tokenizer creates meta items from unparsed logs. The log tokenizer is implemented as a set of built-in parsers that each scan for a subset of recognizable tokens. The functionality of each of these native parsers is shown in the table below. These word items form a full-text index when they are fed to the indexing engine on the Concentrator and Archiver. By manipulating the parsers.disabled configuration entry, you can control which Log Tokenizers are enabled.

Parser Name	Description	Configuration Parameters
Log Tokens	Scans for runs of consecutive characters to produce 'word' meta items.	token.device.types, token.char.classes, token.max.length, token.min.length, token.unicode
IPSCAN	Scans for text that appears to be an IPv4 address to produce 'ip.addr' meta items.	token.device.types
IPV6SCAN	Scans for text that appears to be an IPv6 address to produce 'ipv6' meta items.	token.device.types

Parser Name	Description	Configuration Parameters
URLSCAN	Scans for text that appears to be a URI to produce 'alias.host', 'filename', 'username', and 'password' meta items.	token.device.types
DOMAINSCAN	Scans for text that appears to be a domain name to produce 'alias.host', 'tld', 'cctld', and 'sld' meta items.	token.device.types
EMAILSCAN	Scans for text that appears to be an email address to produce 'email' and 'username' meta items.	token.device.types
SYSLOGTIMESTAMPSCAN	Scans for text that appears to be syslog-format timestamps. Syslog is missing the year and time zone. When such text is located, it is normalized into UTC time to create 'event.time' meta items.	token.device.types
INTERNETTIMESTAMPSCAN	Scans for text that appears to be RFC 3339-format timestamps to create 'event.time' meta items.	token.device.types

These are the Log Tokenizer configuration parameters.

Log Decoder Parser Setting Field	Description
token.device.types	The set of device types that will be scanned for raw text tokens. By default, this is set to `unknown`, which means only logs that were not parsed will be scanned for raw text. You can add additional log types here to enrich parsed logs with text token information. If this field is empty, then log tokenization is disabled.
token.char.classes	This field controls the type of tokens that are generated. It can be any combination of the values `alpha`, `digit`, `space`, and `punct`. The default value is `alpha`. • **alpha**: Tokens may contain alphabetic characters • **digit**: Tokens may contain numbers • **space**: Tokens may contain spaces and tabs • **punct**: Tokens may contain punctuation marks
token.max.length	This field puts a limit on the length of the tokens. The default value is 5 characters. The maximum length setting allows the Log Decoder to limit the space needed to store the word metas. Using longer tokens requires more meta database space, but may provide slightly faster raw text searches. Using shorter tokens causes the text query resolver to have to perform more reads from the raw logs during searches, but it has the effect of using much less space in the metadb and index.
token.min.length	This is the minimum length of a searchable text token. The minimum token length will correspond to the minimum number of characters a user may type into the search box in order to locate results. The recommended value is the default, 3.

Log Decoder Parser Setting Field	Description
token.unicode	This boolean setting controls whether unicode classification rules are applied when classifying characters according to the token.char.classes setting. If this is set to true, each log is treated as a sequence of UTF-8 encoded code points and then classification is performed after the UTF-8 decoding is performed. If this is set to false, then then each log is treated as ASCII characters and only ASCII character classification is done. Unicode character classification requires more CPU resources on the Log Decoder. If you do not need non-English text indexing, you can disable this setting to reduce CPU utilization on the Log Decoder. The default is enabled.

REST Interface Configuration Parameters

This topic lists and describes the available configuration parameters for the REST interface built in to all NetWitness Suite Core Services.

Settings

The following table lists and describes the REST configuration parameters:

REST Configuration Path	/rest/config
cache.dir	Displays the host directory to use for temporarily creating and storing files. Change takes effect on service restart.
cache.size	Displays the total maximum size (default unit is MB) of all files in the cache directory before the oldest are deleted. Change takes effect on service restart.
enabled	Switches to enable or disable REST services, 1 is on, 0 is off. Change takes effect on service restart.
port	Displays the port the REST service will listen on. Change takes effect on service restart.

REST Configuration Path	/rest/config
ssl	Encrypts all REST traffic using SSL, if enabled. The default 'system' means use setting from /sys/config/ssl. Change takes effect on service restart.

NetWitness Suite Core Service system.roles Modes

All NetWitness Suite Core services offer role-based authorization modes. This topic describes the modes that are available, and how they are configured within every service.

The configuration node `/sdk/config/system.roles` sets querying and viewing permissions for meta and content on a per key basis. This parameter supports the data privacy management function and when enabled using one of the non-zero values helps a data privacy officer to control access to specific meta keys and content. This parameter is configurable in the NetWitness Suite user interface (see the **Data Privacy Tab** topic in the *Data Privacy Management* guide for details). When the value is edited, change takes effect immediately.

Zero means that service permissions based on SDK meta keys are disabled.

- 0 - disabled

When one of the non-zero values is specified, the data privacy officer can select a meta key to whitelist or blacklist the display of the associated meta, content, or both, for a specific user role on a service.

- 1 - whitelist meta and content filtered
- 2 - whitelist meta filtered
- 3 - whitelist content filtered
- 4 - blacklist meta and content filtered
- 5 - blacklist meta filtered
- 6 - blacklist content filtered

Troubleshooting Version Updates

Error Message	**Failed to download because of the following errors**.
Problem	When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete.
Cause	Version download files can be large and take a long time to download. If there are communication issues during the download it will fail.
Solution	1. Try to download it again. 2. If the download still fails, try to download it outside of NetWitness Suite as described in "Apply Updates from the Command Line (No Web Access)" under Apply Version Updates to a Host in the *NetWitness Suite Host and Services Getting Started Guide*. 3. If you still cannot download the update file, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Error Message	**Error updating `<ip-address>` to version `<version-number>`.**
Problem	When you select an update version and click **Update** >**Update Host**, the download process is successful, but the update process fails.

Solution	1. Try to apply it again.
	2. If you still cannot apply the new version update:
	a. Monitor the following logs on NW Server as it progresses (for example, use submit the `tail -f` command string from the command line'):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	The error will appear in one or more of these logs.
	b. Try to resolve the issue and reapply the version update.
	3. If that did not work, try to apply the version update outside of the user interface as described in "Apply Updates from the Command Line (No Web Access)" under Apply Version Updates to a Host in the *NetWitness Suite Host and Services Getting Started Guide*.
	4. If you still cannot apply the update, gather the logs from from step 2 and contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Error Message	**Update path not supported.**
Problem	You tried to apply a version update to the Legacy Windows Log Collector.
Cause	RSA does not support updates to the Legacy Windows Log Collector from the Host view.
Solution	Refer to the *RSA NetWitness 11.0 Legacy Windows Collection Guide* on RSA Link (https://community.rsa.com/docs/DOC-75593) for details about how to install or update Legacy Windows collection.

Archiver Overview

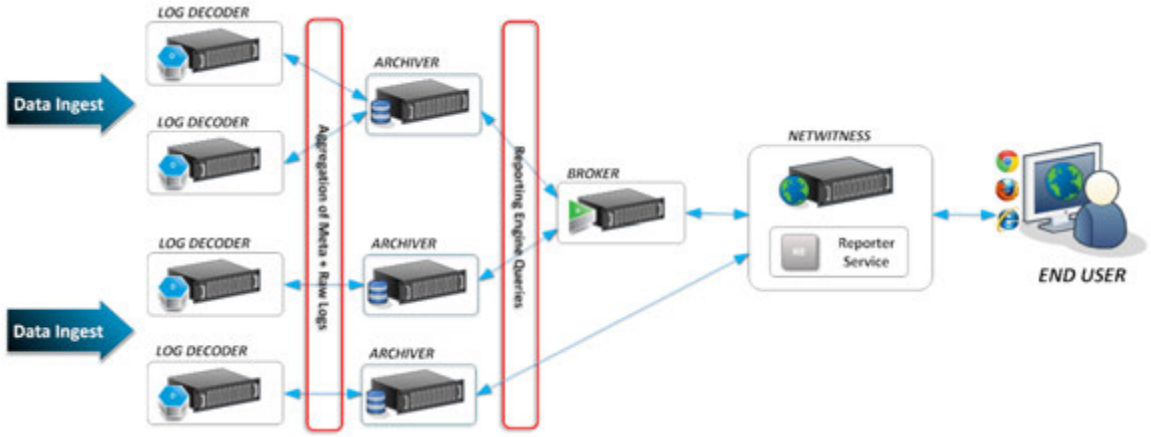
This guide provides detailed instructions on how to configure Archiver in your network, additional procedures that are used at other times, and reference materials that describe the user interface for configuring Archiver in your network.

The NetWitness Suite Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

Note: Raw packets and packet meta are not stored in the Archiver.

The following figure depicts the architecture of a NetWitness Suite network that implements the Archiver.



Configuring an Archiver

The NetWitness Suite Archiver is an appliance that enables long-term log archiving by indexing and compressing log data and sending it to Archiving storage. The Archiving storage is then optimized for long-term data retention and compliance reporting.

Archiver stores raw logs and log meta from Log Decoders for long-term retention and it uses Direct-Attached Capacity (DAC) for storage.

Note: Raw packets and packet meta are not stored in the Archiver.

Prerequisites

Ensure that you have:

- Installed the Archiver host in your network environment.
- Installed and configured Log Decoder version 11.0.0.0 in your network environment.

If you want to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them, refer to **Group Aggregation** in the *Deployment Guide*.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

The following table describes the basic steps for configuring an Archiver.The tasks must be completed in the sequence they are given.

Configuration Step	Description
Add the Archiver Service	Provides information on how to add an Archiver service to the Archiver host and apply a license to it.
Add Log Decoder as a Data Source to Archiver	Provides instructions on how to add a Log Decoder to an Archiver.

Configuration Step	Description
Configure Archiver Storage and Log Retention	Provides instructions on how to configure storage and log retention on an Archiver.
Add Archiver as a Data Source to Reporting Engine	Provides instructions on how to add an Archiver as a data source to Reporting Engine to generate reports for the data collected by an Archiver.
Configure Archiver Monitoring	Provides instructions on how to configure the alert mechanism related to Archiver storage.

Add the Archiver Service

In order to add an Archiver service, ensure that you have installed an Archiver host on which you want to run the Archiver service. See the **Step 1: Add or Update Host** topic in the *Host and Services Getting Started Guide* for the procedure that explains how to add a host.

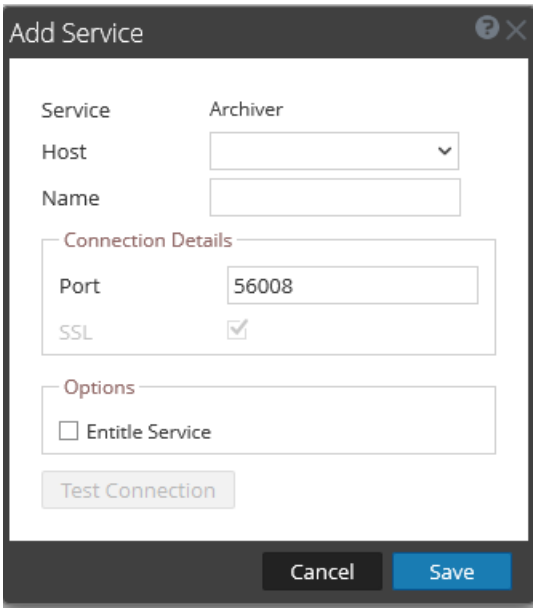
After you install an Archiver host, you need to add an Archiver service an apply a license to it, as explained in the following procedure.

Note: This procedure is only required if you do not have the Archiver service installed.

Perform the following steps to add the Archiver service:

1. Go to **ADMIN > Services**.
2. In the **Services** panel toolbar, select + > **Archiver**.

   The Add Service dialog is displayed.



3. Provide the following details.

Field	Description
Host	Select a host from the drop-down menu.
Name	Type a name for the service.
Port	Default port is 50008.

Field	Description
SSL	Select **SSL** if you want NetWitness Suite to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. **Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel.
Username	(Optional) Type the username for the service.
Password	(Optional) Type the password for the service.
Entitle Service	Select if you want to apply the entitlements currently configured to this service. For more information, see the **Entitlement Capability Implementation** topic in the *Licensing Guide*.

4. Click **Test Connection** to determine if NetWitness Suite connects to the service.
5. When the result is successful, click **Save**.

   The added service is now displayed in the services panel.

   Note: If the test is unsuccessful, edit the service information and retry.

6. Apply license to the Archiver service.

   Refer to the **Synchronize NetWitness Server** topic in the *Licensing Guide* for details on the procedure to activate (apply a license to) the Archiver service.

Add Log Decoder as a Data Source to Archiver

In order to add a Log Decoder as a data source to Archiver, you need to have installed the Archiver host in your network environment, installed and configured a Log Decoder in your network environment, and added the Archiver host to NetWitness Suite and make sure the Archiver service shows as active and licensed.

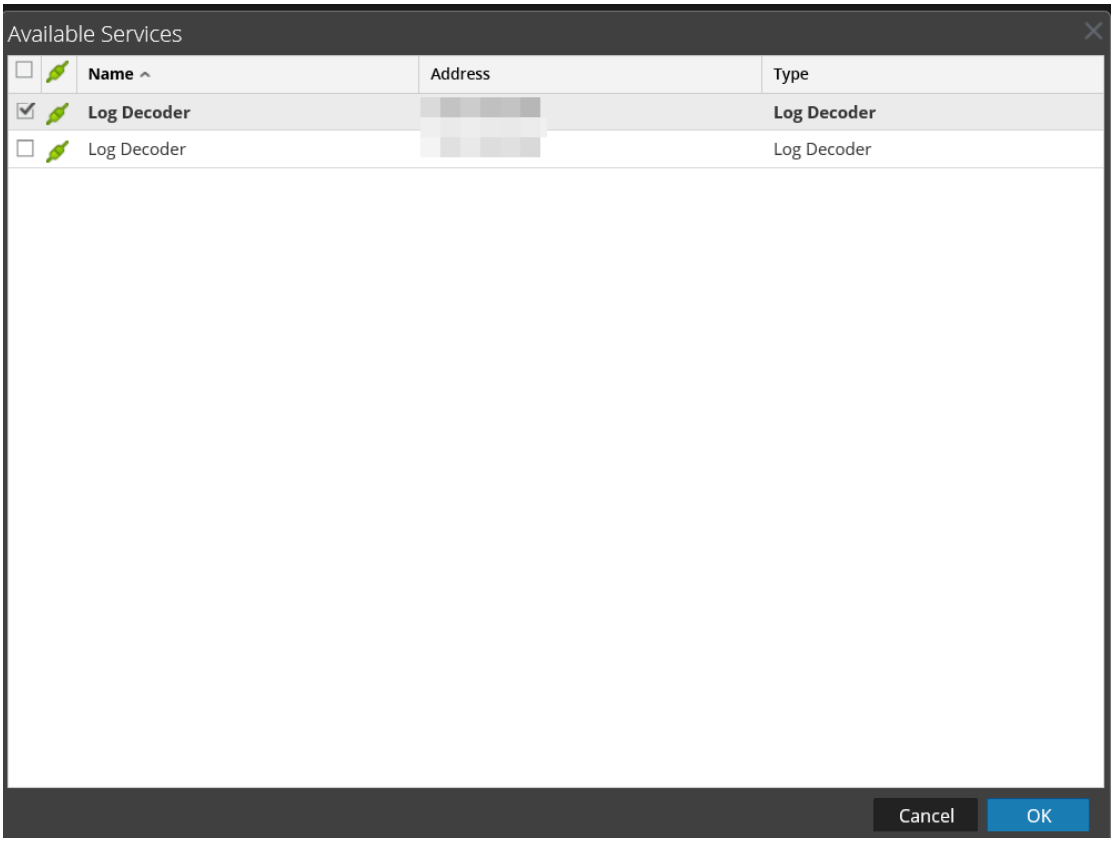
Add Log Decoder as a Data Source to Archiver

To add a Log Decoder as a data source to an Archiver:

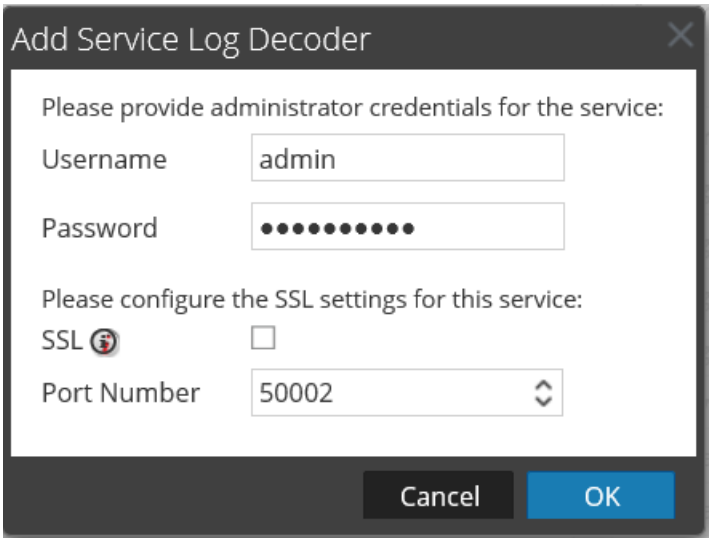
1. Go to **ADMIN > Services**.
2. Select the Archiver service.
3. In the  **Actions** column, select **View > Config**.

   The Services Config view of Archiver is displayed.
4. On the **General** tab, in the **Aggregate Services** panel, click +.

   The Available Services dialog is displayed.



5. Select the Log Decoder service to add as a data source to the Archiver and click **OK**.
6. If the Log Decoder is using the trust model, an Add Service dialog is displayed.



7. Type the username and password for the Log Decoder, and configure the SSL settings.
8. Click **OK**.
   The selected Log Decoder service is listed in the **Aggregate Services** panel.

Archiver Meta Settings Considerations

To maximize retention time, the meta items and index of the Archiver have been reduced (when compared to the Concentrator) to support common reporting needs. This means that, by default, you may not be able to run all of the reports you run on the Concentrator on the Archiver. You can view a list of the current meta and index items used by the Archiver in the following locations:

- **Explorer view**: The **/archiver/devices/<logdecoder>/config/options** path in the **metaInclude** field shows the current list of meta items.
- **Config view > Files tab**: The **index-archiver.xml** shows the default index configuration. The **index-archiver-custom.xml** shows any modifications.

The meta items and index of the Archiver can be customized to support customer specific reporting needs, however this will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

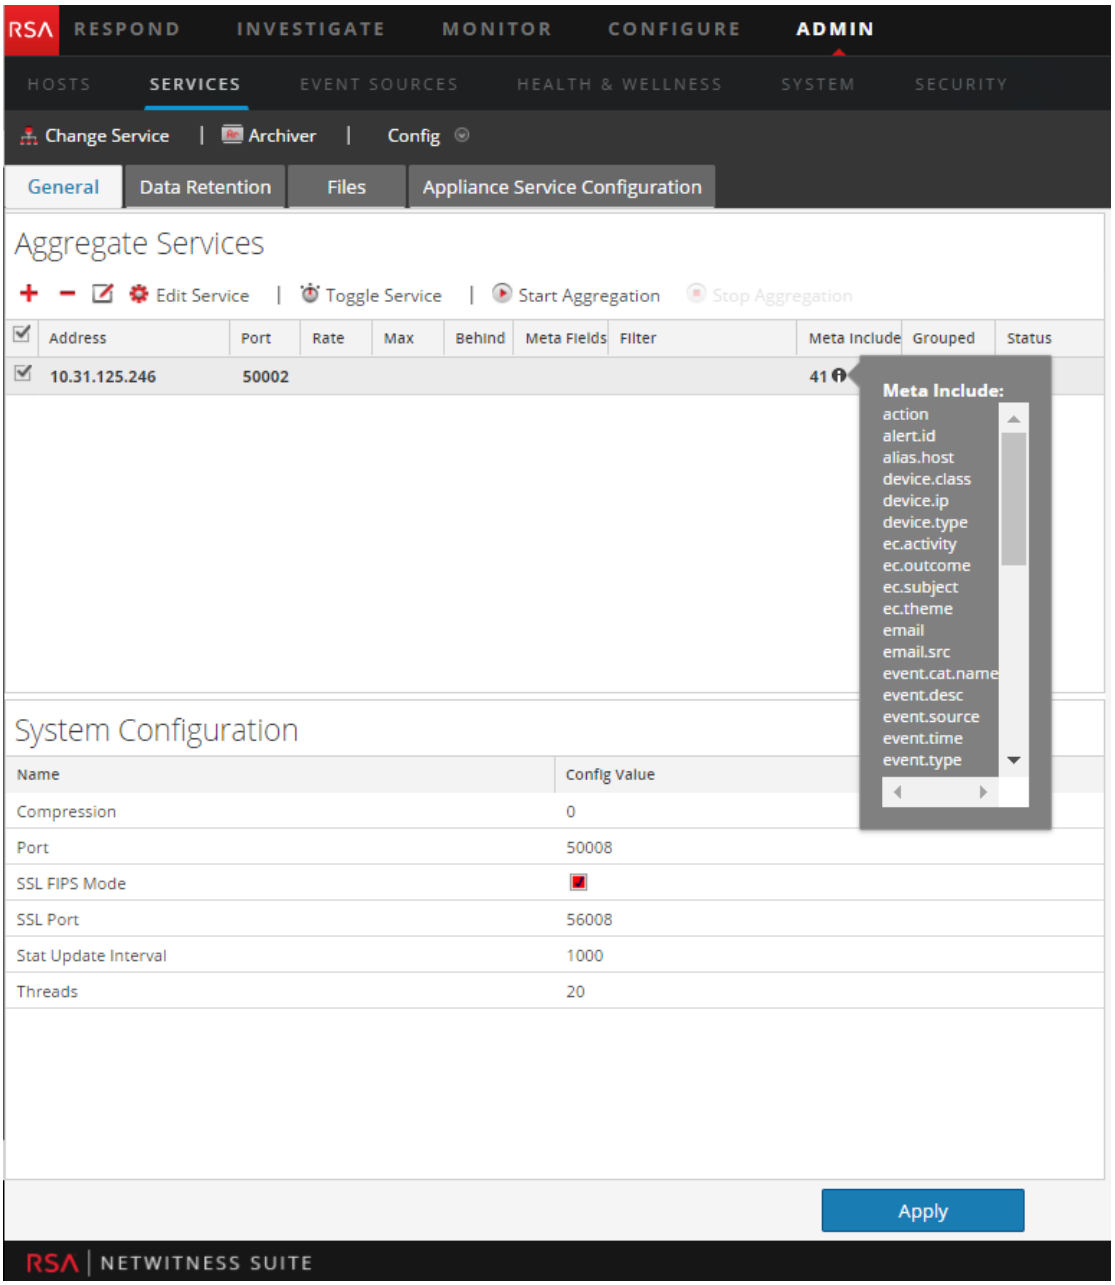
See (Optional) Configure Meta Filters for Aggregation and (Optional) Add Index Entries for Archiver Reporting for additional details.

(Optional) Configure Meta Filters for Aggregation

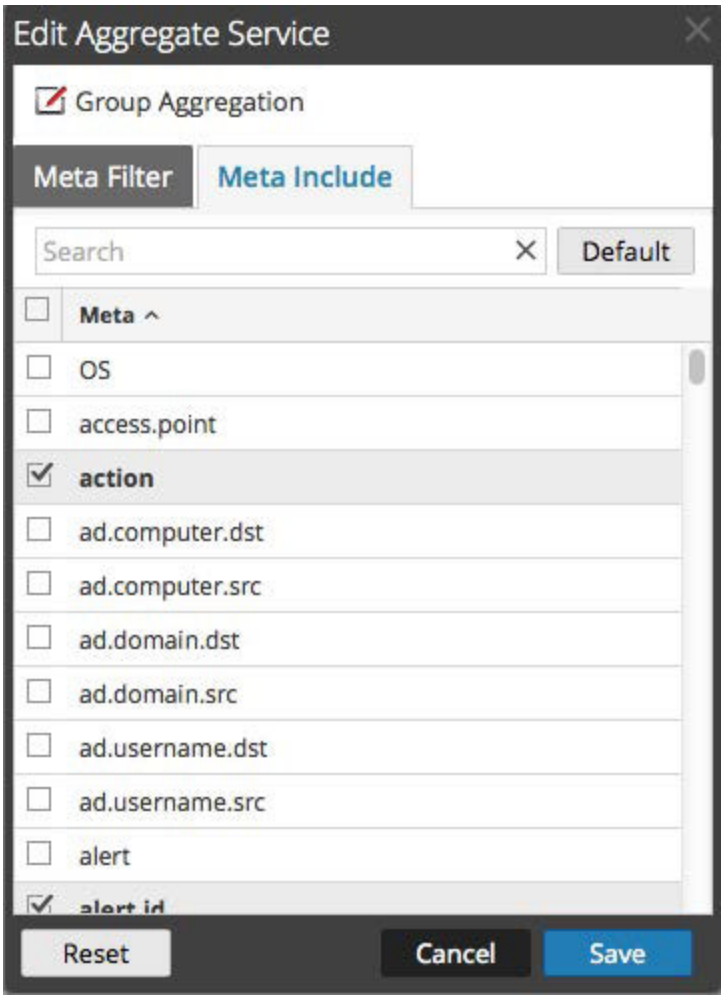
Follow this procedure to view and add additional meta items to the Archiver.

Caution: Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

1. To view the current meta items, in the **Aggregate Services** panel, select the Log Decoder service and click in the **Meta Include** field.



2. To add additional meta items, select the Log Decoder service and click  .



3. In the Edit Aggregate Service dialog, select the meta items to include in the Meta Include list. For example, you may want to consider including ip.srcport, tcp.srcport, udp.srcport, msg, url, query, bytes, alias.host, ip.dst, ip.dstport, ip.src, tcp.dstport, megabytes, time, event.desc, and word.
4. Click **Save** and then click **Apply**.
5. See (Optional) Add Index Entries for Archiver Reporting below for information on how to index the additional meta keys.

(Optional) Add Index Entries for Archiver Reporting

Caution: Adding meta or indexes will require additional storage, CPU resources, and Memory resources to support, and may impact retention time. As more meta items are added to the Archiver, the maximum aggregation rate will decrease, and the time to execute reports will increase.

The Archiver's default index configuration only includes value indexes for these keys:

- time
- decoder source (did)
- destination user account (user.dst),
- alert ID (alert.id)
- device IP (device.ip)
- source IP address (ip.src)
- destination IP address (ip.dst)
- event description (event.desc)
- device class (device.class)
- medium
- object name (obj.name)
- word

For information on customizing this list, see **Index Customization** in the *Core Database Tuning Guide*.

Configure Archiver Storage and Log Retention

This topic provides instructions for Administrators to configure storage and log retention on an Archiver.

For compliance reasons, it is often necessary to retain some logs longer than other logs. Some logs are legally sensitive and cannot be retained for a long period of time. Other logs have a requirement to be retained for years. In addition to compliance, some logs are useful for historic forensics and other logs have little to no security or operationally relevant value and can be deleted after a short time.

Because business requirements vary, NetWitness Suite enables you to configure Collections, which are log retention sets for storing log data. For each collection, you can specify how much of the total storage space to use and how many days to retain the logs in the collection. To specify the type of logs to put in the collection, you define retention rules to associate with the collections. Retention rules for all of your collections execute sequentially in an order that you define.

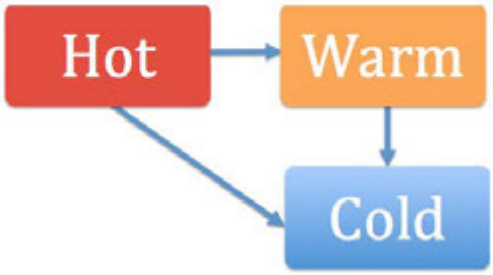
To do this, you must first define the total physical storage space for your collections. NetWitness Suite enables you to define three types of storage:

- **Hot Tier Storage**: This storage contains log data that is in active use as part of the business process. Users can access these logs faster than other types of storage and they can use these logs for reporting and other tasks. Hot storage is usually Direct-Access Capacity (DAC) or SAN storage.
- **Warm Tier Storage**: (Optional) This storage contains older log data aggregated by Archiver. Log data access is slower than hot storage. Users can also use these logs for reporting and other tasks. Warm storage is usually Network Attached Storage (NAS).
- **Cold Tier Storage**: (Optional) This storage contains the oldest log data that is either required for the operation of the business or mandated by regulatory requirements. The logs are offline and Archiver cannot access these logs for reporting or other tasks. However, if you want to access this log data, you can restore it to the collections created on the Archiver service and then use it for reporting. Cold storage is usually offline storage, such as NAS, or temporary storage before archiving to tape. Once data moves to the Cold Tier, that data is no longer managed by Archiver. Once moved, it is incumbent on external processes to back it up or manage that Cold Tier space such that it does not reach 100% capacity. If capacity is reached, this will cause the Archiver to stop aggregation until the problem is fixed.

Archivers are preconfigured to use available hot storage and a default log collection, so you do not have to configure Archiver storage and log retention if you do not have complex log retention requirements.

Logs can move from one type of storage to another in the following ways:

- Hot Storage > Cold Storage
- Hot Storage > Warm Storage > Cold Storage



When a collection reaches its retention limits for hot and warm storage, NetWitness Suite deletes the log data from hot or warm storage. With cold storage configured, a copy goes into cold storage before the logs are deleted from hot or warm storage. For example, if you have a collection with Hot Storage of 1 TB, Warm Storage of 1 TB, and Cold Storage enabled, when the log data reaches 1 TB of hot storage, the oldest log data moves to warm storage. When the log data in warm storage reaches 1 TB, the oldest log data from warm storage is copied to cold storage before it is removed from warm storage.

For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first. For example, if you have a collection with Hot Storage of 1 TB, no Warm or Cold Storage, and a Retention period of 20 days, if the Log data exceeds 1 TB after 11 days, the oldest logs over 1 TB are deleted even though the collection has a 20 day retention period.

After you create hot, warm, and cold storage, you configure your log retention storage collections. You can specify the maximum size of the Hot and Warm Storage for the collection, whether to use Cold Storage, the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved.

After configuring your collections, you define retention rules for your collection. These rules specify the type of logs to be stored in the collection. Each collection must have at least one retention rule associated with it in order to store log data.

Procedure

Perform the following tasks in the order shown to configure storage and log retention.

Task	Reference
1. Configure total hot, warm, and cold storage.	Refer to Configure Hot, Warm, and Cold Storage.

Task	Reference
2. Configure log retention storage collections.	Refer to Configure Log Storage Collections.
3. Define retention rules for the collections and determine the order of execution of the overall list of retention rules.	Refer to Define Retention Rules.

Configure Hot, Warm, and Cold Storage

This topic provides instructions for Administrators on how to configure total hot, warm, and cold storage on an Archiver.

An Archiver host has hot storage pre-configured to the defaults. Administrators can configure total hot, warm, and cold storage to meet their specific business requirements. An Archiver must have total hot storage configured, but warm and cold storage configurations are optional. NetWitness Suite does not manage cold storage.

Prerequisites

Ensure that you have:

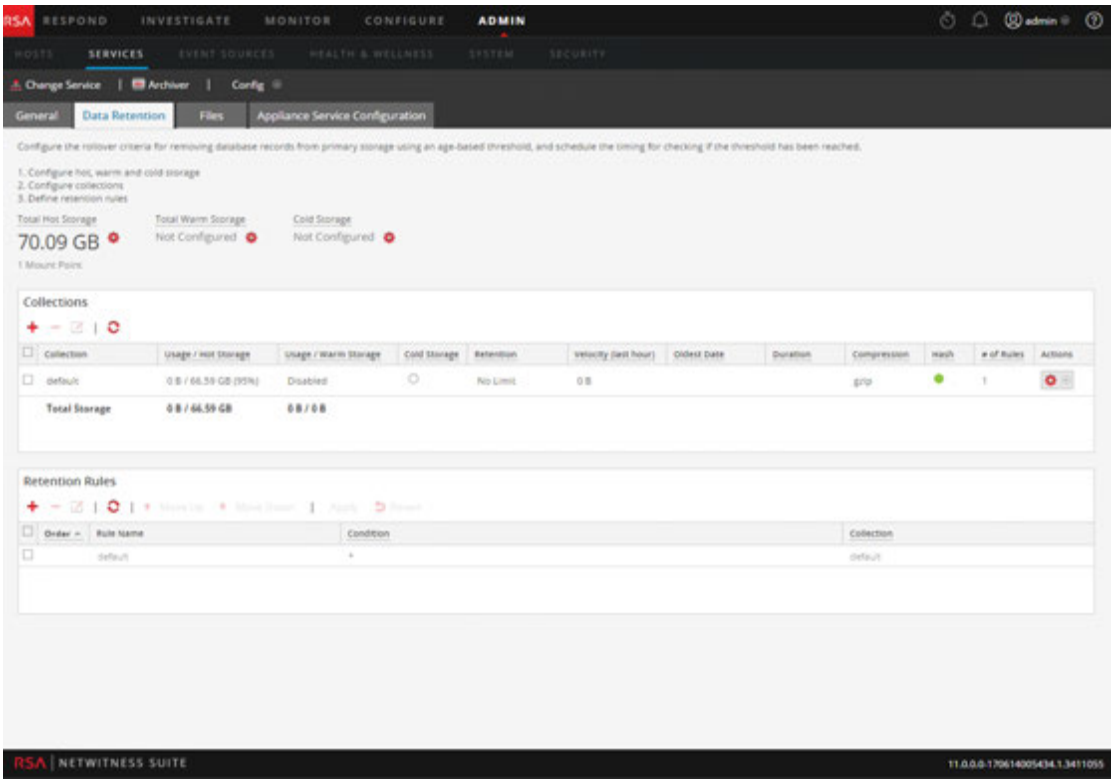
1. Installed the Archiver host in your network environment.
2. Installed and configured Log Decoder in your network environment.
3. Added Archiver as a Core service to your NetWitness Suite deployment.
4. Added Log Decoder services as a data source for Archiver.
5. Installed and configured a DAC or other physical storage in your network environment.
6. Determined your log retention and storage requirements.

Procedures

Configure Total Hot Storage for an Archiver

1. Go to **ADMIN > Services**.
2. Select the Archiver service and  **> View > Config**.

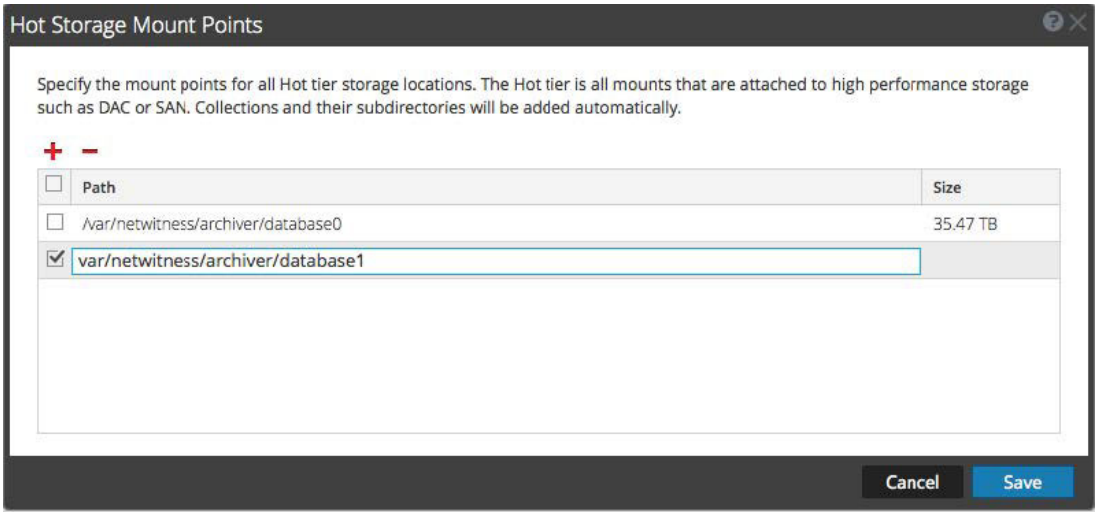
   The Services Config view of Archiver is displayed.
3. On the **Data Retention** tab, in the **Total Hot Storage** section, click  to configure total hot storage.



4. In the **Hot Storage Mount Points** dialog, add the mount points attached to the Archiver host that you want to include in Total Hot Storage.

   These are the paths to high performance storage, such as DAC storage and SAN. Do not add collections or subdirectories to the mount points.

   To add a mount point, click + and type the path to the mount point.



5. Verify that your mount point paths are correct and click **Save**.

   NetWitness Suite will automatically create metadb, packetdb, sessiondb, and index

directories for each collection defined on the Archiver:
<storageLocation>/<CollectionName>/metadb
<storageLocation>/<CollectionName>/packetdb
<storageLocation>/<CollectionName>/sessiondb
<storageLocation>/<CollectionName>/index

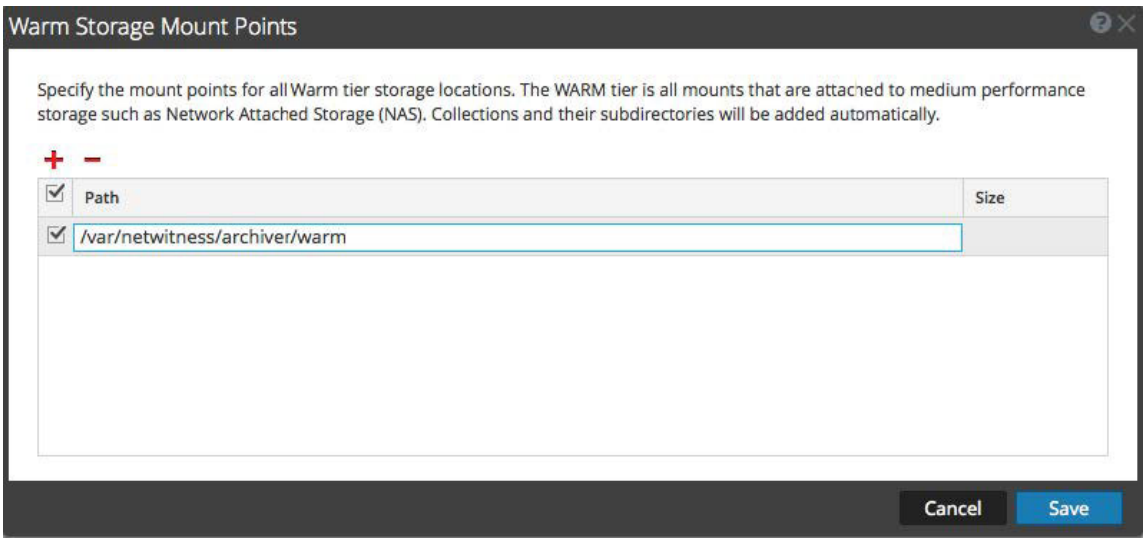
For example, if your mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections:
/var/netwitness/archiver/<CollectionName>/metadb
/var/netwitness/archiver/<CollectionName>/packetdb
/var/netwitness/archiver/<CollectionName>/sessiondb
/var/netwitness/archiver/<CollectionName>/index

After the Archiver service is restarted, data will start being saved to your defined collections. Ensure that your log retention collections are correct before restarting the Archiver service.

Caution: After data has been saved to a mount point, it cannot be removed from the user interface.

Configure Total Warm Storage for an Archiver

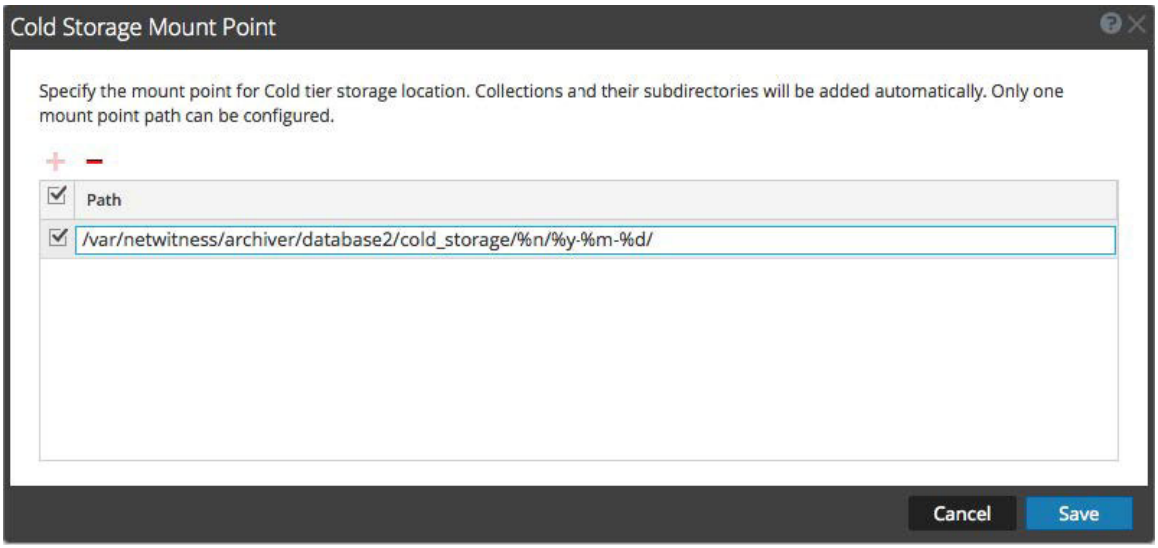
(Optional) The procedure to configure Total Warm Storage for an Archiver is the same as for Total Hot Storage, except that you click  in the Total Warm Storage section and add the mount points that you want to use for warm storage, which are the physical paths to warm storage, such as Network Attached Storage (NAS).



Configure Total Cold Storage for an Archiver

(Optional) The procedure to configure Total Cold Storage for an Archiver is the same as for Total Hot Storage, except that you click in the Total Cold Storage section and you add only one mount point for cold storage. NetWitness Suite does not manage cold storage.

You must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections.



The following format specifiers are allowed in the path:

Format Specifier	Description
%n	collection name (required)
%y	year the data moved to cold storage
%m	month
%d	day
%h	hour
%##r	block of hours for the current day. For example, if you want three 8 hour blocks, you can set it to %8r. The first 8 hours of the day returns 0, the second 8 hours returns 1, and last 8 hours of the day returns 2.

Changes take effect immediately.

For example, if you have a collection named **compliance** and you create the following cold storage path:

```
/sa-cold-storage/%n/%y-%m-%d/
```

NetWitness Suite creates a directory each day with the following format:

/sa-cold-storage/compliance/2015-11-20/

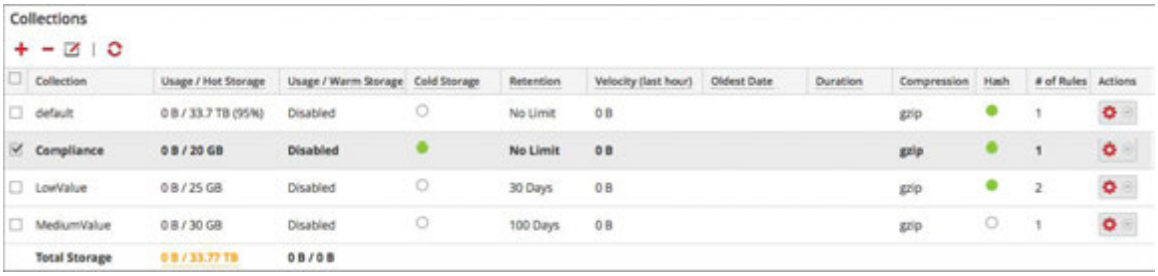
Hot, Warm, and Cold Tier Storage Features

The following table describes features of the Hot, Warm, and Cold Tier Storage dialogs.

Feature	Description
	Adds a mount point.
	Removes a mount point. You cannot delete a mount point that is in use unless you delete the associated collections.
	Select the mount points that you want to include for the Total Hot, Warm, and Cold Storage. You can only select one mount point for Total Cold Storage.
Mount Point	Shows the path to the attached physical storage. For example: **/var/netwitness/archiver/database0**, which is the location of the hot storage DAC. Do not add collections or subdirectories to the mount points. NetWitness Suite will automatically create metadb, packetdb, sessiondb, and index directories for each collection defined on the Archiver: <storageLocation>/<CollectionName>/metadb <storageLocation>/<CollectionName>/packetdb <storageLocation>/<CollectionName>/sessiondb <storageLocation>/<CollectionName>/index For example, if your hot storage mount point is /var/netwitness/archiver, then the following directories will be created for each of your collections: /var/netwitness/archiver/<CollectionName>/metadb /var/netwitness/archiver/<CollectionName>/packetdb /var/netwitness/archiver/<CollectionName>/sessiondb /var/netwitness/archiver/<CollectionName>/index For Cold Storage, you must include the collection name format specifier `%n` somewhere in the cold storage mount point path name to avoid filename collisions between collections.
Storage Size	Shows the size of the attached storage. The Data Retention tab shows the total amount of storage for your reference.

Collections

The Collections section lists all of your storage collections along with Total Storage for Hot and Warm Storage.



Collections Features

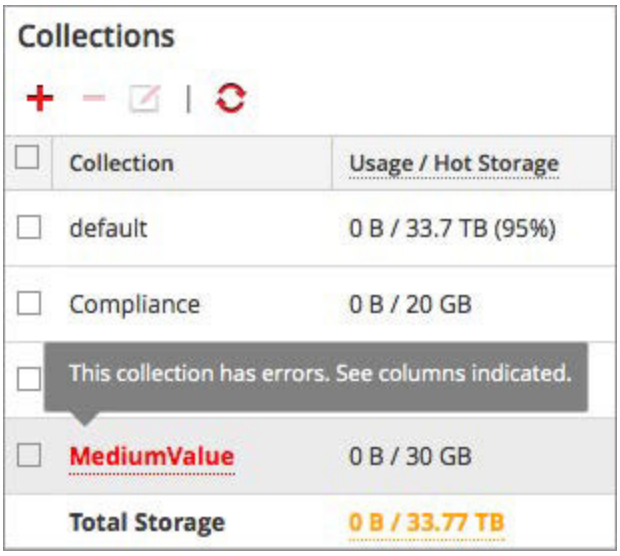
The following table describes the icons and columns of the Collections section. You can hide some of the columns based on your requirements.

Feature	Description
	Opens the Collections dialog, in which you can add a storage collection.
	Removes the selected collection. Deleting the collection permanently removes all stored data from the collection, but the empty data directories remain.
	Opens the Collections dialog, in which you can edit the selected collection.
	Refreshes collection information.
	Selects a collection. For example, you can select a collection for editing or removal.
Collection	Shows the name of your collection, such as Default, Compliance, MediumValue, and LowValue. You can create multiple collections with different criteria for retaining logs. If you do not create any collections, the Default collection is used. If a collection has errors, the collection name and the columns with errors appear in red text.

Feature	Description
Usage / Hot Storage	Shows the current hot storage usage and the maximum hot storage for the collection. When the size of the logs reach the maximum hot storage amount, the logs are removed or they roll to the next available storage tier (warm or cold).
Usage / Warm Storage	Shows the current warm storage usage and the maximum warm storage for the collection. When the size of the logs reach the maximum warm storage amount, the logs are removed or they roll to available cold storage.
Cold Storage	Indicates whether cold storage is enabled or disabled. A solid colored green circle indicates that cold storage is enabled ( ). An blank white circle indicates that cold storage is disabled.
Retention	Shows the number of days that logs are retained before being removed or optionally moved to cold storage. No Limit indicates that log retention is not restricted by a specified number of days. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Velocity (last hour)	Shows the number of logs captured over the last hour.
Oldest Date	Shows the date and time of the last log capture.
Duration	Shows how may days ago that the last log was captured. For example: 20 days.
Compression	Shows the compression type used for the meta and raw data in the collection.
Hash	Shows whether hash is enabled or disabled. When enabled, the hash algorithm is used to ensure the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

Feature	Description
# of Rules	Shows the number of rules applied to the collection. Define at least one rule for each collection. A collection without any associated rules shows a zero in red text as a warning: The collection name also appears in red text, which indicates an error in the collection. **Caution:** If a collection does not have a rule, no logs will ever go into that collection.
Actions	Enables you to see the rules associated with a collection in the Retention Rule section when you select <actions button> **> Select Rules**. In the Retention Rule section, you can change the overall priority of the collection rules.
Total Storage	Shows the current total hot storage usage and the maximum total hot storage at the bottom of the **Usage / Hot Storage** column. It also shows the current total warm storage usage and the maximum total warm storage at the bottom of the **Usage / Warm Storage** column.

Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error.



Collections that have editing disabled (grayed out) also have tooltips that provide information on the problem.

Retention Rules

The Retention Rules section lists all of the retention rules used for your storage collections listed in the order of rule execution.

The following table describes the features of the Retention Rule section.

Feature	Description
	Opens the Rule Definition dialog, in which you can add a retention rule to use in a storage collection.
	Removes the selected retention rule. In order for your log collections to gather and store log data, you must associate them with at least one retention rule.
	Opens the Rule Definition dialog, in which you can edit the selected retention rule.
	Refreshes retention rule information.
 Move Up	Moves the selected retention rule up in the Retention Rule priority list. Retention Rule order is very important. NetWitness Suite evaluates the the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section. You can also use drag and drop to reorder retention rules.
 Move Down	Moves the selected retention rule down in the Retention Rule priority list. Retention Rule order is very important. NetWitness Suite executes the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section.
Apply	Saves the rule order change.
 Revert	Reverts the rule order change.
	Selects or shows a selected retention rule.
Order	Shows the order of a rule in the overall list of retention rules.

Feature	Description
Rule Name	Shows the name of rule, such as ComplianceDevices and GeneralWindowsLogs.
Condition	Shows the conditions for the rule. These conditions specify the type of logs to include in the collection. Define Retention Rules presents the guidelines for all queries and rule conditions in Core services.
Collection	Shows Collection name and how many days that the collection is retained. For example: MediumValue (30 Days)

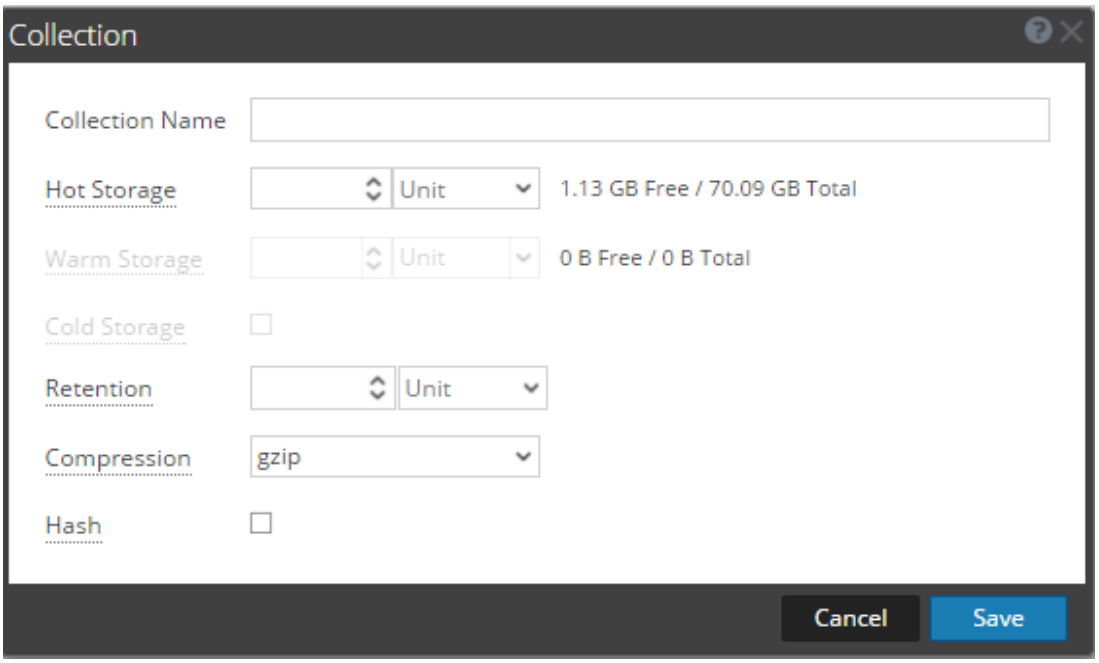
Collection Dialog

On the ADMIN > Services > Config view > Data Retention tab of an Archiver, Administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and Configure Log Storage Collections.

To access the Collection dialog:

1. Select **ADMIN > Services**.
2. Select an Archiver service and  **>View > Config**.
3. In the Services Config view for the service, click the **Data Retention** tab.
4. In the **Collections** section, click  to add or edit the rule.
   The Collection dialog is displayed.



The following table describes the fields in the Collection dialog.

Field	Description
Collection Name	Specify a name for your collection, such as Compliance, MediumValue, or LowValue.
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field. When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold).
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field. When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage.

Field	Description
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

Rule Definition Dialog

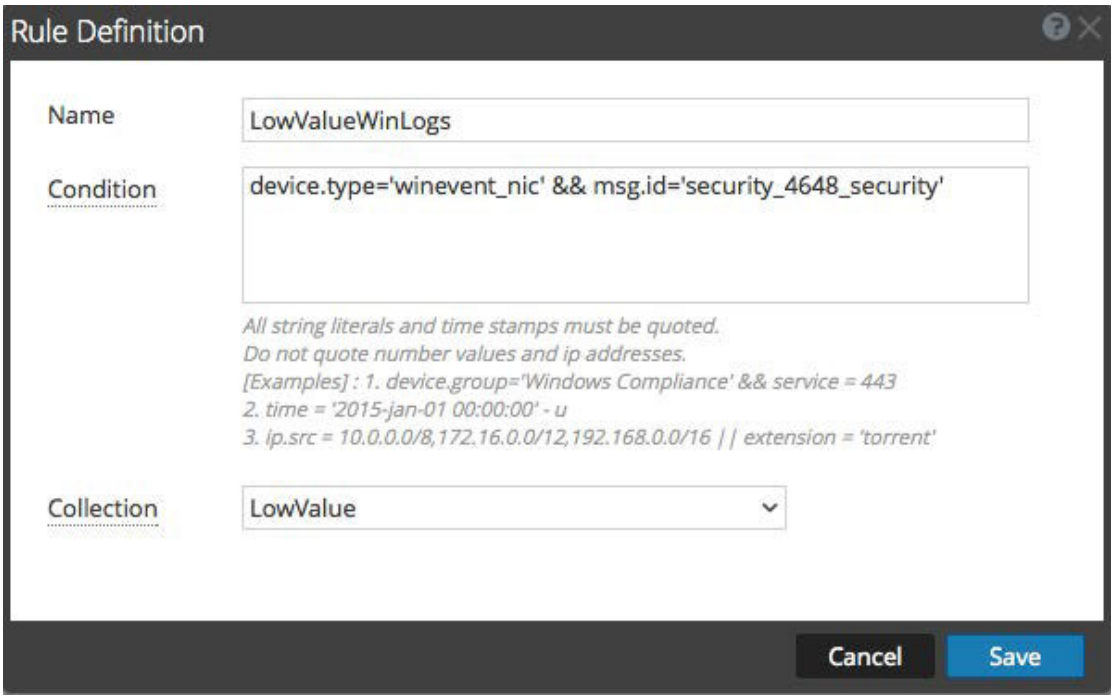
In the ADMIN > Services > Config view > Data Retention tab of an Archiver, Administrators can define the criteria for log retention and storage. In the Rule Definition dialog, which is accessible from the Retention Rules section, you can define retention rules to use for your storage collections.

Procedures related to this dialog box are described in Configure Archiver Storage and Log Retention and .Define Retention Rules

To access the Rule Definition dialog:

1. Select **ADMIN > Services**.
2. Select an Archiver service and **>View > Config**.
3. In the Services Config view for the service, click the **Data Retention** tab.
4. In the **Retention Rule** section, click + or .

   The Rule Definition dialog is displayed.



The following table describes fields in the Rule Definition dialog.

Field	Description
Name	Specify a unique name for your retention rule. For example: ComplianceDevices
Condition	Specify the conditions for the type of logs that you want to include in the collection. All sting literals and time stamps must be quoted. Do not quote number values and IP addresses. For example: device.group='PCI Devices' || device.group='HIPPA Devices'
Collection	Select the collection on which you want to apply this rule. For example: Compliance

Next Step

Configure log storage collections.

Configure Log Storage Collections

This topic provides instructions for Administrators on how to configure log storage collections on an Archiver.

NetWitness Suite enables you to define individual storage collections for different log types. You can specify the maximum size of the Hot and Warm Storage space used by the collection, whether to use offline storage (Cold Storage), the number of days to retain the logs in the collection, the data compression, and whether to use a hash algorithm to be able to verify the data integrity of the files being saved. You should create collections based on your log retention storage requirements. Each collection that you create must be associated with at least one retention rule.

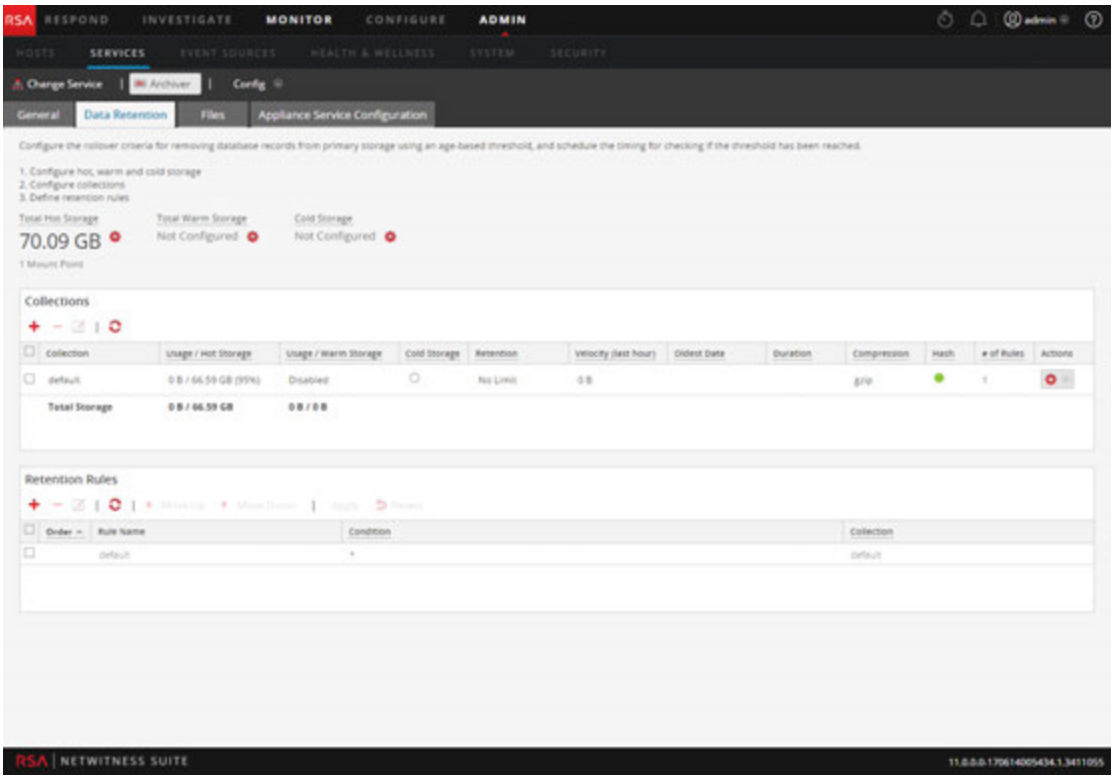
Prerequisites

Before you configure your log retention storage collections, configure total hot, warm, and cold storage.

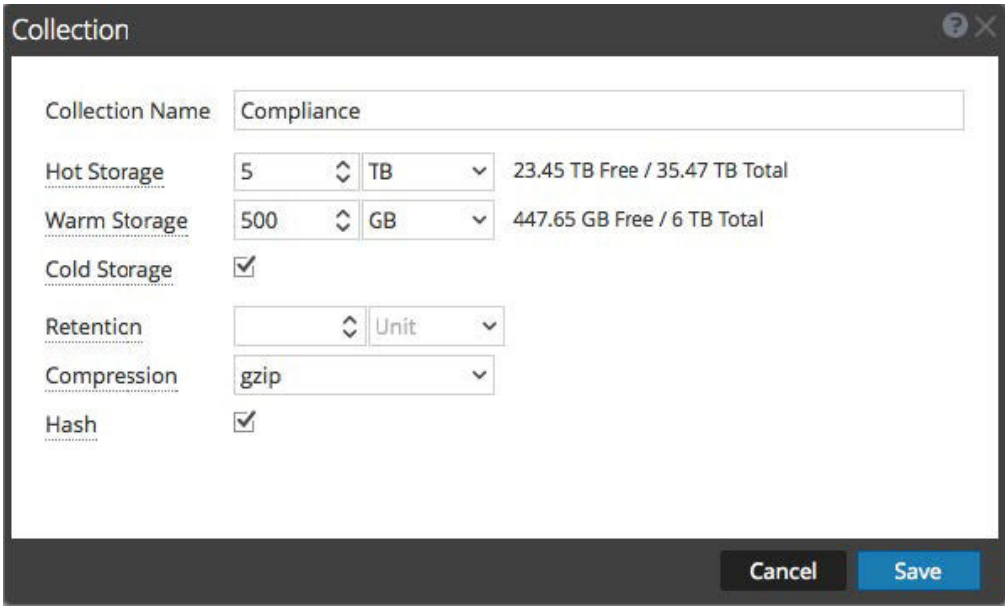
Configure a Log Storage Collection

To configure a log retention storage collection on an Archiver:

1. Go to **ADMIN > Services**.
2. Select the Archiver service and  **> View > Config**.
   The Services Config view of Archiver is displayed.
3. On the **Data Retention** tab, in the **Collections** section, click  to add a collection.
   (If you decide to make changes to an existing collection, you can select the collection and click  to change the settings.)



The **Collection** dialog is displayed.



4. Configure the collection as described in the following table.

Field	Description
Collection Name	Specify a unique name for your collection, such as Compliance, MediumValue, or LowValue.
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage is shown next to this field.
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage is shown next to this field.
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside the storage limits are copied to cold storage before they are deleted from hot or warm storage.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved. By default, the only data being hashed is raw logs and the hash files are saved in the same directory as data.

5. Click **Save**.
   Any errors in the collection appear in red text. A dotted underline indicates that a tooltip is available with information about the error. Your collection name appears in red text until at least one retention rule is defined for your collection.

If you have a collection with editing disabled (grayed out), look at the associated tooltip for more information.

Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

Next Step

Define retention rules for your collections.

Define Retention Rules

Administrators can define and order retention rules for log storage collections on an Archiver. Retention rules specify the type of logs to be stored in the collection. For your log collections to gather and store log data, you must associate them with at least one retention rule. When you configure a retention rule, you specify a condition and a collection for that rule. The condition (rule definition) determines the type of logs stored in that collection.

For the condition, you can use anything that works in a regular query `where` clause.

For example, to get logs from compliance services, you can use the following condition:

```
device.group='PCI Devices' || device.group='HIPPA Devices'
```

After you define the retention rules for your collections, it is important that you specify the order of your retention rules. NetWitness Suite evaluates the retention rules for all of the collections in numerical order by the number listed in the Order column in the Retention Rule section of the Data Retention tab of the Archiver (ADMIN > Services Config view).

Caution: Rule order is very important. It determines the priority for evaluating the log data for storage retention.

Prerequisites

Before you configure your retention rules:

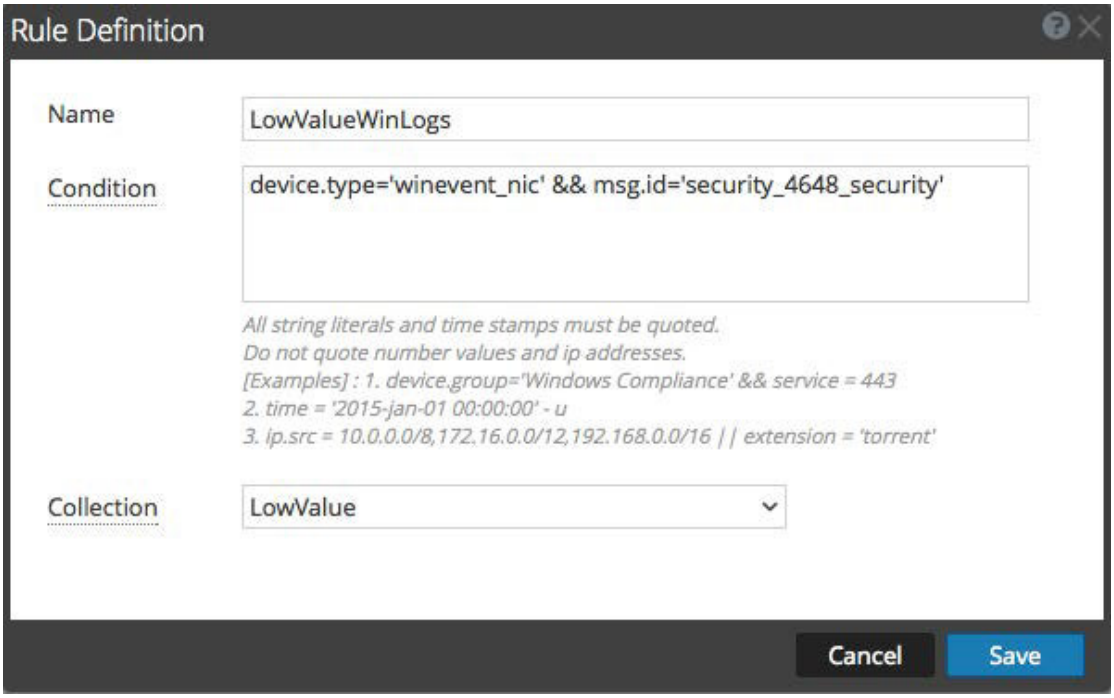
- Configure total hot, warm, and cold storage
- Configure log storage collections

Procedures

Define a Retention Rule for a Collection

1. Go to **ADMIN > Services**.
2. Select the Archiver service and  **> View > Config**.
   The Services Config view of Archiver is displayed.
3. On the **Data Retention** tab, in the **Retention Rule** section, click  .

The **Rule Definition** dialog is displayed.



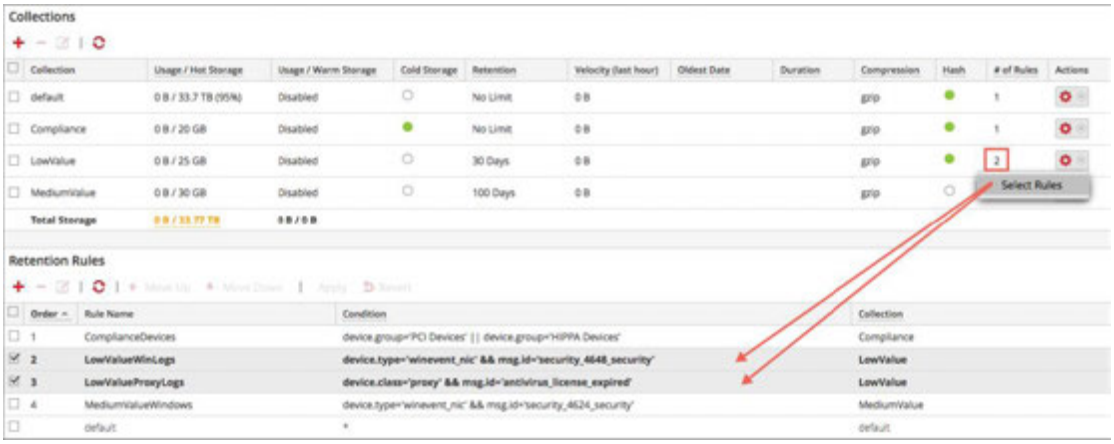
4. Configure the fields in the Rule Definition dialog as described in the following table:

Field	Description
Rule Name	Specify a unique name for your retention rule. It cannot include spaces. For example: LowValueWinLogs
Condition	Specify the conditions for the type of logs that you want to include in the collection. All string literals and time stamps must be quoted. Do not quote number values and IP addresses. For example: `device.type='winevent_nic' && msg.id='security_4648_security'`
Collection	Select the collection on which you want to apply this rule. For example: LowValue.

5. Click **Save**.

   The retention rule that you define becomes associated with the collection you selected. On the **Data Retention** tab, in the **Collections** section, you can click  > **Select Rules** in

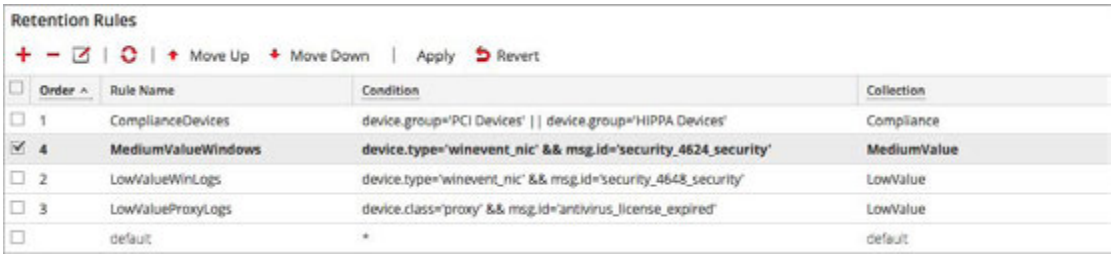
the **Actions** column for the selected collection to view the retention rules associated with the collection in the **Retention Rule** section.



Specify the Order of your Retention Rules

To prioritize the complete list of all of your retention rules:

1. In the **Retention Rule** section of the **Data Retention** tab, select a retention rule and use drag and drop (or select **Move Up** and **Move Down**) to change its order in the priority list.



2. Click **Apply** to save the order of the retention rules.

Caution: Rule order is very important. It determines the priority for evaluating the log data for storage retention.

Next Step

Add Archiver as a Data Source to Reporting Engine.

Add Archiver as a Data Source to Reporting Engine

This topic provides instructions on how to add Archiver Archiver as a data source to Reporting Engine to generate reports for the data collected by Archiver.

Prerequisites

Ensure that you have:

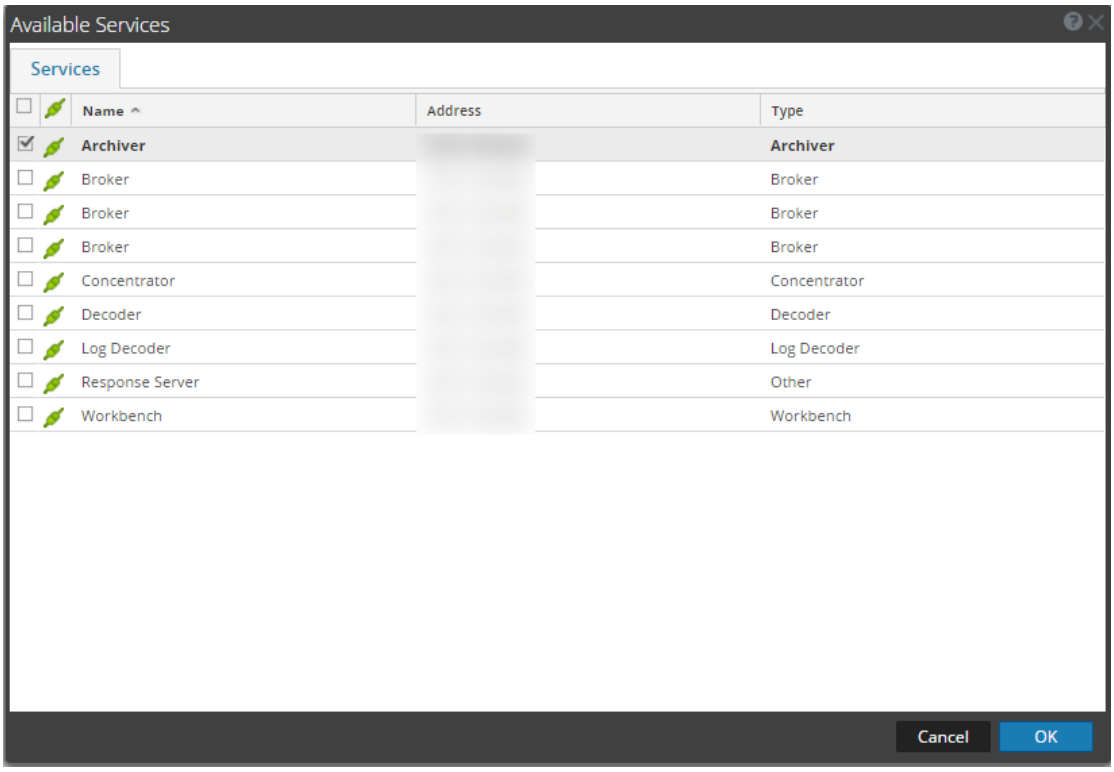
1. Installed the Archiver host in your network environment.
2. Installed and configured a Log Decoder Decoder in your network environment.
3. Verified that Reporting Engine and Archiver services are active.

Procedure

To associate an Archiver data source with Reporting Engine:

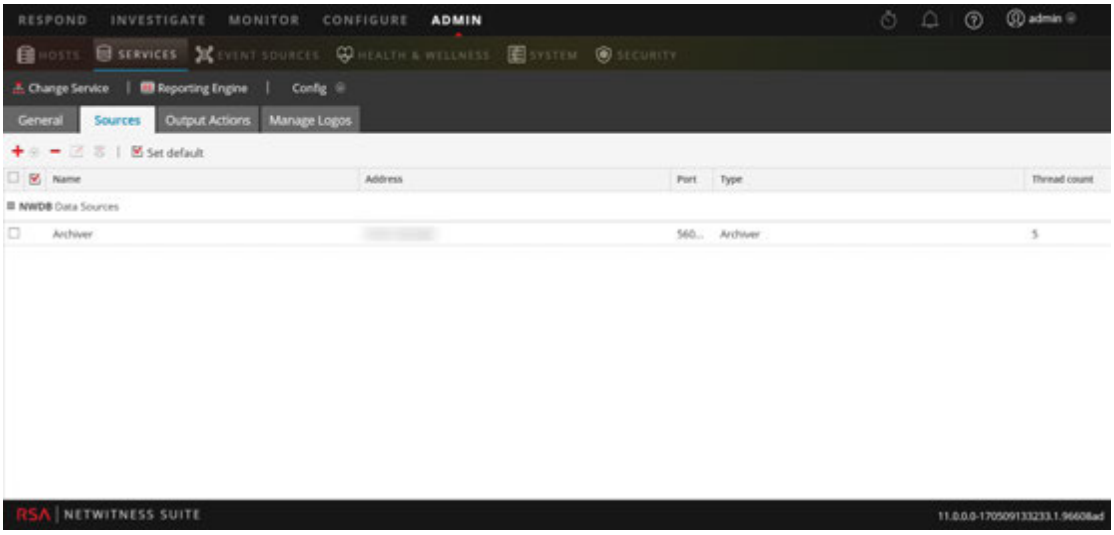
1. Go to **ADMIN > Services**.
2. In the **Services** panel, select a **Reporting Engine** service.
3. In the **Actions** column, select **View > Config**.
4. Select the **Sources** tab.
5. Click + and select **Available Services**.

   The Available Services dialog is displayed.



6. Select the Archiver that you want to add as data source to the Reporting Engine and click **OK**.
7. In the Service Information dialog, type the username and password for the Archiver.
8. Click **OK**.

   The selected Archiver is listed in the NWDB Data Sources category.



You can now create reports on the data collected by Archiver.

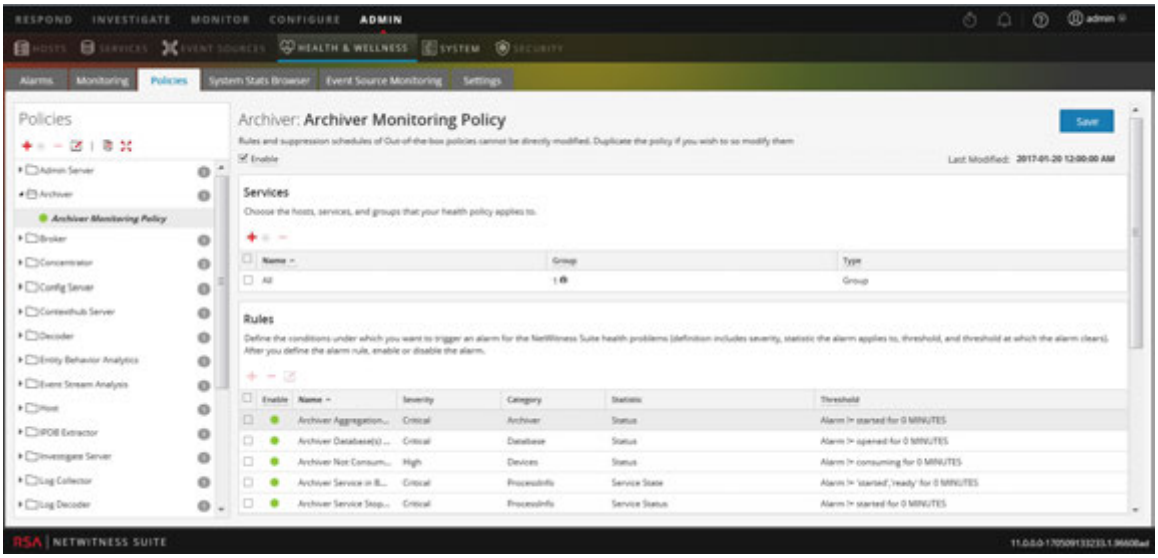
Next Step

Configure alerts for archive storage.

Configure Archiver Monitoring

Health & Wellness enables you to automatically generate notifications when critical thresholds are met.

Review the Health & Wellness policies for Archiver and Host in the Health & Wellness Policies section. Make updates as required.



For detailed information, see **Manage Policies** in the *System Maintenance* guide.

Additional Archiver Configuration

This topic is a collection of individual procedures, which an Administrator may perform at any time and they are not required to complete the initial setup of Archiver. These procedures are presented in alphabetical order.

Use this section when you are looking for instructions to perform a specific task after the initial setup of Archiver.

Topics

Configuring Data Backup and Restore

This topic provides information on the Data Backup and Restore feature for an Archiver. You can use this feature to back up Archiver data and retrieve the backed up data.

You can back up the data in the following ways:

- Use scripts to copy files from cold storage backup folders onto an offline storage.
- Use backup software to copy files from cold storage backup folders onto an offline storage.
- Run EMC Networker or other backup software on Archiver and have it do daily incremental backup of the database files.

Note: For details on the procedure to back up data using Networker, see the *Administration Guide for Networker*.

Once you have the data backup, you have to perform the following tasks to restore the backed up data that is installed on the Archiver.

Action	Description
1. Restore your data to a location accessible by the Archiver.	Refer to Create Collection
2. Create a collection in Archiver that uses that location.	Refer to the **Manage Collections** topic in the *Workbench Configuration Guide*.
3. Add the Archiver service as a data source on Reporting Engine to generate reports for the data restored on the Archiver service.	Refer to Add Archiver as a Data Source to Reporting Engine

Add Archiver Service

The NetWitness Suite Archiver service enables you to create collections with restored data from Archiver offline (cold) storage. This procedure is only required if you do not have the Archiver service installed.

Prerequisites

Make sure you have added an Archiver host and applied a license to it.

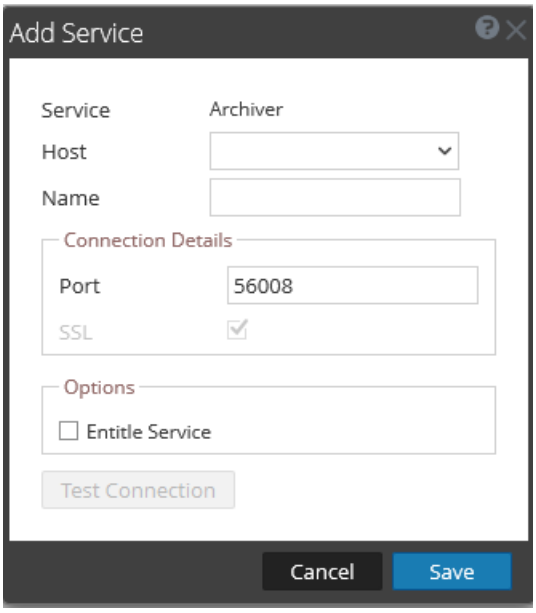
Procedure

Note: This procedure is only required if you do not have Archiver service installed.

Perform the following steps to add the Archiver service:

1. Go to **ADMIN > Services**.
2. In the **Services** panel, select + **>Archiver**.

   The Add Service dialog is displayed, as shown below.



3. Provide the following details.

Field	Description
Host	Select an Archiver host from the drop-down menu.
Name	Type a name for the service.
Port	Default port is 50007.
SSL	Select **SSL** if you want NetWitness Suite to communicate with the service using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. **Note:** If you select SSL, ensure SSL is enabled in the System Configuration panel.
Username	(Optional) Type the username for the service.
Password	(Optional) Type the password for the service.

4. Click **Test Connection** to determine if NetWitness Suite connects to the service.
5. When the result is successful, click **Save**.
   The added service is now displayed in the Services panel.

Note: If the test is unsuccessful, edit the service information and retry.

Create Collection

This topic provides information on how to create a collection on an Archiver service.

You can create a collection using data restored from the backed-up data or an existing subset of data. When you recover the backed-up data, you have to place it in the collection folder created on the Archiver service to enable you to generate the required reports for the retrieved data. For example, if you have backed up the data using EMC Networker at <*location*>, you can use the restore options in Networker to restore the backed-up data to the collection folder created on the Archiver service. For restore procedure using EMC Networker, see the *Administration Guide for Networker*.

Prerequisites

Ensure that you have:

- Archiver service installed on an Archiver host.
- Ensure the Archiverservice has enough space to hold the collection.

- The backed-up data placed in a known location on your local host, if you are creating a collection using the data restored from the backed-up data.

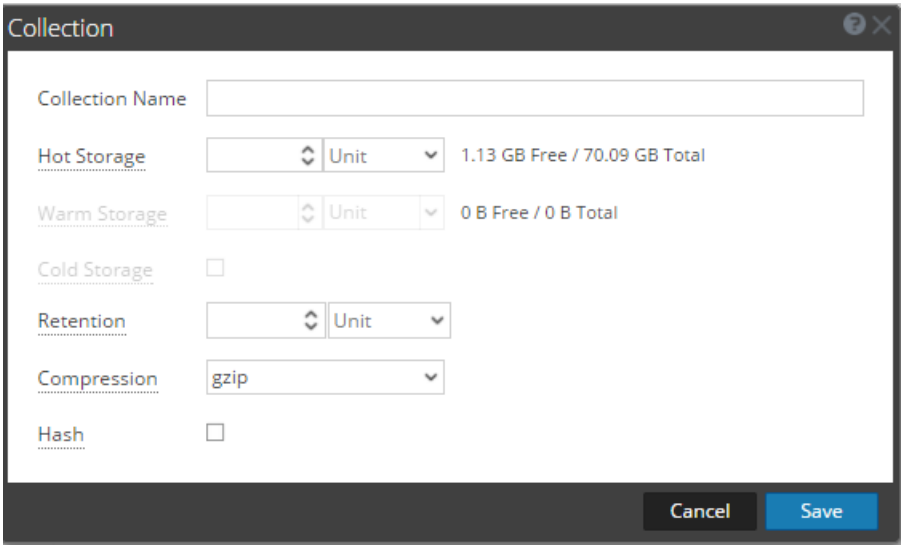
Procedure

The Data Retentions tab enables Administrators to restore and save data that is restored from a backup or from an existing set of data.

Note: The Administrator can point the source path to the location of the database files and the restore command copies them to the Archiver. The Administrator needs to mount those directories to the Archiver before a restoration collection can be created.

To create a collection using data restored from the backed-up data or existing subset of data:

1. Go to **ADMIN > Services > Archiver**.
2. From the **Services** grid, select **>View > Config**.
   The **General** tab is displayed.
3. Select the **Data Retentions** tab and click + in the **Collections** panel to add a collection.
   The **Collection** dialog is displayed.



5. Provide the following information:
   - **Collection Name:** Name of the Archiver collection that you want to restore.
   - **Hot Storage:**Enter the number of Archiver database files and unit size (either Gigabytes or Terabytes) that have been moved from cold storage.
   - **Retention:** Select the number of days or hours that you want to store the collection.
   - **Compression:** Select the compression type for the collection.

6. Click **Save** to restore the collection.

   Note: Target is the location where the collection is created.

   Note: If the source path provided to create the restoration collection does not exist, the following error message is displayed:
   "The source path does not exist '/xxx/xxx/'."
   If there is insufficient storage to restore your collection, the following error is displayed:
   "Error during disk space checking. Insufficient disk space in location '/xxx/xxx'."

   The Schedule Job dialog is displayed with the following message:
   "Restoring data into a new collection. Check the jobs page for progress."

7. Click **Jobs**  icon in the top right area of the main menu to expand the list of restoration collection jobs with their current status.

Note: When restoring a collection, the larger the dataset that you have to restore, the longer the restoration will take. If you are restoring a collection containing hundreds of gigabytes or more, restoration may take several hours.

Add Archiver Service as a Data Source to Reporting Engine

This topic provides instructions on how to add the Archiver service as a data source to Reporting Engine to generate reports for the data restored onto the Archiver.

Prerequisites

Ensure that you have:

- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

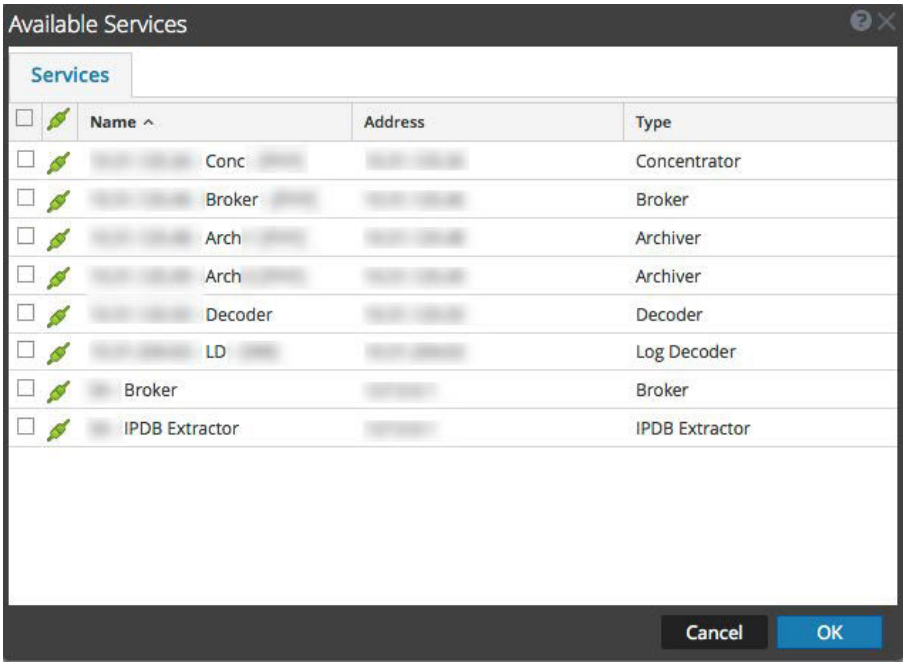
Procedure

Perform the following steps to add the Archiver service as a data source to Reporting Engine:

1. Select **ADMIN > Services**.
2. In the **Services** panel, select a Reporting Engine service.
3. In the **Actions** column, select **View > Config**.
4. Select the **Sources** tab.

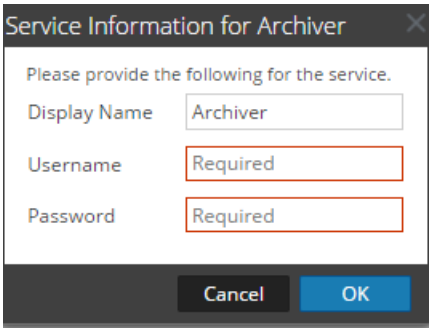
5. Click + and select **Available Services**.

   The Available Services dialog is displayed.



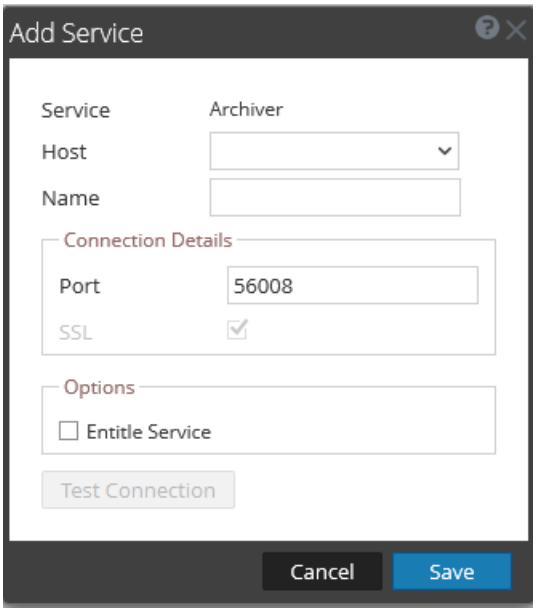
6. Select the Archiver service and click **OK**.

   If the Archiver service is using a Trust Model, the Service Information dialog for the selected service is displayed with the username and password fields required. If the service is not using a Trust Model, these fields will be optional.



7. Type the username and password for admin credentials for the service.

8. Click **OK**.
   The Add Service dialog is displayed.



9. Select a host from the drop-down list and click **Save**.
   The Archiver service is now added as a data source to the Reporting Engine and is listed in the NWDB Data Sources list.

Note: This procedure has to be performed for each collection.

An Administrator can create and delete Workbench collections. and view Workbench statistics and logs. This topic provides all of these procedures and an example procedure for restoring a collection for Reporting and Investigation.

- Mount Archiver Directories
- Create a Collection
- Delete a Collection
- Investigate a Collection
- View Workbench Collection Statistics
- View Workbench Logs

Mount Archiver Directories

If data is in offline storage or cold-tier storage, you need to mount the Archiver directories in order to restore the data for reporting and investigation purposes:

1. Go to **ADMIN > Services**.
2. Select an **Archiver** from the Services grid and select  **> View > Explore**.
   The Explorer view for the Archiver is displayed
3. Right-click on the **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
4. Run the **manifest** command for a time range, for example, 2015-April-01 to 2015-April-10.
   The search returns all files that need to be restored for the selected query.

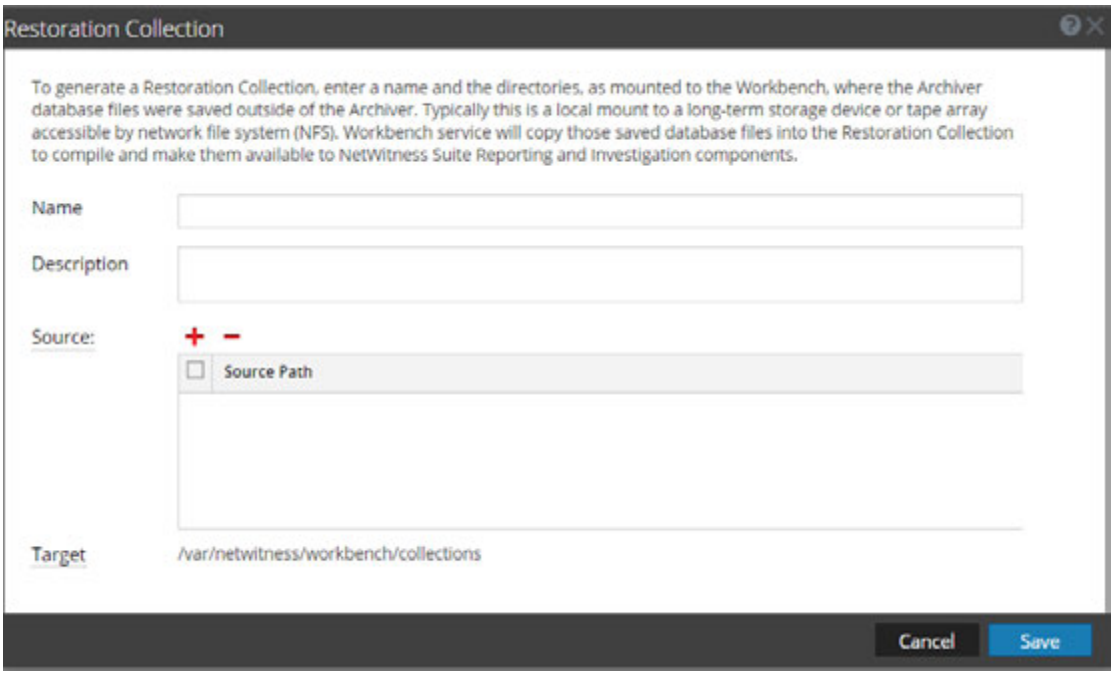
Create a Collection

Administrators can create collections of restored data from a backup or from an existing set of data.

Note: You can point the source path to the location of the database files and the restore command copies them to the Archiver. You need to mount those directories to the Archiver (where the Workbench is installed) before a restoration collection can be created.

To create a collection using data restored from the backed up data or existing subset of data:

1. Go to **ADMIN> Services.**
2. In the Services view, select a **Workbench**, then select  **> View > Config**.
   The Services Config view is displayed with the General tab open.
3. Click the **Collections** tab.
   The Collections grid is displayed.
4. Click + in the toolbar.
   The Restoration Collection dialog is displayed.



5. Provide the following information:
   - **Name:** Name of the Workbench collection that you want to restore.
   - **Source:** Location where the Archiver database files have been moved from cold storage.

   Note: Target is the location where the collection is created.

6. Click **Save** to restore the collection.

   Note: If the source path provided to create the restoration collection does not exist, the following error message is displayed:
   `The source path does not exist '/xxx/xxx/'.`

   If there is insufficient storage to restore your collection, the following error is displayed:
   `Error during disk space checking. Insufficient disk space in location '/xxx/xxx'.`

   The Schedule Job dialog is displayed with the following message:
   `Restoring data into a new collection. Check the jobs page for progress.`

7. Click the **Jobs** icon  in the NetWitness Suite toolbar to expand the list of restoration collection jobs with their current status.

Note: Restoring a collection that is larger than 550 GB may take several hours to process.

Delete a Collection

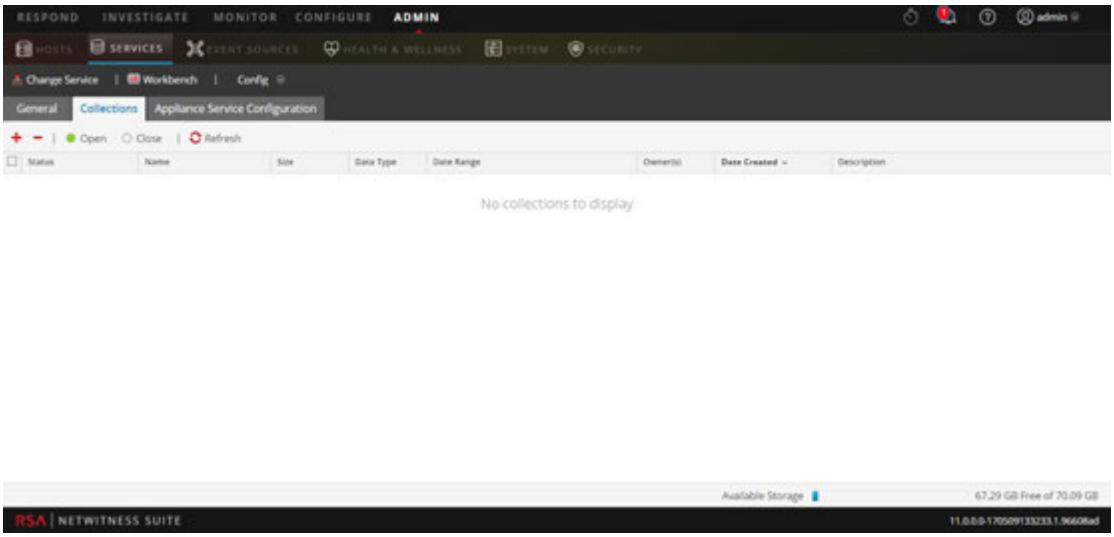
Administrators can delete collections from the Workbench service.

Perform the following steps to delete a collection:

1. Go to **ADMIN > Services.**
2. From the Services view, select a **Workbench** and click  **> View > Config**.

   The Services Config view opens with the General tab displayed.
3. Select the **Collections** tab.

   The Collections grid is displayed.



4. In the Collections grid, select the collection that you want to delete.
5. Click from the toolbar.

   A warning dialog requests confirmation.
6. If you want to delete the collection, click **Yes**.

   The collection is removed from the Workbench service.

Example Procedure: How to Restore a Collection for Reporting and Investigation

The following steps illustrate how to restore data for reporting and investigation purposes that is in offline storage or cold-tier storage. In the following example, data is restored for the time range beginning on 2015-April-01 through 2015-April-10.

To restore data for reporting and investigation purposes:

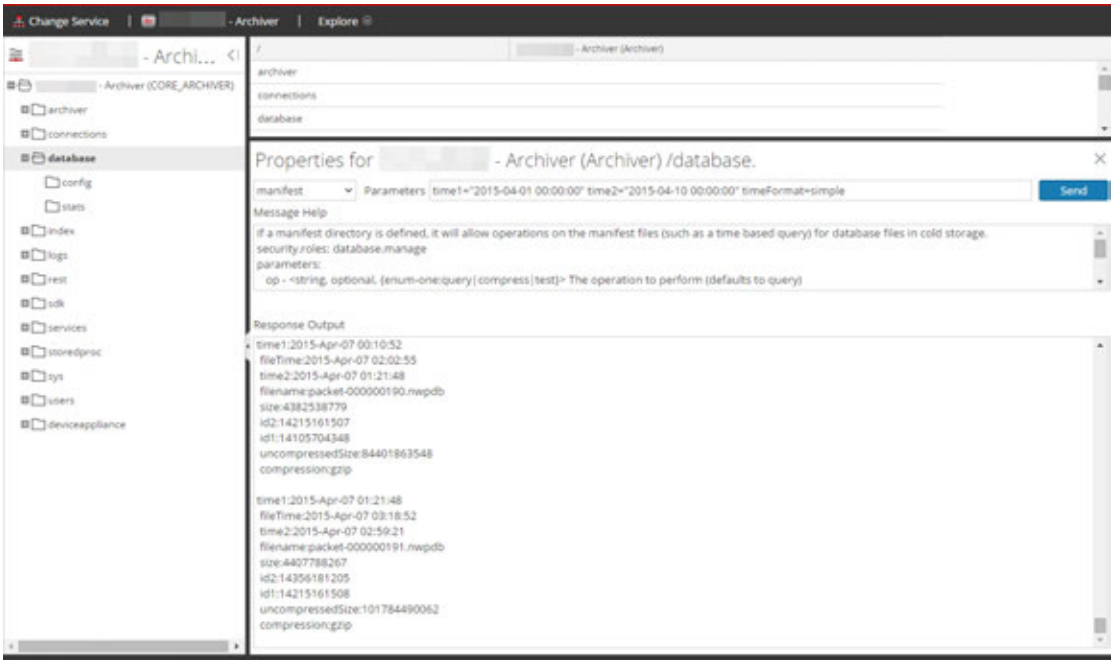
1. Go to **ADMIN > Services**.
2. Select the **Archiver**from the Services grid.
3. Navigate to the Explorer view of the Archiver appliance by selecting  **> View > Explore**.

   The Explorer view for Archiver is displayed
4. Right click on **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
5. Run the **manifest** command for the selected time range 2015-April-01 to 2015-April-10.

   The search returns all files that need to be restored for your selected query.

   Example Search:

   ```
   time1="2015-04-01 00:00:00" time2="2015-04-10 00:00:00"
   timeFormat=simple
   ```



6. Go to **ADMIN > Services**.
7. In the Services view, select a **Archiver**, then select  **> View > Config**.

   The Services Config view is displayed with the General tab open.
8. Select the **Collections tab.**
9. Create a restoration collection with the source path pointing to files listed in the manifest command output.

10. Save the collection.
    After successfully creating a collection, you can use this collection for reporting and investigation purposes.

Investigate a Collection

To perform an investigation on an Archiver collection:

1. Select **Investigate**.
   The Investigate dialog is displayed.
2. Click the **Collections** tab in the Investigate dialog.
3. Select an Archiver service in the left panel.
4. Select the collection you want to investigate in the right panel.
5. Click **Navigate**.

The Navigate view is displayed showing data pertaining to the Archiver collection that you selected.

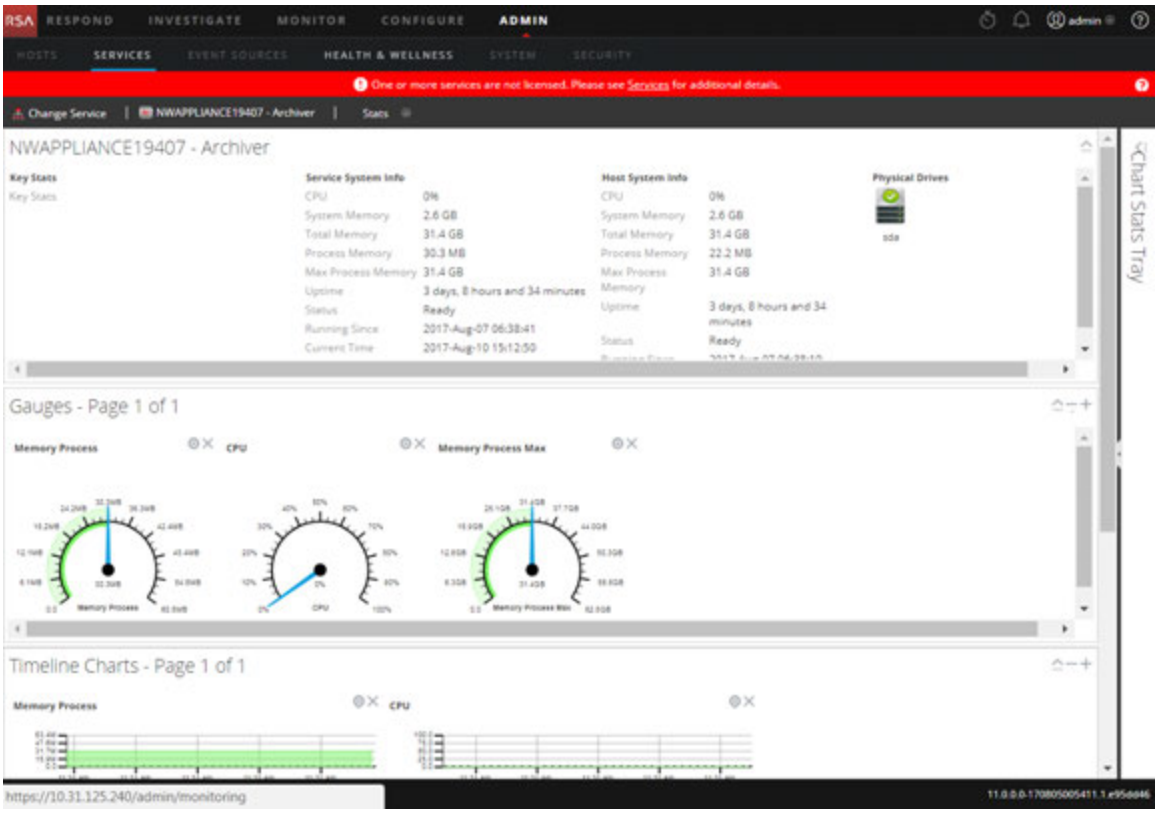
Note: For detailed information about using Investigation, see *Investigation and Malware Analysis*.

View Archiver Collection Statistics

The same statistics available for other services are provided for the Archiver service. The Services Stats view displays key statistics and system information that pertain to your selected Archiver service. The information is displayed in several different sections within the Stats view: Archiver, Gauges, Timeline Charts and Chart Stats Tray. The Chart Stats Tray lists all available statistics for the Archiver. Any statistic in the Chart Stats Tray can be displayed in a gouge or a timeline chart.

Perform the following steps to view Archiver statistics:

1. Go to **ADMIN > Services**.
2. In the Services view, select an Archiver, then select  **> View > Stats**.
   The Services Stats view is displayed.



Note: For more information about Archiver statistics, see the *Host and Services Getting Started Guide*.

View Archiver Logs

Perform the following steps to view logs on an Archiver service:

1. Go to **ADMIN > Services.**
2. In the Services view, select a **Archiver**, then select  **> View > Logs**.
   The Services Logs grid is displayed.

Note: For information about viewing and configuring audit logs, see the topic **Configure Global Audit Logging** in the *System Configuration Guide* .

Add Archiver Service as a Data Source to Broker

Adding the Archiver service as a data source to Broker is useful when you have more than one collection and you want a report on the archived data. To do this, you can add more than one collection as a downstream service to a Broker and then generate a report on it.

Prerequisites

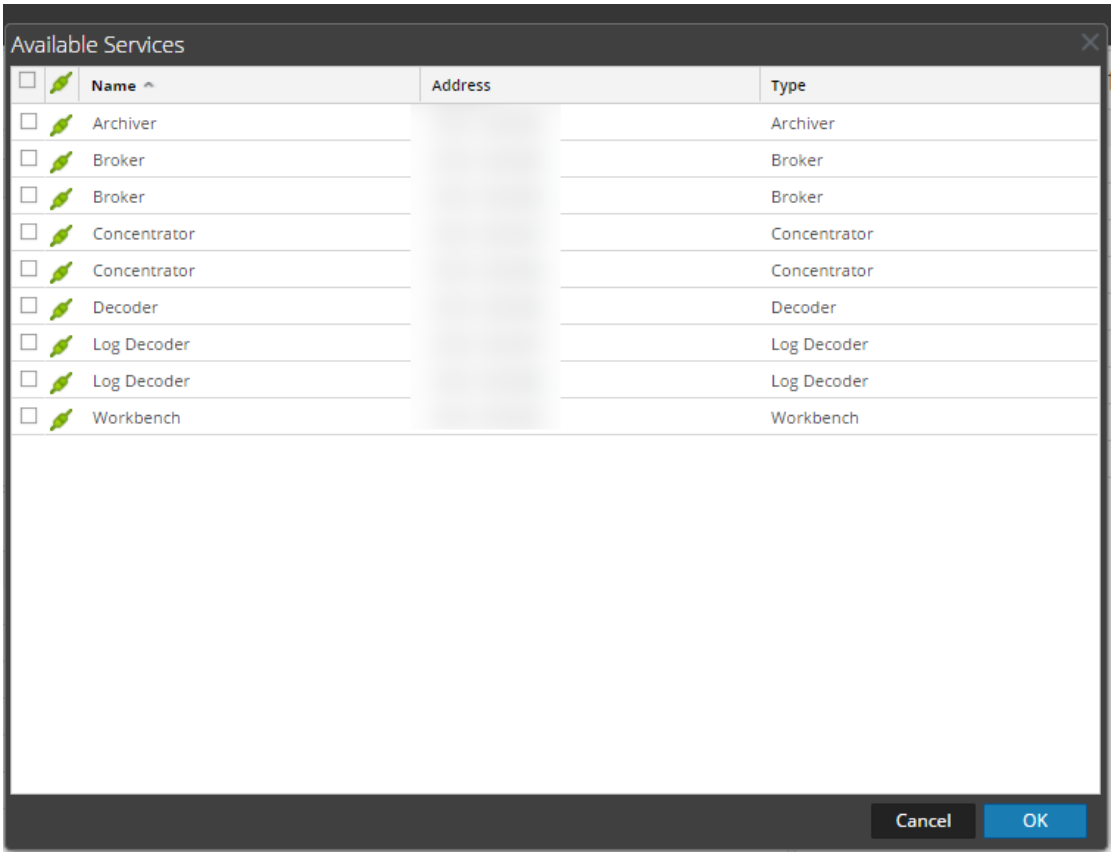
Ensure that you have:

- Installed the Archiver service on the Archiver host.
- Added a collection on the Archiver service.

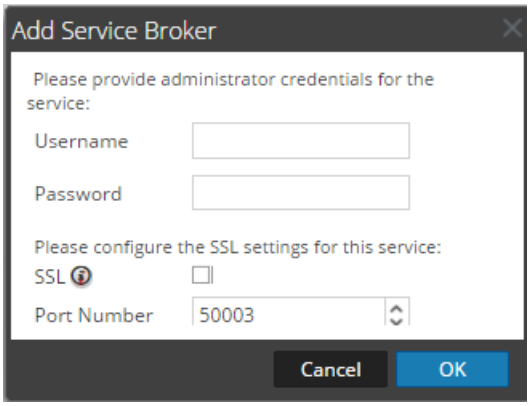
Procedure

To add an Archiver service as a data source on the Broker:

1. Select **ADMIN > Services**.
2. In the **Services** panel, select a Broker service.
3. In the **Actions** column, select > **View** > **Config**.
   The Config view is displayed with the General tab open.
4. In the **Aggregate Services** section, click +.
   The Available Services dialog is displayed.

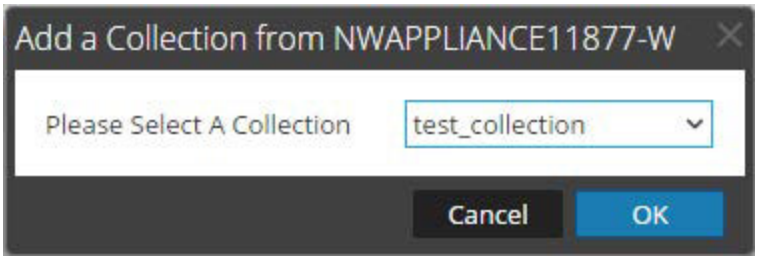


6. Select the Broker service and click **OK**.
7. If the Archiver service is using a Trust Model, a Service Information dialog for the selected service is displayed.



8. Type the username and password for admin credentials for the service.
9. Click **OK**.

   The Add Collection dialog is displayed.



10. Select a collection from the drop-down list and click **OK**.

    The Archiver service is now added as a data source to the Broker.

Note: This procedure has to be performed for each collection.

Retrieve Hash Information

Archiver provides a command, **hashInfo**, which you can use to retrieve the hash information for each session, meta, and packet database that meets the session list or date range criteria. The hash information retrieved is in the form of a list of string parameters, each string parameter corresponding to the hash information for a single database file. You can retrieve the hash information of the database files using the Archiver Service Explore view or REST interface of the Archiver service. The hash information thus retrieved is used to compare the database files in the original location and the exported location to validate data integrity.

The following table lists the criteria that you can use to retrieve the hash files from the database.

Criteria	Description
sessions	You can retrieve the hash information of the database files by specifying the sessions that exist or read from the session database to determine the associated meta and packet id required to determine which meta and packet database files are needed to retrieve the hash information. **For example:** sessions=100 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100. sessions=100,500000 - Retrieves the hash information of all database files that contain the constituent components(session, meta, content) of session 100 and 500000
beginDate	You can specify a begin date as a filter against the database files. This finds the hash information for the files created after the specified date. The begin date specified has to be in the format YYYY-MM-DD HH:MM:SS.
endDate	You can specify an end date as a filter against the database files. This finds the hash information for the files created before the specified date. The end date specified has to be in the format YYYY-MM-DD HH:MM:SS **For example:** beginDate: “2014-Mar-25 05:52:00” endDate=”2014-Mar-27 05:52:00” – Retrieves the hash information of all the database files in between March 25, 2014 and March 27, 2014 in the specified time range on those days.

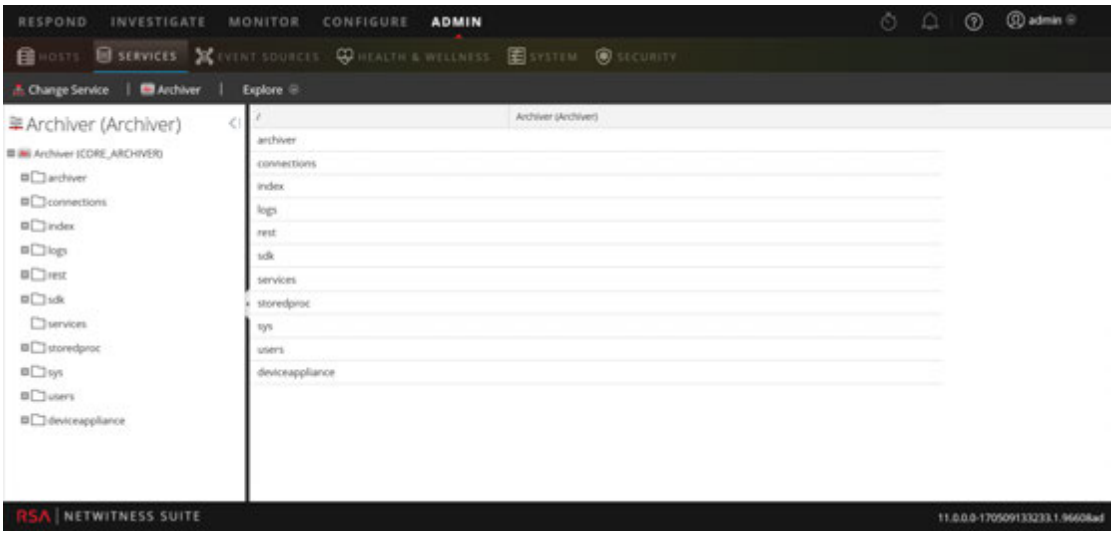
Criteria	Description
directories	By default, the hash information files are stored with the database files they were created for. You can also store the hash information file in different location by defining multiple locations in the hash.dir configuration parameter. You can define the location as a filter and retrieve the hash information files for the configured location. **For example:** directories="/home/hash" – Retrieves the hash information of the database files from the location /home/hash

Procedure

To retrieve hash information of the database files:

1. Select **ADMIN > Services**.
2. Select an Archiver service.
3. In the **Actions** column, select **View > Explore**.

   The Explore view of the Archiver service is displayed.



4. In the node tree, right-click on **archiver** and select **Properties**.

   The Properties dialog is displayed.

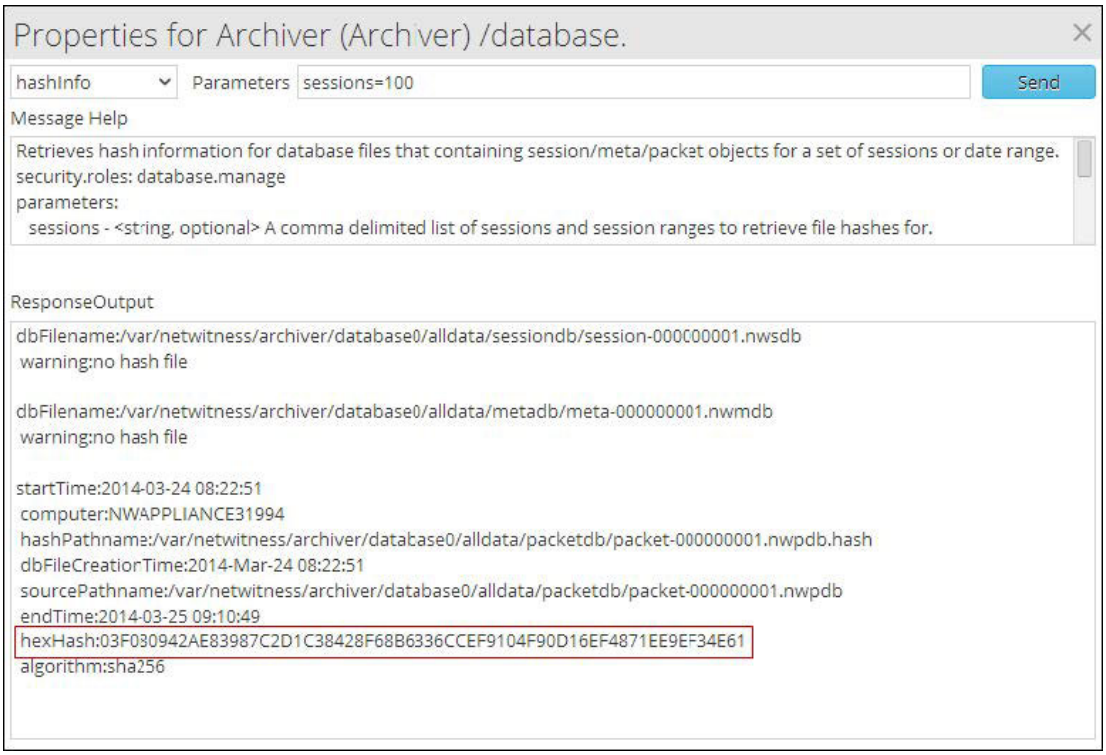
5. In the drop-down menu, select **hashInfo**.
6. In the **Parameters** field, type the criteria that you want to use to retrieve the hash information from the database.
7. Click **Send**.

   The output of the command is displayed in the ReponseOutput textbox. In the output, the hash information is shown in the hexHash parameter. You can use this hash information to verify data integrity manually.

Examples

Retrieve the hash information of the database files for the sessions that exist.
Criteria: sessions=100

Output

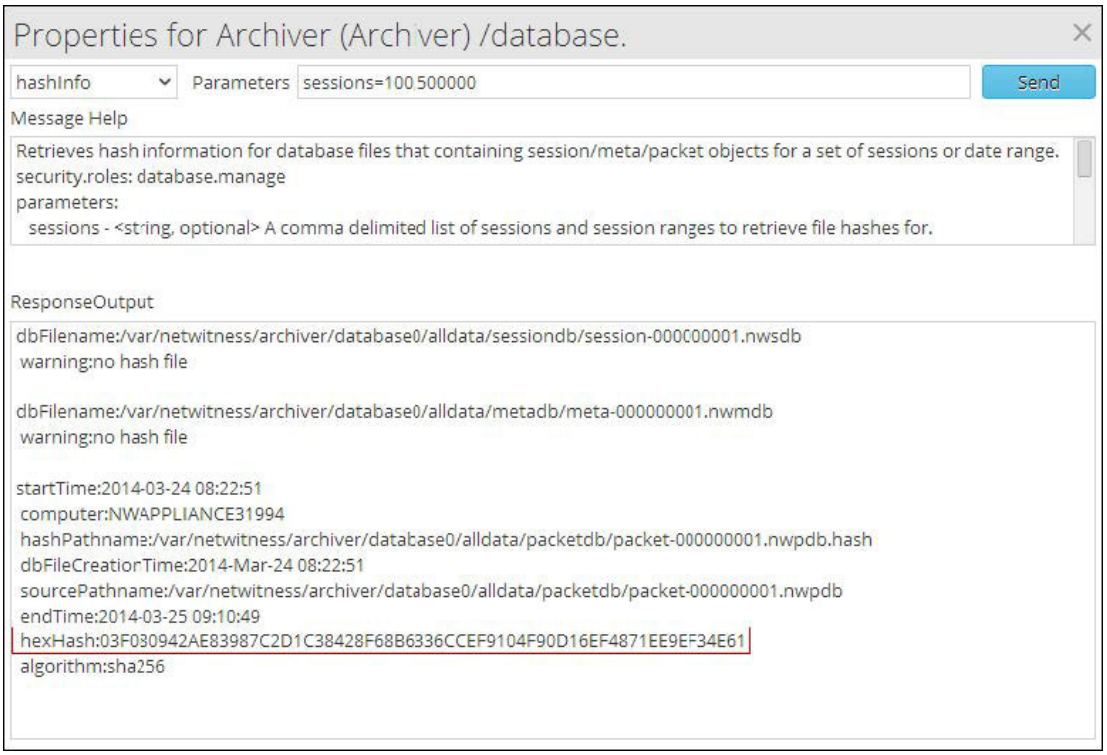


The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session 100.

Retrieve the hash information of the database files for the session ranges that exist.

Criteria: sessions=100,500000

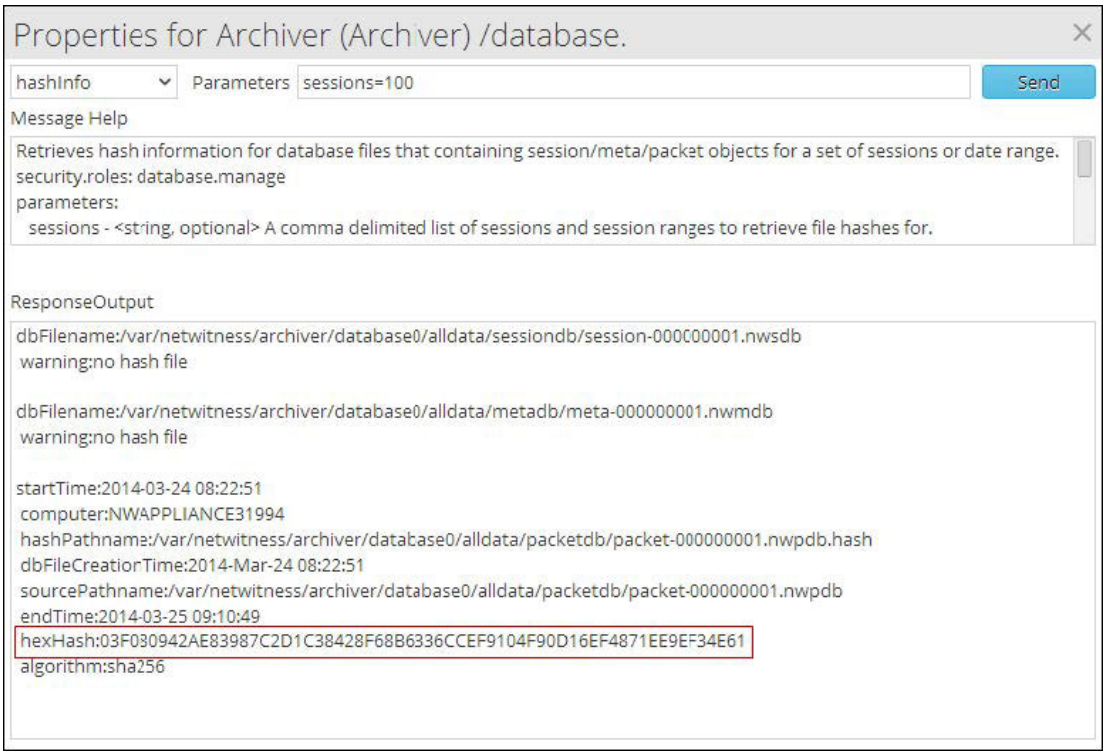
Output



The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for session range 100 - 500000

Retrieve the hash information of the database files created in the specified date range
Criteria: beginDate="2017-Mar-25 05:52:15" endDate="2017-Mar-27 05:52:15"

Output



The hash information shown in the hexHash parameter is retrieved and you can use this to verify data integrity manually for the date range specified.

This topic is a collection of references, which describe the user interface for Archiver in NetWitness Suite.

Topics

Archiver Collection Dialog

On the Administration > Services > Config view > Data Retention tab of an Archiver, Administrators can define the criteria for log retention and storage. In the Collection dialog, which is accessible from the Collections section, you can define individual storage collections to use for different log types. For example, you may want to create collections for compliance reasons or to selectively retain critical logs.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.

What do you want to do?

Role	I want to...	Show me how...
Administrator	Configure Archiver Collections	Configure Archiver Storage and Log Retention

Related Topics

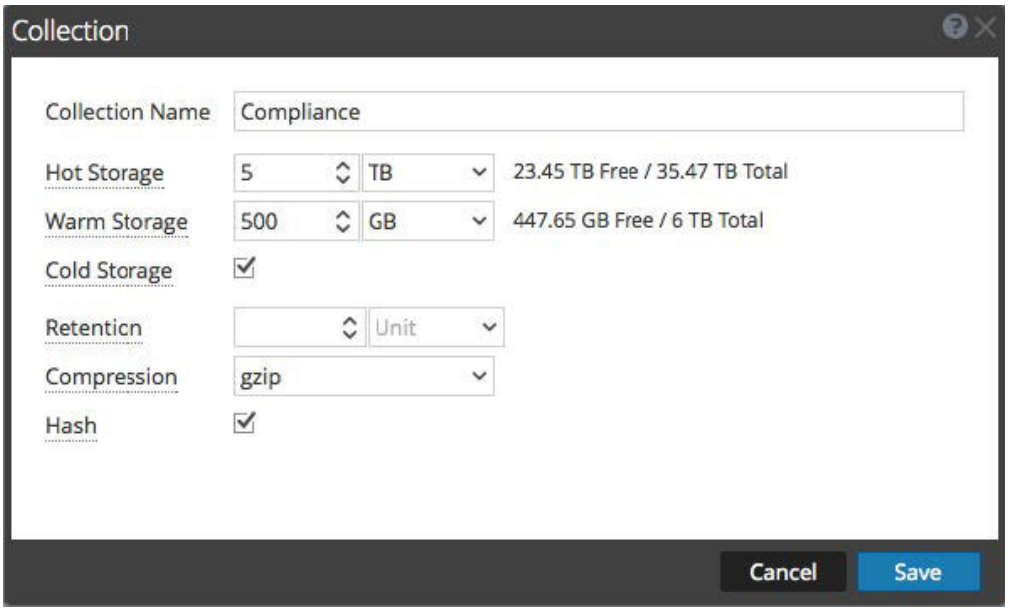
Configure Archiver Storage and Log Retention

Quick Look

To access the Collection dialog:

1. Go to ADMIN > Services.
2. Select an Archiver service and >  View > Config.
3. In the Services Config view for the service, click the Data Retention tab.
4. In the Collections section, click +.

   The Collection dialog is displayed.



Note: When decreasing collection storage allocations or lowering retention time, it may take several minutes to hours for the data to move and space to become available depending on the amount of moving (rolling) data. The default times are every 20 minutes for a size roll and every six hours for a time roll.

The following table describes the fields in the Collection Dialog.

Field	Description
Collection Name	Specify a name for your collection, such as Compliance, MediumValue, or LowValue.
Hot Storage	Specify the maximum size or percentage of hot storage to use for this collection. The free space available to use for hot storage and the total hot storage are shown next to this field. When the size of the logs reach the maximum hot storage size, the logs are removed or they roll to the next available storage tier (warm or cold).
Warm Storage	(Optional) Specify the maximum size or percentage of warm storage to use for this collection. The free space available to use for warm storage and the total warm storage are shown next to this field. When the size of the logs reach the maximum warm storage size, the logs are removed or they roll to available cold storage.

Field	Description
Cold Storage	(Optional) Specify whether to use cold storage for this collection. If you use cold storage for the collection, logs outside of the specified size and retention limits roll over to cold storage. If you do not use cold storage, logs outside of the specified size and retention limits are removed.
Retention	(Optional) Specify the number of days that logs are retained before they are removed or rolled over to cold storage. For Hot and Warm Storage, size and retention period settings for a collection can override each other based on which criterion (size or time) is satisfied first.
Compression	Specify the type of compression to use for meta and raw logs in the collection. You can compress the meta and raw logs using GZIP or LZMA to save space. GZIP is very fast at compressing and decompressing, but it does not compress as well as LZMA. LZMA offers better compression at a cost of decompression speed (roughly three times slower than GZIP). Compression ratios are highly dependent on your data. The default compression is GZIP.
Hash	Specify whether to enable or disable hash. When enabled, the hash algorithm is used to verify the data integrity of the files being saved.

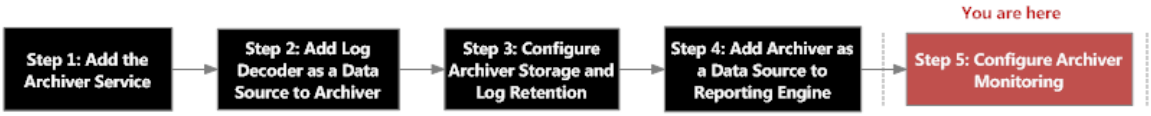
Archiver Services Config View - General Tab

The General tab for an Archiver in the Services Config view helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between an Archiver and the aggregate service.

To access the General tab, go to ADMIN > Services, select an Archiver service, then select View > Config.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.



Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Archivers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

What do you want to do?

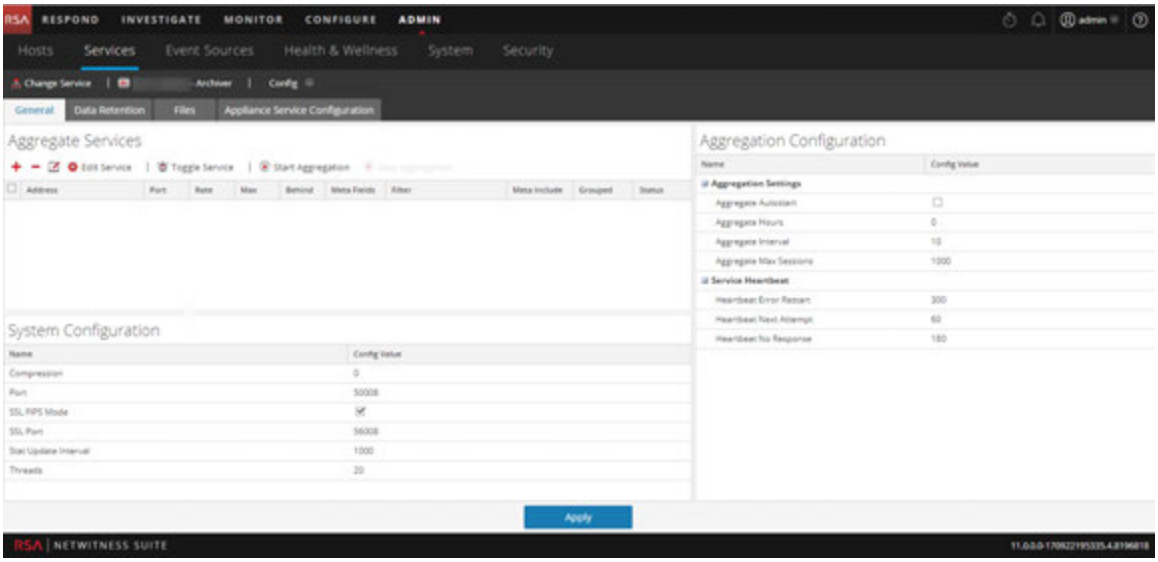
Role	I want to...	Show me how...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Aggregate Services Section
Administrator	Manage System Configuration	System Configuration Section

Related Topics

Configure Archiver Monitoring

Quick Look

This is an example of the General tab.



These are the three major sections in the General tab for Archivers:

- Aggregate Services
- System Configuration
- Aggregation Configuration

Aggregate Services Section

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service. This is an example of the Aggregate Services section for a Concentrator.

The Aggregate Services section toolbar offers these options.

Option	Description
+	Opens a dialog in which you can add a Concentrator, Decoder, or Log Decoder as an aggregate service.
−	Removes the selected aggregate service.
	Opens a dialog to edit **Meta Fields** and **Filter** values.

Option	Description
	When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service.
	When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.
	Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation.

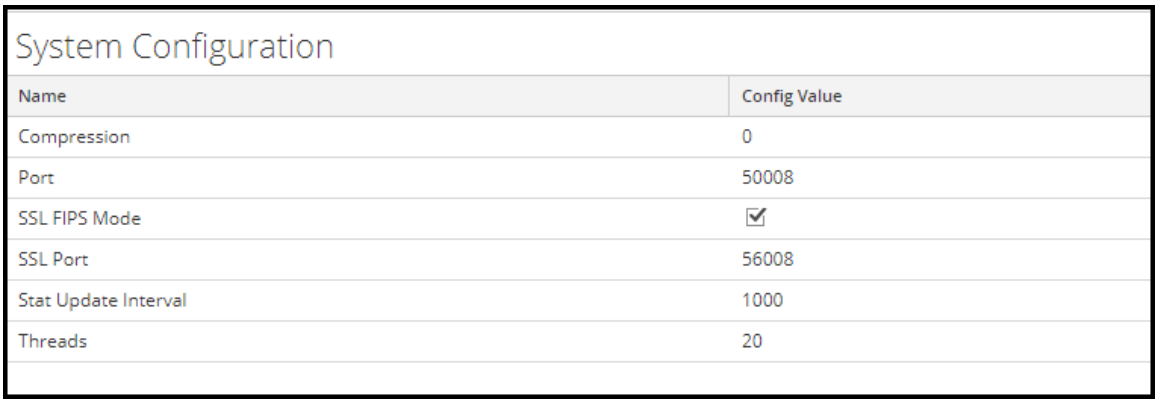
The Aggregate Services section list has these columns.

Column	Description
Address	Lists the address of the service.
Port	Lists the port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
Rate	Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**.

Column	Description
Max	Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture.
Behind	Lists the number of sessions on the service that need to be aggregated.
Collection	For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section.
Meta Fields	For Concentrators only, lists the types of metadata being consumed by the aggregate service.
Filter	For Concentrators only, lists any filter being applied to the metadata being consumed by the aggregate service.
Meta Include	For Concentrators only, lists the number of types of meta included in the aggregate service.
Grouped	Whether or not the aggregate service is part of a group.
Status	Lists the current status of the service: • online = available to provide data for consumption by the Broker or Concentrator • offline = not available to provide data for consumption by the Broker or Concentrator • consuming = providing data for consumption by the Broker or Concentrator

System Configuration Section

The System Configuration section manages service configuration for a service. When a service is first added, default values are in effect. You can edit these values to tune performance.



System Configuration

Name	Config Value
Compression	0
Port	50008
SSL FIPS Mode	☑
SSL Port	56008
Stat Update Interval	1000
Threads	20

The System Configuration section has these parameters.

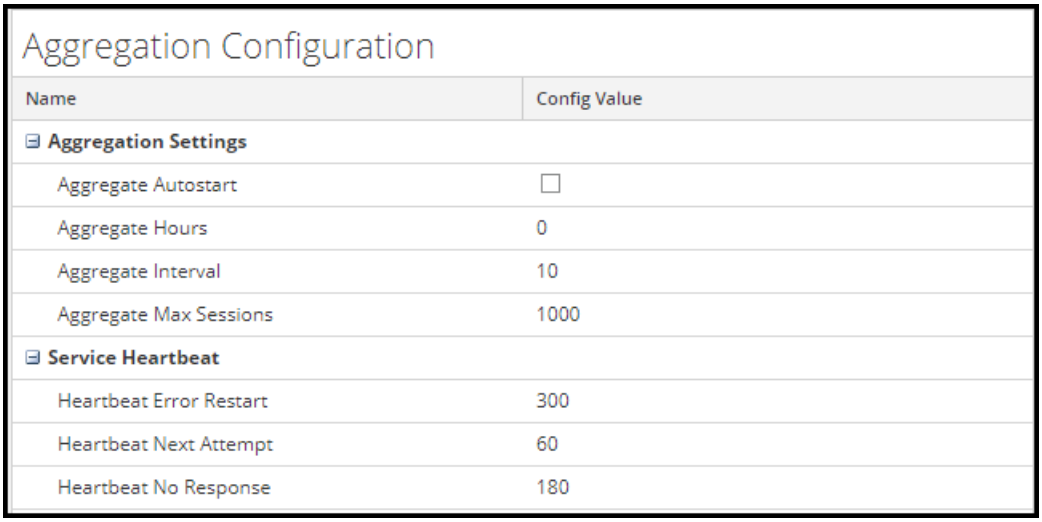
Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
Port	The port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
SSL FIPS Mode	When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
SSL Port	Indicates the SSL port.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.

Parameter	Description
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**. A change takes effect on service restart.

Aggregation Configuration Section

The Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

Caution: Do not edit any of these settings without guidance from Customer Support.

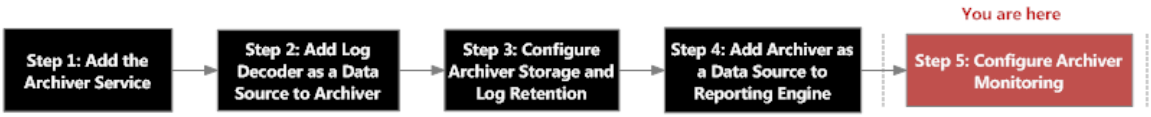


Archiver Service Configuration

This topic lists and describes the available configuration settings for RSA NetWitness Suite Archivers.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver



What do you want to do?

Data Retention Tab - Archiver

From the Admin > Services > Config view > Data Retention tab of an Archiver, Administrators can define the criteria for log retention and storage.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver. From the Data Retention Tab you can configure hot, warm, and cold storage along with configuring multiple storage collections for data retention.

What do you want to do?

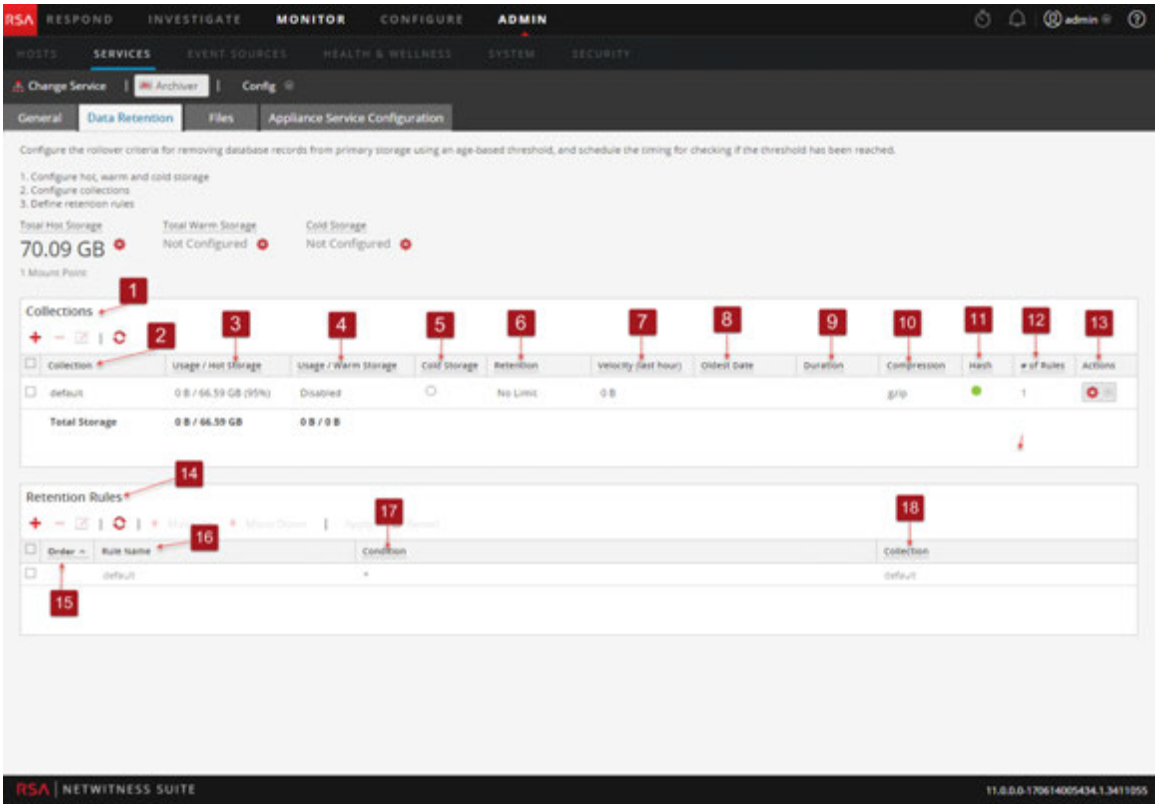
Role	I want to...	Show me how...
Administrator	Configure Total Hot Storage	Configure Hot, Warm, and Cold Storage
Administrator	Configure Total Warm Storage (Optional)	Configure Hot, Warm, and Cold Storage
Administrator	Configure Total Cold Storage (Optional)	Configure Hot, Warm, and Cold Storage
Administrator	Configure Collections	Configure Log Storage Collections
Administrator	Configure Retention Rules	Define Retention Rules

Related Topics

- Configure Hot, Warm, and Cold Storage
- Configure Archiver Storage and Log Retention
- Define Retention Rules

Quick Look

As an Administrator, you can configure hot, warm, and cold storage as well as multiple storage collections with different locations and criteria for retaining logs. For example, you can create a Compliance collection that stores logs for a specific time period as required by government regulations. You can create another collection that stores low value logs in hot storage with a much shorter retention period. The flexibility of these collections enables you to have significantly less overall storage requirements.



1	Displays the Collections panel with the Data Retention tab open.
2	Allows you to sort the collections in ascending or descending order.
3	Displays the allocated hot storage space for the collection, as well as the approximate current usage.
4	Displays the allocated warm storage space for the collection, as well as the approximate current usage.
5	Displays whether the collection uses cold storage for long-term backup.
6	Displays the time range used to determine when data is moved to cold storage or discarded.
7	Displays the amount of data written to the collection during the past hour.

8	Displays the date of the oldest data stored in the collection.
9	Displays the approximate age of the oldest data stored in the collection.
10	Displays the compression type used in collection storage.
11	Displays whether or not hashes are used when storing data in the collection.
12	Displays the number of retention rules that use this collection for storing data.
13	Displays the Actions drop-down menu.
14	Displays the Retention Rules panel.
15	Displays the order in which Retention Rules are evaluated in the execution chain.
16	Displays the name of the Retention Rule.
17	Data that satisfies this condition is stored in the corresponding collection.
18	Displays the collection used to store the data that satisfies this particular rule condition.

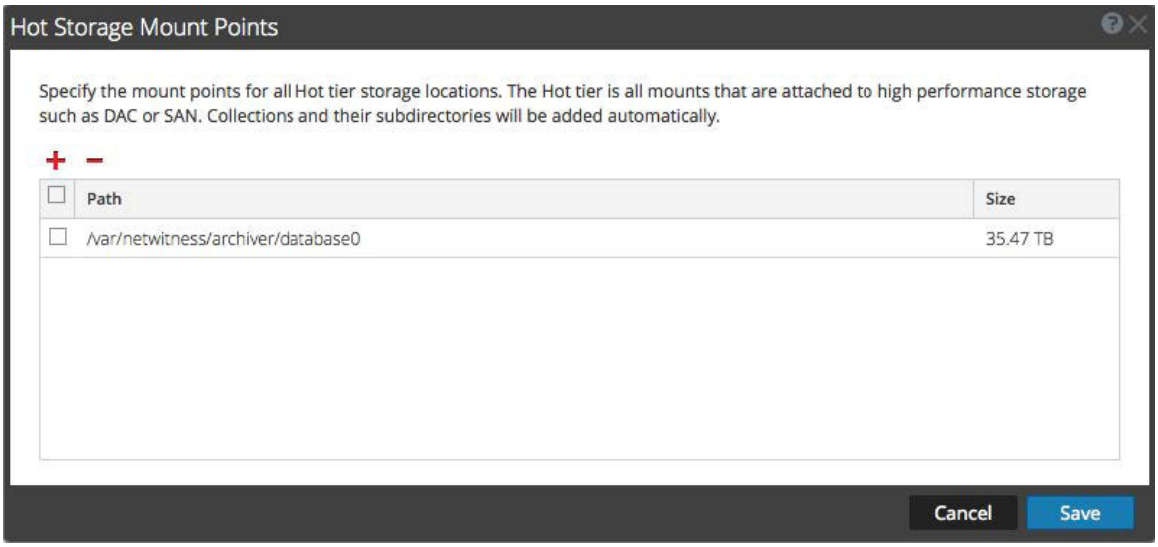
Total Hot, Warm, and Cold Storage

The Total Hot Storage section shows the total amount of Hot storage available and the number of hot storage mount points. The Total Hot Storage section shows the total amount of Warm storage available and the number of warm storage mount points. The Total Cold Storage section shows the total amount of Cold storage and the remaining free space available in Cold storage.

Hot, Warm, and Cold Storage Mount Points Dialogs

In the Hot, Warm, and Cold Storage Mount Points dialogs, you can specify the mount points for your storage locations. You can specify portions of this storage to use for your log storage collections.

To access the Hot, Warm, and Cold Storage Mount Points dialogs, click the  icon near the respective section.



Hot Storage Mount Points
Specify the mount points for all Hot tier storage locations. The Hot tier is all mounts that are attached to high performance storage such as DAC or SAN. Collections and their subdirectories will be added automatically.

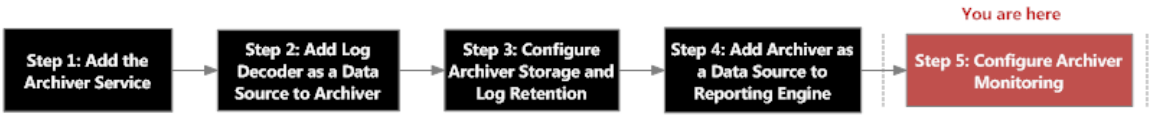
Services Config View - Archiver

The Services Config view (ADMIN > Services > select Archiver service and select >View > Config) provides a way to manage basic service configurations, configure aggregate services, configure log retention and storage, edit service configuration files, and configure the appliance service for an Archiver.

Workflow

This workflow illustrates the end-to-end installation and configuration process for an Archiver.



What do you want to do?

Role	I want to...	Show me how...
Administrator	*Add a Log Decoder as an aggregate service.	Click + in the Aggregate Services section.
Administrator	*Remove the selected aggregate service.	Click − in the Aggregate Services section.
Administrator	*Edit Meta Fields and Filter values of the aggregate service.	Click ✎ in the Aggregate Services section. You can specify the type of metadata that the Archiver consumes from this service. You can also specify a rule to filter data that the Archiver consumes from this service.

Role	I want to...	Show me how...
Administrator	*Communicate with the Archiver.	Click Edit Service in the Aggregate Services section. This enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Archiver.
Administrator	*Toggle the state of a service between offline and online.	Click Toggle Service in the Aggregate Services section.
Administrator	*Aggregate data using the rules defined for the service.	Click Start Aggregation in the Aggregate Services section. Note that it is necessary to start aggregate service after aggregation has been stopped.
Administrator	*Stop aggregation on the Archiver.	Click Stop Aggregation in the Aggregate Services section. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.

*You can perform this task in the current view.

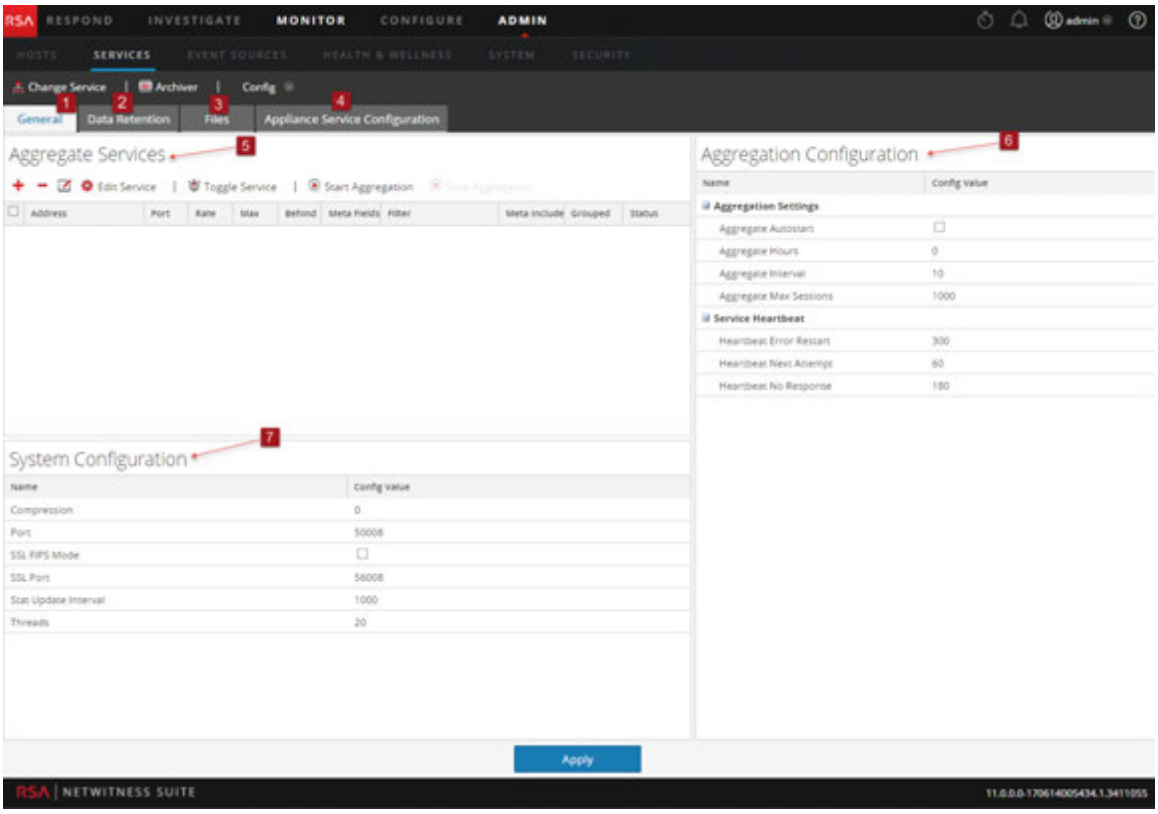
Quick Look

The Services Config view has four tabs and three panels.



1	General tab provides a way to manage basic Archiver service configuration.
2	Data Retention tab provides a way to view and edit collections and retention rules.
3	Files tab allows you to edit enables you to edit the service configuration files for the Archiver as text files
4	Appliance Service Configuration tab provides a way to configure an Archiver service.
5	Aggregate Services panel provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.
6	Aggregation Configuration panel provides configuration settings that affect various aspects of the aggregation process.
7	System Configuration panel provides a way to manage service configuration for an Archiver service.

General

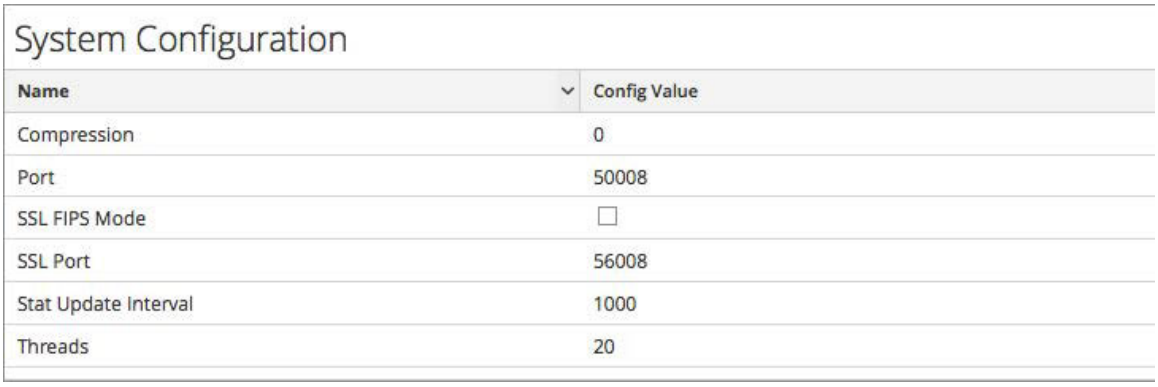
The General tab contains the following sections:

- Aggregate Services
- System Configuration
- Aggregation Configuration

Aggregate Services

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service.

System Configuration

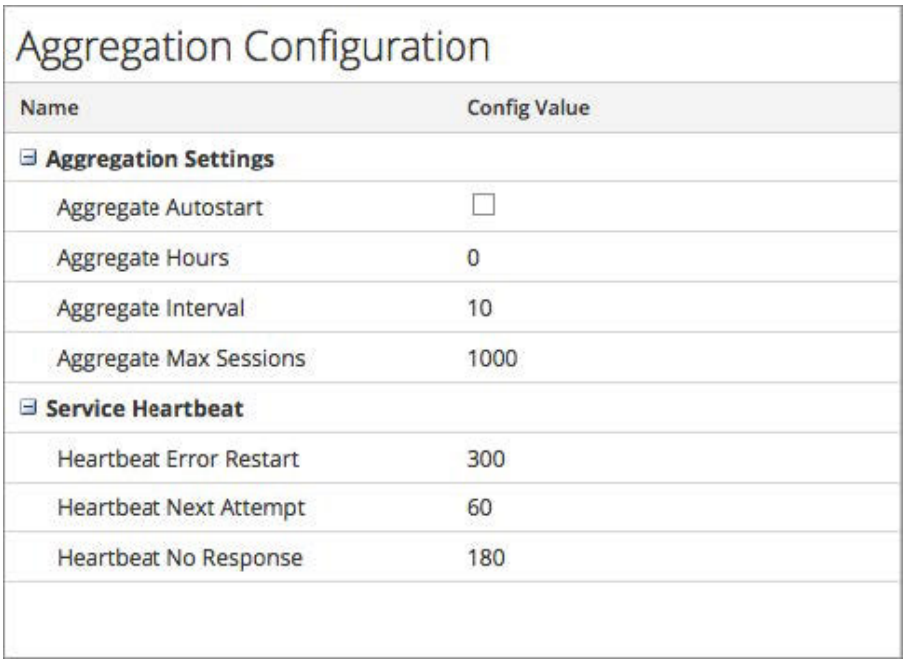


When you add an Archiver service, default values are in effect. RSA designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance. The following table describes the System Configuration parameters.

Task	Description
Compression	Determines the minimum amount of bytes before a message is compressed. If set to zero, messages are not compressed.

Task	Description
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL FIPS mode	If enabled, all the data transferred in the network will be encrypted using SSL.
SSL Port	Indicates the port used for encrypting using SSL.
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system.
Threads	Determines the number of threads in the thread pool to handle incoming requests.

Aggregation Configuration



The Aggregation Configuration section contains the following sections:

- Aggregation Settings
- Service Heartbeat

Aggregation Settings

The Aggregations Settings section has the following parameters.

Parameter	Description
Aggregate Autostart	If enabled, data aggregation will automatically restart after a service restart.
Aggregate Hours	Determines the maximum number of hours a service is allowed to start aggregation.
Aggregate Interval	Determines the minimum number of milliseconds before another round of aggregation is requested.
Aggregate Max Sessions	Determines the number of sessions to aggregate on each round.

Service Heartbeat

The Service Heartbeat section has the following parameters.

Parameters	Description
Heartbeat Error Restart	Determines the number of seconds to wait after a service error before attempting a service reconnect.
Heartbeat Next Attempt	Determines the number of seconds to wait before attempting a service reconnect.
Heartbeat No Response	Determines the number of seconds to wait before taking unresponsive service to offline.

Files

The **Files** tab in the Service Config view enables you to edit the service configuration files for the Archiver as text files. The files available to edit vary depending upon the type of service being configured.

The following files are common to all core services:

- Service index file
- NetWitness file
- Crash reporter file
- Scheduler file
- Feed definitions file

For more information on the **Files** tab, see the "Files Tab" topic in the *Host and Services Getting Started Guide*.

NetWitness Suite Automated Threat Detection

RSA NetWitness® Suite Automated Threat Detection uses preconfigured ESA Analytics modules to identify specific types of threats. An ESA Analytics module is a pipeline composed of activity objects that enrich an event with additional information through mathematical computations. ESA Analytics modules reside within ESA Analytics services. The ESA Analytics services use query-based aggregation (QBA) to collect filtered events for the modules from Concentrators. Only the data required by a module is transferred between the Concentrator and the ESA Analytics system.

There are two ESA services that can run on an ESA host:

- Event Stream Analysis (ESA Correlation rules)
- Event Stream Analytics Server (ESA Analytics)

The first service is the Event Stream Analysis service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live. The second service is the ESA Analytics service, which is used for Automated Threat Detection. Because the ESA Analytics service uses preconfigured modules for Automated Threat Detection, you do not have to create or download rules to use Automated Threat Detection.

NetWitness Suite Automated Threat Detection currently has two Suspicious Domain modules available, Command and Control (C2) for Packets and C2 for Logs.

Because each ESA Analytics module has different data requirements, be sure that all module-specific requirements are met before you deploy a module for Automated Threat Detection.

Automated Threat Detection for Suspicious Domains

The Suspicious Domains modules examine your HTTP traffic to detect domains likely to be malware Command and Control servers connecting to your environment. After NetWitness Suite Automated Threat Detection for Suspicious Domains examines your HTTP traffic, it generates scores based on various aspects of your traffic behavior (such as the frequency and regularity with which a given domain is contacted). If these scores reach a set threshold, an ESA alert is generated. This ESA alert is forwarded to the Respond view. The alert in the Respond view is enriched with data that helps you to interpret the scores to determine what mitigation steps to take.

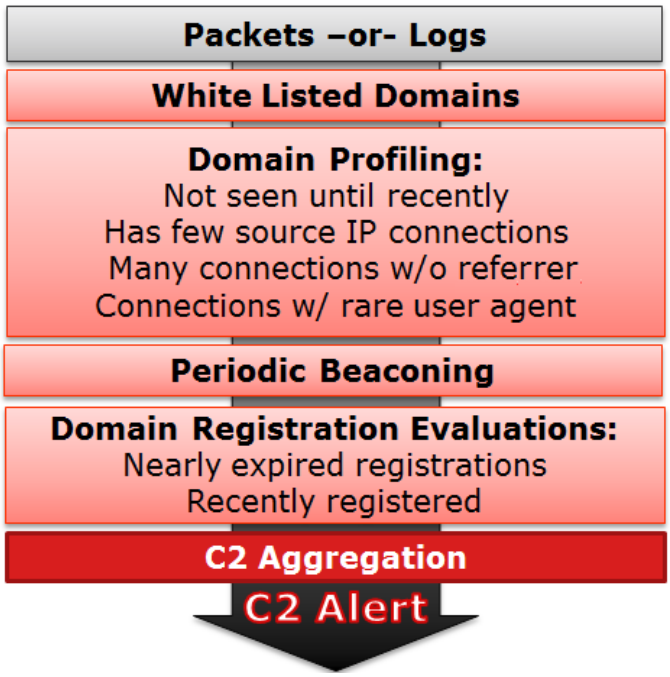
The Automated Threat Detection Suspicious Domain modules provide scoring to detect Command and Control communications. Command and Control communications occur when malware has compromised a system and is sending data back to a source. Often, Command and Control malware can be detected via beaconing behavior. Beaconing occurs when the malware regularly sends communications back to the Command and Control server to notify it that a machine has been compromised and the malware is awaiting further instructions. The ability to catch the malware at this stage of compromise can prevent any further harm from occurring to the compromised machine and is considered a critical stage in the "kill chain."

NetWitness Suite Automated Threat Detection solves several common problems that occur when searching for malware:

- **Ability to use algorithms rather than signatures**. Because many malware creators have begun using polymorphic or encrypted code segments, which are very difficult to create a signature for, this approach can sometimes miss malware. Because NetWitness Suite Automated Threat Detection uses a behavior-based algorithm, it is able to detect malware more quickly and effectively.
- **Ability to automate hunting**. Hunting through data manually is an effective but extremely time-consuming method of finding malware. Automating this process allows an analyst to use his or her time more effectively.
- **Ability to find an attack quickly**. Instead of batching and then analyzing the data, Automated Threat Detection analyzes data as it is ingested by NetWitness Suite, allowing for the attacks to be found in near real-time.

Suspicious Domains Module Workflow

NetWitness Suite Automated Threat Detection works much like a filtering system. It checks to see if certain behavior occurs (or certain conditions exist), and if that behavior or condition occurs, it moves to the next step in the process. This helps to make the system efficient, and frees up resources so that events that are determined to be non-threatening are not held in memory. The following diagram provides a simplified version of the Suspicious Domains module workflow.



1.) **Packets or logs are routed to the ESA**. The HTTP packets or logs are parsed by the Decoder or Log Decoder and sent to the ESA host.

2.) **Whitelist is checked**. If you created a whitelist through the Context Hub, ESA checks this list to rule out domains. If a domain in the event is whitelisted, the event is ignored.

3.) **The domain profile is checked**. Automated Threat Detection checks to see if the domain is newly seen (approximately three days), has few source IP connections, has many connections without a referer, or has connections with a rare user agent. If one or several of these conditions is true, the domain is next checked for periodic beaconing.

4.) **The domain is checked for periodic beaconing**. Beaconing occurs when the malware regularly sends communications back to the command and control server to notify it that a machine has been compromised and the malware is awaiting further instructions. If the site displays beaconing behavior, then the domain registration information is checked.

5.) **Domain registration information is checked**. The Whois service is used to see if the domain is recently registered or nearly expired. Domains that have a very short lifespan are often hallmarks of malware.

6.) **Command and Control (C2) aggregates scores**. Each of the above factors generates a separate score, which is weighted to indicate various levels of importance. The weighted scores determine if an alert should be generated. If an alert is generated, the aggregated alerts appear in the Respond view and can then be investigated further from there. Once the alerts begin to appear in the Respond view, they continue to aggregate under the associated incident. This makes it easier to sort through volumes of alerts that can be generated for a command and control incident.

Analysts can view the alerts in the Respond view.

Suspicious Domains Automated Threat Detection on Packets vs. Web Proxy Logs

RSA NetWitness Suite provides you with the ability to perform Automated Threat Detection for Suspicious Domains using either packets or web proxy logs. While packet data can be streamed directly off of the wire into the NetWitness Suite installation and analyzed directly, if you have the ability to use a web proxy in your installation it may be beneficial to use it. Because some installations use network translation or SSL encryption, the true source IP of an outgoing connection may be masked if you are observing it at the packet level. By using a web proxy you gain the benefit of its ability to accelerate and decrypt SSL traffic as well as its ability to track the true source IP addresses of traffic it monitors.

Both Suspicious Domains for Packets (C2 for Packets) and Suspicious Domains for Logs (C2 for Logs) should produce the same results. From a results point of view, there is no real advantage to using one over the other.

Configuring Automated Threat Detection for Suspicious Domains

This topic tells administrators and analysts how to configure a Suspicious Domains module for NetWitness Suite Automated Threat Detection. The Automated Threat Detection functionality enables you to analyze the data that resides on one or more Concentrators by using preconfigured ESA Analytics modules. For example, using a Suspicious Domains module, an ESA Analytics service can examine your HTTP traffic to determine the probability that malicious activity is occurring in your environment.

There are two types of preconfigured Suspicious Domains modules available in NetWitness Suite: Command and Control (C2) for Packets and C2 for Logs. The Suspicious Domains module defines a subset of events and the activities executed on those events for identifying suspicious C2 domains.

Before you deploy an ESA Analytics module for Automated Threat Detection, it is important to note that there are many potential installation configurations that may be installed on the ESA, including: ESA Analytics, ESA Correlation Rules, and the Context Hub. Each of these may take up resources, so it is important to consider sizing before deploying Automated Threat Detection on your ESA.

Prerequisites

- If you are using Packet data, you must have configured a Decoder for HTTP packet data, and you must have configured an HTTP Lua or Flex parser.
- If you are using web proxy log data, you must have configured the appropriate Log Decoder with the correct parser for your web proxy.
- If you are using web proxy log data, you must have updated to the latest log parsers. The following parsers are supported: Blue Coat Cache Flow (cacheflowelff), Cisco IronPort WSA (ciscoiportwsa), and Zscaler (zscalernss).
- If you are using web proxy log data, for best results you should configure all web proxies the same way (set to the same time zone, use the same collection method -syslog or batch, and if you use batch use the same batching cadence).
- A connection from the ESA host to the Whois service (same location as RSA Live cms:netwitness.com:443) must be opened on port 443. Verify with your System

Administrator that this is complete.

- To whitelist a domain, you need to enable the Context Hub service.

Important: Automated Threat Detection requires a "warm-up" period that acclimates the scoring algorithm to the traffic in your network. You should plan to configure Automated Threat Detection so that the warm-up period can run during normal traffic. For example, starting Automated Threat Detection on a Tuesday at 8:00 am in the timezone that contains the majority of your users allows the module to accurately analyze a day of normal traffic.

Configure Automated Threat Detection for Suspicious Domains

This procedure provides the steps needed to configure an ESA analytics Suspicious Domains module for Automated Threat Detection. ESA analytics modules, such as Suspicious Domains, are considered preconfigured because you do not have to manually create ESA rules for them.

The basic steps required are:

1. **Configure Log settings (for Logs only)**. Before you can use Automated Threat Detection for Logs, you must configure several settings. Skip this step if you plan to use Automated Threat Detection for Packets.
2. **Create a whitelist (optional) using the Context Hub service**. Creating a whitelist allows you to ensure that commonly accessed websites are excluded from any Automated Threat Detection scoring.
3. **Configure the Whois Lookup service**. The Whois service enables you to get accurate data about domains that you connect to. In order to ensure effective scoring, it is important that you configure the Whois Lookup service. Verify that the Whois Service is reachable from your environment.
4. **Map data sources to ESA Analytics modules**. You define how NetWitness Suite Automated Threat Detection should automatically detect advanced threats by mapping a preconfigured ESA analytics module to multiple data sources, such as Concentrators, and an ESA analytics service.
5. **Verify the C2 incident rule is enabled and monitor for activity**. After mapping your Suspicous Domains module, a period of time is required for the scoring algorithm to warm-up. After the warm-up period, verify that the C2 rule is enabled in the Incident Rules and monitor to see if the rule is triggered.
6. **Verify that the incident rules are configured correctly**. When you view incidents in the Respond view, it is helpful if the incidents are grouped by Suspected C&C.

Step 1: (For Logs Only) Configure Log Settings

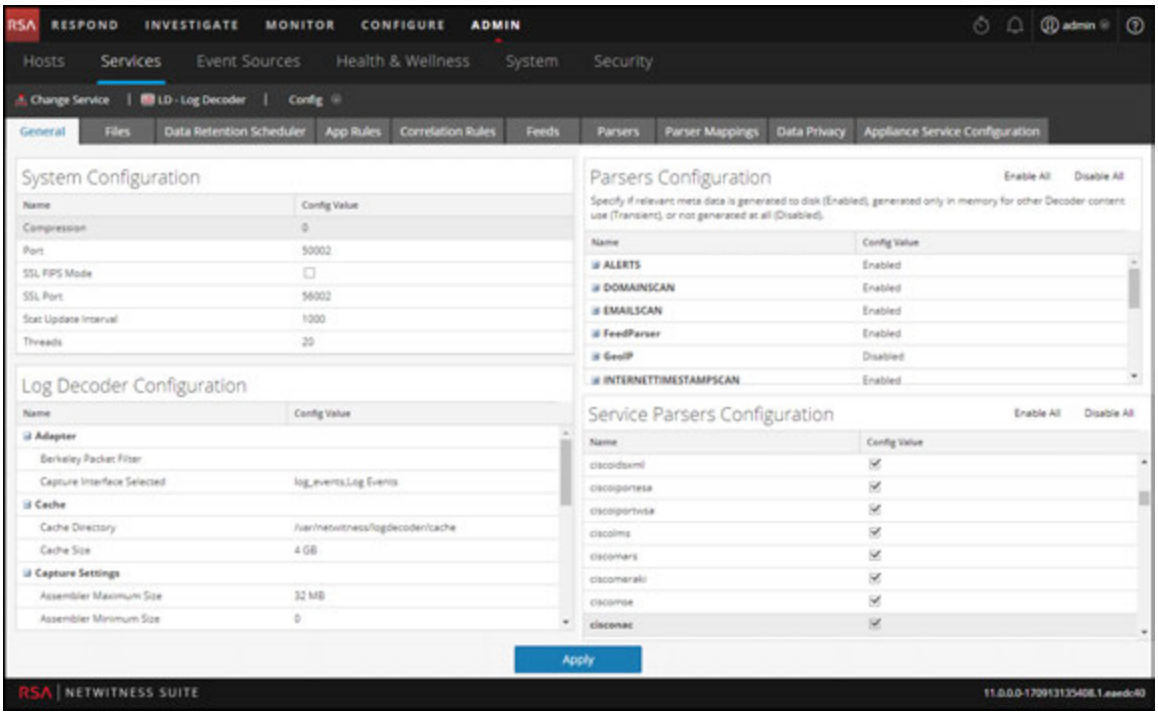
To configure Automated Threat Detection for Logs, you need to complete a few extra configuration steps:

- Verify that the supported parsers are enabled for your Log Decoder.
- Get the latest versions of the appropriate web proxy parser from RSA Live.
- Update the mapping on the Envision config file. This file is required to update the Log Decoder to work with the new meta available via the parsers.
- Verify that the table-map.xml file was updated correctly.
- Verify that the indexes were updated correctly.

To verify your parsers are running on your Log Decoder:

1. Go to **ADMIN** > **Services**.
2. Select your Log Decoder and select  **> View > Config**.

   The Service Parsers Configuration section shows a list of enabled parsers.
3. Verify that the appropriate web proxy parser is enabled.

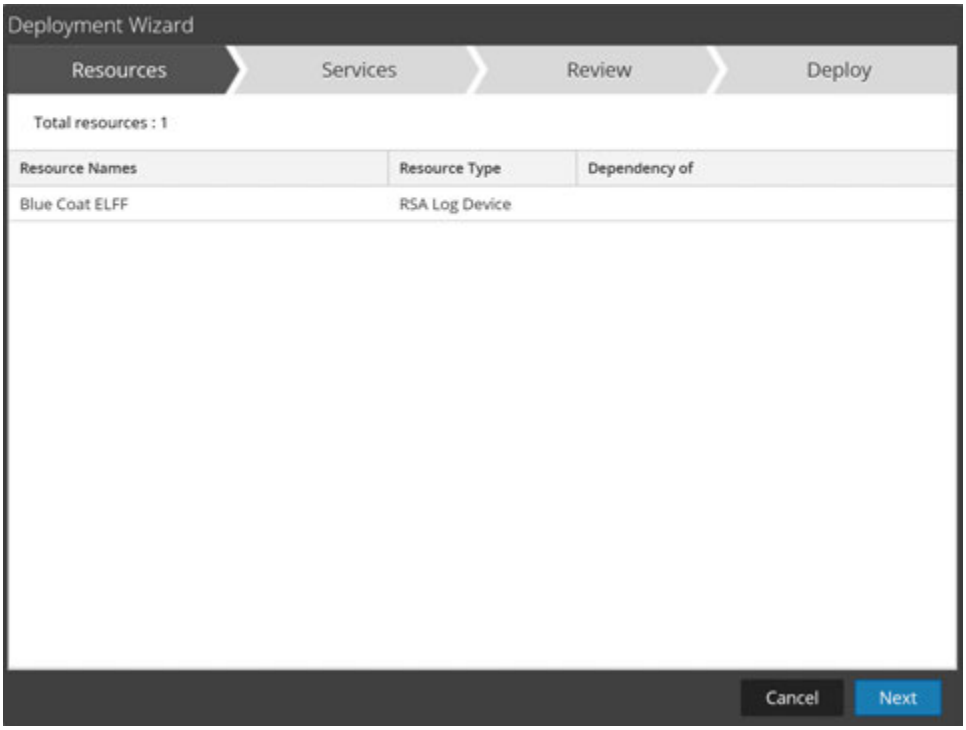


To get the latest parsers from RSA Live:

1. Go to **CONFIGURE** > **Live Content**.
2. Enter a search term for one of the supported web proxy parsers.
3. Select the appropriate web proxy parser [for example, the Blue Coat ELFF (cacheflowelff) parser].

   Note: You should have taken steps to configure logging to occur on your web proxy parser correctly.

4. Click **Deploy**.
   The Deployment Wizard opens.

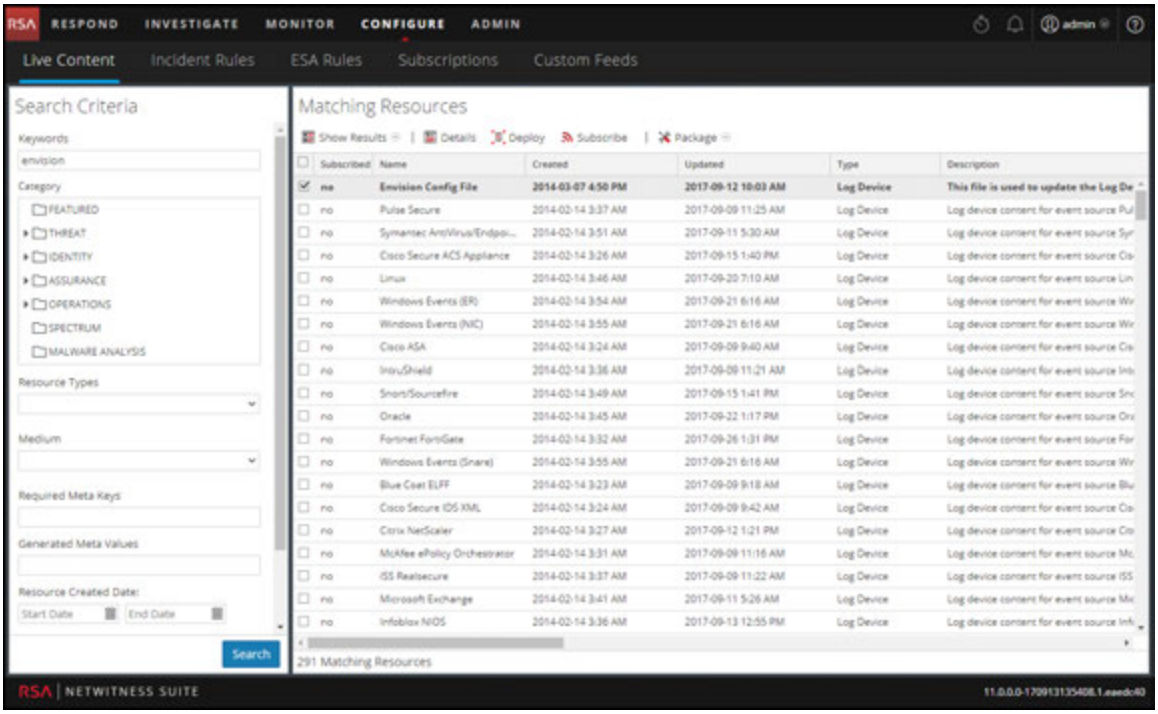


5. Under **Services**, select the Log Decoder as the Service.
6. Click **Deploy** to deploy the parser to your Log Decoder.

To Get the Latest Envision Config File:

1. Go to **CONFIGURE** > **Live Content**.
2. Enter **envision** as the key word for the search.

3. Select the latest Envision Config file, and click **Deploy**.



4. In the Deployment Wizard, under **Services**, select your Log Decoder.
5. Click **Deploy** to deploy the Envision configuration file to the Log Decoder.

To Verify the Envision Configuration File was Updated Correctly:

1. Go to **ADMIN > Services**, select the Log Decoder, and then select > **View > Config > Files** tab.
   You can see the **table-map.xml** file. This file is modified when you update the Envision Configuration file.
2. Search for the term, *event.time*. The field should now read, *"event.time" flags ="None"*. This means that the event.time meta is now included in the mapping. Similarly, the fqdn flag should be set to "None".

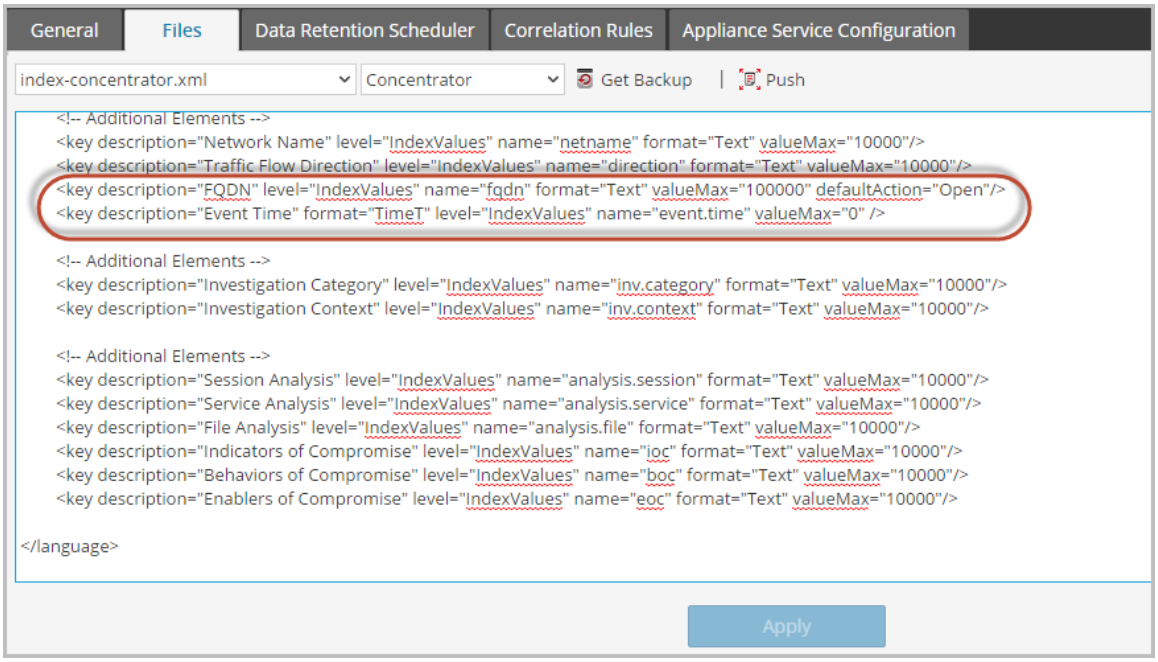
To Verify the Indices for the index-concentrator.xml File are Updated:

You will need to verify that the **index-concentrator.xml** file includes both the event.time and fqdn meta.

1. Go to **ADMIN** > **Services**, select your Concentrator, and then select > **View** > **Config**.
2. On the Files tab, search for the **index-concentrator.xml** file.

3. Verify that the following entry exists in your index-concentrator.xml file. If not, you will need to ensure your Concentrator is upgraded to the correct version:

```
<key description="FQDN" level="IndexValues" name="fqdn" format="Text"
valueMax="100000" defaultAction="Open"/><key description="Event Time"
format="TimeT" level="IndexValues" name="event.time" valueMax="0" />
```



Step 2: Create a Domains Whitelist (Optional)

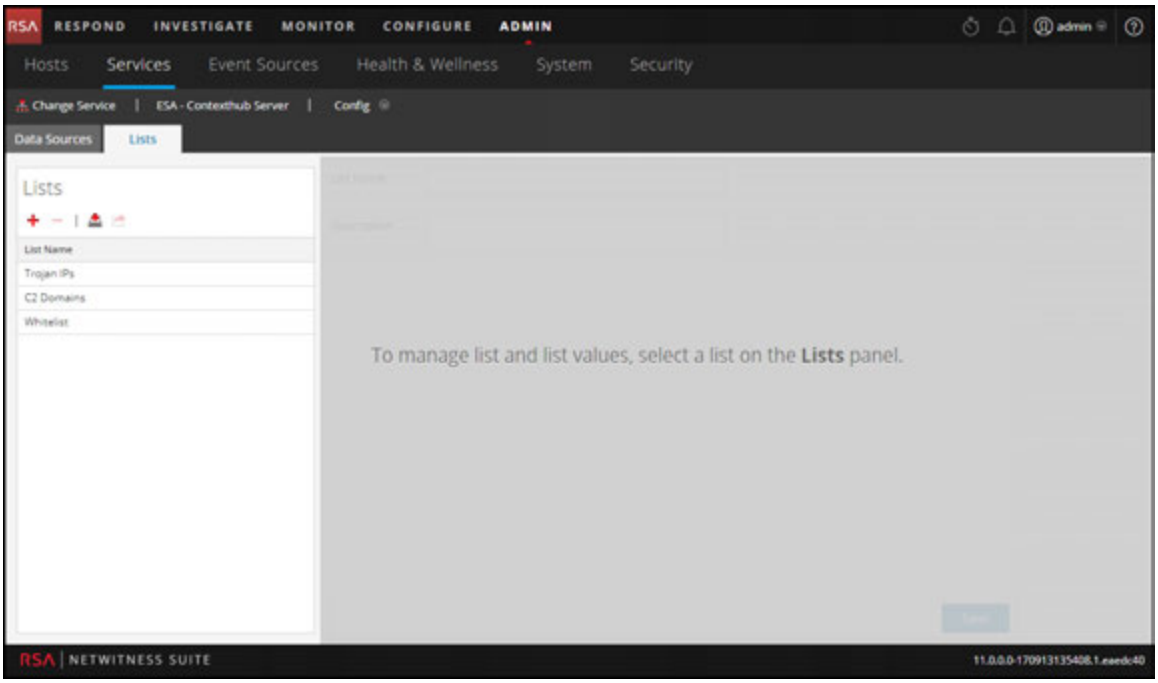
This procedure is used when working with Automated Threat Detection to ensure that certain domains do not trigger a threat score. Sometimes, a domain you access regularly may trigger an Automated Threat Detection score. For example, a weather service might have similar beaconing behavior as a Command and Control communication and trigger an unwarranted negative score. When this happens, it is called a false positive. To prevent triggering a false positive with a specific domain, you can add the domain to a whitelist. Most domains do not need to be whitelisted because the solution only alerts on very suspect behaviors. The domains you may want to whitelist are valid automated services that do not have many host connections.

Note: For migrations from 10.6.x, if your previous Automated Threat Detection whitelist (Whitelisted Domains) appears on the Lists tab, you can rename it to **domains_whitelist** to use it for the Suspicious Domains modules.

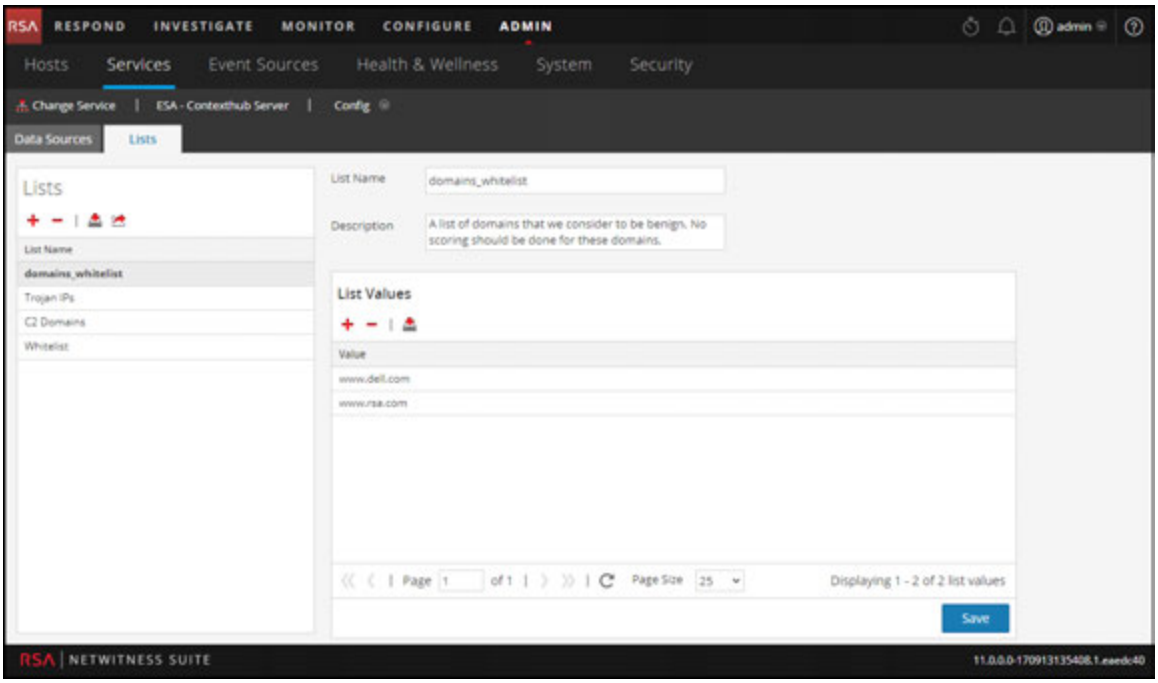
1. Create a whitelist for domains in Context Hub named **`domains_whitelist:`**

   a. Go to **ADMIN > Services**, select the Context Hub Server service, and then select **View > Config > Lists** tab.

   The Lists tab shows the current lists in the Context Hub.



b. In the Lists panel, click + to add a list. In the **List Name** field, type **`domains_whitelist`**. You must use this name in order for the module to recognize it.



2. Manually add domains to the list or import a .CSV file containing a list of domains.
   You can enter full domains, or you can use a wild card to include all sub-domains for a given domain. For example, you can enter *.gov to whitelist all government IP addresses.
   However, you cannot use other regex functions, such as [a-z]*.gov. This is because using

*.gov replaces an entire string, such as www.irs.gov.

a. To add domains manually, in the **List Values** section, click + to add domains.

b. To remove a domain, select the domain and click − .

c. To import a .CSV file, in the **List Values** section, click  , and in the **Import List Values** dialog, navigate to the .CSV file. Choose from the following delimiters: Comma, LF (Line Feed), and CR (Carriage Return) depending on how you have separated the values in your file. Click **Upload**.

3. Click **Save**.
   The **domains_whitelist** appears in the Lists panel. Analysts can add to this list from the Respond view and other parts of Investigation. The *Context Hub Configuration Guide* provides additional information.

Step 3: Configure the Whois Lookup Service

See the "Configure Whois Lookup Service" topic in the *ESA Confguration Guide*.

Step 4: Map Data Sources to ESA Analytics Modules

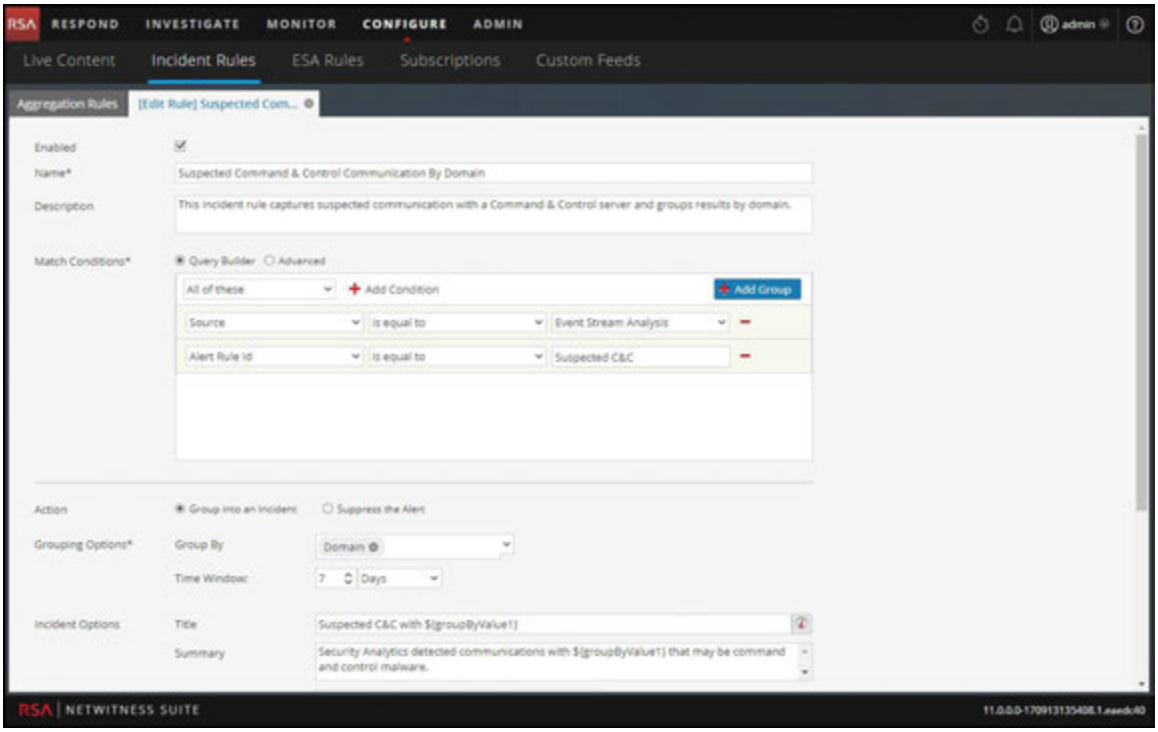
See the "Mapping ESA Data Sources to Analytics Modules" topic in the *ESA Confguration Guide*.

Step 5: Verify the Suspected Command & Control By Domain Rule is Enabled and Monitor the Rule

Verify the Suspected Command & Command Control by Domain rule in the Incident Rules.

1. Go to **CONFIGURE** > **Incident Rules** > **Aggregation Rules**.

2. Select the **Suspected Command & Control Communication by Domain** Rule, and double-click to open it.



3. Verify that **Enabled** is selected.

The Rule displays a green Enabled button when it is enabled.

Result

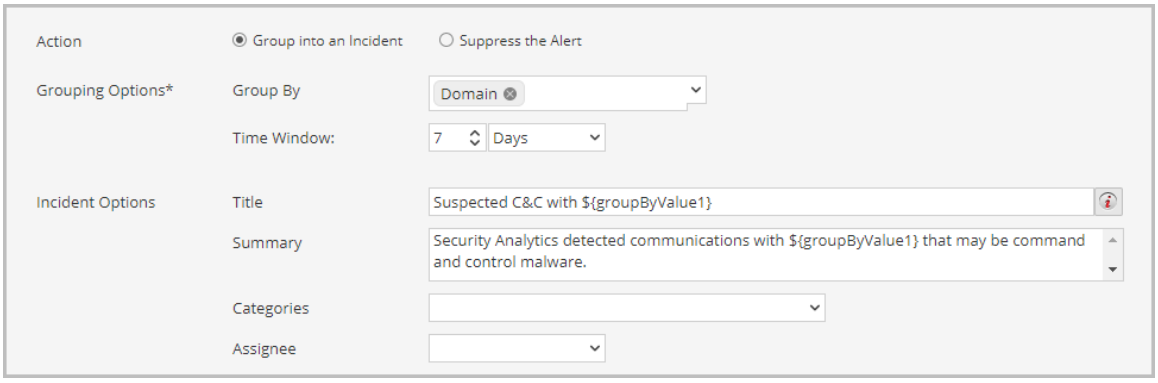
After you deploy the ESA Analytics Suspicious Domains module mapping for Automated Threat Detection, your ESA will begin to perform analytics on the HTTP traffic. You can view detailed information for each incident in the Respond view.

Step 6: Verify the Incident is grouped by Suspected C&C

In order to group incidents correctly the Respond view, set the Group By condition to Domain.

1. Go to **CONFIGURE** > **Incident Rules** > **Aggregation Rules**.
2. Select the **Suspected Command & Control Communication by Domain** rule, and double-click to open it.

3. Verify that the **Group By** field is set to *Domain*.



This will aggregate alerts and incidents will be created for "Suspected C&C".

Next Steps

Monitor the Respond view to see if the rule is triggered. The *NetWitness Respond User Guide* provides additional information.

Troubleshooting NetWitness Suite Automated Threat Detection

NetWitness Suite Automated Threat Detection is an analytics engine that examines your HTTP data. It also makes use of other components, such as the Whois and Context Hub services, which can add complexity to your installation. This topic provides suggestions to help you find issues if your Automated Threat Detection deployment does not provide the results that you expect.

Possible Issues

Problem	Possible Causes	Solutions
I'm seeing too many alerts (false positives).	Several	One possible cause is that the Whois Lookup service is failing or is not configured. The Whois lookup is helpful in determining whether a URL is valid, and if the connection fails or is not properly configured, it can result in false positives. See the "Configure Whois Lookup Service" topic in the *ESA Confguration Guide*.
		You may need to whitelist URLs. Sometimes the legitimate behavior for a URL triggers an alert. One way to prevent this from occurring is to add the URL to the whitelist. See the "Add an Entity to a Whitelist" topic in the *NetWitness Respond User Guide*.
I'm not seeing any alerts.	The ESA host requires a "warm-up" period when you deploy an ESA Analytics Module Mapping for Automated Threat Detection.	When you deploy an ESA analytics module mapping for Automated Threat Detection, there is a "warm-up" period, during which no alerts are viewable. Each module type has a default warm-up period and you need to wait until the warm-up period is complete. For more information, see the "Mapping ESA Data Sources to Analytics Modules" topic in the *ESA Configuration Guide*.

Problem	Possible Causes	Solutions
I'm seeing performance issues (more resource usage or a drop in throughput).	Several	If you are having performance issues on an ESA host that is running both Automated Threat Detection (ESA Analytics) and ESA rules, follow the troubleshooting steps for rules. For these troubleshooting steps, go to "Troubleshoot ESA" in the *Alerting Using ESA Guide*.

Broker and Concentrator Basics

Concentrators and Brokers aggregate data captured or aggregated by other services unlike Decoders, which capture data,

NetWitness Suite supports the Broker and Concentrator services:

- Brokers - aggregate data across entire infrastructure from configured Concentrators. You can have multiple concentrators aggregating into one broker. You can also have multiple brokers aggregating into a single broker.
- Concentrators - aggregates and analyzes data across multiple capture locations from Decoders. Indexes and directs queries.

You can configure various Brokers and Concentrators together under a Broker. Brokers are able to pull in data quickly from the Concentrators because they acquire index information only. This configuration is done using the NetWitness Suite user interface. Most of the configuration is performed in the Administration Services view (Admin > Services).

You can also configure the aggregate services and perform the whole aggregation process using the Services view. This helps setup Aggregation autostart, Timing and performance parameters, maximum number of open meta and session files. In addition to this, you can also time the attempts to restart, reconnect, or take offline a non-responsive aggregate service. Configuring Aggregate services includes managing Concentrators and Decoders as aggregate services. You can also limit the data being consumed from an aggregate service using meta fields and filters. The aggregation tasks are performed in the General tab of Administration Services view (Admin > Services)

Step 1. Verify Service System Configuration

When a service is first added to NetWitness Suite, default values for the system configuration parameters are in effect. You can edit these values to tune performance.

In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

To edit system configuration parameters for a Broker or Concentrator:

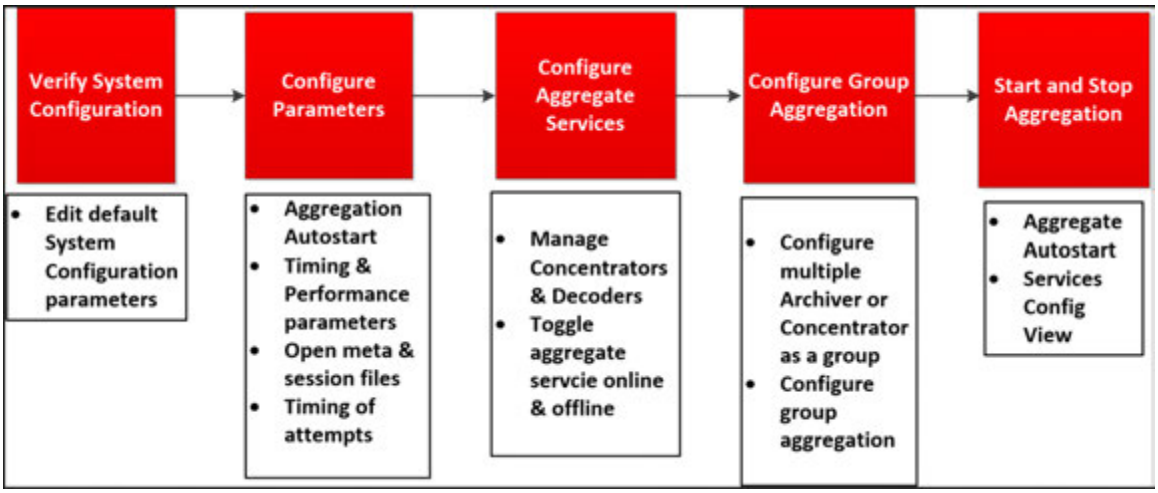
1. In the **main menu**, select ADMIN **> Services**.
2. In the **Services** view, select a Broker or Concentrator, and in the Actions column, select **> View > Config**.
   The Services Config view for the selected service is displayed.

3. Under System Configuration, click a field that you want to edit, and type a new value.
4. When finished editing, click Apply.

Broker and Concentrator Configuration

Setting up a Broker or Concentrator involves configuring the basic system parameters, the aggregate services, and the aggregation process between a Broker or Concentrator and the aggregate services.

These are the required configuration steps for a new Broker or Concentrator, and also for changing the configuration of an existing Broker. Perform the steps in the section in the sequence they are given.



Basic Configuration Checklist

The following checklist provides the sequence for tasks that are required to configure a Broker or Concentrator that has been added to NetWitness Suite in accordance with the *Hosts and Services Guide*.

Configuration Step	Description
Step 1 - Verify System Configuration	Verify system configuration default values for the host and service are appropriate as described in Step 1. Verify Service System Configuration
Step 2 - Configure Parameters	Configure parameters that govern the overall aggregation process as described in Step 2. Configure the Aggregation Process

Configuration Step	Description
Step 3 - Configure Aggregate Services	Configure aggregate services as described in Step 3. Configure Aggregate Services
Step 4 - Configure Group Aggregation	(Optional) Configure group aggregation as described in Step 4. (Optional) Configuring Group Aggregation
Step 5 - Start and Stop Aggregation	Start and stop aggregation as described in Step 5. Start and Stop Aggregation

Step 1. Verify Service System Configuration

When a service is first added to NetWitness Suite, default values for the system configuration parameters are in effect. You can edit these values to tune performance.

In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance.

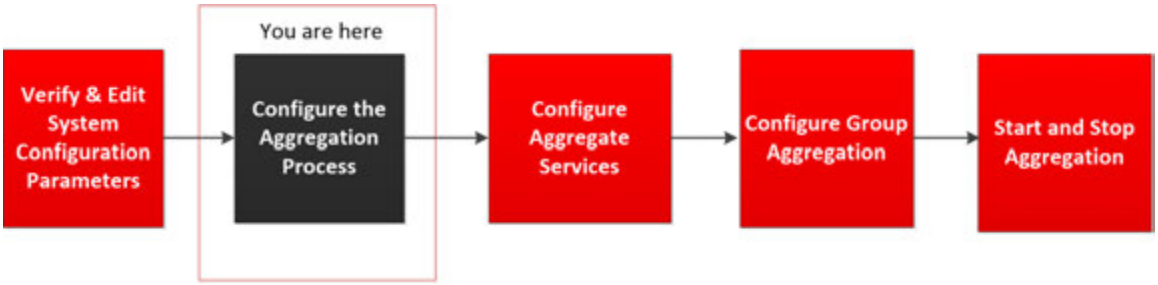
To edit system configuration parameters for a Broker or Concentrator:

1. In the **main menu**, select ADMIN > **Services**.
2. In the **Services** view, select a Broker or Concentrator, and in the Actions column, select > **View** > **Config**.
   The Services Config view for the selected service is displayed.
3. Under System Configuration, click a field that you want to edit, and type a new value.
4. When finished editing, click Apply.

Step 2. Configure the Aggregation Process

Configuring the aggregation process for a Broker or Concentrator includes setting:

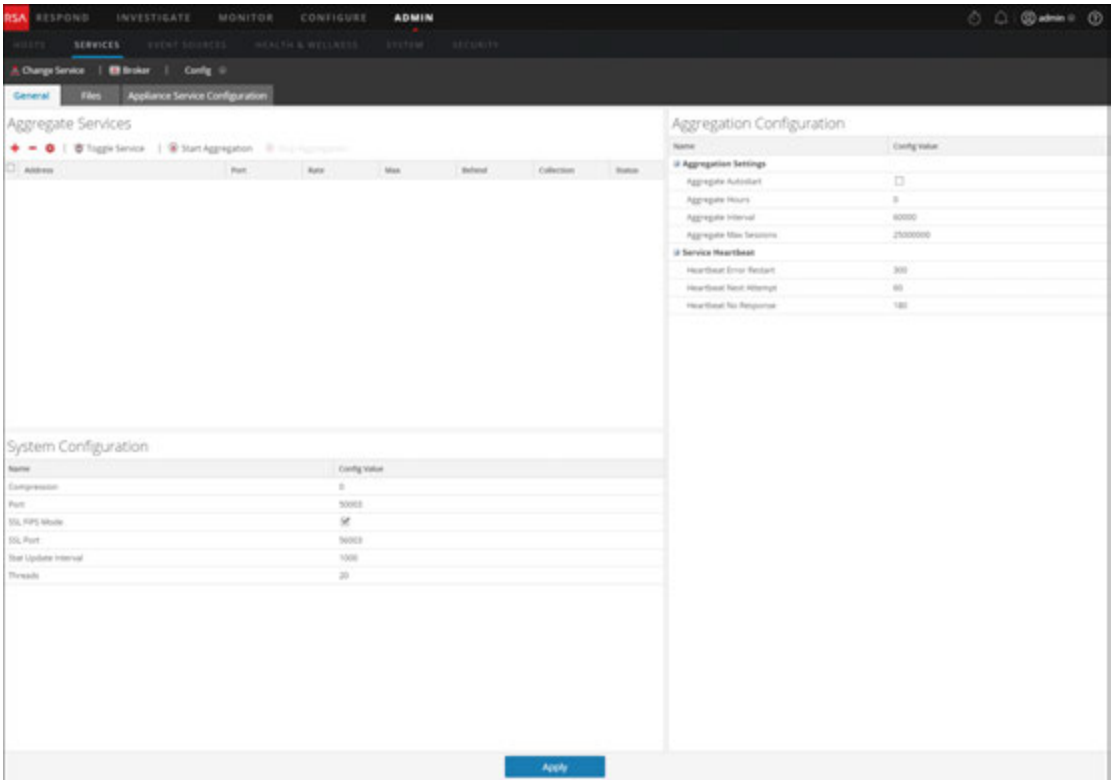
- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- Maximum number of open meta and session files
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service



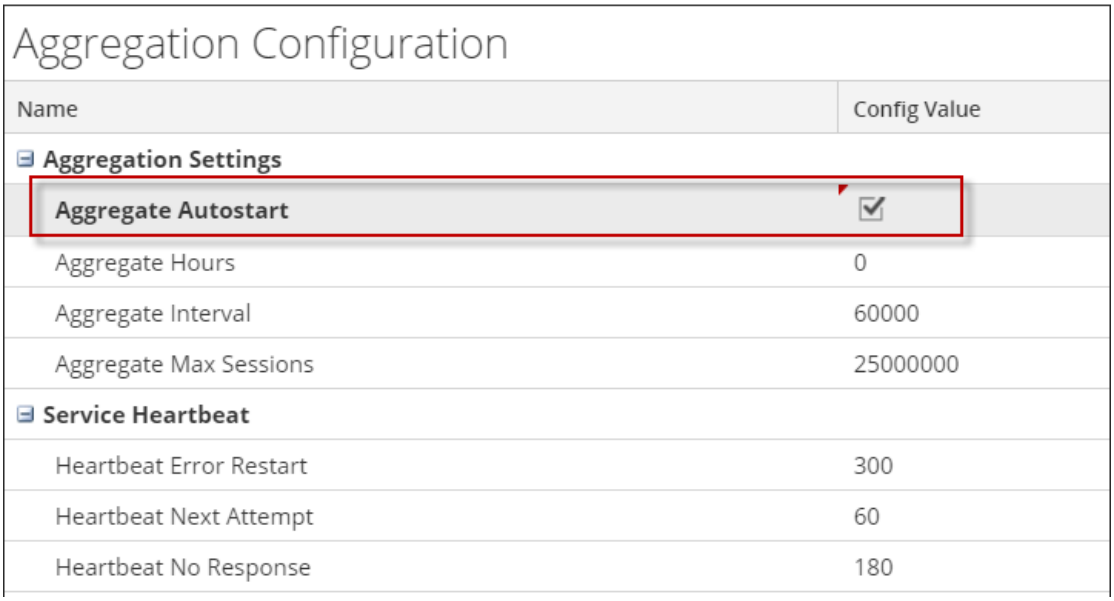
To configure the aggregation process on a Broker or Concentrator:

1. In the **main menu**, select ADMIN > **Services**.
2. In the **Services** view, select a Broker or Concentrator, and select  > **View** > **Config**.
   The Services Config view, which includes the Aggregation Configuration section, is

displayed.



3. (Optional) Select **Aggregate Autostart** to enable automatic start of aggregation when a service is online.



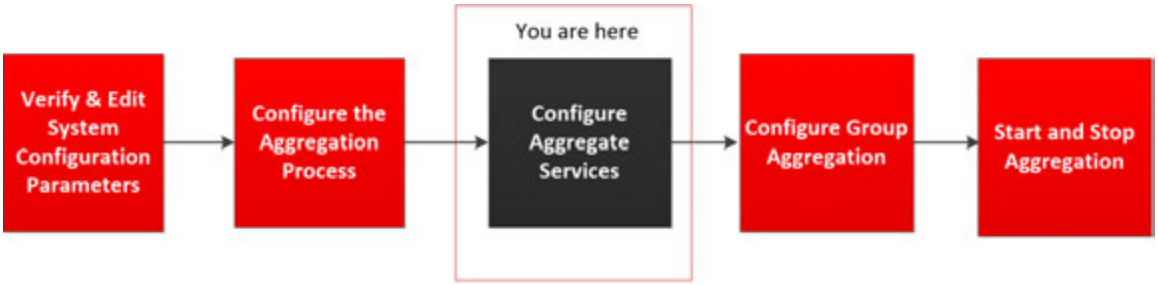
4. (Optional) Edit any of the aggregation settings: the hours back to begin aggregation, the milliseconds between rounds of aggregation, and maximum number of sessions per aggregation round.
5. (Optional) Edit any of the Service Heartbeat settings, which specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.
6. When finished editing the settings, click **Apply**.
   The settings become effective immediately

Step 3. Configure Aggregate Services

This topic introduces basic tasks related to data aggregation on Brokers and Concentrators. For information on the optional setup of group aggregation, see Step 4. (Optional) Configuring Group Aggregation.

Configuring the aggregate services (whose data is consumed and aggregated) includes:

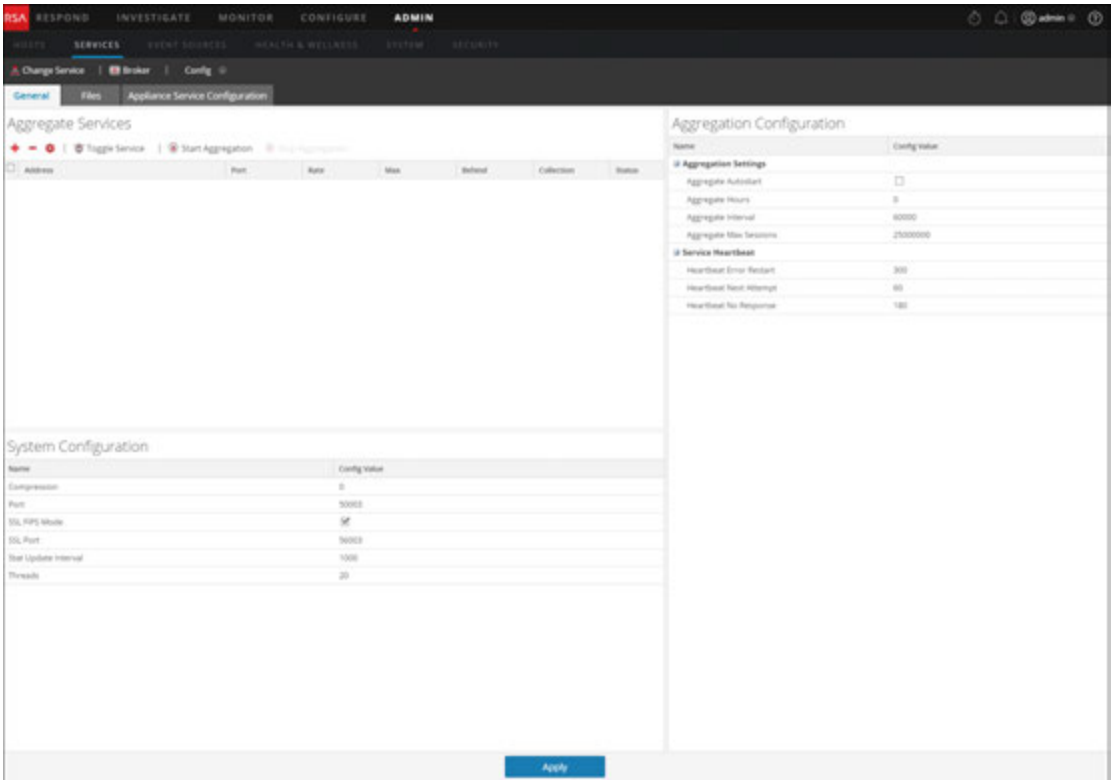
- Adding, editing, and deleting Concentrators and Decoders as aggregate services
- Toggling an aggregate service online and offline



Add Aggregate Services to a Broker or Concentrator

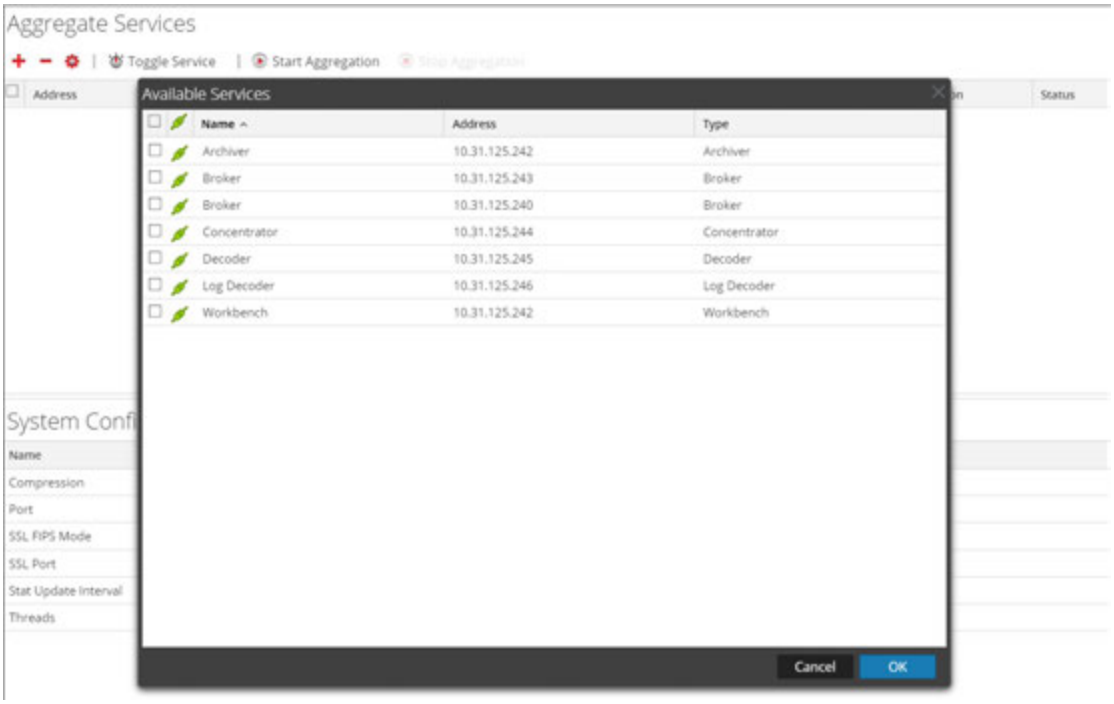
1. In the **main menu** menu, select **ADMIN > Services**.
2. In the **ADMIN Services** view, select a Broker or Concentrator, and select  **> View > Config.**

The Services Config view for the selected service is displayed.

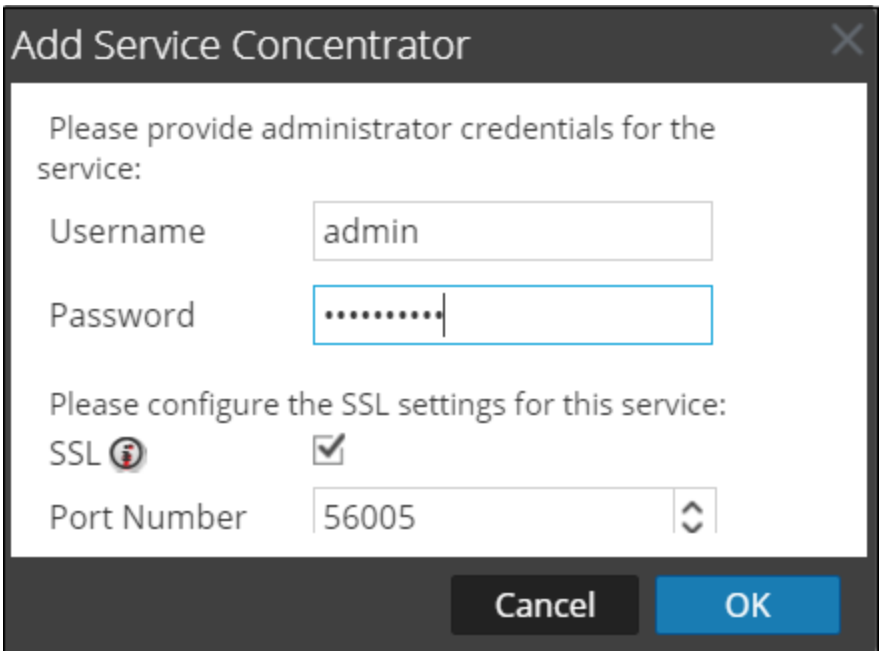


3. Click + in the **Aggregate Services** toolbar.

The Available Services dialog is displayed.



4. Select one or more services to be added and click **OK**.
5. Enter the Administrator username and password to authenticate adding a service.



The added services are listed in the Aggregate Services list.

6. To save the changes, click **Apply**.

Remove Aggregate Services from a Broker or Concentrator

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline.

1. In the **Aggregate Services** list, select one or more services.
2. Click − in the toolbar.

The service is removed from Aggregate Services list.

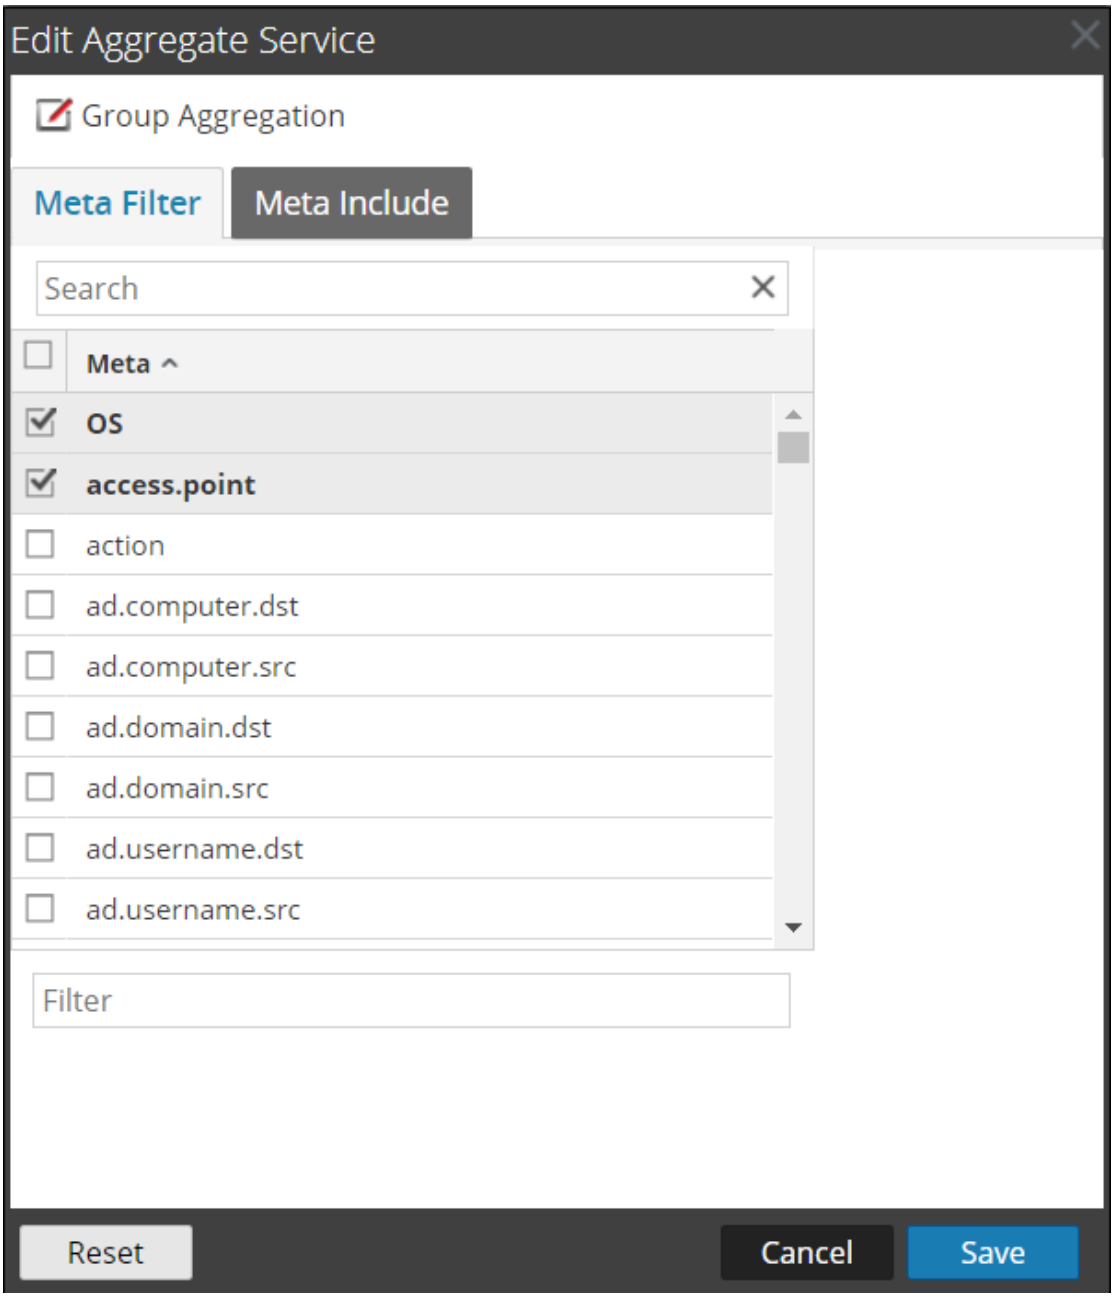
3. To save the change, click **Apply**.

Edit Aggregate Services on a Concentrator

Note: This option applies only to offline services. If the aggregate service is online, you must first toggle the service offline. You can edit only one service at a time.

You can limit the data being consumed from an aggregate service using meta fields and filters. To configure this:

1. Click **Change Service** to change the service to Concentrator.
2. In the **Aggregate Services** list, select one or more services.
3. Click  in the toolbar. Enter the authentication information in the pop up dialog box.
   - If the service was added on a different instance of NetWitness Suite, you must add it to this instance of NetWitness Suite in order to edit. A warning dialog allows you to add the service. If you click **Yes**, the Add Service dialog is displayed.
   - If the service is online, a dialog notifies that the service must be offline and requests confirmation that you want to continue. If you click **Yes**, NetWitness Suite takes the service offline and the Edit Aggregate Service dialog is displayed.
   - If the service is offline, the Edit Aggregate Service dialog is displayed with the editable properties for an aggregate service on a Concentrator.
4. Click a type of metadata in the **Meta Include** tab to select the type of metadata for the Concentrator to consume from this service. Click **Save**.



5. To specify a rule to filter data that the Concentrator consumes from this service, compose a rule in the **Meta Filter** tab. Click **Save**.
6. Click **Close**.
   The Edit Aggregate Service dialog closes and the changes are shown in the Aggregate Services list. In this example, two meta were selected on the Meta Include tab. When you click the information icon in the Meta Include field, it shows the selections.
7. To save the changes, click **Apply**.

Toggle a Service

When data aggregation starts, Brokers and Concentrators consume data from aggregate services that are online. When first added to a Broker or Concentrator, aggregate services are offline. To toggle a service between online and offline:

1. Select a service in the **Aggregate Services** list.
2. Click Toggle Service .

   The status is changed.

Step 4. (Optional) Configuring Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

RSA Group Aggregation Deployment Recommendations

RSA recommends the following deployment for Group Aggregation.

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

Advantages of Using Group Aggregation

Group Aggregation:

- Increases the speed of Security Analytics queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.

Data Ingest

You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated session between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter set to 10000 the services would divide the session between themselves as illustrated in the following table.

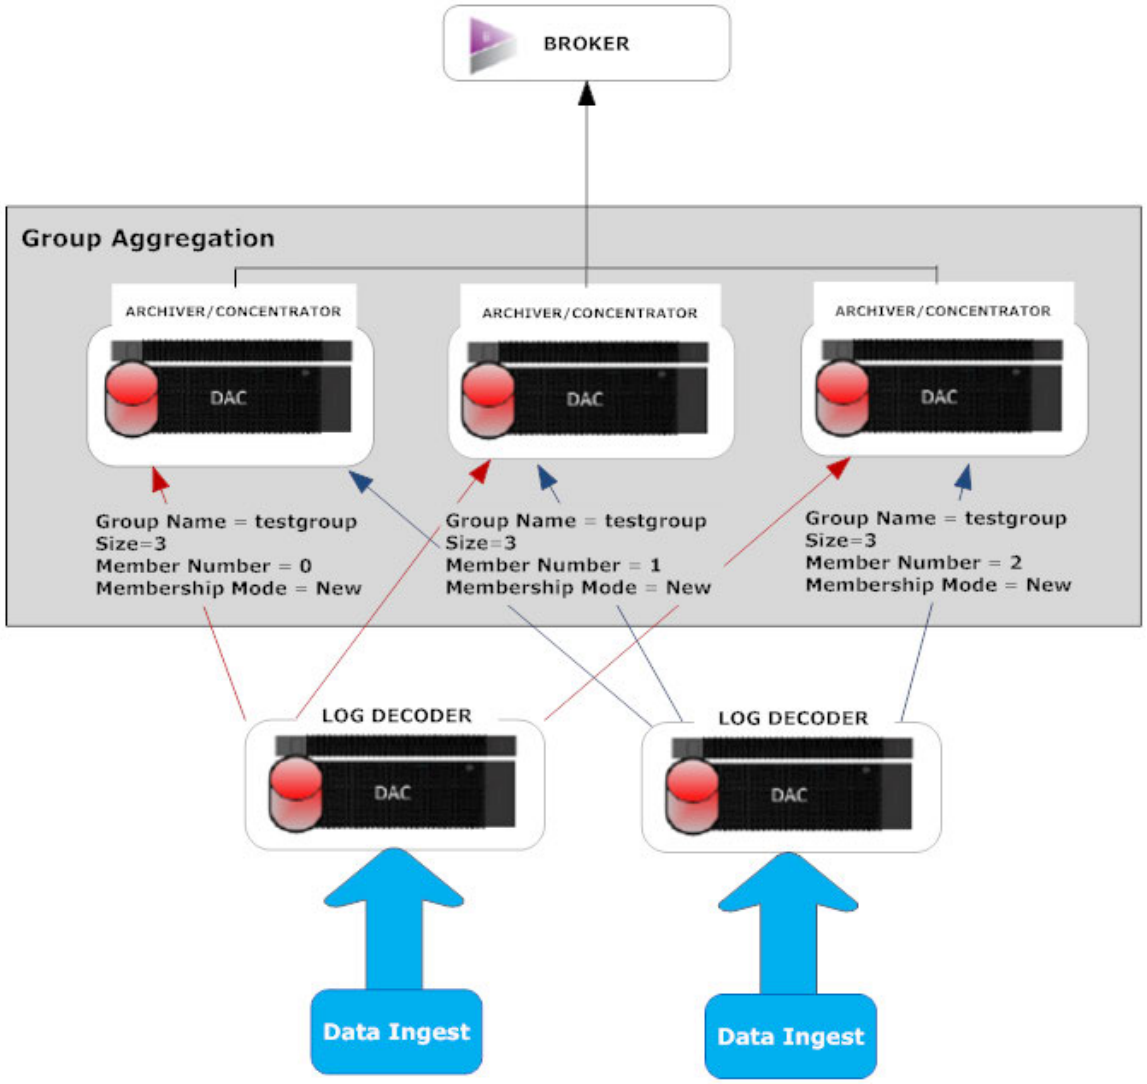
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

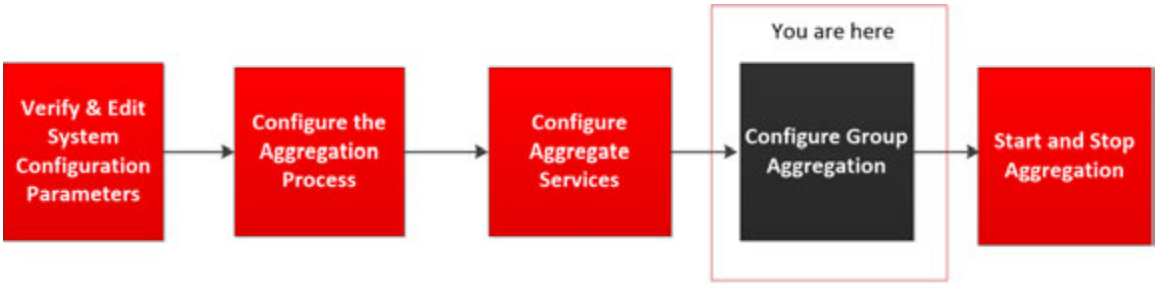
Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrators services in the group should have the same group name.

Size	It determines the number of Archiver or Concentrator services in the aggregation group.
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: New and Replace. New: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. Replace: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from. **Note:** This parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.



Set up Group Aggregation

Complete the following procedure to set up group aggregation.

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.
2. Perform the following on all the Archiver or Concentrator services that you want to be part

of aggregation group:

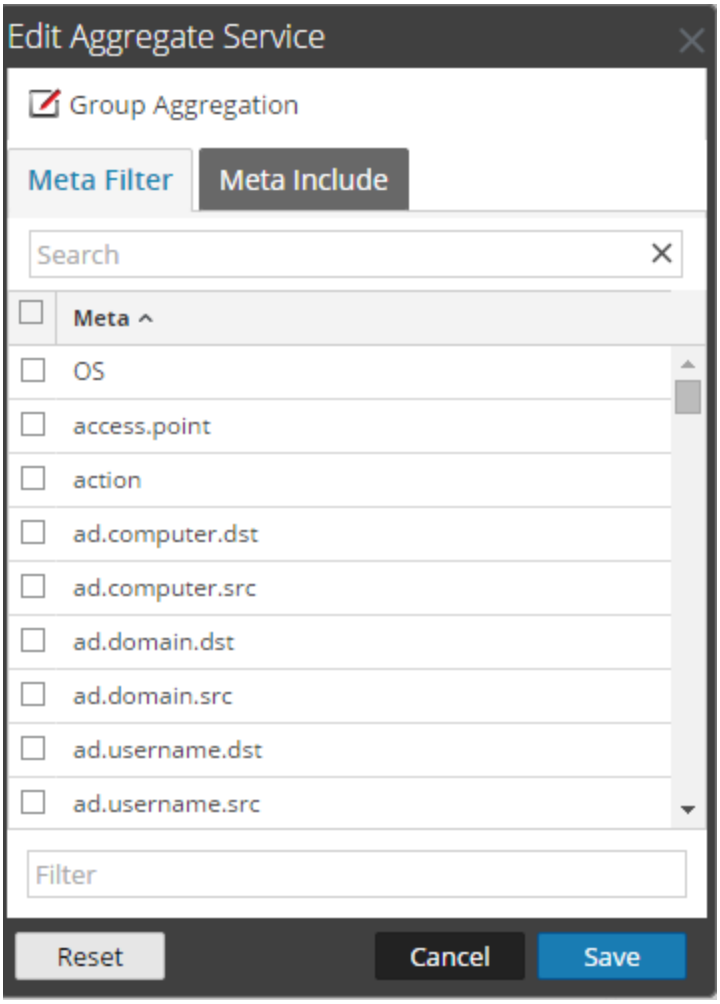
a. In the **main menu**, select **ADMIN > Services**.

b. Select the Archiver or Concentrator service, and in the **Actions** column, select **View > Config**.
The Device Config view of the Archiver or Concentrator is displayed.

c. Under **Aggregate Services** section, select the Log Decoder device.

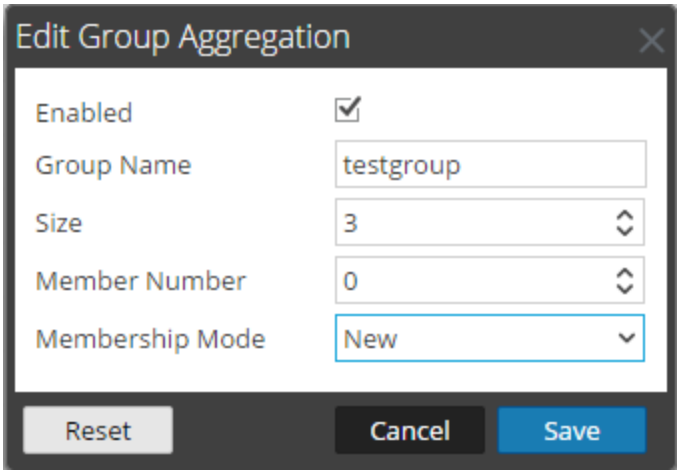
d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.

e. Click .
The **Edit Aggregate Service** dialog is displayed.



f. Click Group Aggregation.

The **Edit Group Aggregation** dialog is displayed.



g. Select the **Enabled** checkbox and set the following parameters:

   In the **Group Name** field, type the group name.
   In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
   In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
   In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

i. In the Device Config View page, click **Apply**.

j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.

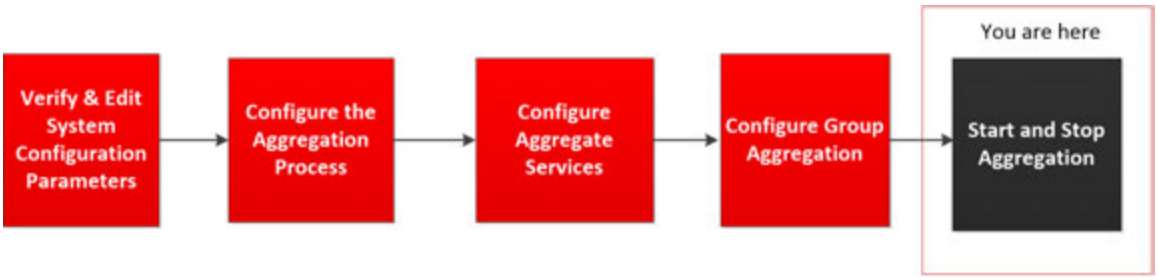
Step 5. Start and Stop Aggregation

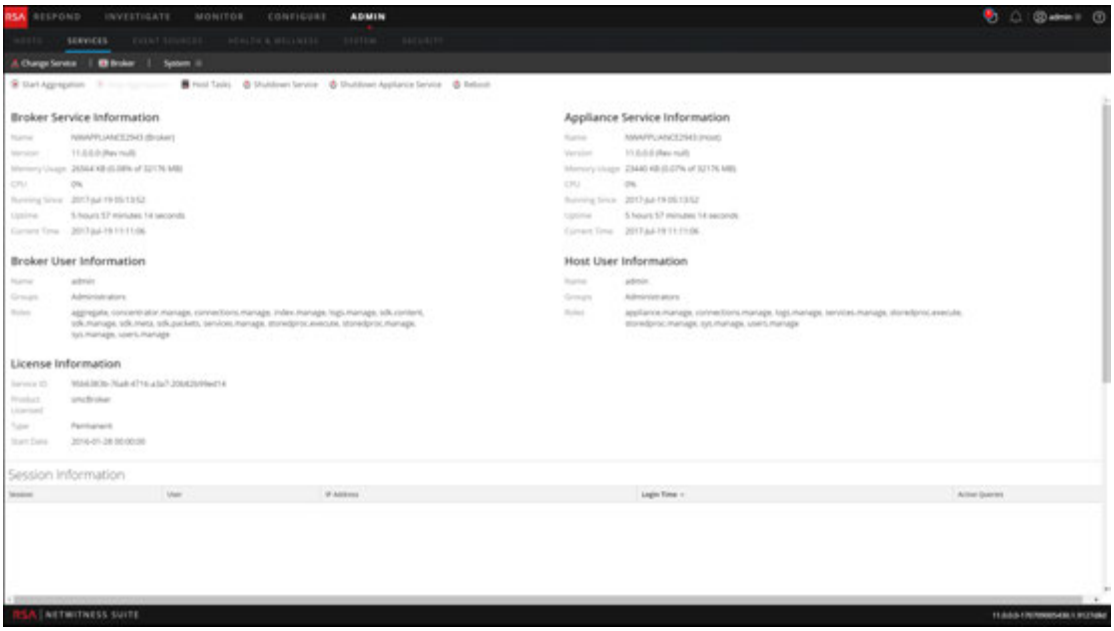
When a Broker or Concentrator starts up, it automatically begins aggregating data if Aggregate Autostart is enabled. When autostart is not enabled, you can start and stop data aggregation manually.



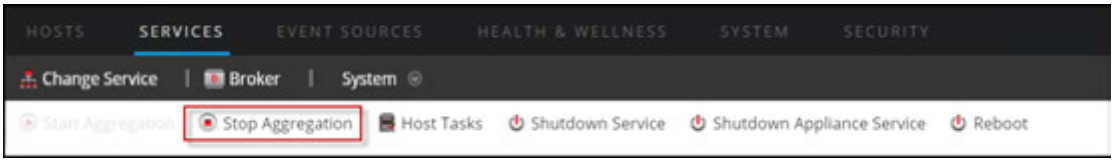
Note: The Aggregate Configuration Settings in the Services Config View for a Broker or Concentrator determine whether Aggregate Autostart is enabled, as well as the size of a round of aggregation and time between rounds.

Start and Stop Data Aggregation in the Services System View

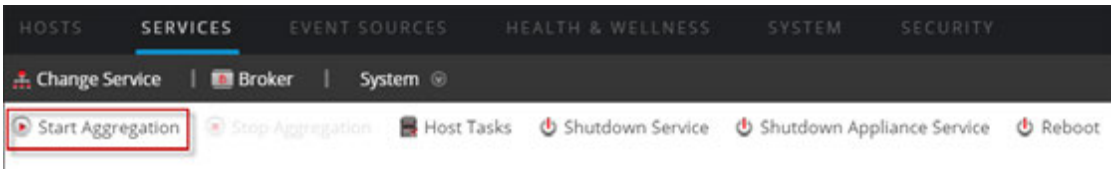
1. In the **main menu**, select **ADMIN > Services**.
2. In the **ADMIN Services** view, select a Broker or Concentrator, and select  **> View > System.**



3. To stop a Broker or Concentrator that is capturing data, click **Stop Aggregation** in the toolbar.
   The service stops aggregating data and the **Stop Aggregation** option in the toolbar is unavailable. The **Start Aggregation** option becomes active.

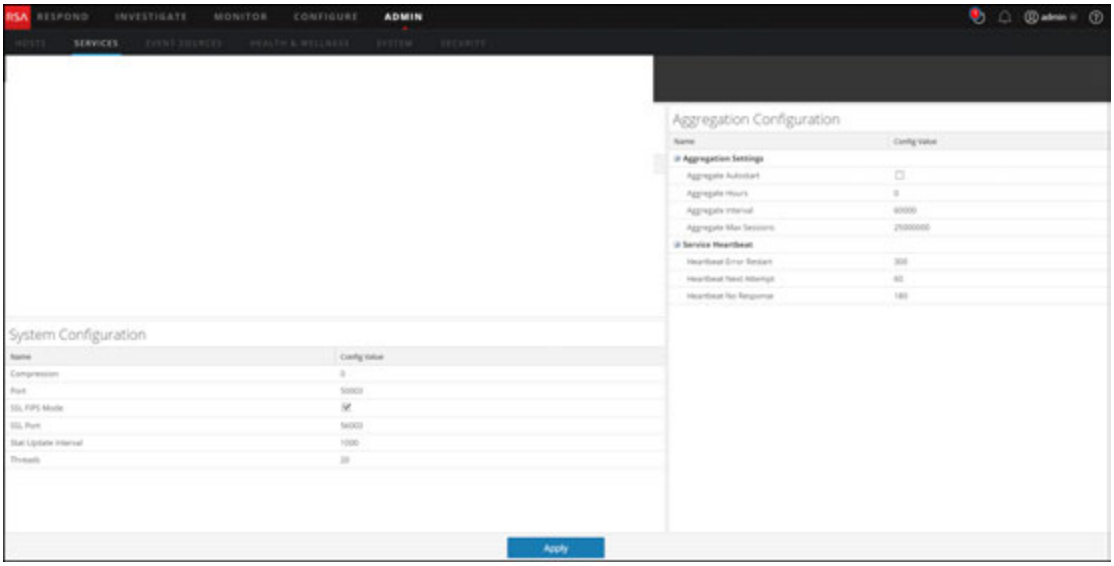


4. If you want the service to start aggregating data again, click **Start Aggregation**.
   You can now investigate the captured data in the Investigation module.



Start and Stop Aggregation in the Services Config View

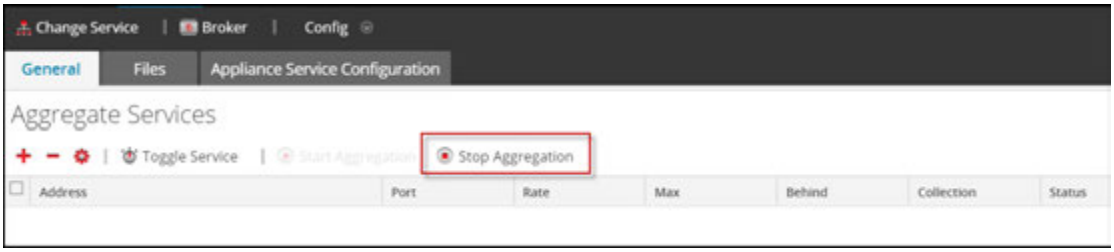
1. In the **main menu**, select **ADMIN > Services**.
2. In the **Admin Services** view, select a Broker or Concentrator, and select  **> View > Config**.
   The Services Config view, which includes the Aggregate Services section, is displayed.



3. To start aggregation on the selected Broker or Concentrator, click 
in the **Aggregate Services** toolbar.
When aggregation starts, the status of all online aggregate services changes to **consuming**. The Start Aggregation button is disabled and the Stop Aggregation button is enabled.

4. To stop aggregation, click 

in the **Aggregate Services** toolbar.
When aggregation stops, the status of all consuming aggregate services changes to **online**. The Stop Aggregation button is unavailable and the Start Aggregation button is available.



Broker and Concentrator Configuration References

You can configure Brokers and Concentrators using the NetWitness Suite user interface.

In addition to the views described here, you can view the complete service nodes in a tree form in the Services Explore view, see the "Services Explore View" topic in the *Hosts and Services Getting Started Guide*.

Topics

Services Config View - Broker or Concentrator General Tab

The General tab for a Broker or Concentrator in the Services Config helps manage basic service configuration, configure the aggregate service, and configure the aggregation process between a Broker or Concentrator and the aggregate service.

Configuring the aggregate service (whose data is consumed and aggregated) includes:

- Adding, editing, and deleting Concentrators and Brokers as aggregate services
- Toggling an aggregate service online and offline
- Monitoring statistics for aggregate services
- Starting and stopping aggregation

Configuring the aggregation process includes setting:

- Aggregation autostart
- Timing and performance parameters, such as the number of sessions per round of aggregation and time between rounds
- The timing of attempts to restart, reconnect, or take offline a non-responsive aggregate service

What do you want to do?

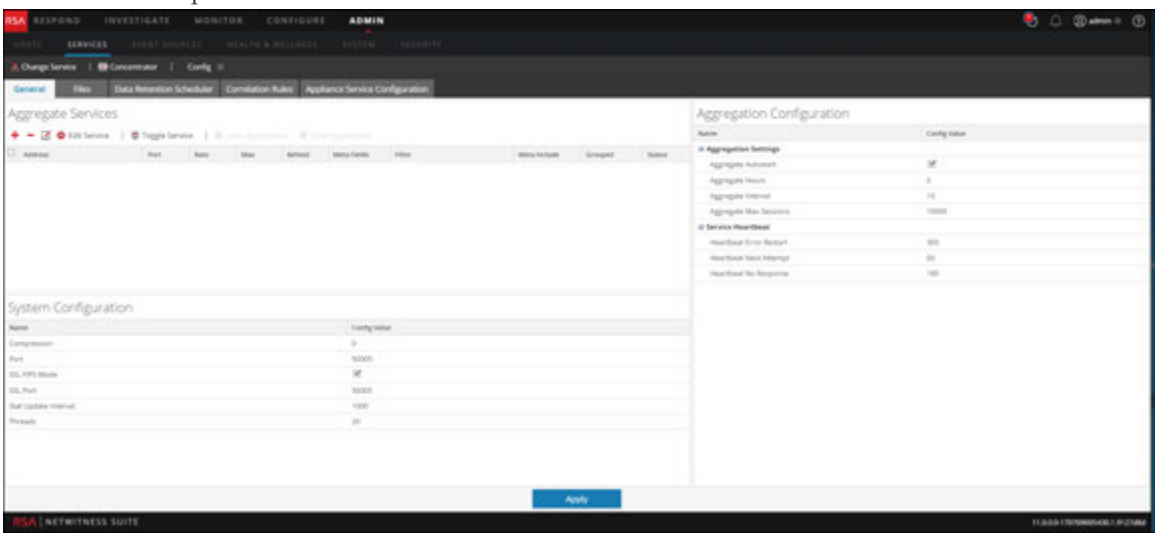
Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Aggregate Services Section
Administrator	Manage System Configuration	System Configuration Section

Related Topics

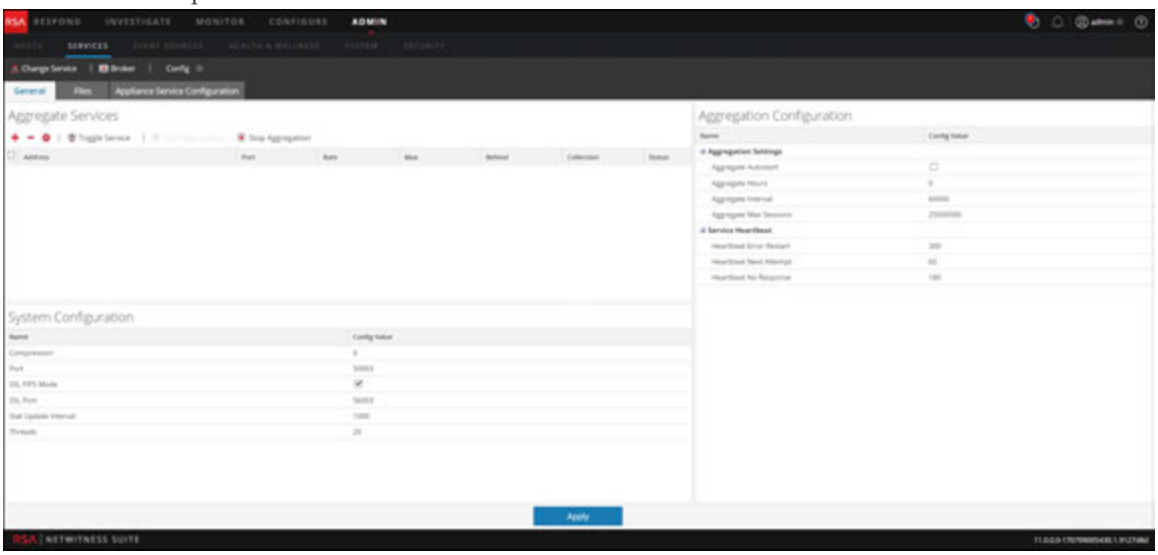
- Broker and Concentrator Basics
- Broker and Concentrator Configuration

General tab

This is an example of the General tab for a Concentrator.



This is an example of the General tab for a Broker.

