Customer unable to delete Trial licenses when Appliance licenses are in use.	Customer had two different NetWitness Server for two different sites (CHN and NOI). Each site had separate mapped entitlements. The red compliance banner was seen on the NOI site, because some Concentrators were attached to the NOI NetWitness Server that was entitled by the CHN site. The reason for the banner was that the NOI NetWitness Server did not have any more concentrator entitlements available for the CHN concentrators attached for investigation. The customer only has Trial licenses for 90 days from the date the NOI NetWitness Server and services were marked as out-of-compliance. **Note:** When there is more than one NetWitness Server in use, NetWitness PlatformVersion 10.5 and above requires a separate license for each NetWitness Server. Also, if you move one or more appliances to a different location, check to make sure there is a valid license for each appliance. A red out-of-compliance banner is displayed if there is no valid license.	Customer was informed that their services will continue to function as required. The out-of-compliance banner can be dismissed by procuring additional entitlements to map onto the NOI NetWitness Server.
License missing after re-imaging.	Various possible causes.	Download license from DLC.

Live Services Management

RSA NetWitness Platform Live is the gateway to a rich environment that offers access to feeds, tools, and other resources.

NetWitness Platform Live

Live is the component of NetWitness Platform that manages communication and synchronization between NetWitness Platform services and a library of Live content available to RSA NetWitness Platform customers. Live provides a simple interface for browsing, selecting, and deploying content from the NetWitness Platform Live Content Management System to NetWitness Platform services and software. In addition to managing feeds from the CMS Library, Live allows users to deploy custom feeds and packages.

The CMS Library

The content management system (CMS) library (known as *Live*) is a valuable source of the latest internet security resources for NetWitness Platform customers. It provides a view into the collective intelligence and analytical skills of the worldwide security community to ensure that users have the most current visibility into attack vectors.

Live gathers the best advanced threat intelligence and content in the global security community - the ideas, research, ongoing tracking, and analysis - and brings it directly into the user's security operations center to definitively classify computers associated with botnets, malware, and other malicious exploits. Live aggregates, consolidates, and illuminates only the most pertinent information relevant to an organization on a real-time basis.

NetWitness Platform Feedback and Data Sharing

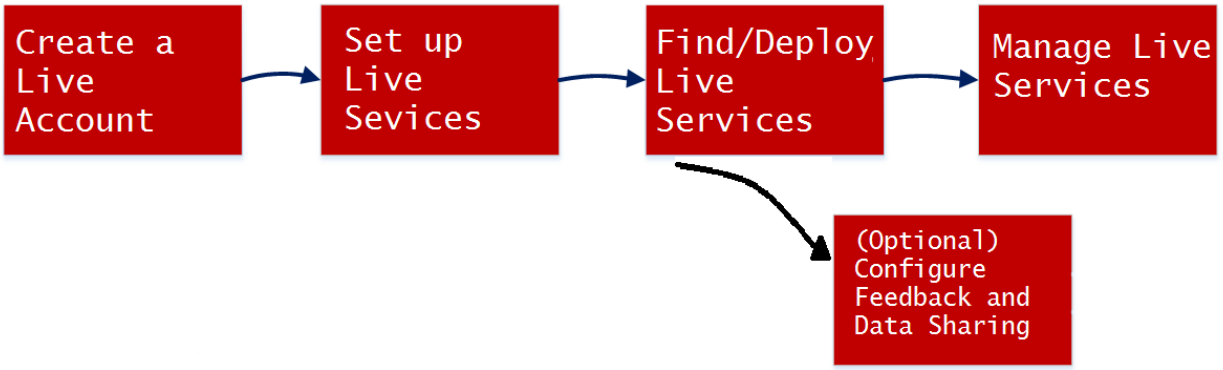
Live Feedback is intended to help improve RSA NetWitness Platform. Once you set up and configure a Live account, usage data is shared with RSA.

RSA Live Connect is a cloud based threat intelligence service. This service collects, analyzes, and assesses threat intelligence data such as IP addresses, domains, and files collected from various sources. It **Threat Insights**, which provide analysts the ability to pull threat intelligence data from the Live Connect service. It also offers **Analyst Behaviors**, an automated data collection service with the goal of sharing potential threat intelligence for analysis.

For more details, see NetWitness Platform Feedback and Data Sharing.

Live Services Required Procedures

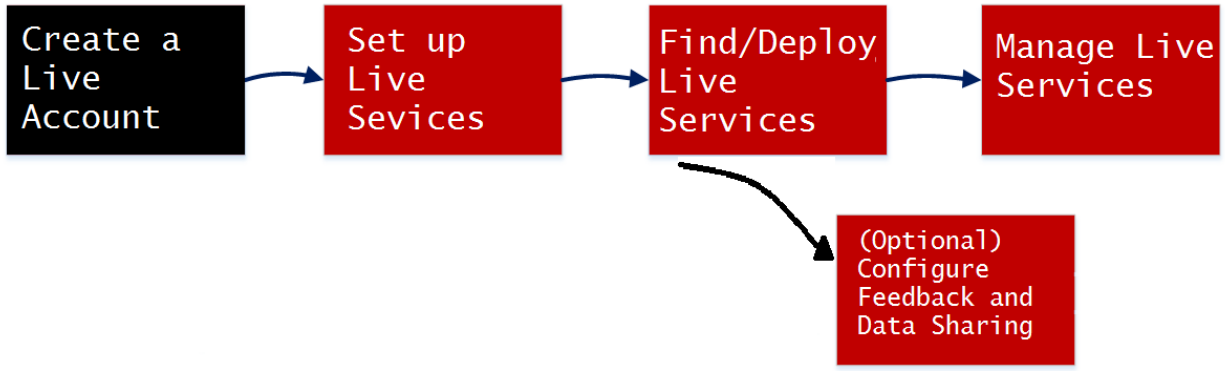
The following workflow breaks out the basic setup into four steps, which you can do individually. The easiest way to set up the Decoder is to follow the end-to-end procedure in this section, Live Services Required Procedures), which includes all of the steps.



Configuration Step	Description
Create Live Account	Create a Live Account on the RSA Live Registration portal URL: https://cms.netwitness.com/registration/. If you have an existing account, you can manage your account using this portal.
Set Up Live Services on NetWitness Platform	Set Up Live Services on NetWitness Platform by configuring a connection with the CMS server.
Find and Deploy Live Resources	Search and browse for resources in the Live Search view, and then, deploy the selected resources.
Manage Live Resources	Procedures for administrators to search for, subscribe to, and deploy resources from Live.
NetWitness Platform Feedback and Data Sharing	Describes the feedback and data sharing features provided in RSA NetWitness® Platform, from Live Services. Participation is optional, but can help to provide useful threat intelligence for the community.

Create Live Account

You must create a Live account using the RSA Live Registration Portal on the CMS server. The CMS Library provides access to all RSA content in one place where you can view, search, deploy, and subscribe to RSA content. You must register on the RSA Live Registration Portal and select a subscription level.



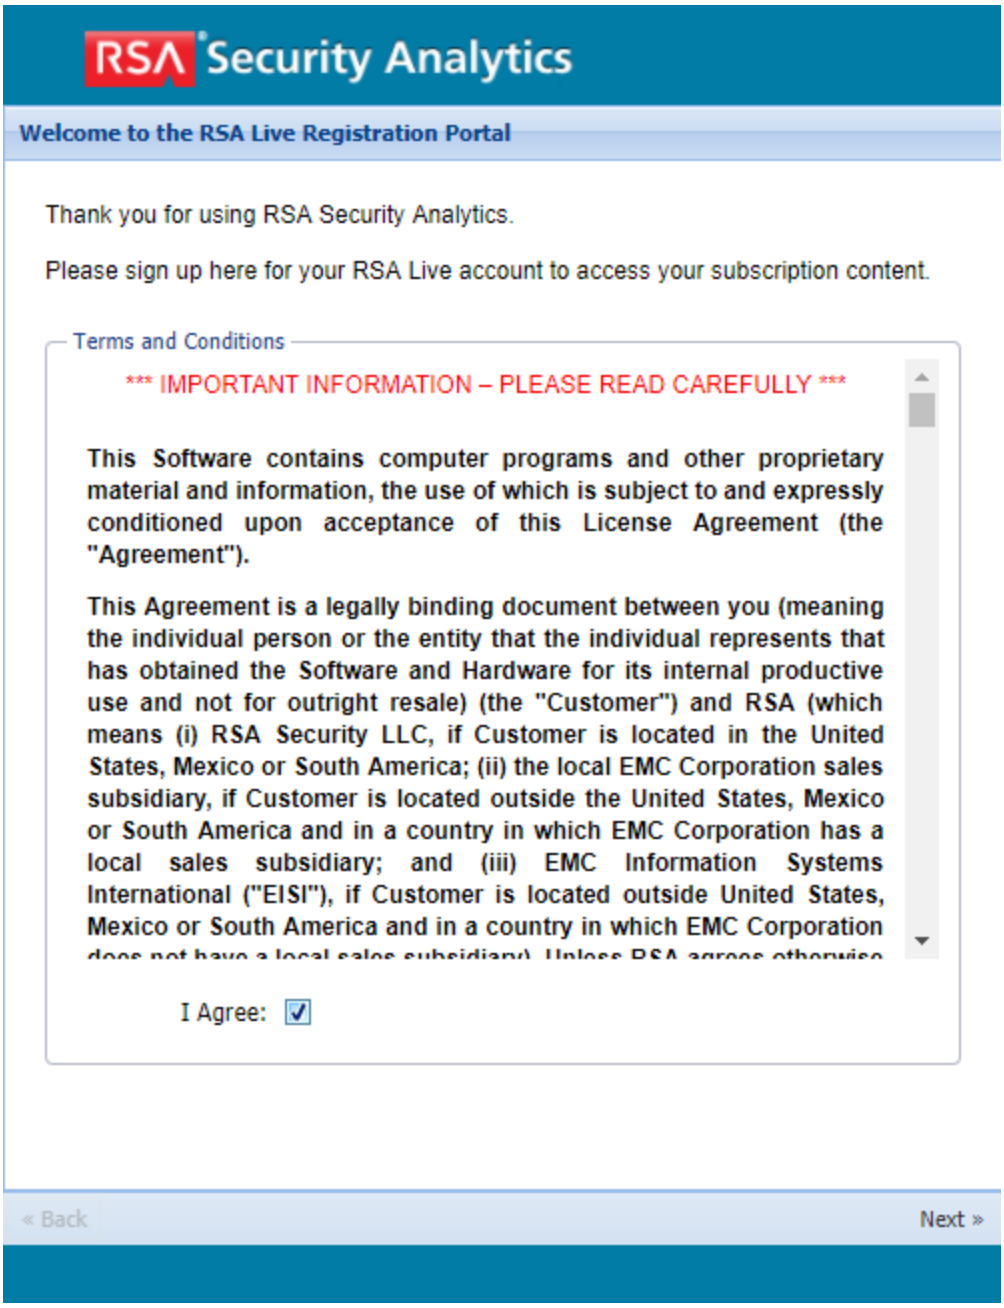
Make sure the following are available to set up a RSA Live account:

- Active internet connection to access the portal.
- A valid and registered NetWitness Platform License Server on the Flexera Server, before you can register for a Live account. You can view the License ID on the **ADMIN > System > Info** panel.

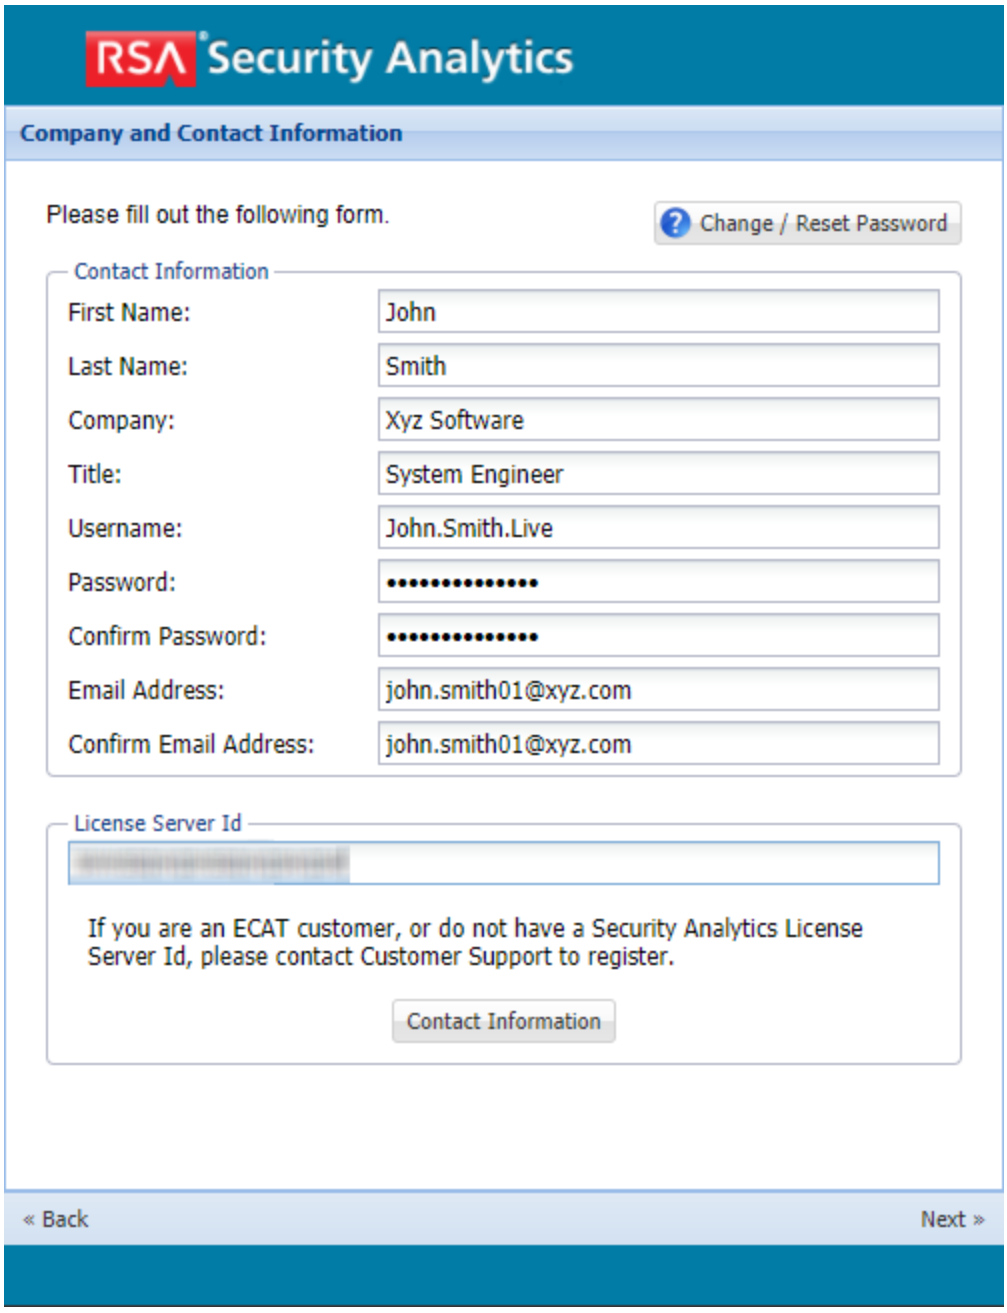
Note: If the License Server is not set up, contact RSA customer support.

To create a Live Account:

1. Access the RSA Live Registration Portal using the URL: https://cms.netwitness.com/registration/. The Welcome page is displayed.
2. Read the Terms and Conditions carefully and select the **I Agree** check box:



3. Click **Next**.
4. In the **Contact Information** section, enter all the fields:
   - The **username** must contain a minimum of nine characters and a maximum of 60 characters.
   - The **password** must contain a minimum of nine characters and a maximum of 60 characters, with at least one uppercase, one lowercase, one number, and one special character.
   - The **email address** you enter is used to send notifications related to your Live account.



5. In the **Subscription Level** section, select one of the following subscription levels:
   - **Basic** - This provides access to the Live content that is tagged for groups such as Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.
   - **Enhanced** - This provides access to the Live content that is tagged for groups such as Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.
   - **Premium** - This provides access to the Live content that is tagged for groups such as Premium, Verisign Premium, Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.
6. In the **Confirm Subscription Level** section, select the subscription level once again to confirm.

7. Enter the **License Server Id**. You can view the License Id on the **ADMIN > SYSTEM > Info** page.

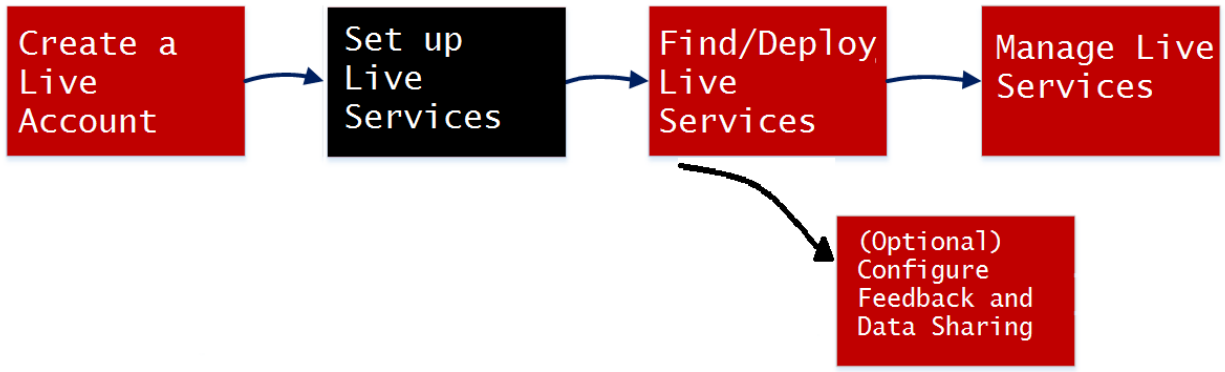
   Caution: Make sure that the license server ID on NetWitness Platform is valid and it is registered on the Flexera Server. If not, contact RSA Customer Support.

8. Click **Next**.

If the registration is successful you will receive RSA Live Account Confirmation email with your username. You now have access to the content subscribed.

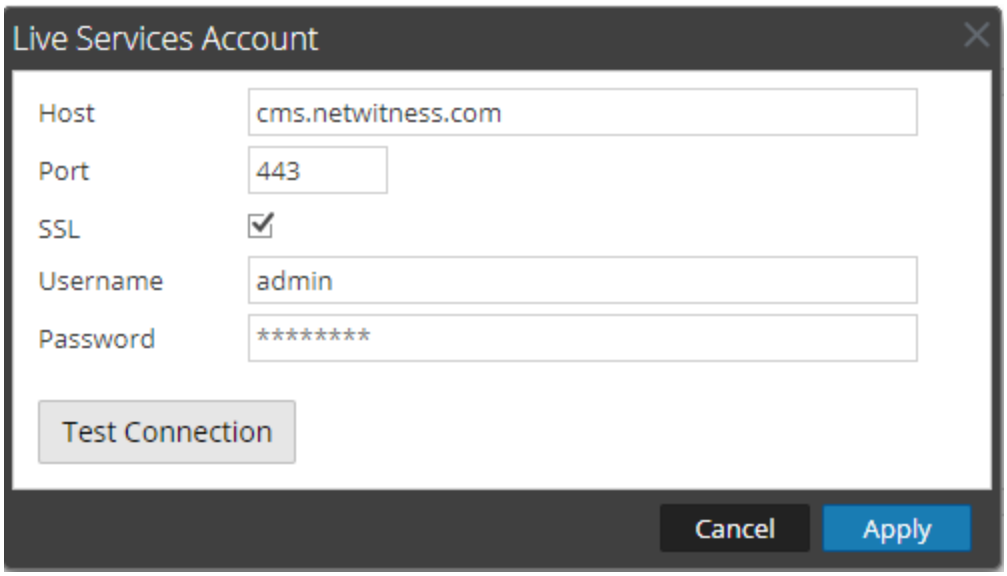
Set Up Live Services on NetWitness Platform

To set up Live on NetWitness Platform, you configure the connection and synchronization between the CMS server and NetWitness Platform. The user interface for this setup is the **ADMIN > System > Live Services** Configuration panel.



To configure the connection to the CMS Server:

1. Configure the connection to the CMS server and the Live account.

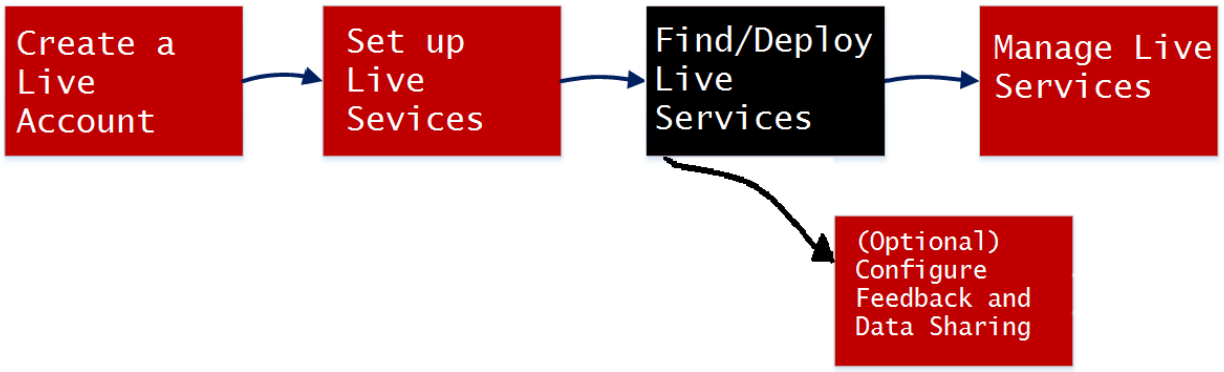


2. Configure the timing for synchronization of NetWitness Platform with updates from Live.

For more details, see the "Configure Live Services Settings" topic in the *System Configuration Guide*.

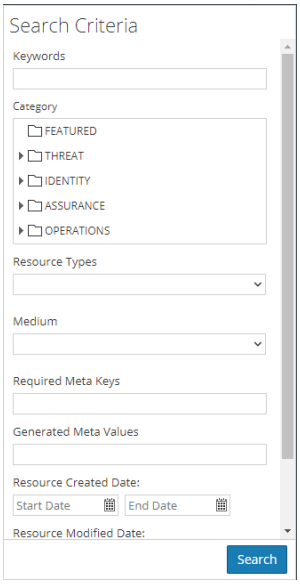
Find and Deploy Live Resources

Administrators can search for resources in the Live Search view, which is also the same as browsing the Live CMS for resources using the Search Criteria panel of the Live Search View.



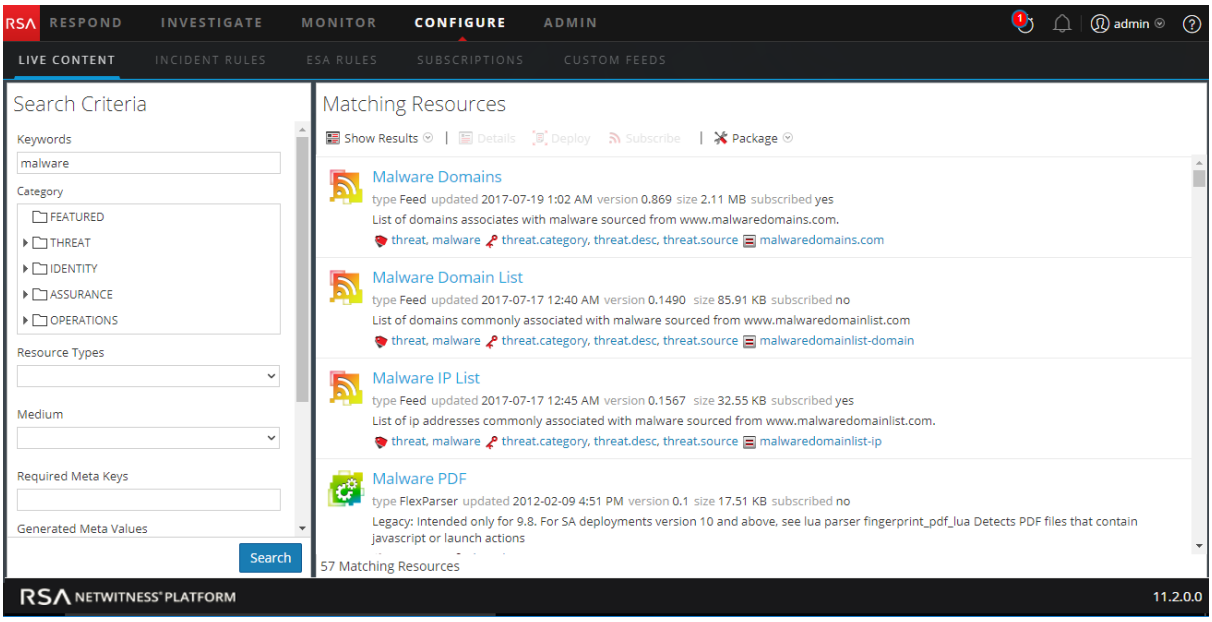
To find resources:

1. In the **Search Criteria** panel, specify search criteria. Enter any or all of these: keyword, category, type of resource, medium, meta keys, meta values, date resource was created, and date resource was modified.



2. Click **Search**.

   Detailed results are shown in the Matching Resources panel.



3. (Optional) To further narrow the results In the Matching Resources panel, click on a tag, meta key, medium or resource meta value in a result.

Deploy Resources in Live

In RSA NetWitness Platform, you can deploy selected resources manually, using the Deployment Wizard, or you can subscribe to a group of resources.

- When you have results from browsing resources in NetWitness Platform Live, you can deploy resources manually to a service or a service group without subscribing to the resources.
- Deploying resources manually deploys to services without taking advantage of the powerful resource management capabilities of NetWitness Platform. If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy them in the Live Configure View.

To deploy manually:

1. Select a resource or group of resources, or select a previously-created package of resources.
2. Click **Deploy**, which starts the Deployment Wizard.
3. Review the list of selected resources.
4. Select the Services or Service Groups on which to deploy the selected resources.
5. Review your previous selections.
6. Deploy.

The following procedure describes how to deploy a group of resources or a resource package:

- You can select one or more resources in the Live Resource View , then deploy them to services.
- Or, if you have previously created and saved a resource package, you can deploy the package to services. Please refer to Resource Package Deployment Wizard for instructions on how to create a package.

To deploy resources manually:

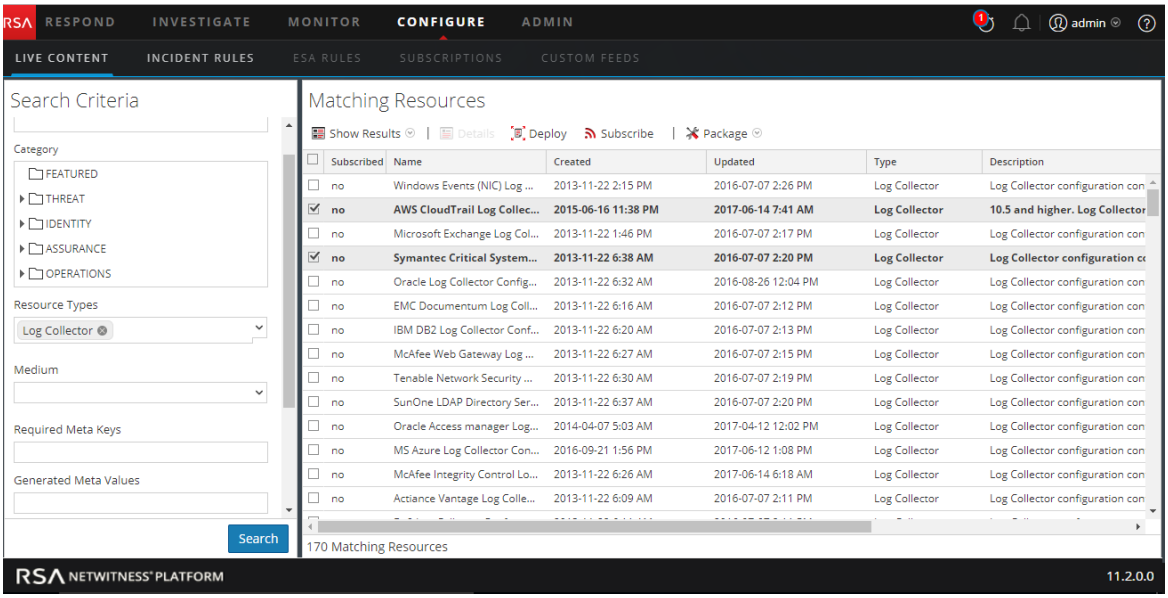
1. Go to **CONFIGURE > Live Content**.
2. Select a group of resources, or a previously created resource package.

   To select a resource or group of resources:

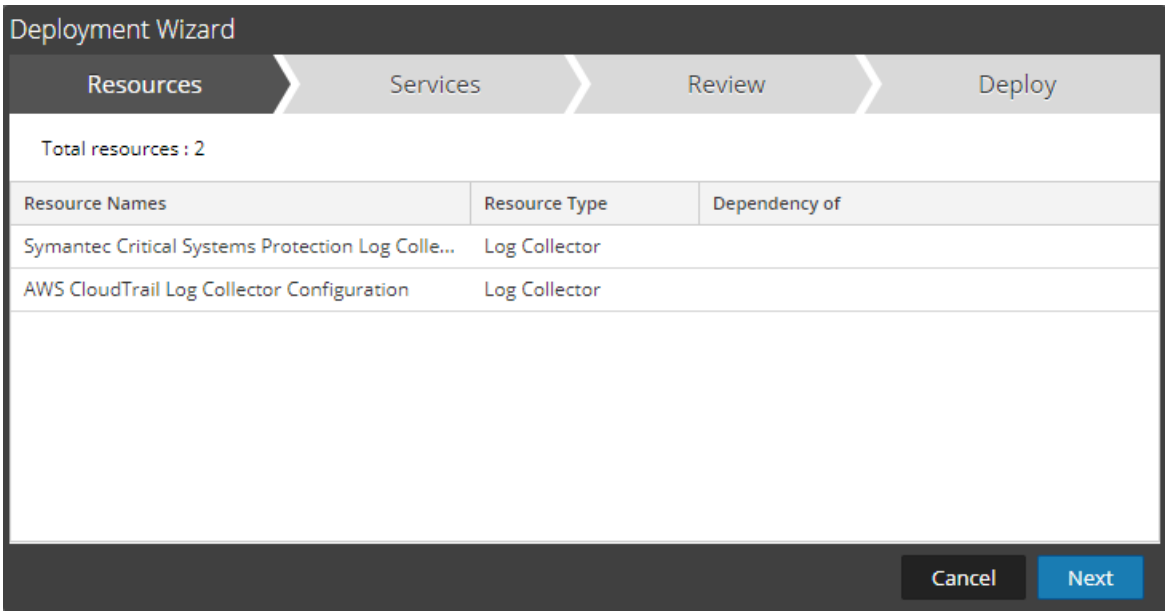
   a. In the **Live Search View,** browse Live resources (for example, search for the **Log Collector** resource Type).

   b. In the **Matching Resources** panel, select **Show Results > Grid**.

   c. Select the checkbox to the left of the resources that you want to deploy.



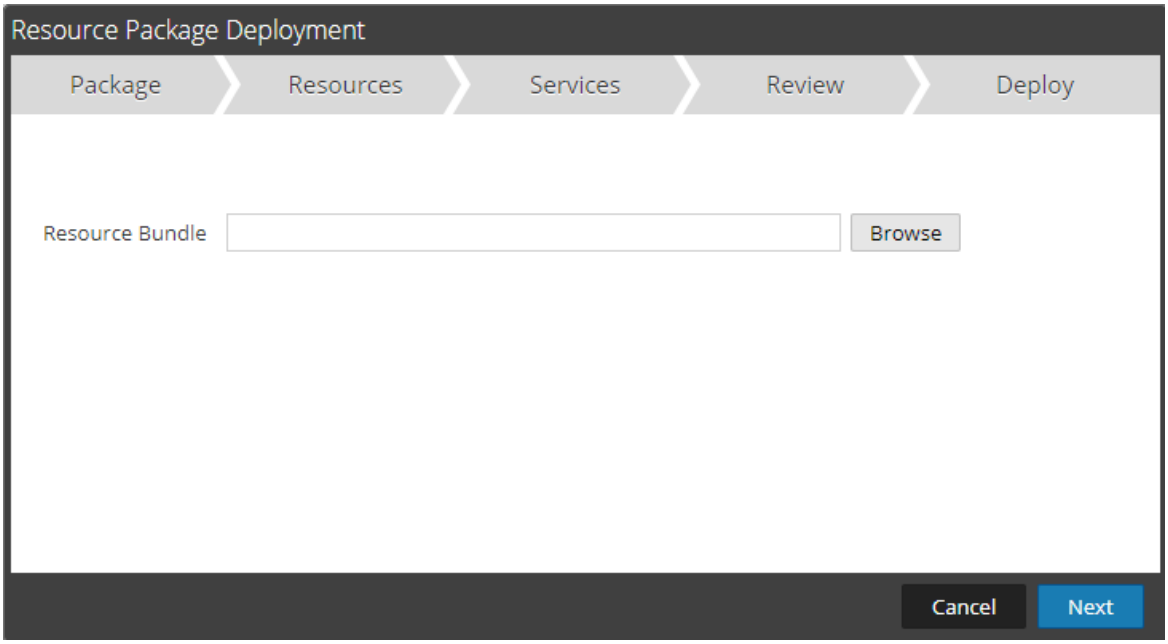
d. In the Matching Resources toolbar, click Deploy.



3. To select a resource package to deploy:

a. In the **Live Search** view **- Matching Resources** toolbar, select **Package** > **Deploy** .

The Package page of the Resource Package Deployment wizard is displayed.



b. Click Browse and select a package from your network (for example **resourceBundle-FeedsParsersContent.zip**).

c. Click **Open**.

At this point, whether you are deploying a package or a group of resources, the **Deployment Wizard** opens, and the **Resources** page is displayed.

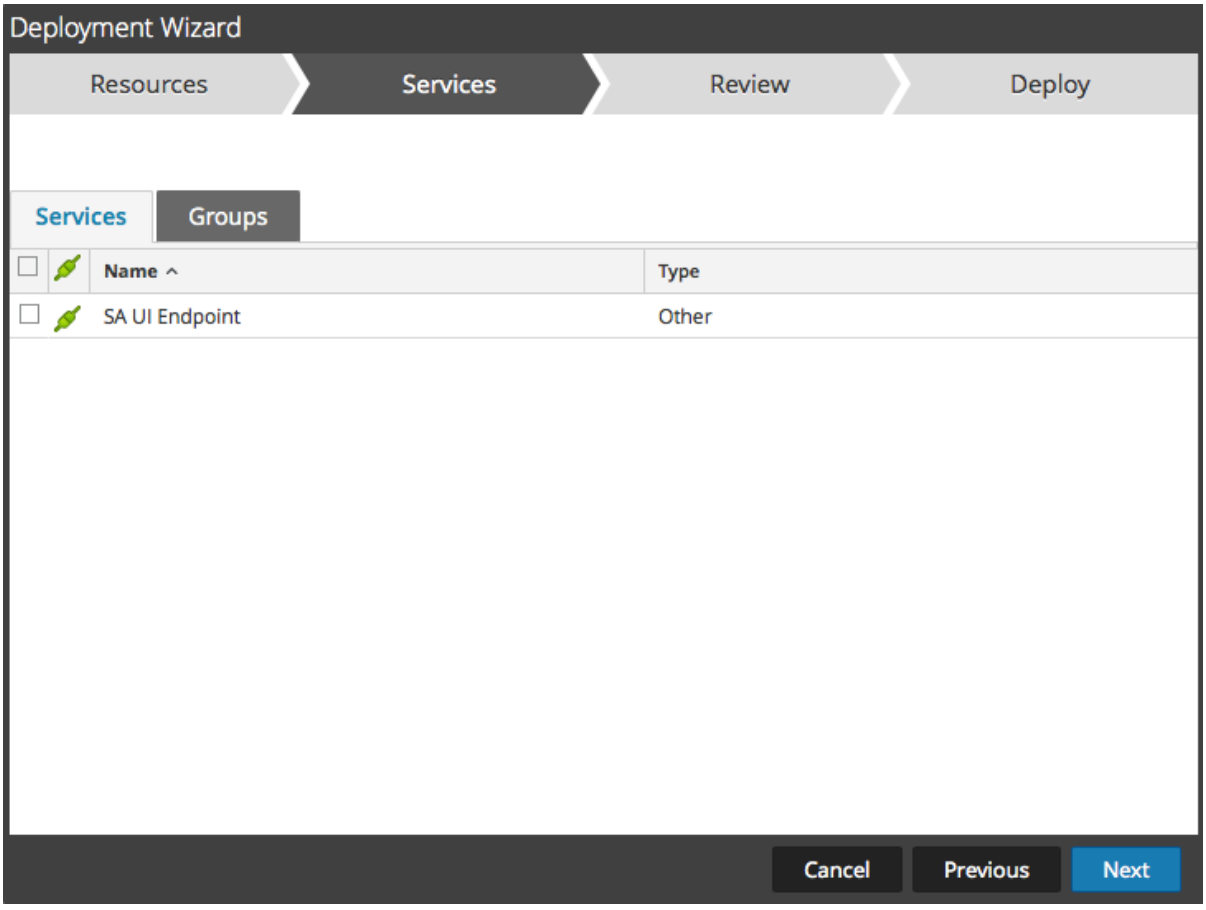
4. Click **Next**.

   The **Services** page displayed has two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the **ADMIN > Services** view. The columns are a subset of the columns available in the Services view.

   Note: The Live server is "smart" about deploying resources to Services. For example, it does not deploy resources that have a Medium of packets to any Log Decoders. This means that only applicable content resources are deployed to each Service.

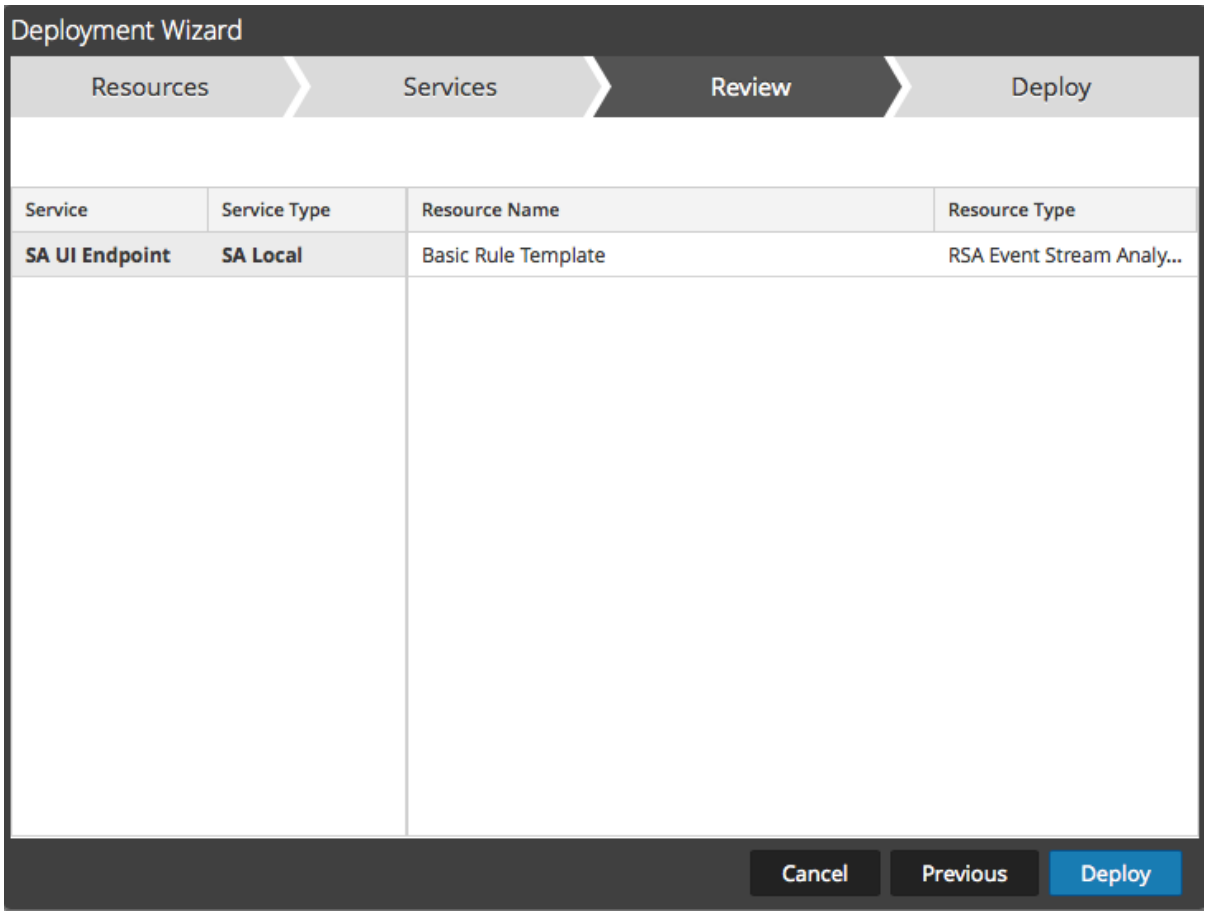
5. Select the services to which you want to deploy the content. You can select any combination of services and service groups.

   - Use the **Services** tab to select individual services, list of services and service groups that are configured in the **ADMIN** Services view.
   - Use the **Groups** tab to select groups of services.



6. Click **Next**.

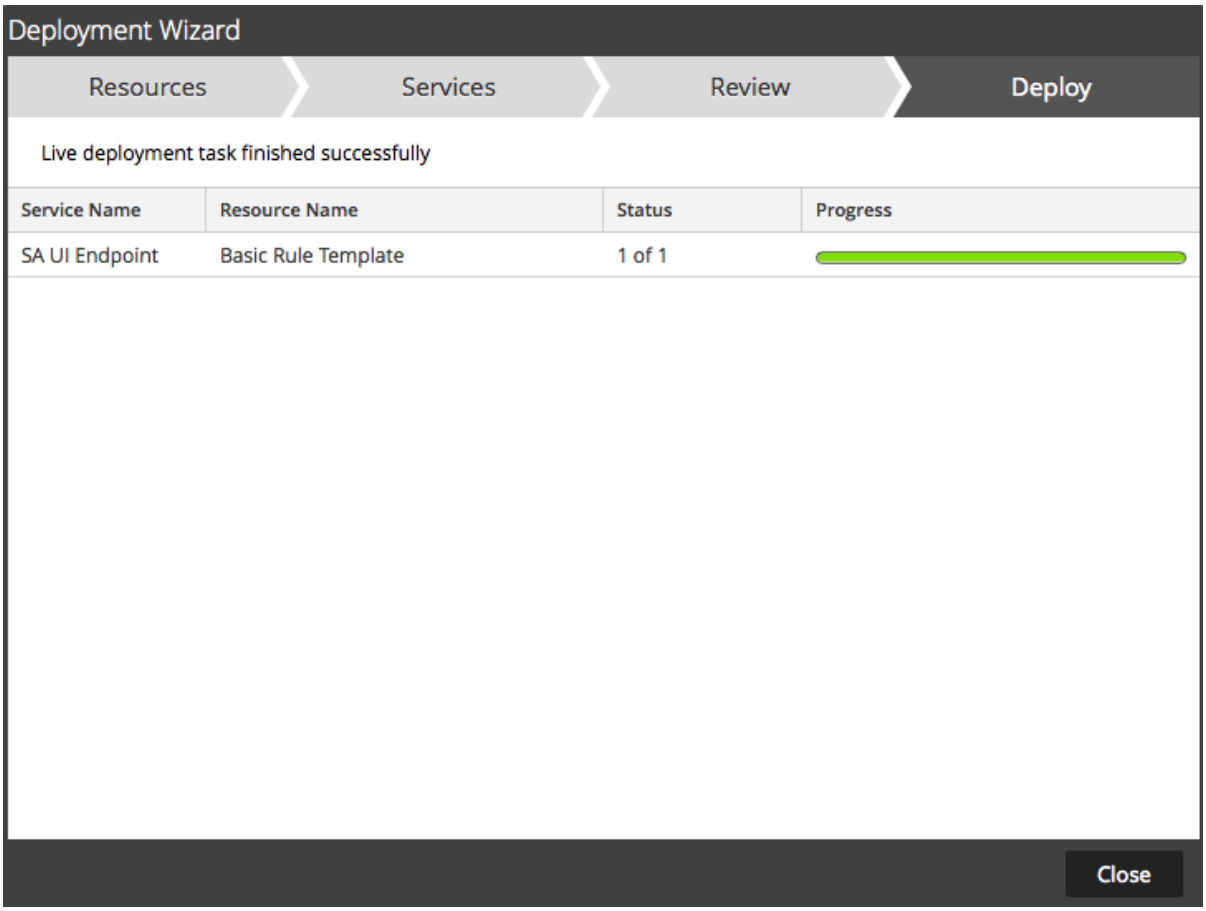
   The **Review** page is displayed.



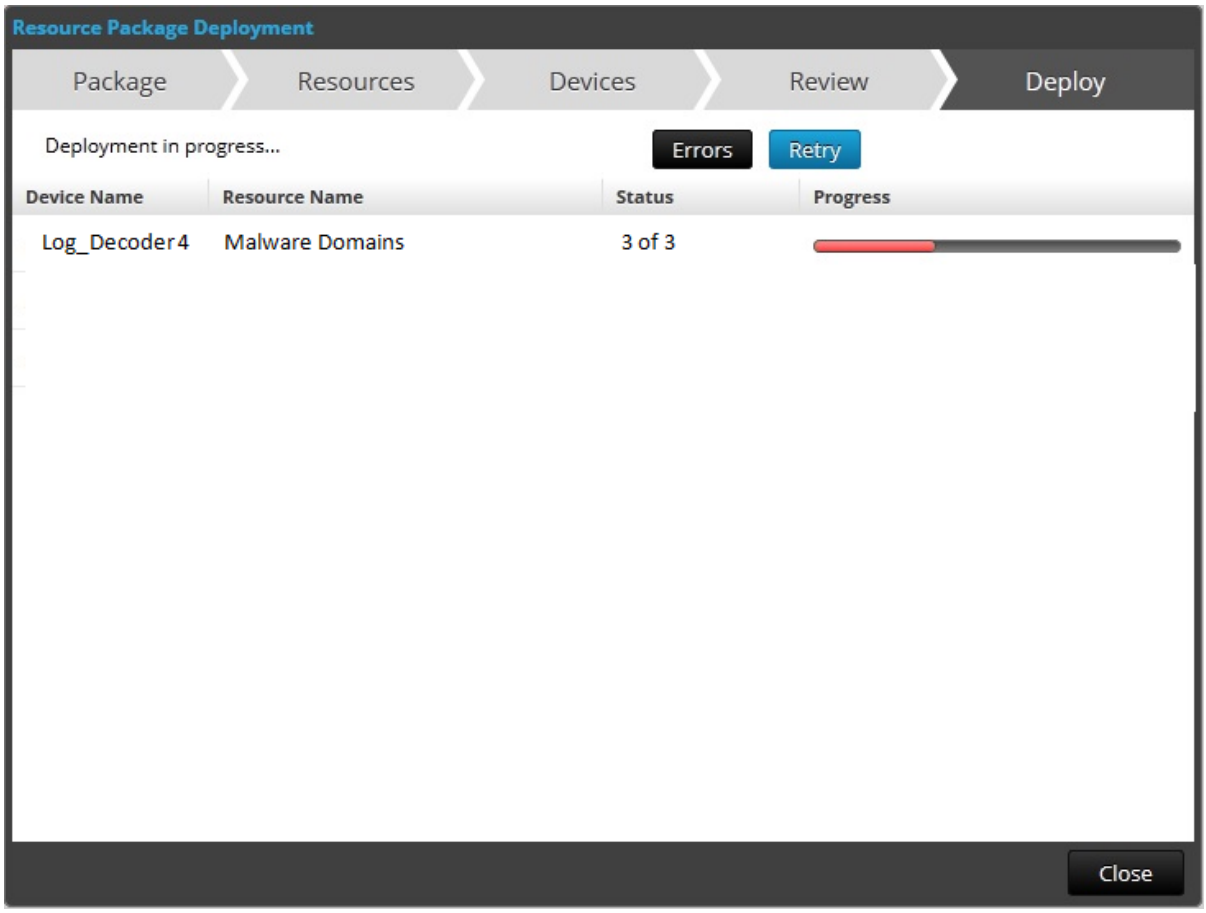
Make sure that you have selected correct resources and the services to which you want to deploy them.

7. Click **Deploy**.

   The **Deploy** page is displayed. The Progress bar turns green when you have successfully deployed the resources to the selected services.



If you try to deploy resources and services that are not compatible, NetWitness Platform displays the Errors and Retry buttons, which you can click to review the errors and re-attempt the deployment.



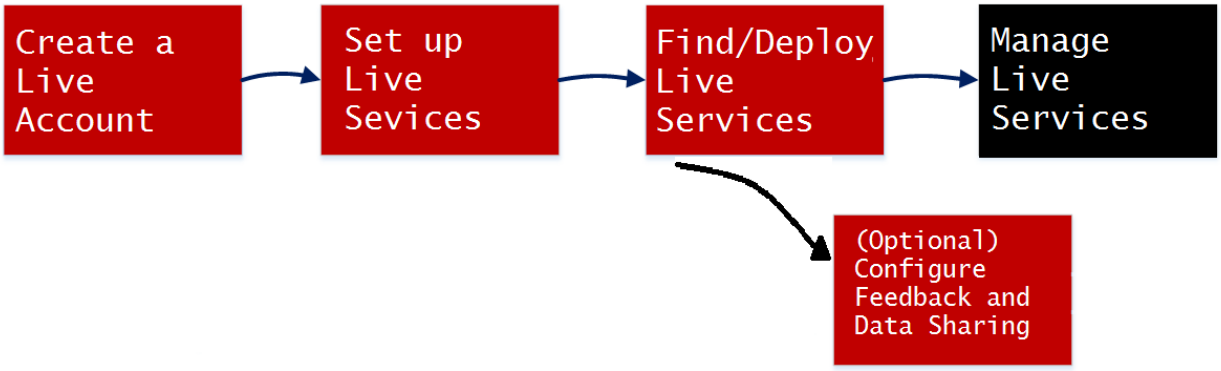
8. Click **Close**.

Next steps

After deploying parsers to Decoders and Log Decoders, you must enable parsers on the individual services as described in the *Decoder and Log Decoder Configuration Guide*.

Manage Live Resources

These procedures are required when administrators want to search for, subscribe to, and/or deploy resources from Live. With a connection to the CMS server, you can search for, subscribe to, and deploy resources from Live in accordance with your subscription level. Once you have found resources, you deploy them to services and service groups that have been configured in the Admin Services view.



Procedures

There are several possible workflows for deploying resources to services and managing those deployments. These include:

- Subscribe and deploy resources
- Deploy a resource bundle
- Remove deployments of resources
- Download resources
- Set up data feeds

Manage Subscription and Deployment

The subscription and deployment workflow takes advantage of the resource management tools available in Live. By subscribing to resources, you agree to receive updated resources in accordance with the synchronization configured in the **ADMIN > Live Configuration** panel.

By adding subscribed resources to the deployments list, you configure NetWitness Platform to automatically push those resources to the selected services at the configured synchronization intervals. This method requires some planning of service groups and services where resources are deployed. In addition:

- You can remove a resource from the deployments list in the Deployments Tab.
- You can unsubscribe from a resource in the Subscriptions Tab and the Live Resource View.

To manage subscriptions and deployment:

1. In the **ADMIN > SYSTEM > Live** panel, specify an interval at which NetWitness Platform checks for updates to subscribed resources in Live and specify the email addresses of people to receive an

email listing subscribed resources that have been updated.

2. In the **Live** > **Search** view, search for and subscribe to Live resources.
3. In the **Live** > **Configure** view > **Deployments** tab, select subscribed resources and add them to the deployment list for services groups.
4. (Optional) In the **ADMIN**> **SYSTEM**> **Live** panel, click 
to deploy the resources listed in the Deployments tab immediately.
5. In the **Live** > **Configure** view > **Deployments** tab, select deployed resources and remove them from services groups.
6. In the **Live** > **Configure** view > **Subscriptions** tab, unsubscribe from resources.

Remove a Deployed Resource

Once deployed to a service, Live resources remain on the service until removed. It is a good practice to remove unused resources from services on which they are deployed.

To remove deployed resources:

1. Go to the Live Resource View,
2. Unsubscribe from a resource, and remove it from deployed services.

Deploy a Resource Bundle

To deploy a content package, use the Resource Package Deployment Wizard. You can deploy a content package created in Live to one or more services. NetWitness Platform accepts packages in **.nwp** files or **.zip** files.

Download Resources

To download resources to your local file system, use the **Download** button in the Live Resource view.

Set Up Data Feeds

In the **Live** > **Feeds** view, you can set up and maintain Custom and Identify feeds.

Additional Procedures

This topic explains the additional procedures an administrator could choose to follow which are not essential for the configuration or use of Live Services.

- Export Data to RSA
- Packaging Resources
- Manage Custom Feeds
  - Creating a Custom Feed
  - Create a STIX Custom Feed
  - Creating and Managing an Identity Feed
  - Editing a Feed
  - Removing a Feed
- Miscellaneous Live Services Procedures

Export Data to RSA

A NetWitness Platform administrator can export the metrics in NetWitness Platform for Live Feedback.

About Live Feedback

In the Live Services Configuration panel, there is a Live Feedback Activity Log which enables you to download the usage data required for Live Feedback. This is active regardless of the Live Account configuration.

If the Live Account is not configured, you can manually upload the usage data to RSA. For more information, see the "Configure Live Services Panel" topic in the *System Configuration Guide*.

You can first download the Live Feedback historical data, and then upload it to share with RSA.

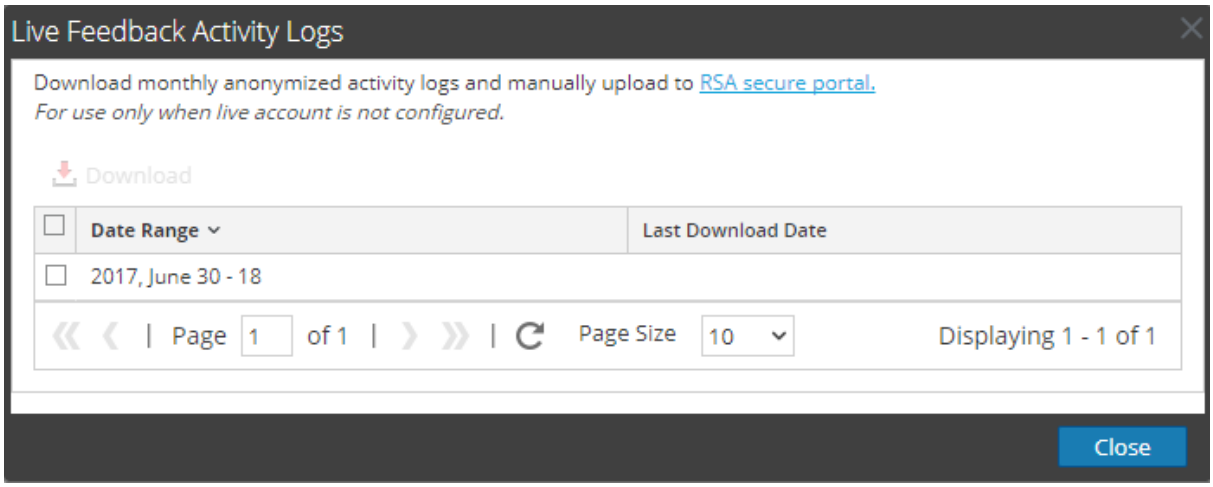
Download Live Feedback Historical Data

To download the Live Feedback historical data:

1. Go to **ADMIN** > **System**.
2. In the options panel, select **Live Services**.

   The **Live Account** screen is displayed which consists of the **RSA Live Status** and Download **Live Feedback Activity Log**.
3. Click **Download Live Feedback Activity Log**.

   The **Download Live Feedback Activity Log** window opens which allows you to download the required Live Feedback historical data.



4. Select one or multiple entries by selecting the checkboxes and click **Download**.

   Note: If you select multiple entries in the history table, the downloaded zip file consists of an individual JSON file for each month.

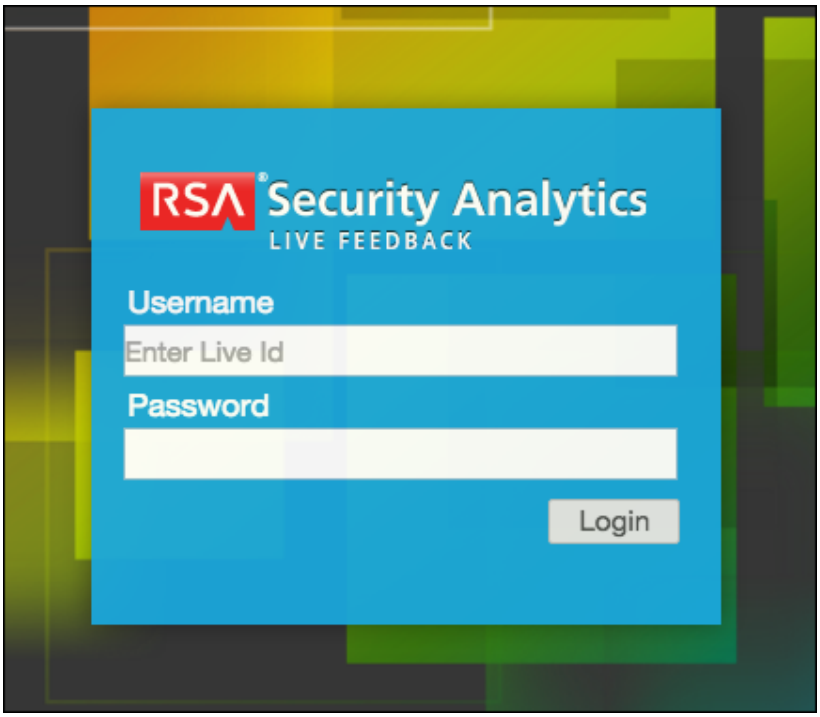
The downloaded Live Feedback data is in JSON format, and is bundled as a .zip file. For more information, see "Live Feedback Overview" in the *System Configuration Guide*.

Share Data to RSA

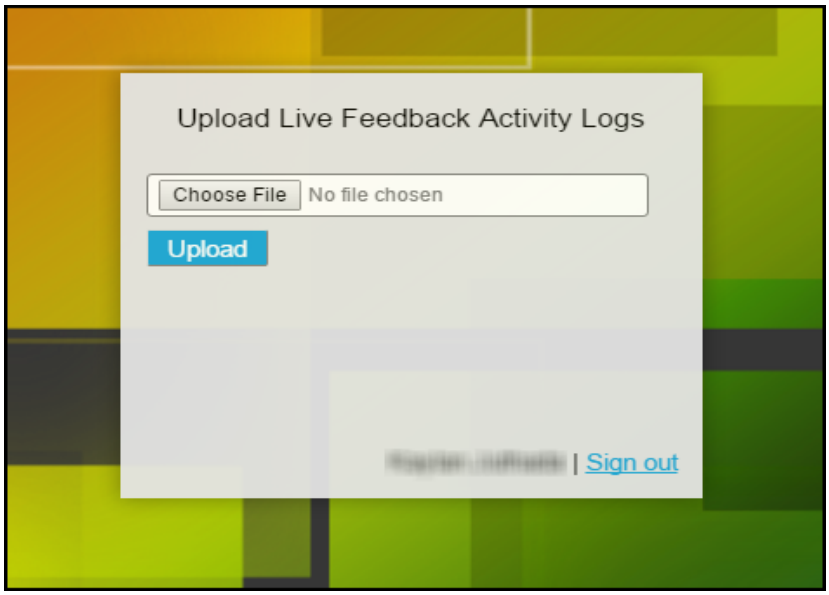
After you download the Live Feedback data, you can then upload it using the following procedure.

To share the data to RSA:

1. Click on the **RSA Secure Portal** available on the **Live Feedback Activity Logs** window.
   The RSA NetWitness Platform Live Feedback log on screen is displayed.
2. Log on to the Upload Live Feedback Activity Logs portal using your Live ID credentials.



3. Click **Download Live Feedback Activity Log**.



4. Click **Upload**.

Packaging Resources

The primary use for creating and subsequently deploying a resource package is for customers using an air gap network environment. In this case, you create a resource package on the network that is connected to the internet, and then deploy the resource package on the more secure network.

Create and Deploy Resource Package Use Case

The basic steps are as follows:

1. Access NetWitness Platform Live Services using an instance that is connected to the internet.
2. Create a Resource package as described below, adding whichever content items you need.
3. Copy the ZIP archive of the packages to your secure NetWitness Platform instance, by using a thumb drive or other manual copying process.
4. On the secure NetWitness Platform instance, deploy the resource package. For more information, see Resource Package Deployment Wizard.

Prerequisites to Create a Resource Package

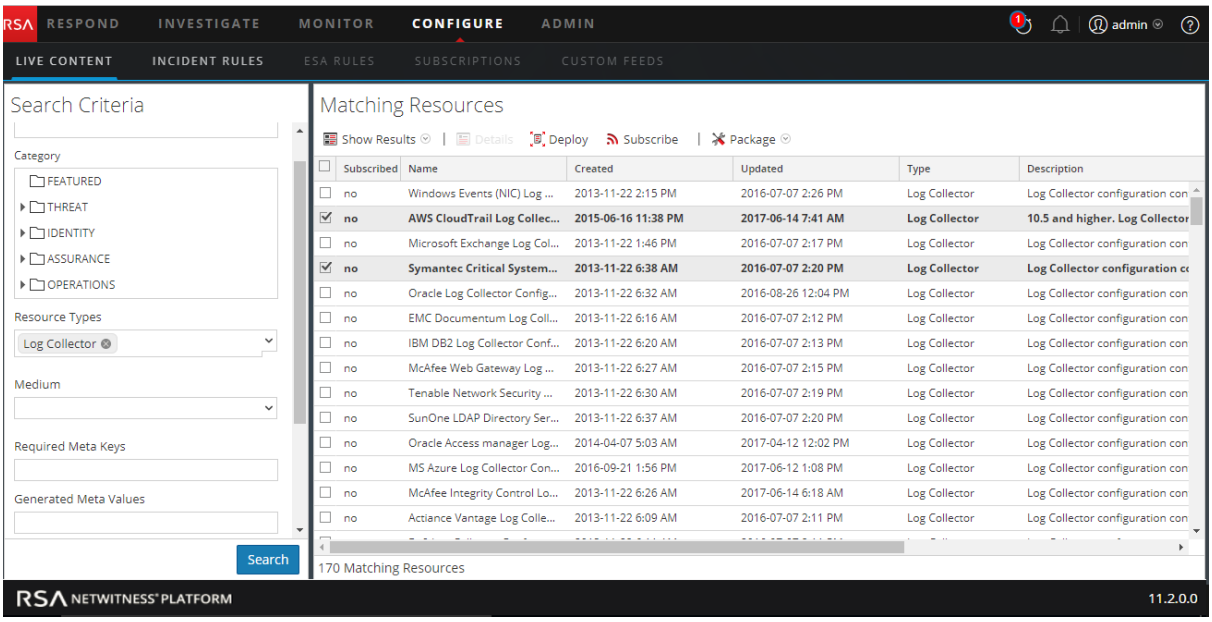
A prerequisite for creating resource packages is configuration of the connection and synchronization between the CMS server and NetWitness Platform and the ability to search for resources in the User Interface.

Creating a Resource Package

The following procedure describes how to create a resource package, as a ZIP archive and save it to your local file system.

To create a resource package:

1. Go to **CONFIGURE** > **Live Content** from the RSA NetWitness UI.
2. Select the resources that you want to package in the Matching Resources grid.



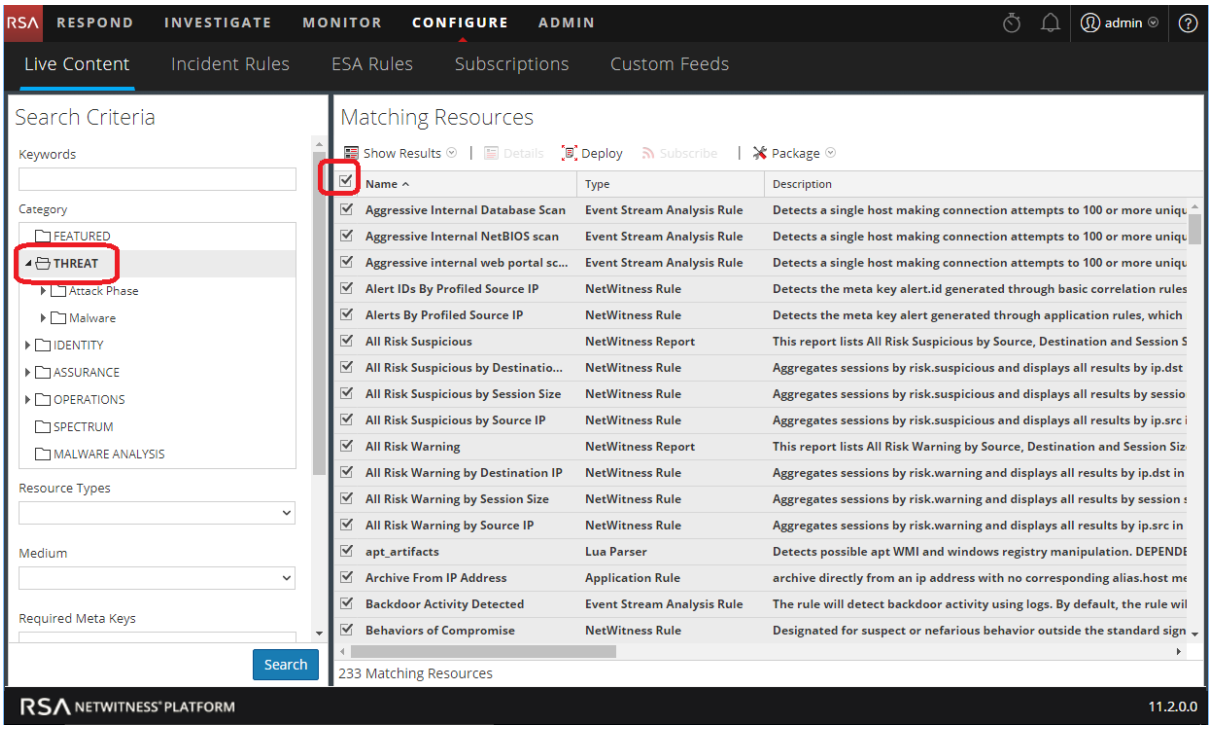
3. Select some or all of the resources that are listed in the Matches Resources pane.
4. Select Package > **Create**.

NetWitness Platform creates a **.zip** archive that contains the selected resources and downloads it to your default download folder. NetWitness Platform gives the package a generic name. You should rename it when you save it so that it identifies the resources contained in the package.

Creating Threat Package

The following procedure describes how to create a resource package that contains all the content that is categorized as **Threat**. Then we rename it, using the type of content and date.

1. Go to **CONFIGURE > Live Content**.
2. From the **Category** section, select **THREAT**.
3. Select all items returned by clicking on the checkbox in the column header row of the **Matching Resources** pane.



4. Select Package > **Create**.

   A ZIP archive is saved to your Downloads folder. For example, **resourceBundle8740753704980701969.zip**.

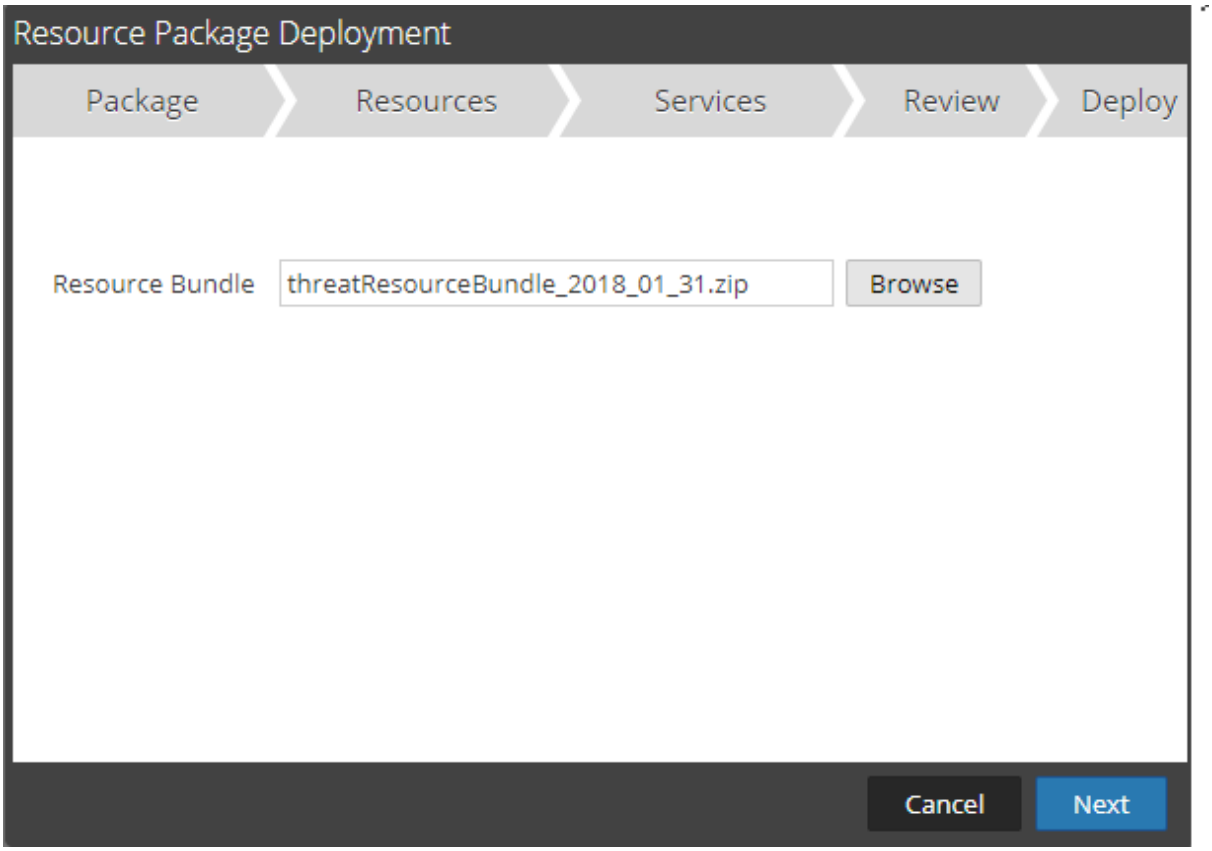
5. Rename the package to something meaningful. For example, in this case, you cold change the package name to **threatResourceBundle_2018_01_31.zip** (assuming today's date is January 31, 2018).

The resource package is now available for later deployment.

Deploying a Threat Package

Continuing the previous example, the following procedure describes how to deploy the resource package.

1. Go to **CONFIGURE > Live Content**.
2. In the **Matching Resources** pane, select Package > **Deploy**.
3. Click **Browse** and navigate to the **threatResourceBundle_2018_01_31.zip** file that were created earlier.



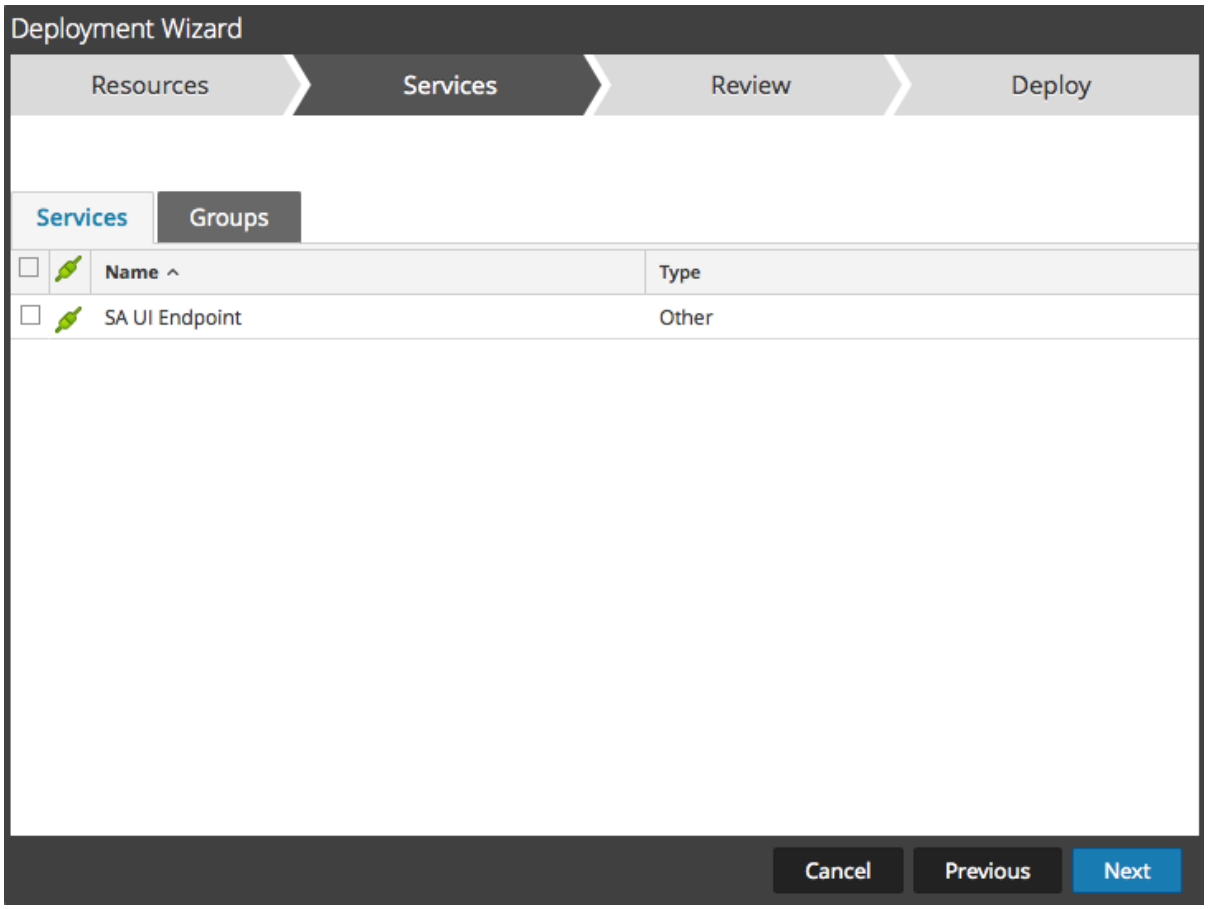
4. Click **Next**.

   The **Resources** page displays details for the resources in the package.

5. Click **Next**.

   The **Services** page displays two tabs, **Services** and **Groups**, which provide a list of services and service groups that are configured in the **ADMIN > Services** view. The columns are a subset of the columns available in the Services view.

6. Select the services to which you want to deploy the content. You can select any combination of services and service groups.



Click **Next**.

The **Review** page is displayed.

Note: Make sure that you have selected correct resources and the services to which you want to deploy them.

7. Click **Deploy** to complete the deployment process. Alternatively, you can choose **Cancel** or **Previous** to either cancel the deployment or go back to the previous screen.

Manage Custom Feeds

This topic introduces the custom feed capability, which is implemented using the Custom Feed Wizard in RSA NetWitness Platform, to quickly populate Decoders with custom and identity feeds.

Custom Feed Creation

You use the **Live** > **Feeds** > **Setup Feed** > **Configure a Custom Feed** wizard to quickly create and deploy Decoder feeds based on deterministic logic that offers the meta keys specific to the selected Decoders and Log Decoders. Although the wizard guides you through the process to create both on-demand and recurring feeds, you should understand the form and content of a feed file when you create a feed.

Feed file names in RSA NetWitness Platform are in the form `<filename>.feed`. To create a feed, NetWitness Platform requires a feed **data** file in `.csv` or `.xml` (for STIX) format and a feed **definition** file in `.xml` format, which describes the structure of a feed data file. The Configure a Custom Feed wizard can create the feed definition file based on a feed data file, or based on a feed data file and the corresponding feed definition file.

The files that you use to create an on-demand feed must be stored on your local file system. The files used to create a recurring feed must be stored at an accessible URL, whence NetWitness Platform can fetch the most current version of the file for each recurrence. After a NetWitness Platform feed is created, you can download the feed to your local file system, edit the feed files, and then edit the NetWitness Platform feed to use the updated feed files.

Sample Feed Definition File

This is an example of a feed definition file named `dynamic_dns.xml`, which NetWitness Platform creates based on your entries in the Feed wizards. It defines the structure of the feed data file named `dynamic_dns.csv`.

Note: The feed file path should be `.csv` regardless of the Feed Type (Default or STIX).

```
<?xml version="1.0" encoding="utf-8"?>
 <FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">

   <FlatFileFeed name="Dynamic DNS Domain Feed"
   path="dynamic_dns.csv"
   separator=","
   comment="#"
   version="1">

   <MetaCallback
   name="alias.host"
   valuetype="Text"
   apptype="0"
   truncdomain="true"/>

   <LanguageKeys>
            <LanguageKey name="threat.source" valuetype="Text" />
            <LanguageKey name="threat.category" valuetype="Text" />
            <LanguageKey name="threat.desc" valuetype="Text" />
   </LanguageKeys>

   <Fields>
   <Field index="1" type="index" key="alias.host" />
   <Field index="4" type="value" key="threat.desc" />
   <Field index="2" type="value" key="threat.source" />
   <Field index="3" type="value" key="threat.category" />
   </Fields>
   </FlatFileFeed>

 </FDF>
```

Feed Definition Equivalents for Custom Feed Wizard Parameters

The NetWitness Platform Feeds wizard provide options to define the structure of the data feed file. These correspond directly to attributes in the feed definition (.xml) file.

NetWitness Platform Parameter	Feed Definition File Equivalent
	Define Feed tab
Feed Type	Select: **Default** - to define a feed based on a `.csv` formatted feed data file. **STIX** - to define a feed based on STIX formatted `.xml` file.
Feed Task Type	Select: **Adhoc** - to create an on-demand feed. **Recurring** - to create a feed that recurs automatically.
Name	Enter a custom feed name in the feed data file that corresponds to the `flatfeedfile name` attribute in the feed definition file; for example, `Dynamic DNS Test Feed`.
File/ Browse	Enter a name of the feed data file that corresponds to the `flatfeedfile path` attribute in the feed definition file; for example, `dynamic_dns.csv`.
(STIX, Recurring) **Trust All Certificate**	Select **Trust All Certificate**, if you do not want to validate the REST server certificate. This option is enabled by default (checked).
(STIX, Recurring) **Certificate/Browse**	For client authentication with the REST URL, in the **Certificate** field, click **Browse** and select the self signed certificate. The supported certificate formats are .cer, .crt with Base64 & DER encoded files.
	Define Feed tab - Advanced Options
XML Feed File	Enter a name of the feed definition file, for example, `dynamic_dns.xml`.
Separator	The separator character used to separate attributes in the feed data file. It corresponds to the **`flatfeedfile separator`** in the feed definition file; for example, a comma.
Comment	The character used to identify a comment in the feed data file. It corresponds to the **`flatfeedfile comment`** attribute in the feed definition file; for example, #.
Remove STIX data older than	The number of days for which the STIX packages downloaded from TAXII server have to be stored. The STIX packages older than the specified number of days are deleted automatically. The default value is 180 days, which is also the maximum.
Select Services tab	Select the services to which you want to send the data feed.

NetWitness Platform Parameter	Feed Definition File Equivalent
(Define Columns tab, Define Index) **Type**	The type of lookup value in the index position of the feed data file. **IP** means that each row in the feed data file contains an IP address in the lookup value position. The IP value is in dotted-decimal format (for example, 10.5.187.42). **IP Range** means that each row in the feed data file contains a range of IP addresses in the lookup value position. The IP range is in CIDR format (for example, 192.168.2.0/24). **Non IP** means that the each row in the feed data file contains a metadata value other than IP address in the lookup value position. The Service Type and Truncate Domain, and Callback Keys fields become active for a Non IP index.
(Define Columns tab, Define Index) **CIDR**	Specifies that the IP value in the lookup position is in CIDR format. The **CIDR** attribute sets the IP address format in the field to Classless Inter-Domain Routing (CIDR) notation.
(Define Columns tab, Define Index) **Service Type**	For a Non IP index, the integer service type to filter meta lookups. It corresponds to **MetaCallback apptype** attribute in the feed definition file. A value of **0** indicates no filtering by service type.
(Define Columns tab, Define Index) **Truncate Domain**	For a Non IP index, for meta values that contain domain names (for example, hostnames), the system can strip off the host specific element in the data. Truncate Domain corresponds to the **MetaCallback truncdomain** attribute. If the value is www.example.com, it is truncated to example.com. A value of **False** selects no truncation, and **True** selects truncation.
(Define Columns tab, Define Index) **Callback Keys**	For a Non IP index, the available meta keys to match on instead of ip.src/ip.dst (the defaults for IP index type) are selectable from the drop-down list. The Callback Key corresponds to the **MetaCallback name** attribute, and the index column of the csv file must contain data that can match the chosen meta key. For example, if the username meta key is chosen, the index column of the csv file needs to be populated with users to be matched.
(Define Columns tab, Define Index) **Index Column**	Identifies the column in the feed data file that provides the lookup value for the row. Each position in each row of the feed data file is identified by a **Field index** attribute in the feed definition file. A field with an index of **1** is the first entry in a row, the second field has an index of **2**, the third field has an index of **3**, and so on. You can select multiple index columns, if the **Feed Type** is **STIX** and **Index Type** is **Non IP**. When you select multiple index columns the values from all the selected columns are merged in the first index column that you selected.
(DEFINE VALUES) **Key**	The name of the **LanguageKey**, as defined in the feed definition file, for which meta is created from this row of the feed data file. It corresponds to the **Field key** attribute in the feed definition file. A key applies only to a field whose type is set to **value**. In the feed definition file, there is a list of LanguageKeys from **index.xml**, or a summary name if Source Name and Destination Name are used. For example, **reputation** is a summary name for **reputation.src** and **reputation.dst**). This value is referenced by the Field key attribute.

Next steps

- Creating a Custom Feed
- Creating and Managing an Identity Feed
- Editing a Feed
- Removing a Feed

Creating a Custom Feed

This topic provides instructions for creating a custom feed using a .csv or STIX formatted feed data file in RSA NetWitness Platform.

Note: From 10.6.1 or later, NetWitness Platform supports Structured Threat Information Expression (STIX). For more information about STIX and creating a STIX custom feed, see Create a STIX Custom Feed.

You can easily create a custom feed using the Custom Feed wizard. To complete this procedure, you need a feed data file in `.csv`or `.xml` format. If you also have an associated feed definition file in `.xml` format, which describes the structure of the feed data file, you can use the feed definition file to create a feed. The Custom Feed wizard can create the feed based on a feed data file, or based on a feed data file and corresponding feed definition file.

After completing this procedure, you will have created a custom feed.

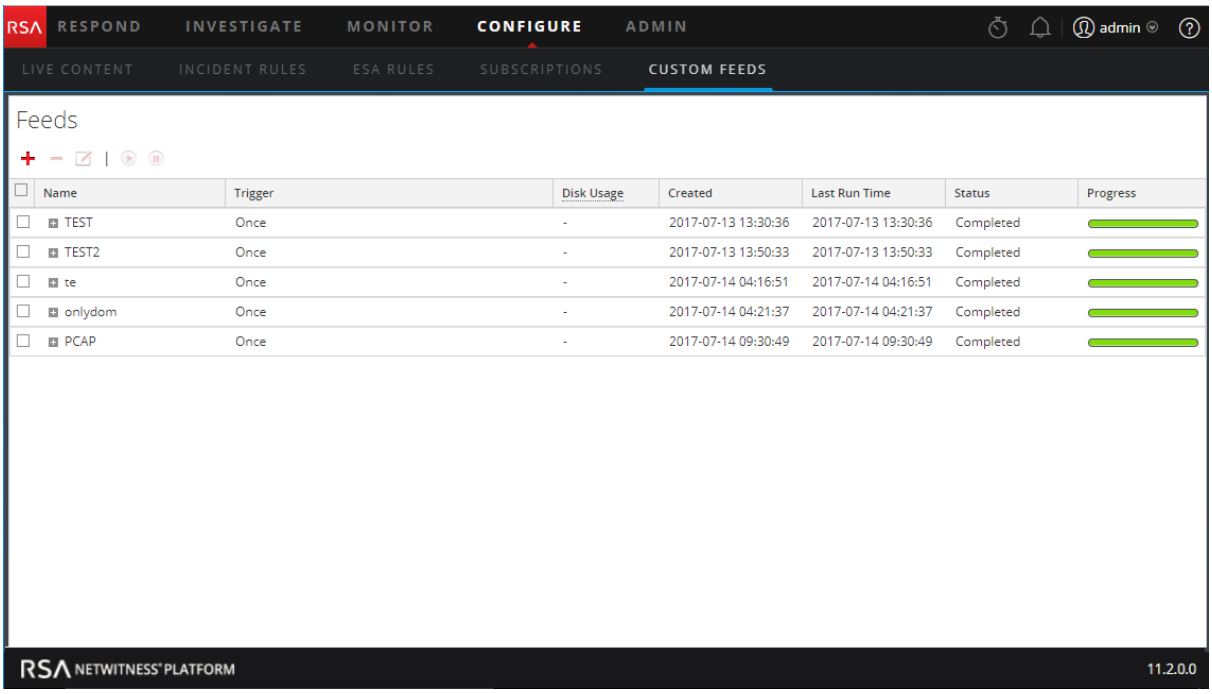
The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness Platform server.

Note: Any feeds that are created in 11.2 release or prior will be automatically pushed to Context Hub as Lists. The lists can be looked up in the context lookup panel of the Respond and Investigate pages. If Context Hub is not configured or the service is down, then the feeds will be pushed to Context Hub the next time the server is available.

To create a custom feed:

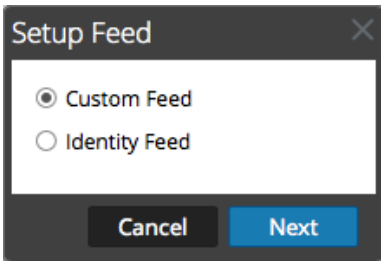
1. Go to t **CONFIGURE > CUSTOM FEEDS**.

   The Custom Feeds view is displayed.



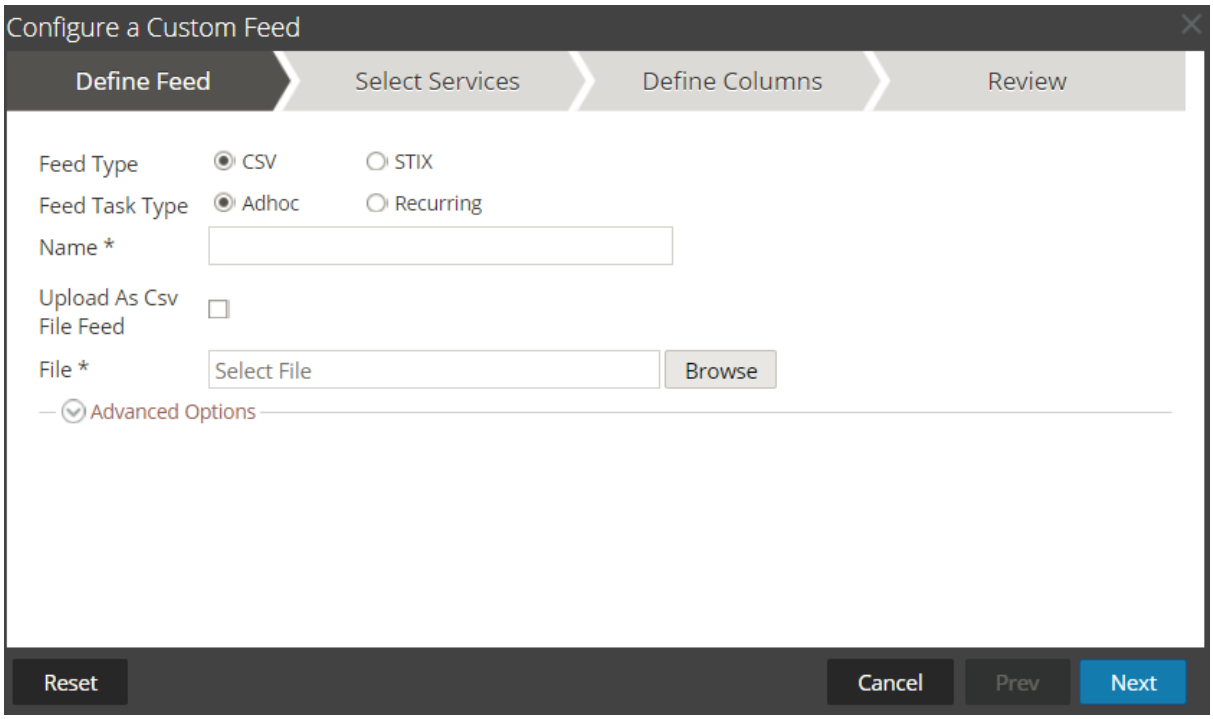
2. In the toolbar, click +.

   The Setup Feed dialog is displayed.



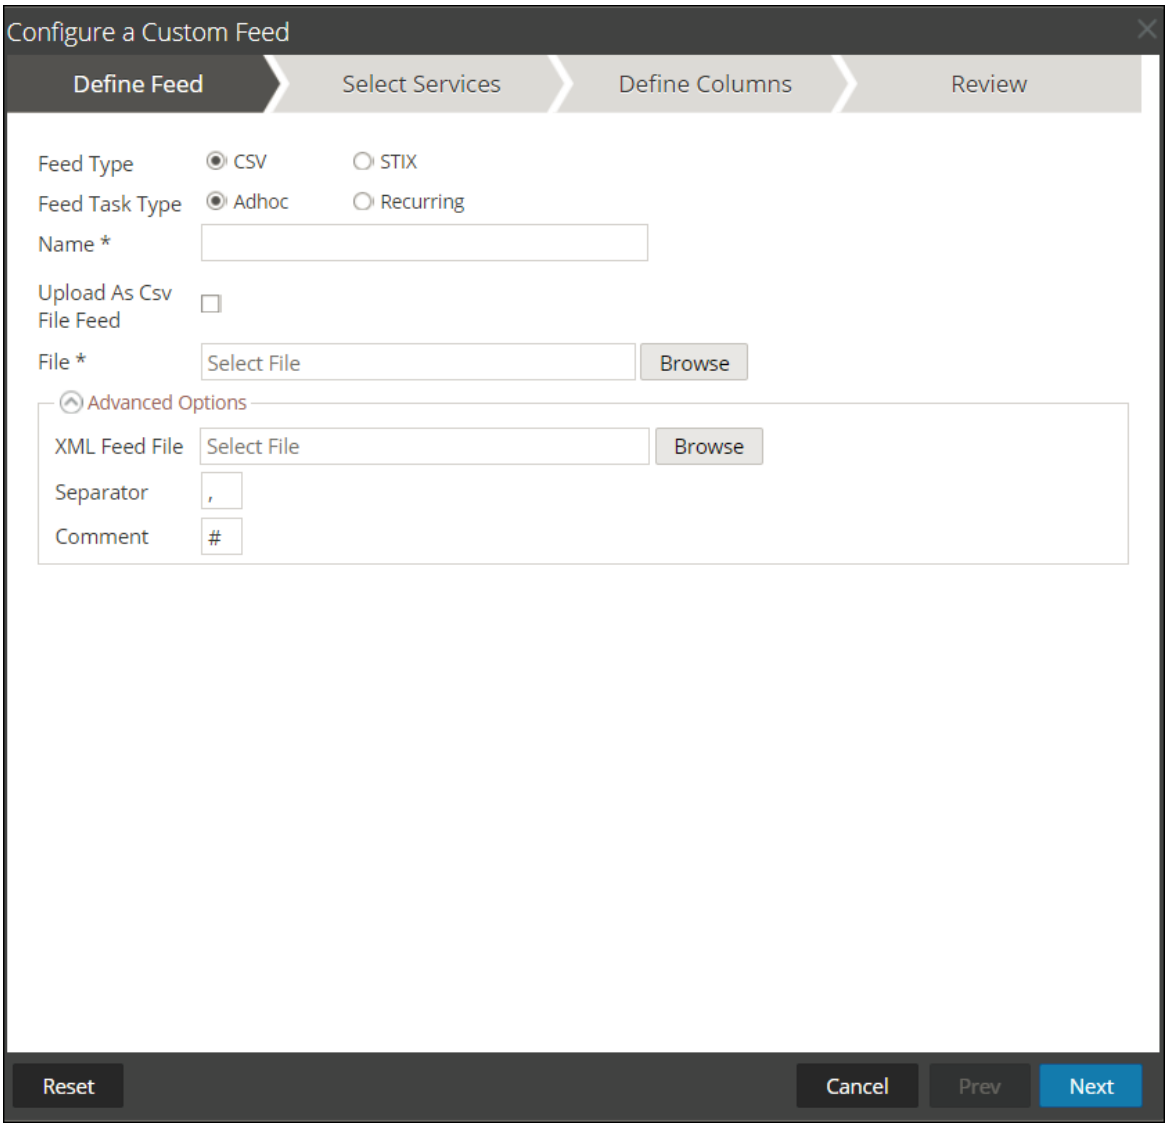
3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.



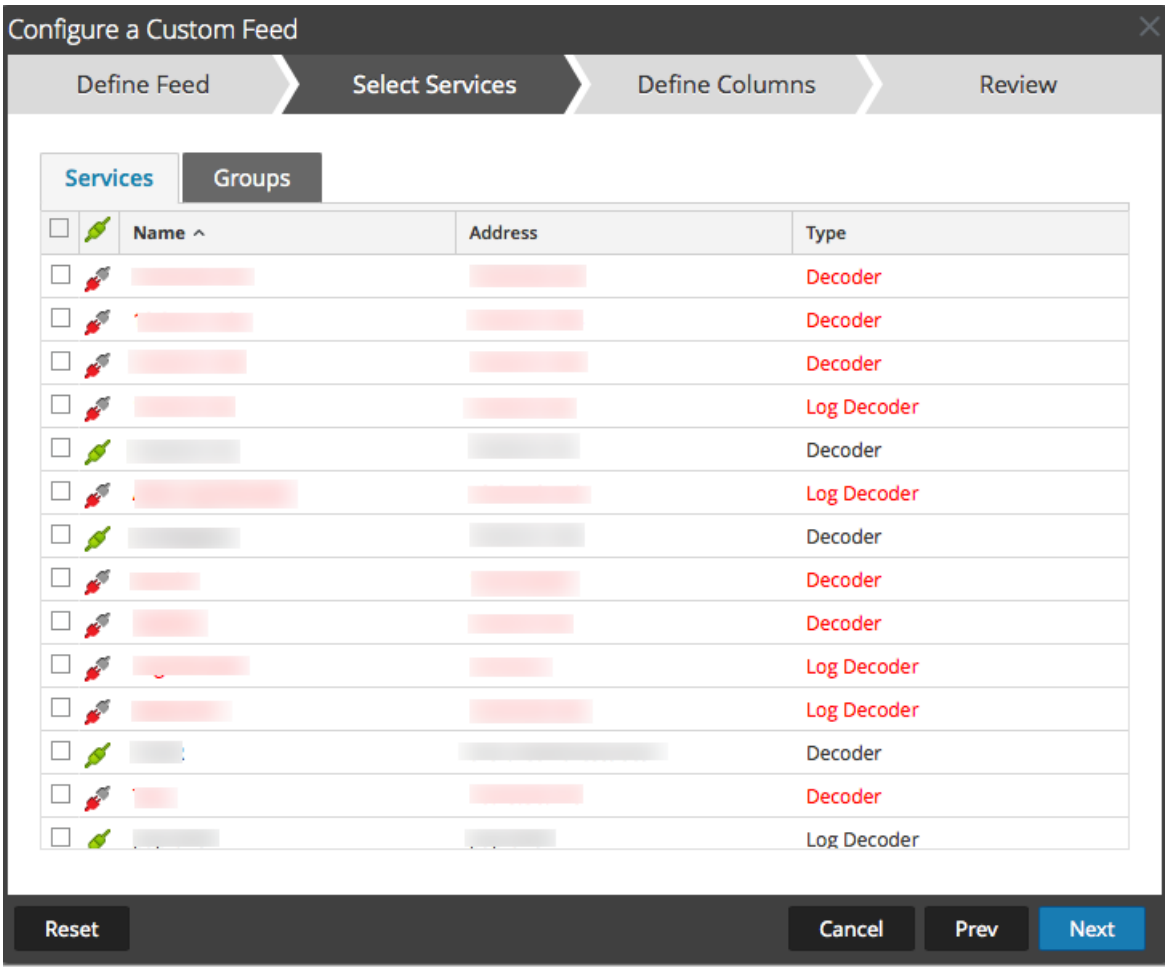
4. To define a feed based on a `.csv` formatted feed data file, select **CSV** in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on a .csv formatted feed data file, type the feed **Name**.
   b. Select the checkbox **Upload As CSV File Feed**, if required.
   c. Select a .csv content **File** from the local file system, and click **Next**.
   d. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

      The Advanced Options are displayed:



e. Select an XML feed file from the local file system, choose the **Separator** (default is comma), and specify the **Comment** characters used in the feed data file (default is #), and click **Next**.

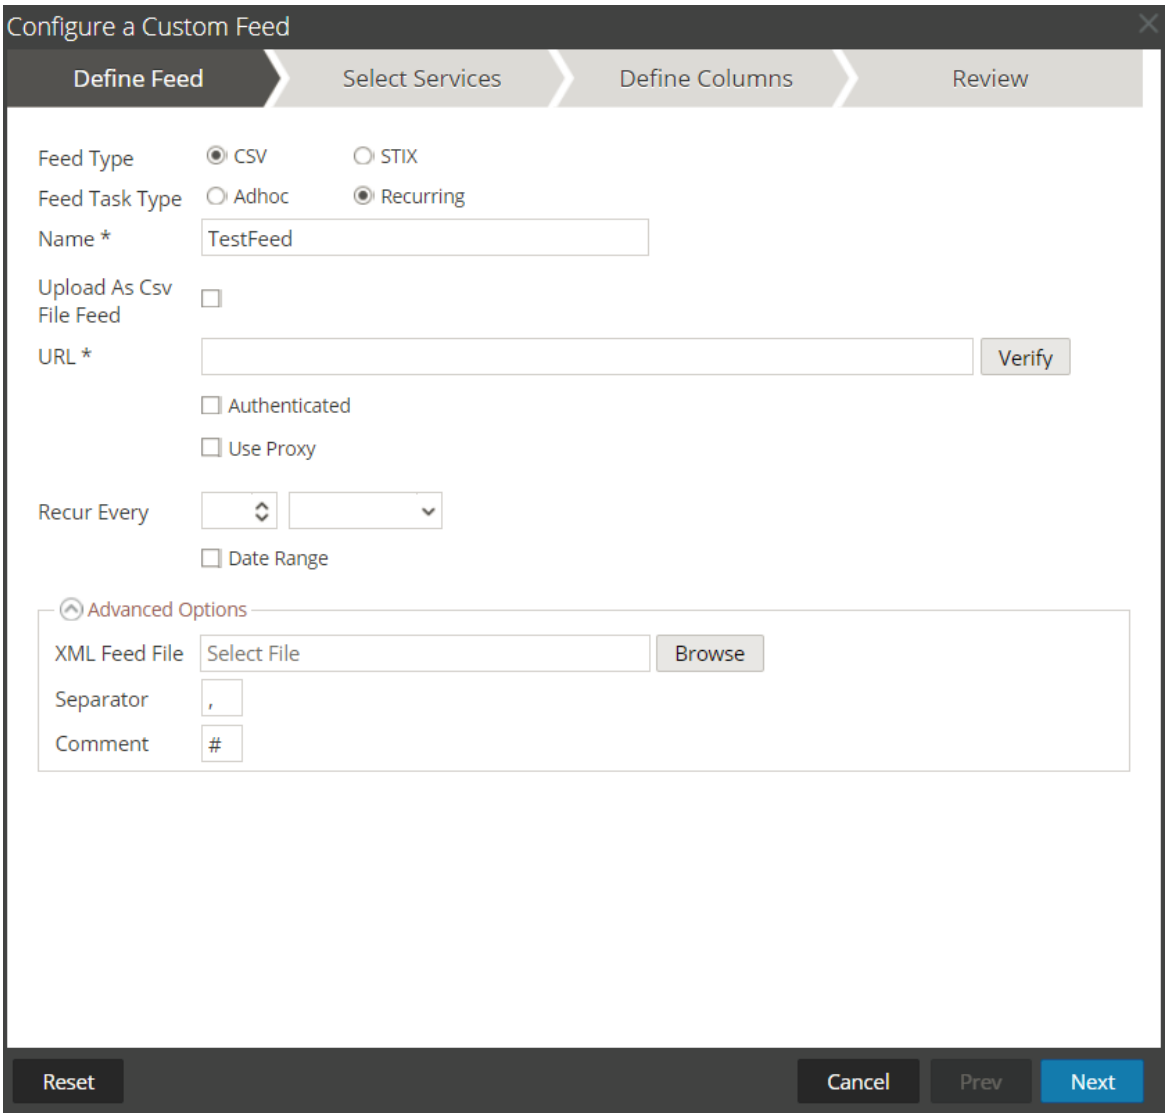
f. The Select Services form is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.



6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.

   a. Select **Recurring** in the **Feed Task Type** field.

      The Define Feed dialog includes the fields for a recurring feed.



b. In the **URL** field, enter the URL where the feed data file is located, for example, `http://<hostname>/<feeddatafile>.csv`, and click **Verify**.

   NetWitness Platform verifiies the location where the file is stored, so that NetWitness Platform can check for the latest file automatically before each recurrence.

c. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

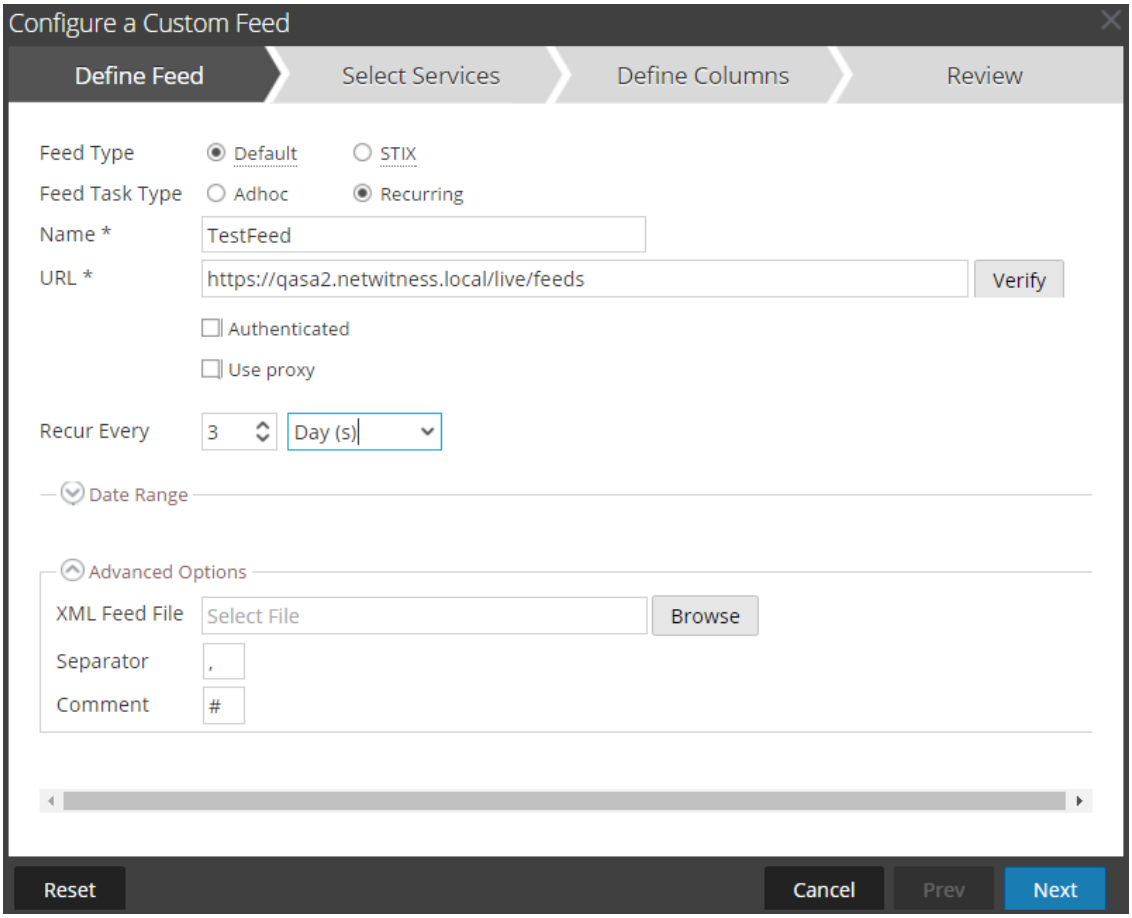
   NetWitness Platform provides your user name and password for authentication to the URL.

d. If you want the NetWitness Platform server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see the **Configure Proxy for NetWitness Platform** topic in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not selected.

e. To define the interval for recurrence, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.
- Specify recurrence every week, and select the days of the week.

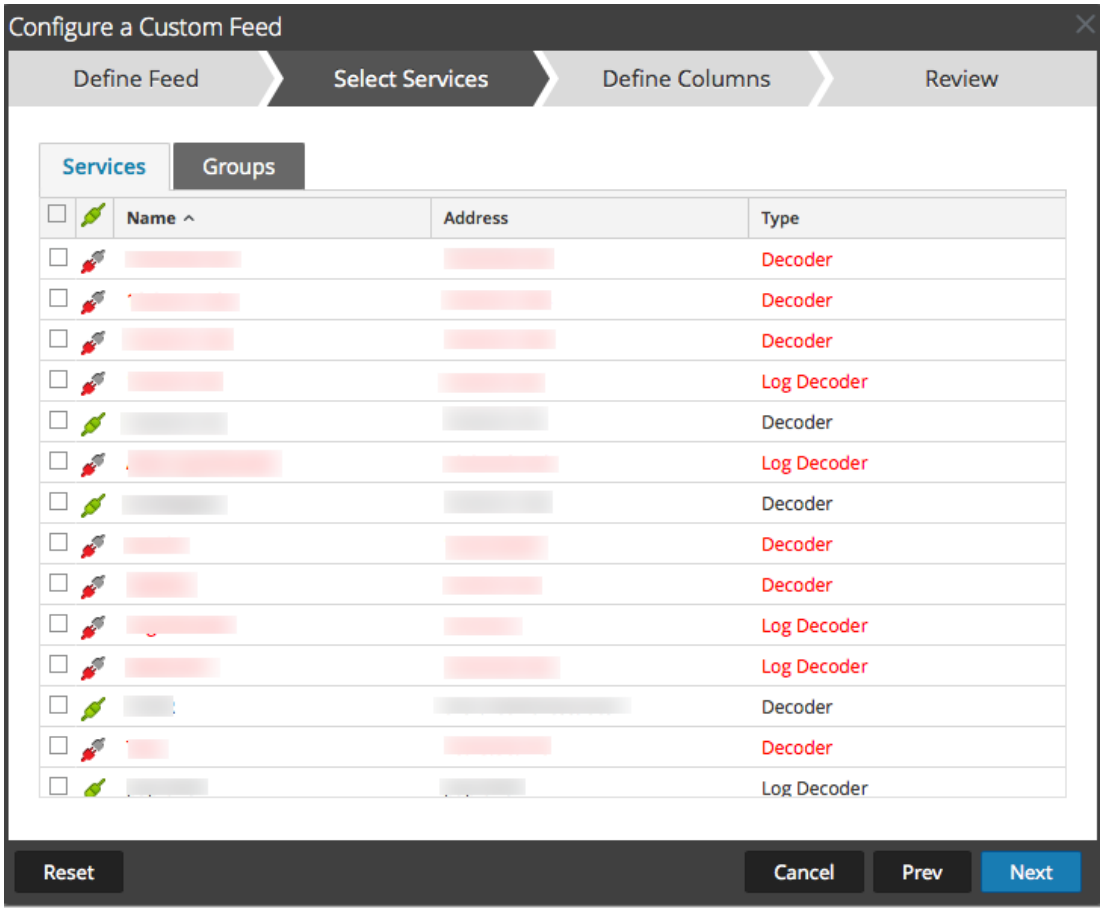
f. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.



7. (Conditional) If you want to define a feed based on an XML feed file:
   - Type the feed **Name**, select **Advanced Options**.

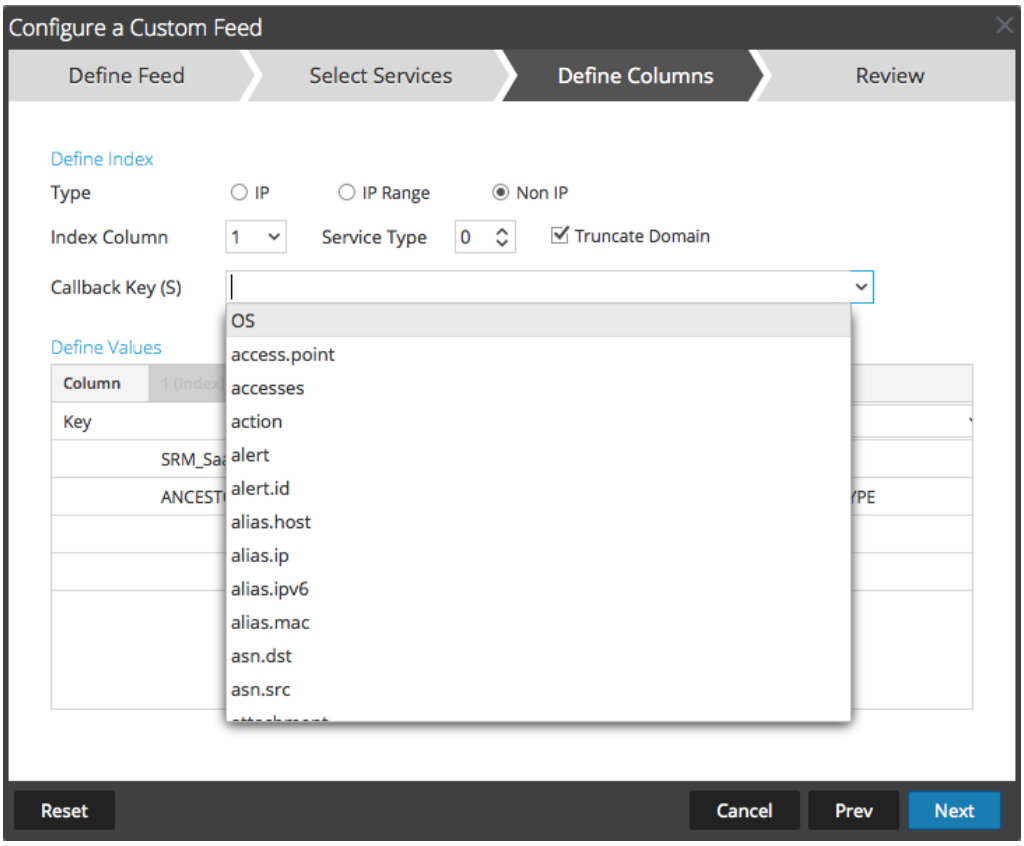
     The Advanced Options fields are displayed.
   - Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #) and click **Next**.

The Select Services dialog is displayed.

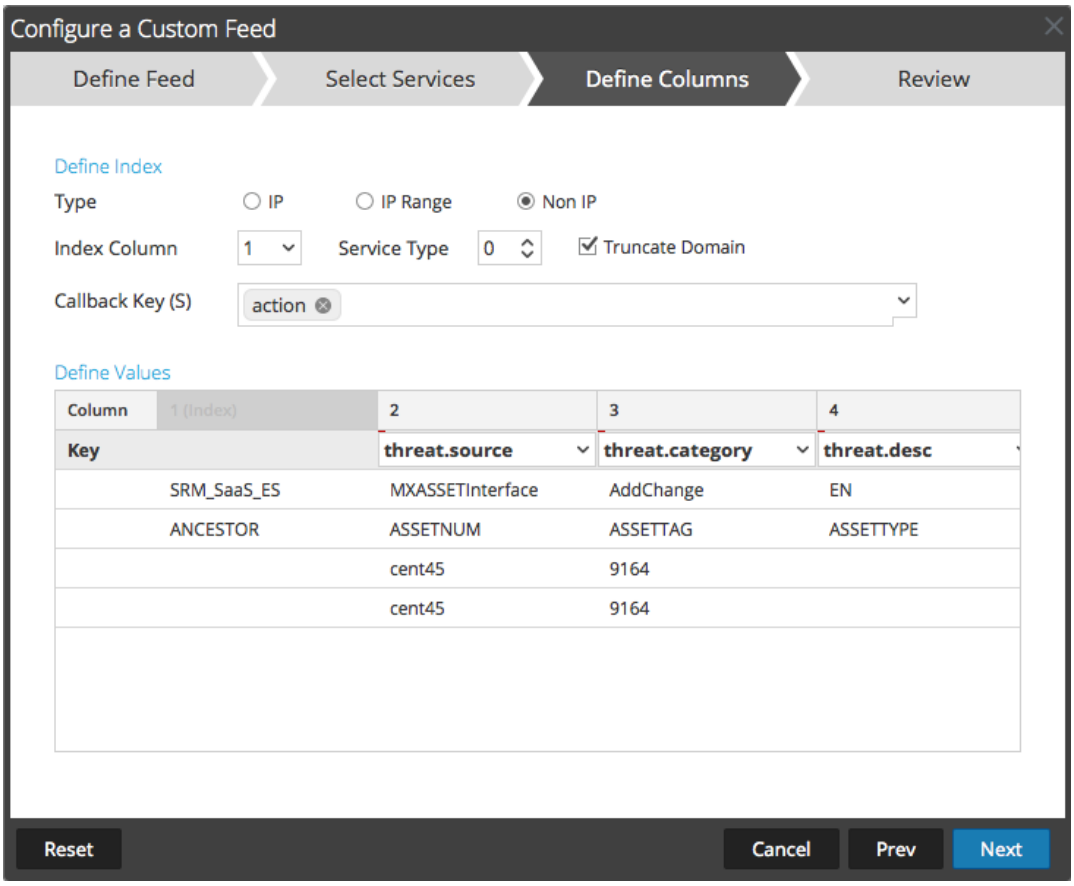


8. To identify services on which to deploy the feed, do one of the following:
   a. Select one or more Decoders and Log Decoders, and click **Next**.
   b. Click the **Groups** tab and select a group. Click **Next**.

      The Define Columns dialog is displayed.
9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Conditional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR.**
   c. (Conditional) If the index type is **Non IP**, additional settings are displayed. Select the service type and **Callback Keys,** and optionally select the **Truncate Domain** option.



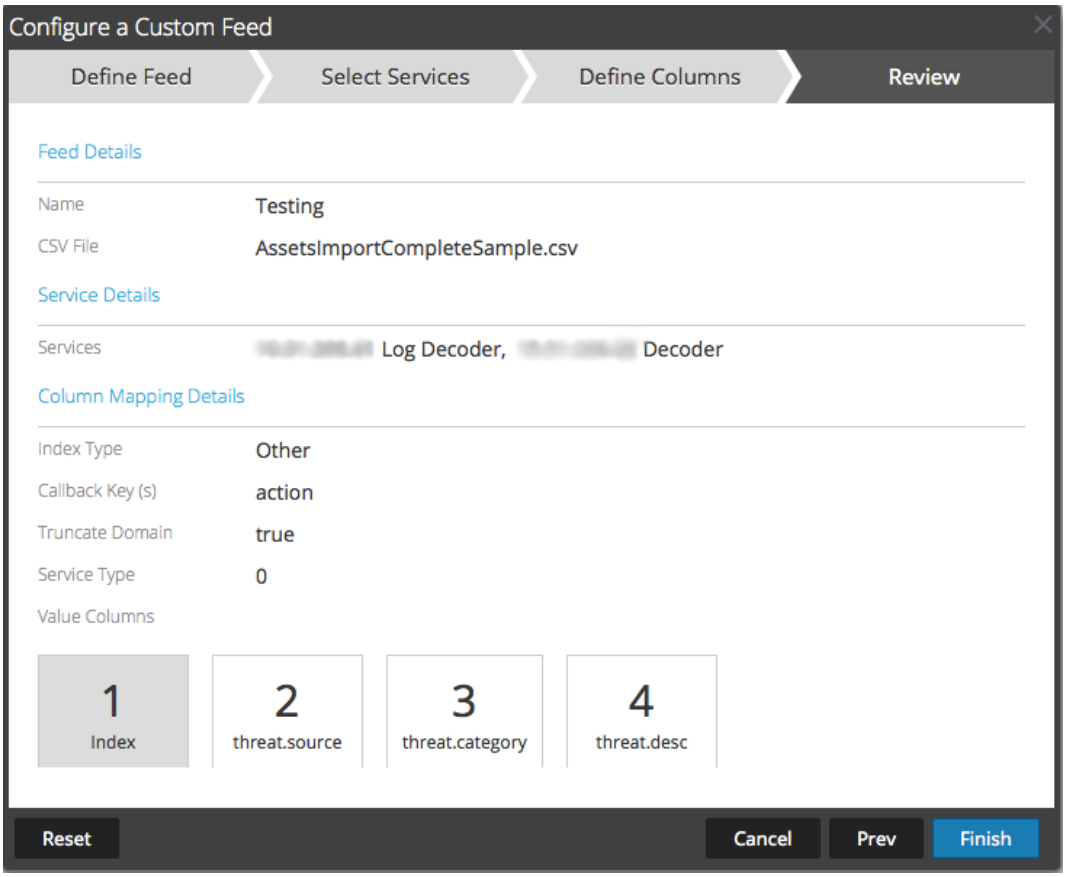
d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.



Note: When a custom feed gets converted into a context hublist, you must map at least one meta key with one or more meta types by mapping a column header with a meta. However, you can add or edit the entity mapping of a list by clicking ⚙ in the Lists tab. For more information, see the *Context Hub Configuration Guide*.

e. Click **Next**.

The Review dialog is displayed.



10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.

Note: When you create a feed, and if there is no entity mapping done such as in case of custom metas, then those columns in the List will not have entity mappings in Context Hub. You have to manually map the entities from the List page.

MetaCallback Feeds using CIDR Index Range for IPv4 and IPv6

This section describes how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using MetaCallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a .csv file and an .xml file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

.csv file:

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

.xml file:

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
      <MetaCallback name="DstIP" valuetype="IPv4" apptype="0"
truncdomain="false">
            <Meta name="ip.dst"/>
      </MetaCallback>
      <LanguageKeys>
            <LanguageKey name="alert" valuetype="Text" />
      </LanguageKeys>
      <Fields>
            <Field index="1" type="index" range="cidr"/>
            <Field index="2" type="value" key="alert" />
      </Fields>
</FlatFileFeed>
</FDF>
```

Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with range="cidr". Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Create a STIX Custom Feed

You can create a custom feed using a .csv or STIX formatted feed data file in RSA NetWitness Platform.

Note: NetWitness Platform supports Structured Threat Information Expression (STIX) 1.0, 1.1 and 1.2 versions only.

Note: From 10.6.1 or later, Security Analytics supports Structured Threat Information Expression (STIX).

Structured Threat Information Expression (STIX™) is a structured language for describing cyber threat information so it can be shared, stored, and analyzed in a consistent manner. For more information about STIX, see https://stixproject.github.io/.

Caution: If STIX recurring feed is configured and you update Security Analytics from 10.6.x to NetWitness Platform 11.0, you must re-configure the STIX recurring feed.

In NetWitness Platform, STIX (`.xml`) feed of type Indicator or Observable which contains the properties such as the IP addresses, File hashes, Domain names, URIs and Email addresses are supported. The properties values in the Equals operator is only supported. And, the attributes such as Type and Title are also read from the STIX (`.xml`). The STIX (`.xml`) with a single STIX_Package is only supported.

TAXII (Trusted Automated eXchange of Indicator Information) is the main transport mechanism for cyber threat information represented in STIX. Using the TAXII services, organizations can share cyber threat information in a secure and automated manner.

The STIX and TAXII communities work closely together to ensure that they continue to provide a full stack for sharing threat intelligence.

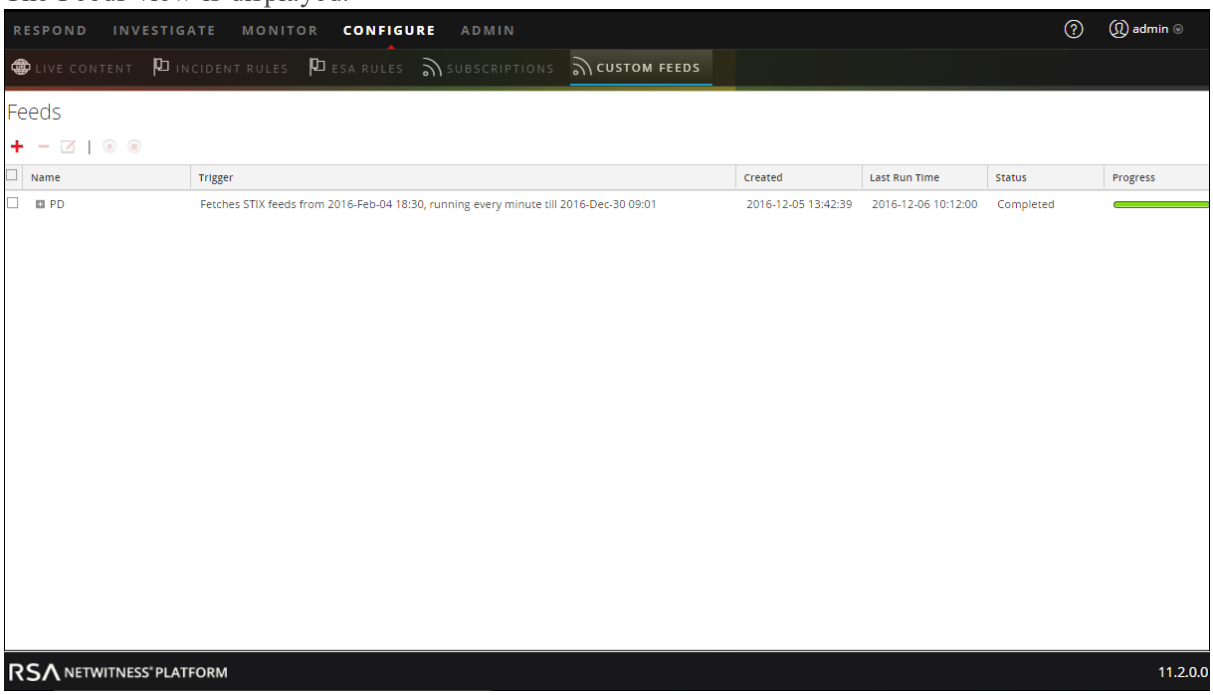
Apart from TAXII server, STIX data can also reside on REST server and you can fetch STIX file from the REST server by providing the URL of the REST server. For example, http://stixrestserver.internal.com.

The feed data file (`.csv` or STIX (`.xml`)) and optionally the feed definition file (`.xml`) must be available on the local file system for an on-demand custom feed. For a recurring custom feed, the files must be available at a URL that is accessible to the NetWitness Platform server.

To create a STIX custom feed:

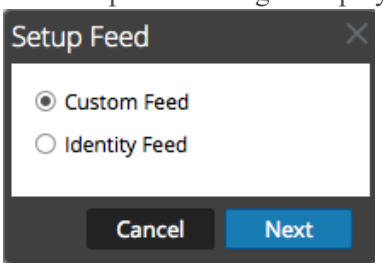
1. Go to **Configure > Custom Feeds**.

   The Feeds view is displayed.



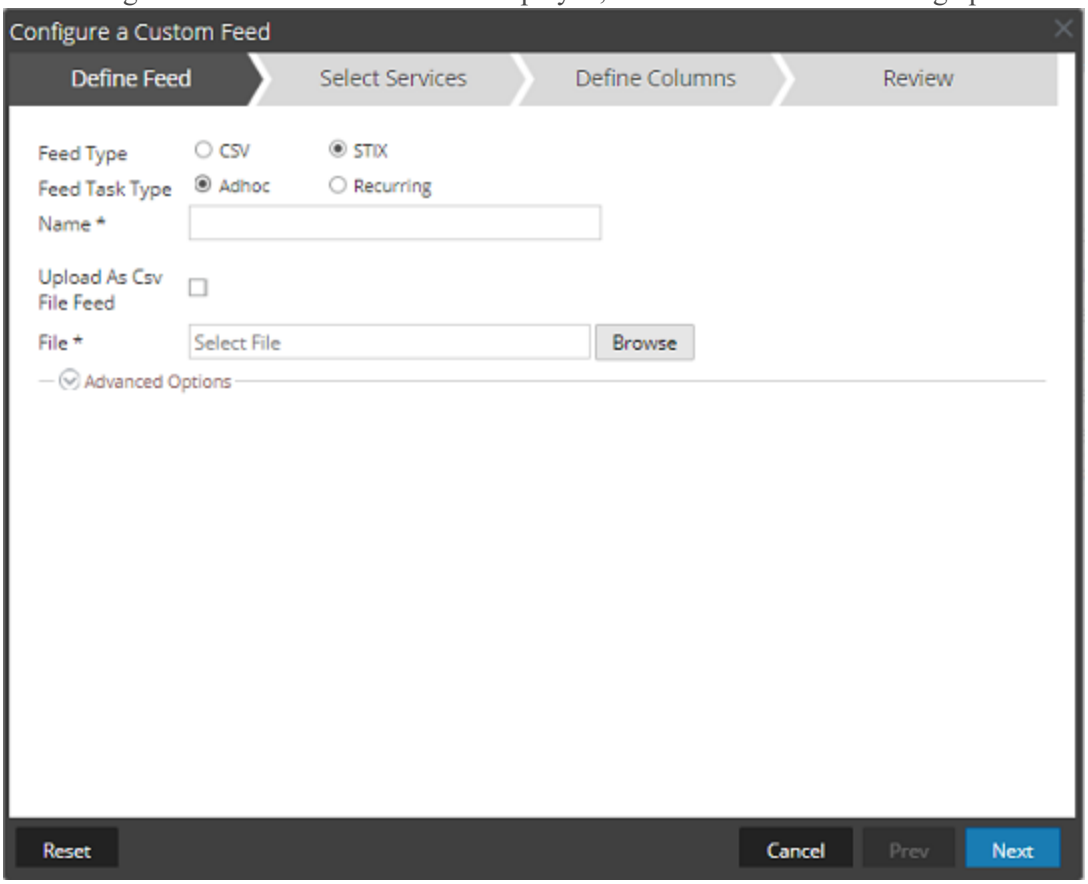
2. In the toolbar, click +.

The Setup Feed dialog is displayed.



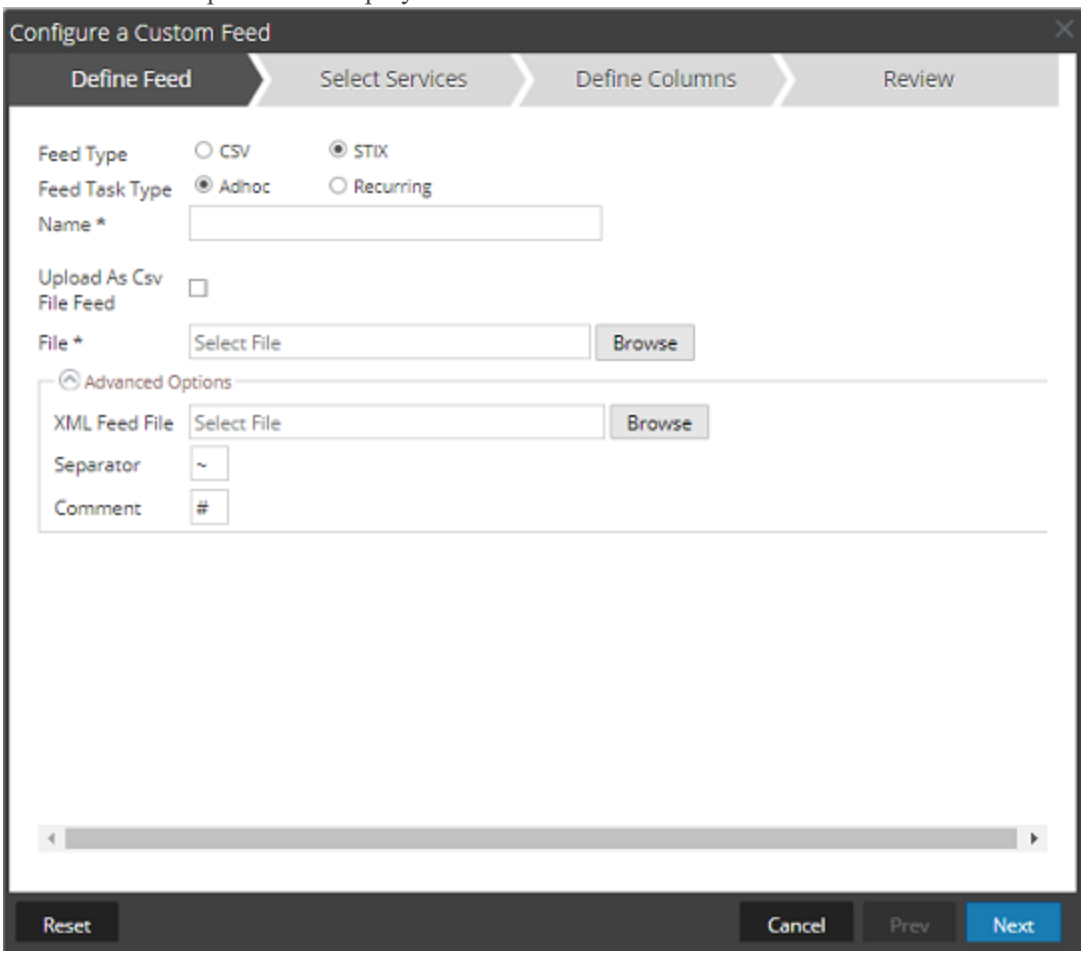
3. To select the feed type, click **Custom Feed** and **Next**.

   The Configure a Custom Feed wizard is displayed, with the Define Feed dialog open.



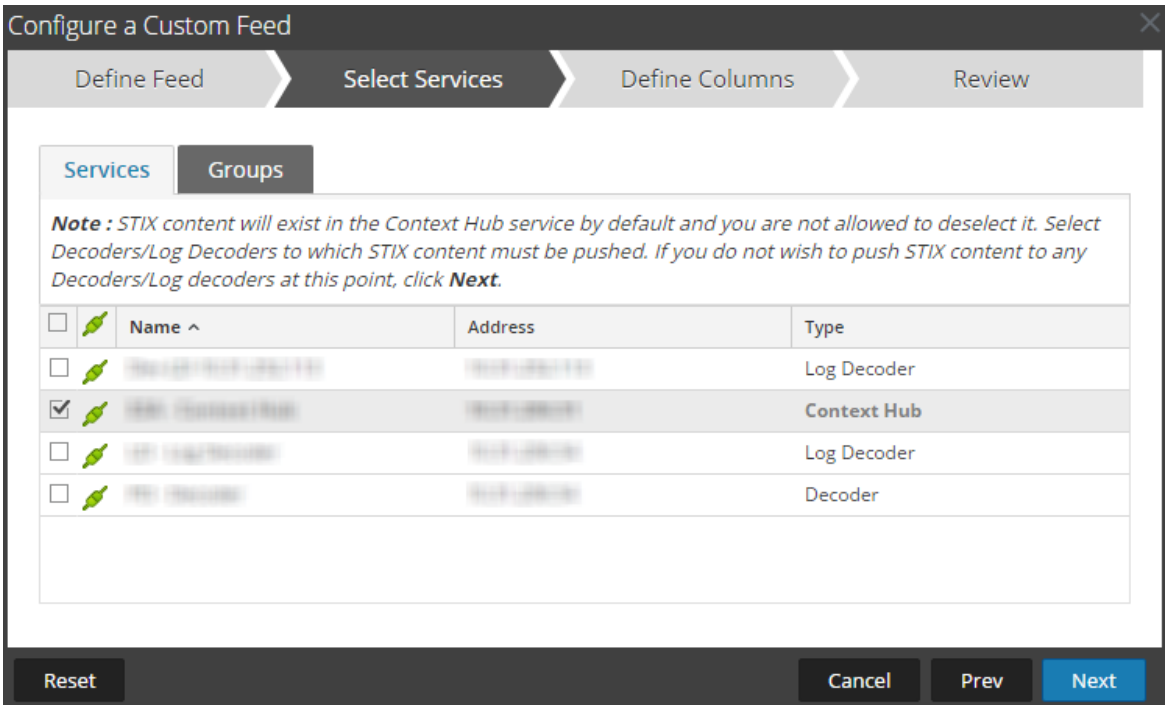
4. To define a feed based on a STIX formatted `.xml` file, select **STIX** in the **Feed Type** field.
5. To define an on-demand feed task that executes once, select **Adhoc** in the **Feed Task Type** field and do one of the following:
   a. (Conditional) To define a feed based on STIX formatted `.xml` file, type the feed **Name**, select a STIX formatted `.xml` content **File** from the local file system, and click **Next**.
   b. (Conditional) To define a feed based on an XML feed file, select **Advanced Options**.

The Advanced Options are displayed:



c. Select an XML feed file from the local file system, choose the **Separator** (default is comma), and specify the **Comment** characters used in the feed data file (default is #), and click **Next**.

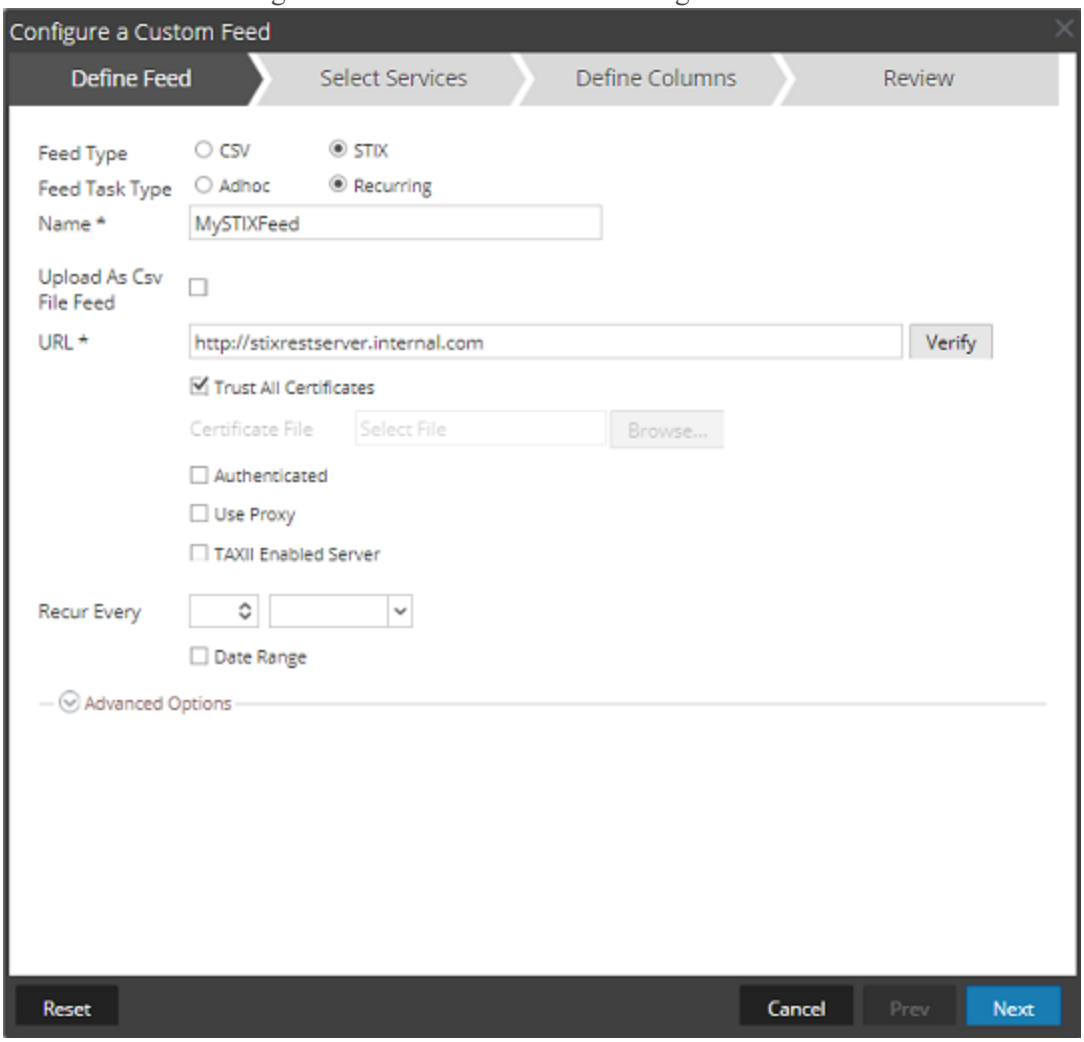
d. The Select Services dialog is displayed. This is an example of the form for a feed based on a feed data file with no feed definition file. If you are defining a feed based on a feed definition file, the Define Columns tab is not needed.



6. To define a recurring feed task that executes repeatedly at specified intervals, during a specified date range.

a. Select **Recurring** in the **Feed Task Type** field.

The Define Feed dialog includes the fields for a recurring feed.



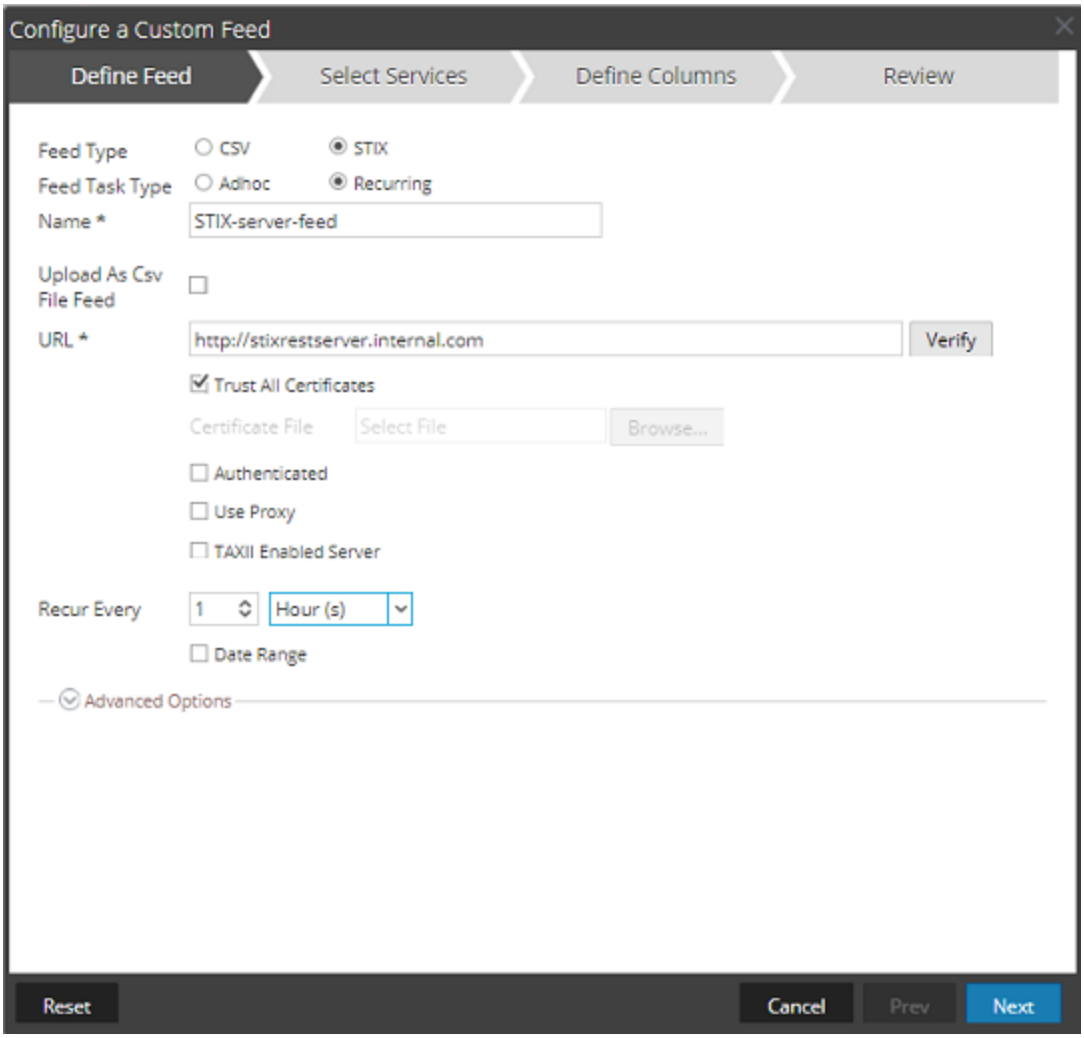
b. In the **URL** field, do one of the following:

- To define a recurring feed based on STIX which pulls STIX packages from a TAXII Server, enter the TAXII server's discovery service URL, for example, http://hailataxii.com/taxii-discovery-service.

  Note: Context Hub service installed on Event Stream Analysis host must be reachable for the specified TAXII server.

- To define a recurring feed based on a STIX formatted .xml file using REST Server, enter the URL of the REST server where the STIX data file is located, for example,

http://stixrestserver.internal.com.



NetWitness Platform verifies the connection to the server, so that NetWitness Platform can check for the latest file automatically before each recurrence.

c. If you do not want NetWitness Platform to verify the REST server's SSL certificate, Select **Trust All Certificate**. This option is enabled by default (checked)

d. For client authentication with the REST URL, in the **Certificate** field, click **Browse** and select the self signed certificate. The supported certificate formats are .cer, .crt with Base64 & DER encoded files.

e. (Optional) If the URL has restricted access and requires authentication using your username and password, select **Authenticated**.

   NetWitness Platform provides your user name and password for authentication to the URL.

f. Select **TAXII Enabled Server**, if you want to select a TAXII collection from the list.
   For a valid URL, one or more TAXII collections that contains the STIX data file is displayed based on your credentials. Select the required TAXII collection from the list. Only one collection

can be added from a TAXII server for a feed.

Note: Though multiple feeds from multiple TAXII servers are supported, only one account (username and password) is supported per TAXII server.

g. If you want the NetWitness Platform server to access the Feed URL through a proxy, select **Use Proxy**. For more information on configuring a proxy, see the **Configure Proxy for NetWitness Platform** topic in the *System Configuration Guide*. By default, the **Use Proxy** checkbox is not selected.

h. (Optional) Click **Verify** to test the settings.

Note: Make sure all the required connection parameters such as Authentication, Proxy, Certificate trust, TAXII Enabled Server etc. are configured before you click **Verify**.

i. To define the interval of recurrence for pushing to Decoder or Log Decoder, do one of the following:

- Specify the number of minutes, hours, or days between recurrences of the feed.
- Specify recurrence every week, and select the days of the week.

j. To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time. The Start Date should be defined from when you want to fetch the data. Make sure that the **Start Date** is not before 180 days from today.

7. (Optional) If you want to define a feed based on an XML feed file:

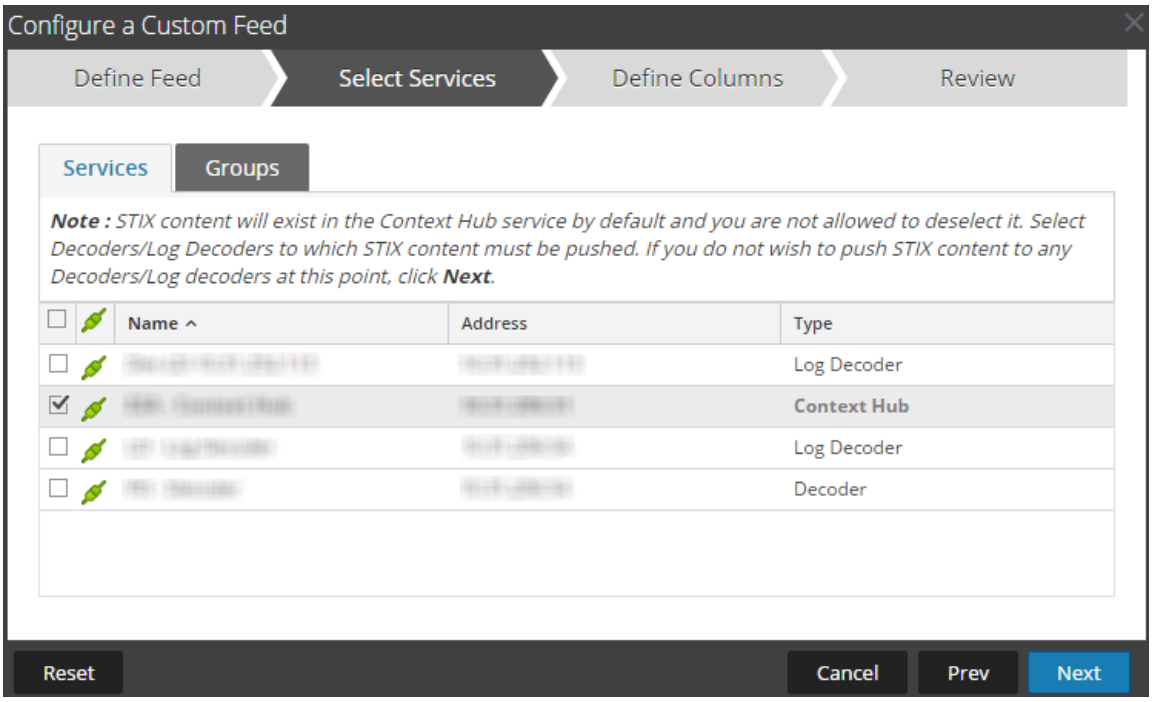
- Type the feed **Name**, select **Advanced Options**.

  The Advanced Options fields are displayed.
- Select an XML feed file from the local file system, choose the **Separator** (default is comma), specify the **Comment** characters used in the feed data file (default is #).
- In the **Remove STIX data older than** field, specify the number of days for which STIX packages pulled from TAXII server is to be stored. The STIX packages older than the specified number of days is deleted automatically.
- Click **Next**.
  The Select Services dialog is displayed.

8. To identify services on which to deploy the feed, do one of the following:

a. Select one or more Decoders and Log Decoders, and click **Next**.

b. In case of STIX feed, Context Hub will be selected by default and you are not allowed to deselect it. In addition, you can select one or more Decoders and Log Decoders and click **Next** or Click the **Groups** tab and select a group. Click **Next**.



Configure a Custom Feed
Define Feed
Select Services
Define Columns
Review
Services
Groups
Note : STIX content will exist in the Context Hub service by default and you are not allowed to deselect it. Select Decoders/Log Decoders to which STIX content must be pushed. If you do not wish to push STIX content to any Decoders/Log decoders at this point, click Next.
Name
Address
Type
Log Decoder
Context Hub

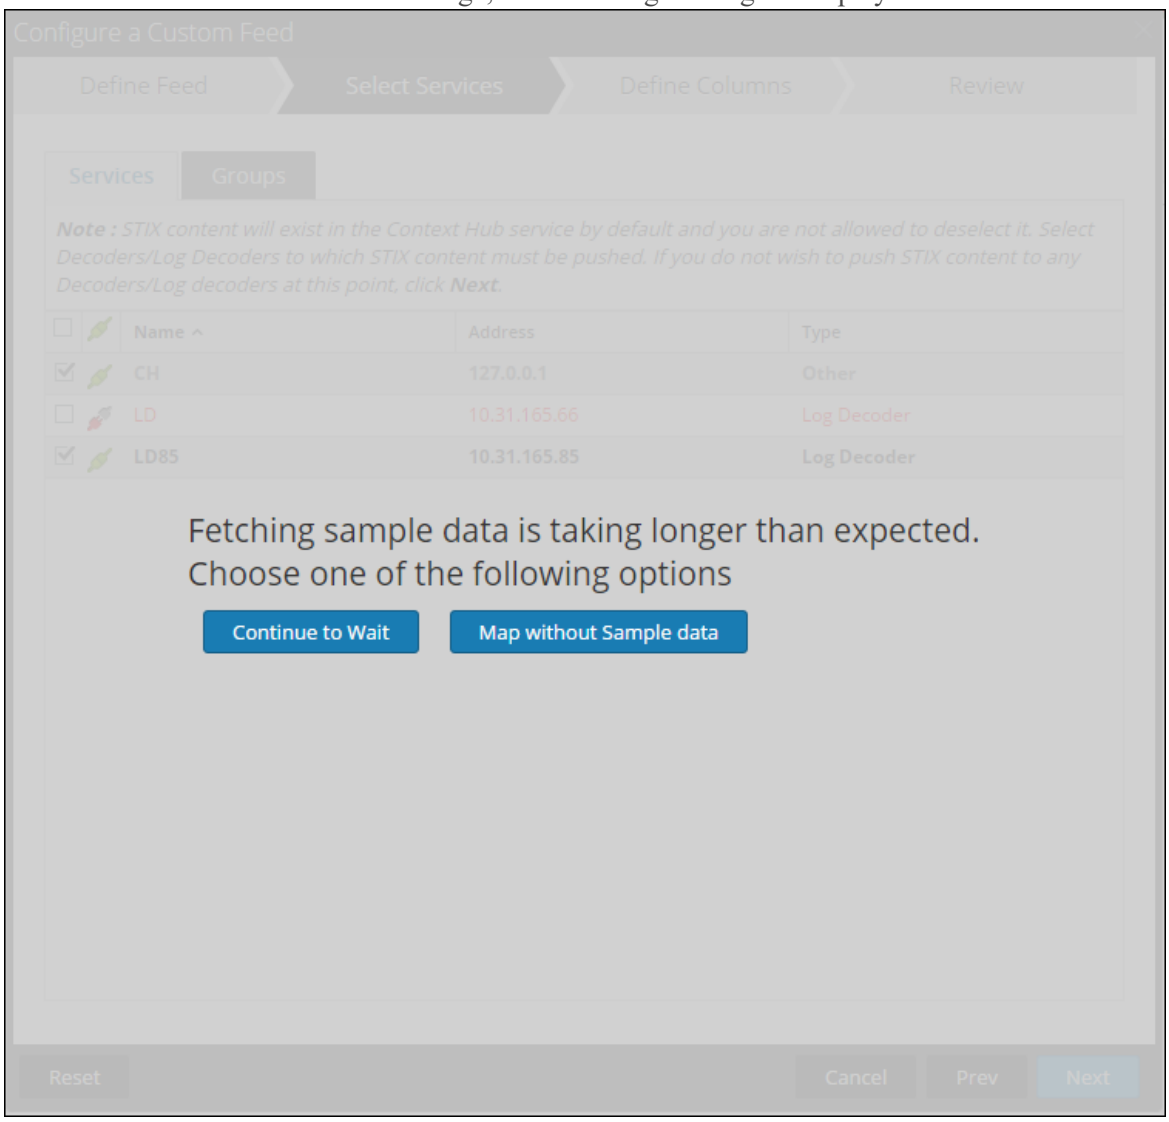
Cancel
Prev
Next

If the data from the STIX server is large, the following message is displayed:

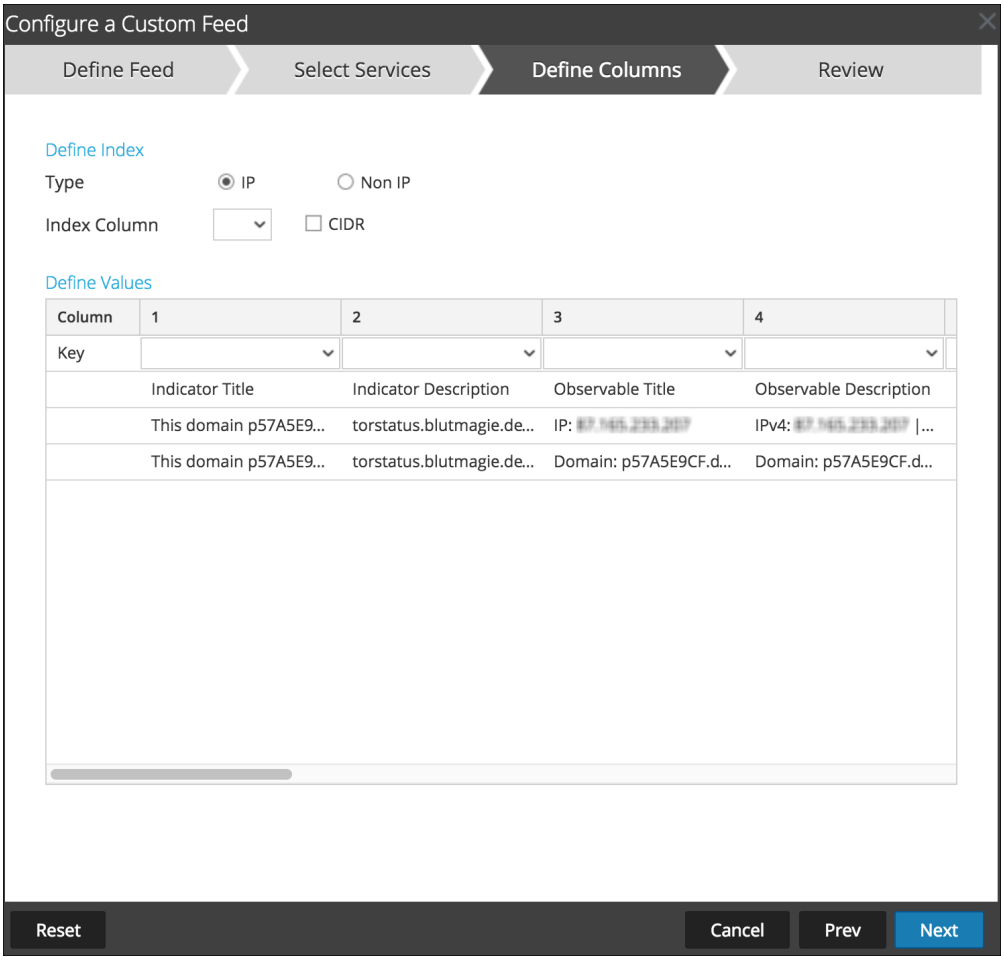


- If you click **Continue to Wait**, it continues to wait till the sample data is fetched or timeout (10 minutes) whichever is sooner. In case of timeout no sample data is retrieved even after 10 minutes.
- If you click **Map Without Sample data**, the mapping column is displayed without any sample data.

The Define Columns dialog is displayed.

9. To map columns in the Define Columns form:
   a. Define the Index type: **IP**, **IP Range**, or **Non IP**, and select the index column.
   b. (Optional) If the index type is **IP** or **IP Range** and the IP address is in CIDR notation, select **CIDR**.
   c. (Optional) If the index type is **Non IP**, additional settings are displayed. Select the service type

and **Callback Keys,** and optionally select the **Truncate Domain** option.

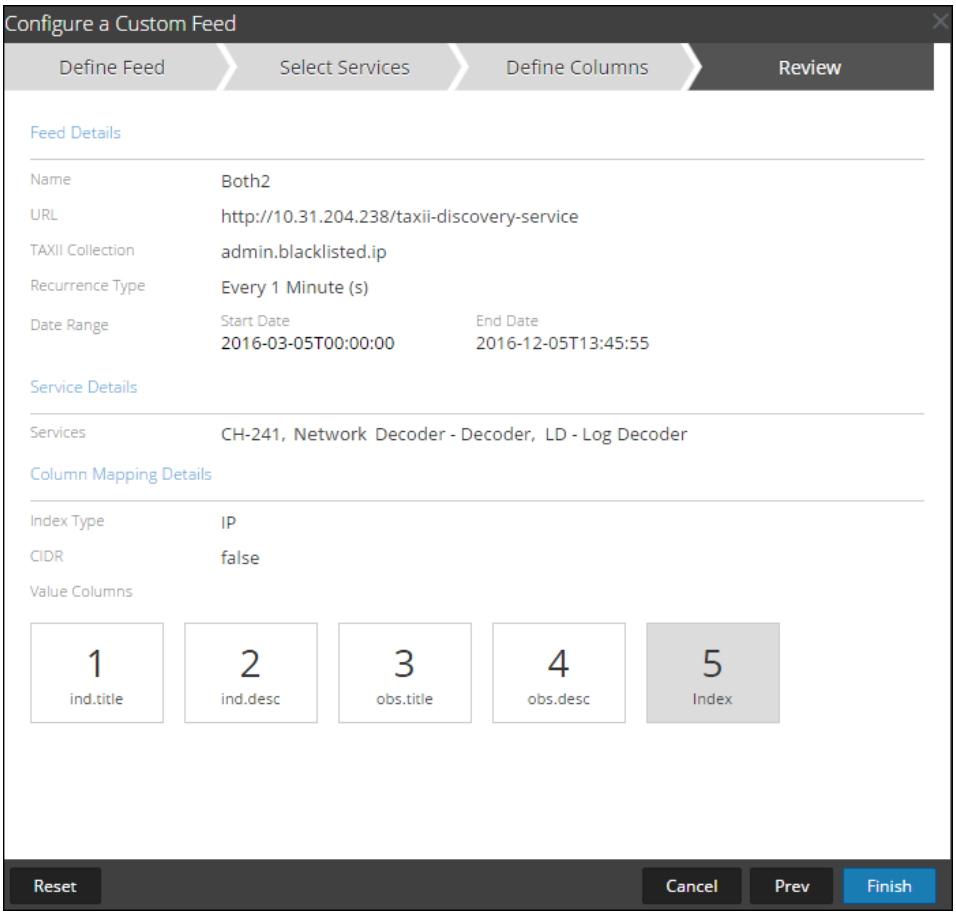


Note:
- If the **Index Type** is Non IP, you can select multiple index columns in the **Index Column(S)**. The values from all the selected columns are merged in the first index column that you selected and the merged values are pushed to the Log Decoder for parsing. For example, in the **Index Column(S)** if you select 2,4,7 as index columns the values from the 2,4 and 7 columns are merged in the column 2 and the values are pushed to Log Decoder for parsing.
- Indexing cannot be done for the columns such as Indicator Title, Indicator Description, Observable Title, Observable Description, as the look up cannot be performed for those columns.

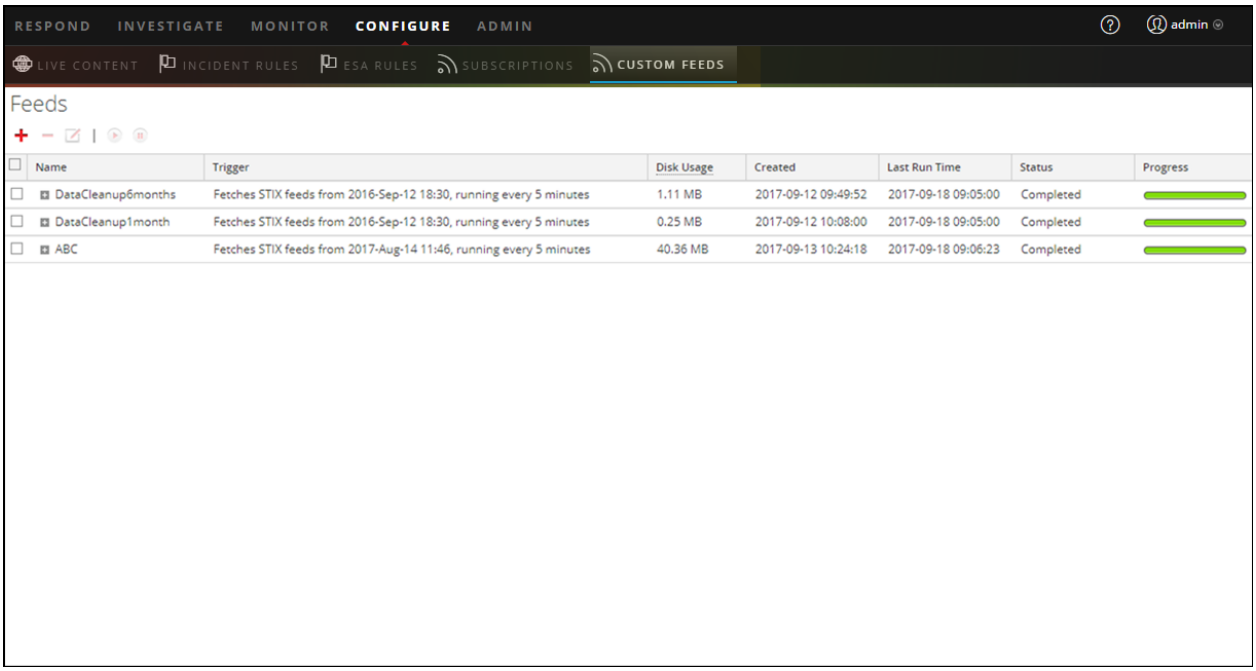
d. Select the language key to apply to the data in each column from the drop-down list. The meta displayed in the drop-down list is based on the meta available for the service define values. You can also add other meta based on advanced expertise.

e. Click **Next**.

The Review dialog is displayed.



10. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next dialog (if not viewing the last form).
    - Click **Prev** to display the previous dialog (if not viewing the first form)
11. Review the feed information, and if correct, click **Finish**.
12. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



Note: Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy due to low memory. For more information on how to troubleshoot `OutOfMemoryError` on `Contexthub` Server, see "Troubleshooting" in the *Live Services Management Guide*.

MetaCallback Feeds using CIDR Index Range for IPv4 and IPv6

This section describes how to use CIDR index ranges for IPv4 and IPv6 in custom MetaCallback feeds. As with other custom feeds, you must create feed data file in .csv format, and a feed definition file in .xml format.

Note: Using Metacallback feeds with CIDR index ranges is supported only through the Advanced Configuration wizard or the REST interface.

The following example shows the contents of both a .csv file and an .xml file for a MetaCallback feed using CIDR index ranges for IPv4 or IPv6.

`.csv file:`

```
192.168.0.0/24, Sydney
192.168.1.0/24, Melbourne
```

`.xml file:`

```
<?xml version="1.0" encoding="UTF-8"?>
<FDF xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="feed-definitions.xsd">
<FlatFileFeed name="ip_test" path="ip_test.csv" separator="," comment="#">
      <MetaCallback name="DstIP" valuetype="IPv4" apptype="0"
truncdomain="false">
            <Meta name="ip.dst"/>
      </MetaCallback>
      <LanguageKeys>
```

```
            <LanguageKey name="alert" valuetype="Text" />
      </LanguageKeys>
      <Fields>
            <Field index="1" type="index" range="cidr"/>
            <Field index="2" type="value" key="alert" />
      </Fields>
</FlatFileFeed>
</FDF>
```

Note: To configure a CIDR index range for feeds with single or multiple MetaCallbacks of value type IPv4 or IPv6, the field of type index MUST contain a range attribute with range="cidr". Also, configuring "cidr" index ranges for feeds with MetaCallbacks of multiple different value types is not supported.

Creating and Managing an Identity Feed

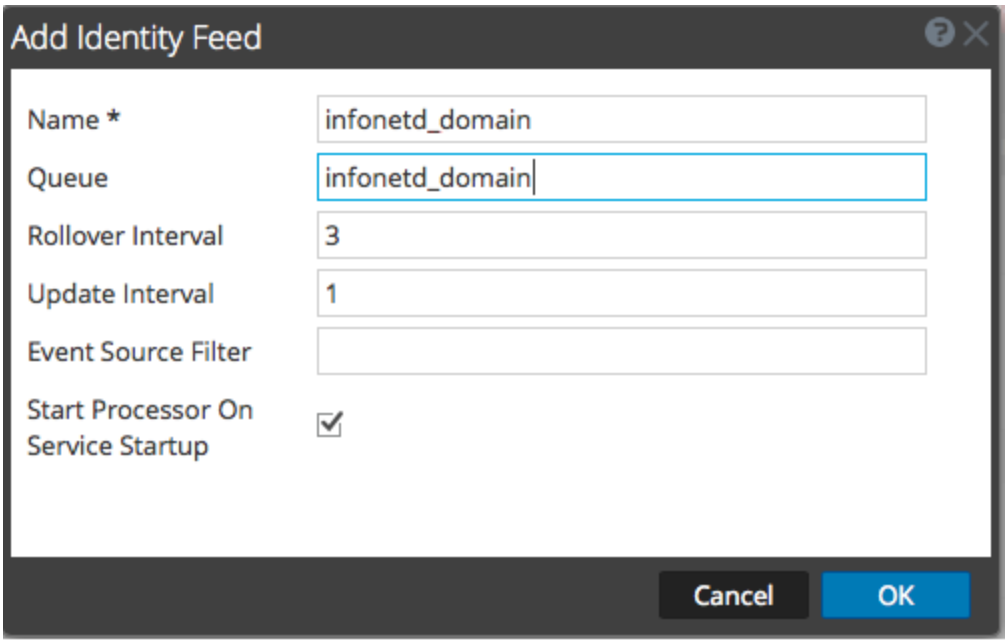
You can easily create an Identity feed and populate it to selected Decoders and Log Decoders. After completing this procedure, you will have created an Identity feed.

To create an identity feed:

1. Add a destination for the feed.
   a. Go to **ADMIN > Services** and in the **Services** list
   b. Select a **Log Collector** service, and select **View > Config**.
   c. Select the **Event Destinations** tab.
   d. In the Select **Event Destinations** field, select **Identity Feed**.

   e. Click + and enter a unique name for the feed.

      The Queue name identifies the feed within the Log Collector. Use the name of the feed for the Queue.



f. Click **OK**.

2. Test generation of messages.

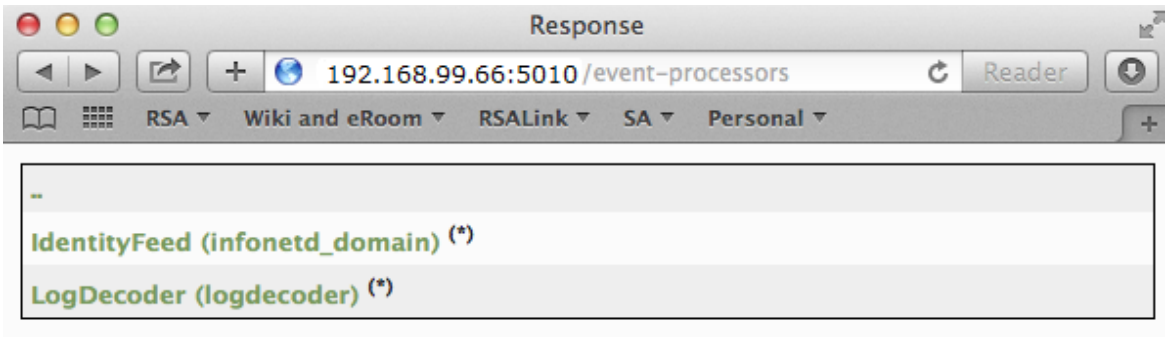
   a. Have users log into Windows boxes on the domain to generate the appropriate log messages on the domain controllers for testing.

   b. Verify that data is written to the feed files. SSH to the Log Decoder/Collector or Virtual Log Collector being configured. Navigate to `/var/netwitness/logcollector/runtime/identity-feed` and verify that the `Identity_deploy` files are getting populated with data.

   c. Open up a web browser (Non-Internet Explorer browsers preferred) and log in to the REST interface of the Log Collector. Use administrative credentials when logging in. For example, if the IP address of your Log Collector is 192.168.99.66, the URL would be:

   - SSL not enabled: **http://192.168.99.66:50101/event-processors**
   - SSL enabled: **https://192.168.99.66:50101/event-processors**

   The browser screen should look like this:

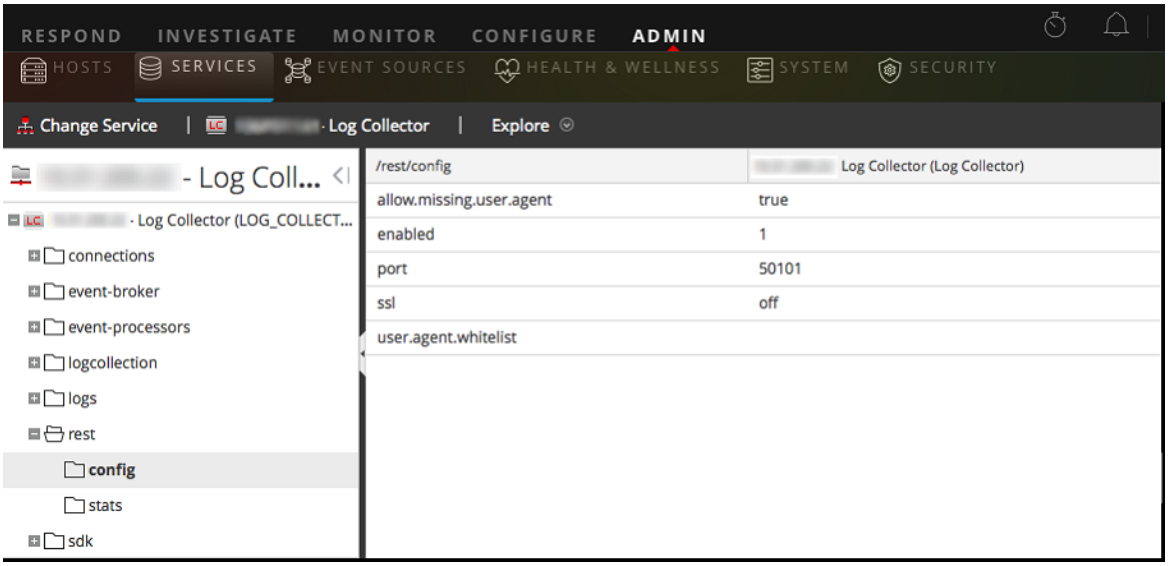


Notice the screen contains the name of the identity feed you created earlier (`infonetd_domain`, in this example).

For the identity feed to function correctly, port 50101 must be active on the Log Collector, and you must determine whether SSL encryption is active.

d. Go to **ADMIN > Services > *<Log Collector being setup>***  **> View > Explore**.

e. In the left pane, expand **rest > config**.



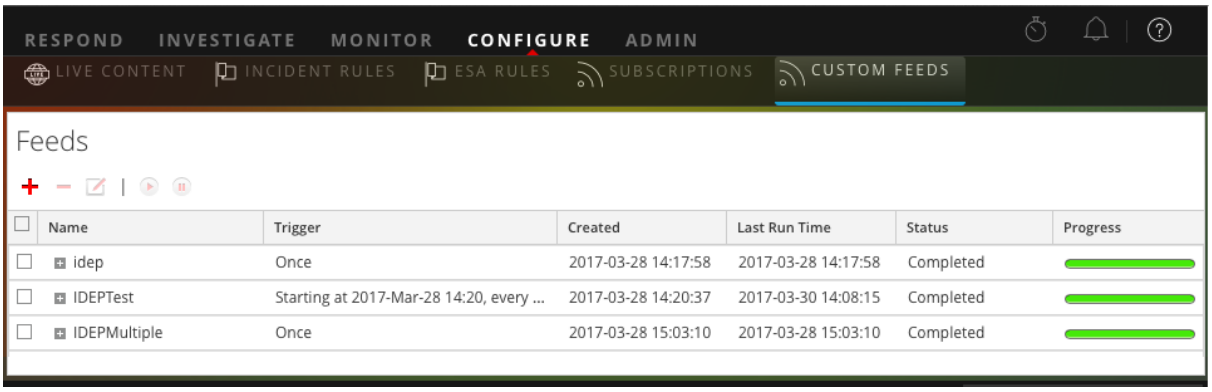
For REST to be active, **enabled** must be set to **1**.

f. Note the value for **ssl**. If SSL should be enabled for your environment, this must be set to **on**.

> **Note:** If you changed the setting for either the **enabled** or **ssl** option you must restart the Log Collector service before moving forward.

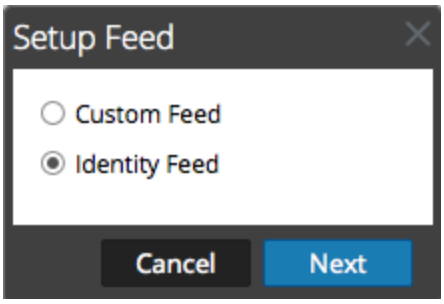
3. Go to **CONFIGURE > Custom Feeds**.

   The Feeds dialog is displayed.



4. In the toolbar, click +.

   The Setup Feed dialog is displayed.



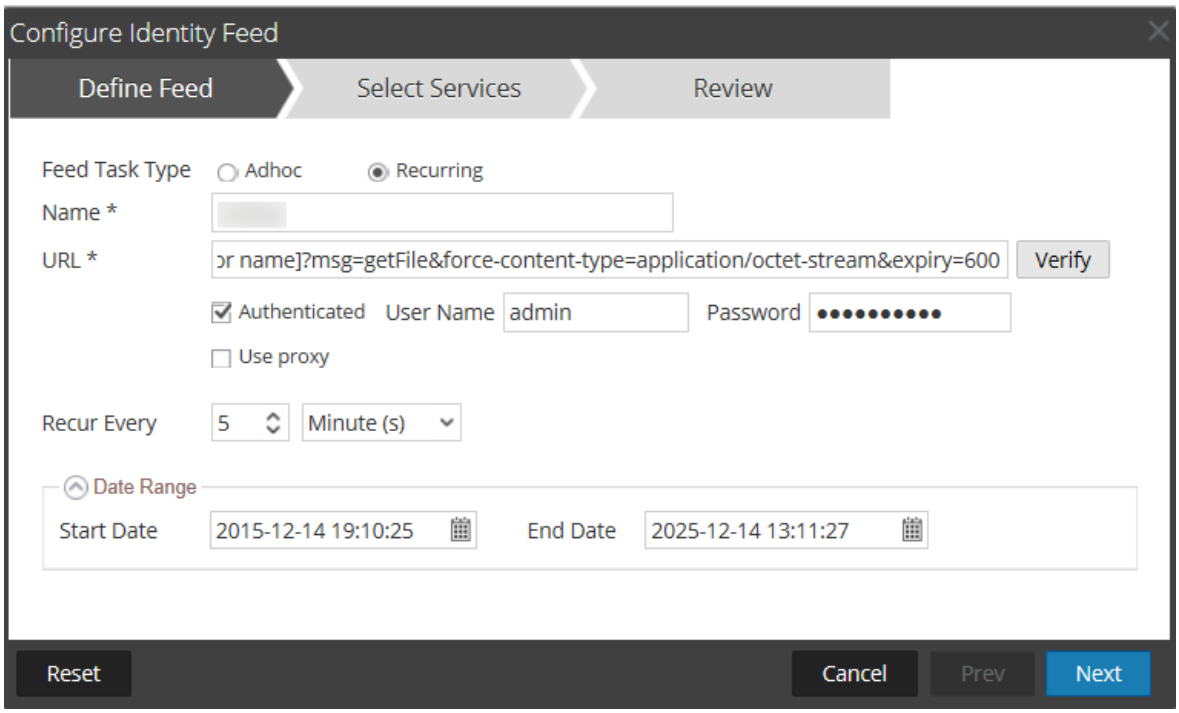
5. Ensure **Identity Feed** is selected and click **Next**.

   The Configure Identity Feed panel opens with the **Define Feed** tab displayed.

6. (Conditional) You can create an on-demand or recurring feed.

   - To define an on-demand Identity feed task that executes once, select **Adhoc** in the **Feed Task Type** field, type the feed **Name**, and browse for and open the feed.
   - To define a recurring Identity Feed task that executes on a recurring basis, select **Recurring** in the **Feed Task Type** field.

     The **Define Feed** dialog includes the fields for a recurring feed.



Note: RSA NetWitness Platform verifies the location where the file is stored, so that NetWitness Platform can check for the latest file automatically before each recurrence.

7. Fill in and verify the URL field.
   a. In the **URL** field, enter the URL where the feed data file is located. This is the REST API interface that was setup earlier. Make sure you have the following information to construct the URL:
      - The IP address of the Log Collector being used to construct the Identity Feed file.
      - The identity queue name, as set in step 2c.
      - Whether or not SSL is enabled on the Log Collector REST port, as set in step 2f.

      You can construct this value as follows:

      - SSL enabled: `https://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`
      - SSL not enabled: `http://<LogCollector>:50101/event-processors/<ID Event processor name>?msg=getFile&force-content-type=application/octet-stream&expiry=600`

      So, using the example from earlier, the complete value that you would enter into this field is as follows:

      ```
      http://192.168.99.66:50101/event-processors/infonetd_
      domain?msg=getFile&force-content-type=application/octet-
      stream&expiry=600?msg=getFile&force-content-
      type=application/octet-stream&expiry=600
      ```

b. For the URL verification to work correctly, it is important that the NetWitness Platform UI server can access the Log Collector's REST API port (50101). This can be tested by going to the NetWitness Platform UI server via SSH. Once there, run the following command:

- SSL enabled: `curl -vk https://<ip of log collector>:50101`
- SSL not enabled: `curl -v http://<ip of log collector>:50101`

If the `curl` command does not connect then there may be a network firewall or routing issue between the NetWitness Platform UI server and the Log Collector.

Example of Bad connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... No route to host
* couldn't connect to host
* Closing connection #0
curl: (7) couldn't connect to host
```

Example of Good connection:

```
* About to connect() to 192.168.99.66 port 50105 (#0)
* Trying 192.168.99.66... connected
* Connected to 192.168.99.66 (192.168.99.66) port 50105 (#0)
> GET / HTTP/1.1
> User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu)
libcurl/7.19.7 NSS/3.19.1 Basic ECC zlib/1.2.3 libidn/1.18
libssh2/1.4.2
> Host: 192.168.99.66:50105
> Accept: */*
>
< HTTP/1.1 401 Unauthorized
< Content-Length: 71
< Connection: Keep-Alive
< Pragma: no-cache
< Expires: -1
< Cache-Control: no-cache, no-store, must-revalidate
< WWW-Authenticate: Basic realm="NetWitness"
< Content-Type: text/xml; charset=utf-8
<
<?xml version="1.0" encoding="utf-8"?>
<error>401 Unauthorized</error>
```

```
* Connection #0 to host 192.168.99.66 left intact
* Closing connection #0
```

8. The REST API requires a username and password when attempting to pull the `identity_deploy.csv` file from the Log Collector. This can be any username and password that is available on the service itself. For more information, see the "Services Security View" topic in the *Hosts and Services Guide*.

   To see which accounts are available, go to **ADMIN > Services > <log collector being setup> > Actions > View > Security**.

   Under the Users table, you see all the users that can be used in this step. It is suggested that a separate user account is created specifically for this setup, and is used nowhere else in the environment, for added security. For details, see "Add a User and Assign a Role" in the *System Security and User Management Guide*. (Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.)

9. To define the interval for recurrence, do one of the following:

   - Specify the number of minutes, hours, or days between recurrences of the feed.
   - To define the date range for the execution of the feed to recur, specify the **Start Date** and time and the **End Date** and time.

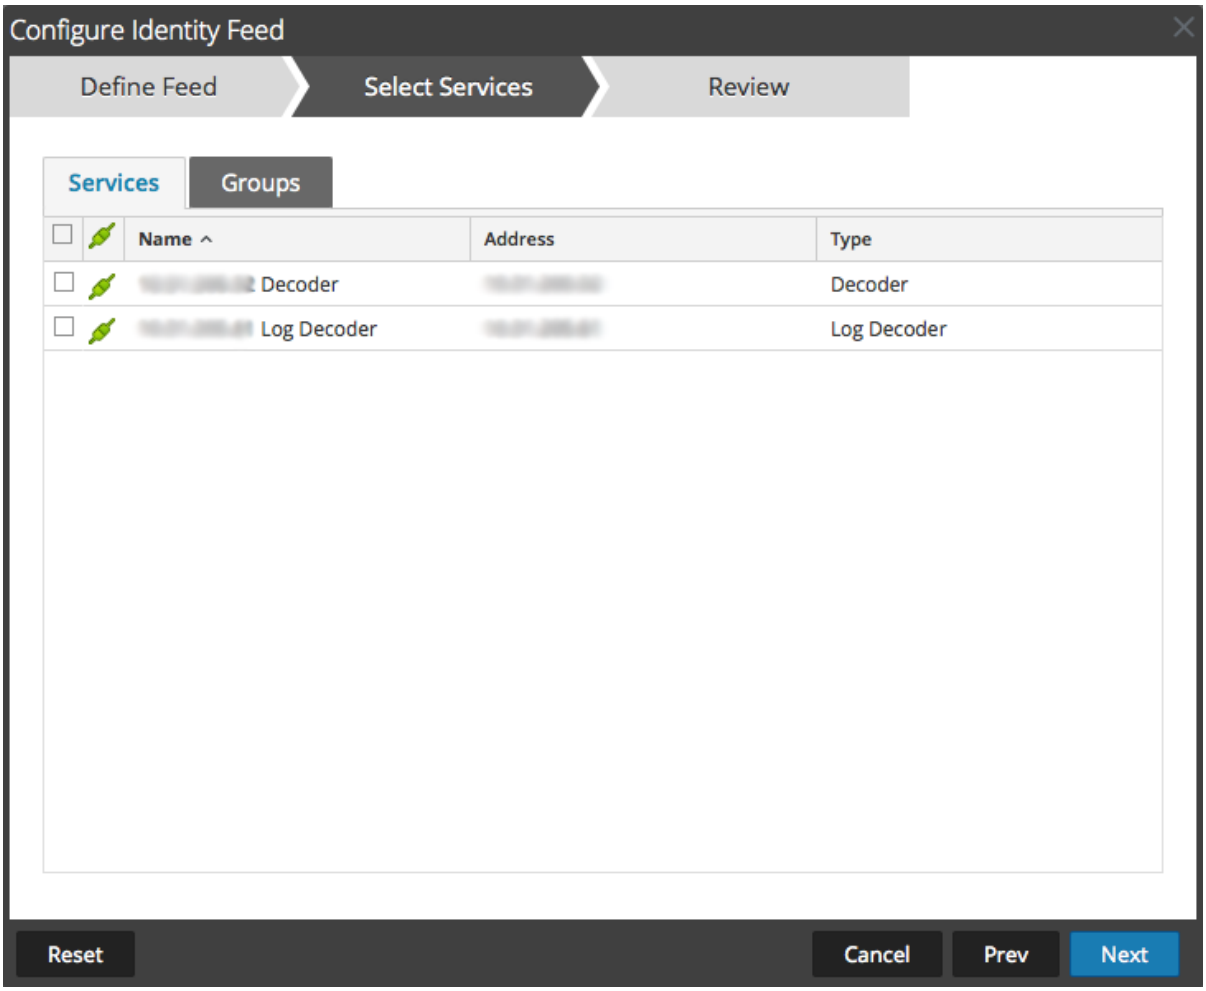
10. If using SSL encryption, you need to install the REST API SSL certificate for the Log Collector into the NetWitness Platform UI server. For more information, see Import the SSL Certificate.

    If, after importing the SSL certificate, the verification of the URL still fails, see Cannot Verify Identity Feed URL.

11. Click **Verify** to verify your identity feed configuration before you proceed to the Select Services dialog.

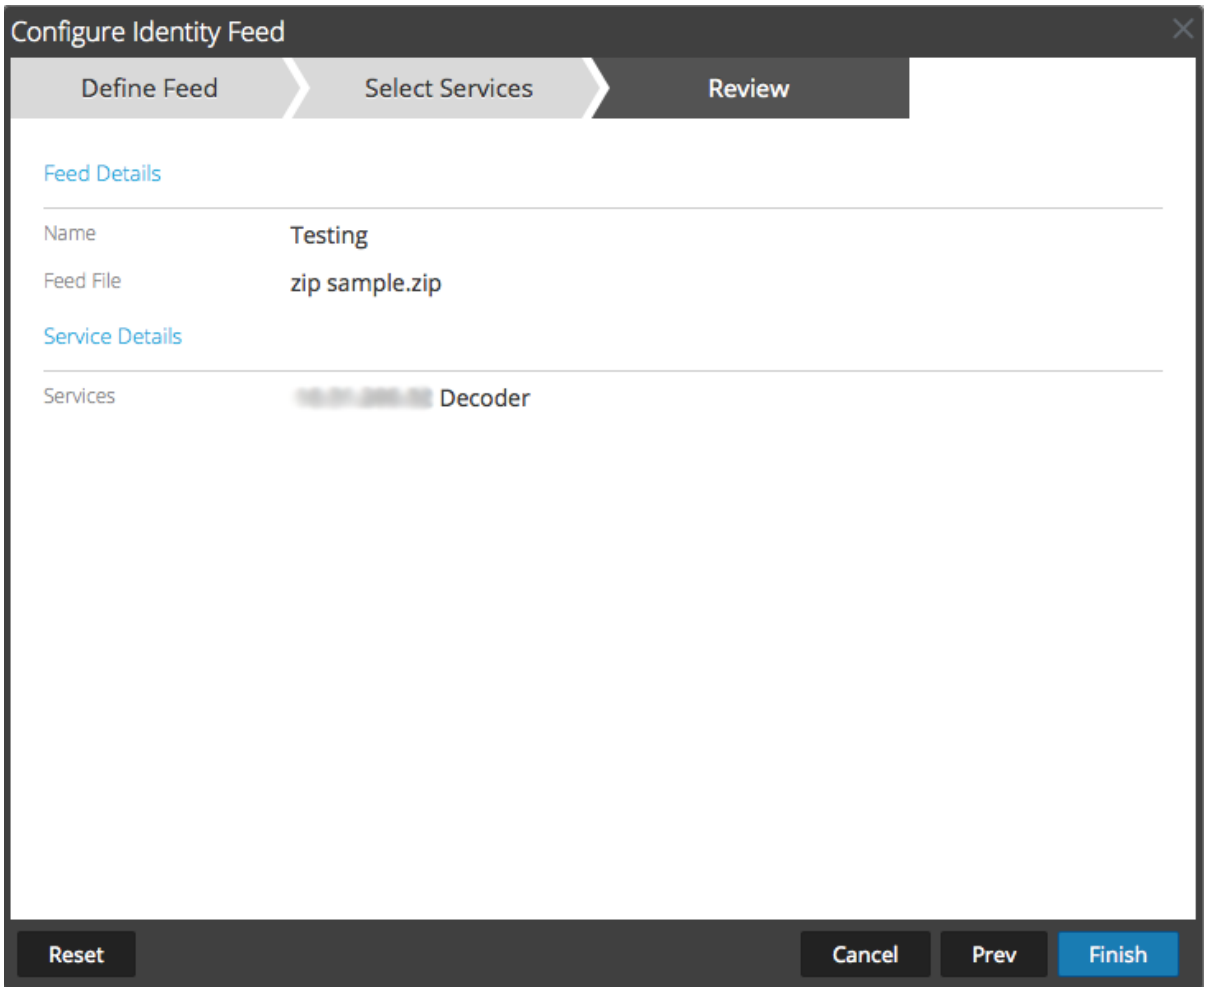
12. Click **Next**.

    The Select Services dialog is displayed.



13. To identify services on which to deploy the feed, select one or more Decoders and Log Decoders and click **Next**.
14. Click the **Groups** tab, select a group, and click **Next**.

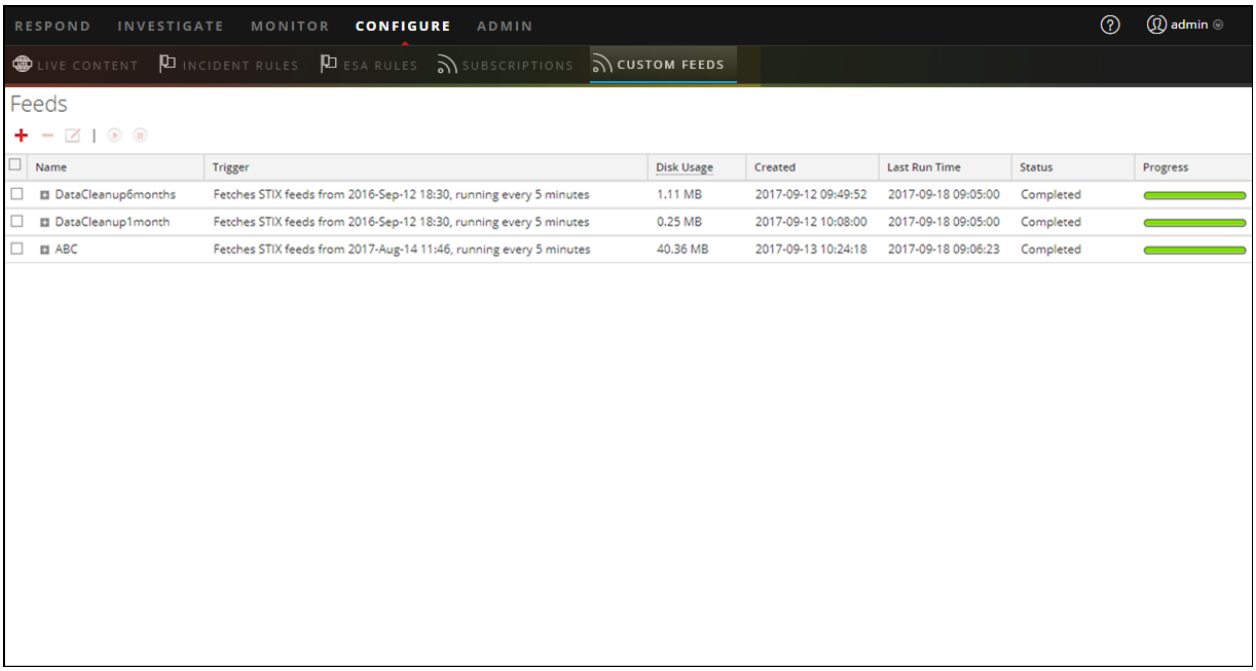
    The Review dialog is displayed.



Note: If a group of devices with Decoders and Log Decoders is used to create recurring or custom feeds and this group is deleted, you can edit the feed and add a new group to the feed.

15. Anytime before you click **Finish**, you can:
    - Click **Cancel** to close the wizard without saving your feed definition.
    - Click **Reset** to clear the data in the wizard.
    - Click **Next** to display the next form (if not viewing the last form).
    - Click **Prev** to display the previous form (if not viewing the first form).
16. Review the feed information, and if correct, click **Finish**.

Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file are listed in the Feed grid and progress bar tracks completion. You can expand or collapse the entry to see how many services are included, and which services were successful.



Import the SSL Certificate

If SSL is configured on the Identity feed's Log Collector, follow these steps to import the Log Collector's SSL certificate into the NetWitness Platform UI server key store. If this certificate is not imported, the NetWitness Platform UI server will be unable to pull the Identify feed file from the Log Collector.

1. To pull the SSL certificate off the Log Collector, SSH into the NetWitness Platform UI server and run the following command:

   ```
   echo -n | openssl s_client -connect <HOST>:<PORT> | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/<SERVERNAME>.cert
   ```

   This command saves the SSL certificate to `/tmp/<SERVERNAME>.cert`.

   For example:

   ```
   echo -n | openssl s_client -connect 192.168.99.66:50101 | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > /tmp/logcollector.cert
   ```

2. To import the SSL certificate into the NetWitness Platform UI server, SSH into the UI server and run the following command:

   ```
   keytool -importcert -alias <name an alias for the cert> -file <the cert file pathname> -keystore /etc/pki/java/cacerts
   ```

   For example:

   ```
   keytool -importcert -alias logcollector01 -file /tmp/logcollector.cert -keystore /etc/pki/java/cacerts
   ```

3. The system requests a password. Enter the password for the keystore on the NetWitness Platform UI server, not for the jetty keystore. The default password is **changeit**.

4. Restart **jettysrv** to allow jetty to read the new certificate in the store.

Cannot Verify Identity Feed URL

If the Identity feed URL cannot be verified, and you are using SSL, make sure you followed the steps in Import the SSL Certificate.

If there are still issues, it is possible that the internal name of the certificate does not match the hostname of the Log Collector. The following procedure checks this.