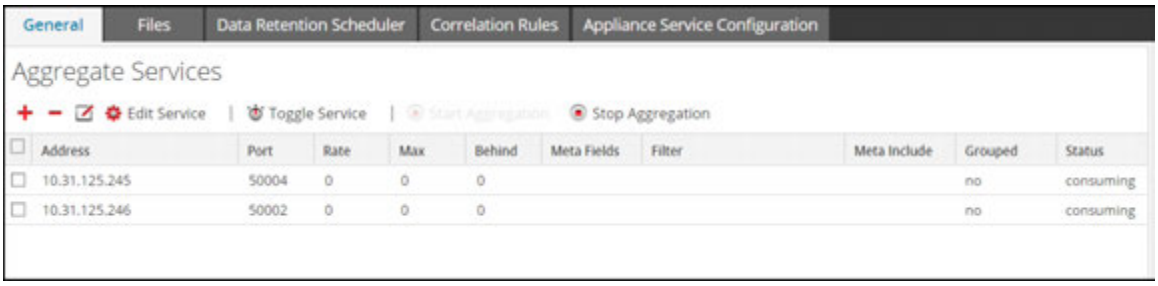


These are the three major sections in the General tab for Brokers and Concentrators:

- Aggregate Services
- System Configuration
- Aggregation Configuration

Aggregate Services Section

The Aggregate Services section provides a way to start and stop aggregation, as well as add, edit, delete, and toggle an aggregate service. This is an example of the Aggregate Services section for a Concentrator.



The Aggregate Services section toolbar offers these options.

Option	Description
+	Opens a dialog in which you can add a Concentrator, Decoder, or Log Decoder as an aggregate service.
−	Removes the selected aggregate service.
	For Concentrators only, opens a dialog to edit **Meta Fields** and **Filter** values for the Concentrator.
Edit Service	Enables you to enter the administrator credentials of the selected aggregate service so that it can communicate with the Broker or Concentrator.
Start Aggregation	When aggregation has been stopped or has not started, starts aggregating data from the online service in the list using the rules defined for the service.
Stop Aggregation	When aggregation is in progress, stops aggregation on the Broker or Concentrator. This stops all services and flushes the index, which may take several minutes to complete. It is necessary to stop aggregate services in order to perform various administrative procedures.
Toggle Service	Toggles the state of a service between offline and online. Only data from online service is consumed during aggregation.

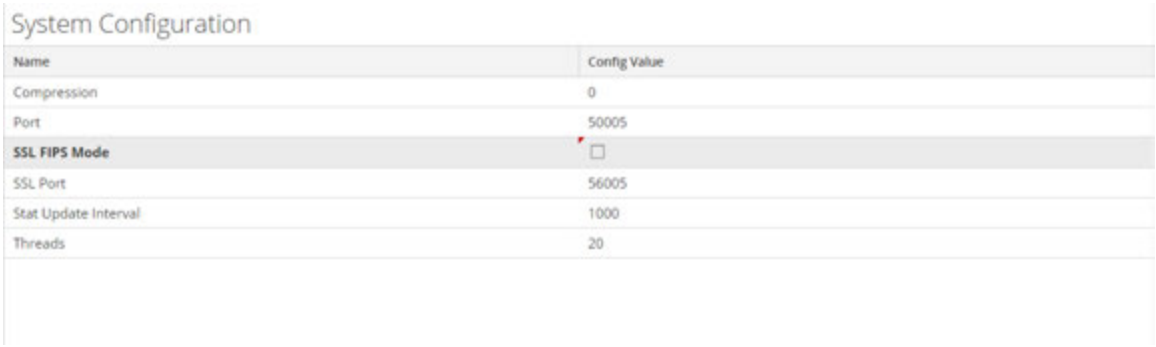
The Aggregate Services section list has these columns.

Column	Description
Address	Lists the address of the service.
Port	Lists the port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
Rate	Lists the number of metadata objects being written to the database per second. Values are rolling average samples over a short time period (10 seconds). After capture stops, the rate is reset to **0**.
Max	Lists the maximum number of metadata objects written to the database per second since capture started. Values are rolling average samples over a short time period (10 seconds). After capture stops, **Max** continues to show the maximum value during capture.
Behind	Lists the number of sessions on the service that need to be aggregated.
Collection	For Brokers only, indicates the collection that was selected when the Analyst Workbench service was added to the Aggregate Services section.
Meta Fields	For Concentrators only, lists the types of metadata being consumed by the aggregate service.
Filter	For Concentrators only, lists any filter being applied to the metadata being consumed by the aggregate service.
Meta Include	For Concentrators only, lists the number of types of meta included in the aggregate service.

Column	Description
Grouped	Whether or not the aggregate service is part of a group.
Status	Lists the current status of the service: • online = available to provide data for consumption by the Broker or Concentrator • offline = not available to provide data for consumption by the Broker or Concentrator • consuming = providing data for consumption by the Broker or Concentrator

System Configuration Section

The System Configuration section manages service configuration for a service. When a service is first added, default values are in effect. You can edit these values to tune performance.



The System Configuration section has these parameters.

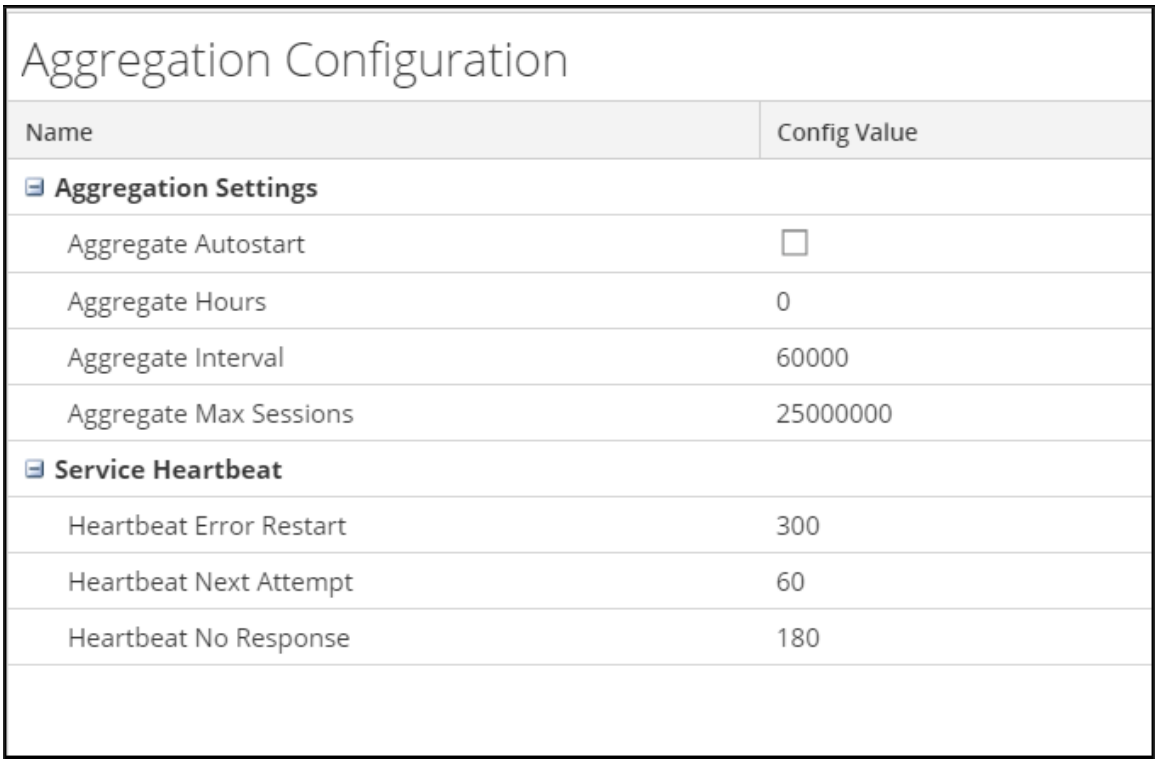
Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of **0** disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.

Parameter	Description
Port	The port on which the service listens. The default ports are: • 50001 for Log Collectors • 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
SSL FIPS Mode	When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
SSL Port	Indicates the SSL port.
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. The default value is **15**. A change takes effect on service restart.

Aggregation Configuration Section

The Aggregation Configuration section provides configuration settings that affect various aspects of the aggregation process. When you click **Apply**, the changes are saved; however, not all settings take effect immediately. The tables for Aggregation Settings and Service Heartbeat provide details.

Caution: Do not change any of these settings unless guided by the Developers or the Customer Support team. Contact the Customer Support, for any questions before editing any of these settings.



Aggregation Settings

Setting	Description
Aggregate Autostart	Option to start aggregation automatically each time the Broker or Concentrator is started. Checked means yes, unchecked means no. This change takes effect immediately.

Setting	Description
Aggregate Hours	The number of hours back for each service that the Concentrator or Broker attempts to recover at the beginning of aggregation. This change takes effect immediately. • If the value is set to 0, aggregation for each service starts where it last left off, no matter the number of hours behind. • If the value is any positive integer, the Concentrator or Broker only consumes sessions less than that number of hours back. For example, if a service's most current session is +10 hours from the last session, this is what happens with two different Aggregate Hours values: • With a value of 12, the Concentrator or Broker starts consuming where it left off. • With a value of 4, all sessions between 5 and 10 hours back are skipped and the Concentrator or Broker starts consuming the session that started 4 hours back.
Aggregate Interval	The number of milliseconds between rounds of service aggregation. All services managed by the Broker or Concentrator request additional rounds of session and metadata to be aggregated. If a Broker or Concentrator is still consuming the previous round of data, it cannot request more until it finishes. Change takes effect immediately.
Aggregate Max Sessions	The maximum number of sessions that the Broker or Concentrator requests in a given round of data aggregation. Change takes effect after restart.

Service Heartbeat

In communicating with each aggregate service, Brokers and Concentrators monitor the heartbeat of the service. These parameters specify the timing of the first attempt to reconnect to a service after an error, the next attempt to reconnect, and taking the service offline after failure to reconnect.

Setting	Description
Heartbeat Error Restart	After a heartbeat error is detected on an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting a service reconnect.
Heartbeat Next Attempt	After a failed attempt to reconnect to an aggregate service, specifies the number of seconds for a Broker or Concentrator to wait before attempting another service reconnect. Change takes effect immediately.
Heartbeat No Response	After failing to reconnect to an unresponsive service, specifies the number of seconds for the Broker or Concentrator to wait before taking the unresponsive service offline. Change takes effect immediately.

When editing parameters in the General tab, you must click **Apply** to save changes.

Services System View - Broker or Concentrator

The Services System view displays information specific to specific to Brokers and Concentrators.

While information displayed in this view is the same for all types of Core services, several options in the toolbar are relevant only for Brokers and Concentrators.

What do you want to do?

Role	I want to...	Refer to...
Administrator	Start and Stop aggregation Add, edit, delete, and toggle an aggregate service	Services System View - Broker or Concentrator
Administrator	Manage System Configuration	Services System View - Broker or Concentrator

Related Topics

- Broker and Concentrator Basics

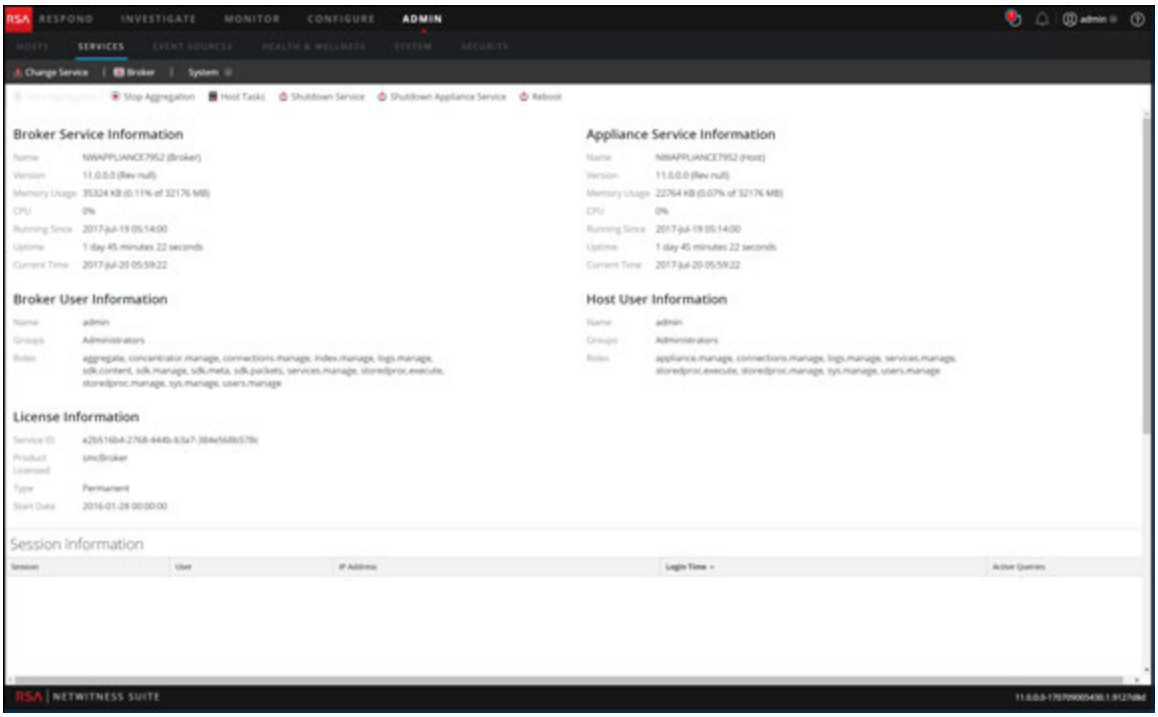
Services System View

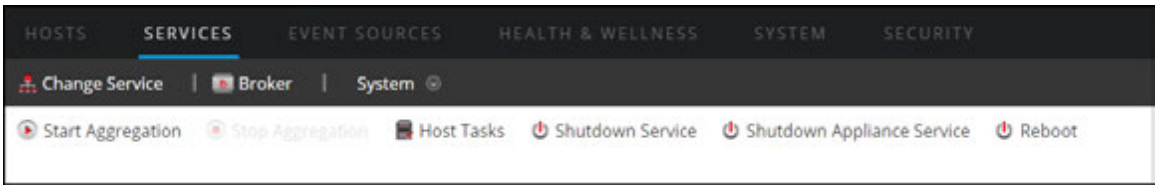
You can access this view by doing the following:

1. In the **main menu**, select **ADMIN > Services.**
2. Select a Concentrator or Broker, and select  **> View > System**.

   The System view for the selected Concentrator or Broker is displayed.



The following figure is an example of the toolbar for a Broker or Concentrator.



Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the **Services System view** topic in the *Host and Services Getting Started Guide*.

This table describes toolbar options that apply only to a Concentrator or Broker. Both buttons are unavailable until aggregator services are configured and consuming data.

Action	Description
Start Aggregation	Starts aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Start Aggregation button is available only when aggregator services are configured and consuming data.
Stop Aggregation	Stops aggregation of data being consumed on a Concentrator or Decoder configured as an aggregation service for the selected Broker or Concentrator. The Stop Aggregation button is available only when aggregation is occurring.

NetWitness Core Database Introduction

This topic provides an overview of the NetWitness Core database. The NetWitness Core services contain a proprietary database developed specifically for use within the NetWitness Suite products. It bears little resemblance to traditional relational databases, and is not based on any off-the-shelf database technology. As such, many users find that there is a steep learning curve to understanding how the Core database works, and how to make best use of it. The purpose of this guide is to help NetWitness Suite users understand the database and use it to its fullest potential.

As a System Administrator, you can use this information to help plan your NetWitness Suite deployment, and to tune it for best performance. As an Analyst, you can use this guide to structure your analysis in ways that will return reports faster. As a Content Developer, you can use this guide to help write content that will be processed efficiently by the database system.

NetWitness Suite Products Covered by this Guide

This guide covers the capabilities of NetWitness Suite 11.0. The following NetWitness Suite components contain the Core database:

- Concentrator
- Archiver
- Decoder
- Log Decoder
- Workbench

Frequently Used Terms

Definitions for terms that are used throughout this document are presented here. The terms are listed in the order in which they enter the NetWitness Suite system:

- **Packet DB** : The packet database contains the raw captured data. On a Decoder, the packet database contains packets as captured from the network. Log Decoders use the packet database to store raw logs. The raw data stored in the packet database is accessible by a Packet ID, however, this ID is typically never visible to the end user.
- **Packet ID** : A number used to uniquely identify a packet or log in a packet database.

- **Meta DB** : The meta database contains items of information that are extracted by a Decoder or Log Decoder from the raw data stream. Parsers, rules, or feeds can generate meta items.
- **Meta ID** : A number used to uniquely identify a meta item in the meta database.
- **Meta Key** : A name used to classify the type of each meta item. Common meta keys include ip.src, time, or service.
- **Meta Value** : Each meta item contains a value. The value is what each parser, feed, or rule generates.
- **Session DB** : The session database contains information that ties the packet and meta items together into sessions.
- **Session** : On a packet Decoder, a session represents a single logical network stream. For example, a TCP/IP connection is one session. On a Log Decoder, each log event is one session. Each session contains the references to all the Packet IDs and Meta IDs that refer to the session.
- **Session ID** : A number used to uniquely identify sessions in the Session DB.
- **Index** : The index is a collection of files that provides a way to look up Session IDs using Meta Values.
- **Core Database** : This refers to the combination of the Packet, Meta, Session, and Index.

For syntax definitions, this document uses EBNF grammar definitions.

NetWitness Core Database History

NetWitness (now RSA) developed the Core database for use in packet capture systems. Early in the history of NetWitness, developers identified that existing database technologies would not be able to keep up with the high ingest rate inherent in full packet capture. Contemporary database technologies were not anywhere close to being able to keep up with capturing the number of sessions received every second, much less sorting every packet. Likewise, the volume of data meant that packet storage would need to be discarded and reused just as quickly as it was consumed. This was also a weakness of databases at the time. Thus, NetWitness created a database consisting of the packet, session, and meta databases.

In order to provide the analytical capabilities of NetWitness Investigator, a meta index was added to the NetWitness database. The index shared the same design goals as the original databases. It was designed to sustain a very high insert rate into a high number of very large indices.

The index has evolved considerably over the years. Early versions of the index were only capable of providing summary estimates about how many unique meta values were present in the meta database. Other versions have had great challenges in meeting acceptable query performance. For example, NetWitness 9.0 more frequently measured report times in minutes rather than seconds. The current version of the index is derived from the NetWitness 9.0 index, but has evolved considerably in order to meet performance expectations and to add new features.

Core Database Strengths and Weaknesses

Strengths:

- High sustained insert rates, without needing down time for bulk inserts.
- Decent query performance simultaneous with high insert rates.
- Automatic cleanup and rollover of old data with minimal fragmentation.
- Extremely high number of meta value indices: more than 100 enabled by default on a Concentrator.
- Ability to scale to Petabyte database sizes and Terabyte index sizes within a single node.
- Using meta key-value pairs, it is very flexible for storing arbitrary meta items within a session. Thus a session can be used to represent nearly any kind of data record.

Weaknesses:

- The query functionality is limited and low level.
- The packet, meta, and session DB schema is fixed, and all customization is done through custom meta keys and values.
- The database provides no transaction atomicity guarantees as you might expect to find in a SQL database.

Basic Database Configuration

This topic covers basic database configuration settings of NetWitness Core services. For information on how to configure the Core services by editing configuration files, see "Service Configuration Settings" in the *Host and Services Getting Started Guide* .

This document assumes that the reader has some familiarity with adjusting the configuration of a NetWitness Core service. To use this document, you should be familiar with one of the mechanisms for modifying the configuration tree of Core services. Examples of such mechanisms include the Explorer view of the Administration pages within the NetWitness Suite user interface, or the REST interface accessible on each service through a web browser.

Find Help within the Core Service

Each configuration item within a Core service has a built-in help description of what the item does. You can view this help information by hovering your mouse over the configuration item in the Explorer view. Each configuration item also indicates whether it can be changed without restarting or if a restart of the service is needed for the change to take effect.

Developers using the REST API can retrieve the help text for each configuration item by sending the `help` message to the configuration node path.

Packet, Meta, and Session Storage

Each of the packet, meta, and session databases are configured through the `/database/config` folder on each NetWitness Core service. Each database has a configurable parameter to specify where the Core service stores data. Packet, meta, and session databases follow a predictable pattern for all of their configuration entries. Configuration items for the packet database start with the prefix `packet` , meta database configuration starts with the prefix `meta` , and the session database configuration items start with the prefix `session` .

Index Storage

The index configuration is stored in the `/index/config` folder on each Core service.

Topics

- Tiered Database Storage
- Manifests

Tiered Database Storage

This topic describes tiered database storage and provides recommendations for Hot, Warm, and Cold tier storage.

Starting with version 10.4, the Archiver service has the capability to be configured to use tiered storage. The concept of tiered storage is to put the most recent data on a Hot tier, which is the fastest storage available on the Archiver.

All services use the Hot tier by default.

The next tier is known as Warm and is typically cheaper and slower storage, such as a network-attached storage (NAS). The Warm tier contains older data; how old depends upon how much storage is allocated on the Hot tier and the average ingest rate. When the Hot tier reaches max utilization, the natural progression is to move the oldest data from the Hot tier to the Warm tier. When configured correctly, this happens automatically and is invisible to the end user. Queries and data access happen automatically no matter what tier (Hot or Warm) the data resides on. However, there can be a performance impact when accessing data on the Warm tier as compared to the Hot tier, because access times on the Warm tier are typically slower.

In addition to Hot and Warm, there is also a Cold tier. The Cold tier is only used as a staging area for offline backup. NetWitness Core services do not access data on the Cold tier. NetWitness Core services move the oldest data to the Cold tier and consider it abandoned (the service no longer accesses the data). This data can then be backed up to long-term storage like tape for possible restoration months or even years later, depending on requirements. The backing up and subsequent removal of data on the Cold tier must be handled outside of NetWitness Core services via scripts or other processes.

If the Cold tier becomes full because external processes are not removing data in a timely manner, this causes the NetWitness Core service to eventually stop the ingestion of new data until the problem is corrected.

When moving data to the Cold tier, RSA recommends that the directory remain on the same mount point as where it is being moved from. Therefore, if the files are coming from the Warm tier, it is far better for performance reasons to set the Cold tier directory on the same file system. The reason for this is that the service attempts to simply move the file and directory to the Cold tier, which is a nearly instantaneous operation on the same file system. If the move fails, the fallback is to copy the data to the Cold tier, which takes more processing time and causes additional I/O contention on the tier from which it is being copied.

Archiver

The tiers of storage capabilities are used by the Archiver. You can configure Archiver to only use Hot storage (the default), Hot and Warm, or all three (Hot, Warm and Cold). All services must use Hot, you cannot configure a service to only use Warm. Data flows from Hot to Warm and finally to Cold. You can also skip Warm and go from Hot to Cold. If Cold (offline) storage is not configured, the oldest data is deleted on the last configured tier, which has been the standard operating procedure.

The typical Archiver deployment sets all the databases to unlimited size (packet.dir, meta.dir, session.dir, index.dir, and optionally the Warm tier variants), which means that the size specifier is left off or set to zero. This lets the databases and index grow unbounded. Instead of each database managing their own size and rolling out only when each individual database exceeds their configured size, Archiver rolls out everything together using the `/index sizeRoll` command. This enables the databases and index to roll out in unison. For more information on sizeRoll, see "Asynchronous Rollover" in Rollover .

Archiver is typically configured to place the index, session, meta, and packet (log) DB on the same volume, instead of multiple volumes like a Concentrator or Decoder. Although this can potentially cause more I/O contention when concurrent reads happen across multiple databases, it also maximizes overall retention. Because all databases are on the same volume, they are configured to roll out together, which minimizes orphaning of data. Decoder and Concentrator are configured for maximum I/O speed, but can suffer from estimates on the proper volume sizing.

For example, if the session DB is too large, it may have enough storage for six months of retention, whereas the meta DB and index only have retention for four months. Because the session, meta DB, and index are intricately tied together, the shortest retention period for all three define the overall retention period (in this case, four months). Retention of individual databases is mostly affected by factors beyond our control, such as traffic captured, meta generated (parsers, feeds, rules) and filtering. The databases are easily resized by a simple configuration change, but this usually also involves changes at the hardware and file system level to adjust partitions, which complicates dynamic resizing. Archiver avoids these problems by using a single volume for everything, with the trade-off of somewhat slower I/O speed.

Manifests

This topic describes manifest files and provides an example manifest for a meta DB file. It also describes manifest searching and provides an example manifest search.

Manifest files are created with every session, meta, and packet (log) DB file and index slice directory. A manifest file is a file that describes several key pieces of information about the data to which it refers. Manifest files are written as a JSON record. Manifest files travel with the data they represent from tier to tier. If the data they represent is deleted, the manifest file is also deleted, except in the following special case. If the service has `/database/config/manifest.dir` configured to a valid directory, at the point when the manifest data is deleted, a copy of the manifest file is placed into the directory pointed at by `manifest.dir` (the directory is created if it does not exist). This enables a NetWitness Suite feature called historical manifest searching.

The intention of this process is to keep historical manifest files for years, in one location for offline querying. As you might imagine from a service running for many years, this can potentially generate hundreds of thousands of files. This should not be a concern however, as the service automatically compresses files into a single archive in order to save space when they grow too numerous. Manifest files are very small and compress well.

Example manifest (`meta-000000023.nwmdb.manifest`) for a meta DB file:

```
{
    "filename" : "meta-000000023.nwmdb",
    "size" : 185153768,
    "fileTime" : 1403903940,
    "id1" : 150814110,
    "id2" : 159341086,
    "session1" : 4023382,
    "session2" : 4250442,
    "time1" : 1403903879,
    "time2" : 1404739851
}

filename  = The filename for the db file the manifest represents
size      = The size in bytes of the db file
fileTime  = The time the file was created
id1       = The starting id in the file (for this example, the starting
meta ID)
id2       = The last id in the file (for this example, the last meta ID)
session1  = The starting session ID of the first meta in the file
session2  = The last session ID of the last meta in the file
time1     = The POSIX time of the first "time" meta found in the file
time2     = The POSIX time of the last "time" meta found in the file
```

In this example manifest, the most important fields are `fileTime` , `time1` and `time2` . All three fields are written in POSIX time. `time1` and `time2` are the starting and stopping times of the meta recorded in the meta DB file `meta-000000023.nwmdb` . In particular, `fileTime` is always the time in which the file was created (not last modified). `time1` and `time2` are representative of the min and max range of the parsed data within the meta DB file. When doing historical searches by time, `time1` and `time2` are preferred over `fileTime` , when they are present. Manifest files for the other databases and index contain some different fields, but all have enough information to perform time based queries.

Search Historical Manifests

When manifests are collected in the directory pointed to by `manifest.dir` , it is assumed that the data they refer to was copied to the Cold tier and eventually backed up to offline storage. Because the historical manifests are still accessible by the service, this allows time-based queries to be performed on offline data, in order to determine what data needs to be restored for a given time range.

You can search manifests using the `/database manifest` command:

```
manifest: If a manifest directory is defined, it will allow operations
on the manifest files (such as a time based query) for database files in
cold storage.
security.roles: database.manage
parameters:
   op - <string, optional, {enum-one:query|compress}> The operation to
perform (defaults to query)
   time1 - <date-time, optional> The beginning time (UTC) for matching
offline database files
   time2 - <date-time, optional> The ending time (UTC) for matching
offline database files
   timeFormat - <string, optional, {enum-one:posix|simple}> Specify the
time format that is returned (posix, simple), default is posix
```

Example search:

```
/database manifest time1="2014-04-20 11:00:00" time2="2014-04-11
11:20:00" timeFormat=simple
```

The search returns all manifests that match the query:

```
[ filename=meta-000001691.nwmdb size=4843826176 fileTime="2014-Apr-20
11:06:34" id1=301555027452 id2=301733101896 session1=15352020201
session2=15361024200 time1="2014-Apr-20 11:05:34" time2="2014-Apr-20
```

```
11:16:34" compression=gzip ]
[ filename=session-000001865.nwsdb size=268439552 fileTime="2014-Apr-20
11:06:35" id1=14674145801 id2=14682041000 metaId1=288217522208
metaId2=288370660984 packetId1=11733872441 packetId2=11741745303 ]
[ filename=session-000001866.nwsdb size=268439552 fileTime="2014-Apr-20
11:18:31" id1=14682041001 id2=14689936200 metaId1=288370660985
metaId2=288520616949 packetId1=11741745304 packetId2=11749618589 ]
```

The returned results can be used to correlate which files should be restored from backup for the given time range. For NetWitness Suite 10.4 and later, a service called Workbench can be used to take the restored files and provide a query interface over the restored data using one or more collections.

Setup of the Workbench service is beyond the scope of this document. For more information, see "Configure Data Backup and Restore" in the *Archiver Configuration Guide* .

Advanced Database Configuration

This topic explains the advanced configuration options of the NetWitness Core database.

The configuration options of the NetWitness Core database may change from one release to the next. However, many of the configuration items do not change frequently and are documented here. This is not an exhaustive list, since new features are added in every release, and they may require new configuration items. For the most up-to-date documentation, refer to the built-in help functionality of the NetWitness Core service.

Topics

Database Configuration Nodes

This topic describes database configuration nodes. The following database configuration nodes are some of the advanced database configuration items of the NetWitness Core database that do not change frequently.

packet.dir,meta.dir,session.dir

This is the primary configuration entry for each database (also known as the Hot tier). It controls where in the file system the respective databases are stored. This configuration entry understands a complex syntax for specifying many directories as storage locations.

Configuration syntax:

```
config-value = directory, { ";" , directory } ;
directory    = path, [ ( "=" | "==" ) , size ] ;
path         = ? linux filesystem path ? ;
size         = number size_unit ;
size_unit    = "t" | "TB" | "g" | "GB" | "m" | "MB" ;
number       = ? decimal number ? ;
```

Example:

```
/var/lib/netwitness/decoder/packetdb=10
t;/var/lib/netwitness/decoder0/packetdb=20.5 t
```

The size values are optional. If set, they indicate the maximum total size of files stored there before databases roll over. If the size is not present, the database does not automatically roll over, but its size can be managed using other mechanisms.

The use of = or == is significant. The default behavior of the databases is to automatically create directories specified when the Core service starts. However, this behavior can be overridden by using the == syntax. If == is used, the service does not create any directories. If the directories do not exist when the service starts, the service does not successfully start processing. This gives the service resilience against file systems that are missing or unmounted when the host boots.

If you modify the size of a directory in use, the size takes effect immediately, as long as it is larger. If the size is smaller, it is ignored if it is more than 10 percent smaller than the existing size. This prevents an accidental mistype that causes a enormous loss of data. For example, if the packet database was configured for `12 TB` and someone mistyped it as `12 GB` , the database would end up deleting over 11 TBs of data in order to shrink it down to just 12 GB. Instead, the database ignores the `12 GB` setting and logs a warning, so that the error can be caught quickly. Of course, if the size specified is actually correct and more than a 10 percent difference from the existing size, the only recourse for it to take effect is to restart the service. When it starts back up, it assumes the size is correct and adjusts the database to the new size by rolling out the oldest data until the new size is reached. If you actually do want to adjust the size downward and by more than 10 percent without restarting the service, you need to modify the size multiple times, each time adjusting it by less than 10 percent. Watch the service logs to know when the database has adjusted to the new size, as it only adjusts the total database size when the latest file being written has been closed.

If new directories get added or deleted (semicolon separated), they do not take effect until the service restarts.

`packet.dir.warm,meta.dir.warm,session.dir.warm`

These settings are optional and are used for Warm tier storage on an Archiver. By default, they are blank and unused. If configured, they follow the same format and behavior as `packet.dir` , `meta.dir` , and `session.dir` (see `_packet.dir` , `meta.dir` , and `session.dir` _ above). When configured, the oldest file on the Hot tier moves to the Warm tier when no available space remains in the Hot tier.

packet.dir.cold,meta.dir.cold,session.dir.cold

These settings are optional and are used to move files from either a Hot or Warm tier storage system to the Cold tier directory specified. Specifically, this setting is nothing more than a directory, there are no size specifiers. However, the defined path name has a few special format specifiers that you can use to name the directory with the date of the data in it.

```
%y   = The year of the data being moved to the cold tier
%m   = The month of the data being moved to the cold tier
%d   = The day of the data being moved to the cold tier
%h   = The hour of the data being moved to the cold tier
%##r = A block of time within a day. So %12r would create two blocks, 00
and 01\. 00 for all data in the AM, 01 for all PM data
```

Example setting:

```
packet.dir.cold = /var/lib/netwitness/archiver/database1/alldata/cold-
storage-%y-%m-%d-%8r
```

For the setting above, if a log database file was about to be moved to cold storage and it was created on `2014-03-02 15:00:00`, it would be moved to the following directory on the Cold tier:

```
/var/lib/netwitness/archiver/database1/alldata/cold-storage-2014-03-02-
01
```

The last number `01` needs some explanation. The `%8r` specifier breaks the hours of the day into 24 / 8 = 3 parts. The first eight hours of the day would be block `00`, so 12 a.m. to 8 a.m. The next eight hours are from 8 a.m. to 4 p.m. and are assigned block `01`. Since the data being moved to cold storage was created at 3 p.m., it falls into block `01`. The `%r` format specifier is useful for backing up files with a granularity somewhere between a day `%d` and a single hour `%h`. The Cold storage directory is created on demand and is defined by the data being moved when the format specifiers are used.

The ability to add a date to the path of the data is just a convenience added for backup and restore. It is a way of tagging the data with a date in the path.

packet.file.size,meta.file.size,session.file.size

This controls the size of the files created with each database. It is normally not necessary to change these values as the default values typically work well. This setting takes effect immediately for subsequent files.

packet.files,meta.files,session.files

This setting controls the number of files held open by the database. You can increase this value to improve performance: however, the operating system has an overall limit on the number of files that service can keep open. If this limit is exceeded, an error is reported and the service does not function. This setting takes effect immediately.

In NetWitness Suite 10.6 and later, the default value for packet.files, meta.files, and session.files is `auto` and the service manages the number of open files based on this criteria:

1. Number of collections
2. Amount of system memory

When set to `auto` , the number is dynamic and you can view it in the logs when it changes. For NetWitness Suite 10.6, RSA recommends that you set this value to `auto` and do not change it to a specific number.

packet.free.space.min,meta.free.space.min, session.free.space.min

This setting provides a safety limit on the minimum free space that exists on the paths specified by the packet.dir, meta.dir, and session.dir directories, respectively. This setting is used to prevent the service from running out of space in the event that other programs have filled up the space that should be dedicated to each of the databases. This setting takes effect immediately.

packet.index.fidelity,meta.index.fidelity

This setting controls how frequently packet ID locations and meta ID locations are indexed. This setting can be increased to reduce the amount of space needed by each packet or meta nwindex file, but increasing the setting reduces the speed at which individual packets or meta items can be located. This setting takes effect immediately.

The session database does not have a fidelity setting because it does not generate index files.

packet.integrity.flush,meta.integrity.flush, session.integrity.flush

This setting controls whether the database forces a sync operation on the file system when it is finished writing a file. The default value is `sync` , which means when a file is closed there will be a significant delay while the data writes to non-volatile storage. It may be necessary to set this to `normal` in order to achieve higher sustained write rates, especially on a Decoder. This setting takes effect on the next file created. Therefore, it is expected that at least one more sync will happen if the value was just changed to `normal` .

If packet drops are occurring and packet.integrity.flush is set to `sync` , set it to `normal` and monitor. Keep the session and meta flush settings on `sync` . If packet drops are still problematic, then set all three to `normal` and monitor.

packet.write.block.size,meta.write.block.size, session.write.block.size

The block size represents how much data is allocated at a time within each database file. Larger block sizes can provide higher throughput and compression ratios, and can improve the rate at which items can be retrieved from the database sequentially. However, larger block sizes have a detrimental impact on random read speed for compressed packet and meta items. This setting takes effect immediately.

packet.compression,meta.compression

These parameters control whether the databases compress data. Compression reduces the amount of storage needed by each database, but it can have a major detrimental impact on the speed at which items are written to the database, and the speed at which items are retrieved from the database. Changes take effect immediately on the next file creation.

As of NetWitness Suite 10.4, the valid values for this parameter are `gzip` , `bzip2` , `lzma` , or `none` . `gzip` is the preferred algorithm when compression is used, because it provides a good balance between performance and space savings. Both `bzip2` and `lzma` can achieve better space savings, but the tradeoff in speed is substantial and likely should only be considered for low ingest speeds and when storage space is at a premium.

packet.compression.level,meta.compression.level

You can use these settings to further refine how the compression algorithms behave. They have no effect when compression is disabled. The valid values are between 0–9\. The default value of zero means let the software pick the best setting for speed and compression. The values between 1 and 9 are used as a sliding scale between performance (1) and compression (9). The value of 9 typically gives you the best compression for a given algorithm, but the worst performance. Somewhere in the middle is usually the best setting, which is what zero picks.

hash.algorithm

This setting controls how the database files are hashed. The default value is `none` , so no hashing is performed. The valid values are `none` , `sha256` , `sha1` , or `md5` . Database files can be hashed to provide evidence that they have not been tampered with since they were closed. Hashing is time intensive and affects ingest performance when enabled. This change takes effect immediately.

hash.databases

This setting controls which databases are hashed. Valid values are `session` , `meta` , and `packet` and are comma separated when hashing multiple databases. This change takes effect immediately.

hash.dir

This setting is normally empty, which means the hash file is created in the same directory as the database file that was hashed. If this setting is defined, the hash file is written to the directory specified instead. This could be some form of write-once storage for resilience against hash tampering.

Hash files are small XML files containing the hex encoded hash along with metadata about the database file that was hashed.

Index Configuration Nodes

This topic describes index configuration nodes. The following index configuration nodes are some of the advanced database configuration items of the NetWitness Core database that do not change frequently.

index.dir

The `index.dir` setting controls where the files used by the index are stored. This setting supports the same syntax as the `packet.dir` , `meta.dir` , and `session.dir` settings.

index.dir.warm

The Warm tier storage for index slices. This setting supports the same syntax as `packet.dir.warm` , `meta.dir.warm` , and `ession.dir.warm` .

index.dir.cold

The Cold tier storage for index slices. This setting supports the same syntax as `packet.dir.cold` , `meta.dir.cold` , and `session.dir.cold` .

index.slices.open

This setting controls the number of index slices held open by the index. Index slices are opened automatically as needed by queries. When queries complete, the index engine may hold the slices open so that subsequent queries execute faster. The most recently created slices are the slices that will be held open, since they are mostly likely to be used by queries.

If queries against the index require the index to open slices, then they will execute slower than if the slices were already open. Therefore, this parameter should be tuned such that most queries executed against the index will work on open slices. However, each open index slice consumes some resources, such as file handles and memory. If there are too many index slices open, the overall performance of the service can suffer.

You should set this parameter so that the open index slices will cover most of the time ranges that most queries will need. For example, if most queries are over the past two weeks, and there are index slices created every 8 hours, then there are 14 days x 3 slices per day, or 42 slices created over the past two weeks. Thus, you could set index.slices.open to 42 so that only slices that are likely to be used are held open.

If this parameter is set to 0, then all slices are held open until the next index save. In this scenario, the only thing limiting the number of slices open in the process is the number of slices in the index.

`page.compression`

Deprecated. Versions of the NetWitness Core index between 9.8 and 10.2 supported two different index compression algorithms, and you can choose between them using this setting. As of 10.3, the only recommended value is the default of `huffhybrid` .

`save.session.count`

This setting controls how often the index is automatically saved when new sessions are inserted. If the value of save.session.count is greater than 0, any time more than `save.session.count` sessions are added to the index, the index automatically saves itself. If the `save.session.count` is set to 0, this feature is disabled and the index will not automatically save itself when new sessions are added to the index.

`save.session.count` can be used to implement an automatic save pattern that is based on the volume of data that enters the index. This is useful because it allows a lightly loaded system to generate save points less often.

For more information on the topic of index saves, see the section in this guide on Optimization Techniques .

`reindex.enable`

This setting controls the operation of the background reindexer .

SDK Configuration Nodes

This topic describes the SDK configuration nodes that affect the database. There are some additional configuration items in each Core service that affect the database, but do not actually affect how the database stores or retrieves data. These settings exist in the `/sdk/config` folder.

max.concurrent.queries

This setting controls how many query operations are allowed on the database simultaneously. Allowing more simultaneous query operations can improve overall responsiveness for more users, but if the query load of the Core service is very I/O bound, having a high max.concurrent.queries value can have a detrimental effect. The recommended value is near the number of cores on the system, including hyper threading. Thus, for an appliance with 16 cores, the value should be somewhere close to 32\. Subtract a few for aggregation threads and general system response threads. Subtract a few more if this is a hybrid system (for example, both a Decoder and Concentrator running on the same appliance). There is no magic number, but somewhere between 16 and 32 should work well.

max.pending.queries

This setting controls the backlog size for the query engine of the database. Larger values allow the database to queue more operations for execution. A queued query does not make progress on its execution, so it may be more useful to make the system produce errors when the queue is full, rather than allowing the queue to grow very large. However, on a system that is primarily performing batch operations such as reports, there may be no detrimental effect to having a large queue.

cache.window.minutes

This setting controls a feature of the query engine that is intended to improve query responsiveness when there are a large number of simultaneous users. For more information on cache window, see Optimization Techniques .

max.where.clause.cache

The where clause cache controls how much memory can be consumed by query operations that need to produce a large temporary data set to evaluate sorting or counting. If the where clause cache size is overflowed, the query still works, but it is much slower. If the where clause cache is too large, it is possible for queries to allocate so much memory that the service would be forced into swap or run out of memory. Thus, this value multiplied by the max.concurrent.queries should always be much less than the size of physical RAM. This setting understands sizes in the form of a number followed by a unit, for example `1.5 GB` .

max.unique.values

The maximum unique values limits how much memory can be consumed by the SDK Values function. SDK Values produces a sorted list of unique values. In order to produce accurate results, it may need to merge together large numbers of unique values from many slices. This merged set of values must be held in memory, so this parameter exists to put a limit on how much memory the merged value set can consume. The default value will limit memory usage to approximately 1/10th of total RAM.

query.level.1.minutes,query.level.2.minutes, query.level.3.minutes

These settings are available in NetWitness Suite 10.4 and earlier versions.

In NetWitness Suite 10.4 and earlier, the Core database supports three query priority levels. Each user is assigned to one of the priority levels. Therefore, there are up to three groups of users that can be defined for the purposes of performance tuning. These settings control how long each user level is allowed to execute the queries. For example, lower privileged users may have a lower value so that they are not able to use all the resources of the Core service with long-running queries.

query.timeout

This setting is available in NetWitness Suite 10.5 and later versions.

Query levels have been replaced in NetWitness Suite 10.5 and later with per user account query timeouts. For trusted connections, these timeouts are configured on the NetWitness Suite server. For accounts on Core services, there is a new config node under each account called `query.timeout`, which is the maximum amount of time in minutes that each query can run. Setting this value to zero means no query timeout will be enforced by the Core service.

max.where.clause.sessions

This setting is available in NetWitnes Suite 10.5 and later versions.

This setting imposes a limit on how many sessions can be scanned by a single query. For example, if a user selects all meta from the database, the database stops processing results once the number of sessions read for the query reaches this configuration value. The value of 0 disables this limit.

The number of sessions needed to fully process a query is equal to the number of sessions that match the WHERE clause of the query, assuming that all terms in the where clause have a suitable index. If there are terms in the where clause that are not indexed, the database has to read more sessions and meta, and reaches this limit sooner.

max.query.groups

This setting is available in NetWitness Suite 10.5 and later versions.

This setting imposes a limit on the number of unique groups collected in a single query. For example, if a query has a group by clause with multiple metas that have high unique value counts, the amount of memory needed for that query could easily outpace the amount of RAM available on the server. Thus, this limit exists to prevent out-of-memory conditions from happening.

Setting a value of 0 disables this limit.

packet.read.throttle

This is a decoder-only setting that affects the access to the packets database. When packet.read.throttle is set to a value greater than 0, the decoder attempts to throttle packet reads when it detects packet contention on the packet database. Higher numbers provide more throttling. Changes takes effect immediately.

cache.dir,cache.size

All NetWitness Suite Core services maintain a small file cache of raw content extracted from the device. These parameters control the location (cache.dir) and size (cache.size) of this cache.

parallel.values

This setting is available in NetWitness Suite 10.5 and later versions.

This setting allows SDK-values operations to be executed in parallel. If this is set to 0, it will disable parallel execution. If it is set to a value greater than 0, it represents the number of threads created when each SDK-values operation is executed. The maximum value is the number of logical CPUs available when the process started.

Setting a higher value for parallel.values is useful when there are small numbers of simultaneous users, since it will allow for more complex Investigations to be executed more quickly. If there are many simultaneous users, it is better to use a low value here, since there will be many independent SDK-values operations executed simultaneously.

parallel.query

This setting is available in NetWitness Suite 10.5 and later versions.

This configuration is similar to the parallel.values setting in that the maximum value is the number of logical CPUs. Setting parallel.query to a specific value should take into account the number of simultaneous users to maximize CPU utilization without consistently exceeding available resources.

Setting a higher value for parallel.query is useful when there are small numbers of simultaneous users and queries, since it will allow more complex queries to be executed more quickly. If there are many simultaneous users and queries, it is better to use a low value, since there will be many independent SDK-query operations executed simultaneously.

Query operations are limited by the meta database read rate, so setting parallel.query to a value higher than 4 is unlikely to produce dramatically better results than the default value of 0\. The best number to use for parallel.query will depend on the type of storage attached. Experiment with different values of parallel.query to determine the best results for your storage system.

Per-User Configuration Nodes

This topic describes the per-user configuration nodes. There are settings that influence the actions users are allowed to perform on the database. These settings are stored in the configuration tree at `/users/accounts/<username>/config` , where `<username>` is the name of the user to which the settings apply.

query.prefix

A query prefix applies a filter to every query operation that the user performs. This is implemented by taking the `query.prefix` values and appending it the the where clause of each query using the logical && (and) operator. For more information on Where Clauses, see Queries .

query.level

This setting is available in NetWitness Suite 10.4 and earlier versions.

The query.level setting assigns the query level that the users have for every query they perform. These influence whether their queries are limited by the query.level.1.minutes, query.level.2.minutes, or query.level.3.minutes.

query.timeout

This setting is available in NetWitness Suite 10.5 and later versions.

The query.timeout setting assigns the maximum amount of time in minutes that a user can run each query. For trusted connections, these timeouts are configured on the NetWitness Suite server. For accounts on Core services, this setting is stored in the configuration tree at `/users/accounts/<username>/config` , where `<username>` is the name of the user to which the setting applies. When this value is set to zero, the Core service does not enforce the query timeout.

session.threshold

The session.threshold setting assigns a maximum session threshold for the user. If set, this threshold value is assigned to all values calls that the user performs. A detailed discussion of both the values call and thresholds is covered in this guide.

Scheduler

This topic provides a brief introduction to the scheduler and explains how to schedule commands. All NetWitness Core services come with a built-in scheduler found under `/sys/config/scheduler` . To use the scheduler, you add the command you want to run periodically using one of two messages:

`/sys/config/scheduler addInter` - Add a command to run at the specified interval (every N hours, minutes or seconds)

or

`/sys/config/scheduler addMil` - Add a command to run at the specified time of day or even specific days of the week

Example

For example, suppose that you have a use case to delete all packet data that is greater than seven days old. Since you cannot configure the packet.dir setting to rollout data based on a time interval, you need to schedule the `/database timeRoll` command to run every so often. For this example, create a timeRoll to run every 20 minutes:

```
addIter minutes=20 pathname=/database msg=timeRoll params="type=packet
days=7"
```

This command adds a scheduled task (it is persisted between restarts of the service) to run every 20 minutes, on the `/database` node, and ages out all packet data older than seven days. The `params` parameter is used to pass all the parameters to the command specified (in this case `timeRoll`). Notice how it quotes all the embedded parameters (`type` and `days`) so they are not interpreted as parameters to be passed to the outer `addIter` command. If the parameters inside `params` need to use quotes, you must escape the inner quotes with a backslash. You can rewrite it with embedded quotes, which does not alter the command in any way:

```
addIter minutes="20" pathname="/database" msg="timeRoll"
params="type=\"packet\" days=\"7\""
```

This command works identically to the original, but demonstrates how to escape complicated parameter passing. Additional useful scheduler commands are:

`/sys/config/scheduler print` - Print all scheduled commands (you can also see them by doing an `ls` on the scheduler node).

`/sys/config/scheduler delSched` - Delete a scheduled command by passing in the identifier shown in the `print` (or `ls`) command.

This is a brief introduction to the scheduler. For more information on command parameters, send the `help` message to the scheduler node and pass in the command name via the `msg` parameter. For more information, see the "Services Explore View" topic in the *Host and Services Getting Started Guide* .

Rollover

This topic describes the two rollover mechanisms. The database operates as a first-in, first-out (FIFO) queue. New data is always appended to the database, and the oldest data is automatically removed as needed. Data that is in the middle of the database is immutable, meaning it cannot be modified.

There are two mechanisms to for rollover: synchronous and asynchronous.

Synchronous Rollover

Synchronous rollover refers to rollover settings that are applied in response to a write operation on the database. That means data is removed from the database in direct response to the need to write new data. Synchronous rollover is configured by setting size values on the configuration for `packet.dir` , `meta.dir` , `session.dir` , and `index.dir` .

Synchronous rollover on the packet, meta, and session databases can occur within any write operation. Synchronous rollover on the index occurs when the index is saved.

Asynchronous Rollover

Asynchronous rollover refers to database file removal that occurs when an explicit rollover command is issued to the database. Most commonly this type of rollover is scheduled to run periodically using the built-in scheduler of the Core service. The user can also explicitly request it.

The asynchronous rollover command is the `sizeRoll` message present on the `/index` and `/database` nodes of the configuration tree. The message on the `/database` node does size rollover on packet, meta, and session databases only, while the message on the `/index` node can do simultaneous rollover on both the index and the packet, meta, and session databases.

The `sizeRoll` command has the following parameter syntax:

```
size-roll-params    = {type-param, space}, (max-size-param | min-free-
param | max-percent-param), {max-size-warm-param, space}
type-param          = "type=", {type-flag} , { ",", type-flag } ;
type-flag           = "packet" | "meta" | "session" ;
max-size-param      = "maxSize=", number, {space}, unit ;
max-percent-param   = "maxPercent=", number, {space}, unit ;
min-free-param      = "minFree=", number, {space}, unit ;
max-size-warm-param = "maxSizeWarm=", number, {space}, unit ;
unit                = "t" | "TB" | "g" | "GB" | "m" | "MB" ;
```

```
number              = ? decimal number ? ;
percentage          = ? number between 0 and 100 ? ;
```

The `type` parameter controls the databases to consider for removing the oldest data based on total size or space remaining. If type is not specified on the `/index` sizeRoll, only the index is considered for rollover operations.

The `maxSize` parameter sets a current maximum size of the database or index. If the database is larger than this size, oldest data is deleted first (or moved to the Warm or Cold tier, depending on the configuration) until total size is less than `maxSize` . The `sizeRoll` operation determines which data is oldest out of all the databases and the index based on session IDs. Sessions or index entries with lowest session IDs are deleted first, possibly including removing meta and packet databases that are orphaned by removing entries from the session database. The index data is rolled out if the sessions that it refers to are removed.

The `maxSizeWarm` parameter sets a current maximum size on the *Warm* tier, but otherwise behaves identically to the `maxSize` parameter. When data is rolled out on the Warm tier, it is moved to the Cold tier (if configured) or deleted.

The `maxPercent` parameter sets a maximum percentage of all the volumes of all databases passed in `type` parameter combined. When exceeded, oldest data is deleted first until total size is less than maxPercent of total volumes.

The `minFree` parameter sets a minimum allowed free space on the volumes before oldest data is deleted.

Each call to the sizeRoll operation provides a single pass through the database to delete files. When the operation completes, the current size utilization of the database will have met the criteria specified by the `maxSize` , `maxPercent` , or `minFree` parameters and the optional `maxSizeWarm` . Therefore, this operation can be scheduled periodically to ensure that the database can continue to operate uninterrupted.

Example

The following example shows a typical sizeRoll scheduler entry for an Archiver:

```
pathname=/index minutes=5 msg=sizeRoll params="type=meta,session,packet
maxSize=25TB maxSizeWarm=150TB"
```

This scheduler entry specifies that every five minutes the database ensures that the max size of the meta, session, packet, and index does not exceed 25 terabytes on the Hot tier and does not exceed 150 terabytes on the Warm tier.

Queries

This topic covers the database query syntax. There are three main mechanisms for performing queries in the database, the `query` , `values` , and `msearch` calls on the `/sdk` folder on each Core service.

The `query` call returns meta items from the meta database, possibly using the index for fast retrieval.

The `values` call returns groups of unique meta values sorted by some criteria. It is optimized to return a subset of the unique values sorted by an aggregate function such as count.

The `msearch` call takes text search terms as it's input, and returns matching sessions that match the search terms. It can search within indexes, meta, raw packets, or raw logs.

`query` Syntax

The `query` message has the following syntax:

```
query-params      = size-param, space, query-param, {space, start-meta-
param}, {space, end-meta-param};
size-param        = "size=", ? integer between 0 and 1,677,721 ? ;
query-param       = "query=", query-string ;
start-meta-param = "id1=", metaid ;
end-meta-param    = "id2=", metaid ;
metaid            = ? any meta ID from the meta database ? ;
```

The `id1` , `id2` , and `size` parameters form a paging mechanism for returning a large number of results from the database. Their usage mostly benefits developers who are writing applications directly against the NetWitness Core database. Normally, results are returned in the order of oldest to newest data (higher meta IDs are always more recent). In order to return results from most recent to oldest, reverse the IDs such that `id1` is larger than `id2` . This has a slight performance penalty, because the where clause must be completely evaluated before processing in reverse order can begin.

When size is left off or set to zero, the system streams back all results without paging. For the RESTful interface, this results in the full response to be returned with chunked-encoding. The native protocol returns the results over multiple messages.

The `query` parameter is a `query` command string with its own NetWitness-specific syntax:

```
query-string      = select-clause {, where-clause} {, group-by-clause {,
order-by-clause } } ;
select-clause     = "select ",  ( "*" | meta-or-aggregate {, meta-or-
```

```
aggregate} ) ;
where-clause      = " where ",  { where-criteria } ;
meta-or-aggregate = meta | aggregate_func, "(", meta-key, ")" ;
aggregate_func    = "sum" | "count" | "min" | "max" | "avg" | "distinct"
| "first" | "last" | "len" | "countdistinct" ;
group-by-clause   = " group by ", meta-key-list
meta-key-list     = meta-key {, meta-key-list}
order-by-clause   = " order by ", order-by-column
order-by-column   = meta-or-aggregate { "asc" | "desc" } {, order-by-
column}
```

The `select` clause allows you to specify either `*` to return all the meta in all the sessions that match the where clause, or a set of meta field names and aggregate functions to select a subset of the meta with each session.

The `select` clause may contain renamed meta key names. Any fields appearing in the result set as a result of a renamed key in the `select` clause will be returned with the meta key name matching the name used in the `select` clause. For example, if the key `port_src` is used to rename `tcp.srcport` , then a query containing `select port_src` will only return `port_src` fields, even if the underlying meta had type `tcp.srcport` .

The aggregate functions have the following effect on the query result set.

Function	Result
`sum`	Add all meta values together; only works on numbers
`count`	The total number of meta fields that would have been returned
`min`	The minimum value seen
`max`	The maximum value seen
`avg`	The average value for the number
`distinct`	Returns a list of all unique values seen
`countdistinct`	Returns the number of unique values seen. `countdistinct` is equivalent to the number of metas that would have been returned by the distinct function.
`first`	Returns the first value seen
`last`	Returns the last value seen
`len`	Converts all field values to a UInt32 length instead of returning the actual value. This length is the number of bytes to store the actual value, not the

length of the structure stored in the meta database. For example, the word "NetWitness" returns a length of 10. All IPv4 fields, like `ip.src` , return 4 bytes.

`where` Clauses

The `where` clause is a filter specification that allows you to select sessions out of the collection by using the index.

Syntax:

```
where-criteria    = criteria-or-group, { space, logical-op, space,
criteria-or-group } ;
criteria-or-group = criteria | group ;
criteria          = meta-key, ( unary-op | binary-op meta-value-ranges )
;
group             = ["~"], "(" where-clause ")" ;
logical-op        = "&&" | "||" ;
unary-op          = "exists" | "!exists" ;
binary-op         = "=" | "!=" | "<" | ">" | ">=" | "<=" | "begins" |
"contains" | "ends" | "regex" ;
meta-value-ranges = meta-value-range, { ",", meta-value-range } ;
meta-value-range  = (meta-value | "1" ), [ "-", ( meta-value | "u" ) ] ;
meta-value        = number | quoted-value | ip-address | mac-address |
relative-time ;
quoted-value      = ( '"' text '"' ) | ( '"' date-time '"' ) ;
relative-time     = "rtp(" , time-boundary , "," ,  positive-integer ,
time-unit, ")" ;
time-boundary     = "earliest" | "latest" ;
positive-integer  = ? any non-negative integral number ?
time-unit         = "s" | "m" | "h" ;
```

When specifying rule criteria, the `meta-value` part of the clause is expected to match the type of the meta specified by the `meta-key` . For example, if the key is `ip.src` the `meta-value` should be an IPv4 address.

Queries using a `meta-key` name will match meta items corresponding both to the `meta-key` name as well as to the names of any "renames" specified for the key. See "Key Renaming" under the Index Customization topic for details on key renaming.

Query Operators

The following table describes the function of each operator.

Operator	Function
=	Match sessions containing the meta value exactly. If a range of values is specified, any of the values is considered a match.
!=	Matches all sessions that would not match the same clause as if it were written with the = operator.
<	For numeric values, matches sessions containing meta with the numeric value less than the right side. If the right side is a range, the first value in the range is considered. If multiple ranges are specified, the behavior is undefined. For text metas, a lexicographical comparison is performed.
<=	Same behavior as < , but sessions containing meta that equals the value exactly are also considered matches.
>	Similar to the < operator, but matches sessions where the numeric value is greater than the right side. If the right side is a range, the last value in the range is considered for the comparison.
>=	Same behavior as > , but sessions containing meta that equals the value exactly are also considered matches.
begins	Matches sessions that contain text meta value that starts with the same characters as the right side.
ends	Matches sessions that contain text meta that ends with the same characters as the right side.
contains	Matches sessions that contain text meta that contains the substring given on the right side.
regex	Matches sessions that contain text meta that matches the regex given on the right side. The regex parsing is handled by boost::regex.
exists	Matches sessions that contain any meta value with the given meta key.
!exists	Matches sessions that do not contain any meta value with the given meta key.
length	Matches sessions that contain text meta values of a certain length. The expression on the right side must be a non-negative number.

Text Values

The system expects quoted text values. Unless it can be parsed as a time (see below), a quoted value is interpreted as text.

IP Addresses

IP addresses can be expressed using standard text representations for IPv4 and IPv6 addresses. In addition, the query can use CIDR notation to express a range of addresses. If CIDR notation is used, it is expanded to the equivalent value range.

MAC Addresses

A MAC address can be specified using standard MAC address notation: `aa:bb:cc:dd:ee:ff`

Date and Time Expressions

In NetWitness Suite, dates are represented using Unix epoch time, which is the number of seconds since Jan 1, 1970 UTC. In queries, you can express the time as this number of seconds, or you can use the string representation. The string representation for the date and time is `"YYYY-mmm-DD HH:MM:SS"` . A three-letter abbreviation represents the month. You can also express the Month as a two-digit number, 01-12.

Time values must be quoted.

All times specified in queries are expected to be in UTC.

Relative Time Points

Relative time points allow a where clause to reference a value at some fixed offset relative to the earliest or latest time metas seen in the collection.

A relative time point expression has the syntax `rtp(boundary, duration)` .

The boundary is either `earliest` or `latest` .

The duration is an expression of hours, minutes, or seconds. For example, `24h` , `60m` , or `60s` .

Relative time points can only be used in SDK operations, where there is a collection from which to get the boundaries for earliest and latest time metas.

Relative time points only work on indexed meta types. The default indexed meta types are `time` and `event.time` .

Examples:

```
Last 90m of collection time:
time = rtp(latest, 90m) - u
```

```
First 2 days of event time:
event.time = l - rtp(earliest, 48h)
```

Special Range Values

Ranges are normally expressed with the syntax * `smallest` * - * `largest` *, but there are some special placeholder values you can use in range expressions. You can use the letter `l` to represent the lower-bound of the all meta values as the start of the range, and `u` to represent the upper bound. The bounds are determined by looking at the smallest or largest meta value found in the index out of all the meta values that have already entered the index.

If you use the `l` or `u` tag, it should be unquoted.

For example, the expression `time = "2014-may-20 11:57:00" - u` would match all time from that 2014-may-20 11:57:00 to the most recent time found in the collection.

Notice that it is easy to confuse a range expression with a text string. Make sure that text values that contain − are quoted, and that hyphens within range expressions are not within quoted text.

`group by` Clause (since 10.5)

The query API has the ability to generate aggregate groups from the results of a query call. This is done using a `group by` clause on the query. When `group by` is specified, the result set for the query is subdivided into groups. Each group of results is uniquely identified by the meta values indicated in the group by clause.

For example, consider the query `select count(ip.dst)` . This query returns a count of all ip.dst metas in the database. However, if you add a `group by` clause, like this: `select count(ip.dst) group by ip.src` , the query returns a count of the ip.dst metas found for each unique ip.src.

As of NetWitness Suite version 10.5, you can utilize up to 6 meta fields in a `group by` clause.

The `group by` clause shares some of the same functionality as the `values` call, but it offers significantly more advanced groups at the expense of longer query times. Producing the results of a grouped query involves reading the meta from the meta database for all sessions that match the `where` clause, while a values call can produce its aggregates by reading the index only.

The contents of each group returned by the query are defined by the `select` clause. The `select` clause can contain any of the aggregate functions or meta fields selected. If multiple aggregates are selected, the result of the aggregate function is defined for each group. If nonaggregate fields are selected, the meta fields are returned in batches for each group.

The result set of a `group by` query is encoded with the following rules:

1. All meta items associated with a group are delivered with the same group number.
2. The first meta items returned to the group identify the group key. For example, if the `group by` clause specifies `group by ip.src` , then the first meta item of each group will be an `ip.src` .
3. The normal, nonaggregate meta items are returned after the `group key` , but they all will have the same group number as the group key metas.
4. The aggregate result meta fields for each group are returned next.
5. All fields within a group are returned together. Different group results will not be interleaved.

If one of the `group by` meta items is missing from one of the sessions matched by the `where` clause, that meta field is treated as a NULL for the purposes of that group. When the results for that group are returned, the NULL-valued parts of the group key will be omitted from the group's results, since the database has no concept of NULL.

The semantics of a `group by` query differ from a SQL-like database in terms of what meta fields are returned. SQL databases require you to select the `group by` columns explicitly in the `select` clause if you want them to be returned in the result set. The NetWitness Core database always implicitly returns the group columns first.

A query with a `group by` clause honors the result set `size` parameter if one is provided. However, due to the nature of the grouping, it puts an additional burden on the caller to page and reform groups if a fixed-size result set is requested. For this reason, you should not specify an explicit result size when making a `group by` call. By not specifying an explicit size, the entire result set will be delivered as partial results.

The following table describes the database honors configuration parameters that limit I/O or memory impact of a group by query.

Parameter	Function
`/sdk/config/max.query.groups`	This is the limit on how many groups can be held in memory to calculate aggregates. This parameter allows you to limit the overall memory usage of the query.
`/sdk/config/max.where.clause.sessions`	This is the limit on how many sessions from the where clause can be processed in a query. This parameter allows you to set a limit on the number

of sessions that have to be read from the meta and session databases to resolve a query.

`order by` Clause (since 10.5)

An `order by` clause can be added to a query that contains a `group by` clause. The `order by` clause causes the set of grouped results to be returned in sorted order.

An `order by` consists of a set of items to sort by in ascending or descending order. Sorting can be performed on any data field that will be returned in the result set. This includes meta specified by the `select` clause, aggregate function results specified by the `select` clause, or `group by` meta fields.

The `order by` clause can sort over many columns. There is no limit on the number of `order by` columns allowed in the query; but a practical limit exists in that each of the `order by` columns must refer to something returned by the `select` clause or `group by` clause. The multiple column sort is imposed lexicographically, meaning that if two groups have equal values for the first column, then they are sorted by the second columns. If they are equal in the second column, they are sorted by the third column, and so on for however many `order by` columns are provided.

The NetWitness Core database is unique in that the groups of results returned by a query may each have many values for a selection. For example, it is possible to select all meta items that match a meta type and organize them into groups, and it is possible to use the `distinct()` function to return groups of distinct meta values. If an `order by` clause references one of the fields in the group that has multiple values, the sorting order is applied as follows:

1. Within each group, the fields with multiple matching values are ordered by the ordering clause
2. All the groups are sorted by comparing the first occurrence of the ordered field found within each group

The `order by` clause is only available in queries that have a `group by` clause, since groups are required to organize the meta fields into distinct records. If you wish to sort an arbitrary query as if there were no grouping applied, use `group by sessionid` . This ensures that results are returned in groups of distinct sessions or events.

`group by` clauses are naturally returned in ascending group key order; but, an `order by` clause can be used to return groups in a different order.

If an `order by` column does not specify `asc` or `desc` , the default ordering is ascending.

Examples:

```
select countdistinct(ip.dst) GROUP BY ip.src ORDER BY countdistinct
(ip.dst)
```

```
select countdistinct(ip.dst) GROUP BY ip.src ORDER BY countdistinct
(ip.dst) desc
select countdistinct(ip.dst),sum(size) GROUP BY ip.src ORDER BY sum
(size) desc, countdistinct(ip.dst)
select sum(size) GROUP BY ip.src, ip.dst ORDER BY ip.dst desc
select user.dst,time GROUP BY sessionid ORDER BY user.dst
select * GROUP BY sessionid ORDER BY time
```

`values` call

The index provides a low-level `values` function to access the unique meta values that have been stored in the index. This function allows developers to perform more advanced operations on groups of unique meta values.

The `values` call parameter syntax:

```
values-params          = field-name-param, space, where-param, space,
size-param, {space, flags-param} {space, start-meta-param}, {space, end-
meta-param}, {space, threshold-param}, {space, aggregate-func-param},
{space, aggregate-field-param}, {space, min-param}, {space, max-param} ;
field-name-param       = "fieldName=", meta-key ;
where-param            = "where=", where-clause ;
size-param             = "size=", ? integer between 1 and 1,677,721 ? ;
start-meta-param       = ? same as query message ?
end-meta-param         = ? same as query message ?
flags-param            = "flags=", {values-flag, {"," values-flag} } ;
values-flag            = "sessions" | "size" | "packets" | "sort-total" |
"sort-value" | "order-ascending" | "order-descending" ;
threshold-flag         = "threshold=", ? non-negative integer ? ;
aggregate-func-param   = "aggregateFunction=", { aggregate-func-flag } ;
aggregate-func-flag    = "count" | "sum" ;
aggregate-field-param = "aggregateFieldName=", meta-key ;
min-param              = "min=", meta-value ;
max-param              = "max=", meta-value ;
```

The `values` call provides the function of returning a set of unique meta values for a given meta key. For each unique value, the `values` call can provide an aggregate total count. The function used to generate the total is controlled by the flags parameter.

Parameters

The following table describes the function of each parameter.

Parameter	Function
`fieldName`	This is the meta key name for which you retrieve unique values. For example, if `fieldName` is `ip.src` , this function returns the unique source IP values in the collection. If the `fieldName` refers to a key with rename references, the result is defined as the combined set of field values for the given meta key name plus all of the references' meta keys.
`where`	This is a `where` clause which filters the set of sessions for which the unique values are returned. For example, if the `fieldName` is `ip.src` , and the `where` clause is `ip.src = 192.168.0.0/16` , only values in the range of `192.168.0.0` to `192.168.255.255` are returned. For information on the `where` clause syntax, see *Where Clauses* .
`size`	The size of the set of unique values to return. This function is optimized to return a small subset of the possible unique values in the database.
`id1` , `id2`	These optional parameters limit the scope of the search for unique values to a specific region of the meta database and the index. Setting the `id1` and `id2` parameters to a limited range of the meta database is very important to running searches quickly on large collections.
`flags`	Flags control how the values are sorted and totaled. Flags are described in the following Values Flags section.
`threshold`	Setting the `threshold` parameter allows the `values` call to short-cut collection of the total associated with each value once the threshold is reached. By providing a threshold, the caller can reduce the amount of index and meta items that must be retrieved from the database. If the `threshold` parameter is omitted or set to 0, this optimization is not used.

`aggregateFunction`	Optional parameter used to change the default behavior from counting sessions, packets, or size to counting or summing the numeric field defined by `aggregateFieldName` . Both parameters must be specified when either is defined. Pass either `sum` or `count` to specify which behavior to perform.
`aggregateFieldName`	The meta field on which to perform the `aggregateFunction` . Both `aggregateFunction` and `aggregateFieldName` parameters must be specified when the `aggregate` flag is set. Performing a `values` call using one of the aggregate functions can be significantly slower than a `values` call that collects totals of sessions, packets, or size. The reason for this is that each session that matches the `where` clause must be retrieved from the meta database. This scan causes a large portion of the query to be I/O bound on the meta DB volumes. The time taken to run an aggregate `values` call is linearly proportional to the number of sessions that match the `where` clause.
`min` , `max`	The minimum and maximum value that should be returned from the call. These parameters are used to iterate (or page) over an extremely large number of values, typically more values than could be returned from a single call. Primarily used in conjuction with the flags `sort-value,sort-ascending` such that the highest value returned would be used in a subsequent call as the `min` parameter value. The values are exclusive. If `min="rsa"` was specified and `rsa` was a valid value, `rsa` would not be returned; instead, the next highest value would be returned.

`values` Flags

The `flags` parameter controls how the values call operates. There are three groups of flags that correspond to the different modes of operation as shown in the following table.

Flag	Description
`sessions` , `size` ,	The `values` call allows you to specify one of these flags to determine how the total for each value is calculated. If the flag is `sessions` , the `values` call

`packets`	returns a count of sessions that contain each value. If the flag is `size` , the `values` call totals the size of all sessions that contain each unique value, and reports the total size for each unique value. If the flag is `packets` , the values call totals the number of packets in all sessions that contain each unique value, and then reports that total for each unique value.
`sort-total` , `sort-value`	These flags control how results are sorted. If the flag is `sort-total` , the result set is sorted in order of the totals collected. If the flag is `sort-value` , the results are returned in order of the sorting order of the values.
`order-ascending` , `order-descending`	These flags control the sort order of the result set. For example, if sorting by total in descending order, the values with the greatest total are returned first.

`values` Call Example

The `values` call is used extensively by the Navigation view in NetWitness Suite. The default view generates calls that look like this:

```
/sdk/values id1=198564099173 id2=1542925695937 size=20
flags=sessions,sort-total,order-descending threshold=100000
fieldName=ip.src where="time=\"2014-May-20 13:12:00\"-\"2014-May-21
13:11:59\""
```

In this example, the Navigation view requests unique values for `ip.src` . It requests unique values of `ip.src` in the time range given. It asks for the count of sessions that match each `ip.src` , and the results are the top 20 `ip.src` values when sorted by the number total count of sessions in descending order. In addition, the Navigation view has a meta ID range in order to provide an optimization hint to the query engine.

`msearch` Call

The index provides a low-level `msearch` function to perform text searches against all meta types. This type of search does not require users to define their queries in terms of known meta types. Instead, it searches all parts of the database for matches. `msearch` is used by the Events view text search. See the "Filter and Search Results in the Events View" topic in the *Investigation and Malware Analysis Guide* for detail on the accepted search forms and examples.

`msearch` parameters:

```
msearch-params  = search-param, {space, where-param}, {space, limit-
param}, {space, flags-param};
search-param    = "search=", ? free-form search string ? ;where-param
 = "where=", ? optional where clause ? ;
limit-param     = "limit=", ? optional session scan limit ? ;flags
    = "flags=", {msearch-flag, {"," msearch-flag} };
msearch-flag    = "sp" | "sm" | "si" | "ci" | "regex" ;
```

The `msearch` algorithm works as follows:

1. A set of sessions is identified from the index by finding the intersection of three sets:
   - (Set 1) All sessions in the database
   - (Set 2) Sessions that match the `where` clause parameter
   - (Set 3) If the `si` flag is specified, sessions that indexed values that match the search string parameter.
2. If the search specifies the `sm` parameter, all meta items from the set of sessions identified in step 1 are read and scanned to see if they match the search string parameter. The meta items will be read from the service nearest to the point where the search was executed. For example, if the search is performed on a Broker, the meta items may be read from the Concentrator nearest to the broker, but if the search is performed on an Archiver the meta items will be read from the Archiver itself.
3. If the search specifies the `sp` parameter, all raw packet or log entries from the set of sessions identified in step 1 are read and scanned to see if they match the search string parameter. The packets will be read from the service nearest to the point where the search was executed. For example, if the search is performed on a Concentrator, the packet data will be read from the Decoder, but if the search is performed on an Archiver, the packet data will be read from the Archiver itself.
4. Matches from step 2 and step 3 are returned as they are found, up to the point where the `limit` parameter is reached. Limit specifies the maximum number of sessions for which meta and packet data will be scanned. If limit is not specified, the entire set of sessions determined in step 1 is scanned.

`msearch` Flags

Flag	Description
`sp`	Scans raw packet data

`sm`	Scans all meta data
`si`	Does index lookups for all search parameters before scanning meta
`ci`	Performs a case insensitive search. Returned results are case-preserving.
`regex`	Treats the search parameter as a regular expression. Only a single regular expression can be specified, but the regular expression may be arbitrarily complex.

`msearch` Index Search Mode

Using the index search mode, specified by using the `si` flag, causes results to be returned significantly faster than any other mode. The main limitation of this mode is that it only returns matches on text terms that match value-indexed meta values.

- The `si` parameter must be combined with the `sm` flag. The `si` parameter implies the search only matches indexed meta.
- The `si` parameter can be used with regex searches, however only text indexed values will match. IP addresses and numbers will not match the regex.

`msearch` Tips

- Always use the `where` clause to specify a time range for the search.
- To search for IP address ranges, specify them in the `where` clause.
- Use the `limit` parameter when not using the index search mode. Without it, there will be an extremely large amount of data read by the meta and packet databases.

Stored Procedures

The `query` and `values` calls provide more low-level search functionality. For more advanced use cases, server-side stored procedures exist.

Use of Quotes in Query Syntax

The query parser does not care whether you use single or double quotes within a query statement. A single- or double-quoted value is treated as text meta.

The query parser attempts to make sense of whatever you put in the statement. It is not very strict about what it will accept.

For example:

```
reference.id=4752
```

This clause identifies sessions that have a `reference.id` meta value that has a *numeric* value of 4752.

`reference.id='4752'` or `reference.id="4752"`

This clause identifies sessions that have a `reference.id` meta value that has a *string* value of `4752` .

However, the query engine implicitly compares numbers and strings that look like numbers as equal when the values are semantically the same. So it works with either syntax.

For most efficient performance, however, it is always a good idea to construct the queries such that the query syntax matches the data types generated by the parser.

For example, if the parser is creating `reference.id` as a numeric data type (such as `uint32` or `uint64`), then use the numeric syntax.

If the parser is creating `reference.id` as a text data type, then use the string syntax.

Index Customization

This topic describes how to use the custom index file to customize the index. Each NetWitness NextGen service is installed with a default index configuration that is intended to cover the index needs for most users of the product. However, it is possible to index new meta keys in order to use the index with custom content that generated custom meta.

Index Configuration File Locations

The index customization is accomplished by making changes to the custom index file. The location of this file is **/etc/netwitness/ng/index-<servicename>-custom.xml** , where **<servicename>** corresponds to the name of the product that you are customizing. For example, the Concentrator custom index file is /etc/netwitness/ng/index-concentrator-custom.xml.

Concentrator products also include a file that describes the default index configuration: **/etc/netwitness/ng/index-concentrator.xml** . This file is useful as a template to show how the custom index file is formatted.

If you make customizations to the index in the custom index file, those customizations override any conflict with the default index configuration.

You can make changes to the custom index file while the service is running. When the service receives an index save command, the changes to the custom index file are read and applied to the index.

Changes to the index can only be applied to new incoming data. Data cannot be retroactively reindexed with a new custom index configuration, except by rebuilding the index .

Index configuration entries

The custom index file is an XML document. The root element of this document is the `language` element, and inside there is an elements per meta key to describe each custom index. Each element of the custom index configuration looks like this:

```
<key name="did" description="Decoder Source" level="IndexValues"
format="Text" valueMax="100"  />
```

Definitions for each attribute in this element: Attribute | Description -|- name | The name of the meta key that will be indexed description | A human-readable description for the meta type level | The type of index that will be created for this meta key valueMax | The maximum unique values that will be stored for this key per slice format | The format of the data held by all meta items with this meta key name.

The next few sections examine these parameters in greater detail.

Meta names

The meta name used by the index refers to the meta key name present within every meta item in the meta database. These meta names are generated by the Decoders when parsing. Parsers can choose to generate meta with any meta key name. Therefore, the custom index allows you to choose which of the meta items generated by the Decoder are indexed.

Meta key names can be 16 characters long, and contain only letters or the '.' character.

Data Types

When the Decoder generates meta items, it assigns a data type. Each parser can choose the data type of the meta it generates. However, there are recommended and standard data types for each of the default meta keys. For example, ip.src and ip.dst are stored as the IPv4 meta type, and alias.host is stored as the Text meta type. Each parser must agree on the data format for each meta key generated by the Decoder.

When adding a custom index to the Concentrator, the data type of the custom index must match the format of the data generated by the Decoder. If the types do not match, the Concentrator attempts conversions of the meta generated into the type specified for the custom index. However, these conversions sometimes fail, and the resulting index can produce undefined results.

Likewise, when many Decoders and Concentrators work together as part of a NetWitness installation, they must all agree on the types for each meta key. Conflicts of meta types between NetWitness NextGen services can lead to undefined behavior.

The following table shows the metadata types supported by the NetWitness NextGen services.

Type	Size in bytes	Description
Int8	1	Signed 8-bit integer
UInt8	1	Unsigned 8-bit integer
Int16	2	Signed 16-bit integer
UInt16	2	Unsigned 16-bit integer
Int32	4	Signed 32-bit integer
UInt32	4	Unsigned 32-bit integer
Int64	8	Signed 64-bit integer
UInt64	8	Unsigned 64-bit integer
UInt128	16	Unsigned 128-bit integer
Float32	4	32-bit floating point number, single precision
Float64	8	64-bit floating point number, double precision

TimeT	8	Unix epoc timestamp
Binary	1-255	Arbitrary binary data
Text	1-255	UTF-8 Encoded text data
IPv4	4	IPv4 address bytes
IPv6	16	IPv6 address bytes
MAC	6	MAC Address bytes

When defining a custom index, it is important to use the best data type for the meta. For example, never store IP addresses as Text, since the Text representation takes more bytes than the IPv4 representation.

Index Levels

There are three levels, or types, of indexing: IndexNone, IndexKeys, and IndexValues.

IndexNone

This type of custom index is not really an index at all. Custom index entries with the IndexNone level exist only to define and document the meta key. IndexNone entries can be used in custom Decoder indices to enforce a specific data type for a meta key across all the parsers on a Decoder.

IndexKeys

This type of custom index indicates that the index only keeps track of sessions that contain meta items with this meta key name. However, it does not index any unique values in the meta database for the meta key.

Key-level indices take much less storage space, memory, and CPU time to manage, but they require a lot more work from the query engine when you perform query or values operations using them.

If used in a where clause, a meta key indexed at the key level can only be used to resolve operations such as exists or !exists.

IndexValues

This type of custom index keeps sessions that contain each individual unique value for the meta key. This type of index is also known as a "full index".

This type of index is needed for efficient processing of most where clauses, and for use of this meta key as the fieldName parameter of a values call.

Value Max

Value max is a parameter that can have a very significant impact on the accuracy and performance of a Value-level index.

As a Decoder parses packets or logs, it is allowed to create meta of any type with any value. Usually, these meta items are created from data copied directly out of the packet or log. Therefore, anyone can create unique meta values in response to nearly any event.

The performance of the index is directly dependent on the number of unique values it has found for each meta key. As the number of unique values increases, the rate at which new meta is indexed can decrease, and the speed with which queries are completed decreases. Since any person can influence the creation of unique meta values, it is possible for any person to affect the performance of the index.

The value max parameter limits the number of unique values that can enter the index. Therefore, a malicious user cannot flood the system with a large number of unique values in an attempt to make the NetWitness system not work.

It is important to set a value max on any meta key that may have its value influenced directly by incoming packets or logs.

The value max applies only to values added since the last index save operation.

The limit for how high value max can be set varies from version to version and on the amount of RAM available to the NetWitness NextGen service. As of 10.3, the recommended ceiling for value max is 5,000,000 for any meta key. If there are a lot of custom indices, then the value max may have to be lower.

maxLength

The max length parameter is used exclusively on the `word` meta type. It must match the corresponding setting for **/decoder/parsers/config/token.max.length** on the Log Decoder service that is generating word token metas. The index uses the maxLength to properly interpret search terms fed into the `msearch` SDK function.

Key Renaming

The index language supports the concept of key renaming. This feature is used to provide backwards compatibility for new key names to deprecate and replace old key names. A renaming is achieved by adding `rename` elements to the key. This has the effect of indicating the parent key renames the key in the rename element. For example, the key definition below defines a new key named `port_src` that renames the key `tcp.srcport` .

```
<key name="port_src" description="Source Port" format="UInt16"
level="IndexValues">
       <rename name="tcp.srcport"/>
</key>
```

The rename element indicates to the database that uses of the parent key, in this case `port_src` will include both meta items with type port_src, and meta items with type tcp.srcport. Thus, new meta items can be added to the database and queried using `port_src` , and the such queries will return information that was previously stored in tcp.srcport as well.

The rename element accepts a single attribute, `name` , that refers to a previously defined key.

Keys referred by rename elements must have the same type as the parent key.

Keys referred by rename elements must have the same index level as the parent key.

If a key is redefined in a custom index file, and the redefined key contains rename elements, then those rename elements replace any previously defined rename elements.

Rebuilding the Index

Under normal operation, changes made to the index configuration for a service are only applied to new data that enters the collection. Rebuilding the index over all the data in the collection is a time-consuming process because it requires all of the meta database storage to be read from disk.

In version 11.0 and later, it is possible to rebuild the index while the service is online. Version 11.0 services rebuild indexes in the background whenever the service detects that part of the session and meta databases is unindexed.

Activating the Background Reindexer

The background reindexer is activated whenever the service starts. During startup, the indexer checks for gaps between sessions that are indexed and sessions that are present in the session and meta database. If any gaps are found, the background reindexer begins reindexing the session and meta database on the service.

Examples of events that may activate the background reindexer:

1. A power failure or crash occurred, rendering the last slice of the index corrupt. The corrupt data is deleted at startup, leaving a gap in the index.
2. Index data is forcibly deleted, either by doing an index reset or deleting files from the filesystem.

Controlling the Background Reindexer

The operation of the background indexer is controlled by the configuration node `/index/config/reindex.enable` . If `reindex.enable` is set to true, the next time the service starts the reindexer will operate. If `reindex.enable` is set to false, the reindexer will not start the next time the service starts, but will continue to operate until the service is restarted.

Background Reindexing Algorithm

The operation of the background indexer is as follows:

1. The index examines the ranges of sessions that are present in the index and compares them to the ranges of sessions that have valid meta data. Any discrepancies between the two are considered gaps.

2. The gaps in the index are subdivided into slices based on the current value of `/index/config/save.session.count`.
3. For each slice that is missing, a temporary index is created in one of the directories specified by `/index/config/index.dir`. The slices are reindexed in reverse numerical order. Thus, the most recently collected sessions are indexed first.
4. Once the slice is completely reindexed, it is moved into its valid location in the online index. If the reindexed slice belongs on the warm tier, it is moved to the warm tier.
5. The newly indexed data appears as part of the collection.

Background indexer status

The stat node `/index/stats/updater.state` indicates the current state of the background reindexer. This node will say `running`, `not running`, or `failed`. If the status is `failed`, check the service log for more diagnostic information.

Effects on Aggregation

Services that perform aggregation utilize the index to keep track of sessions that have already been aggregated. If the index does not have enough information to begin aggregation, aggregation will be offline until enough slices have been reindexed. During this time the aggregation status for the upstream device will indicate that it is waiting on aggregation.

Forcing A Reindex

To force the index on a service to be rebuilt:

1. Ensure that `/index/config/reindex.enable` is true.
2. Reset the index by using the `reset` message on the service. For example: `/concentrator/reset index=1` will restart the service and delete all the index files.
3. Wait for the service to restart. Background reindexing will start.
4. The most recently collected data will be available for queries as soon as the index slice representing those sessions has been reindexed.

Optimization Techniques

This topic describes optimization techniques for the NetWitness Core database. The NetWitness Core database is set up to work with a wide variety of work loads by default. However, like any database technology, its performance can be very sensitive to both the nature of the data being ingested, and the nature of the searches that the user performs against the database.

Thresholds

Thresholds are a useful optimization that can have a dramatic effect on how fast results are returned to the NetWitness Suite Navigate view. Thresholds are applied to the `values` call. For more information about the `values` call, see Queries .

The threshold defines a limit to how much of the database is retrieved from disk in order to produce a count. For most queries, the number of sessions that match the `where` clause is very large. For example, selecting all the log events for just one hour running at 30,000 events per second matches 108,000,000 sessions.

RSA introduced the threshold feature based on the observation that most cases where a count of sessions is required do not have to have results that are accurate down to the very last session. For example, when looking at the top 20 IP addresses present over the past hour, it is not very important if the report indicates that an IP value matched 10,000,000 or 10,000,001 sessions exactly. The estimate is good enough. In these scenarios, we can make an estimate for the value of the count returned when our count exceeds the threshold parameter. When the threshold is reached, the remaining count is estimated, and the results are sorted based on the estimated counts, if necessary.

Complex `where` Clauses

The amount of time it takes for the NetWitness Core database to produce a result is dependent on the complexity of the query. Queries that align directly with the indexes present on the meta can be resolved quickly, but it is very easy to write queries that cannot be resolved quickly. Sometimes, queries that cannot be returned quickly can be processed by the Core database and the index differently to produce much more satisfying results for the customer.

It is useful to know the relative *cost* of each part of the `where` clause. A clause with a high cost takes longer to execute. In the following table, the query operations are ordered in terms of their relative cost, from lowest to highest.

Operation	Cost
exists, !exists	Constant
= , ! =	Logarithmic in terms of the number of unique values for the meta key, linear in

	terms of the number of unique elements that match a range expression
< , > , <= , >=	Logarithmic in terms of unique value lookup, but more likely to be linear since the expression matches a large range of values
begins , ends , contains	Linear in terms of the number of unique values for the meta key
regex	Linear in terms of the number of unique values for the meta key with a high per-value cost

AND and OR

When constructing a where clause, keep in mind that constructing many terms using the AND operator can have a beneficial affect on the performance of a query. Any time that multiple criteria can be used to filter down the set of sessions matching the where clause, there is less work for the query to do. Likewise, each OR clause creates a larger set of sessions to process for each query.

As a general rule of thumb, the more AND clauses in the query, the faster it completes, but the more OR clauses in the query, the slower it completes.

Use Case: Match a Large Subnet

It is common for users to construct queries that attempt to include or exclude a class-A subnet. This type of query is common because the users are trying to include or exclude some large portion of their internal network from their investigation.

It is a problem for the query engine to resolve this query using the ip.src or ip.dst indices alone. The issue arises from the fact that a where clause such as this:

```
ip.src = 10.0.0.0/8
```

Actually must be interpreted as:

```
ip.src = 10.0.0.0 || ip.src = 10.0.0.1 || ip.src = 10.0.0.2 || ... ||
ip.src = 10.255.255.255
```

Thus, the index could have to create a where clause with more than 16 million terms.

The solution to this problem is to use the Decoder to tag common networks of interest using application rules. For example, you could create meta items with an application rule that looks like this:

```
name=internal rule="ip.src = 10.0.0.0/8" order=3 alert=network
```

This rule creates meta items in the meta key network with the value internal for any IP address in the 10.0.0.0/8 network.

The `where` clause could be expressed as:

```
network = "internal"
```

Assuming there is a `value-level` index on the network meta data, the index does not have to expand this query into anything more complex, and the sessions matching the desired subnet are matched very quickly.

Use Case: Substring Matching

Using the operators `begins` , `ends` , `contains` , and `regex` in a `where` clause can be very slow if there are a large number of unique values for the meta key. Each of these operators is evaluated independently against each unique value. For example, if the operator is `regex` , the `regex` must be run independently against each unique value.

To work around this, the most effective strategy is to reorganize the meta items such that the user does not have to use a substring match.

For example, consider if the users are attempting to find the host name within a URL somewhere in the session. The users might write a `where` clause such as:

```
url contains 'www.rsa.com'
```

In this scenario, it is likely that the `url` meta key contains one unique value for every session that was captured by the Decoder, and therefore has a huge number of unique values. In this case, the contains operation is slow.

The best approach is to identify the part of meta data they are attempting to match, and move the matching into the content parser.

For example, if there is meta data being generated for each URL, a parser could also break down the URL into its constituent components. For example, if the Decoder generates URL meta data with the value `http://www.rsa.com/netwitness` , it could also generate `alias.host` meta data with the value `www.rsa.com` . Queries could be performed using:

```
alias.host = 'www.rsa.com'
```

Since the substring operator is no longer needed, the query is much faster.

Index Saves

The Core index is subdivided by save points, also known as slices. When the index is saved, all the data in the index is flushed to disk, and that portion of the index is marked as read-only. Saves serve two functions:

- Each save point represents a place where the index could be recovered in the case of a power failure.
- Periodically saving can ensure that the portion of the index that is actively being updated does not grow larger than RAM.

Save points have the effect of partitioning the index into independent, non-overlapping segments. When a query must cross over multiple save points, it must re-execute parts of the query and merge the results together. This ultimately makes the query take longer to complete.

By default, for NetWitness Suite 10.5 and later installations, a save is performed on the Core index every time 600,000,000 sessions are added to the database. This interval is set by the index configuration parameter `save.session.count` . For more information, see Index Configuration Nodes .

Older versions of NetWitness Suite, or systems that have been upgraded from NetWitness Suite versions prior to 10.5, use a time-based save schedule that saves the index every 8 hours. You can see the current save interval by using the scheduler editor in the NetWitness Admin UI for the service. The default entry looks like this:

```
hours=8 pathname=/index msg=save
```

By adjusting the interval, you can control how often saves are created.

Affects of Increasing the Save Interval

By increasing the save interval, save points are created less frequently, and therefore fewer save points exist. This has a positive effect on query performance, because it becomes less likely that queries traverse slices, and when slices do have to be traversed, there are not as many to traverse.

There are downsides to increasing the save interval though. First, the Concentrator is more likely to hit the `valueMax` limit set on any of the indices. Second, the recovery time in the event of a forced shutdown or power failure is increased. And third, the aggregation rate may suffer if the index slice grows too large to fit in memory.

Affects of Decreasing the Save Interval

By decreasing the save interval, it is possible to avoid hitting the `valueMax` limits while maintaining a full value index for meta data that contains a large number of unique values. Decreasing the save interval does have a detrimental impact on query performance, since more slices are created.

Working with `valueMax`

The `valueMax` limitation can be frustrating to customers who want to index all possible unique meta. Unfortunately that is not possible in the general case. Meta keys exist that can have arbitrary random data from anywhere on the Internet, and all unique values cannot be indexed.

However, it is possible to work around some of the limitations of `valueMax` by using key level indices instead of value indices. Key level indices are not influenced by `valueMax` .

It is possible to use the Navigate view on a meta key indexed at the key level. The database uses value level indices in the `where` clause where possible, but meta database scanning is used to resolve unique values for the `values` call. This approach works well when the `where` clause provides an effective filter to limit search scope to a small number of sessions, perhaps less than 10,000 sessions.

In cases where the `valueMax` is reached, the users can perform a database scan on their queries to ensure no relevant values were dropped. This feature is accessible in the Investigator 9.8 client via the right-click menu on the Navigation view. Although the meta database scan takes a long time, it reassures the customer that they are not missing anything in their reports.

Parallelize Workloads

When the customer is using a lot of reports, ensure that they are making full use of the parallel executing options within Reporting Engine. Likewise, ensure that the number of `max.concurrent.queries` is appropriate for the hardware.

The NetWitness Suite Navigate view has the ability to run the components of its output in parallel, which can have a significant impact on the perceived performance of the NetWitness Core service.

Index Rebuild

In rare cases, a Core service might benefit from an index rebuild. Examples:

- The NetWitness Core service has index slices created by a very old version of the product and has not rolled out any data in more than six months.
- The index was configured incorrectly, and the customer wants to re-index all meta with a new index configuration.
- The traffic load into the Core service was very light, and the save interval was large, causing more slices than needed to be generated.

In these cases, an index rebuild may provide performance improvements. To do so, you must send the message `reset` with the parameter `index=1` to the `/decoder` folder on a Decoder, the `/concentrator` folder on a Concentrator, or the `/archiver` folder on an Archiver.

Be aware that a full reindex takes days to complete on a fully loaded Concentrator, and possibly weeks on a full Archiver.

Scaling Retention

There are several ways to improve the retention of the NetWitness Core database. Retention refers to the period of time that is covered by data stored in the database.

The first step in analyzing retention is to determine which part of the database is the limiting factor in terms of retention. The packet, meta, and session databases provide the `packet.oldest.file.time` , `meta.oldest.file.time` , and `session.oldest.file.time` stats in the `/database/stats` folder to show the age of the oldest file in the database. The index provides the `/index/stats/time.begin` stat to show the oldest session time stored in the index.

Increasing Packet and Meta Retention

The primary mechanism for increasing retention on these databases is adding more storage. If adding more storage to the NetWitness Core service is not possible, then it may be necessary to use the compression options on the packet and meta database to reduce the amount of data each database writes.

If meta retention is a concern, you may want to remove unneeded content from the Decoder generating meta. Many parsers generate meta that the customer does not need to store long term.

Increasing Index Retention

Usually the index has longer retention than the databases, but with a complex custom index the index retention may be shorter. Usually the easiest course of action is to remove unneeded value-level indices from the custom config, or perhaps override some of the default value-level indices with key-level indices.

It is also possible to scale the index by adding additional index storage. However, the index storage should be extended using solid-state drives only.

Scaling Horizontally

Starting in version 10.3, Concentrators and Archivers have the ability to be clustered using group aggregation. Group aggregation allows a single Decoder to feed sessions to multiple Concentrators or Archivers in a load-balanced manner. Group aggregation enables the query and aggregation workload to be split among an arbitrarily large pool of hardware.

For more information, see the "Group Aggregation" topic in the *Deployment Guide* .

Grouping Workloads

The NetWitness Core database works much better when all the users of the system are working within the same region of the database. Since the database is fed data from the Decoder with a first-in-first-out scheme, data in the database typically is clustered together according to the time it was captured and stored. Therefore, the database works better when all users are working on the same time period of data.

It is not always possible for all users to be working on the same time period simultaneously. The NetWitness Core database can handle that use case, but it is slow to do so because it must alternate between having different periods of time in RAM. It is not possible to have all of the time periods in RAM at the same time. Typically less than 1 percent of the database and less than 10 percent of the index fits in RAM.

To make NetWitness Suite work for the customer, it is important to get the customer to organize their users into groups that tend to work on the same time ranges. For example, users who do daily monitoring over the most recent data may be one user group. Perhaps there is another user group that does queries further back in time as part of an investigation. And perhaps another set of users do reports over large periods of time. Attempting to serve all the groups from a single database can lead to frustration and long wait times for results to be produced. However, if the different use cases can be spread to different Concentrator hardware, the perceived performance can be much better. In this case, it may be beneficial to utilize more Concentrator services with less RAM and CPU power rather than a single large and expensive Concentrator intended to meet all needs.

Cache Window

Consider this sequence of events:

1. At 9:00 a.m., user "kevin" logs in to a Concentrator and requests a report on the last one hour of collection time.
2. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
3. At 9:02 a.m., user "scott" logs in to the same Concentrator and also requests a report on the last one hour of collection time.
4. The Concentrator retrieves reports for the time range 8:02 a.m. to 9:02 a.m.

Notice that even though both users were looking at time ranges that were close together, the work done by the Concentrator to produce reports for Kevin could not be re-sent to Scott, since the time ranges are slightly different. The Concentrator had to re-calculate most of the reports for Scott.

The setting `cache.window.minutes` on the `/sdk` node allows you to optimize this situation. When a user logs in, the point in time representing the most recent data for the collection only moves forward in increments of the the number of minutes in this setting.

For example, assume the `/sdk/config/cache.window.minutes` is 10\. Re-evaluating the above action changes the sequence of events.

1. At 9:00 a.m., user "kevin" logs in to a Concentrator and requests a report on the last one hour of collection time.
2. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
3. At 9:02 a.m., user "scott" logs in to the same Concentrator and also requests a report on the last one hour of collection time.
4. The Concentrator retrieves reports for the time range 8:00 a.m. to 9:00 a.m.
5. At 9:10 a.m., user "scott" re-loads the reports for the last one hour of collection time.
6. The Concentrator retrieves reports for the time range 8:10 a.m. to 9:10 a.m.

The report returned in step 3 falls in the cache window, so it is returned instantaneously. This gives Scott the impression that the Concentrator is very fast.

Thus, larger `cache.window` settings improve perceived performance, at the cost of introducing small delays until the latest data is available to search.

Time Limits

When a query is running on the NetWitness Core database for a very long time, the Core service dedicates more and more CPU time and RAM to that query in order to get it to complete faster. This can have a detrimental impact on other queries and aggregation. In order to prevent lower privileged users from using more than their share of the Core service resources, it is a good idea to put time limits on the queries run by normal users.

Appendix A: Statistics

This topic describes statistics used to monitor system operation. The Core services provide a very large number of statistics for monitoring the operation of the system. Some of them are useful for monitoring performance, while some of them exist for monitoring the operation of the system or for debugging purposes.

Statistics in /database/stats

The following table shows the meaning of the statistics in **/database/stats** .

Statistic	Meaning
`meta.bytes` , `packet.bytes` , `session.bytes`	The total size of data (in bytes) stored in each database
`meta.first.id` , `packet.first.id` , `session.first.id`	The first meta ID, packet ID, and session ID, respectively, stored in the database
`meta.last.id` , `packet.last.id` , `session.last.id`	The last meta ID, packet ID, and session ID, respectively, stored in the database
`meta.oldest.file.time` , `packet.oldest.file.time` , `session.oldest.file.time`	The creation date of the oldest file in each database
`meta.rate` , `packet.rate` , `session.rate`	The count of the number of meta, packet, and session objects added to each database over the last second
`meta.total` , `packet.total` , `session.total`	The total number of meta, packet, and session objects within each database
`meta.volume.bytes` , `packet.volume.bytes` , `session.volume.bytes`	The approximate total volume size (in bytes) for all directories used by each database
`meta.free.space` , `packet.free.space` , `session.free.space`	The approximate total unused space (in bytes) across all directories used by each database

Statistics in /index/stats

The following table shows the meaning of the statistics in **/index/stats** .

Statistic	Meaning
`checkpoint.page` , `checkpoint.summary`	The last objects stored the last time an index save was created (debugging)
`index.bytes`	An approximate measure of how much disk space is required by index files
`index.last.load.time`	The timestamp when the current index configuration was loaded from the index configuration files
`memory.used`	An approximate measure of how much memory is occupied by the index
`page.first.id` , `summary.first.id`	The first page and summary object stored in the index (debugging)
`page.last.id` , `summary.last.id`	The last page and summary object stored in the index (debugging)
`page.total` , `summary.total`	Number of pages and summaries in the index (debugging)
`session.first.id`	The ID of the first session indexed
`session.last.id`	The ID of the last session indexed
`sessions.since.save`	The number of sessions currently held by the current index slice
`values.added`	The number of unique values added to the current index slice
`slices.total`	The number of slices in the index
`time.begin`	The oldest time meta indexed
`time.end`	The most recent time meta indexed
`updater.state`	The status of background reindexer

Statistics in /sdk/stats

The following table shows the meaning of the statistics in **/sdk/stats**

Statistic	Meaning
cache.window.time.begin	The beginning of the current time enforced by cache.window.minutes
cache.window.time.end	The end of the current time enforced by cache.window.minutes
queries.active	The number of queries currently executing in the index
queries.queued	The number of queries waiting for execution
values.calls	The number of calls made to the "values" function since the process was started
values.calls.cached	The number of calls made to the "values" function that were resolved by the values call result cache

Per-query Statistics

SDK operations, such as query and values, provide information about their execution status in /sdk/config/stats/queries/<handleid> , where <handleid> is a unique identifier for the query operation.

The following table shows the meaning of per-query statistics.

Statistic	Meaning
channel.path	This stat provides a link to the connection channel over which the operation is communicating. This channel is used to communicate results back to the client.
query.type	The type of operation being performed, such as queries or values
query	The complete set of parameters given to the query
query.progress	The percentage of the query execution that has completed
query.status	A message describing what stage of the query execution is currently occurring
running.since	The time at which the query began execution
user	The user name that executed the query

Appendix B: Index Inspect

The NetWitness Core database index has a built-in debugging feature called `inspect` that provides detailed information about the composition of its indexes. The index inspect feature is located at `/index/inspect` in every Core service configuration tree. Services that do not actually have an index, like Broker, do not have the `/index/inspect` feature.

Parameters

Options

Type: String This parameter may be set to the value `all-slices` to collect inspect information about every slice in the index. If it is not set, information on the current, most recently created slice is returned.

Collecting information on all slices may take a very long time to complete if there are many index slices.

Response

Inspect returns many rows of key value pairs that represent the state of the index.

Slice Summary

The first row returned for every slice is a summary with the following values.

`session1`	The first session ID indexed in the slice
`session2`	The last session ID indexed in the slice
`meta1`	The first meta ID in the first session indexed in the slice
`meta2`	The last meta ID in the last session indexed in the slice

Per-Index Summary

There will be per-index summary rows returned for each index. Only value-level indexes are reported.

`key`	The meta key name for the index
`pathname`	The path on disk to this index
`values`	The number of unique values stored in this index
`summaries`	The number of summary entries occupied by this index in the summary.db file

`pages`	The number of page entries occupied by this index in the page.db file
`sessions`	The number of sessions that had a value that was inserted into this index
`size`	The cumulative "size" meta values for all sessions that inserted a value into this index
`packets`	The cumulative count of packets for all sessions that inserted a value into this index
`summary1`	The first summary ID used by this index
`summary2`	The last summary ID used by this index
`session1`	The first session ID referenced by this index
`session2`	The last session ID referenced by this index

Slice Summary Footer

The last row in each inspect report contains cumulative statistics for all the indexes in the slice.

`totalKeys`	The number of indexed meta types
`totalValues`	The number of unique values tracked by all indices in this slice
`totalMemory`	An approximate total of the memory needed to open this index slice

Decoder and Log Decoder Quick Setup

A basic RSA Network Suite network includes at minimum Brokers, Concentrators, and Decoders. Brokers aggregate data from Concentrators, and Concentrators consume data from at least one Packet Decoder or Log Decoder. The basic network may include both types of Decoders. Packet Decoders are usually referred to as Decoders, and they capture network data in packet form. Log Decoders capture log data as events.

Adding a Decoder makes it visible and available for use with NetWitness SuiteAdministration, Live Services, and Investigate. To add a service in NetWitness Suite, you select the service type, provide service connection information, and validate that the service can be reached. The *Hosts and Services Getting Started Guide* provides the information you need to understand and install all NetWitness Suite services.

After the services are added, you need to configure each service. This is the preferred order for configuring your system:

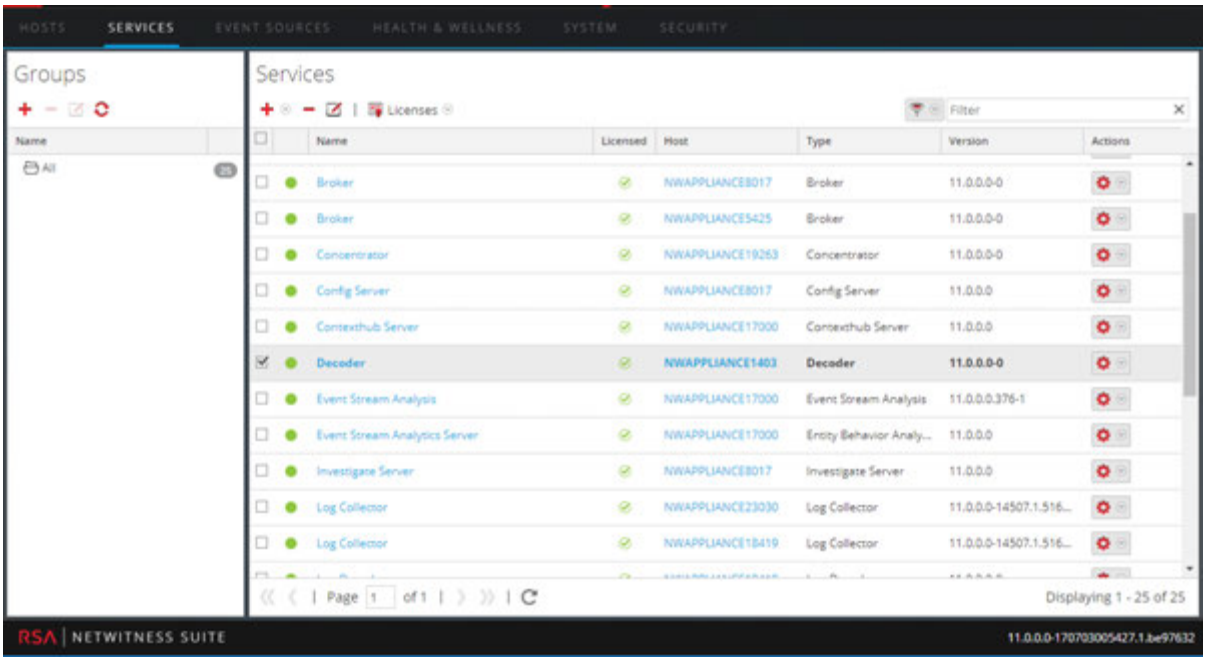
1. Decoders
2. Log Decoders
3. Concentrators (refer to the *Broker and Concentrator Configuration Guide*)
4. Brokers (refer to the *Broker and Concentrator Configuration Guide*)

Note: A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Packet Decoders or Log Decoders is clearly identified.

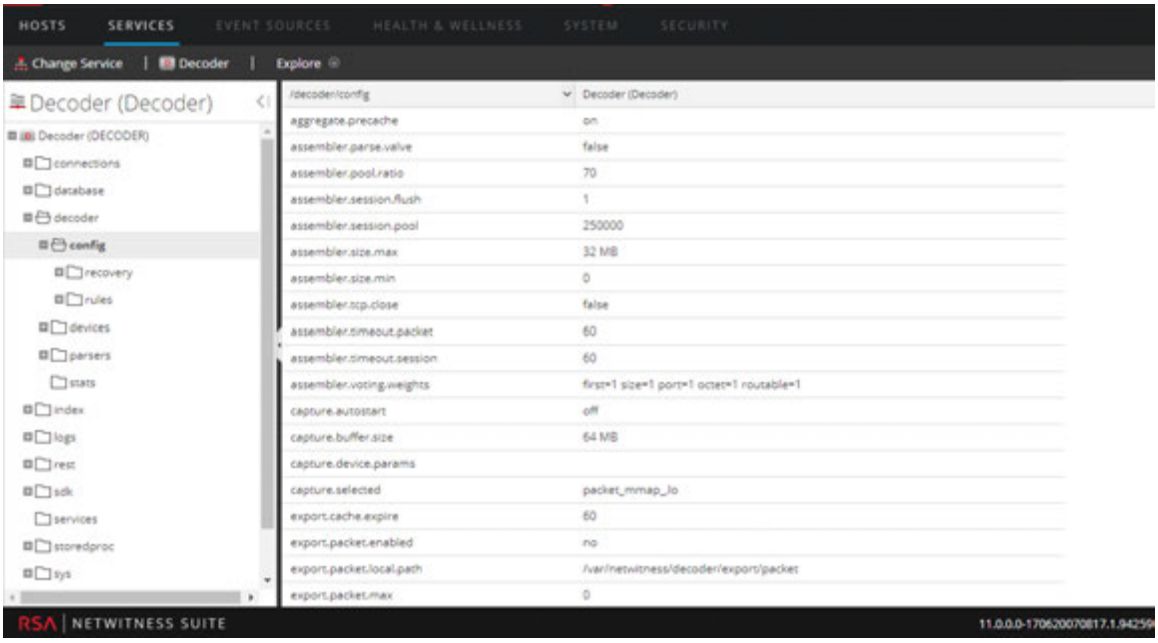
Basic Configuration of the Decoder involves selecting a network adapter interface and starting data capture.

In addition, you can configure each Decoder to control the type of traffic captured using rules, feeds, and parsers. Advanced configuration tasks enable additional features that are relevant to specific applications. For example, configure a 10G Decoder, create custom meta keys, or decrypt incoming packets.

The easiest way to configure all of the required Decoder and Log Decoder settings is to use the options in the NetWitness Suite user interface. For the most part, configuration is performed in the Administration Services view (ADMIN > Services).



Administrators who feel comfortable working outside of the user interface can configure the basic parameters as well as advanced settings by editing database nodes in the Decoder node tree using the Services Explore view.



Perform Initial Quick Setup

This procedure accomplishes the initial, basic configuration of a Decoder, and starts data capture. When the basic setup is complete, the Decoder begins capturing data for the Concentrator to consume.

To configure a Decoder and start capturing data:

1. Assign a network interface for capturing data. For details, see "Select a Network Adapter" in Configure Capture Settings.
2. Do one of the following:
   a. To start capture, select the Decoder and > **View** > **System**. In the toolbar click Start Capture.

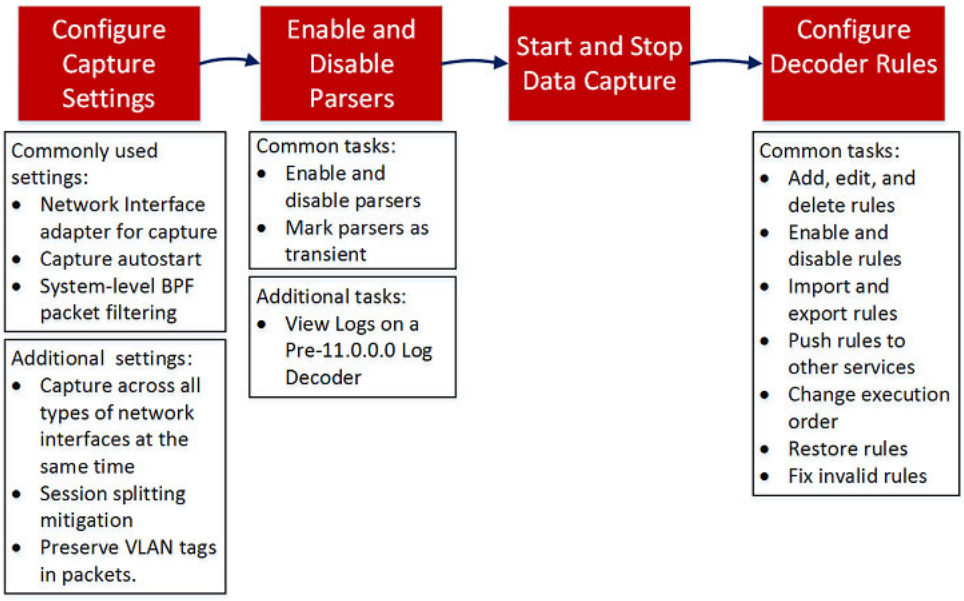
   b. To enable Capture Autostart, see "Configure a Decoder to Begin Capturing Data Automatically" in Configure Capture Settings.
   The Decoder begins capturing data for consumption by a Concentrator. For additional configuration options, refer to Configure Common Settings on a Decoder and Decoder and Log Decoder Additional Procedures

Configure Common Settings on a Decoder

This section introduces commonly used configuration settings on a Decoder with procedures and background information. After you have completed Decoder and Log Decoder Quick Setup, you can refine your configuration by using parsers, feeds, and rules to limit the captured data.

Note: A Log Decoder is a special type of Decoder, which is configured and managed in a similar way to a Decoder. Most of the information in this guide refers to both types of Decoders. "Decoder" refers to both types of Decoders. Information that applies exclusively to Packet Decoders or Log Decoders is clearly identified.

The following workflow illustrates commonly used settings and breaks the configuration process into four steps.

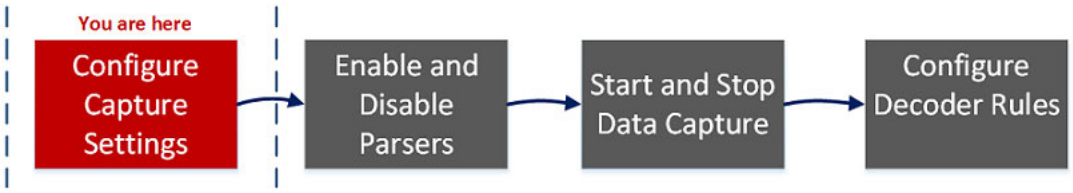


Configuration Step	Description
Configure Capture Settings	When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; one that is frequently used is Capture Autostart.
Enable and Disable Parsers and Log Parsers	View the parsers that have been downloaded and deployed from Live, and manage which ones are enabled or disabled.

Configuration Step	Description
Start and Stop Data Capture	When a Decoder starts up, it automatically begins aggregating data if Capture Autostart is enabled. When autostart is not enabled, you can start and stop data capture manually.
Configure Decoder Rules	Capture rules can add alerts or contextual information to sessions or logs. They can also define which data a Decoder or Log Decoder filters out. By default, no capture rules are defined when you first configure NetWitness Suite. Unless rules are specified and the rules are valid, the packets are not filtered. You can deploy the latest rules from Live as described in the *Live Services Management Guide*. You can define capture rules at any time, and you can fix rules that use invalid syntax (Fix Rules with Invalid Syntax).

Configure Capture Settings

When initially setting up the Decoder, configuring the network adapter interface is required. Additional optional capture settings are available; two that are frequently used are the Berkeley Packet Filter, and Capture Autostart.



Besides the basic network adapter interface setup, you may decide to use one of the special-purpose configurations described in (Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface or (Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The rest of the capture settings have default values chosen to be effective in most cases (see a detailed list in Services Config View - General Tab). You can adjust these in some circumstances, for example, if Customer Support advises a change. You can edit the capture settings at any time.

Select a Network Adapter

The table below describes the Netword Adapter settings for a Decoder. The system administrator sets the default network adapters when the Decoder is installed. Consult your System Administrator for more information.

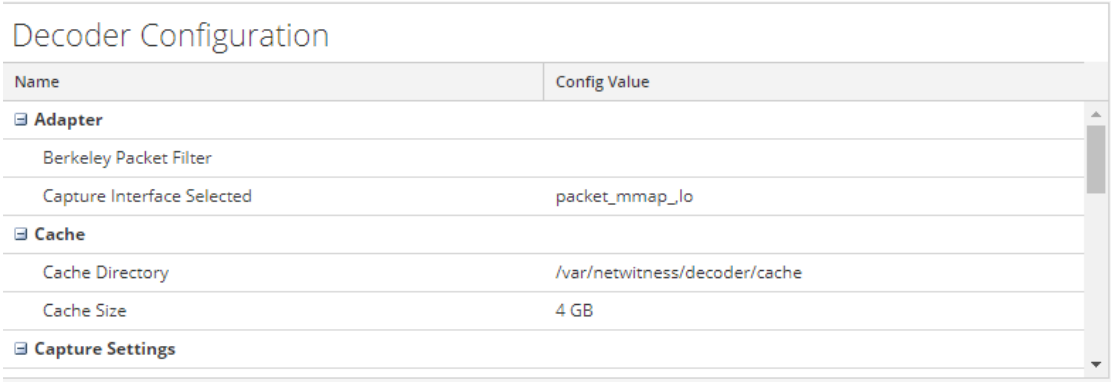
Adapter Parameter	Description
Berkley Packet Filter	Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. However, any packets discarded are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets).

Adapter Parameter	Description
Capture Interface Selected	Select an adapter through which the Decoder captures packets. For the lower speed internal capture interface, use the `packet_mmap_,7,eth1` adapter, which corresponds to the monitor port located on the motherboard. There are six additional capture ports: • `packet_mmap_,1,lo (bpf)` • `packet_mmap_,2,eth2 (bpf)` • `packet_mmap_,3,eth3 (bpf)` • `packet_mmap_,4,eth4 (bpf)` • `packet_mmap_,5,eth5 (bpf)` • `packet_mmap_,8,ALL (bpf)` There are three wireless capture services available: • `packet_netmon_ (Microsoft Netmon)` • `packet_mac80211_ (Linux mac80211)` • `packet_airport_ (Mac OS X AirPort)`
Capture Interface Selected for Log Decoder	The following capture service is available: • `log_events,Log Events`

To configure the network adapter on a Decoder:

1. Go to **ADMIN > Services**.

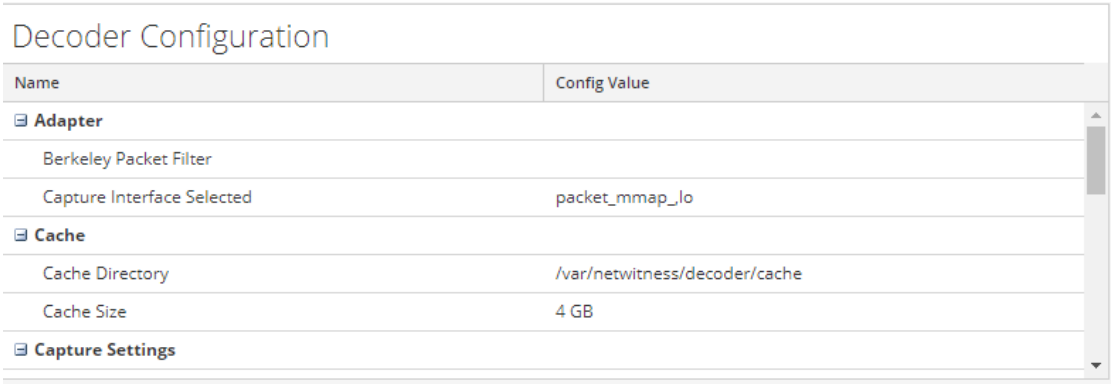
2. In the **Administration Services view**, select the Decoder and > **View** > **Config.**
   The Services Config view is displayed with the General tab open.



3. In the **Capture Interface Selected** field, select the network adapter that best suits the Decoder.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

Configure a Decoder to Begin Capturing Data Automatically

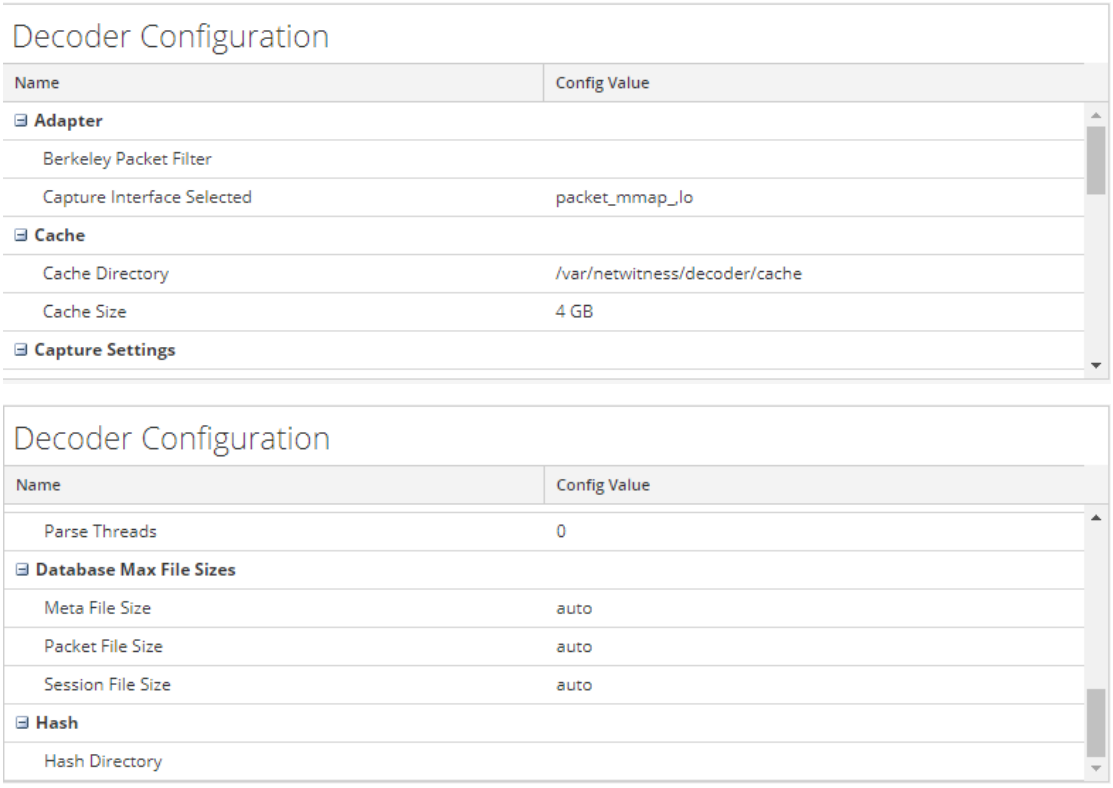
1. Go to **ADMIN** > **Services**.
2. In the **Administration Services view**, select the Decoder and > **View** > **Config.**
   The Services Config view is displayed with the General tab open



3. Under **Capture Settings**, select the **Capture Autostart** checkbox.
4. To save the changes, click **Apply.**
5. If necessary to put the changes into effect, navigate back up to the **Administration Services view**, select the Decoder, and select > **Restart**.

Configure Optional Capture Settings

1. Go to **ADMIN > Services**.
2. In the **Administration Services view**, select the Decoder and > **View > Config.**
   The Services Config view is displayed with the General tab open.



3. If you want to apply a system-level filter to the packet stream before the packets are copied to the Decoder adapter for analysis, configure the Berkeley Packet Filter as described in (Optional) Configure System-Level (BPF) Packet Filtering.
4. In the **Capture Settings** sections, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.
5. In the **Database Max File Sizes** section, review the default values. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change. See Services Config View - General Tab for an explanation of these settings.

6. In the **Hash** section, define a directory for hash files if you are using this feature. See Services Config View - General Tab for an explanation of these settings.

(Optional) Configure System-Level (BPF) Packet Filtering

You can use Berkeley Packet Filters to control which packets and logs are processed by a Decoder.

Berkeley Packet Filters (BPF) are applied to the packet stream before the packets are copied to the Decoder adapter for analysis. This allows unwanted traffic to be efficiently discarded. These discarded packets are not accounted for in any Decoder statistics (capture rate, packets dropped, and packets filtered and total packets).

The Decoder also supports system-level packet filtering defined using `tcpdump/libpcap` syntax. Specifying a `Libpcap` filter can efficiently reduce packet volume based on Layer 2 - Layer 4 attributes. A `Libpcap` filter is appropriate for use when a Decoder is receiving a traffic volume that is placing a load against the physical resources of the platform. In this scenario, the Decoder may consistently drop packets and have a large number of capture pages available (`/decoder/stats/capture.pagefree` is high).
The following is an example of a `libpcap` filter to keep only packets that do not have both source and destination addresses in the 10.21.0.0/16 subnet.

```
not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)
```

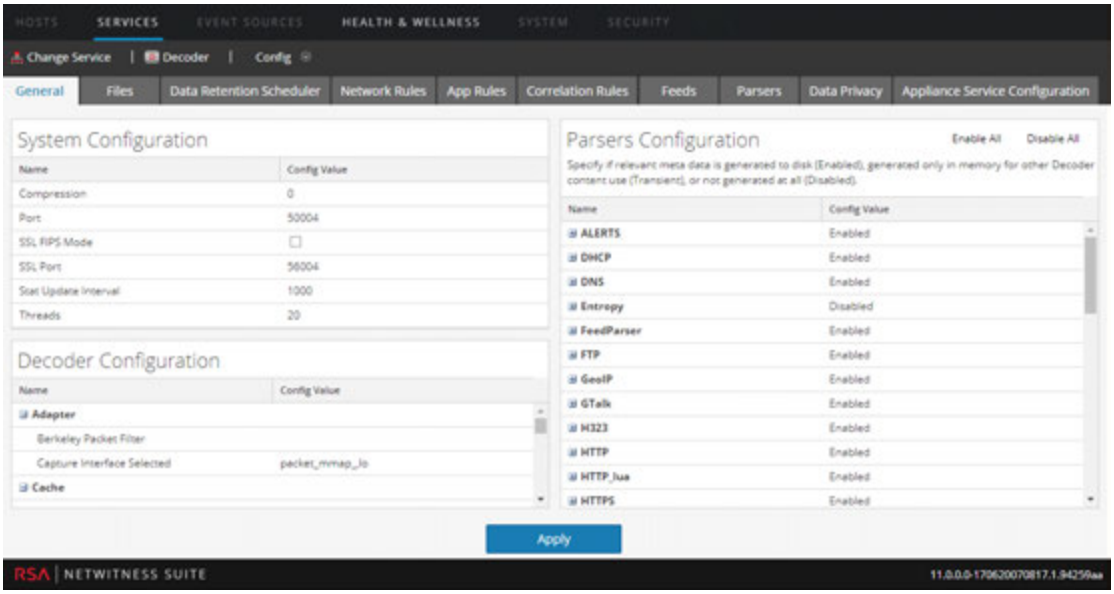
For a full reference of the `Libpcap` filter syntax, see the main pages for:

- tcpdump (http://www.tcpdump.org/tcpdump_man.html).
- pcap-filter (http://www.unix.com/man-page/FreeBSD/7/pcap-filter/).

To add a system-level Berkeley Packet Filter:

1. Go to ADMIN > **Services.**

2. In the Administration Services view, select a Decoder service and > **View** > **Config.**
   The Services Config view is displayed with the General tab open.



3. In the **Decoder Configuration Section**, under **Adapter**, click in the field next to **Berkeley Packet Filter**.
4. Type only one filter in the field. If you want to filter multiple items, join multiple expressions using `and`. Several examples are provided below.
   The user interface validates input at the time you enter your filter string.
5. To save the filter, click **Apply**.
   If the syntax is correct, a confirmation message is displayed.
   If the syntax is incorrect, a **Packet filter is not valid** message is displayed and a corresponding log message will follow in the log messages on the Decoder:
   ```
   164474800 2015-May-01 19:03:08 warning Decoder Failed to parse filter 'example_badrule': syntax error
   ```
6. To activate the filter, you must stop and start capture on the Decoder:
   a. Change the **Config** view to the **System** view.
   b. Click **Stop Capture**.
   c. Click **Start Capture**.
      The active filter will be displayed in the Decoder logs.

Examples

These are several filter examples:

- Drop packets to or from any address in the 10.21.0.0/16 subnet:
  `not (net 10.21.0.0/16)`
- Drop packets that have both source and destination addresses in the 10.21.0.0/16 subnet:
  `not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)`
- Drop packets that are from 10.21.1.2 or are headed to 10.21.1.3.
  `not (src host 10.21.1.2 or dst host 10.21.1.3)`
- Combine both IP and HOST:
  `not (host 192.168.1.10) and not (host api.wxbug.net)`
- Drop all port 53 traffic, both TCP & UDP:
  `not (port 53)`
- Drop only UDP port 53 traffic:
  `not (udp port 53)`
- Drop all IP protocol 50 (IPSEC) traffic:
  `not (ip proto 50)`
- Drop all traffic on TCP ports 133 through 135.
  `not (tcp portrange 133-135`

The following filters combine some of the above to demonstrate how to put multiple directives into one filter:

- Drop any port 53(DNS) traffic sourced from 10.21.1.2 or destined to 10.21.1.3.
  `not (port 53) and not (src host 10.21.1.2 or dst host 10.21.1.3)`
- Drop any traffic using IP proto 50 or port 53 or any traffic from net 10.21.0.0/16 destined to net 10.21.0.0/16
  `not (ip proto 50 or port 53) or not (src net 10.21.0.0/16 and dst net 10.21.0.0/16)`

Caution: The use of parentheses can have a large and potentially disruptive effect on the use of Packet Filters. As a best practice, keep "not" operations outside of parentheses and always test your rules before deploying them. Failure to properly format your rules (despite input validation) can cause a packet filter to drop ALL traffic or behave in other unexpected ways. This is due to the way packet `Libpcap` filters work and is not the result of any logic within NetWitness Suite software.

Testing

BPF filters can and should be tested using either `tcpdump` or `windump` to ensure that they will provide the expected behavior before implementing them. This example shows a test of a filter using windump:

```
windump -nni 2 not (port 53 or port 443) or not (ip proto 50)
```

Conversions

If for the sake of performance, you have decided that an existing network rule filter would be better running as a System-Level Packet Filter, you can convert it. There are a few things to remember when doing conversions.

- `&&` becomes `and`
- `ip.addr` becomes `host` if a single host or **net** if a network.
- `ip.src` becomes `src host` if a single host or `src net` if a network.
- `ip.dst` becomes `dst host` if a single host or `dst net` if a network.
- Use CIDR notation when listing a network (that is, 10.10.10.0/24).
- `||` becomes `or`
- `!` becomes `not`
- Multiple rules must be joined with `and`.

The manual for TCPDump also gives examples of filters and strings that can be used: http://www.tcpdump.org/tcpdump_man.html

Additionally, the following site provides an excellent reference for BPF-style packet filters: http://biot.com/capstats/bpf.html

Caution: If you are capturing `vlan` tagged packets, above standard bpf filter may not work. For example, if you use `not (udp port 123)` to filter `vlan` tagged NTP traffic on udp port 123, it will not work. This is because the bpf filter machinery is simple and does not account for protocols not referenced in the rule. So the OS executing the bpf filter will look for the `udp port` values at the byte offset they would occur in a standard Ethernet/udp packet; but the optional `vlan` tag fields in the Ethernet header pushes those values by 4 bytes, thus the bpf filter rule will fail. To fix it, you need to change the bpf filter to: `not (vlan and udp port 123)`.

(Optional) Configure a Decoder to Capture Data Across All Types of Network Interfaces

The `packet_mmap_,ALL` adapter is capable of capturing across all types of network interfaces at the same time. For example, this can include things like physical network interfaces over different media types and tunnel interfaces.

The default behavior of the `ALL` adapter is to capture from all interfaces from the system, except for the hard-coded defaults of `lo`, `eth0`, and `em1`.

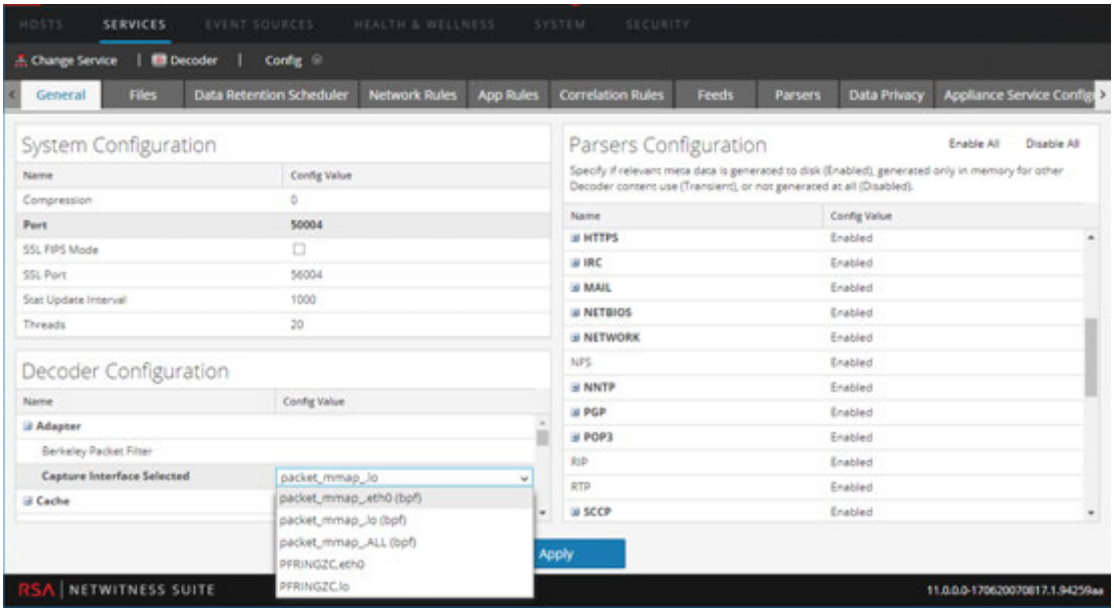
In NetWitness Suite 11.0, you can select any subset of the capture interfaces by editing the Decoder configuration node `/decoder/config/capture.device.params` to include an `interfaces=` parameter. The `interfaces` parameter contains a comma-separate list of interfaces that are used for capture. Instead of using all interfaces for capture, only the specified interfaces are used.

For example, if you want to force capture on interfaces `em1`, `em2`, and `em4`, and ignore `em3`, you can select the `packet_mmap_,ALL` adapter, and then add this line to `capture.device.params`: `interfaces=em1,em2,em4`

Note: Using the `interfaces` parameter to select `eth0`, `lo`, or `em1` overrides the default behavior, which is to drop traffic from those ports.

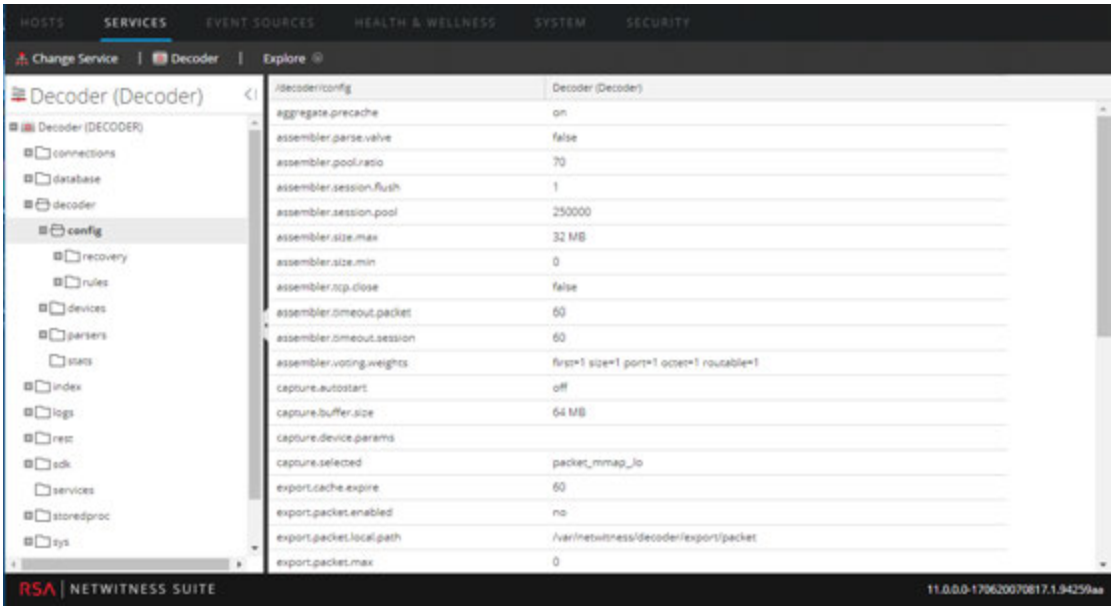
To configure the `packet_mmap_,ALL` adapter to capture from specific interfaces instead of all interfaces:

1. In the **Administration Services view**, select the Decoder service and ⚙ > **View** > **Config.**
2. In the **Services Config view**, set **Capture Interface Selected** to `packet_mmap_,ALL` adapter.

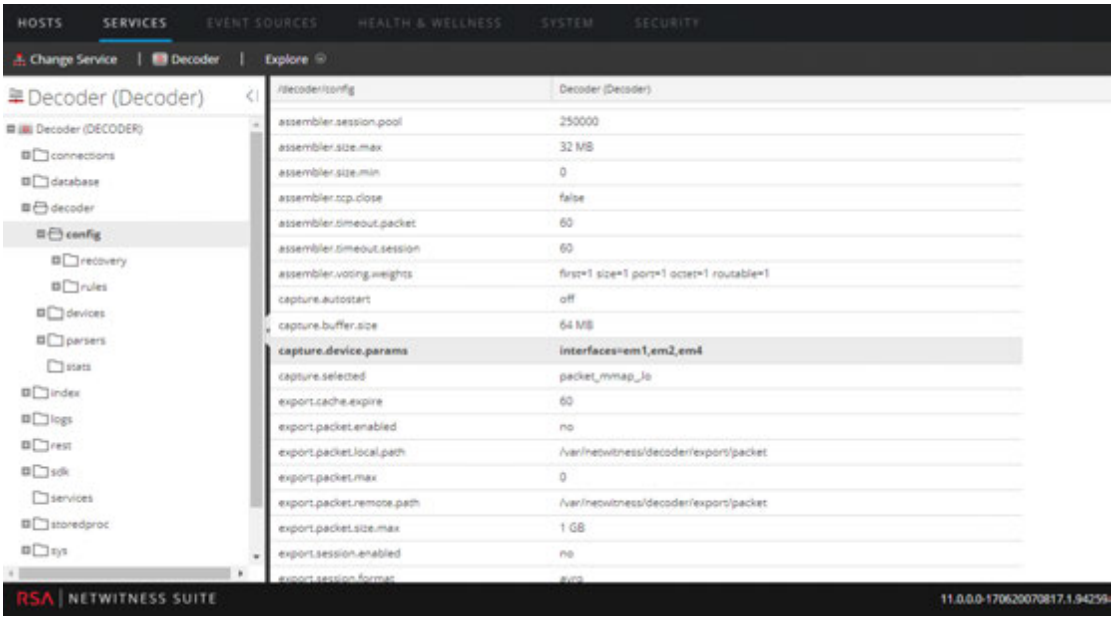


3. To go to the Services Explore view, click **Config** in the toolbar and select **Explore** in the drop-down list.

4. In the Services Explore view, select **decoder** > **config**.



5. Click in the values column next to `capture.device.params`, type `interfaces=em1,em2,em4`, and press **Enter**.



The change goes into effect immediately; only traffic on `em1`, `em2`, and `em4` interfaces is captured.

(Optional) Preserve VLAN Tags When Using the Packet MMAP Capture Interface

When capturing traffic containing VLAN tags, you may need to configure the Packet MMAP capture interface to preserve the VLAN tags in the packets (VLAN fixup). By default, the network capture hardware removes the tags. Performing this procedure preserves the tags in the packets, and the tag values are parsed into VLAN meta data for further analysis.

There are two mechanisms for enabling the VLAN fixup.

- Option 1: Set `vlan-fix=true` within `capture.device.params`. This option performs the VLAN fixup on all traffic entering the Decoder. This option is appropriate in most cases, since it is assumed that all the traffic will be VLAN tagged.This mechanism works on either single-interface mode, or on all-interfaces mode. This option overrides the VLAN fixup settings on individual interfaces; even interfaces that are not configured to do VLAN fixup will have the feature enabled.
- Option 2: Use the `interfaces` parameter within `capture.device.params` on a per-device basis. The `interfaces` parameter accepts a comma-separated list of interface names on which to capture packets. By adding `:vlan` to an interface name, you can enable the VLAN fixup on individual interfaces. If the interface does not have the `:vlan` suffix added, then it will not perform the VLAN fixup.

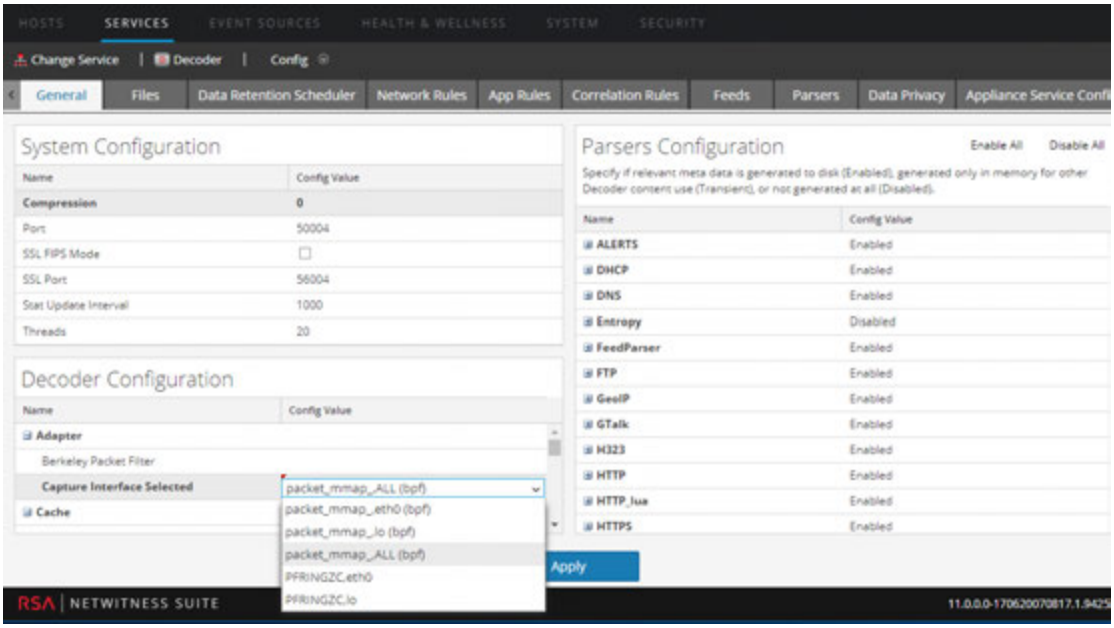
After editing this parameter, you must restart capture on the Decoder in order for changes to `capture.device.params` to take effect.

These are `vlan` examples of both options. If you need to pass multiple settings for `capture.device.params`, use the following synax. Notice that quotes are needed for values with whitespace, see *Core Database Tuning Guide*.
`name1="value1" name2="value2"`.

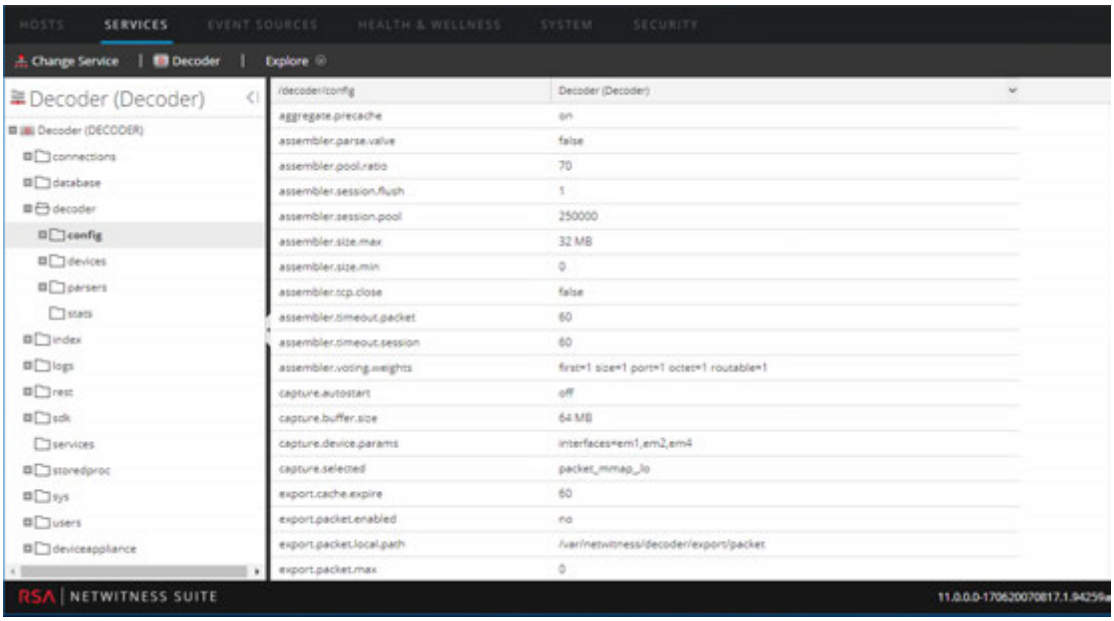
Parameter	Value	Effect
`capture.device.params`	`vlan-fix=true`	VLAN fixup always performed on all interfaces. The default value is `vlan-fix=false`.
`capture.device.params`	`interfaces=eth0:vlan,eth1`	VLAN fixup performed on traffic capture on `eth0` interface only
`capture.device.params`	`interfaces=eth0:vlan,eth1 vlan-fix=true`	VLAN fixup always performed because the `vlan-fix` setting overrides the interfaces setting.

To configure the `packet_mmap_` adapter to preserve the VLAN tags in packets:

1. In the **Administration Services view**, select the Decoder service and ⚙ > **View** > **Config.**
2. In the **Services Config view**, set **Capture Interface Selected** to `packet_mmap_,ALL` adapter.



3. To go to the Services Explore view, click **Config** in the toolbar and select **Explore** in the drop-down list.
4. In the Services Explore view select **decoder** > **config**.

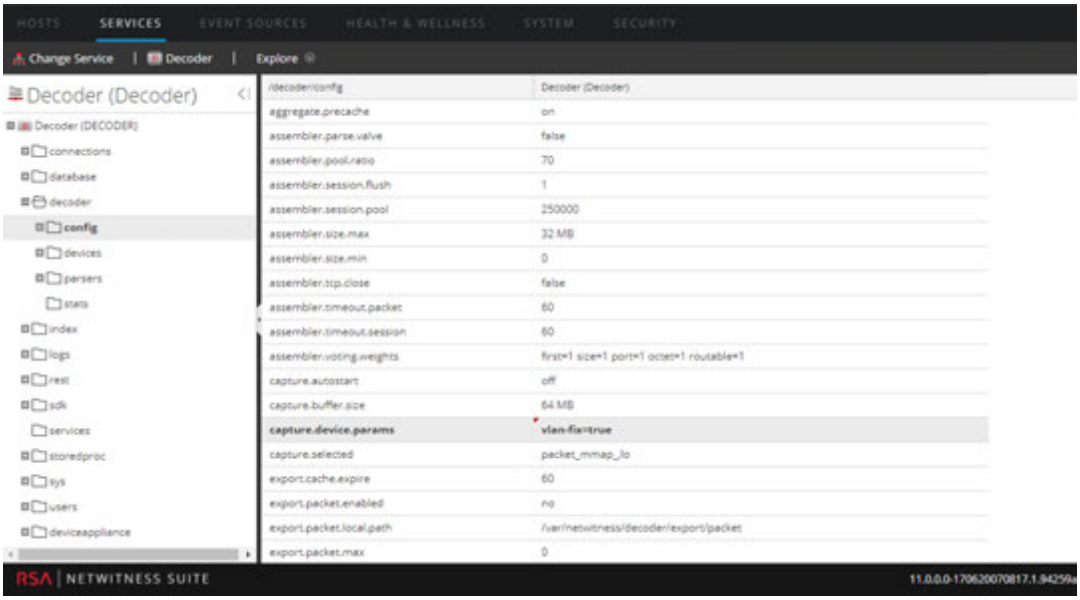


5. Click in the values column next to `capture.device.params`, and do one of the following:

   - To preserve VLAN tags on an interface in the interfaces list, add **`:vlan`** after the interface name and press **Enter**. For example, this specifies that VLAN tags are preserved on `em1`, but not on `em2` and `em4`:
     `interfaces=em1:vlan,em2,em4`

   The change goes into effect immediately; only traffic on `em1` has the VLAN tags preserved.

   - To preserve VLAN tags on all interfaces, enter the following and press **Enter**:
     `vlan-fix=true`.

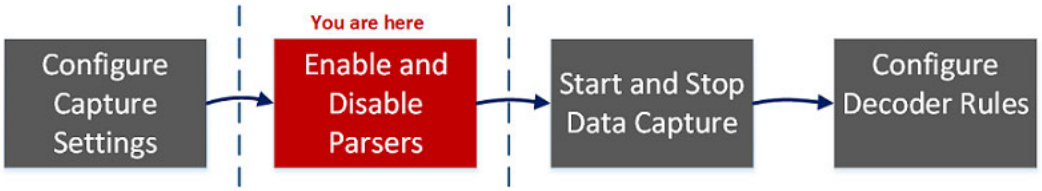


The change goes into effect immediately; VLAN tags are preserved on all capture interfaces.

Enable and Disable Parsers and Log Parsers

Administrators can see which parsers have been downloaded from Live and deployed on a Decoder or Log Decoder, see which of these have been enabled, and enable or disable parsers and log parsers.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.



You should only download and deploy the parsers you need for the following reasons:

- There is an impact on performance as you increase the number of deployed parsers.
- The more parsers you deploy, the more meta data created, which impacts data retention
- Not having extra (unnecessary) log parsers deployed reduces the potential for misidentification of messages.

The Parsers Configuration panel provides a way to select parsers to use on the Decoder. Within some parsers, you can also configure the metadata that the parser creates. These are the options in the Parsers Configuration panel.

Option	Description
Enable All **Disable All**	These options provide a way to quickly select either all parsers or no parsers.
Name	The names of parsers available to the Decoder. A plus sign indicates that the metadata generated by the parser is configurable. Clicking the plus sign displays the metadata that the parser can create.

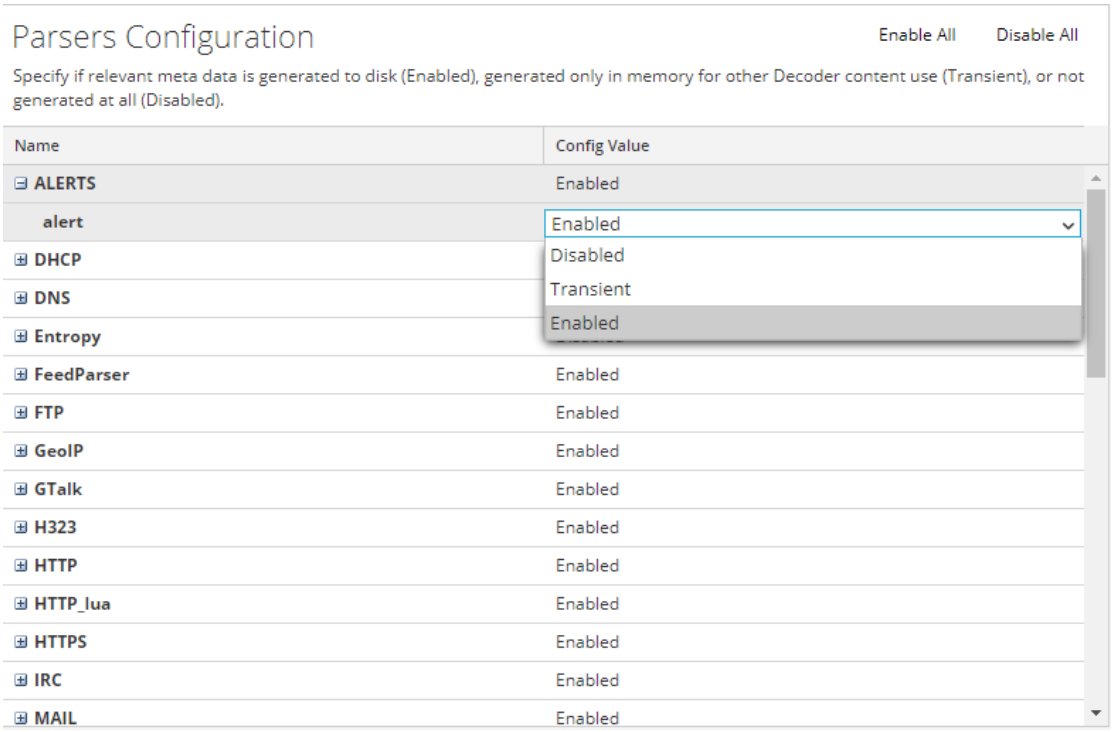
Option	Description
Config Value	A drop-down list changes the setting for the parser or metadata to **Enabled**, **Disabled**, or **Transient**. • When **Enabled**, the Decoder is using the parser to filter traffic. • When **Transient**, the Decoder is using the parser to filter traffic, and the generated metadata is not stored on disk. The transient metadata is available in memory to additional content (that is, parsers, feeds, and application rules) on that Decoder. This helps administrators to protect certain data and is usually done as part of a data privacy plan (see the *Data Privacy Management Guide*). • When **Disabled**, the Decoder is not using the parser. If the generated metadata for the parser is configurable, clicking the plus sign to expand the parser displays configurable meta keys and the same drop-down list selects the meta key the parser will create.

Note: For a Log Decoder You must have previously deployed log parsers from Live, See the **Find and Deploy Live Resources** topic in the *Live Services Management* Guide for details. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

To enable or disable an parser, or to view the status for each parser:

1. Go to **ADMIN** > **Services**.
2. In the **Administration Services view**, select a Log Decoder or a Decoder, and  **>View** > **Config**.

3. In the **Parsers Configuration** panel, look for the Decoder parser or the Log Decoder event source parser.



4. In the **Config Value** column, note the current status for your parser.

   You can update the status of any individual parser by selecting its **Config Value** and selecting **Disabled**, **Transient**, or **Enabled** from the drop-down menu. Alternatively, you can select **Enable All** or **Disable All** to update the status for all of your log parsers at once.

5. Click **Apply**.

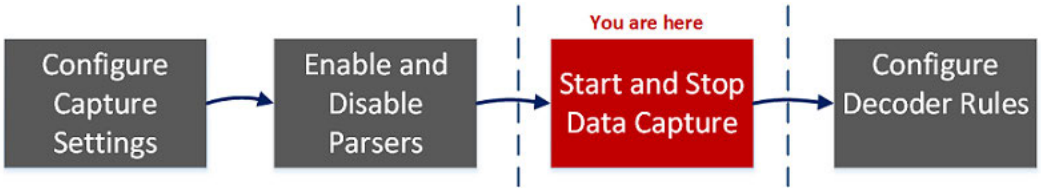
When you click **Apply**, note that all parsers are reloaded into NetWitness Suite. The status for each parser is updated, based on your selections.

Start and Stop Data Capture

When a Decoder starts up, it automatically begins aggregating data if **Capture Autostart** is enabled. When autostart is not enabled, you can start and stop data capture manually.

Note: The Capture Configuration Settings in the Service Config view for a Decoder determine whether Capture Autostart is enabled.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup. You may want to stop and start capture at other times, for example, before you shut down the service.



To start and stop capture:

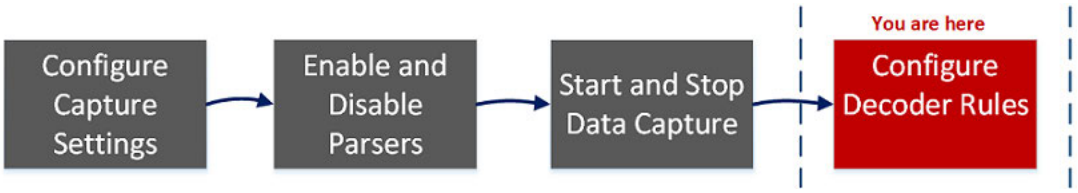
1. Go to **ADMIN > Services.**
2. In the **Admin Services** view, select a Decoder or Log Decoder service, and select > **View** > **System**.
3. In the toolbar, click **Start Capture**.
   If the service is a Decoder, it begins capturing packets. If the service is a Log Decoder, it begins capturing logs.
   When packet or log capture is in progress, the option in the toolbar changes to **Stop Capture**, and the option to upload a file is unavailable.
4. Whenever you want to discontinue traffic capture on a Decoder, click **Stop Capture**.
   Packet or log capture ceases, and the option to upload a file to the service is again available.

Note: When you stop the Log Decoder service while capture is running, all events currently in Log Decoder memory will be processed and persisted. Should an issue arise where it is necessary to quickly shutdown the service, use the Services Explore view to stop capture (**/decoder stop**), passing the parameters ***flush=false*** before stopping the Log Decoder service. For further information, see the "Services Explore View" in the *Host and Services Getting Started Guide*.

Configure Decoder Rules

This topic provides procedures for creating and managing rules for Decoder or Log Decoder traffic capture in the Services Config view > Rules tabs . Services Config View - Rules Tabs provides details about the Rules tab options.

The following figure illustrates commonly used settings on a Decoder. For a quick basic setup with only the required steps, see Decoder and Log Decoder Quick Setup.



Capture rules can add alerts or contextual information to sessions or logs. They can also define which data is filtered out by a Decoder or Log Decoder. Rules are created for specific metadata patterns, which result in predefined actions when matches are found. For example, to keep all traffic that fits certain criteria, but discard all other traffic, you can create a rule to perform the necessary actions. When applied, rules affect both packet capture file importing, as well as live network capture.

Rule and Query Guidelines provides guidelines that all queries and rule conditions in NetWitness Suite Core Services must follow.

By default, no rules are defined when you first install NetWitness Suite. Until rules are specified, the packets are not filtered. You can deploy the latest rules from Live. You can define three types of rules: Network Rules, Application Rules, and Correlation Rules.

- Network rules are applied at the packet level and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied to the Decoder. Rules can be applied to multiple layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules are only available on packet Decoders.
- Application rules are applied at the session level. If the first rule listed is not a match, the Decoder then attempts to match the next rule listed, until a match is found.
- Correlation rules are applied over a configurable sliding time window. When a match is found, the service creates a new super session that identifies other sessions that match the rule, then creates a session list for analysis.

The two most common uses of rules are:

- To alert, and thereby create a custom alert meta value, when certain conditions are found.
- To filter out certain types of traffic that do not add value to the analysis of the data.

Groups of capture rules form rule sets, which you can import and export. This feature enables use of multiple rule sets for various scenarios. You can import the exported rule set, in the form of an .nwr file, to other NetWitness Suite services, simplifying the deployment and configuration of multiple services.

Rule Processing

These are the principles governing capture rule processing:

- Multiple rules can be applied to the Decoder.
- Capture rules are executed one after the other, in sequence.
- Rule processing stops when all rules are processed or after a rule configured to stop rule processing is matched.
- A default rule can be used to either include or exclude all traffic not otherwise selected by a rule. A default rule, if used, must always be placed at the bottom of the rule list. Otherwise, rule processing stops as soon as the default rule is evaluated since, by definition, all traffic is selected by the default rule.
- When rule processing stops, the session is saved using the configured session options and debug options.

Rule Configuration

Rule and Query Guidelines

All queries and rule conditions in RSA NetWitness Core services must follow these guidelines:

All string literals and time stamps must be quoted. Do not quote numbers, MAC, or IP addresses.

- `extension = 'torrent'`
- `time='2015-jan-01 00:00:00'`
- `service=80`
- `ip.src = 192.168.0.1`

Note: The space on the right and the left of an operator is optional. For example, you can type a rule as `service=80` or `service = 80` .

Rule Examples

The following table shows examples of rule conditions. You can use rule conditions for log retention collections in an Archiver and for application, network, and correlation rules on a Decoder, Log Decoder, or Concentrator. Rule conditions are also used in all `WHERE` clauses in all Core database queries.

For detailed information on rule syntax in NetWitness Suite, see "`WHERE` Clauses" in the "Queries" section of the *Core Database Tuning Guide* .

Rule Name	Condition
ComplianceDevices	`device.group='PCI Devices' || device.group='HIPPA Devices'`
HighValueWindows	`device.group='Windows Compliance'`
MediumValueWindows	`device.type='winevent_nic' && msg.id='security_4624_security'`
LowValueWinLogs	`device.type='winevent_nic' && msg.id='security_4648_security'`
LowValueProxyLogs	`device.class='proxy' && msg.id='antivirus_license_expired'`
GeneralWindows	`device.type='winevent_nic'`

Invalid Rules

NetWitness Suite uses a rule parser that strictly defines valid syntax for rules and queries. When a Core service encounters invalid syntax, it writes a warning in the NetWitness Suite logs indicating the error.

Note: NetWitness Suite 11.0 does not support parsing of legacy syntax rules (as NetWitness Suite 10.6 did). After you update to NetWitness Suite 11.0, rules with invalid syntax are highlighted in the user interface, and no rules will be applied until the invalid rules are corrected. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. See Fix Rules with Invalid Syntax.

The `/decoder/config/rules/rule.errors` and `/concentrator/config/rules/rule.errors` stats, contain the count of rules with errors. If `rule.errors` is nonzero, NetWitness Suite generates a Health and Wellness alert to indicate that you need to fix the rules.

General Syntax Guidelines

- All text values must quote literal values. Example: `username = 'user1'`
- Quotes can use single or double quotes; but they must match. (You cannot start with a single quote and finish with a double quote.)
- If the literal value has a quote, you can escape it (using a backslash) or use a different starting quote character. Both of the following examples are valid: `username = "User's"`, `username = 'User\'s'`

The following are valid syntax rules:

- To use a backslash in a literal string, escape it using an extra backslash: `\`
- All time values should use quotes for dates in this form:
  `time = 'YYYY-MM-DD HH:MM:SS'`
- All time values that are the number of seconds since EPOCH (Jan 1, 1970), should not be quoted.
  Example: `time = 1448034064`
- **Everything** else is unquoted: IP addresses, MAC addresses, numerics, and so on. Example:
  `service = 80 && ip.src = 192.168.1.1/16`

Capture Rule Syntax

Capture rules compare fields to values or to other fields. This is an example of a simple expression with a meta key on the left side of the operator and a value on the right side.

```
ip.dst=192.168.1.1
```

The syntax allows a meta key on the right side of the operator in Decoders and Log Decoders for application and network rules. Meta key comparison does not apply in the `where` clause in queries. This is an example of a simple expression with a meta key on the left side of the operator and a meta key on the right side.

```
ip.src=ip.dst
```

Rules that include a meta key comparison support renamed meta keys; if a rule queries a meta key that has been renamed, the rule is parsed for the renamed meta key. For example, if the meta key `ip_dst` is used in a rule, it is transparently mapped to the renamed meta key: `ip.dst`. Existing rules that include original keys will trigger alerts that include data for the renamed meta key. .

This is an example of a rule that finds packets having the same `ip.src` address and `ip.dst` address on a Decoder, and generates an alert on the Concentrator.

```
alert=alert.id name=testRule8 rule="ip.src=ip.dst" order=38
```

This rule would generate an error because `eth.src` and `ip.src` are incompatible formats.

```
rule="eth.src=ip.src" name="testRule99" alert=alert.id
```

Values can be expressed as discrete values, a range of values, an upper or lower bound, or a combination of these three. You can create a greater than or less than comparison, and test equality or inequality against a range of values or an upper/lower bound.

`key 0-5` (a range of values)

`key = 0-u` is the same as `key >= 0` (upper bound, greater than or equal to)

The following table summarizes the operators on meta keys.

Left Operand Format	Operator	Right Operand Format	Description
any	=	compatible with left operand	Equality operator. You can use values or meta keys on the right side of the equality operator.
any	!=	compatible with left operand	Inequality operator. You can use values or meta keys on the right side of the inequality operator.
any	<	compatible with left operand	Less than operator. You can use values or meta keys on the right side of this operator.
any	<=	compatible with left operand	Less than or equal to operator. You can use values or meta keys on the right side of this operator.
any	>	compatible with left operand	Greater than operator. You can use values or meta keys on the right side of this operator.

Left Operand Format	Operator	Right Operand Format	Description
any	>=	compatible with left operand	Greater than or equal to operator. You can use values or meta keys on the right side of this operator.
text	contains	text	Find values that contain the right operand. You can use meta keys or values on the right side of this operator.
text	begins	text	Find values that begin with the right operand. You can use meta keys or values on the right side of this operator.
text	ends	text	Find values that end with the right operand. You can use meta keys or values on the right side of this operator.
text	length	integer	Find strings of a certain length. You can use meta keys or values on the right side of this operator.
any	count	integer	Find values with a specific number of occurrences within the session. You can use meta keys or values on the right side of this operator.
any	ucount and unique	integer	Finds a number of uniquely occurring values. You can use meta keys or values on the right side of this operator. For example, if the results include instances of a meta key with 5 unique values and 3 of the same value, the ucount is 6.
N/A	exists	any	Finds any values for the meta key. You can use meta keys or values on the right side of this operator.
N/A	!exists	any	Finds any sessions in which the meta key does not occur. You can use meta keys or values on the right side of this operator.

Left Operand Format	Operator	Right Operand Format	Description
text	`regex`	text	Finds values matching a regular expression. You can use values on the right side of this operator.

The following table summarizes other syntax elements used in rules.

Syntax element	Description
*	Default rule. By using an asterisk (*) as the sole character in a rule, that rule will select all traffic.
`u`	Upper bound of a range a range of times, IP addresses, or numeric formats. For example, to select all TCP ports above 40000, the syntax would be: `tcp.port = 40000-u`
`l`	Lower bound of a range of times, IP addresses, or numeric values. For example, to select all TCP ports below 40000, the syntax would be: `tcp.port = l-40000`
- (dash)	Denotes a range. This is only applicable to time values, IP or MAC addresses, or numeric values. Separate the lower and upper bounds of the range with a dash (-) character. For example, to select TCP ports between 25 and 443, the syntax would be: `tcp.port = 25-443`
, (comma)	Denotes a list of ranges or values or meta keys. Single values may be used as well as any combination of ranges and upper or lower bounds. Single meta keys may be used in a list. Meta keys and literal values cannot both appear on the right-hand side of an operator. For example, the following is valid syntax: `tcp.port = 1-10,25,110,143-225,40000-u`

Syntax element	Description
( )	Grouping operator. An expression can be enclosed in parentheses to create a new logical expression. For example, the following would select traffic on port 80 to/from 192.168.1.1 OR traffic on port 443 to/from 10.10.10.1: `(ip.addr=192.168.1.1 && tcp.port=80) || (ip.addr=10.10.10.1 && tcp.port=443)`
~	Logical NOT operator, a negation of an expression.
&&	Logical AND operator, a conjunction of two expressions.
||	Logical OR operator, a disjunction of two expressions.

Configure Capture Rules

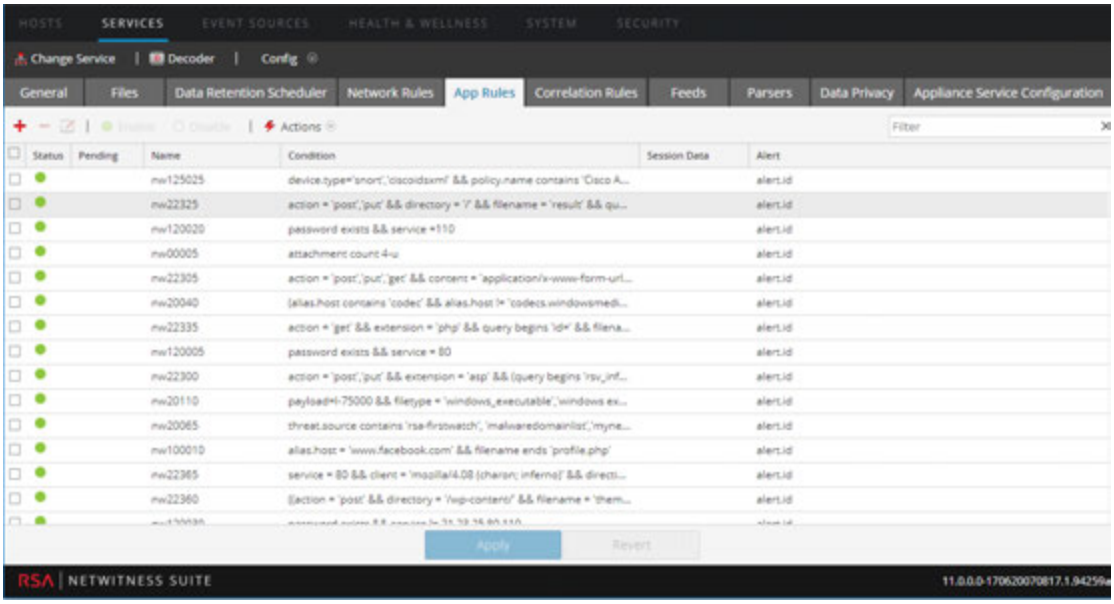
The Decoder and Log Decoder rules are editable in the Services Config view. While each type of rule (network, application, and correlation) has its own tab; the functions are similar for all types of rules. You can:

- Add, edit, and delete rules
- Enable and disable rules
- Change the execution sequence of rules
- Import rules from a file
- Export rules to a file
- Push rules to another service
- Revert or apply rule changes
- Restore one of the last ten rule configurations from a snapshot

To configure rules in the Rules tabs

1. Go to **ADMIN > Services**.
2. In the **Services** view, select a Decoder service and  **> View > Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.

The rules list for the selected rule type is displayed.



Each type of rule has a list with slightly different columns and different parameters. Several basic guidelines apply to all rule management activities:

- The rules are executed in the sequence they are displayed in the list. To change the execution sequence of rules, drag and drop rules to the appropriate location in the list or use the context menu options to arrange the rules in the list.
- To select a single row, click the row.
- To select a group of adjacent rows, click the first, then shift-click the row at the end of the group.
- To select multiple non-adjacent rows, click the first, then control-click the others.
- When editing rules in the Rules tab, you must apply the configuration changes in order to activate.
- Until changes are applied, you can discard edits to the list and revert to the unedited rules.
- Once rules are applied, you can recover the last ten rules configurations using the **History** option in the **Actions** menu.

To add a rule in any Rules tab, do one of the following:

- Click **+**.
- Right-click a rule, and select **Insert Above** or **Insert Below** from the context menu.
  The Rule Editor dialog for that type of rule is displayed.

To remove a rule:

1. From any Rules tab, select the rules to remove from the rules list.
2. Click −.

   The selected rules are removed from the list, but still exist on the service.

To edit a rule

1. From any Rules tab, select the rule to edit.
2. Click or double-click the rule row.

   The Rule Editor dialog for that type of rule is displayed.

To disable a rule:

1. From any Rules tab, select the rules to disable.
2. Click Disable.

   The status changes to disabled in the rules list, but the rule is still enabled on the service.

To enable a rule:

1. From any Rules tab, select the rules to enable.
2. Click Enable.

   The status changes to enabled in the rules list, but the rule is still disabled on the service.

Import Rules from a File and Export Rules

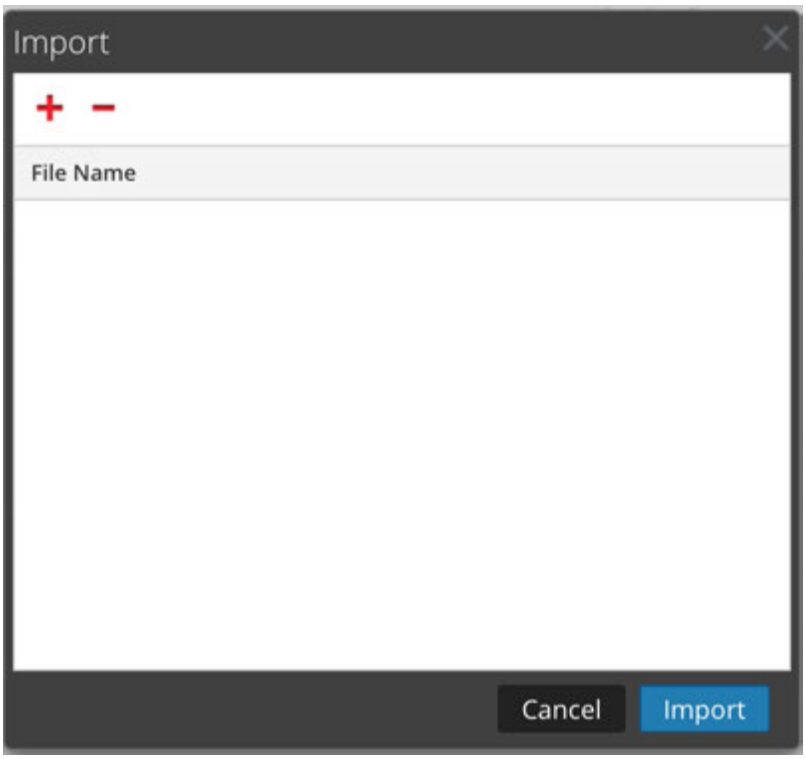
You can import network, application, and correlation rules to a Decoder from a file that contains rules of the same type. After the rules are imported, you can edit and manage them as you would any other rules.

When you attempt to import a group of rules, NetWitness Suite Administration checks the type of rules imported. If you are successful, a message displays the number of rules imported. If the rule type differs from the active tab type, the rules are not imported. You must re-import the rules under the correct tab or select another file to import.

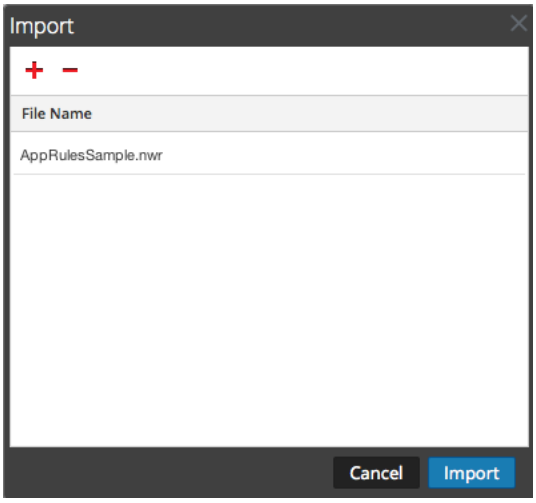
To import rules to a service:

1. From any Rules tab, select Actions > Import.

   The Import dialog is displayed.



2. Click +.
   A view of the directory structure is displayed.
3. Choose one or more NetWitness rules (.nwr) files to import, and click **Open**.
   The file is added to the list in the Import dialog.



4. Click **Import**.
   The rules are imported into the user interface. Imported rules have a red corner in each edited column.
5. Edit or reorder the rules if needed.

6. To save the rules to the service, click **Apply**.
   The rules for the service are updated with the changes.

To export a rule to a file:

1. To export a subset of the rules, select the rules to be exported.
2. Do one of the following:
   - In the toolbar, select 
 > Export > Selection. (**Export > All** exports all rules in the rules listeven if you have a subset selected for export.)
   - Right-click the selected rules and select **Export Selection**.
     A prompt for the filename is displayed.
3. Enter the filename and click **Export**.
   The .**nwr** file is downloaded.

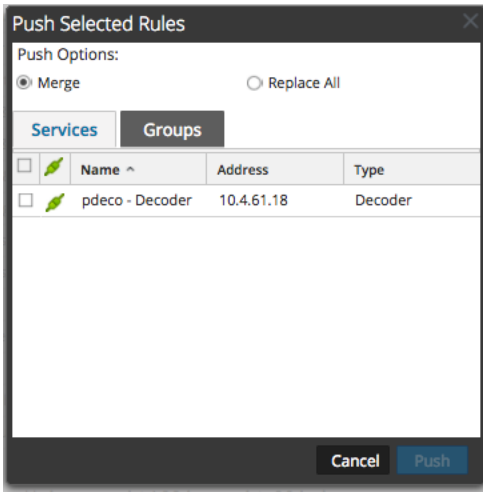
Push Rules to Other Services

You can apply (push) rules or selected rules to other services (Decoders or Log Decoders) or service groups. When you push all rules to other services, all rules on the target services are removed and replaced with all of the rules on the source service.

To push selected rules from this Decoder to other Decoders:

1. From any Rules tab, select the rules that you want to push to another Decoder.
2. Do one of the following:
   - Select 
 > Push > Selection.

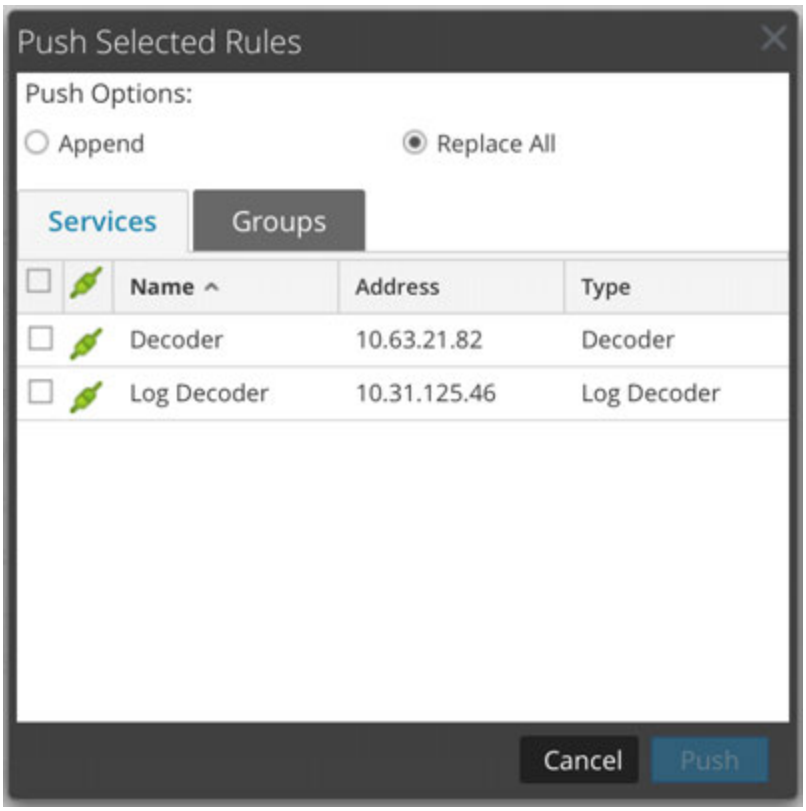
- Right-click the selected rules and select **Push Selected Rules**.
  The Push Selected Rules dialog is displayed.



3. Select a Push Option:
   - Select **Replace All** to delete all rules on the target services and replace them with the selected rules. This is the default selection.
   - Select **Merge** to merge the selected rules with the existing rules on the target services.
4. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
5. Click **Push**.
   The rules are pushed to the selected services and become effective immediately.

To push all rules from this Decoder to other Decoders:

1. From any Rules tab, select Actions > **Push** > **All**.
   (**Push** > **All** pushes all rules in the rules list even if you have a subset selected to push.) The Push Selected Rules dialog is displayed.



2. On the **Services** tab, select the target services to receive the pushed rules, or select the groups of services from the **Groups** tab.
3. Click **Push**.
   All rules from the target services are deleted and replaced with all of the rules from source service. The rules become effective immediately.

Change Execution Order of Rules

Capture rules are applied in the order they are displayed in the rules list. To reorder rules, use either of these methods:

- Drag and drop the rules in the appropriate location in the rules list.
- Right-click a rule to display the context menu, and use the **Cut** and **Paste** options.

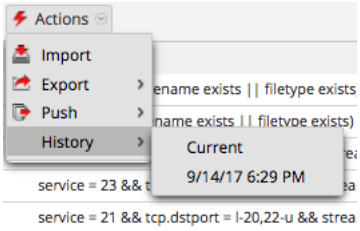
Restore a Rule Snapshot from History

NetWitness Suite keeps the last ten snapshots of rules applied to a service.

To restore a rules snapshot from history:

1. Select Actions > **History**.

   A submenu of snapshots is displayed.



2. Select the snapshot time from the submenu.

   The rules from the snapshot are loaded into the rules list, replacing the current set. But the current set is still in use on the service.

3. To apply the rules to the service, click **Apply**.

   The rules are applied to the service.

Configure Application Rules

Application layer rules are applied at the session level. The following are sample application rules.

To truncate packets carried via Server Message Block protocol (SMB), create a rule as follows:

- Rule Name: Truncate SMB
- Condition: `service=139`
- Rule Action: Truncate

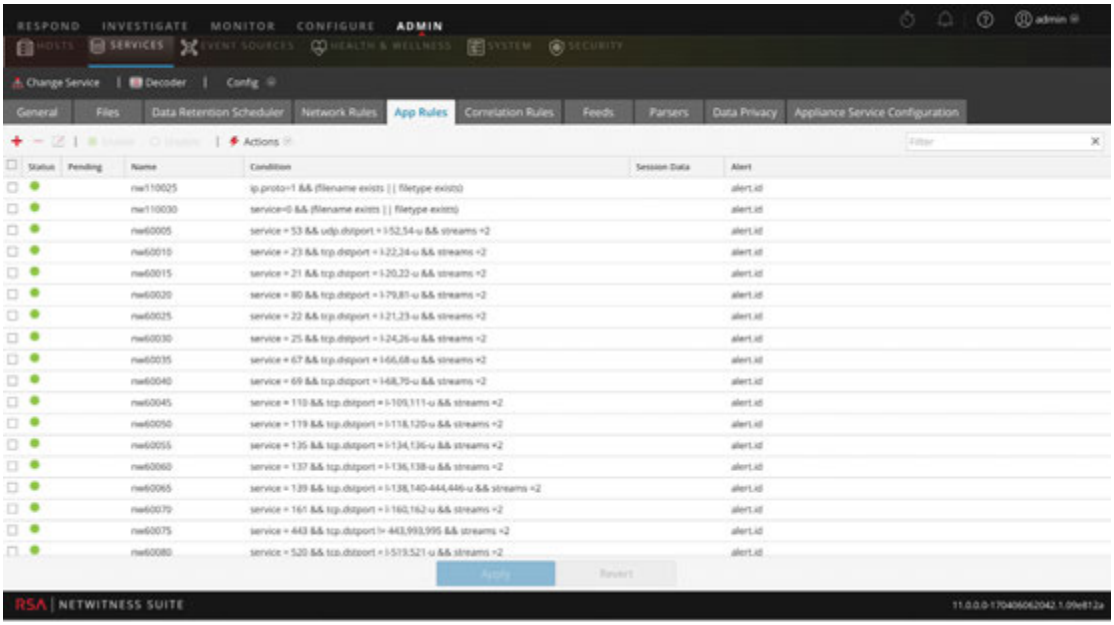
To retain email to and from a specific e-mail address, create a rule as follows:

- Rule Name: Email Filter Tom Jones
- Condition: `email='Tom.Jones@TheShop.com'`
- Rule Action: Filter

To add or edit an application rule:

1. Go to **ADMIN > Services.**
2. Select a Decoder or Log Decoder service and  **> View > Config**.

   The Systems Config view for the selected service is displayed.
3. Select the **App Rules** tab.

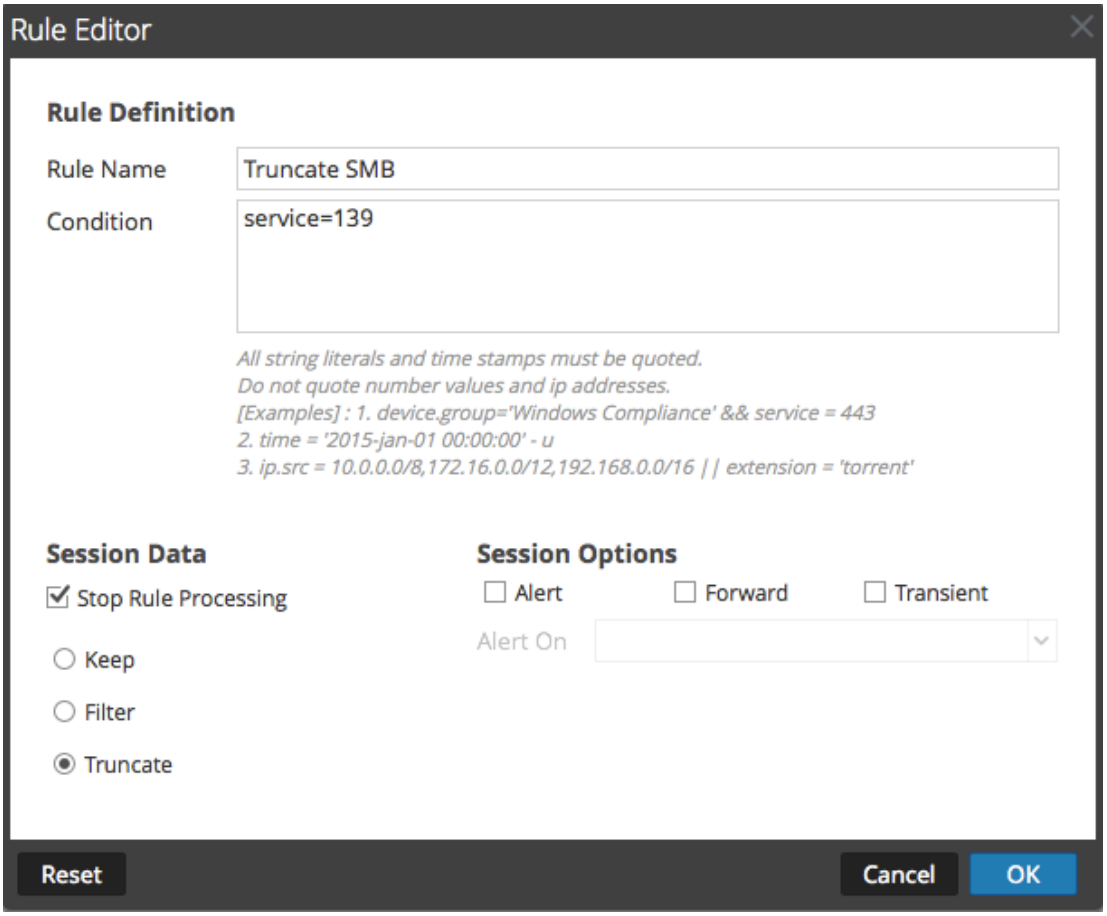


4. Do one of the following:

   If adding a new rule, click **+** .

   If editing a rule, select the rule from the rules list and click  .

5. The Rule Editor Dialog is displayed with application rule parameters.



a. In the **Rule Name** field, type a name for the rule. For example, for a rule that truncates all SMB, type **Truncate SMB**.
b. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, NetWitness Suite displays syntax errors and warnings. For example, to truncate all SMB, type **service=139**.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
c. If you want rule evaluation to end with this rule, check the **Stop Rule Processing** checkbox.
d. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:
   Keep: The packet payload and associated meta are saved when they match the rule.
   Filter: The packet is not saved when it matches the rule.

Truncate: The packet payload is not saved when it matches the rule, but packet headers and associated meta are retained.

e. In the **Session Options** section, do any of the following:

- **To generate a custom alert** when a session metadata matches the rule, enable the Alert flag and select the name of the alert meta from the **Alert On** drop-down list.
- **To perform syslog forwarding** when the log matches the rule, enable the **Forward** flag. Make sure that:
  - You have enabled both the Alert and Forward flags to carry out syslog forwarding.
  - The name of the rule mentioned in the Rule Editor dialog matches the syslog forwarding destination name specified in the Log Decoder > View > Explore > `/decoder/config/logs.forwarding.destination` parameter
- **To prevent the alert metadata that is created from being written to the disk**, enable the **Transient** flag.

6. To save the rule and add it to the grid, click **OK**.
   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.
7. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.
8. To apply the updated rule set to the Decoder or Log Decoder, click **Apply**.
   NetWitness Suite saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

Configure Correlation Rules

Basic Correlation Rules are applied at the session level and alert the user to specific activities that may be occurring in their environment. NetWitness Suite applies correlation rules over a configurable sliding time window. When the conditions are met, alert metadata is created for this activity and there is a visible indicator of the suspicious activity.

The following are sample correlation rules illustrating two use cases and the syntax.

Objective: In sessions where tcp.dstport exists, if there is any combination of ip.src and ip.dst where the count of unique instances of tcp.dstport > 5 within 1 minute, then alert. To achieve this objective, create a rule as follows:

- Rule Name: IPv6 Vertical TCP Port Scan 5
- Rule: `tcp.dstport exists`
- Instance Key: `ip.src,ip.dst`
- Threshold: `u_count(tcp.dstport)>5`
- Time Window: 1 min

Objective: In sessions where `action==login` and `error==fail`, if there is any combination of `ip.src` and `ip.dst` that appears in more than 10 sessions within 5 minutes, then alert. To achieve this objective, create a rule as follows:

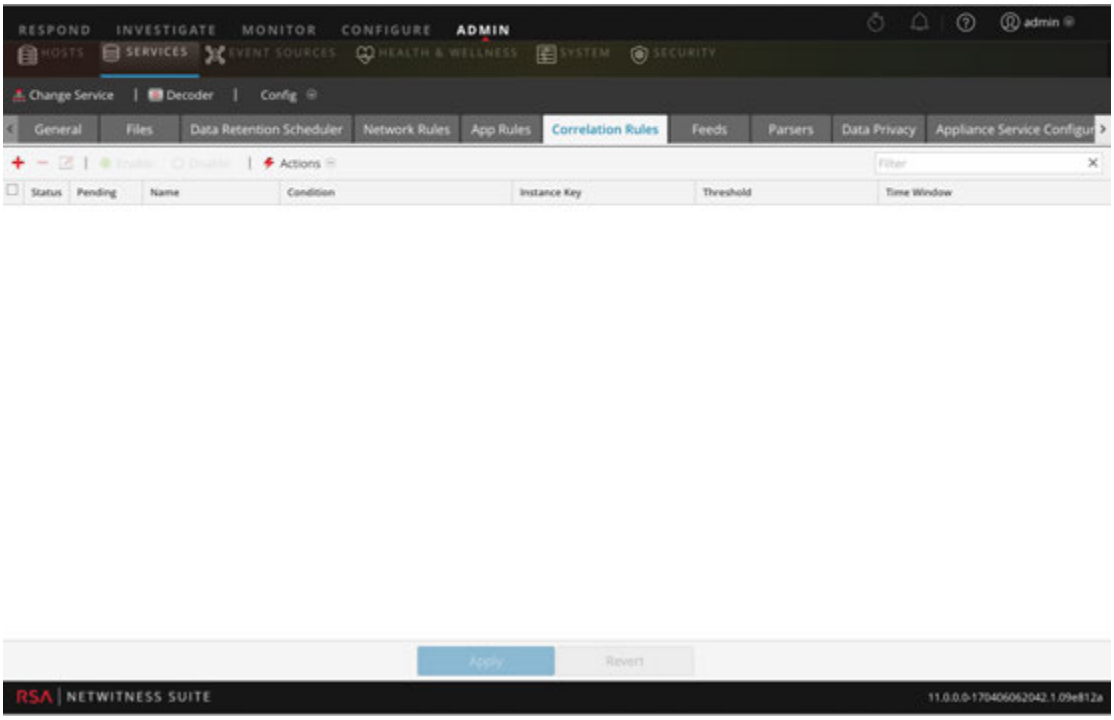
- Rule Name: IPv4 Potential Brute Force 10
- Rule: action=`'login' && error='fail'`
- Instance Key: `ip.src,ip.dst`
- Threshold: `count()>10`
- Time window: 5 mins

Both sample rules have the same instance key: `ip.src` and `ip.dst`. Because we are looking for unique combinations of `ip.src` and `ip.dst` that match the correlation condition, **`ip.src`** and **`ip.dst`** are **primary keys**.
Threshold can include an **associated key** that identifies the meta type that we are counting to determine if the condition is satisfied. In the first example, the associated key specified in Threshold is `tcp.dstport`. We are counting unique instances of `tcp.dstport` for every `ip.src/ip.dst` pair. In the second example, the associated key is not specified in the Threshold because it is merely a count of sessions. It is helpful to think of this scenario as counting unique session IDs and the associated meta is implicitly session.id. We are counting unique `session.id` for every `ip.src/ip.dst` pair.

Invalid use case: In sessions where (rule), if there is any combination of `ip.src` and `ip.dst` that have a unique count of `ipv6.dst > 5` within (time window), then alert. This case does not work because the associated key `ipv6.dst` is an IPv6 meta type. IPv4 and IPv6 meta types are not permitted to be used as associated keys.

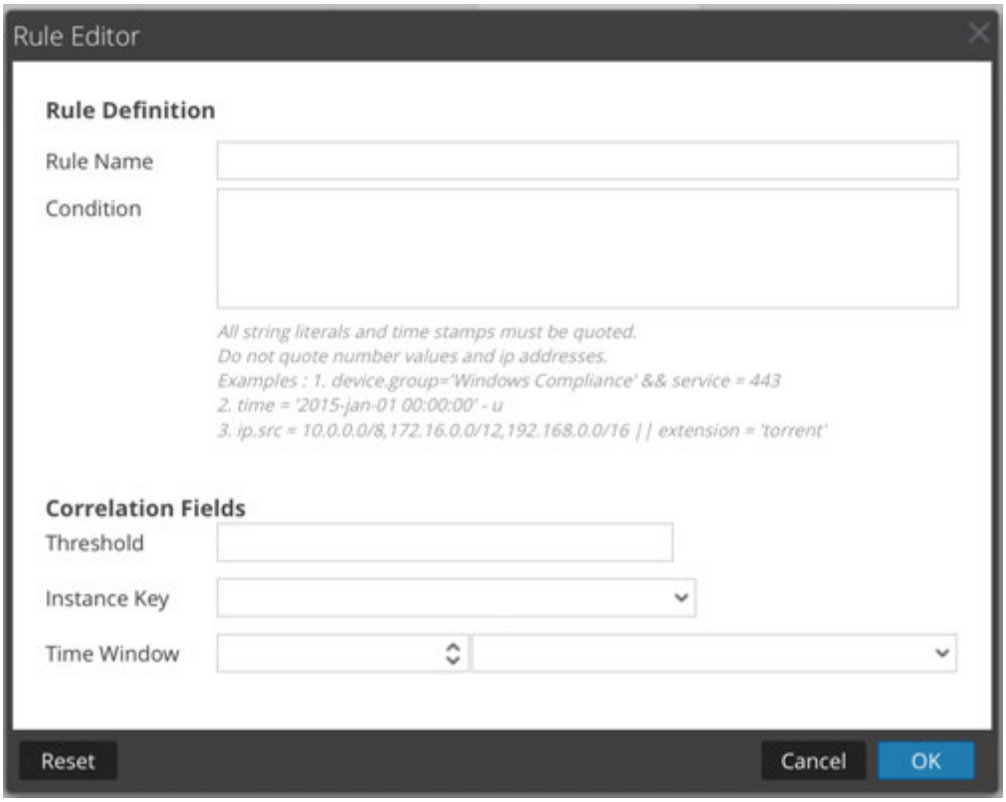
To add or edit a correlation rule

1. Go to **ADMIN > Services,** select a service, and > **View > Config**.
   The Service Config view for the selected service is displayed.
2. Select the **Correlation Rules** tab.



3. In the **Correlation Rules** tab, do one of the following:
   - If adding a new rule, click .

- If editing a rule, select the rule from the rules grid and click .
  The Rule Editor dialog is displayed with correlation rule parameters.



4. In the **Rule Name** field, type a name for the rule. For example, to create the sample rule, **IPv6 Vertical TCP Port Scan 5**.
5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, syntax errors and warnings are displayed by NetWitness Suite. For example, to create the sample rule, type **tcp.dstport exists**. When this condition is matched, the session data action is performed.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
6. In the **Threshold** field, use one of the threshold parameters to specify the minimum number of occurrences required to create a correlation session and an associated key if required. The associated key cannot be an IPv4 or IPv6 meta type.
   - u_count(associated_key) = the count of unique values of the specified key
   - sum(associated_key) = the values of the specified key
   - count = number of sessions (no associated key is specified)

7. In the **Instance Key** field, select the target indicator to base the event upon. This can be a single key or a compound key (two primary keys, separated by a comma).
8. In the **Time Window**, set the duration during which the threshold must be reached to create a correlation session.
9. To save the rule and add it to the grid, click **OK**.
   The rule is added at the end of the grid or inserted where you specified in the context menu. The plus sign is displayed in the **Pending** column.
10. Check that the rule is in the correct execution sequence with other rules in the grid. If necessary, move the rule.
11. To apply the updated rule set to the service, click **Apply**.
    NetWitness Suite saves a snapshot of the currently applied rules, then applies the updated set to the Decoder or Log Decoder.

Configure Network Rules

Network rules are applied at the packet level on a Decoder and are made up of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied at the packet level to a Decoder. Network rules can apply to multiple network layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules do not apply to Log Decoders, they apply only to packet Decoders.

You can create and manage network rules in the Services Config view > Network Rules tab.

Supported Meta Keys in Network Rule Conditions

The following table describes the meta keys that NetWitness Suite supports for use in network rule conditions.

Meta Key	Description
eth.addr	Ethernet source or destination address. Commonly known as the MAC address.
eth.dst	Destination Ethernet address. This is the same as the Ethernet address field except that it selects only packets where the destination address matches the selected value(s).
eth.src	Same as Ethernet destination except that it focuses on the source address.
eth.type	Ethernet frame type.
hdlc.type	Frame type of the HDLC frame.
ip.addr	IPv4 source or destination address in standard form. IP addresses can be entered in CIDR notation for subnets.
ip.dst	Destination IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets.
ip.proto	IPv4 protocol field.
ip.src	Source IPv4 address in standard form. IP addresses can be entered in CIDR notation for subnets.

Meta Key	Description
ipv6.addr	IPv6 source or destination address in hex format. Generally IPv6 addresses are written as eight groups of four hex digits, thus expressing the entire 128 bit address length. Supports notation to represent multiple blocks of 0000 in an address. Does not support CIDR notation.
ipv6.dst	Destination IPv6 address in hex format.
ipv6.proto	IPv6 protocol field. This maps to the Next Header field in the IPv6 header and uses the same values as the IPv4 protocol field.
ipv6.src	Source IPv6 address in hex format.
tcp.dstport	Destination TCP port.
tcp.port	TCP source or destination port.
tcp.srcport	Source TCP port.
udp.dstport	Destination UDP port.
udp.port	UDP source or destination port.
udp.srcport	Source UDP port.

The following are sample network rules.

To truncate all SSL from the source port, create a rule as follows:

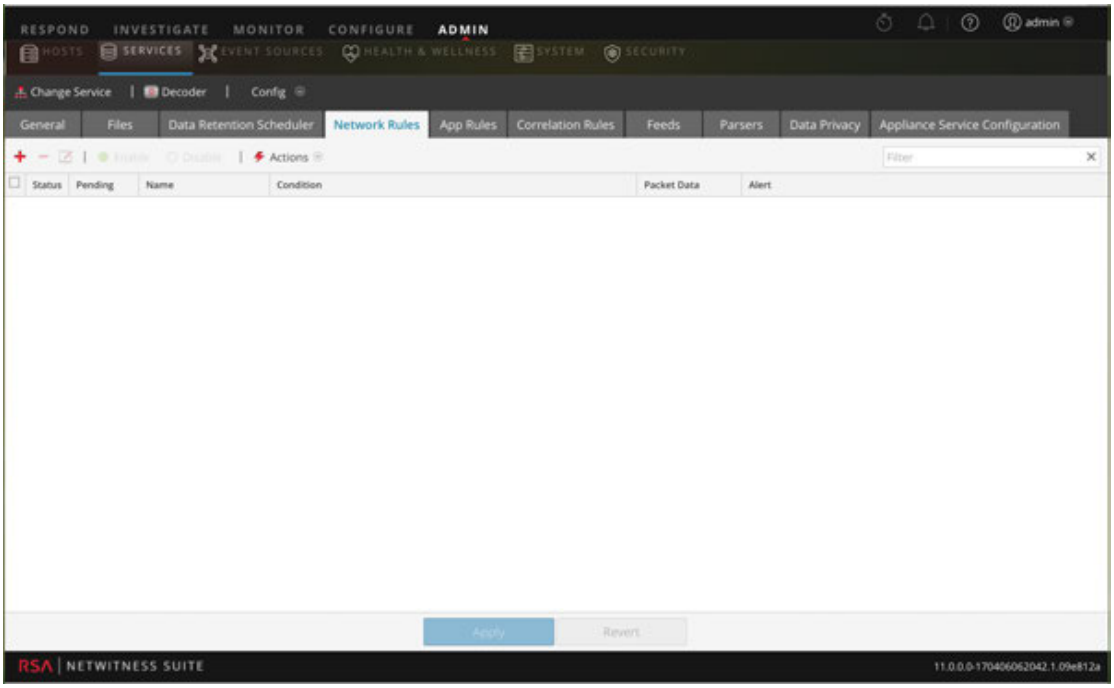
- Rule Name: Truncate SSL
- Condition: `tcp.srcport=443`
- Rule Action: Truncate

To filter subnet traffic, create a rule as follows:

- Rule Name: Subnet Filter
- Condition: `ip.addr=192.168.2.0/24`
- Rule Action: Filter

To add or edit a network rule:

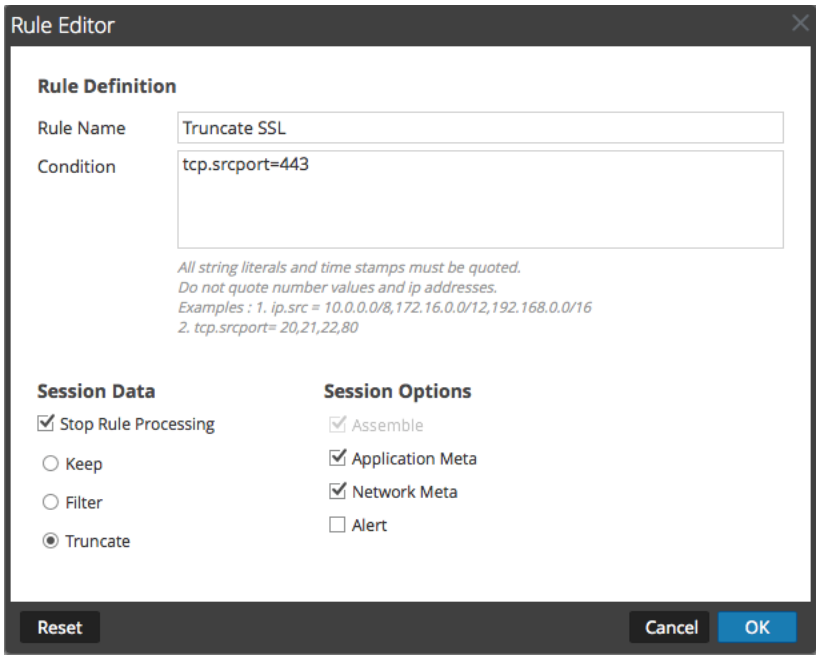
1. Go to **ADMIN > Services,** select a Decoder service, and  **> View > Config**.
   The Services Config view for the selected service is displayed.
2. Select the **Network Rules tab**.
   The Network Rules tab is displayed.



3. In the **Network Rules** tab, do one of the following:
   - If adding a new rule, click  .

- If editing a rule, select the rule from the rules list and click .

  The Rule Editor dialog is displayed.



4. In the **Rule Name** field, provide a name for the rule. For example, for a rule that truncates all SSL from the source port, type **SSL Truncate**.
5. In the **Condition** field, build the rule condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the window actions. As you build the rule definition, NetWitness Suite displays syntax errors and warnings. For example, to truncate all SSL from the source port, `tcp.srcport=443`.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. Supported Meta Keys in Network Rule Conditions describes the meta keys that NetWitness Suite supports for use in network rule conditions.
6. If you want rule evaluation to end with this rule, select the **Stop Rule Processing** checkbox.
7. In the **Session Data** section, choose one of the following actions to apply when a matching packet is found:
   - **Keep**: The packet payload and associated meta are saved when they match the rule.
   - **Filter**: The packet is not saved when it matches the rule.
   - **Truncate**: The packet payload is not saved when it matches the rule, but packet headers and associated meta are retained.
8. In the **Session Options** section, select all options that apply of these four.

- **Assemble**: The assembler assembles the packet chain when it matches the rule.
- **Network Meta:** The packet generates network metadata when it matches the rule.
- **Application Meta**: The packet generates application metadata when it matches the rule.
- **Alert**: The packet generates a custom alert when metadata matches the rule.

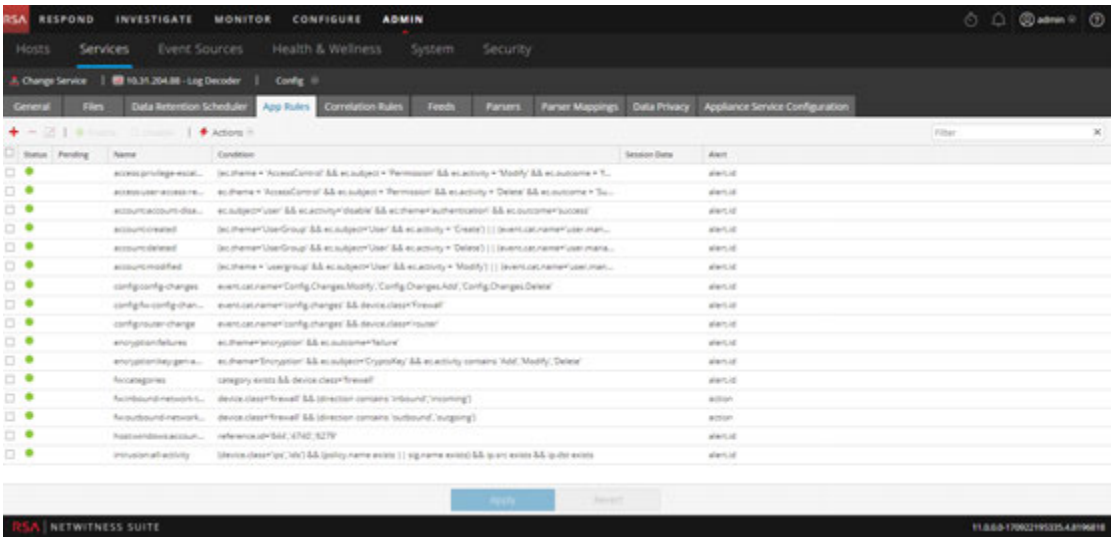
9. To save the rule and add it to the rules list, click **OK**.
   The rule is added at the end of the list or inserted where you specified in the context menu.
10. Check that the rule is in the correct execution sequence with other rules in the list. If necessary, move the rule.
11. To apply the updated rule set to the Decoder, click **Apply**.
    NetWitness Suite saves a snapshot of the currently applied rules, then applies the updated set to the Decoder and removes the pending indicator from the rules that were pending.

Fix Rules with Invalid Syntax

After an update to NetWitness Suite 11.0, the user interface highlights any rules with invalid syntax. The Rule Editor provides additional tooltips. After you fix the rules, the highlights disappear. Configure Decoder Rules provides guidelines that all queries and rule conditions in NetWitness Suite must follow.

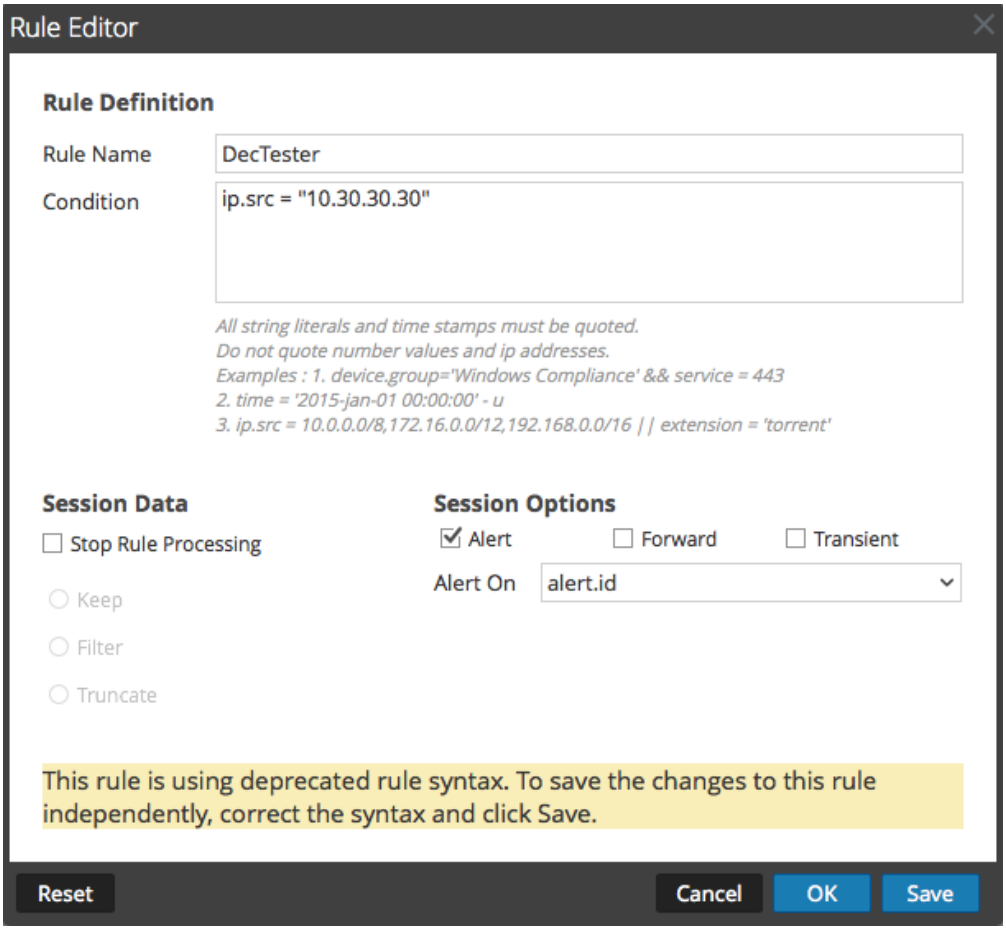
To correct rules with invalid syntax:

1. Go to **ADMIN > Services**.
2. In the **Services** view, select a Decoder and > **View** > **Config**.
3. In the **Services Config** view, select one of the Rules tabs: Network Rules, App Rules, or Correlation Rules.
   The Rules tab for the selected rule type shows the number of rules using invalid syntax and the invalid rules are highlighted.



4. Select an invalid rule and click .
   The Rules Editor shows additional information for the invalid rule and it includes an

additional Save option.



5. In the **Condition** field, correct the rule syntax.
   All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
   For example, if the invalid rule condition is `ip.src="10.30.30.30"`, correct the syntax by removing the quotes: `ip.src=10.30.30.30`
6. Do one of the following:
   - To correct the rule individually, click **Save**.
     The corrected rule is applied independently to the Decoder. The corrected rule appears on the Rules tab without highlights.
   - To correct the rule and apply the rule to the Decoder later with other rules, click **OK**.
     The corrected rule appears on the Rules tab without highlights. The rule is not applied to the Decoder.

Decoder Commands for Managing Rules

In the NetWitness Core database, the Rules tree holds the main functionality related to managing rules for all Core services that have rules: Concentrators, Decoders, Log Decoders, and Archivers. Although you can manage rules in the NetWitness Suite user interface, advanced users may prefer to manage rules using a command line to add, merge, replace, delete, and validate rules on a service. This section provides a brief overview of the commands and their usage. These are the available commands:

- `add` - Adds a single rule at the specified position.
- `clear` - Deletes all existing rules in the current node on the service. For example, using the command in `/decoder/config/rules/application` node deletes all existing application rules on the Decoder.
- `delete` - Deletes one or more rules at a specified position and count.
- `merge` - Merges a pushed rule set with an existing rule set. Existing rules that match the incoming rules (by name or rule) are replaced; otherwise, rules are inserted by the position indicated as described in merge Command.
- `replace` - Deletes all existing rules and replaces them with the incoming rule set.
- `validate` - Validates the syntax of a rule, but does not validate the meta keys.

add Command

The `add` command adds the rule to the existing rule set. Formatting is important because the API uses double quotes in the rule language and also uses double quotes as parameters to all RSA NetWitness® Suite APIs. Therefore, you must escape any double quotes in the rule itself by preceding it with a backslash (\) character. This is the syntax of the command:

```
add rule=<string> name=<string> alert=<string, optional> atPos=<<uint32, optional>
```

- `rule` is the rule to add. Be sure to place double quotes around any rules with white space and to escape any double quotes that are part of the rule with a backslash.
- `name` is the name of the rule.
- `alert` is the alert for the rule (if any).
- `atPos` is the position at which the rule should be added (1 based). Zero is the top of the list and any number larger than the current size of the list is appended to the list.

This is an example of command to add a rule using NwConsole

```
send /decoder/config/rules/application add rule="ip.src exists" order=1
alert=alert.id name=testrule
```

For example, take the following rule:

```
alias.host = "myPC" && country.src="china","russian federation"
```

To add this as a rule, you would need to send the parameters as follows:

```
rule="alias.host = \"myPC\" && country.src=\"china\",\"russian
federation\"" name=myRule filter
```

Notice how all the double quotes had to be escaped inside the rule parameter. A simple trick to make this more readable is to use single quotes inside the rule. Single and double quotes are interchangeable in the rule and query language, but not in parameters for the API (only double quotes are supported there). Therefore, this is more readable:

```
rule="alias.host = 'myPC' && country.src='china','russian federation'"
name=myRule filter
```

merge Command

The `merge` command is used to merge an incoming list of rules with the existing rules on the service. This is how it works:

- It finds existing rules that match via the name OR via a matching rule, updates the existing rule name, and keeps the same position.
- It inserts new rules into the rule list based on the NUMBER position. If the number is zero, it goes to the top of the list.
- It processes the rules in the order received so if you have two rules numbered zero, the second rule is processed after the first and claims the top spot. All existing rules are pushed down two places. Any numbers higher than existing rule positions are appended after the last existing rule and numbered in sequence.
- Any non-numbered rule is appended after the last existing rule and numbered in sequence.

This is the syntax of the merge command:

```
merge --file-data=<string> --file-format<string>
```

- `file-data` is the full path and name of the rules file to merge.
- `file-format` is the format of the rules file. Valid values are `params-list`, `string`, `params`, `binary`, and `params-binary`.

Methods of Sending a List of Rules to a Service

There are two ways to send a list of rules. You can send them as a `.nwr` (NetWitness Rule) file or as a numbered set of parameters, each number indicates the position to insert the rule at as well as the encoded rule. If you want to see the current list of rules on a service, you need to run the `ls` command on the rule category (for instance, application rules on a Decoder are found in `/decoder/config/rules/application`).

This is an example of commands to list the existing rules using NwConsole:

```
login <hostname>:50004 <username> <password>
cd /decoder/config/rules/application
ls
```

This is another example to list existing rules in NwConsole:

```
send /decoder/config/rules/application ls
```

This is an example of the command to point to network rules in the RESTful port, which supports a basic `admin HTML` app.

```
http[s]://<decoder>:50104/decoder/config/rules/network
```

Send a NetWitness Rule File

Let's start with an example `nwr` file, each rule must be on a separate line:

```
rule="ip.src=192.168.0.1" name=first keep
rule="ip.src=192.168.1.1" name=second alert=risk.info
rule="ip.src=192.168.2.1" name=third filter
```

To push and merge rules using NwConsole, use the following commands:

```
login <hostname>:50004 <username> <password>
send /decoder/config/rules/application merge --file-data=/root/App_Rules.nwr --file-format=params-list
```

To replace the existing rules with the rules in the file, instead of using the `merge` command , use the `replace` command.

```
send /decoder/config/rules/application replace --file-data=<pathname> --file-format=params-list
```

To merge the rules in an `nwr` file using the RESTful port, you can use a `curl` command that pushes the rules:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --data-binary @<pathname> -X POST "http://<hostname>:50104/decoder/config/rules/application?msg=merge"
```

The examples are pushing application rules. To push network rules, send the rules to `/decoder/config/rules/network`. For correlation rules, send the rules to `/decoder/config/rules/correlation`.

Send Numbered Parameters

The other way to send a list of rules is to send them as numbered parameters. The difficulty with this method is remembering to escape the quotes within each numbered rule. Though it is only a problem if you are trying to do it by hand. For instance, to send the same rules above as parameters via NwConsole, use the following command:

```
send /decoder/config/rules/application merge 1="rule=\"ip.src=192.168.0.1\"
name=first keep" 2="rule=\"ip.src=192.168.1.1\" name=second alert=risk.info"
3="rule=\"ip.src=192.168.2.1\" name=third filter"
```

This command is hard to read because you have to escape the inner quotes with a backslash (\). Otherwise, these two commands accomplish the same thing. Merging or adding three rules in positions 1, 2 and 3. If you think the above was hard to read, this is what the equivalent `curl` command looks like:

```
curl -u "<username>:<password>"
"http://<hostname>:50104/decoder/config/rules/application?msg=merge&1=rule%3D%22ip.src%3D
192.168.0.1%22%20name%3Dfirst%20keep&2=rule%3D%22ip.src%3D192.168.1.1%22%20name
%3Dsecond%20alert%3Drisk.info&3=rule%3D%22ip.src%3D192.168.2.1%22%20name%3Dthird
%20filter"
```

For more details on how to escape double quotes inside parameters, see add Command.

Ordering Rules When Pushing

Pushed rules are ordered in one of two ways. When passing as parameters, the number of each parameter determines the insertion order. If it is not actually a number, `merge` checks for an `order` parameter within the rule itself and uses that value if found.

Note: Using `order` is the only way to set the order with a `.nwr` file. If neither a number nor an `order` parameter is found, there are no guarantees of the insertion order.

Example

A Decoder has the following application rules installed; notice the numbering is ALWAYS consecutive and starts at 1:

0001 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep

0002 : rule="ip.src=192.168.1.1" name=second alert=risk.info

0003 : rule="ip.src=192.168.2.1" name=third filter

And you want to merge the following four rules:

rule="ip.src=192.168.3.1" name=third keep

rule="ip.dst=192.168.4.1" name=NewRule filter order=0

rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append

rule="service=80,443" name=web filter order=3

Use any method to push your rules and this is what you end up with:

0001 : rule="ip.dst=192.168.4.1" name=NewRule filter order=1

0002 : rule="ip.src = 192.168.0.1 || ip.dst = 192.168.0.1 || alias.host = 'My-PC'" name=first keep order=2

0003 : rule="service=80,443" name=web filter order=3

0004 : rule="ip.src=192.168.1.1" name=second alert=risk.info order=4

0005 : rule="ip.src=192.168.3.1" name=third keep order=5

0006 : rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=6

Are there any surprises here? This is how each rule was processed.

1. rule="ip.src=192.168.3.1" name=third keep

This rule had the same name as an existing rule on the Decoder (third). So the rule updated the existing rule, `changing _filter_ to _keep_`.

2. rule="ip.dst=192.168.4.1" name=NewRule filter order=0

This rule is new and had `order=0` in it, which means insert at the very top.

3. rule="alias.host = 'pc1','pc2'" name=filterTheseNames filter order=append

This rule had a non-number `append` for `order`, therefore, it went to the end of the list. You can accomplish the same thing by giving a very large number, like `999999`.

`4. rule="service=80,443" name=web filter order=3`

This rule is last but has `order=3`, therefore, if it does not match an existing rule by name or the text of the rule itself, it should be placed in position 3. And there it is, the third rule in the list. Any rules that follow were pushed further down.

replace Command

The `replace` command removes all existing rules and replaces them with the incoming rule list. Refer to merge Command for details on how to format the incoming rule list and how ordering works.

This is an example of the `replace` command using a Netwitness Rule File :

send /decoder/config/rules/application replace --file-data=/root/Decoder-AppRules.nwr --file-format=string

This is an example of the `replace` command using Numbered Parameters :

send /decoder/config/rules/application replace 1="rule=\"ip.src exists\" name=\"test rule\" order=1 alert=alert.id"

clear Command

The `clear` command removes all existing rules on the service. This is an example of the command:

```
send /decoder/config/rules/application clear
```

delete Command

The `delete` command deletes one or more rules on the service.

delete atPos <uint32> count <uint32, optional>

- `atPos` deletes the rule at the given position. Rules are numbered starting with 1 and go in sequential order.
- `count` deletes one or more rules starting `atPos`. This is an optional parameter defining the number of rules to delete starting `atPos`. The default value is 1.

This example of the command deletes four rules beginning at position 0003:

```
send /decoder/config/rules/application delete atPos=0003 count=4
```

validate Command

The `validate` command takes the provided rule and verifies that it parses correctly. Keep in mind that this command cannot verify whether language keys and entities are valid.

validate rule <string>

`rule` - is the name of the rule to validate. Make sure to place double quotes around any rules with white space.

Configure Feeds and Parsers

Feeds and parsers are responsible for analyzing the packets and logs when captured or imported in a Decoder or Log Decoder. Most commonly, they are used for static metadata extraction and service identification. The flexible definition allows custom extension of the core defined services to provide extra service type identification and metadata extraction. This is important due to the volume of custom applications that are used on networks.

Note: Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

Configure Parsers

NetWitness Suite has a set of core parsers that are defined by the system, and also has the ability to add additional parsers. Each parser is configurable in the Services Config View - General Tab. The Parser Configuration panel provides a way to enable or disable parsers to use on the Decoder in addition to limiting the metadata that the parser creates.

In addition, there are several types of custom configurable parsers:

- GeoIP – This parser associates the IP addresses with geographical locations.
- Search – This parser is user -configured to generate metadata by scanning for pre -defined keywords and regular expressions.
- FLEXPARSE (deprecated) – This is a generic parser definition language for extending the existing application protocol support of the Decoder. By default this parser is disabled (see Enable or Disable Lua and Flex Parsing Systems).
- Lua – This parser is defined using the Lua scripting language for extending the existing application protocol support of the Decoder.
- enVision – This application parser supports the Log Decoder and is configured to generate metadata by scanning log files.
- SNORT® – This parser supports the payload detection capabilities of SNORT® IDS rules.

In the Services Config view > Parsers tab, you can view deployed parsers on a Decoder, upload parsers, and delete deployed parsers. The user interface includes an Indicator if the parser originated from Live Services, installed through NetWitness Suite, or uploaded manually. Parsers can be added and removed while a Decoder is running without affecting capture.

In addition, you can download parsers using NetWitness Suite Live Services.

Configure Feeds

NetWitness Suite uses feeds to create metadata based on externally defined metadata values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created. This data could identify and classify malicious IPs or incorporate additional information such as department and location based on internal network assignments. Some examples of feeds include threat feeds to identify BOTNets, DHCP mappings, or even active directory information such as physical location or logical department.

You can use the Live module in NetWitness Suite to obtain feeds from outside sources. "Live Content in NetWitness Suite" in the *Live Services Management Guide* provides an overview of the Live content management tool.

Within the NetWitness Suite user interface, you can view the list of currently deployed feeds, along with an indicator if a feed that originated from Live was installed through NetWitness Suite or manually. Feeds can be added, removed, and updated while a Decoder is running without affecting capture.

has a Custom Feed wizard to allow creation and deployment of custom Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides users through the process to create both on-demand and recurring feeds, it is helpful to understand the form and content of a feed file when you create a feed.

NetWitness Suite has a Custom Feed wizard, which streamlines the task of creating and managing custom feeds, as well as populating the feeds to selected Decoders and Log Decoders. In addition, you can download existing feed files and edit the files, then edit the feed or create a new feed using the edited file.

Custom Feed Definition File Structure

The NetWitness Suite Custom Feed wizard allows creation and deployment of custom Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides users through the process to create both on-demand and recurring feeds, it is helpful to understand the form and content of a feed file when you create a feed.

Feed filenames in RSA NetWitness Suite are in the form `<filename>.feed`. To create a feed, NetWitness Suite requires a feed data file in `.csv` or `.xml` format and a feed definition file in `.xml` format, which describes the structure of a feed data file. The Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness Suite can fetch the most current version of the file for each recurrence. After a NetWitness Suite feed is created, you can download the feed to your local file system, edit the feed files, and then edit the NetWitness Suite feed to use the updated feed files.

Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness Suite creates based on your entries in the Custom Feed wizard. It defines the structure of the feed data file named `dynamic_dns.csv`.

Note: The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

```
<?xml version="1.0" encoding="utf-8"?>
 <FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">

   <FlatFileFeed name="Dynamic DNS Domain Feed"
   path="dynamic_dns.csv"
   separator=","
   comment="#"
   version="1">

   <MetaCallback
   name="alias.host"
   valuetype="Text"
   apptype="0"
   truncdomain="true"/>

   <LanguageKeys>
            <LanguageKey name="threat.source" valuetype="Text" />
            <LanguageKey name="threat.category" valuetype="Text" />
```

```
            <LanguageKey name="threat.desc" valuetype="Text" />
    </LanguageKeys>

    <Fields>
    <Field index="1" type="index" key="alias.host" />
    <Field index="4" type="value" key="threat.desc" />
    <Field index="2" type="value" key="threat.source" />
    <Field index="3" type="value" key="threat.category" />
    </Fields>
    </FlatFileFeed>

</FDF>
```

Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Suite Custom Feed wizard provides options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (.xml) file.

NetWitness Suite Parameter	Feed Definition File Equivalent
(Define Feed Tab) Feed Type	Select: **Default** - to define a feed based on a .csv formatted feed data file. **STIX** - to define a feed based on STIX formatted.xml file.
(Define Feed Tab) Feed Task Type	Select: **Adhoc** - to create an on-demand feed. **Recurring** - to update the .csv or .xml file persistently and store it in a location accessible by NetWitness Suite , so NetWitness Suite downloads a file at regular intervals and pushes it to the downstream devices.
(Define Feed tab) **Name**	The custom feed name in the feed data file. It corresponds to the `flatfeedfile name` attribute in the feed definition file. For example, Dynamic DNS Test Feed. **Note:** You can use special characters to define the name of the custom feed.

NetWitness Suite Parameter	Feed Definition File Equivalent
(Define Feed tab) **File/ Browse**	This is the name of the feed data file. It corresponds to the `flatfeedfile path` attribute in the feed definition file. For example, `dynamic_dns.csv`.
(Advanced Options tab) **XML Feed File**	The name of the feed definition file. For example, `dynamic_dns.xml`.
(Advanced Options tab) **Separator**	The separator character used to separate attributes in the feed data file. It corresponds to the `latfeedfile separator` in the feed definition file. For example, a comma.
(Advanced Options tab) **Comment**	The character used to identify a comment in the feed data file. It corresponds to the `flatfeedfile comment` attribute in the feed definition file. For example, `#`.
(Define Columns tab, Define Index) **Type**	The type of lookup value in the index position of the feed data file. **IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42). **IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24). **Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index.

NetWitness Suite Parameter	Feed Definition File Equivalent
(Define Columns tab, Define Index) **CIDR**	Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation.
(Define Columns tab, Define Index) **Service Type**	For a Non IP index, the integer service type to filter meta lookups. It corresponds to the `MetaCallback apptype` attribute in the feed definition file. A value of 0 indicates no filtering by service type.
(Define Columns tab, Define Index) **Truncate Domain**	For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the `MetaCallback truncdomain` attribute. If the value is `www.example.com`, it is truncated to `example.com`. A value of **False** selects no truncation, and **True** selects truncation.
(Define Columns tab, Define Index) **Callback Keys**	For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list. The Callback Key corresponds to the `MetaCallback name` attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the username meta key is chosen, the index column of the csv file needs to be populated with users to be matched.
(Define Columns tab, Define Index) **Index Column**	Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on.

NetWitness Suite Parameter	Feed Definition File Equivalent
(DEFINE VALUES) **Key**	The name of the `LanguageKey`, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the `Field key` attribute in the feed definition file. A key applies only to a field whose type is set to `value`. In the feed definition file, there is a list of `LanguageKeys` from `index.xml`, or a summary name if Source Name and Destination Name are used. For example, `reputation` is a summary name for `reputation.src` and `reputation.dst`. This value is referenced by the Field key attribute.

Sample Files for a MetaCallback Feed Using CIDR Index Range for IPv4 and IPv6

These sample files demonstrate how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a `.csv` file and an `.xml` file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

.csv file:

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

.xml file:

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
        <MetaCallback name="DstIP" valuetype="IPv4" apptype="0" truncdomain="false">
                <Meta name="ip.dst"/>
        </MetaCallback>
        <LanguageKeys>
```

```
            <LanguageKey name="alert" valuetype="Text" />
        </LanguageKeys>
        <Fields>
            <Field index="1" type="index" range="cidr"/>
            <Field index="2" type="value" key="alert" />
        </Fields>
</FlatFileFeed>
</FDF>
```

Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with range="cidr". Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Create a Custom Feed

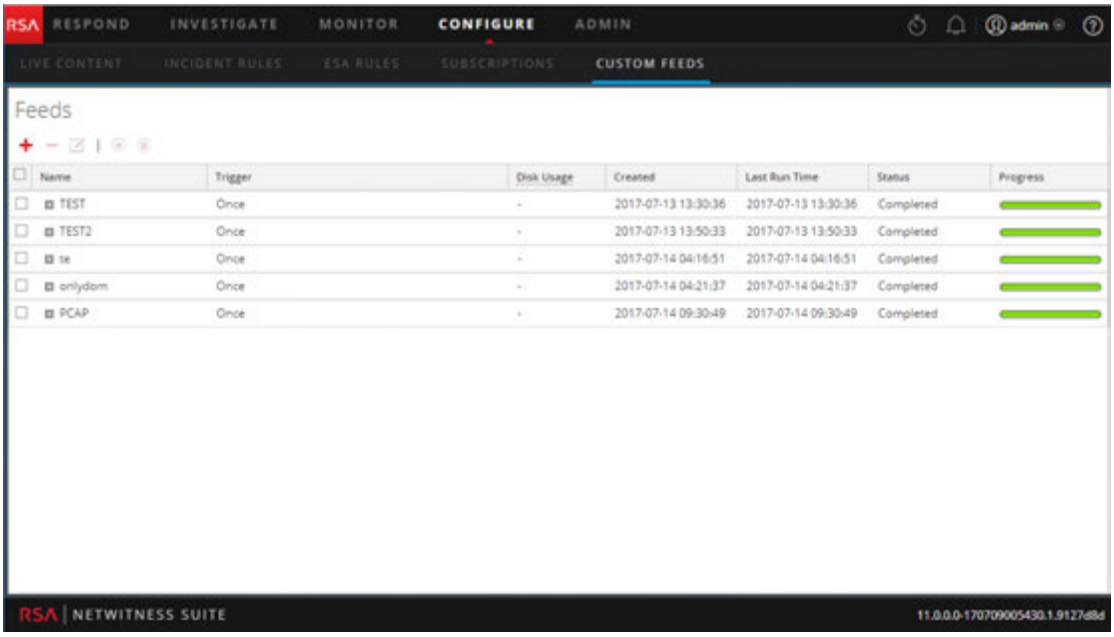
You can create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv`or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

Note: From 10.6.1 or later, NetWitness Suite supports Structured Threat Information Expression (STIX). For more information about STIX and creating a STIX custom feed.

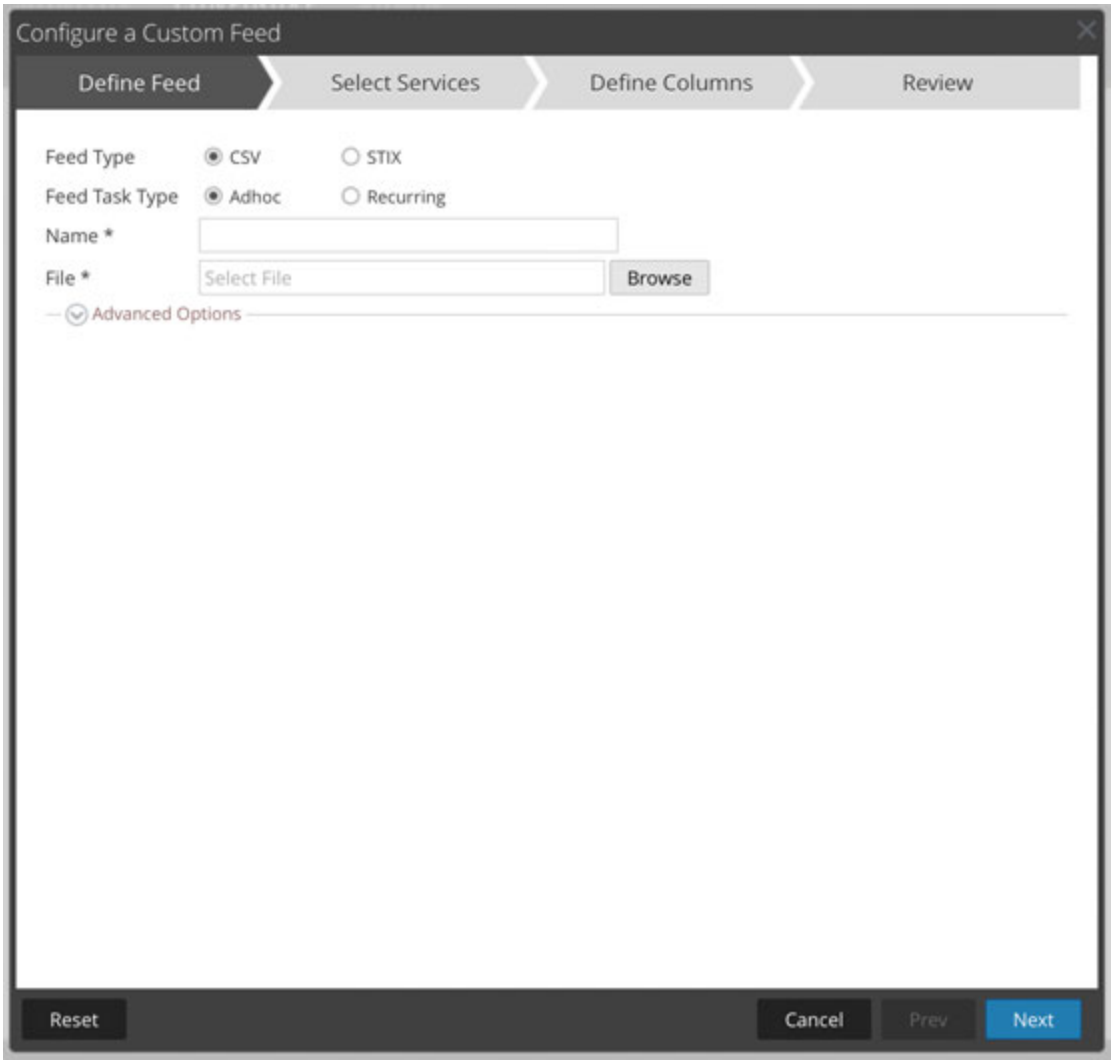
The feed data file and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness Suite server.

To create a custom feed:

1. Go to **CONFIGURE > Custom Feeds**, and in the **Feeds** panel click **+**.
   The Custom Feeds view is displayed.



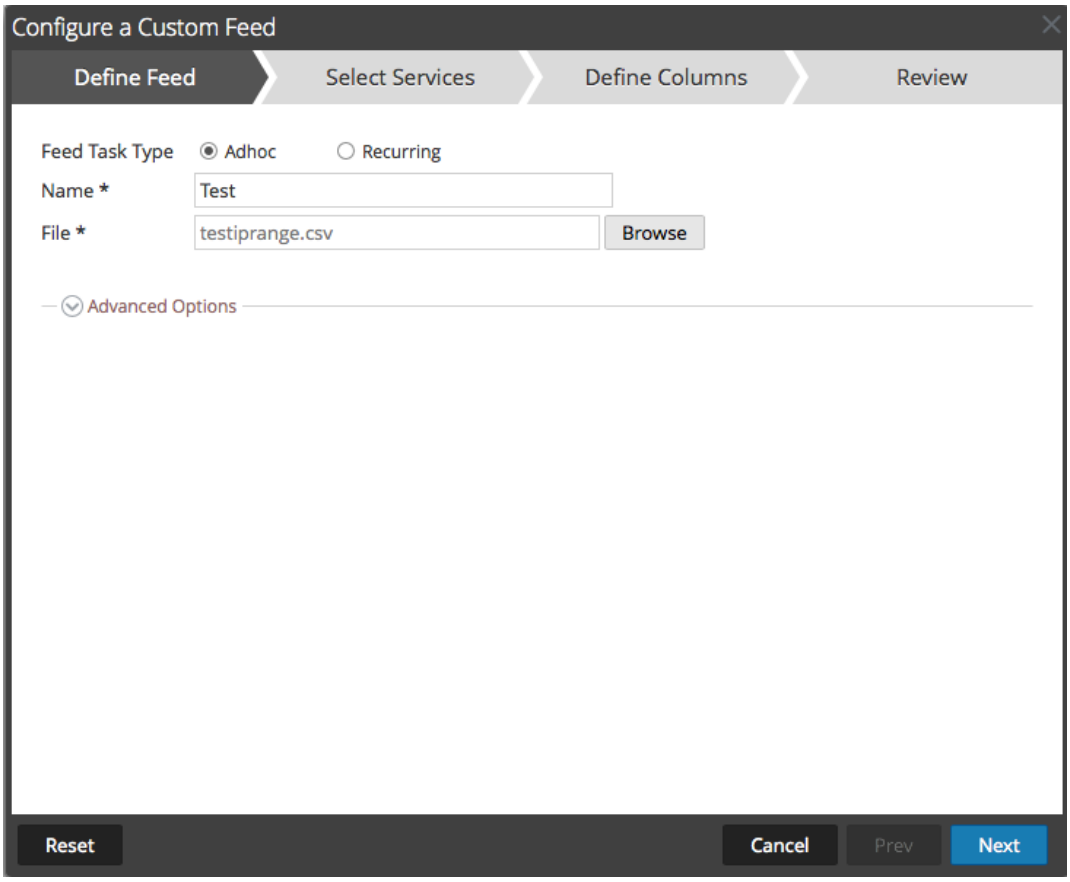
2. Click **Custom Feed** and **Next**.
   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



3. Select the Feed Type: **CSV** or **STIX**.
4. To define a feed based on a `.csv` formatted feed data file, select **Default** in the **Feed Type** field.

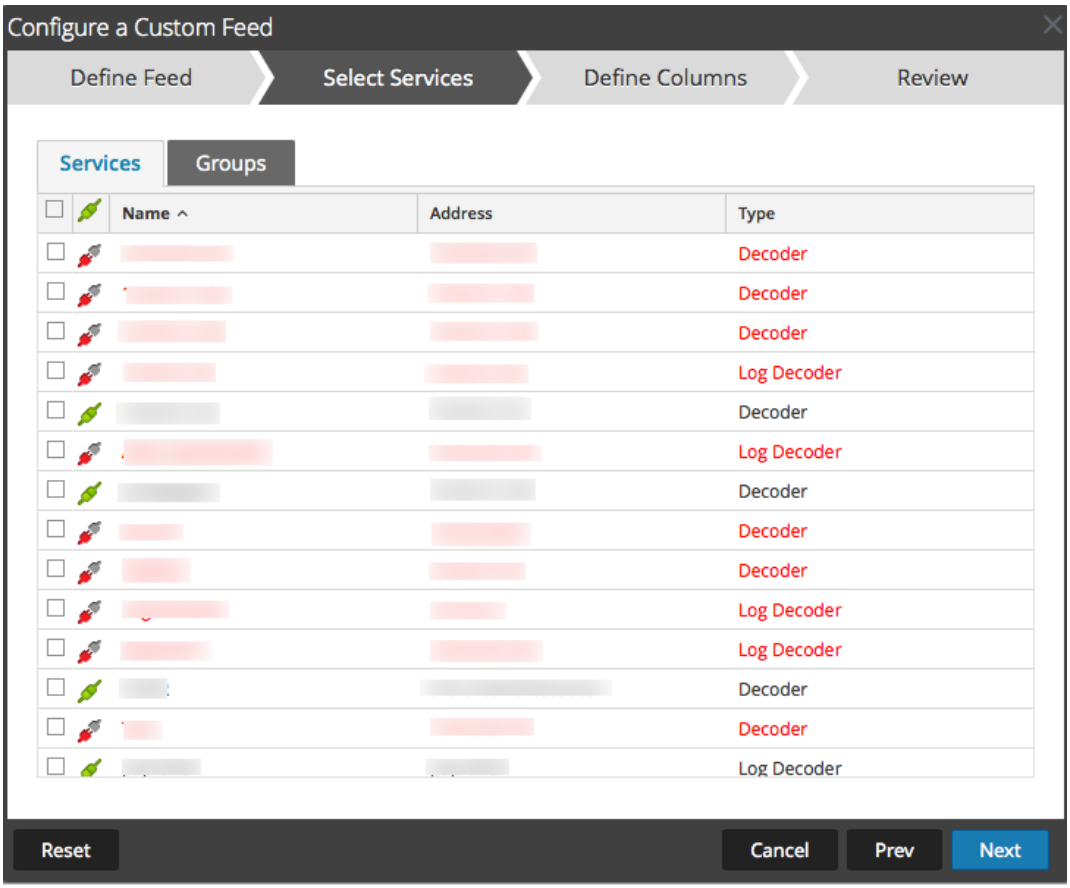
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on a `.csv` formatted feed data file, type the feed **Name**, select a .csv content **File** from the local file system, and click **Next**.
   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      The Advanced Options are displayed:



c. Select an XML feed file from the local file system, choose the **Separator** (default is comma), and specify the **Comment** characters used in the feed data file (default is #), and click **Next**.

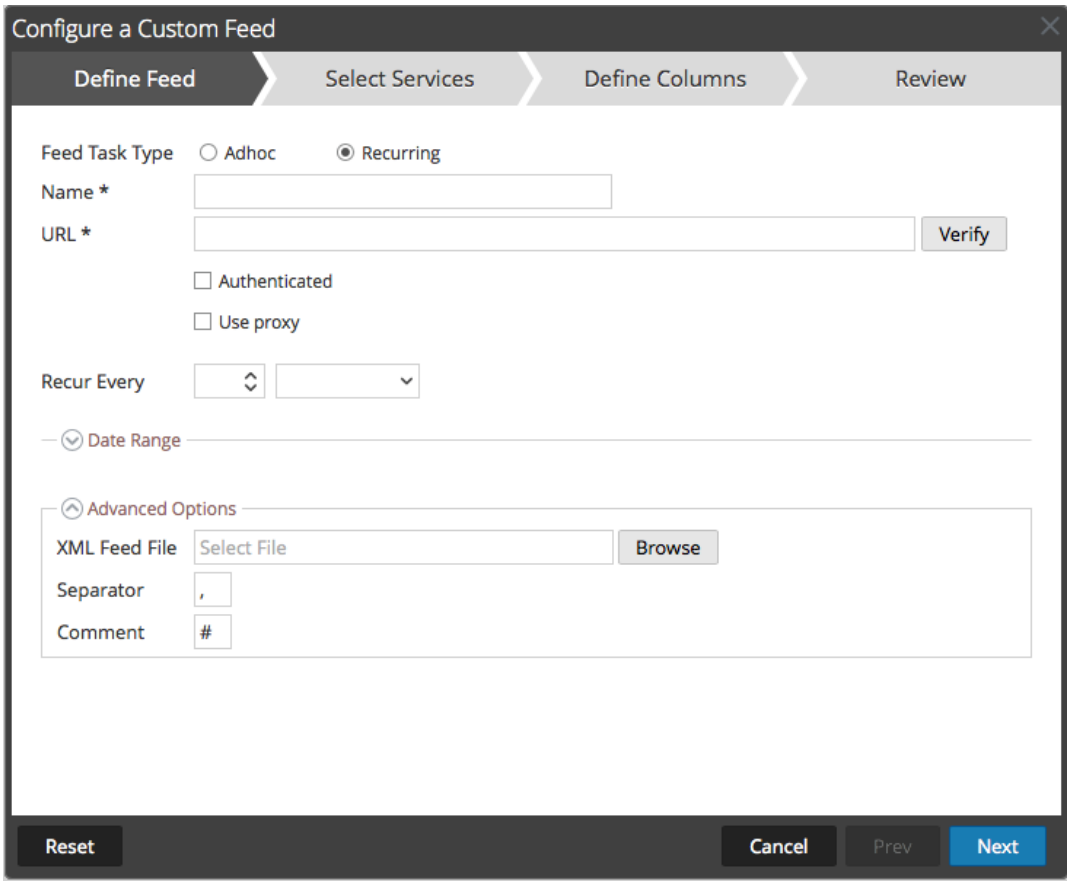
d. The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.



6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.

a. Select **Recurring** in the **Feed Task Type** field.

The Define Feed form includes the fields for a recurring feed.



b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**.