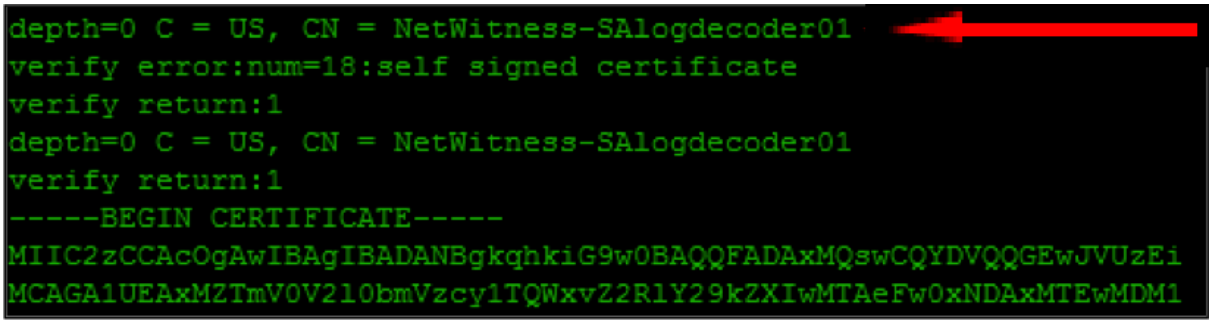
1. SSH to the NetWitness Platform UI server.
2. Run the following command to output the CN name of the SSL cert:

   ```
   echo -n | openssl s_client -connect <log decoder>:50101 | sed -ne
   '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

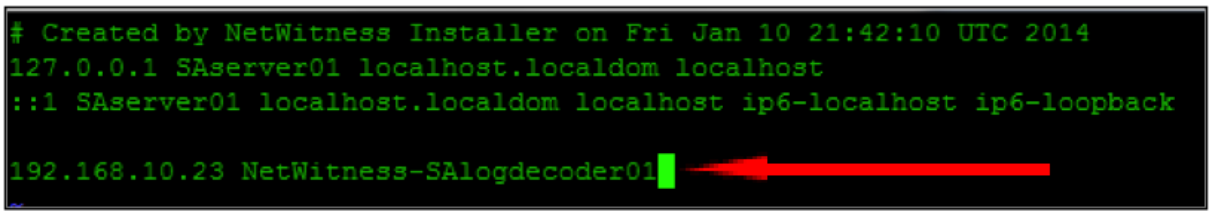
   Example:

   ```
   echo -n | openssl s_client -connect salogdecoder01:50101 | sed -ne
   '/BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p'
   ```

3. Retrieve the CN name of the SSL certificate.



4. Edit the `/etc/hosts` file and add the IP address and CN name to the file.



5. Restart the network service on the appliance.
6. Confirm that the name placed in the **/etc/hosts** file is used instead of the FQDN or IP address in the Identity feed URL.
7. Re-verify the Identity feed URL.

Investigating an Identity Feed

An identity feed tracks interactive log on events from the Windows operating system. Identity feeds do not track interactive log off events.

In order for an identity feed to process events and tag them, the events need to be collected using a Windows Log Collection module where an Active Domain Controller/non-Domain Controller is configured. Note that identity feeds can only be processed via an Identity Feed Event Processor.

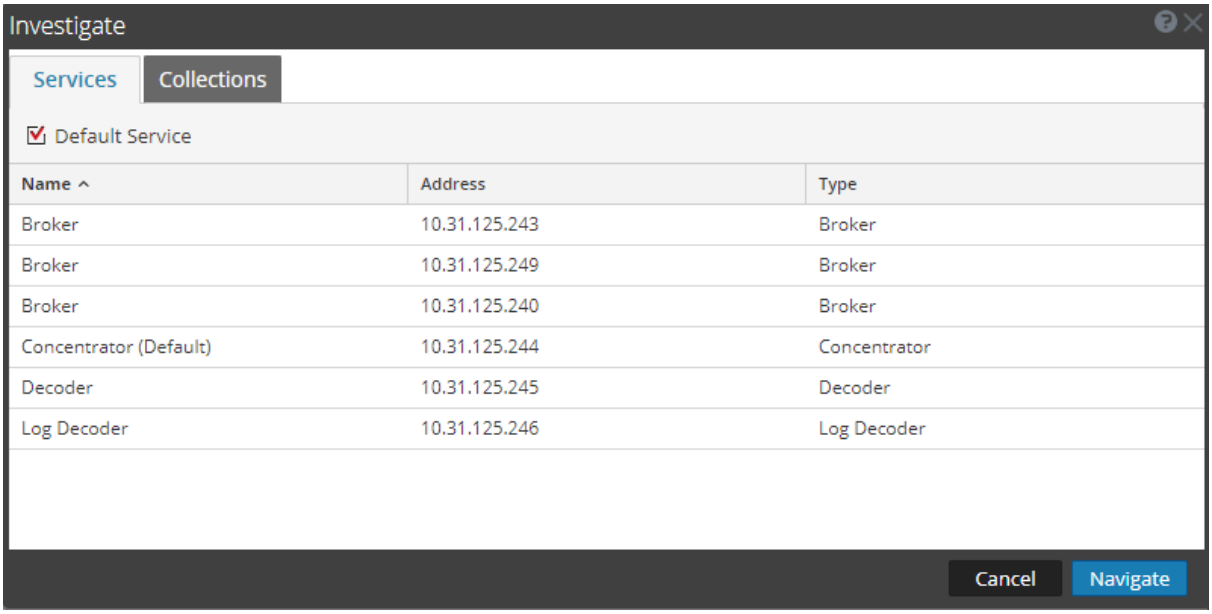
Note: An identity feed only tracks one log in at a time. If two users log in to a system at the same time, the second user will overwrite the first user's data in the identity feed.

Once you have created an identity feed, you can view the results by investigating the feed.

To investigate a configured identity feed:

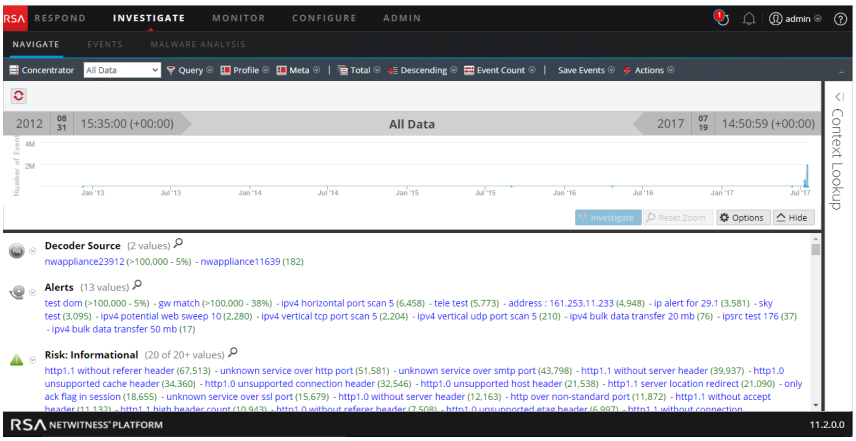
1. Go to **INVESTIGATE > Navigate**.

   If no default service is selected, the Investigate dialog is displayed.



2. Select a service, usually a Concentrator, and click **Navigate**.
3. Select **Load Values** to retrieve meta data.

In the Values panel, scroll down to find the Meta Keys shown in the following illustration.



The identity feed provides information to selected Decoders and Log Decoders. It associates the Host IP data from the Windows operating system to the user logging into that Host in order to tag all logs associated with that IP and investigate.

Editing a Feed

This topic provides instructions for editing a custom feed using the Custom Feed Wizard.

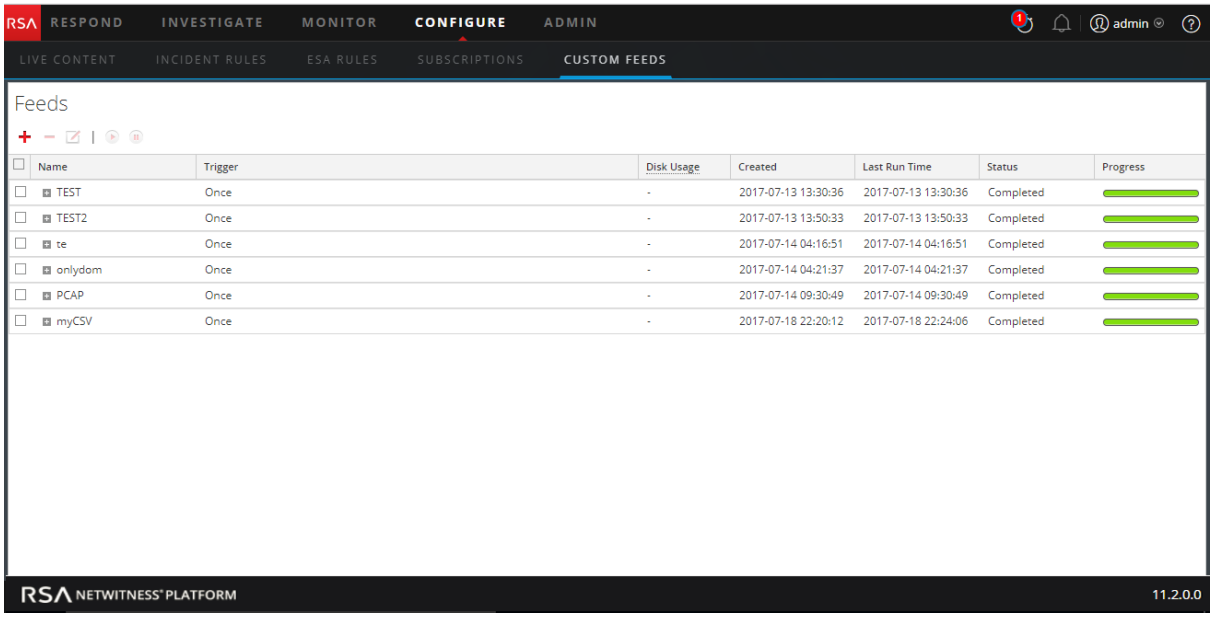
Completing this procedure will result in:

- An existing custom feed opened.
- The feed (**.zip** format) or the file used to create the feed (**.csv** or **.xml**) downloaded and edited.
- The feed recreated with the updated file and new feed specifications.

To edit an existing feed:

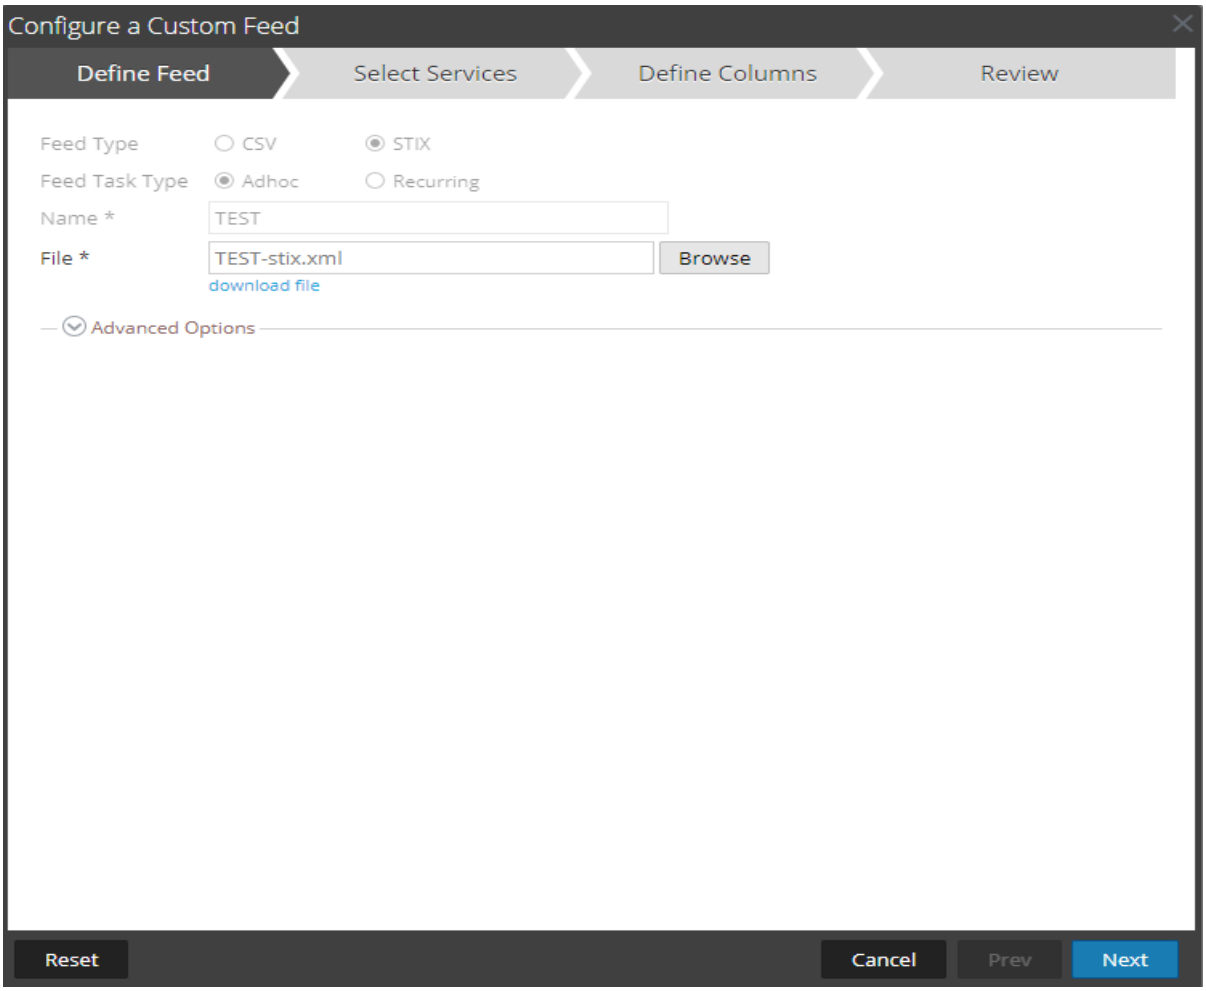
1. Go to **CONFIGURE > CUSTOM FEEDS**.

   The Custom Feeds dialog is displayed.



2. In the toolbar, select a feed and click  .

   The Configure Custom Feed or Configure Identity Feed panel opens in the Custom Feed wizard.



3. If you want to edit the feed file:
   a. Click **download file**.

      For an Identity feed, the .zip file is downloaded. For a custom feed, the .csv or .xml file is downloaded to your local file system.

   b. Edit and save the file.

   c. In the **Define Feed** tab, browse for and open the edited file.
4. Edit any other parameters in the **Define Feed** tab, **Select Services** tab, and **Define Columns** tab that apply to the type of feed.
5. Anytime before you click **Finish**, you can:
   - Click **Cancel** to close the wizard without saving your changes.
   - Click **Reset** to clear the data in the wizard.
   - Click **Next** to display the next form (if not viewing the last form).
   - Click **Prev** to display the previous dialog (if not viewing the first form).
6. In the **Review** tab, review the feed information, and if correct, click **Finish**.

The feed is added to the feeds list and progress bar tracks completion. Upon successful creation of the feed definition file, the Create Feed wizard closes, and the feed and corresponding token file is listed in the Feeds list. You can expand or collapse the entry to see how many services are included, and which services are successful.

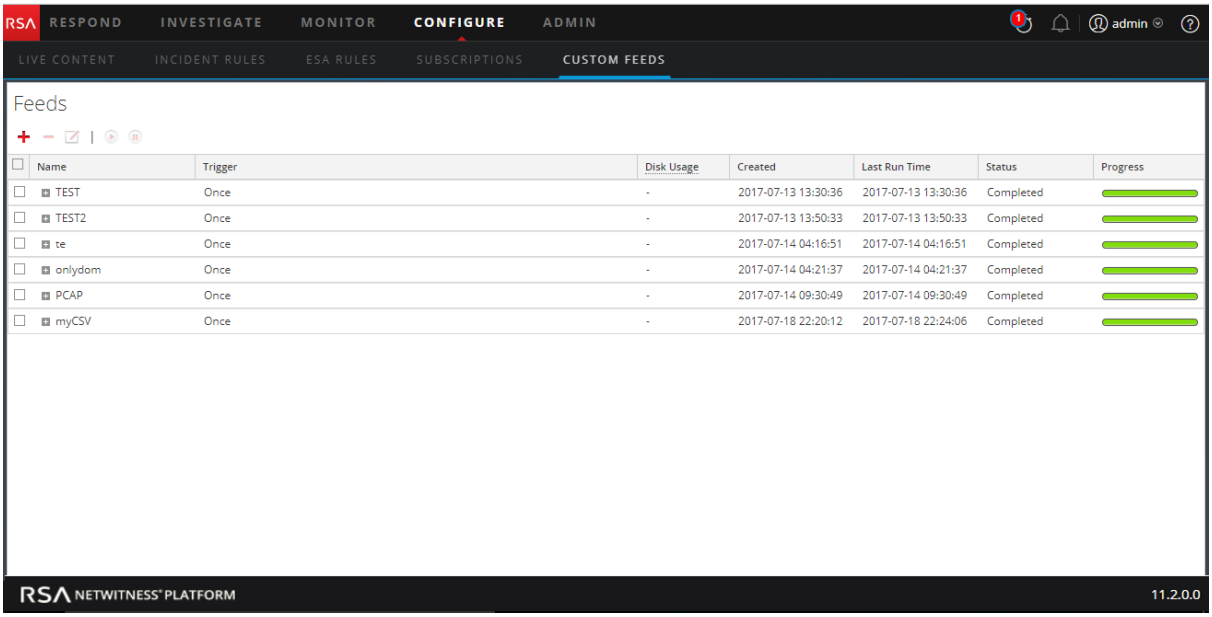
Removing a Feed

This topic provides instructions for removing a feed.

To remove a feed:

1. Go to **CONFIGURE > CUSTOM FEEDS**.

   The Custom Feeds dialog is displayed.



2. In the toolbar, select a feed and click − .

   The Delete Custom Feeds dialog is displayed.

   You can select one of the following options to delete the feed:

   - If you choose to delete the feed from **Local DB and Service**, the feed is deleted from both the service and the local NetWitness Platform box. The deleted feed will no longer seen on the NetWitness Platform user interface.

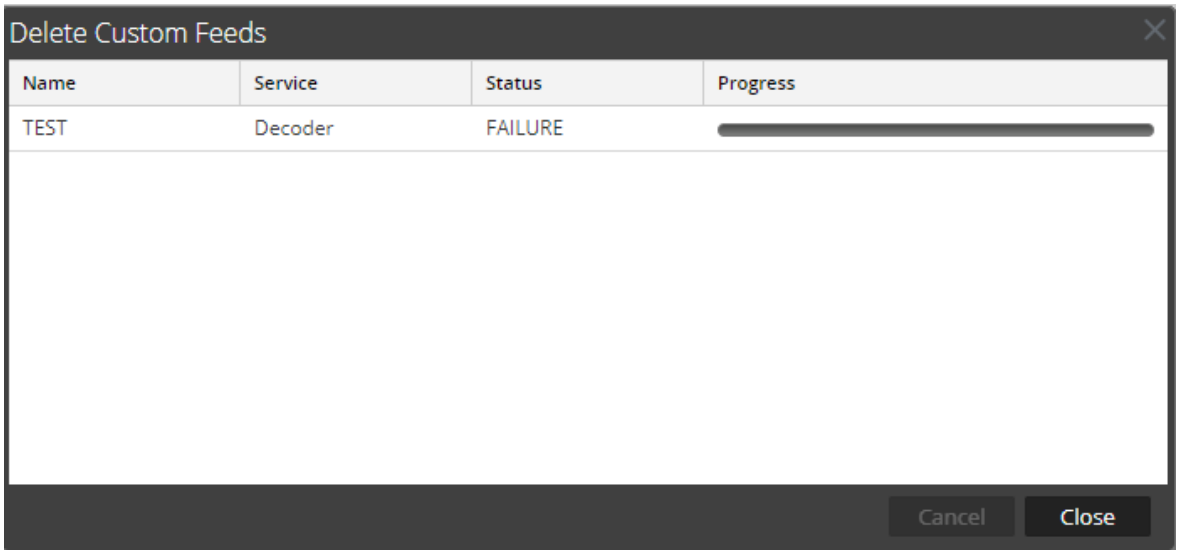
- If you choose to delete the feed from **Local DB Only**, the feed is deleted from the local NetWitness Platform box. The deleted feed will not be seen on the NetWitness Platform user interface; however, the last deployed version of the feeds will be present on the service. The undeployed feeds will be deleted forever.
- If you choose to delete the feed from **Service Only**, the feed is deleted from the service. The deleted feed will appear on the NetWitness Platform user interface and can be deployed again

3. Select which feed you want to delete and click **Delete**.

   A warning dialog is displayed.

4. Click **yes** to confirm that you want to delete the feed from the selected areas.

   - If you chose to delete the feed from the **Local DB Only**, the feed is deleted.
   - If you chose to delete the feed from the **Local DB and Service** or **Service Only**, the Delete Custom Feeds dialog is displayed showing the progress of the deletion on the service.



Miscellaneous Live Services Procedures

This section covers the following procedures:

- Adding Subscribed Resources for Deployment to Services
- Deleting a Subscription
- Displaying Resource Details in Live Resource View
- Downloading a Resource
- Locating and Removing a Deployed Resource from Services
- Removing Subscribed Resources from the Deployments Subscriptions Grid
- Showing Results as a List or in Detail
- Subscribe and Unsubscribe to a Resource

- Viewing Resource Details
- Viewing Subscribed Resources Selected to Deploy on Services

Adding Subscribed Resources for Deployment to Services

1. Go to **CONFIGURE > SUBSCRIPTIONS > Deployments Tab**.
2. In the **Groups** panel, select a group.
   Subscribed resources, if any, are listed in the Deployments tab Subscriptions panel.
3. In the **Subscriptions** panel, click  .

   The Add Subscription dialog, which lists subscriptions available for deployment, is displayed.
4. Select the subscribed resources that you want to deploy to the services group.
5. Click **Save**.

   The dialog closes and the subscriptions are added to the listing in the Deployments tab, Subscriptions panel. This stages the resources for deployment at the next synchronization.

Deleting a Subscription

When you delete a subscription to a resource, deployed instances of the resource are not deleted. The deployed resource remains on services until explicitly removed, but the resource is no longer synchronized with the resource in NetWitness Platform Live.

To delete a subscription:

1. In the **Subscriptions tab**, select the subscriptions you want to delete.
2. Click .

   A dialog asks for confirmation that you want to delete the subscription.
3. To confirm removal, click **Yes**.

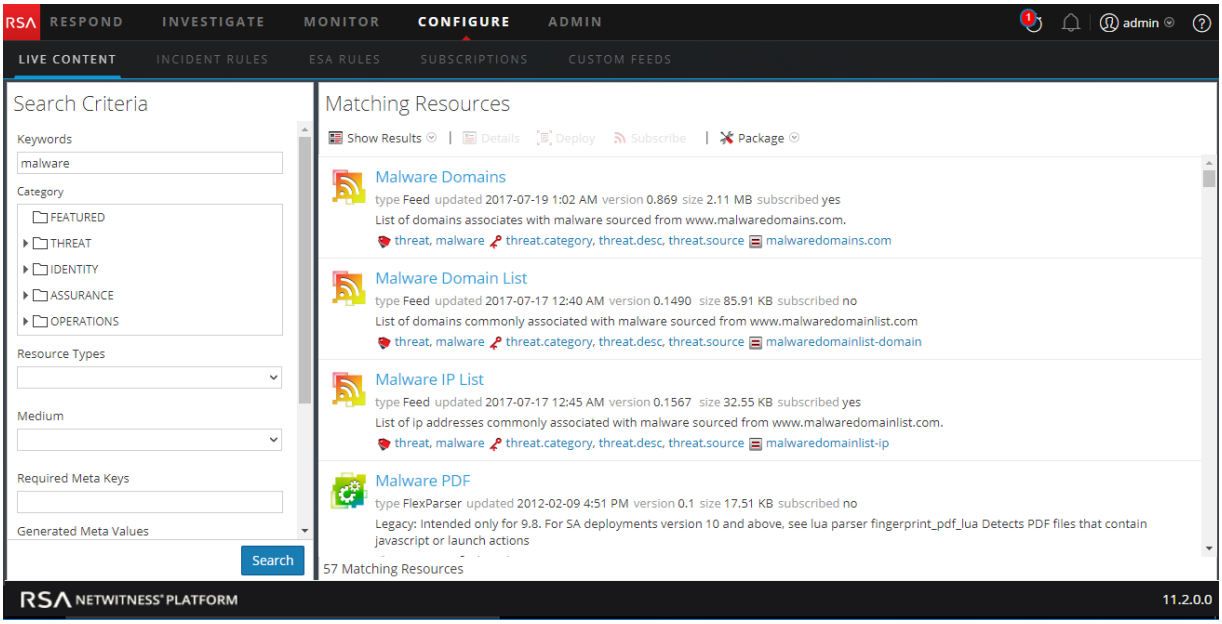
   The subscription is deleted from the subscriptions list, but any deployed instances of the subscribed resource remain on the services.

Displaying Resource Details in Live Resource View

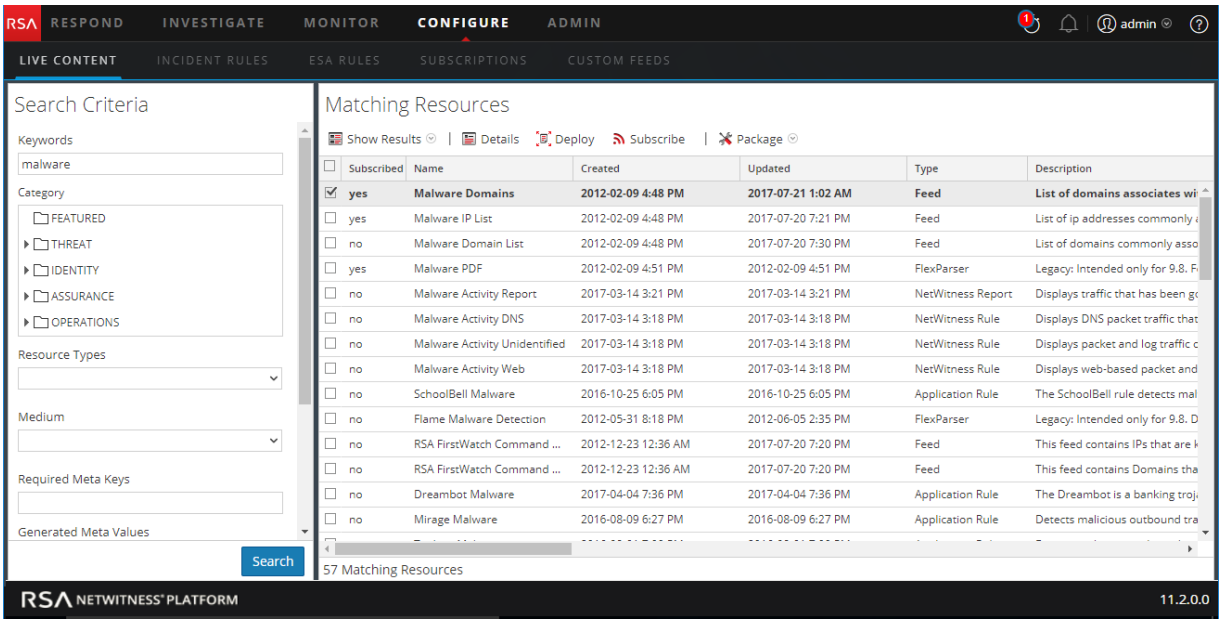
After you select a resource (in the Live Resource View), you can display its detailed information.

To open a separate tab in the Live Resource view with details of a selected resource, do one of the following:

- If you are viewing the **Detailed Results**, click the resource type icon or the resource name.



- If you are viewing the list results, double-click a resource or select a resource and click **Details**.



Downloading a Resource

You can download a single resource from the Live Resource View.

To download a resource:

1. Go to **CONFIGURE > Live Content**.
2. In the **Search Criteria** panel, enter the criteria needed to return the resource you want to download.

3. Select a single resource, then click Details.
4. Click Download.

The resource is saved as a ZIP archive to your local Downloads folder.

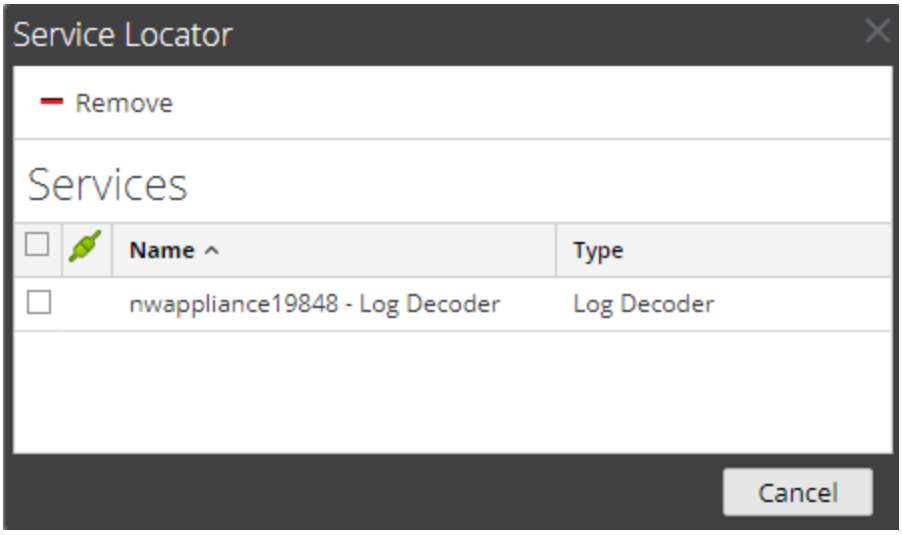
Locating and Removing a Deployed Resource from Services

You can locate and remove a deployed resource from services from the Live Resource View.

To view a list of services on which a resource is deployed:

1. With a resource displayed in the **Resource View**, click Service Locator.

   The Service Locator dialog is displayed.



2. Select one or more services in the **Services** list.
3. Click .

   The resource is removed from the selected services.

Removing Subscribed Resources from the Deployments Subscriptions Grid

Subscriptions that are selected for deployment to a service group are deployed during synchronization. You can remove subscriptions from the Live Configure view > Deployments tab > Subscriptions panel, but any that have actually been deployed to services remain deployed until someone removes them.

To remove resources from the Deployments tab Subscriptions panel:

1. In the **Groups** panel, select a group.

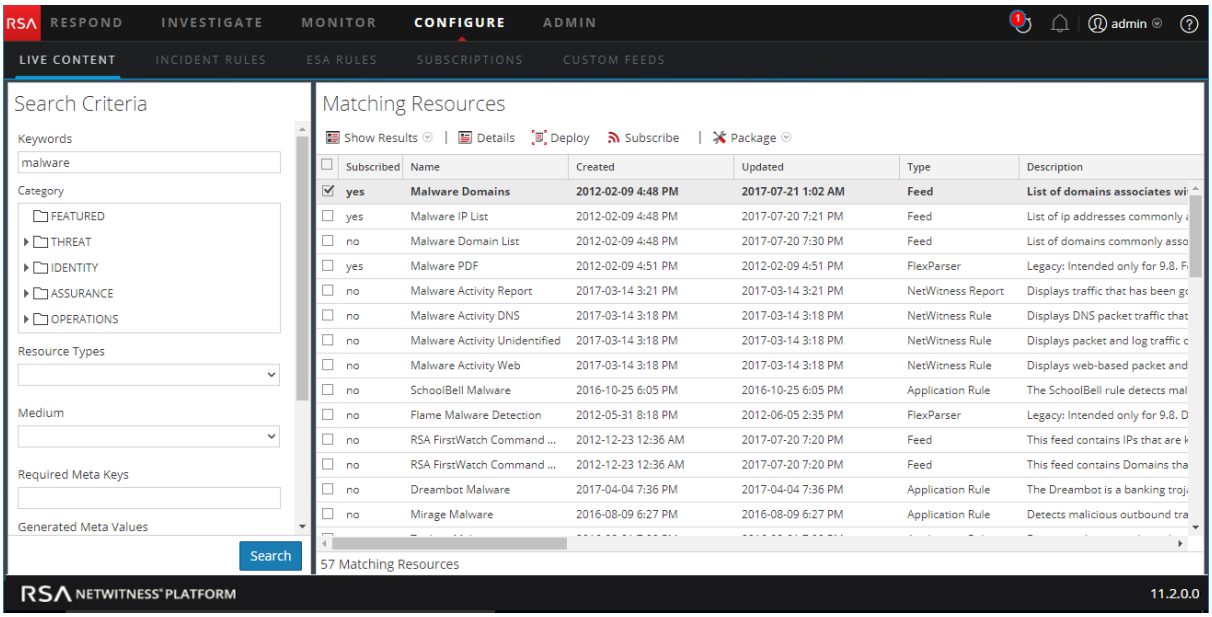
   Subscribed resources, if any, are listed in the Subscriptions panel.

2. In the Subscriptions panel, click .

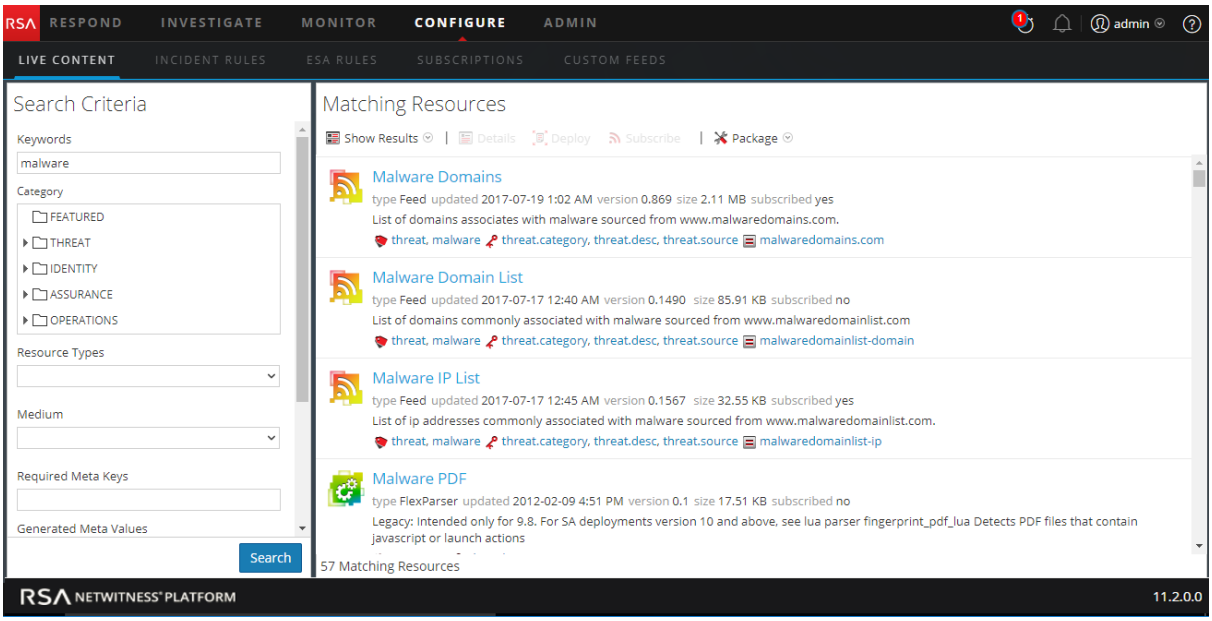
A dialog requests confirmation that you want to delete the resource from the service group. The resource is removed from the Deployments tab Subscriptions panel, but is not removed from services on which it is deployed.

Showing Results as a List or in Detail

1. To change to grid results when viewing detailed results, select **Show Results > Grid**.



2. To change to detailed results when viewing grid results, select **Show Results > Detailed**.



Subscribe and Unsubscribe to a Resource

Subscribe

When you subscribe to resources, you will receive notification when new versions of the resources are available.

To subscribe to a resource:

1. Go to **Live > Search** view.
2. In the **Search Criteria** panel, specify search criteria and click **Search**.
3. Select one or more resources and click Subscribe.

   A confirmation dialog is displayed: **By subscribing to these resources, you are indicating that you wish to receive notification when new versions are available.**
4. To confirm that you want to subscribe to the resource, click **OK**.

   The resource is added to the subscriptions managed in the Subscriptions tab and is available for deployment in the Deployments tab.

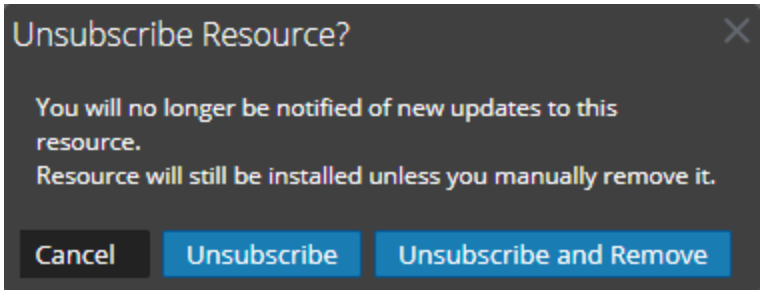
Unsubscribe

When unsubscribing from a resource, you have the option to leave the resource on services on which it is deployed or to remove it from services.

To unsubscribe from a resource:

1. With a resource displayed in **SUBSCRIPTIONS**, click Unsubscribe.

   A confirmation dialog is displayed.



2. Do one of the following:
   - To confirm that you want to unsubscribe from the resource and leave it on the services where it is deployed, click **Unsubscribe**.
   - To confirm that you want to unsubscribe from the resource and remove it from the services where it is deployed, click **Unsubscribe and Remove from Services**.
   - To close the dialog without unsubscribing, click **Cancel**.

   The selected action is applied.

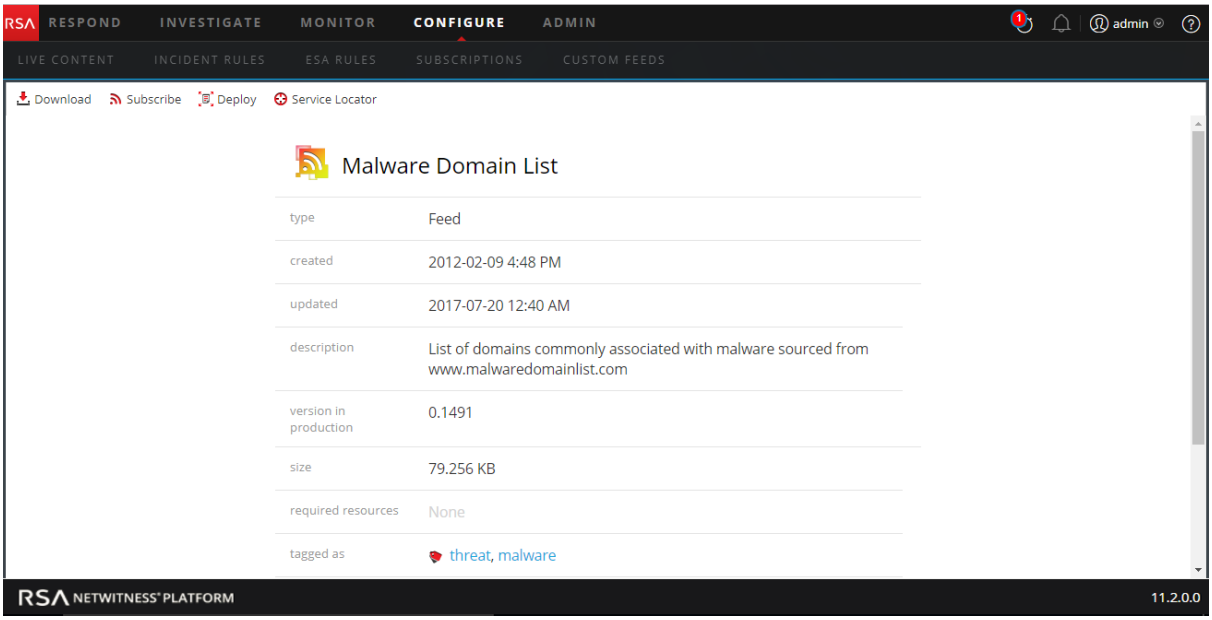
Viewing Resource Details

You can display detailed information about a subscribed resource in the Resource View.

To view details:

1. In the **Subscriptions tab**, select a single subscription.
2. Click Details .

   The details of the resource are displayed in the Resource View.



Viewing Subscribed Resources Selected to Deploy on Services

In the **Live Configure view > Deployments** tab you can view subscribed resources that have been selected for deployment on services.

To view subscribed resources that have been selected for deployment on services:

In the **Groups** panel, select a group, and expand it to view services in the group.
The resource subscriptions selected for deployment are listed in the Deployments tab Subscriptions panel.

References

This topic is a collection of references, which describe the user interface and more detailed information about how Live works in NetWitness Platform. These topics are presented in alphabetical order.

- Deployments Tab
- Discontinued Resources Tab
- Live Configure View
- Live Feeds View
- Live Resource View
- Live Search View
- NetWitness Platform Feedback and Data Sharing
- Resource Package Deployment Wizard
- RSA Live Registration Portal
- Subscriptions Tab

Live Configure View

In the Live Configure view, NetWitness Platform provides integrated tools for managing Live resources. You can manage resource subscriptions, deployments to services and discontinued resources. The required role to access this view is **Configure Live Resources**. For a high-level description of how to use the different views in NetWitness Platform Live, please read Live Services Management.

To access this view:

1. Go to **CONFIGURE > Subscriptions**. This view has the following tabs:

- Deployments Tab
- Subscriptions Tab
- Discontinued Resources Tab

Deployments Tab

The Deployments tab provides a user interface in the Live Configure view for:

- Viewing subscribed resources that are selected for deployment on services in a service group.
- Selecting subscribed resources to deploy to services in a service group.
- Removing resources that are selected for deployment on services in a service group.

The resources listed here are not deployed immediately after adding to a service group. Instead the subscribed resources are pushed to the services when NetWitness Platform synchronizes with RSA NetWitness Platform Live. The synchronization schedule is configured in the Live Configuration panel. If you do not want to wait for the scheduled synchronization, you can also tell NetWitness Platform to synchronize now in the Live Configuration panel.

Likewise, resources deleted from the Deployments panel are not deleted from service where they have been deployed. To delete resources from services, delete them in the Live Resource View.

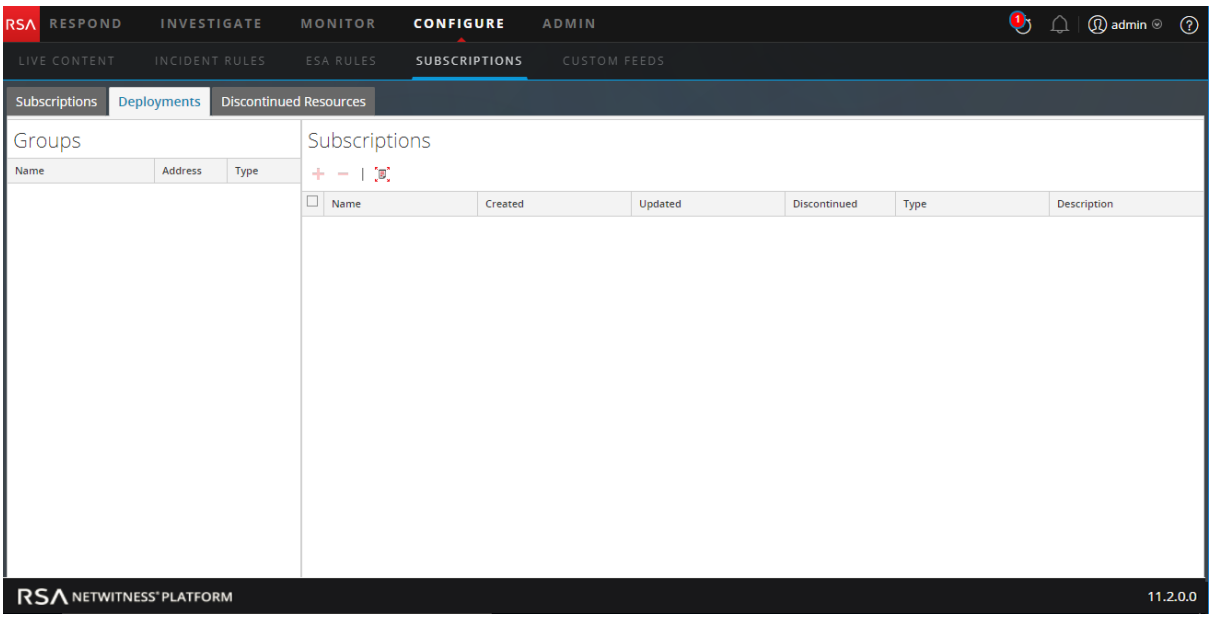
The required permission to access this view is **Manage Live Resources**.

To access this view:

1. Go to **CONFIGURE > Subscriptions**.

   The **Subscriptions** tab is open by default.

2. Click the **Deployments** tab.



The Deployments tab has two panels: **Groups** and **Subscriptions**.

Groups Panel

The Groups panel is a static display of configured service groups that were created in the Administration Services view. Selecting a group in the Groups panel populates the Subscriptions panel with a list of subscriptions that are selected for deployment on the services in the service group.

Feature	Description
Name	Displays the service group name. Clicking the plus sign displays a nested list of services in the group.
Address	Displays the IP address of each service in the group.
Type	Displays the type of service.

Subscriptions Panel

The following table describes the features in the Subscriptions panel.

Feature	Description
	Click  to open a dialog that lists subscriptions that were added in the Live Search view or in the Live Resource view and are available for deployment.
	Click to delete the selected subscriptions from the deployment list for service group.
	Click  to synchronize your resources to the latest versions available on Live.
Name	Displays name of the resource.
Created	Displays date and time that the resource was created.
Updated	Displays date and time that the resource was last updated.
Type	Displays type of resource.
Description	Displays description of the resource.

Subscriptions Tab

Subscriptions are NetWitness Platform Live resources to which you subscribed in the Live Search view or Live Resource view. When you subscribe to a resource, you agree to receive updates on a regular basis from RSA NetWitness Platform Live. The choices made in the Live Configuration panel determine how often synchronization occurs and if you receive email notifications of updates. In addition, if you don't want to wait for the next update, you can force an immediate synchronization.

The Subscriptions tab provides a way to manage subscriptions. Each resource to which NetWitness Platform is subscribed is listed in this tab.

In the Subscriptions tab, you can:

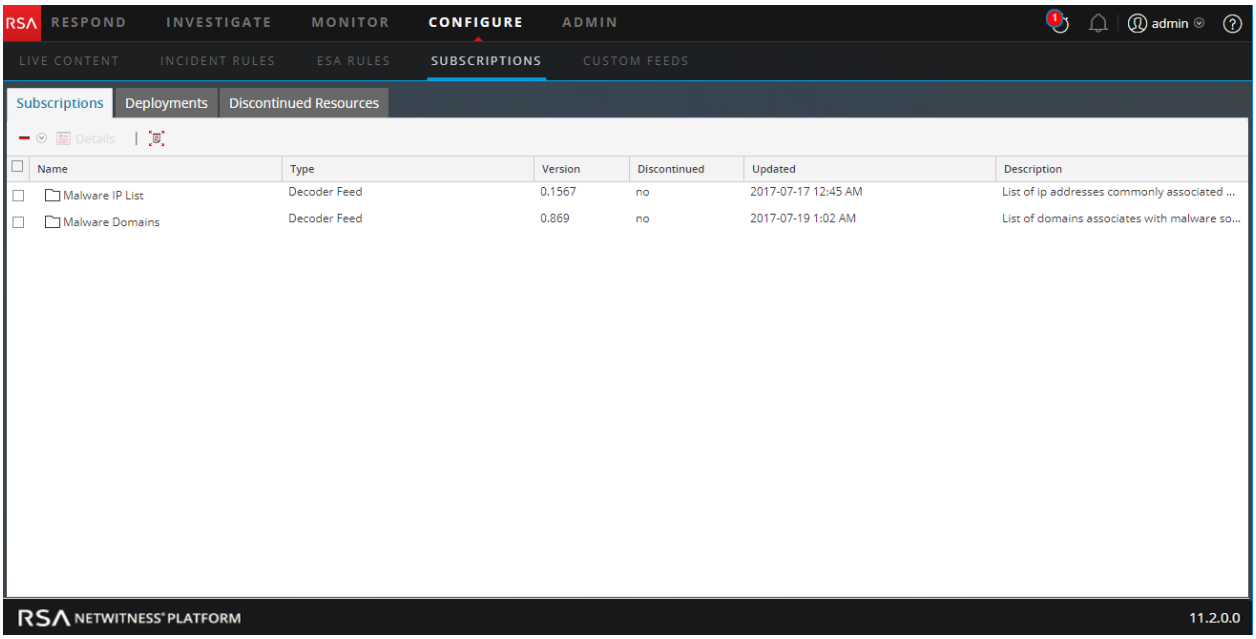
- View all resources to which this NetWitness Platform instance is subscribed.
- Open a detailed view of a subscription in the Live Resource View.
- Delete a subscription.

Note: Subscribing to a resource does not deploy the resource to any services. To deploy one or more subscribed resources, go to the Deployments tab. To deploy a single resource manually, use the Deploy option in the Resource View.

The required permission to access this view is **Manage Live Resources**.

To access this view, in the main menu, select **CONFIGURE > Subscriptions**.

The Subscriptions tab is open by default.



The **Subscriptions** tab has a toolbar and a grid.

Toolbar

This table describes the options available in the toolbar.

Feature	Description
	Deletes the selected subscriptions.
	Displays the details of a single subscribed resource in the Resource View.
	Check the Live Server for the latest discontinued resources.

Grid

Column	Description
	Selects subscribed resources to view in detail or delete. You can view details for a single resource. You can delete one or more resources from the subscribed resources, in effect unsubscribing.
Name	Displays name of the subscribed resource.
Type	Displays type of subscribed resource.
Version	Displays version of the subscribed resource.

Column	Description
Discontinued	Indicates the status of the discontinued resources for the subscribed resource. **Yes** - Resource is discontinued. **No** - Resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Updated	Displays date and time when the subscribed resource was last updated.
Description	Displays description of the subscribed resource.

Discontinued Resources Tab

This topic introduces the features of the **Live Configure view > Discontinued Resources** tab.

The Discontinued Resources tab provides a user interface in the Live Configure view for:

- Scanning the services for the discontinued resources.
- Removing the discontinued resources from any service or service group.

Note: Discontinued content still appears. With discontinued content there just won't be any updates, and users won't see these items when they search in Live, unless they check the **Include Discontinued Resources** box while searching.

In the RSA Content space on RSA Link, you can view the complete, up-to-date list of discontinued resources (Discontinued Content). For each resource, there is a description of why it was discontinued. Use these details to determine whether or not to remove a discontinued resource from your installation. .

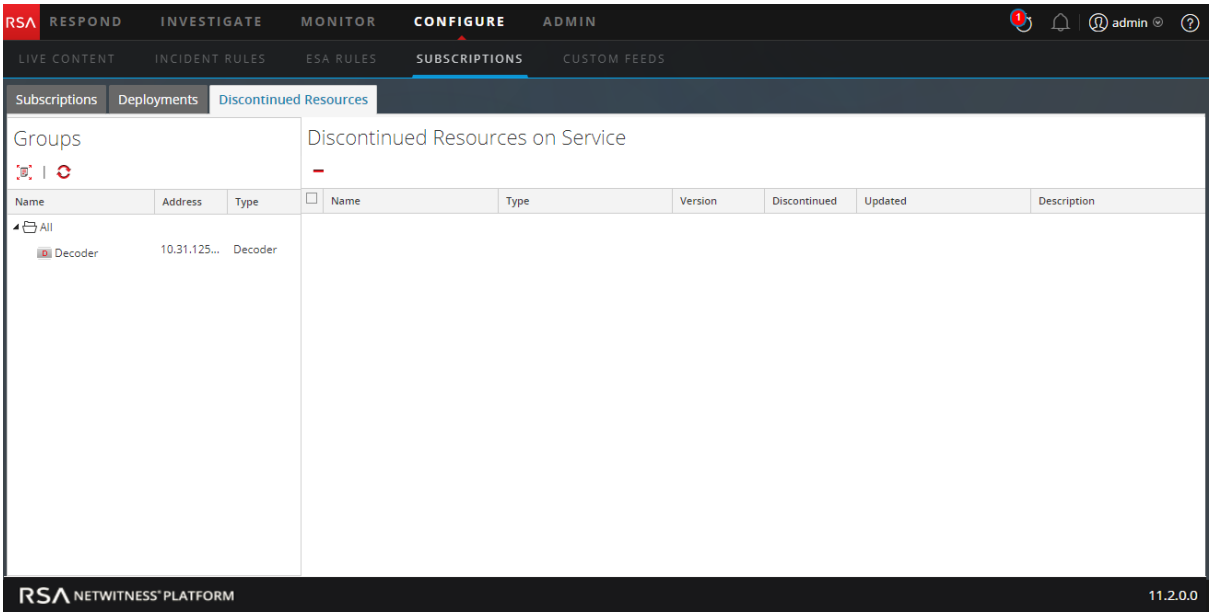
The required permission to access this view is **Manage Live Resources**.

To access this view:

1. Go to **CONFIGURE > Subscriptions**.

   The **Subscriptions** tab is open by default.
2. Click the **Discontinued Resources** tab.

This is an example of the Discontinued Resources tab.



The Discontinued tab has two panels: Groups and Discontinued Resources on Service.

Groups Panel

The Groups panel is a static display of configured service groups that were created in the Admin Services view. Selecting a group in the Groups panel populates the Discontinued Resources panel with a list of discontinued resources which are deployment on the selected service or service group.

Feature	Description
	Click to scan the services for a discontinued resource.
	Displays the current status of the discontinued resources on a service. **Note:** The status of a service may change while the services are being scanned.
Name	Displays service group name. Clicking the plus sign displays a nested list of services in the group.
Address	Displays IP address of each service in the group.
Type	Displays type of service.

Discontinued Resources on Service Panel

The following table describes the features in the Discontinued Resources on Service panel.

Feature	Description
	Click to delete the selected resources from the service or service group.

Feature	Description
Name	This is the name of the resource.
Type	This is the type of resource.
Version	Version of the discontinued resource.
Discontinued	Indicates the status of the discontinued resources for the subscribed resource. **Yes** - The resource is discontinued. **No** - The resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Updated	Displays date and time that the resource was last updated.
Description	Displays description of the resource.

Live Feeds View

Use the Live Feeds View to:

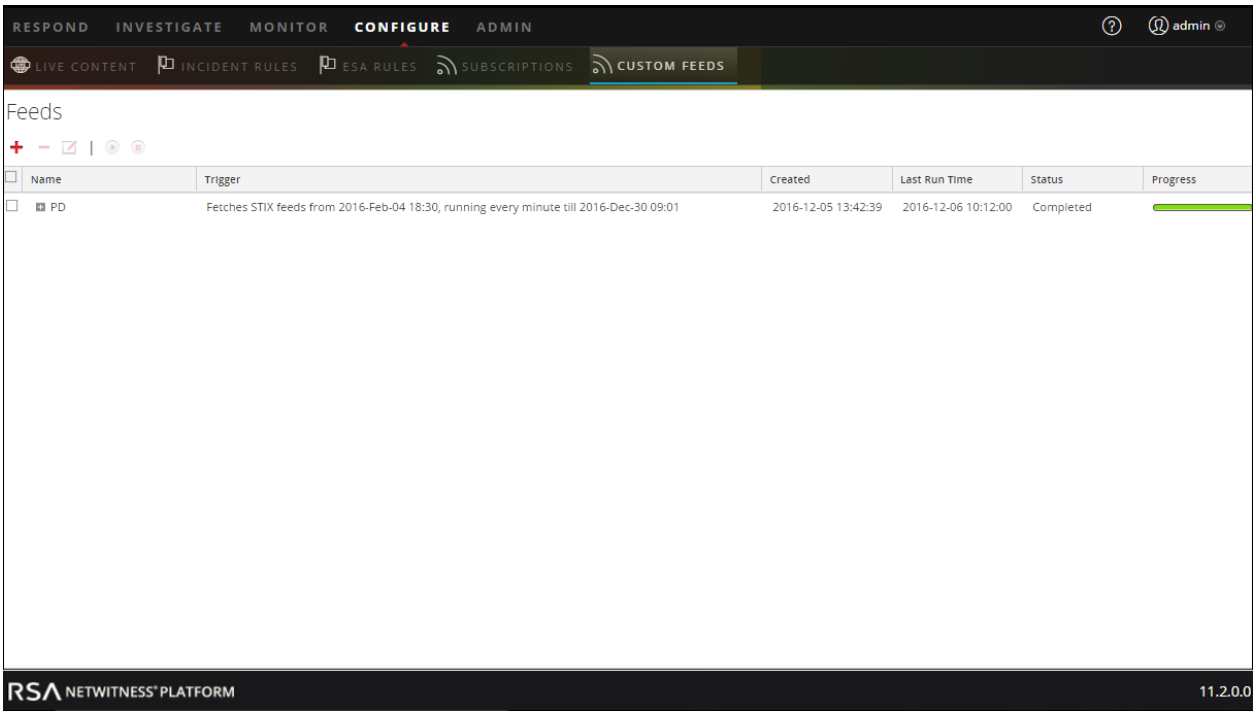
- Create custom feeds.
- Create identity feeds.
- Edit feeds.

The required role to access this view is **Manage Devices**.

To access this view, do one of the following:

- In the main menu, select **Live > Feeds.**
- From any view in the Live Module, select **Feeds** in the main menu.

This is an example of the Feeds view.



The **Feeds** tab has a toolbar and a grid.

Toolbar

This table describes the options in the toolbar.

Feature	Description
	Initiates the creation of a custom or identify feed by displaying the **Setup Feed** dialog is displayed.  • Custom Feed opens the **Configure a Custom Feed** wizard. • Identity Feed opens the **Configure Identity Feeds** wizard.
	Deletes the feed that you selected.
	Opens the Configure Custom Feed or Configure Identity Feed wizard for the feed that you selected (see Editing a Feed.
	Start or resume data feed.

Feature	Description
	Stop or pause data feed.

Feeds Grid

This table describes the columns in the grid.

Column	Description
	Selects a feed.
Name	Name of the feed. **Note:** You can now use special characters to define the name of the custom feed.
Trigger	Displays how often the feed runs which is determined by what you defined in **Feed Task Type** when the feed was created.
Created	Displays date and time when the feed was created.
Disk Usage	Displays the MongoDB storage size used by the TAXII feed.
Last Run Time	Displays date and time when the feed was last run.
Status	The status of the feed.
Progress	Progress bar.

Live Resource View

The Live Resource View shows a detailed view of a selected resource, and has options to:

- Download the resource.
- Subscribe or unsubscribe the resource.
- Deploy the resource to services.
- Locate services on which the resource is deployed and remove the resource from services.

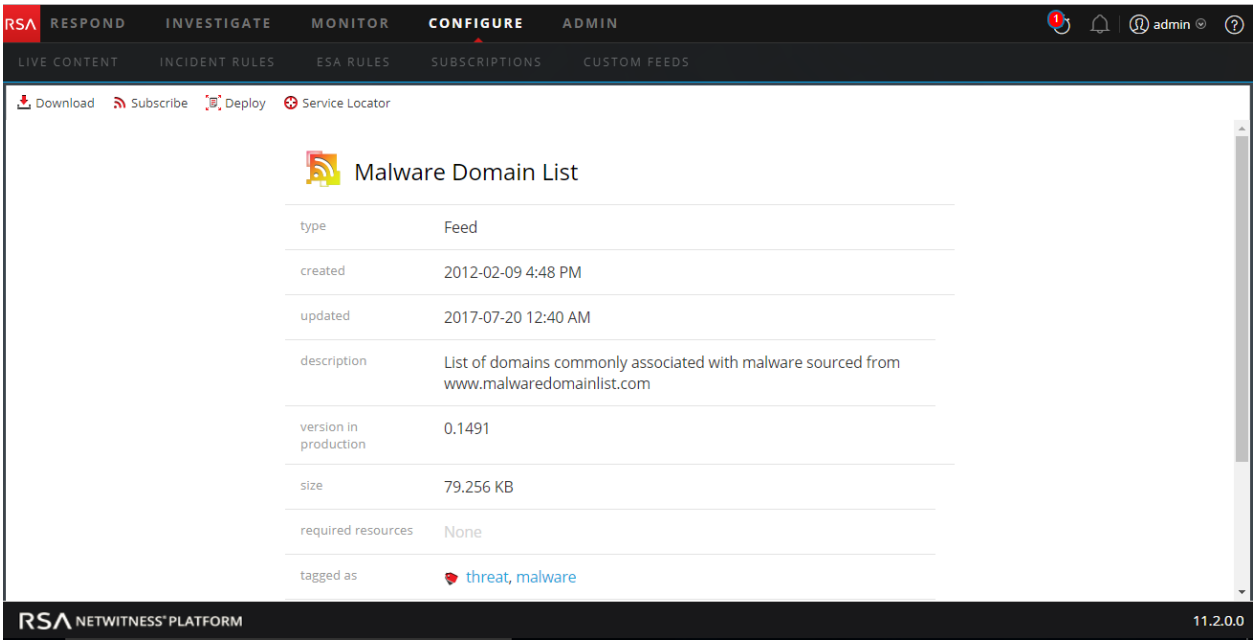
The required permission to access this view is View Live Resource Details.

To access this view, do one of the following:

1. Go to **CONFIGURE > LIVE CONTENT > Search Criteria**.
2. In the Live Search view, **Detailed Results**, click the resource type icon or the resource name.

3. In the Live Search view, **Grid Results**, double-click a resource or select a resource and click **Details**.

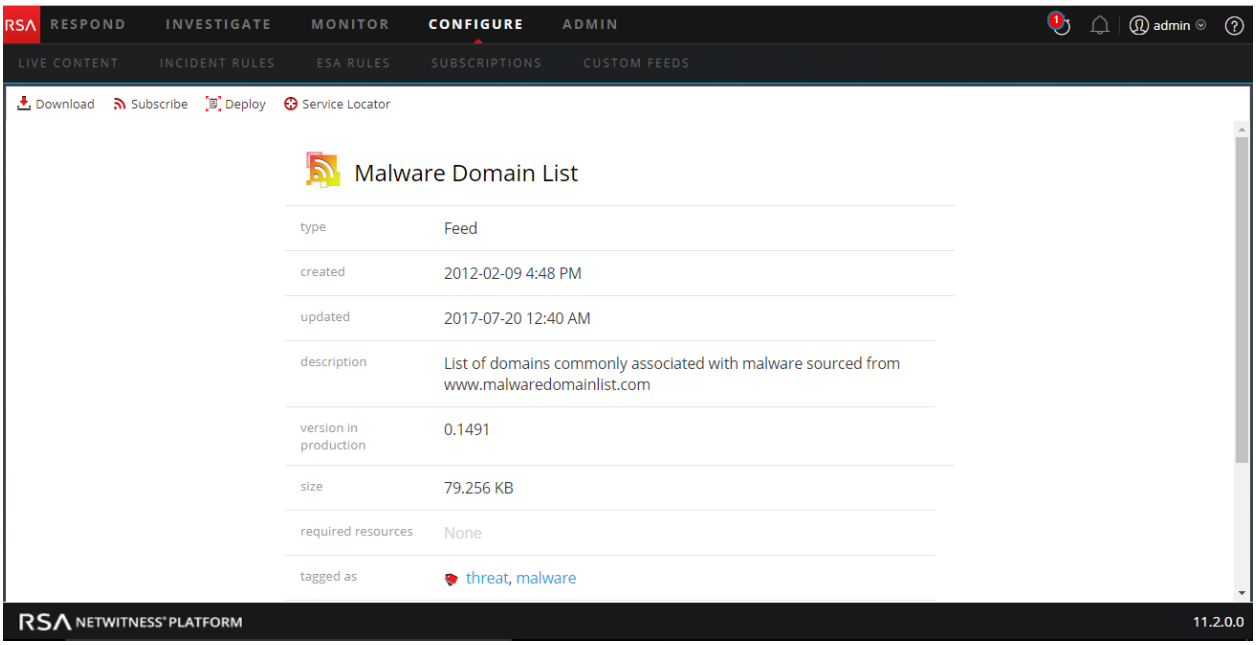
This is an example of the Resource view.



The Live Resource View has a detailed view of a single resource and a toolbar.

Resource Details

This is an example of the resource details displayed in the Resource View.



The following table describes the elements in the Resource Details section.

Feature	Description
Resource Type Icon	A graphic representation of the resource type, for example  .
Name	The name of the resource, for example, **fingerprint_office_lua**.
Type	The type of resource, for example, **RSA Lua Parser**.
Created	The date the resource was created, for example, **2013-09-15 02:16 PM**.
Updated	The date the resource was last updated, for example, **2013-09-15 02:16 PM**
Description	The description of the resource, for example, **Identifies Microsoft Office 95, 2007 Word, Excel, and PowerPoint documents**.
Version in production	The version of the resource, for example, **0.1**.
Size	The size of the resource, for example, **9.079 KB**.
Required Resources	A list of resources on which this resource depends, for example, **NetWitness Lua Library**. Clicking a resource replaces the currently displayed details with the details of the one you clicked.
Tagged as	The tags  that apply to the resource. In the example, the tag is **featured, informational**. Clicking a tag opens the Live Search View with the search narrowed to match resources with that tag.
Required Meta Keys	The meta keys  that apply to the resource. In the example, there are no meta keys required. Clicking a meta key opens the Live Search View with the search narrowed to match resources with that meta key.
Generates Meta Values	The meta values  that the resource generates. In the example, there are no meta values generated. Clicking a meta value opens the Live Search View with the search narrowed to match resources with that meta value.
Permissions	The permissions required for the resource.

Resource View Toolbar

This table describes the Live Resource view toolbar options.

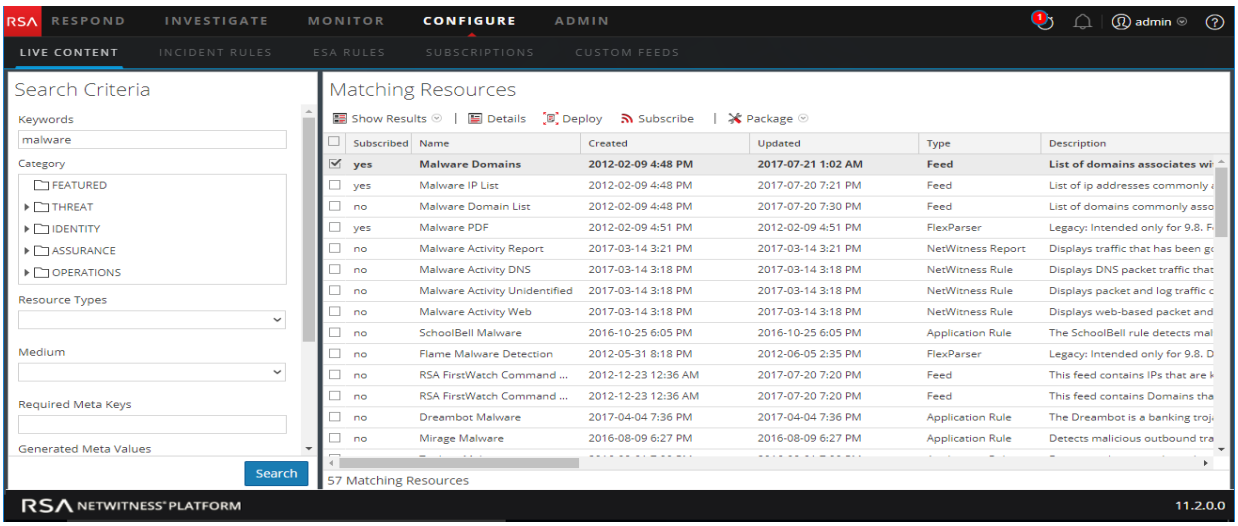
Feature	Icon	Description
Download		This option downloads the resource currently displayed in the Resource View.

Feature	Icon	Description
Subscribe or Unsubscribe		This option subscribes to or unsubscribes from the resource currently displayed in the Resource View. • Clicking **Subscribe** opens a dialog notifying that you are agreeing to receive notification when the selected resources are updated. You can cancel or click **OK**. • Clicking **Unsubscribe** asks for confirmation that you want to stop receiving notification when the selected resources are updated. You can then choose to cancel or you can click **Unsubscribe** or **Unsubscribe and Remove**, which also removes the resource from services on which it is deployed.
Deploy		This option provides a way to deploy the resource currently displayed in the Resource View. Clicking **Deploy** opens the Manual Resource Deployment dialog.
Service Locator		This option displays a list of services on which the currently displayed resource is deployed. You can remove the resource from all services or selected services.

Live Search View

The Live Search view provides the ability to browse the configured Live CMS for resources. Once matching resources are found, you can view details, subscribe to resources, and deploy resources to services and service groups.

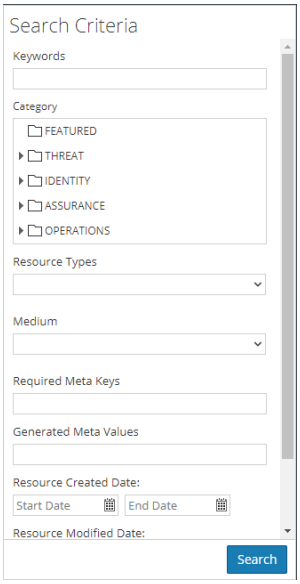
This is an example of the Search view.



The Live Search view has a panel for specifying search criteria and a panel that displays matching resources. The Search Criteria panel is collapsible to provide more width for viewing the Matching Resources panel.

Search Criteria Panel

This is an example of the Search Criteria panel.



The following table provides descriptions of the Search Criteria panel features.

Feature	Description
Keyword(s)	Enter a keyword or keywords to browse for resources that have the keyword in the resource name or the resource description. You can use wildcards when you enter a keyword.
Category	The categories mirror the hierarchical Investigation Model that RSA uses to organize resources. The purpose of the Investigation model is to deliver an accurate path to information security incident response. For more information, see the Investigation Model topic.

Feature	Description
Resource Types	Select resources types from the drop-down list to filter resources by type of resource. Possible values are: • Advanced Analytics (Warehouse) • Application Rule • Bundle • Correlation Rule • Event Stream Analysis Rule • Feed • FlexParser • Log Collector • Log Device • Lua Parser • Malware Rules • NetWitness List • NetWitness Report • NetWitness Rule **Note:** Some rules that have been deployed to an earlier version of RSA NetWitness® Platform may not deploy or execute on NetWitness 11.x. For more information, see the Troubleshooting.
Medium	Select one or more mediums from the drop-down list to search for content based on the meta data source. Available values for medium are as follows: • **log**: applied to content that uses meta derived from log data • **packet**: applied to content that uses meta derived from network packets • **log and packet**: applied to content that correlates meta derived across log and packet data
Tags	Select meta tags from the drop-down list to browse based on how the meta is tagged. For example, to browse resources for a Log Decoder, select the **netwitness for logs** tag. Alternatively, you can click a tag in the Matching Resources panel to insert that tag in this field.
Required Meta Key(s)	Enter a specific meta key; for example, **threat.source**. Alternatively, you can click a meta key in the Matching Resources panel to insert that tag in this field.
Generated Meta Value(s)	Enter a generated meta value; for example, **netwitness**. Alternatively, you can click a generated meta key in the Matching Resources panel to insert that tag in this field.

Feature	Description
Research Created Date	Specify a date range during which resources were created. For example, to browse resources that were created between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click and pick dates from a calendar.
Research Modified Date	Specify a date range during which resources were modified. For example, to browse resources that were modified between January 1 and January 4, you select January 1 as the start date and January 4 as the end date. You must enter dates in mm/dd/yyyy format or you click and pick dates from a calendar.
Search	Click **Search** to send the search request to the Live server. More specific search criteria return matching resources more quickly.
Cancel	Click **Cancel** to cancel the search in progress.
Include Discontinued Resources	Check **Include Discontinued Resources** to include the discontinued resources in the search result. For an up-to-date list of resources that have been discontinued, see the Discontinued Content topic.

Matching Resources Panel

The Matching Resources panel presents search results based on the selections made in the Search Criteria panel. Results are initially displayed in a grid, but you can switch between two Show Results options: Detailed or Grid.

Detailed Results

In the detailed results, you can click a tag, meta key, or resource meta value to auto fill the Search Criteria panel and pivot the search results.

The following table describes the elements in the detailed results.

Feature	Description
Resource Type Icon	A graphic representation of the resource type. For example .
Name	The name of the resource, for example, **Group Management**. **Note:** (Discontinued) is displayed next to the resource name if a resource is discontinued.
Type	The type of the resource, for example, **Rule**.
Updated	The date the resource was last updated, for example, **2015-09-15 4:27 PM**.
Version	The version of the resource, for example, **0.1**.
Size	The size of the resource, for example, **153 B**.

Feature	Description
Subscribed	Subscription status: • **yes**: This NetWitness Platform instance is subscribed to this content resource. • **no**: This NetWitness Platform instance has not subscribed to this content resource.
Description	The description of the resource, for example, **Compliance Rule-Group Management**.
Tags	The tags that apply to the resource. Clicking a tag narrows the search to resources with that tag. For example,  .
Meta Keys	The meta keys that apply to the resource. Clicking a meta key narrows the search to resources with that meta key. For example,  .
Resource Meta Values	The meta values generated by the resource. Clicking a meta value narrows the search to resources that generated the meta value. For example,  .

Grid Results

In the grid view, you can select one or more resources and use additional options in the toolbar to view the details of a single resource, subscribe to resources, and deploy resources.

The following table describes the elements in the grid results.

Feature	Description
Subscribed	Subscription status: • **yes**: This NetWitness Platform instance is subscribed to this content resource. • **no**: This NetWitness Platform instance has not subscribed to this content resource.
Name	The name of the resource, for example, **Group Management**. **Note:** The resource name is displayed in red color if it is discontinued.
Created	The date the resource was created, for example, **2015-08-12 3:11 PM**.
Updated	The date the resource was last updated, for example, **2015-09-15 4:27 PM**.
Type	The type of the resource, for example, **Rule**.
Discontinued	The status of the discontinued resources: **yes** - The resource that matches the search criteria is discontinued. **no** - The resource is not discontinued. **--** - The Live Server is not checked for the discontinued resources.
Description	The description of the resource, for example, **Compliance Rule-Group Management**.
Toolbar	

Feature	Description
Show Resu	This menu offers two ways to view search results: **Detailed** and **Grid**.
Details	This option applies to a single selected resource. Clicking **Details** opens the selected resource in the Live Resource view.
Deploy	This option applies to one or more selected resources.
Subscribe	This option applies to one or more selected resources. Clicking **Subscribe** opens a dialog that asks for confirmation that you want to receive notification when the selected resources are updated.

Package	This menu offers two packaging functions for the selected resources:
	• **Create**: creates a **resourceBundle.zip** file that contains the selected resources and opens a dialog in which you can either:
	  • open the file, or
	  • save the file for subsequent deployment.
	• **Deploy**: opens the Deployment Wizard, in which you can choose a **resourceBundle.zip** file and deploy it.

See Also

- For more information on Deployment (Deploy), see Find and Deploy Live Resources.
- For more information on Deploying a Package (Package), see the Resource Package Deployment Wizard,.

Resource Package Deployment Wizard

If you have created a package of resources and saved it on a network drive, you can use the Resource Package Deployment Wizard to deploy the resources manually to a service or a service group without subscribing to the resources. NetWitness Platform accepts packages in **.nwp** files or **.zip** files.

Deploying resources manually deploys them directly to the services without taking advantage of the powerful resource management capabilities of NetWitness Platform.

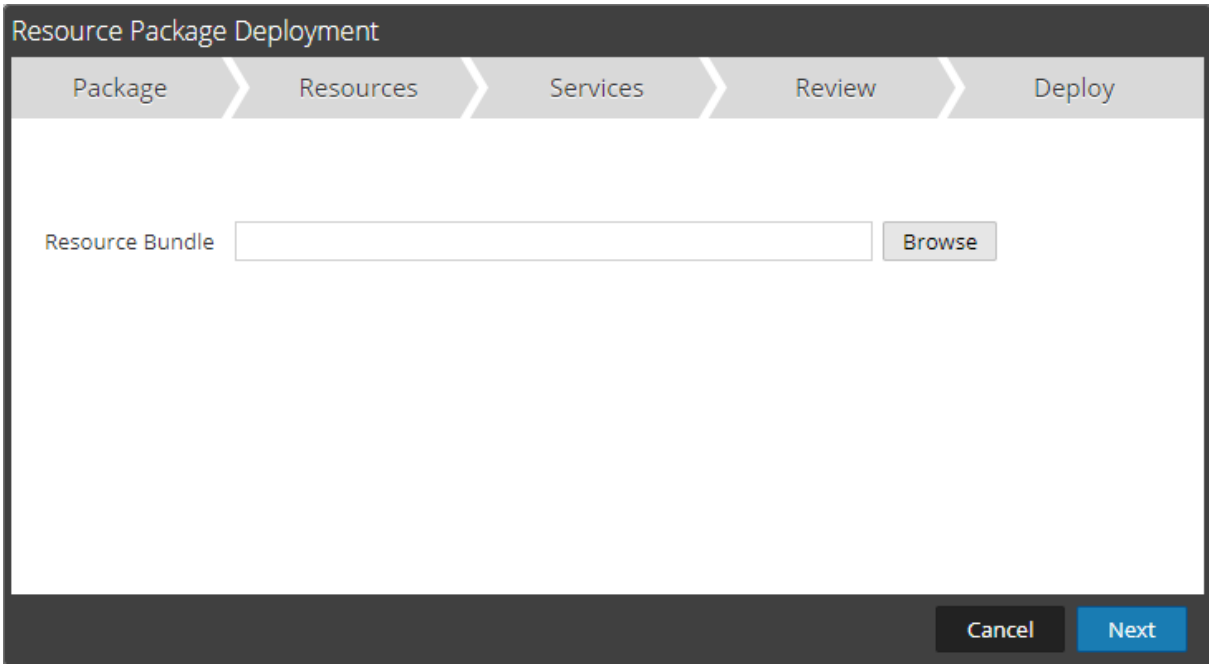
If you want to receive notification and updates for updated resources and be able to easily remove resources from a service, you must subscribe to resources in the Live Search view and deploy the resources in the **Live Configure** view.

Note: Use NetWitness Platform Live to create resource bundles; this is a different application that is not part of NetWitness Platform. Selecting **Package** > **Create** in the **Live Search - Matching Resources** toolbar displays the Content Package Tool window. You can choose resources to include in a package and save the package as a NetWitness Platform Package File.

The required permission to access this view is **Deploy Live Resources**.

To access this view:

1. Go to **CONFIGURE > Live Content**.
2. In the **Live Search - Matching Resources** toolbar, select Package > **Deploy**.
   The Resource Package Deployment wizard is displayed.



Features

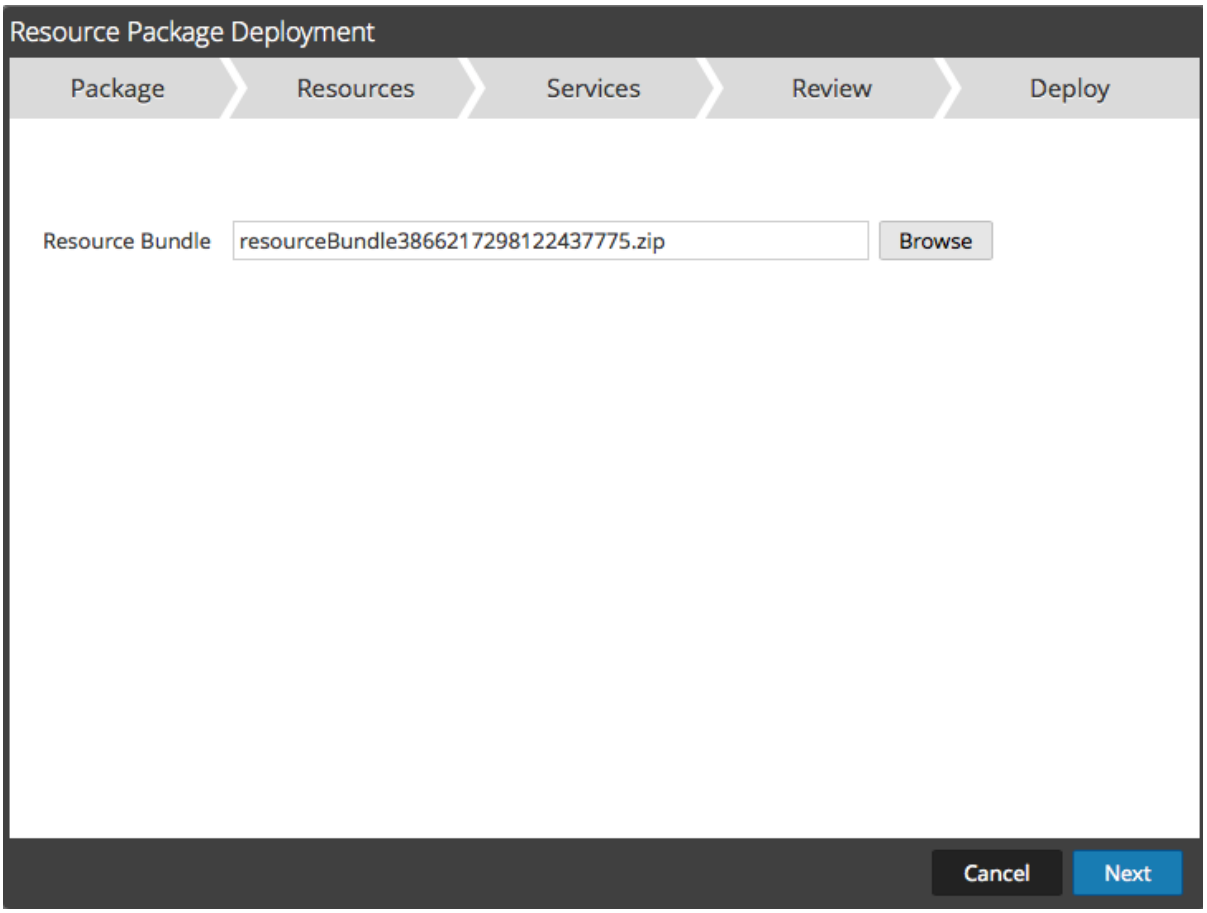
The Deployment Wizard has five tabs: **Package, Resources**, **Services**, **Review** and **Deploy**.
Use **Close** to exit before you complete the wizard.

When you complete the wizard, NetWitness Platform returns to the Live Resources View.

Package Tab

You use this tab to select a resource bundle from your network in this page.

This is an example of the Package tab, with a resource bundle already selected.



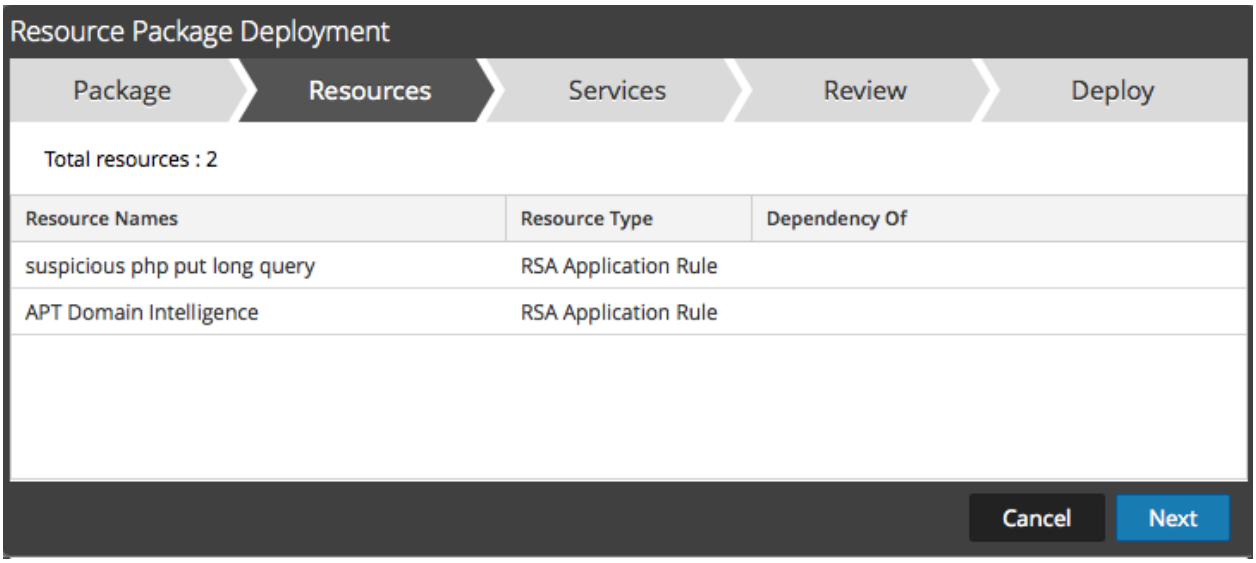
The following table describes the elements in the Package tab.

Column	Description
Resource Bundle	The input field to specify a resource bundle. You can type a path in this field or search using the Browse button.
Command Buttons	
Browse	This button opens a File Upload dialog in which you can browse the local file system and select a bundle.
Cancel	Cancels the deployment and closes the wizard.
Next	Displays the next tab of the wizard.

Resources Tab

This tab displays the resources contained in the bundle.

The following figure shows an example of the Resources tab.



The following table describes elements in the Resources tab.

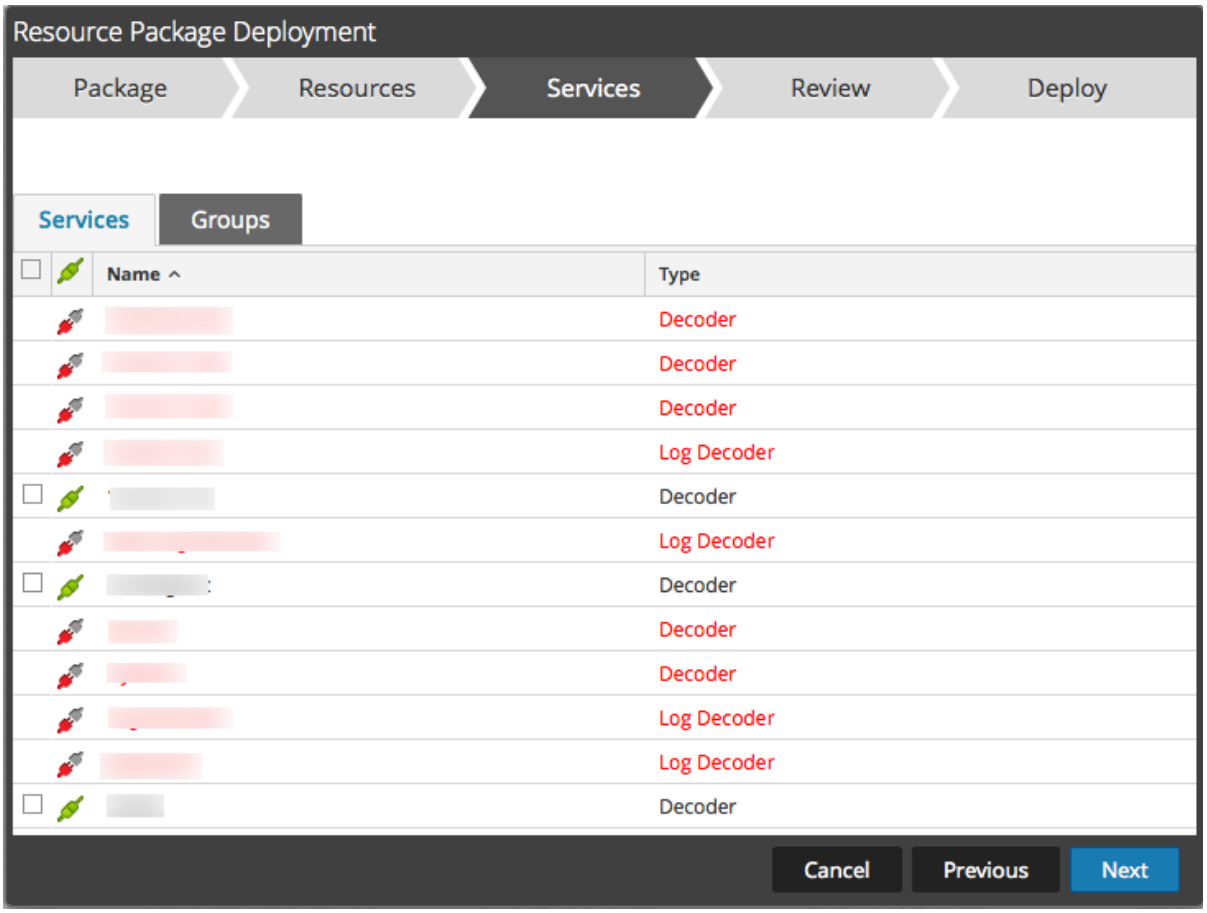
Column	Description
Resource Name	Displays the name of the resources in the bundle (for example, **NetWitness Lua Library**).
Resource Type	Displays the resource types for the resources in the bundle (for example, **RSA Lua Parser**)
Dependency Of	Displays Resources on which the selected resource depends (for example, **AIM lua**).

Services Tab

You select the services to which you want to deploy the resources in the bundle.

The Services tab has two tabs, **Services** and **Groups**. These provide a list of services and service groups that are configured in the **ADMIN > Services** view. The columns are a subset of the columns available in the Services view. You can select the services or the service groups to which you want to deploy the resources in the bundle.

This is an example of the Services tab.



The following table describes the elements in the Services tab.

Column	Description
Services	
	Selects services to which you want to deploy the content. You can select any combination of services and service groups.
Name	Displays the services in your environment to which you can deploy the content.
Host	Displays the name of the resource host.
Type	Displays the type of NetWitness Platform service.
Groups	
	Selects service groups (if you have service groups defined in your environment).
Name	Displays the names of the service groups.

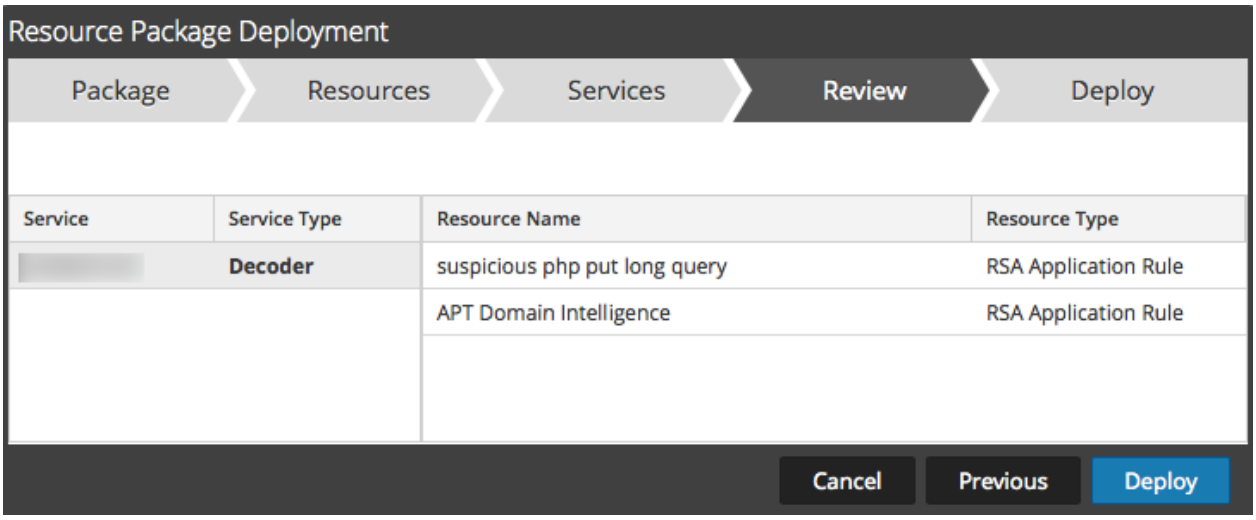
Review Tab

Displays the resources and services on which the resources will be deployed.

In this tab, you can do the following:

- Review the content and services before you deploy.
- Initiate the deployment of the resources.

The following figure shows an example of the Review tab.



The following table describes the elements in the Review tab.

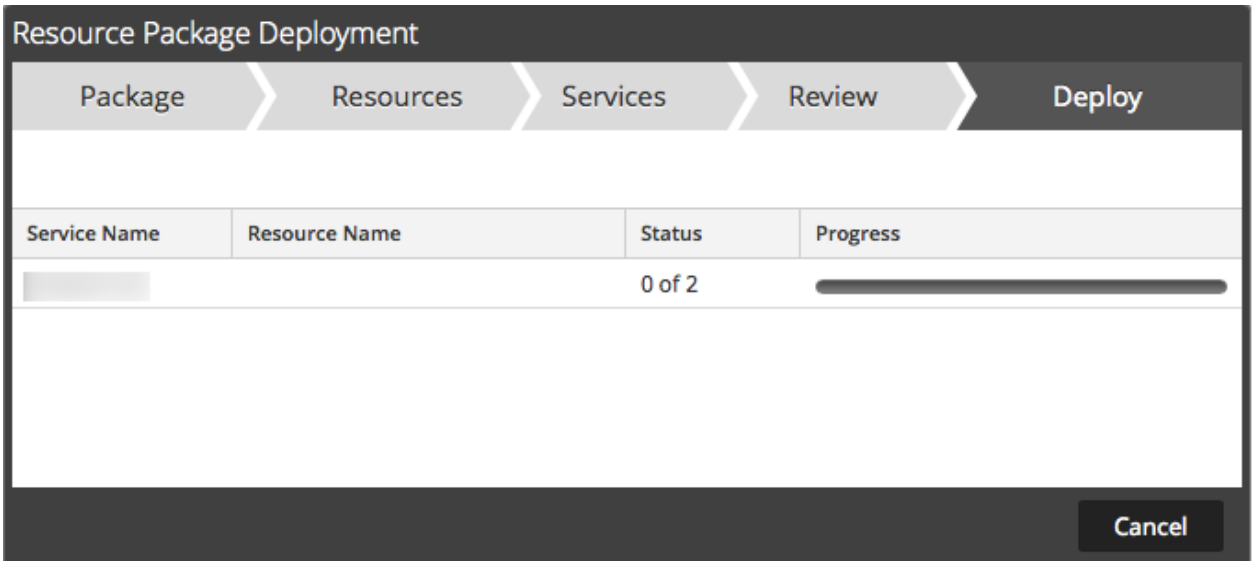
Column	Description
Service Information	
Service	Displays the services in your environment to which you can deploy the content.
Service Type	Displays the type of each NetWitness Platform service (type of host/service).
Resource Information	
Resource Name	Displays the name of the resources you have selected (for example, **NetWitness Lua Library**).
Resource Type	Displays the resource types for the resources you have selected (for example, **RSA Lua Parser**).
Deploy	Initiates the deployment of the resources and displays the **Deploy** page (final page of the wizard).

Deploy Tab

This tab allows you to do the following:

- View the progress of the job
- Cancel the job

This is an example of the Deploy tab.

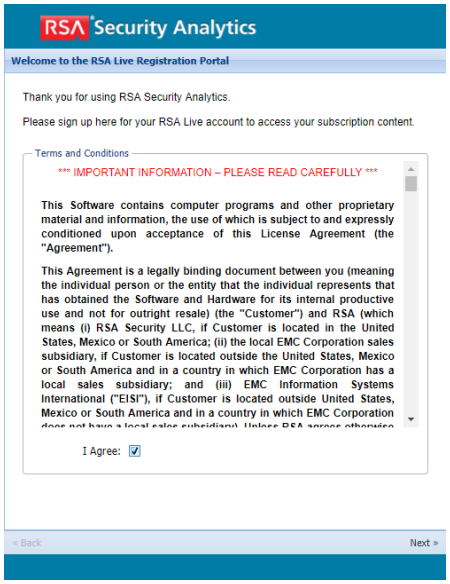


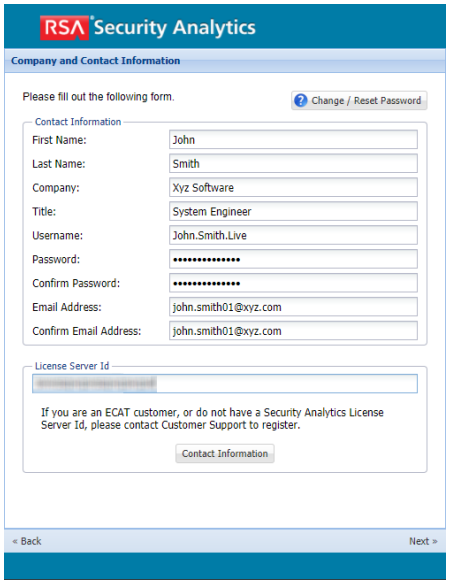
The following table describes the elements in the Deploy tab.

Feature	Description
Service Name	Name of the services to which resources are deployed.
Resource Name	Name of the resources.
Status	Status of the manual deployment.
Progress	Progress of the manual deployment in a progress bar. When complete, the bar is solid green.
Command Buttons	
Close	Closes the wizard.
Errors	Only displays if NetWitness Platform encountered any errors. Click to display the errors.
Retry	Only displays if NetWitness Platform encountered any errors. Click this button to try to deploy the resources again using the wizard.

RSA Live Registration Portal

The RSA Live Registration Portal is a self-service wizard in which customers can set up a Live account and change or reset the password. A Live account is required to get access to the feeds, parsers, rules, and other content in RSA Live library. To access the portal, go to the following URL: https://cms.netwitness.com/registration/.





After you agree to the Terms and Conditions, click **Next**: the fields for setting up an account are displayed. These include Contact Information, Subscription Level, and License Server Id.

The following table lists the contact information section fields and its descriptions:

Parameter	Description
Change / Reset Password	Allows users to change or reset their RSA Live password.
First Name	Your first name.
Last Name	Your last name.
Company	The name of your company.
Title	Your job title or function in the company.
Username	The username used to log on to RSA Live account. The username must contain a minimum of nine characters and a maximum of 60 characters.
Password	The password for the RSA Live account. The password must contain minimum of nine characters and the maximum length is 60, with at least one uppercase, one lowercase, one number, and one special character.
Confirm Password	Confirmation of your password.
Email Address	The email address where you want to receive notifications related to the Live account.
Confirm Email Address	Confirmation of the email address.

Parameter	Description
Subscription Level / Confirm Subscription Level	• **Basic** - This provides access to the Live content that is tagged for groups like Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis. • **Enhanced** - This provides access to the Live content that is tagged for groups like Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis. • **Premium** - This provides access to the Live content that is tagged for groups like Premium, Verisign Premium, Enhanced, Basic, Panorama for Log Decoder, and Spectrum for Malware Analysis.
License Server Id	This is the License Id on the **ADMIN > SYSTEM > Info** page. **Caution:** The license server ID on NetWitness Platform must be valid and must be registered on the Flexera Server. If not, contact RSA Customer Support.

NetWitness Platform Feedback and Data Sharing

This topic introduces the Feedback and Data Sharing features of NetWitness Platform.

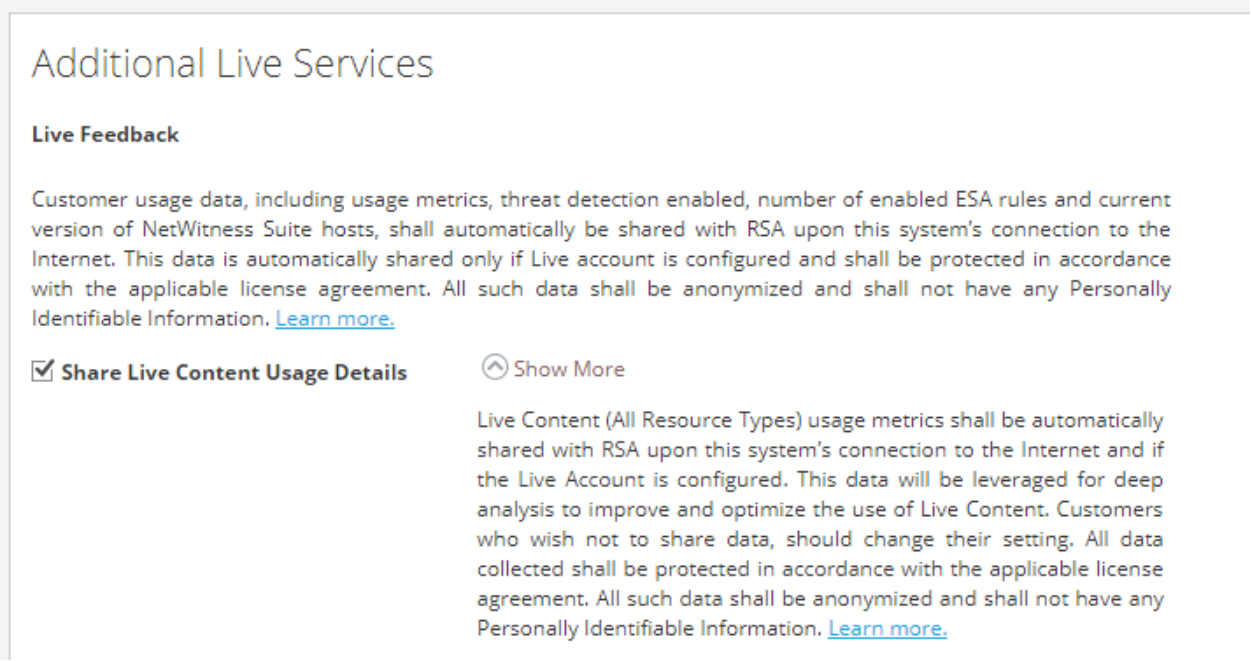
The settings for these features are available in **ADMIN** > **SYSTEM** > **Live Services** view, in the Additional Live Services section.

Additional Live Services

Participation in the Additional Live Services is configured in the **ADMIN > SYSTEM > Live Services** view.

Live Feedback

Live Feedback is intended to help improve RSA NetWitness Platform.



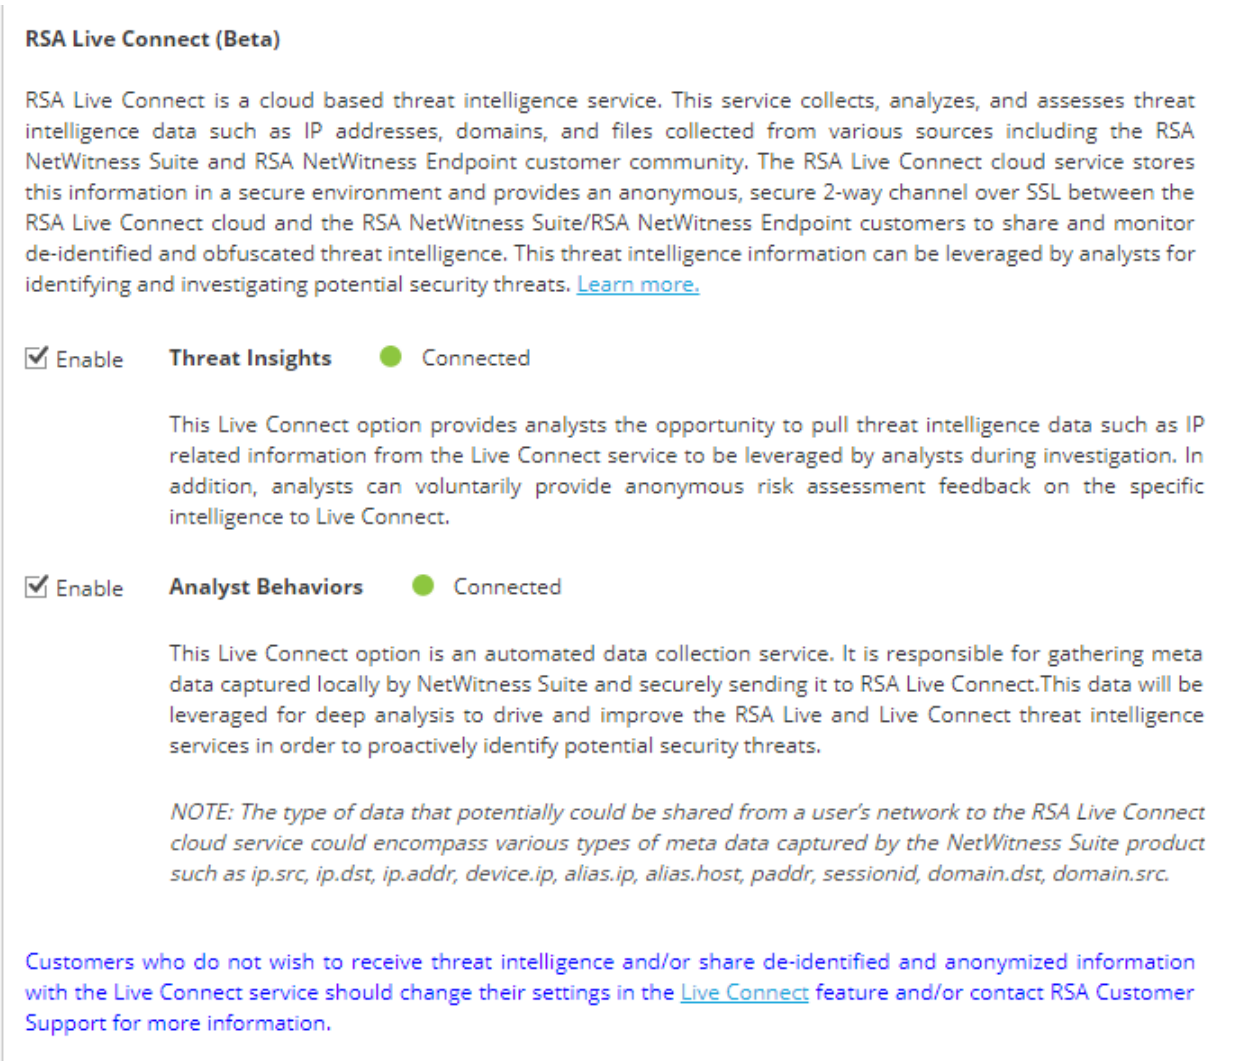
Once you set up and configure a Live account, usage data is shared with RSA. This data is automatically shared only if Live account is configured and shall be protected in accordance with the applicable license agreement. All such data shall be anonymized and shall not have any Personally Identifiable Information.

Before data is sent to RSA, all Personally Identifiable Information is removed. Thus, only anonymous usage data gets transferred to RSA.

For more information, see the **Live Feedback Overview** topic in the *System Configuration Guide*.

RSA Live Connect

RSA Live Connect is a cloud based threat intelligence service. This service collects, analyzes, and assesses threat intelligence data such as IP addresses, domains, and files collected from various sources including the RSA NetWitness Platform and RSA ECAT customer community.



RSA Live Connect consists of the following features:

- Threat Insights
- Analyst Behaviors

Threat Insights

Threat Insights provides analysts the opportunity to pull threat intelligence data such as IP related information from the Live Connect service to be leveraged by the analysts during investigation.

By default, **Threat Insights** is enabled in **Additional Live Services** section. If Context Hub service is configured, Live Connect is automatically added as a data source for Context Hub. For more information, see the **Configure Live Connect Data Source for Context Hub** topic in the *Context Hub Configuration Guide*.

With Live Connect as a data source for context hub, you can use the Context Lookup option in Investigation > Navigate view or Investigation > Events view to fetch contextual information. For instructions, see View Additional Context for a Data Point.

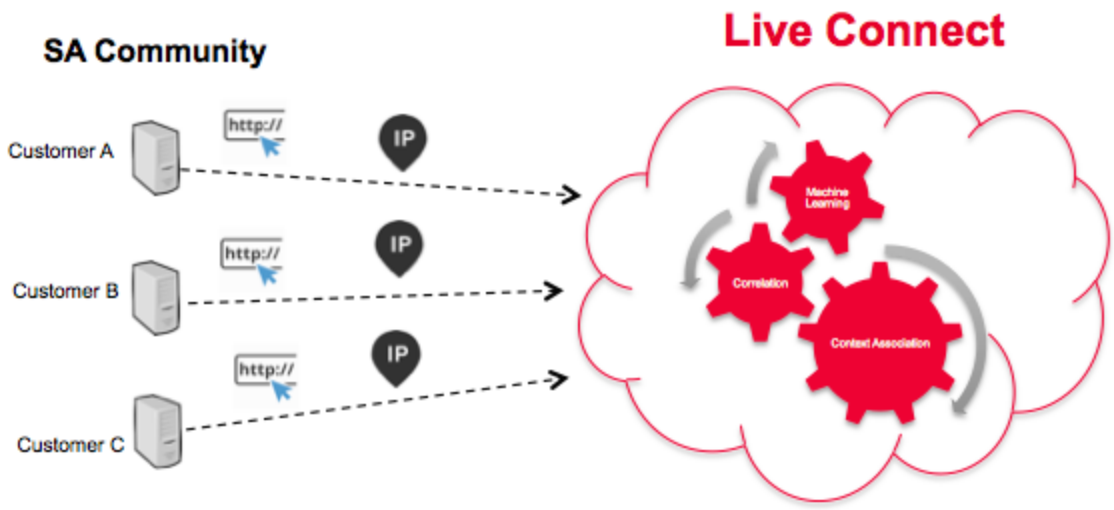
Analyst Behaviors

Analyst Behaviors is a feature where analysts participate in sharing data to RSA community. This is an automated data collection service. Its goal is to share potential threat intelligence data to the RSA Live Connect cloud service for analysis. The type of data that could be shared from your network to RSA Live Connect includes various types of meta data captured by NetWitness Platform such as ip.src, ip.dst, ip.addr, device.ip, alias.ip, alias.host, paddr, sessionid, domain.dst, domain.src.

Note: All data collected locally is de-identified and obfuscated and then sent securely and anonymously to the RSA Live Connect cloud service, where it is stored in a secure environment.

Description

Live Connect Threat Data Sharing has been developed as a Community based threat intelligence sharing platform.



It has the following characteristics and goals:

- Crowd-sourced: the RSA community contributes to the entire collection of intelligence
- Centrally collect and analyze data from the RSA community
- Reduce the intelligence cycle time from days to minutes

Some details to consider:

- We are leveraging analyst investigation activity
- We are harvesting meta data such as IP addresses and domain names
- We are doing deep data analysis: Trending, correlation, anomaly detection
- Remember, this feature is currently in Beta

Participation

Customer participation is optional. Upon initial install or upgrade to NetWitness Platform 11.0, you are presented with a confirmation screen. By default, you are entered into the program, but you can opt out at any time.

Cloud Authentication

Authentication for the program is done in the NetWitness Platform UI, where you configure the Live account in the Live services section.

Configuration

To view or change the settings for Live Connect Threat Data Sharing, in the main menu, select **ADMIN > SYSTEM > Live Services**. Check or clear the **Enable** box to participate or stop participating in the program.

Data Collection

Data is collected as follows:

- Data Attribution: Anonymous
- Data Source: Subset of meta keys and meta values of a NetWitness Platform analyst's page views from the NetWitness Platform Core Query logs.
- Query Log Harvesting Process:
  - Timing: Batch mode every 24 hours (4 AM – 6 AM UTC)
  - Log Collection: NetWitness Platform server collects NetWitness Platform core device log entries for the previous 24 hours
  - Log Entries: Only SDK-Value and SDK-Query API calls that contain a where clause are collected
  - Log Attribute Parsing: Each entry must have one of the following meta key indicators present: **ip.src**, **ip.dst**, **ip.addr**, **device.ip**, **alias.ip**, **alias.host**, **paddr**, **sessionid**, **domain.dst**, or **domain.src**. If so, meta keys and meta values from the entry will be collected.

Note: Once the above criteria is met, NetWitness Platform sends all of the meta keys and values from the query to the cloud—not just the meta key indicators.

The log report is sent in JSON format, over SSL. It contains:

- Timestamps
- Live CMS username (sha256)
- NetWitness Platformlicense server ID (sha256)
- List of SA endpoint IDs (sha256)
- Harvested meta values (MD5 and SHA256 hashed)

Example

This section lists entries from a log, and then the corresponding section of extrapolated data.

Section from a log file:

```
User admin (session 204298, 10.4.50.60:57454) has issued values (channel 205237) (thread
2332): fieldName=filter id1=1 id2=23138902 threshold=100000 size=20 flags=sessions,sort-
total,order-descending,ignore-cache where="(alias.host = 'mail.google.com') && (ip.src =
161.253.31.130) && time=\"2015-12-07 18:08:00\"-\"2015-12-07 21:07:59\""
```

Data extrapolation with hashing:

```
{
    timestamp: 1452282588000,
    session: 204298,
    id1: 1,
    id2: 23138902,
    userName: "8c6976e5b5410415bde908bd4dee15dfb167a9c873fc4bb8a81f6f2ab448a918",
    loggerName: "SDK-Values",
    timeRange: "\"2015-12-07 18:08:00\"-\"2015-12-07 21:07:59\"",
  - metaList: [
      - {
            metaKey: "alias.host",
          - properties: {
                domain_hint: "mai*********.com",
                domain_tld: "com",
                md5_value: "be5cab0695415d9363d18ad1345c73eb",
                sha256_value: "3f2728499a4b29460f3e3150df508e06b19edf0f58efd051fac777844d28e452"
            }
        },
      - {
            metaKey: "ip.src",
          - properties: {
                md5_value: "03b81ffdff109a05a3dac88dbec10c59",
                sha256_value: "1d88c6893797c896070bd5470d0026e11b515d5dee97c6173771a43719fa7e78"
            }
        }
    ]
},
```

Troubleshooting

This section discusses a bit about troubleshooting Live Connect Threat Data Sharing.

Query Log Retrieval Sample

To retrieve a sample of threat intelligence data sent to Live Connect, you construct a URL by setting the following parameters:

- **sendReport**: value is **true** or **false**: true to send this report to the Live Connect server. False to just create the report for viewing. The value defaults to false.
- **hashValues**: value is **true** or **false**: true to hash the values as md5/sha256. False to show values in clear text – should use only for manual viewing. Defaults to false.
- **startDate / endDate**: Dates for time boundaries for log entries. Format: YYYY-MM-DD HH:mm:ss

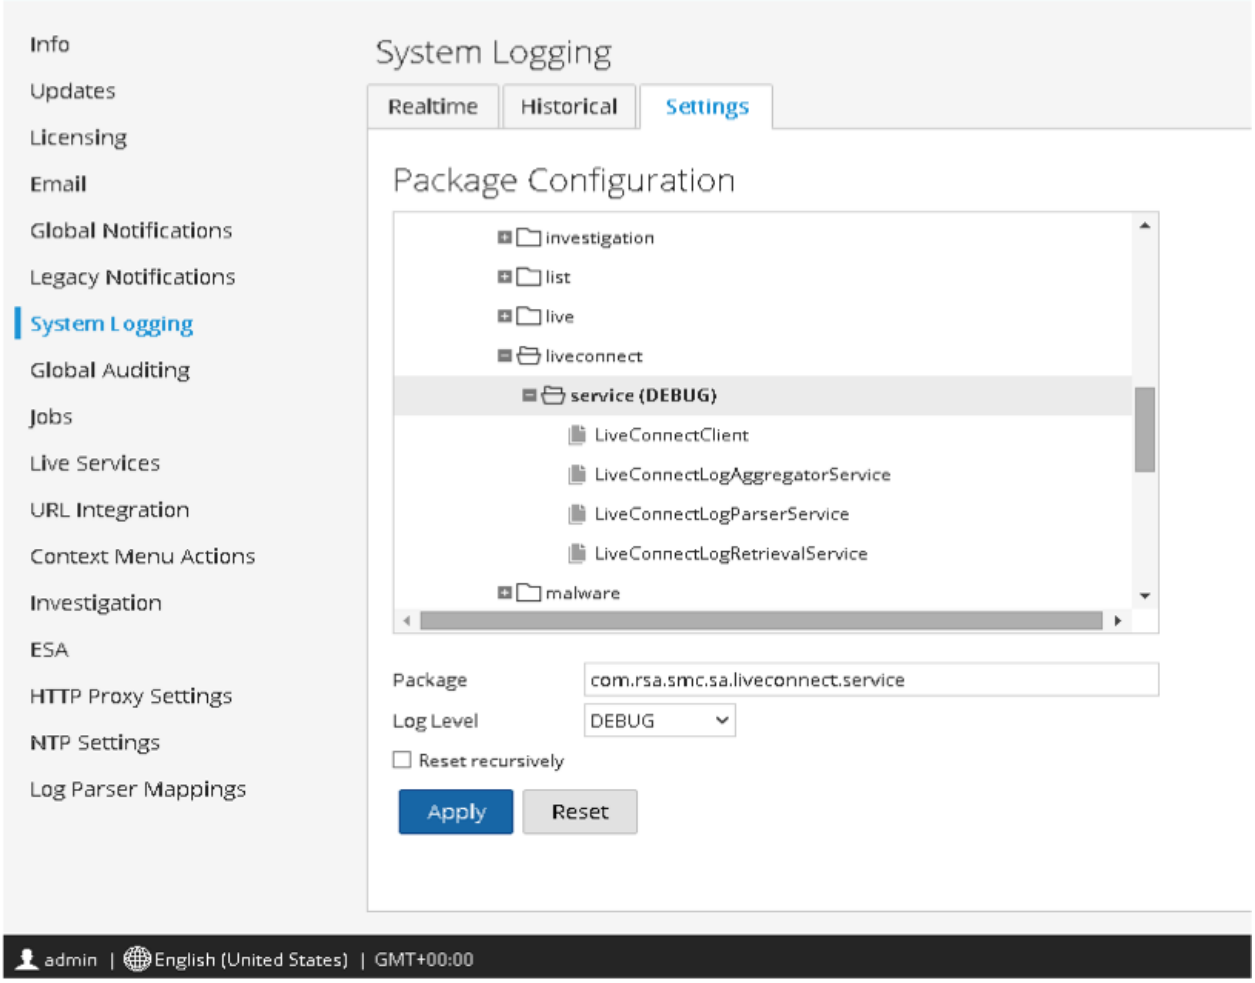
The following is an example of the URL to use to retrieve query logs:

`https://<server>/admin/liveconnect/force_aggregation?`**`startDate=2016-01-18%2000:00:00&endDate=2016-01-19%2010:10:00&sendReport=false&hashValues=true`**

System Logging: Debug

You can access some debug information as follows.

1. Go to **ADMIN > SYSTEM > System Logging**.
2. Select the **Settings** tab.
3. In the Package Configuration section, select **com > netwitness > platform > server > liveconnect > service (DEBUG)**.



Troubleshooting

This section provides troubleshooting instructions for issues faced when using the Live Services module in NetWitness Platform.

Some Rules Are Invalid for Version 11.x

The rules "NetWitness Incident Management - Alert Details" and "NetWitness Incident Management - Incident Summary" are not valid for RSA NetWitness Platform version 11.x. Do not deploy these rules to an 11.x system.

Note: Rules are updated frequently, and the documentation for them is available in the Content space on RSA Link. For the latest information on Rules, see RSA NetWitness Rules.

Troubleshooting OutOfMemoryError on Context Hub Server

This section provide troubleshooting instructions when you encounter OutOfMemoryError on Context Hub server and the service becomes unresponsive.

If there are any TAXII feeds configured, Health and Wellness raises alerts when the available heap memory of Context Hub server is critically low. If the status of Context Hub server is Unhealthy because of low memory, perform the following:

1. Make sure that the feeds **Start Date** is within 180 days.
2. Check if any TAXII feed is consuming too much disk space. A TAXII feed can consume maximum of 300 MB. If it consumes more disk space, you must reduce the value in the **Remove STIX data older than** field under **Advanced Options** in the **Custom Feed Creation Wizard** when you edit a TAXII feeds.

   Note: If the issue still persists, you must execute step 3.
3. To decrease the number of parallel threads available for processing STIX:
   a. Go to **ADMIN** > **Services** > **Context Hub service** > **View** > **Explore**.
   b. In the tree panel, navigate to **enrichment/stix/ config**.
   c. In the right panel, set the **stix-query-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to process queries for STIX data at the same time.
   d. Set the **taxii-poll-scheduler-pool-size** field value to 2. By default the value is 5. This setting controls how many number of threads are allowed to poll TAXII servers at the same time.
   e. Restart the Context Hub server.

Troubleshooting Content Deployment Using logon.type Meta Key

This section provides instructions for issues deploying content that uses the `logon.type` meta key, such as the Application Rule `Nwfl_account:logon-success-direct-access`.

To solve this issue, perform the following steps:

1. In the NetWitness Platform UI, go to **Configure** > **Live Content**.
2. In the **Resource types** drop-down list, select **Log Device** and click **Search**
3. Select **Envision Config** file (Version 0.36 and above) from the search results.
4. Click **Deploy** to deploy the content.
5. Complete the Deployment Wizard.

February 2018

Table of Contents

Overview

The NetWitness Platform API can be accessed using the same host and port as the NetWitness user interface.

Current Version

By default, all requests to the REST API will automatically use the latest version of the API available. To provide API stability, clients can specify the API version to use by adding the `NetWitness-Version` HTTP header:

```
NetWitness-Version: 1.0
```

Schema

All data is sent and received as JSON. Any resources containing fields without values will have those fields included with `null` as the value instead of being omitted.

Any fields containing timestamps or dates will be in ISO 8601 format:

```
YYYY-MM-DDTHH:MM:SS.SSSZ
```

HTTP Usage

The RSA NetWitness API tries to adhere as closely as possible to standard HTTP and REST conventions in its use of HTTP verbs and status codes.

HTTP Verbs

Verb	Usage
`GET`	Used to retrieve a resource.
`POST`	Used to create a new resource.
`PATCH`	Used to update an existing resource, including partial updates. Only fields that are modified should be included in the request.
`PUT`	Used to replace an existing resource.
`DELETE`	Used to delete an existing resource.

HTTP Status Codes

Status code	Usage
`200 OK`	The request completed successfully.

`201 Created`	A new resource has been created successfully. The resource's URI is available from the response's `Location` header.
`204 No Content`	An update to an existing resource has been applied successfully.
`400 Bad Request`	The request was malformed. The response body will include an error providing further information. See Error Response.
`401 Unauthorized`	Similar to `403 Forbidden`, but specifically for use when authentication is required and has failed or has not yet been provided. See Authentication and Authorization.
`403 Forbidden`	The request was valid, but the server is refusing the action. The user might not have the necessary permissions for a resource.
`404 Not Found`	The requested resource does not exist.
`500 Internal Server Error`	An unexpected error has occurred. The response body will include a message providing further information.

Case Sensitive

All URLs, request parameters and JSON fields are case sensitive.

Error Response

A common JSON structure is always returned for errors:

Path	Type	Description
`status`	`Number`	The HTTP status code returned.
`timestamp`	`String`	The timestamp of the request.
`errors[]`	`Array`	An array of errors for the given request.
`errors[].message`	`String`	A user-friendly error message explaining what went wrong.
`errors[].field`	`String`	The field or parameter containing the error.

```
{
  "status" : 400,
  "timestamp" : "2018-02-23T18:40:52.660Z",
  "errors" : [ {
    "message" : "Value must be less than or equal to \"10\"",
    "field" : "start"
  }, {
    "message" : "Invalid range"
  } ]
}
```

Pagination

A common JSON structure is always used for paginated results:

Path	Type	Description
`items`	`Array`	An array containing the requested resources.
`pageNumber`	`Number`	The requested page number.
`pageSize`	`Number`	The requested number of items to return in a single page.
`totalPages`	`Number`	The total number of pages available.
`totalItems`	`Number`	The total number of items available.
`hasNext`	`Boolean`	Indicates if there is a page containing results after this page.
`hasPrevious`	`Boolean`	Indicates if there is a page containing results before this page.

```
{
  "items" : [ ],
  "pageNumber" : 0,
  "pageSize" : 10,
  "totalPages" : 3,
  "totalItems" : 25,
  "hasNext" : true,
  "hasPrevious" : false
}
```

Authentication and Authorization

All requests must include the `NetWitness-Token` HTTP header containing a valid JSON Web Token (JWT):

```
NetWitness-Token:
eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCJ9.eyJleHAiOjE1MTEyNDczODYyNjMsImlzcyI6InNlY3VyaXR5L
XNlcnZlci0zODA1NTA0OS0xZWMyLTQ0MDAtOTUwYS0zZTVkMmJiYTljMjIiLCJpYXQiOjE1MTEyMTEzODYyNjM
sImF1dGhvcml0aWVzIjpbIkFkbWluaXN0cmF0b3JzIl0sInVzZXJfbmFtZSI6ImFkbWluIn0.StBjg9ruIX4Fr
yfCX8qvrSBGZHF8DN3qHZM0Ei9-
thFndm1q_DLP_cnh8Fpm43fdKcs1ErcVRTqhaYvVULYmsF9ShUaSThpLts6zbJVEKlq3ldUGWWCY9bfVGRH3n5
KmWzITPi7xZ-
Rf_Kp2Sj8ecVAip3qDwha7TxYrReXefCnUj0UxgaaXjeZIFjwxFmK6NPZ7TAK9OcvcVhozaR8V92g1kUVP8_54
x7iZ2jL4JvDPaScWBjBTvVEffHNbX9_iLNoRmKqvDELSla6E_trkSREogCt6pZh709Qh70uoC3BsKwNQKbHNEO
U1tRPFaUFfRH7bCdp8v3Aeh3PTaKEuQA
```

The JSON Web Token is defined in RFC-7519. Tokens can be obtained using the methods outlined below.

In the remainder of this document, the token will be truncated to just `eyJ...AT` for brevity.

Obtaining a Token

A JSON Web Token can be obtained using the methods below.

Using a Username and Password

Users can retrieve an access token using their username and password credentials. Since the API gateway is secured using TLS, all credentials will be encrypted in transit.

```
POST /rest/api/auth/userpass
```

Request Parameters

Parameter	Description
`username`	The username of the account to authenticate.
`password`	The password of the account.

Response Fields

Path	Type	Description
`id`	`String`	The account identifier.
`roles`	`Array`	The roles assigned to the user.

Path	Type	Description
accessToken	String	A digitally signed access token that is acceptable as proof of authentication at any Launch service that trusts the public key of this service. The string holds a JSON web-token. See RFC-7519.
refreshToken	String	A digitally signed refresh token that can be used to refresh an expired access token. Refresh tokens have longer expiry periods and can be used by services to re-authenticate users without (storing and) presenting credentials.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/auth/userpass' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1' \
    -d 'username=ian&password=changeMe'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Fri, 23 Feb 2018 18:39:38 GMT
Content-Length: 106
```

```
{
  "id" : "ian",
  "roles" : [ "Analyst" ],
  "accessToken" : "eyJ...AT",
  "refreshToken" : "eyJ...AT"
}
```

Using a Refresh Token

Users can also retrieve an access token using a refresh token.

```
POST /rest/api/auth/token
```

Request Parameters

Parameter	Description
token	A refresh token.

Response Fields

Path	Type	Description
id	String	The account identifier.
roles	Array	The roles assigned to the user.
accessToken	String	A digitally signed access token that is acceptable as proof of authentication at any Launch service that trusts the public key of this service. The string holds a JSON web-token. See RFC-7519.
refreshToken	String	A digitally signed refresh token that can be used to refresh an expired access token. Refresh tokens have longer expiry periods and can be used by services to re-authenticate users without (storing and) presenting credentials.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/auth/token' -i -X POST \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/x-www-form-urlencoded; charset=ISO-8859-1' \
    -d
'token=eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCJ9.eyJleHAiOjE1MjIwMDMxNzk3MTQsImlzcyI6InNlY3

W4If27aZyQzEFs3hw'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Fri, 23 Feb 2018 18:39:39 GMT
Content-Length: 106
```

```
{
  "id" : "ian",
  "roles" : [ "Analyst" ],
  "accessToken" : "eyJ...AT",
  "refreshToken" : "eyJ...AT"
}
```

Authorization

In order to make requests through the NetWitness Platform API, users must belong to roles that have the `integration-server.api.access` permission, as well as any underlying permissions required to fulfill the request.

Incidents

An Incident is a logically grouped set of alerts created automatically by the Incident Aggregation Engine and grouped by a specific criteria. An Incident, available in the Respond Interface, allows an Analyst to triage, investigate, and remediate these groups of alerts. Incidents can be moved between users, notated, and explored via the nodal graph. Incidents allow users to ensure they understand the full scope of an attack or event in their NW system and then take action.

Attributes

The incident resource is comprised of the following attributes:

Path	Type	Description
`id`	`String`	The unique identifier of the incident.
`title`	`String`	The title of the incident.
`summary`	`String`	The summary of the incident.
`priority`	`String`	The incident priority. See the valid values.
`riskScore`	`Number`	The incident risk score is calculated based on the associated alert's risk score. Risk score ranges from 0 (no risk) to 100 (highest risk).
`status`	`String`	The current status. See the valid values.
`alertCount`	`Number`	The number of alerts associated with an incident.
`averageAlertRiskScore`	`Number`	The average risk score of the alerts associated with the incident. Risk score ranges from 0 (no risk) to 100 (highest risk).
`sealed`	`Boolean`	Indicates if additional alerts can be associated with an incident. A `sealed` incident cannot be associated with additional alerts.
`totalRemediationTaskCount`	`Number`	The number of total remediation tasks for an incident.
`openRemediationTaskCount`	`Number`	The number of open remediation tasks for an incident.
`created`	`String`	The timestamp of when the incident is created.
`lastUpdated`	`String`	The timestamp of when the incident was last updated.
`lastUpdatedBy`	`String`	The NetWitness user identifier of the user who last updated the incident.
`assignee`	`String`	The NetWitness user identifier of the user currently working on the incident.
`sources`	`Array`	Unique set of sources for all of the alerts in an incident.

Path	Type	Description
`ruleId`	`String`	The unique identifier of the rule that created the incident.
`firstAlertTime`	`String`	The timestamp of the earliest occurring Alert in this incident.
`categories`	`Array`	The list of categories this incident is categorized under.
`categories[].id`	`String`	The unique category identifier.
`categories[].parent`	`String`	The parent name of the category.
`categories[].name`	`String`	The friendly name of the category.
`journalEntries`	`Array`	Set of notes about the incident investigation, also known as the JournalEntry.
`journalEntries[].id`	`String`	The unique journal entry identifier.
`journalEntries[].author`	`String`	The author of this entry.
`journalEntries[].notes`	`String`	Notes and observations about the incident.
`journalEntries[].created`	`String`	The timestamp of the journal entry created date.
`journalEntries[].lastUpdated`	`String`	The timestamp of the journal entry last updated date.
`journalEntries[].milestone`	`String`	Incident milestone classifier. See the valid values.
`createdBy`	`String`	The NetWitness user id or name of the rule that created the incident.
`deletedAlertCount`	`Number`	The number of alerts that are deleted from the incident.
`eventCount`	`Number`	The number of events associated with incident.
`alertMeta`	`String`	An object containing unique set of meta values, by type, across all alerts associated with this incident.
`alertMeta.SourceIp`	`Array`	Unique source IP addresses.
`alertMeta.DestinationIp`	`Array`	Unique destination IP addresses.

Incident Priority

The `priority` field can contain these values:

Value	Description
`Low`	Low Priority
`Medium`	Medium Priority
`High`	High Priority
`Critical`	Critical

Incident Status

The `status` field can contain these values:

Value	Description
`New`	New incident.
`Assigned`	Incident is assigned to a user.
`InProgress`	Incident response is in progress.
`RemediationRequested`	Remediation tasks have been requested.
`RemediationComplete`	Remediation tasks are complete.
`Closed`	Incident is closed.
`ClosedFalsePositive`	Incident is closed as it was created due to false positive.

Milestone

Each journal entry can contain a `milestone` consisting of these values:

Value	Description
`Reconnaissance`	Intruder is in the initial phase of the attack where targets and vulnerabilities are identified.
`Delivery`	Intruder transmitted malware to the target.
`Exploitation`	Malware code triggers, which takes action on target network to exploit vulnerability.
`Installation`	Malware weapon installs access point usable by intruder.
`CommandAndControl`	Malware enables intruder to have persistent access to target network.
`ActionOnObjective`	Intruder takes action to achieve their goals, such as data exfiltration, data destruction, or encryption for ransom.
`Containment`	Incident is contained.
`Eradication`	Necessary actions taken to eliminate components of incident and restore the system status.
`Closure`	Incident is addressed.

Requests

Get a Single Incident

A single incident can be retrieved using an incident's unique identifier.

```
GET /rest/api/incidents/{id}
```

Path Parameters

Parameter	Description
`id`	The unique identifier of the incident.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100' -i \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Fri, 23 Feb 2018 18:42:20 GMT
Content-Length: 1329
```

```
{
  "id" : "INC-100",
  "title" : "Suspected C&C with suspicious-domain.com",
  "summary" : "Security Analytics detected communications with suspicious-domain.com
that may be command and control malware.",

  }
}
```

Get Incidents by Date Range

Incidents can be retrieved by the date and time they were created.

```
GET /rest/api/incidents
```

The requested date range can be unbounded, by only supplying either the `since` or `until` parameter, or bounded, by providing both parameters.

Request Parameters

Parameter	Description
`pageNumber`	The requested page number.
`pageSize`	The maximum number of items to return in a single page.
`since`	A timestamp in ISO 8601 format (e.g., `1018-01-01T14:00:00.000Z`). Retrieve incidents created on and after this timestamp.
`until`	A timestamp in ISO 8601 format (e.g., `1018-01-01T14:00:00.000Z`). Retrieve incidents created on and before this timestamp.

All results will be returned using the paginated response payload sorted by the `created` date, in descending order.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents?since=2018-01-
01T04%3A00%3A00.000Z&until=2018-01-01T05%3A00%3A00.000Z&pageSize=100&pageNumber=0' -i
\
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Fri, 23 Feb 2018 18:42:18 GMT
Content-Length: 1560

  "hasNext" : false,
  "hasPrevious" : false
}
```

Update an Incident

Currently an incident's `status` and `assignee` can be modified using the incidents endpoint.

```
PATCH /rest/api/incidents/{id}
```

The `assignee` field must include the unique identifier for a valid NetWitness user. The list of users can be found in the security section of the administration user interface.

Request Fields

Path	Type	Description
`status`	`String`	The current status. See the valid values.
`assignee`	`String`	The NetWitness user identifier of the user currently working on the incident.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100' -i -X PATCH \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8' \
    -d '{"status":"InProgress"}'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Fri, 23 Feb 2018 18:42:20 GMT
Content-Length: 1330
```

```
{
  "id" : "INC-100",
  "title" : "Suspected C&C with suspicious-domain.com",
  "summary" : "Security Analytics detected communications with suspicious-domain.com
that may be command and control malware.",
  "priority" : "Critical",
  "riskScore" : 100,

  }
}
```

Remove an Incident

A single incident can be removed using the incident's unique identifier.

```
DELETE /rest/api/incidents/{id}
```

Path Parameters

Parameter	Description
id	The unique identifier of the incident.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100' -i -X DELETE \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 204 No Content
Date: Fri, 23 Feb 2018 18:42:22 GMT
```

```
```

Add a Journal Entry

A journal entry, or note, can be added to an existing incident.

```
POST /rest/api/incidents/{id}/journal
```

Path Parameters

Parameter	Description
id	The unique identifier of the incident.

Request Fields

Path	Type	Description
author	String	The NetWitness user id of the user creating the journal entry.
notes	String	Notes and observations about the incident.
milestone	String	The incident milestone classifier.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-100/journal' -i -X POST \
    -H 'NetWitness-Token: eyJ...AT' \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'Content-Type: application/json;charset=UTF-8' \
    -d '{"author":"duke","notes":"This incident is
contained.","milestone":"Containment"}'
```

Sample Response

```
HTTP/1.1 201 Created
Location: https://api.netwitness.local/rest/api/incidents/INC-100
Date: Fri, 23 Feb 2018 18:42:22 GMT
```

```
```

Get an Incident's Alerts

All the alerts that are associated with an incident can be retrieved using the incident's unique identifier.

```
GET /rest/api/incidents/{id}/alerts
```

Path Parameters

Parameter	Description
id	The unique identifier of the incident.

Request Parameters

Parameter	Description
pageNumber	The requested page number.
pageSize	The maximum number of items to return in a single page.

Response Fields

Path	Type	Description
items	Array	An array containing the requested resources.
pageNumber	Number	The requested page number.
pageSize	Number	The requested number of items to return in a single page.
totalPages	Number	The total number of pages available.
totalItems	Number	The total number of items available.

Path	Type	Description
hasNext	Boolean	Indicates if there is a page containing results after this page.
hasPrevious	Boolean	Indicates if there is a page containing results before this page.
items[].id	String	The unique alert identifier.
items[].title	String	The title or name of the rule that created the alert.
items[].detail	String	The details of the alert. This can be the module name or meta that the module included.
items[].created	String	The timestamp of the alert created date.
items[].source	String	The source of this alert. For example, "Event Stream Analysis", "Malware Analysis", etc.
items[].riskScore	Number	The risk score of this alert, usually in the range 0 - 100.
items[].type	String	The type of alert, "Network", "Log", etc.
items[].events	Array	The events that make up this alert.
items[].events[].source	Object	The source of the event.
items[].events[].source.device	Object	The device contains the endpoint network information.
items[].events[].source.device.ipAddress	String	The IP address.
items[].events[].source.device.port	Number	The port.
items[].events[].source.device.macAddress	String	The ethernet MAC address.
items[].events[].source.device.dnsHostname	String	The DNS resolved hostname.
items[].events[].source.device.dnsDomain	String	The top-level domain from the DNS resolved hostname.
items[].events[].source.user	Object	The user contains the endpoint user information.
items[].events[].source.user.username	String	The unique username.
items[].events[].source.user.emailAddress	String	An email address.
items[].events[].source.user.adUsername	String	An Active Directory (AD) username.
items[].events[].source.user.adDomain	String	An Active Directory (AD) domain.
items[].events[].destination	Object	The destination of the event.
items[].events[].destination.device	Object	The device contains the endpoint network information.
items[].events[].destination.device.ipAddress	String	The IP address.

Path	Type	Description
items[].events[].destination.device.port	Number	The port.
items[].events[].destination.device.macAddress	String	The ethernet MAC address.
items[].events[].destination.device.dnsHostname	String	The DNS resolved hostname.
items[].events[].destination.device.dnsDomain	String	The top-level domain from the DNS resolved hostname.
items[].events[].destination.user	Object	The user contains the endpoint user information.
items[].events[].destination.user.username	String	The unique username.
items[].events[].destination.user.emailAddress	String	An email address.
items[].events[].destination.user.adUsername	String	An Active Directory (AD) username.
items[].events[].destination.user.adDomain	String	An Active Directory (AD) domain.
items[].events[].domain	String	The top-level domain or Windows domain.
items[].events[].eventSource	String	The source of the event. This may be a fully-qualified hostname with a port, or simple name.
items[].events[].eventSourceId	String	The unique identifier of the event on the source. For Network and Log events, this is the Nextgen Session ID.

Sample Request

```
$ curl 'https://api.netwitness.local/rest/api/incidents/INC-
100/alerts?pageSize=10&pageNumber=0' -i \
    -H 'Accept: application/json;charset=UTF-8' \
    -H 'NetWitness-Token: eyJ...AT'
```

Sample Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Transfer-Encoding: chunked
Date: Fri, 23 Feb 2018 18:42:22 GMT
Content-Length: 1301
```

Access NwConsole and Help

RSA NetWitness Console, also known as NwConsole, is a multi-platform terminal application that provides powerful tools and command line access to Core services, such as Decoder, Log Decoder, Concentrator, Broker, and Archiver. While most users complete their tasks and investigations through the NetWitness Platform user interface, some advanced users, such as administrators and developers, require direct access to the services without going through the user interface. NwConsole enables you to enter commands from the command line or run multiple commands from a file.

This topic describes how to access NwConsole and view the internal help within NwConsole.

Extensive help information is available within the NetWitness Platform console, also known as NwConsole. You can access this help from the NetWitness Platform command line.

Prerequisites

All NetWitness Platform appliances have the NwConsole application installed. You can also install it on Windows, Mac, and CentOS to connect and interact with a Core service.

NwConsole is available from the command line on a NetWitness Platform appliance. If you are accessing a Core appliance remotely, you need to have the RSA NetWitness Console application installed on a Windows, Mac, or CentOS machine. To obtain the NetWitness Console application installer, contact RSA Customer Care.

Access NwConsole

To run NwConsole from the command line on a NetWitness Platform appliance or on a terminal emulator, at the <$> prompt, type `NwConsole` (Linux) or `nwconsole` (Windows). The actual command is `NwConsole`, but Windows is not case sensitive. RSA NetWitness Console is displayed as shown in the following example.

```
Last login: Thu Sep 24 14:00:42 on console
usxx<username>m1:~ <username>$ NwConsole
RSA NetWitness Platform Console 11.2.0.0.6105
Copyright 2001-2018, RSA Security Inc. All Rights Reserved.

Type "help" for a list of commands or "man" for a list of manual
pages.
>
```

View Help

NwConsole provides help on individual commands as well as help on specific topics.

Caution: To get the latest information, view the command and help topics within NwConsole.

View a List of Commands

To view a list of available commands and their descriptions, at the (>) prompt, type `help`. The following example shows a list of available commands.

```
> help
Local commands:
    avro2nwd      - Convert AVRO files to NWD files
    avrodump      - Display schema and contents of AVRO file (for debugging)
    blockspeed    - Tests various write block sizes to determine best setting
    compileflex   - Compile all flex parsers in a directory
    createflex    - Create a flex parser that matches tokens read from a file
    dbcheck       - Perform a database integrity check over one or more
                    session, meta, packet, log or stat db files
    diskspeed     - Measures the speed of the disk(s) mounted at a specified
                    directory
    echo          - Echos the passed in text to the terminal
    encryptparser - Encrypt all parsers in a directory
    feed          - Create and work with feed files
    fmanip        - Manipulate a file with XOR and check for embedded PEs
    hash          - Creates or verifies hashes of database files
    help          - Provides help information for recognized console commands
    history       - Displays, erases or executes a command in the command
                    history
    httpAggStats  - Tests HTTP aggregation and reports statistics as it
                    continues
    log           - Perform operations on a log database
    logParse      - Parse line delimited logs on stdin and post results to
                    stdout
    logfake       - Create a fake log pcap file
    lua           - Execute a lua script
    makec3        - Generate C3 Test Data
    makepcap      - Convert packet database files to pcap or log files
    man           - Displays a list of topics or opens a specific manual page
                    on a topic
    metaspeed     - Tests read performance over an existing meta db
    netbytes      - Display statistics on network interface utilization
    nwdstrip      - Convert full NWD file into just session and meta file
    pause         - Wait for user input when running a script file
```

```
    reindex       - reindex a collection
    sdk           - Execute SDK commands based on the C SDK library, type "sdk
                    help" for more information
    sleep         - Sleeps for the specified milliseconds
    timeout       - Globally change the timeout for waiting for a response from
                    a service
    tlogin        - Open a trusted SSL connection to an existing service
    topQuery      - Returns the top N longest running queries from the audit
                    log (either a file or from the log API)
    vslice        - Validate index slices

Remote commands (executed on the connected service, see "login"):
    login         - Connect to a remote service.  Once connected, type help to
                    see commands available for remote execution.

For detailed help, type "help <command>"
>
```

View Detailed Help on a Command

To view detailed information about a command, type `help <command>`. The following example shows help for the `logParse` command after typing `help logParse`.

```
For detailed help, type "help <command>"
> help logParse
Usage: logParse {in=<pathname>} {indir=<pathname>} [out=<pathname>]
                [content=<c2|c3>] [device=<device,[device...]>]
                [path=<log-parsers-config-path>] [metaonly] [srcaddr=<src
                address>] [srcaddrfile=<filename,IP Address>]
Parse line delimited logs on stdin and post results to stdout

    in          - The input source file. "in=stdin" means interactive typing of
                  log.
    indir       - The input source files parent directory
    out         - The output file or output file parent directory if input is
                  set by indir. If not specified, use stdout as output.
    content     - Content version, either c2 or c3. Default is c2.
    device      - Comma delimited device list specifying devices that is
                  enabled. Default enable all devices.
    path        - The logparsers configuration path. Default will find
                  configuration file like logdecoder.
```

```
    metaonly    - The output will only contains parsed meta, otherwise will
                  print log message after metas.
    srcaddr     - The source address of the all the logs
    srcaddrfile - The source address for logs in one input file, in the format
                  filename,ipaddress
>
```

View a List of Help Topics

To view a list of help topics, type `man`. The following example shows a list of help topics.

```
> man
List of topics:

    Introduction
    Connecting to a Service
    Monitoring Stats
    Feeds
    Converting Packet DB Files to PCAP
    Packets
    Verifying Database Hashes
    SDK Content
    SDK Content Examples
    Troubleshooting

Type "man <topic>" for help on a specific topic, partial matches are acceptable
>
```

View a Specific Help Topic

To view help about a specific topic, type `man <topic>`. The following example shows the Packets help topic after typing `man Packets`.

```
Type "man <topic>" for help on a specific topic, partial matches are acceptable
> man Packets
                                    Packets
                                    =======

The *packets* command can be used to generate a pcap or log file based on a
list of Session IDs, a time period or a where clause.  The command is quite
flexible and can be used on any running service that has access to the raw
```

```
data from a downstream component.  Before running the command, you must first
*login* to a service and then change directory to the appropriate sdk node,
(e.g., "cd /sdk").  Unlike the *makepcap* command, which only works on the
local file system, this command is meant to be used on a remote service.

    login ...
    cd /sdk
    packets where="service=80 && time='2015-03-01 15:00:00'-'2015-03-01
    15:10:00'" pathname="/tmp/march-1.pcap"
Write 10 minutes of HTTP only packets from March 1st, to the file
/tmp/march-1.pcap.  All times are in UTC.

    packets time1="2015-04-01 12:30:00" time2="2015-04-01 12:35:00"
    pathname=/media/sdd1/packets.pcap.gz
Write all packets between the two times to a gzip compressed file at
/media/sdd1/packets.pcap.gz

    packets time1="2015-04-01 12:30:00" time2="2015-04-01 12:35:00"
    pathname=/media/sdd1/mylogs.log
Write all logs between the two times to a plaintext file at
/media/sdd1/mylogs.log.  Any pathname ending with .log indicates that the
format of the output file should be plaintext line-delimited logs.
>
```

Caution: To get the latest information, view the command and help topics within NwConsole.

Quit NwConsole

To exit the NwConsole application, type `quit` at the command line.

Basic Command Line Parameters and Editing

NwConsole is like a Swiss army knife; it contains many tools buried underneath its command line interface. NwConsole is multi-platform. Executables are available for CentOS, Windows, and Mac. NwConsole is included on all hosts.

Basic Command Line Parameters

Here are some basic command line parameters:

- To run a set of commands from a file, us the `-f` attribute as shown here:

  ```
  NwConsole -f /tmp/<somefile.script>
  ```

- To pass in a list of commands from the command line, use the `-c` attribute as shown here:

  ```
  NwConsole -c <command1> -c <command2> -c <command3>
  ```

  This is not recommended except for very simple scripts. The Bash interpreter can jumble quoted strings if you do not escape properly. If you have non-obvious errors passing through the command line, switch to reading from a file to see if that fixes the issues.

- Normally, the Nwconsole exits after running commands passed by a file or command line. If you want to keep the interactive prompt open after the commands are executed, include `-i` in the command line.

- You can also run NwConsole and type the commands in the console window.

Line Editing

You can use the keys in the following table when editing a command.

Key	Descripton
Ctrl-U	Clears the current line
Ctrl-W	Deletes the word that the cursor is on
Ctrl-A	Moves the cursor to the beginning of the line
Ctrl-E	Moves the cursor to the end of the line
Up arrow	Displays the previously executed command

Key	Descripton
Down arrow	Displays the command executed after the current command (only valid if the up arrow has been pressed)
Left arrow	Moves the cursor to the previous character
Right arrow	Moves the cursor to the next character
Tab	Provides context sensitive completion of most commands and their parameters. The Tab key is very helpful for editing. For example, to view the *Connecting to a Service* help topic, at the command line, you can type `mancon` and then press the `Tab` key. NwConsole completes the command for you: `man Connecting to a Service` Press enter to run the command and view the topic.
`history`	Displays a numbered list of previous commands
`history execute=#`	Executes a previous command, which is also equivalent to typing `!#` For example, `!1` executes the previous command.
`history clear`	Clears all command history
`history erase=#`	Erases a specific command from the history buffer. History is automatically stored from one session to the next.

Connecting to a Service

To connect and interact with a NetWitness Platform Core service (Decoder, Concentrator, Broker, Archiver, and so on), you must first issue the `login` command. You must have an account on that service. You can `type help` login at any time for more information. Here is the syntax of the `login` command:

`login <hostname>:<port>[:ssl] <username> [password]`

For example: `login 10.10.1.15:56005:ssl someuser`

If you do not include the password, the NwConsole prompts you.

If you have set up proper trust between NwConsole and the endpoint, you can use the `tlogin` command and avoid having to enter a password. Setting up trust is beyond the scope of this documentation, but it involves adding NwConsole's SSL cert to the endpoint via the `send /sys peerCert op=add --file-data=<pathname of cert>` command. You must first use a normal login with the proper permissions before you can add a peer cert for subsequent trusted logins.

Once connected, you can interact with the endpoint service through a virtual file system. Instead of files, what you are looking at are the nodes of that service. Some nodes are folders and have child nodes, forming a hierarchical structure. Each node serves a purpose and all of them support a subset of commands like `info` and `help`. The `help` message returns information about the commands each node supports. When you first log on, you are on the root node, which is the path `/`, just like a Linux or Mac system. To see a list of nodes under `/`, type the `ls` command.

All services have nodes like `sys` and `logs`. To interact with the **/logs** API, you can first send the `help` command to the **/logs** node. To do this, you must use the `send` message, which has this syntax:

```
Usage: send {node pathname} {message name} [name=value [name=value]]

            [--file-data=<pathname>] [--string-data=<text>] [--binary-data=<text>]
            [--output-pathname=<pathname>] [--output-append-pathname=<pathname>]
            [--output-format={text,json,xml,html}]
Sends a command to a remote pathname.  For remote help, use "send <pathname>help" for
details.

    pathname                - The node pathname to retrieve information on
    message                 - The command (message) to send
    parameters              - Zero or more name=value parameters for the command
    --file-data             - Loads data from a file and send as either a BINARY
                              message or as a PARAMS_BINARY message if other
                              parameters exist
    --string-data           - Sends text as a STRING message type
    --binary-data           - Send text as either a BINARY message type or as a
```

```
                              PARAMS_BINARY message type if other parameters
                              exist
   --output-pathname        - Writes the response output to the given pathname,
                              overwriting any existing file
   --output-append-pathname - Writes the response output to the given pathname,
                              will append output to an existing file
   --output-format          - Writes the response in one of the given formats,
                              the default is text
```

So, to send a `help` message, you would send this:

```
send /logs help
```

And your response would look something like this:

```
    description: A container node for other node types
    security.roles: everyone,logs.manage
    message.list: The list of supported messages for this node
    ls:  [depth:<uint32>] [options:<string>] [exclude:<string>]
    mon:  [depth:<uint32>] [options:<uint32>]
    pull:  [id1:<uint64>] [id2:<uint64>] [count:<uint32>] [timeFormat:<string>]
    info:
    help:  [msg:<string>] [op:<string>] [format:<string>]
    count:
    stopMon:
    download:  [id1:<uint64>] [id2:<uint64>] [time1:<date-time>] [time2:<date-time>]
op:<string>
  [logTypes:<string>] [match:<string>] [regex:<string>] [timeFormat:<string>]
[batchSize:<uint32>]
    timeRoll:  [timeCalc:<string>] [minutes:<uint32>] [hours:<uint32>] [days:<uint32>]
[date:<string>]
```

To get more information about a specific message or command, you can specify the `msg=<message name>` on the help command as a parameter. For example, look at the `pull` message help:

```
send /logs help msg=pull
```

```
    pull: Downloads N log entries
    security.roles: logs.manage
    parameters:
    id1 - <uint64, optional> The first log id number to retrieve, this is mutually
exclusive with id2
    id2 - <uint64, optional> The last log id number that will be sent, defaults to most
recent log
 message when id1 or id2 is not sent
```

```
    count - <uint32, optional, {range:1 to 10000}> The number of logs to pull
    timeFormat - <string, optional, {enum-one:posix|simple}> The time format used in each
log message,
 default is posix time (seconds since 1970)
```

The built in message help says that this command grabs the last N log entries if you leave off id1 and id2. To look at the last 10 log entries:

```
send /logs pull count=10 timeFormat=simple
```

Almost all of the commands on the service follow this simple format. The only commands that do not are the ones that require more complicated handshaking, like importing a PCAP to a Decoder. To import a PCAP, use the NwConsole `import` command, which takes care of the complicated communication channel handshaking.

Some parameters are specific to NwConsole's `send` command and are not actually sent to the service. You can use these parameters to change the output format of the response, write the response to a file, or read a file from the local machine and send it to the service. The local parameters to NwConsole's `send` command all start with two dashes --.

- `--output-format` — This parameter changes the normal output of the command from plain text to one of these types: JSON, XML, or HTML.
- `--output-pathname` — Instead of writing the output to the terminal, it writes it to the pathname specified (truncates any existing file).
- `--output-append-pathname` — This is the same as `--output-pathname` except that it appends the output to an existing file (or creates the file if it does not exist).
- `--file-data` — Reads in a file and uses it as the command payload. This is useful for commands like `/sys fileEdit`. The following example shows how you can send an updated **index-concentrator-custom.xml** file using NwConsole:

```
send /sys fileEdit op=put filename=index-concentrator-custom.xml --
file-data="/Users/user/Documents/index-concentrator-custom.xml"
```

- `--file-format` — When reading an input file with `--file-data`, this parameter forces NwConsole to interpret the file as a specific type of input. The allowed enumerations are: `binary`, `params`, `param-list`, `string` and `params-binary`. As an example, to send a file of application rules (`*.nwr`) to a Decoder, you can use this command:

```
send /decoder/config/rules/application replace --file-
data=/path/rules.nwr --file-format=param-list
```

- `--string-data` — Sends the command payload as a string instead of a list of parameters.
- `--binary-data` — Sends the command payload as binary instead of a list of parameters.

Example Streaming Query to JSON file (could be a large result set):

```
send /sdk query size=0 query="select * where service=80 &&
time='2015-03-05 13:00:00'-'2015-03-05 13:59:59'" --output-
format=json --output-pathname=/tmp/query.json
```

One thing to note about the send command is the fact that, by default, there is a timeout of 30 seconds waiting for a response. Some commands (like the query above) may take longer to receive results. To avoid a premature client-side timeout, you can use the `timeout [secs]` command to increase the wait. For instance, `timeout 600` would wait 10 minutes for a response before timing out. Once enacted, it takes effect for all subsequent commands.

To navigate around the virtual node hierarchy of the service, you can use the `cd` command like you would on any command shell. This covers the basics of connecting and interacting with a service. Once you are connected, the `help` command lists all the commands that you can use to interact with the endpoint. These commands do not display when you are not connected to an endpoint.

Monitoring Stats

You can use NwConsole to watch statistics (stats) change on a service in real time. However, be warned that this can result in a LOT of output. If you are not careful and monitor too many nodes, the screen scrolls by too quickly to be useful.

As a simple example, if you log on to a Decoder, you can monitor the capture rate in real time. To do this, issue these commands after connecting to a Decoder:

```
decoder/stats
```

```
mon capture.rate
```

That is all you need to do! Now, any time the capture rate changes, it outputs into the console window.

You can add another monitor:

```
mon capture.avg.size
```

Now it watches those two stats and outputs those values when they change. You may have noticed that as you tried to type the second command, the output from the original monitor was messing up your display. This is the problem with monitoring stats. It is not really meant for doing more than just watching the stats after the first command is entered.

However, you can stop the monitoring by typing `delmons` and pressing **Enter**. Just ignore the output while you type and it returns you to a proper command prompt. If you want to monitor many stats at once, you can give the path of the parent stat folder and it monitors all of the stats underneath it. For instance, typing `mon /decoder/stats` or `mon .` (they are equivalent) monitors everything. Be prepared for a lot of output! Remember to enter `delmons` if it is scrolling too fast.

Useful Commands

The following NwConsole commands are useful when interacting with NetWitness Server Core services:

- **feed**: Enables you to create and work with feed files.
- **makepcap**: Converts Packet database (DB) files to PCAP.
- **packets**: Retrieves packets or logs from the logged in service.
- **hash**: Creates or verifies hashes of database files.

The following sections as well as the NwConsole help and topic information (man) pages, provide additional information.

Feeds

The `feed` command provides several utilities for creating and examining feed files. A feed file contains the definition and data of a single feed in a format that has been precompiled for efficient loading by a Decoder or Log Decoder. For a complete reference on feed definitions, see the "Feed Definitions File" topic in the *Decoder and Log Decoder Configuration Guide*.

create

```
feed create <definitionfile> [-x <password>]
```

The `feed create` command generates feed files for each feed defined in a feed definition file. A definition file is an XML document that contains one or more definitions. Each feed definition specifies a data file and the structure of that data file. The resulting feed files will be created in the same directory as the definition file with the same name as the data file, but with the extension changed to **.feed** (for example, **datafile.csv** results in **datafile.feed**). Any existing files with the target name will be overwritten without a prompt.

```
$ ls
example-definition.xml    example-data.csv
$ NwConsole
RSA NetWitness Console 10.5.0.0.0
Copyright 2001-2015, RSA Security Inc.  All Rights Reserved.

Type "help" for a list of commands or "man" for a list of manual pages.
> feed create example-definition.xml
Creating feed Example Feed...
done.  2 entries, 0 invalid records
All feeds complete.
```

```
> quit
$ ls
example-definition.xml    example-data.feed    example-data.csv
$
```

Optionally, feed files can be obfuscated using the option `-x` followed by a password of at least 16 characters (no spaces). This will be applied to all feeds defined in the definition file. In addition to the feed file, a token file will be generated for each feed file. The token file must be deployed with the corresponding feed file.

```
feed create example-definition.xml -x 0123456789abcdef
```

stats

```
feed stats <feedfile>
```

The `feed stats` command provides summary information for an existing, un-obfuscated feed file. Specifying an obfuscated feed file will result in an error.

```
> feed stats example.feed
 Example Feed stats:
 version  : 0
 keys count  : 1
 values count: 2
 record count: 2
 meta key  : ip.src/ip.dst
 language keys:
 alert    Text
```

dump

```
feed dump <feedfile> <outfile>
```

The `feed dump` command generates a normalized, key-value pair listing of an un-obfuscated feed file. You can use the resulting file to validate a feed file or assist in determining which records were considered invalid when the feed was created. Specifying an obfuscated feed file will result in an error. If `outfile` exists, the command will abort without overwriting the existing file.

```
feed dump example.feed example-dump.txt
```

Converting Packet DB Files to PCAP

You can use the `makepcap` command to quickly convert any Packet DB file to a generic PCAP file, preserving the capture time order. This command offers many options (see `help makepcap`), but is easy to use. All it really needs is the Packet DB directory (via the `source=<pathname>` parameter) to get started.

Note: You must stop the Decoder or Archiver service before running this command. If you want to generate a PCAP while the service is running, see the `packets` command.

```
makepcap source=/var/netwitness/decoder/packetdb
```

This command converts every Packet DB file into a corresponding PCAP file in the same directory. If the disk is almost full, see the next command.

```
makepcap source=/var/netwitness/decoder/packetdb dest=/media/usb/sde1
```

This command writes all of the output PCAPs to the directory at **/media/usb/sde1**.

```
makepcap source=/var/netwitness/decoder/packetdb dest=/media/usb/sde1
filenum=4-6
```

This command only converts the files numbered 4 thru 6 and skips all other files. In other words, it converts the Packet DB files: **packet-000000004.nwpdb**, **packet-000000005.nwpdb**, and **packet-000000006.nwpdb**.

```
makepcap source=/var/netwitness/decoder/packetdb time1="2015-03-01
14:00:00" time2="2015-03-02 07:30:00" fileType=pcapng
```

This command only extracts packets with a timestamp between March 1st, 2015 at 2 PM and March 2nd, 2015 before or on 7:30 AM. It writes the file as pcapng in the same directory as the source. All timestamps are UTC.

Packets

You can use the `packets` command to generate a PCAP or log file based on a list of Session IDs, a time period, or a where clause. This command is very flexible you can use it on any running service that has access to the raw data from a downstream component. Before running the command, you must first `login` to a service and then change directory to the appropriate sdk node (for example, `cd /sdk`). Unlike the `makepcap` command, which only works on the local file system, you use this command for a remote service.

```
login ...

cd /sdk

packets where="service=80 && time='2015-03-01 15:00:00'-'2015-03-01 15:10:00'"
pathname="/tmp/march-1.pcap"
```

This command writes 10 minutes of HTTP only packets from March 1st to the file **/tmp/march-1.pcap**. All times are in UTC.

```
packets time1="2015-04-01 12:30:00" time2="2015-04-01 12:35:00"
pathname=/media/sdd1/packets.pcap.gz
```

This command writes all packets between the two times to a GZIP compressed file at **/media/sdd1/packets.pcap.gz**.

```
packets time1="2015-04-01 12:30:00" time2="2015-04-01 12:35:00"
pathname=/media/sdd1/mylogs.log
```

This command writes all logs between the two times to a plaintext file at **/media/sdd1/mylogs.log**. Any pathname ending with **.log** indicates that the format of the output file should be plaintext line-delimited logs.

Verifying Database Hashes

By default, Archiver writes an XML file for every DB file that is written. This XML file ends with the extension **.hash** and contains a hash of the file along with other pertinent information. You can use the `hash` command to verify that the DB file has not been tampered with by reading the hash stored in the XML file and then rehashing the DB file to verify that the hash is valid.

```
hash op=verify
hashfile=/var/netwitness/archiver/database0/alldata/packetdb/packet-
000004880.nwpdb.hash
```

This command verifies that the Packet DB file **packet-000004880.nwpdb** still matches the hash in the XML file **packet-000004880.nwpdb.hash**. For proper security, the hash file should be stored somewhere else to prevent the XML file from being tampered with (like write once only media), but the hash command itself does not care where it is stored.

SDK Content Command

One of the powerful commands in NwConsole is `sdk content`. It contains numerous options to do just about anything, at least as far as extracting content from the NetWitness Platform Core stack. You can use it to create PCAP files, log files, or extract files out of network sessions (for example, grab all of the pictures from email sessions). It can append files, have a max size assigned before creating a new file, and automatically clean up files when the directory grows too large. It can run queries in the background to find new sessions. It breaks queries into manageable groups and performs those operations automatically. When the group is exhausted, it does a requery to get a new set of data for further operations. The list of options for the sdk content command is very extensive.

Because the command has so many options, this document provides examples of commands for different use cases.

Before you can run `sdk content`, there are a few commands (like logging into a service) that you need to run first. Here are some examples:

- First connect to a service:
  `sdk open nw://admin:netwitness@10.10.25.50:50005`
- If you need to connect over SSL, use the nws protocol:
  `sdk open nws://admin:netwitness@10.10.25.50:56005`
- Keep in mind that you are passing a URL and must URL encode it properly. If the password is `p@ssword`, the URL looks like this: `sdk open nw://admin:p%40ssword@10.10.25.50:50005`
  This also applies to username.
- Once you log in, you can set an output directory for the commands: `sdk output <some pathname>`
- For command line help, type: `sdk content`

Before you try some example commands, it is important to understand the `sessions` parameter. This parameter is very important and controls how much or how little data you want to grab (the where clause is also important). The sessions parameter is either a single session id or a range of session ids. All NetWitness Platform Core services work with session ids, which start at 1 and increase by 1 for every new session added to the service (network or log session). Session ids are 64-bit integers, so they can get quite large. To keep it simple, assume we have a Log Decoder that has ingested and parsed 1000 logs. On the service, you now have 1000 sessions with session ids from 1 to 1000 (session id 0 is never valid). If you want to operate over all 1000 sessions, you pass sessions=1-1000. If you only want to operate over the last 100 sessions, you pass sessions=901-1000. Once the command finishes processing session 1000, it exits back to the console prompt.

Many times, however, we do not care about specific session ranges. We just want to run a query over all of them and process the sessions that match a query. Here are some shortcuts that simplify this:

- The letter `l` (lowercase L) means lower bound or the lowest session id.
- The letter `u` means the highest session id. In fact, it actually means the highest session id for future sessions as well. In other words, if you pass `sessions=l-u`, this special range means operate over all the current sessions in the system, but also do not quit processing, and as new sessions enter the system, process those, too. The command pauses and waits for new sessions once it reaches the last session on the service. To summarize, the command never exits and goes into continuous processing mode. It runs for days, months, or years, unless it is killed.
- If you do not want the command to run forever, you can pass `now` for the upper limit. This determines the last session id on the service at the time the command starts and processes all sessions until it reaches that session id. Once it reaches that session id, the command exits, regardless of how many sessions may have been added to the service since the command started. So, for the example Log Decoder, `sessions=200-now` starts processing at session 200 and goes all the way to session 1000 and quits. Even if another 1000 logs were added to the Log Decoder after the command started, it still exits after processing session 1000.
- The parameter `sessions=now-u` means start at the very last session and continue processing all new sessions that come in. It does not process any existing sessions (except the last one), only new sessions.

For example commands and what they do, type `man sdk content examples` or see SDK Content Command Examples.

SDK Content Command Examples

The first NwConsole sdk content command example below is simple and shows all of the commands that you need to enter. After that, the examples show only the `sdk content` commands. The first example creates a log file and grabs the first 1000 logs out of a Concentrator aggregating from a Log Decoder:

```
sdk open nw://admin:netwitness@myconcentrator.local:50005

sdk output /tmp

sdk content sessions=1-1000 render=logs append=mylogs.log
fileExt=.log
```

This script outputs 1000 logs (assuming sessions 1 thru 1000 exist on the service) to the file **/tmp/mylogs.log**. The logs are in a plain text format. The parameter `fileExt=.log` is necessary to indicate to the command that we want to output a log file.

```
sdk content sessions=1-1000 render=logs append=mylogs.log
fileExt=.log includeHeaders=true separator=","
```

This command grabs the same 1000 logs as above, but it parses the log header and extracts the log timestamp, forwarder, and other information, and puts them in a CSV formatted file.

Example CSV: 1422401778,10.250.142.64,10.25.50.66,hop04b-LC1,%MSISA-4: 81.136.243.248...

The timestamp is in Epoch time. The `includeHeaders` and `separator` parameters can only be used on NetWitness Platform installs 10.4.0.2 and later.

```
sdk content sessions=1-now render=logs append=mylogs.log fileExt=.log
includeHeaders=true separator="," where="risk.info='nw35120'"
```

This command writes a log file across the current session range, but only logs that match `risk.info='nw35120'`. Keep in mind that when you add a where clause, it performs a query in the background to gather the session ids for export. The query should be run on a service with the proper fields indexed (which is typically a Broker or Concentrator). In this case, since you are querying the field `risk.info`, double-check the service where you run the command to make sure it is indexed at the value level (IndexValues, see index-concentrator.xml for examples). By default, most Decoders only have time indexed. If you use any field but time in the where clause, you need to move the query from the Decoder to a Concentrator, Broker, or Archiver with the proper index levels for the query. You can find more information on indexing and writing queries in the *NetWitness PlatformCore Database Tuning Guide*.

```
sdk content sessions=1-now render=logs append=mylogs.log fileExt=.log
includeHeaders=true separator="," where="threat.category exists &&
time='2015-01-05 15:00:00'-'2015-01-05 16:00:00'"
```

This command is the same as above, but it only searches for matching logs between 3 PM and 4 PM (UTC) on Jan 5, 2015 that have a meta key `threat.category`. Again, because this query has a field other than time in the where clause (`threat.category`), it should be run on a service with `threat.category` indexed at the `IndexKeys` level (the operators `exists` and `!exists` only require an index at the key level, although values work fine, too).

```
sdk content sessions=1-now render=logs append=mylogs fileExt=.log
where="event.source begins 'microsoft'" maxFileSize=1gb
```

This command creates multiple log files, each one no larger than 1 GiB in size. It prepends the filenames with **mylogs** and appends them with the date-time of the first packet/log timestamp in the file. Some example filenames: **mylogs-1-2015-Jan-28T11_08_14.log**, **mylogs-2-2015-Jan-28T11_40_08.log** and **mylogs-3-2015-Jan-28T12_05_47.log**. On versions older than Security Analytics 10.5, the T separator between date and time is a space.

```
sdk content sessions=1-now render=pcap append=mypackets
where="service=80,21 && time='2015-01-28 10:00:00'-'2015-01-28
15:00:00'" splitMinutes=5 fileExt=.pcap
```

This command grabs all packets in between the five-hour time period for service types 80 and 21 and writes a PCAP file. Every 5 minutes, it starts a new PCAP file.

```
sdk content time1="2015-01-28 14:00:00" time2="2015-01-28 14:15:00"
render=pcap append=mydecoder fileExt=.pcap maxFileSize=512mb
sessions=1-now
```

Pay attention to this command. It works for both packets and logs and is *extremely fast*. The downside is that you get everything between the two time ranges and you cannot use a where clause. Again, it starts streaming everything back almost immediately and does not require a query to run first on the backend. Because everything is read using sequential I/O, it can completely saturate the network link between the server and client. It starts creating files prepended with **mydecoder** and splits to a new file once it reaches 512 MiBs in size.

```
sdk tailLogs
```

or (the equivalent command):

```
sdk content render=pcap console=true sessions=now-u
```

This is a fun little command. It actually uses `sdk content` behind the scenes. The purpose of this command is to view all incoming logs on a Log Decoder. As logs come into the Log Decoder (you can also run it on a Broker or Concentrator), they are output on the console screen. It is a great way to see if the Log Decoder is capturing and what exactly is coming into the Log Decoder. This command runs in continuous mode. Do not use it if the Log Decoder is capturing at a high ingest rate (this command cannot keep up with it). However, it is helpful for verification or troubleshooting purposes.

```
sdk tailLogs where="device.id='ciscoasa'"
pathname=/mydir/anotherdir/mylogs
```

This command is the same as above, except it only outputs logs that match the where clause and instead of outputting to the console, it writes them to a set of log files under `/mydir/anotherdir` that do not grow larger than 1 GiB. Obviously, you can accomplish this with the `sdk content` command as well, but it is a little less typing with this command if you like the default behavior.

```
sdk content sessions=now-u render=pcap where="service=80" append=web-traffic fileExt=.pcap maxFileSize=2gb maxDirSize=100gb
```

This command starts writing PCAPs of all web traffic from the most recent session and all new incoming sessions that match service=80. It writes out PCAPs no larger than 2 GiBs and if all the PCAPs in the directory grow larger than 100 GiBs, then it deletes the oldest PCAPs until the directory is 10% smaller than the max size. Keep in mind that the directory size checking is not exact and it only checks every 15 minutes by default. You can adjust the number of minutes between checks by passing `cacheMinutes` as a parameter, but this only works with Security Analytics 10.5 and later.

```
sdk content sessions=79000-79999 render=nwd append=content-%1%.nwd metaFormatFilename=did
```

This is a poor person's backup command. It grabs 1000 sessions and outputs the full content (sessions, meta, packets, or logs) to the NWD (NetWitness Data Format) format. NWD is a special format that can be re-imported to a Packet or Log Decoder without reparsing. So essentially, the original parsed session imports without changes. The timestamp does not change as well, so if it was originally parsed 6 months ago, the timestamp upon import will be retained as 6 months ago.

Note: Do not expect great performance with this command, especially with packets. Gathering the packets for a session involves a lot of random I/O and can drastically slow down the export. Logs do not suffer as much from this problem (only one log per session), but behind the scenes, this command uses the /sdk content API, which is not a performance minded streaming API like /sdk packets.

The `metaFormatFilename` parameter is very helpful in this command. If this command is run on a Concentrator with more than one service, the NWD filenames will be created with the `did` meta for each session (the %1% in the append parameter is substituted with the value of `did`). Each filename will indicate exactly which Decoder the data came from.

```
sdk content session=1-u where="service=80,139,25,110" render=files maxDirSize=200mb cacheMinutes=10
```

This is another fun little command. It works very similar to our old Visualize product if you pair the output directory with something like Windows Explorer in Icon mode. It extracts files from all web, email, and SMB traffic. This includes all kinds of files, such as images, zip files, videos, PDFs, office

documents, text files, executables, and audio files. If it extracts malware, your virus scanner will flag it. Nothing will be executed by the command, so it does not infect the machine (unless you try to execute it yourself). However, it can be useful because if you do find malware, the filename indicates the session id where it was extracted. You can then query that session id and see what host the malware possibly infected and take action. You can filter what gets extracted with the parameters `includeFileTypes` or `excludeFileTypes` (see the command help). For instance, adding `excludeFileTypes=".exe;.dmg;.msi"` prevents executables and installers from being extracted. This command just runs nonstop extracting files from all existing and any new sessions. After the directory gets littered with more than 200 MiBs of files, it automatically starts cleaning up the files every 10 minutes.

Note: This command only makes sense for packet sessions, not logs.

```
sdk content session=1-now where="time='2015-01-27 12:00:00'-'2015-01-
27 13:00:00' && (service=25,110,80)"
subdirFileTypes="audio=.wav;.mp3;.aac;
video=.wmv;.flv;.mp4;.mpg;.swf;
documents=.doc;.xls;.pdf;.txt;.htm;.html
images=.png;.gif;.jpg;.jpeg;.bmp;.tif;.tiff archive=.zip;.rar;
other=*" renameFileTypes=".download|.octet-
stream|.program|.exe;.jpeg|.jpg" render=files maxDirSize=500mb
```

This command extracts files from HTTP and email sessions from a one-hour period and then groups the extracted files into directories specified by the `subdirFileTypes` parameter. For instance, any extracted audio file with the extension .wav, .mp3, or .aac will be placed into the subdirectory audio, which will be created under the specified output directory. The same goes for all the other groups specified in that parameter. Some files will also be automatically renamed based on their file extension, which is handled by `renameFileTypes`. Any file with an extension .download, .octet-stream or .program will be renamed to .exe. Files with the extension .jpeg will be renamed .jpg. Once the top-level directory exceeds 500 MiBs, the oldest files get cleaned. This command stops at the last session at the time the command started.

```
sdk search session=1-now where="service=80,25,110"
search="keyword='party' sp ci"
```

This command searches all packets and logs (the `sp` parameter) for the keyword `party`. If party is found anywhere in the packets or logs, it outputs the session id along with the text it found and the surrounding text for context. The where clause indicates that it only searches web and email traffic. The `ci` parameter means that it is a case insensitive search. You can substitute `regex` for `keyword` and it performs a regex search.

```
sdk search session=1-now search="keyword='checkpoint' sp ci"
render=log append=checkpoint-logs.log fileExt=.log
```

This is an interesting command example. It searches all logs (or it could be packets) for the keyword `checkpoint` and if that keyword is seen, it extracts the log to a file **checkpoint-logs.log**. There are all kinds of possibilities with this command. Essentially, when a hit is detected, it hands off the session to the content call. So any parameters you pass to `sdk search` that it does not recognize, it just passes along to the content call. This allows the full capabilities of the `sdk content` call, but only working on those sessions with content search hits.

Commands Used for Troubleshooting

NwConsole provides the following commands that are helpful when troubleshooting NetWitness:

- **whatIsWrong**: Provides a snapshot of a service's configuration, stats, and failure and warning logs for a specified past period of time.
- **dbcheck**: Performs consistency checking of database files.
- **topQuery**: Helps pinpoint queries that are taking an excessively long time to run.
- **netbytes**: Troubleshoots the network connections on the current host
- **netspeed**: Troubleshoots the connection between the host computer running NwConsole and the remote computer connected to it using the `login` command.

The following sections as well as the NwConsole help and topic information (man) pages, provide additional information.

whatIsWrong

When a service is not working correctly, the reason is usually somewhere in the logs that the service has written. You can use the `whatIsWrong` console command to obtain a snapshot of a service's configuration, stats, and failure and warning logs (with surrounding context logs) for a specified past period of time, which defaults to the previous seven days. You can save the results of running whatIsWrong into a specified plain text file. The output of this command can be a useful starting point to help determine what is currently wrong with a service.

To use the `whatIsWrong` console command, log on to the service to troubleshoot using the `login` command, and run the `whatIsWrong` command.

Note: Use `help whatIsWrong` to see all of the available parameters, including the number of days/hours to look back for events, the pathname to store results, whether or not to append or overwrite the results file, and the delimiter to use for log fields. You can also limit the number of most recent logs used to find context, and you can specify how many context logs per warning/failure log to retrieve.

Whenever you receive a request for logs for a Core service, you should run the `whatIsWrong` command first and use the results collected as a starting point.

dbcheck

The `dbcheck` command is used to perform consistency checking of database files (session, meta, packets, logs, stats, and so on). This might be necessary when a service cannot start because of errors in the consistency of the database files. Normally a service would automatically recover and correct any consistency issues on startup, but there are times when this does not occur. When a service starts (like Decoder), it typically does not read or open most database files in order to start quickly. It assumes most files are in a consistent state and only does a cursory check of the most recently written files. If there are problems, `dbcheck` can perform those consistency checks, but ONLY if the service is not running.

Caution: Do not attempt to run this command while a service is running.

For example, you can check a single file:

```
dbcheck /var/netwitness/decoder/packetdb/packet-000000001.nwpdb
```

You can also use wildcards to check multiple files:

```
dbcheck /var/netwitness/decoder/metadb/meta-00000002*.nwmdb
```

topQuery

The `topQuery` command can help pinpoint queries that are taking an excessively long time to run. This command parses the audit logs of a service and returns the top N longest running queries for the specified time period.

The easiest way to run it is to log on to the service (usually a Broker or Concentrator) and type `topQuery`. The default behavior is to return the top 100 longest running queries for the last seven days.

Type `help topQuery` for the list of parameters. Here are some additional examples with explanations:

```
topQuery hours=12 top=10
```

This command returns the top 10 queries for the last 12 hours.

```
topQuery time1="2015-03-01 00:00:00" time2="2015-03-14 00:00:00"
```

This command returns the top 100 queries between March 1, 2015 and March 14, 2015. Times are in UTC, not local.

```
topQuery input=/var/log/messages output=/tmp/top20.txt top=20
user=sauser1
```

Instead of connecting to a service, it parses the syslog audit messages for the top 20 queries in the last 7 days, but only for queries executed by user sauser1. It writes the top 20 queries to /tmp/top20.txt instead of the console screen. The parameter user is a regex, so you can specify multiple usernames by writing something like `user="(sauser1|sauser2)"`.

netbytes

The `netbytes` command is very useful for troubleshooting the network connections on the current host. It displays continuous send and receive statistics for all network interfaces. Once executed, you must press **Ctrl-C** to exit this command, which also exits NwConsole.

netspeed

The `netspeed` command is used to troubleshoot the connection between the host computer running NwConsole and the remote computer connected to it through the `login` command. You must supply the amount of bytes to transfer and it will time the speed of the connection. The netspeed command is very useful for troubleshooting Aggregation performance issues that might be network related.

```
login somedecoder:50004 admin ...
```

```
netspeed transfer=4g
```

To troubleshoot the connection between a Concentrator and a Decoder, SSH into the Concentrator, run NwConsole, and then log on to the Decoder and run `netspeed`. The output from the command gives you an indication of the maximum network throughput. If it is much less than the standard 1 Gbps interface, it could indicate a network issue.

Disaster Recovery (Backup and Restore Instructions)

You can use the NetWitness Recovery Tool (NRT) to back up and restore data from the NetWitness Server and component host systems. The NRT is a script that you run from the command line to back up and restore data on hosts for RMAs, hardware refreshes, and general backup and restore requirements. Refer to Disaster Recovery in Azure Deploymentfor specific steps on how to perform disaster recovery for hosts deployed in Azure VMs.

Note: You must run the NRT on each host system locally. You cannot run it from remote hosts or an external host.

The following types of hosts can be backed up and restored.

Note: In the NRT script, the following terms in bold are referred to as categories.

- **NetWitness Admin Server** (may include Respond, Health and Wellness, and Reporting Engine)
- **Malware** Malware Analysis (stand-alone)
- **Archiver** Log Archiver
- **Broker** Stand-alone Broker
- **Concentrator** Network or Log
- **Decoder** Network Decoder
- **Endpoint Hybrid**
- **Endpoint Log Hybrid**
- **Event Stream Analysis (ESA) Primary** Including Context Hub and Incident Management database
- **ESA Secondary**
- **Gateway** Cloud Gateway
- **Log Collector** Including Virtual Log Collector if installed
- **Log Decoder** Including Local Log Collector and Warehouse Connector, if installed.
- **Log Hybrid**
- **Network Hybrid**
- **UEBA** User Entity and Behavior Analytics
- **Warehouse**

Basic Usage of the NetWitness Recovery Tool

You can use the NRT to back up data by using the `export` option. To restore data, use the `import` option. The basic usage of the tool is to run the following command from the root directory level:

```
nw-recovery-tool [command] [option]
```

The commands and options that you can use with this tool are described in the following tables.

Commands and Options	Description
`-h, --help`	Display help on commands and option. For example, specify: `nw-recovery-tool --help-categories` to get a list of all the valid category names.
`-e, --export`	Export data or configuration.
`-i, --import`	Import data or configuration.
`-d, --dump-dir <path>`	Path for the where data will be exported or imported from (for example, `var/netwitness/backup`).
`-C, --category <name>`	Select components by category. Valid category names are `AdminServer`, `Archiver`, `Broker`, `Concentrator`, `Decoder`, `EndpointHybrid`, `EndpointLogHybrid`, `ESAPrimary`, `ESASecondary`, `Gateway`, `LogCollector`, `LogDecoder`, `LogHybrid`, `Malware`, `NetworkHybrid`, `UEBA`, and `Warehouse`. You can specify a single category or multiple categories. For example: `--category AdminServer` for the Admin Server exclusively. `--category AdminServer --category Gateway` for the Admin Server and the Cloud Gateway.
`-p, --deploy-password <pwd>`	Specify deployment password. This is only needed if the selected category or component includes Mongo (for hosts such as AdminServer, Endpoint, or ESA Primary).

Required Conditions

Make sure that the following conditions are met:

- Read the entire document before backing up any data. The document covers all deployment scenarios, so you want to make sure you have all the information required to back up and restore your implementation of NetWitness Platform before going through this process.
- Run the NRT for both backup and recovery locally, on each system being backed up or restored. You cannot run the NRT on an external host, or back up or restore several hosts simultaneously. However, you can back up several components on the same host system simultaneously.
- Export and import data on the same host. If a host fails and you need to build a new system, the new system must have the same identity parameters (i.e., the same IP address), and must be on the same version of NetWitness Suite
- Make sure that there is adequate disk space in the backup location (`var/netwitness/backup` is the recommended directory) before the export command in the nw-recovery tool is executed. Do not use a `tmp` directory because it fills up quickly and may cause the system to crash.
- Restore to the exact ISO Image that each host had at the time of backup.
- If you have multiple services co-located on a single host, include all the services in a single command string for the `import` and `export` commands in the nw-recovery tool.

Note: 1.) When you run the NRT, the Malware , Reporting Engine, and Postgresql services are stopped and restarted during both the backup (export) and restore (import) processes. Log and packet collection is not stopped.

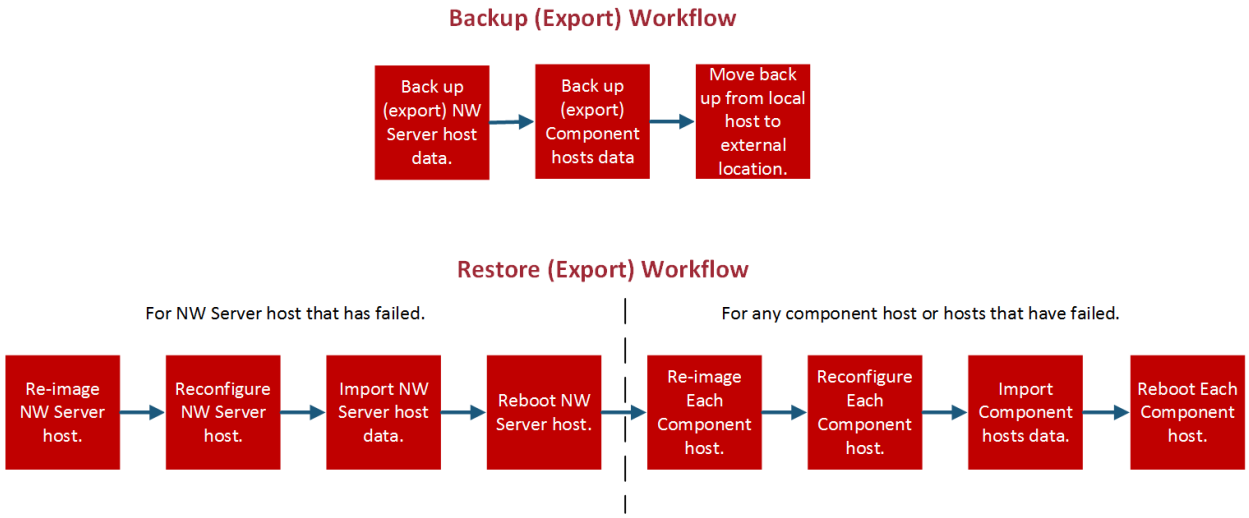
Disaster Recovery Workflow

The following diagram shows the high-level Disaster Recovery tasks.

Note: You only need to recover a host if it failed. This means that you can recover a single host, or any combination of hosts depending on which host or hosts failed.

The following diagram shows the tasks for:

- Backup (perform as soon as possible and as frequently as possible).
- Restore (only required if you need to restore your data).



Back Up and Restore Data for 11.x Hosts

The procedures for backing up and restoring data are different for NetWitness Server host systems and for component systems.

Caution: 1.) Do not remove component hosts (that is any host other than the NW Server host) from the Hosts View (Admin >Hosts) from the user interface when you are performing the following disaster recovery procedure. 2.) You must retain (restore) the 'Host name' that existed prior to performing the disaster recovery procedure. 3.) Make sure that you record your master password and store it in a safe location so you can access the system in the case of Disaster Recovery.

Back Up and Restore Data on the 11.x NetWitness Server

Note: If you are using shared storage to export data from multiple hosts (for example, a shared mount or drive), use host-specific subfolders for the path to the location of the exported files for each host, to avoid overwriting one host's exported data with another. For example, you could use a path similar to `--dump-dir /mnt/storage/<host-specific-name>` for the path to the location of the exported files.

Back Up Data on a NetWitness Server Host

Perform this procedure on an existing, functional 11.x NetWitness Server host system.

1. At the root level, type the following command:
   `nw-recovery-tool --export --dump-dir var/netwitness/backup --category AdminServer`

   Note: If a service (for example Cloud Gateway) is co-located on the NW Server with the Admin Server rather than on its own, dedicated host, you must include it in the command string. For example.
   `nw-recovery-tool--export --dump-dir var/netwitness/backup --category AdminServer --category Gateway`

2. Replace `var/netwitness/backup` with the path to the location to which the data should be exported
   a. Ensure that this location has sufficient space to store the backup data.
   b. The backup directory path should be located on the local host. However, the backup files could be located on a network mount or an external device.
3. When you are prompted for the deployment administration password, enter the password, or include the following additional argument for the `nw-recovery-tool` command:
   `--deploy-password <password>`

   Note: Use the existing `deploy_admin` password that was used when you first installed the host.

   The data is backed up on the NetWitness Server host in the location you set up in step 2 .
4. Move the backed up data from the local host to an external server or a USB stick.

Restore Data on a NetWitness Server Host

1. Re-image the NetWitness Server host using the same network configuration settings of the original host. For information about re-imaging the NetWitness Server host, see "Task 1 - Install 11.2 on the NetWitness Server Host" in the *Physical Host Installation Guide for Version 11.2 Guide*

   a. **Optional** If you need to establish network connectivity before you can fetch backup data, for example, if it is on a remote host, run the following script using the same IP address, subnet, gateway, DNS and domain information as the original host:
   `netconfig --static --interface <name> --ip <address> --netmask <netmask> --gateway <gateway>`
   For example:
   `netconfig --static --interface eth0 --ip 192.168.1.100 --netmask 255.255.255.0 --gateway 192.168.1.1`
   Optional: To specify DNS server(s), include the following additional parameter:
   `--dns <address>`
   Optional: To set the local domain name, include the following additional parameter:
   `--domain <name>`

   b. (**Optional**) If you are using DHCP, run the following script:
   `netconfig --dhcp --interface <name>`
   For example:
   `netconfig --dhcp --interface eth0`

   c. Add the backup data to the backup directory path on the local host, for example, `var/netwitness/backup`.

2. Run the `nwsetup-tui` command. This initiates the Setup program.

   Note: During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same identical network configuration that was used for the original installation of 11.x on this host.

3. When you are prompted, select install type option **3: Recover (Reinstall)**, click **OK**, and then enter the path to the backup directory containing the backup data.

4. After the installation completes successfully, ensure that the host is running the exact same release and patch version of the data that was backed up:

   - If the data was on an 11.x system that was updated to a later patch release, update the host by following the instructions for updating systems offline in the update guide for the same patch version as what was previously running on the host (the exact release/patch version for which data was backed up).
   - If the data was on a major release version (for example, 11.x) that had not been updated to a later patch version, you do not need to update the host system.

5. When the host is running at the correct version, run the following command on the NetWitness Server to restore data:
   ```
   nw-recovery-tool --import --dump-dir var/netwitness/backup --category
   AdminServer
   ```

   Note: If a service is co-located on the NW Server with the Admin Server rather than on its own, dedicated host, you must include it in the command string. For example.
   ```
   nw-recovery-tool--import--dump-dir var/netwitness/backup --category
   AdminServer --category Gateway
   ```

6. (Conditional) For customers using custom firewall rules (that is, replied "Yes" to the "Disable Firewall" nwsetup-tui prompt during installation), restore the `/etc/sysconfig/iptables` file from the backup copy located in the `<dump-dir>/unmanaged/etc/sysconfig/iptables` file.

7. Reboot the NetWitness Server host.

Back Up and Restore Data on Other Component Hosts

Perform these procedures on each existing, functional 11.x component host system.

Back Up Data on a Component Host

1. At the root level, type the following command:
   `nw-recovery-tool --export --dump-dir var/netwitness/backup --category <category name>`
   where the category name is one of the following:
   `Archiver, Broker, Concentrator, Decoder, EndpointHybrid, EndpointLogHybrid, ESAPrimary, ESASecondary, LogCollector, LogDecoder, LogHybrid, Malware, NetworkHybrid, UEBA`

   Note: 1.) Use the category that matches the host type. 2.) If services are co-located on a Component Host rather than on its own dedicated host, you must include it in the command string. For example, a Warehouse Connector resides on a Log Decoder host. The following is an example of this command string.
   `nw-recovery-tool--export --dump-dir var/netwitness/backup --category LogDecoder --category Warehouse`

2. **(Optional)** Replace `var/netwitness/backup` with the path to the location to which the data should be exported
   a. Ensure that this location has sufficient space to store the backup data.
   b. The backup directory path should be located on the local host. However, the backup files could be located on a network mount or an external device.

3. For **EndpointHybrid**, **EndpointLogHybrid**, and **ESAPrimary** systems, you can export application data that is stored in the database by running the following command:
   `nw-recovery-tool --export --dump-dir var/netwitness/backup --component mongo`
   You can replace `var/netwitness/backup` with the path to the location to which the data should be exported.

   Note: 1.) Make sure that there is enough space in the export location for the files from the Mongo database. 2.) You can back up the **EndpointHybrid**, **EndpointLogHybrid**, or **ESAPrimary** host data and Mongo database in a single command string. For example, `nw-recovery-tool --export --dump-dir var/netwitness/backup --category EndpointHybrid --component mongo`

   When you are prompted for the deployment administration password, enter the password, or include the following additional argument for the `nw-recovery-tool` command:
   `--deploy-password <password>`

4. For **Malware**, you can export application data from the Malware application database by running the following command:
   `nw-recovery-tool --export --dump-dir var/netwitness/backup --component postgresql`

You can replace `var/netwitness/backup` with the path to the location to which the data should be exported.

Note: Ensure that there is enough space in the export location for the files from the Malware database.

5. Move the backed up data from the local host to an external server or a USB stick.

Restore Data on a Component Host

1. Re-image the component host using the same network configuration settings of the original host. For information about re-imaging a component host, see "Task 2 - Install 11.x on Other Component Hosts" in the *Physical Host Installation Guide for Version 11.x Guide*
2. **Optional** If you need to establish network connectivity before you can fetch backup data, for example, if it is on a remote host, run the following script using the same IP address, subnet, gateway, DNS and domain information as the original host:
   `netconfig --static --interface <name> --ip <address> --netmask <netmask> --gateway <gateway>`
   For example:
   `netconfig --static --interface eth0 --ip 192.168.1.100 --netmask 255.255.255.0 --gateway 192.168.1.1`
   Optional: To specify DNS server(s), include the following additional parameter:
   `--dns <address>`
   Optional: To set the local domain name, include the following additional parameter:
   `--domain <name>`
   a. (**Optional**) If you are using DHCP, run the following script:
      `netconfig --dhcp --interface <name>`
      For example:
      `netconfig --dhcp --interface eth0`
   b. Add the backup data to the backup directory path on the local host, for example, `var/netwitness/backup`.
3. Run the `nwsetup-tui` command. This initiates the Setup program.

   Note: During the Setup program, when you are prompted for the network configuration of the host, be sure to specify the same identical network configuration that was used for the original installation of 11.x on this host.
4. When you are prompted, select install type option **3: Recover (Reinstall)**, click **OK**, and then enter the path to the directory containing the backup data.

5. After completing the `nwsetup-tui` command setup, you must re-install the appropriate services (except EndpointHybrid and EndpointLogHybrid) on the host using the Install command from the Hosts View in the NetWitness Platform User Interface.
   For EndpointHybrid and EndpointLogHybrid, you must use the orchestration-cli-client on the Admin Server to install the Endpoint services. Run the following command:

   ```
   orchestration-cli-client --hostaddr-as-id -i -o <host IP Address> --
   category <EndpointHybrid or EndpointLogHybrid> --version <version>
   ```

   For example:

   ```
    orchestration-cli-client --hostaddr-as-id -i -o 192.168.200.83 --category
   EndpointLogHybrid --version 11.2.0.0
   ```

   Note: The version number must match the version of the media that was used to re-image the host.

6. After the service installation completes, ensure that the host is running the exact same release and patch version of the data that was backed up:
   - If the data was on an 11.x system that was updated to a later patch release, update the host by following the instructions for updating systems offline for the same patch version as what was previously running on the host (the exact release/patch version for which data was backed up).
   - If the data was on a major release version (for example, 11.x) that had not been updated to a later patch version, you do not need to update the host system.

7. When the host is running at the correct version, return to the root level of the component host and run the following command to restore data:
   `nw-recovery-tool --import --dump-dir var/netwitness/backup --category <category name>`

   Note: If services are co-located on a Component Host rather than on its own dedicated host, you must include it in the command string. For example, a Warehouse Connector resides on a Log Decoder host. The following is an example of this command string.
   `nw-recovery-tool--import --dump-dir var/netwitness/backup --category LogDecoder --category Warehouse`

8. For **EndpointHybrid**, **EnpointLogHybrid**, and **ESAPrimary** systems, you can import application data to be restored by running the following command:
   `nw-recovery-tool --import --dump-dir var/netwitness/backup --component mongo`
   When you are prompted for the deployment administration password, enter the password, or include the following additional argument for the `nw-recovery-tool` command:
   `--deploy-password <password>`

9. For **Malware**, you can import application data from the Malware application database to be restored by running the following command:
   `nw-recovery-tool --import --dump-dir var/netwitness/backup --component postgresql`

10. For a Decoder, Log Decoder , Concentrator, Archiver, Network Hybrid, or Log Hybrid configured with external storage (JBOD / SAN /Unity / Powervault):
    a. Scan the `<dump-dir>/unmanaged/etc/fstab` file for devices with mount points that do not exist in the system `/etc/fstab` file.
    b. Complete the following steps for each device in the backup copy of `<dump-dir>/unmanaged/etc/fstab`.
        i. Verify that the corresponding device is present and attached. If it not attached, attach it. If the device is no longer applicable, skip it and go to the next device.
        ii. Verify that the mount point directory exists on the file system. If it does not exist, create the directory with the `mkdir <path>` command.
        iii. Add the `fstab` entry from the backup copy to the system `/etc/fstab` file.
    c. Run the following command on each host.
    `mount -a`
11. From ASOC-59466) (Conditional) For customers using custom firewall rules (that is, replied "Yes" to the "Disable Firewall" nwsetup-tui prompt during installation), restore the `/etc/sysconfig/iptables` file from the backup copy located in the `<dump-dir>/unmanaged/etc/sysconfig/iptables` file.
12. Reboot the component host.

Disaster Recovery in Azure Deployment

The section tells you how to back up and restore NetWitness Platform 11.x deployed on Azure virtual hosts (also referred to as VMs in this section). The two major tasks to back up and restore 11.x data in an Azure deployment are:

- Task 1 - Backup and Export Data
- Task 2 - Restore and Import Data

Task 1 - Backup and Export Data

1. Export the data by running the `nw-recovery-tool --export` commands as described in the Disaster Recovery section of this document.

Task 2 - · Restore and Import Data

You need to refer to the *10.6.5 to 11.2 Azure Upgrade Guide* to complete this task. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

1. Delete the VM.

   Caution: Do not delete the resources (for example, do not delete Disks, Network Interface, and so on).

2. Complete the following steps for the AdminServer host, Broker host, ESA host, Endpoint host, and LogCollector host (where host = `--category`).

   a. Delete the all the resources except the network interface card of the older 11.2 VM.

   b. Deploy the fresh 11.2 VM with the same disk and resources and power it off.
   For detailed instructions on how to deploy a virtual host in Azure, see the *11.2 Azure Deployment Guide*.

   c. Run the `azure-mac-retention.ps1` from the local machine.
   See the *10.6.5 to 11.2Azure Upgrade Guide* for instructions on how to run this script.

   d. Follow the procedure for the NRT restoration for the respective host as described in Restore Data on a Component Host.

   e. After you restore NRT the component host, restore the following files.

   - `/etc/fstab`
   - `/etc/hosts` (if hostname is not changed)
   - `/etc/waagent.conf`
   - `/etc/logrotate.d/waagent.logrotate`
   - `/etc/krb5.conf` from the `<dump-dir>/unmanaged` folder

3. Complete the following steps for the LogDecoder host, Concentrator host, and Archiver host (where host = `--category`.

   a. Delete all the resources except the disks that are named **external** and the network interface card of the older 11.2 VM.

   b. Deploy the fresh 11.2 VM with the same disk and resources listed in the *11.2 Azure Deployment Guide* and power it off.

   > **Note:** Do not create the **external** disk. Only create the **nwhome** disks.

   c. Run the `azure-mac-retention.ps1` from the local machine.
   See the *10.6.5 to 11.2Azure Upgrade Guide* for instructions on how to run this script.

   d. Follow the procedure for the NRT restoration for the respective hosts as described in Restore Data on a Component Host.

   e. After you restore NRT the component host, restore the following files.

   - `etc/fstab`
   - `/etc/hosts` (if hostname is not changed)
   - `/etc/waagent.conf`
   - `etc/logrotate.d/waagent.logrotate`
   - `/etc/krb5.conf`

Disaster Recovery in AWS Deployment

The section tells you how to back up and restore NetWitness Platform 11.x deployed on AWS virtual hosts (also referred to as VMs in this section). The two major tasks to back up and restore 11.x data in an AWS deployment are:

- Task 1 - Backup and Export Data
- Task 2 - Restore and Import Data

Task 1 - Backup and Export Data

1. Export the data by running the `nw-recovery-tool --export` commands as described in the Disaster Recovery section of this document.
2. Record the IP addresses. You need to refer to them later in the Disaster Recovery process. Refer to the *10.6.5 to 11.2 AWS Upgrade Guide* for instructions on how retain the IP addresses. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 2 - · Restore and Import Data

You need to refer to the *10.6.5 to 11.2 AWS Upgrade Guide* to complete this task.

1. Delete the VM.

   Caution: Do not delete the resources (for example, do not delete Disks).

2. Complete the following steps for the AdminServer host, Broker host, ESA (Primary/Seconday) host, Endpoint Hybrid host, Endpoint Log Hybrid host, and LogCollector host (where host = `--category`).

   a. Delete the all the resources of the older 11.2 VM.

   b. Deploy the fresh 11.2 VM with the same IP address, disk and resources and power it off. For detailed instructions on how to deploy a virtual host in AWS, see the *11.2 AWS Deployment Guide*.

   c. Follow the procedure for the NRT restoration for the respective host as described in Restore Data on a Component Host.

   d. After you restore NRT the component host, restore the following files.

   - `/etc/fstab`
   - `/etc/hosts` (if hostname is not changed)

3. Complete the following steps for the LogDecoder host, Decoder (Network Decoder) host, Concentrator host, and Archiver host (where host = `--category`.

   a. Delete all the resources except the **external disks** of the older 11.2 VM.

   b. Deploy the fresh 11.2 VM with the same IP address, disk and resources listed in the *11.2 AWS Deployment Guide* and power it off.

   > **Note:** Do not create the **external** disk. Only create the **nwhome** disks.

   c. Follow the procedure for the NRT restoration for the respective hosts as described in Restore Data on a Component Host.

   d. After you restore NRT the component host, restore the following files.

   - `etc/fstab`
   - `/etc/hosts` (if hostname is not changed)
   - `/etc/krb5.conf`

RESTful API

The RESTful API that ships with NetWitness Platform is a way to programmatically communicate with the NEXTGEN architecture. It must be enabled by setting `/rest/config/enabled` to **on**, which is the default. The default port for communication is the default port + 100 (for example, **50105** for a Concentrator), but that can be changed by setting the `/rest/config/port` parameter. SSL is controled by the setting in `/sys/config/ssl`. For information about how to perform these tasks, see Access the RESTful API in NetWitness Platform.

The API is based on HTTP and is quite easy to use. The acceptable output formats are:

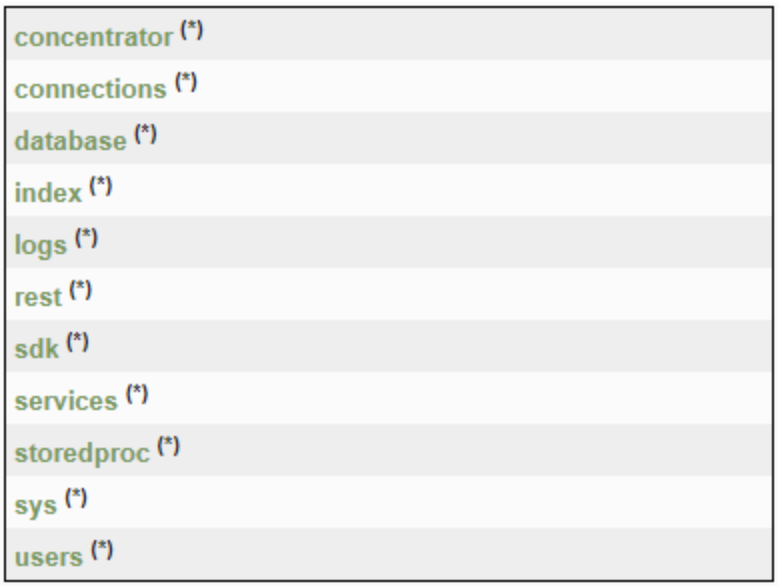
- text/plain
- text/xml
- text/html
- application/json

The content type that is returned can be controlled through the **HTTP Accept** header. It is possible to set the parameter **force-content-type** to one of the previous values.

The easiest way to begin is to point a browser to the REST port (for details about how to perform these tasks, see Access the RESTful API in NetWitness Platform):

`PATH: http://<hostname or IP>:<REST port>`

This command performs the default command of **ls**, and returns a listing for the root node tree used by NEXTGEN:



Usage

The REST API accepts commands by using URL parameters and by POSTing application/json.

The special content type, `application/x-netwitness-string-params`, passes parameters, as plain text, in the format:

```
param1=value1 param2="value \"2\""
```

Note: Quotes, as part of the value, must be preceded by the backslash \ character. Any character can be escaped in this manner, including the backslash itself \\.

The format of the URL consists of the following components:

```
http://<hostname or IP>:<port>/[node1][/node2][…]?msg=<message name>
[&param1=value1][&param2=value2][…]
```

Usage example: the "/logs" Node

The /logs node supports several different messages:

- **ls**–Returns a list of child nodes. It supports the parameters depth and options.
- **mon**–Monitor this node (and possibly descendants) for changes. However, this message is not supported by the REST API because it requires a persistent connection and pipe that cannot be done via REST. Monitoring currently requires the full NextGen SDK library.
- **pull**–This command pulls logs from the service. It supports two parameters: **count**, which controls how many logs to return, and **id2**, which controls the ending log ID to return. **id2** is optional and when it is not provided, the last log written is returned.
- **info**–Returns detailed node information.
- **help**–The parameters are covered in more detail in Find More Details.
- **count**–A simple command to return the number of child nodes.
- **stopMon**–Stop monitoring the node from a previous mon command (also not supported by REST).
- **download**–A more complicated command to download a large number of log messages with several parameters to control log types and text matching capabilities. Like the **mon** command, this requires more than a simple request/response, which is not supported by the REST node interface.
- **timeroll**–Any log entries that exceed a given age are deleted.

To get a full list of NEXTGEN messages and parameters, use the help message:

```
http://<hostname>:<port>/logs?msg=help
```

The above command returns:

description	A container node for other node types
security.roles	everyone,logs.manage
message.list	The list of supported messages for this node
ls	[depth:<uint32>] [options:<string>]
mon	[depth:<uint32>] [options:<uint32>]
pull	[id2:<uint64>] [count:<uint32>] [timeFormat:<string>]
info	
help	[msg:<string>] [op:<string>] [format:<string>]
count	
stopMon	
download	[id1:<uint64>] [id2:<uint64>] [time1:<date-time>] [time2:<date-time>] op:<string> [logTypes:<string>] [match:<string>] [regex:<string>] [timeFormat:<string>]
timeroll	[timeCalc:<string>] [minutes:<uint32>] [hours:<uint32>] [days:<uint32>] [date:<string>]
debugGen	[count:<uint32>]

Example Syntax

To view the last 100 logs:

```
http://hostname:50105/logs?msg=pull
```

To view the logs in XML format:

```
http://hostname:50105/logs?msg=pull&force-content-type=text/xml
```

To see the last 10 logs in plain text:

```
http://hostname:50105/logs?msg=pull&count=10&force-content-type=text/plain
```

Find More Details

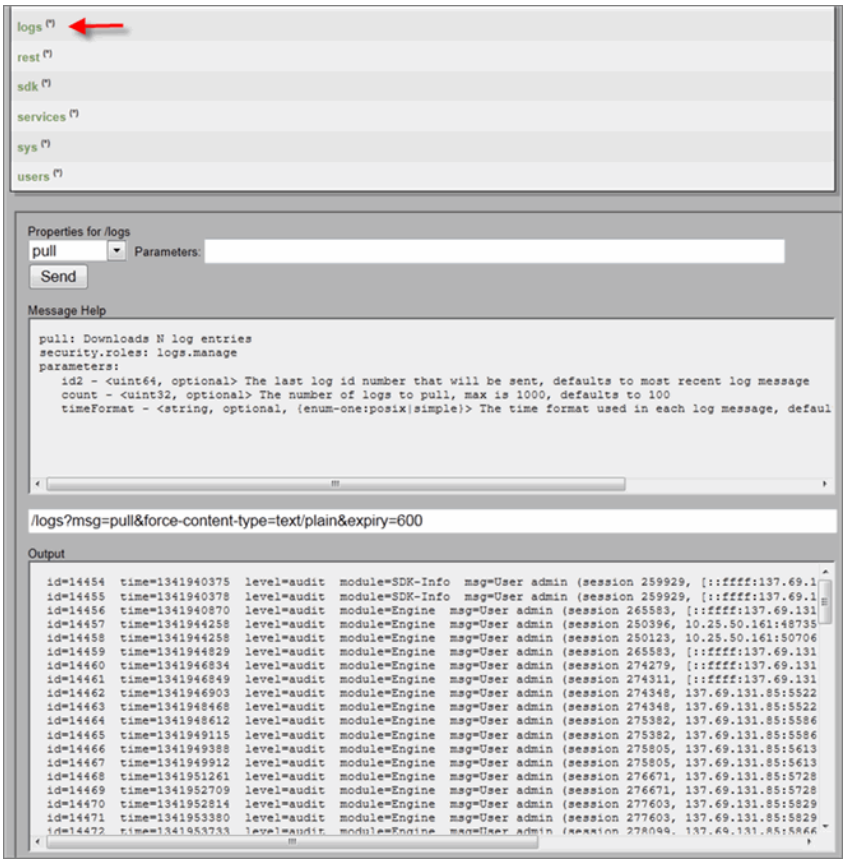
For more detailed information about a message (for example the pull message), request help specific to just that message. The **help** message displayed above uses the parameter name **msg**, but in the URL below, **message** is used, an alias for the help **msg** parameter to avoid conflicts with the REST API **msg**.