NetWitness Suite verifies the location where the file is stored in order to enable checking for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

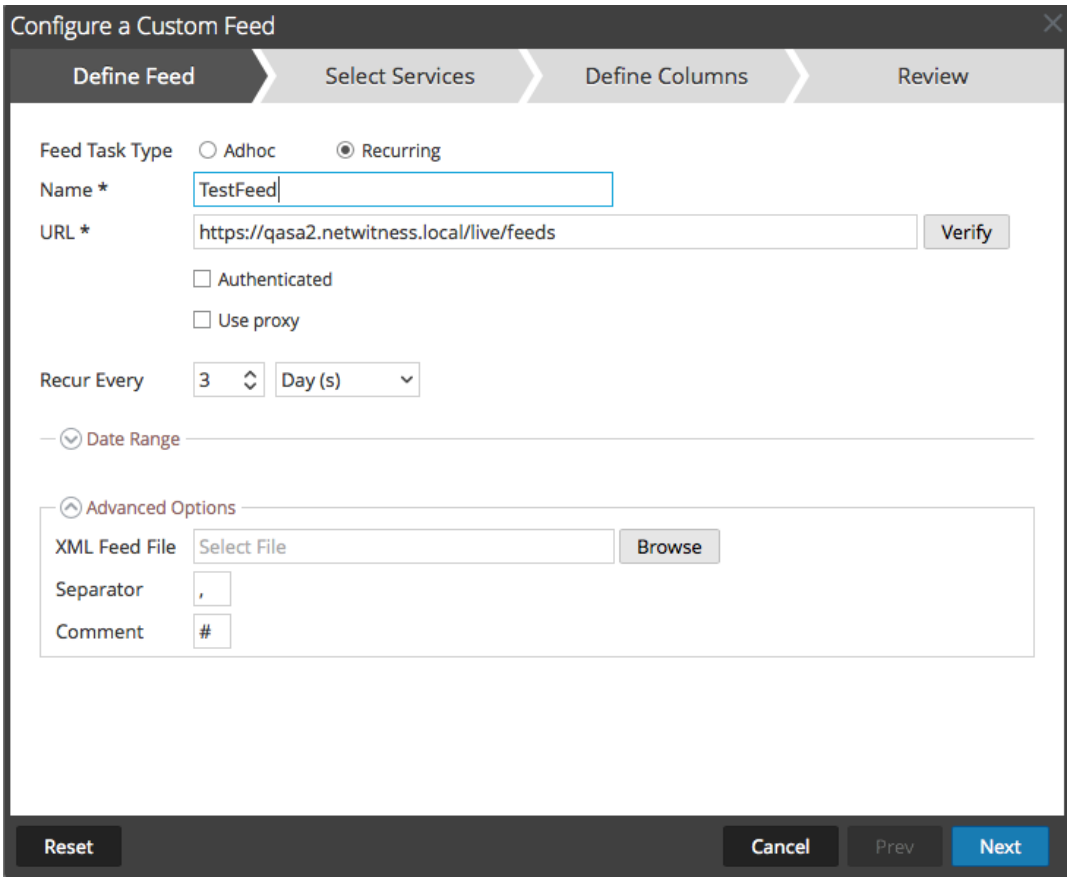
NetWitness Suite provides your user name and password for authentication to the URL.

d. If you want the NetWitness server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see "Configure Proxy for NetWitness Suite" in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not selected.

e. To define the interval for recurrence, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.
- Specify recurrence every week, and select the days of the week.

f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.



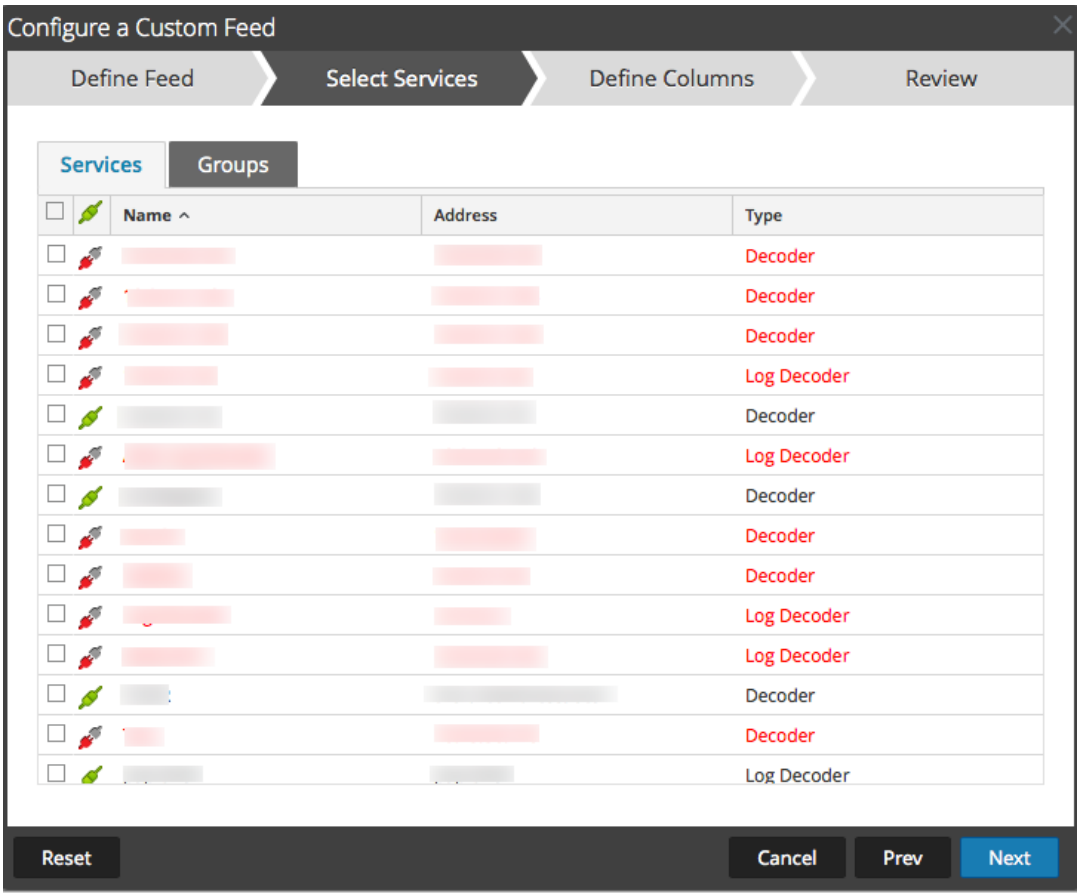
7. (Conditional) If you want to define a feed based on an XML feed file:

- Type the feed **Name**, select **Advanced Options**.

  The Advanced Options fields are displayed.

- Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**.

  The Select Services form is displayed.



8. To identify services on which to deploy the feed, do one of the following:

   a. Select one or more Decoders and Log Decoders, and click **Next**.

   b. Click the **Groups** tab and select a group. Click **Next**.

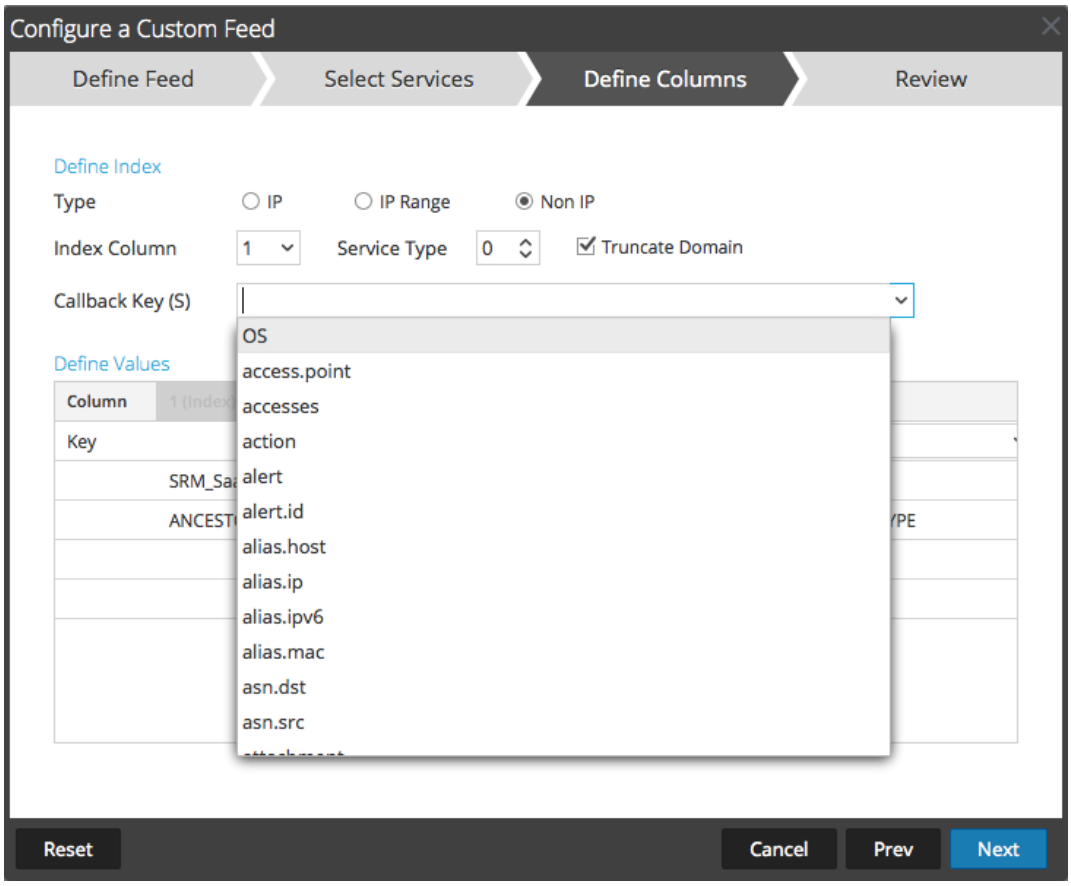
      The Define Columns form is displayed.

9. To map columns in the Define Columns form:

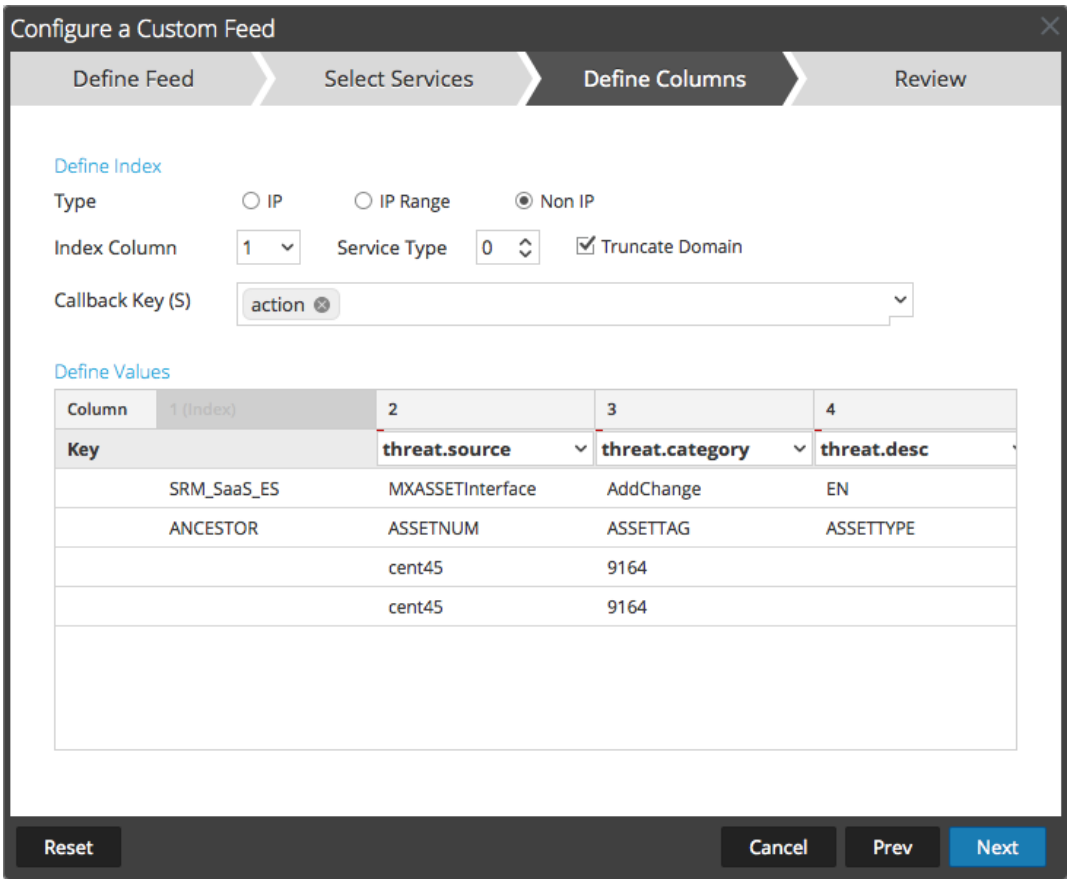
a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.

b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR.**

c. (Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.

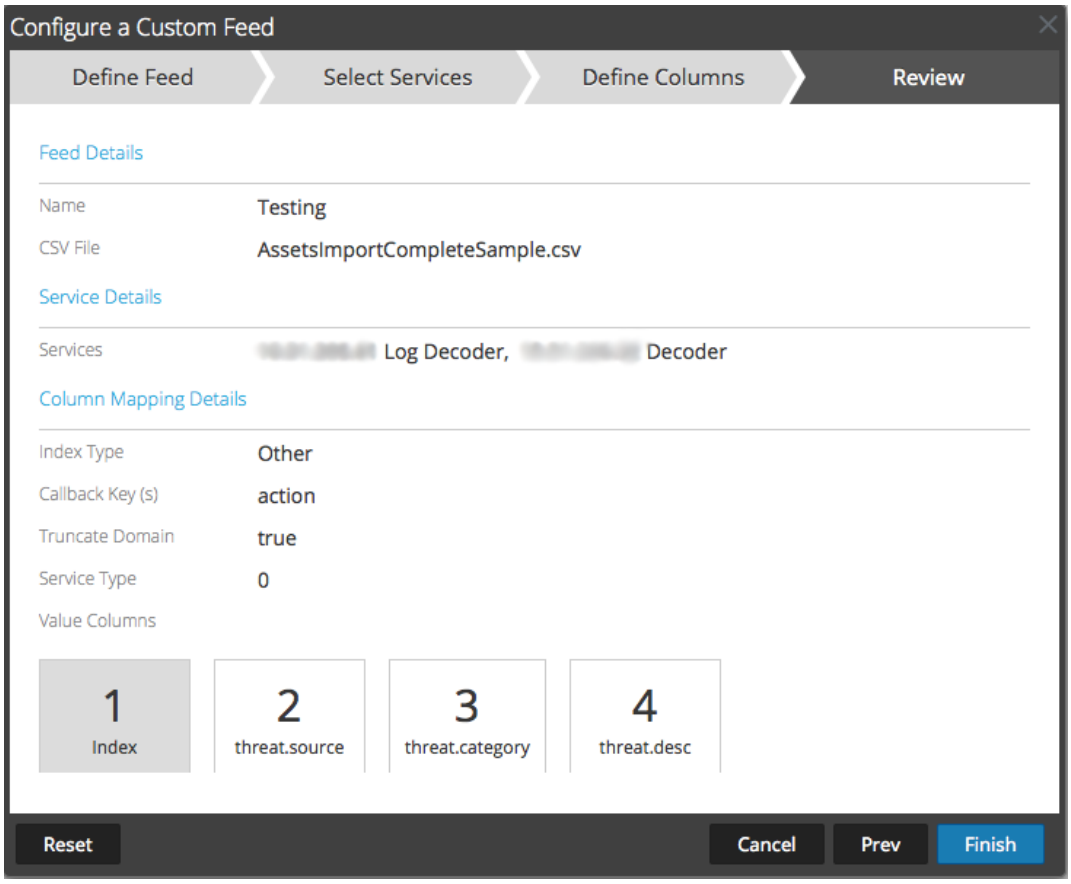


d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.



e. Click **Next**.

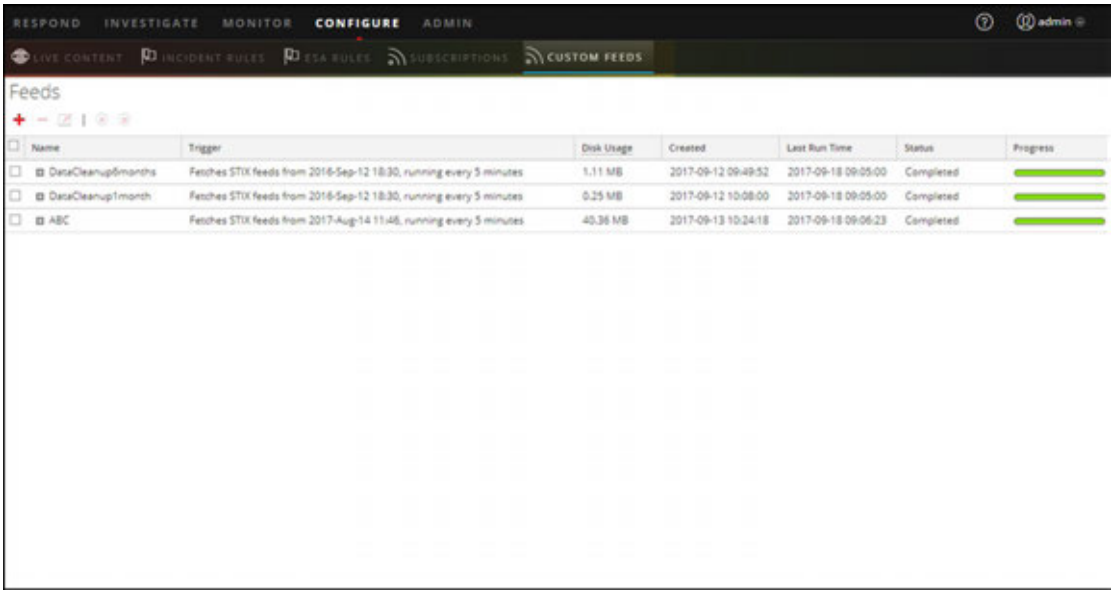
The Review form is displayed.



10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.

12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

    ..



Create a STIX Custom Feed

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://stixproject.github.io/.

You can create a custom feed using a STIX-formatted feed data file (`.xml`) in RSA NetWitness Suite. NetWitness Suite supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

Caution: If a STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness Suite 11.0, you must re-configure the STIX recurring feed.

In NetWitness Suite, STIX feeds of type Indicator or Observable that contain properties such as the IP addresses, File hashes, Domain names, URIs and Email addresses are supported. The properties values in the Equals operator are supported. Attributes such as Type and Title are also read from the STIX. A STIX file with a single STIX_Package is supported.

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.

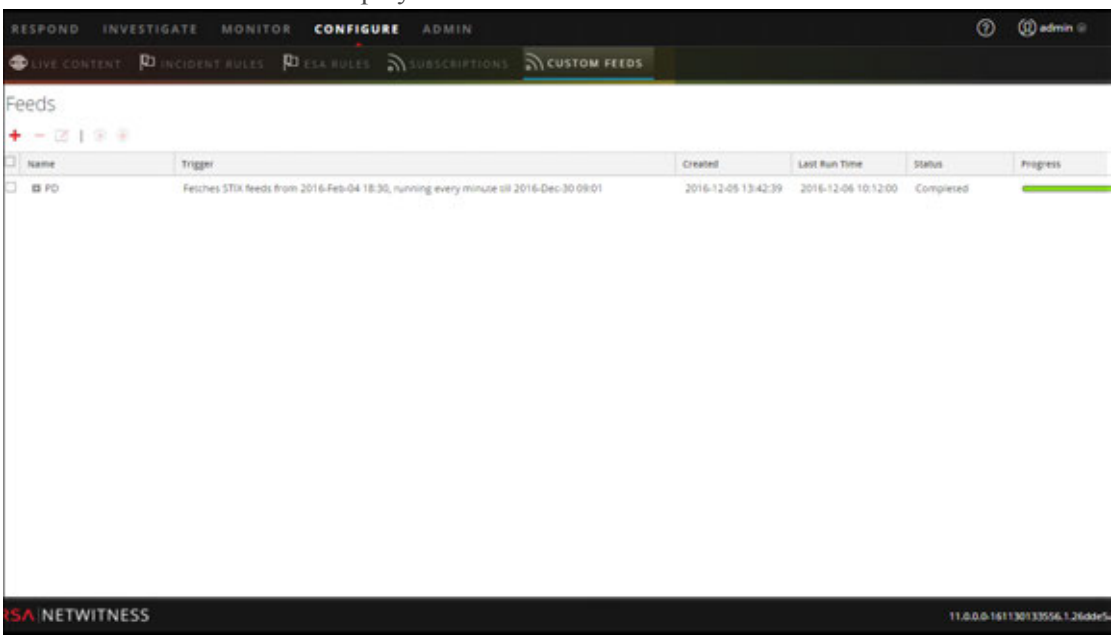
Apart from the TAXII server, STIX data can also reside on a REST server and you can fetch the STIX file from the REST server by providing the URL of the REST server. For example, `http://stixrestserver.internal.com`.

The STIX feed data file and optionally the feed definition file, both in `.xml` format must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness Suite server.

To create a STIX custom feed:

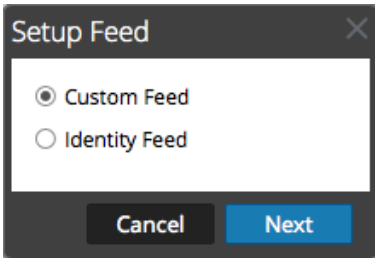
1. Go to **Configure > Custom Feeds**.

   The Custom Feeds view is displayed.



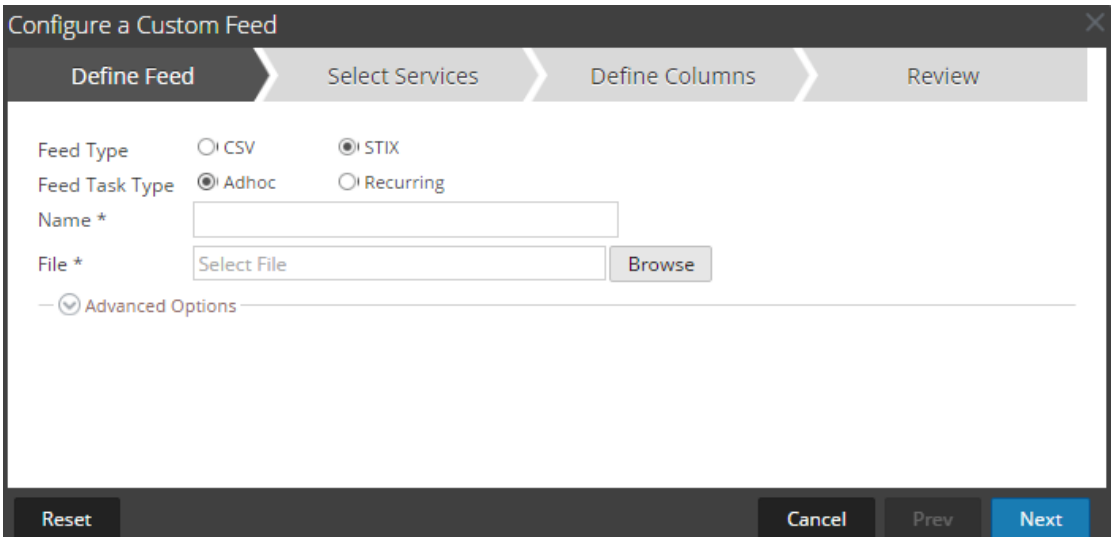
2. In the toolbar, click **+**.

   The Setup Feed dialog is displayed.



3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.

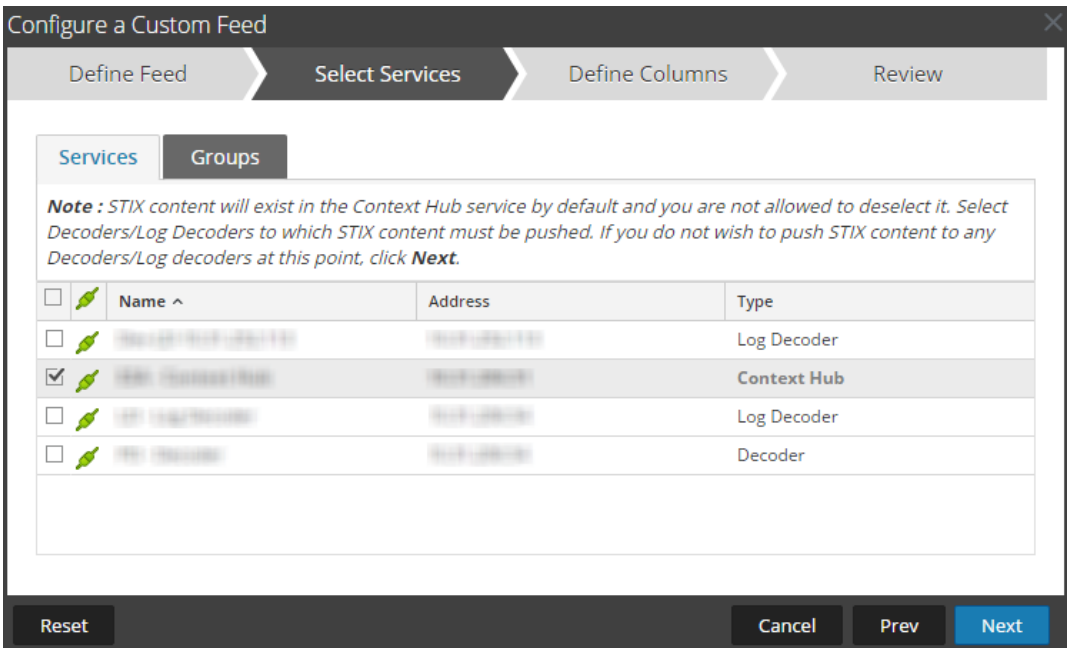


4. To define a feed based on a STIX formatted `.xml` file, select **STIX** in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on STIX-formatted `.xml` file, type the feed **Name**, select a STIX formatted `.xml` content **File** from the local file system, and click **Next**.
   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      The Advanced Options are displayed.

   c. Select an XML feed file from the local file system, choose the **Separator** (default is

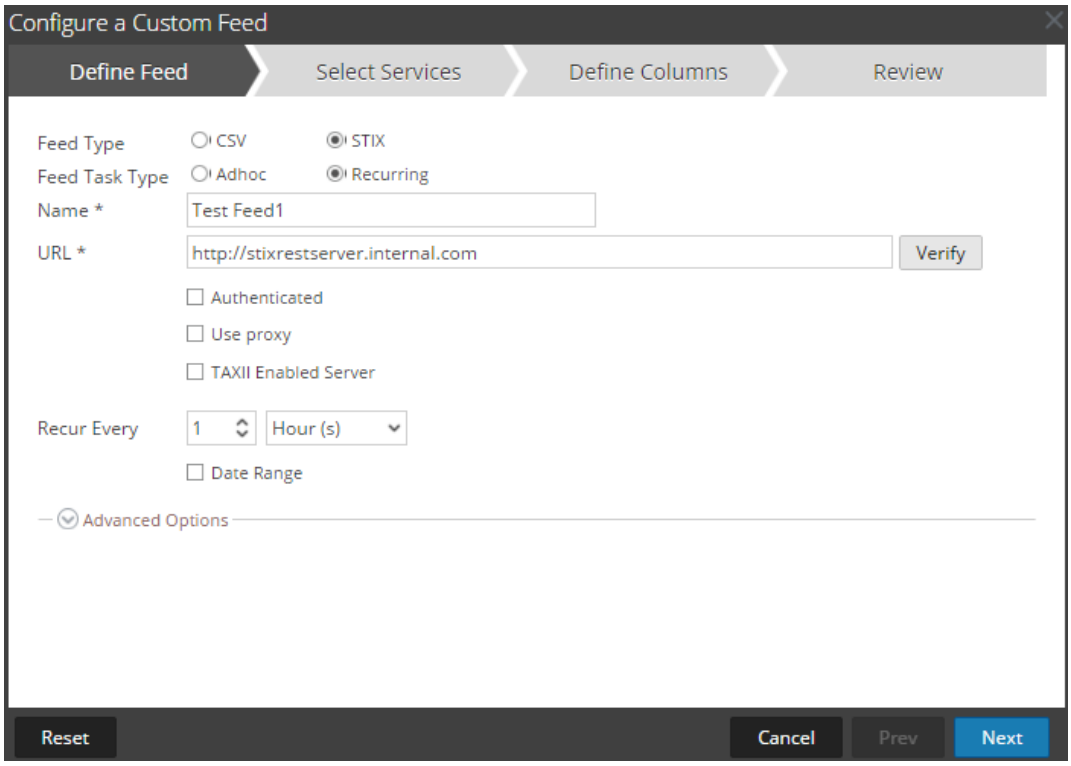
comma), specify the **Comment** characters used in the feed data file (default is #), and click **Next**.
The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.



6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.

   a. Select **Recurring** in the **Feed Task Type** field.

      The Define Feed form includes the fields for a recurring feed.



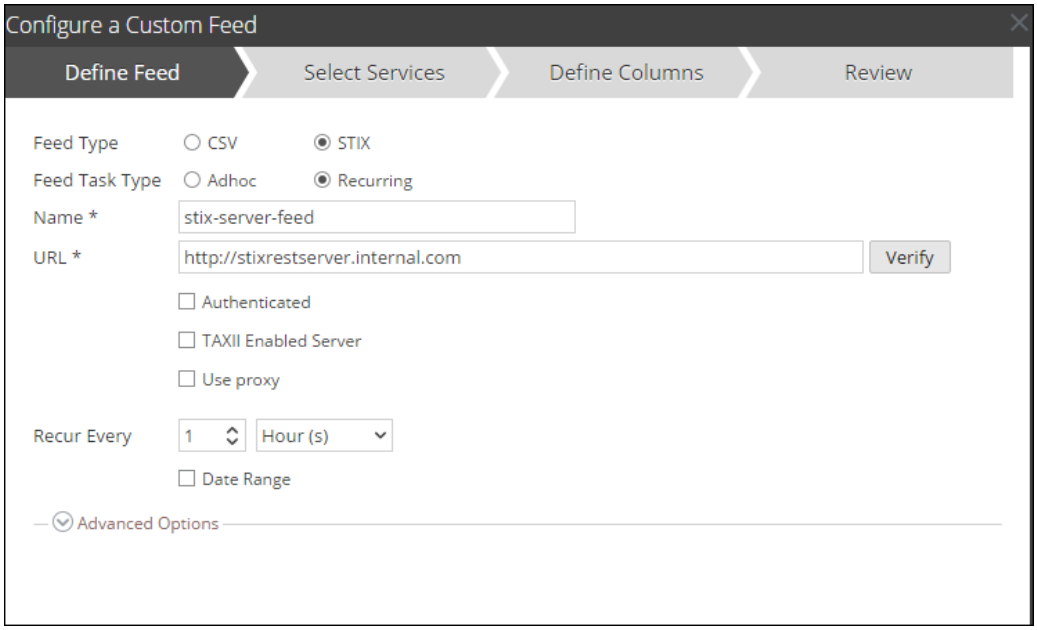
b. In the **URL** field, do one of the following:

- To define a recurring feed based on STIX which pulls STIX packages from a TAXII Server, enter the TAXII server's discovery service URL, for example, `http://hailataxii.com/taxii-discovery-service`.

  Note: A Context Hub service installed on Event Stream Analysis host must be reachable for the specified TAXII server.

- To define a recurring feed based on a STIX-formatted `.xml` file using the REST Server, enter the URL of the REST server where the STIX data file is located, for

example, `http://stixrestserver.internal.com`.



NetWitness Suite verifies the connection to the server, so that NetWitness Suite can check for the latest file automatically before each recurrence.

c. If you do not want NetWitness Suite to verify the REST server's SSL certificate, Select **Trust All Certificate**. This option is enabled by default (checked).

d. For client authentication with the REST URL, in the **Certificate** field, click **Browse** and select the self signed certificate. The supported certificate formats are `.cer`, `.crt` with `Base64` and `DER` encoded files.

e. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

NetWitness Suite provides your user name and password for authentication to the URL.

f. Select **TAXII Enabled Server**, if you want to select a TAXII collection from the list. For a valid URL, one or more TAXII collections that contains the STIX data file is displayed based on your credentials. Select the required TAXII collection from the list. Only one collection can be added from a TAXII server for a feed.

Note: Though multiple feeds from multiple TAXII servers are supported, only one account (username and password) is supported per TAXII server.

g. If you want the NetWitness Suite server to access the feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see "Configure Proxy for NetWitness Suite" in the *System Configuration Guide*. (Go to the Master Table of

Contents for Version 11.0 to find NetWitness Suite 11.0 documents.) By default, the **Use Proxy** checkbox is not selected.

h. (Optional) Click **Verify** to test the settings.

> **Note:** Make sure all the required connection parameters such as Authentication, Proxy, Certificate trust, TAXII Enabled Server, and others, are configured before you click Verify.

i. To define the interval of recurrence for pushing to the Decoder or Log Decoder, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.
- Specify recurrence every week, and select the days of the week.

j. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time. The Start Date should be defined from when you want to fetch the data.

7. (Conditional) If you want to define a feed based on an XML feed file:

- Type the feed **Name**, select **Advanced Options**.

  The Advanced Options fields are displayed.

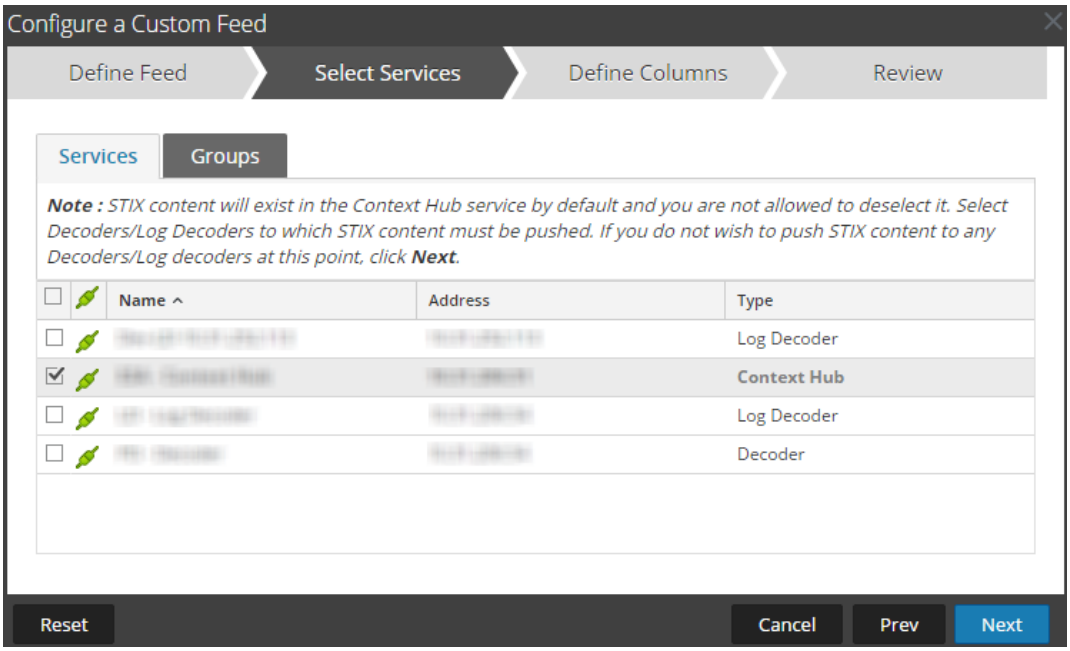
- Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #).
- In the **Remove STIX data older than** field, specify the number of days for which STIX packages pulled from TAXII server is to be stored. The STIX packages older than the specified number of days is deleted automatically.
- Click **Next**.

  The Select Services form is displayed.

8. To identify services on which to deploy the feed, do one of the following:

a. Select one or more Decoders and Log Decoders, and click **Next**.

b. In case of STIX feed, Context Hub will be selected by default and you are not allowed to deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or click the **Groups** tab and select a group. Click **Next**.

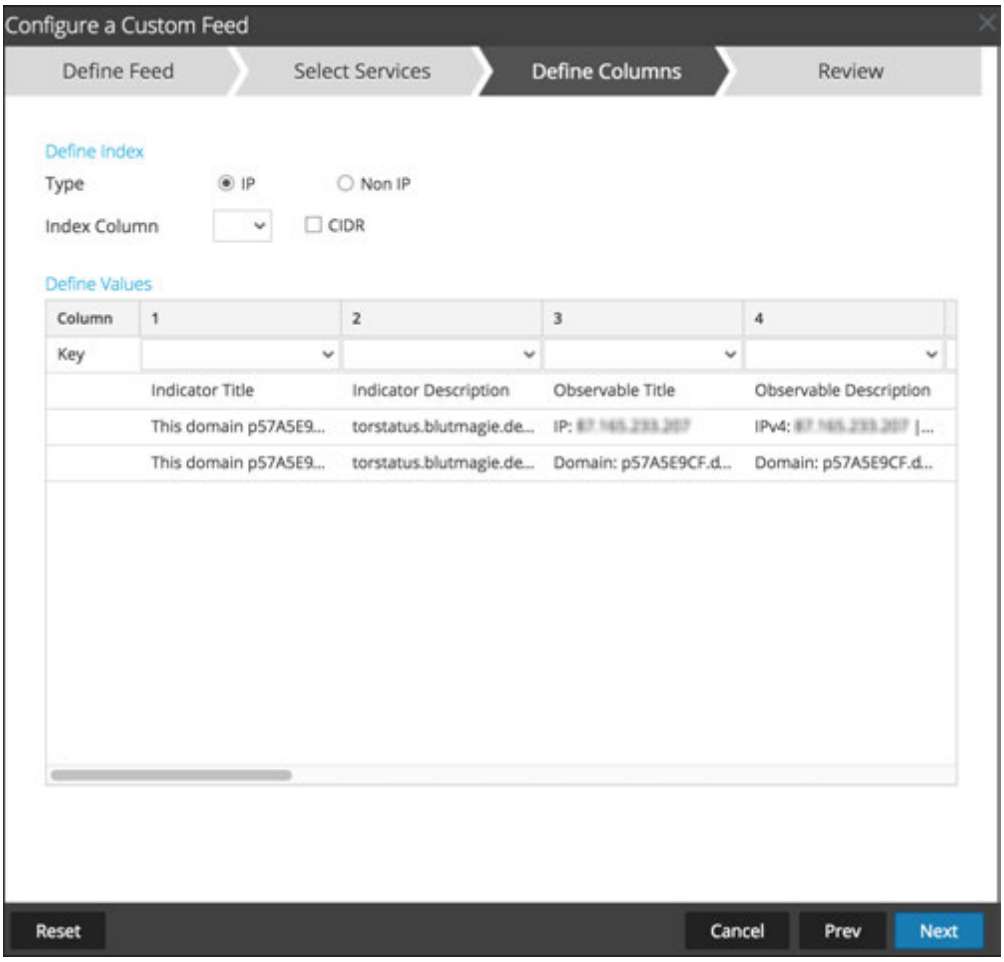


If the data from the STIX server is large, the following message is displayed: "Fetching sample date is taking longer than expected. Choose one of the following options." You have two options: continue to wait or map without sample data.

- If you click **Continue to Wait**, the Feed Wizard continues to wait till the sample data is fetched or a timeout (10 minutes) occurs, whichever is sooner. If there is a timeout, no sample data is retrieved.
- If you click **Map without Sample data**, the mapping column is displayed without any sample data.

The Define Columns form is displayed.

9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. (Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.

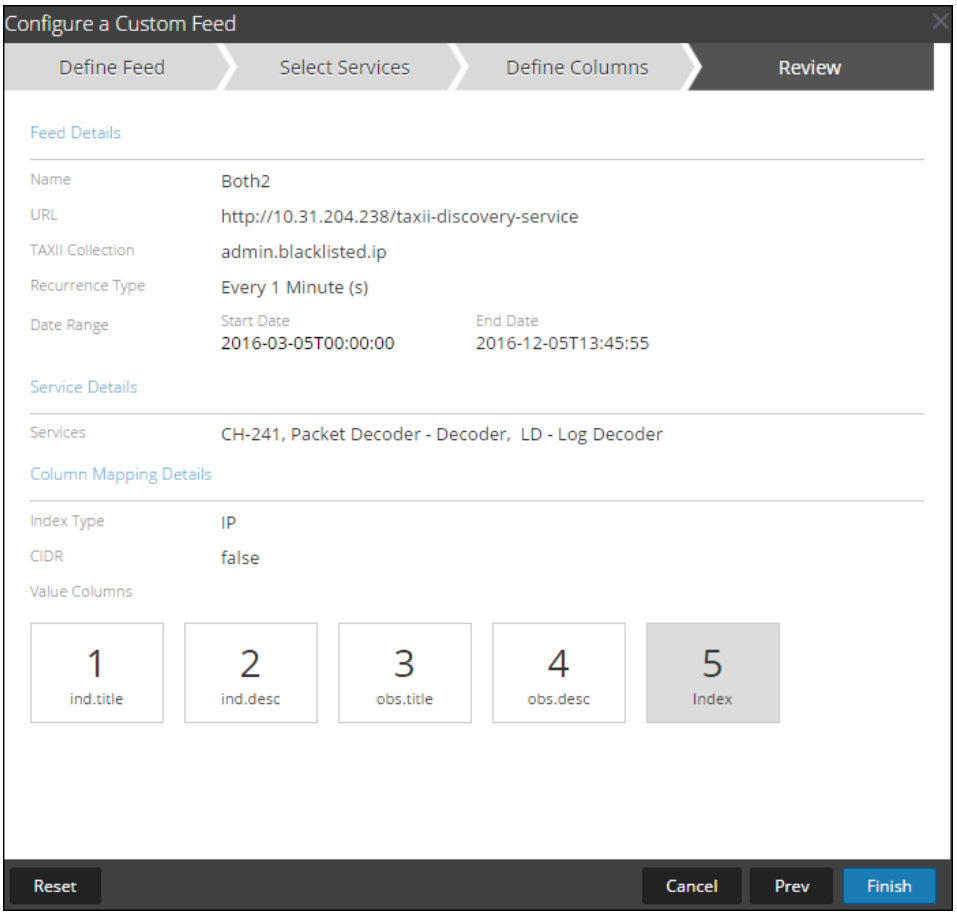


- If the Index Type is Non IP, you can select multiple index columns in the Index Columns. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the Index Columns if you select 2,4,7 as index columns the values from the 2,4 and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for columns such as Indicator Title, Indicator Description, Observable Title, Observable Description, as the look up cannot be performed for those columns.

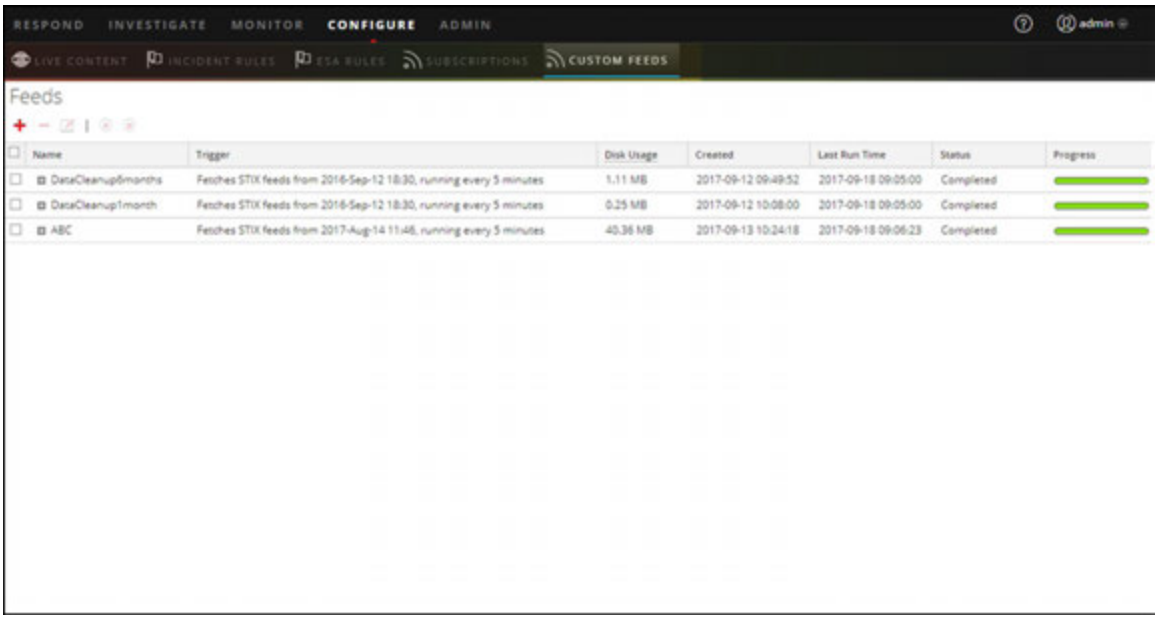
d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

e. Click **Next**.

The Review form is displayed.



10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, the feed and corresponding token file are listed in the Feed grid, and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



Note: Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy due to low memory. For more information on how to troubleshoot `OutOfMemoryError` on `Contexthub` Server, refer to "Troubleshooting" in the *Live Services Management Guide*.

Create an Identity Feed

You can create an Identity feed and populate it to selected Decoders and Log Decoders. In order to create an identity feed, you need to have:

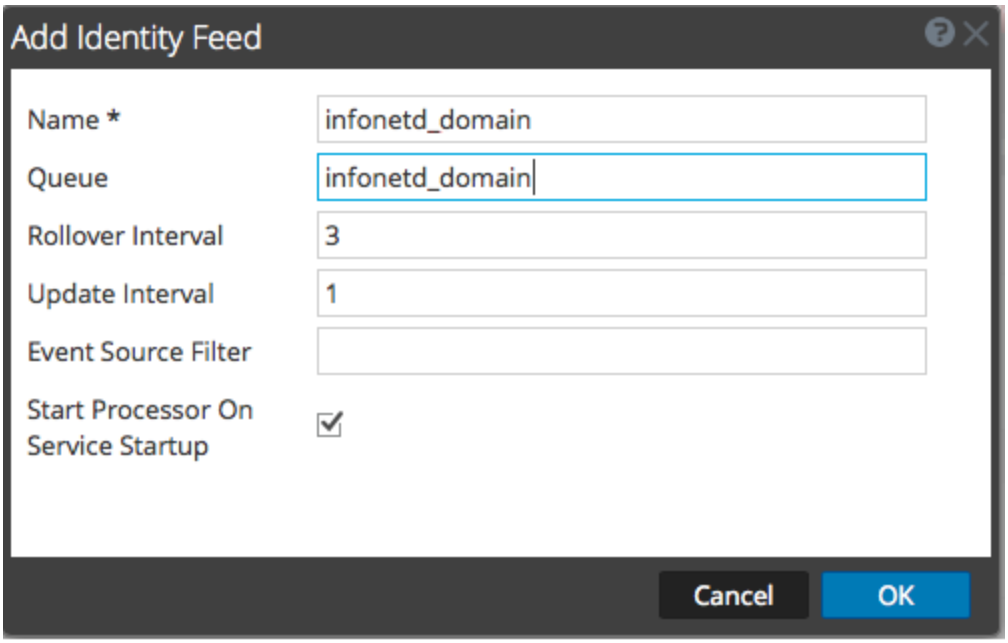
- A Log Collector service with an Identity Feed Event Processor
- A Log Collector service with Windows Collection configured and enabled

To create an identity feed:

1. Add a destination for the feed.
   a. Go to **ADMIN > Services**, in the **Services** list select a **Log Collector** service, and **View > Config**.
   b. Select the **Event Destinations** tab.
   c. In the Select **Event Destinations** field, select **Identity Feed**.

   d. Click + and enter a unique name for the feed.

      The Queue name identifies the feed within the log collector. Use the name of the feed for the Queue.



e. Click **OK**.

2. Test generation of messages.

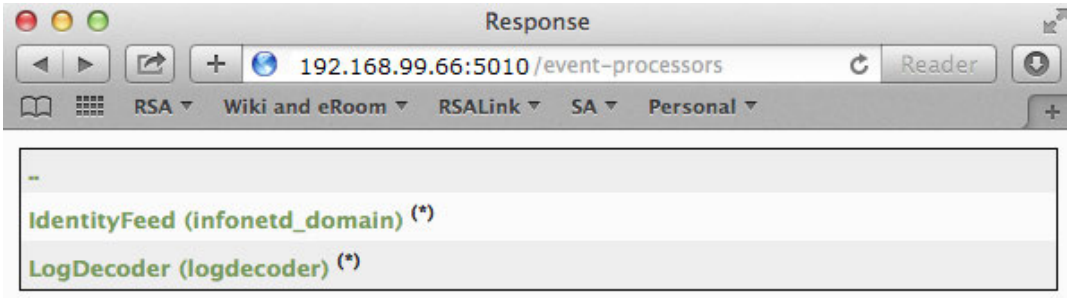
   a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

   b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.

   c. Open up a web browser (Non-Internet Explore browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your log collector is 192.168.99.66, the URL would be:

- SSL not enabled: **http://192.168.99.66:50101/event-processors**
- SSL enabled: **https://192.168.99.66:50101/event-processors**

The browser screen should look like this:

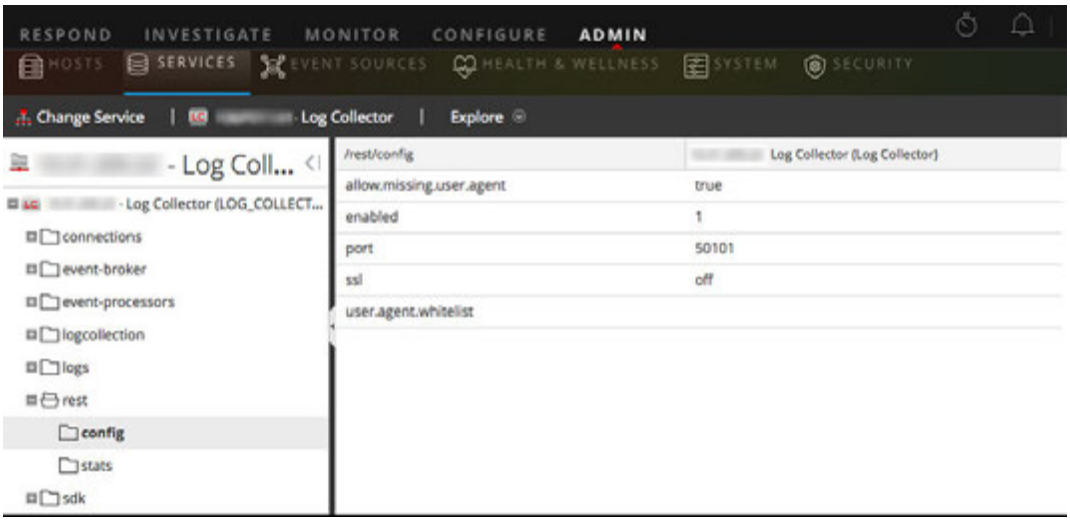


Notice the screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to **AdMIN > Services > <*Log Collector being setup*> > View > Explore**.

e. In the left pane, expand **rest > config**.



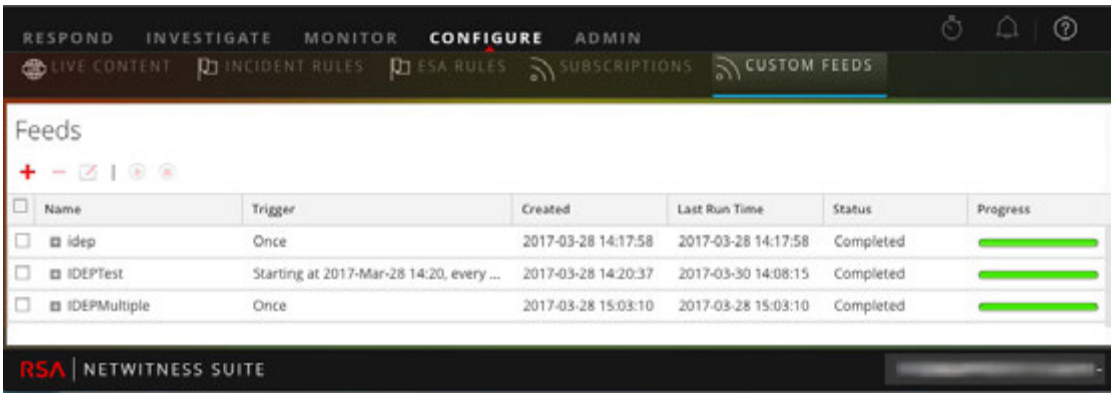
For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

> **Note:** If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

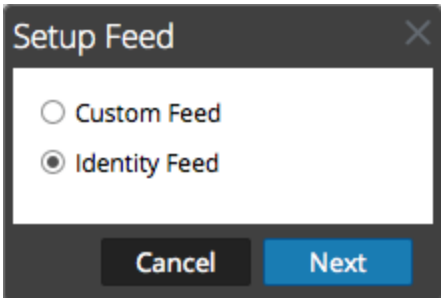
3. Go to **CONFIGURE > Live Content > Custom Feeds**.

The Feeds grid is displayed.



4. In the toolbar, click +.

   The Setup Feed dialog is displayed.



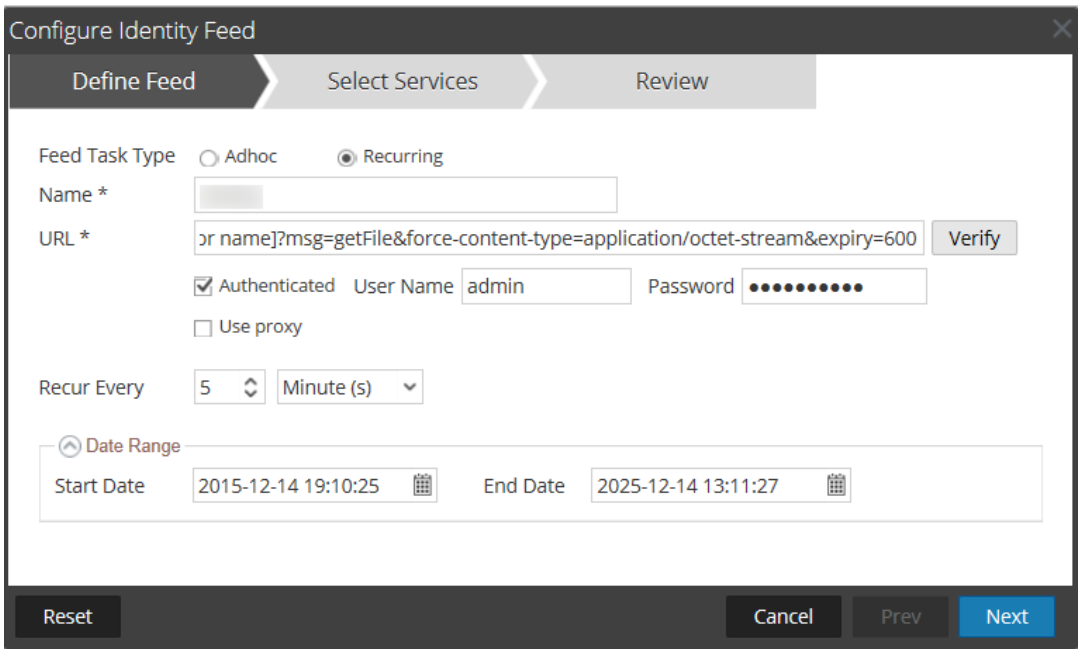
5. Ensure **Identity Feed** is selected and click **Next**.

   The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** form includes the fields for a recurring feed.



Note: RSA NetWitness Suite verifies the location where the file is stored, so that Security Analytics can check for the latest file automatically before each recurrence.

7. Fill in and verify the URL field.

   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. You need to know the following information to construct the URL:

   - The IP address of the log collector being used to construct the Identity Feed file.
   - The identity queue name, as set in step 2c.
   - Whether or not SSL is enabled on the log collector REST port, as set in step 2f.

   You construct this value as follows:

   - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
   - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

   So, using our example from earlier, the complete value that you would enter into this field is as follows:

```
http://192.168.99.66:50101/event-processors/infonetd_
domain?msg=getFile&force-content-type=application/octet-
stream&expiry=600?msg=getFile&force-content-
type=application/octet-stream&expiry=600
```

b. For the URL verification to work correctly, it is important that the Security Analytics UI server can access the log collector's REST API port (50101). This can be tested by going to the Security Analytics UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the Security Analytics UI server and the Log Collector.

Example of Bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of Good connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105
(#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu)
libcurl/7.19.7 NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18
libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*
>
< HTTP/1.1 401 Unauthorized
< Content-Length: 71
< Connection: Keep-Alive
< Pragma: no-cache
```

```
< Expires: -1
< Cache-Control: no-cache, no-store, must-revalidate
< WWW-Authenticate: Basic realm="NetWitness"
< Content-Type: text/xml; charset=utf-8
<
<?xml version="1.0" encoding="utf-8"?>
<error>401 Unauthorized</error>
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the log collector. This can be any username and password that is available on the service itself. For details, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to **ADMIN > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.)

9. To define the interval for recurrence, do one of the following:

   - Specify the number of minutes, hours, or days between recurrences of the feed.
   - To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

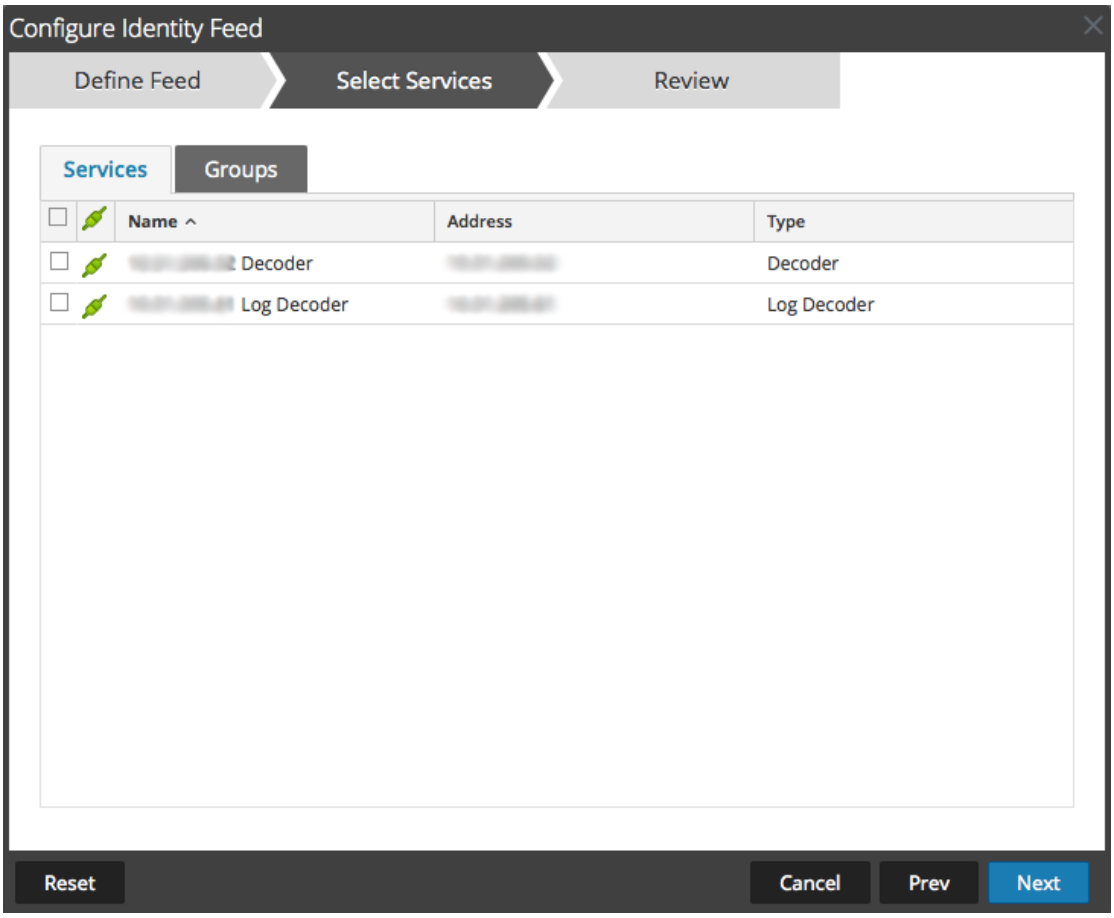
10. If using SSL encryption, you need to install the REST API SSL certificate for the log Collector into the Security Analytics UI server. For details, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.

11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services form.

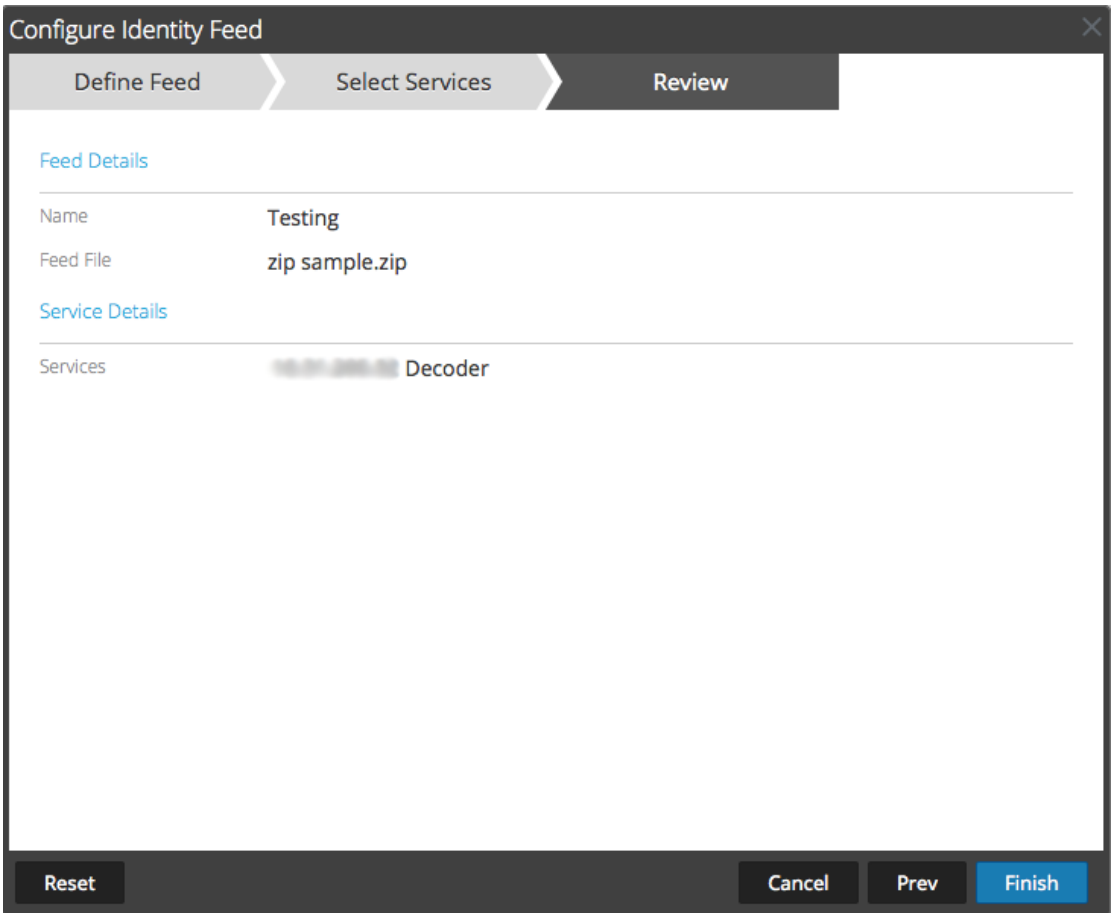
12. Click **Next**.

    The Select Services form is displayed.



13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

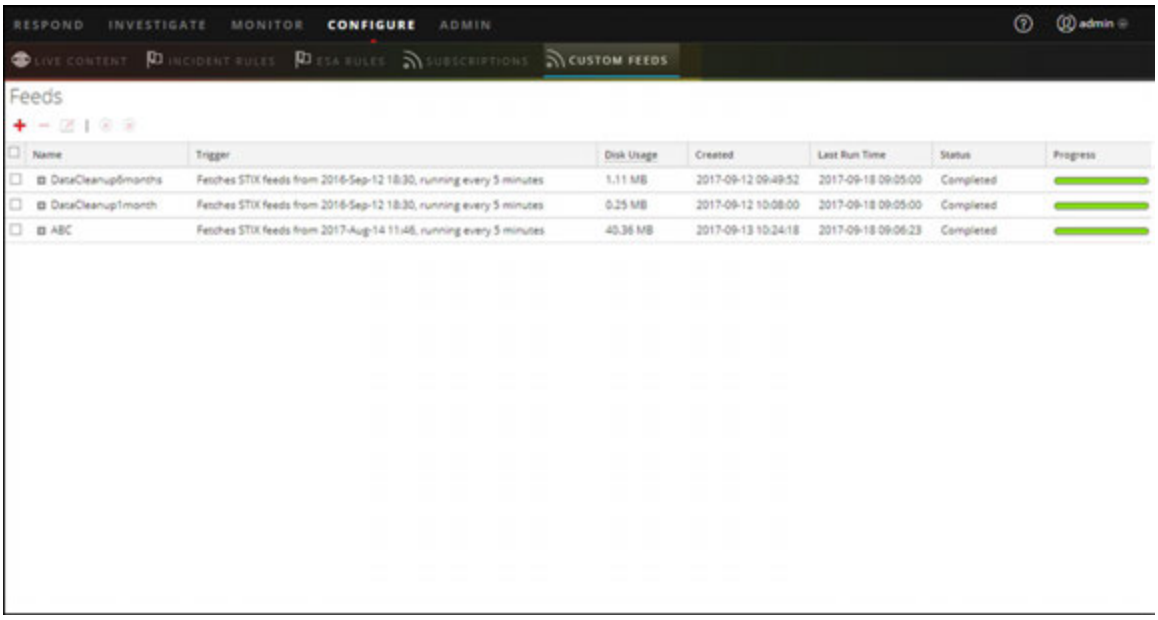
    The Review form is displayed.



Note: If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the Security Analytics UI server key store. If this certificate is not imported, the Security Analytics UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the log collector, SSH into the Security Analytics UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne
   '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' >
   /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`.

   For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed
   -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' >
   /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the Security Analytics UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file
   <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

```
keytool -importcert -alias logcollector01 -file
/tmp/logcollector.cert -keystore /etc/pki/java/cacerts
```

3. The system requests a password. Enter the password for the keystore on the Security Analytics UI server, not for the jetty keystore. The default password is **changeit**.
4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are still issues, it is possible that the internal name of the certificate does not match the hostname of the log collector. The following procedure checks this.

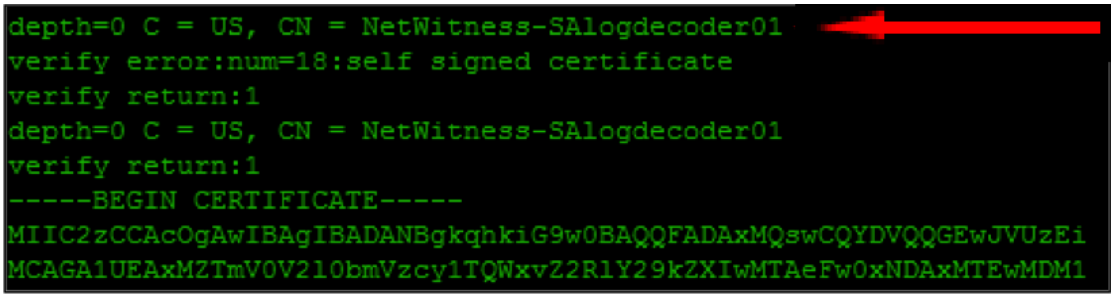
1. SSH to the Security Analytics UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
   echo -n | openssl s_client -connect <log decoder>:50101 | sed
   -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

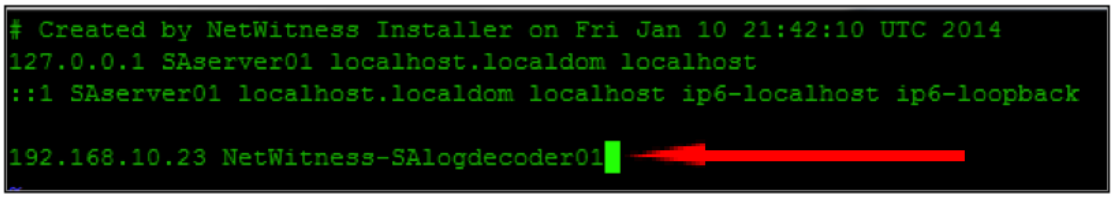
   Example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 |
   sed -ne '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.



4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.



5. Restart the network service on the appliance.

6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.

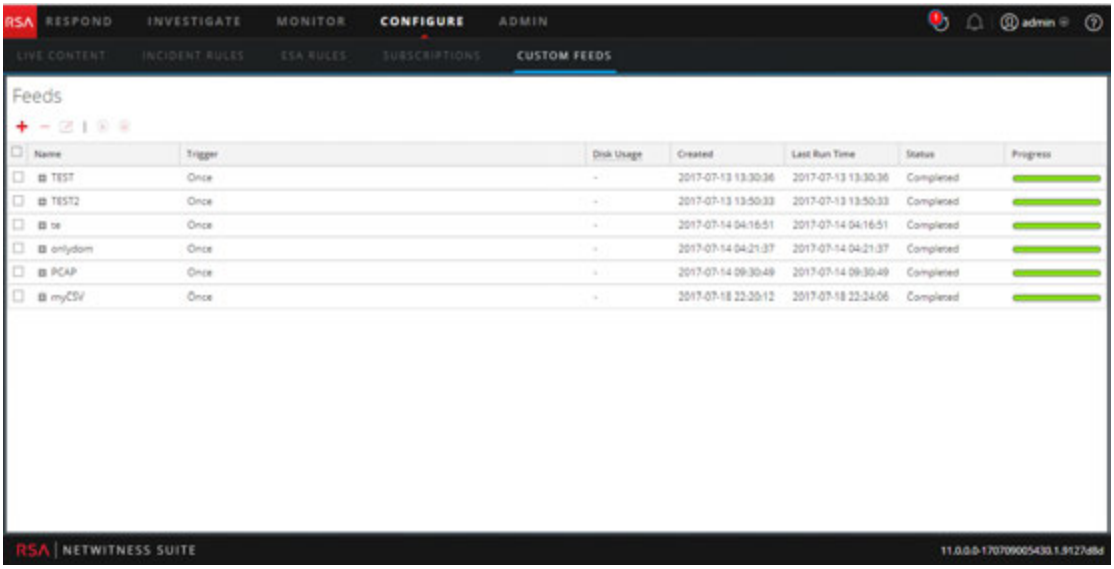
Edit, Upload, or Remove a Feed

You can upload a feed, edit an existing feed, or remove a feed.

To edit an existing feed:

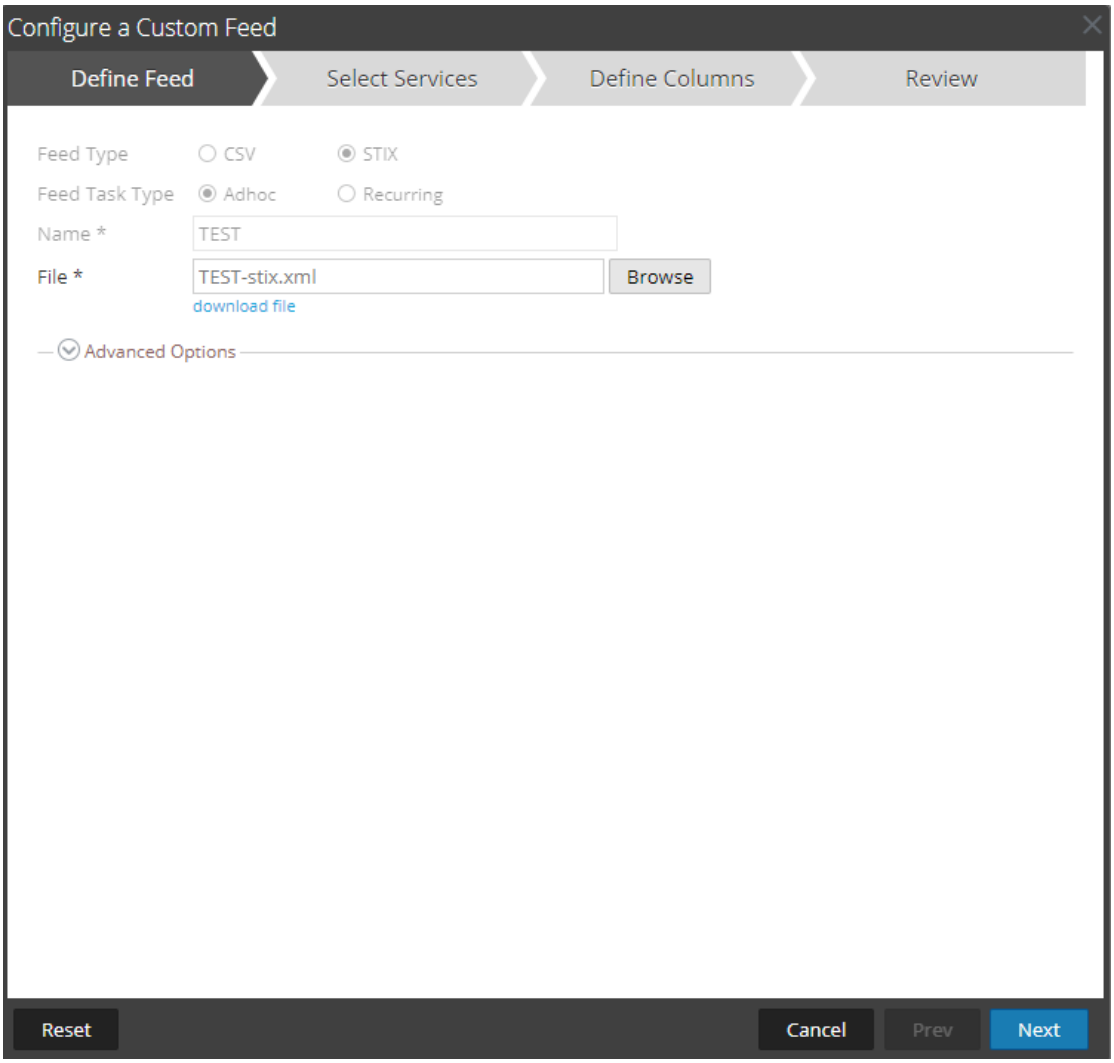
1. Go to **CONFIGURE > Custom Feeds**.

   The Feeds view is displayed.



2. In the toolbar, select a feed and click .

   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.



3. If you want to edit the feed file:
   a. Click **download file**.

      For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system. For a STIX feed, the .xml file is downloaded to your local file system.

   b. Edit and save the file.

   c. In the **Define Feed** tab, browse for and open the edited file.
4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:

- Click **Cancel** to close the wizard without saving your changes.
- Click **Reset** to clear the data in the wizard.
- Click **Next** to display the next form (if not viewing the last form).
- Click **Prev** to display the previous form (if not viewing the first form).

6. In the **Review** tab, review the feed information, and if correct, click **Finish**.

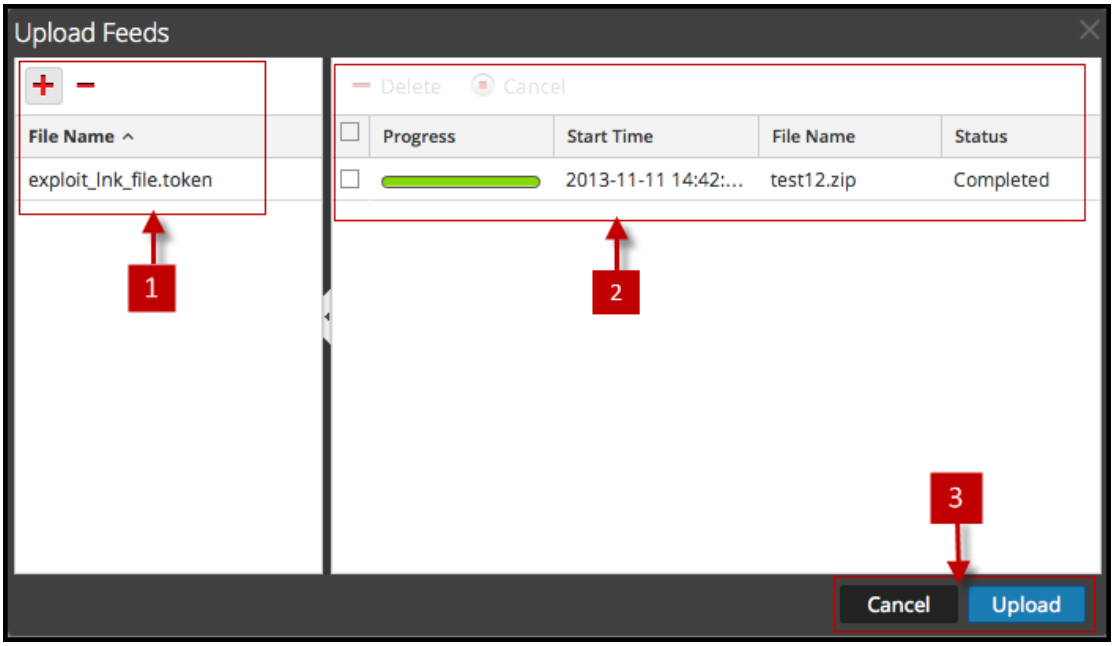
The feed is recreated with the updated file and new feed specifications. The feed is added to the Feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.

To upload a feed to a Dcoder or Log Decoder:

1. Go to **ADMIN > Services**.
2. Select a service and click > **View** > **Config**.

   The Services Config view is displayed with the General tab open.
3. Select the **Feeds** tab.
4. In the Feeds tab toolbar, click Upload.

   The Upload Feeds dialog is displayed.

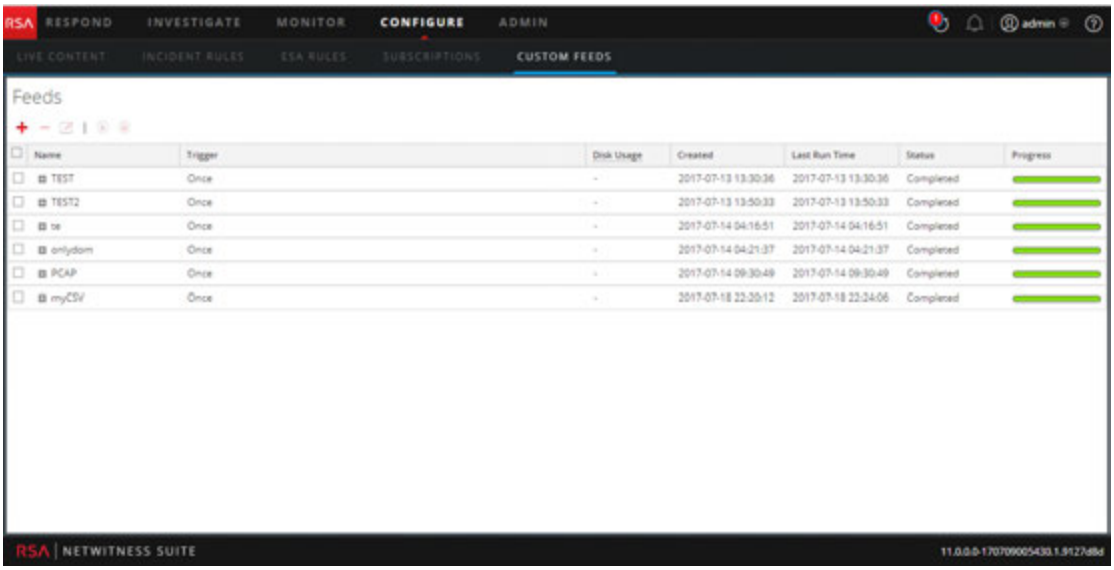


5. In the **File** grid, click + and select a feed file. Supported files are *.feed, *.token, and *.filter.

6. Select the feed file from the **File** list and click **Upload**.
   The Upload Job list is updated to show the progress and status of the uploaded feed.

To remove a feed:

1. Go to **CONFIGURE > Custom Feeds**.
   The Custom Feeds view is displayed.



2. In the toolbar, select a feed and click − .
   The Delete Custom Feeds dialog is displayed.

   You can select one of the following options to delete the feed:

   - If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness Suite box. The deleted feed will no longer seen on the NetWitness Suite user interface.
   - If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness Suite box. The deleted feed will not be seen on the NetWitness Suite user

interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.

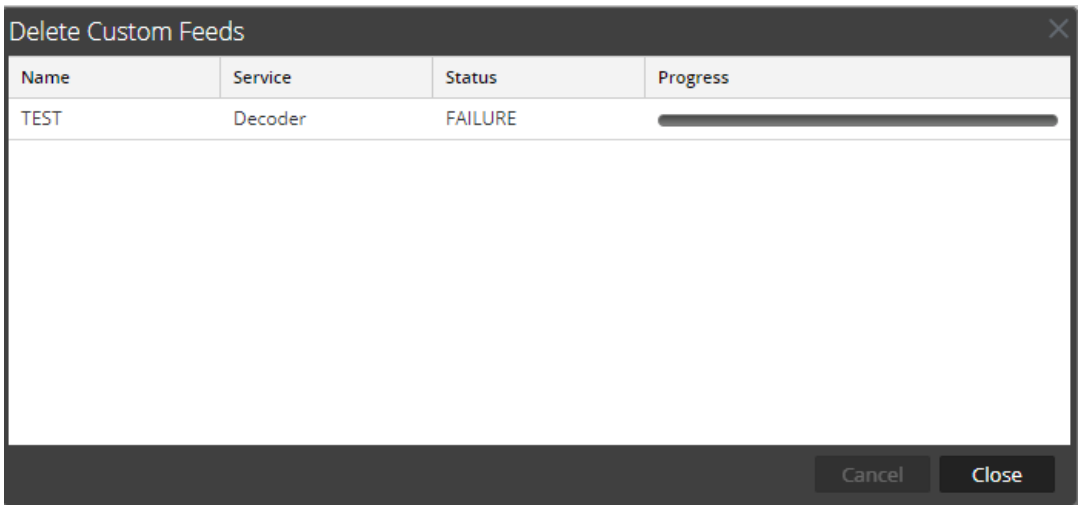
- If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness Suite user interface and can be deployed again

3. Select where you want to delete the feed and click **Delete**.

   A warning dialog is displayed.

4. Click **yes** to confirm that you want to delete the feed from the select areas.

   - If you chose to delete the feed from the **Local DB Only**, the feed is deleted.
   - If you chose to delete the feed from the **Local DB and Service** or **Service Only**, the Delete Custom Feeds view is displayed showing the progress of the deletion on the service.



Create Custom Meta Keys Using a Custom Feed

This topic provides information on how to add custom meta keys, using a custom feed in the Log Decoder.

You can create custom meta keys to retrieve data, to investigate and analyze the logs and packets. Custom meta keys enable you to add an enrichment context for the log and packet data. This document highlights the configuration changes to reflect the custom meta keys in the Concentrator, ESA, Archiver, Warehouse Connector, and Reporting Engine schema.

Here is a example of creating the custom meta key in the Log Decoder. In this scenario, an organization wants to track the location of an asset such as a printer. So, a custom meta key **source location** is introduced, which indicates the location of the asset, for example Printer1, which is located in the 'Fifth Floor A wing'.

Note: Custom meta keys can be created in the Decoder as well. Select the `index-decoder-custom.xml` file when you create a custom meta in the Decoder.

Add a Custom Meta Key in the Log Decoder

To add custom meta keys using custom feed:

1. Go to **ADMIN** > **Services** > **Log Decoder.**
2. Select a service and click  > **View** > **Config** > **Files** tab > **index-logdecoder-custom.xml.**

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexNone"
name="location.src" format="Text"/>
 </Language>
```

3. Restart the Log Decoder service. In the Services view, click  > **Restart**.

Deploy a Log Decoder Feed in Live

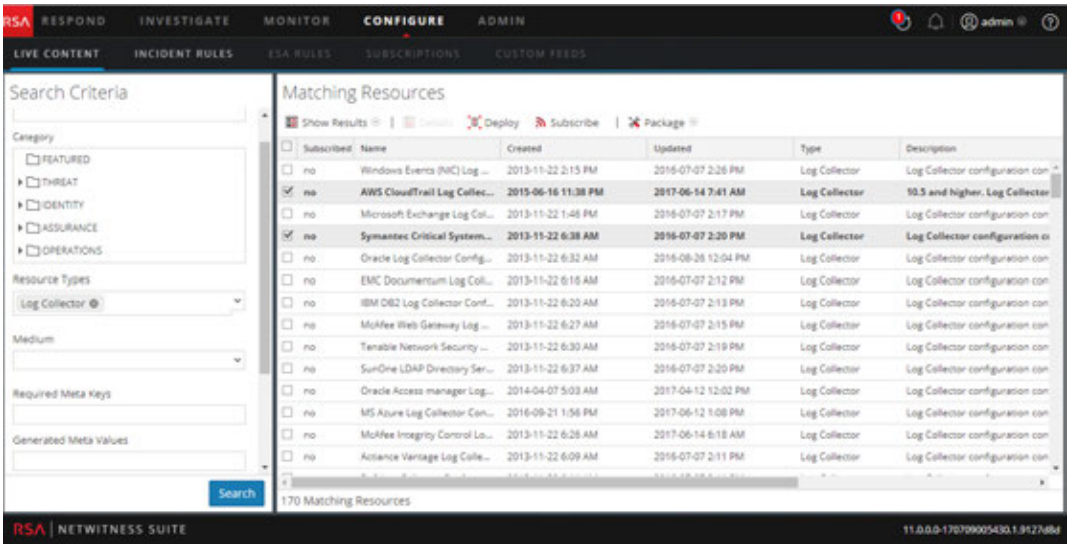
To deploy the feed in the live environment:

1. Go to **CONFIGURE > Live Content.**
2. Select a group of resources, or a previously-created resource package. To select a resource or group of resources:

a. In the **Live Search View,** browse Live resource (for example, search for the **Log Collector** resource Type).

b. In the **Matching Resources** panel, select **Show Results > Grid**.

c. Select the checkbox to the left or the resources that you want to deploy.

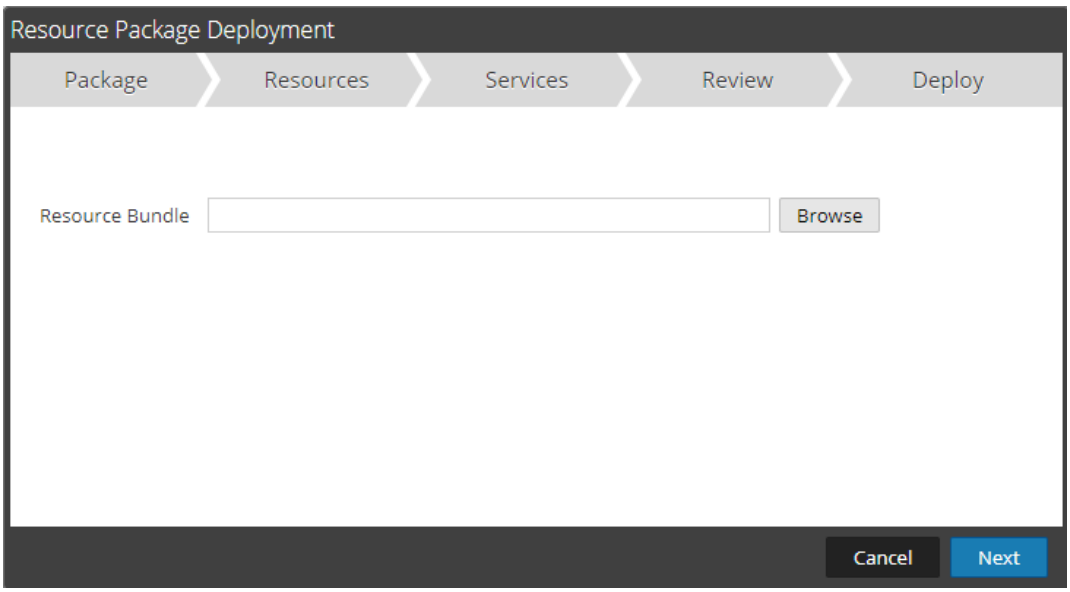


d. In the Matching Resources toolbar, click Deploy

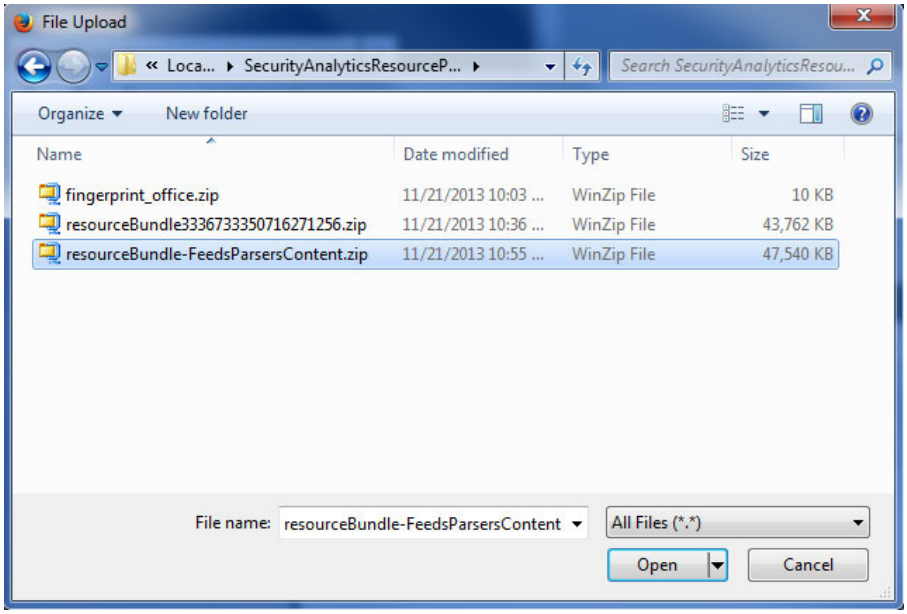
.

3. To select a resource package to deploy:

a. In the **Live Search** view **- Matching Resources** toolbar, select **Package** > **Deploy** : The Package page of the Resource Package Deployment wizard is displayed.



b. Click **Browse** and select a package from your network (for example **resourceBundle-FeedsParsersContent.zip**).



c. Click **Open.**

At this point, whether you are deploying a package or a group of resources, the Deployment Wizard opens, and the Resources page is displayed.

3. Click **Next**.

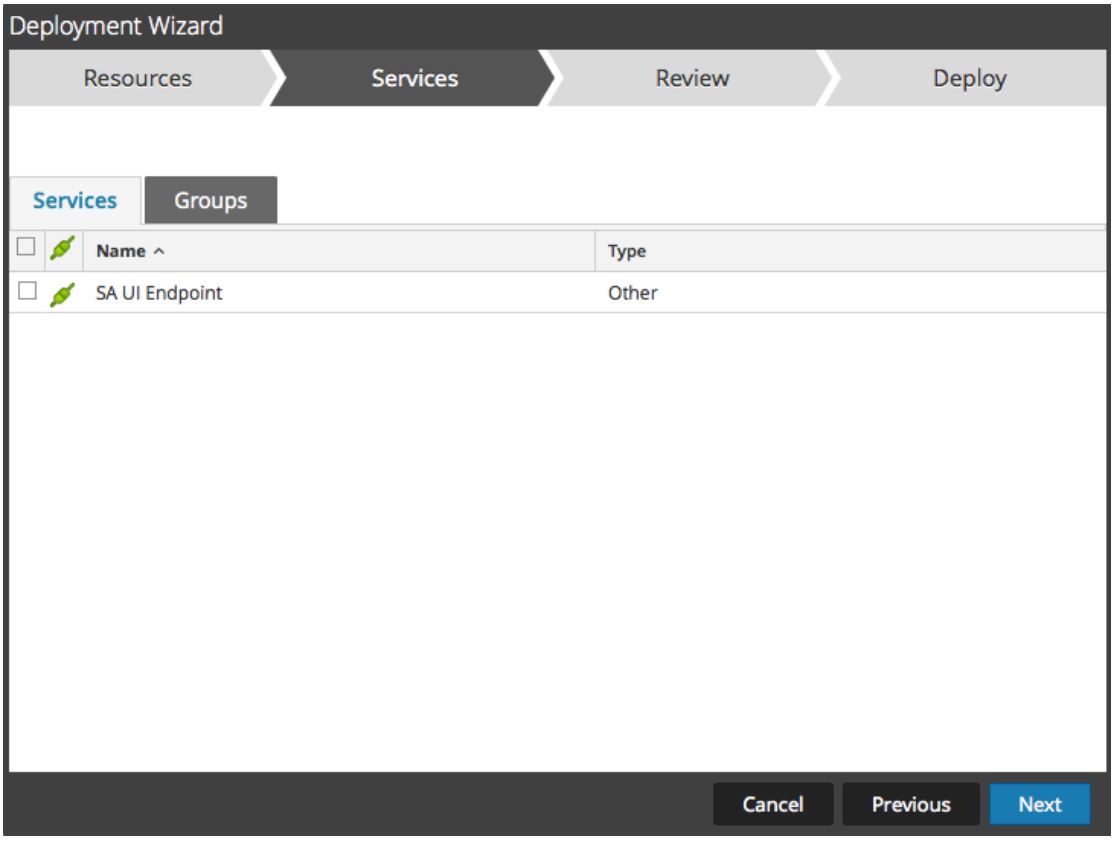
The **Services** page is displayed that has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the Admin > Services View. The columns are a subset of the columns available in the Services View.

Note: The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.

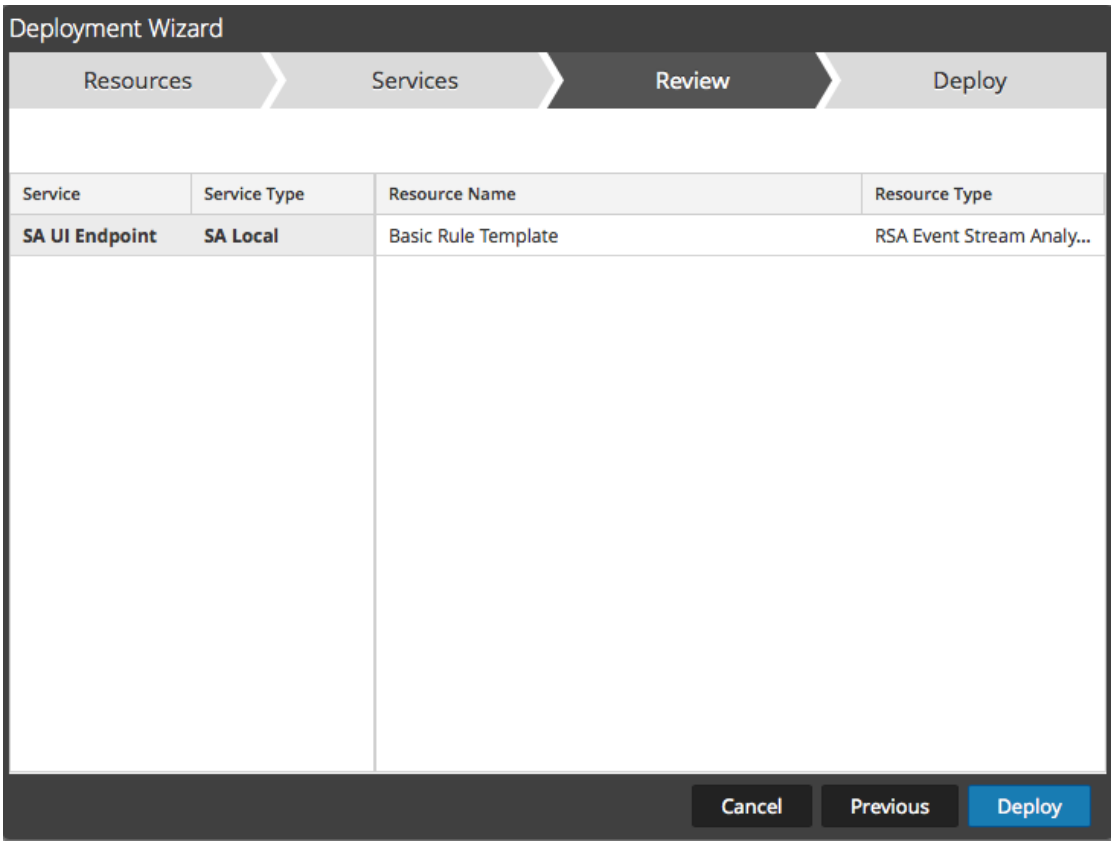
4. Select the services to which you want to deploy the content. You can select any combination of services and service groups.

Use the **Services** tab to select individual services, list of services and service groups that are configured in the Admin Services view.

Use the **Groups** tab to select groups of services.

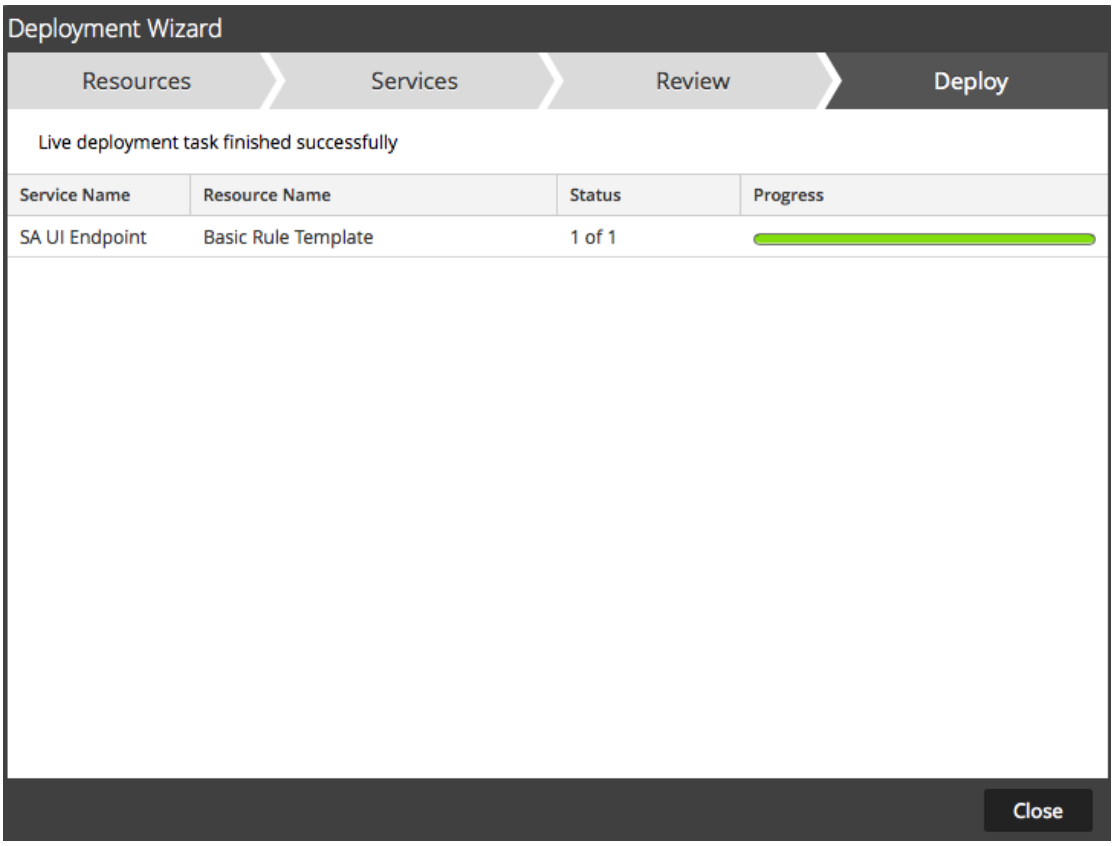


5. Click **Next**.
   The **Review** page is displayed.

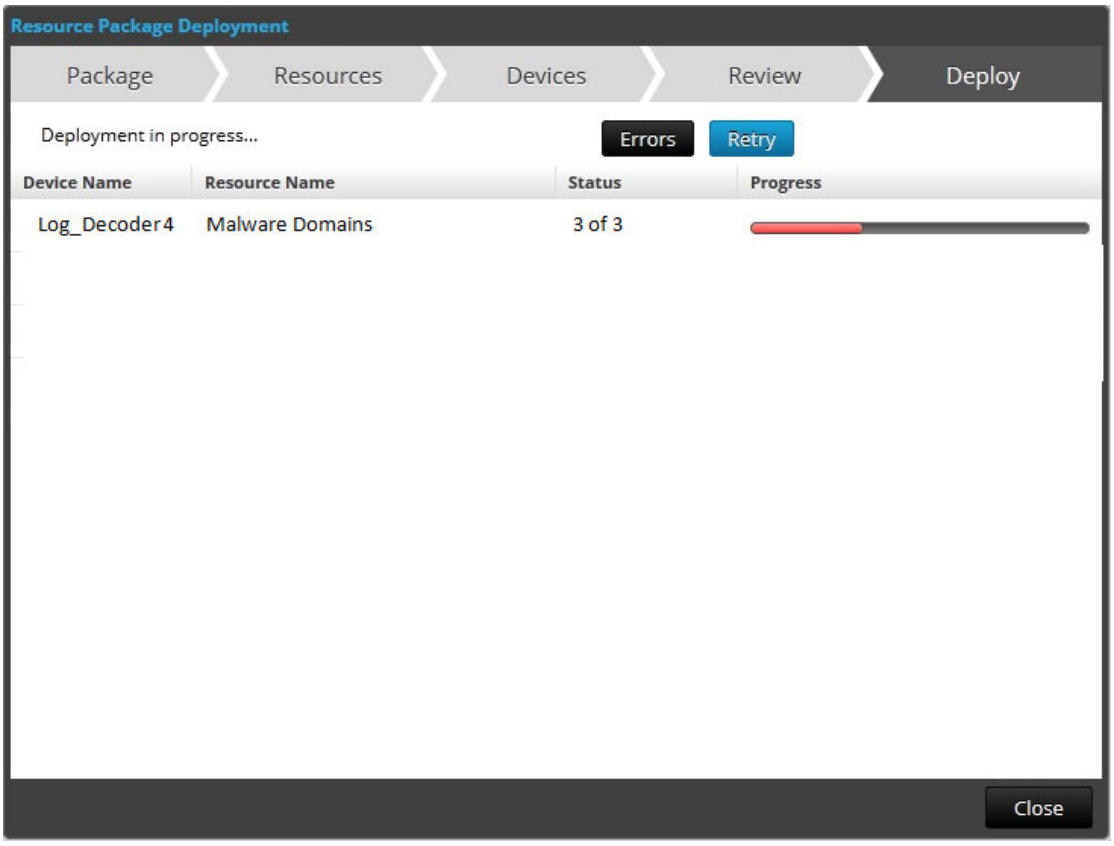


Make sure that you have selected correct resources and the services to which you want to deploy them.

6. Click **Deploy**.
   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.



If you try to deploy resources and services that are not compatible, NetWitness Suite displays the Errors and Retry buttons, which you click to review the errors and re-attempt the deployment.



7. Click **Close**.

Note: The Source IP should be indexed by selecting the type as 'IP' as the ip.src. and ip.dst are in IPv4 format.

In this scenario, a custom meta key location.src (location source) is added by indexing the hostname (alias.host). In this example, the printer hostname are populated in meta key 'alias.host'. So, select 'alias.host' as callback key, and index type as 'Non IP' in the Feed Wizard as shown below. In the Define Values section, select the custom meta key from the drop down menu.

Add the Custom Meta Key Entry in the Concentrator Custom Index file

To add the custom meta entry in the concentrator custom index file:

1. Go to **ADMIN** > **Services** > **Concentrator**.
2. Click > **View** > **Config** > **Files** tab > **index-concentrator-custom.xml.**
3. Add the custom meta key entry in the Concentrator index file.

```
 <Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
   <!-- Reserved Meta key for Feed -->
   <Key description="Source Location"  level="IndexValues"
name="location.src" format="Text"  valueMax="10000"
defaultAction="Open"/>
  </Language>
```

4. To restart the Concentrator service, in the Services view, click > **Restart**.

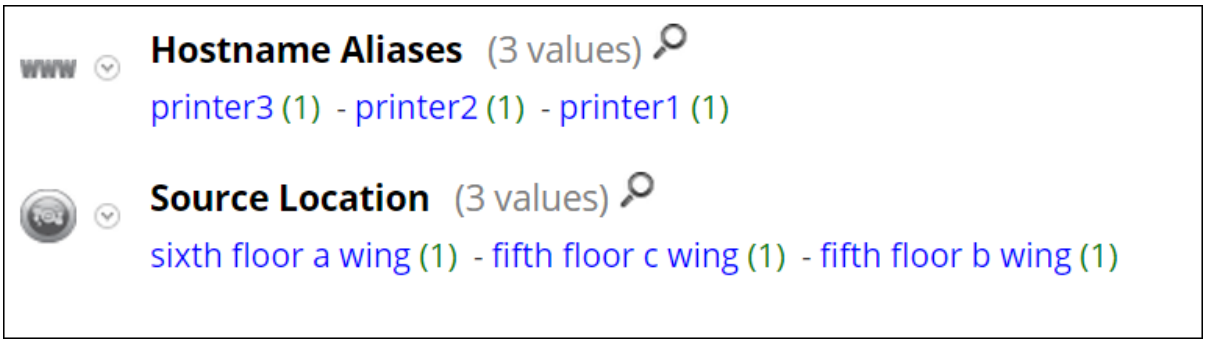
Note: In case of the Broker, the Broker derives its index from the Concentrator from which it aggregates. So you do not need to create custom meta in the broker. If you have not indexed the meta key in the concentrator, the broker will not display in the investigation.

Investigate on the Custom Meta Key

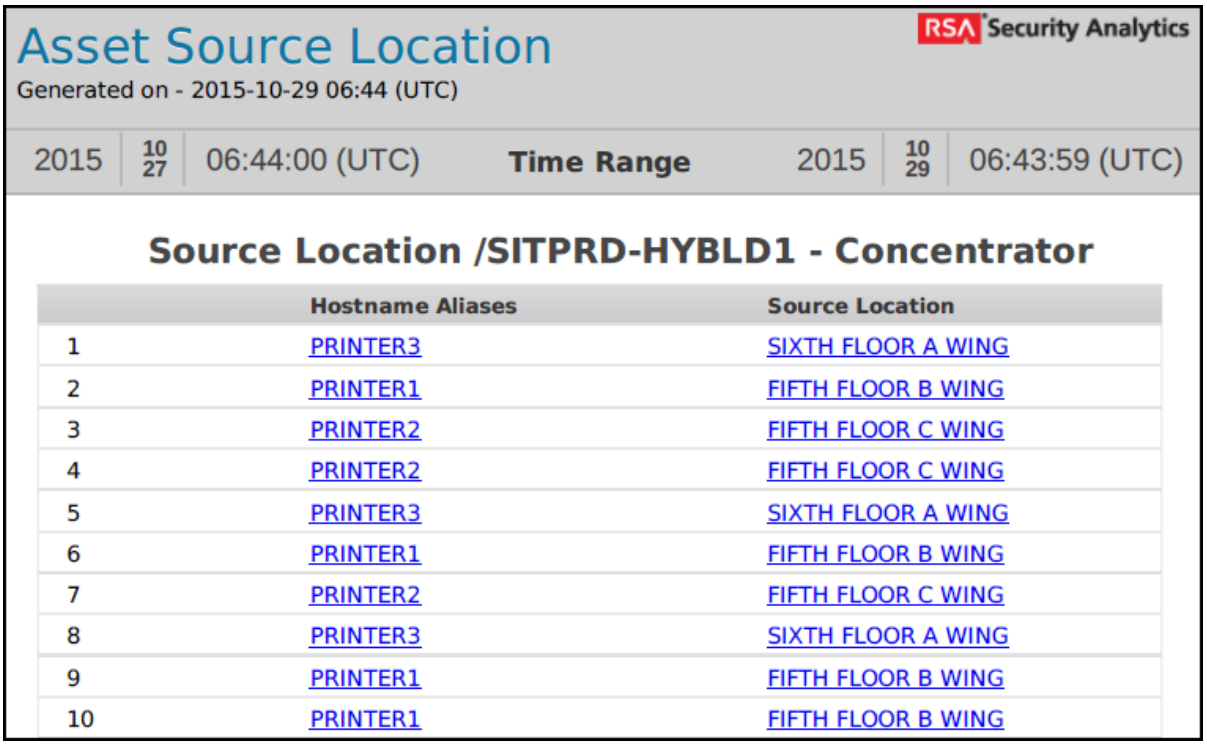
Note: You have to log out and log in from the NetWitness Suite User Interface, before you can view the custom meta key in Investigation.

To investigate on the custom meta key:

1. Go to **INVESTIGATE** > **Navigate**.
2. Select a Concentrator service, and click **Navigate**.



Here is an example of a report executed on the concentrator.



Asset Source Location

RSA Security Analytics

Additional Procedures

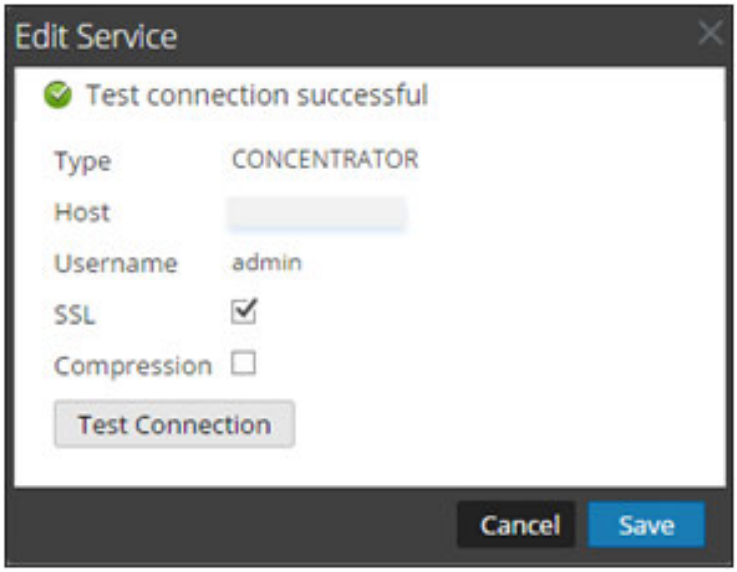
The following procedures must be executed if you have Warehouse Connector, Archiver, Reporting Engine and ESA configured.

Update the Schema in ESA

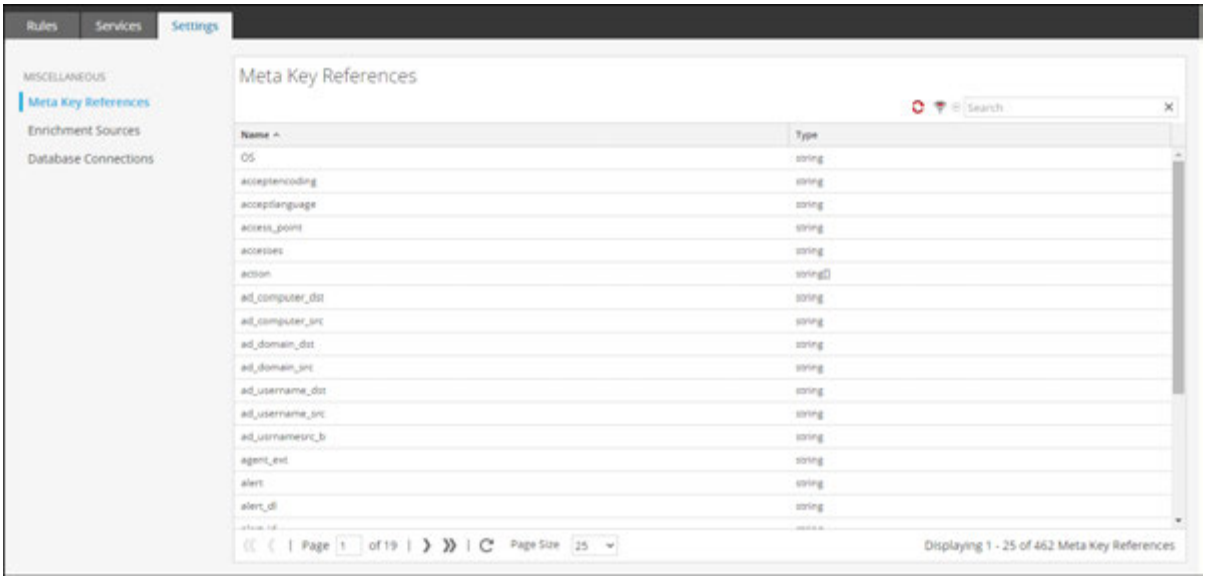
Before you update the schema in ESA, the custom meta key should be indexed in the concentrator.

To update the schema ESA rules and to be able to use the new custom meta keys:

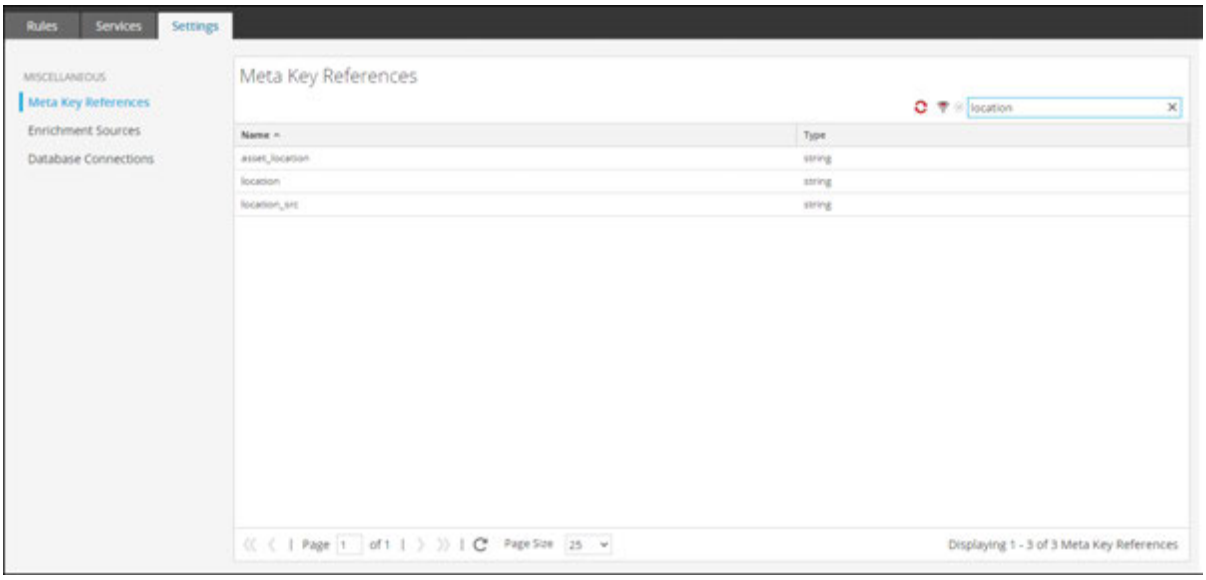
1. Go to **ADMIN** > **Services** > **ESA- Event Stream Analysis** > **View** > **Config**.
2. Edit the Concentrator Datasource.
3. Click **Test Connection.**



4. Click **Save** after the connection is successful.
5. Click **Apply**.
6. Navigate to **Alerts** > **Configure** > **Settings**.



7. Click the **Search** tab and search for the name of the custom meta key.
   The custom meta key name and type is displayed.



Update the Schema in Archiver

If you want to configure the Archiver, using the new custom meta keys, you need to update the Archiver schema in the Reporting Engine. To update the Archiver schema in Reporting Engine:

1. Go to **ADMIN** > **Services** > **Archiver**.
2. Select > **View** > **Config** > **Files** > **index-archiver-custom.xml**.
3. Add the custom meta key entry in the Archiver index file.

```
<Language>
  <?xml version="1.0" encoding="utf-8"?>
  <Language level="IndexNone" defaultAction="Auto">
  <!-- Reserved Meta key for Feed -->
  <Key description="Source Location" level="IndexValues"
name="location.src" format="Text"
  valueMax="10000" defaultAction="Open"/>
 </Language>
```

4. To restart the Archiver service, click > **Restart.**

   The Archiver schema is updated with the custom meta key.

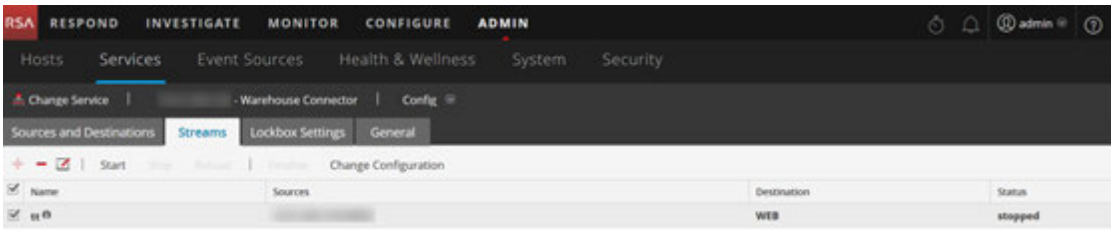
Update the Schema in Warehouse Connector

If you want to configure the Warehouse with custom meta and use it in warehouse report then you need to update the Warehouse schema in the Reporting Engine.

If the Log Decoder or Decoder, where the custom meta key is added, is one of the sources in the Warehouse Connector stream, you need to update the schema in the Warehouse Connector.

To update the Warehouse schema in the Reporting Engine:

1. Go to **ADMIN** > **Services** > **Warehouse Connector**.
2. Click ⚙ > **View** > **Config** > **Files** tab > **index-logdecoder-custom.xml.**
3. Select the stream and click **Reload**.
   The warehouse connector pulls the schema from the downstream devices (Log Decoder/Decoder).



For more information on streams, see "Configure Streams" in the *Warehouse Connector Configuration Guide*.

Update the Schema in Reporting Engine

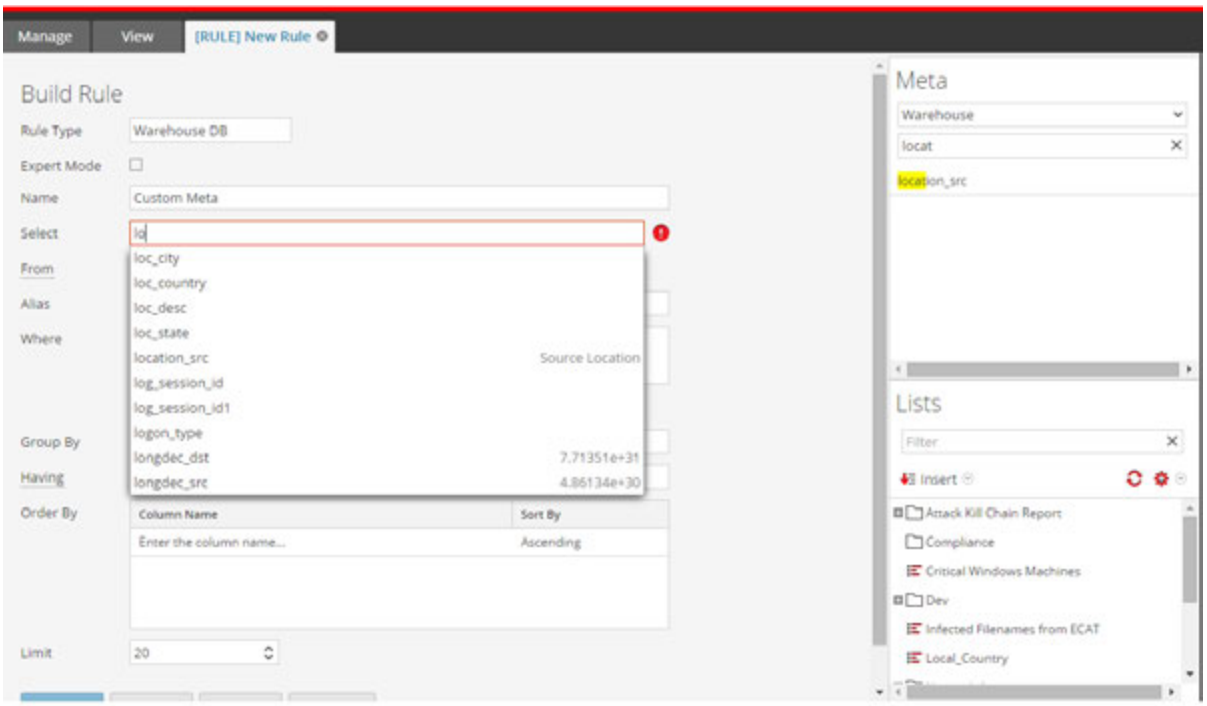
To update the schema in Reporting Engine:

1. Go to **ADMIN** > **Services** > **Reporting Engine.**
2. Click ⚙ > **Restart.**

Note: Restart the Reporting Engine or wait for thirty minutes for the schema to be updated.

To view the custom meta key:

1. Navigate to **Reports** > **Rules**.
2. In the toolbar, click +.
3. Select **Warehouse DB**.
4. In the Build Rule tab, search for the custom meta from the right panel.
   The custom meta key is displayed.



Upload and Delete Custom Parsers

RSA NetWitness Suite has the ability to upload parsers from your local system and delete these parsers.

Upload Parsers to a Decoder or Log Decoder

The Upload option in the Service Config view > Parsers tab displays the Upload Parsers dialog, in which you can manage the uploading of parsers to a Decoder or Log Decoder. In the File list, you prepare a list of parsers for uploading. You can add files from a directory structure, and delete files from the list if you decide that you don't want to upload a particular file. When the list is ready, clicking Upload starts the upload process.

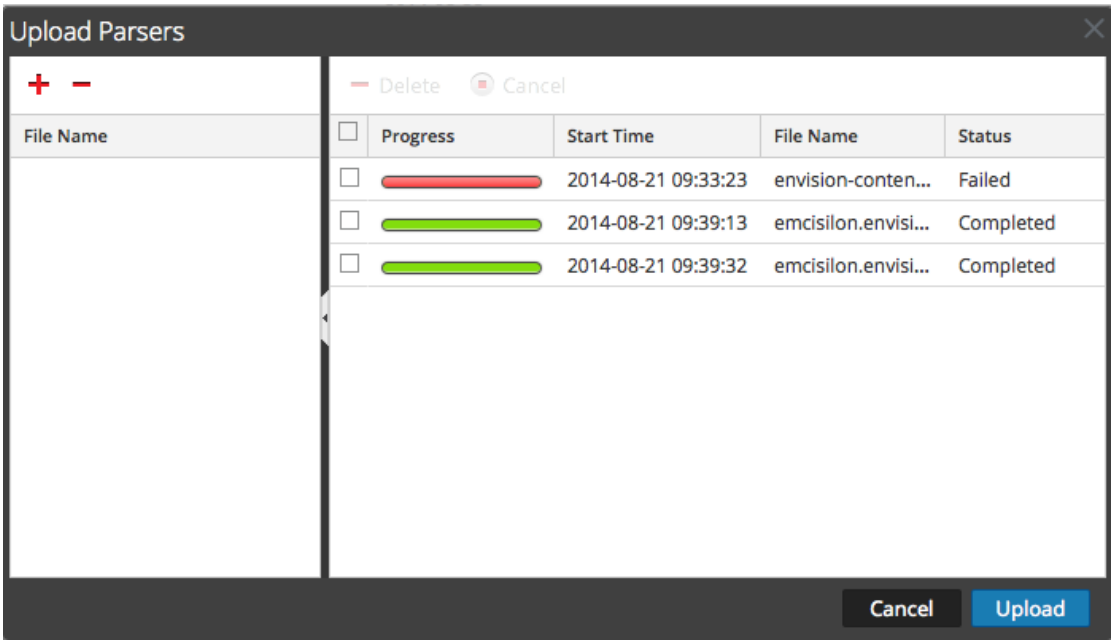
1. Go to **ADMIN > Services**, select a service, and > **View > Config.**

   The Config view for the selected service is displayed.

2. Click the **Parsers** tab.

3. Click Upload.

   The Upload Parsers dialog is displayed.

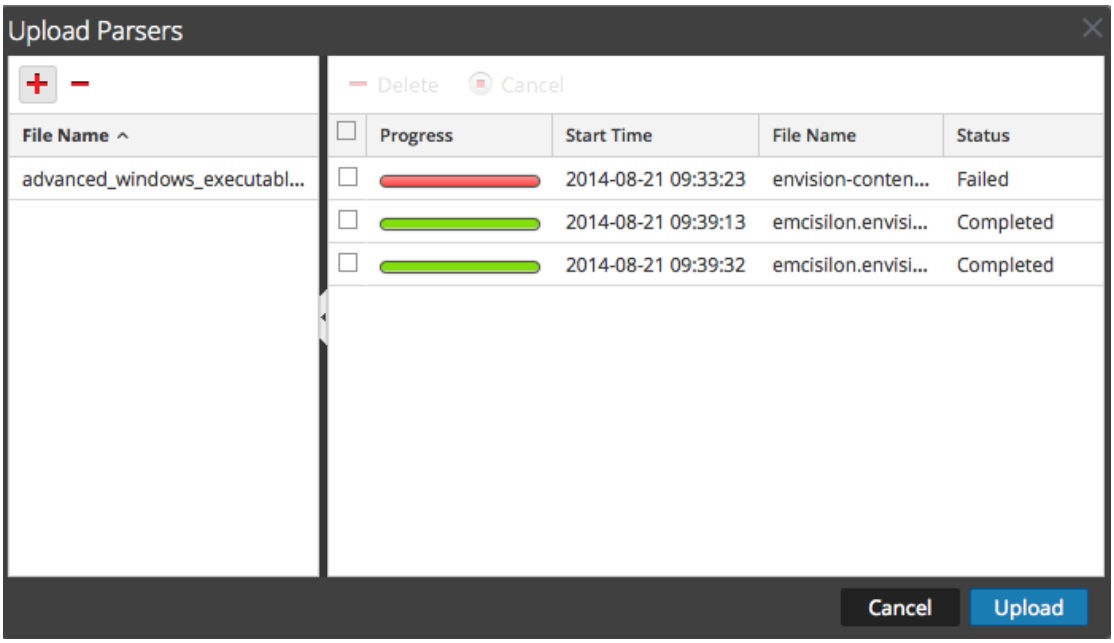


4. Click + .

   A file selection dialog is displayed.

5. Select the **.flex**, **.parser**, and **.lua** files to be updated, and click **Open**.

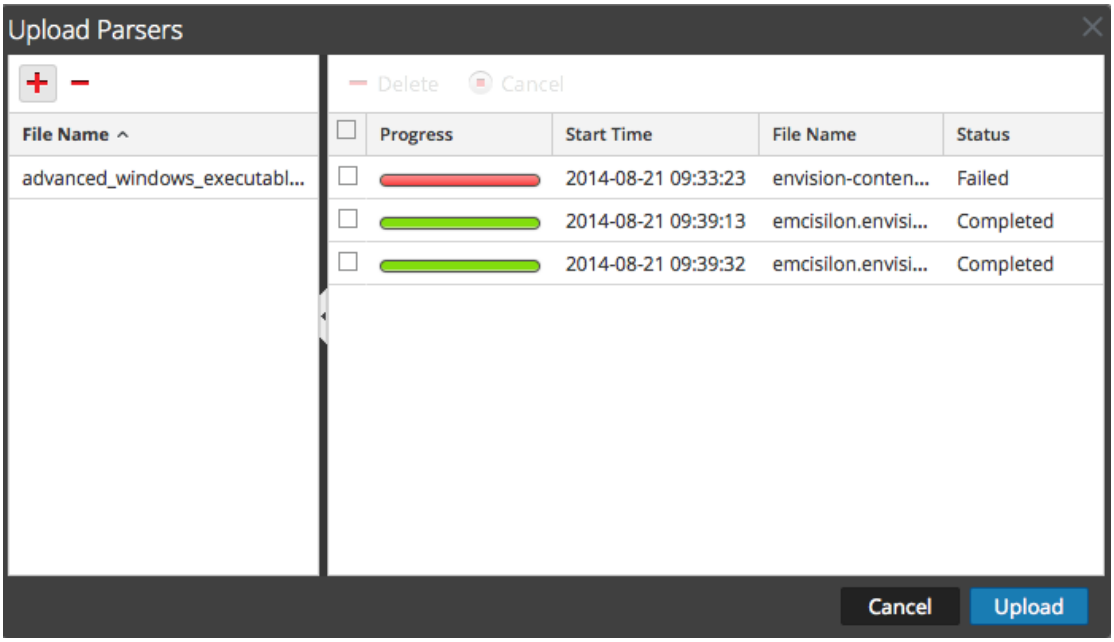
   The dialog closes, and the selected files are displayed in the File list.



6. Click **Upload**.

   The Upload Job grid shows the progress of the upload jobs with each job representing a file

being uploaded.



7. Use any of the Upload grid tools to manage the upload of selected jobs: pause and resume, cancel, and delete.
   Once a job is complete, it is deployed on the Decoder and listed with the deployed parsers in Parsers tab.

Manage Upload Jobs

You can use any of the Upload grid tools to manage the upload of selected jobs: pause, resume, cancel, and delete.

- To cancel uploading a set of parsers while the upload is in queue or progress, click Cancel.
- To pause uploading a set of parsers, if the upload is not yet complete, click Pause.
- To resume uploading a set of parsers after a pause, click Resume.
- To delete an upload job, click .

Delete Deployed Parsers

The Delete option in the Service Config view > Parsers tab provides a way to delete deployed parsers from a Decoder or Log Decoder. Parsers can be added and removed while a Decoder is running without affecting capture.

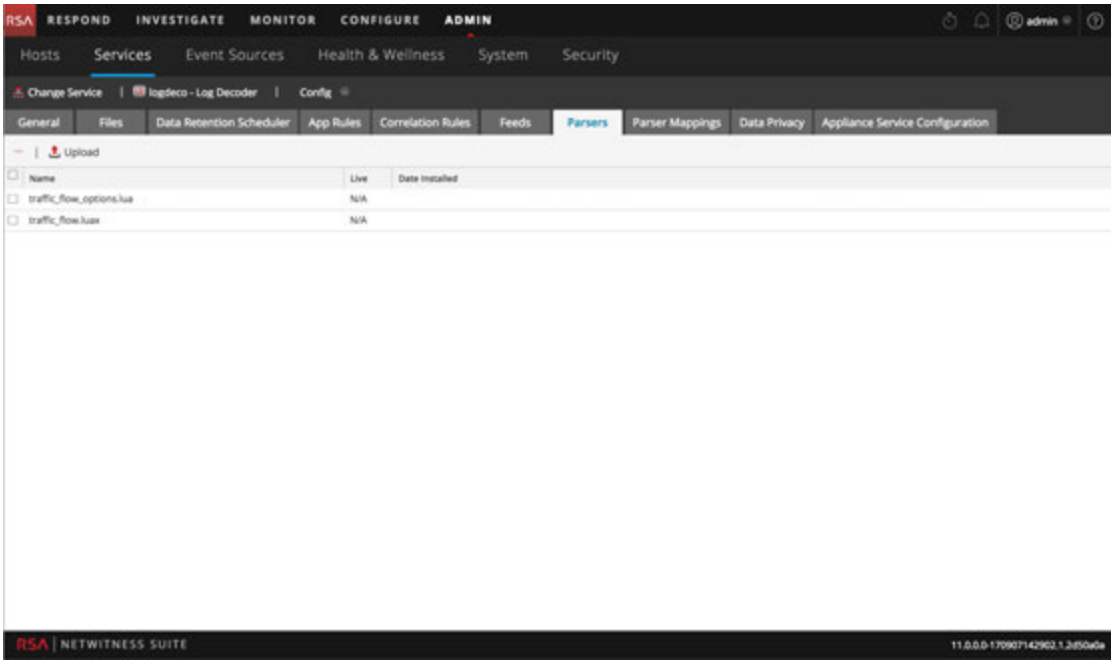
Note: Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

To delete a parser from a Decoder:

1. Go to **ADMIN > Services**, elect a service, and > **View > Config.**

   The Services Config view for the selected service is displayed.

2. Click the **Parsers** tab.



3. In the **Parsers** tab, select one or more parsers to delete.
4. Click −.

   A dialog requests confirmation that you want to delete the parsers.

5. If you want to delete the parsers, click **Yes**.

   The parsers are removed from the Decoder immediately.

Enable and Configure the Entropy Parser

Beginning with NetWitness Suite 11.0, the administrator can configure a Decoder to use a NetWitness native parser, known as the Entropy parser. When the Entropy parser is enabled, analysts have visibility into channels that are trying to blend in with other traffic, but do not follow normal protocol behavior. This helps to identify channels that do not conform to the normal environment traffic baseline, and may, therefore, be worthy of investigation.

The parser creates meta keys, based on statistics collected by the native NetWitness Suite parser, that help to identify behavior of any channel that is getting lots of network traffic. When the parser is first enabled, the analyst needs to become familiar with overall behavior for the different channels seen in a captured session to understand the frequency of bytes and the normal client and server payload. Once the normal behavior is known, analysts can use the meta keys to find behavior that does not match the expected.

By default, the Entropy parser generates 10 additional meta keys that do not add significantly to the load on a Decoder, and are useful for this specialized case. The parser is disabled by default.

Enable indexing if you have interest in exploring interesting sessions based on payload byte analysis of the packets. By default, to make indexing easier, the normal `Float32` value for `entropy.req` and `entropy.res` is multiplied by 10k and stored in a `UInt16` (thus giving four digits of precision, 0 to 10,000).

However, if you define the `entropy.*` fields in the Decoder language to be `Float32`, the Decoder will store it as a float with a range of 0.0 to 1.0. Take care to change the language everywhere if you decide to keep it as a `Float32`.

RSA does not recommend indexing as a `Float32` because of the high unique counts due to minute changes in precision.

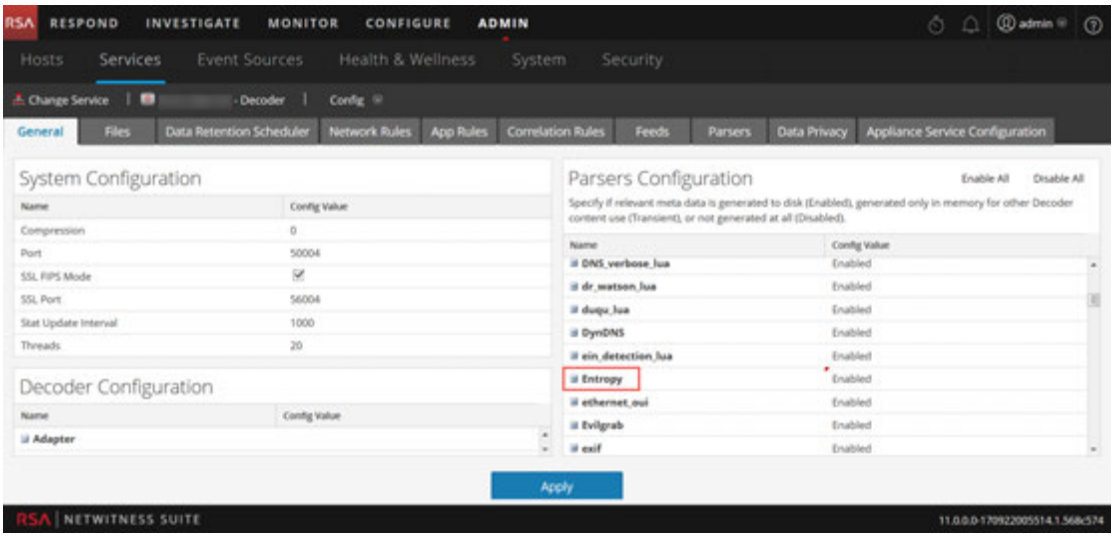
These are the 10 new meta keys generated by the Entropy parser by default:

- `entropy.req` and `entropy.res`: These meta keys capture entropy using the Shannon entropy equation, which has a floating point value as a result. The floating point value of 0 to 1.000 is multiplied by 10000 and written in NetWitness Suite Suite as `UInt 16`, an unsigned integer of 0 through 10000. .
- `mcb.req` and `mcb.res`: The most common byte is simply which byte for each side (0 thru 255) was seen the most.
- `mcbc.req` and `mcbc.res`: The most common byte count is the number of times the most common byte (above) was seen in the session streams.
- `ubc.req` and `ubc.res`: - Unique byte count is the number of unique bytes seen in each stream. 256 would mean all byte values of 0 thru 255 were seen at least once.
- `payload.req` and `payload.res`: The payload size metrics are the payload sizes of each session side at the time of parsing. However, in order to keep indexing from having high unique counts (bad for performance), the two payload size metas below are calculated this way:
  - Less than 1000 is the exact number of payload bytes.
  - 1000 or greater is bucketed in increments of 1000. So a size of 5826 would be stored as 5000.

To enable and configure the Entropy parser on a Decoder

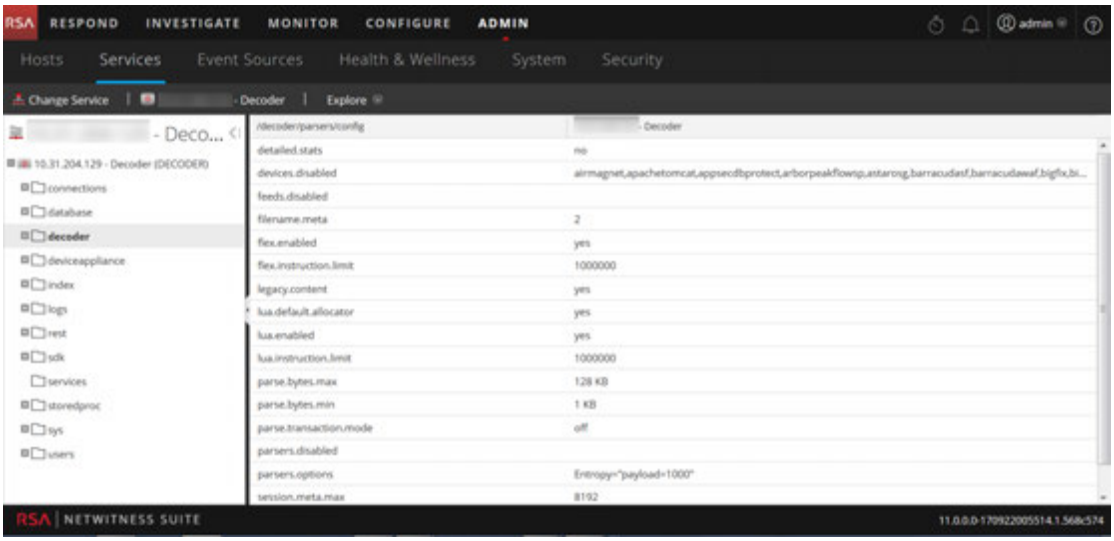
1. Log in to RSA NetWitness, and select **ADMIN > Services** in the NetWitness Suite menu.
2. In the Services view, select the Decoder that you want to configure, and then **View > Config**.
   The Services Config view for the selected Decoder is displayed.

3. The Entropy parser is disabled by default. Click the drop-down list under **Config Value** and select **Enabled**. If you want to disable some of the meta keys, click the drop-down list and select **Disabled** next to the meta key.



4. Click **Apply**
   The Entropy parser is enabled and begins creating the new meta keys as configured in the Concentrator custom index file.

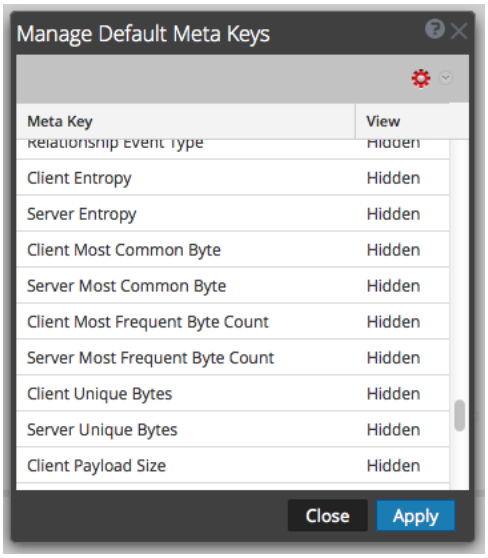
5. Navigate to the **Explore View** for the Decoder, and select the **decoder > parsers > config** node. In the `parsers.options`, you can set the Entropy parser payload. The default value shown in the screen capture is `Entropy = payload = 1000`. When defining the value, the syntax is `Entropy = payload = "1000"` The quotes are required if there is white space in the value, and it is a good practice to always use them to avoid white space issues. If you want to see the exact payload, set this parameter to "1".



The default Entropy payload is 1000, which means that if the payload count is less than 1000,

the exact value is provided. If the payload count is greater than 1000, the value is rounded down to the nearest 1000. For example, a count of 3798 is rounded down to 3000.

6. If you want to change the default Entropy payload rounding factor, edit the value. This change takes effect when the parser is reloaded
7. In the Service Config view select the Concentrator that is aggregating traffic from this Decoder. Select **View > Files** and open the Custom Index file for the Concentrator. Look for the Entropy parser meta keys to see if they are included and uncommented.
   By default the keys are commented out and therefore not enabled. To enable that part of the language the administrator needs to copy that part of index file into the `index-concentrator-custom.xml` and uncomment the `key description` line for each meta key. An example of the custom index file with the Entropy parser keys and instructions is shown below.
8. With the Entropy meta keys enabled, they are available to analysts in Investigate, but hidden by default. To make the meta keys visible in the Investigate Values view, edit the default meta keys in the Default Meta Keys dialog so that they are open instead of hidden. You can manage these meta key the same way you manage other meta keys.



Entropy Parser Configuration in the Concentrator Custom Index File

The following is an excerpt of the Concentrator Index file lines that the administrator must copy to the custom index file. The comments provide guidance on configuring the parser.

<!-- This section is commented out because it's only used by the Entropy parser which is disabled by default. To enable this part of the language, copy to index-concentrator-custom.xml and uncomment the keys. HOWEVER, take note that depending on how the Entropy parser is configured, the entropy.req and entropy.res format might be a Float32 instead of a UInt16. So make sure to change to the correct type if necessary.-->

<!-- Entropy parser meta - enable indexing if you have interest in exploring this for interesting sessions based on payload byte analysis of the packets. By default, to make indexing easier, the normal Float32 value for entropy.res and entropy.req is multiplied by 10k and stored in a UInt16 (thus giving 4 digits of precision, 0 to 10,000). However, if you define the *.entropy fields in the Decoder language to be Float32, it will store it as a float with a range of 0.0 to 1.0. Take care to change the language everywhere if you decide to keep it as a Float32. We also don't recommend indexing as a Float32.-->

<!--

<key description="Client Entropy" format="UInt16" level="IndexNone" name="entropy.req" valueMax="10001"/>

<key description="Server Entropy" format="UInt16" level="IndexNone" name="entropy.res" valueMax="10001"/>

-->

<!-- The most common byte is simply which byte for each side (0 thru 255) was seen the most -->

<!--

<key description="Client Most Common Byte" format="UInt8" level="IndexNone" name="mcb.req"/>

<key description="Server Most Common Byte" format="UInt8" level="IndexNone" name="mcb.res"/>

-->

<!-- The most frequest byte count is the number of times the most common byte was seen in the session streams -->

<!--

<key description="Client Most Frequent Byte Count" format="UInt32" level="IndexNone" name="mcbc.req" valueMax="500000"/>

<key description="Server Most Frequent Byte Count" format="UInt32" level="IndexNone" name="mcbc.res" valueMax="500000"/>

-->

<!-- Unique byte count is the number of unique bytes seen in each stream. 256 would mean all byte values of 0 thru 255 were seen at least once -->

<!--

<key description="Client Unique Bytes" format="UInt16" level="IndexNone" name="ubc.req"/>

<key description="Server Unique Bytes" format="UInt16" level="IndexNone" name="ubc.res"/>

-->

<!-- The payload size metrics are the payload sizes of each session side at the time of parsing. However, in order to keep

indexing from having high unique counts (bad for performance), the two payload size meta values below are calculated like so:

Less than 1000 is the exact number of payload bytes

1000 or greater is bucketed in increments of 1000. So a size of 5826 would be stored as 5000. -->

<!--

<key description="Client Payload Size" format="UInt32" level="IndexNone" name="payload.req" valueMax="500000"/>

<key description="Server Payload Size" format="UInt32" level="IndexNone" name="payload.res" valueMax="500000"/>

-->

Decoder and Log Decoder Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration of the Decoder or Log Decoder.

Topics

Configure 10G Capability

This topic guides administrators in how to tune a Packet Decoder specifically for high speed packet capture using NetWitness Suite 11.0. This applies when capturing packets on a 10G interface card. Packet capture at high speeds requires careful configuration and pushes the Decoder hardware to its limits, so please read this entire topic when implementing a 10G capture solution.

RSA NetWitness Suite provides support for high-speed collection on the Decoder. You can capture network packet data from higher speed networks and optimize your Packet Decoder to capture network traffic up to 8Gb/sec sustained and 10Gb/sec burst, depending on which parsers and feeds you have enabled.

Enhancements that facilitate capture in these environments include the following:

- Utilization of the `pf_ring` capture driver capability to leverage the commodity 10G Intel NIC card for high-speed capture.
- Introduction of `assembler.parse.valve` configuration, which automatically disables application parsers when certain thresholds are exceeded, to limit risk of packet loss. When the application parsers are disabled, network layer parsers are still active. When stats fall below exceeded thresholds, application parsers are automatically re-enabled.

Hardware Prerequisites

- A Series 4S or Series 5 Decoder
- An Intel 82599-based ethernet card, such as the Intel x520. All RSA-provided 10G cards meet this requirement. Two examples are:
  - All SMC-10GE cards provided by RSA.
  - A Dell Network Daughter Card using an Intel controller to provide 10G network interfaces. This is included in all Series 5 hardware.
- For the Series 4S / Dell R620 only: 96 GB of DD3-1600 memory in **dual-rank** DIMMs. Single-rank DIMMs may decrease performance by as much as 10%. To determine the speed and rank of the installed DIMMs, run this command:
  `dmidecode -t 17`.
- Sufficiently large and fast storage to meet the capture requirement. Storage considerations are covered later in this topic.
- Each Packet Decoder configured with a minimum of 2 DACs or SAN connectivity.

Software Prerequisites

- Dell R620-based systems, such as the Series 4S, must have their BIOS updated to v1.2.6 or later.
- The 10G Decoder capability is only supported on RSA-provided Decoder Installation images. All required software is installed by default.
- If upgrading from a previous release, perform the upgrade first before proceeding with configuration

Install the 10G Decoder

Note: You can skip to "Configure the 10G Decoder" if you are starting with new Series 5 hardware.

Perform the following steps to install the NetWitness 10G Decoder:

Download and Update the BIOS

Note: BIOS revisions earlier than v1.2.6 have issues properly identifying the location of the 10G capture card within the system. It is recommended that customers update to the latest v2.2.3 BIOS, but is not required for 10G if they are running v1.2.6 or later.

1. Download BIOS v2.2.3 from the following location:

   http://www.dell.com/support/home/us/en/19/Drivers/DriversDetails?driverId=V7P04
2. Download the Update Package for the Red Hat Linux file.
3. Copy the file to the NetWitness server.
4. Login as `root`.
5. Change the permissions on the file to execute.
6. Run the following file:

   ```
   ./BIOS_V7P04_LN_2.2.3.BIN
   ```
7. Reboot the system when execution is complete and a reboot is requested.

Note: The BIOS installation procedure takes approximately 10 minutes.

Locate the 10G Decoder Packages

The packages required to configure the 10G Decoder should already be present on the Decoder installation image. You should not have to install any additional packages. The packages that provide the 10G driver capability are:

- `pfring-dkms-6.5.0-6.rpm`
- `ixgbe-zc-4.1.5.6-dkms.noarch.rpm`

Verify 10G Decoder Packages Are Installed

Installation of the 10G Decoder packages is handled automatically. Therefore, there should be no action to enable the 10G functionality.

- If you upgraded the kernel packages as part of an upgrade, a reboot is required. The operating system will recompile and install the drivers for the upgraded kernel.
- You can verify that the installation was successful if you see additional `PFRINGZC` interfaces available when selecting the Capture Port Adaper as described below.

Configure the 10G Decoder

Perform the following steps to configure the 10G Decoder:

1. From the **Decoder Explorer** view, right-click **Decoder** and select **Properties**.
2. In the properties drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=10g`
   This adjusts the Decoder packet processing pipeline to allow for higher raw data throughput, but less parsing ability.
3. From the **Decoder Explorer** view, right-click **database** and select **Properties**.
4. In the **Properties** drop-down menu, select **reconfig** and enter the following parameters:
   `update=1 op=10g`
   This adjusts the packet database to use very large file sizes and Direct I/O.
5. Select the capture port adapter. Options for this include:
   - Single port capture - **PFRINGZC,p1p1** or **PFRINGZC,p1p2**
   - Capture off both ports – Select **PFRINGZC,P1P1** and in the **Explorer** view, set `capture.device.params = device=zc:p1p2,zc:p1p1`
6. If the write thread is having trouble sustaining the capture speed, you can try the following:

   Change `/datebase/config/packet.integrity.flush` to `normal`.

   Note: You can adjust the `packet.file.size` to a higher value, but keep the file size under 10 GB, as the whole file is buffered in memory.
7. (Optional) Application parsing is extremely CPU intensive and can cause the Decoder to drop packets. To mitigate application parsing-induced drops, you can set

/decoder/config/assembler.parse.valve to true. These are the results:

- When session parsing becomes a bottleneck, application parsers (HTTP, SMTP, FTP, and others) are temporarily disabled.
- Sessions are not dropped when the application parsers are disabled, just the fidelity of the parsing performed on those sessions.
- Sessions parsed when the application parsers are disabled still have associated network meta (from the network parser).
- The statistic /decoder/parsers/stats/blowoff.count displays the count of all sessions that bypassed application parsers (network parsing is still performed).
- When session parsing is no longer a potential bottleneck, the application parsers are automatically re-enabled.
- The assembler session pool should be large enough that it is not forcing sessions.
- You can determine if sessions are being forced by the statistic /decoder/stats/assembler.sessions.forced (it will be increasing). Also /decoder/stats/assembler.sessions will be within several hundred of /decoder/config/assembler.session.pool.

8. (Optional) If you need to adjust the MTU for capture, add the snaplen parameter to capture.device.params. Unlike previous releases, the snaplen does not need to be rounded up to any specific boundary. The Decoder automatically adjusts the MTU set on the capture interfaces.
9. The following configuration parameters are deprecated and no longer necessary
   - The core= parameter in capture.device.params
   - Any configuration files under /etc/pf_ring directory

   Note: An Ethernet device installed post imaging does not require any configuration for use as a capture device. It does require configuration if it is used as a network interface, or for system tools to access it without manual configuration.

Typical Configuration Parameters

Typical configuration parameters are listed below. Actual parameters may vary depending on the amount of memory and CPU resources available.

1. session and packet pool settings(under /decoder/config):
   - pool.packet.pages = 1000000
   - pool.session.pages = 300000

2. Packet write block size under (`/database/config/packet.write.block` size) set to `filesize`.

   Note: This configures the Decoder to buffer the file with huge pages and write using direct I/O for maximum performance.

3. Parse Thread Count (under `/decoder/config`).

   `parse.threads =12`

Storage Considerations

When capturing at 10G line rates, the storage system holding the packet and meta databases must be capable of sustained write throughput of 1400 MBytes/s.

Using the Series 4S Hardware (With Two or More DAC Units)

The Series 4S is equipped with a hardware RAID SAS controller capable of an aggregate 48Gbit/s of I/O throughput. It is equipped with eight external 6 Gbit ports, organized into two 4-lane SAS cables. The recommended configuration for 10G is to balance at least two DAC units across these two external connectors. For example, connect one DAC to one port on SAS card, and then connect another DAC to the other port on the SAS card.

For environments with more than two DACs, chain them off each port in a balanced manner. This may require re-cabling of DACs in an existing deployment, but should not affect data that has already been captured on the Decoder.

If adding new capacity, use the currently available `NwMakeArray` script to provision the DAC units. The script automatically adds one DAC per execution (that means, if adding three DACs, then the script must be run three times), adding the DACs to the `NwDecoder10G` configuration as separate mount points. The independent mount points are important, as this configuration allows the `NwDecoder10G` to segregate write I/O from capture from the read I/O needed to satisfy packet content requests.

Using SAN and Other Storage Configurations

The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8-Gbit FC link to a SAN is not sufficient to store packet data at 10G; in order to use a SAN it may be required to perform aggregation across multiple targets using a software-RAID Scheme. Thus environments using SAN are required to configure connectivity to the SAN using multiple FCs.

Parsing and Content Considerations

Parsing raw packets at high speeds presents unique challenges. Given the high session and packet rates, parsing efficiency is paramount. A single parser that is inefficient (spends too long examining packets) can slow the whole system down to the point where packets are dropped at the card.

For initial 10G testing, start with only native parsers (except SMB/WebMail). Use the native parsers to establish baseline performance and with little to no packet drops. Do not download any Live content until this has been done and the system is proven to capture without issue at high speeds.

After the system has been operational and running smoothly, Live content should be added very slowly - especially parsers.

Best Practices

Whether you are updating a currently deployed system or deploying a new system, it is recommended you use the following best practices to minimize risk for packet loss. One caveat is if you are updating a current 10G deployment but not adding any additional traffic. For example, a current Decoder capturing off a 10G card at 2G sustained should see no difference in performance, unless part of the update also entails adding additional traffic for capture.

- Incorporate baseline parsers (except SMB/Webmail, both of which generally have high CPU utilization) and monitor to ensure little to no packet loss.
- When adding additional parsers, add only one or two parsers at a time.
- Measure performance impact of newly added content, especially during peak traffic periods.
- If drops start occurring when they did not happen before, disable all newly-added parsers and enable just one at a time and measure the impact. This helps pinpoint individual parsers causing detrimental effects on performance. It may be possible to refactor it to perform better or reduce its feature set to just what is necessary for the customer use case.
- Although lesser performance impacts, feeds should also be reviewed and added in a phased approach to help measure performance impacts.
- Application Rules also tend to have little observable impact, though again, it is best not to add a large number of rules at once without measuring the performance impact.

Finally, making the recommended configuration changes outlined in the Configuration section will help minimize potential issues.

Tested Live Content

All (not each) of the following parsers can run at 10G on the test data set used:

- MA content (7 Lua parsers, 1 feed, 1 application rule)
- 4 feeds (alert ids info, nwmalwaredomains, warning, and suspicious)
- 41 application rules
- DNS_verbose_lua (disable DNS)

- fingerprint_javascript_lua
- fingerprint_pdf_lua
- fingerprint_rar_lua
- fingerprint_rtf_lua
- MAIL_lua (disable MAIL)
- SNMP_lua (disable SNMP)
- spectrum_lua
- SSH_lua (disable SSH)
- TLS_lua
- windows_command_shell
- windows_executable

NOT TESTED:

- SMB_lua, native SMB disabled by default
- html_threat

OTHER:

- HTTP_lua reduces the capture rate from >9G to <7G. At just under 5G this parser can be used in place of the native without dropping (in addition to the list above).
- xor_executable pushes parse CPU to 100% and the system can drop significantly due to parse backup.

Aggregation Adjustments Based on Tested Live Content

A 10G Decoder can serve aggregation to a single Concentrator while running at 10G speeds. Deployments using Malware Analysis, Event Stream Analysis, Warehouse Connector, and Reporting Engine are expected to impact performance and can lead to packet loss.

For the tested scenario, the Concentrator aggregates between 45 and 70k sessions/sec. The 10G Decoder captures between 40-and 50k sessions/sec. With the content identified above, this is about 1.5 to 2 million meta/sec. Due to the high volume of session rates, the following configuration changes are recommended:

- Nice aggregation on the Concentrator limits the performance impact on the 10G Decoder. The following command turns on nice aggregation.
  ```
  /concentrator/config/aggregate.nice = true
  ```

- Due to the high volume of sessions on the Concentrator, you may consider activating parallel values mode on the Concentrator by setting `/sdk/config/parallel.values` to `16`. This improves Investigation performance when the number of sessions per second is greater than 30,000.
- If multiple aggregation streams are necessary, aggregating from the Concentrator instead has less impact on the Decoder.
- Further review for content and parsing is required for deployments where you want to use other NetWitness Suite components (Warehouse, Malware Analysis, ESA, and Reporting Engine).

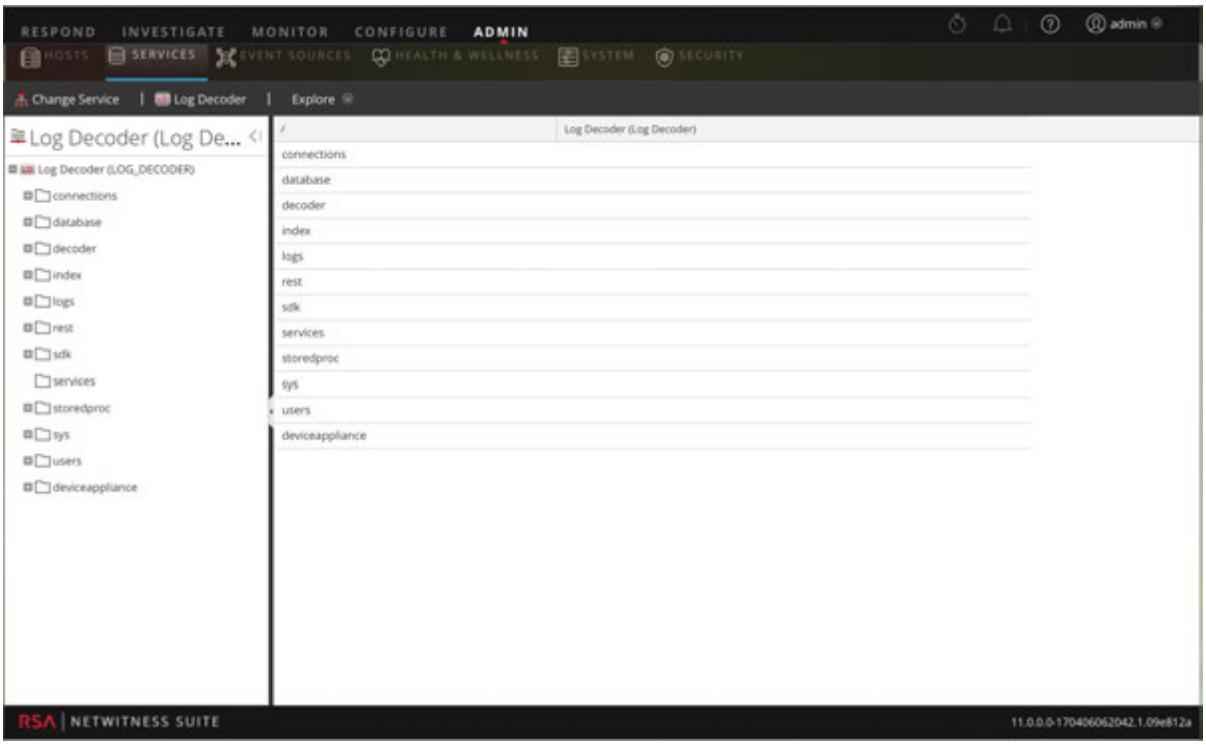
Configure a Log Decoder to Accept Protobuf

There are occasions when you want to analyze log files that are in protobuf (Protocol Buffer) format. You can configure a Log Decoder to accept logs in protobuf (Protocol Buffer) format.

To import a log file to a Log Decoder:

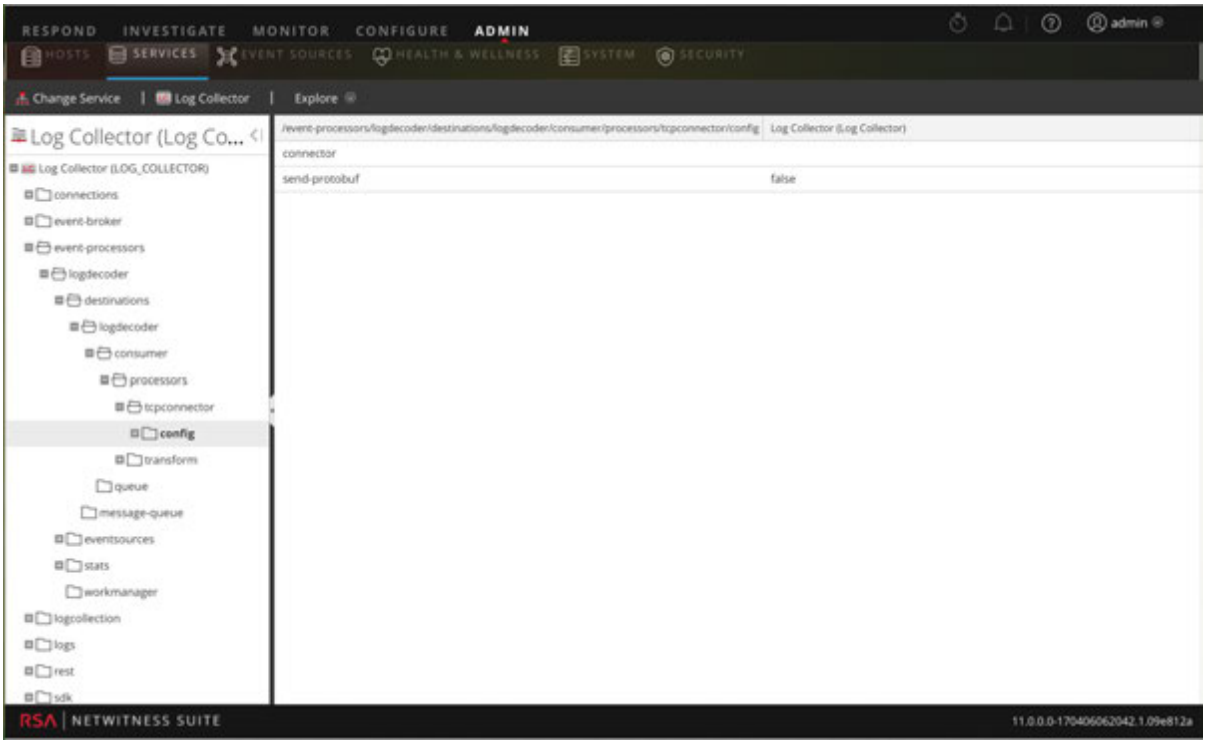
1. Go to **ADMIN > Services**.
2. Select a Log Decoder in the **Service** list, and select > **View** > **Explore**.

   The Explorer view for the Log Decoder is displayed.



3. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config`

Your screen should look similar to the following.



4. For the **send-protobuf** field, select **false**, and change the value to **true.**
5. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/channel/tcp` and change the **port** value to **50202**.
6. Navigate to `event-processors/logdecoder/destinations/logdecoder/consumer/processors/tcpconnector/config/connector/event` and change the following parameters:
   - Clear the **delimiter** field
   - Change **format** to **%text%**

Configure Session Split Timeouts

The default behavior of the Decoder is to automatically end sessions that exceed a configured size or have been inactive for a period of time. When the session is ended due to timeout, any subsequent packets received in that session appear to be stored in a new session. You can mitigate the effect of session splitting due to long periods of inactivity between packets using this procedure.

When a Decoder session exceeds a configured size (32MB by default, the `/decoder/config/assembler.max.size`) or has been inactive for a period of time, the session is split. NetWitness Suite has the previous packet and the next packet and can propagate session state from the initial session fragment to the subsequent session fragment.

Each session fragment is annotated (`session.split` meta) such that it can be identified and associated with other fragments from the actual network session. Directionality as determined by the initial session reduces the occurrence of fragments having reversed directionality.

If there is a gap in time between packets large enough that there are no longer any packets for the session in memory, the session is removed from the Decoder. If a subsequent packet shows up after this occurs, a new session is created with no context to the preceding session. The issue is the inability to continue a session when we encounter a gap between packets of a session that is larger than the packets we are buffering (based upon available memory and timeout configurations). Once the last packet of a session is removed from memory, the session is also removed, and with it the necessary context for ensuring consistent directionality.

There are two timeout settings in a Packet Decoder, `/decoder/config/assember.timeout.session` and `assembler.timeout.packet`. Both default to 60 seconds. The setting `assembler.timeout.session` controls how long a session lives in Assembler without receiving another packet. The setting `assembler.timeout.packet` controls how long a session waits before getting parsed. If the session is kicked out of Assembler before this timeout, then it automatically goes to parsing.

The session timeout is the number of seconds since the last packet was added to that session. Therefore, this timeout resets on every packet added to that session. The packet timeout is the number of seconds since the very first packet for that session was added (in other words, the packet that created the session). This is never reset and once the timeout expires, the session is parsed.

The important point is a session can be parsed but still remain in Assembler. A session in Assembler can still have packets added to it, even if it has already been parsed. Packets added after the session is parsed will never be seen by parsers, but they will be attached to the session and can be viewed by a subsequent `/sdk content` or `/sdk packets` call.

After a session is parsed, the session AND its metadata are written to disk. At this point, they can be aggregated and "seen" by `sdk` commands. Packets are written in order of capture and are not reordered by what session they belong to. Nor are they necessarily written when the session and meta data are written.

You can disable both timeout nodes, `/decoder/config/assembler.timeout.session` and `assembler.timeout.packet`, by setting them to zero in the Services Explore view.

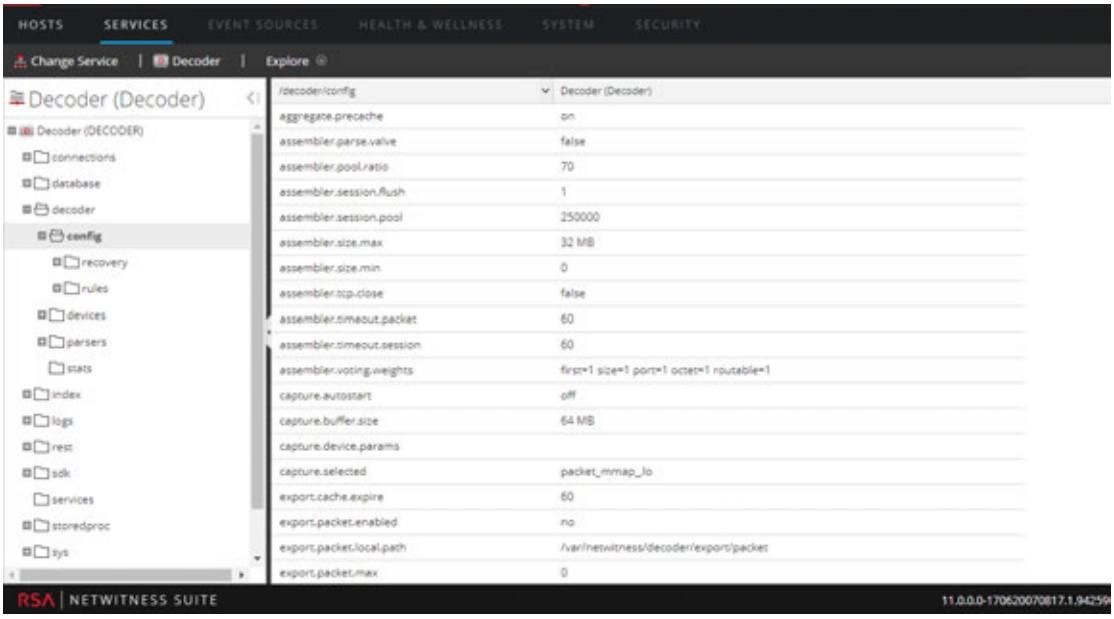
If both timeouts are disabled, the sessions are still split due to time or size expiration. However, the Decoder keeps track of the network stream for as long as it has sufficient memory. Thus, when more packets arrive on the same network stream, the Decoder adds `split` meta items to the subsequent sessions. Using a combination of the `split` metadata and the stream key, it is possible to reconstruct the network stream from the multiple sessions.

The length of time for which sessions are tracked is limited by the number of session pool entries available on the Decoder, and therefore the actual time window varies according to the rate at which new sessions are added. If new sessions are added at a high rate, the size of the time window decreases. The size of the pool is set using the configuration entry `/decoder/config/assembler.session.pool`, which sets the maximum number of sessions that will be tracked at a time.

The `/decoder/stats/assembler.timespan` statistic allows you to see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track. This statistic shows the number of seconds tracked within the session table, which is the effective time window in which the Decoder can link together sessions. Under normal operation this statistic matches the value of `/decoder/config/assembler.timeout.session`, but when running in Time Split mode, the `/decoder/stats/assembler.timespan` statistic grows or shrinks depending on the ingest rate.

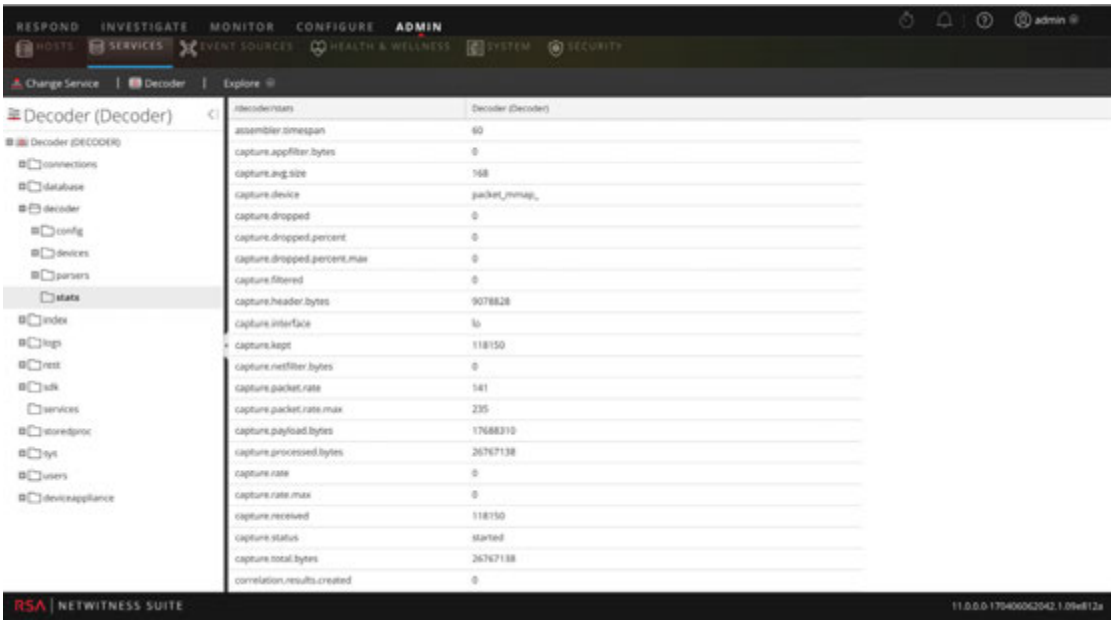
To configure Time Split mode, set the following configuration parameters and restart the Decoder:

1. In the Admin > Services view, select the Decoder service and **> View > Explore.**
2. In the Services Explore view select **decoder** > **config**.



3. Click in the **Value** column next to the parameter and set these two parameters :
   `/decoder/config/assembler.session.flush = 0`
   `/decoder/config/assembler.timeout.session = 0`

4. To see when the Decoder is no longer tracking session splits because the ingest rate is too high and the Decoder does not have enough memory to track, view the `/decoder/stats/assembler.timespan` statistic, in the Services Explore view select **decoder** > **stats**.



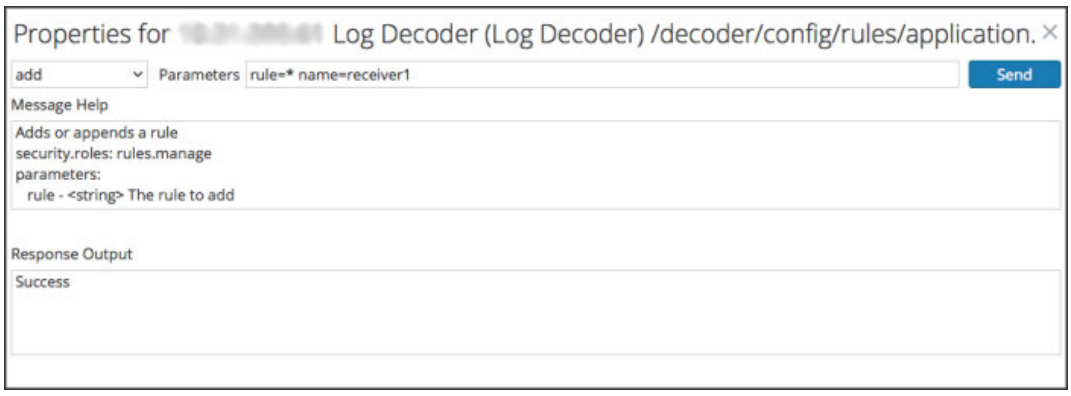
Configure Syslog Forwarding to Destination

In addition to collecting Syslog messages, you can configure the Log Decoder to forward Syslog messages to another Syslog receiver. NetWitness Suite forwards Syslog messages after it has parsed the messages and before it writes the messages to the Log Decoder.

Note: You must configure Syslog Forwarding using the steps defined in this topic under **Procedure** using the **Explore** view.

The Log Decoder must be in the **Started** state before you can configure Syslog Forwarding. To configure Syslog Forwarding:

1. Configure Log Decoder application layer rules (Application rules) to tag Syslog messages with metadata that instructs NetWitness Suite to forward the messages:
   a. In the **Services** view, select a Log Decoder, and in the Actions column, select > **View** > **Explore**.
   b. Go to the **/decoder/config/rules/application** node, right-click **application,** and click **Properties**.
   c. In the **Properties** view, specify the **add** command with the following parameters:
      `rule=<query> name=<name>`
      Example 1: `rule=*name=receiver1`
      Example 2: `rule="device.type='winevent_nic'" name=receiver`)
   d. Click **Send**.



NetWitness Suite creates the `name=receiver1 rule=* order=<n>` rule. NetWitness Suite inserts the order number (for example, `order=49`) based on when you set up the rule.

e. Go to the `/decoder/config/rules/application` node and click the `name=receiver1 rule=* order=49` rule.

f. Add **alert forward** parameters to the rule parameters.

```
rule=* name=receiver1 order=49 alert forward
```

All other rule parameters have the same meaning as they do in other application rules.

The following Application rule example selects all logs with the `*` rule. It creates an alert meta with the value "**`receiver1`**" and tags the entire log for forwarding it to the syslog forwarding destination. You can define as many different forwarding rules as you need with the same name or unique names.

2. Define Syslog forwarding destinations and enable forwarding.

   a. In the **Services** view, select a Log Decoder, and ⚙ > **View** > **Explore**.

   b. Syslog forwarding destinations are defined in the configuration node `/decoder/config/logs.forwarding.destination`.
   This configuration node contains one or more name/value pairs. The name corresponds to the name parameter in the application rule that you used to tag logs with forwarding meta. The value is a colon-separated triple of transport, host, and port followed by an optional formatting parameter.
   `name=(udp|tcp|tls):host:port[:(retainsource|rfc3164)]`
   The first parameter indicates the transport protocol and must be one of udp, tcp, or tls. Specifying udp will forward logs via RFC 3164 / RFC 5426 UDP syslog protocol. Specifying tcp will forward logs via a TCP connection with RFC 6587 framing. Specifying tls will forward logs in accordance with RFC 5425.

   The host is an IPv4 address, IPv6 address, or host name.

   The port is the port to which the logs are sent. This is typically port 514 for UDP syslog, and 6514 for TLS connections. There is no standard port assignment for syslog over TCP.

Optionally, `retainsource` or `rfc3164` can be specified at the and of the destination string to indicate that additional formatting and information should be included with each log forwarded. Specifying `retainsource` will include z-connector headers at the beginning of the log based and will be populated by the `time`, `device.(ip|ipv6|host)`, and `lc.cid` meta and is best used for forwarding to other log decoders. The `rfc3164` option will prepend a valid RFC3164 header to all events forwarded constructed of the `syslog.pri`, `time`, and `device.(ip|ipv6|host)` meta. In both cases, the original log text is unmodified.

Example forwarding destination:

```
gears=tls:gears.netwitness.local:6514
```

Example forwarding over tcp to blackout on port 514 with z-connector headers:

```
fwdrule=tcp:blackout.netwitness.local:514:retainsour
```

In the `/decoder/config/logs.forwarding.destination` parameter, specify the destination. For example:
TLS Connections: `receiver1=tls:receiver1.netwitness.local:6514`
UDP Connections: `receiver1=udp:receiver1.netwitness.local:514`
TCP Connections: ***`receiver1=tcp:receiver1.netwitness.local:514`***

Note:
You can configure:
- Multiple rules to forward logs to the same destination.
- Multiple rules to forward logs to multiple destination.

For TLS connections, the certificate of the forwarding destination must be validated. The certificate authority that signed the destination's certificate must be present in the Log Decoder's CA trust store and the certificate must reside on the destination or Syslog receiver. Refer to "Configure Certificates" in the *Log Collection Configuration Guide* for information about manipulating the Log Decoder's CA trust store. (Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.)

c. In the `/decoder/config/logs.forwarding.enabled` parameter, specify **true**.

Configure Transaction Handling on a Decoder

Beginning with 11.0, administrators can configure a Decoder to subdivide incoming sessions into smaller transaction sessions when using LUA parsers designed to create transactions. The feature allows analysts to perform analytics on the split sessions in downstream services such as Investigate.

Transaction Handling

The Decoder service configuration node has a new parameter for configuration of transaction handling: `/decoder/parsers/config/parser.transaction.mode`. This node controls the behavior of the Decoder when a parser defines a transaction within a network session.

The values for `parser.transaction.mode` correspond to the operating modes:

- `{{off}}` (transactions off)
- `{{meta}}` (transactions represented as meta Items)
- `{{split}}` (transactions split sessions)

Transactions Off

When transactions mode is off, any application-level transactions created by parsers are ignored, and nothing is stored in the collection to represent the transaction.

Transactions Represented as Meta Items

In this mode of operation, when a parser generates an application-level transaction, a new meta item of type `{{trans}}` is added to the session in which the transaction occurred. The `{{trans}}` meta item contains a list of other meta items that constitute the transaction.

Transactions Split Sessions

In this mode of operation, when a parser generates an application-level transaction, the session is split. The session splitting is accomplished by:

1. A new session item is created.
2. Network meta items are copied from the parsed session into the new session.
3. Meta items marked in the transaction are moved from the original session to the new session.

The following meta items are duplicated into the split session from the session that was parsed:

- `time`
- `medium`

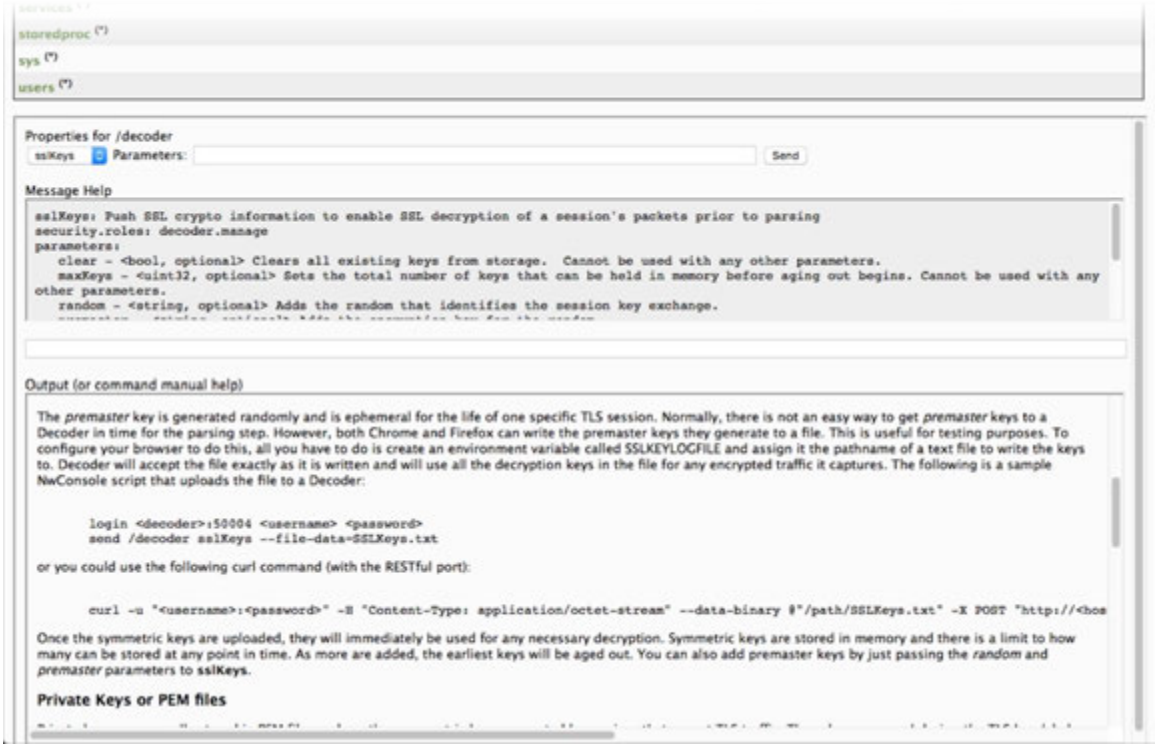
- eth.src
- eth.dst
- eth.type
- ip.proto
- ip.src
- ip.dst
- ipv6.src
- ipv6.dst
- ipv6.proto
- tcp.srcport
- tcp.dstport
- tcp.flags
- udp.srcport
- udp.dstport
- service
- udp.srcport
- udp.srcport
- tls.premaster

Decrypt Incoming Packets

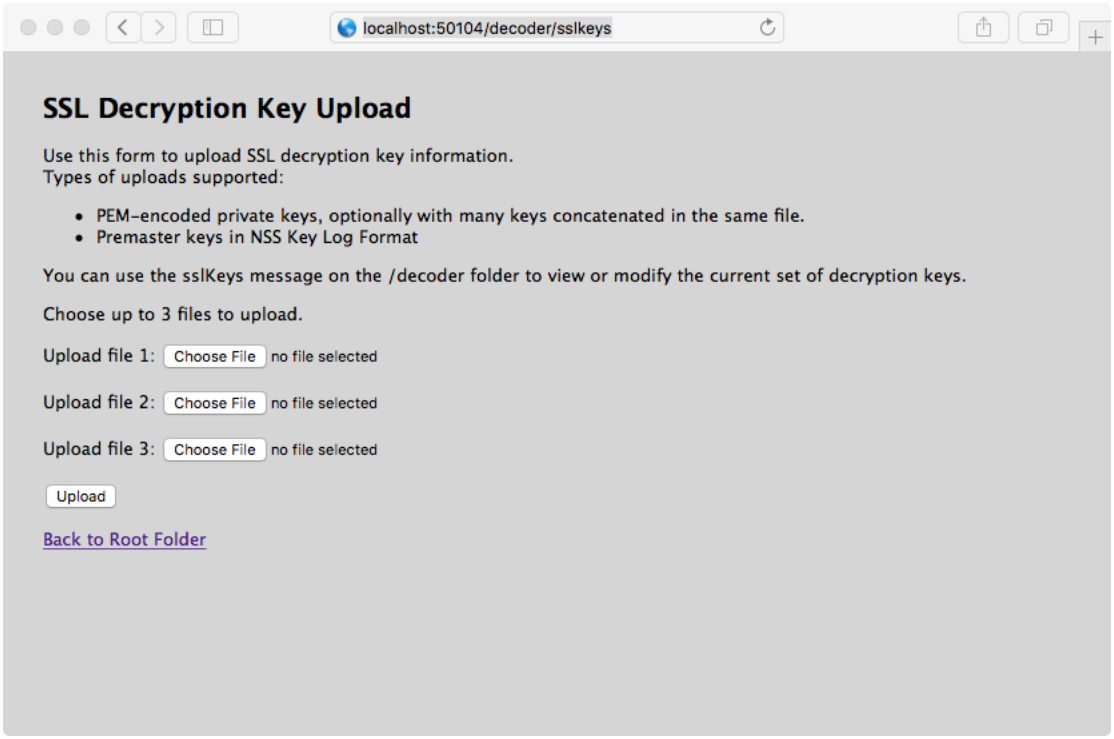
Beginning with NetWitness Suite 11.0, administrators can configure a Packet Decoder to decrypt incoming packets using the `sslKeys` command. Enabled parsers will see the unencrypted packet payload and create metadata accordingly. If the Decoder is not configured to decrypt incoming packets, most enabled parsers will see only encrypted garbage and will fail to create meaningful metadata.

Note: If FIPS is enabled, the list of ciphers for decryption is restricted to only those that are FIPS approved.

The `sslKeys` command provides a way to upload premaster or private keys to the Decoder, so that captured encrypted packets that match the keys can be decrypted before parsing. Administrators configure the Decoder by entering the `sslKeys` command using the NwConsole command line interface or the Decoder RESTful interface.



The RESTful interface form at the path: `/decoder/sslkeys` allows uploading a single PEM-encoded private key, a single file containing multiple private keys concatenated together, or a single file of multiple premaster keys.



Although the packets are decrypted during the parse stage, only the encrypted packets are written to disk. The matching premaster key used for decrypting is written to the `tls.premaster` meta key, which analysts can use to subsequently view unencrypted packets on demand.

Details for administrators to configure decryption of incoming packets, and for analysts to view unencrypted packets on demand are provided below.

Performance Considerations

Decrypting packets in real time requires extra work in the parsing stage. Before implementing this feature, plan carefully to ensure the incoming traffic bandwidth does not overwhelm the available compute power. You may need more Decoders to decrypt traffic than you would need if not decrypting.

Packets captured on a Decoder normally have a timeout of ~60 seconds in the assembly stage before they are sent to the parsing step. If the Decoder is under memory pressure due to very high bandwidth, the lifetime of the packets in Assembler may be shortened. To alleviate this situation, you can configure a longer timeout value and increase the amount of memory available to hold packets in Assembly. Also, in order to perform decryption of the packets, the Decoder must receive the decryption key before the parsing stage.

Note: Currently, only TLS 1.2 and earlier protocols can be decrypted

With no feeds loaded, the following parsers enabled, and 50% of the sessions being decrypted,a Decoder can process traffic at 3 Gbps .

Parser Name	Description
SYSTEM	Session Details
NETWORK	Network Layer
ALERTS	Alerts
GeoIP	Geographic data based on ip.src and ip.dst
HTTP	Hyper Text Transport Protocol (HTTP)
HTTP_Lua	Hyper Text Transport Protocol (HTTP) Lua
FTP	File Transfer Protocol (FTP)
TELNET	TELNET Protocol
SMTP	Simple Mail Transport Protocol (SMTP)
POP3	Post Office Protocol (POP3)
NNTP	Network News Transport Protocol (NNTP)
DNS	Domain Name Service (DNS)
HTTPS	Secure Socket Layer (SSL) Protocol
MAIL	Standard E-Mail Format (RFC822)
VCARD	Extracts VCARD fullname and email information
PGP	Identifies PGP blocks within network traffic
SMIME	Identifies SMIME blocks within network traffic
SSH	Secure Shell (SSH)
TFTP	Trivial File Transfer Protocol (TFTP)
DHCP	Dynamic Host Configuration Protocol (DHCP and BOOTP)
NETBIOS	Extracts NETBIOS computer name information.
SNMP	Simple Network Management Protocol (SNMP)

Parser Name	Description
NFS	Network File System (NFS) protocol
RIP	Routing Information Protocol (RIP).
TDS	MSSQL and Sybase database protocol (TDS)
TNS	Oracle database protocol (TNS)
IRC	Internet Relay Chat (IRC) protocol
RTP	Real Time Protocol (RTP) for audio/video
SIP	Session Initiation Protocol (SIP)
H323	H.323 Teleconferencing protocol
SCCP	Cisco Skinny Client Control Protocol
GTalk	Google Talk (GTalk)
VlanGre	Vlan ID and GRE/EtherIP tunnel addresses
BITTORRENT	BitTorrent File Sharing Protocol
FIX	Financial Information eXchange Protocol
GNUTELLA	Gnutella file sharing protocol
IMAP	Internet Message Access Protocol
MSRPC	Microsoft Remote Procedure Call protocol
RDP	Remote Desktop Protocol
SHELL	Command Shell Identification
TLSv1	TLSv1
SearchEngines	A parser that extracts search terms
FeedParser	External Feed Parser

Encryption Keys

The `sslKeys` command accepts two types of encryption keys:

- Premaster key: the symmetric key used in the TLS payload stream for encryption and decryption.
- Private key: the asymmetric private key used during the TLS handshake that encrypts the premaster.

Premaster Key

The premaster key is generated randomly and is ephemeral for the life of one specific TLS session. Normally, there is not a good way to get premaster keys to a Decoder in time for the parsing step. However, both Chrome and Firefox can write the premaster keys they generate to a file. This is useful for testing purposes. To configure your browser to do this, create an environment variable called SSLKEYLOGFILE and assign it the pathname of a file to which the keys will be written. The Decoder will accept the file exactly as written and will use all the decryption keys in the file for any encrypted traffic it captures.

This is a sample NwConsole script that uploads the file to a Decoder:

```
login <decoder>:50004 <username> <password>

send /decoder sslKeys --file-data=SSLKeys.txt
```

This is an example using a curl command (with the RESTful port) to upload the file to a Decoder:

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --data-binary @"/path/SSLKeys.txt" -X POST "http://<hostname>:50104/decoder?msg=sslKeys"
```

After the symmetric keys are uploaded, they will immediately be used for any necessary decryption. Symmetric keys are stored in memory and there is a limit to how many can be stored at any point in time. As more keys are added, the earliest keys will be aged out. You can also add premaster keys by just passing the `random` and `premaster` parameters to `sslKeys`.

Private Keys or PEM files

Private keys are normally stored in PEM files and are the asymmetric keys generated by services that accept TLS traffic. These keys are used during the TLS handshake to encrypt the premaster symmetric key that will be used for the rest of the payload encryption.

For example, if you have a web server whose traffic you want visibility into, you need to upload the private key it uses to encrypt traffic. You only need to do this once, as it is stored permanently (or until removed by a delete command). Private keys are automatically encrypted before storing to protect them. After upload, you must issue a parser reload command so that the newly installed key becomes visible to the HTTPS parser. Now, all TLS handshakes that use that private key will be able to be decrypted by the Decoder.

Note: Not all ciphers suites use a "known" private key (for example, Ephemeral Diffie Hellman). Encrypted traffic with those ciphers cannot be decrypted unless the premaster key is uploaded to the Decoder before the session is parsed.

These are some sample commands that upload a PEM file to be used for decryption.

Using NwConsole:

```
send /decoder sslKeys pemFilename=MyKey.pem --file-data=/path/MyKey.pem
```

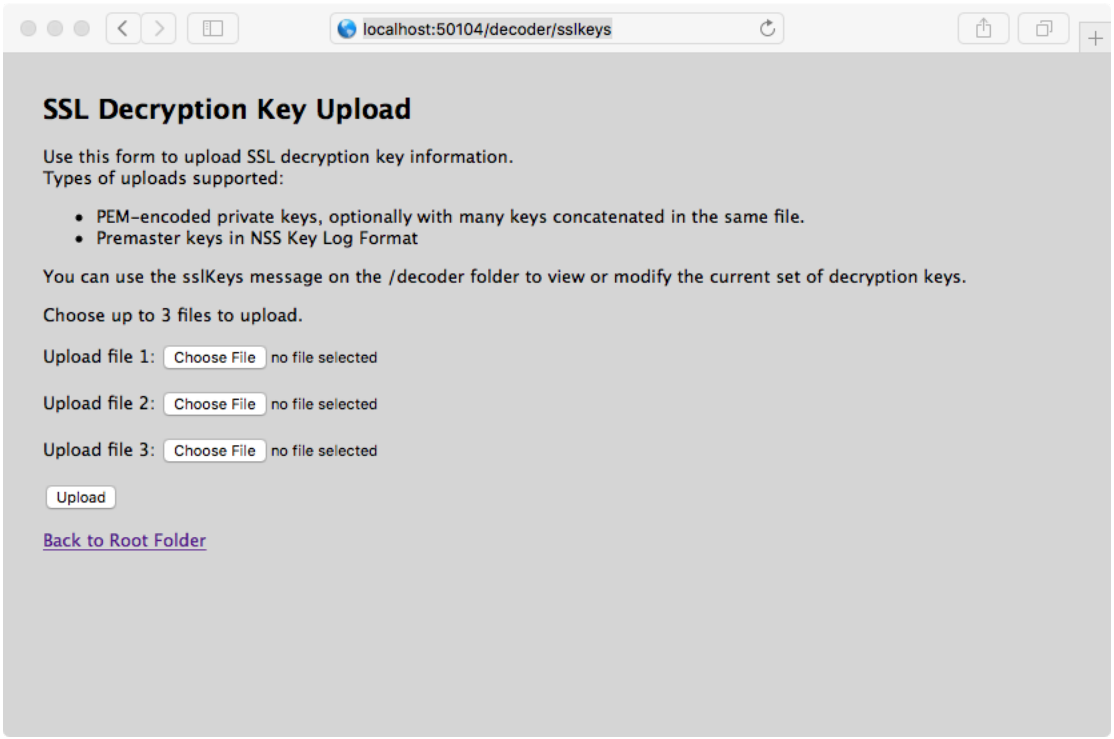
Using the RESTful interface (you must provide the `pemFilename` parameter in the URL):

```
curl -u "<username>:<password>" -H "Content-Type: application/octet-stream" --data-binary
@"/path/MyKey.pem" -X POST
"http://<hostname>:50104/decoder?msg=sslKeys&pemFilename=MyKey.pem"
```

Upload Multiple Premaster and Private Keys

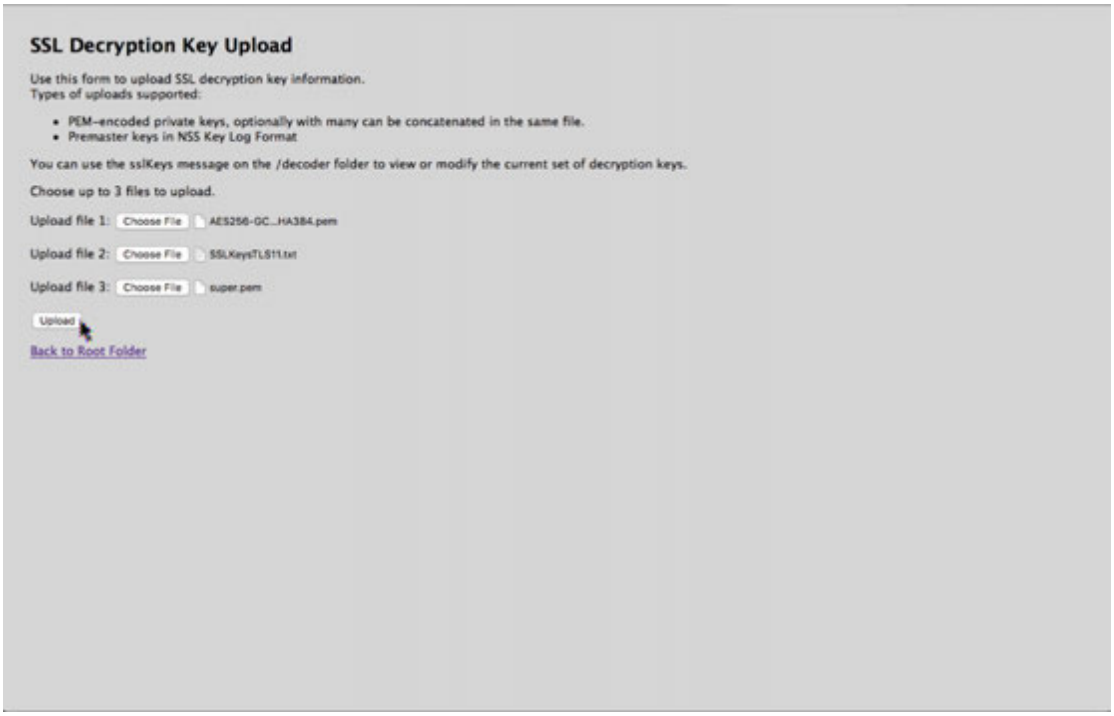
You can use the RESTful interface form to facilitate uploading of multiple keys, both premaster and private at the same time.

1. Open the RESTful API in your browser, and navigate to this path on the Decoder that you want to configure: `/decoder/sslkeys`.



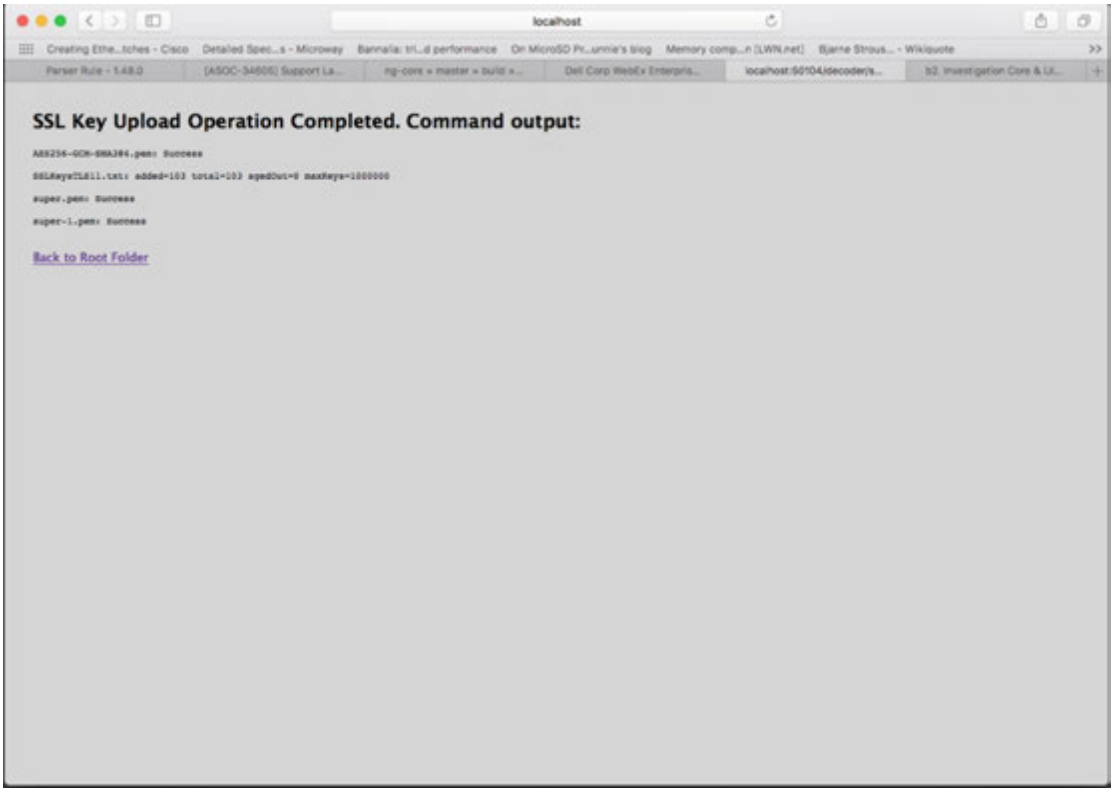
2. Next to **Upload File 1**, click **Choose File** and locate the premaster key file or PEM file that you want to upload on you local file system.

3. (Optional) repeat for **Upload File 2** and **Upload File 3**.



4. Click **Upload**.

   The files are uploaded to the Decoder and results are displayed in the form.



Parameters for Managing Keys

The `sslKeys` command has several parameters for managing premaster and private keys. This is the full list of parameters:

Parameter	Description
`clear`	Removes all premaster keys from memory. Does not delete any PEM files installed on the system.
`maxKeys`	Changes the maximum number of premaster keys that are stored in memory.
`listPems`	Returns a list of all installed private key PEM files.
`deletePem`	Deletes the named PEM file from the file system. You can pass this parameter more than once to remove multiple files.
`random`	The random hash used to identify the premaster key.
`premaster`	The premaster key that will be installed for the previous `random` parameter. They must show up in pairs and `random` must be first.

Return Values

Most `sslKeys` commands return name/value pairs of statistics about the premaster keys in memory. The statistics are listed in the following table.

Name	Description
`added`	The number of premaster keys just added during this command.
`total`	The total number of premaster keys loaded in memory.
`agedOut`	The total number of premaster keys that were removed during this command; this is not a lifetime stat.
`maxKeys`	The current maximum allowed premaster keys

Viewing Unencrypted Traffic

If packets are decrypted during the parse stage, encrypted packets are written to disk, and the matching premaster key used for decrypting is written to the `tls.premaster` meta key, analysts can view the unencrypted packets using the `tls.premaster` meta key.

One Decoder API that you can use to see the unencrypted packets is the /sdk/content RESTful service. You need to know the Session ID of the encrypted packets and the `flags` parameter masked to the value 128 (or 0x80 in hex). Point your browser to the Decoder RESTful interface and type in the following command, substituting the actual Session ID for <id>:

```
http://<decoder>:50104/sdk/content&session=<id>&flags=128&render=text
```

The Decoder returns a simple web page showing the packets after they are decrypted.

If you want to see what the packets look like encrypted, type in one of the following commands, substituting the Session ID for <id>:

```
http://<decoder>:50104/sdk/content&session=<id>&render=text
```

```
http://<decoder>:50104/sdk/content&session=<id>&flags&render=text
```

For more information on the /sdk/content service, see the manual page for /sdk content.

Edit Decoder System Configuration

When a service is first added to NetWitness Suite, default values for the system configuration parameters are in effect. In most cases, the default values for compression, statistics update interval, and number of threads in the thread pool are set at a good point for optimal system performance. You do not need to edit these setting unless an RSA Customer Support technician advises you to change them.

System Configuration

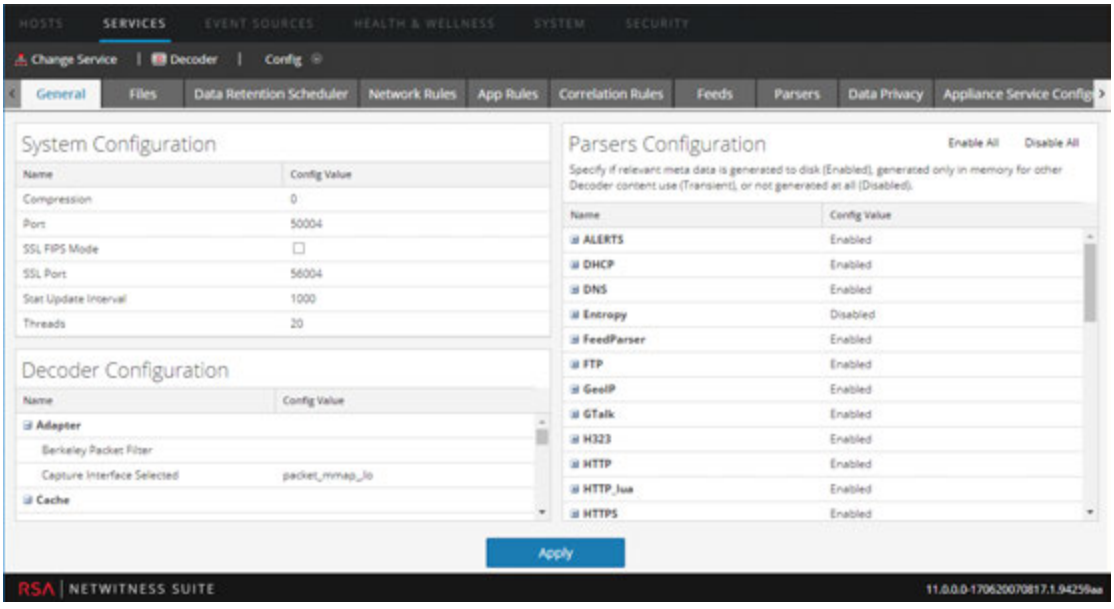
Name	Config Value
Compression	0
Port	50004
SSL FIPS Mode	☐
SSL Port	56004
Stat Update Interval	1000
Threads	20

One parameter that you may want to change for your environment is the SSL setting, which by default is not enabled. When enabled, the security of data transmission is managed by encrypting information and providing authentication with SSL certificates.

To edit system configuration parameters for a Decoder or Log Decoder:

1. Go to**ADMIN > Services**.
2. In the Admin > System view, select a Decoder or Log Decoder service, and select **> View > Config**.

   The Services Config view for the service is displayed with the General tab open.



3. Under **System Configuration**, click in a field that you want to edit **(Compression**, **Port**, **SSL FIPS Mode**, **SSL Port**, **Stat Update Intervals**, or **Threads**). Type a new value.
4. When finished editing, click **Apply.**
   The settings become effective immediately.

Enable CPU Usage Statistics for Installed Content

Beginning with NetWitness Suite 11.0, the Decoder provides CPU utilization statistics for all installed content, which you can use to reveal how much CPU time is used by parsers, feeds, application rules, and lexical scanning. The statistics are visible as Stat nodes in the service tree from the Explorer view when **/decoder/parsers/config/detailed.stats** is enabled and the Decoder is capturing the stats.

Each piece of content is accounted as a single percentage value (0-100) regardless of the number of parse threads running. The percentage represents an average of the CPU utilization for the content across all threads.

To enable usage statistics monitoring:

1. Navigate to the Decoder Explorer view and select the `/decoder/parsers/config/detailed.stats` parameter.
2. Change the value to **enabled**. If the Decoder is not capturing data, start capture.
   When you open the Decoder Stats node in the Explorer view, the new statistic is visible.

Enable Parser Mappings

This topic tells administrators how to enable event source mapping on a Log Decoder.

The Log Collector discovers the event source type on a per-message basis. If the correct parser is not identified for the event source, a small percentage of logs may be misidentified. The misclassified messages do not populate event source rules and alerts, and the reports do not have the correct data. If there are multiple event source types associated with an IP address, it makes it difficult for the parsers to identify the exact event source from which the logs are generated.

If you map an IP address to its event source type, the Log Decoder can identify the event source from which the log is generated. When messages are delivered to the Log Decoder from a mapped event source, only the assigned parsers are queried to find event matches.

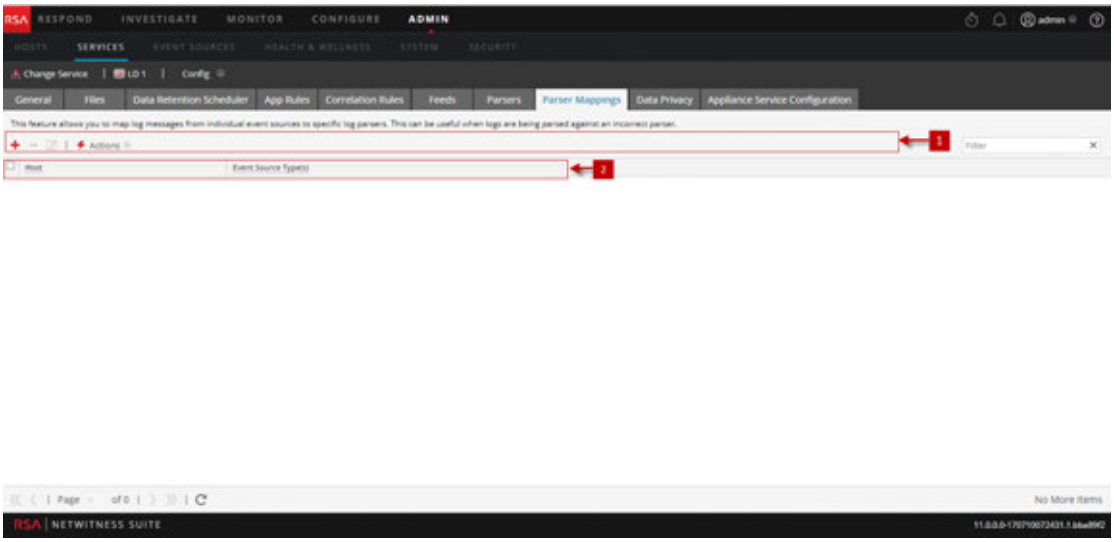
You can assign event source types to IPV4, IPV6, or the hostname value of the event source. You can also assign multiple event source types to a single IP address. You can also use the Log Collector ID when different event source types with the same IP address are sent to different Log Collectors.

Note: You can also enable parser mapping functions by navigating to **ADMIN > Event Sources > Discovery.**

Enable IP Address to Event Source Mapping

To enable an IP address to event source mapping:

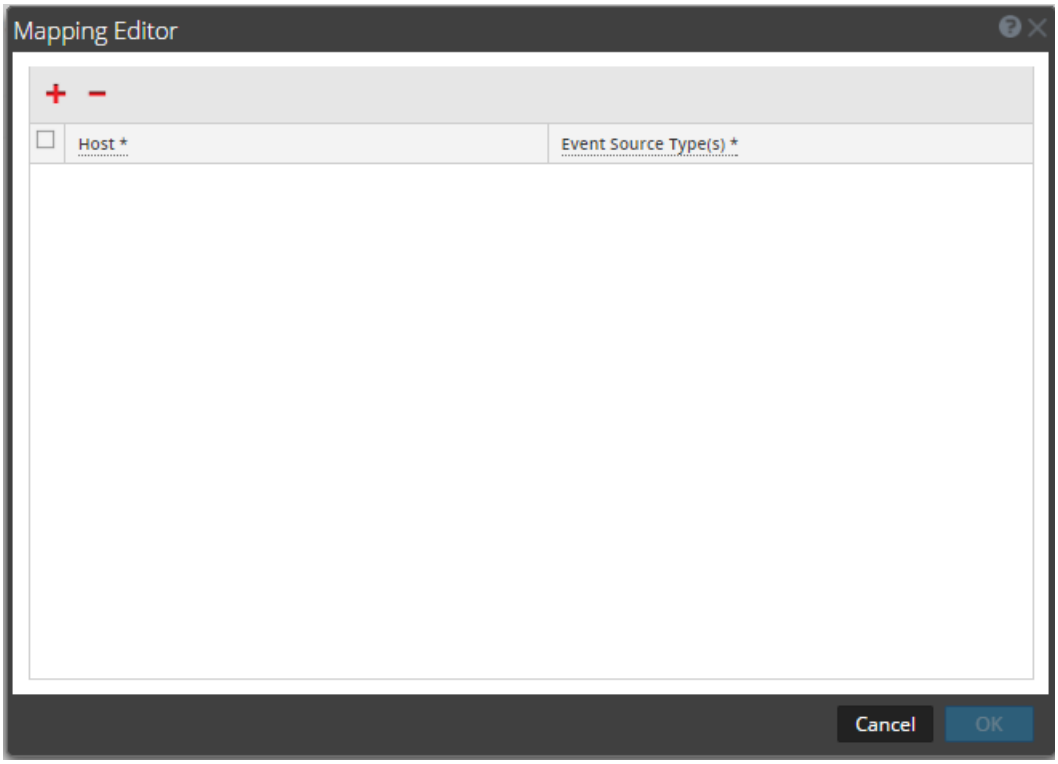
1. Go to **ADMIN > System > Log Parser Mappings**.
2. Select **Decoder**, then select > **View** > **Config**.
3. In the Configuration page, select the **Parser Mappings** tab.
   The Parser Mappings tab is displayed in the Services Config view.



Update IP to Event Source Mapping

To update an IP to event source mapping:

1. Go to **ADMIN > Services**.
2. Select a **Log Decoder**, and in the **Actions** column, select  **> View > Config**.
   The Services Config view is displayed.
3. Select the **Parsers Mapping** tab.
4. Click  .
   The Mapping Editor is displayed.



5. Any of the following mappings can be defined:

One Host and One Event Source Type
- In the **Host** field, enter the hostname.
  For example: `10.0.0.1`
- In the **Event Sources(**s) field, enter the event source type.
  For example: `apache`

One Host and One or More Event Source Types
- In the **Host** field, enter the hostname.
  For example: `10.0.0.1`
- In the **Event Source(s)** field, enter the event source type.
  For example: `apache,sap,aix`

One Host, One Log Collector, and One Event Source Type

- In the **Host** field, enter the hostname and Log Collector ID.
  For example: `10.0.0.1,LC-1`.
- In the **Event Source(s)** field, enter the event source type.
  For example: `apache`

One Host, One Log Collector ID, and One or More Event Source Types

- In the **Host** field, enter the hostname and Log Collector ID.
  For example: `10.0.0.1,LC-1`
- In the **Event Source(s)** field, enter the event source type.
  For example: `apache,sap,aix`

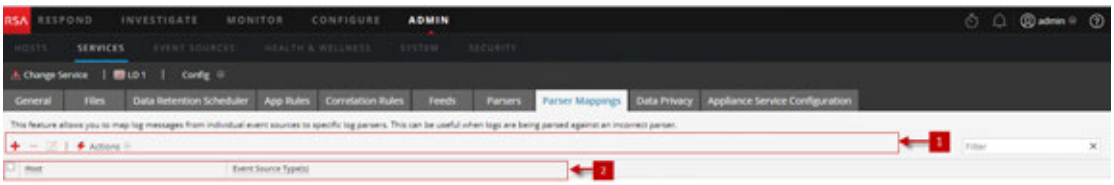
Note: The event source types are processed in the order you enter the parsers and if one or more parsers matches a log, the first parser in the list is queried. The Host/IP can be IPv4, IPv6, or Hostname.

6. Click **OK**.
   The Parser Mapping is added.
7. To cancel the parser mappings selection, click **Cancel**.

Read IP to Event Source Type Mappings

To read an IP to event source type mappings:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select  **> View > Config**.
   The Services Config view is displayed.
3. Select the **Parsers Mapping** tab.
   The mappings are displayed.



Edit an IP to Event Source Type Mapping

To edit an IP to event source type mapping:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select > **View** > **Config**.
   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to edit.
   Note: You can only edit one mapping at a time.
5. Click
6. In the **Event Source(s)** field, modify the event source(s).
   Note: The host is not editable and the field is disabled.
7. Click **OK** to accept the edited Event Source.
8. To cancel the changes, click **Cancel**.

Delete an IP to Event Source Type Mapping

To delete an IP to event source type mapping:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select > **View** > **Config**.
   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mapping you want to delete.
5. Click .
   The mapping is deleted and the grid is refreshed.
6. To cancel the changes, click **Cancel**.

Sort the Hostname or Event Source Type

To sort the hostname or event source type:

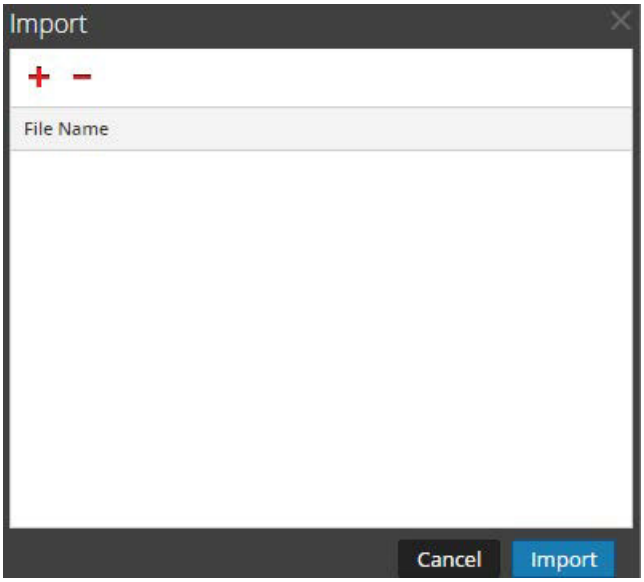
1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select > **View** > **Config**.
   The Service Config view is displayed.

3. Select the **Parser Mappings** tab.
4. To sort a column, click in the column header.
   Event Source Type(s) are applied for your selected IP address. Logs are parsed against the parsers in the order they are listed.

Import IP to Event Source Mapping Entries

To import IP to event source mapping entries:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select  **> View > Config**.
   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select **Actions > Import**.
   The Import dialog is displayed.



5. Click  .
6. Select the file you want to import and click **OK**.
7. To load the parser, click **Import**.

Note: You can only import one .csv file at a time.

Export IP to Event Source Mapping Entries

To export IP to event source mapping entries:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select > **View** > **Config**.
   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Select the mappings you want to export.
5. Select **Actions** > **Export** > **Selection**.
   The Export Selection dialog is displayed.

6. Enter the file name and click **Export**.

Search IP to Event Source Mapping Entries

To search IP to event source mapping entries:

1. Go to **ADMIN > Services**, and select a Log Decoder service.
2. In the Actions column, select > **View** > **Config**.
   The Service Config view is displayed.
3. Select the **Parser Mappings** tab.
4. In the Parsers Mappings toolbar, enter the Host or Event Source in the **Filter** field.
5. Click **Enter**.
   The Hosts or Event Sources that match the names entered in the **Filter** field are displayed.

Enable or Disable Lua and Flex Parsing Systems

This topic tells administrators how to enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder. Flex parsers are deprecated and disabled by default.

The settings to enable or disable Lua and Flex parsing systems are configured correctly by default and you do not typically have to change them. However, you may need to adjust these settings at the request of RSA Customer Care or for troubleshooting purposes.

In addition to configuring individual parsers, you can enable and disable all Lua parsing as well as all Flex parsing in the Services Explore view. You enable and disable the Lua parsing and Flex parsing systems settings separately, but they work in the same way.

- If you **disable** the Lua or Flex parsing system, the corresponding parsing system is disabled and no parsers are loaded.
- If you **enable** the Lua or Flex parsing system, the corresponding parsing system is enabled and individual parsers are enabled and disabled following the current individual configurations.

To enable or disable Lua and Flex parsing systems on a Decoder or Log Decoder:

1. Go to **ADMIN > Services.**
2. Select a Decoder or Log Decoder and  **> View > Explore.**
   The Services Explore view for the selected service is displayed.
3. In the Node list, navigate to and select **/decoder/parsers/config**.
4. In the Monitor panel:
   - To enable the Lua parsing system, in the value field for `lua.enabled`, type **yes**.
   - To disable the Lua parsing system, in the value field for `lua.enabled`, type **no**.
   - To enable the Flex parsing system, in the value field for `flex.enabled`, type **yes**.
   - To disable the Flex parsing system, in the value field for `flex.enabled`, type **no**.

Map IP Address to Service Type for Log Parsing

This topic describes the procedure to map an IP address to a service type for log parsing.

The Log Collector discovers event source type on a per-message basis. If the correct parser is not used for the specific event source, the messages that are common between event source types are misclassified. The misidentified messages will not populate service rules and alerts, and the reports will not have proper information. Also, if there are multiple services associated with an IP address, it can be difficult for the parsers to identify the exact service from which the log is generated.

If you map an IP address to its services, the log decoder can identify the service from which the log is generated. When messages come into the log decoder from a mapped service, the assigned parsers are loaded to find event matches.

You can assign service types to IPV4, IPV6 or hostname value of the event source. You can also assign multiple service types to a single IP address. You can also use the CollectorID when different service types with the same IP address are sent to different collectors.

Map an IP Address to a Service Type

To map an IP address to a service type, do the following:

1. Go to **ADMIN > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select  **> View > Explore**.
3. Go to **/decoder/parsers** node, right-click **parsers**, and select **Properties**.
4. In the **Properties** view, specify the **ipdevice** command with the following parameters: `op=add/remove entries="ipaddress=service"` (for example, `op=add entries="10.100.201.300=ciscoasa"`)
5. Click **Send**.

IPdevice Command

In the `ipdevice` command, three operations are available:

- `add`: This operation adds or updates entries in the ipdevice map. Multiple space delimited address/type pairs may be specified.
  `op=add entries="<address>=<service type>"`
- `remove`: This operation removes entries from the ipdevice map. Multiple space delimited address/type pairs may be specified.
  `op=remove entries="<address>"`
- `describe`: This operation returns the values currently in the ipdevice map.

Map an IP Address to a Time Zone

Often times logs do not fully specify timestamps and may be missing time zone information. To properly normalize such timestamps to UTC, the Log Decoder provides the ability to associate devices from a specific address (IPv4 or IPv6) or hostname to a time zone or a fixed offset.

Three time zone formats are currently accepted and are shown in the following examples:

- Olson format: America/Anguilla
- POSIX format: AST2:45ADT0:45,M4.1.6/1:45,M10.5.6/2:45
- Offset by Hours format: = -500

NetWitness Suite maps the device address (IPv4 or IPv6) or hostname to a specific time zone or offset. Event time meta that is parsed from a log that is from a mapped address and does not include an offset or time zone as part of the timestamp is adjusted to UTC according to the mapping.

To map an IP address to a time zone, do the following:

1. Go to **ADMIN > Services**.
2. In the **Services** view, select a Log Decoder, and in the **Actions** column, select  **> View > Explore**.
3. Go to **/decoder/parsers** node, right click **Parsers**, and select **Properties**.
4. In the **Properties** view, specify the `iptmzone` command with the following parameters:
   `op=add entries="ipaddress=timezone" (for example, op=add entries="10.10.10.10=Africa/Addis Ababa")`
5. Click **Send**.

iptmzone Command

In the `iptmzone` command, three operations are available:

- `add`: This operation adds or updates entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.
  `op=add entries="<address>=<time zone>"`
- `remove`: This operation removes entries in the iptmzone map. Multiple space delimited address/type pairs may be specified.
  `op=remove entries="<address>"`
- `describe`: This operation returns the values currently in the iptmzone map.

Examples

The following examples provide instances fro mapping IP addresses to time zones:

- If you want to map two different entries with different IPV4 values and time zone, enter the following parameter in the **iptmzone** command and click **Send**
  `"op=add entries=”10.10.10.10=America/Anguilla 10.10.10.11=Pacific/Rarotonga”`
- If you want to remove an entry for a single IPV4 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.

```
"op=remove entries=10.5.245.9"
```

- If you want to create a single entry for an IPV6 value and time zone, enter the following parameter in the **iptmzone** command and click **Send**.

```
op=add entries=”2001:DB8:85A3::8A2E:370:7334=America/Anguilla”
```

- If you want to create a single entry to map an IPV4, IPV6, or hostname with the Minute Offset, Olson, or POSIX format,enter the following parameter in the **iptmzone** command and click **Send**.

```
op=add entries="10.168.0.2=America/Anguilla
2001:DB8:85A3::8A2E:370:7334=0500nwappliance21=EST5EDT,M3.2.0/2
,M11.1.0"
```

Obtain Log Files a from Pre-11.0 Log Decoder

NetWitness 11.0. added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

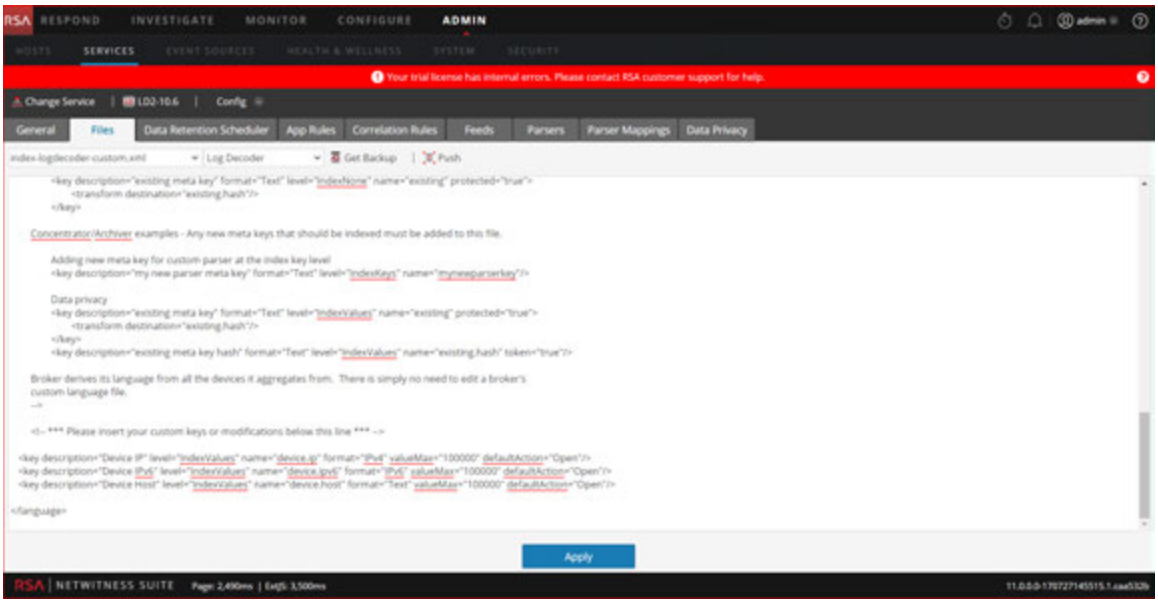
To enable logs preview for a pre-11.0 Log Decoder, follow these steps on the Log Decoder:

1. Go to **ADMIN > Services >** select a **Log Decoder**, then select **> View > Config**.
2. Click the **Files** tab and select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):

```
<key description="Device IP" level="IndexValues" name="device.ip" format="IPv4"
valueMax="100000" defaultAction="Open"/>
<key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6"
valueMax="100000" defaultAction="Open"/>
<key description="Device Host" level="IndexValues" name="device.host" format="Text"
valueMax="100000" defaultAction="Open"/>
```

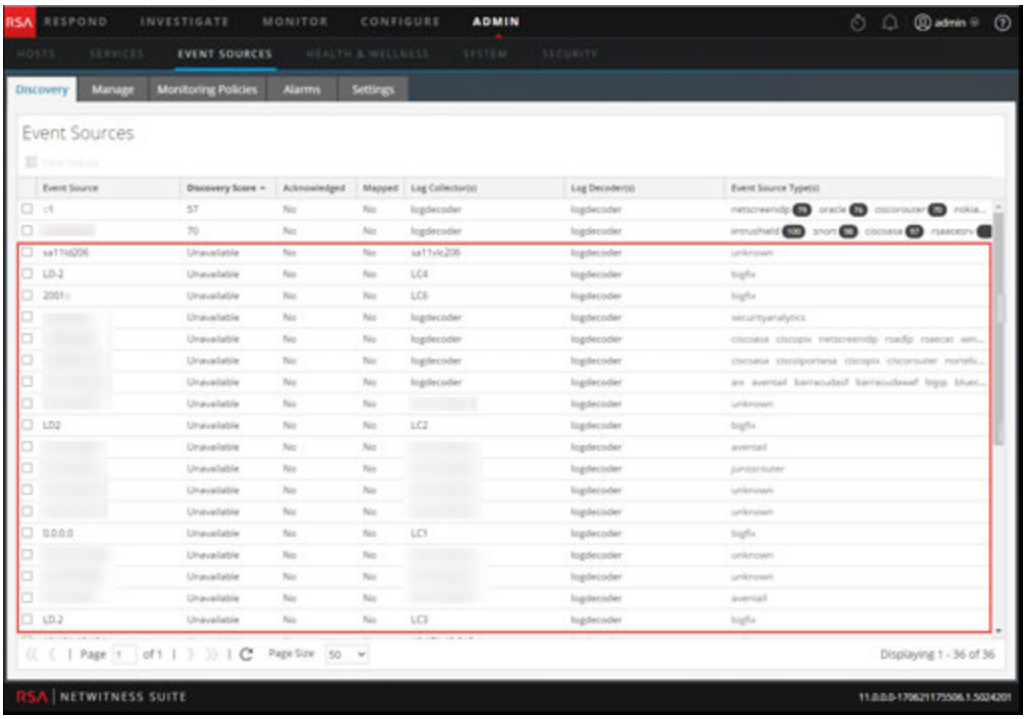
4. Click **Apply**.
5. Restart the Log Decoder service as follows.
   Select Log Decoder service **> Explore > decoder > Properties > reset**

This is an example of the **index-logdecoder-custom.xml** file.



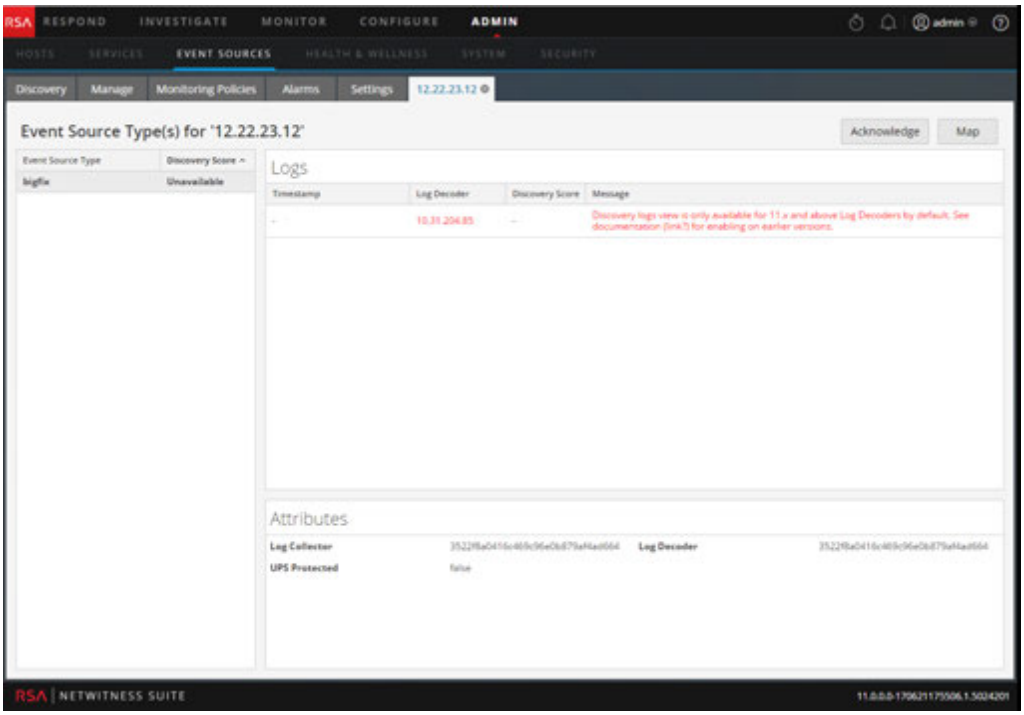
Note: Discovery Scores are only available for 11.x and above Log Decoders. Discovery Scores for pre-11.x Log Decoders are displayed as Unavailable.

The following example shows the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0 Log Decoder.



Note: Device logs are only available for 11.x and above Log Decoders.

The following example shows the message that is displayed in the Logs panel for a pre-11.0 Log Decoder.



Upload a Log File to a Log Decoder

This topic describes the method for importing a log file to a Log Decoder.

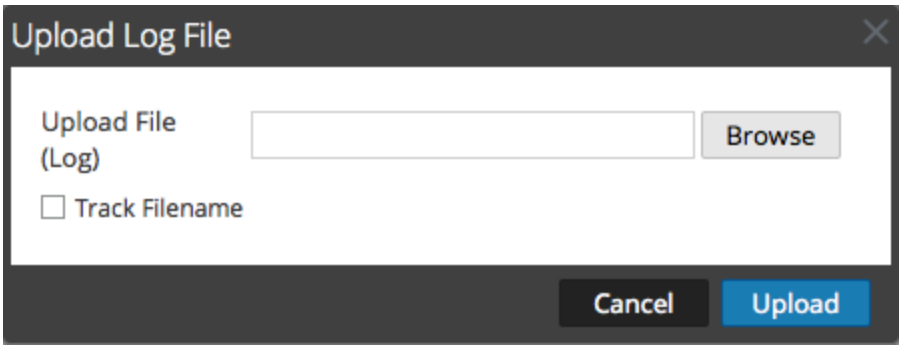
There are occasions when you want to analyze a log file that is not available on the service you are using. You can upload a log file captured on another service to NetWitness Suite. Log filenames are of the type **.log**.

When a log file is uploaded to a Log Decoder, the Log Decoder analyzes and generates meta for each log it contains. These logs are added to the already decoded logs on the Log Decoder and are available for analysis. NetWitness Suite includes a filename tracking option that makes searching for a particular set of logs easier. When the log file is uploaded with file tracking, the Log Decoder adds meta to each log based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a log file is dimmed when other Log Decoder operations prevent an upload from occurring. For example, when the Log Decoder is capturing logs.

To import a log file to an Log Decoder:

1. Go to **ADMIN > Services**.
2. Select a Log Decoder in the **Service** grid, and select > **View** > **System**.
   The Services System view for the Log Decoder is displayed.
3. In the toolbar, click **Upload Log File**.



4. To choose a log file, click **Browse**.
   A directory view is displayed.
5. Select the log file that you want to upload.
   The filename is displayed in the **Upload File** field.
6. If you want the Log Decoder to add meta to the logs based on the filename, click the checkbox next to **Track Filename**.

7. To upload the file, click **Upload**.
   The selected file is uploaded and a status message indicates that the file is uploaded. The log file is available for analysis.

Upload a Packet Capture File

There are occasions when you want to analyze a packet capture file that is not available on the service you are using. You can upload a file captured on another service to NetWitness Suite. Supported packet capture file types are `pcap` and `pcap.gz`.

When a packet capture file is uploaded to a Decoder, the Decoder creates sessions from the packet capture file packets. These sessions are added to the already decoded sessions on the Decoder and are available for analysis. NetWitness Suite includes a filename tracking option that makes searching for a particular set of sessions easier. When the packet capture file is uploaded with file tracking, the Decoder adds meta to the sessions based on the uploaded filename. You can then filter sessions for analysis using that meta.

The option to upload a packet capture file is dimmed when other Decoder operations prevent an upload from occurring; for example, when the Decoder is capturing packets.

To select and upload a packet capture file:

1. Go to **ADMIN >Services**.

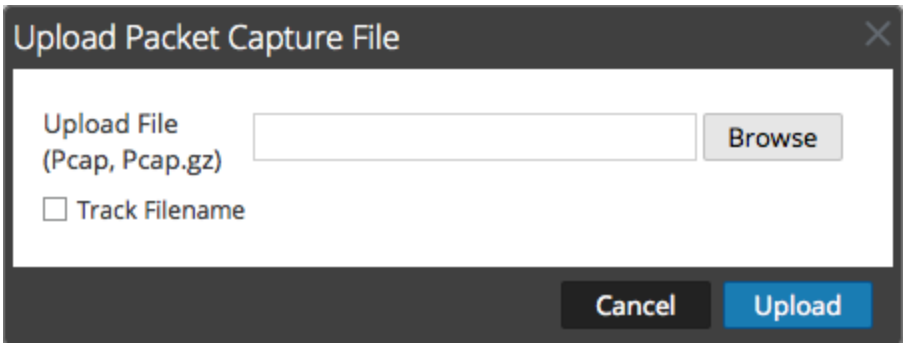
   The Administration Services view is displayed.

2. Select the Decoder name, and  **> View > System**.

   The Services System view for the Decoder is displayed.

3. In the toolbar, click **Upload Packet Capture File**.

   The **Upload Packet Capture File dialog** is displayed.



4. To choose a capture file, click **Select**.

   A directory view is displayed.

5. Browse the directory and select the packet capture file that you want to upload.

   The filename is displayed in the **Upload File(pcap,pcap.gz)** field.

6. If you want the Decoder to add meta to the sessions based on the filename, click the checkbox next to **Track Filename**.

7. To upload the file, click **Upload**.

   A progress bar shows upload progress.

   Upload time varies depending on the size of the file. When the file upload is complete, a status message is displayed. The file is now available for investigation.

Feed and Parser References

This topic provides more details about the feeds and parsers that the Decoder uses.

- Feed Definitions File
- Flex Parsers
- Geo IP Parser
- Lua Parsers
- Search Parser
- Wireless LAN Configuration

Feed Definitions File

This topic introduces the feed definitions file, which is available for editing in the Services Config view > Files tab.

One of the files available for editing in the Services Config view > Files tab is **`feed-definitions.xml`**, the feed definitions file.

feed-definitions.xml

You can define feeds in the `feed-definitions.xml` file. The Decoder uses an XML schema to define feed messages when it creates a binary .feed file from the feeds defined here.

For details on the feed definition language, refer to the NextGen System Administrator Guide.

Flex Parsers

One of the files available for editing in the Services Config view > Files tab is **NwFlex.xml**, the flex parser.

NwFlex.xml

There are two kinds of Flex parsers:

- **Service identification based solely on port.** These are parsers that use only the source or destination ports to identify the session application type (service). These are the most basic and easiest to define.
- **Service identification based on a found token(s).** These parsers use tokens to identify the service type. This is also an easy way to expand which service types are identified. These are important when identifying non -internet standard applications. These parsers require that the protocol has a definable token that can uniquely identify the service type.

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

Detailed language information and samples are provided in this topic. This topic describes the XML schema used to define a FlexParse file. The SML node, attribute, and values referenced in descriptive text are **bold**. The root node of every file must be the **parsers** node. Under that node there can be any number of parser nodes. Each parser node defines a single parser.
A parser node can have an optional **declaration** node and any number of **match** nodes.

Topics

- Nodes
- Payload Functions
- Regex
- String Functions
- Lua Parsers

Arithmetic Functions

This topic defines language for the flex parser arithmetic functions.

This topic defines language for the flex parser arithmetic functions. All numbers are 64-bit unsigned values and subject to both underflow and overflow, depending on the operation.

Language Definition

The following table provides language definitions.

Node Name	Attribute Name	Description
and		Performs bitwise AND between two numbers.
	name	Variable to AND result into.
	value	Number to AND into result.
or		Performs bitwise OR between two numbers.
	name	Variable to OR result into.
	value	Number to OR into result.
increment		Performs ADDITION of two numbers.
	name	Variable containing the initial value AND to receive ADDITION results.
	value	Number to ADD to initial value.
decrement		Performs SUBTRACTION of two numbers.
	name	Variable containing initial value AND to receive SUBTRACTION results.
	value	Number to SUBTRACT from initial value.
divide		Performs DIVISION of two numbers.

Node Name	Attribute Name	Description
	name	Variable containing the initial value AND to receive DIVISION results.
	value	Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser.
modulo		Performs MODULO of two numbers.
	name	Variable containing the initial value AND to receive MODULO results.
	value	Number by which to divide the initial value. Division by zero generates an error and stops any further processing of the current session by this parser.
multiply		Performs MULTIPLICATION of two numbers.
	name	Variable containing the initial value AND to receive MULTIPLICATION results.
	value	Number by which to MULTIPLY the initial value.
shiftleft		Performs a binary shift left.
	name	Variable containing the initial value AND to receive shift results.
	value	Number of bits to shift by.
shiftright		Performs a binary shift right.
	name	Variable containing the inital value AND to receive shift results.
	value	Number of bits to shift by.

Common Parser Operations

This topic provides some examples of common parser operations.

This topic includes five common parser operations.

Match Port and Identify Immediately

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
          <parser name="CustApp" desc="Acme Custom App" service="45324">
               <declaration>
                    <port name="port" value="45324" />
               <declaration>
               </match name="port">
                    <identify />
               </match>
          </parser>
</parsers>
```

Match Port and Delay Identification

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MSRPC" desc="Microsoft RPC protocol" service=135">
          <declaration>
               <port name="port" value="135" />
               <number name="state" scope="session" />
               <session name="end" value="end" />
          </declaration>
          <match name="port">
               <assign name="state" value="1" />
          </match>
          <match name="end">
```

```
            <if name="state" equal="1" />
                 <identify />
            </if>
        </match>
    </parser>
</parsers>
```

Match Token and Identify Immediately

```
<?xml version="1.0" encoding="utf-8?>
<parsers
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="RDP" desc="Remote Desktop Protocol" service="3389">
          <declaration>
               <token name="signature" value="Cookie: mstshash=" />
          </declaration>
          <match name="signature">
               <identify />
          </match>
     </parser>
</parsers>
```

Match Multiple Tokens

```
<?xml version="1.0" encoding="utf-8"?>
<parsers
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="MyServiceMultiToken" desc="Multiple Tokens"
     service="333">
          <declaration>
               <number name="state" scope="stream" />
               <token name="user" value="USER " />
               <token name="pass" value="PASS " />
               <session name="session" value="end" />
          </declaration>
```

```
          <match name="user">
               <or name="state" value="1" />
          </match>
          <match name="pass">
               <or name="state" value="2" />
          </match>
          <match name="session">
               <if name="state" equal="3">
                    <identify />
               </if>
          </match>
     </parser>
</parsers>
```

Match Token and Create Metadata

```
<?xml version="1.0" encoding="utf-8"?>
<parsers xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="parsers.xsd">
     <parser name="SHELL" desc="Command Shell Identification">
          <declaration>
               <token name="cmd.exe" value=" (C) Copyright 1985-2001
               Microsoft Corp" options="linestart" />
               <meta name="client" key="client" format="Text" />
          </declaration>
          <match name="cmd.exe"
               <register  name="client" value="MS Command Shell" />
          </match>
     </parser>
</parsers>
```

General Functions

This topic defines language for the flex parser general functions.

General Functions Language Definition

Node Name	Attribute Name	Description
apptype		Gets the currently defined service type for the current session.
	name	A number variable to receive the current service type.
identify		Marks the session with the parser's service type if the service type has not already been identified.
assign		Assigns a value to a variable.
	name	The unique identifier assigned to the item in the declaration section.
	value	Optional. If specified, the action defined in the match is only applied when the declaration matches the given value.
getmeta		Retrieves the value of meta that generated a callback. This function will return empty results (0, zero length string) if called when there was no meta callback.
	name	The variable to receive the value of the meta that generated the callback.OK.
gettoken		Returns the current matched token.
	name	A string variable to receive the current matched token. If there is no current token, the variable is assigned an empty string.
end		This terminates the execution of the current **match** section.

Node Name	Attribute Name	Description
if		Compares two values. If the comparison is true, executes any sub-actions. Comparisons can be **number** or **string** types, as long as both values are the same type.
	name	The unique variable identifier assigned to the item in the **declaration** section.
	equal notequal less lessequal greater greaterequal and or	The operation value to compare. If true, any sub-actions are executed.
register		Adds metadata to the session.
	name	The unique identifier of a meta variable to be created, as defined in the **declaration** section.
	value	The value of the metadata to be created.
while		Compares two values and executes any sub-actions if the comparison is true. Comparisons can be **number** or **string** types, as long as both values are the same type.
	name	The unique variable identifier assigned to the item in the declaration section.

Node Name	Attribute Name	Description
	equal notequal less lessequal greater greaterequal and or	Specifies the operation value to compare. If true, any sub-action is executed. The **and** and **or** attributes signify bitwise operations and can only be applied to **number** variables.
call		Execute the specified **match** element. This can be any match element defined in the same flex parser regardless of how it was declared.
	value	The name of the match element, or a string variable containing the name of a match element. • If the match element name is specified, the parser will not load if the named matched element doesn't exist. • If a string variable is specified, the **call** element will execute any child elements that it may have if the string value resolves to a match element after executing the named match element. • If no **match** element can be found matching the string value, no action is taken.

Logging Functions

This topic defines language for the flex parser logging functions.

Logging functions provide a means for a flex parser to write to the system log. Logging functions can be extremely useful when creating a new flex parser, but should be kept to an absolute minimum when a flex parser is deployed to a production system.

Language Definition

Node Name	Attribute Name	Description
`failure`		Logs a message to the system log with the log level **Failure.**
	`value`	A string to include as the log message.
`warning`		Logs a message to the system log with the log level **Warning.**
	`value`	A string to include as the log message.
`info`		Logs a message to the system log with the log level **Info**.
	`value`	A string to include as the log message.
`debug`		Logs a message to the system log with the log level **Debug.**
	`value`	A string to include as the log message.

Nodes

This topic defines language for the flex parser nodes.

Nodes Language Definition

Node Name	Attribute Name	Description
`parsers`		The root node in each definition file.
	`xmins:xsi`	Defines the namespace to use for the schema inclusion. This attribute is not required; however, language definition is not possible without it. This node must have the following value: http://www.w3.org/2001/XMLSchema-instance
	`xsi:noNamespaceSchemaLocation`	Defines the XSD schema validation file used to validate the language definition. This attribute is not required; however, language definition is not possible without it. This node must have the following value: parsers.xsd
`parser`		The node that defines a single parser definition. This node must be directly under the `parsers` node. There can be more than one per file.

Node Name	Attribute Name	Description
	name	The name that uniquely identifies the parser. This name should be short and succinct. This is used by the system to allow enabling and disabling. It should contain only the letters [a-z] and [A-Z].
	desc	This node provides a friendly description of what the parser does.
	service	This is the unique number assigned to the session when identified.
declaration		The node that delineates the definition. Each of these definitions can have an associated match entry.
token		Specifies a definition for identifying a token somewhere in the session protocol. This defines a match callback when the specified tokens are encountered in a session payload. The read position is set to the byte immediately following the matched token.
	name	This is a unique identifier for the declaration.
	value	This is the exact token value to be identified.

Node Name	Attribute Name	Description
	options	Options specify that the token should start on a new line or at an end of a line (linestart or linestop).
meta-callback		Registers a callback for the flex parser whenever meta of a specific format is created. This can be further qualified to generate callbacks only for sessions that have been identified as a specific apptype (e.g. 80 for http).
	name	Name of the match element to be executed when a callback occurs. (String)
	key	Name of the meta key that generates callbacks. (String)
	format	The data type of the meta key that will generate the meta.
	apptype	The meta callback is only generated if the session being parsed has been identified with the specified apptype. (Unsigned Integer, Optional)
number		Defines a numeric variable that can be referenced elsewhere within the parser definition. All numeric values are 64-bit unsigned values.

Node Name	Attribute Name	Description
	`name`	This is a unique identifier for the declaration.
	`scope` (optional)	Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
`string`		Defines a numeric variable that can be referenced elsewhere within the parser definition.
	`name`	This is a unique identifier for the declaration.
	`scope` (optional)	Specifies when to reset the variable. This can either be for each side of a two-sided session or only after a new session is detected. The possible values are **`global`**, **`constant`**, **`stream`**, and `session` (default).
port		Defines a **match** callback when a session is encountered using the specified port. The **read** position is set to the first byte of the first stream (client) in the session.
	`name`	This is a unique identifier for the declaration.

Node Name	Attribute Name	Description
	value	This is the port number to identify.
session		Defines a match callback for session begin/end events. These events only occur if a token for the parser is encountered in the session.
	name	This is a unique identifier for the declaration.
	value	Specifies that processing takes place at the beginning of a new session or at the end of a session (begin or end).
stream		Defines a match callback for stream begin/end events. These events only occur if a token for the parser is encountered in the stream.
	name	This is a unique identifier for the declaration
	value	Specifies that processing takes place at the beginning or at the end of a stream (begin or end).
function		Defines a match section that can be used as a generic function. No callbacks are associated with this declaration.
	name	This is a unique identifier for the declaration.

Node Name	Attribute Name	Description
meta		Defines the type of data that the parser will create.
	key	Specifies the key name. The key needs to be 1-16 bytes in size.
	format	Specifies the variant type (for example, **Text**, **IPv4**, **UInt32**). Refer to the SDK documentation for a full list.
pattern		Defines a regular expression variable for use by the regex function
	name	This is a unique identifier for the declaration.
	scope (optional)	Specifies when to reset the variable. This can be for each side of a two-sided session or only after a new session is detected. Possible values are **global**, **constant**, **stream**, and session (default).
	value (optional)	Specifies a regular expression to assign to the pattern variable. This attribute is only valid when the **scope attribute** is set to constant.

Node Name	Attribute Name	Description
match		The possible entries for taking an action once a match criterion has been found for a declaration. These nodes can be nested to provide deeper logic. There are several categories of execution elements (functions) that can appear as children of a match element: • General • Arithmetic • String • Payload

Payload Functions

This topic defines language for the flex parser payload functions.

These functions operate on a `read` position, set at the beginning of a `match` element.

Language Definition

Node Name	Attribute Name	Description
`find`		Searches the stream payload starting at the read position for a provided string value. If the value is found, the offset from the read position is returned. Any child elements will then execute. If not found, any child elements will not execute.
	`name`	A `number` variable to receive the offset from the `read` position where the match begins.
	`value`	A string to find.
	`length` (optional)	A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance.
`install-decoder`		To enable tokens to match on payload data that may be fragmented or otherwise encoded. A scan decoder can be installed to preprocess a section of the payload before it is scanned for tokens. An example would be an HTTP response that uses the chunked transfer encoding with gzip content encoding. By parsing the HTTP header, the necessary type, offset, and length parameters can all be set, after which the HTTP response payload would appear to the token scanning as if neither encoding had been applied. However, this incurs significant overhead.

Node Name	Attribute Name	Description
	type	The type of decoder to install. Valid options are: gzip, deflate, chunked, chunked-gzip, chunked-deflate.
	offset	Offset from the current read position to begin decoding.
	length	The maximum payload length to decode.
isdecoding		Tests whether an installed decoder is currently active. If so, any children of this function will execute. This function has no parameters.
move		Moves the read position forward in the current stream by a specified number of bytes. If there is sufficient data in the stream, the read position is updated and any child elements will then execute. If not found, the read position remains unchanged and any child elements will not execute.
	value	The number of bytes to move the read position.
	direction (optional)	The direction to move the current read position. Can be forward (default) or **reverse.**
packetid		Returns the id of the packet for the current read position. It is possible for the result to be 0, which indicates that the packet id could not be determined.
	name	A number variable to receive the current packet id.
payload-position		Returns the current read position. This is a zero based index into the stream payload.
	name	A number variable to receive the current read position.

Node Name	Attribute Name	Description
`read`		Reads a specified number of bytes starting at the `read` position into a variable. If there is sufficient data in the stream, the `read` position is updated, the data read assigned, and any child elements will then execute. If not found, the `read` position remains unchanged and any child elements will not execute.
	`name`	The name of a `string` or `number` variable to receive stream data. If a `number` variable is provided, the bytes read are interpreted as a single unsigned numeric value.
	`length`	The number of bytes to read from a stream.
	`endianess` (optional)	The byte ordering to use when reading into a number variable. Can be `big` (default) or `little`. The attribute is invalid when reading into a `string` variable.

Regex

This topic defines language for the flex parser regex node.

Regex searches the stream payload starting at the `read` position for matches to a provided regular expression. If matches are found, the offset from the `read` position and, optionally the matched string, is returned. Any child elements execute. If no matches are found, child elements do not execute.

Language Definition

Attribute Name	Description
`name`	A `number` variable to receive the offset from the `read` position where the match begins.
`value`	A regular expression to find.
`length` (optional)	A limit to the length of the payload to be searched. If a limit is not provided, the remainder of the payload is searched. It is recommended to always use the smallest value possible here in order to reduce the effect on performance.
`found` (optional)	The name of a `string` variable to receive a matched string.

String Functions

This topic provides language definitions for the flex parser string functions.

String Functions Language Definition

Node Name	Attribute Name	Description
`append`		Attaches a number or string to the end of a `string` variable.
	`name`	The unique identifier of a string variable to which the specified value is to be attached.
	`value`	A number or string to attach.
`find`		Searches a string for a provided string value. If it is found, the position is returned and any child elements will execute. Otherwise, child elements will not execute.
	`name`	A `number` variable to receive the zero-based position, where the provided value string was found in the **in** string.
	`value`	A string to find.
	`in`	A string to search.
	`length` (optional)	A limit to the length of the **in** string to be searched. If a limit is not provided, all of **in** will be searched.
`length`		Assigns the length of a string to a `number` variable.
	`name`	A `number` variable to receive the length of the specified string.

Node Name	Attribute Name	Description
	value	A string value whose length is to be determined.
regex		Searches a string for matches to the provided regular expression. If a match is found, the position and, optionally, the matching string is returned. Any child elements will then execute. If not found, any child elements will not execute. Regular expression operations can adversely affect system performance.
	name	A number variable to receive the zero-based position, where the provided regular expression matched in the in string.
	value	A regular expression to be searched for.
	in	A string to search.
	length (optional)	A limit to the length of the in string to be searched. If a limit is not provided, all of **in** will be searched.
	found (optional)	The name of a string variable to receive the matched string.
substring		At least one of the optional attributes from and length must be specified.
	name	The unique identifier of a string variable to receive the extracted value.
	value	A string value from which to extract a substring.
	from (optional)	The zero-based position from which to begin the substring. If not specified, it defaults to zero.

Node Name	Attribute Name	Description
	length (optional)	The number of characters to extract. If not specified, it defaults to the remaining length of the string.
tolower		Converts a string to all lowercase letters.
	name	The name of a string variable to process.
toupper		Converts a string to all uppercase letters.
	name	The name of a string variable to process.
urldecode		Decode a string containing url-encoded characters.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.
base64decode		Decodes a base-64 encoded string.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.
uudecode		Decode a uuencoded string.
	name	A string variable to receive the decoded string.
	value	A uuencoded string. The header and trailing lines should not be included.
quotedprintabledecode		Decode a Quoted-printable encoded string.
	name	A string variable to receive the decoded string.
	value	A quoted-printable encoded string.

Node Name	Attribute Name	Description
convert-ebcdic		Convert an EBCDIC string to its ASCII equivalent.
	name	A string variable to receive the decoded string.
	value	A url-encoded string to decode.

Geo IP Parser

This topic introduces the Geo IP parser for Decoders.

One of the files available for editing in the Services Config view > Files tab is **GeoPrivate.ipl**, the Geo IP parser.

GeoPrivate.ipl

The Geo IP parser is a fixed parser that takes IP addresses and converts them to geographical locations. The locations are displayed through the Google Earth display.

The geolocation metadata in GeoPrivate.ipl, are added for both **ip.src** and ip.dst. The parser uses two external data files, **GeoCity.dat** and GeoCountry.dat, which are both stored in the application directory. There are up to eight metadata for each IP address as listed in the table below.

Metadata	Description
city.dst	Destination City
city.src	Source City
country.dst	Destination Country
country.src	Source Country
latdec.dst	Destination Decimal Latitude
latdec.src	Source Decimal Latitude
longdec.dst	Destination Decimal Longitude
longdec.src	Source Decimal Longitude

Lua Parsers

One of the files available for editing in the Services Config view > Files tab is **`NwLua.xml`**, the Lua parser.

List of Lua Parsers

There are a number of Lua parsers available from Live. See RSA Content for:

- A complete list of these parsers
- Their interdependencies
- The Flex parsers that are subsumed by each Lua parser.

Five common parser operations are:

- Match Port and Identify Immediately
- Match Port and Delay Identification
- Match Token and Identify Immediately
- Match Multiple Tokens
- Match Token and Create Metadata

Search Parser

This topic explains how to configure a custom parser used on a Decoder to generate metadata by scanning for pre -defined keywords and regular expressions in the Services Config view > Files tab.

One of the files available for editing in the Services Config view > Files tab is **search.ini**, the search parser.

search.ini

The Search Parser is a custom parser used to generate metadata by scanning for pre -defined keywords and regular expressions. The parser searches the payload of a reconstructed session for string matches and can execute a regular expression search. You can configure the parser by editing the search.ini file.

Caution: The search parser can have a significant impact on system performance. It is important that both the search mechanism and the data to which it is applied to be well understood before creating new search definitions and enabling the search parser.

The search definition is used across all protocols. There are three basic search methods:

- Keyword: Search a stream for a specific set of words
- Pattern: Search a stream for a regular expression match
- Keyword + Pattern: Search a stream for a regular expression if it contains any of a given set of keywords.

For a detailed explanation, see Search Parser in the search.ini Search String Syntax.

search.ini Search String Syntax

This topic introduces search methods and syntax for use in Search parser.

The Search parser uses three basic search methods:

- Keyword: Search a stream for a specific set of words.
- Pattern: Search a stream for a regular expression match.
- Keyword+Pattern: Search a stream for a regular expression if it contains any of a given set of key words.

Syntax

```
Maxrecon=<max_size>Maxsearch=<max_ssearch_length>MatchLimit=<max_
matches_per_stream
Search Name
Services=<service_id_list>Keywords=<keyword_
list>|Pattern=<expression>Case=0|1
Proximity=<number_of_bytes>Recon=0|1
Raw=0|1
```

Parameters

Parameters used in this command:

Parameter	Description
`autocheck`	Automatically fixes all problems without prompting
`header Only`	Check/display the header of each file
`chatty`	Displays a hex dump of every object in the file (huge amount of data)
`dump#-#`	Indicates a zero-based object or range of objects in the file to output in hex to the console

Example

Following is an example of the command:

To check all NetWitness database files located in the Collection named Default. If any problems are found, the command will describe the problem and ask if you would like to fix it.

```
dbcheck C:\Documents and Settings\User\My Documents\NetWitness\
Investigations\Default\*.nw*
```

Wireless LAN Configuration

This topic introduces the wireless LAN configuration file for Decoders, which is in the Services Config view > Files tab.

wlan-config.xml

One of the files available for editing in the Services Config view > Files tab is **`wlan-config.xml`**, the wireless LAN configuration file.

It controls the 802.11 parsers. Its chief purpose is to control decryption of raw 802.11 frames captured by the Decoder. This file is optional. If decryption of 802.11 traffic is not desired, there is no need to create the file.

There are five link-level parsers related to wireless LAN packet capture:

- IEEE 802.11 parser (data frames and beacons only)
- Radiotap w/ 802.11 header
- Absolute Value Systems (AVS) w/ 802.11 header
- Prism II w/ 802.11 header
- CACE's "Per Packet Information" (PPI) w/ 802.11 header

The 802.11 wireless parsers introduced in 9.8 all share a single configuration file. This wlan - config.xml file is used to define any wireless access points the user may have in the network, and its primary purpose is to control decryption. The BSSID of the access point and the SSID that it's authoritative for is added to this file as well as all of the active default keys used by the access point.

Decoder and Log Decoder References

This is a collection of references, which provide information about the user interface for Decoders and Log Decoders in NetWitness Suite, with references to the procedures that describe the work you can do in that part of the user interface. These topics are presented in alphabetical order.

Topics

Services Config View - Data Privacy Tab

In the Data Privacy tab (**ADMIN > Services > Select a Decoder or Log Decoder >**  **> Config > Data Privacy tab)**, Administrators can configure data privacy parameters for certain Core services. For the Decoder and Log Decoder, you can set the default hash algorithm and salt.

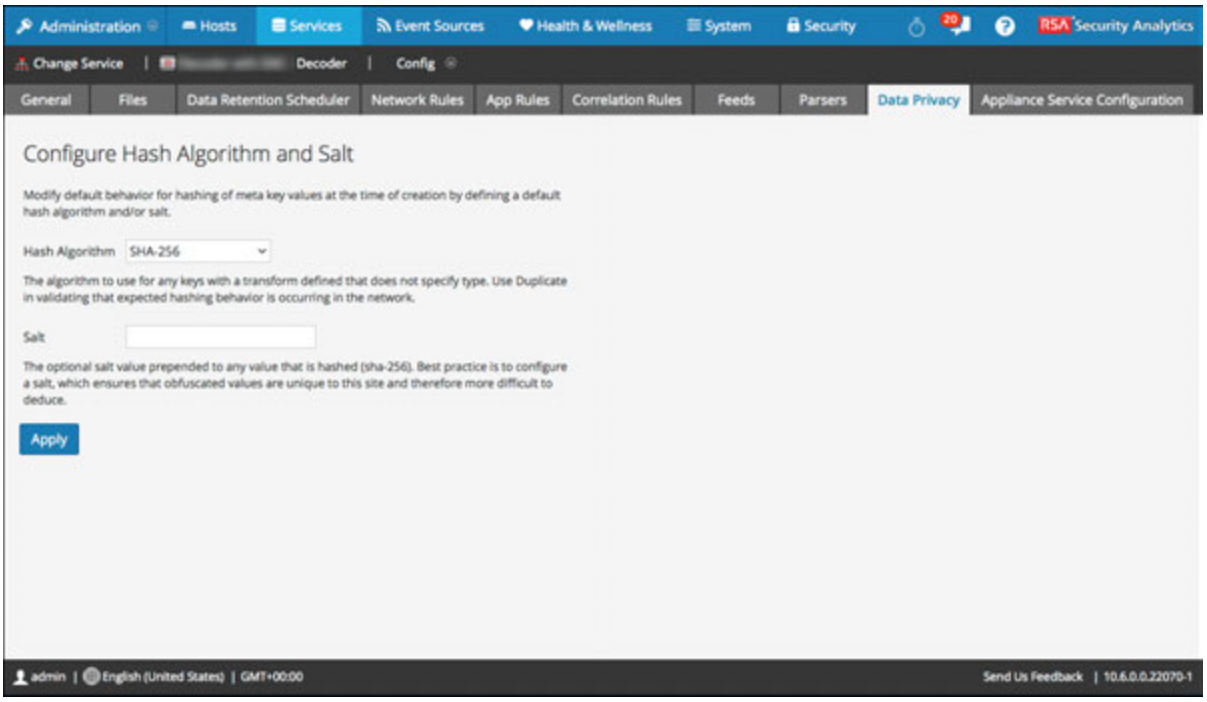
What do you want to do?

User Role	I want to ...	Documentation
Administrator	configure hash algorithm and salt	"Configure the Hash Algorithm and Salt" in the *Data Privacy Management Guide*. (Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.)

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

Quick Look



The Data Privacy tab has the Configure Hash Algorithm and Salt configuration settings. The following table describes the parameters in this tab.

Parameter	Description
Hash Algorithm	Displays a drop-down list of hash algorithms to use for any keys with a transform that does not specify algorithm type. Possible values are SHA-256 and Duplicate. Duplicate is a special algorithm available for administrators to use when validating that expected hashing behavior is occurring in the network. In versions of NetWitness Suite prior to 10.5, SHA-1 was available as a hash algorithm, but RSA does not recommend use of SHA-1.
Salt	Indicates the optional salt value prepended to any value that is hashed. Best practices for security purposes dictate a salt value that is no less than 100 bits or 16 characters in length. Configuring a value ensures that obfuscated values are unique to this site and therefore more difficult to deduce. For more information on this field, see "Configure Data Obfuscation" in the *Data Privacy Management* guide.

Parameter	Description
Apply	Applies any changes.

Services Config View - Data Retention Scheduler

In the Services Config View Data Retention Scheduler tab, you can set the rollover criteria for removing database records from primary storage using an age-based threshold. You can also schedule the timing to check whether the threshold is reached.

To access the Data Retention Scheduler tab, go to ADMIN > Services > select a Decoder or Log Decoder service and click > View > Config > Data Retention tab.

What do you want to do?

User Role	I want to...	Documentation
Administrator	Schedule the timing to see if the threshold is reached.	Configure Transaction Handling on a Decoder

Related Topics

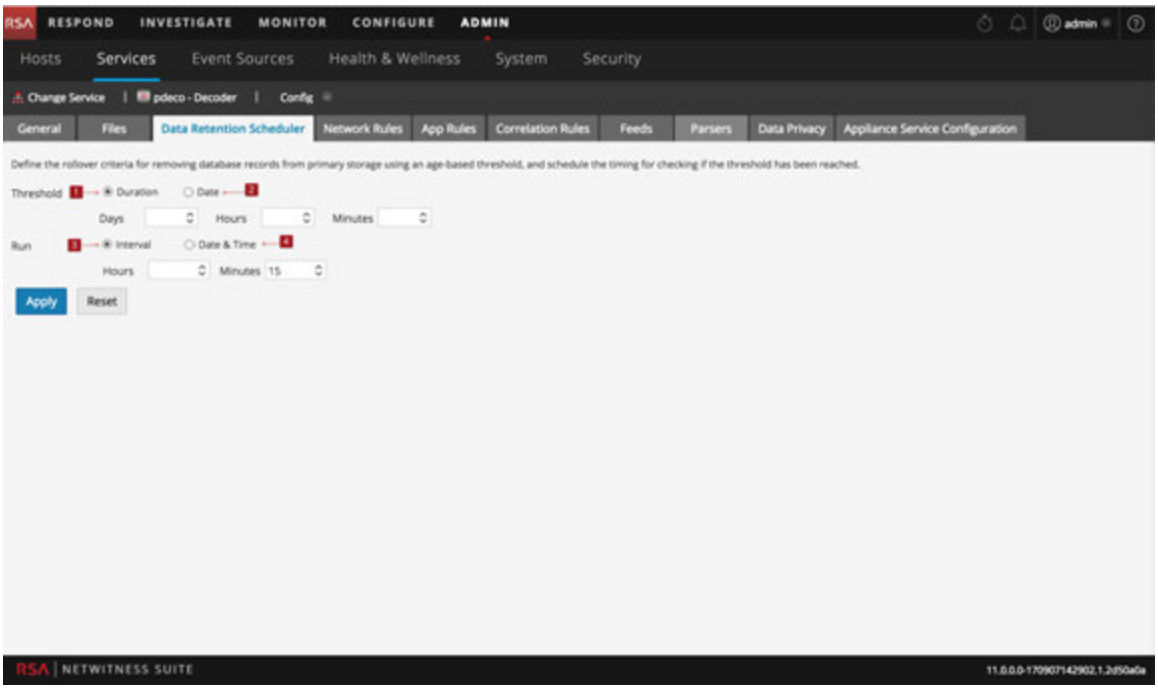
Quick Look

This is an example of the Data Retention Scheduler tab.



1	**Threshold Duration**: Removes database files older than the selected number of days, minutes, or hours.
2	**Threshold Date**: Removes database files older than the selected UTC date (YYYY-MM-DD-HH:MM:SS) that are not compatible with minutes, hours, or days parameters.
3	**Run Interval**: Indicates the number of hours between executions.
4	**Run Date and Time**: Defines which days of the week to execute the scheduler, as well as time of execution in HH:MM:SS format for the local time of the service.

Services Config View - Feeds Tab

Feeds and parsers are Lua programs loaded and compiled when either processing capture files in Investigation or capturing data with Decoders. Most commonly, they are used for static meta extraction and service identification.

Note: Pre-11.0 versions of NetWitness used FLEXPARSE programs in addition to Lua programs; Flexparsers are deprecated in NetWitness Suite 11.0. Unless otherwise stated, any reference to Decoders applies to Log Decoders as well.

NetWitness Suite uses feeds to create metadata based on externally defined meta values. A feed is a list of data that is compared to sessions as they are captured or processed. For each hit, additional metadata is created. This data can identify and classify malicious IPs or incorporate additional information such as department and location based on internal network assignments. Some examples of feeds include threat feeds to identify BOTNets, DHCP mappings, or even active directory information such as physical location or logical department.

Feeds can be added, removed, and updated while a Decoder is running without affecting capture. The Feeds tab (**ADMIN > Services >** select a service and click **> View > Config > Feeds tab**) provides a user interface for managing feeds on Decoders.

What do you want to do?

User Role	I want to...	Documentation
Administrator	configure feeds	Configure Feeds and Parsers
Administrator	enable and disable parsers	Enable and Disable Parsers and Log Parsers

Related Topics

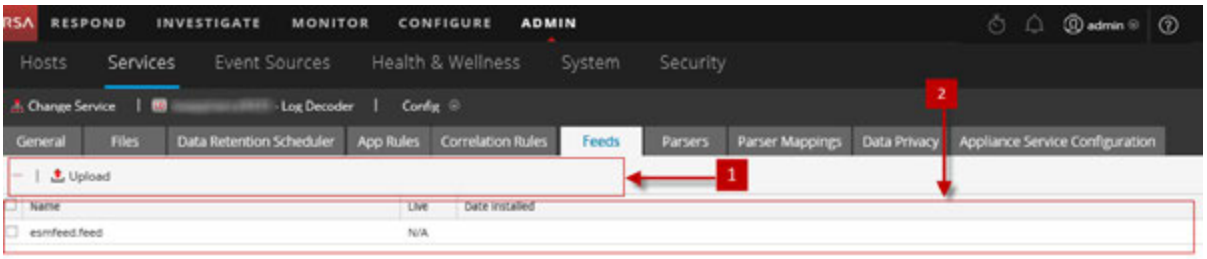
Quick Look

This is an example of the Feeds tab.



1 Feeds Tab Toolbar - Provides options to work with feeds in the grid

2 Feed Grid - Lists all feeds that are currently deployed on the Decoder

Feeds Tab Toolbar

Feature	Description
Upload	Displays the Upload Feeds dialog.
−	Deletes the selected feeds.

Feeds List

The Feeds list provides a listing of all currently deployed feeds for the Decoder.

Column	Description
Name	The name of the feed or the feed file.
Live	Indicates if the feed originated from Live. Possible values are **Yes**, **No**, or **N/A**. • **Yes** = Installed through Live • **No** = Installed through NetWitness Suite • **N/A** = The feed has no attributes file created by NetWitness Suite to track the installation date. The feed may have been installed manually, not through NetWitness Suite or Live Services. Manually installed feeds still function properly.
Date Installed	The date the feed was pushed to the service.

Upload Feeds Dialog

This topic describes the features of the Upload Feeds dialog in the Services Config view > Feeds tab.

The **Upload** option in the Services Config view > Feeds tab displays the Upload Feeds Dialog, in which you can manage the uploading of feeds to a Decoder or Log Decoder.

What do you want to do?

User Role	I want to...	Documentation
Administrator	prepare a list of feeds for upload	Edit, Upload, or Remove a Feed
Administrator	view and delete upload jobs	Edit, Upload, or Remove a Feed

Related Topics

- Decoder and Log Decoder Quick Setup

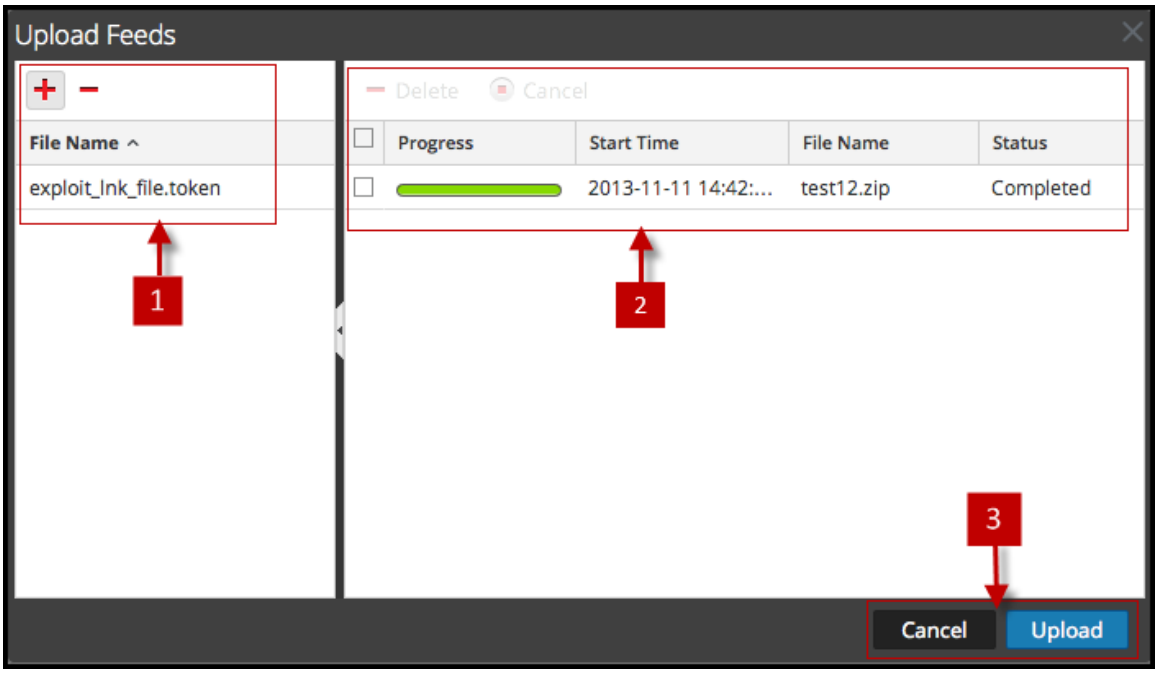
Quick Look

This is an example of the Upload Feeds dialog.



1 File List - Provides place to prepare a list of feeds for uploading

2 Upload Job List - Provides a view of upload jobs

3 Upload Feeds Dialog Buttons

File List

The File List is the place to prepare a list of feeds for uploading. You can add files from a directory structure, and delete files from the grid if you decide that you don't want to upload a particular file. When the list is ready, clicking **Upload** starts the upload process.

Feature	Description
+	Opens a view of the directory structure where you can select files to add to the File list.
−	Deletes the selected files from the File list.
File Name	Lists the feed files you have added from a file system in preparation for uploading to a Decoder. When you click **Upload**, the files listed here are uploaded.

Upload Job List

The Upload Job list provides a view of upload jobs started by clicking **Upload**.

Feature/Column	Description
Delete	Deletes an upload job.
Progress	Displays progress of an upload job.
Start Time	Displays the start time of an upload job.
File Name	Lists filename of the feed being uploaded.
Status	Displays the status of upload job.

Upload Feeds Dialog Buttons

Feature	Description
Cancel	Closes the Upload Feed dialog.
Upload	Starts uploading the feed files listed in the File list. Each feed is listed in a separate row in the Upload Process list.

Services Config View - Files Tab

The Decoder and Log Decoder configuration files are visible and editable in the Services Config view > Files tab. "Edit Core Services Configuration Files" in the *Hosts and Services Getting Started Guide* provides general instructions for editing files. (Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.)

Like other Core services, both the Decoder and Log Decoder have an index file, and may also have a crashreporter, netwitness, and scheduler. The Decoder and Log Decoder index files are named **`index-decoder-custom.xml`** and **`index-logdecoder-custom.xml`**.

Note: This file type is available only for Log Decoder with Envision content installed. `Table-map.xml` and `table-map-custom.xml` will now show up but only if `table-map.xml` was found on the file system (for example, it is a log decoder with envision content installed).

What do you want to do?

User Role	I want to...	Documentation
Administrator	obtain log files from pre-11.0 Log Decoder	Obtain Log Files a from Pre-11.0 Log Decoder
Administrator	edit files and parsers	Feed and Parser References

Related Topics

Quick Look

Filename	Description
`GeoPrivate.ipl`	This fixed parser takes the IP addresses and converts them to geographical locations. The locations are displayed through the Google Earth display.

Filename	Description
`feed-definitions.xml`	Used to create custom feeds, this is the XML schema used by the Decoder to define a **feed** message when it creates a **.feed** file.
`traffic_flow_options.lua`	Used to provide directionality information. Update this file with environment-specific internal and external subnets for the Lua parser to create proper directionality in metadata. The parser is described in RSA Content for RSA NetWitness Suite.
`search.ini`	This is the Search Parser configuration file. The Search Parser is a custom parser, used to generate metadata by scanning for pre-defined keywords and regular expressions.
`wlan-config.xml`	This is the wireless LAN configuration file (9/9/2009). This file controls the 802.11 parsers. Its chief purpose is to control decryption of raw 802.11 frames captured by the Decoder.

Services Config View - General Tab

The General tab for a Decoder in the Services Config view provides a way to manage basic service configuration, configure data capture, and select the parsers that are applied to the captured data. To access the General tab, go to **ADMIN > Services >** select a Decoder or Log Decoder and click > **View > Config > General tab**.

Workflow

The following figure depicts common Decoder configuration tasks with the steps you can complete in this view highlighted.

What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings*	Configure Capture Settings
Administrator	manage parsers and log parsers*	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture	Start and Stop Data Capture
Administrator	configure rules	Configure Decoder Rules

*You can complete these tasks here.

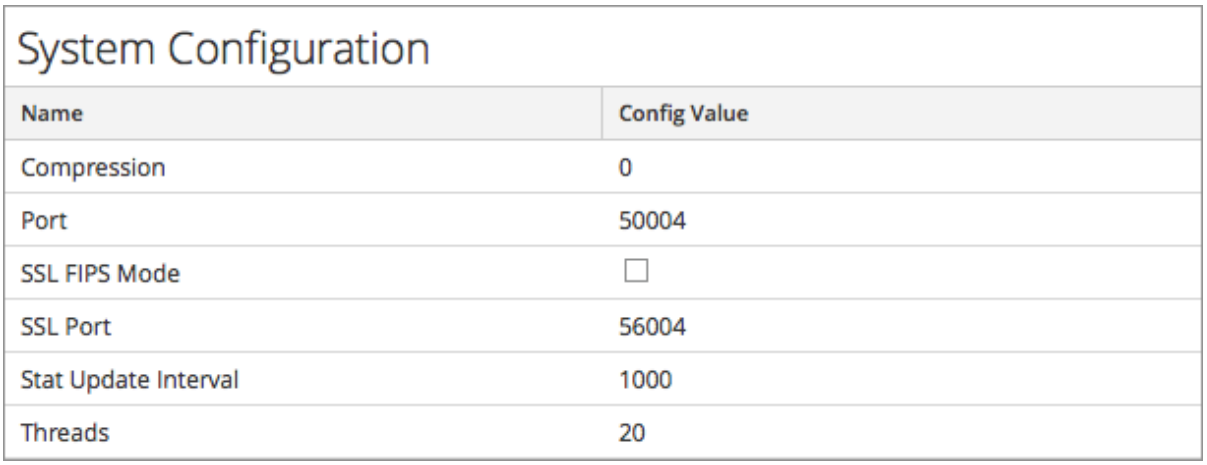
1. System Configuration - Manages service configuration for a Decoder.
2. Decoder Configuration or Log Decoder Configuration - Lets you view and edit service configuration parameters for a Decoder or Log Decoder.
3. Parsers Configuration - Lets you select parsers to use on the Decoder.
4. Service Parsers Configuration (Log Decoders only) - Lets you select service parsers to use on the Log Decoder.

System Configuration Section

The System Configuration section manages service configuration for a Decoder. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.



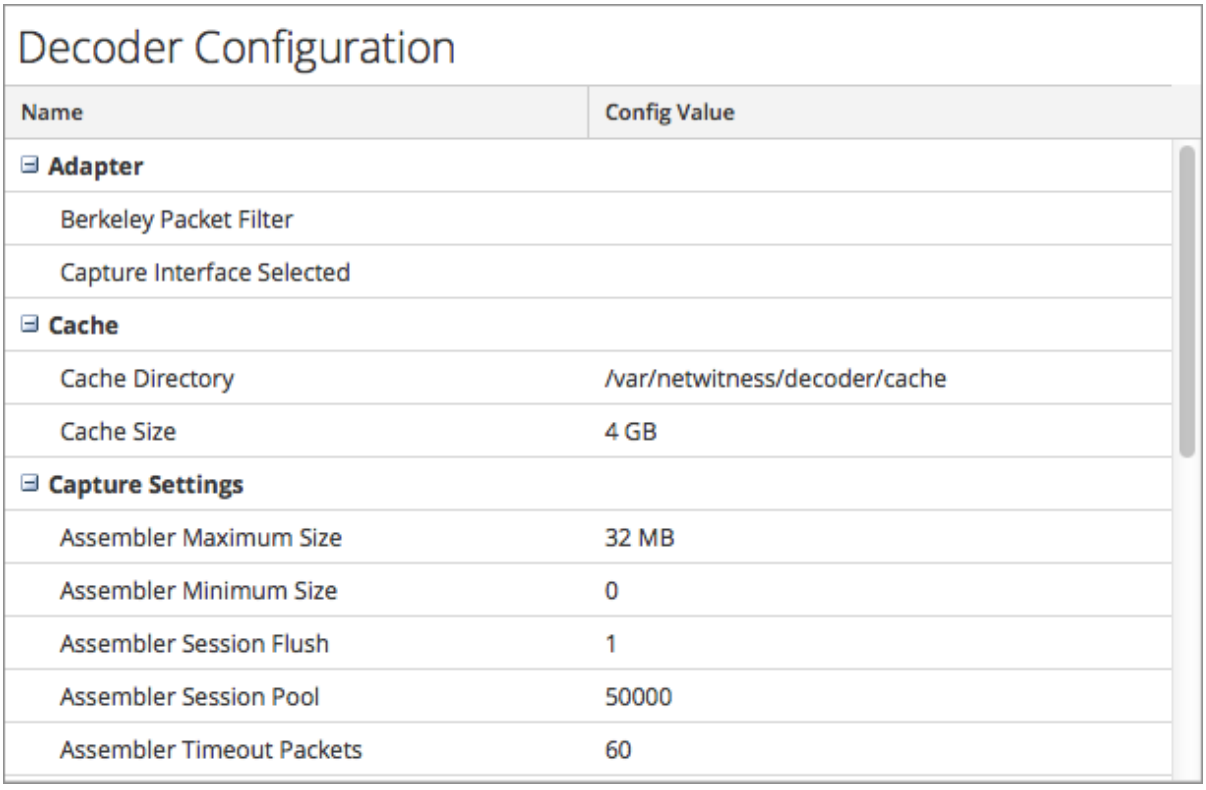
The System Configuration section has these parameters.

Parameter	Description
Compression	The minimum number of bytes that must be transmitted per response before compression. A setting of 0 disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL FIPS mode	If enabled, all the data transferred in the network will be encrypted using SSL.
SSL Port	Indicates the port used for encrypting using SSL.

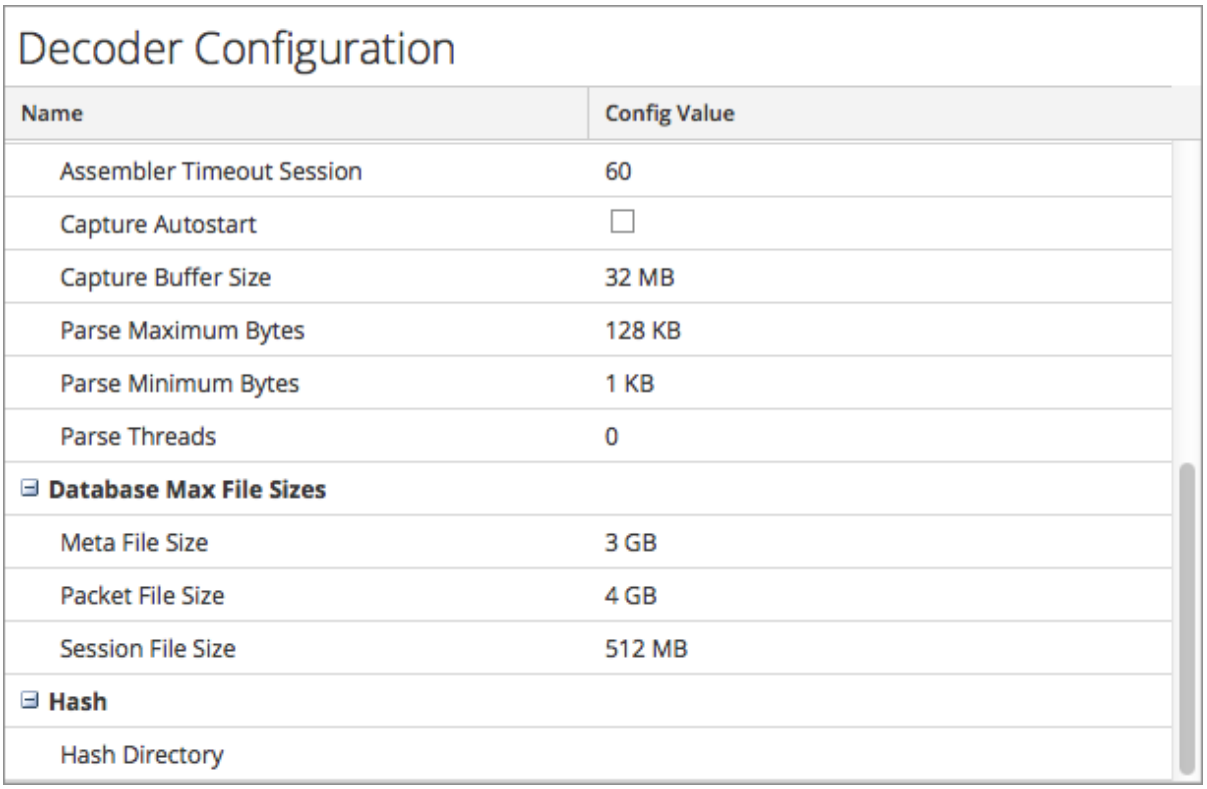
Parameter	Description
Stat Update Interval	The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
Threads	The number of threads in the thread pool to handle incoming requests. A setting of **0** lets the system decide. A change takes effect on service restart.

Decoder Configuration Section

The Decoder Configuration section provides a way to view and edit service configuration parameters for a Decoder or Log Decoder. When a service is first added, default values are in effect. You can edit these values to manage traffic capture.



Scrolling to the bottom of the section reveals these additional Decoder Configuration parameters.



Adapter Section

Adapter parameters configure the network interface for capture as described in Configure Capture Settings.

Cache Section

Cache parameters configure the cache directory and size for session cache files. The following table describes the cache settings. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

Cache Parameter	Description
Cache Directory	The directory where session cache files are stored. The default value is `/var/netwitness/decoder/cache`. Change takes effect immediately.
Cache Size	The maximum size, in Megabytes (MB), that all files in the cache directory can attain before the oldest files are deleted. Once the threshold is reached, the cache size is reduced by 10%. The default value is **4 GB**. Change takes effect immediately.

Capture Settings Section

The Capture Settings section provides a way to configure operational capture settings. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

Capture Settings Parameter	Description
Assembler Maximum Size	Specifies the maximum size in bytes that a session's packet data size can attain. The default value is **32 MB**. Change takes effect immediately.
Assembler Minimum Size	Specifies the minimum size in bytes that a session must have in order to generate metadata. A value of **0** means every session has metadata generated. The default value is **0.** Change takes effect immediately.
Assembler Session Flush	Specifies whether a session is removed from the assembler when the session's last chain is removed from the assembler. The default value is **1**. • **2** = if the first packet of a session times out of assembler, the session is removed from assembler after parsing is complete. Any subsequent packets for this session create a new session in assembler. • **1** = If the last chain of a session times out of assembler, the session is removed from assembler. Any subsequent packets for this session create a new session in assembler. • **0** = If the last chain of a session times out of assembler, the session is left in assembler until it times out. Any subsequent packets for this session are filtered Change takes effect on service restart.
Assembles Session Pool	Specifies the number of entries in the session pool. The default value is **350000**. Change takes effect on service restart.

Capture Settings Parameter	Description
Assembler Timeout Packets	Specifies the number of seconds before a packet or chain is timed out. T default value is **60**. Change takes effect immediately.
Assembler Timeout Session	Specifies the number of seconds before a session is timed out. Default value is **60**. Change takes effect immediately.
Capture Autostart	Specifies whether capture begins automatically each time Decoder is started. When checked, the value = yes. When unchecked, the value = no. The default value is **no**. Change takes effect immediately.
Capture Buffer Size	The capture memory buffer allocation in Megabytes. Default value is **64 MB**. Change takes effect on service restart.
Parse Maximum Bytes	The maximum number of bytes to scan a stream for additional tokens. When the first token is found, the stream is scanned up to the set number of bytes, but no further. A setting of **0** removes the early termination and the full stream is scanned regardless of size. The default value is **128 KB**. Change takes effect immediately.
Parse Minimum Bytes	The minimum number of bytes to scan a stream for the first token. If no token is found within the set number of bytes, scanning is terminated. A setting of **0** removes the early termination and the full stream is scanned regardless of size. The default value is **1 KB**. Change takes effect immediately.
Parse Threads	The number of parse threads to use for session parsing. A value of **0** means let the server decide. The default value is **0**. Change takes effect on service restart.

Database Max File Sizes Section

The Database Max File Sizes section controls the maximum file size for various databases. When a service is first added, default values are in effect and should be changed only in special circumstances, for example, if Customer Support advises a change.

File Size Parameter	Description
Meta File Size	The maximum size of meta database files in Megabytes. The default value is **10 MB**. Change takes effect on service restart.
Packet File Size	The maximum size of packet database files in Megabytes. The default value is **10 MB**. Change takes effect on service restart.
Session File Size	The maximum size of session database files in Megabytes. The default value is **100 MB**. Change takes effect on service restart.

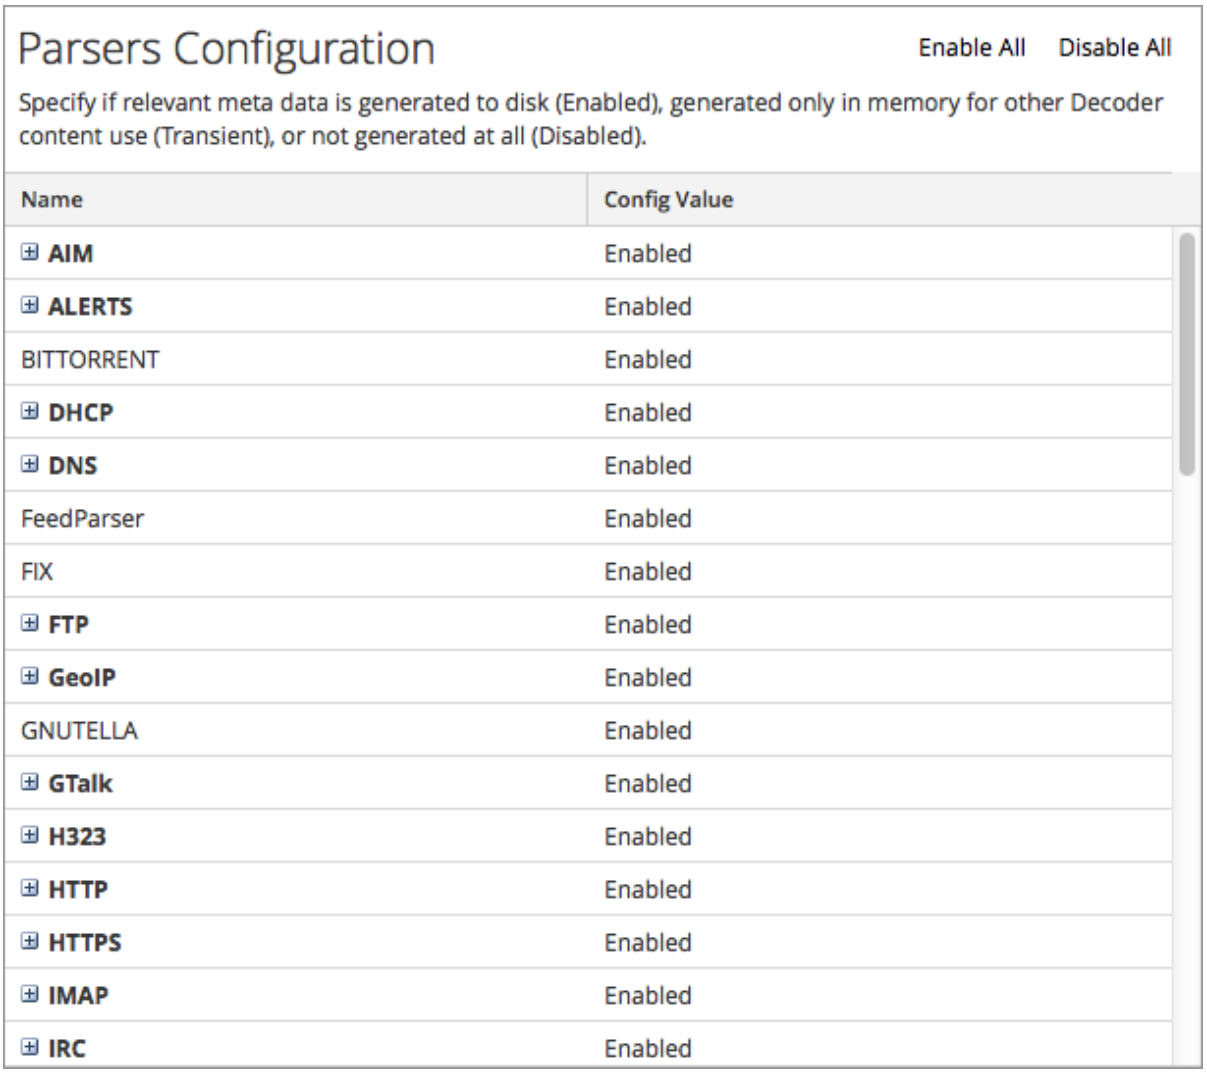
Hash Section

The Hash section settings control data base file hashing options. There is a small performance penalty when hashing.

Hash Parameter	Description
Hash Directory	The server directory where all hash files are written. If empty, each hash file is written to the same directory as the file being hashed. The default value is blank. Change takes effect on service restart.

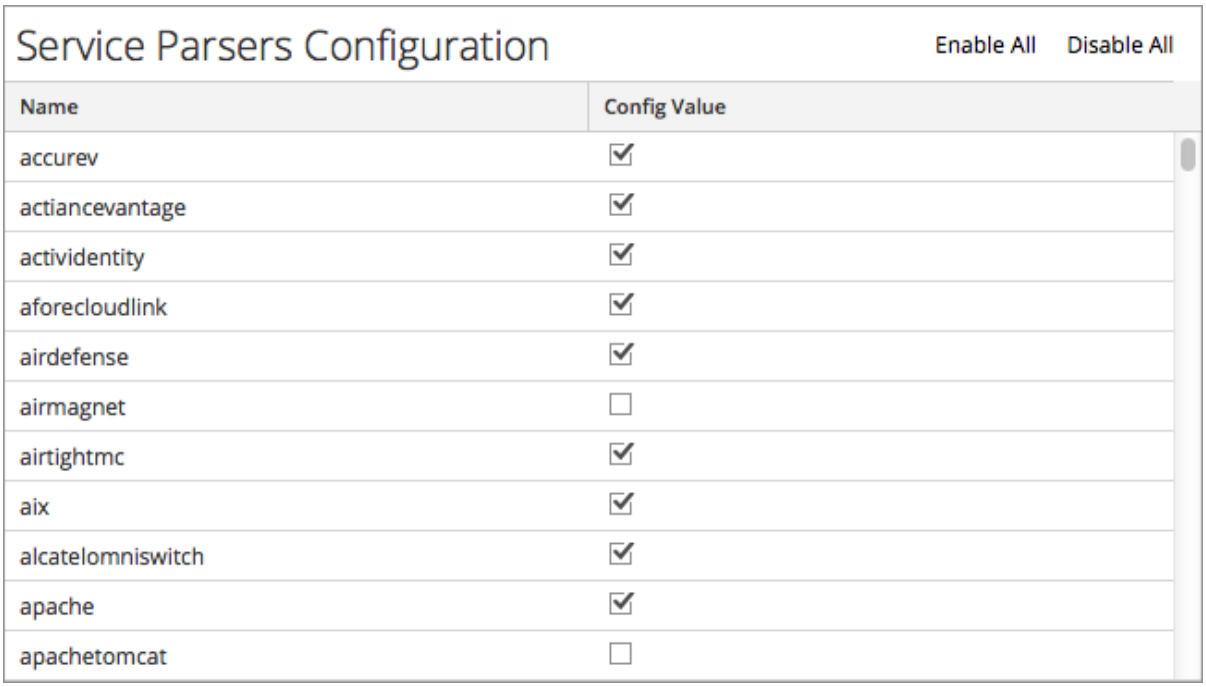
Parsers Configuration Panel

The Parsers Configuration panel provides a way to select parsers to use on the Decoder. Within some parsers, you can also configure the metadata that the parser creates. See Enable and Disable Parsers and Log Parsers for detailed information and procedures.



Service Parsers Configuration Section for Log Decoder

The Service Parsers Configuration section provides a way to select Service parsers to use on the Log Decoder.



Services Config View - Parsers Tab

In the Services Config View > Parsers tab, you can view deployed parsers on a Decoder or Log Decoder, upload parsers, and delete deployed parsers. Parsers can be added and removed while a Decoder or Log Decoder is running without affecting capture.

To access the Parsers tab, go to ADMIN > Services > select a Decoder or Log Decoder service and click > View > Config > Parsers tab.

What do you want to do?

User Role	I want to...	Documentation
Administrator	View deployed parsers.	Enable and Disable Parsers and Log Parsers
Administrator	Upload parsers to a Decoder or Log Decoder.	Enable and Disable Parsers and Log Parsers

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

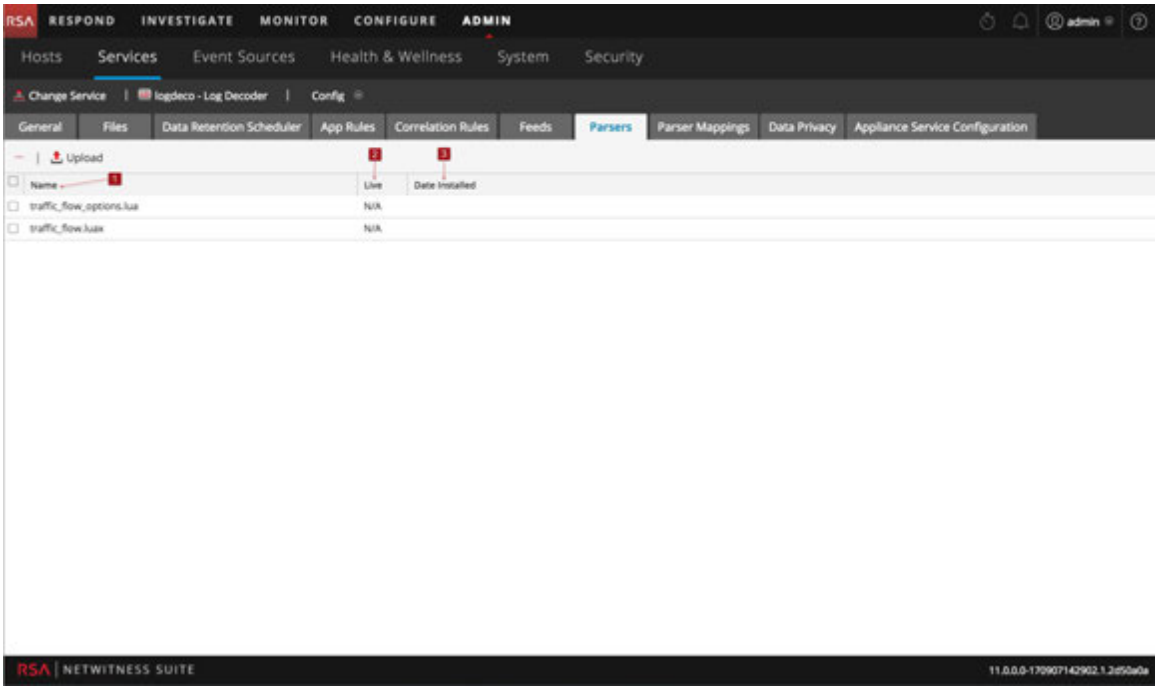
Quick Look

This is an example of the Parsers tab. The Parsers grid lists all parsers that are currently deployed on the Decoder.



1	**Name**: The name of the parser or the parser file.
2	**Live**: Indicates if the parser originated from Live. Possible values are **Yes**, **No**, or **N/A**. • **Yes** = Installed through Live Services. • **No** = Installed through NetWitness. • **N/A** = The parser has no attributes file created by NetWitness to track the installation date. The parser may have been installed manually, not through NetWitness or Live Services.
3	**Date Installed**: The date the parser was pushed to the service.

Parsers Tab Toolbar

The Parsers Tab toolbar has options to work with parsers in the grid.

Feature	Description
	Enables you to upload parsers to a Decoder or Log Decoder.
	Requests confirmation that you want to delete the selected parsers. You can select **No** to cancel the deletion, or select **Yes** to delete the selected parsers.

Services Config View - Parser Mappings Tab

This topic provides a description of the configurable options for a Log Decoder in the Parser Mappings tab.

In the Parser Mappings Administrators can configure log parser mappings for Log Decoder services. To access the Parser Mappings tab, go to ADMIN > Services > select a service and click > View > Config > Parser Mappings tab.

Note: You can also configure log parser mappings for Log Decoder services by navigating to **ADMIN > Services > Event Sources > Discovery**.

This feature is intended to track a subset of Event Sources that is parsing against the wrong parser.

What do you want to do?

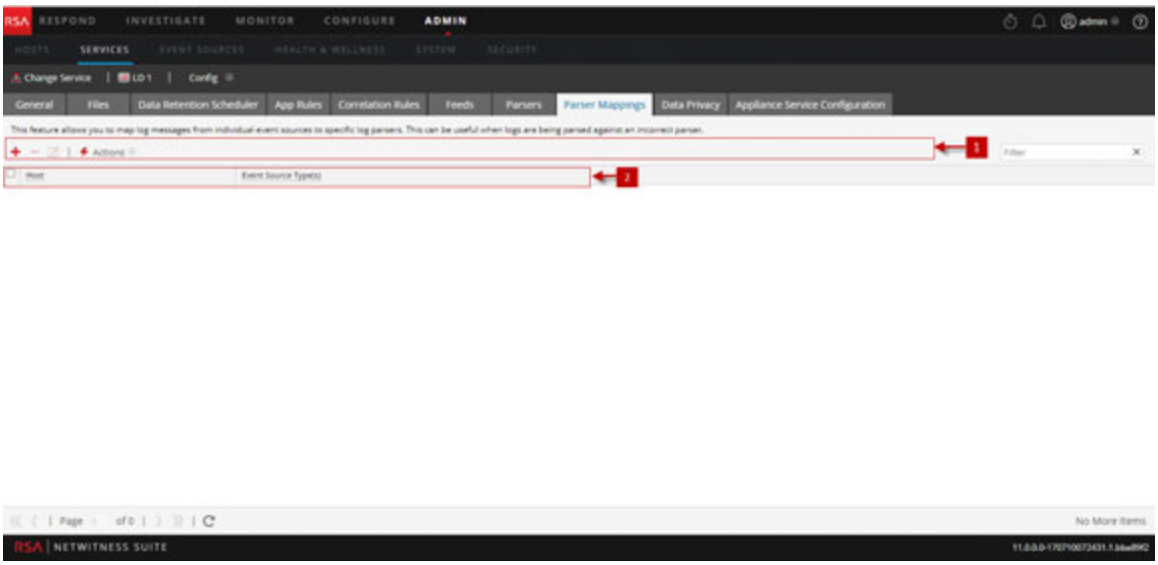
User Role	I want to...	Documentation
Administrator	Manage IPs for Event Source Mapping.	Enable Parser Mappings

Related Topics

- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder

Quick Look

This is an example of the tab.



1 Parser Mappings Toolbar - Provides options to work with parser mappings in the grid

2 Parser Mappings Grid - Lists all parsers that are currently mapped on the Log Decoder

Parser Mappings Toolbar

The Parser Mappings toolbar has options to work with parser mappings in the grid.

Feature	Description
+	Add a parser mapping.
−	Delete the selected parser mapping.
	Edit a parser mapping.
	Refresh the list of parser mappings.
	Display the Actions menu. • **Import** - Import a parser mapping to a file. • **Export** - Save a parser mapping to a file.

Parser Mappings List

The Parser Mappings list displays all parsers that are currently mapped on the Log Decoder.

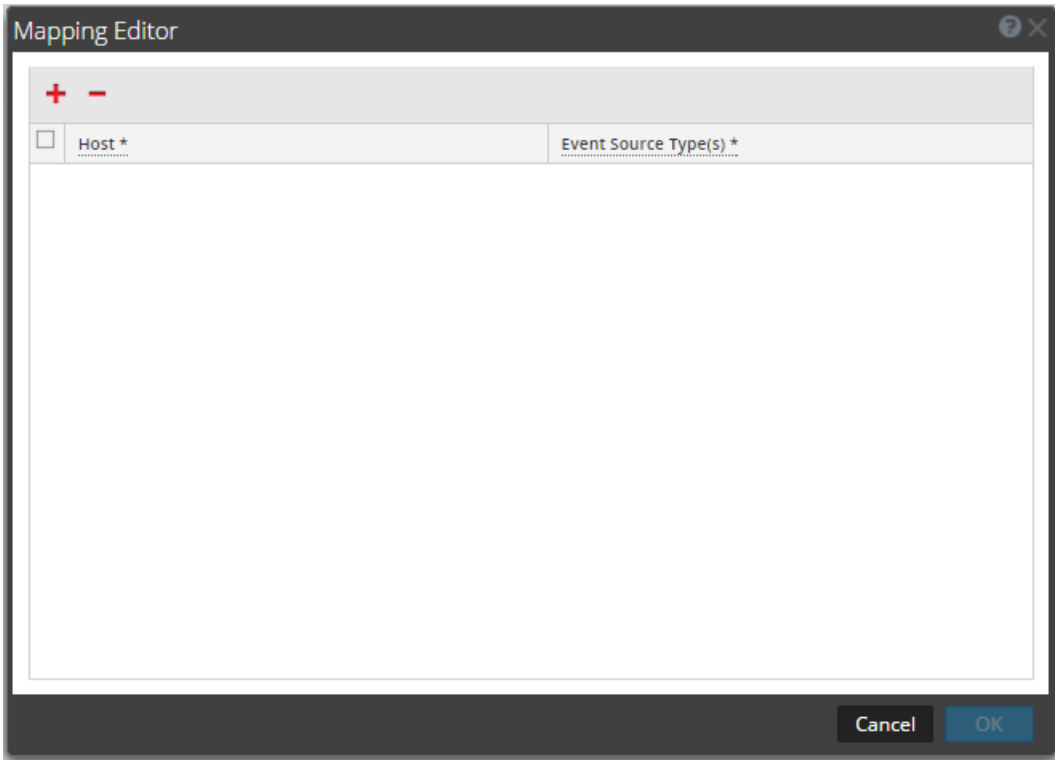
Parameter	Description
Host	Displays the IP address of the host.
Event Source	Displays the Event Sources that are parsing incorrectly.

Parser Mappings Editor Dialog

The Parser Mappings Editor dialog allows you to update an IP to event source mapping.

To access the Parser Mappings Editor dialog, follow these steps:

1. In the NetWitness Suite menu, select **ADMIN > Services**.
2. Select a **Log Decoder**, and in the **Actions** column, select > **View** > **Config**.
   The Services Config view is displayed.
3. Select the **Parser Mappings** tab.
4. Click .
   The Mapping Editor dialog is displayed.



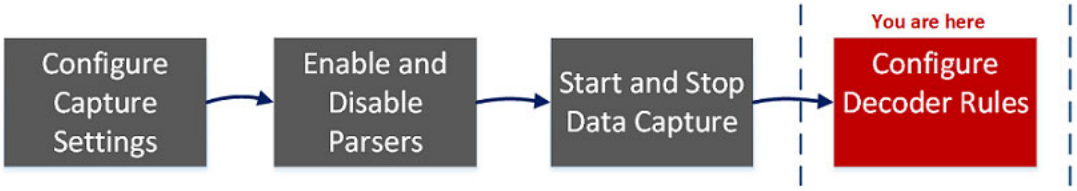
For more information on the Parser Mapping Editor dialog, refer to Enable Parser Mappings.

Services Config View - Rules Tabs

The Rules tabs in the Services Config view (**ADMIN > Services >** select a service and click **> View > Config**) enable you to define and manage capture rules. Each type of rule has a grid with slightly different columns and different parameters in the Rule Editor dialog. Application and correlation rules apply to both Decoders and Log Decoders. Network rules apply only to packet Decoders.

Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.



What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings	Configure Capture Settings
Administrator	manage parsers and log parsers	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture	Start and Stop Data Capture
Administrator	configure rules*	Configure Decoder Rules
Administrator	import, export, or push a rule*	Configure Decoder Rules
Administrator	enable or disable a rule*	Configure Decoder Rules
Administrator	add, edit, or delete a rule*	Configure Decoder Rules

*You can complete these tasks here.

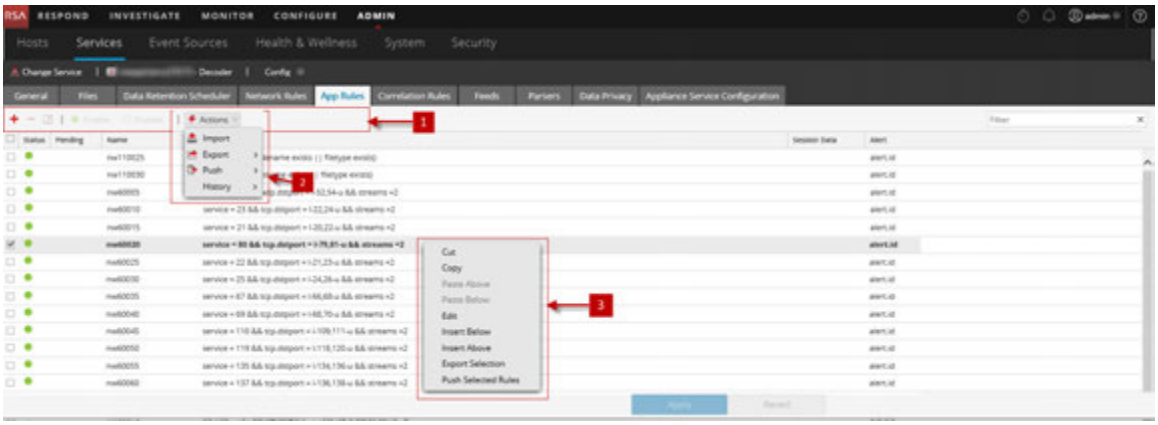
Quick Look

This is an example of the App Rules tab.



1	Rules Tab Toolbar - Provides options to work with rules in the grid
2	Rules Actions Menu - Provide options to manage sets of rules
3	Rules List Context Actions - Displays the Rules List Context Menu

Rules Tab Toolbar

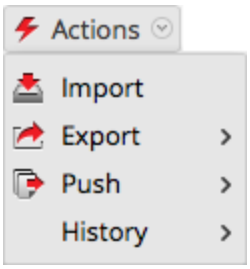
The toolbar is the same for all Config view > Rules tabs.

Feature	Description
Actions	Displays the **Actions** menu.
+	Adds a new rule to a service.
−	Deletes a rule from a service.

Feature	Description
	Allows rule modification.
	Disables a rule (without deleting the rule).
	Enables (reactivates) a rule.
Filter	The input field for a search string. NetWitness Suite filters the rules dynamically as you type a search string. Clicking **x** clears the input field, restoring the unfiltered view.
Apply	Saves the changes made to rules and applies the configured rules to a service. Until you apply changes, it is possible to reload the rules as they were before current modifications.
Revert	Discards unsaved changes to the grid and reverts to the unedited rules.

Rules Actions Menu

The Actions menu has options that help to manage sets of rules.



Option	Description
Import	Imports a set of rules into the user interface so that it can be applied to a service. You can edit the rules before applying.
Export	Saves selected rules or all rules to an .nwr file on the client machine.

Option	Description

Push	Allows rules to be applied to other services (Decoders or Log Decoders) or Decoders belonging to a service group. When pushing, the rules can either be merged (update existing rules and append new ones) or replaced.
	• **Push > All.** Pushes all rules to other services. All rules on the target services are removed and replaced with all of the rules on the source service.
	• **Push > Selection.** Pushes selected rules to other services. You have two options:
	  • **Replace.** Deletes all rules on the target services and replaces them with the selected rules from the source service.
	  • **Merge.** Merges the selected rules with the existing rules on the target services

History	Displays the last ten snapshots of rules applied through NetWitness Suite. You can select and apply (restore) a snapshot to the Decoder at anytime.

Rules List Context Actions

Within a rules grid, right-clicking a row displays the Rules Grid Context Menu.

Option	Description
Cut	Deletes the current rule.
Copy	Copies the current rule.
Paste Above	Pastes the copied rule above the current rule.
Paste Below	Pastes the copied rule below the current rule.
Edit	Edits the current rule.
Insert Below	Inserts imported rules below the current rule.
Insert Above	Inserts imported rules above the current rule.
Export Selection	Exports the selected rules.
Push Selected Rules	Pushes the selected rules to other services.

App Rules Tab

The App Rules tab (**ADMIN > Services >** select a Decoder or Log Decoder and click > **View > Config > App Rules tab**) enables you to manage application rules. NetWitness Suite applies application rules at the session level.

What do you want to do?

User Role	I want to...	Documentation
Administrator	add or edit application rules	Configure Application Rules

Related Topics

- Decoder and Log Decoder Quick Setup

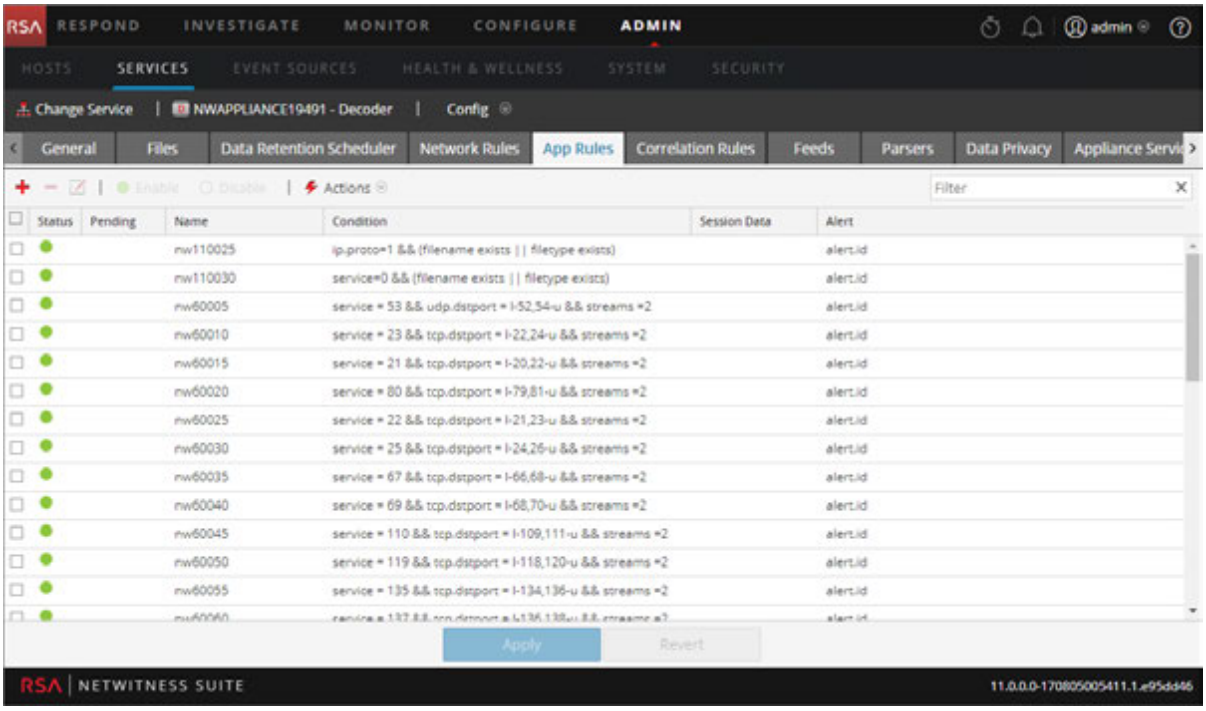
- Services Config View - Rules Tabs

Quick Look

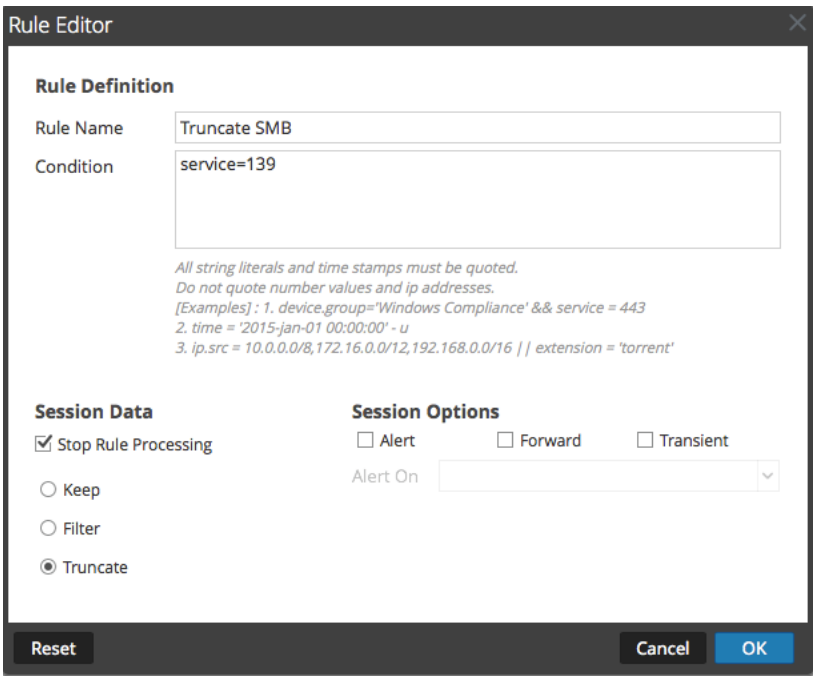
The following figure shows an App Rules tab and the table describes the columns..



Column	Description
Pending	This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed.
Name	This is the rule name, a descriptive identifier for the rule.
Condition	This is the definition of the condition that triggers an action when matched.
Session Data	This column displays the Session Data action taken when a packet matches the rule. Possible values are **Filter**, **Keep**, or **Truncate**.
Alert	This column displays the name of the custom alert that the Decoder generates when metadata matches the rule.
Status	This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled.

Rule Editor Dialog

The following figure shows the Rule Editor dialog for an application rule.



The Rule Editor dialog provides the fields and options needed to define an application rule.

Field	Description
Rule Name	The descriptive name that identifies the rule.
Condition	The definition of the condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the Intellisense window actions. As you build the rule definition, Intellisense displays syntax errors and warnings. All string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rulesprovides additional details.

The following table describes the Session Data actions and options.

Action	Description
Stop Rule Processing	If checked, further rule evaluation ends if the rule is matched, and the session is saved in accordance with the session action. If not checked, rule evaluation continues until all rules are evaluated.
Keep	The packet payload and associated metadata are saved when they match the rule.
Filter	The packet is not saved when it matches the rule.
Truncate	The packet payload is not saved when it matches the rule, but packet headers and associated metadata are retained.
Alert and **Alert On**	If **Alert** is checked, the packet generates a custom alert when metadata matches the rule. You can select the name of the alert in the **Alert On** field.
Forward	Enables the performance of syslog forwarding when the log matches the rule.
Transient	Prevents the alert metadata that is created from being written to the disk.

The following table describes Rule Editor dialog actions.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.

Correlation Rules Tab

The Correlation Rules tab (**ADMIN > Services >** select a service and click **> View > Config > Correlation Rules tab**) enables you to manage correlation rules. Basic correlation rules are applied at the session level and alert the user to specific activities that may be occurring in their environment. NetWitness Suite applies correlation rules over a configurable sliding time window.

What do you want to do?

User Role	I want to...	Documentation
Administrator	add or edit a correlation rule	Configure Correlation Rules

Related Topics

- Configure Common Settings on a Decoder
- Decoder and Log Decoder Quick Setup
- Configure Decoder Rules

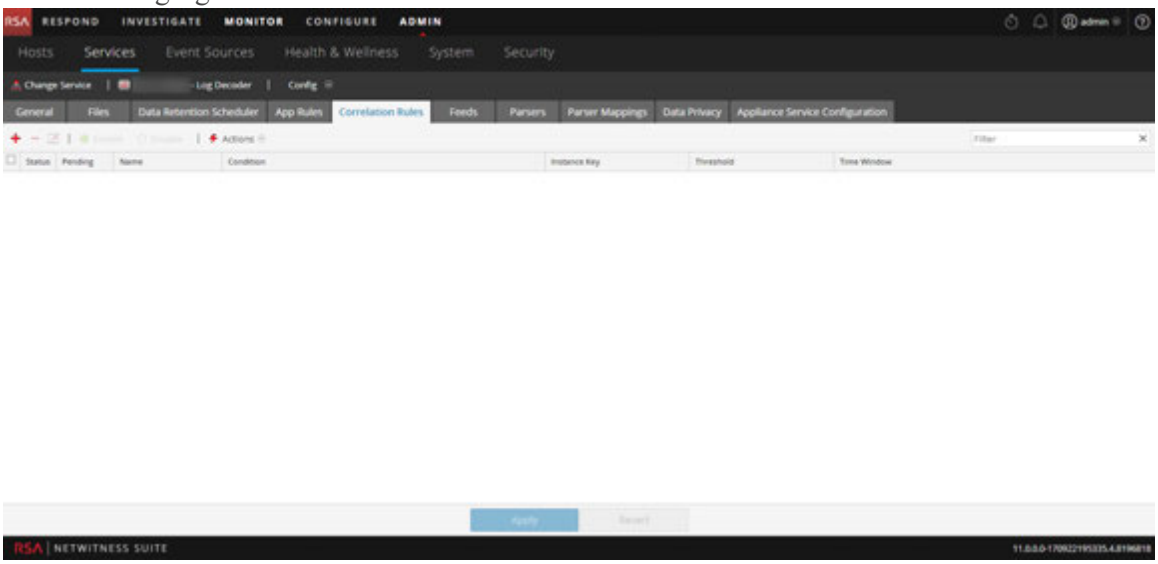
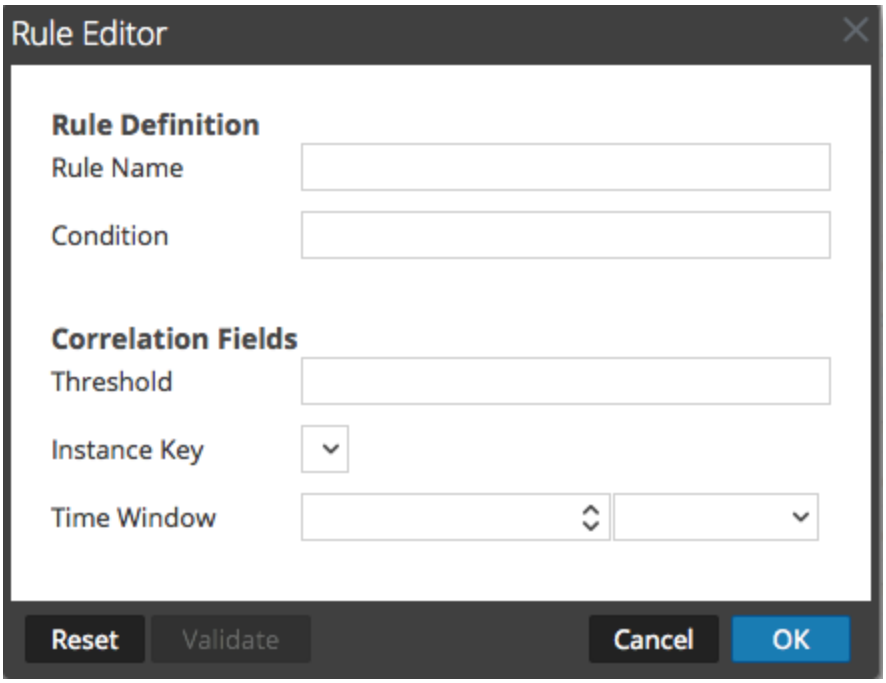
Quick Look

The following figure shows the Correlation Rules tab.



The following figure shows the Rule Editor dialog for a correlation rule.



The following table describes the Correlation Rules tab columns.

Column	Description
Pending	This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed.
Name	This is the descriptive name for the rule.
Condition	This is the definition of the condition that triggers an action when matched. In conditions, all string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details.
Instance Key	This is the target indicator to base the event upon. It can be a single primary key, such as ip.src or a compound primary key such as ip.src,ip.dst.

Column	Description
Threshold	This is the minimum number of occurrences required to trigger a correlation session and can include a associated key that identifies the meta type that were are counting to determine if the condition is satisfied. The correlation engine cannot use IPv4 or IPv6 as an associated meta type. Use one of these three arguments: • u_count(associated_key) = the count of unique values of the specified key. A key is required. • sum(associated_key) = the values of the specified key. a key is required. • count() = number of sessions, no associated key used. If included, it is ignored.
Time Window	This is the duration in hours, minutes, or seconds within which the threshold must be reached to trigger a correlation session.
Status	This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled.

The **Rule Editor** dialog provides the fields and options needed to define a network rule. The fields correspond exactly to the grid columns.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor Dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor Dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.

Network Rules Tab

The Network Rules tab (**ADMIN > Services >** select a Decoder and click **> View > Config > Network Rules tab**) enables you to manage network rules. NetWitness Suite applies network rules at the packet level. Network rules consist of rule sets from Layer 2, Layer 3, and Layer 4. Multiple rules can be applied to the Decoder. Rules can be applied to multiple layers (for example, when a network rule filters out specific ports for a specific IP address). Network rules apply only to packet Decoders.

What do you want to do?

User Role	I want to...	Documentation
Administrator	add, edit, or fix network rules	Configure Network Rules

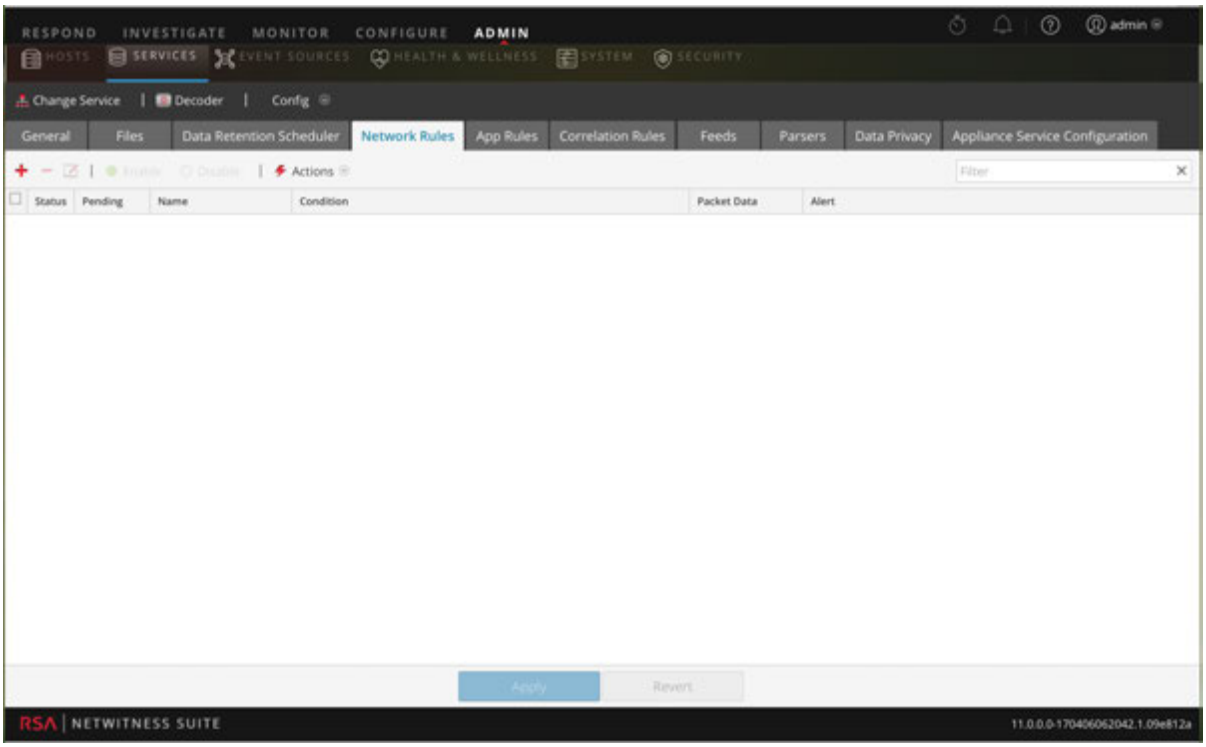
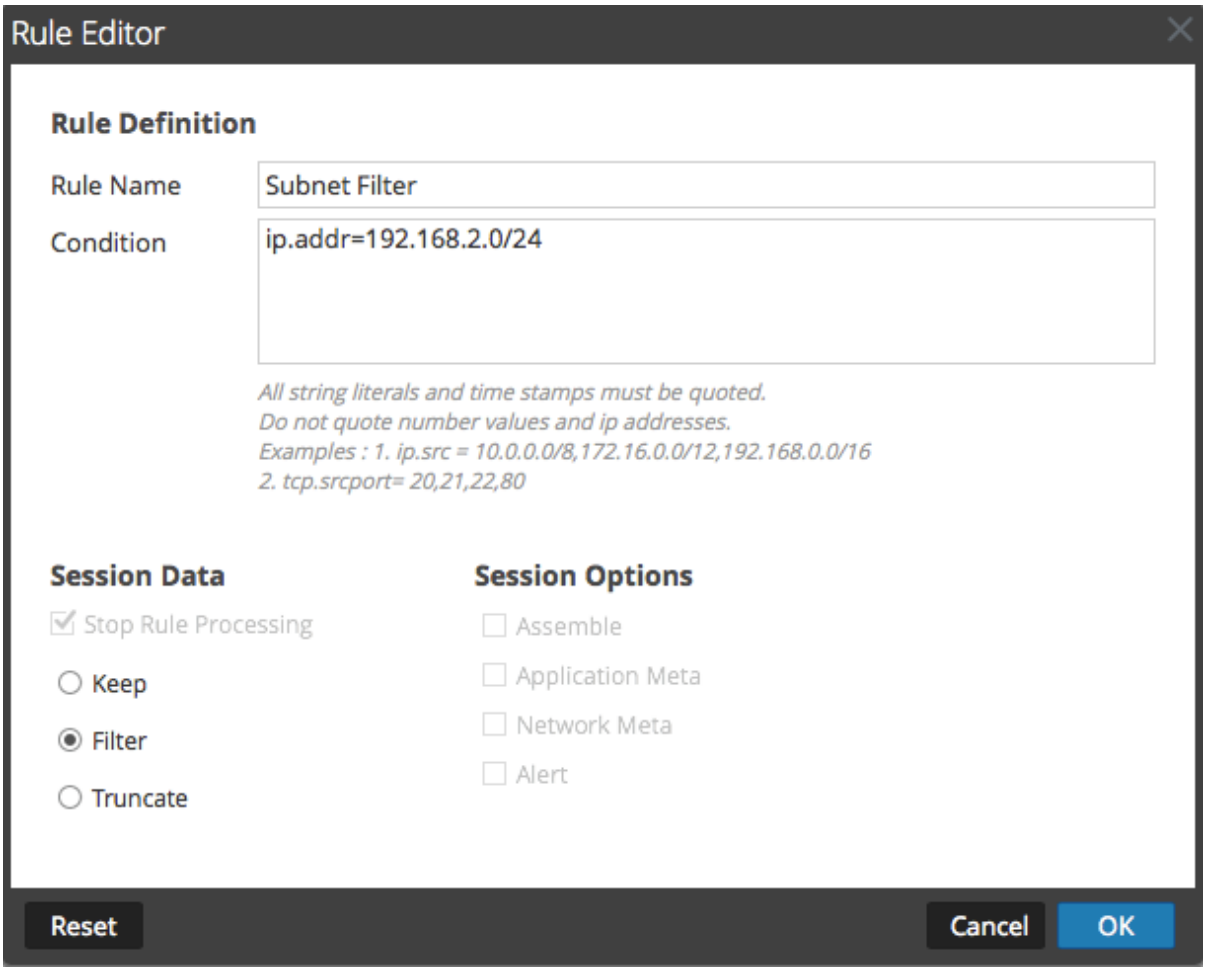
- Services Config View - Rules Tabs

Quick Look

The following figure shows the Network Rules tab.



The following figure shows the Rule Editor dialog for a network rule.



The following table describes the columns in the Network Rules grid.

Column	Description
Pending	This column indicates whether a rule has pending changes. Rules that are currently active on the Decoder have no indicator. If the rule is new or has been modified, the column contains . Once the rules are applied, the pending indicator is removed.
Name	This is the rule name, a descriptive identifier for the rule.
Condition	This is the definition of the condition that triggers an action when matched.
Packet Data	This column displays the Session Data action taken when a packet matches the rule. Possible values are **Filter**, **Keep**, or **Truncate**.

Column	Description
Alert	This column indicates whether the Decoder generates a custom alert when metadata matches the rule. Possible values are **Enabled** or **Disabled**.
Status	This column indicates whether the rule is enabled or disabled with a circle icon. If the circle is filled green, the rule is enabled. If the circle is empty, the rule is disabled.

The **Rule Editor** dialog provides the fields and options needed to define a network rule.

The following table describes the Rule Definition fields.

Field	Description
Rule Name	The descriptive name that identifies the rule.
Condition	The definition of the condition that triggers an action when matched. You can type directly in the field or build the condition in this field using meta from the Intellisense window actions. As you build the rule definition, Intellisense displays syntax errors and warnings. In conditions, all string literals and time stamps must be quoted. Do not quote number values and IP addresses. Configure Decoder Rules provides additional details. This section also describes the meta keys that NetWitness Suite supports for use in network rule conditions.

The following table describes the Session Data actions.

Action	Description
Stop Rule Processing	If checked, further rule evaluation ends if the rule is matched, and the session is saved as indicated. If not checked, rule evaluation continues until all rules are evaluated.

Action	Description
Keep	The packet payload and associated meta are saved when they match the rule.
Filter	The packet is not saved when it matches the rule.
Truncate	The packet payload is not saved when it matches the rule, but packet headers and associated meta are retained.

The following table describes the session options.

Action	Description
Assemble	If checked, the assembler assembles the packet chain when it matches the rule.
Network Meta	The packet generates network metadata when it matches the rule.
Application Meta	The packet generates application metadata when it matches the rule.
Alert	The packet generates a custom alert when metadata matches the rule.

The following table describes Rule Editor dialog actions.

Action	Description
Reset	Resets the contents of the dialog to their values before editing; changes are discarded.
Cancel	Cancels any edits and closes the Rule Editor dialog.
OK	Saves the new rule or edited rule, and adds it to the rules grid. The Rule Editor dialog closes.
Save	(Rules with deprecated syntax only) Applies a corrected rule individually to the Decoder service. See Fix Rules with Invalid Syntax.

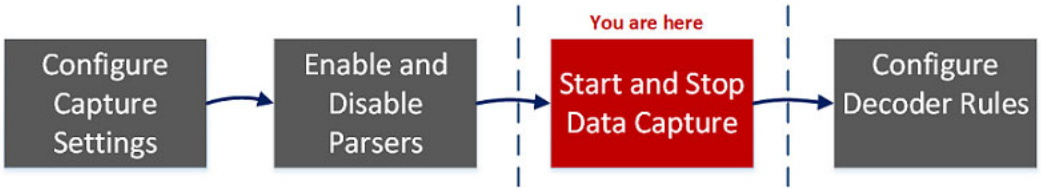
Services System View - Decoders

A Log Decoder is a special type of Decoder, and is configured and managed in a similar way to a Decoder. Therefore, most of the information in this section refers to both types of Decoders. Differences for Log Decoders are noted.

To reach the Services System view, go to **ADMIN > Services >** select a Decoder or Log Decoder > > **View** > **System**.

Workflow

The following figure depicts the workflow for common Decoder configuration tasks with the steps you can complete in this view highlighted.



What do you want to do?

User Role	I want to...	Documentation
Administrator	configure capture settings	Configure Capture Settings
Administrator	manage parsers and log parsers	Enable and Disable Parsers and Log Parsers
Administrator	start and stop data capture*	Start and Stop Data Capture
Administrator	upload packet capture and log files*	Upload a Log File to a Log Decoder Upload a Packet Capture File
Administrator	reset log stats, perform host tasks, shutdown the service, shutdown the appliance service, and reboot the host*	*Hosts and Services Getting Started Guide*

User Role	I want to...	Documentation
Administrator	configure rules	Configure Decoder Rules

*You can complete these tasks here.

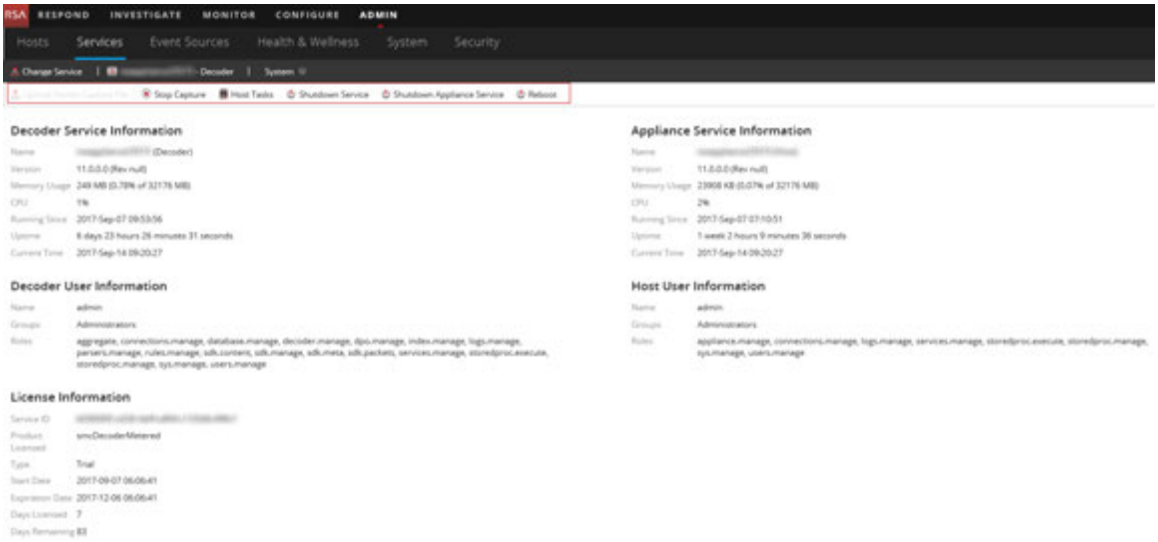
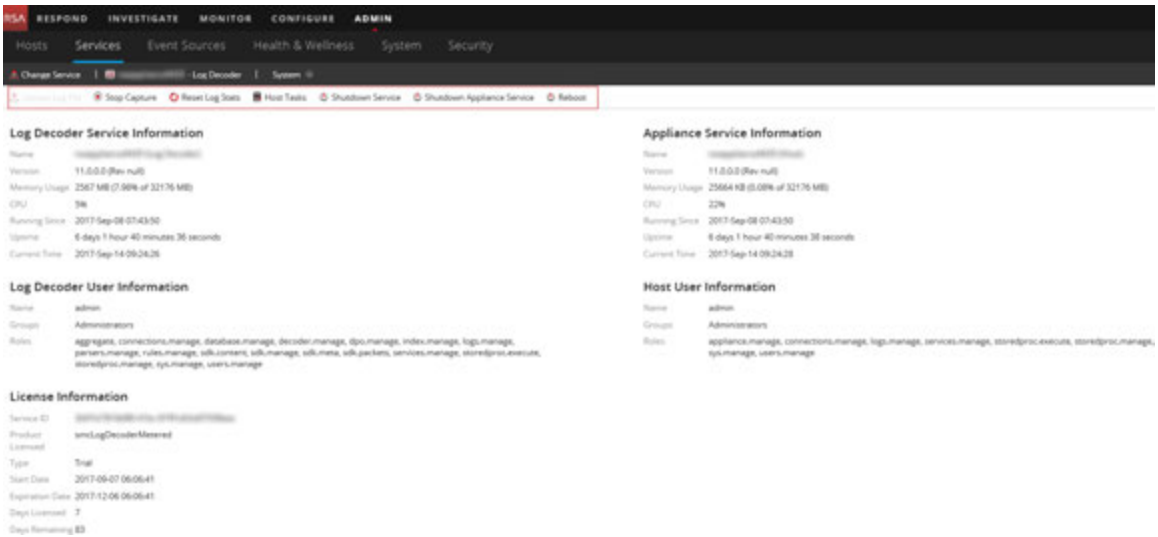
- Decoder and Log Decoder Quick Setup
- Configure Common Settings on a Decoder
- "Services System View" in the *Hosts and Services Getting Started Guide*

Quick Look

This is an example of the Services System view for a Decoder.

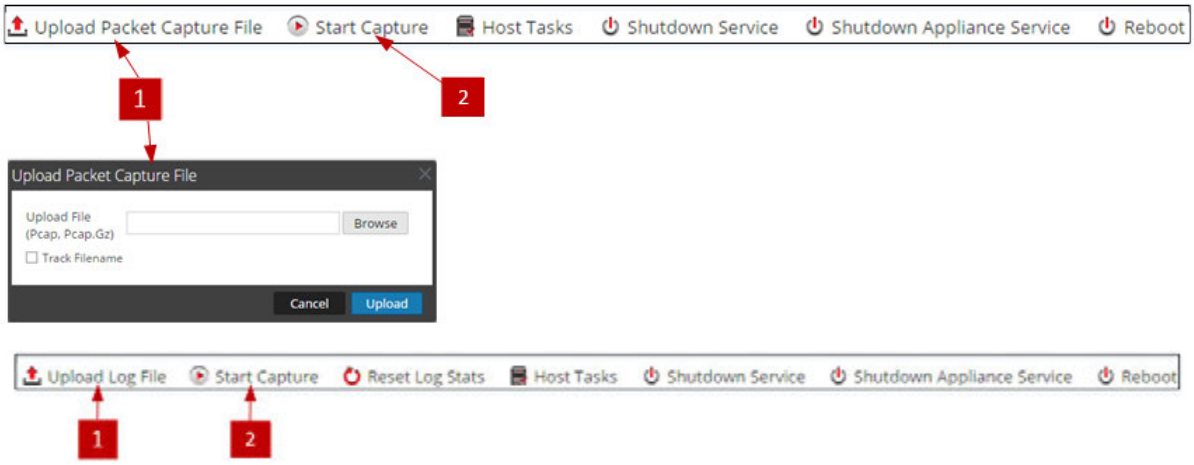


This is an example of the Services System view for a Log Decoder.



Service Info Toolbar

These two toolbars illustrate the options specific to Decoders and Log Decoders.



In addition to the common options in the Services System view toolbar, you can start and stop capture of packets or logs. The upload file options are different for the standard Decoder (packet capture file) and the Log Decoder (log file).

Action	Description
Upload Packet Capture File	Displays a dialog that provides a way to select a packet capture (.pcap) file for upload to the selected Decoder. For more information, see Upload a Packet Capture File. **Note:** This option does not apply to Log Decoders.

Action	Description
Upload Log File	Displays a dialog that provides a way to select a log (.log) file for upload to the selected Log Decoder. For more information, see Upload a Log File to a Log Decoder.
Start/Stop Capture	Starts packet capture on the selected Decoder. When packet capture is in progress, the option in the toolbar changes to Stop Capture, and the option to upload a file is unavailable.

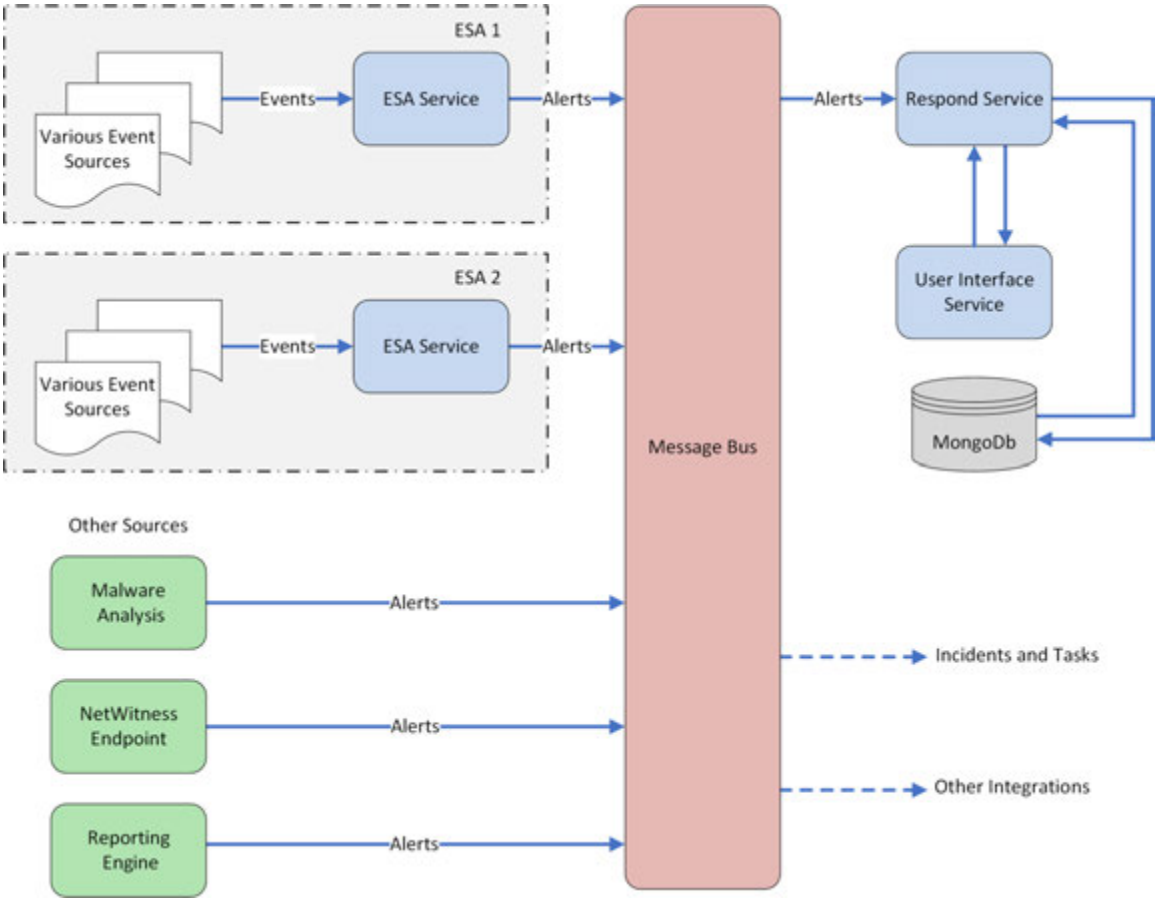
Event Stream Analysis Overview

RSA NetWitness® Suite Event Stream Analysis (ESA) provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators.

ESA's advanced Event Processing Language allows you to express filtering, aggregation, joins, pattern recognition and correlation across multiple disparate event streams. Event Stream Analysis helps to perform powerful incident detection and alerting.

The following diagram shows the high-level data workflow:



There are two ESA services that can run on an ESA host:

- Event Stream Analysis (ESA Correlation Rules)
- Event Stream Analytics Server (ESA Analytics)

The first service is the Event Stream Analysis service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live. The second service is the ESA Analytics service, which is used for Automated Threat Detection. Because the ESA Analytics service uses preconfigured ESA Analytics modules for Automated Threat Detection, you do not have to create or download rules to use Automated Threat Detection.

ESA Analytics services use query-based aggregation (QBA) to collect filtered events for the ESA Analytics modules from Concentrators. Only the data required by a module is transferred between the Concentrator and the ESA Analytics system. For example, using a Suspicious Domains ESA Analytics module, such as C2 for Packets (http-packet), an ESA Analytics service can examine your HTTP traffic to determine the probability that malicious activity is occurring in your environment.

Configure ESA Correlation Rules

This topic provides high-level tasks to configure RSA NetWitness Suite Event Stream Analysis (ESA) Correlation Rules using the Event Stream Analysis service.

Prerequisites

Make sure that you:

- Install the Event Stream Analysis service in your network environment.
- Install and configure one or more Concentrators in your network environment.

Procedure

Note: You can configure ESA using an SSL port (50030) only. There is no option to configure a Non-SSL port.

To configure Event Stream Analysis:

Tasks	Reference
1. Add a Concentrator as data source to the Event Stream Analysis service.	Refer to Step 1. Add a Data Source to an ESA Service
2. Configure notifications for the Event Stream Analysis service.	Refer to "Notification Methods" in the *Alerting Using ESA Guide*.
3. Download Event Stream Analysis content using Live.	Refer to "Live Search View" in the *Live Resource Managment Guide*.
4. (Optional) Advanced configuration for Event Stream Analysis service.	Refer to Step 2. Configure Advanced Settings for an ESA Service.

Result

The Event Stream Analysis service is configured and you can now add ESA Rules for event processing and alerting. For information on adding ESA Rules, see "Add Rules to the Rule Library" in the *Alerting Using ESA Guide*.

Step 1. Add a Data Source to an ESA Service

This topic describes how to add a new or existing data source to the Event Stream Analysis service.

An ESA service ingests data from a Concentrator to detect incidents and alert the user. For ESA to analyze data, you need to configure the sources from which the ESA will read data. Use the procedures in this topic to add data sources for your ESA.

Prerequisites

You must have one or more Concentrators configured in NetWitness Suite.

The Event Steam Anaysis service must be installed and running on NetWitness Suite.

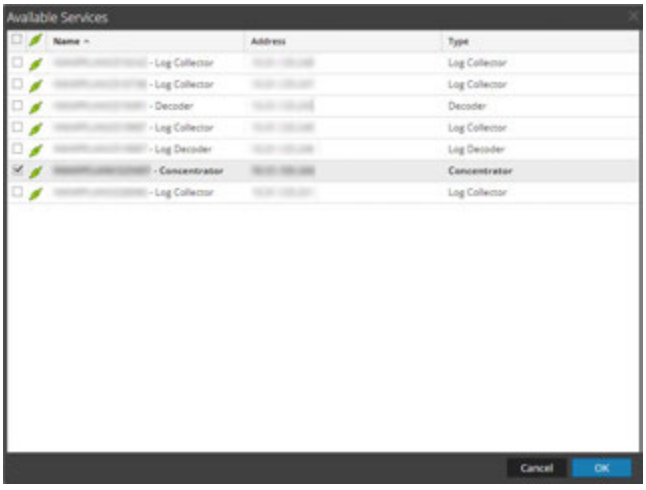
You must perform the following steps to add a data source:

- Add an Available Data Source
- Specify username and password for the Data Source

Procedures

Add Existing Services as Data Source

1. Go to **ADMIN> Services**.
   The Services view is displayed.
2. In Services view, select an ESA service and select  **> View > Config**.
3. On the **Data Sources** tab, click  .
   The available services are displayed as shown in the following figure.



4. Select one or more Concentrators and click **OK**.
   The service is added to the list of services in the **Data Sources** tab.

5. (Optional) Click **Enable** to enable the data source.
6. Click **Apply** to save the configuration.

Specify Username and Password for the Data Source

Note: You can add a Log Decoder as a data source for ESA but RSA recommends you add a Concentrator to take advantage of undivided aggregation as the Decoder may have other processes aggregating from it.

To specify the username and password for the data source:

1. Go to **ADMIN > Services**.
   The Services view is displayed.
2. In the **Services** view, select a Concentrator service.
3. Click  .
4. Specify the username and password.
5. Click **Save**.

Step 2. Configure Advanced Settings for an ESA Service

This topic provides instructions to configure advanced settings for an Event Stream Analysis service.

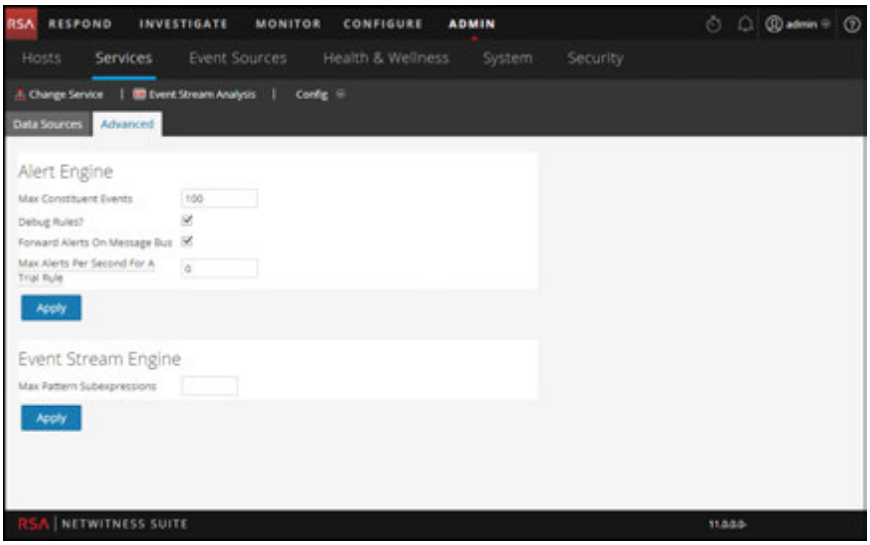
In the Advanced view, you can configure advanced settings to improve performance, to preserve events for rules with multiple events, to buffer events in memory, and to specify the number of events to be stored on the ESA.

Procedures

Configure Advanced Settings

To access the Advanced view and configure advanced settings for an ESA service:

1. Go to **ADMIN > Services**.
   The Services view is displayed.
2. In Services view, select an ESA service and  **> View > Config**.
3. Select the **Advanced** tab.
   The Advanced view is displayed.

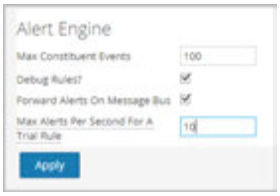


Configure Alert Engine Settings

In the Alert Engine section, you specify values to preserve events for rules that choose multiple events.

Note: After you upgrade to 10.5, the Debug Rules option if enabled previously will be disabled. You will need to enable this option after upgrade.

The following figure shows the Alert Engine section.



To configure Alert Engine settings:

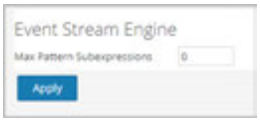
1. In the Alert Engine section, specify a value for **Max Constituent Events**. The default value is 100.
2. Select **Debug Rules?** to enable debugging rules.
3. If you want alerts to be sent to Message Bus and Respond, select the **Forward Alerts On Message Bus** option.
4. To specify the maximum number of alerts to be forwarded to the Message Bus for the trial rule, select **Max Alerts Per Second for a Trial Rule**. The The default value is **10**.
5. Click **Apply** to save the changes and put them into effect immediately.

Note: For more information on the parameters in the Alert Engine section, see Alert Engine Settings in ESA Advanced View.

Configure Event Stream Engine Settings

In the Event Stream Engine section, you specify details to improve performance.

The following figure shows the Event Stream Engine section.



To configure Event Stream Engine settings:

1. In the Event Stream Engine section, specify **Max Pattern Subexpressions**.
2. Click **Apply** to save the changes and put them into effect immediately.

Note: For more information on the parameters in the Event Stream Engine section, see Event Stream Engine Settings in ESA Advanced View.

Configure ESA Analytics

This section provides high-level tasks to configure ESA Analytics services for RSA NetWitness® Suite Automated Threat Detection. The Automated Threat Detection functionality enables you to analyze the data that resides on one or more Concentrators by using preconfigured ESA Analytics modules, such as Suspicious Domains. For example, using a Suspicious Domains module, an ESA Analytics service can examine your HTTP traffic to determine the probability that malicious activity is occurring in your environment.

There are two ESA services that can run on an ESA host:

- Event Stream Analysis (ESA Correlation rules)
- Event Stream Analytics Server (ESA Analytics)

The first service is the Event Stream Analysis service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live. The second service is the ESA Analytics service, which is used for Automated Threat Detection and is configured in this section. Because the ESA Analytics service uses preconfigured ESA Analytics modules for Automated Threat Detection, you do not have to create or download rules to use it.

There are currently two ESA Analytics modules available and they are both for Suspicious Domains:

- C2 for Packets (http-packet)
- C2 for Logs (http-log)

Configure the Whois Lookup Service

The RSA NetWitness Suite Automated Threat Detection functionality enables you to automatically analyze data sources by using preconfigured ESA Analytics modules. An ESA Analytics module is a pipeline composed of activity objects that enrich an event with additional information through mathematical computations. ESA Analytics services process these modules to identify advanced threats.

The Whois Lookup service configuration is required for the Suspicious Domains modules.

Note: (**Important**) RSA strongly recommends that you configure the Whois Lookup service for accuracy in Automated Threat Detection scoring.

Prerequisites

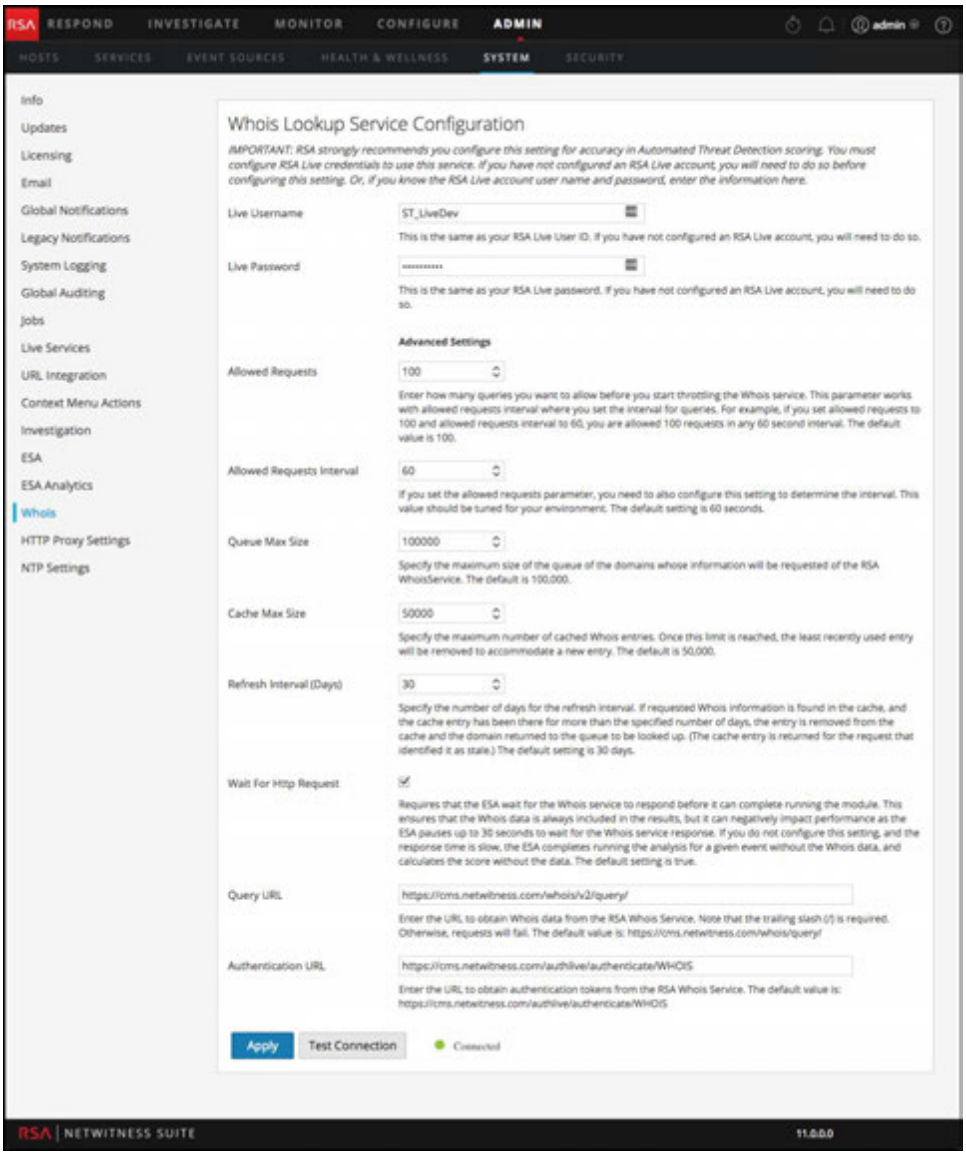
- You must have an RSA Live account to use the Whois Lookup service.
- The ESA Analytics Server service must be available (shows a green circle) in the ADMIN > Services view.

If you configured a Live account in the Live Services panel (ADMIN > System > Live Services), the Whois Lookup Service is automatically configured for you. You only need to check the connection of the Whois Lookup service.

Note: If you do not have an RSA Live account, you can create one at the RSA Live Registration Portal:
https://cms.netwitness.com/registration/
The *Live Services Management Guide* provides additional information.

Configure the Whois Lookup Service

1. Go to **ADMIN > System**.
2. In the options panel, select **Whois**.
3. In the **Whois Lookup Service Configuration** panel, check to see if the Whois Lookup service is connected. At the bottom of the panel, a connected service shows a green circle next to **Connected**:



If it is connected, you are finished with the configuration and you can skip the remaining steps. To adjust the advanced settings, go to step 5.
If the service is not connected, continue to step 4.

4. In the **Live Username** and **Live Password** fields, enter your RSA Live account credentials to access the RSA Whois server.
5. If necessary, you can adjust the advanced settings. However, RSA recommends that you use the default values. Whois Lookup Service Configuration provides additional details.
6. To test your connection, click **Test Connection**.
   A successful connection shows a green circle next to **Connected**: ● Connected
7. Click **Apply** to save your changes.

Mapping ESA Data Sources to Analytics Modules

This topic tells Administrators how to map specific ESA Analytics modules to multiple data sources and ESA Analytics services, which can make processing more efficient.

You can analyze the data that resides on one or more Concentrators with the RSA NetWitness Suite Automated Threat Detection functionality by selecting a preconfigured ESA Analytics module. The data analyzed by these modules is used to identify advanced threats. To better utilize your network resources and reduce unnecessary data flow, you can map multiple data sources, such as Concentrators, to multiple ESA Analytics services in order to process data more efficiently and take advantage of additional capacity.

An *ESA Analytics module* is a pipeline composed of activity objects that enrich an event with additional information through mathematical computations. ESA Analytics modules reside within ESA Analytics services.

When you deploy your mapping, the selected ESA Analytics services use query-based aggregation to collect the appropriate filtered events for the selected module from the Concentrators. Query-based aggregation is a predefined query that only transfers data for the selected ESA Analytics module. Only the data required by the module is transferred between the Concentrator and the ESA Analytics system.

There are currently two ESA Analytics modules available for Suspicious Domains: C2 for Packets (http-packet) and C2 for Logs (http-log).

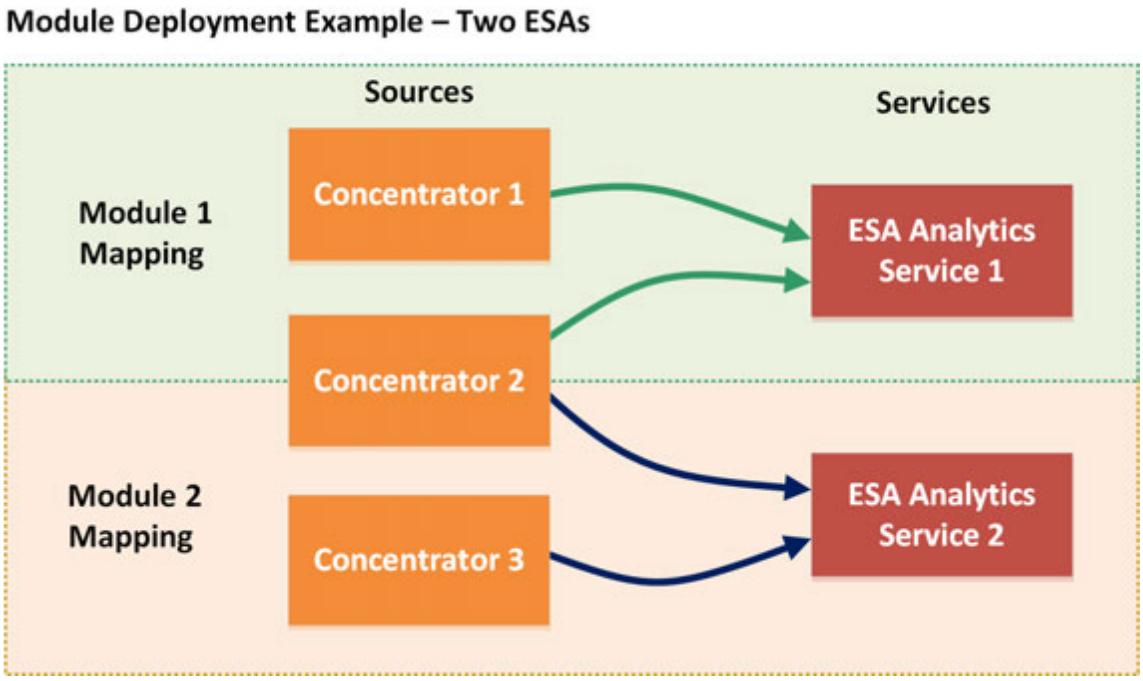
Module Deployment Example - Two ESAs

To take advantage of your additional Concentrator capacity, you can map an ESA Analytics module to an ESA Analytics service and deploy it to analyze data from multiple data sources at the same time.

For example, if you have three Concentrators and two ESA Analytics services, you can create and deploy the following mappings:

- Map Module 1 to the Concentrator 1 and 2 sources and the ESA Analytics 1 service. ESA Analytics Service 1 analyzes Module 1 filtered events from Concentrators 1 and 2.
- Map Module 2 to the Concentrator 2 and 3 sources and the ESA Analytics 2 service. ESA Analytics Service 2 processes Module 2 filtered events from Concentrators 2 and 3.

In this example, Module 1 represents an ESA Analytics module, such as C2 for Packets (http-packet) and Module 2 represents another ESA Analytics module, such as C2 for Logs (http-logs) in another location.



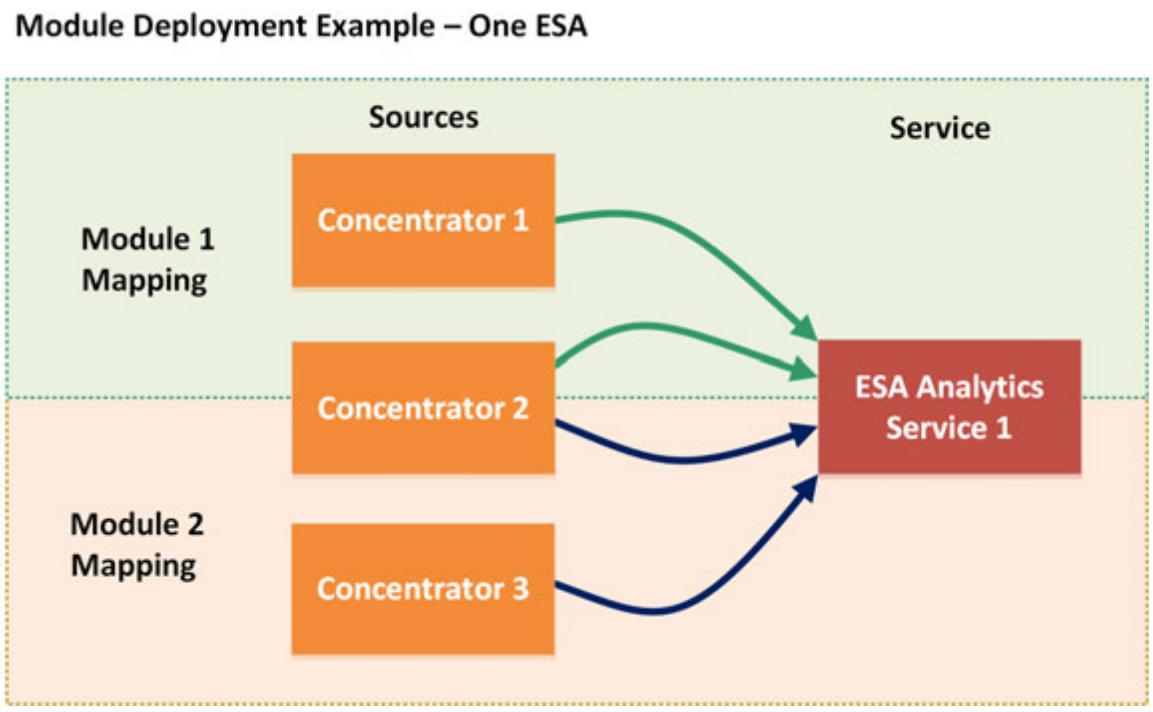
This example shows how both services can process data from the same Concentrator. Notice that ESA Analytics Services 1 and 2 can both process data from Concentrator 2. ESA Analytics Service 1 queries data for Module 1 events and ESA Analytics Service 2 queries different data for Module 2 events.

Module Deployment Example - One ESA

In addition to creating module mappings that are processed by different ESA Analytics services, you can map more than one module to the same ESA Analytics service.

For example, if you have three Concentrators and one ESA Analytics service, you can create and deploy the following mappings:

- Map Module 1 to the Concentrator 1 and 2 sources and the ESA Analytics 1 service. ESA Analytics Service 1 analyzes Module 1 filtered events from Concentrators 1 and 2.
- Map Module 2 to the Concentrator 2 and 3 sources and the ESA Analytics 1 service. ESA Analytics Service 1 also processes Module 2 filtered events from Concentrators 2 and 3.



This example shows how one service can process data from more than one module. Notice that ESA Analytics Service 1 can process data from Concentrators 1 and 2 for Module 1. It also processes data from Concentrators 2 and 3 for Module 2. ESA Analytics Service 1 queries data for Module 1 events and queries different data for Module 2 events.

Caution: Ensure that all NetWitness Suite host services are in sync with a consistent time source.

Prerequisites

- All NetWitness Suite host services must be in sync with a consistent time source.
- The Concentrator hosts and services must be discovered and available in the NetWitness Suite user interface.
- All module-specific requirements must be followed.
  - For Suspicious Domains:
    - Configure log settings (Suspicious Domains for Logs only)
    - Create a whitelist using the Context Hub service.
    - Configure the Whois Lookup Service.

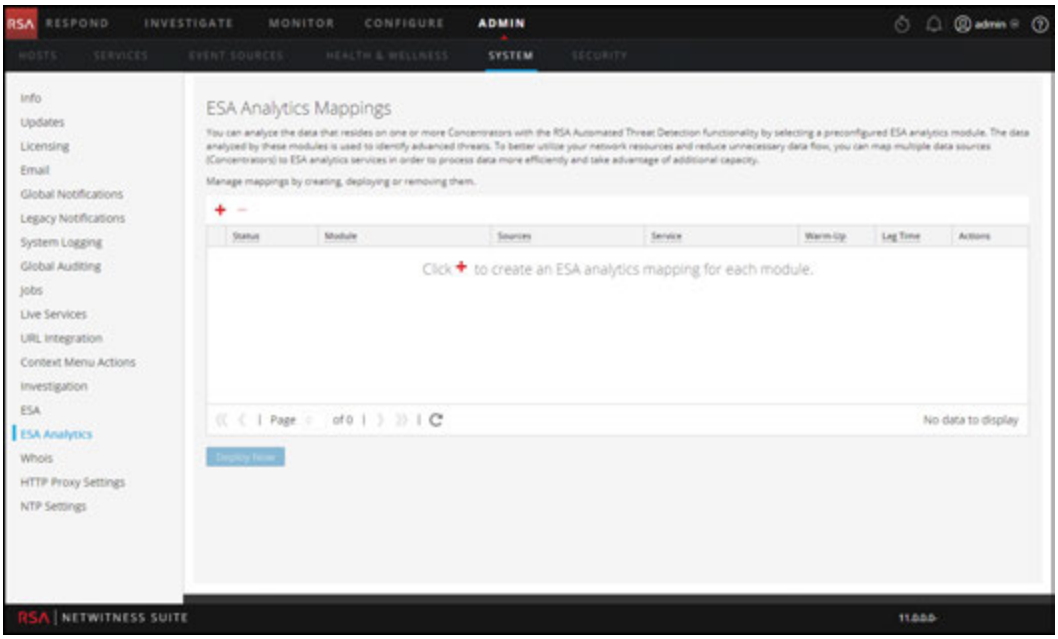
- Verify that the C2 incident rule is enabled and monitor it for activity.
- Verify that the incidents are grouped by Suspected C&C.

For step-by-step procedures, see the *NetWitness Suite Automated Threat Detection Guide*.

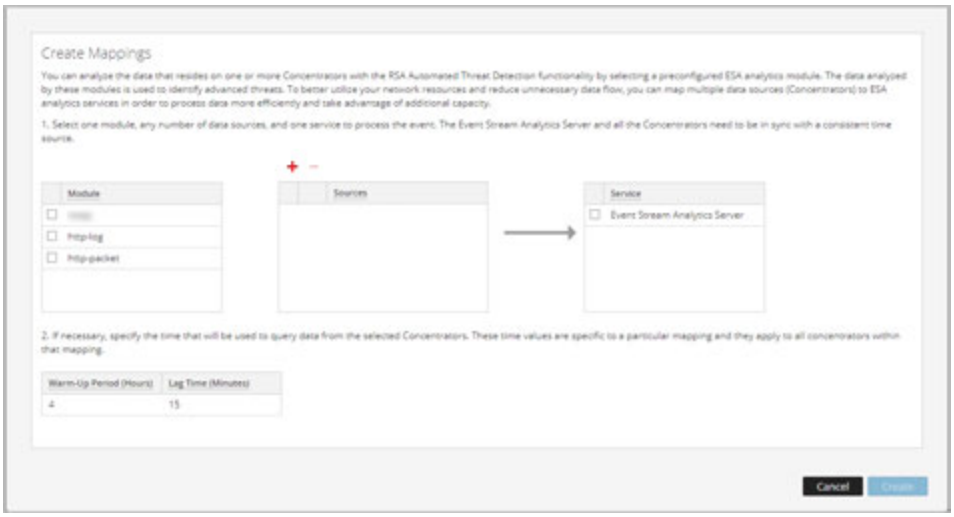
Create ESA Analytics Mappings

The following procedure tells you how to map ESA Analytics modules to sources and services. After creating and reviewing the mappings, you deploy them so that they can start aggregating data.

1. Go to **ADMIN** > **System**, and in the options panel, select **ESA Analytics**.
   The **ESA Analytics Mappings** panel is displayed.

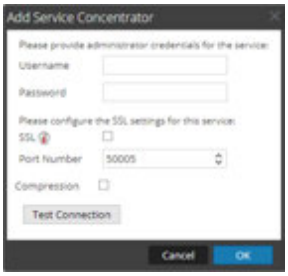


2. Click + to create an ESA Analytics mapping. Create a separate mapping for each module.
   The **Create Mappings** dialog is displayed.



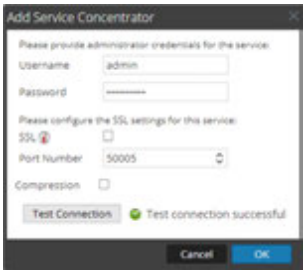
3. In the **Module** list, select a module.
4. Configure one or more data sources (Concentrators) for your mappings. Do the following for each Concentrator:
   a. Click + .
      The Available Sources dialog shows the data sources that are available from the Admin > Services view.

b. In the **Available Sources** dialog, select a Concentrator and click **OK**.
The Add Source dialog is displayed.



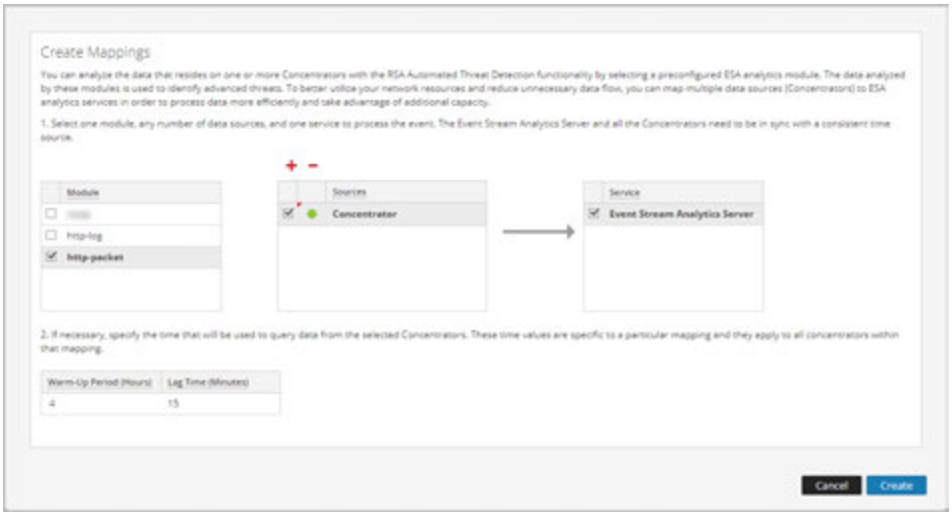
c. In the **Add Source** dialog, type the Administrator username and password for the Concentrator.

d. Click **Test Connection** to make sure that it can communicate with the ESA Analytics service.



e. Click **OK**.
After you configure your data sources and they appear in the Sources list, you can reuse them for additional mappings.

5. In the **Sources** list, select one or more data sources to aggregate the data for the module.



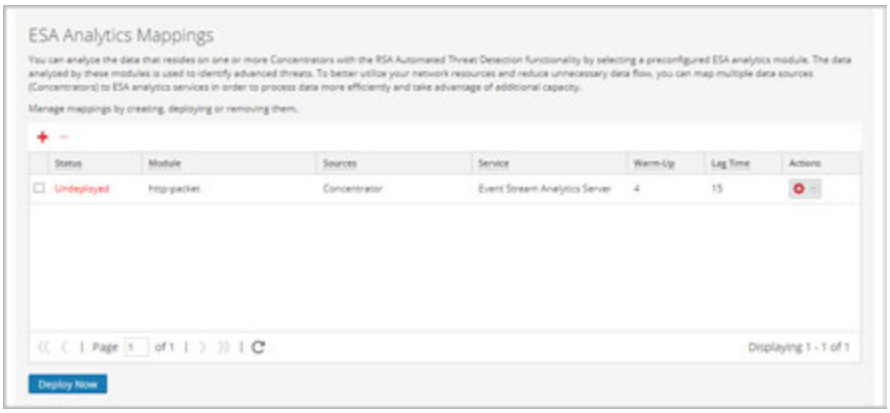
A solid colored green circle indicates a running service and a white circle indicates a stopped service.

6. In the **Service** list, select an ESA Analytics service to process the data for the module.
7. If necessary, specify the time that will be used to query data from the selected Concentrators:

Field	Description
Warm-up Period (Hours)	Specifies a warm-up duration (in hours). A warm-up period is required to allow Automated Threat Detection to "learn" your traffic. The warm-up period should run when typical traffic is running. During this time, alerting for your module mapping is suppressed. The Warm-up Period primes the module with historical data and guarantees that the specified number of hours of data collection completes before sending alerts. RSA provides preconfigured ESA Analytics modules. Each module type has a default warm-up period defined, which you can adjust to your environment, if necessary. After this warm-up period, alerts can be viewed. For more information about Warm-up Period and Lag time, see Module Settings.

Field	Description
Lag Time (Minutes)	Specifies a constant time delay in minutes, which is added to avoid losing events being processed by the data sources during periods of heavy activity. For example, Concentrator performance varies depending on factors such as incoming load, ongoing queries, and indexing. Due to these factors, a Concentrator may not aggregate events in real-time, which leads to the delay. The Lag parameter gives the Concentrator a chance to finish aggregating all of the data. After the warm-up period completes, data aggregation continues at **Current (System) Time - Lag Time**. This is useful when a Concentrator is slow in aggregating data. The Lag time guarantees that the module does not process data that arrives to the Concentrator within the Lag time window so there is adequate delay to ensure all events that get generated in the enterprise can be processed by the module. For example, if Lag time is 30 minutes, and the current time is 2:00 PM, the Concentrator starts pulling records at 1:30 PM. The Lag time window, 30 minutes in this example, remains constant as time advances. When the current time advances to 2:01 PM, the Concentrator pulls the next minute of data at 1:31 PM, and so on. **Important**: The Lag time defines the buffer between the current time and the time when the module ingests the data. **Caution:** RSA recommends that Administrators adjust the Lag parameter dynamically based on the performance of each of the individual Concentrators to avoid missing any events during aggregation. For more information about Warm-up Period and Lag time, see Module Settings.

8. Click **Create**.
   The mappings that you create appear in the list of existing mappings with a status of **Undeployed**.



Important: To start a module so that it starts aggregating data, you need to deploy it.

Deploy ESA Analytics Mappings

After you create your mappings, you need to deploy them in order to start aggregating data for the modules.

1. In the list of mappings, verify that the status of the mappings that you want to deploy show as **Undeployed**.
2. Select one or more mappings with a status of Undeployed and select **Deploy Now**.
   All selected mappings in the Undeployed state start to aggregate data as configured in the mapping. The mapping status changes to **Deployed**.
   You cannot deploy a mapping that has already been deployed.

Update a Mapping

You can only have one mapping per module. If you want to make changes to a deployed mapping, such as adding or removing Concentrators or changing the service, you must undeploy and delete the existing mapping and then create and deploy a new mapping for that module.

You can make the following updates to a deployed mapping without deleting it:

- Undeploy the mapping
- Change the warm-up period and lag time

You can also change the warm-up period and lag time for an undeployed module mapping.

Undeploy a Mapping

If you want to stop aggregating data for a module mapping, but you do not want to delete the mapping, you can undeploy it. This gives you the option of deploying it at a later time. When you undeploy a mapping, the specified ESA Analytics service stops pulling data from the data source for that module.

Caution: Undeploying a mapping with a status of Deployed will affect data aggregation for that module.

To undeploy a mapping:

1. In the ESA Analytics Mappings panel, select the deployed mapping that you want to undeploy.
2. In the **Actions** column, select  > **Undeploy**.

   The status changes from Deployed to Undeployed and data aggregation stops.

Delete a Mapping

You can delete a mapping with a status of Undeployed at any time. Since a mapping in the Undeployed state is not running, it does not affect data aggregation.

You should undeploy a mapping with a status of Deployed before deleting it. Undeploying and deleting a mapping clears the configuration on the ESA server, reverts the deployment for that mapping, and stops pulling data from the data source for that module.

Caution: Undeploying and deleting a mapping will affect data aggregation for that module.

To delete a mapping:

1. In the ESA Analytics Mappings panel, select the mapping that you want to delete. You can only delete one mapping at a time.
2. Click .

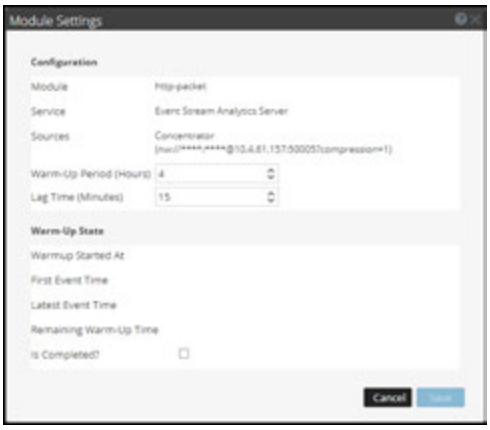
Change the Warm-up Period and Lag Time

You may want to adjust the warm-up period for a specific module mapping. For example, after the warm up period is complete, you can increase the warm-up period setting to allow additional warm-up time. You can even increase the warm-up period when your module mapping is actively warming up.

If necessary, you can change the lag time for the module. The lag time defines the buffer between the current (system) time and the time when the module ingests the data.

1. In the ESA Analytics Mappings panel, select the mapping that you want to change and in the **Actions** column, select  > **Edit Module**.

   The Module Settings dialog shows the selected module, ESA Analytics service, and data sources for the mapping. The data sources show the URLs used to communicate with ESA.



2. Review the **Warm-Up State** section to determine the current warm-up state:
   - **Warm Up Started At** - The time when the first event was processed by the ESA Analytics module from the data source.
   - **First Event Time** - The time that the first event occurred. The warm-up time is based on this time.
   - **Latest Event Time** - The time that the latest event occurred.
   - **Remaining Warm Up Time** - The number of hours remaining in the warm-up period.
   - **Is Completed?** - Indicates whether the warm-up period is complete. If it is true, the warm-up period is complete. If it is false, the module is still warming up and you can view the number of hours remaining in the Remaining Warm Up Time field.
3. In the **Configuration** section, you can update the **Warm-Up Period (Hours)** depending on whether or not the warm-up period is complete.
   - **During the warm up period** - You can add hours to the warm-up period or subtract any remaining warm-up time.
   - **The warm-up period is complete** - You can add hours to the warm-up period by adding the difference between the current time and the First Event Time to the hours that you want to add.
     For example, a warm-up period of 10 hours is complete and the First Event Time shows 12:00:00. The current time is 16:00:00 (4 hours later) and you want to add 5 more hours to the warm-up time. To do this, you need to add 9 hours (4+5=9) to the warm-up period of 10, so you would set the new warm-up period to 19 hours.
     You cannot decrease the warm-up period if it is complete, unless you delete the mapping and create a new one.

4. If necessary, you can adjust the **Lag Time (Minutes)** to give the Concentrators in the mapping additional time to finish aggregating all of the data.
5. Click **Save**.
   Changes DO NOT take effect immediately. For the settings to take effect, you need to undeploy and re-deploy the mapping.
6. To undeploy the mapping, in the ESA Analytics Mappings panel, select the mapping that you want to undeploy and  > **Undeploy**.
   Data aggregation stops for the selected mapping.
7. To re-deploy the mapping, select the mapping that you want to deploy and  > **Deploy**.
   The selected mapping deploys and starts to aggregate data as configured in the mapping.

Additional ESA Correlation Rules Procedures

This topic is a collection of individual procedures, which an Administrator may perform at any time and they are not required to complete the initial setup of ESA Correlation Rules.

Use this section when you are looking for instructions to perform a specific task after the initial setup of ESA.

- Change Memory Threshold for Trial Rules
- Configure ESA to Use a Memory Pool
- Configure ESA to Use Capture Time Ordering
- Start, Stop, or Restart ESA Service
- Audit Logs and Verify ESA Component Versions and Status

Change Memory Threshold for Trial Rules

This procedure is optional and applies only to ESA Correlation Rules.

Administrators can increase or decrease the memory threshold for trial rules. Threshold refers to the ESA memory usage, which includes ESA base memory, trial rules and non-trial rules. When the threshold is exceeded, all deployed trial rules on an ESA service are disabled.

You use trial rules to see if a rule runs efficiently and does not use excessive memory, which can impact performance or force the service to shut down.

By default, the memory threshold is 85, which is the percentage of Java Virtual Memory (JVM).

- The memory threshold is per ESA, not per rule.
- When the memory threshold is exceeded, all trial rules running on the ESA are automatically disabled.
- The ESA configuration has two parameters for trial rules:
  - MemoryThresholdforTrialRules
  - MemoryCheckPeriod, which has a default value of 300 seconds

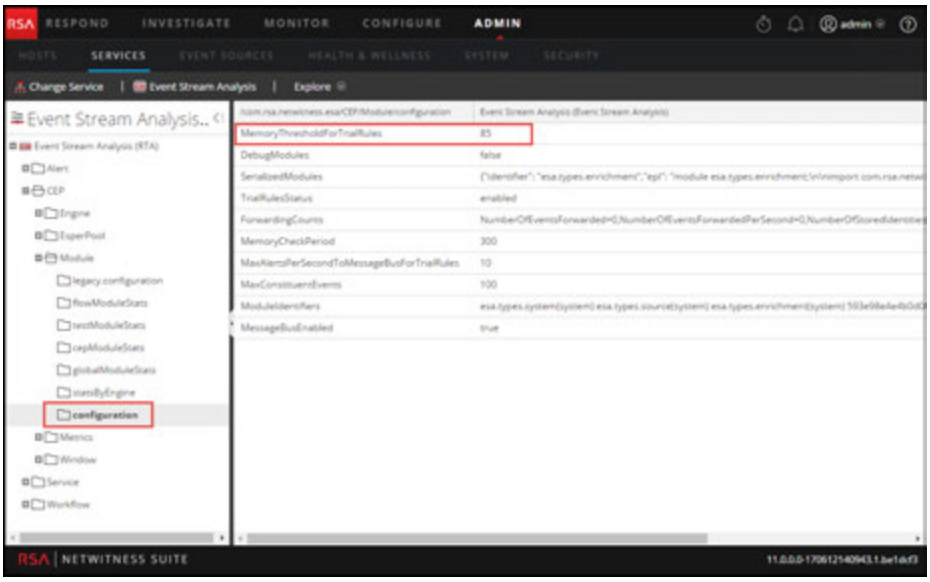
For more information, see "Work with Trial Rules" in the "Alerting Using ESA Guide".

Prerequisites

A role with administrative privileges must be assigned to you.

Procedure

1. Log on to NetWitness Suite as admin.
2. Go to **ADMIN** > **Services**.
3. Select the ESA service and select > **View** > **Explore**.
4. On the left, select **CEP > Module** > **configuration**.



5. In the right panel, in **MemoryThresholdForTrialRules** type a percentage of JVM that trial rules on the ESA can not exceed.
   The new memory threshold takes effect immediately.

Configure ESA to Use a Memory Pool

This procedure applies only to ESA Correlation Rules.

Administrators can configure ESA to use a memory pool. A memory pool is a customized implementation of virtual memory for events held by rules in ESA. This helps in scaling the capability of rules by an order of magnitude. When you want to create rules that cover a large time span or which are very complex, you may want to use a memory pool to handle memory more efficiently. When you use a memory pool, instead of holding all of the events in memory, they can be written to disk. This is helpful because when a rule exists that is complex or extends over a long time frame, a large number of events must be held in memor

You can configure memory pool to run in non-batch mode or batch mode:

- **Non-batch mode**. In non-batch mode, events are written to disk as they enter the memory pool. To configure non-batch mode, set the **MapPoolBatchWriteSize** attribute to 1. Non-

batch mode provides a more stable solution because each event is landed and fetched separately without creating memory spikes.

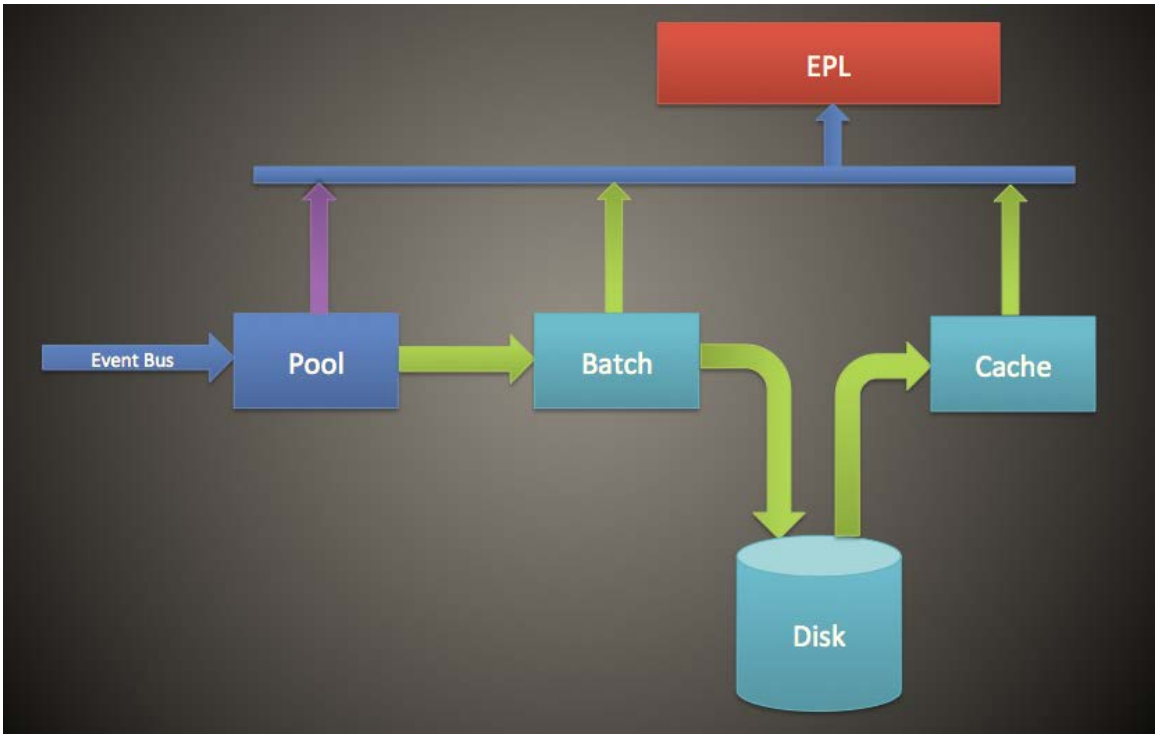
- **Batch mode**. In batch mode, events are grouped into batches and then written to disk. To configure batch mode, set the batch size attribute **MapPoolBatchWriteSize** to a value greater than 1. Batch mode gives better performance since the disk activity for landing events to disk are optimized.

Note: Any changes to these settings will require you to restart the ESA. When ESA restarts, if any events are currently being held by the memory pool, they will be discarded upon restart.

Caution: While this feature can be very helpful in managing memory, it can impact the event processing rate of the ESA. Performance can be affected from 10 to 30 percent, depending on your rules and configuration settings.

Workflow

The following diagram shows the data flow using the memory pool for batch mode.



1. Events are added to the memory pool and references to the events are stored in the memory pool.
2. The events are then batched to be sent to disk (in non-batch mode, this step is skipped).

3. Once the batch has met the threshold, the events are written to disk (in non-batch mode no threshold is required).
4. When the EPL requires an event that was written to disk, the event is sent to the cache and used in the EPL rule.

Procedure

Complete the following steps to configure an ESA memory pool.

1. Go to **ADMIN** > **Services**, select your ESA service, and then  > **View** > **Explore**.
2. Select **CEP** > **EsperPool** > **Configuration**.
3. Enter values for the following fields:

Attribute	Description	Configuration
MapPoolPersistenceURI	Location to store the memory pool file.	The default value is **/opt/rsa/esa/pool/esperPool**. RSA recommends you do not modify the default value. If you modify this setting to use a different partition, ensure the partition contains at least 10 times more space than the memory allocated for ESA. **Caution:** If the memory pool is in use while this path is changed, an ESA restart is required. When this occurs, ESA does not discard the stored events so you must manually purge them.
MapPoolEnable	Enable or disable the memory pool.	The default value is **false**. Set the value to **true** to enable the memory pool. Requires a restart when you enable or disable memory pool.

MapPoolFlushIntervalSecs	Time interval to flush events to disk. For example, any event held in Esper longer than 15 minutes gets flushed to disk.	The default value is **15 minutes**. A smaller value ensures that the ESA is more stable when there are EPLs holding a large number of events in memory. A larger value (greater than 30 minutes), ensures that only relevant events required over a longer period of time are flushed to disk. **Note:** Due to Java memory management design, sometimes events not held by EPL may be sent to disk. To help prevent this from occurring, you can set a higher value for MapPoolFlushIntervalSecs.
MapPoolBatchWriteSize	Specify the batch size (and whether to use batch mode). The events are batched into groups and then flushed to disk. To use non-batch mode, set this value to 1. To use batch mode, set this value to greater than 1.	The default batch size is **100,000** events. At the end of flush interval, if the batch capacity is not reached, the batch expires in 30 seconds and all contents of the batch are written to disk as memory pool files. A smaller value for the batch size (for example, 10,000 events) ensures that when events are fetched from disk, they do not pose a risk of bloating the memory, which creates more stability. However, a larger batch size (100,000 events) minimizes the input/output activity when writing events to disk, which can create better performance.
MapPoolMinSize	Minimum size of the memory pool. This value is used for initialization, so it does not typically require editing.	The default value is **10,000** events. A higher value may increase performance. A lower value ensures that the system is more stable.

MapPool Persist Type	This is a view-only parameter that displays the type of optimization used.	The default value is **RMSerialize**.

Note: The effectiveness of this feature depends on your environment. If you write rules that require frequent access of events over a period of time, this feature may degrade performance with no or minimal improvement in scalability.

Memory pool files get deleted when all the events held in the pool file are no longer referenced by an EPL.

Result

For a simple EPL rule, ESA typically improves memory approximately 8 to 9 times.

Configure ESA to Use Capture Time Ordering

This procedure applies only to ESA Correlation Rules.

Administrators can configure the ESA to use capture time ordering when using two or more Concentrators as a source.

By default, ESA uses the ESA time stamp (time at which events are received by the ESA) to correlate events. However, ESA also supports session-ordering based on capture time (the time at which the packet or log event reached the Decoders). This feature is useful if you are correlating events from two or more Concentrators. When you have two or more Concentrators as sources, time ordering ensures that their sessions are correlated together by capture time. This ensures that sessions captured at the same time are correlated together and alerts are consistent with user's expectation even with transmission delays. If any of the sources go offline or are slow to send sessions, ESA will pause to ensure that sessions with same capture timestamps are correlated together.

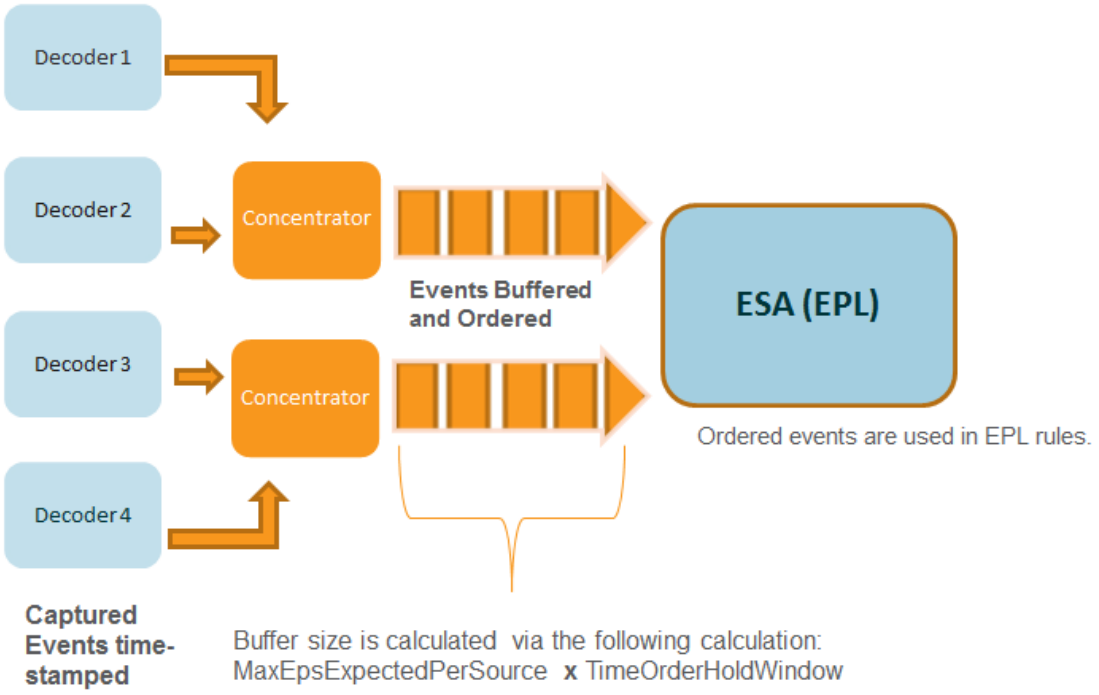
For example, you have two sources with events that occur at 10:00 a.m. Using Capture Time Ordering, these events are held in the buffer until the ESA detects that all events occurring at 10:00 a.m. have been added to the buffer. Once all the events have arrived, events are then processed using EPL rules. This ensures that a rule has all events with the same time-stamp from different sources in order to obtain correct results. If, for example, one Concentrator lags behind another, the ESA pauses until it has all the events time-stamped at 10:00 a.m. from both sources before it runs the EPL rules against the events.

Caution: Although this feature increases accuracy, it impacts performance. The default configuration of the ESA ensures that data is constantly streaming, but because Capture Time Ordering uses a buffer, it takes longer to process events. This is especially true if the ESA must pause for any length of time to wait for the buffer to fill. There are several parameters you can configure (see below) to handle this situation; however, there may still be performance impact.

By default, this feature is disabled.

Capture Time Order Workflow

The following diagram shows the workflow when Capture Time Ordering is enabled.



1. Events are time-stamped as they are captured by the Decoder.
2. After Concentrator processing, events are buffered and ordered. The buffer size is calculated via two parameters MaxEPSExpectedPerSource (the maximum volume of traffic (EPS) you expect **per source** for the ESA to receive) times TimeOrderHoldWindow (the amount of time to allow for events to arrive from all sources).
3. The ordered events are then correctly correlated in EPL rules.

Prerequisites

Two or more Concentrators must be configured as a data source in ESA.

When the **StreamEnabled** parameter is set to true, it is important that all the machines running Core Services should be in NTP Sync.

Procedures

The following procedures tell you how to enable and configure Capture Time Ordering.

Enable Buffering and Capture Time Ordering

Note: After an upgrade or in a high EPS environment, you need to re-add datasources to start seeing the benefits. Or, you must wait until the sessions catch up before you enable Capture Time Ordering.

1. Go to **ADMIN** > **Services**, select your ESA service, and then select  > **View** > **Explore**.
2. Go to **Workflow** > **Source** > **nextgenAggregationSource**.
3. Set the **StreamEnabled** attribute to **true**. StreamEnabled allows ESA to buffer events received from Concentrators.
4. Set the **TimeOrdered** attribute to **true**. This enables the buffered events to be ordered by the time stamp from the Concentrator.

Configure Capture Time Ordering

When you work with Capture Time Ordering, you need to configure several other parameters to ensure performance. The following table shows parameters and their function. Configuring these parameters requires knowledge of your traffic volume and rate.

Note: If you do not know your traffic volume or latency, consult with your Professional Services representative before configuring this feature.

MaxEPSExpectedPerSource	Specify the maximum volume of traffic (EPS, or events per second) you expect for the ESA service to receive from your busiest source (for example, if one source receives 20K EPS, and another receives 25K EPS, set the value at 25K EPS). If you set this rate too low, there is a short-term impact on performance. However, ESA automatically increases the value for `MaxEPSExpectedPerSource` as needed to make progress in Time Ordered mode. The default value is 20K.
TimeOrderHoldWindow	Specify in seconds (whole integers) the amount of time to allow for events to arrive from all sources. Configure this value based on the latency between the sources. The default value is 2 seconds. Decreasing this value can increase the chance of dropped events. Increasing this value can decrease performance because more memory is consumed.
IdleSourceAdvanceAfterSeconds	Specify the interval (in seconds) after which the ESA takes an idle source (no events are coming from the source, but the source is not offline) out of the equation to allow progress on a capture time ordered stream. The default value is 0, meaning that the ESA waits indefinitely for events to arrive.
OfflineSourceAdvanceAfterSeconds	Specify the interval (in seconds) after which the ESA takes an offline source out of the equation to allow progress on a capture time ordered stream. The default value is 0, which means the ESA waits indefinitely. This parameter does not affect the re-connection retries; those which are performed in all cases.

Troubleshooting Tips

Using this feature, it is possible to encounter a situation where events become backlogged. To fix this issue, you can perform one of the following options.

Disable Capture Time Ordering

1. Go to **ADMIN** > **Services**, select your ESA service, and then  **> View > Explore**.
2. Go to **Workflow** > **Source** > **nextgenAggregationSource**.
3. Set the StreamEnabled attribute to false.
4. Set the TimeOrdered attribute to false.

If you disable Capture Time Ordering, you will lose the backlogged data, and events will no longer be ordered by capture time.

Disable Position Tracking

Position tracking allows ESA to track where it stopped processing events if the ESA stops or is shut down. Position tracking is enabled by default with Capture Time Ordering. If you disable position tracking, this allows ESA to skip the backlogged events. For example, if the ESA goes down at 7:00 a.m., and you restart it at 11:00 a.m. with position tracking disabled, the ESA will start processing events that occurred at 10:55 a.m. With position tracking enabled, the ESA will start processing events at the point at which it stopped.

1. Go to **ADMIN** > **Services**, select your ESA service, and then select 
   > **View** > **Explore**.
2. Go to **Workflow** > **Source** > **nextgenAggregationSource**.
3. Set the **PositionTrackingEnabled** attribute to false.

If you disable Position Tracking, you will lose the backlogged data, but going forward, events will be ordered by capture time.

Start, Stop, or Restart ESA Service

This topic provides instructions to start, stop, or restart the Event Stream Analysis service. This procedure applies to ESA Correlation Rules.

Start ESA Service

Before you start:

- Make sure that MongoDB is running.
- If the MongoDB service is not running, use the following command to start the MongoDB service:
  ```
  systemctl start mongod
  ```

To start ESA service:

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press ENTER:
   ```
   systemctl start rsa-nw-esa-server
   ```

Stop ESA Service

To stop ESA service:

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press ENTER:
   ```
   systemctl stop rsa-nw-esa-server
   ```

Restart ESA Service

To restart ESA service:

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press ENTER:
   ```
   systemctl restart rsa-nw-esa-server
   ```

Audit Logs and Verify ESA Component Versions and Status

This topic provides details about audit logging and instructions to verify the versions of the Event Stream Analysis components installed. These procedures apply to ESA Correlation Rules.

Audit Log Rules

Audit logging allows you to view details about rules that are created and edited in NetWitness Suite.

For details on how to access your audit logs, see "Local Audit Log Locations" in the *System Configuration Guide*.

The following sample shows a create, update, and delete log for a given rule.

- **Create log example:** `2016-03-10 14:19:37,951 deviceVersion: "10.6.1.0-SNAPSHOT" deviceService: "EVENT_STREAM_ANALYSIS" category: SYSTEM operation: "CREATE RULE" parameters: "Epl Module Identifier: 56e1f2adbee8290008241296, Esper Instance: default, Rule Enabled: true, Trial Rule: false " key: "Epl Rule: @RSAAlert select * from Event;" identity: "admin" userRole: "ROLE_ESA_ADMINISTRATOR"`
- **Update log example:** `2016-03-10 14:19:37,951 deviceVersion: "10.6.1.0-SNAPSHOT" deviceService: "EVENT_STREAM_ANALYSIS" category: SYSTEM operation: "UPDATE RULE" parameters: "Epl Module Identifier: 56e1f2adbee8290008241296, Esper Instance: default, Rule Enabled: true , Trial Rule: false " key: "Epl Rule: @RSAAlert select * from Event;" identity: "admin" userRole: "ROLE_ESA_ADMINISTRATOR`
- **Delete log example:** `2016-03-10 14:19:37,951 deviceVersion: "10.6.1.0-SNAPSHOT" deviceService: "EVENT_STREAM_ANALYSIS"category: SYSTEM operation: "DELETE RULE" parameters: "Epl Module Identifier: 56e1f2adbee8290008241296, Esper Instance: default, Rule Enabled: true , Trial Rule: false " key: "Epl Rule: @RSAAlert select * from Event;" identity: "admin" userRole: "ROLE_ESA_ADMINISTRATOR "`

Each log contains the following parameters:

- Time stamp: Time the rule was modified. Example: 2016-03-10 14:19:37,951
- DeviceVersion: Version of your ESA device. Example: "10.6.1.0-SNAPSHOT"
- DeviceService: Example: EVENT_STREAM_ANALYSIS
- Category: Example: SYSTEM
- Operation:Example: DELETE/CREATE/UPDATE RULE
- Parameters: Placeholder for the following keys:
- Epl Module Identifier: unique identifier for the rule. Example: 56e1f2adbee8290008241296

- Esper Instance: Esper instance on which rule is deployed. Example: default
- Rule Enabled: Displays if the rule is enabled or not. Example: Rule Enabled: true
- Trial Rule: Displays if the rule is configured as a trial rule or not. Example: Trial Rule: false
- Epl Rule: Displays the rule syntax. Example:

  ```
  @RSAAlert select * from Event;" identity: "admin" userRole: "ROLE_
  ESA_ADMINISTRATOR+ROLE_ESA_ADMINISTRATOR+ROLE_ESA_ADMIN"
  ```

- Identity: Example: “admin"
- userRole: Example: "ROLE_ESA_ADMINISTRATOR"

Note: When a rule is disabled, two logs are generated for the same rule. First a ‘Delete Rule’ [Rule enabled attribute = true] audit log is created, followed by a ‘Create Rule’ [Rule enabled attribute =false] audit log.

Verify ESA Server Version

To verify the ESA Server version:

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press ENTER:

   ```
   rpm -qa | grep rsa-nw-esa-server
   ```

   The ESA server version is displayed.

Verify MongoDB Version

To verify the MongoDB version:

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press ENTER:

   ```
   mongo --version
   ```

   The MongoDB version is displayed.

Verify MongoDB Status

To verify the MongoDB status:

1. Use ssh to connect to the ESA service and log in as the root user.
2. Type the following command and press ENTER:

   ```
   systemctl status mongod
   ```

3. Run the following command if MongoDB is not running.

   ```
   systemctl start mongod
   ```

References

This section is a collection of references, which describe the user interface for ESA Configuration in NetWitness Suite.

See the following topics for details:

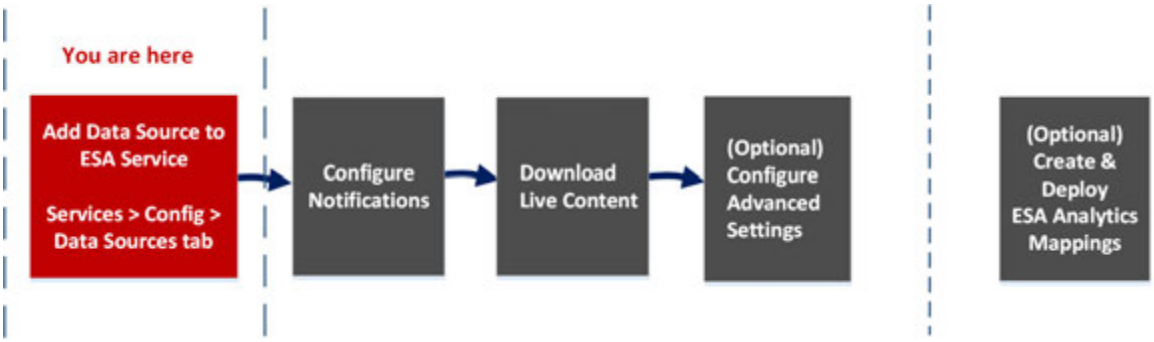
- Services Config View Advanced Tab
- Services Config View Data Sources Tab
- ESA Analytics Mappings
- Module Settings
- Whois Lookup Service Configuration

Services Config View Data Sources Tab

The **Services Config view > Data Sources** tab of an ESA service enables you to configure the sources that ESA uses to analyze data. An ESA service ingests data from Concentrators to detect incidents and alert analysts to potential threats.

Workflow

This workflow shows the overall process for configuring ESA. It also shows where configuring data sources is located in the process.



ESA has two services, the Event Stream Analysis service (ESA Correlation Rules) and the Event Stream Analytics Server service (ESA Analytics). The first four procedures shown pertain to configuring the Event Stream Analysis service:

- Add Data Source to ESA Service
- Configure Notifications
- Download Live Content
- (Optional) Configure Advanced Settings

The last procedure is separate from the others and pertains to creating mappings for the ESA Analytics services to start automatically detecting advanced threats:

- (Optional) Create and Deploy ESA Analytics Mappings

What do you want to do?

Role	I want to ...	Show me how
Administrator	Add a Concentrator as a data source to the Event Stream Analysis Service *	See Configure ESA Correlation Rules and Step 1. Add a Data Source to an ESA Service
Administrator	Configure Notifications	See "Notification Methods" in the *Alerting Using ESA Guide*.
Administrator	Download Live Content	See "Live Search View" in the *Live Resource Management Guide*.
Administrator	Configure Advanced Settings	Step 2. Configure Advanced Settings for an ESA Service

*You can complete these tasks here (that is in the Services Config view Data Sources tab).

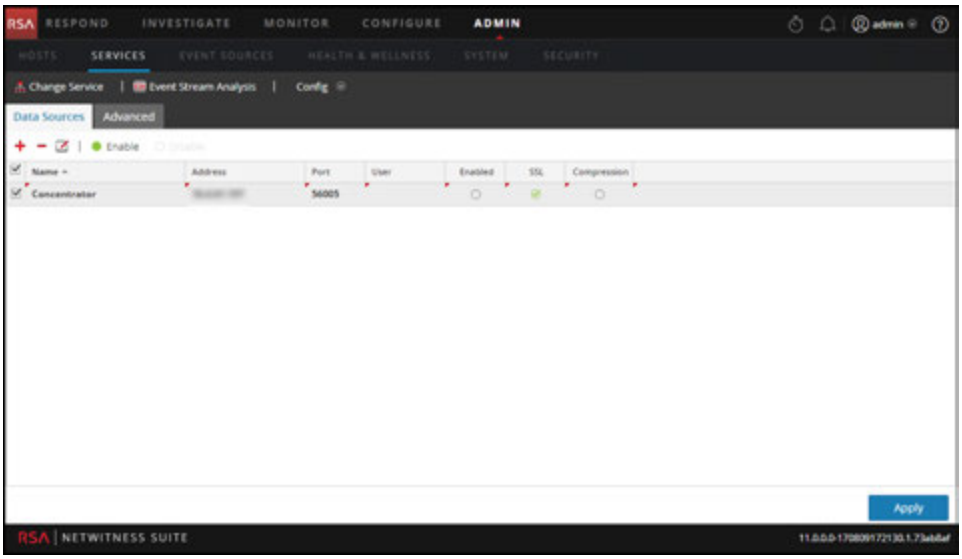
Related Topics

- See "Add or Update a Host" in the *Host and Services Getting Started Guide*

Quick Look

To access the Data Sources tab, go to **ADMIN > Services >** (Select an ESA service) >  > **View > Config**.

The following figure shows the Services Config view Data Sources tab for an ESA service.



Toolbar

The following table describes the options in the toolbar.

Option	Description
+	Adds a new data source to the ESA service.
−	Deletes a data source from the ESA service.
	Edits a data source. You must have the username and password credentials for the service in order to make changes.
Enable	Enables the selected data source.
Disable	Disables the selected data source.

Data Sources

The Data Sources list shows all of the data sources added to the ESA service. The following table describes the columns the Data Sources list.

Column	Description
Name	The name of the data source service.

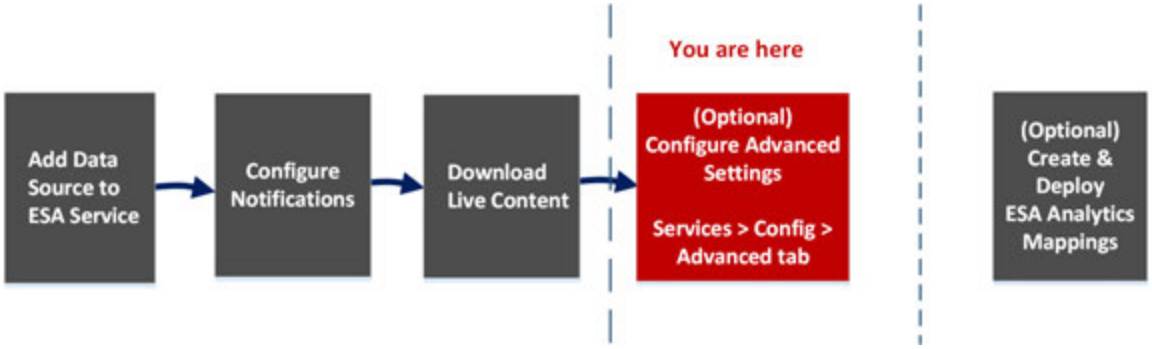
Column	Description
Address	The address of the data source service.
Port	The port used by the data source.
User	The user connected with the data source.
Enabled	Indicates if the data source is enabled.
SSL	Indicates if SSL communication is enabled.
Compression	Indicates if compression is enabled.

Services Config View Advanced Tab

The **Services Config view > Advanced** tab of an ESA service enables you to configure advanced settings. In the Advanced view, you can configure advanced settings to improve performance, to preserve events for rules with multiple events, to buffer events in memory, and to set the number of events to be stored on the ESA.

Workflow

This workflow shows the overall process for configuring ESA. It also shows where configuring advanced settings is located in the process.



ESA has two services, the Event Stream Analysis service (ESA Correlation Rules) and the Event Stream Analytics Server service (ESA Analytics). The first four procedures shown pertain to configuring the Event Stream Analysis service:

- Add Data Source to ESA Service
- Configure Notifications
- Download Live Content
- (Optional) Configure Advanced Settings

The last procedure is separate from the others and pertains to creating mappings for the ESA Analytics services to start automatically detecting advanced threats:

- (Optional) Create and Deploy ESA Analytics Mappings

What do you want to do?

Role	I want to ...	Show me how
Administrator	Add a Concentrator as a data source to the Event Stream Analysis Service	See Configure ESA Correlation Rules and Step 1. Add a Data Source to an ESA Service

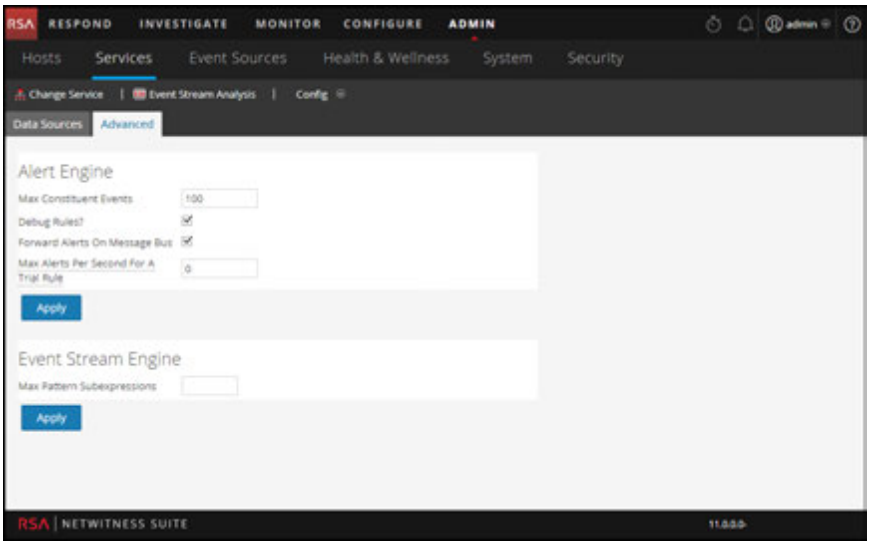
Quick Look

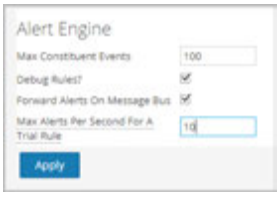
To access the Advanced tab, go to **ADMIN > Services >** (Select an ESA service) >  > **View > Config**.

The following figure shows the Services Config view Advanced tab for an ESA service.



Alert Engine Settings

In the Alert Engine section, you specify values to preserve events for rules that choose multiple events. The following figure shows the Alert Engine section.



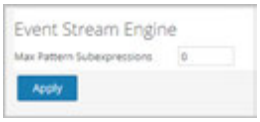
The following table lists the parameters in the Alert Engine section and their descriptions.

Parameter	Description
Max Constituent Events	For rules that choose multiple events, this configuration value decides how many of the associated events are preserved. For example, if a rule fires an alert with 200 associated events and this parameter is set to 100, only the first 100 are preserved by ESA, the rest are dropped. The default value is **100**.
Debug Rules?	Selecting enables debugging rules.
Forward Alerts On Message Bus	To forward ESA alerts for NetWitness Respond, you must select this option. The ESA alerts generated will be sent to the Message Bus and subsequently to Respond. This option is selected by default. You may want to ensure that the Respond Server service is running.

Parameter	Description
Max Alerts Per Second for a Trial Rule	You can specify the maximum number of alerts to be forwarded to the Message Bus for the trial rule. For example, if the value is set to **50**, only 50 alerts will be forwarded to the Message Bus for the trial rule. If the value is set to **0**, then the alerts generated by the trial rule will not be forwarded to the Message Bus. The default value is **10**.

Event Stream Engine Settings

In the Event Stream Engine section, you specify details to improve performance. The following figure shows the Event Stream Engine section.



The following table lists the parameter in the Event Stream Engine section and its description.

Parameter	Description
Max Pattern Subexpressions	Certain rules require ESPER to maintain subexpressions in memory before deciding to fire them or not. These subexpressions consume memory and if left unchecked may cause the service to go down with memory exhaustion. This parameter is a safety measure that keeps such memory hogging rules under check. If a rule exceeds the specified number of subexpressions, its processing is delayed. The default value is **0** which means this setting is disabled. You must set a value if there are service stability issues.

Whois Lookup Service Configuration

In theWhois Lookup Configuration panel (ADMIN > System > Whois), you configure a connection to the Whois Lookup service for your preconfigured ESA Analytics modules used in RSA Automated Threat Detection. The Whois Service enables you to get accurate data about domains that you connect to. In order to ensure effective scoring, it is important that you configure the Whois service settings.

You must have an RSA Live account to use this service.

If you configured a Live account in the Live Services panel (ADMIN > System > Live Services), the Whois Lookup Service is automatically configured for you. You just need to check the connection of the Whois Lookup service.

Note: If you do not have an RSA Live account, you can create one at the RSA Live Registration Portal:
https://cms.netwitness.com/registration/
The *Live Services Management Guide* provides additional information.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure the Whois Lookup service.	Configure the Whois Lookup Service
Administrator	Check the connection of the Whois Lookup service.	Configure the Whois Lookup Service

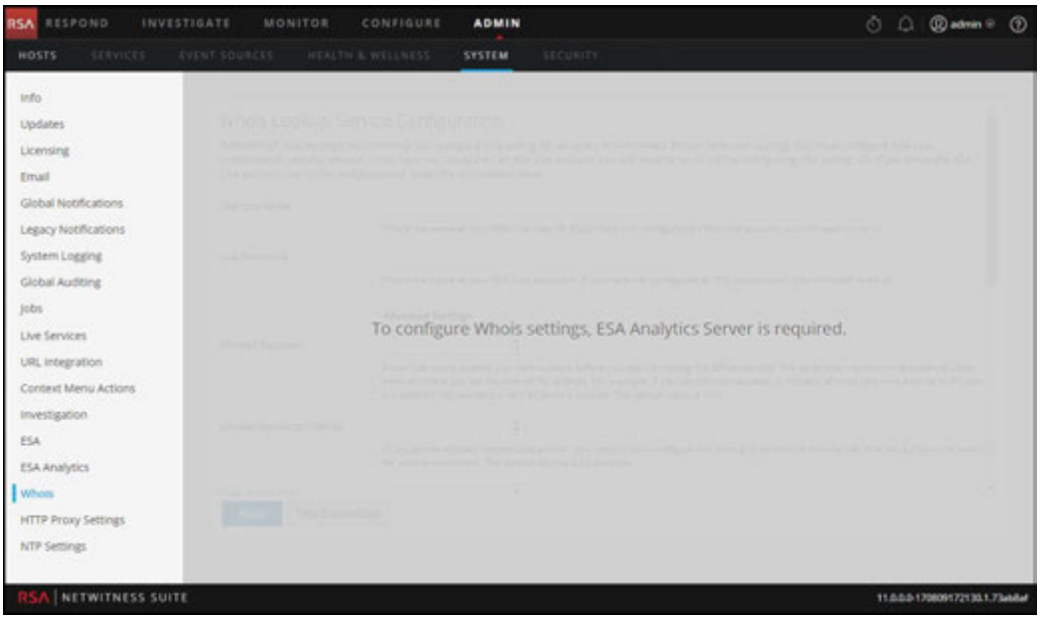
Related Topics

- ESA Analytics Mappings

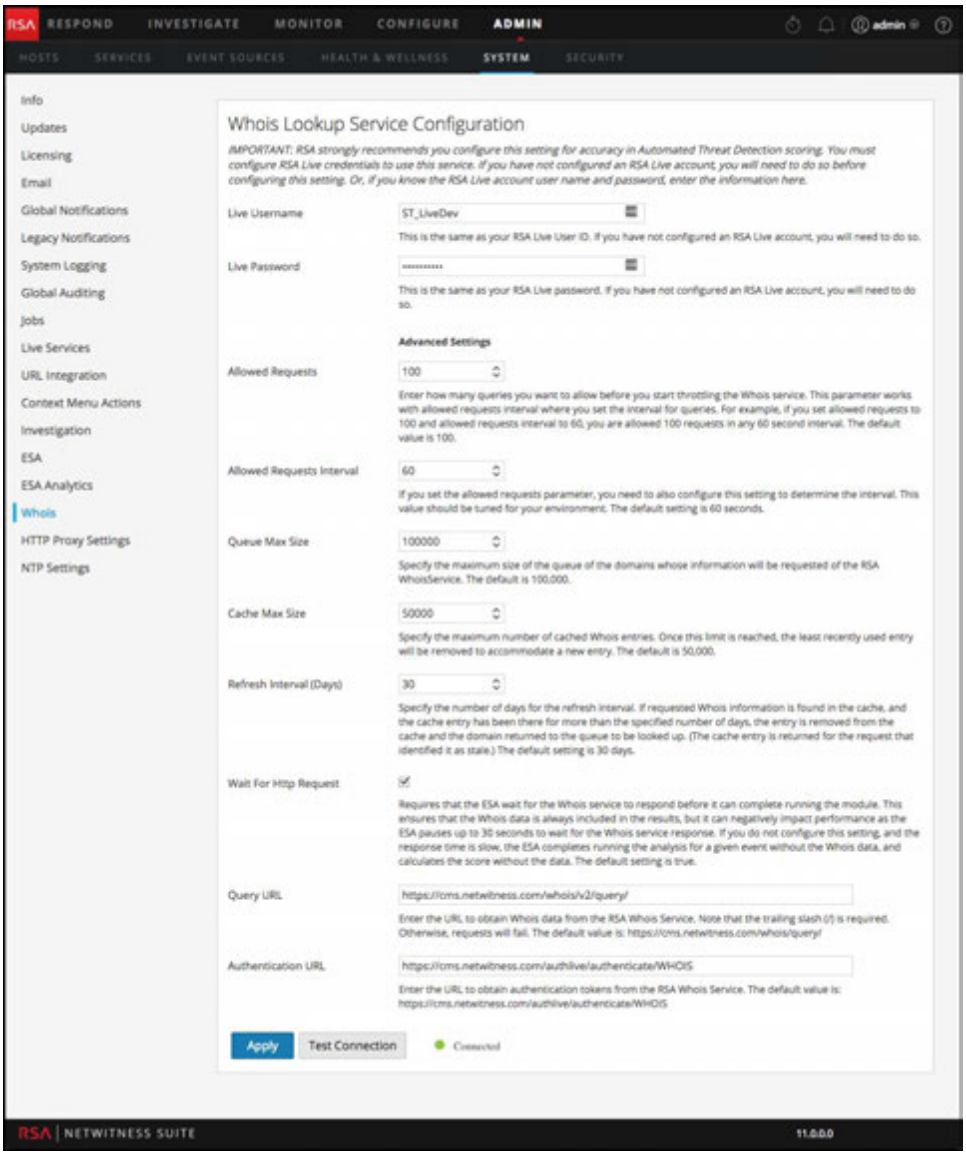
Whois Lookup Service Configuration

To access the Whois Lookup Service Configuration, go to ADMIN > System and in the options panel, select Whois.

The ESA Analytics Server service must be available (shows a green circle) in the ADMIN > Services view. If you do not have an ESA Analytics Server service available, you will see the following panel.



If you have an ESA Analytics Server service available, you will see the following panel.



The following table describes the listed Whois Lookup Service configuration settings.

Parameter	Description
Live Username	**Required only if you did not already configure the Whois Lookup service.** Enter the authentication credential for the RSA Whois Server. This is the same as your RSA Live User ID. If you have not configured an RSA Live account, you will need to do so. The default value is "whois."

Parameter	Description
Live Password	**Required only if you did already configure the Whois Lookup service.** Enter the authentication credential for the RSA Whois Server. This is the same as your RSA Live password. If you have not configured an RSA Live account, you will need to do so. The default value is null.
Allowed Requests	(Optional) Enter how many queries you want to allow before you start throttling the Whois service. This parameter works with **Allowed Requests Interval** (in seconds), where you set the interval for queries. For example, if you set **Allowed Requests** to 100 and **Allowed Requests Interval** to 60, you are allowed 100 requests in any 60 second interval. The default value is 100.
Allowed Requests Interval	(Optional) If you set the **Allowed Requests** parameter, you need to also configure this setting to determine the interval. This value should be tuned for your environment. The default setting is 60 seconds.
Queue Max Size	(Optional) Specify the maximum size of the queue of the domains whose information will be requested of the RSA WhoisService. The default is 100,000.
Cache Max Size	(Optional) Specify the maximum number of cached Whois entries. Once this limit is reached, the least recently used entry will be removed to accommodate a new entry. The default is 50,000.
Refresh Interval Days	(Optional) Specify the number of days for the refresh interval. If requested Whois information is found in the cache, and the cache entry has been there for more than the specified number of days, the entry is removed from the cache and the domain returned to the queue to be looked up. (The cache entry is returned for the request that identified it as stale.) The default setting is 30 days.
Wait For HTTP Request	(Optional) Requires that the ESA wait for the Whois service to respond before it can complete running the module. This ensures that the Whois data is always included in the results, but it can negatively impact performance as the ESA pauses up to 30 seconds to wait for the Whois service response. If you do not configure this setting, and the response time is slow, the ESA completes running the analysis for a given event without the Whois data, and calculates the score without the data. The default setting is **true**.

Parameter	Description
Query URL	(Optional) Enter the URL to obtain Whois data from the RSA Whois service. The trailing slash ('/') is required. Otherwise, requests will fail. The default value is: **https://cms.netwitness.com/whois/v2/query/**
Authentication URL	(Optional) Enter the URL to obtain authentication tokens from the RSA Whois service. The default value is: **https://cms.netwitness.com/authlive/authenticate/WHOIS**

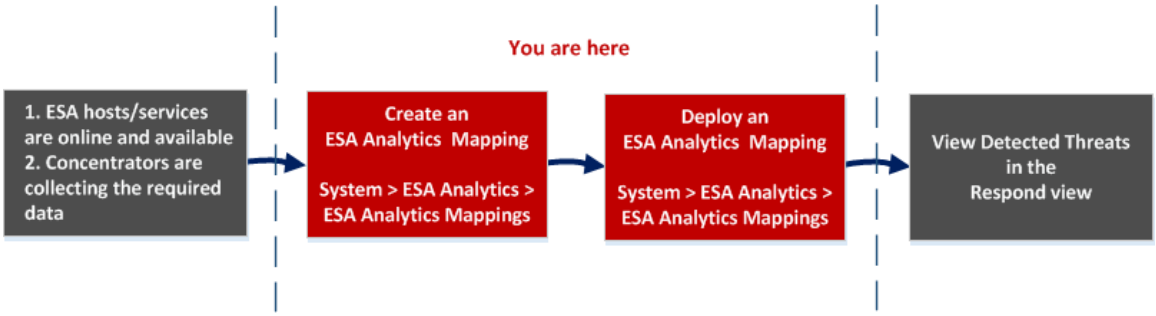
ESA Analytics Mappings

In the ESA Analytics Mappings panel (ADMIN > System > ESA Analytics), you define how the RSA Automated Threat Detection functionality should automatically detect advanced threats. You can analyze the data that resides on one or more Concentrators by selecting a preconfigured ESA Analytics module.

To better utilize your network resources and reduce unnecessary data flow, you can map multiple data sources, such as Concentrators, to available ESA Analytics services in order to process data more efficiently and take advantage of additional capacity.

Workflow

This workflow shows the process for creating and enabling an ESA Analytics mapping to start automatically detecting advanced threats.



Before you create an ESA Analytics mapping, ensure that the ESA hosts and services that you want to use for your mappings are online and available. All of the services need to be in sync with a consistent time source. Also ensure that the Concentrators are collecting the required data. When you create an ESA Analytics mapping, you select an ESA Analytics module to map, such as Suspicious Domains. Then you select the data sources, such as Concentrators, to use for that module along with an ESA Analytics service to process the data. When you are ready to start aggregating data, you deploy the mapping. Analysts can view detected threats for that module in the Respond view.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Verify that the ESA hosts and services are online and available.	ADMIN > HOSTS and ADMIN > SERVICES See *Hosts and Services Getting Started Guide*.
Administrator	Ensure that the Concentrators are collecting the required data.	See *Broker and Concentrator Configuration Guide*
Administrator	Create ESA Analytics mappings*	Mapping ESA Data Sources to Analytics Modules
Administrator	Deploy ESA Analytics mappings*	Mapping ESA Data Sources to Analytics Modules
Administrator, Analyst	View detected threats	See *NetWitness Respond User Guide*.

*You can complete these tasks here (that is in the ESA Analytics Mappings panel).

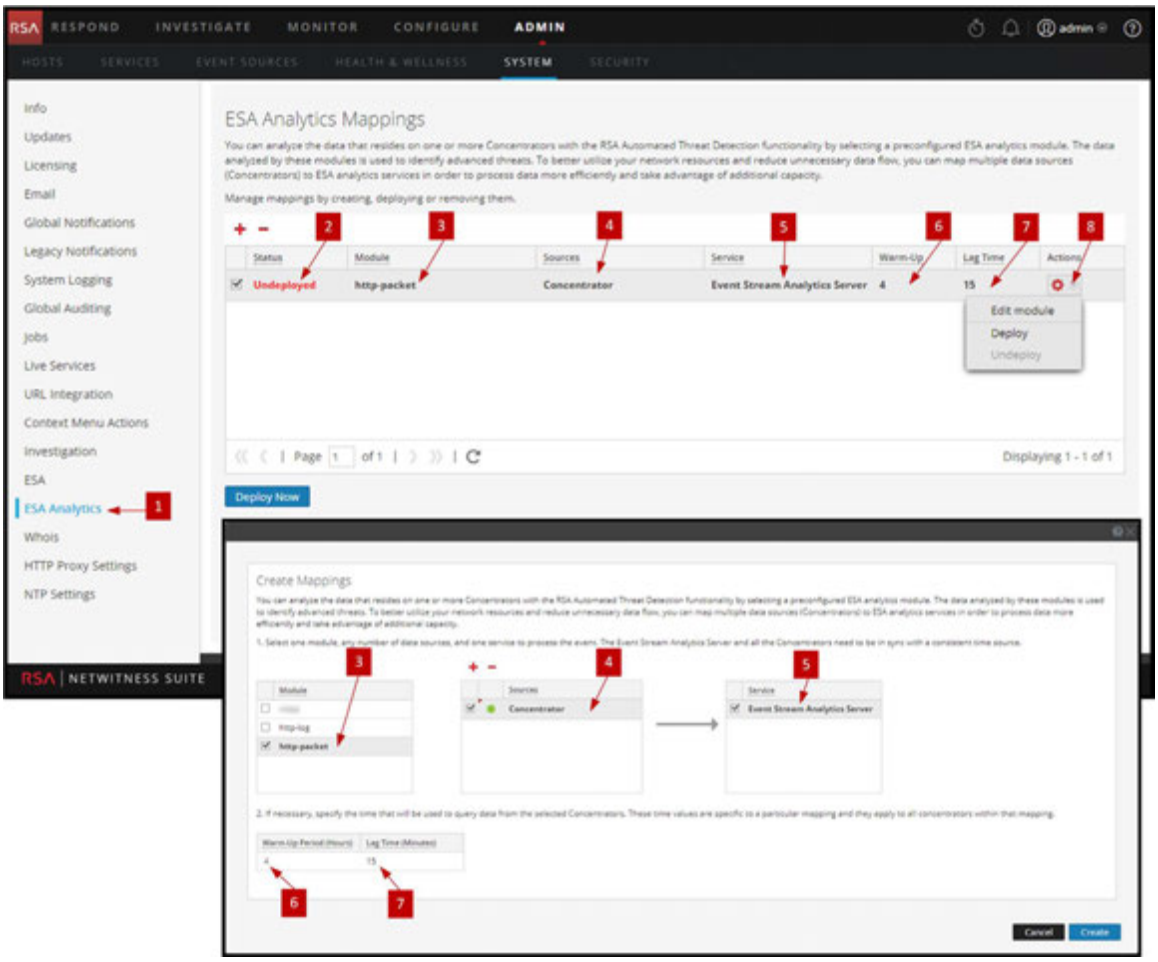
Quick Look

The following example illustrates an ESA Analytics mapping. The configuration defines the data sources for the selected module and the ESA Analytics service that will process the events from those data sources.



1	Displays the ESA Analytics Mappings panel.
2	Shows the status of the ESA Analytics mapping.
3	The name of the module that is mapped.
4	Data sources, such as Concentrators, assigned to the mapping.
5	ESA Analytics service that processes the data for the mapping.
6	Warm-up period configuration (in hours) on the data sources for the mapping.
7	Lag configuration (in minutes) on the data sources for the mapping.
8	Actions for changing module settings, deploying module mappings, and undeploying module mappings.

Toolbar

The following table describes the toolbar actions.

Icon / Button	Description
	Opens the Create Mappings dialog where you can create an ESA Analytics mapping. Create a separate mapping for each module. After creating and reviewing the mappings, you deploy them.
	Deletes an ESA Analytics Mapping. • You can delete a mapping with a status of Undeployed at any time. Since a mapping in the Undeployed state is not deployed and is not running, it does not affect data aggregation. • Deleting a deployed mapping clears the configuration on the ESA server, reverts the deployment for that mapping, and stops pulling data from the data source for that module. You should undeploy a mapping with a status of Deployed before deleting it.
Deploy Now	After you create your mappings, you need to deploy them in order to start aggregating data for the modules. You can select one or more mappings with a status of Undeployed to deploy.

Note: If you want to make changes to a deployed mapping, such as adding or removing Concentrators or changing the service, you must undeploy and delete the existing mapping and then create and deploy a new mapping for that module.

ESA Analytics Mappings

The following table describes the listed ESA Analytics mappings.

Title	Description
	To select an individual mapping, select the checkbox next to the mapping.
Status	Shows the status of the mapping. There are two statuses: **Undeployed** - An undeployed mapping maps an ESA Analytics module to sources and an ESA Analytics service. It does not start aggregating data for the module until you deploy the mapping. **Deployed** - A deployed mapping is deployed and running. In a deployed mapping, the selected ESA Analytics service uses query-based aggregation to collect the appropriate filtered events for the selected module from the Concentrators.

Title	Description
Module	Indicates the selected ESA Analytics module. An ESA Analytics module is a pipeline composed of activity objects that enrich an event with additional information through mathematical computations. The module resides within the ESA Analytics service.
Sources	Sources are the data sources, such as Concentrators, from which ESA will aggregate the data for the specified module.
Service	Indicates the ESA Analytics service that will process the data for the specified module. The selected service needs to be in sync with a consistent time source.
Warm-Up Period (Hours)	Specifies a warm-up duration (in hours). A warm-up period is required to allow Automated Threat Detection to "learn" your traffic. The warm-up period should run when typical traffic is running. During this time, alerting for your module mapping is suppressed. The Warm-up Period primes the module with historical data and guarantees that the specified number of hours of data collection completes before sending alerts. RSA provides preconfigured ESA Analytics modules. Each module type has a default warm-up period defined, which you can adjust to your environment, if necessary. After this warm-up period, alerts can be viewed. For more information about Warm-up Period and Lag time, see Module Settings.

Title	Description
Lag Time (Minutes)	Specifies a constant time delay in minutes, which is added to avoid losing events being processed by the data sources during periods of heavy activity. For example, Concentrator performance varies depending on factors such as incoming load, ongoing queries, and indexing. Due to these factors, a Concentrator may not aggregate events in real-time, which leads to the delay. The Lag parameter gives the Concentrator a chance to finish aggregating all of the data. After the warm-up period completes, data aggregation continues at **Current (System) Time - Lag Time**. This is useful when a Concentrator is slow in aggregating data. The Lag time guarantees that the module does not process data that arrives to the Concentrator within the Lag time window so there is adequate delay to ensure all events that get generated in the enterprise can be processed by the module. For example, if Lag time is 30 minutes, and the current time is 2:00 PM, the Concentrator starts pulling records at 1:30 PM. The Lag time window, 30 minutes in this example, remains constant as time advances. When the current time advances to 2:01 PM, the Concentrator pulls the next minute of data at 1:31 PM, and so on. **Important**: The Lag time defines the buffer between the current time and the time when the module ingests the data. **Caution:** RSA recommends that Administrators adjust the Lag parameter dynamically based on the performance of each of the individual Concentrators to avoid missing any events during aggregation. For more information about Warm-up Period and Lag time, see Module Settings.
	Enables you to select additional actions for the selected module mapping: • **Edit Module** - Enables you to configure the warm-up period and lag time for the selected module mapping. • **Deploy** - Deploys the selected module mapping. The specified ESA Analytics service starts pulling data from the data sources for that module. • **Undeploy** - Undeploys the selected module mapping. The specified ESA Analytics service stops pulling data from the data sources for that module. **Caution:** Undeploying a mapping with a status of Deployed will affect data aggregation for that module.

Module Settings

After you create or deploy a module mapping in the ESA Analytics Mappings panel (ADMIN > System > ESA Analytics), you have the option to change some module configurations for that mapping.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Change the warm-up period for an undeployed module mapping.	Change the Warm-up Period and Lag Time
Administrator	Change the warm-up period for a module mapping during the warm-up period.	Change the Warm-up Period and Lag Time
Administrator	Change the warm-up period for a module mapping after the warm-up period is complete.	Change the Warm-up Period and Lag Time

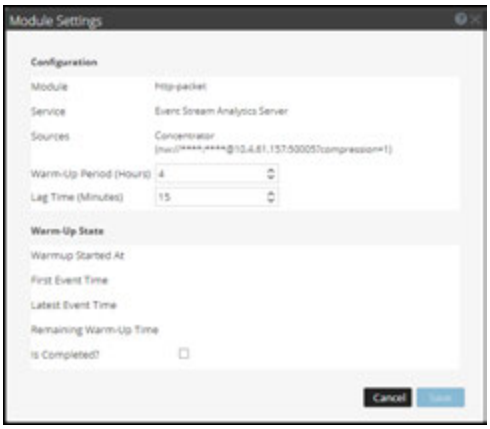
Module Settings

To access the module settings, in the ESA Analytics Mappings panel, select the mapping that you want to change and in the **Actions** column, select > **Edit Module**. The Module Settings dialog has a Configurations section and a Warm-Up State section.



Configurations

The Configurations section enables you to change the Warm-Up Period and Lag Time configurations.

The following table describes the settings available for an ESA Analytics module mapping.

Field	Description
Module	Shows the name of the mapped module.
Service	Shows the ESA Analytics service that processes the data for the mapping.
Sources	Shows the mapped data sources and the URLs used to communicate with ESA.
Warm-Up Period (Hours)	Specifies a warm-up duration in hours. A warm-up period is required to allow Automated Threat Detection to "learn" your traffic. The warm-up period should run when typical traffic is running. During this time, alerting for your module mapping is suppressed. The Warm-up Period primes the module with historical data and guarantees that the specified number of hours of data collection completes before sending alerts. RSA provides preconfigured ESA Analytics modules. Each module type has a default warm-up period defined, which you can adjust to your environment, if necessary. After this warm-up period, alerts can be viewed. You can update the Warm-Up Period of a deployed module mapping depending on whether or not the warm-up period is complete: • **During the warm up period** - You can add hours to the warm-up period or subtract any remaining warm-up time. • **The warm-up period is complete** - You can add hours to the warm-up period by adding the difference between the current time and the First Event Time to the hours that you want to add. For example, a warm-up period of 10 hours is complete and the First Event Time shows 12:00:00. The current (system) time is 16:00:00 (4 hours later) and you want to add 5 more hours to the warm-up time. To do this, you need to add 9 hours (4+5=9) to the warm-up period of 10, so you would set the new warm-up period to 19 hours. You cannot decrease the warm-up period if it is complete, unless you delete the mapping and create a new one. The Warm-up Period value is specific to a particular mapping and it applies to all Concentrators within that mapping after you deploy it. If a Concentrator is shared between two modules with different warm-up times, the Concentrator uses separate Warm-up Period values for each module mapping.

Field	Description
Lag Time (Minutes)	Specifies a constant time delay in minutes, which is added to avoid losing events being processed by the data sources during periods of heavy activity. For example, Concentrator performance varies depending on factors such as incoming load, ongoing queries, and indexing. Due to these factors, a Concentrator may not aggregate events in real-time, which leads to the delay. The Lag parameter gives the Concentrator a chance to finish aggregating all of the data. When you specify a Lag time, the first time the module deploys, data aggregation starts at **Current (System) Time - Lag Time - Warm-Up Time**. For example, if the current time is 2:00 PM, Lag time is 30 minutes, and Warm-up time is 4 hours, when the module deploys for the first time, data collection starts at 9:30 AM (2:00 PM - .5 hour - 4 hours). After the warm-up period completes, data aggregation continues at **Current (System) Time - Lag Time**. This is useful when a Concentrator is slow in aggregating data. The Lag time guarantees that the module does not process data that arrives to the Concentrator within the Lag time window so there is adequate delay to ensure all events that get generated in the enterprise can be processed by the module. For example, if Lag time is 30 minutes, and the current time is 2:00 PM, the Concentrator starts pulling records at 1:30 PM. The Lag time window, 30 minutes in this example, remains constant as time advances. When the current time advances to 2:01 PM, the Concentrator pulls the next minute of data at 1:31 PM, and so on. **Important**: The Lag time defines the buffer between the current time and the time when the module ingests the data. The Lag time value is specific to a particular mapping and it applies to all Concentrators within that mapping after you deploy it. If a Concentrator is shared between two modules with different Lag times, the Concentrator uses separate Lag values for each module mapping. **Caution:** RSA recommends that Administrators adjust the Lag parameter dynamically based on the performance of each of the individual Concentrators to avoid missing any events during aggregation. To determine the correct Lag Time, add together the following to get an environmental lag time: 1. **Log or Packet Latency** - This is the time it takes for the Log Decoder to receive the logs or the (Packet) Decoder to receive packets. For example, the Log Decoder may get logs every 20 minutes. In this case, you would want to set Lag time to at least 20 minutes, preferably 25 minutes, so that you do not miss events. 2. **Aggregation Latency** - This is the time it takes to get the data from the Log

Field	Description
	Decoder to the Concentrator. 3. **Other Buffer** - Add in any additional time delay specific to your environment.

Warm-Up State

The Warm-Up State section provides information about the warm-up state, which you can use to determine the appropriate adjustments to the warm-up period.

Field	Description
Warmup Started At	The time when the first event was processed by the ESA Analytics module from the data source.
First Event Time	The time that the first event occurred. The warm-up time is based on this time.
Latest Event Time	The time that the latest event occurred.
Remaining Warm-Up Time	The number of hours remaining in the warm-up period.
Is Completed?	Indicates whether the warm-up period is complete. If it is true, the warm-up period is complete. If it is false, the module is still warming up and you can view the number of hours remaining in the Remaining Warm Up Time field.

How Malware Analysis Works

NetWitness Suite Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows portable executable (PE), PDF, and MS Office) to assess the likelihood that a file is malicious.

Malware Analysis detects indicators of compromise using four distinct analysis methodologies:

- Network Session Analysis (network)
- Static File Analysis (static)
- Dynamic File Analysis (sandbox)
- Security Community Analysis (community)

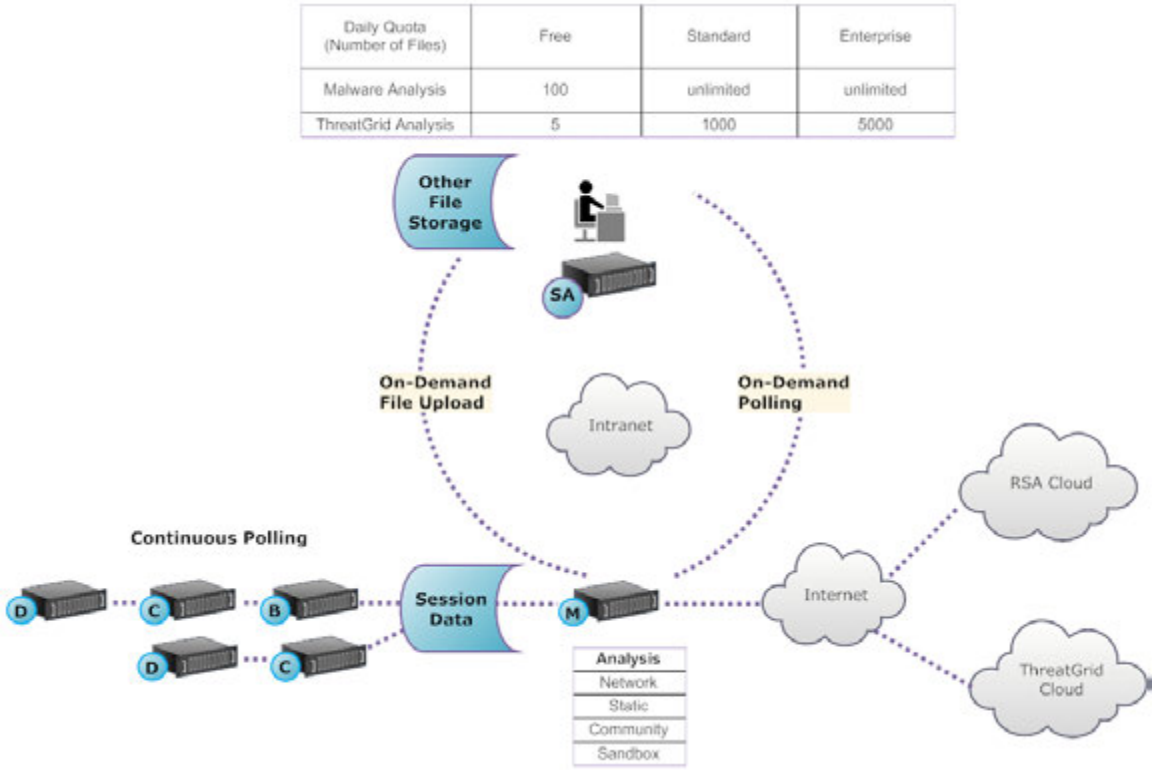
Each of the four distinct analysis methodologies is designed to compensate for inherent weaknesses in the others. For example, Dynamic File Analysis can compensate for Zero-Day attacks that are not detected during the Security Community Analysis phase. By avoiding malware analysis that strictly focuses on one methodology, the analyst is more likely to be shielded from false negative results.

In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language, which allows malware researchers to identify and classify malware samples. This allows IOC authors to add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live. These YARA-based IOCs in RSA Live will automatically be downloaded and activated on the subscribed host, to supplement the existing analysis that is performed in each analyzed file.

Malware Analysis also has features that support alerts for Incident Management.

Functional Description

This figure depicts the functional relationship between the Core services (the Decoder, Concentrator, and Broker), the Malware Analysis service, and the NetWitness Server.



The Malware Analysis service analyzes file objects using any combination of the following methods:

- **Continuous automatic polling of a Concentrator or Broker** to extract sessions identified by a parser as potentially carrying malware content.
- **On-demand polling of a Concentrator or Broker** to extract sessions identified by a malware analyst as potentially carrying malware content.
- **On-demand upload of files** from a user-specified folder.

When automatic polling of a Concentrator or Broker is enabled, the Malware Analysis service continuously extracts and prioritizes executable content, PDF documents, and Microsoft Office documents on your network, directly from data captured and analyzed by your Core service. Because the Malware Analysis service connects to a Concentrator or Broker to extract only those executable files that are flagged as possible malware, the process is both rapid and efficient. This process is continuous and does not require monitoring.

When on-demand polling of a Concentrator or Broker is chosen, the malware analyst uses Investigation to drill into captured data and choose sessions to be analyzed. The Malware Analysis service uses this information to automatically poll the Concentrator or Broker and to download the specified sessions for analysis.

On-demand upload of files provides a method for the analyst to review files captured external to the Core infrastructure. The malware chooses a folder location and identify one or more files to be uploaded and analyzed by Malware Analysis. These files are analyzed using the same methodology as files automatically extracted from network sessions.

Analysis Method

For the Network analysis, the Malware Analysis service looks for characteristics that seem to deviate from the norm, much as an analyst does. By looking at hundreds to thousands of characteristics and combining the results into a weighted scoring system, legitimate sessions that coincidentally have a few abnormal traits are dismissed, while the actual bad ones are highlighted. A user can learn patterns that indicate anomalous activity in the sessions as indicators that warrant further investigation, Indicators of Compromise.

The Malware Analysis service can perform Static analysis against suspicious objects it finds on the network and determine whether those objects contain malicious code. For Community analysis, new malware detected on the network is pushed to the RSA Cloud for checking against RSA's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. For Sandbox analysis, the services can also push data into major security, information and event management (SIEM) hosts (the ThreatGrid Cloud).

Malware Analysis has a unique method for analysis that is partnered with industry leaders and experts, so their technologies can enrich the Malware Analysis scoring system.

NetWitness Server Access to the Malware Analysis Service

The NetWitness Server is configured to connect to the Malware Analysis service and import tagged data for deeper analysis in Investigation. Access is based on three subscription levels.

- Free subscription: All NetWitness Suite customers have a free subscription, with a free trial key for ThreatGrid analysis. The Malware Analysis service is rate-limited to 100 file samples per day. The number of samples (within the set of files from above) submitted to the ThreatGrid Cloud for sandbox analysis is limited to 5 per day. If one network session had 100 files in it, customers would hit the rate limit after processing the one network session. If 100 files were manually uploaded, that would cause the rate limit to be reached.
- Standard subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 1000 per day.
- Enterprise subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 5000 per day.

Scoring Method

By default, the Indicators of Compromise (IOC) are tuned to reflect industry best practices. During analysis, the IOCs that trigger cause the score to move upward or downward to indicate the likelihood that the sample is malicious. The tuning of IOCs is exposed in NetWitness Suite so that the malware analyst can choose to override the assigned score or to disable an IOC from being evaluated. The analyst has the flexibility to either use the default tuning, or to completely customize the tuning to specific needs.

YARA-based IOCs are interleaved with the built-in IOCs within each built-in category and are not distinguished from native IOCs. When viewing IOCs in the Service Configuration view, administrators can select YARA from the Module selection list to see a list of YARA rules.

After a session is imported into NetWitness Suite, all of the viewing and analysis capabilities in Investigation are available to further analyze Indicators of Compromise. When viewed in Investigation, YARA IOCs are distinguished from the built-in native IOCs by the tag `Yara rule`.

Deployment

The Malware Analysis service is deployed as a separate RSA Malware Analysis host. The dedicated Malware Analysis host has an onboard Broker which connects to the Core infrastructure (either another Broker or a Concentrator). Prior to this connection, a collection of parsers and feeds must be added to the Decoders that are connected to the Concentrators and Brokers from which the Malware Analysis service pulls data. This allows suspicious data files to be marked for extraction. These files are `malware analysis` tagged content available through the RSA Live content management system.

Scoring Modules

RSA NetWitness Suite Malware Analysis analyzes and scores sessions and the embedded files within these sessions by scoring four categories: Network, Static Analysis, Community, and Sandbox. Each category comprises many individual rules and checks that are used to calculate a score between 1-100. The higher the score, the more likely the session is to be malicious and worthy of more in-depth follow-on investigation.

Malware Analysis can facilitate a historical investigation into events leading up to a network alarm or incident. If you know that a certain type of activity is taking place on your network, you can select only the reports of interest to examine the content of data collections. You can also modify behavior for each scoring category based on the scoring category or the file type (Windows PE, PDF, and Microsoft Office).

Once you become familiar with data navigation methods, you can explore the data more completely through:

- Searching for specific types of information
- Reviewing specific content in detail.

Category scores for Network, Static Analysis, Community, and Sandbox are maintained and reported independently. When events are viewed based on the independent scores, as long as one category detects malware, it is evident in the Analysis section.

Network

The first category examines each core network session to determine if the delivery of the malware candidates was suspicious. For example, benign software being downloaded from a well-known safe site, using proper ports and protocols, is considered less suspicious than downloading software known to be malicious from a known dubious download site. Sample factors used in the scoring of this criteria set may include sessions that:

- Contain threat feed information
- Connect to well-known bad sites
- Connect to high-risk domains/countries (for example, .cc domain)
- Use well-known protocols on non-standard ports
- Contain obfuscated JavaScript

Static Analysis

The second category analyzes each file in the session for signs of obfuscation in order to predict the likelihood of the file behaving maliciously if allowed to run. For example, software that links to networking libraries is more likely to perform suspicious network activity. Sample factors used in the scoring of this criteria set may include:

- Files found to be XOR encoded
- Files found embedded within non-EXE formats (for example, PE file found embedded in a GIF format)
- Files linking to higher risk import libraries
- Files highly deviating from the PE Format

Community

The third category scores the session and files based on the collective knowledge of the security community. For example, files whose fingerprint/hash is already known to be good or bad by respected anti-virus (AV) vendors is scored accordingly. Files are also scored based on knowledge that a file was delivered from a site known to be good or bad by the security community.

Community scoring also indicates whether the AV on your network flagged the files as malicious. It does not indicate that the resident AV product acted to protect your system.

Sandbox

The fourth category examines the behavior of the software by actually running it in a sandbox environment. By running the software to watch its behavior, a score can be calculated by identifying well-known malicious activity. For example, software that configures itself to autostart on each reboot and make IRC connections would score higher than a file with no known bad behavior.

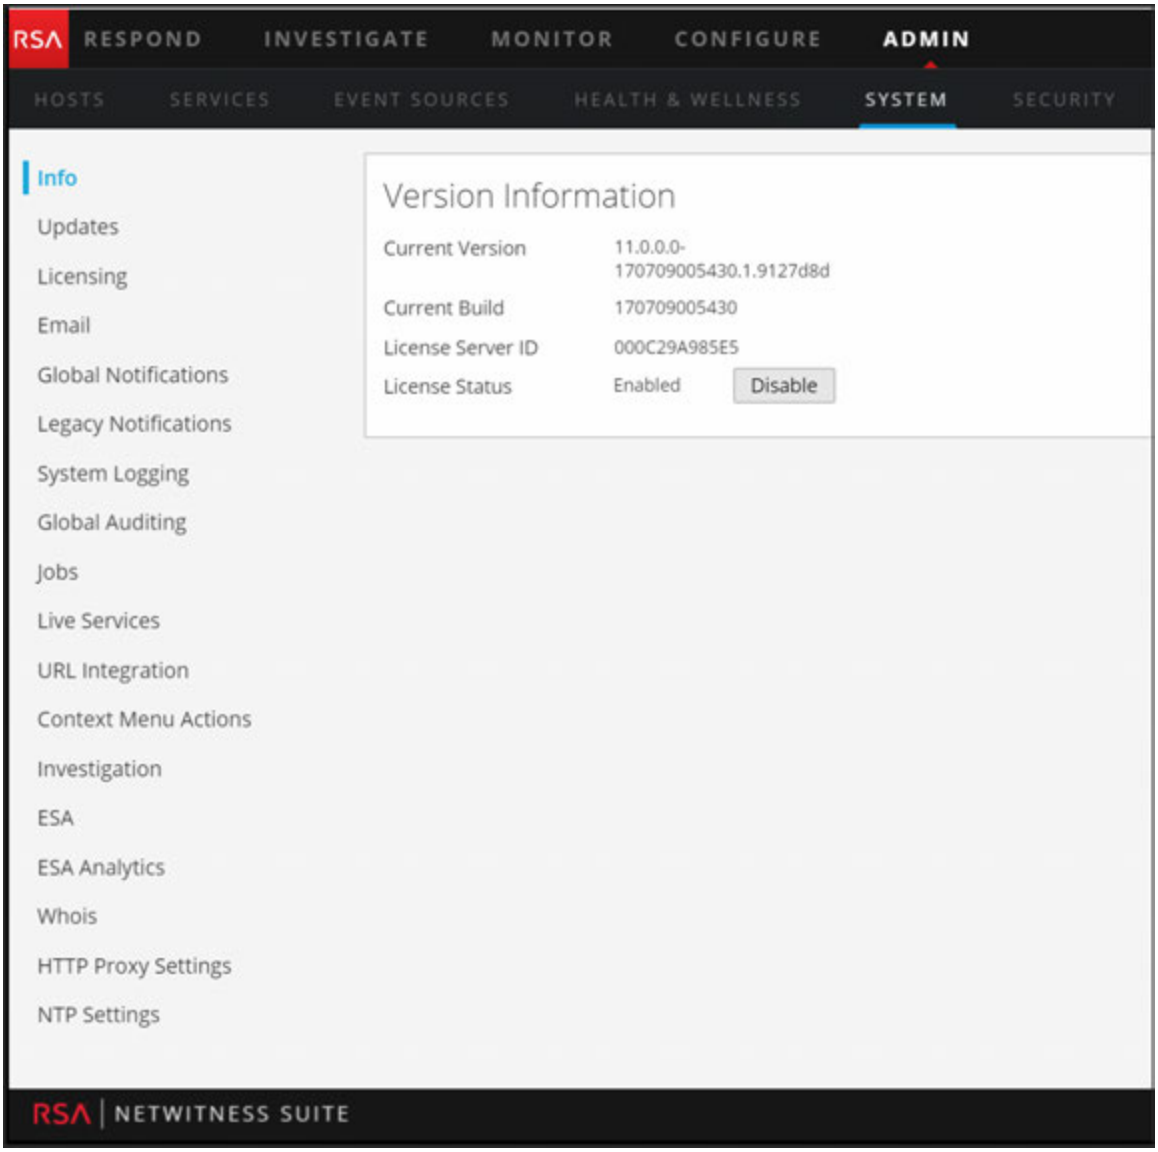
Roles and Permissions for Analysts

This topic identifies the user roles and permissions required for a user to conduct malware analysis in NetWitness Suite. If you cannot perform an analysis task or see a view, the administrator may need to adjust the roles and permissions configured for you.

Required Roles and Permissions

RSA NetWitness Suite manages security by providing access to views and functions using both system permissions and permissions on individual services.

On the system level, the user needs to be assigned a system role, in the Administration > System view, that provides access to specific views and functions.



The default `Malware_Analysts` role in NetWitness Suite 11.0 is assigned all of the permissions listed below. If necessary, an Administrator can create a custom role with some combination of the following permissions:

- Access Investigation Module (required)
- Investigation - Navigate Events
- Investigation - Navigate Values
- Access Incident Module
- View and Manage Incidents
- View Malware Events (to view events)
- File Download (to download files from the Malware Analysis service)
- Initiate Malware Scan (to initiate a one-time service scan or one-time file upload)
- Dashlet permissions for convenience: Dashlet - Investigate Top Values Dashlet, Dashlet - Investigate Service List Dashlet, Dashlet - Investigate Jobs Dashlet, Dashlet - Investage Shortcuts Dashlet.

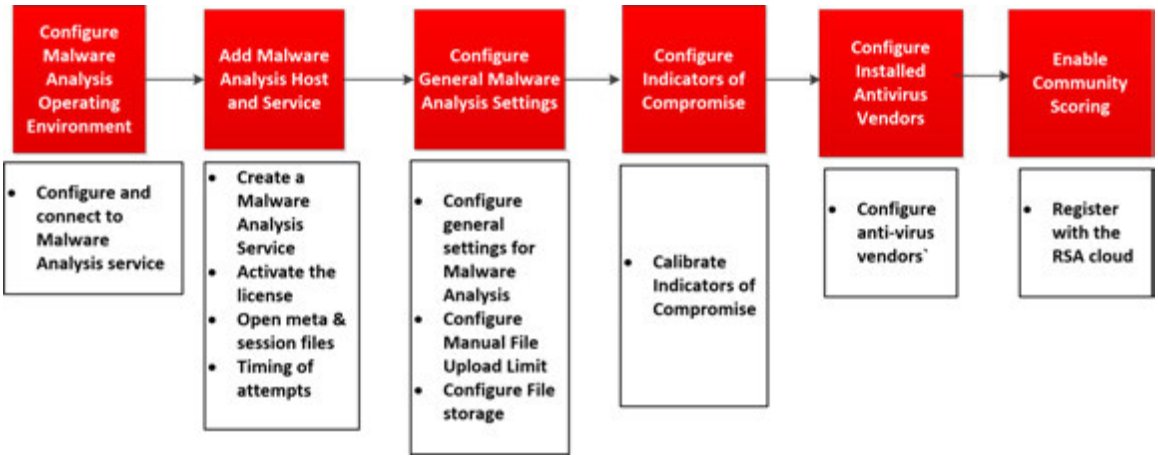
A use case for creating a custom role would be a Junior Malware Analyst role, with limited permissions that do not include the File Download permission.

On specific services, a malware analyst needs to be a member of the **Analysts** group, or to a group that has the two default permissions assigned to the Analyst group: **sdk.meta** and **sdk.content**. Users who have these permissions can use specific applications, run queries, and view content for purpose of analysis on the service.

Malware Analysis Configuration

Malware Analysis can operate as a service on a Decoder or as a service on a dedicated appliance. This guide includes instructions for setting up the operating environment and then configuring the Malware Analysis service. After this configuration is complete, analysts can conduct malware analysis.

These are the required configuration steps for Malware Analysis, and also for editing the configuration. Perform the steps in the section in the sequence they are given.



Basic Configuration Checklist

The following checklist provides the sequence for tasks that are required to configure Malware Analysis that has been added to NetWitness Suite in accordance with the *Hosts and Services Guide*.

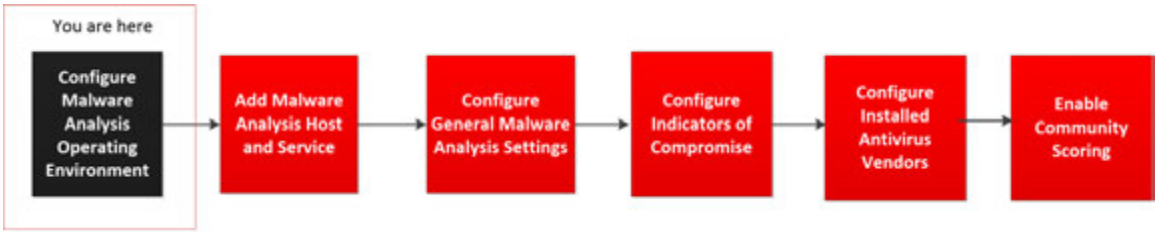
Step	High-Level Task
Step 1 - Configure Malware Analysis Operating Environment	Configure Malware Analysis Operating Environment This topic describes the procedures for configuring the environment to connect to the Malware Analysis service.

Step	High-Level Task
Step 2 - Add Malware Analysis Host and Service	Add Malware Analysis Host and Service **Note:** To complete this step you must have the NetWitness Suite License Server setup as described in the Licensing Guide. In NetWitness Suite, create a Malware Analysis service and activate the license. The default REST port is 60007. Sites that are using the free version of Malware Analysis must configure the service IP address as localhost or loopback.
Step 3 - Configure General Malware Analysis Settings	Configure General Malware Analysis Settings Configure the general settings for Malware Analysis. • Enable continuous polling. • Configure manual file upload limit. • Configure the file storage repository and database. • Calibrate the Static, Network, Community, and Sandbox scoring modules.
Step 4 - Configure Indicators of Compromise	Configure Indicators of Compromise Calibrate Indicators of Compromise that are applied for each scoring module (Static, Network, Community, Sandbox) and for YARA-based IOCs.
Step 5 - Configure Installed Antivirus Vendors	Configure Installed Antivirus Vendors Configure anti-virus vendors that you have installed.
Step 6 - Enable Community Scoring	Enable Community Scoring Register with the RSA cloud and test connections to enable Community scoring.

Step	High-Level Task
Step 7 - Configure Auditing on Malware Analysis Host	(Optional) Configure Auditing on Malware Analysis Host Configure auditing thresholds and enable syslog, snmp, and file auditing.
Step 8 - Configure Hash Filter	(Optional) Configure Hash Filter Configure hash filtering to fine tune Malware Analysis event analysis based on known good or bad file hashes.
Step 9 - Configure Malware Analysis Proxy Settings	(Optional) Configure Malware Analysis Proxy Settings (Optional) Configure Malware Analysis to communicate with the RSA Cloud through a web proxy instead of directly.
Step 10 - Register for a ThreatGrid API key	(Optional) Register for a ThreatGrid API Key Register for ThreatGrid API Key.

Step 1. Configure Malware Analysis Operating Environment

You can configure the NetWitness Suite operating environment to connect to a NetWitness Suite Malware Analysis service.



Malware Analysis operates as a service on a dedicated Malware Analysis appliance. If your site is using a dedicated appliance, do one of the following:

- If your site is adding a new dedicated NetWitness Suite Malware Analysis appliance, install the physical appliance in your network and configure the operating environment.

- If your site is upgrading a dedicated Spectrum appliance to a dedicated NetWitness Suite Malware Analysis appliance, re-image the Spectrum appliance as a Malware Analysis appliance.

Malware Analysis is dependent on the Core infrastructure to operate. The following steps are necessary before Malware Analysis can successfully analyze data.

1. Configure the onboard Broker on the Malware Analysis appliance to connect another Broker or Concentrator in the existing Core infrastructure.

   Note: If no Core infrastructure exists, only manually uploaded files can be analyzed.

2. Use NetWitness Suite Live to find all Live resources with the `malware analysis` tag and deploy these resources to each Decoder service that will be capturing traffic for Malware Analysis to analyze. NetWitness Suite uses this proprietary set of parsers and feeds to find events that are likely to be malware.
3. Configure communications ports. Malware Analysis requires a number of different communications ports to be open, including TCP/443 for HTTPS. These are described below in Network Connections.
4. Configure the NextGen source to which Malware Analysis will connect. This is the Broker or the Concentrator.
   Malware Analysis is now ready to begin analyzing network traffic.

Network Connections

The inbound and outbound network connections must be configured for the Malware Analysis appliance to properly communicate with services, RSA sources for software updates, and other critical information.

Your network firewall must be configured to allow the Malware Analysis access to the internet. Proxy servers may be used to facilitate these connections, if necessary.

Inbound Connections

TCP/22 - Secure Shell access to the Malware Analysis server to review log files and troubleshoot. Access can be limited to IP addresses that will be managing Malware Analysis.

- TCP/443 - HTTPS web-based connection to access the Malware Analysis user interface.
- TCP/50008 - JMX port for performance troubleshooting, using an application such as JVisualVM. This is optional and access can be limited to IP addresses that will be managing Malware Analysis.

Outbound Connections

- TCP/443 - HTTPS connections to SSL-based web servers. Some features include Malware Analysis sending files or documents to servers for analysis, which require a secure connection. Use of a web proxy server is supported.
- (TCP/443 - SSL connection from Malware Analysis to the RSA Cloud. Use of a SOCKS proxy server is supported. Customer infrastructure changes may be required to ensure that 443 is open to cloud.netwitness.com.)
- TCP/50103 - REST API port used to communicate with a Broker. (NetWitness Suite 10.3.x and earlier)
- TCP/50105 - REST API port used to communicate with a Concentrator. (NetWitness Suite 10.3.x and earlier)
- TCP/50003 TCP/56003 - Ports used to communicate with a Broker. (NetWitness Suite 10.4 and later)
- TCP/50005 TCP/56005 - Ports used to communicate with a Concentrator. (NetWitness Suite 10.4 and later)
- ICMP - JMS connection from NetWitness Suite to the Malware Analysis service to verify if the hostname and ip address entered is valid for a successful test connection.

Add Malware Analysis Host and Service

You can add a Malware Analysis host and service to NetWitness Suite. Your NetWitness Suite environment determines how you add a host. Refer to the basic instructions for adding a host (Add or Update a Host) in the Host and Services Getting Started Guide. Use the procedure in this section only if you need to add a Malware Analysis host manually.

Note: To complete this step you must have the NetWitness Suite License Server setup as described in the Licensing Guide.

- Add Malware Analysis host if there is a physical or virtual Malware Analysis appliance.

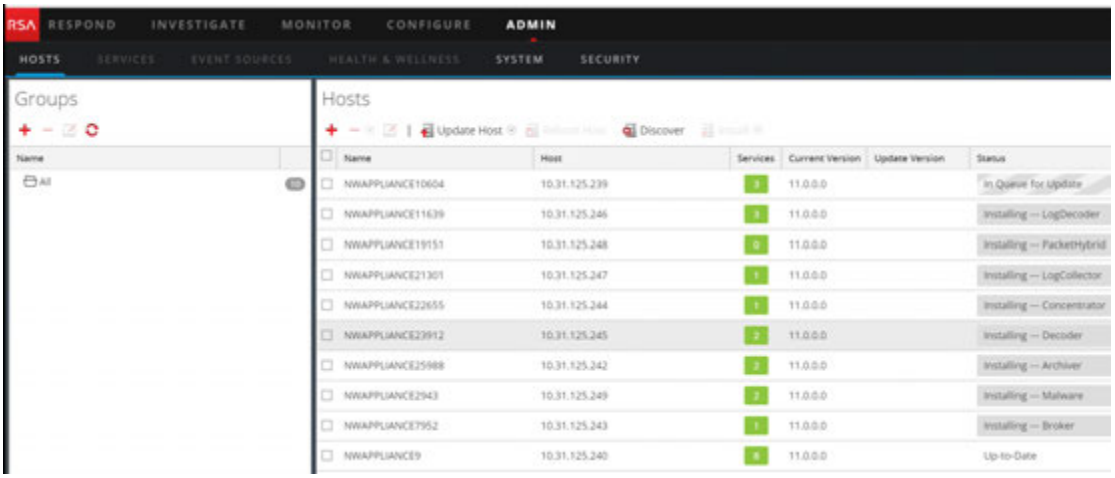
Prerequisite

To add a host and service in NetWitness Suite, the operations setup must be complete and an instance of NetWitness Suite must be installed and running.

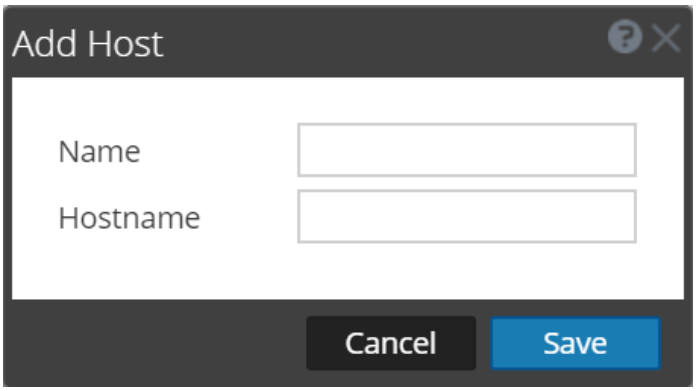
Procedure

To manually add a Malware Analysis host to NetWitness Suite:

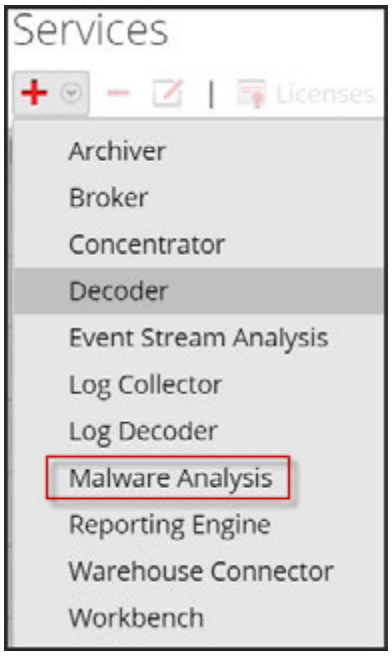
1. Log in to NetWitness Suite.
2. In the main menu, select **Administration > Hosts**. The Administration > Hosts view is displayed.



3. In the Hosts panel toolbar, click  .
   The Add Host dialog is displayed.



4. In the **Name** field, enter a name for the Malware Analysis host. In the **Hostname** field, enter the host name, the virtual IP address, or IP address on the Malware Analysis. Click **Save.**
5. In the toolbar, select **Services**.
6. In the **Services** panel toolbar, click  and select **Malware Analysis** in the resulting drop-down list of available services.



The Add Service dialog is displayed with the service type Malware Analysis

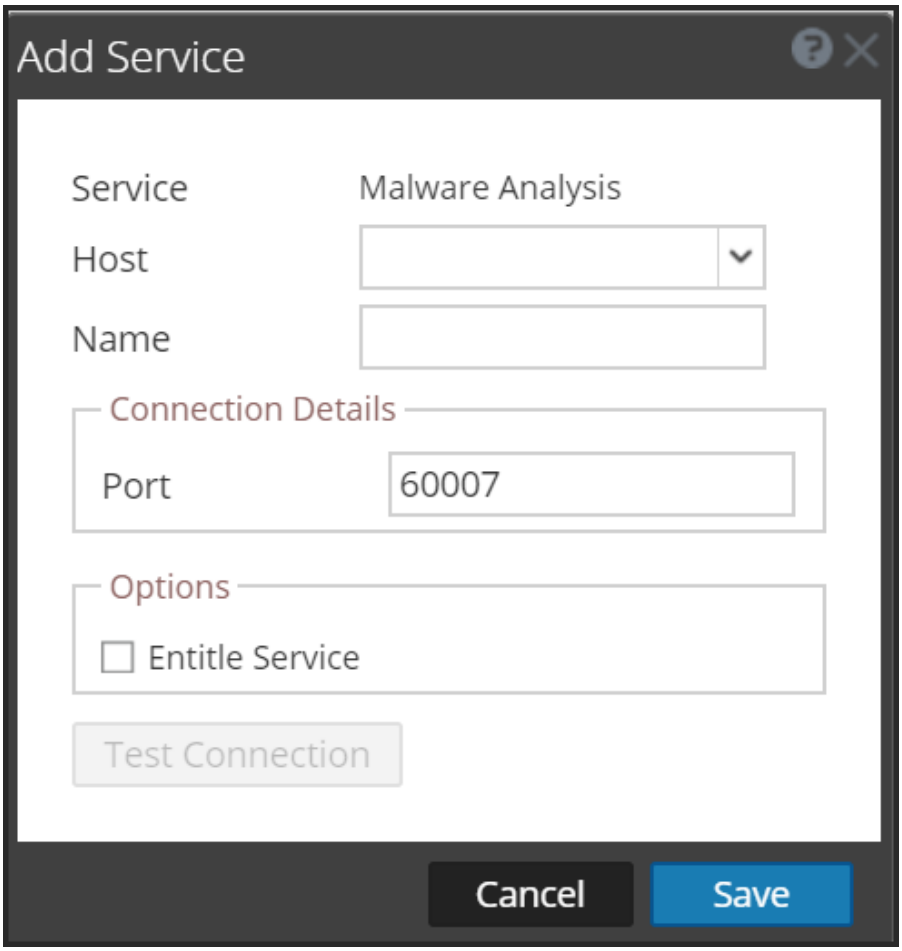
7. Enter the following information:

   In the **Name** field, enter a name for the Malware Analysis service.

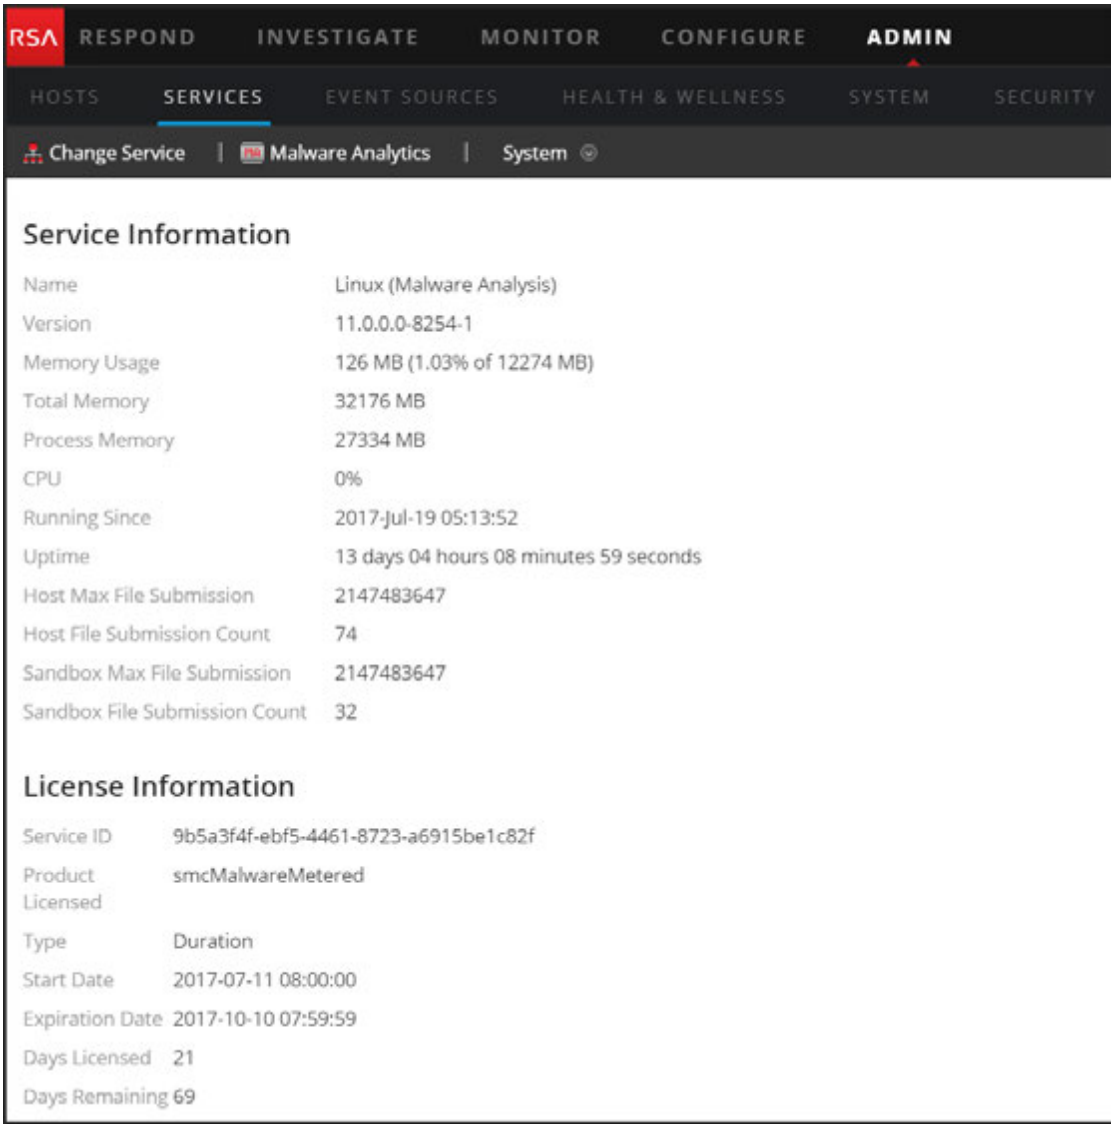
   In the **Host** field, enter the host name, the virtual IP address, or IP address on the Malware Analysis.

   In the **Port** field, enter **60007**.

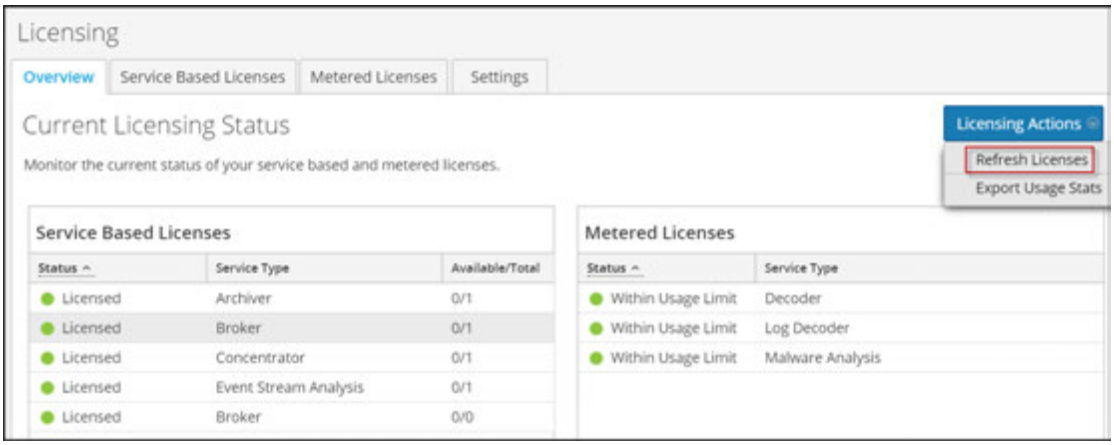
   (Optional) Under **Options**, select **Entitle Service**.



8. Click **Test Connection**.
   While adding the service, NetWitness Suite sends ICMP packets to the service to verify if the hostname and ip address entered is valid for a successful test connection. The result of the test is displayed in the Add Service dialog. If the test is unsuccessful, edit the service information and retry.
9. When the result is successful, click **save**. The Add Service dialog closes and the Malware Analysis service is available to NetWitness Suite.(Optional) Verify the status of the Malware Analysis service. In the Administration Services view, select the Malware Analysis service and select **View > System**. Below is a sample of the information available for a Malware Analysis service.

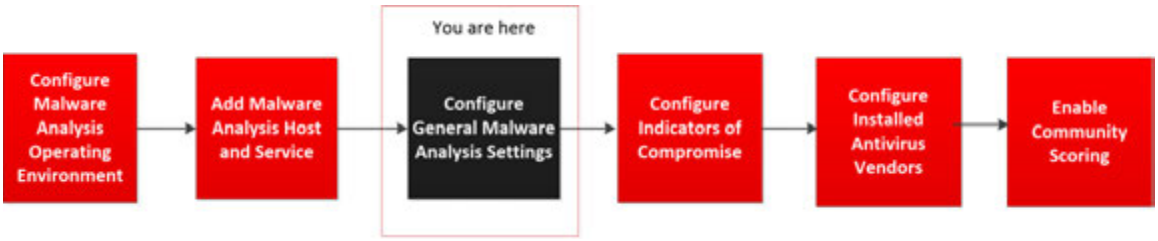


If the service is not licensed, navigate to the Administration > System > Licensing panel, and select **Refresh Licenses** in the **Licensing Actions** menu.



Configure General Malware Analysis Settings

You can configure several basic settings required to enable and calibrate the consumption of sessions, manual file upload, and the different scoring modules that Malware Analysis uses to analyze data.



You can also set up file sharing with the data repository. Malware Analysis has three modes of consuming sessions and files. Any combination of the three choices may be used to initiate analysis in Malware Analysis. The choices are:

- **Continuous Polling of the Core service:** You can enable and configure continuous polling of the Core service. When enabled and configured, Malware Analysis continuously polls the Core service for sessions tagged for analysis. By default, continuous polling is disabled. You can enable Denial of Service (DOS) attack prevention for use during continuous polling. You can test the connection to the Malware Analysis service that is being continuously polled using an option in the Integration tab.

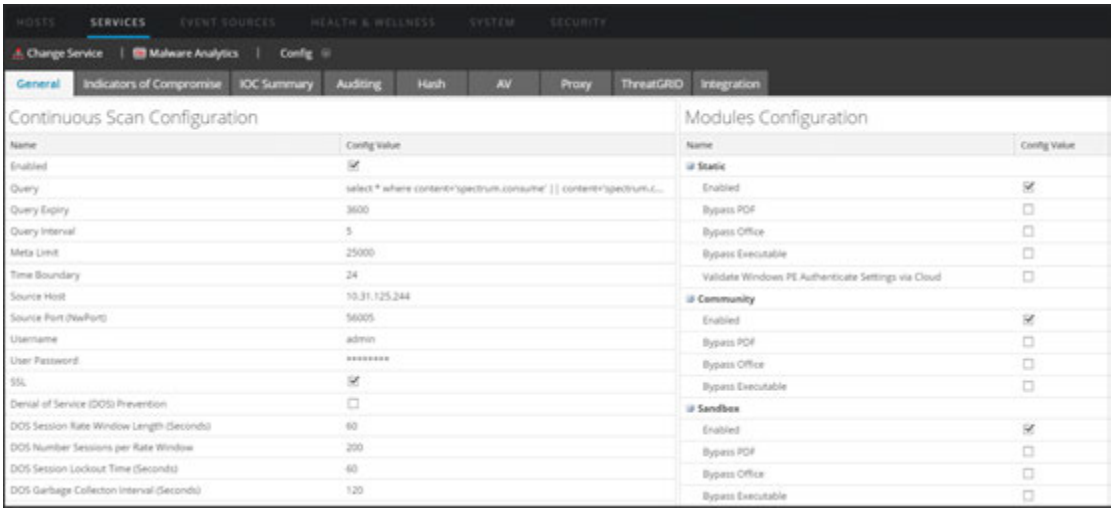
  Note: When adding a Core service as a service for continuous polling on 10.3.5 and earlier Malware Analysis, use the REST port; for example, add a Concentrator to 10.3.5 Malware Analysis with REST port (50105) instead of the native NexGen port (50005).