```
http://<hostname>:<port>/logs?msg=help&message=pull
```

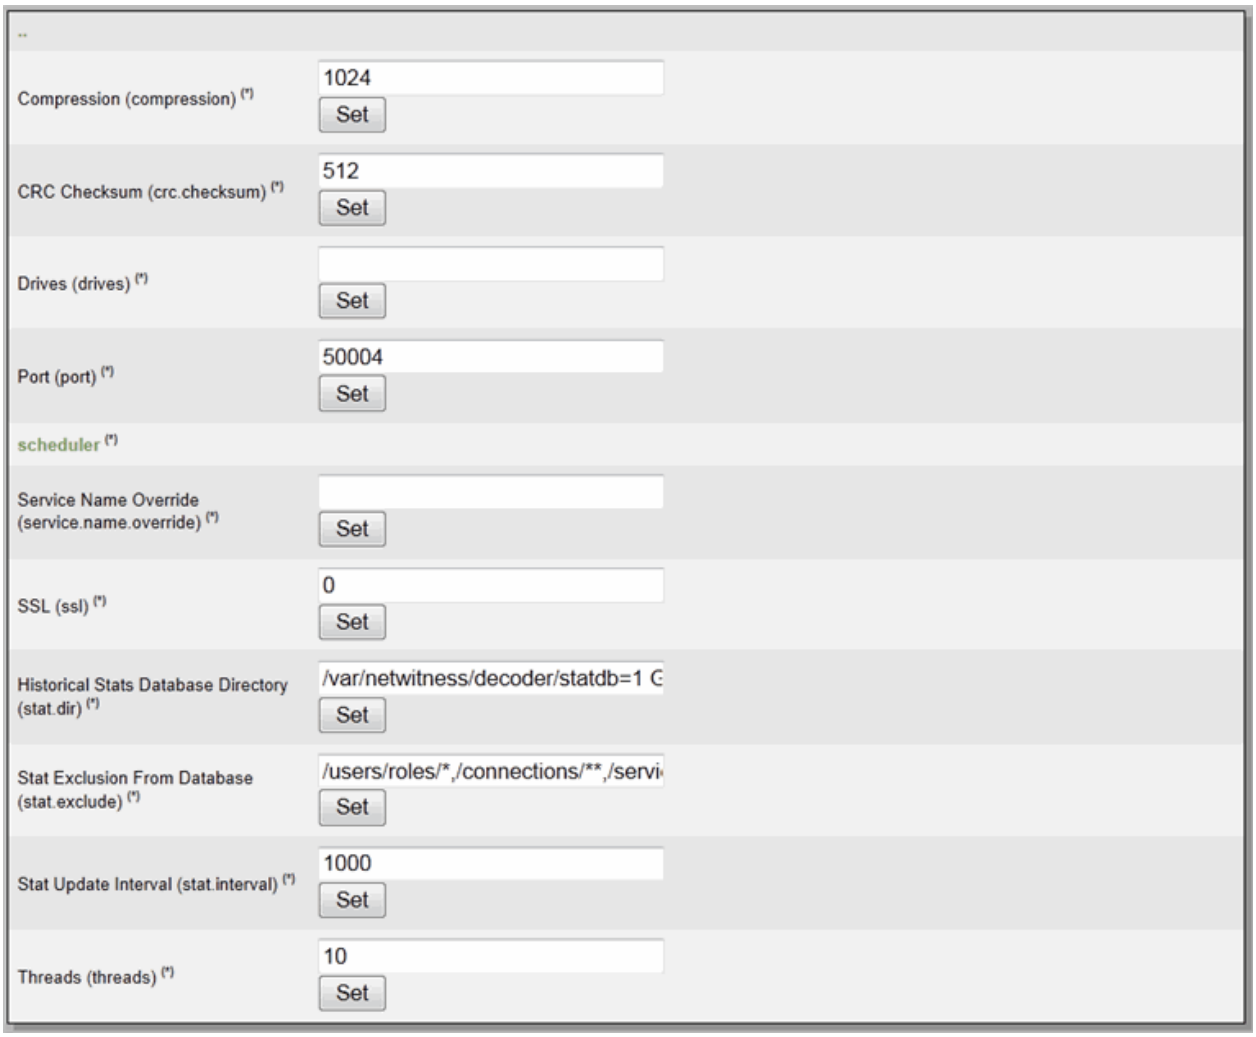
```
        Downloads N log entries
        security.roles: logs.manage
        parameters:
pull    id2 - <uint64, optional> The last log id number that will be sent, defaults to most recent log message
        count - <uint32, optional> The number of logs to pull, max is 1000, defaults to 100
        timeFormat - <string, optional, {enum-one:posix|simple}> The time format used in each log message, default is posix time (seconds since
        1970)
```

Alternately, you can go back to the browser and click the (*) in the properties pane on one of the nodes, as shown here:

When you select a command, the **Message Help** is displayed. When you click **Send**, the output is shown in a separate pane, as shown here:



In this view, you can easily navigate the node tree to use the various commands supported by NEXTGEN or to make configuration changes.



For example, from `/sys/config`, you can make configuration changes and click **Set** to send the changes.

Access the RESTful API in NetWitness Platform

This topic describes how to enable the REST API in NetWitness Platform. The REST API must be enabled by setting `/rest/config/enabled` to **on**, which is the default. The default port for communication is the default port + 100 (for example, **50105** for a Concentrator), but that can be changed by setting the `/rest/config/port` parameter. SSL is controled by the setting in `/sys/config/ssl`.

To enable the REST port:

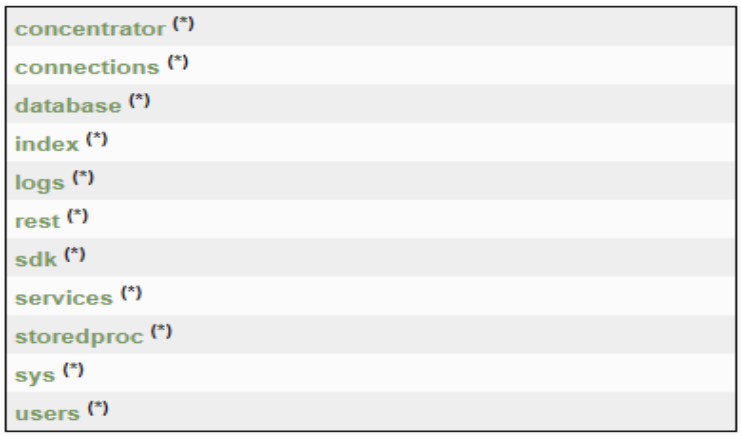
1. In the NetWitness Platform web user interface, go to **ADMIN** > **Services** and select a service, for example, a Concentrator.
2. In the **Host** column, click on the host name. The Hosts page opens, and the IP address of the host is displayed in the **Host** column. Make a note of the IP address.

   Note: If the IP address listed in the Host column is the same as the IP address of the NetWitness Platform web UI, the API is not available for that service.

3. Go to **ADMIN** > **Services**, select the service, and then select **View** > **Config**. Under **System Configuration**, note the port number. You will use this port number as a basis for accessing the API, but you must add 100 to it. For example, if the port number is listed as **50005**, you would enter `50105`.
4. In the browser, type the IP address of the service and append the port number to the IP address as shown here:
   `http://<hostname or IP address>:<port>`

   Note: The URL is HTTP, and not HTTPS.

5. In the Authentication dialog, enter the user name and password and click **Log in**. A listing of the root node tree used by NEXTGEN is displayed:



Packets

You can retrieve a **pcap** file using the REST service.

`http://<hostname>:<port>/sdk/packets`

If you point a browser to this URL, the web page lets you enter a list of session IDs or a time range. When you click **Submit**, it generates a **pcap** based on the supplied criteria.

Programmatically, using HTTP GET or POST, submit either a **sessions** parameter with a comma-separated list of session IDs and session ranges (#-#) or a **time1** and **time2** parameter. Times must be in the format **YYYY-MM-DD HH:MM:SS**, for example: **2010-Apr-20 09:00:00**.

Note: Since the list of sessions can get quite long, this API accepts the content-type `application/x-netwitness-string-params` for a **POST** command.

Importing Packets

You can import packets to a DECODER using the REST service.

`http://<hostname>:<port>/decoder/import`

If you point a browser to this URL, the web page lets you select a **pcap** file for upload. It also accepts pcap files POSTed to this URL.

REST begins processing incoming data immediately after the HTTP header is parsed. This means import of a **pcap** file occurs quickly and allows for large transfers. There is still a limit, but it is much larger (GBs) and is based on how well the import process can keep up with the client POST coming in. If the client posts a huge pcap (many GBs), it is still possible to overfill the current buffer. Any pcap that is 4 GBs or less should be able to process without issue.

Note: The DECODER cannot be concurrently importing or capturing, or an error results.

Parser/Feed Upload

You can upload Parsers and Feeds using the REST service.

`http://<hostname>:<port>/decoder/parsers/upload`

If you point a browser to this URL, the web page lets you select a parser or feed file for upload.

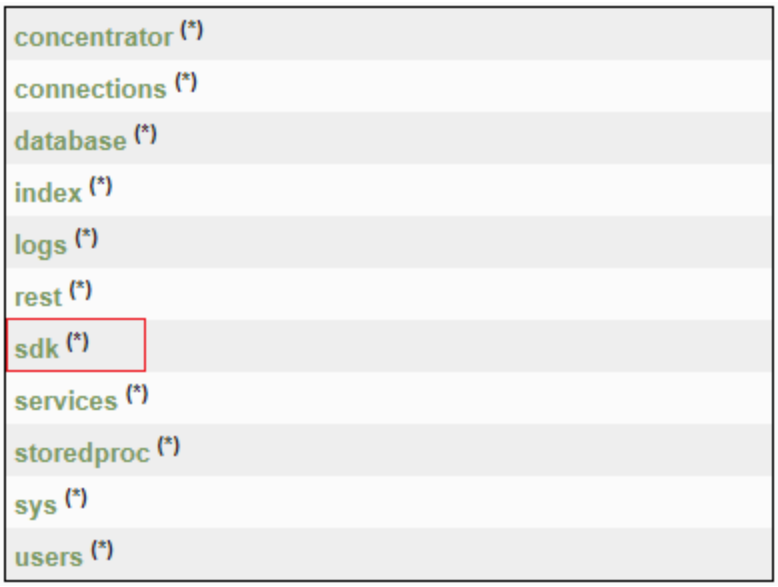
You can also force a reload by selecting the toggle or providing the parameter `reload=1` on the URL.

Stat Graphing

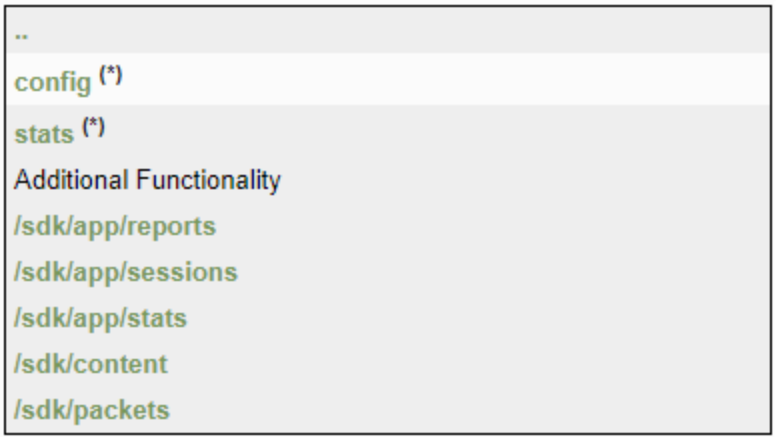
The REST interface has a built-in statistics graphing tool, which helps you monitor performance for a service during a specified time period. You can use this tool to collect and graph single or multiple statistics from a host during a specific time range. You can also graph real-time statistics.

To access the statistical graphing tool:

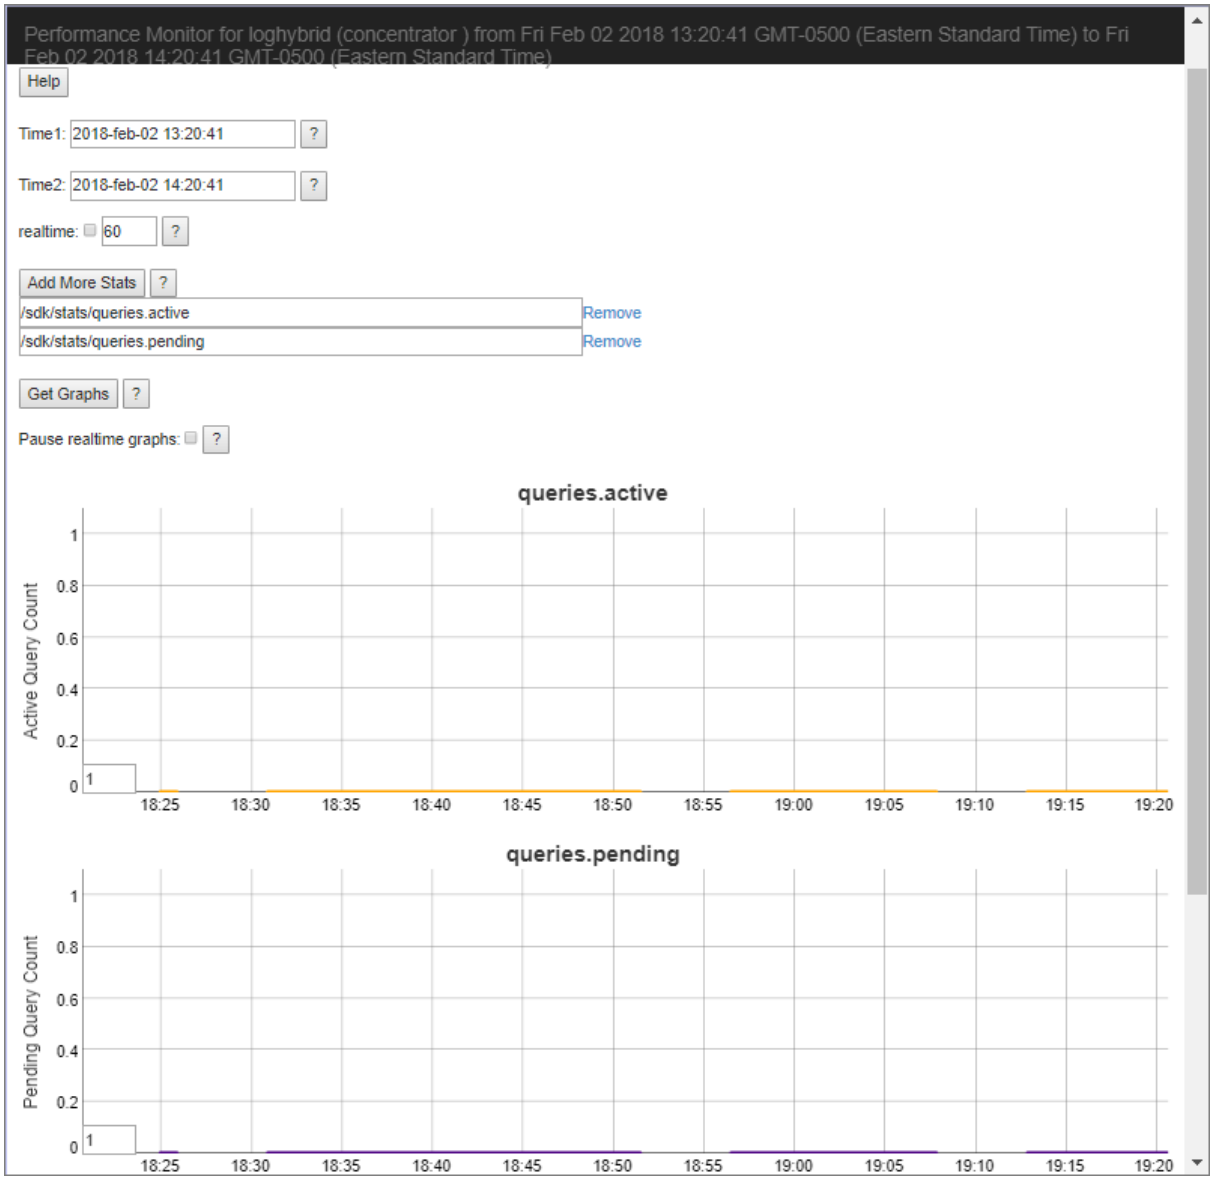
1. From the root node tree page, click `sdk`. (For information on accessing the root tree note page, see Access the RESTful API in NetWitness Platform.)



The options for additional functionality are displayed:



2. Click **sdk/app/stats**. The Performance Monitor window opens, and statistical graphs are displayed at the bottom of the page.



Click the Help buttons for detailed information about this page and the fields it contains.

SDK Commands

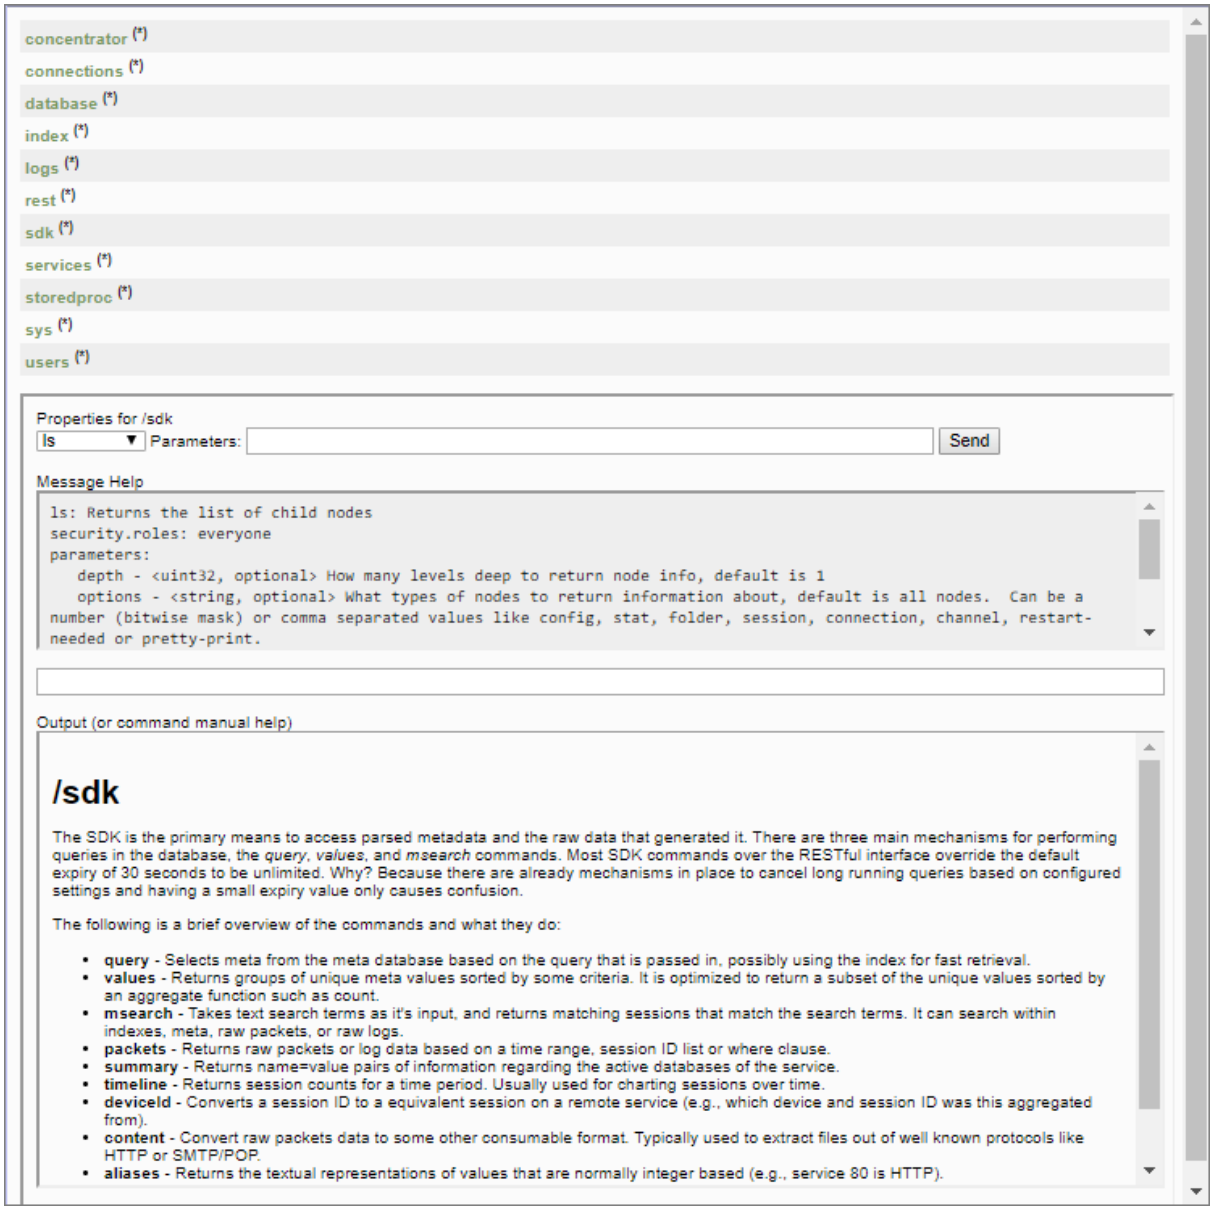
All queries on the system are performed by commands sent to the **/sdk** node.

The **/sdk** node has built-in help documentation for each message. To view the help for each command, click on the asterisk (*) beside the sdk node and then choose one of the messages from the drop-down menu. The documentation for the message is displayed in the Output window at the bottom of the screen.

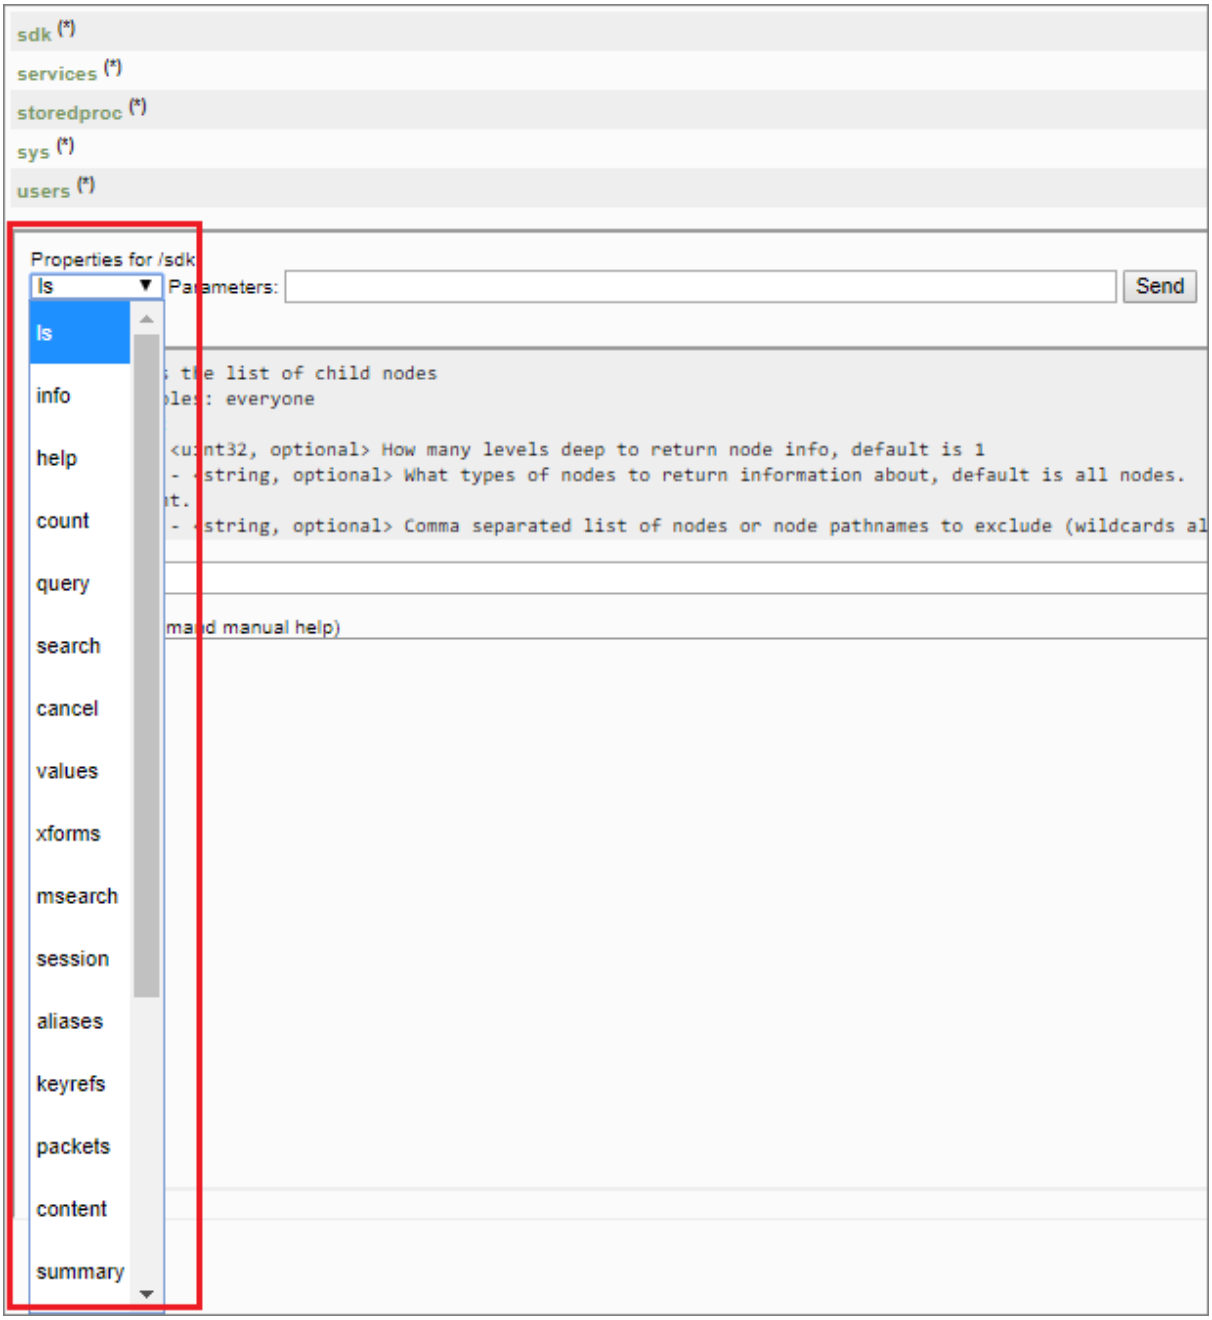
To access the help:

1. From the root node tree page, click `sdk`. (For information on accessing the root tree note page, see Access the RESTful API in NetWitness Platform.)
2. Click the asterisk (*) next to sdk.

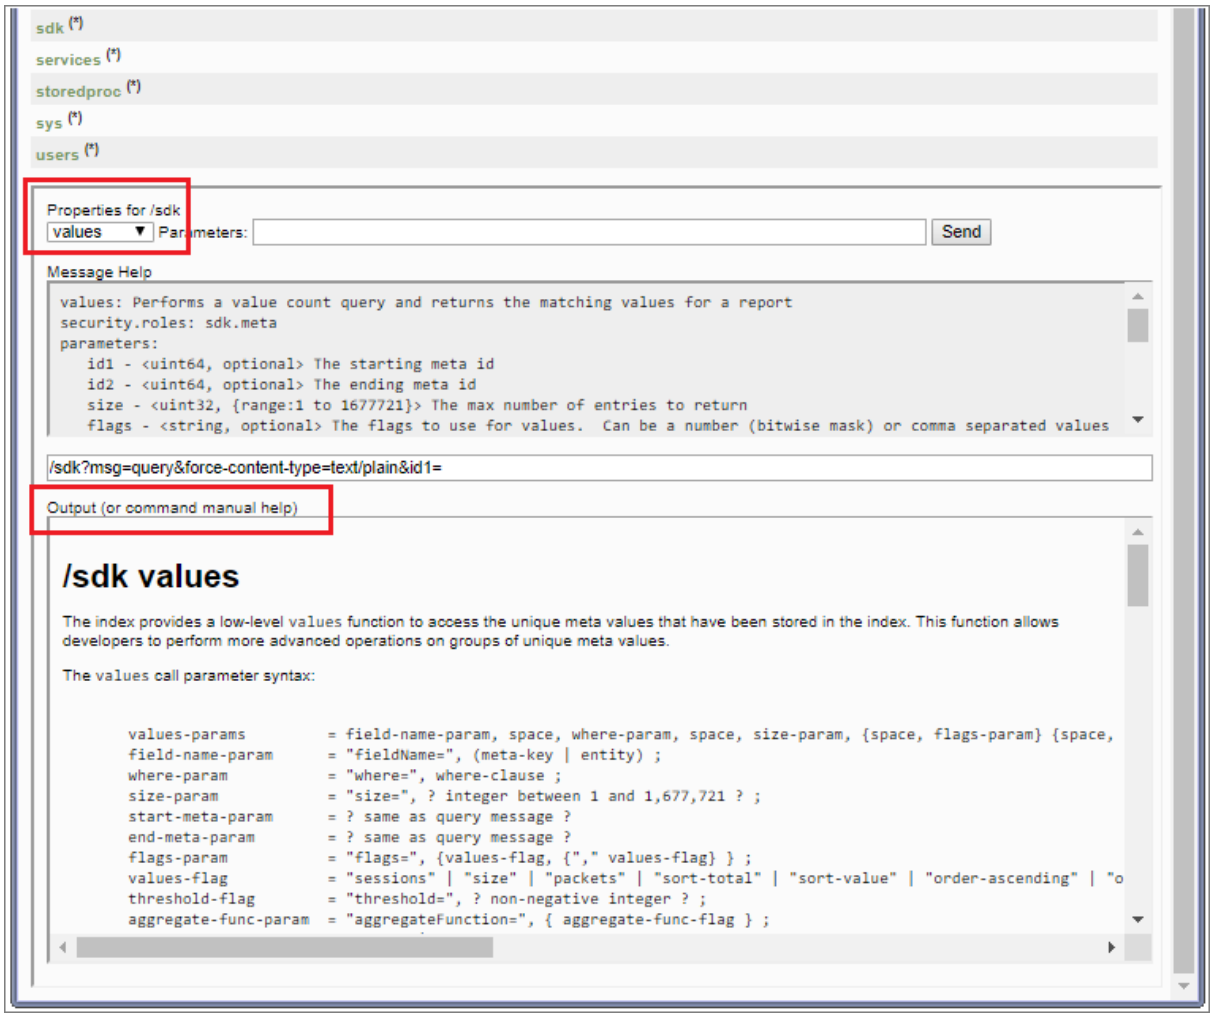
Information about the **/sdk** node is displayed.



3. To find more specific information, select a property from the **Properties for /sdk** drop-down menu:



The help for the property that you selected is displayed in the Output section:



SDK Commands Further Reference

This guide should be used in conjunction with the SDK documentation, which explains the format of queries and results. This document primarily focuses on how to send queries and parameters via the REST API, not how the queries themselves are formatted. The *Core Database Tuning Guide* explains those concepts in detail. Go to the Master Table of Contents for NetWitness Logs & Packets 11.x to find all NetWitness Platform 11.x documents. All metadata returned via REST is encoded as **UTF-8**.

There is another parameter specific to the REST API called **expiry**. This parameter can be set to the number of seconds to wait for a response before the system returns a timeout error. The default is 30 seconds, which is sufficient for most requests. For queries, the standard SDK sets an infinite timeout. If you set **expiry** to zero (`&expiry=0`), this removes the timeout for that request. It is probably a good idea to set a larger timeout for queries and other requests that may take longer than 30 seconds during normal operations.

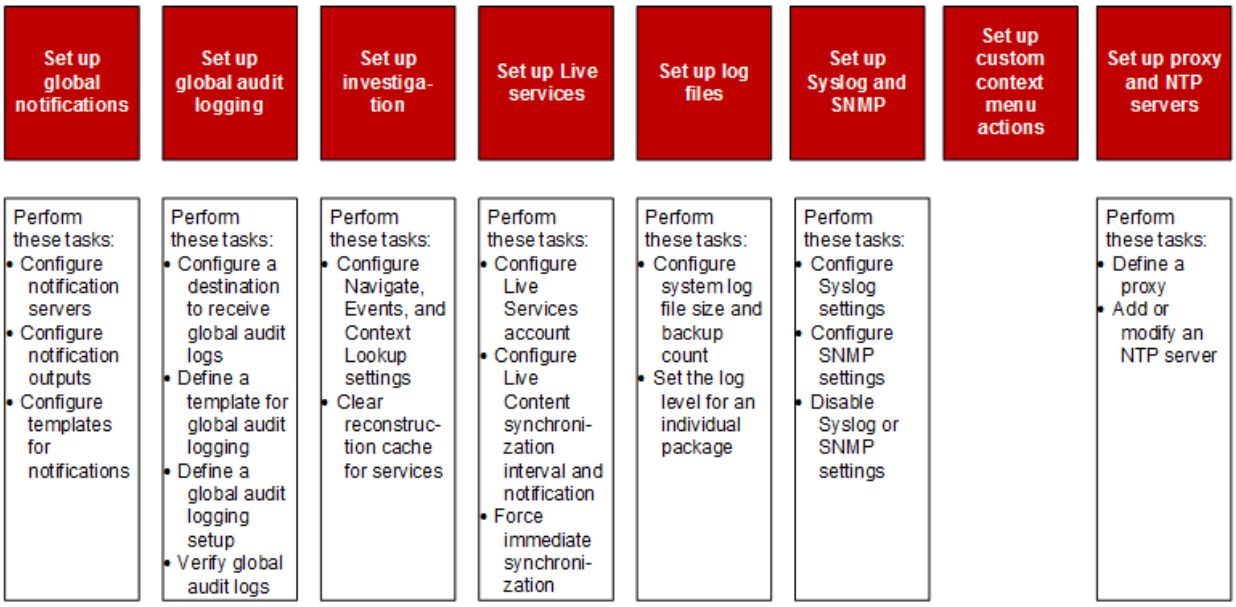
System Configuration Overview

In the Administration System view, administrators can configure system settings to receive optimal performance from NetWitness Platform. This diagram show the available configuration options.



In this guide, the standard procedures provide instructions for administrators who want to customize settings that apply across the system in NetWitness Platform. Although some of these settings have default values, the administrator needs to view and evaluate all default values.

Additional procedures are not essential for the set up of NetWitness Platform, they include certain customization options that are beyond the usual setup; for example, adding custom context menus or setting up a proxy.

In addition, reference topics and troubleshooting topics supply detailed information about the user interface and suggestions for resolving possible issues.

The following sections describe system configuration:

- Standard Procedures provide instructions for administrators who want to customize settings that apply across the system in NetWitness Platform.
- Additional Procedures provide instructions for setting up customization options that are beyond the usual system configuration.

Standard Procedures

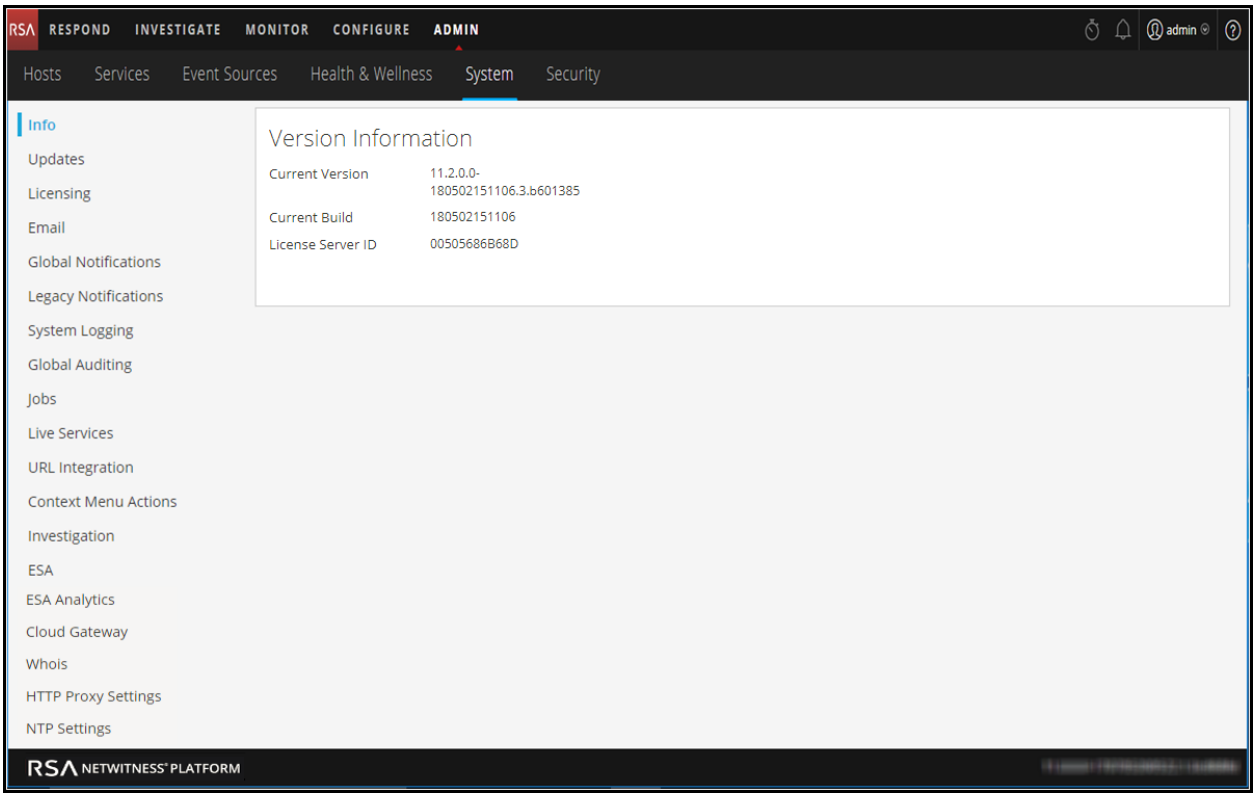
The topics in this section provide instructions for administrators who want to customize settings that apply across the system in NetWitness Platform. Although some of these settings have default values, the administrator needs to view and evaluate all default values. The procedures can be performed in any sequence and are listed alphabetically.

Access System Settings

This topic introduces system configuration capabilities of NetWitness Platform in the Administration System view. Administrators can configure notifications, email notifications, global audit logging, logging settings, connection to Live Services, and URL integration in NetWitness Platform.

To access the system settings:

Go to **ADMIN > System**.
The Administration System view is displayed.



On the left panel of the Administration System view is an options panel listing all system nodes available for configuration. When you select a node, the associated content is displayed in the right panel.

Configure Notification Servers

This topic provides instructions on how to configure notification servers. For ESA, notification servers are required to define an ESA rule. A notification server is also required to configure global audit logging.

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond. Notification Servers define the servers from which you want to receive notifications from the system. For Global Audit Logging, define Log Decoders as Syslog Notification Servers.

You can define, delete, edit, import, and export a notification server in NetWitness Platform. Individual topics describe the relevant procedures. For more information on ESA alert configuration, see "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide*. You delete, edit, import, and export notification outputs and notification servers in the same way as templates. You cannot disable or delete notification servers associated with global audit logging configurations.

Notification Servers Overview

This topic provides an overview of notification servers. You configure notification servers in the Administration System view (ADMIN > System > Notifications > Servers tab).

Global Notifications are used by a variety of components in NetWitness Platform, such as Event Stream Analysis (ESA), Respond, Health and Wellness, Event Source Management (ESM), and Global Audit Logging. Notification settings are called **Notification Servers**.

Event Stream Analysis sends notifications to users through email, SNMP, or Syslog about various system events. In ESA, these alert notification settings are called Notification Servers. You can configure multiple notification servers and use them while defining an ESA rule, for example, you can configure multiple mail servers or Syslog servers and use the settings while defining an ESA rule.

You can configure the following notification servers:

- Email
- SNMP
- Syslog
- Script

Email notification servers enable you to configure email server settings to send alert notifications. SNMP notification servers enable you to configure SNMP trap host settings as a notification server to send alert notifications.

Syslog notification servers enable you to configure Syslog settings as a notification server to send notifications. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis. For Global Audit Logging, you can only use Syslog Notification Servers.

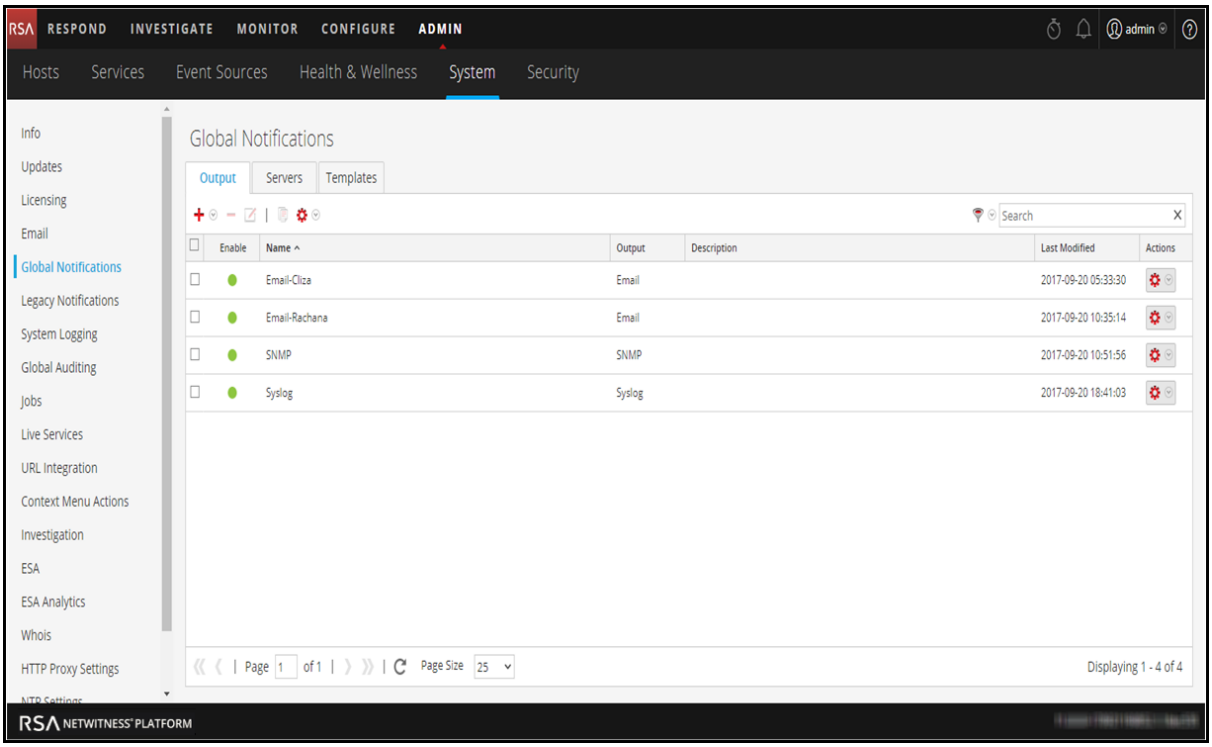
Script notification servers enable you to configure Script as a notification server.

For detailed information on the different notification server configurations, including parameters and descriptions, see Define Notification Server Dialogs.

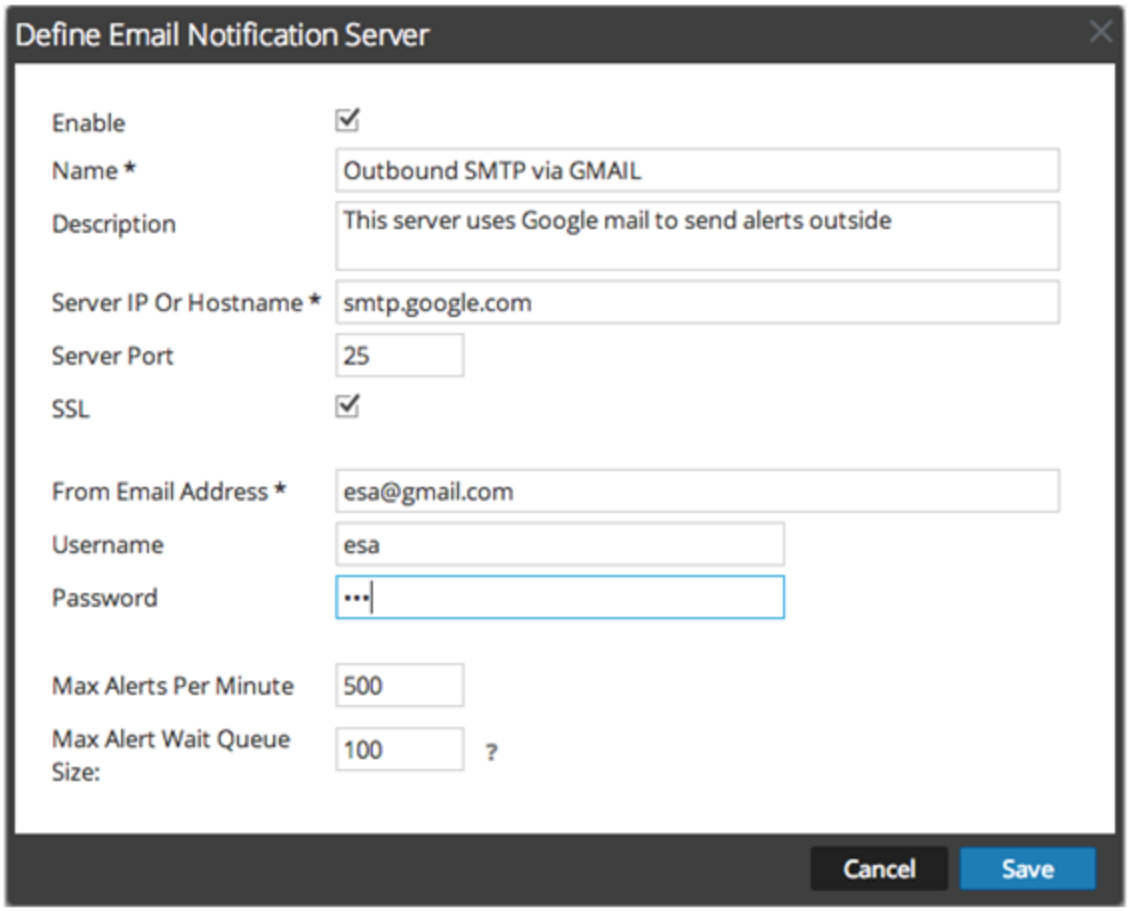
Configure the Email Settings as Notification Server

To configure email server settings as a notification server to send alert notifications:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
   The **Notifications** configuration panel is displayed with the **Output** tab open.
3. Click the **Servers** tab.



4. From the + drop-down menu, select **Email**.



5. In the **Define Email Notification Server** dialog, provide the required information and click **Save**.

Note: For ESM/SMS and ESA notifications, you must specify only the hostname/FQDN in the Server IP or Hostname field.

For details of the parameters and descriptions, see Define Notification Server Dialogs .

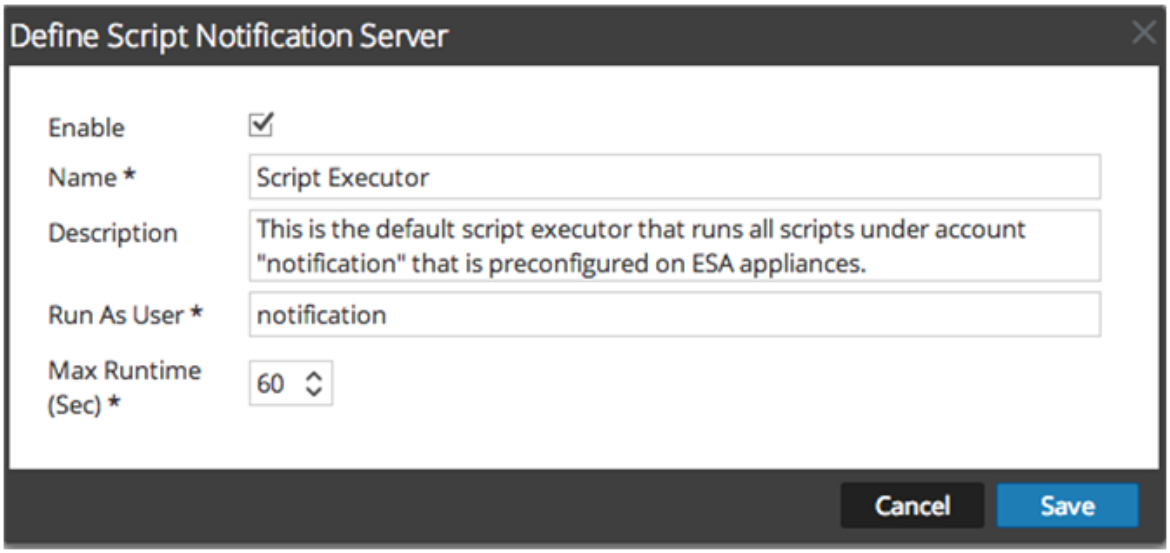
Configure Script as a Notification Server

ESA allows you to run scripts in response to ESA alerts. However, you must first configure the user identity and other details that are required to run the scripts.

To configure Script as a notification server:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the + drop-down menu, select **Script**.



5. In the **Define Script Notification Server** dialog, provide the required information and click **Save**.

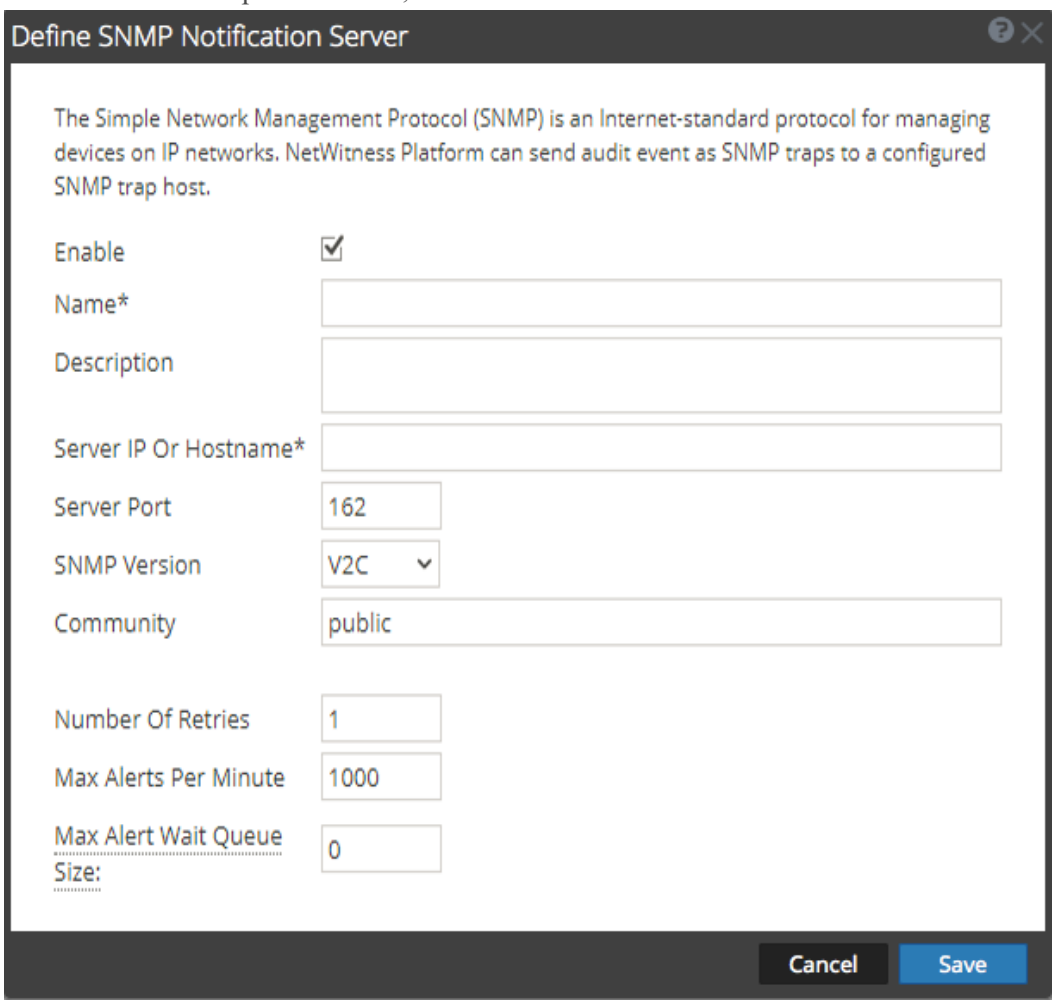
For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure the SNMP Settings as Notification Server

To configure the SNMP trap host settings as a notification server to send alert notifications:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the + drop-down menu, select **SNMP**.



5. In the **Define SNMP Notification Server** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

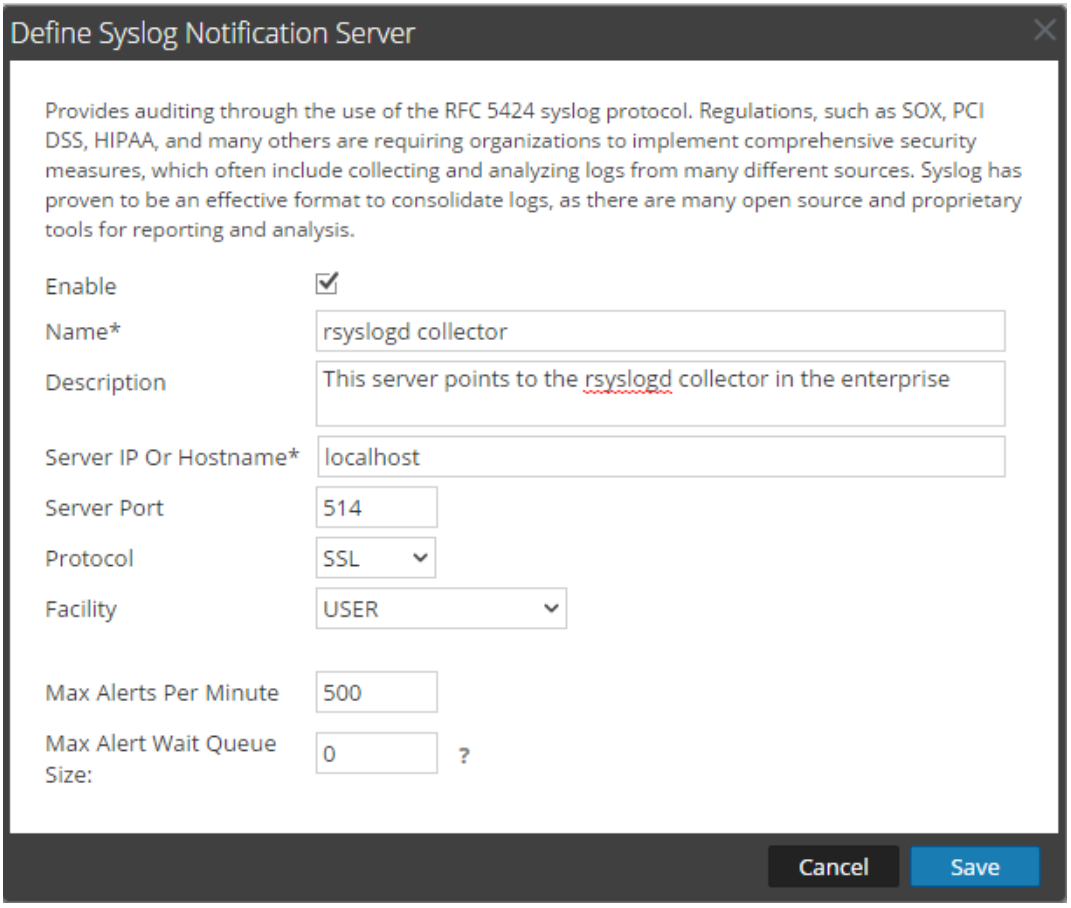
Configure a Syslog Notification Server

This topic provides instructions on how to configure a Syslog notification server. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

To configure Syslog as a notification server:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

4. From the + drop-down menu, select **Syslog**.



5. In the **Define Syslog Notification Server** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Notification Outputs

This topic provides instructions on how configure notification outputs. These notification outputs are required to define an ESA rule.

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Note: You do not need to configure the Output tab for Global Audit Logging.

Notification Output configurations define email addresses and subject lines, SNMP trap OID settings, syslog output settings, and script code.

You can define, delete, edit, import, and export notification outputs in NetWitness Platform. Individual topics describe the relevant procedures. For more information on ESA alert configuration, see "Notification Methods." You delete, edit, import, and export notification outputs and notification servers in the same way as templates. If you attempt to delete a notification output being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use.

Notification Outputs Overview

This topic provides an overview of notification outputs. These notification outputs are required when defining an ESA rule. You configure notification outputs in the Administration System view (ADMIN > System > Notifications > Outputs tab).

Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Note: You do not need to configure notification outputs (the Output tab) for Global Audit Logging.

Notification outputs are the destinations used for sending notifications. For ESA, notification outputs enable you to define how you want to receive the ESA alerts. The following are the different notification outputs supported by NetWitness Platform:

- Email
- SNMP
- Syslog
- Script

Email notification settings define the destination email address to which you can send the alerts. You can also add a custom description in the subject of the email and define multiple destination email addresses.

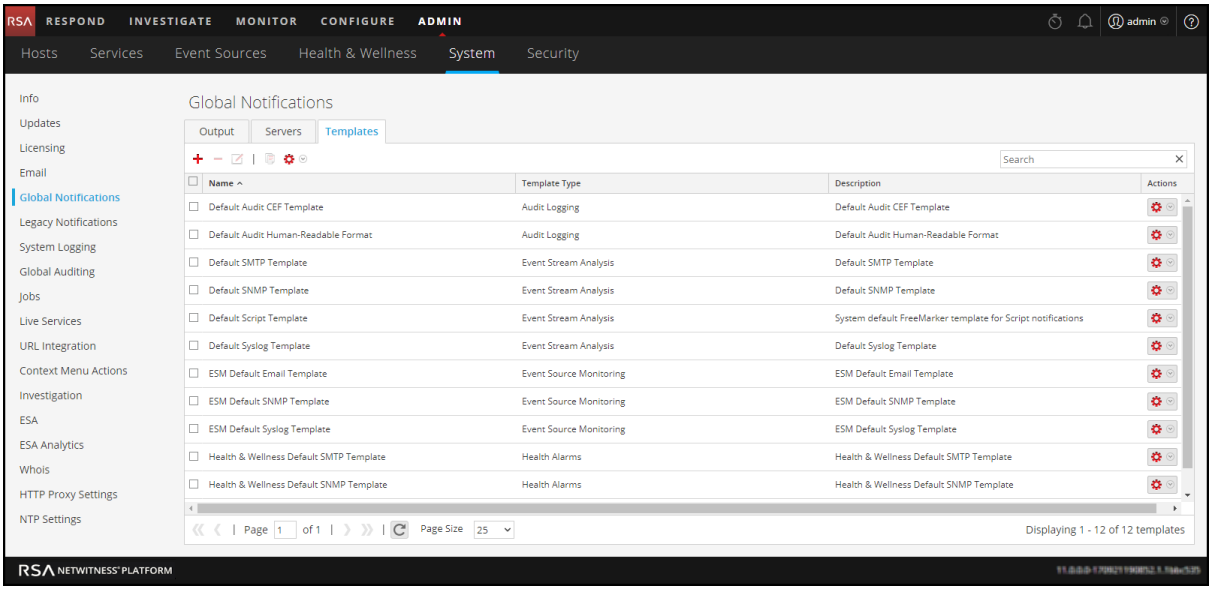
SNMP notification settings enable you to define the SNMP settings to send alert notifications. Syslog notifications enable you to define the Syslog settings used to send alert notifications. Script notifications enable you to define the Script that executes in response to the alert.

For detailed information on the notification configurations, including parameters and descriptions, see Define Notification Server Dialogs.

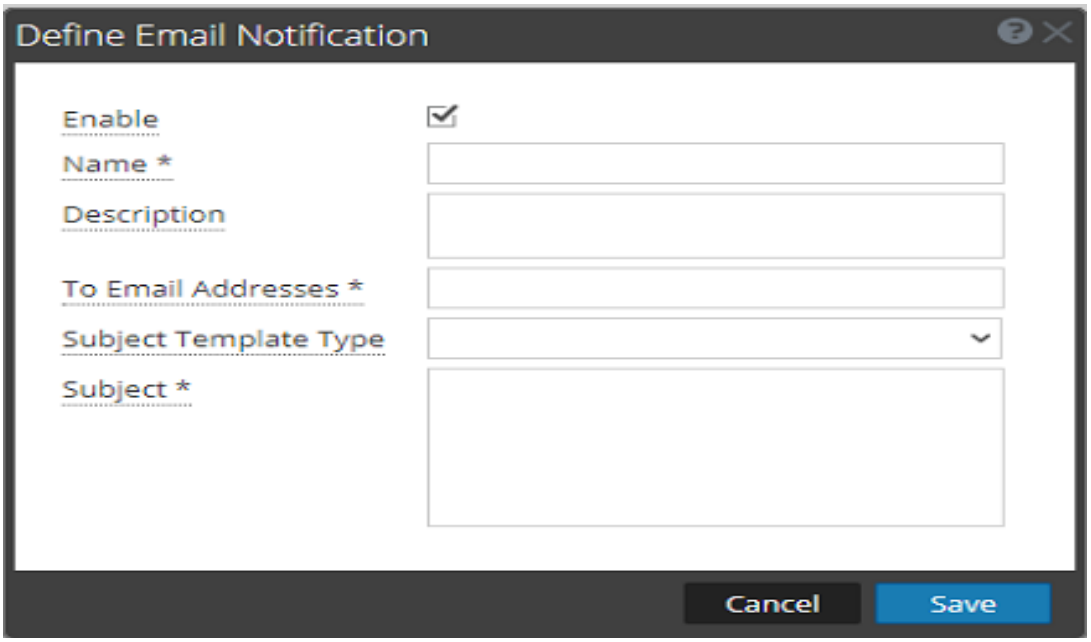
Configure Email as a Notification

To configure Email as a notification:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.



3. On the **Output** tab, from the + drop-down menu, select **Email**.



4. In the **Define Email Notification** dialog, provide the required information and click **Save**.

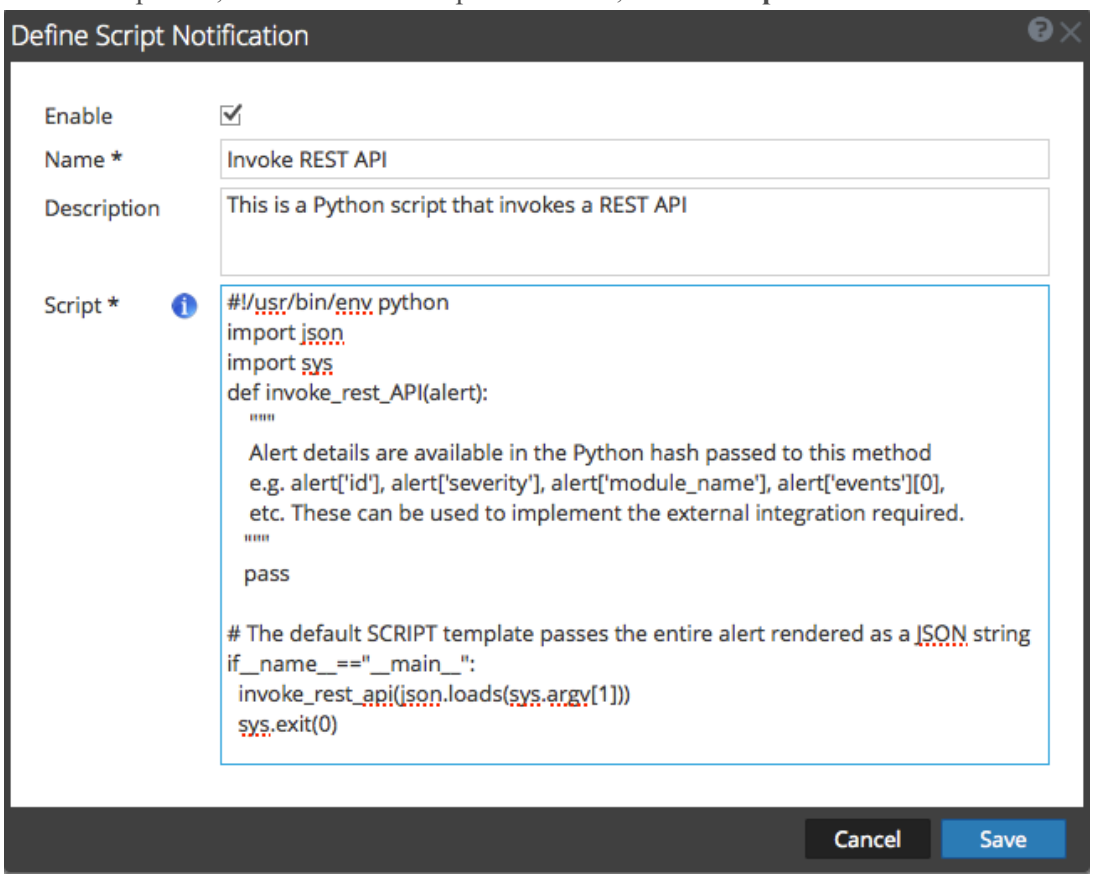
For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Script as a Notification

This topic provides instructions to define the Script and configure it as a notification output. ESA allows you to run scripts in response to ESA alerts. You need to define the script using the ADMIN > System > Notifications > Output tab. You can use any script for ESA notifications.

To configure the script as a notification:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. On the Output tab, from the + drop-down menu, select **Script**.



4. In the **Define Script Notification** dialog, provide the required information and click **Save**.

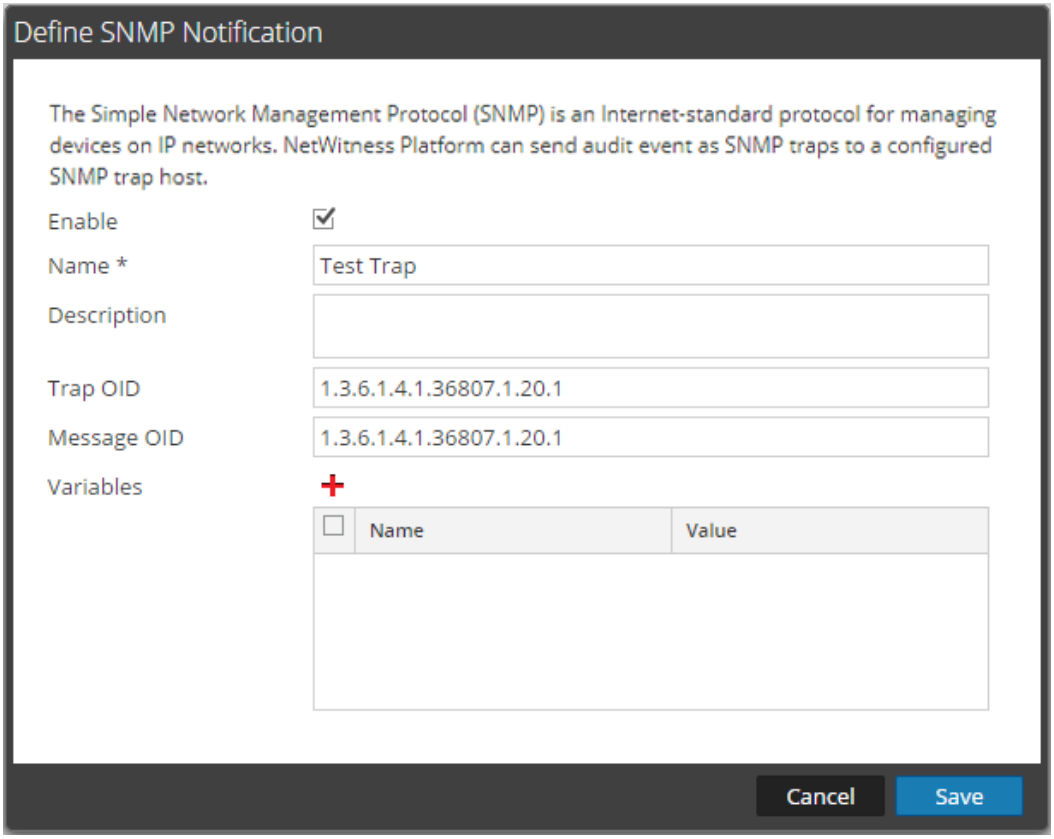
For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure SNMP as a Notification

To configure SNMP as a notification output to send alert notifications:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.

3. On the Output tab, from the + drop-down menu, select **SNMP**.



4. In the SNMP Notification dialog, provide the required information and click **Save**.

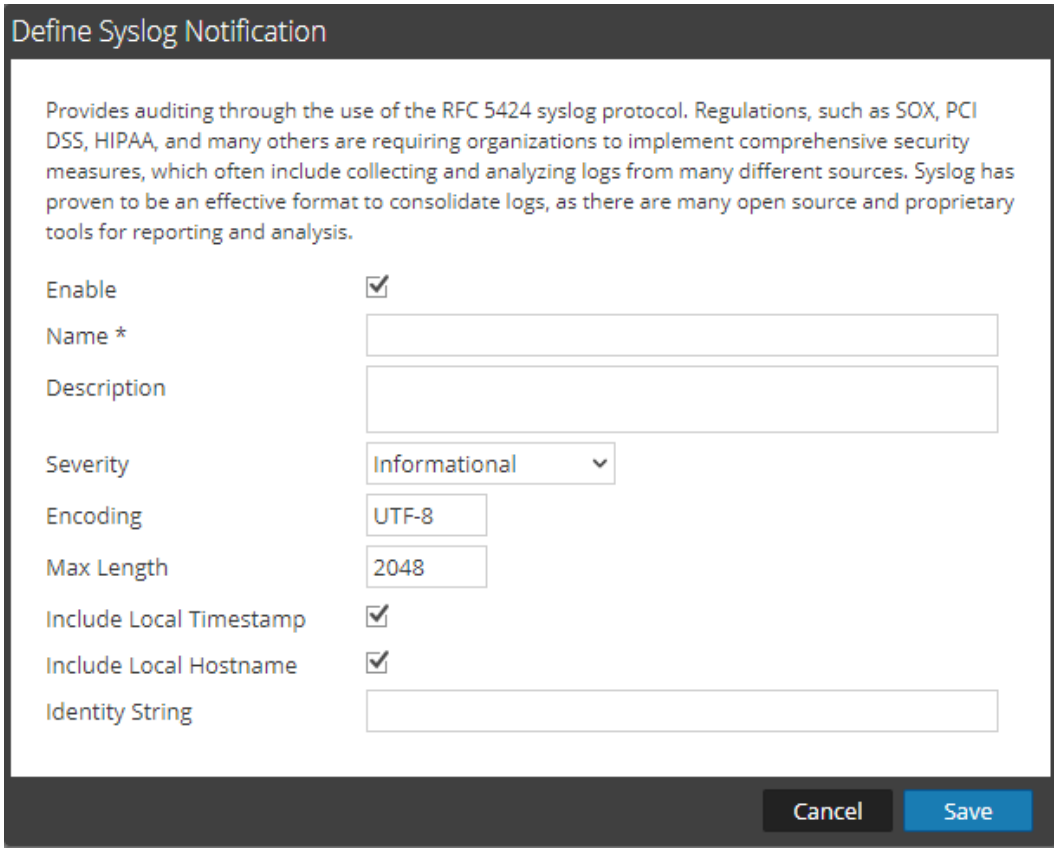
For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Syslog as a Notification

To configure Syslog as a notification output when sending alert notifications:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.

3. On the Output tab, from the + drop-down menu, select **Syslog**.



4. In the **Define Syslog Notification** dialog, provide the required information and click **Save**.

For details of the parameters and descriptions, see Define Notification Server Dialogs.

Configure Templates for Notifications

You configure notification templates in the Administration System view (ADMIN > System > Notifications > Templates tab). A notification template defines the format and message fields of the notifications. There are different template types for the notifications that you can configure:

- Audit Logging
- Event Stream Analysis
- Event Source Monitoring
- Health Alarms

You can use the available default templates or you can configure your own templates for Email, SNMP, Syslog, and Script, depending on the template type.

Global audit logging sends audit logs in the format specified in the Audit Logging template. You can use the default audit logging templates or you can define your own audit logging template. For more information on how to define an Audit Logging template, see Define a Template for Global Audit Logging.

Event Stream Analysis (ESA) sends notifications in the format specified in the Event Stream Analysis templates. The default Event Stream Analysis templates for email, SNMP, Syslog, and Script are available on installation. You can customize these templates as well as create new templates which you can use for the notifications. For more information on how to define ESA templates, see Define a Template for ESA Alert Notifications.

For more information on ESA alert configuration, see "Notification Methods" in the *Alerting with ESA Correlation Rules User Guide*. You cannot delete templates associated with global audit log configurations.

Note: When upgrading from Security Analytics menus 10.4, all existing notification templates migrate to the Event Stream Analysis template type.

To learn how to define, delete, edit, duplicate, import, and export a notification template in NetWitness Platform, see:

Configure Global Notifications Templates

Define a Template for ESA Alert Notifications

Import and Export a Global Notifications Template

Configure Global Notifications Templates

This topic provides instructions for adding, editing, duplicating, and deleting global notifications templates.

You can use the available default templates or you can configure your own templates for Email, SNMP, Syslog, and Script, depending on the template type.

Global audit logging sends audit logs in the format specified in the Audit Logging template. You can use the default audit logging templates or you can define your own audit logging template. For more information on how to define an Audit Logging template, see "Define a Template for Global Audit Logging."

Event Stream Analysis (ESA) sends notifications in the format specified in the Event Stream Analysis templates. The default Event Stream Analysis templates for email, SNMP, Syslog, and Script are available on installation. You can customize these templates as well as create new templates which you can use for the notifications. For more information on how to define ESA templates, see Define a Template for ESA Alert Notifications.

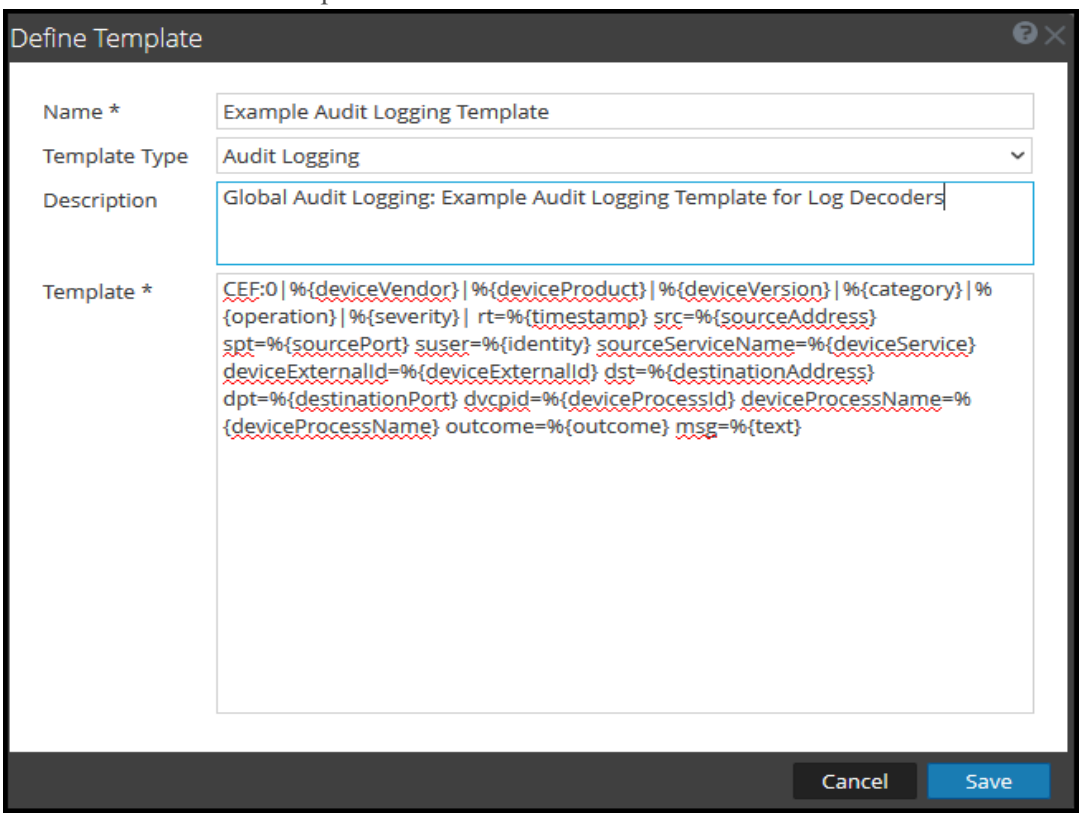
When upgrading from Security Analytics menus 10.4, all existing notification templates migrate to the Event Stream Analysis template type.

Add a Template

You can use the default templates provided or you can configure your own templates. To configure your own template:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Click + to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the type of template you want to create. For example, if you are creating a template for global audit logging, select the Audit Logging template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, specify the format for the template.

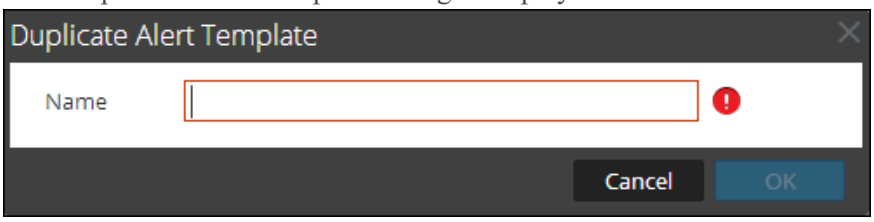
e. Click **Save** to save the template.



Duplicate a Template

You can make a copy of an existing default or user-defined template. To duplicate a template:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select the template that you want to duplicate and click  .
   The Duplicate Alert Template dialog is displayed.



5. Type the name for the duplicate template.
6. Click **OK**.

You can modify a default or user-defined template. When you edit a template, the changes are reflected only when the alert is triggered.

Edit a Template

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select a template and click  .
5. In the **Define Template** dialog, modify the **Name**, **Template Type**, **Description**, and **Template** fields as required.
6. Click **Save** to save the template.

Delete a Template

You can delete a user-defined template. When you delete a template that is used in an ESA rule, the Event Stream Analysis default template is used for alerts. You cannot delete templates associated with global audit logging configurations.

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select one or more templates and click .
   A confirmation dialog is displayed.
5. Click **Yes**.
   The selected template is deleted.

Define a Template for ESA Alert Notifications

This topic describes how you can define a template for alert notifications. Event Stream Analysis (ESA) allows you to define useful templates for alerts. You need to have a good understanding of FreeMarker and the ESA data model to define a template. For more information on FreeMarker, see FreeMarker Template Author's Guide.

ESA Data Model

Consider an ESA alert rule as shown below:

```
@Name('module_144d43f5_f0b4_4cd0_8c6c_5ce65c37e624_Alert')
@Description('Brute Force Login To Same Destination')
@RSAAlert(oneInSeconds=0, identifiers={"ip_dst"})
SELECT* FROMEvent (ec_activity = 'Logon',ec_theme = 'Authentication',ec
outcome = 'Failure',ip_dst IS NOT NULL)
.std:groupwin(ip_dst)
.win:time_length_batch(60 seconds, 2)
GROUPBYip_dst HAVING COUNT(*) = 2;
```

When a rule like the above is fired, the alert generated will have two constituent events each resembling a NextGen session with multiple meta values. The alert data-object passed to the FreeMarker template evaluator will be as follows:

```
(root)
  |
  +- id = "4e67012f-9c53-4f0b-ac44-753e2c982b79"                    // Unique identifier for each alert
  |
  +- severity = 1                                                    // The severity of the alert
  +- time = 2013-12-31T11:02Z                                        // The alert time (needs a
?datetime for proper rendering)
  |  +- moduleType = "ootb"                                          // The module type
  |
  +- moduleName = "Brute Force Login To Same Destination"            // A description of the module
  |
  +- statement = "module_144d43f5_f0b4_4cd0_8c6c_5ce65c37e624_Alert" // The name of the EPL statement
  |  +- events                                                       // The constituent events - as a
sequence of event maps
       |   +- [0]                                                    // offset 0 (i.e. the first
constituent event)
       |   |       |   |
       |   +- event_cat_name = "User.Activity.Failed Logins"
       |   +- device_class = "Firewall"                             // event meta (accessible as
${events[0].device_class}$)
       |   |       |   +- event_source_id = "uttam:50002:1703395"    // Investigation URI to the
individual session (used by SA)
       |   |
       |   +- ...                                                   // Other meta
       |   |
       |   +- sessionid = 1703395                                   // NextGen sessionid
       |   |
       |   +- time = 1388487764                                     // event/session time at NextGen
source (as a long Unix timestamp)
       |   |
       |   +- user_dst = "user5"
       |
       +- [1]                                                       // offset 1 (i.e. the second
consituent event)
           |
           +- device_class = "Firewall"
           |
           +- event_cat_name = "User.Activity.Failed Logins"
           |
           +- event_source_id = "uttam:50002:1703405"
           |
           +- ...
           |
           +- sessionid = 1703405
           |
           +- time = 1388487766
           |
           +- user_dst = "user5"
```

There are two types of template variables available in the data model:

- **Alert Meta Data:** These hold alert level details like statement name, module name, alert id, alert time, severity, and others. In FreeMarker terminology, these are top level variables associated with the alert instance itself and can be referenced simply by their names like `${moduleName}`. The `time` meta is special because it is of type `Date` and it needs to be suffixed with a `?datetime` to be properly rendered.

- **Constituent Event Meta Data**: These include the session meta fields from individual events that constitute the alert. An alert can have multiple constituent events, so there can be more than one such maps in the same alert. These show up as a sequence of hashes to the FreeMarker template evaluator and must be referenced. For instance, the alert has two constituent events the event_source_id for the first is available as `${events[0].event_source_id}` and the same for the second is accessible as ${`events[1].event_source_id`.} You also need to be aware of which meta fields are multi-valued because those need be treated as sequences, for example ${`events[0].alias_host`} will not work because it is a sequence.

Note: The metadata available in the constituent events for a given alert is determined by the EPL SELECT clause. For example, alerts from `SELECT sessionid, time FROM ...` will have only two meta values available (sessionid, time). Constituent events in `SELECT * FROM Event ...` will carry all meta fields from the `Event` type with **non-null** values.

If your template uses meta keys that are not present in all alert output, you should consider using the FreeMarker provisions for default values.

For example, if a template with text Id=${id},ec_outcome=${ec_outcome} is evaluated for an alert which does not include the meta key `ec_outcome` then the template evaluation fails. In such cases, you can use the missing value placeholder `${ec_outcome!"default"}`.

Import and Export a Global Notifications Template

This topic provides instructions on how to import and export a template for notifications.

- You can export default or user-defined templates.
- You can import a template that has been exported from the NetWitness Platform instance. If you import a template with the same name as an existing template, then the existing template will be overwritten.

Import a Template

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. In the toolbar, select  **> Import**.
   The **Import** dialog is displayed.
5. In the **Enter File Name** field, type the filename or click **Browse** and select the file to be imported.
6. Click **Import**.

Export a Template

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select the template you want to export.

   Note: You can export all the templates using the  **> Export All** option.

5. In the **Actions** column, select  **> Export**.
   The **Export** dialog is displayed.
6. In the **Enter File Name** field, type the filename.
7. Click **Save**.

Configure a Template

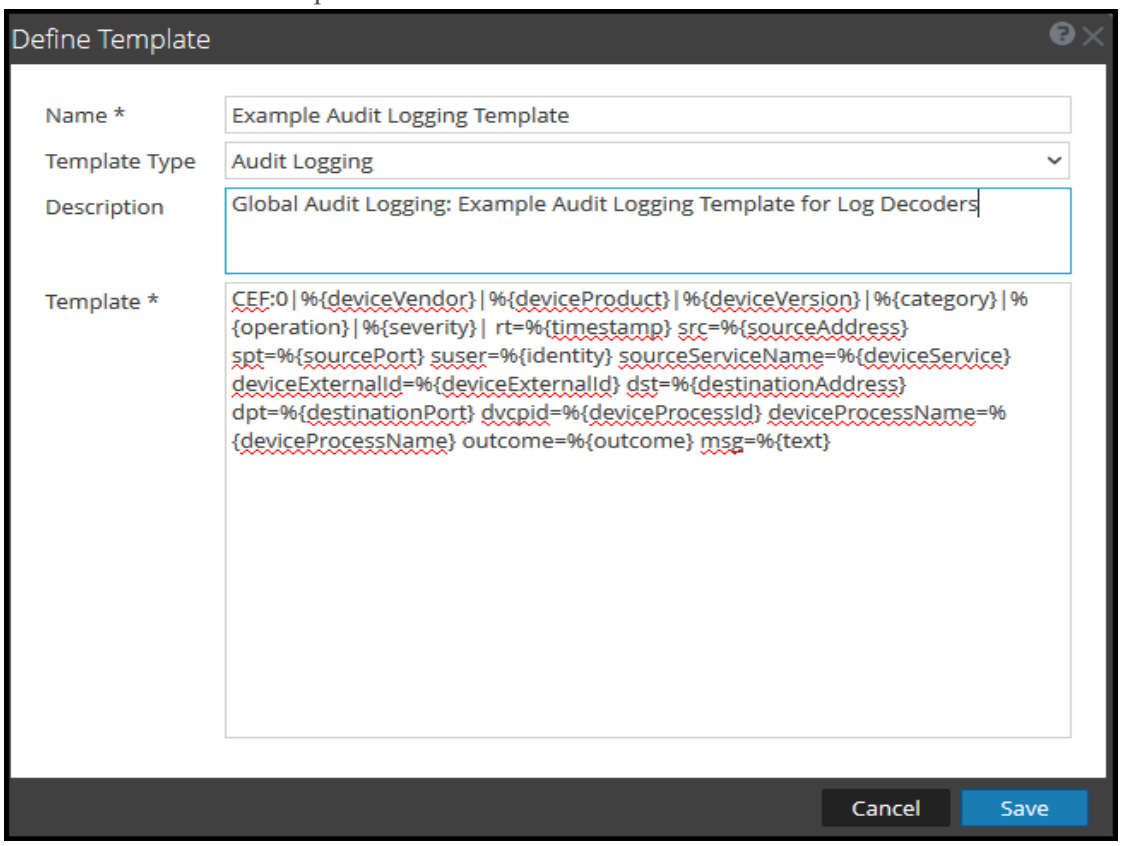
This topic provides instructions to configure a custom template for notifications. There are four template types: Audit Logging, Event Stream Analysis, Event Source Monitoring, and Health Alarms. You can create templates for email, SNMP, Syslog, and Script, depending on the template type.

Define a Template for ESA Alert Notifications provides information on defining a notification template for Event Stream Analysis. Define a Template for Global Audit Logging provides instructions on how to define an audit logging template to use for Global Audit Logging.

You can use the default templates provided or you can configure your own templates. To configure your own template:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Click  to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the type of template you want to create. For example, if you are creating a template for global audit logging, select the Audit Logging template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, specify the format for the template.

e. Click **Save** to save the template.



Edit a Template

Overview

This topic provides instructions on how to edit a template for notifications.

Introduction

You can modify a default or user-defined template. When you edit a template, the changes are reflected only when the alert is triggered.

Edit a Template

1. In the main menu, select **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select a template and click .
5. In the **Define Template** dialog, modify the **Name**, **Template Type**, **Description**, and **Template** fields as required.
6. Click **Save** to save the template.

Delete a Template

This topic provides instructions on how to to delete a template for notifications. You can delete a user-defined template. When you delete a template that is used in an ESA rule, the Event Stream Analysis default template is used for alerts. You cannot delete templates associated with global audit logging configurations.

Procedure

1. In the main menu, select **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select one or more templates and click .
   A confirmation dialog is displayed.
5. Click **Yes**.
   The selected template is deleted.

Duplicate a Template

This topic provides instructions on how to duplicate a template for notifications. You can make a copy of an existing default or user-defined template.

Procedure

To duplicate a template:

1. In the main menu, select **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Select the template that you want to duplicate and click .
   The Duplicate Alert Template dialog is displayed.

5. Type the name for the duplicate template.
6. Click **OK**.

Configure Email Servers and Notification Accounts

This topic provides instructions for configuring email so that users can receive notifications in NetWitness Platform. RSA NetWitness® Platform can send notifications to users via email about various system events. To be able to configure these email notifications, you must first configure the SMTP email server. The Email Configuration panel provides a way to:

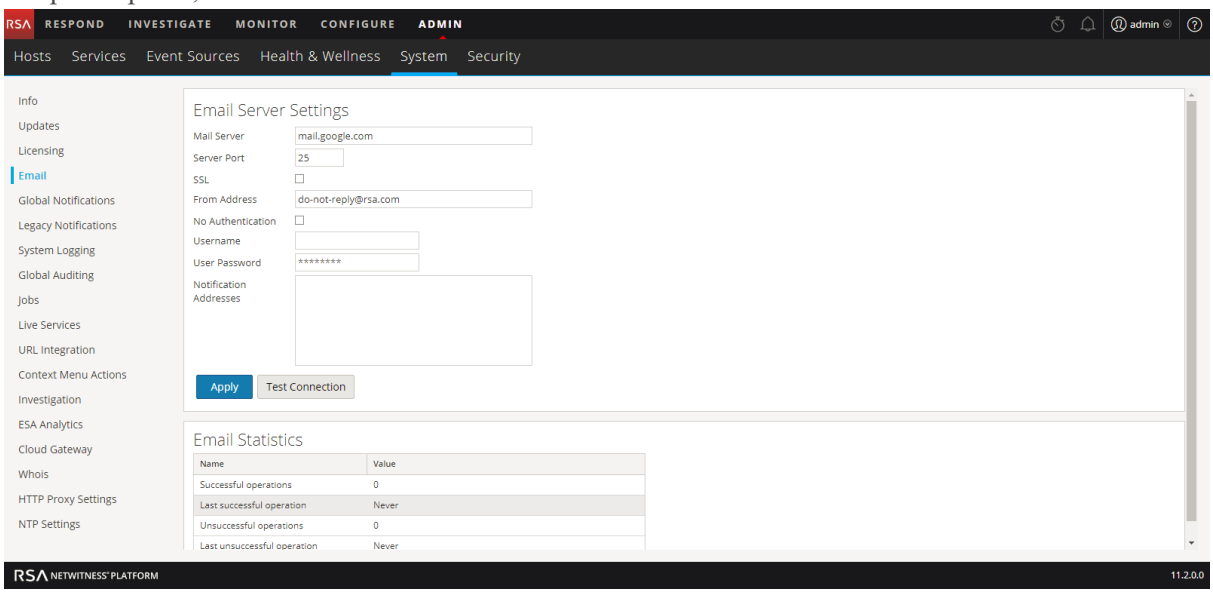
- Configure the email server.
- Set up an email account to receive notifications.
- View statistics on email operations.

NetWitness Platform requires access to an SMTP mail server in order to send reports to users. Each user account can be configured to receive emailed reports. These reports can be generated manually, through the user interface, or automatically, through the auditing system. The following guidelines apply:

- Any SMTP mail host can be used to deliver emails, and each host requires a different configuration. The SMTP provider provides the settings for configuration.
- Some SMTP servers require user authentication in order to relay emails successfully. Typically, this is the login and password for the email account.
- Best practice is to create a new, dedicated email account on the SMTP email server for NetWitness Platform reports.

To configure NetWitness Platform email notifications:

1. Go to **ADMIN > System**.
   The Administration System view is displayed.
2. In options panel, select **Email**.



3. If you want to change the default mail server, specify the **Mail server** name and **Server port**.

4. If the email server communicates with NetWitness Platform using SSL, check the box next to **Use SSL**.
5. In the **From address** field, type the name of the email account sending NetWitness Platform email notifications.
6. If the SMTP server requires user authentication to relay emails successfully, type the **Username** and **User Password** for logging in to the email account.
7. To activate the settings, click **Apply**.
   You can now configure NetWitness Platform modules to receive various notifications by email.

Configure Global Audit Logging

Global Audit Logging provides NetWitness Platform Auditors with consolidated visibility into user activities within NetWitness Platform in real-time from one centralized location. This visibility includes audit logs gathered from the NetWitness Platform system and the different services throughout the NetWitness Platform infrastructure.

NetWitness Platform audit logs collect in a centralized system that converts them into the required format and forwards them to an external syslog system. The external syslog system can be a third-party syslog server or a Log Decoder.

You configure global audit logging in the Global Audit Logging Configurations panel. An audit logging template defines the format and message fields of the audit log entries. A Syslog Notification Server configuration defines the destination to send the audit logs. If you want to forward audit logs to a Log Decoder, configure a Syslog type of Notification Server for the Log Decoder.

The following are some of the user actions logged from NetWitness Platform:

- User logouts
- All UI pages accessed
- Committed configuration changes
- Queries performed by the user
- Data export operations

Note: For examples of some of the user actions logged, see Add New Configuration Dialog

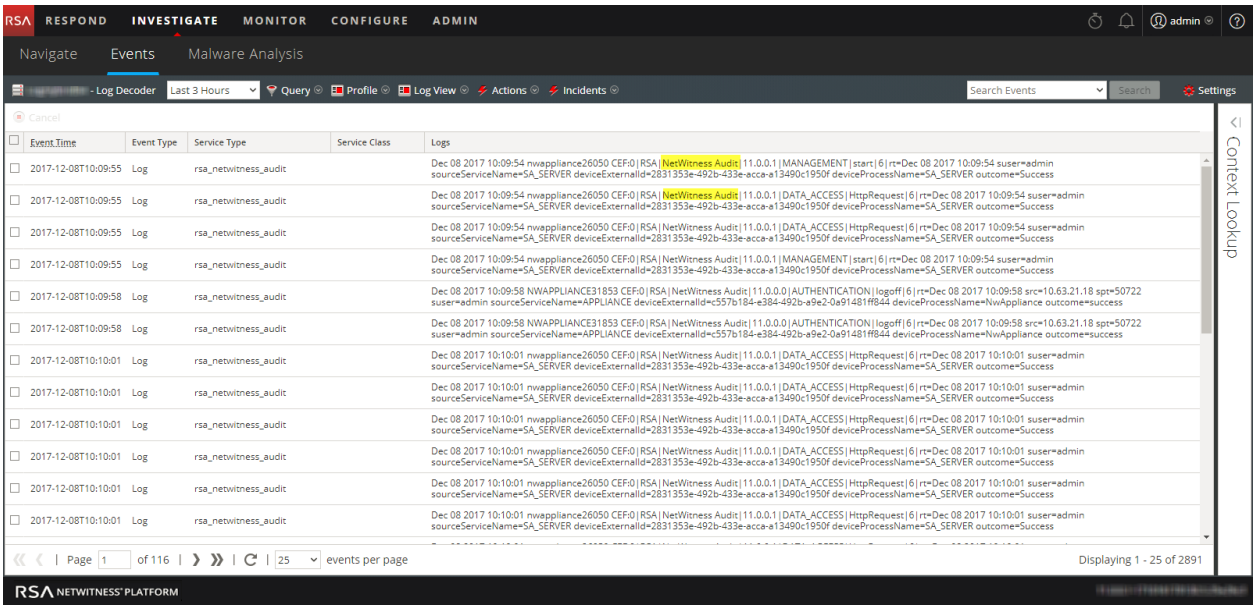
After you create a global audit logging configuration, audit logs containing these user actions automatically go to the external syslog system in the format specified in the selected Audit Logging template. You can create multiple global audit logging configurations for different destinations that use different templates. For example, you can create a global audit logging configuration for an external Syslog server with a template that contains all of the available meta keys and another configuration for a Log Decoder with a template that contains selected meta keys.

For Log Decoders, you use the Default Audit CEF Template. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions and Supported CEF Meta Keys describes the CEF meta keys available to use in the audit logging templates.

For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.

Auditors can view the audit logs on the selected Log Decoder or third-party syslog server. If using a Log Decoder, auditors can view the audit logs using NetWitness Platform Investigations or Reports.

The following figure shows global audit logs in Investigation (INVESTIGATE > Events).



For examples of some of the user actions logged, see Add New Configuration Dialog. For a list of message types being logged by the various NetWitness Platform components, see Global Audit Logging Operation Reference.

Global Audit Logging - High-Level Procedure

Global Audit Logging is configured in the Global Audit Logging Configurations panel, which is accessed from ADMIN > System view > Global Auditing. Before you can configure Global Audit Logging, you need to configure a Syslog Notification Server and an Audit Logging template. A Syslog Notification Server defines the destination to send the audit logs. An Audit Logging template defines the format and message fields of the audit log entry.

The Global Audit Logging Configuration panel provides a **view settings** link that takes you to the Global Notifications panel (ADMIN > System view > Global Notifications) where you can configure the Syslog Notification Server and Audit Logging template.

Perform the following procedures in the order shown to configure Global Audit Logging.

Procedures	Reference / Instructions
1. Configure a Syslog Notification Server.	Configure a Syslog Notification Server to use for Global Audit Logging. You can define a third-party syslog server or Log Decoder as a destination to receive the audit logs. Configure a Destination to Receive Global Audit Logs. Global Audit Logging configurations use the Syslog notification server type. If you want to forward audit logs to a Log Decoder, create a Notification Server of the Syslog type.

Procedures	Reference / Instructions
2. Select or configure an Audit Logging template to use.	Select an Audit Logging template for the Syslog notification server. You can use a default Audit Logging template or define your own audit logging template. Global Audit Logging configurations use the Audit Logging template type and a Syslog notification server. Configure Templates for Notifications provides additional information. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions. For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.
3. (Optional - Only if consuming with a Log Decoder) Deploy the Common Event Format parser to your Log Decoder from Live.	Ensure that you have deployed and enabled the latest Common Event Format parser from Live. Find and Deploy Live Resources and Enable and Disable Log Parsers provide instructions.
4. Define a global audit logging configuration, which defines how the global audit logs are forwarded to external Syslog systems.	Define a Global Audit Logging Configuration provides instructions. After you add a Global Audit Logging configuration, audit logs are forwarded to the selected Notification Server in the configuration.
5. Verify that the global audit logs show the audit events.	Test your audit logs to ensure that they show the audit events as defined in your audit logging template. Verify Global Audit Logs provides instructions.

Configure a Destination to Receive Global Audit Logs

In Global Audit Logging, Syslog Notification Servers are the configurations that define the destinations to receive global audit logs. You need to configure a Syslog Notification Server to use Global Audit Logging. You can define a third-party syslog server or a Log Decoder as the destination to receive the audit logs.

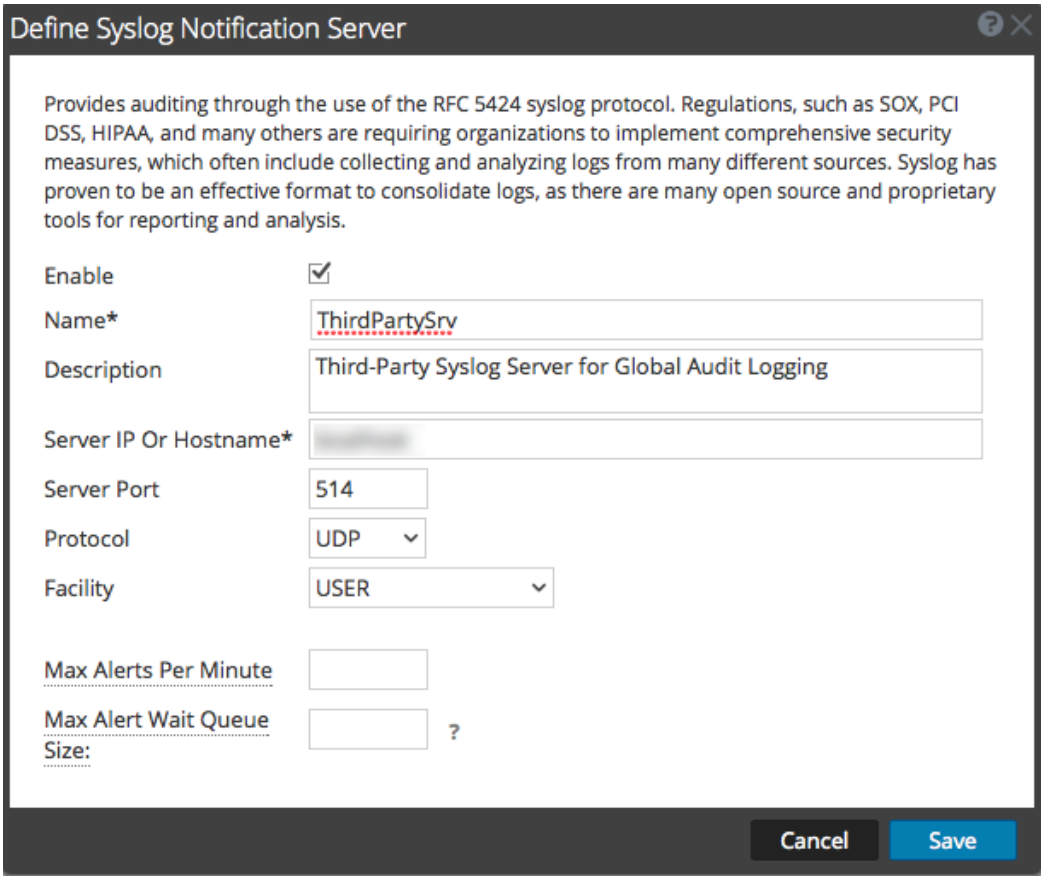
Configure a Syslog Notification Server for a Third-Party Syslog Server

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

Note: You do not need to configure the Output tab for Global Audit Logging.

4. From the + drop-down menu, select **Syslog**.

   The **Define Syslog Notification Server** dialog is displayed.



5. Configure the Syslog notification server as described in the following table.

Field	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the third-party syslog server.
Description	(Optional) A brief description of the notification server.
Server IP or Hostname	The third-party syslog server hostname or IP address.
Server Port	The port number where the target syslog process is listening.
Protocol	The protocol to be used for transferring formatted audit logs to the third-party syslog server.
Facility	The syslog facility to be used for writing formatted audit logs to the third-party syslog server.

The **Max Alerts Per Minute** and **Max Alert Wait Queue Size** fields are not used for Global Audit Logging.

6. Click **Save**.

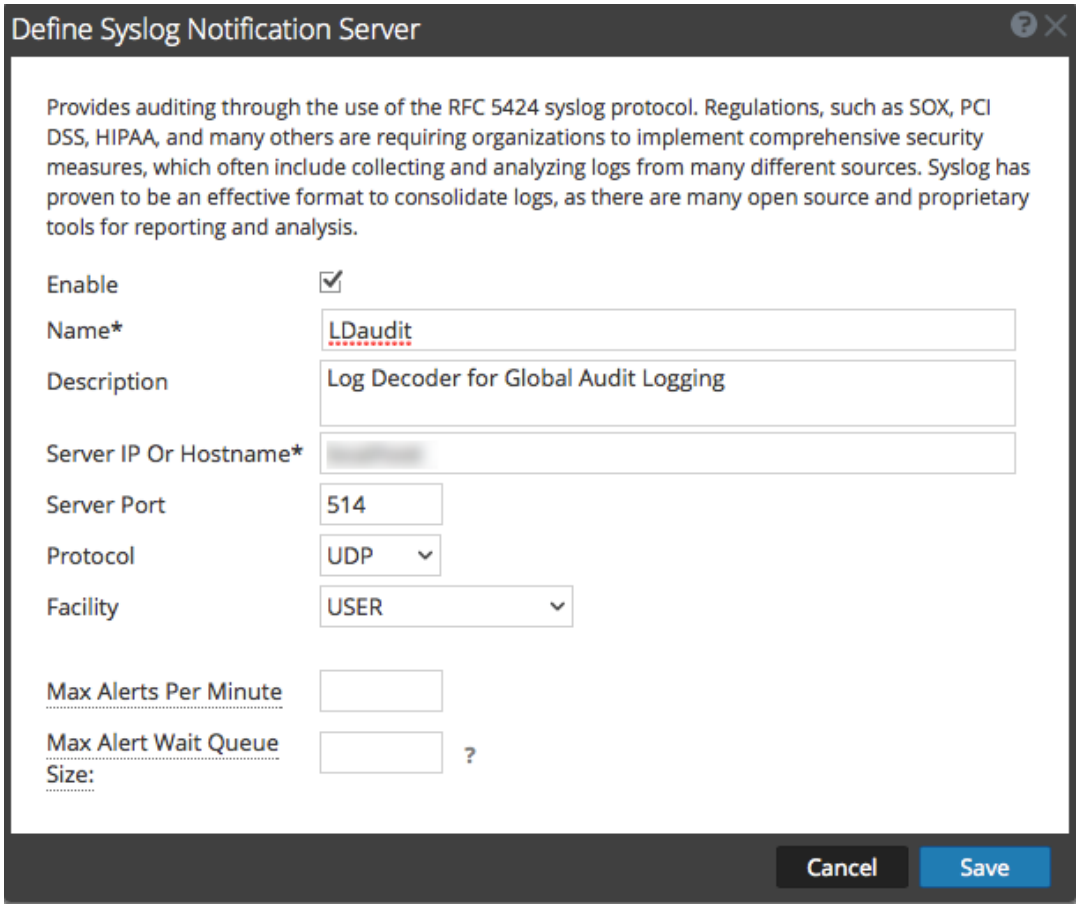
Configure a Syslog Notification Server for a Log Decoder

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Servers** tab.

Note: You do not need to configure the Output tab for Global Audit Logging.

4. From the + drop-down menu, select **Syslog**.

The **Define Syslog Notification Server** dialog is displayed.



5. Configure the Syslog notification server as described in the following table.

Field	Description
Enable	Select to enable the notification server.

Field	Description
Name	A name to identify or label the Log Decoder syslog notification server.
Description	(Optional) A brief description of the notification server.
Server IP or Hostname	The Log Decoder hostname or IP address.
Server Port	The port number where the target syslog process is listening.
Protocol	The protocol to be used for transferring formatted audit logs to the Log Decoder.
Facility	The Syslog facility to be used for writing formatted audit logs to the Log Decoder.

The **Max Alerts Per Minute** and **Max Alert Wait Queue Size** fields are not used for Global Audit Logging.

6. Click **Save**.

Next Steps

Select a default Audit Logging template to use for Global Audit Logging. If necessary, you can define your own custom template. Define a Template for Global Audit Logging provides additional information.

Define a Template for Global Audit Logging

This topic provides instructions on how to define an audit logging template to use for Global Audit Logging. Before you configure Global Audit Logging, configure a Syslog notification server and select an Audit Logging template. You can choose to use a default audit logging template or you can define your own template.

NetWitness Platform includes two default audit logging templates:

- **Default Audit CEF Template**: You can use this template for Log Decoders and third-party syslog servers.
- **Default Audit Human-Readable Format**: You can use this template only for third-party syslog servers. Do not forward messages from this template to a Log Decoder.

The first procedure provides instructions on how to define an audit logging template for a Log Decoder. The audit logging template defines the format and message fields of the audit logs sent to the Log Decoder or third-party syslog server.

Global audit logging templates that you define for a Log Decoder use Common Event Format (CEF) and must meet the following specific standard requirements:

- Include the CEF headers in the template.
- Use only the extensions (Key=Value) listed in the Supported CEF Meta Keys table.
- Ensure that the extensions are in the `key=%{string}<space>key=%{string}` format.

The second procedure provides instructions on how to define a custom global audit logging template in human-readable format for a third-party syslog server. For third-party syslog servers, you can define your own format (CEF or non-CEF).

Define a Global Audit Logging Template for a Log Decoder

You can use the **Default Audit CEF Template** to send global audit logs to a Log Decoder. To define your own template:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Click the **Templates** tab.
4. Click + to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the **Audit Logging** template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, enter the format for the audit logging template.
   The following format is a customized template provided as an example. It differs from the default CEF template.

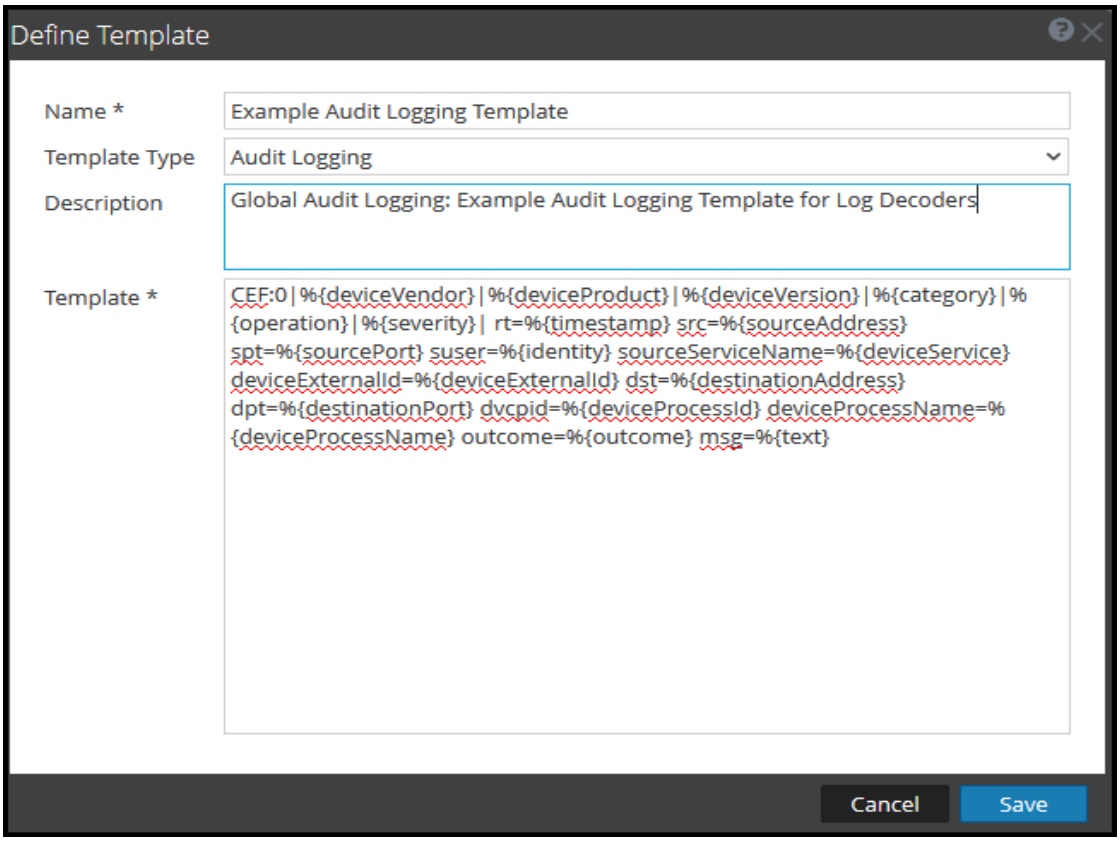
```
CEF:0|%{deviceVendor}|%{deviceProduct}|%{deviceVersion}|%{category}|%
{operation}|%{severity}| rt=%{timestamp} src=%{sourceAddress} spt=%
{sourcePort}
suser=%{identity} sourceServiceName=%{deviceService}
deviceExternalId=%{deviceExternalId} dst=%{destinationAddress}
dpt=%{destinationPort} dvcpid=%{deviceProcessId}
deviceProcessName=%{deviceProcessName} outcome=%{outcome} msg=%{text}
```

The highlighed CEF syslog header is required to conform to the CEF standard and is a requirement for the CEF parser in the Log Decoder. The other keys are optional and you can configure them. See all the supported meta keys that are supported by the CEF parser in the Log Decoder in the Supported CEF Meta Keys table.

Note: Use all of the extensions in the following format:
`deviceProcessName=%{deviceProcessName} outcome=%{outcome}`
Include a `<space>` between each key=%{string} pair in the extension keys section.

Note: After you upgrade to 11.1 from earlier versions, then '$' is replaced with '%' automatically

6. Click **Save**.



After you define the CEF audit logging template, ensure that you have deployed and enabled the latest Common Event Format (CEF) parser from Live. "Find and Deploy Live Resources" in the *Live Services Management Guide* provides instructions.

Note: If you need to use a specific meta key for Investigations and Reporting, ensure that the meta keys that you select are indexed in the **table-map-custom.xml** file on the Log Decoder. If they are not indexed, follow the instructions in the "Maintain the Table Map Files" topic in the *Host and Services Configuration Guide*procedure to update the table mappings. Ensure that the meta keys are also indexed in the **index-concentrator-custom.xml** on the Concentrator. See the "Edit a Service Index File" topic in the *Host and Services Configuration Guide* for additional information.

Define a Custom Global Audit Logging Template

For third-party syslog servers, you can define your own template format (CEF or non-CEF). You can use the **Default Audit Human-Readable Format** template to send global audit logs to a third-party syslog server in a format that is easier to read than the CEF format. If you want to define your own template in human-readable format, follow this procedure.

For Log Decoders, you must use a CEF template with some specific requirements. The *Define an Audit Logging Template for a Log Decoder* procedure above provides instructions for creating a template in CEF format.

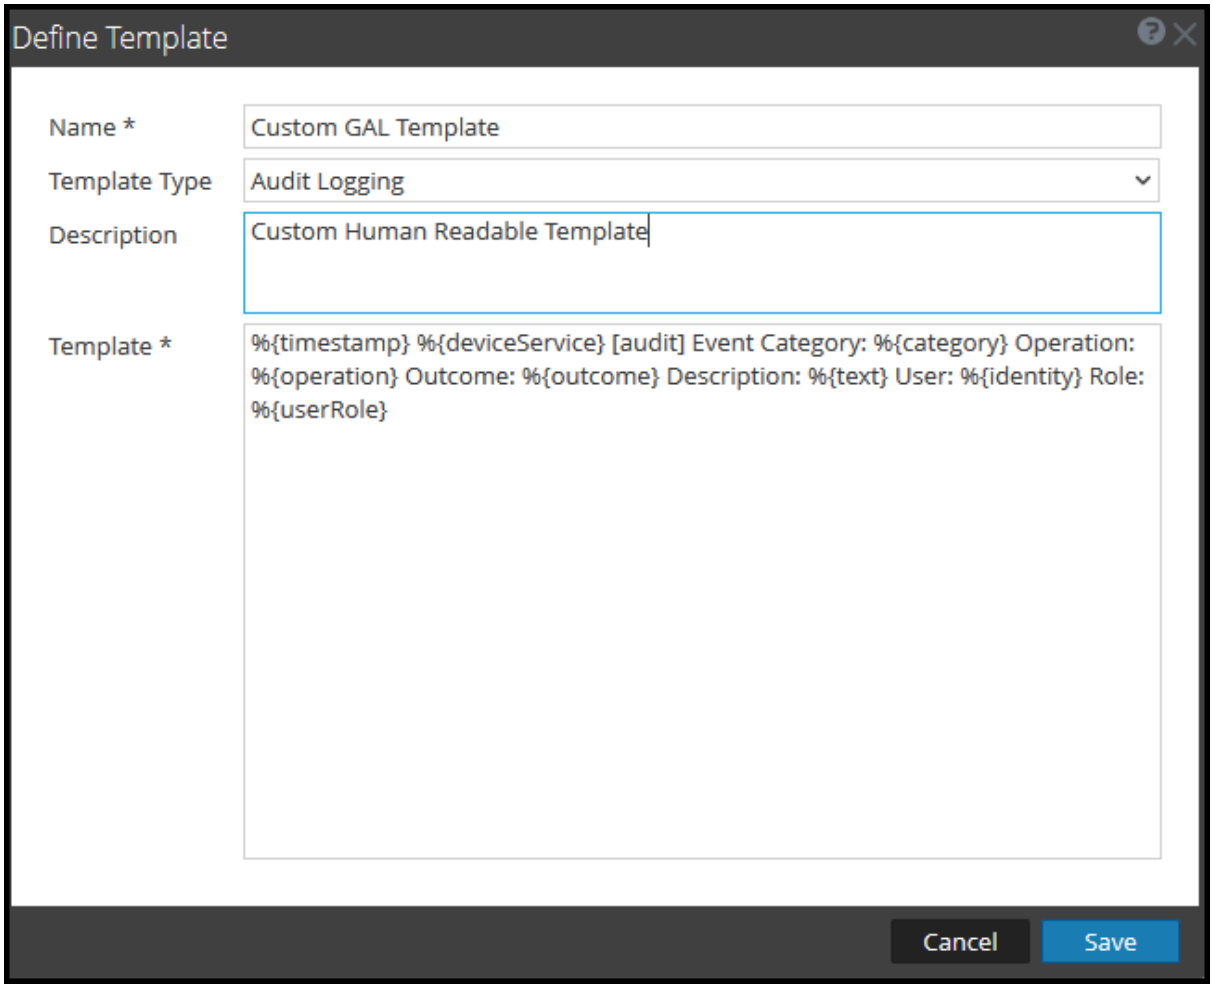
To define a custom global audit logging template in human-readable format:

1. Go to **ADMIN > System**.
2. In the left navigation panel, select **Notifications**.

3. Click the **Templates** tab.
4. Click + to configure a template.
5. In the **Define Template** dialog, provide the following information:
   a. In the **Name** field, type the name for the template.
   b. In the **Template Type** field, select the **Audit Logging** template type.
   c. In the **Description** field, type a brief description for the template.
   d. In the **Template** field, enter the format for the audit logging template. The following example is in human-readable format with selected meta key variables.

```
%{timestamp} %{deviceService} [audit] Event Category: %{category}
Operation: %{operation} Outcome: %{outcome} Description: %{text}
User: %{identity} Role: %{userRole}
```

   You can use any of the meta key variables that are supported by global audit logging shown in the Supported Global Audit Logging Meta Key Variables table.
6. Click **Save**.



The following example shows global audit logs in human-readable format for this template:

```
Apr 06 2018 14:16:04 REPORTING_ENGINE [audit] Event Category: CONFIGURATION
Operation: Set Outcome: null Description: null User: admin Role:
Administrators+Administrators+PRIVILEGED_CONNECTION_AUTHORITY

Apr 06 2018 14:16:04 REPORTING_ENGINE [audit] Event Category: CONFIGURATION
Operation: IPDBConfig Outcome: SUCCESS Description: Config update event
occurred User: admin Role: Administrators+Administrators+PRIVILEGED_
CONNECTION_AUTHORITY

Apr 06 2018 14:16:04 NW_SERVER [audit] Event Category: DATA_ACCESS Operation:
/admin/1/config Outcome: Success Description: null User: admin Role:
Administrators+Administrators+PRIVILEGED_CONNECTION_AUTHORITY
```

Next Step

Define a Global Audit Logging Configuration provides instructions for defining a global audit logging configuration for NetWitness Platform.

Define a Global Audit Logging Configuration

This topic tells administrators how to define a global audit logging configuration. This procedure is required only if you choose to set up centralized audit logging in your environment. These global audit logging configurations define how the global audit logs are forwarded to external syslog systems or Log Decoders. Audit logs are forwarded to the selected Notification Servers.

Prerequisites

Before starting this procedure, configure the following to use for global audit logging:

- Syslog Notification Server
- Audit Logging Template

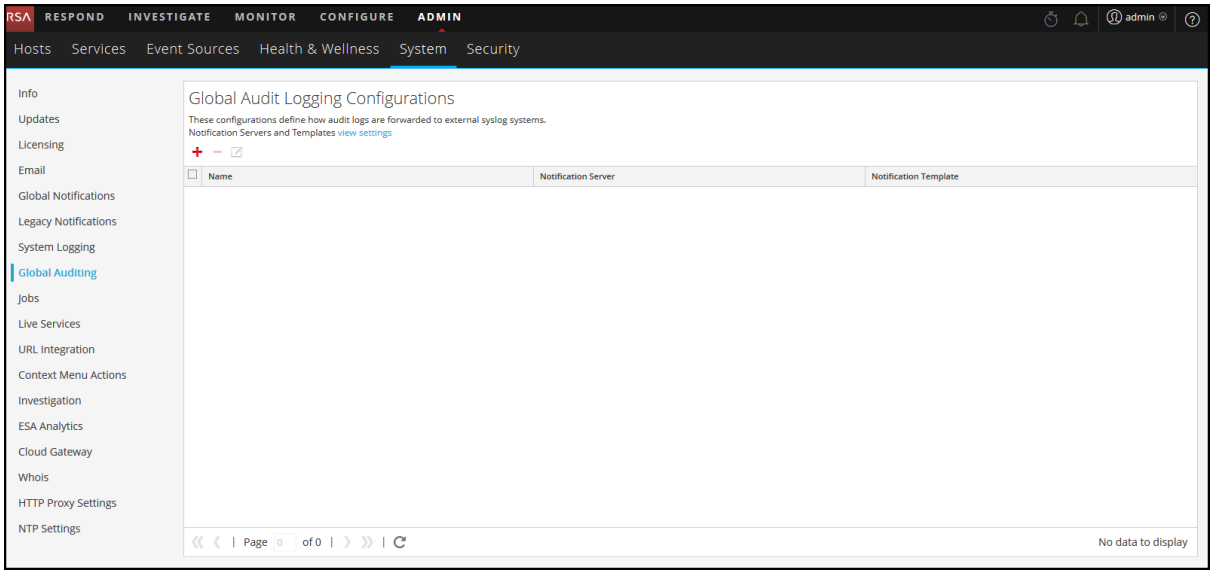
You configure the notification server and template on the Global Notifications panel. You can access the Global Notifications panel by clicking the **view settings** link on the Global Audit Logging Configurations panel. You can only define a Syslog type of Notification Server for global audit logging. For Log Decoders, use a Syslog type of Notification Server and a Common Event Format (CEF) audit logging template. You can use a default audit logging template or define your own template. You can create multiple audit logging templates and Syslog Notification Servers to use for your global audit logging configurations.

If you are forwarding global audit logs to a Log Decoder, deploy the Common Event Format parser to your Log Decoder from Live.

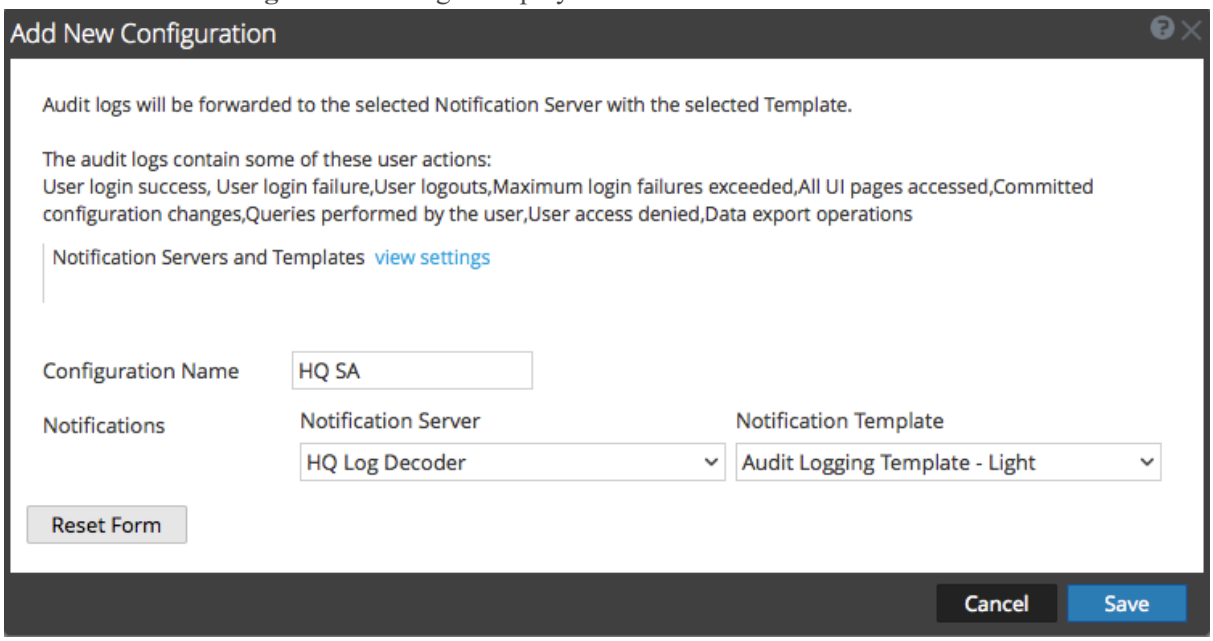
Add a Global Audit Logging Configuration

1. Go to **ADMIN > System**.

2. In the options panel, select **Global Auditing**.
   The **Global Audit Logging Configurations** panel is displayed.



3. Click + to add a global audit logging configuration.
   The **Add New Configuration** dialog is displayed.



4. In the **Configuration Name** field, type a unique name for the global audit logging configuration. For example, you can create a configuration for a specific type of global audit logging configuration, such as HQ NW for a NetWitness Platform headquarters configuration.
5. In the **Notifications** section, select the syslog **Notification Server** to use for this configuration. The notification server is the destination to send the global audit logs.
6. Select the audit logging **Notification Template** to use for this configuration. The Audit Logging template defines the format and audit log message fields to be sent.

7. Click **Save**.

Add New Configuration Dialog provides additional information and examples of the user actions logged. For a list of message types being logged by the various NetWitness Platform components, see Global Audit Logging Operation Reference.

Edit a Global Audit Logging Configuration

This topic provides instructions on how to edit a global audit logging configuration. You can edit a global audit logging configuration to change the destination of the global audit logs for your user audits by selecting a different Notification Server. You can also change the format and message fields of the global audit log entries by selecting a different Notification Template. You make changes to the Notification Server or Template on the Global Notifications panel. You can access the Global Notifications panel by clicking the **view settings** link on the Global Audit Logging Configurations panel.

You cannot change which NetWitness Platform user actions are logged and sent in the global audit logs.

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Auditing**.
3. In the **Global Audit Logging Configurations** panel, select a configuration to edit and click .
4. In the **Add New Configuration** dialog, modify the global audit logging configuration as required. You can modify the **Configuration Name** and select a different **NotificationServer** or **Template**.
5. Click **Save.**

Delete a Global Audit Logging Configuration

Deleting a global audit configuration does not delete the associated notification server and template. After you delete a global audit logging configuration, the forwarding of global audit logs specified in that configuration is discontinued.

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Auditing**.
3. In the **Global Audit Logging Configurations** panel, select a configuration to delete and click .
   A confirmation dialog is displayed.
4. Click **Yes**.
   The selected configuration is deleted.

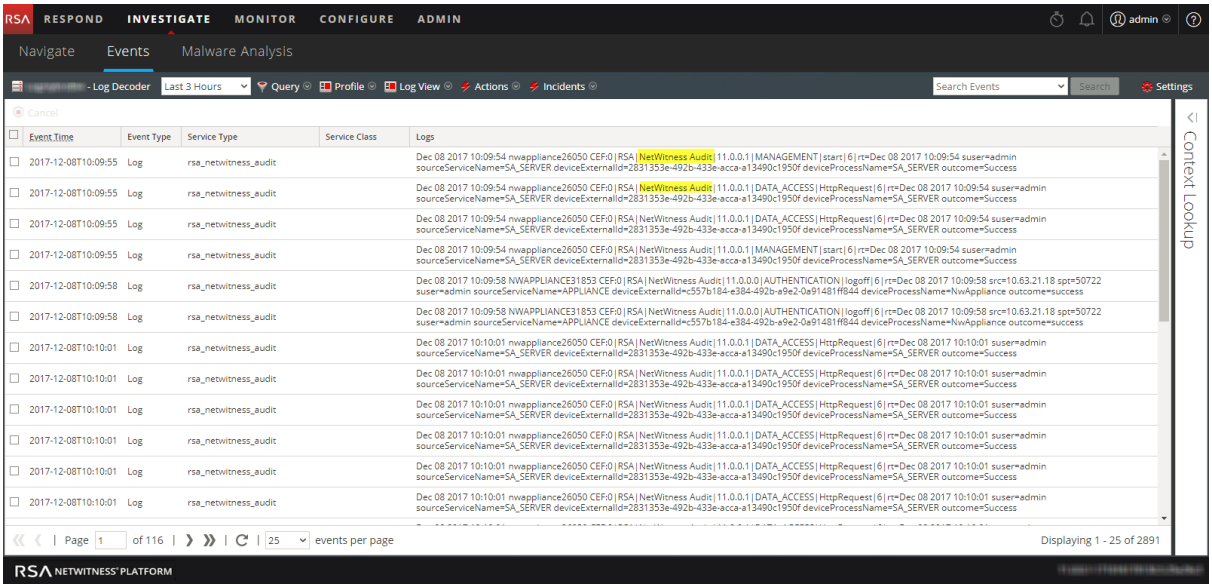
Verify Global Audit Logs

This topic provides instructions on how to verify global audit logs. After you have configured global audit logging, you need to test your global audit logs to ensure that they show the audit events as defined in your global audit logging template.

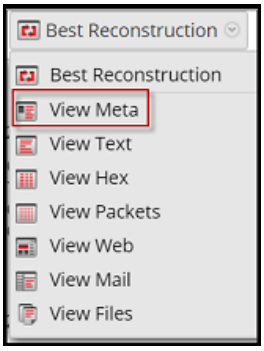
Before starting this task, complete the steps detailed in Configure Global Audit Logging.

To view and verify the global audit logs if you are using a Log Decoder:

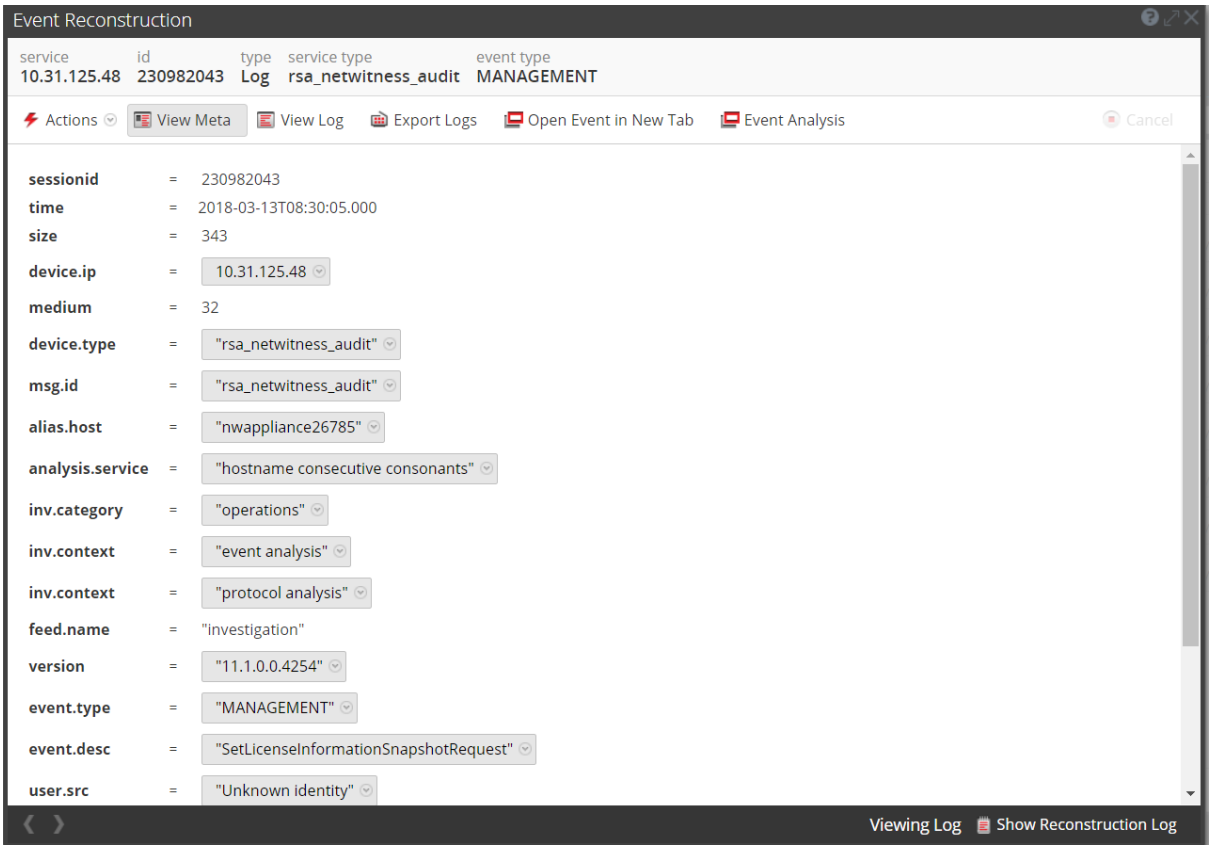
1. Go to **Investigate > Events**.
2. From within the Navigate view, select the Log Decoder, and click **Navigate**.



3. Compare the fields in the global audit logs with the fields defined in the global audit logging template that you used in your global audit logging configuration.
4. Double-click a log and in the Event Reconstruction dialog, select **View Meta**.



5. Verify that the meta that you want to audit is correct.



Example CEF Output

The following example shows global audit logs for an audit logging Common Event Format (CEF) template.

Template:

CEF:0|%{deviceVendor}|%{deviceProduct}|%{deviceVersion}|%{category}|%{operation}|%{severity}|

```
rt=%{timestamp} src=%{sourceAddress} spt=%{sourcePort}
suser=%{identity} sourceServiceName=%{deviceService}
deviceExternalId=%{deviceExternalId} dst=%{destinationAddress}
dpt=%{destinationPort} dvcpid=%{deviceProcessId}
deviceProcessName=%{deviceProcessName} outcome=%{outcome} msg=%{text}
```

Example logs:

```
CEF:0|RSA|NetWitness Audit|11.1.0.0|AUTHENTICATION|logoff|6|rt=Mar 11 2018
08:58:34 src=10.31.125.48 spt=53392 suser=admin sourceServiceName=BROKER
deviceExternalId=92284373-3cdf-4362-be5b-426f46410262
deviceProcessName=NwBroker outcome=success
CEF:0|RSA|NetWitness Audit|11.1.0.0|AUTHENTICATION|logoff|6|rt=Mar 11 2018
09:00:00 src=10.31.125.48 spt=52212 suser=admin sourceServiceName=CONCENTRATOR
deviceExternalId=f17aa153-ac33-4775-ad20-84962d06ab9e
deviceProcessName=NwConcentrator outcome=success
```

```
CEF:0|RSA|NetWitness Audit|11.1.0.0|AUTHENTICATION|logoff|6|rt=Mar 11 2018
08:58:34 src=10.31.125.48 spt=53392 suser=admin sourceServiceName=BROKER
deviceExternalId=92284373-3cdf-4362-be5b-426f46410262
deviceProcessName=NwBroker outcome=success
```

Configure Investigation Settings

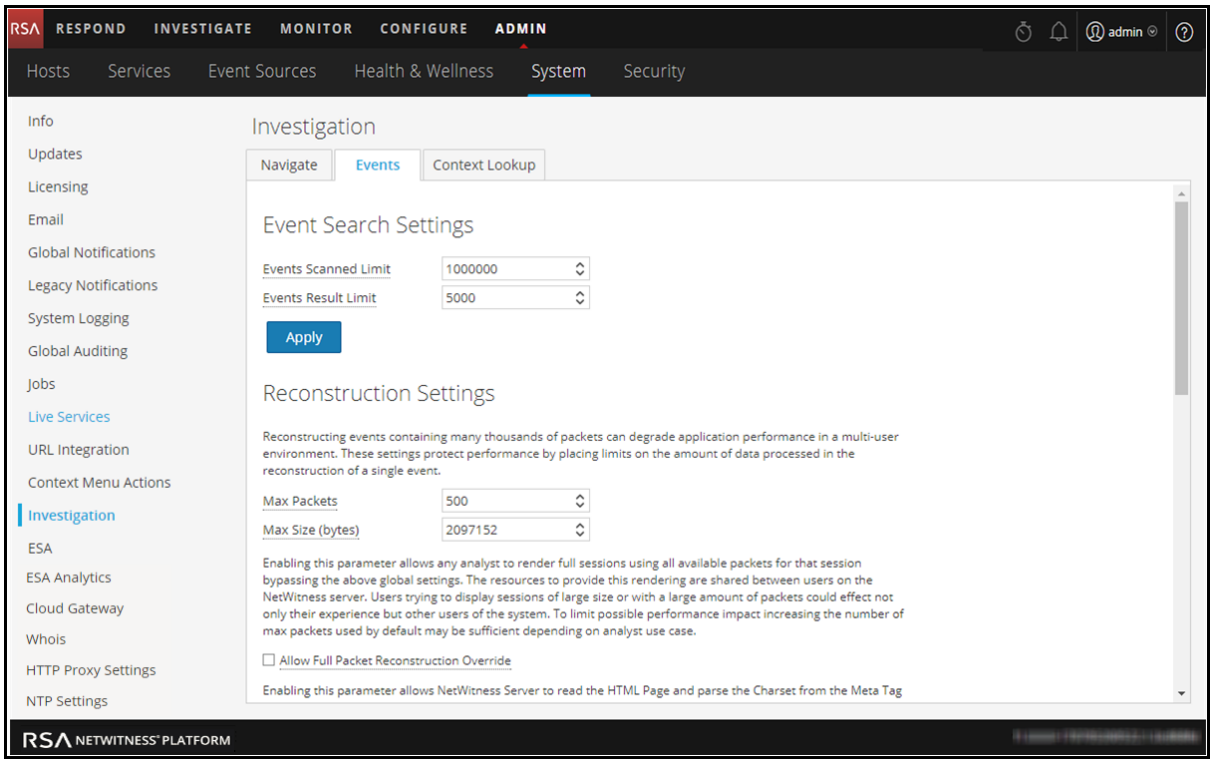
This topic provides instructions for administrators who are configuring the settings that apply to all Investigations on the NetWitness Platform instance being configured. The settings for configuring and tuning behavior of NetWitness Platform Investigation are available in the System view > Investigation panel. These settings apply to all investigations and reconstructions on the current instance of NetWitness Platform.

Configure Navigate, Events, and Context Lookup Settings

The Context Hub is preconfigured with meta fields mapped to the entities. NetWitness Respond and Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, RSA recommends that when mapping meta keys in the ADMIN > SYSTEM > Investigations > Context Lookup tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, `ip.address` is a meta key and `ip_address` is not a meta key (it is a field in the MongoDB).

1. Go to **ADMIN > System.**
2. In the options panel, select **Investigation.**
   The Investigation Configuration panel is displayed.



3. In the **Navigate** tab, in the **Render Threads Settings** field, select the maximum number of concurrent meta key values that are loaded by a single user in the navigate view. Click **Apply**.
4. In the **Navigate** tab, in the **Parallel Coordinates Settings** section, set the maximum limits for meta values scanned and meta value results that can be included in a parallel coordinates visualization. For better performance, these are the recommended settings: Meta Values Scan Limit -100000 and Meta Values Result Limit to 1,000-10,000
   Click **Apply**.
5. In the **Events** tab, in the **Event Search Settings** section, set the maximum numbers of events scanned and event results displayed when an analyst is conducting an event search in the Events view. Click **Apply**.
6. In the **Events** tab, in the **Reconstruction Settings** section, set the limits for the amount of data processed in the reconstruction of a single event. The default values are 100 maximum packets and 2097152 bytes. If analysts are seeing slow performance when reconstructing sessions in Investigation, the reconstructing settings may need adjustment. Click **Apply.**

   Caution: Setting a higher value affects the performance of the NetWitness Server by increasing the time and memory taken to create a reconstruction of an event. Setting the value to zero disables any limit and may lead to a NetWitness Server crash.

7. (Optional) In the **Events** tab, in the **Web View Reconstruction Settings** section, enable the use of supporting files in a web view reconstruction, and configure the additional settings to calibrate web view reconstructions. These include the time range (in seconds) to scan for related events, the maximum number of related events to scan, and overrides to Reconstruction Settings for use with web view reconstructions. Click **Apply**.
8. In the **Context Lookup** tab, manage mapping of Context Hub meta types with meta keys in Investigation. You can add or remove meta keys to the list of meta types supported in Investigation by Context Hub. Procedures associated with this tab are provided in "Manage Meta Type and Meta Key Mapping" in the *Investigation and Malware Analysis Guide*.

Clear Reconstruction Cache for Services

Under Reconstruction Cache Settings, administrators can clear the cache for one or more services. For example, the administrator can clear the cache for a single Broker, a Broker and Decoder, or all connected services. These are a few examples of causes for stale cache being used in a reconstruction.

- The downstream services may have their sessions invalidated or data reset. As an example, if Investigation is browsing a Broker and a downstream Concentrator or Decoder has a data reset, the meta and session data for the investigating service (Broker) does not match the content if the downstream service has reset and repopulated. The reconstruction in Investigation shows content from cache, which does not match the real content. Even if the Decoder is offline, content is still displayed in the Broker reconstruction. Clearing cache on the Broker causes the NetWitness Platform to reach out to the Decoder and an error is returned because the Decoder is offline.
- Another case where cache may be stale is when a service ID for a downstream service changes. This can happen when exporting, importing, deleting, and adding services to NetWitness Platform because NetWitness Platform can reuse service IDs. In this case, clearing the cache on the Broker causes NetWitness Platform to request data from the services.

To clear reconstruction cache, do one of the following:

1. To clear cache for one or more services, select the services and click **Clear Cache for the Selected Services**.
2. To clear the cache for all listed services, click **Clear Cache for All Services.**
   The reconstruction cache for the selected services is cleared. NetWitness Platform sends a request for data to the services.

Configure Live Services Settings

Options for configuring Live Services are in the System view > Live Services Configuration panel. The Live Configuration panel allows you to configure:

- The Live account.
- The Live Content update schedule and preferences for notification of updates.
- Participation in Live Services Feedback.
- Sharing Live Content Usage
- RSA Live Connect (Beta)

Prerequisite

To activate your Live account for NetWitness Platform, please contact RSA Customer Care. When you have a confirmation that your Live account has been set up, you can configure and test the CMS server connection.

The Live Services user interface displays the settings for Live Feedback, Share UEBA Insights, and RSA Live Connect (Beta) options like Threat Insights and Analyst Behaviors.

For information on Analyst Behaviors and Data Sharing, see "NetWitness Platform Feedback and Data Sharing" topic in the *Live Services Management Guide*.

About Live Feedback Participation

When you participate in Live Feedback, it collects relevant information for further improvement. For information on Live Feedback, see Live Feedback Overview.

When you install NetWitness Platform, you will be prompted to participate in Live Feedback. For information, see Configure Live Services Settings

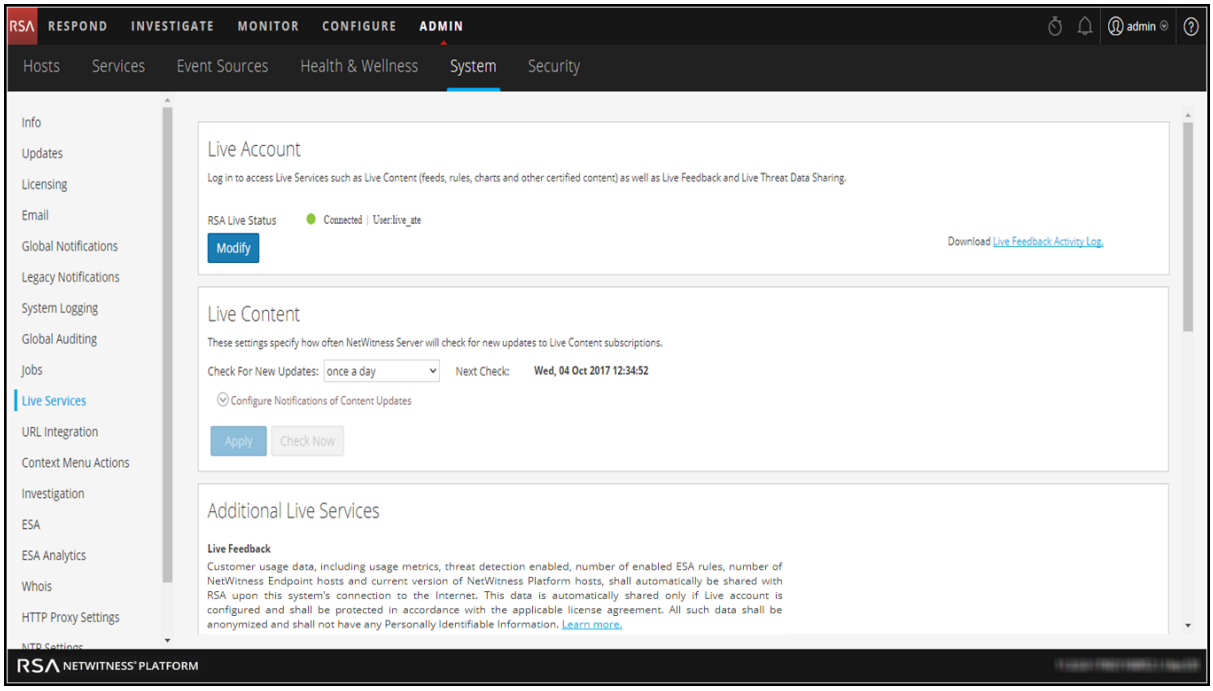
If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.

This topic contains the following procedures:

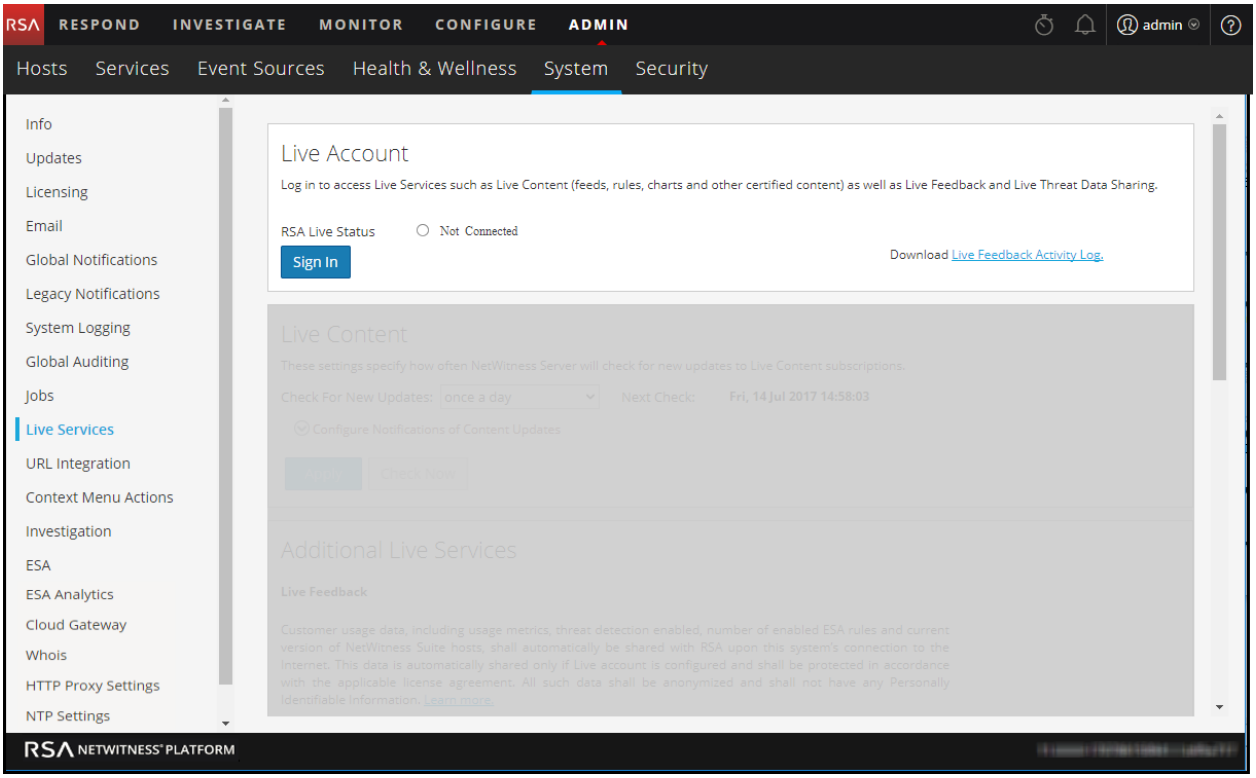
- Access the Live Services Configuration Panel
- Configure Live Account
- Configure the Live Content Synchronization Interval and Notification
- Force Immediate Synchronization
- Using RSA Live Connect

Access the Live Services Configuration Panel

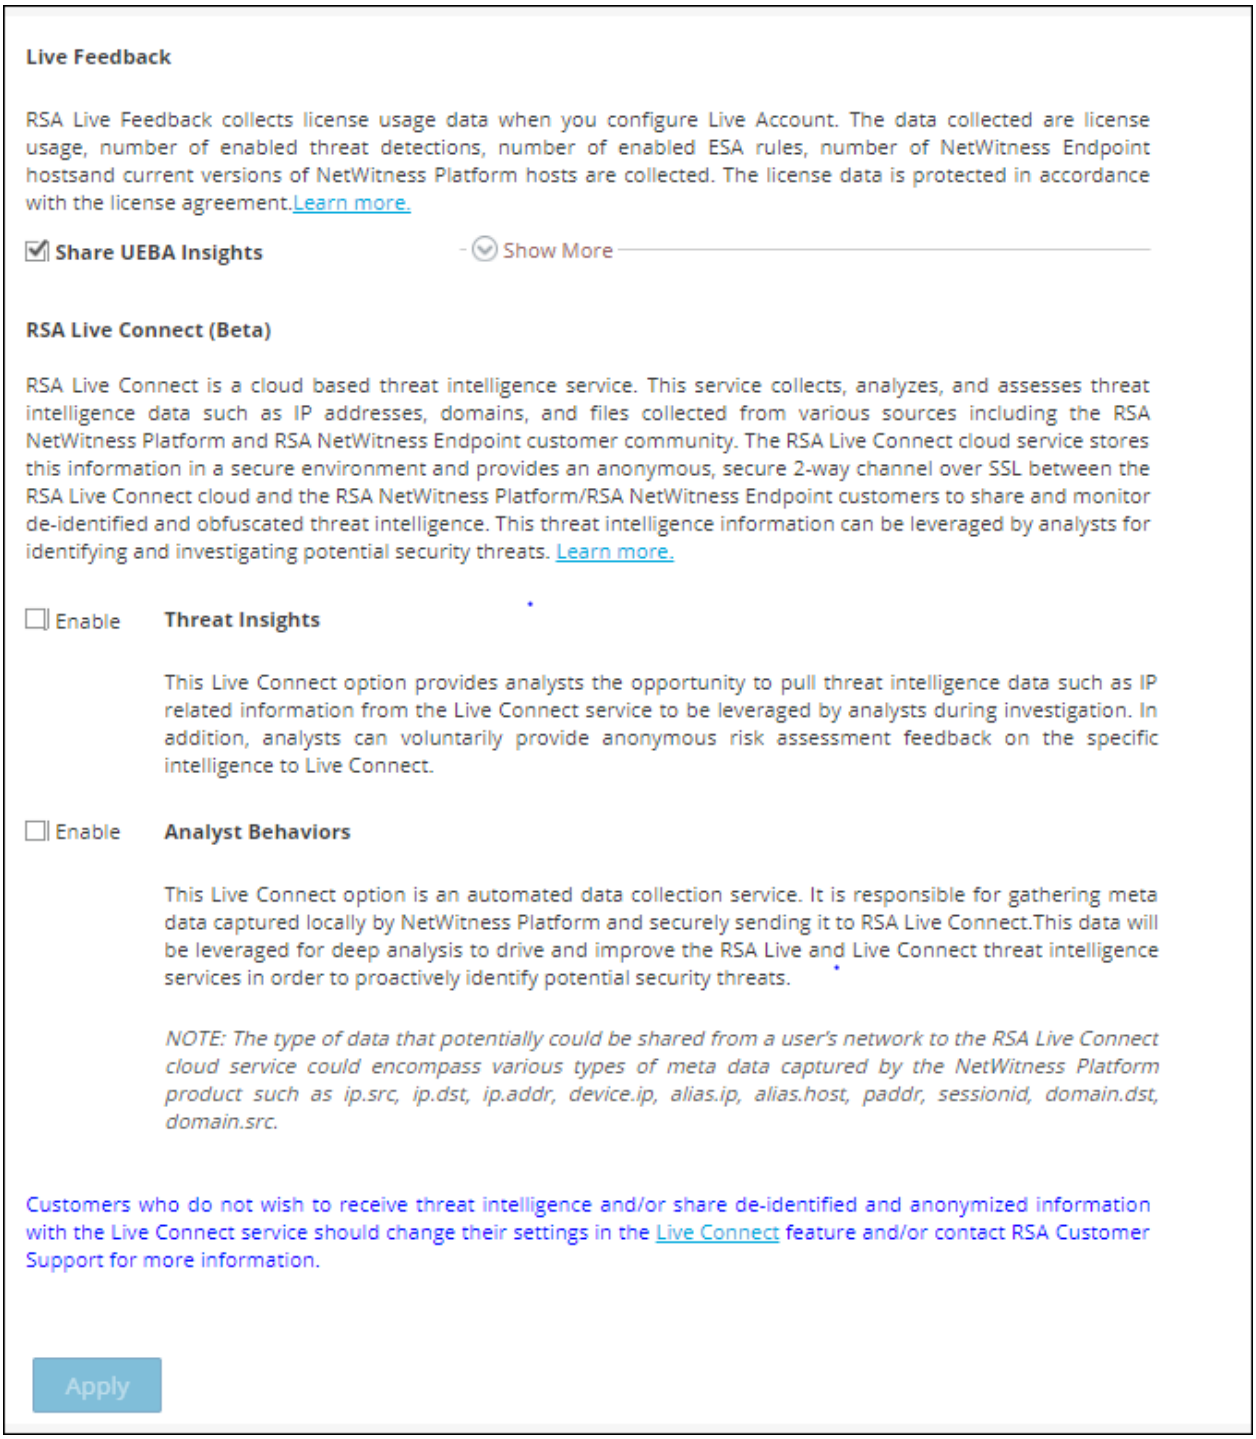
1. Go to **ADMIN** > System.
2. In the options panel, select **Live Services**.



If you are not signed in with your Live Account credentials, a masked screen is displayed.



After you sign in with the Live Credentials, the screen is displayed without a mask.



Configure Live Account

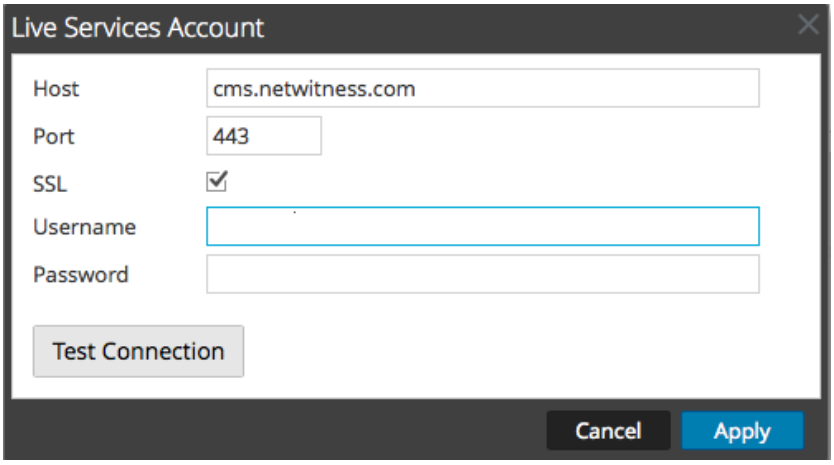
In the **Live Account** section, you must set up the user's Live account. The information needed to set up the user's Live account consists of the Username, Password, and Live URL for the Content Management System. This information is provided by Customer Care.

To configure a Live account:

1. In the **Live Account** section, click **Sign In**.

   Note: The **Modify** button shows that the live account is configured. Click **Modify** to change the user that is accessing Live Services.

2. In the Live Services Account dialog box, enter the Host (typically **cms.netwitness.com**) and type your username and password.

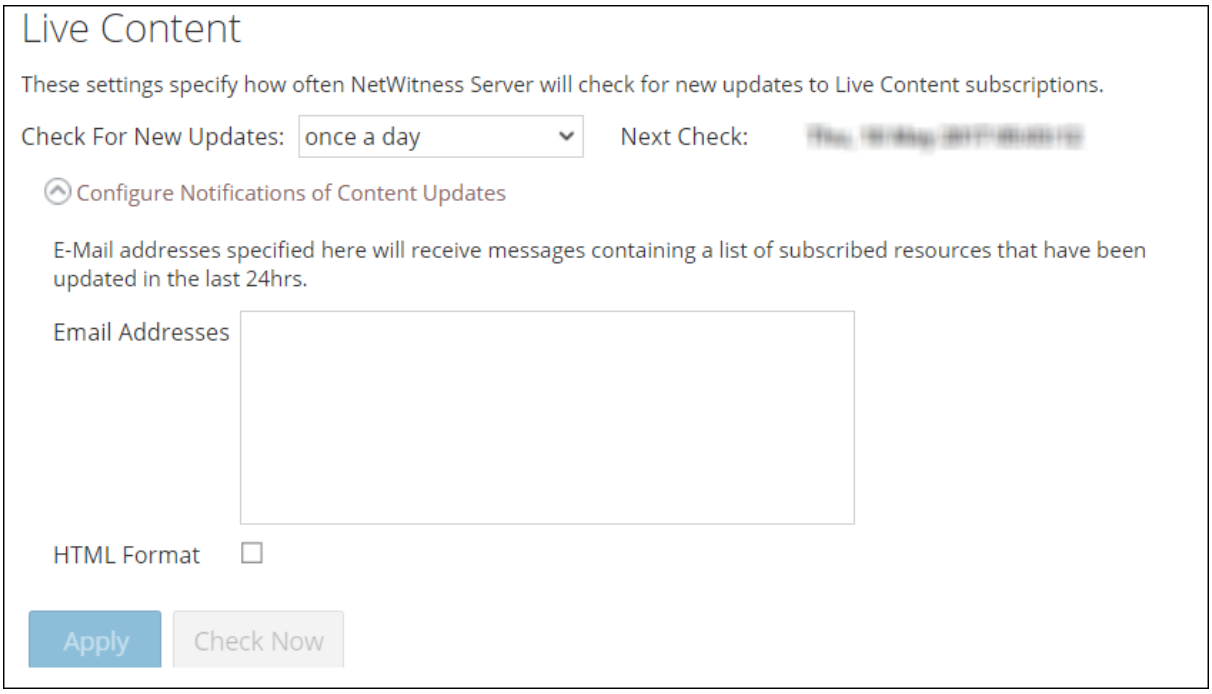


3. (Optional) If you are using a different CMS, type the host URL for the Content Management System. The default points to the CMS at **cms.netwitness.com**.
4. (Optional) If you are using a different CMS, type the communications port for Live to send requests to the Content Management System. The default for this field is **443**, which is the communications port on the Content Management System.
5. (Optional) If you do not want to use SSL, uncheck the **SSL** option. (SSL is enabled by default.)
6. Click **Test connection** to test the connection to CMS.
7. To save and apply the configuration, click **Apply**.

Configure the Live Content Synchronization Interval and Notification

You can change the interval at which NetWitness Platform checks for new updates to Live Content:

1. Use the **Check for New Updates** field to change the interval. Select an interval from the drop-down list. The default value for this setting is **once a day**.



2. To configure Live Services to send update reports to one or more people, in the **Email Addresses** field, type the email addresses as a comma-separated list, for example, **john@company.com,ted@company.com,brian@company.com**
3. (Optional) To receive messages in HTML format rather than plain text, select **HTML Format**.
4. To save and apply, click **Apply**.

   The time and date of the next scheduled Live synchronization based on the configured interval for checking is displayed.

Force Immediate Synchronization

Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness Platform. One use for this is to see the immediate impact of a configuration change. For example, a new service has been added, or new resources have been toggled for automatic deployment. The scheduled synchronization could take place hours later if Live Services is set to synchronize a few times a day.

Caution: Synchronization can cause a parser reload if a FlexParser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.

To force immediate synchronization, click **Check Now**. NetWitness Platform checks for updates in subscribed resources.

Using UEBS Insights

Using the User and Entity Behavior Analytics (UEBA) service the usage metrics is shared which is leveraged for deep analysis to improve and optimize the use of UEBA. The metrics collected are number of alerts created (ADE & output), number of indicators created (ADE & output), number of events processed (input). Customers who wish not to share data, can uncheck this option.

Using RSA Live Connect

RSA Live Connect is a cloud based threat intelligence service. This service collects, analyzes, and assesses threat intelligence data such as IP addresses, domains, and files collected from various sources including the RSA NetWitness® Platform and RSA NetWitness® Endpoint customer community. RSA Live Connect consists of the following features:

- Threat Insights
- Analyst Behaviors

Threat Insights

Threat Insights provides analysts the opportunity to pull threat intelligence data such as IP related information from the Live Connect service to be leveraged by the analysts during investigation.

By default, **Threat Insights** is enabled in **Additional Live Services** section. If Context Hub service is configured, Live Connect is automatically added as a data source for Context Hub. For more information, see "Configure Live Connect Data Source for Context Hub" topic in the *Context Hub Configuration Guide*.

With Live Connect as a data source for context hub, you can use the Context Lookup option in INVESTIGATE > Navigate view or INVESTIGATE > Events view to fetch contextual information. For instructions, see "View Additional Context for a Data Point" topic in the *Investigation and Malware Analysis Guide*.

Analyst Behaviors

Analyst Behaviors is a feature where analysts participate in sharing data to RSA community. This is an automated data collection service. Its goal is to share potential threat intelligence data to the RSA Live Connect cloud service for analysis. The type of data that could be shared from your network to RSA Live Connect includes various types of meta data captured by NetWitness Platform such as ip.src, ip.dst, ip.addr, device.ip, alias.ip, alias.host, paddr, sessionid, domain.dst, domain.src. For information on Analyst Behaviors and Data Sharing, see "NetWitness Platform Feedback and Data Sharing" topic in the *Live Services Management Guide*.

Live Feedback Overview

This topic provides an introduction to Live Feedback. Live Feedback collects relevant information such as the Licensing usage data for Network Decoder, Log Decoder and Malware Analysis, Threat Detection Enabled or Disabled status, Number of enabled ESA rules,and version number details of all the services of NetWitness Platform. For more information about the licensing usage data for Packer Decoder, Log Decoder and Malware Analysis, see the **License Details** tab topic in the *Licensing Guide*. The information is collected to improve future releases of NetWitness Platform. You will automatically be signed on to live feedback and you cannot disable this option.

In addition to this, information on the Live Content Usage can also be shared with RSA. Live Content usage metrics for resource types from **CONFIGURE > Live Content > Search Criteria** such as total count of RSA Application Rule, RSA Correlation Rule etc. can be shared with RSA. The information collected is used to improve the use of Live Content. For more information about sharing live content configuration, see Live Services Configuration Panel.

About Live Feedback Participation

When you participate in Live Feedback, it collects relevant information for further improvement. For information on Live Feedback, see Live Feedback Overview.

When you install NetWitness Platform, you will be prompted to participate in Live Feedback. For information, see Configure Live Services Settings

If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.

Note: Live Feedback is activated only if you have configured your Live account.

The Live Feedback data is in JSON format as mentioned below. When you sign up with your Live Account credentials, a single encrypted JSON file is automatically uploaded to the RSA servers everyday.

JSON File

The JSON file consists of usage data information for a component or a set of components. In case of a set of components with the same license id, the usage data for all the components is aggregated and represented as a component called Entitlement. However, even if there is a single component such as a log decoder or decoder, an Entitlement component will be generated and will display the usage data for a single component. This aggregation is for components namely log decoders, decoders or malware analysis.

Note: The version of Entitlement is always null as it is the aggregate for a license data.

For example, if there are three Decoders with the same license id "xxx" with the following usage data:
Decoder1 = 150 MB
Decoder2 = 250 MB
Decoder3 = 100 MB
The aggregated usage data of 500 MB is displayed.

This JSON file is described in the following sections:

- Components
- Metrics
- Other Product Details
- Sample

Components

Details of each service in your NetWitness Platform deployment. This is represented as Component. For each component the following details are displayed.

Component	Description
Version	Version number of the component in the NetWitness Platform deployment. For example, 11.1.0.0.x.x.x.x.
ID	This is the unique Component ID that represents the host and is used to link to the metrics generated.
Properties	• **Name** - This is the name of the property for that component. For example, malware analysis, ESA, log decoder, etc. • **Value** - This is the unique value to identify the component.

Metrics

Metrics of the components (hosts) such as log decoder, decoder and malware analysis. The license usage data for each host is shared. For Live Content usage metrics, resource types from **CONFIGURE > Live Content > Search Criteria** such as total count of RSA Application Rule, RSA Correlation Rule etc. are shared.

Component	Description
StartTimeUTC	This is the time from when the metrics is collected. (in EPOCH format).
Stats	• **Value** - This is the value generated for the specific component ID for each component. • **Name** - This is the name of the statistics for which the metrics is collected. For example, Capture Total Bytes.
EndTimeUTC	This is the time when the metrics collection is complete (in EPOCH format).
Component ID	This is the ID of the component for which the value is recorded.

Other Product Details

- **Product Type** - This is the name of the product. In this example, the Product Type is NetWitness Platform.
- **Version** - This is the version of the JSON file which tracks the changes made to the file format.
- **Product Instance** - This is the License Server ID.
- **Checksum** - This is the information which is used for integrity checks.

The following table describes details of the JSON file with examples.

Metrics	Description
Content	Displays the content that contains all the Components, Metrics, Product Type and Product Instance data except Checksum.

Metrics	Description

Components	The details of all the services in NetWitness Platform are represented as a Component. The details of the component such as the version number of the component, the name, and the value is displayed as shown below:
	 	"Content": {
	"Components": [{
	"Version": "11.1.0.0",
	"Id": 5,
	"Properties": [{
	"Value": "5714c78be4b0ea5bd2b96e63",
	"Name": "InstanceId"
	}],
	"Name": "malwareanalysis"
	},
	Version: Displays the version of NetWitness Platform service. For example, 11.1.0.0.
	ID: Displays an unique id which is generated for the NetWitness Platform service and is used to link to the metrics for that particular component. In this example, the ID for Malware Analysis is 5 and the metrics is displayed for ComponentId 5 in bytes, as shown below:
	 	"Metrics": [{
	"StartTimeUTC": 1442102400000,
	"Stats": [{
	"Value": "1582940012678",
	"Name": "Total FileBytes"
	}],
	"EndTimeUTC": 1442188799000,
	"ComponentId": 5
	},
	Properties: Displays the properties for the component such as name and value as shown in the above figure.
	Value: Displays the value of the property which is an internal UUID for a component as shown in the above figure This is generated by NetWitness Platform. For example, For malware analysis the value displayed as `"55f7a0b30e502231c42d063f"`
	Name: "InstanceId": Displays the name of the property as shown in the above figure.
	Name": "malwareanalysis": Displays the name of component which is a service name such as LogDecoder, Decoder, or MalwareAnalysis.

Metrics	Description

Metrics	Displays the list of the metrics with the usage data for components namely log decoder, decoder and malware analysis.
	In this example, the metrics is displayed for ComponentId 5 in bytes, as shown below.
	 	"Metrics": [{
	"StartTimeUTC": 1442102400000,
	"Stats": [{
	"Value": "1582940012678",
	"Name": "Total FileBytes"
	}],
	"EndTimeUTC": 1442188799000,
	"ComponentId": 5
	},

	StartTimeUTC: Displays the time when the metrics is collected, in the EPOCH format.
	Stats: Displays the usage value and usage type statistics of the component.
	Value: Displays the value of the statistics. For example, "Value": "1582940012678" as shown in the above figure.
	Name: Displays the name of the statistics. For example, Capture Total Bytes or Total File bytes.
	EndTimeUTC: Displays the time when the metrics collection is complete, in the EPOCH format.
	ComponentId: Displays the component id for which the metric values are collected. This is the same as the "ID" in the Components section.
Content	Displays the content that contains all the Components, Metrics, Product Type and Product Instance data except Checksum.
ProductType	Displays the product type that generates the file. For example, `"ProductType": "NetWitness Platform"`
ProductInstance	Displays the License server Id and is unique per NetWitness Platform. For example, `"ProductInstance": "00-0C-29-6C-66-E3"`
Checksum	Displays the Checksum for the "Content" section in the file. Used by RSA for integrity check. For example, `"Checksum": "883DACF97E4BCD9F590A1461A4DD0A312B5883A6CF82E0518E77AAB6A6DDB654"`

Sample

Here is a sample JSON file.

```
{
    "Content": {

Upload Data to RSA for Live Feedback

This topic provides instructions for a NetWitness Platform administrator to export the metrics in NetWitness Platform for Live Feedback.

If the Live Account is not configured, you can manually upload the usage data to RSA. For more information, see Live Services Configuration Panel.

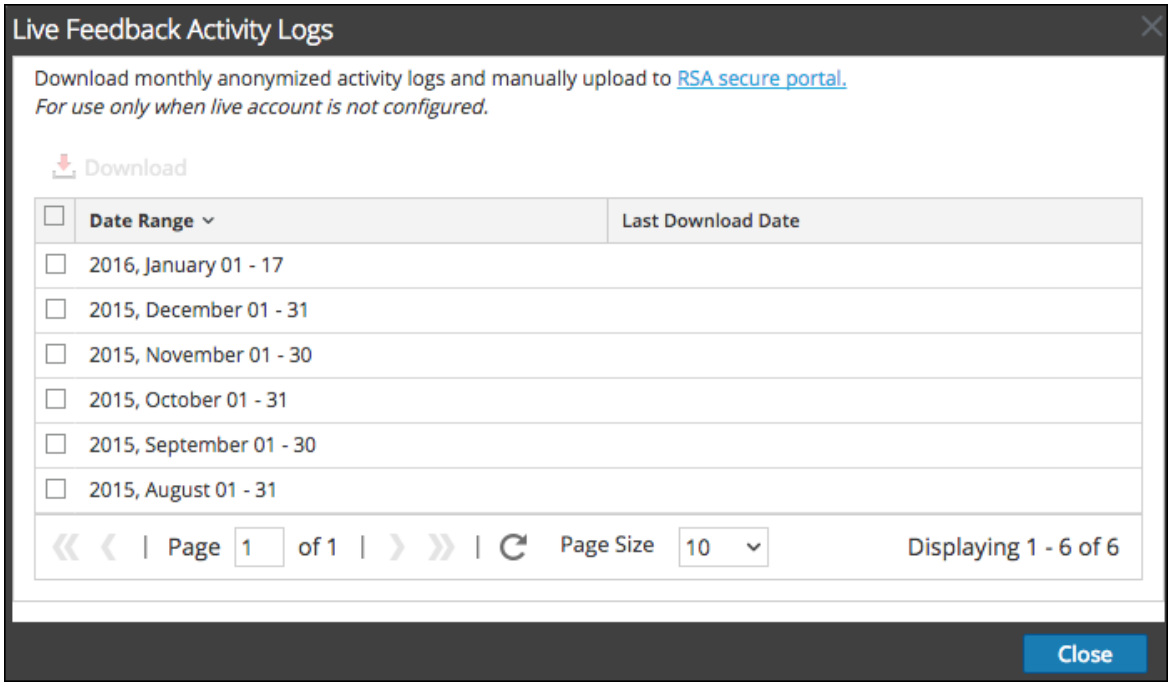
The Live Account section has a Live Feedback Activity Log which enables you to download the usage data required for Live Feedback. This is active regardless of the Live Account configuration.

You can first download the Live Feedback historical data, and then upload it to share with RSA.

Download Live Feedback Historical Data

To download the Live Feedback historical data:

1. Go to **ADMIN** > **System**.
2. In the options panel, select **Live Services**.
   The **Live Account** screen is displayed which consists of the **RSA Live Status** and Download **Live Feedback Activity Log**.
3. Click the **Download Live Feedback Activity Log**.
   The **Download Live Feedback Activity Log** window opens which allows the NetWitness Platform user to download the required Live Feedback historical data.



4. Select one or multiple entries by selecting the checkboxes and click **Download**.

   Note: If you select multiple entries in the history table, the downloaded zip file consists of an individual JSON file for each month.

The downloaded Live Feedback data is in JSON format, and is bundled as a .zip file. For more information, see Live Feedback Overview.

Share Data with RSA

After you download the Live Feedback data, you can then upload it using the following procedure.

To share the data to RSA:

1. Click on the **RSA Secure Portal** available on the **Live Feedback Activity Logs** window.
   The RSA NetWitness® Platform Live Feedback login screen is displayed.
2. Login to the Upload Live Feedback Activity Logs portal using your Live ID credentials.
3. Click **Choose File**, and select the downloaded file.
4. Click **Upload.**

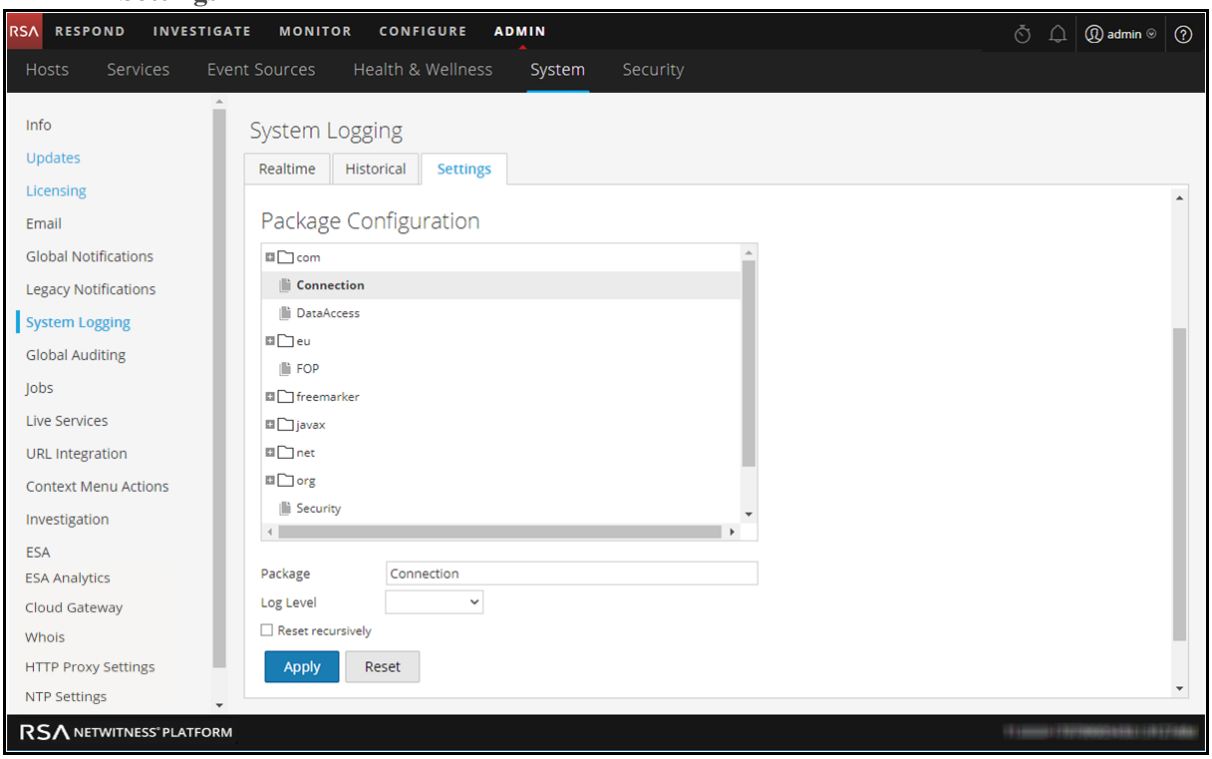
Configure Log File Settings

In RSA NetWitness® Platform, you can configure the size of the log files, the number of backup log files maintained, as well as the default logging levels for the packages within NetWitness Platform.

Configure System Log File Size and Backup Count

The log file size and backup count are configured with default values. If you want to change the default values for the log file size and number of backups:

1. Go to **ADMIN > System.**
2. In options panel, select **System Logging**.
   The System Logging Configuration panel opens to the Realtime tab by default.
3. Click the **Settings** tab.

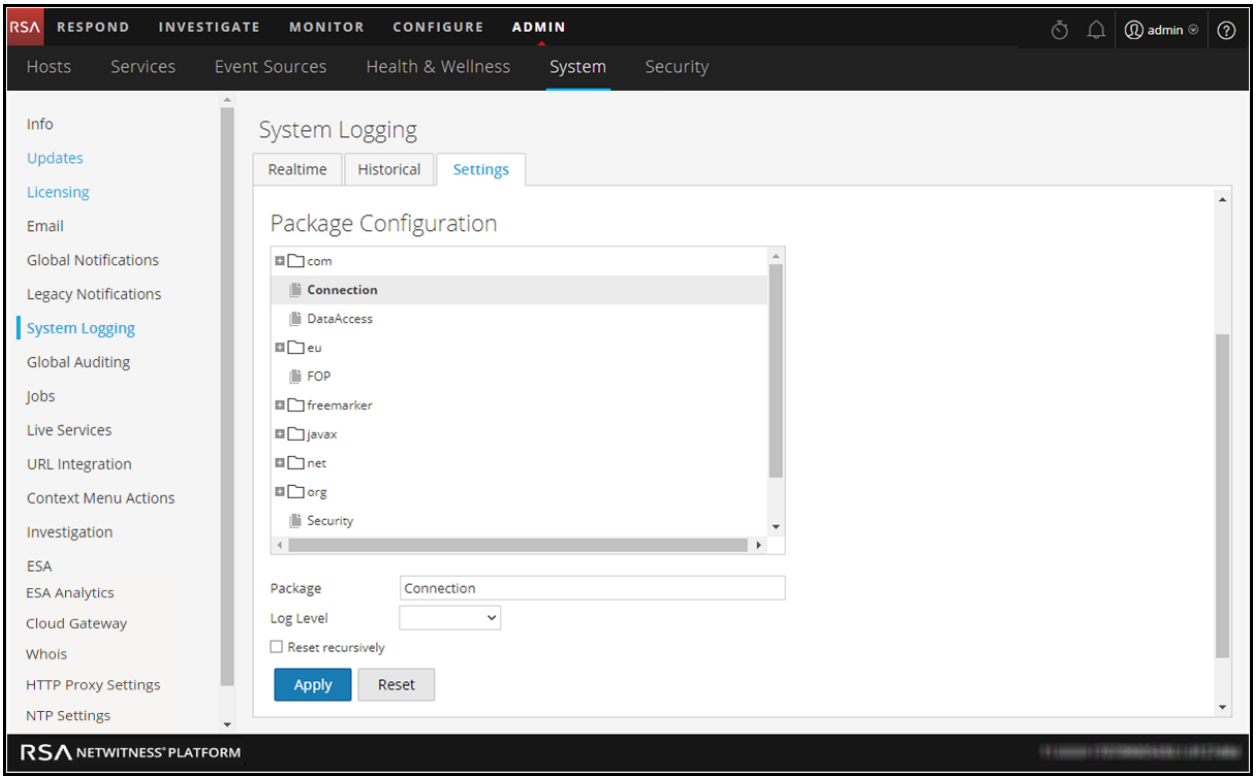


4. In the **Max Log Size** field, type the maximum size in bytes. The minimum value for this setting is **4096**.
5. In the **Max # Backup Files** field, type the maximum number of backup logs to maintain. The minimum value for this setting is **0**. When the maximum number of log files is attained, and a new backup file is made, the oldest backup is discarded.
6. Click **Apply**.
   The changes go into effect immediately.

Set the Log Level for an Individual Package

The Package Configuration section shows the NetWitness Network in a tree structure. The tree contains all the packages used within NetWitness Platform. You can drill down into the tree to view the log levels of each package. The log level for all packages that are not explicitly set is the same as the **root** log level. To set the log level for a package:

1. Select the package in the **Package** tree.
   The name of the package is displayed in the **Package** field. If a log level is already set for the package, that level is shown.



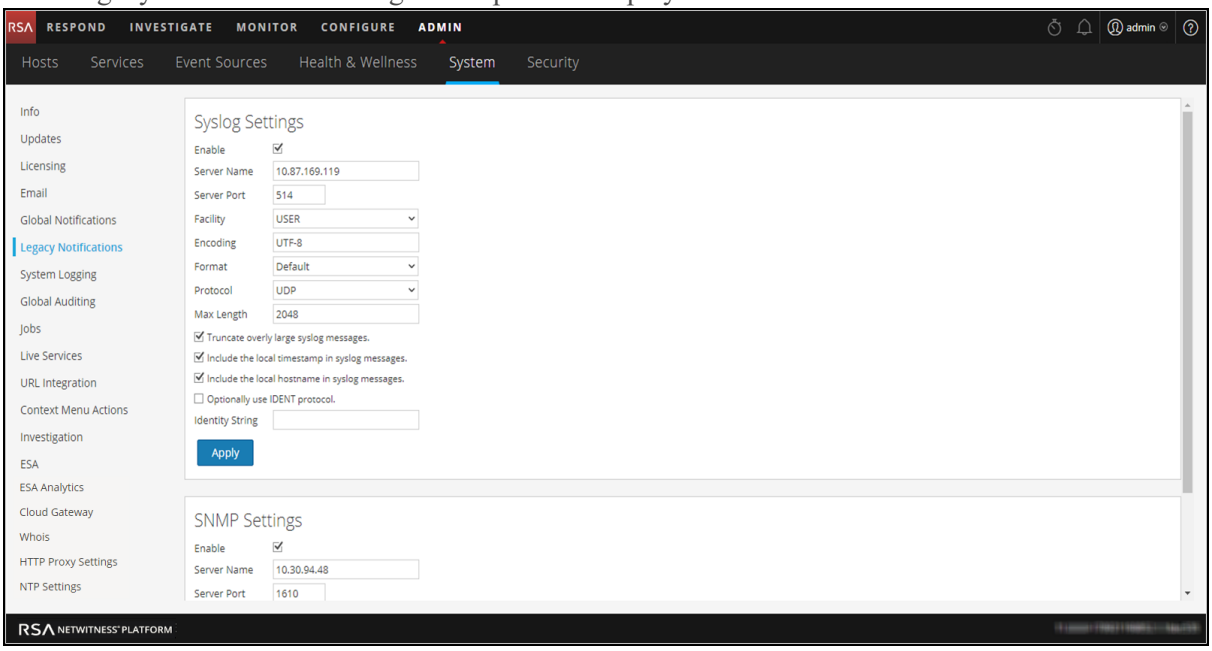
2. Select the **Log Level** in the drop-down list.
3. Click **Apply**.
   The new log level becomes effective immediately.
4. (Optional) If you want to revert to the default log level specified for **root**, click **Reset**.

Configure Syslog and SNMP Settings

On the Legacy Notifications panel, you can configure syslog and SNMP notification settings. These configurations are used for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Configure and Enable Syslog Settings

1. Go to **ADMIN > System**.
2. In the options panel, select **Legacy Notifications**.
   The Legacy Notifications Configuration panel is displayed.



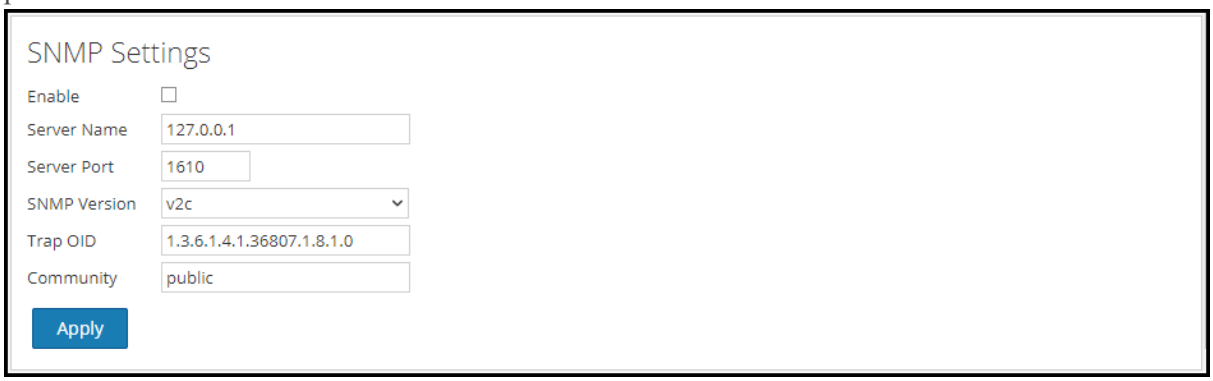
3. In the **Server Name** and **Server Port** fields under **Syslog Settings**, type the host name where the target syslog process is running and the port where the target syslog process is listening.
4. In the **Facility**, **Encoding**, **Format**, and **Max length** fields, specify the syslog facility, message text encoding, message format, and maximum message length.
5. In the **Protocol** field, select either UDP or TCP.
6. (Optional) Select the options for what to include in messages: **Truncate overly large syslog messages**, **Include the local timestamp in syslog messages**, and **Include the local hostname in syslog messages**.
7. (Optional) Configure syslog to prepend an Identity String before each syslog alert.
8. Click the **Enable** checkbox.
9. Click **Apply**.
   Syslog notifications are immediately enabled.

Legacy Notifications Configuration Panel provides detailed information about these settings.

Configure and Enable SNMP Settings

1. Go to **ADMIN > System**.
2. In the options panel, select **Legacy Notifications**.
   The Legacy Notifications Configuration panel is displayed, with SNMP Settings at the bottom of the

panel.



3. In the **Server Name** and **Server Port** fields under **SNMP Settings**, type the host name and listening port of the SNMP trap host.
4. Select the **SNMP version** in the drop-down menu, **v1** or **v2c**.
5. In the **Trap OID** field. specify the object ID for the SNMP trap on the trap host that receives the audit event. The default value is **0.0.0.0.0.1**.
6. In the **Community** field, specify the community string used to authenticate on the SNMP trap host, the default value is **public**.
7. Click the **Enable** checkbox.
8. Click **Apply**.
   SNMP notifications are immediately enabled.

Legacy Notifications Configuration Panel provides detailed information about these settings.

Disable Syslog or SNMP Settings

To disable syslog or SNMP settings on this NetWitness Platform instance:

1. Clear the appropriate **Enable** checkbox.
2. Click **Apply**.
   The selected settings are immediately disabled.

Additional Procedures

Additional procedures are not essential for the set up of NetWitness Platform, they include certain customization options that are beyond the usual setup; for example, adding custom context menus or setting up a proxy.

Add Custom Context Menu Actions

In the Context Menu Actions panel, Data Privacy Officer, Administrator, Analyst, and SOC Manager can view, add, edit, delete, import, and export context menu actions for the current instance of NetWitness Platform. Each context menu action applies to a specific context in the NetWitness Platform user interface, and appears as an option when you right-click a specific location in the user interface.

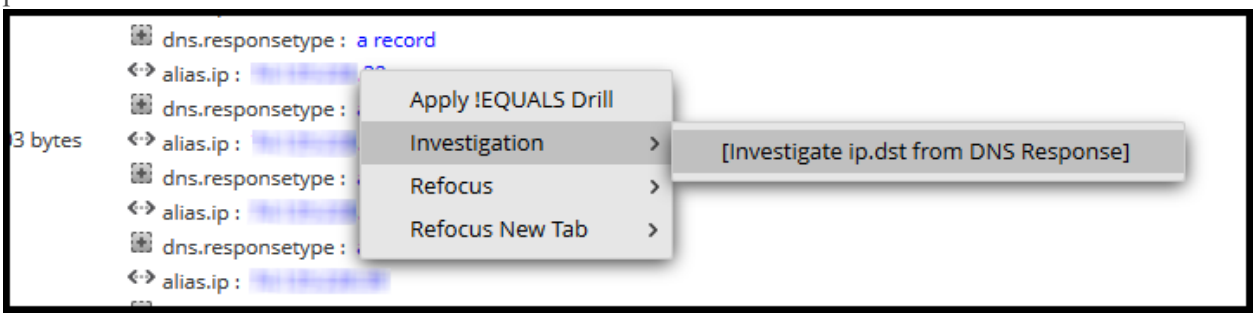
Note: All the context menu actions available in Events in NetWitness Suite 11.1 are also now available under Event Analysis in NetWitness Platform 11.2.

If you want to create a custom variation of a built-in context menu action, you can copy the configuration to a new context menu action and modify the custom context menu action. To copy, switch to the Advanced view, open the action and copy the JSON configuration file, create a new action/edit an existing action and paste. A context menu action is defined by:

- Action: The title of the action in the context menu.
- Component: The NetWitness Platform module in which the context menu is available.
- Meta key: The content to which the action applies.
- Definition: The definition of the action.

Note: All context menu actions created before you upgrade to 11.2, will function as configured.

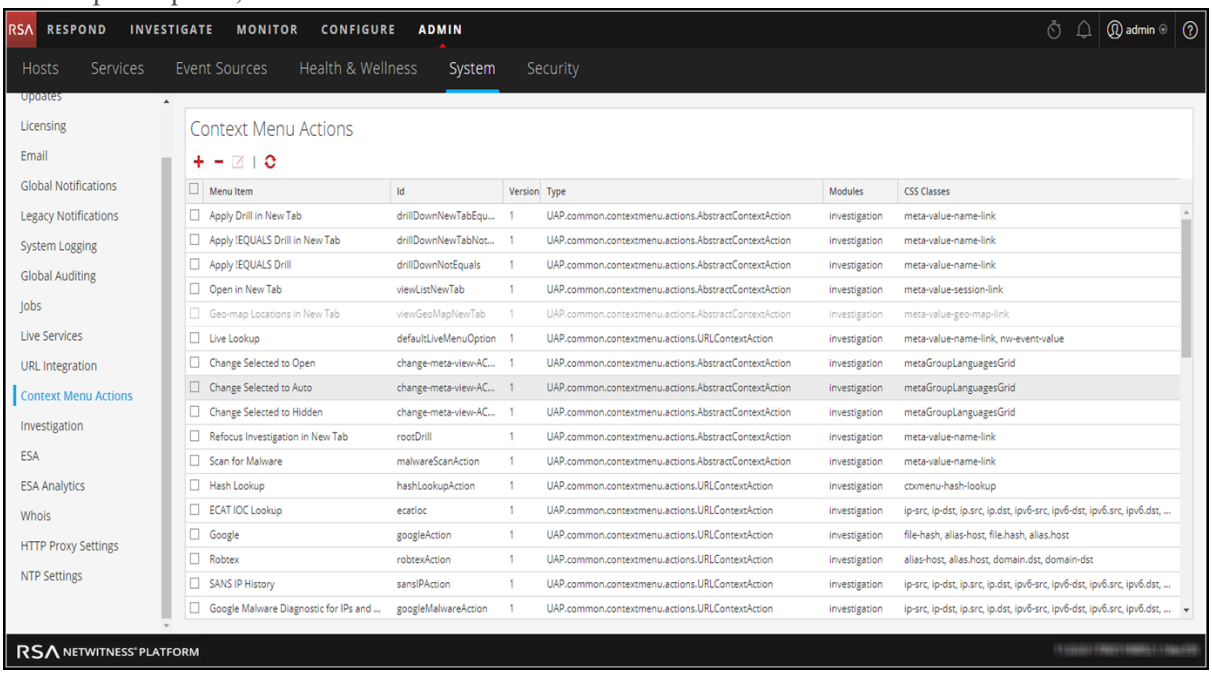
This is an example of a custom context menu action; the steps to create this example are provided as a procedure below.



View Context Menu Actions in NetWitness Platform

To view existing context actions in NetWitness Platform both default and custom:

1. Go to **ADMIN > System.**
2. In the options panel, select **Context Menu Actions**.

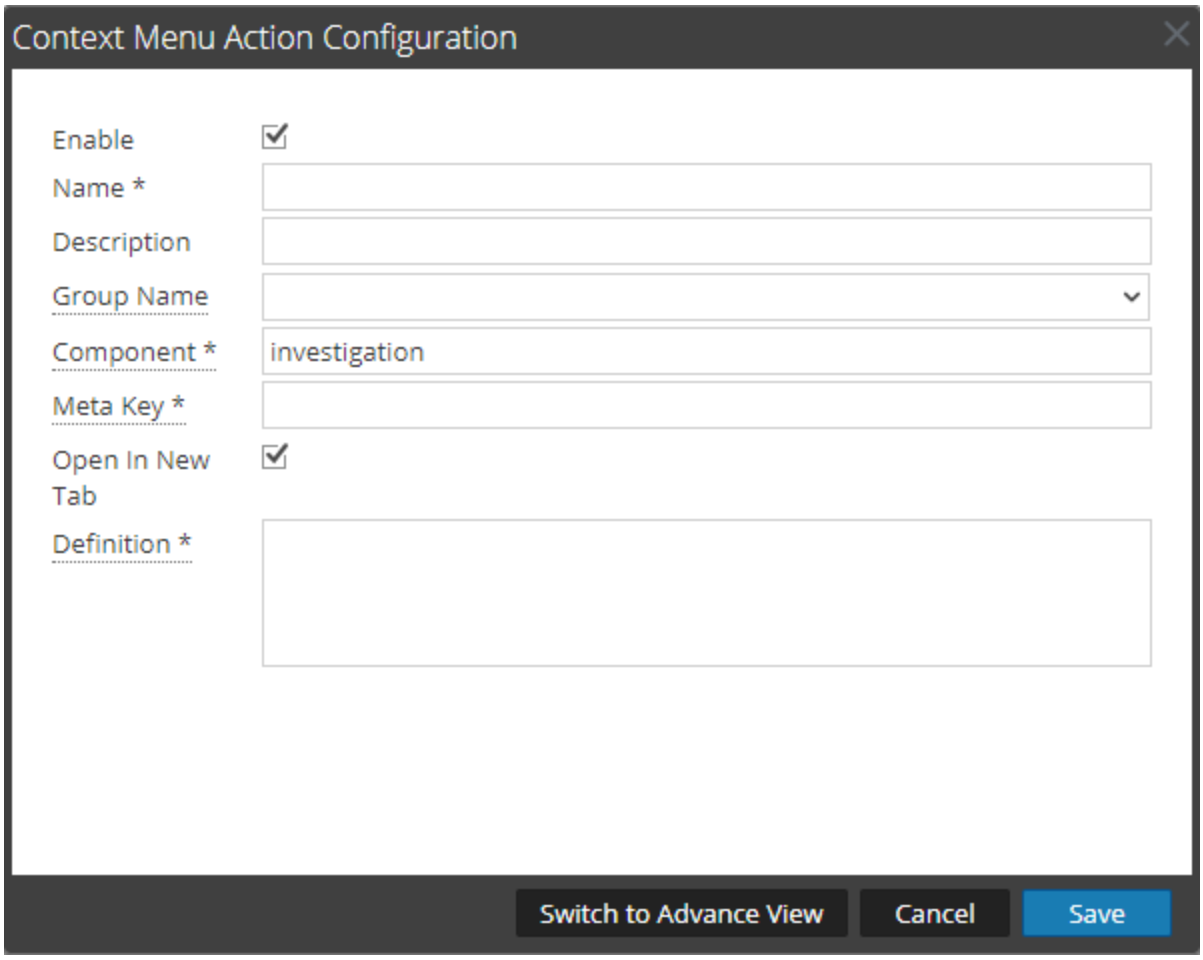


All the new actions which were available in NetWitness Suite 11.1 in the Investigate > Event Analysis tab can now be configured using the context menu actions. Details of the information in the Context Menu Action panel are provided in Context Menu Actions Panel.

Add a Context Menu Action

To add a context menu action in NetWitness Platform:

1. In the toolbar, click +.
   The Context Menu Action Configuration dialog is displayed.



Fill the required fields:

a. Enable: Select Enable to enable this context menu action.

b. Name: Enter the name of the context menu action.

c. Description: Enter a description of the context menu action.

d. Group Name: Select the group name from the drop-down menu. Action will appear under this group in Context menu.

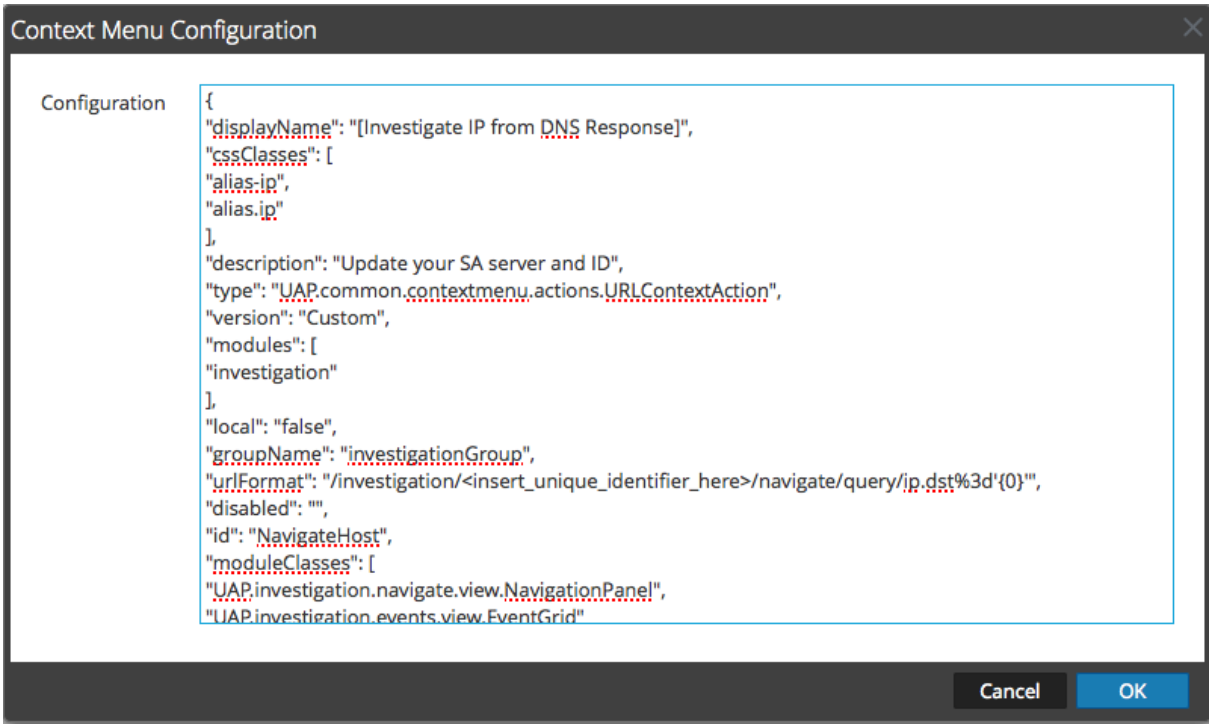
e. Component(s): The name of the component under which action will appear in the user interface. For example. under Investigate, the Context menu action can appear under Investigate-Navigate, Investigate-Events, Investigate-Event Recon and Investigate-Event Analysis.

f. Meta Key: Enter the metas separated by commas to further narrow-down scope for the context menu action. The action will appear on these metas. Context menu actions have to be defined specifically for each meta key, all the key references in a meta key do not inherit a context menu actions. For example, a context menu action created for ip.all will not be created for ip.src as well. A separate action has to be created for the sub-category or key reference of a meta.

g. Open in New Tab: Select this option to open the context menu action in a new tab.

h. Definition: Enter further action performed for this context menu action. For example, open a certain user interface or navigate to an external URL.

2. You can also type the CSS code to define the context menu action. The example procedure at the end of this topic provides step-by-step instructions that you can use to create a useful context menu action. Click **Switch to Advance View** to add the context menu action.



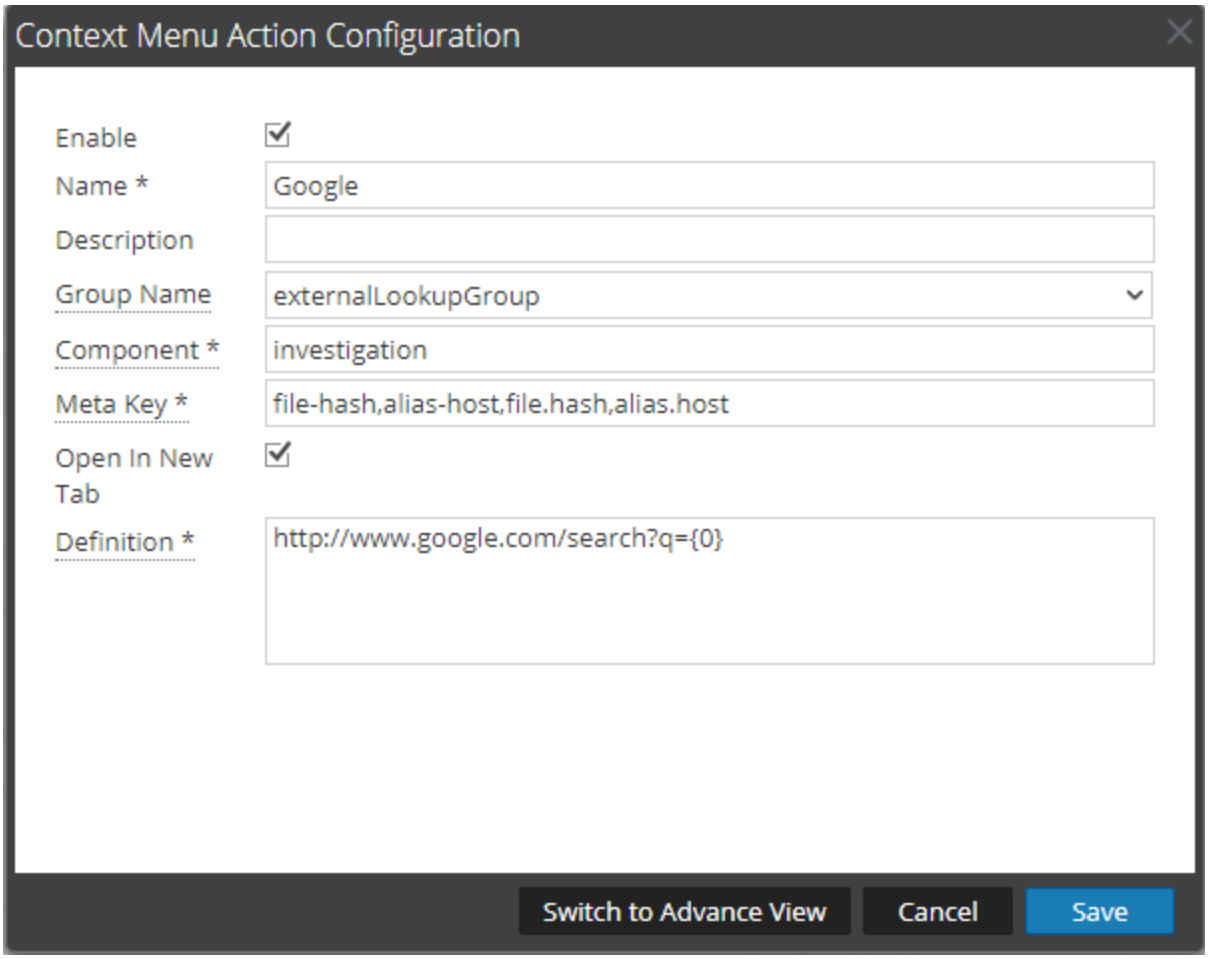
3. Click **OK.**
   The new context menu action is created and added at the end of the list of context menu actions.

4. The context menu action becomes available in the configured location.

Edit a Context Action

To edit a context action:

1. Select the row in the grid and either **double-click** the row or click  .
   The **Context Menu Configuration Dialog** is displayed.



2. Edit the **Configuration**.
3. To save the changes, click **OK**.

Delete a Context Action

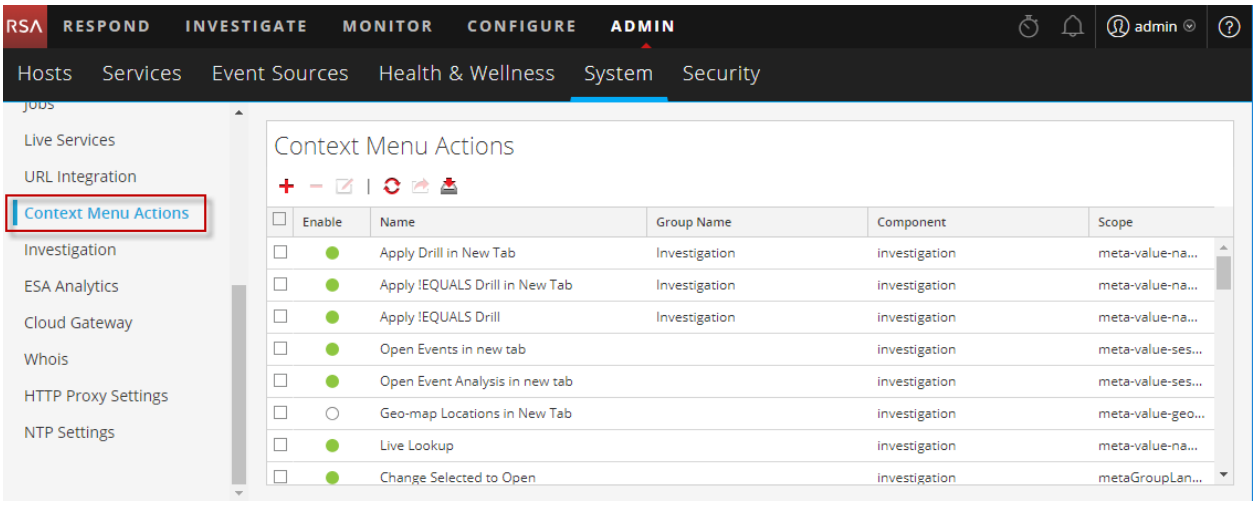
To remove a context menu action from NetWitness Platform entirely:

1. Select the action.
2. Click − .
   A dialog requests confirmation that you want to delete the context menu action.
3. Click **Yes**.
   The option is removed from the Context Menu Actions panel.

Export Context Menu Actions

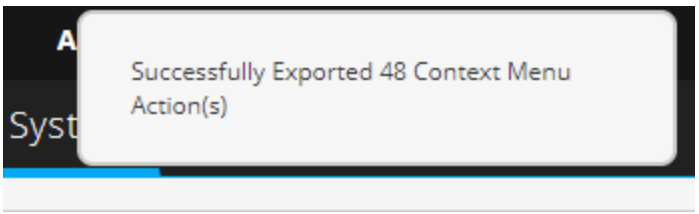
You can export context menu action(s) to a zip file. The zip file contains the JSON files with each each JSON file mapping to a context menu action. To export the context menu action(s), follow these steps:

1. Go to **Admin** > **System**.
2. Click **Context Menu Actions**.



3. Click to select a context menu action to import. Click the header to select ALL the context menu actions.

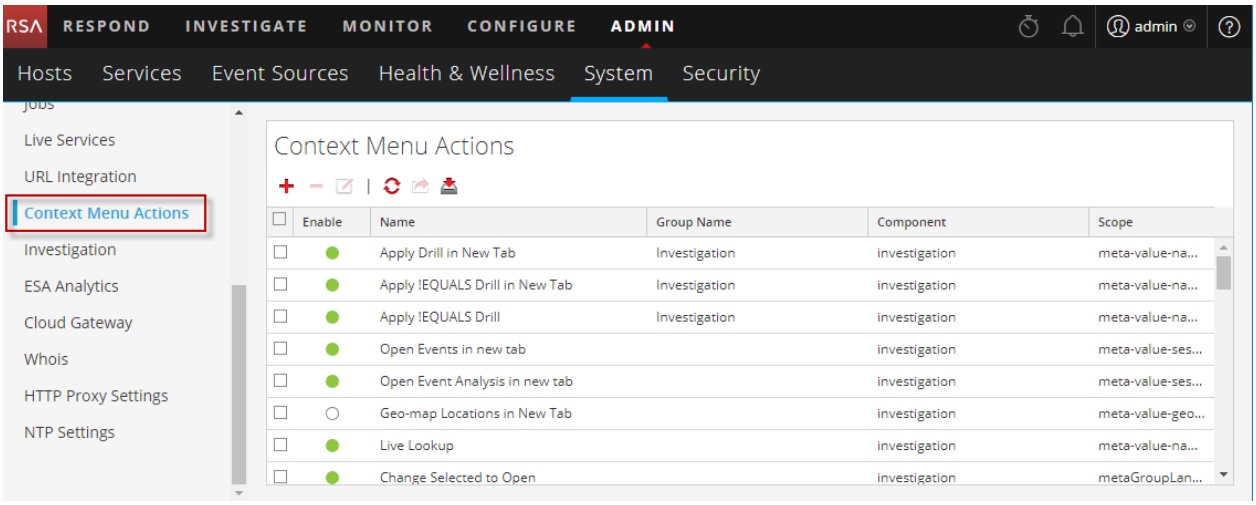
4. Click Export Action(s) under Context Menu Actions.
5. The success message confirming the actions uploaded successfully is displayed.



Import Context Menu Actions

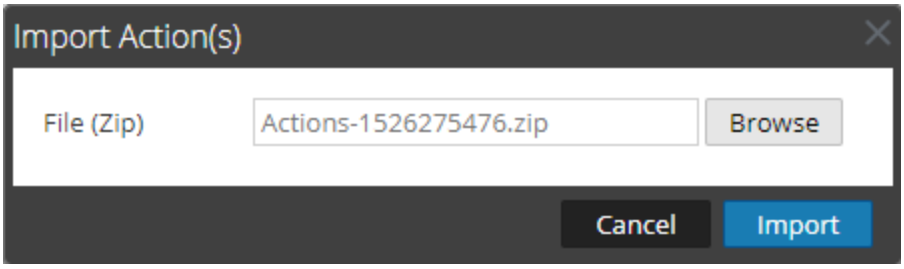
You can import ccontext actions in Context Menu Actions tab. These actions can then be edited or used as is for investigating context where applicable. Follow these steps to import a context menu action(s):

1. Go to **Admin** > **System**.
2. Click **Context Menu Actions**.



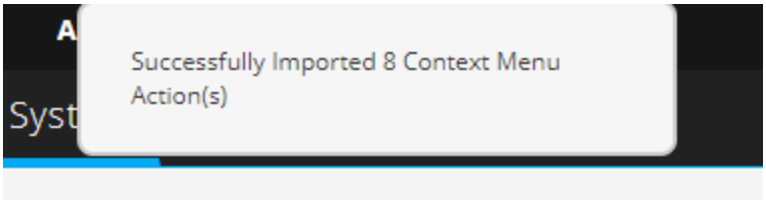
3. Click Import Action(s) under Context Menu Actions.
4. In Import Action(s) click **Browse** to locate and select the file. The zip file typically contains the json files containing context menu actions exported previously.

5. Select the Zip file and click **Open**.
6. Click **Import**



Note: There is no validation for an action for Event Analysis with a Javascript function.

7. The success message confirming the actions uploaded successfully are displayed.



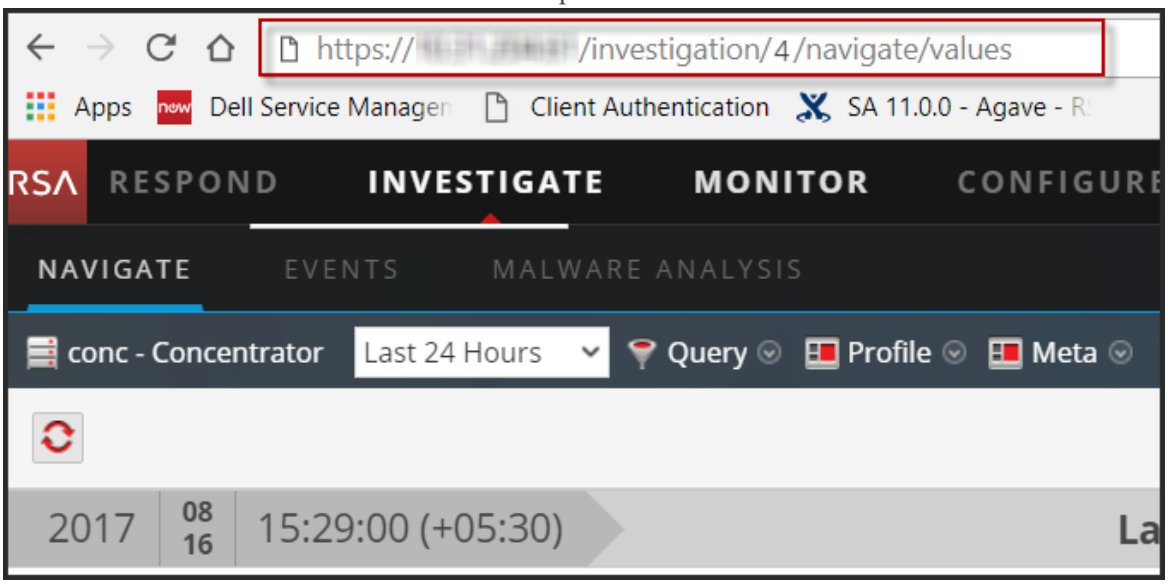
Note: If an error message is displayed, check the log files and try importing the context menu actions file again.

Example Procedure: Context Menu Action to Investigate ip.dst from alias.ip

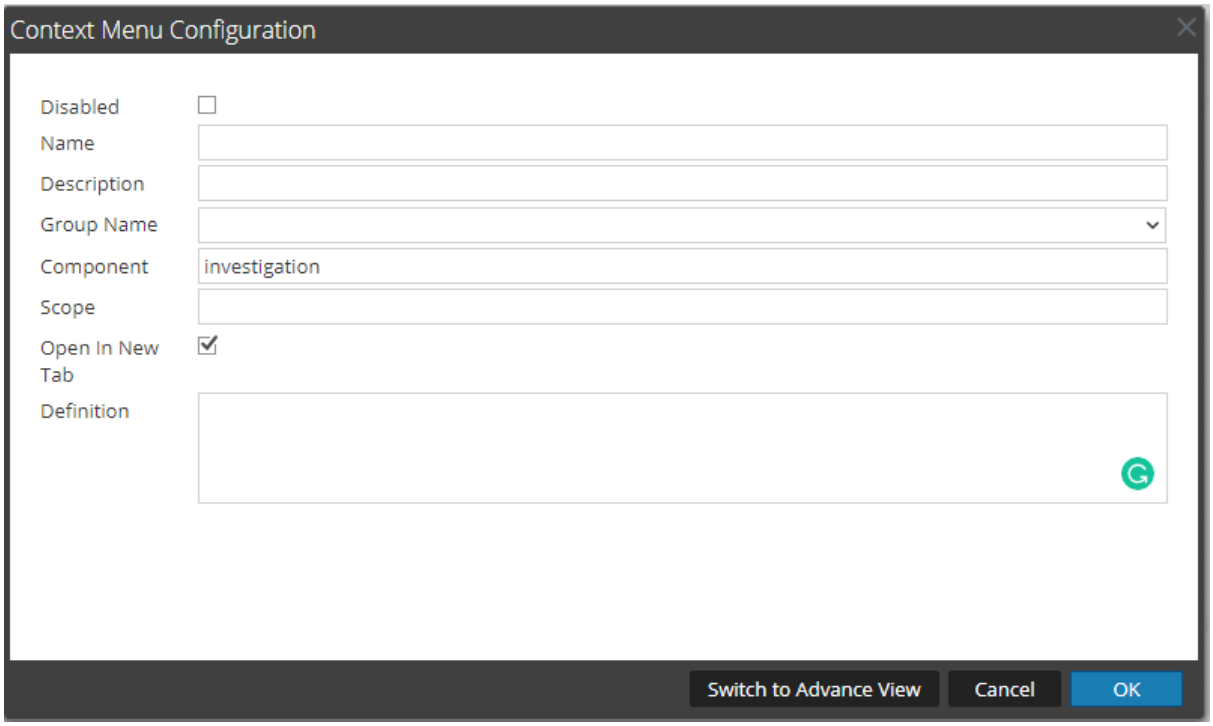
This example adds a context menu action that allows analysts to pivot from the `alias.ip` values (the IP addresses returned from a DNS request) to the `ip.dst` meta key. It helps analysts to locate any detected traffic to the IP address that was returned for a DNS query.

To implement the context menu action:

1. Determine the unique identifier for your NetWitness Server as follows:
   a. Log onto NetWitness Platform, in the main menu, select **INVESTIGATE > Navigate**, choose a service (for example, a Concentrator) to investigate, and wait for the values to load.
   b. Look for the URL and locate the number after `investigation`. In this example, the unique identifier for the action is 4. You need this unique identifier to add to the context menu action.



2. In the toolbar, click +.
   The Context Menu Configuration dialog is displayed.

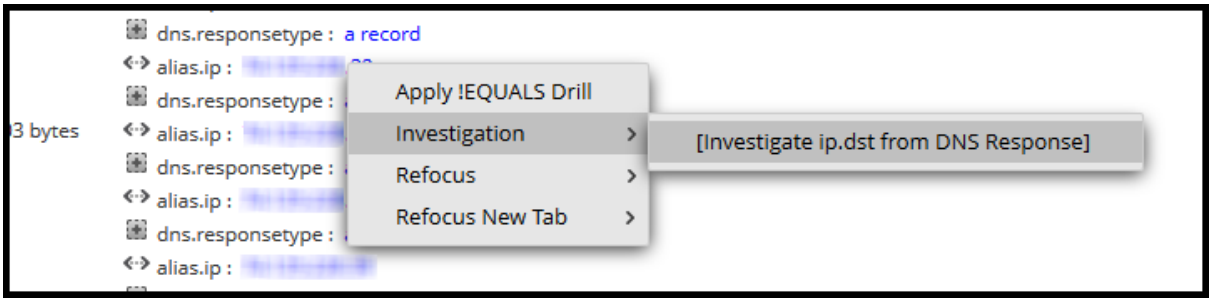


3. Copy the entire sample code block below and paste it in the window.

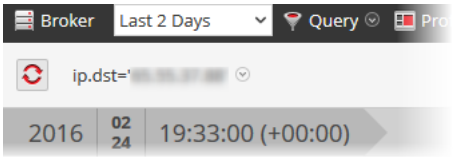
```
{
    "displayName": "[Investigate IP from DNS Response]",
    "cssClasses": [
        "alias-ip",
        "alias.ip"
    ],
    "description": "Update your NW server and ID",
    "type": "UAP.common.contextmenu.actions.URLContextAction",
    "version": "Custom",
    "modules": [
        "investigation"
    ],
    "local": "false",
    "groupName": "investigationGroup",
    "urlFormat": "/investigation/<insert_unique_identifier_
here>/navigate/query/ip.dst%3d'{0}'",
    "disabled": "",
    "id": "NavigateHost",
    "moduleClasses": [
        "UAP.investigation.navigate.view.NavigationPanel",
        "UAP.investigation.events.view.EventGrid"
    ],
```

```
    "openInNewTab": "true"
}
```

4. In the **urlFormat** line replace **<insert-unique_identifier_here>** with your unique identifier. The URL should look like this:
   `"/investigation/4/navigate/query/ip.dst%3d'{0}'"`
5. Click **OK**, and restart your browser.
6. To test the action, open an investigation in the Navigate view and right-click on the meta key `alias.ip`.
   The context menu with the Investigation option should look like the following figure.



7. Should produce a pivot like this.



8. If you are using this example for DNS traffic investigation, you may want to consider creating a meta group specific to DNS traffic as described in "Manage User-Defined Meta Groups" in the *Investigation and Malware Analysis Guide*.

Configure NTP Servers

This topic provides instructions on how to configure Network Time Protocol (NTP) servers. NTP is a protocol designed to synchronize host machine clocks over a network. For more information on NTP go to their home page (http://www.ntp.org/).

Note: NW Core hosts must be able to communicate with the NW host with UDP port 123 for NTP time synchronization.

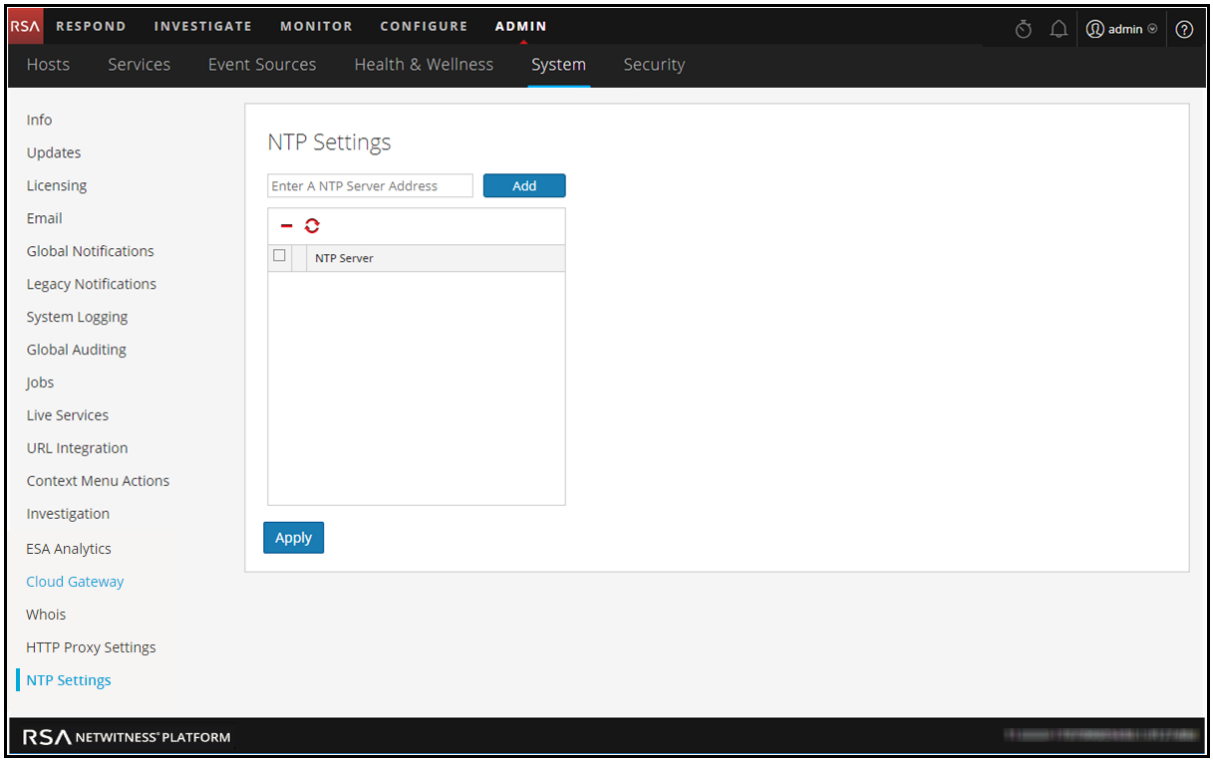
You use the **ADMIN** > **System** > **NTP Settings** view to configure one or more NTP servers. After you configure an NTP server, NetWitness Platform uses NTP to synchronize the host machine clocks. You configure multiple NTP servers for Fail Over purposes. This topic contains the following procedures:

- Add an NTP Server
- Modify an NTP Server

Add an NTP Server

To add an NTP server:

1. Go to **ADMIN > System**.
2. In the options panel, select **NTP Settings**.
   The NTP Settings panel is displayed prompting you to enter the hostname (that is, the IP Address or FQDN) of an NTP server.



3. Enter the IP address or FQDN for an NTP server.
   If the hostname syntax is invalid, NetWitness Platform disables the **Add** and **Apply** buttons and displays **Entered an invalid hostname**.
4. Click **Add**.
   - If the hostname syntax is valid and NetWitness Platform can reach the server, it displays **Validating**.
   - If the hostname syntax is valid and NetWitness Platform cannot reach a server, the following is displayed, where ***hostname*** is the hostname that you attempted to add: **The NTP server *hostname* is unreachable. Please verify the address or check your firewall settings.**
5. Click **Apply**.
   A dialog displays notification that the settings have been saved and requests confirmation that you want to apply the settings now.
6. Click **Yes**.
   The NTP server specified now ensures that your host machine clocks are synchronized. If you

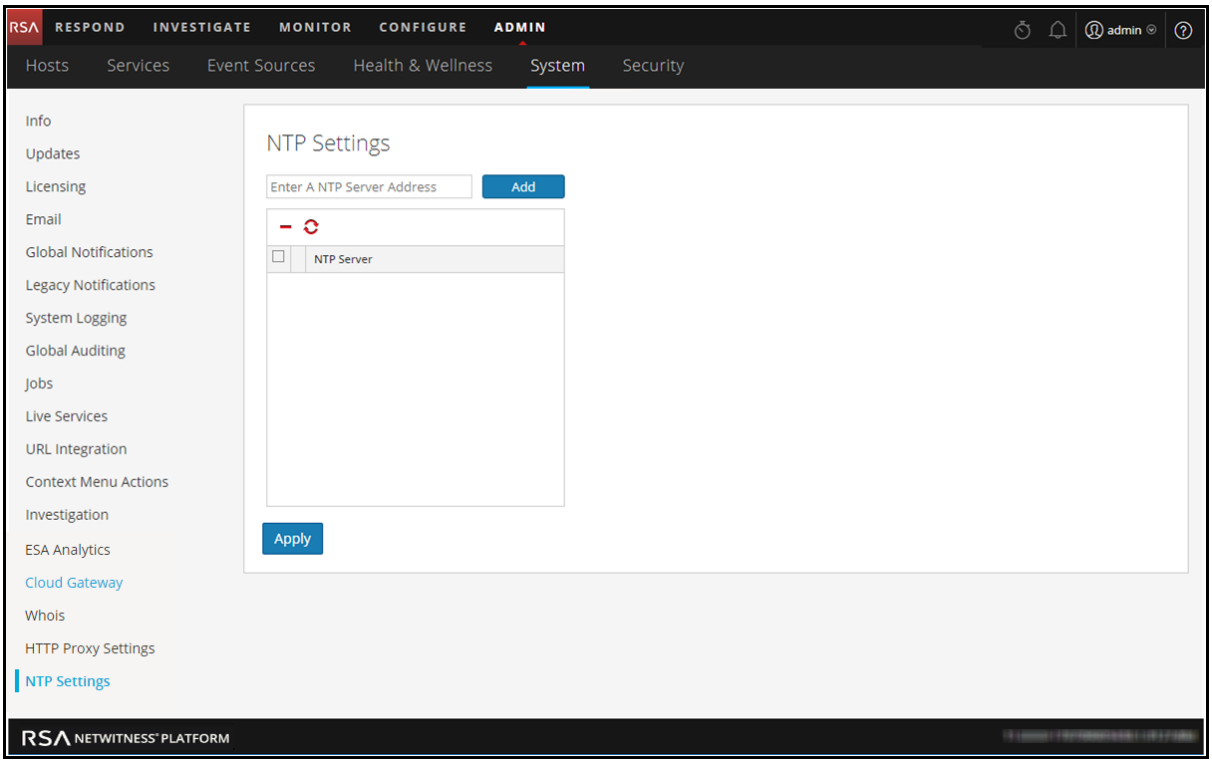
decide to configure multiple NTP servers and a server is down, NetWitness Platform will fail over to next server configured.

For details of the parameters and descriptions, see NTP Settings Panel.

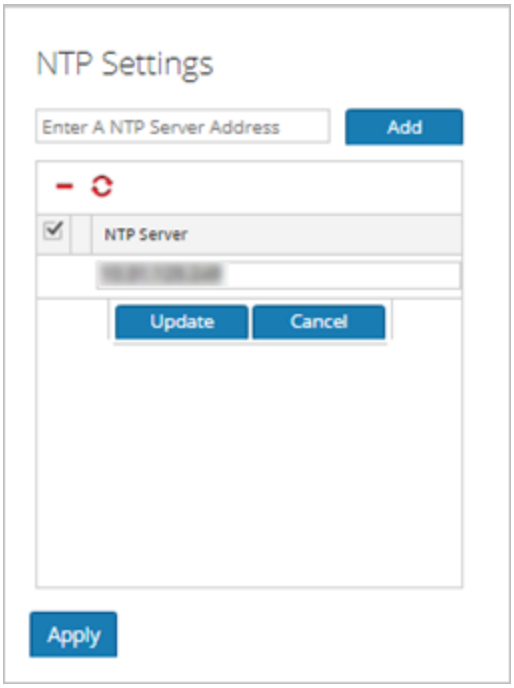
Modify an NTP Server

To modify an existing NTP server:

1. Go to **ADMIN > System**.
2. In the options panel, select **NTP Settings**.
   The NTP Setting panel is displayed.



3. Double-click the **NTP Server** hostname that you want to modify.
   The NTP Server textbox becomes editable and the Update and Cancel buttons are displayed.



4. Edit the hostname, click **Update**, and click **Apply.** (click **Cancel** before you click **Apply** to cancel the edit.)
   NetWitness Platform changes the hostname according to your edits.

Configure Proxy for NetWitness Platform

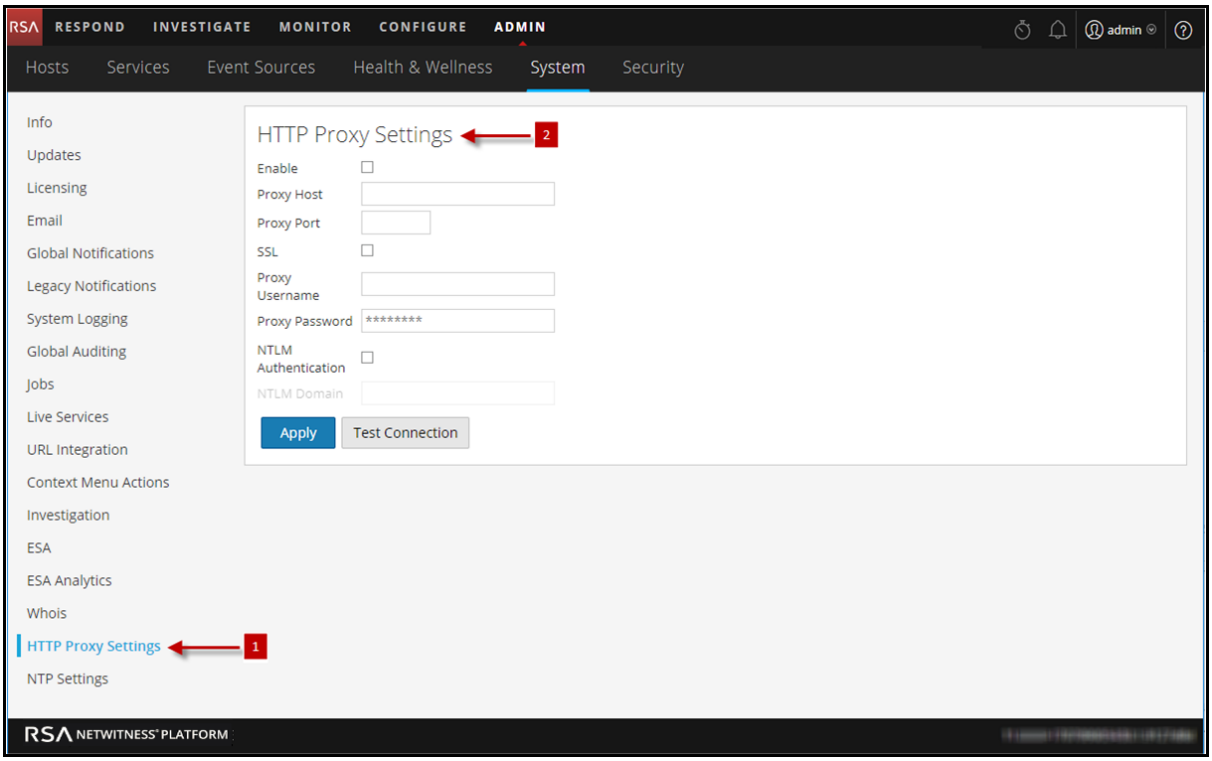
This topic provides a procedure for setting up a proxy that is used across NetWitness Platform modules and services.

Note: Proxy support is only for HTTP and HTTPS proxies and not SOCKS5.

You can configure a proxy that is used across NetWitness Platform modules and services in the System View > Advance Configuration panel. The Proxy Settings in the Advanced Configuration panel set up a proxy to be used wherever a proxy is needed in NetWitness Platform. These settings override any proxy settings configured for an individual service or module, such as Malware Analysis or Live.

To configure a proxy for use across NetWitness Platform modules:

1. Go to **ADMIN > System**.
2. In the options panel, select **HTTP Proxy Settings**. The HTTP Proxy Settings panel is displayed.



3. Click the **Enable** checkbox.

   The fields where you configure the proxy settings are activated.

4. Type the hostname for the proxy server and the port used for communications on the proxy server.
5. (Optional) Type the username and password that serve as credentials to access the proxy server if authentication is required.
6. (Optional) Enable **Use NTLM Authentication** and type the NTLM domain name.
7. (Optional) Enable **Use SSL** if communications use Secure Socket Layer.
8. To save and apply the configuration, click **Apply**.

   The proxy is immediately available for use throughout NetWitness Platform modules and services, for example, Live and Malware Analysis.

Troubleshooting System Configuration

The topics in this section provide troubleshooting information for administrators who are configuring settings that apply across the system in NetWitness Platform.

Troubleshoot Global Audit Logging

Troubleshooting NTP Server Configuration

Troubleshoot Global Audit Logging

This topic provides information about possible issues that NetWitness Platform users may encounter when implementing Global Audit Logging in NetWitness Platform. Look for explanations and solutions in this topic.

After you configure Global Audit Logging, you should test your audit logs to ensure that they show the audit events as defined in your audit logging template. If you cannot view the audit logs on your third-party syslog server or Log Decoder, or the audit logs do not appear as expected, look at the basic troubleshooting suggestions below. If you are still having issues, you can look at the advanced troubleshooting suggestions.

Basic Troubleshooting

If you cannot view audit logs on a third-party syslog server or Log Decoder:

- Verify that RabbitMQ is up and running.
- Verify the syslog notification server configuration and make sure it is enabled. (This configuration is located at ADMIN > System > Global Notifications. Do not select Legacy Notifications.)
- Check the Global Audit Logging configuration.

Configure Global Audit Logging and Verify Global Audit Logs provide instructions. If you are sending audit logs to a Log Decoder:

- Ensure that the Log Decoder is aggregating on the Concentrator on the same host (ADMIN > Services > (Select Concentrator) >  > View > Config).
- Verify that the latest CEF parser is deployed and enabled.
- Check the audit logging notification template. You must use a CEF template and all logs feeding into the Log Decoder must use a CEF template.

If you are sending audit logs to a third-party syslog server:

- Ensure that the destination port configured for the third-party syslog server is not blocked by a firewall.

Advanced Troubleshooting

In order to use Global Audit Logging on your network, RabbitMQ must be functioning.

For centralized audit logging, each of the NetWitness Platform services writes audit logs to rsyslog listening on port 50514 using UDP on the local host. The rsyslog plugin provided in the audit logging package adds additional information and uploads these logs to RabbitMQ. Logstash running on the NetWitness Server host aggregates audit logs from all of the NetWitness Platform services, coverts them to the required format, and sends them to a third-party syslog server or Log Decoder for investigation. You configure the format of the global audit logs and the destination used by Logstash through the NetWitness Platform user interface.

Define a Global Audit Logging Configuration provides instructions.

Verify the Packages and Services on the Hosts

NetWitness Platform Host

The following packages or services must be present on the NetWitness Server host:

- rsyslog-8.4.1
- rsa-audit-rt
- logstash-5.6.4
- rsa-audit-plugins
- rabbitmq server

Services on a Host other than the NetWitness Platform Host

The following packages or services must be present on each of the NetWitness Platform hosts other than the NetWitness Server host:

- rsyslog-8.4.1
- rsa-audit-rt
- rabbitmq server

Log Decoder

If you forward global audit logs to a Log Decoder, the following parser should be present and enabled:

- CEF

Possible Issues

What if I perform an action on a service but audit logs do not reach the configured third-party syslog server or Log Decoder?

The possible causes could be one or all of the following:

- A service is not logging to the local syslog server.
- Audit logs are not getting uploaded to RabbitMQ from the local syslog.
- Audit logs are not aggregated on the NetWitness Server host.
- Aggregated logs on the NetWitness Server host are not being forwarded to the configured third-party syslog server or Log Decoder.

- The Log Decoder is not configured to receive global audit logs in CEF format:
  - Log Decoder capture is not turned on
  - CEF Parser is not present
  - CEF Parser is not enabled

Possible Solutions

The following table provides possible solutions for the issues.

Issue	Possible Solutions

A service is not logging to the local syslog server.	• Ensure that rsyslog is up and running.
	You could use the following command:
	`service rsyslog status`
	• Ensure that rsyslog is listening on port 50514 using UDP.
	You could use the following command:
	`netstat -tulnp|grep rsyslog`
	• Ensure the application or component is sending audit logs to port 50514. Run the tcpdump utility on the local interface for port 50514.
	You could use the following command:
	`sudo tcpdump -i lo -A udp and port 50514`
	See ″Solution Examples" below to view the command outputs.

Audit logs are not getting uploaded to RabbitMQ from the local syslog.	• Ensure that the rsyslog plugin is up and running.
	You could use the following command:
	`ps -ef|grep rsa_audit_onramp`
	• Ensure the RabbitMQ server is up and running.
	You could use the following command:
	`service rabbitmq-server status`
	See "Solution Examples" to view the command outputs.

Issue	Possible Solutions

Audit logs are not aggregated on the NetWitness Server host.	• Ensure Logstash is up and running.
	You could use the following commands:
	`ps -ef|grep logstash`
	`service logstash status`
	• Ensure the RabbitMQ server is up and running.
	You could use the following command:
	`service rabbitmq-server status`
	• Ensure the RabbitMQ server is listening on port 5672.
	You could use the following command:
	`netstat -tulnp|grep 5672`
	• Check for any errors generated at the Logstash level.
	You could use the following command for the location of the log files:
	`ls -l /var/log/logstash/logstash.*`
	See "Solution Examples" to view the command outputs.

Aggregated logs on the NetWitness Server host are not being forwarded to the configured third-party syslog server or Log Decoder.	• Ensure Logstash is up and running.
	You could use the following commands:
	`ps -ef|grep logstash`
	`service logstash status`
	• Check for any errors generated at the Logstash level.
	You could type the following command for the location of the log files:
	`ls -l /var/log/logstash/logstash*`
	See "Solution Examples" below to view the command outputs.
	• Ensure that the destination service is up and running.
	• Ensure that the destination service is listening on the correct port using the correct protocol.
	• Ensure that the configured port on the destination host is not blocked.

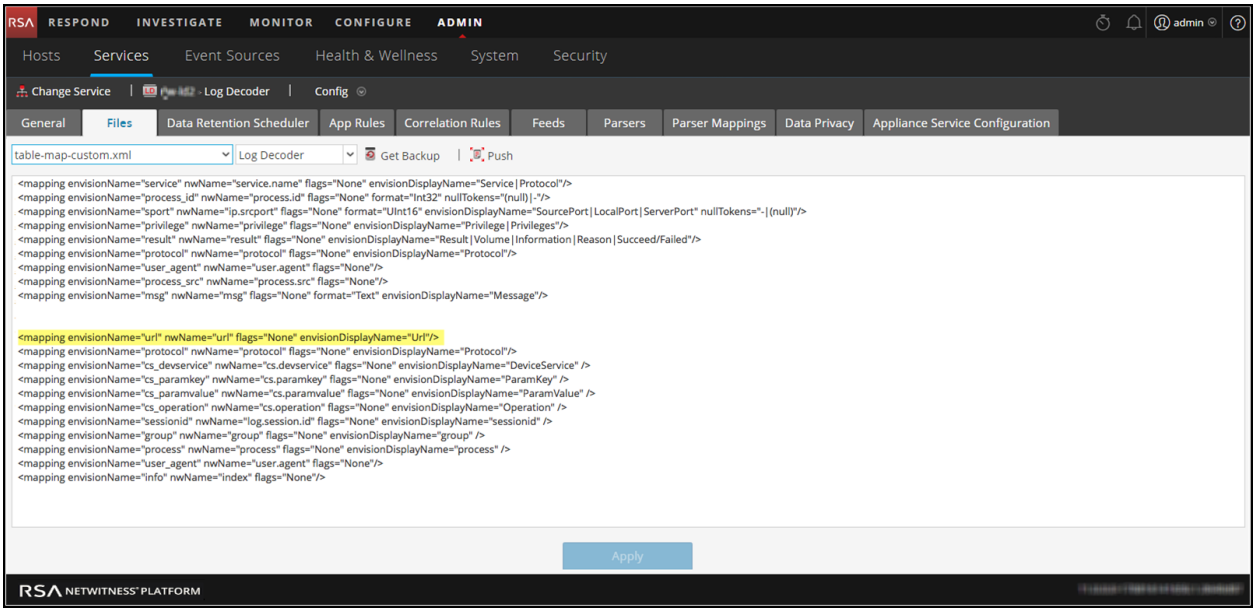
Issue	Possible Solutions
Audit logs forwarded from the Logstash lead to parse failure at the Log Decoder.	• Ensure that you are using an appropriate notification template. Audit Logs parsed by a Log Decoder must be in CEF format. The destination from which audit logs directly or indirectly make their way to the Log Decoder must also use a CEF Template. • The Notification Template must follow the CEF standard. Follow the steps in this guide to either use the default CEF template or create a custom CEF template following strict guidelines. Define a Template for Global Audit Logging provides additional information. • Verify the Logstash configuration.

Why can't we see the custom metadata in Investigation?

Usually, if a meta key is not visible in Investigation, it is not being indexed. If you need to use custom meta keys for Investigations and Reporting, ensure that the meta keys that you select are indexed in the **table-map-custom.xml** file on the Log Decoder. Follow the "Maintain the Table Map Files" procedure to modify the **table-map-custom.xml** file on the Log Decoder.

Ensure that the custom meta keys are also indexed in the **index-concentrator-custom.xml** on the Concentrator. "Edit a Service Index File" provides additional information.

The following figure shows an example **table-map-custom.xml** file in NetWitness Server (ADMIN > Services > (select the Log Decoder) >  >View > Config) with a custom meta `url` example highlighted.



The `url` custom meta example is highlighted in the following code sample from the **table-map-custom.xml** file above:

<mapping envisionName="url" nwName="url" flags="None"

envisionDisplayName="Url"/>

<mapping envisionName="protocol" nwName="protocol" flags="None"

envisionDisplayName="Protocol"/><mapping envisionName="cs_devservice"

nwName="cs.devservice" flags="None" envisionDisplayName="DeviceService"

/><mapping envisionName="cs_paramkey" nwName="cs.paramkey" flags="None"

envisionDisplayName="ParamKey" /><mapping envisionName="cs_paramvalue"

nwName="cs.paramvalue" flags="None" envisionDisplayName="ParamValue"

/><mapping envisionName="cs_operation" nwName="cs.operation" flags="None"

envisionDisplayName="Operation" /><mapping envisionName="sessionid"

nwName="log.session.id" flags="None" envisionDisplayName="sessionid"

/><mapping envisionName="group" nwName="group" flags="None"

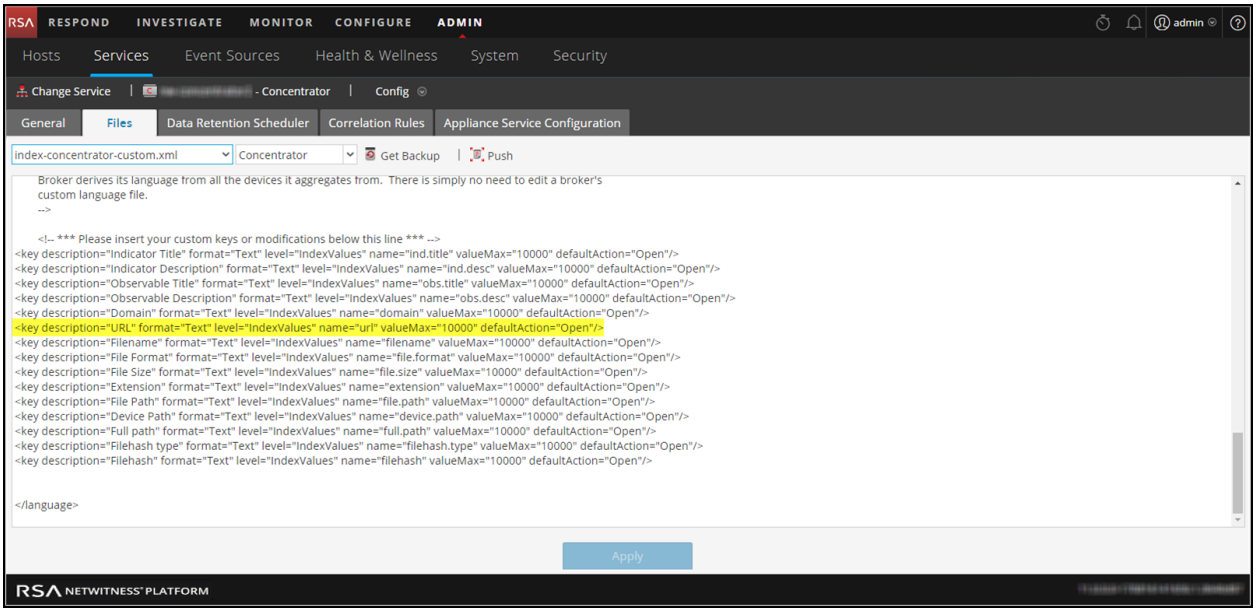
envisionDisplayName="group" /><mapping envisionName="process" nwName="process"

flags="None" envisionDisplayName="process" /><mapping envisionName="user_

agent" nwName="user.agent" flags="None"/><mapping envisionName="info"

nwName="index" flags="None"/>

The following figure shows an example **index-concentrator-custom.xml** file in NetWitness Server (ADMIN > Services > (select the Concentrator) > > View > Config) with a custom meta `url` example highlighted.



The `url` custom meta example is highlighted in the following code sample from the **index-concentrator-custom.xml** file above:

```
<key description="Severity" level="IndexValues" name="severity"
valueMax="10000" format="Text"/><key description="Result" level="IndexValues"
name="result" format="Text"/><key level="IndexValues"  name="ip.srcport"
format="UInt16" description="SourcePort"/><key description="Process"
level="IndexValues" name="process" format="Text"/><key description="Process
ID" level="IndexValues" name="process_id" format="Text"/><key
description="Protocol" level="IndexValues" name="protocol" format="Text"/><key
description="UserAgent" level="IndexValues" name="user_agent"
format="Text"/><key description="DestinationAddress" level="IndexValues"
name="ip.dst" format="IPv4"/><key description="SourceProcessName"
level="IndexValues" name="process.src" format="Text"/><key
description="Username" level="IndexValues" name="username"
format="Text"/><key description="Info" level="IndexValues" name="index"
format="Text"/><key description="customdevservice" level="IndexValues"
name="cs.devservice"  format="Text"/>
<key description="url" level="IndexValues" name="url"  format="Text"/>
<key description="Custom Key" level="IndexValues" name="cs.paramkey"
format="Text"/><key description="Custom Value" level="IndexValues"
name="cs.paramvalue"  format="Text"/><key description="Operation"
level="IndexValues" name="cs.operation"  format="Text"/><key description="CS
Device Service" level="IndexValues" name="cs.device" format="Text"
valueMax="10000" defaultAction="Closed"/>
```

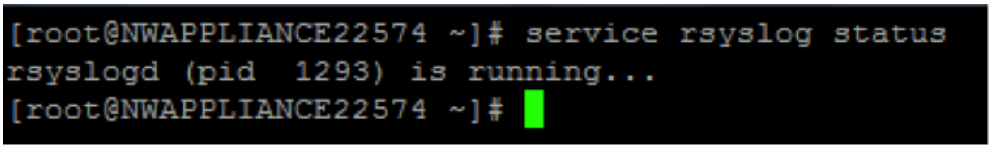
Solution Examples

The following possible solution examples show the outputs of the example commands. See the above table for the complete listing of possible solutions.

Ensure that rsyslog is up and running

You can use the following command:

```
service rsyslog status
```



Ensure that rsyslog is listening on port 50514 using UDP

You can use the following command:

```
netstat -tulnp|grep rsyslog
```

```
[root@NWAPPLIANCE22574 ~]# netstat -tulnp|grep rsyslog
udp        0      0 127.0.0.1:50514             0.0.0.0:*                           1293/rsyslogd
[root@NWAPPLIANCE22574 ~]#
```

Ensure that the application or component is sending audit logs to port 50514

The following figure shows the output of running the tcpdump utility on the local interface for port 50514.

You can use the following command:

```
sudo tcpdump -i lo -A udp and port 50514
```

```
[root@NWAPPLIANCE22574 ~]# sudo tcpdump -i lo -A udp and port 50514
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on lo, link-type EN10MB (Ethernet), capture size 65535 bytes

```

Ensure that the rsyslog plugin is up and running

You can use the following command:

```
ps -ef|grep rsa_audit_onramp
```

```
[root@NWAPPLIANCE22574 ~]# ps -ef|grep rsa_audit_onramp
root      1636  1293  0 06:05 ?        00:00:03 /usr/sbin/rsa_audit_onramp --node_id=96b08193-a9d0-4a79-b362-87b56851f411
root     22248  6921  0 09:09 pts/0    00:00:00 grep rsa_audit_onramp
[root@NWAPPLIANCE22574 ~]#
```

Ensure the RabbitMQ server is up and running

You can use the following command:

```
service rabbitmq-server status
```

```
[root@NWAPPLIANCE22574 ~]# service rabbitmq-server status
Status of node sa@localhost ...
[{pid,1862},
 {running_applications,
     [{rabbitmq_federation_management,"RabbitMQ Federation Management",
         "3.4.2"},

     "Erlang R16B03 (erts-5.10.4) [source] [64-bit] [smp:2:2] [async-threads:30] [kernel-poll:true]\n"},
 {memory,
```

Ensure logstash is up and running

You can use the following commands:

```
ps -ef|grep logstash
service logstash status
```

```
[root@NWAPPLIANCE22574 ~]# ps -ef|grep logstash
logstash  1583     1  0 06:05 ?       00:01:09 /usr/bin/java -Djava.io.tmpdir=/var/lib/logstash -Xmx500m -XX:+UseParNewGC -XX:+UseConcMarkSweepGC -Djava.awt.headless=true -XX:C
MSInitiatingOccupancyFraction=75 -XX:+UseCMSInitiatingOccupancyOnly -jar /opt/logstash/vendor/jar/jruby-complete-1.7.11.jar -I/opt/logstash/lib /opt/logstash/lib/logstash/runner
.rb agent --pluginpath /opt/logstash -f /etc/logstash/conf.d -l /var/log/logstash/logstash.log
root      8509  6921  0 09:31 pts/0    00:00:00 grep logstash
[root@NWAPPLIANCE22574 ~]# service logstash status
logstash is running
[root@NWAPPLIANCE22574 ~]#
```

Ensure the RabbitMQ server is listening on port 5672

For example, type the following command:

```
netstat -tulnp|grep 5672
```

```
[root@NWAPPLIANCE22574 ~]# netstat -tulnp|grep 5672
tcp        0      0 127.0.0.1:5672              0.0.0.0:*                   LISTEN      1862/beam.smp
tcp        0      0 0.0.0.0:25672               0.0.0.0:*                   LISTEN      1862/beam.smp
[root@NWAPPLIANCE22574 ~]#
```

Check for any errors generated at the Logstash level

You can type the following command for the location of the log files:

```
ls -l /var/log/logstash/logstash.*
```

```
[root@NWAPPLIANCE22574 ~]# ls -l /var/log/logstash/logstash.*
-rw-r--r--. 1 root     root        0 Apr 24 06:05 /var/log/logstash/logstash.err
-rw-r--r--. 1 logstash logstash 1043 Apr 24 06:04 /var/log/logstash/logstash.log
-rw-r--r--. 1 root     root       57 Apr 24 06:12 /var/log/logstash/logstash.stdout
[root@NWAPPLIANCE22574 ~]#
```

See the Possible Solutions table above for the complete listing of issues and possible solutions.

Troubleshooting NTP Server Configuration

This topic describes NTP server configuration issues that you may encounter and suggests solutions to these problems.

Issues Identified by Messages in the NTP Settings Panel or Log Files

This section provides troubleshooting information for issues identified by messages NetWitness Platform displays in the NTP Settings panel and log files.

Message	User Interface: **Unexpected error occurred. First check the logs then contact Customer Care to resolve error.** **System Log:** **Timestamp Level Message** *yyyy-dd-mmThh:mm:ss:ms* ERROR com.rsa.smc.sa.adm.exception.MCOAgent Exception: No request sent, we did not discover any nodes
Possible Cause	Low level NetWitness Platform configuration is in error or supporting service is not running.
Solution	Contact Customer Care.
Message	User Interface: **Specified an invalid Hostname syntax**.
Possible Cause	Tried to enter NTP server hostname that does not confirm to IP address or FQDN syntax.
Solution	Reenter hostname in using correct syntax.
Message	User Interface: **Specified NTP server that already exists.**
Possible Cause	Tried to enter NTP server hostname that is already defined in NetWitness Platform.
Solution	Enter hostname for an NTP server not configured in NetWitness Platform.
Message	User Interface: **Cannot reach NTP server *hostname***. Please verify the server address and your firewall settings.
Possible Cause	The server address or firewall settings may be in error.
Solution	Verify the server address and your firewall settings and correct them if required.

References

This topic provides reference materials that describe the user interface for configuring system settings in NetWitness Platform and define parameters. Administrators use options in the Administration System view to configure system settings. Each panel is described in a separate topic.

Global Audit Logging Configurations Panel

In the **Global Audit Logging Configurations** panel (ADMIN > System > Global Auditing), you configure global audit logging by adding configurations that define how global audit logs are forwarded to external syslog systems. Global audit logs are forwarded to the selected Notification Server in your global audit logging configuration using the selected Notification Template.

Global Audit Logging provides auditors with consolidated visibility into user activities within NetWitness Platform in real-time from one centralized location.

Workflow

This workflow shows the necessary procedures to configure and verify Global Audit Logging.

Before you can define a Global Audit Logging configuration, you need to create a Syslog Notification Server on the Global Notifications > Server tab. The Syslog Notification Server is the destination that receives the global audit logs. Next, you need to select or define an Audit Logging template on the Global Notifications > Templates tab. The Audit Logging template defines the format and message fields of the audit logs sent to the Log Decoder or third-party syslog server. If you are consuming with a Log Decoder, deploy the Common Event Format parser to your Log Decoder from Live.

Note: You do not need to configure the Global Notifications > Output tab for Global Audit Logging.

After you add a Global Audit Logging configuration here, audit logs are forwarded to the selected Notification Server in the configuration. Verify your audit logs to ensure that they show the audit events as defined in your audit logging template.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Create a Syslog Notification Server.	Configure a Destination to Receive Global Audit Logs
Administrator	Choose an Audit Logging template.	Define a Template for Global Audit Logging
Administrator	Configure Global Audit Logging	Define a Global Audit Logging Configuration For the complete procedure, see "Global Audit Logging - High-Level Procedure" in Configure Global Audit Logging.

Role	I want to ...	Show me how
Administrator	Verify Global Audit logs	Verify Global Audit Logs

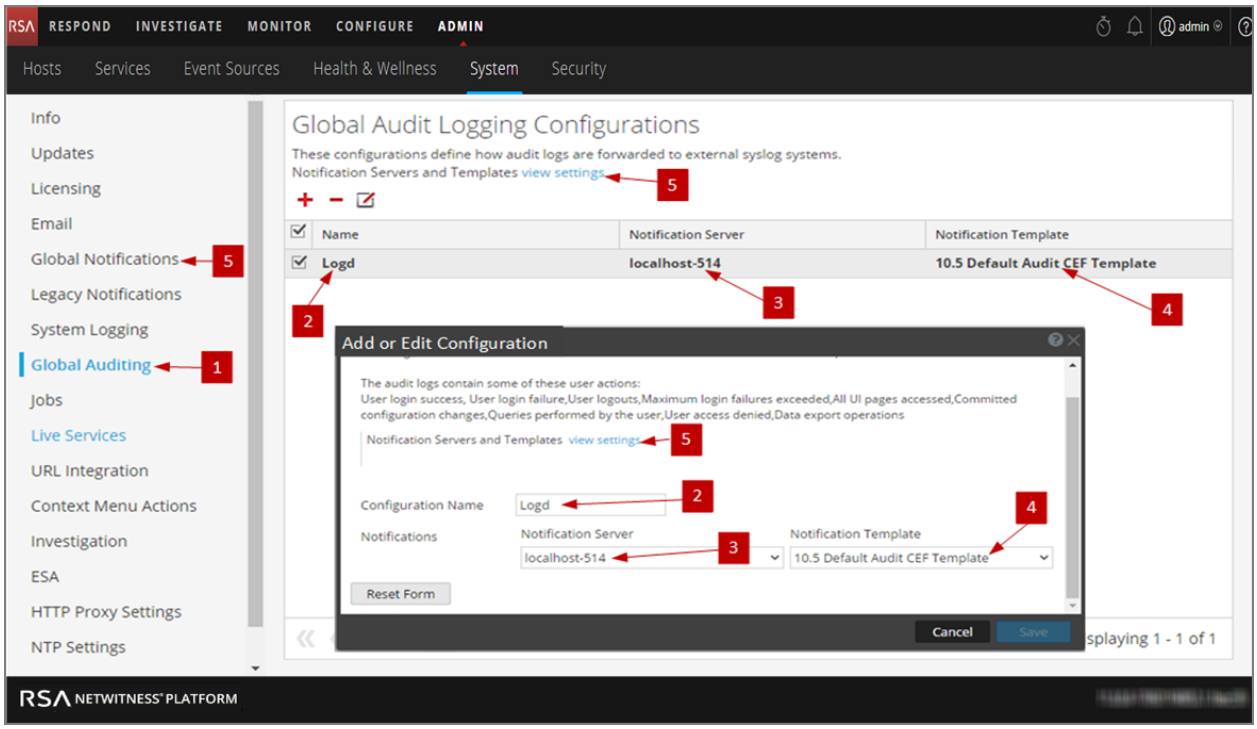
Quick Look

The following example illustrates a Global Audit Logging configuration. The configuration defines how NetWitness Platform forwards global audit logs to external syslog systems.



1 Displays the Global Audit Logging Configurations panel.
2 Name that identifies the Global Audit Logging configuration.
3 Notification Server assigned to the Global Audit Logging configuration.
4 Notification Template assigned to the Global Audit Logging configuration.
5 Displays the Global Notifications panel where you set up Servers and Templates required to configure a Global Audit Logging configuration.

Toolbar

The following table describes the toolbar actions

Icon	Description
	Adds a global audit logging configuration.
	Deletes a global audit logging configuration. Deleting a global audit configuration does not delete the associated notification server and template. After you delete a global audit logging configuration, the forwarding of global audit logs specified in that configuration is discontinued.
	Edits a global audit logging configuration. You can change the destination of the global audit logs for your user audits by selecting a different Notification Server. You can also change the format and message fields of the global audit log entries by selecting a different Notification Template. You cannot change which NetWitness Platform user actions are logged and sent in the global audit logs.

Configurations

The following table describes the listed configurations.

Title	Description
	To select an individual configuration, select the checkbox next to the configuration. To select all configurations, select the checkbox in the title bar of the table.
Name	Displays the name of the global auditing configuration. For example, you can name the configurations based on the destination of the global audit logs, such as HQ SA and My Syslog Server.
Notification Server	Displays the Syslog Notification Server selected as the destination for the global audit logs. If you want to forward global audit logs to a Log Decoder, create a Syslog type of Notification Server. Configure a Destination to Receive Global Audit Logs provides instructions on how to create a Syslog Notification Server for global audit logging.
Notification Template	Displays the Audit Logging Notification Template selected for the configuration. It defines the format and message fields of the audit log entries. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions and Supported CEF Meta Keys describes the available CEF meta keys. For, third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available meta key variables.

Add New Configuration Dialog

In the RSA NetWitness® Platform Administration System view Global Audit Logging Configurations panel, you can create multiple global audit logging configurations. These configurations are used to forward global audit logs to a central location to perform user audits.

Procedures related to global audit logging are described in Configure Global Audit Logging.

To access the **Add New Configuration** dialog:

1. In the main menu, select **ADMIN > System**.
2. In the options panel, select **Global Auditing**.
3. In the **Global Audit Logging Configurations** panel, click +.

   The **Add New Configuration** dialog is displayed.

   The Notifications section enables you to select a syslog notification server for the global audit logging configuration and a template to use for the global audit logs. The template defines the details of the global audit log entries.

Features

The following table describes the features in the Add New Configuration and Edit Configuration dialogs.

Feature	Description
Notifications Servers and Templates **view settings** link	Takes you to the Global Notifications panel where you can view or configure the notification server and template settings. A syslog notification server and an audit logging template are required before you can create a global audit configuration.

Feature	Description
Configuration Name	Specifies the unique name used to identify the global audit logging configuration.
Notification Server	Specifies the syslog notification server to send the selected audit log information. Configure a Destination to Receive Global Audit Logs provides instructions on how to create a Syslog Notification Server for global audit logging.
Notification Template	Specifies the template to use for the global audit logging configuration. The template should be an Audit Logging template. For Log Decoders, use the **Default Audit CEF Template**. You can add or remove fields from the Common Event Format (CEF) template if you have specific requirements. Define a Template for Global Audit Logging provides instructions. For third-party syslog servers, you can use a default audit logging template or define your own format (CEF or non-CEF). Define a Template for Global Audit Logging provides instructions and Supported Global Audit Logging Meta Key Variables describes the available variables.
Reset Form button	Clears the configuration settings in the dialog.

User Actions Logged

The following table provides examples of some of the user actions logged from NetWitness Platform. These actions are the minimum user actions logged when applicable.

User Action	Example
User login success	A user logs on with valid credentials.
User login failure	A user tries to log on using invalid credentials.
User logouts	A user logs out from NetWitness Platform (Administration > Sign Out) or a user logs out due to a session timeout.
Max login failures exceeded	A user tries to log on using invalid credentials five times. Five (5) is the number of Max Login Failures defined in Administration Security view > Settings tab (Administration > Security > Settings tab).
All UI pages accessed	When a user accesses the Reporting module (Administration > Reports), it logs as `[REP] Reports`. When a user accesses the Administration System view (Administration > System), it logs as `[ADM] System`.
Committed configuration changes	A user changes his or her password and or any security setting (Administration > Security > Settings tab).

User Action	Example
Queries performed by the user	A user performs an investigation query.
User access denied	A user tries to access a module and does not have permissions to access it.
Data export operations	A user exports data from the Events view (Investigation > Events > Actions > Export).

The following table shows examples of internal audit logs logged from NetWitness Suite.

User Action	Audit Log Example
User logouts	`2018-08-29 06:41:13,882 deviceVersion: "11.2.0.0" deviceService: "SA_SERVER" category: AUTHENTICATION operation: "Logoff" outcome: "Success" identity: "testuser" userRole: "Operators"`
All UI pages accessed	`2018-08-29 07:18:25,030 deviceVersion: "11.2.0.0" deviceService: "SA_SERVER" category: SYSTEM operation: "Page Accessed" outcome: "Success" key: "[LIVE] Search" identity: "testuser" userRole: "Operators"`
Committed configuration changes	`2018-08-29 06:36:08,978 deviceVersion: "11.2.0.0" deviceService: "SA_SERVER" category: CONFIGURATION scope: "YumRepositoryConfigMXBeanImpl" operation: "Modified" key: "YumRepositoryConfigMXBeanImpl" identity: "admin" userRole: "Administrators"`
Queries performed by the user	`2018-08-29 08:17:32,561 deviceVersion: "11.2.0.0" deviceService: "SA_SERVER" category: DATA_ACCESS operation: "query" parameters: "NativeQueryMessage{ deviceId=14, isAppliancePath=false, timeout=null, collectionName=\'\', appliancePath=false, sdkPath=\'/sdk\', metaIdRange=FieldIdRange [beginId=1, endId=25877356], size=1, flags=null, query=\'select sessionid where (ip.src = 18.206.201.189) && time=\"2018-08-21 06:58:00\"-\"2018-08-21 09:57:59\"\', threshold=null}" outcome: "Success" identity: "testuser" userRole: "Analysts"`
Data export operations	`2018-08-29 08:17:32,584 deviceVersion: "11.2.0.0" deviceService: "SA_SERVER" category: DATA_ACCESS operation: "submitExtractPcap" parameters: "deviceId=14 collectionName= predicateHandle=6 sessionIds=null startDate=2018-08-21T06:58:00.000Z endDate=2018-08-21T09:57:59.999Z id1=1 id2=25877356" outcome: "Success" identity: "testuser" userRole: "Analysts"`

The following table shows examples of Global Audit Logs using the default Common Event Format (CEF) template. After you create a Global Audit Logging configuration, audit logs

automatically go to the external syslog system in the format specified in the selected Audit Logging template.

User Action	CEF Template
User logouts	Aug 29 2018 06:41:13 nwsa11101 CEF:0|RSA|NetWitness Audit|11.2.0.0|AUTHENTICATION|Logoff|6|rt=Aug 29 2018 06:41:13 suser=testuser sourceServiceName=SA_SERVER deviceExternalId=8b5a60e4-de69-4f98-aada-f1ea5d82be88 deviceProcessName=SA_SERVER outcome=Success

The following table shows examples of global audit logs using the default human-readable format template on a third-party syslog server.

User Action	Human-Readable Format Output
User logouts	Aug 29 2018 06:41:13 SA_SERVER [audit] Event Category: AUTHENTICATION Operation: Logoff Outcome: Success Description: null User: testuser Role: Operators
All UI pages accessed	Aug 29 07:19:53 nwsa11101 Aug 29 2018 07:19:53 SA_SERVER [audit] Event Category: SYSTEM Operation: Page Accessed Outcome: Success Description: null User: testuser Role: Operators
Committed configuration changes	Aug 29 2018 06:36:08 SA_SERVER [audit] Event Category: CONFIGURATION Operation: Modified Outcome: null Description: null User: admin Role: Administrators

User Action	Human-Readable Format Output
Queries performed by the user	`Aug 29 08:13:04 nwsa11101 Aug 29 2018 08:13:04 SA_SERVER [audit] Event Category: DATA_ACCESS Operation: query Outcome: Success Description: null User: testuser Role: Analysts`
Data export operations	`Aug 29 08:19:14 nwsa11101 Aug 29 2018 08:19:14 SA_SERVER [audit] Event Category: DATA_ACCESS Operation: submitExtractPcap Outcome: Success Description: null User: testuser Role: Analysts`

For lists of message type being logged by the various NetWitness Platform components, see Global Audit Logging Operation Reference.

Supported CEF Meta Keys

This topic describes the Common Event Format (CEF) meta keys that NetWitness Platform global audit logging supports.

Global audit logging templates that you define for a Log Decoder use Common Event Format (CEF) and must meet the following specific standard requirements:

- Include the CEF headers in the template.
- Use only the extensions and custom extensions in a (Key=Value) format from the meta key table below.
- Ensure that the extensions and custom extensions are in the `key=%{string}<space>key=%{string}` format.

For third-party syslog servers, you can define your own format (CEF or non-CEF).

Procedures related to this table are described in Define a Template for Global Audit Logging and Configure Global Audit Logging.

Supported Common Event Format (CEF) Meta Keys

The following table describes the CEF Syslog meta keys that NetWitness Platform global audit logging supports. The Datetime and Hostname fields in the Syslog Prefix are not configurable and not included in the template, but they are prepended to every log message by default. The CEF Header is required to conform to the CEF standard and for any CEF parser. The Extensions and Custom Extensions are optional. The Default Audit CEF Template contains many of the fields in this table. You can add any of the Extensions and Custom Extensions listed to the global audit logging template that you define.

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
Syslog Prefix				
Datetime	Not Configurable	Syslog Header date time	event.time.str	Transient
Hostname	Not Configurable	Syslog Header hostname	alias.host	None
CEF Header		The CEF Header fields are required to conform to the CEF standard and for any CEF parser.		
CEF:Version	CEF:0	CEF Header	--STATIC--	N/A
DeviceVendor	%{deviceVendor}	The product vendor, RSA	-	N/A

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
DeviceProduct	%{deviceProduct}	The product family. This is always NetWitness Platform Audit.	product	Transient
DeviceVersion	%{deviceVersion}	Host/Service version	version	Transient
Signature ID	%{category}	Identifier of the audit event. It specifies the the category of the audit event.	event.type	None
Name	%{operation}	Description of the event	event.desc	None
Severity	%{severity}	Severity of the audit event	severity	Transient
Extensions				
deviceExternalId	%{deviceExternalId}	Unique ID of the host or service generating the audit event	hardware.id	Transient
deviceFacility	%{deviceFacility}	Syslog facility used when writing the event to syslog daemon. For example, authpriv.	cs.devfacility	Custom
deviceProcessName	%{deviceProcessName}	Name of the executable corresponding to dvcpid	process	None
dpt	%{destinationPort}	Destination Port	ip.dstport	None
dst	%{destinationAddress}	Destination IP Address	ip.dst	None
dvcpid	%{deviceProcessId}	ID of the process generating the event, which is the process ID of the NetWitness Platform service	process.id	Transient
msg	%{text}	Free text, extra information, or actual description for the event	msg	Transient

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
outcome	%{outcome}	Outcome of the operation performed corresponding to the audit event	result	Transient
proto	%{transportProtocol}	Network protocol used	protocol	Transient
requestClientApplication	%{userAgent}	Browser detail of the user accessing the page	user.agent	Transient
rt	%{timestamp}	Time at which the event is reported	event.time	None
sourceServiceName	%{sourceService}	The service that is responsible for generating this event	service.name	Transient
spt	%{sourcePort}	Source Port	ip.srcport	Transient
spriv	%{userRole}	User role permissions assignment. For example: admin.owner, appliance.manage, connections.manage, everyone, logs.manage, services.manage, storedproc.execute, storedproc.manage, sys.manage, users.manage	privilege	Transient
src	%{sourceAddress}	Source IP Address	ip.src	None
suser	%{identity}	Identity of the logged on user responsible for generating the audit event	user.dst	None
Custom Extensions				
deviceService	%{deviceService}	Service responsible for generating the event	cs.devservice	Custom
parameters	%{parameters}	API and Operation parameters, which capture specific parameters about a query	index	Transient

CEF Field	String	Description	NW Meta Keys	Index in Log Decoder
paramKey	%{key}	A configuration item key. It is the config param for which the audit event is captured. For example: /sys/config/stat.interval	cs.key	Custom
paramValue	%{value}	A configuration value. It is the value captured during the update.	cs.value	Custom
userGroup	%{userGroup}	Role assignment. For example: Administrators, Analysts, MalwareAnalysts, Malware_Analysts, Operators, PRIVILEGED_CONNECTION_AUTHORITY, SOC_Managers	group	None
referrerURL	%{referrerUrl}	The parent URL that refers to the current URL	url	Transient
sessionId	%{sessionId}	Session or connection identifier	log.session.id	Transient

Note: Use all of the extensions in the following format:
`deviceProcessName=%{deviceProcessName} outcome=%{outcome}`
Include a `<space>` between a value and a tagname.

By default, all meta keys are not indexed. In the above table, the **Index in Log Decoder** column shows the state of the `flags` keyword (Transient, None, and Custom). If a key is set to `Transient`, it is parsed but not stored in the database. If it is set to `None`, it is indexed and stored in the database. A key listed as "Custom" does not exist in the table-map.xml file and, therefore, it is not stored or parsed at all.

"Maintain the Table Map Files" provides instructions for verifying and updating the table mappings. "Edit a Service Index File" provides information on updating the custom index file on the Concentrator.

Supported Global Audit Logging Meta Key Variables

This topic describes the meta key variables that NetWitness Platform global audit logging supports.

NetWitness Platform provides predefined global audit logging templates that you can use for your global audit logging configurations. For third-party syslog servers, you can define your own template format (CEF or non-CEF) using supported meta key variables.

Procedures related to this table are described in Define a Template for Global Audit Logging and Configure Global Audit Logging.

Supported Global Audit Logging Meta Key Variables

The following table describes the meta key variables that NetWitness Platform global audit logging supports. Use these values to create a custom audit logging template for a third-party syslog server.

Variable	Description
%{category}	Identifier of the audit event. It specifies the the category of the audit event.
%{destinationAddress}	Destination IP Address
%{destinationPort}	Destination Port
%{deviceExternalId}	Unique ID of the service generating the audit event
%{deviceFacility}	Syslog facility used when writing the event to syslog daemon. For example, authpriv.
%{deviceProcessId}	ID of the process generating the event, which is the process ID of the NetWitness Platform service
%{deviceProcessName}	Name of the executable corresponding to dvcpid
%{deviceProduct}	The product family. This is always NetWitness Platform Audit.
%{deviceService}	Service responsible for generating the event
%{deviceVendor}	The product vendor, RSA
%{deviceVersion}	Host/Service version
%{identity}	Identity of the logged on user responsible for generating the audit event
%{key}	A configuration item key. It is the config param for which the audit event is captured.
%{operation}	Description of the event

Variable	Description
%{outcome}	Outcome of the operation performed corresponding to the audit event
%{parameters}	API and Operation parameters, which capture specific parameters about a query
%{referrerUrl}	The parent URL that refers to the current URL
%{sessionId}	Session or connection identifier
%{severity}	Severity of the audit event
%{sourceAddress}	Source IP Address
%{sourcePort}	Source Port
%{sourceService}	The service that is responsible for generating this event
%{text}	Free text, extra information, or actual description for the event
%{timestamp}	Time at which the event is reported
%{transportProtocol}	Network protocol used
%{userAgent}	Browser detail of the user accessing the page
%{userGroup}	Role assignment
%{userRole}	User role permissions assignment
%{value}	A configuration value. It is the value captured during the update

Global Audit Logging Operation Reference

This topic lists message types being logged by the various NetWitness Platform components. Most messages plainly state the operation being logged; when necessary the meaning of the message is explained.

After you create a global audit logging configuration, audit logs automatically go to the external syslog system in the format specified in the selected audit logging template. The message types being logged by the various NetWitness Platform components are shown in the following tables.

CARLOS

The following table lists the operations logged by CARLOS.

Serial #	Operation Name	Meaning
1	SetProviderConfiguration	A new notification server (for example, SMTP server) was added or updated
2	SetInstanceConfiguration	A new notification type (for example, email destination) was added or updated
3	SetTemplateDefinition	A new template was added or updated
4	RemoveProviderConfiguration	A notification server was removed
5	RemoveInstanceConfiguration	A notification type was removed
6	RemoveTemplateDefinition	A template definition was removed
7	Commit	A configuration bean change was committed
8	Set	A JMX property value was set via NetWitness Platform Explore view

ESA

The following table lists the operations logged by the Event Stream Analysis (ESA).

Serial #	Operation Name	Meaning
9	SetSourceRequest	A concentrator was added or updated to ESA as source
10	RemoveSourceRequest	A concentrator was removed from ESA as source
11	SetEplModule	An EPL module was deployed or updated to ESA
12	RemoveEplModule	An EPL module was removed from ESA

Serial #	Operation Name	Meaning
13	SetEnrichmentSourceRequest	An ESA enrichment source was added/updated
14	RemoveEnrichmentSourceRequest	An ESA enrichment source was removed
15	SetDatabaseReference	An enrichment database reference was made to ESA
16	UpdateEnrichmentData	Data rows added to an ESA enrichment source
17	SetEnrichmentConnection	A connection was made between an EPL module and an enrichment source
18	RemoveEnrichmentConnection	A connection between an EPL module and an enrichment source was removed
19	DisableTrialModule	ESA Trial rules were disabled

Investigation

The following table lists the operations logged by Investigations.

Serial #	Operation Name	Meaning
1	VisualizePreferences	Operations related to Informer Visualization Request.
2	ParallelCoordinates	Operations related to Loading of Co-Ordinate View Navigation.
3	TimeLine	Operations related to Loading of Timeline View Navigation.
4	ExteralQuery	Operation when a Direct Query is fired via URL.
5	PrintView	Operations to open Investigation in Print View.
6	submitExtractFiles	Operation to submit a Request to Extract files from Sessions.
7	submitExtractLogs	Operation to submit a Request to Extract Logs from Sessions.
8	submitExtractPcap	Operation to submit a Request to Extract Sessions from Sessions.
9	DataScienceDrill	Operation to investigate from Data Science Report.

Serial #	Operation Name	Meaning
10	breadCrumbs	Operation to access the Query Breadcumbs.
11	Create	Operation when a new Investigation Query is being saved as a predicate to be used for URL Integration.
12	userPredicates	Operation to access Recent Queries of a user.
13	chartDefaultMetas	Operation to access last used Meta for generating Coordinate Chart.
14	defaultDevice	Operation to access the Default Investigation Device.
15	deleteDefaultDevice	Operation to delete the Default Investigation Device.
16	chartPreferences	Operation to edit an Investigation Navigation Chart Parameters such as Height.
17	devicePreferences	Operation to save the preferences about the Investigation Device such asTime Range, Profile, Meta Groups etc.
18	topValues	Operation to get the Top Values for Metas. Normally called from Top Values Dashlet.
19	MetaLanguages	Operation to read the Meta Languages from a Device.
20	MetaGroups	Operations related to Investigation Meta Groups.
21	DefaultMetaKeys	Operations related to Investigation Default Meta Keys.
22	UpdateDefaultMetaKeys	Operations to update Investigation Default Meta Keys.
23	UpdateMetaGroup	Operations to update Investigation Meta Groups.
24	ApplyMetaGroup	Operations to use Investigation Meta Groups.
25	DeactivateMetaGroup	Operations to reset Investigation Meta Groups in UI.
26	DeleteMetaGroup	Operations to remove Investigation Meta Group.

Serial #	Operation Name	Meaning
27	DeleteMetaGroups	Operations to remove multiple Investigation Meta Groups.
28	ImportMetaGroups	Operations to import Investigation Meta Groups.
29	ExportMetaGroup	Operations to export multiple Investigation Meta Groups.
30	GeoMap	Operation to access the Geo Map View of Investigation.
31	deleteEndpointCache	Operation to clear Reconstruction Cache of a Device.
32	delete	Operation to delete Alert Templates.
33	CustomColumnGroup	Operation to apply or read Custom Column Group.
34	Import	Operations related to Import of Column Group or Profiles.
35	Export	Operations related to Export of Column Group or Profiles.
36	SaveProfile	Operation to save an Investigation Profile.
37	ApplyProfile	Operation to apply an Investigation Profile.
38	DeactivateProfile	Operation to deactivate an Investigation Profile.
39	DeleteProfile	Operation to delete an Investigation Profile.
40	DeleteProfiles	Operation to delete multiple Investigation Profiles.

Reporting Engine

The following table lists the operations logged by the Reporting Engine.

Serial #	Operation Name	Meaning
1	TEMPLATE	For all operations related to template
2	CHART	For all operations related to chart
3	REPORT	For all operations related to report

Serial #	Operation Name	Meaning
4	RULE	For all operations related to rule
5	IMAGE	For all operations related to Logo Images used in Reports.
6	LIST	For all operations related to list
7	ALERT	For all operations related to alert
8	CONFIG	For all operations related to configuration change
9	SCHEDULE	For all operations related to schedule
10	ROLE	For all operations related to role/authorization
11	BATCH_JOB	For all operations related to batch jobs
12	SCHEDULER	For all operations related to scheduler
13	QUERYPROCESSOR	For all operations related to queryprocessor
14	FORMATTER	For all operations related to formatter
15	OUTPUTACTION	For all operations related to outputaction
16	STATUSMANAGER	For all operations related to statusmanager
17	BATCH_RUNDEF	For all operations related to batch rundef
18	CHARTGROUP	For all operations related to chart group
19	REPORTGROUP	For all operations related to report group
20	RULEGROUP	For all operations related to rule group
21	LISTGROUP	For all operations related to list group
22	DISKSPACE	For all operations related to disk space

Warehouse Connector

The following table lists the operations logged by the Warehouse Connector.

Serial #	Operation Name	Meaning
1	LockBox Password Create	Operation to create LockBox Password.
2	LockBox Password Update	Operation to update LockBox Password.
3	LockBox Password Refresh	Operation to refresh LockBox Password.

Serial #	Operation Name	Meaning
4	Adding Stream	Operation to add a Stream.
5	Adding Source	Operation to add a Source.
6	Adding Destination	Operation to add a Destination.
7	Removing	Operation to remove a Source, Stream, or Destination.
8	Changing Password	Operation to change the Password.
9	Updating Source	Operation to update a Source.
10	Adding Source to Stream	Operation to add a Source to a Stream.
11	Deleting Source from Stream	Operation to delete a Source from a Stream.
12	Setting Destination to Stream	Operation to set a Destination to a Stream.
13	Finalizing Stream	Operation to finalize a Stream and initiate the aggregation.
14	Stopping Stream	Operation to stop a Stream.
15	Starting Stream	Operation to start a Stream.
16	Reloading Stream	Operation to reload a Stream.

Health & Wellness

The following table lists the operations logged by Health & Wellness.

Serial #	Operation Name	Meaning
1	SavePolicyRequest	Operation while adding or modifying a Policy.
2	RemovePolicyRequest	Operation while removing a Policy.

NetWitness Platform Core Services

The following table lists the operations logged by NetWitness Platform Core Services.

Serial #	Operation Name	Meaning
1	FILE-Command	Operation to list, retrieve and delete files from approved directories on this device.
2	SERVICE-Start	Service started
3	SERVICE-Stop	Service stopped
4	REDIRECT-Syslog	Operation for syslog forwarding.

Serial #	Operation Name	Meaning
5	ADD-Monitor	Issuing a filesystem monitor operation
6	DELETE-Monitor	Issuing a filesystem monitor deletion operation
7	SHUTDOWN-Service/shutdown.service	Shutting down appliance service
8	REBOOT-Service	Restarting appliance service
9	CONFIGURE-Network	Issuing Network Configuration change
10	SET-NTP	Issuing NTP set operation
11	STOP-NTP	Issuing NTP stop operation
12	NTP-Timesync	Issuing NTP time sync operation
13	SET-SNMP	Issuing SNMP set
14	UPGRADE/upgrade	Issuing upgrade operation
15	create.collection	Operation to create an empty collection.
16	restore	Issuing restore
17	session.aggregation	Issuing aggregation start/stop
18	add.device	Adding a device for aggregation
19	edit.device	Editing a device used for aggregation
20	delete.device	Deleting a device used for aggregation
21	capture.start	Starting capture operation
22	capture.stop	Stopping capture operation
23	select.interface	Selecting capture interface
24	export	Operation to export packets or sessions.
25	reload	Issuing a parser reload
26	schema	Issuing a schema request for loaded parsers
27	upload/file.upload	Issuing file upload
28	notify	Issuing feed notify
29	delete	Issuing file deletion
30	edit.config	Configuration change operation
31	parsers.transforms	Perform a language key transformation

Serial #	Operation Name	Meaning
32	data.reset	Data reset operation
33	timeout	REST request timeout
34	cancel	Cancel a running query
35	timeroll	Operation to delete the database files that exceed a given limit.
36	dump	Operation to dump information out of the database in nwd formatted files.
37	session.wipe	Issuing a session wipe operation
38	REPLACE-Rule	Issuing a rule replace operation
39	MERGE-Rule	Issuing a rule merge operation
40	ERASE-Rule	Issuing deletion of a set of all rules
41	ADD-Rule	Issuing a rule addition operation
42	DELETE-Rule	Issuing deletion of a set of rules
43	sdk.info	Issuing SDK summary info.
44	sdk.session	Issuing SDK session info.
45	sdk.language	Issuing SDK language
46	sdk.aliases	Issuing SDK alias request
47	sdk.transform	Issuing SDK transformation request
48	sdk.search	Issuing session content search request
49	sdk.cache	Operation related to session content cache
50	sdk.content	Issuing session content request
51	check.authorization	Operation to check user roles for permissions to execute an operation.
52	close.connection	Issuing a connection close operation
53	handshake	Issuing an SSL handshake
54	logon/login	Operation to login from NW to the other services, mostly to privileged users.
55	STOREDPROCOP	Issuing file upload cancel/start
56	ADD-Task	Added scheduled task
57	DELETE-Task	Deleted scheduled task

Serial #	Operation Name	Meaning
58	logoff	Issuing logout operation
59	list.cacerts	Issuing list trusted CA certificate operation
60	delete.cacerts	Issuing delete trusted CA certificate operation
61	add.cacerts	Issuing addition of trusted CA certificate operation
62	restart.command	Issuing restart command line option
63	delete.file/file.delete	Operation to delete system configuration files.
64	update.file/file.update	Operation to update system configuration file.
65	create.file	Issuing file creation operation
66	query	Issue a database query
67	unlock	Issuing unlock user account operation
68	user.add	Operation to create user accounts on individual devices.
69	user.delete	Operation to delete a user on individual devices.
70	group.create	Operation to add a new group to the system.
71	user.remove	Remove a user account from a group
72	group.delete	Delete a group from the /users/groups tree
73	add.user	Issuing add user command to collection
74	delete.user	Issuing delete user command to collection
75	remove.user	Removing an user from collection
76	collection.open	Issuing an open command for a collection
77	collection.close	Issuing a close command for a collection
78	collection.delete	Issuing collection deletion command
79	reingest.start	Operation to start reingesting of packet data in collection.
80	feed.notify	Issuing a feed notify command

Serial #	Operation Name	Meaning
81	collect	Issuing a collect command
82	collect.start	Issuing a data collection start
83	collection.global	Issuing import parser command
84	parser.reload	Issuing parser reload command
85	reingest	Operation to reingest packet data in collection.
86	collection.create	Issuing a create collection command
87	collection.restore	Issuing a restore collection command
88	collection.clone	Issuing a clone collection command
89	parser.reload	Issuing parser reload command
90	sdk.query	Performs a query against the meta database
91	sdk.msearch	Search for pattern matches in many sessions or packets
92	sdk.values	Performs a value count query and returns the matching values for a report
93	sdk.timeline	Returns the count of sessions/size/packets in discrete time intervals

Malware Analysis

The following table lists the operations logged by the Malware Analysis (MA) component.

Serial #	Operation Name	Meaning
1	GetDashBoardSummaryRequest	Get dashboard analysis statistics
2	GetFileScoreSummaryRequest	Get aggregated file scores by score type and risk level
3	CountEventsAndFilesRequest	Get count of events and files over a time frame
4	GetAvVendorDetectionRequest	Get AV vendor analysis results
5	GetAVVendorsRequest	Get list of AV Vendors supported
6	SetInstalledAVVendors	Request Update list of installed AV Vendors in config
7	CountEventByCriteriaRequest	Count events by criteria

Serial #	Operation Name	Meaning
8	FindEventByIdRequest	Get event by id
9	FindEventByCriteriaRequest	Get event by criteria
10	DeleteEventRequest	Delete event
11	CommentOnEventRequest	Add comment to event
12	ReSubmitEventRequest	Resubmit event for analysis
13	FindEventScoreByIdRequest	Get event score by event id
14	FindEventScoreByCriteriaRequest	Get event score by criteria
15	FindMetaByIdRequest	Get meta by id
16	FindMetaByCriteriaRequest	Get meta by criteria
17	FindMetaValueByCriteriaRequest	Get meta value by criteria
18	CountByDistinctMetaValueRequest	Count distinct meta values
19	CountByMetaNameAndValueWithDate RangeIntervalRequest	Count meta and values with interval for charting
20	CountByValueAndAverageOverallScore Request	Count meta and map to overall scores for events
21	CountByValueAndAverageGroupScore Request	Count meta and map to group scores for events
22	CountFileEntryByCriteriaRequest	Count files by criteria
23	FindFileEntryByIdRequest	Get file by id
24	FindFileEntryByCriteriaRequest	Get file by criteria
25	ReSubmitFileEntryRequest	Resubmit file for analysis
26	FileDownloadRequest	Download file from repository
27	FileUploadRequest	Upload file for analysis
28	FindFileScoreByIdRequest	Get file score by id
29	FindFileScoreByCriteriaRequest	Get file score by criteria
30	FindHashValueByIdRequest	Get whitelist/blacklist Hash value by id
31	FindHashValueByCriteriaRequest	Get whitelist/blacklist Hash value by criteria
32	AddHashValueRequest	Add whitelist/blacklist Hash value
33	UpdateHashValueRequest	Update whitelist/blacklist Hash value

Serial #	Operation Name	Meaning
34	DeleteHashValueRequest	Delete whitelist/blacklist Hash value
35	FindHashValueByMd5Request	Find whitelist/blacklist Hash value by md5
36	AddHashValueInFileRequest	Add File to repository as well as hash value
37	GetDefaultRulesRequest	Get default IOC Rules configuration
38	ResetToDefaultRulesRequest	Reset IOC Rules configuration to default
39	GetAllOverrideRulesRequest	Get IOC Rules user created override configuration
40	FindOverrideRuleByIdRequest	Find IOC override rule by id
41	AddOverrideRuleRequest	Add IOC override rule
42	UpdateOverrideRuleRequest	Update IOC override rule
43	DeleteOverrideRuleRequest	Delete IOC override rule
44	SubmitOnDemandNextGenRequest	Submit new ondemand nextgen scan
45	FindOnDemandJobEntryByIdRequest	Get ondemand job entity by id
46	FindOnDemandJobEntryByCriteria Request	Get ondemand job entity by criteria
47	GetOnDemandJobInfoRequest	Get ondemand job reference entity by id
48	GetOnDemandDefaultConfiguration	Request Get ondemand default configuration
49	CancelOnDemandJobRequest	Cancel ondemand job in progress
50	DeleteOnDemandJobRequest	Delete ondemand job
51	ReSubmitOnDemandJobRequest	Resubmit ondemand job
52	SubscriptionRequest	Subscribe to MA Cloud communication
53	UnSubscribeRequest	Unsubscribe from MA Cloud communication
54	GetTopEventInfluencesRequest	Get Top N event influences
55	GetServerInfoRequest	Get server info, such as server time
56	DataResetRequest	Reset database

Serial #	Operation Name	Meaning
57	OnDemandJobStatusNotification	Report ondemandjob progress to subscribers
58	LicenseStatusNotification	Report license status - num samples analyzed
59	DataResetNotification	Report that data was reset
60	GetIocSummaryRequest	Get IOC rules aggregated by event/file scores
61	FindAlertTemplatesByCriteriaRequest	Get rabbitmq alert templates by criteria
62	SaveAlertTemplateRequest	Update alert template
63	DeleteAlertTemplateRequest	Delete alert template
64	GetJobStatusRequest	Get in progress job analysis thread status
65	GetEventTypeCountSummaryRequest	Get event analysis counts by date chart
66	Logon	Logon to the MA Service
67	Modified	Modifying config changes
68	GetNextGenSummaryRequest	Get nextgen dashboard summary statistics

NetWitness Platform User Interface

The following table lists the operations logged by the NetWitness Platform User Interface component.

Serial #	Operation Name	Meaning
1	uploadTrialLicense	Upload Trial License
2	LicenseEntitle	Entitle License
3	LicenseDeactivation	Deactivate License
4	ExpiredLicense	License Expired
5	LicenseOutOfComplianceAcknowledgement	EULA Acknowledgement
6	resetLicense	Reset License
7	usageDateExport	License data usage - csv/pdf
8	refreshLicense	Refresh LLS license
9	LicenseOutOfCompliance	Out of Compliance

Serial #	Operation Name	Meaning
10	OOTBEntitlementOutOfCompliance	OOTB Trial license Out of Compliance
11	OOTBEntitlementFirstLoginTimeModified	OOTB time modified
12	OOTBEntitlementFileDeleted	OOTB File deleted
13	OOTBEntitlementDataTampering	OOTB data tampering
14	uploadOfflineResponse	Upload offline response
15	offlineDownloadCapRequest	Download offline request
16	movePerpetualToThroughput	Move Appliance license to Throughput
17	moveThroughputToPerpetual	Mover Throughput to Appliance license
18	mapApplianceLicense	Map Service to Real license
19	delete	Operation to delete Alert Templates.
20	HttpRequest	Operation for Audit Logging of the accessed URL.
21	Page Accessed	Operation for Audit Logging of the accessed page.
22	Navigate	Operation to navigate to the accessed page.
23	Events	Operation to view the accessed event page.
24	Recon	Operation for Event Reconstruction requested.
25	Services	Operation while reading the list of available devices for investigation.
26	Service	Operation for a List of devices requested to be investigated.
27	Collections	Operation to view the list of collections requested.
28	Profiles	Operation to apply a Profile.
29	ColumnGroups	Operation to apply or read Column Group.
30	ParallelCoordinates	Operations related to Loading of co-ordinate view navigation.

Serial #	Operation Name	Meaning
31	Timeline	Operations related to loading of timeline view navigation.
32	PrintView	Operations to open investigation in print view.
33	Preferences	Operations related to Informer Request.
34	import	Operations related to Import of Column Group or Profiles.
35	export	Operations related to Export of Column Group or Profiles.
36	Predicate	Operations related to Queries (Predicates) used for Investigation.
37	Languages	Operation for Language requested from a Device.
38	CancelLanguageLoad	Operation for Language Load Canceled from Navigate Page.
39	summary	Operation for a summary requested from a Device.
40	languages	Operation for a language requested from a device.
41	aliases	Operation for meta aliases requested from a device.
42	query	Operation for SDK Query requested from a device.
43	msearch	Operation for a meta search requested from a device.
44	nodeListing	Node Listing for a node requested from a Device.
45	content	SDK Content call requested from a Device for downloading a PCAP or Log.
46	Export Files	File Listing Requested for a Session in File View or Extraction jobs.
47	packets	Packets requested for sessions in Packet View or Extraction Jobs.
48	deleteEndpointCache	Operation to clear reconstruction cache of a device.

Serial #	Operation Name	Meaning
49	Logon	Operation for user to sign in to NetWitness Platform User Interface.
50	Logoff	Operation for user to sign out of NetWitness Platform User Interface.
51	defaultDevice	Operation to access the Default SA UI Device.
52	deleteDefaultDevice	Operation to delete the Default investigation device.
53	submitExtractFiles	Operation to submit a request to Extract files from Sessions.
54	submitExtractLogs	Operation to submit a Request to Extract Logs from Sessions.
55	submitExtractPcap	Operation to submit a Request to Extract Sessions from Sessions.
56	MetaGroup	Operations related to SA UI Meta Groups.
57	ExternalQuery	Operation when a Direct Query is fired via URL.
58	GeoMap	Operation to access the Geo Map View of Investigation.
59	SaveProfile	Operation to save an Investigation Profile.
60	ApplyProfile	Operation to apply an Investigation Profile.
61	DeleteProfile	Operation to apply an Investigation Profile.
62	DeactivateProfile	Operation to apply an Investigation Profile.
63	VisualizePreferences	Operations related to Informer Visualization Request.
64	ExportMetaGroup	Operations to export multiple SA UI Meta Groups.
65	userPredicates	Operations to export multiple SA UI Meta Groups.
66	FileView	Operation for reconstruction request for File View.

Serial #	Operation Name	Meaning
67	resource.update	Operation when Live Subscription State changes.

Respond

The following table lists the operations logged by the RESPOND component.

Serial #	Operation Name	Meaning
1	update	Update notification setting
2	update	Update integration settings configuration
3	delete	Delete Alerts
4	create	Create new incident
5	update	Update incident details
6	read	Read incident details
7	delete	Delete incidents
8	read	Read remediation tasks
9	delete	Delete Remediation tasks
10	update	Update remediation tasks
11	create	Create new rule
12	update	Update existing alert rule
13	reorder	Reorder priority of alert rules

Security Server

The following table lists the events logged by the Security Server.

Log Category	Description
Authentication:	Logs events pertaining to user logins and logouts.
Authorization:	Logs events pertaining to user access checks and RBAC management.
UserAccount	Logs events pertaining to NetWitness Platform domain account management.
ExternalProvider:	Tracks events pertaining with external account providers (for example, Active Directory).

The following example shows an event logged by the Security Server:

```
2018-03-13 16:25:02,938 UserAccount{action=ExpirePassword, success=true,
identity=admin, parameters={id=Justin}}
```

Local Audit Log Locations

NetWitness Platform has global audit logging capabilities. When you configure global audit logging, audit logs from all NetWitness Platform components collect in a centralized system, which converts them into the required format and forwards them to a third-party syslog server or a Log Decoder.

To view audit logs from the individual services, you can look at the local audit log locations.The following table shows the local directory paths of the audit logs for the NetWitness Platform user interface and the various NetWitness Platform services.

Service/Module	Audit Log Location
NetWitness Platform User Interface (NetWitness Platform Web Server)	The NetWitness Platform user interface sends audit logs to the following locations: • `/var/lib/netwitness/uax/logs/audit/audit.log` (human-readable format) • Syslog running on the local host (JSON format) The NetWitness Platform user interface uses the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`/var/lib/netwitness/uax/logs/audit/audit.log`).
Core Services (Decoder, Log Decoder, Concentrator, Broker, and Archiver), Log Collector, Warehouse Connector, and Workbench	The Core services and similar services send audit logs to Syslog running on the local host. Path: `/var/log/secure` (JSON format) The Core services use the AUTHPRIV facility of syslog to write audit logs to syslog.

Service/Module	Audit Log Location

Reporting Engine, Malware Analysis, Respond, and Event Stream Analysis (ESA)	These services send audit logs to the following locations:
	• `<application-home-directory>/logs/audit/audit.log` (human-readable format)
	• Syslog running on the local host (JSON format)
	
	The following are the audit log locations of these services:
	Reporting Engine:
	`/var/netwitness/re-server/rsa/soc/reporting-engine/logs/audit/audit.log`
	Respond Server:
	`/var/log/netwitness/respond-server/respond-server.audit.log`
	Malware Analysis:
	`/var/lib/netwitness/malware-analytics-server/spectrum/logs/audit/audit.log`
	Event Stream Analysis:
	`/opt/rsa/esa/logs/audit/audit.log`
	These services use the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`<application-home-directory>/logs/audit/audit.log`).

Health & Wellness, Event Source Management (ESM), and Appliance and Service Grouping (ASG)	These Services send audit logs to the following locations: • `/opt/rsa/sms/logs/audit/audit.log` (human-readable format) • Syslog running on the local host (JSON format) These services use the AUTH facility of syslog to write audit logs to syslog. You can only see audit logs in the first location (`/opt/rsa/sms/logs/audit/audit.log`).

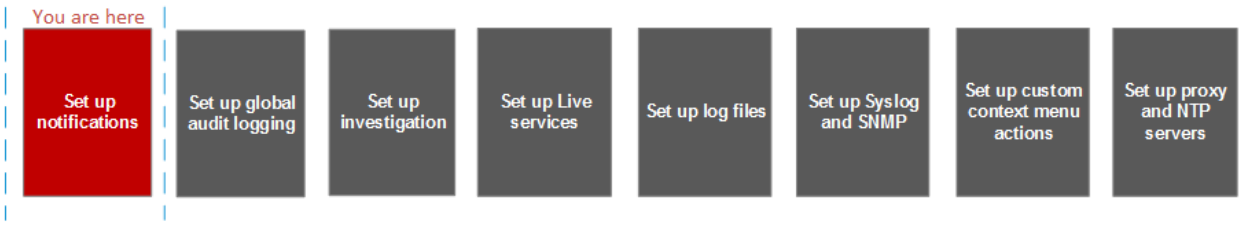
Global Notifications Panel

Global Notifications panel introduces the features for configuring notification settings. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

In the Global Notifications panel, you can configure the following global notification settings:

- Notification Outputs
- Notification Servers
- Templates

WorkFlow



What do you want to do?

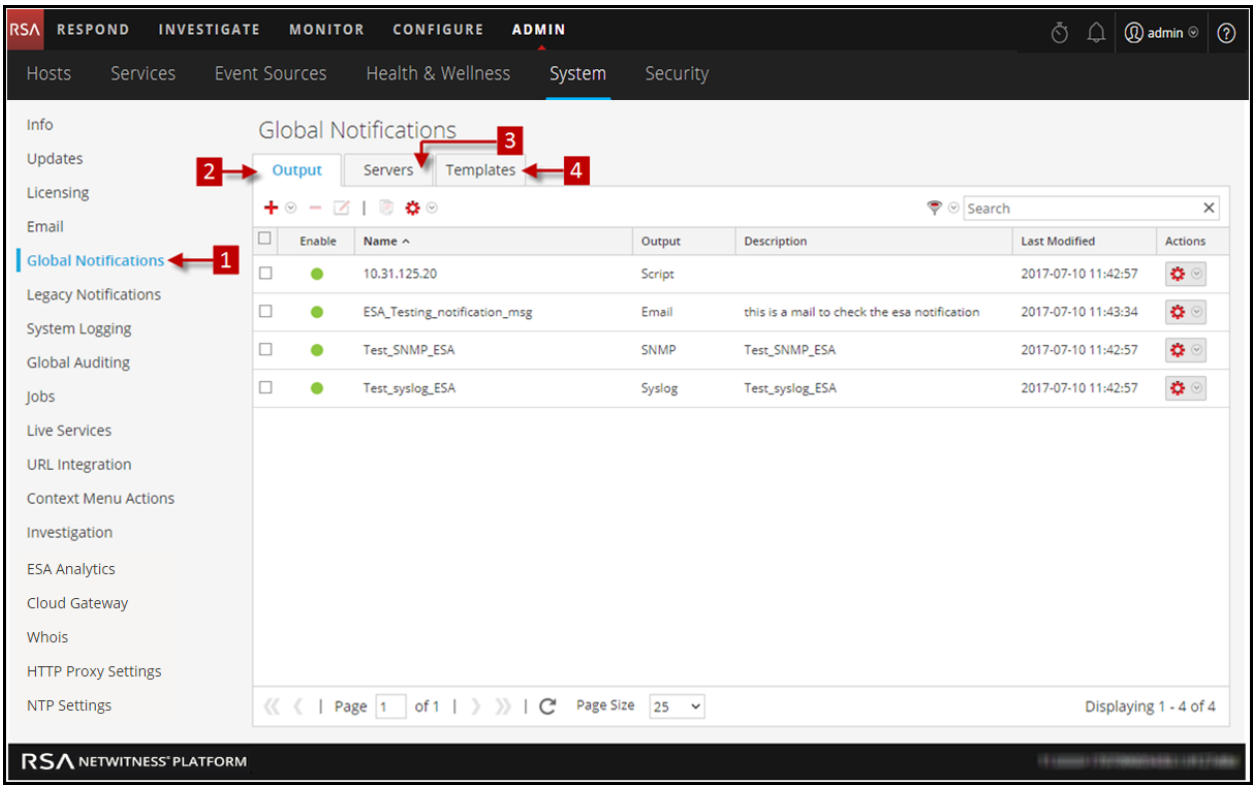
Administrator	Configure Notification Servers	Servers Tab
Administrator	Configure Notification Outputs	Output Tab
Administrator	Configure Notification Templates	Templates Tab

Related Topics

- Configure a Syslog Notification Server
- Configure Script as a Notification Server

Quick Look



1 Displays the Global Notification Panel.
2 Displays the Output Tab
3 Displays the Servers Tab
4 Displays the Templates Tab

Toolbar and Features

The Global Notifications panel has three tabs: Output, Servers, and Templates.

Feature	Description
Output tab	This tab enables you to configure notification outputs. See Output Tab for more information.
Servers tab	This tab enables you to configure notification servers. See Servers Tab for more information.
Templates tab	This tab enables you to configure notification templates. See Templates Tab for more information.

This table describes the columns in the grid for Notification Outputs and Notification Servers.

Column	Description
	Selects a row for an action in the toolbar. Clicking the checkbox in the column title selects or deselects all rows in the grid.
Enable	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
Name	A name that identifies or labels the configuration.
Output	The configuration output. The outputs are Email, SNMP, Syslog, and Script.
Description	A brief description about the configuration.
Last Modified	Shows the date and time of the last configuration change.
Actions	Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

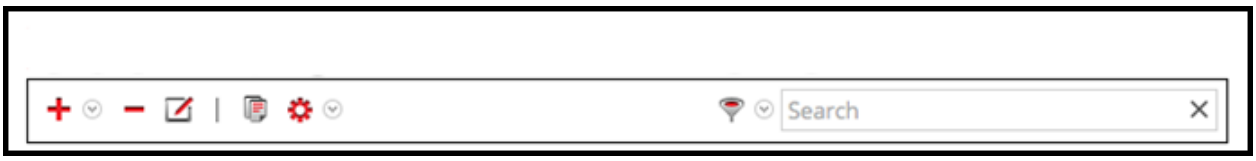
This table describes the columns in the grid for Notification Templates.

Column	Description
	Selects a row for an action in the toolbar. Clicking the checkbox in the column title selects or deselects all rows in the grid.
Name	A name that identifies or labels the template.
Template Type	The type of template. The types are Audit Logging, Event Stream Analysis, Event Source Monitoring, and Health Alarms.
Description	A brief description about the template.
Actions	Provides an Actions menu for the selected configuration with actions that can be taken on the template. The Actions menu enables you to delete, edit, duplicate, and export the template.

Global Notifications Panel Toolbar

The Global Notifications panel toolbar is at the top of the Output, Servers, and Templates tabs.

The following figure shows the toolbar on the Output and Servers tabs.



The following figure shows the toolbar on the Templates tab.

The following table describes the features of the Global Notifications panel toolbar.

Feature	Description
	Adds a notification server on the Servers tab, adds a notification output (notification) on the Output tab, and adds a notification template on the Templates tab. On the Servers and Output tabs, you can select to configure Email, SNMP, Syslog, and Script notification settings.
	Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting > Delete.
	Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting > Edit.
	Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting > Duplicate.
	Displays the following options: • **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration. • **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations. • **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting > Export.
	Filters by Email, SNMP, Syslog, or Script.

Feature	Description
	Searches configurations in the grid.

Define Notification Server Dialogs

This topic describes the Define Notification Server dialogs used to configure the settings of the various types of notification servers. You configure notification servers in the ADMIN > System > Notifications > Servers tab.

Notifications are used by a variety of components in NetWitness Platform, such as Event Stream Analysis (ESA), Respond, and Global Audit Logging. Notification settings are called Notification Servers. In the Servers tab of the Administration System view Notifications panel, you can create multiple Notification Server configurations.

You can configure the following types of notification server settings in NetWitness Platform:

- Email
- SNMP
- Syslog
- Script

For Global Audit Logging, you can only use Syslog Notification Servers.

Procedures related to notification servers are described in Configure Notification Servers.

To access the Define Notification Server dialogs:

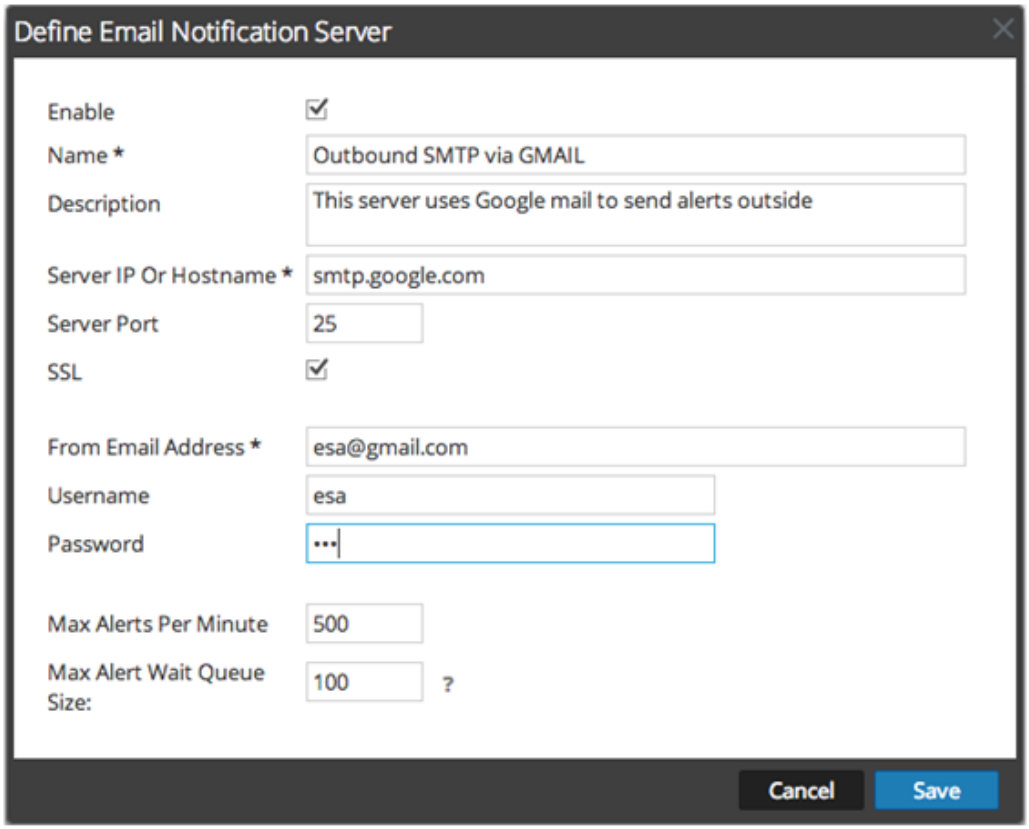
1. Go to **ADMIN > System**.
2. In the left navigation panel, select **Global Notifications**.
3. In the **Notifications Servers** panel, click + and then select a type of notification server (Email, SNMP, Syslog, or Script)
   The Define Notification Server dialog is displayed for your selection.

There are four notification server dialogs, which allow you to configure notification servers.

Email

Email notification servers enable you to configure email server settings to send alert notifications.

The following figure shows the Define Email Notification Server dialog.



The following table lists the various parameters that you need to define for the email notification servers.

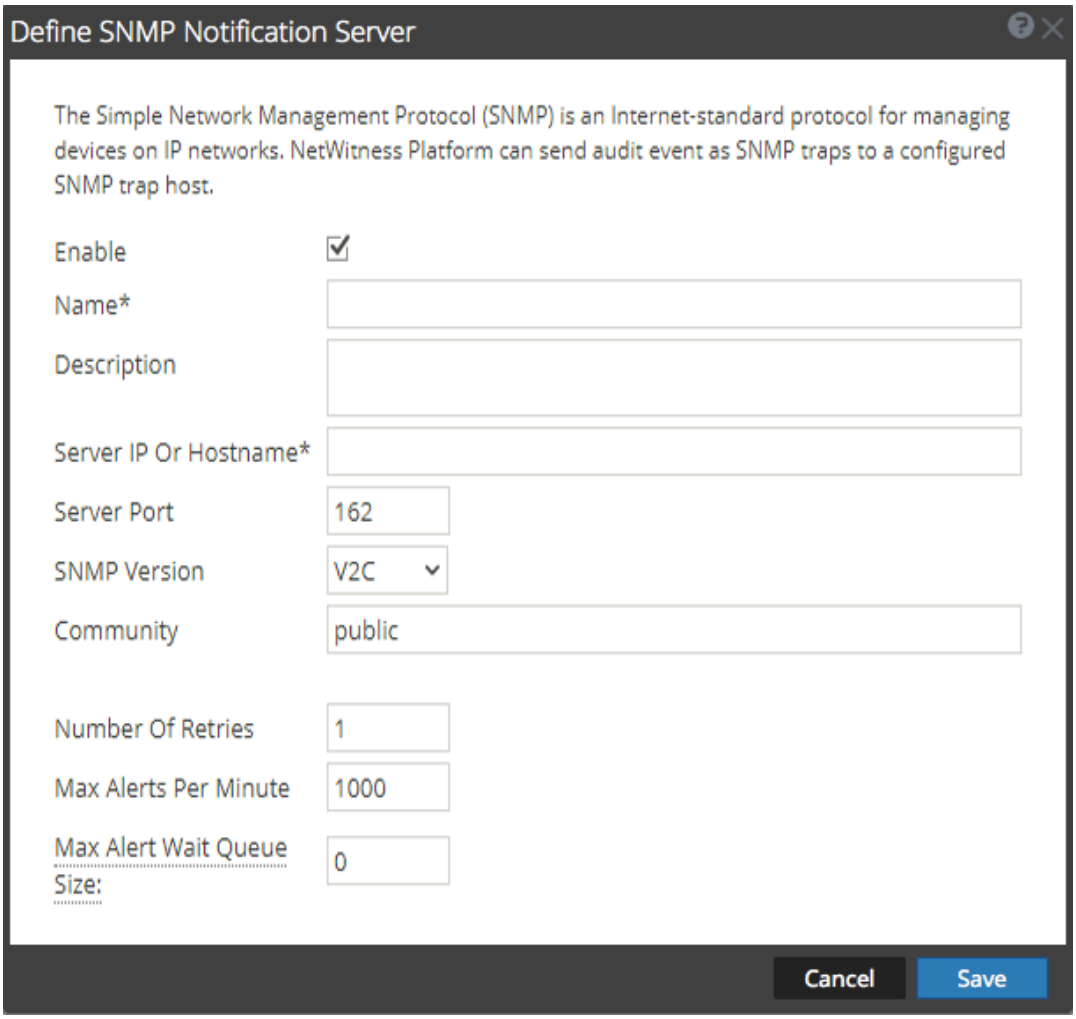
Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	Hostname of the email server. For ESM/SMS and ESA notifications, you must specify only the hostname/FQDN.
Server Port	The server port.
SSL	Select the option if you want the communication to happen through SSL.
From EMail Address	Email account from which you want to send email notifications.
Username	Username for logging into the email account if the SMTP server requires user authentication to relay emails successfully.

Parameters	Description
Password	User password for logging into the email account if the SMTP server requires user authentication to relay emails successfully.
Max Alerts Per Minute	Describes the maximum number of alerts per minute.
Max Alert Wait Queue Size	Describes the maximum number of alerts to be queued before they are dropped.

SNMP

SNMP notification servers enable you to configure SNMP trap host settings as a notification server to send alert notifications.

The following figure shows the Define SNMP Notification Server dialog.



The following table lists the various parameters that you need to define for the SNMP notification servers.

Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	SNMP trap host IP address or hostname.
Server Port	Listening port number on the SNMP trap host.

<table>
<tr><th>Parameters</th><th>Description</th></tr>
<tr><td>SNMP Version</td><td>SNMP version. The following are the options:
V1
V2C
V3
If you select SNMP Version 3 (v3), the following parameters are displayed:
<table>
<tr><th>Parameters</th><th>Description</th></tr>
<tr><td>Notification Type</td><td>Based on the notification type a SNMP messages are sent each time an alert is generated.
The following notification types are supported:
Inform - Inform is acknowledged trap. The sender gets an acknowledgement from the receiver.
Trap - Trap is unacknowledged notification</td></tr>
<tr><td>Authoritative Engine ID (This optioin is availabe only for notification type TRAP)</td><td>An identifier which is used to identify the agents. Authoritative engine ID along with the username is used to uniquely identify the agent.</td></tr>
<tr><td>Security Level</td><td>Define the security level. The following are the options:
Unauthenticated and Unencrypted
Authenticated and Unencrypted
Authenticated and Encrypted</td></tr>
<tr><td>Auth Protocol (This option is available only for security level Authenticated and Unencrypted and Authenticated and Encrypted)</td><td>Authentication protocol which is used to validate a user before providing an access to the server. The options are:
SHA
MD5</td></tr>
<tr><td>Auth Key (This option is available only for security level Authenticated and</td><td>A password that you want to use for authentication.</td></tr>
</table></td></tr>
</table>

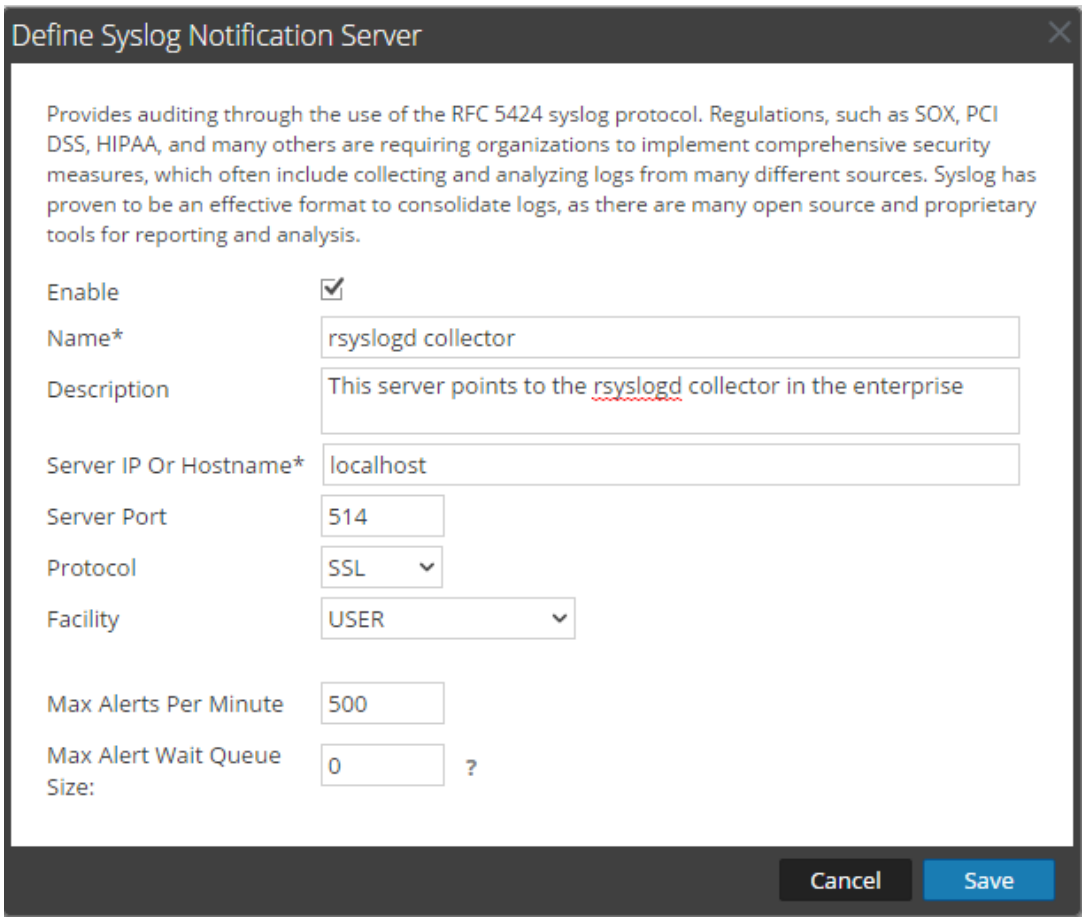
Parameters	Description
	Unencrypted and Authenticated and Encrypted) Privacy Protocol (This option is available only for security level Authenticated and Encrypted) — Privacy protocol is an encryption technique for data communication. Private Key (This option is avaliable only for security level Authenticated and Encrypted) — A password that you want to use for encryption.
Community	Community string used to authenticate on the SNMP trap host. The default value is **public**.
Number of Retries	Number of retries for the trap.
Max Alerts Per Minute	Maximum number of alerts per minute.
Max Alert Wait Queue Size	Maximum number of alerts to be queued before they are dropped.

Syslog

Syslog notification servers allow you to configure Syslog settings as a notification server to send notifications. When enabled, Syslog provides auditing through the use of the RFC 5424 Syslog protocol. Syslog has proven to be an effective format to consolidate logs, as there are many open source and proprietary tools for reporting and analysis.

You cannot disable notification servers associated with global audit logging configurations.

The following figure shows the Define Syslog Notification Server dialog.



The following table lists the various parameters that you need to define for the Syslog notification servers.

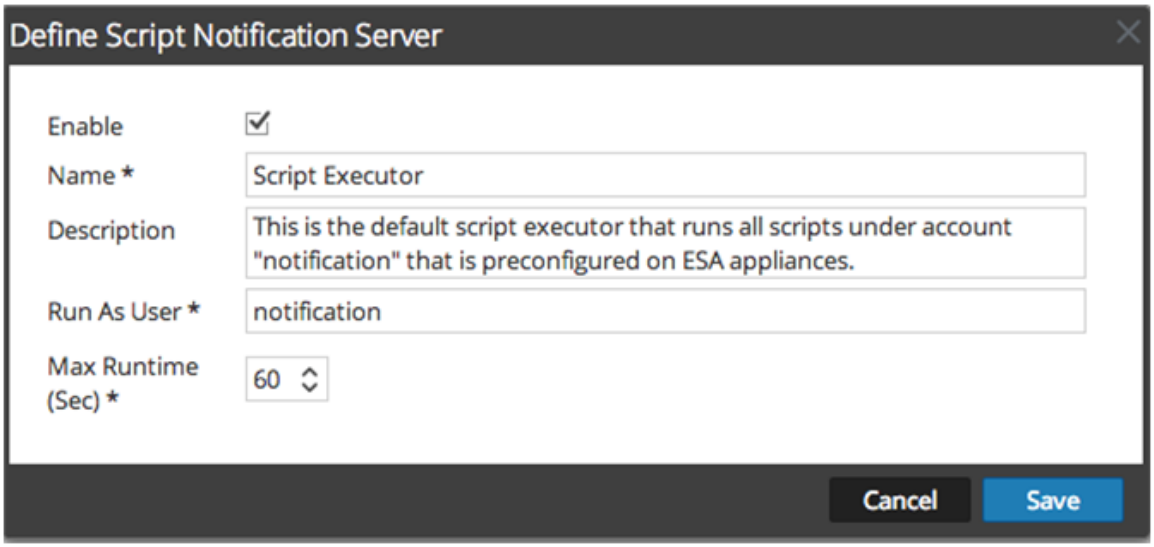
Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Server IP Or Hostname	The hostname of the host where the target Syslog process is running.
Server Port	The port number where the target Syslog process is listening.
Protocol	The protocol to be used to transfer the Syslog files.
Facility	The designated Syslog facility to use for all outgoing messages. It is used to specify what type of program is logging the message. Some possible values are KERN, USER, MAIL, and DAEMON. This lets the configuration file specify that messages from different facilities will be handled differently.

Parameters	Description
Max Alerts Per Minute	Maximum number of alerts per minute. This field is not used for Global Audit Logging.
Max Alert Wait Queue Size	Maximum number of alerts to be queued before they are dropped. This field is not used for Global Audit Logging.

Script

Script notification servers enable you to configure Script as a Notification Server.

The following figure shows the Define Script Notification Server dialog.



The following table lists the various parameters that you need to define for the Script notification servers.

Parameters	Description
Enable	Select to enable the notification server.
Name	A name to identify or label the notification server.
Description	A brief description about the notification server.
Run As User	Name of the user identity under which the script is executed. The default user identity is **notification**. For ESA, you cannot set this to anything else unless you have created the account on the ESA host.
Max Runtime (Sec)	The maximum time (in seconds) the script is allowed to run.

Define Notification Output Dialogs

This topic provides descriptions of the various notification output dialogs. You configure notification outputs in the ADMIN > System > Notifications > Output tab. Notifications are basically the destinations used for sending notifications. For ESA, notifications enable you to define how you want to receive the ESA alerts. The following are the different notifications supported by NetWitness Platform:

- Email
- SNMP
- Syslog
- Script

Procedures related to notifications are described in Configure Notification Outputs.

To access the Define Notification dialogs:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. On the **Output** tab, click + and then select a notification output (Email, SNMP, Syslog, or Script) The Define Notification dialog is displayed for your selection.

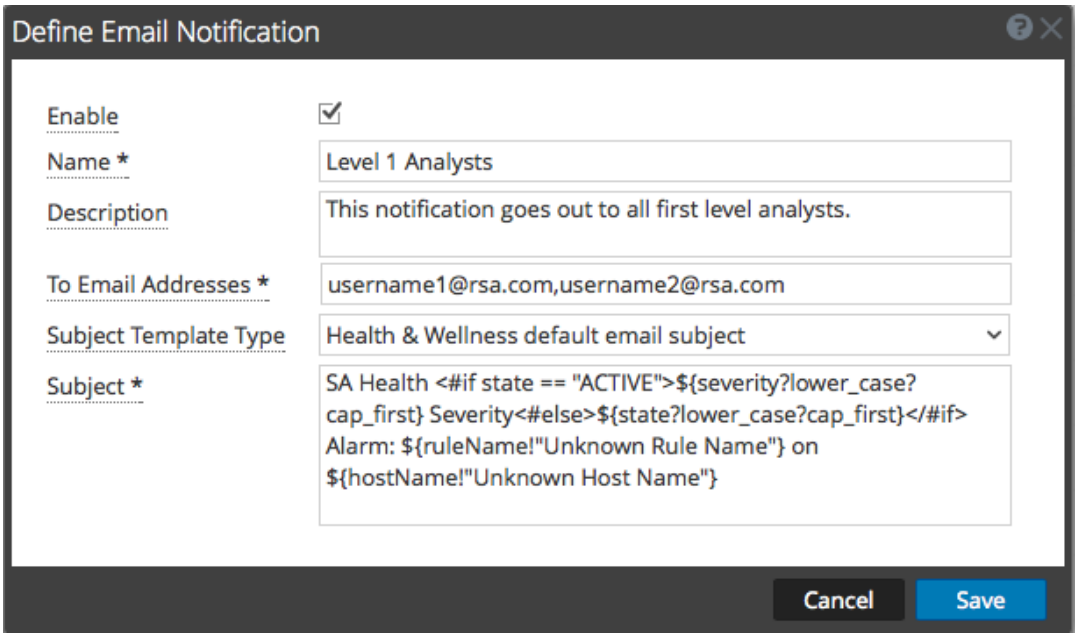
Features

There are four notification dialogs, which allow you to configure notification outputs.

Email

Email notifications enable you to define the destination email address to which you can send the alerts. It also enables you to add a custom description in the subject of the email and also to define multiple destination email addresses.

The following figure shows the Define Email Notification dialog.



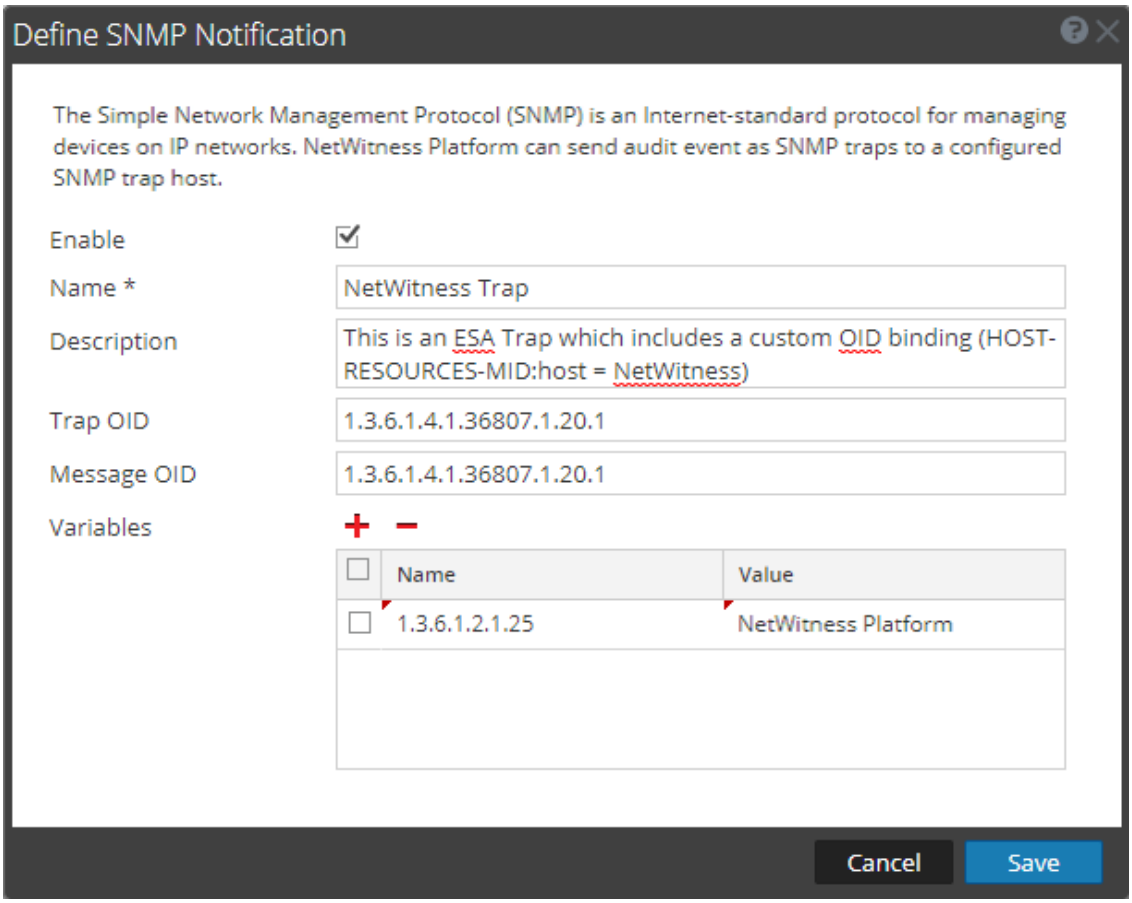
The following table lists the various parameters that you need to define for the email notifications.

Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
To Email Addresses	Describes the destination email address to which the alert needs to be sent. **Note:** You can define multiple email addresses.
Subject Template Type	Lists available templates for creating a subject. When you choose a template, the Subject field is automatically filled in with the code for your chosen template.
Subject	Custom description about the triggered alert. This information is automatically filled in if you choose one of the predefined templates from the Subject Template Type drop-down menu. **Note:** To provide a custom subject, please refer to "Include the Default Email Subject Line" topic in the *System Maintenance Guide*.

SNMP

SNMP notifications enable you to define the SNMP settings to send alert notifications.

The following figure shows the Define SNMP Notification dialog.



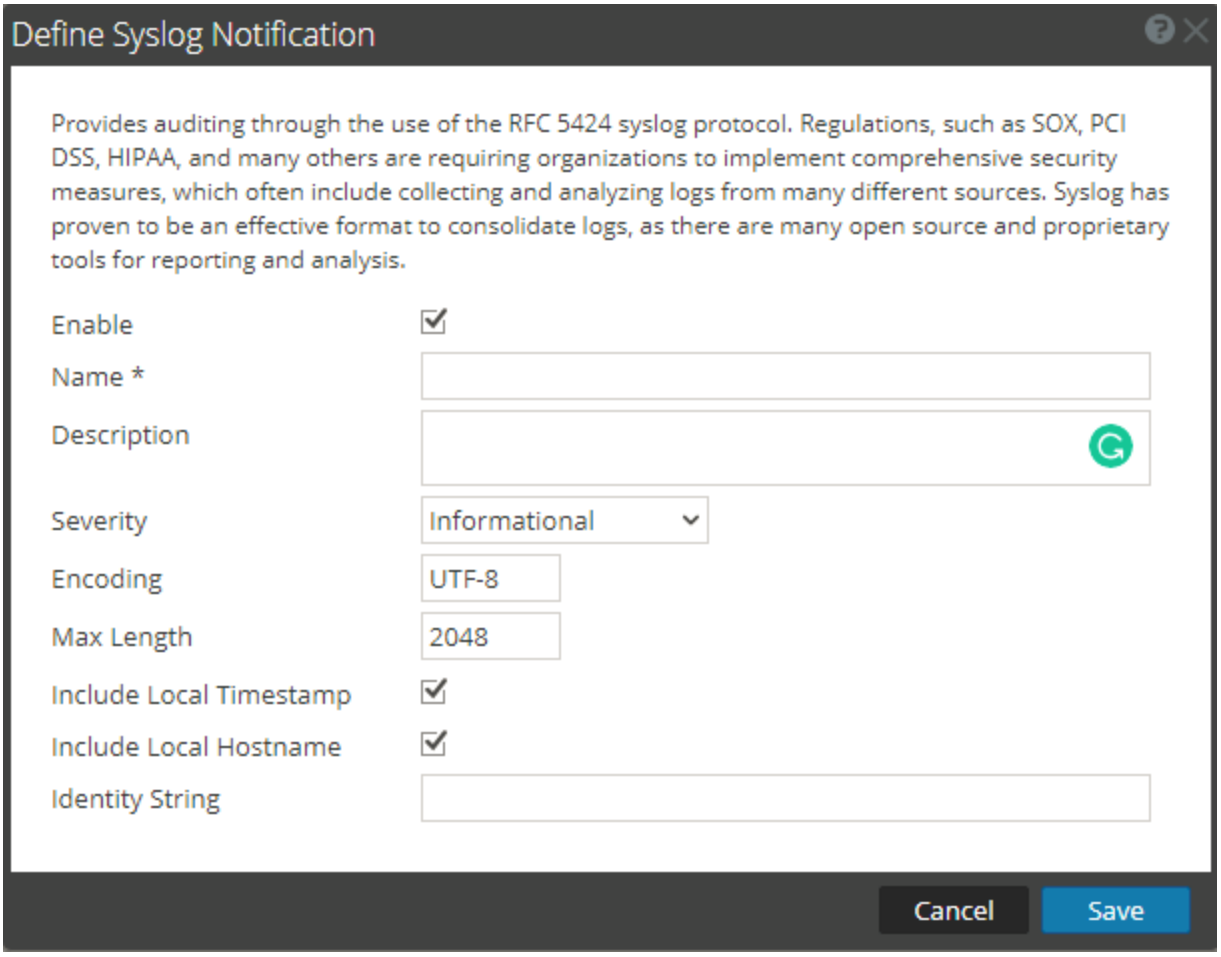
The following table lists the various parameters that you need to define for the SNMP notifications.

Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
Trap OID	The object ID for the SNMP trap on the trap host that receives the event. The default value is **1.3.6.1.4.1.36807.1.20.1**. This value is a hierarchical name that represents the system that generates the trap. 1.3.6.1.4.1 is the common prefix for all enterprises and 36807.1.20.1 identifies NetWitness Platform.
Message OID	The message object identifier for the SNMP trap.
Variables	Additional information that should be included within the trap. It is a variable that is a name value pair.

Syslog

Syslog notifications enable you to define the Syslog settings to send alert notifications.

The following figure shows the Define Syslog Notification dialog.



The following table lists the various parameters that you need to define for the Syslog notifications.

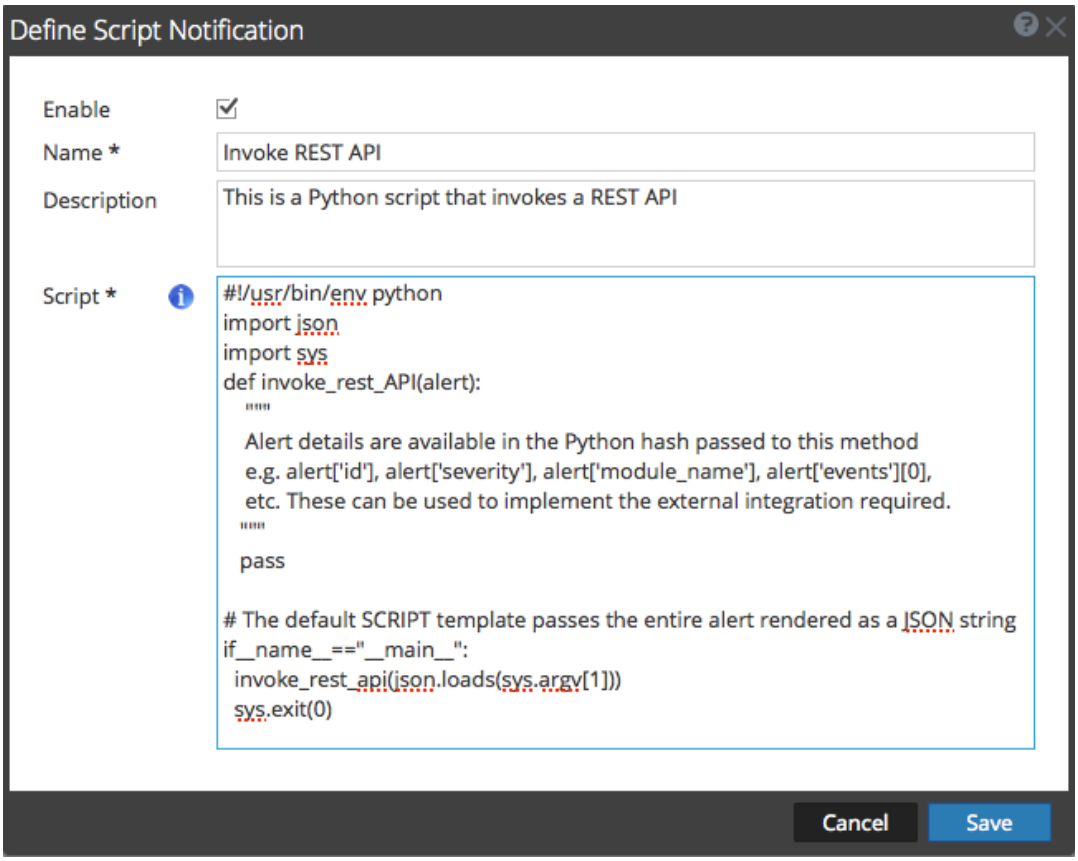
Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
Severity	Defines the severity of the alert.
Encoding	Defines the encoding format. In some environments where no regular character sets are used (for example, Japanese characters), this field will help selecting the right encoding of the characters.

Parameter	Description
Max Length	The maximum length of a Syslog message in bytes. The default value is **2048**. Messages that exceed the maximum length are truncated when the **Truncate overly large syslog messages** checkbox is selected, which is found in Administration > System > Legacy Notifications. Legacy Notifications Configuration Panel provides additional information.
Include Local Timestamp	Select to include the local timestamp in messages.
Include Local Hostname	Select to include the local hostname in Syslog messages.
Identity String	An identity string to be prefixed to each Syslog alert. If the string is blank, no identity string is prefixed to the outgoing Syslog alerts. You can use this to identify the alerts from ESA.

Script

Script notifications enable you to define the Script that executes in response to the alert. You can use any script for ESA notifications.

The following figure shows the Define Script Notification dialog.



The following table lists the various parameters that you need to define for the Script notifications.

Parameter	Description
Enable	Select to enable the notification.
Name	A name to identify or label the notification.
Description	A brief description about the notification.
Script	Defines the script.

Define Notification Template Dialog

In the Global Notifications panel, you can configure global notification settings for Notification Servers, Notification Outputs, and Notification Templates. On the Templates tab, you configure the templates for various notifications. The notification template defines the format and message fields of the notifications. You can select a default template or you can use the Define Template dialog to configure and edit templates.

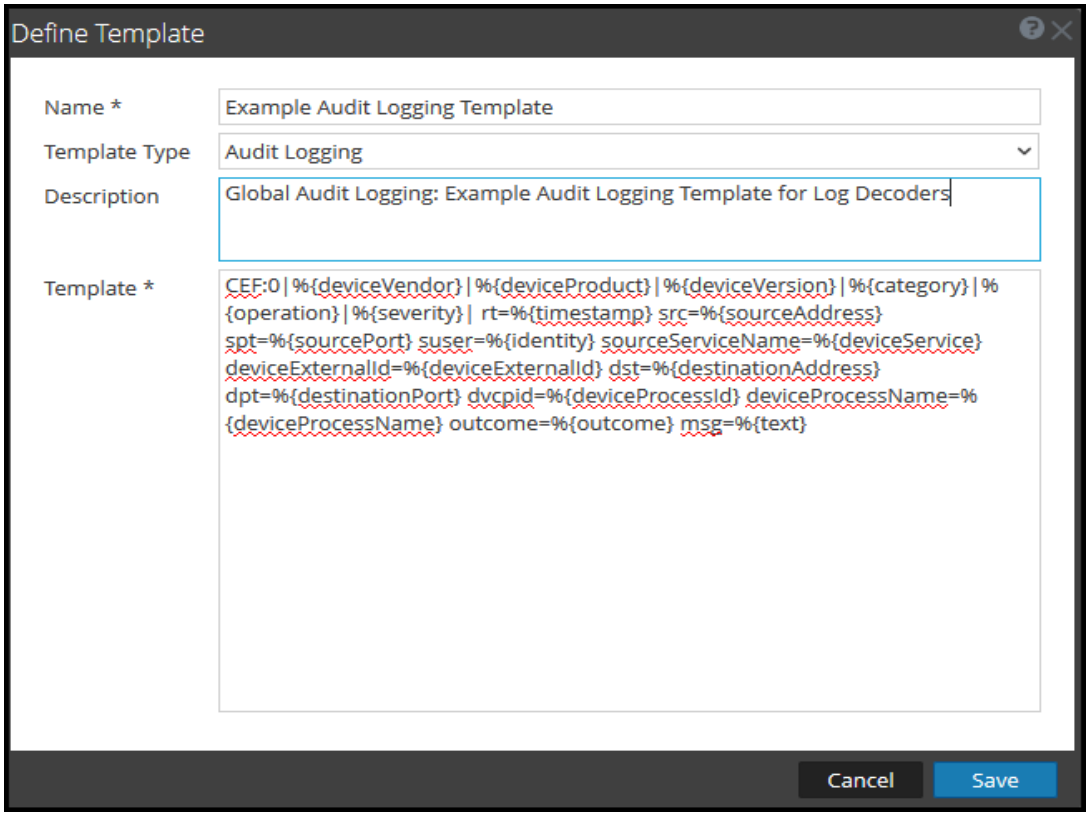
You can define the following template types:

- Audit Logging
- Event Stream Analysis
- Event Source Monitoring
- Health Alarms

Procedures related to notification templates are described in Configure Templates for Notifications.

To access the Define Template dialog:

1. Go to **ADMIN > System**.
2. In the left navigation panel, select **Global Notifications > Template Tab**.
3. In the **Notifications Configurations** panel, click +, or select a configuration and click ✎.
   The **Define Template** dialog is displayed.



The following table describes the features in the Define Template dialog.

Field	Description
Name	Type a unique name for the notification template.
Template Type	Select the type of template that you want to create: • **Audit Logging**: Use this template for Global Audit Logging. • **Event Stream Analysis**: Use this template type for ESA alert notifications. • **Event Source Monitoring**: Use this template type for ESM notifications. • **Health Alarms**: Use this template type for Health and Wellness notifications.
Description	Add a description for the template. For example, if you create a notification template for Log Decoders to use for Global Audit Logging, you could mention that information in the description.
Template	Specify the format for the template. Define a Template for Global Audit Logging provides instructions on how to define an audit logging template to use for Global Audit Logging. To define a template for Event Stream Analysis (ESA), see Define a Template for ESA Alert Notifications.

Output Tab

In the **Global Notifications** panel, in the **Output** tab (ADMIN > System > Notifications > Output), you configure notification outputs. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Notification Output configurations define email addresses and subject lines, SNMP trap OID settings, syslog output settings, and script code.

Notifications are the destinations configured for the alert notifications that are sent by ESA service. You can configure the following as destinations using the Output tab:

- Email
- SNMP
- Syslog
- Script

Note: You do not need to configure the Output tab for Global Audit Logging. For detailed steps, see Configure Global Audit Logging.

Workflow

This workflow shows the necessary procedures to configure and verify the output for Global Notifications. You can perform the following:

- Configure the Email settings as notification.
- Configure SNMP settings as notification.
- Configure Syslog settings as notification.
- Configure a Script as notification.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Define notification outputs.	Configure Notification Outputs

Related Topics

- Notification Outputs Overview

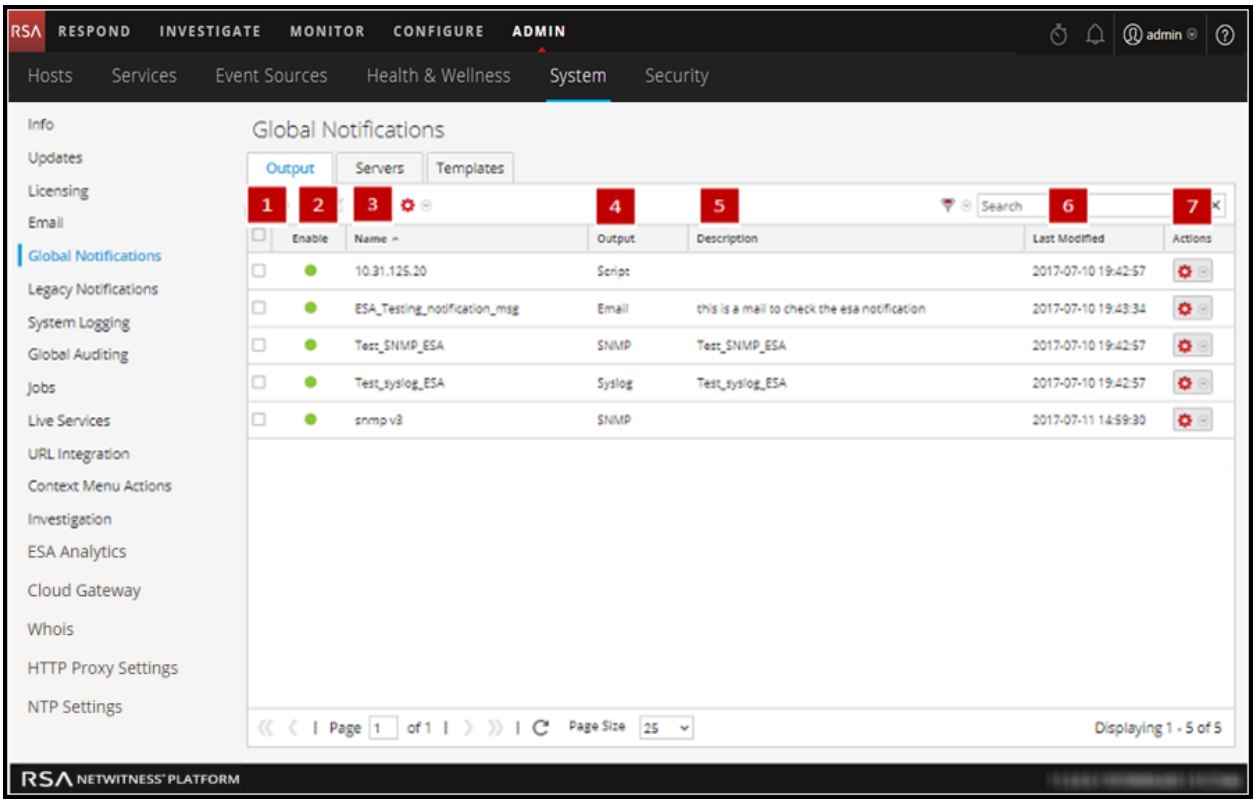
- Configure Syslog as a Notification

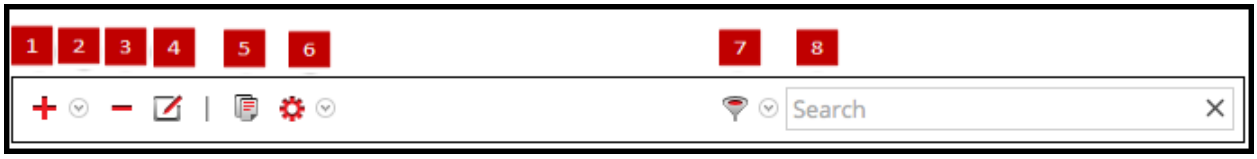
Quick Look

The following example illustrates Global Notification Outputs configuration.



1	Selects a row for an action in the toolbar. Selecting the check box in the column title selects or deselects all rows in the grid.
2	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
3	Identifies or labels the configuration.
4	Identifies the configuration output. The outputs are Email, SNMP, Syslog, and Script.
5	Describes the configuration.
6	Shows the date and time of the last configuration change.
7	Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

The Global Notifications panel toolbar is at the top of the Output tag and provides the following options:



1	Adds a notification output
2	Configures Email, SNMP, Syslog, and Script notification settings.
3	Removes a selected notification configuration. You cannot delete notification servers and notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting > Delete.
4	Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting > Edit.
5	Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting > Duplicate.
6	Displays the following options: • **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration. • **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations. • **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting > Export.
7	Filters by Email, SNMP, Syslog, or Script.
8	Searches configurations in the grid.

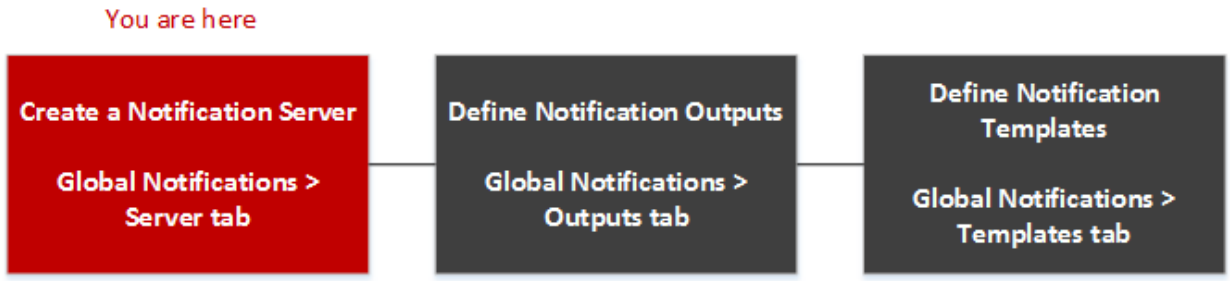
Servers Tab

Servers Tab describes the components of the Global Notifications > Servers tab. This tab enables to configure notification servers. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond.

Configure **Notification Servers** in the Servers tab. On the Servers tab, add the servers from which you want to receive notifications from the system. For Global Audit Logging, define Log Decoders as Syslog Notification Servers.

Event Stream Analysis can send notifications to users through email, SNMP, or Syslog when an alert is triggered on the ESA service. These alert notification senders are called Notification Servers. You can configure multiple notification settings and use them while defining an ESA rule, for example, you can configure multiple mail servers or Syslog servers and use the settings while defining an ESA rule.

Workflow



The workflow shows the necessary procedures to configure and verify the Servers for Global Notifications. You can perform the following:

- Configure the Email settings as a notification server.
- Configure SNMP settings as a notification server.
- Configure Syslog settings as a notification server.
- Configure a Script as a notification server.

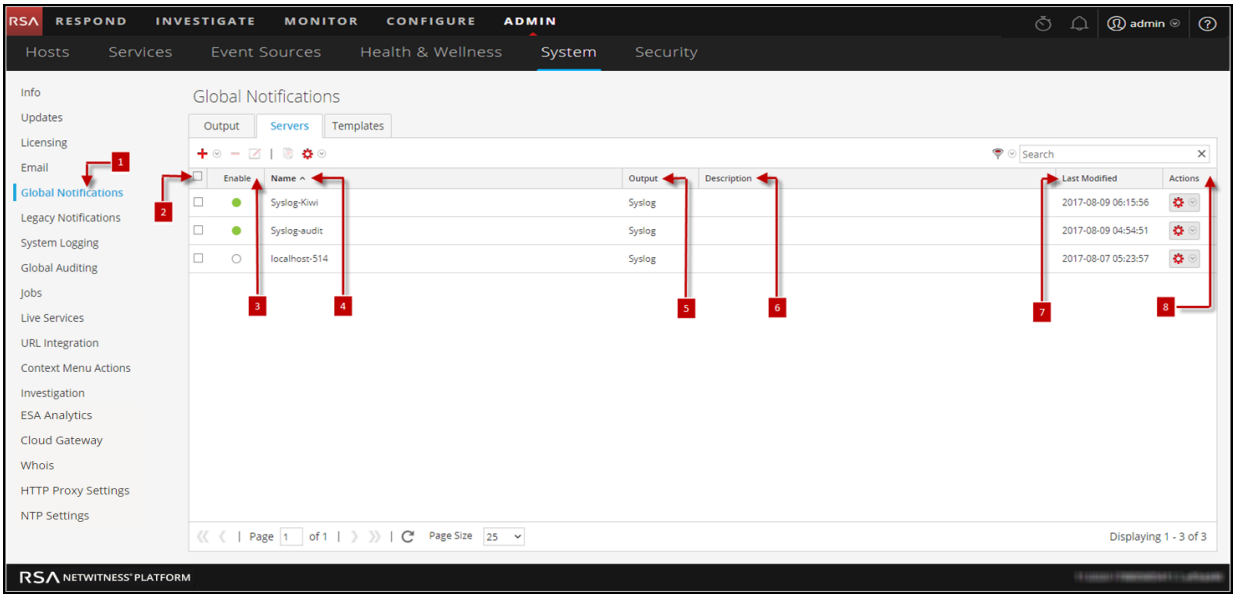
- Configure Script as a Notification Server

- Configure the SNMP Settings as Notification Server
- Configure a Syslog Notification Server

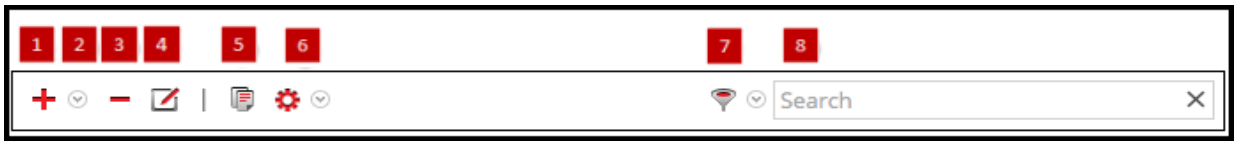
Quick Look

The following example illustrates Global Notification Servers configuration.



1	Displays the Server Tab Panel.
2	Selects a row for an action in the toolbar. Selecting the checkbox in the column title selects or deselects all rows in the grid.
3	Indicates whether the configuration is enabled. A solid colored green circle indicates that a configuration is enabled. A blank white circle indicates that a configuration is not enabled.
4	Identifies or labels the configuration.
5	Identifies the configuration output. The outputs are Email, SNMP, Syslog, and Script.
6	Describes the configuration.
7	Shows the date and time of the last configuration change.
8	Provides an Actions menu for the selected configuration with actions that can be taken on the configuration. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

The Global Notifications panel toolbar is at the top of the Output tag and provides the following options:



1	Adds a notification output
2	Configures Email, SNMP, Syslog, and Script notification settings.
3	Removes a selected notification configuration. You cannot delete notification servers and

	notification types that are associated with global audit log configurations. If you attempt to delete a notification output (notification) being used by alerts, you will receive a warning confirmation message that the alerts using the notification will not function properly. The message shows the number of alerts in use. You can also delete a configuration by selecting a configuration and then in the Actions column, selecting  > Delete.
4	Edits a selected notification configuration. You can also edit a configuration by selecting a configuration and then in the Actions column, selecting  > Edit.
5	Duplicates a selected notification configuration. You can also duplicate a configuration by selecting a configuration and then in the Actions column, selecting  > Duplicate.
6	Displays the following options: • **Import**: Imports a notification server, type, or template. For example, on the Servers tab, you can import a notification server configuration. • **Export All**: Exports all of the configurations. For example, if you are on the Servers tab, you can export all of the notification server configurations. • **Export**: Exports a selected configuration. You can also export a configuration by selecting a configuration and then in the Actions column, selecting  > Export.
7	Filters by Email, SNMP, Syslog, or Script.
8	Searches configurations in the grid.

Templates Tab

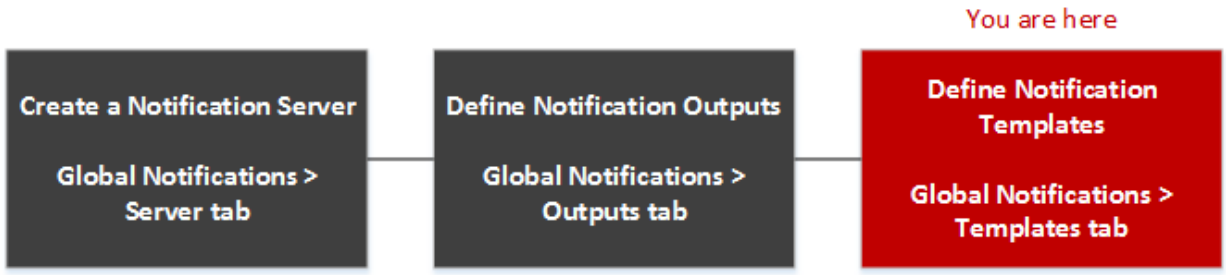
The Notification Templates tab enables to configure notification templates. Global Notifications configurations define notifications settings for Event Source Management (ESM), Health and Wellness, Global Audit Logging, Event Stream Analysis (ESA), and Respond. Notification templates define the format and message fields of the notifications.

Select a default template or configure templates for Email, SNMP, Syslog, and Script, depending on the template type. For Event Stream Analysis (ESA) templates, configure Email, SNMP, Syslog, and Script. For Audit Logging templates, configure Syslog.

Event Stream Analysis templates are not specific to any type of alert notifications, that is, the same template can be used for all types of notifications.

When upgrading from Security Analytics menus 10.4, all existing notification templates migrate to the Event Stream Analysis template type.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Define notification Templates	Configure Templates for Notifications

Related Topics

Configure Global Notifications Templates

Configure a Template

Define a Template for ESA Alert Notifications

Delete a Template

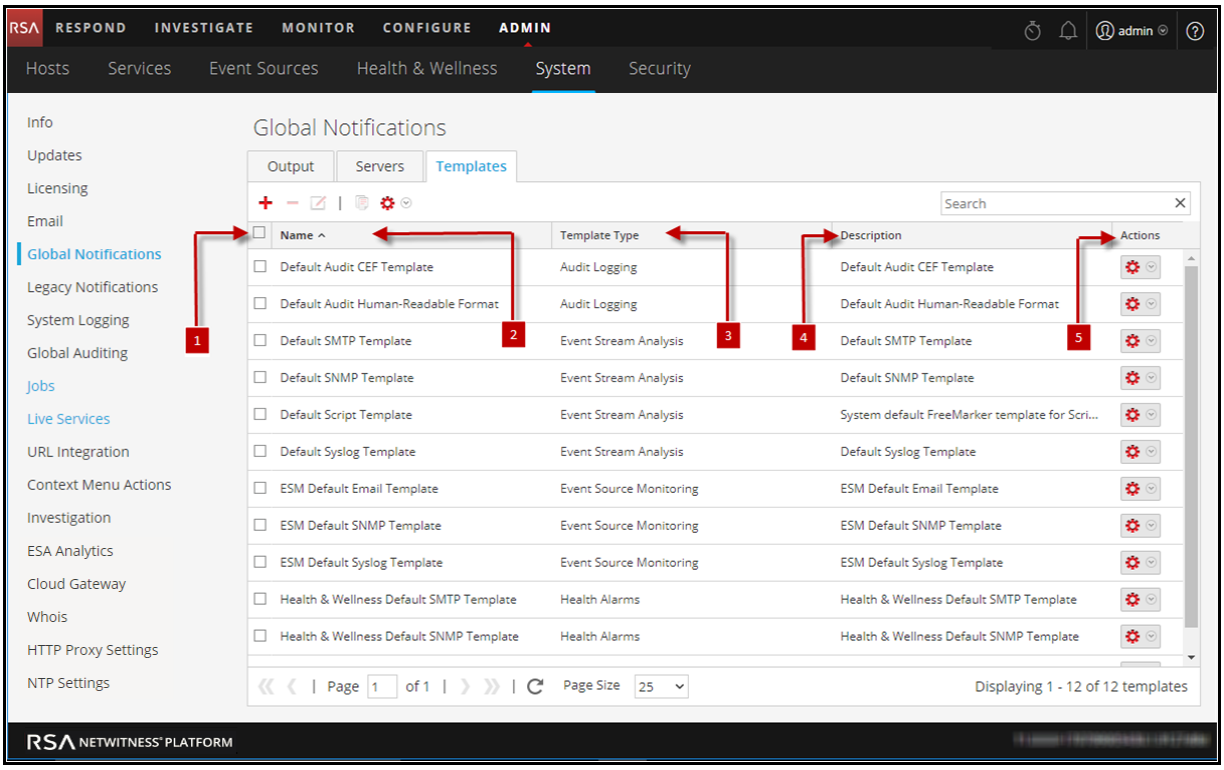
Duplicate a Template

Edit a Template

Import and Export a Global Notifications Template

Quick look

The following example illustrates Global Notification Templates Tab.



1. Selects a row for an action in the toolbar. Selecting the check box in the column title selects or deselects all rows in the grid.
2. Identifies or labels the templates
3. Choose a Template Type
4. Describes the templates
5. Provides an Actions menu for the selected templates with actions that can be taken on the Templates. The Actions menu enables you to delete, edit, duplicate, and export the configuration.

HTTP Proxy Settings Panel

HTTP Proxy Settings Panel introduces the proxy support features of the Administration System view > HTTP Proxy Settings panel.

Note: Proxy support is only for HTTP and HTTPS proxies and not SOCKS5.

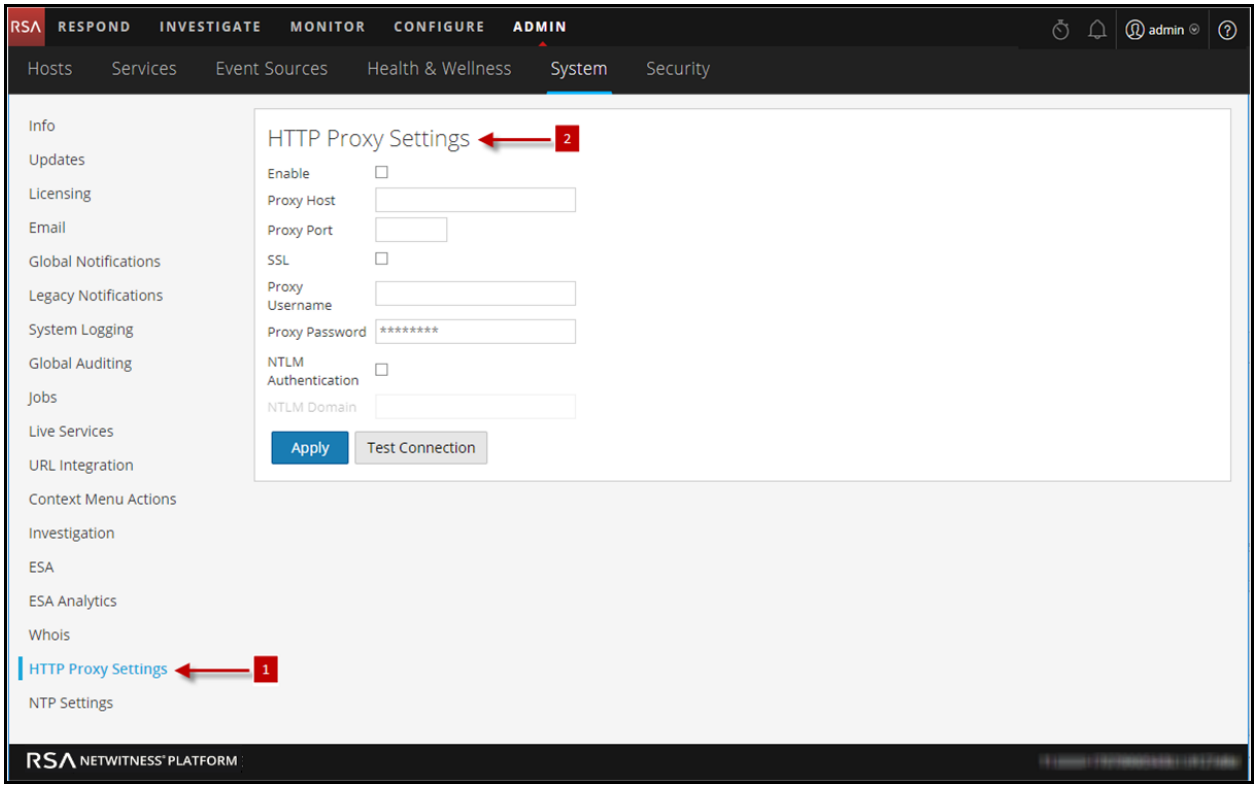
The HTTP Proxy Settings panel provides a user interface for configuring a proxy for use across NetWitness Platform modules and services. The Proxy Settings set up a proxy to be used wherever a proxy is needed in NetWitness Platform. The settings in this panel override any proxy settings configured for an individual service such as Malware Analysis or Live.

Related topics

"Configure Proxy for NetWitness Platform" in Additional Procedures

Quick Look

The following example illustrates an HTTP Proxy Settings Panel.



1 Displays the HTTP Proxy Settings Panel.
2 Allows the user to configure HTTP Proxy Sittings.

This table describes the features in the HTTP Proxy Settings section.

Feature	Description
Enable	Enable the system proxy configuration for use in NetWitness Platform.
Proxy Host	The hostname for the proxy host.
Proxy Port	The port used for communication on the proxy host.
SSL	(Optional) Enable communication using SSL.
Proxy Username	(Optional) The user name used to log on to the proxy host if the proxy requires authentication.
Proxy Password	(Optional) The user password used to log on to the proxy host if the proxy requires authentication.
NTLM Authentication	Use NT LAN Manager authentication and session security protocols.
NTLM Domain	The name of NTLM domain.
Apply	Applies any changes made, and they become effective immediately.

Email Configuration Panel

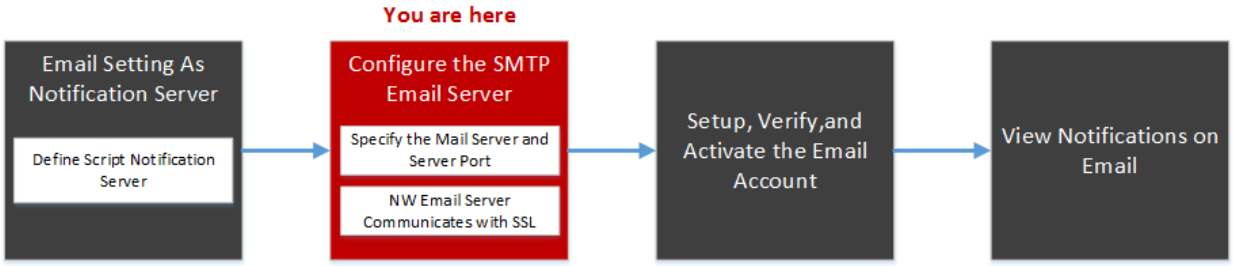
The Email Configuration Panel provides information about email configuration settings in the System View > Email Configuration panel. RSA NetWitness® Platform sends notifications to users via email about various system events. To be able to configure these email notifications, first configure the SMTP email server (See Configure Email Servers and Notification Accounts).

The Email Configuration panel provides a way to:

- Configure the email server.
- Set up an email account to receive notifications.
- View statistics on email operations.

Workflow

This workflow shows the necessary procedures to configure and verify Email Panel.



What do you want to do?

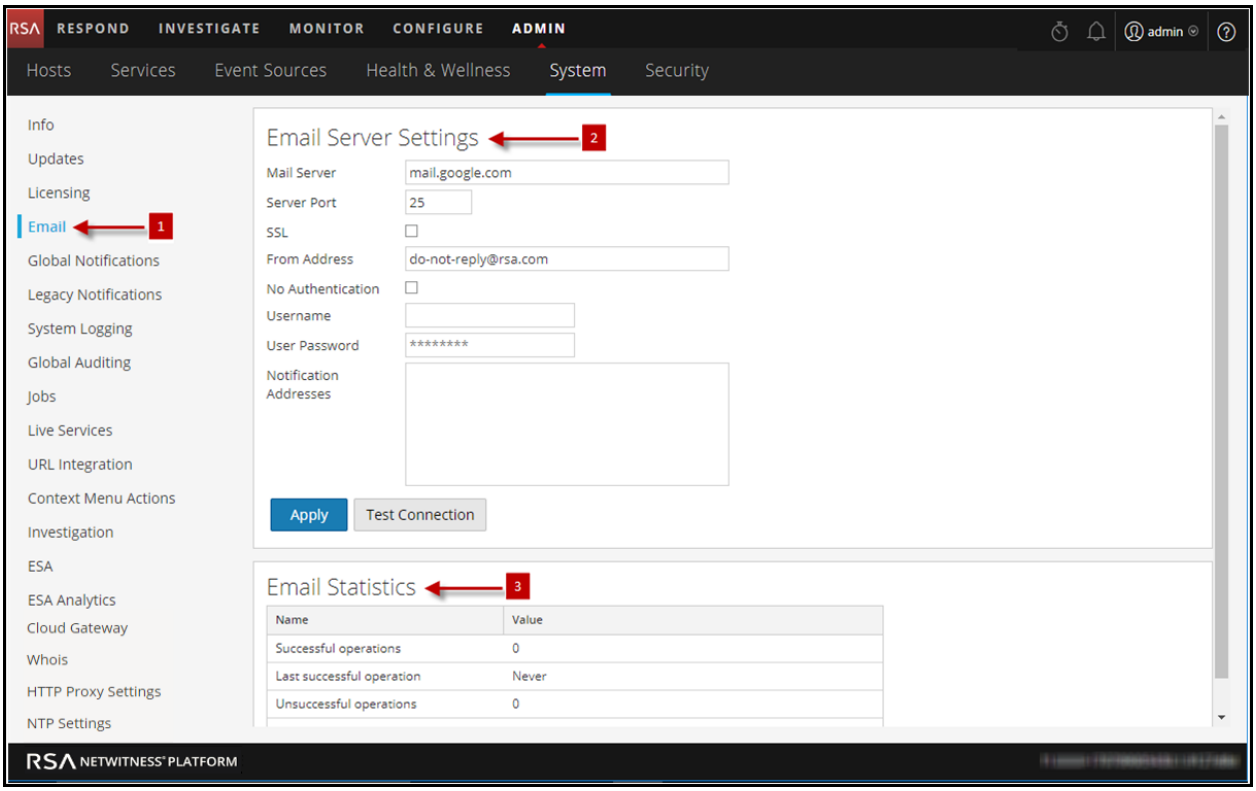
Role	I want to ...	Show me how
Administrator	Configure the SMTP Email Server	Configure Email Servers and Notification Accounts
Administrator	Email Setting as Notification Server	Configure the Email Settings as Notification Server
Administrator	Setup, Verify and Activate the Email Account	Receive Notification on Email

Related Topics

- Configure the Email Settings as Notification Server
- Configure Email as a Notification
- Configure Email Servers and Notification Accounts

Quick Look

The following example illustrates an Email configuration. The configuration defines how events are notified on Email.



1 Displays the Email Configuration Panel.
2 Allows the user to configure Email Server sittings.
3 Provides feedback on Email operations.

The **Email Configuration** panel has two sections: **Email Server Settings** and **Email Statistics**.

Email Server Settings

In the **Email Server Settings** section, you configure the following parameters.

Feature	Description
Mail server	The email server name. The default value is **mail.google.com**.
Server port	The server port used to send and receive emails. The default value is **25**.
Use SSL	The preference for SSL use in communications between the email server and NetWitness Platform. The default value is to not use SSL (unchecked).

Feature	Description
From address	The address that appears in all emails from NetWitness Platform. The default from address for emails is **do-not-reply@rsa.com**.
Username	The username to access the email server. The default value is **blank**.
User password	The user password to access the email server. The default value is **blank**.
Test connection	Tests the connection to the email server.
Apply	Applies the email configuration to this instance of NetWitness Platform.

Email Statistics

The Email Statistics section provides feedback on the number of successful and failed email operations as well as the time of the last successful and unsuccessful email operation. For each statistic the name of the statistic and the value is displayed.

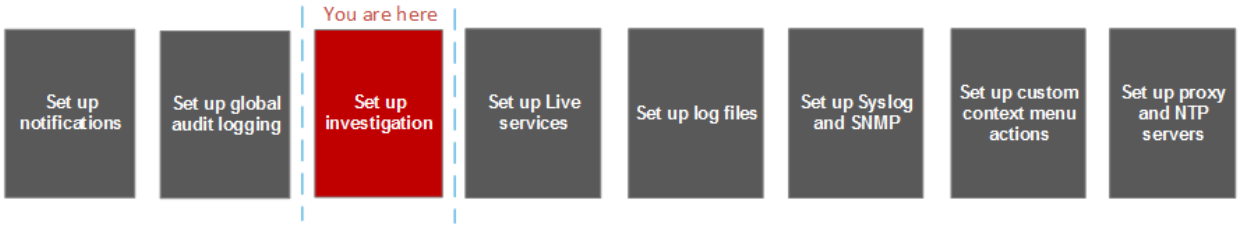
Investigation Configuration Panel

The System view > Investigation Configuration panel, which provides the user interface for Administrators to configure the system-wide settings that NetWitness Platform Investigation uses when analyzing data and reconstructing an event.

The Investigation Configuration settings allow an administrator to manage application performance for Investigation. As analysts analyze and reconstruct sessions that they are investigating, performance can be affected by operations that involve loading, searching, visualizing, and reconstructing large amounts of data.

Note: Analysts can also set individual preferences for Investigation in the Profiles view and in the Navigation view.

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure navigate, events and context lookup settings	Configure Investigation Settings
Administrator	Clear reconstruction cache for services	Configure Investigation Settings

Related Topics

- Standard Procedures

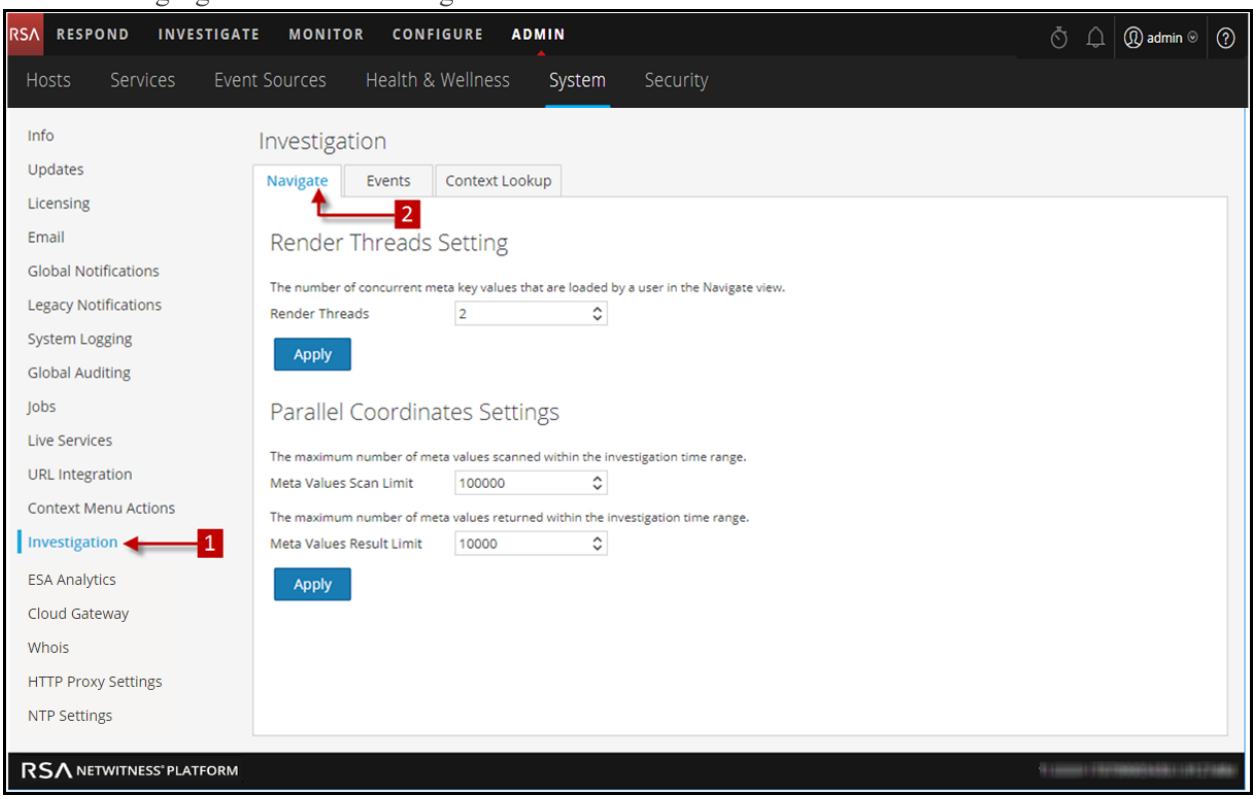
Quick Look

The Investigation Configuration panel has three tabs: Navigate, Events, and Context Lookup.

Though most fields in the tabs have a selection list with specific increments through the range of possible values, you can enter a value within the allowed range manually. An invalid entry is signaled by the field highlighted in red. When valid values are selected, clicking Apply in a given section puts the changes into effect immediately.

Navigate Tab

The following figure shows the Navigate tab.

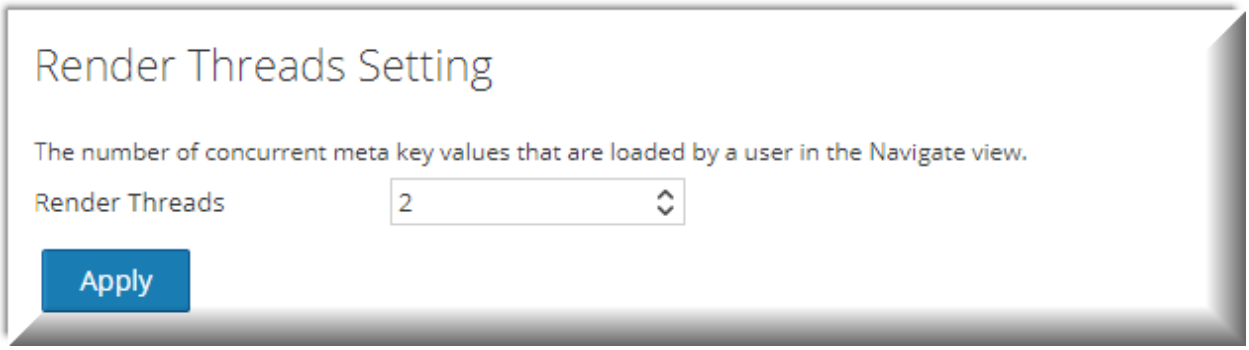


1 Displays the Investigation Configuration Panel.
2 Displays the Navigate Tab.

The Navigate tab has two sections: Render Threads Setting and Parallel Coordinates Settings.

Render Threads Setting

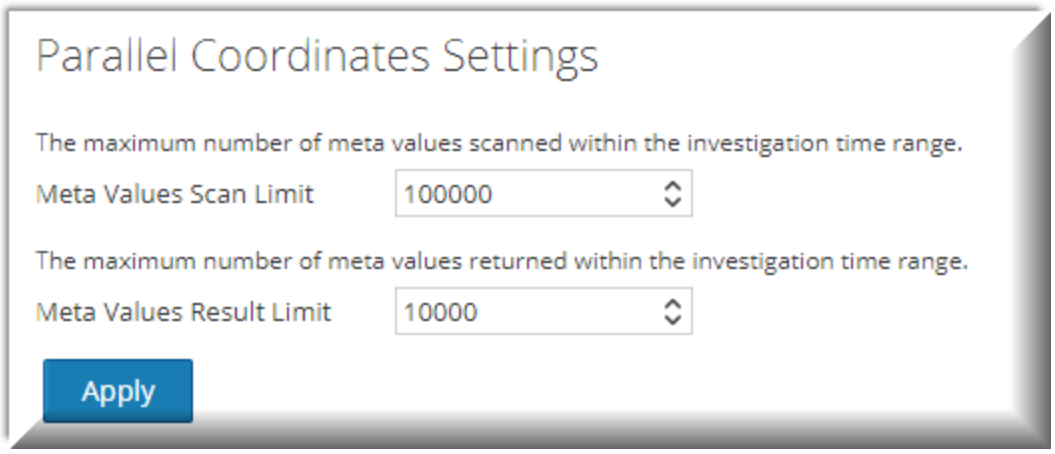
The Render Threads Setting is a selectable value between 1 and 20, which defines the number of concurrent (Values) loads in the Navigate view. The default value is 1.



Parallel Coordinates Settings

The Parallel Coordinates Settings apply to the Parallel Coordinates visualization in the Navigate view. There is a fixed limit on the amount of data that can be rendered as a parallel coordinates chart. In NetWitness Platform the administrator can configure parallel coordinates limits here.

Note: For better performance, recommended settings are **Meta Values Scan Limit: 100000** and **Meta Values Result Limit: 1000-10000**.



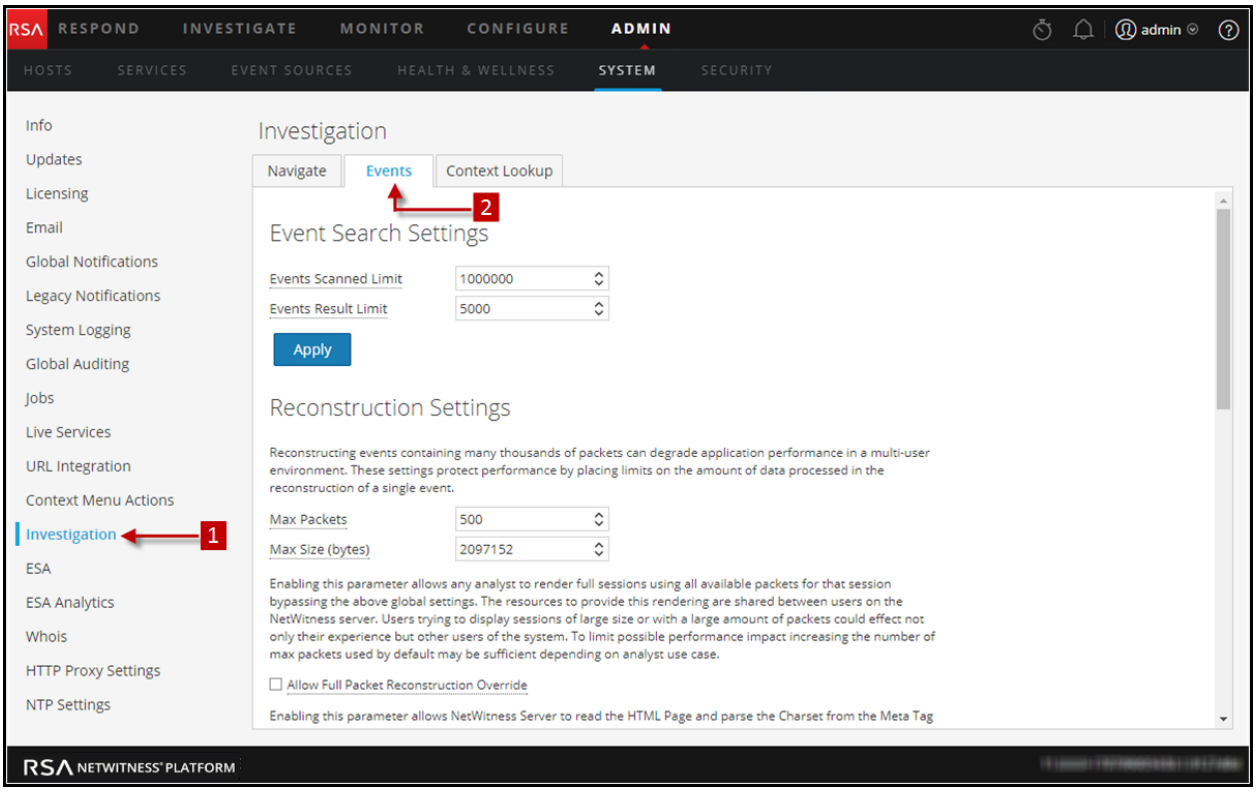
The following table describes the Parallel Coordinates Settings.

Parameter	Description
Meta Values Scan Limit	The maximum number of meta values scanned within the Investigation time range the analyst has selected in the Navigate view. Possible values are in the range of 1,000 to 10,000,000. The default value is 100,000.
Meta Values Result Limit	The maximum number of meta values returned within the Investigation time range the analyst has selected in the Navigate view. Possible values are in the range of 100 to 1,000,000,000. The default value is 10,000.

Quick Look

Events Tab

The following figure shows the Events tab.



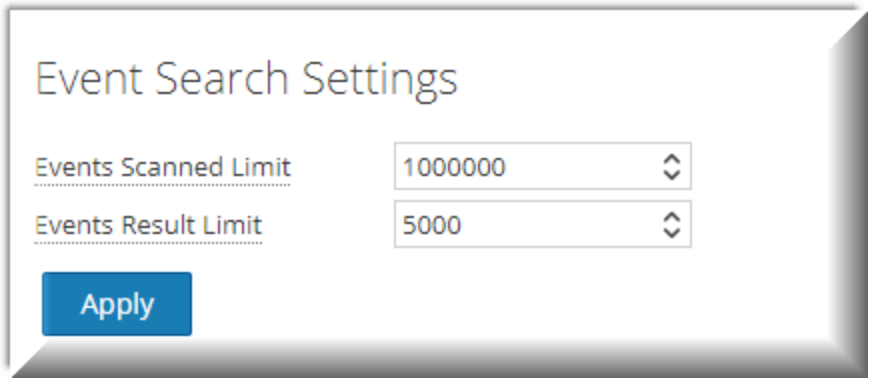
Procedures associated with this panel are provided in Standard Procedures.

1 Displays the Investigation Configuration Panel.
2 Displays the Events Tab.

The Events tab provides configurable settings that affect the investigation of events. This tab has four sections: Event Search Settings, Reconstruction Settings, Web View Reconstruction Settings, and Reconstruction Cache Settings.

Event Search Settings

The Event Search Settings help to limit the number of events scanned when searching in the Events view.



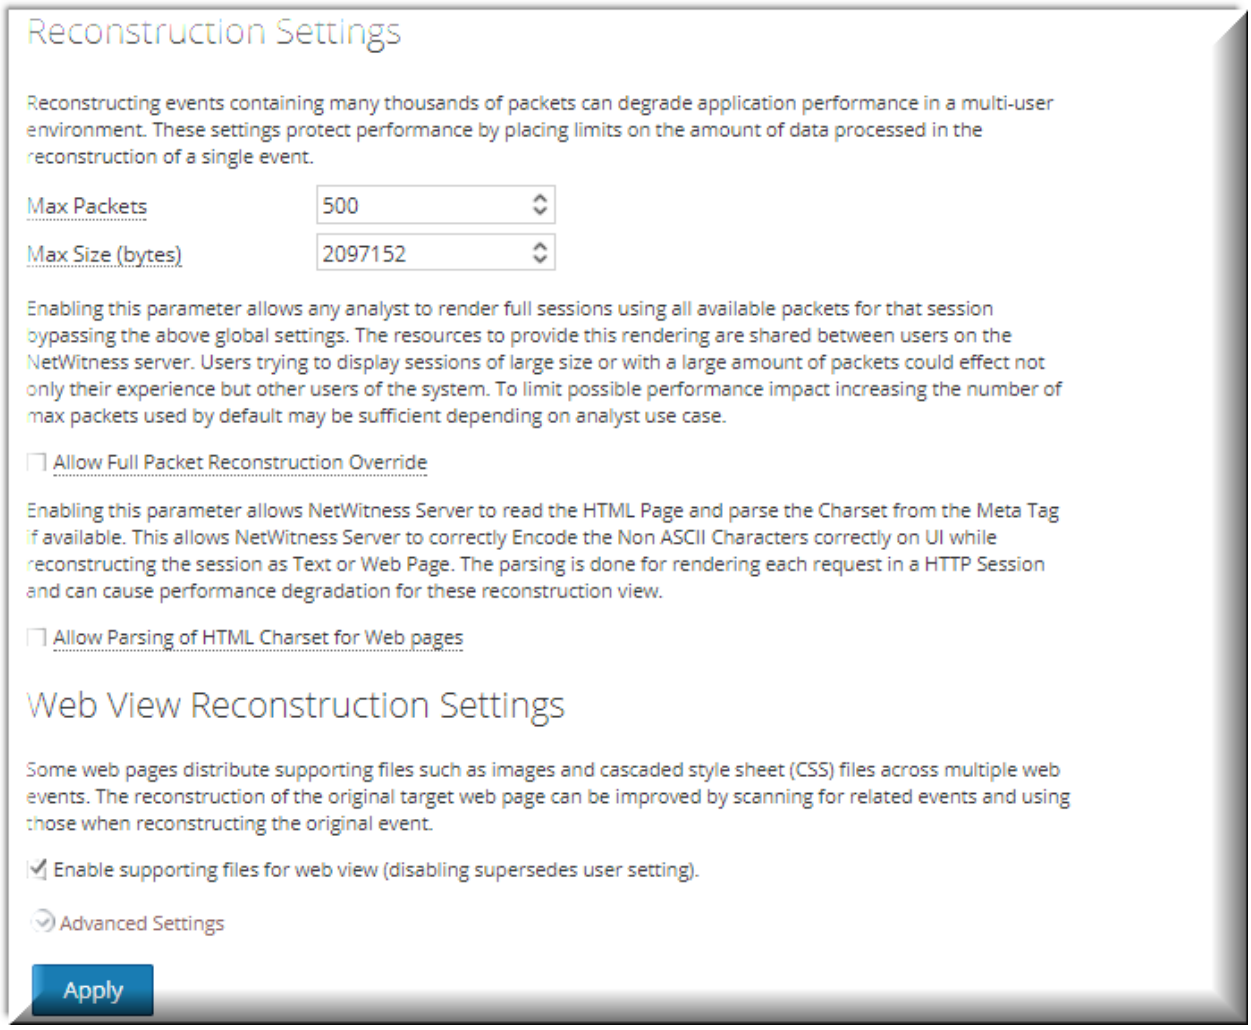
The following table describes the Event Search Settings.

Parameter	Description
Events Scanned Limit	The maximum number of events to scan when searching in the Events view.
Events Result Limit	The maximum number of results to return when searching in the Events view.

Reconstruction Settings

As analysts reconstruct sessions that they are investigating, some events can be very large and contain many thousands of source packets. Reconstructing these sessions, especially in a multi-user environment, can degrade application performance. The Reconstruction Settings allow an administrator to limit the number of packets and the size of a single event during reconstruction.

Note: An override to the Reconstruction Settings section is configurable for web views (under Web View Reconstruction Settings).



The following table describes the Reconstruction Settings features.

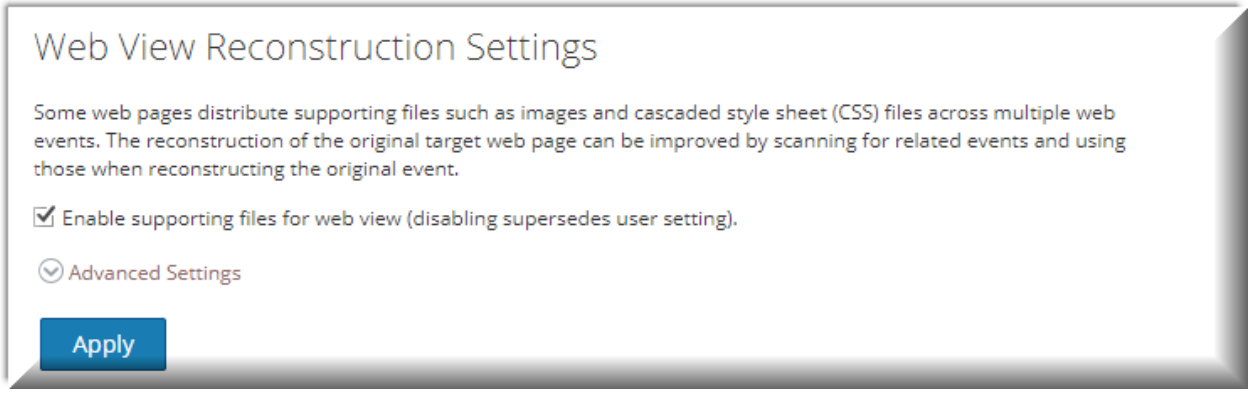
Parameter	Description
Maximum number of packets for a single event	This setting protects performance by placing a limit on the number of packets processed for a single event reconstruction. Possible values are in the range from 100 to 10,000 packets, using manual entry or increments of 100 from the selection list. The default value is 100 packets.
Maximum size, in bytes of a single event	This setting protects performance by placing a limit on the maximum size, in bytes, of a single event reconstruction. Possible values are in the range from 102,400 to 104,857,600 bytes, using manual entry or increments of 10,240 from the selection list. The default value is 2,097,152 bytes.
Allow Full Packet Reconstruction Override	When this checkbox is selected, the analysts is provided with a Use More Packets button in the Reconstruction Panel. This enables the NW Server to regenerate events using all the packets available in the Event.
Allow Parsing of HTML Charset for Web pages	This option allows the NetWitness Server to identify the web page encoding defined in the HTML meta tag instead of the HTTP header. The default setting is disabled.

Web View Reconstruction Settings

The Web View Reconstruction Settings allow an administrator to configure settings that improve the reconstruction of a web view by scanning and reconstructing related events that contain the same supporting files. When NetWitness Platform is reconstructing a web view that spans multiple events, it is possible to improve the reconstruction of the target event by scanning and reconstructing related events that contain the same supporting files, such as images and cascaded style sheet (CSS) files.

- The only related events scanned are HTTP service type events with the same source address as the target event, and a time stamp within a specified time range before and after the target event.
- The maximum number of related events to scan is configurable.

Clicking on the Advanced Settings option displays all configurable settings in this section.

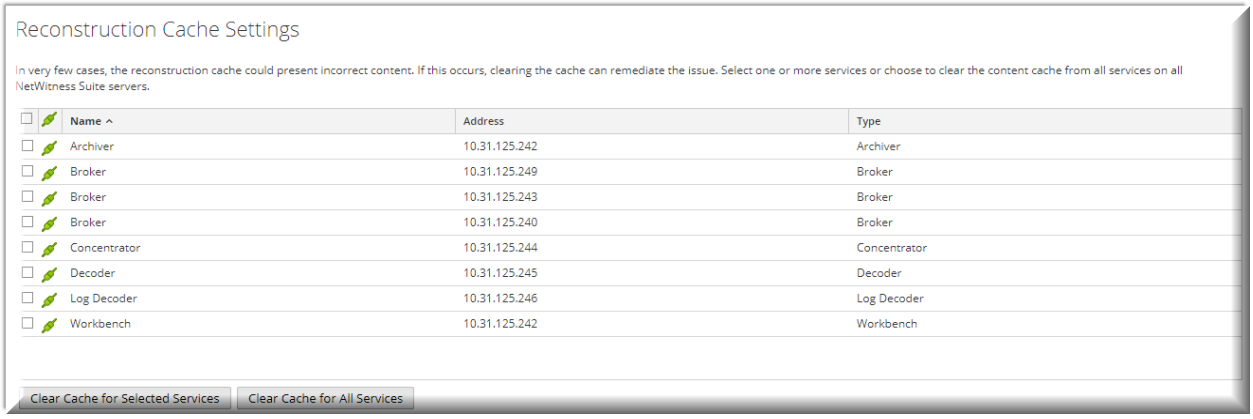


The following table describes the Web View Reconstruction Settings.

Parameter	Description
Enable supporting files for web view	This option determines how web views that have related data in other sessions are reconstructed. The default setting is enabled. When enabled, supporting files from related events can be used in the reconstruction of web views. Additional settings for calibrating the performance are enabled in this section, and Analysts have the option to enable CSS use in reconstructions. When disabled, supporting files from related events are not used and the setting for analysts to enable CSS use in reconstructions is disabled.
Time Range to Scan Related Events	Available when **Enable supporting files for web view** is checked. Configures the time range within which NetWitness Platform scans related events that are of the service type HTTP and have the same source address as the target event. This is a value between 0 and 60. • Seconds Before Target Event • Seconds After Target Event
Limit the number of related events processed	Allows configuration of the maximum number of related events that NetWitness Platform scans within the specified time range to discover supporting files for the target event. By default, this is disabled. When enabled, the Maximum Related Events field becomes active.
Max Related Events	When **Limit the number of events processed** is enabled, this field specifies the maximum number of related events that NetWitness Platform scans within the specified time range to discover supporting files for the target event. This is a selectable value between 10 and 1,000, using an increment of 100. The default value is 100.
Limit the number of packets and size of each related event	Overrides the general settings for the maximum number of packets and maximum size (in bytes) for individual related events.
Maximum Number of Packets for a Single Related Event	Possible values are in the range from 100 to 10,000 packets, using increments of 100 from the selection list. The default value is 100 packets.
Maximum Size, in Bytes, of a Single Related Event	Possible values are in the range from 102,400 to 104,857,600 bytes, using increments of 10,240 from the selection list. The default value is 524,288 bytes.

Reconstruction Cache Settings

In some cases, the reconstruction cache can present incorrect content; for this reason NetWitness Platform removes reconstructions that are older than a day from the cache. The cache is cleaned every day at midnight. Between the daily cache cleanings, certain actions may result in stale cache being used for a reconstruction, and if the need arises, administrators can manually clear cache for one or more services that are connected to the current NetWitness Server.



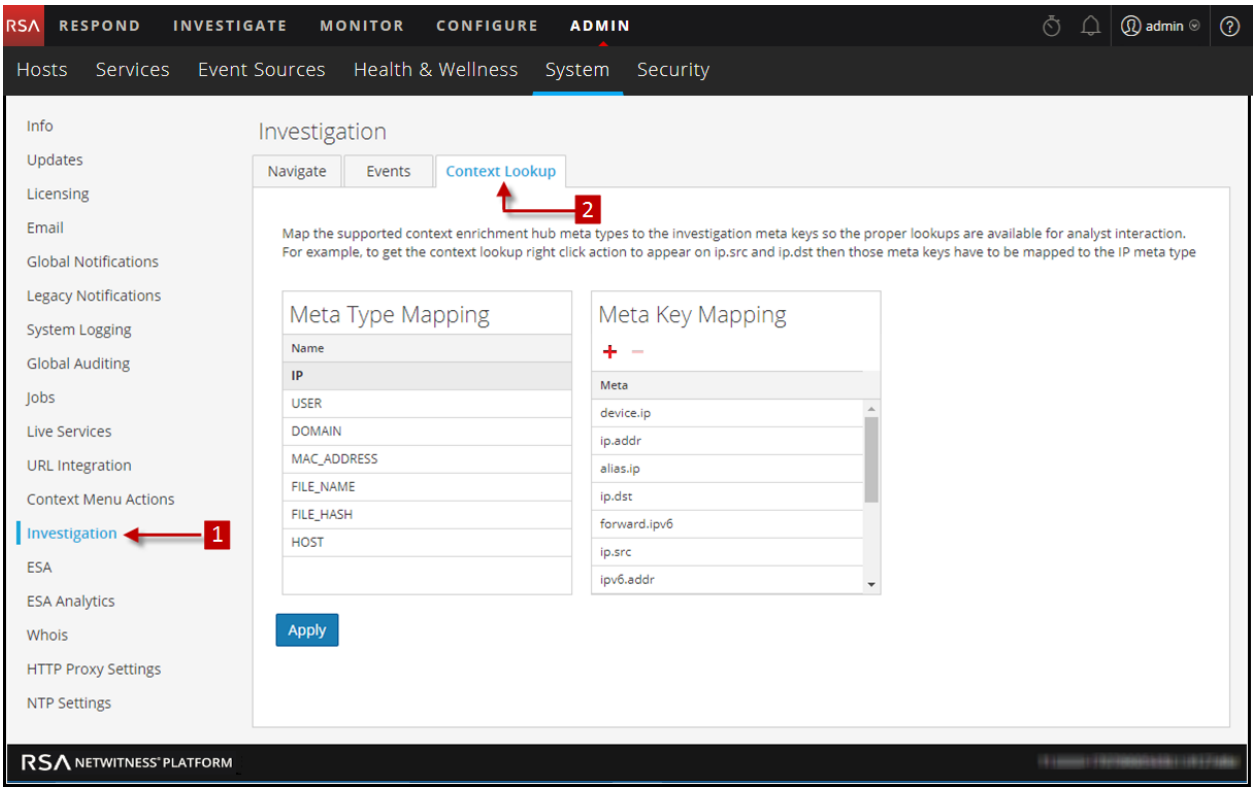
The following table describes the Reconstruction Cache Settings features.

Feature	Description
Selection box	Selection box in individual rows and in the title bar allow selection of one or more, or all services that need to have cache cleared manually.
Clear Cache for Selected Services	Clears the reconstruction cache for each selected service.
Clear Cache for All Services	Clears the reconstruction cache for all services.

Quick Look

Context Lookup Tab

The following figure shows the Context Lookup tab.



Procedures associated with this panel are provided in "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*.

1 Displays the Investigation Configuration Panel.
2 Displays the Context Lookup Tab.

The Context Lookup tab enables the administrator to configure the Investigation meta keys and meta type mapping. The administrator can add or remove meta keys found in Investigation to the list of meta types supported by Context Hub service. NetWitness Respond and Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, RSA recommends that when mapping meta keys in the ADMIN > SYSTEM > Investigations > Context Lookup tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, `ip.address` is a meta key and `ip_address` is not a meta key (it is a field in the MongoDB).

The following table describes the features of the Context Lookup tab.

Feature	Description
+	Adds an meta key to the selected meta type supported by Context Hub.
–	Deletes the meta key from the selected meta type.

Feature	Description
Apply	Saves the changes made to the Context Lookup tab.

Live Services Configuration Panel

Live Services Configuration Panel introduces the features for setting up your Live account and the CMS server connection.

Live Account consists of two sections, namely RSA Live Status and Download Live Feedback Activity Log. **Sign In** by entering your Live Account credentials to access the Live Services. To activate your Live account for NetWitness Platform, please contact RSA Customer Care. When you have confirmation that your Live account has been set up, you can configure the CMS server connection as described in Configure Live Services Settings

The Live Services panel provides the user interface for:

- The Live account
- The Live Content update schedule and preferences for notification of updates
- Participation in Live Feedback
- Sharing Live Content Usage Details
- RSA Live Connect (Beta)

New Features Enabled Dialog

When you log onto NetWitness Platform for the first time, you will be prompted with **New Features Enabled** dialog.

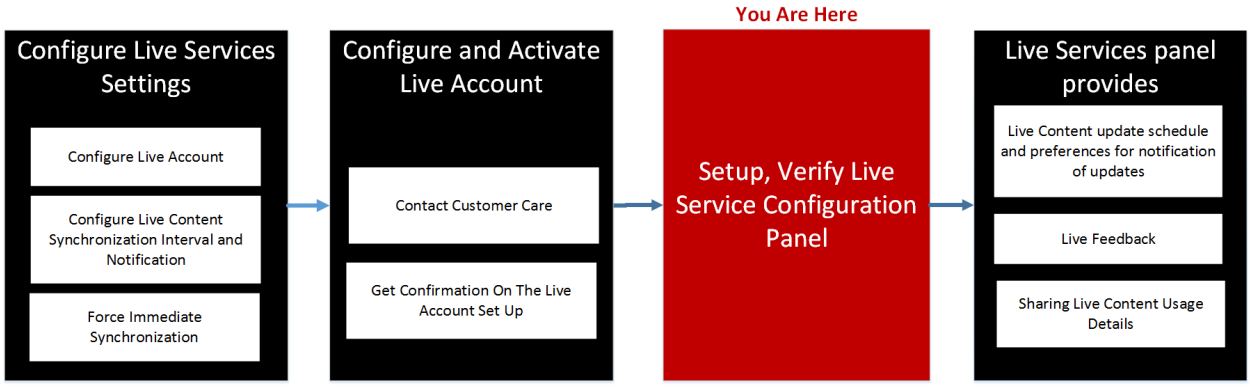
Feature	Description
Accept	Clicking Accept indicates that you agree to the following: • Participate in Live Feedback • Allow NetWitness Platform to send RSA the usage metrics and version of NW hosts about your environment to RSA, provided a Live Account is configured. • Receive threat intelligence data from Live Connect.
View Settings	Clicking **View Settings** redirects you to the Live Services UI to view the settings. If you have not configured the Live Account, a masked screen is displayed.

For information on Live Feedback, see Live Feedback Overview

For information on Analyst Behaviors and Data Sharing, see the "NetWitness Platform Feedback and Data Sharing topic in the *Live Services Management Guide*.

For information on Live Connect Threat Insights, see Configure Live Services Settings

Workflow



What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Live Account, CMS Server Connection	Configure the Email Settings as Notification Server
Administrator	Upload Data to RSA for Live Feedback	Upload Data to RSA for Live Feedback
Administrator	Setup, Verify Live Service Configuration Panel	Live Services Configuration Panel
Administrator	Overview On Live Feedback	Live Feedback Overview

Related Topics

- Live Feedback Overview

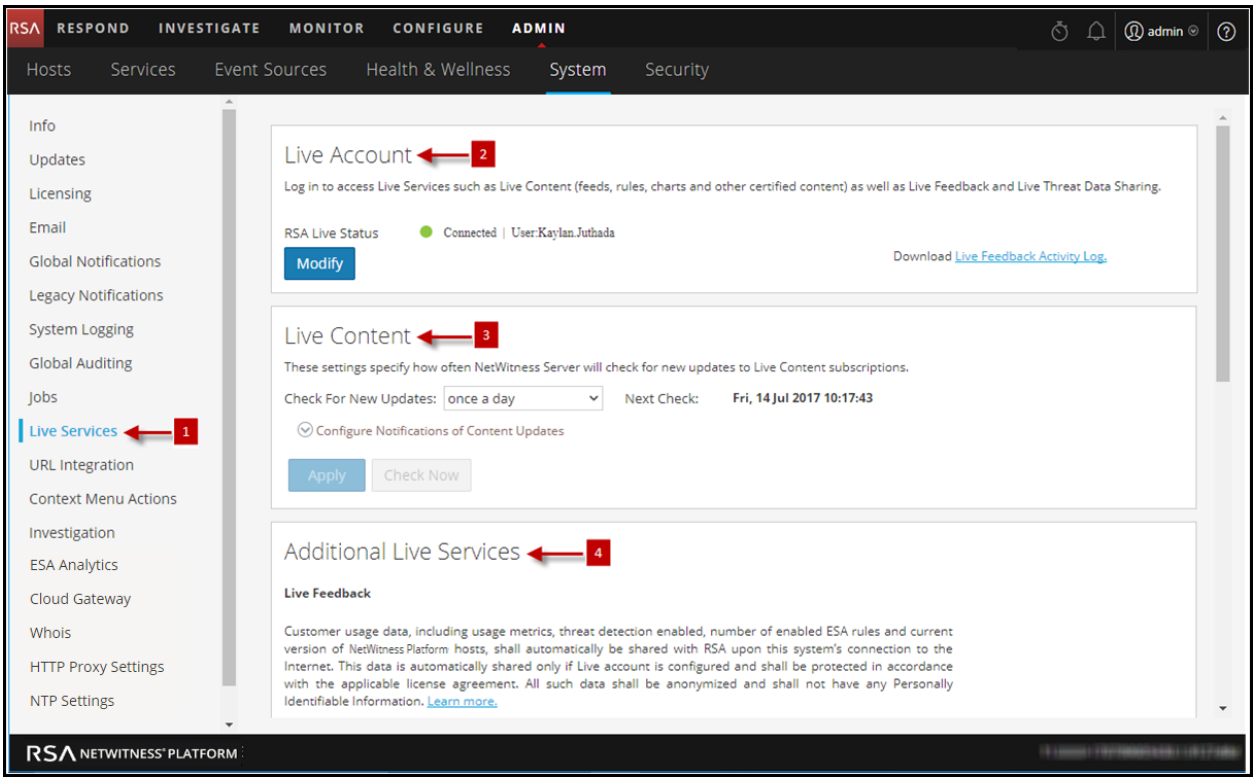
- Live Services Management Guide

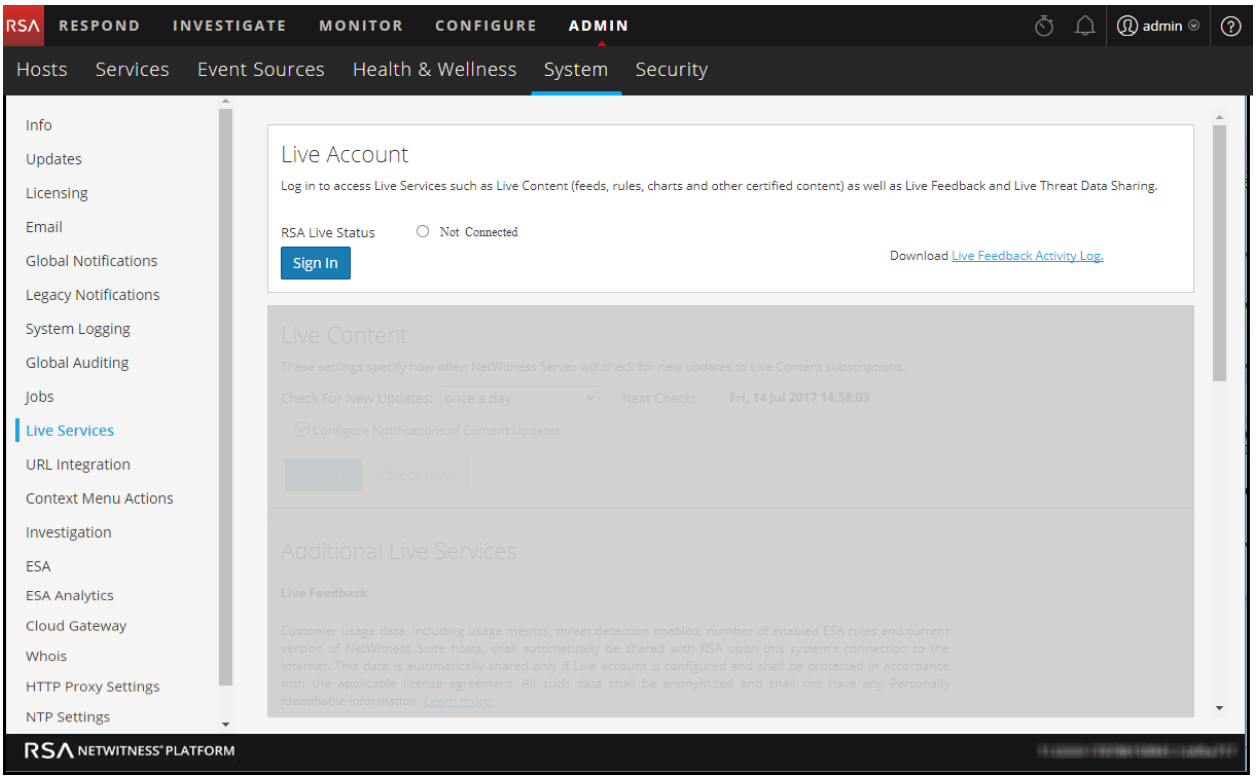
Live Services Quick Look

You access this view in the **ADMIN > System > Live Services**.



1 Displays the Live Services Configuration Panel.
2 Enter Live Account Credentials with the help of Customer Care.
3 Provides updates on Live Content.
4 Additional Live Services provide Live feedback.

Note: If you are not signed in with your Live Account credentials, a masked screen is displayed as shown here.



The Live Configuration panel has three sections: Live Account, Live Content, and Additional Live Services.

Live Account Section

In the **Live Account** section, you must enter the Live credentials. The information needed to set up the user's Live account consists of the Username, Password, and Live URL for the RSA Content Management System. This information is provided by Customer Care.

The following table describes the Live Account section features.

Feature	Description
Host	The Live URL for the Content Management System. The default value points to the RSA CMS at **cms.netwitness.com**.
Port	The communications port for Live to send requests to the Content Management System. The default value for this field is **443**, which is the communications port on the Content Management System.
SSL	Allows the user to communicate via SSL.
Username	The Live account user name as provided by RSA Customer Care.
Password	The Live account user password as provided by RSA Customer Care.
Test connection	Tests if the connection is successful or not.

Feature	Description
Apply	Saves and applies the configuration.

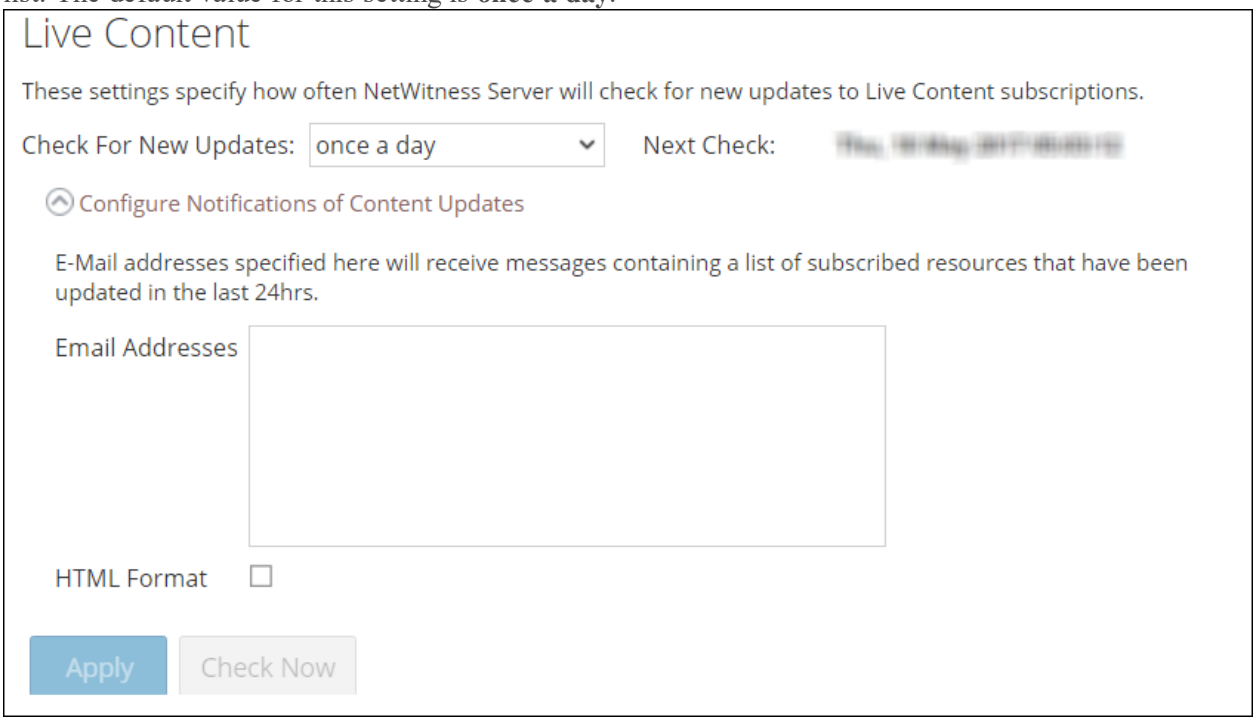
The Live Account section provides an option to download and share the Live Feedback historical data by clicking Live Feedback Activity Log.

For more information about how to download historical data, see Upload Data to RSA for Live Feedback

Live Content Section

You can configure the Live Content Synchronization interval and notification at which NetWitness Platform checks for new updates to Live Content:

Use the **Check for New Updates** field to change the interval. Select an interval from the drop-down list. The default value for this setting is **once a day**.



The following table describes the Live Content features.