- **On-Demand Analysis of the Core service:** You can analyze sessions based on Investigations initiated directly in NetWitness Suite. This method allows manually controlled consumption of Core sessions and allows tighter control over how files in those sessions are processed (for example, send to sandbox for processing). Document types can bypass the default restrictions and be sent to community or sandbox processing regardless of the configured setting.
- **Manual File Upload:** You can manually upload one or more files for analysis by navigating to a visible folder on your computer and selecting files to be uploaded. The maximum size for the uploaded files is configurable.

View the Basic Settings

To view the basic settings:

1. In the **main menu**, select **Administration > Services**.
2. In the **Services** grid, select a Malware Analysis service and click  **> View > Config**.
   The Service Config for the service is displayed with the **General** tab open.



Configure Continuous Polling

Malware Analysis is rate limited so that 1,000 files per day may be submitted to ThreatGrid's Cloud for sandbox processing. To optimize your use of the sandbox, Malware Analysis configuration allows you to choose which of several methods of consumption Malware Analysis uses; you can enable or disable continuous polling.

An important consideration when configuring continuous polling is the Denial of Service (DOS) Prevention parameters. By default this feature is disabled because you need to carefully consider the settings for your environment before enabling the feature.

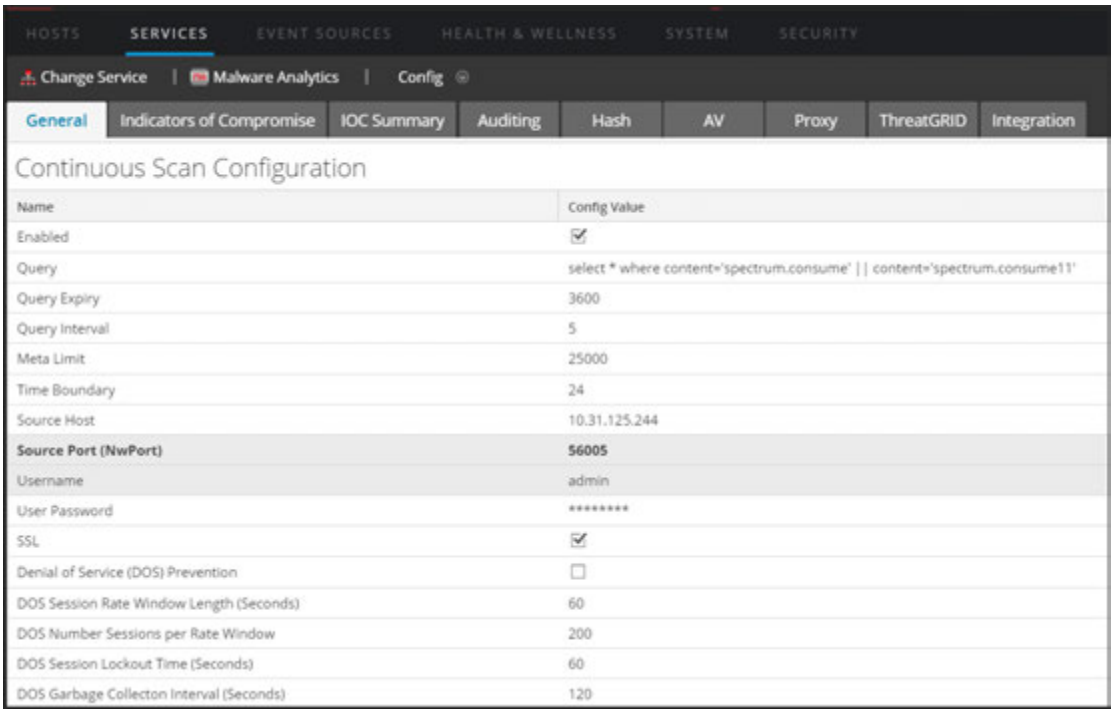
When DOS Prevention is disabled, Malware Analysis analyzes the queued sessions in first-in first-out order. A DOS attack may rapidly fill the queue so that Malware Analysis is busy handling those sessions, while a malware attack is occurring in a later session. The later session with the actual attack may not reach the beginning of the queue and undergo analysis until after the attack has begun.

When DOS Prevention is enabled, Malware Analysis treats too many sessions from a single IP address as a DOS attack. If an IP address exceeds the Number of Sessions per Rate Window, Malware Analysis begins to disregard sessions from that address until the Session Lockout time is reached. Then Malware Analysis resumes analysis of the sessions from that IP address. The disregarded sessions from the IP address are not analyzed at all, so a malware attack may slip through during the Session Lockout period.

Using the DOS Garbage Collection Interval setting, Malware Analysis clears in-memory storage of an IP source after a specified number of seconds. IP addresses with little activity during this interval are cleared from memory. If an IP address is active at intervals that exceed the DOS Garbage Collection Interval, Malware Analysis may not identify it as a DOS attack.

To configure Malware Analysis for continuous polling, in the Continuous Scan Configuration section:

1. Under **Admin**, click **Services**.
2. In the **General** tab, under **Continuous Scan Configuration** you can configure continuous polling.



3. To enable continuous polling, click **Enabled**.
4. (Optional) If you want to change the default values for querying, enter new values for the **Query Expiry**, **Query Interval**, **Meta Limit**, and **Time Boundary**.
5. To configure the Malware Analysis appliance that Malware Analysis queries to retrieve data for analysis, specify the **Source Host** and **Source Port (NwPort)**.
6. (Optional) If you want to change the default logon credentials for the Malware Analysis appliance, specify the **Username** and **User Password**.
7. If you want to use SSL for communication between the Malware Analysis appliance and the Core service, enable **SSL**.
8. (Optional) If you want to configure Denial of Service (DOS) prevention:
   a. Enable the **Denial of Service (DOS) Prevention** parameter.
   b. Set up the DOS prevention session limitations:
      - Specify the number of seconds of the time window during which Malware Analysis counts sessions for a single IP address (**DOS Session Rate Window Length**). The window is called a Rate Window and a counter is set when the first session is received from that IP source. The default value is 60 seconds.
      - Specify the number of sessions allowed per Rate Window in the **DOS Number Session per Rate Window**. The default value is 200 sessions. When the number of

sessions is reached within the Rate Window; Malware Analysis begins disregarding sessions from the IP address and the disregarded sessions from that IP are not analyzed at all. Malware Analysis continues to disregard sessions until the lockout time is reached.

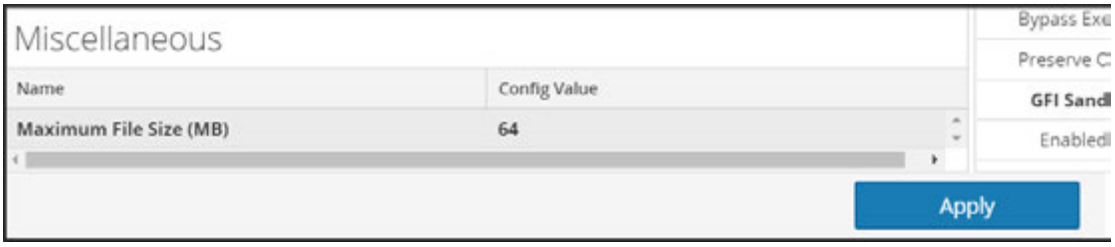
- Specify the length of lockout time (during which sessions from the IP address are disregarded and not analyzed) in the **DOS Session Lockout Time (Seconds)**. The default value is 60 seconds. When the lockout duration has elapsed, Malware Analysis resumes analysis of sessions from that IP address.
- Specify the interval of inactivity for an IP address before NetWitness Suite removes the in-memory object for the IP source in **DOS Garbage Collection Interval (Seconds)**. The default value is 120 seconds.

9. Click **Apply** to apply the changes.
   The applied changes become immediately effective as Malware Analysis receives new packets.
10. Test the connection of the Malware Analysis service to the Core service selected in the **Integration** tab by clicking the **Test Connection** button in the **Continuous Scan Connect Test** section.

Configure Manual File Upload Settings

To configure the maximum file size for manual file upload:

1. In the Miscellaneous section, type the maximum file size in Megabytes allowed for files uploaded manually for Malware Analysis scanning.



2. Click **Apply**.
   The changes become immediately effective.

Configure the Data Repository

Malware Analysis can store a finite number of files on the appliance. The data repository configuration has a file system retention period of 60 days. This setting determines how long files are retained in the Malware Analysis appliance. When old files are deleted, they cannot be recovered. Every day, Malware Analysis deletes files that exceed the file system retention period to ensure that there is no wasted disk space.

The File System Retention Period is the only setting that governs when files are deleted. Files are not deleted based on the amount of disk space being used. If the setting needs to be changed, the administrator must configure the retention period based on the anticipated space usage during the number of retention days specified.

The visible data repository parameters in the NetWitness Suite user interface are:

- The location of the repository is **/var/lib/netwitness/malware-analytics-server/spectrum**. Do not edit this value.
- The file sharing protocol, which allows access through one of the File Sharing Protocols to copy files from the Malware Analysis service.
- The file retention period in number of days.

To configure file sharing, in the Data Repository section:

1. Click on the the File Sharing Protocol to select FTP or SAMBA.
2. Select the number of days that files are maintained in the repository before deletion.
3. Click **Apply.**

The changes become immediately effective.

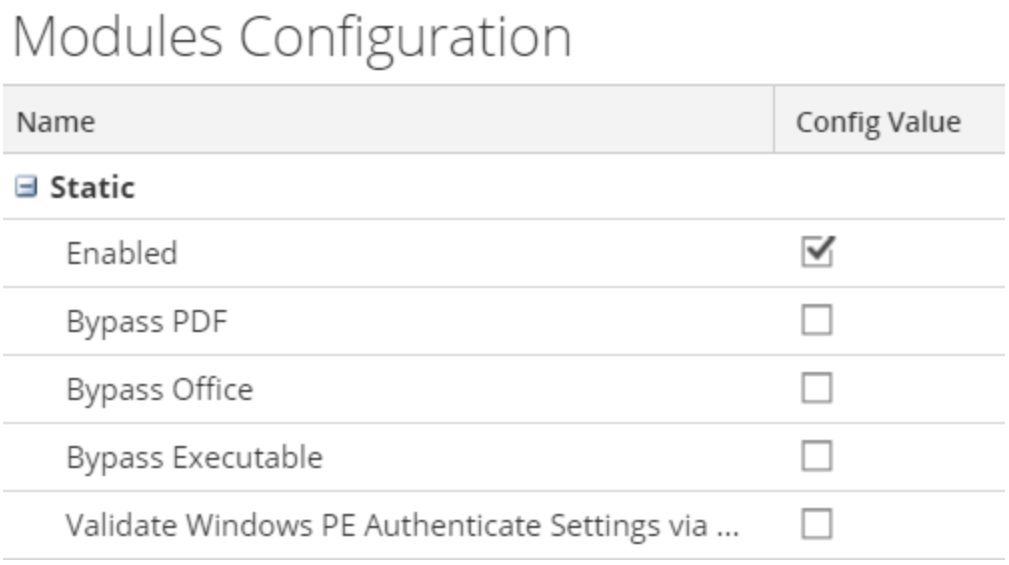
Calibrate Scoring Modules

The Modules configuration section helps configure the following components of Malware Analysis to:

- Completely disable any or all of three scoring modules (Static, Community, and Sandbox). Before disabling or enabling any scoring module, ensure that you understand what each scoring module detects.
- Malware Analysis tags sessions containing Microsoft Office, Windows PE, and PDF files for consumption by the Malware Analysis service. You can configure Malware Analysis to ignore Windows PE, Microsoft Office, and PDF documents entirely. If this is the case, a better option is to adjust your Core settings to ignore these files so they are not tagged for Malware Analysis consumption.

A sample application for using scoring module calibration is this: when setting up rule groups or analyzing system performance, you can test various scenarios in which PDF documents are not analyzed, but Microsoft Office and Windows PE documents are. You can test the scenario in each of the three scoring modules. If you see a measurable improvement in system performance, you can apply this knowledge on a broader scale.

Configure Static Analysis Scoring



To configure Static analysis scoring, in the **Modules Configuration** section:

1. By default the Static module is enabled. To enable or disable Static analysis entirely, click the **Enabled** checkbox.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select any of the checkboxes **Bypass PDF**, **Bypass Office**, and **Bypass Executable**.
3. To configure your preference for Authenticode validation of digitally signed Windows PE files, click the **Validate Windows PE Authenticate Settings via Cloud** checkbox. If you want to prevent Windows PE files that are digitally signed from being transmitted to the RSA Cloud for validation, remove the check.
   When disabled, ALL static analysis is performed locally (skipping Authenticode validation). Regardless of this setting, PDF and MS Office documents are not subject to Authenticode validation and are not transmitted over the network during static analysis.
4. Click **Apply.**The changes become immediately effective as Malware Analysis receives new packets.

Configure Community Analysis Scoring

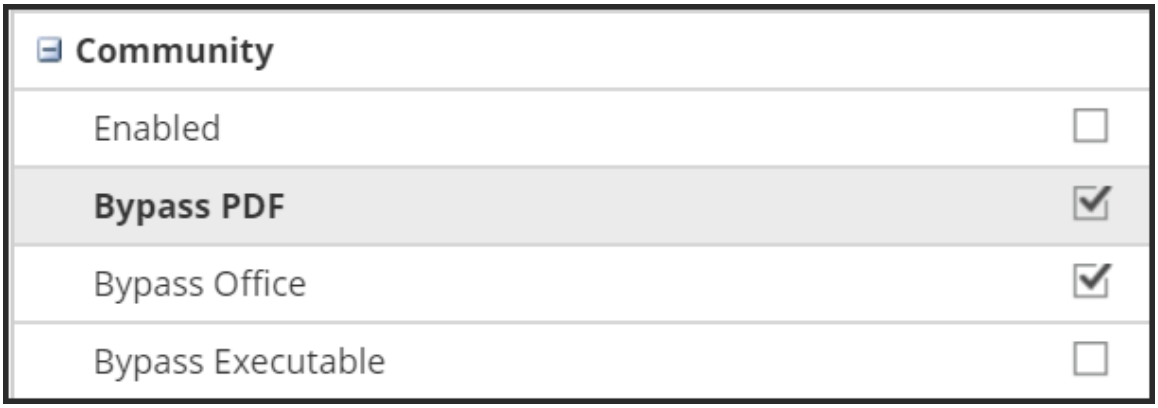
Once the Community module is enabled, the security community analyzes all documents not prevented from processing. This is achieved by sending network session and file attributes to the RSA Cloud for processing. The RSA Cloud then may make external connection to security community partners as needed to process the information.

The file content is never sent to the community for analysis. Instead, the MD5/SHA-1 hash of the file is sent for Anti-Virus detection and Blacklisting. Similarly, session Meta is harvested and analyzed as part of this process. Meta elements such as URL and Domain Name are examined and transmitted to the RSA Cloud to identify known bad URLs/Domains.

You can enable Community analysis and limit which document types are processed. There is no risk for the file content (except for a hash) being sent outside of your network.

Note: To gain access to the RSA Cloud where processing occurs, you must register your Malware Analysis service with RSA customer service. There are two methods: register the service using the options in the Integration tab or contact RSA Customer Care.

To configure Community analysis scoring, in the Modules Configuration section:



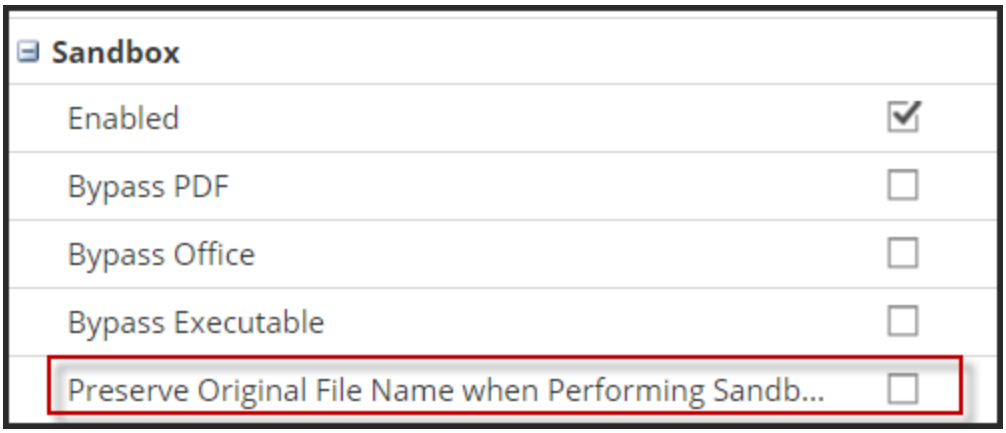
1. To enable or disable Community analysis entirely, click the **Enabled** checkbox. The default value is **Disabled**.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select the specific checkboxes - **bypasspdf**, **bypass office, bypass executable.**
3. Click **Apply** to save the changes and put them into effect immediately as Malware Analysis receives new packets.

Configure Sandbox Analysis Scoring

By default, the sandbox module is disabled and MS Office and PDF files are prevented from being processed. The intent is to set to the most restrictive settings to force the user to specify whether or not potentially sensitive information is sent outside of the network for processing. If a document type is not prevented from being processed, the entire file (not just the hash) is sent to the destination sandbox server.

In addition, you can choose to preserve the original file name when performing sandbox analysis.

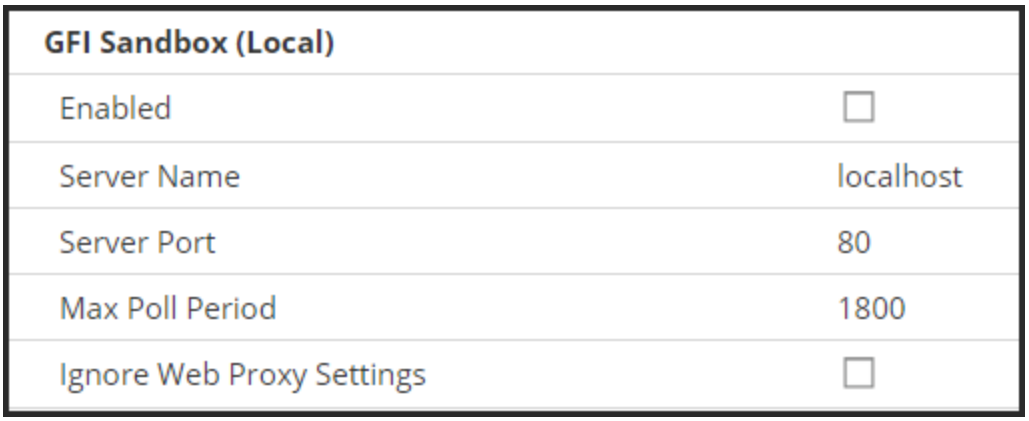
Note: If you do not specify the **Preserve Original File Name when Performing sandbox Analysis** parameter, NetWitness Suite hashes the files.



When you enable the sandbox module, you must specify whether or not the sandbox processing is performed using a local GFI sandbox, a local ThreatGrid sandbox, or a cloud version of the ThreatGrid sandbox. The cloud version of the ThreatGrid sandbox is provided directly by ThreatGrid and requires an activation key to be obtained from ThreatGrid and configured in the ThreatGRID tab.

GFI Sandbox Settings

To use a locally installed GFI sandbox, you must enable GFI and supply the Server Name and Server Port of the GFI sandbox Server. The Max Poll Period and Polling Interval determine how long to wait for a submitted sample to finish processing and how often to check the status (in seconds). The Ignore Web Proxy Settings option allows you to indicate that you want Malware Analysis to bypass a web proxy when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored.



ThreatGrid Sandbox Settings

Note: Before enabling ThreatGrid scoring, a ThreatGrid-supplied Service Key must be configured so that ThreatGrid can recognize that samples submitted from this site are legitimate. Use NetWitness Suite to register for a ThreatGrid API key, then you can enable and configure a locally installed ThreatGrid sandbox or the ThreatGrid Cloud sandbox. Refer to the following detailed task: Register for a ThreatGrid API Key.

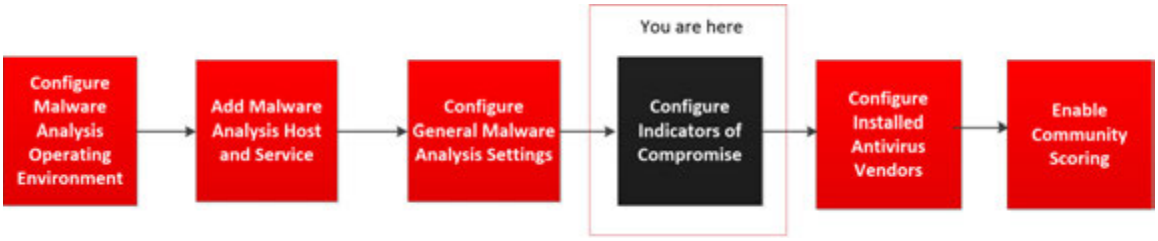
The Ignore Web Proxy Settings allows you to indicate that you want Malware Analysis to bypass a web proxy when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored.

To configure sandbox scoring, in the Modules Configuration section:

1. To enable or disable sandbox analysis entirely, click the **Enabled** checkbox. The default value is **Disabled**.
2. To configure handling of PDF, Microsoft Office, and Windows PE files in a session, select any of the three checkboxes **Bypass PDF**, **Bypass Office, Bypass Executable.**
3. Configure the active sandbox vendor. You have three options:
   a. To use a locally installed instance of the GFI sandbox, provide the Server Name and Server Port of the GFI sandbox Server, the Max Poll Period and Polling Interval, and optionally, select the Ignore Web Proxy checkbox.
   b. To use a locally installed instance of ThreatGrid, enable ThreatGrid scoring, provide the ThreatGrid Service Key and optionally, select the Ignore Web Proxy checkbox.
   c. To use the ThreatGrid Cloud, you must first register for a ThreatGrid API key. Then enable ThreatGrid scoring, provide the ThreatGrid Service Key, enter the URL for the ThreatGrid server (https://panacea.threatgrid.com), and optionally, select the Ignore Web Proxy checkbox.
4. Click **Apply**.
   The changes become immediately effective.

Configure Indicators of Compromise

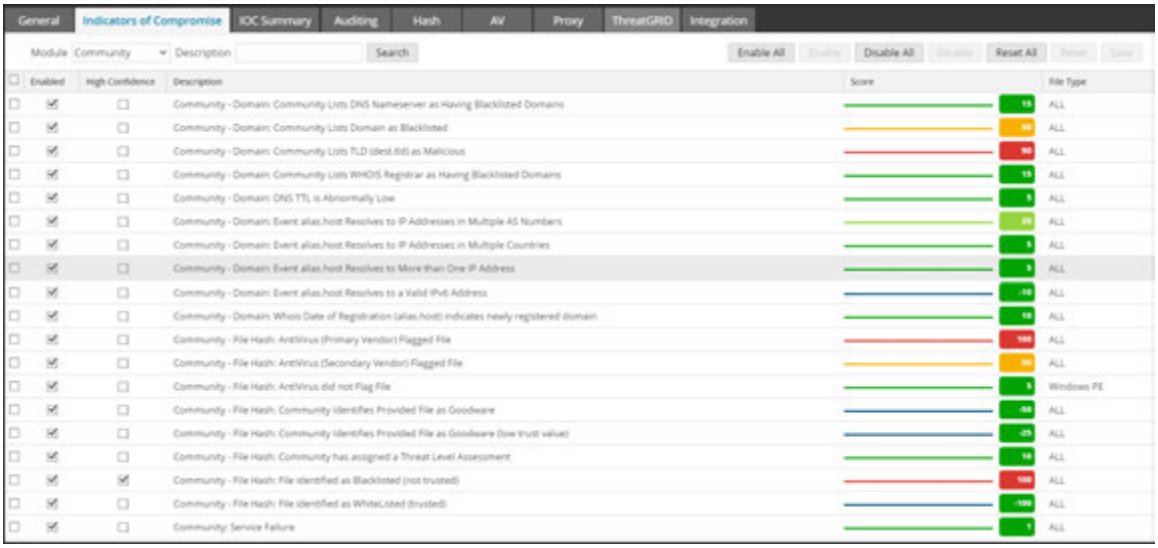
The Indicators of Compromise (IOC) for the Malware Analysis scoring modules are configured since, each Malware Analysis scoring module -- Network, Static, Community, sandbox, and YARA -- has a default set of Indicators of Compromise (IOCs) that it uses to evaluate the file and session data in order to assess the likelihood of malware being present.



Each IOC is assigned a numeric score weighting between -100 (good) and 100 (bad). When an IOC triggers, the numeric score weighting is factored into the total score for the session or file being analyzed. The individual score weightings for all matched IOCs are aggregated to produce the resulting score for each session or file. The aggregated score is adjusted to ensure that it does not exceed the valid score range (-100 through 100).

Note: The score weighting assigned to an IOC is not always the explicit score value that is aggregated (it is not a simple addition of score weights for each IOC that triggers). Instead, the IOC's score is a weighting or indicator of importance that is factored into calculating an overall score.

The Indicators of Compromise (IOC) configuration settings for Malware Analysis are in the Service Config view > Indicators of Compromise tab. Below is an example of the tab.



Using the **Community - File Hash: AntiVirus (Primary Vendor) Flagged File** IOC as an example, the IOC's score weighting could be set to 100. However, Malware Analysis dilutes this value based on the percentage of primary AV vendors that agree if the sample is malicious. The closer to 100% of the vendors who agree that the sample is malicious, the closer to the full 100 points are used in aggregating a score. As the percentage drops closer to 0%, the proportion of the full 100 points used in the aggregated score drops.

IOCs use logic implemented natively in Malware Analysis. You cannot adjust the logic. Instead, you can only adjust the IOC to increase or decrease its impact on scoring, to indicate a confidence setting, or to turn the IOC on or off. The typical scenario is to adjust a limited set of IOC score weighting values downward for IOCs that are inflating the final score and causing false positive analysis results. An extreme version of tuning would be to disable the IOCs entirely if they consistently contribute to false positive results. Additionally, the flexibility exists to allow you to disable all IOCs and to choose a select few to leave enabled. For example, all IOCs can be disabled with the exception of a select few IOCs that detect AntiVirus matches. Using Malware Analysis in this extremely limited configuration, you can reduce results in Malware Analysis such that only known A/V matches generate results.

You can configure this functionality in several ways:

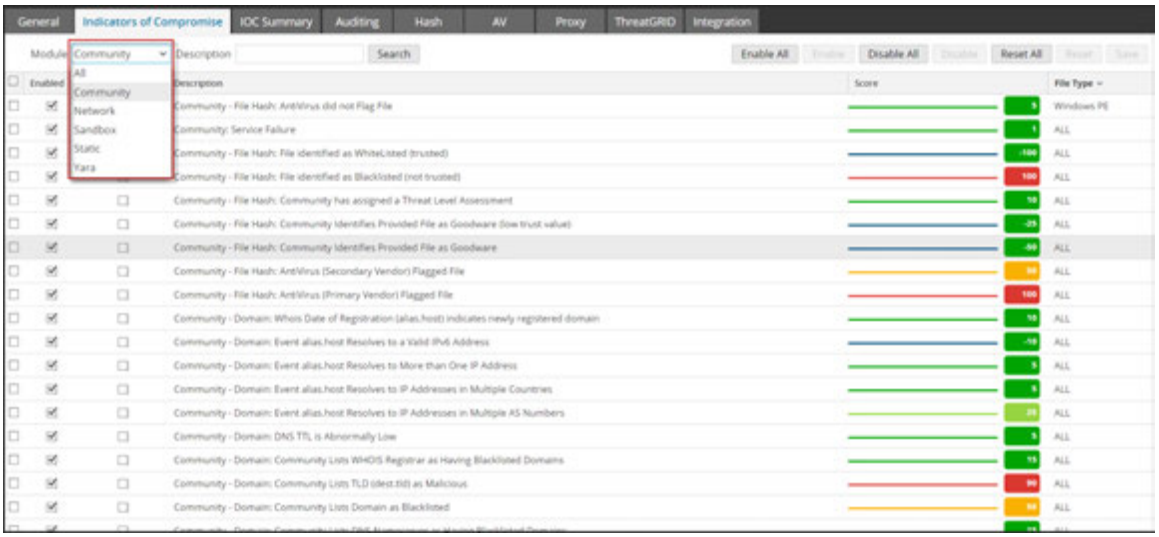
- Disable IOCs so that they are not evaluated as part of the scoring module to which they are assigned.
- Adjust the score weight for an IOC such that its impact on the aggregated score is increased or decreased.
- Mark IOCs that you expect to be strong indicators of malware and display a high-confidence (HC) flag on sessions that triggered these IOCs in the Malware Analysis results.
- Customize score and confidence settings uniquely to the file type being analyzed. Each IOC is pre-assigned a file type to which it is applied. Possible values are **ALL**, **PDF**, **MS Office**, and **Windows PE**. The IOC with the most applicable file type is used during file-based analysis. For example, if a PDF is analyzed, an IOC with a file type set to **PDF** will be chosen rather than the same IOC with a file type set to **ALL.** If no file-type specific match is found, the IOC with a file type set to **ALL** is selected.
- Search for rules to display in the grid based on a match to the rule description.

Filter Displayed IOCs by Module

You can filter the displayed IOCs by scoring module: one of the four built-in modules or YARA. YARA-based IOCs are interleaved with the native IOCs with each category. Although the YARA IOCs are not identified as such in the other views, you can select YARA from the Module selection list to see a list of YARA rules.

To view the IOCs for one or the four scoring modules or for YARA:

1. In the **main menu**, select **Admin > Services.**
2. Select a Malware Analysis service.
3. In the row, select  **> View > Config**.
4. Click the **Indicators of Compromise** tab.
5. In the **Module** selection list, select All, NextGen, Static, Community, sandbox, or Yara.
   The configured rules and settings for the module are displayed.



Filter Displayed Modules to Show Only Modified Modules

The **Indicators of Compromise** tab visually identifies IOCs that are locally modified. When an IOC has been modified, for example, the score weight has been changed, and the name is displayed in red and includes a modification indicator appended to the IOC name. The modification indicator is ++ and can be used as a filtering mechanism when searching for IOCs. To limit the display to locally modified IOCs:

1. In the **Description** field, enter ++.
2. Click **Search**.
   The view is filtered to show only modified IOCs.

Enable and Disable IOCs for a Scoring Module

When an IOC is disabled, it no longer impacts the aggregate score for the scoring module to which it belongs. If the IOC has multiple instances (differentiated only by file type), disabling a more file-type specific IOC results in use of the more file-type agnostic version of the IOC in scoring.

For example, if the same IOC exists as file type **ALL** and file type **Windows PE**, disabling the **Windows PE** instance of the IOC causes the **ALL** version to be used in scoring. In order to disable the IOC entirely for **Windows PE**, while leaving the IOC enabled for other file types, set the score weighting of the **Windows PE** instance of the IOC to a value of zero as described below. This leaves the IOC enabled for Windows PE files (although it has a zero weighting and is suppressed from being displayed in analysis results), while not affecting the other file types. The remaining file types will continue to use the **ALL** instance of the IOC.

To enable or disable an IOC so that it no longer factors into a scoring module:

1. In the **main menu**, select **Admin > Services.**
2. Select a Malware Analysis service, and in the row select  > **View > Config**.
3. Click the **Indicators of Compromise** tab.
4. In the **Module** selection list, select a scoring module: All, Community, Network, sandbox, Static, or Yara.

   The configured rules and settings for the module are displayed.
5. Do one of the following:
   a. Click the **Enabled** checkbox in the column next to a rule that you want to enable.
   b. Select one or more rules, and click **Enable** or **Disable** in the toolbar.
   c. To toggle between Enabled and Disabled for all rules displayed on the page, click the **Enabled** checkbox in the column title.
   d. To enable or disable all rules for the scoring module, click **Enable All** or **Disable All** in the toolbar.
6. To save the changes to the page, click **Save** in the toolbar.

> **Note:** Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

Adjust the Score Weight for an IOC

Adjusting the score weight for an IOC increases or decreases the IOC's overall impact on the aggregate score for the module in which it is configured. To raise or lower the overall impact of the IOC, reduce the current value to a new setting.

- Values ranging from -100 to -1 indicate that the session or file being analyzed is not likely to be malware (-100 being the least likelihood).
- Values ranging from 1 to 100 indicate a likelihood that the file or session being analyzed is malware (100 being the highest likelihood).
- Setting the value to zero leaves the IOC enabled, but causes the IOC to no longer impact the aggregate score and suppresses the IOC from being displayed in analysis results. Setting the

value to zero is a method of disabling a file-type specific instance of an IOC while leaving the original file-type agnostic instance of the rule intact for scoring of the remaining file types.

To adjust the score weight:

1. In the **main menu**, select **Admin > Services.**
2. Select a Malware Analysis service.
3. In the **Toolbar**, select **View > Config**.
4. Click the **Indicators of Compromise** tab.
5. In the **Module** selection list, select a scoring module: All, Network, Static, Community, sandbox or Yara.
   The configured rules and settings for the module are displayed.
6. Do one of the following:
   a. Drag the score slider left or right to decrease or increase the score weight.
   b. Click directly on the displayed score weight and enter a new score weight.
7. To save the changes to the page, click **Save** in the toolbar.

Note: Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

Set the High Confidence Flag for an IOC

The High Confidence setting is used as a method of flagging specific IOCs as high confidence indicators that malware is present. As an example, the **Community - File Hash: AntiVirus (Primary Vendor) Flagged File** IOC has a low probability of being a false positive, combined with a high probability of being an accurate measurement of malware being present. By flagging this IOC (and others) as High Confidence, you can use a filter in the Malware Analysis results to limit display to only those sessions that include one or more high confidence rules. By doing so, the display is limited to a smaller subset of results whose accuracy is accorded a higher degree of confidence. Displaying results not limited to high confidence IOCs still allows you to review results that are more grey in nature. This provides for results that are less prone to false negative results. Choosing to filter or to not filter results based on confidence level has a valid use case in the NetWitness Suite workflow.
To set the High Confidence flag:

1. In the **Indicators of Compromise** tab, select a scoring module from the **Module** selection list: All, Network, Static, Community, sandbox, or Yara.
   The configured rules and settings for the module are displayed.
2. Click the **High Confidence** checkbox in the column next to a rule that you want to flag or unflag as highly likely to indicate the presence of malware in a session when matched.
3. To save the changes to the page, click **Save** in the toolbar.

Note: Rules that have changed settings are displayed with a red corner. If you navigate to another page of rules before saving, all changes to this page are lost.

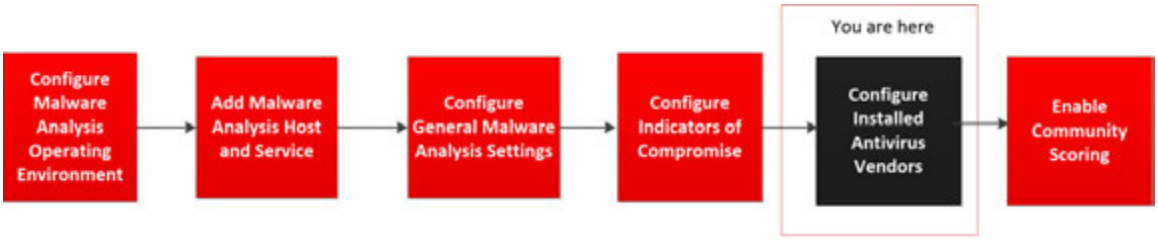
Reset IOCs to Default Settings

1. In the **Indicators of Compromise** tab, select a scoring module from the Module selection list: All, Network, Static, Community, sandbox, or Yara.
   The configured rules and settings for the module are displayed.
2. If you want to reset all rules on the current page to their default settings, click **Reset** in the toolbar.
3. If you want to reset all rules for the selected scoring module to default settings, click **Reset All** in the toolbar.
4. To save changes to the page, click **Save** in the toolbar.

Configure Installed Antivirus Vendors

You can compare file analysis results from your installed antivirus (AV) vendors versus community results from the Malware Analysis knowledge base. While a file is being analyzed by community analysis, Malware Analysis checks an antivirus knowledge base to determine if the sample is already known to be malicious. If the file is known to be malicious, NetWitness Suite flags the file to indicate whether a primary antivirus vendor or a secondary antivirus vendor identified the sample. NetWitness Suite classifies vendors as primary and secondary to indicate the level of reputation the vendors have in the industry, and Indicators of Compromise factor the reputation into scoring. For example, detection made solely by secondary antivirus vendors may score less than detection by primary vendors.

Note: When choosing AV vendor software to install on your network, it is highly recommended that you include at least one from NetWitness Suite Primary Vendors list.



You can identify the antivirus vendors installed on your network to NetWitness Suite. NetWitness Suite compares the antivirus results during community analysis against the results from the installed vendors selected in the AV tab. If a match is detected, the file being analyzed is flagged to indicate that your locally installed primary or secondary antivirus software detected the sample.

The example below shows the community analysis results for a file that had a score of 100. Under **Indicators of Compromise**, you can see that the file was flagged by the listed AV vendors in the Community. Under **AV Vendor Results**, NetWitness Suite indicates whether the AV vendors installed in your environment flagged the file as malicious. If your installed AV vendors detected the virus, the name of the malware is displayed. If your installed AV vendors did not detected the virus, **--Not detected--** is displayed next the the AV vendor name. Under **Not Installed Vendors**, you can click + to expand the section and see if other vendors not installed on your system detected the virus.

Identify Installed AV Software

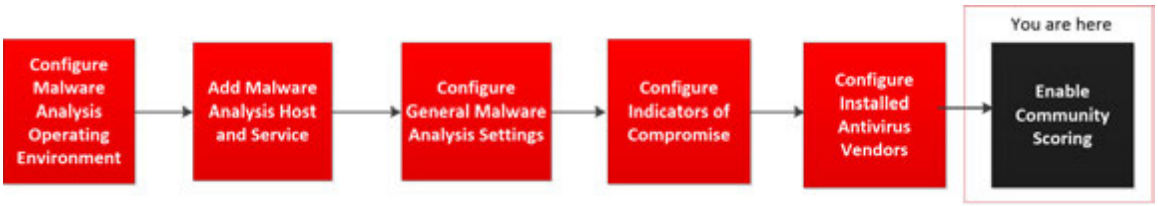
To identify antivirus software installed on your network:

1. In the **main menu**, select **ADMIN > Services.**
2. Select a Malware Analysis service, and in the row select > **View > Config**.
3. In the **Service Config View**, select the **AV** tab.

4. Select the checkbox next to each antivirus vendor (primary and other) whose software is installed on your network.
5. To save the changes, click **Apply**.
   The Community Analysis results will indicate whether your software flagged an event.
6. (Optional) If you want to reset the list of installed AV software to the default value (none), click **Reset**.
   All selections are removed.
7. To save changes, click **Apply**.

Enable Community Analysis

An Administrator can enable community analysis. For Community analysis, new malware detected on the network is pushed to the RSA Cloud for checking against RSA's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. To enable Community analysis, you must register with the RSA cloud and test connection to the cloud, then to test the connection between the RSA cloud and the service you have configured for continuous scanning.



A complete description of analysis methods is provided in How Malware Analysis Works.

1. In the **main menu**, select **ADMIN > Services.**
2. Select a Malware Analysis service, and in the row select **> View > Config**.
3. In the **Service Config View**, select the **Integration** tab.

4. Scroll down to the Continuous Scan Connection Test, and click **RSA Cloud Connection Test and Registration**.
   NetWitness Suite tests communications with the site at `https://cloud.netwitness.com`. If your company uses a proxy for outbound traffic, please check your Proxy settings. A valid connection is required in order to register with the RSA Community Service.
5. Enter your company name and contact email. Click **Register**.
   If all required fields are complete, your registration is completed. The label on the button used to register changes to Update.
6. To verify that the Malware Analysis Service can connect to the Core service selected for continuous scanning, click **Continuous Scan Connection Test**.
   NetWitness Suite initiates a check based on the Source Host, Source Port, Username, and User Password specified in the General tab.
   When the test executes successfully, analysts are able to see Community Scoring in Malware Analysis.

(Optional) Configure Auditing on Malware Analysis Host

This topic introduces the configurable features of the Malware Analysis auditing log and the procedures for configuring the features. Malware Analysis is capable of generating auditing alerts based on configured score module thresholds. Once the analysis score for a file in an analysis session meets or exceeds the configured threshold(s), an auditing alert is generated. Thresholding allows sessions and files that score high enough to be likely malware candidates to automatically generate an alert.

Alerts can be configured to be formatted as SNMP, Syslog or File entries. Supporting various audit formats provides a method for external systems to ingest auditing events based on their capability of parsing the supported formats.

In addition to auditing analysis sessions, the following events will trigger an audit alert:

- User login successes and failures
- Changes to system configuration settings
- Server restart
- Server version upgrade and install

The Auditing configuration settings for Malware Analysis are in the Service Config view > Auditing tab.

Configure the Auditing Threshold

The sole purpose of the thresholds is to specify the criteria that must be reached prior to an alert being generated for an analyzed session/file. If auditing is enabled, each scored file/session is examined to determine if the score in each score module meets or exceeds the configured auditing threshold. If so, an alert is generated using the configured audit alert format (e.g., SNMP, Syslog or File). For example, by configuring SNMP and setting the Community Threshold to 90, all sessions/files that score 90 or higher in the Community Score module generate an SNMP trap. If all of the thresholds are set to 90, then an alert is not generated unless a session/file scores 90 or higher in the Network, Static, Community and sandbox score modules.

To configure the auditing threshold:

1. In the **main menu**, select **ADMIN > Services.**
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, click the **Auditing** tab.
4. In the **Auditing Thresholds** section:
   a. Set the threshold for the **Community**, **Static**, **Network**, and **Sandbox** by doing one of the following for each scoring module:
      - In the slider, click and drag the handle in either direction.
      - In the value field, type a number between 0 and 100, inclusive.
   b. (Optional for 10.3 SP2) Select one or more triggers to record a message and deliver it through all enabled auditing methods.
   c. Click **Apply**.
      - The threshold setting becomes effective immediately for all enabled auditing methods: SNMP, File, and Syslog.
      - The recorded messages are sent through all enabled auditing methods: SNMP, File, and Syslog.

Configure Incident Management Alerting

When enabled, Incident Management can audit Malware Analysis alerts to feed into the Incident Management workflow.

1. In the **main menu**, select **ADMIN > Services**.
2. Select a Malware Analysis service, and select **> View > Config.**
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **Incident Management Alerting** section, select the Enabled checkbox and click Apply.
   Alerting becomes effective immediately.

Configure SNMP Auditing

The Simple Network Management Protocol (SNMP) is an Internet-standard protocol for managing services on IP networks. When SNMP auditing is enabled, Malware Analysis can send an audit event as an SNMP trap to a configured SNMP trap host. In addition to the score and event ID, the alert includes all session meta as well as generated meta data. This is useful for users who want to feed event data to third-party systems.

To configure SNMP auditing:

1. In the main menu, select **ADMIN > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **SNMP Auditing** section, click the checkbox to enable SNMP auditing.
5. Configure the SNMP server name and port.
6. Configure the SNMP version and trap OID for sending traps.
7. Configure the Malware Analysis community, and retry and timeout parameters when sending traps.
8. Click **Apply**.
   The SNMP auditing settings become effective immediately.

Configure File Auditing Settings

When file auditing is enabled, the audit log file is kept in the Malware Analysis Home Directory. The default location for this log file is `/var/lib/netwitness/malware-analytics-server/spectrum/logs/audit/audit.log`. As each log reaches the maximum file size, it is archived and a new log is created. The size of these audit logs and their number are both configurable.

Caution: Avoid setting the max file size and archive file count too high, because it may have an adverse effect on the available disk space on the Malware Analysis appliance.

To configure the file auditing settings:

1. In the **main menu** , select **ADMIN > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **File Auditing** section, click the checkbox to enable file auditing.
5. (Optional) Set the Archive File Count and Max File Size.
6. Click **Apply**.
   The file auditing settings become effective immediately.

Configure Syslog Auditing Settings

When enabled, Syslog provides auditing through the use of the RFC 5424 syslog protocol. Regulations, such as SOX, PCI DSS, HIPAA, and many others are requiring organizations to implement comprehensive security measures, which often include collecting and analyzing logs from many different sources. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

In addition to the score and event ID, the syslog includes all session meta as well as generated meta data. This is useful for users who want to feed event data to third-party systems.

To configure the syslog auditing settings:

1. In the **main menu**, select **ADMIN > Services**.
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Auditing** tab.
4. In the **Syslog Auditing** section, click the checkbox to enable syslog auditing.
5. Configure the host where the target syslog process is running and the port on the host where the syslog process is listening.
6. Configure the facility, encoding, format, max length, and timestamp for outgoing syslog messages.

   Note: (Optional) Configure Identity String to prepend to syslog alerts.
   For CEF format, please refer to Create Custom Alert in CEF Format for additional considerations.

7. Click **Apply**.
   The syslog auditing settings become effective immediately.

(Optional) Configure Hash Filter

This topic introduces hash filters as a method of marking files in Malware Analysis that are known to be good or known to be bad. Hash filtering allows you to maintain a list of known good or known bad file hashes. In the Hash tab, you can fine tune Malware Analysis event analysis based on file hashes. When a file hash is marked as Good, Malware Analysis does not analyze the file the next time it is seen. When a file hash is marked as Bad, Malware Analysis automatically raises the file's community score by a large number of points. Malware Analysis still analyzes the file, just in case new information becomes available.

Note: If an event contains a single file and that file's hash is marked as Good, Malware Analysis filters the entire event and you do not see it in Malware Analysis results.

To add hash filters to the hash list, you can use either of these manual methods:

1. Context menu add in the Event Detail view: Right-click on a file, and a context menu allows marking of the hash for the selected file as Good (Normal) or Bad (Malicious).
2. Hash tab toolbar: Click on the Add button in the Hash tab to add a file hash, file size, and optionally, mark the hash as trusted.

There is also an automated method to add hash filters to Malware Analysis by importing a hash list in bulk from the watched folder. Hashes imported through the watched folder do not appear in the hash list. With bulk importing and the watched directory (/var/netwitness/malware-analytics-server/spectrum/hashWatch) on the Malware Analysis server set up, copy a hash list into the watched folder to be automatically imported into the system. Hashes imported using the bulk import method overwrite hashes that were previously imported through the watched folder.

View the Hash List

To view the Hash List:

1. In the **main menu**, select **ADMIN > Services**.
2. In the Services view, select a Malware Analysis service, and select **> View > Config**.
3. Select the **Hash** tab.
   The hash list is displayed in the Hash tab. Only file hashes that have been added using one of the methods are displayed.

Add a File Hash to the Hash Filter

To add a file hash to the hash filter:

1. In the **Hash** tab, in the toolbar, click **Add**.
   The Add Hash dialog is displayed.

2. If the hash is trusted, select **Trusted**.
3. Enter the MD5 hash and the file size in bytes.
4. Click **Save**
   The file hash is added to the hashes and used to perform hash filtering in Malware Analysis.

Mark a Hash as Trusted or Untrusted

To mark a file hash as trusted or untrusted:

1. In the **Hash** tab, to toggle between trusted and untrusted, click in the **Trusted** column for the hash.
2. In the toolbar, click **Save Edit**.

Delete a Hash from the Hash Filter

To delete a hash from the hash filter:

1. In the **Hash** tab, select one or more hashes that you want to remove from the hash filter.
2. In the toolbar, click **Delete**.
   A dialog requests confirmation and offers an opportunity to cancel.
3. To confirm the deletion, click **Yes**.
   The file hash is deleted from the grid and no longer used to perform hash filtering in Malware Analysis.

Search for a File Hash

In the Hash tab, you can search for a file hash that is displayed in the grid. In the MD5 field, type the file hash for which you are searching, and click **Search**. The list of files that contain the hash is displayed in the grid.

Import a Hash List Using the Watched Folder

To import a hash list from the watched directory, the hash list must be in the specified format and must be sorted on md5. You can drop a file formatted as described below into a folder (/var/netwitness/malware-analytics-server/spectrum/hashWatch) on the Malware Analysis appliance, and it is automatically imported into the local hash database. This is the only way to import file hashes into. An additional use case is to allow a system administrator to expose the watched directory to some process that would push a file to this directory. This is a bulk import method designed to handle a high volume of hash imports.

This is a csv-formatted file with no spaces between the data in each row. The assumption with the data in the hash list is that there are no duplicates. Duplicates are ignored during processing. If duplicate hashes are encountered, the log file will display the following message to indicate the number of duplicate hashes contained in the file:

2013-08-09 09:46:00,674 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Processing - /var/lib/rsa>malware/hashWatch/test.csv
2013-08-09 09:47:56,619 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.services.file.hash.HashServiceImpl - Skipped 21 Duplicate Hashes Already on File
2013-08-09 09:48:06,638 [jobExecutor-2(HashFileWatch)] INFO com.netwitness.malware.core.scheduler.jobs.HashFileWatch - Processed - /var/lib/rsa>malware/hashWatch/test.csv

Below is an example of a hash list in the default file format.

```
[BeginFileExample]
392126E756571EBF112CB1C1cdEDF926,98865,True
0E53C14A3E48D94FF596A2824307B492,2226,True
176308F27DD52890F013A3FD80F92E51,42748,False
9B3702B0E788C6D62996392FE3C9786A,32768,False
937ADE76A75712B7FF339403B4FCB5A6,4821,False
B47139415F735A98069ACE824A114399,1723,False
E6CAF205E602CFA9A65663DB1A087874,704,False
680CA0BCE1FC7BC4136ADF4E210869C5,2075,False
[EndFileExample]
```

A NetWitness Suite configuration file (**/var/netwitness/malware-analytics-server/spectrum/conf/hashFileWatchConfig.xml**) specifies the format and options in the hash list import process. Below is a listing of the configuration file.

```
<config>
 <enabled>true</enabled>
 <distributedCacheEnabled>true</distributedCacheEnabled>

<watchDirectory>/
/var/lib/rsamalware/hashWatch</watchDirectory>

<processedDirectory>/
var/lib/rsamalware/hashWatch/processed</processedDirectory>
```

```
<erroredDirectory>/
var/lib/rsamalware/hashWatch/error</erroredDirectory>
 <md5Col>0</md5Col>
 <fileSizeCol>-1</fileSizeCol>
 <isTrustedCol>1</isTrustedCol>
 <isTrust>false</isTrust>
 <ignoreFirstLine>false</ignoreFirstLine>
 <frequencyInMinutes>1</frequencyInMinutes>
 <isGzipCompressed>false</isGzipCompressed>
 </config>
```

Line	Description
<md5Col>0</md5Col>	The location of the md5 hash in each entry. The default value is position **0**, or the first position.
<fileSizeCol>1</fileSizeCol>	The location of the hash size in each entry. The default value is position **1**, or the second position. If the hash size is not included in the csv file, the value must be **-1**.
<isTrustedCol>2</isTrustedCol>	The location of the Trusted Column in each entry. The default value is position **2**. If the Trusted parameter is not included in the csv file, the value must be **-1**.
<isTrust>false</isTrust>	The default assumption for **Trusted** in each entry is **false**.
<ignoreFirstLine>false</ignoreFirstLine>	The presence or absence of a header in the hash. The default value is **false**. If the hash has a header, the value must be set to **true**.
<frequencyInMinutes>1</frequencyInMinutes>	The interval between checks by NetWitness Suite in the watched directory. The default value is **1** minute.
<isGzipCompressed>false</isGzipCompressed>	The hash is compressed using Gzip. The default value is **false**. If the hash is Gzip compressed, the value must be set to **true** here.

When the hash list has been imported, the system log has entries similar to this:

```
2013-04-11 03:22:00,597 [jobExecutor-9(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch -
Processing -
/var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
 2013-04-11 03:22:00,600 [jobExecutor-9(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch -
Processed -
/var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
```

If there is a problem loading the file, the system log has entries similar to this:

```
2013-04-11 03:17:00,597 [jobExecutor-4(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch -
Processing -
/var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
 ... Verbose log
 2013-04-11 03:17:00,632 [jobExecutor-4(HashFileWatch)] INFO
com.netwitness.malware.core.scheduler.jobs.HashFileWatch -
Error Processing -
/var/lib/rsamalware/spectrum/hashWatch/simpleHash.csv
```

To import a hash list using the watched folder method:

1. Copy the hash lists that you want to import into the **/var/netwitness/malware-analytics-sever/spectrum/hashWatch** directory.
   Malware Analysis automatically watches this folder and processes files placed there.
   Malware Analysis adds every hash found in the hash lists to the hash filter.
   If there are processing errors, they are logged in **/var/netwitness/malware-analytics-sever/spectrum/hashWatch/error**
   Processed files are cataloged in **/var/netwitness/malware-analytics-sever/spectrum/hashWatch/processed**
   Processed files are not removed from the hashWatch directory.
2. After importing hashes in bulk, the System Administrator can use a cronjob to clean up old processed files.

(Optional) Configure Malware Analysis Proxy Settings

This topic describes the configuration of a web proxy for communicating with the RSA Cloud service and local ThreatGrid or GFI service. The settings in the Service Configuration view > Proxy tab set up communication by web proxy, which Malware Analysis can use to communicate with RSA Cloud for community analysis and sandbox analysis. Once the proxy is configured:

- Malware Analysis communicates via web proxy with the RSA Cloud for community analysis.
- Malware Analysis communicates via web proxy with the configured ThreatGrid or GFI sandbox service. Using a web proxy may negatively affect performance. ThreatGrid and GFI configuration sections in the General tab have an option to ignore the web proxy and communicate directly with the sandbox to improve performance.

Configure the Web Proxy

To configure the web proxy for Malware Analysis:

1. In the **main menu**, select **ADMIN > Services.**
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **Proxy** tab.

4. To enable the proxy, select the **Enabled** checkbox.
5. (Optional) To automatically detect proxy settings for the NetWitness Server, select the checkbox.
   The proxy host and proxy port fields are autofilled.
6. If you want to use a different proxy, enter the **Proxy Host** and **Proxy Port**.
7. Enter the username and password used to log on to the proxy host.
8. (Optional) Select **SSL**, if the proxy host communicates over SSL.
9. Click **Apply**.
   The settings are saved and become effective immediately.

> **Note:** Malware Analysis does not support NTML web proxy authentication.

(Optional) Register for a ThreatGrid API Key

This topic provides the procedure for obtaining a trial ThreatGrid API key for use in the ThreatGrid Cloud sandbox. Before enabling ThreatGrid as the sandbox service in the sandbox module, a ThreatGrid-supplied Service Key must be configured so that ThreatGrid can recognize that samples submitted from this site are legitimate.

If you do not have a ThreatGrid-supplied Service Key, you can obtain a key using this tab. The key is provided on a trial basis.

When you fill in your user information and click **Register**, a key is displayed in this tab, and automatically added to the ThreatGrid configuration in the **General** tab. In a few minutes, you will receive an email from ThreatGrid containing a link to their page where you can log on. After you agree to the license terms on the ThreatGrid page, you can submit files for analysis, and ThreatGrid will recognize files that Malware Analysis submits for sandbox analysis.

To obtain a Trial ThreatGrid API key:

1. In the **main menu**, select **ADMIN > Services.**
2. Select a Malware Analysis service, and select **> View > Config**.
3. In the **Services Config** view, select the **ThreatGrid** tab.

4. Enter your full name, job title, organization name, and email address.
5. In the User Id and Password field, create a user ID and password for logging on to ThreatGrid.
6. Click **Register**.
   Your registration is sent to ThreatGrid and an API key is displayed below the Register button. The key is automatically filled in the **General** tab.
7. Select the **General** tab to confirm that the ThreatGRID configuration now includes the API key.

8. When you receive an email from ThreatGrid with a link where you can log on, log on and accept the terms of the agreement.
   Your trial of ThreatGrid begins and Malware Analysis can send five files per day to the ThreatGrid Cloud for sandbox analysis.

Additional Procedures for Configuring Malware Analysis

This topic provides procedures that an Administrator may perform to accomplish an objective that is not part of basic Malware Analysis setup. After Malware Analysis is configured, administrators may want to fine-tune the service and implement advanced customization; an example of this is implementing custom YARA content.

- Create Custom Alert in CEF Format
- Enable Custom YARA Content

Create Custom Alert in CEF Format

This topic provides instructions for creating custom alerts in Common Event Format (CEF) to send to a service that ingests events as CEF. This is an advanced configuration task, which requires sufficient knowledge to manually edit the configuration file: `/var/netwitness/malware-analytics-server/spectrum/conf/malwareCEFDictionaryConfiguration.xml`. Before editing the file, you must stop the Malware Analysis service in the operating system. The CEF Alert becomes active when you restart the Malware Analysis service.

The CEF Template

To send events to a service ingesting events as CEF, NetWitness Suite runs them through a configuration file that serves as a CEF template before feeding the events to a correlation technology. You can tune the configuration file, which specifies the sequence and mapping of syslog fields in each alert.

The following example syslog message shows the CEF fields in the extensions section of the alert (following the last '|' in the alert). Each field can be configured to indicate the sequence (described in the Example section below). Fields can be excluded entirely from the alert via a configuration setting.

```
CEF:0|NetWitness|Spectrum|10.3.0.7995.1.0|Suspicious Event|Detected
suspicious network event ID 4 session ID n/a|2|static=100.0
nextgen=25.0 community=100.0 sandbox=25.0 file.name=myFile.exe
file.size=1234556 file.md5.hash=DEADBEEFBABECAFEDEADBEEFBABECAFE
event.source=spectrum://admin@0:0:0:0:0:0:0:1:64563
event.type=MANUAL_UPLOAD event.id=0 country.dst.code=--
country.dst=Unavailable ip.src=0:0:0:0:0:0:0:1
ip.dst=0:0:0:0:0:0:0:1 event.uuid=f7a6155a-31de-4fa6-ba16-
41fb9a8e5f26 ...
```

Understand a Syslog Auditing File Entry

The description of the file structure is based on the following sample.

```
Feb 6 10:02:28 10.10.10.125 SpectrumServer125

CEF: 0|NetWitness|Spectrum|1.2.1.130|Suspicious Event|Detected
suspicious
 network event ID 857 session ID 73|2|

```

First Line

```
Feb 6 10:02:28 10.10.10.125 SpectrumServer125
```

Log Information	Description
Feb 6 10:02:28	The timestamp for the entry.
10.10.10.125	The source IP address for the event.
SpectrumServer125	The source hostname for the event.

Audit Common Event Format (CEF) Header

```
0|NetWitness|Spectrum|1.2.1.130|Suspicious Event|Detected suspicious
network event ID 857 session ID 73|2|
```

The audit CEF header is a pipe-separated listing of the following fields:

Log Information	Description
0	The ArcSight Common Event Format (CEF) version used for the audit syslog.
NetWitness	The service that created the syslog message.
Spectrum	Malware Analysis is the logger for the event.
1.2.1.130	Malware Analysis version.
event ID 857	Unique network event id for this event.
session ID 73	Core unique session id for the session that included this event.
2	Severity, an integer between 1 and 6 indicates the level of severity for the message. • 1 = INFORMATION_LEVEL • 2 = WARNING_LEVEL • 3 = ERROR_LEVEL • 4 = SUCCESS_LEVEL • 5 = FAILURE_LEVEL • 6 = AUDIT_FAILURE_LEVEL

Audit CEF Extension

```

Analysis Scores

The first entry in the audit CEF extension provides the four Malware Analysis analysis scores for the event: Static, Network, Community, and Sandbox.

Log Information	Sample Value
static	100.0
network	29.0
community	8.0 A score of 0.0 can be a community score for the event or can indicate that no community services were enabled.
sandbox	N/R N/R means not run. This indicates that the GFI sandbox was not enabled.

File Information

The next three entries provide file information: file name, size, and hash.

Log Information	Sample Value
file.name	-CVE-00_DOC_2010-05-13_attachment.doc
file.size	0
file.md5.hash	20a29259c0e5958afb2f50c4177bb307

Event Meta Data Retrieved by NextGen

The record continues with the Core meta data for the event. The meta data in the message depends on the event. The amount of data in the message is truncated to the maximum length in bytes configured in the Syslog Settings. The default value is 1024.

Log Information	Sample Value
com.netwitness.event.internal.id	73
com.netwitness.event.internal.uuid	37d2bad7-06bc-4b34-88e1-df43d9710204

Edit the Configuration File

1. Stop the Malware Analysis service.
2. Edit the configuration file as described in the Example.
3. Start the Malware Analysis service.
   The Malware Analysis service begins processing alerts through the configuration file and sending CEF alerts to designated services.

Example

The configuration file can be used to dictate which fields appear in the resulting alert as well as the label associated with each field and the order in which the data fields appear. The configuration file is composed of one or more XML `MalwareCefExtension` blocks as shown in the example below. The ordering of these blocks in the configuration file implies the order of the data fields in the CEF alert.

In the example below, the CEF alert would include two data fields, `ip.src` followed by `ip.dst`. The `customKey` is used to indicate the labeling of the data field in the alert. This allows the user to choose a custom label in order to force the alerting format to better match the expectations of the alert consumer. In other words, the format can be tuned to prevent unwanted changes to an existing alert parser. Lastly, the `isDisplay` setting determines if the field is included in the alert output. This allows the user to turn off data fields without having to physically delete the `MalwareCefExtension` block from the configuration.

```
<config>
<malwareExtensionList>
<com.netwitness.malware.core.cef.MalwareCefExtension>
  <customKey>ip.src</customKey>
  <malwareKey>ip.src</malwareKey>
  <isDisplay>true</isDisplay>
</com.netwitness.malware.core.cef.MalwareCefExtension>
<com.netwitness.malware.core.cef.MalwareCefExtension>
  <customKey>ip.dst</customKey>
  <malwareKey>ip.dst</malwareKey>
  <isDisplay>true</isDisplay>
</com.netwitness.malware.core.cef.MalwareCefExtension>
</malwareExtensionList>
</config>
```

At the end of the configuration file are three additional settings that can be used to further tune the alert format. They are as follows:

Setting	Description
includesUnknownMeta	This true or false setting indicates if unknown data elements are included in the resulting alert. Any NextGen session meta can be considered for inclusion into a CEF alert. Because additional session meta can be introduced via authoring new NextGen parsers, meta that is not contained in the default configuration may be encountered. You can set includesUnknownMeta to true to include the unknown meta in the alert and label it using the NextGen meta key name. To force a custom key for the unknown meta, you must edit this file and add a new MalwareCefExtension to the dictionary. To omit unknown meta from the alert, set includesUnknownMeta to false.
displayNulls	This true or false setting indicates if values that are set to null are included in the alert. If displayNulls is set to false, the null value fields are omitted even if their MalwareCefExtension isDisplay property is turned on. This allows dynamic formatting of alerts to exclude null fields.
valueIfNull	This true or false setting allows you to specify a string placeholder (n/a by default) to be used as the value for any null valued fields. If displayNulls is set to true, then null valued fields are included in the alerts. Their value is set to the value specified in valueIfNull.

The following represents the default CEF configuration file. The default configuration file includes all default NextGen session meta.

```
<config>
 <malwareExtensionList>
  <com.netwitness.malware.core.cef.MalwareCefExtension>
  <customKey>static</customKey>
  <malwareKey>static</malwareKey>
  <isDisplay>true</isDisplay>
```

```

Enable Custom YARA Content

This topic provides instructions for enabling custom YARA content on the NetWitness Suite host on which the Malware Analysis service is installed. In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language that allows malware researchers to identify and classify malware samples. RSA makes built-in YARA-based Indicators of Compromise (IOCs) available in RSA Live; these are automatically downloaded and activated on subscribed appliances.

Customers with advanced skills and knowledge can add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live or placing YARA rules in a watched folder for the appliance to consume. This section provides instructions for the Administrator who configures appliances to enable the creation of custom YARA content.

Prerequisites

This is an advanced configuration task, which requires sufficient privilege and knowledge to set up a GNU Compiler Collection (GCC) and C++ Python development library to build YARA. In addition, you must be thoroughly familiar with the standard YARA documentation. The following components are required:

- The Perl-Compatible Regular Expression (PCRE) library: pcre-8.33.tar.bz2
- The yara 1.7 (rev:167) stand-alone YARA command line: yara-1.7.tar
- The YARA extension for Python: yara-python-1.7.tar.gz
- YARA rules documentation: YARA User's Manual 1.6.pdf

The components are available for download here: https://code.google.com/p/yara-project/downloads/list

Note: As of writing, YARA 2.0 is available but not supported for Malware Analysis 10.5.

Install Libraries and Applications Required to Build YARA on a CentOs-Based Appliance

As a prerequisite to building YARA on a host that is running CentOS, you must install `make`, the GNU Compiler Collection, and C++ `Python` Development Library on the appliance. To install the applications and libraries required to build YARA:

1. To ensure the standard YUM repo and no other repo files are in the /etc/yum.repos.d folder, enter the following command:

   `ls -al /etc/yum.repos.d`

   The results should be similar to the following:

   ```
   -rw-r-r-. 1 root root 1926 Jun 26  2012 CentOS-Base.repo
   -rw-r-r-. 1 root root  637 Jun 26  2012 CentOS-Debuginfo.repo
   ```

```
-rw-r-r-. 1 root root  626 Jun 26  2012 CentOS-Media.repo
-rw-r-r-. 1 root root 2593 Jun 26  2012 CentOS-Vault.repo
```

2. To install `make` on the appliance, enter the following commands:

   a. **`yum search make`**
   The following message is returned: `make.x86_64 : A GNU tool which simplifies the build process for user`

   b. **`yum install make.x86_64`**

3. To install and test GCC on the host, enter the following commands:

   a. **`yum search gcc`**
   The following messages are displayed:
   `gcc-c+.x86_64 : C+ support for GCC`
   `gcc.x86_64 : Various compilers (C, C++, Objective-C, Java, ...)`

   b. Enter the following commands:
   `yum install gcc.x86_64`
   `yum install gcc-c++.x86_64`

   c. To test the gcc commands, enter the following commands:
   `gcc -v`
   `cc -v`

4. To install the C++ Python development library on the appliance, enter the following commands:

   a. **`yum search python dev`**
   The following message is returned:
   `python-devel.x86_64 : The libraries and header files needed for Python development`

   b. **`yum install python-devel.x86_64`**

Set Up Yara

To create a GCC and C++ Python development library in which you can build YARA on the NetWitness Suite host that is running Malware Analysis:

1. Do one of the following:

   a. If the host on which you are installing is running Mac OS, install xCode for Mac OS.

   b. If the host on which you are installing is running CentOS, install make, GCC and C++ Python development library using the YUM command line.

2. To Install the PCRE library on the host, open a terminal window and enter the following commands:

```
tar -xvf pcre-8.33.tar.bz2
cd pcre-8.33
./configure
make
sudo make install
```

3. To install the stand-alone YARA command line, enter the following commands:

```
tar -xvf yara-1.7.tar
cd yara-1.7
./configure
make
sudo make install
```

4. To test the stand-alone YARA command line:

   a. Enter the following command:

   ```
   yara
   ```

   b. If the command succeeds, continue with Step 7. If the command fails and returns the `yara: error while loading shared libraries: libpcre.so.1: cannot open shared object file: No such file or directory` error, enter the following command to check the `/etc/ld.so.conf` file or `LD_LIBRARY_PATH` environment variable.

   ```
   ldconfig -v
   ```

5. To install the YARA extension for Python, enter the following commands:

```
tar -xvf yara-python-1.7.tar.gz
cd yara-python-1.7
python setup.py build
sudo python setup.py install
```

6. To test the YARA extension:

   a. Enter the following command: **python**

   b. At the Python prompt (>>>), enter the following commands:

   ```
   import yara
   exit()
   ```

When this configuration is complete, analysts can create custom YARA IOCs for consumption on a Malware Analysis host as described in "Implement Custom YARA Content" in the *Investigation and Malware Analysis Guide*

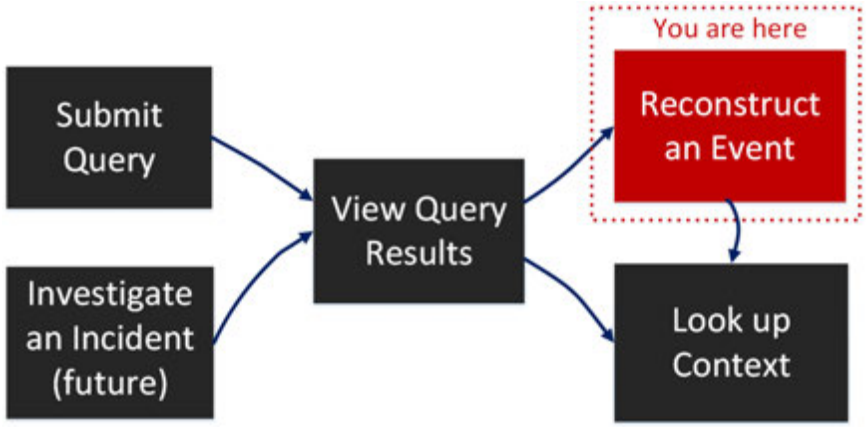
Services Config View - Auditing Tab

In the Events view and the New Events view - Reconstruction panel (**Investigate > Events panel > click an event),** you can safely view a reconstruction of an event of interest that you found in the Navigate view or the Events panel.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
Threat Hunter	submit query	Conducting an Investigation
Threat Hunter	view query results	Analyze Events in the Event Analysis View
Threat Hunter	reconstruct an event*	Reconstruct an Event
Threat Hunter	export files from an event	Reconstruct an Event
Threat Hunter	Look up additional context of an event	Looking up Contextual Information

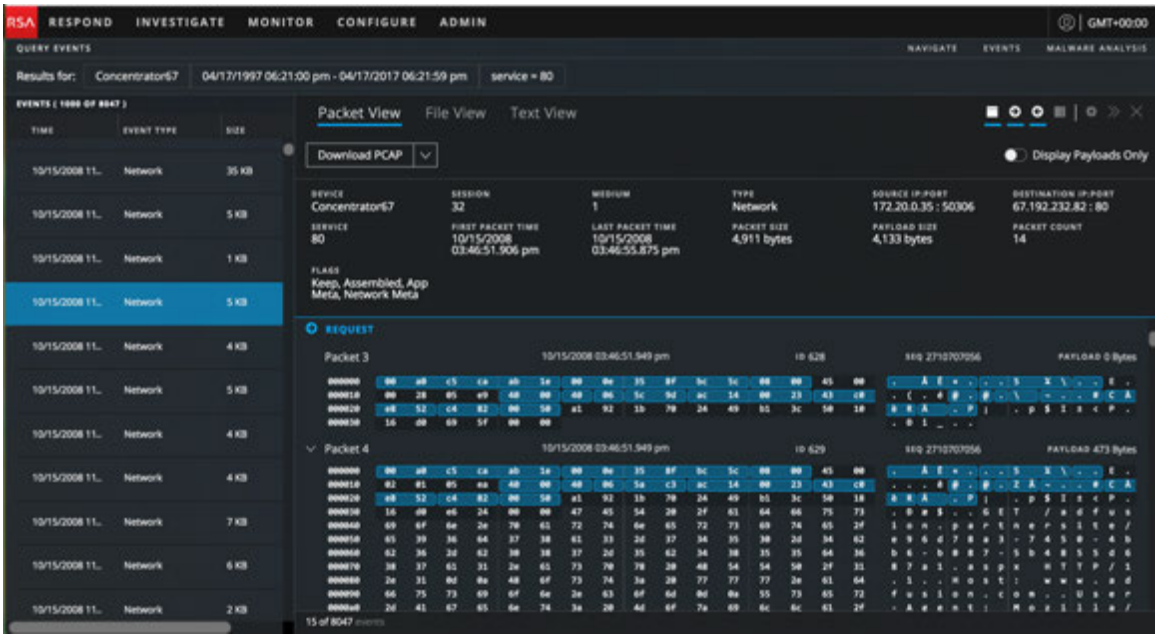
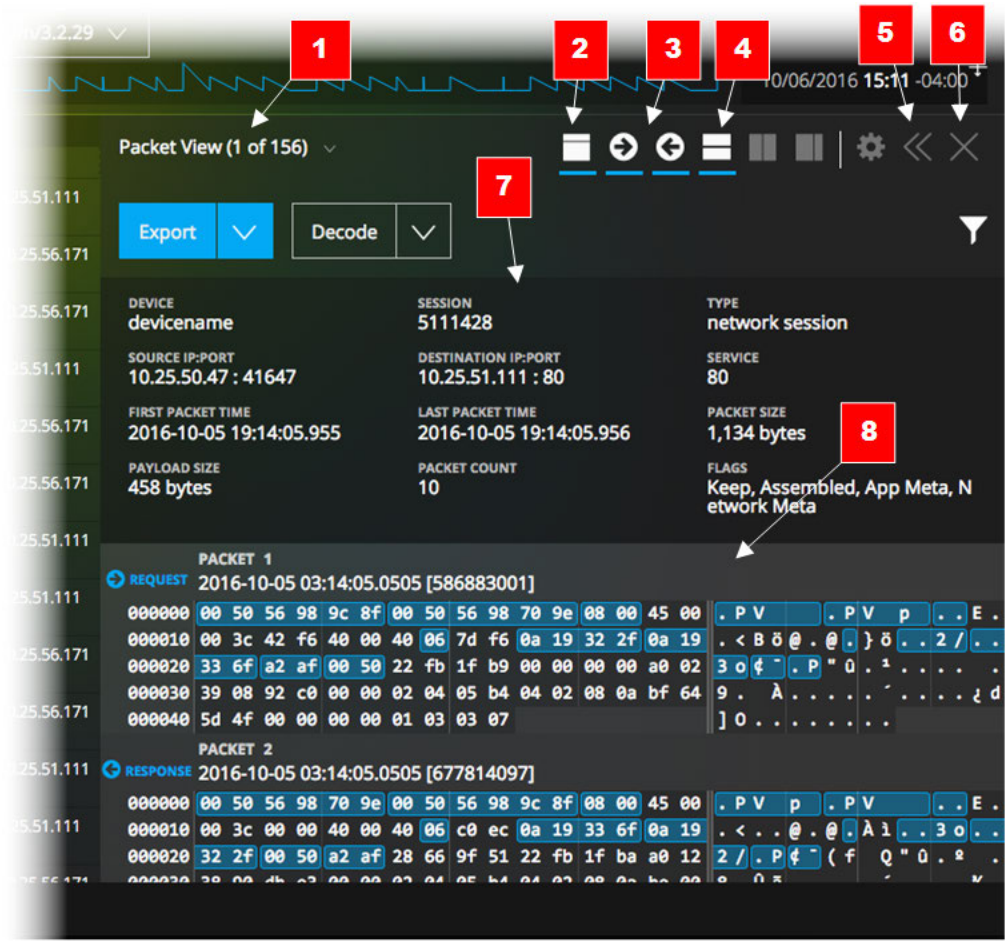
- Event Analysis View - Text Analysis Panel

Quick Look

The Investigate Reconstruction panel displays a reconstruction of a single event in Packet View, File View, and Text View. When you click an event in the Events panel, the adjacent Reconstruction panel shows the packet reconstruction of the event. You can use the options in the Event Reconstruction toolbar to change the reconstruction type and direction (request or response), to hide or display the header panel, and to expand, contract, and close the Event Reconstruction panel. Depending on the reconstruction type selected and the contents of the payload, additional options are available. For example, you can display the payload only in the Text View, download files in the Files View, and download PCAP files in the Packet View.

Below is an example of a packet Reconstruction.





NetWitness Suite Reconstruction Settings and Reconstruction Cache Settings allow an administrator to manage application performance for Investigation. As analysts reconstruct sessions that they are investigating, two situations can affect performance and results

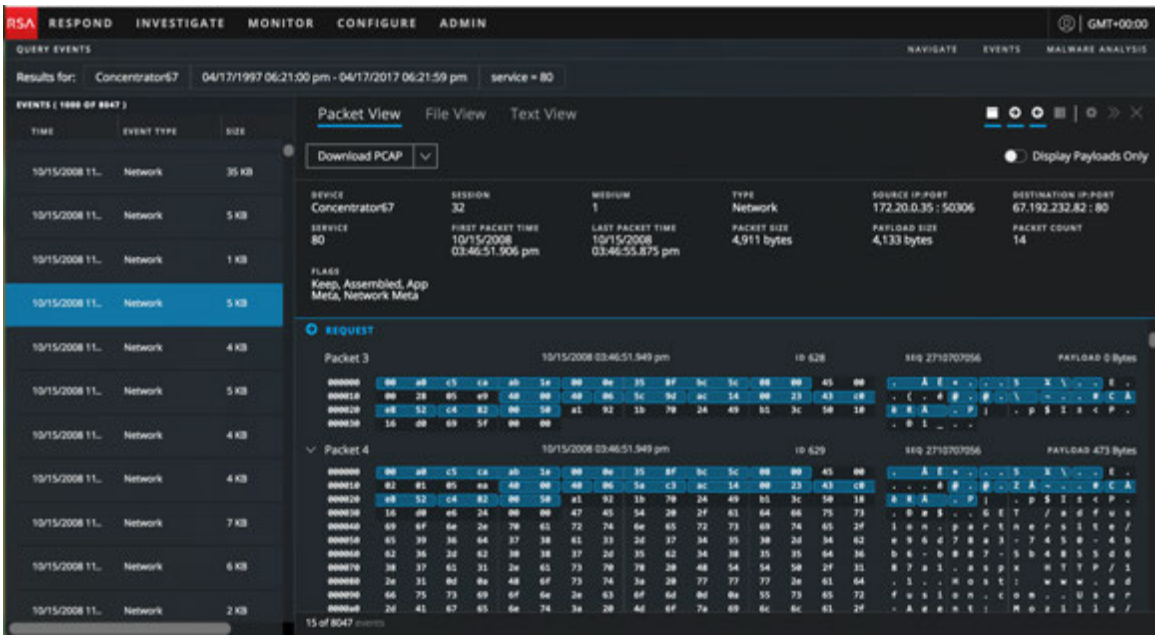
- -Some events can be very large and contain many thousands of source packets. Reconstructing these types of sessions can degrade application performance.
- - In some cases, the reconstruction cache can present incorrect content; for this reason, a Security Analytics cleans cache that is older than a day every 24 hours. Between the daily cache cleanings, certain actions my result in stale cache being used for a reconstruction, and if the need arises, administrators can manually clear cache for one or more services that are connected to the current Security Analytics server.

1	Tabs or drop-down menu to select the reconstruction type: packet view, file view, text view. The currently selected type is displayed in the label.
2	Click to hide or show the header panel.
3	Click these icons to display the Request, Response, or both.

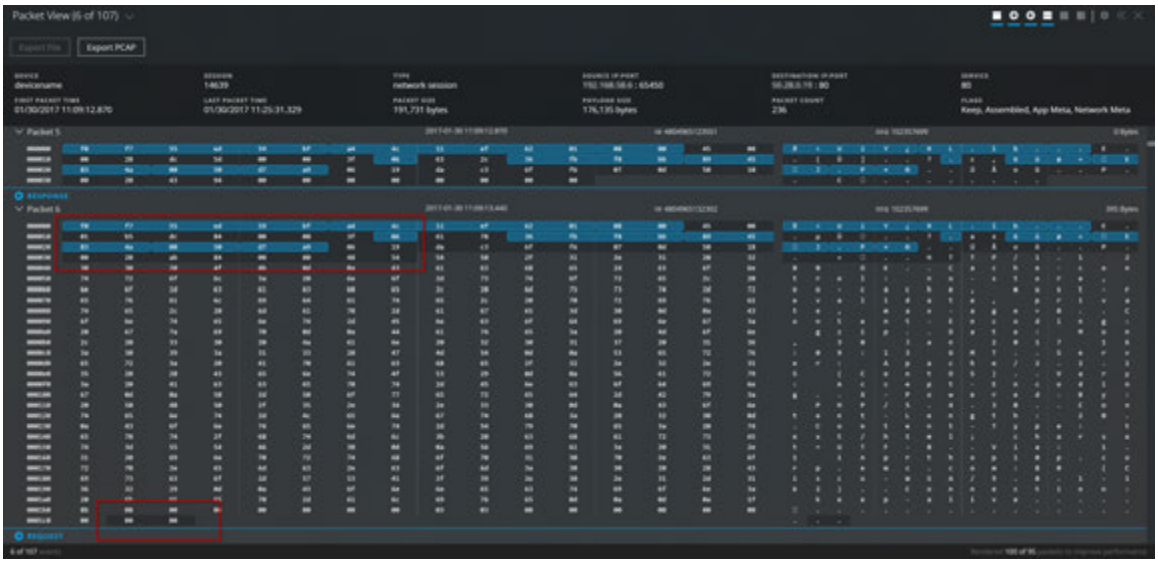
4	Click this icon to show or hide the Event Meta panel, which provides a detailed listing of meta data associated with the event..
5	An option to expand or contract the Reconstruction panel horizontally in the Navigate view.
6	An option to close the Reconstruction panel.
7	The header displays summary information for the event being reconstructed.
8	Lists each packet in the event. For each packet, you can see the packet number, the direction (Request or Response), and the packet contents in binary format on the left, hexadecimal format in the middle, and text format on the right.

Packet Reconstruction Details

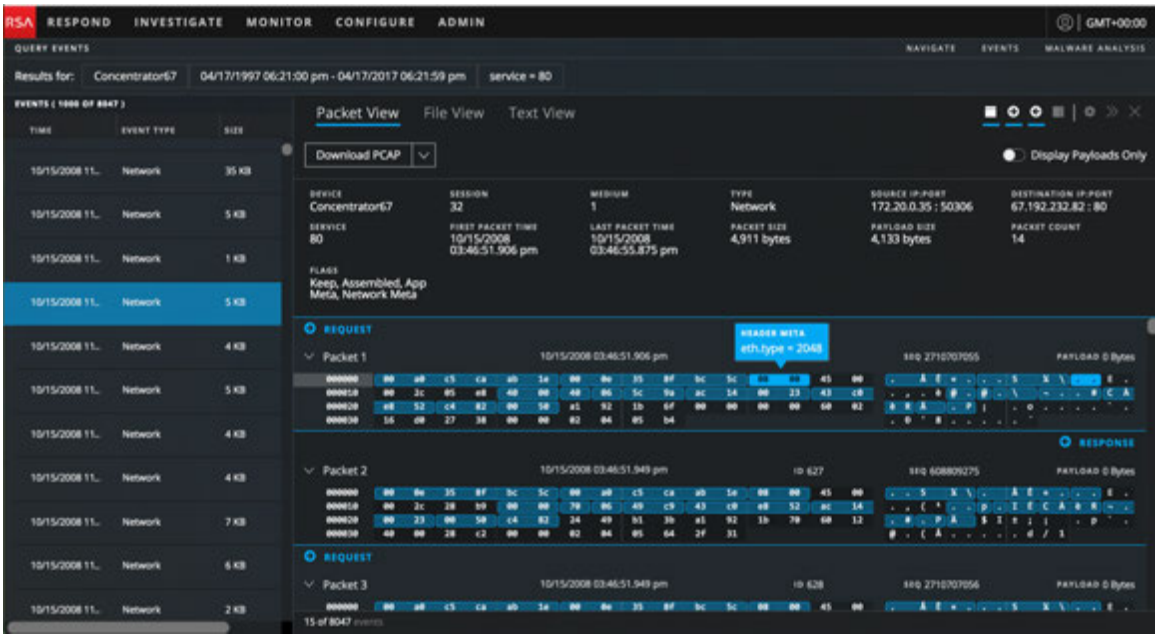
In the packet reconstruction, Investigate provides the packet number, the direction of the packet (Request or Response), the packet start time, and then the contents of the packet.



All packets begin with a header, and some packets have a footer. In the Packet View, the header and footer have a darker background so that you can distinguish them from the payload of the packet. The darker background for the header and footer appears in both the hexadecimal and text format.



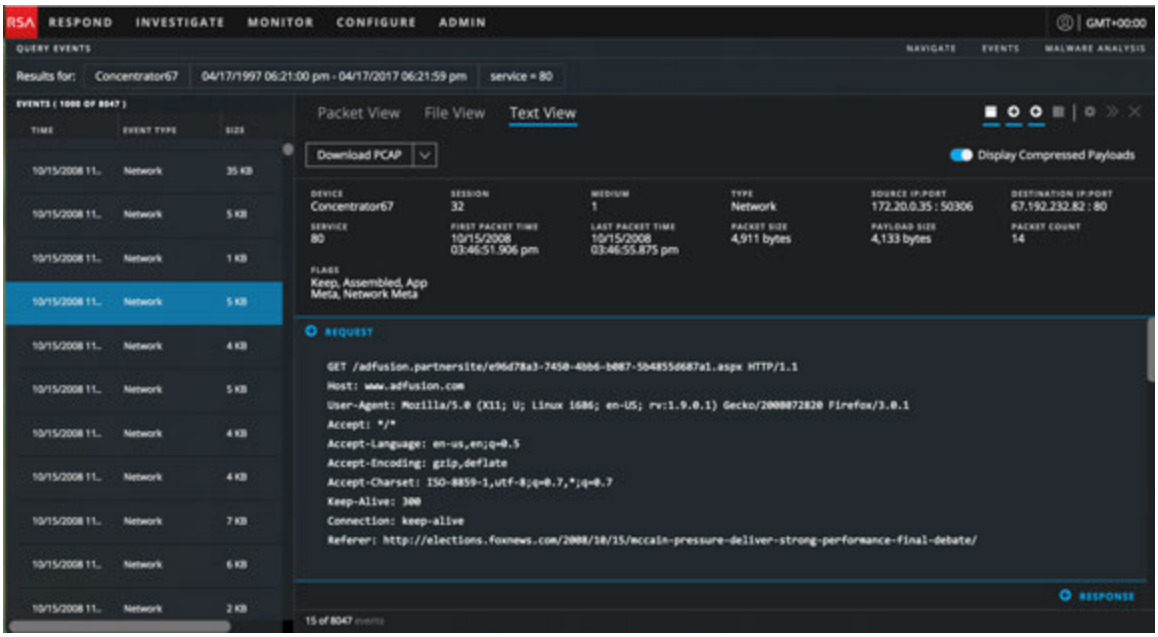
The contents of the packet are provided in hexadecimal, and text format. The meta data is highlighted in blue; when you hover over the meta data, the meta key/meta value information is displayed as a screen tip.



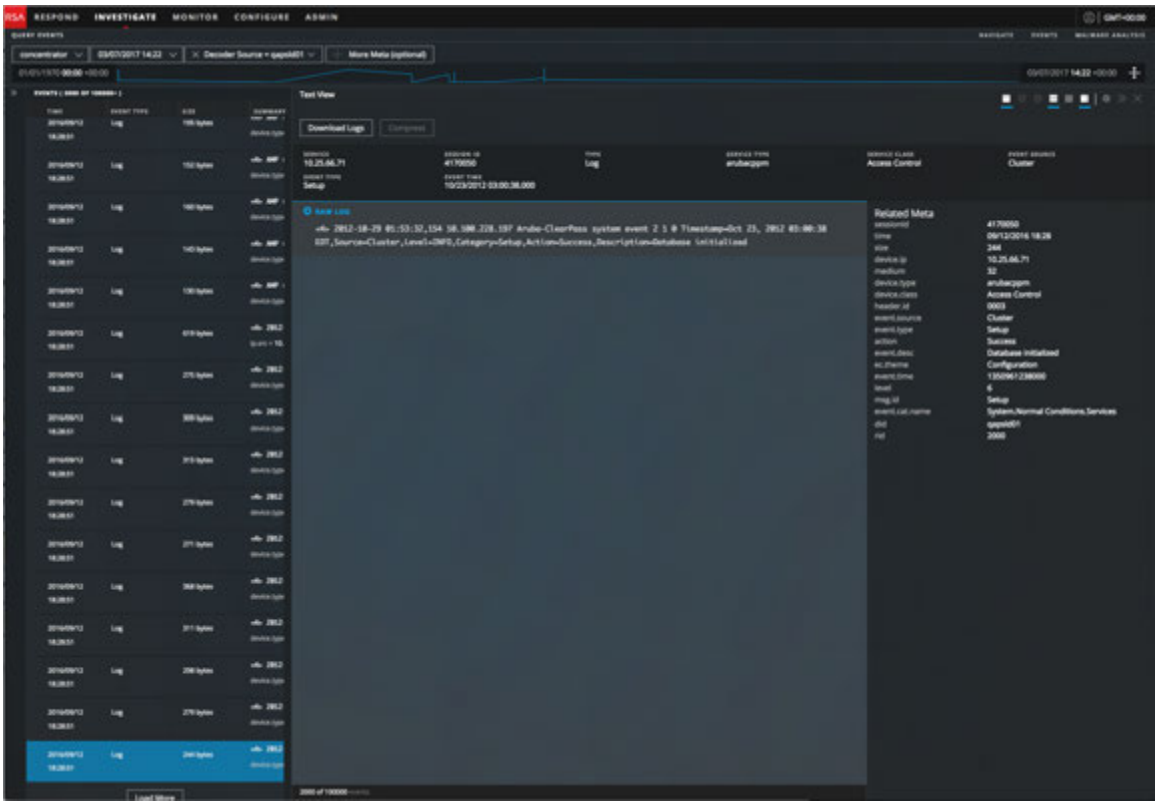
Additional options in the Packet View include the ability to Download the PCAP for the event, and display payloads only. When Payload only is displayed, you can use the Shade Bytes option to help distinguish patterns in the data.

Text Reconstruction Details

In the Text reconstruction, network events and log events are presented differently. For network events, Investigate provides the direction of the packet (Request or Response) and contents of each packet in text format.



For log events, (filter on Medium = Log), there is no request or response; only the raw log is displayed in the Text reconstruction.



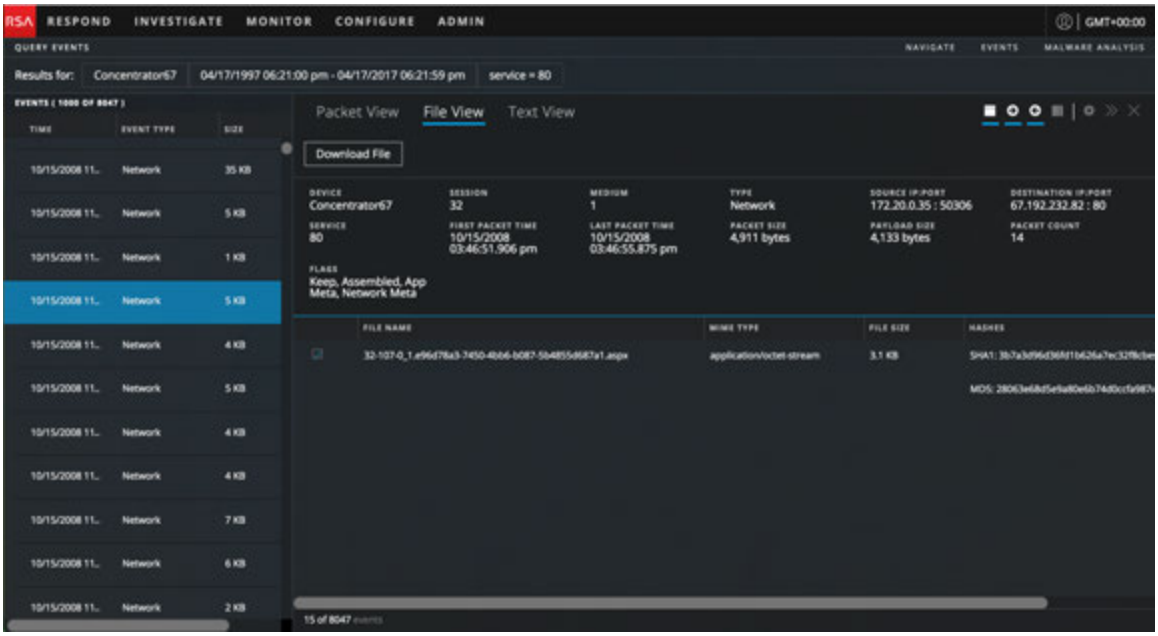
A subset of the reconstruction options is available in the Text View. You can:

- Hide and show the header.
- For Network events, select display of Requests only, Responses only, or both.
- For Network events, export the session as a PCAP file.
- For Log events, export the raw log.
- Switch between a compressed and decompressed view of payloads. When the session is decompressed, the compressed parts of the text become readable.
- Select text for decoding and encoding.

Note: This feature is not available for the File view, non-http network sessions, and log data.

File Reconstruction Details

In the File reconstruction, Investigate presents a list of files associated with the selected network event.



You can select one file, one or more files, or all files to export to your local file system. When files are selected, the Export Files button becomes active and reflects the number of files selected. Clicking the button exports the selected files as a zip archive, which ensures that any potentially malicious files will not be opened by the default application and executed. The exported archive is named using the following convention:

`<service-ID or host name>_SID<nnnnnnnn>_FC<n>.zip`

where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved
- `SID<nnnnnnnn>` is the session ID number
- `FC<nnnnnnnn>` is the file count or number of files in the archive.

To prevent an archive from being unzipped automatically when downloaded, NetWitness Suite exports the archive with password protection. To open an archive, enter the following password: **netwitness**.

Caution: Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

Detailed Description

Feature	Description
Reconstruction type menu	In this menu, you can select the type of reconstruction: **Packet** or **File**. When you first open a reconstruction, NetWitness Suite chooses the best reconstruction by default.
Download options	Options for exporting a log, a PCAP, or files for deeper analysis and to share with others.
	Controls the display of a header above the packet list; you can click this icon to hide the header or display it. Hiding the header allows more space for the packet list, reducing the amount of scrolling required to view more packets. The header provides information about the reconstructed event: the name of the service that collected the packet, session or event number, type of event (network), source IP:port, destination IP:port, sevice type, first packet time in the event, last packet time in the event, event size, payload size in bytes, packet count, and the flags applied to the event (keep, assembled, App meta, network meta).
	Two controls turn the display of Request and Response on and off (see Reconstruct an Event).
	Displays the meta details for the event in another panel.

Feature	Description
	(Future) Settings menu.
	Sizing controls for the Reconstruction panel (see Reconstruct an Event).
	Closes the Reconstruction panel. The view now shows only the Events panel and the Events panel.

Services Config View - AV Tab

This topic introduces the features and functions of the AV tab in the Service Config view for a Malware Analysis service. The AV tab provides a way to identify the anti-virus software vendors whose software is in use on your network. NetWitness Suite can include the results from these vendors in the detailed results view of an event that has been analyzed using Malware Analysis.

This is an example of the AV tab.

Features

The AV tab lists anti-virus vendors whose software may be installed in your network. There are two categories for vendors: Primary, which are the most trusted, and Secondary, which are less known. Each vendor name has a checkbox and an icon. Checking a vendor name indicates that you have installed the selected AV software from that vendor in your environment.

This table describes the options in the AV tab.

Feature	Description
Vendor Checkbox	Choose one or more AntiVirus vendors from the supplied list to indicate which products have been installed in the local organization.
Apply	Saves changes made in the AV tab.
Reset	Resets the AV list to the default state, which has no vendors selected.

Services Config View - General Tab

This topic introduces the configuration settings in the Service Config view > General tab for Malware Analysis, which has parameters specific to the Malware Analysis service. In this tab, you configure:

- The processing parameters for Core services that are capturing data.
- The repository for captured data.
- The static, community, and sandbox scoring categories used to analyze data.

The following task provides detailed procedures: Configure General Malware Analysis Settings.

This is an example of the General tab.

This tab has four sections: Continuous Scan Configuration, Repository Configuration, Miscellaneous, and Modules Configuration.

Continuous Scan Configuration Section

This table describes the features of the Continuous Scan Configuration section.

Parameter	Description
Enabled	Completely disable or enable continuous polling of the Core service. By default this is not selected (**disabled**).
Query	While the Decoder is analyzing network traffic, it creates a meta field called content with a value of **spectrum.consume** in sessions that are likely to contain malware. By default, Malware Analysis only performs analysis on events that have this particular meta value. By changing this query, Malware Analysis can be configured to analyze different types of events. Making this query too broad may force Malware Analysis to analyze too many events, causing it to fall behind or perform poorly. The default query is **select * where content='spectrum.consume'**

Parameter	Description
Query Expiry	When Malware Analysis queries the Core service for meta, it gets a result back within a few seconds. If there is a problem, such as a network connectivity issue, Malware Analysis abandons the query after this configured amount of time. The default value is **3600 seconds**.
Query Interval	How often, in minutes, to query for new session meta and files.
Meta Limit	Each time Malware Analysis queries the Core service, it pulls an amount of meta, up to this meta limit. Using this setting, in conjunction with the query interval, you can tune the performance of Malware Analysis in the Core infrastructure. The default value is **25000**.
Time Boundary	Malware Analysis analyzes sessions that occurred after the Time Boundary. This setting is most important when installing a new Malware Analysis appliance, because it determines how far back in time to begin analysis. Setting the boundary too many hours in the past may cause Malware Analysis to analyze too many past events, causing a large delay before you see any traffic happening in real time. The default value is **24 hours**.
Source Host	Hostname of the Malware Analysis appliance. This is the IP address, or the hostname, of the service that Malware Analysis queries to retrieve its data for analysis. Do not use localhost as the source host. Depending on the model of the appliance and the configuration of the NetWitness Suite infrastructure, this source host can vary.
Source Port	Malware Analysis communicates with the NetWitness Suite infrastructure using the REST service listening on this port. This port number is specific to the type of the Core service that is being used as the Source host. This corresponds to the outbound connections for your Core service.

Parameter	Description
Username	Username. The default value is **admin**. Malware Analysis must authenticate to the Source host each time it queries for data. In most cases, the account used by Malware Analysis is the same account used to access the Core service through NetWitness Suite. However, it is recommended to create a new account on the Core service dedicated to Malware Analysis.
User Password	User password. The default value is **netwitness**.
SSL	Use SSL when communicating with Core. If Malware Analysis is using an SSL connection to communicate with a Core service, check this option. The default value is unchecked.
Denial of Service (DOS) Prevention	The Denial of Service Prevention feature provides safeguards against malware that intentionally generates high volumes of network connections between two endpoints containing Windows PE content. Generating a high volume of connections artificially inflates the amount of traffic that security services monitoring the network must consume and analyze resulting in a denial of service. This feature helps identify these sessions so that you can have the analysis processing disregard them. The default value is unchecked.

Parameter	Description
DOS Session Rate Window Length (Seconds)	Malware Analysis uses this parameter with the **DOS Number Sessions per Rate Window** and **DOS Session Lockout Time (Seconds)** parameters to identify a Denial of Service Attack and determine how long to disregard sessions from a single IP address. To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP address during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic from the IP address is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**. The default value is: **60** seconds
DOS Number Sessions per Rate Window	Malware Analysis uses this parameter with the **DOS Session Rate Window Length (Seconds)** and **DOS Session Lockout Time (Seconds)** parameters to identify a Denial of Service Attack and determine how long to disregard sessions from the IP address. To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP source during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**. The default value is: **200** sessions

Parameter	Description
DOS Session Lockout Time (Seconds)	Malware Analysis uses this parameter with the **DOS Session Rate Window Length (Seconds)** and **DOS Number Sessions per Rate Window** parameters to identify a Denial of Service Attack and determine how long to disregard such an attack. To identify a Denial of Service Attack, Malware Analysis monitors the number of sessions established by a single IP address during a specific time frame. The **DOS Session Rate Window Length (Seconds)** defines this time frame. If the number of sessions exceeds the **DOS Number Sessions per Rate Window** setting within the number of seconds defined in **DOS Session Rate Window Length**, Malware Analysis identifies the activity as a Denial of Service attempt. In this case, traffic is disregarded for the length of time specified in **DOS Session Lockout Time (Seconds)**. The default value is: **60** seconds
DOS Garbage Collection Interval (Seconds)	Performs garbage collection on the internal memory structure used to track Denial of Service attempts. If memory usage is abnormally high, you can decrease this setting to free unused memory more often. If CPU usage is abnormally high, you can increase this setting to eliminate processing overhead (at the expense of memory usage). The default value is: **120** seconds

Repository Configuration Section

Malware Analysis stores all of the files that are analyzed for future use. These files can be downloaded through the user interface or accessed via one of the file sharing protocols.

This table describes the features of the Repository Configuration section.

Parameter	Description
Directory Path	All files are stored in the following directory on the Malware Analysis appliance: **/var/lib/netwitness/spectrum**

Parameter	Description
File Sharing Protocol	Possible values for the file sharing protocol are FTP, SAMBA, and None. You can enable FTP access and SAMBA file sharing to allow a user access to the stored files on the Malware Analysis from a remote location. No credentials are required to access these files. The port required for FTP access is TCP/21. The default file sharing protocol is **None**.
Retention (in days)	Malware Analysis maintains files stored in the repository for a specified number of days. You can set the number of days that files are retained before being deleted. The default value is **60** days.

Miscellaneous Configuration Section (10.3 SP2 and Later)

This table describes the features of the Miscellaneous Configuration section.

Parameter	Description
Maximum File Size	Limits the size of each file that you can scan for manually. This parameter applies to the feature described in "Upload Files for Malware Scanning" in the Investigation and Malware Analysis Configuration Guide. The default value is **64 MB**. If the file size limit is exceeded, prevents you from scanning the file.

Modules Configuration Section

The Modules Configuration section allows configuration of the static, community, and sandbox scoring categories.

Static Analysis Configuration

The static module is the only scoring category that is enabled by default. This table describes the parameters for configuring static analysis.

Feature	Description
Enabled	Completely disable or enable static analysis. By default this is selected (**enabled**).
Bypass PDF	Disable analysis of PDF documents. By default this is not selected; all PDF files undergo static analysis.
Bypass Office	Disable analysis of Office documents. By default this is not selected; all MS Office files undergo static analysis.
Bypass Executable	Disable analysis of Windows PE documents. By default this is not selected; all Windows PE files undergo static analysis.
Validate Windows PE Authenticate Settings via Cloud	Specify whether or not Windows PE files are sent to the RSA-Netwitness Cloud for Authenticode validation. The default value is selected. • When selected, any Windows PE file that is digitally signed is transmitted over the network (in its entirety) to the RSA-Netwitness Cloud for validation. If the intent is to prevent Windows PE files from leaving the customer network, you should disable this option. • When not selected, ALL static analysis is performed locally (skipping Authenticode validation). Regardless of this setting, PDF and M/S Office documents are not subject to Authenticode validation and are not transmitted over the network during static analysis.

Community Analysis Configuration

By default, the community module is disabled and the options are selected to prevent PDFs and MS Office documents from being processed. The intent is to default the settings to the most restrictive choices so that no sensitive documents leave the network unless the user chooses. This table describes the parameters for configuring Community analysis.

Feature	Description
Enabled	Completely disable or enable static analysis. By default this is not selected (**disabled**).

Feature	Description
Bypass PDF	Disable analysis of PDF documents. By default this is selected; PDF files are not processed.
Bypass Office	Disable analysis of Office documents. By default this is selected; Microsoft Office documents are not processed.
Bypass Executable	Disable analysis of Windows PE documents. By default this is selected; Windows PE documents are not processed

Sandbox Analysis Configuration

By default, the sandbox module is disabled and MS Office and PDF files are prevented from being processed. The intent is to set the most restrictive settings to force the user to specifically choose whether or not potentially sensitive information is sent outside of the network for processing. If the document type is not prevented from being processed, the file is sent to the destination sandbox server in its entirety (not limited to a hash of the file contents).

This table describes the parameters for configuring Sandbox analysis.

Feature	Description
Enabled	Completely disable or enable sandbox analysis. By default this is not selected **(disabled)**.
Bypass PDF	Disable analysis of PDF documents. By default this is selected; PDF files are not processed. When not selected, all PDF files are submitted in their entirety to the Sandbox for analysis.
Bypass Office	Disable analysis of Office documents. By default this is selected; Microsoft Office documents are not processed. When not selected, all MS Office files are submitted in their entirety to the Sandbox for analysis.

Feature	Description
Bypass Executable	Disable analysis of Windows PE documents. By default this is selected; Windows PE documents are not processed. When not selected, all Windows PE documents are submitted in their entirety to the Sandbox for analysis.
Preserve Original File Name when Performing Sandbox Analysis	In 10.3 SP2 and later, enable the ability to hash for filenames when they are sent to a local sandbox. By default this is not selected. **Note:** If you do not select this parameter, NetWitness Suite hashes the files.

GFI Sandbox Settings

In the GFI Sandbox section, you can enable sandbox processing by GFI and configure the locally installed GFI sandbox. The table describes the parameters for configuring the GFI sandbox.

Feature	Description
Enabled	When enabled, sandbox processing is performed by a local copy of GFI. The default value is **disabled**. If you enable GFI, you need to configure the remaining parameters.
Server Name	The GFI Sandbox server name. No default value.
Server Port	The GFI Sandbox server port. Default value is **80**.
Max Poll Period	Determines how long to wait for a submitted sample to finish processing. Default value is **600 seconds**.
Ignore Web Proxy Settings	Tells Malware Analysis to bypass the web proxy, if a web proxy is configured, when making this connection. If no web proxy has been configured in Malware Analysis, the setting is ignored.

ThreatGrid Sandbox Settings

In the ThreatGrid Sandbox section, you can enable sandbox processing by ThreatGrid and choose whether to use the locally installed ThreatGrid or the ThreatGrid Cloud for sandbox analysis.

- If you have a local copy of ThreatGrid, configure sandbox processing to use the local copy.
- If no local instance of ThreatGrid has been purchased and installed, configure the ThreatGrid Cloud.

The table describes the parameters for configuring the ThreatGrid sandbox.

Note: Before enabling this service, you must configure a ThreatGrid-supplied Service Key. The service key allows ThreatGrid to recognize that samples submitted from this site are legitimate.

Feature	Description
Enabled	When enabled, sandbox processing is performed by ThreatGrid, either a local copy or the ThreatGrid Cloud. The default value is **disabled**.
Service Key	Before enabling the sandbox module, a ThreatGrid-supplied Service Key must be configured. The service key allows ThreatGrid to recognize that samples submitted from this site are legitimate.
URL	The URL for the ThreatGrid server to be used (if you are not using a locally installed ThreatGrid). The ThreatGrid Cloud is reachable via https://panacea.threatgrid.com
Ignore Web Proxy Settings	Tells Malware Analysis to bypass the web proxy, if a web proxy is configured, when making this connection. If no Web Proxy has been configured in Malware Analysis, the setting is ignored.

Services Config View - Hash Tab

This topic introduces the features and functions available in the Service Config view > Hash tab for Malware Analysis.

In this tab, you can manage hash filtering in Malware Analysis. The hash grid is initially empty; the grid lists filters that have been added to Malware Analysis. In this view, you can add a hash filter, delete a hash filter, mark a hash filter as trusted or untrusted, and save changes.

This is an example of the Hash tab.

This is an example of the Add Hash dialog.

Features

The **Hash** tab consists of a toolbar and a pageable hash grid.

This table describes the Hash tab toolbar.

Feature	Description
MD5 Search	Enter an MD5 hash for which you want to search the results in the grid. The search function is case-insensitive.
Add	Displays the Add Hash dialog in which you can add a new hash to the hash grid, specify whether the hash is trusted or not, and provide the hash file size.
Save Edit	Saves any additions or edits to hashes in the grid.
Delete	Deletes selected hashes from the grid.

This table describes the Hash grid columns.

Feature	Description
Select Checkbox	Click to select a row. Click in the column header to select a header.
Trusted	Marks a hash as trusted or untrusted.
MD5	Identifies the MD5 hash.

Feature	Description
File Size	Identifies the hash file size in kilobytes.

Services Config View - Indicators of Compromise Tab

This topic introduces the features and functions available in the Service Config view > Indicators of Compromise tab, which applies to the Malware Analysis service. This tab provides a way to configure the way each of the four scoring modules uses the available rules to score data.

This is an example of the Indicators of Compromise tab.

Features

The Indicators of Compromise tab consists of a toolbar and pageable grid.

This table describes the features of the grid.

Feature	Description
Module selection list	Selects the scoring module for which you want to view the Indicators of Compromise: All, Network, Static, Community, Sandbox, or Yara.
Search field	Type text for which you are searching in the Description field.
Search option	Filters the grid to display only Descriptions that match the Description search term.
Enable All option	Click to enable all rules for the scoring module, as opposed to enabling all rules on the page using the checkbox.
Enable option	Click to enable selected rules.
Disable All option	Click to disable all rules for the scoring module, as opposed to disabling all rules on the page using the checkbox.

Feature	Description
Disable option	Click to disable selected rules.
Reset All option	Click to reset all rows on the page to their default values.
Reset option	Click to reset selected rows to their default values.
Save option	Click to save changes you made on this page. If you leave the page without saving, the changes are lost. The description of each row with unsaved changes has a red corner.

This table describes the features of the toolbar.

Column	Description
Selection checkbox	Checkboxes for selecting individual rows or all rows on the page.
Enabled checkbox	If the indicator of compromise is enabled, Malware Analysis uses the rule for scoring session data.
High Confidence checkbox	If checked, Malware Analysis treats the rule as one very likely to indicate the presence of malware, and an event that triggers that rule is marked in the results grid.
Description	Describes the Indicator of Compromise.
Score	Specifies the score that you want to factor in to the total score for any event that triggers the rule. The default score is displayed and you can raise or lower the score by dragging the slider or typing a number in the score box.
File Type	Displays the file types to which the rule applies. Possible values are **ALL**, **PDF**, **MS Office**, and **Windows PE**.

Services Config View - Integration Tab

This topic introduces the features and functions of the Integration tab in the Administration Services Config view for Malware analysis. This tab provides a way to test connections and enable Community scoring by registering the Malware Analysis service. An administrator can test the connection to cloud.netwitness.com and to a core service that was configured for continuous scan.

The following figure is an example of the Integration tab.

Features

This tab has two sections: RSA Cloud Connection Test and Registration and Continuous Scan Connection Test. The following table describes the features.

Feature	Description
RSA Cloud Connection Test and Registration button	Clicking this button tests for an active connection to cloud.netwitness.com. NetWitness Suite tests communications with the site and checks Proxy settings. A valid connection is required in order to register with the RSA Community Service.
Company Name	This is the name of your company. This is a required field.
Contact Email	This is the contact email. This is a required field.
Internal EMC Use Only Check box	This is an optional field. EMC customers, salespersons, or demo users should check this option to ensure that their requests do not use bandwidth on the production server. When the box is checked the following warning is displayed: `Checking this box may cause a less robust performance because the production server isn't being used.`
Register button	Clicking the Register button completes registration if all required fields are filled in. The Register button becomes the Update button after registration is complete.

Feature	Description
Update button	The Update button is displayed after registration is complete.
Continuous Scan Connection Test button	Clicking this button initiates a check to verify that the Malware Analysis service can connect to the Core service selected for continuous scanning (the Source Host, Source Port, Username, and User Password as specified in the General tab).

Services Config View - IOC Summary Tab

This topic introduces the features and functions available in the Service Config view > IOC Summary tab. This tab provides a way to view summary information for any IOC. A grid for each scoring module lists the configured IOCs along with statistics associated with that IOC of a specific range of time. The statistics include:

- The number of events for a network session or the number of files for a static, community, or sandbox event that were flagged with the IOC.
- The current score configured for the IOC in the Indicators of Compromise tab.
- The scores returned by each of the scoring modules.

When you select an event, you can show the Malware Events view or Malware Files view for the IOC. You can also open the selected IOC in the Indicators of Compromise tab to edit the Current Score.

This is an example of the IOC Summary tab for the Network scoring module.

Features

The IOC Summary consists of four tabs, one for each scoring module: Network, Static, Community, and Sandbox. Each tab has the same form and same information with a toolbar and pageable grid.

This table describes the features of each tab.

Feature	Description
Time Range	Selects the time range for the IOC Summary. Possible values are: Last 5 Minutes, Last 15 Minutes, Last 30 Minutes, Last Hour, Last 3 Hours, Last 6 Hours, Last 12 Hours, Last 24 Hours, Last 2 Days, Last 5 Days, Early Morning, Morning, Afternoon, Evening, All Day, Yesterday, This Week, Last Week, or Custom.
Description column	Lists the descriptions for the IOCs.

Feature	Description
Count column	Lists the number of occurrences of the IOCs. In the Network tab, the count is the number of events in which the IOC was found. In the other tabs, the count is the number of files in which the IOC was found.
Current Score column	Lists the current score for the IOCs as configured in the Indicators of Compromise tab.
Static, Network, Community, and Sandbox columns	List the scores that each of the scoring modules gave the IOCs.
Actions drop-down	The Actions drop-down menu has two options: Show Events/Files and Edit. Show Events opens the IOC in the Investigation Events view or Files view. This view can also be opened by double-clicking on the IOC. Edit opens the IOC in the Indicators of Compromise tab to edit the Current Score.

Service Config View - Proxy Tab

This topic introduces the parameters configured in the Proxy tab in the Service Config view for a Malware Analysis service. This tab configures Malware Analysis communication via web proxy with the RSA Cloud for community analysis and with the sandbox service for sandbox analysis to preserve anonymity. If you are using a local sandbox service, communications via web proxy are unnecessary and may slow performance. When configuring the sandbox module in the **General** tab, you can choose to bypass the configured web proxy.

This is an example of the Proxy tab.

Features

This table describes the features in the Proxy tab.

Feature	Description
Enabled	Select the checkbox to enable communication via web proxy with the RSA Cloud for community analysis and with the sandbox service for sandbox analysis to preserve anonymity.
Automatically detect web proxy settings	Select the checkbox to use settings configured in the System settings.
Proxy host	Enter the hostname for the proxy host.
Proxy port	Enter the port used for communication on the proxy host
Users	Enter the username used to log on to the proxy host.
User Password	Enter the user password used to log on to the proxy host.
SSL	(Optional) Select the checkbox to enable communication using SSL.
Apply button	Click the **Apply** button to submit chosen settings.

Services Config View - ThreatGRID Tab

This topic introduces the parameters required to obtain a trial ThreatGrid API key in the Malware Analysis **ThreatGRID** tab, which provides a method of obtaining a trial ThreatGrid API key for use in the ThreatGrid Cloud sandbox. Before enabling ThreatGrid as the sandbox service in the Sandbox module, a ThreatGrid-supplied Service Key must be configured so that ThreatGrid can recognize that samples submitted from this site are legitimate.

If you do not have a ThreatGrid-supplied Service Key, you can obtain a key using this tab. The key is provided on a trial basis.

This is an example of the ThreatGRID tab.

Features

This table describes the features of the **ThreatGRID** tab.

Feature	Description
Full Name	Your first and last name.
Title	Your job title.
Organization Name	The name of your organization.
Email	Your email address.
User Id	Your user ID for ThreatGrid access.
Password	Your password for ThreatGrid access.
Register button	Click the **Register** button to submit the request.

Contents

About this Document

This guide provides an overview of NetWitness Respond, detailed instructions on how to configure NetWitness Respond in your network, additional procedures that are used at other times, and reference materials that describe the user interface for configuring NetWitness Respond in your network.

Topics

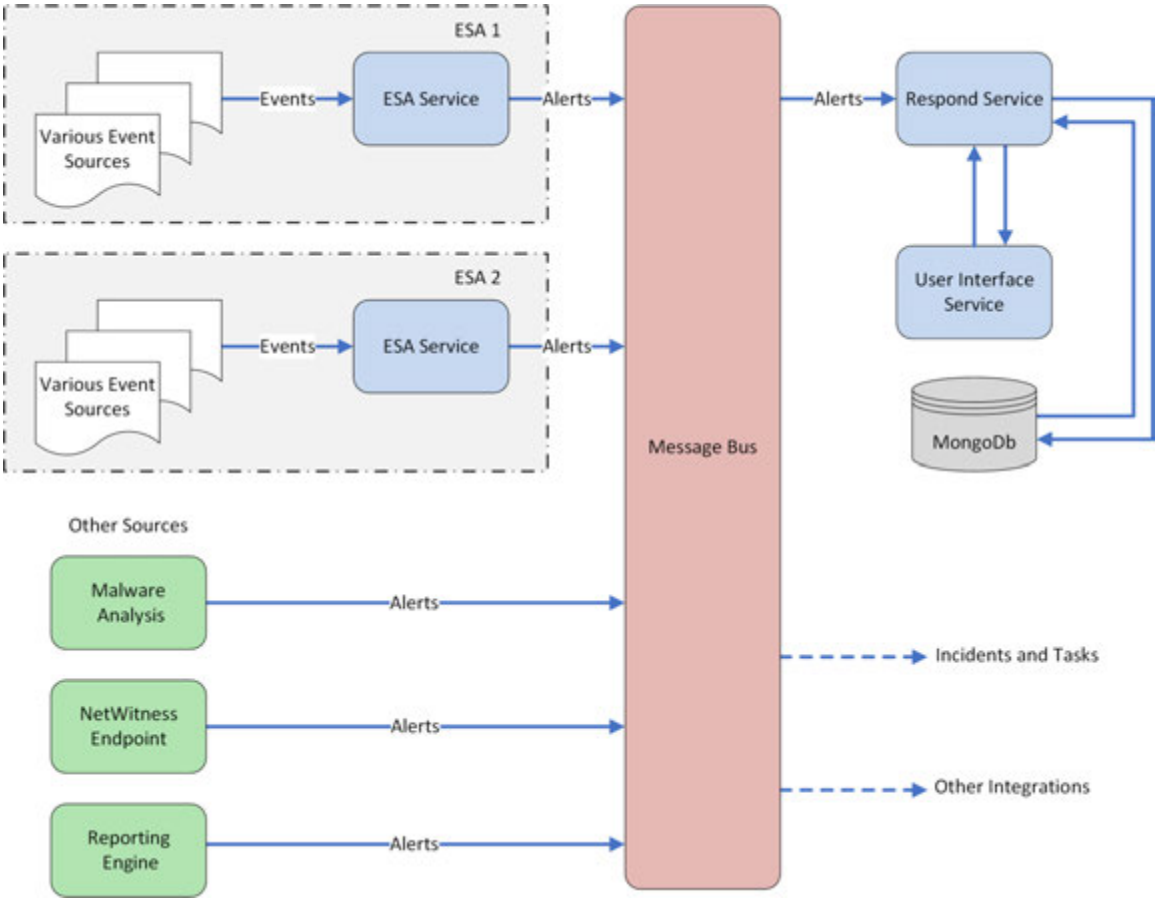
NetWitness Respond Configuration Overview

RSA NetWitness® Suite NetWitness Respond consumes Alert data from various sources via the Message Bus and displays these alerts on the NetWitness Suite user interface. The Respond Server service allows you to group the alerts logically and start a NetWitness Respond workflow to investigate and remediate the security issues raised.

The Respond Server service consumes alerts from the message bus and normalizes the data to a common format (while retaining the original data) to enable simpler rule processing. It periodically runs rules to aggregate multiple alerts into an incident and set some attributes of the Incident (for example, severity, category, and so on). The incidents are persisted into MongoDb by the Respond Server service. Incidents are also posted onto the message bus for consumption by other systems (for example, Archer integration).

Note: NetWitness Respond requires an ESA primary server that contains the MongoDb. Alerts, Incidents, and Task records are persisted into this MongoDb by the Respond Server.

The following diagram illustrates the high level flow of alerts.



You have to configure various sources from which the alerts are collected and aggregated by the Respond Server service.

Configuring NetWitness Respond

This topic provides the high-level tasks required to configure the Respond Server service. The administrator needs to complete the steps in the sequence provided.

Topics

Step 1. Configure Alert Sources to Display Alerts in Respond View

This procedure is required so that alerts from the alert sources are displayed in NetWitness Respond. You have an option to enable or disable the alerts being populated in the Respond view. By default this option is disabled in the Reporting Engine, Malware Analytics, and NetWitness Endpoint and enabled only in Event Stream Analysis. So when you install the Respond Server service you need to enable this option in the Reporting Engine, Malware Analytics, and NetWitness Endpoint to populate the corresponding alerts in the Respond view.

Prerequisites

Ensure that:

- The Respond Server service is installed and running on NetWitness Suite.
- A database is configured for the Respond Server service.
- NetWitness Endpoint is installed and running.

Configure Reporting Engine to Display Alerts Triggered by Reporting Engine in Respond View

The Reporting Engine alerts are by default disabled from being displayed in Respond view. To display and view the Reporting Engine alerts, you have to enable the NetWitness Respond alerts in the Services Config view > General tab for the Reporting Engine.

1. Go to **ADMIN > Services,** select a Reporting Engine service, and select  **> View > Config**.
   The Services Config view is displayed with the Reporting Engine General tab open.
2. Select **System Configuration**.
3. Select the checkbox for **Forward Alerts to Respond**.
   The Reporting Engine now forwards the alerts to NetWitness Respond.

For details on parameters in the General tab, see the "Reporting Engine General Tab" topic in the *Reporting Engine Configuration Guide*.

Configure Malware Analytics to View Alerts Triggered by Malware Analytics in Respond view

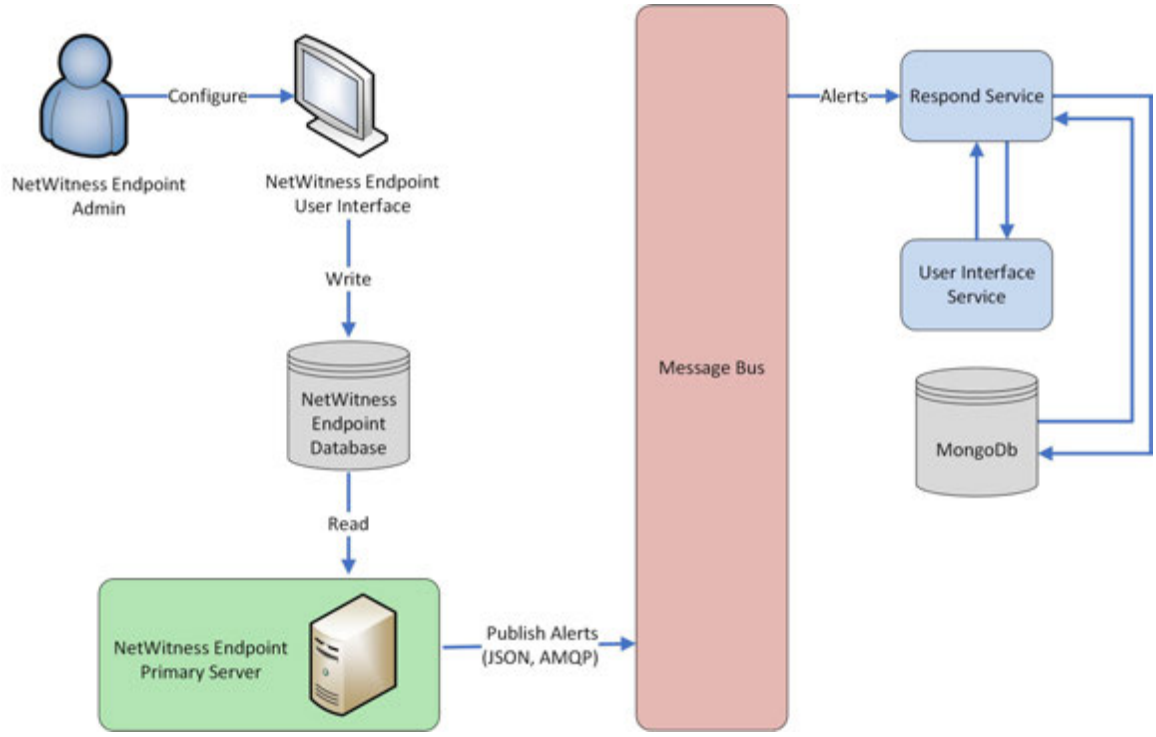
Viewing NetWitness Respond alerts is a function of auditing in Malware Analysis. The procedure of enabling NetWitness Respond alerts is described in the "(Optional) Configure Auditing on Malware Analysis Host" topic in the *Malware Analysis Configuration Guide*.

Configure NetWitness Endpoint to View Alerts Triggered by NetWitness Endpoint in Respond View

This procedure is required to integrate NetWitness Endpoint with NetWitness Suite so that the NetWitness Endpoint alerts are picked up by the NetWitness Respond component of NetWitness Suite and displayed in the **RESPOND > Alerts** view.

Note: RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, or later for NetWitness Respond integration. For more detailed information, see the "RSA NetWitness Suite Integration" topic in the *NetWitness Endpoint User Guide*.

The diagram below represents the flow of NetWitness Endpoint alerts to the NetWitness Suite Respond Server service and its display in the **RESPOND > Alerts** view.



Configure NetWitness Endpoint to Display NetWitness Endpoint Alerts

To configure NetWitness Endpoint to display NetWitness Endpoint alerts in the NetWitness Suite user interface:

1. In the NetWitness Endpoint user interface, click **Configure > Monitoring and External Components**.

The **External Components Configuration** dialog is displayed.

2. From the components listed, select **Incident Message Broker** and click + to add a new IM broker.
3. Enter the following fields:
   a. **Instance Name**: Enter a unique name to identify the IM broker.
   b. **Server Hostname/IP address**: Enter the Host DNS or IP address of the IM broker (NetWitness Server).
   c. **Port number**: The default port is 5671.
4. Click **Save**.
5. Navigate to the **ConsoleServer.exe.Config** file in **C:\Program Files\RSA\ECAT\Server**.
6. Modify the virtual host configurations in the file as follows:
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Suite 11.0, the virtual host is "/rsa/system". For version 10.6.x and below, the virtual host is "/rsa/sa".
7. Restart the API Server and Console Server.
8. To set up SSL for Respond Alerts, perform the following steps on the NetWitness Endpoint primary console server to set the SSL communications:
   a. Export the NetWitness Endpoint CA certificate to .CER format (Base-64 encoded X.509) from the personal certificate store of the local computer (without selecting the private key).
   b. Generate a client certificate for NetWitness Endpoint using the NetWitness Endpoint CA certificate. (You MUST set the CN name to ecat.)

      ```
      makecert -pe -n "CN=ecat" -len 2048 -ss my -sr LocalMachine -a
      sha1 -sky exchange -eku 1.3.6.1.5.5.7.3.2 -in "NWECA" -is MY -ir
      LocalMachine -sp "Microsoft RSA SChannel Cryptographic Provider" -
      cy end -sy 12 client.cer
      ```

> **Note:** In the above code sample, if you upgraded to Endpoint version 4.3 from a previous version and did not generate new certificates, you should substitute "EcatCA" for "NWECA".

c. Make a note of the thumbprint of the client certificate generated in step b. Enter the thumbprint value of the client certificate in the IMBrokerClientCertificateThumbprint section of the ConsoleServer.Exe.Config file as shown.

```
<add key="IMBrokerClientCertificateThumbprint"
value="896df0efacf0c976d955d5300ba0073383c83abc"/>
```

9. On the NetWitness Server, copy the NetWitness Endpoint CA certificate file in .CER format into the import folder:
`/etc/pki/nw/trust/import`

10. Issue the following command to initiate the necessary Chef run:
`orchestration-cli-client --update-admin-node`
This appends all of those certificates into the truststore.

11. Restart the RabbitMQ server:
`systemctl restart rabbitmq-server`
The NetWitness Endpoint account should automatically be available on RabbitMQ.

12. Import the **/etc/pki/nw/ca/nwca-cert.pem** and **/etc/pki/nw/ca/ssca-cert.pem** files from the NetWitness Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Step 2. Assign Respond View Permissions

Add users with the required permissions to investigate incidents and alerts in NetWitness Respond. Users with access to the Respond view need both Incidents and Respond-server permissions.

The following pre-configured roles have permissions in the Respond view:

- **Analysts**: The Security Operations Center (SOC) Analysts have access to Alerting, NetWitness Respond, Investigation, and Reporting, but not system configurations.
- **Malware Analysts**: Malware Analysts have access to investigations and malware events.
- **Operators**: Operators have access to configurations, but not Investigation, ESA, Alerting, Reporting and NetWitness Respond.
- **SOC_Managers**: The SOC Managers have the same access as Analysts plus additional permissions to handle incidents and configure NetWitness Respond.
- **Data_Privacy_Officers**: Data Privacy Officers (DPOs) are like Administrators with additional focus on configuration options that manage obfuscation and viewing of sensitive data within the system. See *Data Privacy Management* for additional information.
- **Respond_Administrator**: The Respond Administrator has full access to NetWitness Respond.
- **Administrators**: the Administrator has full system access to NetWitness Suite and has all permissions by default.

The NetWitness Respond default permissions are shown in the following tables. You need to assign user permissions from both the **Incidents** and **Respond-server** tabs, which are the Permissions tab names in the ADMIN > Security view Add or Edit Roles dialogs.You may want to add additional user permissions for Alerting, Context Hub, Investigate, Investigate-server, and Reports.

Respond-server

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
respond-server.alert.delete			Yes*	Yes*		
respond-server.alert.manage	Yes	Yes	Yes*	Yes*		Yes
respond-server.alert.read	Yes	Yes	Yes*	Yes*		Yes
respond-server.alertrule.manage		Yes	Yes*	Yes*		
respond-server.alertrule.read		Yes	Yes*	Yes*		
respond-server.configuration.manage			Yes*	Yes*		
respond-server.health.read			Yes*	Yes*		
respond-server.incident.delete			Yes*	Yes*		
respond-server.incident.manage	Yes	Yes	Yes*	Yes*		Yes
respond-server.incident.read	Yes	Yes	Yes*	Yes*		Yes
respond-server.journal.manage	Yes	Yes	Yes*	Yes*		Yes
respond-server.journal.read	Yes	Yes	Yes*	Yes*		Yes
respond-server.logs.manage			Yes*	Yes*		
respond-server.metrics.read			Yes*	Yes*		
respond-server.process.manage			Yes*	Yes*		
respond-server.remediation.manage	Yes	Yes	Yes*	Yes*		Yes

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
respond-server.remediation.read	Yes	Yes	Yes*	Yes*		Yes
respond-server.security.manage			Yes*	Yes*		
respond-server.security.read			Yes*	Yes*		

* Data Privacy Officers and Respond Administrators have the **respond-server.*** permission, which gives them all of the Respond-server permissions.

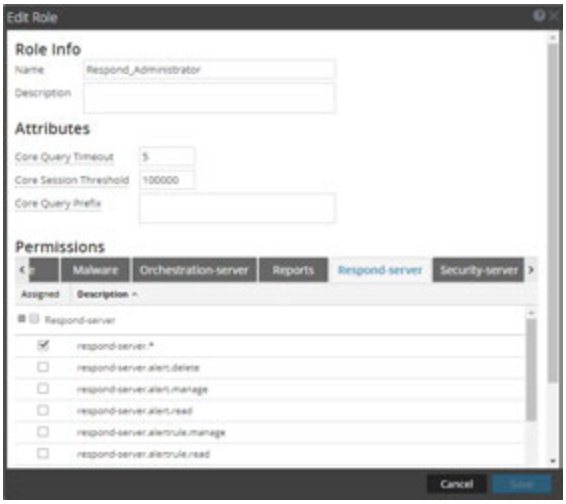
Incidents

Permissions	Analysts	SOC Mgrs	DPOs	Respond Admin	Operators	MAs
Access Incident Module	Yes	Yes	Yes	Yes		Yes
Configure Incident Management Integration		Yes	Yes	Yes		
Delete Alerts and Incidents			Yes	Yes		
Manage Alert Handling Rules		Yes	Yes	Yes		
View and Manage Incidents	Yes	Yes	Yes	Yes		Yes

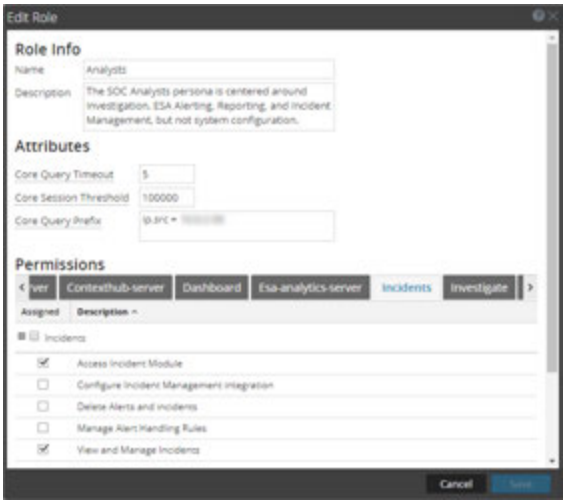
The Respond Administrator has all of the Respond-server and Incidents permissions.

Caution: It is very important that you assign equivalent user permissions from BOTH the Respond-Server tab AND the Incidents tab.

The following figure shows Respond-Server permissions for the default Respond Administrator role. The Respond Administrator role contains all of the NetWitness Respond permissions.



The following figure shows the Incidents permissions for the default Analysts role:



For more information, see "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management* guide.

Step 3. Create an Aggregation Rule for Alerts

You can create aggregation rules with various criteria to automate the incident creation process. Alerts that meet the rule criteria are grouped together to form an incident. This is useful when you know a particular set of alerts can be grouped into an incident and you can set an aggregation rule that takes care of grouping the alerts instead of spending time in manually creating an incident and adding the alerts to that incident individually. To create incidents automatically you need to create an aggregation rule.

To create an aggregation rule:

1. Go to **CONFIGURE > Incident Rules**.

   The **Aggregation Rules** tab is displayed.

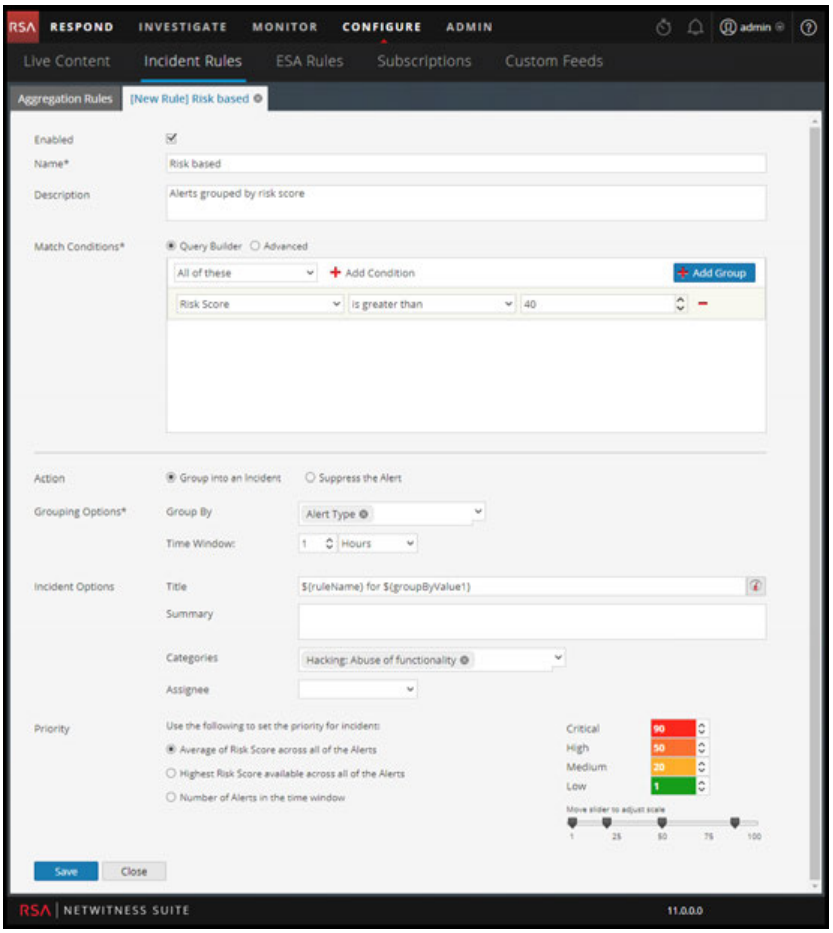
   A list of 11 predefined rules is displayed. You can do one of the following:

   - add a new rule
   - edit an existing rule
   - clone a rule

2. To add a new rule, select +.

   The **New Rule** tab is displayed.

   The example below shows grouping alerts into an incident based on the risk score.



3. Click **Save**.

   The rule is displayed in the **Aggregations Rules** tab. The rule will be enabled and it starts creating incidents depending on the incoming alerts that are matched as per the criteria selected.

See Also:

- For details about various parameters that can be set as criteria for an aggregation rule, see New Rule Tab.
- For details on the parameter and field descriptions in the Aggregation Rules tab, see Aggregation Rules Tab.

Additional Procedures for Respond Configuration

Use this section when you are looking for instructions to perform a specific task after the initial setup of NetWitness Respond.

Set a Retention Period for Alerts and Incidents

Sometimes data privacy officers want to retain data for a certain period of time and then delete it. A shorter retention period frees up disk space sooner. In some cases, the retention period must be short. For example, laws in Europe state that sensitive data cannot be retained for more than 30 days. After 30 days, the data must be obfuscated or deleted.

Setting a retention period for data is an optional procedure. The time that NetWitness Respond receives alerts and creates an incident determine when retention begins. Retention periods range from 30 to 365 days. If you set a retention period, one day after the period ends data is permanently deleted.

Retention is based on the time that NetWitness Respond receives the alerts and the incident creation time.

Caution: Data deleted after the retention period cannot be recovered.

When the retention period expires, the following data is **permanently deleted**:

- Alerts
- Incidents
- Tasks
- Journal entries

Logs track retention and manual deletion so you can see what has been deleted. You can view Respond Server logs in the following locations:

- **Respond Server Service log**: /var/log/netwitness/respond-server/respond-server.log
- **Respond Server Audit log**: /var/log/netwitness/respond-server/respond-server.audit.log

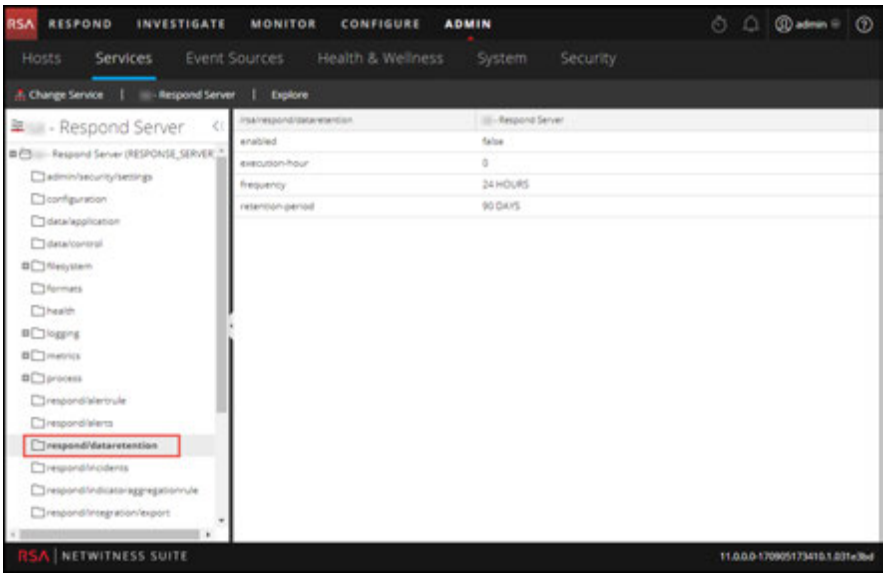
The data retention period that you set here does not apply to Archer or other third-party SOC tools. Alerts and incidents from other systems must be deleted separately.

Prerequisites

The Administrator role must be assigned to you.

Procedure

1. Go to **ADMIN > Services** , select the Respond Server service, and select  **> View > Explore**.
2. In the Explore view node list, select **respond/dataretention**.



3. In the **enabled** field, select **true** to delete incidents and alerts older than the retention period. The scheduler runs every 24 hours at 23:00.
   You will see a notice that the configuration was successfully updated.
4. In the **retention-period** field, type the number of days to retain incidents and alerts. For example, type 30 DAYS, 60 DAYS, 90 DAYS, 120 DAYS, 365 DAYS, or any number of days.
   You will see a notice that the configuration was successfully updated.

Result

Within 24 hours after the retention period ends, the scheduler permanently deletes all alerts and incidents older than the specified period from NetWitness Respond. Journal entries and tasks associated with the deleted incidents are also deleted.

Obfuscate Private Data

The Data Privacy Officer (DPO) role can identify meta keys that contain sensitive data and should display obfuscated data. This topic explains how the administrator maps those meta keys to display a hashed value instead of the actual value.

The following caveats apply to hashed meta values:

- NetWitness Suite supports two storage methods for hashed meta values, HEX (default) and string.
- When a meta key is configured to display a hashed value, all security roles see only the hashed value in the Incidents module.
- You use hashed values the same way you use actual values. For example, when you use a hashed value in rule criteria the results are the same as if you used the actual value.

This topic explains how to obfuscate private data in NetWitness Respond. Refer to the **Data Privacy Management Overview** topic in the *Data Privacy Management* guide for additional information about data privacy.

Mapping File to Obfuscate Meta Keys

In the NetWitness Respond, the mapping file for data obfuscation is data_privacy_map.js. In it you type an obfuscated meta key name and map it to the actual meta key name.

The following example shows the mappings to obfuscate data for two meta keys, ip.src and user.dst:

```
'ip.src.hash' : 'ip.src',
 'user.dst.hash' : 'user.dst'
```

You determine the naming convention for obfuscated meta key names. For example, ip.src.hash could be ip.src.private or ip.src.bin. You must choose one naming convention and use it consistently on all hosts.

Prerequisites

- DPO role must specify which meta keys require data obfuscation.
- Administrator role must map meta keys for data obfuscation.

Procedure

1. Open the data privacy mapping file:
   /var/lib/netwitness/respond-server/scripts/data_privacy_map.js

2. In the `obfuscated_attribute_map` variable , type the name of a meta key to hold obfuscated data. Then map it to the meta key that does not contain obfuscated data according to this format:
   `'ip.src.hash' : 'ip.src'`
3. Repeat step 2 for every meta key that should display a hashed value.
4. Use the same naming convention as in step 2 and use it consistently on all hosts.
5. Save the file.
   All mapped meta keys will display hashed values instead of actual values.
   In the following figure, a hashed value displays for the destination IP address in the Event Details:

   New alerts will display obfuscated data.

Note: Existing alerts still display sensitive data. This procedure is not retroactive.

Manage Incidents in NetWitness SecOps Manager

If you want to manage incidents in RSA NetWitness® SecOps Manager instead of NetWitness Respond, you have to configure system integration settings in the Respond Server service Explore view. After you configure the system integration settings, all incidents are managed in NetWitness SecOps Manager. Incidents created before the integration will not be managed in NetWitness SecOps Manager.

Caution: If you are managing incidents in NetWitness SecOps Manager instead of NetWitness Respond, do not use the following in the Respond view: Incidents List view, Incident Details view, and Tasks List view. Do not create incidents from the Respond Alerts List view or from Investigate.

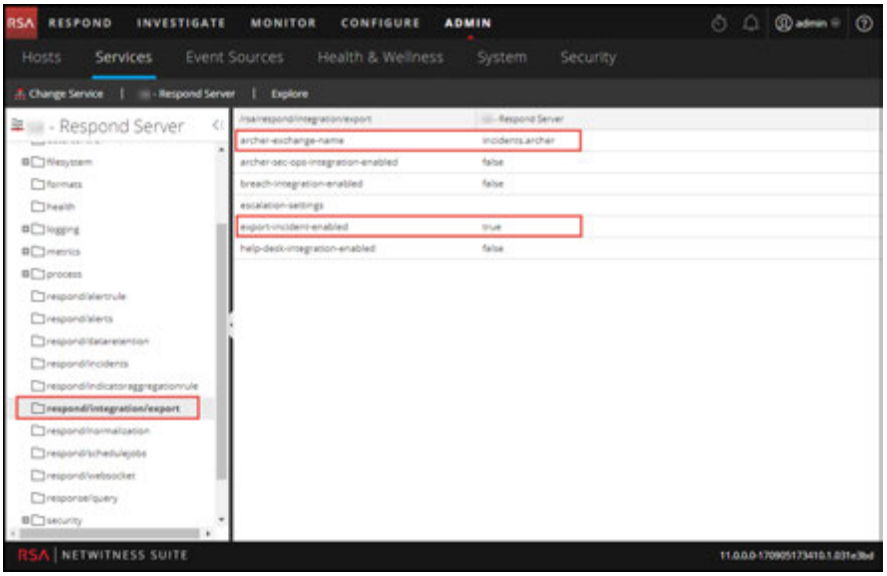
Prerequisites

- NetWitness SecOps Manager 1.3.1.2 (NetWitness Suite11.0 will only work with NetWitness SecOps Manager 1.3.1.2.)

Procedure

Follow this procedure to configure Respond Server service settings to manage incidents in NetWitness SecOps Manager.

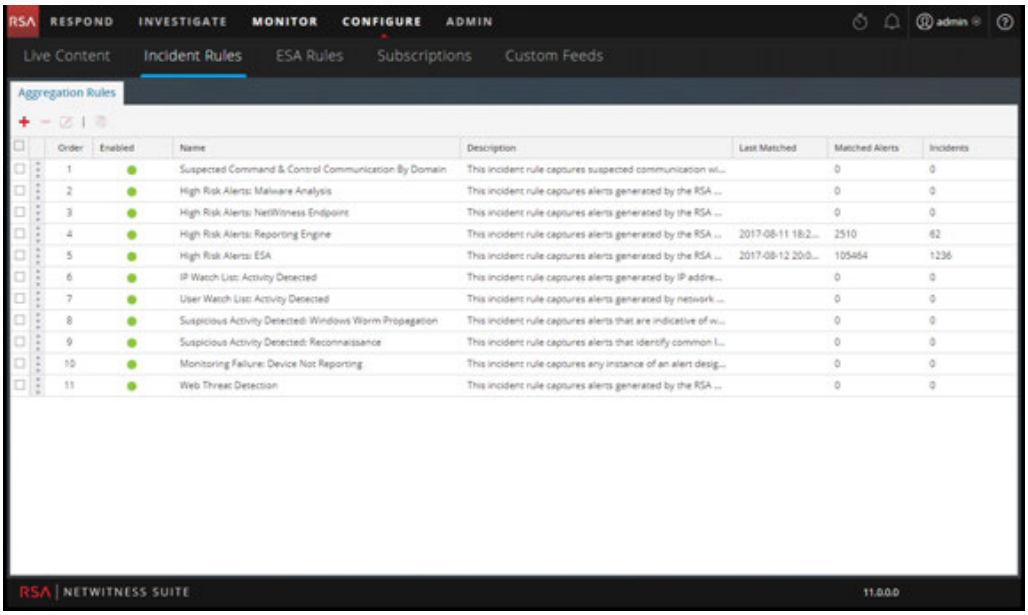
1. Go to **ADMIN > Services**, select the Respond Server service, and select  **> Config > Explore**.
2. In the Explore view node list, select **respond/integration/export**.



3. In the **archer-exchange-name** field, type the NetWitness SecOps Manager exchange name.
   You will see a notice that the configuration was successfully updated.
4. In the **archer-sec-ops-integration-enabled** field, select **true**.
   You will see a notice that the configuration was successfully updated.
   Incidents will be managed exclusively in NetWitness SecOps Manager.

Set Counter for Matched Alerts and Incidents

This procedure is optional. Administrators can use it to change when the count for matched alerts is reset to 0. The Aggregation Rules tab displays these counts in columns on the right.



These columns provide the following information for a rule:

- **Last Matched** column shows the time when the rule last matched alerts.
- **Matched Alerts** column displays the number of matched alerts for the rule.
- **Incidents column** displays the number of incidents created by the rule.

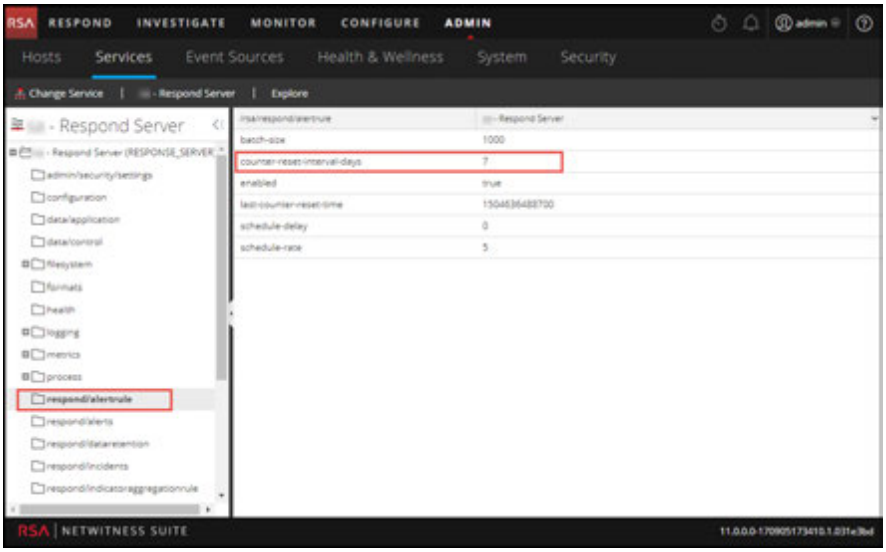
By default, these values reset to zero every 7 days. Depending on how long you want the counts to continue, you can change the default number of days.

Note: When the counter resets to zero, only the numbers in the three columns change to zero. No alerts or incidents get deleted.

To set a counter for matched alerts and incidents:

1. Go to **ADMIN > Services**, select the Respond Server service and select > **View** > **Explore**.

2. In the Explore view node list, select **respond/alertrule**.



3. In the right panel, type the number of days in the **counter-reset-interval-days** field.
4. Restart the Respond Server service for the new setting to take effect. To do this, go to **ADMIN > Services**, select the Respond Server service, and select > **Restart**.

Configure a Database for the Respond Server Service

This procedure is required only if you need to change the database configuration for Respond Server after the deployment of the NetWitness or ESA Primary hosts and their corresponding services. You have to select the ESA Primary server to act as the database host for NetWitness Respond application data, such as alerts, incidents, and tasks. You also have to select the NetWitness Server to act as the database host for NetWitness Respond control data, such as aggregation rules and categories.

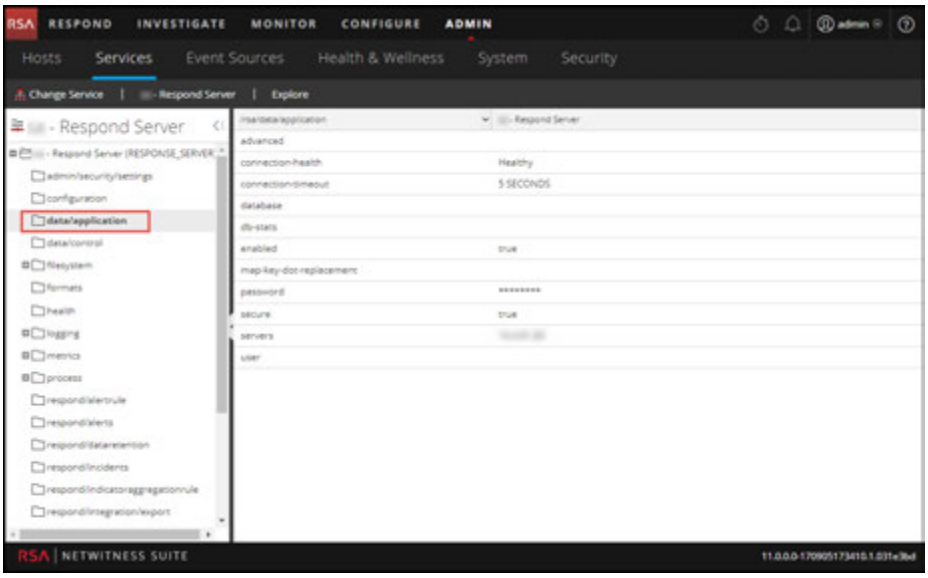
Prerequisites

Ensure that:

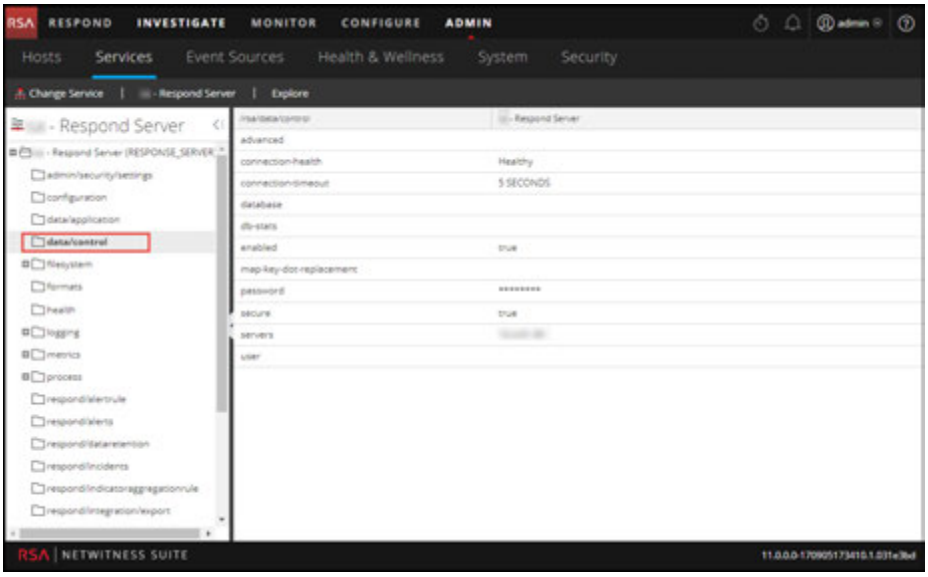
- You have installed a host on which you want to run the Respond Server service. Refer to "Step 1: Deploy a Host" in the *Hosts and Services Getting Started Guide* for the procedure to add a host.
- The Respond Server service is installed and running on NetWitness Suite.
- An ESA host is installed and configured.

Procedure

1. Go to **ADMIN > Services**.
   The Services view is displayed.
2. In the Services panel, select the **Respond Server** service and select  **> View > Explore**.
3. In the Explore view node list, select **data/application**.



4. Provide the following information:
   - **database**: The database name. The default value is respond-server.
   - **password**: The password used for the deployment of the ESA primary server (password for deploy_admin user).
   - **servers**: The hostname or IP address of the **ESA primary server** to act as the database host for NetWitness Respond application data, such as alerts, incidents, and tasks.
   - **user**: Enter **deploy_admin**.
5. In the Explore view node list, select **data/control**.



6. Provide the following information:

- **database**: The database name. The default value is respond-server.
- **password**: The password used for the deployment of the NetWitness Server (password for deploy_admin user).
- **servers**: The hostname or IP address of the **NetWitness Server** to act as the database host for NetWitness Respond control data, such as aggregation rules and categories.
- **user**: Enter **deploy_admin**.

7. Restart the Respond Server service. To do this, go to **ADMIN > Services**, select the Respond Server service, and select  **> Restart**.

Note: Restarting the Respond Server service is important for the database configuration to be complete.

NetWitness Respond Configuration Reference

This section contains reference information for configuring NetWitness Respond.

Configure View

The Configure view enables you to configure NetWitness Respond functionality.

You can configure aggregation rules to automate the Respond workflow for automatically creating incidents.

Aggregation Rules Tab

The Aggregation Rules tab enables you to create and manage aggregation rules for automating the incident creation process. NetWitness Suite provides 11 preconfigured rules. You can add to and adjust these rules for your own environment.

What do you want to do?

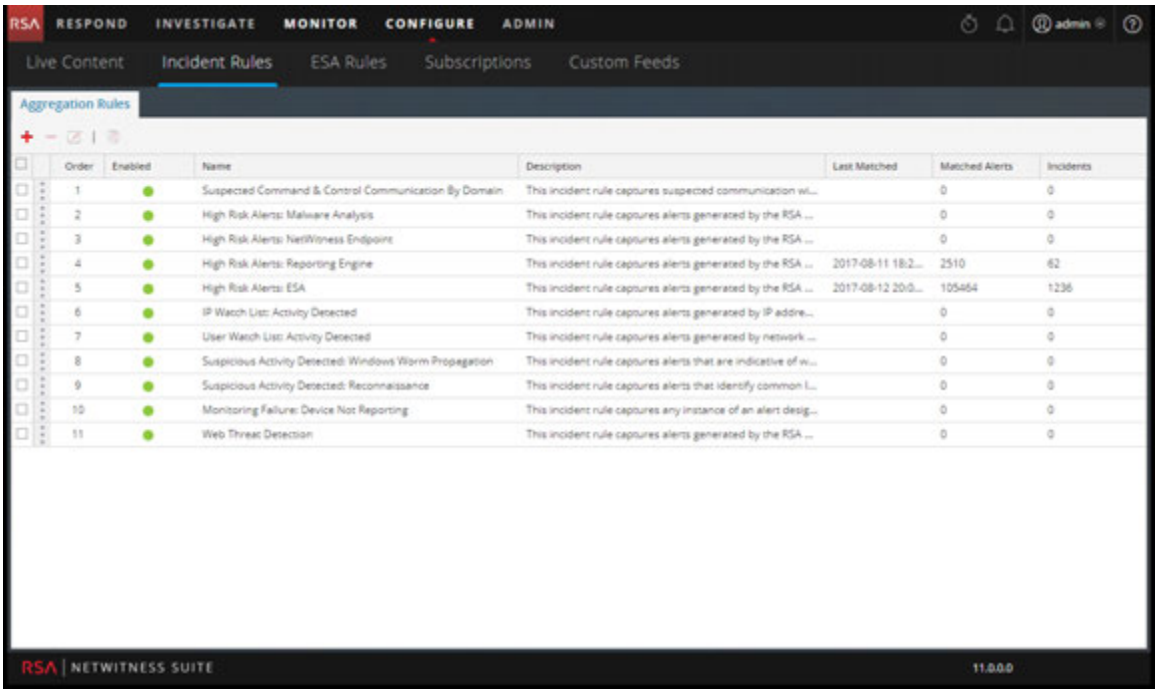
Role	I want to ...	Show me how
Analyst, Content Expert, SOC Manager	Create an aggregation rule.	Step 3. Create an Aggregation Rule for Alerts
Incident Responders, Analysts, Content Experts, SOC Manager	View the results of my aggregation rule (View Detected Threats).	See "Responding to Incidents" in the *NetWitness Respond User Guide*.

Related Topics

- New Rule Tab

Aggregation Rules

To access the Aggregation Rules tab, go to **CONFIGURE > Incident Rules > Aggregation Rules** tab.



The Aggregation Rules tab consists of a list and toolbar.

Aggregation Rules List

The following table describes the columns in the Aggregation Rules list.

Column	Description
Order	Shows the order in which the rule is placed. The rule order determines which rule takes effect if the criteria for multiple rules match the same alert.
Name	Displays the name of the rule.
Enabled	Shows whether the rule is enabled or not. The ● specifies the rule is enabled.
Description	Displays the description of the rule.
Last Matched	Displays the time when an alert was successfully matched with the rule. This value is reset once a week.
Matched Alerts	Displays the number of matched alerts. This value is reset once a week. To change the setting, see Set Counter for Matched Alerts and Incidents.

Column	Description
Incidents	Displays the number of incidents created by the rule. This value is reset once a week. To change the setting, see the Set Counter for Matched Alerts and Incidents.

Aggregation Rules Toolbar

The following table shows the operations that can be performed in the Aggregation Rules tab.

Option	Description
	Allows you to add a new rule.
	Allows you to edit a rule.
	Allows you to delete a rule.
	Allows you to duplicate a rule.

New Rule Tab

The New Rules tab enables you to create custom aggregation rules for automating the incident creation process. This topic describes the information required when creating a new rule.

What do you want to do?

Role	I want to ...	Show me how
Analyst, Content Expert, SOC Manager	Create an aggregation rule.	Step 3. Create an Aggregation Rule for Alerts
Incident Responders, Analysts, Content Experts, SOC Manager	View the results of my aggregation rule (View Detected Threats).	See "Responding to Incidents" in the *NetWitness Respond User Guide*.

Related Topics

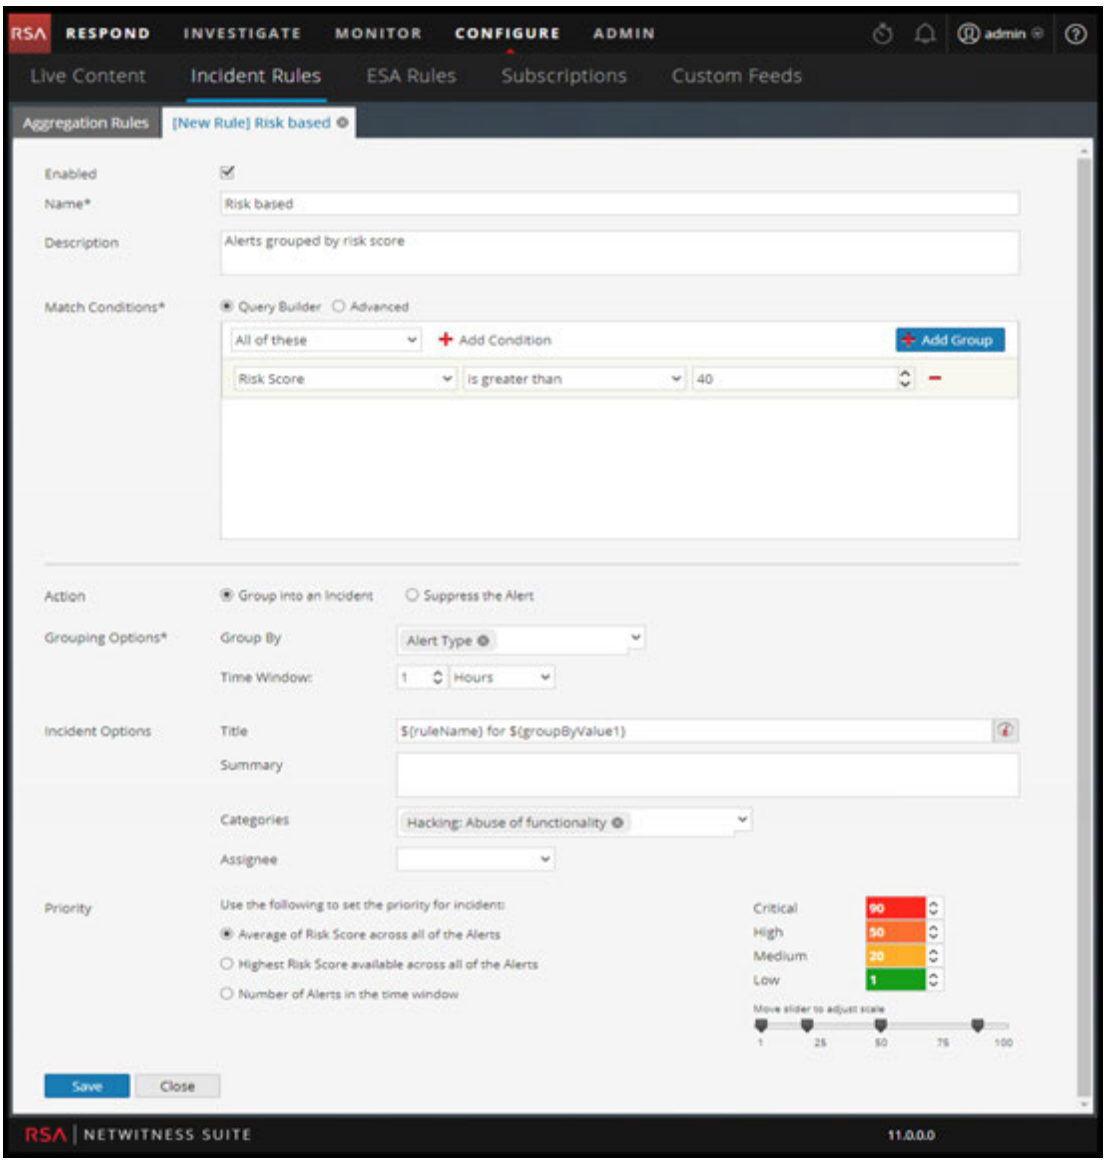
- Aggregation Rules Tab

New Rule

To access the New Rule tab view:

1. Go to **CONFIGURE > Incident Rules > Aggregation Rules** tab.
2. Click +.

The **New Rule** tab is displayed.



The following table describes the options available when creating customized aggregation rules.

Field	Description
Enabled	Select to enable the rule.
Name*	Name of the rule. This is a required field.
Description	A description for the rule to give an idea about what alerts get aggregated.

Field	Description
Match Conditions*	**Query Builder** - Select if you want to build a query with various conditions that can be grouped. You can also have nested groups of conditions. Match Conditions - You can set the value to **All of these**, **Any of these**, or **None of these**. Depending on what you select the the criteria types specified in the Conditions and Group of conditions are matched to group the alerts. **For example**, if you set the match condition to All of these, alerts that match the criteria mentioned in the Conditions and Group Conditions are grouped into one incident. • Add a Condition to be matched by clicking + **Add Condition**. • Add a Group of Conditions by clicking + **Add Group** and adding conditions by clicking + **Add Condition**. You can include multiple Conditions and Groups of Conditions that can be matched as per criteria set and group the incoming alerts into incidents.
	Advanced - Select if you want to add an advanced query builder. You can add a specific condition that needs to be matched as per the matching option selected. **For example:** you can type the criteria builder format **{"$and": [{"alert.severity" : {"$gt":4}}]}** to group alerts that have severity greater than 4. For advanced syntax, refer to http://docs.mongodb.org/manual/reference/operator/query/ or http://docs.mongodb.org/manual/reference/method/db.collection.find/
Action	**Group into an Incident** - If enabled, the alerts that match the criteria set are grouped into an alert. **Suppress the Alert** - If enabled, the alerts that match the criteria are suppressed.
Grouping Options*	**Group By:** The criteria to group the alerts as per the specified category. You can use a maximum of two attributes to group the alerts. You can group the alerts with one or two attributes. You can no longer group alerts with attributes that do not have values (empty attributes). Grouping on an attribute means that all matching Alerts containing the same value for that attribute are grouped together in the same incident. **Time Window:** The time range specified to group alerts. For example if the time window is set to 1 hour, all alerts that match the criteria set in Group By field and that arrive within an hour of each other are grouped into an incident.

Field	Description
Incident Options	**Title -** (Optional) Title of the incident. You can provide placeholders based on the attributes you grouped. Placeholders are optional. If you do not use placeholders, all Incidents created by the rule will have the same title. For example, if you grouped them according to the source, you can name the resulting Incident as Alerts for **${groupByValue1}**, and the incident for all alerts from NetWitness Endpoint would be named **Alerts for NetWitness Endpoint**.
	Summary - (Optional) Summary of the incident.
	Category - (Optional) Category of the incident created. An incident can be classified using more than one category.
	Assignee - (Optional) Name of the assignee to whom the incident is assigned to.
Priority	**Average of Risk Score across all of the Alerts** - Takes the average of the risk scores across all the alerts to set the priority of the incident created. **Highest Risk Score available across all of the Alerts** - Takes the highest score available across all the alerts to set the priority of the incident created. **Number of Alerts in the time window** - Takes the count of the number of alerts in the time window selected to set the priority of the incident created. **Critical, High, Medium, and Low** - Specify the incident priority threshold of the matched incidents. The defaults are: • Critical: 90 • High: 50 • Medium: 20 • Low: 1 For example, with the Critical priority set to 90, incidents with a risk score of 90 or higher will be assigned a Critical priority for this rule. You can change these defaults by manually changing the priorities or by moving the slider under **Move slider to adjust scale**.

How Context Hub Works

Context Hub service provides enrichment lookup capability in the Respond and Investigate views. An Administrator can configure the Context Hub service and the data sources to enable an Analyst to perform the context lookup for the required data sources.

By default, the Context Hub service supports enrichment lookups for meta types such as IP address, User, Domain, MAC address, File Name, File Hash, and Host.

The following data sources are supported by NetWitness Suite and provide enriched data when configured.

Lists- Provides contextual information from a list of blacklists, whitelists, or watchlists.

RSA Archer- Provides Criticality information of a device or specific asset based on the IP or Host which needs constant monitoring.

Active Directory - Provides contextual information of a user to help determine if the user is suspicious or not.

RSA NetWitness® Endpoint - Provides context information for endpoint module and machine indicators and to help determine if any of the Endpoint devices are compromised.

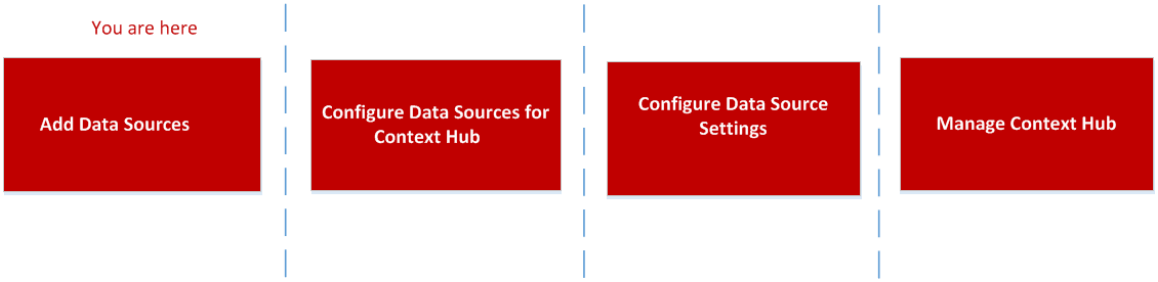
Respond- Provides contextual information of a specific meta available in respond and enables analyst to respond faster based on context data.

Live Connect - Provides contextual information for IP addresses, Domains and File Hashes from RSA Live Connect Threat intelligence community server.

Overview of Context Hub Configuration

The Administrator needs to perform each step in the proper sequence to configure the services to perform the context lookup effectively. In the **ADMIN**> **Services**. Services Config view of Context Hub service, an administrator can configure data sources for Context Hub Service. The administrator can also configure Context Lookups for custom meta keys, if required and also import lists or export lists.

The workflow below describes how the Context Hub service can be configured:



Context Hub service is pre-installed on primary ESA host, and automatically added to the Netwitness Suite.

Note: You can have only one Context Hub service instance enabled in your NetWitness Suite deployment. If there are multiple ESA service in NetWitness Suite, you must choose the appropriate ESA host for Context Hub. A minimum of 8GB space is required to configure Context Hub on ESA host.

Configure Data Sources for Context Hub

To use the enrichment lookup capability and to view the related contextual information, you must configure the data sources for the Context Hub service. You can add the supported data sources such as Lists, RSA Archer, Active Directory, NetWitness Endpoint, Respond, and Live Connect.

Prerequisites

- Ensure that ESA host is available. In case of older versions, administrator must first upgrade ESA host to 11.0
- Ensure Context Hub is automatically added to the NetWitness Suite through orchestration and is enabled.
- Ensure to add the Data Sources.

Configure Lists as a Data Source

Lists as a Data Source uses the Context Hub service to fetch contextual information for meta types that support context lookup. You can create one or more lists and add relevant list values to the list. Make sure that you create meaningful list such as blacklisted IPs, whitelisted IPs, and so on. The lists can contain supported entities such as IP address, MAC address, User name, Host name, Domain name, File name or File hash. You can import a single-column list or a multi-column list from the Data Source tab.

List values are in CSV format available in an external location and can be accessed through the following two methods:

- **Local File Store**: You can share a file from a local location.
- **HTTP(S)**: You can share a file using a web server location.

Note: You can also set up recurring job to fetch data on regular intervals by using the Prefetch settings while configuring meta mapping.

Prerequisites

Before you configure Lists data source, ensure that:

- User should have admin permissions.
- Context Hub service is available in **ADMIN**> **Services** view of NetWitness Suite.
- If you are using Local File Store or HTTP(S) server, the path mentioned should contain the CSV file

  In case of remote Local File Store, the file must be mounted or placed on the local drive location `/var/lib/netwitness/contexthub-server/data`.
- The NetWitness user must have read permission to access the file.

Add List data source using Local File Store

To add List as a data source:

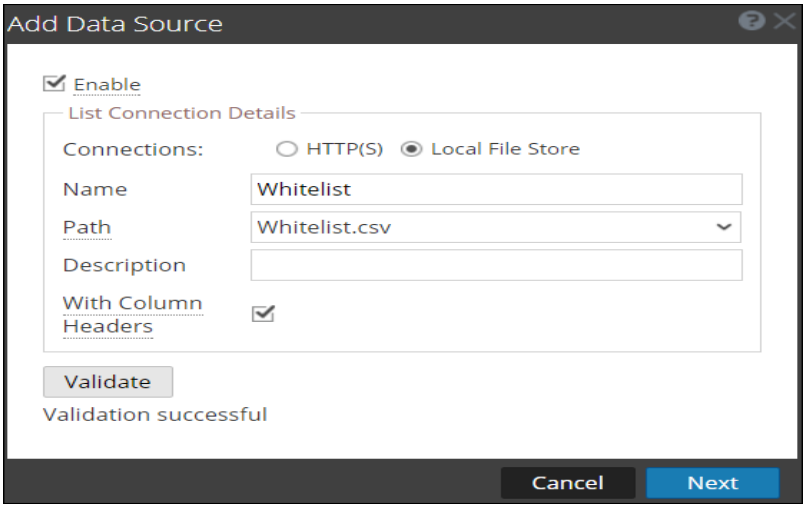
1. Go to **ADMIN** > **Services**.

   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.

   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click + > **LISTS**.

   The **Add Data Source** dialog is displayed

4. By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, view the list in the list tab and view the contextual information.
5. Select the **Local File Store** Connection Type.



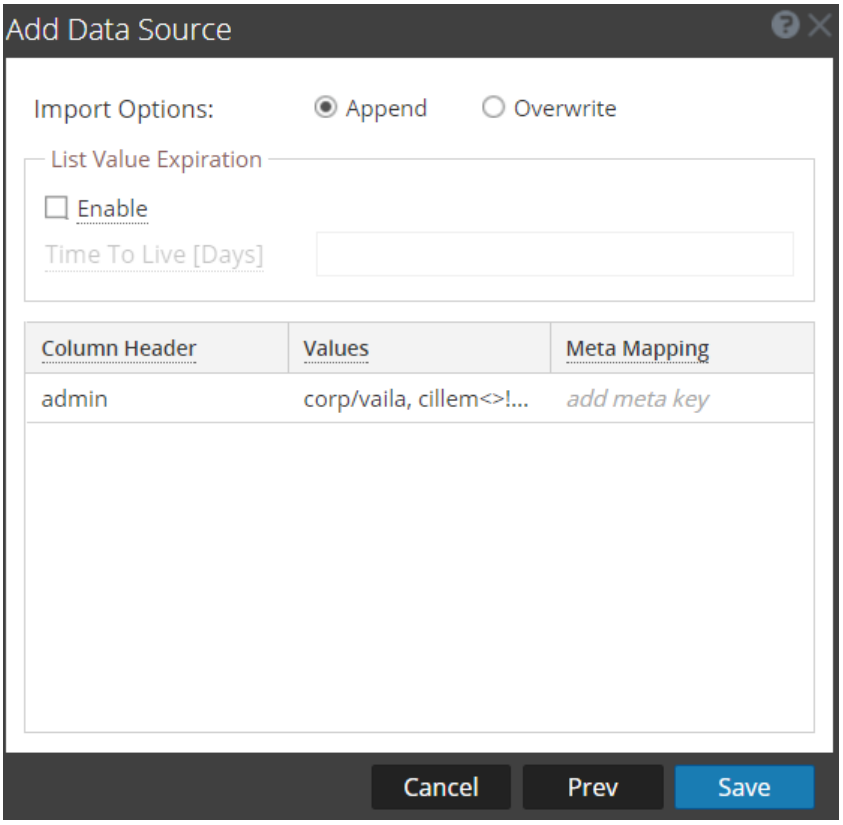
6. Provide the following database connection details:

   - Enter the following fields for Local File Store Connection Type:
     - **Name:** Provide a name for the list data source.
     - **Path:** This field displays all the data files available in the data folder `/var/lib/netwitness/contexthub-server/data`, where context hub service is running. Select the file name from the drop-down.
       A maximum of 32 columns of CSV file are supported that adhere to the RFC1480 standards.
     - **(Optional) Description**: Add a description for the selected file.
     - **With Column Headers**: Select this option to consider the first row as column headers from the CSV file. If you don't select this option, you need to enter the column headers in the next screen.

     Note: For Local File Store connection type, the file can be mounted or copied to the local drive. Also, the user must have read permission to the `/var/lib/netwitness/contexthub-server/data` folder located on the Context Hub machine.

   5. Click **Validate**.
      If the validation fails, you cannot add the data source.

6. Click **Next**.
   The next dialog is displayed.



7. Select any one of the following options:
   Append - Select this option to add the imported values to an existing list.
   Overwrite - Select this option to replace the values in an existing list with the imported values.
8. In the **List Value Expiration** section, the **Enable** option is unchecked, by default. If you want to store the looked up list values in the cache for a specified number of days then select the **Enable** checkbox and enter the number of days in the **Time to Live (days)** field for the list values to be retained.
9. In the next screen, map at least one meta key with one or more meta types by mapping a column header with a meta. The description for each field is as follows:

- **Column Header**: Display headers of the CSV file which must be mapped to a meta type.

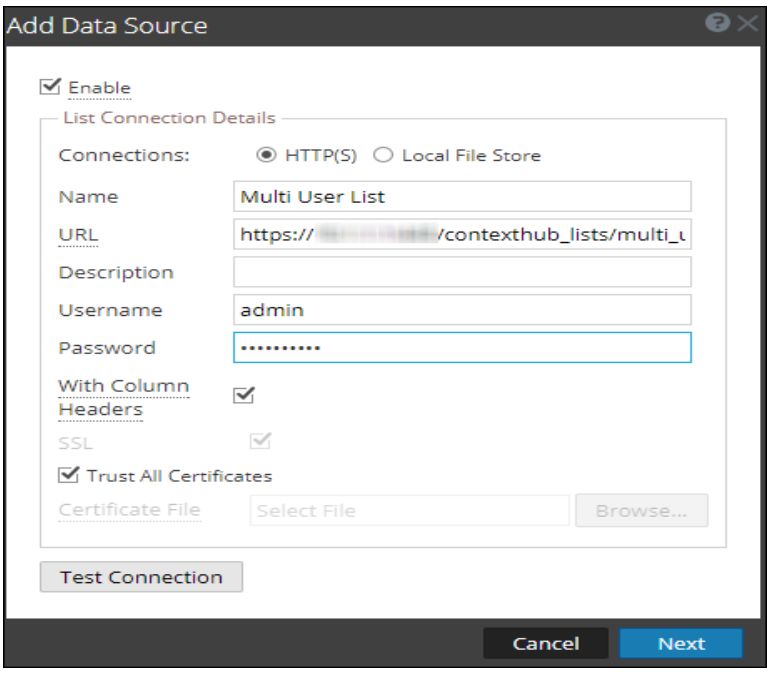
- **Meta Mapping**: Maps a column header field to a meta type.
- **Values**: Displays the first three values from the imported list.

9. Click **Save**.

Add List data source using HTTP(S)

To add List as a data source:

1. Select **ADMIN** > **Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click + > **LISTS**.
   The **Add Data Source** dialog is displayed.
4. Select the HTTP(S) Connection Type.

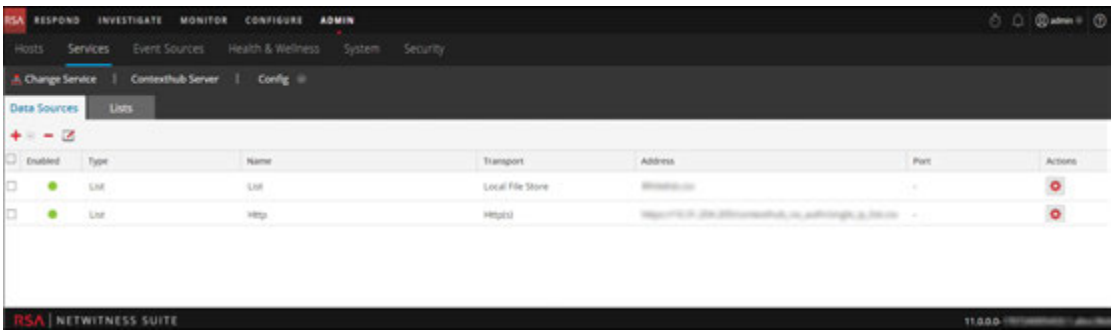


- Enter the following fields for HTTP(S) Connection Type:
  - **Name:** Provide a name for the list data source.
  - **URL**: Enter the path of the CSV file available on the HTTP(S) location along with the host name or IP address of the remote machine where the list is stored. The URL must be of the format: `https://<Hostname or IP-`

address of the HTTP(S)server>:<Port on which the HTTP(S) server is hosted>/<Absolute path of CSV file>. For example, https://10.1.1.1:443/contexthub_lists/multi_user_list.csv

- **(Optional) Description**: Add a description for the selected file.
- **(Optional)Username:** Enter the username to connect to the HTTP(S) server requires basic authentication.
- **(Optional)Password:** Enter the password to connect to the HTTP(S) server requires basic authentication.
- **With Column Headers**: Select this option if you want to import a CSV file with headers. If this option is selected and you import the CSV without headers, the first row will be considered as a header which can be edited.
- **SSL:** If you enter a URL with HTTPS in this field, then this is selected automatically. If you enter a URL with HTTP, then this checkbox is unselected.
- **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format HTTP(S)server certificate for the connection to be successful.

7. Click **Test Connection** to test the connection between Context Hub and the data source.
8. Click **Save** to save the settings.
   List is added as a data source for the configured Context Hub and is displayed in the **Data Sources** tab.



Next Steps:

- Add, edit, or remove values from a specific list.
- Configure the data source settings to determine the data source fields to be displayed in the Context panel. For instructions, see Configure Context Hub Data Source Settings .
- Import and export a list. For more information, see Import or Export Lists for Context Hub .
- View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA Netwitness Respond User Guide* and *RSA Netwitness Investigation and Malware Analysis User Guide*.

Configure Archer as Data Source

You can configure Archer as a data source for Context Hub and use the Context Hub service to fetch contextual information from Archer. Use the procedures in this topic to add Archer as a data source for Context Hub service and configure the settings (if required) for Archer.

Prerequisites

Before you configure Archer data source, ensure that:

- Context Hub service is available in **ADMIN**>**Services** view of NetWitness Suite.
- Archer is installed with Licensed Devices application.

To add Archer as a data source for Context Hub:

1. Go to **ADMIN** > **Services**.

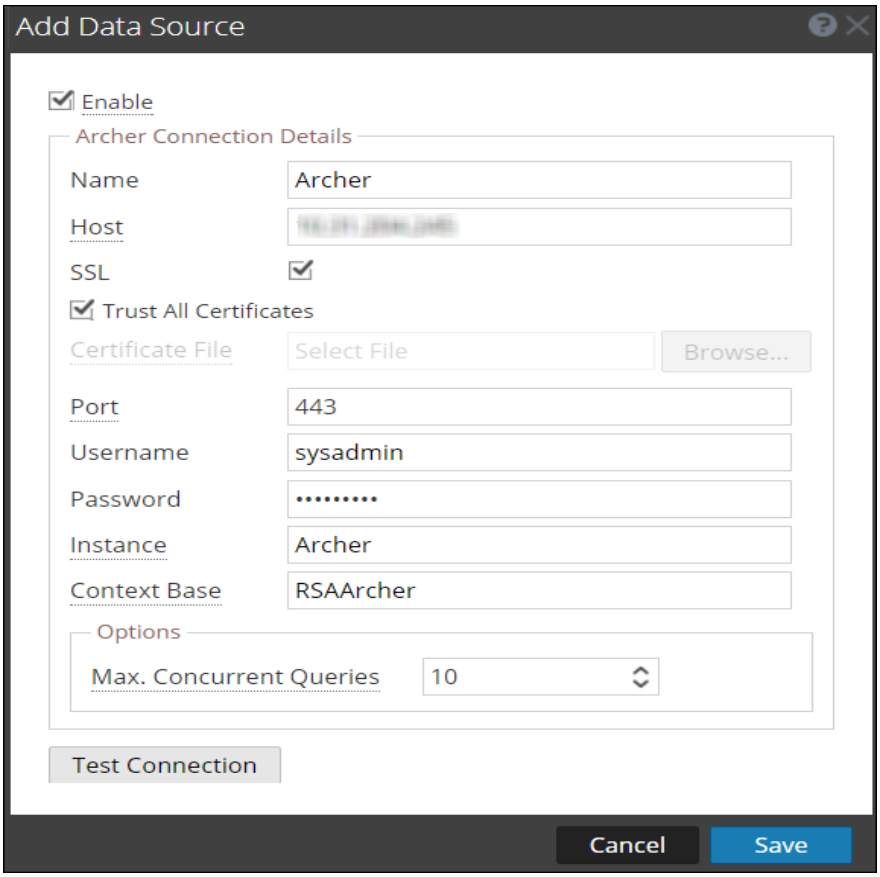
   The Services view is displayed.

2. Select the Context Hub service, and click > **View** > **Config**

   The Services Config view is displayed.

3. In the **Data Sources** tab, click > **Archer**.

   The **Add Data Source** dialog is displayed.



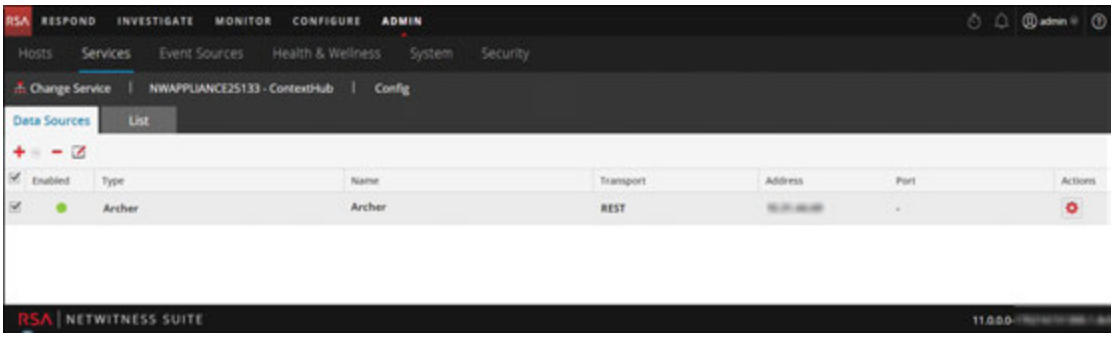
4. Provide the following information:

- By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
- Enter the following fields:
  - **Name**: Enter a name for Archer data source.
  - **Host**: Enter the hostname or IP address where Archer server is installed.
  - **SSL**: By default this option is selected and enables SSL communication to Archer .
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid Endpoint server certificate for the connection to be successful.
  - **Port**: The default port is 443.
  - **Username**: Enter the Archer Server username.
  - **Password**: Enter the Archer Server password.
  - **Instance**: Enter the Instance name from which you want to extract data. An RSA Archer instance is a single set up that includes unique content in a database, the connection to the database, the interface, and log-in. You might have individual instances for each office location or region or for development, test, and production environments. The Instance Database stores the RSA Archer content for a specific instance.
  - **Context Base**: Enter the virtual directory name where the files are stored. For example, rsaarcher located at the RSA Archer web address https://archer.company.com/**rsaarche**r/default.aspx. If the files are stored in the IIS default web address https://archer.company.com/default.aspx, then this field must be empty.
  - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the Archer data source.

6. Click **Save**.

   Archer is added as a data source for Context Hub and is displayed in the **Data Sources** tab.



After adding the data source, you can configure data source settings. For instructions, see Configure Context Hub Data Source Settings . And View the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the *Netwitness Respond User Guide* and *Investigation and Malware Analysis User Guide*

Configure Active Directory as a Data Source

You can configure Active Directory (AD) as a data source for Context Hub using LDAP and use the Context Hub service to fetch contextual information from AD. Use the procedures in this topic to add AD as a data source for Context Hub service and configure the settings(if required) for AD.

Prerequisites

Before you configure Active Directory data source, ensure that:

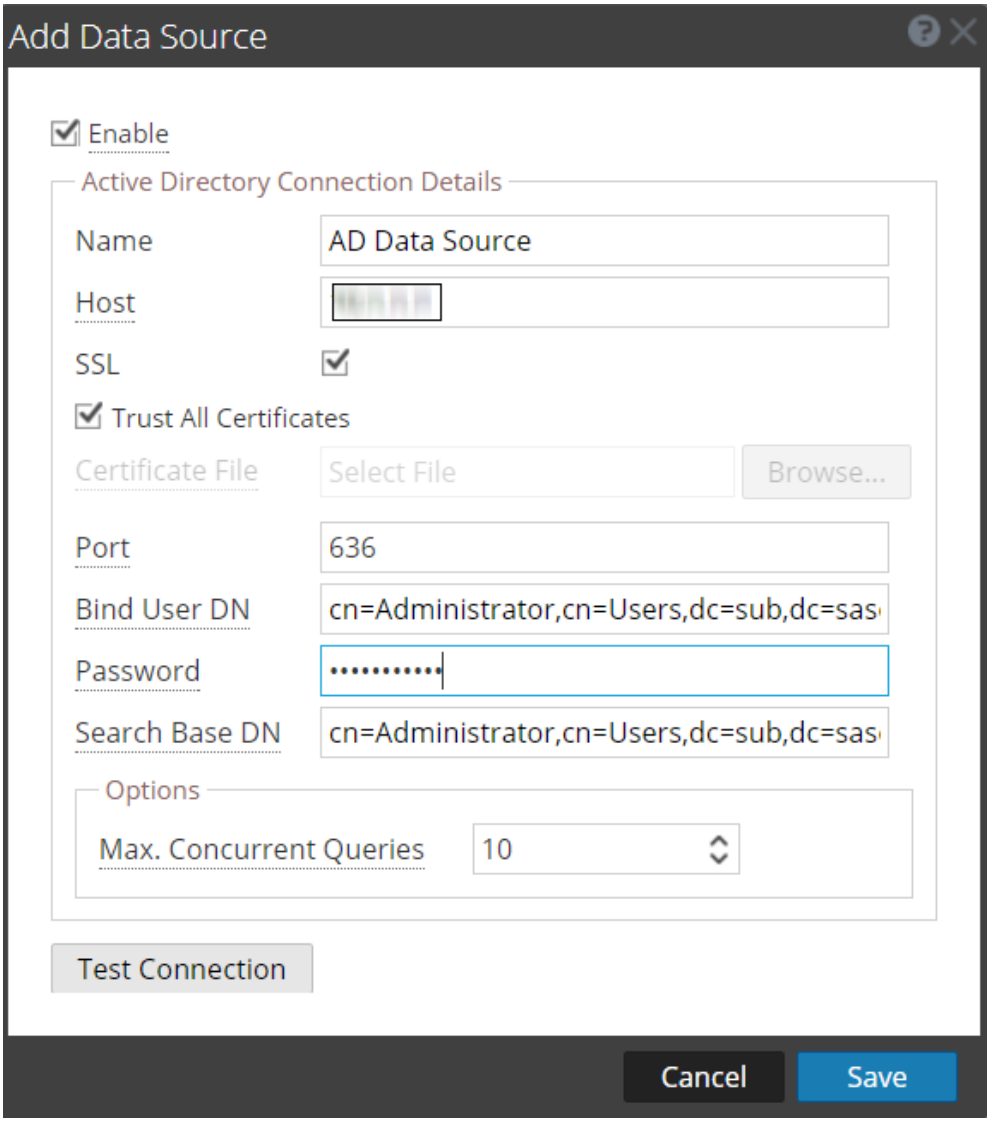
- Context Hub service is available in **ADMIN** > **Services** view of NetWitness Suite.
- AD is available and is running on Windows versions 2003, 2008, and 2012 are supported.

To add AD as a data source for Context Hub:

1. Go to **ADMIN** > **Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.

3. In the **Data Sources** tab, click + > **AD**.

   The **Add Data Source** dialog is displayed.



You need to configure the Active Directory schema to replicate the following attributes to view the data in the RESPOND page:

- Employee ID
- Department
- Company
- Title
- Postal Code

All the other attributes replicate automatically.

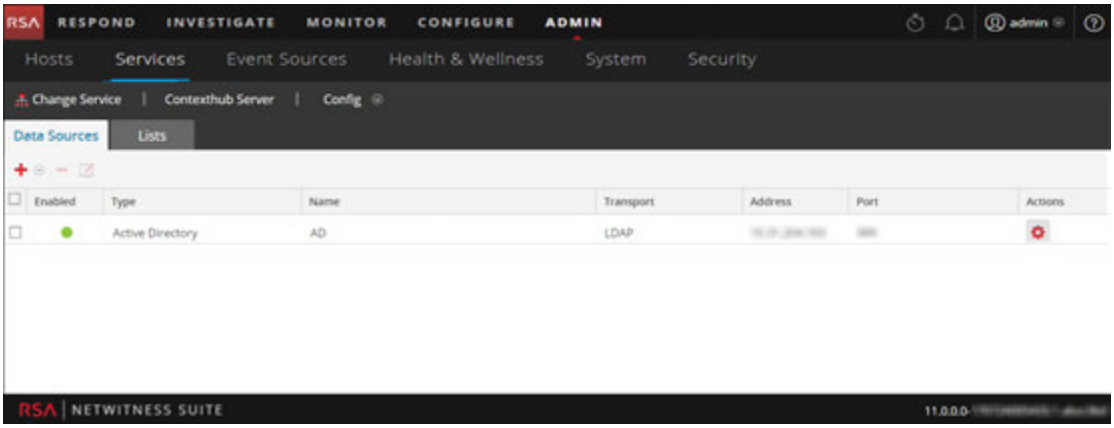
6. Provide the following database connection details:

    - By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
    - Enter the following fields.
        - **Name:** Enter a name for the AD data source.
        - **Host:** Enter the host name or IP address of the AD.
        - **SSL:** By default this will be checked with 636 port number which will connect to the data source using Secure Sockets Layer (SSL) connection.
        - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid .cer or .crt format Active Directory server certificate for the connection to be successful. If you add multiple AD data sources with ssl, you should configure all the data sources with either a valid certificate or a Trust All Certificates.
        - **Port:** The default port is 636 with SSL and 389 without SSL.
          If you want to fetch data from multi-domains you can configure a single data source with the Global catalog port (3269 with SSL or 3268 without SSL).
          Alternately, for multi-domain, you can configure a single data source for each domain with the default port (389 with SSL or 636 without SSL).

          Multi-forest is a collection of multi-domains. If you want to fetch data from multi-forest you need to configure each forest with the Global catalog port (3269 with SSL or 3268 without SSL).
        - **Password:** Enter password of the user DN used to bind with AD.
        - **Bind User DN:** The distinguished name of the user that will authenticate to the search directory. For example, cn=Administrator,cn=Users,dc=sub,dc=saserver,dc=local.
        - **Search Base DN:** The base distinguished name, or base DN, identifies the entry in the directory from which searches are initiated; the base DN is often referred to as the search base. For example, dc=sub,dc=saserver,dc=local.

7. Click **Test Connection** to test the connection between Context Hub and the data source.
8. Click **Save**.
   AD is added as a data source for the configured Context Hub. The added AD data source is

displayed in the **Data Sources** tab.



After adding the data source, you can configure the data source settings. For instructions, see Configure Context Hub Data Source Settings .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, see the **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigation and Malware Analysis Guide*.

Configure Netwitness Endpoint as a Data Source

You can configure NetWitness Endpoint as a data source for Context Hub and use the Context Hub server to fetch contextual information from NetWitness Endpoint. Use the procedures in this topic to add NetWitness Endpoint as a data source for Context Hub service and configure the settings (if required) for NetWitness Endpoint.

Prerequisites

Before you configure NetWitness Endpoint data source, ensure that:

- Context Hub service is available in **Admin** > **Services** view of NetWitness Suite.
- NetWitness Endpoint (v4.1.1 to 4.3.0.5) is installed and configured.
  For more information on how to install, configure and for detailed information on NetWitness Endpoint, see the NetWitness Endpoint documents available at RSA Link.

To add NetWitness Endpoint as a data source for Context Hub:

1. Go to **Admin** > **Services**.

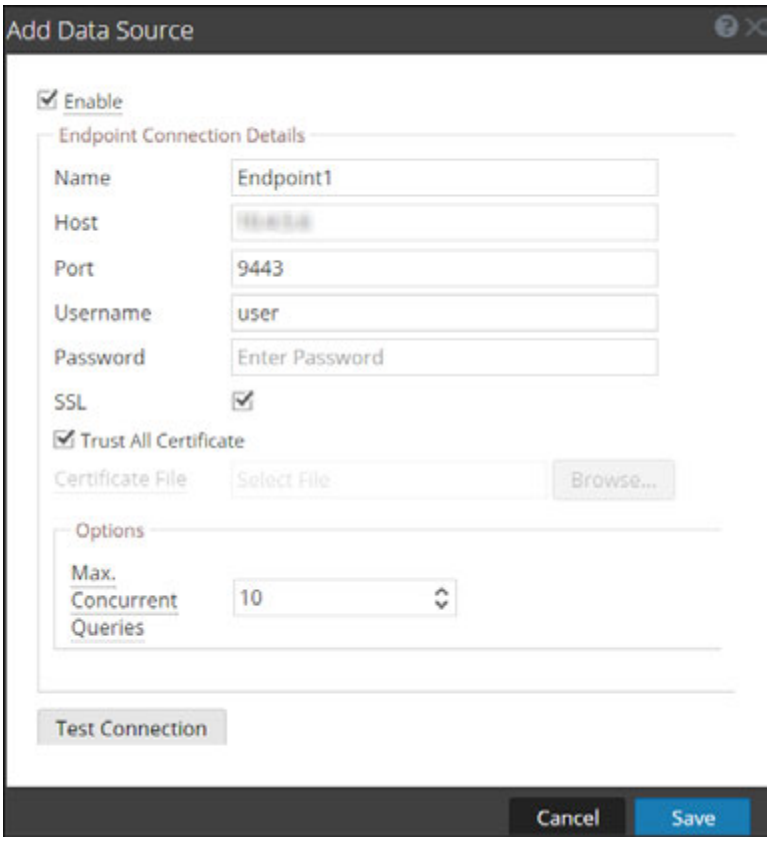
   The Services view is displayed.

2. Select the Context Hub service, and click ⚙ > **View** > **Config**.

   The Services Config view is displayed.

3. In the **Data Sources** tab, click + > **RSA Endpoint**.

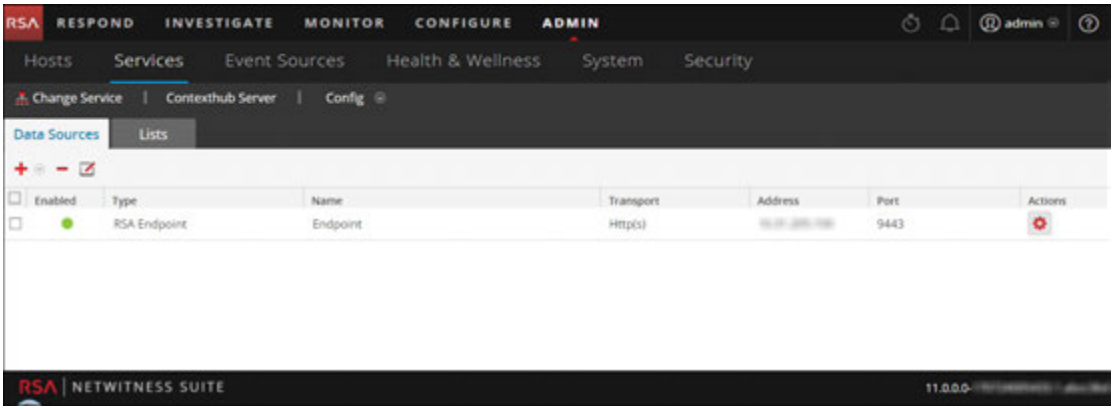
   The **Add Data Source** dialog is displayed.



4. Provide the following information:

- By default, the **Enable** checkbox is selected. If this option is unchecked, the save button is disabled, you cannot add the data source, and cannot view the contextual information.
- Enter the following fields:
  - **Name**: Enter a name for NetWitness Endpoint data source.
  - **Host**: Enter the hostname or IP address where NetWitness Endpoint API server is installed.
  - **Port**: The default port is 9443.
  - **SSL**: Select SSL if you want NetWitness Suite to communicate with the host using SSL. This is enabled by default.
  - **Username**: Enter the NetWitness Endpoint API Server username.
  - **Password**: Enter the NetWitness Endpoint API Server password.
  - **Trust All Certificates**: Select this checkbox to add the data source without validating the certificate. If you uncheck this option, you need to upload a valid server generated or CA certificate to authenticate the connection with the supported formats of .cer or .crt of Base64 [PEM] encoded or DER encoded.
  - **Max. Concurrent Queries**: You can configure the maximum number of concurrent queries to be run against the configured data sources. The default value is 10.

5. Click **Test Connection** to test the connection between Context Hub and the NetWitness Endpoint.
6. Click **Save**.
   NetWitness Endpoint is added as a data source for Context Hub and is displayed in the **Data Sources** tab.



Next steps

After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

Also you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA NetWitness Respond User Guide* and the *RSA Netwitness Investigation and Malware Analysis Guide*

Configure Respond as a Data Source

You can configure Respond as a data source for Context Hub and use the Context Hub service to fetch contextual information from Respond service. If Respond service is already configured, the configuration details are pre-populated while adding Respond as a data source. Use the procedures in this topic to add Respond as a data source for Context Hub service and configure the settings.

Prerequisites

Before you configure Respond data source, ensure that:

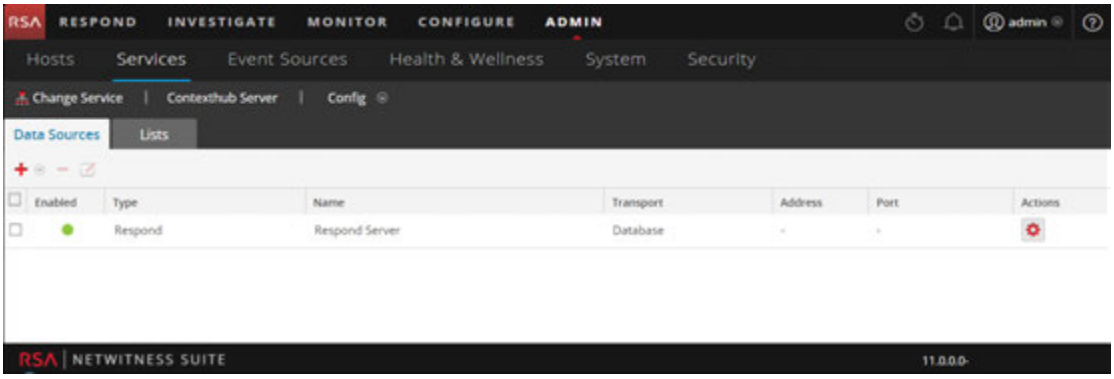
- Context Hub service is available in **ADMIN**> **Services** view of NetWitness Suite.
- Respond service is available.

To add Respond as a data source for Context Hub:

1. Go to **Admin** > **Services**.
   The services view is displayed.
2. Select the Context Hub service and click > **View** > **Config**.
   The Services Config View of Context Hub is displayed.
3. In the **Data Sources** tab, click + > **Respond**.
   The **Add Data Source** dialog is displayed.

   The required fields to configure the Respond data source are automatically updated.

4. Click **Test Connection** to test the connection between Context Hub and the data source.
5. Click **Save**.
   Respond is added as a data source for the configured Context Hub. The added Respond data source is displayed in the **Data Sources** tab.



After adding the data source, you can configure the settings. For more information, see Configure Context Hub Data Source Settings .

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA Netwitness Respond User Guide* and the *RSA Netwitness Investigation and Malware Analysis Guide*.

Configure Live Connect as a Data Source for Context Hub

This topic describes the procedure to configure Live Connect data source for Context Hub.

RSA Live Connect is a cloud based threat intelligence service. This service collects, analyzes, and assesses threat intelligence data such as IP addresses, domains, and files collected from various sources including the RSA NetWitness® Suite and RSA NetWitness® Endpoint customer community.

RSA Live Connect is a part of Live Services and can be configured from the System View > Live Services Configuration panel. For more information about configuring Live Services, see the **Configure Live Services Settings** topic in the *System Configuration* Guide.

RSA Live Connect Threat Insights provides analysts the opportunity to pull threat intelligence data such as IP related information from the Live Connect service to be leveraged by analysts during the investigation process. By default, **Threat Insights** is enabled in **Additional Live Services**. If Context Hub service is configured, Live Connect is automatically added as a data source for Context Hub.

Prerequisites

Ensure that:

- Context Hub is enabled and the service is available in Admin > Services view of NetWitness Suite.
- RSA Live Account is available.

Note: To create a Live Account, see the **Step 1. Create Live Account** topic in the *Live Services Management Guide*.

By default, **Threat Insights** is enabled in **Additional Live Services** section. Before setting up Live Connect data source, make sure that you have signed in to your Live account with your Live Account Credentials and Context Hub is enabled. Live Connect is automatically added as a data source for context hub.

For information about configuring Live Account and Live Services, see the **Configure Live Services Settings** topic in the *System Configuration Guide*.

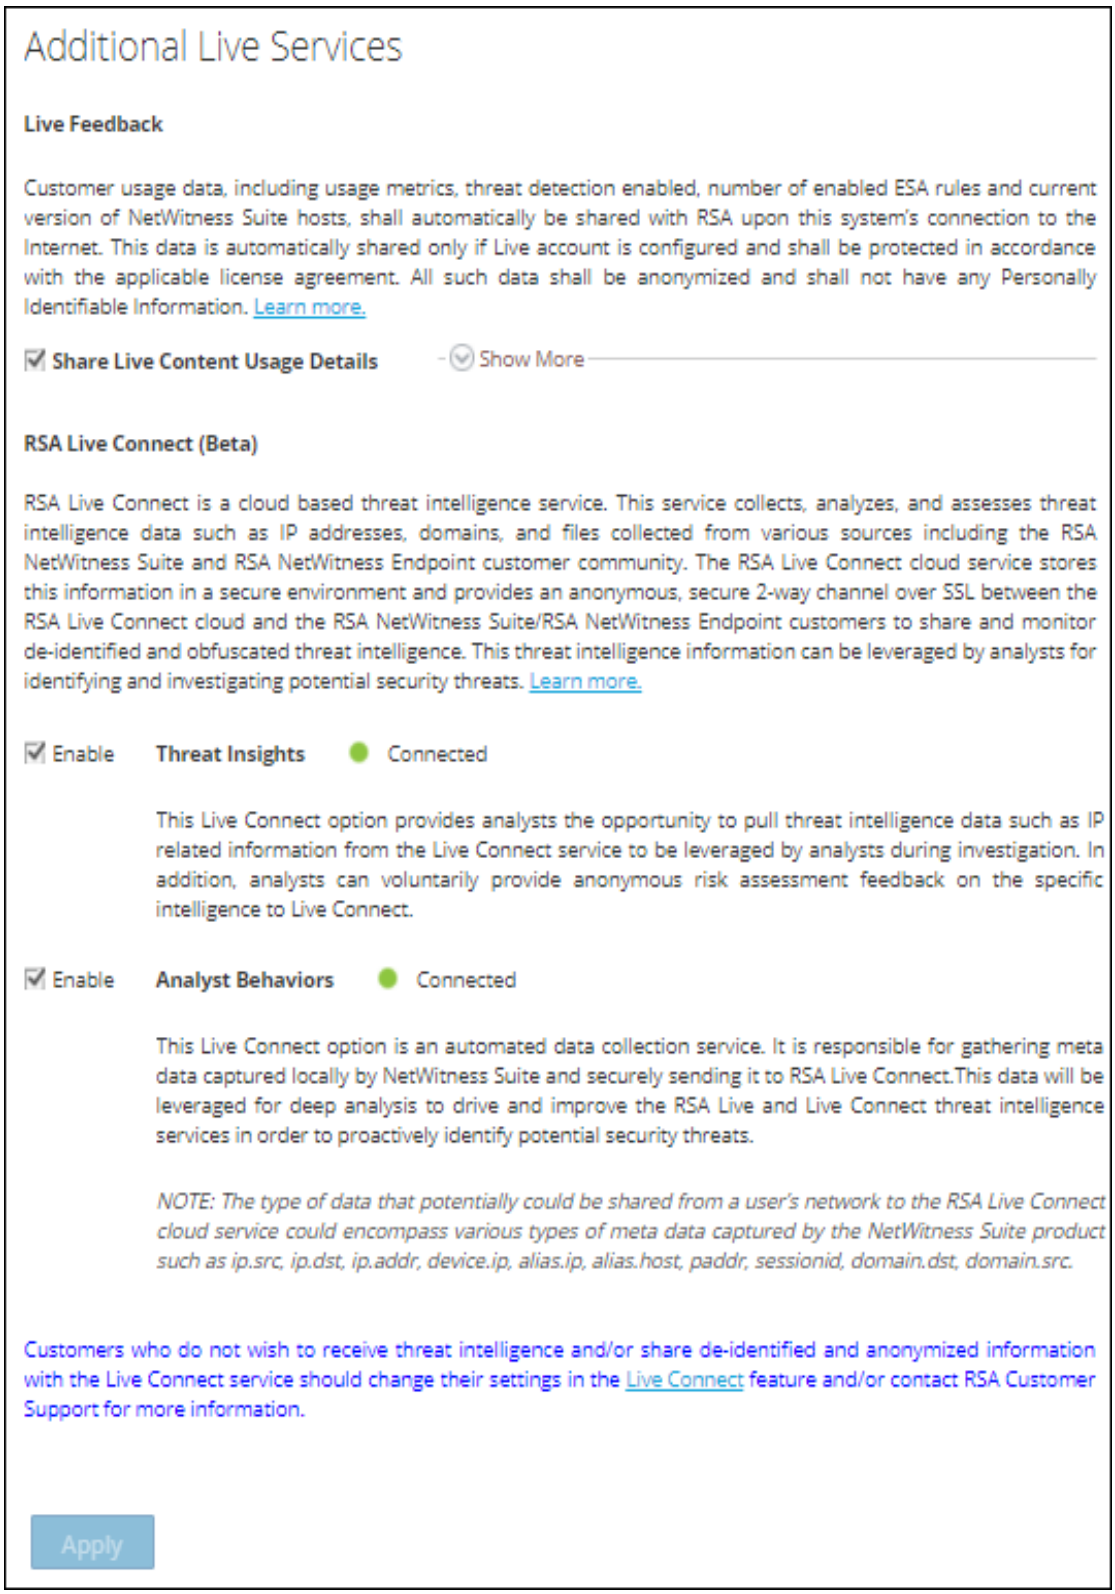
For information about configuring Context Hub service, see the **Step 1. Add the Context Hub Service** topic in the *Context Hub Configuration Guide*.

Enable or Disable Live Connect Data Source

To enable or disable Live Connect data source for Context Hub:

1. Go to **ADMIN > System**.
2. In the left navigation pane, select **Live Services**.

3. In the **Additional Live Services** section, enable **Threat Insights**.

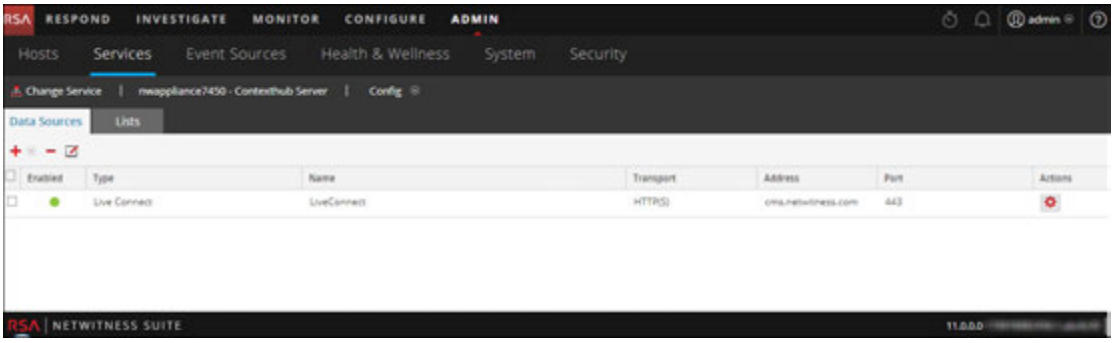


4. Click **Apply**.

   Live Connect data source is enabled for Context Hub service.

5. To verify, go to the **Data Sources** tab and view the available sources.

   Live Connect source must be added to the list of available sources and the **Enabled** field must be a solid green circle (●).



6. To disable Live Connect data source, disable **Threat Insights** in Additional Live Services panel and click **Apply**.

   Live Connect data source is disabled for Context Hub service.

   Note: If Threat Insights is disabled, the Context Lookup panel for Live Connect (in the Investigation Navigate view and Events view) displays a message to configure the Live Connect data source. To view contextual data for Live Connect, you must enable Threat Insights.

Edit Live Connect Data Source Settings

To edit live connect data source for Context Hub:

1. In the main menu, select **Admin > Services**.

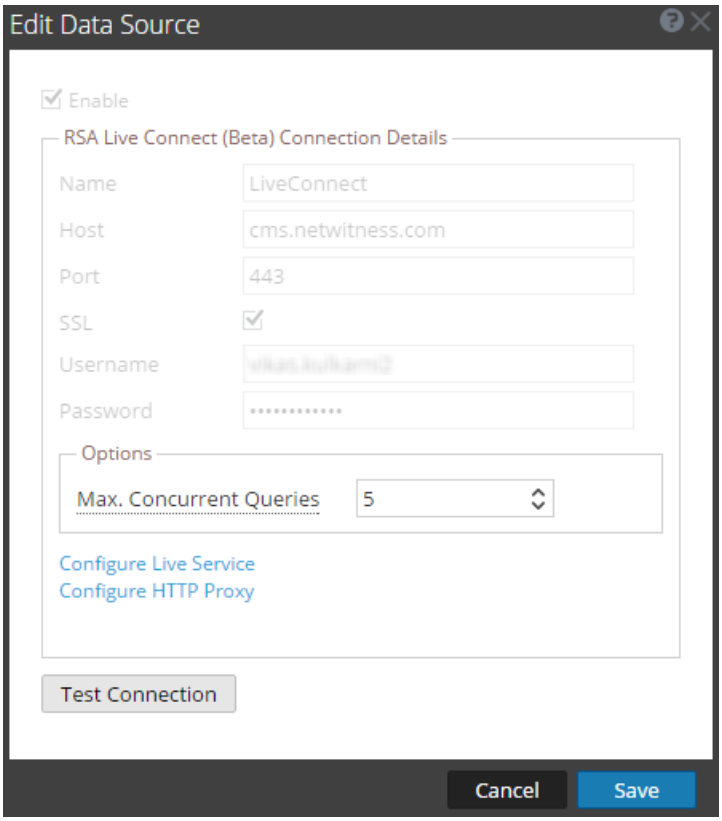
   The Services view is displayed.

2. In the **Services** panel, select the Context Hub service, and ⚙ **> View > Config**.

   The Services Config view is displayed.

3. In the **Data Sources** tab, select the live connect data source and click ✎.

   The **Edit Data Source** dialog is displayed.



4. Edit the required fields:

Field	Description
Max. Concurrent Queries	You can configure the maximum number of concurrent queries defined by the Context Hub service to be run against the configured data sources. The default value is 25.

5. To edit the Live Connection and Proxy settings, do the following:
   - To edit the Live Connection settings, see the **Live Services Configuration Panel** topic in the *System Configuration Guide*.
   - To edit the proxy settings, see **the HTTP Proxy Settings Panel** topic in the *System Configuration Guide*.
6. Click **Test Connection** to test the connection between Context Hub and the data source.
7. Click **Save** to save the settings.

To configure responses and meta mapping for Live Connect data source, see Step 3. Configure Responses for Context Hub Data Sources.

Next steps

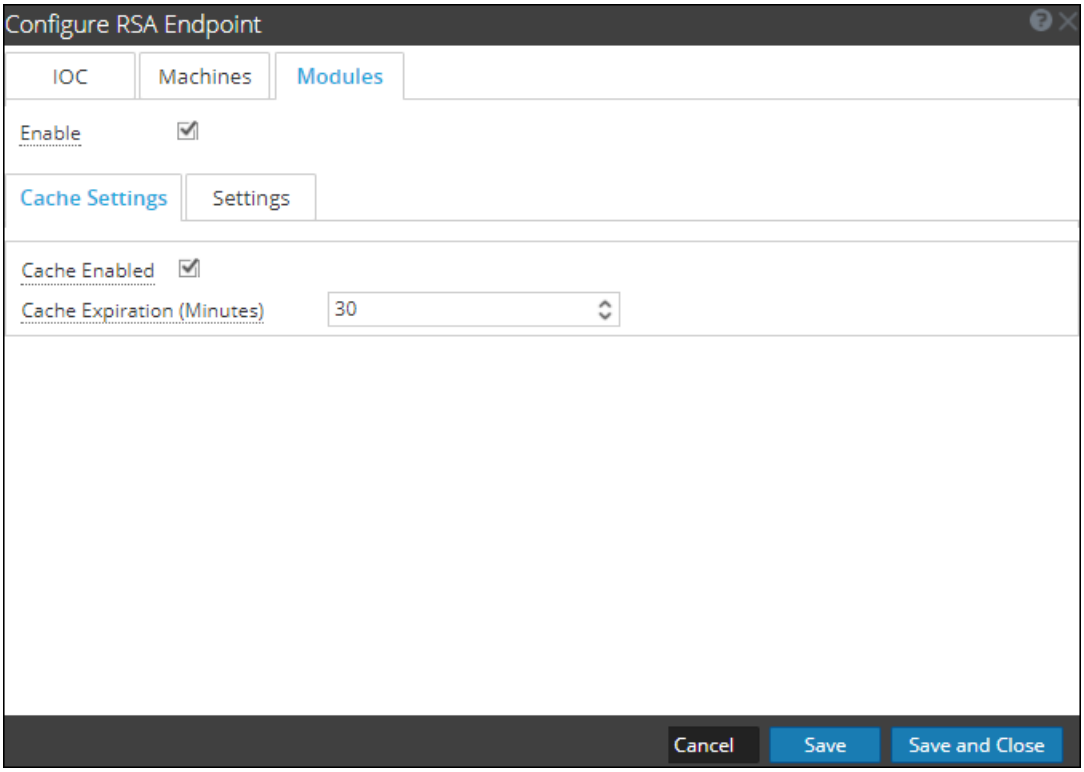
After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For more information, see the *RSA NetwitnessRespond User Guide* and the *RSA Netwitness Investigation and Malware Analysis Guide*.

Configure Context Hub Data Source Settings

After you have configured the required data sources you can customize the settings for the data sources based on your requirement.

To access and configure settings:

1. Go to **ADMIN**> **Services**.
   The services view is displayed.
2. In the Services panel, select the Context Hub service and click > **View** > **Config**.
   The Services Config view of Context Hub is displayed.
3. Select the data source for which you want to configure the settings and click in the Actions column.
   The following screenshot is an example of the NetWitness Endpoint settings dialog:



4. Configure the following fields:

Field	Description
Enable	This option is enabled by default (checked) and can be used to enable or disable the response from the selected data source.
Cache Settings	Any lookup from Context Hub can be stored in the Context Hub cache for a configured time. Response to any subsequent matching request will be fetched from the Context Hub cache. Use this section to define the following cache settings for query lookup: • **Cache Enabled**: By default, this checkbox is selected and the query response is cached. • **Cache Expiration (Minutes)**: The maximum time the query lookup is retained in cache. The default time is 30 minutes and maximum is 7200 minutes that you can configure.
List value Expiration	**Enable**: Select Enable to define the number of days the list values must be available. By default, this option is disabled and the values are retained. **Time to Live (Days)**: Enter the number of days you want to the list values to be retained.
Meta Mapping	Any list stored in Context Hub should be made available for a lookup. The lookup in Context Hub is performed based on meta type or entities. Examples IP, HOST, MAC ADDRESS, DOMAIN, FILE_NAME, FILE_HASH, USER. **Meta Type**: Entities available in Context Hub. **Context Hub Fields**: Column headers from CSV file you have added when adding List Data Source.
Minimum IIOC Score	The minimum IIOC score to be considered for fetching contextual information of Netwitness Endpoint modules.
Query Last (Days)	The duration (in days) for which the Context Data must be queried.
Limit	The maximum number of records to be displayed when Context Lookup is performed.
Recur Every	Configure recurring schedule to fetch and store contextual data for the required intervals.

5. Click any one of the following options:

   - **Cancel** - select this option to cancel the changes.
   - **Save** - select this option to save the changes.
   - **Save and Close** - select this option to save and close the dialog.

Based on the data source you select, the Response Groups differ. The following table describes the response groups for every data source.

Data Source (Connection)	Response Supported Groups	Field Settings
 List	List	Meta Mapping Meta Type Context Hub Fields Settings Data Prefetch Settings Schedule Recurrence List Value Expiration Cache Settings Cache Enabled Cache Expiration (Minutes) [Min is 30 minutes Max is 7200 minutes]
 RSA Archer	Archer	Cache Settings Cache Enabled Cache Expiration (Minutes)

Data Source (Connection)	Response Supported Groups	Field Settings
Active Directory	Users	Meta Mapping Meta Type Context Hub Fields Settings Data Prefetch Settings Schedule Recurrence List Value Expiration Cache Settings Cache Enabled Cache Expiration (Minutes)[Min is 30 minutes Max is 7200 minutes]
RSA Endpoint	IOC Machines Modules	Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Minimum IIOC Score Context Panel Settings

Data Source (Connection)	Response Supported Groups	Field Settings
Respond	Alerts Incidents	Context Panel Settings Data Prefetch Settings Query Last [Days Cache Settings Cache Enabled Cache Expiration (Minutes)
Live Connect	Domain File IP	Cache Settings Cache Enabled Cache Expiration (Minutes) Settings Context Panel Settings

Note: After you configure the data source settings, you can configure the Context Hub configuration parameters by navigating to **ADMIN**> **Services**> **View** > **Explore** view. Make sure you restart the Context Hub service if you make any configuration changes in the Explore view.

Import or Export Lists for Context Hub

As an administrators you can import or export a list that is configured in the Context Hub service which can be used by an analyst. The file to be imported or exported is a CSV file and you can add multiple lists as Data Sources.

Prerequisites

Ensure that Context Hub is enabled and the service is available in **Admin** > **Services** view of NetWitness Suite.

Import a List

After you have imported a list, you can perform the following tasks:

- Import values to an existing list
- Add row to a list
- Edit a list name and description
- Edit a value from a list
- Delete a list
- Delete row from a list

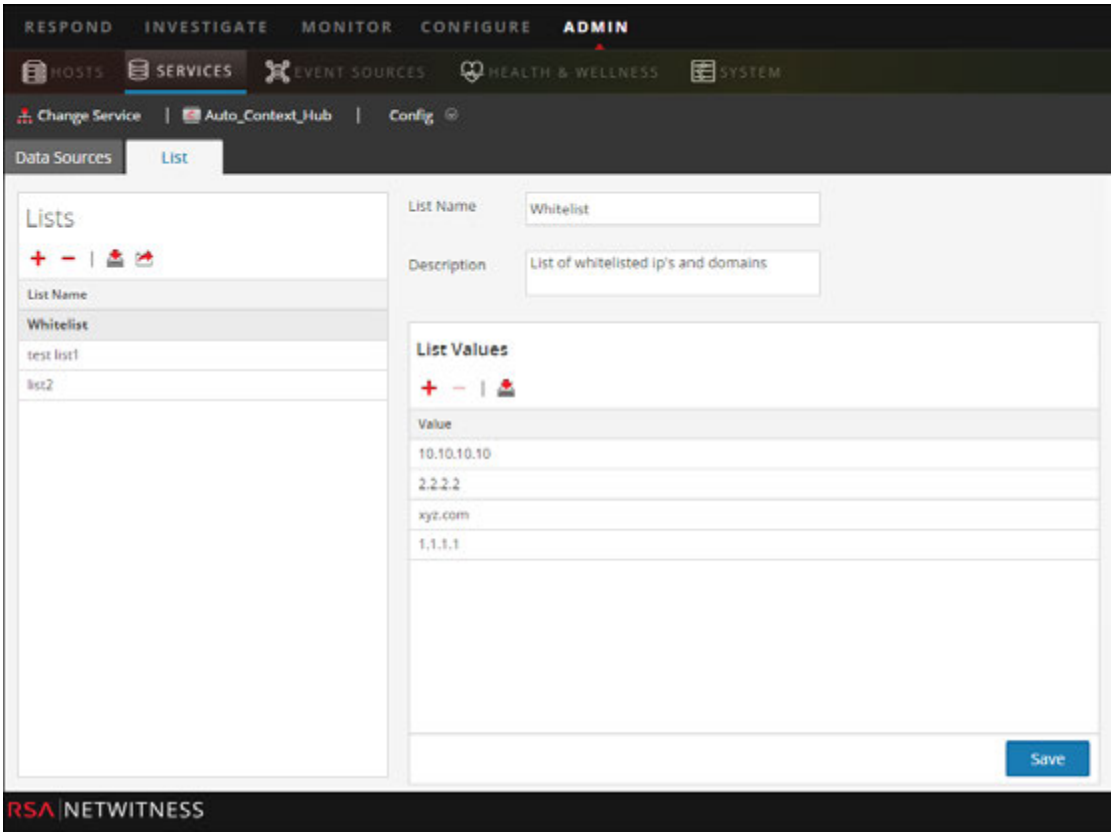
Note: You have to make the same changes to the relevant .CSV file, so that the changes get reflected the next time the schedule recurs. Otherwise, when you import values into an existing single-column or multi-column list, the data is overwritten from the source file the next the schedule recurs.

Import Single-Column List

To import a list:

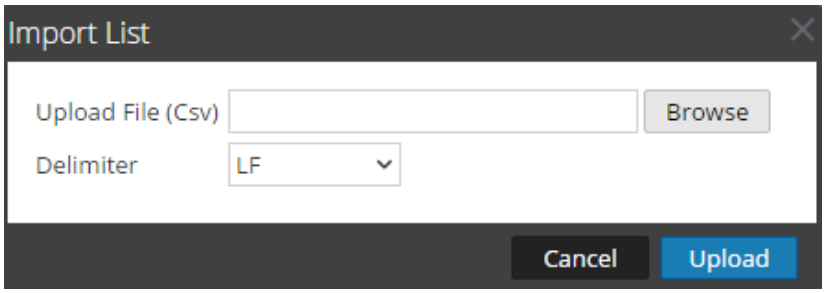
1. Select ADMIN > **Services**.
   The services view is displayed.
2. In the **Services** panel, select the Context Hub service and click > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.

The below image is an example of single-column list.



4. Click on the **Lists** panel.

   The **Import List** dialog is displayed.



5. In the **Import List** dialog, complete the following steps:

   a. In the **Upload File (.CSV)** field, browse and select the `CSV` file.

   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR** (Carriage Return), and **LF** (Line Feed).

6. Click **Upload** to upload the CSV file to Context Hub.

These lists are considered as data sources for retrieving contextual information. But you can append to an existing multi-column list. The data will be appended only if the number of columns match.

Note: You cannot create a new multi column list by importing. For information on how to import multi-column list, see Configure List Data Source for Context Hub.

Import Values to an existing List

When you are importing into existing multi- column list the data is overwritten from the source file when the schedule recurs.

To import values to a list:

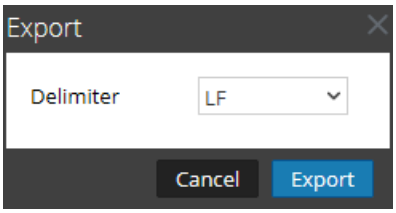
1. Go to **ADMIN** > **Services**.
   The services view is displayed.
2. Service and click > **View** > **Config**.
   The Services Config View of the Context Hub service is displayed.
3. Click the **Lists** tab.
   The Lists tab consists of the **Lists** panel and **List Values** panel.
4. In the Lists panel, select a list for which you want to import the values.
5. Click on the **List Values** panel.
   The **Import List** dialog is displayed.
6. In the **Import List** dialog, complete the following steps:
   a. In the **Upload File (Csv)** field, browse and select the `CSV` file.
   b. In the **Delimiter** field, select the delimiter to separate the values in a list from the options—**Comma**, **CR**(Carriage Return), and **LF**(Line Feed).
7. Click **Upload** to upload the CSV file to NetWitness Suite.

The list values are imported to the selected list. These lists are considered as data sources for retrieving contextual information. But you can append an existing multi column list. The data will be appended only if the number of column match.

Export List for Context Hub

To export a list:

1. On the **Lists** tab of the Services Config view of the Context Hub service, click .
   The **Export** dialog is displayed.



2. In the **Delimiter** field, select the delimiter to separate the values in an exported list from the drop-down [**Comma**, **CR** (Carriage Return), and **LF** (Line Feed)].
3. Click **Export**.

In case of a single-column list, you can select the delimiter. And, in case of a multi-column list, the list is exported as CSV file. to the local machine.

Configure Meta Type Mapping for Context Hub

As an administrator you manage the mapping of Context Hub meta types with Netwitness meta keys.

The Context Hub service provides context lookup for meta values in the Respond and Investigation views. These meta values are grouped into meta types based on the category they belong to. For example, meta keys of NetWitness Suite Respond and Investigation like `ip.src` and `ip.dst`are grouped into the meta type `IP` in Context Hub. The meta type `IP` is in turn mapped to metas like `alert.events.source.device.ip_address` and `alert.events.destination.device.ip_address` in the RESPOND database.

In the **ADMIN**> **System** > **Investigation** view, the Context Lookup tab enables the administrator to configure the Netwitness meta keys and meta type mapping. The administrator can add or remove meta keys to the list of meta types supported by Context Hub.

The Context Hub service is pre-configured with default meta type and meta key mapping, which is expected to work with most deployments, unless there are some custom mappings created for your specific deployment.

Note: You cannot add a new Meta Type.

The default mapping is given below:

Meta Type Name	Meta Keys
IP	device.ip, ip.src, ip.dst, ip.addr,ipv6.src, alias.ip, ipv6.addr, device.ipv6,forward.ip, forward.ipv6,ipv6.dst, ipv6.addr, stransaddr, transaddr
USER	user.src, user.dst, username, event user
DOMAIN	domain.src, domain.dst,fqdn, web.domain, domain, sdomain, ddomain
MAC_ ADDRESS	eth.dst, eth.src, alias.mac
FILE_ NAME	filename, sourcefile
FILE_ HASH	checksum

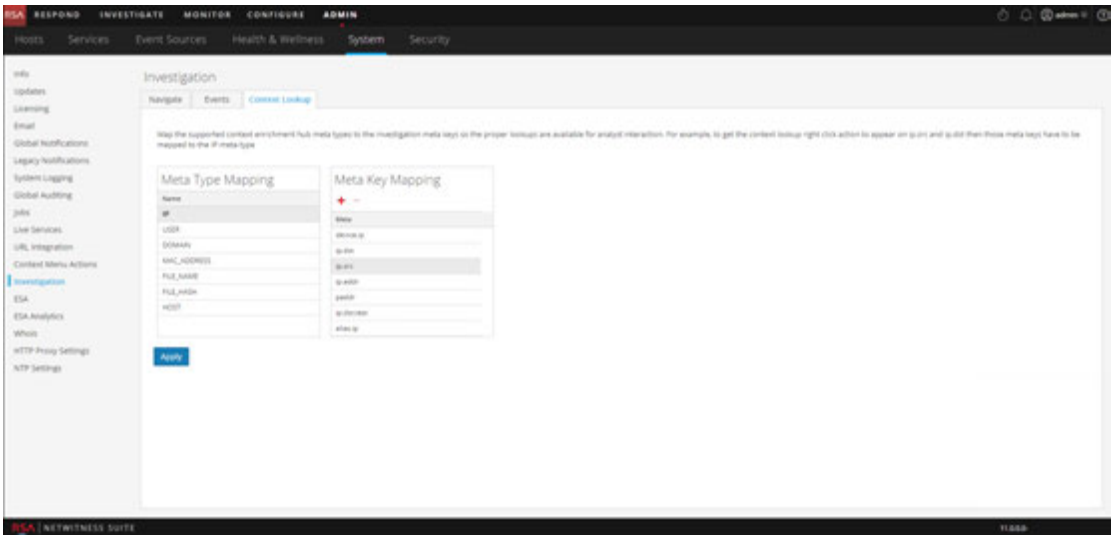
Meta Type Name	Meta Keys
HOST	device.host, alias.host, host.src, host.dst

Procedure

To manage Investigation meta keys mapping:

1. Go to ADMIN > **System**.
2. In the options panel, select **Investigation**.

   The Investigation Configuration panel is displayed.
3. Select the **Context Lookup** tab.



4. Select a meta type to view the default meta keys that are mapped with this meta type.
5. To add a meta key, click + and enter the meta key.
6. To remove a meta key, select the meta key and click −.
7. To save the changes, click **Apply**.
8. In order to add a new meta, they need to be included in the Concentrator's custom index file. For example, if you want to add a meta "**fqdn**" then you need to add an new entry: **<key name="fqdn" description="Fully Qualified Domain Name="IndexValues" format="Text" valueMax="100" />** in the index file. For more information on how to include a new meta in the index file, see Index Customization topic in the *Core Database Tuning*

Guide. After you add the new meta, you can view the contextual information on clicking the Pivot to investigate option in the Respond view.

In case a new meta key is added, the Context Lookup menu option is enabled for the meta values under that meta key. For more information, see the "Investigation Configuration Panel" topic in the *System Configuration Guide*

Context Hub References

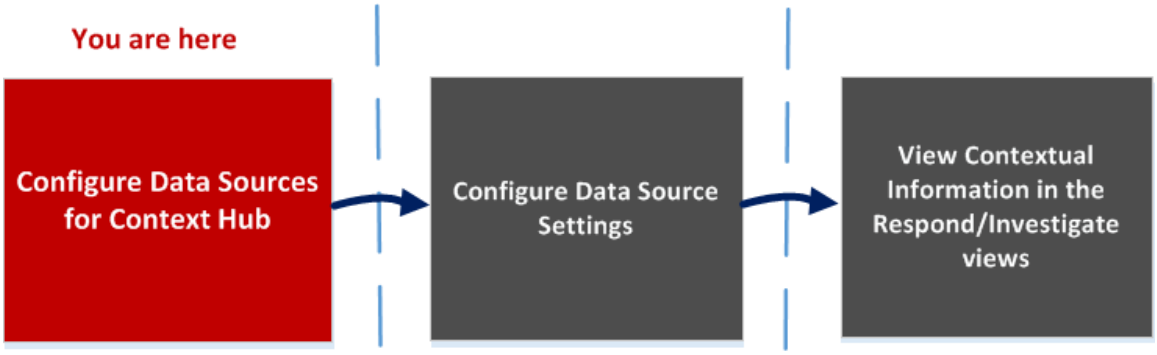
After you have configured the Context Hub service and the required data source, you can manage the settings for each data source. This will help in optimizing and customizing the lookup results.

Context Hub Data Sources Tab

In the **Data Sources** tab, you can configure one or more data sources for Context Hub service. Navigate to **ADMIN** > **SERVICES** > Select Context Hub service > **View** > **Config** > **Data Sources** tab.

Workflow

This workflow shows the procedure to configure data sources for Context Hub service to view contextual information in the Respond / Investigate views.



- The first task is to add a data source
- The second task is to configure data sources settings to enhance your deployment. This task is optional as the settings for each data source is already configured with default values for optimal performance.
- And the third task is to view and analyze the contextual information in the Context Summary panel of the Respond or Investigate views.

What do you want to do?

Role	I want to ...	Show me how

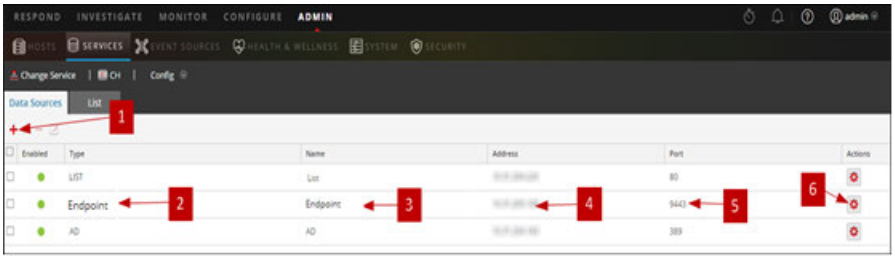
- Configure Active Directory as a Data Source
- Configure Netwitness Endpoint as a Data Source
- Configure Respond as a Data Source
- Configure Live Connect as a Data Source for Context Hub

Quick Look

The following example illustrates how to add a data source for Context Hub service.



1 Click + to display the **Add Data Source** dialog.

2 Displays the type of Data Source.

3 Name that identifies the Data Source.

4 The IP address or hostname of the data source.

5 The connection port for the data source.

6 Opens the **Configure Settings** dialog. You can view and edit the settings to be displayed on the Context Summary panel in the Respond or Investigate views.

7 Click **Test Connection** to verify that the host is connected to the Context Hub service.

Toolbar

The following table describes the toolbar actions.

Feature	Description
	Opens the Add Data Source dialog so that you can add a data source. You can add only one data source of each type. Except in case of Lists and Active Directory data sources which can be added in multiples. For detailed instructions to add a data source, see Configure Data Sources for Context Hub.
	Delete a data source. If you delete a data source, Context Hub does not consider the deleted service as a data source. All contextual information fetched previously will not be available.
	Opens the Edit Data Source dialog. For description of each field in Edit Data Source panel, see Configure Data Sources for Context Hub.
	Opens the Configure Settings dialog. You can view and edit the settings for the data sources. For description of each field in Configure Responses dialog, see Configure Data Source Settings.

Data Source Configurations

The following table describes the listed configurations.

Feature	Description
Enabled	Indicates whether the data source is enabled or disabled. A solid colored green circle indicates that data source is enabled (●). An blank white circle indicates that data source is disabled.
Type	The type of data source. For example, Lists, Archer, Active Directory, Endpoint, Respond, or Live Connect.
Name	The unique name to identify the data source. For example, Respond \.
Address	The IP address or hostname of the data source.
Port	The connection port for the data source and vary based on the data source being added. For example, for Endpoint the port is 9443, for Lists the port is 80 and so on.

Context Hub Lists Tab

In the **Lists** tab, you can create and configure lists for Context Hub. Navigate to **ADMIN** > **SERVICES** > Select Context Hub service > **View** > **Config** > **Lists** tab.

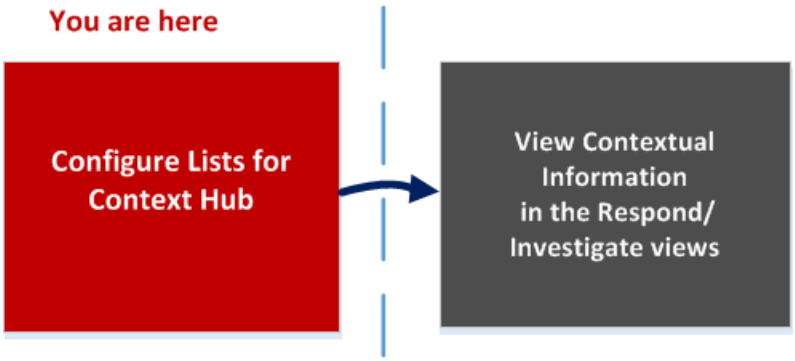
The Lists tab of the Context Hub service allows you to create one or more lists and add relevant list values to the list. These lists are automatically considered as data sources for the Context Hub service.

These lists may be populated with items either by importing CSV files or by adding meta values by using the option Add/Remove from List in Investigation and Respond views.

Note: You can also create lists and add list values from Respond and Investigation views. For more information, see the *RSA NetWitness Respond User Guide* and the *RSA Netwitness Investigation and Malware Analysis Guide*.

Workflow

This workflow shows the procedure to configure lists for Context Hub service and to view contextual information in the Respond and Investigate views.



Creating one or more list is the first task in this workflow. The lists can contain supported metas such as an IP address, User, Host, Domain, MAC address, File Name or File Hash. The next task is to analyze or use the list data to view contextual data in Respond and Investigate views.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure List Data Source for Context Hub*	Configure Lists as a Data Source

Role	I want to ...	Show me how
Administrator/ Analyst	View Contextual Information in Respond View	See the *NetWitness Respond User Guide*.
Administrator/ Analyst	"Manage Lists and List Values in Investigation	See the *Investigation and Malware Analysis User Guide*.
Administrator/ Analyst	Create a list	See the *NetWitness Respond User Guide* and *Investigation and Malware Analysis User Guide*
Administrator/ Analyst	Update a list	See the *NetWitness Respond User Guide* and *Investigation and Malware Analysis User Guide*
Administrator/ Analyst	Delete list	See the *NetWitness Respond User Guide* and *Investigation and Malware Analysis User Guide*
Administrator/ Analyst	Import a list	Import or Export Lists for Context Hub
Administrator/ Analyst	Export list	Import or Export Lists for Context Hub

*You can complete this task here (that is in the Context Hub Lists Tab).

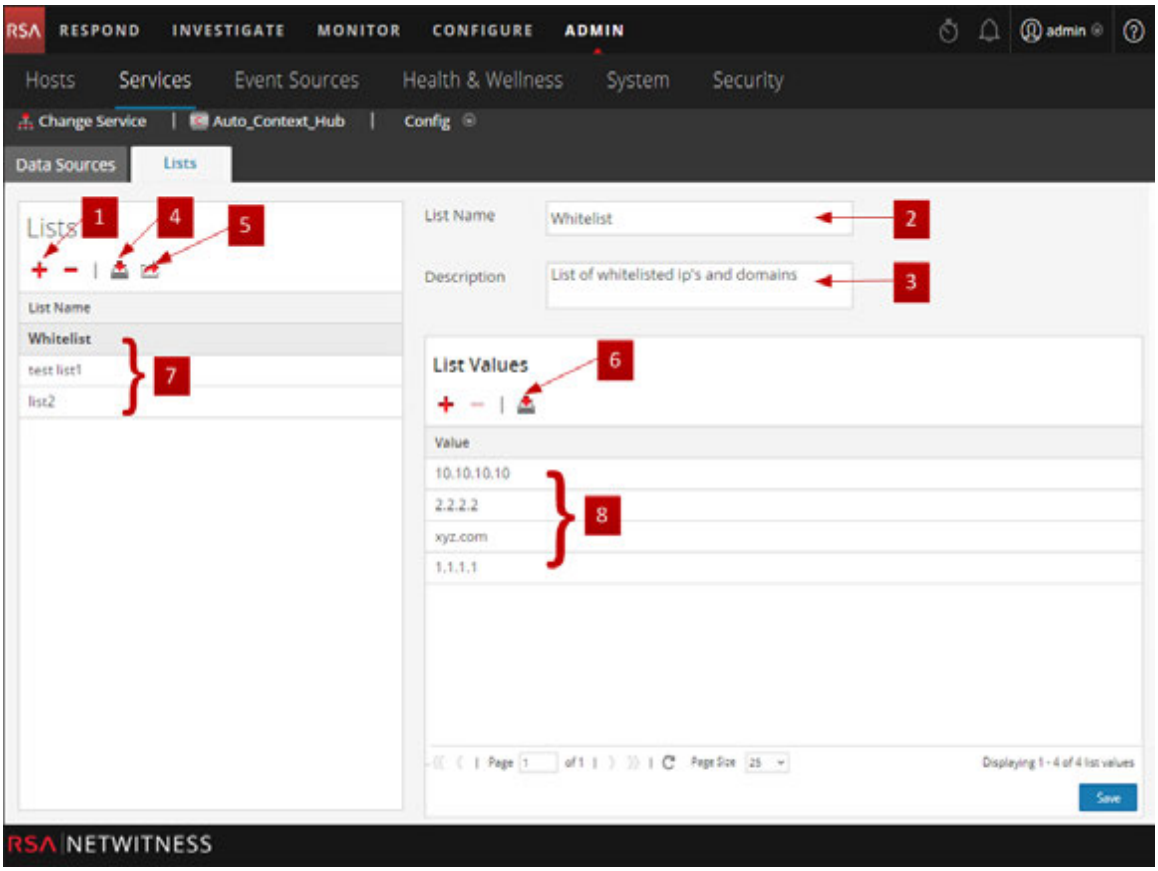
- Context Hub Data Sources Tab

Quick Look

The following example illustrates how to add lists for Context Hub service.