Feature	Description
Check for new updates	This setting dictates how often NetWitness Platform checks for new updates to Live Subscriptions and synchronizes subscribed resources and tags: • once a day • twice a day • four times a day • every hour • every other hour • every half hour The default value for this setting is once a day.
Next Check	Displays the time and date of the next scheduled Live synchronization based on the configured interval for checking.
Email Addresses	Email addresses specified here receive messages containing a list of subscribed resources that have been updated in the last 24 hours.
HTML format	Specifies the format of email messages. • Checked = HTML • Not checked = text
Check Now	Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness Platform. **Caution:** Use this feature with caution because synchronization can cause a parser reload if a Lua Parser or Flex Parser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.
Apply	Applies the changed configuration to the subscription synchronization behavior. The changes become effective immediately. The **Next Live synchronization is scheduled for** field is updated if the time changed.

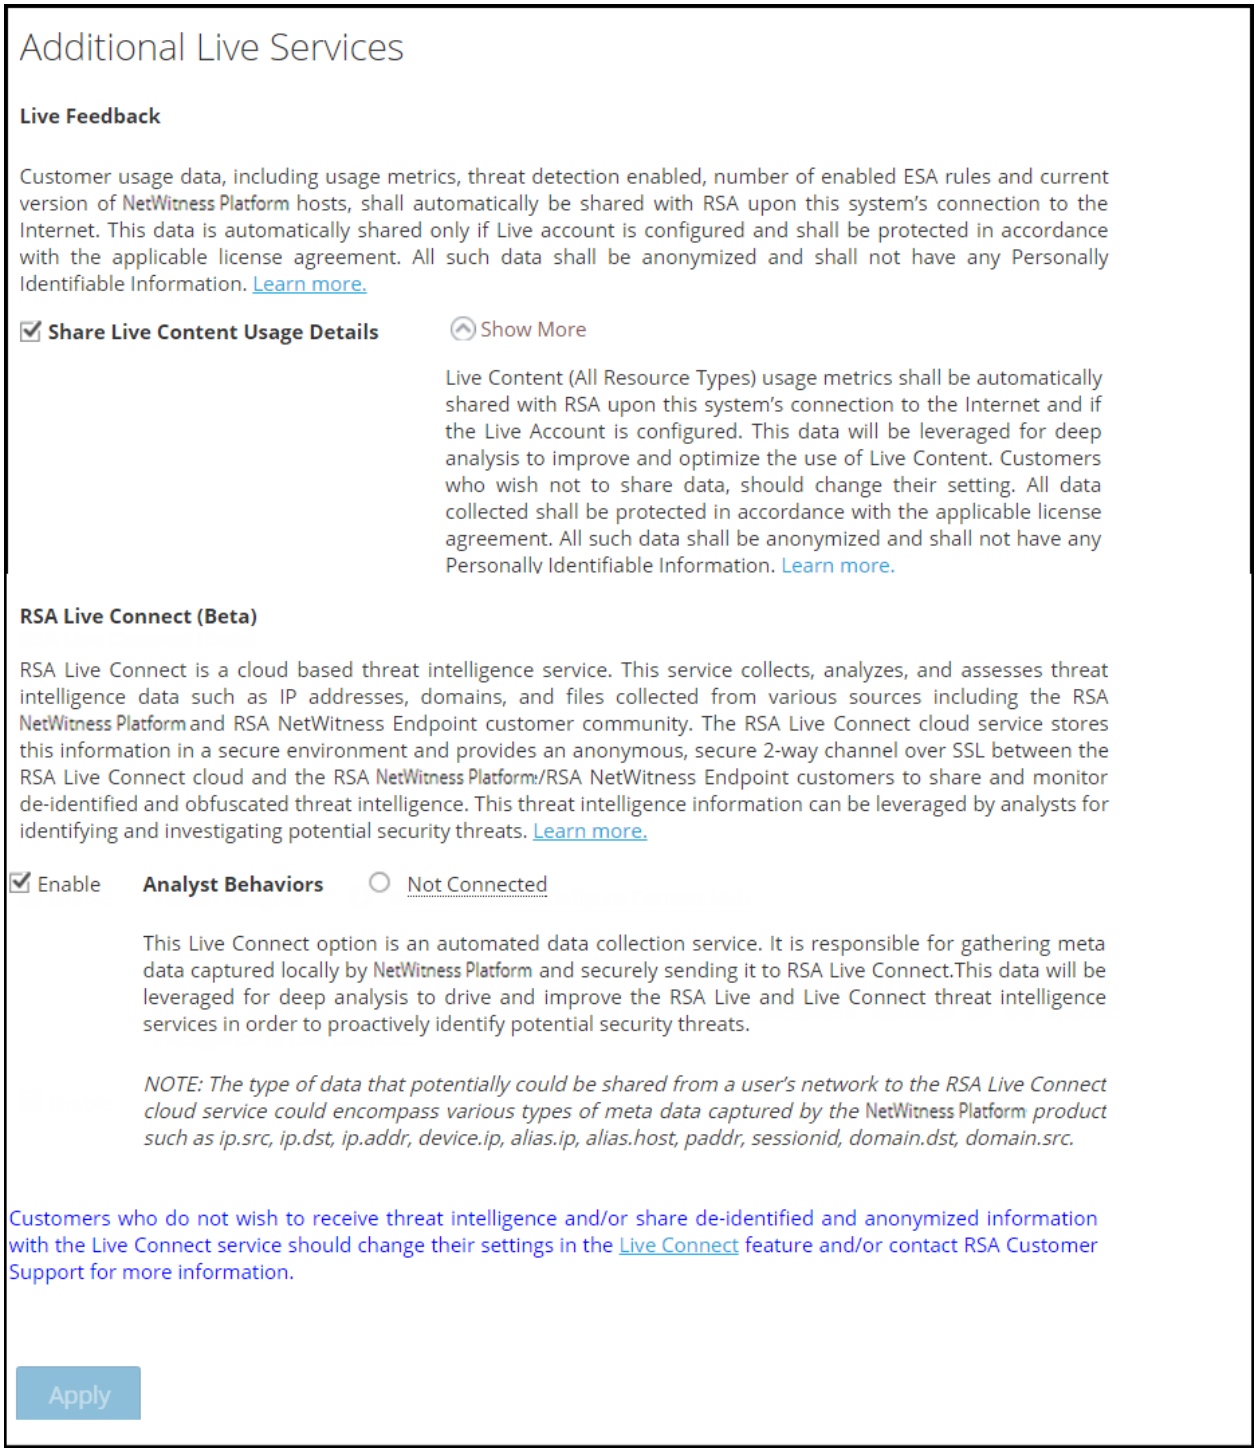
Force Immediate Synchronization

To force immediate synchronization, click **Check Now**. NetWitness Platform checks for updates in subscribed resources.

Instead of waiting for the next scheduled resource cycle, this option forces Live to begin immediate synchronization of the subscribed resources in this instance of NetWitness Platform. One use for this is to see the immediate impact of a configuration change. For example, a new service has been added, or new resources have been toggled for automatic deployment. The scheduled synchronization could take place hours later if Live Services is set to synchronize a few times a day.

Caution: Synchronization can cause a parser reload if a Flex Parser is deployed in the update cycle. This is acceptable once or twice a day, but a number of back-to-back parser reloads can cause packet loss at the Decoder. If this is the initial setup and you haven't configured Live resource subscriptions, do not Synchronize Now. Wait until you have configured subscriptions.

Additional Live Services



Note: Click on Learn more to know more about the data RSA is collecting. For more information, see Live Feedback Overview

The following tables describes the Additional Live Services features.

Feature	Description

Live Feedback	Lists the types of data RSA is collecting:
	• Product Name
	• Product Version
	• Product Instance
	• Activation Key
	• Details of each Component such as:
	  • ID
	  • Name
	  • Version
	  • Instance ID
	• Metrics for each component

Share Live Content Usage Details)	Enables NetWitness Platform to send anonymous, technical data about the content usage metrics to RSA. This option is enabled by default.
RSA Live Connect	Provides more information about Live Connect service and configuring Live Services.
Enable (Threat Insights)	Enables Threat Insights feature where Live Connect is added as a data source for Context Hub service and the analyst can pull threat intel data during investigation. Ensure that context hub is already configured before enabling this feature. This option is enabled by default (checked).
Enable (Analyst Behaviors)	Enables NetWitness Platform to send anonymous, technical data about your environment to RSA. This option is enabled by default (checked).
Apply	Applies the configured changes. The changes become effective immediately. **Note:** This option is applicable only for Threat Insights and Analyst Behaviors.

About Live Feedback Participation

When you participate in Live Feedback, it collects relevant information for further improvement. For information on Live Feedback, see Live Feedback Overview.

When you install NetWitness Platform, you will be prompted to participate in Live Feedback. For information, see Configure Live Services Settings

If needed, you can manually download historical usage data and share it with RSA. For information on how to download historical usage data and share it with RSA, see Upload Data to RSA for Live Feedback.

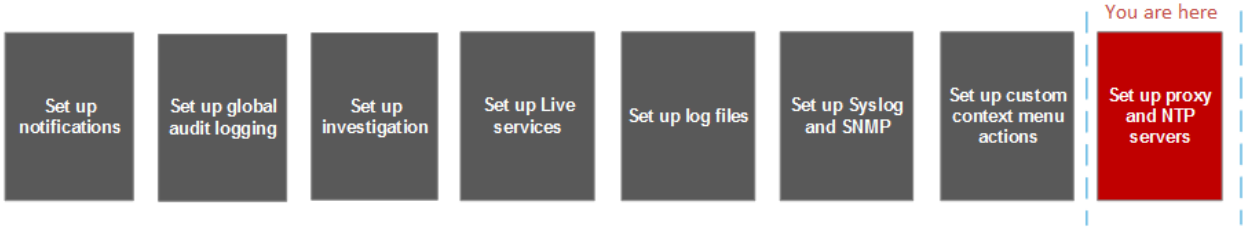
NTP Settings Panel

NTP setting panel is a protocol designed to synchronize the host machine clocks over a network. For more information on NTP see their home page (http://www.ntp.org/).

Note: NetWitness Platform core hosts must be able to communicate with the NW host with UDP port 123 for NTP time synchronization.

You use the**ADMIN** > **System** > **NTP Settings** view to configure one or more NTP servers. After you configure an NTP server, NetWitness Platform uses NTP to synchronize the host machine clocks. You configure multiple NTP servers for Fail Over purposes.

Workflow



What you need to do?

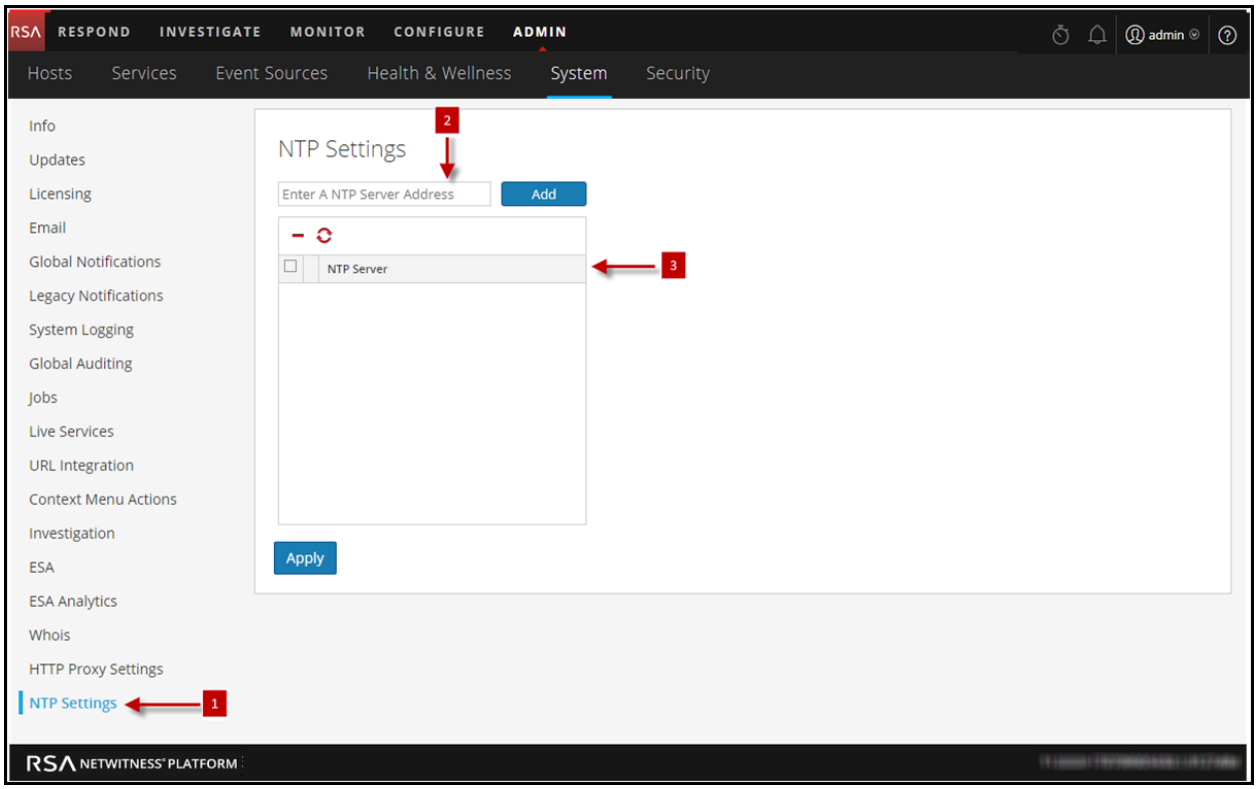
Role	I want to ...	Show me how
Administrator	Add or Modify an NTP Server	Configure NTP Servers

Related Topics

- Configure NTP Servers
- Troubleshooting NTP Server Configuration

Quick Look

The following example illustrates an NTP setting panel. The panel defines how to add NTP server to NTP setting panel.



1 Displays the NTP setting panel.
2 Enter the NTP Server IP Address or hostname.
3 Click on an existing hostname.

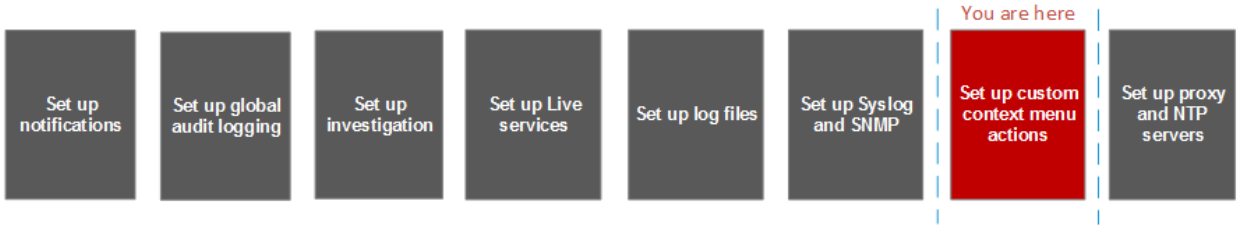
The following table describes the settings in the NTP Settings panel.

Setting	Description
Add	Enter the NTP Server IP Address or hostname to add the NTP server to NetWitness Platform.
	Delete the selected NTP server.
	Synchronizes the selected NTP server.
	Selects the NTP server that you want to delete or synchronize.
NTP Server	NTP Server IP Address or hostname. If you click on an existing hostname, NetWitness Platform makes the hostname editable and displays the following command buttons: • **Update** - Applies your edits. • **Cancel** - Cancels your edits.
Apply	Applies the NTP server settings and synchronizes host machine clocks to NTP.

Context Menu Actions Panel

In the Context Menu Actions panel, Administrators can view built-in context menu actions, and add, edit, or delete custom context menu actions that appear as options in a context menu.

Workflow

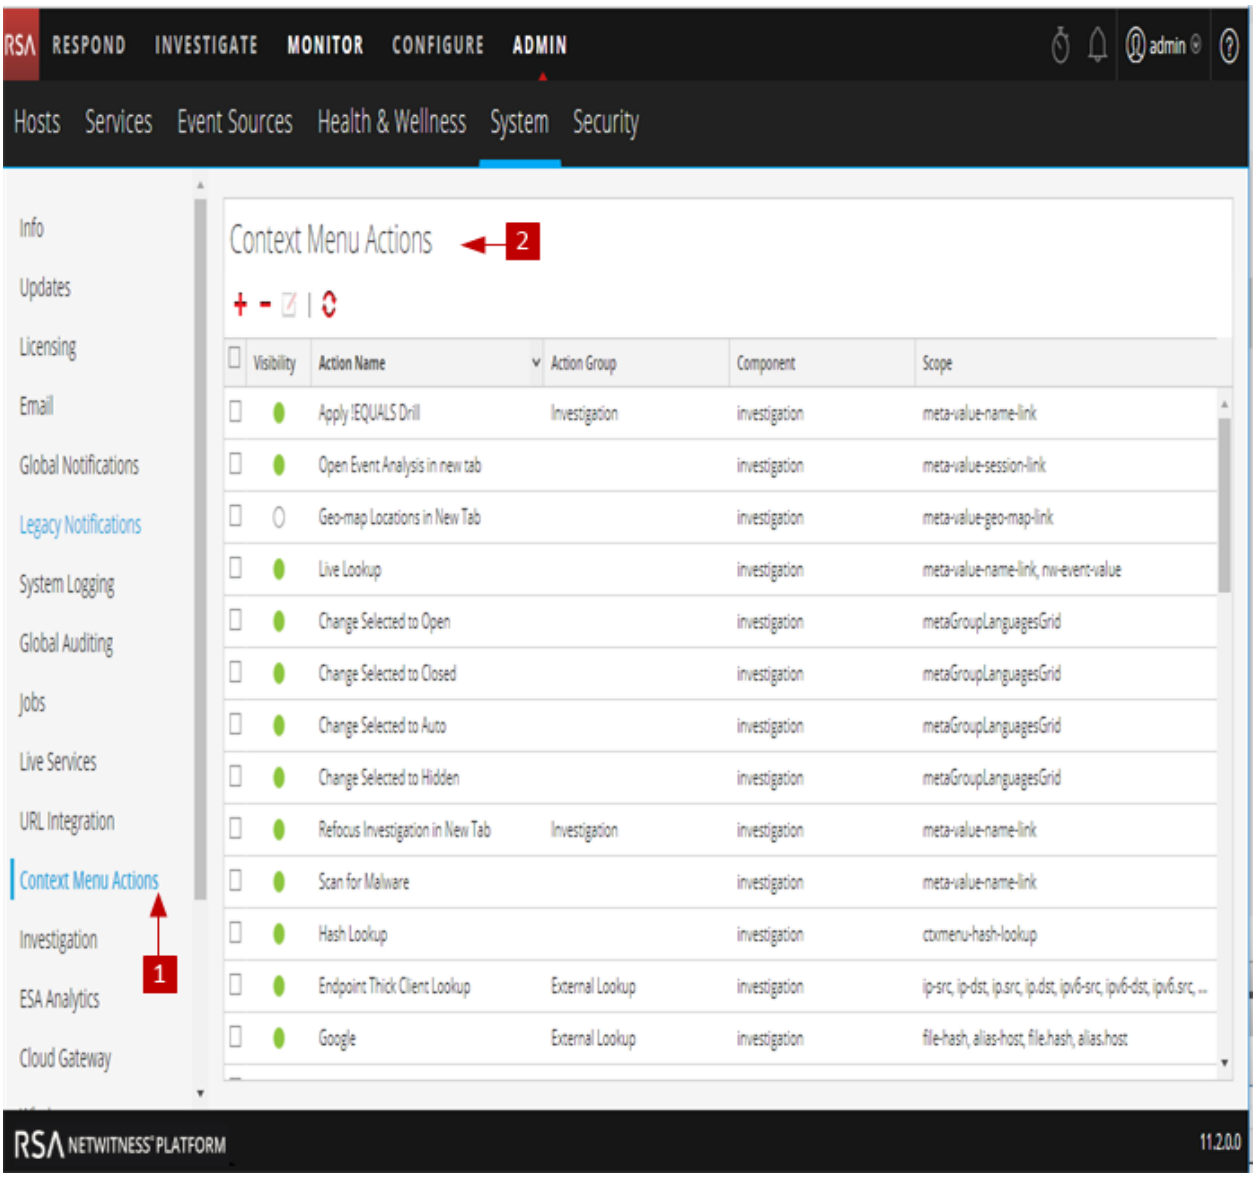


What do you want to do?

Role	I want to ...	Show me how
Administrator	Custom Context Menu Actions panel	Add Custom Context Menu Actions.

Quick Look

The following figure is an example of the Context Menu Actions panel.



1 Displays the Context Menu Actions Panel.
2 Toolbar allows you to Add, Edit, Delete Context Menu Actions.

The Context Menu Actions panel has a list and a toolbar. The following table describes the toolbar options and grid features.

Features	Description
+	Displays the Context Menu Configuration dialog, in which you can create a new context action.
↻	Refreshes the list.

Features	Description
	Deletes the selected context actions. NetWitness Platform does not request confirmation that you want to delete the action. The selected actions are immediately deleted with no opportunity to cancel.
	Displays the Edit Context Action dialog, in which you can edit an existing context action.
Visibility	Displays whether the context menu action is enabled or disabled.
Action Name	The name of the context menu action as it appears on the meta when a user right-clicks to initiate action.
Action Group	The action group under which this context menu action is grouped.
Component	The UI component to which the Action Name and Action Group belong.

Scope	The names of the modules in which the context action is available. Currently all built-in context menu actions are for the Investigation module.
	When creating a context menu action, the parameter is `modules`.
	Here is a line of sample code:
	`"modules": [`
	`"investigation"`
	`],`

CSS Classes and Examples

CSS classes can be meta keys and non-meta keys.

Meta Key CSS Classes

One type of CSS class that you can add is meta keys. For meta keys that have a period, change the period to a dash when defining a CSS class. For example, the meta key `alias.host` becomes the CSS class `alias-host`. The meta key `ip.src` becomes the CSS class `ip-src`.

Non-Meta Key CSS Classes

Built-in non-meta key CSS Classes are also available. The classes in the following table define actions and the part of the user interface where the action is available.

CSS Class	Type	Description
`meta-value-session-link`	Action	Open on meta session count number
`meta-value-name-link`	Action	Open on meta value name
`nw-event-value`	Action	Use for reconstruction context actions on meta value
`UAP.investigation.navigate.view.NavigationPanel`	User interface	Applies to Navigate view

CSS Class	Type	Description
UAP.investigation.events.view. EventGrid	User interface	Applies to Event View
UAP.investigation.reconstruction.view. content.ReconstructedEventDataGrid	User interface	Applies to Event Reconstruction View

Example

This is a commented example of a context menu action to validate the user agent from the Client Application (client) meta key. The comments are removed automatically once applied in the Administration System view. The new menu item is displayed after restarting the browser.

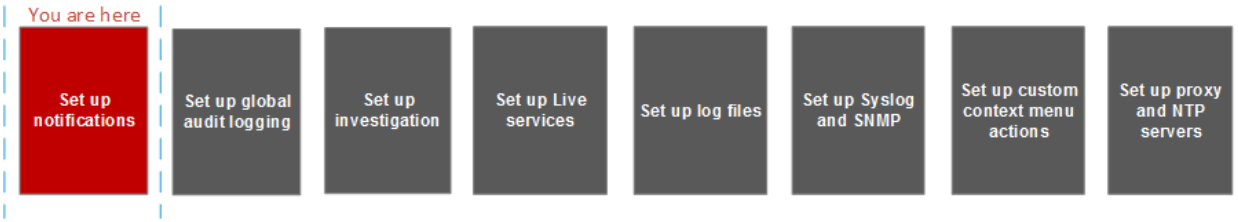
```
{
     "displayName": "User Agent String Lookup”, <!-- What name shows up in NW
UI -->
     "cssClasses": [
         “client”  <!-- What meta key to launch from -->
     ],
     "description": "",
     "type": "UAP.common.contextmenu.actions.URLContextAction",
     "version": "1",
     "modules": [
         "investigation"
     ],
     "local": "false",
     "groupName": "externalLookupGroup”, <!-- What group to show link in.
Remove line to show in main list -->
     "urlFormat": "http://www.useragentstring.com/?uas={0}&getText=all”, <!-- The {0}
gets replaced with whatever was right clicked on -->
     "disabled": "",
     "id": "UserAgentStringAction",
    "moduleClasses": [
         "UAP.investigation.navigate.view.NavigationPanel”, <-- Enabled in
Navigate pane-->
        “UAP.investigation.events.view.EventGrid” <-- Enabled in Event View
pane -->
     ],
     "openInNewTab": "true",
     "order": "15"
 }
```

Legacy Notifications Configuration Panel

The Legacy Notifications Configuration panel provides the ability to configure syslog and SNMP notification settings. These configurations are used for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Procedures related to these settings are described in Configure Syslog and SNMP Settings.

Workflow



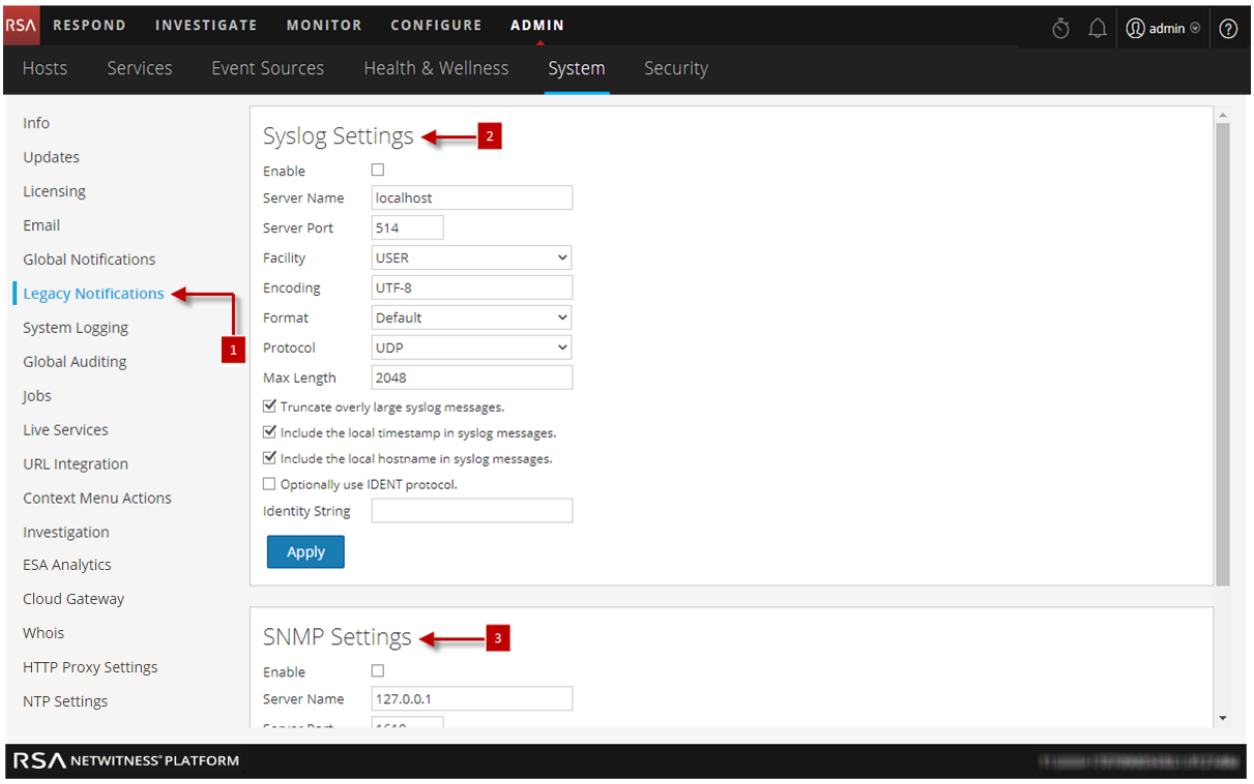
What do you want to do?

Role	I want to ...	Show me how
Administrator	Configure Syslog Settings	Configure Syslog and SNMP Settings
Administrator	Configure SNMP Settings	Configure Syslog and SNMP Settings

Related Topics

- Configure Syslog and SNMP Settings

Quick Look



1	Displays the Legacy Notification Configuration Panel.
2	Allows the user to configure syslog notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.
3	Allows the user to configure SNMP notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

The Legacy Notifications Configuration Panel consists of two sections: Syslog Settings and SNMP Settings.

Syslog Settings

The following table describes the available options for configuring syslog notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Feature	Description
Enable	Enables the syslog settings configured here.
Server Name	Specifies the host where the target syslog process is running.
Server port	Specifies the port where the target syslog process is listening.

Feature	Description
Facility	Specifies the designated syslog facility to use for all outgoing messages. Possible values are KERN, USER, MAIL, DAEMON, AUTH, SYSLOG, LPR, NEWS, UUCP, CRON, AUTHPRIV, FTP, LOCAL1 through LOCAL7.
Encoding	Specifies the encoding to use for text in syslog messages, for example, UTF-8.
Format	Specifies the message format. Possible values are: Default, PCI DSS, or SEC.
Protocol	Specifies the communications protocol used when sending syslogs: UDP or TCP. By default, the UDP protocol is selected.
Max length	Specifies the maximum length in bytes of any syslog message. The default value is **2048**. Messages that exceed the maximum length are truncated when the **Truncate overly large syslog messages** checkbox is selected.
Truncate overly large syslog messages	When checked, any messages exceeding the maximum length are truncated.
Include the local timestamp in syslog messages	When checked, NetWitness Platform includes the local timestamp in messages.
Include the local hostname in syslog messages	When checked, NetWitness Platform includes the local hostname in syslog messages.
Optionally use IDENT protocol	When checked, NetWitness Platform prepends the identity string to outgoing syslog alerts.
Identity string	This is an identity string to be prepended to each syslog alert. If the string is blank, no identity string is prepended to the outgoing syslog alerts. You can use this to identify the source of the alert. Users conventionally set it to the name of the program that sends the syslog message.
Apply	Applies the syslog configuration settings.

SNMP Settings

The following table describes the available options for configuring SNMP notifications for Entitlement, legacy Event Source Management (ESM), Warehouse Connector monitoring, and Archiver monitoring.

Feature	Description
Enable	Enables the SNMP settings configured here.
Server Name	Specifies the SNMP trap host.
Server port	Specifies the listening port on the SNMP trap host

Feature	Description
SNMP version	Specifies the SNMP version, **v1** or **v2c**.
Trap OID	Specifies the object ID for the SNMP trap on the trap host that receives the audit event. The default value is **0.0.0.0.0.1**.
Community	Specifies the community string used to authenticate on the SNMP trap host, the default value is **public**.
Enable	Enables SNMP notifications as configured here.
Apply	Applies the SNMP configuration settings.

RSA NETWITNESS® PLATFORM

System Maintenance Guide

for Version 11.2

Contact Information

RSA Link at https://community.rsa.com contains a knowledgebase that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

Trademarks

For a list of RSA trademarks, go to www.emc.com/legal/emc-corporation-trademarks.htm#rsa.

License Agreement

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on RSA Link. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

NetWitness Platform System Maintenance

This guide tells administrators how to manage hosts and services in the network, maintain and monitor the network, run jobs, and tune performance after initial network setup.

The following diagram shows the different system maintenance tasks available to you.

The following topics describe these tasks:

- Best Practices
- Monitoring Health and Wellness of NetWitness Platform
- Displaying System and Service Logs
- Maintaining Queries Using URL Integration
- Managing NetWitness Platform Updates
- FIPS Support
- Troubleshoot NetWitness Platform

Best Practices

Safeguarding Assets with RSA Supplied Policies

The purpose of the RSA Core Policies delivered with NetWitness Platform are for safeguarding your NetWitness Platform Domain assets immediately (before you configure rules specific to your environment and your Security Policy).

RSA recommends that you set up email notifications to the appropriate asset owners for these policies as soon as possible. This will notify them when performance and capacity thresholds are crossed so they can take action immediately.

RSA also recommends that you evaluate the Core policies and disable a policy or change its service/group assignments according to your specific monitoring requirements.

Safeguarding Assets with Policies Based on Your Environment

RSA Core Policies are generic and may not provide sufficient monitoring coverage for your environment. RSA recommends that you gather issues over a period of time, not identified by the RSA Core Policies, and configure rules to help you prevent these issues.

Creating Rules and Notifications Judiciously

RSA recommends that you make sure that each rule and policy is necessary before you implement it, if possible. RSA also recommends that you review implemented policies or a regular basis for their validity. Invalid alarms and email notifications can adversely affect the focus of the asset owners.

Troubleshooting Issues

RSA recommends that you review Troubleshooting Health & Wellness and Troubleshoot NetWitness Platform when you receive error messages in the user interface and log files from hosts and services.

Monitoring Health and Wellness of NetWitness Platform

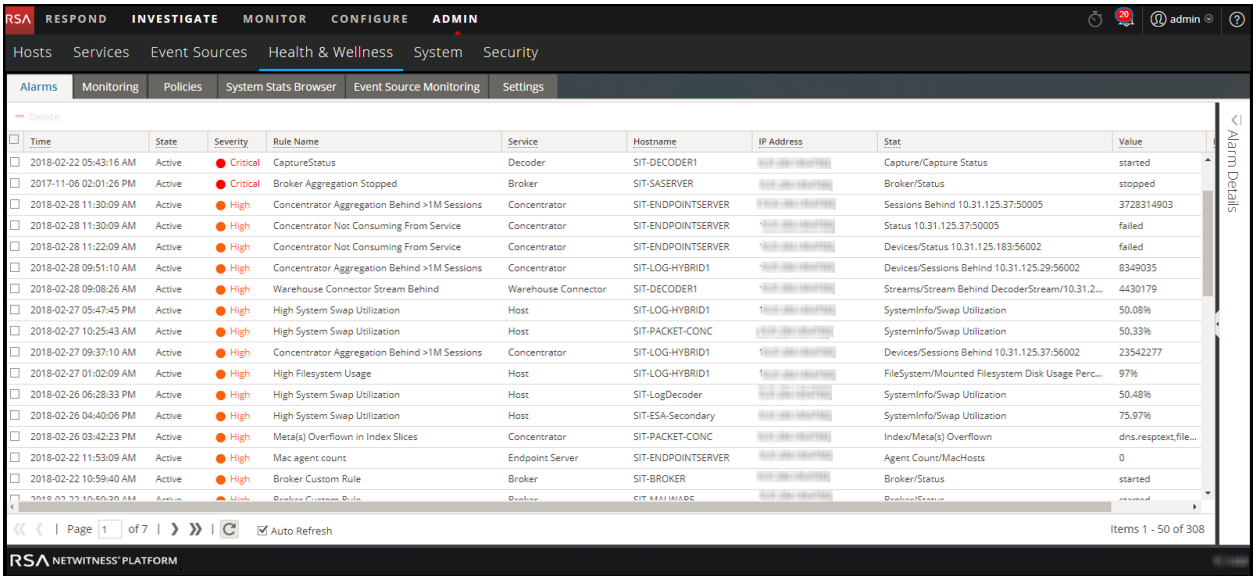
The Health & Wellness module of NetWitness Platform provides the ability to:

- View the current health of all the hosts, services running on the hosts, and various aspects of the hosts' health.
- Monitor the hosts and services in your network environment.
- View details of various event sources configured with NetWitness Platform.
- View system stats for the selected hosts by filtering the views as required.

In addition, you can configure Archiver monitoring and Warehouse Connector monitoring, use the procedures on monitoring host statistics, and work with system logs to monitor NetWitness Platform.

Note: All users have permission to view the entire Health and Wellness interface by default. The Administrator and the Operator roles are the only roles that can manage the Policies view by default. Please refer to the "Role Permissions" topic in the *Security User Management Guide* for a complete list of the default permissions for the NetWitness Platform Interface.

The figure displays the Health & Wellness module of the NetWitness Platform user interface and various sections in the Health & Wellness module.



Manage Policies

Policies are either user-defined or supplied by RSA. A policy defines:

- Services and hosts to which the policy applies.
- Rules that specify statistical thresholds that govern alarms.
- When to suppress the policy.
- Who to notify when an alarm triggers and when to notify them.

For the related reference topics, see NetWitness Platform Out-of-the-Box Policies

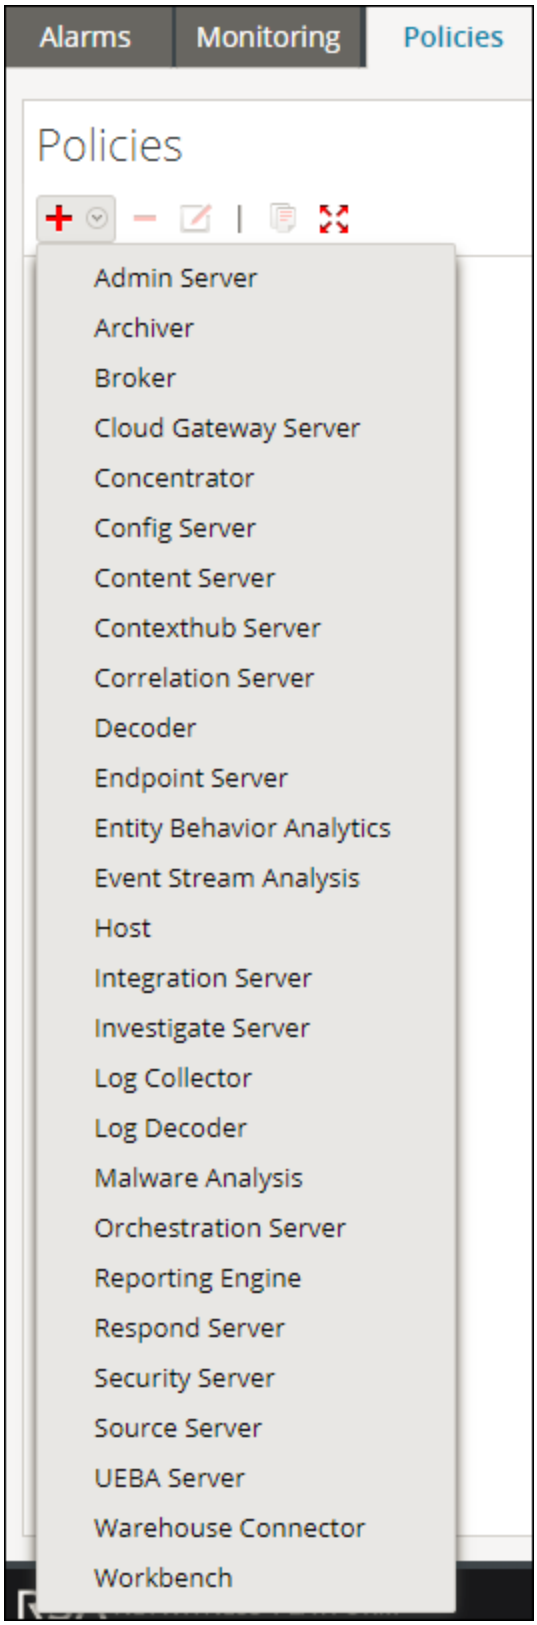
Note: You can now configure a policy to notify Public Key Infrastructure (PKI) certificate expiration status.

Add a Policy

1. Go to **ADMIN > Health & Wellness.**
2. Click **Policies** tab.

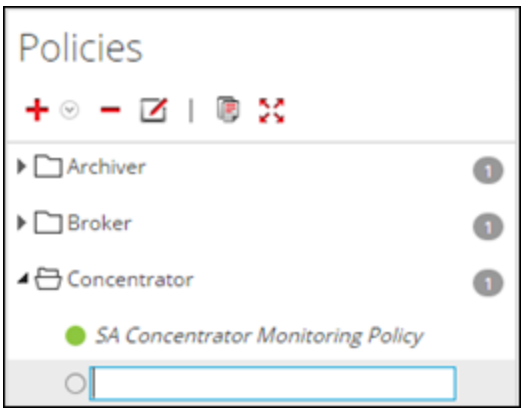
   The Policies view is displayed.
3. Click  in the **Policies** panel.

   A list of your hosts and services displays for which you can create health policies.

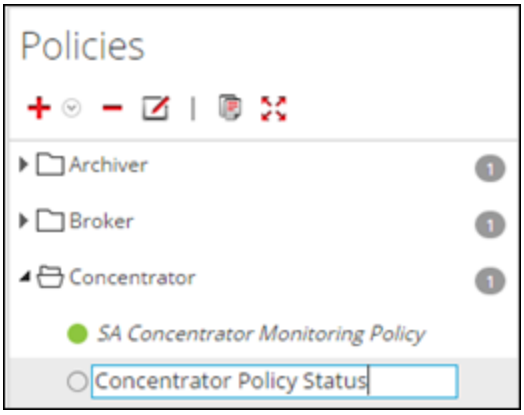


4. Select a host or service (for example, **Concentrator**).
   For PKI policy, you must select a host (for example, Host).

The host or service is displayed in the Policies panel with a blank Policy Detail panel.



5. Enter a name for the Policy (for example, **Concentrator Policy Status**) in the **Policies** panel.



The name (for example, **Concentrator Policy Status**) is now displayed as the policy name in Policy Detail panel.

6. Create a Policy in the Policy Detail panel:

   a. Select the **Enable** checkbox.

   b. Add relevant services (in this example, any relevant Concentrator services) that you want to monitor for health statistics.
   For PKI policy, you must select the LOCALHOST to monitor for health statistics.

   c. Add relevant rule conditions you want to configure for the policy.

   d. Suppress enforcement of the policy for the time periods you want.

   e. Add any email notifications you want for the policy.

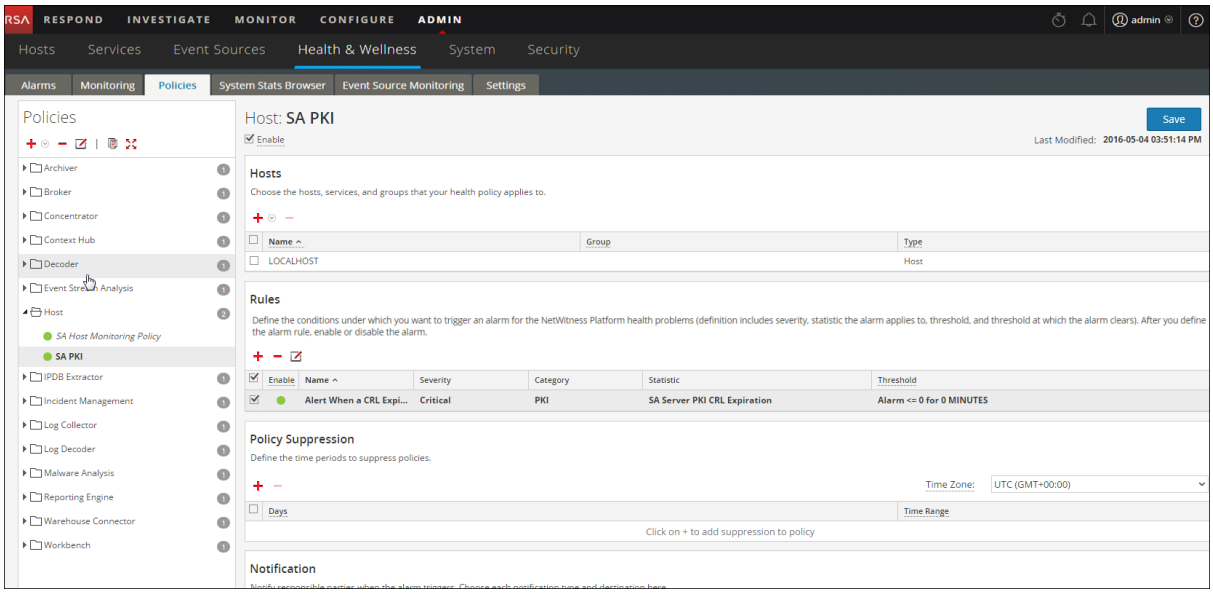
   f. Click **Save** in the Policy Detail panel.

   The Policy is added.

Add Policy Example

Below is the high-level example for configuring PKI policy:

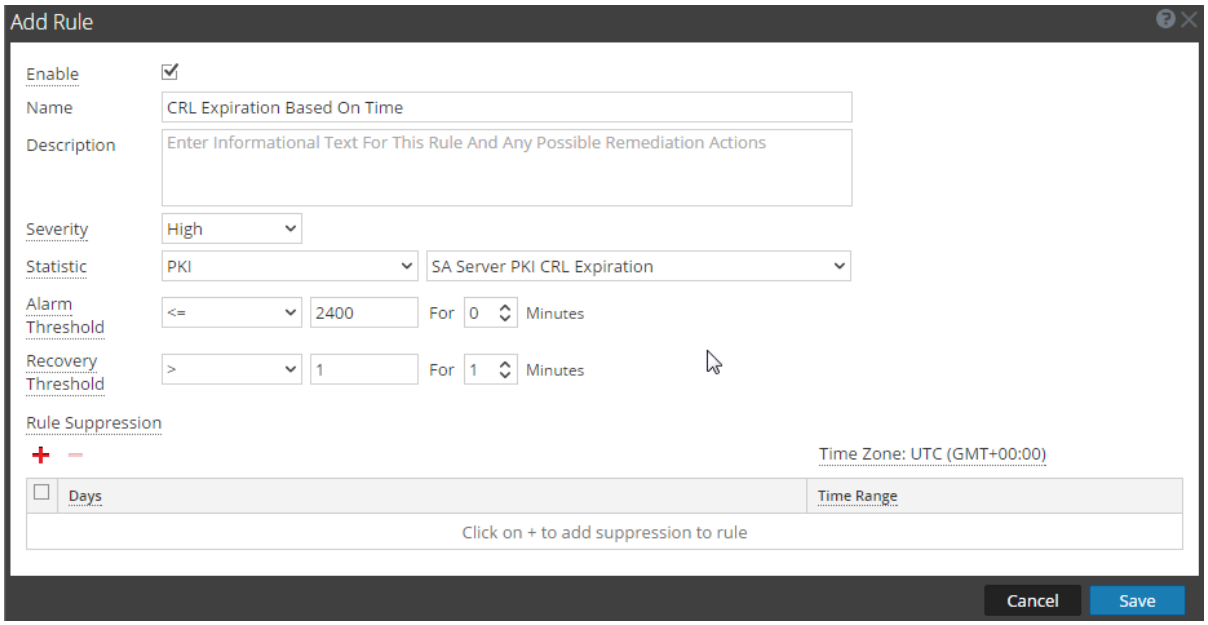
1. Add a new PKI policy.



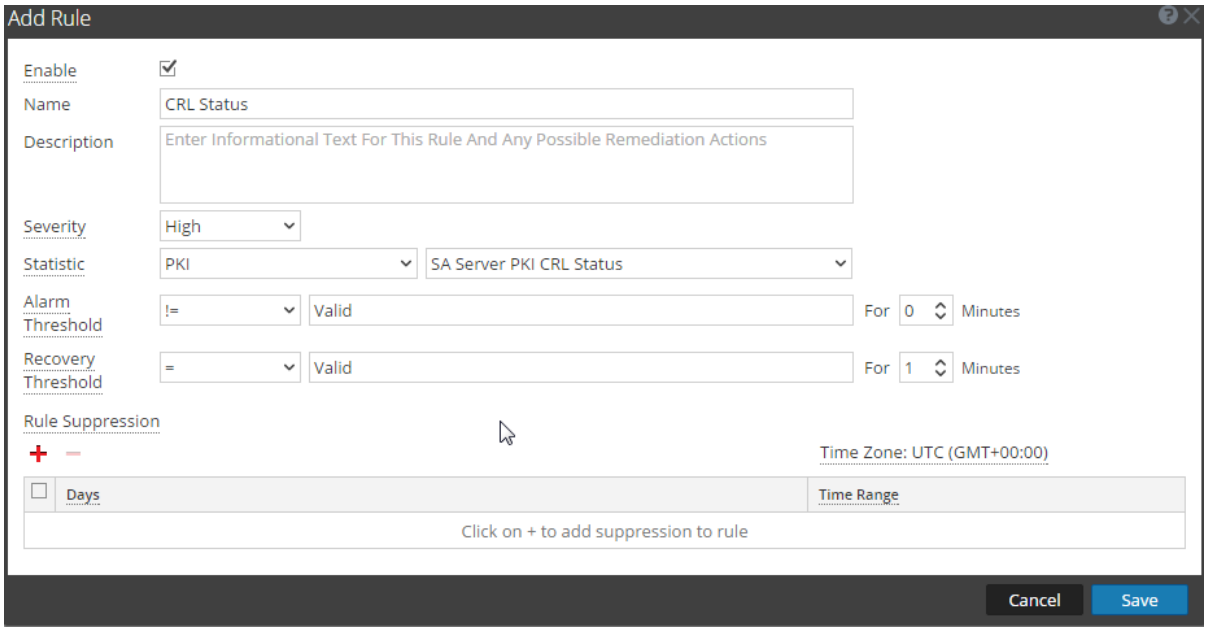
2. Add a Rule with Statistics:

   - For CA Expiration

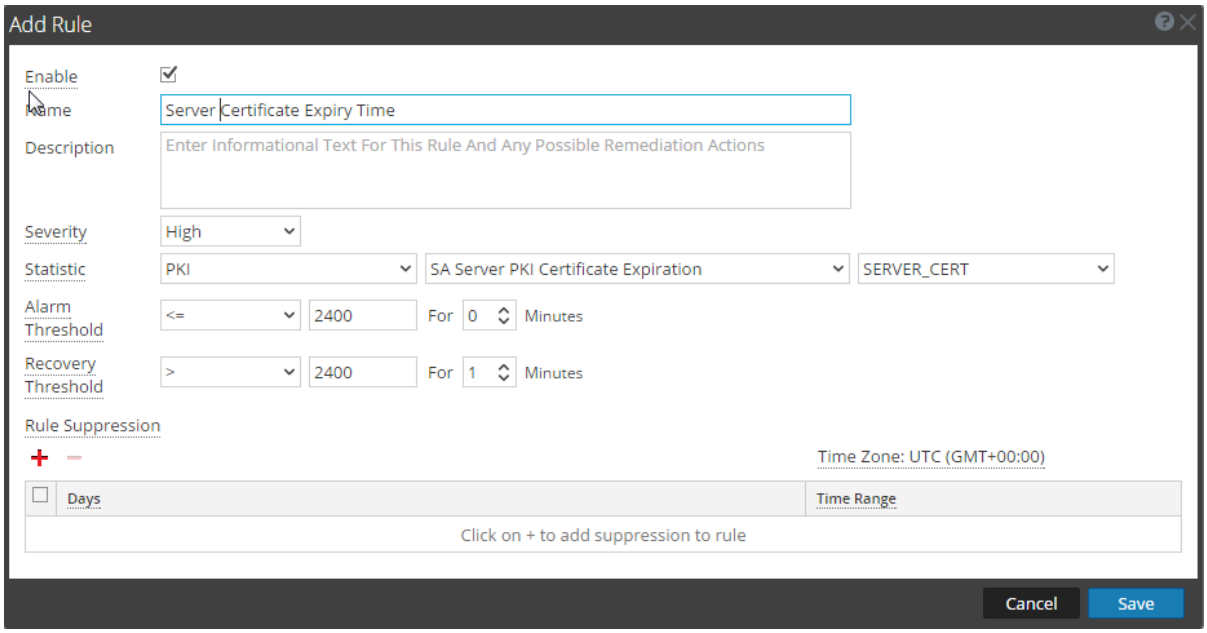
   - For CRL Expiration



- For CRL Status



- For Server Certificate Expiration



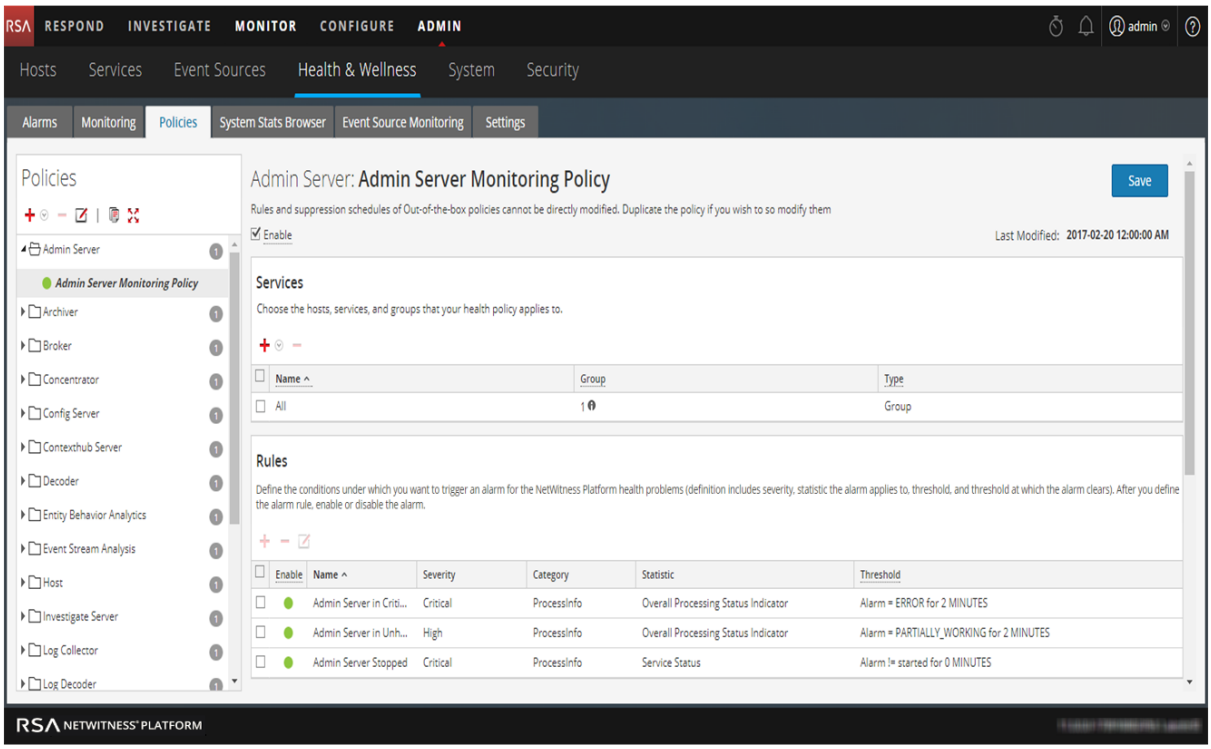
Edit a Policy

1. Go to **ADMIN > Health & Wellness.**
2. Click the **Policies** tab.

   The Policies view is displayed.
3. Select a policy (for example, **Concentrator Policy Status**) under a host or service.

   The Policy Detail is displayed.
4. Click .

   The policy name (for example, **Admin Server Monitoring Policy**) and policy detail panel become editable.



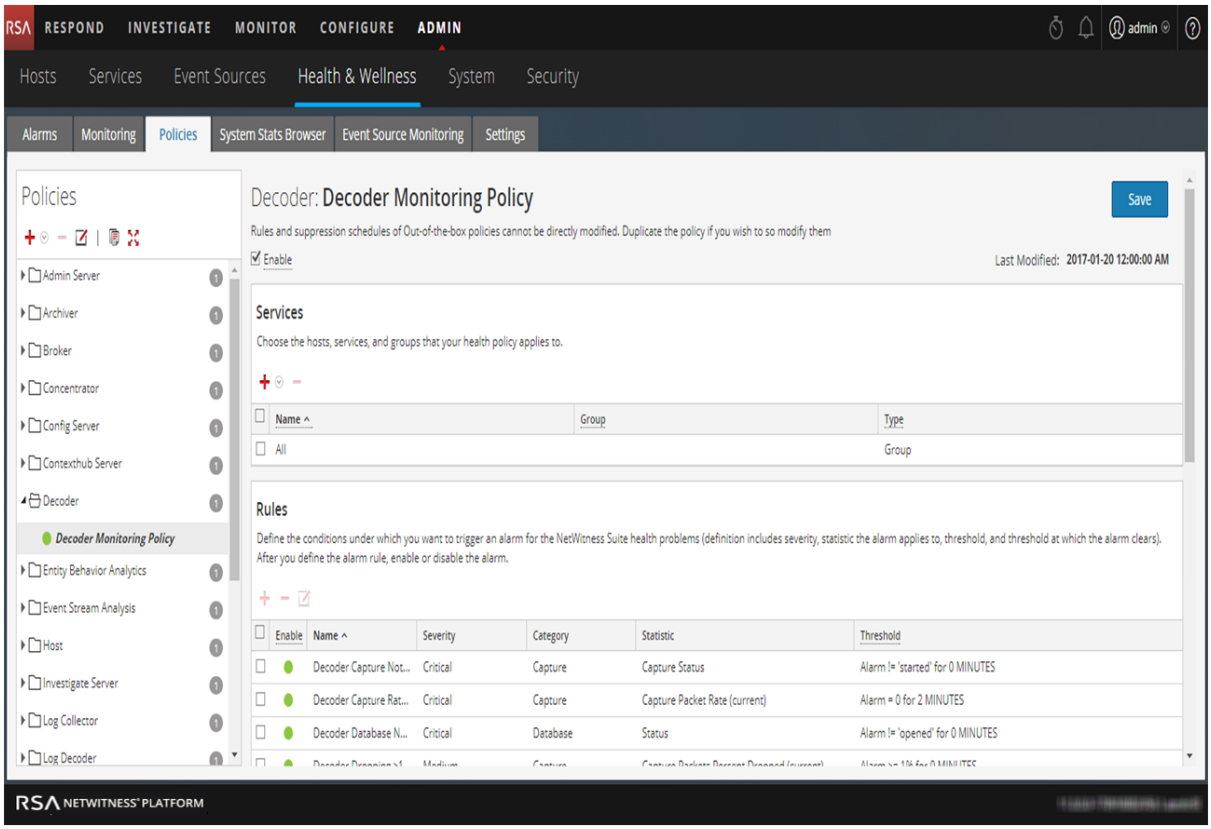
5. Make the required changes and click **Save** in the Policy Detail panel. You can:
   - Edit the Policy name.
   - Enable or disable the policy.
   - Add or delete hosts and services in the policy.
   - Add, delete or modify rules in the policy.
   - Add/Edit/Delete suppressions in the policy.
   - Add/Edit/Delete notifications in the policy.

Note: Save applies the policy rules based on the selection of enable/disable. It also resets the rule condition timers for changed rules, and the entire Policy.

Duplicate a Policy

1. Go to **ADMIN > Health & Wellness**.
2. Click the **Policies** tab.
3. Select a policy (for example, **Concentrator Policy Status**) under a host or service.
4. Click .NetWitness Platform copies the policy and lists it with **(1)** appended to the original policy's

name.



5. Click and rename the Policy [for example, rename **Decoder Monitoring Policy(1)** to **New Concentrator Policy Status**.

> **Note:** A duplicated policy is disabled by default and the host and service assignments are not duplicated. Assign any relevant hosts and services to the duplicated policy before you use it to monitor health and wellness of the NetWitness Platform infrastructure.

Assign Services or Groups

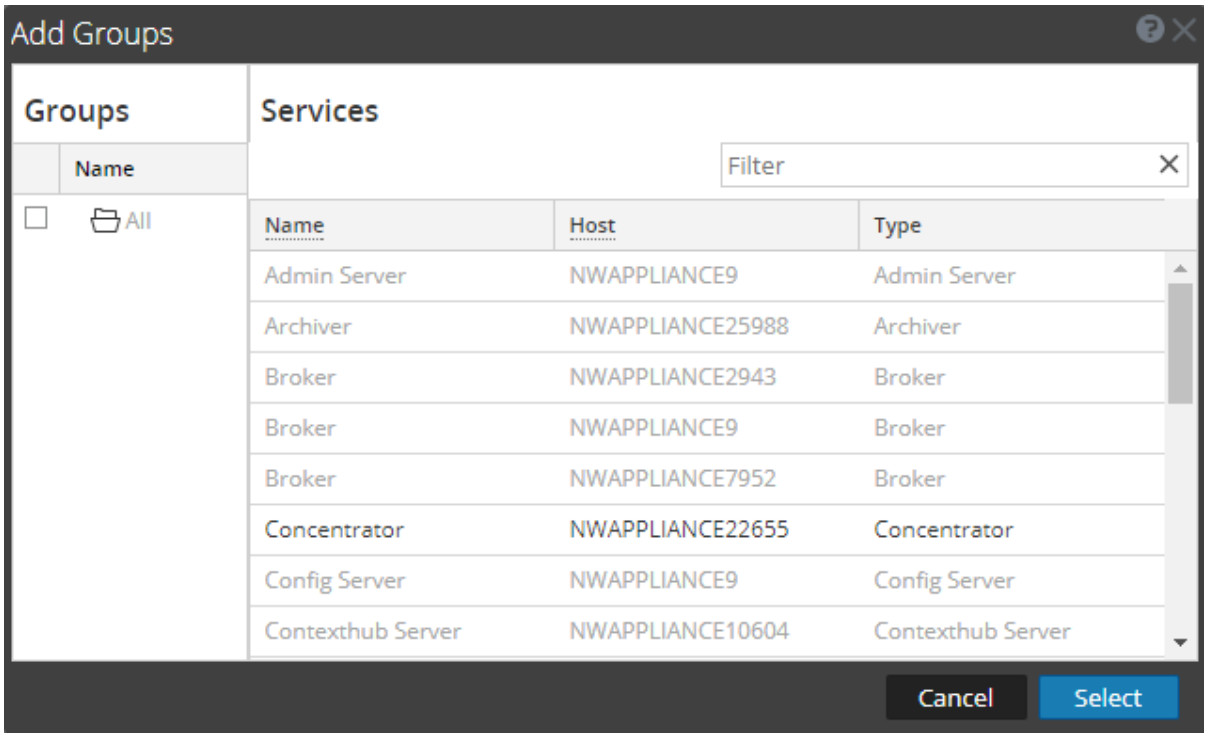
To assign hosts or services to a policy:

1. Go to **ADMIN > Health & Wellness.**
2. Click the **Policies** tab.

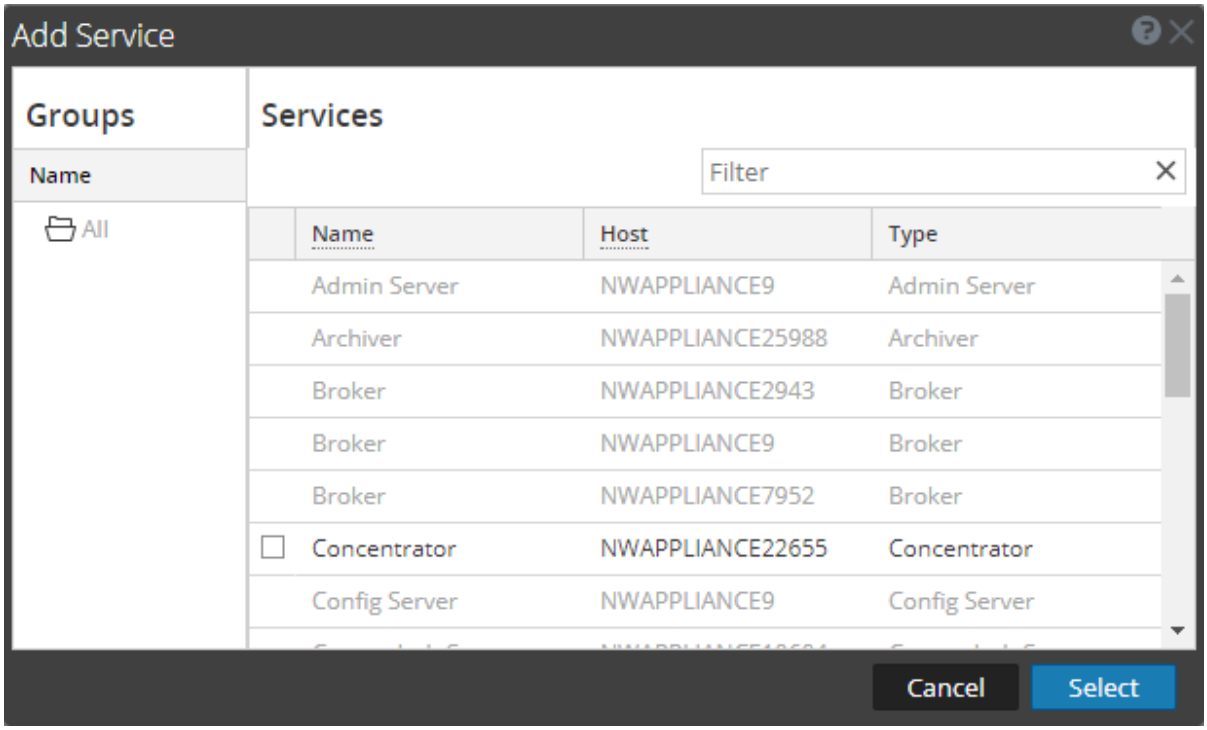
   The Policies view is displayed.
3. Select a policy (for example, **First Policy**) under a host or service.

   The Policy Detail is displayed.
4. Click in the Services and Groups list toolbar.

5. Choose one of the following actions:
   - For Hosts, select **Groups** or **Hosts** from the selection menu.
   - For Services, select **Groups** or **Services** from the selection menu.
6. Depending on whether you are assigning services or groups, perform one of the following actions:
   - **Groups**, the **Groups** dialog is displayed from which you can select predefined groups of hosts or services.



- **Services**, the **Services** dialog is displayed from which you can select individual services.



7. Select the checkbox next to the groups or services you want to assign to the policy, click **Select** in the dialog, and click **Save** in the Policy Detail panel.

Note: Services are filtered for selection based on the type of policies. For example, you can only select concentrator services for a concentrator type policy.

Remove Services or Groups

To remove a host or service from a policy:

1. Go to **ADMIN > Health & Wellness**.
2. Click **Policies** tab.

   The Policies view is displayed.
3. Select a policy under a service.

   The Policy Detail is displayed.
4. Select a host or service.
5. Click − .

   The host or service is removed from the policy.

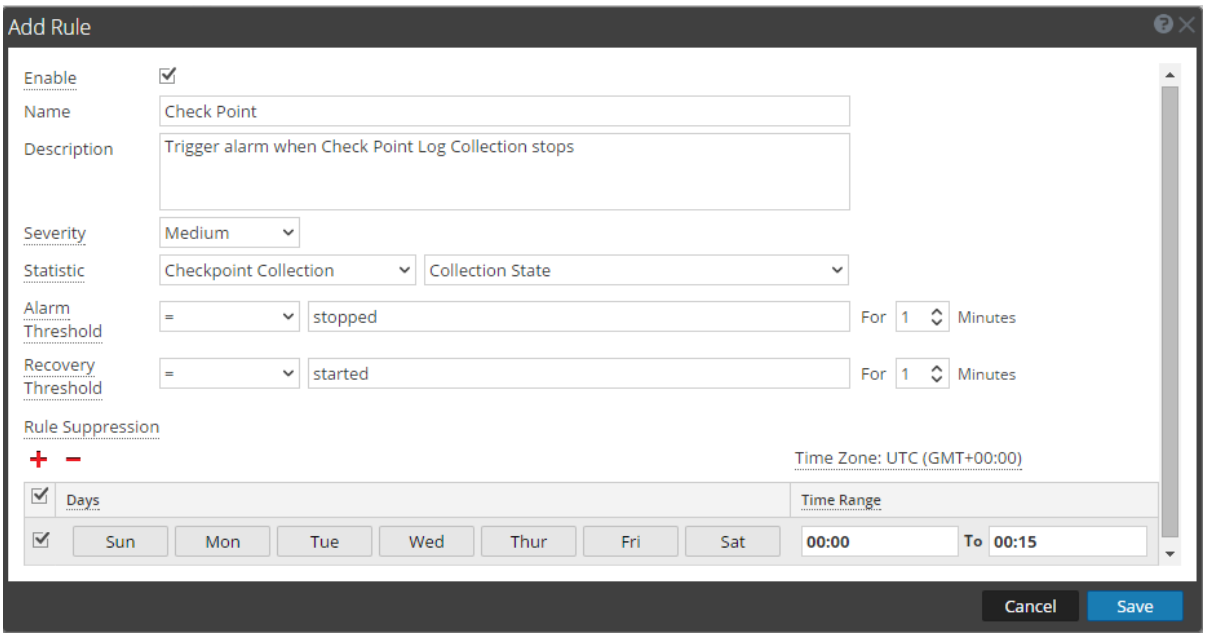
Add or Edit a Rule

To add a rule to a policy:

1. Go to **ADMIN > Health & Wellness.**
2. Click the **Policies** tab.

   The Policies view is displayed.
3. Select a policy (for example, **Checkpoint**) under a host or service.

   The Policy Detail is displayed.
4. Depending on whether you are adding an existing rule or adding a rule, do the following:
   - To add: click + in the Rules list toolbar.
   - To edit: select a rule from the Rules list and click .
5. Complete the dialog to define or update the rule.
6. Add the **Description** field as shown in the following example.



7. Click **OK**.

   The rule is added (or updated) to the policy.

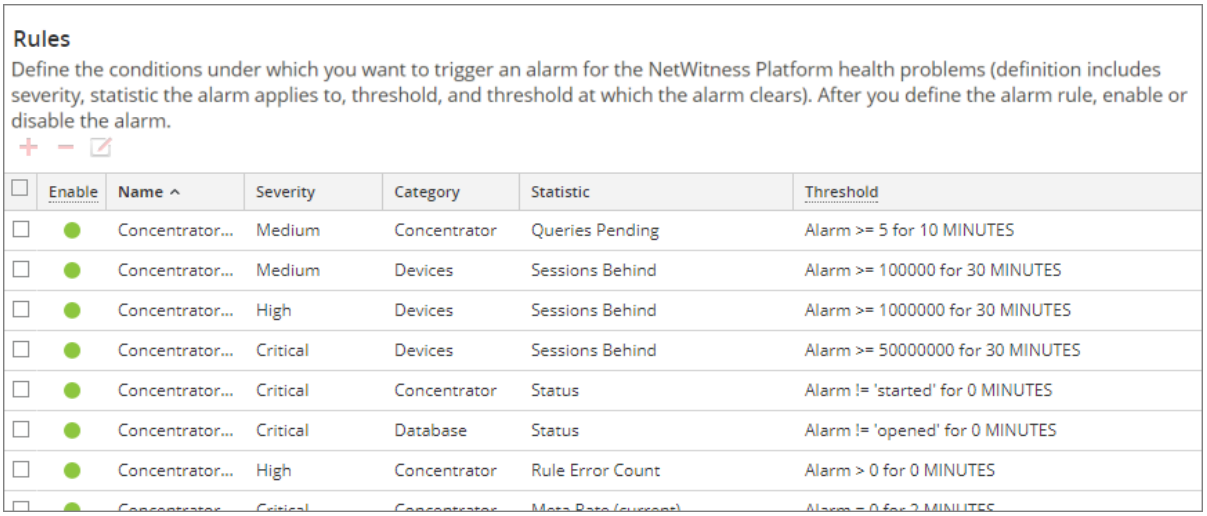
Hide or Show Rule Conditions Columns

To hide or show rule conditions columns in the Rules panel:

1. Go to **ADMIN > Health & Wellness.**
2. Click **Policies** tab.

   The Policies view is displayed.
3. Select a policy under a service.

   The Policy Detail is displayed.
4. Go to the **Rules** panel.



5. Click **v** to the right of **Category** , select **Columns**, and uncheck the **Static** and **Threshold** rule conditions.

   You can check or uncheck any Rules column to show or hide it.
   The **Rules** panel displays without the rule conditions.

Delete a Rule

To remove a host or service from a policy:

1. Go to **ADMIN > Health & Wellness.**
2. Click the **Policies** tab.

   The Policies view is displayed.
3. Select a policy under a service.

   The Policy Detail is displayed.
4. Select a rule from the **Rules** list (for example, **Checkpoint**).
5. Click .

   The rule is removed from the policy.

Suppress a Rule

1. Click the **Policies** tab.
   The Policies view is displayed.
2. Select a policy under a service.
   The Policy Detail is displayed. You can specify rule suppressions time ranges when you initially add it or you can edit the rule and specify suppression time ranges.
3. Add or edit a rule.
4. In the **Rules Suppression** panel of the **Add** or **Edit Rule** dialog, specify the days and time ranges during which you want the rule suppressed.

Suppress a Policy

1. Add or edit a policy.
   The Policies view is displayed.
2. In the **Policy Suppression** panel:
   a. Select a time zone from the **Time Zone** drop-down list.
      This time zone applies to the entire policy (both policy suppression and rule suppression).
   b. Click + in the toolbar.
   c. Specify the days and time ranges during which you want the policy suppressed.

Add an Email Notification

To add an email notification to a policy:

1. Add or edit a policy.
   The Policies view is displayed.
2. In the **Notification** panel:
   a. Click + in the toolbar.
      A blank EMAIL notification row is displayed.
   b. Select the email:
      - Notification types in the Recipient column (see "Configure Notification Outputs" in the *NetWitness Platform System Configuration Guide* for the source of the values in this drop-down list).

- Notification server in the Notification Server column (see 'Configure Notification Servers" in the *NetWitness Platform System Configuration Guide* for the source of the values in this drop-down list).
- Template server in the Template column (see "Configure Notification Templates" in the *NetWitness Platform System Configuration Guide*for the source of the values in this drop-down list).

> **Note:** Refer to **Include the Default Email Subject Line** if you want to include the default Email subject line from the Health & Wellness template in your Health & Wellness Email notifications for specified recipients.

Delete an Email Notification

To add an email notification to a policy:

1. Add or edit a policy.
   The Policies view is displayed.
2. In the **Notification** panel:
   a. Select an email notification.
   b. Click .
   The notification is removed.

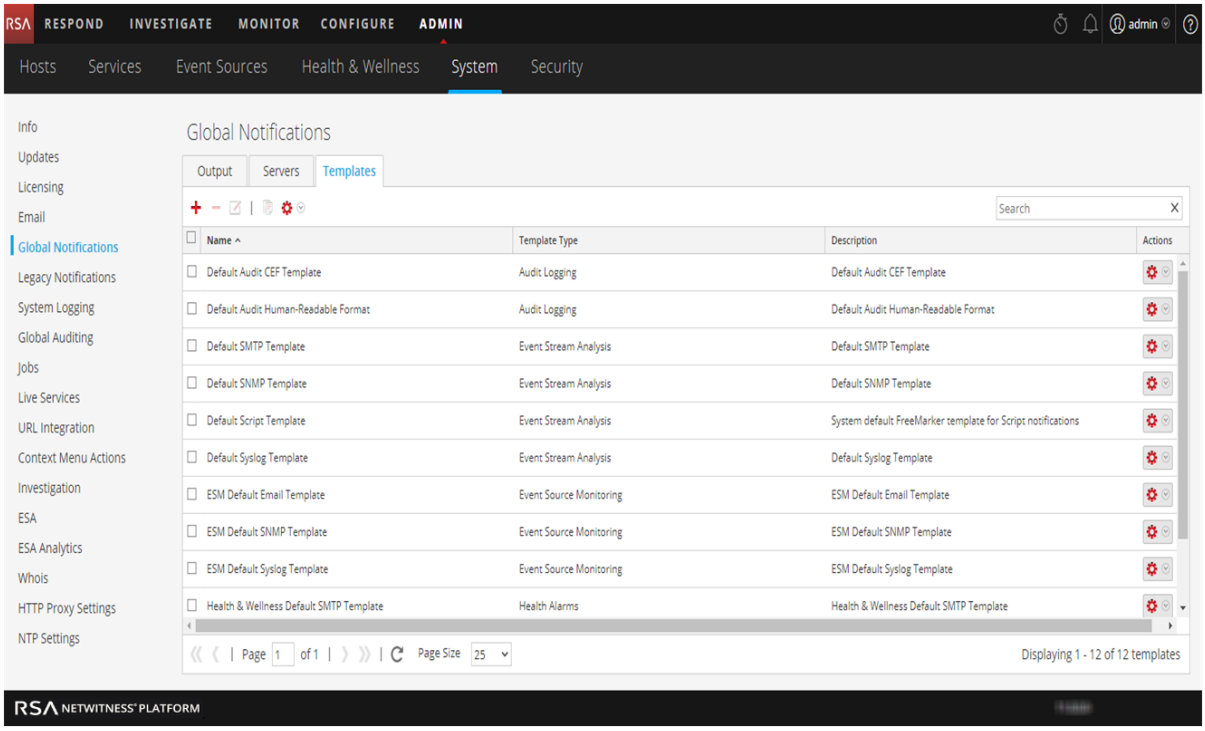
Include the Default Email Subject Line

The emails generated by the notifications you set up for policies do not include the subject line from the Health & Wellness Default Email Notification templates. You need to specify the subject line in the do not include subject lines. This procedure shows you how to insert a subject line into the templates.

For related reference topics, see Policies View and NetWitness Platform Out-of-the-Box Policies.

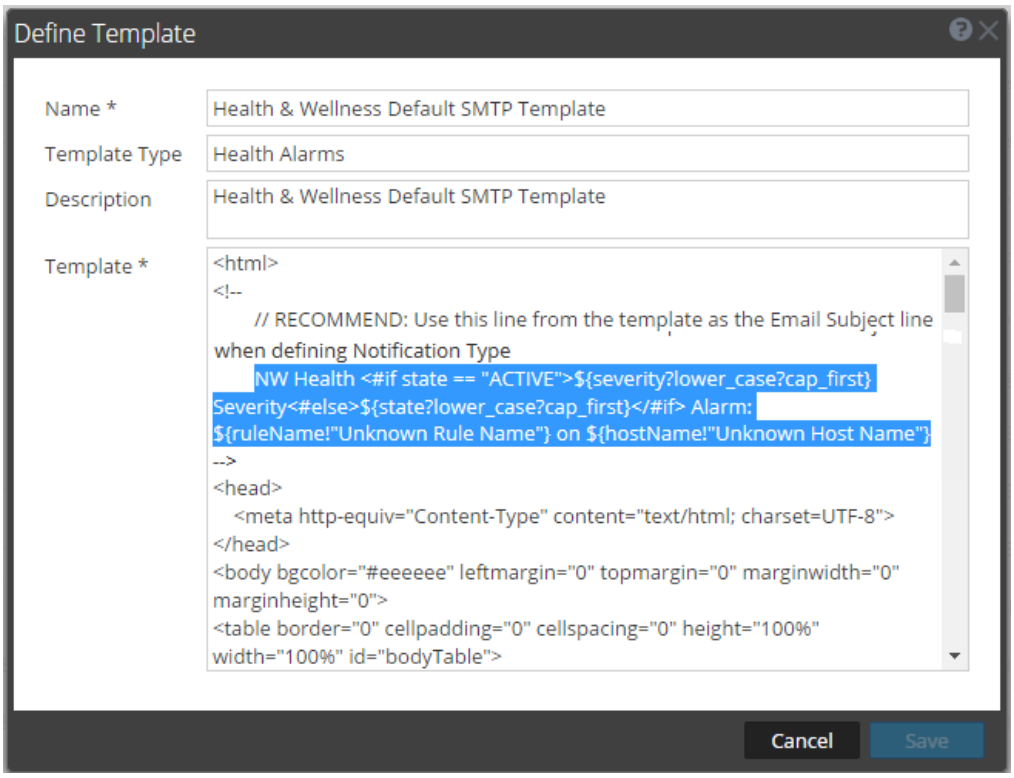
To include the subject line from a Health & Wellness email template in your email notification:

1. Go to **ADMIN > System**.
2. In the options panel, select **Global Notifications**.
3. Select a Health & Wellness Email Template (for example, **Health & Wellness Default SMTP Template**).



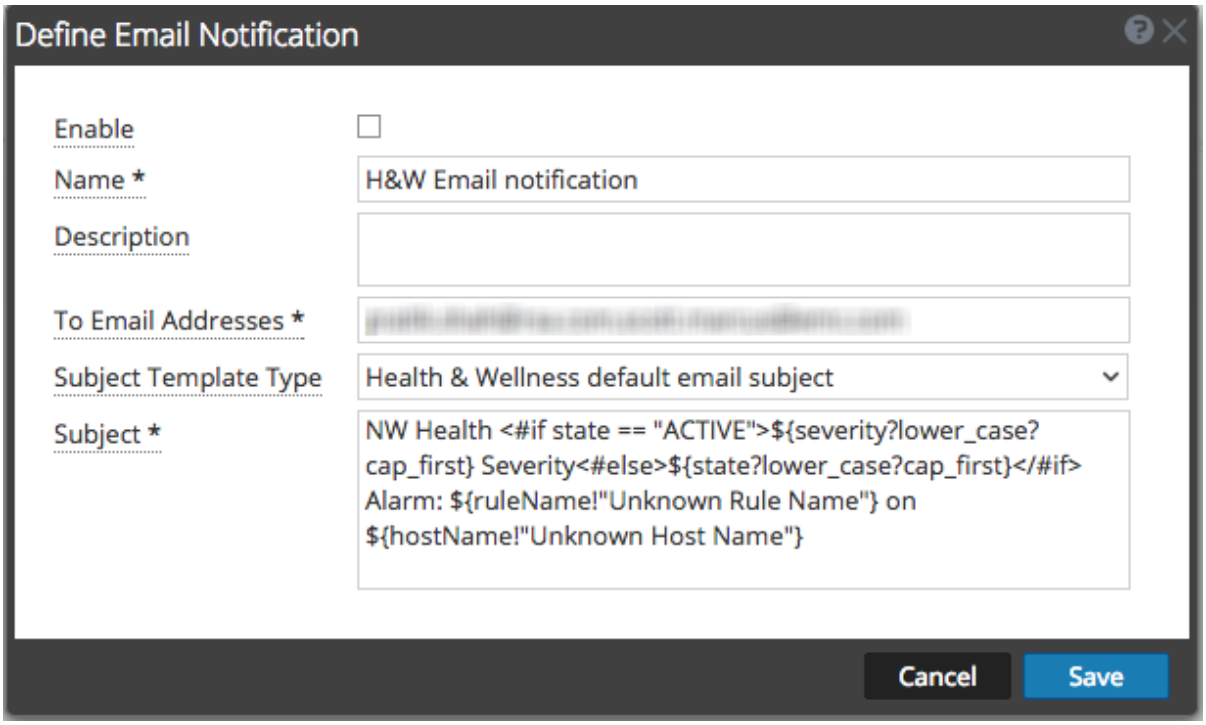
The Define Template dialog is displayed.

4. Click , then in the **Template** field, copy the Subject Line (Highlight the subject line and press Ctrl-C) into the buffer.



5. Click **Cancel** to close the Template.
6. Click the **Output** tab and select a notification (for example **Health & Wellness**).
7. Click .

   The **Define Email Notification** dialog is displayed.
8. Replace the value in **Subject** field text box with the subject line that you have in the buffer (highlight the existing text and press Ctl-V).



Define Email Notification
Enable
Name *
H&W Email notification
Description
To Email Addresses *
Subject Template Type
Health & Wellness default email subject
Subject *
NW Health <#if state == "ACTIVE">${severity?lower_case?
cap_first} Severity<#else>${state?lower_case?cap_first}</#if>
Alarm: ${ruleName!"Unknown Rule Name"} on
${hostName!"Unknown Host Name"}
Cancel
Save

9. Click **Save**.

Monitor System Statistics

The System Stats Browser filters statistics by the selected host, component running on the host, statistical category, individual statistic, or any combination of host, component, category, and statistic. You can also choose the order in which to display this information.

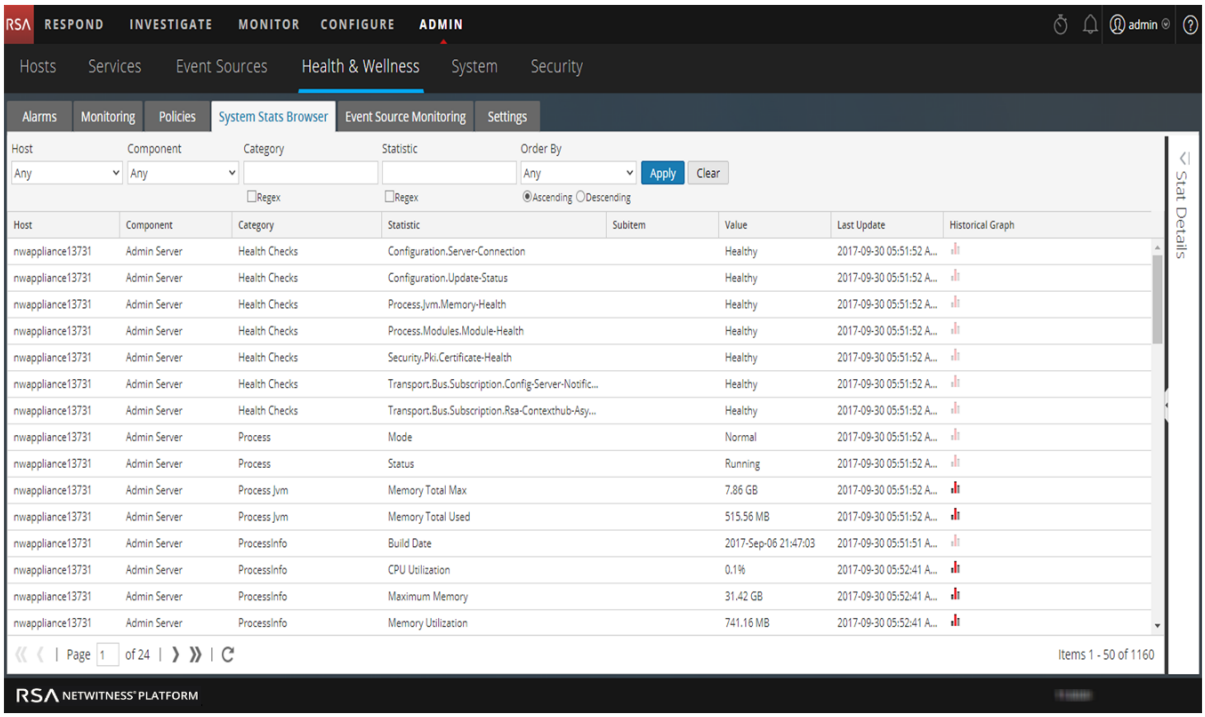
To access the System Stats browser:

1. Go to **ADMIN** > **Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Click the **System Stats Browser** tab.

   The System Stats Browser tab is displayed.



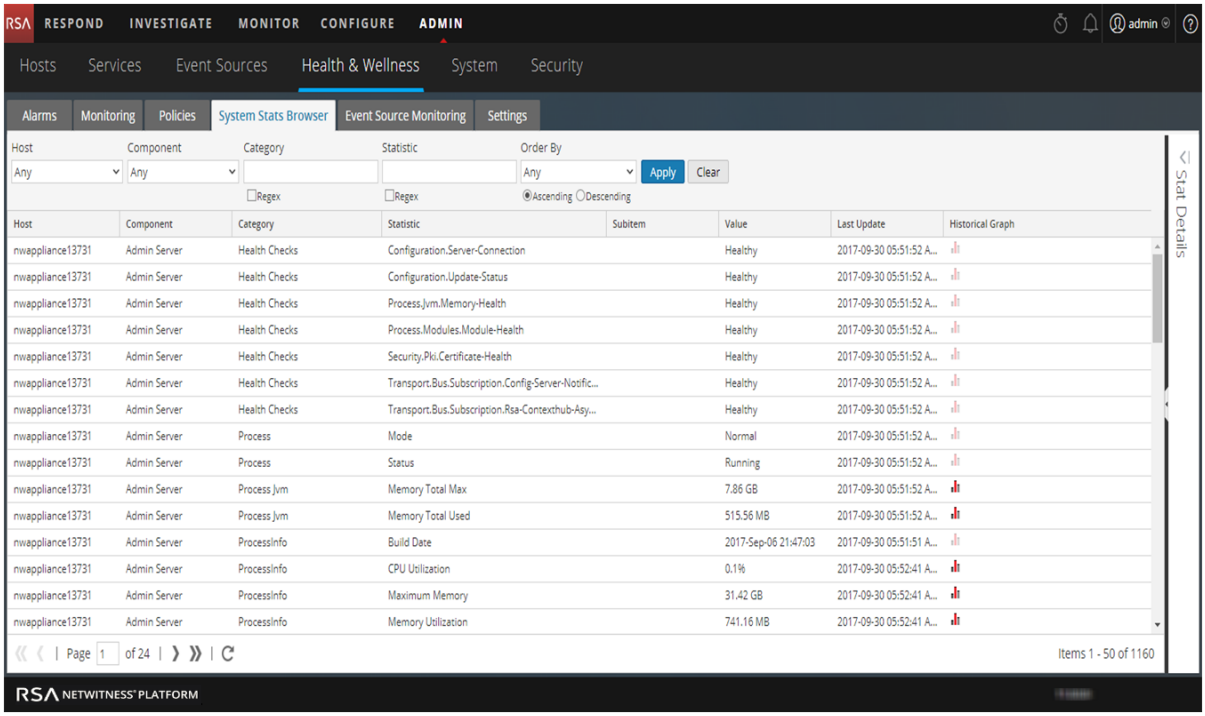
Filter System Statistics

You can filter the System Statistics in one of the following ways to monitor:

- Statistics collected for a particular host
- Statistics collected for a particular component
- Statistics collected of a particular type or that belongs to a certain category
- Statistics listed in an ordered way as per the selection chosen

To filter the list of system statistics:

1. Go to **ADMIN > Health & Wellness**.
   The Health & Wellness view is displayed with the Alarms tab open.
2. Click **System Stats Browser**.
   The System Stats Browser tab is displayed.

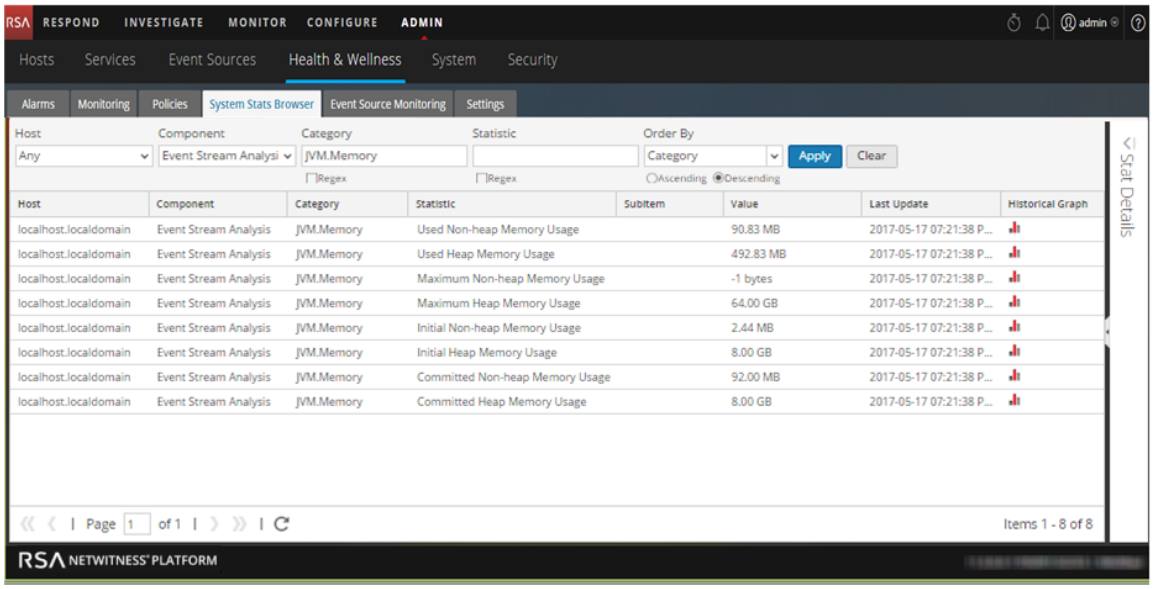


Filter the list of System Statistics in one of the following ways:

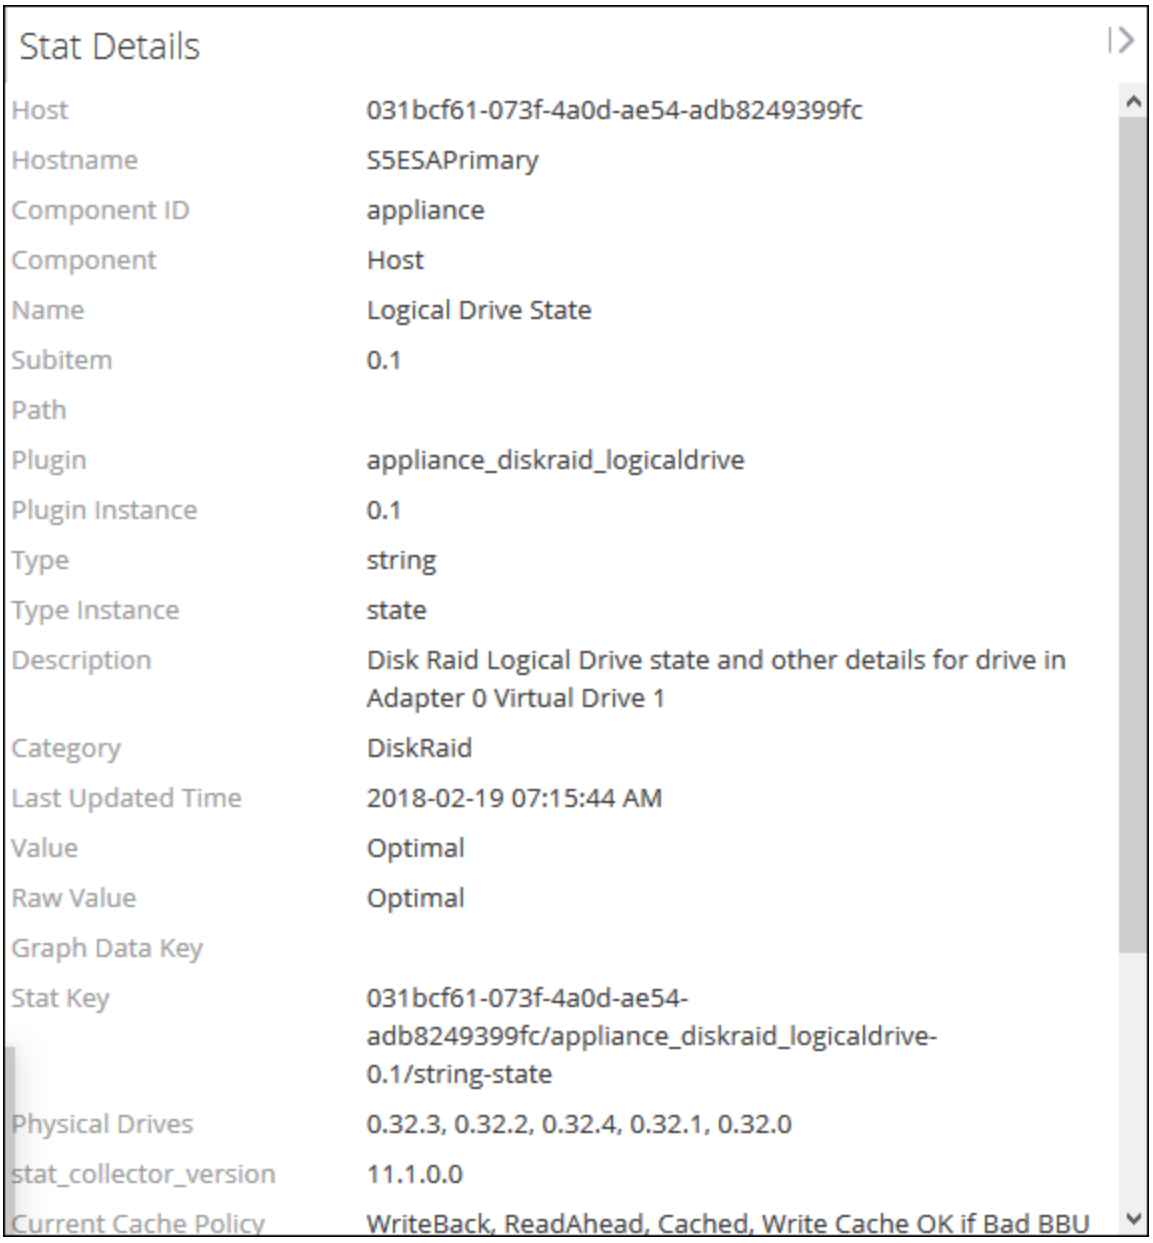
- To view System Stats of a particular host, select the host in the **Host** drop-down list.
  The System Stats for the selected host is displayed.
- To view System Stats of a particular component, select the component in the **Component** drop-down list.
  The System Stats for the selected component is displayed.

- To view System Stats of a particular category, type the category name in the **Category** field. Select **Regex** to enable Regex filter. It performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching. The System Stats for the selected category is displayed.
- To order the list of statistics in a preferred order you can set the order in the **OrderBy** column
- To view a particular statistic across hosts, type the statistic name in the **Statistic** field. Select **Regex** to enable Regex filter. It performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching. The System Stats for the selected statistics is displayed.

  The following figure shows the System Stats Browser filtered by the NWAPPLIANCE10604 host listed in descending statistical category order.



3. To view the details for an individual statistic:
   a. Select a row to select a statistic.
   b. Click <|. The Stat Details is displayed.



For details on various parameters in the **ADMIN** > **Health & Wellness** > **System Stats Browser** view, see System Stats Browser View

View Historical Graph of System Statistics

The historical graph of the collected system stats gives you information about the variation of the stats over a time frame selected.

To view a historical graph:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Click the **System Stats Browser** tab.

3. In the System Stats Browser tab, specify the filter criteria to display the statistics you want.

4. In the **Historical Graph** column, select .

   The Historical graph for the selected statistic is displayed.

   The figure below gives an example of the historical graph for Memory Utilization statistic for a host.

   The graphical view is customized to display the statistics collected for the current day and the values are zoomed in for an interval of an hour (10.15 - 11.15 hrs). Hover over the graph to view the details at a particular instant. For example, in the figure it displays the memory utilization at 11.00 hrs.

Note: You can customize the graph view by selecting the Time Frame and Date range. You can zoom in using the zoom in value, time window, or by just a click and a drag in the plot area. For details on the parameters to customize and zoom in functions, see Historical Graph for System Stats. Any break or gap in chart line indicates that the service or host was down during that time.

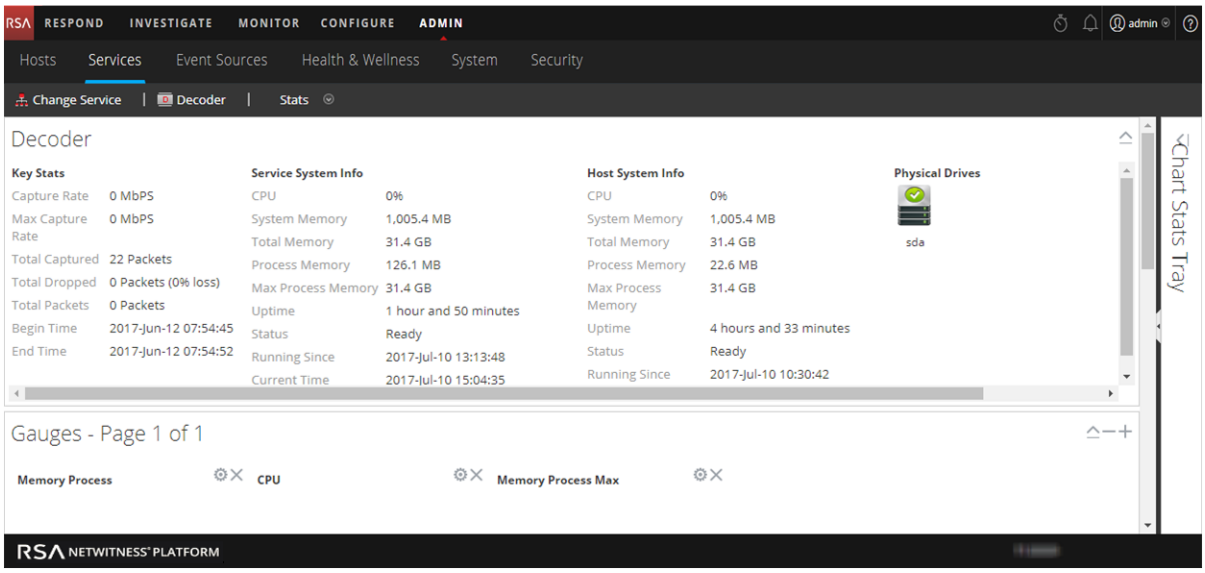
Monitor Service Statistics

NetWitness Platform provides a way to monitor the status and operations of a service. The Service Stats view displays key statistics, service system information, and host system information for a device. In addition more than 80 statistics are available for viewing as gauges, and in timeline charts. Only statistics for session size, sessions, and packets are viewable in historical timeline charts.

Although different statistics are available for different types of services, certain elements are common for any Core device.

To monitor service statistics in NetWitness Platform:

1. Go to **ADMIN > Services**.
   The Services view is displayed.
2. Select a service, and select **View > Stats** in the Actions column.



3. To customize the view: Collapse or expand charts, for example expand the Chart Stats Tray to see available charts. Drag a section up or down to change the sequence. For example, drag the Gauges section to the top so that it is above the Summary Stats section.

Add Statistics to a Gauge or Chart

In the Services Stats view, you can customize the monitored statistics for individual services. The Chart Stats Tray lists all available statistics for the service. The number of statistics varies according to the type of service being monitored. Any statistic in the Chart Stats Tray can be displayed in a gauge or a timeline chart. Only statistics for session size, sessions, and packets are viewable in historical timeline charts.

Create a Gauge for a Statistic

To create a gauge for a statistic in the Services Stats view:

1. Go to **ADMIN > Services**.

   The Admin Services View is displayed.

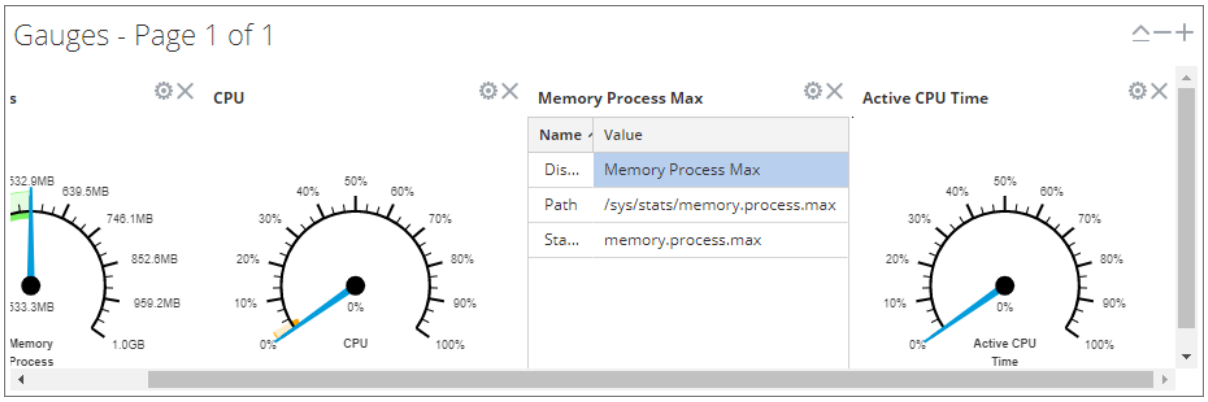
2. Select a service and select **View > Stats** in the Actions column.

   The Chart Stats Tray is displayed on the right side.

3. If the tray is collapsed, click <| to view the list of available statistics.

4. From the **Chart Stats Tray**, click on any statistic and drag it into the **Gauges** section.

   A gauge is created for the statistic. If there is no space for the gauge, a new page is created on the Gauges section and the gauge is added to the new page. In the example, the Active CPU Time chart was added to the Gauges section by dragging it from the Chart Stats Tray.

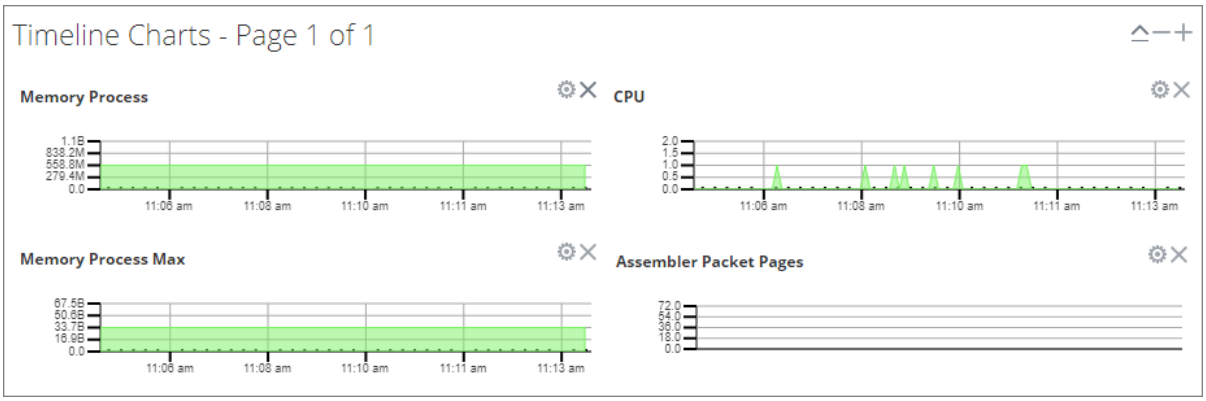


Create a Timeline Chart for a Statistic

To create a timeline for a statistic:

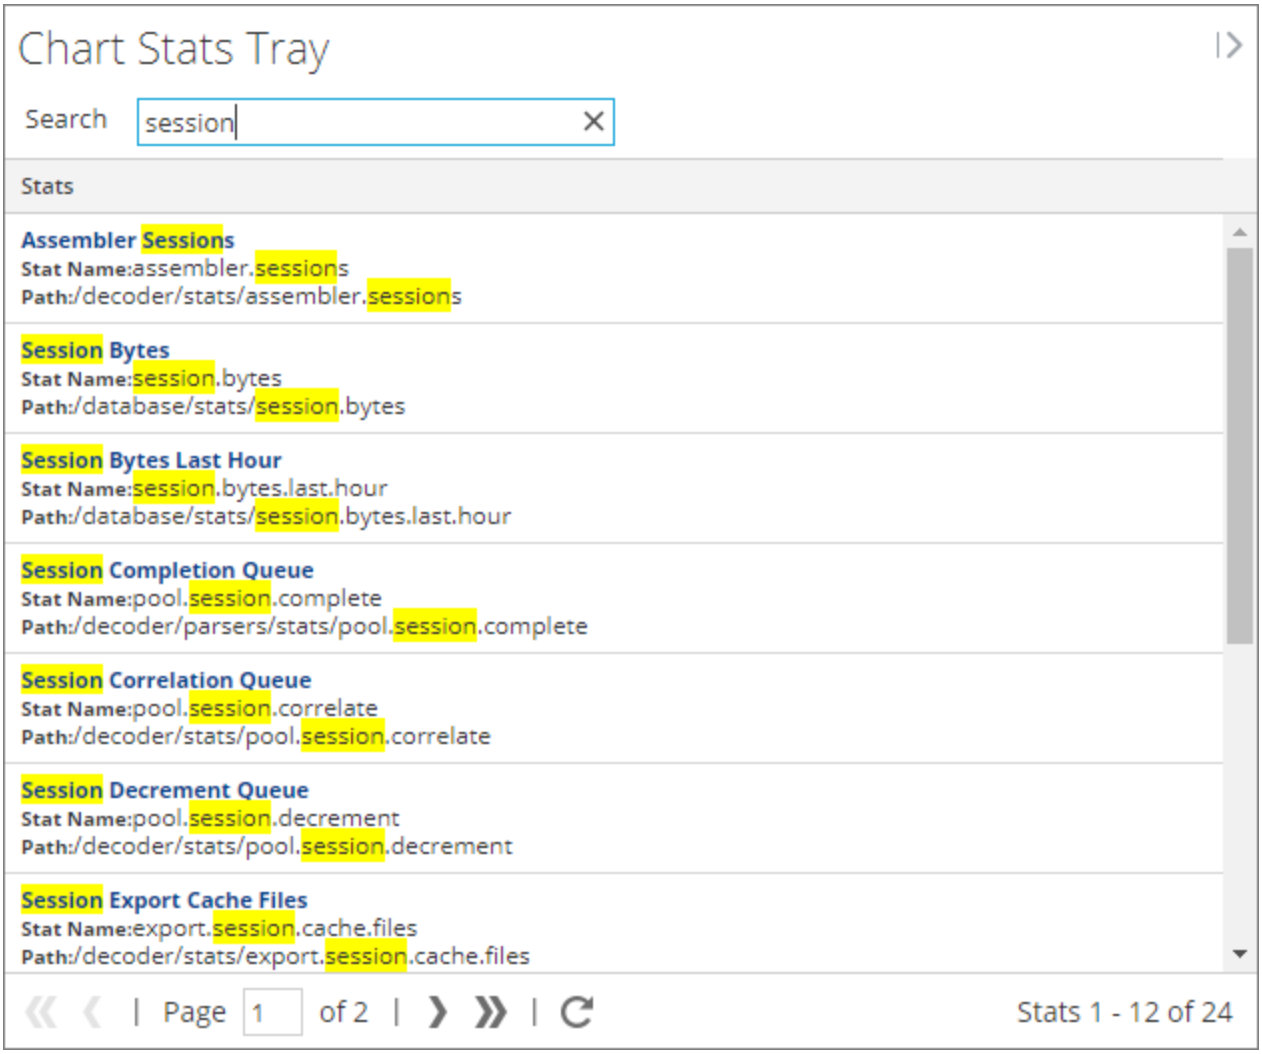
From the **Chart Stats Tray**, click on a statistic and drag it into the **Timeline Charts** or the **Historical Timeline Charts** section.

A timeline chart is created for the statistic. If there is no space for the chart, a new page is created on the Timeline Chart section and the chart is added to the new page. In the example, the Assembler Packet Pages chart was added to the Timeline Charts section by dragging it from the Chart Stats Tray.



Search for a Statistic in the Chart Stats Tray

To search for a statistic, type a search term; for example, **session**, in the Search field and press **RETURN**. Statistics that match are displayed with the matching word highlighted.

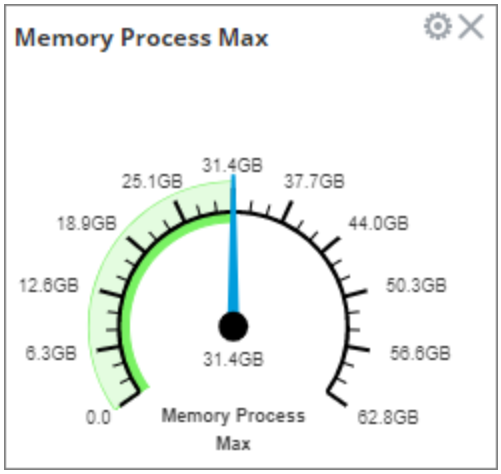


Edit Properties of Statistics Gauges

The Gauges section of the Service Stats view presents statistics in the form of an analog gauge. The properties of each individual gauge are editable; all gauges have an editable title and some have additional editable properties.

Edit Properties of a Gauge

1. Go to **ADMIN > Services**
   The Admin Services view is displayed.
2. Select a service and select **View > Stats** in the Actions column.
   The Service Stats view includes the Gauges section.
3. Go to the gauge for which you want to edit properties (for example, **Memory Process**).



4. Click the Properties icon ( ) to display the parameter names and values.
5. To highlight the value of the **Display Name** field, double-click on the value; for example, **Memory Process**.

   Note: Clicking the other two values does nothing because the properties are not editable in the gauge.

6. Type a new value for the Display Name and click the **Properties** icon ( ).
   The new title replaces **Memory Process**.

Add Stats to the Gauges Section

You can add more gauges by dragging a statistic from the **Chart Stats Tray** into the **Gauges** section.

1. To expand the Chart Stats Tray, click .
2. Scroll down and select a statistic, for example, **Session Rate (maximum)**.

3. Drag the statistic to the **Gauges** section.

   The new gauge is displayed in the Gauges section.

Edit Properties of Timeline Charts

Timeline charts display statistics in a running timeline. The Service Stats view includes two types of timelines: current time and historical. You can drag any statistic available in the Chart Stats Tray to the Timeline Charts section. Only statistics for session size, sessions, and packets are viewable in historical timeline charts. The properties of an individual timeline chart are editable; all timeline charts have an editable title and some have additional editable properties.

To access the charts:

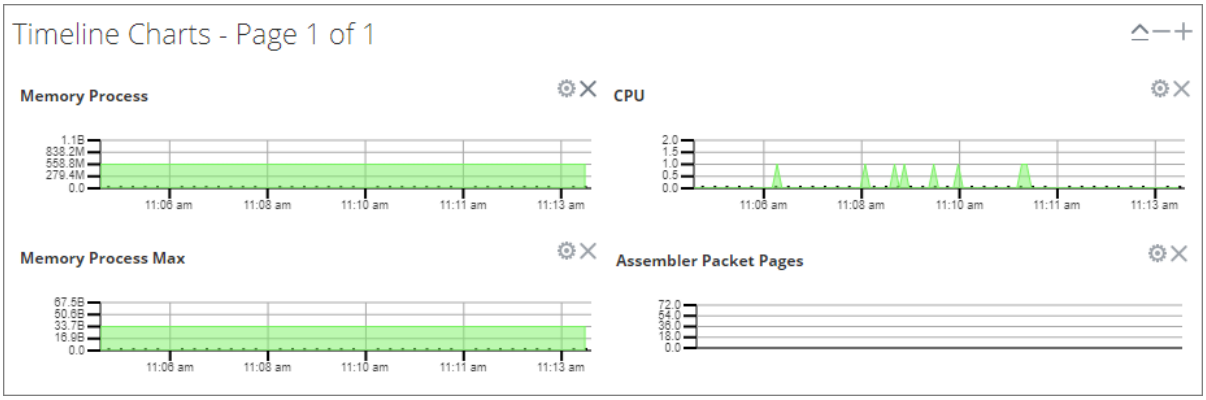
1. Go to **ADMIN > Services**.
2. Select a service and click **Stats**.

   The Services Stats view is displayed. The charts are in this view.

Edit Properties of a Timeline

To edit properties of a timeline chart:

1. Go to the timeline chart for which you want to edit properties (for example, **Memory Process**).



2. Click the **Properties** icon ( ) to display the parameter names and values.
3. Double-click on a value (for example, the **Display Name** field) to make the value editable.

   Note: Clicking the other two values does nothing because the properties are not editable in the chart.

4. Type a new value and click the **Properties** icon.

   The timeline chart is displayed with new values.

Edit Properties of a Historical Timeline

To edit properties of a historical timeline chart:

1. Go to Historical Timeline Charts.
2. Click the **Properties** icon ( ) to display the parameter names and values.
3. Click on a value (for example, **01/27/2015** for the **Begin Date** field) to make the value editable.
4. Type a new value.
5. Edit the **End Date** and **Display Name** if required.
6. Click the **Properties** icon ( ).
   The historical timeline is displayed with new values.

Note: To return the properties of the historical timeline chart back to the default so that the values dynamically update, remove the Begin Date and the End Date, place your cursor in the Begin Date field, and refresh your browser.

Add Stats to Timeline Charts

You can add timeline charts by dragging a statistic from the Chart Stats Tray into the Timelines section.

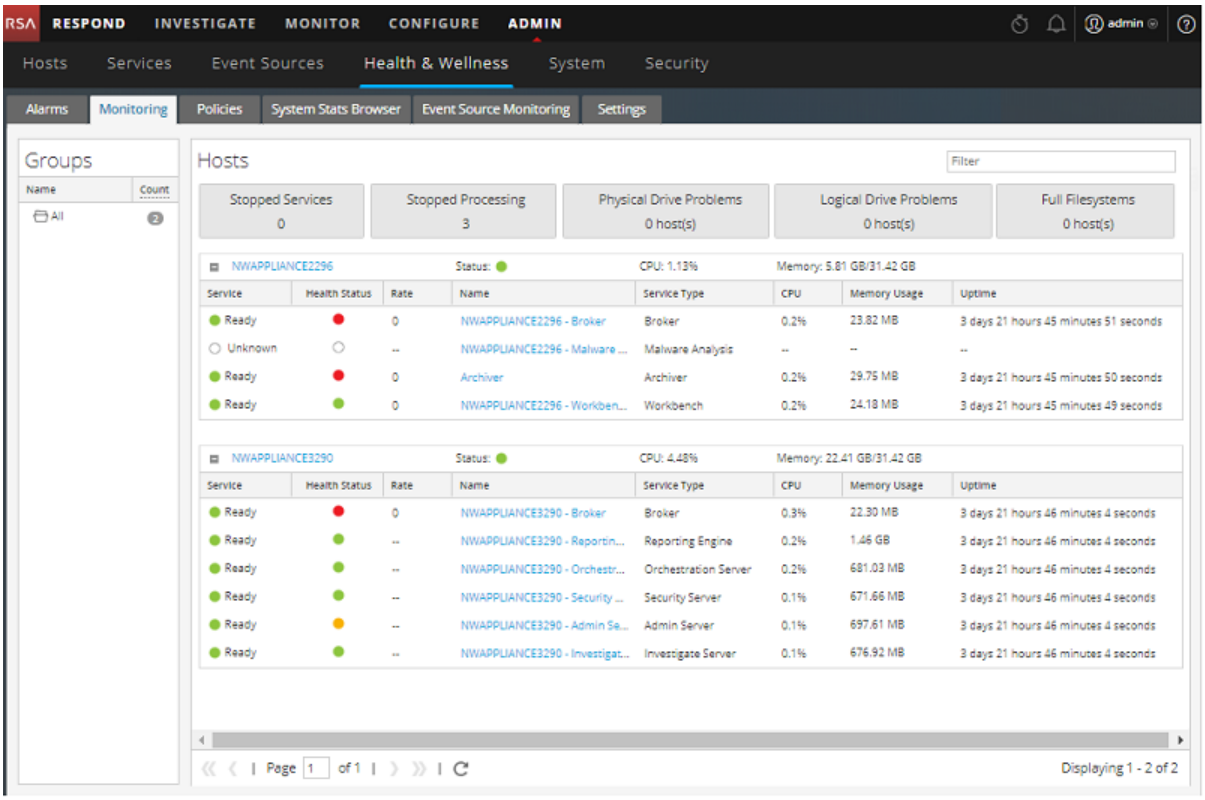
1. To expand the Chart Stats Tray, click .
2. Scroll down and select a statistic; for example, **Session Rate (maximum)**.
3. Drag the statistic to the **Timelines Section**.
   The new timeline is displayed in the Timelines section.

Monitor Hosts and Services

NetWitness Platform provides a way to monitor the status of hosts and services installed. You can view the current health of all the hosts, services running on the hosts, their CPU usage and memory consumption and the host details and service details.

To monitor hosts and services in NetWitness Platform:

1. Go to **ADMIN > Health & Wellness**.
   The Health & Wellness view is displayed with the Alarms tab open.
2. Select the **Monitoring** tab.
   A list of all hosts and their associated services that belong to the group **All** is displayed by default.
   The operational status, CPU usage, and memory usage for each host is displayed.



Click ⊞ to the left of a host (⊞ is visible if there are services installed on a host)

3. A list of services installed on the selected host is displayed.
   The name, operating status, CPU usage, memory usage, and the time operating for each service is displayed.

Filter Hosts and Services in the Monitoring View

You can filter hosts and services in the monitoring view in one of the following ways:

- Hosts belonging to a particular group
- Specific host and its associated services
- Hosts whose services are stopped
- Hosts whose services have stopped processing or processing has been turned off
- Hosts that have Physical drive problems
- Hosts that have Logical drive problems
- Hosts that have Full File systems

For the related reference topic, see Monitoring View.

To filter hosts and services:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open by default.

2. Select the **Monitoring** tab.

3. Filter the hosts and services in one of the following ways:

   - To view a list of hosts and their associated services belonging to a particular group, select the group in the Groups panel.

     All hosts and their associated services belonging to the specified group are displayed in the Hosts panel.

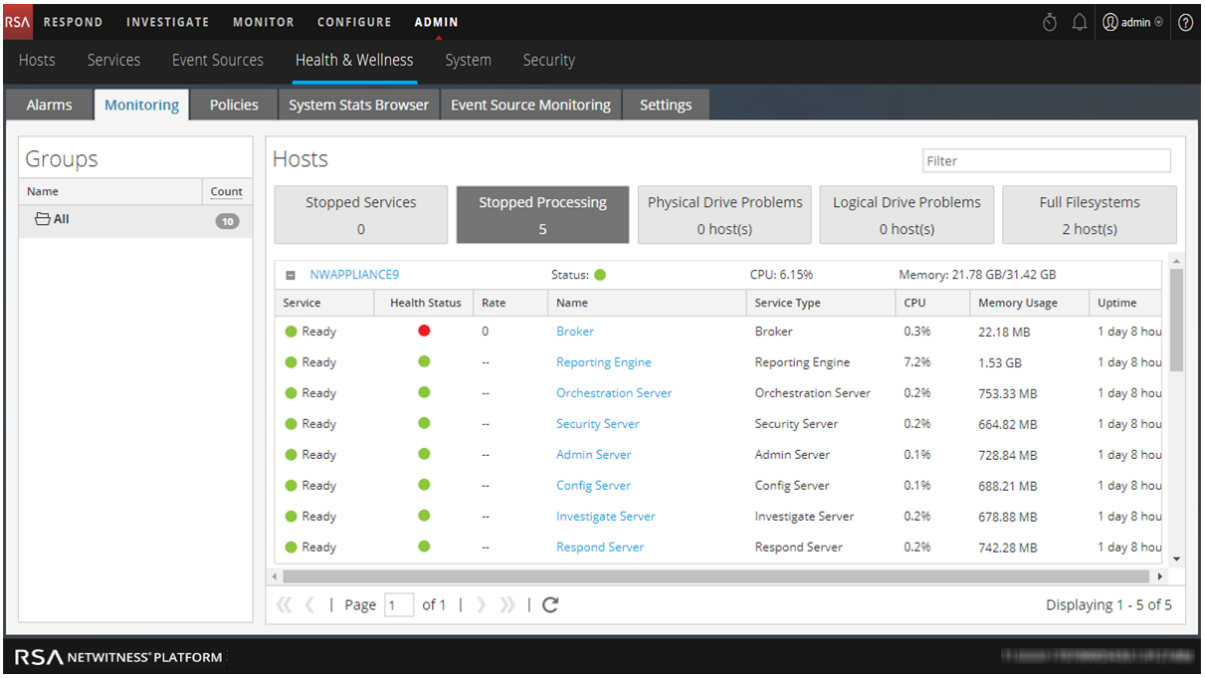
     Note: The grouping of hosts is derived from the groups created in the Administration page. All groups created in the Administration page are displayed here.

     For example, if you select the group **LC_Group** in the Groups panel, a list of all hosts that are part of the group are displayed.

   - To view a list of all services that have stopped processing, click **Stopped Processing** in the Hosts panel.

     A list of all the hosts that have at least one service with the status as stopped processing is displayed.

     Note: The buttons on the top display the System Statistics for all the hosts configured in NetWitness Platform and does not change with application of filters on groups.



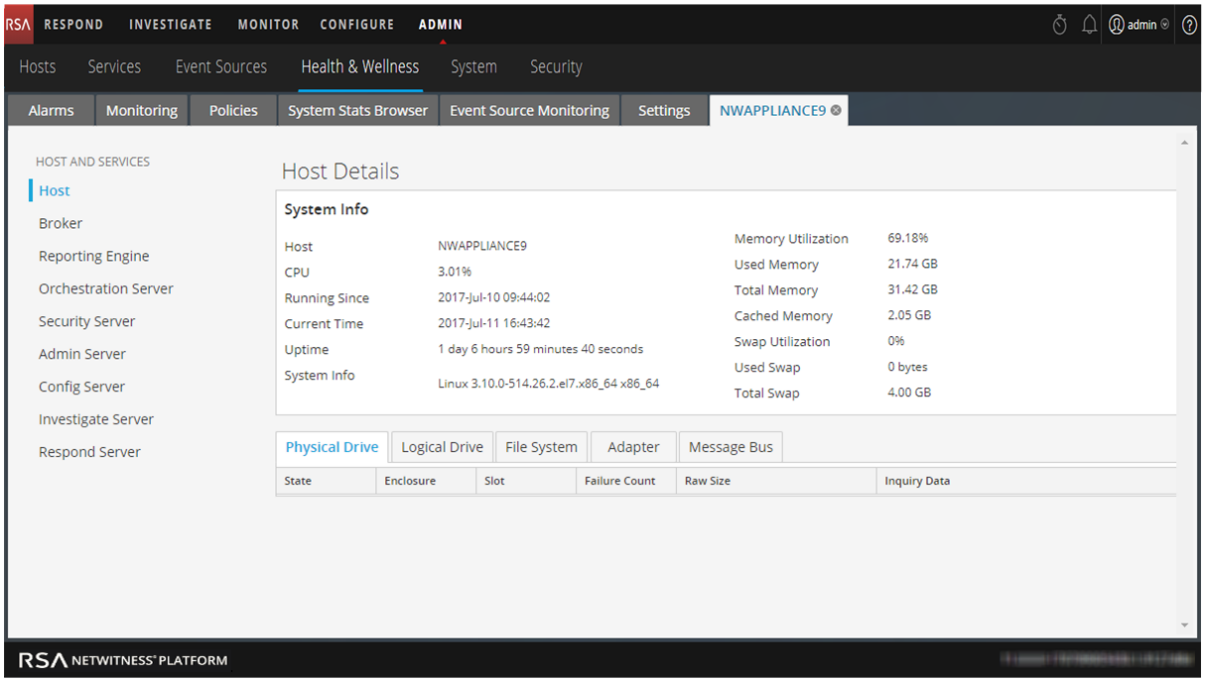
Note: In a similar way you can filter the list of hosts and the associated services by choosing the right filter
- Click Stopped Services to display a list of all stopped services.
- Click Physical Drive Problems to display a list of host with Physical Drive Problems.
- Type the host name in the Filter box to display only the required host and the services running on the host.

Monitor Host Details

You can view the details of the host, its memory and CPU usage, system information, the physical drive, logical drive and file system details to further investigate if you encounter some problem with the host.

To view host details:

1. Go to **ADMIN > Health & Wellness**.
   The Health & Wellness view is displayed with the Alarms tab open.
2. Select the **Monitoring** tab.
3. Click a host in the **Hosts** panel.
   The Host Details view is displayed as a new page.



Monitor Service Details

You can view the details of a service, its memory and CPU usage, system information, and various details depending on the service selected.

To view service details:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Select the **Monitoring** tab.

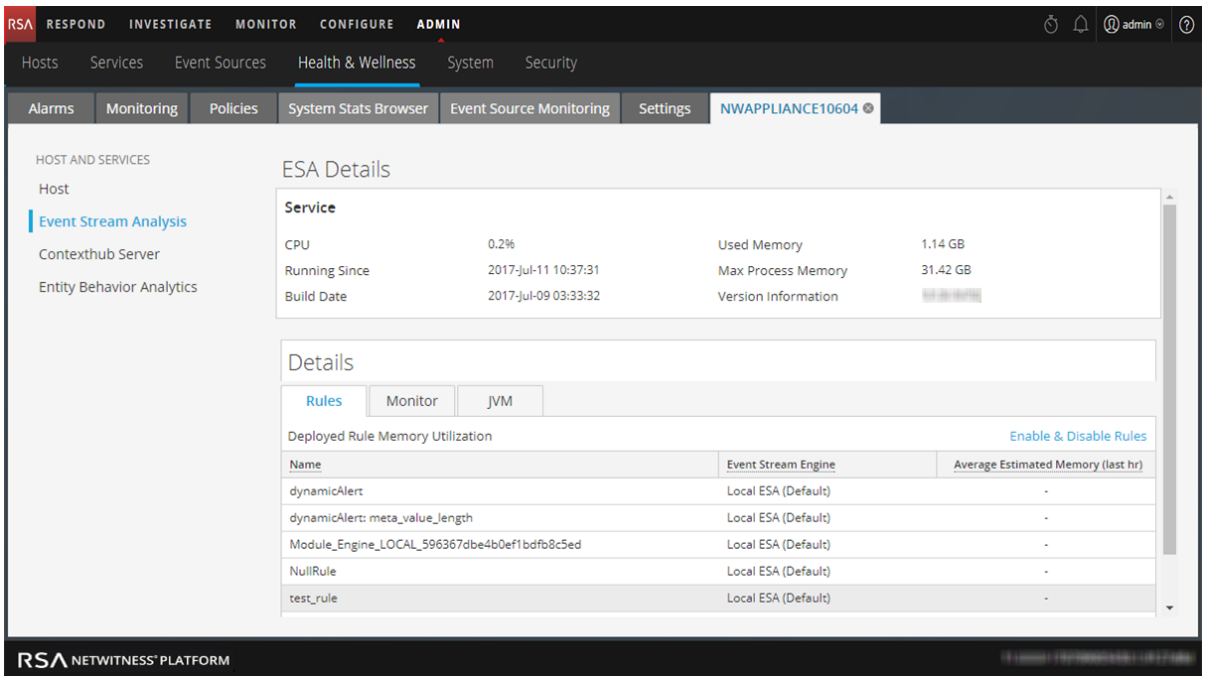
3. Click ⊞ for a host in the Hosts panel.

   A list of services running on the host is displayed.

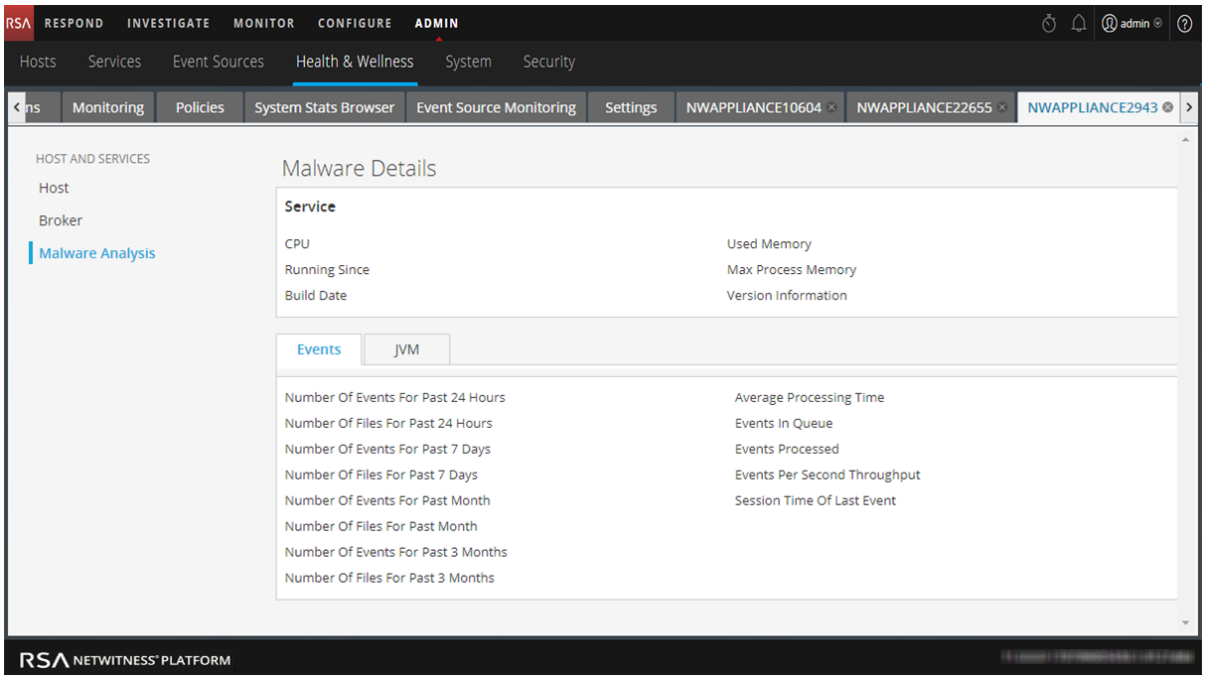
4. Click on any service.

   The service details view is displayed as a new page. The Archiver, Broker, Concentrator, and Decoder service details views have the **Service** and **Details** panels.

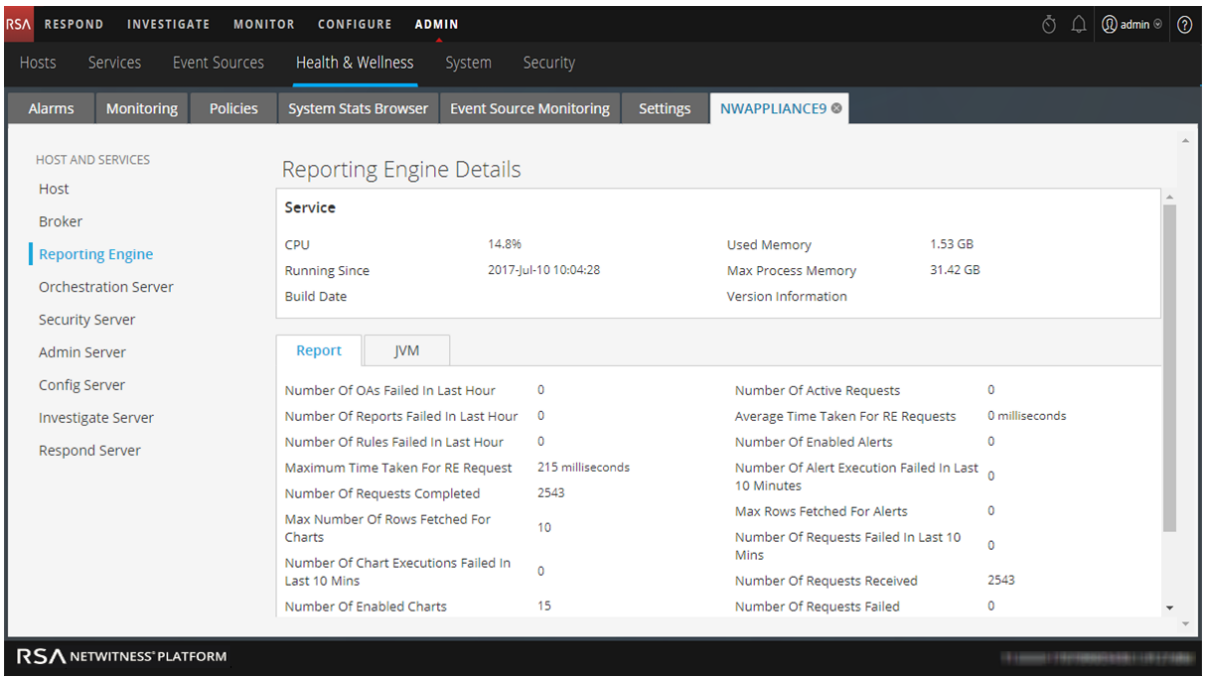
   The Event Stream Analysis (ESA) service details view has the **Service**and **Details** panels, plus the **Monitor** and **JVM** tabs that show additional statistics.



The Malware Analysis service details view has the **Service** panel plus the **Rules, Events,** and **JVM** tabs that show additional statistics.



The Reporting Engine service details view has the **Service** panel plus the **Report** and **JVM** tabs that show additional statistics.



Note: Alternatively, you can access the service details page by clicking the services listed in the options panel in the Host Details view.

Refer to Monitoring View for a detailed description of the Details view for each service.

Monitor Event Sources

The event source monitoring feature of NetWitness Platform provides the following functionalities:

- Support for failover
- Provides a consolidated list of event sources and their associated collector and log decoder devices
- Regex support for rules
- Decommission
- Filtering capabilities
- Historical graph

In addition, you can monitor event sources, check the number of events generated from a source type and view the historical graph of the events collected. To monitor event sources you have to configure the event sources so that they generate and send out notifications when required.

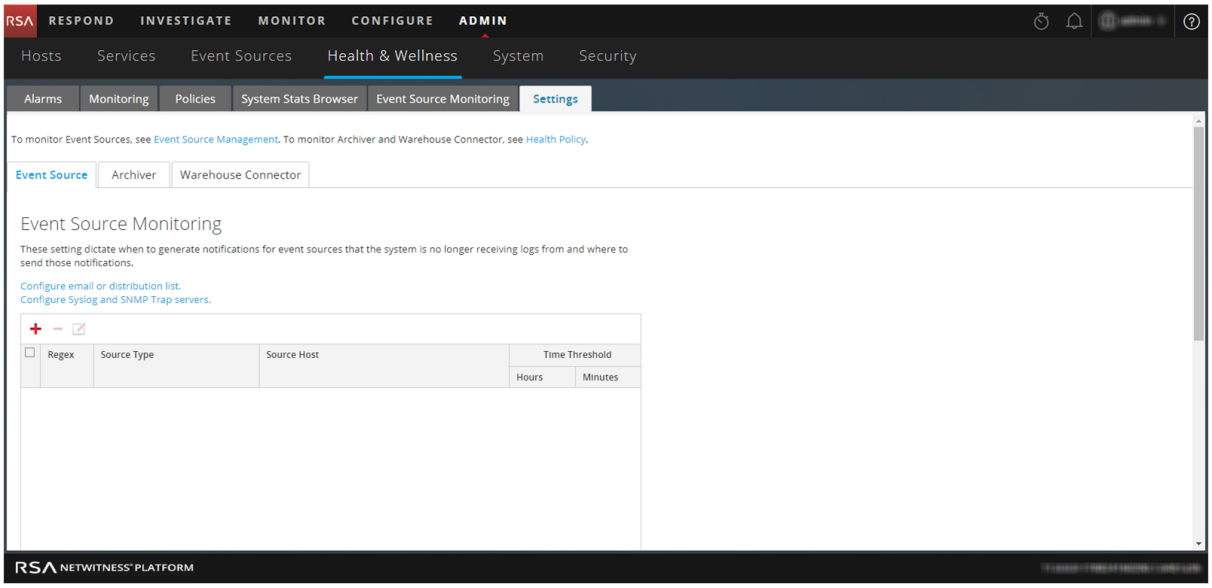
Configure Event Source Monitoring

To monitor event sources you have to configure the event sources so that they generate and send out notifications when required. For the related reference topic, see Health and Wellness Settings View - Event Sources.

To configure and enable event monitoring in NetWitness Platform:

1. Go to **ADMIN** > **Health & Wellness**.
2. Select **Settings** > **Event Source**.

   The Event Source tab is displayed.

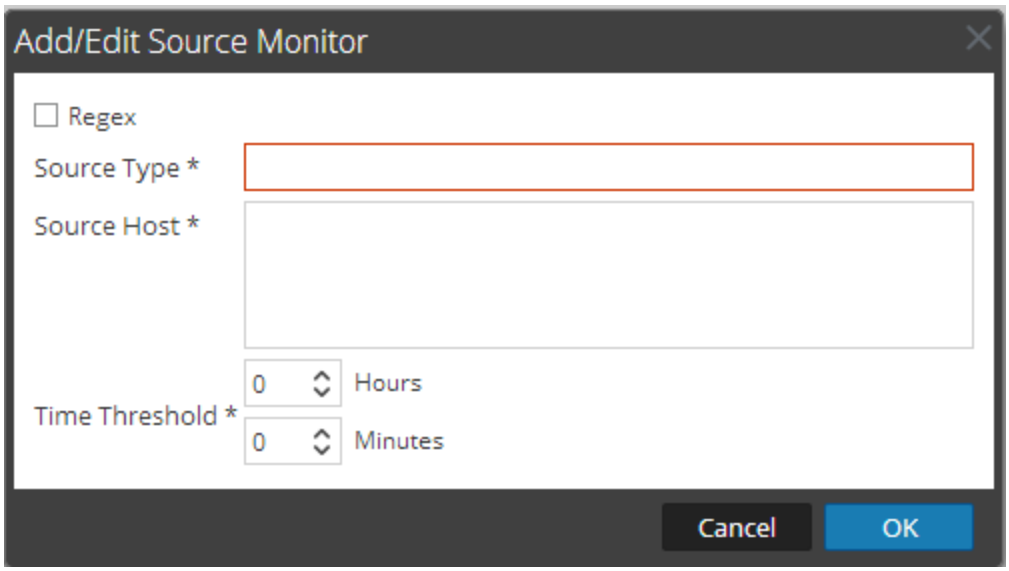


3. Under **Event Source Monitoring**, click +.

   The Add/Edit Source Monitor dialog is displayed.

4. Define the **Source Type**, **Source Host**, and **Time Threshold** for the source of the event source that you want to monitor to detect when NetWitness Platform stops receiving logs from it. If you do not specify a **Time Threshold**, NetWitness Platform monitors the event source until you set a threshold.

   Note: For **Source Type** and **Source Host**, you must specify the values that you configured for the event source in the **Event Sources** tab of the **Administration** > **Services** > Log Collector service > **View** > **Config** view. You add or modify the the event sources that you want to monitor. The two parameters that identify an event source are **Source Type** and **Source Host**. You can use **globbing** (pattern matching and wildcard characters) to specify the **Source Type** and **Source Host** of event sources



5. Click **OK**.

   The event source is displayed in the panel.

6. Configure the method of notification, by doing one of the following:

   - Select **Configure email or distribution list**.

     The AMIN > System > Email Configuration Panel is displayed so that you can specify to whom the notifications are sent.

   - Select **Configure Syslog and SNMP Trap servers**.

     The Administration > System Auditing Configuration panel is displayed so that you can configure the Syslog and SNMP Traps to which the notifications are sent.

7. Click **Apply**.

   NetWitness Platform begins sending notifications when it stops receiving events from this event source after the time threshold has elapsed.

For details on parameters in the Event Source Monitoring settings view, see Event Source Monitoring View.

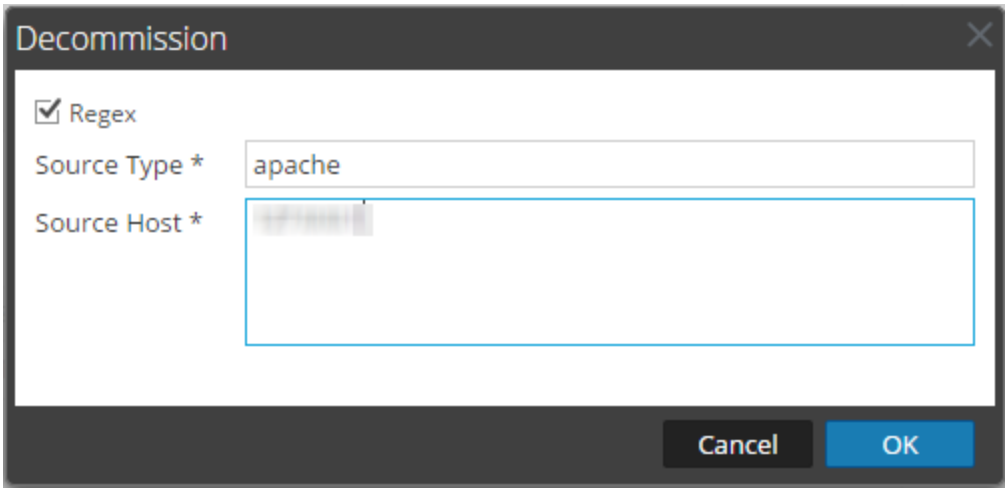
Decommission Event Source Monitoring

If a Log Collector service (Local Collector or Remote Collector) for which you set up Event Source monitoring becomes inoperable, NetWitness Platform continues to notify that you it is not receiving events from it until you decommission the Collector.

Caution: If you configured a failover Local Collector for a Remote Collector and the Local Collector fails over to a standby Log Decoder, you must decommission the Local Collector to stop the notifications.

To decommission event source monitoring for an event source:

1. Go to **ADMIN**> **Health & Wellness**.
2. Select **Settings** > **Event Source**.
   The **Event Source** tab is displayed.
3. Under **Decommission**, click +.
   The **Decommission** dialog displays.
4. Define the **Source Type** and the **Source Host** for the source for which you want to decommission event monitoring notifications.



Filter Event Sources

You can choose a filter to display:

- Events belonging to a particular event source
- Events belonging to particular event source types
- Events collected from a particular log Collector
- Events list arranged in a order based on the Event Source Type, Log Collector, Log Decoder or Last Event Time.

To filter the list of event sources:

1. Go to **ADMIN > Health & Wellness**.
2. Select **Event Source Monitoring**.
3. Filter the list in one of the following ways:
   - To view the events generated by a particular event source, type the required event source in the **Event Source** field. Select **Regex** to enable Regex filter and click **Apply**. It performs a regular

expression search against text and lists out the specified category. This field also supports globbing pattern matching.

All events generated by the Event Source specified are displayed.

- To view events collected from a particular Log Collector, select a Log Collector from the drop-down list and click **Apply**.

  A list of all events being collected from the specified Log Collector from various event sources is displayed.

Note: Similarly, you can also choose the following filters:
- To view events belonging to an event source type, select the event source type and click **Apply**.
- To view events received in a specified time frame, select the required time frame and click **Apply**.

You can further filter the query results to contain only event sources that logs have been received from within the selected time or the query results to contain only event sources that logs have not been received from within the selected time.

For details on various parameters and description, see Event Source Monitoring View.

View Historical Graph of Events Collected for an Event Source

The historical graph of the events collected from an event source gives you information about the variation of the collection over a time frame selected.

To view a historical graph:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Click **Event Source Monitoring**.

   The Event Source Monitoring view is displayed.

3. In the **Historical Graph** column, select  .

   The Historical graph for the selected event source is displayed.

   The figure below gives an example of the historical graph for the event source type **winevent_snare**.

The graphical view is customized to display the events collected for the current day and the values are zoomed in for an interval of an hour (09.05 - 105.05 hrs). Hover over the graph to view the details at a particular instant. For example, in the figure it displays the average rate of collection at 09.30 hrs.

Note: You can customize the graph view by selecting the Time Frame and Date range. You can zoom in using the zoom in value, time window, or by just a click and a drag in the plot area. For details on the parameters to customize and zoom in functions see Health and Wellness Historical Graphs collected from an event source.

If there is no data displayed on the chart it may be due to one of the following reasons:

- event source is down.
- event source is not processing anything right now.

Monitor Alarms

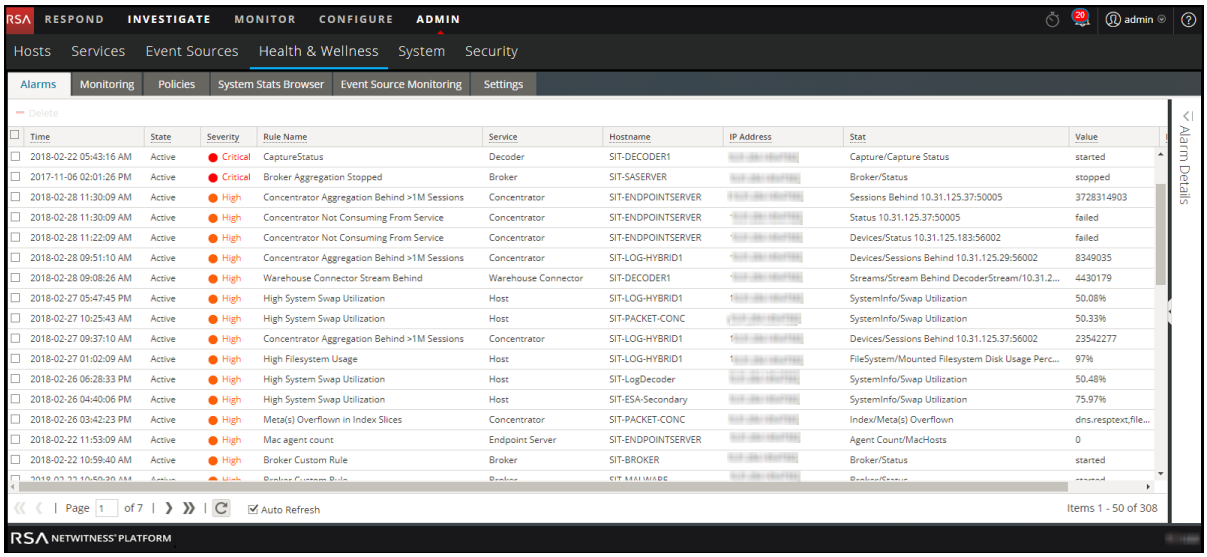
You can set up alarms and monitor them in the Health and Wellness interface for the hosts and services in your NetWitness Platform domain. Alarms display in the view as **Active** when the Policy-rule-defined statistical thresholds for hosts and services have been crossed. Alarms are grayed out and change to the **Cleared** status when the clearing threshold has been crossed.

You set up the parameters for alarms in Manage Policies. For the related reference topic, see Health and Wellness View - Alarms View.

To monitor the alarms set up in NetWitness Platform:

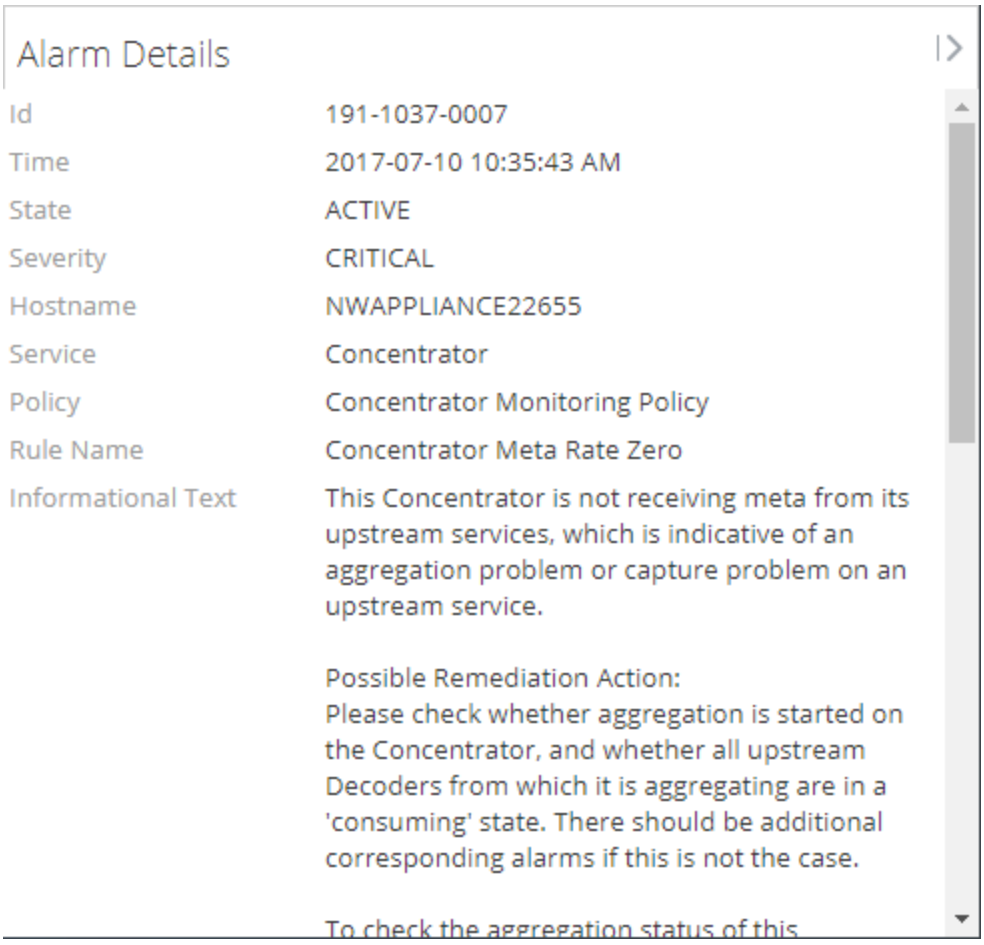
1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open by default.



2. Click on the alarm for which you want to display details in the Details Panel.

3. Click (expand) to view the details for the alarm you selected.



Monitor Health and Wellness Using SNMP Alerts

You can monitor an NetWitness Server component to proactively alert using Simple Network Management Protocol (SNMP) based on the thresholds or system failures.

You can monitor the following for NetWitness Platform components:

- CPU utilization that reaches a defined threshold.
- Memory utilization that reaches a defined threshold.
- Disk utilization that reaches a defined threshold.

SNMP Configuration

The NetWitness Servers can be configured to send out SNMPv3 Threshold Traps and Monitor Traps. Threshold traps are sent in conjunction with configured node thresholds by the NetWitness Platform Core applications themselves. Monitor traps are sent by the SNMP daemon itself for the items indicated in its configuration file. The customer must set up the SNMP daemon on another service to receive SNMP traps from NetWitness Platform. You can set up SNMP on NetWitness Platform in the configuration setting for the NetWitness Server. For more information, see "Service Configuration Settings" in the *NetWitness Platform Host and Services Getting Started Guide* for the specific host.

Thresholds

Thresholds can be set on any service statistics that can accept the setLimit message. You can retrieve the current thresholds using the getLimit message. To set a limit, you can pass a low and high threshold value.

When the value of the stat crosses either the low or high threshold, a SNMP trap is triggered indicating the threshold is crossed. The trap will not be triggered if the value is below the low and above the high value, but another trap is triggered if it crosses back into the normal range (above the low and below the high).

You must set the threshold for the service using the Service Explorer view or the REST API.

Following is a sample threshold for monitoring CPU usage (below 10% or above 90%):

```
/sys/stats/cpu setLimit low=10 high=90
```

Following is an example of how the threshold is set using REST API:

```
http://<log decoder>:50102/sys/stats/cpu?msg=setLimit&low=10&high=90
```

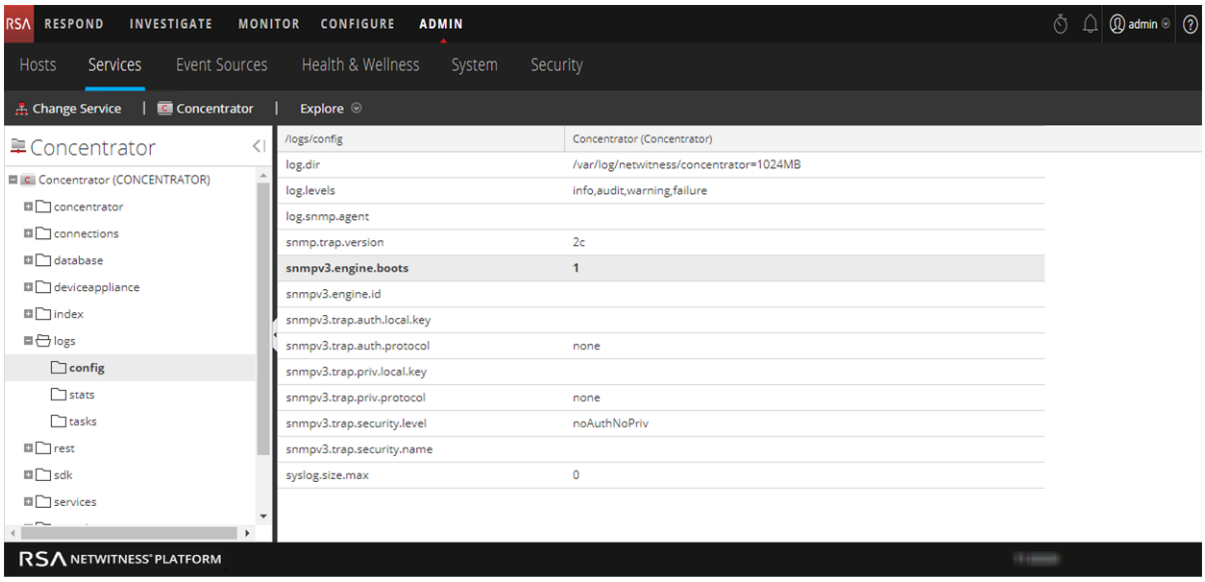
If the CPU usage spikes to 90% or higher, a SNMP trap will be generated:

```
23435333 2013-Dec-16 11:08:35 Threshold warning path=/sys/stats/cpu old=77%
new=91
```

Configure SNMPv3 for a Host

1. Go to **ADMIN > Services**.
   The Services view is displayed.
2. Select the service.
3. In the Actions column, select **View > Explore**.
4. In the nodes list, expand the list and select a config folder. For example, logs > config

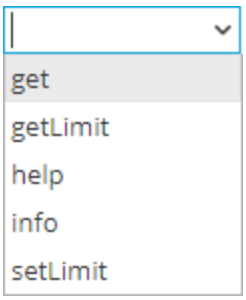
5. Set the SNMPv3 configuration.



Set the Threshold for a Service

1. Go to **ADMIN > Services**.
   The Services view is displayed.
2. Select the service.
3. In the Actions column, select **View > Explore**.
4. In the nodes list, expand the list and select a stat folder.
5. Select a stat, for example, cpu, and right-click.
6. From the drop-down menu, select **Properties.**

   The Properties panel is displayed. The Properties panel has a drop-down list of available messages for the parameter.



7. Select setLimit.
8. Specify the low and high values.

SNMP Traps for System Status

The threshold mechanism can also be used to monitor string-valued stats generated by Core services. There are two ways to monitor string-valued stats:

1. Generate a trap whenever the status value is NOT an expected value. For example, if you want monitor the stat `/broker/stats/status` and generate a trap whenever the value is not `started`, set the `high` limit on the stat to the expected value. You would use the `setLimit` message on `/broker/stats/status` as follows:
   ```
   setLimit high=started
   ```
2. Generate a trap whenever the status value matches an expected value. This is accomplished by using the `low` limit on the stat. For example, if you wanted generate a trap when the stat `/sys/stats/service.status` has the value `"Initialization Failure"`, you would use the `setLimit` message on `/sys/stats/service.status` as follows:
   ```
   setLimit low="Initialization Failure"
   ```

In both of these scenarios, it is possible to check for multiple values by using a comma-separated list of values to check for.

Troubleshooting Health & Wellness

Issues Common to All Hosts and Services

You may see the wrong statistics in the Health & Wellness interface if:

- Some or all the hosts and services are not provisioned and enabled correctly.
- You have a mixed-version deployment (that is, hosts updated to different NetWitness Platform versions).
- Supporting services are not running.

Issues Identified by Messages in the Interface or Log Files

This section provides troubleshooting information for issues identified by messages NetWitness Platform displays in the Health & Wellness Interface or includes in the Health & Wellness log files.

Message	User Interface: **Cannot connect to System Management Service**
	System Management Service (SMS) logs:

Possible Cause	RabbitMQ service not running on the NetWitness Server.

Solution	Restart the RabbitMQ, SMS, and NetWitness Platform services using the following commands.
	`systemctl restart rabbitmq-server`
	`systemctl restart rsa-sms`
	`systemctl restart jetty`

Message/ Problem	User Interface: **Cannot connect to System Management Service**
Cause	The System Management Service, RabbitMQ, or Mongo service is not running.

Solution	Run the following commands on NetWitness Server to make sure all these services are running.
	`[root@nwserver ~]# systemctl status rsa-sms`
	`RSA NetWitness SMS :: Server is not running.`
	`[root@nwserver ~]# systemctl start rsa-sms`
	`Starting RSA NetWitness SMS :: Server...`
	`[root@nwserver ~]# systemctl status rsa-sms`
	`RSA NetWitness SMS :: Server is running (5687).`
	`[root@nwserver ~]# systemctl status mongod`
	`mongod (pid 2779) is running...`
	`systemctl status rabbitmq-server`
	`Status of node nw@localhost ...`
	`[{pid,2501},`

	{running_applications, [{rabbitmq_federation_management,"RabbitMQ Federation Management", "3.3.4"},

Message/ Problem	User Interface: **Cannot connect to System Management Service**
Possible Cause	/var/lib/rabbitmq partition usage is 70% or greater.
Solution	Contact Customer Care.

Message/ Problem	User Interface: **Host migration failed.**
Possible Cause	One or more NetWitness Platform services may be in a **stopped** state.
Solution	Make sure that the following services are running then restart the NetWitness Server: Archiver, Broker, Concentrator, Decoder, Event Stream Analysis, Response Server, IPDB Extractor, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, Workbench.

Message/ Problem	User Interface: **Server Unavailable.**
Possible Cause	One or more NetWitness Platform services may be in a **stopped** state.
Solution	Make sure that the following services are running then restart the NetWitness Server: Archiver, Broker, Concentrator, Decoder, Event Stream Analysis, Response Server,

	IPDB Extractor, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, Workbench.

Message/ Problem	User Interface: **Server Unavailable**
Possible Cause	System Management Service (SMS), RabbitMQ, or Mongo service is not running.

Solution 1	Run the following commands on NetWitness Server to make sure all these services are running.
	`[root@nwserver ~]# systemctl status rsa-sms`
	`RSA NetWitness SMS :: Server is not running.`
	`[root@nwserver ~]# systemctl start rsa-sms`
	`Starting RSA NetWitness SMS :: Server...`
	`[root@nwserver ~]# systemctl status rsa-sms`
	`RSA NetWitness SMS :: Server is running (5687).`
	`[root@nwserver ~]# systemctl status mongod`
	`mongod (pid 2779) is running...`
	`systemctl status rabbitmq-server`
	`Status of node nw@localhost ...`
	`[{pid,2501},`
	`{running_applications,`
	`[{rabbitmq_federation_management,"RabbitMQ Federation Management",`
	`"3.3.4"},`

Solution 2	Make sure `/var/lib/rabbitmq` partition is less than 75% full
Solution 3	Check NetWitness Server log files (`var/lib/netwitness/uax/logs/nw.log`) for any errors.

Message/	ContextHub stops and does not allow you to add or edit data sources and lists.

Problem	
Possible Cause	The storage is full by 95% or above.
Solution 1	Increase the storage by updating the YML file, located at /etc/netwitness/contexthub-server/ contexthub-server.yml. For example, to increase storage from 120 to 150 GB, enter a value (in bytes) by editing the relevant parameter: `rsa.contexthub.data.disk-size: 161061273600`
Solution 2	Delete unwanted or unused large list.
Solution 3	Configure the TTL index for the list to automatically delete STIX and TAXI data and to clean up storage space.

Message/ Problem	Context Hub runs on a fixed memory and 50% is reserved for cache. When cache is 100% full, the cache response stops. For all new lookups the response will be slow.
Possible Cause	The cache is full by 50% or above.
Solution 1	By default, Context Hub cleans the cache every 30 minutes. Reduce the cache expiration time of data sources.
Solution 2	Disable cache for data sources.
Solution 3	Increase the RAM of the CH Java process by editing the `-Xmx` option available in the /etc/netwitness/contexthub-server/contexthub-server.conf file. In `JAVA_OPTS`, search for the `-Xmx` option. For example, edit the entry as follows: `-Xmx8G` where `8G` represents 8GB space. Then restart the ContextHub service. **Note:** The memory is less than the available system memory. Be aware that there are many other services running on the host.

Message/	List Data Source displays an unhealthy stats or status.

Problem	
Possible Cause 1	Unable to: • access the data source • parse or read a CSV file • schema mismatched CSV
Possible Cause 2	Unable to authenticate when accessing the data source.
Solution 1	Make sure to save the csv file at correct location i.e/var/lib/netwitness/contexthub-server/data/ and verify the required read permissions.
Solution 2	Make sure the csv file schema specified while configuring the data source matches. If not, then either create a new data source with the new schema or edit the csv file to match the schema. For example, if you configure a List Data Source with a schema with column1, column2, and column3. And next time you update the csv file where the number of column increase or decrease or the order of the columns are changed. In this case there is a schema mismatch and the configured list data source will show "Unhealthy" in Health and Wellness stats.
Solution 3	Make sure the password is correct. To confirm edit the data source, enter the password and click test connection. For more information related the above solutions, see "Configure Lists as a Data Source" topic in the *Context Hub Configuration Guide*.

Issues Not Identified by the User Interface or Logs

This section provides troubleshooting information for issues that are not identified by messages NetWitness Platform displays in the Health & Wellness Interface or includes in the Health & Wellness log files. For example, you may see incorrect statistical information in the Interface.

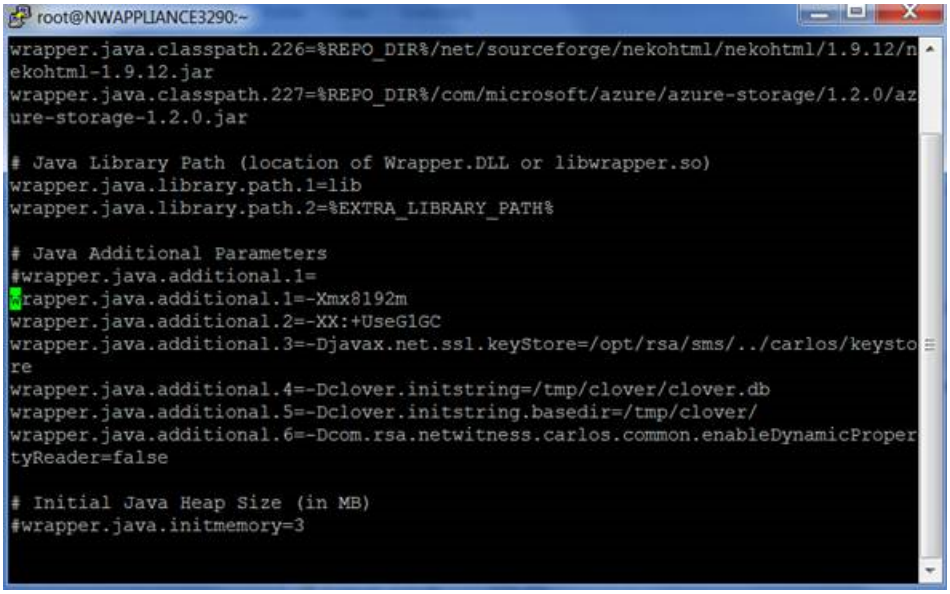
Problem	Incorrect statistics displayed in Health and Wellness interface.
Possible Cause	SMS service is not running. SMS service must be running on the NetWitness Server.

Solution	Restart SMS service.

Problem	NetWitness Platform does not show the version to which you upgraded until you restart jettysrv (jeTTy server).
Possible Cause	When NetWitness Platform checks a connection, it polls a service every 30 seconds to see if it is active. During that 30 seconds, if the service comes back up, it will not get the new version.
Solution	1. Manually stop the service. 2. Wait until you see that it is it offline. 3. Restart the service. NetWitness Platform displays the correct version.

Problem	NetWitness Server does not display the **Service Unavailable** page.
Possible Cause	After you upgrade to NetWitness Platform version 10.5, JDK 1.8 is not default version and this causes the jettysrv (jeTTy server) to fail to start. Without the jeTTy server, the NetWitness Platform server cannot display the **Service Unavailable** page.
Solution	Restart jettysrv.

Problem	The SMS service is stopped and the following error is displayed in the log file: `java.lang.OutOfMemoryError: Java heap space`
Solution	You can use the following solution to increase the memory according to your needs. 1. Open /opt/rsa/sms/conf/wrapper.conf



2. Replace `wrapper.java.additional.1=-Xmx8192m` with:
   `wrapper.java.additional.1=-Xmx16g`
3. Restart the SMS service:
   `systemctl start rsa-sms`

Managing NetWitness Platform Updates

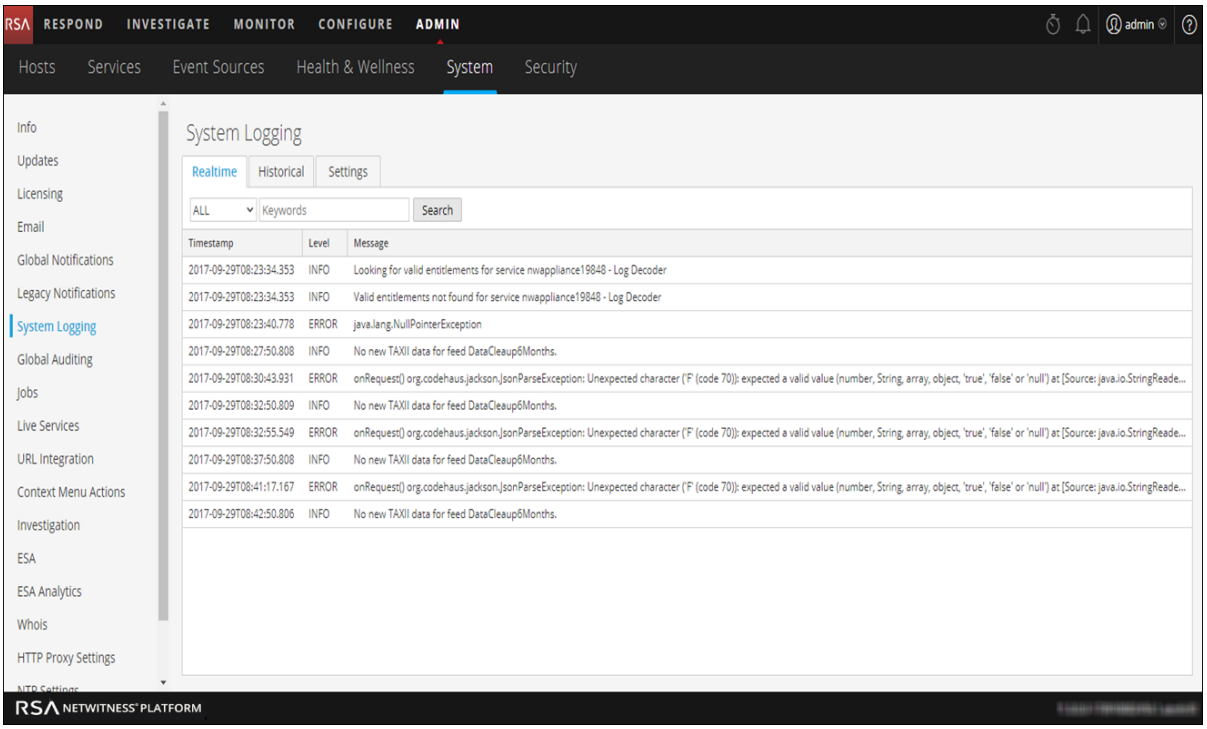
RSA issues NetWitness Platform software version updates on a regular basis as it strives to continually improve the product. A software version update consists of a release, service pack, or patch (including security patch) and ancillary software on which the release, service pack, or patch depends. User guides are provided for each software version update release, which include detailed steps for installing the update. It is important that you download the update guide for the release from RSA Link (https://community.rsa.com/community/products/netwitness) and follow the steps described there. Additional information is available in the "Apply Version Updates to a Host" topic in the *Hosts and Services Getting Started Guide* and in System Updates Panel - Settings Tab.

Displaying System and Service Logs

NetWitness Platform provides views into system logs and service logs. When you view service logs, you can also select messages for the service or host.

View System Logs

1. Go to **ADMIN > System.**
2. In the options panel, select **System Logging**.

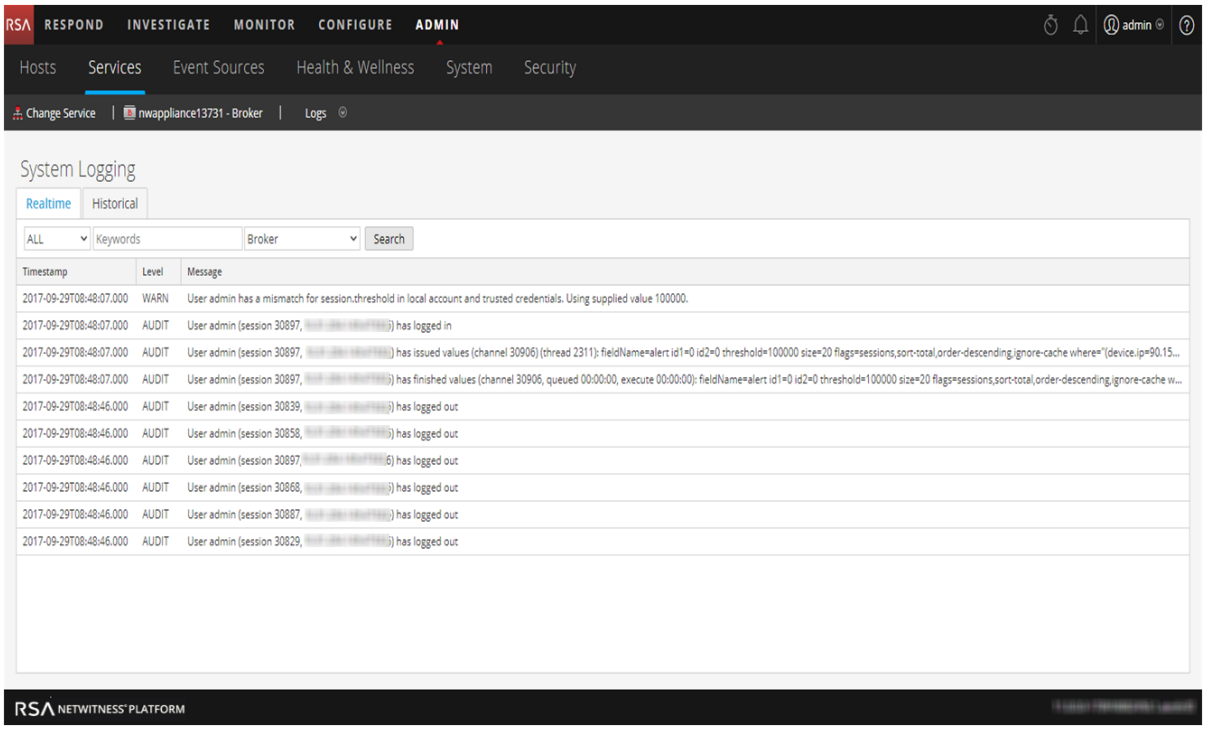


Display Service Logs

To display NetWitness Platform service logs:

1. Go to **ADMIN > Services**.
2. In the **Services** grid, select a service.

3. In the **Actions** column, select **View > Logs**.



Filter Log Entries

To filter the results shown in the Realtime tab:

1. (Optional) For system and service logs, select a **Log Level** and a **Keyword**, or both. System logs have seven log levels. Service logs have only six log levels because they do not include the **TRACE** level. The default is **ALL** log entries.
2. (Optional) For service logs, select the Service: host or service.
3. Click **Filter**.

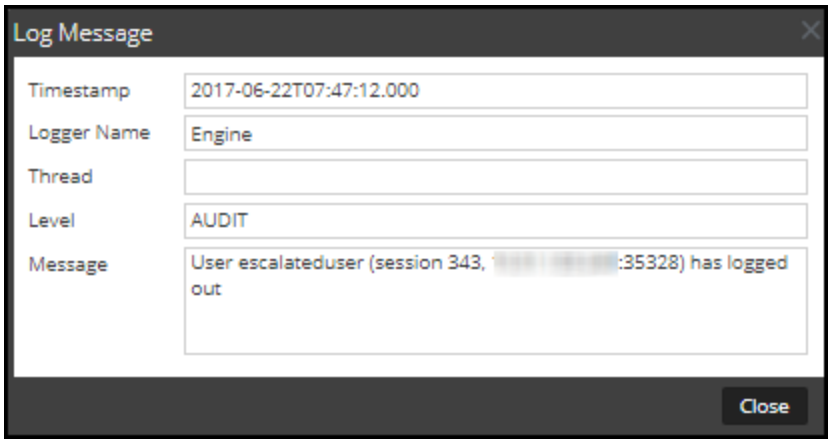
   The view is refreshed with the most recent 10 entries matching your filter. As new matching log entries become available, the view is updated to show those entries.

Show Details of a Log Entry

Each row of the Realtime tab Log grid provides the summary information of a log entry. To view complete details:

1. Double-click a log entry.

   The **Log Message** dialog, which contains the Timestamp, Logger Name, Thread, Level and Message, is displayed.



2. After viewing, click **Close**.

Access Reporting Engine Log File

All Log Files

The Reporting Engine stores the following logs in the **rsasoc/rsa/soc/reporting-engine/log** directory:

- Current logs in the **reporting-engine.log** file.
- Backup copies of previous logs in the **reporting-engine.log.*** file.
- All UNIX script logs in the files that have the following syntax: **reporting-engine.sh_*timestamp*.log** (for example, **reporting-engine.sh_20120921.log**).

The Reporting Engine rarely writes command line error messages to the **rsasoc/nohup.out** file.

Upstart Logs

The Reporting Engine appends the log messages and output written by upstart daemon and the commands used to start the reporting-engine to the **/var/log/secure** directory.

An upstart log file is a system log file so only the root user can read it. The Reporting Engine generates log files, retains backup copies of previous log files, stores UNIX script log files, and appends upstart log files to another directory.

Search and Export Historical Logs

NetWitness Platform provides a searchable view of the NetWitness Platform log or the service log in a paged format. When initially loaded, the grid shows the last page of the log entries for the system or the service. You can export logs from the current view.

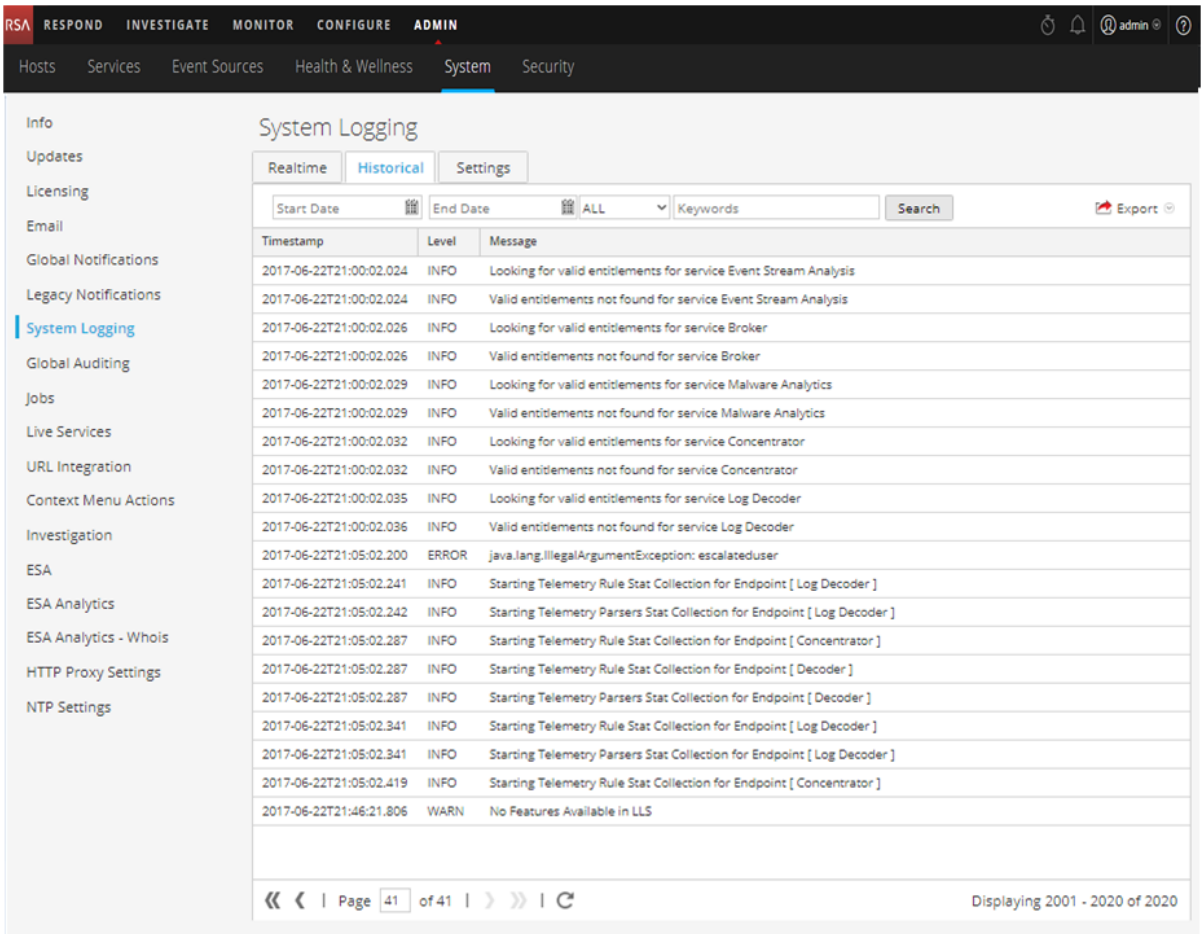
Display the Historical System Log

To display the historical log for the system:

1. Go to **ADMIN > System.**
2. In the options panel, select **System Logging**.

   The System Logging panel is opened to the Realtime tab by default.
3. Click the **Historical** tab.

   A list of historical logs for the system is displayed.



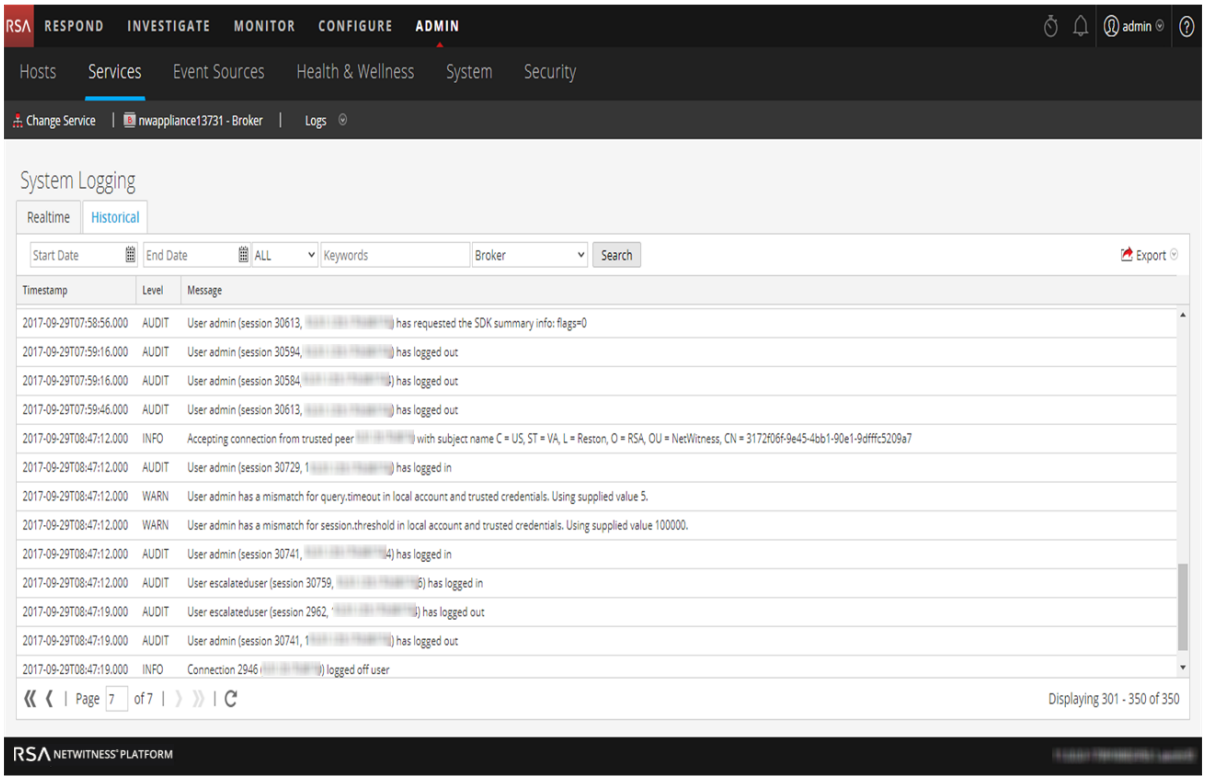
Display a Historical Service Log

To display the historical log for services:

1. Select **ADMIN > Services**.
2. Select a service.
3. In the **Actions** column, select **View > Logs**.

   The service logs view is displayed with the Realtime tab open.
4. Click the **Historical** tab.

   A list of historical logs for the selected service is displayed.



Search Log Entries

To search the results shown in the **Historical** tab:

1. (Optional) Select a **Start Date** and **End Date**. Optionally, select a **Start Time** and **End Time**.
2. (Optional) For system and service logs, select a **Log Level** and a **Keyword**, or both. System logs have seven log levels. Service logs have only six log levels because they do not include the **TRACE** level. The default is **ALL** log entries.
3. (Optional) For service logs, select the Service: host or service.

4. Click **Search**.

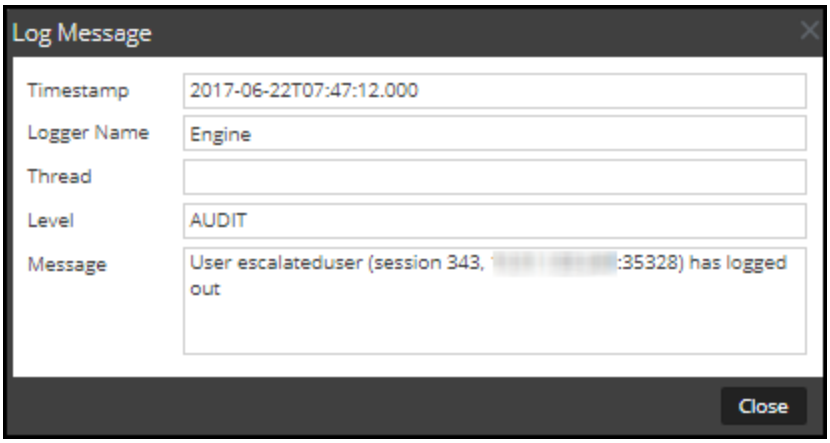
   The view is refreshed with the most recent 10 entries matching your filter. As new matching log entries become available, the view is updated to show those entries.

Show Details of a Log Entry

Each row of the **Historical** tab Log grid provides the summary information of a log entry. To display all the details for a log message:

1. Double-click a log entry.

   The **Log Message** dialog, which contains the Timestamp, Logger Name, Thread, Level and Message, is displayed.



2. After viewing, click **Close**.

   The dialog closes.

Page Through Log Entries

To peruse the different pages of the grid, use the paging controls on the bottom of the grid as follows:

- Use the navigation buttons
- Manually type the page number you want to view, and press **ENTER**.

Export a Log File

To export the logs in the current view:

Click **Export**, and select one of the drop-down options: **CSV Format** or **Tab Delimited**.
The file is downloaded with a filename that identifies the log type and the field delimiter. For example, a NetWitness Platform system log exported with comma-separated values is named **UAP_log_export_CSV.txt**, and a host log exported with tab-separated values is named **APPLIANCE_log_export_TAB.txt**.

Maintaining Queries Using URL Integration

A URL integration provides a way to represent the bread crumbs, or query path, you take when actively investigating a service in the Navigate view. You do not need to display and edit these objects often.

A URL integration maps a unique ID that is automatically created each time you click on a navigation link in the Navigation view to drill into data. When the drill-down completes, the URL reflects the query IDs for the current drill point. The Display Name is displayed in the bread crumb in the Navigate view.

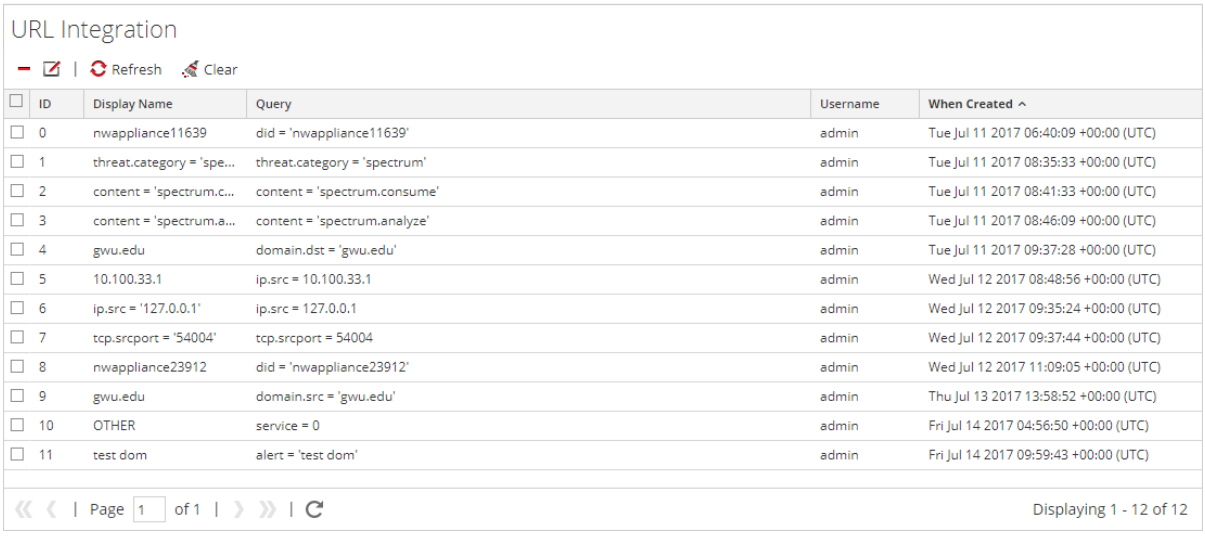
The **URL Integration** panel provides a list of queries and allows users who have the proper permissions to modify this underlying source of data and analyze the query patterns of other users of the NetWitness Platform system. Within the panel, you can:

- Refresh the list.
- Edit a query.
- Delete a query.
- Clear all queries in the list.

Caution: After a query has been removed from the system, any Investigation URLs that included the ID of that query will no longer function.

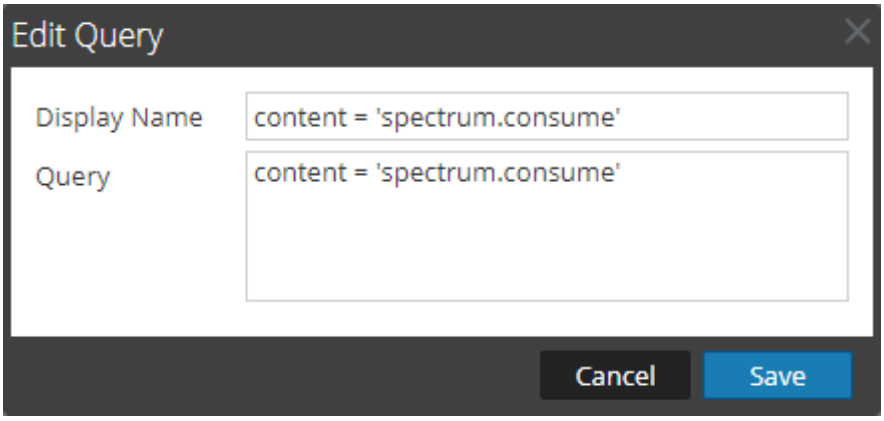
Edit a Query

1. Go to **ADMIN > System**.
2. In the options panel, select **URL Integration**.



3. Select the row in the grid and either double-click the row or click .

   The **Edit Query Dialog** is displayed.



4. Edit the **Display Name** and the **Query**, but do not leave either field blank.
5. To save the changes, click **Save**.

Delete a Query

Caution: After a query has been removed from the system, any Investigation URLs that included the ID of that query will no longer function.

To remove a query from NetWitness Platform entirely:

1. Select the query.
2. Click

   A dialog requests confirmation that you want to delete the query.
3. Click **Yes**.

Clear All Queries

To clear all queries from the list:

- Click Clear

  The entire list is cleared.

Use a Query in a URI

URL Integration facilitates integrations with third-party products by allowing a search against the NetWitness Platform architecture. By using a query in a URI, you can pivot directly from any product that allows custom links, into a specific drill point in the Investigation view in NetWitness Platform.

The format for entering a URI using a URL-encoded query is:

http://<nw host:port>/investigation/<serviceId>/navigate/query/<encoded query>/date/<start date>/<enddate>
where

- **<nw host: port>** is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is only needed if access is configured over a non-standard port through a proxy.
- **<serviceId>** is the internal Service ID in the NetWitness Platform instance for the service to query against. The service ID can be represented only as an integer. You can see the relevant service ID from the url when accessing the investigation view within NetWitness Platform. This value will change based on the service being connected to for analysis.
- **<encoded query>** is the URL-encoded NetWitness Platform query. The length of query is limited by the HTML URL limitations.
- **<start date>** and **<end date>** define the date range for the query. The format is <yyyy-mm-dd>T<hh:mm>. The start and end dates are required. Relative ranges (for example, Last Hour) are not supported in this version. All times are run as UTC.

For example:
http://localhost:9191/investigation/12/navigate/query/alias%20exists/date/2012-09-01T00:00/2012-10-31T00:00

Examples

These are query examples where the NetWitness Server is 192.168.1.10 and the serviceID is identified as 2.

All activity on 03/12/2013 between 5:00 and 6:00 AM with a hostname registered

- Custom Pivot: alias.host exists
- https://192.168.1.10/investigation/2...13-03-12T06:00

All activity on 3/12/2013 between 5:00 and 5:10 PM with http traffic to and from IP address 10.10.10.3

- Custom Pivot: service=80 && (ip.src=10.10.10.3 || ip.dst=10.0.3.3)
- Encoded Pivot Dissected:
  - service=80 => service&3D80
  - ip.src=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3
  - ip.dst=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3
  - https://192.168.1.10/investigation/2...13-03-12T17:10

Additional Notes

Some values may not need to be encoded as part of the query. For example, commonly the IP src and dst is used for this integration point. If leveraging a third-party application for integration of this feature, it is possible to reference those without encoding applied.

FIPS Support

NetWitness Platform 11.x ships with FIPS-validated 140-2 Cryptographic Modules that support all cryptographic operations within NetWitness Platform. NetWitness Platform leverages two modules that support a level 3 design assurance:

- RSA BSAFE Crypto-J
- OpenSSL with BSAFE (OWB)

Both modules have been certified with an operational environment comparable to the standard NetWitness Platform configuration.

By default, the cryptographic modules enforce the usage of FIPS-certified cipher suites wherever possible. For exceptions, refer to the information below and to the release notes. For additional information about the FIPS modules, see http://csrc.nist.gov/groups/STM/cmvp/documents/140-1/140val-all.htm.

The RSA BSAFE Crtypo-J FIPS Certificate number is 2468 and the OWB FIPS Certificate is included in the RSA BSAFE Crypto-C Micro Edition with certificate number 2300.

In 11.x, FIPS is enabled on all services except Log Collector. This includes Log Decoder and Decoder if they were FIPS-enabled in 10.6.x or any previous version. FIPS cannot be disabled on any services except for Log Collector, Log Decoder and Decoder.

Note: For a fresh installation of 11.x, by default, all core services will be FIPS enforced except Log Collector and Log Decoder. FIPS cannot be disabled on any services except for Log Collector, Log Decoder and Network Decoder.

Note: For upgrades to 11.x from previous versions, the following conditions apply for the Log Collector, Log Decoder and Decoder services:
- Log Collector is not FIPS enabled after upgrading to 11.x, even if FIPS was enabled in a previous version. You must enable FIPS support after upgrading to 11.x. See the instructions in FIPS support for Log Collectors.
- If FIPS was enabled for the Log Decoder and Network Decoder services in a prevous version, FIPS will also be enabled in 11.x. However, if Log Decoder and Network Decoder were NOT FIPS enabled in a previous version, they will not be enabled in 11.x, and you can manually enable FIPS for these services if required. See the instructions in FIPS support for Log Decoders and Decoders.

FIPS support for Log Collectors

To enable FIPS for Log Collectors:

1. Stop the Log Collector service.
2. Open the `/etc/systemd/system/nwlogcollector.service.d/nwlogcollector-opts-managed.conf` file.
3. Change the value of the following variable to **off** as described here:
   `Environment="OWB_ALLOW_NON_FIPS=on"`
   to
   `Environment="OWB_ALLOW_NON_FIPS=off"`
4. Reload the system daemon by running the following command:
   `systemctl daemon-reload`
5. Restart the Log Collector service.
6. Set the FIPS mode for the Log Collector service in the UI :

   Note: This step is not required if you are upgrading from 10.6.x to 11.x and FIPS was enabled in 10.6.x.

   a. Go to **ADMIN** > **Services**.
   b. Select the Log Collector service and go to **View** > **Config**.
   c. In SSL FIPS Mode, select the checkbox under Config Value and click **Apply**.

FIPS support for Log Decoders and Decoders

To enable FIPS for Log Decoders and Decoders that did not have FIPS enabled in 10.6.x:

1. Go to **ADMIN** > **Services** and select a Log Decoder or Network Decoder service.
2. Select **View** > **Config**, and in **System Configuration**, enable **SSL FIPS Mode** by selecting the check box in the **Config Value** column.
3. Restart the service.
4. Click **Apply**.

Troubleshoot NetWitness Platform

For information about troubleshooting NetWitness Platform, see the following topics:

Debugging Information

NetWitness Platform Log Files

The following files contain NetWitness Platform log information.

Component	File
rabbitmq	/var/log/rabbitmq/nw@localhost.log /var/log/rabbitmq/nw@localhost-sasl.log
collectd	/var/log/messages
nwlogcollector	/var/log/messages
nwlogdecoder	/var/log/messages
sms	/opt/rsa/sms/wrapper.log
sms	/opt/rsa/sms/logs/sms.log
sms	/opt/rsa/sms/logs/audit/audit.log
NetWitness Platform	/var/lib/netwitness/uax/logs/nw.log
NetWitness Platform	/var/lib/netwitness/uax/logs/ audit/audit.log
NetWitness Platform	/opt/rsa/jetty9/logs

Files of Interest

The following files are used in key NetWitness Platform components, and can be useful when trying to track down miscellaneous issues.

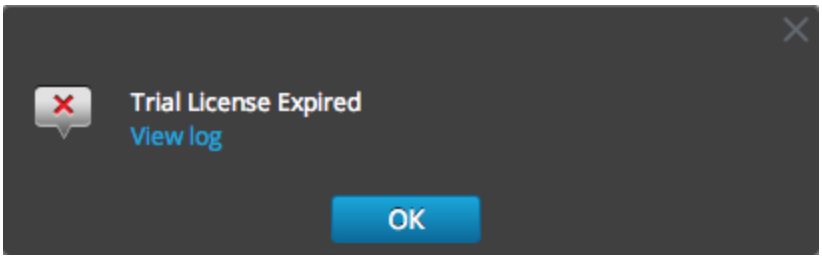
Component	File	Description
rabbit	/etc/rabbitmq/rabbitmq.config	RabbitMQ configuration file. This configuration file partially drives the behavior of RabbitMQ, particularly around network/SSL settings.
rabbit	/etc/rabbitmq/rabbitmq-env.conf	RabbitMQ environment configuration file. This file specifies the RabbitMQ node name and location of the enabled plugins file.
rabbit	/etc/rabbitmq/rsa_enabled_plugins	This file specifies the list of enabled plugins in RabbitMQ. This file is managed by the RabbitMQ server, via the rabbitmq-plugins command. This file overrides the /etc/rabbitmq/enabled_plugins path, in order to work around issues with upgrading the Log Collector from early versions.
rabbit	/etc/rabbitmq/ssl/truststore.pem	The RabbitMQ trust store. This file contains a sequence of PEM-encoded X.509 certificates, represented trust CAs. Any clients that connect to RabbitMQ and present a certificate that is signed by a CA in this list is considered a trusted client.

Component	File	Description
rabbit	/var/log/rabbitmq/mnesia/nw@localhost	The RabbitMQ Mnesia directory. Mnesia is the Erlang/OTP database technology, for storing Erlang objects persistently. RabbitMQ uses this technology for storing information such as the current set of policies, persistent exchanges and queues, and so forth. Importantly, the msg_store_persistent and msg_store_transient directories are where RabbitMQ stores messages that have been spooled to disk, e.g., if messages are published as persistent messages, or which have paged off to disk due to memory limitations. Keep a close eye on this directory, if the disk or memory alarms have tripped in RabbitMQ. **Caution:** Do not delete these files manually. Use RabbitMQ tools to purge or delete queues. Modifying these files manually may render your RabbitMQ instance inoperable.

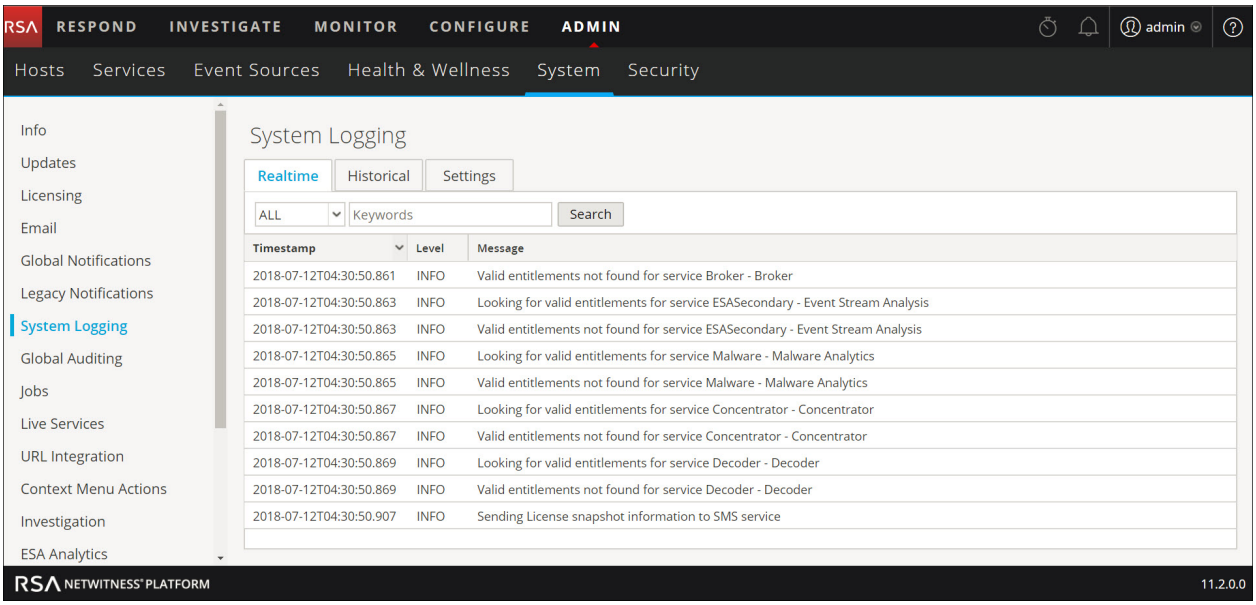
Error Notification

NetWitness Platform has a set of error message types associated with different components and operations. NetWitness Platform displays feedback in the form of a simple error notification and a log entry.

When an error notification dialog is displayed, you have two options: simply acknowledge the message or view the system log for more information.



If you want to view the system log for more information when an error notification is displayed, click **View log**. The log opens in the **ADMIN** > **System** view with a list of messages. Timestamp and message level are also listed.



Miscellaneous Tips

Audit Log Messages

It can be useful to see which user actions result in which log message types in the **/var/log/**messages file.

The event categories spreadsheet included in the log parser package in the NetWitness Platform Parser v2.0.zip archive lists the event categories and the event parser lines to help with building reports, alerts, and queries.

NwConsole for Health & Wellness

RSA has added a command option called **logParse** in **NwConsole**. This command option supports log parsing, a convenient way to check log parser without setting up the full system to do log parse. For more information about the **logParse** command, at the command line, type `help logParse`.

Thick Client Error: remote content device entry not found

Error: "*The remote content device entry was not found*," generated for a correlation rule applied to a concentrator.

Problem: in Investigation, if you click the `correlation-rule-name` meta value in the Alert meta key, you do not get session information.

Solution: Instead of using correlation rules on decoders and concentrators, use ESA rules. The ESA rules **do** record the correlation sessions that match the ESA rule.

View Example Parsers

Since flex and lua parsers are encrypted when they are delivered by Live, you cannot easily view their contents.

However, some plain text examples are available here: **https://community.emc.com/docs/DOC-41108**.

Configure WinRM Event Sources

The following Inside EMC article has a video that walks through the process of setting up Windows RM (Remote Management) collection: **https://inside.emc.com/docs/DOC-122732**.

Additionally, it contains two scripts that are shortcuts for procedures described in the "Windows Event Source Configuration Guide."

NwLogPlayer

NwLogPlayer is a utility that simulates syslog traffic. In the hosted environment, `NwLogPlayer.exe` is a command line utility located on the RSA NetWitness® Platform Client machine in the following directory:

```
C:\Program Files\NetWitness\NetWitness 9.8
```

NwLogPlayer is also located on the Log Decoder host in `/usr/bin`.

Usage

At the command line, type `nwlogplayer.exe -h` to list the available options, as reproduced here:

`--priority arg`	set log priority level
`-h [ --help ]`	show this message
`-f [ --file ] arg (=stdin)`	input message; defaults to **stdin**
`-d [dir ] arg`	input directory

`-s [ --server ] arg (=localhost)`	remote server; defaults to **localhost**
`-p [ --port ] arg (=514)`	remote port; defaults to **514**
`-r [ --raw ] arg (=0)`	Determines raw mode. • 0 = add priority mark (default) • 1= File contents will be copied line by line to the server. • 3 = auto detect • 4 = enVision stream • 5 = binary object
`-m [ --memory ] arg`	Speed test mode. Read up to 1 Megabyte of messages from the file content and replays.
`--rate arg`	Number of events per second. This argument has no effect if **rate** > eps that the program can achieve in continuous mode.
`--maxcnt arg`	maximum number of messages to be sent
`-c [ --multiconn ]`	multiple connection
`-t [ --time ] arg`	simulate time stamp time; format is `yyyy-m-d-hh:mm:ss`
`-v [ --verbose ]`	If **true**, output is verbose
`--ip arg`	simulate an IP tag
`--ssl`	use SSL to connect
`--certdir arg`	OpenSSL certificate authority directory
`--clientcert arg`	use this PEM-encoded SSL client certificate
`--udp`	send in UDP

Troubleshoot Feeds

Overview

The purpose of the feed generator is to generate a mapping of an event source to the list of groups to which it belongs.

If you have an event source from which you are collecting messages, and yet it is not displayed in the correct event source groups, then this topic provides background and information to help you track down the problem.

Details

The ESM Feed maps multiple keys to single value. It maps the DeviceAddress, Forwarder, and DeviceType attributes to groupName.

The purpose of the ESM feed is to enrich event source Meta with the groupName collected on the Log Decoder.

How it Works

The feed generator is scheduled to update every minute. However, it is triggered only if there are any changes (create, update, or delete) in event sources or groups.

It generates a single feed file with event source to group mapping, and pushes the same feed to all of the Log Decoders that are connected to NetWitness Platform.

Once the feed file is uploaded on the Log Decoders, for any new events, it enriches events Meta data with groupName, and appends this groupName to logstats.

Once the groupName is in logstats, the ESM Aggregator groups information and sends it to ESM. At this point, you should see the **Group Name** column under the **Event Source Monitoring** tab.

The entire process can take some time. Therefore, you may need to wait for several seconds after you add a new group or event source, before the Group name is displayed.

Note: If the event source type attribute changes when the feed is updated, NetWitness Platform adds a new logstats entry, rather than updating the existing one. Thus, there will be two different logstats entries in logdecoder. Previously existing messages would have been listed under the previous type, and all new messages are logged for the new event source type.

Feed File

The format of the feed file is as follows:

```
DeviceAddress, Forwarder, DeviceType, GroupName
```

The `DeviceAddress` is either `ipv4`, `ipv6`, or `hostname`, depending on which of these have been defined for the event source.

The following is a sample of the feed file:

```
"12.12.12.12","d6","NETFLOW","grp1"
"12.12.12.12","ld4","netflow","grp1"
"12.12.12.12","d6","netfow","grp1"
"0:E:507:E6:D4DB:E:59C:A","10.25.50.243","apache","Apachegrp"
"1.2.3.4","LCC","apache","Apachegrp"
"10.100.33.234","LC1","apache","Apachegrp"
"10.25.50.248","10.25.50.242","apache","Apachegrp"
"10.25.50.251","10.25.50.241","apache","Apachegrp"
"10.25.50.252","10.25.50.255","apache","Apachegrp"
"10.25.50.253","10.25.50.251","apache","Apachegrp"
"10.25.50.254","10.25.50.230","apache","Apachegrp"
"10.25.50.255","10.25.50.254","apache","Apachegrp"
"13.13.13.13","LC1","apache","Apachegrp"
"AB:F255:9:8:6C88:EEC:44CE:7",,"apache","Apachegrp"
"Appliance1234",,"apache","Apachegrp"
"CB:F255:9:8:6C88:EEC:44CE:7","10.25.50.253","apache","Apachegrp"
```

Troubleshooting

You can check the following items to narrow down where the problem is occurring.

Feed File Existence

Verify that the feeds ZIP archive exists in the following location:

`/opt/rsa/sms/esmfeed.zip`

Do not modify this file.

Group Meta Populated on LD

Verify that the group meta is populated on the Log Decoder. Navigate to the Log Decoder REST and check logstats:

`http://LogDecoderIP:50102/decoder?msg=logStats&force-content-type=text/plain`

This is a sample logstats file with group information:

```
device=apache  forwarder=NWAPPLIANCE10304  source=1.2.3.4  count=338
lastSeenTime=2015-Feb-04 22:30:19  lastUpdatedTime=2015-Feb-04 22:30:19
groups=IP1234Group,apacheGroup
device=apachetomcat  forwarder=NWAPPLIANCE10304  source=5.6.7.8  count=1301
```

```
lastSeenTime=2015-Feb-04 22:30:19  lastUpdatedTime=2015-Feb-04 22:30:19
groups=AllOtherGroup,ApacheTomcatGroup
```

In the above text, the group information is **bold**.

Device Group Meta on Concentrator

Verify that the **Device Group** meta exists on the Concentrator, and that events have values for the `device.group` field.

SMS Log File

Check the SMS log file in the following location to view informational and error messages: `/opt/rsa/sms/logs/sms.log`

The following are example informational messages:

```
Feed generator triggered...
Created CSV feed file.
Created zip feed file.
Pushed ESM Feed to LogDeocder : <logdecoder IP>
```

The following are example error messages:

```
Error creating CSV File : <reason>Unable to push the ESM Feed: Unable to
create feed zip archive.
Failed to add Group in CSV: GroupName: <groupName> : Error: <error>
Unable to push the ESM Feed: CSV file is empty, make sure you have al-least on
group with al-least one eventsource.
Unable to push the ESM Feed: No LogDecoders found.
```

```
Unable to push the ESM Feed: Unable to push feed file on LogDecoder-
<logdecoderIP>Unable to push the ESM Feed:
admin@<logdecoderIP>:50002/decoder/parsers received error: The zip archive
"/etc/netwitness/ng/upload/<esmfeedfileName>.zip" could not be opened
Unable to push the ESM Feed: <reason>
```

Verify Logstats data is getting Read & Published by ESMReader & ESMAggregator

These are the steps to verify that logstats are collected by **collectd** and published to Event Source Management.

ESMReader

1. On LogDecoders add **debug "true"** flag in **/etc/collectd.d/NwLogDecoder_ESM.conf**:

```
#
# Copyright (c) 2014 RSA The Security Division of EMC
#
<Plugin generic_cpp> PluginModulePath "/usr/lib64/collectd"
    debug "true"
    <Module "NgEsmReader" "all"> port "56002"
        ssl       "yes"
        keypath   "/var/lib/puppet/ssl/private_keys/d4c6dcd4-6737-4838-
a2f7-ba7e9a165aae.pem"
        certpath  "/var/lib/puppet/ssl/certs/d4c6dcd4-6737-4838-a2f7-
ba7e9a165aae.pem"
        interval  "600"
        query     "all"
        <stats></stats></Module><Module "NgEsmReader" "update"> port
"56002" ssl "yes"
        keypath   "/var/lib/puppet/ssl/private_keys/d4c6dcd4-6737-4838-
a2f7-ba7e9a165aae.pem"
        certpath  "/var/lib/puppet/ssl/certs/d4c6dcd4-6737-4838-a2f7-
ba7e9a165aae.pem"
        interval  "60"
        query     "update"
        <stats></stats></Module></Plugin>
```

2. Run the command:

```
collectd service restart
```

3. Run the following command:
   `tail –f /var/log/messages | grep collectd`
   Verify that ESMReader is reading logstats and there are no errors. If there are any read issues, you will see errors similar to the following:

```
Apr 29 18:47:45 NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_all:
error getting ESM data for field "groups" from logstat device=checkpointfw1
forwarder=PSRTEST source=1.11.51.212. Reason: <reason>Apr 29 18:58:36
NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_update: error getting ESM
data for field "forwarder" from logstat device=apachetomcat
source=10.31.204.240. Reason: <reason>
```

ESMAggregator

1. On NetWitness Platform, uncomment the verbose flag in **/etc/collectd.d/ESMAggregator.conf**:

```
# ESMAggregator module collectd.conf configuration file
#
# Copyright (c) 2014 RSA The Security Divsion of EMC
#

<Plugin generic_cpp>    PluginModulePath "/usr/lib64/collectd"

<Module "ESMAggregator">
        verbose 1
        interval "60"
        cache_save_interval "600"
        persistence_dir "/var/lib/netwitness/collectd"
</Module>    </Plugin>
```

2. Run the following:
   `collectd service restart.`
3. Run the following command:
   `run “tail –f /var/log/messages | grep ESMA`
   Look for for ESMAggregator data and make sure your logstat entry is available in logs.

Sample output:

```
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[0]
logdecoder[0] = d4c6dcd4-6737-4838-a2f7-ba7e9a165aae
```

```
Mar  1 02:32:08 NWAPPLIANCE15936 collectd[11203]: ESMAggregator: MetaData[1]

RRD stat NWAPPLIANCE15788/esma_rrd-cacheflowelff/esm_counter-3.3.3.3 with a
value of 1752 for NWAPPLIANCE15788/cacheflowelff/esm_counter-3.3.3.3
aggregated from 1 log
```

Configure JMX Feed Generator Job Interval

Although the feed generation job is scheduled to execute every minute by default, you can change this by using `jconsole`, if necessary.

To change the feed generator job interval:

1. Open **jconsole** for the SMS service.
2. On the MBeans tab, navigate to **com.rsa.netwitness.sms** > **API** > **esmConfiguration** > **Attributes**.
3. Modify the value for the property **FeedGeneratorJobIntervalInMinutes**.

4. Go to **Operations** under the same navigation tree, an click **commit()**. This persists the new value in the corresponding json file under **/opt/rsa/sms/conf**, and uses the value if SMS is restarted.

Setting a new value reschedules the feed generator job for the new interval.

References

This section describes the NetWitness Platform user interface views in which you can perform system maintenance tasks. You use this interface to:

- Monitor and maintain services (settings, statistics, command and message syntax, REST API, RSA Console utility, and protocols supported in NetWitness Platform).
- Display the current NetWitness Platform version and license status.
- Manage your Local Update Repository from which you apply software version updates to hosts.

The following topics describe each interface in detail:

- Health and Wellness View
- System View - System Info Panel

Health and Wellness View

The Health and Wellness settings allow you to set and view alarms, monitor events, and view policies and system statistics. For more details on each of these, see the following topics:

- Health and Wellness View - Alarms View
- Event Source Monitoring View
- Health and Wellness Historical Graphs
- Health and Wellness Settings View - Archiver
- Health and Wellness Settings View - Event Sources
- Health and Wellness Settings View - Warehouse Connector
- Monitoring View
- Policies View
- System Stats Browser View

Health and Wellness View - Alarms View

You can monitor hosts and services to determine when user-defined limitations have been reached by viewing all the active alarms. Policy rules, that you define or assign to hosts and services, in the **Policies tab** trigger these alarms. You can:

- View all the alarms that are currently active for all your systems and services
- Select an alarm and view its details

What do you want to do?

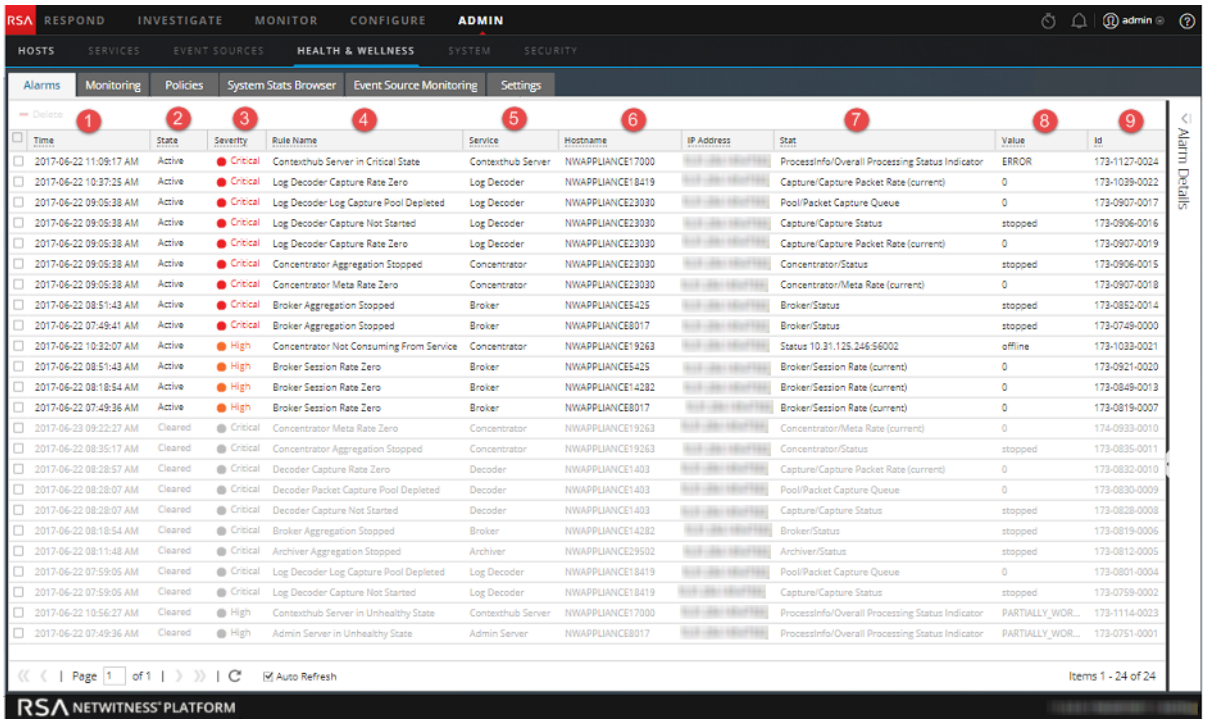
Role	I want to ...	Show me how
Administrator	View the alarm status of NetWitness Servers and services.	Monitor Alarms
Administrator	View detailed information about a specific alarm.	Monitor Alarms

Related Topics

Manage Policies

Quick Look

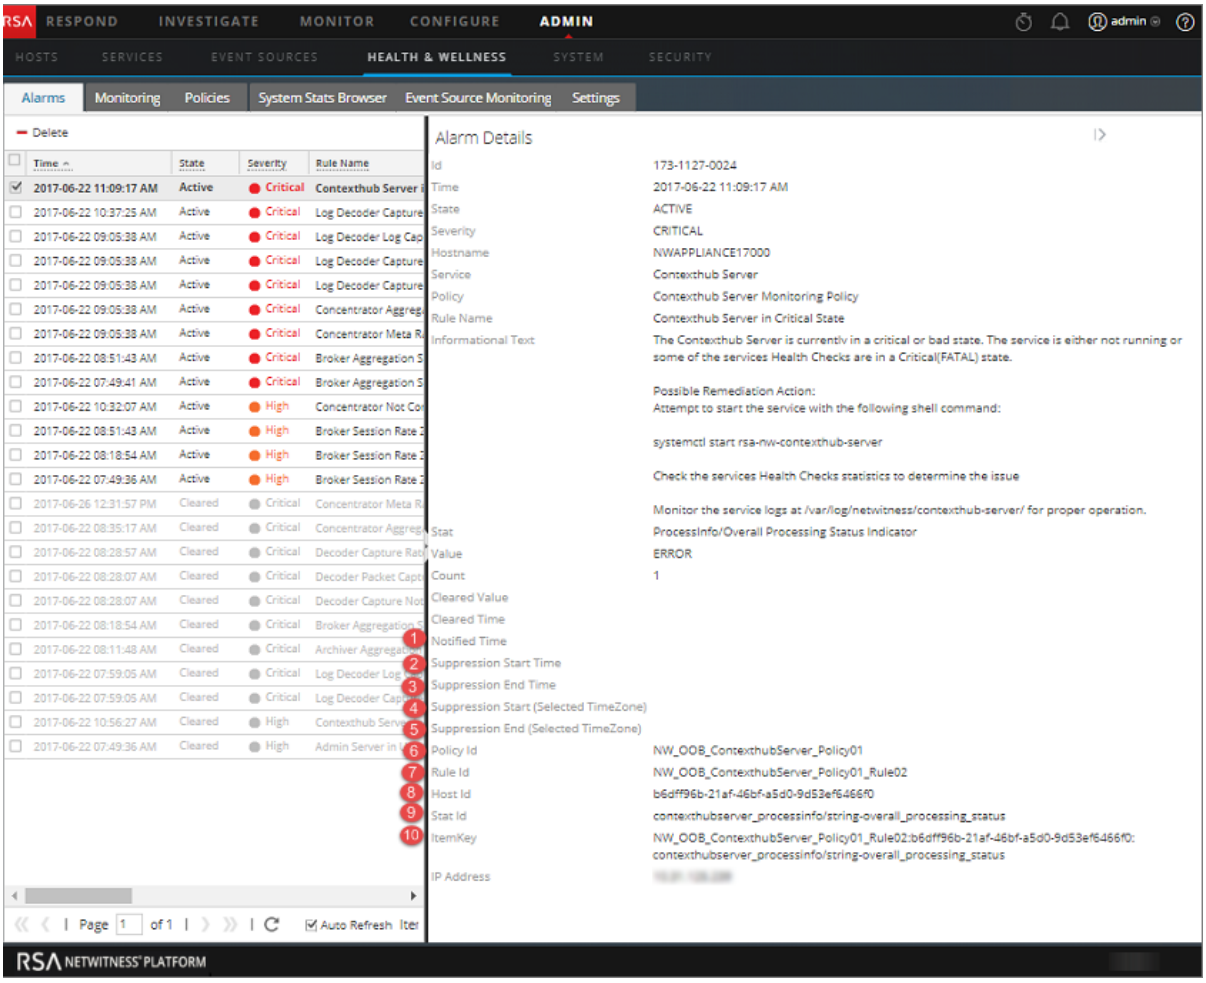
The required permission to access this view is **Manage services**. To access the Alarms view, go to **Admin** > **Health & Wellness**. The Health & Wellness view opens with the Alarms tab displayed. The Alarms tab contains an alarms list and an Alarm Details panel.



1	Time when the alarm was triggered.
2	Status of the alarm: • **Active** - the statistical threshold was crossed triggering the alarm. • **Cleared** - the clearing threshold was crossed and the alarm is no longer active.
3	Severity assigned to this alarm: • **Critical** • **High** • **Medium** • **Low**
4	Name of the rule that triggers the alarm.
5	Service defined in the rule.
6	Host on which the alarm is triggered.
7	Statistic selected in the rule that triggers the alarm.
8	Value of the statistic that triggered the alarm.
9	Identification number of the alarm.

Note: NetWitness Platform sorts the alarms in time order. You can sort the relevant parameters in ascending or descending order.

This figure shows the Alarms tab with the Alarm Details panel expanded.



Alarm Details Panel

The Alarm Details panel displays information for the alarm selected in the Alarms list. It contains all the information in the Alarms list plus the following fields.

1	Alarm Notified time
2	Suppression start time
3	Suppression end time
4	Suppression start (selected time zone)
5	Suppression end (selected time zone)
6	The Policy ID

7 The Rule ID

8 The Host ID

9 The Stat ID

Event Source Monitoring View

Note: To manage Event Sources, see "About Event Source Management" in the *NetWitness Platform Event Source Management Guide*.

NetWitness Platform provides a way to monitor the statistics for various event sources in the User Interface. The information displayed is historical and comes from the Log decoder. You can customize the view depending on the parameter you select to filter the data.

To access the Event Source Monitoring view:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Click **Event Source Monitoring**.

What do you want to do?

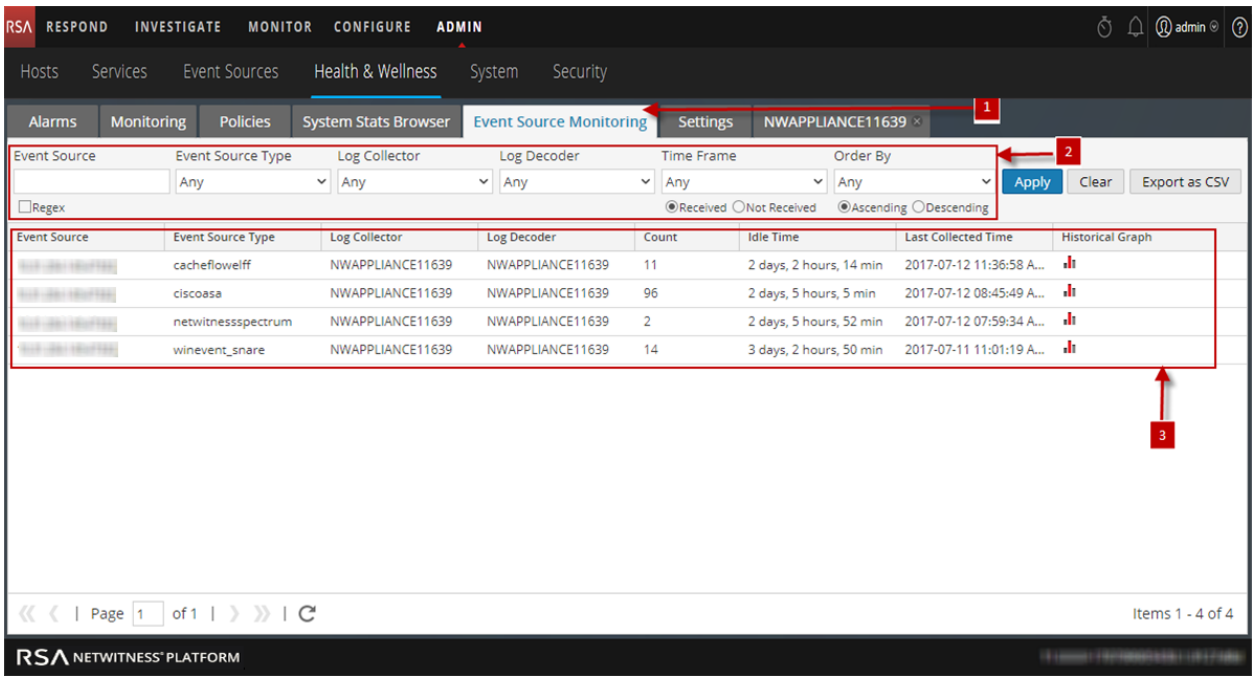
Role	I want to ...	Show me how
Administrator	View the Events Collected from an Event Source	Historical Graph View for Events Collected from an Event Source

Related Topics

- Monitor Event Sources
- Filter Event Sources
- View Historical Graph of Events Collected for an Event Source

Quick Look

The Event Source Monitoring view is displayed.



1 Displays Event Source Monitoring tab.

2 Toolbar used to filter and customize the Event Source Monitoring tab.

3 Displays Event Source Stats panel.

Filters

This table lists the various parameters you can use to filter and customize the event source monitoring view.

Parameter	Description
Event Source	Type the name of an event source you want to monitor. Select Regex to enable Regex filter. It performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching.
Event Source Type	Select an event source type for the event source selected.
Log Collector	Select the Log Collector to display the data collected by the specified Log Collector.

Parameter	Description
Log Decoder	Select a Log Decoder to display the data collected by the specified Log Decoder.
Time Frame	Select the time frame for which you want the stats. Select **Received** if you need the query results to contain only event sources that logs have been received from within the selected time. or Select **Not Received** if you need the query results to contain only event sources that logs have not been received from within the selected time
Order By	Select the order in which the list needs to be filtered. Select Ascending to filter it in an ascending order.
Apply	Click to apply the filters chosen and display the list accordingly.
Clear	Click to clear the chosen filters.
Export as CSV	Click to export the information as a csv file.

Event Source Stats View Display

Parameter	Description
Event Source	Displays the name of the event source.
Event Source Type	Displays the event source type.
Log Collector	Displays the Log Collector from where the events were initially captured.
Log Decoder	Displays the Log Decoder where the events are being processed.
Count	Displays the number of events received by Log Decoder since last reset of count value.
Idle Time	Displays the time lapsed after the last stat collection.

Parameter	Description
Last Collected Time	Displays the time at which the Log Decoder last processed an event for the event source
Historical Graph	Click  to view the historical graph of the stats collected for the event source.

Health and Wellness Historical Graphs

Configuring the Archiver monitoring enables you to automatically generate notification when critical thresholds concerning Archiver aggregation and storage have been met. The Historical Graph view provides a visualization of historical data.

Note: Historical graphs are not available for non-numeric statistics, and is indicated by a greyed out icon.

See the following topics for more details:

- Historical Graph View for Events Collected from an Event Source
- Historical Graph for System Stats

Historical Graph View for Events Collected from an Event Source

The Historical Graph view for events collected from an event source provides a visualization of historical data. To access this view:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Monitoring tab open.

2. Click **Event Source Monitoring**.

   The Event Source Monitoring view is displayed.

3. In the **Historical Graph** column, select  .

   The Historical graph for the selected event source type is displayed in a popup window.

The figure displays the events collected from the event source type **winevent_snare**.

You can customize the graph as required. The table lists the various parameters used to customize the historical graph.

Parameter	Description
Time Frame	Select the Time Frame for which you want to view the historical data. The available options are: Current Day, Current, Week, Current Month.
From <date> To <date>	Select the date range for which you want to view the historical data.

You can zoom in for a detailed view of the data in the Historical graph.

Zoom In Function 1 and 2

You can select one of the values to view the historical data for the selected value. The figure below displays an example for the 6h frame selected for zoom in. The slider bar at the right bottom corner is also changed to a 6h window.

Alternatively, you can slide the bar in the right hand corner to zoom in to a required frame.

Zoom In Function 3

You can click and drag in the plot area to zoom in for a required frame of time.

Historical Graph for System Stats

To access the Historical Graph for the System Stats:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

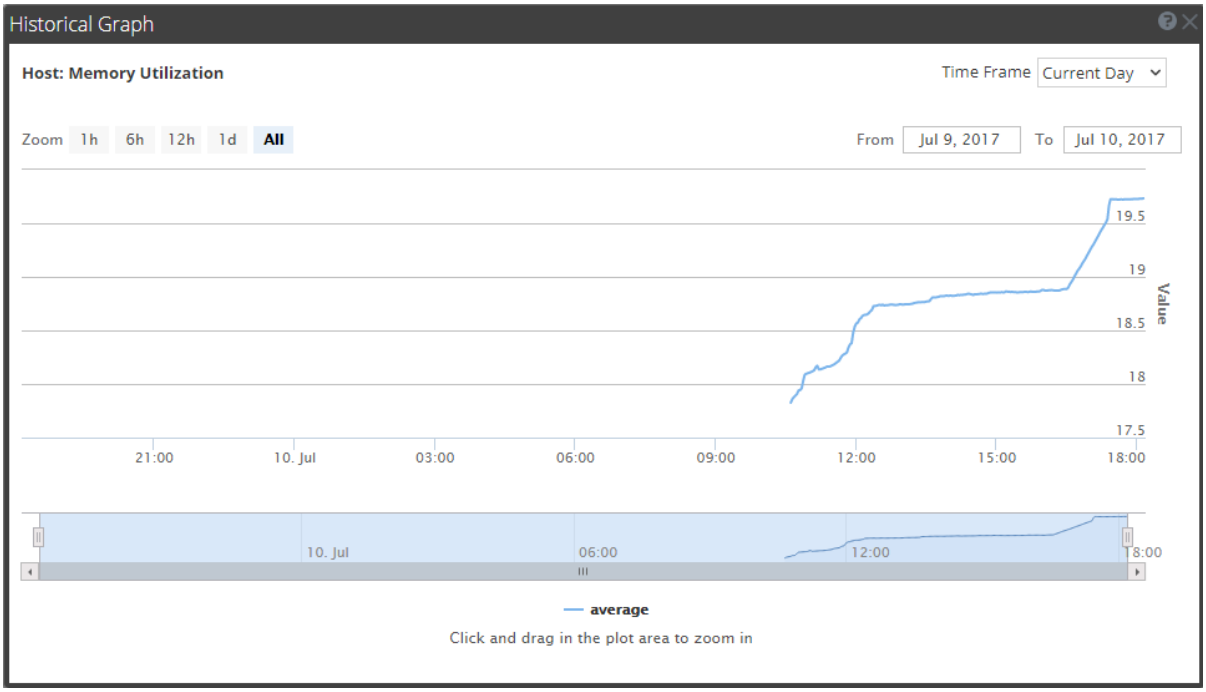
2. Click the **System Stats Browser** tab.

   The System Stats Browser tab is displayed.

3. In the **Historical Graph** column, select .

   The Historical graph for the selected statistic for a host is displayed.

   The figure displays the system stats view for the Memory Utilization statistics.



Parameters

You can customize the graph view as required. The table lists the various parameters used to customize the historical graph view.

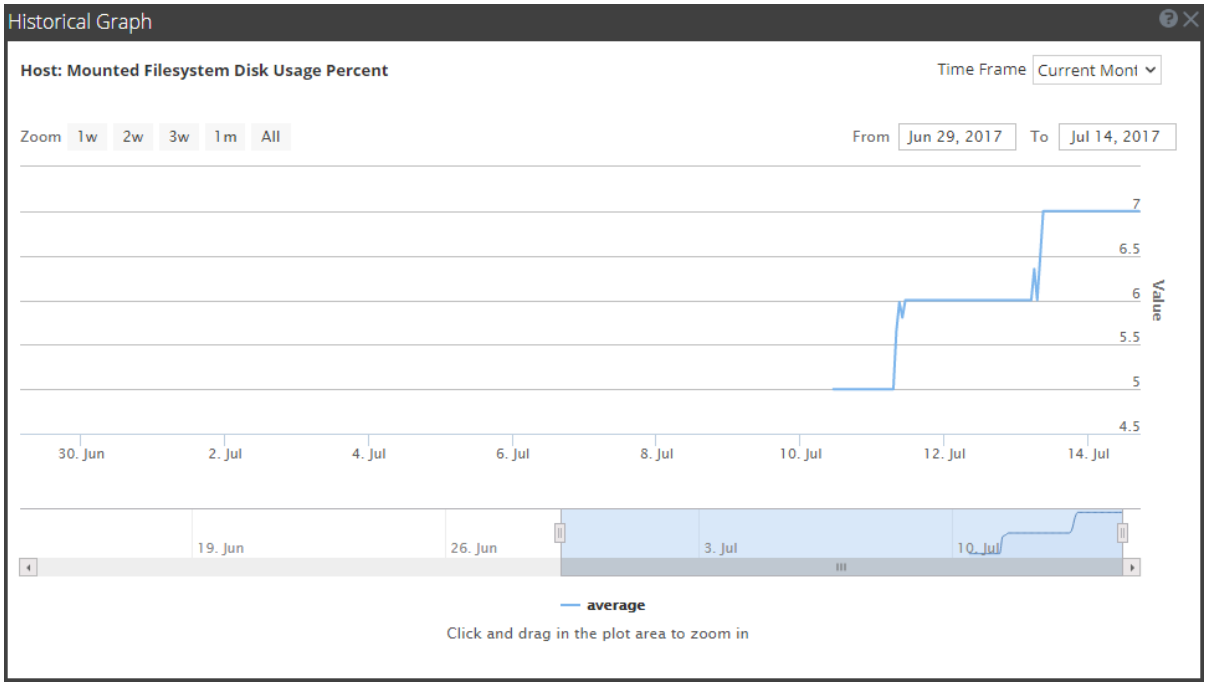
Parameter	Description
Time Frame	Select the time frame for which you want to view the historical data. The available options are: **Current Day**, **Current Week**, **Current Month**, and **Current Year**.
From <date> To <date>	Select the date range for which you want to view the historical data,

You can zoom in for a detailed view of the data in the Historical graph.

Zoom in function 1 and 2:

You can select one of the values to view the historical data for the selected value. The figure below displays an example for the 6h frame selected for zoom in. The slider bar at the right bottom corner is also changed to a 6h window.

Alternatively, you can slide the bar in the right hand corner to zoom in to a required frame.



Zoom in function 3:

You can click and drag in the plot area to zoom in for a required frame of time.

The figure below displays an example of how the graph appears while you click and drag.

Health and Wellness Settings View - Archiver

Note: To monitor Archiver and Warehouse Connector, see Health Policy.

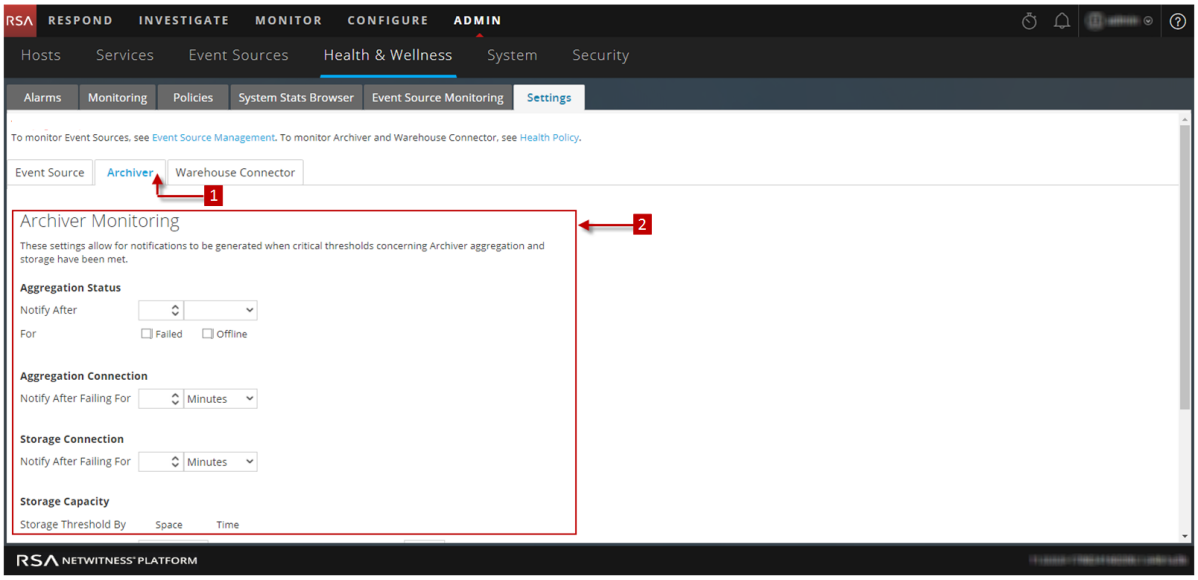
To access the Archiver Monitoring view:

1. Go to **Administration > Health & Wellness**.
2. Select **Settings > Archiver**.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Monitor service details of Archiver	Monitor Service Details

Quick Look



1	Displays Archiver Monitoring Panel
2	Configure Archiver Monitoring Panel to automatically receive notification

Features

The following table lists the parameters required to configure the Archiver to automatically generate notification when critical thresholds are reached.

Parameter	Value	Description
Aggregation Status	Notify After	Number of minutes or hours after which the you will get notified of the Aggregation status
	For	Failed - If enabled, you get notification when the Archiver aggregation status is failed for the defined number of minutes or hours. Offline - If enabled, you get a notification when the Archiver aggregation status is offline for the defined number of minutes or hours
Aggregation Connection	Notify After Failing for	Number of minutes or hours after which you will receive a notification if the Archiver aggregation connection fails.
Storage Connection	Notify After Failing for	Number of minutes or hours after which you will receive a notification if the Archiver storage connection fails.
Storage Capacity	Storage Threshold By	Select **Space**, if you want to receive a notification when the Archiver storage capacity exceeds the percentage defined in the **When Storage Size Is** field. Select **Time**, if you want to receive a notification when the files stored in the Archiver exceeds the defined number of days in the **When Oldest Storage File Is** field
	When Storage Size Is	Enter what percent full the storage size should be if you want to receive a notification.
	When Warm Storage Size Is	Enter what percent full the warm storage size should be if want to receive a notification.

Parameter	Value	Description
Notification Type	Configure email or distribution list	Click to configure email so that you can receive notifications in NetWitness Platform.
	Configure Syslog and SNMP Trap servers	Click to configure audit logs.
	NW Console, Email, Syslog Notification, SNMP Trap Notification	Enable NW Console to get notifications on the NetWitness Platform UI notification toolbar. Enable Email to get email notifications. Enable Syslog Notification to generate syslog events. Enable SNMP Trap Notification to get audit events as SNMP traps.

Health and Wellness Settings View - Event Sources

Note: To manage Event Sources, see "About Event Source Management" in the *RSA NetWitness Platform Event Source Management Guide*.

The Event Source Monitoring view consists of the Event Source panel, Add/Edit Source Monitor dialog, Decommission panel, and the Decommission dialog. You use the view to configure:

- When to generate notifications for event sources from which the Log Collector is no longer receiving logs.
- Where to send those notifications.
- When to decommission a Log Collector when a Remote Collector and the Local Collector fails over to a standby Log Decoder.

The required role to access this view is **Manage NW Auditing**. To access this view:

1. Go to **Admin > Health & Wellness**.
2. Select **Settings > Event Source**.

What do you want to do?

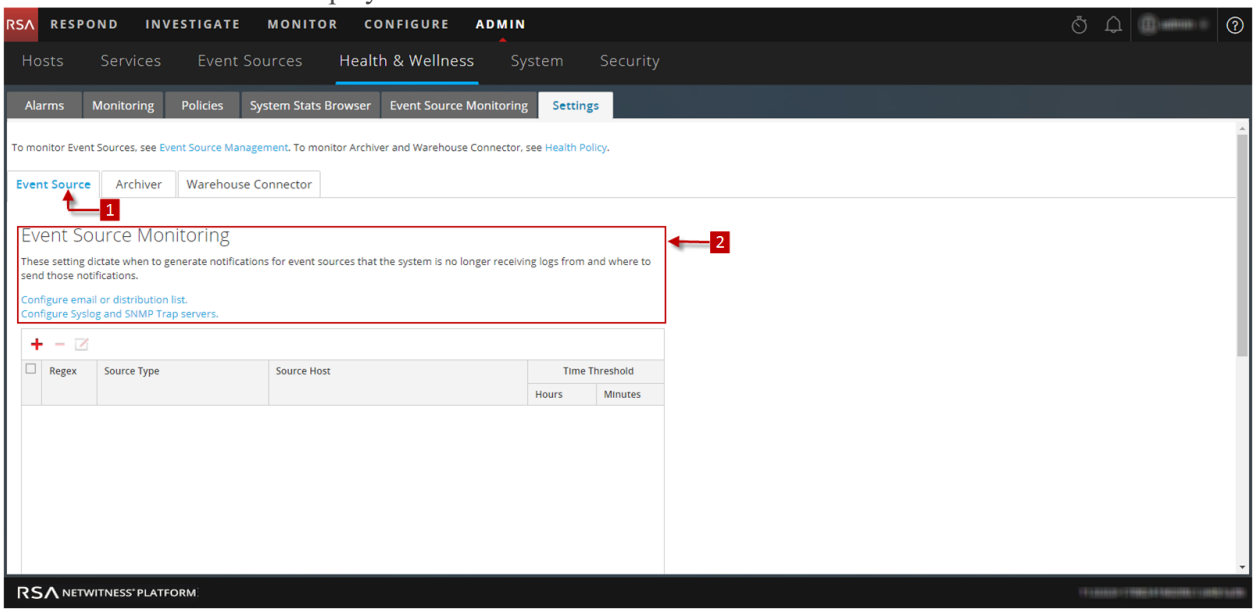
Role	I want to ...	Show me how
Administrator	View the functionality of Event Source Monitoring	Monitor Event Sources

Related Topics

Configure Event Source Monitoring

Quick Look

The Event Source tab is displayed.



1	Displays Event Source Monitoring Panel
2	Configure Event Source Monitoring Panel to receive notification

Event Source Monitoring Panel

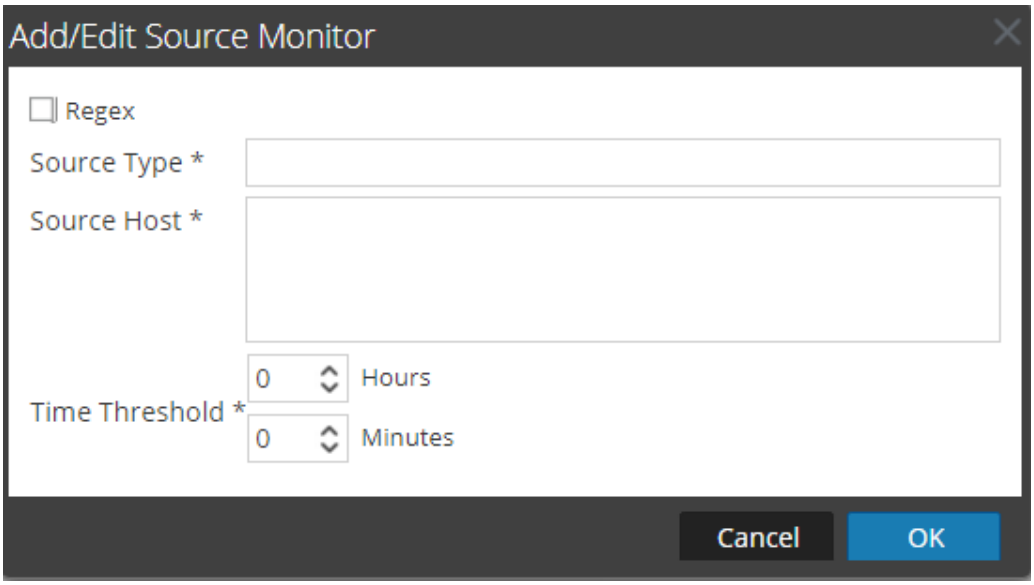
Feature	Description
Configure email or distribution list.	Opens the **Administration** > **System** > **Email view** so you can adjust the email distribution for the Event Source Monitoring output, if necessary.
Configure Syslog and SNMP Trap servers.	Opens the **Administration** > **System** > **Auditing view** so you can adjust the Syslog and SNMP trap distribution for the Event Source Monitoring output, if necessary.
+	Displays the Add/Edit Source Monitor dialog in which you add or modify event sources to monitor.
−	Deletes the selected event sources from monitoring.
☐	Selects an event source.

Feature	Description
Source Type	Displays the source type of the event source.
Source Host	Displays the source host of the event source.
Time Threshold	Displays the time period after which NetWitness Platform stops sending notifications (Time Threshold).
Apply	Applies any additions, deletions, or changes and they become effective immediately.
Cancel	Cancels any additions, deletion, or changes.

Decommission Panel

Feature	Description
	Displays the Decommission dialog in which you add or modify event sources to decommission.
	Deletes the selected event sources from decommissioning.
	Selects an event source.
Regex	Displays if you choose to use regular expressions
Source Type	Displays the source type of the decommissioned event source.
Source Host	Displays the source host of the decommissioned event source.
Apply	Applies any additions, deletions, or changes and they become effective immediately.
Cancel	Cancels any additions, deletions, or changes.

Add/Edit Source Monitor Dialog



In **Add/Edit Source Monitor** dialog, you add or modify the the event sources that you want to monitor. The two parameters that identify an event source are **Source Type** and **Source Host**. You can use **globbing** (pattern matching and wildcard characters) to specify the Source Type and Source Host of event sources as shown in the following example:

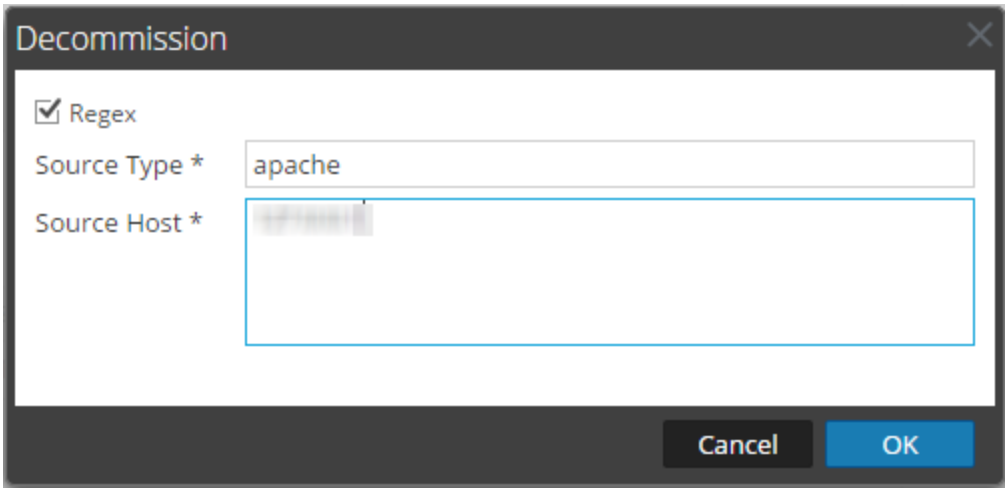
Source Type	Source Host
ciscopix	**1.1.1.1**
*	**1.1.1.1**
*	*
*	**1.1.1.1|1.1.1.2**
*	**1.1.1.[1|2]**
*	**1.1.1.[123]**
*	**1.1.1.[0-9]**
*	**1.1.1.11[0-5]**
*	**1.1.1.1,1.1.1.2**
*	**1.1.1.[0-9]|1.1.1.11[0-5]**

Source Type	Source Host
*	**1.1.1.[0-9]|1.1.1.11[0-5],10.31.204.20**
*	**1.1.1.***
*	**1.1.1.[0-9]{1,3}**

Features

Feature	Description
Regex	Select the checkbox if you want to use regular expressions
Source Type	The source type of the event source. You must use the value that you configured for the event source in the **Event Sources** tab of the **Administration** > **Services** > Log Collector service > **View** > **Config** view.
Source Host	Hostname or IP address of the event source. You must use the value that you configured for the event source in the **Event Sources** tab of the **Administration** > **Services** > Log Collector device > **View** > **Config** view.
Time Threshold	The time period after which NetWitness Platform starts sending notifications.
Cancel	Closes the dialog without adding the event source, or changes to the event source, to the Event Source Monitoring panel.
OK	Adds the event source to the Event Source Monitoring panel.

Decommission Dialog



Feature	Description
Source Type	The source type of the event source. You must use the value that you configured for the event source in the **Event Sources** tab of the **Administration** > **Services** > Log Collector device > **View** > **Config** view.
Source Host	Hostname or IP address of the event source. You must use the value that you configured for the event source in the **Event Sources** tab of the **Administration** > **Services** > Log Collector service > **View** > **Config** view.
Cancel	Closes the dialog without applying any event source additions, deletions, or changes to the Decommissioning panel.
OK	Applies any event source additions, deletions, or changes to the Decommissioning panel.

Health and Wellness Settings View - Warehouse Connector

Note: To monitor Archiver and Warehouse Connector, see "Health Policy".

Configuring the Warehouse Connector monitoring enables you to automatically generate notification when critical thresholds concerning Warehouse Connector and storage have been met.

Access the Warehouse Connector Monitoring view

1. Go to **Admin > Health & Wellness**.
2. Select **Settings > Warehouse Connector**.

What do you want to do?

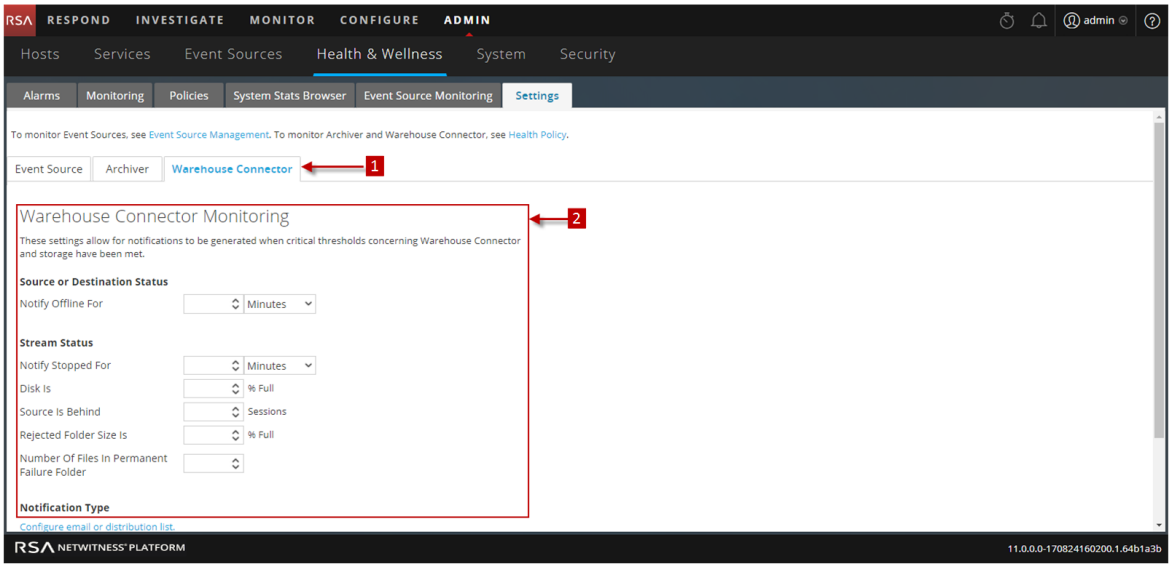
Role	I want to ...	Show me how
Administrator	View the details of Warehouse connector	Warehouse Connector Details View

Related topics

Monitor Service Details

Quick Look

The Warehouse Connector Monitoring view is displayed.



1	Displays Warehouse Connector Monitoring view Panel
2	Allows to configure Warehouse Connector Monitoring parameters

Warehouse Connector Monitoring parameters

The following table lists the parameters required to configure the Warehouse Connector to automatically generate notification when critical thresholds are reached.

Parameter	Value	Description
Source or Destination Status	Notify Offline For	Number of minutes or hours after which the you will receive a notification if the source or destination connection fails.
Stream Status	Notify Stopped For	Number of minutes or hours after which you would like to receive a notification when the Stream goes offline.
	Disk Is	The limit on the percentage of disk usage after which you would like to receive a notification.
	Source Is Behind	Number of sessions after which a notification is raised if the source goes behind the defined number of sessions.
	Rejected Folder Size Is	Limit on the percentage of folder usage after which you would like to receive a notification.
	Number Of Files in Permanent Failure Folder	Limit on the number of files in the permanent failure folder after which you would like to receive a notification.
Notification Type	Configure email or distribution list	Click to configure email so that you can receive notifications in NetWitness Platform.
	Configure Syslog and SNMP Trap servers	Click to configure audit logs.
	NW Console, Email, Syslog Notification, SNMP Trap Notification	Enable NW Console to get notifications on the NetWitness Platform UI notification toolbar. Enable Email to get email notifications. Enable Syslog Notification to generate syslog events. Enable SNMP Trap Notification to get audit events as SNMP traps.

Monitoring View

NetWitness Platform provides detailed statistics and other information about the host and the individual NetWitness Platform services on Details views. You can view the current health of all the hosts, services running on the hosts, various aspects of the hosts' health, host details and service details in the Monitoring view.

To access this view:

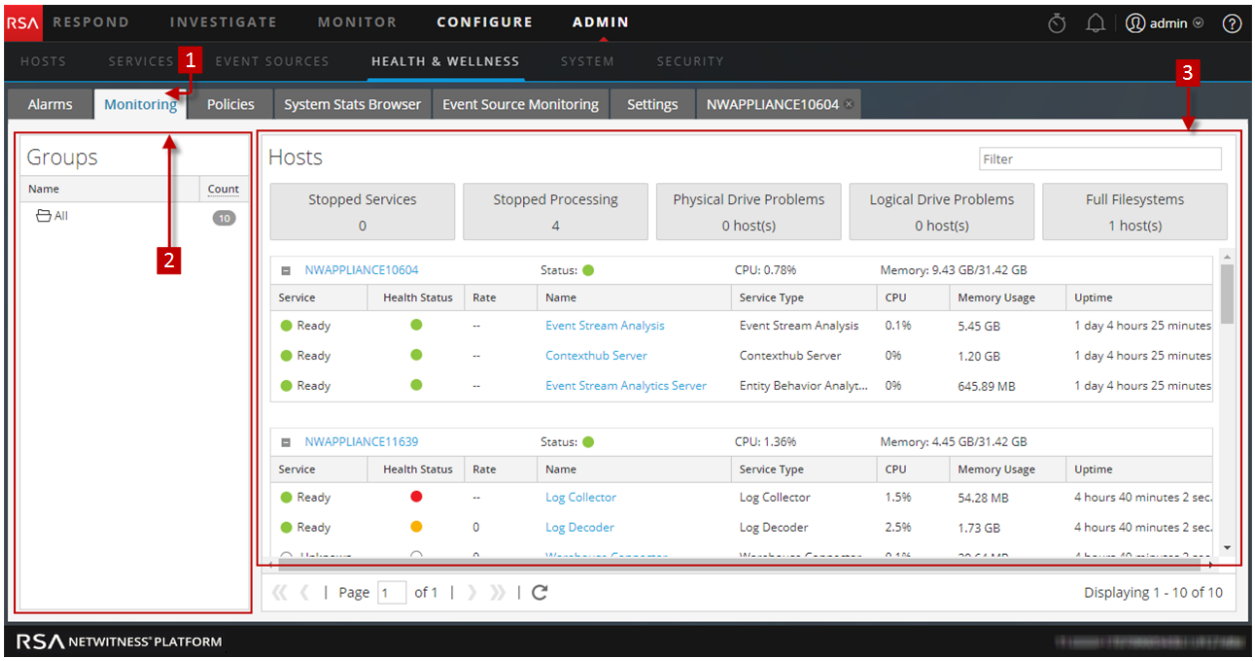
1. Go to **ADMIN > Health & Wellness**.
2. Click the **Monitoring** tab.

What do you want to do?

Role	I want to ...	Show me how
Administrator	View and Perform Procedures	Monitor Hosts and Services

Quick Look

The Monitoring view is displayed.



1	Displays Monitoring tab.
2	Group Panel to select a Group.
3	Hosts panel displays operational statistics.

Groups Panel

The Groups panel lists all the groups of hosts available. When you select a group, the associated content is displayed in the Hosts panel.

Note: If the total host **Count** in the **Groups** panel is lower than the actual number of hosts displayed in the **Hosts** panel, please refer to the Troubleshooting Health & Wellness topic for possible causes of this issue and recommended solutions.

Hosts Panel

The Hosts panel displays operational statistics for hosts and the services running on each host.

Parameter	Description
Filter	Type a host name or a service name in the Filter field to display the corresponding hosts and services in the Host panel.
Stopped Services	Click **Stopped Services** to display a list of all stopped services. It also displays the host on which the service is installed.
Stopped Processing	Click **Stopped Processing** to display a list of all the hosts that have services installed on them that are in the stopped processing status.
Physical drive Problems <#> host(s)	Click to view the hosts that have physical drive problems.
Logical Drive Problems <#> host(s)	Click to view the hosts that have logical drive problems.
Full Filesystems <#> host(s)	Click to view the hosts that have full file systems.

Note: The summary information in the boxes at the top displays the System Statistics for all the hosts configured in NetWitness Platform and does not change with host of filters on groups.

The top panel is followed by a list of hosts, the services installed on them and information regarding the hosts and services.

Parameter	Description
Host Name	Displays the host name. If a host has services installed you will see a ⊞ prefixed to the host name. Click ⊞ to view all the services installed on the host.
Status	Displays the status of the Host. ● - denotes that the host is active and running. ● - denotes that the host is stopped or yet to start processing.
CPU	Displays the current CPU usage of the host.
Memory	Displays the Memory used by the host.

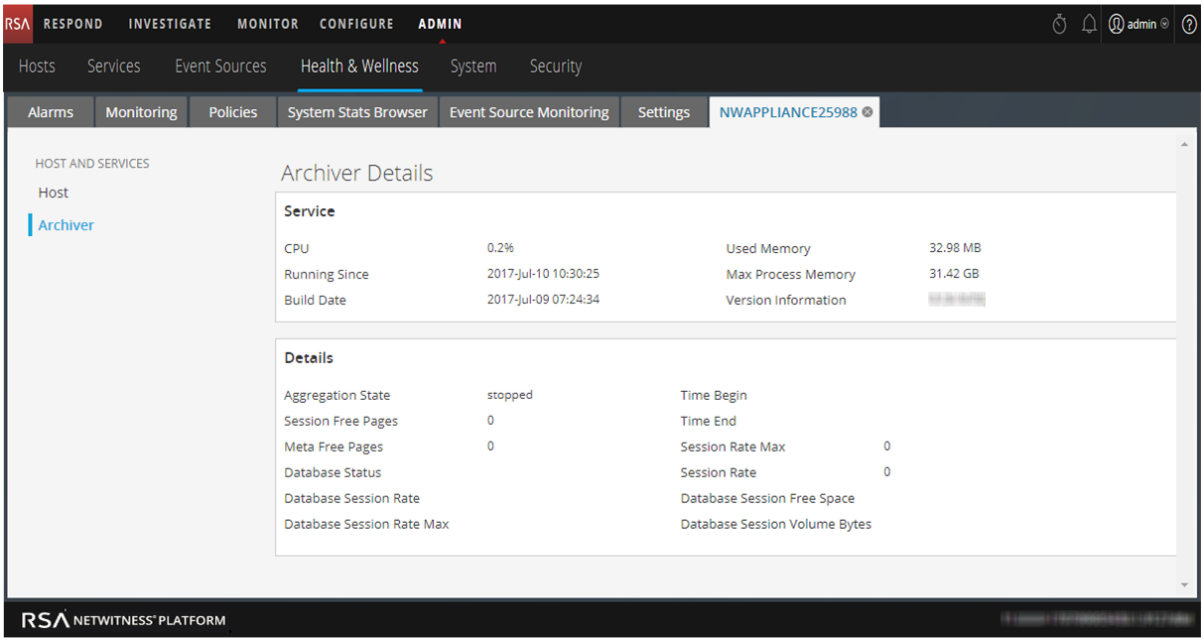
When you click ⊞ prefixed to the host name, a list of all the services installed on the host is displayed. The table below describes various parameters displayed for a service and their description.

Parameter	Description
Service	Displays the status of the service. ● Ready - denotes that the service is active and running. ● Stopped - denotes that the service is stopped or yet to start processing.
Health Status	Displays the processing status of the Service. ● - denotes that the process is running and the data is being processed at a rate greater than zero. ● - denotes that the processing is stopped. ● - denotes that the processing is turned on but the data is not being processed.
Rate	Denotes the rate at which the data is being processed.
Name	Name of the service.
Service Type	Name of the type of service.
CPU	Displays the current CPU usage of the service.

Parameter	Description
Memory Usage	Displays the Memory used by the service.
Uptime	Displays the time for which the service has been running.

Archiver Details View

The Archiver Details view provides information about the Archiver. The following figure depicts the Archiver Details.



For the related procedure, see Monitor Service Details

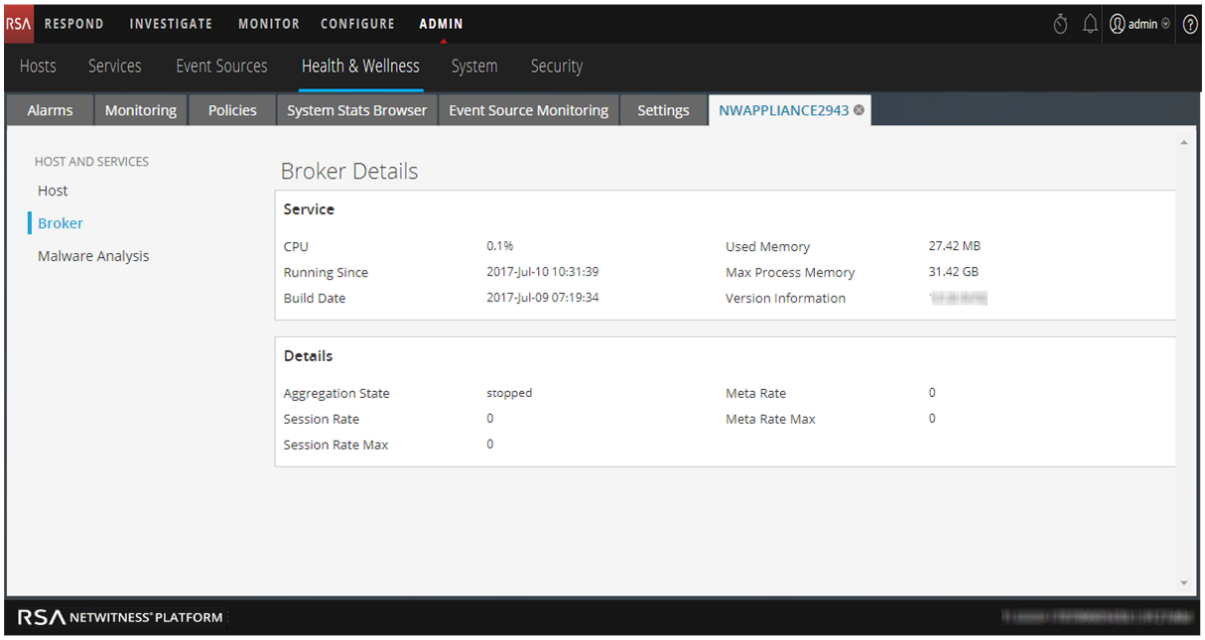
This section displays the current generic statistics for the service.

Statistic	Description
Aggregation State	State of data aggregation.
Time Begin	Time (UTC) when the first session was tracked by the index.
Session Free Pages	Session pages available for aggregation.
Time End	Time (UTC) when the last session was tracked by the index.
Meta Free Pages	Pages available for aggregation.
Session Rate Max	Maximum sessions per second rate.

Statistic	Description
Database Status	Status of databases. Valid values are: • **closed** - not available for QUERY and UPDATE (databases are being initialized). This value is seldom seen. • **opened** - available for QUERY and UPDATE. • **failure** - failed to open. This can happen for any number of reasons. You can check this if CAPTURE fails to start or if queries fail to return data. This is normally caused by database corruption.
Session Rate	Sessions per second rate.
Database Session Rate	Per second rate at which the service is writing sessions to the database.
Database Session Free Space	Amount of session free space available for aggregation.
Database Session Rate Max	Maximum per second rate at which the service is writing sessions to the database.
Database Session Volume Bytes	Number of session bytes in the database.

Broker Details View

The Broker Details view provides information for the Broker. The following figure depicts the Broker Details.



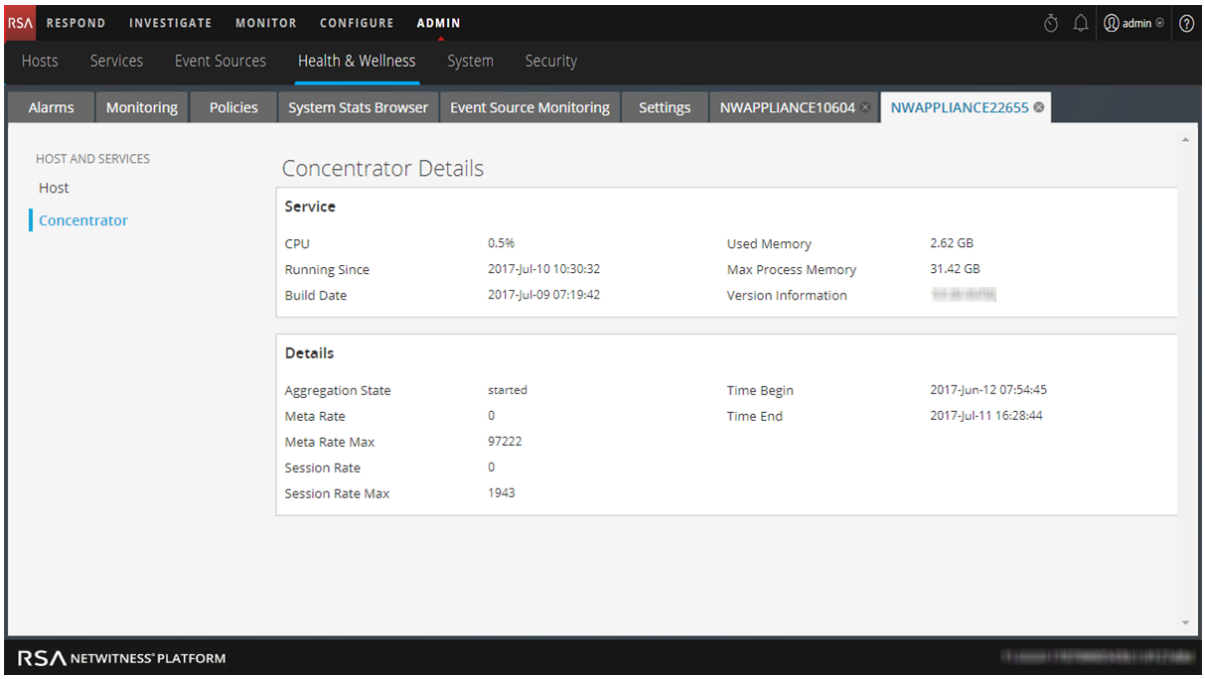
For the related procedure, see Monitor Service Details.

This section displays the current generic statistics for the service.

Statistic	Description
Aggregation State	State of data aggregation.
Meta Rate	Metadata objects per second rate.
Session Rate	Sessions per second rate.
Meta Rate Max	Maximum metadata objects per second rate.
Session Rate Max	Maximum sessions per second rate.

Concentrator Details View

The Concentrator Details view provides information for the Concentrator. The following figure depicts the Concentrator Details.



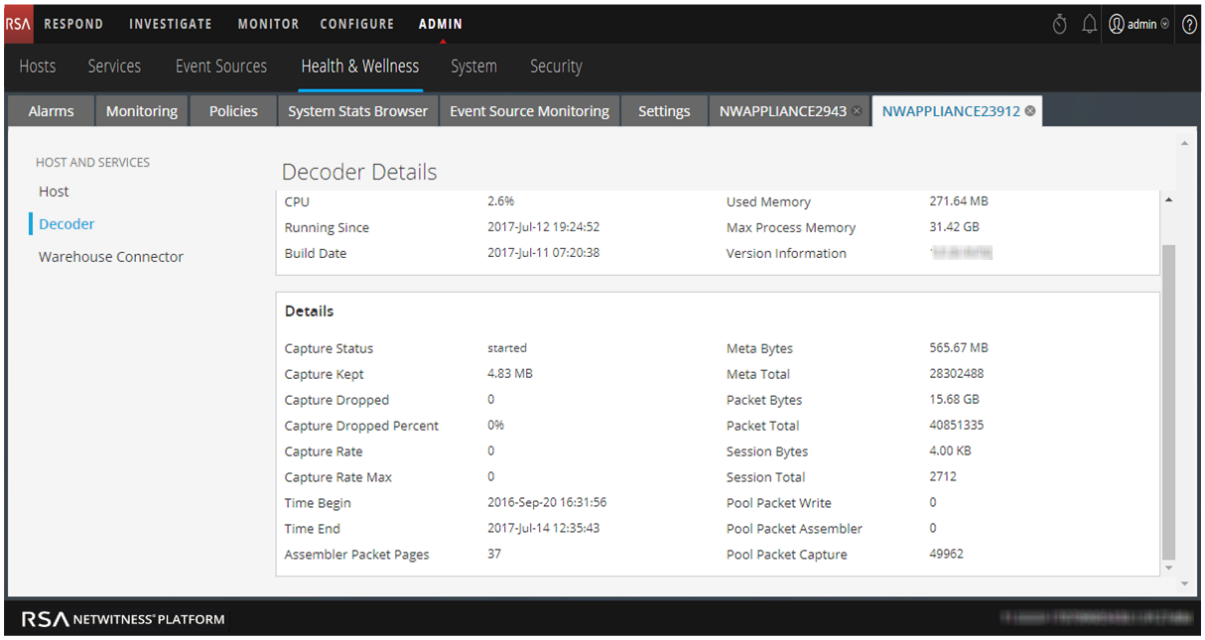
For the related procedure, see Monitor Service Details

The section displays the current generic statistics for the service.

Statistic	Description
Aggregation State	State of data aggregation.
Time Begin	Time (UTC) when the first session was tracked by the index.
Meta Rate	Metadata objects per second rate.
Time End	Time (UTC) when the last session was tracked by the index.
Meta Rate Max	Maximum metadata objects per second rate.
Session Rate	Sessions per second rate.
Session Rate Max	Maximum sessions per second rate.

Decoder Details View

The Decoder Details view provides information for the Decoder. The following figure depicts the Decoder Details.



For the related procedure, see Monitor Service Details.

This section displays the current generic statistics for the service.

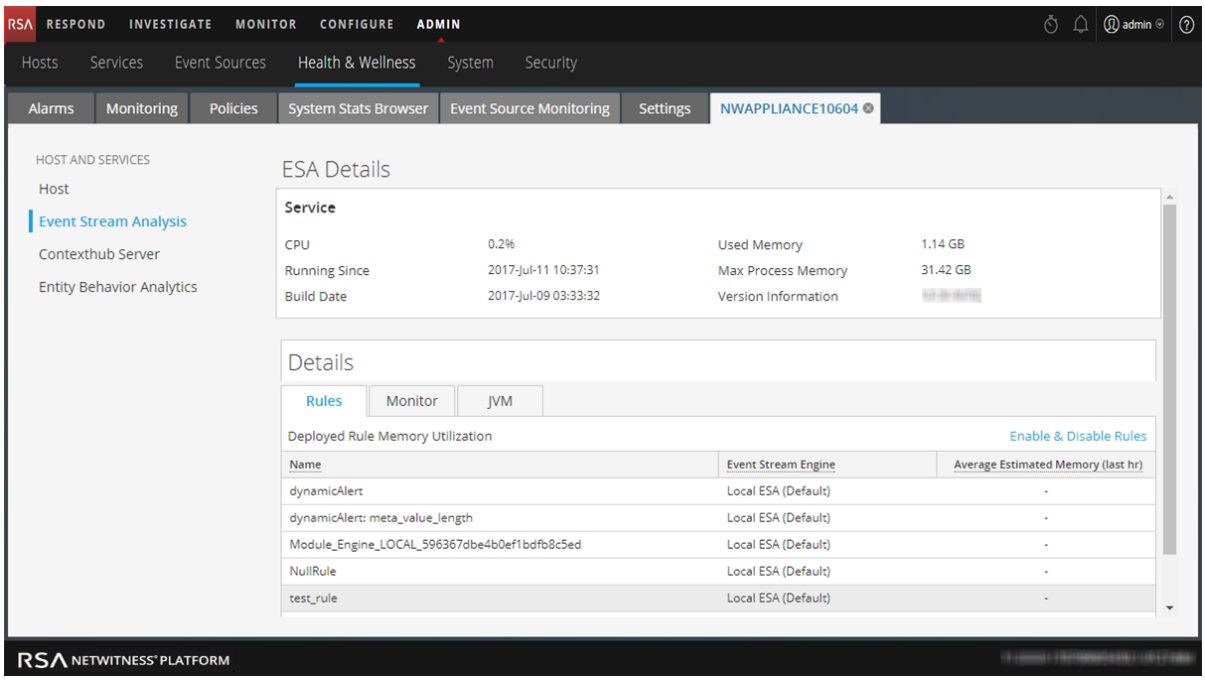
Statistic	Description
Capture Status	Status of data capture. Valid values are: • **starting** - Starting data capture (not capturing data yet). • **started**- Capturing data. • **stopping**- Stopping data capture (received request to stop data capture, but not have not stopped capturing data yet). • **stopped** - Not capturing data. • **disabled** - Not configured as a Decoder service.
Meta Bytes	Number of meta bytes in the database.
Capture Kept	Number of packets kept during capture.

Statistic	Description
Meta Total	Number of metadata in the database.
Capture Dropped	Number of packets reported by the network card as dropped. After the service stops capturing data, rate is reset to zero.
Packet Bytes	Number of packet bytes in the database.
Capture Dropped Percent	Packets reported by the network card as dropped as a percentage.
Packet Total	Number of packet objects held in the packet database. The total decreases when the database rolls files off due to size constraints. After the service stops capturing data, the number is not reset.
Capture Rate	Megabits per second rate at which the service is capturing data. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, rate is reset to zero.
Session Bytes	Number of session bytes in the database.
Capture Rate Max	Maximum megabits per second rate at which the service is capturing data. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, displays the maximum rate during data capture.
Session Total	Number of sessions held in the session database. This value shrinks when the database rolls files off due to size constraints. After the service stops capturing data, the number is not reset.
Time Begin	Time when first packet was captured (time when the first packet was stored in the packet database). This time increases as packets are rolled out of the packet database.

Statistic	Description
Pool Packet Write	Number of packet pages currently in the PCS pipeline that need to be written to the database.
Time End	Time when the last packet was captured (time when packet was written to the database). The time increases as new packets are captured.
Pool Packet Assembler	Number of packet pages waiting to be assembled.
Assembler Packet Pages	Number of packet pages waiting to be assembled.
Pool Packet Capture	Number of packet pages available for capture.

Event Steam Analysis (ESA) Details View

The Event Stream Analysis Details view provides information for ESA. The following figure depicts the Event Stream Analysis Details.



For the related procedure, see Monitor Service Details.

This section displays the current generic statistics and Rule information for the service. It consists of **Rules**, **Monitor**, and Java Virtual Machine (**JVM**) tabs that show Event Stream Analysis rules and additional statistics.

Monitor tab

Displays the following generic statistical information for the Event Stream Analysis service:

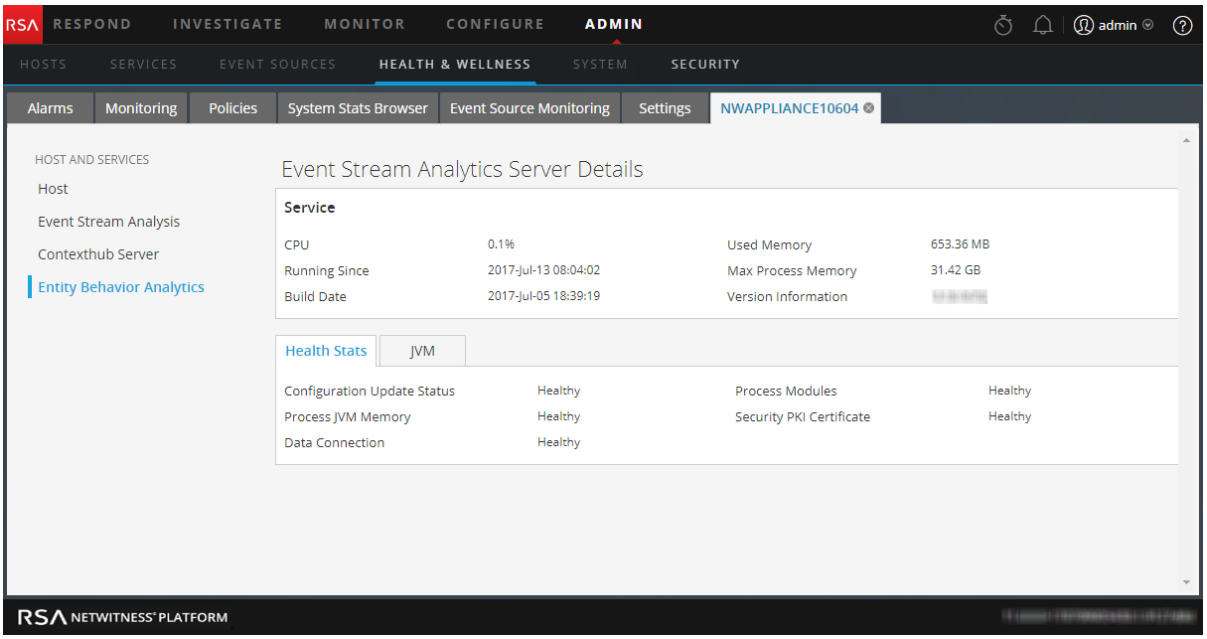
- Average number of bytes received per event message field.
- Average number of bytes received per event message.
- Total number of bytes of bytes received.
- Total number of fields received.
- Number of rules deployed on the ESA Service. The Sum of Enabled rules and Disabled rules should equal to Deployed
- Total number of events matched to all rules on the ESA service.
- Total number of events analyzed by the ESA Service since the last service start.
- Total number of alerts fired based on all the rules on the ESA service.
- Total dropped as late.
- Total fed on time.

- Total exit early.
- Seconds between feeds.
- Time span in window.
- Total events in window.
- Percent window consumed.
- Total source work units.
- Total bus dropped by payload.
- Total bus dropped events.
- Total bus dropped by fields.
- Total number of alerts sent to the message bus.
- Total number of bus events.
- Total number of Bus work units.
- Total endpoints detected.
- Total lost endpoints.
- Total failed client count.
- Total successful client count.
- Total successful server count.
- Minutes since last success.
- Number of times proxy was requested and granted.
- Total successful requests.
- Number of times proxy was requested and not granted.
- Total unsuccessful requests.

ESA Analytics Details View

The ESA Analytics Details view provides health status information about the selected ESA Analytics service. ESA Analytics services process the data for automated threat detection. It is important that you address any checked item that shows a status other than green (healthy), so that data processing is not interrupted and critical events are not missed.

The following figure shows the ESA Analytics Details view.



For the related procedure, see Monitor Service Details.

ESA Analytics Details

This section displays the current generic statistics for the selected ESA Analytics service.

Health Status

The Health Status section shows the health of the following items for the selected ESA Analytics service:

- Mongo
- JVM (Java Virtual Machine)
- Disk Space
- Suspicious Domains Module
- User Behavior Analytics Module

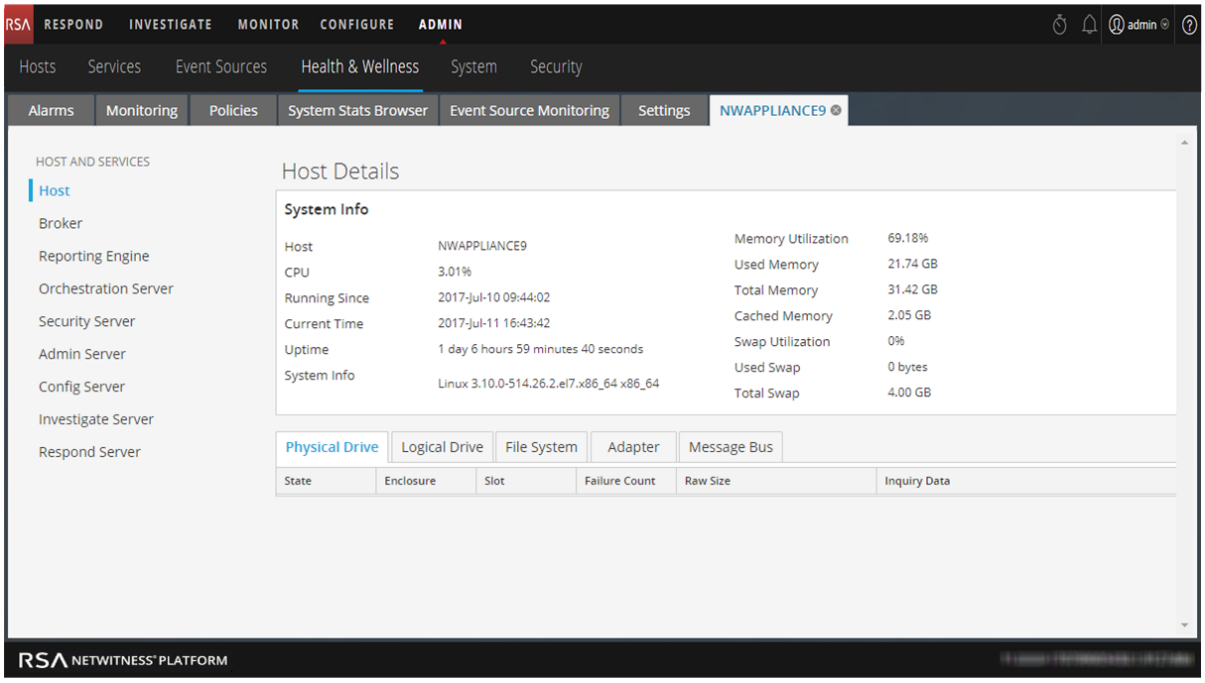
The following table describes the meaning of each health status.

Health Status	Description
Green	Healthy
Yellow	Unhealthy
Red	Critical and it needs immediate attention.

Health Status	Description
- -	Inapplicable

Host Details View

The Host Details view provides information about a host. The following figure depicts the Host Details.



The options panel on the left displays the host and the services installed on the host. You can click on Host any service to view the statistics and other pertinent information for that host or service.

The Details panel displays information that is specific to the host and provides additional information regarding the hardware of the host.

For the related procedure, see .Monitor Service Details

This section displays the current performance, capacity, and historical statistics for the host.

Parameter	Description
Host	Hostname.
CPU	Current CPU usage of the host.
Running Since	Time when the host was started.
Current Time	Current time on the host

Parameter	Description
Uptime	Time for which the host has been active.
System Info	OS version installed on the host.
Memory Utilization	Percentage of memory utilized by the host.
Used Memory	Memory used in GB.
Total Memory	Capacity of the memory installed on the system.
Cached Memory	Memory that is cached to disk in GB.
Swap Utilization	Percentage of system swap in use.
Used Swap	Swap used in GB.
Total Swap	Capacity of the swap installed on the system.

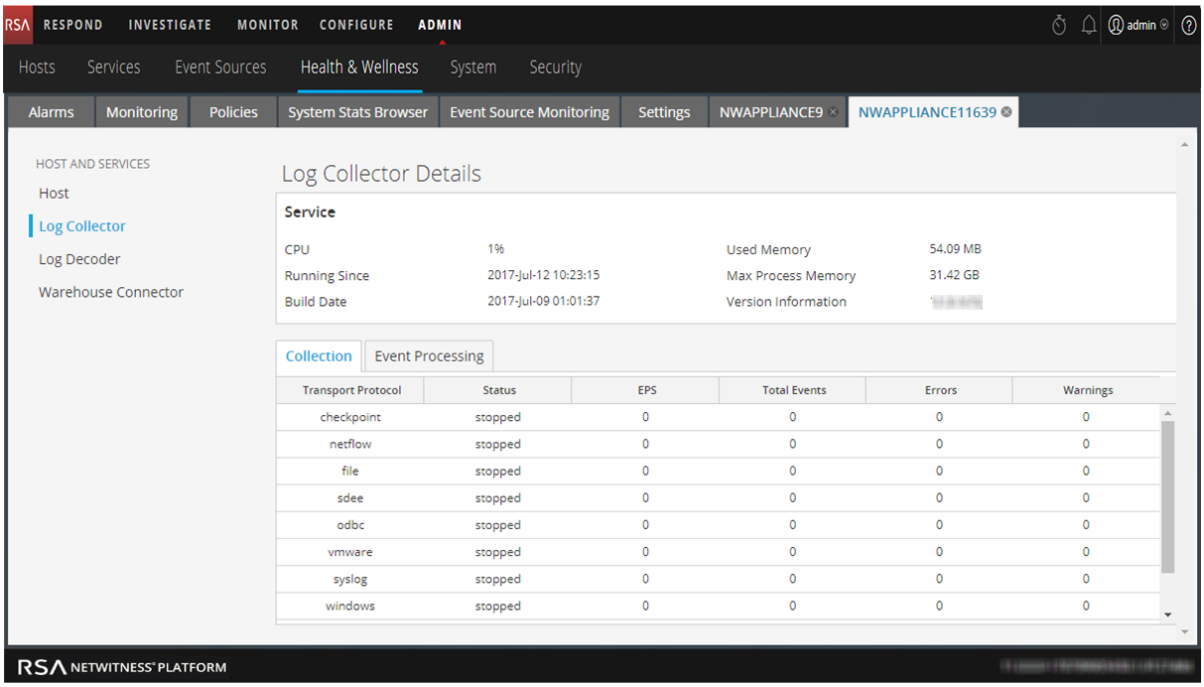
The lower section displays the current generic statistics for the host in the tabs described in the following table.

Tab	Description
Physical Drive	Type of physical drive, its usage and additional information of the physical drive on the host.
Logical Drive	Logical drive on the host.
File System	File system information, the size, current usage and available capacity on the host.
Adapter	Adapter used on the host.

Tab	Description
Message Bus	**Publish In Rate** - rate at which incoming messages are published to the message bus queue. **Total Messages Queued** - number of messages in the message queue. **Memory Used** - amount of memory used by the message bus (in bytes). **Disk Free** - free disk space available for the message bus (in bytes). **Memory Limit** - system memory limit. If the memory usage exceeds this value, this trips the **Memory Alarm** and Security Analytics stops accepting messages. **Disk Free Limit** - limit of free disk space available for the message bus. If the available disk space falls below this value, this trips the **Disk Free Alarm** and Security Analytics stops accepting messages. **Memory Limit Available** - Amount of memory available to this message broker (in bytes) before the **Memory Used Alarm** is tripped. **Disk Limit Available** - Amount of free disk space available to this message broker (in bytes) before the **Disk Free Limit** alarm is tripped. **Disk Free Alarm** - **True** or **False**. **True** indicates that the available disk space is below the value set in **Disk Free Limit** and Security Analytics has stopped accepting messages. **Memory Alarm** - **True** or **False**. **True** indicates that the available memory is below the value set in **Memory Limit** and Security Analytics has stopped accepting messages.

Log Collector Details View

The Log Collector Details view provides information for the Log Collector. The following figure depicts the Log Collector Details.



For the related procedure, see Monitor Service Details.

The lower section consists of the **Collection** and **Event Processing** tabs that display generic statistics for the service.

Collection Tab

Displays the event collection statistics for each Log Collection protocol you have implemented in NetWitness Platform (see "Log Collection Getting Started Guide" in the ***Log Collection Guides***).

Event Processing Tab

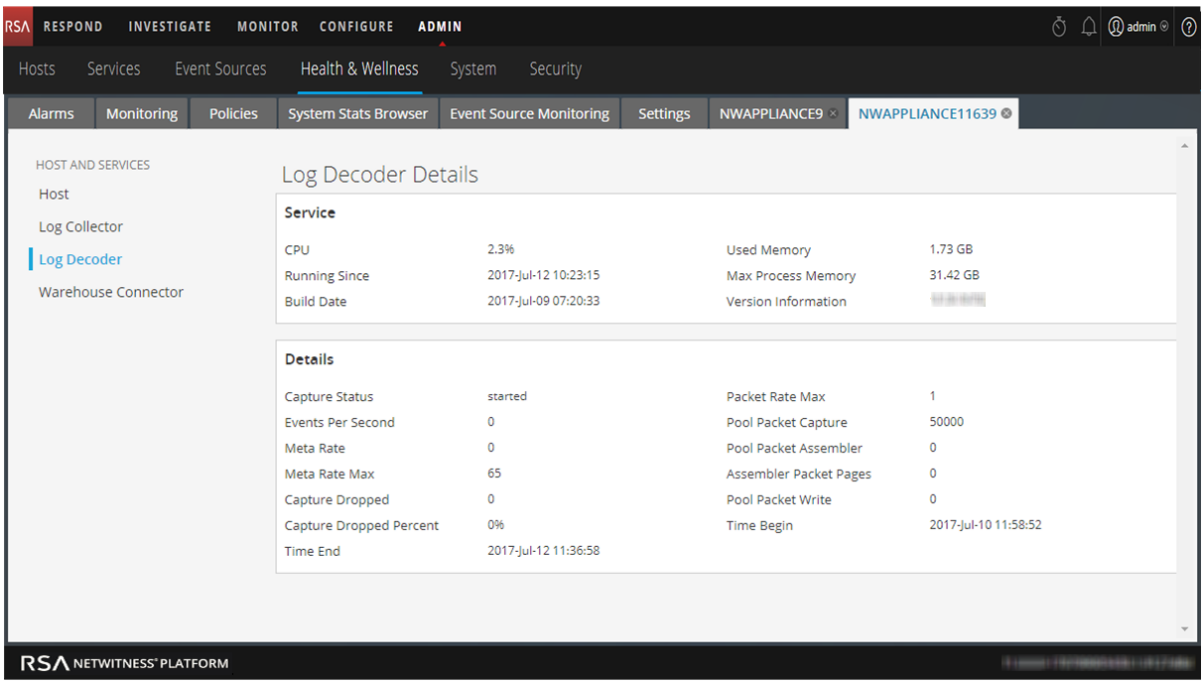
Displays statistics for the NetWitness Platform internal event processing protocol (that is, the Log Decoder) for Log Collection.

Parameter	Description
Transport Protocol	NetWitness Platform protocol use for Log Collections (that is, the Log Decoder).

Parameter	Description
Status	Status of the Log Decoder. Valid values are: • **starting** - Starting data capture (not capturing data yet). • **started** - Capturing data. • **stopping**- Stopping data capture (received request to stop data capture, but not have not stopped capturing data yet). • **stopped** - Not capturing data. • **disabled** - Not configured as a Decoder service.
EPS	Rate (events per second) at which this the Log Decoder is processing events from the Log Collector.
Total Events	Total events processed by the Log Decoder.
Errors	Number of errors encountered.
Warnings	Number of warnings encountered.
Byte Rate	Current throughput in bytes per second.

Log Decoder Details View

The Log Decoder Details view provides information for the Log Decoder. The following figure depicts the Log Decoder Details.



For the related procedure, see Monitor Service Details.

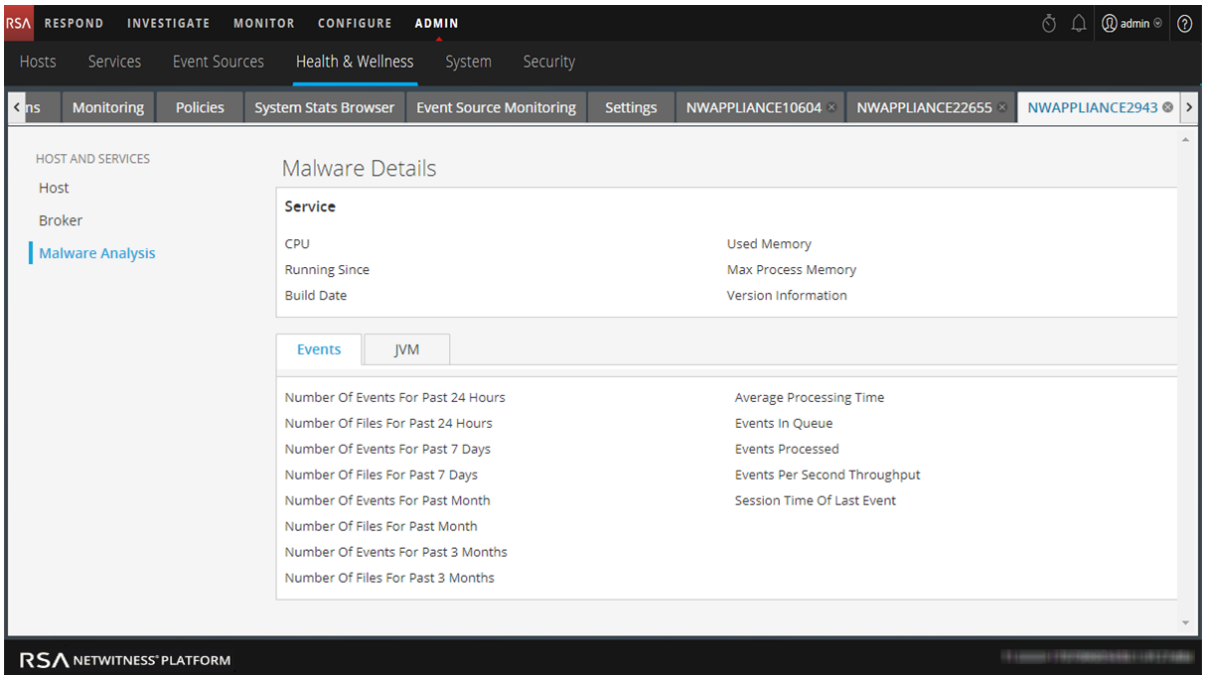
This section displays the current generic statistics for the service.

Statistic	Description
Capture Status	Status of data capture. Valid values are: • **starting** - Starting data capture (not capturing data yet). • **started** - Capturing data. • **stopping** - Stopping data capture (received request to stop data capture, but not have not stopped capturing data yet). • **stopped** - Not capturing data. • **disabled** - Not configured as a Log Decoder service.
Packet Rate Max	Maximum per second rate at which the service is writing packets to the database. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, displays the maximum rate during data capture.
Events Per Second	Rate (events per second) at which the Log Decoder is processing events from the Log Collector.

Statistic	Description
Pool Packet Capture	Number of packet pages available for capture.
Meta Rate	Per second rate at which the service is writing metadata objects to the database. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, rate is reset to zero.
Pool Packet Assembler	Number of packet pages waiting to be assembled.
Meta Rate Max	Maximum per second rate at which the service is writing metadata objects to the database. Rate is a rolling average sample over a short time period (10 seconds). After the service stops capturing data, displays the maximum rate reached during data capture.
Assembler Packet Pages	Number of packet pages waiting to be assembled.
Capture Dropped	Number of packets reported by the network card as dropped. After the service stops capturing data, rate is reset to zero.
Pool Packet Write	Number of packet pages in the PCS pipeline that need to be written to the database.
Capture Dropped Percent	Packets reported by the network card as dropped as a percentage.
Time Begin	Time when first packet was captured (time when the first packet was stored in the packet database). This time increases as packets are rolled out of the packet database.
Time End	Time when the last packet was captured (time when packet was written to the database). The time increases as new packets are captured.

Malware Details View

The Malware Details view provides information for Malware Analysis. The following figure depicts the Malware Details.



For the related procedure, see Monitor Service Details.

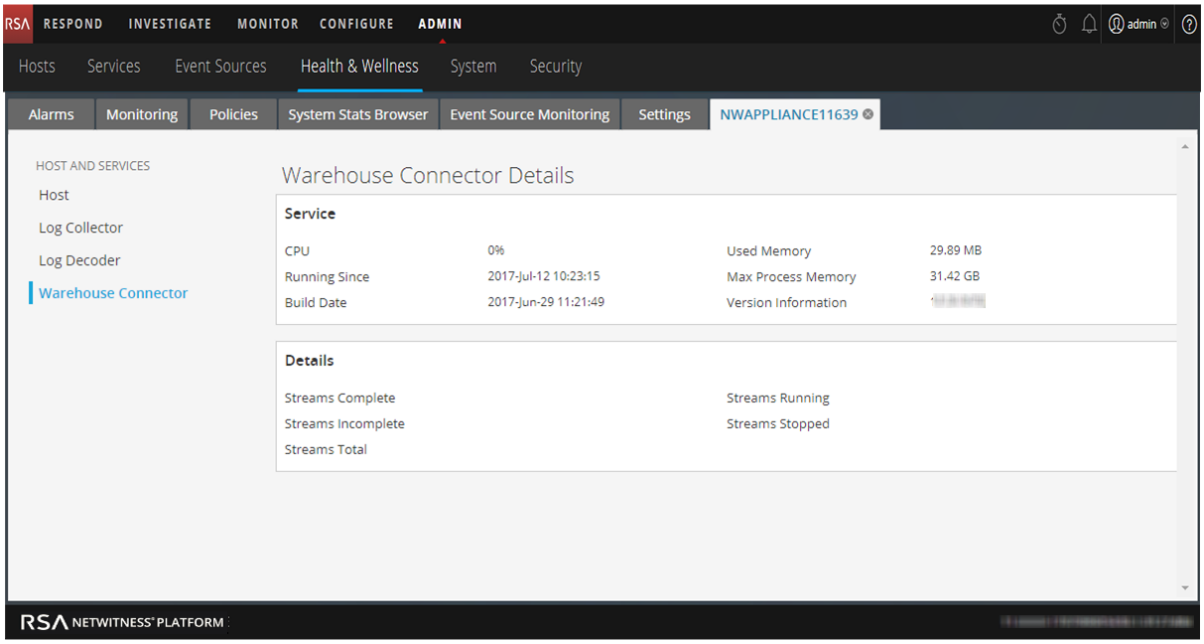
Displays the following event-related statistical information for the Malware Analysis service.

- Number of events for the past 24 hours
- Average processing time
- Number of files for the past 24 hours
- Events in queue
- Number of events for the past 7 days
- Events processed
- Number of events for the past 7 days
- Events per second throughput
- Number of events for the past month
- Session time of the last event
- Number of files for the past month

- Number of events for the past 3 months
- Number of files for the past 3 months

Warehouse Connector Details View

The Warehouse Connector Details tab provides information for the Warehouse Connector, such as the date it was built, CPU, and version information. The following figure depicts the Warehouse Connector Details.



For the related procedure, see Monitor Service Details.

Policies View

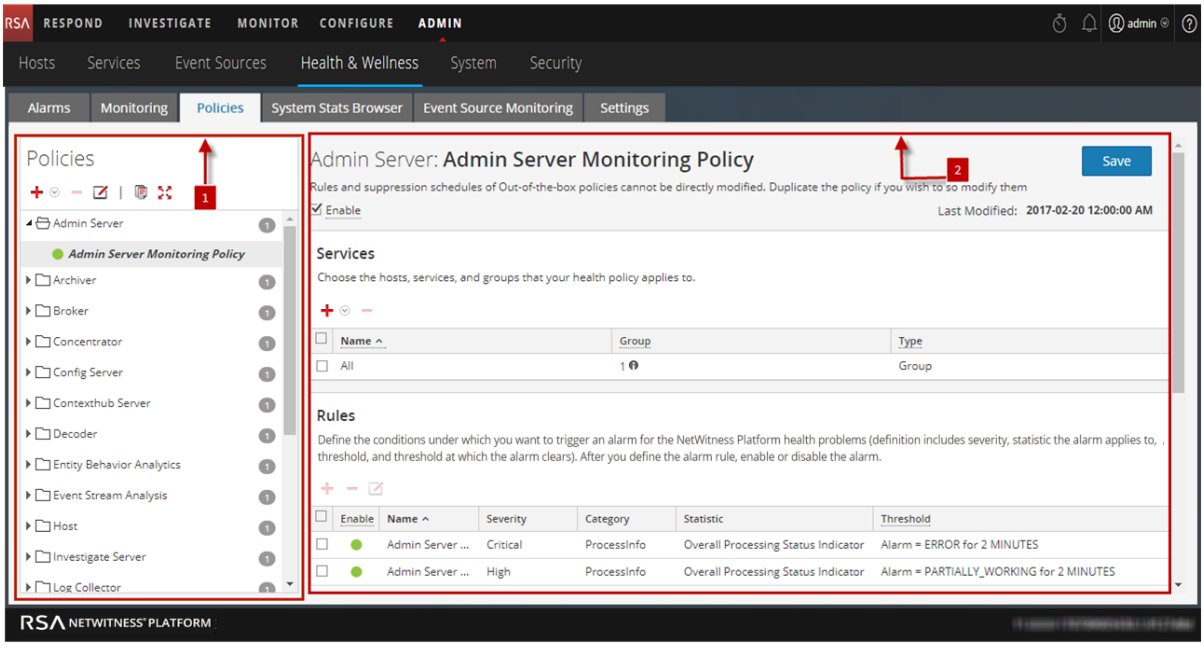
The required permission to access this view is **Manage services**.

What do you want to do?

Role	I want to ...	Show me how
Administrator	View the policies NetWitness Server and Services	Manage Policies
Administrator	Add, Edit, Duplicate, and Delete Policies	Manage Policies

Quick Look

The figure depicts the Policies view.



1 Policies Panel

2 Policy Detail Panel

1. Go to **ADMIN > Health & Wellness**.
2. Click the **Policies** tab.

Policies Panel

In the Policies panel, you can add or delete policies for hosts and services in this panel.

Feature	Description
	Displays available service types to create a new policy . Select one so that you can define a policy or policies for it.
	Deletes the selected policy from the Policies panel. You can only delete one policy at a time.
	Allows you to change the name of the policy.
	Creates a copy of the selected policy. For example, if you select **First Policy** and click  , NetWitness Platform creates a copy of this policy and names it First Policy (1).
	Expands the list of policies under the services and hosts in the **Policies** panel.
	Contracts the list of policies under the services and hosts in the **Policies** panel.
	List of: • Services and hosts for which you have defined policies. • RSA standard policies that you can apply to hosts and services.

Policy Detail Panel

The **Policy Detail** panel displays the policy selected from the Policies panel.

Feature	Description
Save	Saves any changes you made in this panel.
Policy Type	Displays the type of policy you selected.
Modified Date	Displays the last date this policy was modified.
☐ Enable	Select and deselect this checkbox to enable and disable the policy.
Services	

Feature	Description
	Displays menu in which you select: • **Groups** to display the **Groups** dialog from which you select service groups to this policy. • **Service/Host** to display the **Services/Hosts** dialog from which you select services to add to this policy. If policy type is **Host**, the menu will have **Host** not **Service**. You can select services based on policy type.
	Deletes the selected service or group from this policy.
Rules	
	Displays the Add Rule dialog in which you define a rule for this policy.
	Deletes the selected rule from this policy.
	Displays the Edit Rule dialog for the selected rule.
Policy Suppression	
	Adds a policy suppression timeframe row.
	Deletes the selected policy suppression timeframe row.
Time Zone	Selects the time zone for the Policy from the drop-down list. This time zone applies to both Policy Suppression and Rule Suppression.
	Selects the checkbox to select a policy suppression timeframe row.
Days	Days of the week that you want to suppress the policy according to the time range specified. Click on the day of the week that you want to suppress the policy. You can select any combination of days including all days.
Time Range	Time range during which the policy is suppressed for the days selected.
Notifications	

Feature	Description
+	Adds an EMAIL notification row.
−	Deletes the selected policy suppression timeframe row.
Notification Settings	Opens the Notification Servers view in which you can define the Email notification settings.
☐	Selecting the checkbox selects a policy suppression time frame row.
Output	The type of notification defined on the Global Notifications page. Can be email, SNMP, Syslog, or Script.
Recipient	The name of the person receiving the notification.
Notification Server	Select the EMAIL notification server. See "Configure Notification Servers" in the *System Configuration Guide* for the source of the values in this drop-down list.
Template	Select the Template for this EMAIL notification. RSA provides the Health & Wellness Default SMTP Template and the alarms template. See" Configure Notification Templates"in the *System Configuration Guide* for the source of the other values in this drop-down list. **Note:** Refer to Include the Default Email Subject Line if you want to include the default Email subject line from the Health & Wellness template in your Health & Wellness Email notifications for specified recipients.

Groups dialog

Feature	Description
Groups panel	
Name	Displays the service groups you have defined. You can select: • **All** to display all your services in the **Services** panel. • A group to display the services in comprise that group in the **Services** panel.
Services panel	

Feature	Description
Name	Displays the name of the service.
Host	Displays the host on which the service is running.
Type	Displays the type of service.

Rules Dialog

Feature	Description
☐ Enable	Select and deselect this checkbox to enable and disable the rule for this policy.
Name	Enter the name of the rule.
Description	Enter the description of the rule. RSA suggests that you include the following information in this field. • Informational description - purpose of the rule and what problem it monitors. • Remediation - steps to take to resolve the condition that triggers the alarm for this rule.
Severity	Select the severity of the rule. Valid values are: • Critical • High • Medium • Low

Feature	Description
Statistic	Select the statistics you want to check with this rule. You can select: • Statistical category from the left drop-down list. • Statistic from the right drop-down list. **Note:** For Public Key Infrastructure (PKI) policy, select PKI in the category and statistics as any one of the following: - NetWitness Server PKI Certificate Expiration - Displays the time left before the certificate expires. - NetWitness Server PKI CRL Expiration - Displays the time left before the Certificate Revocation List (CRL) expires. - NetWitness Server PKI CRL Status - Displays the current status of the CRL. Please refer to the System Stats Browser View for examples of the statistics you may want to check with a rule.
Alarm Threshold	Define the threshold of the rule that will trigger the policy alarm: • Amount **Note:** For CRL expiry the supported format is ddddhhmm, for example: - 10000 represent 1 day - 2359 represent 23 hours and 59 minutes - 10023 represent 1 day and 23 minutes - 3650100 represent 365 days and 1 hour • Time in minutes

Recovery	Defines when to clear the threshold of the rule:
	• Operator:
	  • For NetWitness Platform 10.5 (=, !=, <, <=, >, or >=)
	  • For NetWitness Platform 10.5.0.1 and later (See Threshold Operators below)
	• Amount
	• Time in minutes

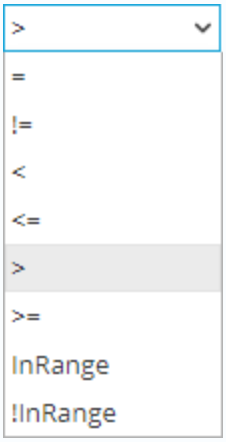
Rule Suppression	
+	Selecting this option allows you to add a rule suppression timeframe row.
−	Selecting this option allows you to delete the selected rule suppression time frame row.

Feature	Description
☐	Selecting the checkbox allows you to select a rule suppression time frame row.
Time Zone: *time-zone*	Displays the Policy time zone. You select the time zone for a policy in the Policy Suppression panel.
Days	Days of the week that you want to suppress the rule according to the time range specified. Click on the day of the week that you want to suppress the rule. You can select any combination of days including all days.
Time Range	Time range during which the rule is suppressed for the days selected.

Threshold Operators

The **Alarm Threshold** and **Recovery Threshold** fields in the **Rules** dialog prompt you for either numeric or string operators based on the statistic criteria you specify.

Numeric operators drop-down menu:



=
!=
<
<=
>
>=
InRange

NetWitness Platform Out-of-the-Box Policies

The following table lists the NetWitness Platform Out-of-the-Box Policies with the rules defined for each policy.

You can perform the following tasks on any of these policies:

- Change service/group assignments.
- Disable/enable them.

You cannot perform the following tasks on any of these policies:

- Delete them.
- Edit Policy names.

Note: Additional information about the Out-of-the-Box Policies can be found in the User Interface under
Health & Wellness – Policies.

Policy Name	Rule Name	Alarm Triggered
	Communication Failure Between Master Security Analytics Host and a Remote Host	Host is down, Network is down, Message Broker is Down, or Invalid or missing security certificates for 10 minutes or more.

Policy Name	Rule Name	Alarm Triggered
	Critical Usage on Rabbitmq Message Broker Filesystem	For `var/lib/rabbitmq`, Mounted Filesystem Disk Usage goes over 75%.
	Filesystem is Full	Overall Mounted Filesystem Disk Usage reaches 100%.
	High Filesystem Usage	Overall Mounted Filesystem Disk Usage goes over 95%.
	High System Swap Utilization	Swap Utilization goes under 5 % for 5 minutes or more.
	High Usage on Rabbitmq Message Broker Filesystem	Mounted Filesystem Disk Usage for `var/lib/rabbitmq` goes over 60%.
NetWitness Server Monitoring Policy	Host Unreachable	Host down.
	LogCollector Event Processor Exchange Bindings Status	Issue with Log Collection Message Broker Queues for 10 minutes or more.
	LogCollector Event Processor Queue with No Bindings	Issue with Log Collection Message Broker Queues for 10 minutes or more.
	LogCollector Event Processor Queue with No Consumers	Issue with Log Collection Message Broker Queues for 10 minutes or more.
	Power Supply Failure	Host not receiving power.
	RAID Logical Drive Degraded	For Raid Logical Drive, Drive State equals Degraded or Partially Degraded.
	RAID Logical Drive Failed	For Raid Logical Drive, Logical Drive State equals Offline, Failed, or Unknown.
	RAID Logical Drive Rebuilding	For Raid Logical Drive, Logical Drive State equals Rebuild.

Policy Name	Rule Name	Alarm Triggered
	RAID Physical Drive Failed	For Raid Physical Drive, Physical Drive State does not equal Online, Online Spun Up, or Hotspare.
	RAID Physical Drive Failure Predicted	For Raid Physical Drive, Physical Drive Predictive Failure Count is greater than 1.
	RAID Physical Drive Rebuilding	For Raid Physical Drive, Physical Drive State equals Rebuild.
	RAID Physical Drive Unconfigured	For Raid Physical Drive, Physical Drive State contains Unconfigured(good).
	SD Card Failure	SD Card Status does not equal ok.
NetWitness Platform Archiver Monitoring Policy	Archiver Aggregation Stopped	Archiver Status does not equal started.
	Archiver Database(s) Not Open	Database Status does not equal opened.
	Archiver Not Consuming From Service	Devices Status does not equal consuming.
	Archiver Service in Bad State	Service State does not equal started or ready.
	Archiver Service Stopped	Server Status does not equal started.

Policy Name	Rule Name	Alarm Triggered
NetWitness Platform Broker Monitoring Policy	Broker >5 Pending Queries	Queries Pending greater than or equal to 5 for 10 minutes or more.
	Broker Aggregation Stopped	Broker Status does not equal started.
	Broker Not Consuming From Service	Devices Status does not equal consuming.
	Broker Service in Bad State	Service State does not equal started or ready.
	Broker Service Stopped	Server Status does not equal started.
	Broker Session Rate Zero	Session Rate (current) equals 0 for 2 minutes or more.

Policy Name	Rule Name	Alarm Triggered
NetWitness Platform Concentrator Monitoring Policy	Concentrator >5 Pending Queries	Queries Pending greater than or equal to 5 for 10 minutes or more.
	Concentrator Aggregation Behind >100K Sessions	Devices Sessions Behind is greater than or equal to 100000 for 1 minute or more.
	Concentrator Aggregation Behind >1M Sessions	Devices Sessions Behind is greater than or equal to 1000000 for 1 minute or more.
	Concentrator Aggregation Behind >50M Sessions	Devices Sessions Behind is greater than or equal to 50000000 for 1 minute or more.
	Concentrator Aggregation Stopped	Broker Status does not equal started.
	Concentrator Database(s) Not Open	Database Status does not equal opened.
	Concentrator Meta Rate Zero	Concentrator Meta Rate (current) equals 0 for 2 minutes or more.
	Concentrator Not Consuming From Service	Devices Status does not equal consuming.
	Concentrator Service in Bad State	Service State does not equal started or ready.
	Concentrator Service Stopped	Server Status does not equal started.

Policy Name	Rule Name	Alarm Triggered
NetWitness Platform Decoder Monitoring Policy	Decoder Capture Not Started	Capture Status does not equal started.
	Decoder Capture Rate Zero	Capture Rate (current) equals 0 for 2 minutes or more.
	Decoder Database Not Open	Database Status does not equal opened.
	Decoder Dropping >1% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 1%.
	Decoder Dropping >10% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 10%.
	Decoder Dropping >5% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 5%.
	Decoder Packet Capture Pool Depleted	Packet Capture Queue equals 0 for 2 minutes or more.
	Decoder Service in Bad State	Service State does not equal started or ready.
	Decoder Service Stopped	Server Status does not equal started.
NetWitness Platform Event Steam Analysis Monitoring Policy	ESA Overall Memory Utilization > 85%	Total ESA Memory Usage % is greater than or equal to 85 %.
	ESA Overall Memory Utilization > 95%	Total ESA Memory Usage % is greater than or equal to 95 %.
	ESA Service Stopped	Server Status does not equal started.
	ESA Trial Rules Disabled	Trial Rules Status does not equal enabled.

Policy Name	Rule Name	Alarm Triggered
NetWitness Platform IPDB Extractor Monitoring Policy	IPDB Extractor Service in Bad State	Service State does not equal started or ready.
	IPDB Extractor Service Stopped	Server Status does not equal started.
NetWitness Platform Incident Management Monitoring Policy	Incident Management Service Stopped	Server Status does not equal started.
NetWitness Platform Log Collector Monitoring Policy	Log Collector Service Stopped	Server Status does not equal started.
	Log Decoder Event Queue > 50% Full	Number of events currently in the queue is using 50% or more of the queue.
	Log Decoder Event Queue > 80% Full	Number of events currently in the queue is using 80% or more of the queue.
	Log Collector Service in Bad State	Service State does not equal started or ready.

Policy Name	Rule Name	Alarm Triggered
NetWitness Platform Log Decoder Monitoring Policy	Decoder Dropping>10% of Packets	Capture Packets Percent Dropped (current) is greater than or equal to 10%
	Log Capture Not Started	Capture Status does not equal started.
	Log Decoder Capture Rate Zero	Capture Rate (current) equals 0 for 2 minutes or more.
	Log Decoder Database Not Open	Database Status does not equal opened.
	Log Decoder Dropping >1% of Logs	Capture Packets Percent Dropped (current) is greater than or equal to 1%.
	Log Decoder Dropping >5% of Logs	Capture Packets Percent Dropped (current) is greater than or equal to 5%.
	Log Decoder Packet Capture Pool Depleted	Packet Capture Queue equals 0 for 2 minutes or more.
	Log Decoder Service Stopped	Server Status does not equal started.
	Log Decoder Service in Bad State	Service State does not equal started or ready.
NetWitness Platform Malware Analysis Monitoring Policy	Malware Analysis Service Stopped	Server Status does not equal started.

Policy Name	Rule Name	Alarm Triggered
NetWitness Platform Reporting Engine Monitoring Policy	Reporting Engine Alerts Critical Utilization	Alerts Utilization is greater than or equal to 10 for 5 minutes or more.
	Reporting Engine Available Disk <10%	Available disk space is less than 10%.
	Reporting Engine Available Disk <5%	Available disk space is less than or equal to 5%.
	Reporting Engine Charts Critical Utilization	Charts Utilization is greater than or equal to 10 for 5 minutes or more.
	Reporting Engine Rules Critical Utilization	Rules Utilization is greater than or equal to 10 for 5 minutes or more.
	Reporting Engine Schedule Task Pool Critical Utilization	Schedule Task Pool Utilization is greater than or equal to 10 for 15 minutes or more.
	Reporting Engine Service Stopped	Server Status does not equal started.
	Reporting Engine Shared Task Critical Utilization	Shared Task Pool Utilization is greater than or equal to 10 for 5 minutes or more.

Policy Name	Rule Name	Alarm Triggered
NetWitness Platform Warehouse Connector Monitoring Policy	Warehouse Connector Service in Bad State	Service State does not equal started or ready.
	Warehouse Connector Service Stopped	Server Status does not equal started.
	Warehouse Connector Stream Behind	Stream Behind is greater than or equal to 2000000.
	Warehouse Connector Stream Disk Utilization > 75%	Stream Disk Usage (Pending Destination Load) is greater than or equal to 75.
	Warehouse Connector Stream in Bad State	Stream Status does not equal consuming or online for 10 minutes r more.
	Warehouse Connector Stream Permanently Rejected Files > 300	Number of files in the permanently rejected files is greater than or equal to 300.
	Warehouse Connector Stream Permanently Rejected Folder > 75% Full	Rejected folder usage is greater than or equal to 75%.
NetWitness Platform Workbench Monitoring Policy	Workbench Service in Bad State	Service State does not equal started or ready.
	Workbench Service Stopped	Server Status does not equal started.

System Stats Browser View

NetWitness Platform provides a way to monitor the status and operations of hosts and services. The System Stats Browser tab displays key statistics, service system information, and host system information for a host or service.

You can customize the stats view depending on the parameter you select to filter the data.

To access the System Stats Browser view:

1. Go to **ADMIN > Health & Wellness**.

   The Health & Wellness view is displayed with the Alarms tab open.

2. Click the **System Stats Browser** tab.

What do you want to do?

Role	I want to ...	Show me how
Administrator	View the System Stat Historical Graph	Historical Graph for System Stats

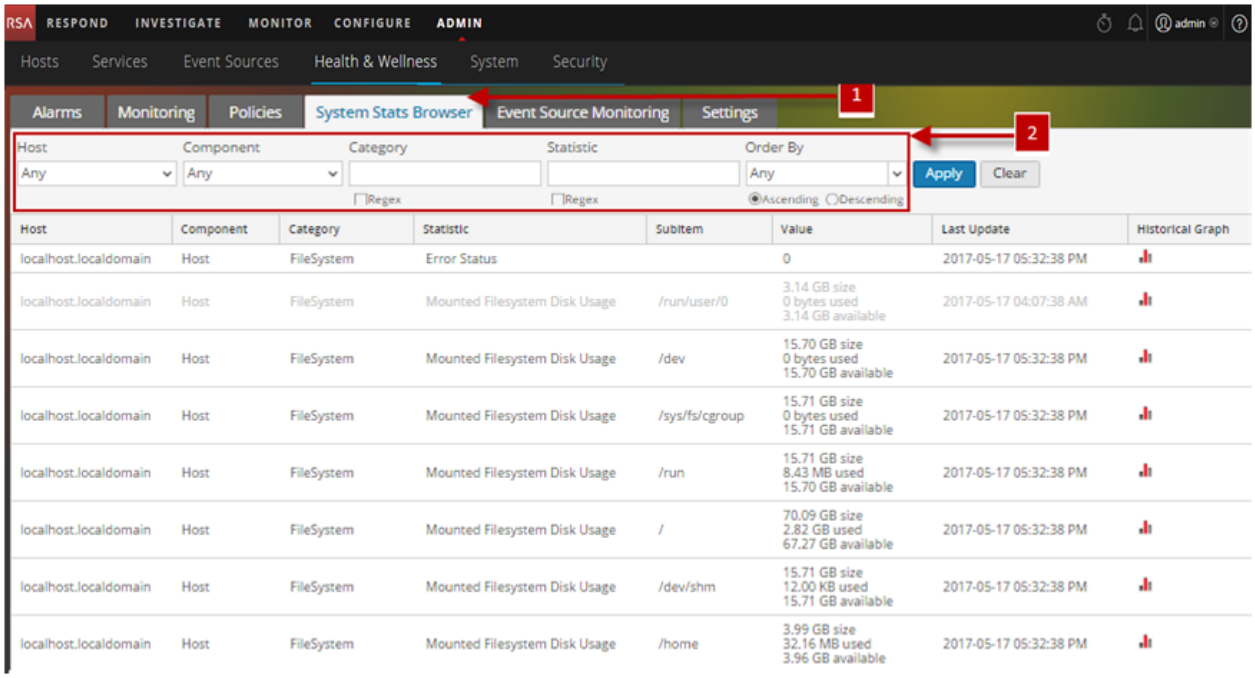
Related Topics

Monitor Service Statistics

Filter System Statistics

Quick Look

The System Stats Browser view is displayed.



1 Displays System Stats Browser View

2 Toolbar used to filter and customize the System Stats Browser View

Note: Historical graphs are enabled, and can be displayed, for statistics with numeric values. However, historical graphs are disabled for statistics with string values, for example, Health checks (Healthy), and are displayed as gray in the UI.

Filters

This table lists the various parameters you can use to filter and customize the System Stats view.

Parameter	Description
Host	Select a host from the drop-down menu to display the stats of the selected host. Select **Any** to list all the available hosts.
Component	Select a component from the drop-down menu to display the stats for the selected component. Select **Any** to list out all the components on a selected host.
Category	Type the category to display the stats for the required category. Select Regex to enable Regex filter. It performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching.
Statistic	Type the statistic to display the required statistic on all the hosts or components. Select Regex to enable Regex filter. This performs a regular expression search against text and lists out the specified category. If Regex is not selected it supports globbing pattern matching.
Order By	Select the order in which the list needs to be filtered. Select Ascending to filter the list it in an ascending order.

Commands

Command	Action
Apply	Click to apply the filters chosen and display the list accordingly.
Clear	Click to clear the chosen filters.

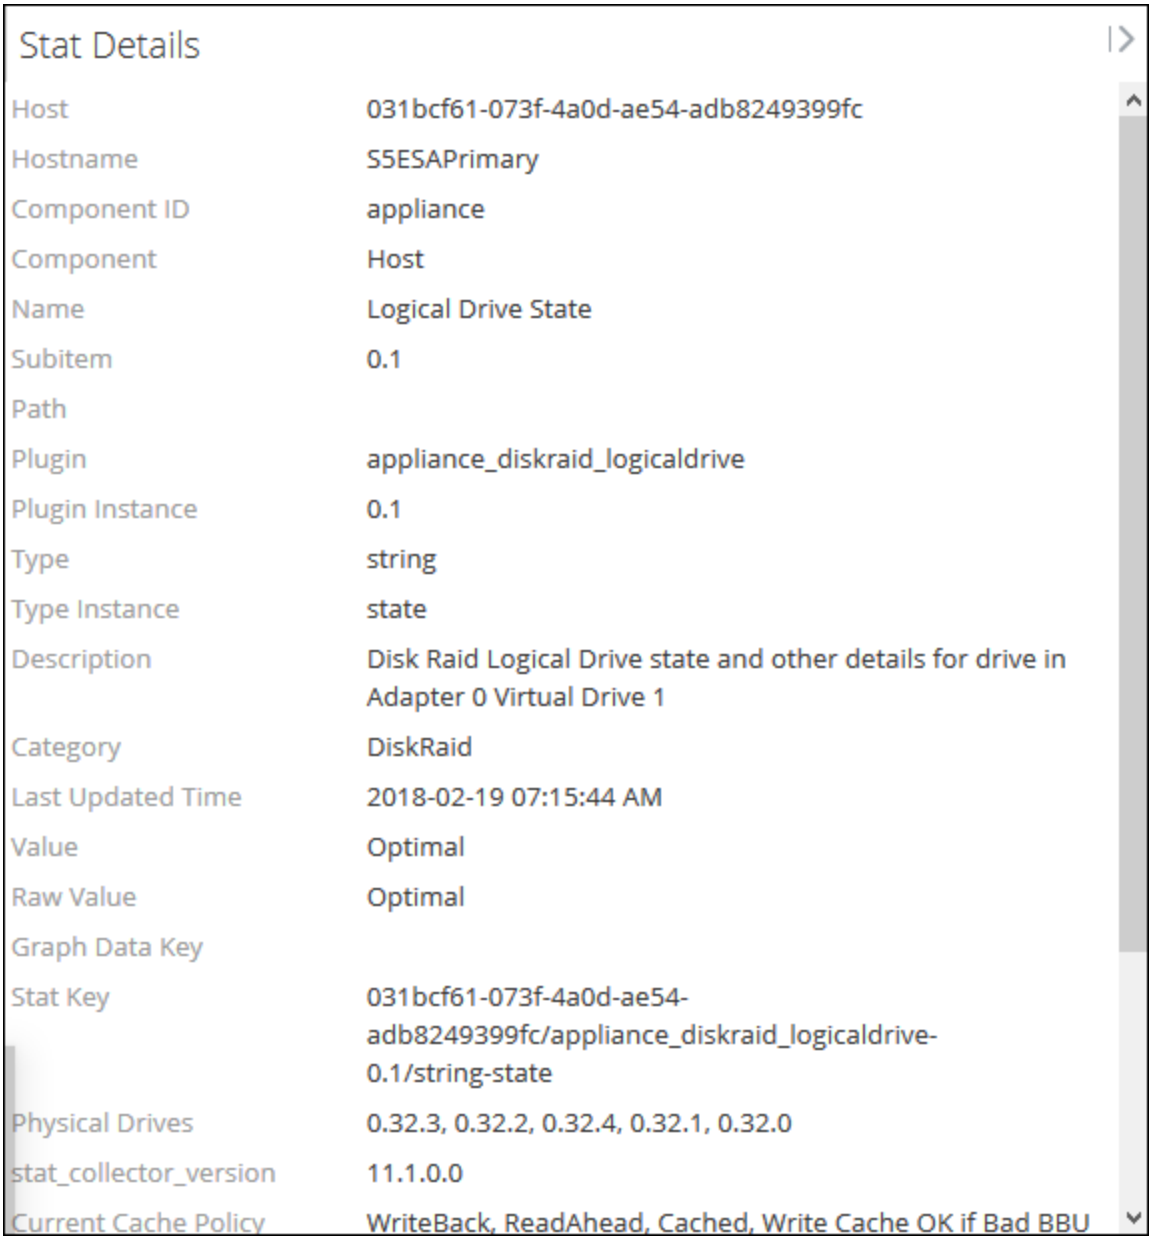
System Stats View Display

Displays statistics, service system information, and host system information for a host or service.

Access Stats Details

Select one of the stats and click **Stats Details** on the right hand side of the panel.

The Stats details panel opens with details of the selected stats.



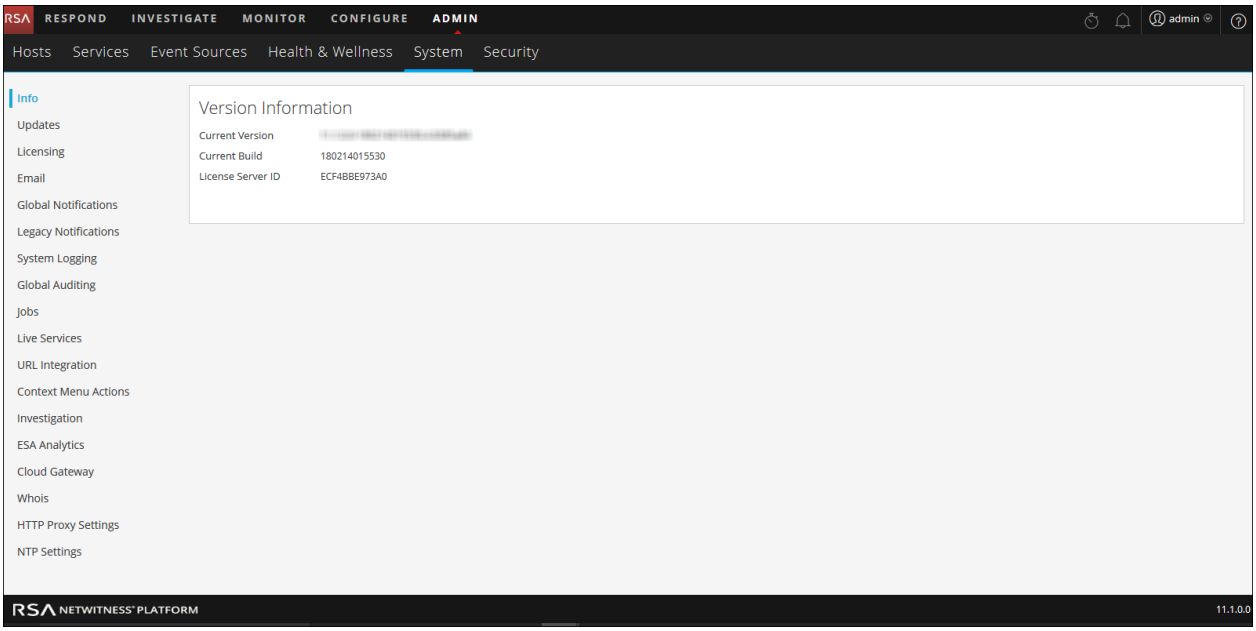
System View - System Info Panel

This topic describes the System Information panel, which displays information about the system version and license status.

The required role to access this view is **Manage System Settings**.

To access this view, do one of the following:

- Go to **ADMIN > System**.
  The System Information panel is displayed by default.
- When you receive a notification that a new version of NetWitness Platform is available in the Notifications tray, click **View**.



The Version Information section displays version information about the version of NetWitness Platform that is currently installed. The following table describes the features of the Version Information section.

Name	Description
Current Version	Displays the version of Security Analytics that is currently running. The format of the version is *major-relase.minor-release.stability-id.build-number*. Possible values for the *stability-id* are: • 1 - Development • 2 - Alpha • 3 - Beta • 4 - RC • 5 - Gold
Current Build	Identifies the current build revision for use in troubleshooting situations.
License Server ID	Each client host is shipped with the Local Licensing Server (LLS) installed to manage host licenses. This field indicates whether the LLS is installed for this instance of Security Analytics. • When the LLS is installed, the Licensing Server ID is displayed. • **Unknown** indicates that the LLS is not installed.
License Status	Indicates whether or not the license is enabled. If the license is: • Enabled, **Enabled** is displayed in this field and there is a **Disable** button to the right so you can disable it. • Disabled, **Disabled** is displayed in this field and there is an **Enable** button to the right so you can enable it.

System Updates Panel - Settings Tab

System Updates Settings tab describes the interface you use to set up a connection to Live Update Repository. These settings ensure that the NetWitness Platform can reach the Live Update Repository and synchronize it with your Local Update Repository.

The required permission to access this view is **Apply System Updates**.

To access this view:

1. Go to **ADMIN > System**.
2. Select **Updates**.

What do you want to do?

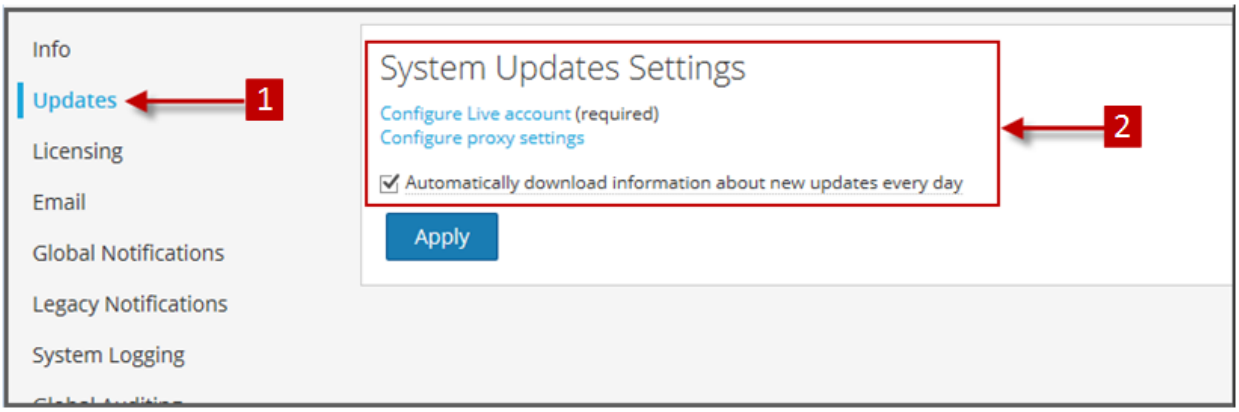
Role	I want to ...	Show me how
Administrator	Automatically download updates	Enable automatic synchronization with the RSA update repository.

Related Topics

Managing NetWitness Platform Updates

Quick Look

The System Updates Settings panel is displayed.



1 Displays System Update Setting Tab

2 Configure Account and Setting for Automatic Updates

Features

This table describes the features in the System Updates Settings panel.

Feature	Description
Configure Live account	Displays the **ADMIN** > **System** > **Live Services** panel in which you can configure your Live Account credentials if they are not configured.
Configure proxy settings	Displays the **ADMIN** > **System** > **HTTP Proxy Settings** panel in which you can configure an HTTP proxy if it is not configured.
Automatically download information about new updates every day	Select to enable automatic synchronization with the RSA update repository. If there are new updates available, information will automatically be displayed in the **ADMIN** > **HOSTS** panel.
Apply	Applies the settings in this tab.

System Logging - Settings View

The RSA NetWitness PlatformSettings view in the System Logging panel configures the size of the log files, the number of backup log files maintained, as well as the default logging levels for the packages within NetWitness Platform. The **Configure Log File Settings** topic in the *System Configuration Guide* provides detailed procedures.

To access the Settings tab:

1. Go to **ADMIN > System.**
2. In the options panel, select **System Logging**.
   The System Logging panel opens to the Realtime tab by default.
3. Click the **Settings** tab.

What do you want to do?

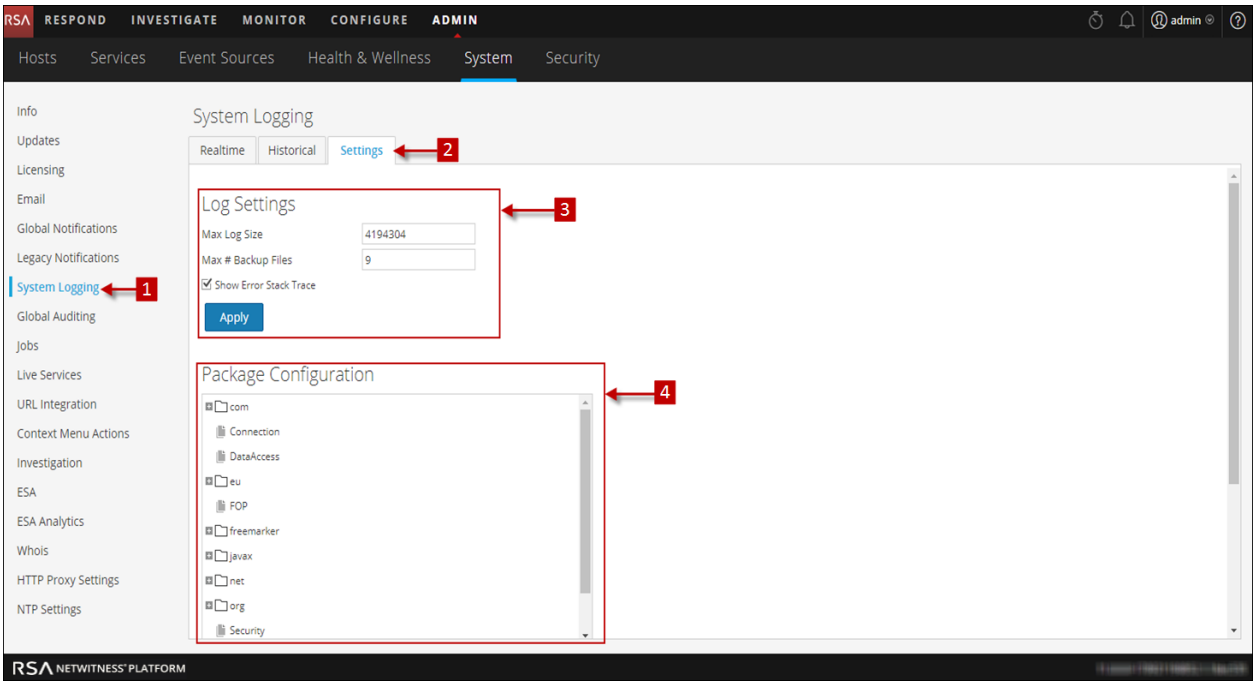
Role	I want to ...	Show me how
Administrator	Configure the size of the Log files	Setup the Log Settings Toolbar

Related Topics

System Logging - Historical Tab

System Logging - Realtime Tab

Quick Look



1	Displays System Logging Panel
2	Displays Settings Tab
3	The section allows the user to configure Log Settings
4	The section allows the user to configure Package

Features

The **Settings** tab has two sections: Log Settings and Package Configuration.

Log Settings

The Log Settings section configures the size of the NetWitness Platform log files and the number of backup logs that NetWitness Platform maintains.

Feature	Description
Max Log Size	Configures the maximum size in bytes of each log file. The minimum value for this setting is **4096**.

Feature	Description
Max # Backup Files	Specifies how many backup log files are maintained. The minimum value for this setting is **0**. When the maximum number of log files is attained, and a new backup file is made, the oldest backup is discarded.
 Show Error Stack Trace	Select checkbox to display ERROR, STACK, and TRACE log messages.
Apply	Puts the settings into effect immediately for all future logs.

Package Configuration

The Package Configuration section shows the NetWitness Platform packages in a tree structure.

Feature	Description
Package tree	The tree contains all the packages used within NetWitness Platform. You can drill down into the tree to view the log levels of each package. The **root** logging level represents the default log level for all packages that are not explicitly set. The root level is set to **INFO**
Package field	This field is populated with the name of the selected package when you select a package in the **Package** tree.
Log Level	If the selected package has a log level explicitly set, the value is displayed in the **Log Level** field.
 Reset recursively	Select checkbox to reset the log recursively.
Apply	This button puts the settings into effect immediately for all future logs.
Reset	This button resets the selected package to the log level of **root**.

System Logging - Realtime Tab

This topic describes the features of the System Logging > Realtime tab and the Services Logs view > Realtime tab.

The **Realtime** tab is a view of the NetWitness Platform log or a service log. When it is initially loaded, the view contains the last 10 log entries. As new entries become available, the view is updated with those entries.

To access the Realtime tab:

1. Go to **ADMIN > System.**
2. In the options panel, select **System Logging**.
   The System Logging panel opens to the **Realtime** tab by default.

What do you want to do?

Role	I want to ...	Show me how
Administrator	See details of Log entry	Displaying System and Service Logs

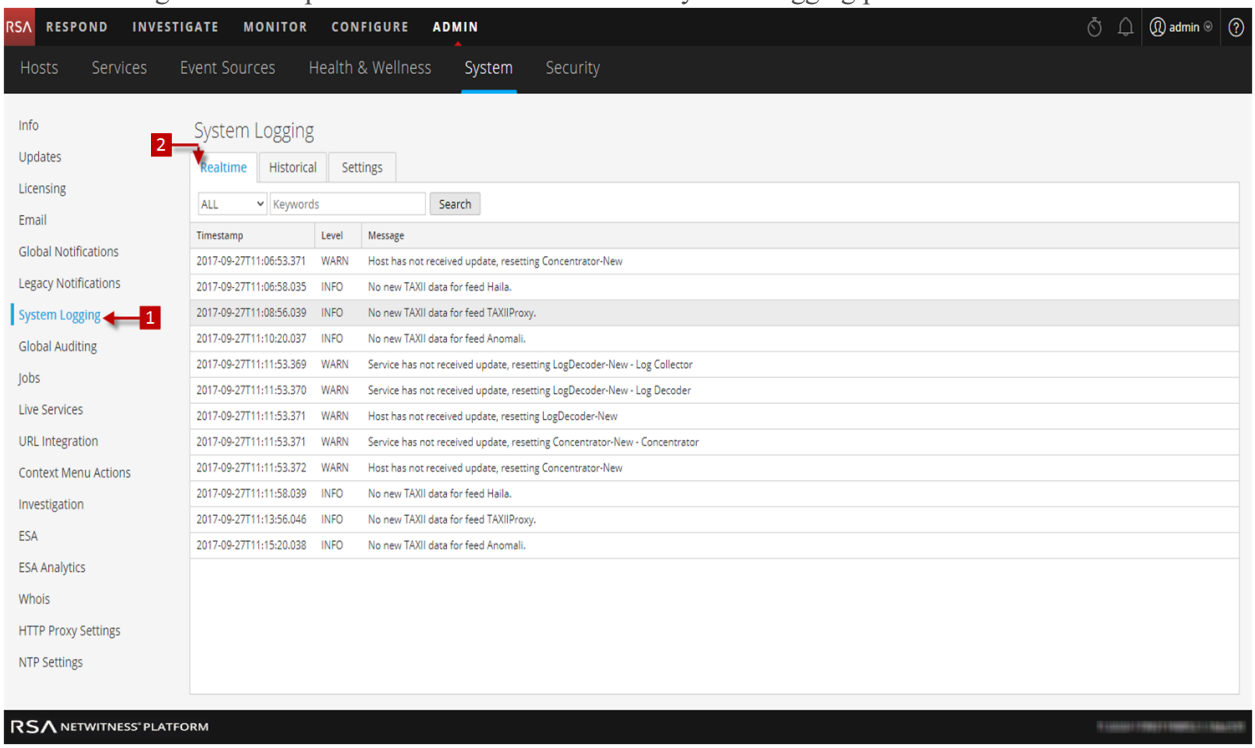
Related Topics

System Logging - Settings View

System Logging - Historical Tab

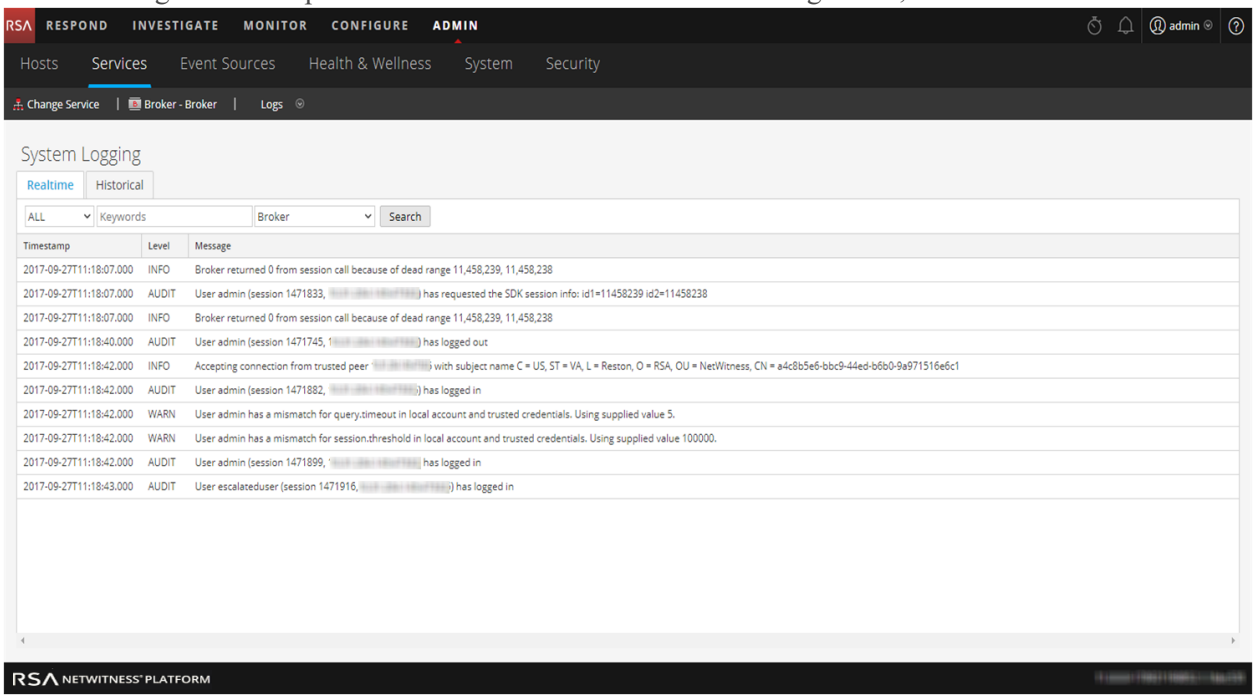
Quick Look

The following is an example of the **Realtime** tab in the System Logging panel.



1	Displays System Logging Panel
2	Displays Realtime Tab

The following is an example of the **Realtime** tab in the Services Logs view, which is similar.



Features

The **Realtime** tab has a toolbar with input fields to allow filtering of the entries, and below the toolbar is a grid containing the log entries.

Toolbar

Feature	Description
Log Level drop-down 	Selects the log level for entries to display in the grid. The **Log Level** drop-down shows the available log levels for the system or the service. • System logs have seven log levels. • Service logs have only six log levels because they do not include the **TRACE** level. • The default is **ALL** log entries.
Keywords field	Specifies a keyword to use when filtering entries. This field is the same for system and service log filtering.

Feature	Description
Service field (Service Logs only)	Specifies the service type to use when filtering service log entries. Possible values are the host or the service.
Filter button	Click to activate filtering based on the log level, keyword, and service selections.

Log Grid Columns

Column	Description
Timestamp	This is the timestamp for the entry.
Level	This is the log level for the message.
Message	This is the text of the log entry.

System Logging - Historical Tab

The Historical tab provides a searchable view of the NetWitness Platform log or the service log in a paged format. When initially loaded, the grid shows the last page of the log entries for the system or the system.

To access the Historical tab:

1. Go to **ADMIN > System.**
2. In the options panel, select **System Logging**.

   The System Logging panel opens to the **Realtime** tab by default.
3. Click the **Historical** tab.

What do you want to do?

Role	I want to ...	Show me how
Administrator	View the Historical Graph	Historical Graph for System Stats

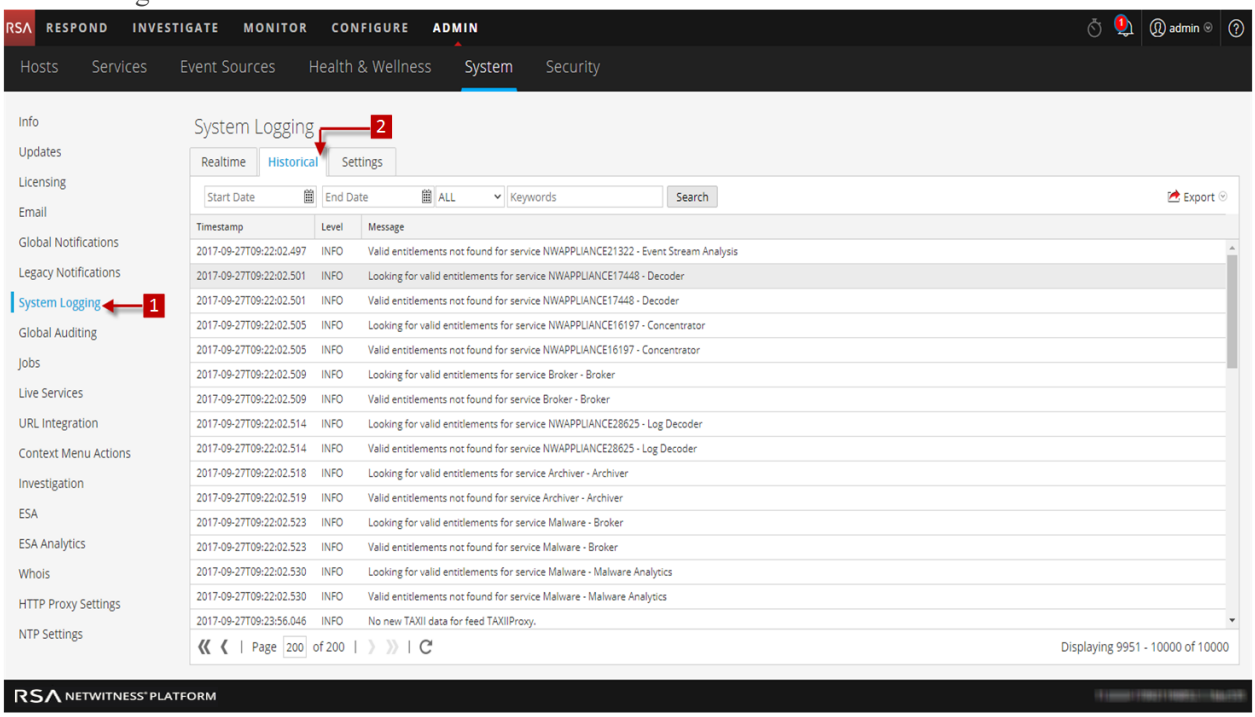
Related Topics

System Logging - Realtime Tab

System Logging - Settings View

Quick Look

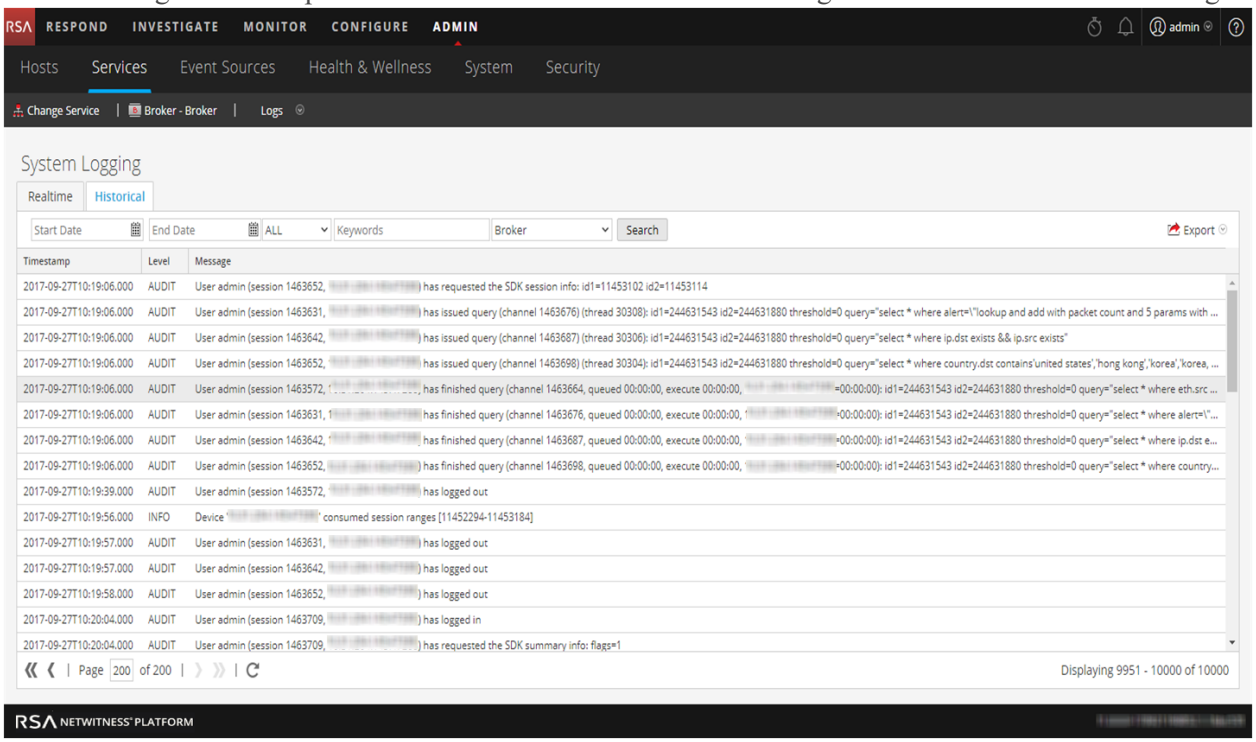
The following is an example of the **Historical** tab in the System Logging panel. It shows the NetWitness Platform logs.



1 Displays System Logging Tab

2 Displays Historical Tab

The following is an example of the **Historical** tab in the Services Logs view. It shows the services logs.



Features

The **Historical** tab has a toolbar with input fields to allow filtering of the entries, a grid containing the log entries, and paging tools.

Feature	Description
Start Date and **End Date**	The **Start Date** and **End Date** range search options limit the log entries to a point in time. When used, you must provide both a start and end date. The times are optional. The date range is validated to assure that the end date is not before the start date.
Log Level drop-down ALL ALL TRACE DEBUG INFO WARN ERROR FATAL	Selects the log level for entries to display in the grid. The **Log Level** drop-down shows the available log levels for the system or the service. • System logs have seven log levels. • Service logs have only six log levels because they do not include the **TRACE** level. • The default is **ALL** log entries.

Feature	Description
Keyword field	Specifies a keyword to use when filtering entries. This field is the same for system and service log filtering.
Service field (Service Logs only)	Specifies the service type to use when filtering service log entries. Possible values are the host or the service.
Search button	Click to activate a search based on the start and end date, log level, keyword, and service selections.
Export	Click to export the currently viewed grid entries to a text file. You can select either comma-separated or tab-separated format for the entries in the file.

Column	Description
Timestamp	This is the timestamp for the entry.
Level	This is the log level for the message.
Message	This is the text of the log entry.

The paging tools below the grid provide a way to navigate through the pages of log entries.

Search Log Entries

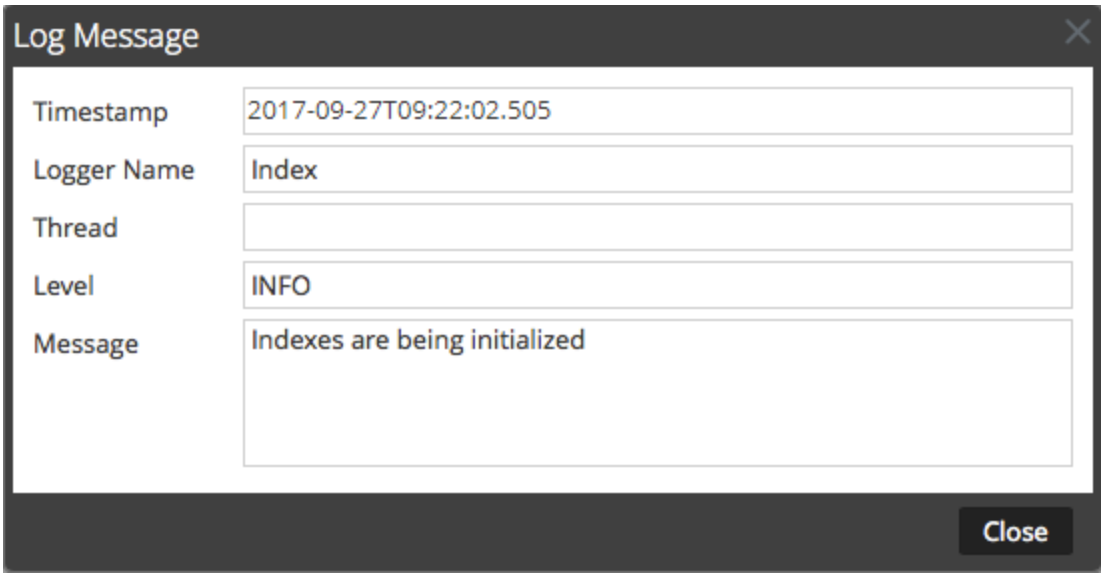
To search the results shown in the **Historical** tab:

1. (Optional) Select a **Start Date** and **End Date**. Optionally, select a **Start Time** and **End Time**.
2. (Optional) For system and service logs, select a **Log Level** and a **Keyword**, or both.
3. (Optional) For service logs, select the **Service**: host or service.
4. Click **Search**.
   The view is refreshed with the most recent 10 entries matching your filter. As new matching log entries become available, the view is updated to show those entries.

Show Details of a Log Entry

Each row of the **Historical** tab Log grid provides the summary information of a log entry. To view complete details:

1. Double-click a log entry.
   The Log Message dialog, which contains the Timestamp, Logger Name, Thread, Level and Message, is displayed.



2. When finished viewing, click **Close**.

Page Through the Entries

To view the different pages of the grid, use the paging controls on the bottom of the grid as follows:

- Use the navigation buttons
- Manually enter the page you want to view, and press **ENTER**.

Export

To export the logs in the current view:

Click **Export**, and select one of the drop-down options, **CSV Format** or **Tab Delimited**.
The file is downloaded with a filename that identifies the log type and the field delimiter. For example, a NetWitness Platform system log exported with comma-separated values is named **UAP_log_export_CSV.txt**, and an appliance log exported with tab-separated values is named **APPLIANCE_log_export_TAB.txt**.

System Security and User Management

This guide provides information about setting up security and controlling user access. The System Administrator needs to understand system-wide settings, user accounts, system roles, permissions, and access to services.

Topics

Set Up System Security

This topic introduces a set of end-to-end procedures for implementing system security. Each step in the following topics explains a system-wide setting. Follow the steps in order to set up security in NetWitness Platform.

Topics

Step 1. Configure Password Complexity

This topic provides instructions to set system-wide NetWitness Platform password complexity requirements.

Passwords are an important part of your network security strategy. They provide critical front-line protection for your computer systems and help prevent attacks and unauthorized access to private information.

Password policies, designed to enhance the security of corporate networks, vary depending on the industry, corporate requirements, and regulations. Because of these password policy variations, NetWitness Platform software allows you to configure the password complexity requirements for internal NetWitness Platform users to conform to your corporate password policy guidelines.

Password complexity requirements apply only to internal users and are not enforced for external users. External users rely on their own methods and systems to enforce password complexity.

In addition, you can set a global default user expiration period and determine if and when internal users receive notification that their passwords are about to expire. The password expiration notification consists of a password expiration message when a user logs on to NetWitness Platform.

Password Strength

Strong passwords make it more difficult for attackers to guess user passwords and help prevent unauthorized access to your organization's network. You can define the appropriate level of password strength for your NetWitness Platform users. When you configure the password strength settings, they apply to internal NetWitness Platform users, including the admin user.

You can choose to enforce any combination of the following password strength requirements when a NetWitness Platform user creates or changes their password:

- Minimum password length
- Minimum number of uppercase characters
- Minimum number of lowercase characters
- Minimum number of decimals (0 through 9)
- Minimum number of special characters
- Minimum number of non-Latin alphabetic characters (includes Unicode characters from Asian languages)
- Whether or not the password can contain the username

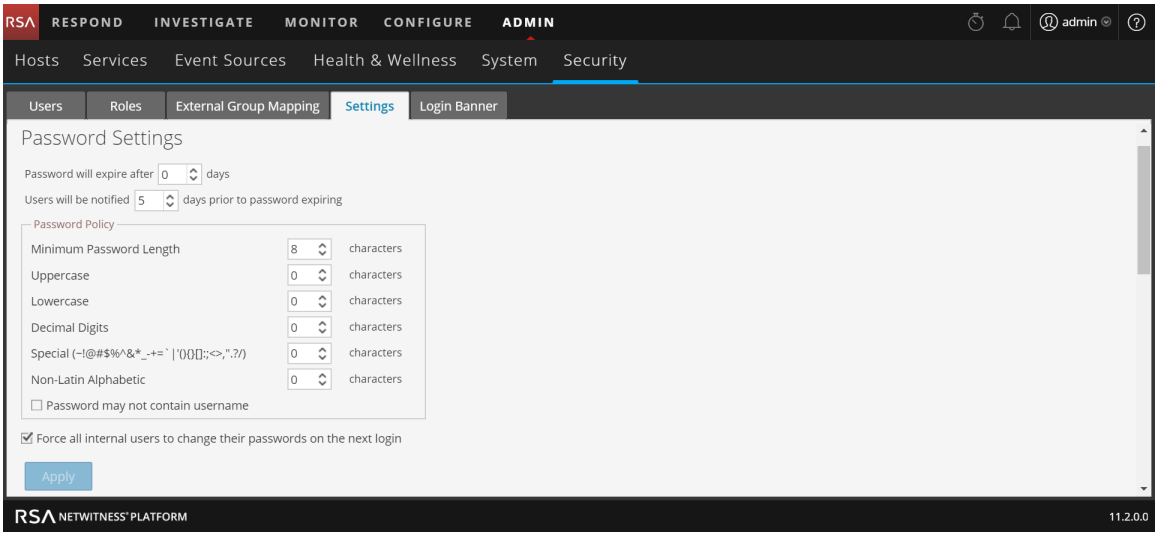
For example, you can create a strong password requirement that has a minimum of 8 characters, cannot contain the username of the user, and contains a mix of uppercase and lowercase letters, numbers, and special characters.

If you choose to enforce a minimum number of non-Latin alphabetic characters, ensure that your users have these characters available to them when setting their passwords.

The topic "STIG Compliant Passwords" in the *System Maintenance Guide* provides an example of a strong password policy.

Configure Password Strength

1. In NetWitness Platform, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.



3. In the **Password Settings** section, select the password complexity requirements to enforce when NetWitness Platform users set their passwords and specify the minimum characters required, if applicable. Set the value to 0 for requirements you do not want to enforce, except for Minimum Password Length, which has a minimum value of 4 characters.

Requirement	Description
Password will expire after <n> days	The default number of days before a password expires for all internal NetWitness Platform users. A value of zero (0) disables password expiration. For new installations, the default value is 0. For upgrades, the previous value will migrate automatically to the upgraded installation.
Users will be notified <n> days prior to password expiring	The number of days before the password expiration date, to notify a user that their password is about to expire. Users see a Password Expiration Message dialog when they log on to NetWitness Platform. The minimum value is 1 day.
Minimum Password Length	Specifies a minimum password length. A minimum password length prevents users from using short passwords that are easy to guess. There is a minimum password length of 4 characters required by default.

Requirement	Description
Uppercase	Specifies a minimum number of uppercase characters for the password. This includes European language characters A through Z, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic uppercase: Д Ц • Greek uppercase: Π Λ
Lowercase	Specifies a minimum number of lowercase characters for the password. This includes European language characters a through z, sharp-s, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic lowercase: д ц • Greek lowercase: π λ
Decimal Digits	Specifies a minimum number of decimal characters (0 through 9) for the password.
Special (~!@#$%^&*_-+=`|'(){}[]:;<>,".?/)	Specifies a minimum number of special characters for the password: ~!@#$%^&*_-+=`|'(){}[]:;<>,".?/
Non-Latin Alphabetic	Specifies a minimum number of Unicode alphabetic characters that are not uppercase or lowercase. This includes Unicode characters from Asian languages. For example: • Kanji (Japanese): 頁 (leaf) 枒 (tree)
Password May Not Contain Username	Specifies that a password cannot contain the case-insensitive username of the user.

4. If you want your password policy changes to take effect at the next login instead of the next password change, select **Force all internal users to change their passwords on the next login**. Note that this setting is selected by default.
5. Click **Apply**.
   The password strength settings take effect when internal users create or change their passwords. If you selected **Force all internal users to change their passwords on the next login**, all internal users must change their password the next time they log on to NetWitness Platform.

Step 2. Change the Default Admin Passwords

This topic provides instructions for changing the admin password for the NetWitness Platform service and for the Core services.

The system administrator's user account is installed with NetWitness Platform. The username is **admin** and the default password is the password that was entered in the Text-based User Interface (TUI) during the NetWitness Platform installation process. The **Administrators** role is assigned to admin. This role has full system privileges to control what a user can do and which services a user can access. The only modification you can make to this account is to change the password. Unlike other NetWitness Platform users, changes to the **admin** user password do not automatically propagate to downstream services. When you configure the password strength settings, they apply to all NetWitness Platform users, including the admin user.

Passwords, an important aspect of computer security, are the front line of protection for your system. The **admin** user is pre-installed in NetWitness Platform and on each Core service. For security, you create the users and roles for your organization in NetWitness Platform, and on each Core service.

Best Practices

RSA recommends the following best practices:

- Change the **admin** password of each service from the default.
- Create a different password for the **admin** account on each service.

Change the admin Password for the NetWitness Platform

Change the **admin** password for the NetWitness Platform in the Profile view. See "Change Password" in the *NetWitness Platform Getting Started Guide*. The password of the **admin** user does not propagate to Core services.

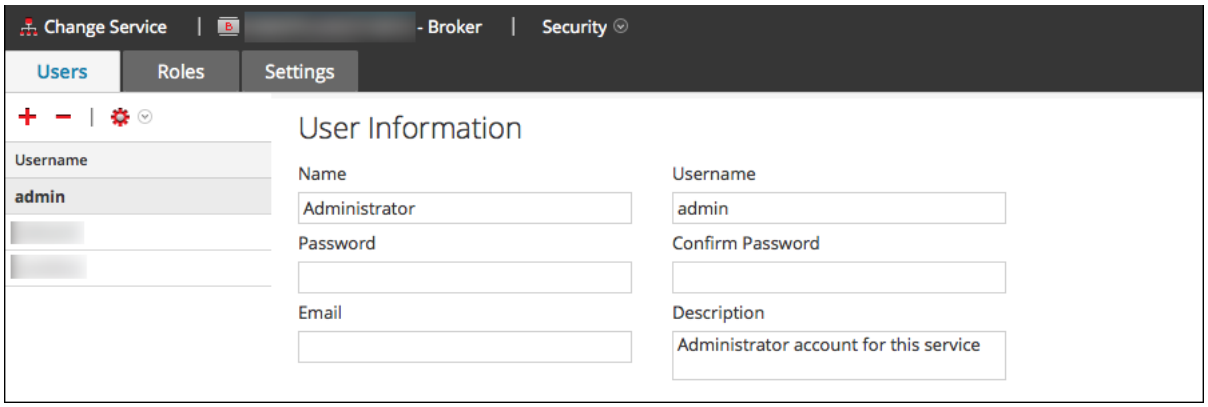
Note: After you change the admin password, you must remove and re-add a data source on the Reporting Engine. For more information, see the **Remove and re-add a Data Source on the Reporting Engine** section below.

Change the admin Password for Core Services

To change the admin password for a Core service:

1. In NetWitness Platform, go to **ADMIN > Services.**
2. Select a service, and then select  **> View > Security**.

3. On the **Users** tab, select the **admin** user.



4. In the **Password** field, type a new admin password for the selected service.
5. In the **Confirm Password** field, retype the new password.
6. Click **Apply**.

Note: After you change the admin password, you must remove and re-add a data source on the Reporting Engine. For more information, see **Remove and re-add a Data Source on the Reporting Engine** below.

Remove and re-add a Data Source on the Reporting Engine

Reporting Engine validates a data source using the data source username and password. If you change the username or password of a data source, you must remove and re-add the data source.

To remove and re-add a data source on the Reporting Engine:

1. In NetWitness Platform, go to **ADMIN > Services**.
2. In the Services view, select Reporting Engine and **View > Config**.
3. Click the **Sources** tab.
4. Select a service to remove and click −
5. Click + and select **Available Services.**
6. Select the service you removed in step 4 and click **OK**.
7. When prompted, enter the new username and password for the service.

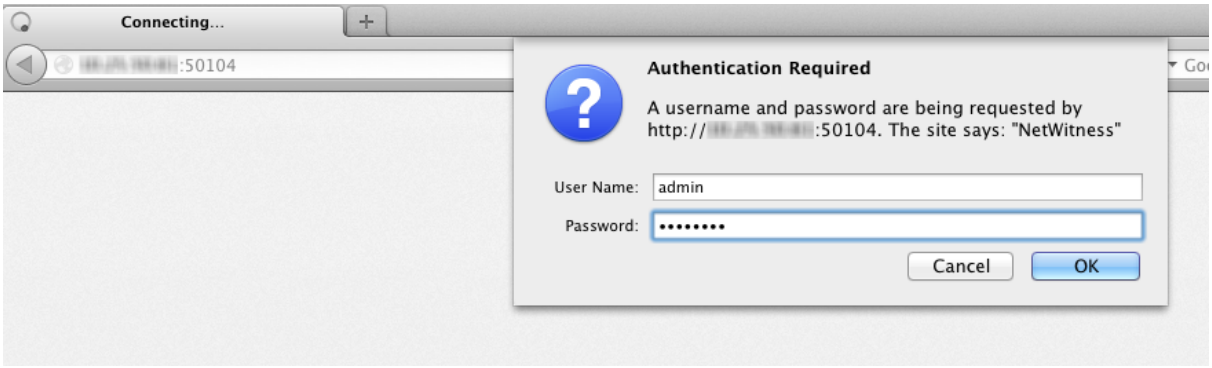
Change the admin Password for a Service Using the REST API

In rare circumstances, you may need to change the admin password for a Core service outside of the NetWitness Platform user interface. This is simply another way to perform the Core service password change, and is not the preferred method.

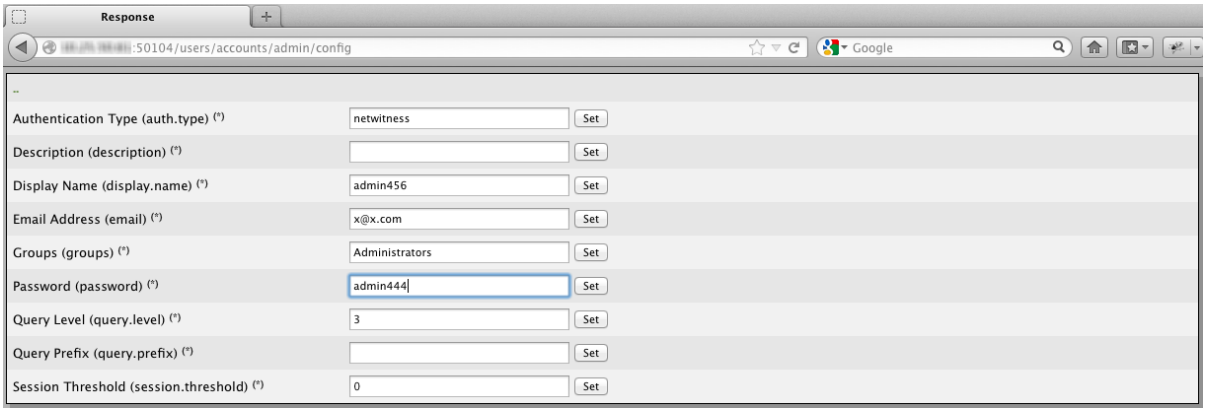
To change the admin password for the service using the REST User Interface:

1. Open a web browser, and go to the following URL:
   <hostname>:<port>

where the **hostname** is the name of a NetWitness Platform Core service and **port** is the port used for REST communication. Here is an example for a Decoder: `http://10.20.30.40:50104`
The authentication dialog is displayed.



2. In the dialog, enter the user name and password used for authentication as admin on the service, and click **OK**. The default user name is **admin** and the default password is **netwitness**.
   The REST window for the service is displayed.
3. Navigate through the node structure to **users/accounts/admin/config**.
   The user configuration fields for admin are displayed in the browser window.



4. In the Password field, type a new admin password and click **Set**.

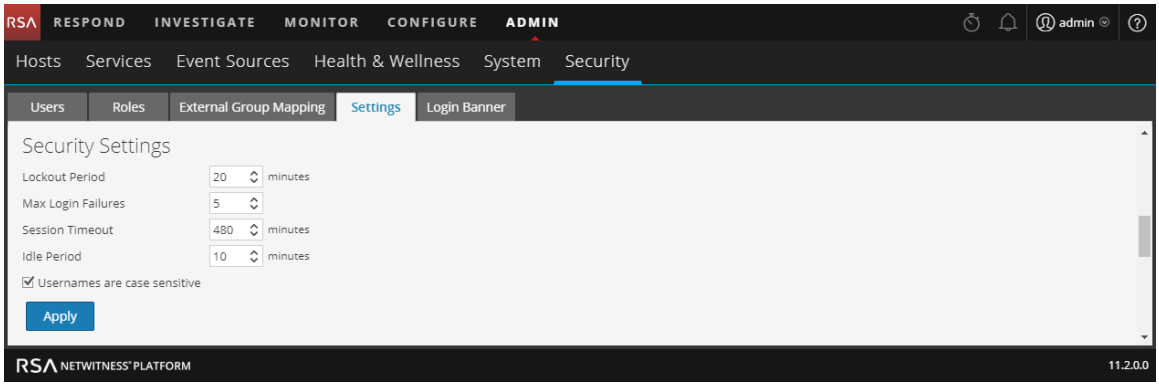
Step 3. Configure System-Level Security Settings

This topic explains how to set system-wide security parameters.

Most global security settings, such as the maximum number of failed login attempts to allow, apply to all NetWitness Platform users and sessions. Settings related to passwords in the Password Strength section, such as password expiration period and the default number of days before user passwords expire, apply to internal NetWitness Platform users, but not external users.

Configure Security Settings

1. In NetWitness Platform, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.



3. In the **Security Settings** section, specify values for the fields as described in the following table.

Field	Description
Lockout Period	Number of minutes to lock a user out of NetWitness Platform after the configured number of failed logins is exceeded. The default value is 20 minutes.
Max Login Failures	The maximum number of unsuccessful login attempts before a user is locked out. The default value is 5.
Session Timeout	The maximum duration of a user session before timing out in minutes. The default value is 480. The session times out when the configured time has elapsed, after which the user must log in again. The maximum allowed value is 30,000. **Note:** If you migrated to NetWitness Platform 11.x from version 10.6.x and previously used a value of 0 for an unlimited session timeout, the value was reset automatically to 30,000 minutes, as a value of 0 is no longer supported.

Field	Description
Idle Period	Number of minutes of inactivity before a session times out. The default value is 10. The maximum allowed value is 30,000. **Note:** If you migrated to NetWitness Platform 11.x from version 10.6.x and previously used a value of 0 for an unlimited idle period, the value was reset automatically to the default value of 10, as a value of 0 is no longer supported.
Usernames are case sensitive	Select this option if you want the Username field on the NetWitness Platform login screen to be case sensitive. For example, if usernames are case sensitive, you could use admin to log on to NetWitness Platform, but you could not use Admin.

4. Click **Apply**. The Security Settings take effect immediately. If a password expires, the user receives a prompt to change the password when they log on to NetWitness Platform.

Step 4. (Optional) Configure External Authentication

This topic introduces the external authentication methods that NetWitness Platform supports.

When a user logs in, NetWitness Platform first attempts to authenticate locally. If no local user is found, and External Authentication configuration is enabled, an attempt is made to authenticate externally.

External authentication allows users who do not have an internal NetWitness Platform user account to log on to NetWitness Platform and receive role-based permissions.

NetWitness Platform supports two methods of external authentication, Active Directory and Pluggable Authentication Modules (PAM). Topics in this section describe how to configure and test each method.

Topics

- Configure Active Directory
- Configure PAM Login Capability

Configure Active Directory

This topic explains how to configure NetWitness Platform to use Active Directory to authenticate external user logins.

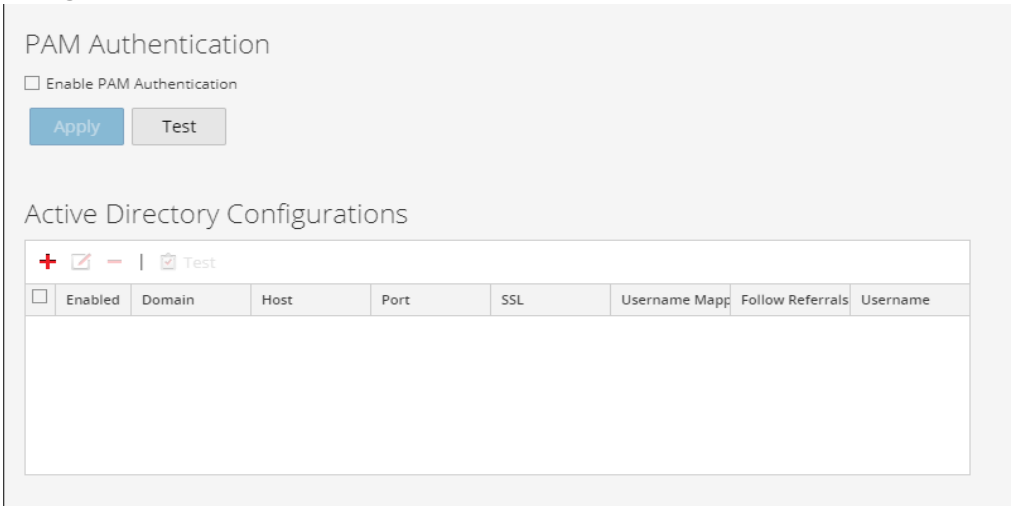
When a user logs in, NetWitness Platform first attempts to authenticate locally. If no local user is found, and Active Directory configuration is enabled, an attempt is made to authenticate with Active Directory Service. You can configure Active Directory settings to enable authentication of external groups in the ADMIN > Security view > Settings tab.

In an environment with multiple authentication servers, LDAP forwarding allows LDAP referral following for AD group lookups. LDAP forwarding can increase the time required to log on because AD group lookups are extended to connected authentication servers. When your AD instance attempts to contact domain controllers that are blocked by your firewall, users can experience a delay of several minutes in logging on to NetWitness Platform. NetWitness Platform has a configuration option that specifies whether LDAP forwarding occurs; by default, LDAP referrals are disabled. When disabled, your AD instance does not attempt to contact referred domain controllers.

Note: The Settings tab also provides the option to enable PAM configuration, which can be used simultaneously with Active Directory configurations. For information on enabling and configuring PAM authentication, see Configure PAM Login Capability.

Configure Active Directory Authentication

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.
   The Active Directory Configurations list is displayed in the panel so that you can add or edit a configuration.



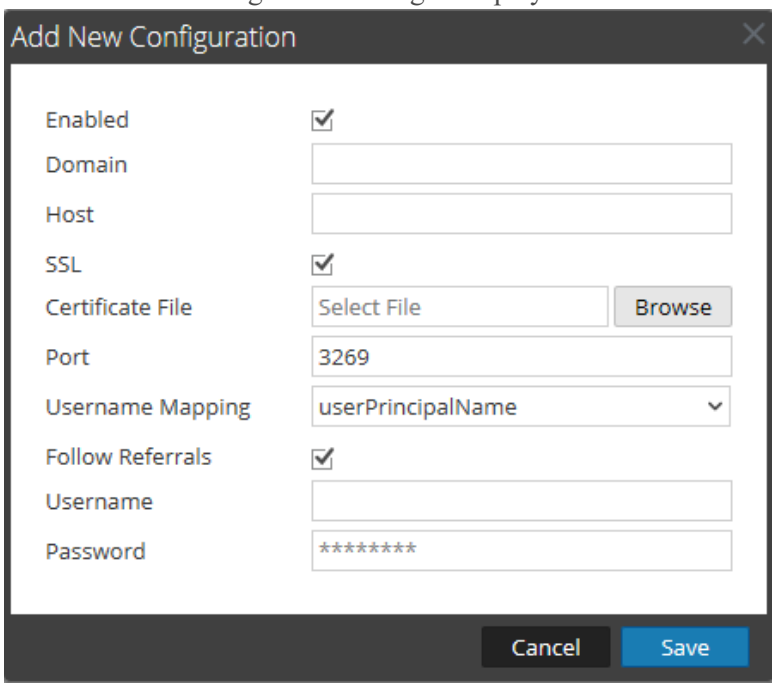
3. Add, edit, or delete domains as necessary, as described in the following sections.
   The domains added to this list are automatically populated in the External Group Mapping tab so that you can map security roles to each group.

Note: To configure security roles used for Active Directory access, see Step 5. (Optional) Map User Roles to External Groups.

Add a New Active Directory Configuration

To add a new active directory configuration in the Active Directory Configurations list:

1. Under Active Directory Configurations, click +.
   The Add New Configuration dialog is displayed.



2. Select the **Enabled** checkbox.
3. Enter **Domain**, **Host** and **Port** information for the Active Directory Service.
4. (Optional) To select SSL for this configuration, select the **SSL** checkbox. You must then enter the Active Directory server certificate file by clicking **Browse** and selecting the desired file to upload.
5. In the **Username Mapping** field, select the Active Directory search field to use for username mapping. You can select userPrincipalName (UPN) or sAMAccountName.
6. For sites that have multiple authentication servers, click **Follow Referrals** to enable or disable LDAP referral following for AD group lookups.
7. To provide credentials to bind to the Active Directory Service while searching Active Directory group, enter the credentials in the **Username** and **Password** fields.

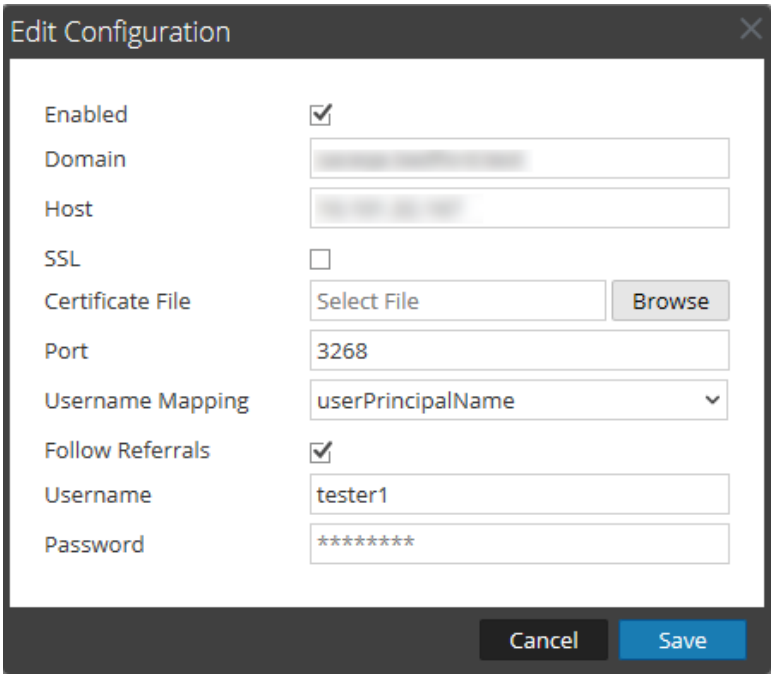
Note: If you selected sAMAccountName in the **Username Mapping** field, you must enter the username in the format "domain\user" to authenticate.

8. Click **Save**.
   The new configuration is listed in the Active Directory Configurations list.

Edit an Active Directory Configuration

To edit an active directory configuration in the Active Directory Configurations list:

1. Under **Active Directory Configurations**, select the configuration you wish to edit and click . The Edit Configuration dialog is displayed.



2. (Optional) Enter the **Domain**, **Host** and **Port** information for the Active Directory Service.
3. (Optional) To select SSL for this configuration, select the **SSL** checkbox. You must then enter the Active Directory server certificate file by clicking **Browse** and selecting the desired file to upload.
4. (Optional) In the **Username Mapping** field, select the the Active Directory search field to use for username mapping.
5. To specify the Follow LDAP referrals behavior in environments with multiple authentication servers, select the **Follow Referrals** checkbox.
   a. If you want to disable LDAP forwarding, clear the box.
   b. If you want to enable LDAP forwarding, select the box.
6. To provide credentials to bind to the Active Directory Service while searching Active Directory group, enter the credentials in the **Username** and **Password** fields.
7. Click **Save**.
   The configuration is listed in the Active Directory Configurations list.

Test an Active Directory Configuration

To test an active directory configuration:

1. Select the configuration to be tested from the Active Directory Configurations list.
2. In the toolbar, click Test.
   A message that the test is successful is displayed.
3. If the test does not succeed, review and edit the configuration.

Delete an Active Directory Configuration

To delete an active directory configuration:

1. Under Active Directory Configurations, select the configuration to be deleted from the Active Directory Configurations list.
2. In the toolbar, click −.
   A message is displayed warning you that all users in the selected Active Directory configuration will not be able to log in to NetWitness Platform if it is deleted.
3. Do one of the following:
   a. To confirm the deletion, click **Yes**.
   b. To cancel the deletion, click **No**.

Configure PAM Login Capability

This topic explains how to configure NetWitness Platform to use Pluggable Authentication Modules (PAM) to authenticate external user logins.

PAM login capability involves two separate components:

- PAM for user authentication
- NSS for group authorization

Together they provide external users the capability to log on to NetWitness Platform without having an internal NetWitness Platform account, and to receive permissions or roles determined by mapping the external group to a NetWitness Platform security role. Both components are required for a login to succeed.

External authentication is a system-level setting. Before configuring PAM, carefully review all of the information here.

Pluggable Authentication Modules

PAM is a Linux-provided library responsible for authenticating users against authentication providers such as RADIUS, Kerberos, or LDAP. For implementation, each authentication provider uses its own module, which is in the form of an operating system (OS) package such as pam_ldap. NetWitness Platform uses the OS-provided PAM library, and the module that the PAM library is configured to use, to authenticate users.

Note: PAM provides only the ability to authenticate.

Name Service Switch

NSS is a Linux feature that provides databases that the OS and applications use to discover information like hostnames; user attributes like home directory, primary group, and login shell; and to list users that belong to a given group. Similar to PAM, NSS is configurable and uses modules to interact with different types of providers. NetWitness Platform uses OS-provided NSS capabilities to authorize external PAM users by looking up whether a user is known to NSS and then requesting from NSS the groups of which that user is a member. NetWitness Platform compares the results of the request to the NetWitness Platform External Group Mapping and if a matching group is found, the user is granted access to log on to NetWitness Platform with the level of security defined in the External Group Mapping.

Note: NSS does not provide authentication.

PAM and NSS Combination

Both PAM (authentication) and NSS (authorization) must succeed in order for an external user to be allowed to log on to NetWitness Platform. The procedure for configuring and troubleshooting PAM is different than the procedure for configuring and troubleshooting NSS. The PAM examples in this guide include Kerberos, LDAP, and Radius. The NSS examples include LDAP and UNIX. The PAM and NSS module combination used is determined by site needs.

Process Overview

To configure PAM login capability, follow the instructions in this document to complete each step:

1. Configure and test the PAM module.
2. Configure and test the NSS service.
3. Enable PAM in NetWitness Server.
4. Create group mappings in NetWitness Server.

Prerequisites

Before beginning the setup of PAM, review the procedure and gather the external authentication server details depending on the PAM module you want to implement.

Before beginning the setup of NSS, review the procedure, identify the group names that you will use in the External Group mapping, and gather the external authentication server details, depending on the NSS service being used.

Before beginning setup of PAM in NetWitness Platform, identify the group names that you will use in the External Group mapping. When mapping roles, the role in NetWitness Platform must match a group name that exists in the external authentication server.

Configure and Test the PAM Module

Choose one of the following sections to set up and configure the PAM component:

- PAM Kerberos
- PAM RADIUS
- PAM Agent for SecurID

PAM Kerberos

Kerberos Communication Ports – TCP 88

To configure PAM authentication using Kerberos:

1. Execute the following command (but first verify that the `krb5-workstation` package is installed in your environment):
   `yum install krb5-workstation pam_krb5`
2. Edit the following lines in the Kerberos configuration file `/etc/krb5.conf`. Replace variables, which are delimited by <angle brackets>, with your values and omitting the angle brackets. Capitalization is required where shown.

```
# Configuration snippets may be placed in this directory as well
includedir /etc/krb5.conf.d/

[logging]
default = FILE:/var/log/krb5libs.log
kdc = FILE:/var/log/krb5kdc.log
admin_server = FILE:/var/log/kadmind.log

[libdefaults]
 dns_lookup_realm = false
 ticket_lifetime = 24h
 dns_lookup_kdc = true
 renew_lifetime = 7d
 forwardable = true
 rdns = false
 default_realm = <DOMAIN.COM>
 default_ccache_name = KEYRING:persistent:%{uid}

[realms]
 <DOMAIN.COM> = {
 kdc = <SERVER.DOMAIN.COM>
 admin_server = <SERVER.DOMAIN.COM>
 }

 [domain_realm]
 <domain.com> = <DOMAIN.COM>
 <.domain.com> = <DOMAIN.COM>
```

3. Test the Kerberos configuration with the command:
   `kinit <user>@<DOMAIN.COM>`
   No output after entering the password indicates success.
4. Edit the NetWitness Server PAM configuration file `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:
   `auth sufficient pam_krb5.so no_user_check`

This completes the configuration for PAM Kerberos. Now, go to the next section, Configure and Test the NSS Service.

PAM RADIUS

Radius Communication Ports - UDP 1812 or UDP 1813

To configure PAM authentication using Radius you must add the NetWitness Server to your Radius Server's Client list and configure a shared secret. Contact the Radius Server Administrator for this procedure.

To configure PAM authentication using RADIUS:

1. Execute the following command (but first verify that the `pam_radius_auth` package is installed in your environment):
   ```
   yum install pam_radius_auth
   ```
2. Edit the RADIUS configuration file, `/etc/raddb/server` as follows:
   ```
   # server[:port] shared_secret  timeout (s)
   server    secret     3
   ```
3. Edit the NetWitness Server PAM configuration file `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:
   ```
   auth sufficient pam_radius_auth.so
   ```
4. Execute the following command to copy the RADIUS library:
   ```
   cp /usr/lib/security/pam_radius_auth.so /usr/lib64/security/
   ```

Caution: For PAM RADIUS to work, the `/etc/raddb/server` files must have write permission. The command needed for this is: `chown netwitness:netwitness /etc/raddb/server`.

Caution: You must restart the Jetty server after making the above changes for PAM RADIUS. The command for this is:
`systemctl restart jetty`

The PAM Modules and associated services output information to `/var/log/messages` and `/var/log/secure`. These outputs can be used to assist in troubleshooting configuration problems.

The following procedure is an example of the steps to configure PAM authentication for RADIUS using SecurID:

Note: The examples in these tasks use RSA Authentication Manager as the RADIUS server.

1. Execute the following command (but first verify that the `pam_radius_auth` package is installed in your environment):
   ```
   yum install pam_radius_auth
   ```
2. Edit the RADIUS configuration file, `/etc/raddb/server` and update it with the authentication manager instance hostname, shared secret and timeout value:
   ```
   # server[:port] shared_secret timeout (s)
    111.222.33.44        secret       1
    #other-server       other-secret 3
   ```

```
192.168.12.200:6369 securid      10
```

Note: You must comment out `127.0.0.1` and `other-server` lines and add the IP address of the authentication manager primary instance with RADIUS port number (for example, `192.168.12.200:1812`), RADIUS shared secret, and a timeout value of 10.

3. Edit the NetWitness Server PAM configuration file `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:

   ```
   auth sufficient pam_radius_auth.so
   ```

   Note: You can add `debug` to the end of the above line in the `/etc/pam.d/securityanalytics` file to enables PAM debugging (for example, `auth sufficient pam_radius_auth.so debug`)

4. Execute the following command to copy the RADIUS library:
   `cp /usr/lib/security/pam_radius_auth.so /usr/lib64/security/`

The PAM Modules and associated services output information to `/var/log/messages` and `/var/log/secure`.These outputs can be used to assist in troubleshooting configuration problems.

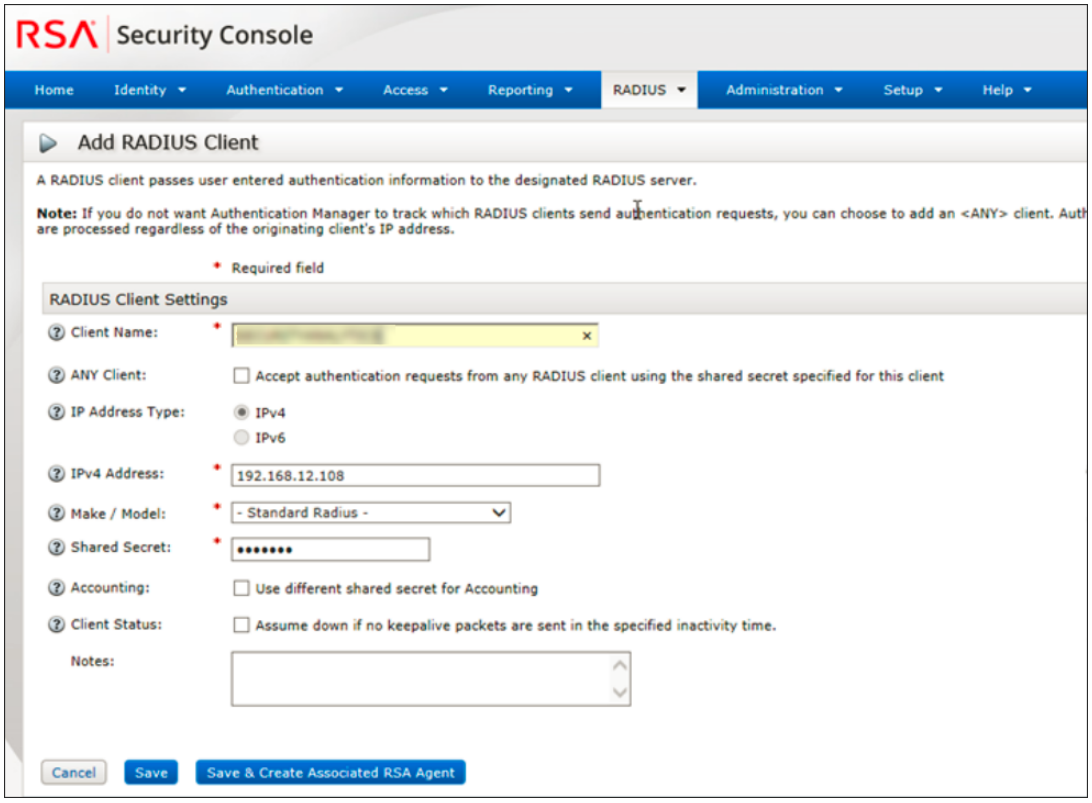
Add a RADIUS Client and Associated Agent

Note: The examples in these tasks use RSA Authentication Manager as the RADIUS server. You must use administrative account credentials to log on RSA Authentication Manager Security Console.

To add a RADIUS Client and Associated Agent:

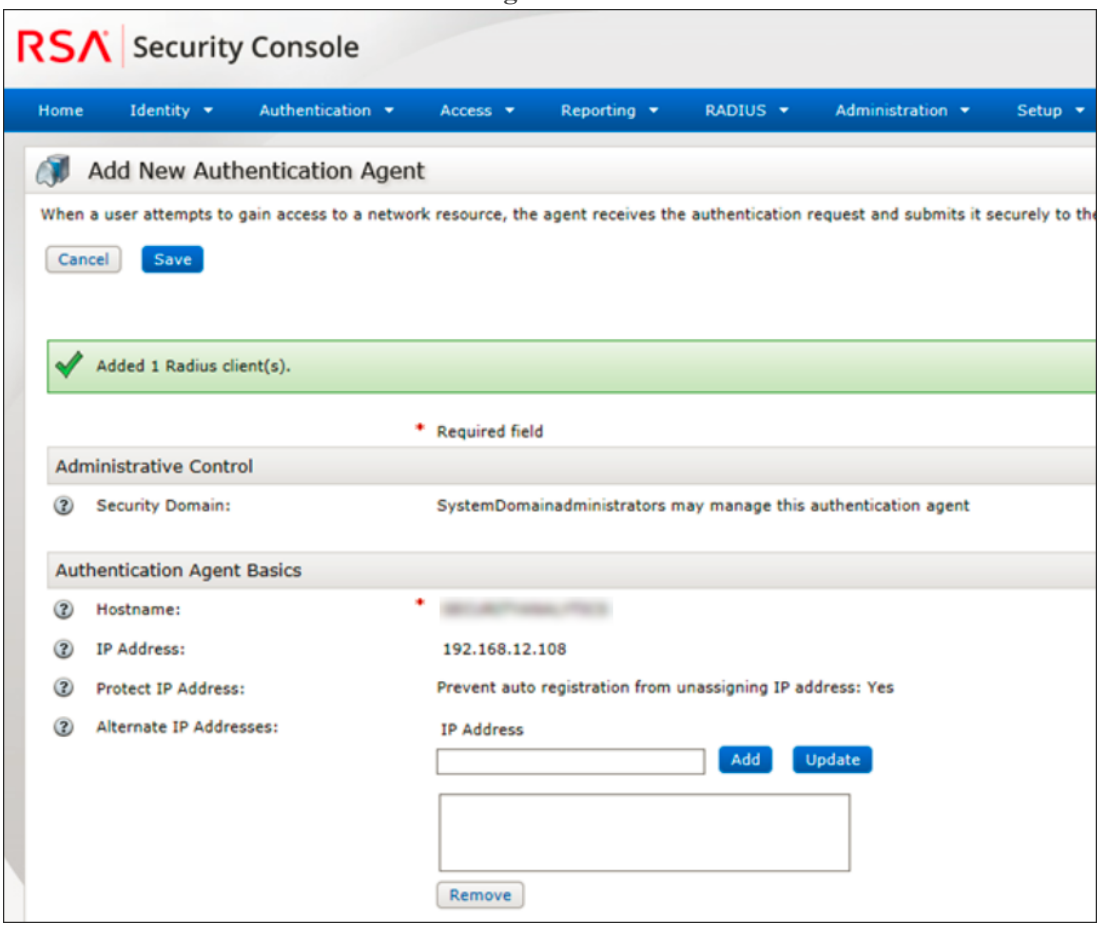
1. Log on to RSA Authentication Manager.
   The Security Console is displayed.

2. In the Security Console, click **RADIUS > RADIUS Client > Add New**.
   The Add RADIUS Client page is displayed.



3. In RADIUS Client Settings, provide the following information:
   a. In the **Client Name** field, enter the name of the client, for example, NetWitness Platform.
   b. In the **IPv4 Address** field, enter the IPv4 address of the RADIUS client, for example, 192.168.12.108.
   c. In the **Make/Model** drop-down list, select the type of RADIUS client, for example, Fortinet.
   d. In the **Shared Secret** field, enter the authentication shared secret.

4. Click **Save & Create Associated RSA Agent**.



5. Click **Save**.

If the Authentication Manager instance is unable to find the authentication agent on the network, a warning page is displayed. Click **Yes, Save Agent**.

For more information, see the "Add a RADIUS Client" topic in *RSA Authentication Manager 8.2 Administrator's Guide*.

This completes the configuration for PAM RADIUS. Now, go to the next section, Configure and Test the NSS Service.

PAM Agent for SecurID

PAM Communication Port - UDP 5500

Prerequisites

The RSA SecurID PAM module is supported only under the following condition:

- Trusted connections must be enabled and functioning between NetWitness Platform and Core services.

Process Overview

The high-level steps to configure the SecurID PAM module are:

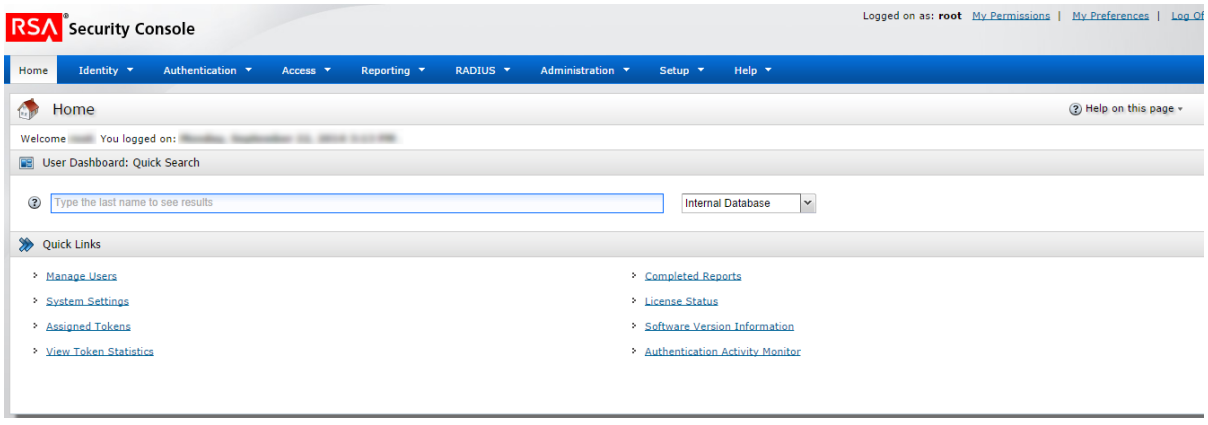
1. Configure the **Authentication Manager**:
   a. Add an Authentication Agent.
   b. Create and download a configuration file.
2. Configure the **NetWitness Server**:
   a. Copy the configuration file from Authentication Manager and customize it.
   b. Install the PAM SecurID Module.
3. Test connectivity and authentication.

Then follow the remaining procedures in the sections that follow:

- Configure and Test the NSS Service
- Enable PAM in NetWitness Server
- Create Group Mappings in NetWitness Server

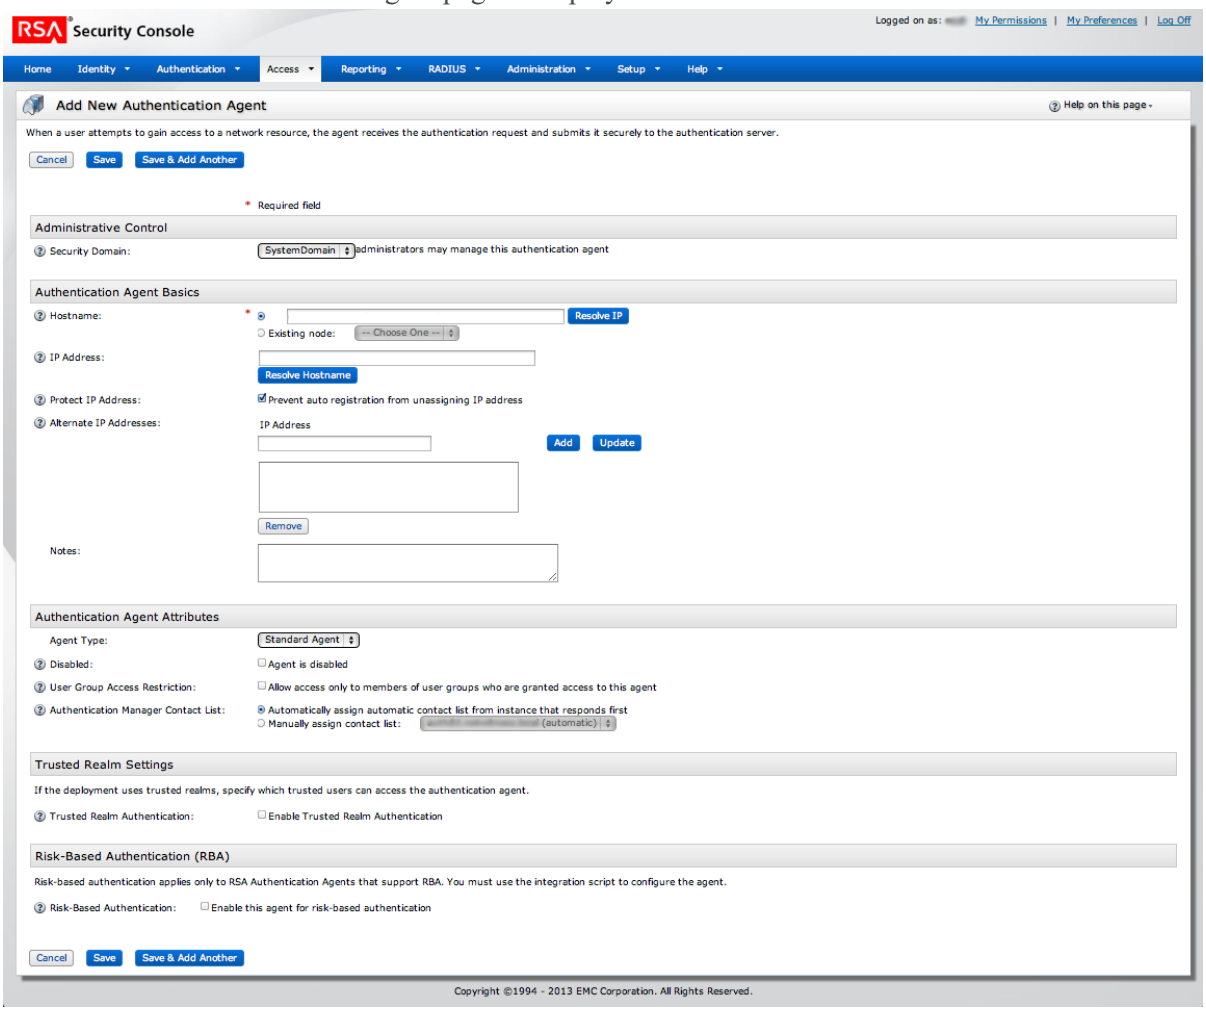
To configure Authentication Manager:

1. Log on to RSA Authentication Manager.
   The Security Console is displayed.



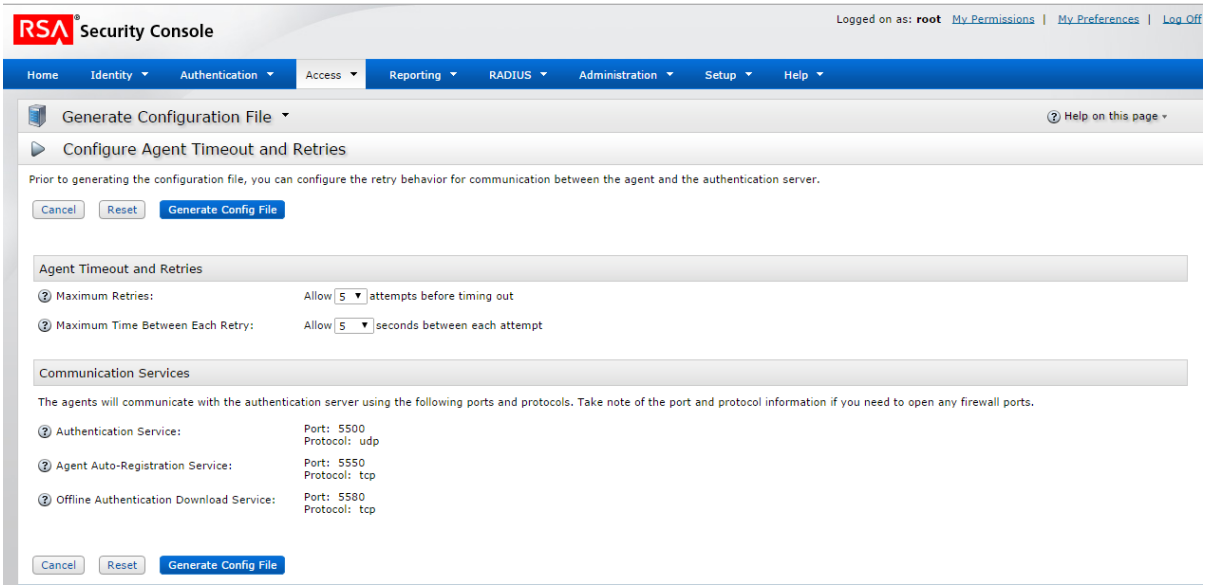
2. In the Security Console, add a new authentication agent.
   Click **Access > Authentication Agents > Add New.**

The Add New Authentication Agent page is displayed.