The List tab consists of the **Lists** panel and **List Values** panel. The **Lists** panel has a toolbar with options to add, delete, import, and export lists. The entries under **List Name** are lists that are added or imported for the Context Hub service.
The **List Values** panel has a toolbar with options to add, delete, and import list values to the selected list. The entries under **Value** identify each list entry included in the list.



1	Click + to add a new list.
2	Name that identifies the list.
3	Description of the list.
4	Click to import list(s) to Context Hub.
5	Click to export a list to the local machine.
6	Click to import list values to selected list.
7	Displays the custom list(s) that are added to Context Hub.
8	Displays the list values that are added to the selected list.

Toolbar

The following table describes the toolbar actions.

Feature	Description
	Add a new list. For more information, see Configure Lists as a Data Source for Context Hub.
	Delete a list. If you delete a list from Context Hub, the list is no longer considered as a data source for retrieving contextual information.
	Import lists to Context Hub. For more information, see Import or Export Lists for Context Hub.
	Export a list to the local machine. For more information, see Import or Export Lists for Context Hub.

List View Options

The following table describes the Lists configurations.

Feature	Description
List Name	Unique name to identify the list.
Description	Description of the list.
Save	Saves the changes made to the list.

Next steps

After completing the configuration, you can view the contextual data in the Context Summary Panel of the Respond view or Investigate view. For instructions, **Navigate to Context Summary Panel and View Additional Context** topic in the *Investigation and Malware Analysis User Guide*.

Troubleshooting

This topic provides information about possible issues that NetWitness Suite users may encounter when setting up their Context Hub service in NetWitness Suite.

Possible Issues

Problem	Solutions
SSL handshake with Archer certificate fails while adding it as a data source.	Use an archer generated certificate with the Trust All Certificates option configured.
Pivot to Investigate option on the Respond page does not navigate to the correct link.	When you stop and restart the RabbitMQ server, the Pivot to Investigate option available on the respond screen is not visible. And the context panel for Pivot to Investigate reopens the same page. You need to restart the jetty service on the Netwitness Server, login to the Netwitness Server Host and enter the service jetty restart command.

How Reporting Engine Works

Netwitness Reporting Engine is a service on the Netwitness Admin Server and facilitates the data extraction from different data sources to generate reports for compliance and analysis. Reporting Engine stores the definitions of the charts, rules, reports and alerts that are used to generate reports, charts and alerts.

Reporting Engine configuration includes configuring the data sources, definitions of outputs or notifications and parameters to improve the performance of data extraction and report, chart, and alert generation.

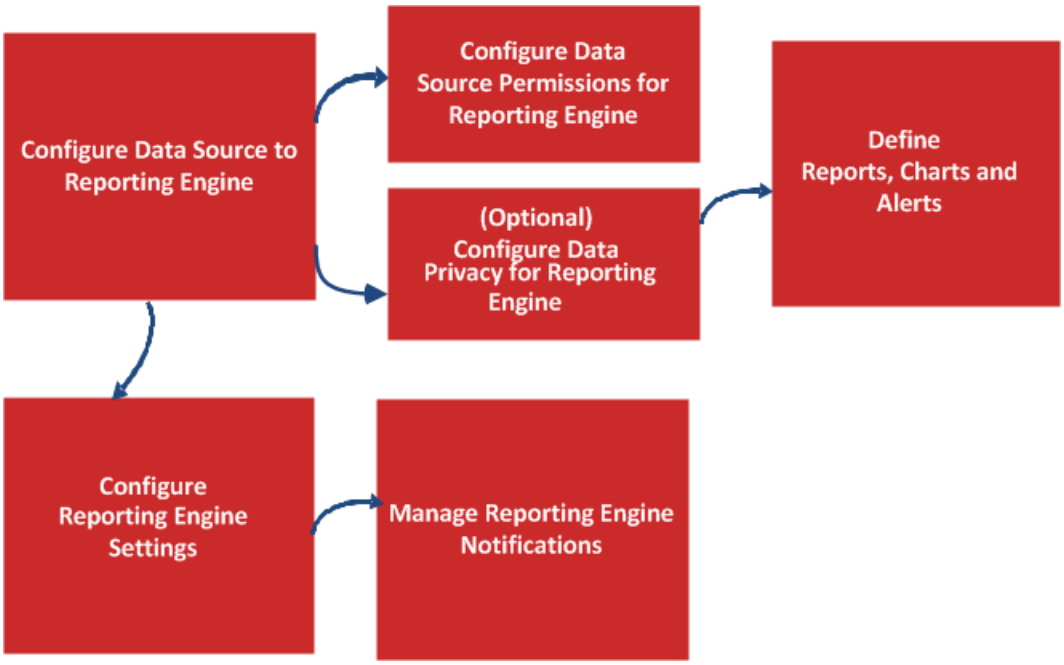
When you install the NetWitness Suite, Reporting Engine is automatically installed as a service. This enables the Reports, Charts, and Alerts to be maintained in the RSA NetWitness Suite and be available to view, download reports as PDF or CSV format, download charts as PDF and be added as dashlets.

For the Reporting Engine to run reports and alerts based on the data drawn from a data source, you must associate a data source, or multiple data sources to a Reporting Engine. There are three types of data sources:

- NWDB Data Sources - The NetWitness Database (NWDB) data sources are Decoders, Log Decoders, Brokers, Concentrators, Archiver, and Collection. Generation of reports, alerts, and charts on NWDB data sources is supported in Reporting Engine.
- Warehouse Data Sources - The Warehouse data sources are Horton Works and MapR which collects information from the Warehouse Connector and generates reports and alerts. This data source generated Reports only.
- Respond Data Sources - Respond is used to generate reports on alerts and incidents. This data source generated Reports only.

Workflow

This following workflow shows an overview of the Reporting Engine configuration which enables the user to generate Reports, Charts, and Alerts.



Configure Data Source to Reporting Engine
Configure Data Source Permissions for Reporting Engine
(Optional) Configure Data Privacy for Reporting Engine
Define Reports, Charts and Alerts
Configure Reporting Engine Settings
Manage Reporting Engine Notifications

Configure the Reporting Engine

On installation of the Netwitness Server, the Reporting Engine service is automatically available and some parameters are pre-populated with default values to achieve optimal results.

You must also ensure that the data sources are deployed and configured in the NetWitness Suite. For more information, see "Add Service or Edit Service Dialog" topic in the *Host and Service Configuration Guide*.

You can perform the following tasks:

- Check Live for the latest data source content and deploy it on a regular basis. (For more information, see "Manage Live Resources" topic in the in *Live Services Guide*).
- (Optional) Add Additional Space for Large Reports.

Configure the Data Sources

You must configure data sources such as NWDB, Warehouse, or RESPOND. You can configure NWDB, Warehouse, and RESPOND to generate Reports, Charts, and Alerts respectively. Optionally, you can also configure Archiver, Collection, and Workbench data sources.

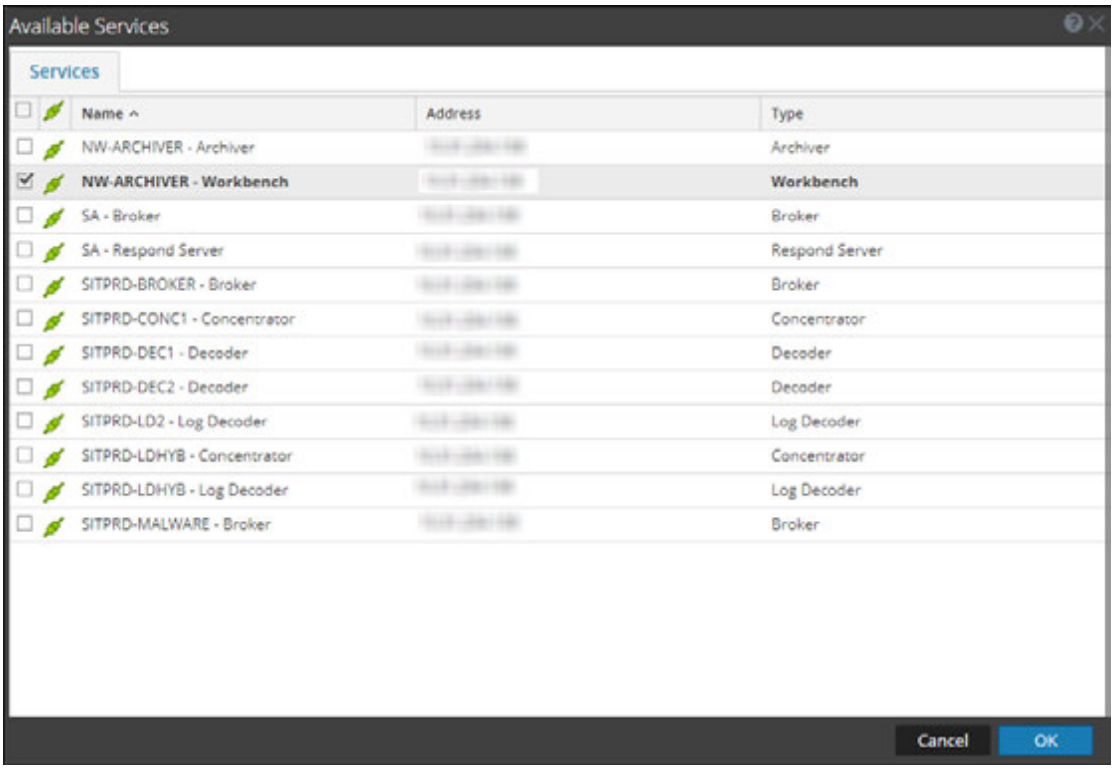
Configure a NWDB Data Source

To add a NWDB data source:

1. Go to **ADMIN** > **Services**.
2. In the **Services**, select **Reporting Engine** service.
3. Click > **View** > **Config**

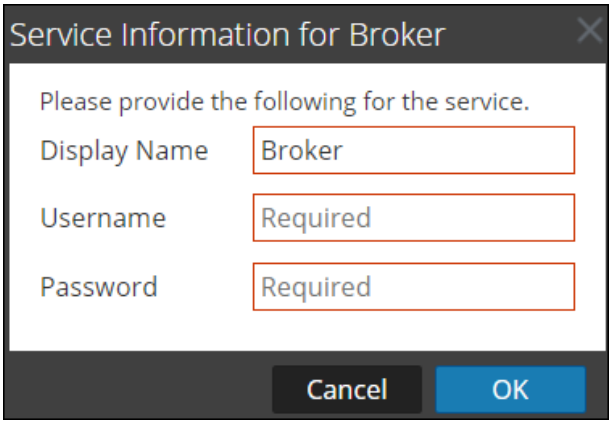
   The Services Config View of Reporting Engine is displayed.
4. On the **Sources** tab, click > **Available Services**.

   The **Available Services** dialog is displayed.

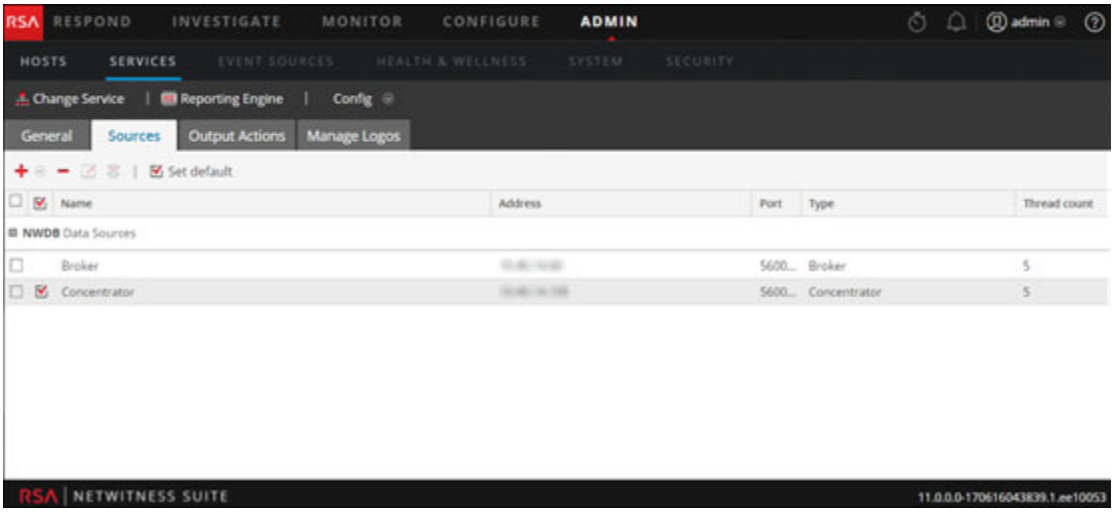


5. Select a NWDB service you want to add and click **OK**.

6. In the Service Information for Broker dialog, enter the service information for the service and click **OK**. In this example, we are adding a Broker service.



7. The service is displayed in the Sources tab when it is successfully added.



Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

Configure a Warehouse Data Source

You can add the warehouse data source to Reporting Engine, so that you can extract the data from the required services, store them in MapR or Horton works and generate Reports and Alerts. The procedure to configure Warehouse as a data source differs. To extract data from a Warehouse data source, you must configure it using the following procedure.

Note: Warehouse Analytics is not supported in Netwitness Suite 11.0 release.

Prerequisite

Make sure you:

- Add a Warehouse Data Source to Reporting Engine
- Set Warehouse Data Source as the Default Source
- HIVE server is in running state on all the Warehouse nodes. Use the following command to check the status of the HIVE server:

  ```
  status hive2 (MapR deployments)
  service hive-server2 status (Horton Works deployments)
  ```

- Warehouse Connector is configured to write data to the warehouse deployments.
- If Kerberos authentication is enabled for HiveServer2, make sure that the keytab file is copied to the `/var/netwitness/re-server/rsa/soc/reporting-engine/conf/` directory in the Reporting Engine Host.

  Note: The **rsasoc** user should have read permissions for the keytab file. For more information, see Configure Data Source Permissions.

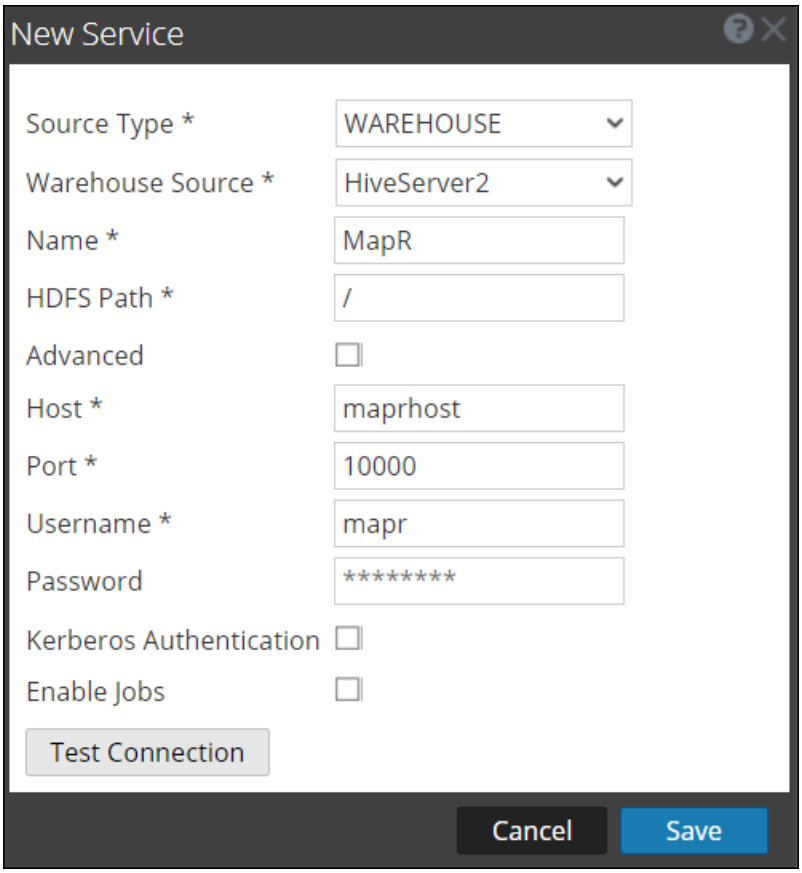
  Also, make sure that you update the keytab file location in the **Kerberos Keytab File** parameter in the Reporting Engine Service Config View. For more information, see General Tab.

To add Warehouse data source for MapR:

1. Go to **Admin** > **Services**.
2. In the **Services** list, select the **Reporting Engine** service.
3. Click  > **View** > **Config**.
4. Click the **Sources** tab.

   The **Service Config** view is displayed with the Reporting Engine **Sources** tab open.
5. Click + and select **New Service**.

   The New Service dialog is displayed.



6. In the **Source Type** drop-down menu, select **WAREHOUSE**.
7. In the **Warehouse Source** drop-down menu, select the warehouse data source.
8. In the **Name** field, enter the host name of the Warehouse data source.
9. In the **HDFS Path** field, enter the HDFS root path to which the Warehouse Connector writes the data.

   For example:
   If **/saw** is the local mount point for HDFS that you have configured while mounting NFS on the device. And if you have installed the Warehouse Connector service to write to SAW. For more information, see "Mount the Warehouse on the Warehouse Connector" topic in the *RSA Netwitness Warehouse (MapR) Configuration Guide*.

   If you have created a directory named **Ionsaw01** under **/saw** and provided the corresponding Local Mount Path as **/saw/Ionsaw01**, then the corresponding HDFS root path would be **/Ionsaw01**.

   The **/saw** mount point implies to /as the root path for HDFS. The Warehouse Connector writes the data **/ Ionsaw01** in HDFS. If there is no data available in this path, the following error is displayed:

   "No data available. Check HDFS path"

Make sure that **/lonsaw01/rsasoc/v1/sessions/meta** contains avro files of the meta data before performing test connection.

10. Select the **Advanced** checkbox to use the advanced settings, and fill in the **Database URL** with the complete JDBC URL to connect to the HiveServer2.

    For example:
    If kerberos is enabled in HIVE then the JDBC url will be:

    jdbc:hive2://<host>:<port>/<db>;principal=<Kerberos serverprincipal>

    If SSL is enabled in HIVE then the JDBC url will be:

    jdbc:hive2://<host>:<port>/<db>;ssl=true;sslTrustStore=<trust_store_path>;trustStorePassword=<trust_store_password>

    For more information on HIVE server clients, see https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients.

11. If not using the advanced settings, enter the values for the **Host** and **Port**.

    - In the **Host** field, enter the IP address of the host on which HiveServer2 is hosted.

      Note: You can use the virtual IP address of MapR only if HiveServer2 is running on all the nodes in the cluster.

    - In the **Port** field, enter the HiveServer2 port of the Warehouse data source. By default, the port number is **10000**.

12. In the **Username** and **Password** field, enter the JDBC credentials used to access HiveServer2.

    Note: You can also use LDAP mode of authentication using Active Directory. For instructions to enable LDAP authentication mode, see Enable LDAP Authentication.

13. To run warehouse analytics reports, see Enable Jobs in Configuring Data Sources For Reporting.

14. Enable Kerberos authentication: see Enable Kerberos Authentication in Configuring Data Sources For Reporting.

15. If you want set the added Warehouse data source as default source for the Reporting Engine, select the added Warehouse data source and click Set default.

To add Warehouse data source for Horton Works (HDP):

Note: Make sure you download the `hive-jdbc-1.2.1-with-full-dependencies.jar`. This jar contains the driver file of HIVE 1.2.1 which connects to Reporting Engine for Hive 1.2.1 Hiveserver2, from RSA Link (https://community.rsa.com/docs/DOC-67251).

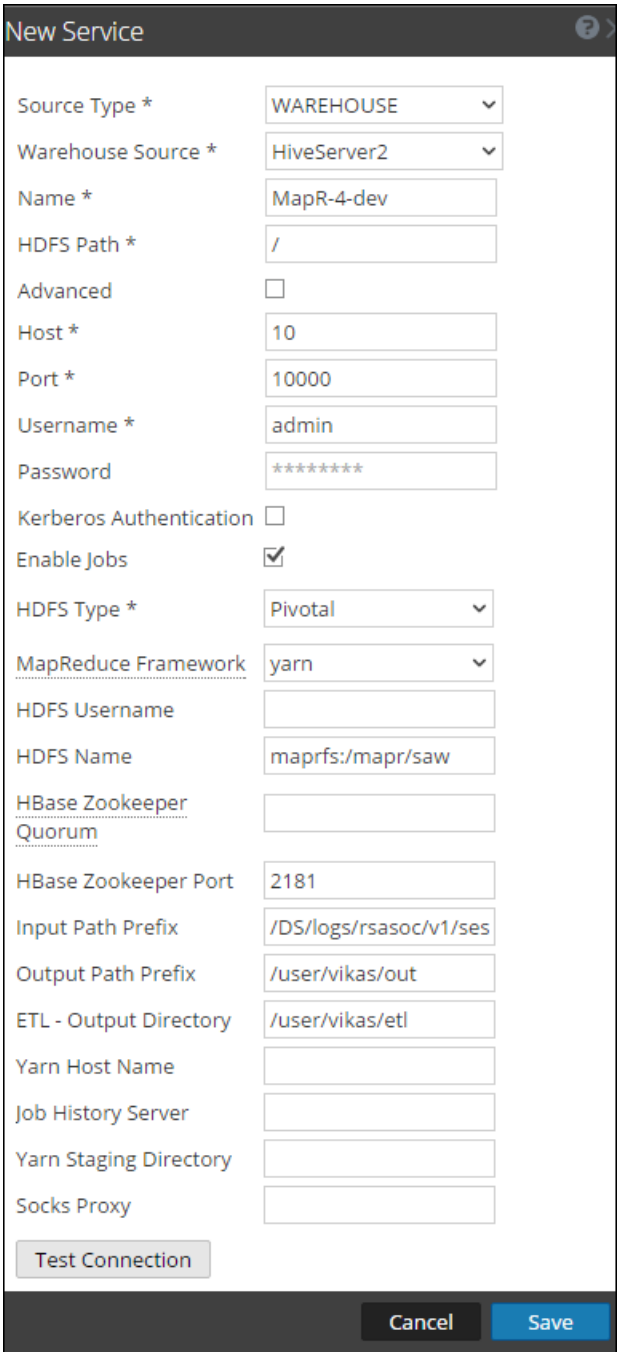
1. SSH to the Netwitness Suite server.
2. In the `/opt/rsa/soc/reporting-engine/plugins/` folder, take a backup of the following jar:
   `hive-jdbc-0.12.0-with-full-dependencies.jar` or `hive-jdbc-1.0.0-mapr-1508-standalone.jar`
3. Remove the following jar:
   `hive-jdbc-0.12.0-with-full-dependencies.jar` or `hive-jdbc-1.0.0-mapr-1508-standalone.jar`
4. In the /opt/rsa/soc/reporting-engine/plugins folder, copy the following jar using WinSCP:
   `hive-jdbc-1.2.1-with-full-dependencies.jar`
5. Restart the Reporting Engine service.
6. Log in to [[[Undefined variable SAVariables.ProductShortName]]] UI.
7. Select the **Reporting Engine** service and select  > **View** > **Explore**.
8. In the **hiveConfig**, set **EnableSmallSplitBasedSchemaLiteralCreation parameter** to **true**.

Enable Jobs

Note: Warehouse Analytics is not supported in Netwitness Suite 11.0 release.

To run warehouse analytics reports, perform this procedure.

1. Select the **Enable Jobs** checkbox.



Note: Do not select Pivotal in the HDFS field as it is not supported for this release.

2. Enter the following details:

a. Select the type of HDFS from the **HDFS Type** drop-down menu.

- If you select the Horton Works HDFS type, enter the following information:

Field	Description
HDFS Username	Enter the username that Reporting Engine should claim when connecting to Horton Works. For standard horton works DCA clusters, this would be 'gpadmin'.
HDFS Name	Enter the URL to access HDFS. For example, hdfs://hdm1.gphd.local:8020.
HBase Zookeeper Quorom	Enter the list of host names separated by a comma on which the ZooKeeper servers are running.
HBase Zookeeper Port	Enter the port number for the ZooKeeper servers. The default port is 2181.
Input Path Prefix	Enter the output path of the Warehouse Connector (`/sftp/rsasoc/v1/sessions/data/<year>/<month>/<date>/<hour>`) until the year directory. For example, `/sftp/rsasoc/v1/sessions/data/`.
Output Path Prefix	Enter the location where the data science job results are stored in HDFS.
Yarn Host Name	Enter the Hadoop yarn resource-manager host name in the DCA cluster. For example, **hdm3.gphd.local**.
Job History Server	Enter the Hadoop job-history-server address in the DCA cluster. For example, **hdm3.gphd.local:10020**.
Yarn Staging Directory	Enter the staging directory for YARN in the DCA cluster. For example, `/user`.

Field	Description
Socks Proxy	If you are using the standard DCA cluster, most of the hadoop services will be running in a local private network, not reachable from Reporting Engine. Then, you must run a socks proxy in the DCA cluster and allow access from outside to the cluster. For example, **mdw.netwitness.local:1080**.

- If you select the MapR HDFS type, enter the following information:

Field	Description
MapR Host Name	The user can populate the public ip address of any one of the MapR warehouse hosts.
MapR Host User	Enter a UNIX username in the given host that has access to execute map-reduce jobs on the cluster. The default value is 'mapr'.
MapR Host Password	(Optional)To setup password-less authentication, copy the public key of the “rsasoc” user from **/home/rsasoc/.ssh/id_rsa.pub** to the “authorized_keys” file of the warehouse host located in **/home/mapr/.ssh/authorized_keys**, with the assumption that “mapr” is the remote UNIX user.
MapR Host Work Dir	Enter a path that the given UNIX user (for example, “mapr”) has write access to. **Note:** The work directory is used by Reporting Engine to remotely copy the Warehouse Analytics jar files and start the jobs from the given host name. You must not use “/tmp” to avoid filling up of the system temporary space. The given work directory will be remotely managed by Reporting Engine.
HDFS Name	Enter the URL to access HDFS. For example, to access a specific cluster, maprfs:/mapr/<cluster-name>.

Field	Description
HBase Zookeeper Port	Enter the port number for the ZooKeeper servers. The default port is 5181.
Input Path Prefix	Enter the output path (`/rsasoc/v1/sessions/data/<year>/<month>/<date>/<hour>`) until the year directory. For example, `/rsasoc/v1/sessions/data/`.
Input Filename	enter the file name filter for avro files. For example, **sessions-warehouseconnector**.
Output Path Prefix	Enter the location where the data science job results are stored in HDFS.

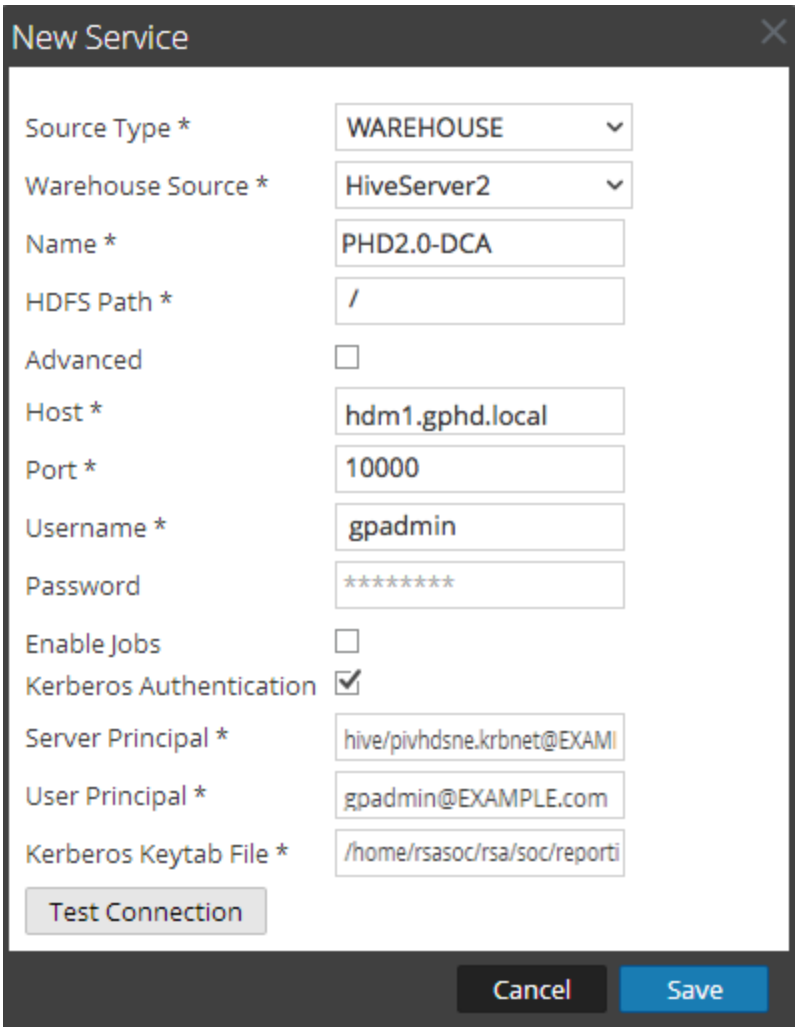
b. Select the MapReduce Framework as per the HDFS type.

> **Note:** For HDFS type MapR, select MapReduce framework as Classic. For HDFS type Horton Works, select MapReduce Framework as Yarn.

Next, enable Kerberos authentication.

Enable Kerberos Authentication

1. Select **Kerberos Authentication** checkbox, if the Warehouse has Kerberos enabled HIVE server.



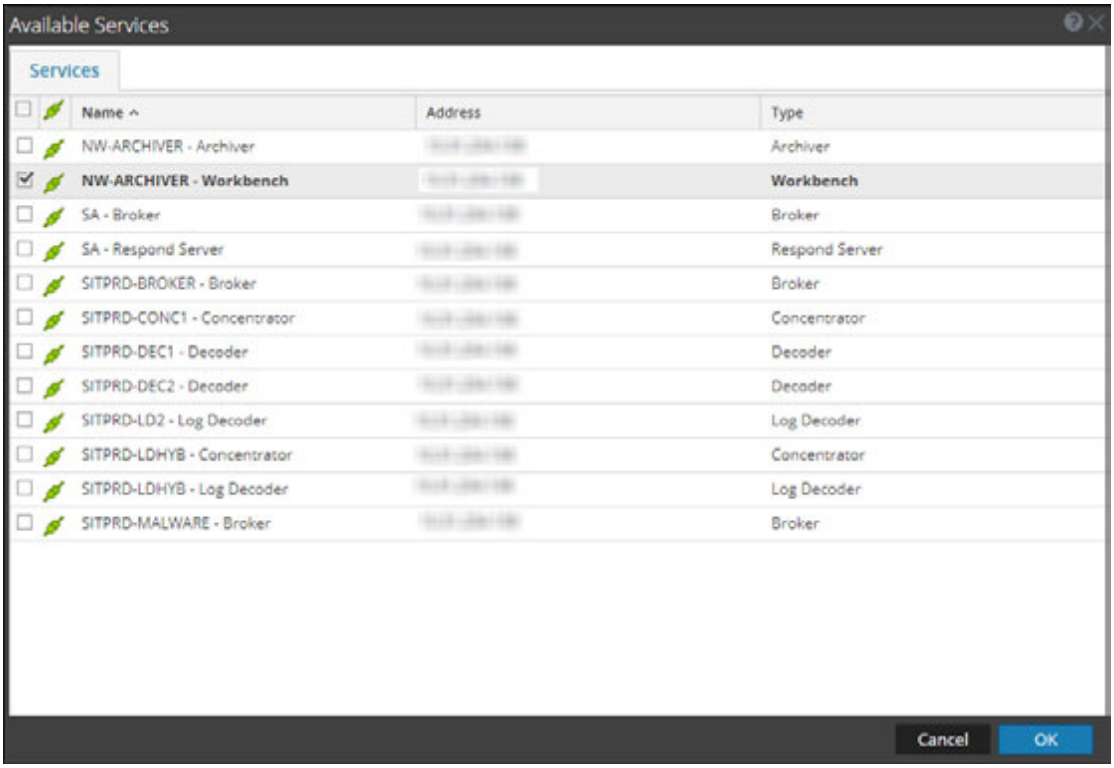
2. Fill in the fields as follows:

Field	Description
Server Principal	Enter the Principle used by the HIVE server to authenticate with the Kerberos Key Distribution Center (KDC) Server.
User Principal	Enter the Principle that HIVE JDBC client uses to authenticate with the KDC server for connecting the HIVE server. For example, **gpadmin@EXAMPLE.COM**.
Kerberos Keytab File	View the Kerberos keytab file location configured in the HIVE Configuration panel on the Reporting Engine General Tab. **Note:** Reporting Engine supports only the data sources configured with the same Kerberos credentials, like, User Principal and key tab file.

3. Click **Test Connection** to test the connection with the values entered.
4. Click **Save**.

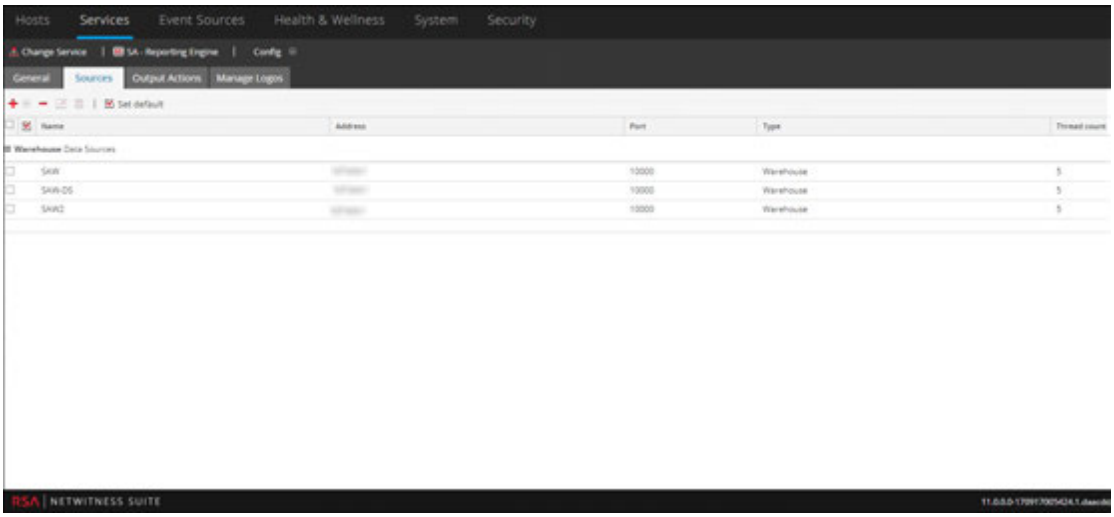
   The added Warehouse data source is displayed in the Reporting Engine Sources tab.
5. Click + > **Available Services**.

   The Available Services dialog box is displayed.



6. In the Available Services dialog box, select the service that you want to add as data source to the Reporting Engine and click **OK**.

   NetWitness Suite adds this as a data source available to reports and alerts against this Reporting Engine.



Note: This step is relevant only for an Untrusted model.

Set a Data Source as the Default Source

To set a data source to be the default source when you create reports and alerts:

1. Go to **Dashboard** > **Administration** > **Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Select > **View**> **Config**.

   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The **Services Config View** is displayed with the Reporting Engine Sources tab open.
5. Select the source that you want to be the default source (for example, Broker).
6. Click the **Set Default** checkbox.

   NetWitness Suite defaults to this data source when you create reports and alerts against this Reporting Engine.

(Optional) Add Workbench as Data Source

You have to carry out the following Workbench configurations to you to be able to use data from Workbench data source to generate Reports and Alerts. This topic provides following instructions describes on how to add Workbench service as a data source to Reporting Engine to generate report for the data collected by Workbench.

Prerequisites

Make sure you have:

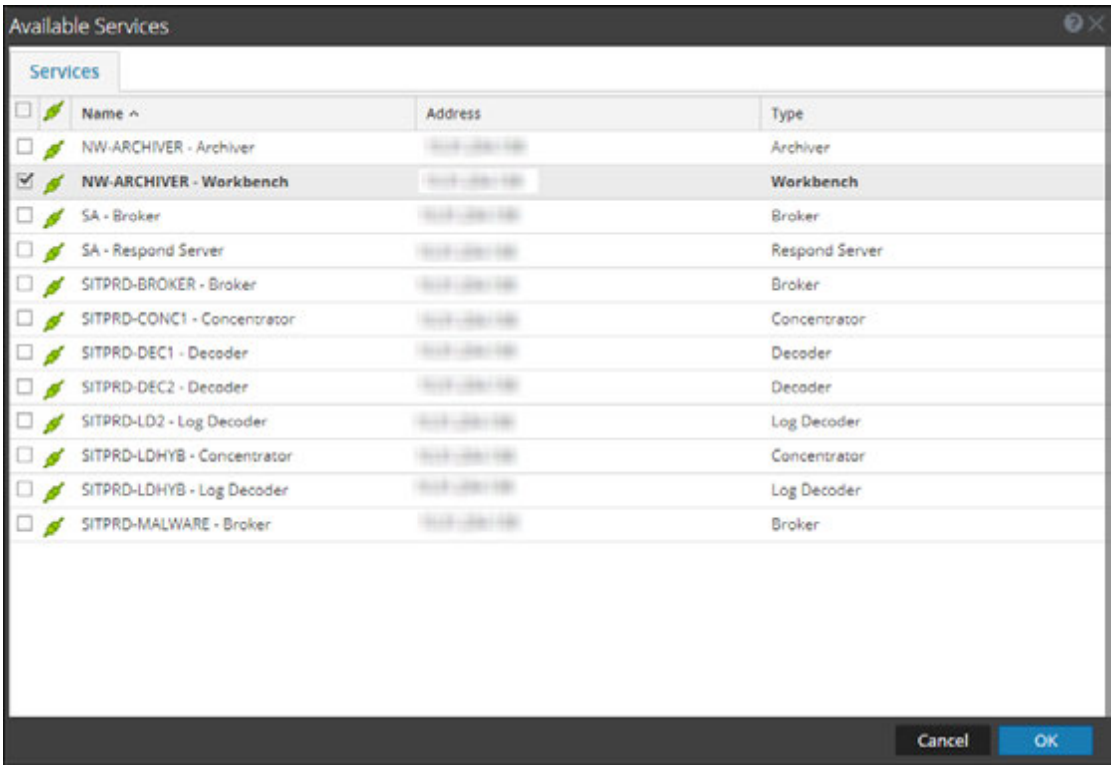
1. Added Workbench as a service to your NetWitness Suite deployment. For more information, see the *Archiver Configuration Guide*.
2. Added a Collection on the Workbench service.

To add Workbench as a data source to Reporting Engine:

1. Go to ADMIN > **Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Select > **View** > **Config**.

   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click + and select **Available Services**.

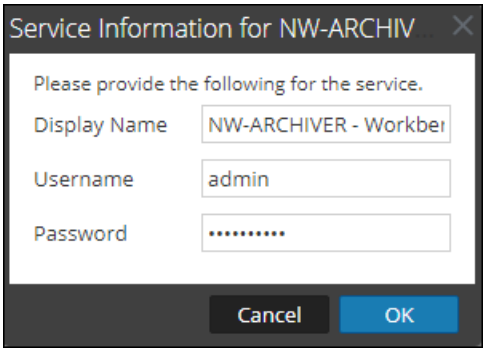
   The Available Services dialog is displayed:



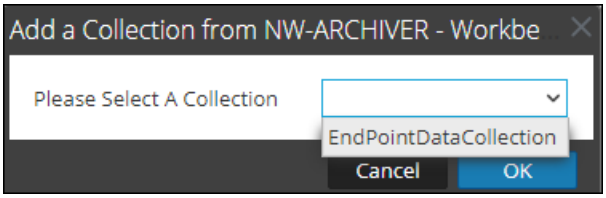
6. Select the Workbench service and click **OK**.

   A list of collections are displayed.

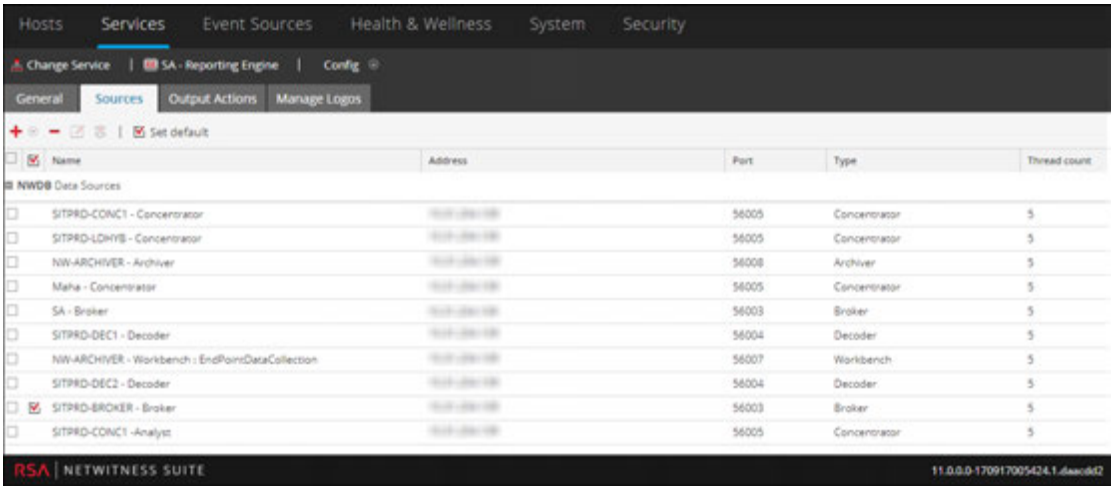
7. Enter the service information, and click **OK**



8. Select a collection from the dropdown.



9. The data source is displayed in the Sources tab.



The workbench service is now added as a data source to the Reporting Engine.

Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

(Optional) Add Archiver as Data Source

You have to carry out the following Archiver configurations to you to be able to use data from Archiver data source to generate Reports and Alerts:

Prerequisites

Ensure that you have:

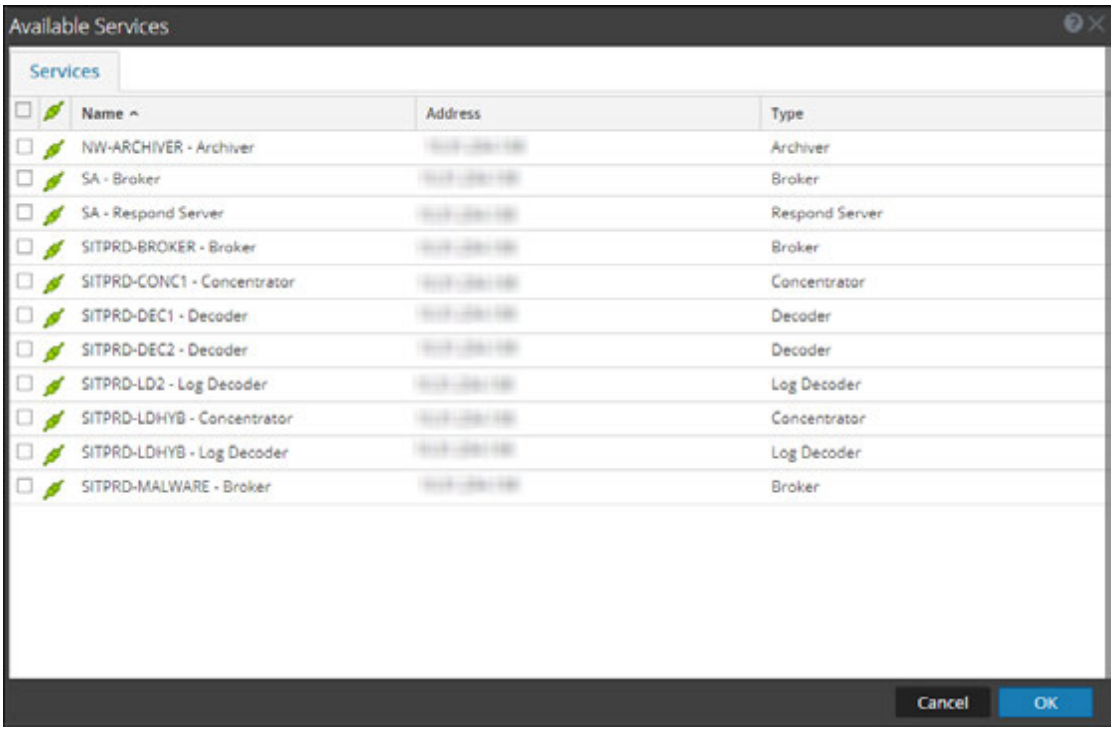
1. Installed the NetWitness Suite Archiver host in your network environment. For more information, see the *Hosts and Services Getting Started Guide*.
2. Installed and configured Log decoder in your network environment. For more information, see "Add Log Decoder as a Data Source to Archiver" in the *Archiver Configuration Guide*.
3. Reporting Engine as a service is available in your NetWitness Suite deployment.
4. Added Archiver as a service to your NetWitness Suite deployment. For more information, see "Add the Archiver Service" in the *Archiver Configuration Guide*.
5. Applied license to the Archiver service.

To add Archiver Data Source to Reporting Engine:

1. Go to **ADMIN** > **Services**.
2. In the **Services** list, select the **Reporting Engine** service.
3. Click > **View** > **Config**.

   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click + and select **Available Services**.

   The Available Services dialog is displayed.



6. Select the Archiver service and click **OK**.

   The service authentication dialog box is displayed.

   Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

7. Type the Username and Password for the Archiver.
8. Click **OK**.

   The selected Archiver is listed in the Aggregate Services pane.

(Optional) Integrate Endpoint Information Into Reports

You can use the Endpoint data by using the following instructions and adding the Endpoint information into Reports. *RSA Endpoint Integration Guide* provides an overview of Endpoint integration into RSA NetWitness Suite.

Prerequisites

Make sure that:

- You have configured the Endpoint alerts via syslog into a Log Decoder. For more information see, "Configure Endpoint Alerts Via Syslog into a Log Decoder" topic in *RSA Endpoint*

Integration Guide).

To integrate Endpoint information into Reports:

1. In **Reporting Engine**> **View**> **Config**> **Sources**.
2. Add the Concentrator that is consuming data from the Log Decoder as a data source.
   Endpoint meta is populated in Reporting Engine.
3. Run reports by selecting the appropriate meta.

(Optional) Add Collection as Data Source to Reporting Engine

You have to carry out the following Collection configurations for you to be able to use data from Collection data source to generate Reports, Charts, and Alerts:

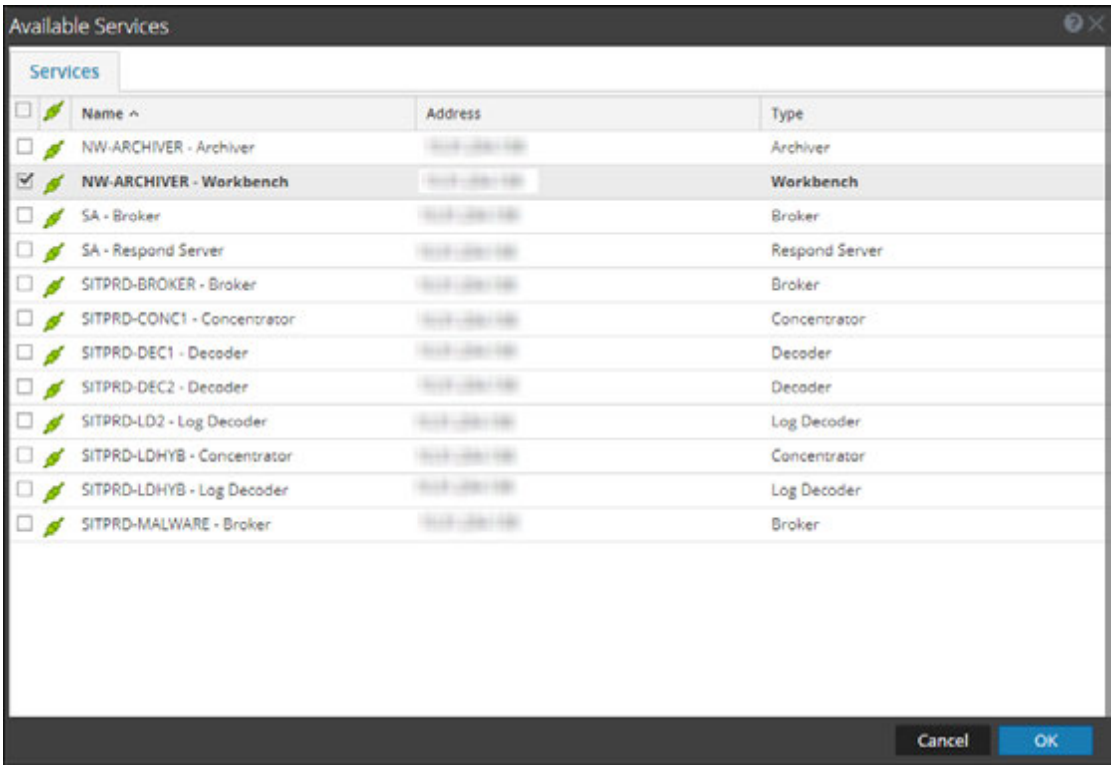
Prerequisites

Make sure that you have:

- Installed a Workbench service on a Reporting Engine host.
- Backed up data in a known location on your local host, if you are adding a collection using the data restored from the backed up data.

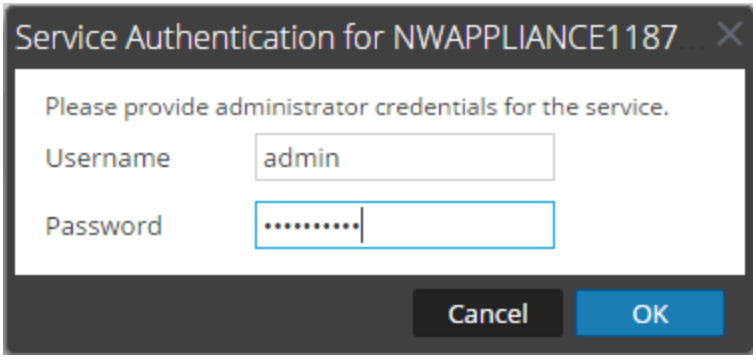
To associate a Collection as a data source with Reporting Engine:

1. Go to **ADMIN** > **Services**.
2. In the **Services** list , select a **Reporting Engine** service.
3. Click > **View** > **Config**.
   The Services Config View of Reporting Engine is displayed.
4. Select the **Sources** tab.
5. Click + and select **Available Services**.
   The Available Services dialog is displayed.



6. Select the Workbench service and click **OK**.

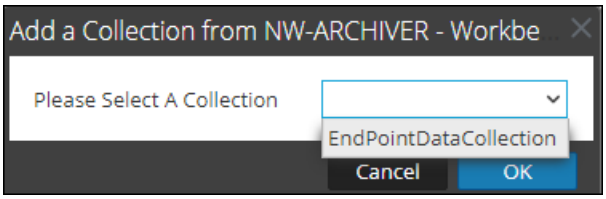
   The Service Authentication dialog for the selected service is displayed.



Note: The services with the Trust Model enabled must be added individually. You are prompted to provide a username and password for the selected service.

7. Type the username and password for admin credentials for the service.
8. Click **OK**.

   The add collection dialog is displayed.



9. Select a collection from the drop-down list and click **OK**.

   The workbench service is now added as a data source to the Reporting Engine.

Configure Data Privacy for the Reporting Engine

You can configure the data privacy for all data sources of Reporting Engine using the Sources tab of the Services > View > Config view.

With the addition of the Data Privacy feature to NetWitness Suite 11.0 and above, access to sensitive meta in NetWitness Suite Core services can be restricted by configuring separate data sources for Data Privacy Officer (DPO) users and non-DPO users, and limiting access to those data sources by assigning appropriate permissions.

In the Services Config view, you can add each Core service as two separate data sources: one with a service account having privileges equivalent to a DPO and the other with a service account having privileges equivalent to any other user. Then, to limit access to those data sources based on roles, you can assign read access or no access to those data sources for individual roles. To limit access to Warehouse data sources, you can do the same.

For more information, see Configure Data Source Permissions.

Note: A user assigned to the `Data_Privacy_Officers` role (or an equivalent custom role), can create a report, chart and alert. Also, configure a report or alert output actions in the Reporting module. In an environment where data privacy features of NetWitness Suite are enabled and one or more meta keys are configured as protected, these actions can result in the following:
- When an alert is created by a DPO user, any protected or sensitive meta involved in the alert is automatically available in Respond. This may inadvertently provide all the users of Respond module access to the sensitive meta values, regardless of their roles. One option to prevent this is to disable publishing into Respond from Reporting.
- When an Output Action is configured by a DPO user, either sensitive meta values, reports with sensitive meta values or both, may become available to target users or destinations of that Output Action, regardless of the role assigned to the target user.

It is strongly recommended that DPO users completely avoid creating alerts or configuring output actions for a report or alert in the Reporting module. If they do such configuration, the above implications must be carefully considered.

NetWitness Suite Core services (for example, Concentrator, Broker, or Archiver) support the ability to restrict meta data based on the configured user role. To make use of the data privacy feature for Reporting Engine, you can configure two separate service accounts against Core. One service account for general purpose reporting that does not include any sensitive data and the other account for privileged users with access to all data including sensitive data. The access to restricted meta data for the two service accounts is configured as part of the data privacy plan on each Core service.

In Reporting Engine, you can add each Core service as two separate data sources (one being the regular data source and the other a privileged data source) using the two separate service accounts. You can configure Reporting Engine to allow only users with privileged roles to access the sensitive data source. Hence, Reporting Engine can connect to a NWDB Data source in two ways:

- Using a service account with DPO role.
- Using a service account without a DPO role.

Note: You can also add two or multiple data sources for the same Core service.

After adding two data sources with different service accounts for the same Core service, you can configure data source permissions to manage access to these data sources. For more information, see Configure Data Source Permissions.

Note: If the content is changed to utilize the transformed meta key, the hash value of the original meta is displayed in its place when viewing reports, charts and alerts.

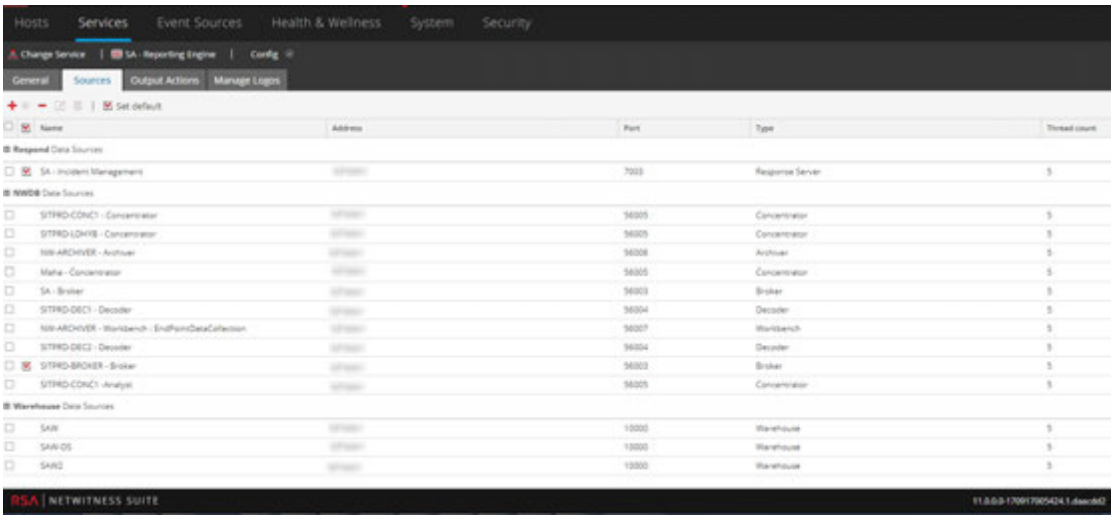
Add a NWDB Data Source with Different Service Accounts

To add a NWDB data source:

1. Go to **ADMIN** > **Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click  **View** > **Config**.

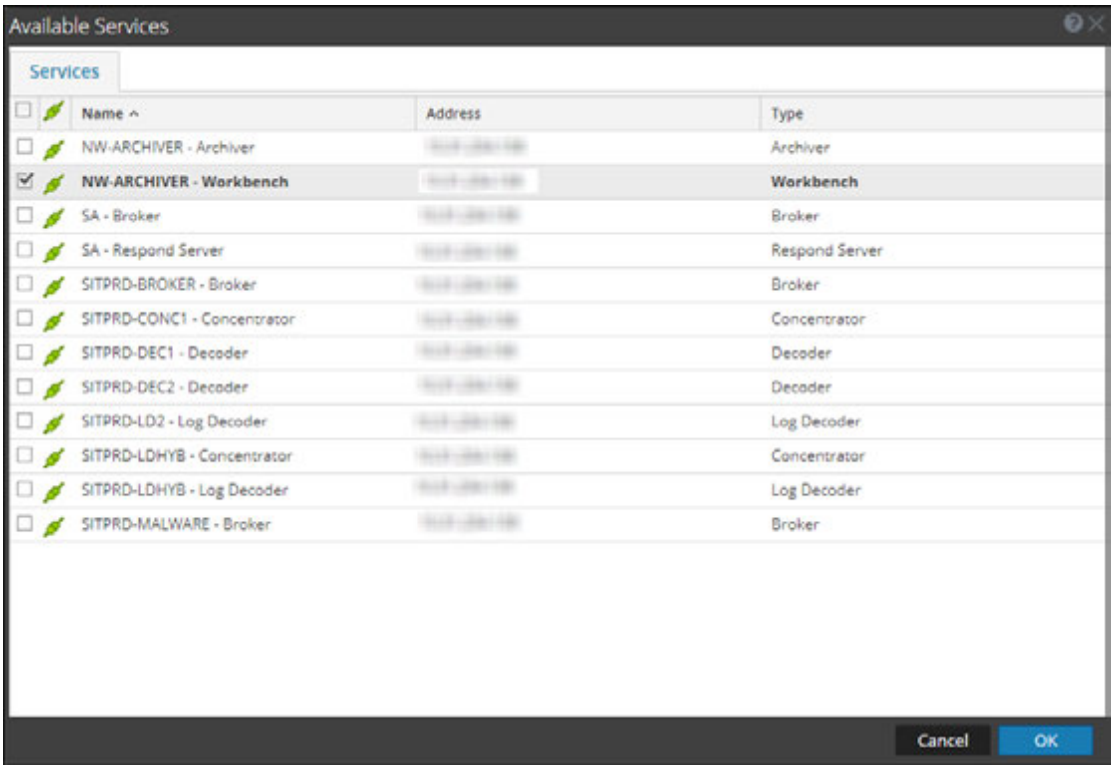
   The Services Config view of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The Services Config View is displayed.



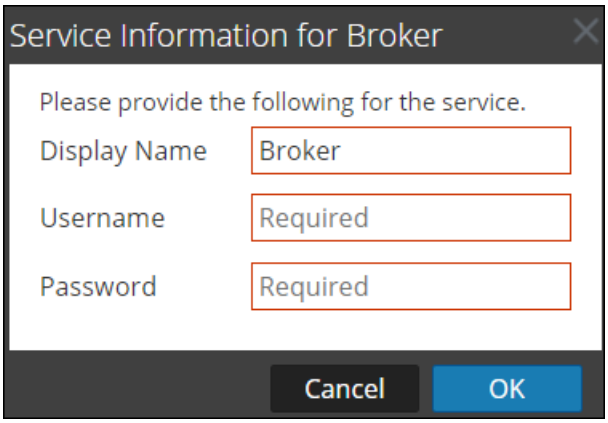
5. Click + and select Available Services.

   The Available Services dialog is displayed. All services are listed, including those that have already been added to the Reporting Engine.



6. Select the checkbox next to the service and click **OK**.

   The Service Information dialog for the selected service is displayed.



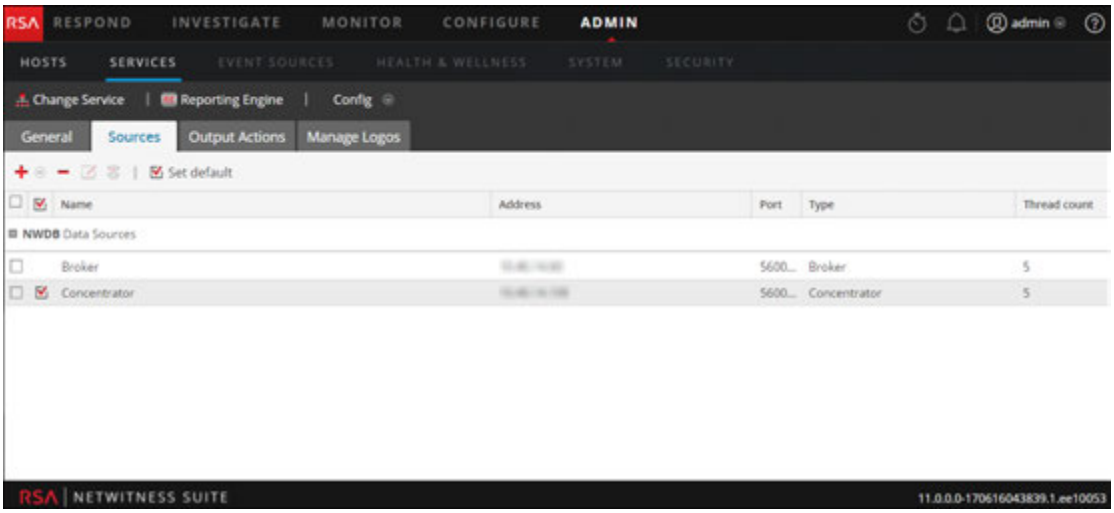
Note: NetWitness Suite prompts you to provide a username and password for the selected service. To limit access to sensitive data, DPO users must use their credentials while adding the source instead of using the admin credentials. These credentials need to be applied to the host even if using trusted connections between the NetWitness Suite server and NetWitness Suite Core hosts.

   Repeat the step for Non-DPO data source.

7. Type the username and password for the required service account.

8. Click **OK**.

   The required service is added as a data source to the Reporting Engine. Two data sources are added to Reporting Engine for the same Core device.



Configure Data Source Permissions

You can configure data source permissions using the Sources tab of the Services Config view for the Reporting Engine. This helps manage access control to the data sources by setting the data source permissions. Now, with the ability to add more than one data source for the same Core service, you can configure different permissions to each data source of the same Core service. For example, data privacy officers (DPO) can create a Warehouse source using their credentials, and that allows them to execute reports against the Warehouse while restricting everyone else from being able to use that source.

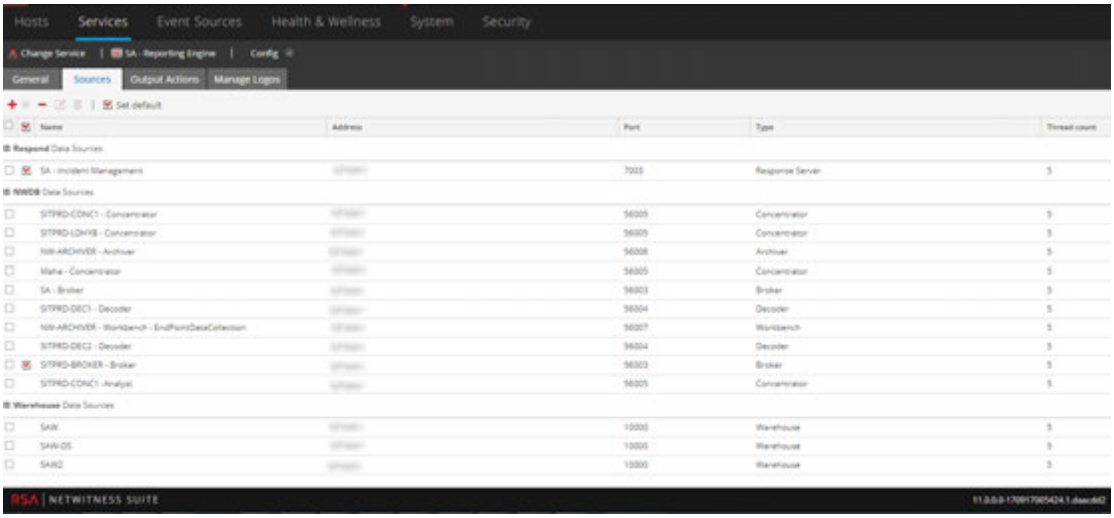
Note: In 11.0, the permissions for NWDB and Warehouse data sources are automatically set based on the permissions of the reporting objects. For example, if the role had the permissions set as **Read Only**/**Read & Write** for any reporting object in 10.5, then that role is automatically assigned read only permission for all the data sources that existed in 10.5. If no permission is set for the role, then the data source permission is automatically set to No Access.

To configure permissions to data sources:

1. Go to **ADMIN** > **Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click  > **View** > **Config**.

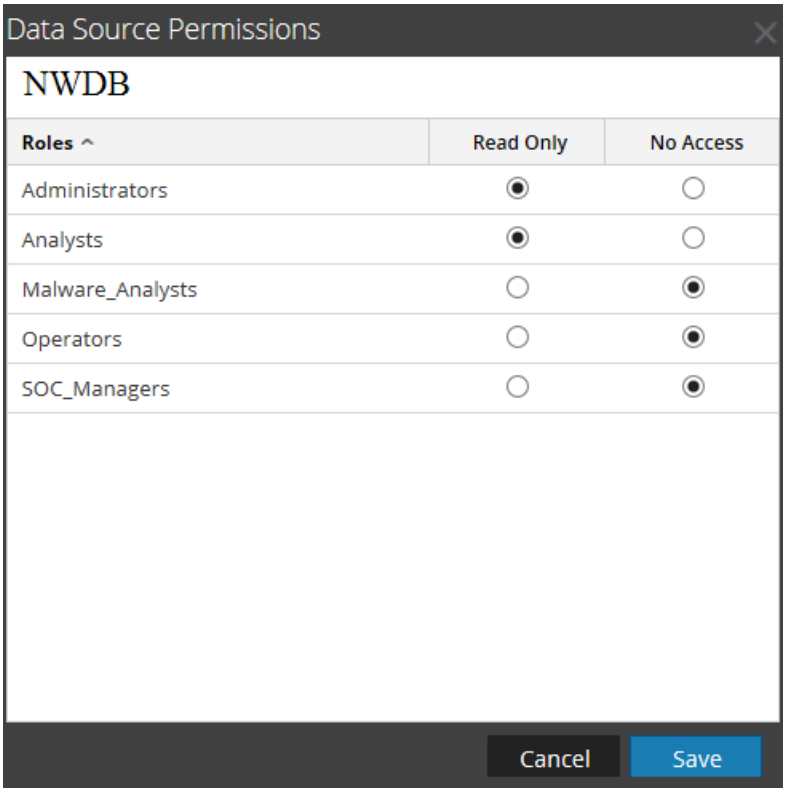
   The Services Config view of Reporting Engine is displayed.
4. Select the **Sources** tab.

   The Service Config View displays the Sources tab.



5. Select the data source for which you want to configure permissions by selecting the checkbox.
6. Click  .

   The Data Source Permissions dialog is displayed.



7. Modify the access permission for different users based on the type of service account of the data source. The permission can be either **Read Only** or **No Access**.
8. Click **Save**.

   The required permissions are configured for the data source.

For more information, see the *Reporting Guide*.

Configure Reporting Engine Settings

After you configure the Reporting Engine and required data sources based on your requirements, you can modify some of the configurations to customize your Reports, Charts, and Alerts.

To configure the settings:

1. Go to **ADMIN** > **Services**.
2. In the **Services** list, select a **Reporting Engine** service.
3. Click > **View** > **Config**.

   The Services Config View of Reporting Engine is displayed with the General tab highlighted. For more information on Reporting Engine General tab, see General Tab.
4. Edit the Reporting Engine service settings and click **Apply**.

   The service settings are configured on Reporting Engine.

Enable LDAP Authentication

To enable LDAP mode of authentication using Active Directory for HiveServer2 for Warehouse data source, follow these steps.

1. Log on to the RSA Analytics Warehouse appliance as root user.
2. Navigate to `/opt/mapr/hive/hive-0.11/conf.new/` directory. Type the following command and press ENTER:

   ```
   cd /opt/mapr/hive/hive-0.11/conf.new/
   ```
3. Edit the file `hive-site.xml`. Type the following command and press ENTER:

   ```
   vi hive-site.xml
   ```
4. Add the following properties under `<Configuration>` tag:

   ```
   <property>
       <name>hive.server2.authentication</name>
       <value>LDAP</value>
   </property>
   <property>
       <name>hive.server2.authentication.ldap.url</name>
       <value>LDAP_URL</value>
   </property>
   ```

Where `LDAP_URL` is the URL of the LDAP Server.

5. Restart HiveServer2.

Add Additional Space for Large Reports

To add additional disk space to the Reporting Engine for large reports, follow the below steps. If large compliance reports have to be generated for Warehouse, the Reporting Engine disk space might get consumed quicker than expected. In such cases, you can mount any external storage such as SAN or NAS for storing reports.

The directories that tend to fill up disk space are `resultstore` and `formattedReports` under the Reporting Engine home directory. It is recommended to move only these two directories to SAN or NAS and replace the original locations with soft links pointing to the new locations. It is also recommended to leave the remaining directories in the local disk itself for reliable and high I/O performance.

Note: The following steps assume that the Reporting Engine home directory is located at `/var/netwitness/re-server/rsa/soc/reporting-engine/` and the external storage is mounted under `/externalStorage/`. Also, the 'rsasoc' user must have read-write access to the specified external storage path.

To move disk space for the Reporting Engine to external storage:

1. Stop Reporting Engine service as a root user.

   ```
   service rsasoc_re stop
   ```

2. Switch to `rsasoc` user.

   ```
   su rsasoc
   ```

3. Change to RE home directory.

   ```
   cd /var/netwitness/re-server/rsa/soc/reporting-engine/
   ```

4. Move the resultstore directory to a mounted external storage. Type the following command and press ENTER:

   ```
   mv resultstore /externalStorage
   ```

5. Move the formatted Reports directory to a mounted external storage. Type the following command and press ENTER:

   ```
   mv formattedReports /externalStorage
   ```

6. Create a soft link for resultstore. Type the following command and press ENTER:

   ```
   ln -s /externalStorage/resultstore /var/netwitness/re-server/rsa/soc/reporting-engine/resultstore
   ```

7. Create a softlink for formattedReports. Type the following command and press ENTER:

```
ln -s /externalStorage/formattedReports /var/netwitness/re-server/rsa/soc/reporting-engine/formattedReports
```

8. Exit the `rsasoc` user.

   ```
   exit
   ```

9. Start Reporting Engine service as a root user.

   ```
   service rsasoc_re start
   ```

   Note: If the external storage is offline, you cannot perform the following tasks:
   1) Execute Reports or Reporting Alerts
   2) View existing Reports or Reporting Alerts
   However, you can create new Reporting objects such as Reports and Charts, and access Charts and Live Dashboard created for charts. Therefore, you must ensure that the external storage is reliable and has the required space.

   Additionally, if you want to store reports beyond 100 days, change the retention configuration appropriately in the Configure Reporting Engine Settings.

Accessing Reporting Engine Log Files

You can access the Reporting Engine log files which are stored in the following logs directory `/var/netwitness/re-server/rsa/soc/reporting-engine/logs/`

- Current logs in the `reporting-engine.log` file.
- Backup copies of previous logs in the `reporting-engine.log.*` file.
- All UNIX script logs in the files that have the following syntax: `reporting-engine.sh_timestamp.log` (for example, `reporting-engine.sh_20120921.log`)

The Reporting Engine rarely writes command line error messages to the **rsasoc/nohup.out** file.

The Reporting Engine appends the log messages and output written by systemd system and the commands used to start the reporting-engine to the directory `/var/log/messages`.
A `/var/log/messages` log file is a system log file so only the root user can read it.

Configuring Task Scheduler for a Reporting Engine

You can configure queues and pools in the reporting engine to schedule NWDB or Warehouse reports. For more information on Task Schedulers, see "Task Scheduler for Warehouse Reporting" in the *RSA Netwitness Suite Reporting Guide*

Prerequisites

Make sure that you have identified the following:

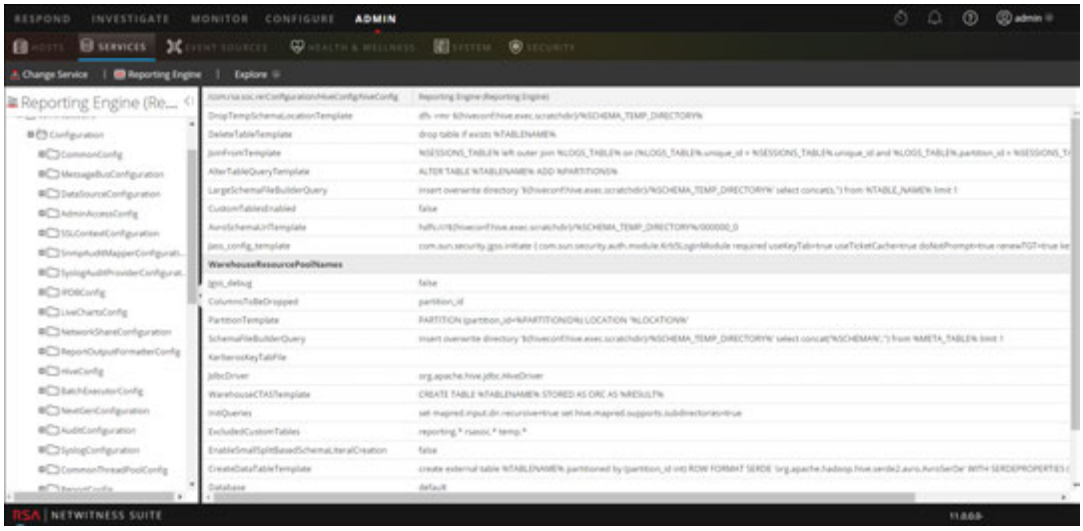
- Scheduler type and pools or queues you want to use. You can configure only one scheduler for the Reporting Engine. By default the Fair Scheduler is configured.
- Names of the queues or pools, and the resources given to each queue and pool.
- NetWitness Suite does not support multiple queues or pools per cluster. RSA recommends that you either provide unique names to queues or pools in all the clusters or use the same queue or pool names in both the clusters. If cluster size is large, there may be more than 3 pools or queues.
- If you are using an unsupported scheduler, the Reporting Engine does not set any property for the jobs that it launches.
- If the name of the pool or queue does not exist in the cluster, then Capacity Scheduler will use the default queue for the report. The Fair Scheduler may not execute the rule or it will create a new pool with the lowest share. This is based on the value specified for the Fair Scheduler property `mapred.fairscheduler.allow.undeclared.pools`.
- If you do not specify a pool or queue, the job launched by the test rule is in the `mapr` pool or the default queue. RSA recommends that you configure a pool mapr with low (around 1/10 of total capacity) share with `maxRunningJobs = 2` so that these rules do not disrupt running reports. Make sure that you do not specify this pool name for any reports.

Specify the Pools and Queues

To specify the pools and queues:

1. Go to **ADMIN** > **Services**.
2. Select **Reporting Engine** and click  > **View** > **Explore**.
3. Select **com.rsa.soc.re** > **Configuration** > **HiveConfig** > **hiveconfig** > **WarehouseResourcePoolNames**.
4. In the **WarehouseResourcePoolNames** field, enter the pool or queue names separated by spaces. For example, to configure four pools or queues with the names pool1, pool2,

wrong and default, enter the names separated by a space.



Define Reports, Charts, and Alerts

After you configure the Reporting Engine and required data source based on your requirement, you can generate your Reports, Charts, and Alerts.

How to define Reports

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Reporting module:

- **Define a Rule**
- **Test a Rule**
- **Schedule Reports**
- **Add an Alert**
- **Add a Chart**
- **Test a Chart**

For more information, see the above topics in the *RSA Netwitness Reporting Reports Guide*.

How to define Charts

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Reporting module:

- **Define a Chart and Chart Groups**
- **Test a Chart**
- **Investigate Charts**
- **Manage Charts**

For more information, see the above topics in the *RSA Netwitness Reporting Reports Guide*.

How to define Alerts

After creating the data sources and configuring the user permissions to these data sources, you can now use these data sources to perform the following tasks for Alerting module:

- **Configure Alerts**
- **Generate Alerts**
- **Add an Alert**
- **View an Alert**
- **View Alerts Schedule**
- **Investigate an Alert**

For more information, see the above topics in the *RSA Netwitness Reporting Alerting Guide*.

Configure Reporting Engine General Settings

On adding and configuring the Reporting Engine service, the system settings are defined with default values to achieve optimal results. However, you can modify and customize the Reporting Engine notifications based on your requirement by navigating to the General tab in the Services Config view for a Reporting Engine.

Access the General Tab

You need to open the General tab to configure the general parameters for Reporting Engine.

To access this view:

1. Go to **ADMIN** > **Services**.
2. In the Available Services list, select a **Reporting Engine** service.
3. Click **View** > **Config**.
4. Select the **General** tab.
5. Click **Apply** after you edit the parameters.

After you navigate to the general tab, you can modify the following parameters.

- System Configuration
- Logging Configuration
- Warehouse Analytics Output Configuration
- Warehouse Analytics Model Configuration
- Warehouse Kerberos Configuration

For more information see, General Tab for details on the configuration parameters.

References

To be able to customize and make optimum use of the service, you can modify the Reporting Engine settings in the Services Config view, which has parameters that specifically pertain to the Reporting Engine.

General Tab

The General tab for the Reporting Engine service controls several settings that can tune the performance of a service and specify the user credentials for the service. Navigate to Services > View > Config > Reporting Engine > General) These settings are used for the Reporting Engine service exclusively.

The required permission to access this view is Manage Services.

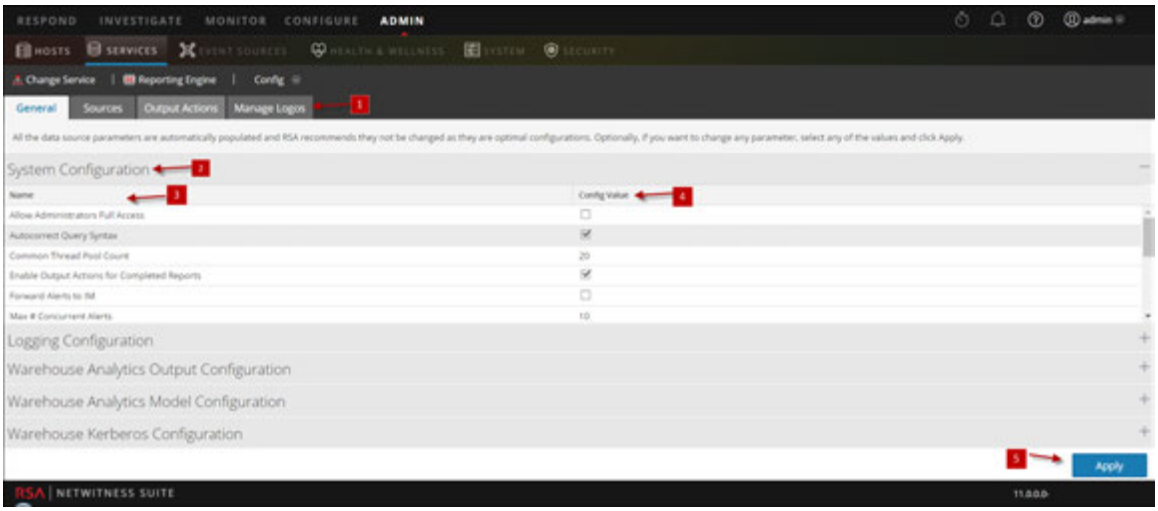
- How Reporting Engine Works

Quick Look

Here is example of the General tab where service configurations are displayed.



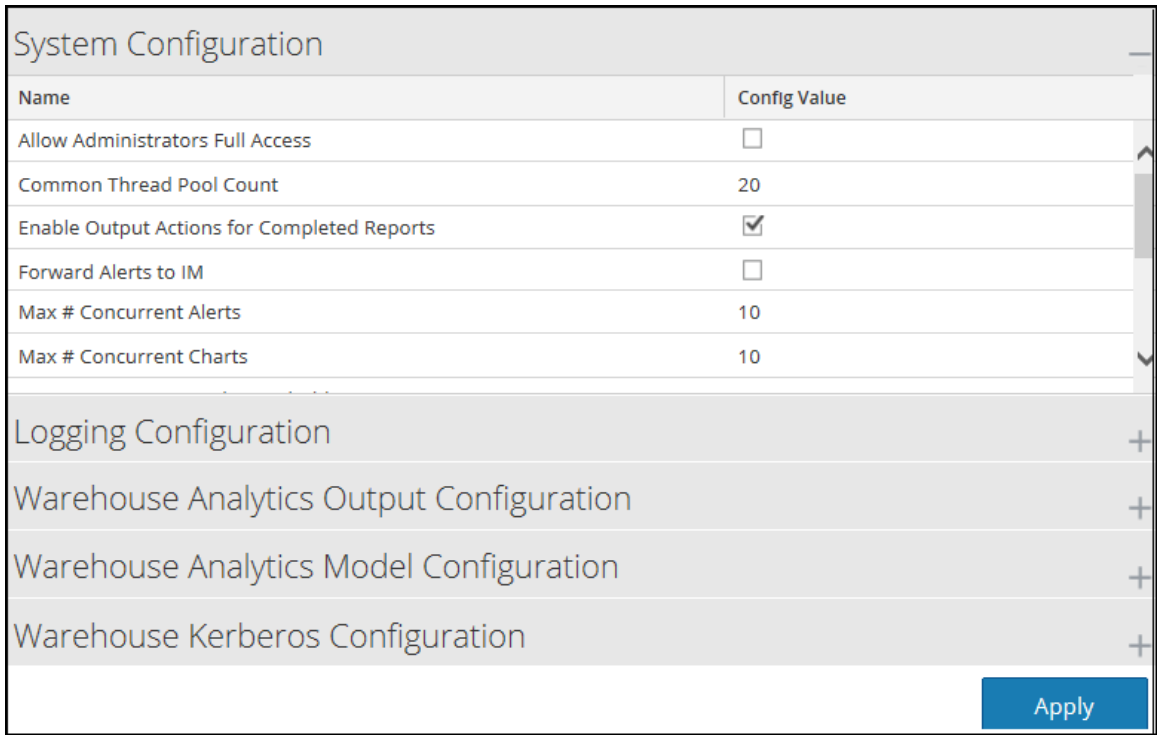
1. Displays all the available configurable tabs.
2. Displays the available configuration parameters for the system.
3. Displays the name of the parameter.
4. Displays the set values for each parameter.
5. Applies the changes.

Note: Warehouse Analytics is not supported in Netwitness Suite 11.0 release.

System Configuration

The System Configuration panel parameters for the Reporting Engine manage service configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. The default values are designed to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance.

The following figure displays the fields that can be configured in the System Configuration panel:



The following table describes the System Configuration panel features.

Name	Config Value
Allow Administrators Full Access	Select the checkbox if you want to access all the Reporting Engine objects (Reports, Rule, Charts, Schedule, and List) created by other users (non-admin). By default, this is not enabled. **Note:** If you enable the checkbox and then disable it, the access on all Reporting Engine objects that were enabled by selecting the checkbox will not be accessible. But, if you have defined the access on specific objects via Permissions window (**Reports > Manage > RE Object >** ⚙ **> Permissions**), enabling/disabling this checkbox will not have impact on these objects.
Common thread pool count	The number of thread pools assigned for executing common tasks on the Reporting Engine. A valid value is an integer (**20** default).

Name	Config Value
Enable Output Actions for Completed Reports	Select the checkbox to process the output actions only for reports with all rule executions successful. By default, this is enabled. If disabled, the output actions are processed for all scenarios (completed, partial, failure).
Forward Alerts to Respond Server	Select the checkbox to forward all the alerts to Respond. By default, this is not enabled.
Max# of Concurrent Alerts	The maximum number of alerts that can be run simultaneously. This has a direct impact on the RSA service against which the alerts are run, as each alert consumes a query thread on the RSA service. A valid value is an integer (**10** default).
Max # of Concurrent Charts	The maximum number of charts that can be run simultaneously. A valid value is an integer (**10** default).
Max # of Concurrent LookupAndAdd Queries	The maximum number of parallel LookupAndAdd Queries that can be run per NWDB rule. A valid value is an integer (**2** default). When you increase this value, for better performance, you must ensure the NWDB data source is configured to handle the parallel queries.
Max # Concurrent List Value Reports	The maximum number of list value reports per schedule that can be generated in parallel. A valid value is an integer (**1** default).
Max # List Value Reports	The maximum number of list value reports generated, irrespective of the number of values in the list. A valid value is an integer (**10000** default).
Max rows stored per Rule (Billions)	The maximum number of rows that a rule can fetch when queried. A valid value is an integer (**100** default).

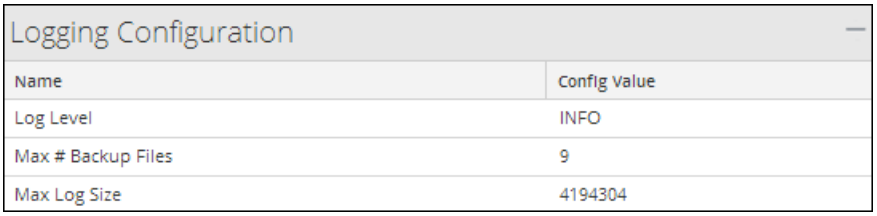
Name	Config Value
Maximum disk space threshold	The maximum disk space threshold allotted (in GB) to execute reports, alerts and charts. The initial value is configured based on the available system space.
Minimum disk space threshold	The minimum disk space threshold allotted (in percentage) required to execute reports, charts, and alerts. By default, this is value is set to 5. **Note:** Note: If the minimum threshold is reached, then the execution of reports, charts and alerts will stop even if the service is running.
NWDB Info Queries Time Out	The info queries time out in seconds for NWDB server. A valid value is an integer (**0** default).
NWDB Maximum aggregate Rows	The maximum number of rows that is returned when an aggregation is used in the NWDB rule. A valid value is an integer (**1000** default).
NWDB Query Time out	The time out in seconds for NWDB server to time out the rule execution, if it cannot process the result in configured time. The default value is set to 0 which implies that there is no time out. A valid value is an integer.
Process output actions for successful reports only	Select this checkbox to process output actions only for reports whose all rule executions are successful. When you de-select this checkbox, output action will be triggered for partial, completed, and failed reports. **Note:** This is applicable for all output actions except for dynamic list output actions.
Retain Alert history for # days	The maximum number of days to retain the alert history and alert status. A valid value is an integer (**100** default).

Name	Config Value
Retain Chart history for # days	The maximum number of days to retain the chart history and chart status. A valid value is an integer (**30** default).
Retain Report history for # days	The maximum number of days the system retains report history and report status. A valid value is an integer (**100** default).
Schedule Thread pool count	The number of thread pools assigned for scheduled tasks (for example, clearing history) on the Reporting Engine. A valid value is an integer (**5** default).

Logging Configuration

The Logging Configuration panel parameters of the Reporting Engine manages the logging configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. RSA designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance of the Reporting Engine.

The following figure displays the fields that can be configured in the Logging Configuration panel.



The following table describes the Logging Configuration panel features.

Name	Config Value
Log Level	The logging level that determines the scope of information included in log files. Possible values are: • ERROR • WARN • INFO (default) • DEBUG • ALL
Maximum # Backup Files	The maximum number of backup log files the system retains. A valid value is an integer (**9** default).
Max Log Size	The maximum size (in bytes) of the primary log file. A valid value is an integer (**4194304** default).

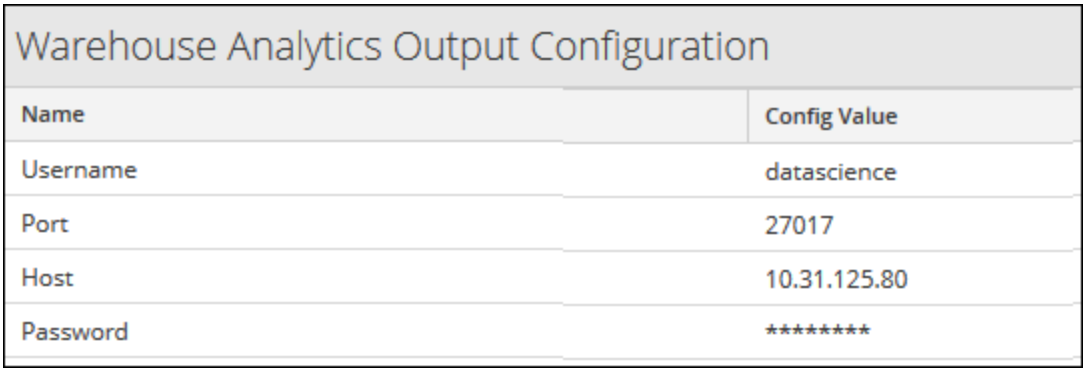
For more information on Reporting Engine logging, see Accessing Reporting Engine Log Files.

Warehouse Analytics Output Configuration

Note: Warehouse Analytics is not supported in Netwitness Suite 11.0 release.

The Warehouse Analytics Output Configuration panel provides a way to specify the Warehouse Analytics Output configuration on this Reporting Engine.

The following figure displays the fields that can be configured in the Warehouse Analytics Output Configuration panel:



After an upgrade, make sure you update the centralized **Mongo DB** details to be able to use Warehouse Analytics.

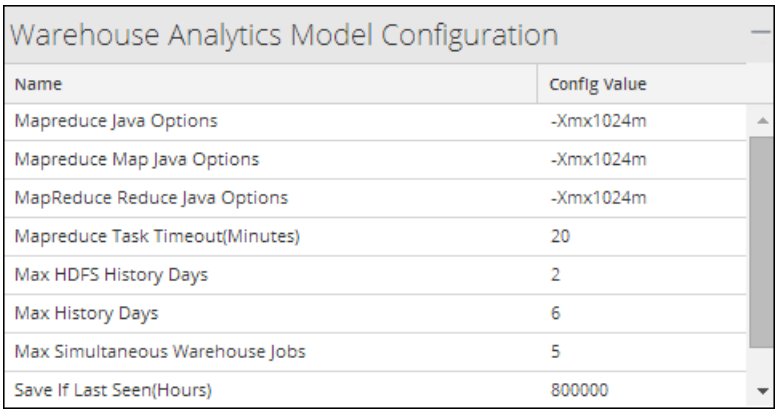
The following table describes the Warehouse Analytics Output Configuration panel features.

Name	Config Value
Username	The username for the warehouse analytics user.
Port	The port of the Mongo DB used by warehouse analytics.
Host	The host of the Mongo DB used by warehouse analytics.
Password	The password for the warehouse analytics user.

Warehouse Analytics Model Configuration

The Warehouse Analytics Model Configuration panel provides a way to specify the Warehouse Analytics Model configuration on this Reporting Engine.

The following figure shows the fields that can be configured in the Warehouse Analytics Model Configuration panel:



The following table describes the Warehouse Analytics Model Configuration panel features:

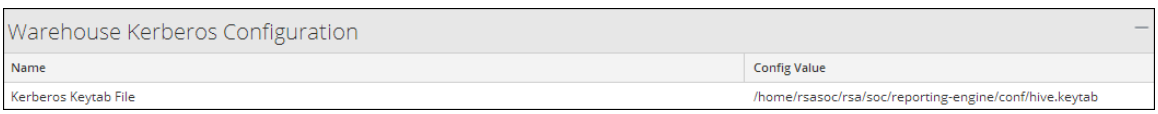
Name	Config Value
Mapreduce Java Options	The JVM Parameters for Hadoop MapReduce task tracker child JVM. By default, the value is **-Xmx1024m**.
Mapreduce Map Java Options	The parameter which controls the JVM parameters for Map jobs inside the Hadoop cluster. By default, the value is **-Xmx1024m**.

Name	Config Value
MapReduce Reduce Java Options	The parameter which controls the JVM parameters for Reduce jobs inside the Hadoop cluster. By default, the value is **-Xmx1024m**.
Mapreduce Task Timeout (Minutes)	The number of minutes before a task is terminated when a MapReduce framework titles it as non-responsive or idle. A valid value is an integer (**20** default).
Max HDFS History Days	The maximum number of days to maintain the temporary and output files of the job in HDFS. A valid value is an integer (**2** default).
Max History Days	The maximum number of days to maintain the job output in Mongo DB. A valid value is an integer (**6** default).
Max Simultaneous Warehouse Jobs	The parameter which controls the maximum number of parallel jobs executed through the Warehouse Analytics framework. A valid value is an integer (**1** default).
Save If Last Seen (Hours)	The parameter to save the keys from the job output is they were not seen in the last 'n' hours. A valid value is an integer (**800000** default).
Threshold Score	The parameter to save the keys from the job output to watchlists for use by ESA only if the score is greater than 'n'. A valid value is an integer (**55** default).

Warehouse Kerberos Configuration

The Warehouse Kerberos Configuration panel provides a way to specify the Kerberos Keytab file on this Reporting Engine.

The following figure displays the field that can be configured in the Warehouse Kerberos Configuration panel:



The following table describes the Kerberos Configuration panel features:

Name	Config Value
Kerberos Keytab File	The Kerberos keytab file location. For example, `/var/netwitness/re-server/rsa/soc/reporting-engine/conf/hive.keytab`.

The default Kerberos configuration file is located at, `/etc/kbr5.conf` in the Reporting Engine. You can modify the configuration file to provide details for Kerberos realms and other parameters related to Kerberos.

Added the host name (or FQDN) and IP address of the Horton Works nodes and Warehouse Connector to the DNS server. If the DNS server is not configured, add the host name (or FQDN) and IP address of the Horton Works nodes and Warehouse Connector to the `/etc/hosts` file in the host on which the Warehouse Connector service is installed.

Sources Tab

The services configuration parameters are available in the Sources tab of the Services Config view for the Reporting Engine. The Sources tab for the Reporting Engine service in the Services Config view controls that data sources associated with a Reporting Engine. The Source tab consists of a single panel with a toolbar and a grid that lists the data sources associated with the Reporting Engine.

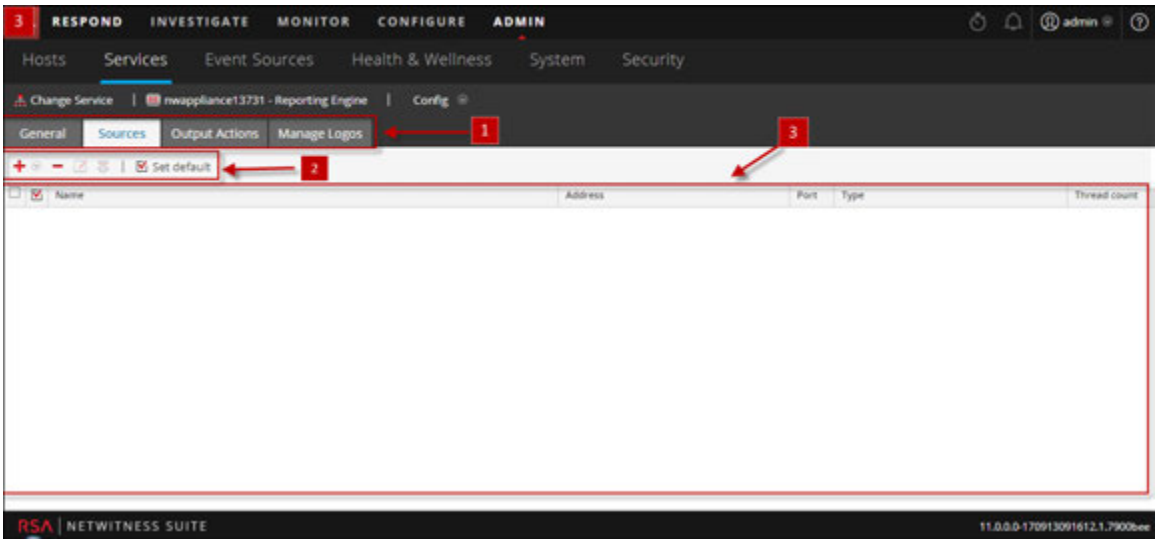
Related Topics

- How Reporting Engine Works

Quick Look

Here is example of the Sources tab where the available services are displayed.



1 Displays all the available configurable tabs.

2 Displays the available configuration parameters for the selected service .

3 Displays the field parameters for the selected service.

The data sources available to the Reporting Engine for which you are defining reports, charts and defining alerts are:

- **NWDB Data Sources** - The NetWitness Database (NWDB) data sources are Decoders, Log Decoders, Brokers, Concentrators, Archiver, and Collection.

  Note: When a data privacy plan has been implemented to limit access to sensitive data on a data source, you must configure different service accounts in Reporting Engine for privileged and non-privileged users. To configure different service accounts for data privacy, you can add more than one NWDB data source. This procedure is available under Configure Reporting Engine Settings.

- **Warehouse Data Sources** - The Warehouse data sources are Horton Works and MapR.
- **Respond Data Sources** - Respond is used to generate reports on alerts and incidents. The Respond data sources are Reporting Engine, ESA, Malware, EndPoint, and Web Threat Detection. Respond is used to store the alerts and incidents reports.

If you set a source as the default data source, NetWitness Suite uses that source when you create reports and alerts unless you choose to override it with one of the other sources listed in this tab.

Note: You can manage access control to NWDB and Warehouse Data Sources. For more information, see Configure Reporting Engine Settings.

Features

You can perform the following actions on the Sources tab:

Icon	Actions
	This option adds new services as data sources for Reporting Engine. Add existing services (Archiver, Workbench, and Collection) as data sources for Reporting Engine.
	This option removes data sources from a Reporting Engine.
	This option configures the Data Source Permissions. This is enabled only for NWDB and Warehouse Data Sources. For more information, see Configure Data Source Permissions.
	This option sets the default data sources for a Reporting Engine. This is the source to which NetWitness Suite defaults in the **Data source** field of the following views: • Rule Definition view. • Create or Modify Alert view.

The NetWitness Suite data sources are listed under the different categories as follows:

- NWDB Data Sources category displays the NetWitness data sources.
- Warehouse Data Sources category displays the Warehouse data sources.

Column	Description
	Clicking the check box selects the data source. After you select it, you can use toolbar to remove the source or set the source as the default.
Name	Displays the name of the data source.
Address	Displays the IP Address of the data source.
Port	Displays the port of the data source.
Type	Displays the service type of the data source.

Column	Description
Thread Count	Displays the thread pool size used for executing rules on the data source.

Output Actions Tab

You can configure output actions for a Reporting Engine to determine the format you want the data to be presented to you based on your requirements. The service configuration parameters are available in the Output Actions tab of the Services Config view configured for a report or an alert execution. This tab consists of the following panels:

- NetWitness Suite Configuration
- Simple Mail Transfer Protocol (SMTP)
- Simple Network Management Protocol (SNMP)
- Syslog
- Simple File Transfer Protocol (SFTP)
- Uniform Resource Locator (URL)
- Network Share

For instance, Syslog output action is used specifically for Reporting Engine Alerts, whereas, SFTP, URL, and Network Share output action is used specifically for Reporting Engine Reports.

You can configure the required permission to access this view in Manage Services.

You must ensure that the Reporting Engine is up and running and the data source from which you want to generate a report is configured in the NetWitness Suite.

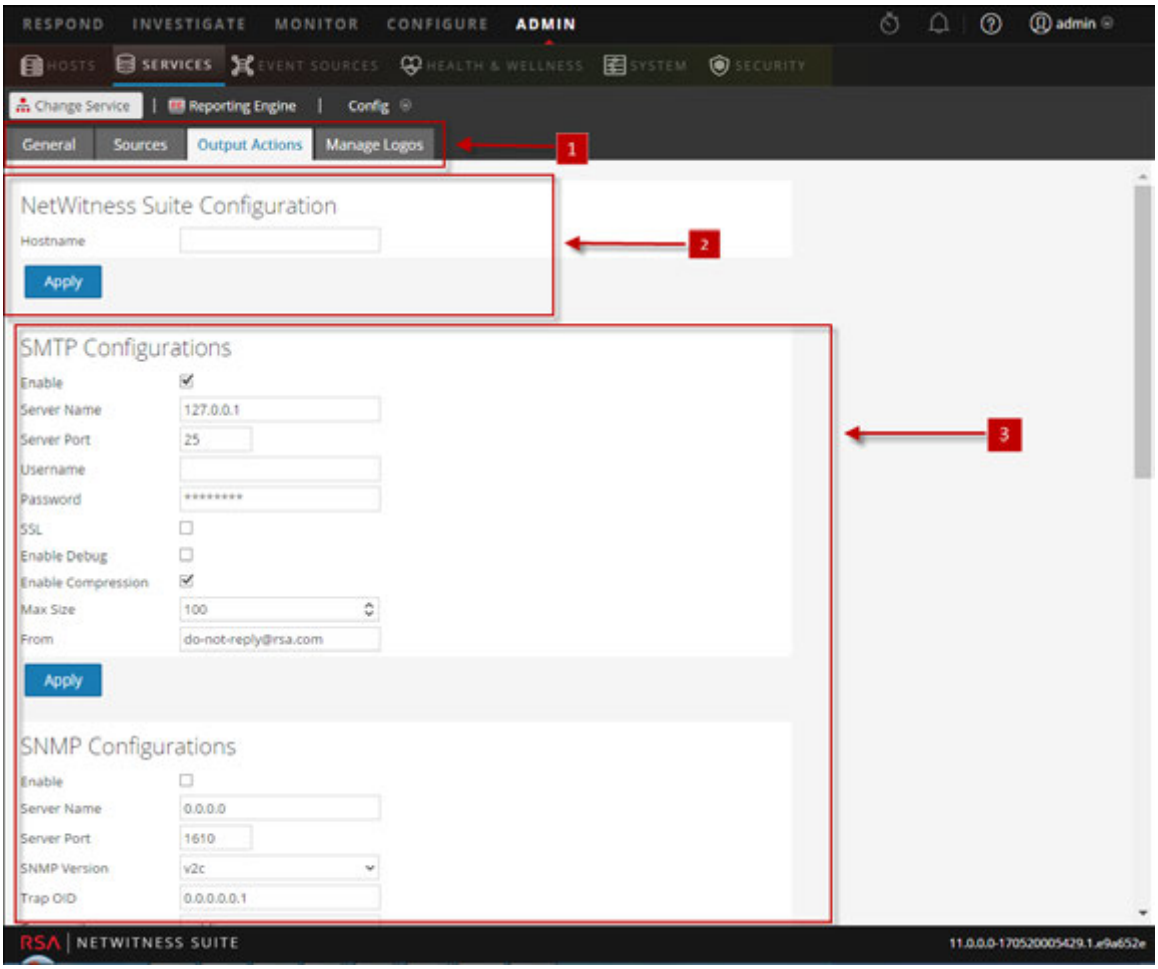
Related Topics

- How Reporting Engine Works

Quick Look



1 Displays all the available configurable tabs.

2 Displays the Netwitness Suite configuration host.

3 Displays all the types of output action that can be configured.

NetWitness Suite Configuration

The following figure shows the NetWitness Suite Configuration on the Output Actions Tab.

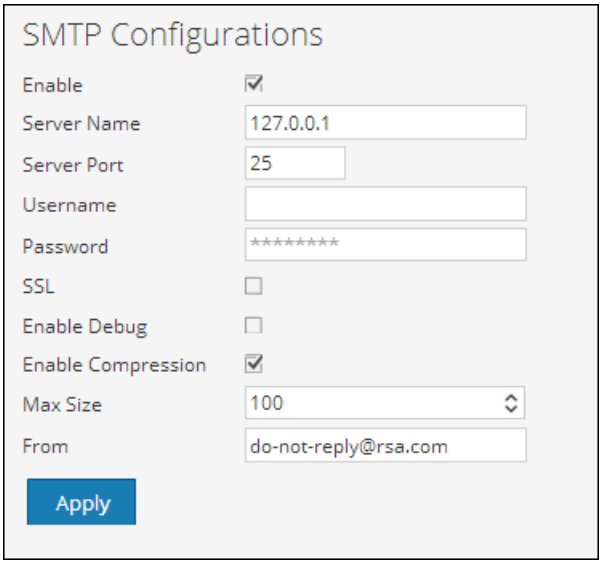
The following parameters identify the NetWitness Suite host that is associated with the Reporting Engine.

Name	Config Value
Host Name	IP Address or Hostname of the NetWitness Suite server. You must specify this parameter for all kind of deployments so that you can refer to this address to create investigation links to NetWitness Suite from Reports, Alerts, and so on. The NetWitness Suite uses this parameter to correctly generate: • SMTP Output Action • SNMP Output Action • Syslog Output Action • SFTP Output Action • URL Output Action • Network Share Output Action • Hyperlinks for meta values in Report PDFs
Apply	Update the configuration.

SMTP

After an execution is completed, an email notification is sent to the user based on the SMTP configuration.

The following figure shows the SMTP Configuration on the Output Actions Tab.



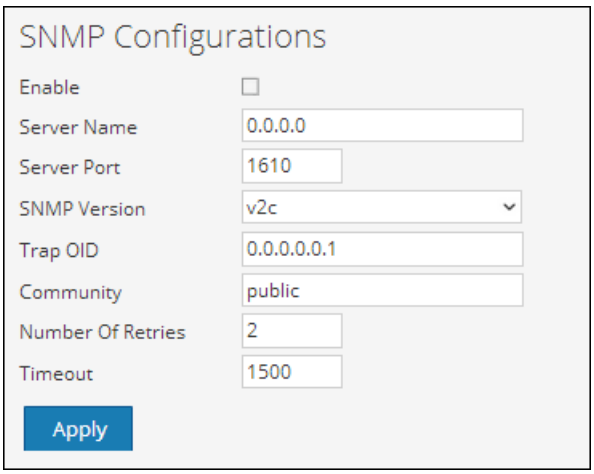
The following parameters manage SMTP (email) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
Enable	Check this box to enable SMTP as an output action for both alert and report from this Reporting Engine. By default, this value is enabled.
Server Name	Specify the hostname or IP Address of the server on which the target SMTP server runs. Default value is 0.0.0.0.
Server Port	Specify the SMTP server port number. Default value is 25.
Username	Specify the username of your SMTP account. Default value is blank. Password Specify
Password	Specify the password of your SMTP account.
SSL	Check this box to use Secure Socket Layer (SSL) to communicate with the SMTP server. Default value is do not use SSL.
Enable Debug	Check this box to enable debugging. Default value is do not enable debug.
Enable Compression	Check this box to enable compression. Default value is enable compression. If this value is enabled, the output files will have `.zip` extension.
Max Size	Specify the maximum size of attachments that can be sent. Default value is 100.
From	Specify the email address from which Security Analytics sends all messages. Default value is `do-not-reply@rsa.com`.
Apply	Update the configuration.

SNMP

After an execution is completed, a trap notification is sent to the user based on the SNMP configuration.

The following figure shows the SNMP Configuration on the Output Actions Tab.



The following parameters manage SNMP (messages to network-attached services) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, default values are in effect. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

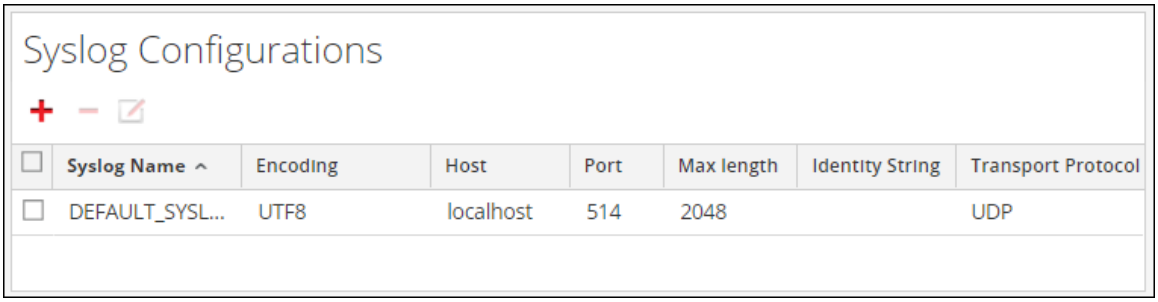
Name	Config Value
Enable	Check this box to enable SNMP output action as an output for alert messages from this Reporting Engine. Default value is Disable.
Server Name	Specify the hostname or IP Address of the server on which the target SNMP server runs. Default value is **0.0.0.0**.
Server Port	Specify the port number of the server on which the target SNMP server listens for faults and exceptions. Default value is **1610**.
SNMP Version	Specify the version number of the SNMP protocol NetWitness Suite uses to send SNMP traps.
Trap OID	Specify the object identification number that identifies the type of trap to send. Default value is **0.0.0.0.0.1**.
Community	Specify the SNMP group to which NetWitness Suite belongs. The default value is **public**.
Number Of Retries	Specify the maximum number of times NetWitness Suite tries to resend the alert message through SNMP. Default value is **2**.

Name	Config Value
Timeout	Specify the number of seconds after which NetWitness Suite times out (stops trying to send SNMP alerts). Default value is **1500**.
Apply	Update the configuration.

Syslog

After an execution is completed, all notifications are sent via Syslog messages to a particular host based on the Syslog configuration. Multiple Syslog servers can be configured on the Syslog Configuration panel.

The following figure displays the Syslog Configuration on the Output Actions Tab.



The following parameters manage syslog output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
Syslog Name	The name of the Syslog configuration. **Note:** You cannot create a Syslog configuration with a name that already exists in the Reporting Engine Syslog configuration list.
Encoding	Specify the internationalization encoding for Syslog messages. Default value is **UTF8**.
Server Name	Specify the hostname or IP Address of the server on which the target Syslog process runs. Default value is blank.

Name	Config Value
Server Port	Specify the port number of the server on which the target Syslog server listens for faults and exceptions. Default value is **514**.
Max Length	Specify the maximum size (in bytes) of each Syslog alert message. Default value is **2048**. If **UDP** is the transport type and the Syslog message size is greater than 1024 bytes, you must configure a Syslog server that supports message sizes greater than 1024 bytes.
Identity String	Specify the string NetWitness Suite inserts as a prefix in all Syslog alert messages. Default value is blank.
Include Local Hostname	Check this box to include the local hostname in all Syslog alert messages. Default value is do not include local hostname.
Truncate Message	Check this box to truncate all Syslog alert messages. Default value is do not truncate Syslog messages.
Use Identity	Check this box to use the IDENT protocol. Default value is does not use this protocol.
Include Local Timestamp	Check this box to include the local timestamp in all Syslog alert messages. Default value is do not include local timestamp.
Transport Protocol	Specify the transport type for Syslog message delivery. There are three parts to the Syslog transport type: UDP, TCP, and SECURE_TCP. Default value is **UDP**.
Syslog Message Delimiter	Specify the delimiter for the Syslog message. There are three delimiters: CR, LF, and CRLF. By default the value is **CR**. **Note:** This field populates when you select TCP or SECURE_TCP as the transport protocol.
Trust Store Password	Specify the password for the Trust store. **Note:** This field populates when you select SECURE_TCP as the transport protocol.

Name	Config Value
Key Store Password	Specify the password for the Key store. **Note:** This field populates when you select SECURE_TCP as the transport protocol.
Apply	Save the configuration.

SFTP

After an execution is completed, you can send or transfer files to a remote location based on the SFTP configuration.

The following figure displays the SFTP Configuration on the Output Actions Tab.

The following parameters manage SFTP (file transfer to a local drive) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

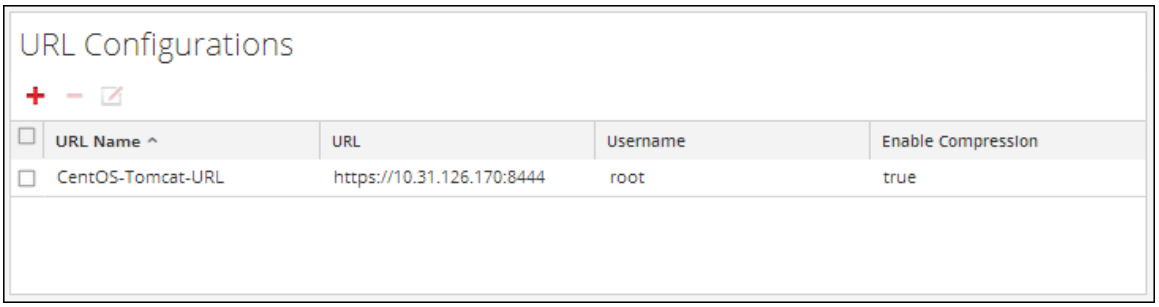
Name	Config Value
SFTP Name	The name of the SFTP configuration. **Note:** You cannot create an SFTP configuration with a name that already exists in the Reporting Engine SFTP configuration list.
Host	The IP Address or Hostname of the Reporting Engine server associated with the file transfer.
Port	If you want to use a different port than the default port, enter a port number. Default value is **22**.

Name	Config Value
Username	Specify the username for the SFTP configuration.
Password	Specify the password for the SFTP configuration.
Custom Folder	Select an SFTP location where you want to transfer the file to. You can use the pre-defined Windows or Linux directory structure in the custom folder path. For example, **/root/Downloaded_Files**. **Note:** If the directory does not exist, RE will create the directory in the custom folder path and copy files to this directory.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

URL

After an execution is completed, the output files are published to a URL based on the URL configuration.

The following figure shows the URL Configuration on the Output Actions Tab.



The following parameters manage URL (file transfer to a URL) output action configuration for a Reporting Engine service. When you add an Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the Config Values of these parameters according to the requirements of your enterprise.

Name	Config Value
URL Name	The name of the URL configuration. **Note:** You cannot create a URL configuration with a name that already exists in the Reporting Engine URL configuration list.

Name	Config Value
URL	The URL address associated with the file transfer.
Username	Specify the username for the URL configuration.
Password	Specify the password for the URL configuration.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

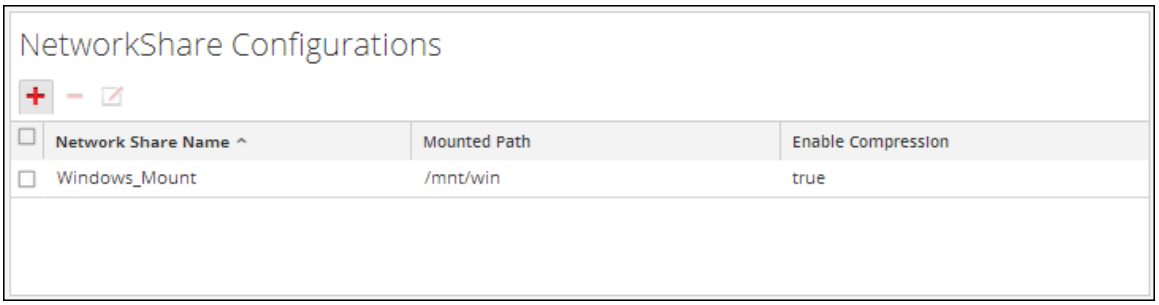
After the URL is configured, the files will be copied under the "URL_OUTPUT_ACTION" directory and the following parameters are sent to the server along with the compressed file.

Name	Config Value
filename	The name of the file.
filesize	The file size in bytes.
filetype	The file type associated with the file.
filechecksum	The number computed from a file that can be used to confirm that this is the one you expect and has been downloaded and stored properly.
hashingalgorithm	The hashing algorithm used to calculate the file checksum.
reportname	The name of the downloaded report.
executionid	The execution id associated with the report execution.
reportexecutionstarttime	The start time the report was executed.
status	The report creation status.
status description	The status description.

Network Share

After an execution is completed, you can transfer the output files to a mounted path or shared location based on the Network Share configuration.

The following figure shows the Network Share Configuration on the Output Actions Tab.



The following parameters manage Network Share (file transfer to a shared location on the network) output action configuration for a Reporting Engine service. When you add a Reporting Engine service, you can define values for this output configuration, as no default values are available for this configuration. You must modify the **Config Values** of these parameters according to the requirements of your enterprise.

Name	Config Value
Network Share Name	The name of the Network Share. **Note:** You cannot create a Network Share configuration with a name that already exists in the Reporting Engine Network Share configuration list.
Mounted Path	The path (location) associated with the file transfer. You can use the pre-defined Linux directory structure in the mounted path. For example, **/mnt/win**. **Note:** The 'rsasoc' user must have read-write access to the specified Network Share mounted path.
	Click to view how the mounted path is created. This pop-up notifies that you must manually create the mounted path.
Enable Compression	Select this checkbox to enable compression. Default value is enable compression. If this value is enabled, the output files will have ".zip" extension.

The following table lists the common operations you can perform in the Syslog, SFTP, URL and Network Share sections.

Operation	Description
+	Create a Syslog, SFTP, URL and Network Share configuration.

Operation	Description
	Delete a Syslog, SFTP, URL and Network Share configuration.
	Edit a Syslog, SFTP, URL and Network Share configuration.

Manage Logos Tab

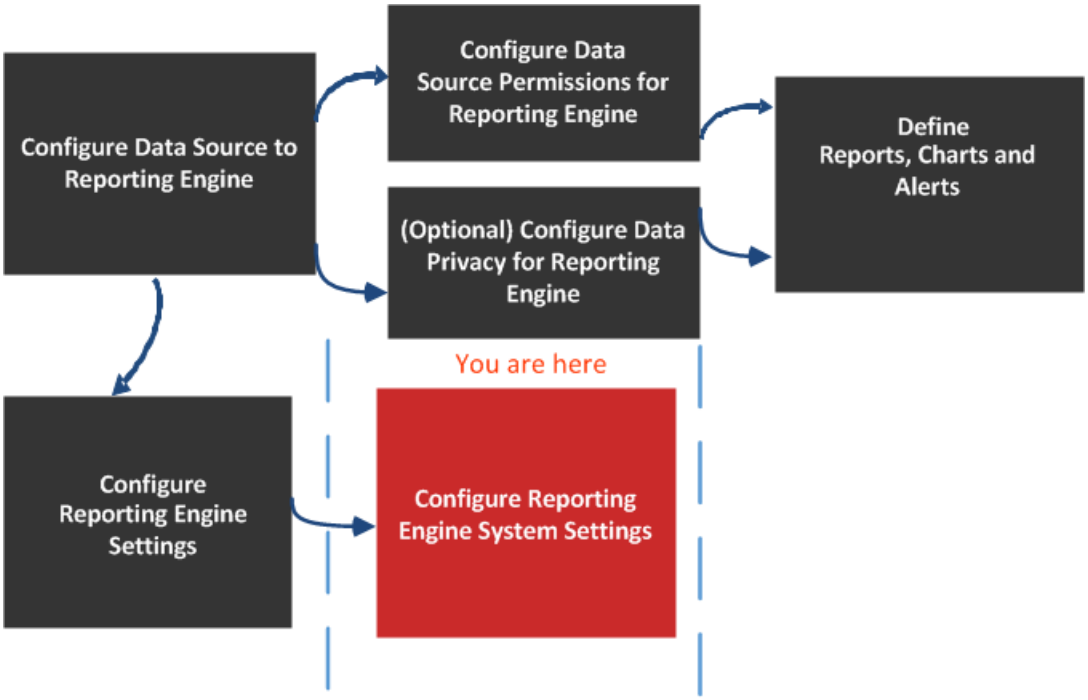
The Manage Logos option available in the **Services Config View** > **Manage Logos** tab, helps you to manage the logos associated with the Reporting Engine. The Manage Logos tab consists of a single panel with a toolbar and a grid that lists the logos.

You can upload the logos that you want to use in your report. After you upload the logo, you can set any logo as a default logo which will be automatically used in all the scheduled reports. You can choose to override the default logo with any other logo listed in this tab when you schedule a report. For more information, see "Select a Logo Dialog" topic in the *Reporting Guide*.

The supported image formats are:

- .jpg
- .png
- .gif

Workflow



What do you want to do?

Role	I want to...	Refer to...
Administrator	Configure Data Source to Reporting Engine	Configure the Data Sources
Administrator	Configure Data Source Permissions for Reporting Engine	Configure Data Source Permissions
Administrator	Configure Data Privacy for Reporting Engine	Configure Data Privacy for the Reporting Engine
Administrator	Define Reports, Charts, and Alerts	Define Reports, Charts, and Alerts
Administrator	Configure Reporting Engine Settings	Configure Reporting Engine Settings
Administrator / SOC Manager	Add, or delete logos*	Configure Reporting Engine General Settings
Administrator / SOC Manager	View the list of logos*	Configure Reporting Engine General Settings
Administrator / SOC Manager	Set a logo as default*	Configure Reporting Engine General Settings

*You can complete these tasks here.

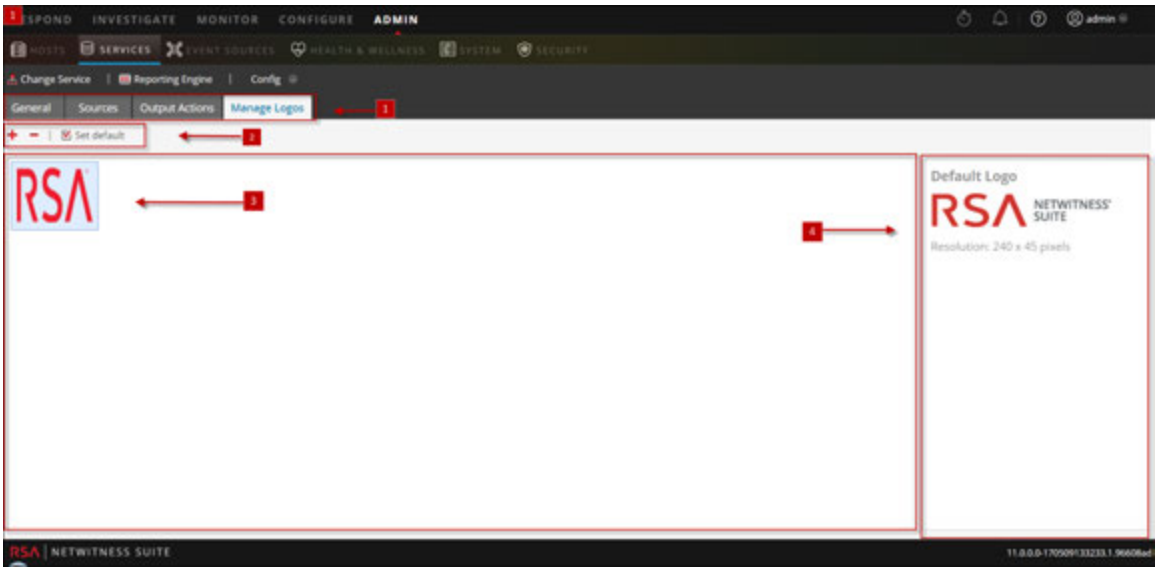
- How Reporting Engine Works

Quick Look



Note: The logo to be uploaded should not exceed 500 KB. The required permission to access this view is Manage Services.

1. Displays all the available configurable tabs.
2. Displays edit actions.
3. Displays all the logos that have been used
4. Displays the default logo used.

You can perform the following actions on the Manage Logos Tab.

Icon	Actions
+	Add new logos from the local directory of the system to the Reporting Engine. **Note:** The logo size cannot exceed 500 KB. The logos chosen must be of the following file types: * .jpg * .gif * .png

Icon	Actions
	Removes logos from the Reporting Engine. **Note:** By performing (Ctrl+click), you can select multiple logos to delete.
	Sets the default logo for a Reporting Engine. This is the logo NetWitness Suite defaults to in the **Log** panel of the Schedule a Report view. **Note:** If no default logo is selected, the RSA logo is displayed.

How Warehouse Connector Works

Warehouse Connector collects meta and events from Decoder and Log Decoder and writes them in AVRO format into a Hadoop-based distributed computing system. You can set up Warehouse Connector as a service on existing Log Decoders or Decoders.

The Warehouse Connector contains the following components:

- Data Source
- Destination
- Data Stream

Data Source

A data source is the service from which the Warehouse Connector collects data to store in the destination. The supported data sources are Log Decoder and Decoder services. The Log Decoder collects log events and the Decoder collects packet and meta exclusively.

Destination

Destination is the Hadoop-based distributed computing system that collects, manages, and enables reporting on security data. The following are the supported destinations:

- RSA NetWitness Warehouse (MapR) deployments
- HortonWorks Data Platform
- Any Hadoop-based distributed computing system that supports WebHDFS or NFS mounting of HDFS file systems.
    - Example: Commercial MapR M5 Enterprise Edition for Apache Hadoop

Data Streams

A data stream is a logical connection between the data source and destination. You can have multiple streams for different subsets of data collected. You can setup streams to segregate data from multiple Decoder and Log Decoder services. You can create a stream with multiple data sources and a single destination or with a single data source and destination.

The Warehouse Connector does the following:

- Aggregates session and raw log data from Decoders and Log Decoders.
- Transfers the aggregated data into supported destinations like Hadoop based deployments.
- Serializes the aggregated data that includes both schema and data into AVRO format.

In addition the Warehouse Connector also supports the following:

Meta Filters

Meta filters enables you to filter the meta keys that should be written into the Warehouse. For more information, see Specify Meta Filters.

Support for Multi-Valued Meta Keys

RSA NetWitness Warehouse supports multi-valued meta keys. The multi-valued meta keys is the meta field with the array type. You can use the meta keys library to determine the meta fields of type array and write HIVE queries with the correct syntax for arrays. By default, the following meta keys are treated as multi-valued and are defined in the file, **multivalue-bootstrap.xml** located at **/etc/netwitness/ng** in the Warehouse Connector:

- alias.host
- action
- username
- alias.ip
- alias.ipv6
- email
- device.group
- event.class

Checksum Validation

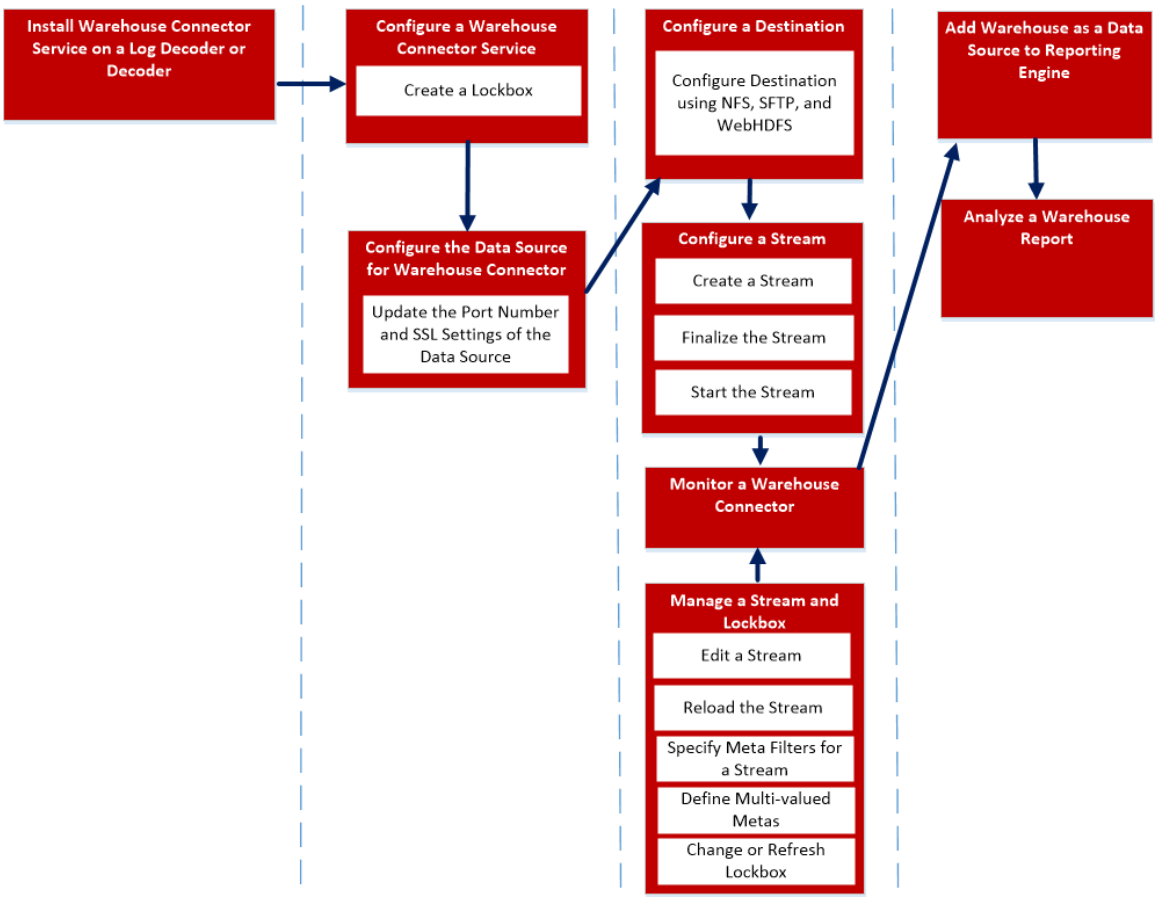
Warehouse Connector enables you to validate the file integrity of the AVRO files that are transferred from the Warehouse Connector to the data destinations. You need to enable checksum validation while you configure the Warehouse Connector.

Lockbox Support

Lockbox provides an encrypted file that Warehouse Connector uses to store and protect sensitive data. You need to create the lockbox by providing a lockbox password while configuring the Warehouse Connector for the first time.

You can implement Warehouse Connector by setting up Warehouse Connector as a service on your existing Log Decoder or Decoder hosts.

The following is an overview of the entire process of installing and configuring the Warehouse Connector service on Log Decoder or Decoder, configuring the Warehouse Connector service on NetWitness, configuring data sources, destinations, streams for Warehouse Connector, and configuring alert notifications on NetWitness.



To install and configure the Warehouse Connector service, perform the following:

1. Install Warehouse Connector service on a Log Decoder or Decoder
2. Configure a Warehouse Connector service
3. Configure the Data Source for Warehouse Connector
4. Configure a Destination
5. Configure a Stream
6. Monitor a Warehouse Connector
7. Add Warehouse as a Data Source to Reporting Engine
8. Analyze a Warehouse Report
9. Manage a Stream and Lockbox

Install Warehouse Connector Service on a Log Decoder or Decoder or Hybrid

To install (fresh install) the Warehouse Connector service on a Log Decoder or Decoder or Hybrid:

1. Log on to the Log Decoder or Decoder host.
2. Enter the following command on NetWitness Server:
   `warehouse-installer --help`
   The command line interface (CLI) usage descriptions are displayed.

   Note: If you install Warehouse Connector on a host updated to a version beyond 11.0.0.0, you must specify the host version.
3. To get the host version, execute the following command:
   `upgrade-cli-client -list`
4. Install Warehouse Connector service by executing either of the following commands:
   `warehouse-installer --host-addr 10.0.0.0 --version 11.0.0.2`
   `warehouse-installer --host-id 5928b9d8-83be-4143-9602-fa936de5c41e`
   `warehouse-installer --host-name NW11AdminServer`
   Where,
   10.0.0.0 - IP address of the Host
   11.0.0.2 - Host version
   5928b9d8-83be-4143-9602-fa936de5c41e - Host ID
   NW11AdminServer - Host name

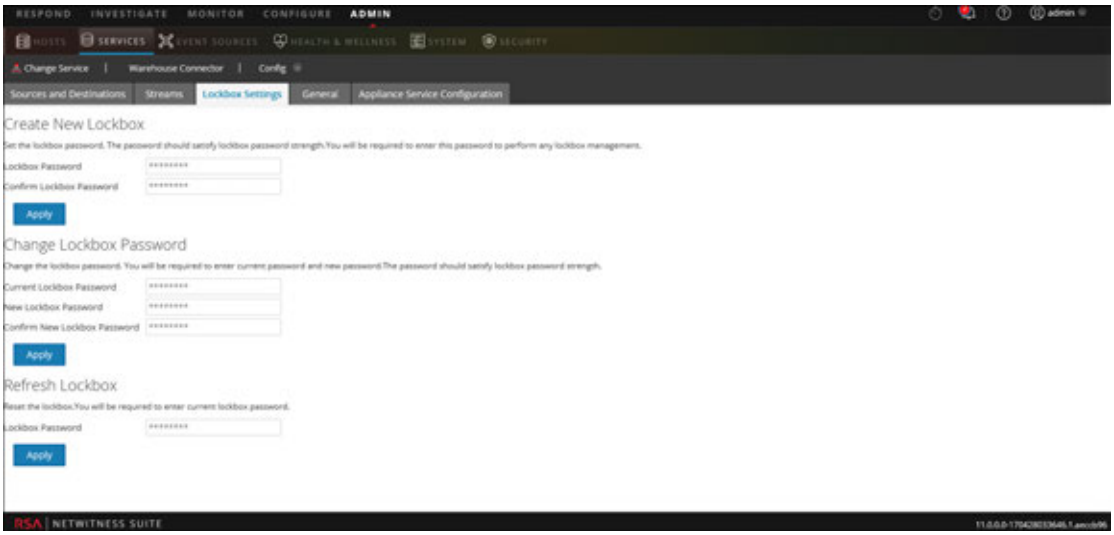
The Warehouse Connector service is successfully installed on the Log Decoder or Decoder or Hybrid.

Configure a Warehouse Connector Service

You can configure the Warehouse Connector service using the following procedure.

To set the Lockbox password:

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.
4. In the Services Config view of Warehouse Connector, click the **Lockbox Settings** tab.



5. In the **Create New Lockbox** section, perform the following:
   a. In the **Lockbox Password** field, enter the new lockbox password.

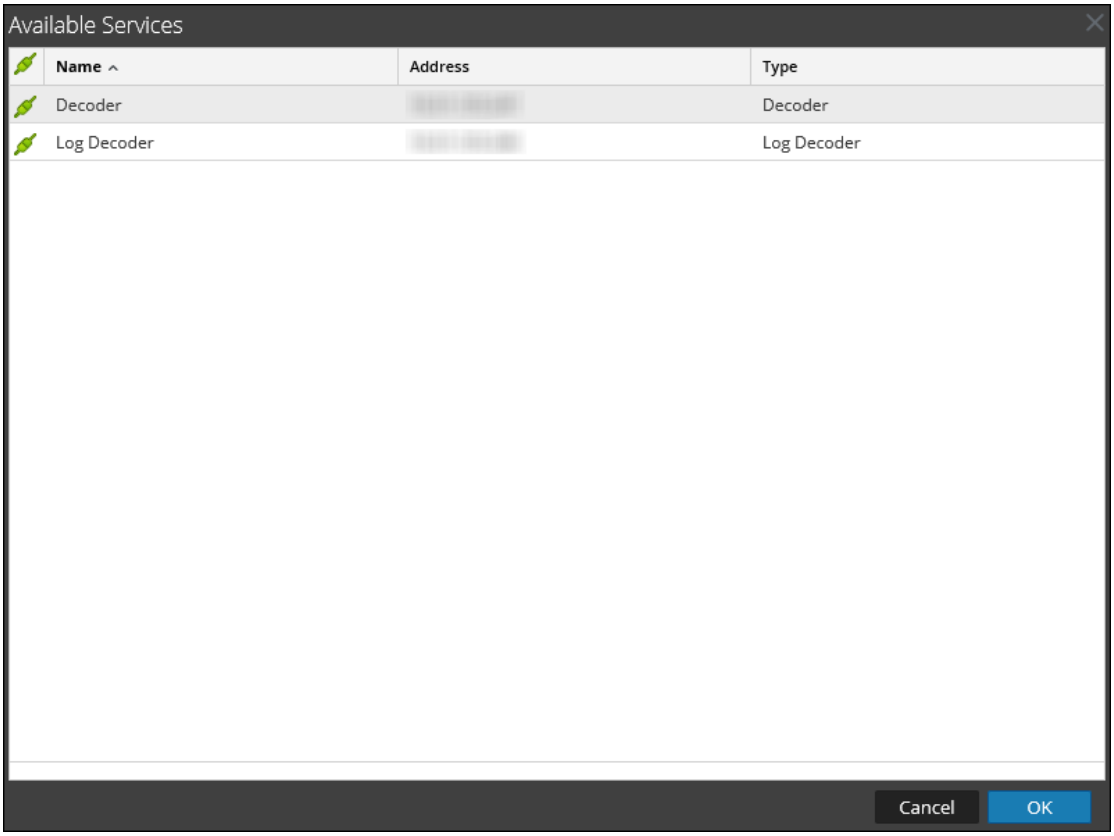
      Note: The lockbox password must be at least eight characters in length and it must contain at least three of the following groups: one uppercase character [A-Z], one lowercase character [a-z], one numeral [0-9], and one special character.

   b. In the **Confirm Lockbox Password** field, enter the added lockbox password to confirm.
   c. Click **Apply**.
      The Lockbox password is set.

Configure the Data Source for Warehouse Connector

To configure the data source:

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
4. On the **Sources and Destinations** tab, in the **Source Configuration** section, click +.



5. In the **Available Services** dialog, select the Log Decoder or Decoder services that you want to add as a source to the Warehouse Connector service and click **OK**.
   The selected Log Decoder and Decoder services are listed in the **Source Configuration** section.

Update the Port Number and SSL Settings of the Data Source

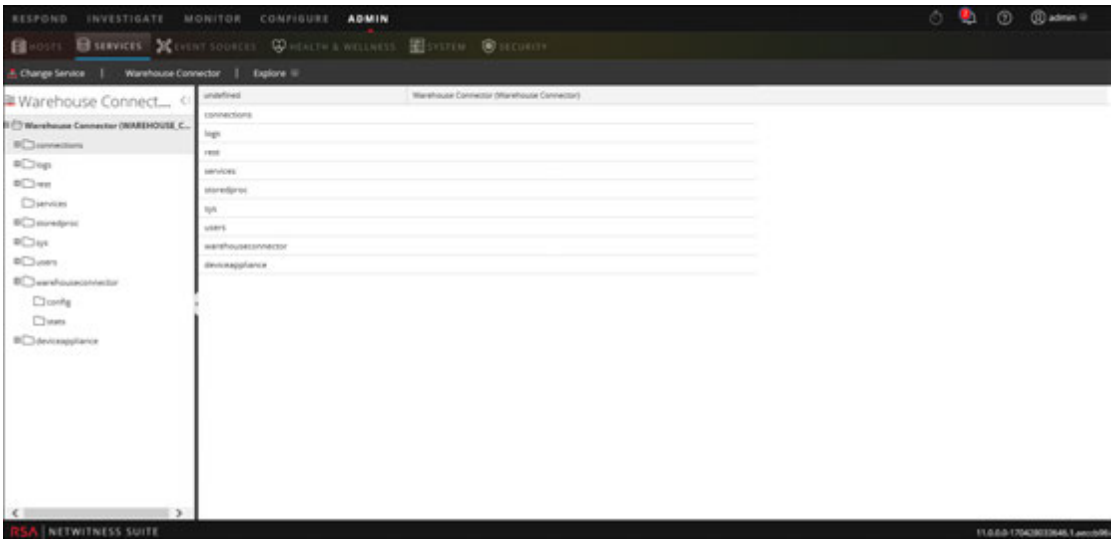
If there is change in the port number or SSL settings of the data sources used in the Warehouse Connector, you can directly update these details in Warehouse Connector, using the Explore view of the Warehouse Connector.

Make sure that:

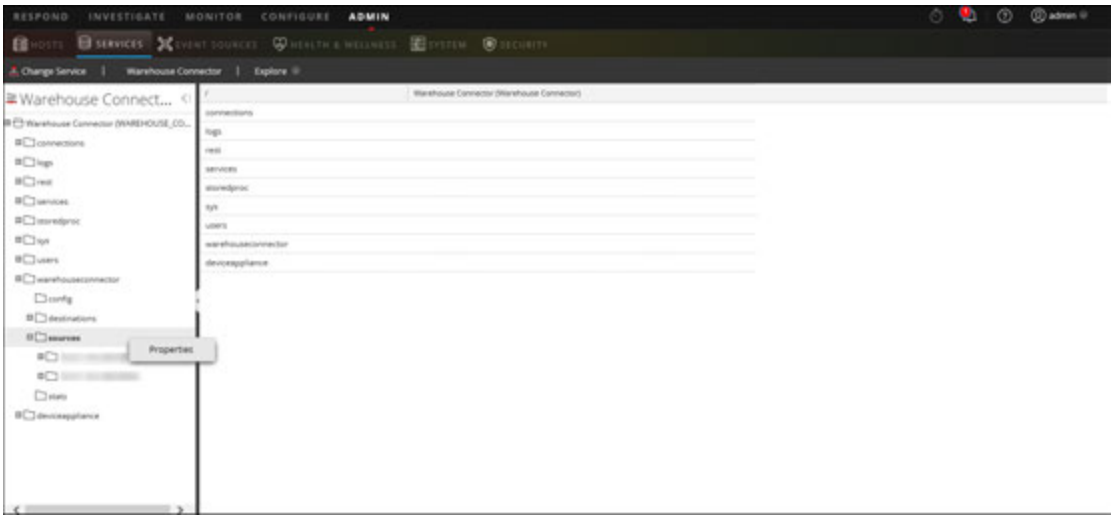
- You have the updated port number or SSL settings of the data source.
- You stop the streams related to the data source that you want to update the port number or SSL settings.

To update the port number or SSL settings:

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service and select  **> View > Explore**.
   The Service Explore view of Warehouse Connector is displayed.



4. Navigate to **warehouseconnector/sources**, right-click the source, and click **Properties**.
   The Properties section of the source is displayed.

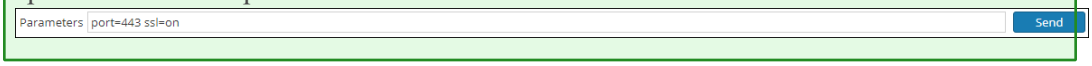


5. In the drop-down menu, select **update**. In the Parameters field, perform the following:
   - To update the port number of the source, enter `port=<new_source_portnumber>` and click **Send**.

     
   - To update the SSL settings of the source, enter `ssl=<new_ssl_settings>` and click **Send**.

     Note: You can also update the port number and ssl settings simultaneous by adding space between the parameters.

6. Restart the Warehouse Connector service.
7. Start the streams.

Configure the Destination

You can configure the destination using NFS, SFTP, and WebHDFS.

You must configure the destination to which the Warehouse Connector service needs to write the collected data using NFS:

- RSA NetWitness Warehouse (MapR) deployments
- Commercial MapR M5 Enterprise Edition for Apache Hadoop deployments

You must configure the Warehouse Connector to write to a remote destination using Secure File Transfer Protocol (SFTP). The remote destination can be a remote server that is NFS mounted to the MapR cluster or it can be a remote staging server.

By default, in the remote destination the Warehouse Connector writes data in the following directory structure:

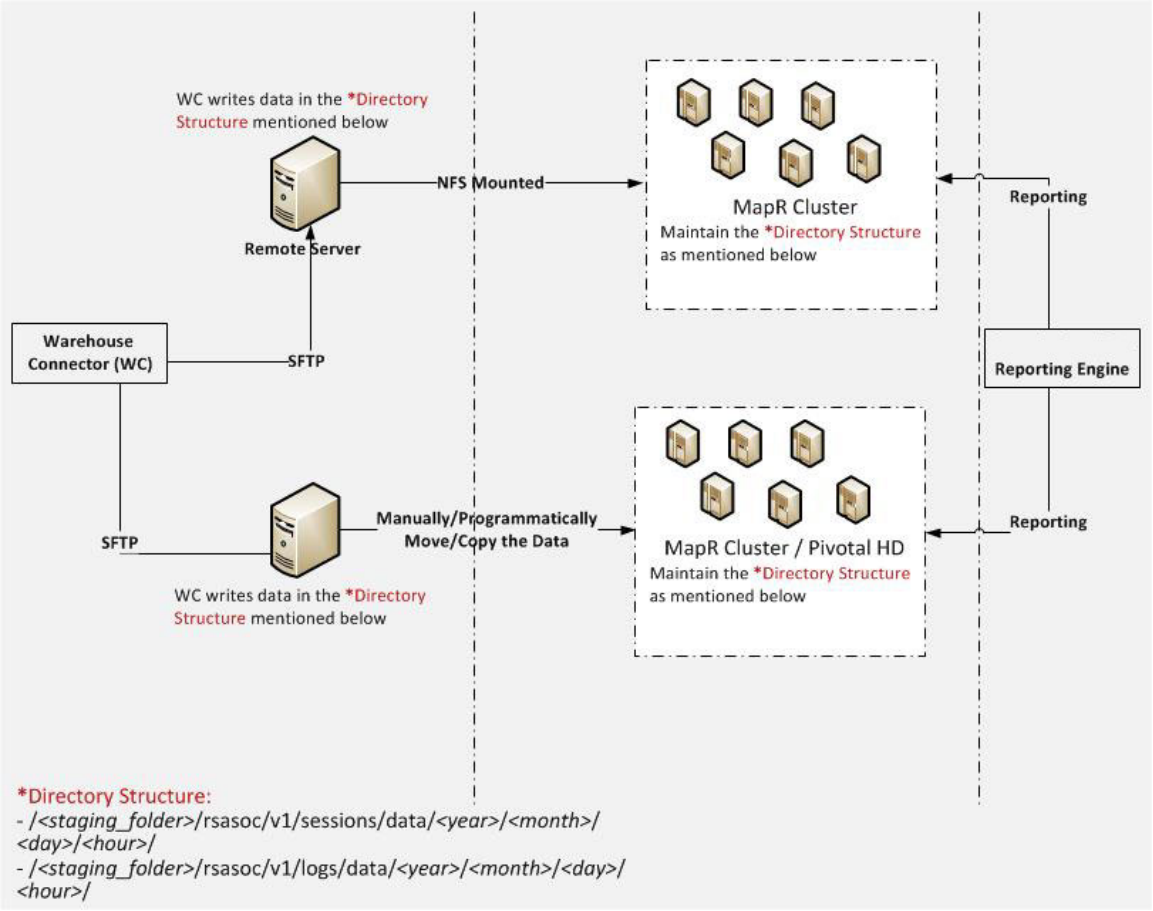
- `/<staging_folder>/rsasoc/v1/sessions/data/<year>/<month>/<day>/<hour>/`
- `/<staging_folder>/rsasoc/v1/logs/data/<year>/<month>/<day>/<hour>/`
  Where <staging_folder> is the folder on the remote server where the Warehouse Connector writes the data.

If you are using a remote staging server as the remote destination, you need to manually copy or move the directory structure to any of the following deployments:

- RSA NetWitness Warehouse (MapR)
- Commercial MapR M5 Enterprise Edition for Apache Hadoop
- HortonWorks HD

To generate reports from the data written by Warehouse Connector, make sure that in your Hadoop deployment you maintain a similar directory structure that is created by Warehouse Connector in the remote destinations.

The following illustration describes how you can use SFTP to write data from Warehouse Connector to a remote destination.



You must configure the Warehouse Connector service to write the collected data to a Hadoop-based distributed computing system that supports WebHDFS.

Configure the Destination Using NFS

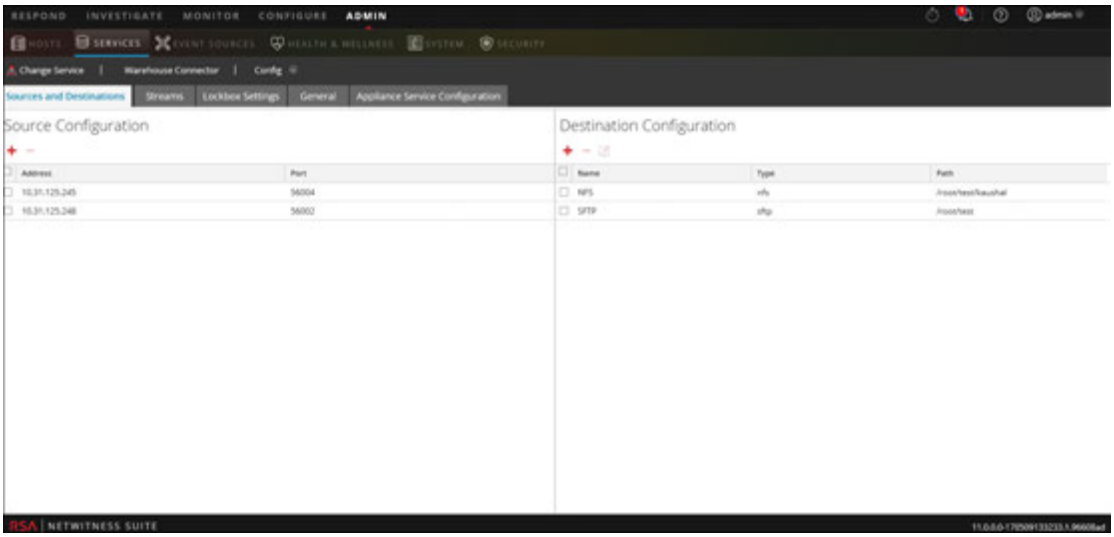
Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see the 'Add a Service to a Host' in the *Hosts and Services Getting Started Guide*.
- Set up NFS on Warehouse Connector. For more information on how to set up NFS on Warehouse Connector, see the 'Configure Warehouse Connector to Write to Warehouse' in the *Warehouse (MapR) Configuration Guide*.

To configure the destination using NFS:

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the Warehouse Connector service, and select  **> View > Config**.

   The Services Config View of Warehouse Connector is displayed.



4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click +.
5. In the **Add Destination** dialog, select **NFS** from the **Type** drop-down list.
6. In the **Name** field, enter a unique symbolic name for the destination.

Note: The **Name** field does not support spaces or special characters except underscore (_).

7. In the **Local Mount Path** field, enter the locally mounted directory for HDFS where you want the Warehouse Connector to write the data.

   For example:
   If **/saw** is the local mount point for HDFS that you have configured while mounting the mapr NFS cluster on the host where you have installed the Warehouse Connector service to write to RSA NetWitness Warehouse (MapR), create a directory named **Ionsaw01** under **/saw** and the corresponding Local Mount Path for the destination would be **/saw/Ionsaw01**.

   For more information, see the **Mount the Warehouse on the Warehouse Connector** topic in the *Warehouse (MapR) Configuration Guide*.

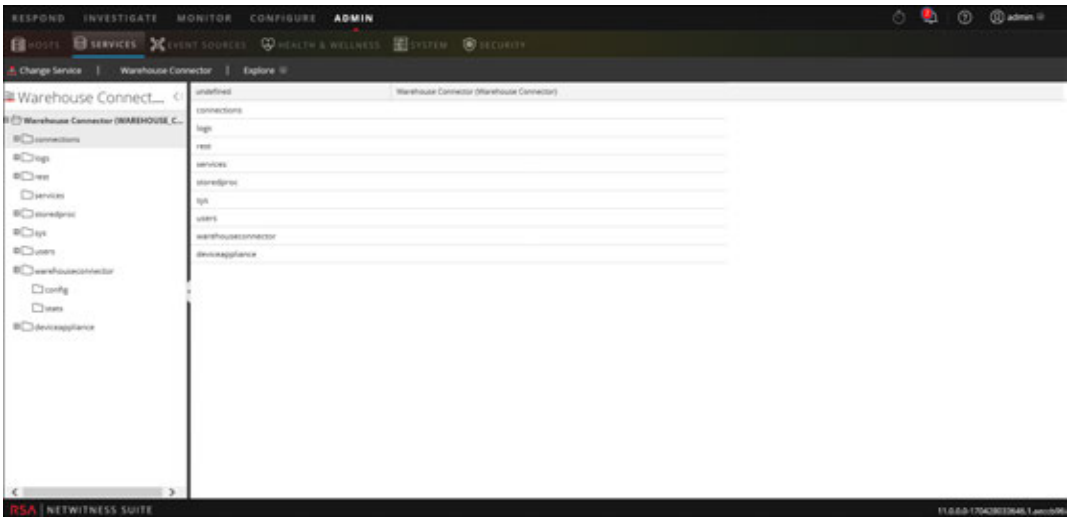
   The **/saw** mount point implies to / as the root path for HDFS. The Warehouse Connector writes the data to **/Ionsaw01** in HDFS.

8. Click **Save**.

9. (Optional) If you want to enable checksum validation, perform the following:

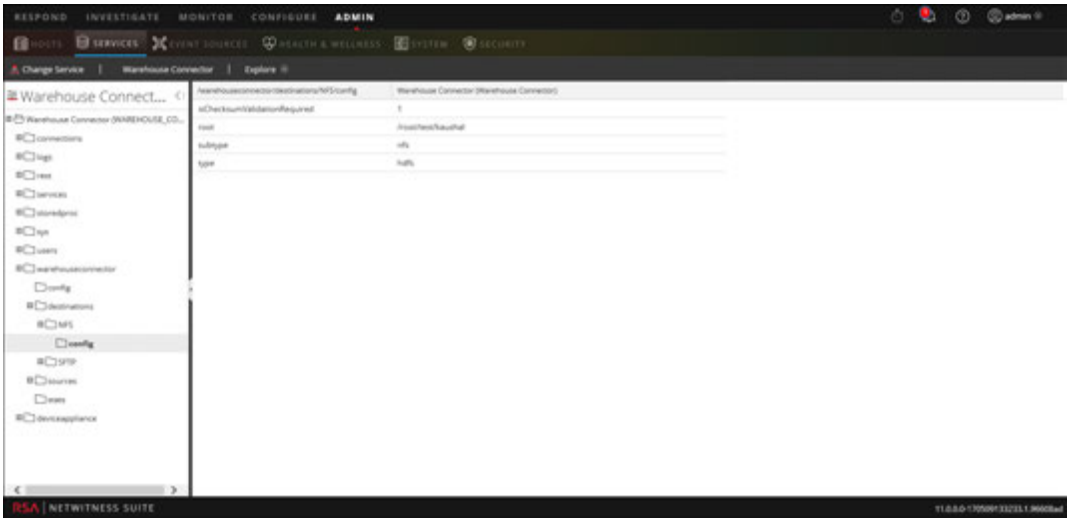
   a. In the main menu, select **ADMIN > Services**.

   b. In the Services view, select the added Warehouse Connector service, and select  **> View > Explore**.
   The Explore view of Warehouse Connector is displayed.



c. In the options panel, navigate to **warehouseconnector/destinations/nfs/config**.

d. Set the parameter `isChecksumValidationRequired` to **1**.



e. Restart the respective stream.

Configure the Destination Using SFTP

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see the 'Add a Service to a Host' in the *Hosts and Services Getting Started Guide*.
- For the SFTP destination type, the destination host should be listed in the **/root/.ssh/known_hosts** file used by the ssh service (for example, sshd) running on the Warehouse Connector.

Add Destination from Warehouse Connector Host

To add the destination host to the **/root/.ssh/known_hosts** file, from the Warehouse Connector host, initiate a secure connection to the destination host:

1. Login to the Warehouse Connector.
2. Enter `ssh root@<SAWIP>` or `ssh username@<SAWIP>`.
3. Select **Yes** and enter the password.
4. Add the host key in the **/root/.ssh/known_hosts** file

> **Note:** After you upgrade Warehouse Connector to 11.0, you must make sure that the destination host is listed in the /root/.ssh/known_hosts file used by the ssh service (i.e. sshd) running on the Warehouse Connector. If you do not perform this action, the streams configured with SFTP in Warehouse Connector will not start.

- If you want to use SFTP to write data into the destination using SSH key-based access, you need to configure SSH key-based access between the Warehouse Connector and the Warehouse host or Hadoop node. For more information, see **Configure SSH Keys** below.

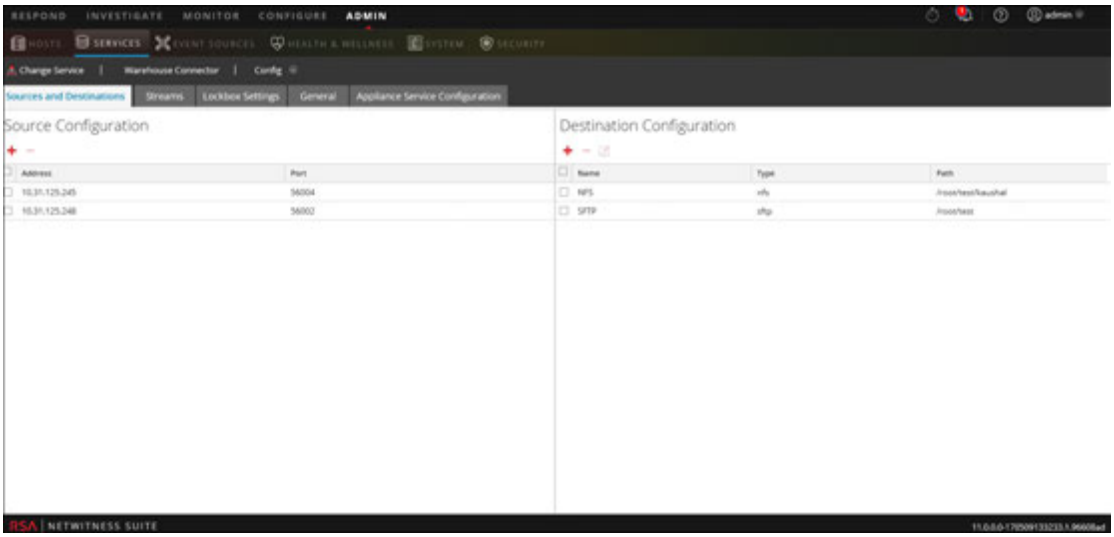
> **Note:** If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you generate the keys without setting the passphrase and do a key exchange between warehouse connector and the warehouse nodes.

Configure Warehouse Connector to Write to a Remote Destination

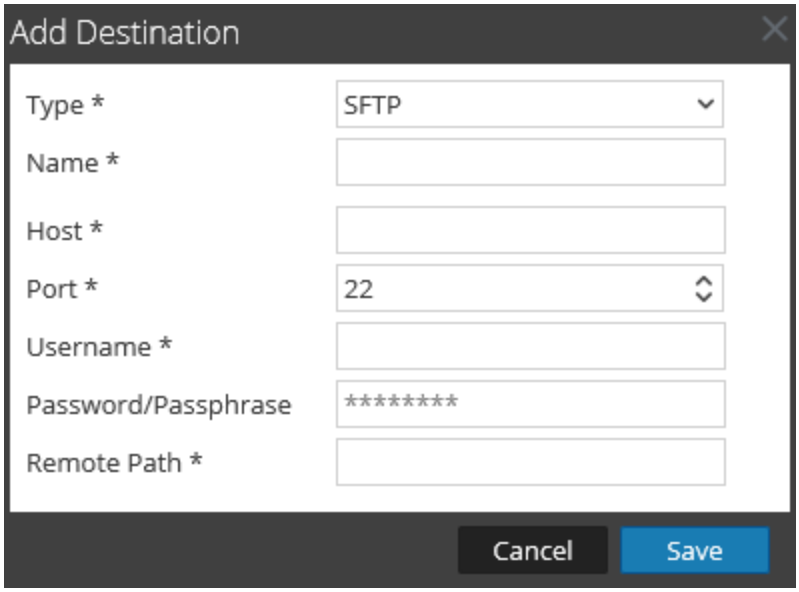
To configure the destination:

1. Log on to NetWitness
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.

   The Services Config view of Warehouse Connector is displayed.



4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click +.
5. In the **Add Destination** dialog, select **SFTP** from the **Type** drop-down list.



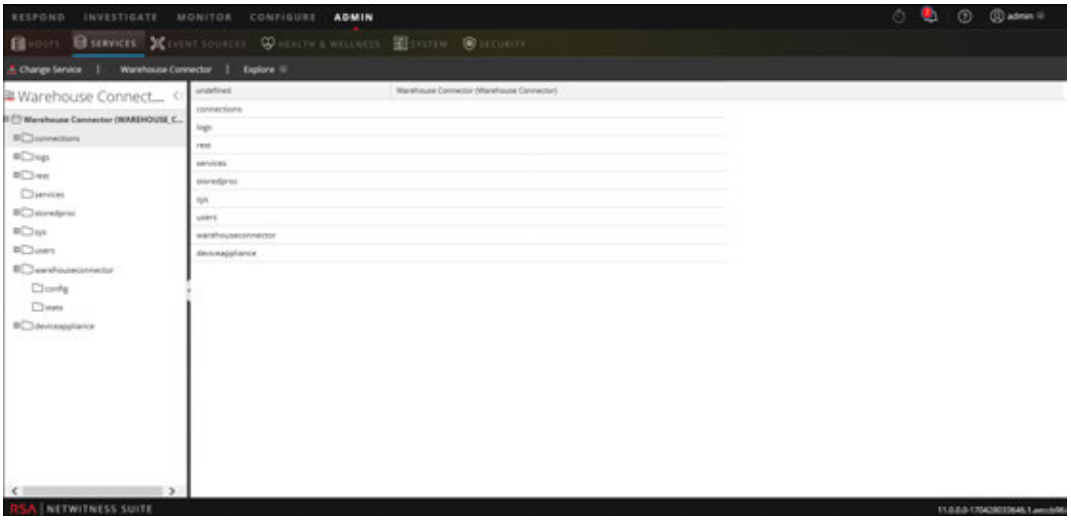
6. In the **Name** field, enter a unique symbolic name for the destination.

   Note: The **Name** field does not support spaces or special characters except underscore (_).

7. In the **Host** field, enter the remote server IP address.
8. In the **Port** field, retain the default port, **22**.
9. In the **Username** field, enter the SSH username.

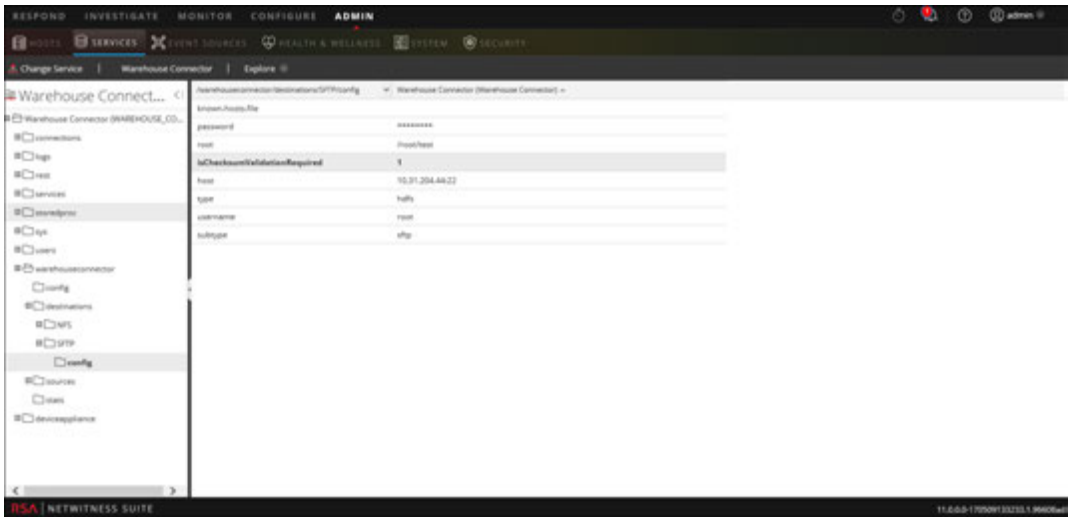
   Note: In the case of HortonWorks HD, ensure that the username is gpadmin and for password based access the password for gpadmin should be used. For passphrase-based access, the passphrase used to generate the keys for gpadmin user should be used.

10. In the **Password/Passphrase** field, enter one of the following:
    - SSH password - If you are using SFTP to write data into the destination using password-based access.
    - SSH passphrase - If you are using SFTP to write data into the destination using SSH key-based access.
11. In the **Remote Path** field, enter the path of the directory present on the SFTP server.
12. Click **Save**.
13. (Optional) If you want to enable checksum validation, perform the following:
    a. In the main menu, select **ADMIN > Services**.
    b. In the Services view, select the added Warehouse Connector service, and select  **> View > Explore**.
    The Explore view of Warehouse Connector is displayed.



c. In the options panel, navigate to **warehouseconnector/destinations/sftp/config**.

d. Set the parameter `isChecksumValidationRequired` to **1**.



e. Restart the respective stream.

Configure SSH Keys

To configure SSH key-based access between the Warehouse Connector and the Warehouse host or Hadoop node:

1. Generate SSH keys on the Warehouse Connector at the default location. Perform the following:

   a. Log on to the Warehouse Connector.

   b. Type the following command and press ENTER:

   ```
   $ OWB_FORCE_FIPS_MODE_OFF=1 ssh-keygen -t dsa
   ```

   c. The command prompts you to enter the file in which to save the generated key.

   ```
   Enter file in which to save the key (/root/.ssh/id_dsa):
   ```

   d. Enter the file in which you want to save the key and press ENTER.

   The command prompts you to enter and confirm the passphrase.

   Note: If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you do not set the **passphrase**. Then, the below steps e, f, g, and h are not applicable.

```
Enter passphrase (empty for no passphrase):
 Enter same passphrase again:
```

The public key is generated and is saved in the location that you provided.

e. Change the directory by entering the following command:

```
cd /root/.ssh/
```

f. Move the generated key to the below location:

```
mv id_dsa id_dsa.old
```

g. Type the following command and press ENTER:

```
$ OWB_FORCE_FIPS_MODE_OFF=1 openssl pkcs8 -topk8 -v2 des3 -in id_
dsa.old -out id_dsa
```

The command prompts you to enter and confirm the passphrase.

h. Enter the encryption passphrase.

i. Run the following command to change the file permission:

```
chmod 600 id_dsa
```

2. Append the generated public key to the remote Warehouse host or Hadoop node's authorized keys list located at: `~/.ssh/authorized_keys`

> **Note:** Make sure that you copy the public keys to the Hadoop node and while copying the public key ensure that you provide the login details of the user using which the WebHDFS destination would be added.

You can now securely communicate between Warehouse Connector and Warehouse nodes or Hadoop nodes.

Configure the Destination Using WebHDFS

Make sure that you have:

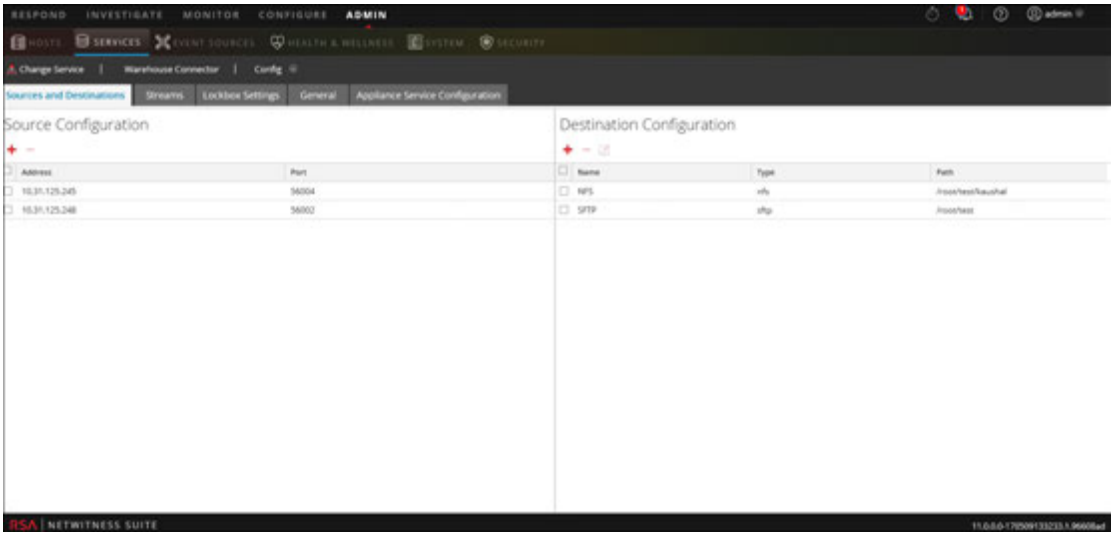
- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see the 'Add a Service to a Host' in the *Hosts and Services Getting Started Guide*.
- Added the hostname (or FQDN) and IP address of the warehouse nodes and Warehouse Connector to the DNS server. If the DNS server is not configured, add the hostname (or FQDN) and IP address of the warehouse nodes and Warehouse Connector to the file in the host on which the Warehouse Connector service is installed.
- If you want Kerberos authentication between the warehouse connector and the warehouse cluster, make sure that you perform the following:
  - Kerberos Key Distribution Center (KDC) Server is configured in your network environment and the Kerberos Keytab file is copied to the host on which you have installed Warehouse Connector.
  - Kerberos authentication is enabled in the warehouse cluster.
- If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you generate the keys without setting the passphrase and do a key exchange between the Warehouse Connector and the warehouse nodes. You need to configure SSH key-based access between the Warehouse Connector and the Warehouse host or hadoop node. For more information, see 'Configure SSH Keys' in Configure the Destination Using SFTP.

Configure Warehouse Connector to Write to a Remote Destination

To configure the destination:

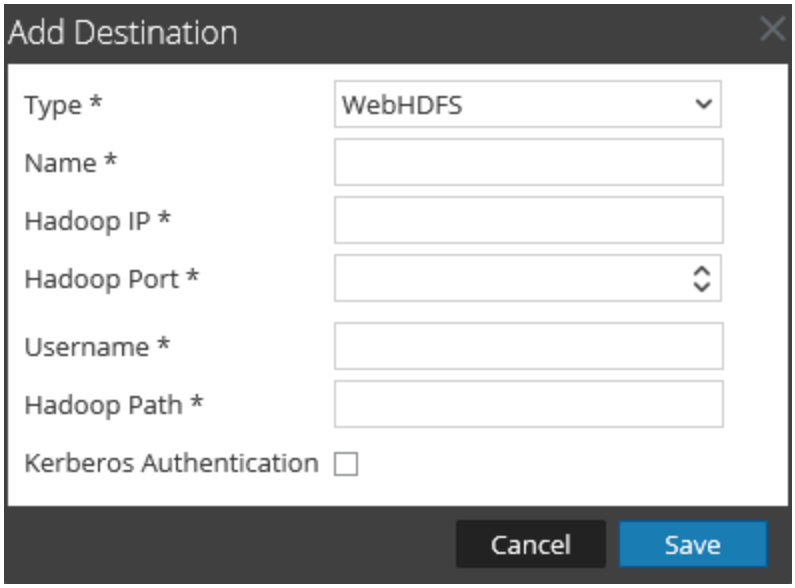
1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.

   The Services Config view of Warehouse Connector is displayed.



4. On the **Sources and Destinations** tab, in the **Destination Configuration** section, click +.

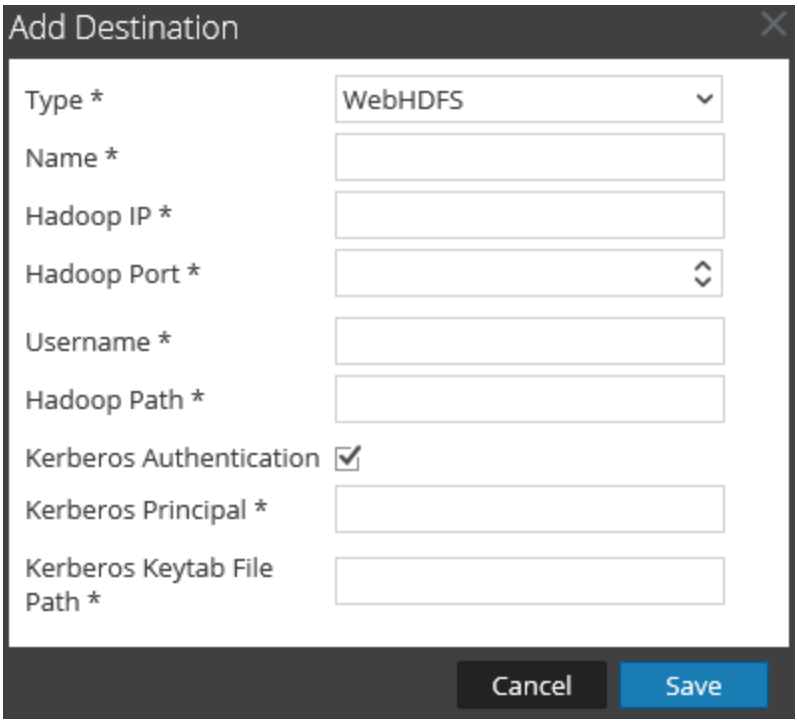
5. In the **Add Destination** dialog, select **WebHDFS** from the drop-down list.



6. In the **Name** field, enter a unique symbolic name for the destination.

   Note: The **Name** field does not support spaces or special characters except underscore (_).

7. In the **Hadoop IP** field, enter the namenode IP address of the warehouse cluster.
8. In the **Hadoop Port** field, enter the base port that is used by the namenode web user interface.
9. In the **Username** field, enter the owner of the directory in the warehouse to which Warehouse Connector should write the data.
10. In the **Hadoop Path** field, enter the path of the directory in the warehouse to which Warehouse Connector should write the data.
11. Select the **Kerberos Authentication** checkbox, if you want the warehouse connector to securely communicate with the warehouse using Kerberos authentication.



Perform the following:

a. In the **Kerberos Principal** field, enter the KDC Principal used for Kerberos authentication.

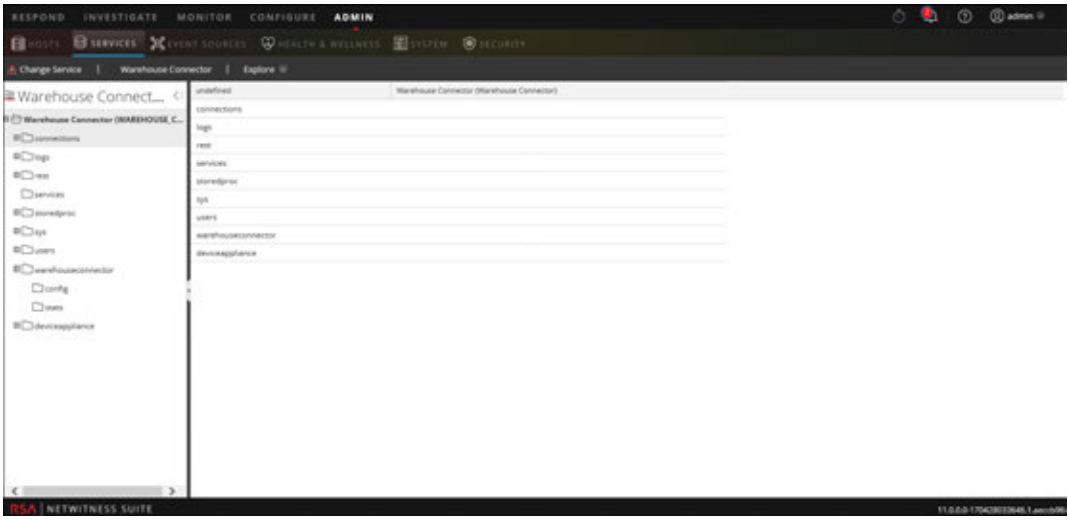
b. In the **Kerberos Keytab File Path** field, enter the path of the Kerberos Keytab file in the Warehouse Connector.

12. Click **Save**.

13. (Optional) If you want to enable checksum validation, perform the following:

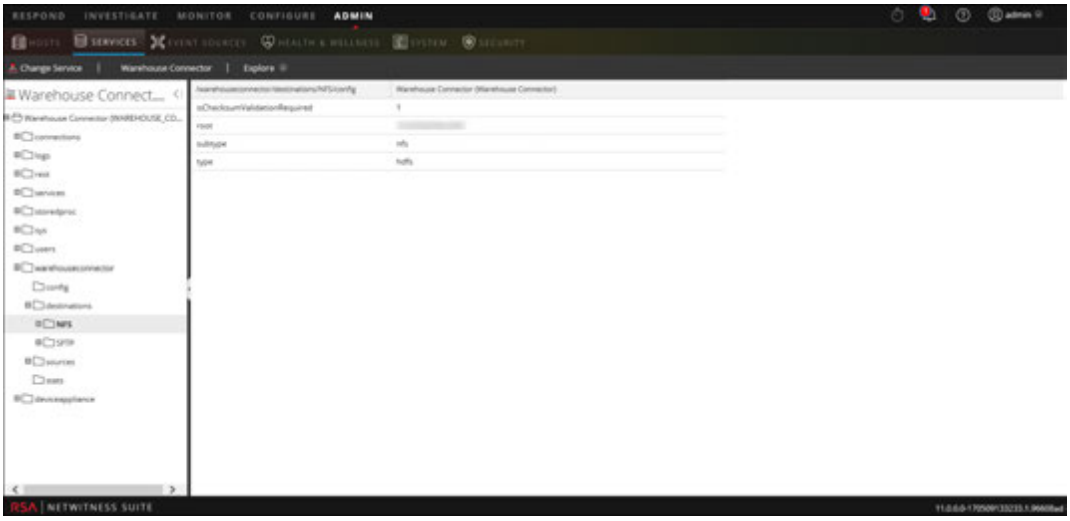
    a. In the main menu, select **ADMIN > Services**.

    b. In the Services view, select the added Warehouse Connector service and select  **> View > Explore**.
    The Explore view of Warehouse Connector is displayed.



c. In the options panel, navigate to **warehouseconnector/destinations/webhdfs/config**.

d. Set the parameter `isChecksumValidationRequired` to **1**.



e. Restart the respective stream.

Configure a Stream

You can configure the data stream to define the data source and destination combinations.

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see the 'Add a Service to a Host' in the *Hosts and Services Getting Started Guide*.
- Configured the data source from which the Warehouse Connector service needs to collect data. For more information, see Configure the Data Source for Warehouse Connector.
- Configured the destination to which the Warehouse Connector service needs to write the collected data. For more information, see Configure the Destination.

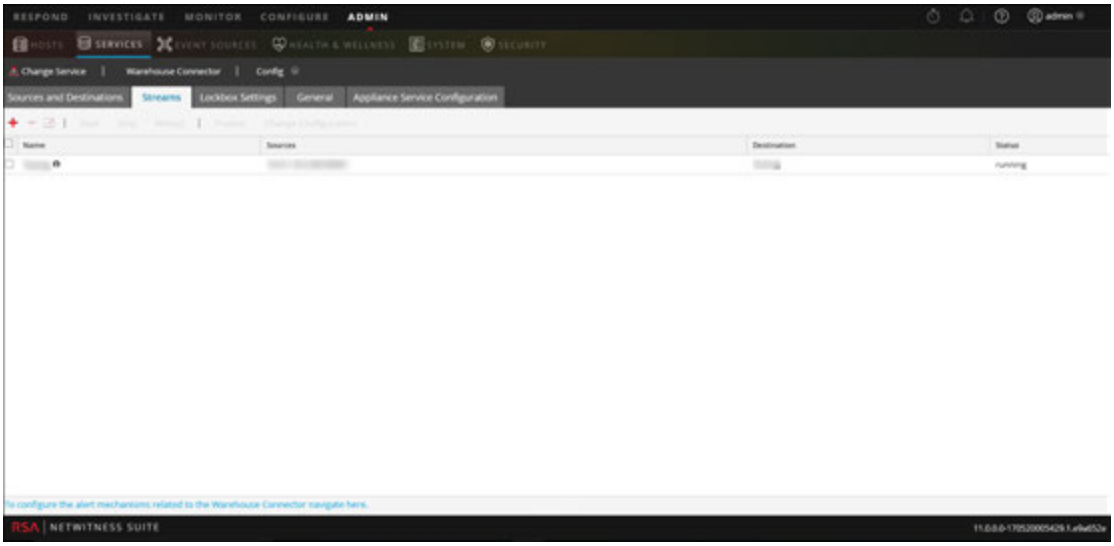
To configure the stream:

1. Create a stream
2. Finalize the stream
3. Start the stream

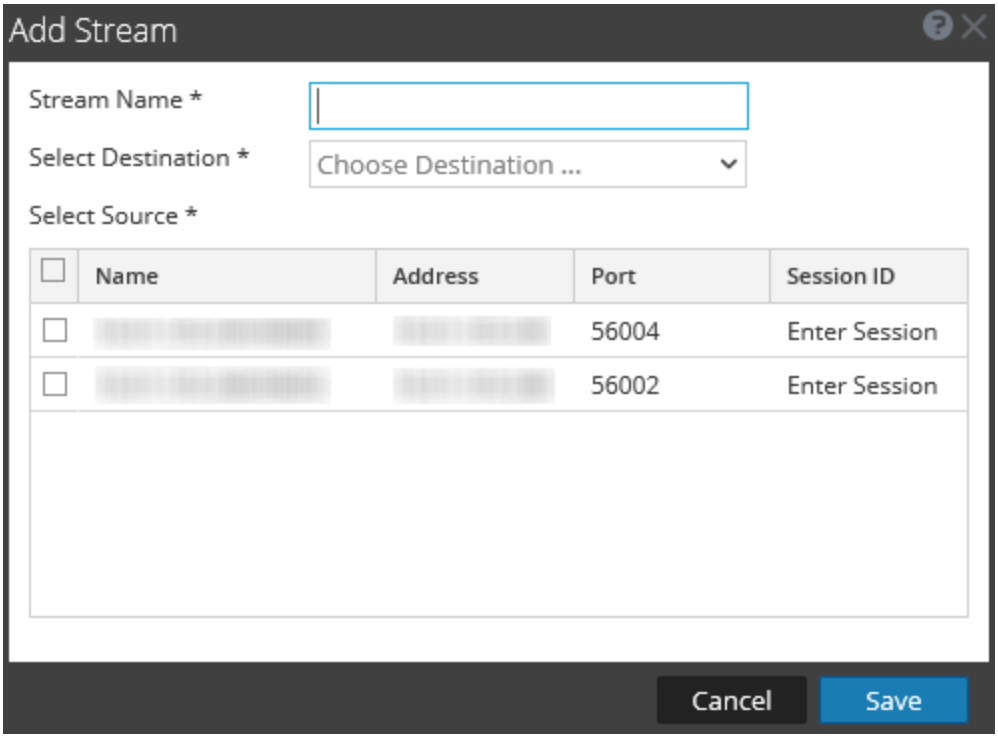
Create a Stream

To create a stream:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
3. Click the **Streams** tab.



4. On the **Streams** tab, click +.



5. In the **Add Stream** dialog, perform the following:

   a. In the **Stream Name** field, enter a name for the stream.

   Note: The **Stream Name** field does not support spaces or special characters except underscore (_).

   b. In the **Select Destination** drop-down menu, select a destination from the list of destinations added to the Warehouse Connector.

   c. In the **Select Source** field, select sources from the list of sources displayed.

   d. In the **Session ID** column, enter the last session id.
   If you provide any session id, the Warehouse Connector will start the aggregation from that session, whereas if this is left blank, the aggregation will start from the current session.

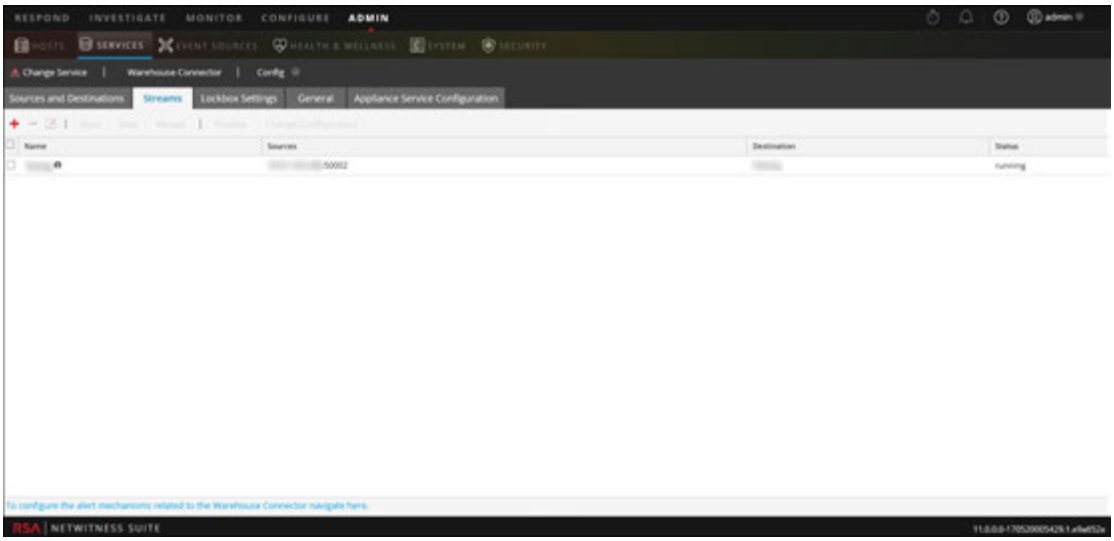
   e. Click **Save**.

Finalize the Stream

Make sure that you have created a stream.

To finalize the stream:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
3. On the **Streams** tab, select the stream that you have created.



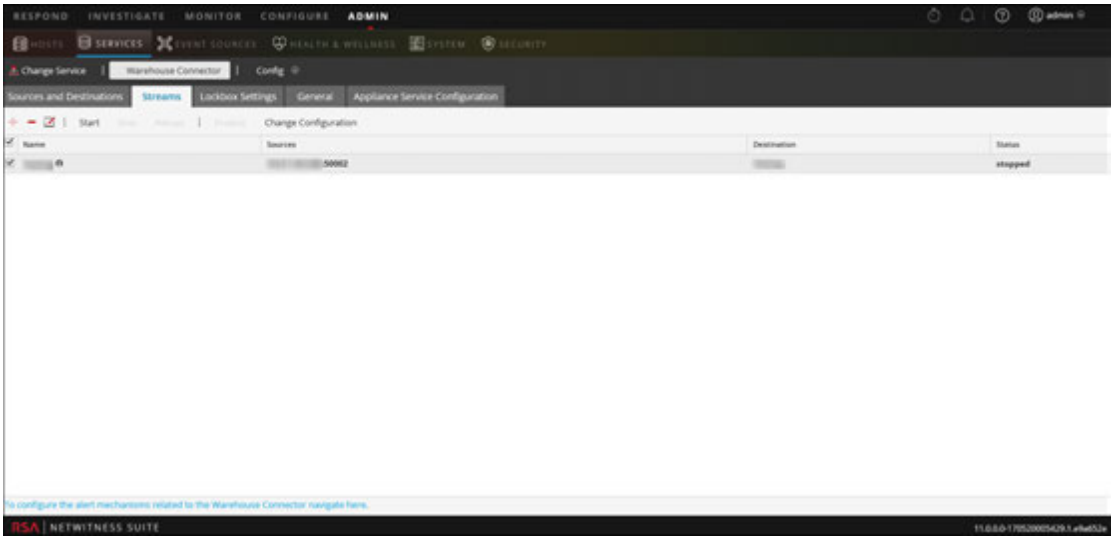
4. Click **Finalize**.

Start the Stream

Note: If you have deployed a Warehouse Connector Virtual Appliance, make sure that you change the default value of the `Maximum Message Hold Count` parameter to 800000. For more information, see General Tab Settings.

To start the stream:

1. In the main menu, select **ADMIN> Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
3. On the **Streams** tab, select the stream that you have created.



4. Click **Start**.

Monitor a Warehouse Connector

By monitoring a Warehouse Connector, you can automatically generate notifications when critical thresholds concerning Warehouse Connector and its storage have been met.

To monitor a Warehouse Connector:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.
3. Click the **Streams** tab.
4. At the bottom of the **Streams** tab, click **To configure the alert mechanisms related to the Warehouse Connector navigate here**.
   The Warehouse Connector Monitoring page is displayed.

Caution: This page is deprecated and will be removed in a future release.

5. In the **Source or Destination Status** section, select the number of minutes or hours in the **Notify After Failing For** field.
   You will receive a notification if the source or destination connection fails for the defined number of minutes or hours.
6. In the **Stream Status** section, perform the following:
   a. In the **Notify Stopped For** field, define the number of minutes or hours after which you would like to receive a notification when the stream goes offline.
   b. In the **Disk Is** field, define the limit on the percentage of disk usage after which you would like to receive a notification.
   c. In the **Source is Behind** field, define the number of sessions. A notification is raised if the source goes behind the defined number of sessions.
   d. In the **Rejected Folder Size is** field, define the limit on the percentage of folder usage after which would like to receive a notification.
   e. In the **Number Of Files in Permanent Failure Folder** field, define the limit on the number of files in the permanent failure folder after which you would like to receive a notification.

7. In the **Notification Type** field, perform the following:
   a. Click **Configure email or distribution list** to configure email so that you can receive notifications in NetWitness. For more information, see the **Configure Email Server and Notification Account** topic in the *System Configuration* guide.
   b. Click **Configure Syslog and SNMP Trap servers** to configure audit logs. For more information, see the **Configure Syslog and SNMP Settings** topic in the *System Configuration* guide.
   c. Select the following notification mechanisms as per your requirement:
      - **NetWitness Console** - To get notifications on the NetWitness UI notification toolbar.
      - **Email** - To get email notifications.
      - **Syslog Notification** - To generate syslog events.
      - **SNMP Trap Notifications** - To get audit events as SNMP traps.

Add Warehouse as a Data Source to Reporting Engine

You must add Warehouse as a data source to Reporting Engine to make this data source available to reports and alerts against this Reporting Engine. For more information, see **Add Warehouse as a Data Source to Reporting Engine** topic in the *Reporting Engine Configuration Guide*.

Analyze a Warehouse Report

The Warehouse modules provide analysts with reports of early indicators of compromise. The following Warehouse reports can be analyzed in NetWitness:

- Suspicious Domains report
- Suspicious DNS Activity report
- Host Profile report

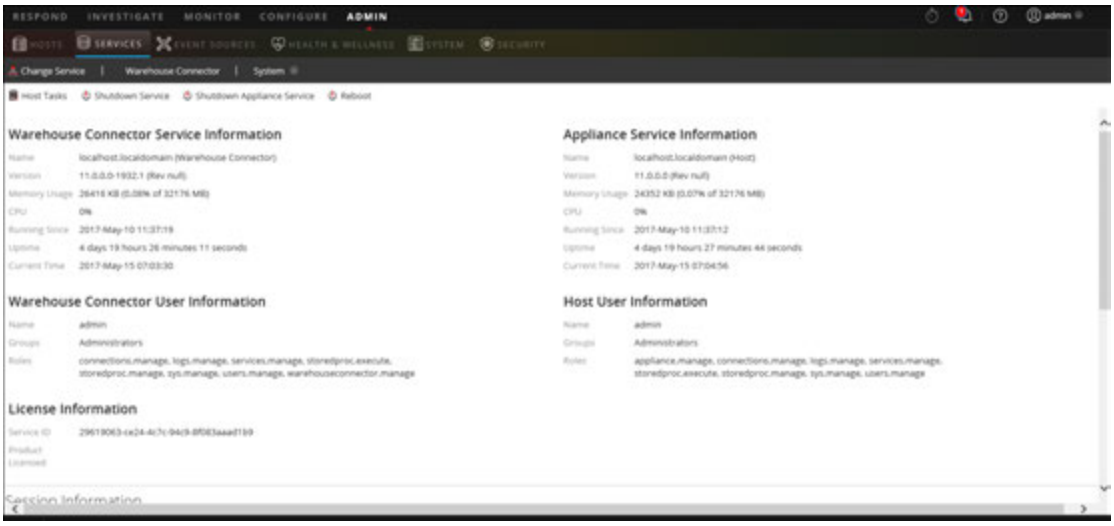
For more information, see **Step 4. Analyze a Warehouse Report** topic in the *Warehouse Guide*.

View the Warehouse Connector Service

While the information displayed in the Services System view is the same for all types of core services, several options in the toolbar are relevant only for Warehouse Connector.

To access this view:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select a Warehouse Connector and select  **> View > System**. The Systems view for the selected Warehouse Connector is displayed.



The following is an example of toolbar options for Warehouse Connectors.

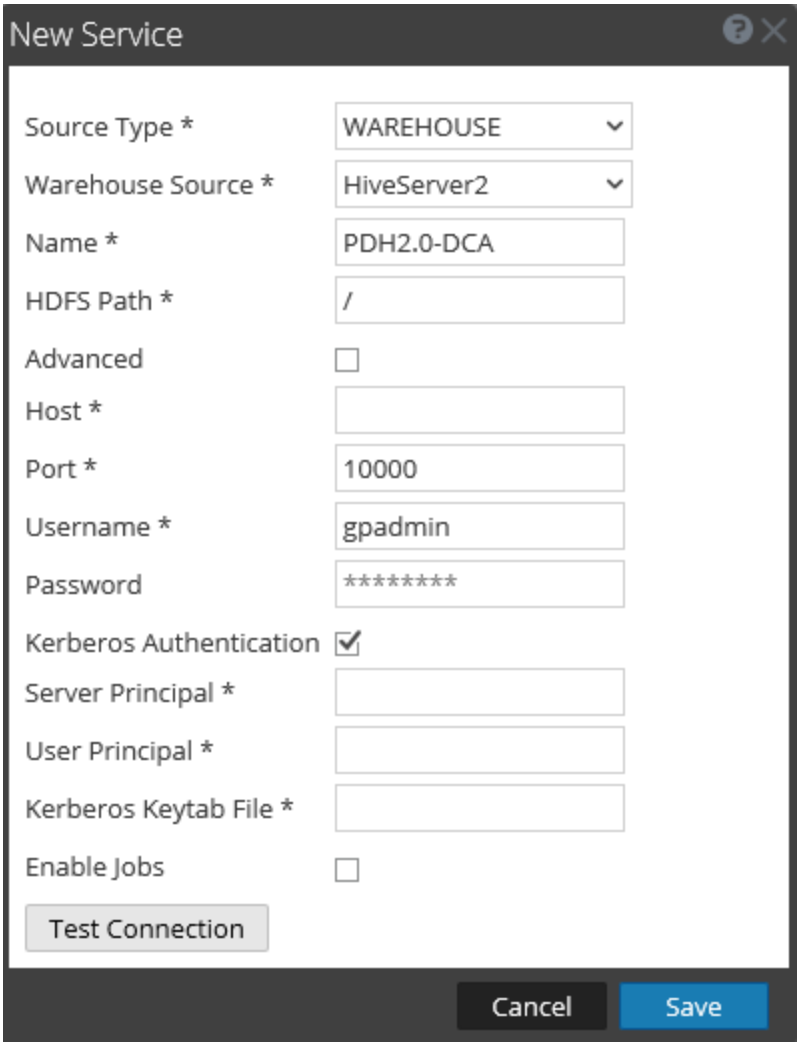
Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the *Hosts and Services Getting Started Guide*.

Troubleshoot the Warehouse Connector

The following information suggests the possible issues that NetWitness users may encounter when adding a Warehouse service to the Reporting Engine as a data source for reporting in NetWitness. Look for explanations and solutions in this section.

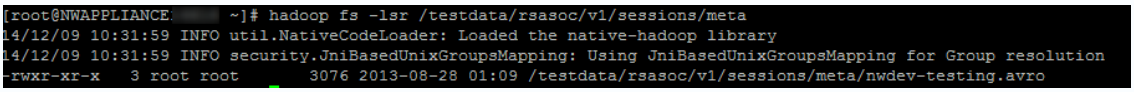
While adding a Warehouse service to the Reporting Engine as a data source for reporting, you may observe some of the errors listed in this document. Information is provided on how to troubleshoot the errors and add the data source successfully.

The following figure shows the New Service dialog.



For more information, see the **Add Warehouse as a Data Source to Reporting Engine** topic in the *Reporting Engine Configuration Guide*.

Error	Possible Solutions
Could not open connection to HiveServer	• Ensure that the HiveServer2 is running on the Host. • Check if the port provided can be accessible from the Reporting Engine server.
No Schema found in HDFS path	Ensure that meta avro data file(s) are available in the HDFS path (**<HDFS Path>/rsasoc/v1/sessions/meta**) mentioned. The following figure shows an example of the command to check the files in hdfs.
Could not open connection to HiveServer, GSS initiate failed	GSS initiate failed errors will be observed only in the case of Kerberos enabled Hive. Ensure that the proper keytab file is provided and it should have read options for the rsasoc user (user on which the Reporting Engine Server runs). Ensure that the system time is synchronized between KDC, Hadoop (HortonWorks) server, and the Reporting Engine system.



Manage a Stream and Lockbox

You can manage a stream using the following procedures:

- Edit a Stream
- Reload the Stream
- Specify meta filters for a Stream
- Define muti-valued metas

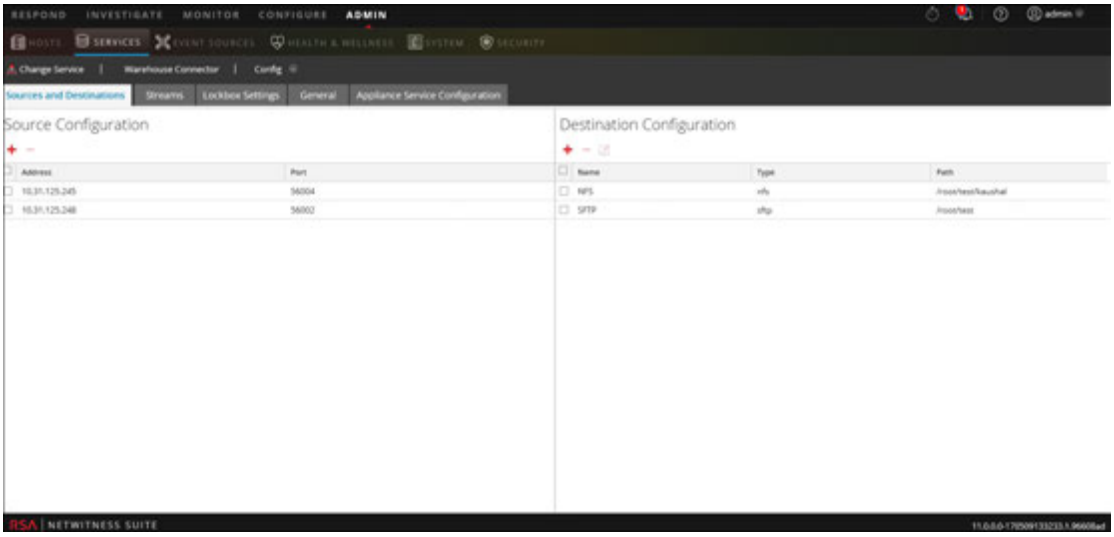
Edit a Stream

You can edit a stream to perform the following:

- Add more data sources to the stream.
- Delete existing data sources from the stream.

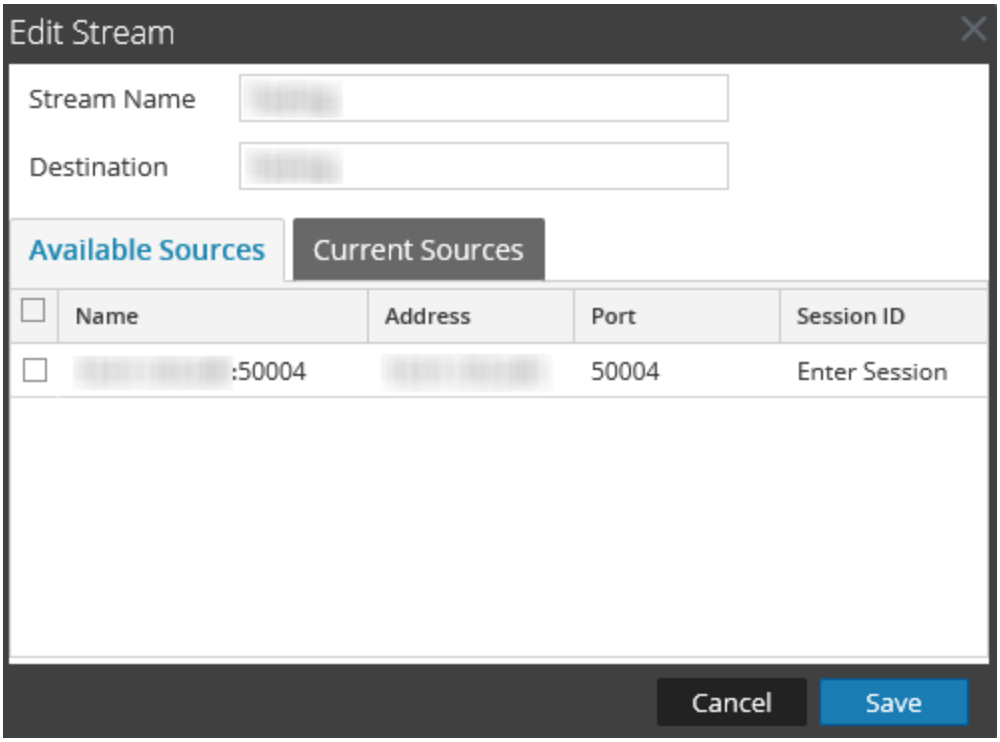
To edit a stream:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.
   The Services Config view of Warehouse Connector is displayed.



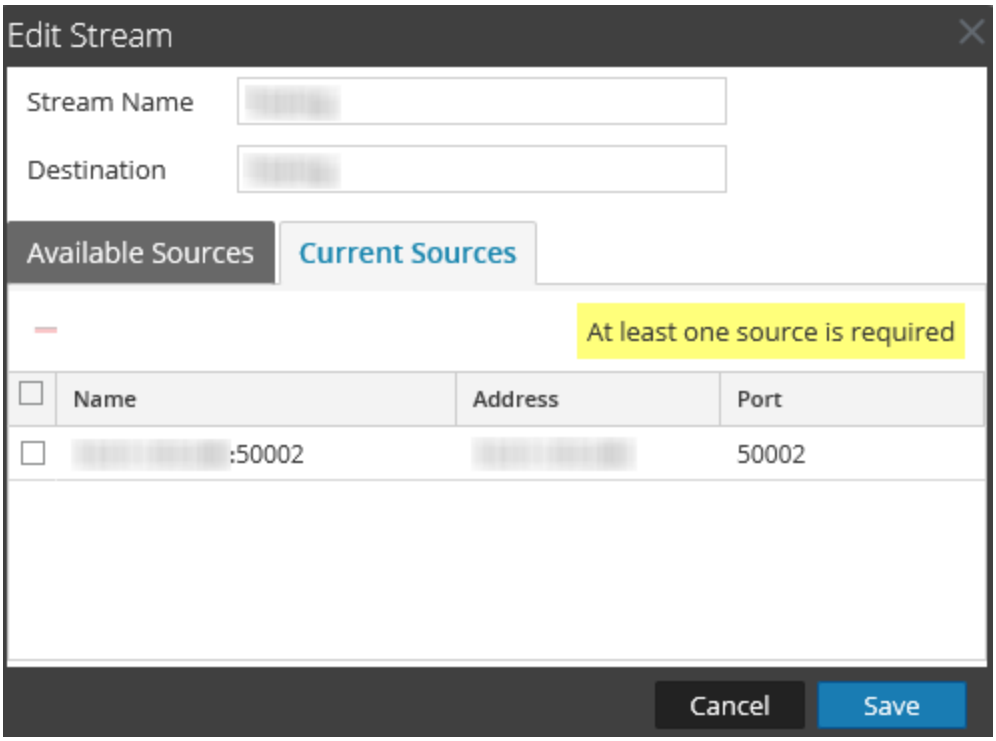
3. On the **Streams** tab, click .
4. In the **Edit Stream** dialog, you can perform the following:

- On the **Available Sources** tab, you can select the available data sources to add to the stream and click **Save**.



- On the **Current Sources** tab, you can delete an existing data source from the stream.

  Select the data source and click − .



Reload the Stream

When you reload the stream, the Warehouse Connector updates the schema file for the stream. You should reload the stream whenever you add a new custom meta to the Log Decoder or Decoder.

To reload the stream:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select the added Warehouse Connector service and select  **> View > Config**.

   The Services Config view of Warehouse Connector is displayed.
3. On the **Streams** tab, select the stream that you want to reload.
4. Click **Reload**.

Specify Meta Filters for a Stream

You need to specify the filter for each stream in the `export.session.meta.fields` parameter in the Explore view of the Warehouse Connector.

The following table lists the values that you can provide as a filter:

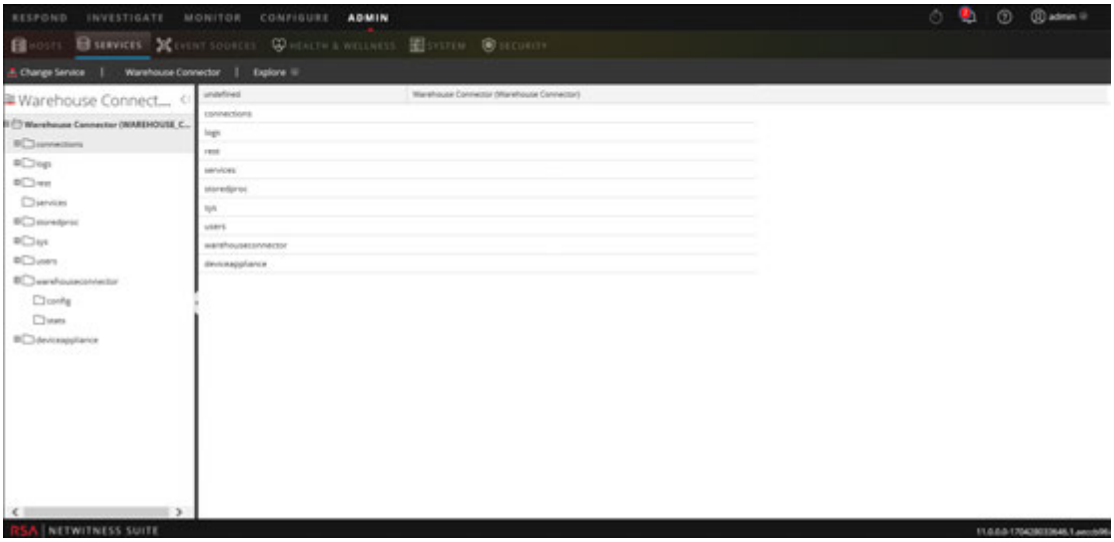
Values	Description
*	All the collected metas are written to SAW.
*, *meta1*, *meta2*	All the metas except the defined metas are written to SAW. For example, **Filter:** `*,ip.src` All the metas except `ip.src` is written to SAW.
meta1, meta2, meta3	Only the defined metas are written to SAW.

Note: By default, the following metas are written to Warehouse even if you specify them in the filter:
- ng_source
- unique_id
- time

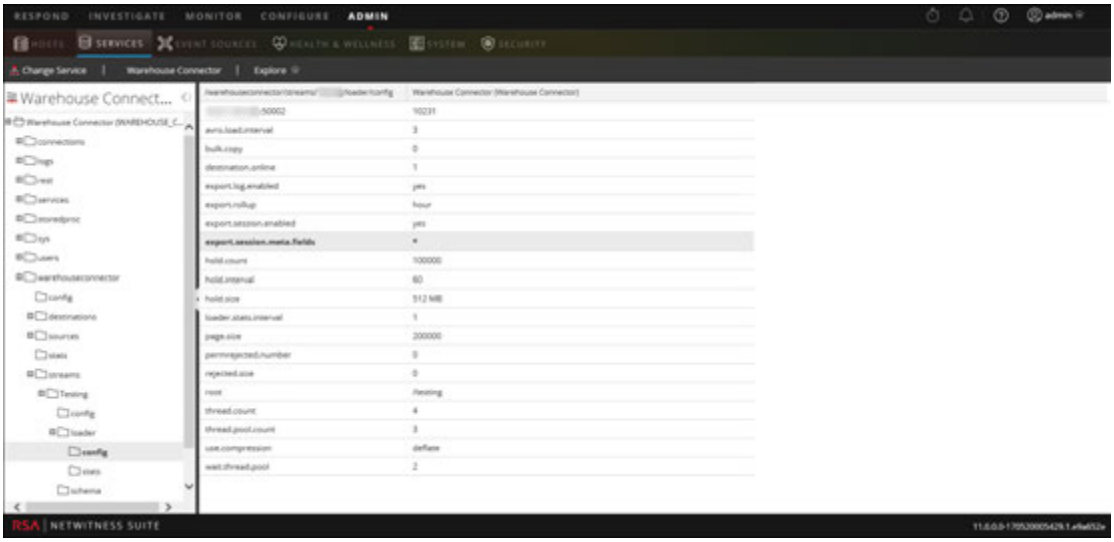
To specify meta filters for a Stream:

1. In the main menu, select **ADMIN > Services**.
2. In the Services view, select a Warehouse Connector services and select  **> View > Explore**.

The Explore view of the Warehouse Connector service is displayed.



3. In the options panel, select **warehouseconnector > streams > <stream_name> > loader > config**.
4. In the `export.session.meta.fields` parameter, enter the filter.



5. Restart the stream.

Define Multi-valued Metas

You can also define an existing meta or a custom meta to be treated as multi-valued meta.

To define multi-valued metas:

Caution: Defining an existing meta to be treated as multi-valued may change the data type of the meta and cause the associated reports to fail.

1. Create a new file with the filename **multivalue-users.xml** in the **/etc/netwitness/ng** directory.
2. Add the following entries:

```
<?xml version="1.0" encoding="utf-8"?>

<Netwitness>
    <MultiValueMetas>
<Meta>NEWMETANAME</Meta>
    </MultiValueMetas>
</Netwitness>
```

   Where *NEWMETANAME* is the existing meta or a custom meta to be treated as multi-valued meta.

   Caution: Make sure that you do not add metas that are by default treated as non multi-value.

3. Restart the stream.

Manage a Lockbox

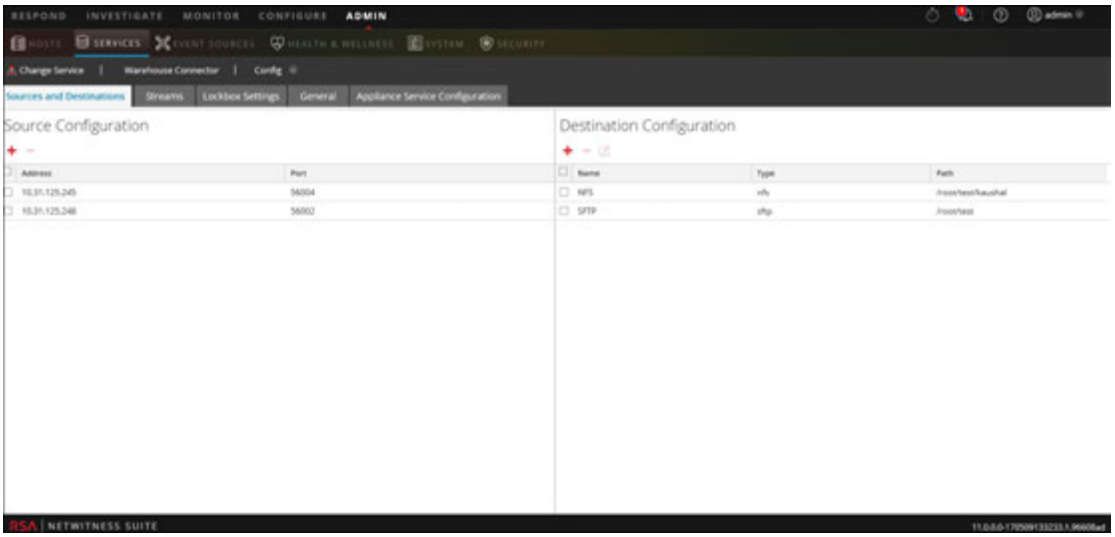
You can manage a lockbox using the following procedures:

- Change the Lockbox password
- Refresh the Lockbox

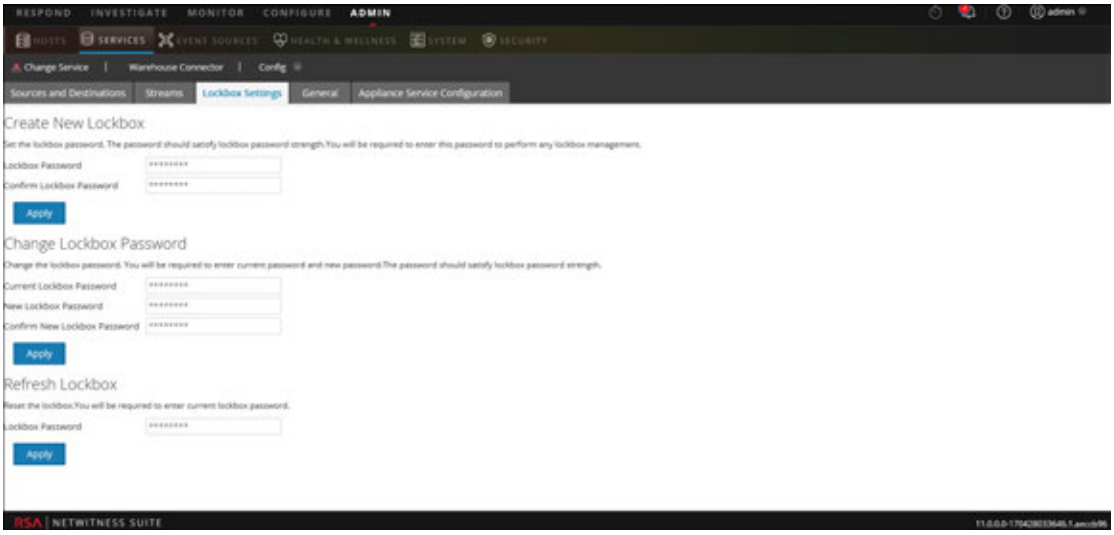
To change the Lockbox password:

1. Log on to NetWitness.
2. In themain menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.

   The Services Config view of Warehouse Connector is displayed.



4. Click the **Lockbox Settings** tab.



5. In the **Change Lockbox Password** section, perform the following:

   a. In the **Current Lockbox Password** field, enter the current lockbox password.

   b. In the **New Lockbox Password** field, enter the new lockbox password.

   Note: The lockbox password must be at least eight characters in length and it must contain at least three of the following groups: one uppercase character [A-Z], one lowercase character [a-z], one numeral [0-9], and one special character.

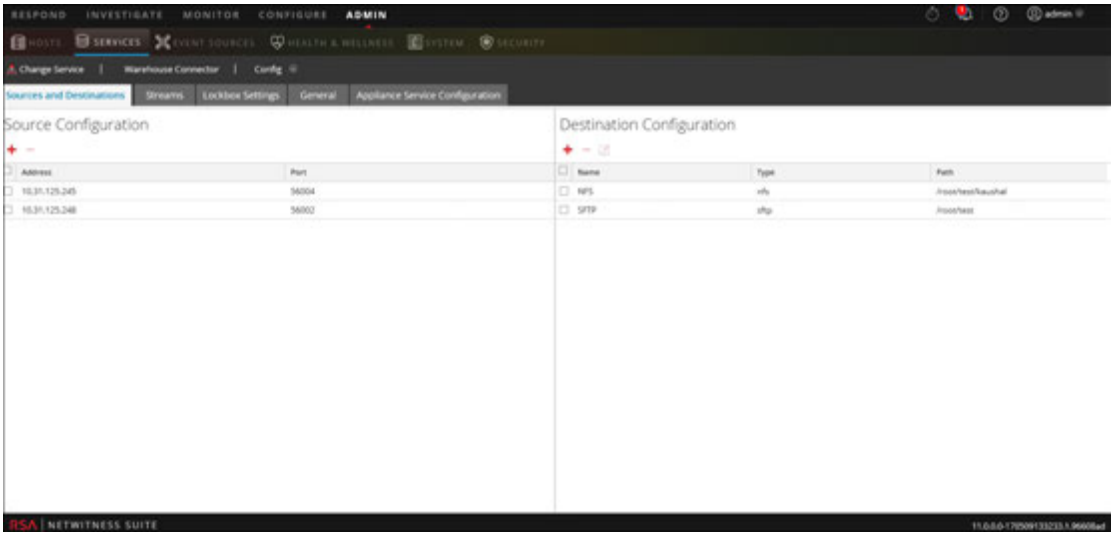
   c. In the **Confirm New Lockbox Password** field, enter the new lockbox password to confirm.

   d. Click **Apply**.
   The Lockbox password is successfully changed.

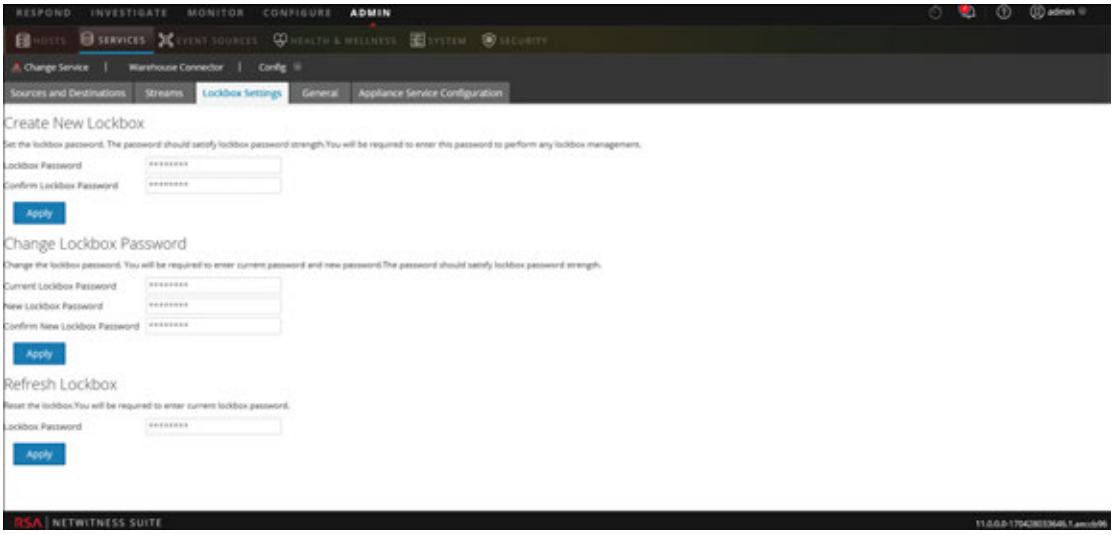
To refresh the Lockbox:

1. Log on to NetWitness.
2. In the main menu, select **ADMIN > Services**.
3. In the Services view, select the added Warehouse Connector service, and select  **> View > Config**.

The Services Config view of Warehouse Connector is displayed.



4. Click the **Lockbox Settings** tab.



5. In the **Refresh Lockbox** section, enter the current lockbox password in the **Lockbox Password** field.
6. Click **Apply**.
   The Lockbox is reset.

Warehouse Connector Configuration References

This section contains descriptions of the user interface as well as other reference information.

General Tab Settings

The General tab displays the general configuration settings for Warehouse Connector service.

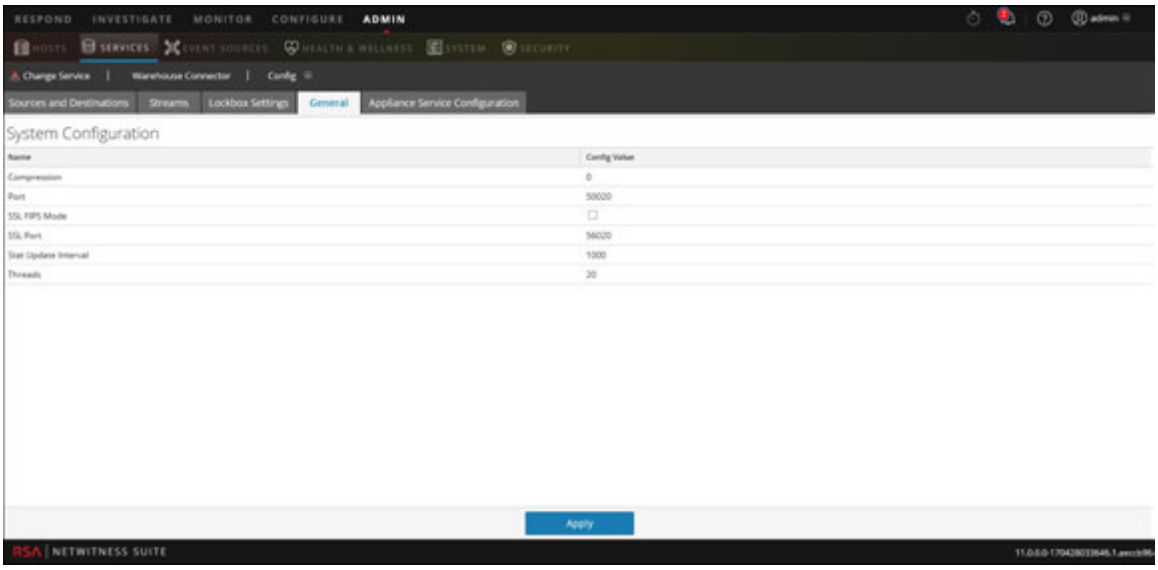
Quick View

The following figure shows the General tab on the Warehouse Connector Services Config view.

The General tab displays the system configuration parameters for the Warehouse Connector service.



When you add a Warehouse Connector service, default values are in effect. RSA designed the default values to accommodate most environments and recommends that you do not edit these values because it may adversely affect performance.

The following table describes the System Configuration parameters:

Name	Config Value
Compression	Determines the minimum amount of bytes before a message is compressed. If set to zero, messages are not compressed.
Port	Determines the port used by the service. **Note:** If you change the port number, ensure that you restart the service.
SSL	If enabled, all the data transferred in the network will be encrypted using SSL.
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system.
Threads	Determines the number of threads in the thread pool to handle incoming requests.

Appliance Service Configuration Tab Settings

The Appliance Service Configuration tab displays the appliance configuration settings for Warehouse Connector service. For more information, see the **Appliance Service Configuration** topic in the *Hosts and Services Getting Started Guide*.

Quick View

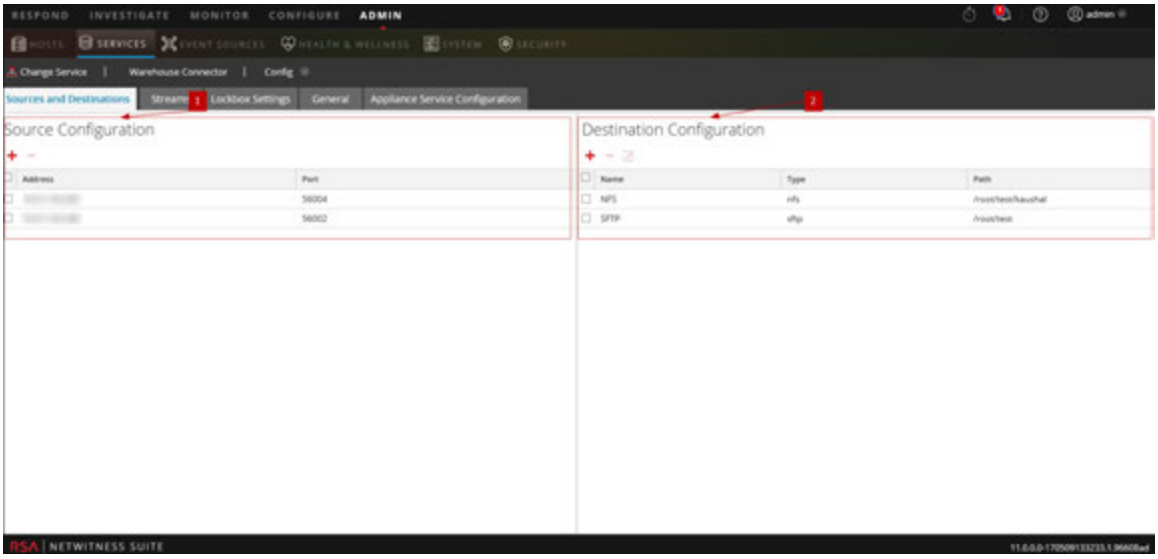
The following figure shows the Sources and Destinations tab on the Warehouse Connector Services Config view.



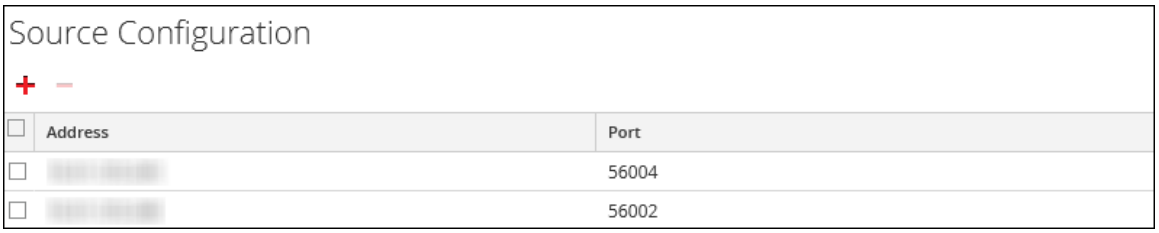
The Sources and Destinations tab includes the following two sections:

1. Source Configuration
2. Destination Configuration

Source Configuration

The Source Configuration section allows you to configure the data sources from which the Warehouse Connector service needs to collect data.

The following is an example of the Source Configuration section.

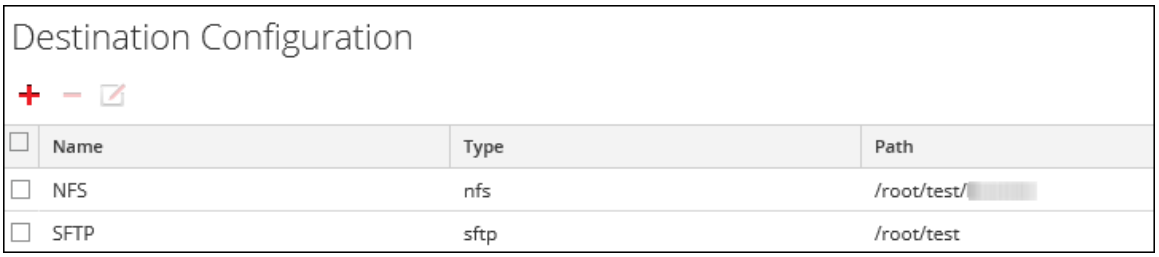


The Source Configuration section allows you to perform the following:

Features	Description
+	Add the data source.
−	Delete the data source.

Destination Configuration

The Destination Configuration section allows you to configure the destination to which the Warehouse Connector service needs to write the collected data.



The Destination Configuration section allows you to perform the following:

Features	Description
+	Add the destination.

Features	Description
	Delete the destination.
	Edit the destination. **Note:** You can only edit the SFTP destination type.

Add Stream Dialog

You can configure and add a stream to a Warehouse Connector in this dialog

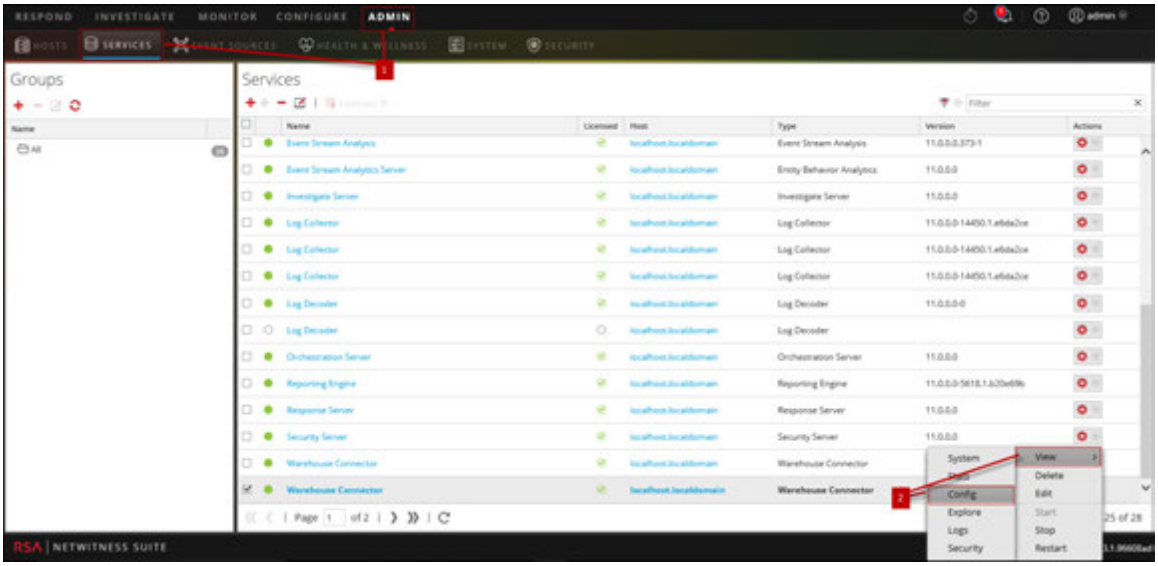
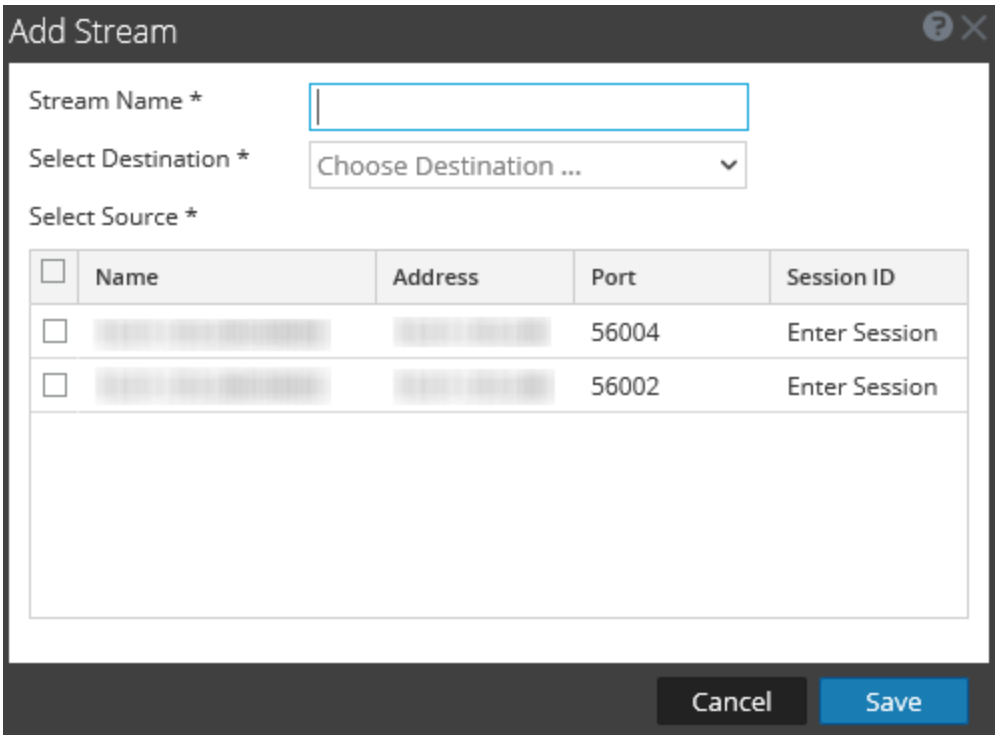
Related Topics

- Configure a Stream

Quick View

The following figure is an example with the important features labeled.





1. In the main menu, select **ADMIN > Services**.
2. In the **Services** view, select a Warehouse Connector service and select > **View** > **Config**.
3. In the **Streams** tab, click + to view the add stream dialog.

The following table describes the fields in the Add Stream dialog:

Parameter	Description
Stream Name	Type the name of the stream. The stream name may only contain alphanumeric characters and underscores. It cannot exceed 20 characters in length.
Select Destination	Select a destination from the drop-down list.

Parameter	Description
Select Source	Select a source from the grid at the bottom section of the dialog.
Name	The name of the source.
Address	The address of the source.
Port	The port of the source.
Session ID	The session ID of the source.

Streams Configuration

The Streams tab for a Warehouse Connector in the Services Config view provides a way to manage stream configuration.

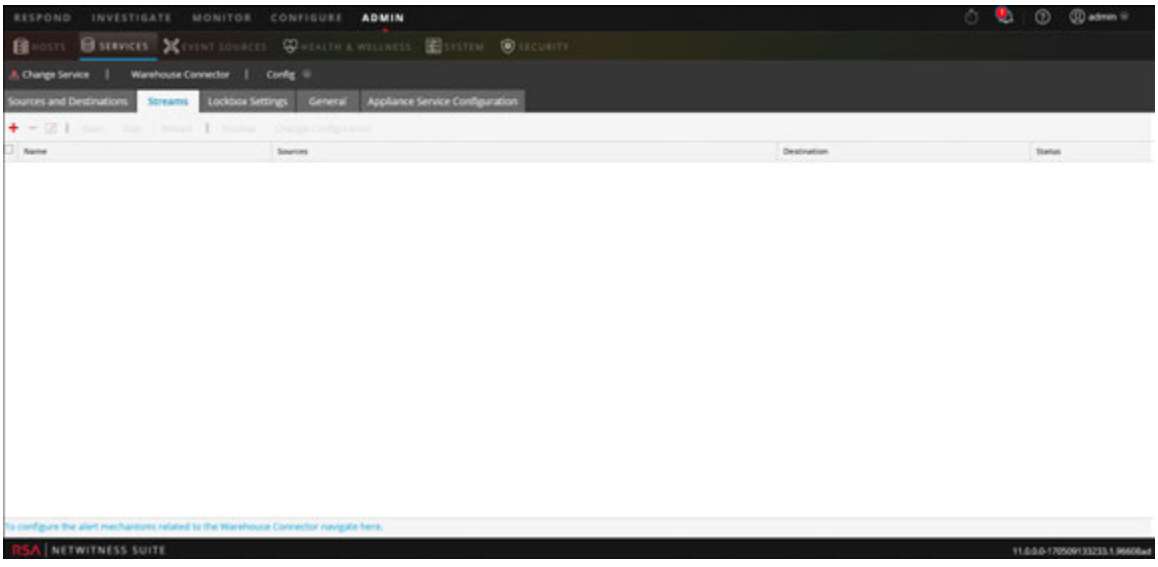
Related topics

Configure a Stream

Quick View

The following figure shows the Streams tab on the Warehouse Connector Services Config view.



The Streams tab allows you to perform the following:

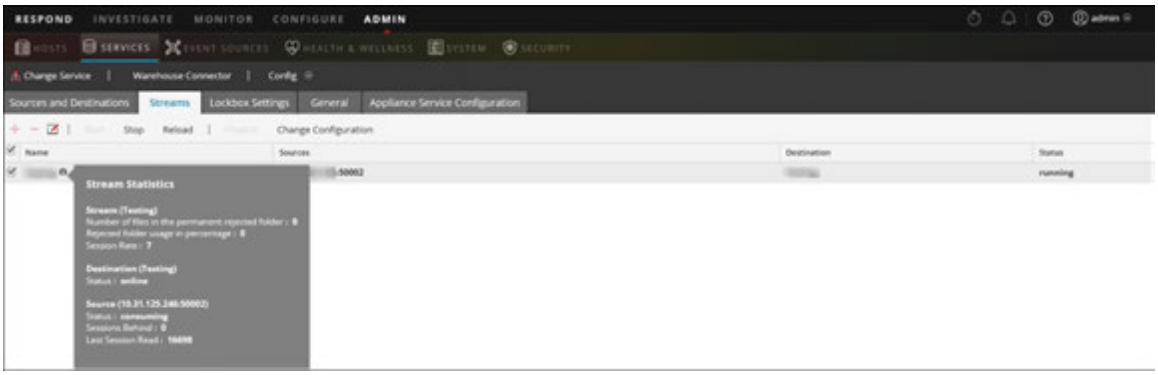
Features	Description
	Add a stream.
	Delete a stream.
	Edit the stream.
Start	Start the stream.
Stop	Stop the stream.
Finalize	Finalize the stream.
Reload	Reload the stream. If you have added a new meta or if a new meta is added as part of content update to any of the sources, Log Decoder or Decoder, you need to reload the stream for the meta to be visible in the schema for the Reporting Engine. Reloading a stream does not have any impact on the data, but only the new meta list is fetched from the sources.

The following table describes the fields in the Streams tab:

Parameter	Description
Name	Name of the stream.
Sources	The sources associated with the stream.
Destination	The destinations associated with the stream.
Status	Status of the stream.

Stream Statistics

You can view the statistics of a configured stream. Click the  icon next to the name of the stream.



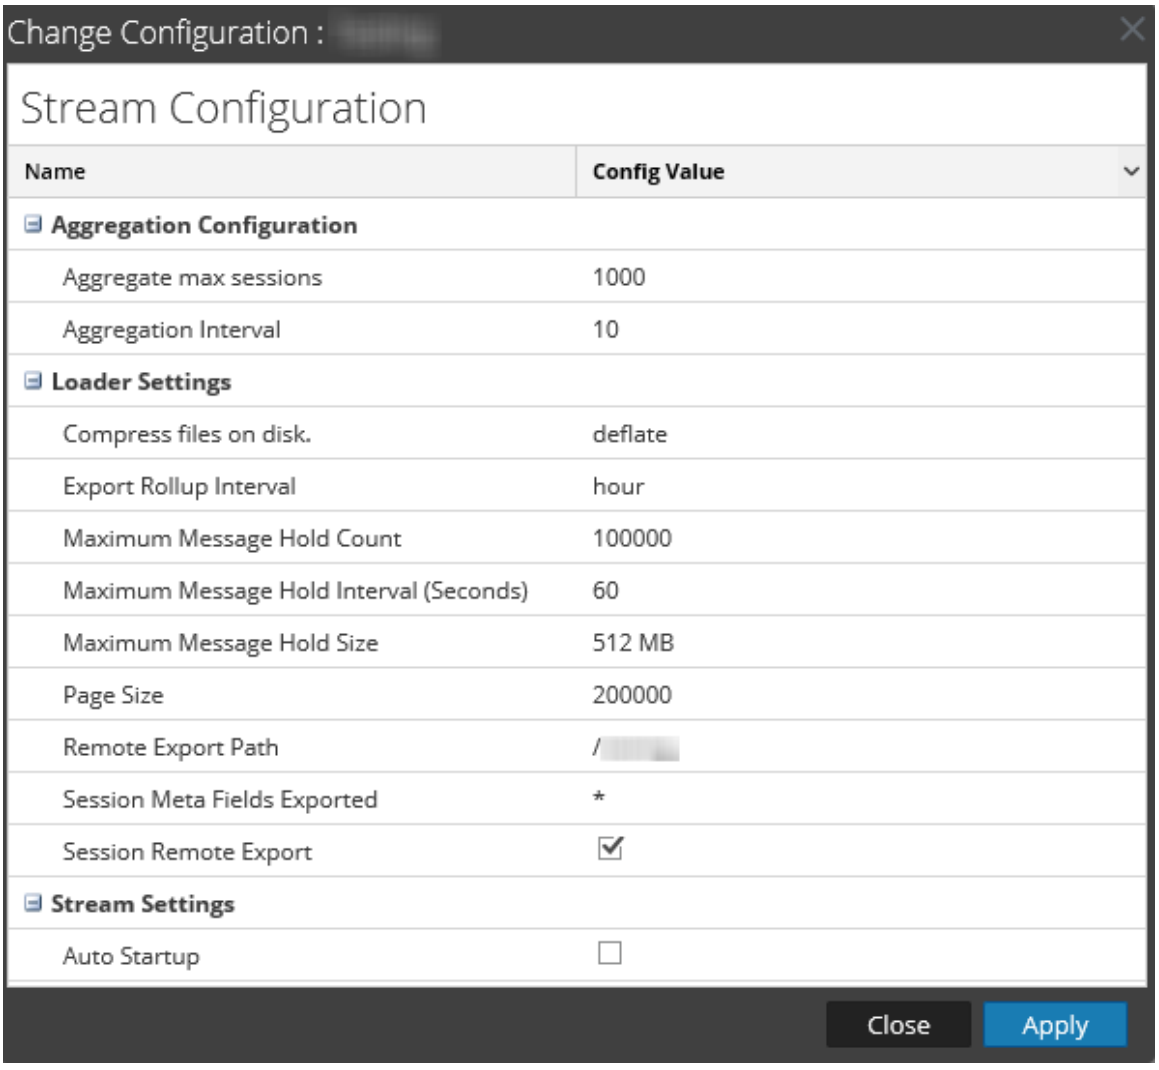
The following parameters are displayed in the Stream Statistics:

Section	Parameter	Description
Stream		
	Number of files in the permanent rejected folder	Determines the number of files in the permanent rejected folder (named, **permfail**) in the Warehouse Connector. The permanent rejected folder contains the files that Warehouse Connector failed to write to the destination.
	Rejected folder usage in percentage	Determines the disk usage of the rejected folder.
	Session Rate	Determines the rate at which the session is processed by the Warehouse Connector for the source.
Destination		
	Status	Indicates the status of the destination.
Source		
	Status	Indicate the status of the source.
	Sessions Behind	Determines that number of sessions that needs to be processed by the Warehouse Connector.

Section	Parameter	Description
	Last Session read	Determines the last session id processed by the Warehouse Connector.

Change Stream Configuration

You can change configuration of a stream in runtime. In the **Streams** tab, click **Change Configuration** to change the configuration of the selected stream.



You can change the following parameters of the Stream Configuration:

Note: If you change the value of any parameter in stream configuration, make sure that you restart the stream.

After upgrading, if the values of Maximum Message Hold Count, Maximum Message Hold Interval and Maximum Message Hold Size are 3000000, 60 and 128 respectively, ensure that you assign the following values to the streams:

- Maximum Message Hold Count - 2400000
- Maximum Message Hold Interval - 600
- Maximum Message Hold Size - 512

You can assign these values by modifying the existing Stream configuration.

Section	Parameter	Description
		Aggregation Configuration
	Aggregate max sessions	Determines the maximum number of sessions in a response for an aggregation request from the Warehouse Connector to the source .
	Aggregation Interval	Determines the time between the responses from the source.
		Loader Settings
	Compress files on disk	Enable to compress files on disk. Supported values: • Deflate - Provides smaller compressed files and good performance while generating reports. • Off By default, the parameter is set to **deflate**.

Section	Parameter	Description
	Export Rollup Interval	Determines the roll-up interval for export files and also the directory structure the Warehouse Connector writes to the destination. For example: If the parameter is set to: **Value** **Directory Structure** hour /rsasoc/v1/[logs | sessions]/data/{year}/{month}/{day}/{hour} minute /rsasoc/v1/[logs | sessions]/data/{year}/{month}/{day}/{hour}/{minute} day /rsasoc/v1/[logs | sessions]/data/{year}/{month}/{day} If you change the value of the parameter, ensure that you restart the stream. Recommended value is **hour**.
	Maximum Message Hold Count	Determines the maximum number of sessions to store in the memory before processing. **Note:** If you have deployed a Warehouse Connector Virtual Appliance, make sure that you change the default value of the parameter to 800000.
	Maximum Message Hold Interval (Seconds)	Determines the maximum time (in seconds) to hold the sessions in memory before processing.
	Maximum Message Hold Size	Determines the maximum size for the sessions to store in the memory before processing.

Section	Parameter	Description
	Remote Export Path	Determines the remote local mount point for HDFS (nfs://) and the location to export the data.
	Page Size	
		Stream Settings
	Auto Startup	Enable to automatically start the stream whenever the Warehouse connector process is restarted. By default, the parameter is set to **off**.

Lockbox Settings

The Lockbox Settings tab for a Warehouse Connector in the Services Config view provide a way to manage the lockbox settings.

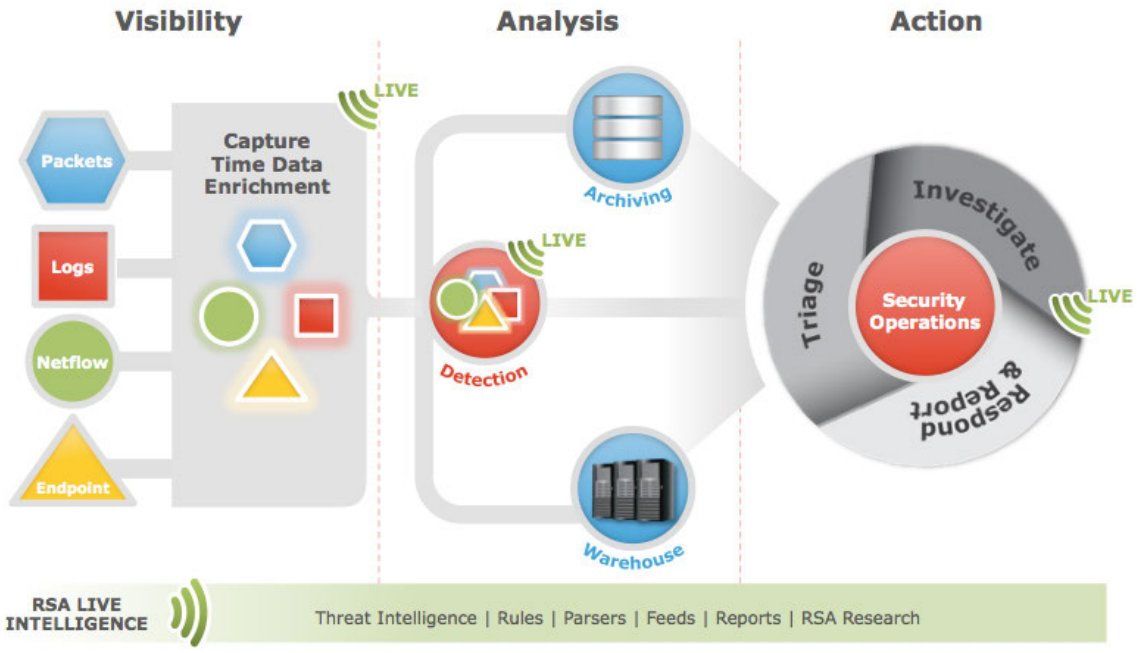
RSA NetWitness Warehouse Overview

RSA NetWitness Warehouse provides the capacity to process large amounts of current and long term data through a Hadoop-based distributed computing system that collects, manages, and enables advanced analytics and reporting on NetWitness Suite data. RSA NetWitness Warehouse requires a service called Warehouse Connector to collect metadata and events from Decoder and Log Decoder and write them in Avro format into a Hadoop-based distributed computing system. For more information on the Warehouse Connector, see the "How Warehouse Connector Works" topic in the *Warehouse Connector Configuration Guide*.

The Warehouse is made up of three or more nodes depending on the organization's analytic, archiving, and resiliency requirements.

The following figure depicts the architecture of a NetWitness Suite network that implements the RSA NetWitness Warehouse component.



How Warehouse (MapR) Works

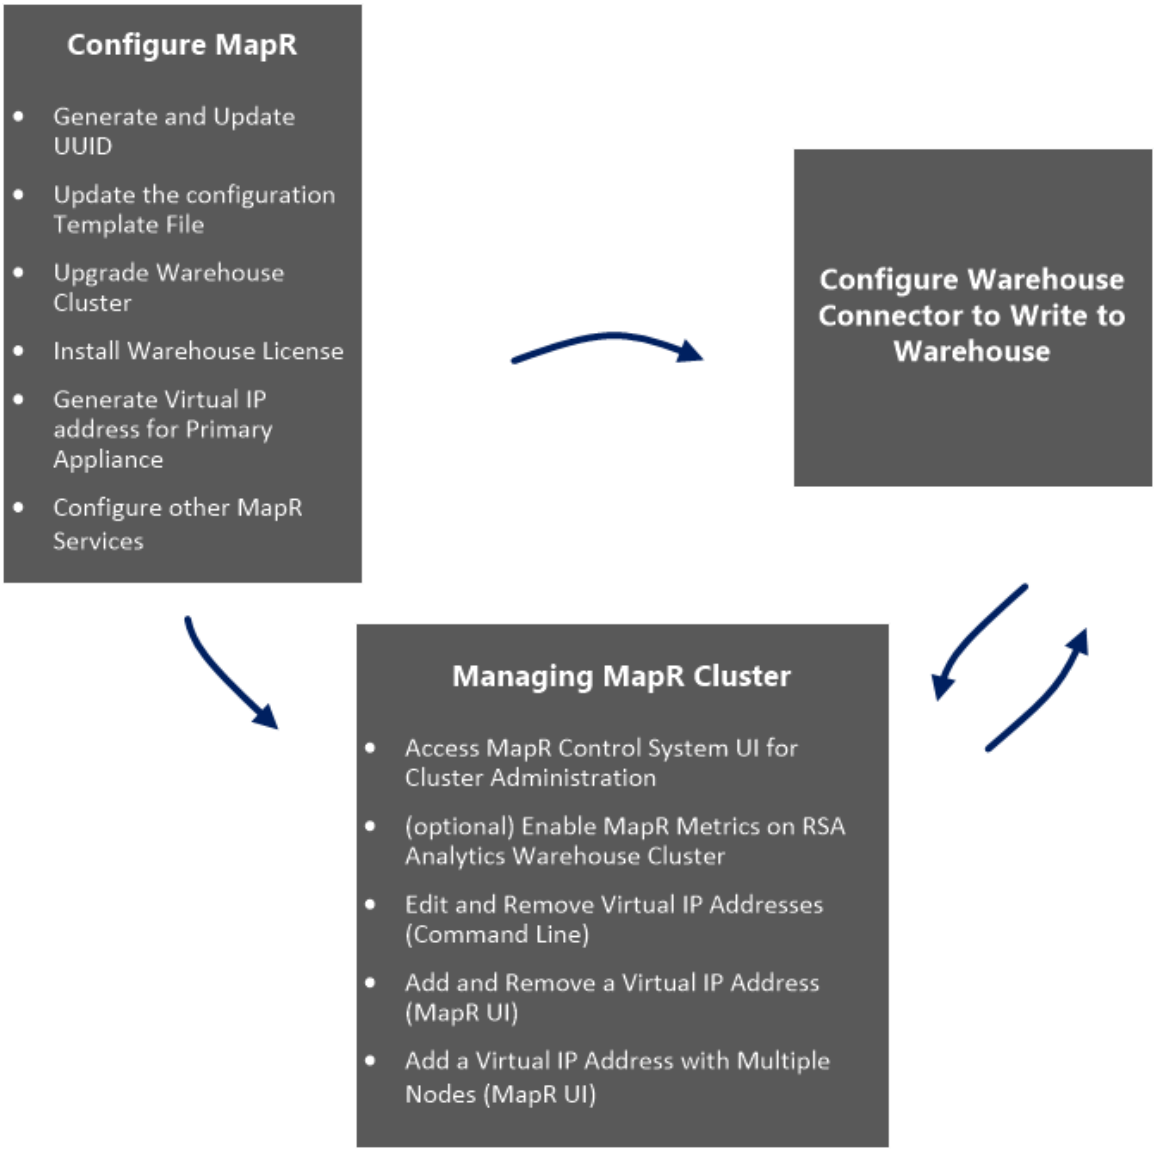
You must configure the nodes for the RSA NetWitness Warehouse (MapR). It only applies to RSA NetWitness Warehouse instances running MapR.

Prerequisites

Make sure that you have:

- Installed the RSA NetWitness Warehouse appliance in your network environment. For more information, see the "RSA Analytics Warehouse (MapR) Setup Guide" in the *Hardware Setup guides*.
- Configured the network interface of the Warehouse appliance.

This figure is an overview of the entire process of configuring Warehouse appliance in your network.



To configure the nodes for the RSA NetWitness Warehouse (MapR), perform the following:

Note: If you are planning to have a cluster of Warehouse appliances, make sure you perform the following tasks on all the appliances in the cluster.

Caution: Prerequisites are mandatory. Your installation will fail if you have not set the network configuration as described in the *RSA Analytics Warehouse (MapR) Setup Guide* or *Virtual Host Setup Guide* depending on your deployment.

1. Configure MapR
2. Configure Warehouse Connector to Write to NetWitness Warehouse
3. Manage MapR Cluster

Configure MapR

You can configure MapR using the following procedure:

Generate and Update the Default UUID in Appliances

You need to manually generate and update the default Universally Unique Identifier (UUID) on the Appliances in the cluster. The UUID must be unique to the Appliance in the cluster.

To generate and update the default UUID in the Appliance:

1. Log on to the Appliance as root user.
2. Generate the UUID and copy it in the correct files, using the following commands:
   - `/opt/mapr/server/mruuidgen > /opt/mapr/hostid`
   - `cp /opt/mapr/hostid /opt/mapr/server/hostid.xxxxx`

   Where, xxxxx refers to the 5-digit number randomly assigned to the existing file.

   Note: Review `/opt/mapr/server` for the full name of this file.
3. Restart the appliance, using the following command:
   `reboot`

Update the Configuration Template File

You must update the configuration template file in the RSA NetWitness Warehouse Appliance. The configuration template file in the RSA NetWitness Warehouse appliance must include the following parameters:

- nodes
- Internalnetworks
- clustername
- disks

By default, a configuration template is provided with the RSA NetWitness Warehouse appliance and is located on the RSA NetWitness Warehouse appliance at `/opt/rsa/saw/install`.

Prerequisites

Make sure that you validated the volume in the server to identify available drive space for Warehouse to store data. The total drive space of the additional volume is considered as a single drive by the HDFS. In Warehouse, the AVRO files are stored in the drive space.

Note: The server contains additional volumes of identical size other than the operation system volume.

To check free space, enter the command `fdisk -l | grep /dev/s |sort` in the Warehouse node. You will get a list of disks that are not partitioned for usage. You need to list the identified disks in the configuration template file so that Warehouse utilizes this space for the Hadoop Cluster.

To update the configuration template file in the RSA NetWitness Warehouse Appliance:

1. Log on to the appliance as the root user.
2. Navigate to `/opt/rsa/saw/install`, enter the following command:

   ```
   cd /opt/rsa/saw/install
   ```
3. Create a copy of the configuration template, enter the following command:

   ```
   cp conf.template conf.template-<name>
   ```

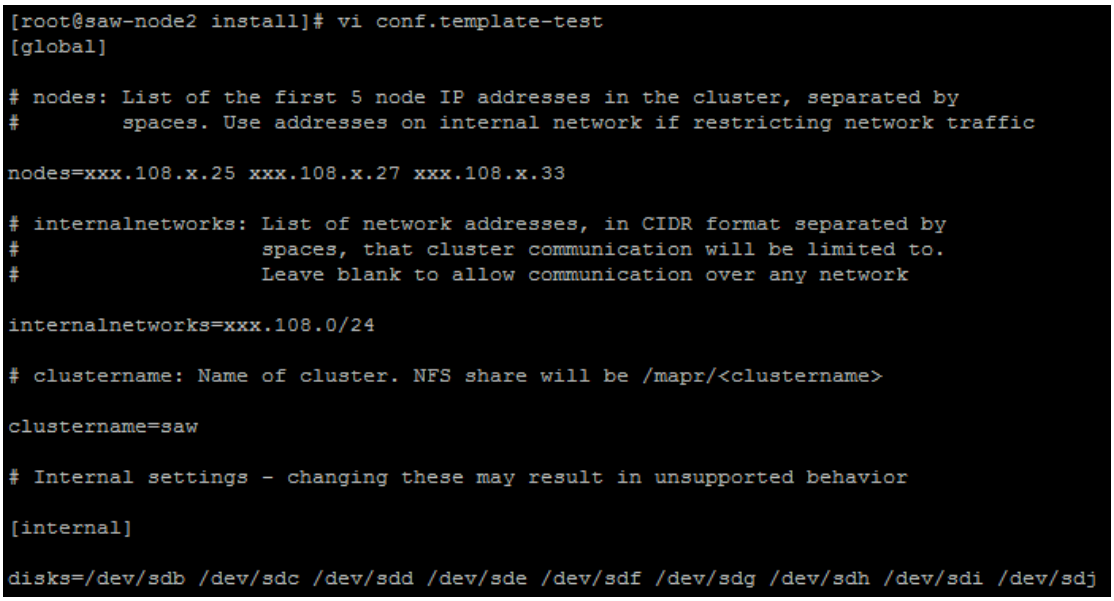
   where `<name>` is the custom name of the configuration template file.
4. Edit the configuration template file, enter the following command:

   ```
   vi conf.template-<name>
   ```

Parameter	Description
Nodes	List the IP addresses of the appliances in the cluster separated by spaces. All the appliances in the cluster must be listed in the same order in every configuration file for each RSA NetWitness Warehouse appliance.
Internalnetworks	List the network addresses in CIDR format separated by spaces. This Warehouse appliance cluster communication is limited to the provided network addresses. **Note:** RSA recommends that you do not leave this parameter blank.
Clustername	Name of the cluster. The cluster name is used to identify the Network File System (NFS) share.

Parameter	Description
Disks	Displays the list of disks recognized by the operation system, and these disks will be formatted in HDFS for the Warehouse when this configuration script is executed.

The following figure displays a sample configuration template file:



5. Execute the configuration template file, using the following command:

   ```
   ./configure.py conf.template-<name>
   ```

6. Restart the appliance, using the following command:

   ```
   reboot
   ```

Upgrade the Warehouse Cluster

You must upgrade the warehouse cluster after updating the configuration template file and reboot the RSA NetWitness Warehouse appliance.

To Upgrade the Warehouse Cluster

You must manually open Hiveserver port 10000, which is not opened by default:

1. Get the line number where the REJECT statement appears in the Iptable.
2. Make sure that the Iptables service is running, using the following command:

   ```
   NUM=$(iptables -L INPUT -n --line-numbers |grep 'reject-with'
   |awk ' {print $1}')
   ```

Note: The ACCEPT statements that follow the REJECT statement in the Iptables will not take effect. You can incorporate the line number of the REJECT statement in the command to ensure that the ACCEPT statements proceed the REJECT statement.

3. Add the firewall exception for port 10000 to the Iptables. Enter the following command:

   ```
   iptables -I INPUT $NUM -m state --state NEW -p tcp --
   dport 10000 -j ACCEPT
   ```

4. Save the Iptables. Enter the following command:

   ```
   /etc/init.d/iptables save
   ```

5. Restart the Iptables. Enter the following command:

   ```
   /etc/init.d/iptables restart
   ```

6. Verify if the firewall exceptions for the ports are added. Enter the following command:

   ```
   Service iptables status | grep 10000
   ```

   The following output should be displayed:

   ```
   ACCEPT tcp -- 0.0.0.0/0 0.0.0.0/0 state NEW tcp dpt:10000
   ```

Install the Warehouse License File

You need to manually install the Warehouse license file on the Warehouse appliance. If you have a cluster of Warehouse appliances, you need to install the license file on the first Warehouse appliance in the cluster.

Prerequisites

Make sure that you have:

- Obtained the Warehouse license file.
- Copied the license file to `/root/` on the first Warehouse appliance in the cluster using a USB drive or through SCP.

To install the Warehouse license file:

1. Log on to the appliance as a root user.
2. Install the license file, using the following command:

   ```
   maprcli license add -is_file true -license <license_filename>
   ```

where <license_filename> is filename of the RSA NetWitness Warehouse license file. The license file is installed without any output messages. If you included a network range in the internalnetworks parameter in the configuration template file, a warning message appears suggesting that the Warehouse is configured only to communicate with the network entered in the configuration template file. You can ignore this warning as this does not have any functional issue.

3. Confirm the license file installation, using the following command:

   ```
   maprcli license list
   ```

   The output messages appears on the console screen. The last two lines of the output message should be similar to the following sample:

   ```
   hash: "b8xO1flW8EMNSqq7zztn8D2BXnQ="
    3 May 14, 2013
   ```

4. Retrieve a list of directories, run the following command:

   ```
   hadoop fs -ls /
   ```

Generate the Virtual IP Address for Primary Appliance

Generate a virtual IP address for the primary RSA NetWitness Warehouse (Warehouse) appliance.

Prerequisites

Make sure you note down the MAC addresses of all the Warehouse appliances in the cluster. Use the following command on the appliance to view the MAC address of appliance:

```
ifconfig <interface> | grep HWaddr
```

where <interface> is the network interface.

To generate a virtual IP address for the primary Warehouse appliance:

1. Log on to the primary appliance as root user.
2. Create the virtual IP address. Enter the following command:

   ```
   maprcli virtualip add -virtualip <VIP_address> -netmask
   <netmask> -macs <mac_node1> <mac_node2> <mac_node3> ……< mac_
   node n>
   ```

   where:

   - <VIP_address> is the virtual IP address for the primary Warehouse appliance.
   - <netmask> is the netmask address of the primary Warehouse appliance.

- <mac_node1> is the MAC address of the first node in the Warehouse cluster.
- <mac_node2> is the MAC address of the second node in the Warehouse cluster.

For example, if the MAC address for node 1 is 01:Z1:1X:00:20:Y1 and node 2 is 32:Y2:4Z:40:10:X3, and the IP address is 192.168.100.10, then enter the command as following:

```
maprcli virtualip add -virtualip 192.168.100.10 -
netmask <netmask> -macs 01:Z1:1X:00:20:Y1 32:Y2:4Z:40:10:X3
```

3. Verify the virtual IP address, using the following command:
   ```
   maprcli virtualip list
   ```
4. To add or remove virtual IP addresses, you can use the command line or the MapR Control System. For more information, see "Edit and Remove Virtual IP Addresses (Command Line)" and "Add and Remove a Virtual IP Address (MapR UI)" sections in Manage MapR Cluster.

Configure other NetWitness Suite Services

Configure other NetWitness Suite services for the RSA NetWitness Warehouse (MapR).

1. If you are not using Vulnerability Response Management (VRM), disable the Hbase services to return the configured memory so that it is available for use elsewhere in the cluster. To stop the Hbase services, you can use the command line or the MapR Control System. For more information, see Stop the Hbase Services Using the Command Line and Stop the Hbase Services Using the MapR Control System.
2. Add Warehouse data sources to the Reporting Engine. For the detailed procedure, see the "Add Warehouse as Data Source to Reporting Engine" topic in the *Reporting Engine Configuration Guide*.

Stop the Hbase Services Using the Command Line

This section provides the steps to stop the Hbase services using the command line. If you are not using Vulnerability Response Management (VRM), stop the Hbase services to return the configured memory so that it is available for use elsewhere in the cluster.

To stop the Hbase services using the command line:

1. Stop the **Hbase RegionServer** service on *all of the appliances*, using the following command:
   ```
   maprcli node services -hbregionserver stop -filter "[hn==*]"
   ```

2. Stop the **Hbase RegionServer** service on *a specific node*, using the following command:
   `maprcli node services -hbregionserver stop -filter "[hn==<Hostname>]"`
   Where `<Hostname>` is the specific node hostname.
3. Stop the **Hbase Master** service on *all of the appliances*, using the following command:
   `maprcli node services -hbmaster stop -filter "[hn==*]"`
4. Stop the **Hbase Master** service on *a specific node*, using the following command:
   `maprcli node services -hbmaster stop -filter "[hn==<Hostname>]"`
   Where `<Hostname>` is the specific node hostname.

Hbase Services Stop and Start Commands Summary

The following tables summarize the commands used to stop and start the Hbase services for the **HBase RegionServer** and **HBase Master** services.

HBase RegionServer	Command to run using the Command Line
Stop on All the Appliances	`maprcli node services -hbregionserver stop -filter "[hn==*]"`
Start on All the Appliances	`maprcli node services -hbregionserver start -filter "[hn==*]"`
Stop on Specific node	`maprcli node services -hbregionserver stop -filter "[hn==<Hostname>]"`
Start on Specific node	`maprcli node services -hbregionserver start -filter "[hn==<Hostname>]"`

HBase Master	Command to run using the Command Line
Stop on All the Appliances	`maprcli node services -hbmaster stop -filter "[hn==*]"`

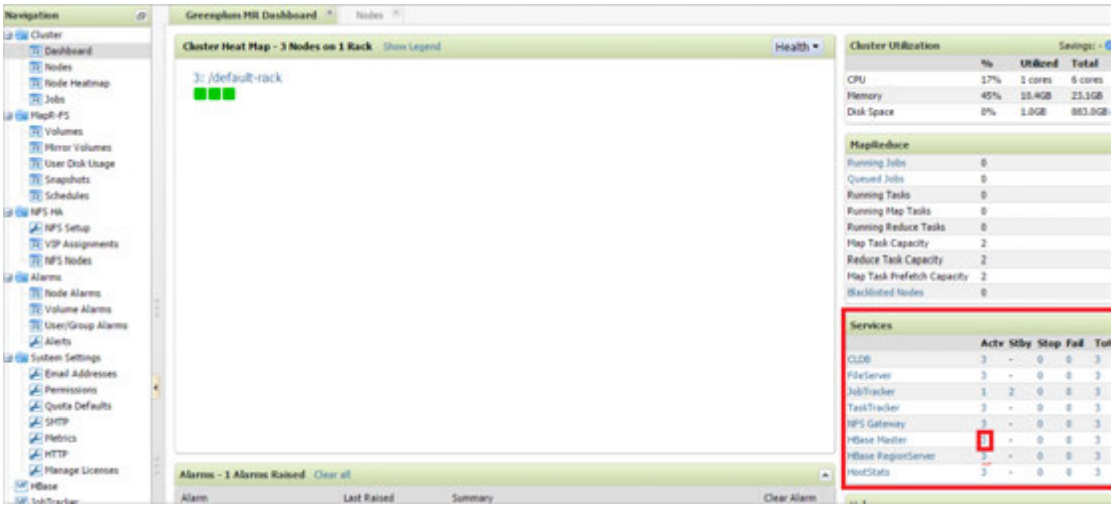
HBase Master	Command to run using the Command Line
Start on All the Appliances	`maprcli node services -hbmaster start -filter "[hn==*]"`
Stop on Specific node	`maprcli node services -hbmaster stop -filter "[hn==<Hostname>]"`
Start on Specific node	`maprcli node services -hbmaster start -filter "[hn==<Hostname>]"`

Where `<Hostname>` is the specific node hostname.

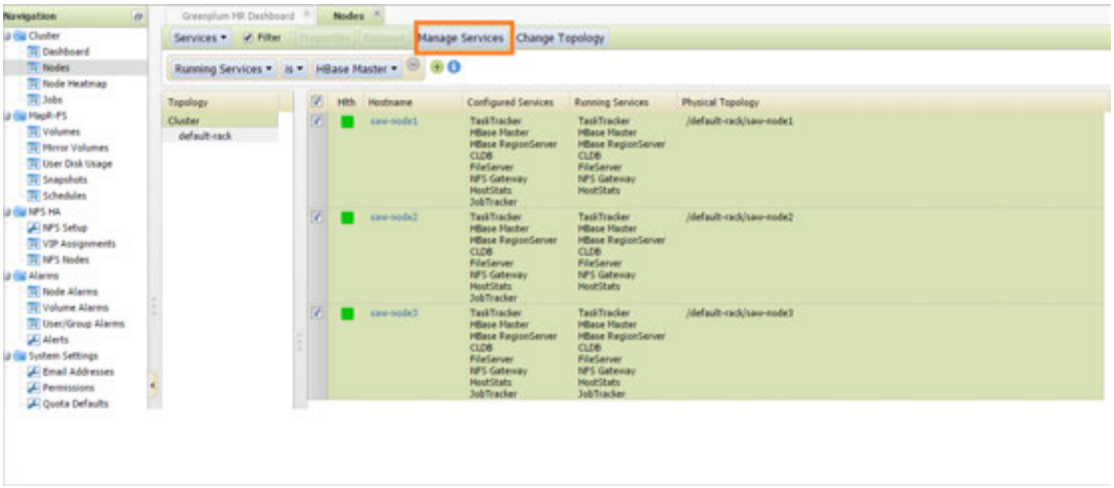
Stop the Hbase Services Using the MapR Control System

This section provides the steps to stop the Hbase services using the MapR Control System. If you are not using Vulnerability Response Management (VRM), stop the Hbase services to return the configured memory so that it is available for use elsewhere in the cluster.

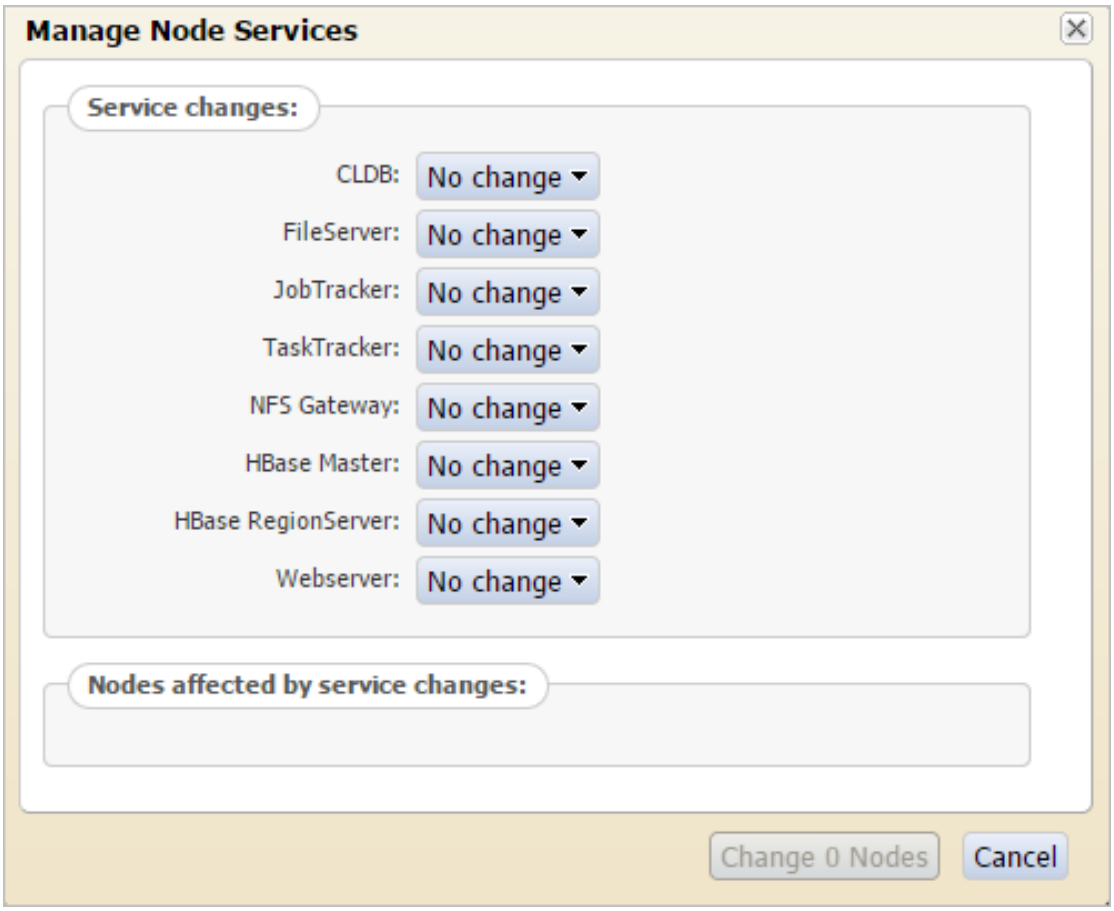
1. Log on to the MapR Control System user interface. For more information see "Access MapR Control System UI for Cluster Administration" section in Manage MapR Cluster.
2. Stop the **HBase Master** services, in the **Services** section of the dashboard, click the number in the **Actv** column for the **HBase Master** service. This is the number of active services for the **HBase Master** service.



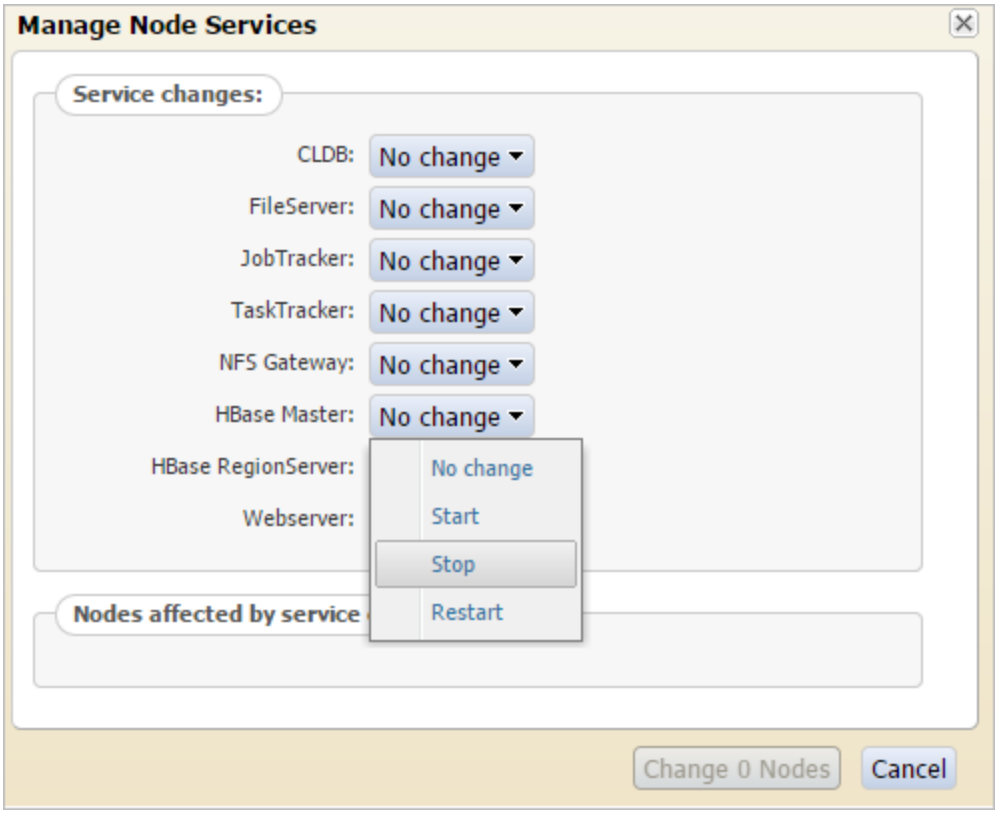
3. On the **Cluster Nodes** tab, click **Manage Services**.



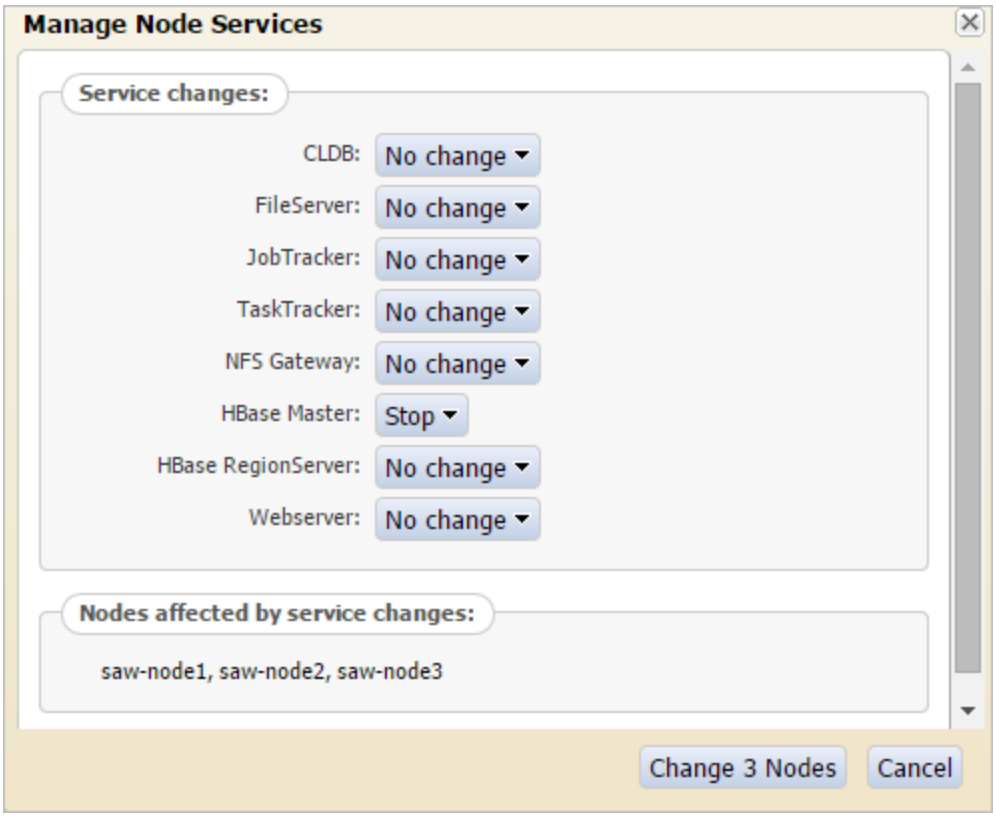
The **Manage Node Services** dialog is displayed.



4. In the **HBase Master** field, select **Stop**.



5. Click **Change <number_of_nodes> Nodes.**
   Where <number_of_nodes> is the number of active nodes selected.
   For example, click **Change 3 Nodes**.



The **Hbase Master** service on the selected nodes must be in a stopped state.

6. Stop the **Hbase RegionServer** services, repeat steps 2 to 5 for the **Hbase RegionServer** services.

Configure Warehouse Connector to Write to NetWitness Warehouse

You must enable the Warehouse Connector services to write to RSA NetWitness Warehouse.

To configure Warehouse Connector to write to the NetWitness Warehouse, perform the following tasks on the Log Decoders and Decoders where the Warehouse Connectors are installed:

Note: If you are configuring on a virtual environment, perform these tasks on a standalone Warehouse Connector server.

Verify the Network File System (NFS) Services Status

To verify the NFS services status:

1. Log on to the Warehouse Connector appliance where you have installed the Warehouse Connector service.
2. Enter the following command:
   ```
   rpm -qa |grep nfs
   ```
   The NFS package names appear in the output message. For example:
   ```
   nfs-utils-lib-1.1.5-6.el6.x86_64
   nfs-utils-1.2.3-36.el6.x86_64
   ```
3. If the output message is empty, install the NFS packages.

Install the Network File System Packages

Prerequisites

If the NFS packages are already downloaded on the appliances manually, install the packages and mount RSA NetWitness Warehouse. You need to have internet access to complete this task. If internet access is not available, you must download the RPM packages offline and copy them to this machine for installation.

Note: Install the NFS packages only if the NFS packages are not displayed when you verify the status of NFS in the Warehouse Connector appliance or on the appliance where you have installed the Warehouse Connector service.

To install NFS packages:

1. Log on to the Warehouse Connector appliance or on the appliance where you have installed the Warehouse Connector service.
2. Verify the NFS status, using the following command:

   ```
   rpm -qa |grep nfs
   ```

   The NFS package names appear in the output message. For example:

   ```
   nfs-utils-lib-1.1.5-6.el6.x86_64
    nfs-utils-1.2.3-36.el6.x86_64
   ```

   If the `nfs-utils` and `nfs-utils-lib` are properly identified, you can skip the remaining steps in this procedure (*Install the Network File System Packages*).
3. Search for NFS package, using the following command:

   ```
   yum search nfs-utils
   ```

   The output ends with the following message:

   ```
   "name and summary matches only, use "search all" for
   everything."
   ```

   Note: Contact RSA Customer Support if the output ends with the following message: `"no matches found"`
4. Install the NFS programs, using the following command:

   ```
   yum install nfs-utils nfs-utils-lib
   ```

   The output prompts for **y** or **n**. Type **y** and press **ENTER**.

The NFS packages are successfully installed.

Mount the Warehouse on the Warehouse Connector

To mount RSA NetWitness Warehouse on the appliance:

1. Create a new directory named **/saw**, using the following command:

   ```
   mkdir /saw
   ```
2. Enter the following command:

   ```
   ll /
   ```

   The new directory is displayed.
3. Mount the Warehouse, using the following command:

   ```
   mount -t nfs -o nolock,tcp,hard,intr <IP_Address_for_
   ```

`SAW>:/mapr/<cluster-name> /saw`

Where `<IP_Address_for_SAW>` is the IP address of the primary Warehouse appliance in the cluster and `<cluster-name>` is the name provided in the template file.

Note: If a virtual IP address is configured for the Warehouse, you have to use it as the IP address in `<IP_Address_for_SAW>`.

4. Verify if the Warehouse is mounted successfully, using the following command

   `mount`

   The IP address of the primary Warehouse appliance and other details you have provided in **step 3** appear in the last line of the output message.

5. List the content in the newly created directory, **/saw**, using the following command:

   `ll /saw`

   The following directories are displayed:

   hbase

   index-scratch

   jars

   logs

   user

   var

6. To add NFS to the Auto-mount options. Do the following:

   a. To check if the IP address of the primary Warehouse appliance and other details you have provided while mounting Warehouse appears in `/etc/fstab`, enter the following command:

      `cat /etc/fstab`

      If the detail does not appear in the `/etc/fstab` file, perform the following steps.

   b. Enter the following command:

      `tail –n 1 /etc/mtab`

      The IP address of the primary Warehouse appliance and other details you provided while mounting Warehouse appear in the last line of the output message.

   c. Enter the following command:

      `tail –n 1 /etc/mtab >> /etc/fstab`

   d. Edit the /etc/fstab file to add the word ‘auto’ at the end of the file. Enter the following command:

      `vi /etc/fstab`

For example, `10.11.111.11:/mapr/saw /saw nfs rw,nolock,tcp,auto,addr=10.11.111.11 0 0`

Manage MapR Cluster

You can manage the MapR cluster using the following procedures:

Access MapR Control System UI for Cluster Administration

You can access the MapR Control System user interface for RSA NetWitnessWarehouse cluster administration. MapR Control System user interface enables you to administer the RSA NetWitnessWarehouse cluster. The MapR Control System user interface provides details of the following:

- Nodes
- Node Heatmap
- Jobs
- MapR Tables
- Volumes
- Mirrors
- User Disk Usage
- Snapshots
- Schedules
- NFS Setup
- Virtual IP Assignments
- NFS Nodes
- Node Alarms
- Volume Alarms
- User/Group Alarms
- HBase
- JobTracker
- CLDB

To access the MapR Control System user interface:

1. Log on to one of the appliances in the RSA NetWitnessWarehouse cluster.
2. Start the webserver. Enter the following command:

   ```
   /opt/mapr/adminuiapp/webserver start
   ```

   Note: The default port used by the webserver is **8443**.

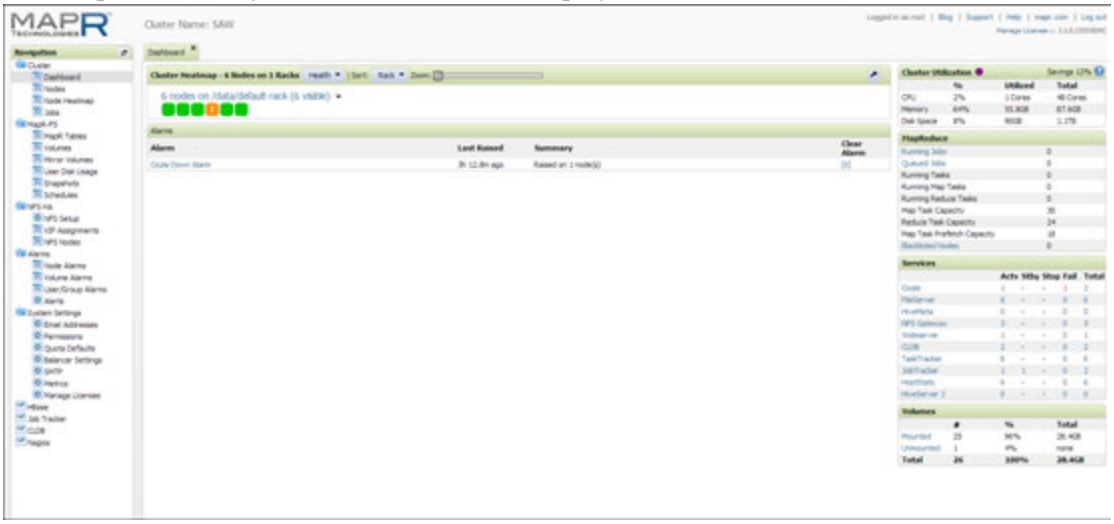
   Note: If you receive the error `/opt/mapr/conf/ssl_keystore (No such file or directory)` in the `/opt/mapr/logs/adminuiapp.log` after executing the command `/opt/mapr/adminuiapp/webserver start`, enter the following commands:

   ```
   ./configure.sh -R -genkeys
   service mapr-warden restart
   ```

3. Using a web browser to access the MapR Control System, type the following url:

   ```
   https://<NODE-IP-OR-HOSTNAME>:8443
   ```

   The MapR Control System user interface is displayed.



Enable MapR Metrics on RSA NetWitnessWarehouse Cluster

You can enable MapR Metrics on the RSA NetWitnessWarehouse cluster. This optional procedure enables Administrators to see job details in the MapR Control System UI rather than going to the JobTracker for details.

Prerequisites

Make sure that you have the following MapR Metrics dependencies installed in your environment:

- MySQL Server installed and configured.
- Libraries hosted on the EPEL Repository.
- Libraries hosted on the CentOS base repositories.

To Enable MapR Metrics

To enable MapR Metrics on the RSA NetWitnessWarehouse cluster, follow the instructions at the following links:

- http://doc.mapr.com/display/MapR/Setting+up+the+MapR+Metrics+Database
- http://doc.mapr.com/display/MapR/MapR+Metrics+and+Job+Performance

Note: Make sure you install MapR Mertics on the nodes in your RSA NetWitnessWarehouse Cluster where Job Tracker or Web Server is running.

Edit and Remove Virtual IP Addresses (Command Line)

You can edit and remove virtual IP addresses in the Warehouse cluster using the command line. This procedure is optional and used when you want to change the virtual IP addresses in the Warehouse cluster.

Adding and removing Warehouse appliances to and from a virtual IP group is accomplished by executing an **edit** command. This is the same as the add command, except that ALL of the MAC addresses are replaced with ONLY the MAC addresses that you enter.

Prerequisites

Make sure you note down the MAC addresses of all the Warehouse appliances in the cluster. Use the following command on the appliance to view the MAC address of the appliance:

```
ifconfig <interface> | grep HWaddr
```

where `<interface>` is the network interface.

Also note the MAC addresses of the Warehouse appliances that you want to add.

To add or remove a virtual IP address in the primary Warehouse appliance:

1. Log on to the primary appliance as root user.
2. Edit the virtual IP address. Enter the following command:

```
maprcli virtualip edit -virtualip <VIP_address> -netmask
<netmask> -macs <mac_node1> <mac_node2> <mac_node3> ……< mac_
node n>
```

where:

- `<VIP_address>` is the virtual IP address for the primary Warehouse appliance.
- `<netmask>` is the netmask address of the primary Warehouse appliance.
- `<mac_node1>` is the MAC address of the first node in the Warehouse cluster.
- `<mac_node2>` is the MAC address of the second node in the Warehouse cluster.

For example, if the IP address of the primary warehouse is `192.168.100.10` and the MAC address for node 1 is `01:Z1:1X:00:20:Y1`, node 2 is `32:Y2:4Z:40:10:X3`, and you want to add node 3, which is `20:Y2:4Z:20:10:X3`, then enter the following:

```
maprcli virtualip edit -virtualip 192.168.100.10 -
netmask <netmask> -
macs 01:Z1:1X:00:20:Y1 32:Y2:4Z:40:10:X3 20:Y2:4Z:20:10:X3
```

3. Verify the virtual IP addresses. Enter the following command:

```
maprcli virtualip list
```

To remove the virtual IP address of the primary Warehouse appliance group entirely:
Enter the following command:

```
maprcli virtualip remove -virtualip 192.168.100.10
```

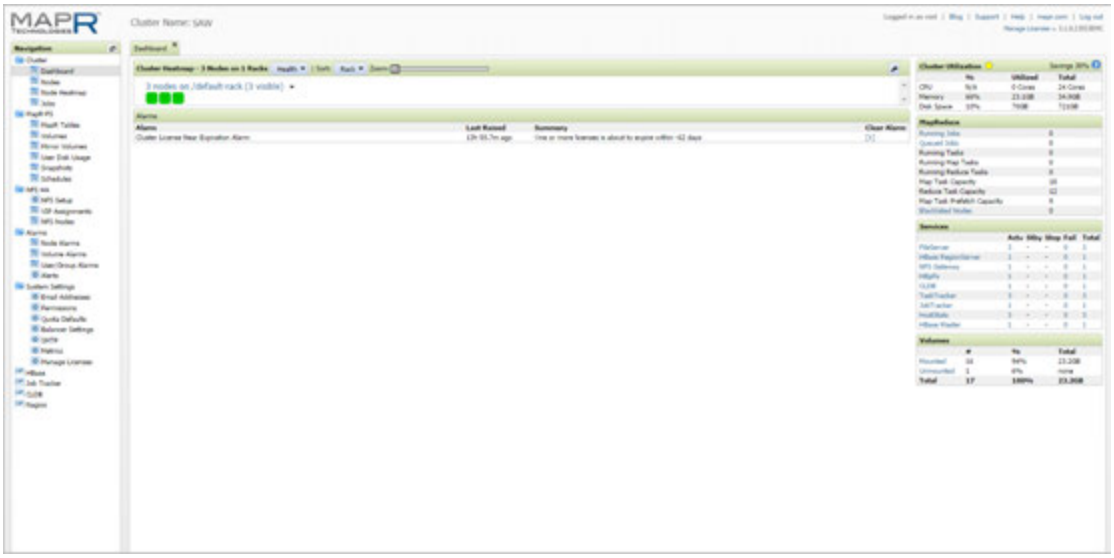
Add and Remove a Virtual IP Address (MapR UI)

You can add a virtual IP address in the Warehouse cluster using the MapR Control System. This procedure is optional and used when you want to add a virtual IP address (VIP) in the Warehouse cluster.

Prerequisites

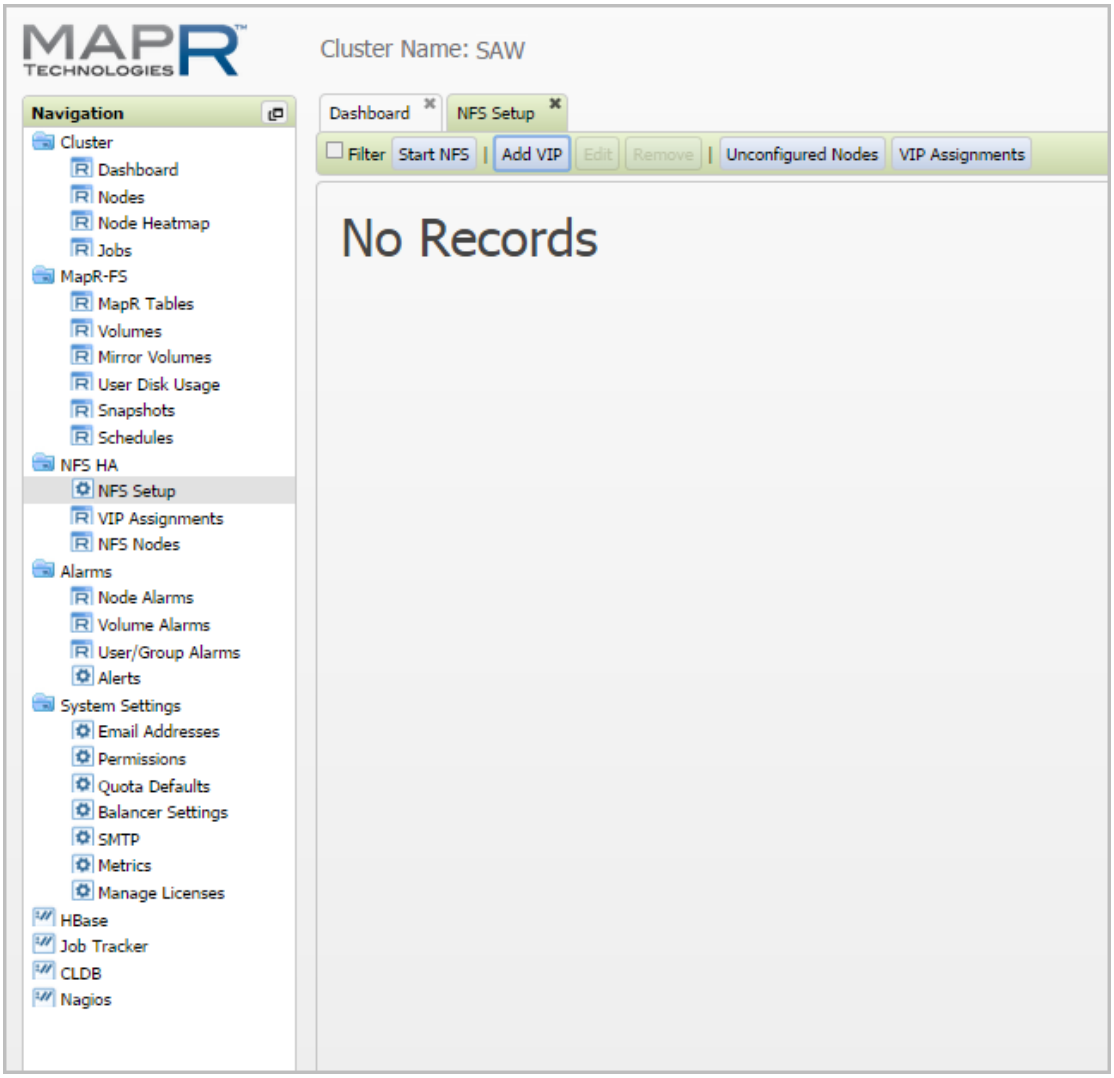
Follow the instructions in Access MapR Control System UI for Cluster Administration before completing this procedure.

1. Log on to the MapR Control System.

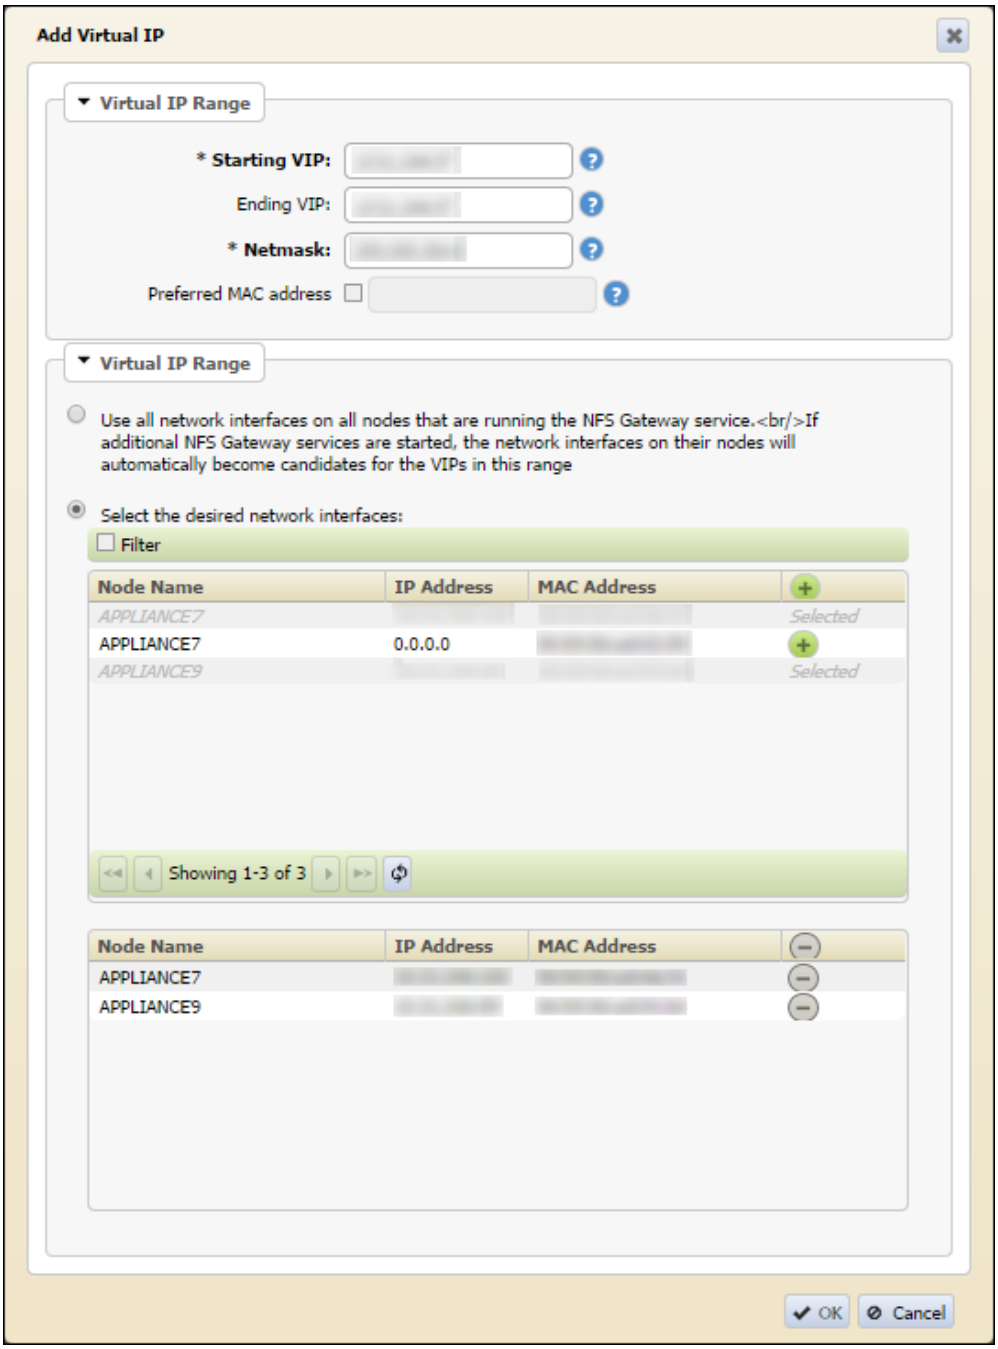


2. In the Navigation panel, select **NFS HA > NFS Setup**.
   The NFS Setup tab is displayed. The NFS Setup tab enables you to edit, remove or add VIPs in the Warehouse cluster.

3. On the **NFS Setup** tab, click the **Add VIP** button.



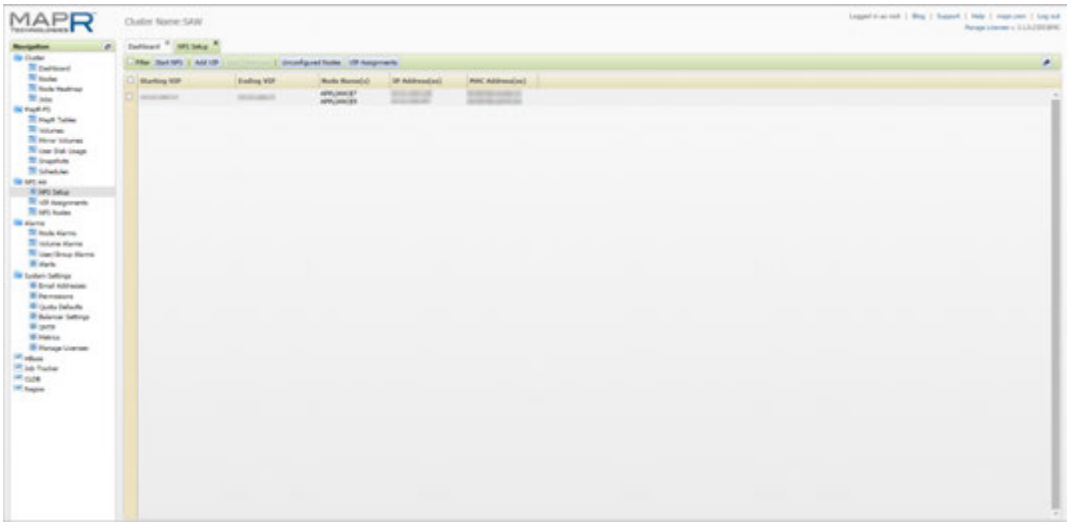
The **Add Virtual IP** dialog is displayed.



4. In the **Add Virtual IP** dialog, do the following:
   a. In the **Starting VIP** field, type the starting IP Address for VIP.
   b. In the **Ending VIP** field, type the ending IP Address for VIP. If this field is left blank, only one IP address is used for VIP allocation.
   c. In the **Netmask** field, type the Netmask for the deployment.

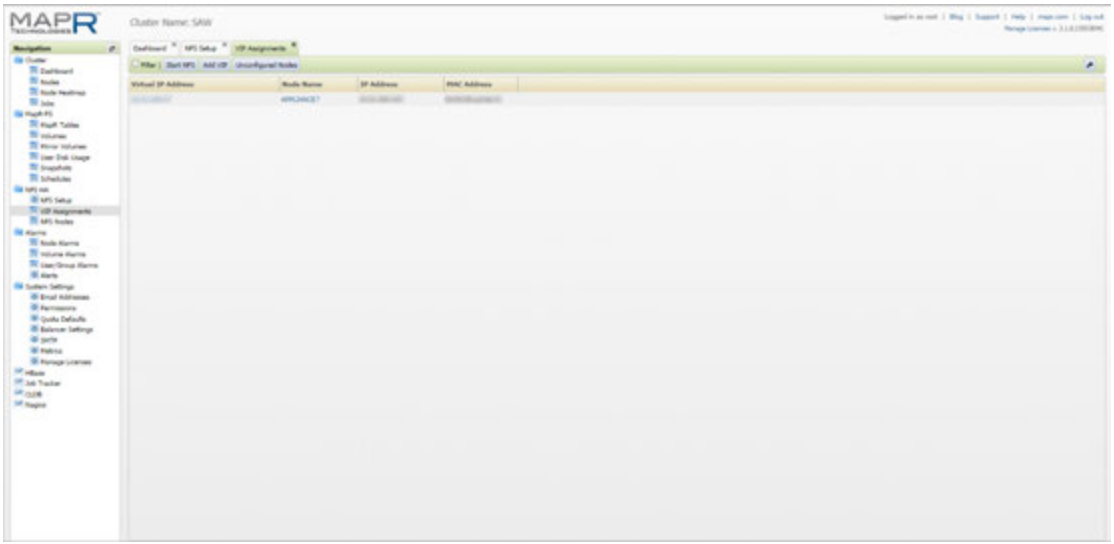
d. Select **Select Desired Network Interfaces** to choose the available Network Interfaces that need to be used for VIP assignment. Select all of the external Interfaces from the list of available nodes by clicking the plus button next to the interface entry. Selected Interfaces will appear in the bottom list.

e. Click **OK** to add the VIP.
The newly added VIP appears in the list on the **NFS Setup** tab.



Note: VIP allocation can also be removed or edited from the **NFS HA > NFS Setup** tab by selecting a VIP and clicking the **Edit** or **Remove** button.

5. In the Navigation panel, select **NFS HA > VIP Assignment** to view the node that is assigned to the newly added VIP.



Add a Virtual IP Address with Multiple Nodes (MapR UI)

You can add a virtual IP address (VIP) with multiple nodes. Virtual IP (VIP) is a technique used to load balance data access into HDFS by using a floating IP Address among the cluster nodes. This technique is mostly used by the MapR Hadoop Distribution along with the MapR-NFS Service. VIP can provide High Availability and Load Balancing by dynamically allocating the Floating IP among the nodes.

Optimal VIP Configuration

We recommend using one VIP for every three Nodes, because the replication factor for HDFS is 3 by default. This also helps in optimizing the performance of the cluster.

In the case of High Data Load (>20K EPS), a single NFS might overload while replicating the file into the cluster. If the NFS Server crashes before the data is replicated, you may lose data.

Multiple NFS Servers also allow more distributed data locality which helps in High Availability and Fault Tolerance.

Prerequisites

Calculate how many VIPs you can afford.

- We suggest **One VIP per 3 Nodes**.
- In case the number of nodes that you have is not a multiple of three, you can allocate multiple VIPs to more than three nodes. For example, two VIPs among five Nodes.

The steps to add the VIP are the same as adding any other VIP, but instead of choosing “all nodes” for VIP, you choose a subset of nodes to participate in the VIP.

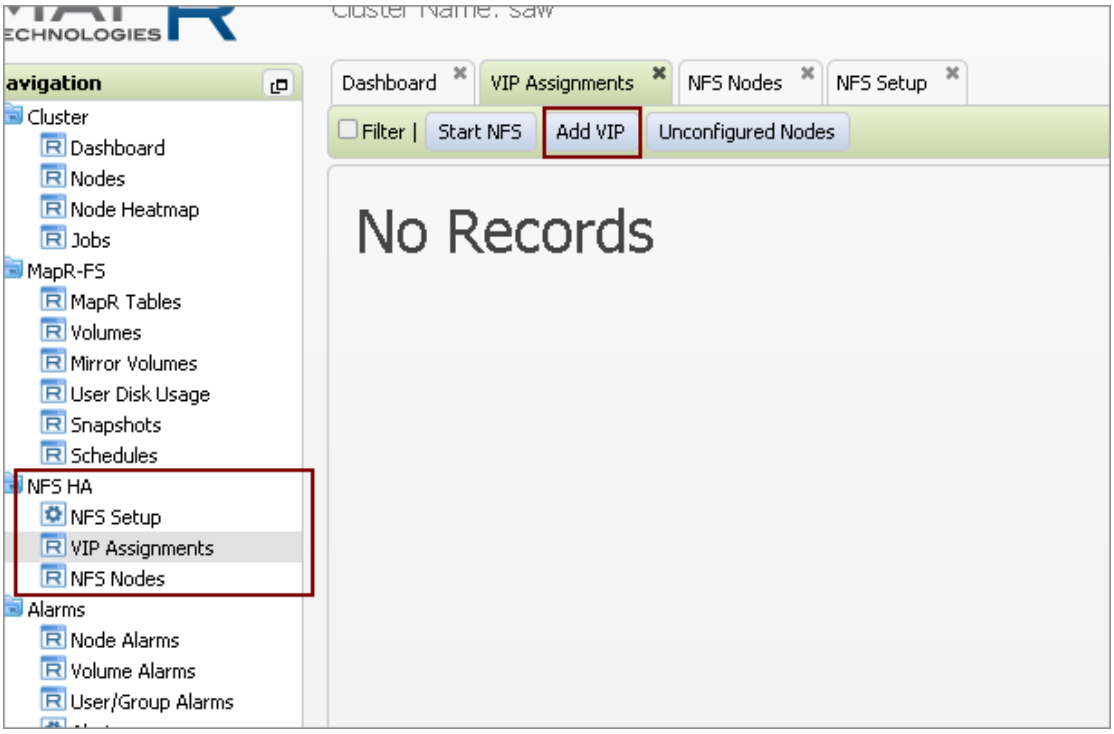
- A node can participate in Multiple VIPs.
- For more information, see http://doc.mapr.com/display/MapR/Setting+Up+VIPs+for+NFS

Optimal Configuration with the Warehouse Connector

The recommended configuration is to have one VIP per Warehouse Connector. In cases where Warehouse Connector numbers are higher than VIPs, configure multiple Warehouse Connectors to write to a VIP in a way so that traffic on VIPs can be normalized.

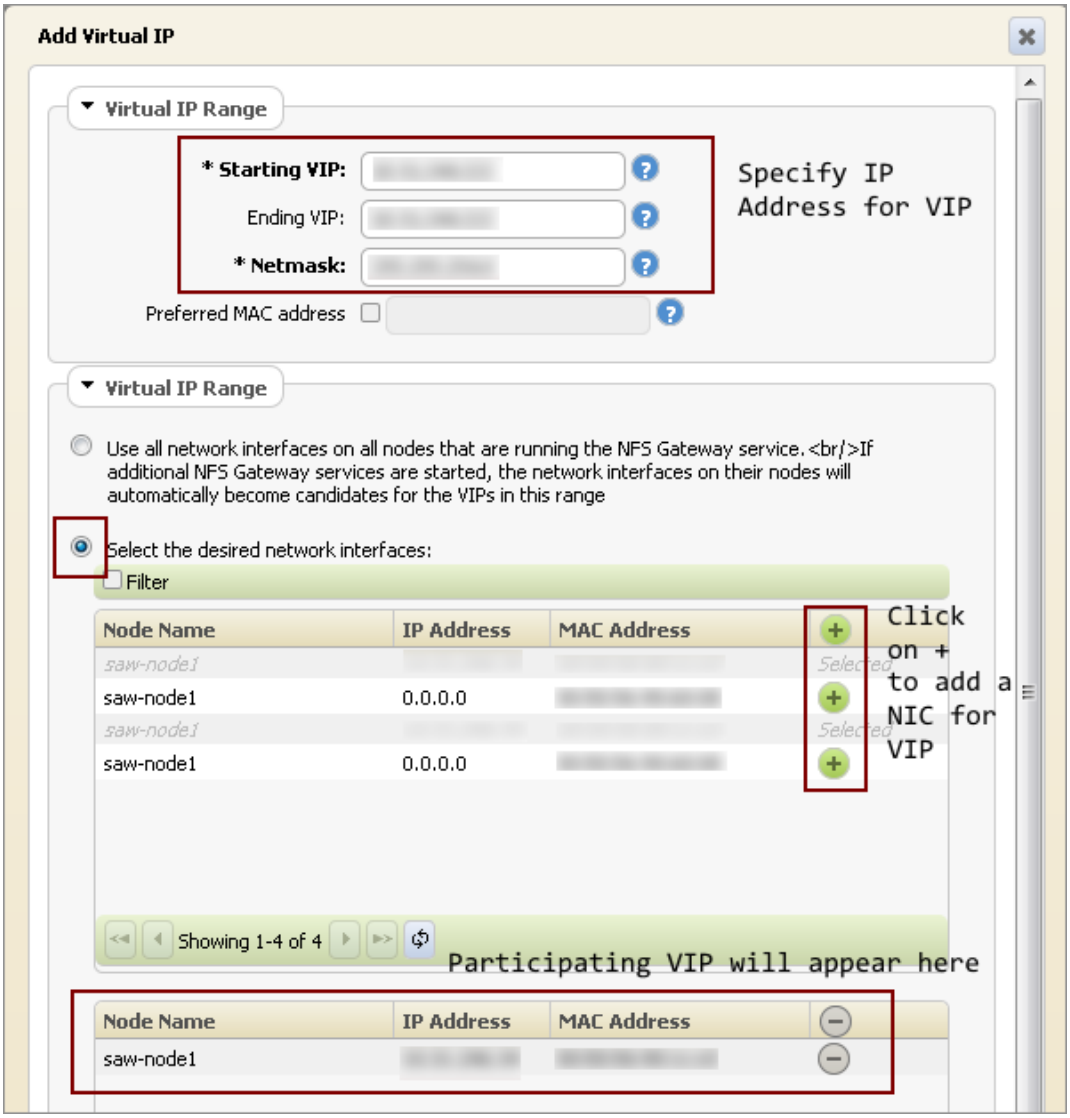
Add a Virtual IP Address that has Multiple Nodes

1. Log on to the MapR Control System.
2. In the Navigation panel, select **NFS-HA > VIP Assignments**.
3. On the **NFS Setup** tab, click the **Add VIP** button.



4. In the **Add Virtual IP** dialog, do the following:

a. Specify the Starting and Ending VIP as the same IP address.



b. Select **Select the Desired Network Interfaces** to choose the available Network Interfaces that need to be used for the VIP assignment. Select the NIC Cards that you want to participate in the VIP. A node can have multiple NICs, so depending on the Network Configuration you can select them.

c. Click **OK** to add the VIP.

Example VIP Configurations

The following table shows example configurations of virtual IP addresses (VIPs) with different numbers of nodes in the cluster.

Number of Nodes in Cluster	Number of VIPs
3 Nodes	1 VIP
5 Nodes	2 VIPs (3 Nodes each, 1 Common Node)
7 Nodes	2 VIPs (3 Nodes each, 1 Free Node)
8 Nodes	3 VIPs (3 Nodes each, 1 Common Node among 2 VIPs)
11 Nodes	4 VIPs (3 Nodes each, 1 Common Node among 2 VIPs)
11 Nodes	3 VIPs (3 Nodes each, 2 Free Nodes)

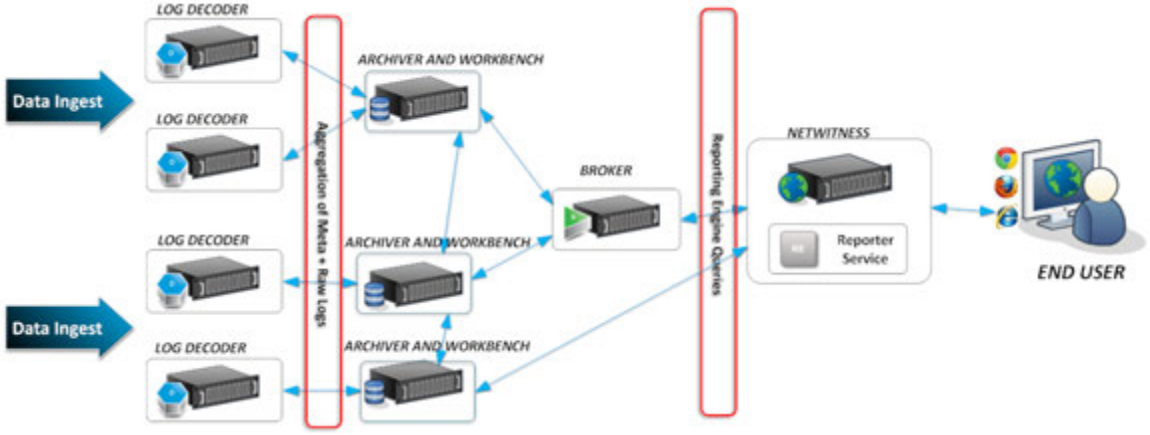
Workbench Overview

The NetWitness Suite Workbench service allows collections to be created with restored data that was saved offline from an Archiver. Once the data has been copied and saved into a collection, it can be analyzed from Investigation and Reporting.

The following diagram depicts the architecture of a NetWitness Suite network that implements the Workbench.

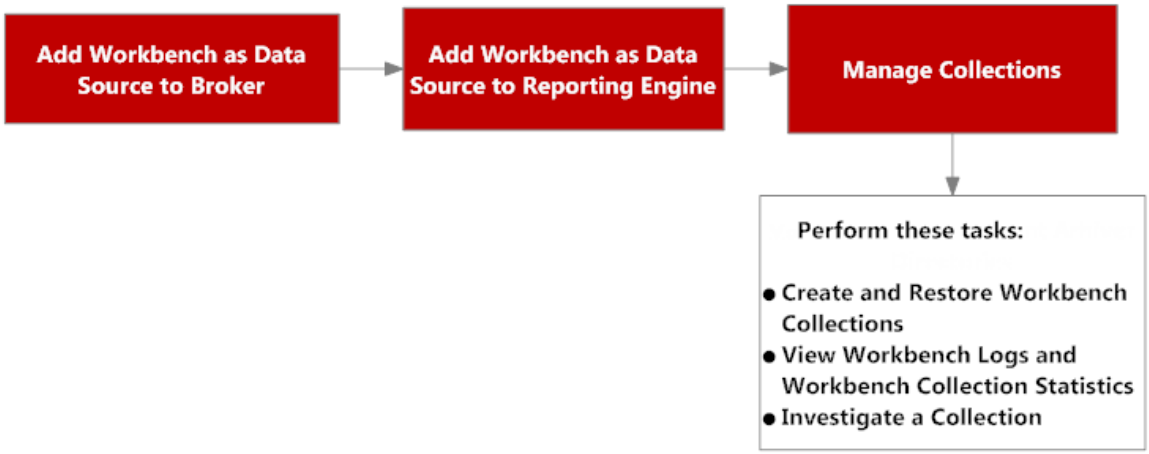


Workbench Configuration Procedures

Note: While NetWitness Suite 11.0.0.0 continues to support the Workbench, and some customers may have configured Workbench to handle restoring of data, the best practice for restoring data is to use the Archiver. to configure archival and restoring of data, following the instructions provided in the *Archiver Configuration Guide*.

Workflow

These are the basic steps for configuring and managing a Workbench service.



1. Add a Workbench service as a data source to Broker (see Adding Workbench Service as a Data Source to Broker).
2. Add a Workbench service as a data source to Reporting Engine (see Adding Workbench as a Data Source to Reporting Engine
3. Manage collections on a Workbench service (see Managing Collections).
4. Investigate a Workbench (see Managing Collections).

Prerequisites

Before configuring the Workbench service, you must:

- Add the NetWitness Suite workbench service to the host in your network environment. (Refer to Workbench Overview.)

- Install the NetWitness Suite Workbench host in your network environment. For more information, refer to the *Host and Services Getting Started Guide*.

The steps to configure the Workbench service are:

1. Adding Workbench Service as a Data Source to Broker
2. Adding Workbench as a Data Source to Reporting Engine

When configuration is complete, you can create and manage collections as described in Managing Collections.

Adding Workbench Service as a Data Source to Broker

Prerequisites

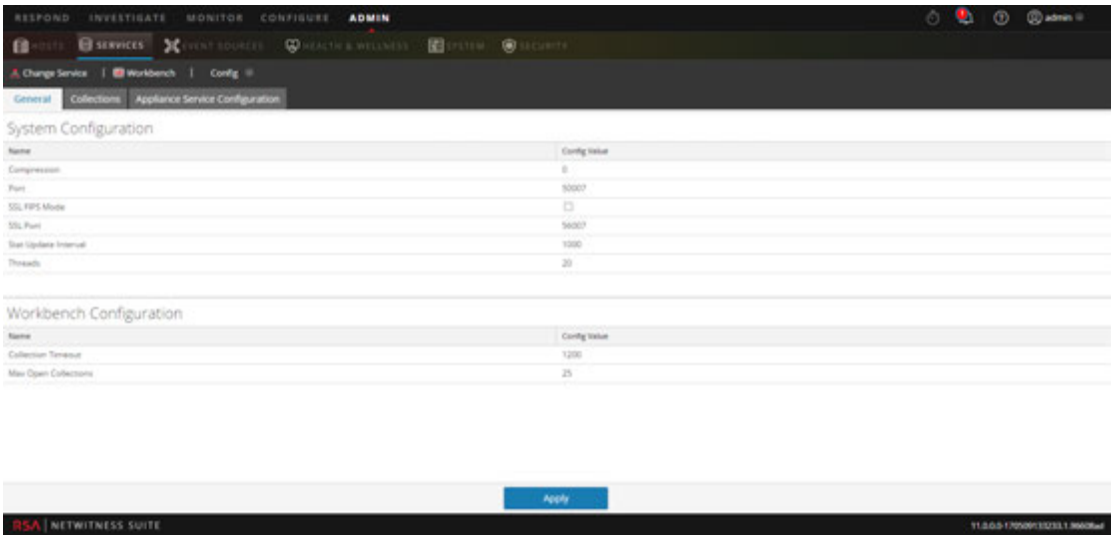
Before adding the Workbench service, you must:

- Install the Workbench service on the Archiver appliance.
- Add a collection on the workbench service.

To add the Workbench service as a data source on the Broker:

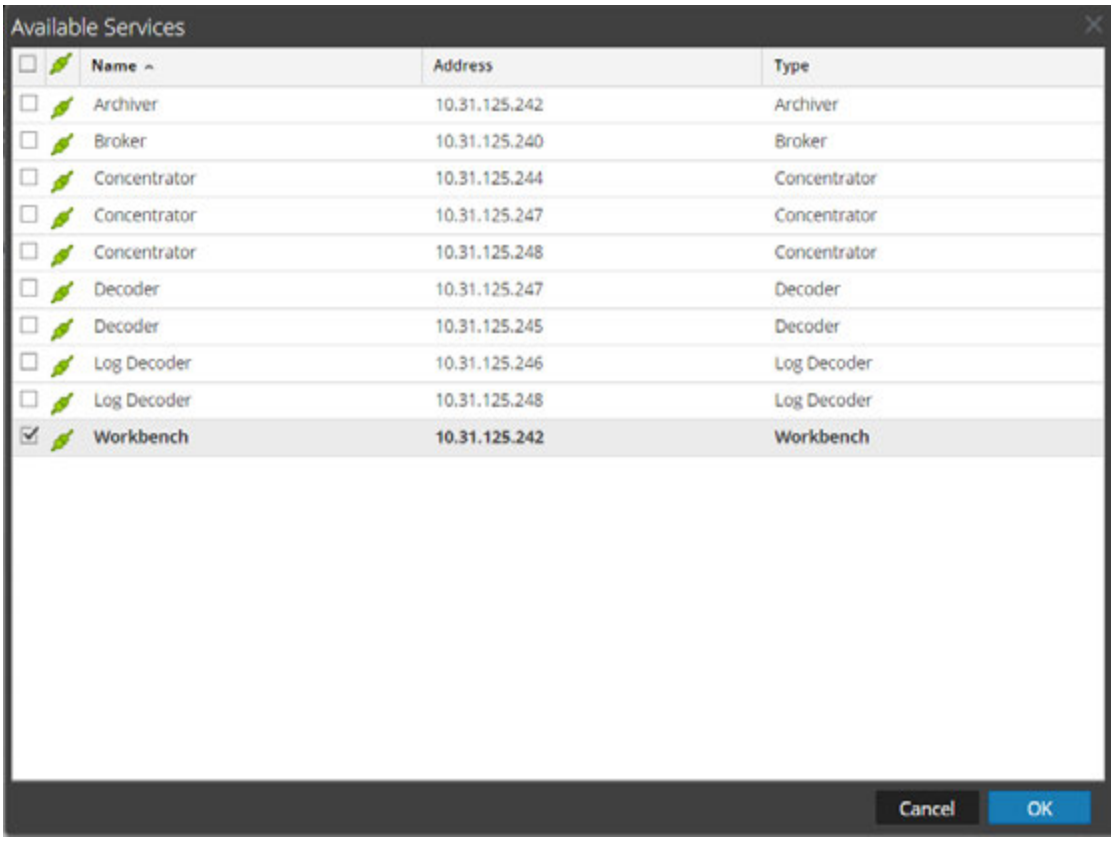
1. Go to **ADMIN >Services**.
2. Select a Broker service, and select  **> View > Config.**

   The Service Config view is displayed.

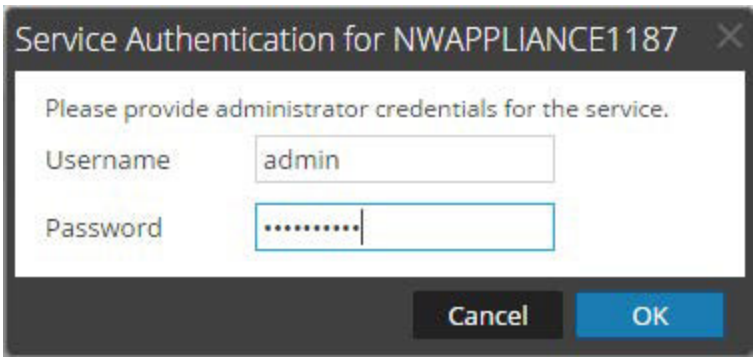


3. Select the **General** tab.
4. Click + and select **Available Services**.

   The Available Services dialog is displayed.

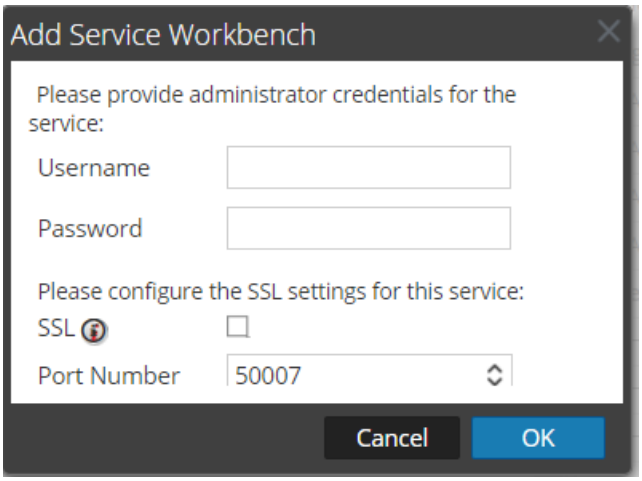


5. Select the Workbench service and click **OK**.
6. If the Workbench service is using a Trust Model, a Service Authentication dialog for the selected service is displayed.



7. Type the username and password for admin credentials for the service and click **OK**.

   The Add Service Workbench dialog is displayed.



8. Type the username and password for admin credentials for the service and click **OK**.

   The workbench service is now added as a data source to the Broker and is listed in the NWDATA Sources list.

Note: This procedure has to be performed for each collection.

Adding Workbench as a Data Source to Reporting Engine

Prerequisites

These are the tasks required before adding the Workbench as a data source to Reporting:

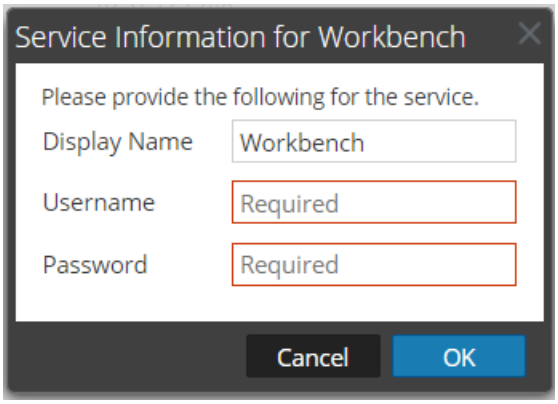
1. Add the Reporting Engine as a service to your NetWitness Suite deployment.
2. Add the Workbench as a service to your NetWitness Suite Archiver host (if not already installed).

Note: Adding Workbench collections as a data source to Reporting Engine depends on a trusted connection. If the Workbench is established with a trusted connection, you must manually add Workbenchcollections as a source to the Reporting Engine.

To associate the Workbench data source with the Reporting Engine:

1. Go to **ADMIN > Services**.
2. Select a **Reporting Engine** in the Services grid. Select  **View > Config**.
3. Switch to the **Sources** tab.
4. Select  .
5. Select **Available Services**. Select a Workbench service in the Available Services dialog.
6. Click **OK**.

   The Service Information dialog is displayed.



7. Enter User Name and Password.

- Required if the Workbench service is Trusted.
- Optional if the Workbench service is not trusted (added manually).

8. Click **OK**.
9. Select **Collection** in Add a Collection from Workbench dialog.
10. Click **OK**.

Result

You can now create reports on the data collected by the Workbench.

Managing Collections

An Administrator can create and delete Workbench collections and view Workbench statistics and logs. This topic provides all of these procedures and an example procedure for restoring a collection for Reporting and Investigation.

- Mount Archiver Directories
- Create a Collection
- Delete a Collection
- Investigate a Collection
- View Workbench Collection Statistics
- View Workbench Logs

Mount Archiver Directories

If data is in offline storage or cold-tier storage, you need to mount the Archiver directories in order to restore the data for reporting and investigation purposes:

1. Go to **ADMIN > Services**.
2. Select an **Archiver** from the Services grid and select  **> View > Explore**.
   The Explorer view for the Archiver is displayed
3. Right-click on the **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
4. Run the **manifest** command for a time range, for example, 2017-April-01 to 2017-April-10.
   The search returns all files that need to be restored for the selected query.

Create a Collection

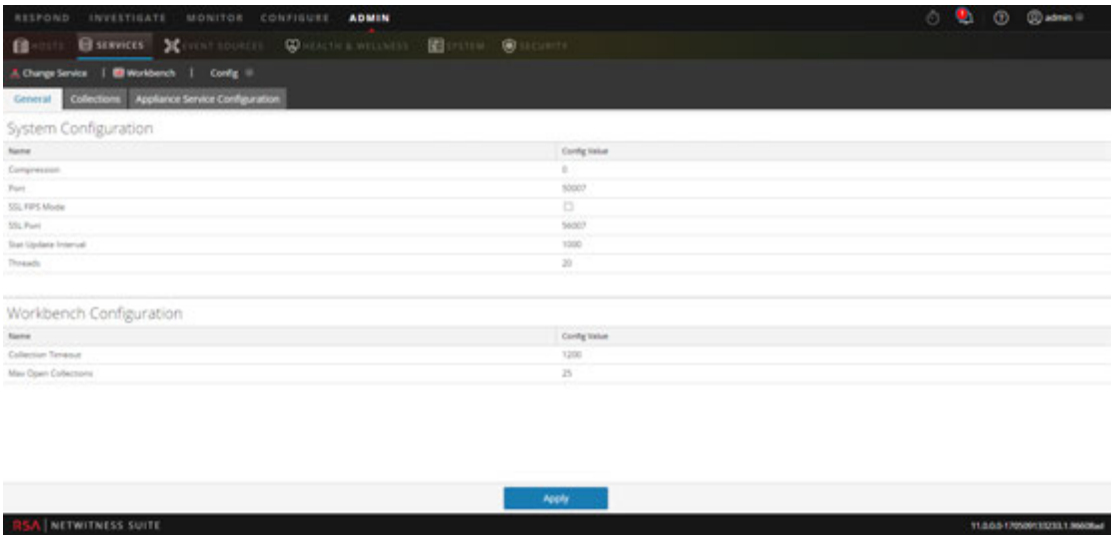
Administrators can create collections of restored data from a backup or from an existing set of data.

Note: You can point the source path to the location of the database files and the restore command copies them to the workbench. You need to mount those directories to the Archiver (where the Workbench is installed) before a restoration collection can be created.

To create a collection using data restored from the backed up data or existing subset of data:

1. Go to **ADMIN> Services.**
2. In the Services view, select a **Workbench**, then select  **> View > Config**.

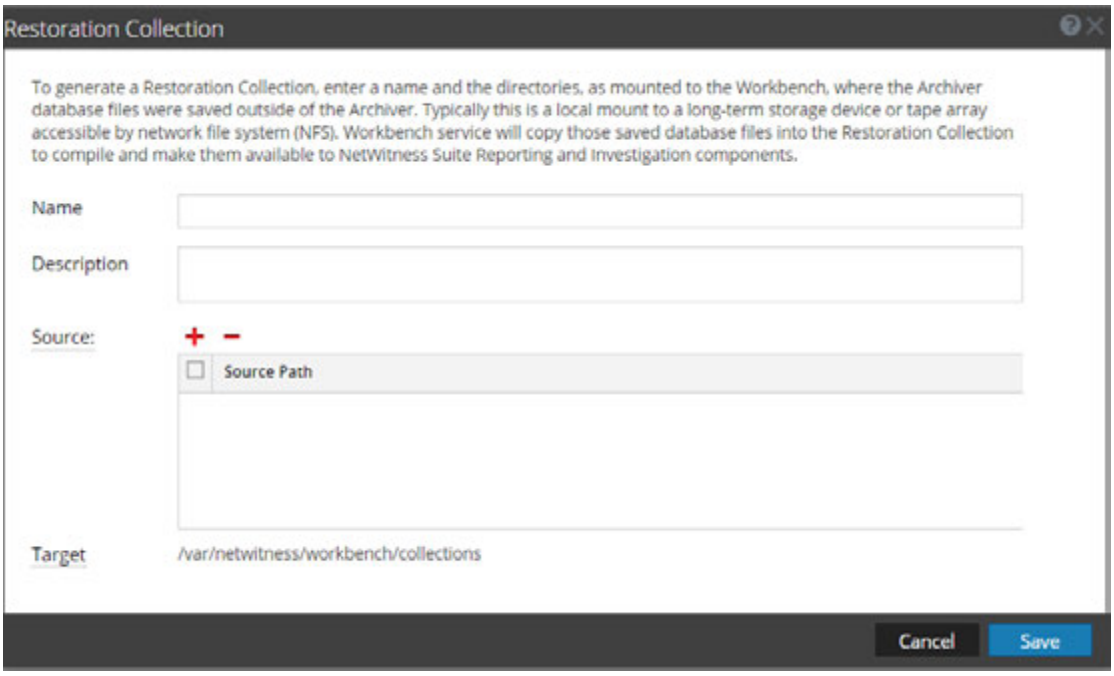
   The Services Config view is displayed with the General tab open.



3. Click the **Collections** tab.

   The Collections grid is displayed.
4. Click  in the toolbar.

   The Restoration Collection dialog is displayed.



5. Provide the following information:

- **Name:** Name of the Workbench collection that you want to restore.
- **Source:** Location where the Archiver database files have been moved from cold storage.

Note: Target is the location where the collection is created.

6. Click **Save** to restore the collection.

Note: If the source path provided to create the restoration collection does not exist, the following error message is displayed:

```
The source path does not exist '/xxx/xxx/'.
```

If there is insufficient storage to restore your collection, the following error is displayed:

```
Error during disk space checking. Insufficient disk space in
location '/xxx/xxx'.
```

The Schedule Job dialog is displayed with the following message:

```
Restoring data into a new collection. Check the jobs page for
progress.
```

7. Click the **Jobs** icon  in the NetWitness Suite toolbar to expand the list of restoration collection jobs with their current status.

Note: Restoring a collection that is larger than 550 GB may take several hours to process.

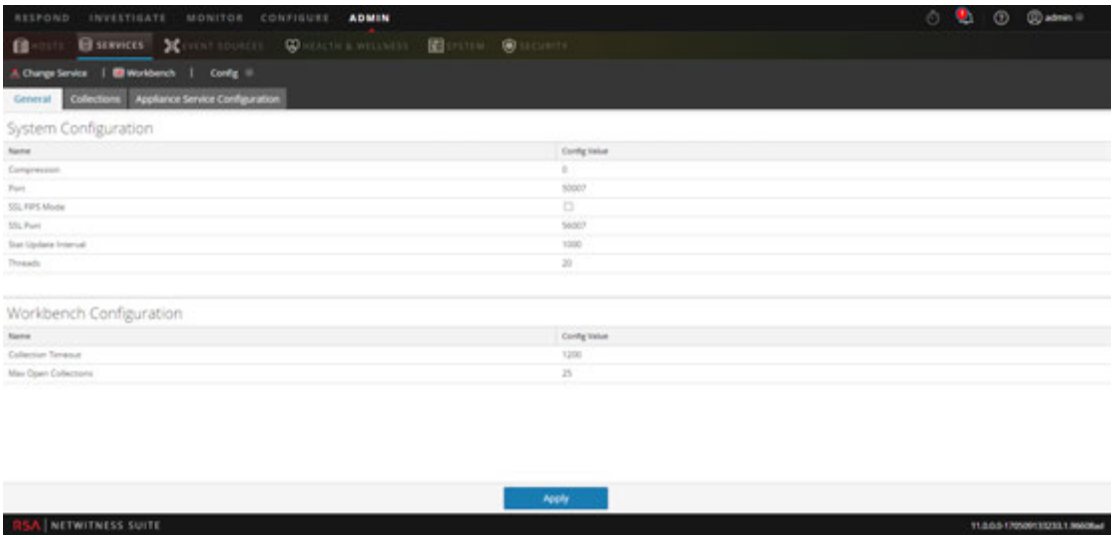
Delete a Collection

Administrators can delete collections from the Workbench service.

Perform the following steps to delete a collection:

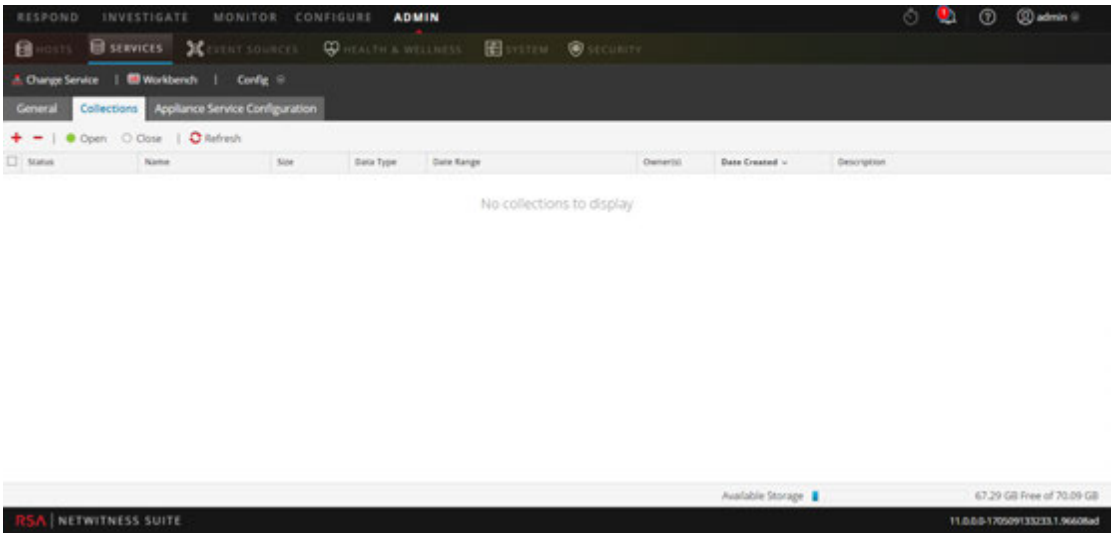
1. Go to **ADMIN > Services.**
2. From the Services view, select a **Workbench** and click  **> View > Config**.

   The Services Config view opens with the General tab displayed.



3. Select the **Collections** tab.

   The Collections grid is displayed.



4. In the Collections grid, select the collection that you want to delete.
5. Click − from the toolbar.

   A warning dialog requests confirmation.
6. If you want to delete the collection, click **Yes**.

   The collection is removed from the Workbench service.

Example Procedure: How to Restore a Collection for Reporting and Investigation

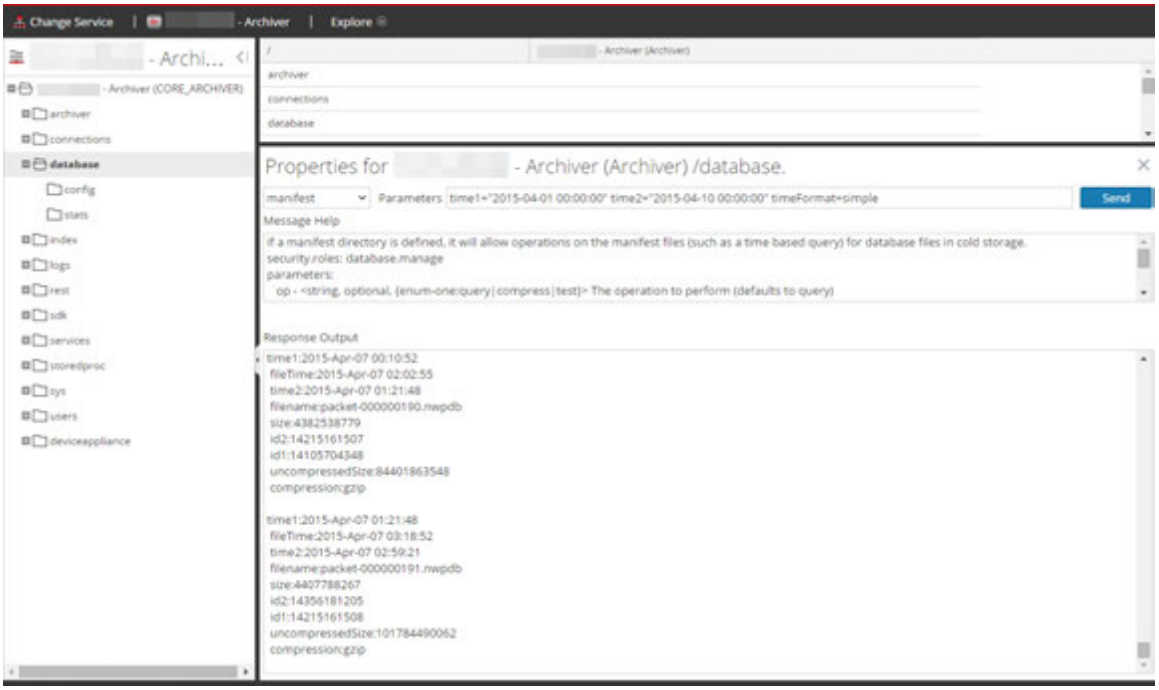
The following steps illustrate how to restore data for reporting and investigation purposes that is in offline storage or cold-tier storage. In the following example, data is restored for the time range beginning on 2015-April-01 through 2015-April-10.

To restore data for reporting and investigation purposes:

1. Go to **ADMIN > Services**.
2. Select the **Archiver** from the Services grid.
3. Navigate to the Explorer view of the Archiver appliance by selecting  **> View > Explore**.
   The Explorer view for Archiver is displayed
4. Right click on **Database** node in left-hand tree and select **Database** properties to open them in the right-hand panel.
5. Run the **manifest** command for the selected time range 2015-April-01 to 2015-April-10.
   The search returns all files that need to be restored for your selected query.

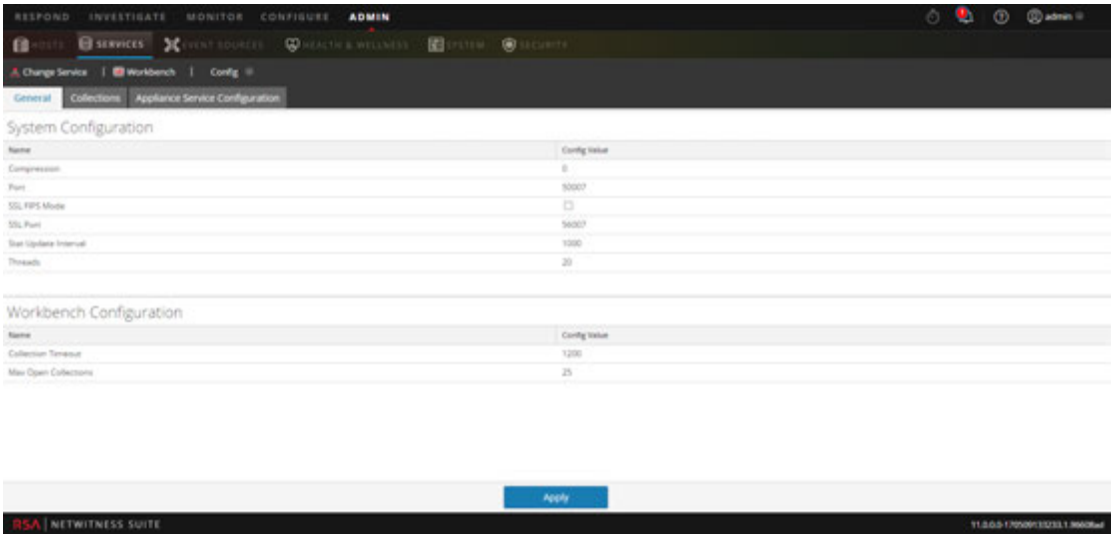
Example Search:

```
time1="2015-04-01 00:00:00" time2="2015-04-10 00:00:00"
timeFormat=simple
```



6. Go to **ADMIN > Services**.
7. In the Services view, select a **Workbench**, then select  **> View > Config**.

   The Services Config view is displayed with the General tab open.



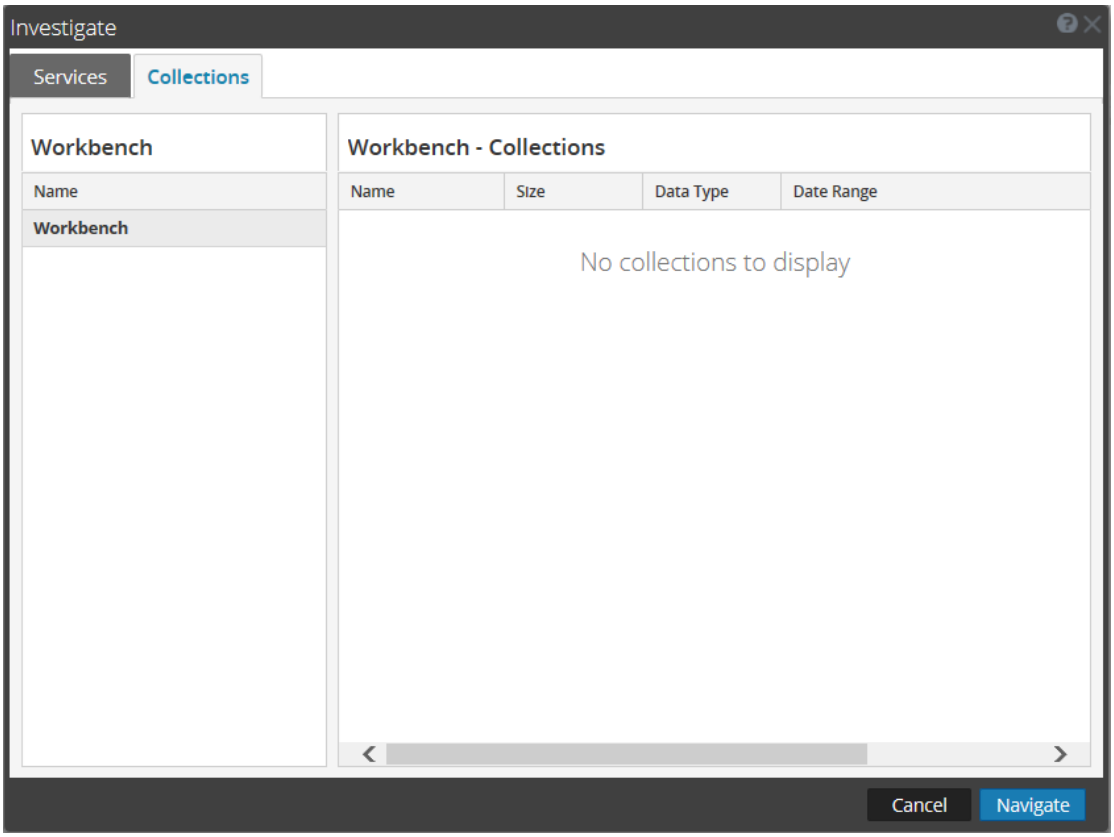
8. Select the **Collections tab.**
9. Create a restoration collection with the source path pointing to files listed in the manifest command output.
10. Save the collection.

    After successfully creating a collection, you can use this collection for reporting and investigation purposes.

Investigate a Collection

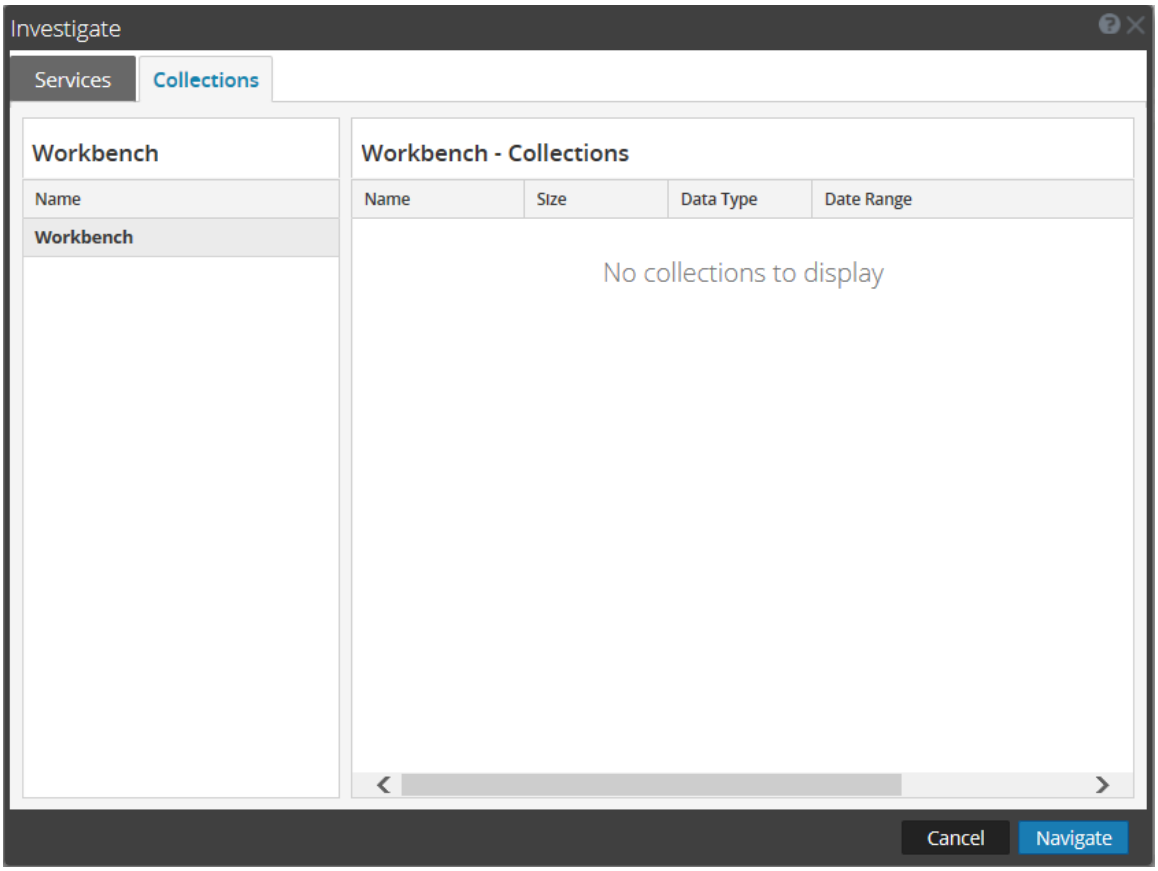
To perform an investigation on a workbench collection:

1. Select **Investigate**.
   The Investigate dialog is displayed.



2. Click the **Collections** tab in the Investigate dialog.
3. Select a Workbench service in the left panel.
4. Select the collection you want to investigate in the right panel.
5. Click **Navigate**.

The Navigate view is displayed showing data pertaining to the Workbench collection that you selected.



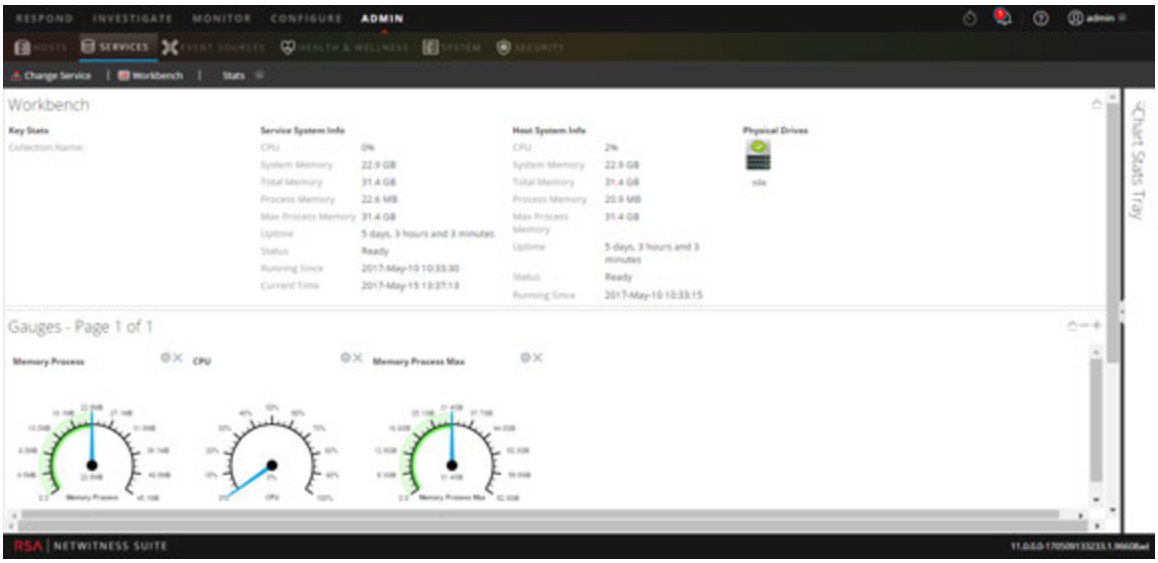
Note: For detailed information about using Investigation, see *Investigation and Malware Analysis Guide*.

View Workbench Collection Statistics

The same statistics available for other services are provided for the Workbench service. The Services Stats view displays key statistics and system information that pertain to your selected Workbench service. The information is displayed in several different sections within the Stats view: Workbench, Gauges, Timeline Charts and Chart Stats Tray. The Chart Stats Tray lists all available statistics for the Workbench. Any statistic in the Chart Stats Tray can be displayed in a gouge or a timeline chart.

Perform the following steps to view workbench statistics:

1. Go to **ADMIN > Services**.
2. In the Services view, select a **Workbench**, then select  **> View > Stats**.
   The Services Stats view is displayed.



Note: For more information about Workbench statistics, see the *Host and Services Getting Started Guide*.

View Workbench Logs

Perform the following steps to view logs on a Workbench service:

1. Go to **ADMIN > Services.**
2. In the Services view, select a **Workbench**, then select  **> View > Logs**.
   The Services Logs grid is displayed.

Note: For information about viewing and configuring audit logs, see the topic **Configure Global Audit Logging** in the *System Configuration Guide* .

- Managing Collections

Quick Look

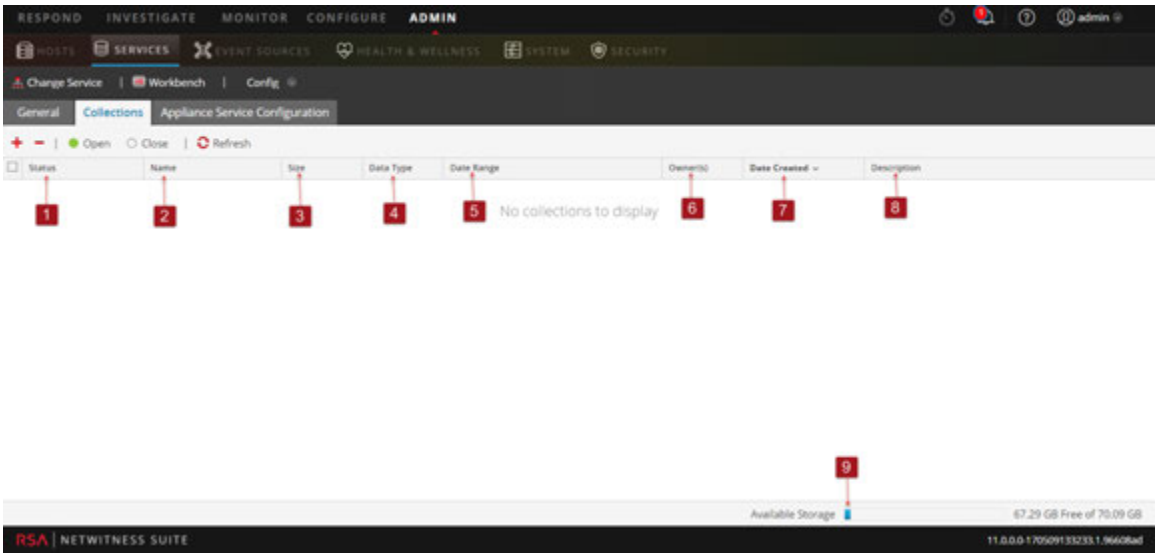
The Collections tab has a toolbar and a grid that lists relevant information about the Workbench collections.

The following figure is an example of the Collections grid.



1	Status of the Restoration Collection: • **Resorting Data** - Data restoration is in progress. • **Closed** - Data is restored. • **Opening** - Data is being indexed. • **Ready** - Indexing is complete. • **Closing** - Collection is closing.
2	**Name**: Name of the file being restored.
3	**Size**: Collection size.
4	**Data Type**: Logs.
5	**Date Range**: Lists the range of dates when the collection is being restored.
6	**Owner**: Lists the Collection creator.
7	**Date Created**: Shows the date when the collection was created.
8	**Description**: Description of the Restoration collection.
9	**Available Storage Indicator**: Shows the available disk space, given in gigabytes (GB). The Workbench validates to ensure there is enough available space when attempting to create a restoration collection.

Toolbar

These are the toolbar options.

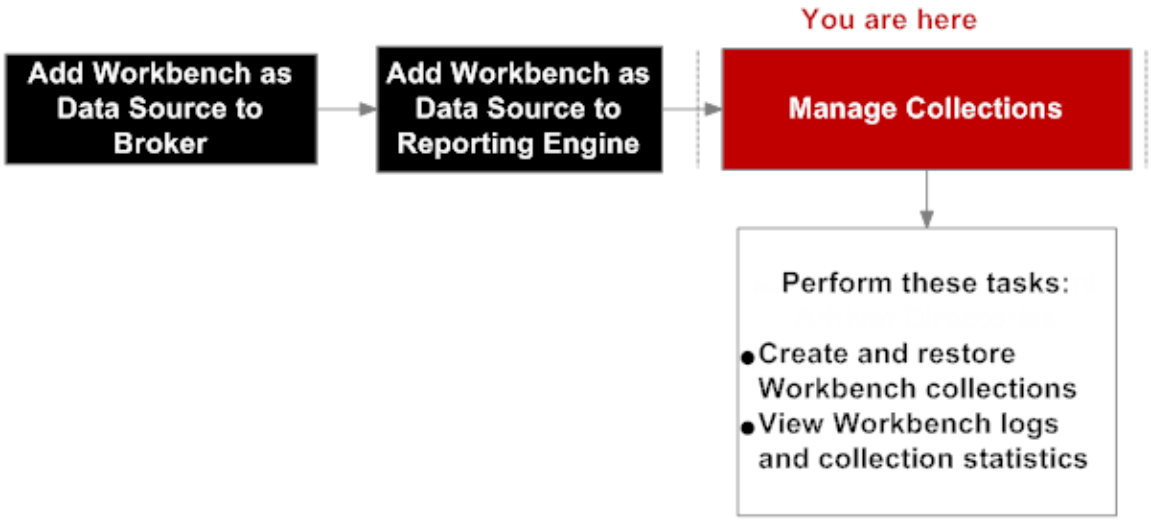
Parameter	Description
	Creates a new restoration collection.
	Deletes the selected Workbench collection.
Open and Close - Refers to the status of the restoration collection.	Open - Makes collection available for investigation and reporting. Close - Makes collection unavailable for investigation and reporting while preserving resources.
	Refreshes the list of Workbench collections.

Services Config View - General Tab

The General tab for the Workbench service provides a way to manage basic service configuration. To access the General tab, go to Admin > Services > select service and select  **> View > Config**.

Workflow

These are the basic steps for configuring and managing a Workbench service.



What do you want to do?

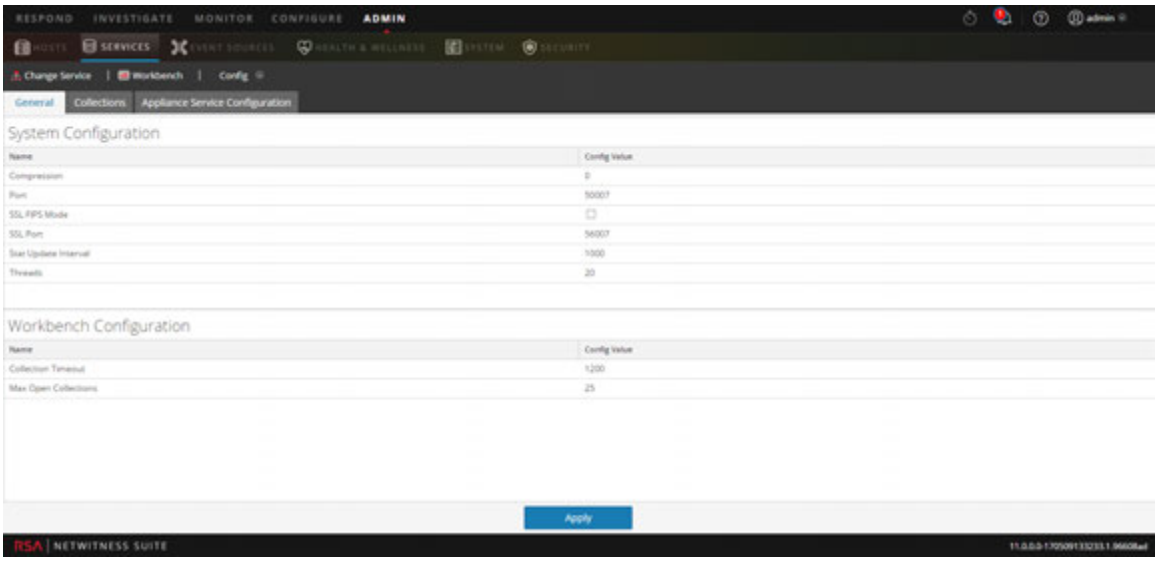
- Workbench Configuration Procedures

Quick Look

The General tab has two panels:

- System Configuration
- Workbench Configuration

The following figure is an example of the General tab.



System Configuration Panel

The System Configuration panel displays configuration parameters for the Workbench service. The following table describes the System Configuration panel features.

Parameter	Description
Compression	When set to a positive value, the minimum amount of bytes before a message is compressed. **0** means no compression for any message. Change takes effect on subsequent connections.
Port	The unencrypted port this service will listen on. **0** means disabled. Change takes effect on service restart.
SSL FIPS Mode	Determines whether the OpenSSL library will enter FIPS mode. Change takes effect on service restart.
SSL Port	The SSL port this service will listen on. **0** means disabled. Change takes effect on service restart.

Parameter	Description
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system. Change takes effect immediately.
Threads	The number of threads in the thread pool to handle incoming requests. Change takes effect immediately.

Workbench Configuration Panel

The Workbench Configuration panel displays configuration parameters for the Workbench collections. The following table describes the Workbench Configuration panel features.

Parameter	Description
Collection Timeout	The number of seconds before an idle collection is automatically closed.
Max Open Collections	The number of collections that can be open at once. A setting of 0 disables the limit.
Apply	Updates the modified configurations in the panel.

Troubleshooting

NetWitness Suite notifies users of issues using popup notifications.

NetWitness Suite Workbench returns the following types of error messages explained in the following table.

Problem	Possible Causes	Solutions

Unable to connect to workbench service from NetWitness Suite **user interface Administration page.**	NetWitness Suite service is not running.	Verify that your NetWitness Suite service is running. Log in to your NetWitness Server and run the following command:
		`status nwworkbench`
		Firewall rules should allow connections from 50007, 50607 and 50107.
		Verify your connection by running the following command:
		`service iptables status`
		Verify that you are able to launch REST. Execute the following command for your appliance:
		`https://<IPAddress>:50107 service`
		If you are able to launch REST service for your appliance, you can confirm that there is no problem with the appliance. Navigate to the NetWitness Suite side for further investigation as follows:
		• Enable debug mode and watch for sa.log errors located at:
		`/var/lib/netwitness/uax/logs`
		• Enable developer tools using the shortcut `Ctrl+Shift+I` for Chrome and verify the preview and response for the request.

Problem	Possible Causes	Solutions
Not able to view Appliance service configuration tab for workbench appliance running in SSL mode.		Enable SSL for appliance service and restart the appliance service.

The following error message is displayed when trying to load meta in order to create a report on a workbench collection: "Unable to fetch schema from data source when trying to load meta."		Load meta for the appliance from the NetWitness Suite User Interface Rule library and watch for any errors in Reporting Engine log located at:
		`/home/rsasoc/rsa/soc/reporting-engine/logs`
		Launch REST for the device and watch for any error if you run the following query:
		`/sdk?msg=language&force-content-type=text/plain&expiry=600&size=10`

Problem	Possible Causes	Solutions
No results are displayed after running query from NetWitness Suite User Interface via the Reporting Engine.		Run the query on the Reporting Engine and watch for `/var/log/messages` on the data source. Look for an exact query that matches the data source. **TIP**: Search for `[SDK-Query]` in log file. Copy the exact query and run from REST SDK to see if you get any results. REST Query: /sdk?msg=query&force-contenttype=text/plain&expiry=600&query=select%20user.dst&size=10
Workbench Available storage indicator in Workbench Collections Tab is not accurate.	Available storage indicator in the User Interface displays the default Collections directory shown below: /VAR/NETWITNESS/WORKBENCH/COLLECTIONS	None.
Unable to open new collections after opening existing collections.	There is a workbench configuration called “Max Open Collections” that is set to 25 by default. This configuration specifies the number of collections that can be open at the same time.	You can modify this number. A setting of zero disables the limit of maximum open collections.

Problem	Possible Causes	Solutions
Successfully opened a collection that got to Ready state. But after a while, the collection automatically changed to Closed state.	There is a workbench configuration called “collection.timeout” that is set to 1200 seconds by default. This configuration specifies the number of seconds before an idle collection is automatically closed. Maximum time allowed before timeout occurs is 86,400 seconds (24 hours).	A setting of zero disables the timeout.
Querying for a time range using `/database manifest` command returned blank output.	Blank output indicates that there are no **nwdb** files available for the time range.	None.
Created collection, but collection status is not available in Jobs, and collection is not displayed in workbench Collections tab.	You might be running in a mixed mode environment (for example, creating a collection on a 10.4.x version of workbench from a 10.5 NetWitness Suite User Interface.	The collection is displayed in the workbench Collections tab after you reload the page.

Problem	Possible Causes	Solutions
Noticed blank Date Range and Date Created values for collections.	All collections display blank Date Range and blank Date Created values.	Date Range and Date Created values are displayed after upgrading to 10.5.
Discrepancy in behavior of adding workbench collections as a data source to Reporting Engine.	This behavior depends on whether you have a trusted connection or a non-trusted connection.	If your workbench service is established with a trusted connection, you should manually add workbench collections as a source to Reporting Engine. If your workbench service is not established with a trusted connection when the workbench restoration collection was created, it automatically sends a message to the Reporting Engine to add it as a source in the Reporting Engine.
Collection attributes (size, date range and date created) are not displayed.	Date range is not displayed for a collection if Jetty service is restarted while restoration is in process. Restoration collections created from an Explorer view display a blank Date Range. Any collections created on a 10.4 Workbench will display blank Date Range and blank Date Created values after upgrading to 10.5. In a mixed mode environment (10.5 NetWitness Server and 10.4.x workbench), size, date range, and date created are not displayed.	None.

Problem	Possible Causes	Solutions
Exception or blank page is displayed when drilling down on a workbench collection.	Collection closed because it exceeded the collection time out.	Investigate the collection from the beginning.
Empty collection is created.	Empty collection is displayed if restoration fails because Workbench service is restarted during collection creation.	None.
Service abruptly shuts down.		Run the service from command line and watch for any errors. For an example, run the command from the server console `/usr/sbin/NwWorkbench` for workbench.
REST request denied.		Verify user.agent.whitelist config located at `/rest/config/`. If non-blank, this should be a regex expression to match valid HTTP user agents. If the regex fails to match, all REST requests will be denied (see allow.missing.user.agent for the potential exception). If blank, all requests are allowed.

Problem	Possible Causes	Solutions
Queries with raw meta return blank values for Raw field.		Verify that you have a relevant `packet db`.

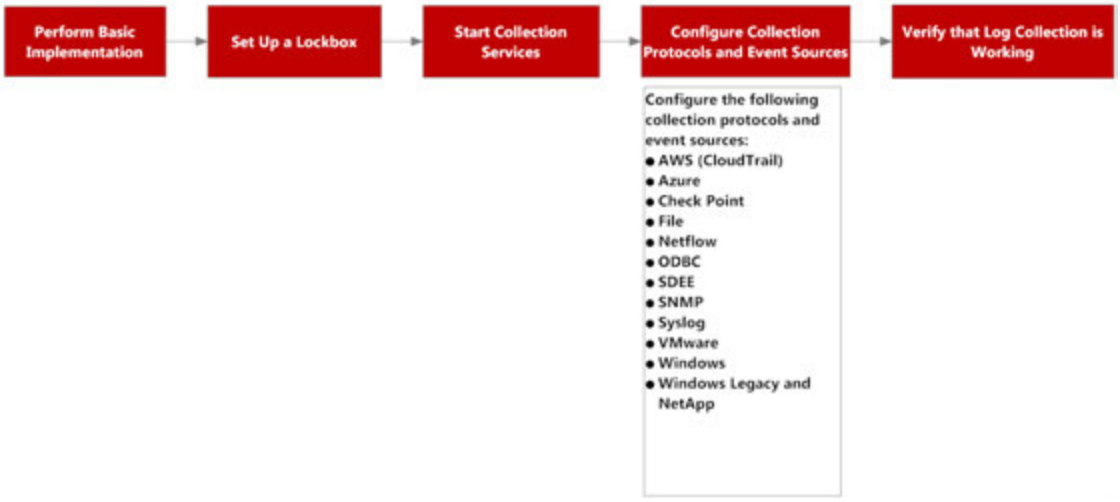
About Log Collection

This guide describes the high-level steps and subtasks for setting up and configuring log collection for event sources that include:

- What Log Collection does, how it works from a high level, and provides high-level deployment diagrams.
- How to start collecting events.
- Where to find instructions to set up more complex deployments.
- How to start any collection protocol.
- What the structure of the Log Collection Configuration User Interface is.
- Which tools to use to troubleshoot Log Collection issues and lists global troubleshooting instructions.
- How to fine tune and customize Log Collection in your environment.
- How to configure individual collection protocols. Instructions are in the individual Log Collection sections.

Workflow

This workflow depicts the basic tasks needed to start collecting events through Log Collection.



High-Level Procedures

At a high level, these are the procedures you must follow for log collection:

I. Add local and remote collectors to RSA NetWitness Suite.

   Set up a Log Collector locally on a Log Decoder (that is a Local Collector). You can also set up Log Collectors in as many remote locations (that is Remote Collectors) as you need for your enterprise. For details, see Basic Implementation.

II. Download the latest content from Live. This is a task that you perform periodically, as the content provided on Live is updated regularly.

   LIVE is the Content Management System for RSA NetWitness® Suite, from which you download the latest content. The two resource types you use to download Log Collection content are:

   - **RSA Log Collector** - content enabling the collection of event source types.
   - **RSA Log Device** - the latest supported event source parsers.

   You can also subscribe to content on Live. For details, see the *Live Services Management Guide*.

III. Configure Settings: set up the lockbox and Certificates.

   For details, see Set Up a Lockbox and Configure Certificates.

IV. Configure Event Sources.

   You configure all the event sources on your network to send their log information to RSA NetWitness Suite. Whenever you add new event sources, you need to perform this procedure as well. All event source configuration guides are found in the RSA Supported Event Sources space in RSA Link.

V. Start and stop services for configured protocols. Occasionally, you may be required to stop and restart services, based on new event sources that you add to RSA NetWitness Suite.

VI. Verify that Log Collection is working.

   Whenever you set up a new event source or add a new collection protocol, you should verify that the correct logs are being sent to RSA NetWitness Suite.

Log Collection Architecture

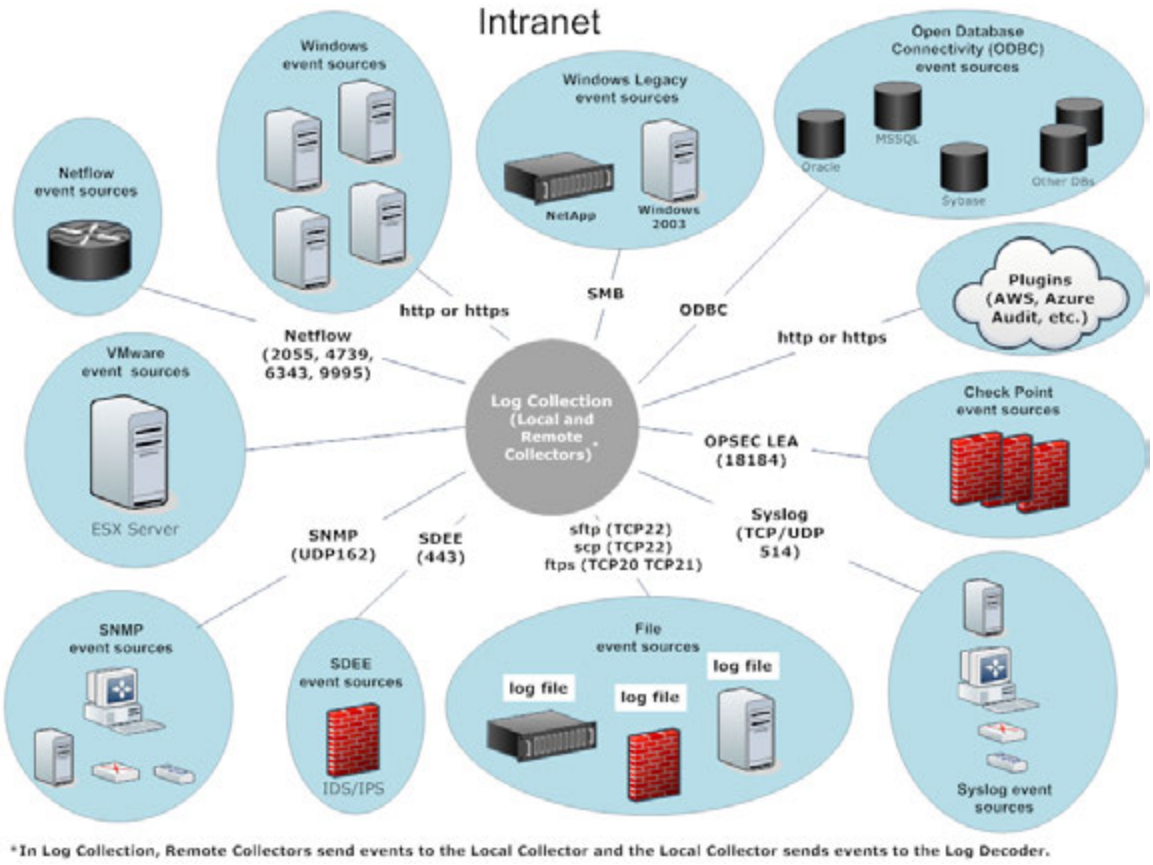
This topic describes how NetWitness Suite performs log collection.

How You Deploy Log Collection

You can deploy Log Collection according to needs and preferences of your enterprise. This includes deploying Log Collection across multiple locations and collect data from varying sets of event sources. You do this by setting up a Local Collector with one or many Remote Collectors.

Components of Log Collection

The following figure shows all the components involved in event collection through the NetWitness Suite Log Collector.



Local and Remote Collectors

The following figure illustrates how the Local and Remote Collectors interact to collect events from all of your locations.

In this scenario, log collection from various protocols like Windows, ODBC, and so on, is performed through both the Remote Collector and Log Collector service. If the log collection is done by the Local Collector , it is forwarded to the Log Decoder service, just like the local deployment scenario. If the log collection is done by a Remote Collector, there are two methods in which these are transferred to the Local Collector :

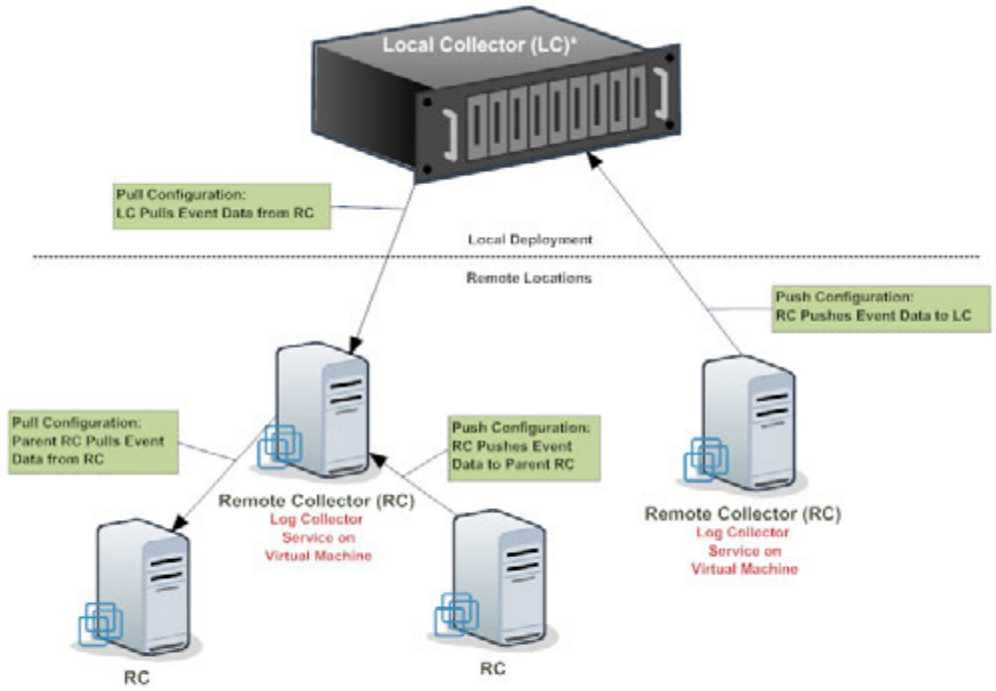
- **Pull Configuration** - From a Local Collector , you select the Remote Collectors from which you want to pull events.
- **Push Configuration** - From a Remote Collector, you select the Local Collector to which you want to push events.

Note: The typical use case is Push. Pull is available if you have a DMZ in your environment. Less secure network segments are not allowed to make connections to more secure network segments. With Pull, the Log Collector (or Virtual Log Collector) in the secure network initiates the connection to the VLC in the less secure network, and the logs are then transferred without breaking the connection rules.

You can configure one or more Remote Collectors to push event data to a Local Collector , or you can configure a Local Collector to pull event data from one or more Remote Collectors.

Additionally, you can set up a chain of Remote Collectors for which you can configure:

- One or more Remote Collectors to push event data to a Remote Collector.
- A Remote Collector to pull event data from one or more Remote Collectors.



* The Local Collector (LC) is the Log Collector service on the Log Decoder appliance.

Windows Legacy Remote Collector

The RSA NetWitness® Suite Windows Legacy Collector is a Microsoft Windows based remote log collector (RC) which can be installed on a Windows domain.

It supports collection from:

- Windows 2003 and earlier event sources
- NetApp ONTAP host evt files

The following figure illustrates the deployment required to collect events from Windows Legacy event sources.

Setup

Basic Implementation

This topic tells how to perform the initial setup of Local Collectors and Remote Collectors.

Prerequisites

Verify that the Log Decoder is set up:

- is capturing data.
- has the current content loaded.
- is properly licensed.

Roles of Local and Remote Collectors

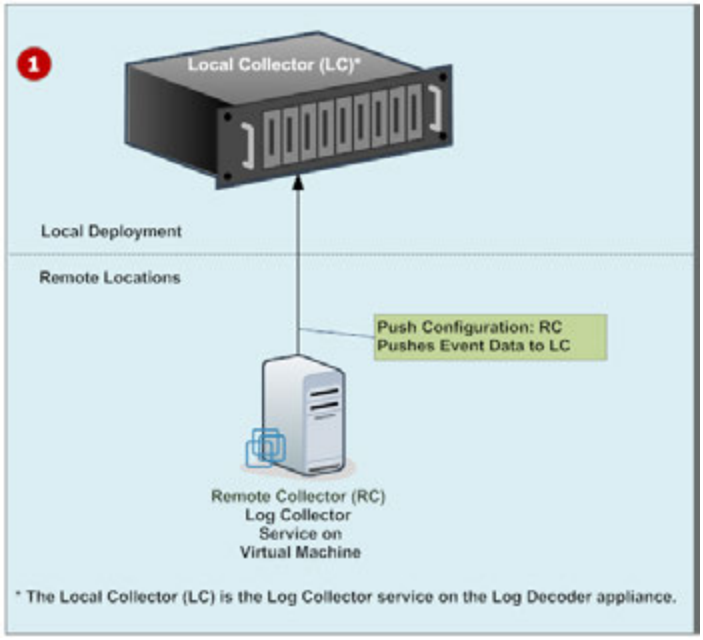
A Local Collector (LC) is a Log Collector service running on a Log Decoder host. In a local deployment scenario, the Log Collector service is deployed on a Log Decoder host, with the Log Decoder service. Log collection from various protocols like Windows, ODBC, and so on, is performed through the Log Collector service, and events are forwarded to the Log Decoder service. The Local Collector sends all collected event data to the Log Decoder service.

You must have at least one Local Collector to collect non-Syslog events.

A Remote Collector (RC), also referred to as a Virtual Log Collector (VLC), is a Log Collector service running on a stand-alone Virtual Machine. Remote Collectors are optional and they must send the events they collect to a Local Collector. Remote Collector deployment is ideal when you have to collect logs from remote locations. Remote Collectors compress and encrypt the logs before sending them to a Local Collector.

Deploying and Configuring Log Collection

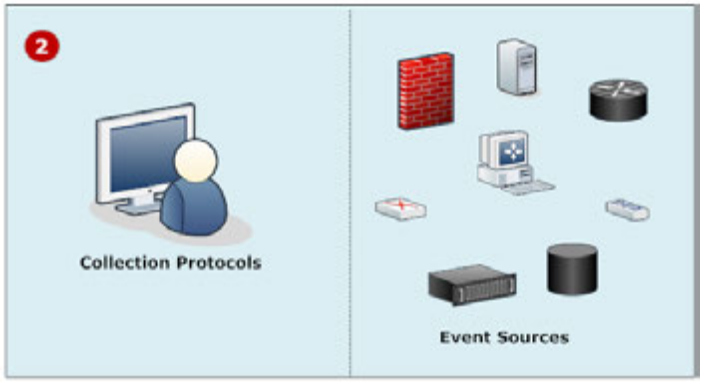
The following figure illustrates the basic tasks you must complete to deploy and configure Log Collection. To deploy Log Collection, you need to set up a Local Collector. You can also deploy one or more Remote Collectors. After you deploy Log Collection, you need to configure the events sources in NetWitness Suite and on the events sources themselves. The following diagram shows the Local Collector with one Remote Collector that pushes events to the Local Collector.



1 Set up Local and Remote Collectors.

The Local Collector is the Log Collector service running on the Log Decoder host.

A Remote Collector is the Log Collector service running on a virtual machine or Windows server in a remote location.



2 Configure event sources:

- Configure collection protocols in NetWitness Suite .
- Configure each event source to communicate with the NetWitness SuiteLog Collector .

Adding Local Collector and Remote Collector to NetWitness Suite

To add a Local Collector and Remote Collector to NetWitness Suite:

1. Go to **ADMIN > Services**.
2. Click + and select **Log Collector** from the menu.

   The **Add Service** dialog box is displayed.
3. Define the details of the **Log Collection** service.
4. Select **Test Connection** to ensure that your Local or Remote Collector is added.

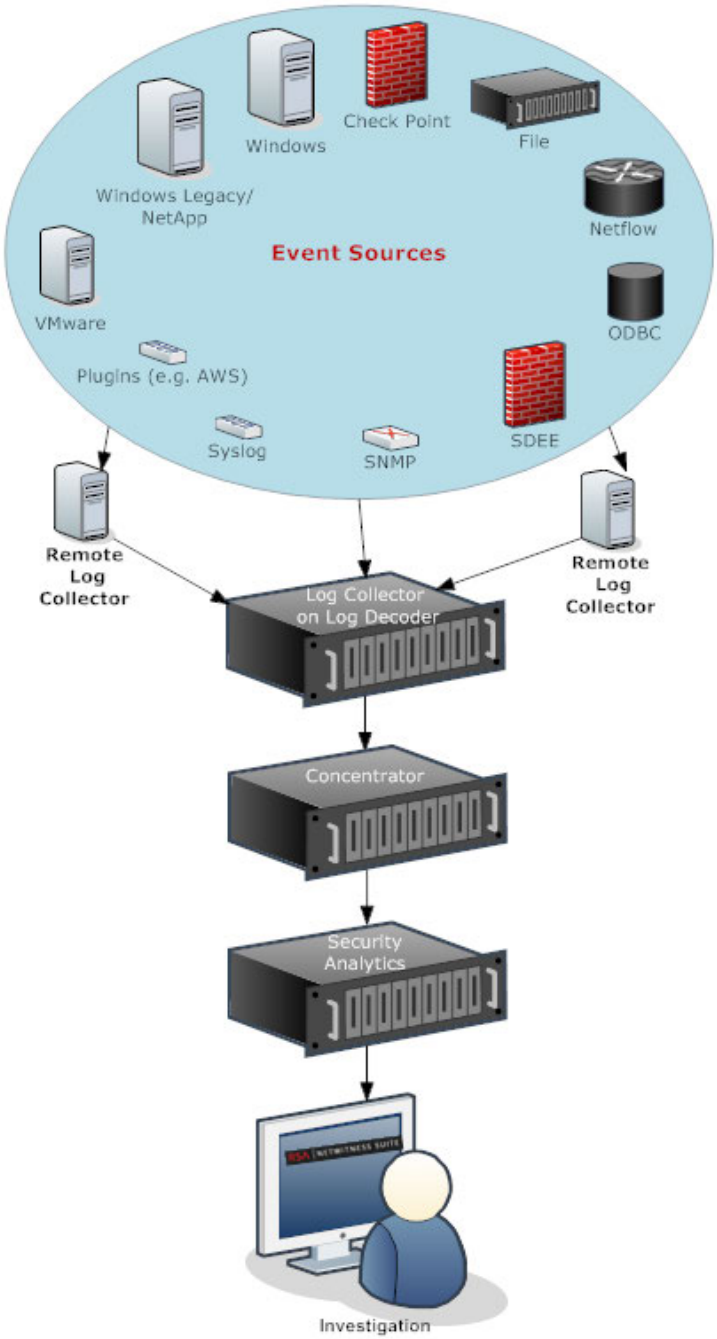
Configuring Log Collection

You choose the Log Collector , that is a Local Collector (LC) or Remote Collector (RC), for which you want to define parameters in the Services view. The following figure shows how to navigate to the Services view, select a Log Collector service, and display the configuration parameter interface for that service.

1. Go to **ADMIN > Services**.
2. Select a Log Collection service.
3. Click ⚙ under **Actions** and select **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Define global Log Collection parameters in the **General** tab.
5. For a:
   - Local Collector,NetWitness Suite displays the **Remote Collectors** tab. Select the Remote Collectors from which the Local Collector pulls events in this tab.
   - Remote Collector, NetWitness Suite displays the **Local Collectors**. Select the Local Collectors to which the Remote Collector pushes events in this tab.
6. Edit configuration files as text files in the **Files** tab.
7. Define collection protocol parameters in the **Event Sources** tab.
8. Define the lockbox, encryption keys, and certificates in the Settings tab.
9. Define Appliance Service parameters in the **Appliance Service Configuration** tab.

Data Flow Diagram

You use the log data collected by the Log Collector service to monitor the health of your enterprise and to conduct investigations. The following figure shows you how data flows through NetWitness Suite Log Collection to Investigation.



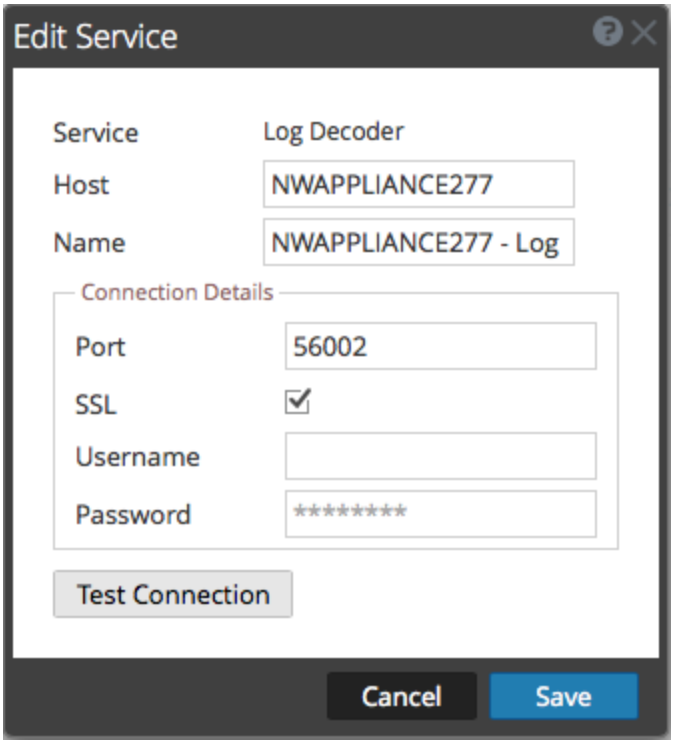
Provision Local Collectors and Remote Collectors

The NetWitness Suite server verifies if an appliance has a Log Decoder service. If there is a Log Decoder service, it becomes a Local Collector . If a Log Decoder service is missing, it becomes a Remote Collector . A local Log Collector has an Event Destination and by default goes to the Local Log Decoder service. A Remote Collector does not have an Event Destination. The NW Server server identifies a Legacy Windows Collector as a Remote Collector .

To edit a Local Collector or Remote Collector :

1. Go to **ADMIN > Services**.
2. In the **Services** view, select in the toolbar.

   The **Edit Service** dialog is displayed.



3. In the **Edit Service** dialog, provide the following information.

Field	Description
Service	Select Log Collector as the service type.
Host	Select a Log Decoder host.
Name	Type name you want to assign to the service.
Port	Default port is 50001 for clear text and 56001 for SSL encrypted.
SSL	Select **SSL** if you want NetWitness Suite to communicate with the host using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates.

Field	Description
(Optional) Username	Type the username of the Local Collector .
(Optional) Password	Type the password of the Local Collector .

4. Click **Test Connection** to determine if NetWitness Suite connects to the service.
5. When the result is successful, click **Save**.

   If the test is unsuccessful, edit the service information and retry.

Configure Local and Remote Collectors

This topic tells you how to configure Local and Remote Collectors.

When you deploy Log Collection, you must configure the Log Collectors to collect the log events from various event sources, and to deliver these events reliably and securely to the Log Decoder host, where the events are parsed and stored for subsequent analysis.

You can configure one or more Remote Collectors to push event data to a Local Collector , or you can configure a Local Collector to pull event data from one or more Remote Collectors.

This topic tells you how to:

- Configure Local Collector to Pull Events from Remote Collector

  If you want a Local Collector to pull events from Remote Collector, you set this up in the Remote Collectors tab of the Local Collector's Configuration view.
- Configure Remote Collector to Push Events to Local Collectors

  If you want a Remote Collector to push events to a Local Collector , you set this up in the Local Collector tab of the Remote Collector's Configuration view. In the Push configuration, you can also:

  - Configure Failover Local Collector for Remote Collector

    You set up a destination made up of local collectors. When the primary Local Collector is unreachable, the Remote Collector attempts to connect to each Local Collector in this destination until it makes a successful connection.
  - Configure Replication

    You set up multiple destination groups so that NetWitness replicates the event data in each group. If the connection to one of the destination groups fails, you can recover the required data because it is replicated in the other destination group.
  - Configure Log Routing for Specific Protocols

You set up multiple destinations in a destination group to direct event data to specific locations according to protocol type.

- Configure Chain of Remote Collectors

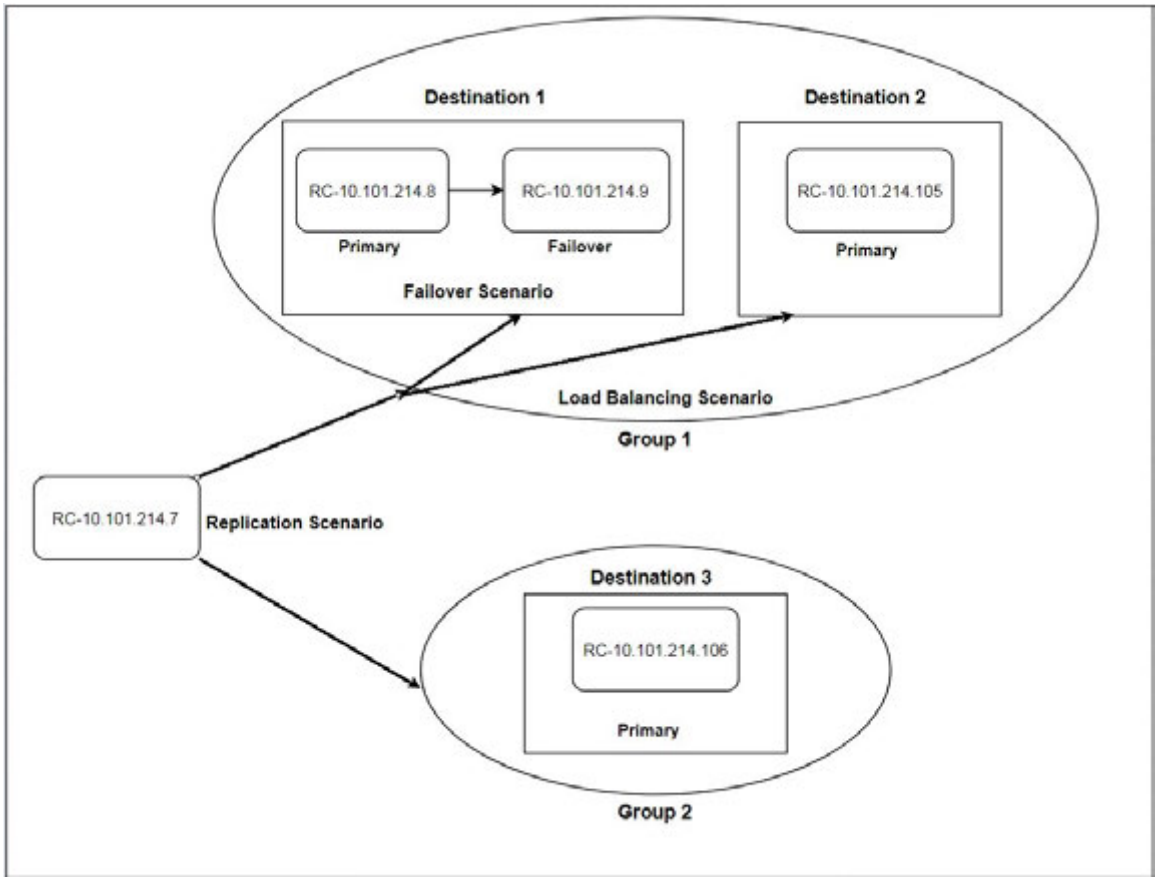
  You can set up a chain of Remote Collectors to push event data to a Local Collector , or you can configure a Local Collector to pull event data from a chain of Remote Collectors.

  - One or more Remote Collectors to push event data to a Remote Collector.
  - A Remote Collector to pull event data from one or more Remote Collectors.

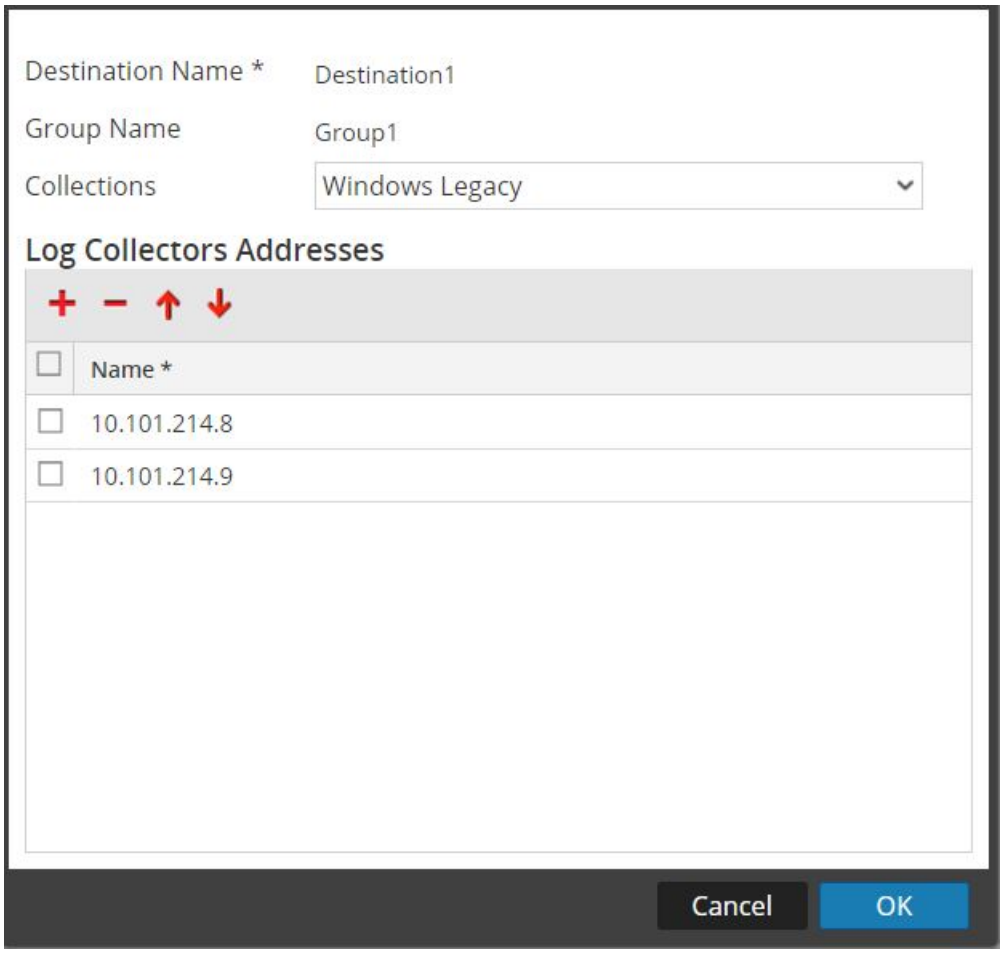
Failover, Replication and Load Balancing

This section describes failover, replication, and load balancing work in how RSA NetWitness Suite.

The following figure illustrates a Remote Collector configured for load balancing, failover and replication.

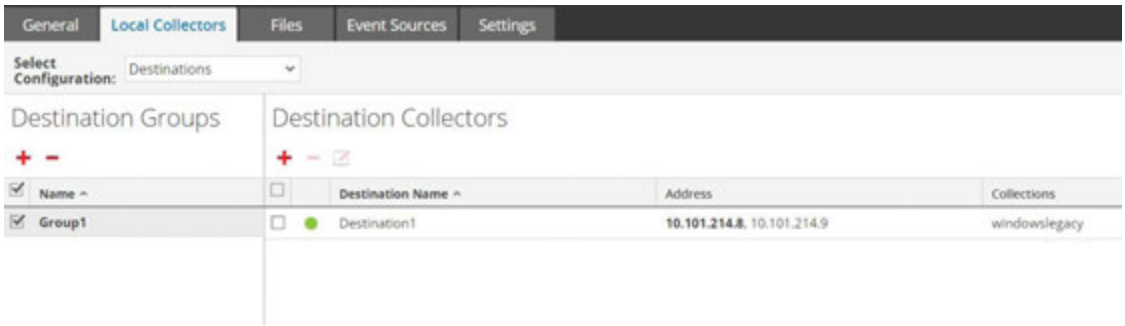


- **Failover** is achieved by setting up multiple collectors in the same Destination. Destination 1 has a primary Collector, and second, failover Collector. This is done in NetWitness Suite by adding multiple Log Collectors to the same Destination.



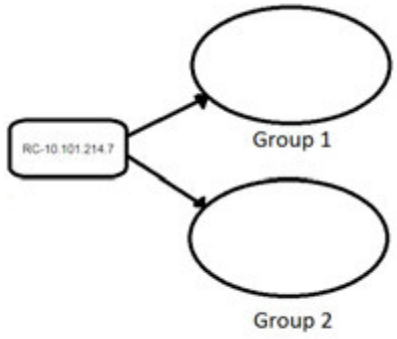
Since 10.101.214.8 is listed first, that becomes the primary collector, and 10.101.214.9 becomes the failover. To make 10.101.214.9 the primary, use the up arrow to change the order.

Below, you can see the two collectors both listed for Destination 1. The primary (10.101.214.8) is in bold.

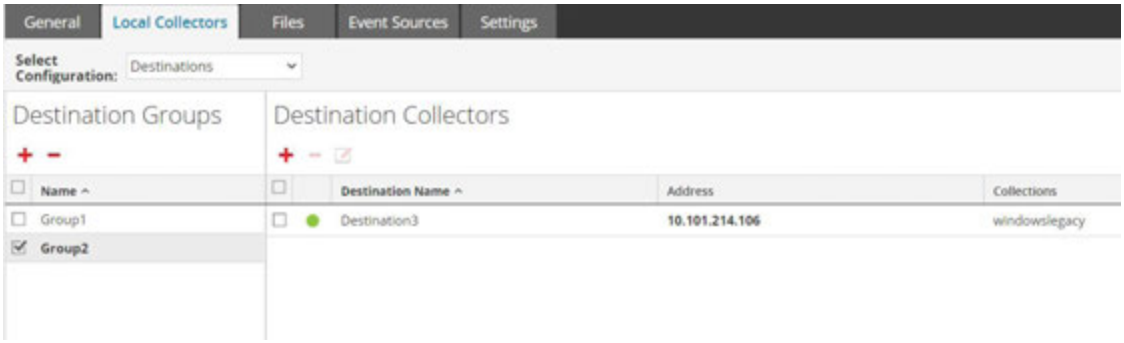


- **Replication** is accomplished by having multiple Destination Groups: each group receive the

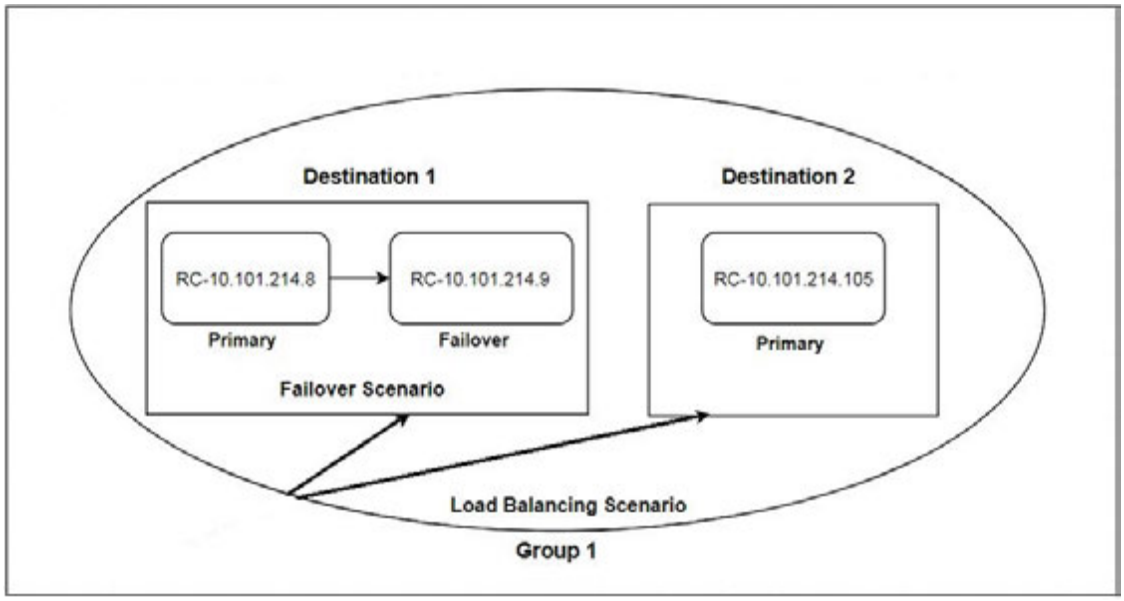
entire set of message data.



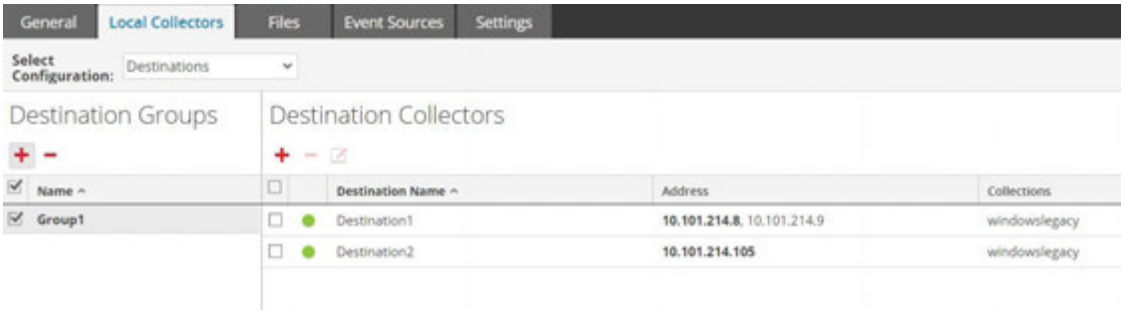
In the following screen, you can see that message data is sent to the collectors in Group 1 *and* Group 2.



- **Load balancing** is achieved by setting up multiple Destinations within a Group.



In the following screen, you can see that Group 1 has two destinations, Destination 1 and Destination 2. The message data is divided up equally among the Destinations in the group.



With two Destinations, each destination receives half the message data. With three Destinations, each would receive 1/3 of the total message data. Keep adding Destinations to further reduce the load on the collectors in each destination.

Note: You can also set up log routing so that event data for specific protocols is sent to specific destinations.

Configure a Local Collector or Remote Collector

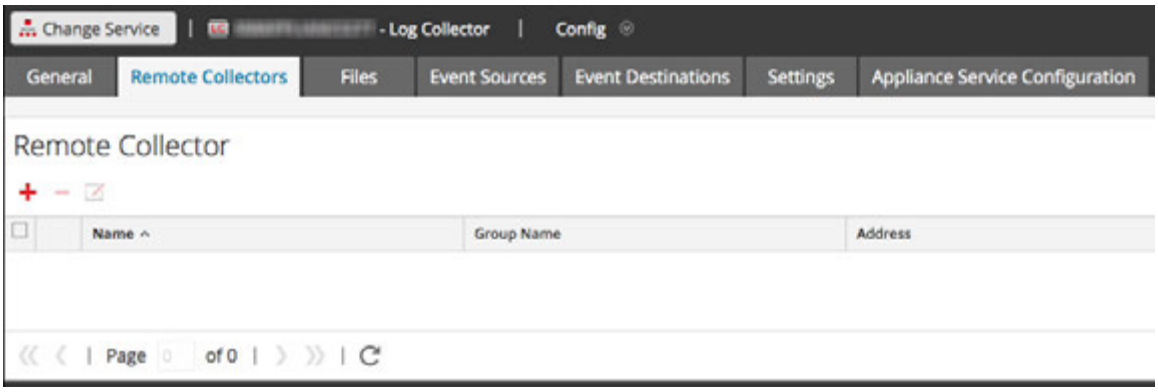
You choose the Log Collector , that is a Local Collector (LC) or Remote Collector (RC), for which you want to define deployment parameters in the Services view. The following procedure shows you how to navigate to the Services view, select a Local or Remote Collector, and display the deployment parameter interface for that service.

To configure a Local Collector or Remote Collector:

1. Go to **ADMIN > Services**.
2. Select a Local or Remote Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Depending on your selection in step 2:
   - If you selected a Local Collector , the **Remote Collectors** tab is displayed. Select the Remote Collectors from which the Local Collector pulls events in this tab.
   - If you selected a Remote Collector, the **Local Collectors** are displayed. Select the Local Collectors to which the Remote Collector pushes events in this tab.

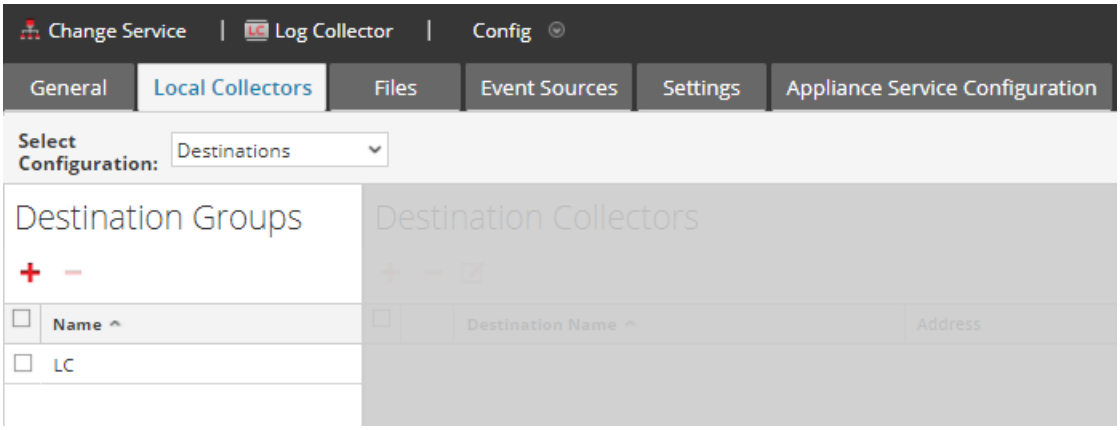
Remote Collectors Tab

The following figure depicts the **Remote Collectors** tab for aLocal Collector that is configured to pull events from a Remote Collector . NetWitness Suite displays this tab when you have selected a Local Collector in **Admin > Services**.

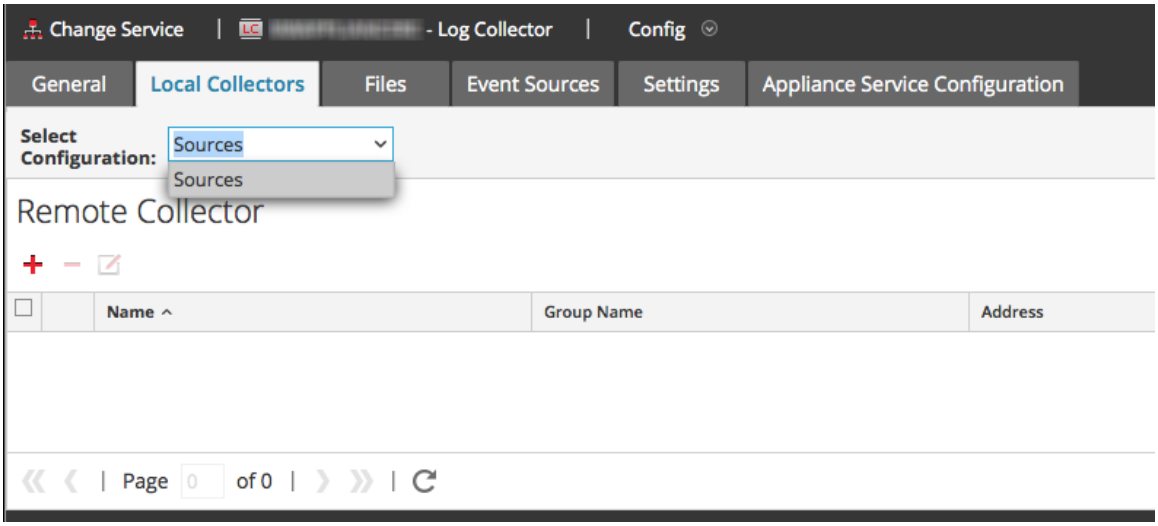


Local Collectors Tab for a Remote Collector

The following figure depicts a **Local Collectors** tab for a Remote Collector that is configured to push events to a Local Collector or another Remote Collector.



The following figure depicts the Local Collectors tab for a Remote Collector that is configured to pull events from a Remote Collector . NetWitness Suite displays this tab when you have selected a Remote Collector in **Admin > Services**.



Parameters

Remote/Local Collectors Configuration Parameters

Configure Failover Local Collector

This topic tells you how to set up a Failover Local or Remote Collector.

Set up a Failover Local Collector

You can set up a Failover Local Collector that RSA NetWitness® Suite will fail over to if your primary Local Collector stops operating for any reason.

1. Go to **ADMIN> Services**.
2. In **Services**, select a Remote Collector service.
3. Click  under **Actions** and select **View > Config**.

   The Service Config view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. In the **Destination Groups** panel section, select  .

   The Add Remote Destination dialog displays.
6. Set up a Destination Group and select a primary Local Collector (for example, **LC-PRIMARY**).
7. Select the Group (for example, **Primary_Standby_LCs**) in the Destination Groups panel and click  .

   The Group you selected is displayed in the Local Collectors panel.
8. Add the Failover Local Collector (for example, **LC-STANDBY**).

   The following examples show the newly added primary and failover Local Collectors showing the primary Local Collector as **Active** and the Failover Local Collector as **Standby**. The active Local Collector is highlighted (for example, **LC-PRIMARY**).
9. (Optional) Add, delete, and change the order of Local Collectors to each Remote Destination.
   a. Click  to add a Log Collector as a failover Remote Destination.
   b. When connecting to a Remote Destination, the Remote Collector will attempt to connect to each Local Collector in this list in order, until it makes a successful connection.
   c. Select a Local Collector and use the up () and down () arrow buttons to change the

order of connection.

d. Select one or more Local Collectors and click − to remove them from the list.

The selected Local Collectors are added to the Log Collector section. When the Remote Collector starts collecting data, it pushes data to these Log Collectors.

Set up a Failover Remote Collector

You can set up a Failover Remote Collector that RSA NetWitness® Suite will fail over to if your primary Remote Collector stops operating for any reason.

1. Go to **ADMIN > Services**.
2. In **Services**, select a Remote Collector service.
3. Click ⚙ under **Actions** and select **View > Config**.

   The Service Config view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. Select **Sources** in **Select Configuration** drop-down menu.
6. Click + to display in **Add Source** dialog.
7. Define the failover Remote Collector and click **OK**.

Parameters

Remote/Local Collectors Configuration Parameters

Configure Replication

This topic tells you how to replicate event data sent by a Remote Collector.

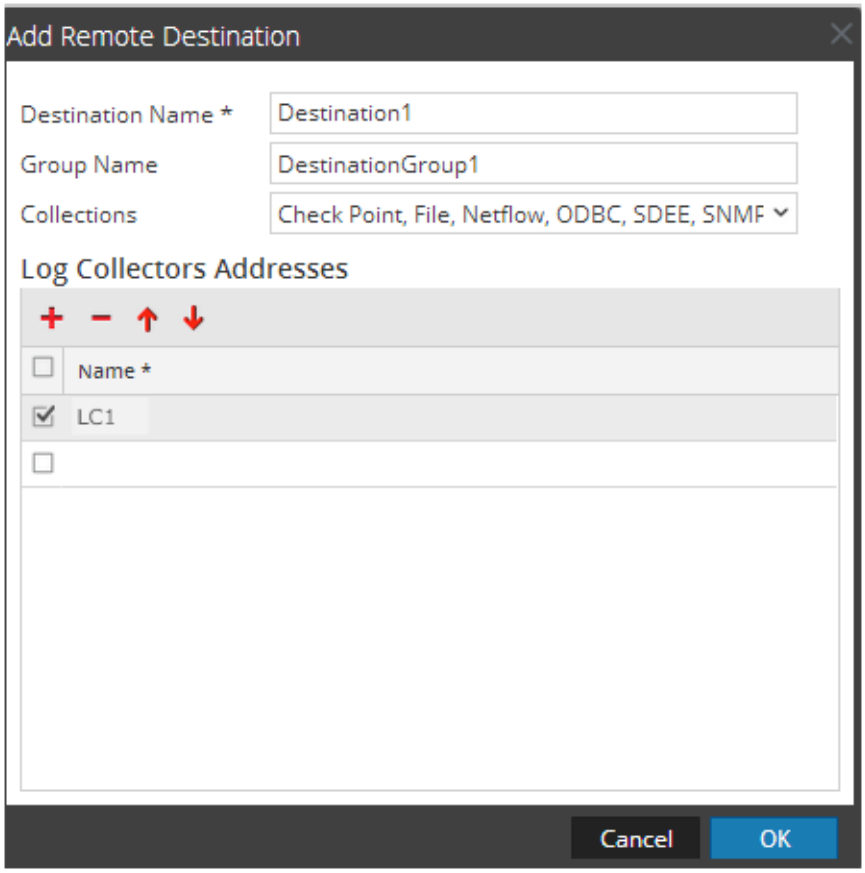
You can specify multiple Destination Groups so that the event data is replicated to each group.

To replicate event data to multiple Local Collectors:

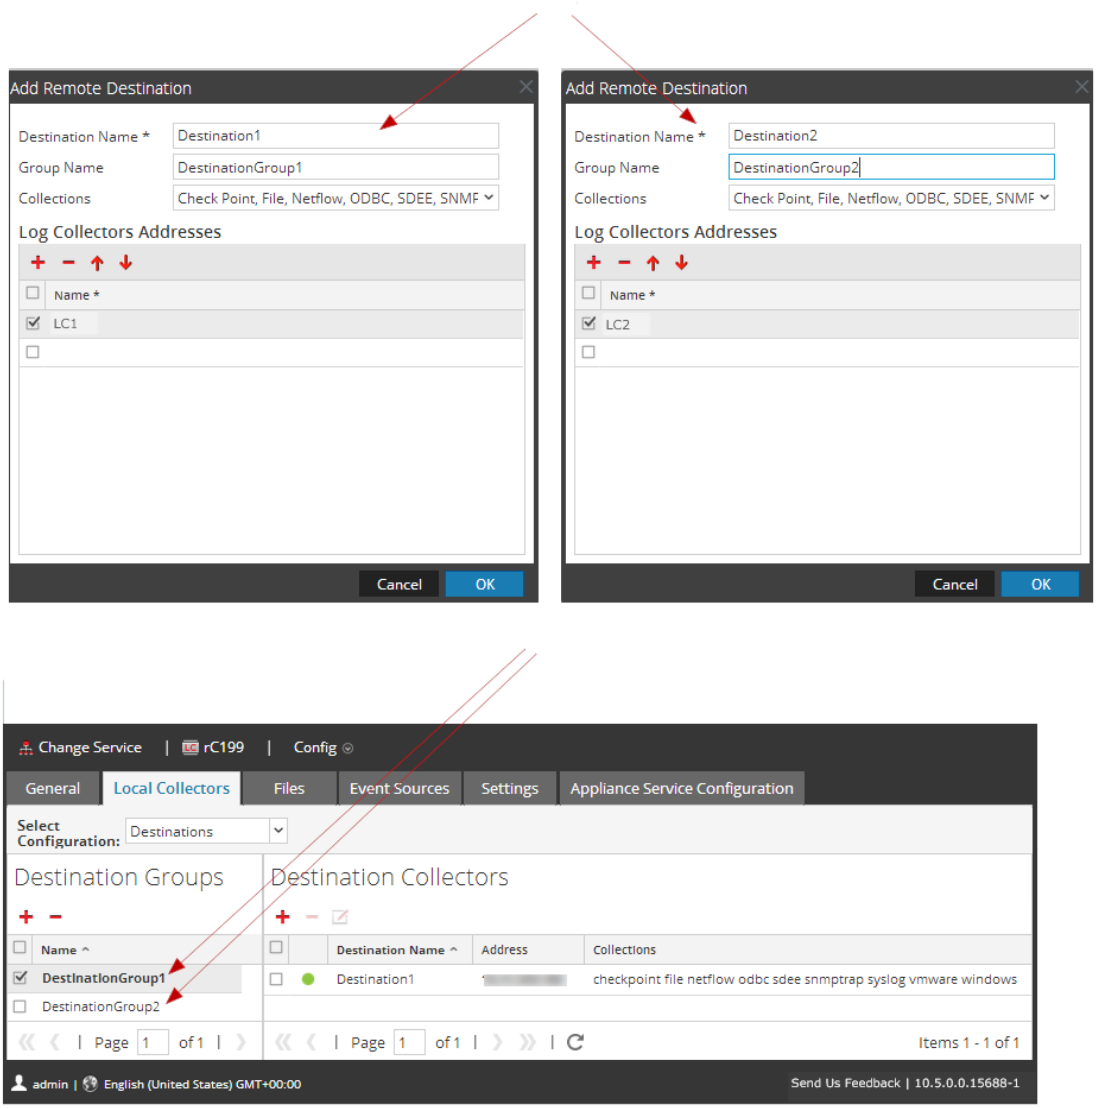
1. Go to **ADMIN > Services.**
2. Select a Remote Log Collection service.
3. Under Actions, select ⚙ **> View > Config**.

   The Service Config view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. In the **Destination Groups** panel section, click +.

   The **Add Remote Destination** dialog is displayed.



6. Set up a separate Destination for each Local Collector and designate the protocols for which you want to push event messages to that Local Collector. The following examples shows the addition of two Destination Local Collectors (**Destination1** and **Destination2**) for the **Check Point**, **File**, **Netflow**, **ODBC**, **SDEE**, **SNMP**, **Syslog**, and **Windows** collection protocols:



a. Type the **Destination Name**.

b. Type the **Group Name**. If you do not type a Group Name, the Destination Name is taken as the Group Name.

c. Select the collection protocols in the drop-down list.

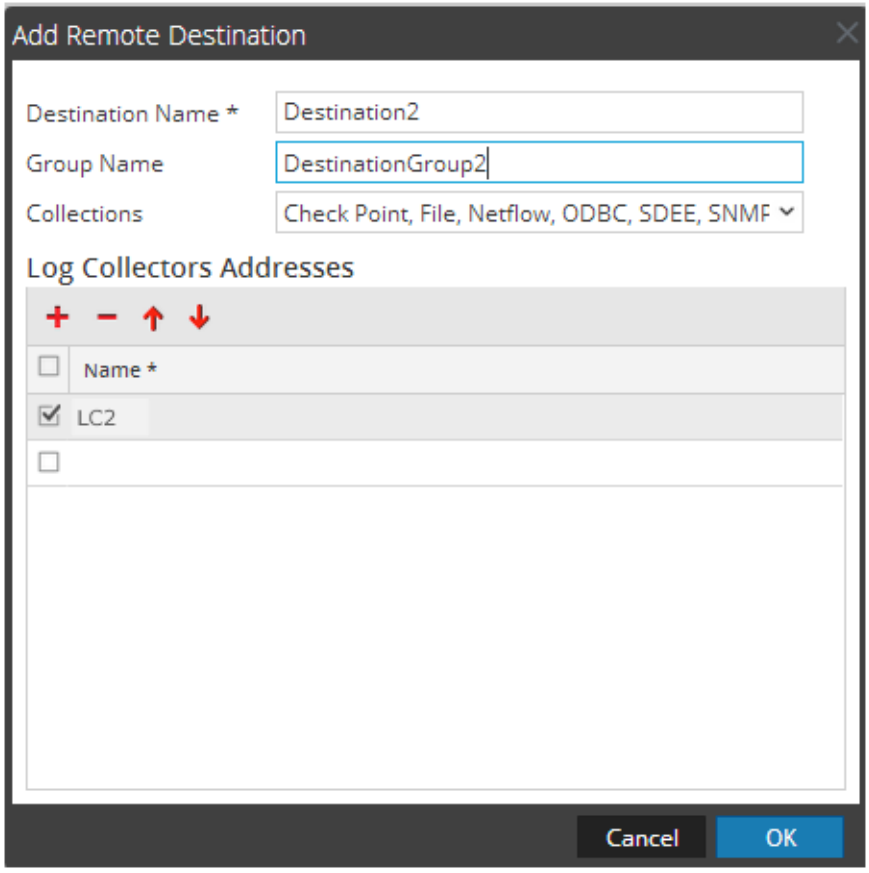
d. Select a Local Collector (for example, **LC1**).

e. Click **OK**.

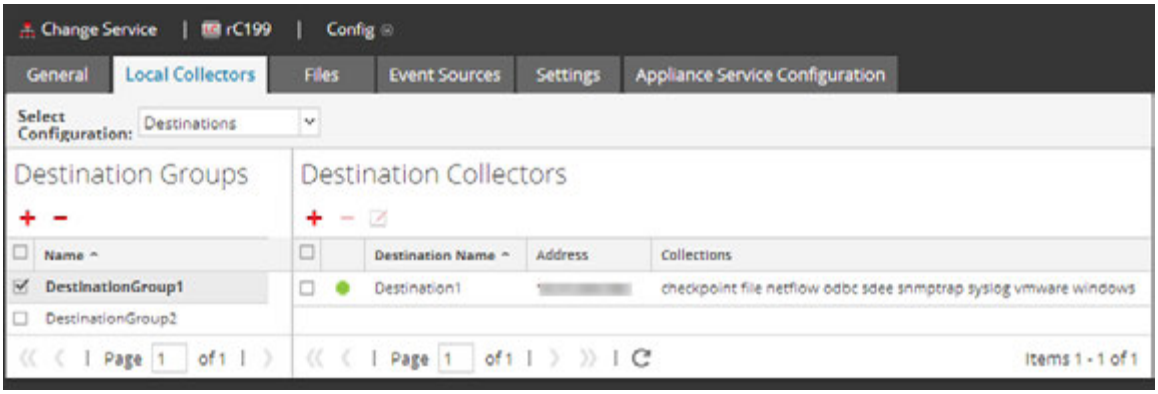
f. Select the new group (for example, **DestinationGroup2**) group in the **Destination Groups** panel and click + in the **Local Collector** panel.

g. In the **Local Collector** panel, click + and complete the **Add Remote Destination**

dialog as illustrated in the following figure.



The **Check Point**, **File**, **Netflow**, **ODBC**, **SDEE**, **SNMP**, **Syslog**, and **Windows** collection protocols are sent to two Local Collectors (**LC1** and **LC2**). Both Local Collectors are active and collecting event data.



Configure Chain of Remote Collectors

This topic describes how to chain Remote Collectors (also referred to as VLCs).

You can set up a chain of Remote Collectors to push event data to a Remote Collector, or you can configure a Remote Collector to pull event data from a chain of Remote Collectors.

- **Remote Collectors to push data.** Push data from a Remote Collector to other Remote Collectors or Local Collectors.
- **Remote Collector to pull data.** Use a Remote Collector to pull data from one or more Remote Collectors.

Configure Remote Collector to Push Event Data to Remote Collector

You can configure a Remote Collector to push event data to a Remote Collector.

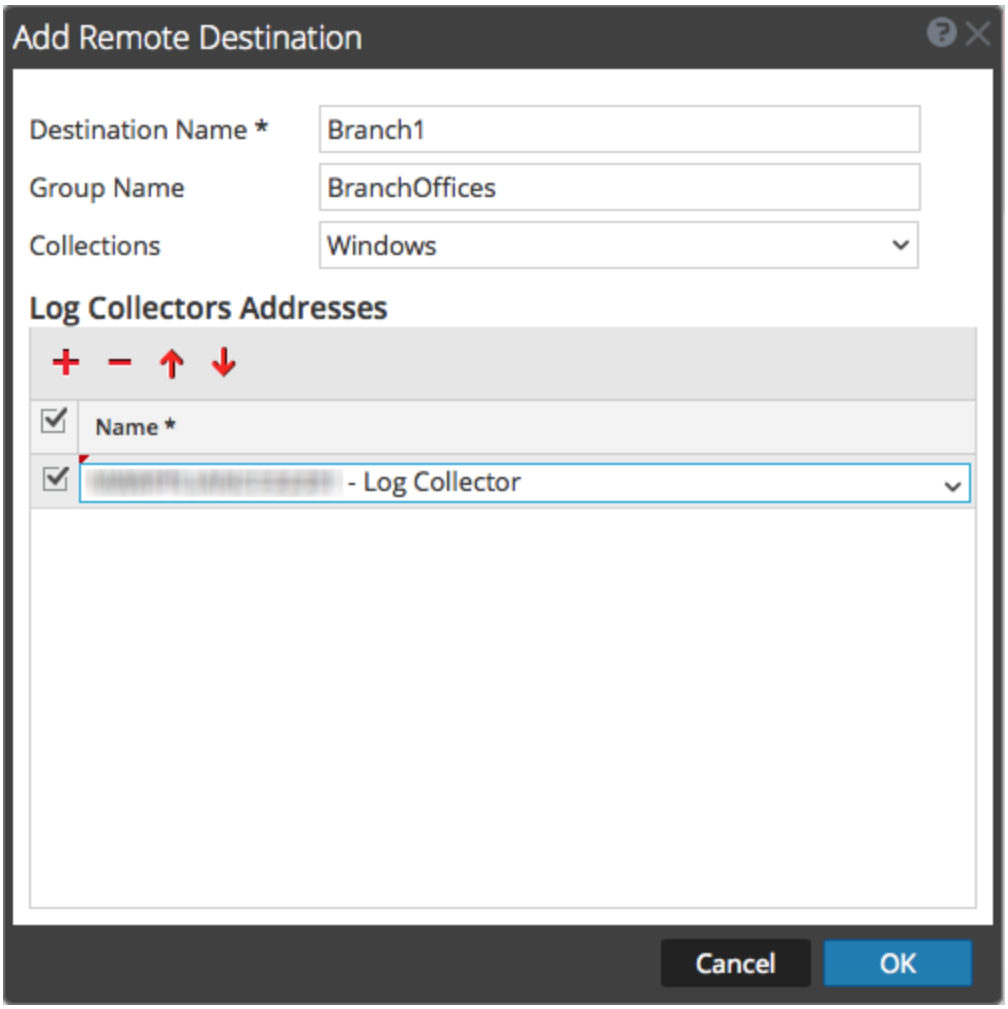
Configure a Remote Collector to Push Events to Specified Remote Collector

1. Go to **ADMIN > Services.**
2. In **Services**, select a **Remote Collector**.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.

   The **Log Collector Service Config** view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.
5. Select **Destinations** in the **Select Configurations** drop-down menu.
6. In the **Destination Groups** panel section, select  .

   The **Add Remote Destination** dialog is displayed.
7. Set up a **Destination Group**:
   a. Enter a **Destination Name**.
   b. (Optional) **Enter a Group Name**. If you leave Group Name blank, NetWitness Suite sets it to the value that you specified in Destination Name.
   c. Select one or more collection protocols in the **Collections** drop-down list.

d. Under **Log Collectors Addresses**, click + to select a Remote Collector.



Note: If you do not select a collection protocol, the Remote Collector pushes all collection protocols to the Remote Collectors.

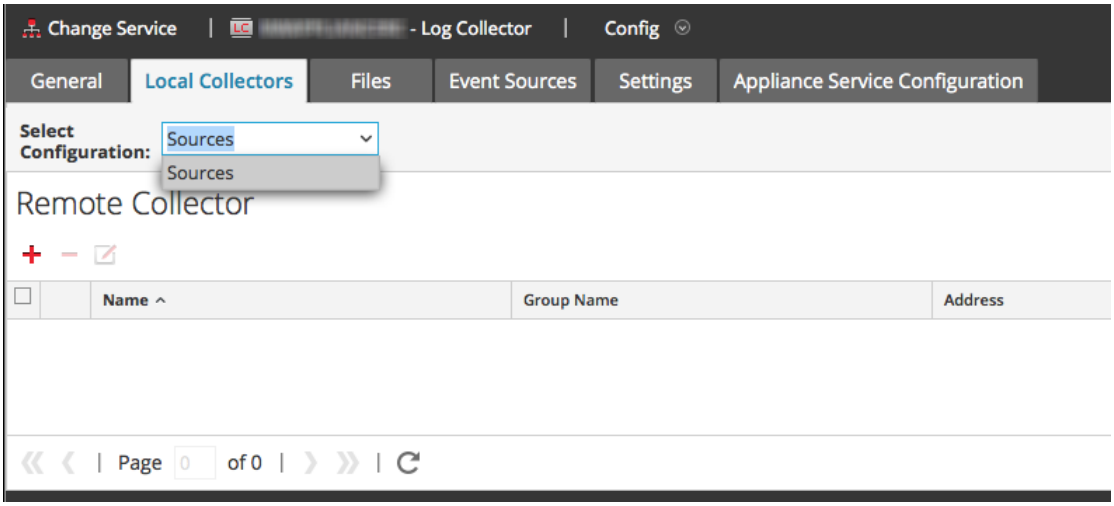
Configure Remote Collector to Pull Event Data from a Remote Collector

Configure the Selected Remote Collector to Pull Events from Specified Remote Collector

1. Go to **ADMIN > Services.**
2. In **Services**, select a **Remote Collector**.
3. Under Actions, select ⚙ **> View > Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the **Log Collector General** tab open.
4. Select the **Local Collectors** tab.

5. Select **Sources** in the **Select Configurations** drop-down menu.



6. In the **Remote Collectors** panel, select +.

   The **Add Source** dialog is displayed.

7. In the **Add Source** dialog:

   a. Select one or more collection protocols.

   If you do not select a collection protocol, the Remote Collector pulls all collection protocols from the Remote Collector.

   b. Click **OK**.

   The Remote Collector is added to the Remote Collector section. When the Log Collector starts collecting data, it pulls event data from this Remote Collector.

Throttle Remote Collector to Local Collector Bandwidth

To improve performance, you can throttle the bandwidth to control the rate that the Remote Collector sends event data to Local Collector or between Message Brokers. To do this, you configure the Linux kernel's filtering and IPTable functionality.

This works for both push and pull Remote Collector configurations. The **set-shovel-transfer-limit.sh** shell script located on the **/opt/netwitness/bin** automates the configuration of the kernel filter and iptables related to this port.

This topic describes how to throttle Remote Collector to Local Collector bandwidth using the **set-shovel-transfer-limit.sh** shell script. It contains the following sections:

- The **set-shovel-transfer-limit.sh** shell script command line help.

Note: The filter value that you need to set depends on the rate at which remote log

collector is sending events to the Local Collector.

- An example that sets the Filter to 4096 kilobits per second.

Command Line Help for Set Shovel Transfer Limit Script

Issue the `-h` command to display help for `set-shovel-transfer-limit.sh` shell script.

```
cd /opt/netwitness/bin
./set-shovel-transfer-limit.sh
```

Usage:

```
code>set-shovel-transfer-limit.sh -s|-c|-d|[-i interface] [-r rate]
```

where:

- -c = clear existing
- -d = display filter
- -s = set new values
- -i = interface is the name of the network interface. Default value is **eth0**
- -r = rate is the bandwidth rate. Default value is **256kbps**

Bandwidths and rates can be specified in:

- **nolimit**: disables throttling
- **kbit**: Kilobits per second
- **mbit**: Megabits per second
- **kbps**: Kilobytes per second
- **mbps**: Megabytes per second
- **bps**: Bytes per second

Set the Filter to 4096 Kilobits per Second

This example sets the Filter to 4096 kilobits per second.

```
[root@<hostname> bin]# ./set-shovel-transfer-limit.sh -s -r 4096kbit
```

```
RATE=4096kbit
 PORTNUMBER=5671
 DEVICE_INTERACE=eth0
```

```
iptables: No chain/target/match by that name.

Set Up a Lockbox

This topic tells you how to configure Lockbox Security Settings.

What Is a Lockbox

A lockbox is an encrypted file that you use to store confidential information about an application. The NetWitness Suite Lockbox stores an encryption key for the Log Collector .

The encryption key is used to encrypt all event source passwords and the event broker password.

When you create the Lockbox, you need to define a password for the Lockbox.

TheLog Collector operates the Lockbox in a mode during data collection that does not require you to specify the password (theLog Collector uses the host system fingerprint instead).

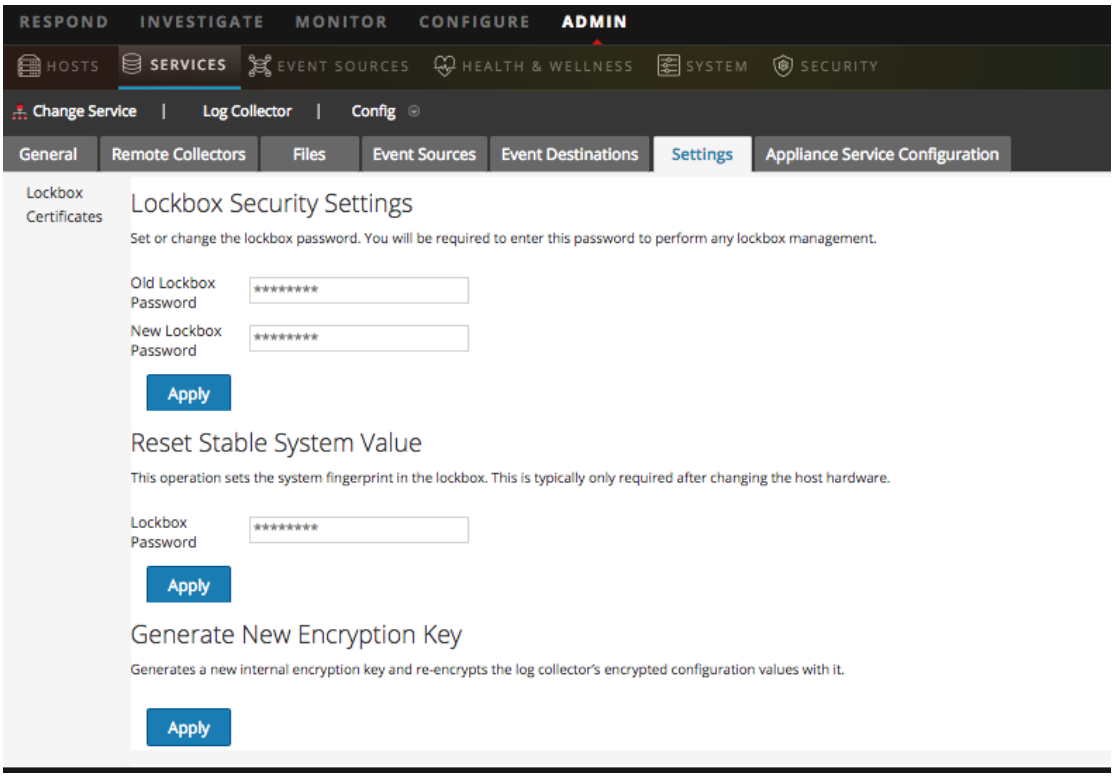
These are the lockbox security settings.

Feature	Description
Old Lockbox Password	When you set up a Lockbox for the first time, this field is blank. NetWitness Suite populates this field after you enter a New Lockbox Password and click Apply.
New Lockbox Password	Initial or new lockbox password. To maximize lockbox security, specify a password that is eight or more characters in length with at least one numeric character, uppercase character, and non-alphanumeric character such as # or !
Apply	Click **Apply** to save the changes to the lockbox password.

Set Up a Lockbox

To set up a lockbox you need to set a password, as follows:

1. Go to **ADMIN > Services** .
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Settings** tab.



5. In the options panel, select **Lockbox** to configure Lockbox settings.
6. Under **Lockbox Security Settings**, enter a password in the **New Lockbox Password** field and click **Apply**.

Start Collection Services

If a collection service stops, you may need to start it again. You can also enable the automatic start of collection services.

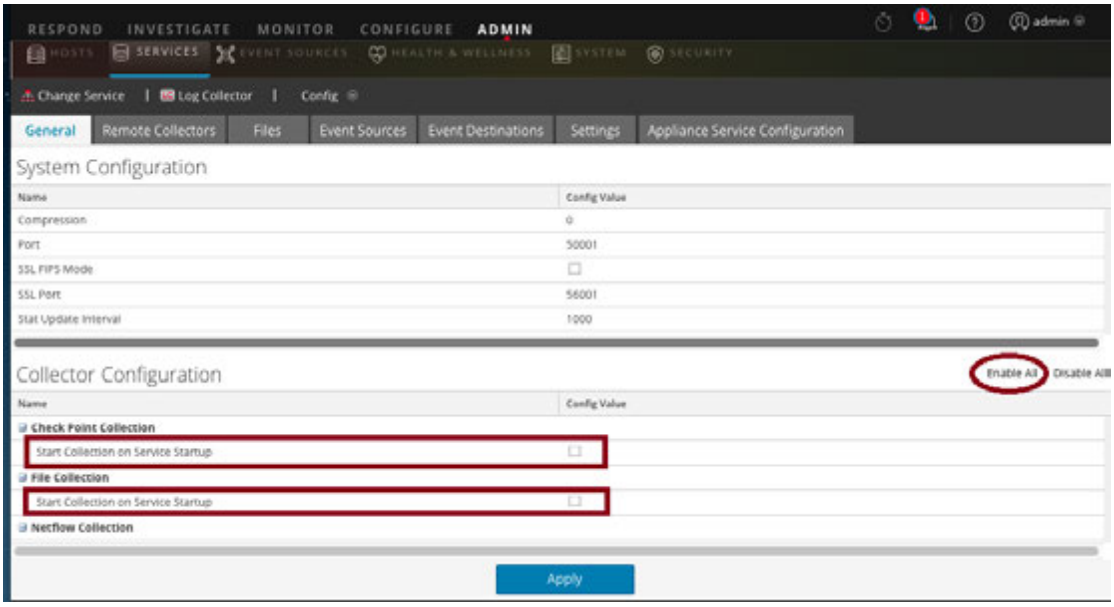
Start a Collection Service

1. Go to **ADMIN > Services**.
2. Select a Log Collector service and click  under **Actions**.
3. Click **View** > **System**.
4. Click **Collection** > ***service*** (for example **File**) and click **Start**.

Enable Automatic Start of Collection Services

1. Go to **Admin > Services**.
2. Select a Log Collector service and click  under **Actions**.
3. Click **View** > **Config**.

   The General tab is displayed.
4. In the Collector Configuration panel, select **Start Collection on Service Startup** for the individual collection services that you want to start automatically. Alternatively, select **Enable All** to automatically start all collection services.



5. Click **Apply** for your changes to take effect.

Verify That Log Collection Is Working

This topic tells you how to verify that you have set up Log Collection correctly.

The following methods verify that Log Collection is working.

- Verify that there is event activity the Event Source Monitoring tab of the **Administration > Health & Wellness** view.
- Verify that there are parsers in the **device.type** field in the **Details** column in the **Investigation > Events** view for the collection protocol you configured.

Please refer to the topics for each Collection Protocol for steps on how to verify that the protocol is set up correctly.

Configure Certificates

You manage certificates by creating trust stores on the Log Collector. The Log Collector refers to these trust stores to determine whether or not the event sources are trusted.

Add a Certificate

To add a certificate:

1. Go to **ADMIN > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click  under **Actions** and select **View > Config**.
4. Click the **Settings** tab.
5. In the options panel, select **Certificates**.
6. Click  in the **Certificates** tool bar.

   The **Add Cert** dialog is displayed.
7. Click **Browse** and select a certificate (***.PEM**) from your network.
8. Specify a password (if required).
9. Click **Save**.

Certificates Panel

The following table describe the buttons and columns available in the Certificates panel.

Field	Description
	Opens the Add Cert dialog in which you can add a certificate and password.
	Deletes the selected certificates.
	Selects certificates.
Trust Store Name	Displays the name of the trust store.
Certificate Distinguished Name	For Check Point event source only, displays the distinguished name for the certificate.

Field	Description
Certificate Password Name	For Check Point event source only, displays the password name for the certificate.

Add Cert Dialog

The following table describes the parameters available in the **Add Cert** dialog.

Field	Description
Trust Store Name	Enter a trust store name.
File	Click Browse to select a certificate (*.PEM file) file from your network
Password	Specify the password for this certificate.
Close	Closes the dialog without adding a certificate.
Save	Adds the certificate.

Log Collection Basics

How Log Collection Works

The Log Collector service collects logs from event sources throughout the IT environment in an organization and forwards the logs to other NetWitness Suite components. The logs and the descriptive content are stored as meta data for use in investigations and reports.

Event sources are the assets on the network, such as servers, switches, routers, storage arrays, operating systems, and firewalls. In most cases, your Information Technology (IT) team configures event sources to send their logs to the Log Collector service and the NetWitness Suite administrator configures the Log Collector service to poll event sources and retrieve their logs. As a result, the Log Collector receives all logs in their original form.

Collection Protocols

RSA NetWitness Suite can collect logs from a wide variety of event sources. When you are configuring log collection for a specific event source, you need to know, first and foremost, the protocol that is used to collect the logs.

Collection Protocol	Description
Check Point	Collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs. For details, see Configure Check Point Event Sources in NetWitness Suite.
File	Collects events from log files. Event sources generate log files that are transferred using a secure file transfer method to the Log Collector service. For details, see Configure File Event Sources in NetWitness Suite.
Netflow	Accepts events from Netflow v5 and Netflow v9. For details, see Configure Netflow Event Sources in NetWitness Suite.
ODBC	Collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface. For details, see Configure ODBC Event Sources in NetWitness Suite.

Collection Protocol	Description
Plugins	The Plugins collection is a generic collection framework for collecting events using external scripts written in other languages. RSA currently provides collection for Amazon Web Services (AWS) CloudTrail and Microsoft Azure. • **AWS**: Collects events from Amazon Web Services (AWS) CloudTrail. Specifically CloudTrail records AWS API calls for an account. For details, see Configure AWS (CloudTrail) Event Sources in NetWitness Suite • **Azure**: Collects events from Microsoft Azure. For details, see Configure Azure Event Sources in NetWitness Suite. Customers can use this framework to develop their own collection protocols.
SDEE	Collects Intrusion Detection System (IDS) and Intrusion Prevention Service (IPS) messages. For details, see Configure SDEE Event Sources in NetWitness Suite.
SNMP Trap	Accepts SNMP traps. For details, see Configure SNMP Event Sources in NetWitness Suite.
Syslog	Accepts messages from event sources that issue syslog messages. For details, see Configure Syslog Event Sources for Remote Collector. **Note:** You do not configure Syslog Collection for Local Log Collectors. You only need to configure Syslog Collection for Remote Collectors.
VMware	Collects events from a VMware virtual infrastructure. For details, see Configure VMware Event Sources in NetWitness Suite.
Windows	Collects events from Windows machines that support the Microsoft Windows model. Windows 6.0 is an event logging and tracing framework included in the operating system beginning with Microsoft Windows Vista and Windows Server 2008. For details, see Configure Windows Event Sources in NetWitness Suite.

Collection Protocol	Description
Windows Legacy	Collects events from: • Older Windows versions such as Windows 2000 and Window 2003 and collects from Windows event sources that are already configured for enVision collection without having to reconfigure them. • NetApp ONTAP appliance event source so that you can now collect and parse NetApp evt files. • For more information, see .Windows Legacy and NetApp Collection Configuration. **Note:** You install the NetWitness Suite Windows Legacy Collector on a physical or virtual Windows 2008 R2 SP1 64-Bit server using the **SALegacyWindowsCollector-*version-number.exe***.

Basic Procedure

The basic procedure is the same for all of the supported Collection Protocols.

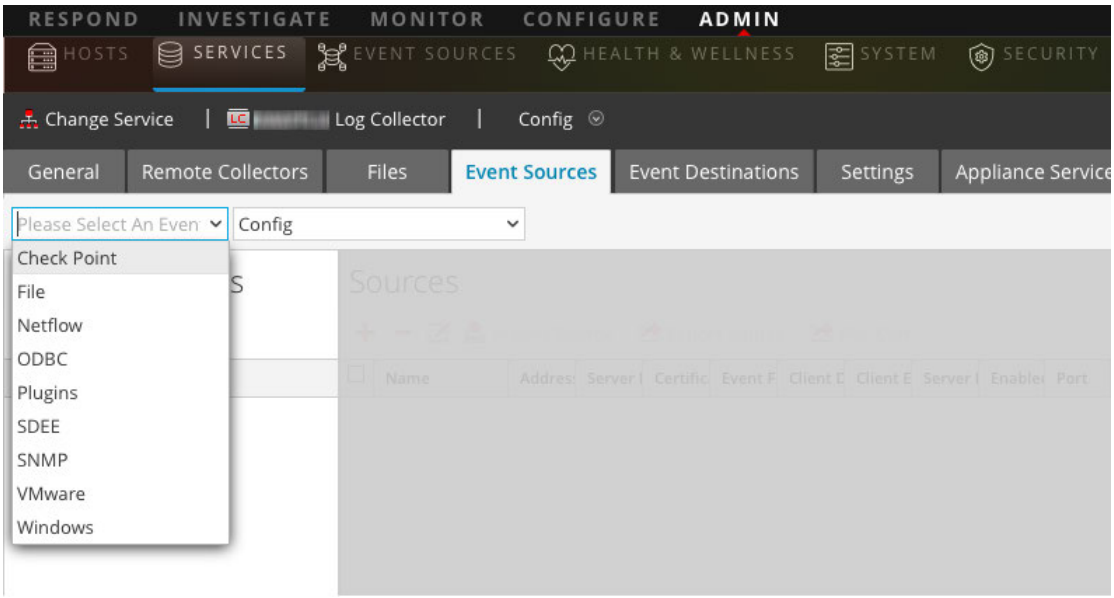
1. **Set up your Event Source for collection.** Each supported event source has a configuration document available in the RSA Supported Event Sources space on RSA Link
   a. Navigate to the RSA Supported Event Sources space on RSA Link.
   b. Find the Instructions for your Event Source.
      The Overview page lists all of the currently supported Event Sources, as well as information about the collection method, device class, and supported versions.
   c. Download the configuration instructions for your event source, and follow them.
2. **Configure collection on RSA NetWitness Suite.** The event source configuration guide contains these instructions. However, this guide also provides these instructions, based on the collection method used by your event source. See Collection Protocols for details.
3. **Start the Service for your Collection Method.** Normally, you only need to do this for the first event source that uses this collection method. For example, the first time you configure an event source that uses File Collection, you may need to start the File Service in NetWitness Suite.
4. **Verify that Collection is working for your Event Source.**

The remainder of this topic discusses steps 2, 3, and 4 in more detail.

Configure Collection in RSA NetWitness Suite

The process to configure event sources is dependent upon the collection method they use. Note, however, that they are very similar. The following procedure is generic: more details for individual collection methods are available in topics that cover the details for each specific collection method.

1. Go to **ADMIN> Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Log Collector Event Sources** tab, select your collection method from the drop-down menu.
6. In the **Event Categories** panel toolbar, click  .

   The Available Event Source Types dialog box is displayed.
7. Select an event source type and click **OK**.

   The newly added event source type is displayed in the Event Categories panel.
8. Select the new type in the **Event Categories** panel and click  in the Sources toolbar.

   The **Add Source** dialog is displayed.

9. Enter values for the available parameters.

   Refer to the Parameters section of the specific collection method that you are configuring.

10. Click **OK**.

Start the Service for your Collection Method

To start the service for your collection method, do the following:

1. Go to **Admin > Services**.
2. Select a **Log Collector** and select  **> View > System**.
3. Click **Collection >** ***protocol*****> Start**

   where ***protocol*** is the protocol that you wish to start, for example **Netflow**.

Verify that Collection is working for your Event Source

You can verify that a collection method is working from the **Admin > Health & Wellness > Event Source Monitoring** tab.

To verify that collection is working for an event source:

1. Go to **ADMIN > Health & Wellness**
2. Click the **Event Source Monitoring** tab.
3. In the grid, find the **Log Decoder**, **Event Source**, and **Event Source Type**.
4. Look for activity in the **Count** column for an event source to verify that collection is accepting events.

Configure Event Filters for a Collector

This topics tells you how to create and maintain Event filters across all collection protocols.

Note: You cannot configure Syslog Collection for Local Log Collectors. You only need to configure Syslog Collection for Remote Collectors. See Configure Local and Remote Collectors for additional configuration information.

Configure an Event Filter

To configure an event source:

1. Go to **ADMIN > Services**.
2. Select a Log Collection service.

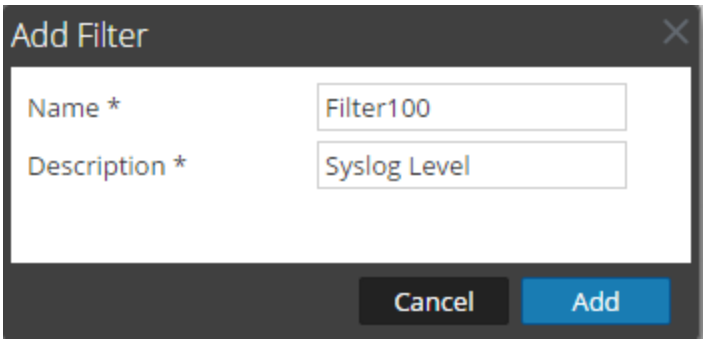
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select any collection method / **Filter** from the drop-down menus.

   The following screen shows **Syslog** selected.

   Note: Syslog configuration is only available on Remote Collectors: if you are working with a Local Collector service, **Syslog** is not available from the drop-down menu.

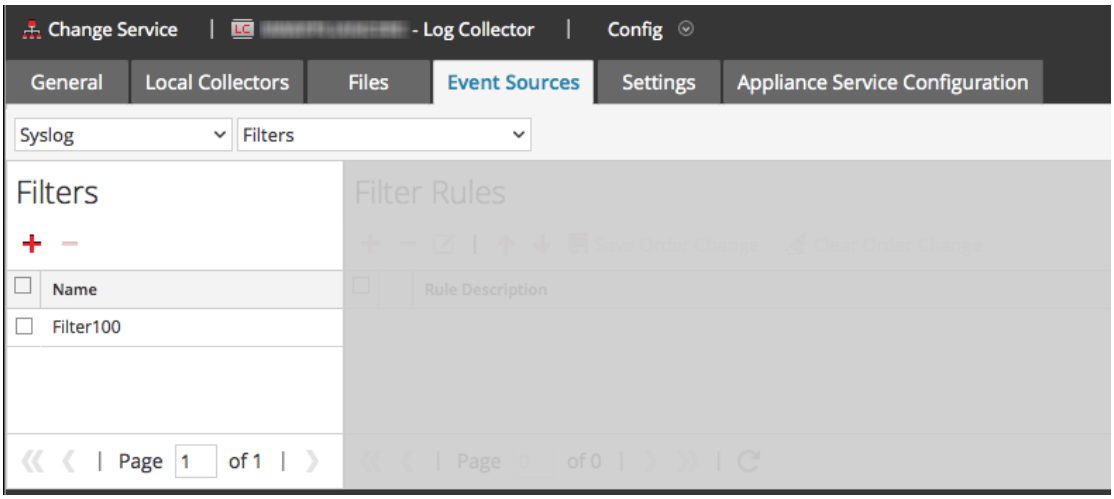
   The **Filters** view displays the filters that are configured for the selected collection method, if any.
6. In the **Filters** panel toolbar, click +.

   The **Add Filter** dialog displays.



7. Enter a name and description for the new filter and click **Add**.

   The new filter displays in the **Filter** panel.

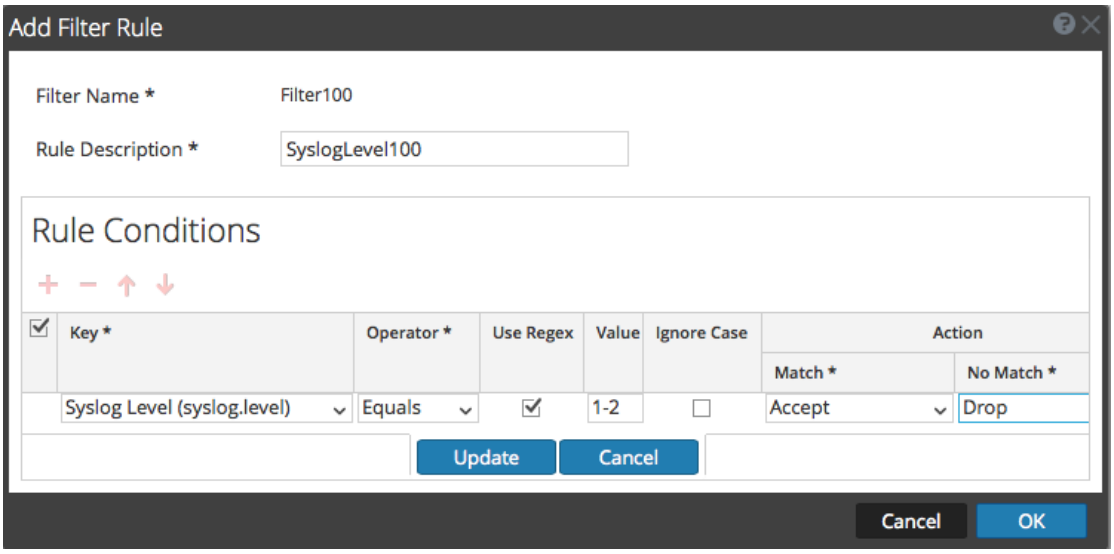


8. Select the new filter in the **Filters** panel and click + in the **Filter Rules** panel toolbar.

   The **Add Filter Rule** dialog is displayed.

9. Click + under **Rule Conditions**.

10. Add the parameters for this rule and click **Update** > **OK**.



NetWitness Suite updates the filter with the rule that you defined.

Note: Rules are processed in order from top down until an Action type aborts the processing, or the final rule is checked. Default behavior is to accept the rule if no matches are found.

The following tables describe the parameters for adding a filter rule.

Event Filter Rule "Key" Parameter

The values for the Key field depend on the Collection method to which the filter applies.

Collection Method	Values for the *Key* Field
Checkpoint, File, Netflow, Plugin, SDEE SNMP and VMware	• All Data Fields • Event Source Type • Event Source Name • Source IP • Raw Event
ODBC	• All Data Fields • Event Source Type • Event Source Name • Source IP • Message ID • Message Level
Syslog	• All Data Fields • Event Source Type • Event Source Name • Source IP • Syslog level • Raw Event

Collection Method	Values for the *Key* Field
Windows	• All Data Fields • Event Source Type • Event Source Name • Source IP • Event ID • Provider • Channel • Computer • UserName • DomainName
Windows Legacy	• All Data Fields • Event Source Type • Event Source Name • Source IP • Event ID

Other Event Filter Rule Parameters

The following table describes all the other available fields for creating an event filter rule.

Field	Description
Operator	Valid values are: • Contains • Equal
Use Regex	Optional. You can select this if you want to use regex.
Value	Value depends on the key value you selected. For example if you choose **Syslog level** for Key, the value will be a number that denotes the syslog level.

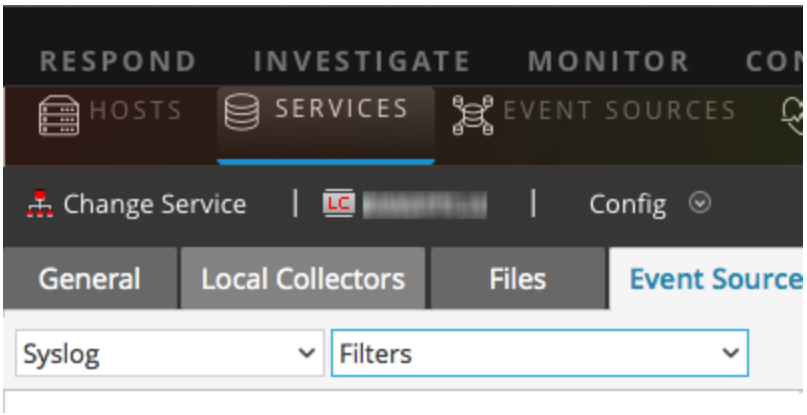
Field	Description
Ignore case	Optional. Select this to ignore the case sensitivity.
Action	If there is a match you can choose an action to accept, drop, next condition or next rule: • **Accept**: events that match the IDs provided will be included in event logs, and will display in the Systems Analytics UI. • **Drop**: events that match the IDs provided will not be included in event logs and will not display in the UI. • **Next condition**: the filter will ignore events with IDs that match, and will move on to the next rule condition. • **Next rule**: the filter will ignore events with IDs that match, and will move on to the next rule. If there is no match, you can choose an action to accept, drop, next condition or next rule.

Modify Filter Rules

To modify an event source:

1. Go to **ADMIN > Services** .
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select any collection method / **Filter** from the drop-down menus.

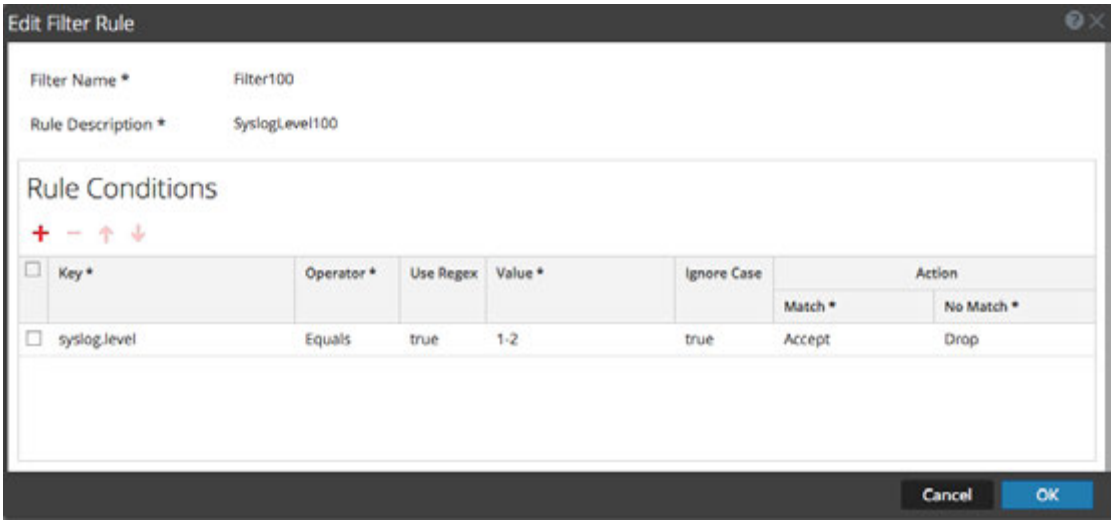
   The following screen shows **Check Point** selected.



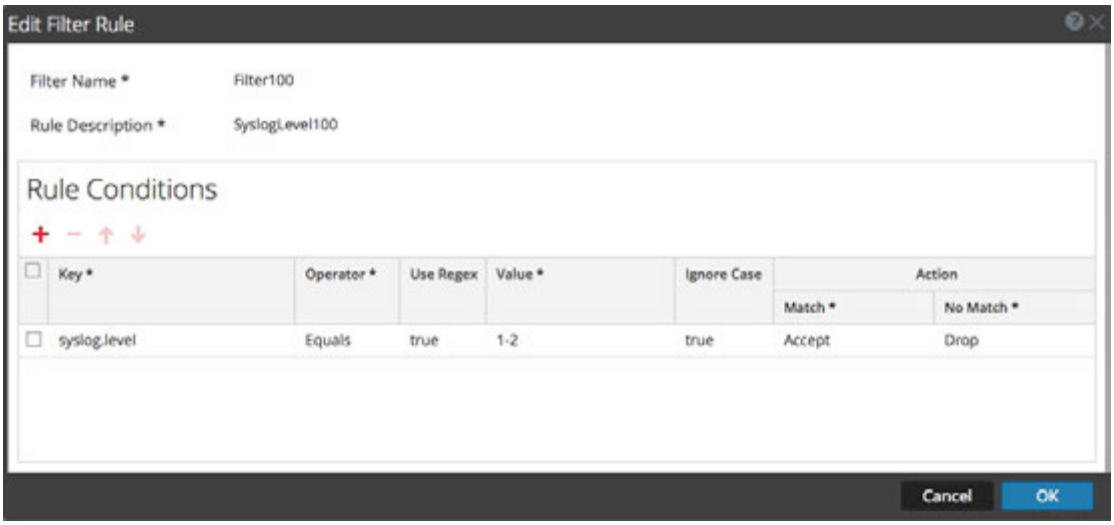
The **Filters** view displays the filters that are configured for the selected collection method, if any.

6. In the **Filter Rules** list, select a rule and click .

   The **Edit Filter Rule** dialog is displayed.



7. Select the rule condition that you want to modify.



8. Modify the condition parameters that require changes and click **Update** > **OK**.

NetWitness Suite applies the condition parameter changes to the selected filter rule.

Import, Export, Edit and Test Event Sources in Bulk

This topic describes how to import, export, edit and test event sources in bulk.

You can use the bulk export option to export the event source details of your current set up and store it. This data can be imported in bulk when you face a problem with your current set up and require the event source data you had.

You can use the bulk edit feature when you have multiple event sources that need a specific modification. You can select all the sources and apply the edit option across them at a time and avoid applying the change one by one.

Import Event Sources in Bulk

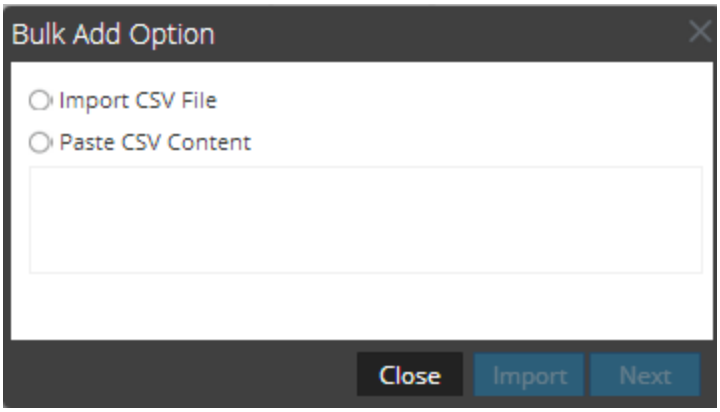
Warning: When using a spreadsheet program to edit an exported event source CSV file, some data fields like numbers and dates can be re-formatted into the spreadsheet program's native field types. This can cause issues when re-importing this information, as some data fields may be garbled or formatted incorrectly. This can be avoided by importing the CSV file into the spreadsheet program, and specifying all data fields as text values.

To import multiple event sources at once:

1. Go to **Admin** > **Services** .
2. Select a Log Collection service.
3. Under Actions, select > **View** > **Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.
5. Select **Check Point**, **File**, **Netflow**, **ODBC**, **Plugins**, **SDEE**, **(Syslog for Remote Collectors) only**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have an Import function.).
6. In the **Sources** panel toolbar, click **Import Source**.

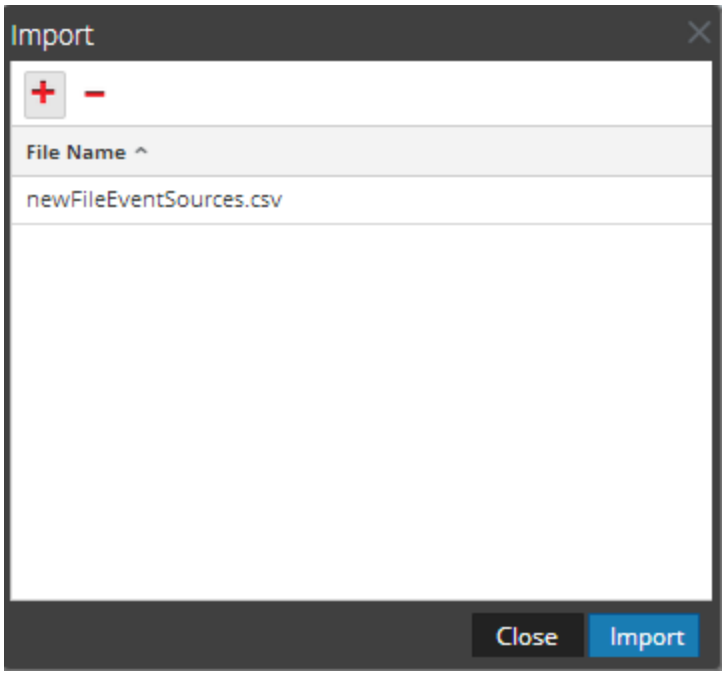
   The **Bulk Add Option** dialog is displayed.



7. Select either **Import CSV File** or **Paste CSV Content**. If you select:
   - Import CSV File:
     a. Click **Next**.

        The **Import dialog** is displayed.

     b. Click **Add** and select a **.csv** file from your network.

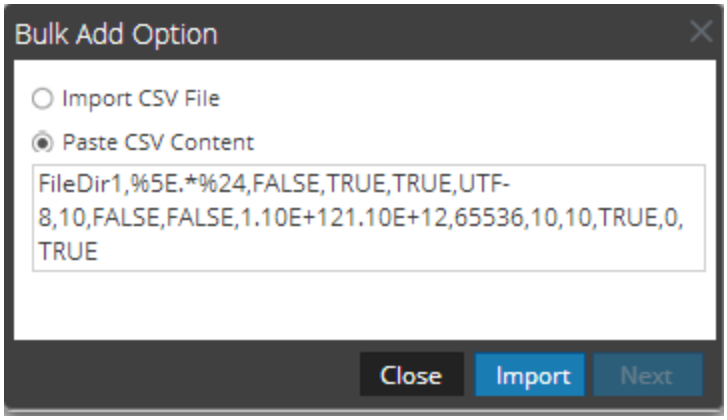


c. Click **Import**.

The event sources are added to the **Event Source** list.

- Paste CSV Content

a. Copy the contents of the **.csv** file and paste them into the dialog.



b. Click **Import**.

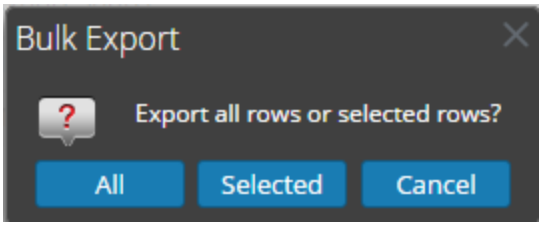
The event sources are added to **Event Source List**.

Export Event Sources in Bulk

Warning: When using a spreadsheet program to edit an exported event source CSV file, some data fields like numbers and dates can be re-formatted into the spreadsheet program's native field types. This can cause issues when re-importing this information, as some data fields may be garbled or formatted incorrectly. This can be avoided by importing the CSV file into the spreadsheet program, and specifying all data fields as text values.

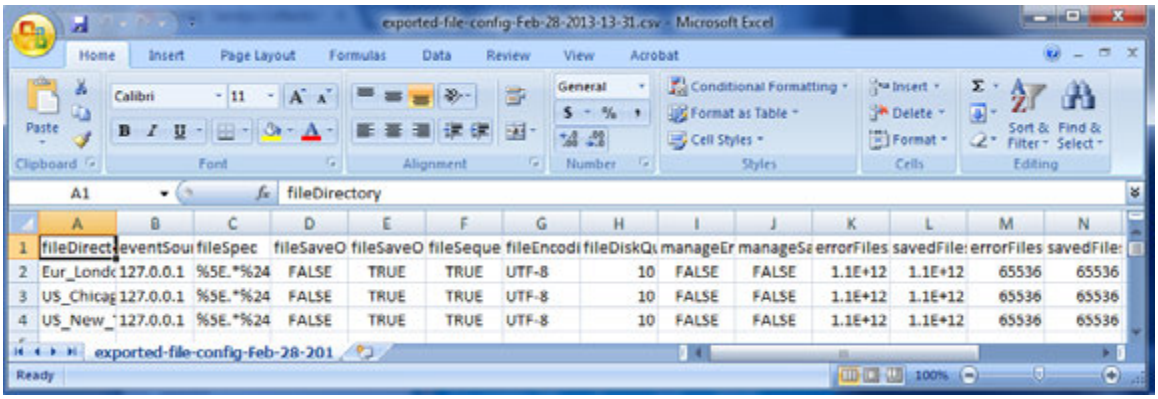
1. Go to **Admin** > **Services** .
2. Select a Log Collection service.
3. Under Actions, select  > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. Select **Check Point**, **File**, **Netflow**, **ODBC**, **Plugins**, **SDEE**, **(Syslog for Remote Collectors) only**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have an Export function.).
6. In the **Sources** panel, select one or multiple event sources and click **Export Source**.

   The **Bulk Export** dialog is displayed.

7. Based on your selection:
   - **All**, NetWitness Suite exports all event sources to a time-stamped CSV file.
   - **Selected**, NetWitness Suite exports the event source or sources you selected to a time-stamped CSV file.
   - **Cancel**, NetWitness Suite cancels the export.

   The following is an example of a time-stamped CSV file that gets created with the event sources that you selected from the list.

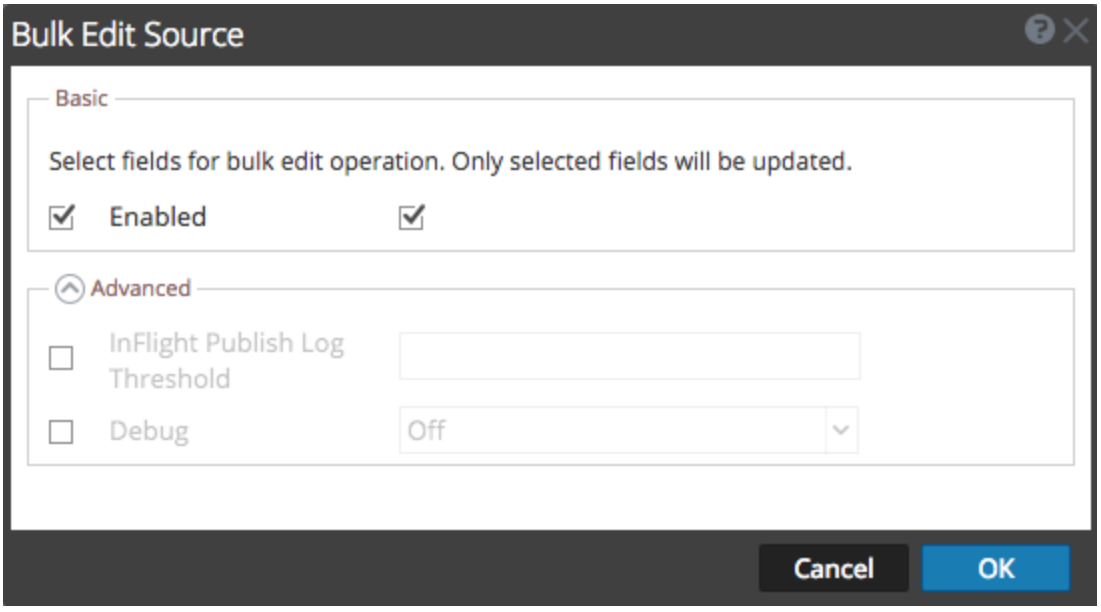


Edit Event Sources in Bulk

To edit multiple event sources at once:

1. On the **Log Collector Event Sources** tab, select **Check Point**, **File**, **Netflow**, **ODBC**, **Plugins**, **SDEE**, **Syslog**, **VMware**, **Windows**, or **Windows Legacy** (SNMP does not have an Edit function.).
2. In the **Sources** panel, select multiple event sources and click (edit icon).

   The appropriate **Bulk Edit** dialog for the selected event source is displayed. The following figure is an example of **Bulk Edit Source** dialog for File event source parameters.



3. Select the checkbox to the left of the fields that you want to modify (for example, **Debug**).
4. Modify the selected parameters (for example, change Debug from **Off** to **On**).
5. Click **OK**.

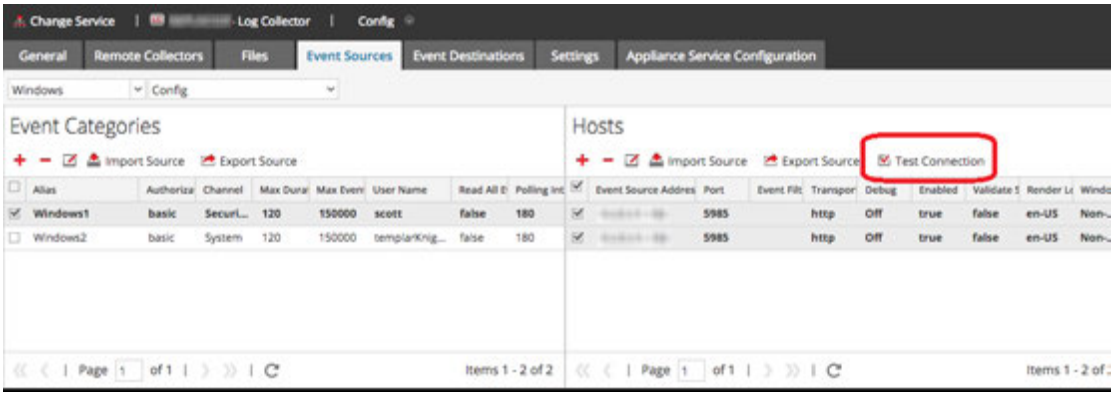
NetWitness Suiteapplies the same parameter value change to all of the selected event sources

Test Event Source Connections in Bulk

To test multiple event source connections at once:

1. Go to **Admin** > **Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Under Actions, select > **View** > **Config** to display the Log Collection configuration parameter tabs.
4. Select the **Event Sources** tab, select **Plugins**, **ODBC**, or **Windows** (the other protocols do not have a bulk test connection function).
5. Select one or more:
   - sources from the **Sources** panel for **Plugins** or **ODBC**
   - hosts from **Hosts** panel for **Windows**

   The **Test Connection** button is enabled.



6. Click Test Connection.

   The **Bulk Test Connections** dialog is displayed showing the current status of the test for each source. The status can be waiting, testing, passed or failed.

   If you choose to close the testing before it is completed, the testing stops and the **Bulk Test Connections** dialog closes.

After the testing is complete, the results are displayed in the **Bulk Test Connections** dialog.

See Also

You can use the **Event Sources** module (Administration > Event Sources) to create groups of event sources, typically imported from a CMDB, and to monitor event sources based on those groups. For details, see the following topics in the *Event Source Management Guide*:

- Import Event Sources
- Export Event Sources
- Bulk Edit Event Source Attributes

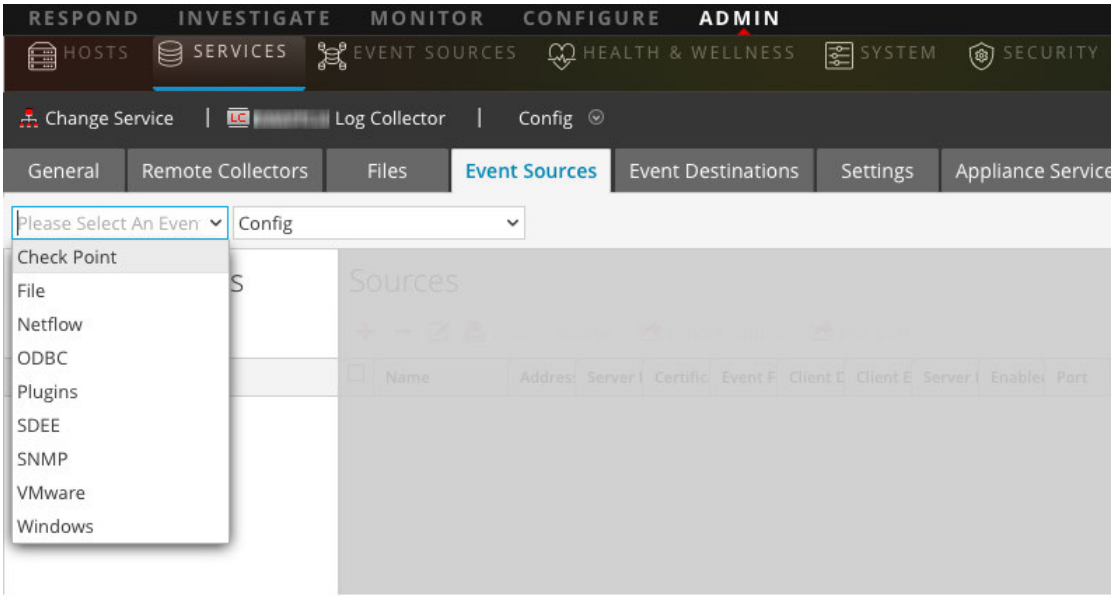
Configure Collection Protocols and Event Sources

This topic tells you how to configure collection protocols and the event sources using those protocols.

You configure the Log Collector to collect event data from your event sources in the Event Sources tab of the Log Collection parameter view.

To configure a collection protocol:

1. Go to **ADMIN> Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. Select a collection protocol (for example, **File**) and select **Config**.
6. Click + and select an event source.
7. Select the newly added category and click +.
8. Specify the parameters for the event source. For details, see the individual collection protocol topics.

The following guides provide detailed instructions on how to configure the collection protocols and their associated event sources in NetWitness Suite. Each guide includes an index to configuration instructions for the event sources supported for that collection protocol.

To configure individual collection protocols, see the following topics:

Configure AWS (CloudTrail) Event Sources in NetWitness Suite

This topic tells you how to configure the AWS collection protocol, which collects events from Amazon Web Services (AWS) CloudTrail.

Note: The AWS plugin is meant only for collecting from AWS CloudTrail logs, and not for collecting from arbitrary logs in S3 buckets (under arbitrary directories). The AWS CloudTrail logs are sent in JSON format, as detailed in the AWS documentation here: http://docs.aws.amazon.com/awscloudtrail/latest/userguide/cloudtrail-event-reference.html.

How AWS Collection Works

The Log Collector service collects events from Amazon Web Services (AWS) CloudTrail. CloudTrail records AWS API calls for an account. The events contain the identity of the API caller, the time of the API call, the source IP address of the API caller, the request parameters, and the response elements returned by the AWS service. The AWS API call history provided by CloudTrail events enables security analysis, resource change tracking, and compliance auditing. CloudTrail uses Amazon S3 for log file storage and delivery. NetWitness Suite copies the log files from the cloud (S3 bucket), and sends the events contained in the files to the Log Collector .

Deployment Scenario

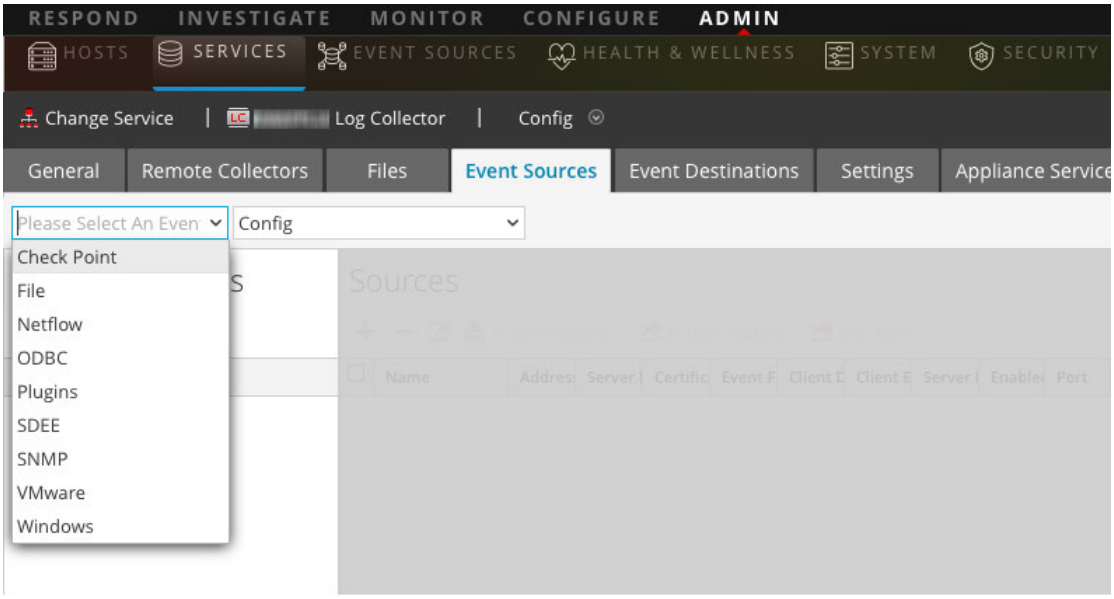
The following figure illustrates how you deploy the AWS Collection Protocol in NetWitness Suite.

Configuration

To configure an AWS (CloudTrail) Event Source:

1. Go to **ADMIN> Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Plugins/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click + .

   The **Available Event Source Types** dialog is displayed.
7. Select **cloudtrail**) and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.

   The **Add Source** dialog is displayed.
9. Define parameter values. For details, see AWS Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

    Log Collectortakes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness Suite displays an error message.
11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

AWS Parameters

The following table describes the available configuration parameter for AWS collection.

Parameter	Description
Parameter	**Description**
	Basic
Name *	Name of the event source.
Enabled 	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Account Id *	Account Identification code of the S3 Bucket
S3 Bucket Name *	Name of the AWS (CloudTrail) S3 bucket. Amazon S3 bucket names are globally unique, regardless of the AWS (CloudTrail) region in which you create the bucket. You specify the name at the time you create the bucket. Bucket names should comply with DNS naming conventions. The rules for DNS-compliant bucket names are: • Bucket names must be at least three and no more than 63 characters long. • Bucket names must be a series of one or more labels. Adjacent labels are separated by a single period “.”. Bucket names can contain lowercase letters, numbers, and hyphens. Each label must start and end with a lowercase letter or a number. • Bucket names must not be formatted as an IP address (for example, 192.168.5.4). The following examples are **valid** bucket names: • **myawsbucket** • **my.aws.bucket** • **myawsbucket.1** The following examples are **invalid** bucket names: • **.myawsbucket** - Do not start a Bucket Name with a period ".". • **myawsbucket.** - Do not end a Bucket Name with a period ".". • **my..examplebucket** - Only use one period between labels.

Parameter	Description
Access Key *	Key used to access the S3 bucket. Access Keys are used to make seure REST or Query protocol requests to any AWS service API. Please refer to Manage User Credentials on the Amazon Web Services support site for more information on Access Keys.
Secret Key *	Secret key used to access the S3 bucket.
Region *	Region of the S3 bucket. **us-east-1** is the default value.
Region Endpoint	Specifies the AWS CloudTrail hostname. For example, for an AWS public cloud for us-east region, the Region Endpoint would be s3.amazonaws.com. More information can be found at http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region. This parameter is necessary to collect CloudTrail logs from AWS Government or Private clouds.
Use Proxy	Enable **Use Proxy** to set proxy for AWS server. By default, it is disabled.
Proxy Server	Enter the proxy name you want to connect to access the AWS server.
Proxy Port	Enter the port number that connects to the proxy server to access the AWS server.
Proxy User	Enter the user name to authenticate with the proxy server.
Proxy Password	Enter the password to authenticate with proxy port.
Start Date *	Starts AWS (CloudTrail) collection from the specified number of days in the past, measured from the current timestamp. The default value is 0, which starts from today. The range is 0–89 days.
Log File Prefix	Prefix of the files to be processed. **Note:** If you set a prefix when you set up your CloudTrail service, make sure to enter the same prefix in this parameter.
Advanced	

Parameter	Description
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).
Command Args	Arguments added to the script.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is 60. For example, if you specify 60, the collector schedules a polling of the event source every 60 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 60 seconds for the polling to start because the threads are busy.
SSL Enabled 	Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The check box is selected by default.

Parameter	Description
Test Connection	Validates the configuration parameters specified in this dialog are correct. For example, this test validates that: • NetWitness can connect with the S3 Bucket in AWS using the credentials specified in this dialog. • NetWitness can download a log file from the bucket (test connection would fail if there were no log files for the entire bucket, but this would be extremely unlikely).
Cancel	Closes the dialog without adding the AWS (CloudTrail).
OK	Adds the current parameter values as a new AWS (CloudTrail).

Configure Azure Event Sources in NetWitness Suite

This topic tells you how to configure the Azure collection protocol. Microsoft Azure is a cloud computing platform and infrastructure for building, deploying, and managing applications and services through a global network of Microsoft-managed data centers.

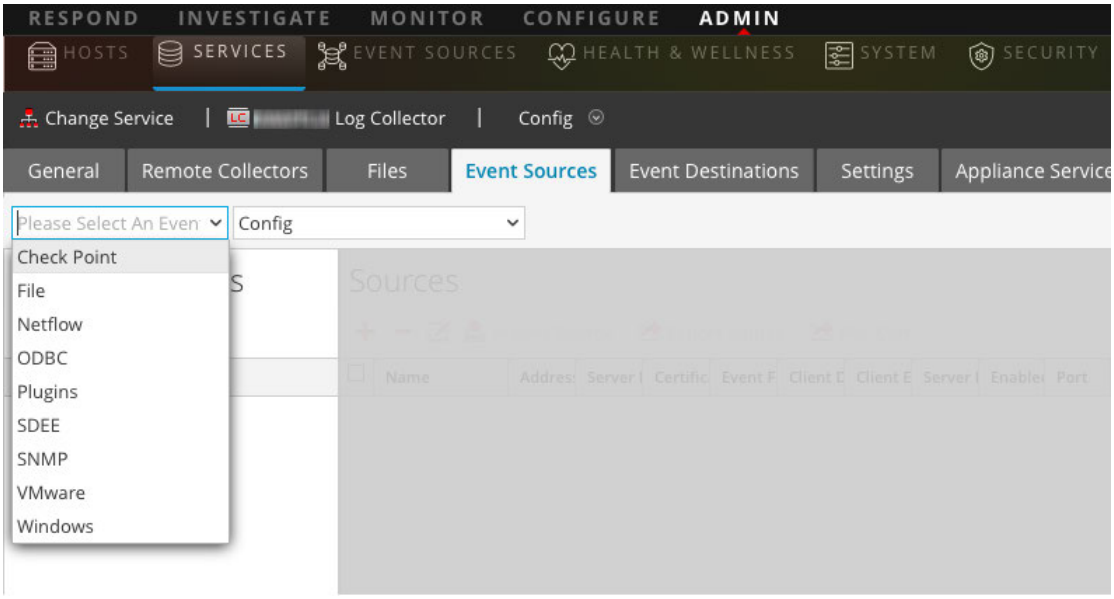
Configuration in NetWitness Suite

For complete details about configuring Azure as an event source, see the Azure Event Source Configuration Guide, available on RSA Link.

To configure an Azure Event Source:

1. Go to **ADMIN> Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Plugins/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click +.

   The **Available Event Source Types** dialog is displayed.
7. Select **azureaudit**) and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.

   The **Add Source** dialog is displayed.
9. Define parameter values. For details, see Azure Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

    Log Collectortakes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness Suite displays an error message.
11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

Azure Parameters

This section describes the Azure event source configuration parameters.

Note: Items that are followed by an asterisk (*) are required.

Basic Parameters

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Client ID *	The Client ID is found the Azure Application Configure tab. Scroll down until you see it.
Client Secret *	When you are configuring the event source, the client secret is displayed when you are creating a key, and you select a duration of validation. Make sure to save this, because you will only be able to see it once, and it cannot be retrieved later.
API Resource Base URL *	Enter `https://management.azure.com/`. Be sure to include the trailing slash (/).
Federation Metadata Endpoint *	In your Azure application, click the **View Endpoints** button (near the bottom of the pane). There are a lot of links that all begin with the same string. Compare the URLs and find the common string that begins most of them. This common string is the endpoint that you need to enter here.
Subscription ID *	You can find this in the Microsoft Azure dashboard: click on Subscriptions at the bottom of the list on the left.
Tenant Domain *	Go to the active directory and click on the directory. In the URL, the tenant domain is the string directly following **manage.windowsazure.com/**. The tenant domain is the string up to and including the **.com**.
Resource Group Names *	In Azure, select Resource groups from the left navigation pane, then select your group.
Start Date *	Choose the date from which to start collecting. Default's to the current date.
Test Connection	Checks the configuration parameters specified in this dialog to make sure they are correct.

Advanced Parameters

Click  next to **Advanced** to view and edit the advanced parameters, if necessary.

Name	Description
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Duration Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Max Idle Time Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.
Command Args	Optional arguments to be added to the script invocation.
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. **Caution:** Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact.

Configure Check Point Event Sources in NetWitness Suite

This topic tells you how to configure the Check Point collection protocol, which collects events from Check Point event sources.

This protocol collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.

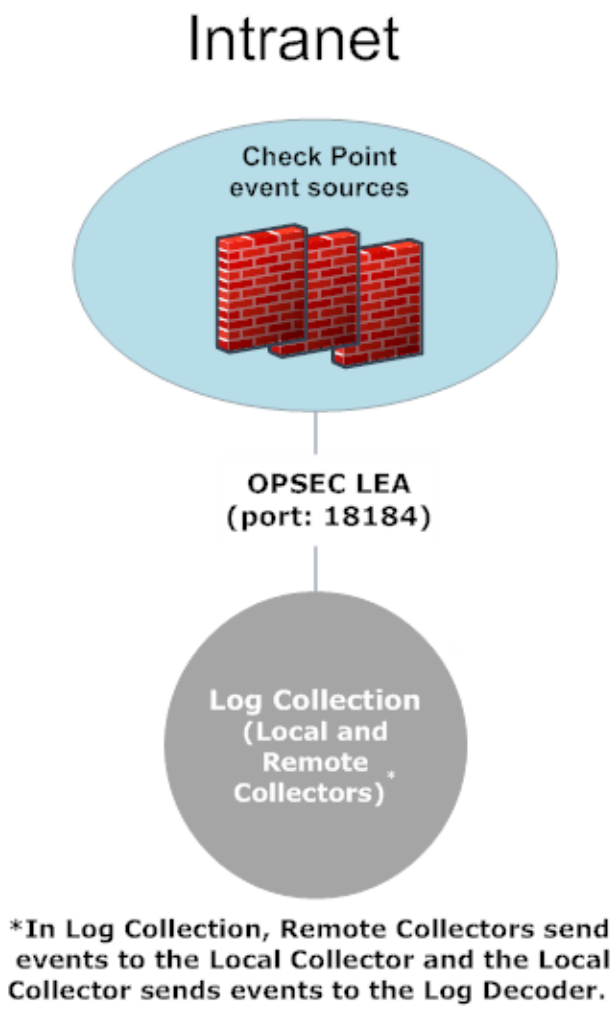
How Check Point Collection Works

The Log Collector service collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.

Note: OPSEC LEA (Log Export API) supports extraction of logs from Check Point event sources configured with a SHA-256 or SHA-1 certificate.

Deployment Scenario

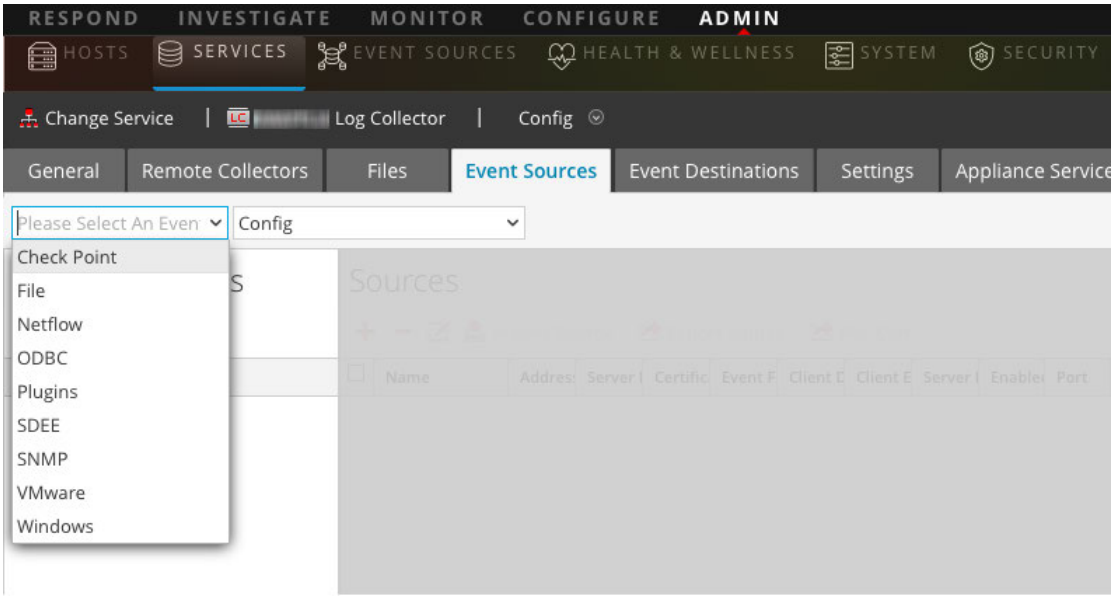
The following figure illustrates how you deploy the Check Point Collection Protocol in NetWitness Suite.



Configuration in NetWitness Suite

To configure a Check Point Event Source:

1. Go to **ADMIN> Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Check Point/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click  .

   The **Available Event Source Types** dialog is displayed.
7. Select a check point event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click  in the **Sources** toolbar.

   The **Add Source** dialog is displayed.
9. Define parameter values. For details, see Check Point Parameters below.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the device or service information and retry.

Log Collectortakes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness Suite displays an error message.

11. If the test is successful, click **OK**.

    The new event source is displayed in the **Sources** panel.

Check Point Parameters

This section describes the Check Point event source configuration parameters.

Basic Parameters

Parameter	Description
Name*	Name of the event source.
Address*	IP Address of the Check Point server.
Server Name*	Name of the Check Point server.
Certificate Name	Certificate name for secure connections to use when the transport mode is https. If set, the certificate must exist in the certificate trust store that you created using the Settings tab. Select a certificate from the drop-down list. The file naming convention for Check Point event source certificates is **checkpoint_*name-of-event-source***.
Client Distinguished	Enter the Client Distinguished Name from the Check Point server.
Client Entity Name	Enter the Client Entity Name from the Check Point server.
Server Distinguished	Enter the Server Distinguished Name from the Check Point server.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Pull Certificate	Select the checkbox to pull a certificate for first time. Pulling a certificate makes it available from the trust store.

Parameter	Description
Certificate Server Address	IP Address of the server on which the certificate resides. Defaults to the event source address.
Password	Only active when you select the Pull Certificate checkbox for first time. Password required to pull the certificate. The password is the activation key created when adding an OPSEC application to Check Point on the Check Point server.

Determine Advanced Parameter Values for Check Point Collection

You use less system resources when you configure a Check Point event source connection to stay open for a specific time and specific event volume (transient connection). RSA NetWitness Suite defaults to the following connection parameters that establish a transient connection:

- Polling Interval = **180** (3 minutes)
- Max Duration Poll = **120** (2 minutes)
- Max Events Poll = **5000** (5000 events per polling interval)
- Max Idle Time Poll = **0**

For very active Check Point event sources, it is a good practice to set up a connection that stays open until you stop collection (persistent connection). This ensures that Check Point collection maintains the pace of the events generated by these active event sources. The persistent connection avoids restart and connection delays and prevents Check Point collection from lagging behind event generation.

To establish a persistent connection for a Check Point event source, set the following parameters to the following values:

- Polling Interval = **-1**
- Max Duration Poll = **0**
- Max Events Poll = **0**
- Max Idle Time Poll = **0**

Parameter	Description
Port	Port on the Check Point server that Log Collector connects to. Default value is 18184.

Parameter	Description
Collect Log Type	Type of logs that you want to collect: Valid values are: • **Audit** - collects audit events. • **Security** - collects security events. If you want to collect both audit and security events, you must create a duplicate event source. For example, first you would create an event source with Audit selected pulling a certificate into the trust store for this event source. Next you would create another event source with the same values except that you would select Security for the Collect Log Type and you would select the same certificate in Certificate Name that you pulled when you set up the first set of parameters for this event source and you would make sure that Pull Certificate was not selected.
Collect Logs From	When you set up a Check Point event source, NetWitness collects events from the current log file. Valid values are: • **Now** - Start collecting logs now (at this point in time in the current log file). • **Start of Log** - Collect logs from the beginning of the current log file. If you choose "Start of Log" for this parameter value, you may collect a very large amount of data depending on how long the current log file has been collecting events. Note that this option is effective only for the first collection session.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Duration Poll	The maximum duration of polling cycle (how long the cycle lasts) in seconds.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).

Parameter	Description
Max Idle Time Poll	Maximum idle time, in seconds, of a polling cycle. 0 indicates no limit.> **300** is the default value.
Forwarder	Enables or disables the Check Point server as a forwarder. By default it is disabled.
Log Type (Name Value Pair)	Logs from the event source in Name Value format. By default it is disabled.
Debug	**Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables and disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

Verify Check Point Collection is Working

The following procedure illustrates how you can verify that Check Point collection is working from the **Administration > Health & Wellness > Event Source Monitoring** tab.

1. Access the **Event Source Monitoring tab** from the **Administration > Health & Wellness** view.
2. Find **checkpointfw1** in the **Event Source Type** column.
3. Look for activity in the **Count** column to verify that Check Point collection is accepting events.

The following procedure illustrates how you can verify that Check Point collection is working from the **Investigation > Events** view.

1. Access the **Investigation > Events** view.
2. Select the Log Decoder (for example, **LD1**) collecting Check Point events in the **Investigate a Device** dialog.
3. Look for a Check Point event source parser (for example, **checkpointfw1**) in the **device.type** field in the **Details** column to verify that Check Point collection is accepting events.

Note: If the logs from the VSX Checkpoint firewall server are collected by the Log Collector checkpoint service, to translate the VSX IP in the logs to **ip.orig** meta, you must add the VSX hostname and the VSX IP address to the `/etc/hosts` file in the Log Collector.

Configure File Event Sources in NetWitness Suite

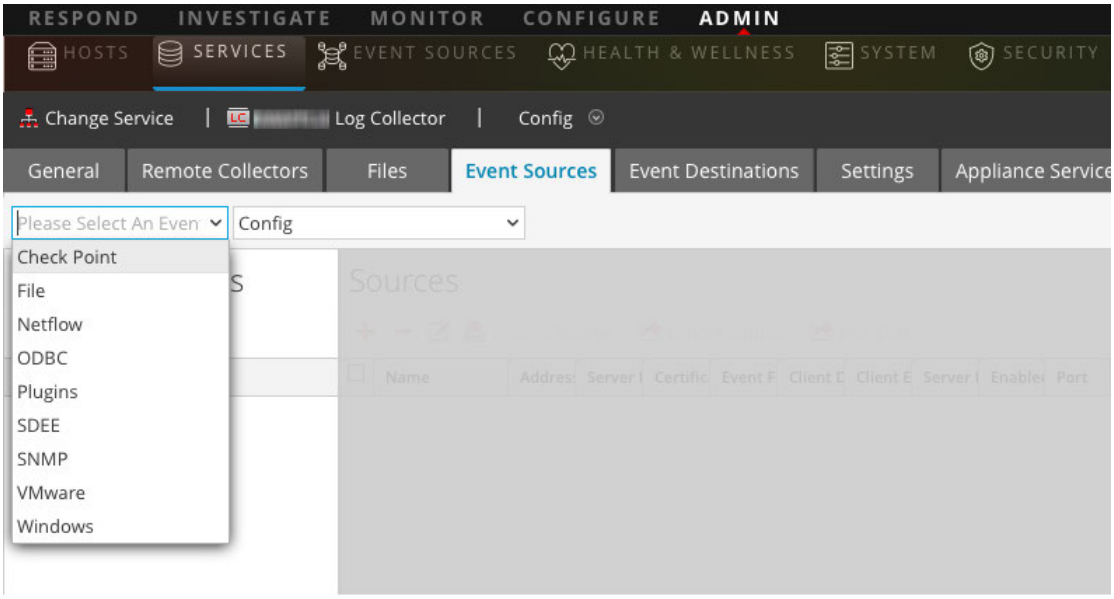
This topic tells you how to configure the File collection protocol.

Configure a File Event Source

To configure a File Event Source:

1. Go to **ADMIN> Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **File/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click + .

   The **Available Event Source Types** dialog is displayed.
7. Select a file event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.

   The **Add Source** dialog is displayed.
9. Add a **File Directory** name and modify any other parameters that require changes. For details, see File Collection Parameters below.
10. To get the public key and enter it into the dialog box, do the following:
    a. Select and copy the public key from the Event Source by running: **cat ~/.ssh/id_rsa.pub**
    b. Paste the public key in the **Eventsource SSH Key** field.
11. Click **OK**.

You need to restart file collection for your changes to take effect.

Stop and Restart File Collection

After you add a new event source that uses file collection, you must stop and restart the NetWitness Suite File Collection service. This is necessary to add the key to the new event source.

File Collection Parameters

The following table provides descriptions of the File Collection source parameters.

Name	Description
	Basic
File Directory*	Collection directory (for example, **Eur_London100**) into which the File event source places its files. Valid value is a character string that is conforms to the following regular expression: **[_a-zA-Z][_a-zA-Z0-9]*** This means that the file directory must start with a letter followed by numbers, letters, and underscores. Do not modify this parameter after you start collecting event data. After you create the collection, the Log Collector creates the work, save, and error sub-directories under the collection directory.
Address*	IP address of the event source. Valid value is an **IPv4 address**, **IPv6 address**, or a **hostname** including a fully-qualified domain name.
File Spec	Regular expression. For example, **^.*$** = process everything.
File Encoding	Internationalization file encoding. Enter the File Encoding method, the following strings are examples of valid methods: • UTF-8 (default) • UCS-16LE • UCS-16BE • UCS-32LE • UCS-32BE • SHIFT-JIS • EBCDIC-US
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
	Advanced

Name	Description
Ignore Encoding Conversion Errors	Select the check box to ignore encoding conversion errors and ignore invalid data. The check box is selected by default. **Caution:** This may cause parsing and transformation errors.
File Disk Quota	Determines when to stop saving files regardless of the **Save On Error** and **Save On Success** parameter settings. For example, a value of 10 indicates that when there is less than 10% available disk left, the Log Collector stops saving files to reserve enough space for your estimated normal collection processing. **Caution:** Available disk refers to a partition where the base collection directory is mounted. If the Log Decoder server has a 10TB disk size and 2TB is allocated to base collection directory, then setting this value to 10 causes log collection to stop when less than 0.2TB (10% of 2TB) of space is left. It does not mean 10% of 10TB. Valid value is a number in the **0** to **100** range. **10** is the default.
Sequential Processing	Sequential processing flag: • Select the check box (default) to process event source files in collection order. • Do not select the checkbox to process event source files in parallel.
Save On Error	Save on error flag. Check the checkbox to retain the **eventsource collection** file when the Log Collector it encounters an error. The check box is selected by default.
Save On Success	Save **eventsource collection** file after processing flag. Check the checkbox to save the eventsource collection file after processing it. The check box is not selected by default.

Name	Description
Eventsource SSH Key	SSH public key used to upload files for this event source. Please refer to the *Generate Key Pair on Event Source and Import Public Key to Log Collector* section in the Install and Update the SFTP Agent Guide for instructions on generating keys. **Note:** If File collection is stopped, NetWitness Suite does not update the authorized_keys file with the SSH public key that you add or modify in this parameter. You must restart File collection to update the public key. You can add or modify the value of the public key in this parameter in multiple File event sources without File collection running, but NetWitness Suite will not update the **authorized_keys** file until File collection is restarted.
Manage Error Files	By default, the Log Collectoruses the **File Disk Quota** parameter to ensure that the disk does not fill up with error files. If you set this parameter to **true**, you can specify one of these: • Maximum space allotted to error files in the **Error Files Size** parameter. • Maximum number of error files allowed in **Error Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached. Select the check box to manage error files. The check box is not selected by default.
Error Files Size	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Specifies to what extent NetWitness Suite saves error files. The value that you specify is the maximum total size of all the files in the error directory. Valid value is a number in **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Error Files Count	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Maximum number of error files allowed in the error directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.

Name	Description
Error Files Reduction %	Percent amount by size or count of the error files that the Log Collectorservice removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.
Manage Saved Files	Select the check box to manage saved files. The check box is not selected by default. By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with saved files. If check this check box, you can specify one of these: • Maximum space allotted to saved files in the **Saved Files Size** parameter. • Maximum number of saved files allowed in **Saved Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached.
Saved Files Size	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum total size of all the files in the save directory. Valid value is a number in the **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved Files Count	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum number of saved files in the save directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved File Reduction %	Percent amount by size or count of the saved files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.

Name	Description
Debug	**Caution:** Only enable debugging (set this parameter to **On** or **Verbose**) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables/disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).
Cancel	Closes the dialog without making adding an event source type.
OK	Adds the parameters for the event source.

Configure Netflow Event Sources in NetWitness Suite

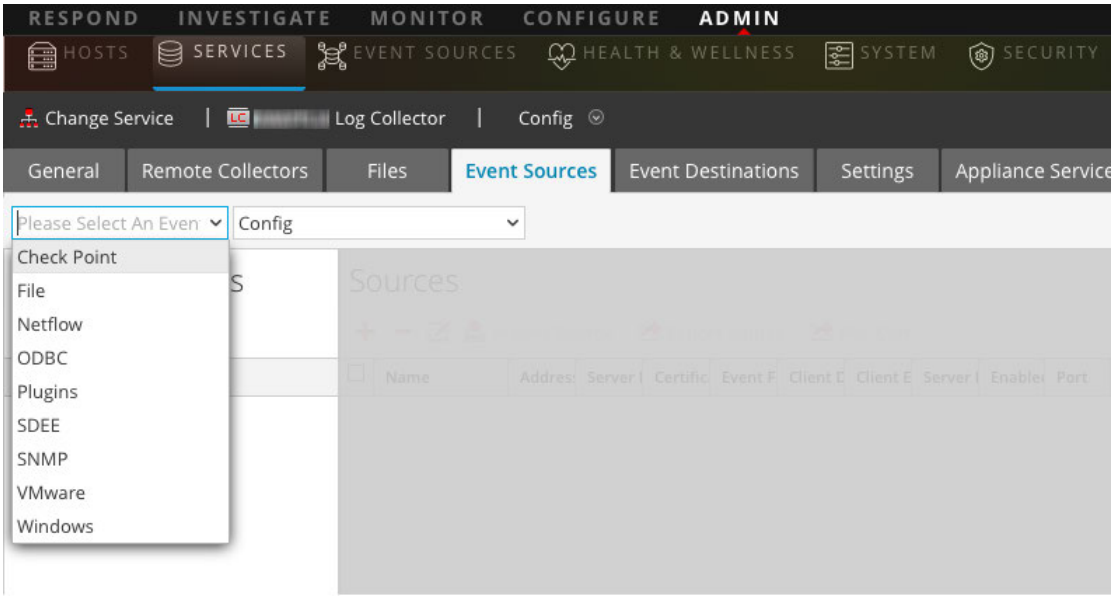
This topic tells you how to configure the Netflow collection protocol.

Configure a Netflow Event Source

To configure a Netflow Event Source:

1. Go to **ADMIN> Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **Netflow/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click +.

   The **Available Event Source Types** dialog is displayed.
7. Select the **netflow** event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.

   The **Add Source** dialog is displayed.
9. Enter a port number in the **Port** field, and ensure the Enabled box is checked.

   Note: NetWitness Suite opens the 2055, 4739, 6343, and 9995 ports on the firewall by default. You can open other ports for Netflow if required.

For details of other parameters, see Netflow Collection Parameters below.

10. Click **OK**.

The new event source is displayed in the list.

Netflow Collection Parameters

The following table provides descriptions of the Netflow Collection source parameters.

Name	Description
	Basic
Port	Specify the port number configured for the Netflow event source. NetWitness Suite opens the 2055, 4739, 6343, and 9995 ports for Netflow by default. You can open other ports for Netflow if required.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
	Advanced
InFlight Publish Log Threshold	Establishes a threshold that, when reached, NetWitness Suite generates a log message to help you resolve event flow issues. The Threshold is the size of the netflow event messages currently flowing from the event source to NetWitness Suite . Valid values are: • **0 (default)** - disables the log message. • **100-100000000** - generates a log message when this Log Collector has processed the specified number of netflow events. For example, if you set this value to 100, NetWitness Suite generates a log message when 100 netflow events of the specific netflow version (v5 or v9) have been processed.

Name	Description
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector . Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).
Cancel	Closes the dialog without making adding an event source type.
OK	Adds the parameters for the event source.

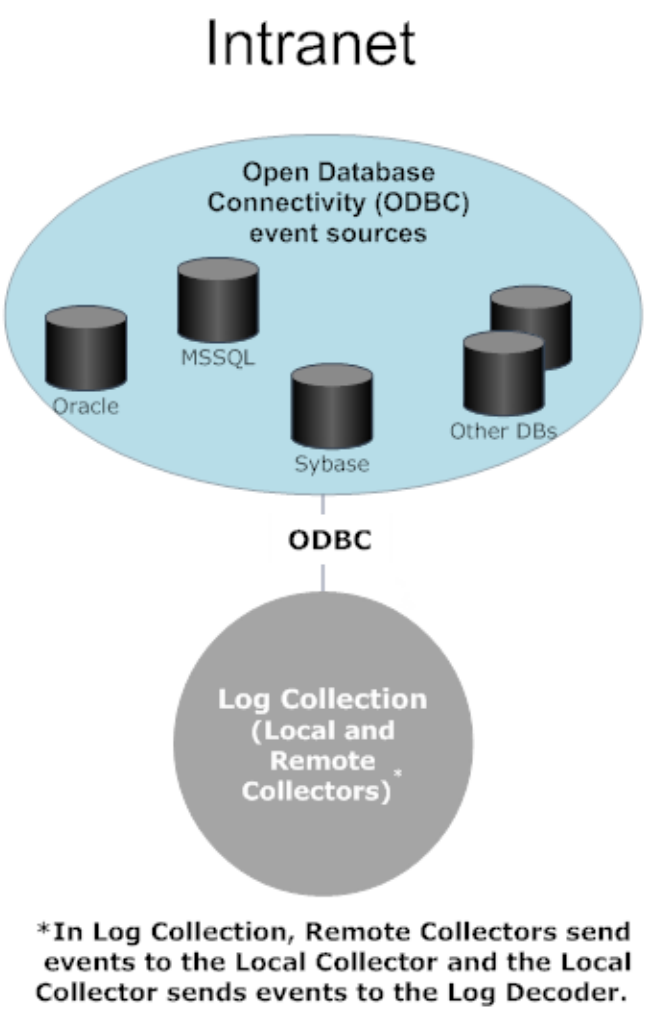
ODBC

Configure ODBC Event Sources in NetWitness Suite

This topic tells you how to configure ODBC collection protocol which collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface.

Deployment Scenario

The following figure illustrates how you deploy the ODBC Collection Protocol in NetWitness Suite.



Configure an ODBC Event Source

To configure an ODBC event source, you need to configure an event source type, and also choose a DSN template.

Configure a DSN

The following procedure describes how to add a DSN from an existing DSN template. For other procedures related to DSNs, see Configure Data Source Names (DSNs).

Configure a DSN (Data Source Name):

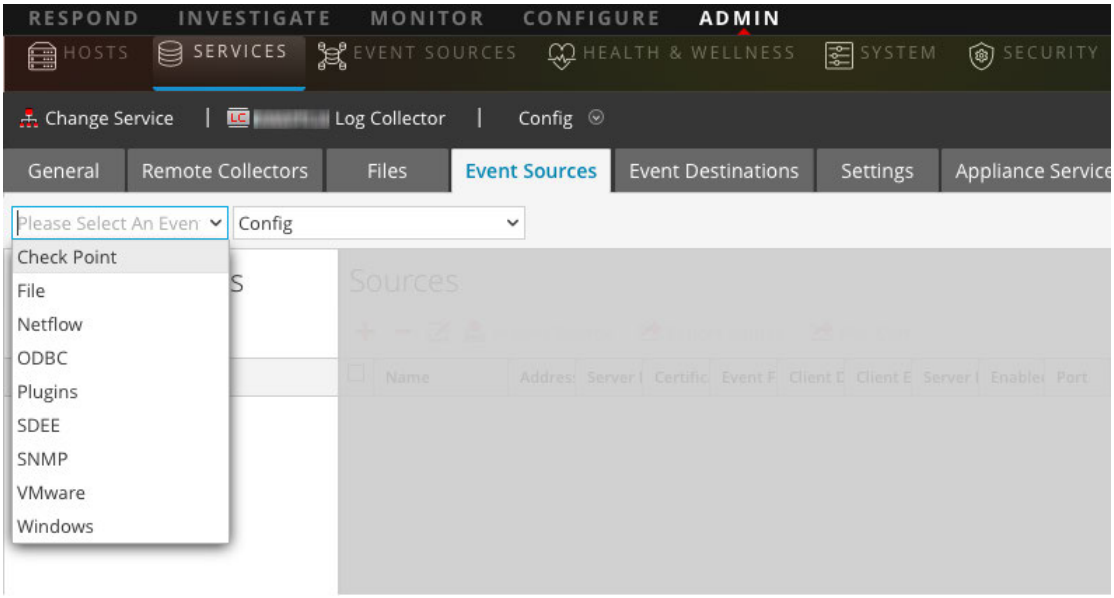
1. Go to **Administration** > **Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click  under **Actions** and select **View** > **Config**.
4. In the Log Collector **Event Sources** tab, select **ODBC/DSNs** from the drop-down menu.

5. The DSNs panel is displayed with the existing DSNs, if any.
6. Click + to open the **Add DSN** dialog.
7. Choose a DSN Template from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.) If required, click Manage Templates to add or delete DSN templates.
8. Fill in the parameters and click **Save**.

Add an Event Source Type

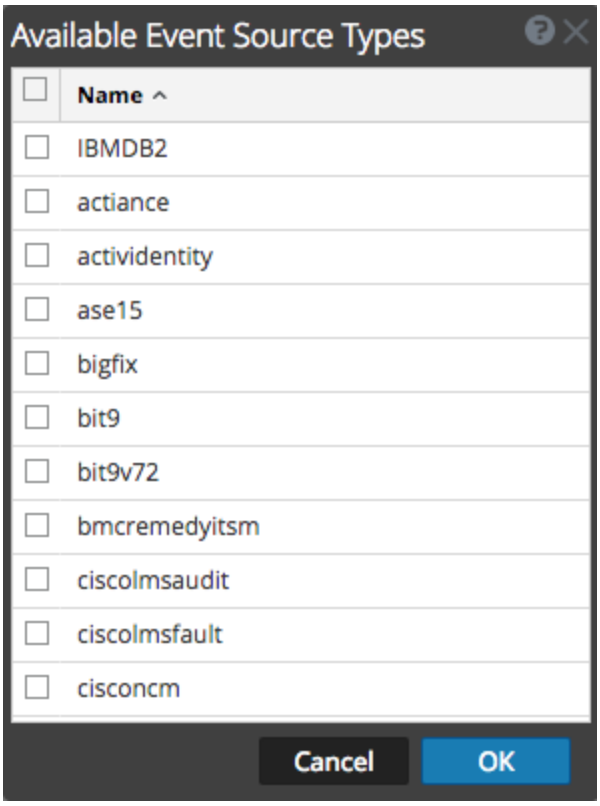
To configure an ODBC Event Source Type:

1. Go to **ADMIN> Services** .
2. Select a Log Collection service.
3. Under Actions, select > **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **ODBC/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click + .

   The **Available Event Source Types** dialog is displayed.

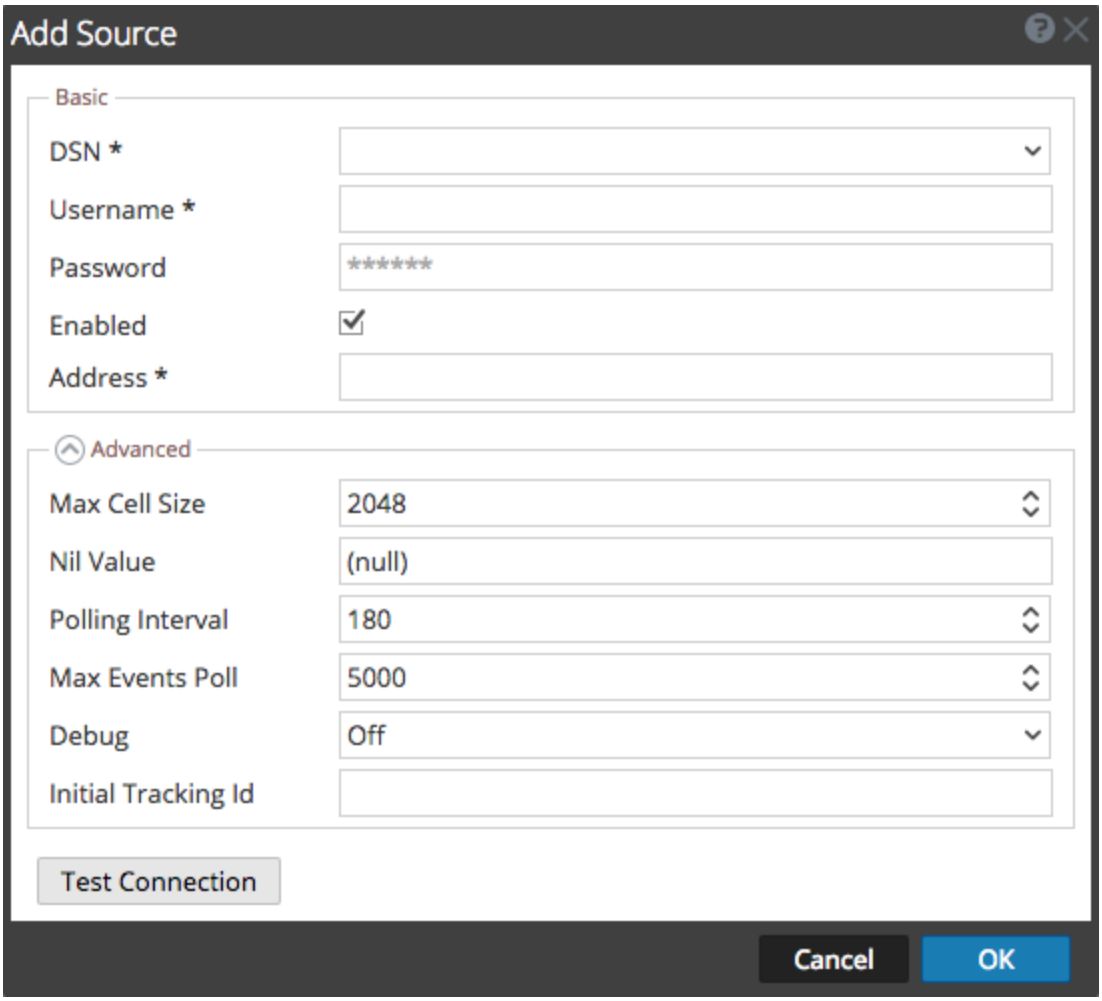


7. Select an event source category (for example **mssql** and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the **Event Categories** panel and click + in the **Sources** toolbar.

   The **Add Source** dialog is displayed.



9. Select a DSN from the drop down list, specify or modify the other parameters as required, and click **OK**.
10. Click **Test Connection**.

    The result of the test is displayed in the dialog box. If the test is unsuccessful, edit the DSN information and retry.

    Note: Log Collectortakes approximately 60 seconds to return the test results. If it exceeds the time limit, the test times out and the NetWitness Suite server displays an error message.

11. If the test is successful, click **OK**.

The newly defined DSN is displayed in the **Sources** panel.

ODBC Collection Parameters

The following table provides descriptions of the ODBC Collection source parameters.

Configure Data Source Names (DSNs)

This topic tells you how to create and maintain DSNs for ODBC Collection.

Context

Open Database Connectivity (ODBC) event sources require Data Source Names (DSNs) so you need to define DSNs with their associate value pairs for ODBC event source configuration.

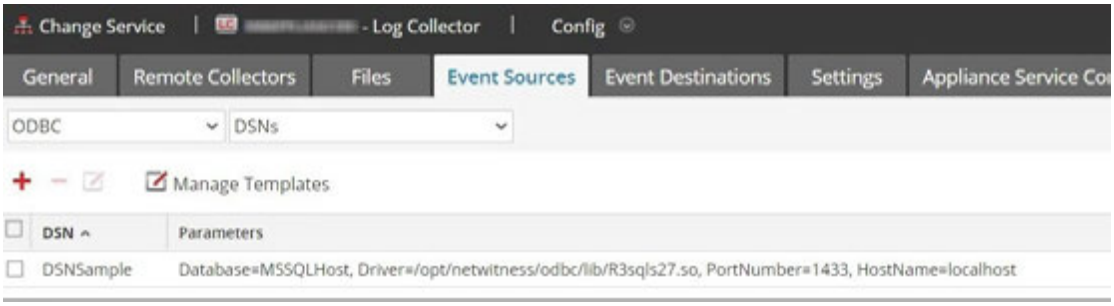
Navigate to the DSN Panel

To add or edit DSNs or DSN templates, first navigate to the appropriate screen.

To navigate to the DSN templates panel:

1. Go to **Administration > Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click  under **Actions** and select **View > Config**.
4. In the **Log Collector Event Sources** tab, select **ODBC/DSNs** from the drop-down menu.

   The **DSNs** panel is displayed with the DSNs that are added, if any.



From this screen, you can perform the following actions:

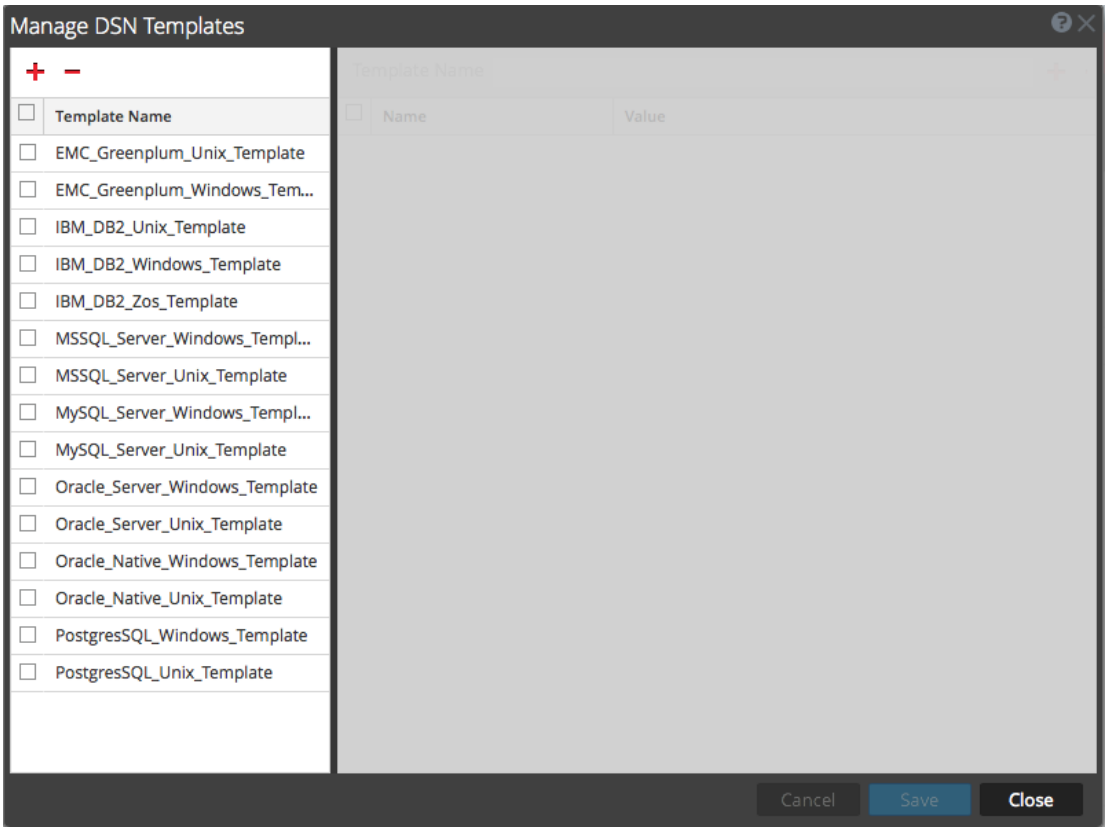
- Add a new DSN template
- Add a DSN from an existing template
- Add a DSN by editing an existing DSN template
- Remove a DSN or DSN template

Add a New DSN Template

If none of the predefined DSN templates fit your needs, use this procedure to add a DSN template.

1. From the DSNs panel, click  .

   The **Manage DSN Templates** dialog is displayed.



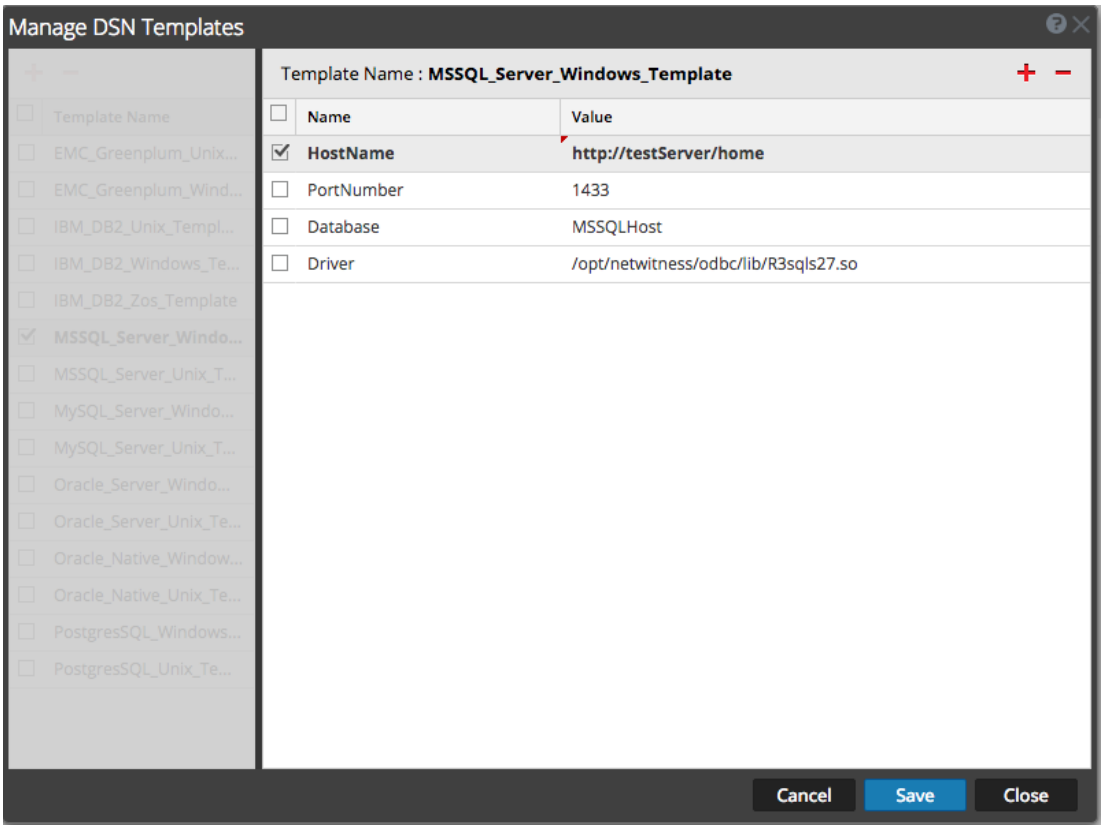
Note: RSA provides default templates on the left side panel that you can use while adding a new DSN.

2. Click +.

   The right panel is activated.

3. Specify a template name and click + on the right panel to add parameters.

4. Specify the parameters. Click **Save**.



The new DSN template is added in the **Manage DSN Templates** list.

Add a DSN from an existing template

You can select an existing template, and fill in the parameters for your needs.

1. From the DSNs panel, click + to open the Add DSN dialog box.

   The **Add DSN** dialog is displayed with existing DSNs, if any

2. Choose a DSN Template from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.)

3. Fill in the parameters and click **Save**.

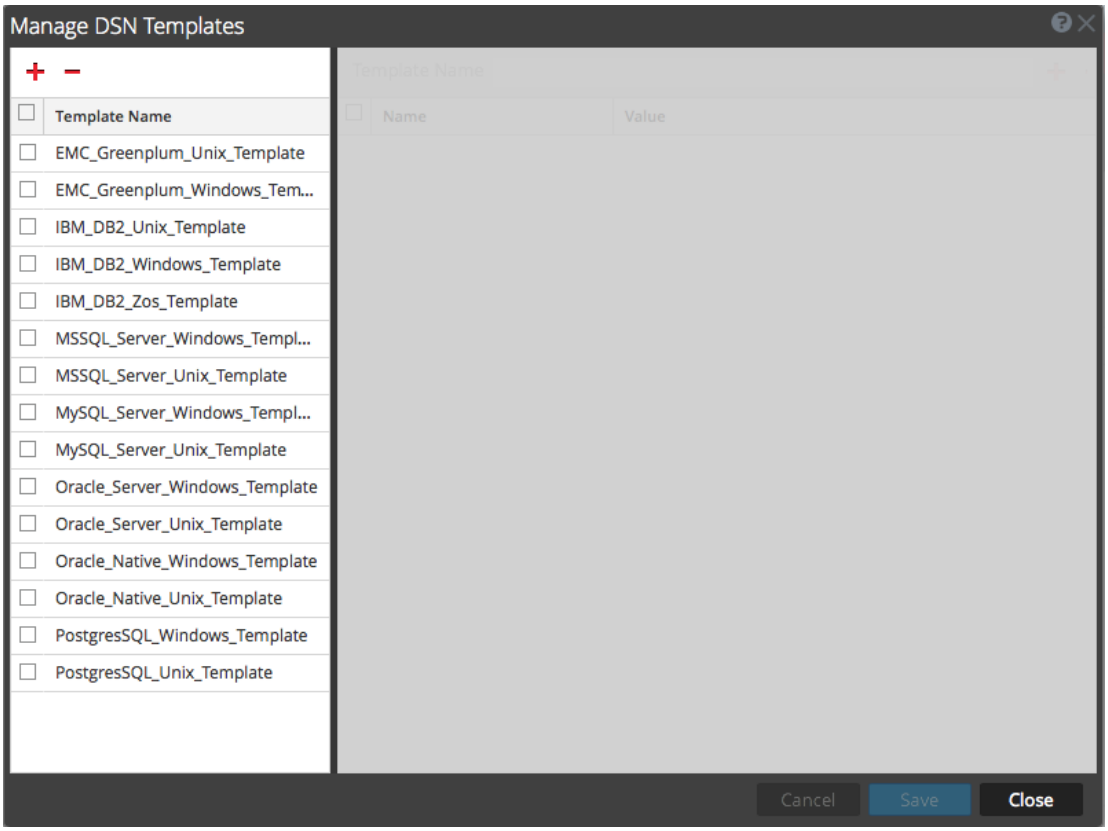
Your DSN is added to the list of DSNs.

Add a New DSN by editing an existing DSN template

You can add a DSN by updating an existing DSN template to fit your needs.

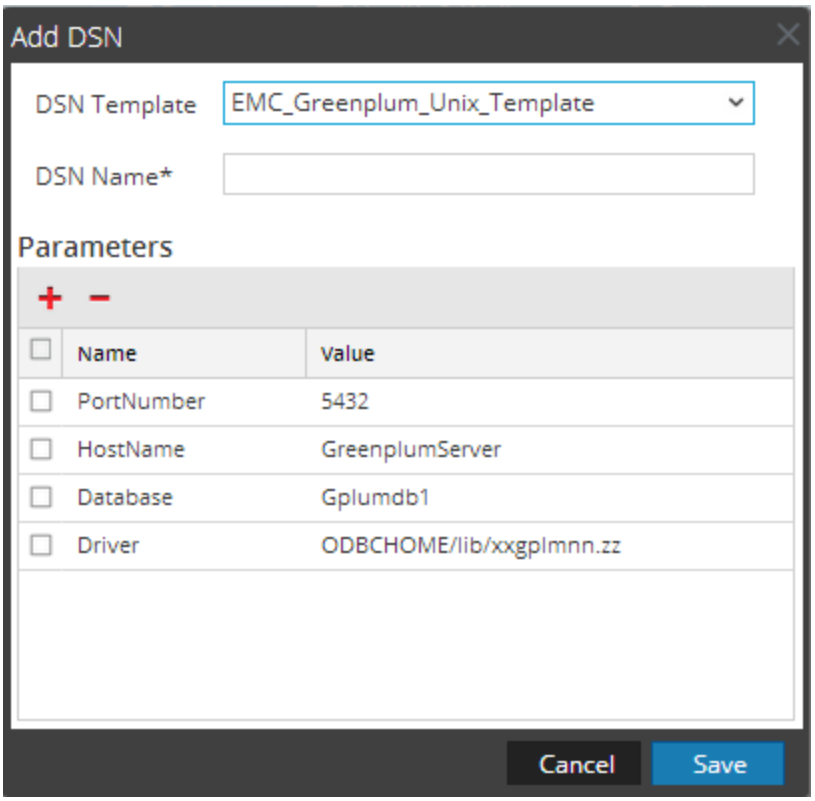
1. From the DSNs panel, click Manage Templates.

   The **Manage DSN Templates** dialog is displayed.



2. Select the existing template that you want to modify.

   The right panel is activated, and the default parameters for the selected template are displayed.



3. Specify a name in the **DSN Name** field.
4. Add, delete or edit the default parameters.
5. Once you have the set of required parameters, click **Save**, then **Close**.
6. Choose the DSN Template that you updated from the drop down menu and enter a name for the DSN. (You use the name when you set up the ODBC event source type.)
7. Fill in the parameters and click **Save**.

Your DSN is added to the list of DSNs.

Remove a DSN or DSN template

If you no longer use a DSN or a DSN template, you can remove it from the system.

To remove an existing DSN:

1. From the DSNs panel, select an existing DSN.
2. Click —.

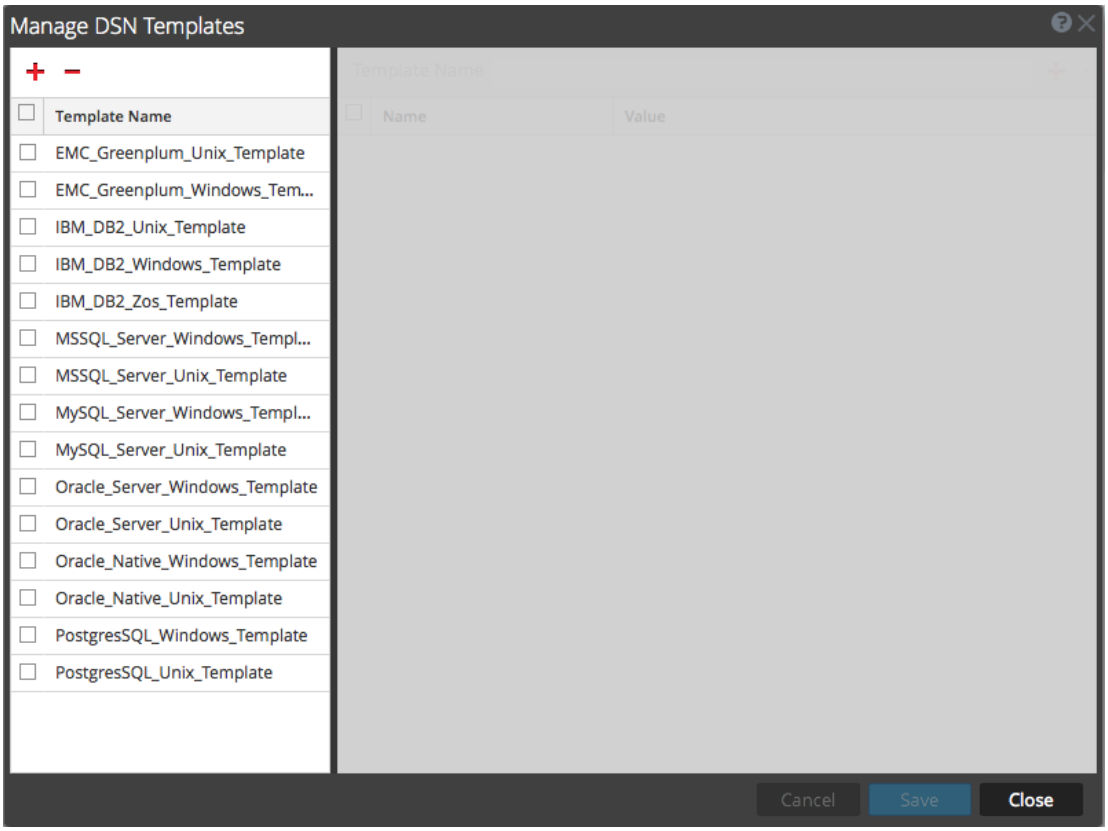
   A Warning message appears, asking whether you are sure you want to delete the DSN.
3. To delete the DSN, click **Yes**. Alternatively, to cancel the deletion, click **No**.

If you confirmed the deletion, the selected DSN is removed from the system.

To remove an existing DSN Template:

1. From the DSNs panel, click Manage Templates.

   The **Manage DSN Templates** dialog is displayed.



2. From the DSNs panel, select an existing DSN Template.
3. Click −.

   A Confirmation message appears, asking whether you are sure you want to delete the DSN Template.

4. To delete the DSN Template, click **Yes**. Alternatively, to cancel the deletion, click **No**.

If you confirmed the deletion, the selected DSN Template is removed from the system.

Create Custom Typespec for ODBC Collection

This topic tells you how to create a custom typespec for the Log Collector . The topic includes:

- Create Custom typespec procedure
- ODBC Collection typespec syntax
- Sample ODBC Collection typespec files

Create Custom Typespec

To create a custom typespec file:

1. Open an SFTP client (for example, WinSCP) and connect to a Log Collector or remote Log Collector .
2. Navigate to **/etc/netwitness/ng/logcollection/content/collection/odbc**, and copy an existing file, for example **bit9.xml**.
3. Modify the file according to your requirements. See ODBC Collection Typespec Syntax for details.
4. Rename and save the file to the same directory.
5. Restart the Log Collector .

Note: You will not be able to see new Event Source type in NetWitness Suite until you restart the Log Collector.

ODBC Collection Typespec Syntax

The following table describes the typespec parameters.

Parameter	Description
name	The display name of your ODBC event source (for example, **activeidentity**). NetWitness Suite displays this name in the **Sources** panel of the **View > Config > Events Sources** tab. Valid value is an alphanumeric string. You cannot use - (dashes), _ (underscores), or spaces . The name must be unique across all typespec files in the folder.
type	Event source type: **odbc**. Do not modify this line.
prettyName	User-defined name for the event source. You can use the same value as name (for example, apache) or use a more descriptive name.
version	Version of this typespec file. Default value is 1.0.
author	Person who created the typespec file. Replace author-name with your name.
description	Formal description of the event source. Replace formal-description with your description of the event source.
<device> Section	

Parameter	Description
parser	This optional parameter contains the name of the log parser. This value forces the Log Decoder to use the specified log parser when parsing logs from this event source. **Note:** Please leave the field blank when unsure of the log parser to be used.
name	Name your ODBC event source (for example, **ActivIdentity ActivCard AAA Server**).
maxVersion	The version number of the event source (for example, **6.4.1**).
description	Description of the event source.
<collection> Section	
odbc	The syntax under `<odbc>` is used for event collection and processing. You can provide multiple queries for the same event source type by adding `<query>` tags.
query	This section contains the details of the query used to collect information from the event source.
tag	The prefix tag you want to add to events during transformation (for example **ActivIdentity**).
outputDelimiter	Specify the delimiter to use to separate fields. Specify any of the following values: • || (piping) • ^ (caret) • **,** (comma) • **:** (colon) • **0x20** (to represent a space)
interval	Specify the number of seconds between events. Default value is **60**.

Parameter	Description
dataQuery	Specify the query to fetch data from the ODBC eventsource database for SQL-syntax. For example: SELECT acceptedrejected, servername, serveripa, sdate, millisecond, suid, groupname, ipa, reason, info1, info2, threadid FROM A_AHLOG WHERE sdate > '%TRACKING%' ORDER BY sdate
maxTrackingQuery	The query used on the initial pull of events to identify the starting point within the data set to begin pulling logs from. After the initial pull, this query is no longer used, unless the **maxTracking** value has been reset or altered. For example: SELECT MAX(Event_Id) from ExEvents
trackingColumn	The tracking column value used when the ODBC collector pulls a new set of events.

Sample ODBC Collection Typespec Files

The following sample is the typespec file for the IBM ISS SiteProtector event source.