3. In the **Hostname** field, type the hostname of the NetWitness Server.
4. Click **Resolve IP**.
   The IP address of the NetWitness Server is automatically displayed in the **IP Address** field.
5. Keep the default settings and click **Save**.
6. Generate a configuration file.
   Go to **Access > Authentication Agents > Generate Configuration File**.

The Generate Configuration File page is displayed.



7. Keep the defaults and click **Generate Config File**.
   This creates **AM_Config.zip**, which contains two files.
8. Click **Download Now**.

To install and configure the PAM SecurID module:

1. On the NetWitness Server, make the following directory:
   `mkdir /var/ace`
2. On the NetWitness Server, copy `sdconf.rec` from the .zip file to `/var/ace`.
3. Create the text file `sdopts.rec` in the `/var/ace` directory.
4. Insert the following line:
   `CLIENT_IP=<IP address of NetWitness Server>`
5. Install the SecurID Authorization Agent for PAM, which is available in the yum repository:
   `yum install sid-pam-installer`
6. Run the install script:
   `/opt/rsa/pam-agent-installer/install_pam.sh`
7. Follow the prompts to accept or change the defaults.
8. Edit the NetWitness Server PAM configuration file, `/etc/pam.d/securityanalytics` to add the following line. If the file does not exist, create it and add the following line:
   `auth sufficient pam_securid.so`

This completes the installation of the SecurID PAM module. Next, test the connectivity and authentication. Then, follow the procedures in Configure and Test the NSS Service.

Note: If the PAM SecurID setup is not complete, it may crash the Jetty server and the NetWitness Platform UI will not be displayed. You must wait until the PAM authentication configuration is complete and then restart the Jetty server.

To test connectivity and authentication:

1. Run `/opt/pam/bin/64bit/acetest`, and enter the **username** and **passcode**.
2. (Optional) If acetest fails, turn on debugging:
   `vi/etc/sd_pam.conf`
   `RSATRACELEVEL=15`
3. Run `/opt/pam/bin/64bit/acestatus`. The output is displayed as shown below.

```
RSA ACE/Server Limits
 ---------------------
 Configuration Version : 15 Client Retries : 5
 Client Timeout : 5 DES Enabled : Yes

RSA ACE/Static Information
 -------------------------
 Service : securid Protocol : udp Port Number : 5500

RSA ACE/Dynamic Information
 --------------------------
 Server Release : 8.1.0.0 Communication : 5

RSA ACE/Server List
 ------------------
 Server Name :  auth81.netwitness.local
 Server Address :  192.168.100.10
 Server Active Address : 192.168.100.10
 Master : Yes Slave : No Primary : Yes
 Usage : Available for Authentications
```

4. (Optional) To troubleshoot the Authentication Manager server,
   go to **Reporting > Real-time Activity Monitors > Authentication Activity Monitor.**
   Then click **Start Monitor**.
5. If you changed the setting, reset RSATRACELEVEL to 0:
   `vi/etc/sd_pam.conf`
   `RSATRACELEVEL=0`

Caution: After installation, verify that VAR_ACE in the `/etc/sd_pam.conf` file points to the correct location of the sdconf.rec file. This is the path to the configuration files. The command needed for this is: `chown -R netwitness:netwitness /var/ace`.

This completes the configuration for PAM Agent for SecurID. Now, go to the next section, Configure and Test the NSS Service.

Configure and Test the NSS Service

NSS UNIX

No configuration is necessary to enable the NSS UNIX module; it is enabled in the host operating system by default. To authorize a user for a specific group, simply add that user to the operating system and add them to a group:

1. Create an OS group to use add your external user to with this command:
   `groupadd <groupname>`
2. Add the external user to the OS with this command:
   `adduser -G <groupname> -M -N <externalusername>`

Note: This does NOT permit or allow access to the NetWitness Server console.

This completes the configuration for NSS UNIX. Next, go to Test NSS Functionality.

Test NSS Functionality

To test whether NSS is working with any of the previous NSS services, use the following commands:

```
getent passwd <pamUser>
 getent group <groupOfPamUser>
```

Output should be similar to:

```
[root@~]# getent passwd myuser
 myuser:*:10000:10000::/home/myuser:/bin/sh
```

```
[root@~]# getent group mygroup
 mygroup:*:10000:myuser3
```

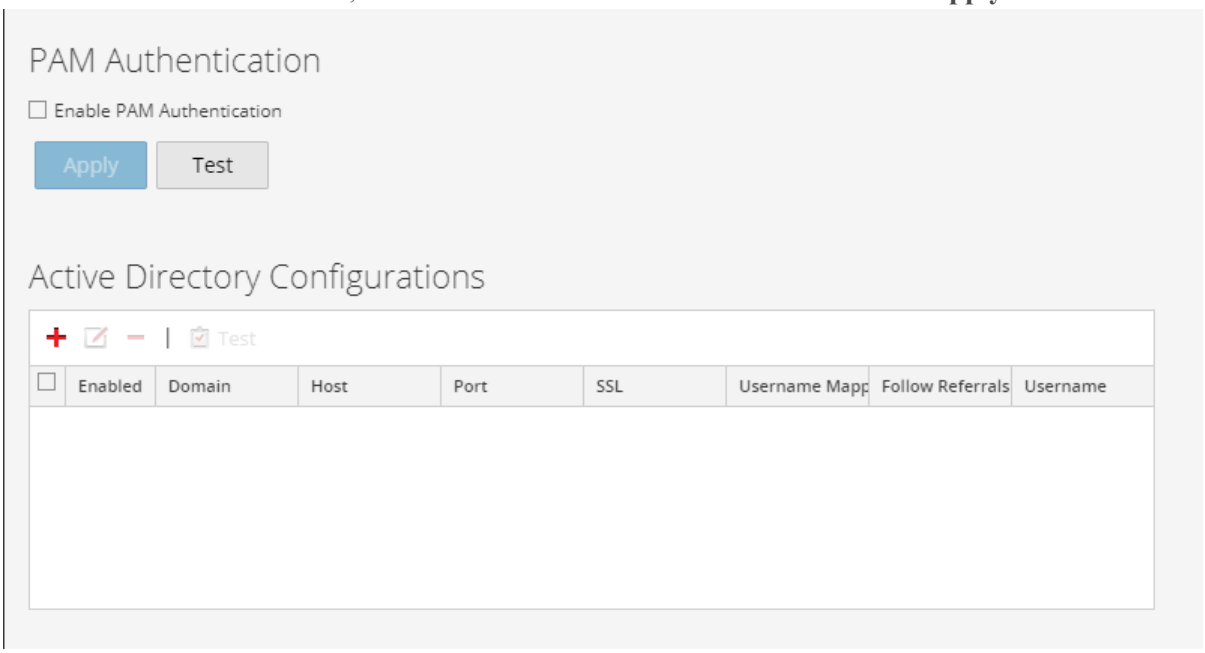
- If neither command produces output, NSS is not working properly for external authorization. Refer to the troubleshooting guidance for your NSS module provided in this document.
- If `getent` commands succeed and authentication success is confirmed in `/var/log/secure` but NetWitness Platform still fails to allow External users to login:
  - Was the correct group name specified for the NSS group in NW External Group Mapping? See Enable PAM and Create Group Mappings below.
  - It is possible that the NSS configuration has changed and NetWitness Platform has not picked up the change. A reboot of the NetWitness Platform host will cause NetWitness Platform to pick up NSS configuration changes. A restart of the Jetty server is not sufficient.

Go to the next section, Enable PAM in NetWitness Server.

Enable PAM in NetWitness Server

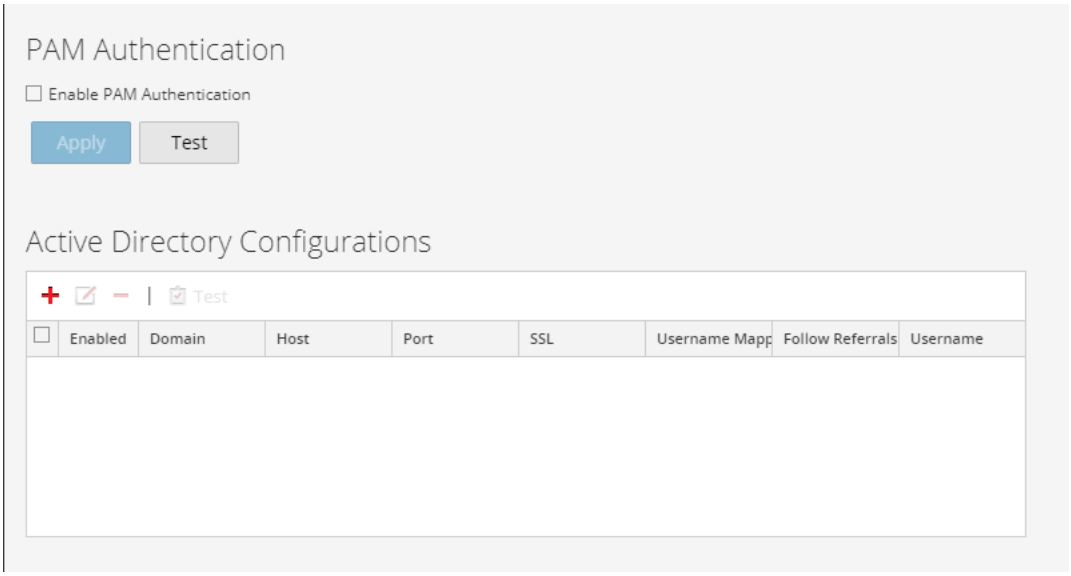
1. In NetWitness Platform, go to **ADMIN > Security**.
   The Admin > Security view is displayed with the Users tab open.
2. Click the **Settings** tab.

3. Under **PAM Authentication**, select **Enable PAM Authentication** and click **Apply**.

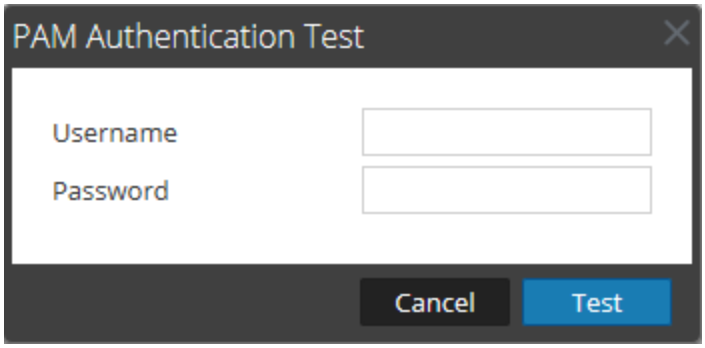


Test External Authentication for PAM

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.
3. Under **PAM Authentication**, select **Enable PAM Authentication**.



4. Under **PAM Authentication** options, click **Test.**
   The **PAM Authentication Test** dialog is displayed.



5. Type a user name and password that you want to test for authentication using the current PAM configuration.
6. Click **Test**.
   The external authentication method is tested to ensure connectivity.
7. If the test does not succeed, review and edit the configuration.

PAM is enabled, and Active Directory configurations will also remain enabled. PAM configurations are automatically populated in the External Group Mapping tab so that you can map security roles to each group.

Create Group Mappings in NetWitness Server

To configure security roles used for PAM access, see Step 5. (Optional) Map User Roles to External Groups.

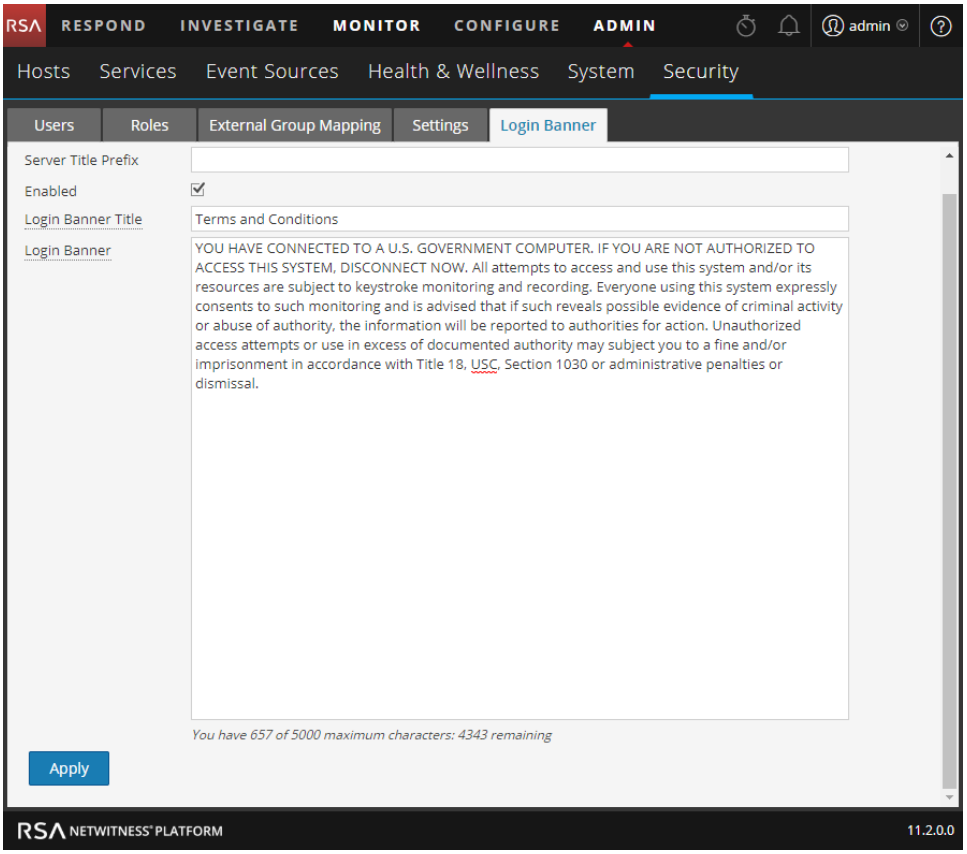
Step 5. (Optional) Create a Customized Login Banner

This topic provides instructions for creating a login banner that is displayed before users log on to NetWitness Platform.

You can create and enable a customized banner asking users to agree to conditions before logging on. Users who do not agree are not able to log on.

Create and Enable a Customized Login Banner

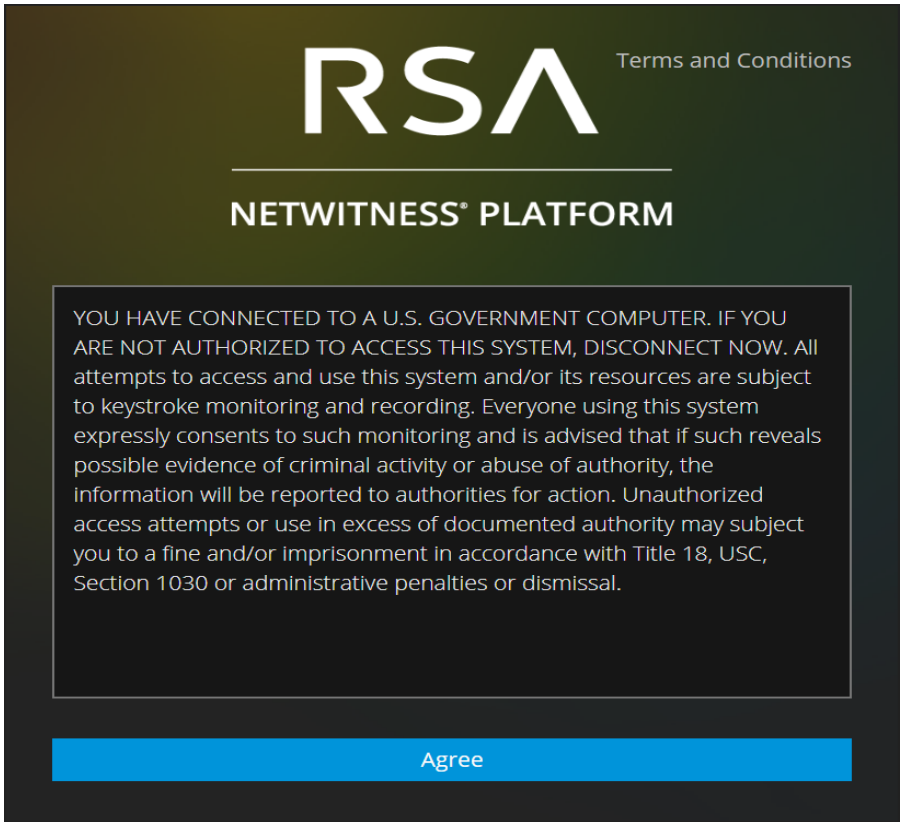
1. Go to **ADMIN > Security.**
   The Security view is displayed with the Users tab open.
2. Click the **Login Banner** tab and select the **Enabled** checkbox to toggle between enabling and disabling the banner.
   When Enable is selected, the Login Banner Title and Login Banner fields become active with default content in place.



3. Use the default content or type the custom title and content for your banner and click **Apply**.
   The banner is enabled and becomes active immediately.

Note: While both plain text and text with HTML tags are allowed, any suspicious tags will be removed. For example, all links must use 'https' protocols.

4. To test the banner, log out. The banner is displayed in front of the fields for entering NetWitness Platform credentials.



5. Click **Agree**.
   The banner closes and you can log on.

How Role-Based Access Control Works

This topic explains role-based access control (RBAC) when there is a trusted connection between NetWitness Server and a Core service.

In the RSA NetWitness® Platform, roles determine what users can do. A role has permissions assigned to it and you must assign a role to each user. The user then has permission to do what the role allows.

Preconfigured Roles

To simplify the process of creating roles and assigning permissions, there are preconfigured roles in NetWitness Platform. You can also add roles customized for your organization.

The following table lists each preconfigured role and the permissions assigned to it. All permissions are assigned to the Administrators role. A subset of permissions is assigned to each of the other roles.

Role	Permission
Administrators	Full system access. The System Administrators persona is granted all permissions by default.
Respond_ Administrator	Access to all Respond permissions. The Respond Administrator persona is focused on system configuration of Respond.
Data_Privacy_ Officers	The Data Privacy Officer (DPO) persona is similar to Administrators with additional focus on configuration options that manage obfuscation and viewing of sensitive data within the system (see the *Data Privacy Management Guide*). Users with the DPO role can see which meta keys are flagged for obfuscation, and they also see obfuscated meta keys and values created for the flagged meta keys.
SOC_ Managers	Same access as Analysts plus additional permission to handle incidents. The SOC Managers persona is identical to Analysts, but with permissions necessary to configure Respond.
Operators	Access to configurations but not to meta and session content. The System Operators persona is focused on system configuration, but not investigation, ESA, Alerting, Reporting, and Respond.
Malware_ Analysts	Access to investigations and malware events. The only access granted to the Malware Analysts persona is the Malware Analysis module.

Role	Permission
Analysts	Access to meta and session content but not to configurations. The Security Operation Center (SOC) Analysts persona is centered around investigation, ESA Alerting, Reporting, and Respond, but not system configuration.
UEBA_ Analysts	Access to the RSA NetWitness UEBA service in the **Investigate** > **Users** view. NetWitness UEBA is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all entities in your network environment. **Note:** You do not need to set up specific permissions for this role. You only need to assign this role to a user, and that user will have access to NetWitness UEBA.

Trusted Connections Between Server and Service

In a trusted connection, a service explicitly trusts NetWitness Server to manage and authenticate users. This reduces administration on each service because authenticated users do not have to be defined locally in each Core service.

As the following table shows, you perform all user management tasks on the server.

Task	Location
Add a user	Server
Maintain usernames	Server
Maintain passwords	Server
Authenticate internal NetWitness Platform users	Server
(Optional) Authenticate external users with:	
- Active Directory	Server
- PAM	Server
Install and configure PAM	Server

The benefits of a trusted connection and centralized user management are that:

- You perform all user administration tasks once, on NetWitness Server only.
- You control access to services but do not have to set up and authenticate users on the services.
- Users enter passwords once at NetWitness Platform logon and are authenticated by the server.
- Users, already authenticated by the server, access every Core service in ADMIN > Services without entering a password.

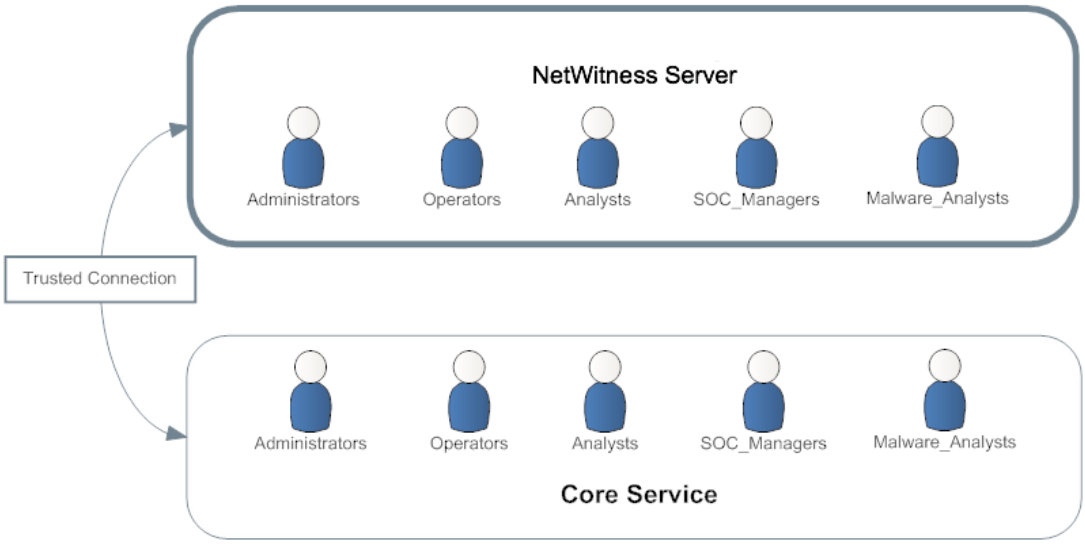
How Trusted Connections Are Established

When you install or upgrade to 11.x, trusted connections are established by default with two settings:

- SSL is enabled.
- The Core service is connected to an encrypted SSL port.

Common Role Names on the Server and Services

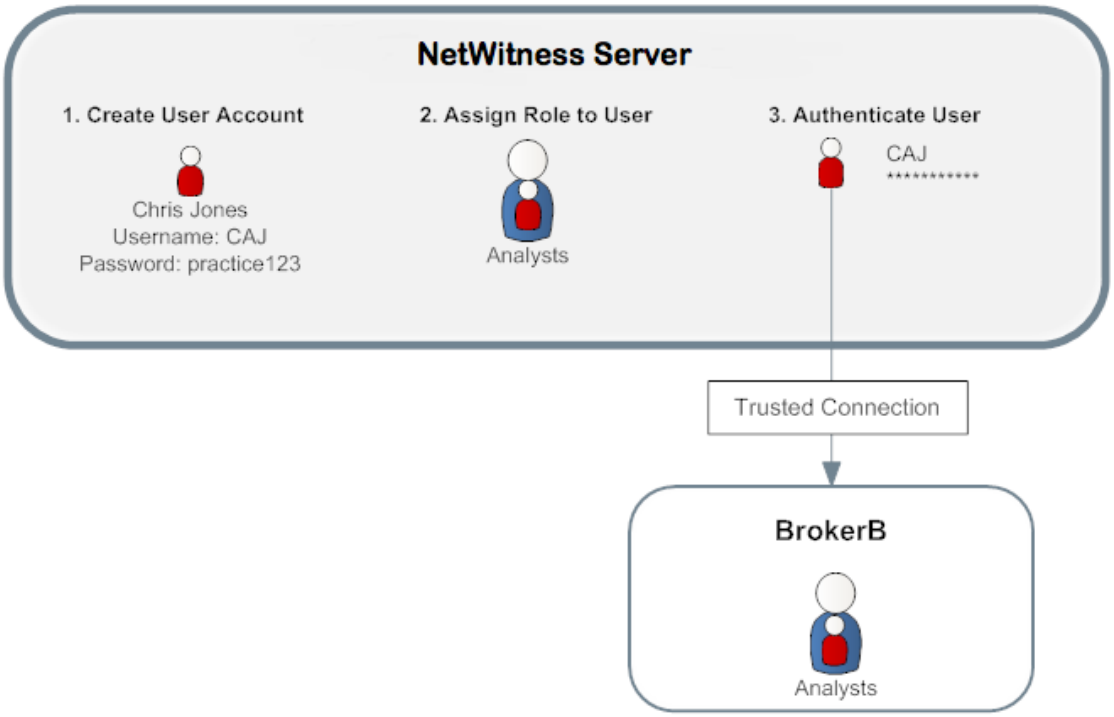
Trusted connections rely on common role names on the server and service. On a fresh installation, NetWitness Platform installs the five preconfigured roles on the server and each Core service.



If you add a custom role, such as JuniorAnalysts, you must add the role to each service, such as ArchiverA and BrokerB. Role names are case-senstive, cannot contain spaces and must be identical. For example, JuniorAnalyst (singular) and JuniorAnalysts (plural) do not meet the requirements for common role names.

End-to-End Workflow for User Setup and Service Access

This workflow shows how role-based access control works when there is a trusted connection between NetWitness Server and the service BrokerB.



1. On NetWitness Server, create an account for a new user:
   Name: Chris Jones
   Username: CAJ
   Password: practice123
2. Determine if you want to assign a preconfigured or custom role to Chris Jones:
   - **Preconfigured role**
     a. Keep or modify the default permissions assigned to the **Analysts role,** which include permissions such as access to the Alerting, Investigation and Malware modules,
     b. Assign the Analysts role to Chris Jones.
   - **Custom role**
     a. Create the custom role, such as JuniorAnalysts.
     b. Assign permissions to the **JuniorAnalysts role**.
     c. Assign the JuniorAnalysts role to Chris Jones.
     d. Add the JuniorAnalysts role to the service, such as BrokerB.
3. The user, Chris Jones, logs on to NetWitness Server:
   Username: CAJ

Password: practice123

4. The server authenticates Chris.
5. The trusted connection allows the authenticated user, Chris, to access BrokerB without entering another password.

For more detailed descriptions and procedures, see Manage Users with Roles and Permissions.

Related Topic

- Role Permissions

Role Permissions

This topic describes access to the user interface that users assigned to the built-in NetWitness Platform roles have by default.

Within NetWitness Platform, user access to each module, dashlet, and view is restricted based on the assigned permissions described in this topic. You can locate these role permissions in the Add or Edit Roles dialogs accessible from the Admin > Security > Roles tab.

In the Add or Edit Role dialogs, the tabs in the Permission section represent different areas of NetWitness Platform and show the available permissions for those areas. For example, the Administration tab shows the permissions available in the Admin view.

Note: There is no Configure tab in the Add/Edit Role dialogs that corresponds to the Configure view. To assign permissions in the Configure view, assign permissions to the views contained within the Configure view: Live Content (Live), Incident Rules (Incidents), Respond Notifications (Incidents, Respond-server, Integration server), ESA Rules (Alerting), Subscriptions (Live), and Custom Feeds (Live).

Note: To the left of the Administration tab is a tab marked with an asterisk (*). This tab indicates access to management of backend services only.

The tables that follow show the default permissions assigned to each NetWitness Platform user role:

- Administrators
- Respond Administrators
- Data Privacy Officers (DPOs)
- SOC Managers (SOC Mgrs)
- Operators
- Malware Analysts (MAs)
- Analysts

Since the Administrators role has all of the permissions by default, it is not included in the tables.

Service Permissions Format for New Services

The service permissions for some new NetWitness Platform services contain three parts in the following format:

`<service name>.<resource>.<action>`

For example, for the **investigate-server.metrics.read** permission:

- `service name` = **investigate-server**
- `resource` = **metrics**
- `action` = **read**

Users assigned this permission can read any metrics that the investigate-server service exposes.

Administration

The following table lists the permissions in the Administration tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Administration Module	Yes	Yes	Yes	Yes	Yes
Access Health & Wellness	Yes	Yes	Yes	Yes	Yes
Apply System Updates	Yes				
Can Opt In to Live Intelligence Sharing	Yes				
Manage Advanced Settings	Yes				
Manage ATD Settings	Yes				
Manage Auditing	Yes				Yes
Manage Email	Yes				
Manage Global Auditing	Yes				Yes
Manage Health & Wellness Policy	Yes				
Manage LLS	Yes				
Manage Logs	Yes				Yes
Manage Notifications	Yes				
Manage Plugins	Yes				
Manage Predicates	Yes				
Manage Reconstruction	Yes				
Manage Security	Yes				Yes
Manage Services	Yes				Yes

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Manage System Settings	Yes				
Modify ESA Settings	Yes				
Modify Event Sources	Yes				
Modify Hosts	Yes				
Modify Services	Yes				Yes
View Event Sources	Yes		Yes

View Health & Wellness Stats Browser	Yes	Yes	Yes		Yes
View Hosts	Yes				Yes
View Services	Yes				Yes

Admin-server

The following table describes the permissions in the Admin-server tab. The Administrators role has all of the permissions and is the only role granted permissions by default.

Permission	Description
admin-server.configuration.manage	Permission to modify all service configuration parameters
admin-server.health.read	Permission to view any health notifications that the service exposes
admin-server.logs.manage	Permission to change log-related configuration
admin-server.metrics.read	Permission to view any metrics that the service exposes
admin-server.process.manage	Permission to start and stop the service
admin-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)

Permission	Description
admin-server.security.read	Permission to view security-related resources

Alerting

The following table lists the permissions in the Alerting tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Alerting Module	Yes	Yes	Yes		Yes
Manage Rules			Yes		Yes
View Alerts	Yes	Yes	Yes		Yes
View Rules			Yes		Yes

Cloud-gateway-server

The following table describes the permissions in the Cloud-gateway-server tab. The Administrators role has all of the permissions and is the only role granted permissions by default.

Permission	Description
cloud-gateway-server.configuration.manage	Permission to modify all service cloud gateway parameters
cloud-gateway-server.health.read	Permission to view any health notifications that the service exposes
cloud-gateway-server.logs.manage	Permission to change log-related configuration
cloud-gateway-server.metrics.read	Permission to view any metrics that the service exposes
cloud-gateway-server.process.manage	Permission to start and stop the service
cloud-gateway-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)

Permission	Description
cloud-gateway-server.security.read	Permission to view security-related resources
cloud-gateway-server.uploadstream.manage	Permission to edit uploadstream configuration settings
cloud-gateway-server.uploadstream.read	Permission to view uploadstream configuration settings

Config-server

The following table describes the permissions in the Config-server tab. The Administrators role has all of the permissions and is the only role granted permissions by default.

Permission	Description
config-server.*	All permissions (everything below)
config-server.configuration.manage	Permission to modify all service configuration parameters
config-server.health.read	Permission to view any health notifications that the service exposes
config-server.logs.manage	Permission to change log-related configuration
config-server.metrics.read	Permission to view any metrics that the service exposes
config-server.process.manage	Permission to start and stop the service
config-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
config-server.security.read	Permission to view security-related resources

Content-server

The following table describes the permissions in the Content-server tab.

Permission	Description
content-server*	All permissions (everything below)

Permission	Description
content-server.logparser.manage	Permission to manage log parser configurations
content-server.logparser.read	Permission to view log parser configurations

The following table lists the permissions in the Content-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrator role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
content-server.*	Yes				Yes
content-server.logparser.manage	Yes				Yes
ontent-server.logparser.read	Yes	Yes	Yes		Yes

Contexthub-server

The following table describes the permissions in the Contexthub-server tab.

Permission	Description
contexthub-server.*	All permissions (everything below)
contexthub-server.configuration.manage	Permission to modify all service configuration parameters
contexthub-server.connection.manage	Permission to modify all connection settings
contexthub-server.connection.read	Permission to view all connection settings
contexthub-server.connectiontypes.read	Permission to view all configured connection types
contexthub-server.datasource.manage	Permission to modify data source settings
contexthub-server.datasource.read	Permission to view data source settings

Permission	Description
contexthub-server.health.read	Permission to view any health notifications that the service exposes
contexthub-server.listentries.manage	Permission to modify list entries
contexthub-server.logs.manage	Permission to change log-related configuration
contexthub-server.metrics.read	Permission to view any metrics that the service exposes
contexthub-server.process.manage	Permission to start and stop the service
contexthub-server.query.read	Permission to view queries
contexthub-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
contexthub-server.security.read	Permission to view security-related resources
contexthub-server.stix.read	Permission to view stix settings
contexthub-server.taxiidatasource.manage	Permission to modify settings for the taxii data source
contexthub-server.taxiidatasource.read	Permission to view settings for the taxii data source

The following table lists the permissions in the Contexthub-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrator role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
contexthub-server.*					Yes
contexthub-server.configuration.manage					
contexthub-server.connection.manage					
contexthub-server.connection.read		Yes	Yes	Yes	
contexthub-server.connectiontypes.read			Yes		

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
contexthub-server.datasource.manage		Yes	Yes	Yes	
contexthub-server.datasource.read		Yes	Yes	Yes	
contexthub-server.health.read					
contexthub-server.listentries.manage		Yes	Yes	Yes	
contexthub-server.logs.manage					
contexthub-server.metrics.read					
contexthub-server.process.manage					
contexthub-server.query.read		Yes	Yes	Yes	
contexthub-server.security.manage					
contexthub-server.security.read					
contexthub-server.stix.read		Yes	Yes	Yes	
contexthub-server.taxiidatasource.manage		Yes	Yes	Yes	
contexthub-server.taxiidatasource.read		Yes	Yes	Yes	

Dashboard

The following table lists the permissions in the Dashboard tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Dashlet Access - Admin Device List Dashlet	Yes	Yes	Yes		Yes
Dashlet Access - Admin Device Monitor Dashlet					Yes

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs

Dashlet Access - Unified RSA First Watch Dashlet	Yes	Yes	Yes		Yes
Dashlet Access - Unified Shortcuts Dashlet	Yes	Yes	Yes		Yes

Endpoint-server

The following table describes the permissions in the Endpoint-server tab. The Administrators role has all of the permissions by default.

Permission	Description
endpoint-server*	All permissions (everything below)
endpoint-server.agent.manage	Permission to download and manage agent packager configuration
endpoint-server.agent.read	Permission to view the agent packager configuration
endpoint-server.ca.manage	Permission to generate and download the agent packager
endpoint-server.ca.read	Permission to generate and download the agent packager
endpoint-server.configuration.manage	Permission to modify all endpoint configuration parameters
endpoint-server.dataretention.manage	Permission to configure the data retention policy
endpoint-server.dataretention.read	Permission to view the data retention policy
endpoint-server.filter.manage	Permission to delete filters
endpoint-server.filter.read	Permission to view filters
endpoint-server.health.read	Permission to view any health notifications that the service exposes
endpoint-server.logs.manage	Permission to change log-related configuration
endpoint-server.machine.manage	Permission to delete hosts
endpoint-server.machine.read	Permission to view hosts
endpoint-server.metrics.read	Permission to view any metrics that the service exposes
endpoint-server.policy.manage	Permission to update and save schedule scan configuration
endpoint-server.policy.read	Permission to view existing schedule scan configuration
endpoint-server.process.manage	Permission to start and stop the service

Permission	Description
endpoint-server.scan.manage	Permission to perform endpoint scan
endpoint-server.scan.read	Permission to view endpoint scan data
endpoint-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
endpoint-server.security.read	Permission to view security-related resources

The following table lists the permissions in the Endpoint-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrator role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
endpoint-server*	Yes				
endpoint-server.agent.manage					
endpoint-server.agent.read					
endpoint-server.ca.manage					
endpoint-server.ca.read					
endpoint-server.configuration.manage					
endpoint-server.dataretention.manage					
endpoint-server.dataretention.read					
endpoint-server.filter.manage		Yes			
endpoint-server.filter.read		Yes			
endpoint-server.health.read

endpoint-server.scan.read		Yes			
endpoint-server.security.manage					
endpoint-server.security.read					

Esa-analytics-server

The following table describes the permissions in the Esa-Analytics-server tab. The Administrators and Operators roles have all of the permissions and are the only roles granted permissions by default.

Permission	Description
esa-analytics-server.*	All permissions (everything below)
esa-analytics-server.analytics.manage	Permission to modify ESA analytics
esa-analytics-server.analytics.read	Permission to view ESA analytics
esa-analytics-server.configuration.manage	Permission to modify all service configuration parameters
esa-analytics-server.health.read	Permission to view any health notifications that the service exposes
esa-analytics-server.logs.manage	Permission to change log-related configuration
esa-analytics-server.metrics.read	Permission to view any metrics that the service exposes
esa-analytics-server.model.manage	Permission to modify ESA models

Permission	Description
esa-analytics-server.model.read	Permission to view ESA models
esa-analytics-server.process.manage	Permission to start and stop the service
esa-analytics-server.security.manage	Permission to modify security-related resources
esa-analytics-server.security.read	Permission to view security-related resources

Incidents

The following table lists the permissions in the Incidents tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Incident Module		Yes	Yes	Yes	Yes
Configure Incident Management Integration			Yes		Yes
Delete Alerts and incidents					Yes
Manage Alert Handling Rules			Yes		Yes
View and Manage Incidents		Yes	Yes	Yes	Yes

Integration-server

(The Integration-server permissions are available in NetWitness Platform version 11.1 and later.)

The following table describes the permissions in the Integration-server tab.

Permission	Description
integration-server.*	All permissions (everything below)
integration-server.api.access	Permission to authorize external requests from 3rd party applications

Permission	Description
integration-server.configuration.manage	Permission to view and modify all service integration configuration parameters
integration-server.health.read	Permission to read any health notifications that the service exposes
integration-server.logs.manage	Permission to change log-related integration configurations
integration-server.metrics.read	Permission to read any metrics that the service exposes
integration-server.notification.manage	Permission to change global notification configurations (for example, SMTP server)
integration-server.notification.read	Permission to read global notification configurations (for example, SMTP server)
integration-server.notification.send	Permission to send notifications (for example, Email)
integration-server.process.manage	Permission to start and stop the service
integration-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
integration-server.security.read	Permission to read security-related resources
integration-server.template.manage	Permission to change notification template
integration-server.template.read	Permission to read notification template

The following table lists the permissions in the Integration-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrator role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
integration-server.*					Yes

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
integration-server.api.access					
integration-server.configuration.manage					
integration-server.health.read					
integration-server.logs.manage					
integration-server.metrics.read					
integration-server.notification.manage	Yes		Yes		
integration-server.notification.read	Yes		Yes		
integration-server.notification.send	Yes		Yes		
integration-server.process.manage					
integration-server.security.manage					
integration-server.security.read					
integration-server.template.manage	Yes		Yes		
integration-server.template.read	Yes		Yes		

Investigate

The following table lists the permissions in the Investigate tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Investigation Module		Yes	Yes	Yes	Yes
Context Lookup		Yes	Yes	Yes	
Create Incidents from Investigation		Yes	Yes	Yes	
Manage List from Investigation		Yes	Yes	Yes	

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Navigate Events		Yes	Yes	Yes	Yes
Navigate Values		Yes	Yes	Yes	Yes

Investigate-server

The following table describes the permissions in the Investigate-server tab. The Administrators, Analysts, SOC Managers, Malware Analysts, and Data Privacy Officers roles have all of the permissions and are the only roles granted permissions by default.

Permission	Description
investigate-server.*	All permissions (everything below) for the Event Analysis view
investigate-server.configuration.manage	Permission to change any configuration properties for the service
investigate-server.content.export	Permission to export content from the service
investigate-server.content.reconstruct	Permission to view the summary view, the packet, packet map, text, log, and file reconstructions, as well as the packet count
investigate-server.event.read	Permission to view events that the service exposes
investigate-server.health.read	Permission to view any health notifications that the service exposes
investigate-server.logs.manage	Permission to change log-related configuration
investigate-server.metagroup.manage	Permission to manage meta groups
investigate-server.metagroup.read	Permission to view and use meta groups
investigate-server.metrics.read	Permission to view any metrics that the service exposes

Permission	Description
investigate-server.process.manage	Permission to start and stop the service
investigate-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
investigate-server.security.read	Permission to view security-related resources

Live

The following table lists the permissions in the Live tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Live					
Access Live Module	Yes	Yes	Yes		Yes
Manage Live System Settings	Yes				
Resources					
Deploy Live Resources	Yes				Yes
Manage Live Feeds	Yes				Yes
Manage Live Resources	Yes				Yes
Search Live Resources	Yes	Yes	Yes		Yes
View Live Resource Details	Yes	Yes	Yes		Yes

Malware

The following table lists the permissions in the Malware tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
Download Malware File(s)		Yes	Yes	Yes	Yes
Initiate Malware Analysis Scan		Yes	Yes	Yes	Yes
View Malware Analysis Events		Yes	Yes	Yes	Yes

Orchestration-server

The following table describes the permissions in the Orchestration-server tab. The Administrators, Operators, and Data Privacy Officers roles have all of the permissions and are the only roles granted permissions by default.

Permission	Description
orchestration-server.*	All permissions (everything below)
orchestration-server.configuration.manage	Permission to modify all service configuration parameters
orchestration-server.file.read	Permission to view files
orchestration-server.health.read	Permission to view any health notifications that the service exposes
orchestration-server.logs.manage	Permission to change log-related configuration
orchestration-server.metrics.read	Permission to view any metrics that the service exposes
orchestration-server.process.manage	Permission to start and stop the service
orchestration-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
orchestration-server.security.read	Permission to view security-related resources

Reports

The following table lists the permissions in the Reports tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators role has all of the permissions by default and is not listed.

View Jobs		Yes	Yes		Yes

Respond-server

The following table describes the permissions in the Respond-server tab.

Permission	Description
respond-server.*	All permissions (everything below)
respond-server.alert.delete	Permission to delete alerts
respond-server.alert.manage	Permission to create, update, or delete alerts
respond-server.alert.read	Permission to view alerts
respond-server.alertrule.manage	Permission to create, update, or delete alert aggregation rules
respond-server.alertrule.read	Permission to view alert aggregation rules
respond-server.configuration.manage	Permission to change any configuration properties for the service
respond-server.health.read	Permission to view any health notifications that the service exposes
respond-server.incident.delete	Permission to delete incidents
respond-server.incident.manage	Permission to create, update, or delete incidents
respond-server.incident.read	Permission to view incidents
respond-server.journal.manage	Permission to create, update, or delete journal entries for an incident

Permission	Description
respond-server.journal.read	Permission to view journal entries for an incident
respond-server.logs.manage	Permission to change log-related configuration
respond-server.metrics.read	Permission to view any metrics that the service exposes
respond-server.notification.manage	(This permission is available in NetWitness Platform version 11.1 and later.) Permission to configure Respond notification settings such as the selected email server, SOC Managers, and who will be sent the notifications (Assignee and SOC Managers).
respond-server.notification.read	(This permission is available in NetWitness Platform version 11.1 and later.) Permission to view Respond notification settings.
respond-server.process.manage	Permission to start and stop the service
respond-server.remediation.manage	Permission to create, update, or delete remediation tasks
respond-server.remediation.read	Permission to view remediation tasks
respond-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
respond-server.security.read	Permission to view security-related resources

The following table lists the permissions in the Respond-server tab assigned to each role. A blank field indicates that the role does not have the permission. The Administrators and Respond Administrator roles have all of the permissions by default and are not listed.

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
respond-server.*					Yes
respond-server.alert.delete					
respond-server.alert.manage		Yes	Yes	Yes	
respond-server.alert.read		Yes	Yes	Yes	
respond-server.alertrule.manage			Yes		
respond-server.alertrule.read			Yes		
respond-server.configuration.manage					
respond-server.health.read					
respond-server.incident.delete					
respond-server.incident.manage		Yes	Yes	Yes	
respond-server.incident.read		Yes	Yes	Yes	
respond-server.journal.manage		Yes	Yes	Yes	
respond-server.journal.read		Yes	Yes	Yes	
respond-server.logs.manage					
respond-server.metrics.read					
respond-server.notification.manage			Yes		
respond-server.notification.read			Yes		
respond-server.process.manage					
respond-server.remediation.manage		Yes	Yes	Yes	
respond-server.remediation.read		Yes	Yes	Yes	
respond-server.security.manage					

Permission	Operators	Analysts	SOC Mgrs	MAs	DPOs
respond-server.security.read					

Respond Notification Settings Permissions

Note: The Respond notification setting permissions are available in NetWitness Platform version 11.1 and later.
If you are updating from NetWitness Platform version 11.0 to 11.1 or later, you will need to add additional permissions to your existing built-in NetWitness Platform user roles. For all upgrades to 11.1 or later, you will need to add additional permissions to custom roles.

The following permissions are required for Respond Administrators, Data Privacy Officers, and SOC Managers to access Respond Notification Settings (CONFIGURE > Respond Notifications).

Incidents tab:

- Configure Incident Management Integration

Respond-server tab:

- respond-server.notification.manage
- respond-server.notification.read

Integration-server tab:

- integration-server.notification.read
- integration-server.notification.manage

Respond Event Analysis Permissions

Note: The Event Analysis panel in the Respond view is available in NetWitness Platform version 11.2 and later.

The Event Analysis panel in the Respond view shows the Event Analysis view from Investigate for specific indicator events. The following Investigate Server permissions are required to view Event Analysis in the Respond view:

Investigate-server tab:

- investigate-server.event.read
- investigate-server.content.reconstruct
- investigate-server.content.export

Security-server

The following table describes the permissions in the Security-server tab. The Administrators, Operators, and Data Privacy Officers roles have all of the permissions and are the only roles granted permissions by default.

Permission	Description
security-server.*	All permissions (everything below)
security-server.account.manage	Permission to view, create, modify, or remove NetWitness Platform local accounts
security-server.account.read	Permission to view NetWitness Platform local accounts
security-server.ca.manage	Permission to manage NetWitness Platform deployment PKI parameters (for example, sign certificates, and so on)
security-server.ca.read	Permission to view NetWitness Platform deployment PKI parameters
security-server.configuration.manage	Permission to modify all service configuration parameters
security-server.health.read	Permission to view any health notifications that the service exposes
security-server.logs.manage	Permission to change log-related configuration
security-server.metrics.read	Permission to view any metrics that the service exposes
security-server.permission.manage	Permission to create or remove NetWitness Platform permissions
security-server.process.manage	Permission to start and stop the service
security-server.role.manage	Permission to create, modify, or remove NetWitness Platform roles (for example, add role permissions)
security-server.role.read	Permission to view NetWitness Platform role definitions
security-server.security.manage	Permission to edit security-related resources (passwords, keys, and so on)
security-server.security.read	Permission to view security-related resources

Permission	Description
security-server.user.manage	Permission to view, create, modify, or remove NetWitness Platform user profiles
security-server.user.read	Permission to view NetWitness Platform user profile details (for example, roles, login times, and so on)

Source-server (Future Use)

The following table describes the permissions in the Source-server tab.

Permission	Description
source-server*	All permissions (everything below)
source-server.group.manage	Permission to create and manage USM groups
source-server.group.read	Permission to view USM groups
source-server.policy.manage	Permission to create and manage USM policies
source-server.policy.read	Permission to view USM policies
source-server.grouppolicy.read	Permission to view the canonical groups and policies

Manage Users with Roles and Permissions

This topic introduces a set of end-to-end procedures for managing users in NetWitness Platform. These steps explain how to add a user in NetWitness Platform and then how to control what the user can do.

Topics

Step 1. Review the Preconfigured NetWitness Platform Roles

To simplify the process of creating roles and assigning permissions, there are preconfigured roles in NetWitness Platform.

Role	Permission
Administrators	Full system access. The System Administrators persona is granted all permissions by default.
Respond_ Administrator	Access to all Respond permissions. The Respond Administrator persona is focused on system configuration of Respond.
Data_Privacy_ Officers	The Data Privacy Officer (DPO) persona is similar to Administrators with additional focus on configuration options that manage obfuscation and viewing of sensitive data within the system (see the *Data Privacy Management Guide*). Users with the DPO role can see which meta keys are flagged for obfuscation, and they also see obfuscated meta keys and values created for the flagged meta keys.
SOC_ Managers	Same access as Analysts plus additional permission to handle incidents. The SOC Managers persona is identical to Analysts, but with permissions necessary to configure Respond.
Operators	Access to configurations but not to meta and session content. The System Operators persona is focused on system configuration, but not investigation, ESA, Alerting, Reporting, and Respond.
Malware_ Analysts	Access to investigations and malware events. The only access granted to the Malware Analysts persona is the Malware Analysis module.
Analysts	Access to meta and session content but not to configurations. The Security Operation Center (SOC) Analysts persona is centered around investigation, ESA Alerting, Reporting, and Respond, but not system configuration.

Role	Permission
UEBA_ Analysts	Access to the RSA NetWitness UEBA service in the **Investigate** > **Users** view. NetWitness UEBA is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all entities in your network environment. **Note:** You do not need to set up specific permissions for this role. You only need to assign this role to a user, and that user will have access to NetWitness UEBA.

The administrator can also add custom roles.

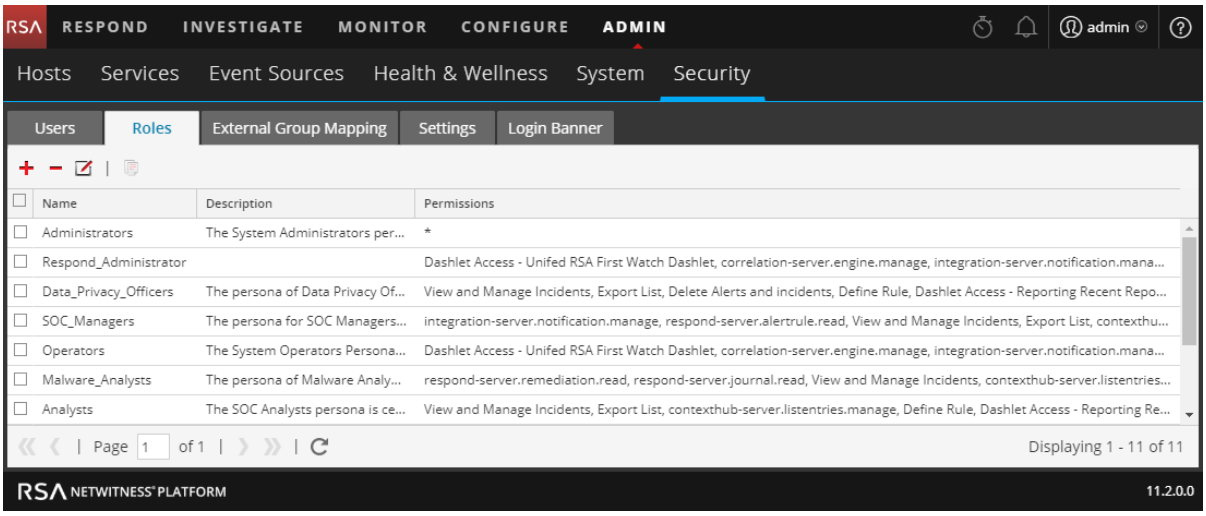
Step 2. (Optional) Add a Role and Assign Permissions

Although NetWitness Platform has preconfigured roles, you can add custom roles. For example, in addition to the preconfigured Analysts role you could add custom roles for AnalystsEurope and AnalystsAsia. For a detailed list of permissions, see Role Permissions.

Each of the following procedures starts on the **Roles** tab.

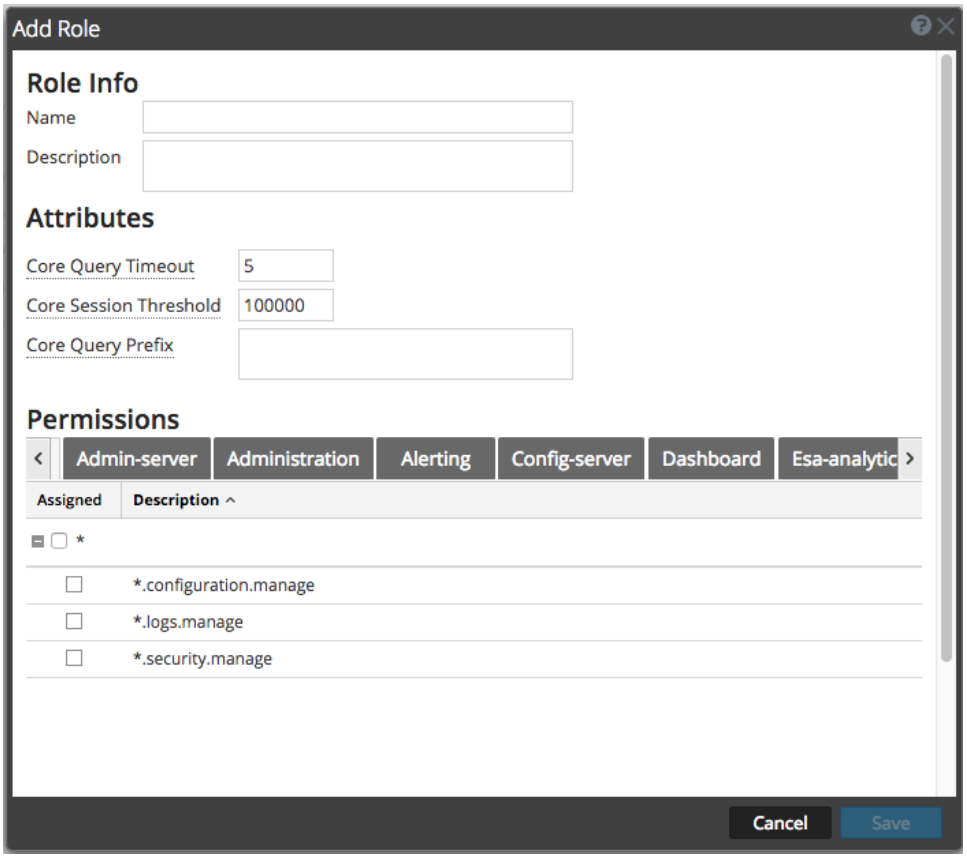
To navigate to the Roles tab:

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Roles** tab.



Add a Role and Assign Permissions

1. In the **Roles** tab, click ✚ in the toolbar.
2. The **Add Role** dialog is displayed.



3. In the **Role Info** section, type the following information for the role:
   - **Name**
   - (Optional) **Description**
4. In the **Attributes** section, enter the desired values for each attribute. For more information on attributes, see Step 3. Verify Query and Session Attributes per Role.
5. In the **Permissions** section:
   - Click ‹ and › to scroll through the modules.
   - Select a module the role will access.
   - Select each permission the role will have.
6. Repeat the previous step until you select all permissions to assign to the role.
7. Click **Save** to add the new role, which is effective immediately. You can now assign the new role to users.

Duplicate a Role

An efficient way to add a new role is to duplicate a similar role, save it with a new name and revise the permissions that are already assigned.

1. In the **Roles** tab, select the role you want to duplicate and click  .
2. Type a new role name and click **Save**.
3. To change the permissions, follow the steps in the next procedure.

Change Permissions Assigned to a Role

1. In the **Roles** tab, select the role and click  .
   The **Edit Role** dialog is displayed.
2. In the **Permissions** section:
   - Click  and  to scroll through the modules.
   - Select a module to revise permissions for it.
   - Select or deselect each permission.
3. Repeat the previous step until the role has the required permissions.
4. Click **Save**. The revised permissions are effective immediately.

Delete a Role

You can delete a role if it is not assigned to any users.

1. In the **Roles** tab, select the role and click .
2. A dialog requests confirmation that you want to delete the role. Click **Yes**.

Step 3. Verify Query and Session Attributes per Role

This topic explains the query and session attributes and provides instructions for setting these attributes for user roles. This topic also describes how these role settings impact individual user settings and what happens if a user is a member of multiple roles.

After you define your user roles, it is important to verify the query and session attributes that are set for each role. You can adjust these settings according to your requirements.

Query and Session Attributes

Query and session attributes determine how to handle the queries that a user runs. These attributes enable you to lock down the information that users can retrieve. These attributes apply to all sessions of users assigned to a role.

Depending on your requirements, you can specify the following query-handling attributes for a user role:

- **Core Query Timeout** is an optional setting that applies to NetWitness Platform Core services. It specifies the maximum number of minutes that a user can run a query. If this value is set, it must be zero (0) or greater. A value of zero represents no timeout. The default value is 5 minutes.
- **Core Session Threshold** is a required setting. This value must be zero (0) or greater. The default is 100000. The limit you specify here overrides the **Max Session Export** value defined in the Investigate view settings. If the threshold is greater than zero, a query optimization will extrapolate the total session counts that exceed the threshold. When the meta value count returned by the query reaches the threshold, the system will:
  - Stop its determination of the session count.
  - Show the threshold and percentage of query time used to reach the threshold.
- **Core Query Prefix** is an optional filter applied to queries the user runs. The prefix restricts query results that the user sees. For example, the `'service' = 80` query prefix is prepended to any queries run by the user, and the user can only access metadata of HTTP sessions.

Note: In Version 11.1 and later, you can use configured meta entities in a Core Query Prefix. For additional information about configuring meta entities, refer to the *Core Database Tuning Guide*.

The query-handing attribute settings applied for a user depend on the role memberships of the user. It is important to verify the query-handling attribute settings for your roles.

How Query-Handling Attribute Settings Apply to Individual Users

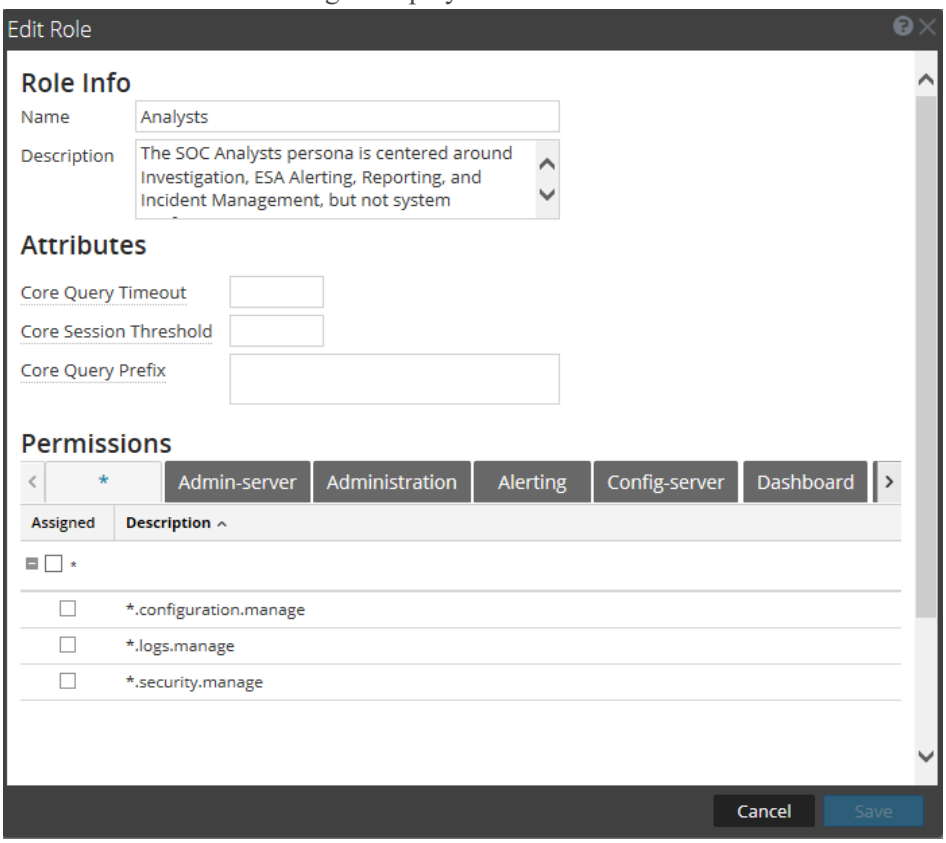
If a user is a member of multiple roles, the following logic applies for the user:

- **Query Timeout:** The most permissive (highest) value of all assigned roles is applied to the user.
- **Query Prefix:** The query prefixes of each of the user roles are AND'd together.
- **Session Threshold:** The highest value of all the assigned roles is applied to the user.

Set Query Handling Attributes for a User Role

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.

2. Click the **Roles** tab. If you are adding a role, click  . If you are editing a role, select the role and click  .
   The Add or Edit Role dialog is displayed.



3. To set the attributes for the role, in the **Attributes** section:
   - (Optional) In the **Core Query Timeout** field, type the maximum number of minutes that a user can run a query. This timeout applies to queries performed from Investigate.
   - Type a **Core Session Threshold** for the system to stop its determination of the session count.
   - (Optional) Type a **Core Query Prefix** to filter query results that role members see in the Investigate Navigate view, Events view, and Event Analysis view. You can specify a query that is prepended to all queries executed by users with a specific role. For example, if the `'service' = 80` query prefix is prepended to all queries by users in this role, the users can only access metadata of HTTP sessions. If users attempt to navigate to non-HTTP event, the view is not displayed.

4. Click **Save.**

Step 4. Set Up a User

This topic introduces procedures to set up a new user.

Topics

Add a User and Assign a Role

This topic explains how to add a new user to each type of user account, local and external. It also explains how to assign a role to a local user.

All NetWitness Platform users must have a local or external user account.

The following considerations are important when managing local and external user accounts.

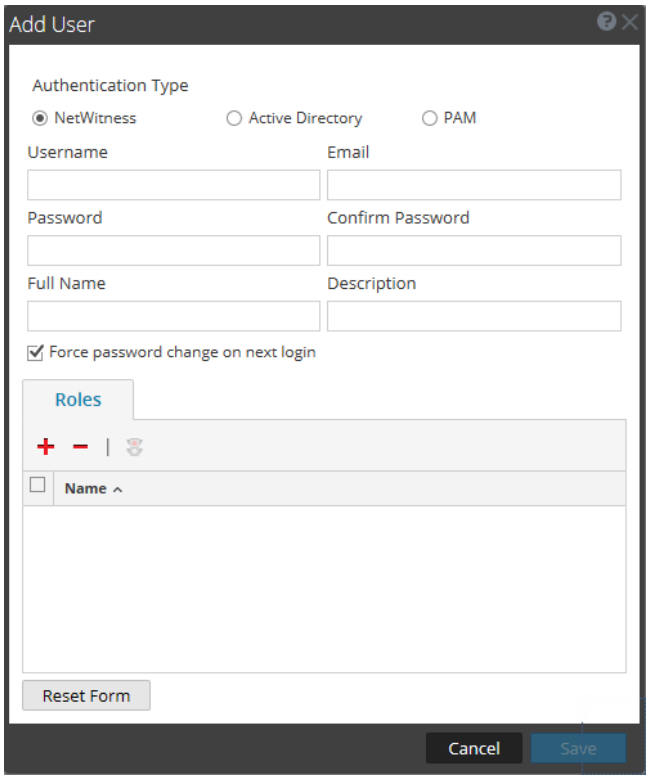
Local User Account	External User Account
Managed within NetWitness Platform.	Managed externally and outside the scope of this document.
Roles assigned directly.	Roles assigned by external group mapping.
Derives permissions from each role assigned to the user, as explained in this topic.	Derives permissions from each role mapped to the account's external user group, as explained in Step 5. (Optional) Map User Roles to External Groups.
NetWitness Platform manages all user information.	NetWitness Platform manages user identification only. This includes Username, Full Name and Email.

Each of the following procedures starts on the Users tab. To navigate to the Users tab, go to **ADMIN** > **Security**. The Security view is displayed with the Users tab open.

Add a Local User

To add a local user account and assign a role to the user:

1. In the **Users** tab, click  in the toolbar.
   The **Add User** dialog is displayed.



2. Type the following account information for the new user:
   - **Authentication Type**: **NetWitness** is selected by default and is the correct choice when adding a local user. This option is only displayed when there are AD or PAM configurations set up to allow for selecting that authentication type.

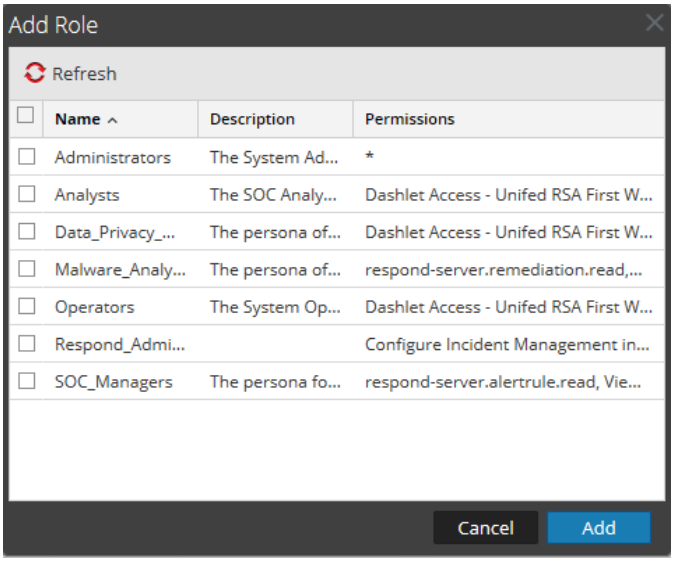
Note: If there are no AD or PAM configurations, the authentication type is set to NetWitness automatically and there are no other options available.

   - **Username** for logging on to NetWitness Platform
   - **Email** address
   - Password for logging on to NetWitness Platform, in the **Password** and **Confirm Password** fields
   - **Full Name** of the new user
   - (Optional) **Description** of the user account

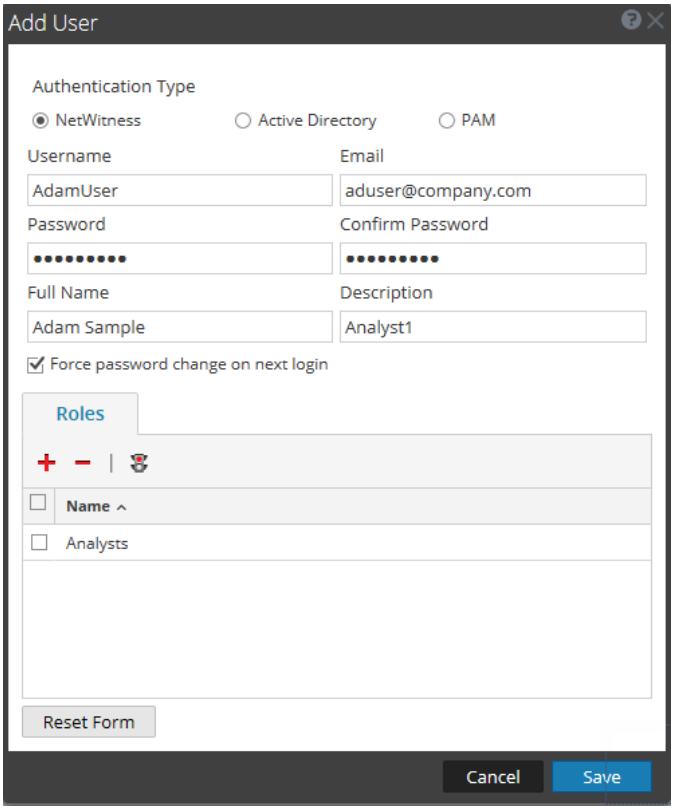
3. To expire the user password the next time the user logs on, select **Force password change on next login**.

   This does not affect any active user sessions. The  appears in the user row to show that the user password expired. After a password is expired, you cannot undo it. This checkbox is cleared the next time you edit the user account.

4. To assign a role to the user, click + in the **Roles** tab.
   The **Add Role** selection dialog shows the list of available roles.

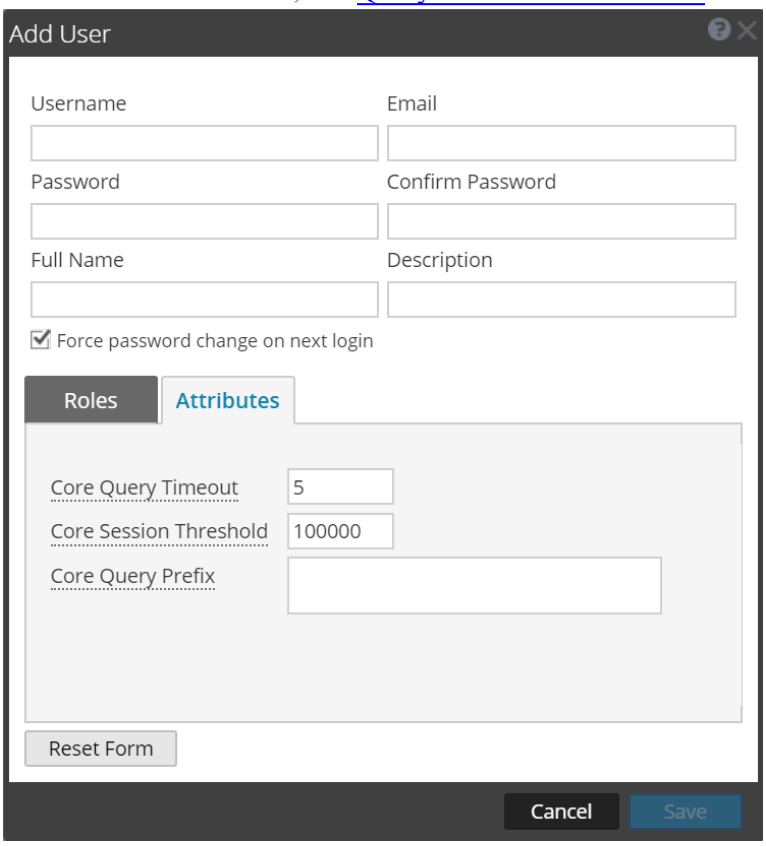


5. Select each role to assign and click **Add**.
   The **Add User** dialog shows each role assigned to the user.

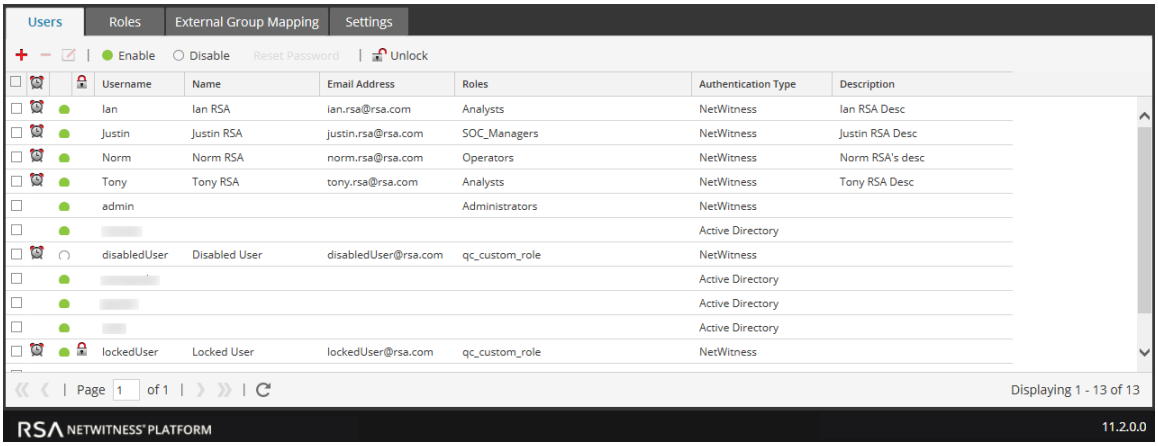


6. (Optional) To assign attributes to a user, go to **Attributes** and modify the appropriate values. These attributes are unique to the user and follow all the same rules for attributes within roles. For more

information on attributes, see Query and Session Attributes.



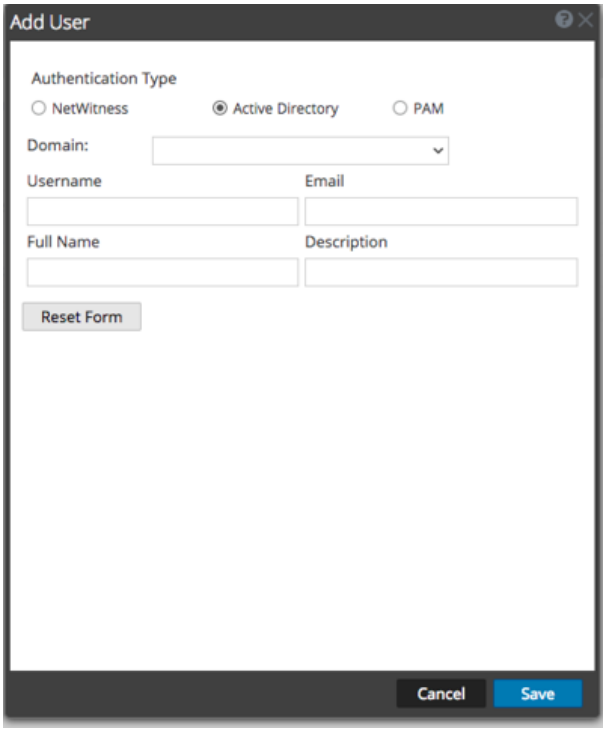
7. (Optional) Select a role and click to **Show all permissions** for the role.
8. Click **Save**.
   The **Users** tab shows the new user and each role assigned to the user. The account is active immediately.

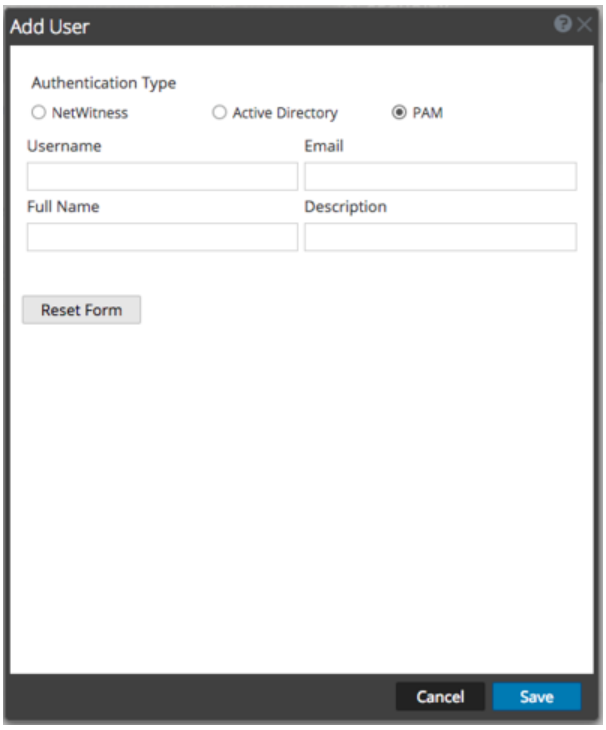


Add a User for External Authentication

Prerequisite: External authentication must be configured. Refer to Step 4. (Optional) Configure External Authentication.

1. In the **Users** tab, click + in the toolbar.
   The **Add User** dialog is displayed.
2. For **Authentication Type**, select either **Active Directory** or **PAM**. The dialog will update to show the required fields for the selected external authentication type.





3. Type the following information:
   - **Domain** (if select Active Directory authentication only): Select the Active Directory domain for the user from the drop-down list of available domains.
   - **Username** for logging on to NetWitness Platform
   - **Email** address
   - **Full Name** of the new user
   - (Optional) **Description** of the user account
4. Click **Save**. The Users tab shows the new user account, which still needs a role and permissions.
5. To map a role to the new user, see Step 5. (Optional) Map User Roles to External Groups.

Change User Information or Roles

To change a user's account information or assigned roles:

1. In the **Users** tab, select a user and click in the toolbar.
   The **Edit User** dialog is displayed.
2. To edit user information, change any of the following fields:
   - **Email**
   - **Full Name**
   - **Description**

3. To expire the **internal** user password the next time the user logs on, select **Force password change on next login**.

   This does not affect any active user sessions. The  appears in the user row to show that the user password expired. After a password is expired, you cannot undo it. This checkbox is cleared the next time you edit the user account.

4. In the **Roles** section:
   - To assign another role, click +, select a role and click **Add**.
   - To remove an assigned role, select the role and click −.

7. Click **Save**.

Delete a User

1. In the **Users** tab, select a user.
2. In the toolbar, click −.
3. Click **Save**.

Note: To fully delete a user that is externally authenticated by Active Directory, you must also delete the user from the AD Group.

Reset a User Password

1. In the **Users** tab, select a user.
2. In the toolbar, click **Reset Password**.

   The **Password Format Requirement** section lists the specific requirements for the password. Administrators can adjust these requirements for all internal users in the password policy. See Step 1. Configure Password Complexity.

3. Choose whether to force a password change the next time the user logs in to NetWitness Platform.
4. Click **Save**.

Enable, Unlock, and Delete User Accounts

This topic provides instructions for enabling, unlocking, and deleting user accounts.

All users of NetWitness Platform must either have a local user account with username and password or have an external user account. Within NetWitness Platform, you can enable, disable, and delete local user accounts.

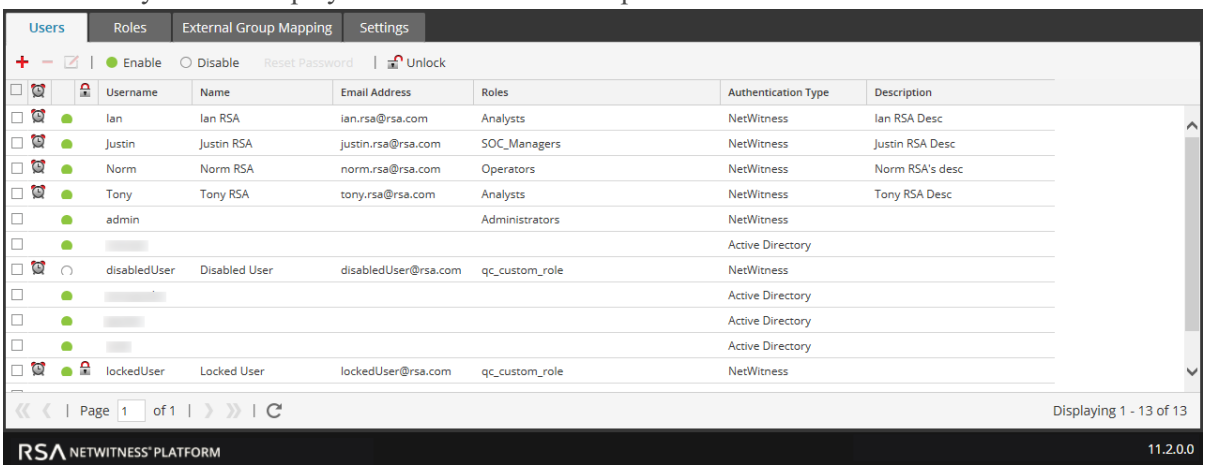
The first time an external user logs into NetWitness Platform, a new user entry is automatically created with NetWitness Platform. NetWitness Platform manages only user identification information; for example, Full Name and Email.

You can unlock locked accounts for both local and external users.

Enable Disabled NetWitness Platform User Accounts

To enable NetWitness Platform user accounts that have been disabled:

1. In NetWitness Platform, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.



2. In the **Users** grid, select one or more accounts.
3. Click Enable.
   A dialog requests confirmation.
4. If you want to enable the accounts, click **Yes**.
   The accounts are enabled, and the user can log in to NetWitness Platform.

Disable NetWitness Platform User Accounts

You can block user access by disabling users. Disabling the user does not delete user preferences. This action blocks user access without deleting user preferences so that upon re-enabling users, user preferences are intact. You can re-enable users to restore user access. Disabling users applies only to Local users and not External Users.

To disable NetWitness Platform user accounts:

1. In the **Users** grid, select one or more accounts.
2. Click Disable.
   A dialog requests confirmation.
3. If you want to disable the accounts, click **Yes**.
   The accounts are disabled, and the user can no longer log in to NetWitness Platform.

Unlock Locked NetWitness Platform User Accounts

A user is locked out for a period of time after a number of failed consecutive login attempts. To unlock NetWitness Platform user accounts that are locked due to excessive failed login attempts:

1. In the **Users** grid, select one or more accounts.
2. Click Unlock.
   A dialog requests confirmation.
3. If you want to unlock the accounts, click **Yes**.
   The accounts are unlocked, and the user can log on to NetWitness Platform.

Delete NetWitness Platform User Accounts

If not using External Authentication, a user can log on to NetWitness Platform using a local account. These local accounts are directly managed using NetWitness Platform. To revoke access to a local user, either disable the account or delete the account completely from the system.

Note: This deletes all user preferences for the account from NetWitness Platform. If this is not the intention, disable the user instead of deleting the user.

To delete NetWitness Platform user accounts:

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. In the Users list, select one or more accounts.
3. Click .
   A warning dialog requests confirmation.
4. If you want to delete the accounts, click **Yes**.
   The accounts are removed from NetWitness Platform, and the users can no longer log in to NetWitness Platform.

Step 5. (Optional) Map User Roles to External Groups

This topic describes the method for mapping NetWitness Platform user roles to external groups.

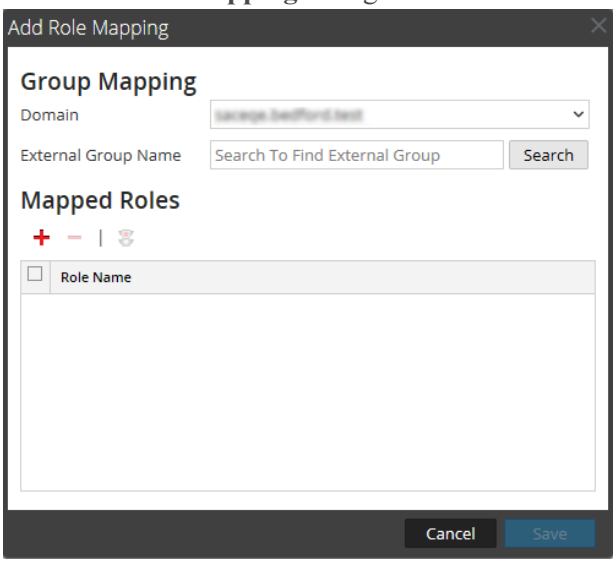
In NetWitness Platform, external groups derive permissions for various modules and views from NetWitness Platform user roles, which have permissions assigned to them. To provide access to an external group, map user roles to it. To modify an external group's access, edit the roles mapped to it. Add and delete roles until the external group has the necessary access. Changes take effect immediately.

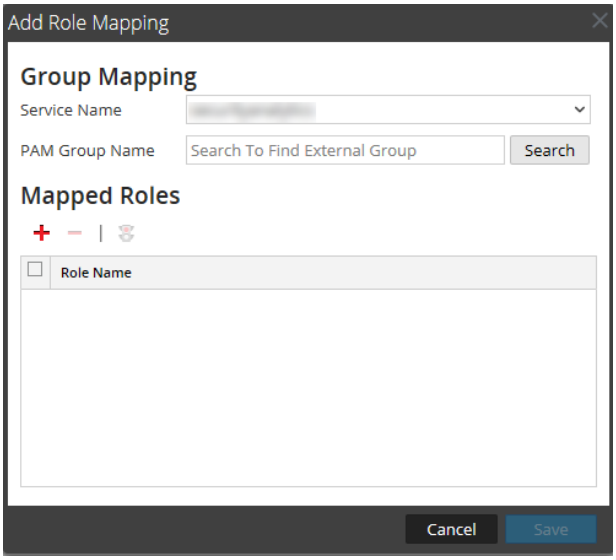
Prerequisites

In the Settings tab, you must set up a method for external user authentication to make external groups visible to NetWitness Platform.

Add Role Mapping for an External Group

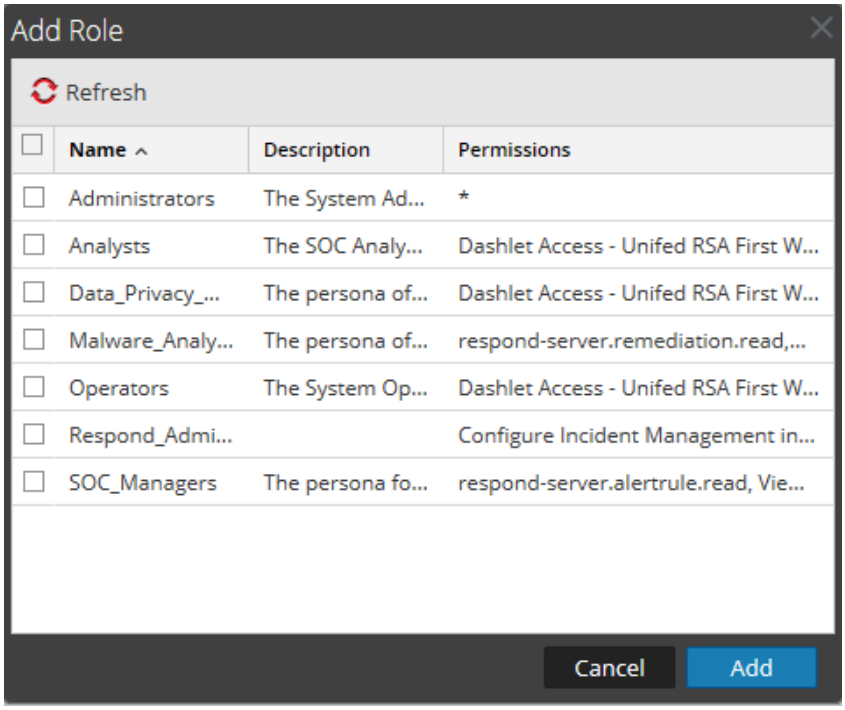
1. In NetWitness Platform, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **External Group Mapping** tab.
3. In the toolbar, click +.
   The **Add Role Mapping** dialog for the external authentication method you selected is displayed.





4. Click **Search** and search for an external group name in the Search for External Groups, then select an external group name.

5. To add roles to the group mapping, click + in the **Mapped Roles** section.
   The **Add Role** dialog is displayed.



6. Select the checkbox in the title bar to select all roles, or select roles individually.
7. To add the roles to the **Mapped Roles** section in the Add Role Mapping dialog, click **Add**.
   The dialog closes and the selected roles are displayed in the Mapped Roles section.
8. If you want to delete roles from the **Mapped Roles** section, select the roles and click −.
9. When the **Add Role Mapping** dialog reflects the role mapping that you want to define for the group, click **Save**.
   The Add Role Mapping dialog closes, and the new role mapping is listed in the External Group Mapping tab list.

Edit Role Mapping for a Group

1. In the **External Group Mapping** action bar, click **Edit**.
   The **Edit Role Mapping** dialog is displayed with the group name in the **External Group Name** field.
2. To add roles to the mapping, click + in the **Mapped Roles** section.
   The Add Role dialog is displayed.
3. Select the checkbox in the title bar to select all roles, or select roles individually.
4. To add the roles to the **Mapped Roles** section in the **Add Role Mapping** dialog, click **Add**.
   The dialog closes, and the selected roles are displayed in the Mapped Roles section.
5. If you want to delete roles from the **Mapped Roles** section, select the roles and click −.

6. When the **Edit Role Mapping** dialog reflects the role mapping that you want to define for the group, click **Save**.
   The dialog closes, and the edited role mapping is listed in the External Group Mapping tab.

Related Topic

- Search for External Groups

Search for External Groups

This topic provides instructions for searching for external groups that have NetWitness Platform user roles mapped to them.

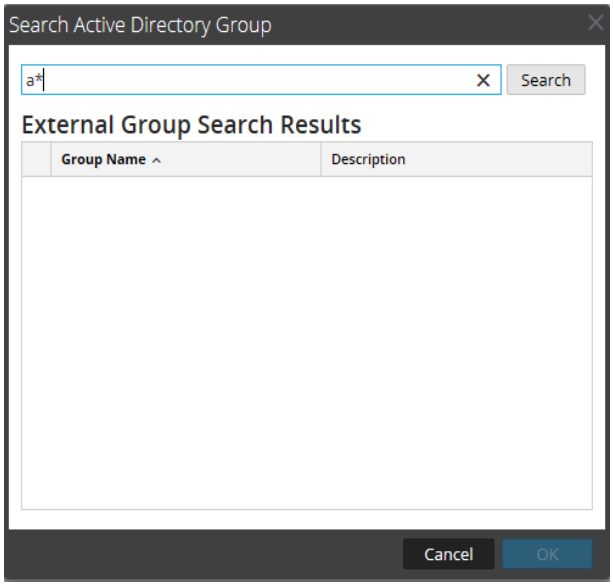
Prerequisites

A method for external user authentication must be enabled.

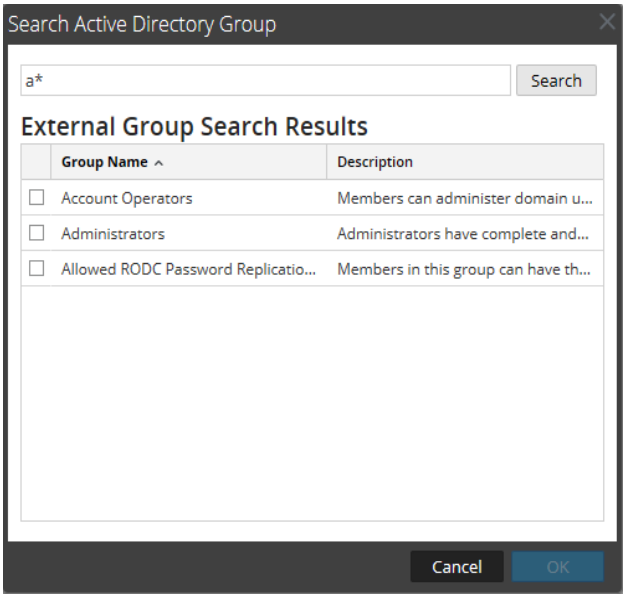
Procedure

To search for an external group:

1. In NetWitness Platform, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **External Group Mapping** tab.
3. In the toolbar, click + or .
   The **Add Role Mapping** dialog for the external authentication method you selected is displayed.
4. The **Group Mapping** section is dependent on the selected external authentication method.
   - For **Active Directory**, select a **Domain**. Then click **Search** next to **External Group Name**.
   - For **PAM**, click **Search** next to **PAM Group Name**.
     The **Search External Groups** dialog is displayed.
5. In **Common Name**, type a group name or part of a group name with the wild card character (*).



6. Click **Search**.
   The results are displayed in the **External Group Search Results** section.



7. Select the group to which you want to assign roles and click **OK**.

Admin Security View

This topic describes each user interface element in the **Admin** > **Security** view and in all related dialogs and tabs. The interface components are listed in alphabetical order.

The **Admin** > **Security** view provides the capability to manage user accounts, manage user roles, map external groups to NetWitness Platform roles, and modify other security-related system parameters. These apply to the NetWitness Platform system and are used in conjunction with the security settings for individual services.

What do you want to do?

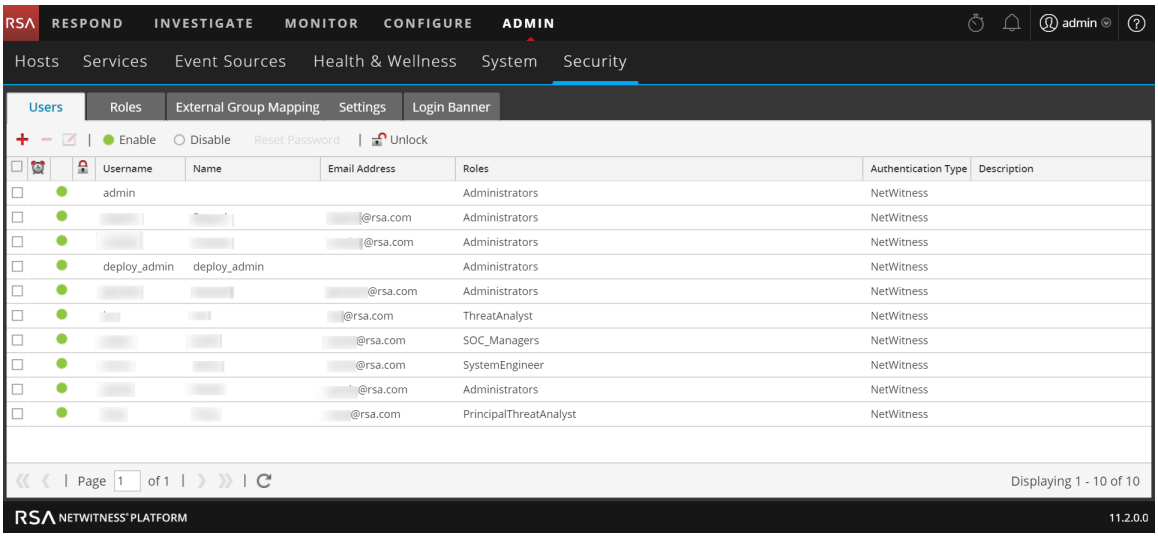
Role	I want to ...	Show me how
Admin	Manage users	Step 4. Set Up a User
Admin	Manage roles	Step 1. Review the Preconfigured NetWitness Platform Roles Step 2. (Optional) Add a Role and Assign Permissions
Admin	(Optional) Configure external group mappings	Step 5. (Optional) Map User Roles to External Groups
Admin	Configure settings	Step 3. Configure System-Level Security Settings
Admin	(Optional) Set login conditions	Step 5. (Optional) Create a Customized Login Banner

Related topics

- Users Tab
- Roles Tab
- External Group Mapping Tab
- Settings Tab
- Login Banner Tab

Quick Look

To display the Admin Security view, go to **ADMIN > Security**.



The **Admin** > **Security** view has five tabs:

- The **Users** tab provides a way to manage user accounts.
- The **Roles** tab provides a way to define security roles and assign roles to user accounts.
- The **External Group Mapping** tab provides a way to manage access parameters for LDAP groups.
- The **Settings** tab provides a way to configure password complexity and expiration for internal NetWitness Platform users and to configure system behavior due to failed logins and inactivity. It also provides a way to configure external authentication.
- Review the Preconfigured NetWitness Platform Roles
- The **Login Banner** tab provides a way to set conditions which must be agreed to before gaining access to the login screen.

Users Tab

This topic introduces the features and functions to set up a user account in the Admin > Security view > Users tab.

Each NetWitness Platform user must have a user account. In the Users tab, you can create, edit, delete, enable/disable and unlock a user account.

What do you want to do?

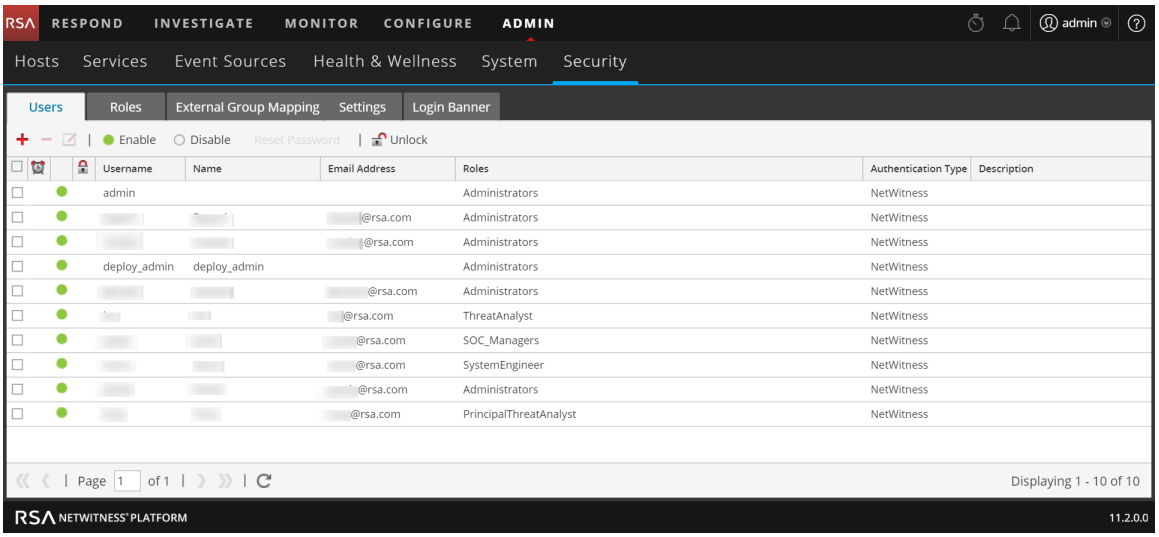
Role	I want to ...	Show me how
Admin	Set up a new user	Step 4. Set Up a User Add a User and Assign a Role
Admin	Manage user accounts	Enable, Unlock, and Delete User Accounts

Related Topics

- Add or Edit User Dialog

Quick Look

To access this view, go to **ADMIN > Security**. The Security view opens to the **Users** tab by default.



The Users tab consists of the User list with a toolbar at the top. These are the toolbar features.

Feature	Description
+	Opens the Add User dialog.

Feature	Description
	Deletes the selected user.
	Opens the Edit User dialog for the selected user.
	Enables a disabled user account with all user preferences intact.
	Blocks user access without deleting user preferences so that upon re-enabling users, user preferences are intact.
Reset Password	Opens the Reset Password dialog, which enables you to change the password of the selected user. This dialog lists the password format requirements necessary to change the password and allows you to force the user to change their password on the next login.
 Unlock	Unlocks a user account that has been locked due to too many failed login attempts.

The **Users** list has these columns.

Column	Description
	If this icon appears in a user row, it indicates that the user password has expired.
Username	Username to log on to NetWitness Platform.
Name	Name of the user to whom the account belongs.
Email Address	Email address of the user.
Roles	Role assigned to the user.
External	Authentication method, which could be external by Active Directory or PAM or internal by NetWitness Platform.
Description	Description of the user account.

Add or Edit User Dialog

This topic introduces the Add User and Edit User dialogs accessible from the Admin > Security view > Users tab.

All users must either have a local user account with username and password or an external user account that is mapped to NetWitness Platform.

What do you want to do?

Role	I want to ...	Show me how
Administrator	Add a User and Assign a Role	Add a User and Assign a Role
Administrator	Change User Information	Change User Information or Roles
Administrator	Reset a User Password	Reset a User Password
Administrator	Add a User for External Authentication	Add a User for External Authentication

Related Topics

- Manage Users with Roles and Permissions
- Enable, Unlock, and Delete User Accounts

Quick Look

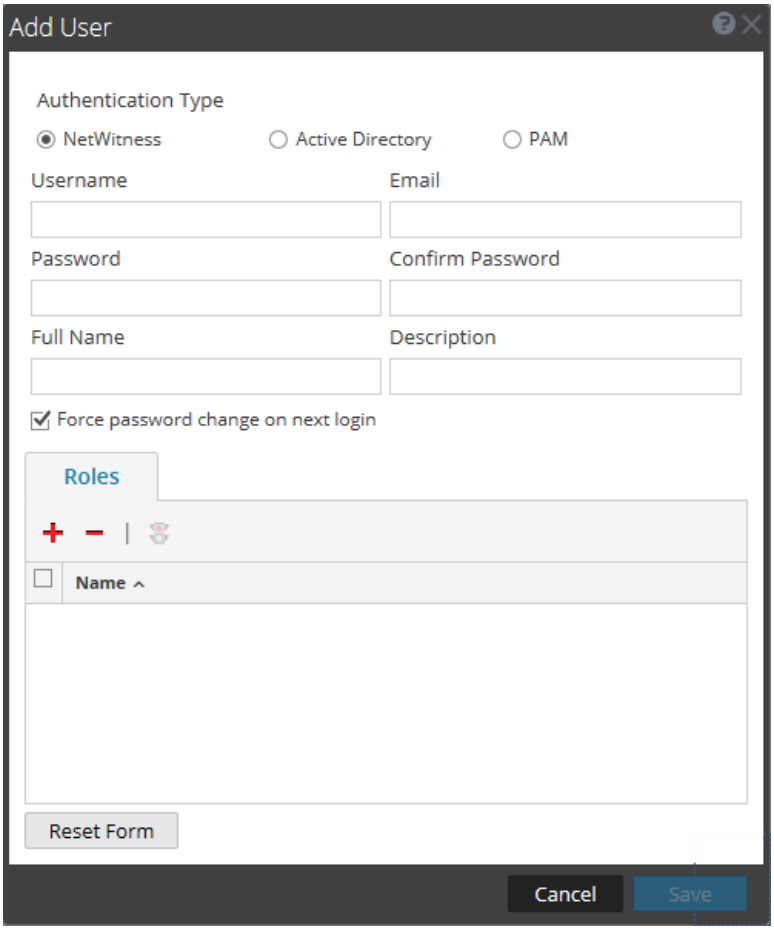
To display the **Add User** or **Edit User** dialog:

1. In NetWitness Platform, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Do one of the following:
   - In the action bar, click  .
     The **Add User** dialog is displayed.
   - Select a user and in the action bar, click  .
     The **Edit User** dialog is displayed.

The Add User and Edit User dialogs are the same except that the Add User dialog contains additional **Password** and **Confirm Password** fields. You can add a password for a new user in the Add User dialog. Users can change their own passwords in the user preferences. You can reset a password for a user directly from the Users tab.

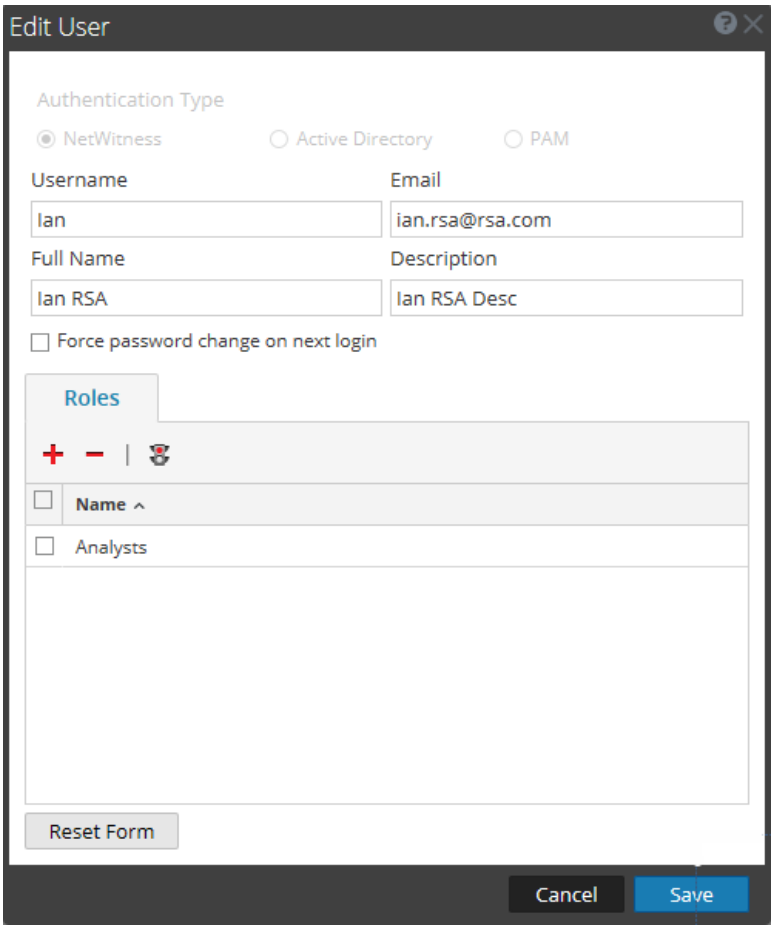
Add User Dialog

This is the Add User dialog for an internal user.



Edit User Dialog

This is the Edit User dialog for an internal user.



The Add User and Edit User dialogs show:

- Authentication type
- User information
- Roles to which the user belongs

User Information

The following table provides descriptions of the user information.

Field	Description
Authentication Type	The authentication type for the user. Default selection is NetWitness, which designates an internal user. Options for external users are Active Directory and PAM. This field is disabled when editing a user.
Username	Username for the NetWitness Platform user account.
Full Name	Name of the user.

Field	Description
Password	(Add User dialog only) Password to log on to NetWitness Platform.
Confirm Password	(Add User dialog only) Password confirmation for adding the user password.
Email	Email address of the user.
Description	(Optional) Description of the user.
Force password change on next login	Expires the user password the next time the user logs on to NetWitness Platform. This field applies only to internal users. This does not affect any active user sessions. The  appears in the user row to show that the user password expired. After a password is expired, you cannot undo it. This checkbox is cleared the next time you edit the user account.
Reset Form	Removes any changes in process.

Roles Tab

The following table provides descriptions of the Roles tab options. The Roles tab shows the roles that are assigned to the user.

Option	Description
	Opens the Add Role dialog that lists roles you could assign to the user.
	Removes the selected role from being assigned to the user.
	Shows permissions for the selected role.
Name	Lists each role assigned to the user.

Roles Tab

This topic introduces the functions of the Admin > Security view > Roles tab.

Roles are assigned to all NetWitness Platform users. Users receive the permissions the roles allow. In the Roles tab you can create, duplicate, edit and delete a role. You can also see a list of all roles and their respective permissions.

What do you want to do?

Role	I want to ...	Show me how
Admin	View preconfigured roles	Step 1. Review the Preconfigured NetWitness Platform Roles
Admin	Create a new role	Step 2. (Optional) Add a Role and Assign Permissions

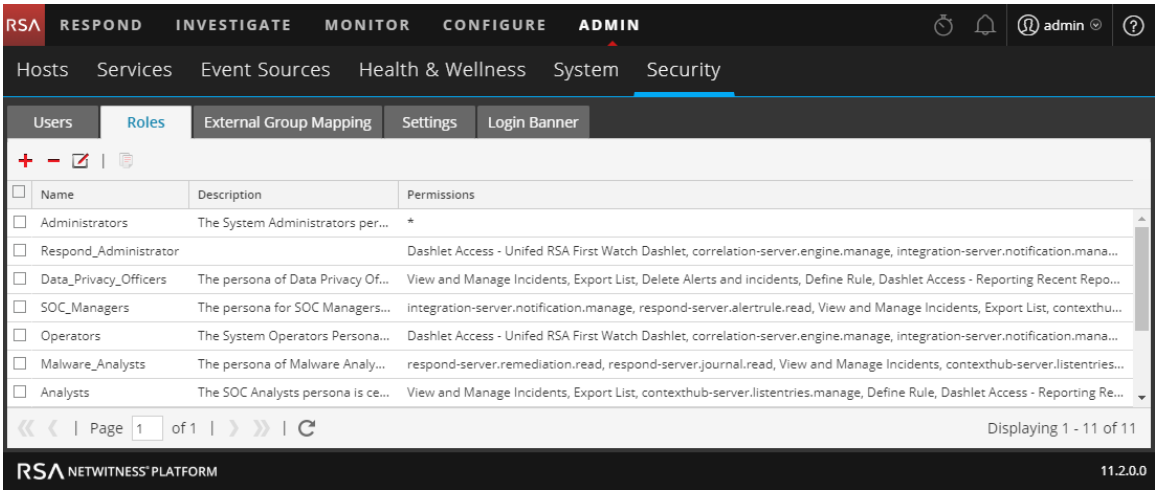
Related Topics

- Add or Edit Role Dialog

Quick Look

To access this view:

1. Go to **ADMIN > Security**.
   The Security view opens to the **Users** tab by default.
2. Click the **Roles** tab.



The Roles tab consists of the Roles list with a toolbar at the top.

The following table describes the toolbar features.

Feature	Description
	Displays the Add Role dialog.
	Displays the Edit Role dialog.
	Displays a warning message, and asks for confirmation that you want to delete a role.
	Duplicates a role to save with a different name.

The following table describes the roles list features.

Column	Description
Name	Displays the name of a role that can be given to a user.
Description	Displays a description of the role.
Permissions	Displays the permissions assigned to the role.

Add or Edit Role Dialog

This topic introduces the Add Role and Edit Role dialogs accessible from the **Admin** > **Security view** > **Roles** tab.

In the Add Role and Edit Role dialogs, you can add or edit a role and the permissions assigned to it. You can also specify the query-handling attributes for role members to lock down the information that they can retrieve. The structure of these dialogs is the same. The only difference is that you either add a new role or modify an existing role.

When you change permissions for a role, the change is immediately applied to users who are assigned the particular role after the role is saved.

What do you want to do?

Role	I want to ...	Show me how
Admin	View preconfigured roles	Step 1. Review the Preconfigured NetWitness Platform Roles
Admin	Create a new role	Step 2. (Optional) Add a Role and Assign Permissions
Admin	Edit a role	Step 2. (Optional) Add a Role and Assign Permissions
Admin	Delete a role	Step 2. (Optional) Add a Role and Assign Permissions

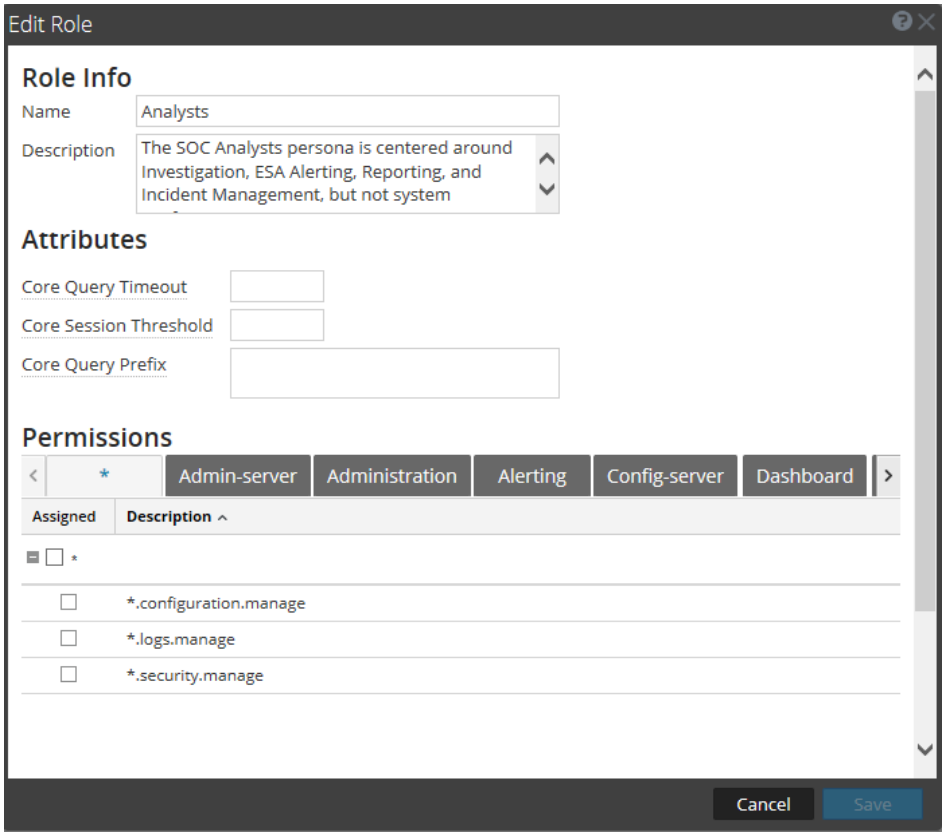
Quick Look

To access this view:

1. In NetWitness Platform, go to **ADMIN > Security**.
   The Security view opens to the **Users** tab by default.
2. Click the **Roles** tab.
3. Do one of the following:

   - In the action bar, click  .
     The **Add Role** dialog is displayed.

- Select a role and in the action bar, click .
  The **Edit Role** dialog is displayed.



The Add Role and Edit Role dialogs include three sections: **Role Info**, **Attributes**, and **Permissions**.

Role Info

This is the information in the **Role Info** section.

Feature	Description
Name	The name of the user role.
Description	An optional description of the user role.

Attributes

This is the information in the **Attributes** section. Step 3. Verify Query and Session Attributes per Role provides more information.

Feature	Description
Core Query Timeout	(Optional) Specifies the maximum number of minutes that a user can run a query. The default value is 5 minutes. This timeout only applies to queries performed from Investigation. If this value is set, it must be zero (0) or greater. A value of zero represents no timeout.
Core Session Threshold	Controls how the service scans meta values to determine session counts. This value must be zero (0) or greater. If this value is greater than zero, a query optimization will extrapolate the total session counts that exceed the threshold. When the meta value returned by the query reaches the threshold, the system will: • Stop its determination of the session count • Show the threshold and percentage of query time used to reach the threshold The default value is `100000`. The limit you specify here overrides the **Max Session Export** value defined in the INVESTIGATE view settings.
Core Query Prefix	(Optional) Filters query results to restrict what the role members see. By default, this is blank. For example, the `'service' = 80` query prefix prepends to any queries run by the user and the user can only access meta of HTTP sessions.

Permissions

This is the information in the **Permissions** section. Role Permissions describes the permissions.

Feature	Description
Module tabs	There are fifteen default tabs, one for each module: Administration, Admin-server, Alerting, Config-server, Incidents, Investigation, Investigation-server, Integration-server, Live, Malware, Orchestration-server, Reports, Response-server, Security-server and Dashboard. Additional tabs may be available based on the installation. Each tab lists the permissions for a module.
Description column	List of all permissions for the module.
Assigned column	Checkbox that indicates if a module permission is assigned to the role.

Feature	Description
Save	Saves the role with the selected permissions assigned to it.
Cancel	Cancels any work and closes the dialog.

Login Banner Tab

The Login Banner tab provides a way to add a banner to the NetWitness Platform login screen, which will prevent a user from logging on until they agree to the conditions. Add the server title prefix to differentiate the NetWitness Server of the current tab, when you have multiple deployed in your system. You can customize the default title and text of the login banner. The banner is disabled by default.

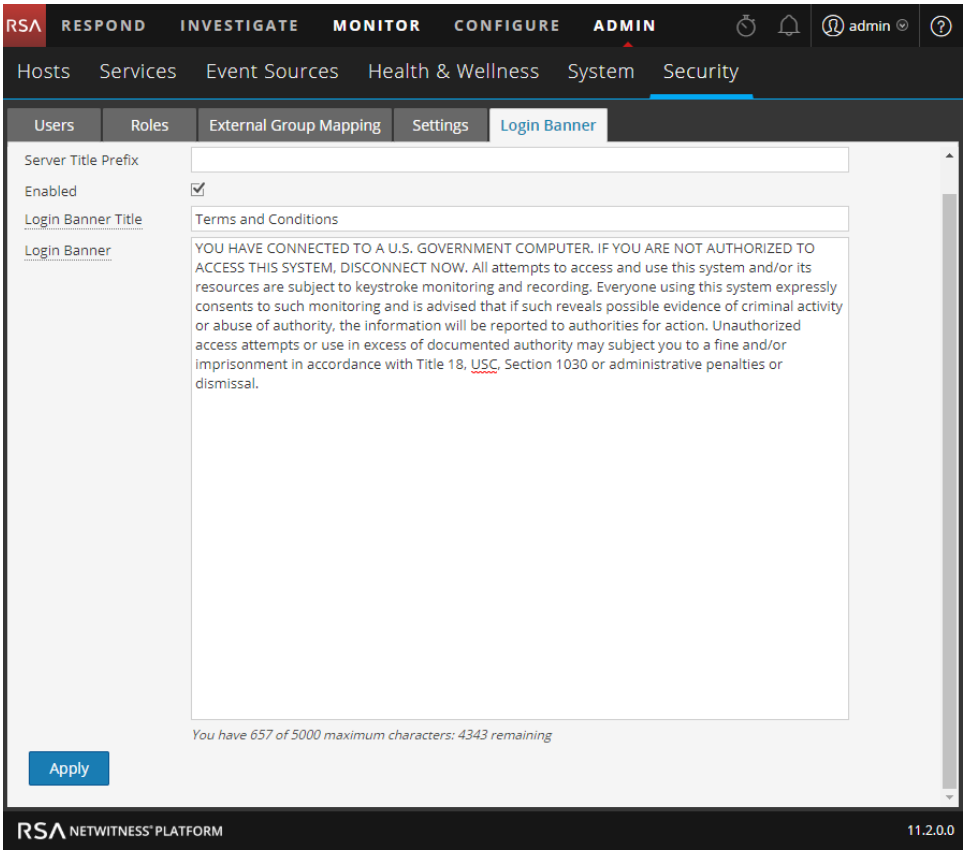
What do you want to do?

Role	I want to ...	Show me how
Admin	Create or enable a login banner	Step 5. (Optional) Create a Customized Login Banner

Quick Look

To access the Login Banner tab:

1. Go to **ADMIN > Security**.
   The Security view opens to the **Users** tab by default.
2. Click the **Login Banner** tab.



When enabled, the banner appears on the NetWitness Platform login screen.

The following table lists the features of the Login Banner tab.

Feature	Description
Server Title Prefix	Displays the prefix of the NetWitness Server on the title bar.
Enabled	Checkbox that indicates whether or not the login banner is enabled. This box is cleared by default.
Login Banner Title	Shows the title of the dialog box that contains the login conditions.
Login Banner	Shows the conditions the user must acknowledge.

External Group Mapping Tab

If you set up external user authentication, you can map NetWitness Platform user roles to an external group. The External Group Mapping tab provides information about each external group to which you have mapped roles.

What do you want to do?

Role	I want to ...	Show me how
Admin	Map a role to an external group	Step 5. (Optional) Map User Roles to External Groups
Admin	Search for an external group	Search for External Groups

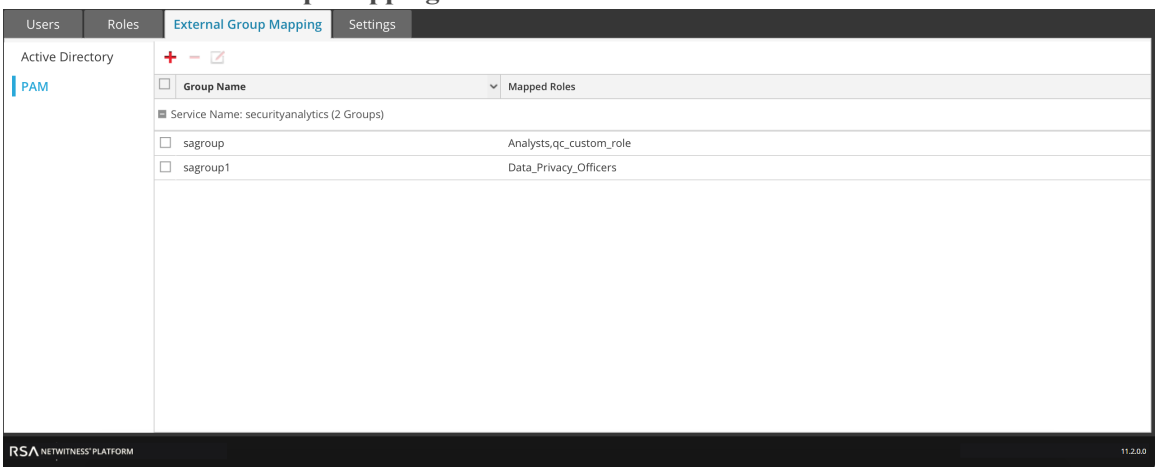
Related Topics

- Add Role Mapping Dialog
- Search External Groups Dialog

Quick Look

To access this view:

1. In NetWitness Platform, go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **External Group Mapping** tab.



The External Group Mapping tab consists of a toolbar and list.

The list has the following features.

Feature	Description
Group type	In the column on the left, click either **Active Directory** or **PAM** to show groups for the selected type.
Selection box	In a row, toggles selection of a group name. In the title bar, toggles selection of all group names.
Group Name	Displays the name of the external group that has access to NetWitness Platform.
Mapped Roles	Displays the NetWitness Platform roles mapped to the external group.

The **toolbar** has the following features.

Feature	Description
	Displays the Add Role Mapping dialog in which you can select an external group and map it to a NetWitness Platform role.
	Displays a warning message and asks for confirmation to remove all NetWitness Platform roles mapped to the external group.
	Displays the Edit Role Mapping dialog in which you can add or remove NetWitness Platform roles from the external group.

Add Role Mapping Dialog

This topic introduces the features of the Admin > Security > External Group Mapping tab > Add Role Mapping dialog.

In NetWitness Platform each user role has its own set of permissions. You can map one or more NetWitness Platform roles to an external group, which grants the group the same set of permissions that each role has.

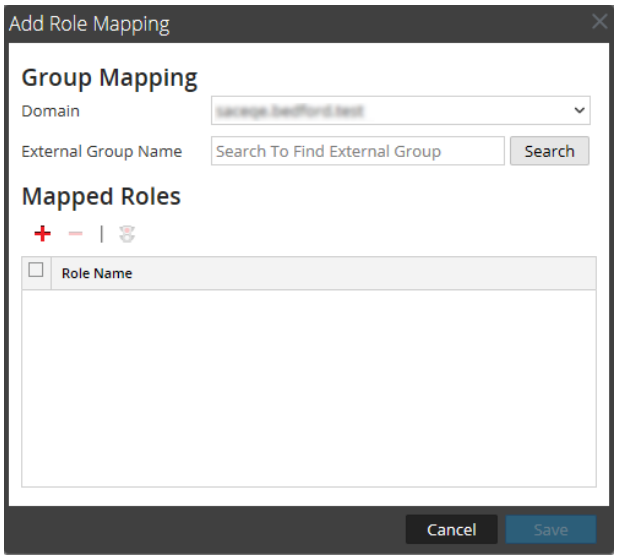
What do you want to do?

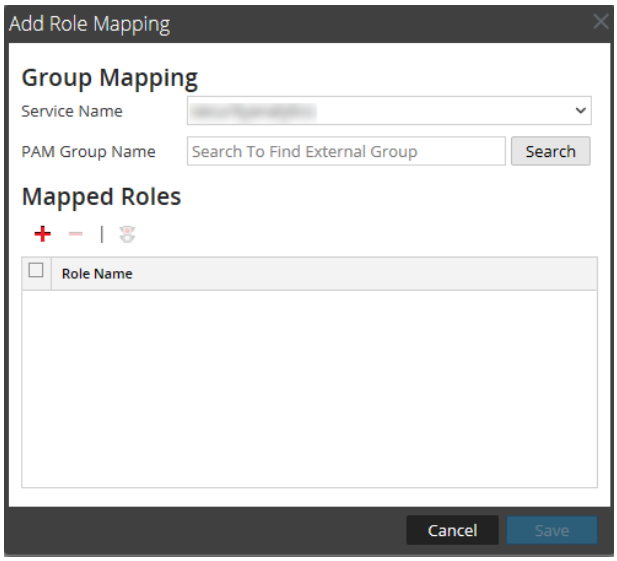
Role	I want to ...	Show me how
Admin	Map a role to an external group	Step 5. (Optional) Map User Roles to External Groups
Admin	Search for an external group	Search for External Groups

Quick Look

To access this dialog:

1. In NetWitness Platform, go to **ADMIN > Security**.
2. Click the **External Group Mapping** tab.
3. In the toolbar, click +.
   The **Add Role Mapping** dialog for the external authentication method you set up is displayed.





The Add Role Mapping and the Edit Role Mapping dialogs are nearly identical. The only difference is that you cannot search in the Edit Role Mapping dialog.

Group Mapping

The **Group Mapping** section has the following features.

Feature	Description
Domain	Displayed if you set up Active Directory for external user authentication.The domain name of the external AD group to which roles are mapped.

Feature	Description
External Group Name	Displayed if you set up Active Directory for external user authentication.The external group to which roles are mapped.
PAM Group Name	Displayed if you configured PAM for external user authentication. The name of the external group to which roles are mapped.
Search	Displays a search dialog in which you can search for external groups. Search is not available in the Edit Role Mapping dialog.

Mapped Roles

The **Mapped Roles** section has the following features.

Feature	Description
	Opens the Add Role dialog, in which configured NetWitness Platform user roles to add are listed.
	Removes selected roles from the Mapped Roles grid.
Name	Displays the name of the NetWitness Platform user role.
Permissions	Displays the permissions associated with the NetWitness Platform user role.
Cancel	Cancels the new group mapping or changed group mapping and closes the dialog.
Save	Saves the new group mapping or changed group mapping and closes the dialog.

Search External Groups Dialog

This topic describes the features of the Admin > Security view > Search External Groups dialog.

If you set up external user authentication, you can map NetWitness Platform user roles to external groups. You search for external groups to select the groups to which you want to map NetWitness Platform roles.

What do you want to do?

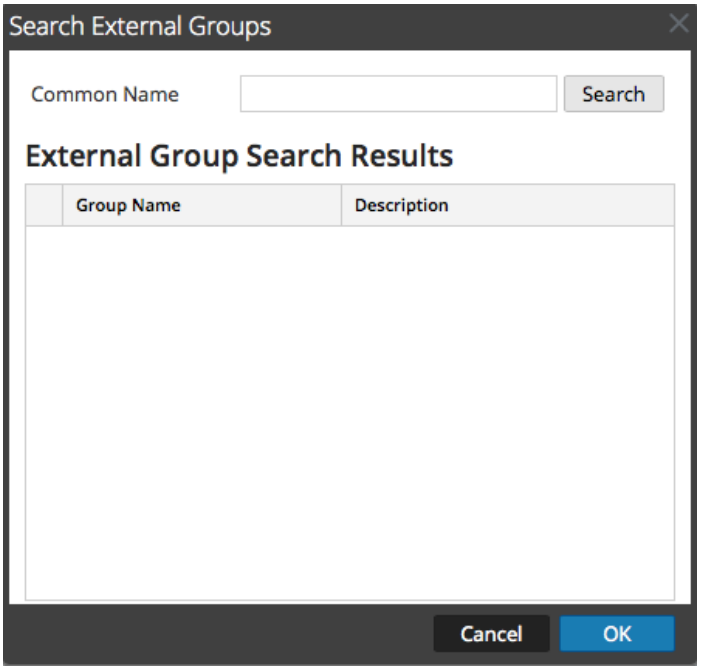
Role	I want to ...	Show me how
Admin	Map a role to an external group	Step 5. (Optional) Map User Roles to External Groups
Admin	View external group mappings	External Group Mapping Tab
Admin	Search for external groups	Search for External Groups

Quick Look

To access this dialog:

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **External Group Mapping** tab.
3. In the toolbar, click +.
   The Add Role Mapping dialog for the external authentication method you set up is displayed.
4. In the Group Mapping section, select a **domain**.

5. In the Group Mapping section, click **Search**.
   The **Search External Groups** dialog is displayed.



The following table describes the features of the Search External Groups dialog.

Feature	Description
Common Name	Group name for which you are searching. Can be the exact name or can contain the wild card character (*) to match any character.
Group Name	External group to which you could map roles.
Description	Optional text about the group.
OK	Displays the Add Role Mapping dialog, showing the external group you selected.
Cancel	Closes the dialog.

Settings Tab

This topic explains the ADMIN > Security view > Settings tab. In the Settings tab, you configure password complexity for internal NetWitness Platform users and system-wide security parameters.

For information on configuring NetWitness Platform security, see Set Up System Security.

Password complexity requirements apply only to internal users and are not enforced for external users. External users rely on their own methods and systems to enforce password complexity.

What do you want to do?

Role	I want to ...	Show me how
Admin	Configure password complexity	Step 1. Configure Password Complexity
Admin	Configure system-level security settings	Step 3. Configure System-Level Security Settings
Admin	(Optional) Configure external authentication	Step 4. (Optional) Configure External Authentication

Related Topics

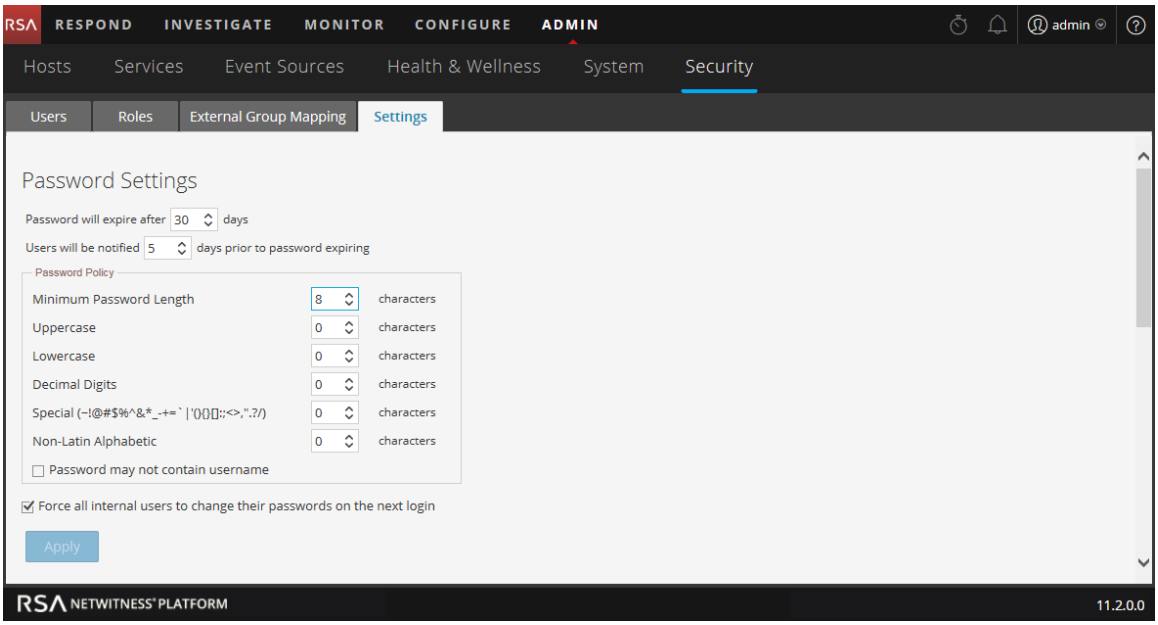
- Set Up System Security

Quick Look

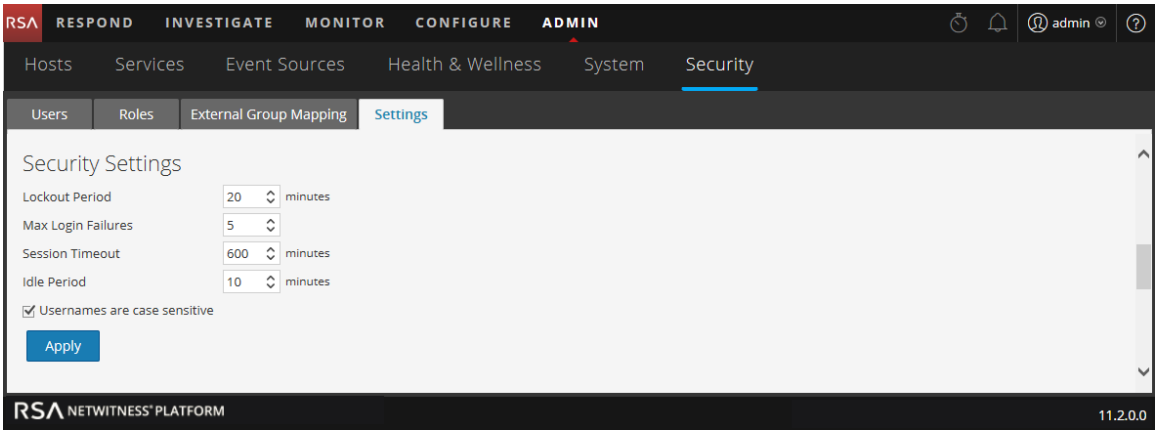
To access the Settings tab:

1. Go to **ADMIN > Security**.
   The Security view is displayed with the **Users** tab open.
2. Click the **Settings** tab.

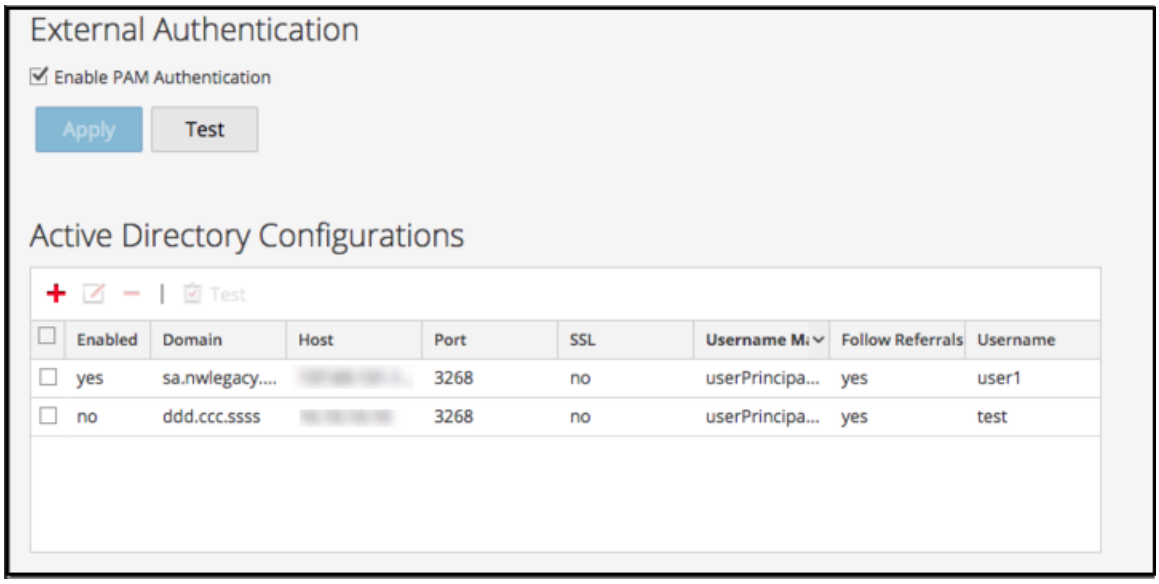
The following figure shows the Password Settings section of the Settings tab.



The following figure shows the Security Settings section of the Settings tab.



The following figure shows the PAM Authentication and Active Directory Configurations sections of the Settings tab.



Password Settings

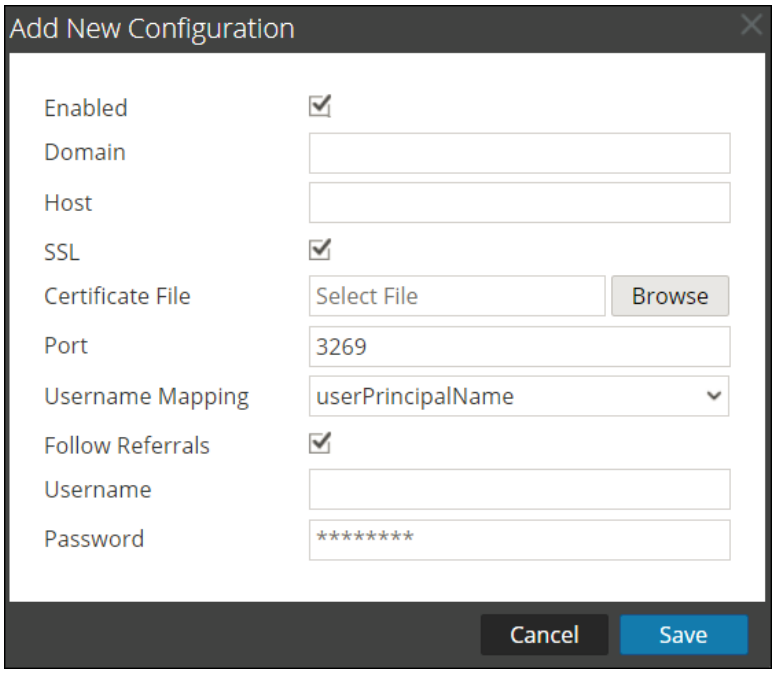
The Password Policy section enables you to configure password complexity requirements for internal NetWitness Platform users when they set their passwords.

Option	Description
Password will expire after <n> days	The default number of days before a password expires for all internal NetWitness Platform users. A value of zero (0) disables password expiration. For new installations, the default value is 30. For upgrades, the previous value will migrate automatically to the upgraded installation.
Users will be notified <n> days prior to password expiring	The number of days before the password expiration date, to notify a user that their password is about to expire. Users receive a one-time email on the specified date before their passwords expire. They also see a Password Expiration Message dialog when they log on to NetWitness Platform. The minimum value is 1 day.
Minimum Password Length	Specifies a minimum password length requirement for NetWitness Platform user passwords. A minimum password length prevents users from using short passwords that are easy to guess.

Option	Description
Uppercase	Specifies a minimum number of uppercase characters for the password. This includes European language characters A through Z, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic uppercase: Д Ц • Greek uppercase: Π Λ
Lowercase	Specifies a minimum number of lowercase characters for the password. This includes European language characters a through z, sharp-s, with diacritic marks, Greek characters, and Cyrillic characters. For example: • Cyrillic lowercase: д ц • Greek lowercase: π λ
Decimal Digits	Specifies a minimum number of decimal characters (0 through 9) for the password.
Special (~!@#$%^&*_-+=`|'(){}[]:;<>,".?/)	Specifies a minimum number of special characters for the password: ~!@#$%^&*_-+=`|'(){}[]:;<>,".?/
Non-Latin Alphabetic	Specifies a minimum number of Unicode alphabetic characters that are not uppercase or lowercase. This includes Unicode characters from Asian languages. For example: • Kanji (Japanese): 頁 (leaf) 枒 (tree)
Password May Not Contain Username	Specifies that a password cannot contain the case-insensitive username of the user.
Force all internal users to change their passwords on the next login	Forces all internal users to change their passwords the next time they log on to NetWitness Platform instead of when they create or change their passwords. Note that this setting is checked by default.

Option	Description
Apply	Password strength settings take effect when NetWitness Platform users create or change their passwords. If **Force all internal users to change their passwords on the next login** is selected, all internal users must change their password the next time they log on to NetWitness Platform.

The following figure shows the Active Directory Configurations Add New Configuration dialog of the Settings tab.



Security Settings

The Security Settings section enables you to configure global security settings for NetWitness Platform users.

Option	Description
Lockout Period	Number of minutes to lock a user out of NetWitness Platform after the configured number of failed logins is exceeded. The default value is 20 minutes.
Max Login Failures	The maximum number of unsuccessful login attempts before a user is locked out. The default value is 5

Option	Description
Session Timeout	The maximum duration of a user session before timing out in minutes. The default value is 600. If the value is 0, there is no maximum time for a session. If the value is a positive integer, the session times out when the configured time has elapsed. The user must log in again.
Idle Period	Number of minutes of inactivity before a session times out. The default value is 10. If the value is 0, the session will not timeout.
Usernames are case sensitive	Select this option if you want the Username field on the NetWitness Platform login screen to be case sensitive. For example, if usernames are case sensitive, you could use admin to log on to NetWitness Platform, but you could not use Admin. This is a mandatory field.
Password	Enter the password if you want to add or edit the Active Directory Security Settings. This is a mandatory field.
Apply	Makes the settings become effective immediately.

PAM Authentication

The PAM Authentication section enables you to configure NetWitness Platform to use Active Directory or PAM to authenticate and test external user logins.

Option	Description
Enable PAM Authentication	Allows NetWitness Platform to use Pluggable Authentication Modules (PAM) to authenticate external user logons.
Apply	Makes the PAM configuration settings become effective in the next logon.
Test	Prompts for a username and password, then tests the currently enabled PAM authentication method.

Active Directory Configurations

The Active Directory Configuration section enables you to configure NetWitness Platform to use Active Directory to authenticate external user logins.

Option	Description
Enabled	Enables Active Directory authentication for NetWitness Platform users.
Domain	Domain name where the Active Directory Service is located.
Host	Host name or IP address where the Active Directory Service is located.
Port	Port on the host that is used for Active Directory Service authentication.
SSL	Indicates whether the Active Directory Service uses Secure Sockets Layer (SSL). To enable SSL so that your Active Directory Service can communicate with NetWitness Platform version 11.1 and later, you must upload an Active Directory server certificate.
Username Mapping	Indicates the Active Directory search field to use for username mapping. You can specify userPrincipalName (UPN) or sAMAccountName.
Follow Referrals	Indicates whether NetWitness Platform will follow LDAP referrals made by Active Directory.
Username	If Username is provided here, it binds to the Active Directory Service while searching Active Directory groups. This credential is not used for any other purpose.

Security Configuration Guide Overview

This guide provides information about the security configuration settings NetWitness Platform and security best practices for RSA NetWitness Platform.

This guide applies to NetWitness Platform version 11.0 or later. There will be periodic updates made to the content.

Anyone using this guide should possess experience as a network engineer, equivalent to at least that of a journeyman, and also have a strong understanding of network concepts and TCP/IP communications.

Security Configuration Settings

This topic describes information about various security configuration settings that are designed to help you securely operate RSA NetWitness Platform.

You can adjust the following security configuration settings:

- Access Control Settings
- Log Settings
- Communication Security Settings
- Data Security Settings
- Alert System Settings
- Other Security Considerations

Access Control Settings

Access control settings are designed to enable the protection of resources against unauthorized access or by external components.

- User Authentication
- User Authorization
- Component Authentication

User Authentication

User authentication settings are designed to control the process of verifying an identity claimed by a user for accessing RSA NetWitness Platform.

NetWitness Platform Core Trusted Connection

NetWitness Platform Core 11.2 has the ability to connect and authenticate over SSL without having to provide user account information on the service itself. This feature is only available over the native port and not the REST interface. For more information on trusted connection, see *Host and Services Getting Started Guide*.

User Accounts

The following table identifies the default RSA NetWitness Platform user roles including the Administrator (admin) account and several service accounts. When deploying, you must enter a password for the system administrator account and all the service accounts. For more information on passwords and password strength, see "Settings Tab" Help topic in *System Security and User Management Guide*.

Note: Custom roles can be added as required. For instructions, see "Add a Service User Role" topic in *Host and Services Configuration Guides*.

User Roles	Description
Administrators	Full system access
Operators	Access to configurations but not to meta and session content.
Analysts	Access to meta and session content but not to configurations.
SOC_Managers	Same access as Analysts plus additional permission to handle incidents.
Malware_Analysts	Access to malware events and to meta and session content.
Data_Privacy_Officers	Access to meta and session content as well as configuration options that manage obfuscation and viewing of sensitive data within the system (see Data Privacy Management).

User Roles	Description
Respond_ Administrator	Access to all Respond server and Incidents permissions.
UEBA_Analysts	Access to the User and Entity Behavior Analytics (UEBA) service in the Investigate > Users view. UEBA is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all entities in your network environment.

Note: You do not need to set up specific permissions for this role. You only need to assign this role to a user, and that user will have access to UEBA.

Configuring New Accounts

Each RSA NetWitness Platform user must have an account to log on to the UI. For instructions on adding new user accounts, see "Manage Users with Roles and Permissions" Help topic in *System Security and User Management Guide*.

Caution: RSA recommends that you ensure that users are approved by the company for logging on to the system before creating an account for them. Even if users are approved, RSA recommends that you only assign the minimum set of access permissions that enable the users to perform their jobs.

Authentication Configuration

User authentication settings are designed to control the process of verifying an identity claimed by a user for accessing NetWitness Platform. For more information, see "Set Up System Security" topic in the *System Security and User Management Guide*.

Below are recommendations for some of the configurations:

- **Default System Administrator Account**: RSA recommends that you instruct RSA NetWitness Platform administrators on your corporate IT policy and security best practices to generate and manage passwords for the default System Administrator account. RSA recommends that you change the default System Administrator password and the admin passwords for the service accounts per your company's password policy. For more information on password strength settings, see "Password Strength" topic in the *System Security and User Management Guide*. You should change the System Administrator password using the Admin user preferences. For instructions on how to change the password, see "Change the Default admin Passwords" in the *System Security and User Management Guide*.

- **External Authentication**: RSA NetWitness Platform supports external authentication. For more information, see "Configure External Authentication" topic in the *System Security and User Management Guide*.

User Passwords

NetWitness Platform Users

Administrators can set the appropriate level of password strength for the user and can force users to change their passwords when password strength policy changes. Administrators can specify global default user password expiration period and the notification period for the password expiry. For more information, see "Configure System-Level Security Settings" topic in the *System Security and User Management Guide*.

The following table shows the default security parameters settings for passwords.

Caution: RSA recommends that you change these settings in accordance with your corporate policy. Users must ensure the idle period and session time-out is specified.

Parameter	Default Setting
Global Default User Password Expiration Period	0
Notify User <n> Days Prior to Password Expiry	5

NetWitness Platform Core Service Users

Administrators can change the password of a service user and replicate the new password to all the NetWitness Platform Core services with the defined user account. For more information, see "Change a Service User Password" topic in the *Host and Services Configuration Guides*.

You can also change your password from the Preferences panel in the Profile view. For more information, see "Profile View Preferences Panel" topic in the *NetWitness Platform Getting Started Guide*.

Security Parameter Settings

The following table shows the default security parameters settings.

Caution: RSA recommends that you change these settings in accordance with your corporate policy.

Parameter	Default Setting
Lockout Period	20 minutes

Parameter	Default Setting
Idle Period	10 minutes
Session Timeout	480 minutes
Max Login Failures	5

For more information on security parameter settings, see "Configure System-Level Security Settings " topic in the *System Security and User Management Guide*.

User Authorization

User authorization settings are designed to control rights or permissions that are granted to a user for accessing a resource managed by RSA NetWitness Platform.

Access Roles

RSA NetWitness Platform allows you to create access roles that you can assign to users. Each access role is mapped to a list of user authorization settings.

For more information, see the following NetWitness Platform 11.2 topics:

- "Role Permissions" in the *Alerting Using ESA Guide*.
- "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

Note: Additionally, RSA NetWitness Platform recommends that you review users' task permissions on a routine basis to ensure that each user is granted the correct task permissions.

RSA NetWitness Platform allows access roles to be assigned to users through external group membership or directly to user accounts. RSA recommends that you assign permissions through group membership and not assign permissions directly to user accounts. For more information, see "Map User Roles to External Groups" Help topic in the *System Security and User Management Guide*.

The user roles assigned also control permissions that are granted to accounts that need access to a specific component of NetWitness Platform.

Component Authentication

This topic describes Component authentication settings control the process of verifying an identity claimed by an external or internal system or component.

Host Configuration and Service Authentication

When you install or upgrade to NetWitness Platform 11.0 or later, trusted connections are established by default with two settings:

1. SSL is enabled.
2. NetWitness Platform is connected to core services using the encrypted SSL port.

RSA NetWitness Platform allows secure authentication services for the following hosts as SSL is enabled by default:

- NetWitness Server
- Decoder
- Log Decoder
- Concentrator
- Broker
- Log Collector
- Archiver
- ESA
- Malware Analysis
- Endpoint
- UEBA

Note: By default all the services on the hosts have SSL enabled.

For more information, see Help topic in the *Host and Service Configuration Guides*.

Changing Credentials for Default Configuration Service Accounts

For instructions on resetting the password for the admin of the host service accounts, see "Users Tab" topic in the *Host and Services Configuration Guides*.

Note: The default user name othe host service accounts (admin) cannot be modified.

Configuring Live Account Authentication

RSA NetWitness Platform supports secure authentication for the Live account connection to Content Management System (CMS) as the SSL is enabled by default. The default communications port on the CMS is 443. For instructions on configuring this setting, see "Configure Live Settings" topic in the *System Configuration Guide*.

Configuring Lockbox Authentication

Lockbox provides an encrypted file that Warehouse Connector or Log Collector uses to store and protect sensitive data. You need to create the lockbox by providing a lockbox password while configuring the Warehouse Connector or Log Collector for the first time. For more information on lockbox setup, see the following topics:

- "Log Collector - Step 3: Set Up a Lockbox" in the *Log Collection Guides*.
- "Warehouse Connector - Step 2: Create Lockbox" in the *Host and Services Configuration Guides*.

Display Logon Banner for Remote SSH Connections

RSA NetWitness Platform allows you to customize the logon banner to display standard government or corporate warning signs for SSH remote connections to the hosts. An example message would be the following:

"This system is private. Use or misuse may be logged and invalid access pursued."

1. Log on to the appliance using root credentials.
2. Type **cd /etc/** to switch to the **/etc/** directory.
3. Edit the **/etc/issue.net** file with the required banner text.
4. Save the changes and exit.
5. Type **cd /etc/ssh** to switch to the **/etc/ssh** directory.
6. Edit the **/etc/ssh/sshd_config** file to remove the comment for the banner and provide the location of the banner text file (For example, **/etc/issue.net**).
   The following file is an example of an **sshd.config** file before being modified:

   ```
   # no default banner path
   #Banner none
   ```

   The following file is an example of an **sshd.config** file after being modified:

   ```
   # no default banner
   #Banner /etc/issue.net
   ```

7. Save the changes and exit.
8. Type **service sshd restart** in order to restart the sshd service.

Log Settings

A log is a chronological record of system activities that enables the reconstruction and examination of the sequence of environments and activities surrounding or leading to an operation, procedure, or event in a security-relevant transaction.

Global Audit Logging provides NetWitness Platform Auditors with consolidated visibility into user activities within NetWitness Platform in real-time from one centralized location. NetWitness Platform audit logs collect in a centralized system that converts them into the required format and forwards them to an external syslog system. The external syslog system can be a third-party syslog server or a Log Decoder. For more information, see "Global Audit Logging Overview" topic in the *System Configuration Guide*.

Log Description

The following table shows the security-relevant logs provided by RSA NetWitness Platform.

Component	Reference
Appliance and Service Logs	See "Services Explore View and Services Logs View" topics in the *Host and Services Configuration Guides* and "Configure Log File Settings" topic in the *System Configuration Guide*.
Audit Logs	See " Configure Global Audit Logging" topic in *System Configuration Guide*.
Syslogs	See " Configure Syslog and SNMP Settings" topic in the *System Configuration Guide*.

Log Management and Retrieval

For more information on:

- Log settings: See "Configure Log File Settings" topic in the *System Configuration Guide*.

  Note: RSA recommends that you set the maximum log file size in accordance to your corporate policy.

- Log forwarding: See "Set Syslog Forwarding" topic in the *Host and Services Configuration Guides*.
- Setting log overrides:
  You may override the default logging levels if you want to include messages generated by specific modules.

`Syntax: <module>=<level>`

`SDK-Language=none`

Where level is one or more of `"none|debug|info|warning|failure|audit|all"`, all options must be separated by a pipe |

none and all are mutually exclusive with each other and all other options.

Overrides are useful for query auditing (that is, those modules that begin with SDK-) or for debugging by module (that is, Index)

- Data
- Engine
- Index
- Network
- Packet
- Parse
- Decoder
- Rules
- Concentrator
- Appliance
- SDK
- SDK-Query
- SDK-Values
- SDK-Language
- SDK-Info
- SDK-Session
- SDK-Timeline
- SDK-Content
- SDK-Search

Note: RSA recommends that you restrict permissions to the log files folder to the appropriate user.

Communication Security Settings

Communication security settings are designed to enable the establishment of secure communication channels between RSA NetWitness Platform components, as well as between RSA NetWitness Platform components and external systems or components.

Port Usage

To help ensure security, RSA recommends that you configure your firewall rules and access control lists to expose only the ports and protocols necessary for the operation of RSA NetWitness Platform. The services, such as Reporting Engine, Respond Service, Malware, Log Collector, Live account, Broker, Concentrator, Decoder, and Log Decoder, use specific TCP ports to communicate with each other and the following:

- Web user client interfaces
- Live CMS
- LDAP synchronization
- Third-party email server
- NetWitness Platform console

All communication from NetWitness Platform is over the native NetWitness Platform Core ports as against the REST API ports. The additional native NetWitness Platform Core port per appliance allows an administrator to enable secure (SSL) network communications while still being able to utilize non-secure (HTTP and NetWitness Platform Core native) connectivity methods for communication between services that are present on the same system. Administrators can toggle the ports on and off to support only SSL, only non-SSL, or both.

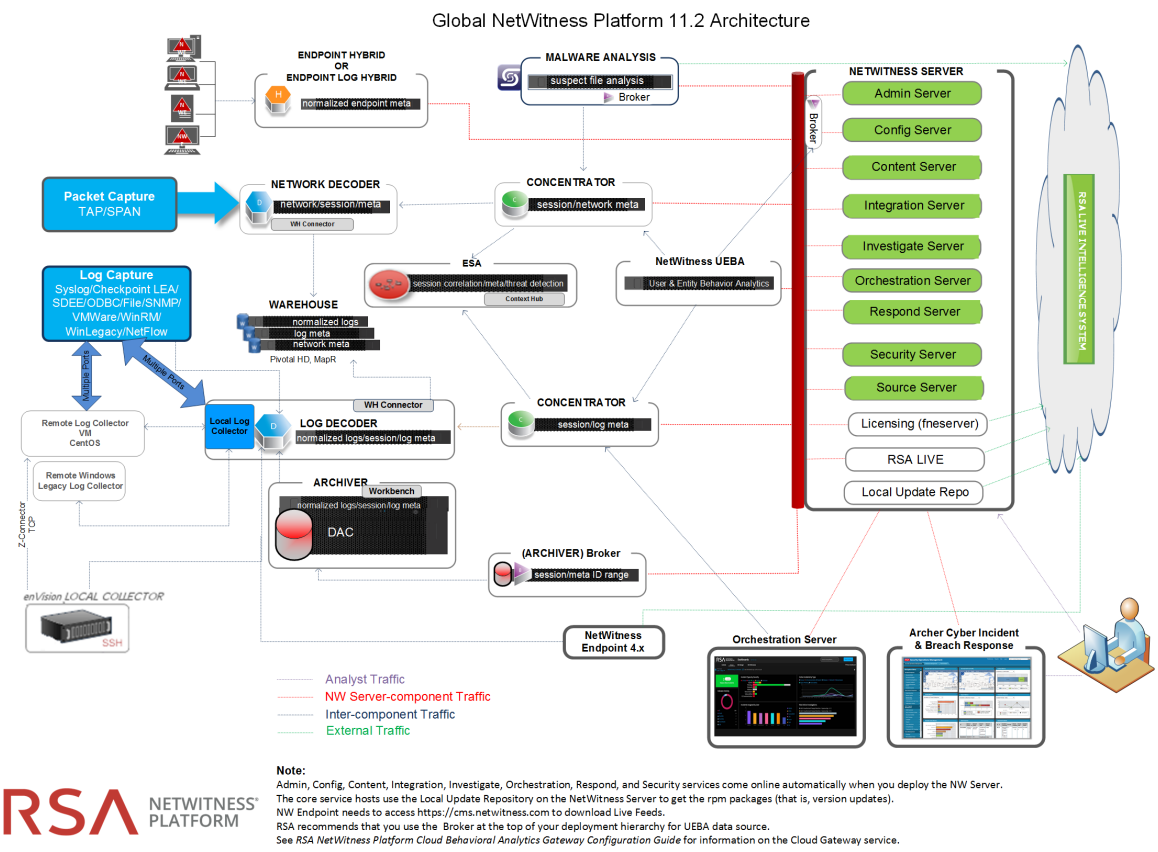
Refer to the following diagram and port table to ensure that all the relevant ports are opened for components in your NetWitness Platform deployment to communicate with each other.

For more information on individual Endpoint Architectural diagrams, see Communication Security Settings at the end of this topic.

NetWitness Platform Network Architecture Diagram

The following diagram illustrates the NetWitness Platform network architecture including all of its component products.

Note: NetWitness Platform core hosts must be able to communicate with the Netwitness Server through UDP port 123 for Network Time Protocol (NTP) time synchronization.



RSA NETWITNESS® PLATFORM

Note:
Admin, Config, Content, Integration, Investigate, Orchestration, Respond, and Security services come online automatically when you deploy the NW Server.
The core service hosts use the Local Update Repository on the NetWitness Server to get the rpm packages (that is, version updates).
NW Endpoint needs to access https://cms.netwitness.com to download Live Feeds.
RSA recommends that you use the Broker at the top of your deployment hierarchy for UEBA data source.
See *RSA NetWitness Platform Cloud Behavioral Analytics Gateway Configuration Guide* for information on the Cloud Gateway service.

Comprehensive List of NetWitness Platform Host and Service Ports

Note: 1.) For ports used in event collection through the Netwitness Logs, see the "The Basics" in the *RSA NetWitness Platform Log Collection Deployment Guide*.

This section contains the port specifications for the following hosts.

- NW Server Host
- Archiver Host
- Broker Host
- Concentrator Host
- Endpoint Hybrid/Endpoint Log Hybrid Host
- Event Stream Analysis Host
- Log Collector Host
- Log Decoder Host
- Log Hybrid Host
- Malware Host
- Network Decoder Host
- Network Hybrid Host
- UEBA Host

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
Admin Work-station	NW Server	TCP 443, 80	nginx - NetWitness UI
NW Hosts	NW Server	TCP 443	RSA Update Repository
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI
Admin Work-station	NW Server	TCP 22	SSH
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Server	NW Server	TCP 50003, 50103, 56003	Broker Ports
NW Server	NW Server	TCP 5671	RabbitMQ-amqp
NW Hosts	NW Server	TCP 5671	RabbitMQ-amqp
NW Server	NW Server	UDP 50514	Audit Ports
NW Server	NW Server	TCP 7000, 7003, 7006, 7009, 7010	Launch Ports
NW Server	NW Server	TCP 50006, 50106, 56006	NetWitness Appliance Ports
NW Hosts	NW Server	UDP 123	NTP
NW Hosts	NW Server	TCP 27017	MongoDB
NW Server	NW Server	UDP 123	NTP
NW Server	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
NW Server	NW Endpoint	TCP 443, 9443	For NW Endpoint 4.x integrations

Source Host	Destination Host	Destination Ports	Comments

Archiver Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Archiver	TCP 15671	RabbitMQ Management UI
Admin Workstation	Archiver	TCP 22	SSH
NW Server	Archiver	TCP 56008 (SSL), 50008 (Non-SSL), 50108 (REST)	Archiver Application Ports
NW Server	Archiver	TCP 56006 (SSL), 50006 (Non-SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Archiver	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
NW Server	Archiver	TCP 514, 6514, 56007 (SSL), 50007 (Non-SSL), 50107 (REST), UDP 514	Workbench Application Ports
Archiver	Archiver	UDP 50514	Audit Data
Archiver	Archiver	UDP 123	NTP
Archiver	NFS Server	TCP 111 2049 UDP 111 204	iDRAC Installations

Broker Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Broker	TCP 15671	RabbitMQ Management UI
Admin Workstation	Broker	TCP 22	SSH
NW Server	Broker	TCP 56003 (SSL), 50003 (Non-SSL), 50103 (REST)	Broker Application Ports
NW Server	Broker	TCP 56006 (SSL), 50006 (Non-SSL), 50106 (REST)	NetWitness Appliance Ports
NW Server	Broker	TCP 5671	RabbitMQ (AMQPS) message bus for all NW hosts.
Broker	Broker	UDP 50514	Audit Data
Broker	Broker	UDP 123	NTP
Broker	NW Server	TCP 111 2049 UDP 111 2049	iDRAC Installations

Concentrator Host

Source Host	Destination Host	Destination Ports	Comments
Admin Work-station	Concentrator	TCP 15671	RabbitMQ Management UI
Admin Work-station	Concentrator	TCP 22	SSH
NW Server	Concentrator	TCP 56005 (SSL), 50005 (Non-SSL), 50105 (REST)	Concentrator Application Ports

Source Host	Destination Host	Destination Ports	Comments
Malware	Concentrator	TCP 56005 (SSL)	Malware
NW Server	Concentrator	TCP 56006 (SSL), 50006 (Non-SSL), 50106 (REST)	NetWitness Appliance Ports

Note: For the latest architecture and port usage information, see "Network Architecture and Ports" topic in the *Deployment Guides*.

Topics

- Network Encryption

Network Encryption

You can configure RSA NetWitness Platform to send or receive data from external data sources.

Note: RSA recommends that whenever you have the option to choose between unsecured and secured versions of a communication protocol, you choose the secured version.

NetWitness Platform Web Server Communications

The RSA NetWitness Platform UI or web server which communicates with the Live Service (CMS) over port 443 using the HTTPS protocol.

Note: During installation, the system is engineered to set the default communication protocol to HTTPS over port 443.

Reporting Engine, ESA and Warehouse Connector : External Communication

RSA recommends that you use the secure tcp protocol and enable an SSL connection while configuring Reporting Engine, ESA, Warehouse Connector, Licensing, and Malware.

For more information on Reporting Engine, see "Step 4: Configure Output Actions" topic in the *Host and Services Configuration Guides*.

For more information on Malware external communication, see " Step 1. Configure Malware Analysis Operating Environment" topic in the *Host and Services Configuration Guides*.

For more information on ESA, see " Notification Methods" topic in the *Alerting Using ESA Guide*.

For more information on the Warehouse Connector, see "Configure Warehouse Connector" topic in the *Host and Services Configuration Guides*.

For more information on Licensing, see "Configure NetWitness Platform Notifications" topic in the *Alerting Using ESA Guide*.

Log Collector Service

To help secure communication between the Log Collector service running on the Log Decoder and the event sources, RSA recommends the protocols in the following table

Event Source	Protocol	Resources
File	SFTP, SCP, FTPS	For more information, see " File Collection Protocol Configuration" topic in the *Log Collection Guides*.
ODBC	ODBC	For more information on configuring an ODBC event source, see "ODBC Collection Configuration" topic in the *Log Collection Guides*. **Note:** Note: Depending on the event source, administrators can configure additional progress driver parameter for secure connections. For more information, see Progress document at https://www.progress.com/odbc/resources/documentation/books-and-readme-file. For more information on using a Certificate, see the certificate creation kit at http://openssl.org/. For more information on securing communication with SQL Server, Oracle, and ODBC, see the URLs: http://technet.microsoft.com/en-us/l...QL.105%29.as http://technet.microsoft.com/en-us/l.../cc754431.aspx http://www.oracle.com/technetwork/database/options/advanced-security/overview/index.html http://www.psdn.progress.com/progres...92/odr/odr.pdf
Windows	HTTPS	For more information on configuring a Windows event source to use certificates and enable HTTPS, see NetWitness Platform 11.2 Help topic *Windows Collection Configuration Guide*.
Check Point	OPSEC LEA	For more information on configuring a Check Point event source to use certificates, seeNetWitness Platform 11.2 Help topic *Check Point Collection Configuration Guide*.
Netflow	Netflow	For more information on configuring a Netflow event source to use certificates, seeNetWitness Platform 11.2 Help topic *Netflow Collection Configuration Guide*.

Event Source	Protocol	Resources
SDEE	SDEE	For more information on configuring a SDEE event source to use certificates, see NetWitness Platform 11.2 Help topic *SDEE Collection Configuration Guide*.
SNMP	SNMP	For more information on configuring a SNMP event source to use certificates, see NetWitness Platform 11.2 Help topic *SNMP Collection Configuration Guide*.
VMware		For more information on configuring a VMware event source to use certificates, see NetWitness Platform 11.2 Help topic *VMware Collection Configuration Guide*.
Legacy Windows and NetApp		For more information on configuring a Legacy Windows event source to use certificates, see NetWitness Platform 11.2 Help topic *Legacy Windows and NetApp Collection Configuration Guide*
Amazon Web Services (AWS) Cloud Trail	HTTPS	For more information on configuring an AWS Cloud Trail event source to use certificates, see NetWitness Platform 11.2 Help topic *AWS (CloudTrail) Collection Configuration Guide*.

Note: For more information on enabling SSL for component communications, see Component Authentication.

Enabling HTTPS on REST Interfaces for Core Services

To enable HTTPS on REST interfaces:

1. Log in to REST interface.
2. Go to the **rest** > **config** node.
3. Set **SSL** config to **on**.
4. Restart the service.

Data Security Settings

Data security settings are designed to enable the definition of controls to prevent data permanently stored by RSA NetWitness Platform from being disclosed in an unauthorized manner.

Securing Data

To help protect online data, such as current database, log, and configuration files, RSA recommends that you restrict access to the files and database and configure permissions so that only trusted administrators are allowed to access them.

RSA recommends that you back up your sensitive data, encrypt it, and keep it in a secure physical location in accordance with your corporate disaster recovery and business continuity policies.

The backup can be done in the following ways:

- Regular backup of Configuration and Data files – You can back up and restore data and configuration files for the core host and services and all the modules of NetWitness Platform. For more information, see "Back Up and Restore Data for Hosts and Services" topic in the *System Maintenance Guide*.
- Regular backup of critical configuration – You can export configurations using the Export option available on the UI. For example, you can take a backup of critical rules, reports, alerts, ESA rules, dashboards, investigation profiles, meta groups, event sources, global notifications, and so on. For more information, see topics:
  - "Export a Rule, Export an Alert and Export a Report" in the *Reporting Guide*.
  - "Rule Library View and Dashboard" in the *Alerting using ESA Guide*.
  - "Manage Profiles Dialog and Export a Meta Group" in the *Investigation and Malware Analysis Guide*.
  - "Events View and Export Event Sources" in the *Event Source Management Guide*.
  - "Global Notifications Panel Toolbar" in the *System Configuration Guide*.

Data Privacy

Data Privacy is very integral and helps you manage privacy-sensitive data. You can achieve data privacy using the Data Privacy Officer (DPO) role. The DPO can configure NetWitness Platform to limit the exposure of meta data and raw content (packets and logs) using a combination of techniques. The methods available to protect data in NetWitness Platform include:

- Data Obfuscation
- Data Retention Enforcement
- Auditing Logging

For more information, see topics in the Data Privacy Management.

Default Storage Passwords

The default storage passwords for database accounts that store alerts in ESA, Respond Service, and Data Science can be changed. For more information, see "Change Default Storage Passwords" topic in the *Host and Services Configuration Guide*.

Alert System Settings

For instructions on configuring NetWitness Platform to send alerts or notifications, see following topics in the *System Configuration Guide*:

- "Email Configuration Panel"
- "Global Audit Logging Configurations Panel"
- "Global Notifications Panel"

FIPS Compliance

This topic provides information on the Federal Information Processing Standards (FIPS) compliant mode for RSA NetWitness Platform. The FIPS publications are guidelines that set best practices for software and hardware security products for the protection of valuable and sensitive information.

When the FIPS compliant mode is used, products that support one or more FIPS standards can be set into a mode where the product uses FIPS approved algorithms and methods only.

NetWitness Platform supports both FIPS approved and non-FIPS approved functions. In FIPS mode, the product is incapable of using any non-FIPS approved methods.

NetWitness Platform Components working in FIPS mode

The table below lists the NetWitness Platform components that work in FIPS mode. The method you use to activate or deactivate FIPS depends on the type of security library used by your NetWitness Platform services. Your NetWitness Platform services use the security libraries, as mentioned in the following table.

Services	Security Library
Event Stream Analysis (ESA), Malware Analysis, Reporting Engine, NetWitness Platform Host, Respond Service, Context Hub and Endpoint	BSAFE
Broker, Concentrator, Decoder, Log Decoder, Warehouse Connector, Archiver, and Workbench	BSAFE

FIPS 140-2 Certified Cryptographic Modules are enabled for all services that perform cryptographic operations. For the following services, although the FIPS Cryptographic Module is leveraged, the use of FIPS cipher suites is not being enforced:

- NTP: UPD Port 123
- TCP: SSH Port 22
- TCP: Salt API Loopback Port 8000
- CollectD
- Log Collector
- Log Decoder

Note: In 11.0 or later, FIPS is enabled by default for all services, except for Log Collector and Log Decoder. For more information on how to enable FIPS on log Collector and Log Decoder see NetWitness Platform *11.0 Release note*.

Note: Security Technical Implementation Guide (STIG) is not supported for version 11.0 or later.

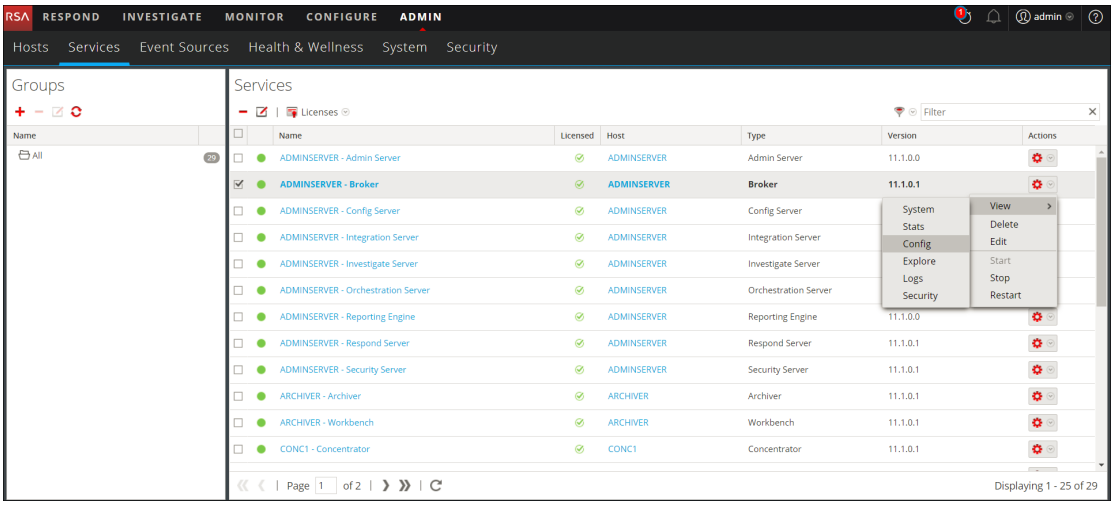
Common Criteria Compliance

This topic provides information on Common Criteria Compliance for RSA NetWitness Platform.To support this requirement, you must ensure that only a secure communication is configured for the core services. To achieve this you must disable the unencrypted ports for the NetWitness core services.

Disabling Unencrypted Ports For NetWitness Core Services

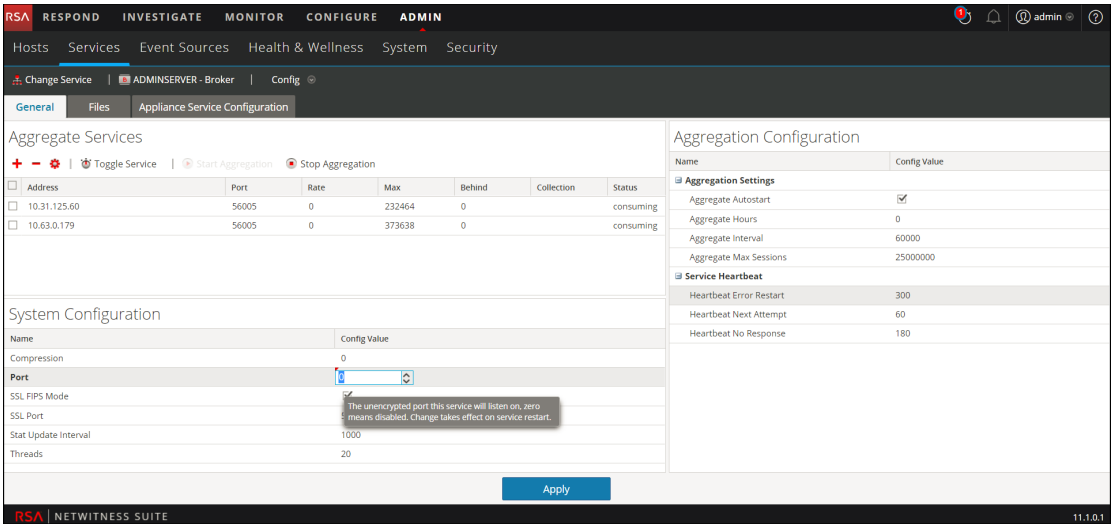
To disable an unencrypted port for a NetWitness core service:

1. Log in to NetWitness Platform UI.
2. Go to **ADMIN** > **Services**.
   The Services page is displayed.
3. Select a core service to configure.
4. Click  and select **View** > **Config**.



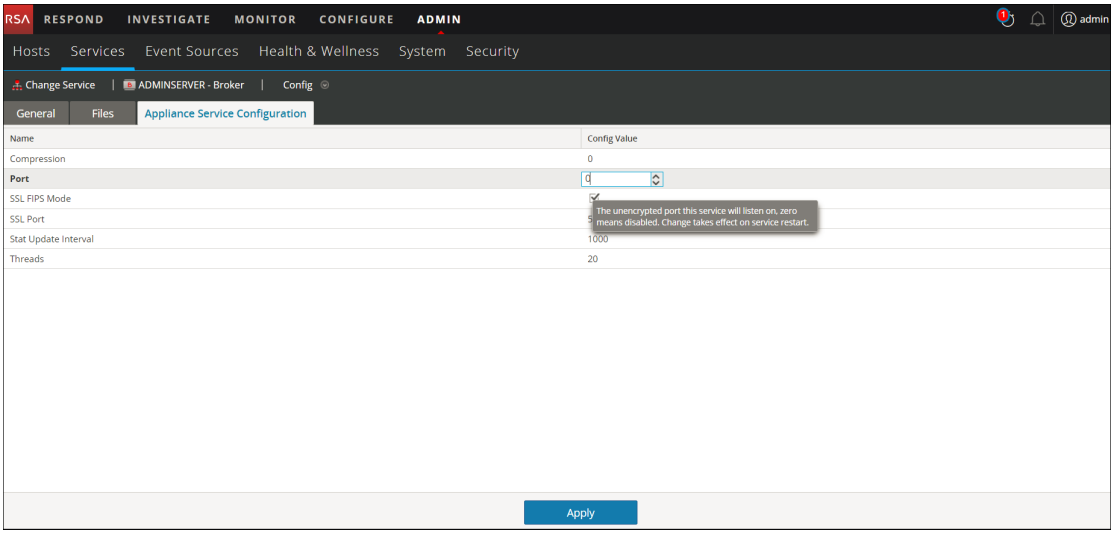
5. Select the General tab.

6. In the Port field under the System Configuration section, replace the existing value with **0**.



7. Now click the Appliance Service Configuration tab.

8. In the Port field, replace the existing value with **0**.



9. Click **Apply** and restart the service, if prompted.

Note: After you apply the changes only the SSL port is configured for the service and no unencrypted interfaces are available to interact with the service.

Other Security Considerations

This topic describes various other security configuration settings that are not covered in previous sections.

Changing the RabbitMQ Management Password for Windows Legacy Collectors

For Windows Legacy Log Collectors (WLCs), a default password is used for the "logcollector" username to access the RabbitMQ broker on that machine. RSA recommends that you change the password for WLCs, per the procedure outlined, which involves changing the RabbitMQ password for the Log Collector and for the RabbitMQ broker.

Note: For CentOS, changing the RabbitMQ password is not supported.

If you are using a Log Collector, you may have to initialize the "lockbox". For instructions, see "Step 3: Set Up a Lockbox" topic in the *Log Collection Guides*.

To change the RabbitMQ password:

1. Change the RabbitMQ password in Log Collector:
   a. Go to the Explore view for the Log Collector service.
   b. Right-click the **event-broker** node and select **config**.
   c. Type the new password in the **amqp_password** field. The password is encrypted by a key that is managed through the lockbox of this Log Collector. This only changes the password on the Log Collector side.

   Note: Most of the settings should not be changed. Ensure you do NOT change the Message Queue User Name "amqp_username" because it is referred to in some certificate checks.
2. Change the RabbitMQ password for the RabbitMQ broker:
   a. Go to the Explore view for the Log Collector service.
   b. Right-click the **event-broker** node and select **properties**.
   c. Select **passwd** in the drop-down list.
   d. In the **Parameters** field, type the old and new password.
   Ensure you remember your old password. If it was never changed, it should be "netwitness" by default.

Example: `Parameters: oldpw=<netwitness> newpw=<YourNewPasswordHere>`

e. Click **Send**.

Hardening the NetWitness Platform Core service

By default, all NetWitness PlatformCore services ship with a default username and password and with SSL turned off. To harden the service, you have to run it with the command line option `-s harden=true`.

Using a Decoder, here's an example command line:

```
NwDecoder -s harden=true -s defaultUsername=<username> -s
defaultPassword=<password>
```

The above command does the following:

1. Removes the default admin account (with caveats, see below).
2. Creates a new account <username> with a password of <password> (thus meeting the password requirements below).
3. Enables SSL on both the native and REST ports.
4. Strengthens default password requirements:
   - /users/config/account.lockout.time = 60
   - /users/config/password.alpha.lowercase.min = 1
   - /users/config/password.alpha.uppercase.min = 1
   - /users/config/password.length.min = 8
   - /users/config/password.numeric.min = 1
   - /users/config/password.symbol.min = 1
5. Sets /rest/config/user.agent.whitelist = Apache-HttpClient/\d\.\d\.\d

   Note: This setting prevents the browsers to connect to the REST port.

The caveat for changing the default user account is that there cannot be an already existing configuration file. This is always true the first time the service is run or before the service is licensed. To harden a service, you must run it before a configuration is written or delete whatever configuration file exists and then harden.

To alter the command line for a service that writes its own upstart script without actually SSHing into the box and modifying the script, there is a new parameter that you can pass to either the /sys shutdown or /decoder reset command (substitute decoder for the actual service name) and this parameter is called "cl" for command line. What you do is pass name=value pairs to the "cl" parameter and those parameters will take affect on the next restart of the service.

Example:

```
/sys shutdown reason="Restart because license was applied"
cl="harden=true default
Username=<username> defaultPassword=<password>"
```

The above command shuts down the service (which should be restarted by Linux upstart) and the command line parameters will be applied on the restart. This command line exactly matches the command line given above for the decoder service. If you want to do a configuration reset, you can use the following:

```
 /broker reset config=true cl="harden=true defaultUsername=<username>
defaultPassword=<password>"
```

This will delete the broker configuration file and create a new default configuration that is automatically hardened with the given default account and credentials. The admin account will not exist when the broker restarts, only the <username> account exists.

NFS Access Controls

By default, the NFS mounts are wide open. To lock them down to a specific address, you must edit the exports file and specify the IP addresses that are allowed to interact with the SAW.

The SAW NFS service is managed from the command line using *mapr-nfsserver*.

```
[root@saw-node1 ~]# service mapr-nfsserver
Usage: /etc/init.d/mapr-nfsserver {start|stop|status|restart|}
[root@saw-node1 ~]# service mapr-nfsserver status
nfsserver (pid 5692 5691) is running...
[root@saw-node1 ~]#
```

If nfs-utils is installed on the node, you can execute a *showmount* on the localhost to see the exposed exports.

```
[root@saw-node1 ~]# showmount -e localhost
Export list for localhost:
/mapr *
/mapr/saw *
[root@saw-node1 ~]#
```

Exports are controlled using the exports file in the */opt/mapr/conf* directory.

```
[root@saw-node1 ~]# cat /opt/mapr/conf/exports
# Sample Exports file
# for non /mapr exports
# <Path> <comma separated cldb addresses=host:port> <exports_control>
# for /mapr exports
# <Path> <exports_control>
#access_control -> order is specific to default
# list the hosts before specifying a default for all
# a.b.c.d,1.2.3.4(ro) d.e.f.g(ro) (rw)
# enforces ro for a.b.c.d & 1.2.3.4 and everybody else is rw
# special path to export clusters in mapr-clusters.conf. To disable
exporting,
# comment it out. to restrict access use the exports_control
#
/mapr (rw)
#to export only certain clusters, comment out the /mapr & uncomment.
# Note: this will cause /mapr to be unexported
#/mapr/clustername (rw)
#to export /mapr only to certain hosts (using exports_control)
#/mapr a.b.c.d(rw),e.f.g.h(ro)
# export /mapr/cluster1 rw to a.b.c.d & ro to e.f.g.h (denied for
others)
#/mapr/cluster1 a.b.c.d(rw),e.f.g.h(ro)
# export /mapr/cluster2 only to e.f.g.h (denied for others)
#/mapr/cluster2 e.f.g.h(rw)
# export /mapr/cluster3 rw to e.f.g.h & ro to others
#/mapr/cluster2 e.f.g.h(rw) (ro)
[root@saw-node1 ~]#
```

To restrict the SAW exports to a certain IP address or group of IPs, you must first edit the exports file and then restart the *mapr-nfsserver service*.

```
[root@saw-node1 ~]# vi /opt/mapr/conf/exports
[root@saw-node1 ~]# cat /opt/mapr/conf/exports | grep ^/mapr
/mapr 10.42.1.87(rw)
[root@saw-node1 ~]# showmount -e localhost
Export list for localhost:
/mapr *
/mapr/saw *
```

```
[root@saw-node1 ~]# service mapr-nfsserver restart
[root@saw-node1 ~]# showmount -e localhost
Export list for localhost:
/mapr 10.42.1.87
/mapr/saw 10.42.1.87
[root@saw-node1 ~]# mount -t nfs -o nolock,tcp localhost:/mapr/saw
/saw
mount.nfs: access denied by server while mounting localhost:/mapr/saw
[root@saw-node1 ~]#
```

Note: Trying to mount the export on the localhost will fail as only a specific host IP is now allowed to use the NFS mount

Secure Deployment and Usage Settings

This topic describes the settings for secure deployment and usage. It is very important to protect all physical, local, and remote access to the RSA NetWitness Platform appliances. It is also important to restrict all access methods to the absolute minimum required to maintain RSA NetWitness Platform.

Note: RSA recommends that you do not set up the test environments to be exact copies of the full production environment. If the test environment is identical to the production environment, you should take the same precautions to protect the test environment as you do in the production environment.

Security Controls Map

This topic describes the security controls map. An RSA NetWitness Platform deployment can consist of the following components:

- Decoder
- Log Decoder
- Concentrator
- Broker
- Log Collector
- Context Hub
- Malware
- ESA
- Archiver
- NetWitness Warehouse
- NetWitness Server
- External Warehouse - Hortonworks
- External CMS Library (Live)
- Endpoint Insights
- UEBA Server

NetWitness Platform supports integration with products such as RSA NetWitness Platform 4.x and RSA Archer.

RSA recommends that you access the host on secure client machines within the network. If you must access the host through remote access, RSA recommends that you connect to the network through a secure VPN connection. Only allow remote access to NetWitness Platform hosts for secure maintenance using the Remote Desktop Protocol (RDP) through a secure VPN connection.

Caution: RSA recommends that you deploy the hosts in a secure location, where physical access to the hosts are restricted only to the personnel who manage the hosts.

Secure Enclave

To help protect NetWitness Platform against unauthorized authentication and access by end users or machines, RSA recommends that you deploy NetWitness Platform hosts such as Broker, Concentrator, and Decoder.

You can help create a secure enclave by separating the low security corporate network from the high security network with firewalls. To help create a secure enclave, RSA recommends that you:

- Implement basic physical security elements, policies, procedures, and processes for the low security network.
- Provide access to the hosts within the secure enclave through a secure virtual private network (VPN) tunnel only, such as IPSec tunnel, to establish encryption and authentication of all network traffic to and from the hosts.

Note: The client machines through which you access NetWitness Platform can be present outside of the Secure Enclave.

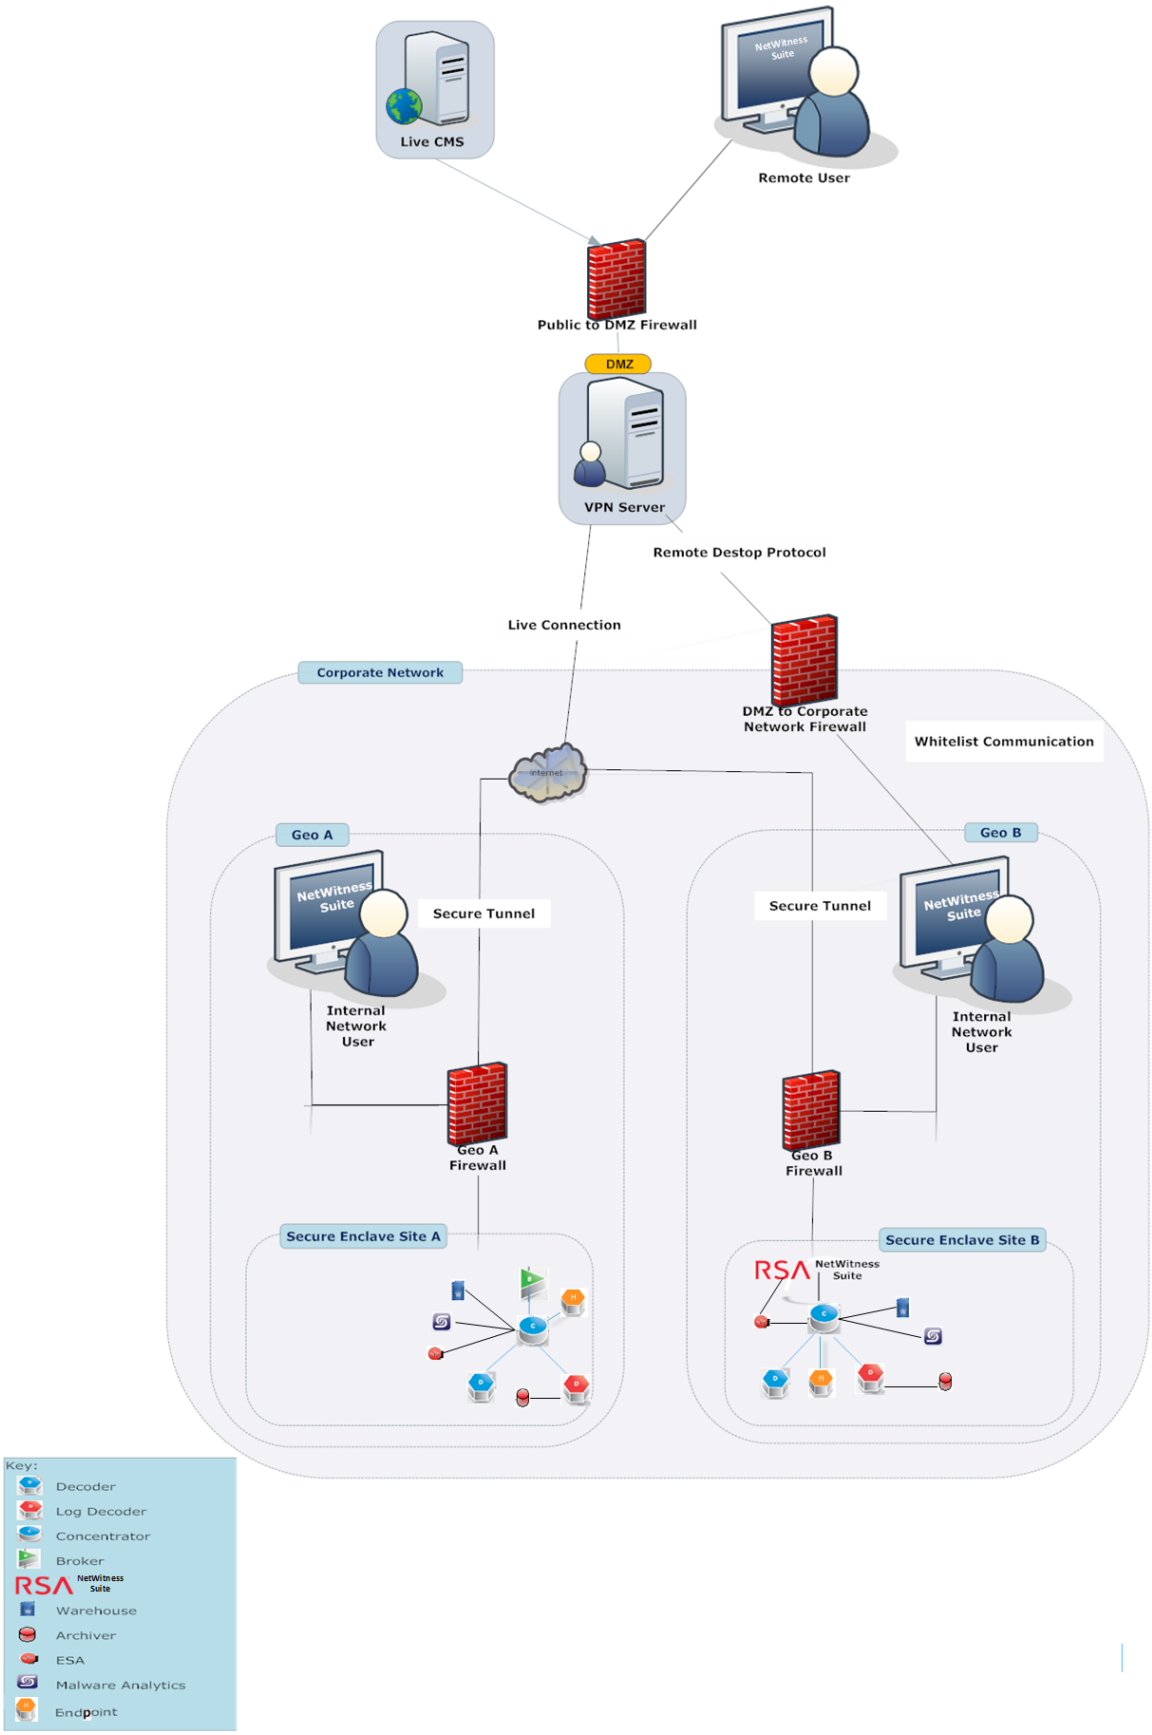
Secure Deployment Guidelines

To help ensure a secure deployment, RSA recommends that you:

- Deploy multiple hosts in the corporate network. The multiple hosts in the example are in two geographic locations and include the following components:
  - NetWitness Platform
  - Broker
  - Packet Decoder
  - Log Decoder
  - Concentrator
  - ESA
  - Archiver
  - NetWitness Warehouse
  - Malware Analysis
  - Endpoint
  - UEBA Server
- Ensure that all the components are connected to the same subnetwork.

- Deploy firewalls at each site to ensure the secure transfer of data from an instance of NetWitness Platform at one site to another instance of NetWitness Platform located at a different site.
- Configure firewall rules to control all communication between different sites and other components in the network as depicted in the previous figure.
- Implement data transfer between sites using a secure tunnel IPSec.

The following figures show the deployment of multiple sites within a corporate network:



Live CMS
NetWitness Suite
Remote User
Public to DMZ Firewall
DMZ
VPN Server
Remote Destop Protocol
Live Connection
Corporate Network
DMZ to Corporate Network Firewall
Whitelist Communication
Internet
Geo A
Geo B
NetWitness Suite
Secure Tunnel
Secure Tunnel

Internal Network User
Internal Network User
Geo A Firewall
Geo B Firewall
Secure Enclave Site A
Secure Enclave Site B
RSA NetWitness Suite
Key:
Decoder
Log Decoder
Concentrator
Broker
RSA NetWitness Suite
Warehouse
Archiver
ESA
Malware Analytics
Endpoint

Firewall Rules

It is important that you use a firewall to restrict network traffic between RSA NetWitness Platform and external systems. RSA NetWitness Platform recommends that you configure firewall rules to help ensure secure communication for the following connections:

- Demilitarized zone (DMZ) to corporate network
- Corporate network to site sub network
- Site to site
- Live CMS to DMZ
- External email server to DMZ

Note: RSA recommends that you restrict access from client hosts to only known IP addresses. For example, if you set up the NetWitness Platform Client UI on IP address 192.168.0.1, configure your firewall to allow only the IP address 192.168.0.1 to connect to the NetWitness Platform host.

Note: The firewall rules should be configured on an external firewall and not on any of the NetWitness Platform host.

RSA recommends that you configure firewall rules as described in the sections below. These recommendations are based on the following assumptions:

- You have a stateful firewall, indicating that only the establishment of TCP ports is considered.
- You specify the direction of communication for the UDP ports because the connections are sessionless.
- You deploy NetWitness Platform as shown in the Security Controls Map.
- The firewall processes the rules top to bottom, finishing with a generic drop of all the packets.

DMZ to Corporate Network

RSA recommends that you:

- Configure whitelist communication from the VPN server in the DMZ to the client machines on which you run RSA NetWitness Platform applications such as NetWitness Platform Web UI.

- Create firewall rules for all the machines from which you intended to remotely access the corporate network through Remote Desktop Protocol (RDP).

Corporate Network to Site

RSA recommends that the firewall at each RSA NetWitness Platform site allow access only from designated client machines through a whitelisted IP address and port.

RSA recommends that you secure the following ports to ensure secure communication between the client machine that is set as the RSA NetWitness Platform Web UI and the NetWitness Platform site:

- TCP 443

For more information, see Communication Security Settings. To help ensure secure communication between the client machines that access the NetWitness Platform UI and a site, you must set up the firewall rules as shown below:

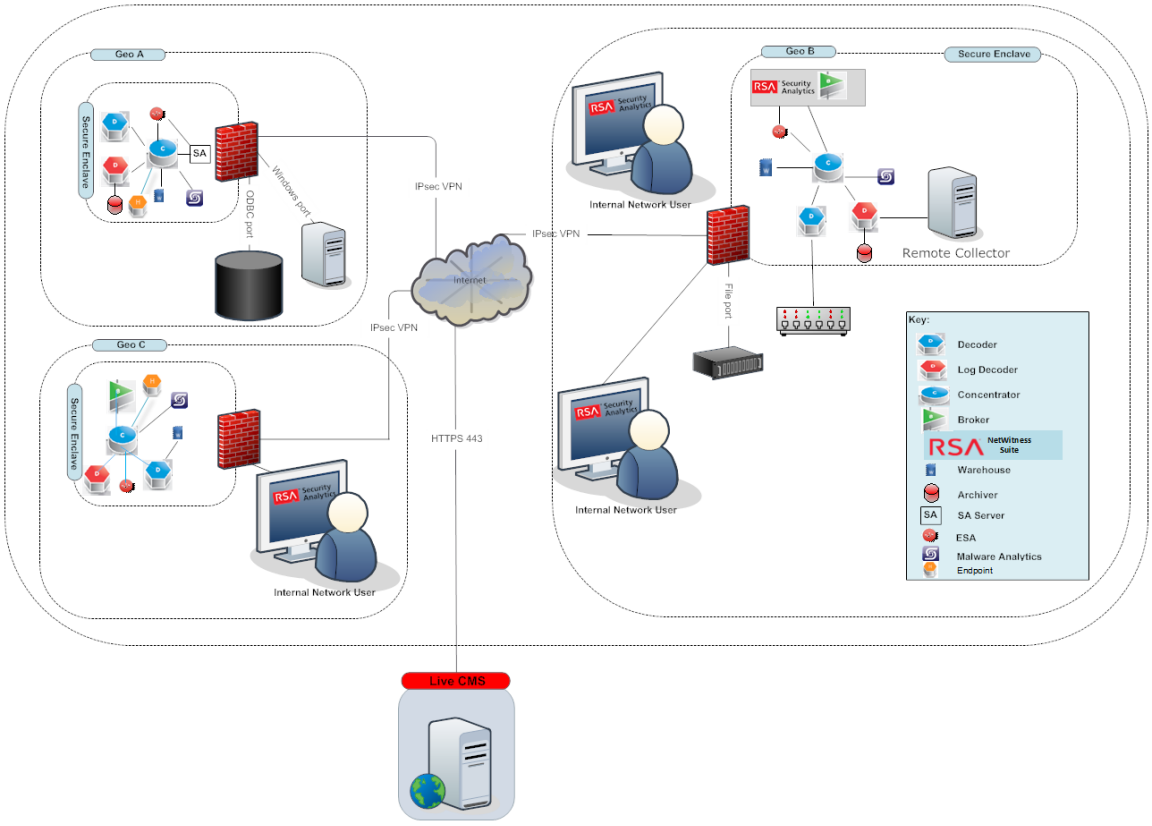
ALLOW $nwclient_IP to $nwsite_IP on port 443/tcp

DROP all from * to *

where **nwclient_IP** is the IP address assigned to the client machine that is set as the NetWitness Platform web UI and **nwsite_IP** is the IP address assigned to the Broker host within which the RSA NetWitness Platform web server is running.

Site to Site

RSA NetWitness Platform may run in multiple sub-networks within your corporate network, called sites. You can configure RSA NetWitness Platform to allow the hosts located in one site to communicate with the hosts in another site.



For this scenario, RSA recommends that you do the following:

- Ensure that the firewall at each RSA NetWitness Platform site allows communication between two sites only through a whitelisted IP address and port. For a graphical depiction of the site-to-site security control map showing the site firewalls, see the above figure.
- NetWitness Platform system update uses port 80. That means NetWitness Platform site to another site (where brokers, decoders exist), port 80 should be open.

Live CMS to DMZ

To ensure secure communication between the RSA NetWitness Platform site and Live CMS, set up the firewall rules as shown below:

ALLOW $nw_site_IP to $Live_IP on port 443/tcp

DROP all from * to *

where **nw_site_IP** and **Live_IP** are the IP addresses assigned to the NetWitness Platform site and the Live CMS respectively.

Note: If you are using proxy server with self-signed certificate, you must add exception in proxy server rule to allow traffic between Live CMS server (cms.netwitness.com, port 443) and NetWitness Platform.

RSA Download Central to DMZ

To ensure secure communication between the RSA NetWitness Platform site and RSA Download Central, set up the firewall rules as shown below:

ALLOW $nw_site_IP to $rsa_DLC_IP on port 80/tcp

DROP all from * to *

where **nw_site_IP** and **rsa_DLC_IP** are the IP addresses assigned to the NetWitness Platform site and RSA Download Central respectively.

External Email Server to DMZ

To ensure secure communication between the RSA NetWitness Platform site and the External Email Server, set up the firewall rules as shown below:

ALLOW $nw_site_IP to $Email_IP on port 443/tcp

DROP all from * to *

where **nw_site_IP** and **Email_IP** are the IP addresses assigned to the NetWitness Platform site and the external email server respectively.

Syslog Server to Site

If you have enabled the syslog port, to ensure secure communication between the RSA NetWitness Platform site and the Syslog Server, set up the firewall rules as shown below:

ALLOW $nw_site_IP to $Syslog_IP on port 514/udp

DROP all from * to *

where **nw_site_IP** and **Syslog_IP** are the IP addresses assigned to the NetWitness Platform site and the syslog server respectively.

SNMP Server to Site

If you have enabled the SNMP port, to ensure secure communication between the RSA NetWitness Platform site and the SNMP Server, set up the firewall rules as shown below:

ALLOW $nw_site_IP to $SNMP_IP on port 1610/SNMP

DROP all from * to *

where **nw_site_IP** and **SNMP_IP** are the IP addresses assigned to the NetWitness Platform site and the SNMP server respectively.

Secure Deployment Settings

The following table shows the security controls that RSA recommends putting in place to help secure the deployment.

Default Deployment Setting	Secure Deployment Settings	Pros of Secure Deployment Settings	Cons of Secure Deployment Settings	Instructions on how to configure secure deployment settings
HTTPS is enabled by default between the NetWitness Platform client and the server	For the best possible security between the client and the server, use certificates from CA.	Provides a high level of protection for the communication between client and server by avoiding tampering, spoofing, and man-in-the middle attacks.	May have impact on performance	For instructions on installing external certificates, see SSL Certificate Guidance for NetWitness Platform

Secure Maintenance

This topic describes some common solutions to help ensure secure maintenance.

Security Patch Management

All security patches for RSA NetWitness Platform originate at RSA and are available for you via the NetWitness Platform User Interface. For more information, see "Manage NetWitness Platform Updates" topic in the *System Maintenance Guide* .

The following table lists the third-party components for which patches are needed.

Third-party Component for which patch is needed	Frequency of Patch	EMC Respons-ibility (Y/N)	Customer Responsibility (Y/N)	Reference to instructions for Applying Patch
NetWitness Plat-form Hosts	Monthly and Quarterly	Y	Y	Based on EMC RSA recom-mendations

Note: From 2016 onwards, security patches will be part of the product release only and will not be shipped out separately.

Virus Scanning

RSA recommends that you:

- Deploy anti-virus client software on the deployed servers in accordance with your enterprise requirements.
- Run anti-virus and anti-malware tools with the most current definition files on the deployed servers.
- Scan all files/drivers before uploading on the deployed server.
- Follow best practices for patch management and regularly review available patches for all anti-virus and anti-malware software.

Ongoing Monitoring and Auditing

As with any critical infrastructure component, RSA NetWitness Platform recommends that you constantly monitor your system and perform periodic and random audits (for example, configuration, permissions, and security logs). You should ensure that the configurations and user access settings match your company policies and needs. For more information, see "Global Audit Logging Configurations Panel" topic in the *System Configuration Guide*.

Hardware Replacement

If RSA NetWitness Platform hardware fails or is faulty, order a replacement by contacting RSA Customer Support. While awaiting a replacement, the Redundant Array of Independent Disks (RAID) configuration is designed to ensure that there is no data loss due to a hardware failure.

The RAID configuration on NetWitness Platform:

- Hosts are RAID 1.
- Direct Attach Capacity (DAC) disk shelves is RAID 5.

Physical Security Controls Recommendations

This topic describes physical security controls.

Recommendations

Physical security controls help to enable the protection of resources against unauthorized physical access and physical tampering. RSA recommends that the physical devices and servers for RSA NetWitness Platform are deployed in a secure data center leveraging the organization's best practices for physically securing a data center, server rack, and/or server.

Supporting Users

This topic describes well-defined policies around help desk procedures for your RSA NetWitness Platform installation.

It is important to have well-defined policies around help desk procedures for your RSA NetWitness Platform installation. RSA recommends that your help desk administrators understand the importance of password strength and the sensitivity of data, such as user logon names and passwords. Creating an environment where an end user is frequently asked for this kind of sensitive data increases the opportunity for social engineering attacks. Train end users to provide, and help desk administrators to request, the least amount of information needed in each situation.

Preventing Social Engineering Attacks

Fraudsters frequently use social engineering attacks to trick unsuspecting employees or individuals into divulging sensitive data that can be used to gain access to protected systems. RSA recommends that you use the following guidelines to help reduce the likelihood of a successful social engineering attack:

- Help desk administrators should only ask for User IDs over the phone when receiving help desk calls. Help desk administrators should never ask for user passwords.
- The help desk telephone number should be well known to all users.
- Help desk administrators should perform an action to authenticate the user's identity before performing any administrative action on a user's behalf. For example, ask users one or more questions to which only they know the answer.
- If help desk administrators need to initiate contact with a user, they should not request any user information. Instead, users should be instructed to call the help desk back at a well-known help desk telephone number to ensure that the original request is legitimate.

Confirming User Identities

It is critical that your help desk administrators verify end users' identities before performing any help desk operations on their behalf. RSA recommends that you verify user identity using the following methods:

- Call the end user back on a phone owned by the organization and on a number that is already stored in the system.

Caution: Be wary of using mobile phones for identity confirmation, even if they are owned by the company because mobile phone numbers are often stored in locations that are vulnerable to tampering or social engineering.

- Send the user an email to a company email address. If possible, use encrypted email.
- Work with the employee's manager to verify the user's identity.
- Verify the identity in person.
- Use multiple open-ended questions from employee records. For example, "Name one person in your group" or "What is your badge number?" Avoid yes or no questions.

Advice for Your Users

RSA recommends that you instruct your users to do the following:

- Never give passwords to anyone.
- Change passwords at regular intervals.
- Inform your users of what information requests to expect from help desk administrators.
- Always log off from the web interface when finished.
- Always lock their desktops when stepping away from their computers.
- Regularly close their browser and clear their cache of data.

Note: Consider regular training to communicate this guidance to users.

Appendix A: Customer Provided Certificates

The following procedure takes effect when you update to [[[Undefined variable SAVariables.NW]]] 11.2. The procedure tells you how to replace the internally generated [[[Undefined variable SAVariables.NW]]] web server certificate (NGINX front-door) with a customer issued certificate. This enables client browsers to establish a trusted SSL connection.

Caution: The cert files and key files must be `.pem` format. All the files must have the same name and permissions as the original files generated by NetWitness Platform.

1. Rename your certificate files and save them in for NGINX.
   - Rename the customer provided `cert.pem` certificate pem file to `web-server-cert.pem`.
   - Rename the customer provided `key.pem` key pem file to `web-server-key.pem`.
   - Rename customer provided `cert.chain` certificate chain file to `web-server-cert.chain`.
   - Rename `cert.p7b` certificate p7b file to `web-server-cert.p7b`.
2. SSH to the NW Server.
3. Replace the existing NetWitness Platform generated `/etc/pki/nw/web/web-server-cert.pem`, `/etc/pki/nw/web/web-server-key.pem`, `/etc/pki/nw/web/web-server-cert.chain` and `/etc/pki/nw/web/web-server-cert.p7b` files with the files you renamed in step 1.
4. Restart NGINX service.
   `service nginx restart.`

RSA Archer Integration

Administrators can integrate RSA NetWitness Platform with RSA Archer® Cyber Incident & Breach Response to send alerts and incidents from NetWitness Platform to Archer for incident management and remediation. This guide provides a high-level workflow for configuring this integration.

Note: When you upgrade from Security Analytics 10.6.5 to NetWitness Platform 11.x, the RSA Archer® Cyber Incident & Breach Response integration is no valid, and must be re-configured.

The following table list the NetWitness Platform 11.x integration options with RSA Archer® Cyber Incident & Breach Response Version 1.3.1.2.