```
<?xml version="1.0" encoding="UTF-8"?>
<typespec>

   <name>siteprotector4_x</name>
   <type>odbc</type>
   <prettyName>SITEPROTECTOR4_X</prettyName>
   <version>1.0</version>
   <author>Administrator</author>
   <description>Collects events from SiteProtector</description>

   <device>
      <name>Internet Security Systems, Inc. RealSecure SiteProtector v 2.0</name>
      <maxVersion>2.0</maxVersion>
      <description></description>
      <parser>iss</parser>
   </device>

   <configuration>
   </configuration>

   <collection>
      <odbc>
         <query>
```

```
            <tag></tag>
            <outputDelimiter></outputDelimiter>
            <interval></interval>
            <dataQuery></dataQuery>
            <maxTrackingQuery></maxTrackingQuery>
            <trackingColumn></trackingColumn>
            <levelColumn></levelColumn>
            <eventIdColumn></eventIdColumn>
            <addressColumn></addressColumn>
         </query>
      </odbc>
   </collection>
</typespec>
```

The following sample is the typespec file for the Bit9 Security Platform event source.

```
<?xml version="1.0" encoding="UTF-8"?>
<typespec>

   <name>bit9</name>
   <type>odbc</type>
   <prettyName>BIT9</prettyName>
   <version>1.0</version>
   <author>Administrator</author>
   <description>Bit9 Events</description>

   <device>
      <name>Bit9</name>
      <parser>bit9</parser>
   </device>

   <configuration>
   </configuration>

   <collection>
      <odbc>
         <query>
            <tag>BIT9</tag>
            <outputDelimiter>||</outputDelimiter>
            <interval>10</interval>
            <dataQuery>
            SELECT
```

```
            Timestamp,
            Event_Id,
            Computer_Id,
            File_Catalog_Id,
            Root_File_Catalog_Id,
            Priority,
            Type,
            Subtype,
            IP_Address,
            User_Name,
            Process,
            Description
            FROM
            ExEvents
            WHERE
            Event_Id > '%TRACKING%'
            </dataQuery>
            <trackingColumn>Event_Id</trackingColumn>
            <maxTrackingQuery>SELECT MAX(Event_Id) from
ExEvents</maxTrackingQuery>
            <eventIdColumn></eventIdColumn>
         </query>
      </odbc>
   </collection>
</typespec>
```

Troubleshoot ODBC Collection

You can troubleshoot problems and monitor ODBC collection by reviewing the ODBC collector log informational, warning, and error messages to during execution of collection.

Each ODBC log messages includes the:

- Timestamp
- Category: `debug`, `info`, `warning`, or `failure`
- collection method = `OdbcCollection`
- ODBC event source type (GOTS-name) = Generic ODBC Type Specification name that you configured for the event source.
- collection function completed or attempted (for example, `[processing]`)

- ODBC event source name (DSN-name) = Data Source Name that you configured for the event source.
- description (for example, how many events the Log Collector collected)
- tracking ID = the Log Collector position in the target database table.

The following example illustrates the message you would receive upon successful collection of an ODBC event:

2014-July-25 17:21:25 info (OdbcCollection) : [event-source] [processing] [event-source] Published 100 ODBC events: last tracking id: 2014-July-25 13:22:00.280

The following example illustrates a message you may receive upon unsuccessful collection of an ODBC event:

Log Message	timestamp failure (OdbcCollection: [event-source] [processing][event-source-type] Failed during doWork: Unable to prepare statement: state: S0002; error-code:208; description: [RSA] [ODBC-driver][event-source-type]Invalid object name 'object-name'.
Possible Cause	ODBC collection failed while accessing the ODBC Driver or the target database.
Solutions	Validate the DSN value pairs for the events source.

Configure SDEE Event Sources in NetWitness Suite

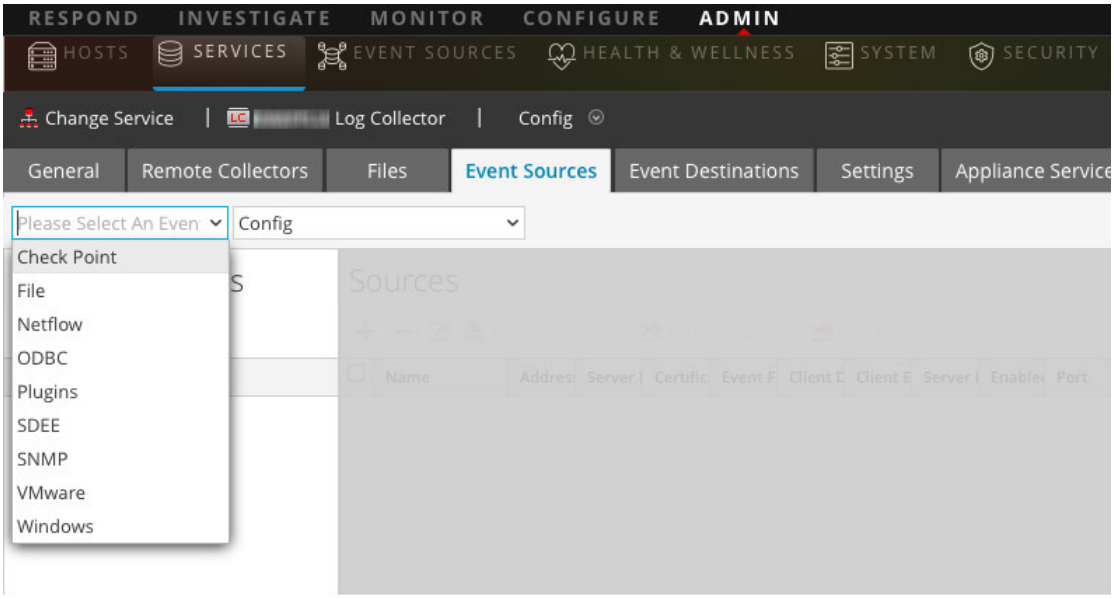
This topic tells you how to configure the SDEE collection protocol.

Configure an SDEE Event Source

To add an SDEE Event Source:

1. Go to **ADMIN> Services** .
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.

4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **SDEE/Config** from the drop-down menu.

   The Event Categories panel displays the SDEE event sources that are configured, if any.

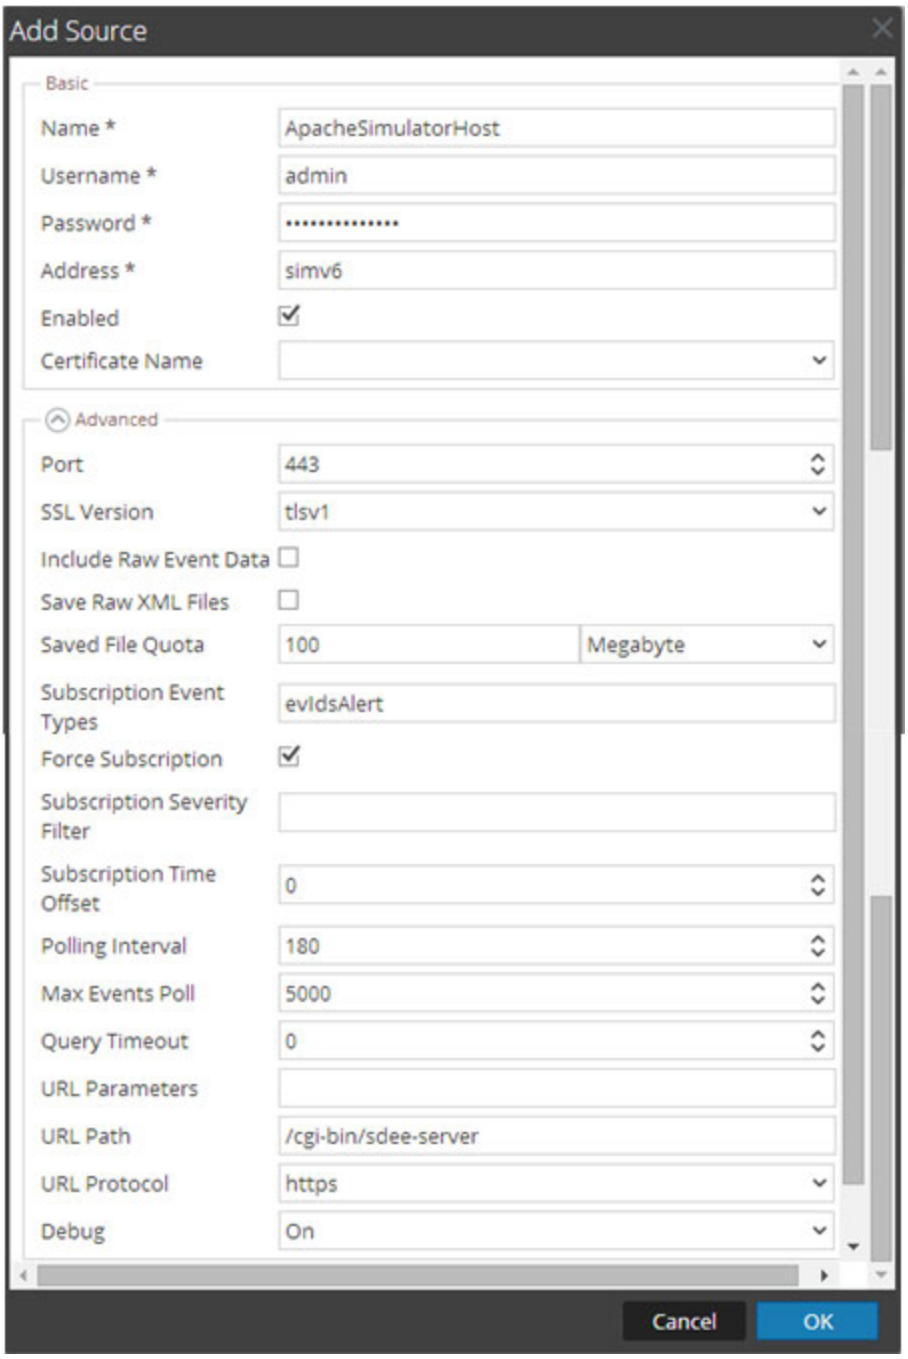
6. In the **Event Categories** panel toolbar, click + .

   The **Available Event Source Types** dialog is displayed.

7. Select an event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.

8. Select the new type in the Event Categories panel and click + in the Sources panel toolbar. The Add Source dialog is displayed.



9. Add a Name, Username, Address, and Password, and modify any other parameters that require changes, and click **OK**.

Configure SNMP Event Sources in NetWitness Suite

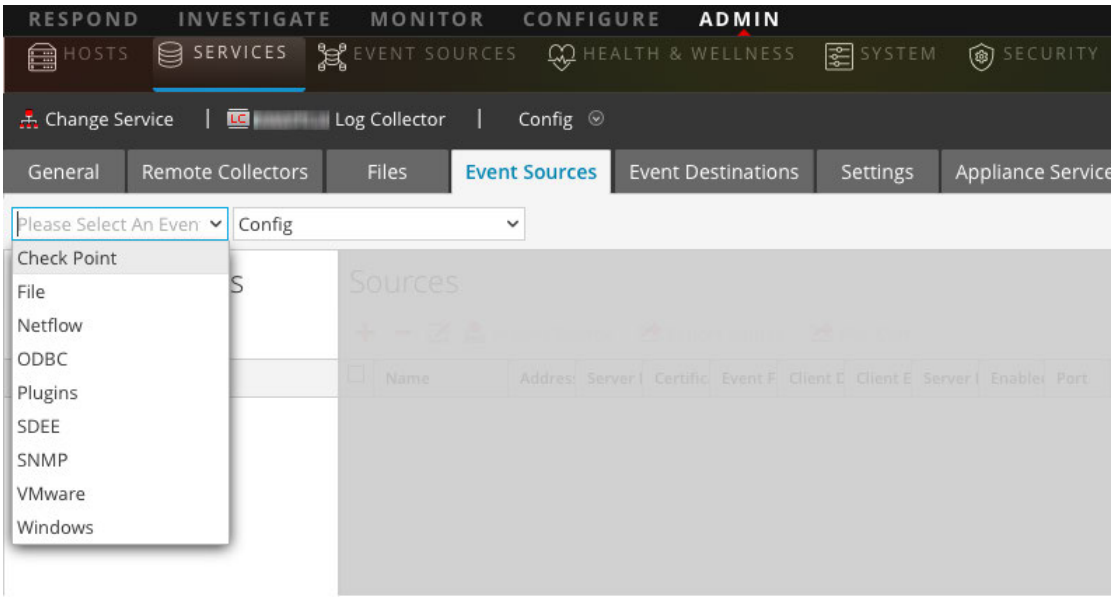
This topic tells you how to configure the SNMP collection protocol.

Configure the SNMP Trap Event Source

To add the SNMP Event Source:

Note: If you have previously added the **snmptrap** type, you cannot add it again. You can edit it, or manage users.

1. Go to **ADMIN> Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. In the **Event Sources** tab, select **SNMP/Config** from the drop-down menu.
6. In the **Event Categories** panel toolbar, click  .

   The **Available Event Source Types** dialog is displayed.
7. Select the **snmptrap** event source type and click **OK**.

   The newly added event source type is displayed in the **Event Categories** panel.
8. Select **snmptrap** in the Event Categories panel.

9. Select **snmptrap** in the Sources panel and then click the Edit icon, , to edit the parameters.
10. Update any of the parameters that you need to change and click **OK**.

(Optional) Configure SNMP Users

If you are using SNMPv3, follow this procedure to update and maintain the SNMP v3 users.

Configure SNMP v3 Users

1. Go to **Admin** > **Services**.
2. In the **Services** grid, select a **Log Collector** service.
3. Click under **Actions** and select **View** > **Config**.
4. In the Log Collector **Event Sources** tab, select **SNMP/SNMP v3 User Manager** from the drop-down menu.

   The SNMP v3 User panel is displayed with the existing users, if any.
5. Click to open the **Add SNMP User** dialog.
6. Fill in the dialog with the necessary parameters. The available parameters are described below.

SNMP User Parameters

The following table describes the parameters that you need to enter when you create an SNMP v3 user.

Parameter	Description
Username *	User name (or more accurately in SNMP terminology, security name). NetWitness Suite uses this parameter and the **Engine ID** parameter to create a user entry in the SNMP engine of the collection service. The **Username** and **Engine ID** combination must be unique (for example, **logcollector**).
Engine ID	(Optional) Engine ID of the event source. For all event sources sending SNMP v3 traps to this collection service, you must add the username and engine id of the sending event source. For all event sources sending SNMPv3 informs, you must add just the username with a blank engine id.

Parameter	Description
Authentication Type	(Optional) Authentication protocol. Valid values are as follows: • **None** (default) - only security level of **noAuthNoPriv** can be used for traps sent to this service • **SHA** - Secure Hash Algorithm • **MD5** - Message Digest Algorithm **DO NOT USE: do not select MD5, as it conflicts with the Log Collector running in FIPS mode.**
Authentication Passphrase	Optional if you do not have the **Authentication Type** set. Authentication passphrase.
Privacy Type	(Optional) Privacy protocol. You can only set this parameter if Authentication Type parameter is set. Valid values are as follows: • **None** (default) • **AES** - Advanced Encryption Standard • **DES** - Data Encryption Standard **DO NOT USE: do not select DES, as it conflicts with the Log Collector running in FIPS mode.**
Privacy Passphrase	Optional if you do not have the **Privacy Type** set. Privacy passphrase.
Close	Closes the dialog without adding the SNMP v3 user or saving modifications to the parameters.
Save	Adds the SNMP v3 user parameters or saves modifications to the parameters.

Configure Syslog Event Sources for Remote Collector

This topic tells you how to configure Syslog event sources for the Log CollectorLog Collector .

You do not configure Syslog Collection for Local Log Collectors. You only need to configure Syslog Collection for Remote Collectors.

Configure a Syslog Event Source

Note: You only need to configure Syslog collection the first time that you set up an event source that uses Syslog to send its output to RSA NetWitness Suite.

You should configure either the Log Decoder or the Remote Log Collector for Syslog. You do not need to configure both.

To configure the Log Decoder for Syslog collection:

1. Go to **Admin > Services** .
2. In the Services grid, select a Log Decoder, and from the Actions menu, choose  > **View > System**.
3. Depending on the icon you see, do one of the following:
   - If you see  , click the icon to start capturing Syslog.
   - If you see  , you do not need to do anything; this Log Decoder is already capturing Syslog.

To configure the Remote Log Collector for Syslog collection:

1. Go to **Admin > Services** .
2. In the Services grid, select a Remote Log Collector, and from the Actions menu, choose  **> View > Event Sources**.
3. Select **Syslog/Config** from the drop-down menu.

   The Event Categories panel displays the Syslog event sources that are configured, if any.
4. In the Event Categories panel toolbar, click  .

   The Available Event Source Types dialog is displayed.
5. Select either **syslog-tcp** or **syslog-udp**. You can set up either or both, depending on the needs of your organization.
6. Select the new type in the Event Categories panel and click  in the Sources panel toolbar.

   The Add Source dialog is displayed.
7. Enter **514** for the port, and select **Enabled**. Optionally, configure any of the Advanced parameters as necessary.

   Click **OK** to accept your changes and close the dialog box.

Once you configure one or both syslog types, the Log Decoder or Remote Log Collector collects those types of messages from all available event sources. So, you can continue to add Syslog event sources to your system without needing to do any further configuration in RSA NetWitness Suite.

Syslog Parameters

The following table describes the available parameters for Syslog configuration.

Name	Description
	Basic
	Advanced
OK	Adds the parameters for the event source.
Cancel	Closes the dialog without making adding an event source type.
Port*	Default port is **514**.
Inflight Publish Log Threshold	Establishes a threshold that, when reached, NetWitness generates a log message to help you resolve event flow issues. The Threshold is the size of the syslog event messages currently flowing from the event source to NetWitness. Valid values are: • **0** (default) - disables the log message • **100-100000000** - generates log message when the syslog event messages currently flowing from the event source to NetWitness are within the 100 to 100000000 byte range.
Maximum Receivers	Maximum number of receiver resources used to process collected syslog events. The default value is **2**.

Name	Description
Debug	**Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables/disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).
Event Filter	Select a filter. Please refer to Configure Event Filters for a Collector for instructions on how to define filters.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.

Configure VMware Event Sources in NetWitness Suite

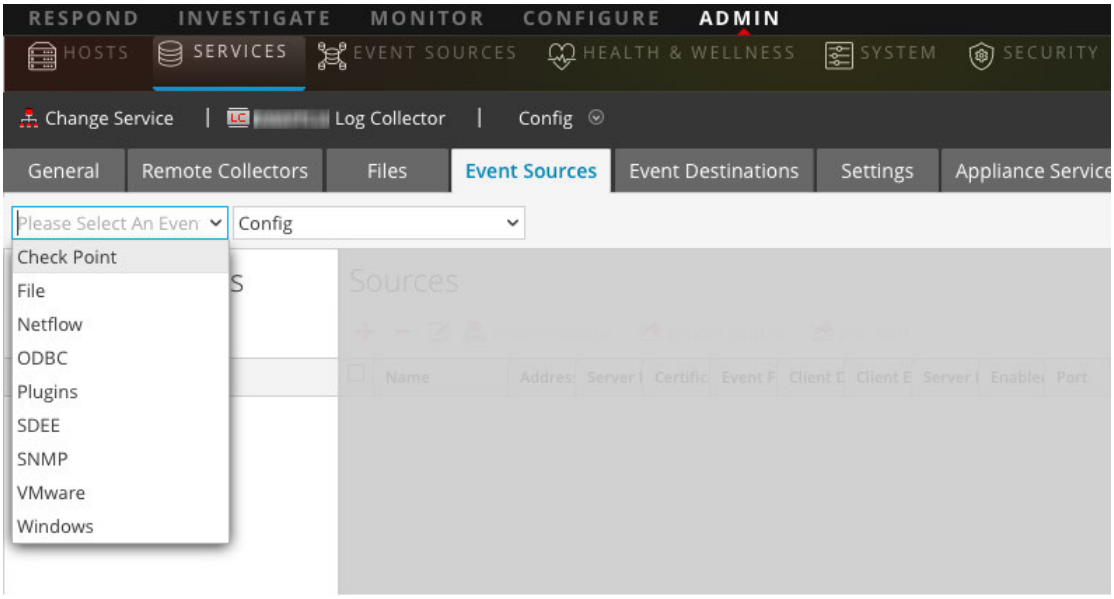
This topic tells you how to configure the VMware collection protocol.

Configure a VMware Event Source

To add a VMware Event Source:

1. Go to **ADMIN> Services** .
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.

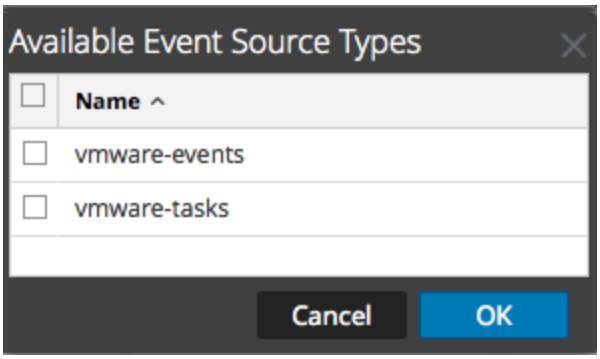
4. Click the **Event Sources** tab.



5. In the Log Collector **Event Sources** tab, select **VMware/Config** from the drop-down menu.

   The Event Categories panel displays the VMware event sources that are configured, if any.

6. Click + to open the **Available Event Source Types** dialog.



7. Select **vmware-events** or **vmware-tasks** from the Available Event Source Types dialog and click **OK**.

   The VMware available event source types are as follows:

   - **vmware-events:** Setup vmware-events to collect events from vCenter Servers and ESX/ESXi servers.
   - **vmware-tasks:** (Optional) Setup vmware-tasks to collect tasks from vCenter Servers.

8. Select the new type in the Event Categories panel, and click + in the Sources toolbar.
9. Add a Name, Username and Password, and modify any other parameters that require

changes.

Caution: If you need to enter the domain name as part of the Username, you must use a double-backslash as a separator. For example, if the domain|username is corp\smithj, you must specify **corp\\smithj**.

10. Click **OK** to save your changes.

Configure Windows Event Sources in NetWitness Suite

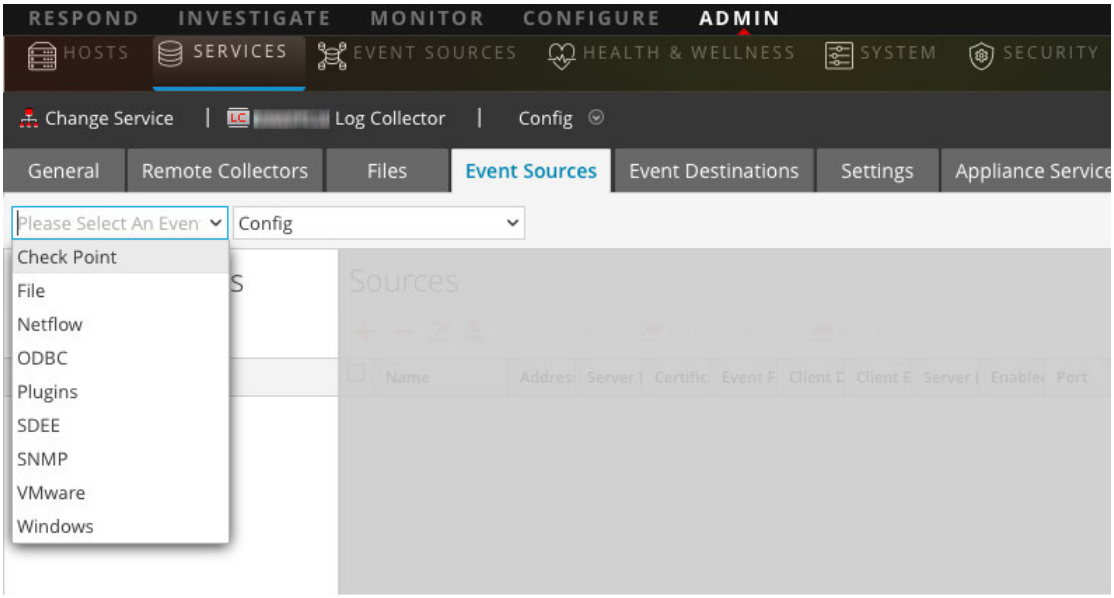
This topic tells you how to configure the Windows collection protocol.

Configure a Windows Event Source

In RSA NetWitness Suite, you need to configure the Kerberos Realm, and then add the Windows Event Source type.

To configure the Kerberos Realm for Windows collection:

1. Go to **ADMIN > Services** .
2. Select a Log Collection service.
3. Under Actions, select > **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.



5. Select **Windows/Kerberos Realm** from the drop-down menu.
6. In the Kerberos Realm Configuration panel toolbar, click

+ to add a new realm.

The Add Kerberos Domain dialog is displayed.

7. Fill in the parameters, using the guidelines below.

Parameter	Details
Kerberos Realm Name	Enter the realm name, in all caps. For example, DSNETWORKING.COM. Note that the Mappings parameter is automatically filled with variations on the realm name.
KDC Host Name	Enter the name of the Domain Controller. ***Do not*** use a fully qualified name here: just the host name for the DC. **Note:** Make sure that the log collector is configured as a DNS client for the corporate DNS server. Otherwise, the Log Collector will not know how to find the Kerberos Realm.
Admin Server	(Optional) The name of the Kerberos Administration Server in FQDN format.

8. Click **Save** to add the Kerberos domain.

To add a Windows Event Source:

1. Go to **ADMIN > Services** .
2. Select a Log Collection service.
3. Under Actions, select > **View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the Log Collector **Event Sources** tab, select **Windows/Config** from the drop-down menu.

   The Event Categories panel displays the VMware event sources that are configured, if any.

Next, continue from the current screen to add a Windows Event Category and type.

To configure the Windows Event Type:

1. Select **Windows/Config** from the drop-down menu.
2. In the Event Categories panel toolbar, click + to add a source.

   The Add Source dialog is displayed.

3. Fill in the parameters, using the guidelines below.

Parameter	Details
Alias	Enter a descriptive name.
Authorization Method	Choose **Negotiate**.
Channel	For most event sources that use Windows collection, you want to collect from the **Security**, **System**, and **Application** channels.
User Name	Enter the account name for the Windows user account that you set up earlier for communicating with NetWitness. Note that you need to enter the full account name, which includes the domain. For example, **rsalog@DSNETWORKING.COM**.
Password	Enter the correct password for the user account.
Max Events Per Cycle	(Optional). RSA recommends that you set this value to 0, which collects everything.
Polling Interval	(Optional). For most users, a value of **60** should work well.

4. Click **OK** to add the source.

   The newly added Windows event source is displayed in the Event Categories panel.

5. Select the new event source in the Event Categories panel.

   The **Hosts** panel is activated.

6. Click + in the Hosts panel toolbar.

7. Fill in the parameters, using the guidelines below.

Parameter	Details
Event Source Address	Enter the IP address for the Windows host.
Port	Accept the default value, **5985**.
Transport Mode	Enter **http**.
Enabled	Ensure the box is checked.

8. Click **Test Connection**.

   Note: You should be able to successfully test the connection, even if the Windows service is not running.

For more information on any of the previous steps, see the following Help topics in the NetWitness Suite User Guide:

- Configure Windows Collection: https://community.rsa.com/docs/DOC-43410
- Microsoft WinRM Configuration Guide: https://community.rsa.com/docs/DOC-58163
- Test and Troubleshoot Microsoft WinRM Guide: https://community.rsa.com/docs/DOC-58164

Windows Legacy and NetApp Collection Configuration

This **Windows Legacy** protocol collects events from Windows Legacy (Windows 2003 or earlier event sources) and CIFS Auditing events from NetApp ONTAP event sources.

You must deploy Log Collection, that is set up a Local Collector and Windows Legacy Remote Collector, before you can configure the Windows Legacy collection protocol.

How Legacy Windows and NetApp Collection Works

You use the Windows Legacy collection protocol to configure NetWitness Suiteto collection events from:

- Legacy Microsoft Windows event sources (Window 2003 and earlier event sources)
- NetApp event sources

Window 2003 and Earlier Event Sources

Legacy Windows event sources are older Windows versions (such as Windows 2000 and Window 2003). The Windows Legacy collection protocol collects from Windows event sources that are already configured for enVision collection without having to reconfigure them. You set up these event sources under the windows event source type.

NetApp Event Sources

NetApp appliances running Data ONTAP support a native auditing framework that is similar to Windows Servers. When configured, this auditing framework generates and saves audit events in Windows .evt file format. The Windows Legacy collection protocol supports collection of events from such NetApp .evt files. You set up these event sources under the netapp_evt event source type.

The NetApp Data ONTAP appliance is configured to generate CIFS Auditing events and save them periodically as .evt files in a format that includes the timestamp in the filename. Refer to the Network Appliance Data ONTAP Event Source Configuration Guide on RSA Link for details. The collection protocol saves the timestamp of the last processed .evt filename to keep track of collection status.

Net App Specific Parameters

Most of the parameters that you maintain in Add/Edit Source dialog apply to both Windows Legacy and Net App events sources.

The following two parameters are unique to NetApp event sources.

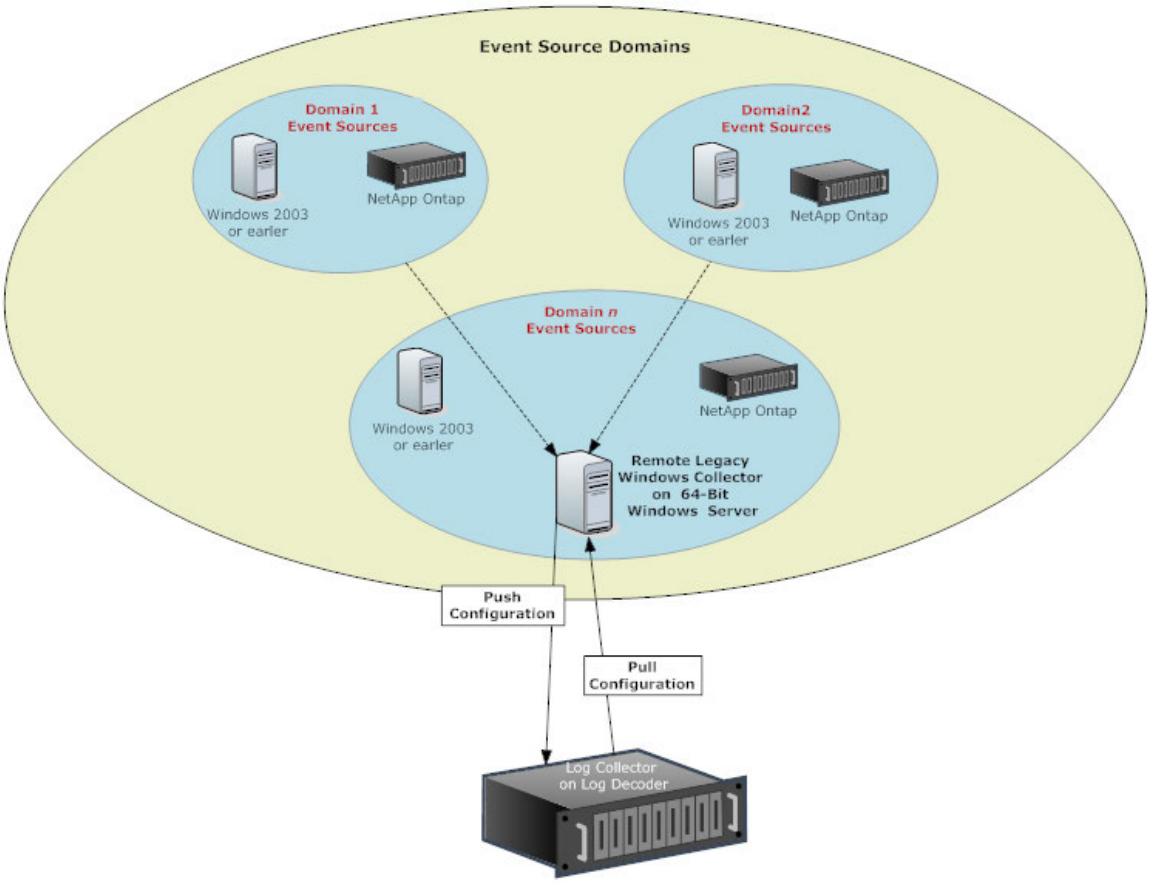
- **Event Directory Path** - The NetApp appliance generates event data and saves it in .evt files in a shareable directory on the NetApp appliance. NetWitness Suite requires you to specify this directory path in the Event Directory Path parameter
- **Event File Prefix** - Similar to the Event Directory Path, NetWitness Suite requires you to specify the prefix (for example, adtlog.) of the event data .evt files so that NetWitness Suite can process this data.

In each polling cycle, NetWitness Suite browses the configured NetApp shared path for the **.evt** files that you identified with the Event Directory Path and Event File Prefix parameters. NetWitness Suite:

- Sorts Files matching the event-file-prefix.YYMMDDhhmmss.evt format in ascending order.
- Uses the timestamp of the last file processed to determine the files that still need processing. If NetWitness Suite finds a partially processed file, it skips the events already processed.

Deployment Scenario

The Windows Legacy collection protocol collects event data from Windows 2003 or earlier, and NetApp ONTAP appliance, event sources. The Windows Legacy Remote Collector is the SA Legacy Windows Collector installed on physical or virtual Windows 2008 64-bit server in your event source domain.



Set Up the Windows Legacy Collector

This topic tells you where to find the executable and instructions required to install or upgrade the Windows Legacy collector in your Windows Legacy domain or domains.

You install the NetWitness Suite Windows Legacy collector on a physical or virtual Windows 2008 R2 SP1 64-Bit server using the **NWLegacyWindowsCollector-11.*version-number.exe***. You download the **NWLegacyWindowsCollector-11.*version-number.exe*** from RSA Link. Please refer to the *NetWitness 11.x Windows Legacy Collection Upgrade & Installation Instructions* for the details on how to install or upgrade Windows Legacy collection.

Note: The Microsoft Management Console (MMC) should be closed during the installation process.

Configure Windows Legacy and NetApp Event Sources

This topic tells you how to configure Windows Legacy event sources in NetWitness Suite.

The Windows Legacy collection protocol collects event data from Windows 2003 or earlier event sources, and from NetApp event sources.

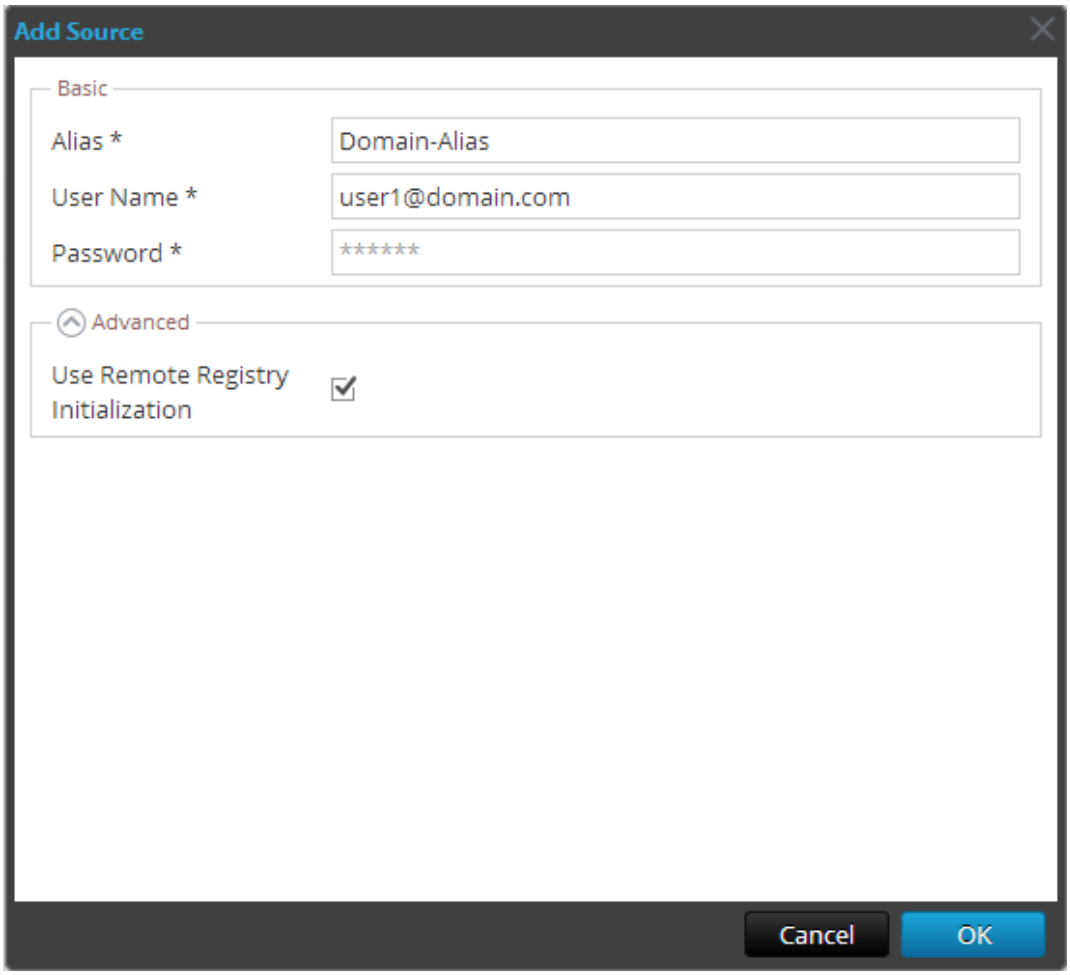
Prerequisites

Before you configure a Windows Legacy event source, make sure that you have:

1. Installed the NetWitness Suite Windows Legacy Remote Collector on a physical or virtual Windows 2008 64-bit server.
2. Added this Windows Legacy Remote Collector to NetWitness Suite.

Add a Windows Legacy Event Source

1. Access the Services view by selecting **Admin > Services** from the NetWitness Suite menu.
2. In the **Services** grid, select a **Windows Legacy Log Decoder** service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Sources** tab.
5. In the **Event Sources** tab, select one of the following options from the drop-down menu.
   - Windows Legacy/Windows.
   - Windows Legacy/NetApp.
6. Configure the alias:
   a. Click  in the **Event Categories** panel toolbar.
   The **Add Source** dialog is displayed.
   b. Specify values for the parameters and click **OK**.



Note: By default, **Remote Registry Initialization** is selected. For details, see Remote Registry Access below.

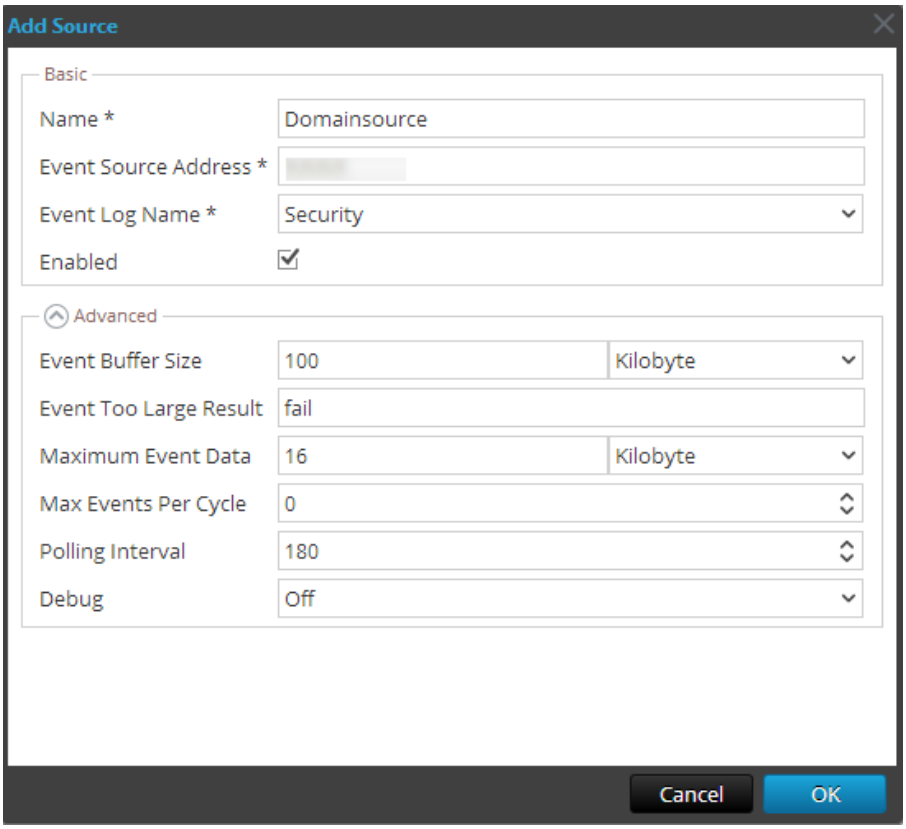
The newly added windows event source type is displayed in the **Event Categories** panel.

7. Add the event source:

   a. Select the new alias in the **Event Categories** panel and click + in the **Source** panel toolbar.

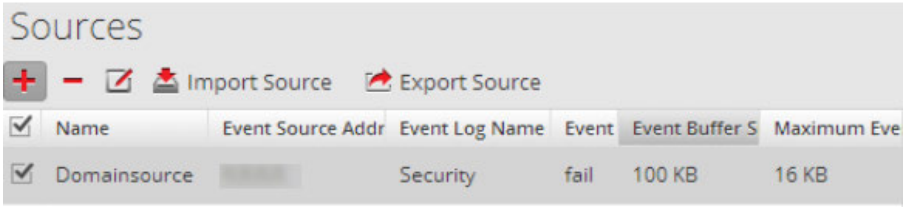
      The **Add Source** dialog is displayed.

   b. Specify values for the event source parameters and click **OK**.



For details, see Windows Legacy Configuration Parameters below.

The newly added Windows event source is displayed in the **Event Categories** panel.



Remote Registry Access

Windows Legacy Collector performs an initial verification of the event source before collecting data. By default, Windows Legacy Collector uses Windows Management Instrumentation (WMI) method to perform this initial verification. If you enable Remote registry access method, Windows Legacy Collector performs a remote registry query to verify the event source.

Windows Legacy Configuration Parameters

The following table describes the parameters for a Windows Legacy event source.

Feature	Description
	Basic
Name*	The name of the event source. Valid value is a name in the **[_a-zA-Z] [_a-zA-Z0-9]*** range. You can use a dash "**-**" as part of the name.
Event Source Address*	IP address of the event source. Valid value is an IPv4 address, IPv6 address, or a hostname including a fully qualified domain name. NetWitness Suite defaults to **127.0.0.1**. Log Collector converts the hostname to lower-case letters to prevent duplicate entries.
Event Log Name	The name of the event log from which to collect event data (for example, **System**, **Application**, or **Security**). The following are examples of some of these channels: • **System** - applications that run under system service accounts (installed system services), drivers, or a component or application that has events that relate to the health of the system. • **Application** - all user-level applications. This channel is unsecured and it is open to any application. If an application has extensive information, you should define an application-specific channel for it. • **Security** - the Windows Audit Log (event log) used exclusively for the Windows Local Security Authority.
Enabled	Select this checkbox to collect from this event source. If you do not check this checkbox, the Log Collector does not collect events from this event source.

Feature	Description

Event Directory Path	NetApp **.evt or .evtx** files directory path. This must be the UNC path.
	The NetApp generates event data and saves it in .evt or .evtx files in a shareable directory on the NetApp appliance.
	• In each polling cycle, Log Collector browses the configured NetApp shared path for the .evt files that you identified with the **Event Directory Path** and **Event File Prefix parameters**. Log Collector :
	  ◦ sorts files that match the **event-file-prefix.YYMMDDhhmmss.evt** format in ascending order.
	  ◦ uses the timestamp of the last file processed to determine the files that still need processing. If Log Collector finds a partially processed file, it skips the events already processed.
	• In each polling cycle, Log Collector browses the configured NetApp shared path for the **.evtx** files that you identified with the **Event Directory Path** and **Event File Prefix parameters**. Log Collector :
	  ◦ sorts files that match the **event-file-prefix.YYMMDDhhmmssms.evtx** format in ascending order.
	  ◦ uses the timestamp of the last file processed to determine the files that still need processing. If Log Collector finds a partially processed file, it skips the events already processed.

Event File Prefix	Prefix of the **.evt** files (for example, **adtlog**.) saved in the **Event Directory Path**.
	Advanced
Event Buffer Size	Maximum size of the data the Log Collector pulls from the event source for each request. Valid value is a number in **0** to **511** Kilobytes range. You specify this value in **Kilobytes**.
Event Too Large Result	Tells Log Collector what to do if an event is too large for the event buffer.

Feature	Description
Maximum Event Data	Maximum size of event data to include in the output. Valid value is a number in **0** to **511Kilobytes** range. You specify this value in **Kilobytes** or **Megabytes**. • 1 Kilobyte - 100 Megabytes • 0 = do not include event data in the output.
Max Events Per Cycle	The maximum number of events per polling cycle (how many events collected per polling cycle).
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector . Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). Limit the number of event sources for which you use Verbose debugging to minimize performance impact.
Cancel	Closes the dialog without adding the Windows Legacy event source.
OK	Adds the current parameter values as a new event source

Troubleshoot Windows Legacy and NetApp Collection

This topic highlights possible problems that you may encounter with Windows Legacy Collection (LWC) and suggested solutions to these problems.

Note: In general, you receive more robust log messages by disabling SSL.

Protocol Restart Problems

Problem	Possible Causes	Solutions
You restart the Legacy Windows collection protocol, but NetWitness Suite is not receiving events.	The logcollector service is stopped.	Restart the **logcollector** service. 1. Log on to the **Windows Legacy Remote Collector**. 2. Go to **Start > Administrative Tools > Task Scheduler** and click on **Task Scheduler Library**. 3. In the right panel, look for the **restartnwlogcollector** task and make sure that it is running. 4. If this is not the case, right-click **restartnwlogcollector** and select **Run**.

Installation Problems

If you see any of the following messages in the **MessageBroker.log**, you may have issues.

Log Messages	Any message that contains "rabbitmq"
Possible Cause	RabbitMQ service may not be running. Port **5671** may not be opened.
Solutions	Make sure that the RabbitMQ service is running. Make sure that port **5671** is open.
Log Messages	Error: Adding logcollector user account. Error: Adding administrator tag to logcollector account. Error: Adding Adding logcollection vhost.

	Error: Setting permissions to logcollector account in all vhosts.
Possible Cause	**rabbitmq-server** was not running when installer tried to create users and vhosts.
Solutions	Make sure that the **RabbitMQ** service is running and run below commands manually. rabbitmqctl -q add_user logcollector netwitness rabbitmqctl -q set_user_tags logcollector administrator rabbitmqctl -q add_vhost logcollection rabbitmqctl -q set_permissions -p / logcollector ".*" ".*" ".*" rabbitmqctl -q set_permissions -p logcollection logcollector ".*" ".*" ".*"

Windows Legacy Federation Script Issues

If you see any of the following messages in the federation script log, you may have issues.

Problem	Possible Symptoms	Solutions
Federation script started, b ut the LWC service went down.	NetWitness Suite log shows connection failure exceptions with Windows Legacy Collector.	This issue is fixed automatically after restarting the Windows Legacy service.

Problem	Possible Symptoms	Solutions

LWC is running, but RabbitMQ service is down or restarting.	Federation log file at Windows Legacy side displays an error message about RabbitMQ service being down.
	The log file to look at is: **C:\NetWitness\ng\logcollector**
	The following error message is logged in case RabbitMQ is not running:
	`"Unable to connect to node logcollector@localhost: nodedown"`
	The following diagnostics messages are displayed:
	`attempted to contact: [logcollector@localhost]`
	`logcollector@localhost:`
	`* connected to epmd (port 4369) on localhost`
	`* epmd reports: node 'logcollector' not running at all other nodes on localhost: ['rabbitmqctl-4084']`
	`* suggestion: start the node`
		Run the **federation.bat** script manually at LWC.
		To run the **federate.bat** script manually, perform the following steps:
		1. Go to folder C**:\Program Files\NwLogCollector** where the Windows Legacy instance is installed.
		2. Locate the file **federate.bat i**n this folder. Select the file and right click.
		3. Select **Run as Administrator**.
		4. To monitor the log file, navigate to **C:\NetWitness\ng\logcollector\federate.log** while the **federate.bat** script is being executed.
		Note: Make sure the log file does not show any errors while the script is being executed.

RabbitMQ service is down on the NetWitness Suite side.	NetWitness Suite User Interface pages do not work.	Restart RabbitMQ service.

Problem	Possible Symptoms	Solutions
Customer receives a Health and Wellness notification, or the following Health and Wellness Alarm is displayed: "Communication failure between Master NetWitness Suite Host and a Remote Host" with LWC Host as the Remote IP.	**Federate.bat** script failed to run successfully.	If the **Federate.bat** script did not run correctly, run it manually as described previously.

AWS Parameters

This topic provides an overview of the AWS collection configuration parameters for deploying a remote log collection service (VLC) in an Amazon Web Services (AWS) environment.

What do you want to do?

Role	I want to...	Documentation
Administrator	Configure AWS Collection parameters.	Configure AWS (CloudTrail) Event Sources in NetWitness Suite

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

Related Topics

- Configure AWS (CloudTrail) Event Sources in NetWitness Suite

The following table describes the available configuration parameter for AWS collection.

Parameter	Description
Parameter	**Description**
	Basic
Name *	Name of the event source.

Parameter	Description
Enabled 	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Account Id *	Account Identification code of the S3 Bucket
S3 Bucket Name *	Name of the AWS (CloudTrail) S3 bucket. Amazon S3 bucket names are globally unique, regardless of the AWS (CloudTrail) region in which you create the bucket. You specify the name at the time you create the bucket. Bucket names should comply with DNS naming conventions. The rules for DNS-compliant bucket names are: • Bucket names must be at least three and no more than 63 characters long. • Bucket names must be a series of one or more labels. Adjacent labels are separated by a single period “.”. Bucket names can contain lowercase letters, numbers, and hyphens. Each label must start and end with a lowercase letter or a number. • Bucket names must not be formatted as an IP address (for example, 192.168.5.4). The following examples are **valid** bucket names: • **myawsbucket** • **my.aws.bucket** • **myawsbucket.1** The following examples are **invalid** bucket names: • **.myawsbucket** - Do not start a Bucket Name with a period ".". • **myawsbucket.** - Do not end a Bucket Name with a period ".". • **my..examplebucket** - Only use one period between labels.
Access Key *	Key used to access the S3 bucket. Access Keys are used to make seure REST or Query protocol requests to any AWS service API. Please refer to Manage User Credentials on the Amazon Web Services support site for more information on Access Keys.

Parameter	Description
Secret Key *	Secret key used to access the S3 bucket.
Region *	Region of the S3 bucket. **us-east-1** is the default value.
Region Endpoint	Specifies the AWS CloudTrail hostname. For example, for an AWS public cloud for us-east region, the Region Endpoint would be s3.amazonaws.com. More information can be found at http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region. This parameter is necessary to collect CloudTrail logs from AWS Government or Private clouds.
Use Proxy	Enable **Use Proxy** to set proxy for AWS server. By default, it is disabled.
Proxy Server	Enter the proxy name you want to connect to access the AWS server.
Proxy Port	Enter the port number that connects to the proxy server to access the AWS server.
Proxy User	Enter the user name to authenticate with the proxy server.
Proxy Password	Enter the password to authenticate with proxy port.
Start Date *	Starts AWS (CloudTrail) collection from the specified number of days in the past, measured from the current timestamp. The default value is 0, which starts from today. The range is 0–89 days.
Log File Prefix	Prefix of the files to be processed. **Note:** If you set a prefix when you set up your CloudTrail service, make sure to enter the same prefix in this parameter.
Advanced	

Parameter	Description
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).
Command Args	Arguments added to the script.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is 60. For example, if you specify 60, the collector schedules a polling of the event source every 60 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 60 seconds for the polling to start because the threads are busy.
SSL Enabled 	Select the check box to communicate using SSL. The security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The check box is selected by default.

Parameter	Description
Test Connection	Validates the configuration parameters specified in this dialog are correct. For example, this test validates that: • NetWitness can connect with the S3 Bucket in AWS using the credentials specified in this dialog. • NetWitness can download a log file from the bucket (test connection would fail if there were no log files for the entire bucket, but this would be extremely unlikely).
Cancel	Closes the dialog without adding the AWS (CloudTrail).
OK	Adds the current parameter values as a new AWS (CloudTrail).

Azure Parameters

Microsoft Azure is a cloud computing platform and infrastructure for building, deploying, and managing applications and services through a global network of Microsoft-managed data centers.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Configure Azure event source parameters.	Configure Azure Event Sources in NetWitness Suite

Related Topics

- Configure Azure Event Sources in NetWitness Suite

Azure Event Source Configuration Parameters

This topic describes the Azure event source configuration parameters.

Note: Items that are followed by an asterisk (*) are required.

Basic Parameters

Name	Description
Name *	Enter an alpha-numeric, descriptive name for the source. This value is only used for displaying the name on this screen.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Client ID *	The Client ID is found the Azure Application Configure tab. Scroll down until you see it.

Name	Description
Client Secret *	When you are configuring the event source, the client secret is displayed when you are creating a key, and you select a duration of validation. Make sure to save this, because you will only be able to see it once, and it cannot be retrieved later.
API Resource Base URL *	Enter `https://management.azure.com/`. Be sure to include the trailing slash (/).
Federation Metadata Endpoint *	In your Azure application, click the **View Endpoints** button (near the bottom of the pane). There are a lot of links that all begin with the same string. Compare the URLs and find the common string that begins most of them. This common string is the endpoint that you need to enter here.
Subscription ID *	You can find this in the Microsoft Azure dashboard: click on Subscriptions at the bottom of the list on the left.
Tenant Domain *	Go to the active directory and click on the directory. In the URL, the tenant domain is the string directly following **manage.windowsazure.com/**. The tenant domain is the string up to and including the **.com**.
Resource Group Names *	In Azure, select Resource groups from the left navigation pane, then select your group.
Start Date *	Choose the date from which to start collecting. Default's to the current date.
Test Connection	Checks the configuration parameters specified in this dialog to make sure they are correct.

Advanced Parameters

Click next to **Advanced** to view and edit the advanced parameters, if necessary.

Name	Description
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.

Name	Description
Max Duration Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Max Idle Time Poll	Maximum duration, in seconds, of a polling cycle. A zero value indicates no limit.
Command Args	Optional arguments to be added to the script invocation.
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. **Caution:** Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact.

Check Point Parameters

The Check Point Collection protocol collects events from Check Point event sources using OPSEC LEA. OPSEC LEA is the Check Point Operations Security Log Export API that facilitates the extraction of logs.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Configure Check Point parameters.	Configure Check Point Event Sources in NetWitness Suite

Related Topics

Check Point Collection Configuration Parameters

Basic Parameters

Parameter	Description
Name*	Name of the event source.
Address*	IP Address of the Check Point server.
Server Name*	Name of the Check Point server.

Parameter	Description
Certificate Name	Certificate name for secure connections to use when the transport mode is https. If set, the certificate must exist in the certificate trust store that you created using the Settings tab. Select a certificate from the drop-down list. The file naming convention for Check Point event source certificates is **checkpoint_*name-of-event-source***.
Client Distinguished	Enter the Client Distinguished Name from the Check Point server.
Client Entity Name	Enter the Client Entity Name from the Check Point server.
Server Distinguished	Enter the Server Distinguished Name from the Check Point server.
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Pull Certificate	Select the checkbox to pull a certificate for first time. Pulling a certificate makes it available from the trust store.
Certificate Server Address	IP Address of the server on which the certificate resides. Defaults to the event source address.
Password	Only active when you select the Pull Certificate checkbox for first time. Password required to pull the certificate. The password is the activation key created when adding an OPSEC application to Check Point on the Check Point server.

Determine Advanced Parameter Values for Check Point Collection

You use less system resources when you configure a Check Point event source connection to stay open for a specific time and specific event volume (transient connection). RSA NetWitness Suite defaults to the following connection parameters that establish a transient connection:

- Polling Interval = **180** (3 minutes)
- Max Duration Poll = **120** (2 minutes)

- Max Events Poll = **5000** (5000 events per polling interval)
- Max Idle Time Poll = **0**

For very active Check Point event sources, it is a good practice to set up a connection that stays open until you stop collection (persistent connection). This ensures that Check Point collection maintains the pace of the events generated by these active event sources. The persistent connection avoids restart and connection delays and prevents Check Point collection from lagging behind event generation.

To establish a persistent connection for a Check Point event source, set the following parameters to the following values:

- Polling Interval = **-1**
- Max Duration Poll = **0**
- Max Events Poll = **0**
- Max Idle Time Poll = **0**

Parameter	Description
Port	Port on the Check Point server that Log Collector connects to. Default value is 18184.
Collect Log Type	Type of logs that you want to collect: Valid values are: • **Audit** - collects audit events. • **Security** - collects security events. If you want to collect both audit and security events, you must create a duplicate event source. For example, first you would create an event source with Audit selected pulling a certificate into the trust store for this event source. Next you would create another event source with the same values except that you would select Security for the Collect Log Type and you would select the same certificate in Certificate Name that you pulled when you set up the first set of parameters for this event source and you would make sure that Pull Certificate was not selected.

Parameter	Description
Collect Logs From	When you set up a Check Point event source, NetWitness collects events from the current log file. Valid values are: • **Now** - Start collecting logs now (at this point in time in the current log file). • **Start of Log** - Collect logs from the beginning of the current log file. If you choose "Start of Log" for this parameter value, you may collect a very large amount of data depending on how long the current log file has been collecting events. Note that this option is effective only for the first collection session.
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, it will wait for it to finish that cycle. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Duration Poll	The maximum duration of polling cycle (how long the cycle lasts) in seconds.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Max Idle Time Poll	Maximum idle time, in seconds, of a polling cycle. 0 indicates no limit.**> 300** is the default value.
Forwarder	Enables or disables the Check Point server as a forwarder. By default it is disabled.
Log Type (Name Value Pair)	Logs from the event source in Name Value format. By default it is disabled.

Parameter	Description
Debug	**Caution:** Only enable debugging (set this parameter to "On" or "Verbose") if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables and disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).

File Parameters

This topic describes the File Collection configuration parameters.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Configure File Collection source parameters.	Configure File Event Sources in NetWitness Suite

Related Topics

- Configure File Event Sources in NetWitness Suite

File Collection Event Source Parameters

The following table provides descriptions of the File Collection source parameters.

Name	Description
Basic	

Name	Description
File Directory*	Collection directory (for example, **Eur_London100**) into which the File event source places its files. Valid value is a character string that is conforms to the following regular expression: **[_a-zA-Z][_a-zA-Z0-9]*** This means that the file directory must start with a letter followed by numbers, letters, and underscores. Do not modify this parameter after you start collecting event data. After you create the collection, the Log Collector creates the work, save, and error sub-directories under the collection directory.
Address*	IP address of the event source. Valid value is an **IPv4 address**, **IPv6 address**, or a **hostname** including a fully-qualified domain name.
File Spec	Regular expression. For example, **^.*$** = process everything.
File Encoding	Internationalization file encoding. Enter the File Encoding method, the following strings are examples of valid methods: • UTF-8 (default) • UCS-16LE • UCS-16BE • UCS-32LE • UCS-32BE • SHIFT-JIS • EBCDIC-US
Enabled	Select the check box to enable the event source configuration to start collection. The check box is selected by default.
Advanced	
Ignore Encoding Conversion Errors	Select the check box to ignore encoding conversion errors and ignore invalid data. The check box is selected by default. **Caution:** This may cause parsing and transformation errors.

Name	Description
File Disk Quota	Determines when to stop saving files regardless of the **Save On Error** and **Save On Success** parameter settings. For example, a value of 10 indicates that when there is less than 10% available disk left, the Log Collector stops saving files to reserve enough space for your estimated normal collection processing. **Caution:** Available disk refers to a partition where the base collection directory is mounted. If the Log Decoder server has a 10TB disk size and 2TB is allocated to base collection directory, then setting this value to 10 causes log collection to stop when less than 0.2TB (10% of 2TB) of space is left. It does not mean 10% of 10TB. Valid value is a number in the **0** to **100** range. **10** is the default.
Sequential Processing	Sequential processing flag: • Select the check box (default) to process event source files in collection order. • Do not select the checkbox to process event source files in parallel.
Save On Error	Save on error flag. Check the checkbox to retain the **eventsource collection** file when the Log Collector it encounters an error. The check box is selected by default.
Save On Success	Save **eventsource collection** file after processing flag. Check the checkbox to save the eventsource collection file after processing it. The check box is not selected by default.
Eventsource SSH Key	SSH public key used to upload files for this event source. Please refer to the *Generate Key Pair on Event Source and Import Public Key to Log Collector* section in the Install and Update the SFTP Agent Guide for instructions on generating keys. **Note:** If File collection is stopped, NetWitness Suite does not update the authorized_keys file with the SSH public key that you add or modify in this parameter. You must restart File collection to update the public key. You can add or modify the value of the public key in this parameter in multiple File event sources without File collection running, but NetWitness Suite will not update the **authorized_keys** file until File collection is restarted.

Name	Description
Manage Error Files	By default, the Log Collectoruses the **File Disk Quota** parameter to ensure that the disk does not fill up with error files. If you set this parameter to **true**, you can specify one of these: • Maximum space allotted to error files in the **Error Files Size** parameter. • Maximum number of error files allowed in **Error Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached. Select the check box to manage error files. The check box is not selected by default.
Error Files Size	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Specifies to what extent NetWitness Suite saves error files. The value that you specify is the maximum total size of all the files in the error directory. Valid value is a number in **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Error Files Count	Only valid if the **Manage Error Files** and **Save On Error** parameters are set to true. Maximum number of error files allowed in the error directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Error Files Reduction %	Percent amount by size or count of the error files that the Log Collectorservice removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.

Name	Description
Manage Saved Files	Select the check box to manage saved files. The check box is not selected by default. By default, the Log Collector uses the **File Disk Quota** parameter to ensure that the disk does not fill up with saved files. If check this check box, you can specify one of these: • Maximum space allotted to saved files in the **Saved Files Size** parameter. • Maximum number of saved files allowed in **Saved Files Count** parameter. A reduction percent is also specified, which tells the system how much to reduce when the maximum is reached.
Saved Files Size	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum total size of all the files in the save directory. Valid value is a number in the **0** to **281474976710655** range. You specify these values in either **Kilobytes**, **Megabytes**, or **Gigabytes**. **100 Megabytes** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved Files Count	Only valid if the **Manage Saved Files** and **Save On Success** parameters are set to true. Maximum number of saved files in the save directory. Valid value is a number in **0** to **65536** range. **65536** is the default. If you change this parameter, the change does not take effect until you restart collection or restart the Log Collector service.
Saved File Reduction %	Percent amount by size or count of the saved files that the Log Collector service removes when the maximum size or count has been reached. The service removes the oldest files first. Valid value is a number in the **0** to **100** range. **10** is the default.

Name	Description
Debug	**Caution:** Only enable debugging (set this parameter to **On** or **Verbose**) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables/disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. The debug logging is verbose, so limit the number of event sources to minimize performance impact. If you change this value, the change takes effect immediately (no restart required).
Cancel	Closes the dialog without making adding an event source type.
OK	Adds the parameters for the event source.

Log Collection Service System View

A Log Collector is a service that runs on a Log Decoder host (referred to as a Local Collector) or sends events from a Remote Collector to a Local Collector, and is configured and managed in a similar way to a Log Decoder.

To access the Log Collection Service System view, go to ADMIN > Services and select a Log Collector service, then select View > System.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Start collecting event data from a stopped protocol.	Start Collection Services
Administrator	Stop collecting event data from a started protocol.	Start Collection Services

Related Topics

- Start Collection Services

Quick Look

From the Log Collector Service Information Toolbar, you can manage event data using the Collection icon to start event data from a stopped protocol or stop collecting data from a started protocol. From the Host Tasks icon, you can select tasks that you want to run. You can also shutdown your service and reboot your service from the Service Information Toolbar.

ODBC Event Source Configuration Parameters

This topic tells you how to configure ODBC collection protocol which collects events from event sources that store audit data in a database using the Open Database Connectivity (ODBC) software interface.

Access ODBC Configuration Parameters

To access the ODBC Event Source Configuration Parameters:

1. Go to **Administration > Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the Log Collector **General** tab open.
4. Click the **Event Sources** tab, and select **ODBC/Config** from the drop-down menu.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	View or update ODBC parameters.	Configure ODBC Event Sources in NetWitness Suite

Related Topics

Data Source Name (DSN) Parameters

Use the Sources panel to review, add, modify, and delete Data Source Name (DSN) parameters.

Sources Panel

An ODBC DSN tells the Log Collector how to reach an ODBC endpoint. You refer to an ODBC DSN when you configure a data source name with information such as which ODBC driver to use or the host name and port of the ODBC endpoint.

An ODBC DSN is a sequence of name-value pairs. For information about the valid names for a given ODBC data source type, such as Sybase, Microsoft SQL Server, or Oracle, please download the *DataDirect Connect Series for ODBC User's Guide and DataDirect Connect Series for ODBC User's Guide* in the Progress DataDirect Document Library.

Toolbar

The following table provides descriptions of the toolbar options.

Option	Description
	Opens the Add DSN dialog in which you add an event source for the event source type you selected in the Event Categories panel.
	Deletes the selected event sources.
	Opens the Edit DSN dialog in which you modify the configuration parameters for the selected event source. When you select multiple event sources, this option opens the Bulk Edit Source dialog in which you can edit the parameters values for the selected file directories. Refer to the *Log Collection Configuration Guide*for detailed steps on how to import, export, and edit event sources in bulk.
	Opens the Bulk Add Option dialog in which you can import DSN parameters in bulk from a comma-separated values (CSV) file. The Bulk Add Option dialog has the following two options. Refer to the *Log Collection Configuration Guide*for detailed steps on how to import, export, and edit event sources in bulk.
	Creates a **.csv** file that contains the parameters for the selected DSNs. Refer to the *Log Collection Configuration Guide*for detailed steps on how to import, export, and edit event sources in bulk.

Option	Description
Test C	Validates the configuration parameters for the selected ODBC database. Refer to the *Log Collection Configuration Guide*for detailed steps on how to test event source connections in bulk.

Add or Edit DSN Dialog

In this dialog, you add or modify an event source for the selected event source.

Name	Description
	Basic
DSN*	The data source name (DSN) that defines the database from which to collect events. Select an existing DSN from the drop-down list. For details, see ODBC DSNs Event Source Configuration Parameters.
Username*	User name that the data source name uses to connect to the database. You must specify a user name when you create the event source.
Password	Password that the data source name uses to connect to the database. **Caution:** The password is encrypted internally and is displayed in its encrypted form.
Enabled	Select the checkbox to enable the event source configuration to start collection. The checkbox is selected by default.
Address*	For ODBC, this field is not used. The Log Collector uses the address in the **ODBC.ini** file.
	Advanced
Max Cell Size	Maximum size in bytes of the data that the Log Collector can pull from one cell in the database. The default value is **2048**.
Nil Value	Character string that the Log Collector displays when NIL is returned for a cell in the database. Default value: **“”** (null).

Name	Description
Polling Interval	Interval (amount of time in seconds) between each poll. The default value is **180**. For example, if you specify 180, the collector schedules a polling of the event source every 180 seconds. If the previous polling cycle is still underway, the collector waits for that cycle to finish. If you have a large number of event sources that you are polling, it may take longer than 180 seconds for the polling to start because the threads are busy.
Max Events Poll	The maximum number of events per polling cycle (how many events collected per polling cycle).
Debug	**Caution:** Only enable debugging (set this parameter to On or Verbose) if you have a problem with an event source and you need to investigate this problem. Enabling debugging will adversely affect the performance of the Log Collector. Enables or disables debug logging for the event source. Valid values are: • **Off** = (default) disabled • **On** = enabled • **Verbose** = enabled in verbose mode - adds thread information and source context information to the messages. This parameter is designed to debug and monitor isolated event source collection issues. If you change this value, the change takes effect immediately (no restart required). The debug logging is verbose, so limit the number of event sources to minimize performance impact.
Initial Tracking Id	Initial identification code that the Log Collector assigns to this event source if collection is not started. If there is no value for this parameter, the Log Collector starts at the end of the table and only pulls rows after the end of the table as they are added. The default value is **“”** (null).
Filename	For Microsoft SQL Server Event Sources only, the location of the trace files directory (for example, **C:\MyTraceFiles**). Please refer to the RSA Microsoft SQL Server Event Source Configuration Guide, located on RSA Secure Care Online (SCOL) for detailed information on how to create this directory with the correct permissions.
Test Connection	Checks the configuration parameters specified in this dialog to make sure they are correct.

Name	Description
Cancel	Closes the dialog without adding or modifying DSN parameters.
OK	Adds or modifies the parameters for the DSN.

ODBC DSNs Event Source Configuration Parameters

Open Database Connectivity (ODBC) event sources require Data Source Names (DSNs) so you need to define DSNs with their associate value pairs for ODBC event source configuration.

Access ODBC Configuration Parameters

To access the ODBC Event Source Configuration Parameters:

1. Access the Services view by selecting **Admin > Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the Log Collector **General** tab open.
4. Click the **Event Sources** tab, and select **ODBC/DSNs** from the drop-down menu.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Configure ODBC Data Source Names DSNs configuration parameters.	Configure Data Source Names (DSNs)

Related Topics

ODBC DSN Configuration Parameters

This topic describes the Data Source Names DSNs configuration parameters.

DSN Panel

In the DSNs panel, you can add, delete, or edit DSNs and the DSN name-value pairs for ODBC Event sources.

Feature	Description
	Displays the Add DSN dialog in which you define a DSN and its parameters.
	Deletes the selected DSNs.
	Displays the Edit DSN dialog in which you edit the name-value pairs for the selected DSN.
	Displays the Manage DSN Templates dialog in which you can add or delete DSN name-value pair templates.
	Selects DSNs.
DSN	Name of the DSN that you added.
Parameters	**<name-value for="" p="" pairs="" the=""> </name-value>**

Add or Edit DSN Dialog

In this dialog, you add or modify a file directory for the selected event source.

Feature	Description
DSN Template	Select a predefined DSN value name-value pairs template for the DSN.
DSN Name*	Add the name of the DSN. You cannot edit a DSN name after you add it. This value must correspond with a DSN entry in the ODBC.ini file. Valid value is a character string that is restricted to the following characters: [_a-zA-Z][_a-zA-Z0-9]* This means that the file directory must start with a letter followed by numbers, letters, and underscores (for example, **oracle_executive_compensation**).

Feature	Description
Parameters	Adds a row in which you can define a parameter name-value pair. Deletes the selected parameter name-value pair. Selects parameter name-value pairs. Name - Enter or modify the parameter name. Value - Enter or modify the value associated with the parameter name.
Cancel	Closes the dialog without adding the DSN and its name-value pairs or saving modifications to the name-value pairs.
Save	Adds the DSN and its name-value pairs or saves modifications to the name-value pairs.

Manage DSN Templates Dialog

In this dialog, you can add or delete DSN name-value pair templates.

Feature	Description
	Template Selection Panel
	Opens the Add Template panel in which you can add a DSN name-value pair template.
	Deletes the selected template.
	Selects a template for deletion or modification.
	Add Template Panel
	Adds a value pair row.
	Deletes a value pair row.
	Selects a value pair row.

Feature	Description
Name	Enter the parameter name.
Value	Enter the value associated with the parameter name.
Cancel	Cancels any changes you made in the dialog.
Save	Adds the DSN and its name-value pairs or saves modifications to the name-value pairs.
Close	Closes the dialog without adding the DSN and its name-value pairs or saving modifications to the name-value pairs.

Remote/Local Collectors Configuration Parameters

When you deploy Log Collection, you must configure the Log Collectors to collect the log events from various event sources, and to deliver these events reliably and securely to the Log Decoder host, where the events are parsed and stored for subsequent analysis.

This topic introduces features of the Services Config view > Remote Collectors/Local Collectors tab.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Add or delete Local Collectors	Configure Local and Remote Collectors
Administrator	Add or delete Remote Collectors.	Configure Local and Remote Collectors

Related Topics

- Provision Local Collectors and Remote Collectors
- Configure Local and Remote Collectors

Services Config View

The Services Config view is the view on which you maintain all the Log Collection parameters. The tab in which you maintain the deployment parameters referred to in this guide is the **Remote/Local** Collectors tab:

- If you are configuring a Local Collector , NetWitness Suite displays the **Remote Collectors** tab so that you can configure the Local Collector to pull events from Remote Collectors.

- If you are configuring a Remote Collector , NetWitness Suite displays the **Local Collectors** tab so that you can configure the Remote Collector to push events to a Local Collector .

Remote Collectors Tab

On a Local Collector, the Remote Collectors panel provides a way to add or delete Remote Collectors from which the Local Collector pulls events.

Column	Description
	Displays the **Add Source** dialog in which you select the Remote Collectors from which you want the Local Collector to pull events.
	Deletes the Remote Collector from the Local Collector Remote Collectors panel.
	Displays the **Edit Source** dialog for the selected Remote Collector .
	Selects Remote Collectors.
Name	Names of the Remote Collectors from which the Local Collector currently pulls events.
Address	IP Addresses of the Remote Collectors from which the Local Collector currently pulls events.
Collections	Choose which collection protocols that the Remote Collector pushes to a Local Collector. You can select any combination of protocols. If you do not select a protocol, NetWitness Suite selects all protocols.

Local Collector Tab

On a Remote Collector , the Local Collector panel provides a way to add or delete the Local Collectors to which you want to the Remote Collector to push events.

Select the **Destination** or **Source** in the **Select Configuration** drop-down menu.

- **Destination** displays the **Add Remote Destination** dialog.
- Source displays the **Add Source** dialog.

The following table describes the Add Source dialog.

Column	Description
	Displays the **Add Source** dialog in which you select the Remote Collectors from which you want the Local Collector to pull events.
	Deletes the Remote Collector from theLocal Collector Remote Collectors panel.
	Displays the **Edit Source** dialog for the selected Remote Collector .
	Selects Remote Collectors.
Name	Names of the Remote Collectors from which the Local Collector currently pulls events.
Address	IP Addresses of the Remote Collectors from which the Local Collector currently pulls events.

The following table describes the Local Collectors Panel.

Column	Description
	Displays the **Add Remote Destination** dialog for the Group that you selected. You add destination Local Collectors for this group to which you want the Remote Collector to push events.
	Deletes the destination Log Collector from the group.
	Displays the **Edit Remote Destination** dialog for the selected destination Local Collector .
	Selects a destination Local Collector .
Destination Name	Displays the name of the destination Local Collector .
Address	Displays the IP address of the destination Local Collector .

Column	Description
Collections	Choose which collection protocols that the Local Collector pulls from a Remote Collector. You can select any combination of protocols. If you do not select a protocol, NetWitness Suite selects all protocols.

Log Collection Tabs

This topic describes the tabs available in the Log Collection view.

Access Log Collection View

1. Go to **ADMIN > Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Under Actions, select **View > Config** to display the Log Collection configuration parameter tabs.

   The **Service Config** view is displayed with the Log Collector **General** tab open.
4. Select any of the available tabs to view or update the corresponding parameters.

Available Tabs

Use the Admin > Services view to maintain Log Collection parameters. It has the following tabs:

- **General**: contains high-level parameters that govern the operation of the Log Collector service and each collection protocol. See Log Collection General Tab for details.
- **Remote Collectors**: use this tab to set up remote collectors. See Configure Local and Remote Collectors for details.
- **Files**: provides an interface for editing Log Collector configuration files.
- **Event Sources**: use this tab to configure collection for your event sources. See Log Collection Event Sources Tab for details.
- **Event Destinations**: Use the Event Destinations tab of the Log Collection service Config view to configure the destination of event data collected by the Log Collector. See Log Collection Event Destinations Tab for details.
- **Settings**: contains parameters for Lockbox security setup, and certificate management.

- **Appliance Service Configuration**: contains configuration parameters for the RSA NetWitness Suite Core Appliance service.

Please refer to the **Files** tab and the **Appliance Service Configuration** tab in the *Host and Services Configuration Guide* for information on the configuration parameters on these tabs.

Log Collection General Tab

This topic introduces features of the service Config view > General tab that relate specifically to Log Collector .

To access the Log Collection General tab:

1. Go to **ADMIN> Services** from the NetWitness Suite menu.
2. Select a Log Collection service.
3. Click  under Actions and select **View > Config**.

   The **Service Config** view is displayed with the Log Collector **General** tab open.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

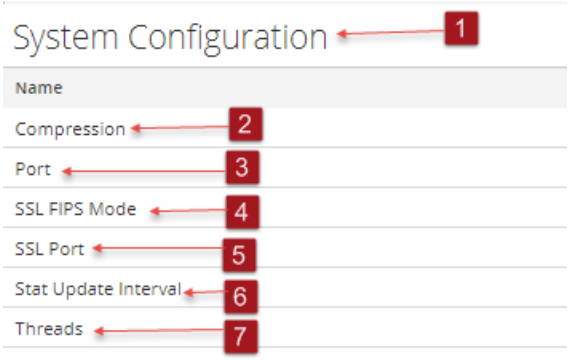
Quick Look

The RSA NetWitness Suite administrator must configure event sources to send logs to the collectors. When event sources are configured they poll event sources, retrieve logs, and send the event data to NetWitness Suite).

System Configuration Panel

The System Configuration panel manages service configuration for a NetWitness Suite service. When a service is first added, default values are in effect. You can edit these values to tune performance. Refer to the **General** tab for a description of these parameters.

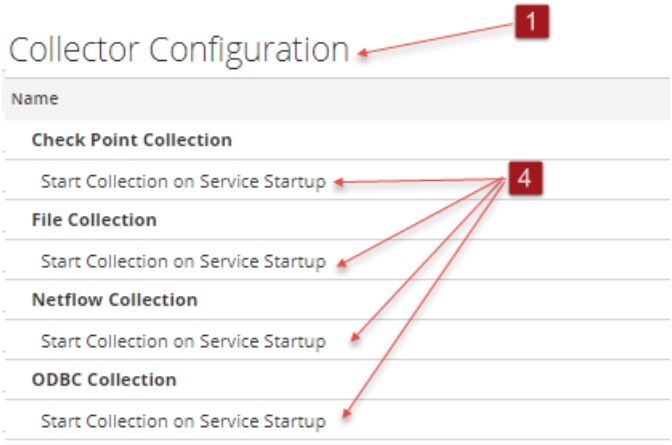


1	System Configuration Panel manages service configuration for a NetWitness Suite service.
2	Compression: The minimum number of bytes that must be transmitted per response before compression. A setting of 0 disables compression. The default value is **0**. A change in value is effective immediately for all subsequent connections.
3	Port: The port on which the service listens. The ports are: • 50001 for Log Collectors

	• 50002 for Log Decoders • 50003 for Brokers • 50004 for Decoders • 50005 for Concentrators • 50007 for other services
4	SSL FIPS Mode: When enabled (**on**), the security of data transmission is managed by encrypting information and providing authentication with SSL certificates. The default value is **off**.
5	SSL Port: The NetWitness Suite Core SSL port on which the service listens. The ports are: • 56001 for Log Collectors • 56002 for Log Decoders • 56003 for Brokers • 56004 for Decoders • 56005 for Concentrators • 56007 for other services
6	Stat Update Interval: The number of milliseconds between statistic updates on the system. Lower numbers cause more frequent updates and can slow down other processes. The default value is **1000**. A change in value is effective immediately.
7	Threads: The number of threads in the thread pool to handle incoming requests. A setting of 0 lets the system decide. The default value is 15. A change takes effect on service restart.

Collector Configuration Panel

The Collector Configuration panel provides a way to enable automatic start of log collection by event source type.



1	Collector Configuration Panel provides a way to enable automatic start of log collection by event source type.
2	Enable All enables the automatic collection for all event types. **Enable All** = start receiving events and collecting logs for all event types when the Log Collector service starts.
3	Disable all disables the automatic collection for all event types. **Disable All** = (default) do not receive event data for all event types until you explicitly start collection.
4	Start Collection on Service Startup enables automatic start, per event source type, of log collection when the Log Collector service starts. Valid values are: • Selected = start collecting logs when the Log Collector service starts. • Not selected = (default) do not collect event data until you explicitly start collection.
5	**Apply**: Click **Apply** to save the changes to the parameter values.

Log Collection Event Destinations Tab

Use the Event Destinations tab of the Log Collection service Config view to configure the destination of event data collected by the Log Collector :

- Log Decoders
- Identity Feed

Prerequisites

You must implement the following configuration to create an identity feed.

- A Log Collector service with an Identity Feed Event Processor
- A Log Collector service with Windows Collection configured and enabled

Note: See the "Create an Identity Feed" topic in the *Live Resource Management Guide* for more information on how to create and investigate on an identity feed.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

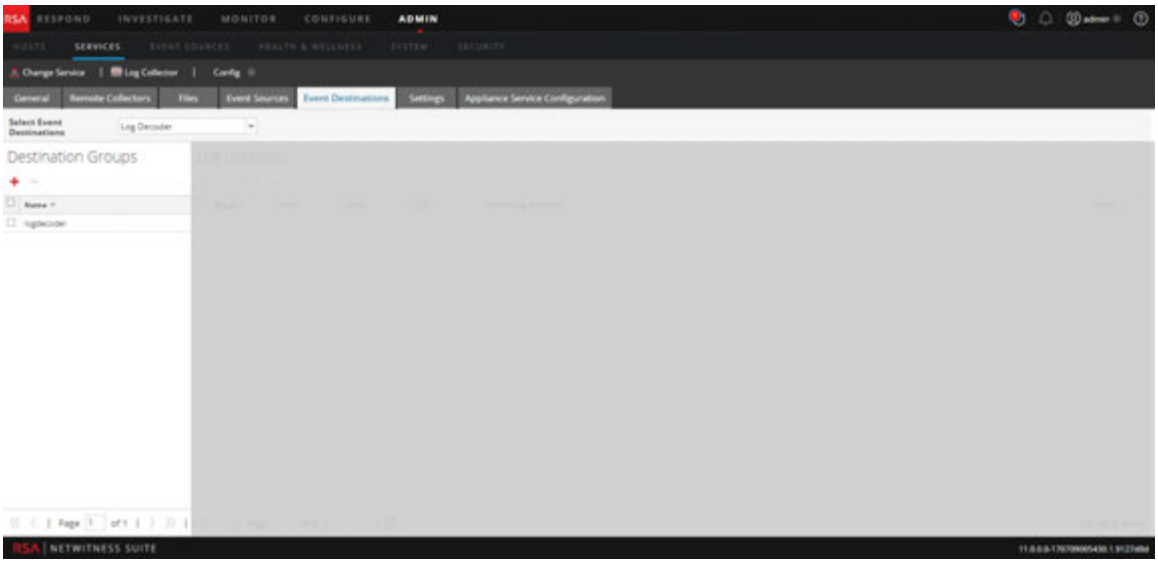
Role	I want to...	Documentation
Administrator	Configure the destination of event data collected by the Log Collector	Refer to the instructions below.

Related Topics

- See the **Create an Identity Feed** topic in the *Live Resource Management Guide*.

Quick Look

The Event Destinations tab of the Log Collection service Config view allows you to configure the destination of event data collected by the Log Collector .



The required permission to access this view is Manage Services.

1. Go to **ADMIN> Services** .
2. Select a Log Collection service.
3. Under Actions, select  **> View > Config** to display the Log Collection configuration parameter tabs.
4. Click the **Event Destinations** tab.
5. In the **Select Event Destinations** drop-down menu:
   - Select **Log Decoder** to configure Log Decoder destinations for event data collected by the Log Collector .

     Note: You must select a Log Decoder service from the Add Log Decoder Destination dialog, but the remainder of the configuration is done automatically.
   - Select **Identity Feed** to configure an identity feed destination for event data collected by the Log CollectorLog Collector .

Log Collection Event Sources Tab

Use the Event Sources tab to configure the AWS (CloudTrail), Check Point, File, ODBC, SDEE, SNMP, Syslog, SNMP, VMware, Windows, and Windows Legacy event sources.

To access the Event Sources tab, go to ADMIN > Services > select Log Collection service > View > Config > Event Sources) .

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Configure AWS (CloudTrail) event sources.	Configure AWS (CloudTrail) Event Sources in NetWitness Suite
Administrator	Configure CheckPoint event sources.	Configure Check Point Event Sources in NetWitness Suite
Administrator	Configure File event sources.	Configure File Event Sources in NetWitness Suite
Administrator	Configure ODBC event sources.	Configure ODBC Event Sources in NetWitness Suite
Administrator	Configure SDEE event sources.	Configure SDEE Event Sources in NetWitness Suite
Administrator	Configure SNMP event sources.	Configure SNMP Event Sources in NetWitness Suite
Administrator	Configure Syslog event sources.	Configure Syslog Event Sources for Remote Collector
Administrator	Configure VMware event sources.	Configure VMware Event Sources in NetWitness Suite

Role	I want to...	Documentation
Administrator	Configure Windows event sources.	Configure Windows Event Sources in NetWitness Suite
Administrator	Configure Windows Legacy event sources.	Windows Legacy and NetApp Collection Configuration

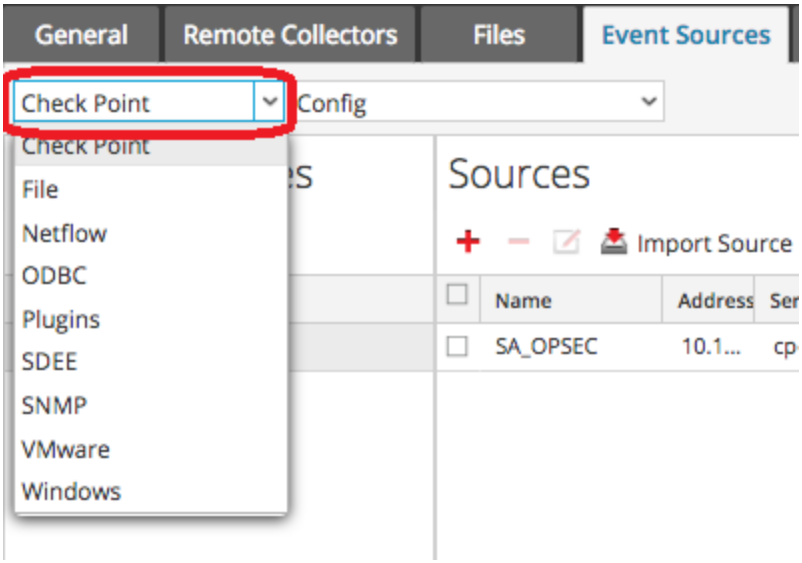
Related Topics

- Configure AWS (CloudTrail) Event Sources in NetWitness Suite
- Configure Check Point Event Sources in NetWitness Suite
- Configure File Event Sources in NetWitness Suite
- Configure ODBC Event Sources in NetWitness Suite
- Configure SDEE Event Sources in NetWitness Suite
- Configure SNMP Event Sources in NetWitness Suite
- Configure Syslog Event Sources for Remote Collector
- Configure VMware Event Sources in NetWitness Suite
- Configure Windows Event Sources in NetWitness Suite
- Windows Legacy and NetApp Collection Configuration

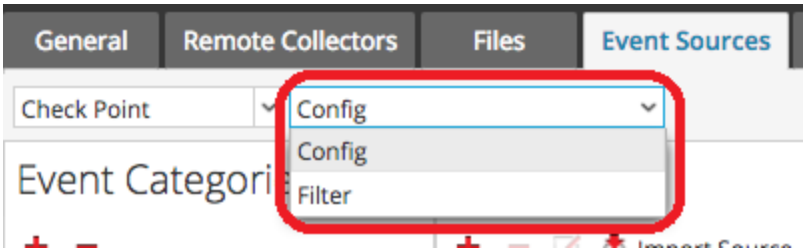
Quick Look

The Config view has two drop-down menus:

- The left-most menu lists all of the available collection protocols.



- The right-most menu has two choices: **Config** and **Filter**.



The Config view in the Event sources tab has two panels: Event Categories and Sources.

Note: For details on the Filter menu item, see Configure Event Filters for a Collector.

Event Source Types Menu

The Log Collector Event Sources tab has a two-box, drop-down menu in which you select the collection protocol and any supporting parameters for that protocol.

In the left box, you select one of the following protocols: Check Point, File, ODBC, Plugins, SDEE, SNMP, SNMP, VMware, Windows, and Windows Legacy.

In the right box, you select:

- Config to configure the generic event source parameters for the type you selected in the left drop-down. All generic Config panels have a toolbar with these options:

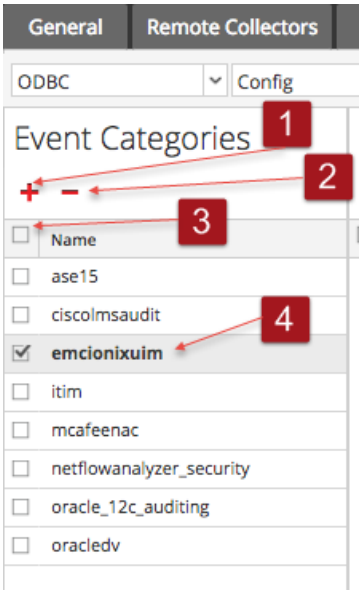
- Add, Edit, and Delete
- Import (also Import Source, Import DSN)
- Export (also Export Source, Export DSN)

- For ODBC, SNMP, and Windows only:
  - For ODBC, DSNs to configure
  - For SNMP, SNMP v3 User Manager
  - For Windows, Kerberos Realm Configuration

Selecting an option displays a configuration panel where you configure the collection parameters for the event source. The configuration panels are slightly different for different event sources and are described separately.

Event Categories Panel

Once you select a collection protocol, the Event Categories panel is populated with all of the event sources that you have configured for that collection protocol. For example, the following image shows ODBC event sources that have been configured:



The Event Categories panel provides a way to add or delete event source types.

1	Displays the Available Event Source Types dialog from which you select the event source type for which you want to define parameters.
2	Deletes the selected event source types from the Event Categories panel.
3	Selects event source types.

4	Displays the name of the event source types that you have added.

Sources Panel

The Sources panel lists the values of the parameters for the selected event source type. For details, see the individual collection protocol topics.

Log Collection SettingsTab

Use the Settings tab to:

- Set up a lockbox
- Reset Stable System value
- Manage certificates

Caution: If the host name on which the Log Collector is installed is changed after installation, the Log Collector will fail to collect events from event sources. You must reset stable system values if the hostname changes.

To access the Log Collection Settings Tab, go to ADMIN > Services. In the Services grid, select a Log Collector Service. Click Actions menu cropped under Actions and select View > Config.

Workflow

This workflow illustrates the basic tasks needed to start collecting events through Log Collection.

What do you want to do?

Role	I want to...	Documentation
Administrator	Set up a lockbox to maintain lockbox settings.	Set Up a Lockbox
Administrator	Add or delete certificates.	Configure Certificates

Troubleshoot Log Collection

This topic describes the format and content of Log Collection Troubleshooting. NetWitness Suite informs you of Log Collector problems or potential problems in the following two ways.

- Log files.
- Health and Wellness Monitoring views.

Log Files

If you have an issue with a particular event source collection protocol, you can review debug logs to investigate this issue. Each event source has a Debug parameter that you can enable (set parameter to On or Verbose) to capture these logs.

Caution: Only enable debugging if you have a problem with this event source and you need to investigate this problem. If you have Debug enabled all the time it will adversely affect the performance of the Log Collector.

Health and Wellness Monitoring

Health and Wellness monitoring makes you aware of potential hardware and software problems in a timely manner so that you can avoid to outages. RSA recommends that you monitor the Log Collector statistical fields to make sure that the service is operating efficiently and is not at or near the maximum values you have configured. You can monitor the following statistics (Stats) described in the **Admin > Health & Wellness** view.

Sample Troubleshooting Format

RSA NetWitness Suite returns the following types of error messages in the log files for.

Log Messages	timestamp failure (LogCollection) Message-Broker Statistics: ... timestamp failure (AMQPClientBaseLogCollection): ... timestamp failure (MessageBrokerLogReceiver): ...
Possible Cause	The Log Collector cannot reach the Message Broker because the Message Broker: • stopped running. • has erroneous connection settings.

Solutions

1. <use the="the" systemctl="systemctl" command="command" on="on" console="console" to="to" check="check" status="status" of="of" message="message" broker="broker" shell="shell" console.="console.">returns the following if the message broker is not running:</use>

   prompt$ systemctl status rabbitmq-server

   rabbitmq start/running, process 10916

2. Start the RabbitMQ Message Broker on event-broker node in the Explore view:

Data Privacy Overview

This topic introduces the concept and implementation considerations for a data privacy officer or administrator who is managing exposure of privacy-sensitive data in RSA NetWitness® Suite. In addition, information about recommended use cases is included.

Note: A data privacy plan touches on most components of NetWitness Suite. The person who configures data privacy needs to understand NetWitness Suite network components, configuration of NetWitness Suite hosts and services as described in the *Host and Services Getting Started Guide*, and the types of information that need to be protected.

Regulatory mandates in some locations, for example the European Union (EU), require that information systems have a means of protecting privacy-sensitive data. Any data that could directly or indirectly identify "Who did what when?" may be considered privacy-sensitive data. A few examples are user names, email addresses, and host names. NetWitness Suite provides a range of controls that customers can leverage to protect privacy-sensitive data. These controls can be used in a variety of combinations to protect privacy-sensitive data, without significantly reducing analytical capability.

A user role for a Data Privacy Officer (DPO) was added in NetWitness Suite 10.5 to support the management of privacy-sensitive data. The DPO can configure NetWitness Suite to limit exposure of meta data and raw content (packets and logs) using a combination of techniques. The methods available to protect data in NetWitness Suite include:

- Data Obfuscation
- Data Retention Enforcement
- Auditing Logging

Data Obfuscation

NetWitness Suite has configurable options for data obfuscation, Data privacy officers and administrators can specify which meta keys in their environment are privacy-sensitive and limit where the meta values and raw data for those keys are displayed in the NetWitness Suite network. In place of the original values, NetWitness Suite can provide obfuscated representations to enable investigation and analytics. In addition, DPOs and administrators can prevent persistence of privacy-sensitive meta values and raw logs or packets.

Three methods work together to implement data obfuscation:

- Obfuscation of meta values for privacy-sensitive meta keys with an optional salt. Meta keys configured as protected are represented by obfuscated values at the time of creation on a Decoder or Log Decoder; the obfuscated values are hashed and considered to be impossible

to read. To implement, you need to configure the Decoder and Log Decoder hash algorithm and salt, and configure privacy-sensitive language keys as protected on all Core services.

- Role-based access (RBAC) to the raw logs or packets and the privacy-sensitive meta values. The DPO can use roles with granular permission capabilities to restrict what an analyst versus a data privacy officer is able to view during configuration, analysis, and investigation. The *System Security and User Management Guide* provides in-depth coverage of RBAC implementation in NetWitness Suite. To implement, you need to configure meta and content visibility per role on individual Brokers, Concentrators, Decoders, Log Decoders, and Archivers.
- Preventing persistence of privacy-sensitive meta values and raw logs or packets. To implement, you need to configure meta keys on parsers for individual Decoders and Log Decoders as transient.

Data Retention Enforcement

NetWitness Suite can ensure that data is retained only as long as necessary or as specified. An administrator can configure data retention using age and time thresholds on a per-service basis. Schedulers running on each service automatically delete data meeting those thresholds. Once the data is deleted, it is no longer available through user interfaces, queries, or application programming interface (API) calls. Some of the NetWitness Suite components also support purging of data through overwrites.

An administrator can manage data retention in several ways:

- Configure how long data persists in storage on the system.
- For Core services, strategically remove privacy-sensitive data that may have been written by configuring automatic removal of data of a specific age.
- Configure NetWitness Suite so that original data is not sent or saved to the other components. If privacy-sensitive data makes its way into another database on the Reporting Engine, Malware Analysis, and NetWitness Servers, data retention can be managed there as well. This configuration for Event Stream Analysis is managed in the Services Explorer view.

Note: If a situation arises where the DPO decides that already collected data is privacy-sensitive after the system is functional, the administrator can manually overwrite the data from databases or files where the data is saved.

Audit Logging

Administrators can leverage audit logs that NetWitness Suite creates using the Global Audit Logging feature. The audit logging feature generates audit log entries about many activities, and the following are examples of log entries that are relevant to data privacy:

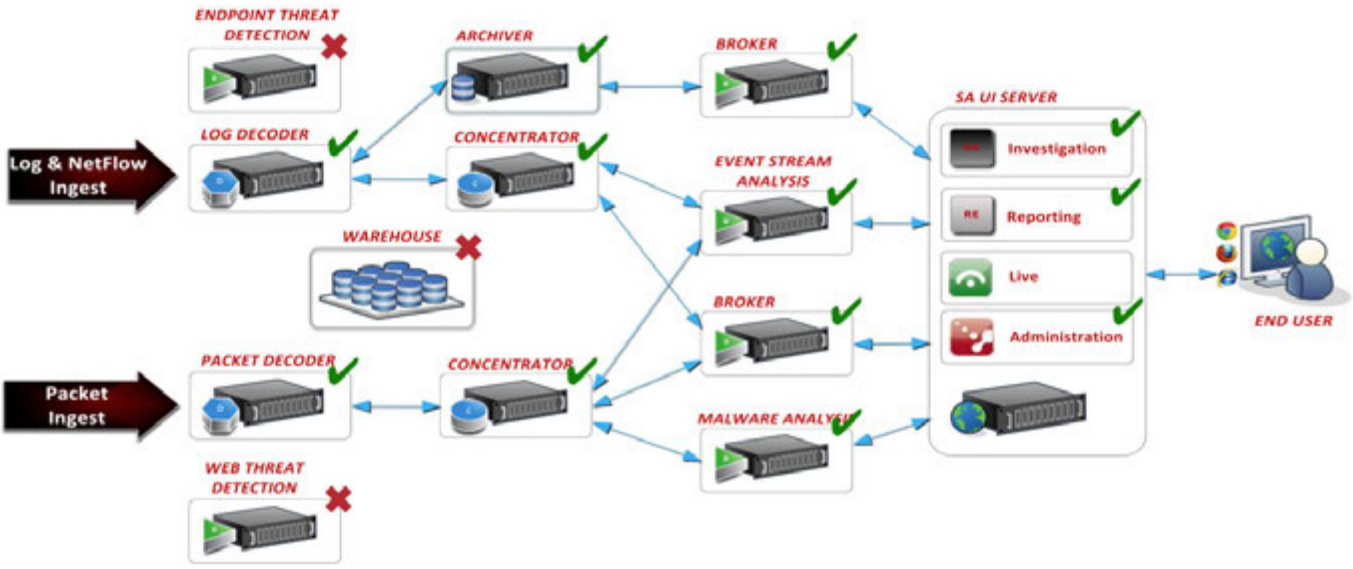
- Modifications to permissions and users assigned to roles.
- Failed and successful attempts to log on to NetWitness Suite and log off.
- Data deletion.
- Data exports and downloads.
- Navigation by users to user interfaces and queries that users performed.
- Attempts (successful or not) to view or modify privacy-sensitive data, including an identification of the user who made the attempts.

All audit log entries are part of a standard audit trail for NetWitness Suite. Administrators can configure NetWitness Suite to forward audit logs to a designated destination, including third-party systems to provide additional filtering and reporting capabilities. For more information on Global Audit Logging, see **Configure Global Audit Logging** in the *System Configuration* guide.

Components Covered by the Data Privacy Feature

The figure below identifies the NetWitness Suite components covered by the 10.5 or later data privacy feature with a green check mark. Components marked with an X are not supported by data privacy functions. The *NetWitness Suite Getting Started Guide* provides a functional description of NetWitness Suite components.

Note: NetWitness Suite data privacy features are not supported for Warehouse and protected meta data can make it to Warehouse via Warehouse Connector, unless explicitly configured to be filtered out using Warehouse Connector Meta Filters. If protected meta data makes it to Warehouse, users having direct access to Warehouse can query such data. Data privacy officers need to prevent that through administrative, technical, and procedural controls outside of NetWitness Suite.



Data Privacy Feature Implementation by Component

The following table identifies which data privacy features are supported for each NetWitness Suite component. For each component, a checkmark indicates if the component supports data obfuscation, data retention enforcement, data overwriting, and audit logging.

Component	Data Obfuscation	Data Retention Enforcement	Data Overwriting	Audit Logging
Ingestion				
Decoder	✓	✓	✓	✓
Log Decoder	✓	✓	✓	✓
Meta Aggregation				
Concentrator	✓	✓	✓	✓
Broker	n/a	✓ (stored in DPO cache only)[1]		✓
Real-Time Analysis				

Component	Data Obfuscation	Data Retention Enforcement	Data Overwriting	Audit Logging
Investigation	✓	✓ (stored in DPO cache only)[2]		✓
Event Stream Analysis	✓			✓
Malware Analysis	✓	✓		✓
Respond	✓	✓		✓
Reporting				
Reporting Engine	✓	✓		✓
Long-Term Analytics				
Archiver	✓	✓	✓ (uncompressed)[3]	✓
Warehouse				

Notes:
1 - Brokers can cache data and this needs to be cleared by configuring an independent rollover and other removal of cache as required. The administrator can configure cache rollover for a Broker using the Scheduler in the Services Config view Files tab.
2 - Investigation and the NetWitness Server cache data, and this is cleared automatically every 24 hours.
3 - The overwriting procedure described in Configure Data Retention applies to uncompressed data.

Component-Specific Configuration Guidelines

NetWitness Suite components and modules that obtain access to privacy-sensitive meta data and their obfuscated counterparts are Investigation, Event Stream Analysis (ESA), Malware Analysis, Respond, and Reports. They get access to data based on the permissions defined for the role to which the user belongs. The Administrator or DPO configures each Decoder or Log Decoder to identify meta keys that are flagged for obfuscation.

These components have additional guidelines to ensure that they function as expected with a data privacy scheme:

- **Event Stream Analysis**. When ESA receives privacy-sensitive data from NetWitness Suite core, ESA passes on only the obfuscated version of the data. ESA does not store or show protected data. There are some additional guidelines for configuring advanced EPL rules and enrichment sources (described in the **Sensitive Data** topic in the *Alerting Using ESA* guide). Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.
- **Malware Analysis**. Malware Analysis references certain meta keys during scoring, including `alias.host`, `client`, and others. To ensure no loss of analytical functionality Malware Analysis should be configured as a trusted client; that is, configured to connect to the NetWitness Suite Core infrastructure with an account equivalent to a user in DPO role. Otherwise, if meta keys referenced by Malware Analysis do get tagged for obfuscation and are not accessible to Malware Analysis, some of the Indicators of Compromise (IOCs) may be rendered ineffective.
- **Respond Server service.** The Respond Server service uses a data privacy mapping file to display obfuscated data in alerts.(see the **Obfuscate Private Data** topic in the *Respond User* guide) and has a configurable data retention period for alerts (see the **Set a Retention Period for Alerts and Incidents** topic in the *Respond User* guide). Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.
- **Reports.** In Reporting Engine, each Core service is added as two separate data sources, using the two separate service accounts; one data source has a service account representing the Data Privacy Officer role and the other data source has a service account representing a non-Data Privacy Officer role. The **Configure Data Privacy for Reporting Engine** topic in the *Reporting Engine Configuration Guide* provides procedures to configure data privacy for Reporting Engine. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

Recommended Configurations

This topic describes the recommended data privacy implementation for NetWitness Suite and several additional use cases for managing exposure of privacy-sensitive data in NetWitness Suite. Administrators can set up the NetWitness Suite hosts and services to meet data privacy requirements for their environment. RSA has recommended configurations for both data privacy and data retention.

Recommended Data Privacy Configuration

The recommended configuration to obtain the best analytical value with data obfuscation enabled is to define privacy-sensitive meta data and keep both original and obfuscated (hash) values of privacy-sensitive data on disk for Decoders, Log Decoders, Concentrators, and Brokers.

The assumption is that only a handful of meta data (approximately 10 meta keys) will be classified as protected and a FIPS 140-compliant algorithm for hashing will be used along with a salt to make reverse engineering the original value difficult. The recommended solution is SHA-256 with a salt of length at least 16 characters and up to 60 characters.

Note: By default, hash values are stored in binary format for faster response times and because it requires less storage space in the database when compared to saving them in string format. The recommended storage method is text/string.

Brokers and Investigation may have original and obfuscated data in cache due to data privacy officers using Investigation to confirm the original value to which the obfuscated value maps during investigations. Downstream services can also limit the use of the original sensitive values to in-memory processing so that data does not persist on disk in those downstream systems; this holds true for ESA and Malware Analysis.

The recommended solution to delete data when ready is the built-in and automatic data retention enforcement, which deletes data at a certain threshold. You can use this method for the following components in NetWitness Suite 10.5: Decoder, Log Decoder, Log Collector, Archiver, Malware Analysis, Incident Management, and Reporting Engine. You can manually configure Event Stream Analysis to support similar automatic data retention enforcement.

To manage cache storage, the NetWitness Server clears cache related to investigations of events every 24 hours. The Broker can also be configured to execute a periodic removal of locally stored cache.

Options for Data Retention Configurations

NetWitness Suite provides alternative controls that the administrator can apply to enforce stronger restrictions on privacy-sensitive data storage when data obfuscation is enabled.

Data Storage With Data Retention Options in Effect

The following table summarizes where data is stored in the default configuration with no data privacy as well as for each data retention alternative. A checkmark indicates that privacy-sensitive data is saved on the component; an X indicates that no privacy-sensitive data is stored on the component.

Component	Default Configuration	Data Storage Options		
	Original Data Stored	Original Data and Hash Stored (recommended)	Only Hash Stored	No Data Stored (all meta data is transient)
Ingestion				
Decode	✓	✓	X	X
Log Decoder	✓	✓	X	X
Meta Aggregation				
Concentrator	✓	✓	X	X
Broker	✓ (Cache only)	✓ (Cache only)	X	X
Real-Time Analysis				
Investigation	✓	✓ (Cache only)	X	X
Event Stream Analysis	✓	X	X	X
Malware Analysis	✓	X	X	X
Respond Server service	✓	X	X	X

Component	Default Configuration	Data Storage Options		
	Original Data Stored	Original Data and Hash Stored (recommended)	Only Hash Stored	No Data Stored (all meta data is transient)
Reporting				
Reporting Engine	✓	✓ (Optional)	X	X
Long-Term Analytics				
Archiver	✓ (Optional)	✓ (Optional)	X	X
Warehouse	✓ (Optional)	✓ (Optional)	X	X
Content				
Live	n/a	n/a	n/a	n/a
Fraud Analysis				
RSA Fraud and Risk Intelligence Suite	n/a	n/a	n/a	n/a
End Point Protection				
NetWitness Endpoint	n/a	n/a	n/a	n/a

Component	Default Configuration	Data Storage Options		
	Original Data Stored	Original Data and Hash Stored (recommended)	Only Hash Stored	No Data Stored (all meta data is transient)

Notes:

Cache Only means that sensitive data is in the Broker or NetWitness Server cache. Configure Data Retention provides details about automated and manual clearing of cache.

Optional means that sensitive data storage does occur, but can be limited by optional configurations. For example, to limit where sensitive data is stored, do not enable DPO access for Reporting and do not aggregate original protected data into the Archiver.

Option 1: No Original Data Saved to Disk, Only Hash Stored

Administrators can eliminate the persistence of sensitive data to disk and store only an obfuscated value if the risk of exposure is too great. In this scenario, meta data generated during parsing on the Decoders and Log Decoders is used only in memory and not written to disk. Administrators can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that sensitive meta data is not written to disk. Downstream services do not see original values and must use obfuscated values to conduct investigation and analytics.

To configure this data privacy scheme, data obfuscation must be enabled with hash values configured. You can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that original values are not written to disk.

- Original values identified as sensitive are extracted from the raw data during parsing on the Decoder and Log Decoder and are accessible to the system during parsing (parsers, rules, feeds).
- The Decoder does not save the original values for meta keys identified as sensitive, storing only the hash of original values along with other non-sensitive meta data related to the event.

A side effect of these options is some loss in analytical capability, but you can configure these to suit the needs of your environment.

- By configuring all sensitive data as Transient, sensitive values are not persisted to disk, and the analytic capabilities using the original value are available at parse time only (parsers, rules, feeds).
- Event stream analysis (ESA) and malware analysis systems must rely only on the obfuscated meta values when doing their correlation and scoring respectively.
- Reporting Engine is limited to pulling reports using the non-sensitive and obfuscated values.
- The data privacy officer cannot view the original value, but can use the configured hash and salt to determine if an obfuscated value represents a specific known original value.

Option 2: No Original or Obfuscated Values Stored: not recommended

Administrators can eliminate the persistence of the original value to disk entirely if the risk of exposure is too great. As in Option 1, in this scenario, meta data generated during parsing on the Decoders and Log Decoders is used only in memory and not written to disk. Administrators can configure individual meta keys on a Decoder or Log Decoder as transient to ensure that sensitive meta data is not written to disk. Downstream services do not see original values and have no obfuscated values to conduct investigation and analytics.

To configure this data privacy scheme, configure individual meta keys on a Decoder or Log Decoder as transient to ensure that original values are not written to disk.

- Original values identified as sensitive are extracted from the raw data during parsing on the Decoder and Log Decoder and are accessible to the system during parsing (parsers, rules, feeds).
- The Decoder does not save not save the original values for meta keys identified as sensitive, storing only non-sensitive meta data related to the event.

A side effect of these options is significant loss in analytical capability, but you can configure these to suit the needs of your environment.

- By configuring all sensitive data as Transient, sensitive values are not persisted to disk, and the analytic capabilities using the original value are available at parse time only (parsers, rules, feeds). See Configure Data Retention.
- All downstream components have no visibility in the original values, obfuscated or otherwise.
- The data privacy officer has no visibility into the original value obfuscated or otherwise.

Optional Data Overwriting Options

Several options for overwriting data are available, and you should thoroughly understand each one before implementing data overwriting.

Option 1: Limit Disk Space for Continuous Overwriting of Older Data

If the desired data retention period to store the data, and therefore the amount of storage required for that data, is known the size of the underlying hardware or the partition can be limited to that size. By reducing the hard drive storage or the partition size, the amount of free space available that has to be filled before new data overwrites it would also be limited. The newly ingested data continually overwrites the older data. Either solution must be done at deployment time to be effective.

Side effects of this option are:

- The removal of some disks will limit the number of resources available to distribute the I/O, causing some degradation in performance.
- The smaller partition size may cause some degradation in performance, but would alleviate some of the performance impact of removing disks.

Option 2: Use Tiered Storage to Overwrite Data on a Scheduled Basis

If overwriting of data is required on a scheduled automatic basis, you can configure the Decoders and Concentrators to use tiered storage. The tiered storage configuration provides a mechanism for invoking a script after a database file has been removed from the application but prior to its removal from the file system. If necessary, instead of moving the file to the second tier, or cold storage, (the intended function in a tiered storage use case), the script can use a utility like the CentOS `shred` utility to overwrite the file. This tool is less effective when the database is stored in a journaling file system like XFS, in which the Core database resides, and on a RAID logical drive like the ones with which the Core hosts connect.

Most other NetWitness Suite components do not have this option; their data is stored in a database that does not support the tiered storage mechanism. The only other component that could use this overwrite method is the Reporting Engine since it saves reports and alerts as individual files. However, the Reporting Engine charts are stored in a database so they would be immune to this technique.

Option 3: Purge Data Using String and Pattern Redaction Option

Data purging provides a mechanism to strategically overwrite a specific subset of data from the system in case any sensitive data has been persisted either on purpose or by accident. The NetWitness Suite `wipe` utility allows for unique patterns to be written over the data in the meta and packet databases for Core services, which may contain RAW packets or logs for existing sessions, based on a session identifier. All Core components have the capability to overwrite a subset of data that has been found by executing a query string, including regex patterns. The session identifiers resulting from the query are fed into the NetWitness Suite wipe utility.

Note: This option is not available if the data in the Core database has been compressed (as typically done in Archiver deployments).

In most NetWitness Suite components the database in use does not provide a built-in redaction or secure deletion mechanism. The Malware Analysis component can overwrite the data object in the database with the value `private` instead of deleting it during the data retention management process, but this is not meant to be a secure deletion mechanism.

Caution: Using this method on a large number of sessions has two drawbacks: it can be time-consuming and impact performance.

Limitations to Data Overwriting

There are limitations to the overwriting techniques described as Option 2 and 3. To perform the overwrite of the data in the disk sectors, the above options for overwriting and the overwrite command line tool provided as an alternative method (`shred`, a function of CentOS) make assumptions about the disk layout. NetWitness Suite hosts use SSD drives and RAID configurations for performance and reliability reasons, and these inhibit the functionality of the overwrite techniques. If overwrite techniques alter SSD drives and RAID configurations in an attempt to increase security, there will inevitably be an associated performance cost reflected in ingest rates, query speeds, and potentially other areas. The command line tools available for overwrite are recommended only for special use cases when it is necessary to redact specific data. The tools are not for use in a real-time continuous method because of the potential performance cost that will be incurred.

Quick Start Procedures

This section provides end-to-end instructions for preparing to configure data privacy features, then completing the configuration of the recommended data privacy solution.

- Prepare to Configure Data Privacy
- Configure the Recommended Data Privacy Solution

Prepare to Configure Data Privacy

This topic provides general guidelines for planning and configuring data privacy policies in the NetWitness Suite network. Before beginning configuration, you must understand the data that needs to be protected on your network and develop a plan. You will need to:

1. Identify the meta keys that hold privacy-sensitive data and need to be protected. This decision is based on requirements specific to your site.
2. Decide which users need access to privacy-sensitive meta data and raw content. The first decision is whether to separate the DPO and administrator roles for your site by configuring a custom administrators system role on Decoder and Log Decoders and removing the `dpo.manage` permission. By default, administrators have all permissions including the ability to configure the salted hash transform used to obfuscate data; some sites may want to reserve this access for data privacy officers. The **Service User Roles and Permissions** in the *Hosts and Services Getting Started Guide* has more details on exactly what permissions each role has and the purpose of the permissions.
3. Plan the configuration changes you need to make in your NetWitness Suite deployment to support adequate data privacy.
4. Assess how your configuration may impact out-of-the-box and custom content. For example, by default content available via Live for Reporting Engine is not geared toward obfuscated meta values.

In a single deployment, certain data-privacy configurations in the Core services must be the same. The following table lists these settings and uses a checkmark to identify the services for which the configuration must be the same.

	Configure the Same For:				
Data-Privacy Setting	**Decoder**	**Log Decoder**	**Archiver**	**Concentrator**	**Broker**
Hash algorithm and salt for privacy-sensitive data	✓	✓			

	Configure the Same For:				
Data-Privacy Setting	**Decoder**	**Log Decoder**	**Archiver**	**Concentrator**	**Broker**
Language key data privacy attributes in the custom index file (includes configuring keys as protected)	✓	✓	✓	✓	✓
Transient meta keys (not persisted on disk) per service and parser	✓	✓			
Meta data and raw content visibility per system user group. (The meta keys must exist in the custom index file.)	✓	✓	✓	✓	✓
User who has the `Aggregation` service user role assigned is added.*	✓	✓	✓		

	Configure the Same For:				
Data-Privacy Setting	**Decoder**	**Log Decoder**	**Archiver**	**Concentrator**	**Broker**

* When trying to access data on an aggregate service, the Log Collector or Broker requests authentication. When prompted to enter user name and password, you must authenticate as a user who is assigned the `Aggregation` service role. The **Aggregation Role** topic in the *Hosts and Services Getting Started Guide* provides detailed information about this role. Follow the instructions in the **Add, Replicate or Delete a Service User** topic in the *Hosts and Services Getting Started Guide* to create a user and assign the new user the Aggregation service user role.

Configure the Recommended Data Privacy Solution

This topic tells administrators and data privacy officers how to configure the recommended data privacy solution in a NetWitness Suite network. These are the basic steps to follow to configure the NetWitness Suite system to identify sensitive data and determine who can see the sensitive data. The recommended configuration generates obfuscated values of certain original meta keys and then persists both the original and obfuscated data so that it is available to users assigned privileged role access.

This configuration has several parts:

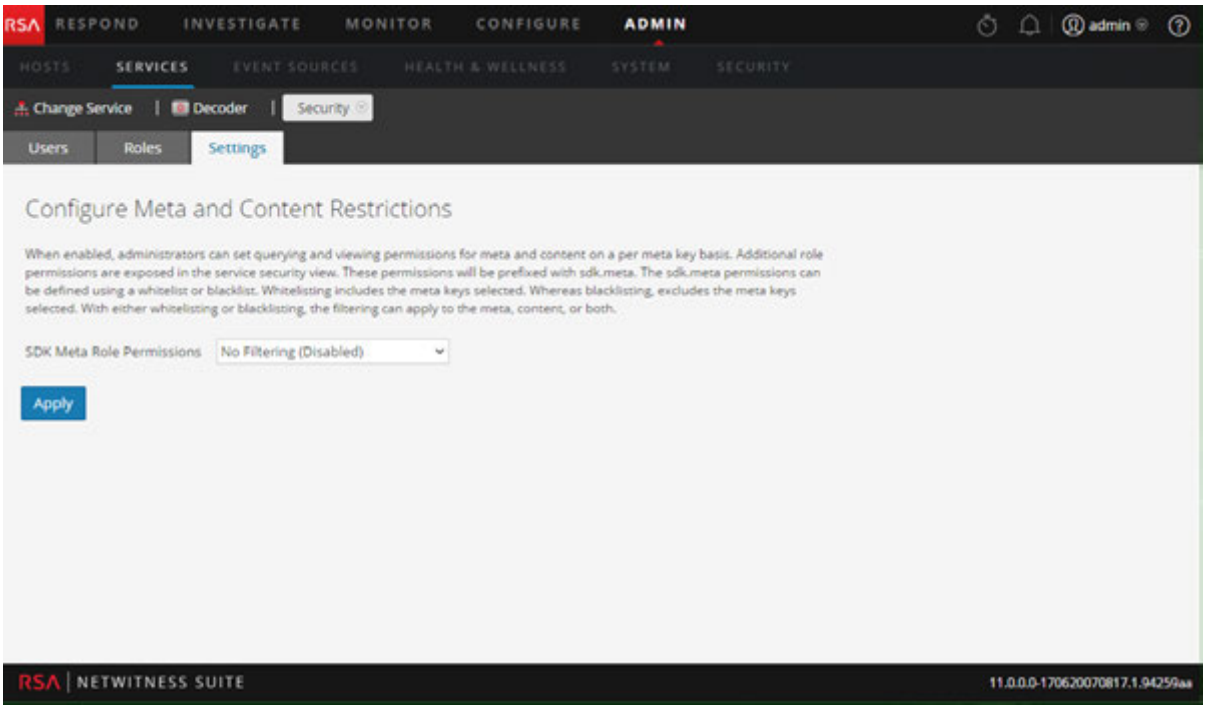
1. Create two users with different levels of permissions. One user (the data privacy officer) can view all meta data and another user (an analyst) is restricted from seeing certain meta data and content with associated meta data.
2. Set up two transforms using a salt and hash to create an obfuscated version of original `username` and `ip.src` meta keys.
3. Configure data retention on the Decoder and Concentrator services.

Note: The following conditions are required in order to complete this procedure:
-The Concentrator and Decoder must be added to the NetWitness Server using trusted connections.
-The NW Server version must be 10.5 or later.
-The Core services must be 10.5 or later.
-Aggregation must use Aggregators accounts on all Core services.

Configure Meta and Content Restrictions on Brokers, Concentrators, and Decoders

To restrict the meta and raw content that users can view, you must enable SDK system roles to allow more granular controls by configuring meta and content restrictions on each service in the Services Security view.

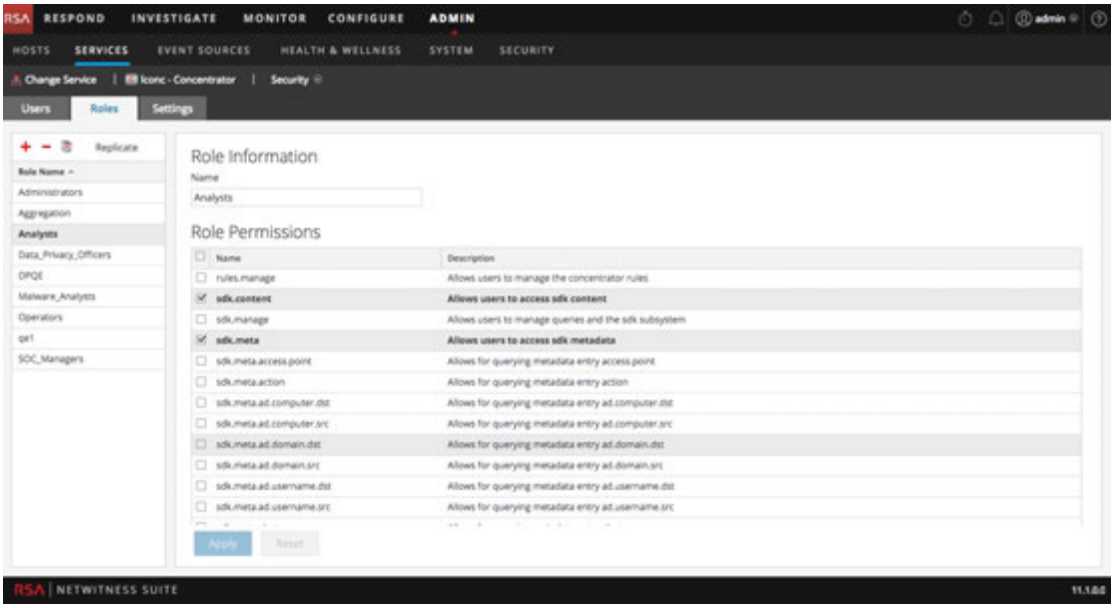
1. In the **Admin Services** view, select a service and then click  **> View > Security**.
2. Click the **Settings** tab.



3. In the **SDK Meta Role Permissions** field, select **Blacklist meta and content**. Click **Apply**.

   This allows the administrator to blacklist individual meta keys so that only the data privacy officer can see the meta keys and content. New roles per meta key are added to the Roles tab.

4. Click the **Roles** tab and select a role, for example **Analysts**.



5. In the **Roles** tab,

   a. Select the meta keys that you do not want analysts to see, for example, select `sdk.meta.username` and `sdk.meta.ip.src`.
   This restricts the analyst from seeing the privacy-sensitive meta keys `username` and `ip.src` as well as any content for any session that contains that meta within it.

   b. Ensure that `sdk.packets` is selected.
   If it is de-selected, analysts lose the ability to bulk export raw packets and logs. In RSA Security Analytics 10.6, Role-Based Access Control (RBAC) for the `/sdk packets` command was either on or off, per user. Restricted users usually had access removed, so pcap generation from Investigate was not allowed even for sessions that did not have restrictions. In RSA NetWitness Suite 11.0 and above, RBAC just works for packets. Sessions that are restricted will just be skipped during pcap generation in Investigate. Sessions that are allowed will have packets returned. For more information on RBAC, see the *System Security and User Management Guide*.

   c. Click **Apply**.

6. In the Roles tab, ensure that the `Data_Privacy_Officers` role has no sdk.meta.values selected. Click **Apply**.

   A DPO can view any meta and any session.

   In the Roles tab, ensure that the `Aggregation` role has the following permissions: select `aggregate`, `sdk.content`, `sdk.meta`, and `sdk.packets`.

Add Data Privacy Officer and Analyst Accounts on the NetWitness Server

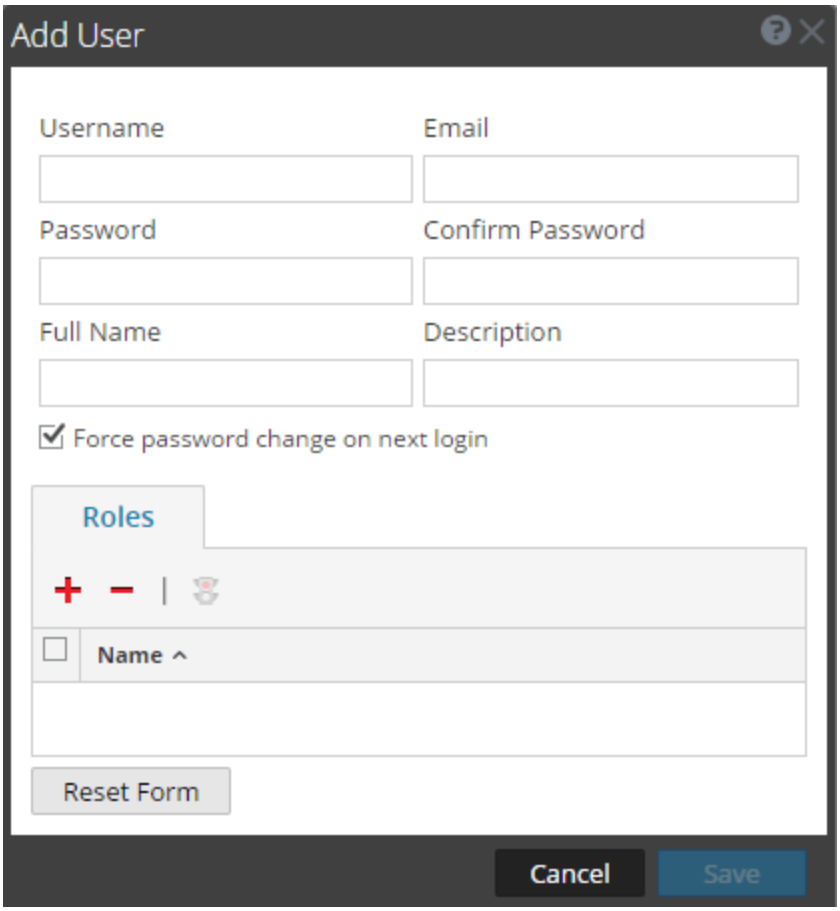
You must add two new user accounts in NetWitness Suite at the system level to depict a privileged data privacy officer and a typical analyst. If the environment is configured using the default trusted connections, you do not need to create the new user accounts on the Core services (Brokers, Concentrators, and Decoders). When a user is created in the NetWitness Server, that user can log on to the services.

Note: The role name is required to exist on both the server and the services, and the role name must be identical. If you create a new custom role on the NetWitness Server, make sure to add it to all Core services as well.

1. Create a new user account for the data privacy officer:

   a. In the **Services Security** view, select the **Users** tab. In the **Users** tab toolbar, click  .

   The Add User dialog is displayed.



b. Create the new account with the following credentials.

   Username = <new user name for logon, for example, DPOadmin>
   Email = <new user's email, for example, DPOadmin@rsa.com>
   Password = <new user's password for logging on, for example, RSAprivacy1!@>
   Full Name = <new user's full name, for example, DPO Administrator>

c. Click the Roles tab, +, and select the `Data_Privacy_Officers` role for the new user.

d. Select **Save**.

2. Create a new user account for the analyst with limited privileges:

   a. In the **Services Security** view, select the **Users** tab. In the **Users** tab toolbar, click +.

      The Add User dialog is displayed.

   b. Create the new account with the following credentials:

      Username = <new user name for logon, for example, NonprivAnalyst>
      Email = <new user's email, for example, NonprivAnalyst@rsa.com>
      Password = <new user's password for logging on, for example, RSAprivacy2!@>
      Full Name = <new user's full name, for example, Nonprivileged Analyst>

c. Click the Roles tab, +, and select the `Analysts` role for the new user.

d. Select **Save**.

Configure Obfuscated Data on Decoders and Concentrators

This procedure creates the obfuscated values to provide to users who do not have access to the original values.

1. Configure a salt so that the obfuscated value becomes unique. Different companies may have analysts of the same first name and potentially the same login username, and using a salt limits the possibility of someone outside your organization determining your obfuscation mechanism. In this example, you use a simple salt and SHA-256, but the salt is configurable and the hash algorithm can be changed. For additional information, see Configure Data Obfuscation.

   a. To define the salt and hash algorithm, select the **ADMIN > Services** view.

   b. Select a **Decoder** in the **Admin Services** view and click  > **View > Config**.

   c. Click the **Data Privacy** tab, and select hash algorithm (SHA-256). In the Salt field, type a hash, for example, **rsasecurity** and click **Apply**.

2. Define the transforms, including the hash format, between the original meta key and obfuscated meta key on the Decoder. The default hash format is binary, but the recommended configuration calls for using the text/string format.

   a. Click the **Files** tab, and in the drop-down menu select **index-decoder-custom.xml.** (You can apply this same configuration to the Log Decoder in the index-logdecoder-custom.xml file.)

   b. Enter the following lines in the available input area:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexNone" defaultAction="Auto">
<key name="username" description="Username" format="Text"
protected="true"><transform
destination="username.hash"/></key>
<key name="username.hash" description="Username Hash"
format="Text"/>
<key name="ip.src" description="Source IP Address"
format="IPv4" protected="true"><transform
destination="ip.src.hash"/></key>
<key name="ip.src.hash" description="Source IP Address
Hash" format="Text"/>
</language>
```

c. To restart the Decoder service, in the toolbar, select **System** in the **View** drop-down menu (currently labeled Config). In the Services System view, select **Shutdown Service**. The service should automatically restart.

3. Define the meta keys on the Concentrator in the index-concentrator-custom.xml file:

a. Click the **Files** tab, and in the drop-down menu select **index-concentrator-custom.xml**

b. Enter the following lines in the available input area:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexValues" defaultAction="Auto">
<key name="username" description="Username" format="Text"
level="IndexValues" protected="true"/>
<key name="username.hash" description="Username Hash"
format="Text" level="IndexValues" token="true"/>
<key name="ip.src" description="Source IP Address"
format="IPv4" level="IndexValues" protected="true"/>
<key name="ip.src.hash" description="Source IP Address
Hash" format="Text" level="IndexValues" token="true"/>
</language>
```

c. To restart the Concentrator service, in the toolbar, select **System** in the **View** drop-down menu (currently labeled Config). In the Services System view, select **Shutdown Service**. The service should automatically restart.

Configure Data Retention on Concentrators and Decoders

Data retention configuration ensures that the data residing in the NetWitness Suite Core components is deleted after a certain time. Configuring data retention on Concentrators and Decoders is not required for all environments, but it may be necessary to be in compliance with applicable laws and regulations. It is important to evaluate an appropriate retention period for your environment. The Data Retention Scheduler settings that you set apply to ALL data on a Concentrator or Decoder.

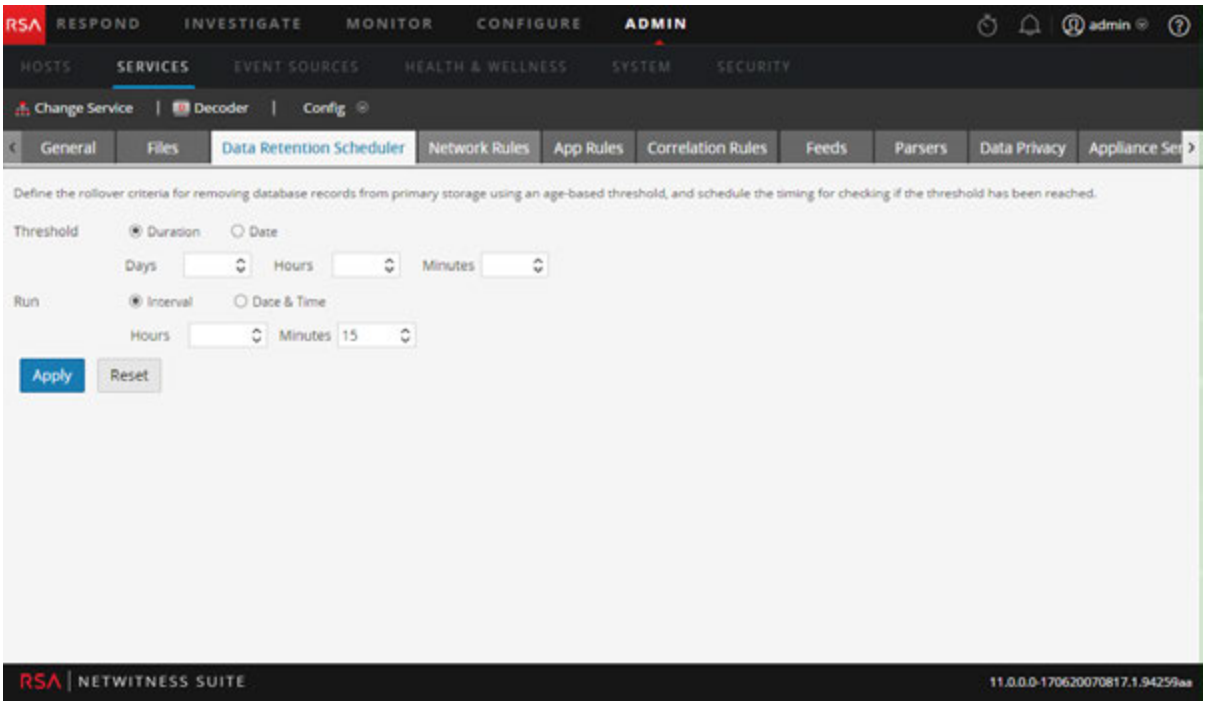
In the following example, NetWitness Suite is configured to execute a check every 15 minutes to determine if the duration threshold has been met. If the threshold is met, NetWitness Suite deletes data older than 90 days in the relevant databases.

Caution: The 90 day retention period is just an example. Adjust your rollover criteria depending on the location of the data and the applicable laws. In a strict data privacy environment, such as in Europe where laws require that Personally Identifiable Information (PII) not be saved or removed frequently, you may need to adjust the time.

This procedure is optional. If you do not set a time retention limit, the system automatically deletes the oldest data when the hard drive space is full.

(Optional) For each Concentrator and Decoder:

1. Navigate to the **Services Config** view > **Data Retention Scheduler** tab.



2. Define the data retention period. For example, set the **Threshold** to **Duration**, and in the **Days** field, type **90**.
3. Define how often the scheduler checks to see if the threshold has been met. For example, set the runtime to **Interval** and in the **Minutes** field, select **15**.
4. To save the configuration, click **Apply**.

Validate Data Privacy Protection

At this point, users have been added with roles that have permissions around specific types of meta data. The next step is to make sure the restricted user (the analyst) cannot view what the unrestricted user (the DPO) can. Also you need to ensure that the data retention configuration is limiting how long data is kept on the systems.

1. View role-based obfuscation in action:
   a. Log on as the unrestricted user (DPOadmin) and make sure this user can see all the data including the protected sensitive data `username` and `ip.src` along with any session that contains that meta.
   b. Log off and the back on as the DPO user.

c. For each Decoder and Log Decoder, import a PCAP or logfile into the Services System view. Use the **Upload Packet File** option to upload a PCAP file that contains `username` and `ip.src` meta data.

d. When the import is complete, look at the meta data in the **Investigation > Navigate** view, choosing the Concentrator connected to the Decoder to which the data was just imported.

e. Scroll down to make sure the `username` and `ip.src` meta keys and corresponding values are visible.

f. Click one of the green numbers next to a `username` or `ip.src` value and verify that the session loads in the Events view.

g. Make a note of the session ID to check when logging on as the restricted user.

h. Log off and log on as the restricted user (NonprivAnalyst).

i. Repeat steps c through f to verify that the user cannot see any `username` or `ip.src` meta or sessions with that meta including the one previously mentioned.

j. To jump to a specific session navigate to the **Investigation > Navigate** view. in the **Actions** menu, select **Go to Event** and enter the session ID.

2. Validate that the data retained in the database falls within the retention time configured in the Data Retention Scheduler.

a. Log off and log on as the unrestricted user (DPOadmin).

b. On the Concentrator, navigate to the **Services > Explore** view.

c. In the node tree, select the **database** node and then **stats**.

d. Observe the `meta.oldest.file.time` value and verify that this is not older then the threshold put on the data retention scheduler.

e. Change the service to the Decoder and repeat steps b through d, check for `stats meta.oldest.file.time` and `packet.oldest.file.time`.

In-Depth Procedures

This topic is a collection of procedures that a Data Privacy Officer uses to implement a data privacy plan for the NetWitness Suite network. These procedures are part of an overall configuration, and are performed as needed to implement the data privacy plan and manage the flow of information in the network.

- Configure Data Obfuscation
- Configure Data Retention
- Configure User Accounts for Use in Data Privacy

Configure Data Obfuscation

This topic provides the procedures for configuring data obfuscation in NetWitness Suite. In a single deployment, all Core service configurations for a data privacy solution must be the same; be sure to use the same hash and salt across all Decoders and Log Decoders.

Note: In order for data obfuscation to work, user accounts need to be configured as described in Configure User Accounts for Use in Data Privacy.

Configure the Decoder Hash Algorithm and Salt

Value hashing accomplished as part of the data privacy solution occurs at the time of meta key creation on the Decoder and Log Decoder. Both services have default settings for use with all meta keys whose values are transformed without a specified hash algorithm type or salt value. The initial NetWitness Suite values for defaults are: hash algorithm (SHA-256) and salt (none).

Note: NetWitness Suite 10.4 and below supports the use of the SHA-1 hash algorithm for backwards compatibility. RSA does not recommend the use of the SHA-1 algorithm and it is not available in NetWitness Suite 10.5 and above.

If you want to change the default settings, you can edit them in the Services Config view > Data Privacy tab or in the following nodes in the NetWitness Suite Services Explorer view:

- `/decoder/parsers/transforms/default.type`

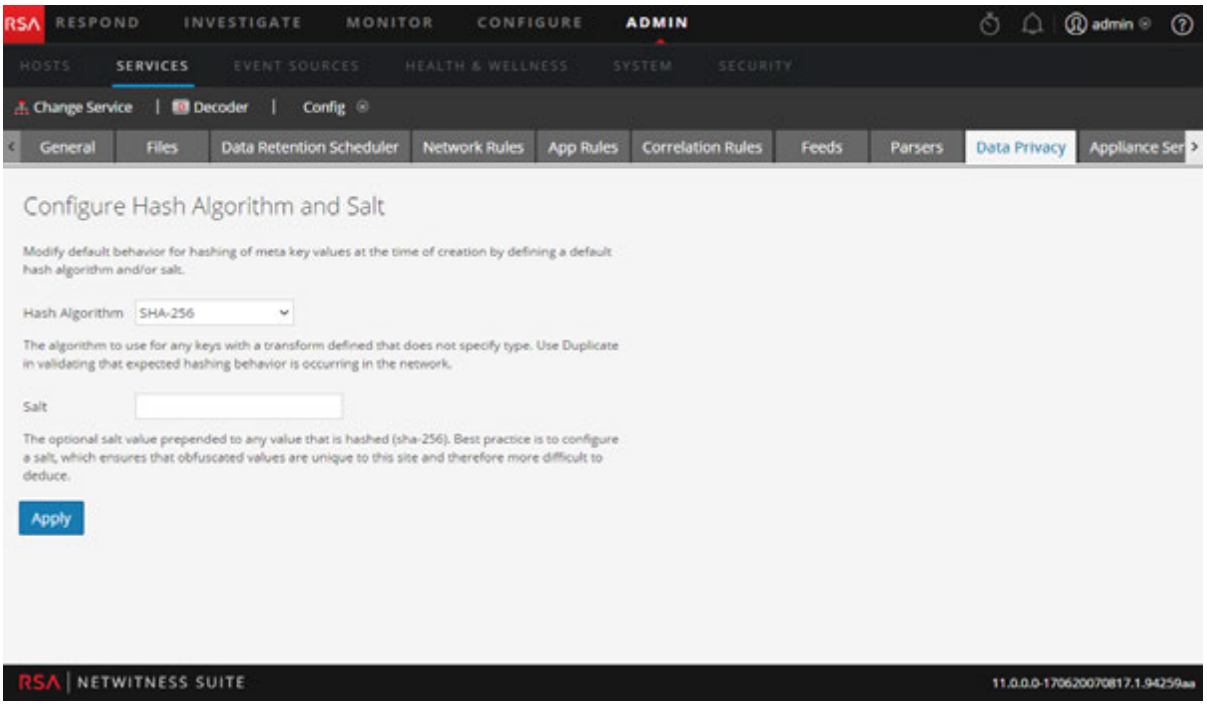
  The algorithm to use for any keys with a transform defined that does not specify `type`. The supported algorithms are: `duplicate` and `sha-256`.

- `/decoder/parsers/transforms/default.salt`

  The salt value prepended to any value that is hashed (`sha-256`). This value is optional, an empty salt is valid and produces an unsalted hash. The salt is not defined by default so that you can create a unique salt for your environment. In general, the longer and more complex the salt, the better the security. A salt of up to 60 characters can be used without any major impact. A salt of at least 16 characters is recommended.

To edit the default hash algorithm and salt:

1. In the **Admin** section, select the **Services** view.
2. In the **Services** grid, select a Decoder or Log Decoder service and click  **> View > Config** . Select the **Data Privacy** tab.



3. In the **Configure Hash Algorithm and Salt** section, select a **Hash Algorithm** to use for any meta keys with a defined transform that does not specify type: `sha-256`. (A second algorithm, `duplicate`, is available for administrators to use in validating that expected hashing behavior is occurring in the network.)
4. (Optional) In the **Salt** field, enter a salt value to be prepended to any value that is hashed. This value is optional, an empty salt is valid and produces an unsalted hash. The salt is not defined by default so that you can create a unique salt for your environment. In general, the longer and more complex the salt, the better the security. Best practices for security purposes dictate a salt value that is no less than 100 bits or 16 characters in length. If a unique salt is required for each individual meta key, that needs to be configured in the index file as shown in example 3 below.
5. Click **Apply**.

   The new settings become effective immediately.

Configure Language Keys

In NetWitness Suite 10.5 the NetWitness Suite Core Language had several language key attributes added to facilitate data privacy. You can edit these attributes in the custom index file for each Decoder or Log Decoder. The custom index file (for example, index-decoder-custom.xml) is editable in the Services Configuration view > Files tab. After making changes in the index file, like the ones shown in the examples below, a service restart in a specific sequence is required.

Based on the data privacy requirements for your site, configure individual meta keys to be protected using the following `key` attributes:

- `protected`

  This attribute specifies that NetWitness Suite should consider the values as protected and tightly control any release of the value. When propagating the protected attribute, NetWitness Suite ensures that any downstream trusted system treats the values accordingly. Add this attribute to all services that create the protected values (that is, Decoder or Log Decoder) and any services that will provide trusted access (software development kit (SDK) query/values, aggregation) outside of Core services. The exception to this rule is that a Broker with no index file specified does not need to have the attribute added.

- `token`

  This attribute specifies that values for this key are stand-ins for another value and may not be visually interesting. The `token` attribute is informational, primarily for UI elements to display the value in a more useful or visually pleasing format.

- `transform`

  This child element of `key` indicates that any values for a given meta key should be transformed and the resulting value persisted in another meta key. The `transform` element is only required on Decoders and Log Decoders and is informational if specified on any other Core services. The `transform` element has the following attributes and children:

Name	Type	Description	Optional or Required
`destination`	attribute	Specifies the key name where the transformed value will be persisted.	required
`type`	attribute	The transform algorithm to apply. If not specified, the value of `/decoder/parsers/transforms/default.type` is used.	optional

Name	Type	Description	Optional or Required
param	child-element	A name/value pair, where each param element has a required attribute name and the child text is the value. The only supported param is used to specify a key specific salt value. If not specified, the value of /decoder/parsers/transforms/default.salt is used.	optional

Example 1

On a Decoder or Log Decoder, mark username as protected and hash all values into username.hash with the default algorithm and salt:

```
<key name="username" description="Username" format="Text"
protected="true"><transform destination="username.hash"/></key>
```

Example 2

On a Concentrator, mark username as protected and username.hash as token:

```
<?xml version="1.0" encoding="utf-8"?>
<language level="IndexNone" defaultAction="Auto">
<key description="Username" format="Text" level="IndexValues"
name="username" protected="true"/>
<key description="Username Hash" format="Binary" level="IndexValues"
name="username.hash" token="true"/>
</language>
```

Example 3

On a Decoder or Log Decoder, mark username as protected and hash all values into username.bin with the specified algorithm and salt:

```
<key name="username" description="Username" format="Text"
protected="true">
<transform destination="username.bin" type="sha-256">
<param name="salt">0000</param>
</transform></key>
```

Configure Metadata and Content Visibility Per User Role on Core Services

On individual Broker, Concentrator, Decoder, Log Decoder, and Archiver services being viewed in the Services Security view, administrators can configure the visibility of metadata and content based on the user group or role assigned to a user. This is called the SDK meta roles capability, and it is enabled by default.

Note: Administrators who want to configure metadata and content visibility per user must not disable the `sdk.content` permission (in the Roles tab). If the `sdk.content` permission has been disabled in the Roles tab, packets and raw logs are not visible to `system.roles` node. The `system.roles` node handles the filtering using the method configured in the Settings tab.

With `sdk.content` capability enabled, the next step is to select the method of filtering metadata and content in the Settings tab. Selecting a blacklist or whitelist option makes additional permissions for specific meta keys available in the Roles tab. The result is that administrators can choose a user role, such as analyst, in the Roles tab and select specific meta keys (and content) to be blacklisted or whitelisted for that user group. The permissions apply to any user in the user group.

The following table lists the options for filtering in the Settings tab and the numeric values used to disable (0) and the types of filtering (1 through 6). There is no need to know the numeric value unless configuring metadata and content visibility manually in the `system.roles` node.

system.roles Node Value	Settings Tab Option	Event Metadata	Original Event
0	**No Filtering.** System roles that define permissions on a per meta key basis are disabled.	Visible	Visible
1	**Whitelist meta and content.** By default no meta keys and no packets are visible. Selecting individual SDK meta roles per user group allows users to see metadata and packets for that SDK meta role.	Not Visible Select to Show	Not Visible Select to Show

system.roles Node Value	Settings Tab Option	Event Metadata	Original Event
2	**Whitelist only meta.** By default packets are shown, but no metadata is visible. Selecting individual SDK meta roles per user group allow users to see metadata for that role.	Not Visible Select to Show	Visible
3	**Whitelist only content.** By default metadata is visible, but no packets are visible. Selecting individual SDK meta roles per user group allow users to see packets for that role.	Visible	Not Visible Select to Show
4	**Blacklist meta and content.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing metadata and packets for that role.	Visible Select to Hide	Visible Select to Hide
5	**Blacklist only meta.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing metadata for that role.	Visible Select to Hide	Visible
6	**Blacklist only content.** By default all metadata and all packets are visible. Selecting individual SDK meta roles per user group prevents users from seeing packets for that role.	Visible	Visible Select to Hide

Three factors determine what a user sees:

- The SDK meta role setting (blacklist or whitelist).
- The restricted meta keys configured for the group to which the user belongs.
- The meta keys in the session being analyzed.

Caution: Be aware that with blacklisting, implicit trust is granted for all except the configured metadata. For a Decoder to have RBAC enabled and use implicit trust, it must only use a blacklist system setting; a whitelist setting will result in some issues with meta keys that are not explicitly enabled and therefore not visible. It is impossible to grant implicit trust under whitelist rules because the universe of meta keys cannot be known. If you want to use whitelisting, a workaround is to turn RBAC off for the Decoder and disable any user accounts from connecting directly to the Decoder if they should be RBACed.

Here's an example of how the SDK meta role configuration meshes with a Group that has restricted meta keys.

Configuration:

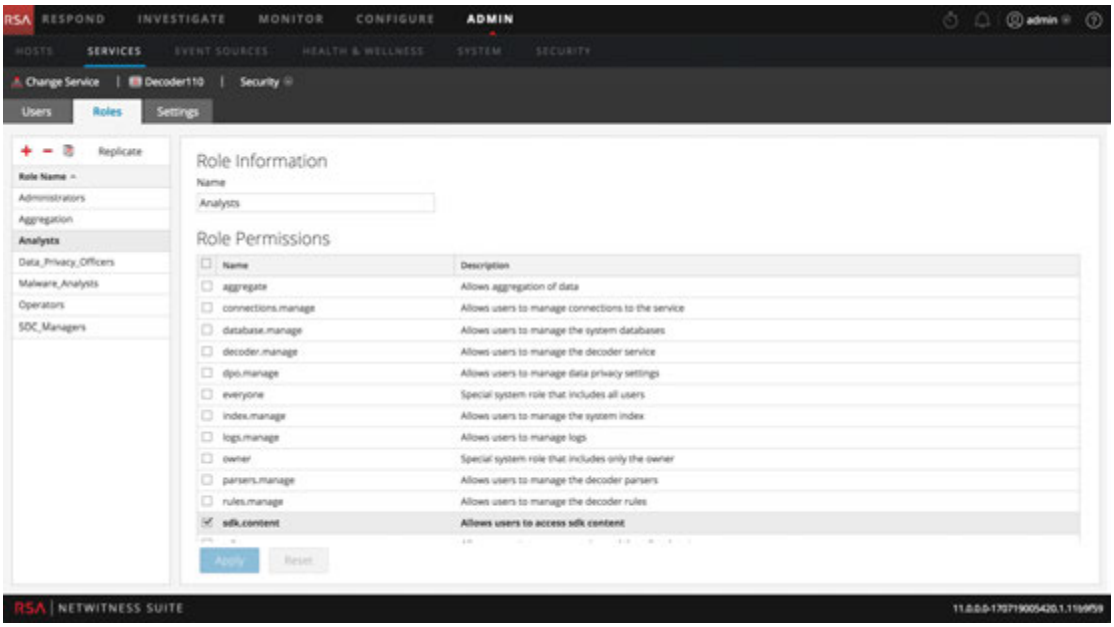
- The SDK meta role setting is **Blacklist meta and content**. With this option implemented, all meta and all content (packets and logs) are visible by default.
- The Administrator has restricted meta keys configured for the Analysts group to prevent viewing of sensitive data (for example, `username`).
- The packets and logs for any session that includes the `username` meta key are not visible to an Analyst.

Result: Now a user who is a member of the Analyst Group investigates a session. Depending on the content of the session, the results are different:

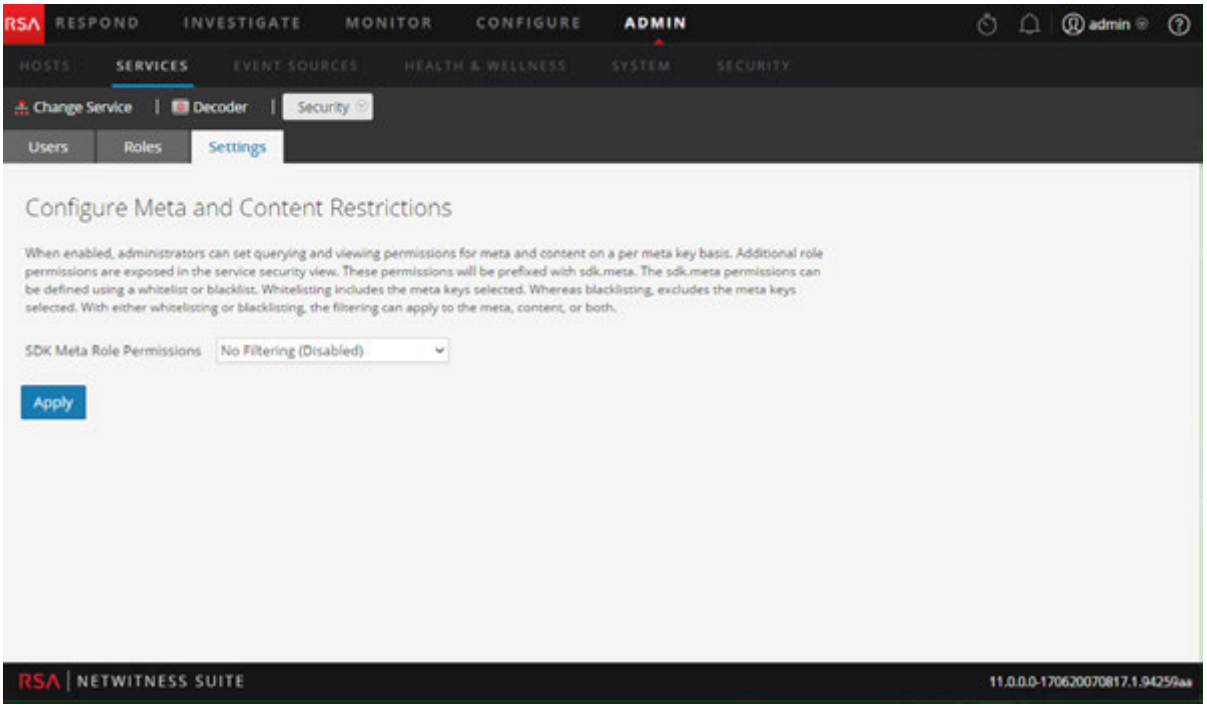
- Session 1 includes the following meta keys: `ip`, `eth`, `host`, and `file`. The session does not include `username` so all packets and logs in the session are displayed.
- Session 2 includes the following meta keys, `ip`, `time`, `size`, `file`, and `username`, Because the session includes `username` , no packets or logs from the session are displayed for the Analyst.

To configure meta and content restrictions for a Decoder or Log Decoder:

1. In the **Admin** view, select **Services**.
2. In the **Services** grid, select a Broker, Concentrator, Decoder, Log Decoder, or Archiver service and click  **> View > Security**. Click the **Roles** tab, select a role, and verify the `sdk.content` role is enabled.

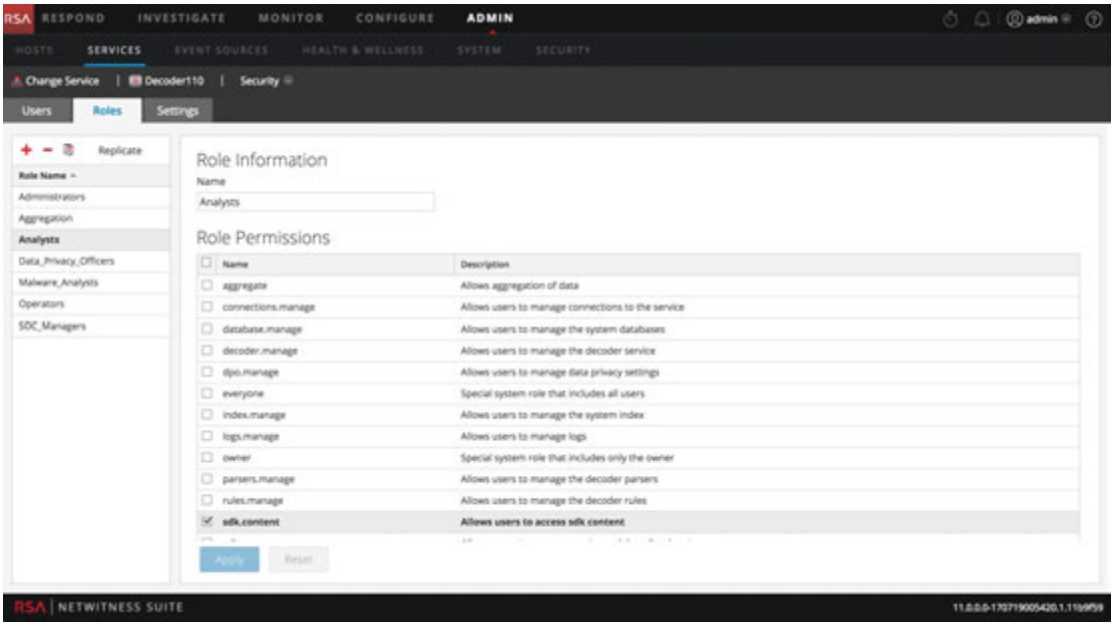


3. Click the **Settings** tab.



4. Select one of the filtering methods (blacklist or whitelist) and content types (meta and content, meta only, or content only), and click **Apply**.
5. Click the **Roles** tab and a role for which you want to allow content (whitelist) or block content (blacklist) as specified in the SDK Meta Role Permissions setting.

The Role Permissions for the selected role are displayed, and the SDK Meta Role Permissions are available for selection, for example, `sdk.meta.action`. If you selected one of the whitelist options in the SDK Role Permissions setting, you must assign each SDK meta role to make the selected content visible to users assigned that SDK meta role. If you selected one of the blacklist options in the SDK Role Permissions setting, selected content will be hidden from users assigned that SDK meta role.



6. Select the SDK meta role permissions for users assigned this role. Click **Apply**.

   The settings become effective immediately and apply to new packets and logs processed by the Decoder or Log Decoder.

Configure Meta Keys Not Written to Disk Per Parser on a Decoder

On a Decoder and Log Decoder, a Data Privacy Officer can configure individual meta keys that are not written to disk. To do so, the DPO specifies the meta keys as transient in the index and the parser configuration.

Note: The same capability was previously available on Log Decoders, and was configured when setting up parsers by modifying the table-map.xml file. Now it is integrated in the Services Config view.

To configure selected meta keys on individual parsers that will not written to disk:

1. In the **Admin** section, select **Services**.
2. In the **Services** grid, select a Decoder or Log Decoder service and  **> View > Config**.
3. In the **Parsers Configuration** section of the **General** tab, select a parser and then select

Transient in the **Config Value** drop-down list. Access the list by clicking on the configuration value (Enabled, Disabled, or Transient).

The configuration change is marked by a red triangle.

4. Click **Apply**.

   The change is effective immediately. The parser configured as Transient will no longer store meta keys to disk.

Configure Data Retention

A NetWitness Suite user with the role of Administrator can configure NetWitness Suite to ensure that sensitive data has been removed after a specific retention period, regardless of system ingest rate. For instance, the policy might be to keep packets (both raw data and meta data) for no more than 24 hours, and to keep some logs (both raw data and meta data) for up to seven days. If sensitive data makes its way into another database on the Reporting Engine, Malware Analysis, Event Stream Analysis, and NetWitness Servers, data retention can be managed there as well. The administrator needs to set up each service individually across all NetWitness Suite components (except Event Stream Analysis) based on policy and data privacy laws.

Sensitive data may also be in cache.

- Brokers can cache data and this needs to be cleared by configuring an independent rollover and other removal of cache as required. The administrator can configure cache rollover for a Broker by editing the Scheduler file in the Services Config view Files tab.
- Investigation and the NetWitness Server cache data, and this is cleared automatically every 24 hours.
- If the Data Privacy Officer (DPO) exports data, that is the same as saving data on the NetWitness Server in the jobs queue. To clear this data, the administrator or DPO should clean up the jobs queue on a regular basis.

Data Retention

You can schedule a recurring job for Decoder, Log Decoder, and Concentrator services in NetWitness Suite to check if data is ready to be removed. The Data Retention Scheduler provides a means to configure basic scheduling (see below), and advanced Scheduler settings are also available by editing the Scheduler file in the Services Config view Files tab or the node in the Explorer view.

The Archiver has flexible data storage and retention options. You can place different types of log data into individual collections and manage them separately. These collections enable you to specify how much of the total storage space to use and how many days to store the logs in the collection. You can also determine whether to delete the log data or to move it to offline cold storage after it reaches the maximum specified storage space for the collection.

For example, you can put sensitive information in a collection and configure a limitation on how long to keep it, such as 30 days. To delete the data after 30 days, you would not enable warm or cold storage for that collection.

Deleting versus Retaining Log Data

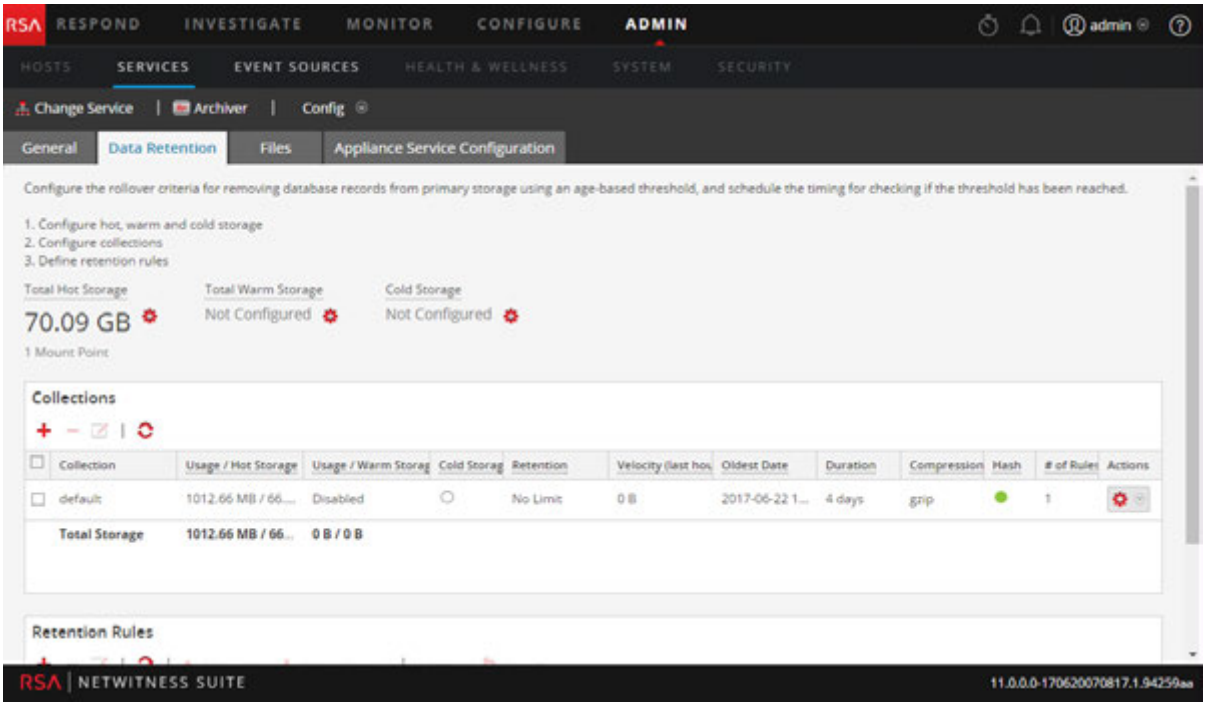
Administrators can configure hot, warm, and cold tiered storage on an Archiver. Cold storage contains the oldest log data that is either required for the operation of the business or mandated by regulatory requirements. When a collection reaches its retention limits for hot and warm storage, NetWitness Suite deletes the log data from hot or warm storage. With cold storage configured, a copy goes into cold storage before the logs are deleted from hot or warm storage. You can choose whether to enable cold storage for each log storage collection. NetWitness Suite does not manage cold storage.

Enable or Disable Cold Storage in a Log Storage Collection

When log data in a collection reaches its retention limits for hot and warm storage, you can delete it or move it to offline (cold) storage.

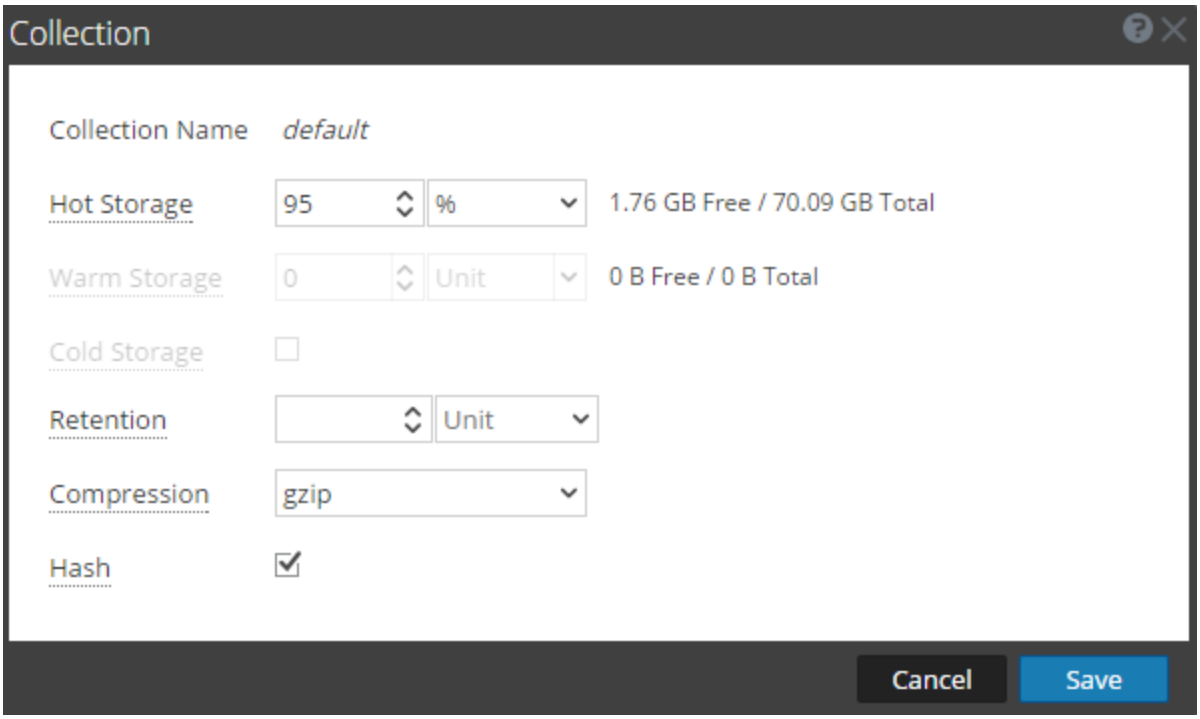
To enable or disable cold storage in a log retention storage collection on an Archiver:

1. In the **Admin** section, select the **Services** view.
2. Select the Archiver service and  **> View > Config**.
3. Click the **Data Retention** tab.



4. In the **Collections** section of the Data Retention tab, select a collection and click  .

   The Collection dialog is displayed.



Note: If the maximum storage size of the collection does not allow full data retention for the retention period specified, NetWitness Suite deletes the data or it goes to warm or cold storage if specified in the collection.

5. Enable or disable cold storage:
   - To delete log data when the collection reaches its specified retention limits, clear the **Cold Storage** checkbox.
   - To move log data to offline storage when the collection reaches its specified retention limits, select the **Cold Storage** checkbox.
6. Click **Save**.

Configure Log Retention and Storage on an Archiver

To configure log retention and storage on an Archiver, see the **Configure Archiver Storage and Log Retention** topic in the *Archiver Configuration Guide*.

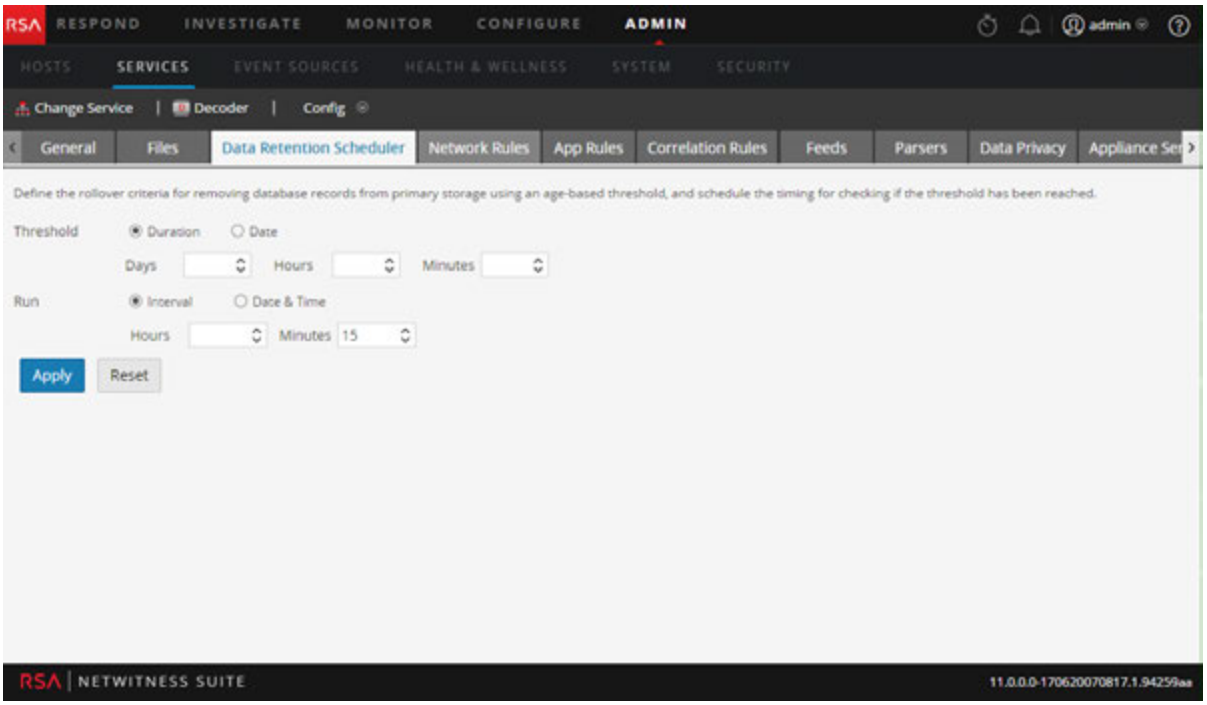
Schedule a Recurring Job to Check Data Retention Thresholds

The data retention scheduler configuration ensures that the data residing in the Decoder, Log Decoder, and Concentrator components is deleted after a certain time. For example, data retention on a Decoder might be configured to execute a check every 15 minutes to determine if the specified duration threshold has been met. If the threshold is met, NetWitness Suite deletes data older then 4 hours in the relevant databases.

Caution: The schedule overwrites any previous schedule and becomes effective immediately. If the retention period is decreased, the data exceeding this retention period is removed.

For a Decoder, Log Decoder, or Concentrator:

1. In the **Admin** section, select the **Services** view.
2. In the **Services** grid, select a Decoder, Log Decoder, or Concentrator service and click  **> View > Config**.
3. Click the **Data Retention Scheduler** tab.



4. Set the threshold based on the duration of time the data has been stored or the date on which the data was stored. Do one of the following:
   a. To define the duration of time that data can be stored before removal, select **Duration**, and then specify the number of days (365 maximum), hours (24 maximum), and minutes (60 maximum) that have elapsed since the time stamp on the data.
   b. To define the removal of data based on the date of the timestamp, select **Date**, and then specify the monthly date and time in the Calendar and Time fields.
5. Do one of the following to configure the **schedule for checking rollover criteria**:

a. If you want to set a regular interval at which the scheduled database check occurs, select **Interval** and specify the **Hours** and **Minutes** between the scheduled checks.

b. If you want to set a regular date and time at which the scheduled database check occurs, select **Date and Time** and specify the system clock time in `hh:mm:ss` format for the rollover.

   - To specify the day, select **Every Day**, **Weekdays,** or **Weekends**. The Scheduler defaults to **Every Day**.
   - To specify a different set of days of the week, select **Custom** and click on each day on which the database check occurs.

   Caution: The schedule overwrites any previous schedule and becomes effective immediately. If the retention period is decreased, the data exceeding this retention period is removed.

6. Click **Apply** to complete the configuration.

Configure User Accounts for Use in Data Privacy

This topic provides the procedures for configuring user accounts that work with data obfuscation in NetWitness Suite. In order for data obfuscation to work, accounts and permissions for several types of users must be configured.

- Customize the default `Administrators` system role in NetWitness Suite to remove permissions that should be available only to the Data Privacy Officer.
- Add two new user accounts at the system level to depict a data privacy officer and a typical analyst.
- Add a user account at the service level with the aggregation role so that Decoders and Log Decoders can aggregate data to a Concentrator or Broker.
- On the Reporting Engine, configure two separate service accounts. One service account for general purpose reporting that does not include any sensitive data and the other account for privileged users with access to all data including sensitive data. This procedure is described in the *Reporting Engine Configuration Guide* under **Configure Data Source Permissions**.

Customize the Default Administrators User Role at the Service Level

To separate the data privacy officer and administrator functions on each Decoder and Log Decoder, you need to remove the `dpo.manage` permission from a clone of the Administrators role.

1. In the **Admin Services** view, select a Decoder or Log Decoder. Click  **> View > Security**.
2. In the **Services Security** view, click the **Roles** tab, select **Administrators** and click  .
   In the **Enter Role Name** dialog, enter a new role name such as Non_DPO_Administrators and click **Save**.
3. Select the new role.
   The Role Information is displayed for editing.
4. Click the box next to **dpo.manage** so that it is no longer checked and click **Apply**.
   The permission to manage data privacy configuration is removed for the new role.
5. In the **Users** tab, select each user who has the **Administrators** role, and change their role to the cloned role.

6. Validate that the users with the modified Administrators role can login as with admin privileges.
7. Validate that the users with the modified Administrators role cannot configure meta and content restrictions in the Settings tab.

Add a User Account with the Aggregation User Role at the Service Level

To ensure that Decoders and Log Decoders can aggregate data to a Concentrator or Broker:

1. In the **Admin Services** view, select a Decoder or Log Decoder. Click  **> View > Security**.
2. In the **Users** tab, add a user with the `Aggregation` role and click **Apply**.

Note: The **Aggregation Role** topic in the *Hosts and Services Getting Started Guide* provides details about the application of this user role.

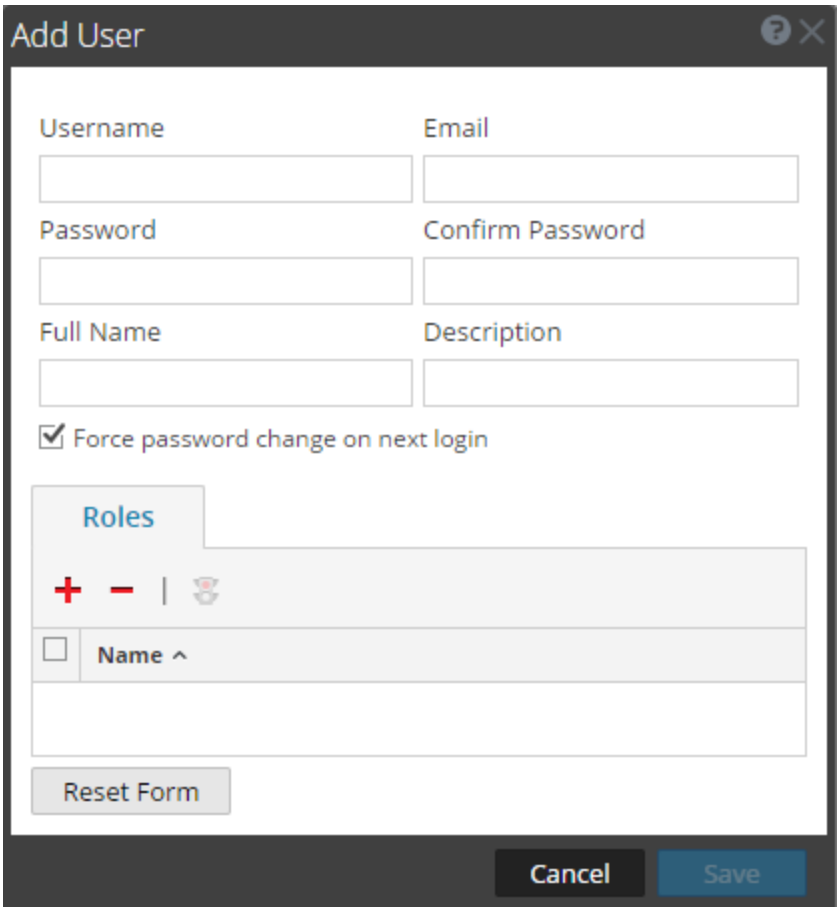
Add Data Privacy Officer and Analyst Accounts on the NetWitness Server

You need to add two new user accounts in NetWitness Suite at the system level to depict a privileged data privacy officer and a typical analyst. If the environment is configured using the default trusted connections, you do not need to create the new user accounts on the Core services (Brokers, Concentrators, and Decoders). When a user is created in the NetWitness Server, that user can log on to the services.

Note: The role name is required to exist on both the server and the services, and the role name must be identical. If you create a new custom role on the NetWitness Server, make sure to add it to all Core services as well.

1. Create a new user account for the data privacy officer:
   a. In the **Security** view, select the **Users** tab and click  .

      The Add User dialog is displayed.



b. Create the new account with the following credentials.

   Username = <new user name for logon, for example, DPOadmin>
   Email = <new user's email, for example, DPOadmin@rsa.com>
   Password = <new user's password for logging on, for example, RSAprivacy!@>
   Full Name = <new user's full name, for example, DPO Administrator>

c. In the **Roles and Attributes** section, click the **Roles** tab, +, and select the `Data_Privacy_Officers` role for the new user.

d. Select **Save**.

2. Create a new user account for the analyst with limited privileges:

   a. In the **Admin > Security** view, click the **Users** tab. In the **Users** tab toolbar, click +.

      The Add User dialog is displayed.

   b. Create the new account with the following credentials:

      Username = <new user name for logon, for example, NonprivAnalyst>
      Email = <new user's email, for example, NonprivAnalyst@rsa.com>
      Password = <new user's password for logging on, for example, RSAprivacy!@>
      Full Name = <new user's full name, for example, Nonprivileged Analyst>

c. In the **Roles and Attributes** section, click the **Roles** tab,  , and select the `Analysts` role for the new user.

d. Select **Save**.

Data Privacy References

The following reference materials are available for management of data privacy and data retention. Go to the Master Table of Contents for Version 11.0 to find NetWitness Suite 11.0 documents.

- See the **Data Privacy Tab** topic in the *Decoder and Log Decoder Configuration Guide*.
- See the **Data Retention Tab - Archiver** topic in the *Archiver Configuration Guide*.
- See the **Data Retention Scheduler Tab** topic in the *Hosts and Services Getting Started Guide*.

RSA NETWITNESS® SUITE

Licensing Management Guide

for Version 11.0

Contact Information

How Licensing Works

RSA NetWitness Suite version 11.0 entitlement uses a trust-based licensing model. Appliances continue to function even if they are out-of-compliance with current licensing.

Configuration Step	Description
Step 1. Register the NetWitness Server	Before you begin the licensing process, you must ensure that your license server is installed and running.
Step 2. Synchronize NetWitness Server	Your NetWitness Server must be registered to Download Central and entitlements must be mapped. There are two methods of synchronizing NetWitness Suite with Download Central: online and offline.
Step 3: Install Product Licenses from Download Central (DLC)	Your DLC Welcome e-mail message contains system log in instructions to Download Central. Instructions for downloading your product licenses can be found in this document, as well as the Download Central (DLC) website.

Choosing a License Type

The type of license you choose is based on your network requirements. If you want a license that is based on a throughput per day of logs (SIEM) or network packets (Network Monitoring and Network Malware), Metered licensing is your best bet.

The following types of licenses are available in RSA NetWitness Suite 11.0:

- Metered Licensing
- Service-based Licensing
- Out-of-the-box Trial Licensing

Note: You should purchase or install a license within 90 days, although the functionality will continue after the 90-day out-of-the-box trial period ends.

Metered Licensing

Metered licensing is based on a throughput per day of logs (SIEM) or network packets (Network Monitoring and Network Malware), combined with the separate purchase of the hardware needed to deploy the system and meet customers' retention requirements.

The throughput per day for logs is measured in Gigabytes per day and in Terabytes per day for packets. Customers can then acquire the amount of Gigabytes per day of logs, or Terabytes per day of packets that they require in order to meet their needs. The total amount of throughput per day is selected from one of five volume tiers of license levels, based on the total amount of throughput per day that is being licensed across the customer's entire enterprise deployment of NetWitness.

With this licensing system, organizations can scope their throughput per day capacity independently from their hardware infrastructure components, optimizing specifically for their network environment. A customer effectively licenses NetWitness software from RSA based on their network or log throughput and then purchases the infrastructure components (servers to deploy the Decoders, Concentrators, Brokers, and so on) that are required for their particular deployment.

Note: If you want to change the default allotment of licenses by moving between metered and service-based, you can do this by selecting under the actions of each license entry, provided there is support for both license types.

Service-based Licensing

RSA NetWitness Suite version 11.0 supports service-based licensing. Support for service-based licensing is applicable for all appliances that require a license. This is a per-service permanent license that has no expiration date. You do not need to activate any version 11.0 services manually.

The following list includes services that can have service-based licenses:

- Decoder
- Log Decoder
- Concentrator
- Broker
- Archiver
- Event Stream Analysis
- Malware Analysis

Note: The one exception is a co-located instance of Malware Analysis, which is licensed by default.

Out-of-the-Box Trial Licensing

Out-of-the-Box Licensing for RSA NetWitness Suite version 11.0 ships with a default Trial out-of-the-box license that enables customers to use the product with full functionality for 90 days. The 90-day time period begins when the NetWitness Suite user interface is configured and used for the first time.

You are given a choice to include appliances under an Out-of-the-Box (OOTB) Trial Metered License, or a Service- based License. Metered licenses are only supported for Decoder, Log Decoder, and Malware Analysis.

Version 11.0 provides the flexibility to move your license to an Out-of-the-Box Trial service-based License. An Out-of-Compliance banner notifies you when you need to take action on your license.

Licensing at a Glance

Note: You are entitled to the latest software version based on your maintenance contract. If your maintenance contract expires, you can still use the product, but you are not covered for maintenance or Technical Support.

Service-based

Service-based licenses are applicable to the following services:

- Decoder
- Log Decoder
- Concentrator
- Broker
- Archiver
- ESA
- Malware Analysis

Metered

- License usage is based on the amount of data throughput per day.
- Only applies to Log Decoder, Packet Decoder, and Malware Analysis (standalone) services.
- Throughput per day is measured in Gigabytes per day for Log Decoders and Packet Decoders, and is measured in Terabytes per day for Malware Analysis.
- Metered license usage statistics are captured hourly and made available in CSV or PDF formats for export.

Perpetual

License is based on aggregate usage, as opposed to a per-appliance service. There is no specified end date; the Metered license works indefinitely

Subscription

License is purchased for a specific period of time, such as 12 months, 24 months, or 36 months. Use of the software is discontinued at the end of your subscription period.

Licensing Measurement

- Usage stats reflect daily average usage.
- Perpetual and service-based licenses, such as Netmon or Network, or Decoder are offered in 1 TB increments
- SIEM or Log Decoder offered in 50 GB increments
- Malware Analysis offered in 1 TB increments on a per-day average usage.
- Contracted daily usage can be exceeded three times in a calendar month. Fourth spike puts the customer in an out-of- compliance state. If you are able to keep your usage within compliance for seven consecutive days until the end of the calendar month, the Out-of-Compliance banner disappears.

  For example, if the fourth spike occurs on November 23, 2017, the Grace Period ends on December 31, 2017 and the Out-of-Compliance banner disappears.
- Breach period starts immediately after Grace Period ends.
- Red banner cannot be dismissed.

Note: Even when the Red banner is displayed, there is no loss of functionality, all NetWitness appliances continue to work with full functionality. All other functionality is included in the license (ESA, storage, and so on).

- Customer pays for hardware.
- Usage is measured as an aggregate of all metered appliances.

  For example, a Decoder can be licensed for 10 GB per day. Customers are allowed to use multiple Decoders under the same license.
- Services are licensed automatically under the following conditions:
  - When services are resolved.
  - When a scheduled task runs every hour.
  - License Refresh is triggered by the user.
- Subscription-based licenses are billed yearly.

Out-of-Compliance Banner

The Out-of-Compliance banner is displayed when one of the following conditions occurs:

- License is tampered with during the out-of-the-box trial period.
- A service is not licensed.
- A license has expired, or is due to expire within the next two weeks.
- Usage exceeds entitled limit.
- Usage is approaching entitled limit.

To resolve an out-of-compliance state:

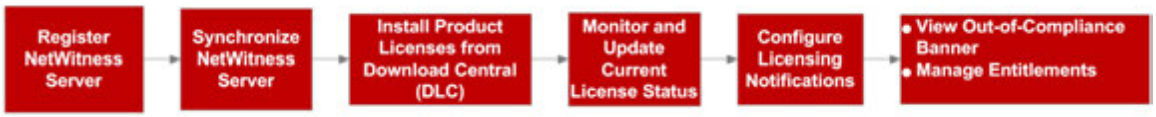
- Reduce usage, or
- Adjust contracted usage amount

Initial Set Up

This topic provides all of the steps required for installing entitlements in NetWitness Suite. The Administrator setting up licensing needs to perform each step in the proper sequence. After initial setup, refer to Troubleshoot Licensing for any maintenance or troubleshooting information.

Workflow

The following workflow illustrates the end-to-end licensing process.



Prerequisites

Before implementing the NetWitness Suite entitlements capability, ensure that the following prerequisites have been met.

- An order for entitlements is in place with RSA, and a pool of entitlements is available for the customer in the RSA Download Central site - https://download.rsasecurity.com/.
- A web browser that supports HTML5 and JavaScript.
- HTTPS access for the NetWitness Suite web Interface.
- The NetWitness Server and all appliances managed by the server must be on the same DLC Account ID or account in the order management system. Licenses on the NetWitness Server can be added only to appliances on the same DLC Account ID or account.
- Administrative access to the NetWitness Server and to other appliances running NetWitness Suite version 11.0.
- Ability of all appliances to communicate with the NetWitness Server so that appliance licenses remain activated.
- If online registration between NetWitness Suite and RSA Download Central is planned:
  - Internet access with HTTP from NetWitness Server to Download Central.
  - NetWitness Server DNS resolution of at least the Download Central site.

Step 1. Register the NetWitness Server

This topic provides instructions for the first step in the NetWitness Suite entitlement process, registering the NetWitness Server and mapping entitlements to the Local License Server (LLS).

Prerequisites

A prerequisite for registering the NetWitness Server to Download Central is to have the License Server installed and running. This is required to tie entitlements to the server.

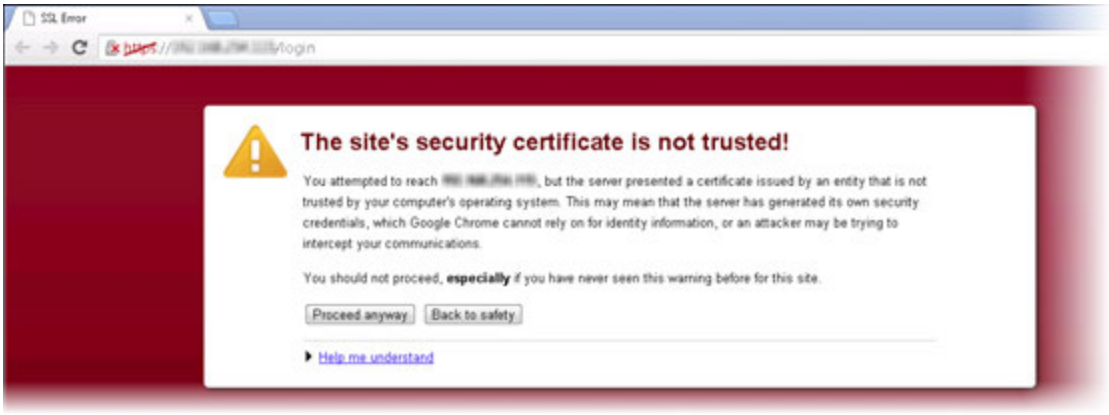
Verify That the License Server is Installed and Running

To verify the License Server is installed and running:

1. Log on to the NetWitness Server at **https://*<NW-IP>***, where ***<NW-IP>*** is the NetWitness Server IP address. You are prompted with a screen asking for your RSA Product License Number. You must enter the Serial Number of your NetWitness Server host in order to continue with the license installation process. This can be found through SSH by issuing the following command:

   ```
   dmidecode -s system-serial-number
   ```

   The following message may be displayed.



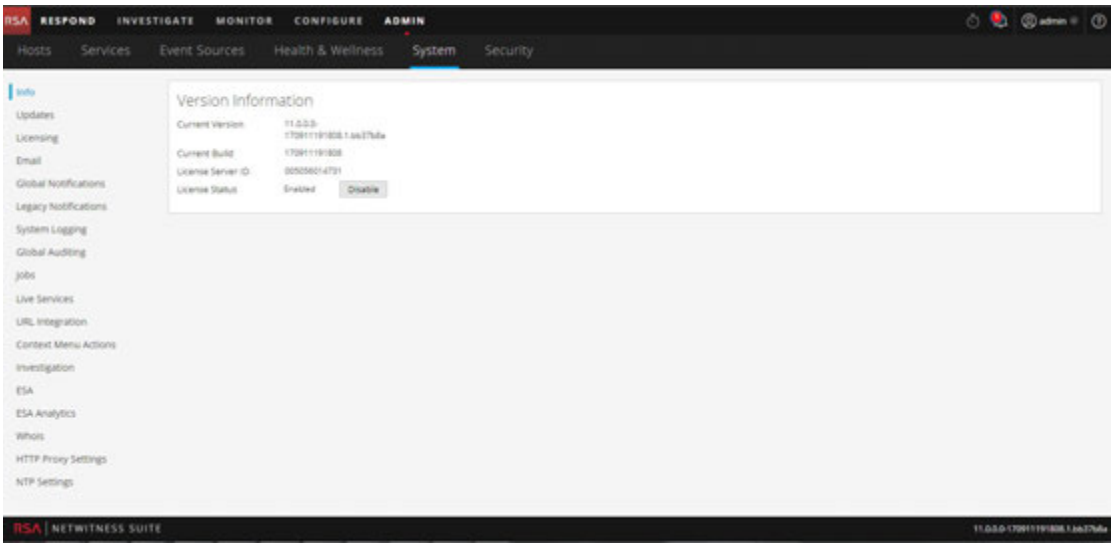
2. If you receive a message that the certificate is not installed, click **Proceed Anyway**. A document describing how to update with a self-signed or CA certificate is available at:

   https://knowledge.rsasecurity.com/scolcms/knowledge.aspx#a58829.

   The NetWitness Suite user interface is displayed.

3. Go to **ADMIN > System**.

4. The Admin System view opens to display the Version Information in the **Info** panel.



5. Under **Version Information**, locate the **License Server ID**.
   - If the field contains a value and the **License Status** is **Enabled**, the Local License Server (LLS) packages are installed and running. You can proceed with server registration.
   - If the field contains a value and the **License Status** is **Disabled**, the Local License Server (LLS) packages are installed but not running. Click **Enable** to enable the LLS before proceeding with server registration.