RSA Archer® Cyber Incident & Breach ResponseVersion	NetWitness Platform 11.x Integration	Reference
1.3.1.2	Event Stream Analysis (ESA)	See "Configure Event Stream Analysis for Integration with RSA Archer® Cyber Incident & Breach Response" section.
1.3.1.2	Reporting Engine (RE)	See "Configure Reporting Engine for Integration with RSA Archer® Cyber Incident & Breach Response" section.
1.3.1.2	Respond	See "Configure Respond for Integration with RSA Archer® Cyber Incident & Breach Response 1.3.1.2" section.
1.3.1.2	Archer Feeds	See "RSA Archer Feeds" section.

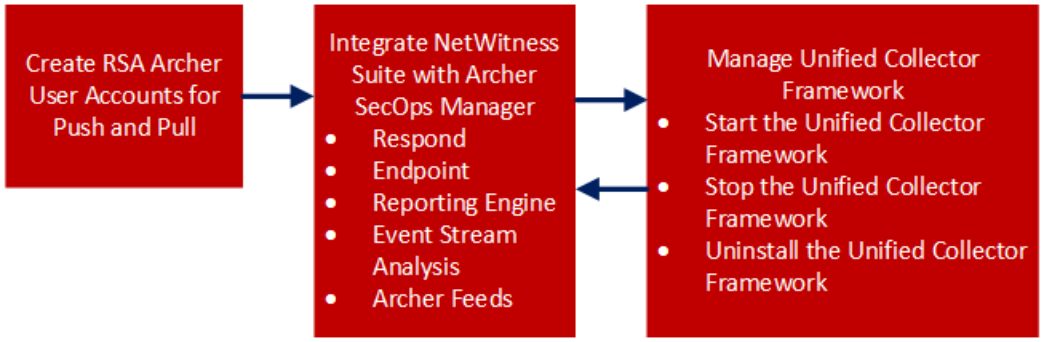
Configure NetWitness to Work With Archer

The RSA Archer® Cyber Incident & Breach Response solution enables you to aggregate all actionable security alerts, allowing you to become more effective, proactive, and targeted in your incident response and SOC management. For more information on RSA Archer® Cyber Incident & Breach Response capabilities, see RSA Archer documentation on the RSA Archer Community or on the RSA Archer Exchange Community.

This version of RSA Archer determines how NetWitness Platform will be integrated. For supported Archer platforms, see the *SecOps Installation Guide*.

RSA Archer® Cyber Incident & Breach Response1.3.1.2 integrates with NetWitness Platform using the RSA UCF (Unified Collector Framework), which comprises of NetWitness Respond integration service and RSA Archer® Cyber Incident & Breach Response Watchdog service.

This figure represents the flow of NetWitness Platform 11.x integration with RSA Archer® Cyber Incident & Breach Response 1.3.1.2.



Create RSA Archer User Accounts for Push and Pull

You must create a user account for the web service client to transfer data to the RSA Archer GRC Platform.

You require two RSA Archer user accounts to avoid conflicts while sending and receiving data from RSA NetWitness Platform.

To create a user account for push and pull:

1. On the RSA Archer UI, click **Administration** > **Access Control** > **Users** > **Add New**.
2. In the **First Name** and **Last Name** fields, enter a name that indicates that the Unified Collector Framework (UCF) uses this account to push data into RSA Archer GRC. For example, UCF User, Push.

   Note: When configuring the Pull account, enter a name that indicates that the UCF uses this account to pull data from RSA Archer GRC. For example, UCF User, Pull.

3. (Optional) Enter a user name for the new user account.

   Note: If you do not specify a user name, the RSA Archer GRC Platform creates the user name from the first and last name entered when you save the new user account.

4. In the **Contact Information** panel, in the **Email** field, enter an email address to associate with the new user account.
5. In the **Localization** section, change the time zone to (UTC) Coordinated Universal Time.

   Note: The UCF uses UTC time to baseline all the time-related calculations.

6. In the **Account Maintenance** section, enter and confirm a new password for the new user account.

   Note: Make a note of the user name and password for the new user account that you created. You need to enter these credentials when you set up the UCF to communicate with the RSA Archer GRC Platform through the web service client.

7. Clear the Force Password Change On **Next Sign-In** option.
8. In the **Security Parameter** field, select the security parameter that you want to use for this user.

   Note: If you assign a default security parameter with a password change interval of 90 days, you also must update the user account password stored in the SA IM integration service every 90 days. To avoid this, you can optionally create a new security parameter for the SA IM integration service user account, and set the password change interval to the maximum value allowed by your corporate standards.

9. Click the **Groups** tab, and perform the following:
   a. In the **Groups** panel, click **Lookup**.
   b. In the **Available Groups** window, expand Groups.
   c. Scroll down and select **SOC: Solution Administrator and EM: Read Only**.
   d. Click **OK**.
10. Click **Apply** and click **Save**.
11. If the machine language and regional settings of your RSA Archer GRC system are set to anything other than English-US, perform the following:
    a. Open the user account you just created, and in the **Localization** section, in the **Locale** field, select **English (United States)**, and click **Save**.
    b. On the Windows system hosting your RSA Archer GRC Platform, open **Internet Information Services (IIS) Manager**.
    c. Expand your RSA Archer GRC site, click **.Net Globalization**, in both the **Culture** and **UI Culture** fields, select **English (United States)**, and click **Apply**.
    d. Restart your RSA Archer GRC site.
12. Repeat steps 1 – 11 to create a second user account for the UCF to pull data from RSA Archer GRC.

Integrate NetWitness Platform With RSA Archer Cyber Incident & Breach Response

You have to configure the system integration settings to manage incident workflow in RSA Archer® Cyber Incident & Breach Response.

For information on how to configure system integration settings, see the "Manage Incidents in RSA Archer® Cyber Incident & Breach Response" in the *NetWitness Respond Configuration Guide*.

RSA Unified Collector Framework

RSA NetWitness Platform integrates with RSA Archer® Cyber Incident & Breach Response 1.3.1.2 using the RSA UCF. The RSA UCF integrates with all supported SIEM tools and the RSA Archer® Cyber Incident & Breach Response solution. After you configure the system integration settings, all incidents are managed in RSA Archer® Cyber Incident & Breach Response instead of NetWitness Respond. Incidents created before the integration will not be managed in RSA Archer® Cyber Incident & Breach Response.

Note:
• You must configure the same option in both RSA NetWitness Platform and the Unified Collector Framework.
• Integration of the RSA NetWitness Respond module with Reporting Engine or Event Stream Analysis can result in duplicate events, alerts, and incidents created in RSA Archer® Cyber Incident & Breach Response.

UCF supports multiple SIEM tools connections at the same time, such as supporting NetWitness Platform Reporting Engine, HP ArcSight, and NetWitness Respond. However, different instances of the same SIEM tool are not supported, such as two NetWitness Platform servers connected to the same UCF.

Prerequisites

- Install the RSA Archer® Cyber Incident & Breach Response package on Archer. See RSA Archer documentation RSA Archer Community or on the Content Tab at https://community.emc.com/community/connect/grc_ecosystem/rsa_archer_exchange.
- Install RSA Archer® Cyber Incident & Breach Response 1.3.1.2.
- Ensure you have NetWitness Platform 11.1 as it is compatible with RSA Archer® Cyber Incident & Breach Response 1.3.1.2.
- Ensure that Respond is configured in RSA NetWitness Platform.

The RSA UCF allows you to integrate your RSA Archer® Cyber Incident & Breach Response system with the following:

- NetWitness Respond
- NetWitness Platform Reporting Engine

- NetWitness Platform Event Stream Analysis
- Archer Feeds

Configure Respond for Integration with RSA Archer® Cyber Incident & Breach Response

Step 1: Select the Mode for NetWitness Respond

1. Go to **ADMIN** > Services, select the Respond Server service, and then select  > **Config** > **Explore**.
2. Navigate to `respond/integration/export`.
3. Set the `archer-sec-ops-integration-enabled` field to **true**.
4. Restart the Respond service by running the following command:
   `systemctl restart rsa-nw-respond-server`

Step 2: Configure NetWitness Respond to Forward Alerts to UCF

1. Navigate to `C:\Program Files\RSA\SA IM integration service\cert-tool\certs` in the SecOps Middleware box.
2. Copy both `keystore.crt.pem` and `rootcastore.crt.pem` from the certs folder (to the import folder of NetWitess server):
   ```
   cp rootcastore.crt.pem /etc/pki/nw/trust/import

   cp keystore.crt.pem /etc/pki/nw/trust/import
   ```

   Note: Before you copy the files from UCF to NetWitness Admin server, examine the files to remove any blank lines and save them.
3. SSH to NW-server box
   a. Run the update-admin-node command:
      `orchestration-cli-client --update-admin-node`
   b. Restart the RabbitMQ service:
      `systemctl restart rabbitmq-server`
   c. Restart the SMS service:
      `systemctl restart rsa-sms.service`

      Note: This step is mandatory to avoid receiving the "message bus down" error message which indicates that the EventSourceMessagePublisher has failed to reconnect to RabbitMQ on restart. This can cause some features such as deleting event sources to function improperly.
   d. Create user archer and set permissions for the virtual host '`/rsa/system`'
      ```
      rabbitmqctl add_user archer archer

      rabbitmqctl clear_password archer

      rabbitmqctl set_permissions -p /rsa/system archer ".*" ".*" ".*"
      ```

Step 3: Forward Alerts to the NetWitness Respond

- To forward NetWitness Platform Event Stream Analysis alerts to the NetWitness Respond:
  a. Go to **ADMIN > Services > ESA** service.
  b. Select an Event Stream Analysis service and then select  **> View > Config**.
  c. Click the **Advanced** tab.
  d. Make sure that the **Forward Alerts on Message Bus** checkbox is selected by default. If not, select the **Forward Alerts on Message Bus** checkbox, and click **Apply**.
- To forward NetWitness Platform Reporting Engine alerts to NetWitness Respond:
  a. Go to **ADMIN > Services > Reporting Engine** service.
  b. Select the Reporting Engine service, and then select  **> View > Config**.
  c. Click the **General** tab.
  d. In the **System Configuration section**, select the **Forward Alerts to Respond** checkbox and click **Apply**.
- To forward NetWitness Platform Malware Analysis alerts to NetWitness Respond:
  a. Go to **ADMIN > Services > Malware Analysis** service
  b. Select the Malware Analysis service, and then select  > **View** > **Config**.
  c. Click the **Auditing** tab.
  d. In the **Respond Alerting** panel, verify that the **Enabled Config Value** checkbox is selected. If the checkbox is not selected, select the checkbox, and click **Apply**.

Step 4: Forward Endpoint Alerts to the NetWitness Respond

You can forward Endpoint alerts to the RSA Archer GRC through NetWitness Respond. For more information on how to Configure NetWitness Endpoint Alerts via Message Bus, see "Configure NetWitness Endpoint Alerts via Message Bus" in the *NetWitness Endpoint Integration Guide*.

Step 5: Aggregate Alerts into Incidents

The Respond Server service consumes alerts from the message bus and normalizes the data to a common format (while retaining the original data) to enable simpler rule processing. It periodically runs rules to aggregate multiple alerts into an incident and set some attributes of the Incident (for example, severity, category, and so on). For more information on aggregating alerts, see the "Configure Alert Sources to Display Alerts in Respond View" topic in the *NetWitness Respond Configuration Guide*.

To configure alert aggregation:

1. Go to **CONFIGURE > Incident Rules**.
2. To enable the rules provided out-of- the-box:
   a. Double-click the rule.
   b. Select **Enabled**.

c. Click **Save**.

d. Repeat steps a-c for each rule.

3. To add a new rule:

a. Click ✚.

b. Select **Enabled**.

c. Enter the values in the following fields:

- Rule Name
- Action
- Match Conditions
- Grouping Options
- Incident Options
- Priority
- Notifications

4. Click **Save**.

Configure Endpoints in RSA Unified Collector Framework

Endpoints provide the connection details required for the UCF to reach both your RSA NetWitness Platform and RSA Archer GRC systems.

Note: Some endpoints are necessary to use different integrations. The following list shows the mandatory endpoints.

Mandatory Endpoint Integration

- Archer Push endpoint
- Archer Pull endpoint
- Mode selection: SecOps or Non SecOps mode.

Note:
• If Non SecOps mode is selected, incidents are managed in NetWitness Respond instead of RSA Archer® Cyber Incident & Breach Response.
• You must configure the port depending on the protocol (TCP, UDP, or secure TCP).
• Make sure the certificate subject name for your RSA Archer GRC server matches the hostname.

Procedure

1. On the UCF system, open the Connection Manager, as follows:

a. Open a command prompt.

b. Change directories to `<install_dir>\SA IM integration service\data-collector`.

c. Enter `runConnectionManager.bat`.

2. In the **Connection Manager**, enter **1** for Add Endpoint.
3. Add an endpoint for pushing data to RSA Archer® Cyber Incident & Breach Response, as follows:
   a. Enter the number for Archer.

      Note: Enable SSL to add the RSA Archer endpoints.

   b. For the endpoint name, enter **push**.
   c. Enter the URL of your RSA Archer GRC system.
   d. Enter the instance name of your RSA Archer GRC system.
   e. Enter the user name of the user account you created to push data into your RSA Archer GRC system.
   f. Enter the password for the user account you created to push data into your RSA Archer GRC system, and confirm the password.
   g. When prompted if this account is used for pulling data, enter **False**.
4. Add an endpoint for pulling data from RSA Archer® Cyber Incident & Breach Response, as follows:
   a. Enter the number for Archer.

      Note: SSL must be enabled to add the RSA Archer endpoints.

   b. For the endpoint name, enter **pull**.
   c. Enter the URL of your RSA Archer GRC system.
   d. Enter the instance name of your RSA Archer GRC system.
   e. Enter the user name of the user account you created to pull data from your RSA Archer GRC system.
   f. Enter the password for the user account you created to pull data from your RSA Archer system, and confirm the password.
   g. When prompted if this account is used for pulling data, enter **True**.
5. Add an endpoint for RSA NetWitness Platform:
   - For RESPOND
     a. Enter the number for NetWitness Platform IM.
     b. Enter a name for the endpoint.
     c. Enter the SA Host IP address.
     d. For SA Messaging Port, enter **5671**.
     e. Enter the target queue for remediation tasks. Selecting All processes both the RSA Archer Integration (GRC) and IT Helpdesk (Operations).
     f. When prompted to automatically add certificates to the SA trust store, enter **No**.
     The certificates are added manually in previous steps.

g. In UCF connection manager, select the mode, as follows:

i. Enter the number for Mode Selection.

ii. Select Manage incident workflow exclusively in RSA Archer® Cyber Incident & Breach Response from the drop-down.

Note: Make sure you select the second option as the first option is not supported in NetWitness Platform 11.x release.

- For Reporting Engine and Event Stream Analysis

a. To use third-party integrations, add the Syslog Server Endpoint, as follows:

i. Enter the number for Syslog Server Endpoint.

ii. Enter the following:

- User defined name
- SSL Configured TCP port number

  Note: Defaults to 1515. If you do not want to host the Syslog server in this mode, enter **0**.

- TCP port number - Enter the TCP port if the Syslog client sends the Syslog message in TCP mode.

  Note: Defaults to 1514. If you do not want to host the Syslog server in this mode, enter **0**.

- UDP port number - Enter the UDP port if the Syslog client sends the Syslog message in UDP mode.

  Note: Defaults to 514. If you do not want to host the Syslog server in this mode, enter **0**.

By default, the Syslog server runs in the above three modes, unless it is disabled by entering **0**.

b. To test the Syslog client, enter the number for Test Syslog Client. Use the Test Syslog client with the files from `<install_dir>\SA IM integration service\config\mapping\test-files\`.

6. In the Connection Manager, enter **5** to test each endpoint.

Configure Reporting Engine for Integration with RSA Archer® Cyber Incident & Breach Response

To configure Syslog Output Action for the Reporting Engine:

1. Select **ADMIN > Services**.
2. Select the Reporting Engine Service, and click  **View** > **Config**.

3. Click the **Output Actions** tab.
4. In the **NetWitness Platform Configuration** panel, in the **Host Name** field, enter the host name or IP address of the Reporting Engine server.
5. In the **Syslog Configuration** section, add the Syslog Configuration as follows:
   a. In the **Server Name** field, enter the host name of the UCF.
   b. In the **Server Port** field, enter the port that you selected in the UCF Syslog configuration.
   c. In the **Protocol** field, select the transport protocol.

   Note: Configure SSL if you select Secure TCP.
6. Click **Save**.

To configure NetWitness Platform Reporting Engine SSL for Secure Syslog Server:

1. Copy the certificate `keystore.crt.der` from the UCF machine to NetWitness Platform server box at `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.161-0.b14.el7_4.x86_64/jre/lib/security`.
2. Run the following command:

   ```
   keytool -import -file keystore.crt.der -alias ucf-syslog -keystore /etc/pki/nw/trust/truststore.jks -storepass changeit
   ```

   Note: Do not copy and paste the above command. Type the command to avoid errors.
3. Enable **ServerCertificateValidationEnabled** to **true:**
   - Navigate to **ADMIN** > **Service**.
   - Click  > **View > Explore** of the Reporting Engine service .
   - Expand **com.rsa.soc.re** > **Configuration** > **SSLContextConfiguration**.
   - Expand **SSLContextConfiguration** and set **ServerCertificateValidationEnabled** to **true**.
4. Restart the Reporting Engine service by running the following command:
   `service rsasoc_re restart`

To configure rules in NetWitness Platform:

1. Click **MONITOR > Reports > Manage**.
   The Manage tab is displayed.
2. In **Rule Groups** panel, click +.
3. Enter a name for the new group.
4. Select the group you created, and in the Rule toolbar, click +.
5. In the **Rule Type** field, select **NetWitness DB**.
6. Enter a name for the rule.
7. Enter values in the **Select** and **Where** fields based on the rule that you want to create.

Note: Add the Syslog configuration with the Syslog name set above.

8. Click **Save**.

Note: To see the same number of alerts in the Reporting Engine and RSA Archer GRC, make sure that you have selected **Once** for execute in both the Syslog and Record tabs.

To add Alert Templates for the Reporting Engine in NetWitness Platform:

The UCF syslog configuration contains out-of-the-box alert templates that you can use to create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your RSA Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_Templates`

1. Click **MONITOR > Reports > Manage > Alerts**.
2. Click the **Template** tab.
3. Click ✚.

Note: After you copy the template in the Create/Modify Template window, make sure to replace `cs25=${sa.host} cs25Label=sahost` to `cs25=${nw.host} cs25Label=nwhost`.

4. In the **Name** field, enter a name for the alert template.
5. In the **Message** field, enter the alert message.
6. Click **Create**.
7. Repeat steps 3 to 6 for each alert template that you want to add.

To Configure Alerts in NetWitness Platform:

In RSA NetWitness Platform Reporting Engine, an alert is a rule that you can schedule to run on a continuous basis and log its findings to several different alerting outputs.

1. Click **MONITOR > Reports > Manage > Alerts**.
2. Click ✚.
3. Select **Enable**.
4. Select the rule you created.
5. Select **Push to Decoders**.

Note: If you do not enter a value in this field, the link in the RSA Archer Security Alerts application to RSA NetWitness Platform does not work.

6. From the Data Sources list, select your data source.
7. In the **Notification** section, select **Syslog**.
8. Click ✚.
9. Complete the Syslog configuration fields.

10. In the **Body Template** field, select the template that you want to use for this Syslog alert.
11. Click **Save**.

Configure Event Stream Analysis for Integration with RSA Archer® Cyber Incident & Breach Response

To configure Event Stream Analysis Syslog Notification Settings in NetWitness Platform:

1. Click **ADMIN** > **System** > **Global Notifications**.
2. Click the **Output** tab.
3. Define and enable an Event Stream Analysis Syslog notification.
4. Click the **Servers** tab.
5. Define and enable a Syslog notification server.
6. In the Syslog Server Configuration section, enter the following:

   Field Description:

   - Name - Specify the custom name.
   - Server IP (Hostname) - Specify the hostname or IP Address of the system on which you installed the UCF.
   - Port - Specify the port number on which you want the UCF to listen.
   - Facility - Specify the Syslog facility.
   - Protocol - Select the protocol.
7. Click **Save**.

To configure NetWitness Platform Event Stream Analysis SSL for Secure Syslog Server:

If the Syslog server is configured with Secure TCP, configure the SSL.

1. Select **ADMIN > Services**.
2. Select the Event Stream Analysis service.
3. Go to **Explore > Configuration > SSL** .
4. Set **ServerCertificateValidationEnabled** to **true.**
5. Copy the `rootcastore.cert.pem` from the UCF machine to the Event Stream Analysis server to `/etc/pki/ca-trust/source/anchors`.
6. Run the following command:

   ```
   update-ca-trust
   ```
7. Restart the Event Stream Analysis server by running the following command:
   ```
   service rsa-nw-esa-server restart
   ```

To Add Event Stream Analysis Alert Templates

The UCF syslog configuration contains out-of-the-box alert templates that you can use to create an alert with a syslog output action. These templates define the criteria used to aggregate alerts into incidents in your RSA Archer GRC Platform.

The sample templates are located in the following location on the UCF system:

`<install_dir>\SA IM integration service\config\mapping\templates\SecOps_SA_Templates\SecOps_SA_ESA_templates.txt`

1. Select **ADMIN > System > Global Notifications**.
2. Click the **Templates** tab.
3. Click ✚.
4. In the **Template Type** field, select Event Stream Analysis.
5. In the **Name** field, enter the name for the template.
6. 6. (Optional) In the **Description** field, enter a brief description for the template.
7. 7. In the **Template** field, enter the alert message.
8. 8. Click **Save**.
9. 9. Repeat steps 3 – 8 for each alert template that you want to add.

To Create Event Stream Analysis Rules

1. Click **CONFIGURE** > **ESA Rules**.
2. In the **Rule Library**, click ✚.
3. Select **Rule Builder**.
4. In the **Rule Name** field, enter a name for the rule.
5. In the **Description** field, enter a description for the rule.
6. Select the **Severity**.
7. In the **Condition** panel:
   a. Click ✚ to build a statement.
   b. Enter a name, select a condition type, and add meta data/value pairs for the statement.
   c. Click **Save**.
   d. Repeat steps a – c until you have built all the statements for the rule.
8. In the **Notifications** section, select **Syslog**.
9. Select the notification, Syslog server, and template that were created previously.
10. Click **Save** and click **Close**.
11. Click **Configure** > **Deployments**.
12. Click ✚ for Event Stream Analysis services section.
13. Select the Event Stream Analysis Service.
14. Click **Deploy Now**.

15. In the **Event Stream Analysis Rules** section, click ✚ to select the Event Stream Analysis Rule that you created, and click **Deploy Now**.

RSA Archer Feeds

By default, only the IP address and Criticality Rating fields in the RSA Archer Devices application are fed into RSA NetWitness Platform by the SA IM Integration Service. You can customize the Enterprise Management plug-in to include the Business Unit and Facility fields that are cross-referenced in the Devices application in the feed. For more details, see Archer documentation at https://community.emc.com/community/connect/grc_ecosystem/rsa archer or https://community.emc.com/community/connect/grc_ecosystem/rsa_archer_exchange.

Note: If you want to feed Business Unit and Facility information from your RSA Archer GRC Platform into Live, you must also add keys for these fields in the index-concentrator-custom.xml file.

Update the Concentrator and Decoder Services

The SA IM Integration Service in RSA Archer® Cyber Incident & Breach Response manages the files for a custom feed and deposits these files in a local folder that you specify when you configure the Enterprise Management Endpoint. The Live module of RSA NetWitness Platform retrieves the feed files from this folder. Live then pushes the feed to the Decoders, which start creating metadata based on the captured network traffic and the feed definition. To enable the Concentrator to detect a new metadata created by the Decoders, make sure to edit the `index-concentrator-custom.xml`, `index-logdecoder-custom.xml`, and `index-decoder-custom.xml` files.

1. Select **ADMIN > Services**.
2. Select the Concentrator, and select  > **View > Config**.
3. Click the **Files** tab.
4. From the drop-down list, select the `index-concentrator-custom.xml` file. Do one of the following:
   - If content already exists in the file, add a key for the new metadata element:

     ```
     <key description="Criticality" format="Text" level="IndexValues"
     name="criticality" defaultAction="Open"/>
     ```

     Note: Do not copy and paste above command . Type the command to avoid errors.
   - If the file is blank, add the following content:

     ```
     <?xml version="1.0" encoding="utf-8"?>
     <language level="IndexNone" defaultAction="Auto">
     <key description="Criticality" format="Text" level="IndexValues"
     name="criticality" defaultAction="Open"/>
     </language>
     ```
5. Click **Apply**.
6. To add multiple devices:
   a. Click **Push**.
   b. Select the devices to which you want to push this file.

c. Click **OK**.

7. Repeat steps 1 to 6 for the Log Decoders and Index Decoders, using index-logdecoder-custom.xml and index-decoder-custom.xml.
8. Restart the Concentrator and Decoder services by running the following commands:
```
service nwdecoder restart
service nwconcentrator restart
```

Add the RSA Archer Enterprise Management Endpoint in UCF

1. In the UCF connection manager, select the mode:
   a. Enter the number for Mode Selection.
   b. Select one of the following options:
      - Manage incident workflow in RSA NetWitness Platform.
      - Manage incident workflow exclusively in RSA Archer® Cyber Incident & Breach Response.
2. Add the RSA Archer Enterprise Management Endpoint:
   a. Enter the number for Enterprise Management.
   b. Enter the values in the fields as described in the table below.

Field	Description
Endpoint Name	Optional endpoint name.
Web Server Port	Defaults to 9090. You can configure this to host the web server url by providing the URL with the port number as in the NetWitness Platform live feed: http://hostname:port/archer/sa/feed.
Criticality	Criticality of the assets to be pulled from RSA Archer GRC. If **false**, pull assets with any criticality. If **true**, pull assets with only high criticality. To configure this manually, edit the em.criticality property in the collector-config properties file to provide a comma-separated list of criticalities: LOW, MEDIUM, HIGH.
Feed Directory	Directory where the assets CSV file from RSA Archer GRC are saved. **Note:** The directory path provided must exist.
Web Server Username	Username for authenticating to the EM web server.

Field	Description
Web Server Password	Password for authenticating to the EM web server.
SSL Mode	Defaults to No. If **No**, the URL uses `http mode: http://hostname:port/archer/sa/feed` If you have not updated the host file, see "Update the RSA NetWitness Platform Host File" section. **Note:** NetWitness Platform currently does not support Archer recurring feeds in SSL mode.

Update the RSA NetWitness Platform Host File

1. Edit the host file on the NetWitness Platform server at the following location: `vi /etc/hosts`.
2. Enter the following for the UCF host IP address:

   `<ucf-host-ip> <ucf-host-name>`
3. Restart NetWitness Platform server by running the following command:

   `service jetty restart`
4. While configuring the NetWitness Platform live feed, enter the host name for the URL instead of the IP address and the port number configured for Enterprise Management endpoint in the UCF:

   `http: //<ucf-host-name> : <EM_Port>/archer/sa/feed.`
5. Verify that the connection works.

Create a Recurring Feed Task

For RSA NetWitness Platform to download feed files from the NetWitness Respond Integration Service and push the feeds to Decoders, you must create a recurring feed task and define the feed settings.

Note: For RSA Archer® Cyber Incident & Breach Response 1.2: For RSA NetWitness Platform to download feed files from the UCF machine and push the feeds to Decoders, you must create a recurring feed task and define the feed settings. The procedure is similar to RSA Archer® Cyber Incident & Breach Response 1.3, with a few exceptions. See documentation on the RSA Archer Exchange Community for details.

1. Select **CONFIGURE > Custom Feeds**.
2. In the Feeds view, Click ✚.
3. Select **Custom Feed**, and click **Next**.
4. Select **Recurring**.
5. Enter a name for the feed.
6. In the URL field, enter the following:

   `http://ucf_hostname/archer/sa/feed`

where, *http :ucf_hostname_or_ip:port* is the address of the NetWitness Respond Integration Service system. For example: `http://<ucf-host-name>` .

7. Select **Authenticated**.
8. In the **User Name** and **Password** fields, enter the credentials of the user account you created in the Add the RSA Archer Enterprise Management Endpoint in UCF procedure.
9. Define the recurrence interval for the feed.
10. In the **Date Range** panel, define a start and end date for the feed, and click **Next.**
11. Select each Decoder to which you want to push this feed, and click **Next**.
12. In the **Type** field, amke sure that IP is selected.
13. In the **Index Column** field, select 1.
14. In the second column, set the Key value to criticality, and click **Next**.
15. Review your feed configuration details and click **Finish**.

Manage Unified Collector Framework

This section provides additional tasks for configuring and managing the RSA UCF for RSA Archer® Cyber Incident & Breach Response1.3.1.2 Integration.

Start the RSA Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Select **RSA Unified Collector Framework**.
3. Click **Start**.

Stop the RSA Unified Collector Framework

1. Click **Control Panel > Administrative Tools > Services**.
2. Stop the RSA Archer® Cyber Incident & Breach Response WatchDog Service.

   Note: If you do not stop the Watchdog service, the Watchdog service starts the NetWitness Respond Service.

3. Select **RSA Unified Collector Framework**.
4. Click **Stop**.

Note: If the service takes too long to shutdown, use the Task Manager to end the RSASAIMDCService.

Uninstall the RSA Unified Collector Framework

1. Click **Control Panel** > **Programs and Features**.
2. Select **RSA Unified Collector Framework**.
3. Click **Uninstall**.

Troubleshoot RSA Archer Integration

This section provides resolutions to common problems that you may encounter while configuring RSA Archer® Cyber Incident & Breach Response 1.3.1.2 with NetWitness Respond.

Problem	Solutions
After adding the endpoint for NetWitness Respond, the Certificate Authority truststore fails to set. **Resolution**	1. Make sure that the SSH credentials for the NetWitness Platform host are valid. 2. If the credentials are correct, but the error still occurs, manually copy certificates.
Remediation Tasks being pushed to the operations queue through the UCF are not appearing in RSA Archer® Cyber Incident & Breach Response as Findings.	1. Open the Connection Manager using the command prompt: • `Change directories to <install_dir>\SA IM integration service\data-collector.` • `Type: runConnectionManager.bat` 2. Enter **2** to edit endpoint. 3. Enter **3** to NetWitness Platform Respond. 4. Make sure the Target Queue is set to **All** or **Operations**.
In the `<install_dir>\SA IM integration service\logs\collector.log`, there are SSL errors between RSA NetWitness Platform and RSA Unified Collector Framework.	1. Verify that the SSL certificates are valid. **Note:** NetWitness Respond certificates are valid for two years. 2. If your certificates are expired, regenerate and copy the expired certificates. **To regenerate and copy the certificates:** 1. In the Command Prompt, go to `<install_dir>\SA IM`

Problem	Solutions
	integration service\data-collector. 2. Enter runConnectionManager.bat 3. Enter the number for Regenerate NetWitness Platform RESPONDIntegration Service Certificate. 4. In the NetWitness Platform Respond endpoint, in Connection Manager, enter the number for Edit Endpoint. 5. Enter **Yes** to copy the certificates automatically to the NetWitness Platform trust store. **Note:** If certificates fail to copy, manually copy the certificates.
When ESA alerts with severity High or Low are forwarded to RSA Archer, the Security Alert Priority field is not populated in the RSA Archer UI.	None, as it functions as designed.
When ESA Command and Control Aggregate Scores details are forwarded from NetWitness Suite to RSA Archer UI, fields such as Beaconing Behavior, Rare Domains, Rare User Agents, Missing Referrers, and Suspicious Domains Aggregate Score do not get populated.	None, as it functions as designed.
RSA Archer recurring feeds does not work in SSL mode.	Make sure you create the RSA Archer recurring feeds in non-SSL mode.

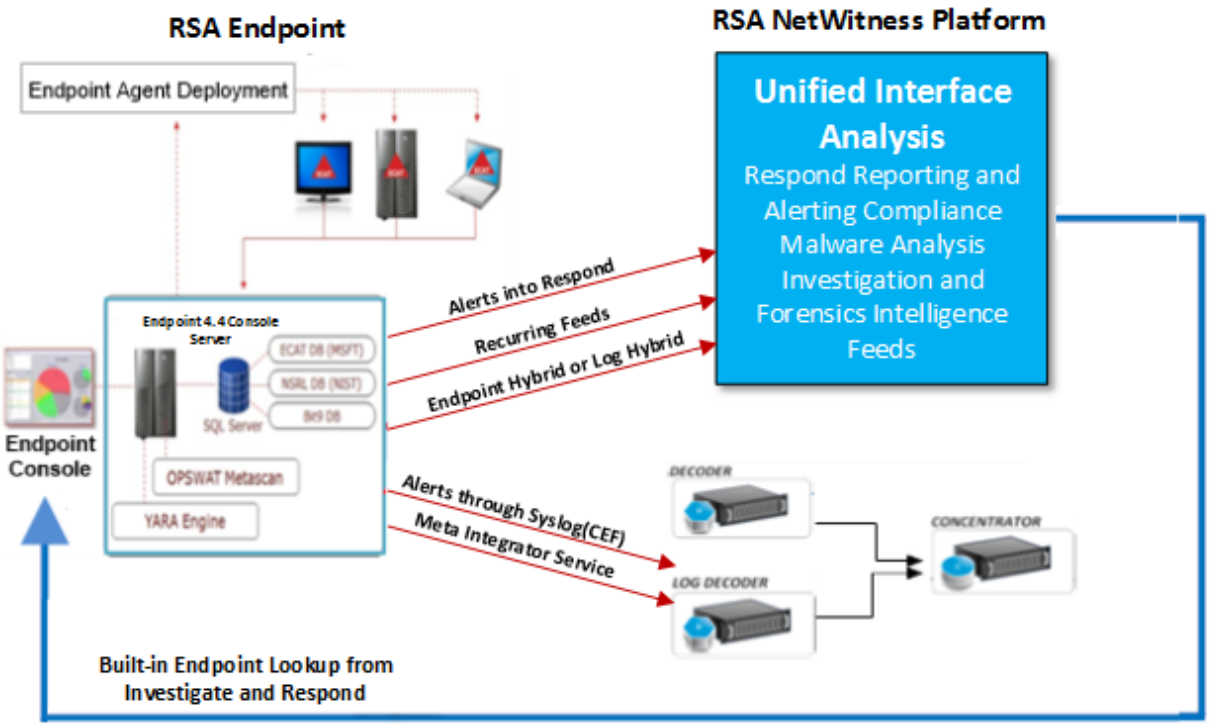
RSA NetWitness Endpoint Integration

RSA customers who are using RSA NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later can integrate into NetWitness Platform 11.x in several different ways.

Note: In Version 11.2 and later, the following components are rebranded:
- RSA NetWitness Suite to RSA NetWitness Platform
- Packet Decoder to Network Decoder

Integration Options



Integration Methods

The following are the RSA NetWitness Endpoint integration methods:

- Configure Endpoint Alerts through Respond
- Configure Contextual Data from Endpoint through Recurring Feed
- Configure Endpoint Alerts through Syslog into a Log Decoder
- Configuring NetWitness Endpoint 4.4.0.2 Console Server to an Endpoint Hybrid or Endpoint Log

Hybrid

- Configuring Meta Integrator service in the NetWitness Endpoint 4.4.0.2 directly to a Log Decoder

Endpoint alerts into NetWitness Respond. This integration provides the capability for forwarding Endpoint alerts to Respond.

Contextual data from Endpoint through a NetWitness Platform Live recurring feed. This integration can enrich the session displayed in NetWitness Platform Investigation with contextual information; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data.

NetWitness Endpoint alerts through Syslog (CEF) into **NetWitness Platform Log Decoders**. This integration provides the capability to forward Endpoint events through Syslog and to correlate the events with other log or packet metadata in the NetWitness Platform ecosystem.

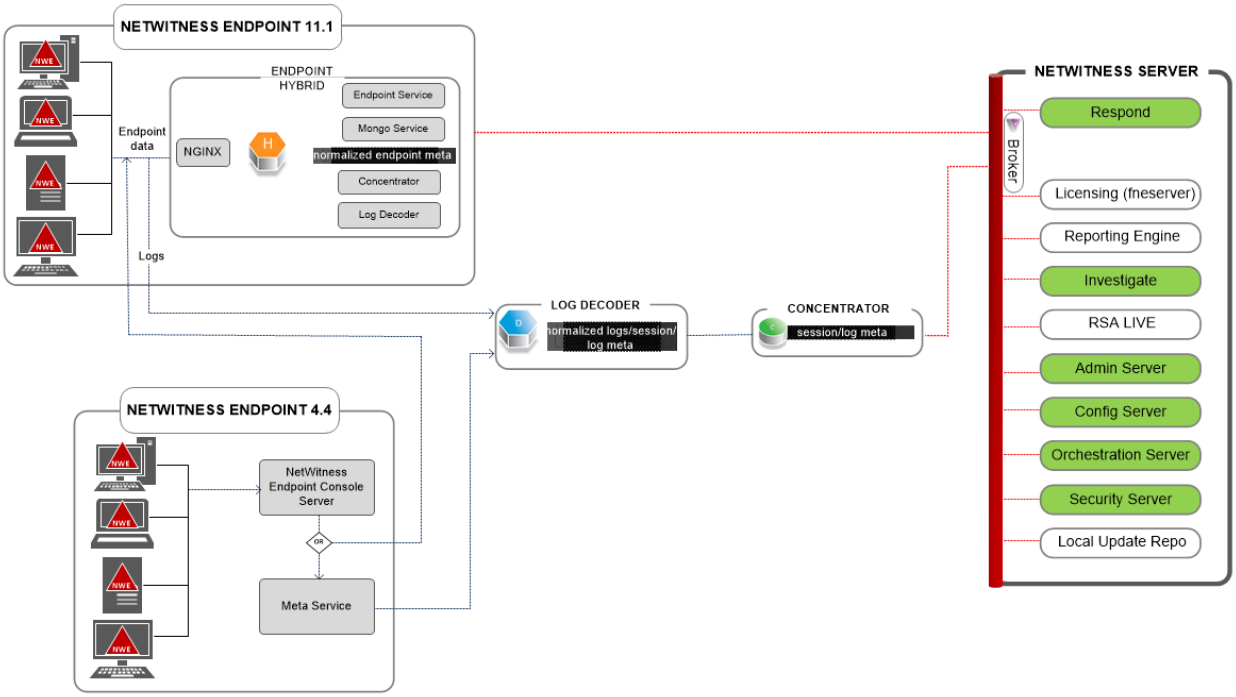
(For Version 11.1) **NetWitness Endpoint to an Endpoint Hybrid or Endpoint Log Hybrid.** This integration lets you can view the Endpoint metadata in the **Investigate > Navigate** and **Event Analysis** view similar to Logs and Packets. The NetWitness Endpoint 4.4.0.2 or later agents data is available in the **Investigate > Hosts** and **Files** view.

(For Version 11.1) **NetWitness Endpoint directly to a Log Decoder.** This integration lets you view the Endpoint metadata in the **Investigate > Navigate** and **Event Analysis** view similar to Logs and Packets. The NetWitness Endpoint 4.4 agents data will not be available in the **Investigate > Hosts** and **Files** view.

Note: For information on NetWitness Endpoint 4.4.0.x integration with NetWitness Platform 11.1 or later, see *Endpoint Insights Configuration Guide*.

NetWitness Endpoint Meta Integration

The NetWitness Platform provides seamless integration allowing Endpoint metadata to be included into the NetWitness work flow. This lets analyst to investigate an incident and respond using packet, log, and endpoint metadata. The endpoint metadata provides further indicators and context related to a host, user, process, or file. It also provides tracking data that provide data of what has transpired with a host, user, process, or file.



Built-in NetWitness Endpoint Lookup

With the RSA NetWitness Endpoint user interface (UI) installed on the same machine where the analyst is using a browser to access NetWitness Platform, the built-in NetWitness Endpoint Lookup from NetWitness Platform Investigation and NetWitness Platform Respond provides right-click access to the NetWitness Endpoint console server for the following meta keys: IP address (ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip), host (alias-host, domain.dst), client, and file-hash. These are described in the "Launch an External Lookup of a Meta Key" topic in *Investigation and Malware Analysis User Guide* and the "View Alerts" topic in *NetWitness Respond User Guide*.

NetWitness Platform configuration is not required for endpoint lookup when you are using one of the built-in parsers, NetWitness Endpoint or CEF, and you have not customized the default meta keys used when loading metadata in Investigation. For more information, see "Manage and Apply Default Meta Keys in an Investigation" topic in the *Investigation and Malware Analysis User Guide*.

Note: The exception occurs if you customize NetWitness Platform by editing the display setting for the default meta keys in Investigation, add meta keys to the table-map-custom.xml file, or customize NetWitness Endpoint feeds. Some configuration is required to add the custom meta keys to the context menu NetWitness Endpoint Lookup in the **ADMIN** > **System** view as described in the "Add Custom Context Menu Actions" topic in the *System Configuration Guide*.

NetWitness Endpoint Alerts and Indicators of Compromise

NetWitness Endpoint IIOC (Instant Indicator of Compromise) is a database query that NetWitness Endpoint runs on collected NetWitness Endpoint scan data to determine the presence of potential malware on scanned hosts. RSA NetWitness Endpoint 4.1.2 or later ships with IOCs that users can enable and mark as alertable. RSA NetWitness Endpoint runs IOC queries regularly on new scan data, which is collected and stored in the database. If the IOC query is satisfied, this indicates a potential indicator of compromise, and the event can be reported to a user or sent to an external system as an alert.

Possible types of alerts are:

- Machine alert: This alert indicates that the machine in question is suspicious.
- Module alert: This alert indicates that a module, such as a file, a DLL, or an executable, is suspicious. It contains details about the module in question.
- Event alert: This alert represents any other suspicious activity detected by NetWitness Endpoint that does not fall into the above categories.

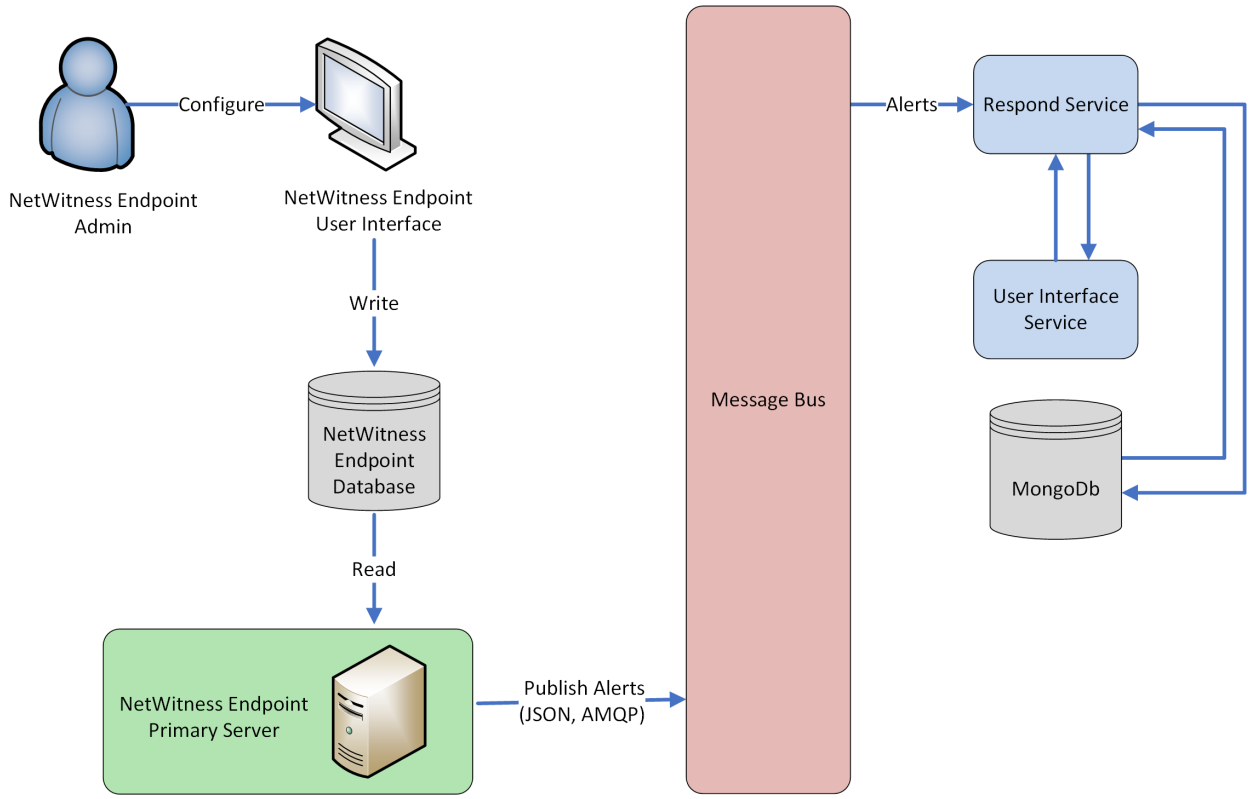
Each of these alert types can be sent to NetWitness Platform.

Configure NetWitness Endpoint Alerts to Respond

This procedure is required to integrate NetWitness Endpoint with NetWitness Platform so that the NetWitness Endpoint alerts are picked up by the Respond component of NetWitness Platform and displayed in the **RESPOND > Alerts** view.

Note: RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later for NetWitness Respond integration. For more information, see the "RSA NetWitness Suite Integration" topic in the *NetWitness Endpoint User Guide*.

The diagram below represents the flow of NetWitness Endpoint alerts to the Respond Incident List view of NetWitness Platform and its display in the **RESPOND > Alerts** view.



Prerequisites

Ensure that you have the following:

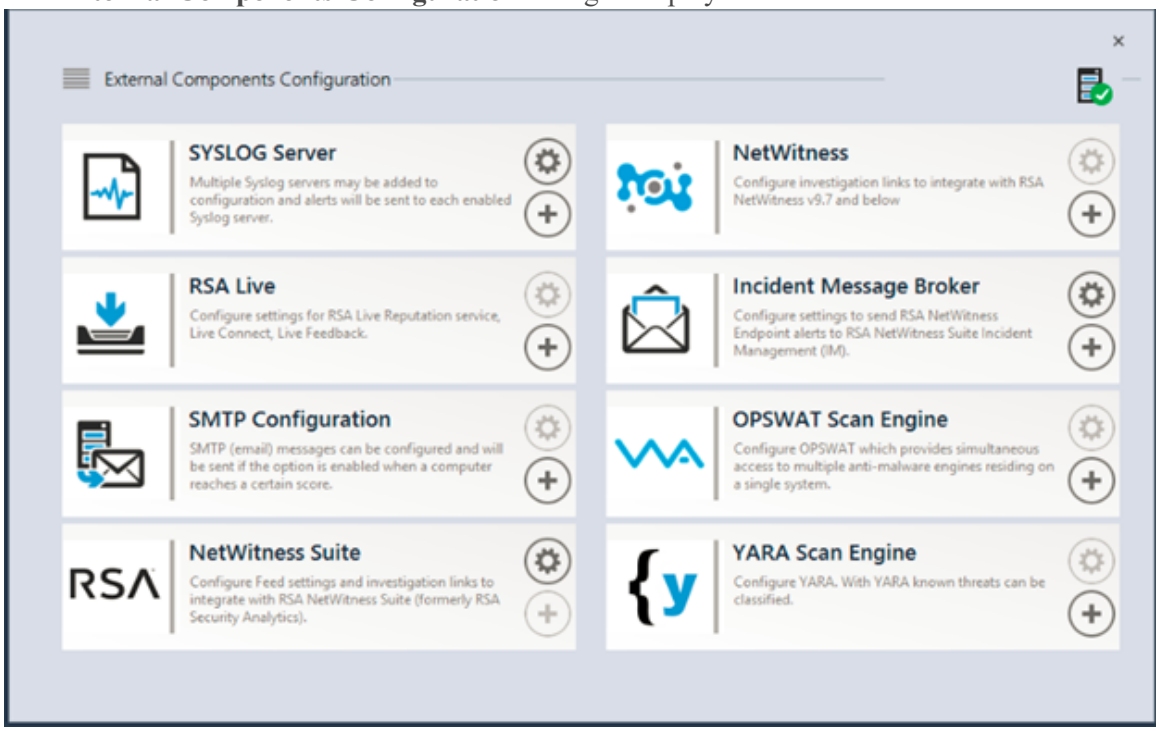
- The Respond service is installed and running on NetWitness Platform.
- NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later is installed and running.

Configure NetWitness Endpoint to Forward NetWitness Endpoint Alerts

To configure NetWitness Endpoint to send alerts to Respond to the NetWitness Platform user interface:

1. In the NetWitness Endpoint user interface, click **Configure > Monitoring and External Components**.

   The **External Components Configuration** dialog is displayed.



2. From the components listed, select **Incident Message Broker** and click + to add a new IM broker.
3. Enter the following fields:
   a. **Instance Name**: Enter a unique name to identify the IM broker.
   b. **Server Hostname/IP address**: Enter the Host DNS or IP address of the IM broker (NetWitness Server).
   c. **Port number**: The default port is 5671.
4. Click **Save**.
5. Navigate to the **ConsoleServer.exe.config** file in **C:\Program Files\RSA\ECAT\Server**.
6. Modify the virtual host configurations in the file as follows:
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Platform 11.0 and 11.1, the virtual host is “/rsa/system”. For version 10.6.x and below, the virtual host is “/rsa/sa”.
7. Restart the API Server and Console Server.

8. To set up SSL for Respond Alerts, perform the following steps on the NetWitness Endpoint primary console server to set the SSL communications:

   a. Export the NetWitness Endpoint CA certificate to .CER format (Base-64 encoded X.509) from the personal certificate store of the local computer (without selecting the private key).

   b. Generate a client certificate for NetWitness Endpoint using the NetWitness Endpoint CA certificate. (You MUST set the CN name to ecat. Run cmd.exe console with Administrator rights.)

   ```
   makecert -pe -n "CN=ecat" -len 2048 -ss my -sr LocalMachine -a sha1 -sky
   exchange -eku 1.3.6.1.5.5.7.3.2 -in "NweCA" -is MY -ir LocalMachine -sp
   "Microsoft RSA SChannel Cryptographic Provider" -cy end -sy 12
   c:\client.cer
   ```

   Note: In the previous code sample, if you upgraded to version 4.3 (or later) from a previous version and did not generate new certificates, you should substitute `"EcatCA"` for `"NweCA"`. Or, if your current operating system has PowerShell version 5.1 or later, you can use the following code sample:

   ```
   PS C:\> New-SelfSignedCertificate -KeyExportPolicy Exportable -Subject
   "CN=ecat" -KeyAlgorithm RSA -KeyLength 2048 -CertStoreLocation
   "cert:\LocalMachine\My" -HashAlgorithm SHA256 -KeySpec KeyExchange -
   TextExtension @("2.5.29.37={text}1.3.6.1.5.5.7.3.2,1.3.6.1.5.5.7.3.1") -
   Provider "Microsoft RSA SChannel Cryptographic Provider" -KeyUsage
   DigitalSignature, KeyEncipherment, KeyAgreement -Signer (Get-ChildItem -
   Path Cert:\LocalMachine\My\ -DnsName NweCA)-NotAfter (Get-Date).AddYears
   (5); Export-Certificate -Cert (Get-ChildItem -Path
   Cert:\LocalMachine\My\ -DnsName ecat) -FilePath C:\Client.cer
   ```

   c. Make a note of the thumbprint of the client certificate generated in step b. Enter the thumbprint value of the client certificate in the IMBrokerClientCertificateThumbprint section of the ConsoleServer.Exe.Config file as shown.

   ```
   <add key="IMBrokerClientCertificateThumbprint"
   value="896df0efacf0c976d955d5300ba0073383c83abc"/>
   ```

9. On the NetWitness Server, copy the NetWitness Endpoint CA certificate file in .CER format into the import folder:
   `/etc/pki/nw/trust/import`

10. Issue the following command to initiate the necessary Chef run:
    `orchestration-cli-client --update-admin-node`
    This appends all of those certificates into the truststore.

11. Restart the RabbitMQ server:
    `systemctl restart rabbitmq-server`
    The NetWitness Endpoint account should automatically be available on RabbitMQ.

12. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NetWitness Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Troubleshooting

This section suggests how to resolve problems you may encounter when you configure NetWitness Endpoint alerts to Respond.

Known Issues	Solutions
Orchestration fails on admin node.	You must copy and paste the content of NweCA or EcatCA certificate in `/etc/rabbitmq/ssl/truststore.pem` and restart the Rabbitmq service.

Configure Contextual Data from NetWitness Endpoint Through Recurring Feed

You can configure RSA NetWitness Endpoint data in RSA NetWitness Platform to provide contextual data from NetWitness Endpoint to Decoder and Log Decoder sessions. This configuration adds contextual meta values in addition to the instant IOC alerts that can be used to build correlations to other metadata in the NetWitness Platform ecosystem.

Administrators can configure NetWitness Platform to consume system scan contextual data from NetWitness Endpoint through a NetWitness Platform Live recurring feed. This integration can enrich the session from a Decoder or Log Decoder with contextual information displayed in NetWitness Platform Investigation; some examples include the host operating system, MAC address, IIOC score, and other data that may not be present in the log or packet data into sessions from a Decoder or Log Decoder.

Note: Although this feature is targeted for customers with a Network Decoder, a recurring feed can also be implemented in Log Decoders.

Caution: In an environment with many NetWitness Endpoint hosts, using recurring feed may result in decreased performance on the NetWitness Platform ingest devices (Decoder and Log Decoder).

Prerequisites

- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint Console server and NetWitness Server Version 10.4 and above installed.
- Version 11.0 or 11.1 RSA Decoder and Concentrator connected to the NetWitness Server in the network.

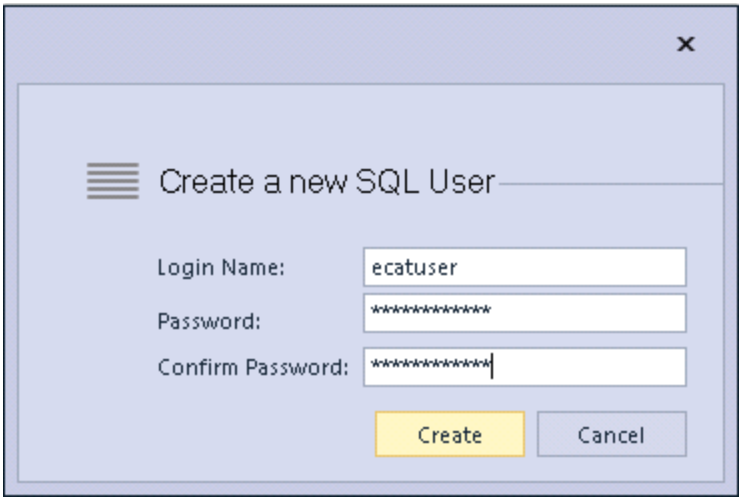
To Configure Contextual Data from NetWitness Endpoint Through Recurring Feed, perform the following:

1. Enable the NetWitness Endpoint Feed for NetWitness Platform in the NetWitness Endpoint User Interface.
2. Export the NetWitness Endpoint CA Certificate from the NetWitness Endpoint Console server and Import it into NetWitness Platform trust store.
3. Configure the NetWitness Platform Concentrator service to define which meta keys are indexed.
4. Create a recurring feed in NetWitness Platform Live.

Enable the NetWitness Endpoint Feed for NetWitness Platform

1. In the NetWitness Endpoint user interface, create SQL user in NetWitness Endpoint:
   a. Open the NetWitness Endpoint user interface and log on using the proper credentials.
   b. From the menu bar, select **Configure > Manage Users and Roles**, right-click in the pane, and select **create sql user**.

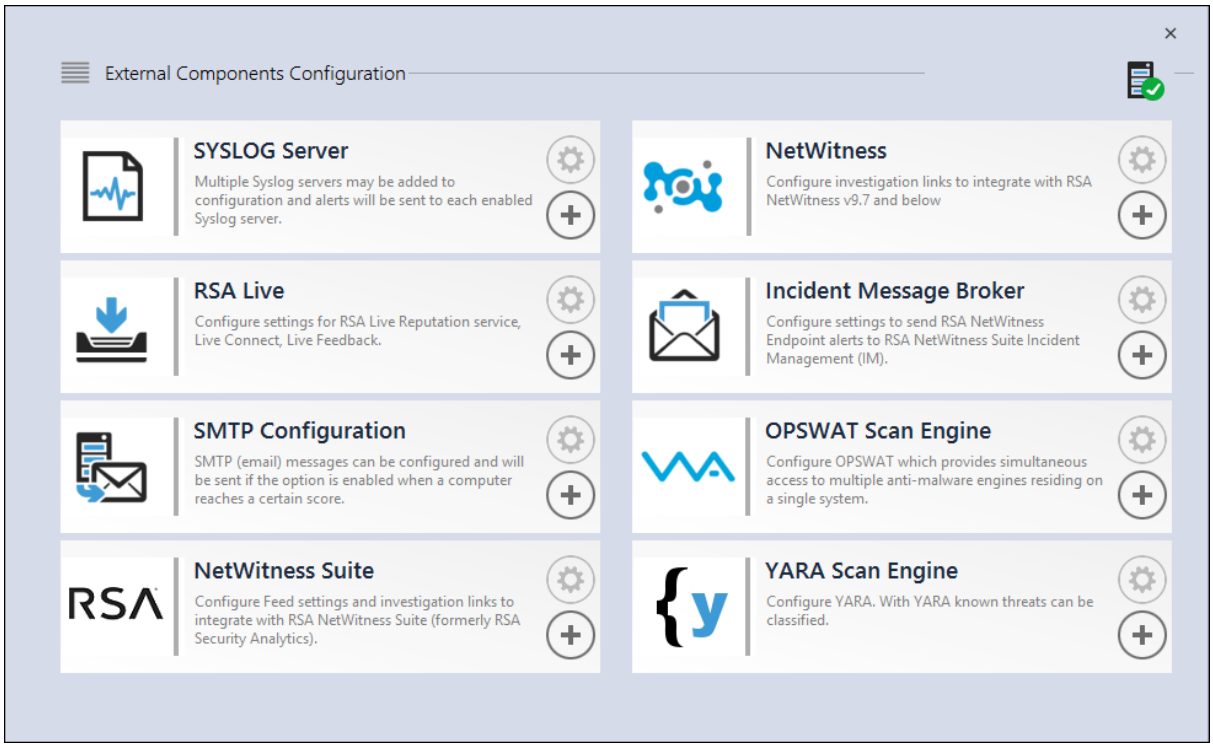
The Create a new SQL User dialog is displayed.



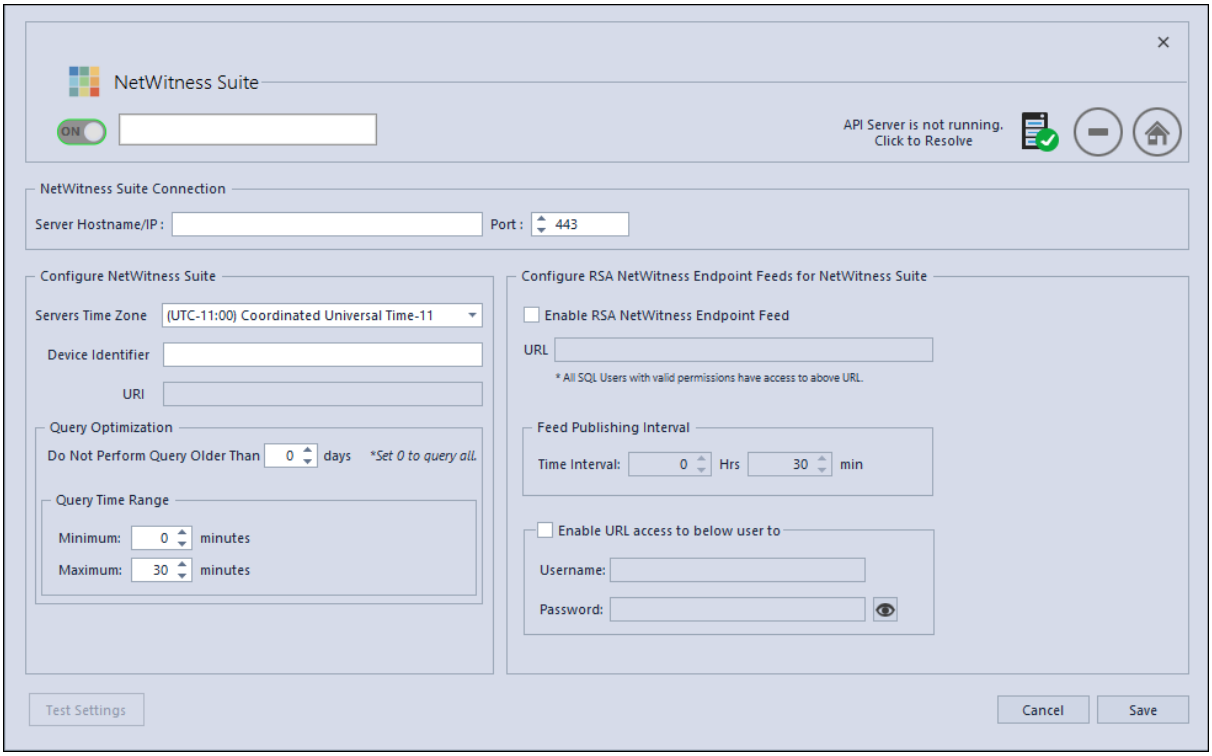
c. Enter the **Login Name** and **Password** and click **Create**.

2. From the menu bar, select **Configure > Monitoring External Components**.

   The External Components Configuration dialog is displayed.



3. In NetWitness Platform, click +.
   The NetWitness Platform dialog is displayed.



4. In the **NetWitness Platform** panel, in **On**, enter the name to identify the NetWitness Platform component.
5. In the **NetWitness Platform Connection** panel, perform the following.
   a. In the **Server Hostname/IP** field, enter the host name or IP address of the NetWitness Server.
   b. In the **Port** field, enter the port number. By default port number is 443.
6. In the **Configure NetWitness Platform** panel, perform the following:
   a. In the **Servers Time Zone** field, select the time zone for the component from the drop-down list.
   b. In the **Device Identifier** field, enter the NetWitness Platform concentrator device ID.

   Note: You can find the Device Identifier in NetWitness Platform when you look up a Concentrator or Broker in **Investigation > Navigate > <*Concentrator or Broker Name*>**. The Device Identifier is the number in the URL after "investigation." For example, in the URL `https://<IP address>investigation/319/navigate/values`, the Device Identifier is **319**.

   The **URI** field is populated when you click **Save**.
7. In the **Query Optimization** panel, in the **Do Not Perform Query Older Than** field, enter the number of days to limit the query period. Enter **0** if you want to discard this feature.

8. In the **Query Time Range** panel, perform the following:
   a. In the **Minimum** field, enter the number of minutes for the minimum query time range. This value is used to automatically increase the time range submitted to NetWitness Platform. This ensures that a query returns a positive response if the NetWitness Endpoint Agent's reported time is slightly different than NetWitness Endpoint's time.
   b. In the **Maximum** field, enter the number of minutes to limit the time range. This value is used to automatically limit the time range submitted to NetWitness Platform, so that a query does not overload the NetWitness Server.
9. In the **Configure RSA NetWitness Endpoint Feeds for NetWitness Platform** panel, perform the following:
   a. Select **Enable RSA NetWitness Endpoint Feed**.
   b. In the **URL** field, enter the SQL **Username** and **Password** (configured in step 1) to access the location of the feed.
   The **URL** field is populated when you click **Save**.
   c. Enter the time interval for the frequency at which feeds are published.
10. In the **Feed Publishing Interval** panel, in the **Time Interval** field, select the time interval in **hrs** and **mins** for the frequency at which feeds are published.
11. In the **Enable URL access to below user to** panel, enter the **Username** and **Password** of the NetWitness Endpoint user.
12. Click **Save**.
    A feed is created.

Export the NetWitness Endpoint SSL Certificate

Note: This procedure works only for NetWitness Platform 10.5 and above because Java 8 support was added for 10.5. If you are using an earlier version of NetWitness Platform, refer to the applicable version of this guide.

To export the NetWitness Endpoint CA certificate from the NetWitness Endpoint Console server and copy it to the NetWitness Platform host:

1. Log on to the NetWitness Endpoint Console.
2. Open **MMC**.
3. Add a certificate snap-in for **Computer account**.
4. Export the certificate named **`NweCA`** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **`EcatCA`** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).
   a. Export without a private key.
   b. Export in DER encoded binary X.509 (`.CER`) format.

c. Name it **NweCA.cer** (in NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh install) or **EcatCA.cer** (in NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5).

5. Copy the NetWitness Endpoint CA certificate to the NetWitness Platform host:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5 or 4.4 fresh installation:
     scp NweCA.cer root@<sa-machine>:.
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5:
     scp EcatCA.cer root@<sa-machine>:.
6. To import the NetWitness Endpoint CA certificate into the NetWitness Platform Trusted store, perform the following:
   a. Check the Java version installed on your NetWitness Platform using the following command:
      `java -version`
      The openjdk version is displayed. For example, openjdk version "`1.8.0_71`"
   b. To set the JDK parameter, navigate to java directory. Enter the following commands:
      - `JDK=/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.141-1.b16.el7_3.x86_64/jre/`
      - For NetWitness Endpoint fresh installation:

        ```
        $JDK/bin/keytool -import -v -trustcacerts -alias nweca -file
        ~/NweCA.cer -keystore $JDK/lib/security/cacerts -storepass changeit
        ```

      - For NetWitness Endpoint upgraded from previous version:

        ```
        $JDK/bin/keytool -import -v -trustcacerts -alias ecatca -file
        ~/EcatCA.cer -keystore $JDK/lib/security/cacerts -storepass changeit
        ```

   Note: `$JDK` represents the full path of the current Java version.

   When prompted for certificate update confirmation, enter **Yes**.
7. On the NetWitness Platform host, do one of the following:
   - For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, edit **/etc/hosts** to map the IP address of the NetWitness Endpoint Console server to the name **NweServerCertificate** by adding the following line to the file:

     `<ip-address-ecat-cs> NweServerCertificate`
   - For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, edit **/etc/hosts** to map the IP address of the upgraded NetWitness Endpoint Console server to the name **ecatserverexported** by adding the following line to the file:

     `<ip-address-ecat-cs> ecatserverexported`
8. To restart NetWitness Platform, enter the following command:

   `service jetty restart`

Configure the NetWitness Platform Concentrator Service

1. Log on to NetWitness Platform and go to **ADMIN > Services**.
2. Select a Concentrator from the list and select **View > Config.**

3. Select the **Files** tab, and from the **Files to Edit** drop-down menu, select **index-concentrator-custom.xml**.
4. Add the following NetWitness Endpoint meta keys to the file and click **Apply**. Make sure that this file contains the XML sections already; if the lines are not included, add them. The following lines are examples; make sure the values match your configuration and the column names you included in the feed definition, where:
   description is the name of the meta key you want to display in NetWitness Platform Investigation.
   level is "IndexValues"
   name matches the column name of the CSV file that NetWitness Platform uses while defining the recurring feed (see the table in *Configure the Recuring Custom Feed Task in NetWitness Platform* below).

```
<key description="Gateway" format="Text" level="IndexValues" name="gateway"
valueMax="250000" defaultAction="Open"/>

<key description="Risk Number" format="Float64" level="IndexValues"
name="risk.num" valueMax="250000" defaultAction="Open"/>

<key description="Strans Addr" format="IPv4" level="IndexValues"
name="stransaddr" valueMax="250000" defaultAction="Open"/>

<key description="Domain" format="Text" level="IndexValues" name="domain"
valueMax="250000" defaultAction="Open"/>

<key description="User Account" format="Text" level="IndexValues"
name="username" valueMax="250000" defaultAction="Open"/>

<key description="Ecat Connectiontime" format="Text" level="IndexValues"
name="ecat.ctime" valueMax="250000" defaultAction="Open"/>

<key description="Ecat Scantime" format="Text" level="IndexValues"
name="ecat.stime" valueMax="250000" defaultAction="Open"/>
```

5. Restart the Concentrator to activate the custom key updates.

Configure the Recurring Custom Feed Task in NetWitness Platform

1. Log on to NetWitness Platform and go to **CONFIGURE > Custom Feeds**.
   The Feeds view is displayed.
2. In the toolbar, click  .
   The Setup Feed dialog is displayed.
3. In the Setup Feed dialog, select **Custom Feed** and click **Next**.
   The Configure a Custom Feed wizard is displayed, with the Define Feed form open.
4. In the **Define Feed**, perform the following:
   a. In the **Feed Type** field, select **CSV**.
   b. In the **Feed Task Type** field, select **Recurring**.
   c. In the **Name** field, enter the name of the feed. For example, EndpointFeed.
   d. Enable the **Upload As Csv File Feed** checkbox to upload the feed as a CSV file.

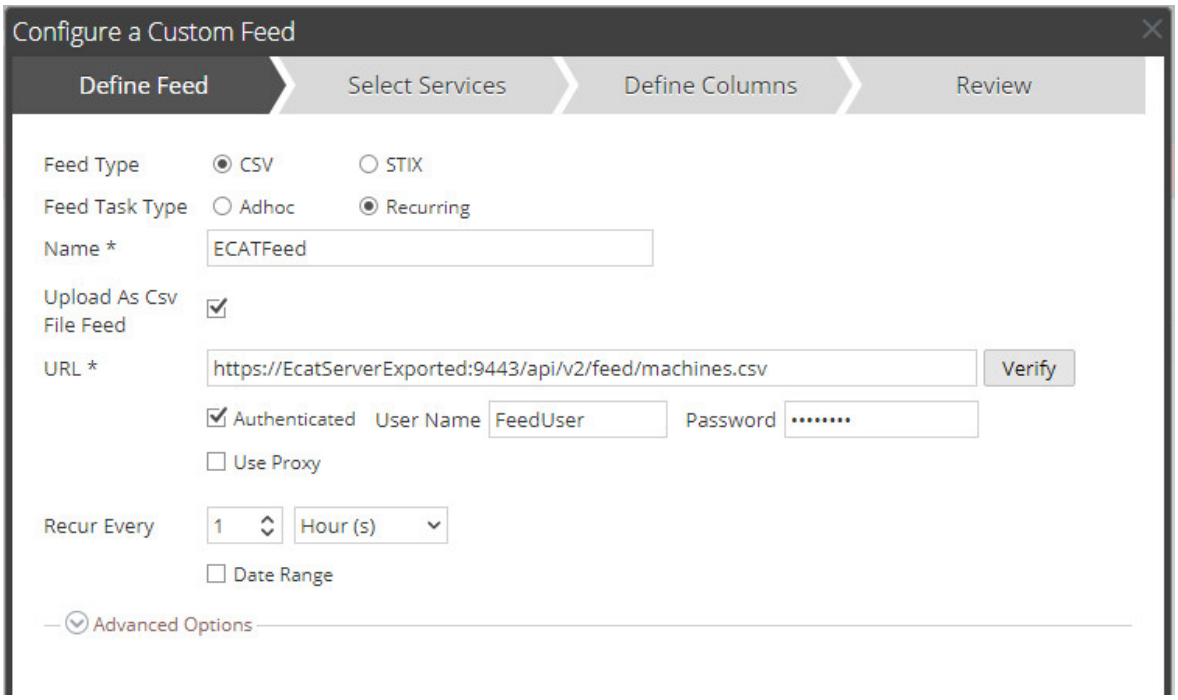
e. In the **URL** field, enter the URL with the hostname of the Windows server on which NetWitness Endpoint is installed:

- For NetWitness Endpoint 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later fresh installation, use the URL **`https://NweServerCertificate:9443/api/v2/feed/machines.csv`.**
- For NetWitness Endpoint upgraded from previous version to 4.3.0.4 or 4.3.0.5, use the URL **`https://ecatserverexported:9443/api/v2/feed/machines.csv`.**

f. Enable the **Authenticated**checkbox and enter the username and password as noted in *Enable the ECAT Feed* above.

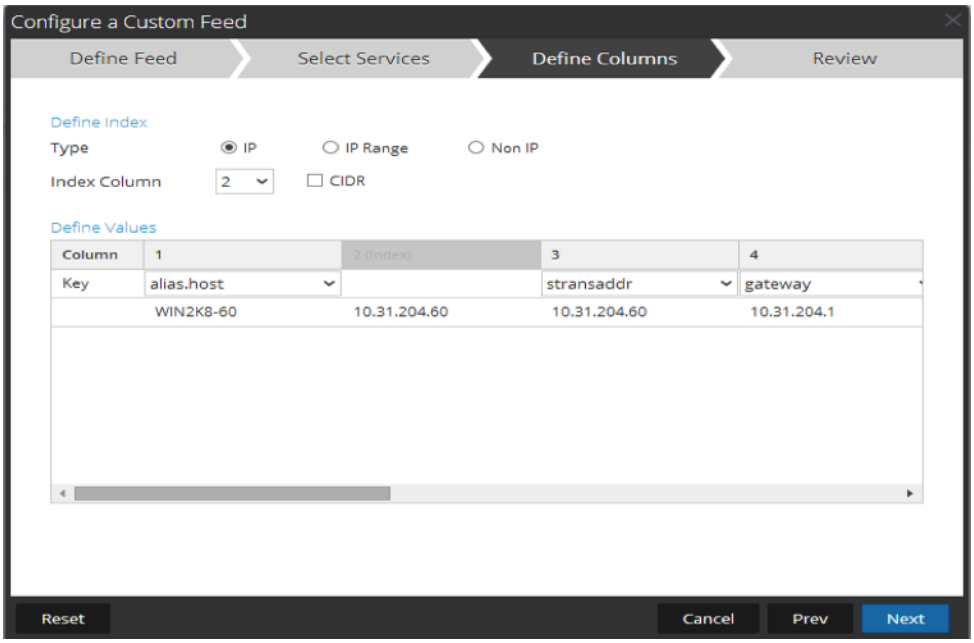
g. Click **Verify** to check if NetWitness Platform can reach the web resource.

.



h. Define the schedule and click **Next**

5. In the **Select Services** tab, select the Decoder or groups to consume the feed. Click **Next**.
6. In the **Define Columns** tab, enter the column names as shown in the table below and save the feed.

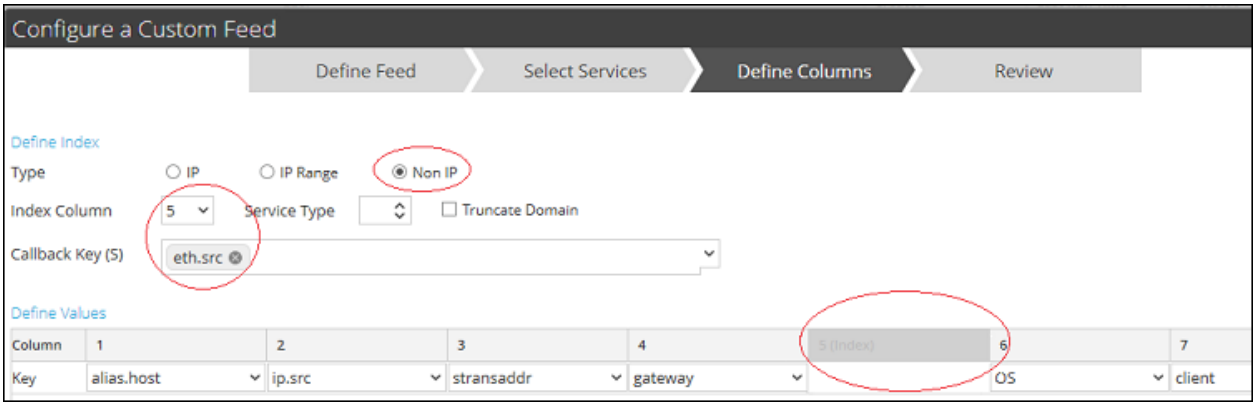


The following table shows the columns in the CSV file for the NetWitness Endpoint feed.

Column	Name	Description	Column Name in NetWitness Platform (Meta Key Name)
1	MachineName	Host name of the Windows agent	alias.host
2	LocalIp	IPv4 address	IP type (indexed column)
3	RemoteIp	Far end IP as seen by the router	stransaddr
4	GatewayIp	IP of the gateway	gateway
5	MacAddress	MAC address	eth.src
6	OperatingSystem	Operating system used by the Windows Agent	OS
7	AgentID	Agent ID of the host (unique ID assigned to the agent)	client
8	ConnectionUTCTime	Last time when the agent connected to NetWitness Endpoint server	ecat.ctime
9	Source Domain	Domain	domain.src
10	ScanUTC time	Last time when the agent was scanned	ecat.stime

Column	Name	Description	Column Name in NetWitness Platform (Meta Key Name)
11	UserName	Username of the client machine	username
12	Machine Score	Score of the agent indicating the suspicious level	risk.num

Note: In the table, the recommended index setting is LocalIp. However, if the LocalIp for NetWitness Endpoint Agent PC is allocated by a DHCP Server and the DHCP lease has expired, and if the IP is then re-allocated to another PC, the metadata created by the feed will be incorrect. To avoid this risk, use the machine name or the Mac address instead of the localIP address as the Feed's index. For example, to use a Mac address, you could enter the values as shown in the following figure.



Result

When viewing feed data in NetWitness Platform, upon a match of the indexed value (ip.src), meta data is populated in Investigation, Reporting, and Alerting Interfaces.

Configure Endpoint Alerts Through Syslog into a Log Decoder

You can configure the use of RSA NetWitness Endpoint data in RSA NetWitness Platform to provide NetWitness Endpoint alerts through Syslog into Log Decoder sessions. This generates metadata that is used by NetWitness Platform Investigation, Alerts, and Reporting Engine.

For NetWitness Platform networks that are consuming logs, this integration of NetWitness Endpoint with NetWitness Platform pushes NetWitness Endpoint events to the Log Decoder through common event format (CEF) syslog messages and generates metadata that is used by NetWitness Platform Investigation, Alerts, and Reporting Engine. The use case for this integration is SIEM Integration to allow centralized event management, correlation of NetWitness Endpoint events with other Log Decoder data, NetWitness Platform reporting on NetWitness Endpoint events, and NetWitness Platform alerting of NetWitness Endpoint events.

Prerequisites

The following are required for this integration:

- Version 4.3.0.4, 4.3.0.5, 4.4, 4.4.0.2, or later NetWitness Endpoint UI.
- NetWitness Server Version 11.1 is installed.
- Version 10.4 or later RSA Log Decoder and Concentrator connected to the NetWitness Server in the network.
- Port UDP- 514 or TCP - 1514 open from NetWitness Endpoint server to Log Decoder in the firewall.

Procedure

1. Deploy the required parser (CEF or rsaecat) to the Log Decoder as described in the "Manage Live Resources" topic in *Live Services Management*. After you deploy the parser, make sure the parser is enabled. For more information, see "Services Config View - General Tab" in the *Malware Analysis Configuration Guide*.

Note: Use only one of these parsers. When the CEF parser is deployed, it supersedes the NetWitness Endpoint parser, and all CEF messages into NetWitness Platform are processed by the CEF parser. Enabling both parsers is an unnecessary burden on performance.

2. Configure NetWitness Endpoint to send syslog output to NetWitness Platform and generate NetWitness Endpoint alerts to the Log Decoder.
3. (Optional) Edit the table mapping in `table-map-custom.xml` and the `index-concentrator-custom.xml` to add fields based on user preferences for metadata to be mapped to NetWitness Platform.

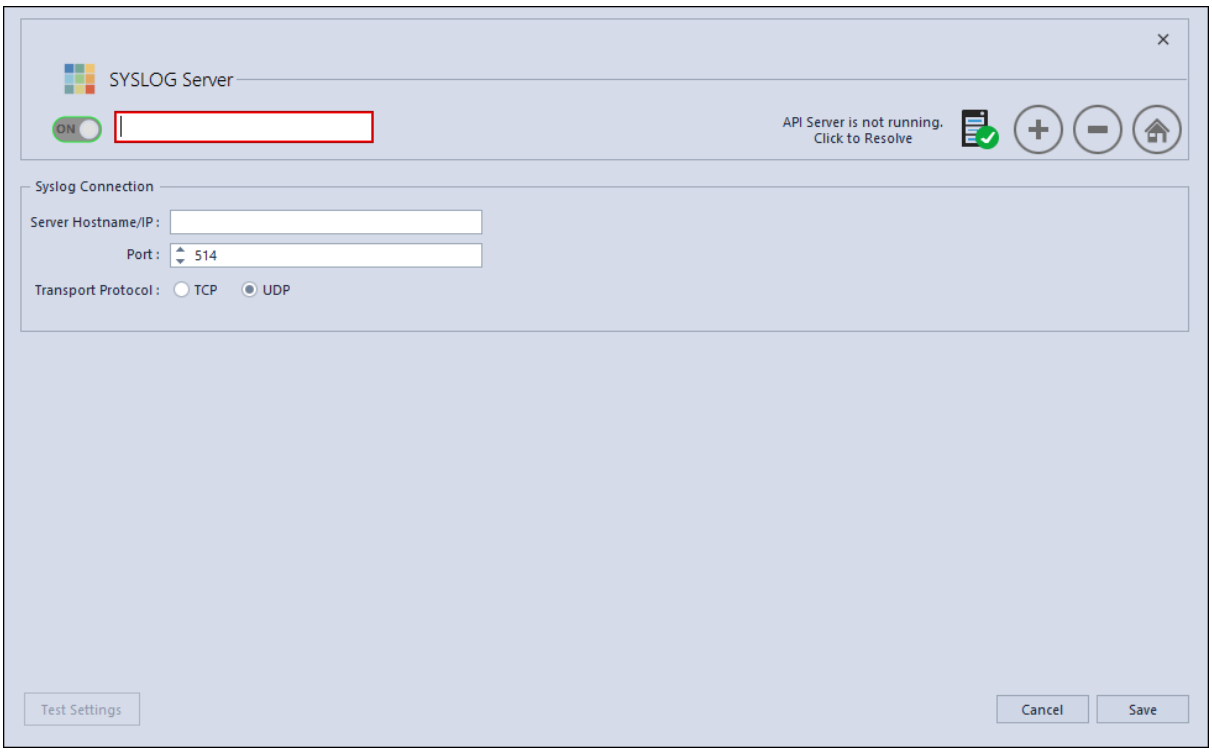
Configure NetWitness Endpoint to Send Syslog Output to NetWitness Platform

To add the Log Decoder as a Syslog external component and generate NetWitness Endpoint alerts to the Log Decoder:

1. Open the NetWitness Endpoint user interface and log on using the proper credentials.
2. From the menu bar, select **Configure > Monitoring and External Components**.

   The External Components Configuration dialog is displayed.
3. In **SYSLOG Server**, click +.

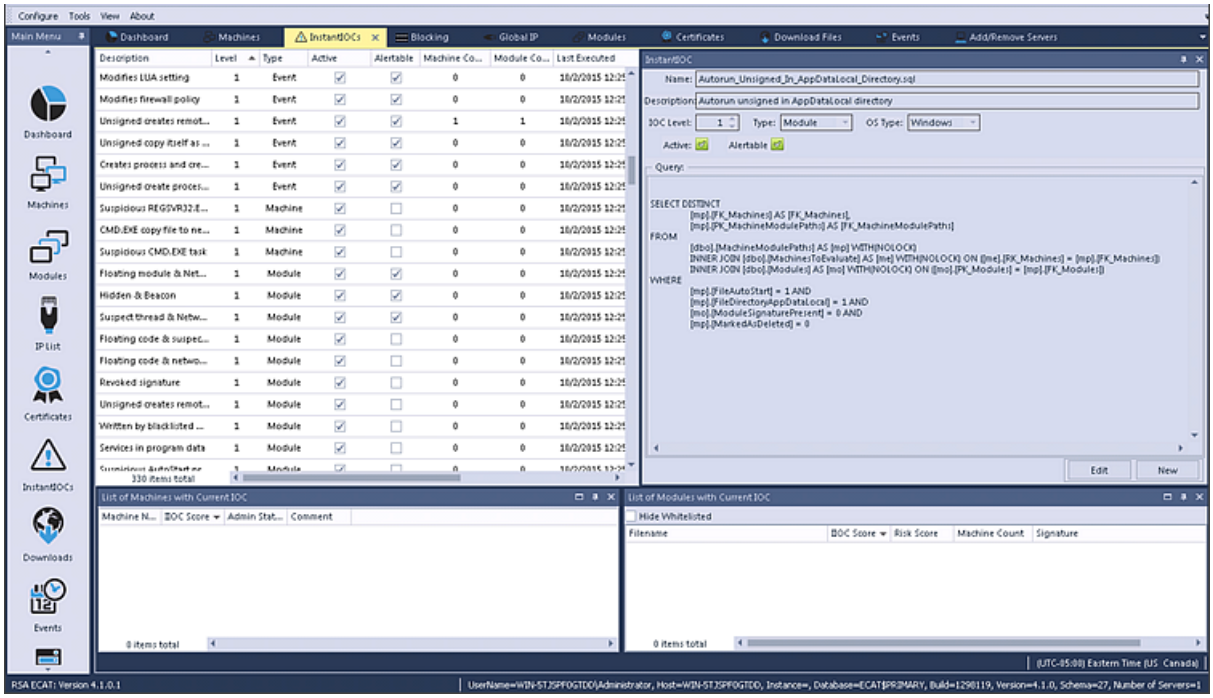
   The SYSLOG Server dialog is displayed.



4. In the **NetWitness Platform** panel, in **On**, enter the descriptive name for the Log Decoder.
5. In the **Syslog Connection** panel, perform the following to enable Syslog messaging:

   Server Hostname/IP = The hostname DNS or IP address of the RSA Log Decoder
   Port = 514
   Transport Protocol = Select **UDP** or **TCP** as appropriate for your Syslog server for the transport protocol.
6. Click **Save**.
7. Open the **InstantIOCs** window in the NetWitness Endpoint UI and, in the **Alertable** column, click

to enable each IIOC for which you want alerts sent to the Log Decoder.



When the instant IOCs are triggered, Syslog alerts from the NetWitness Endpoint server are sent to the Log Decoder. Log Decoder alerts are then aggregated to the Concentrator. These events are injected into the Concentrator as metadata.

Contents

Introduction

This document lists enhancements and fixes in RSA NetWitness® Platform 11.2.0.0. Read this document before deploying or updating to RSA NetWitness® Platform 11.2.0.0.

What's New

The RSA NetWitness® Platform 11.2.0.0 release provides new features and enhancements for investigation on logs, packets, and endpoints. As part of this release, user and entity behavioral analytics is introduced to detect and investigate attacks and identity-based anomalies.

NetWitness User and Entity Behavior Analysis (UEBA)

RSA NetWitness® UEBA is now part of the RSA NetWitness® Platform. NetWitness UEBA provides comprehensive user and entity behavioral analytics to better detect, investigate, and respond to advanced internal attacks and identity-based anomalies.

NetWitness UEBA has the following features, UEBA:

- Leverages dynamic statistical outlier analytics for behavior baselining, behavior modeling and peer group analytics to uncover anomalous behavior, lateral movement, insider threats, and data exfiltration.
- Identifies suspicious behavior-based anomalies leveraging unsupervised machine learning algorithms.
- Generates an identity and alert risk scoring model to only raise severity and priority on high risk indicators, reducing alert fatigue and false positives.

NetWitness UEBA Service Deployment. NetWitness UEBA can be configured and deployed from the NetWitness Platform Admin Server. NetWitness UEBA Server captures Windows log data from NetWitness Platform services, processes the data, and displays results on the NetWitness GUI. If the NetWitness Insights Endpoint agent is deployed, Windows log data collected is also analyzed. For information on deploying UEBA, see the *Physical Host Installation Guide* and the *Virtual Host Installation Guide*.

In version 11.2, UEBA natively supports a variety of the following Windows log sources such as:

- Windows Active Directory
- Windows Logon and Authentication Activity
- Windows File Servers

Identity Behaviors Baselining. Machine learning models are applied on historical and real-time data for the creation of behavior baselines that help with identifying outliers and provides visibility into organizational and individual metrics. Standard modeling policy executes a 30 day-training period. If additional historical data is stored beyond that point, the training period can be modified to execute upon an earlier timeframe. Only abnormal behaviors to these baselines result in anomalies or indicators of compromise.

Investigation of Top Alerts and High Risk Users. Analysts can leverage a pre-defined Out-of-the-Box (OOTB) dashboard and reporting to investigate top alerts (Alerts triggered by a sequence of indicators within a round hour (that is, one full hour) and high-risk users (Users with a high risk score). Analysts can view users that require immediate attention, perform deeper investigation, and reduce risk scores.

NetWitness UEBA License. The NetWitness UEBA License is based on the total number of users in your organization. Users are individuals who have network access and login credentials. If the number of users exceeds five percent (5%) of the purchased license, you must procure new licenses. For more information, contact your RSA Account Manager. for more information on licensing, see the *Licensing Management Guide*.

For more information on UEBA, see the *NetWitness User Entity and Behavior Analytics User Guide* .

NetWitness Respond

Access Event Analysis directly from the Incident Details view. You can seamlessly access Event Analysis from the Investigate view from within the Indicators panel storyline of an incident. To further investigate an incident, you can click an event type hyperlink within an event in the storyline to open the Event Analysis view in Respond.

Added the ability to send incidents from within NetWitness Respond to RSA Archer. If RSA Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response. When configured, you will see a Send to Archer button and Sent to Archer status in NetWitness Respond. You will also have the option to filter the incidents list for incidents sent to Archer. When you send an incident to Archer, the system automatically creates an entry in the journal for the incident.

Pivot to RSA Archer from Incidents. You can pivot to RSA Archer for device details and other information in RSA Archer® Cyber Incident & Breach Response for specific entities. These entities are IP address, host, and Mac address. In the Context Lookup panel, you can view the attributes for the underlined entity such as business unit values, device name, device type, and so on. For more information, see the *NetWitness Respond User Guide*.

Improved manual incident creation from the Alerts List view. You can add a priority, an assignee, and categories when you create an incident manually from alerts.

Added the ability to hide node types in the nodal graph. To further study the interactions between the entities on the nodal graph, you can select the node types that you would like to include in the nodal graph. This can be especially helpful if a nodal graph contains over 100 nodes.

Adjusted the incidents filter for assigned and unassigned incidents. In the Incidents List Filters panel, you can no longer filter for assignees and unassigned incidents at the same time. If you select “Show only unassigned incidents”, the Assignee filter drop-down list is now disabled. If you select an Assignee from the drop-down list, the “Show only unassigned incidents” option is now disabled.

Improved the user experience with sorting the Incident List. You can click anywhere on the column header in the list to toggle the sort. You no longer have to click the up or down arrows to sort the list.

For more information, see the *NetWitness Respond User Guide* and the *NetWitness Respond Configuration Guide*.

NetWitness Investigate

Contextual information for a meta value in the Event Analysis view. The Context Lookup panel, which was previously available in the Navigate view and the Events view, has been added to the Event Analysis view. The Context Lookup panel shows details about elements associated with an event (IP Address, User, Host, Domain, MAC Address, Filename, File hash) in the Context Hub. You can interact with the meta values of an event to get further insight such as related incidents, alerts, custom lists, RSA Archer assets, Active Directory details, and NetWitness Endpoint Thick Client. For more information, see "View Additional Context for a Data Point" in the *NetWitness Investigate User Guide*.

Pivot to Archer from meta values in Event Analysis view. You can now pivot to RSA Archer from these underlined entities - IP address, Mac and host in Event Analysis for viewing device details.

Free-Form queries in the Event Analysis view. Free-Form mode is an alternative to the basic query (Guided) mode available in earlier versions. In Free-Form mode, analysts can enter complex text queries, and switch between Free-Form and Guided mode. For more information, see "Filter Results in the Event Analysis View" in the *NetWitness Investigate User Guide*.

Profile enhancements include profile groups, new and updated profiles, and including the preQuery for a profile in the breadcrumb. For more information, see "Use Profiles to Encapsulate Custom Views" in the *NetWitness Investigate User Guide*.

- Profile groups allow you to organize profiles into logical groups, for example, different profile groups for different use cases, or for different users. You can move existing and new profiles into profile groups.
- A new out-of-the-box profile called RSA Endpoint Analysis uses a preQuery of `device.type=nwendpoint` and the RSA Endpoint Analysis meta group and column groups.
- In the RSA Threat Analysis profile, the following three meta keys are replaced:
  `risk.warning` is now `behavior of compromise (boc)`
  `risk.suspicious` is now `indicator of compromise (ioc)`
  `risk.informational` is now `enabler of compromise (eoc)`
- When a profile is selected in the Navigate View or Events View, the PreQuery for the profile is displayed in the breadcrumb.

Improved search option configuration. The menu for setting search options has been reorganized to make it easy to understand and choose. For more information, see "Configure the Navigate View and Events View" in the *NetWitness Investigate User Guide*.

Improvements to the Text Analysis panel. In the Event Analysis view, several improvements address usability in viewing data.

- New pagination controls allow more flexibility in paging through a list of events.
- If a reconstructed event in the Text Analysis panel has a request or response that exceeds the maximum number of bytes limit, the header indicates that the message has been truncated. This provides as much data as possible when viewing the Text Analysis of an event that is too large to render.

Event Source Management

Identify Idle Event Sources. This new attribute displays the number of days since a log was last received from each event source. You can use this attribute to group event sources that have been idle for a specified time (for example, 90 days), for review or bulk removal.

Context Hub

Option to Import or Export Attributes. The attributes in Context Lookup panel can now be managed to help users view the attributes intended for RSA Archer device details. You can configure the attribute of interest from the device application of RSA Archer and view these attributes in the context panel. To perform this, you can export the existing attributes, add the new attribute and import the updated set of attributes. These attributes are reflected in the order imported in the Context Lookup panel when you view the context for an incident or an event on Event Analysis view. For more information, see the *Context Hub Configuration Guide*.

Services Implemented with the NetWitness Server

New Content Service. The new **Content** service manages the RSA provided and user created parser rules. You can now add parser rules in the UI. The Content service is used in the Log Parser Rules tab, which is described in Log Parsing section later in this document.

Log and Network Decoder

Support for standard pcapng files. To provide a more open database format, the Network Decoder can now write standard pcapng files. This capability is enabled by default if you install 11.2 directly. If you upgrade from a previous version to 11.2, you must enable pcapng-formatted database files manually, which can result in an approximate 4% decrease in disk space (as the pcapng files require more space than the nwdb files). You can also use the pcapng format with 10 Gbps capture, which does not decrease performance significantly (< 1%).

To enable the new configuration node:
`/database/config/packet.file.type = 'netwitness' or 'pcapng'`

New GeoIP2 Parser. The new GeoIP2 Parser converts IP addresses into geographic locations, provides the latest Maxmind GeoIP package, and supports IPv6 addresses as well as IPv4. The GeoIP2 Parser reads from `ip.src`, `ip.dst`, `ipv6.src` and `ipv6.dst` to generate GeoIP information, and is enabled in the Decoder by default. For more information, see "GeoIP2 and GeoIP Parsers" in the *Decoder and Log Decoder Configuration Guide*.

GeoIP Lookups on IPv4 IPv6 Metadata. You can now perform GeoIP lookups on any IPv4 or IPv6 metadata so that you can understand geographic information in scenarios when `ip.src` and `ip.dst` are not the focus for analysis.

- There is a new Lua API that provides Lua parsers with complete access to any GeoIP2 information. The Lua API returns the requested information from the GeoIP2 database. The parser is then free to use this information to create meta or to perform its own analysis.
- You can configure the native GeoIP2 parser to generate GeoIP2 metadata on any IPv4 or IPv6 key using the `config` node `parsers.options`.

For more information, see "GeoIP2 and GeoIP Parsers" in the *Decoder and Log Decoder Configuration Guide*.

TLS Certificate Hashing. The Network Decoder can produce hashes of certificates that are seen in the packet stream. These hashes are the SHA-1 value of any DER-encoded certificate encountered during a TLS handshake. The hashed data is written to the `cert.checksum` key. The hashes produced can be used to compare network traffic with hashes from public SSL blacklists. For more information, see "TLS Certificate Hashing" in the *Decoder and Log Decoder Configuration Guide*.

User Interface

Log Parser Rules tab has moved. The Log Parser Rules tab, located in ADMIN > Event Sources for version 11.1, has been moved to CONFIGURE for version 11.2.

Added additional language support. In the User Preferences, there is a new Language option, which enables you to select another available language. The selected language alters the text across the NetWitness Platform. For more information, see the *NetWitness Platform Getting Started Guide*.

NetWitness Rebranding. The NetWitness 11.2 product has been rebranded throughout the user interface, documentation, and other relevant occurrences as follows:

1. RSA NetWitness® Suite to RSA NetWitness® Platform
2. RSA NetWitness® Packets to RSA NetWitness® Network
3. RSA NetWitness® Logs and Packets to RSA NetWitness® Logs & Network
4. Packet Hybrid host type to Network Hybrid host type
5. Packet Decoder host type to Network Decoder host type
6. RSA NetWitness® SecOps Manager to RSA Archer® Cyber Incident & Breach Response

Administration

Configurable Context Menu Actions in Investigate. Right-click actions available in Investigate can now be configured using the Context Menu Actions UI by using different fields and groups. You can create new context menu actions and manage them using Context Menu Actions available under ADMIN > System. The Context Menu Actions configured using the UI can be viewed as a right-click action on meta keys in Investigation tab under - Navigate, Events, and Event Analysis views. In Event analysis, right-click actions are supported on meta keys as well.

Improved Login Banner available. The login banner now features fully customizable text and increased security measures.

Log Parsing

Log Parser Rules tab has been enhanced. RSA has added the ability to extend existing log parsers, add custom log parsers, and update log parser rules for your log parsers. Log parser rules change the way meta information is extracted from the event source logs. You can add log parser rules that extend existing log parsers in your system, as well as to the default log parser, which extracts meta from messages that might otherwise be listed as unknown. For more details, see the *Log Parser Customization Guide* available in RSA Link. For 11.1, the log parser rules were read-only.

Upgrade Instructions

The following upgrade paths are supported for RSA NetWitness® Platform 11.2.0.0:

- RSA NetWitness® Platform 10.6.6.x to 11.2.0.0
- RSA NetWitness® Platform 11.0.x or 11.1.x to 11.2.0.0

For more information on upgrading to 11.2.0.0, see the upgrade instructions in the Product Documentation section.

Fixed Issues

This section lists issues fixed since the last major release.

Security

Tracking Number	Description

General Application Issues

Tracking Number	Description
ASOC-46483	The system logs off idle users in Respond and some Investigate Views

Investigate

Tracking Number	Description
ASOC-51011	Three new meta groups for 11.0 and the same column groups for 11.1 are not created when you upgrade from 10.6.5 to 11.x: RSA Endpoint Analysis, RSA Outbound HTTP, RSA Outbound SSL/TLS.
ASOC-50702	After upgrading to 11.1, there are mismatched data types between the Log Decoder (table-map.xml) and Concentrator (index-concentrator.xml) definitions.
ASOC-50924	Attempting a direct query, or query via link, that uses an IPV6 meta value with unsupported special characters generates an error in the Event Analysis view and the Navigate view.
ASOC-50771	If you go to Event Analysis from the Events view, either by clicking the Event Analysis link or by right-clicking one of the events, the right-click options on meta values do not work.
ASOC-49854	The Service selector spinner keeps loading infinitely.
ASOC-50712	Cannot add meta entities to a custom column group in the Events view when the Optimize Investigation Page Loads option is disabled.
ASOC-50349	Custom column groups that contain meta entities can be created in the Events view, but when the custom column group is used in the Event Analysis view, you cannot see the meta keys included in the meta entity in the results.

Tracking Number	Description
ASOC-50041	When you right-click on a meta value that contains a semicolon in the Event Analysis view and attempt to apply the drill in a new tab in the Navigate view, there is an error: Unable to build visualization.
ASOC-45198	When you alter the URL and the new URL is for a restricted event, the reconstructed content for the previous query persists in the Event Analysis view and no error message is displayed.
ASOC-48945	When you enter a query to a session to which you do not have access in the Event Analysis view, no data is displayed and there is no error message.
ASOC-48710	When investigating in the Event Analysis view, the following error message is returned: “An Unexpected error has occurred.”

Respond

Tracking Number	Description
ASOC-40749	Respond Administrator cannot query Investigate or view Live dashlets in the Dashboard.
ASOC-41891	Security Analytics Incident Management link in the NetWitness SecOps Manager 1.3.1.2 is not valid in NetWitness Suite 11.1.0.0.
ASOC-46834	Unable to select Domain for Suspected C & C and Domain in the rule builder
ASOC-50911	Aggregation Stops after Reconnection to Mongo
ASOC-51480	Endpoint events with a detector IP are not being aggregated by the Endpoint incident rule and do not create incidents with the current default incident rule’s match condition. See the “Set Up and Verify Default Incident Rules” topic in the *NetWitness Respond Configuration Guide*.

Event Stream Analysis (ESA)

Tracking Number	Description
ASOC-50201	When you deploy new ESA rules in the Health and Wellness view and create a new policy under Event Stream Analytics using the statistic ESA Rule Memory usage, all ESA rules deployed were not listed.

Features Not Supported

The following tables provide information on features no longer supported in RSA NetWitness® Platform 11.1 or Later Releases.

Features Not Supported in 11.1.0.0 or later releases

No.	Feature	Notes
1	Malware Colo	Malware co-located is not supported in 11.1.0.0 and later releases. Malware Analysis is supported using a standalone Malware Analysis.
2	All-In-One (AIO) Deployment	All-in-one deployment is not supported. Fresh Install AIO has been removed.
3	Standalone Warehouse Connector	Standalone Warehouse Connector is not supported.
4	Administration Features	1. Forgot my password. 2. Email Notification to user when password expires. 3. Test/Search AD user.
5.	Pivotal	Pivotal is not supported.
6.	Warehouse Analytics	Warehouse Analytics is not supported.

Features Available in Future Releases

The following features are not available in 11.2 and may be available in a future release.

No.	Feature	Notes
1	IPDB Reporting	IPDB Extractor service is not supported in 11.2.0.0 and will be available in later releases.
2	STIG	If you have a STIG hardened host, you cannot upgrade to 11.2.0.0 as the backup scripts do not support that.

No.	Feature	Notes
3	Multiple Security Analytics Server (NetWitness Server) support	Multiple server deployment is not supported.
4	PKI Authentication	The PKI Authentication feature is not available in 11.2.0.0.
6	Endpoint Analytics	Analytics, such as risk score or IOC calculation, is not supported on the endpoint scan data.
7	Endpoint Remediation	Response functionality (containment/blocking) is not supported.
8	Endpoint Tracking	Tracking network events is not supported.
9	Endpoint Kernel mode	The Endpoint agent currently works in User mode and does not support Kernel mode detection.
10	Endpoint File reputation	File reputation, such as OPSWAT, YARA, and Reversing Lab lookups, are not supported and thus cannot whitelist or blacklist files.

Known Issues

This section describes issues that remain unresolved in this release. Wherever a workaround is available, it is noted or referenced in detail.

Known Issues During Upgrade to 11.2

The following known issues occur during upgrade from 10.6.6 to 11.2 or update from 11.1 or 11.1.x to 11.2.

STIX recurring feed fails on upgrade from 10.6.6 to 11.2

Tracking Number: ASOC-61227

Problem: When you upgrade Security Analytics 10.6.6 to NetWitness Platform 11.2, the STIX Recurring feed you created using HTTPS URL fails to work. This is because, in 10.6.x, by default, all the certificates are trusted. However, this is not the case in 11.2. In 11.2, the Trust All certificates option is provided and is disabled by default.

Workaround: Navigate to Configure > Custom Feeds and edit the failed feed. Either enable the Trust all option, or upload a valid SSL certificate to resolve the issue. In case of any further queries, contact the RSA Customer Support.

On upgrade to NetWitness Platform 11.2, license details are not retained on AWS cloud

Tracking Number: ASOC-61614

Problem: When you upgrade from Security Analytics 10.6.6 to NetWitness Platform 11.2, the license server id is not retained. Admin server is thus unable to obtain the license server details from the external back-end system, due to which the services cannot be licensed.

Workaround: Follow the steps provided in “Access Download Central” and “Register the Server (Online)” topics in the *Licensing Management Guide* to obtain the license details from the external back-end system and register the new license server ID.

After upgrade from 10.6.6 to 11.2.0.0, offline licenses are not retained

Tracking Number: ASOC-41757

Problem: Even if you upload a new response bin file from Download Central, offline licenses do not work. Though old files are restored in `/var/lib/fneserver`, the licenses remain deactivated.

Workaround: Perform the following steps to restore the licenses:

1. Generate a new response bin file from Download Central.
2. SSH into a Netwitness Server host 11.2.0.0 (AdminServer).
3. Move ra* files (3 files) out of `/var/lib/fneserver/`

4. Log in to the RSA NetWitness 11.2.0.0 UI with admin user credentials and go to **ADMIN** > **System** > **License Details**tab.
5. Click **Refresh Licenses**.
6. Upload the response file received from Download Central. Go to **ADMIN** > **System** > **Licensing** > **Settings** tab
7. Click **Upload Response**.

Note: Upgrade using Online mode (RSA Netwitness Suite 11.2.0.0 connected to the Internet) works successfully and all licenses are restored after upgrade to 11.2.0.0.

The investigation links are disabled for static charts during 10.6.6 to 11.2 post-upgrade

Tracking Number: ASOC-42136

Problem: The investigation link is disabled for the static chart (the result of the report is in chart format) which has the datasource as NetWitness Suite-Broker (This service is available by default).

Workaround: There are two workarounds for this issue:

- The rules that have the result in a static chart can be viewed in Tabular format and the investigation works as expected.
- Or you can perform the following steps to fix the issue:
  1. Delete and add the NetWitness Suite-Broker again as the datasource to Reporting Engine with the same name.
  2. If the reports with a static chart are scheduled reports, then in the next run, the investigation link will work as expected.
  3. If the report is an Adhoc report, then re-run the report to restore the investigation links.

On upgrade from 10.6.6 to 11.2, the Geo-map dashlet cannot be created using a pre-configured (OOTB) chart.

Tracking Number: ASOC-41896

Problem: When you upgrade to Netwitness Suite 11.2.0.0, the Geo-map dashlet cannot be created using a preconfigured chart. This happens if a custom dashboard uses a Geo-map dashlet, which is created using a preconfigured chart.

Workaround: The data source must be manually updated for that preconfigured chart that is required to be used in the dashlet with Geo-map. Or, create a new chart using the same preconfigured rule and use the new chart in the dashlet with Geo-map.

On upgrade from 11.x to 11.2, if you have been using the Entropy Parser and indexing payload, you will need to add the bucket flag to the index file so that the Entropy Parser can use index buckets

Tracking Number: ASOC-45721

Problem: When you upgrade from Version 11.0 to Version 11.2, if you have been using the Entropy Parser on the Decoder (packets only) and are indexing payload, you must add the bucket flag to your index file to take advantage of the new index buckets feature.

Note: If you are upgrading from Version 11.1 or later to Version 11.2, you do not need to make this change.

Workaround: Add bucket flag to index file so Entropy Parser can use index buckets, as follows:

1. In the NetWitness Suite menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each Concentrator service that is aggregating traffic from the decoders.
3. Under  (actions), select **View** > **Config** and select the **Files** tab.
4. Select the `index-concentrator-custom.xml file` and set the `bucket` flag to `true` for `payload.req` and `payload.res`. For example:
   ```
   <key description="Payload Size Request" format="UInt 32"
   level="IndexNone" bucket="true" name="payload.req"
   valueMax="500000"/>
   <key description="Payload Size Response" format=UInt32"
   level="IndexNone" bucket="true" name="payload.res"
   valueMaz="500000"/>
   ```
5. Click **Apply**.
6. For changes in the `index-concentrator-custom.xml` file to take effect, you must restart the concentrator service:
   ```
   systemctl restart nwconcentrator
   ```

UEBA

When the proxy is configured, and in case of updates, the license details do not get refreshed automatically

Tracking Number: ASOC-52366

Problem: When the proxy is configured, and in case of updates the license details do not get refreshed automatically or even after clicking the Refresh button in the License Details view. This is because the communication to the license server is not established.

Workaround: The Administrator has to manually download the license details using the offline mode and upload latest license details through the NetWitness Platform UI. For more information, see the *Licensing Management Guide*.

Endpoint

Nginx rejects post requests exceeding request size 1 MB

Tracking Number: ASOC-56236

Problem: The Nginx server is upgraded and the default payload size is set to 1 MB. This causes any data post request exceeding 1 MB to fail.

Workaround: Add the following setting to the Nginx configuration file (`/etc/nginx/conf.d/nginx.conf`) and restart the Nginx server.

```
client_max_body_size 100M
```

Generate and copy *nwelcfg file, does not update the timestamp

Tracking Number: ASOC-49847

Problem: After installing the Endpoint Insights agent, if the administrator wants to update a new Log collection configuration through any of the copy methods or third party Endpoint management tool, the configuration file timestamp remains to be Endpoint server time and not the agent time. As a result, if the endpoint agent is on a different timezone from the endpoint server, the timestamp does not get updated properly.

.**Workaround**: After copying the configuration file, run the command on the Endpoint Agent: `copy /b <filename.nwelcfg> +,,` from the folder %programdata%\NWEAgent\ where the nwelcfg file is there.

Respond

When all alerts are deleted for an alert rule, the filter for the rule is not properly removed

Tracking Number: ASOC-59243

Problem: In the Alerts List view (Respond > Alerts), you can filter alerts by Alert Name and then delete all of the alerts that have that name. If you do not remove the alert name filter after deleting the alerts, the next time the Alerts List view loads, the filter will still be in place, but it will no longer be visible as a checkbox in the Filters panel because all alerts with that name have been deleted. You will continue to see zero results when visiting the Alerts List view.

Workaround: Before you refresh or reload the Alerts List view, you can remove the filter by clearing the checkbox by the alert name. If you already refreshed or reloaded the Alerts List view, the only way to remove the hidden filter is to press the **Reset Filters** button, which removes all filters, including the hidden alert name filter.

Incidents are not flagged when a user manually adds alerts to an existing incident

Tracking Number: ASOC-52428

Problem: Meta values in hover over values are not highlighted when alerts in Respond have manually been added to an incident. While alerts that are automatically or dynamically added to an incident are shown in hover over.

Workaround: None.

Malware event File name with Korean characters is not shown properly in the Respond view

Tracking Number: ASOC-40159

Problem: If there are Korean characters in an alert that is received from Malware Analysis, they will not be displayed correctly in the Respond view.

Workaround: None.

ESA Rules with severity as High or Low are not populated in the RSA Archer UI

Tracking Number: ARCHER-47101

Problem: When ESA alerts with severity High or Low are forwarded to RSA Archer, the Security Alert Priority field is not populated in the RSA Archer UI.

Workaround: None.

Incidents and Tasks are still available when RSA Archer Cyber Incident & Breach Response integration is enabled

Tracking Number: ASOC-39886

Problem: After enabling Archer Cyber Incident & Breach Response (NetWitness SecOps Manager) integration in the Respond Server service, all incidents are managed in Archer Cyber Incident & Breach Response. In previous versions, when SecOps was enabled, incidents and remediation tasks were hidden. In NetWitness Platform 11.0.0.x, users are still able to access incidents and tasks in the Respond view (RESPOND > Incidents and RESPOND > Tasks). They are also not prevented from creating incidents in NetWitness Platform. If they create incidents from the Respond Alerts List view (RESPOND > Alerts) or from Investigate, those incidents will not go to Archer Cyber Incident & Breach Response.

Workaround: If you enabled Archer Cyber Incident & Breach Response (NetWitness SecOps Manager) integration in the Respond Server service, do not use the following in the Respond view: Incidents List view, Incident Details view, and Tasks List view. Also, do not create incidents from the Respond Alerts List view or from Investigate.

For migrated incidents, the event count always shows as 0 in the Overview panel

Tracking Number: ASOC-38026

Problem: In the Incidents Overview panel Catalysts field, the number of events for migrated incidents always shows as 0 (zero). This is expected behavior in NetWitness Platform 11.0.0.x and later. (To access the Overview panel, go to Respond > Incidents. If you click an incident in the Incidents List, the Overview panel appears to the right. If you click a link in the ID or NAME field in the Incidents List, the Incident Details view opens with the Overview panel on the left.)

Workaround: None.

In memory table enrichment information is not displayed for ESA alerts

Tracking Number: ASOC-37533

Problem: You cannot view custom enrichments for ESA Correlation Rules in the Respond Alerts view.

Workaround: None.

Integration Settings for Archer Cyber Incident & Breach Response should be exposed in the User Interface

Tracking Number: ASOC-25127

Problem: The Integration settings for sending all incidents to Archer Cyber Incident & Breach Response (NetWitness SecOps Manager) should be exposed in the user interface.

Workaround: The user interface for partial Archer Cyber Incident & Breach Response (NetWitness SecOps Manager) integration was removed in 11.0.0.x. Administrators can complete the integration from the Explorer view for the Respond Server service.

Log Collector

FIPS is disabled by default for the Log Collector Service

Tracking Number: ASOC-41841

Problem: FIPS is disabled by default for the Log Collector service, even if FIPS was enabled in 11.2.0.0.

Note: Even if FIPS is enabled in 11.2.0.0, it becomes disabled post-migration.

Workaround: To enable FIPS on the Log collector service, perform the following steps:

1. Stop the Log Collector service.
2. Open the `/etc/systemd/system/nwlogcollector.service.d/nwlogcollector-opts-managed.conf` file.
3. Change the value of the following variable to **off** as described here:

   `Environment="OWB_ALLOW_NON_FIPS=on"`
   to
   `Environment="OWB_ALLOW_NON_FIPS=off"`
4. Reload the system daemon by running `systemctl daemon-reload` command.
5. Restart the Log Collector service.
6. Set the FIPS mode for the Log Collector service on the UI:

   Note: This step is not required in case of upgrade, if FIPS was enabled on 11.2.0.0.

   a. Go to **ADMIN** > **Services**.

   b. Select the Log Collector service and go to **View** > **Config**.

   c. In SSL FIPS Mode, select the checkbox under Config Value and click **Apply**.

Note: To enable Log Decoder and Packet Decoder, in `/sys/config` set `ssl.fips` to ON and restart the service.

Investigate

Imported Investigate profiles are not displayed in the Profiles drop-down menu

Tracking Number: ASOC-61230

Problem: When you import Profiles to the Navigate view or the Events view using the Manage Profiles dialog, the newly imported profiles are not added to the Profiles drop-down menu.

Workaround: Refresh the browser window to see the recently added profiles.

In the Event Analysis view, log and network events are not interleaved

Tracking Number: ASOC-60941

Problem: Network and log events are interleaved and sorted in time order in the Events view, but in the Event Analysis view, events are sorted differently. In the Event Analysis view, the events are not interleaved as they should be; instead all log events sorted in time order are displayed before all network events sorted in time order.

Workaround: Use the Events view to see interleaved network and log events.

When a large PCAP is extracted from the Events view, if it times out after 5 minutes, the query time is displayed as 8 hours in the Jobs tray error message

Tracking Number: ASOC-60464

Problem: When exporting a PCAP with ~100000 sessions from the Events view using Export > Export All PCAP, the download may fail due to the 5-minute packets call timeout. If the call times out, the error message in the Jobs tray incorrectly displays the timeout as 8 hours (28800000 ms).

Workaround: None.

Users who have not been assigned investigate-server* permission do not get the proper error message explaining why they don't have access to the Event Analysis view

Tracking Number: ASOC-60366

Problem: If the administrator has not assigned investigate-server* permission for a user, the user should see the permission denied error when attempting to view a session in the Event Analysis view. Instead, the internal server error is returned.

Workaround: None.

Active Directory meta values in the Event Analysis view, such as username, may have context data available, but the meta values are not underlined as an indicator

Tracking Number: ASOC-58853

Problem: Analysts working in the Event Analysis view will not see an indicator that active directory metadata has context enrichment; they must hover the mouse over an active directory meta value to determine if it has associated context and open the Context Lookup panel.

Workaround: Hover over or select a meta value and click the **View Context** button to determine if it has associated context for Active Directory.

If the URL for a drill point is very long and you use the query in the Event Analysis view, an error (414 Request error) is returned

Tracking Number: ASOC-50196

Problem: Several situations create a very long query that the browser cannot handle, especially if you are using Internet Explorer, which has a much lower character limit than most browsers. Pivoting to Event Analysis from Reporting can result in a very long query, and a number of pivots in the Navigate view can create a very long query.

Workaround: Continue to work in the Navigate view or Events view when the URL becomes too long to render in the Event Analysis view.

The query builder in the Event Analysis view is unresponsive for filters that contain a space

Tracking Number: ASOC-49427

Problem: When adding a filter, if you add an extra space before <meta key>, between <meta key> and <operator>, and after <operator>, the query builder becomes unresponsive and the Query Events button is disabled so that you cannot continue adding filters.

Workaround: Click on an existing filter, and then click the query builder. If that does not work, refresh the page.

Custom Feeds

The status of STIX feed progress bar is incomplete

Tracking Number: ASOC-40642

Problem: Sometimes, the status of the progress bar for some of the STIX feeds are incomplete even if the feeds are successfully pushed to the Decoder(s).

Workaround: None.

Event Stream Analysis (ESA)

ESA CH rules get disabled during upgrade or ESA host reboot

Tracking Number: ASOC-60511

Problem: If the ESA host restarts and Context Hub rules are deployed on ESA, the Context Hub rules may be disabled. This happens as a result of a race condition between the Context hub and Event Stream Analysis services startup order on the ESA host.

Workaround: To resolve this issue, do one of the following:

- Go to the **CONFIGURE > ESA Rules > Services** tab and enable the disabled rules that are dependent on Context Hub.
- Restart the Event Stream Analysis service.

ESA Rules with custom meta do not deploy on the ESA Server

Tracking Number: ASOC-60367

Problem: If you add new custom meta keys in 11.2, ESA rules using those meta keys may not deploy. This happens because the Event Stream Analysis service needs information from the Concentrator.

Workaround: To deploy an ESA Correlation Rule with custom meta, do the following:

1. Add the non-standard keys to the index-concentrator-custom.xml file (ADMIN > Services > Select a Concentrator and then select Actions > View > Config > Files tab).
2. Restart the Concentrator (ADMIN > Services > Select a Concentrator and then select Actions > Restart).
3. Ensure that the Concentrator is configured as a data source for the Event Stream Analysis service (ADMIN > Services > Select the Event Stream Analysis service and then select Actions > View > Config > Data Sources tab).
4. Restart the Event Stream Analysis service (Actions > Restart).
5. Ensure that the new meta keys are listed in the Meta Key References (CONFIGURE > ESA Rules > Settings tab > Meta Key References).
6. Deploy the ESA Rule with custom meta.

Unable to deploy ESA rule with array meta in Enrichment

Tracking Number: ASOC-47584

Problem: If a user configures an In-Memory table as an Enrichment Source in ESA where a table column has type as string, creates an ESA rule with a whitelist condition, and maps the string list column to a string array event meta key, when the rule is deployed, the rule is disabled as the datatype conversion from String[] to String is not allowed.

Workaround: None.

For ESA rules that use enrichment sources, the Ignore Case option does not work for first statement

Tracking Number: ASOC-49906

Problem: When creating an ESA rule that uses any enrichment source, if the Ignore Case option is enabled on the first enrichment statement, no results are returned. Note that this issue does not apply to any statements after the first statement (that is, substatements).

Workaround: When creating a new rule, the Ignore Case option is now disabled. For existing rules that have the Ignore Case option enabled for an enrichment statement, the option is still enabled but users will be prompted to disable the option when opening the rule in ESA and then save the updated rule.

Cannot set ESA compression level as in other appliances

Tracking Number: ASOC-26481

Problem: Administrators cannot set the compression level in ESA like they can with other appliances, even using the Explorer view.

Workaround: Delete the Concentrator source from ESA and add it again so that the compression level changes are reflected:

1. Remove the Concentrator data source from ESA. (Go to ADMIN > Services, select the Event Stream Analysis service, and from the actions menu select View > Config. On the Config view Data Sources tab, remove the Concentrator data source.)
2. Set compression level in ESA. (Go to the Explore view, and in the node list, navigate to Workflow/Source/nextgenAggregationSource and set the CompressionLevel.)
3. Add the Concentrator Data Source again to ESA. (Return to the Config view Data Sources tab and add the Concentrator data source.)

Event Stream Analysis service becomes unresponsive when using Query-based aggregation for automated threat detection for Logs

Tracking Number: ASOC-25174

Problem: Event Stream Analysis may become unresponsive due to heavy resource usage, and the configuration for the wrapper may need to be adjusted.

Workaround: You may need to change the ping time settings in the `wrapper.conf` file. Perform the following:

1. Go to **Administration > Services > Event Stream Analysis> Explorer** and navigate to the **`/opt/rsa/esa/conf/`**folder.
2. Change the settings to the following values:
   `wrapper.ping.timeout=300`
3. Add the following lines at the end of the file:
   `wrapper.restart.delay=40`
   `wrapper.ping.timeout.action=RESTART`
4. Restart the Event Stream Analysis service.

ESA Displays Warning For Array Operators

Tracking number: ASOC-14157

Problem: When writing an advanced rule, array operators, such as anyOf, fails. For example:

```
SELECT * FROM
Event(
alias_host.anyOf(i => i.length()>50)
);
```

results in an error similar to the following:

```
Logger name: com.espertech.esper.epl.enummethod.dot.PropertyExprEvaluatorScalarArray
Thread: pipeline-sessions-0
Level : WARN
Message : Expected array-type input from property 'alias_host' but received class java.util.Vector
```

Workaround: To do a fuzzy comparison, first convert the array to a string. For example:

SELECT * from Event **(cast(alias_host, string)**LIKE '%TESTHOST%');

> **Note:** If you used array operators in EPL developed in versions 10.5, 10.5.0.1, and 10.6, you will need to modify the EPL to use the above workaround.

Deployment fails if the server that hosts an external database goes down

Tracking Number: ASOC-9011

Problem: You configure a database connection to use the database as an enrichment source for a rule. A reference to the database is deployed on every ESA, even if the ESA does not deploy any rules that use the database. If the server that hosts the database goes down, any new deployment will fail.

Workaround: Restart the server that hosts the database.

Reporting

Hide and Investigate options are not supported in Google Chrome and Mozilla Firefox browsers on Windows 10 operating system

Tracking Number: ASOC-37590

Problem: If you are using Chrome or Firefox browsers on a Windows 10 operating system, and click on a chart data point, the hide and investigate options are not displayed. However, these options are available using the Internet Explorer browser.

Workaround: Disable the touch feature on Chrome and Firefox browsers. To disable this option in Chrome use the following procedure:

1. Navigate to - chrome://flags/ on Chrome or Firefox Browser.
2. Select the "Disable" option for "Touch Events API" flag.
3. Relaunch the browser.

To disable this option in Firefox, use the following procedure:

1. Navigate to - "about:config".
2. Click "I accept the risk".
3. Search for the "Preference Name" - "dom.w3c_touch_events.enabled".
4. Update the "Value" column to 0.
5. Relaunch the browser.

Event Source Management

The Manage Parser Mappings window has an empty Display Name for Log Parsers if the Event Source was created manually

Tracking Number: ASOC-53914

Problem: When you open the Manage Parser Mappings window from the ADMIN > Event Sources > Discovery view, the display name for mapped event sources is empty for event sources that were created manually.

Workaround: Close the mapping window and re-open it.

Not all types are displayed for auto mapped addresses

Tracking Number: ASOC-48328

Problem: If a new application is added on an existing event source that is auto-mapped, there could be a delay in when that type shows in the Event Source Discovery view, and before it no longer shows up as auto mapped.

Workaround: None.

SMS Service crashes with Out of Memory Error

Tracking Number: ASOC-62575

Problem: On systems with a large number of active event sources, when the system cannot keep up with the processing of log statistics messages, the SMS service can crash with a **java.lang.OutOfMemoryError: Java heap space** error.

Workaround: If you experience this issue, please contact RSA support for details on how to address the issue.

Core Services

The SSL FIPS Mode checkbox in the Services Config view should be disabled for Brokers, Concentrators, and Archivers, because changing the checkbox value does not turn off FIPS enforcement for the service

Tracking Number: ASOC-41902

Problem: In 11.0.0.x or later, the Broker, Concentrator, and Archiver are always FIPS enforced and the administrator does not have the option to toggle between FIPS and Non-FIPS. The admin can use the SSL FIPS Mode checkbox to toggle FIPS mode on and off on a Log Decoder, Packet Decoder, or Log Collector.

Workaround: None.

Custom Feed configuration- Advanced Option XML file invalid error for multi metacallback

Tracking Number: ASOC-40867

Problem: NetWitness Platform does not support uploading feeds for the XMLs where there are more than one callback.

Workaround: The ad hoc Feed can be uploaded using NwConsole or the REST URL of the Decoder directly. This is not applicable for Recurring Feed.

Product Documentation

Contents

Introduction

This document describes RSA® NetWitness Log Parser Tool, Version 1.1. RSA recommends reading this document before installing and using the NetWitness Log Parser Tool.

Product Description

The RSA NetWitness Log Parser Tool (NwLPT) enables content users to build and modify NetWitness log parsers in an offline environment without affecting NetWitness. The Log Parser Tool enables analysts to create custom parsers for critical or custom sources in their environment that are not currently parsed in NetWitness.

The NetWitness Log Parser Tool enables you to create a new log parser or customize an existing log parser with a simplified User interface.

Product Documentation

The following documentation is provided with this release.

Document	Location
RSA® NetWitness Log Parser Tool User Guide 1.1	https://community.rsa.com/docs/DOC-85016

Installation

Installation Instructions for New Users

You can install the RSA NetWitness Log Parser Tool standalone on a Microsoft Windows or MacOS computer. Download the Windows and MacOS versions of the NetWitness Log Parser Tool from the following location and running the installer locally on your computer:

https://community.rsa.com/docs/DOC-85202

If you are using an older version of the tool, uninstall the previous version and then install this version.

What's New

RSA NetWitness Log Parser Tool 1.1 includes the following new features:

Log Parser Customization

Log Parsers can be customized by adding new parser elements or modifying existing elements. On customization, you can save it as a separate custom parser file, such that the base parser can be updated independently and customizations can be applied on top of it.

VALUEMAPS are Editable

You can now edit, insert or delete VALUEMAPS.

New TAB Delimiter in TAGVALUE

A new delimiter **TAB** is introduced to enable easy parsing of event logs using the **<TAGVAL>** format. You must enter "TAB" in the **TAGVALUE** field.

Retaining Comments

The comments in the parser XML file is now retained, in case they are written by content authors to add additional coding context.

Retaining Parser Rules

The Dynamic Parsing technology introduced in 11.1 allows Parser Rules to be added to parsers. All the existing parser rules are retained by the tool.

Version 1.0 features

RSA NetWitness Log Parser Tool 1.0 includes the following features:

Periodic Saving

All parsers opened in the tool are auto-saved to a temporary location at an interval of 30 seconds. The last saved time is displayed on the top right section of the tool.

Cloning Headers and Messages

All defined Headers and Messages can now be cloned. This allows easy parser development for cases where a similar pattern is needed for a Message or Headers.

Resizing Message ID and Message Group

Message IDs and Message Groups can be of different sizes, which allows resizing them as needed.

Validation Checks for Headers and Messages

Multiple validation checks have been added to ensure the parser follows the right syntax and best practices. For example, an empty Header ID is not allowed, only 1 MessageID allowed per Header definition, creation of messages is not allowed unless the MessageID and Payload are defined.

Parser can be Exported as a Live Resource

The parser can be exported in a format that can be consumed by the Live Service in NetWitness. This allows easy deployment of parsers on multiple Log Decoders simultaneously.

Improved MessageID Concatenation Box

The MessageID concatenation box has been improved to add Literals and Meta keys easily.

Usability and User Experience Improvements

Several updates have been made to improve the overall user experience.

- Create Header/Create Message buttons are enabled based on work flow.
- Improved Event Category and Device Class selection.
- Landing Page now points to the parser and the logs directly.
- Allow changing the log file.
- Display log file name and path.

Graceful Error Handling

- Error/Exception handling added to multiple parts of the tool.
- Appropriate user readable error messages are displayed. For example, read-only files cannot be edited, you cannot open a non-compliant parser.

Redesigned Workflow to Create Headers and Messages

- Dedicated context options are added to create MessageIds, Payload, and Payload Rewinds.
- Improved the overall work flow to create Headers and Messages in a step-by-step format and direct user to the next step.

Loading Latest Table Map/Table Map Custom Through Log Parser Tool

Allow loading the latest Table Map available in Live, or uploading Custom Table Maps applicable to the customer's environment through the Log Parser tool.

Redesigned Login Work Flow

The Login work flow now allows either creation of a new parser, or modifying an existing parser with one step to add all required fields to create or edit a parser.

Context Menu to Perform Operations on Headers and Messages

Added Context Menu with shortcuts to perform regular operations such as Reorder, Delete, and Duplicate Headers and Messages.

Removed All Obsolete enVision Functionality

Loading an existing parser now removes enVision-specific functionality arguments, such as **tableid**, **parsedef**, **level**, **summary**, **sumdata**, and so on.

Fixed Issues

This section lists issues fixed in RSA NetWitness Log Parser Tool 1.1 since the last major release.

Tracking Number	Description
SACE-8689	When you create new literals or variables and save them, they are replaced with underscores.
SACE-8712	When new parsers are created, the event category is saved in the scientific format in the parser XML file. This prevents the parser from successfully parsing the messages resulting in "unknown" messages.
SACE-8840	If you areusing an older version of Intel driver on Windows 10 and update it to version 22.20.16.4836, the File Menu is missing.

Known Issues

This section describes issues that remain unresolved in the version 1.1. Wherever a workaround or fix is available, it is noted or referenced in detail.

Description: Log Parser Tool does not launch the application after installation

Tracking Number: ASOC-46707

Workaround: You can search for the Log Parser Tool in the Start menu and run the application.

Version 1.0 Known Issues

Description: Close icon is not visible in the Parser tab on a MacOS machine.

Tracking Number: ASOC-45687

Workarounds: From the main menu, select **File > Close**.

You can use the following shortcut keys to exit from the Parser tab:

- Windows: **CTRL+W**
- MacOS: **CMD+W**

Description: In Windows 10, the header and message section cannot be moved.

Tracking Number: ASOC-45675

Workaround: None.

Description: Does not work on Windows Server 2008 VMs that do not have a video card backend.

Tracking Number: ASOC-23434

Workaround: None.

Description: Sometimes Payload Rewind rectangle periodically overlaps at the end of a header on MacOS.

Tracking Number: None.

Workaround: None.

Description: Vertical scrolling of events in the Log Data section may not be smooth when you are using the Tools scroll bar.

Tracking Number: ASOC-17707

Workaround: Use your mouse to scroll in the Log Data section.

Description: *Invalid empty Header/Message node is created when Header or Message is deleted from the Detail View*.

Tracking Number: ASOC-32031

Workaround: This is a user interface issue only. Click on a different Header/Message, then click on the invalid Header/Message to get rid of the empty Header/Message node.

Description: Log Parser Tool dialog box text may overflow if the Display is set to Medium (125%) or Larger (150%) on a Windows System".

Tracking Number: None.

Workaround: Follow the steps below.

1. Click **Start** button in Windows.
2. Select **Control Panel**.
3. Click **Appearance and Personalization**.
4. Click on **Display**.
   A page opens that displays three radio buttons: **Smaller**, **Medium**, and **Larger**.
5. Select the **Smaller** radio button to reduce the size of the text and click **Apply**.
6. Restart your computer for the change to take effect.

Contacting Customer Care

When you contact Customer Care, you should be at your computer. Be prepared to give the following information:

- The version number of the RSA NetWitness Suite product or application you are using.
- The type of hardware you are using.

Use the following contact information if you have any questions or need assistance.

Contents

Introduction

The instructions in this guide apply to physical hosts exclusively. See the RSA *NetWitness Platform Virtual Host Installation Guide* for instructions on how to set up virtual hosts in 11.2.

Supported Hardware

Series 4, Series 4S, and Series 5.

Refer to the RSA *NetWitness Platform* Hardware Setup Guides for detailed information on each series type (https://community.rsa.com/community/products/netwitness/hardware-setup-guides).

Endpoint Hybrid or Endpoint Log Hybrid Host Hardware Specifications

You must install the new Endpoint Hybrid host or Endpoint Log Hybrid host on the Series 5 (Dell R730) hardware or Series 6 (Dell R740 hardware. See "(Optional) Task 2 - Install Endpoint Hybrid or Endpoint Log Hybrid" in Post Installation Tasks for instructions on how to install Endpoint Hybrid and Endpoint Log Hybrid.

RSA NetWitness UEBA Host Hardware Specifications

You must install the new NetWitness UEBA host on the S5 (Dell R630 appliance) hardware. See "(Optional) Task 3 - Install NetWitness UEBA" in Post Installation Tasks for instructions on how to install NetWitness UEBA.

SERIES 5 (DELL R630) SPECIFICATIONS

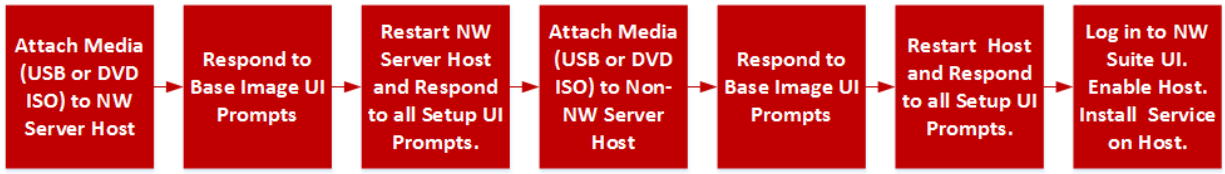
Specification	Capacity
Model	Dell PowerEdge R630xl
Processor Type	Intel Xeon E5 -2680v3
Processor Speed Cache Number of Cores Number of Processors Number of Threads	2.5 GHz 30MB 12 2 24
Total Memory	256GB
Internal Disk Controller	Dell PERC H730
External Disk Controller	Dell PERC H830
SAN Connectivity (HBA) - Optional	N/A

Specification	Capacity
Remote Management Card	iDRAC8 Enterprise
Drives	Total - 6 Drives 2 x 1TB, 2.5" HDD 4 x 2TB, 2.5" HDD
Chassis	1U
Weight	18.4 kg (40.5 lbs)
NIC Card*	On Board 2 x 10 Gb Copper 2 x 10 Gb & 2 x 1Gb Copper (Other options are available)
Dimensions	H: 4.28 cm (1.68 in.) x W: 48.23 cm (18.98 in.) x D: 75.51 cm (29.72 in.)
Power	1100W Redundant
BTU/hr	4100 BTU/hr (max)
Amps (Spec)	1100W / 220VAC = 5A
Actual Amp Draw (Post Startup)	2.1 Amps
Events Per Second (EPS)	100K EPS
Throughput	N/A

* NIC Card options are available for swap with on-board daughter card or add on.

Physical Host Installation Workflow

The following diagram illustrates the RSA NetWitness® Platform 11.2 Physical Host Installation workflow.



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Platform 11.2.

Installation Preparation - Open Firewall Ports

The"Network Architecture and Ports" topic in the *RSA NetWitness® Platform Deployment Guide* lists all the ports in a deployment. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

Installation Tasks

This topic contains the tasks you must complete to install NetWitness Platform 11.2 on physical hosts.

There are two main tasks that you must complete in the order shown.

Task 1 - Install 11.2 on the NetWitness Server (NW Server) Host

Task 2 - Install 11.2 on All Other Component Hosts

Task 1 - Install 11.2 on the NetWitness Server (NW Server) Host

For the NW Server, this task:

- Creates a base image.
- Sets up the 11.2 NW Server host.

Complete the following steps to install the 11.2 NW Server host.

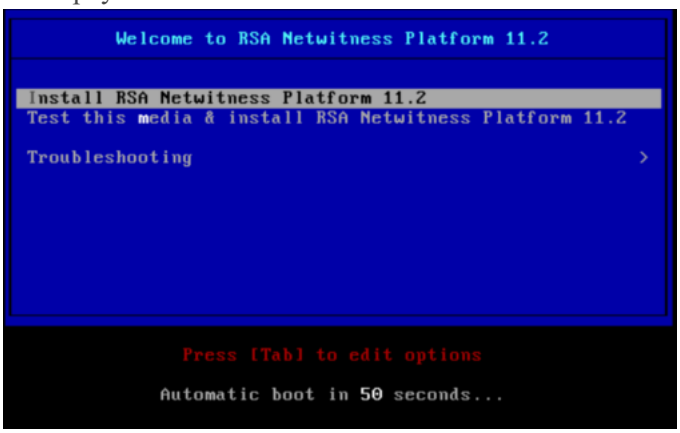
1. Create a base image on the host:
   a. Attach media (ISO) to the host.
   See the *RSA NetWitness Platform Build Stick Instructions* for more information.
      - Hypervisor installations - use the ISO image.
      - Physical media - use the ISO to create bootable flash drive media using the Universal Netboot Installer (UNetbootin) or another suitable imaging tool. See the *RSA NetWitness® PlatformBuild Stick Instructions* for information on how to create a build stick from the ISO. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.

   b. Log in to the host and reboot it.

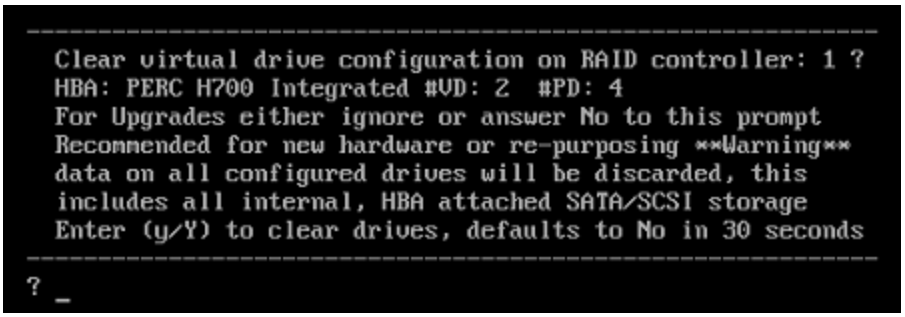
```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```

   c. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to RSA NetWitness Platform 11.2** installation menu is displayed. The menu graphics will render differently if you

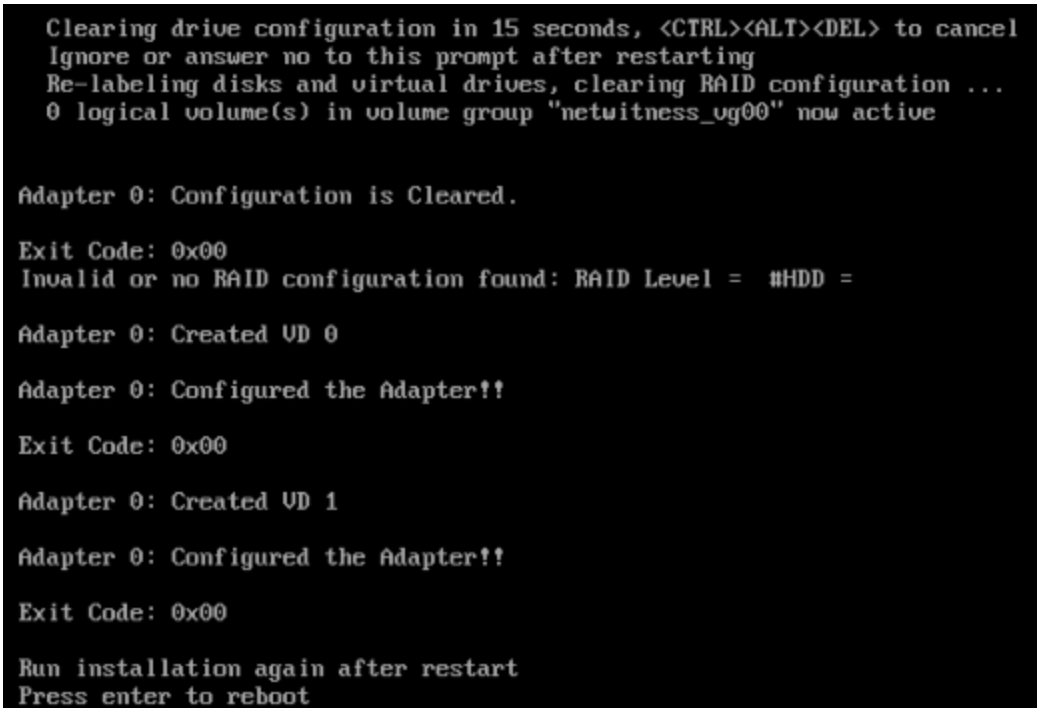
use a physical USB flash media.



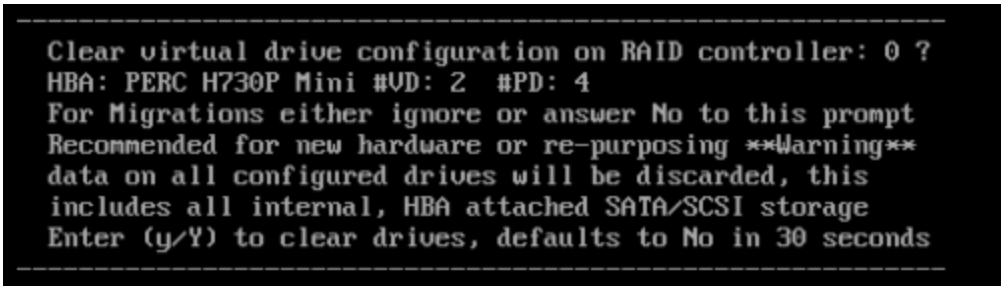
d. Select **Install RSA Netwitness Platform 11.2** (default selection) and press **Enter**.
The Installation program runs and stops at the **Enter (y/Y) to clear drives** prompt that asks you to format the drives.



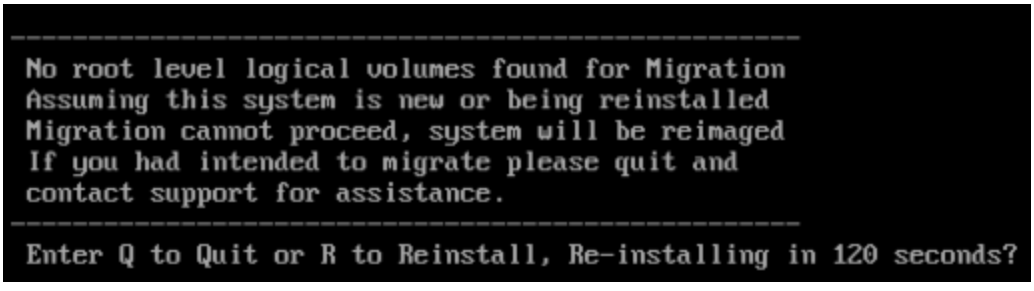
e. Type **Y** to continue.
The default action is No, so if you ignore the prompt and it will select No in 30 seconds and will not clear the drives. The **Press enter to reboot** prompt is displayed.



f. Press **Enter** to reboot the host.
The Installation program asks you to clear the drives again.



g. Type **N** because you already cleared the drives.
The **Enter Q (Quit) or R (Reinstall)** prompt is displayed.



h. Type **R** to install the base image.
The installation program displays the components as they are installed, which varies depending on the appliance, and reboots.

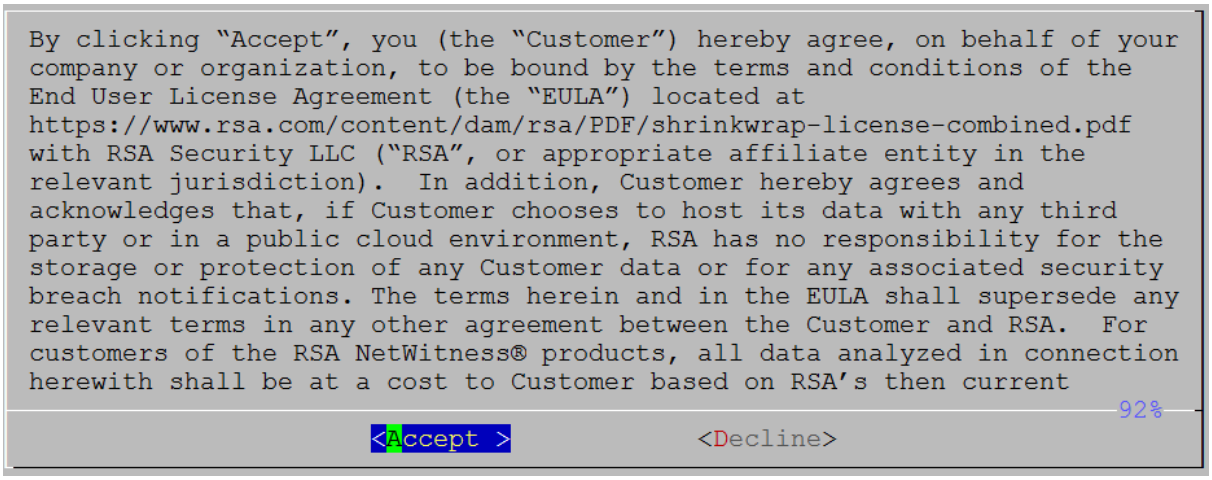
Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).

i. Log in to the host with the `root` credentials.

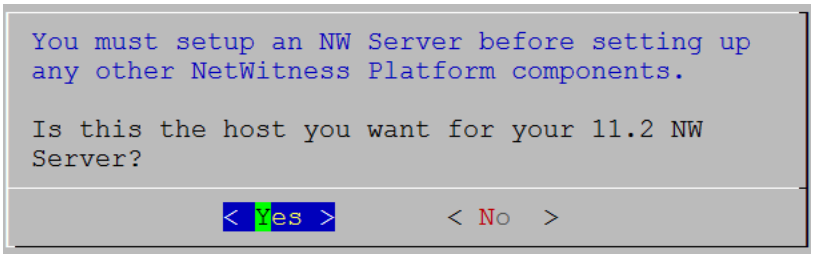
2. Run the `nwsetup-tui` command to set up the host.

This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use the Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "(Optional) Task 1 - Re-Configure DNS Servers Post 11.2" in Post Installation Tasks.
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



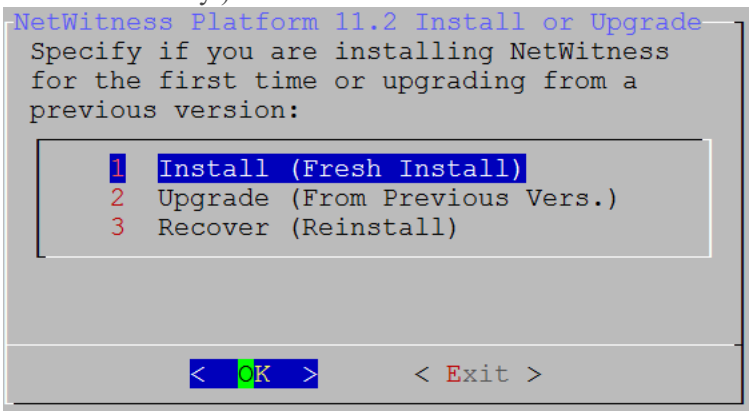
3. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.2 NW Server** prompt is displayed.



4. Tab to **Yes** and press **Enter**.
   Choose **No** if you already installed 11.2 on the NW Server.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program and complete (steps 2 -14) to correct this error.

   The **Install or Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.2 Disater Recovery.).



5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **Host Name** prompt is displayed.

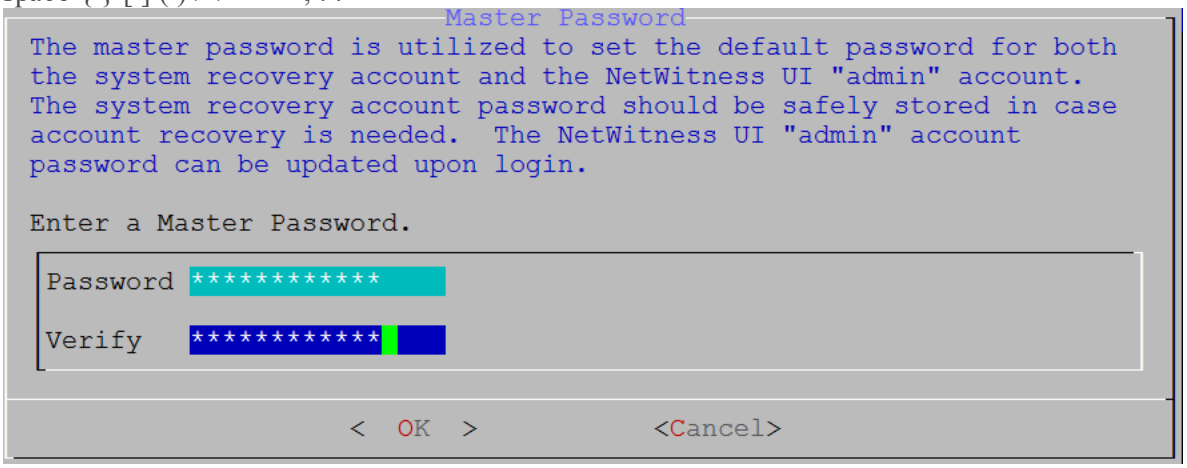
   Caution: If you include "." in a host name, the host name must also include a valid domain name.

   The **Master Password** prompt is displayed.

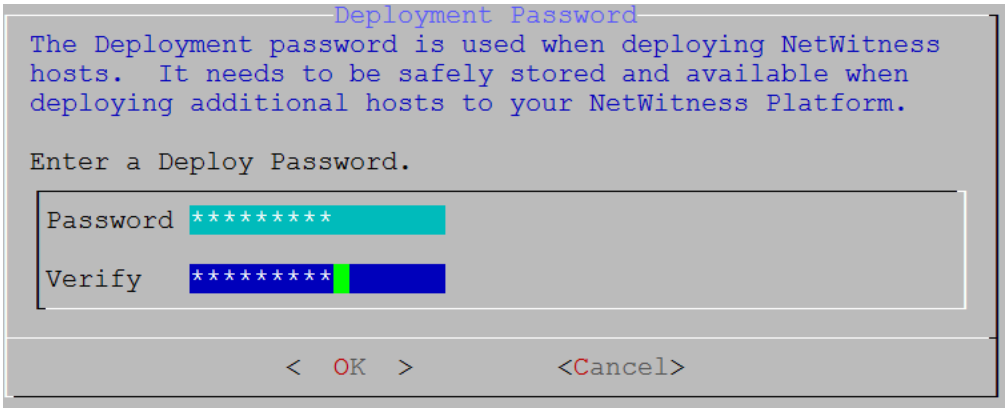
6. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols : ! @ # % ^ +
   - Numbers : 0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

   No ambiguous characters are supported for Master Password and Deployment Password. For example:
   space { } [ ] ( ) / \ ' " ` ~ ; : . < > -



7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   The **Deployment Password** prompt is displayed.



8. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. One of the following conditional prompts is displayed.

   - If the Setup program finds a valid IP address for this host, the following prompt is displayed.

     
     Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.

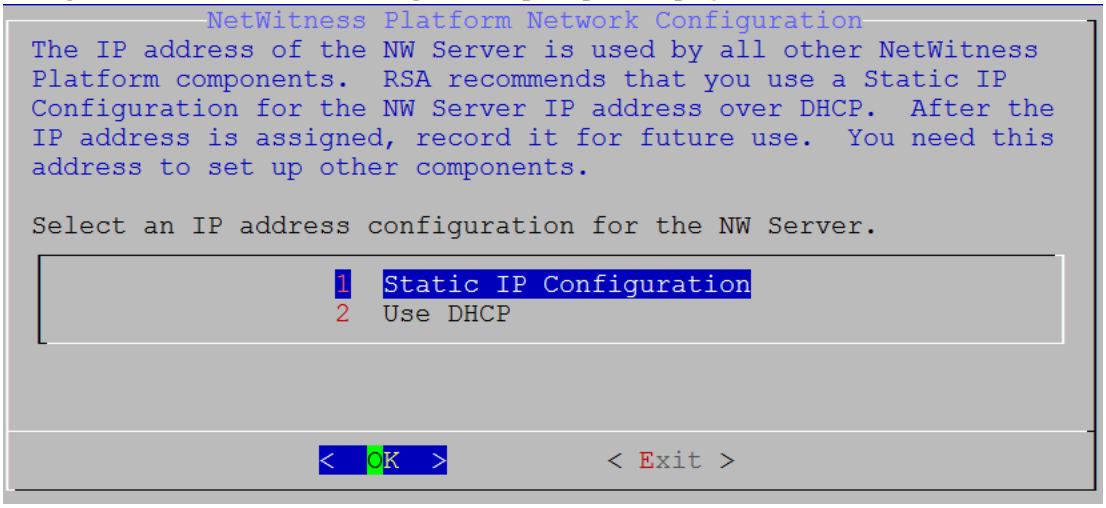
   - If you are using an SSH connection, the following warning is displayed.

     Note: If you connect directly from the host console, the following warning will not be displayed.

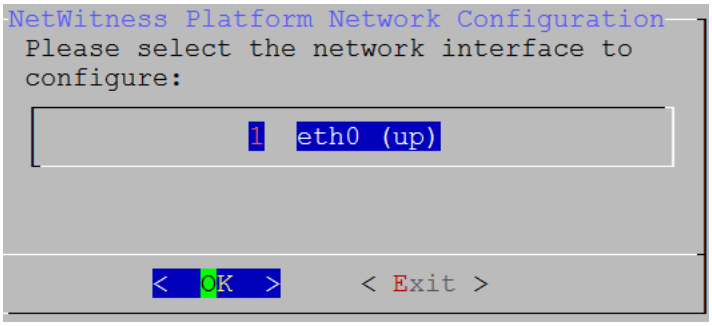
     
     Press **Enter** to close warning prompt.

   - If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 12 to and complete the installation.

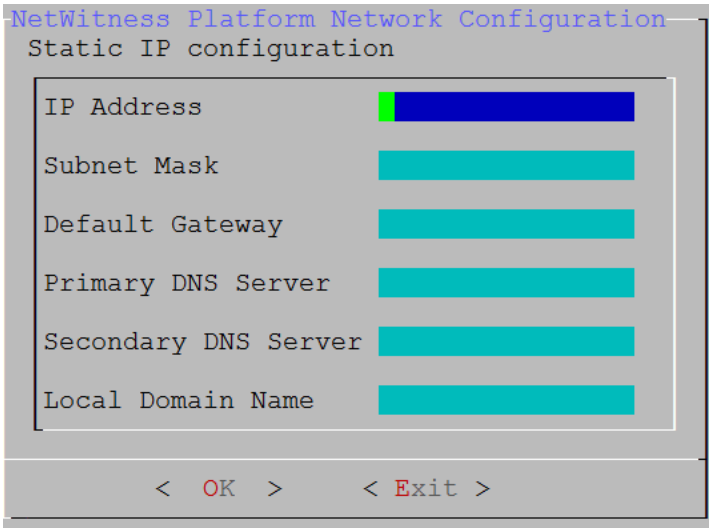
   - If the Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

9. Tab to **OK** and press **Enter** to use **Static IP**.
   If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
   The **Network Configuration** prompt is displayed.



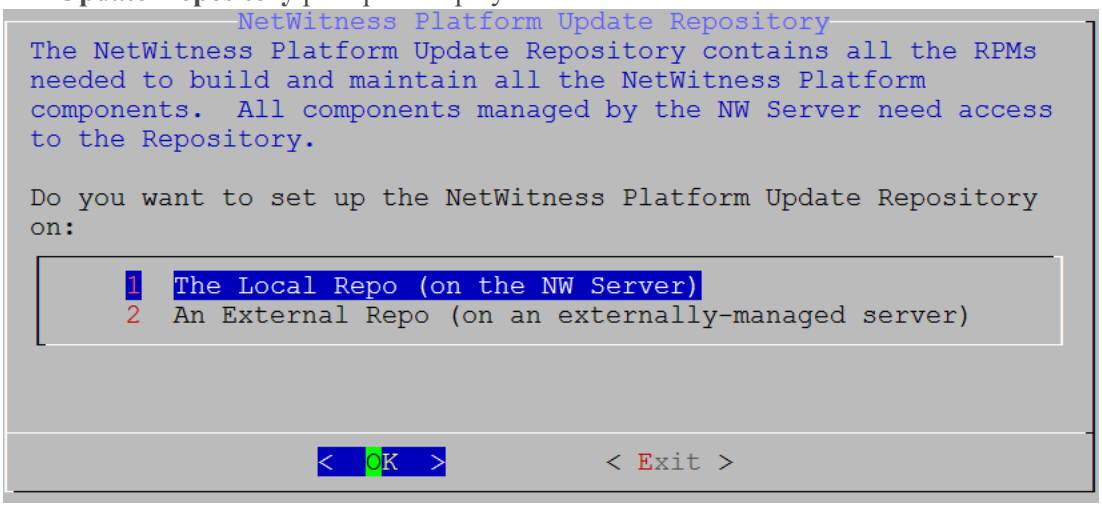
10. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit.**
    The following **Static IP Configuration** prompt is displayed.



11. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

The **Update Repository** prompt is displayed.



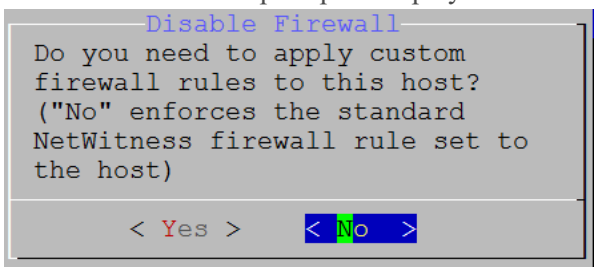
12. Press **Enter** to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**.

    - If you select **1 The Local Repo (on the NW Server)** in the Setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness Platform 11.2.0.0. If the program cannot find the attached media, you receive the following prompt.

    - If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to Appendix B. Create an External Repository for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

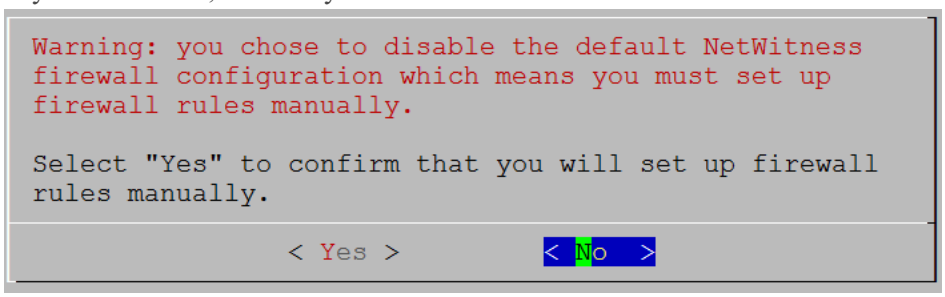
      Enter the base URL of the NetWitness Platform external repo and click **OK.** The **Start Install** prompt is displayed.
      See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

The Disable firewall prompt is displayed.

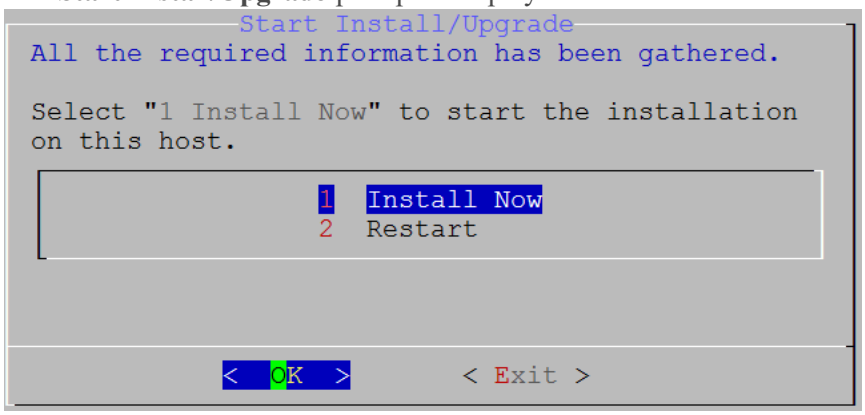


13. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

- If you select **Yes**, confirm your selection or **No** to use the standard firewall configuration.

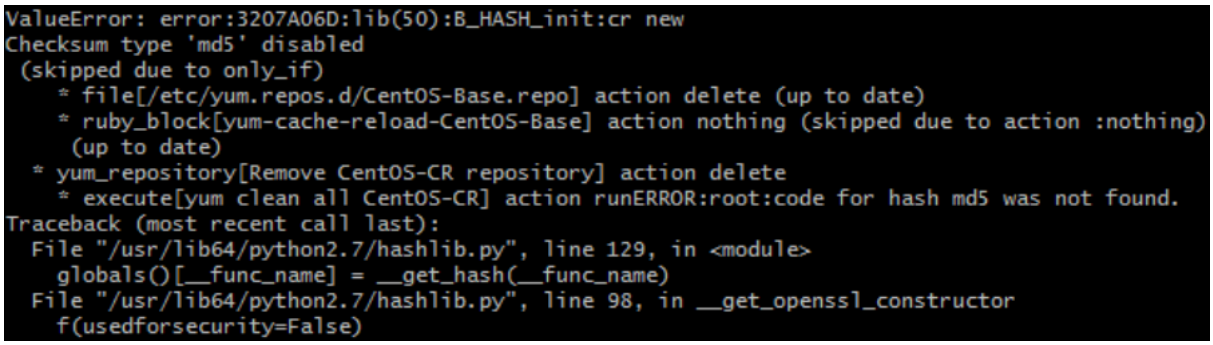


The **Start Install/Upgrade** prompt is displayed.



14. Press **Enter** to install 11.2 on the NW Server.
    When **Installation complete** is displayed, you have installed the 11.2 NW Server on this host.

    Note: Ignore the hash code errors similar to the errors shown in the following figure that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



Task 2 - Install 11.2 on Other Component Hosts

For a non-NW Server host this task:

- Creates a base image.
- Sets up the 11.2 non-NW Server host.

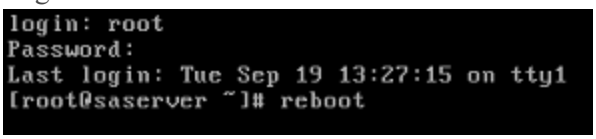
For ESA hosts:

- Install your primary ESA host and install the **ESA Primary** service on it after you finish the Set Up program in the UI on the **ADMIN > Hosts** view.
- (Conditional) If you have a secondary ESA host, install it and install the **ESA Secondary** service on it after you finish the Set Up program in the UI on the **ADMIN > Hosts** view.

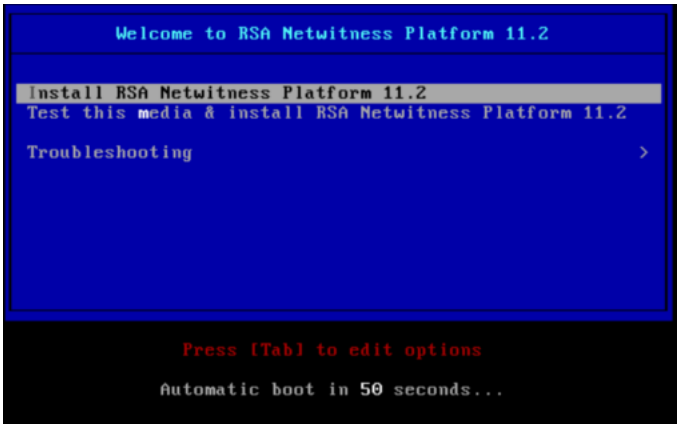
Complete the following steps to install NetWitness Platform 11.2 on a non-NW Server host.

1. Create a base image on the host:
   a. Attach media (media that contains the ISO file, for example a build stick) to the host.
   See the *RSA NetWitness Platform Build Stick Instructions* for more information.
      - Hypervisor installs - use the ISO image.
      - Physical media - use the ISO file to create bootable flash drive media using the Universal Netboot Installer (UNetbootin) or another suitable imaging tool. See the *RSA NetWitness® Platform Build Stick Instructions* for information on how to create a build stick from the ISO file. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.

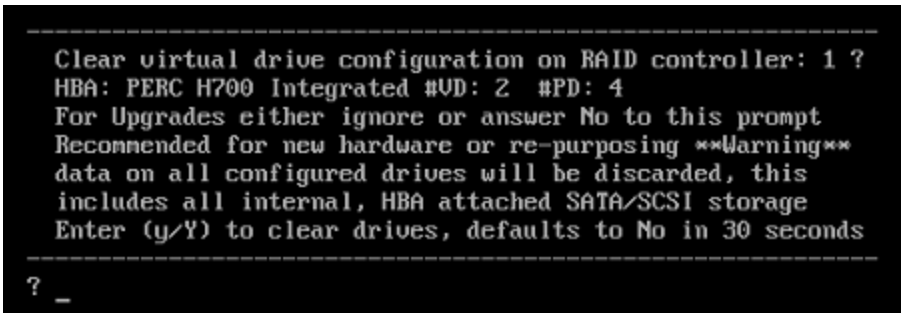
      See the *RSA NetWitness Platform Build Stick Instructions* for more information.
   b. Log in to the host and reboot it.



c. Select **F11** (boot menu) during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to RSA NetWitness Platform 11.2** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.



d. Select **Install RSA Netwitness Platform 11.2** (default selection) and press **Enter**.
The Installation program runs and stops at the **Enter (y/Y) to clear drives** prompt that asks you to format the drives.



e. Type **Y** to continue.
The default action is No, so if you ignore the prompt and it will select No in 30 seconds and will not clear the drives. The **Press enter to reboot** prompt is displayed.

```
  Clearing drive configuration in 15 seconds, <CTRL><ALT><DEL> to cancel
  Ignore or answer no to this prompt after restarting
  Re-labeling disks and virtual drives, clearing RAID configuration ...
  0 logical volume(s) in volume group "netwitness_vg00" now active

Adapter 0: Configuration is Cleared.

Exit Code: 0x00
Invalid or no RAID configuration found: RAID Level =  #HDD =

Adapter 0: Created VD 0

Adapter 0: Configured the Adapter!!

Exit Code: 0x00

Adapter 0: Created VD 1

Adapter 0: Configured the Adapter!!

Exit Code: 0x00

Run installation again after restart
Press enter to reboot
```

f. Press **Enter** to reboot the host.
The Installation program asks you to clear the drives again.

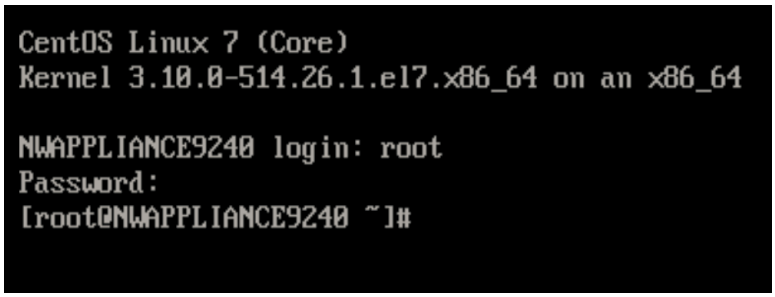
```
------------------------------------------------------------
  Clear virtual drive configuration on RAID controller: 0 ?
  HBA: PERC H730P Mini #VD: 2  #PD: 4
  For Migrations either ignore or answer No to this prompt
  Recommended for new hardware or re-purposing **Warning**
  data on all configured drives will be discarded, this
  includes all internal, HBA attached SATA/SCSI storage
  Enter (y/Y) to clear drives, defaults to No in 30 seconds
------------------------------------------------------------
```

g. Type **N** because you already cleared the drives.
The **Enter Q (Quit) or R (Reinstall)** prompt is displayed.

```
------------------------------------------------
No root level logical volumes found for Migration
Assuming this system is new or being reinstalled
Migration cannot proceed, system will be reimaged
If you had intended to migrate please quit and
contact support for assistance.
------------------------------------------------
Enter Q to Quit or R to Reinstall, Re-installing in 120 seconds?
```

h. Type **R** to install the base image.
The installation program displays the components as they are installed, which varies depending on the appliance, and reboots.

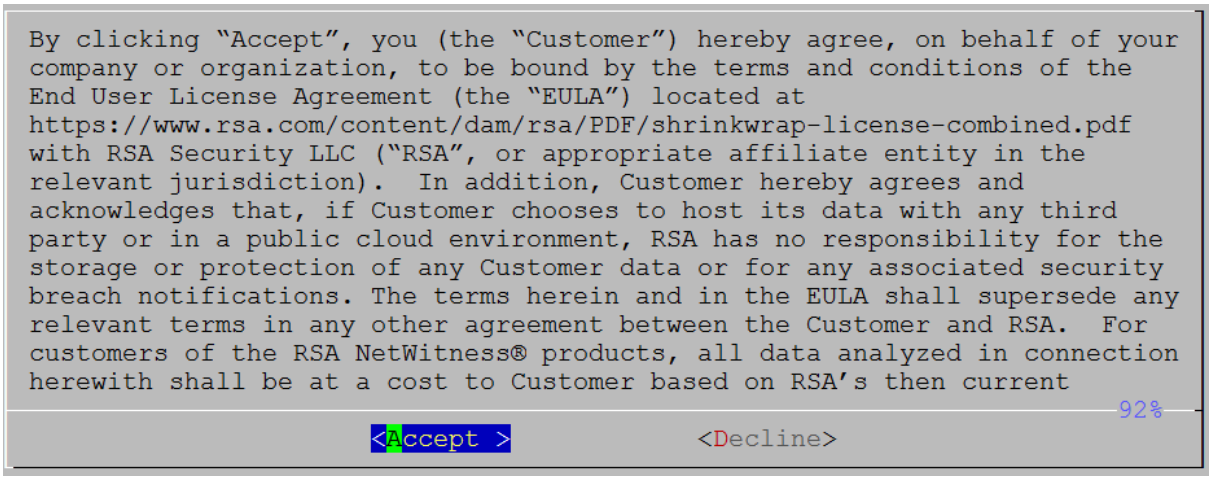
Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).



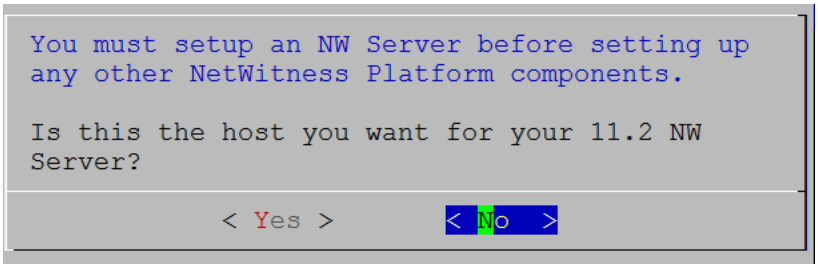
i. Log in to the host with the `root` credentials.

2. Run the `nwsetup-tui` command to set up the host..
This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

Note: If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach a DNS server after setup that is unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see "(Optional) Task 1 - Re-Configure DNS Servers Post 11.2" in Post Installation Tasks.
If you do not specify DNS servers during `nwsetup-tui`, you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 11 (the DNS servers are not defined so the system cannot access the external repo).

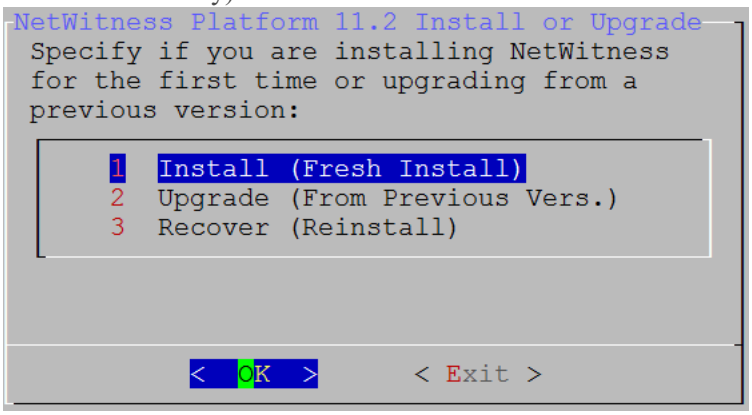


3. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.2 NW Server** prompt is displayed.

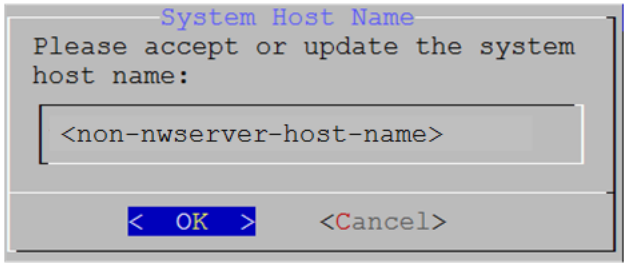


Caution: If you choose the wrong host for the NW Server and complete the installation, you must restart the step up program and complete (steps 2 - 14) of Task 1 - Install 11.2 on the NetWitness Server (NW Server) Host to correct this error.

4. Press **Enter** (No).
   The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.2 Disaster Recovery).



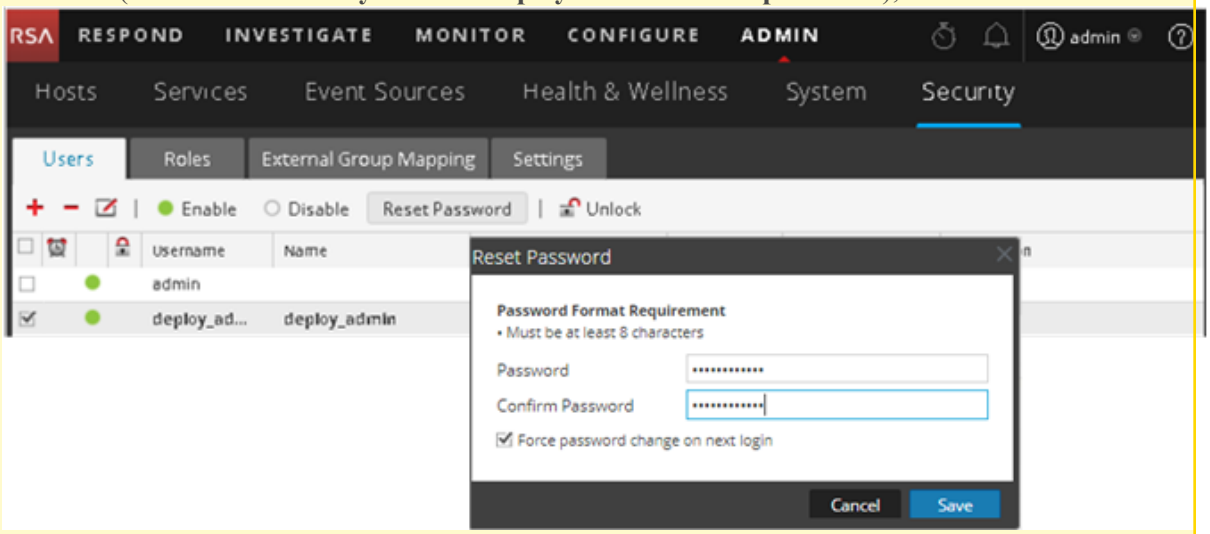
5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **Host Name** prompt is displayed.



Caution: If you include "." in a host name, the host name must also include a valid domain name.

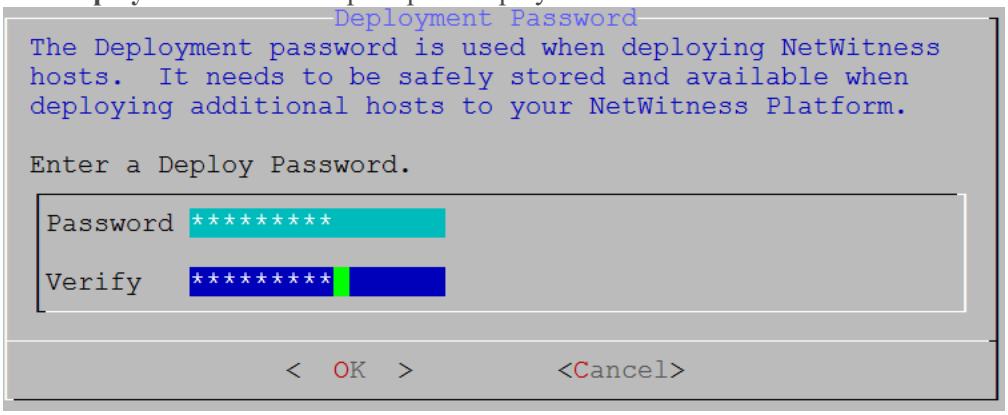
6. If want to keep this name, press **Enter**. If you want to change this name, edit it, tab to **OK**, and press **Enter**.
   The **Master Password** prompt is displayed.

Caution: If you change the **deploy_admin** user password in the NetWitness Platform User Interface (**ADMIN** > **Security** > Select **deploy-admin - Reset password**),



you must:
1. SSH to the NW Server host.
2. Run the `(/opt/rsa/saTools/bin/set-deploy-admin-password` script.
3. Use the new password when installing any new non-NW Server hosts.
4. Run `(/opt/rsa/saTools/bin/set-deploy-admin-password` script on all non-NW Server hosts in your deployment.
5. Write down the password because you may need to refer to it later in the installation.

The **Deployment Password** prompt is displayed.



Note: You must use the same deployment password that you used when you installed the NW Server.

7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

   - If the Setup program finds a valid IP address for this host, the following prompt is displayed.

     
     Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** If you want to change the IP configuration found on the host.

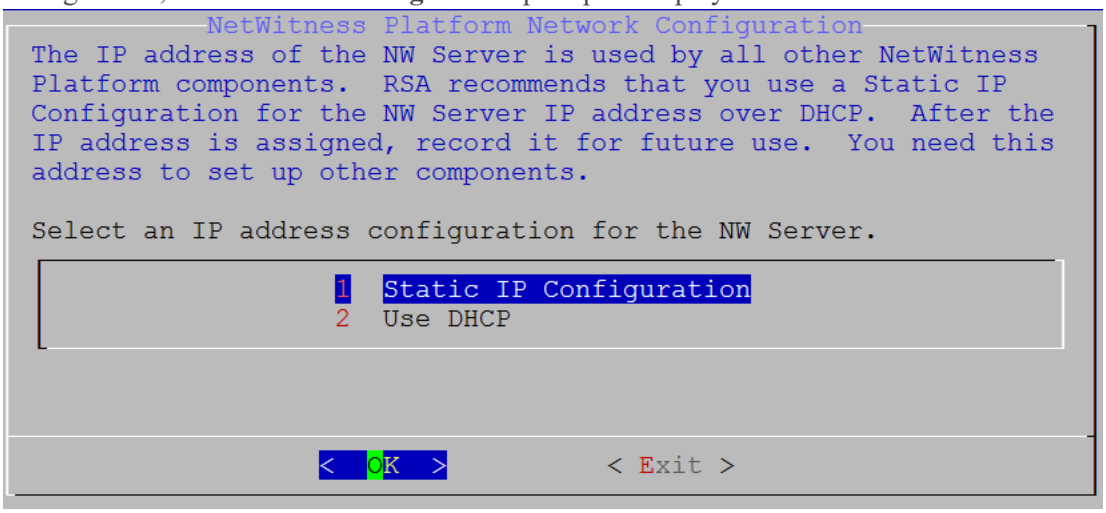
   - If you are using an SSH connection, the following warning is displayed.

     Note: If you connect directly from the host console, the following warning will not be displayed.

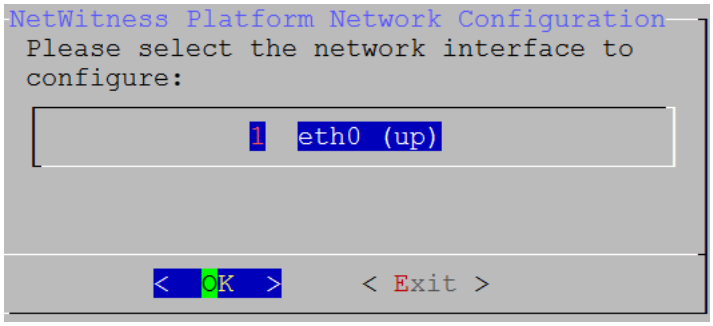
     
     Press **Enter** to close warning prompt.

   - If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 11 to and complete the installation.

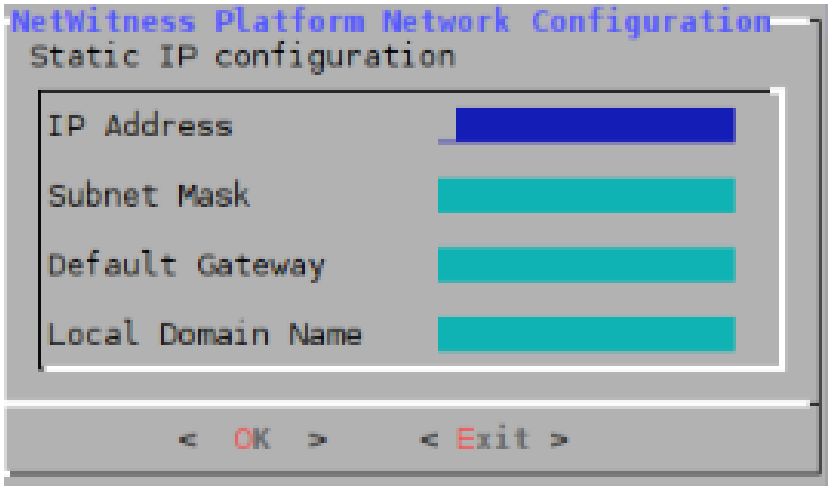
   - If the Setup Program could not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

8. Tab to **OK** and press **Enter** to use a **Static IP**.
   If you want to use DHCP, down arrow to **2 Use DHCP** and press **Enter**.
   The **Network Configuration** prompt is displayed.



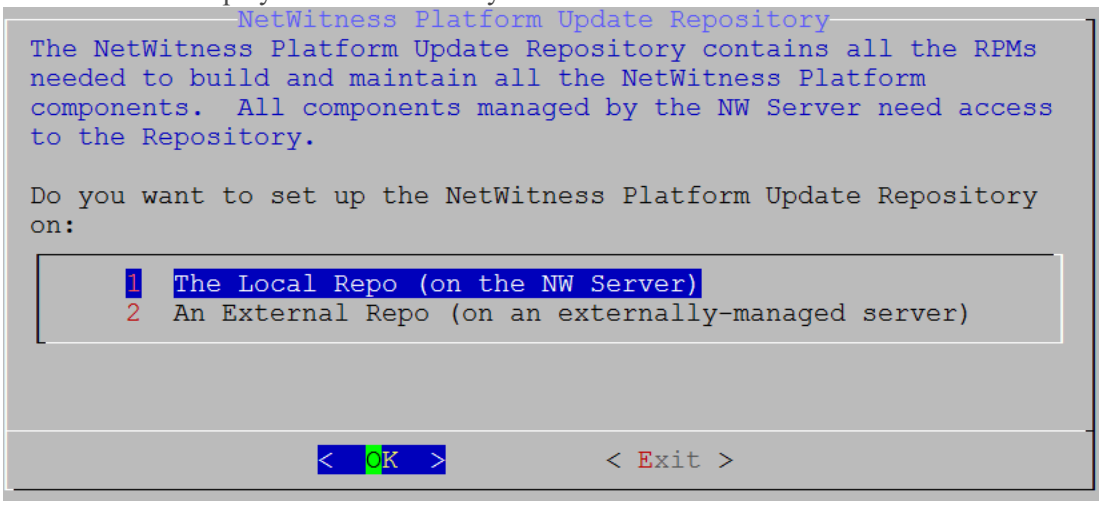
9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.
   The following **Static IP Configuration** prompt is displayed.



10. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**.
    If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required).
    If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

    The **Update Repository** prompt is displayed.
    Select the same repo you selected when you installed the NW Server Host for all hosts.

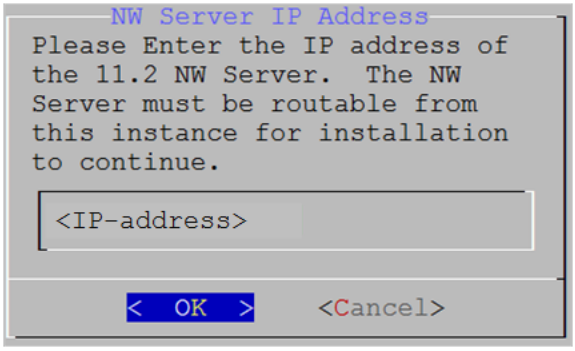


11. Press **Enter** to choose the **Local Repo** on the NW Server.
    If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**.

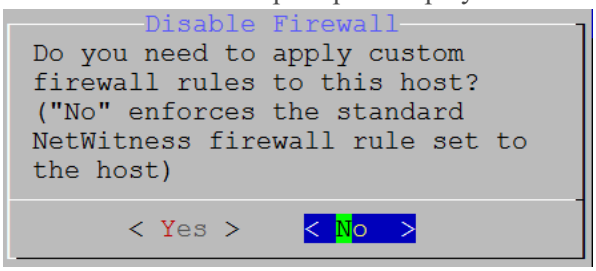
    - If you select **1 The Local Repo (on the NW Server)** in the setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness Platform 11.2.0.0.
    - If you select **2 An External Repo (a server managed externally - not on the NW Server)**, the UI prompts you for a URL. The repositories give you access to RSA updates and CentOS updates. Refer to Appendix B. Create an External Repository for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

    Enter the base URL of the NetWitness Platform external repo, tab to **OK** and press **Enter**.

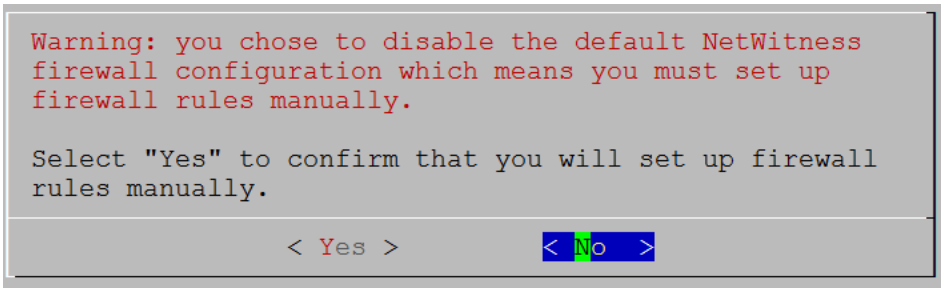
The **NW Server IP Address** prompt is displayed.



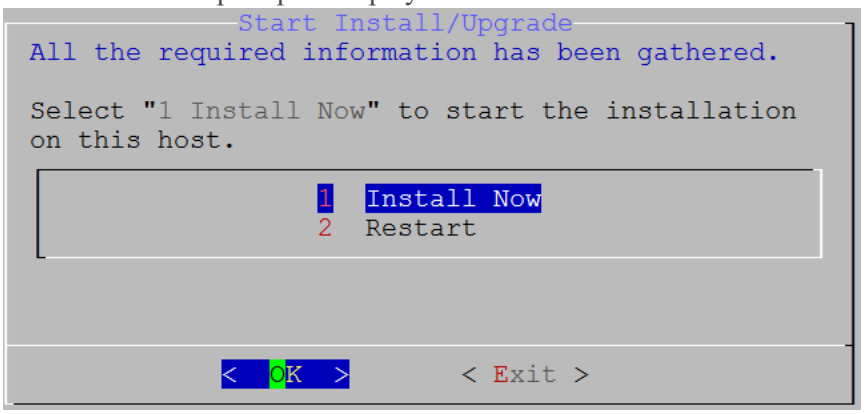
12. Type the NW Server IP address. Tab to **OK** and press **Enter**.
    The **Disable Firewall** prompt is displayed.



13. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.
    - If you select **Yes**, confirm your selection or **No** to use the standard firewall configuration.



The **Start Install** prompt is displayed.



14. Press **Enter** to install 11.2 on the non-NW Server.
    When **Installation complete** is displayed, you have a generic non-NW Server host with an operating system compatible with NetWitness Platform 11.2.
15. Install a component service on the host.
    a. Log into NetWitness Platform and go to **ADMIN** > **Hosts**.
    The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

    Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    b. Select the host in the **New Hosts** dialog and click **Enable**.
    The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

    c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click Install.
    The **Install Services** dialog is displayed.

    d. Select the appropriate host type (for example, **ESA Primary**) in **Host Type** and click **Install**.

    You have completed the installation of the non-NW Server host in NetWitness Platform.
16. Complete steps 1 through 15 for the rest of the NetWitness Platform non-NW Server components.
17. Complete licensing requirements for installed services.
    See the *NetWitness Platform 11.2 Licensing Management Guide* for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness Legacy Windows Collection Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Installation Tasks

This topic contains the tasks you complete after you install 11.2.

- General
- RSA NetWitness® Endpoint Insights
- FIPS Enablement
- RSA NetWitness® UEBA

General

(Optional) Task 1 - Re-Configure DNS Servers Post 11.2

On the NetWitness Server, complete the following steps to re-configure the DNS servers in NetWitness Platform 11.2.

1. Login to the server host with your `root` credentials.
2. Edit the `/etc/netwitness/platform/resolv.dnsmasq` file:
   a. Replace the IP address corresponding to `nameserver`.
   If you need to replace both DNS servers , replace the IP entries for both the hosts with valid addresses.
   The following example shows both DNS entries.

   The following example shows the new DNS values.

   b. Save the `/etc/netwitness/platform/resolv.dnsmasq` file.
   c. Restart the internal DNS by running the following command:
   `systemctl restart dnsmasq`

RSA NetWitness Endpoint Insights

(Optional) Task 2 - Install Endpoint Hybrid or Endpoint Log Hybrid

You must install one of the following services to install NetWitness Platform Endpoint Insights in your deployment:

- Endpoint Hybrid
- Endpoint Log Hybrid

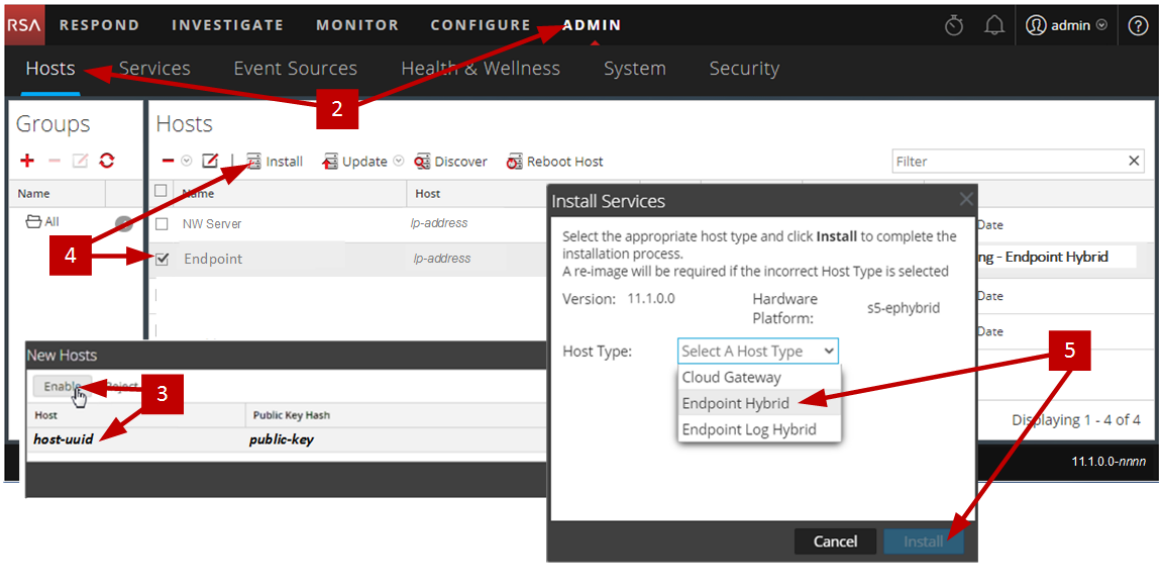
Caution: You can only install one instance of the above services in your deployment.

Note: You must install the Endpoint Hybrid or Endpoint Log Hybrid on the S5 or Dell R730 appliance.

1. Complete steps 1 - 14 for Physical Host or steps 1 - 15 for Virtual Hosts under "Task 2 - Install 11.2 on Other Component Hosts" in "Installation Tasks" of the *NetWitness Platform Physical Host Installation Guide for Version 11.2*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
2. Log into NetWitness Platform and click **ADMIN** > **Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.
3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.
4. Select that host in the **Hosts** view (for example, **Endpoint**) and click 
.
   The Install Services dialog is displayed.

5. Select the appropriate service, either **Endpoint Hybrid** or **Endpoint Log Hybrid**, and click **Install**.
   Endpoint Hybrid is used as an example in the following screen shot.



6. Make sure that all Endpoint Hybrid or Endpoint Log Hybrid services are running.

7. Configure Endpoint Meta forwarding.
   See *Endpoint Insights Configuration Guide* for instructions on how to configure Endpoint Meta forwarding. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

8. Install the Endpoint Insights Agent.
   See *Endpoint Insights Agent Installation Guide* for detailed instructions on how to install the agent. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

FIPS Enablement

(Optional) Task 3 - Enable FIPS Mode

Federal Information Processing Standard (FIPS) is enabled on all services except Log Collector, Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder. For information about how to enable FIPS for these services, see the "Activate or Deactivate FIPS" topic in the *RSA NetWitness Platform System Maintenance Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

RSA NetWitness® UEBA

(Optional) Task 4 - Install NetWitness UEBA

To set up NetWitness UEBA in NetWitness Platform 11.2, you must install and configure the NetWitness UEBA service.

Note: The `ueba-server-config` script referred to in these instructions is in the `/opt/rsa/saTools/` directory.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. Complete steps 1 - 14 for Physical Host or steps 1 - 15 for Virtual Hosts under "Task 2 - Install 11.2 on Other Component Hosts" in "Installation Tasks" of the *NetWitness Platform Physical Host Installation Guide for Version 11.2*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.

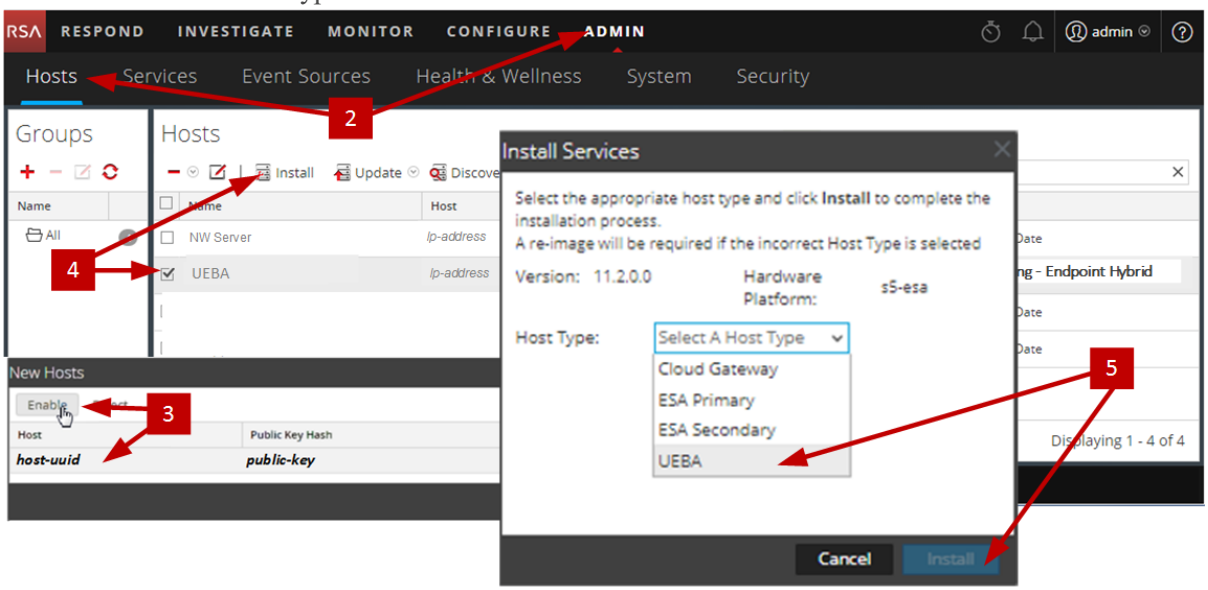
2. Log into NetWitness Platform and go to **ADMIN** > **Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.

4. Select that host in the **Hosts** view (for example, **UEBA**) and click 
   .
   The Install Services dialog is displayed.

5. Select the **UEBA** Host Type and click **Install**.



6. Make sure that the UEBA service is running.

7. Complete licensing requirements for NetWitness UEBA.
   See the *NetWitness Platform 11.2 Licensing Management Guide* for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

8. Configure NetWitness UEBA.
   You need to configure a data source (Broker or Concentrator), historical data collection start date, and data schemas.

   IMPORTANT: If your deployment has multiple Concentrators, RSA recommends that you assign the Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

   a. Determine the earliest date in the NWDB of the data schema you plan to choose (`AUTHENTICATION`, `FILE`, `ACTIVE_DIRECTORY`, or any combination of these schemas) to specify in `startTime` in step c. If you plan to specify multiple schemas, use the earliest date among all the schemas. You can use one of the following methods to determine the data source date.

      - Use the Data Retention date (that is, if the Data Retention duration is 48 hours, `startTime` = <48 hours earlier than the current time>).
      - Search the NWDB for the earliest date.

   b. Create a user account for the data source (Broker or Concentrator) to authenticate to the data source.

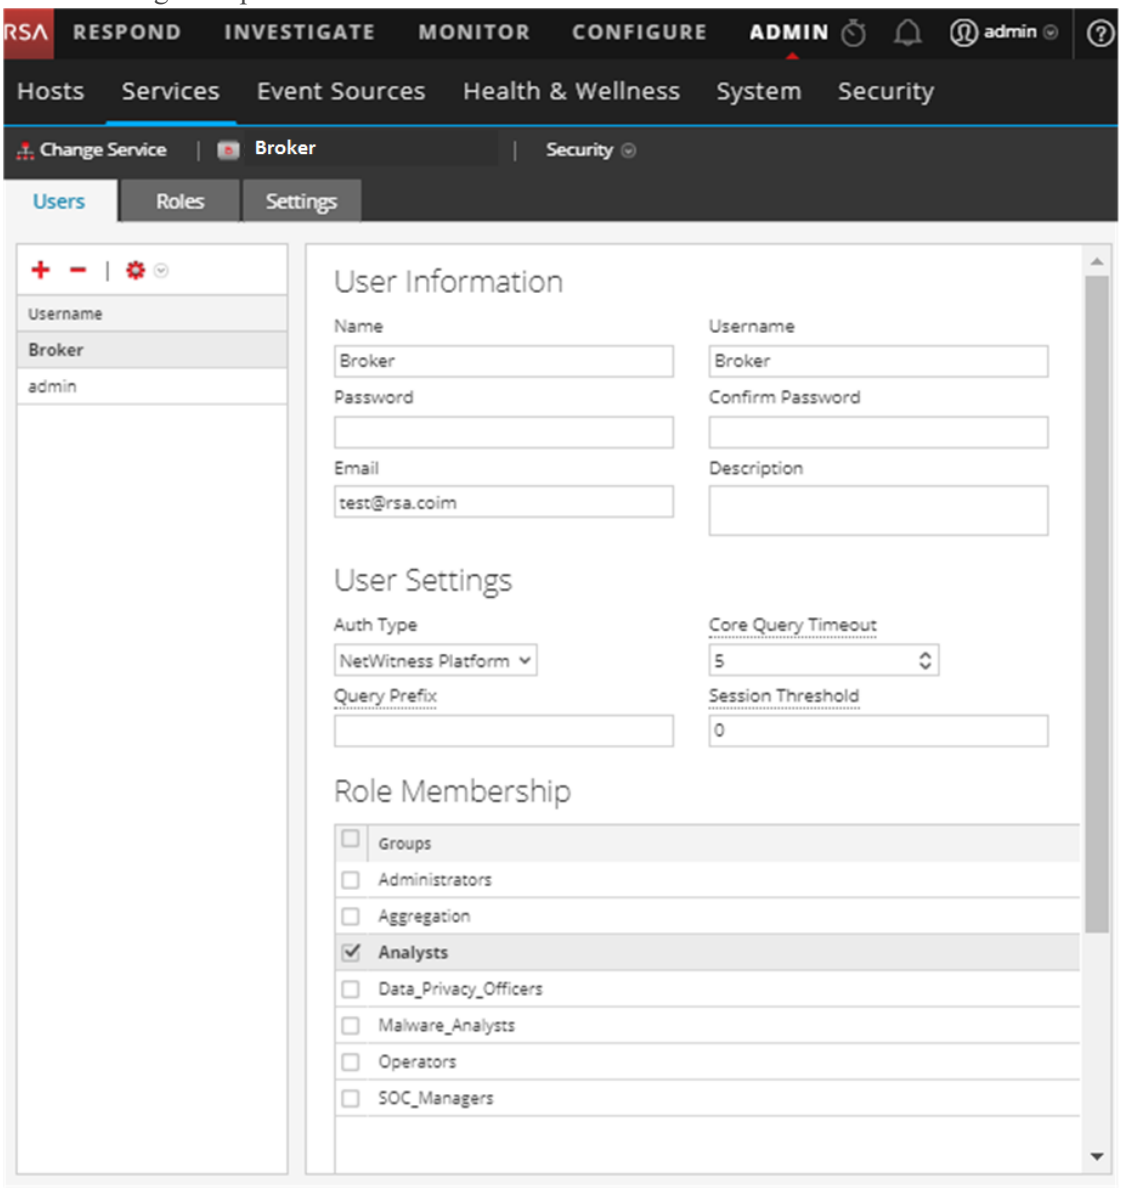
      i. Log into NetWitness Platform.

      ii. Go to **Admin** > **Services**.

      iii. Locate the data source service (Broker or Concentrator).

Select that service, and select  (Actions) > **View** > **Security**.

iv. Create a new user and assign the "UEBA_Analysts" role to that user.
The following example shows a user account created for a Broker.



c. SSH to the NetWitness UEBA server host.

d. Submit the following commands.

```
./ueba-server-config.sh -u <user> -p <password> -h <host> -o <type> -t
<startTime> -s <schemas> -v
```

Where:

Argument	Variable	Description
`-u`	`<user>`	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.
`-p`	`<password>`	Password of the credentials for the Broker or Concentrator instance that you are using as a data source.
`-h`	`<host>`	IP address of the Broker or Concentrator used as the data source.
`-o`	`<type>`	Data source host type (`broker` or `concentrator`).
`-t`	`<startTime>`	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, `2018-08-15T00:00:00Z`).
`-s`	`<schemas>`	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, `'AUTHENTICATION FILE ACTIVE_ DIRECTORY'`).
`-v`		verbose mode.

9. Complete NetWitness UEBA configuration according to the needs of your organization.
See the *RSA NetWitness UEBA User Guide* for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Appendix A. Troubleshooting

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Backup Script
- Event Stream Analysis
- Log Collector Service (`nwlogcollector`)
- Orchestration
- NW Server
- Reporting Engine
- NetWitness UEBA

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed. 2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health. AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Backup (`nw-backup` script)

Error Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA Mongo admin password back to the original default of 'netwitness' before running backup.

Error	Backup errors caused by the `immutable` attribute setting. Here is an example of an error that can be displayed: Cause	If you have any files that have the immutable flag set (to keep the Puppet process from overwriting a customized file), the file will not be included in the backup process and an error will be generated.
Solution	On the host that contains the files with the immutable flag set, run the following command to remove the immutable setting from the files: `chattr -i <filename>`

Error	Error creating Network Configuration Information file due to duplicate or bad entries in primary network configuration file: `/etc/sysconfig/network-scripts/ifcfg-em1` Verify contents of `/var/netwitness/logdecoder/packetdb/nw-backup/2018-02-23/S5-BROK-36-10.25.53.36-network.info.txt`
Cause	There are incorrect or duplicate entries for any one of the following fields: DEVICE, BOOTPROTO, IPADDR, NETMASK or GATEWAY, that were found from reading the primary Ethernet interface configuration file from the host being backed up.

Solution	Manually create a file at the backup location on the external backup server, as well as the backup location local to the host where other backups have been staged. The file name should be of the format `<hostname>-<hostip>-network.info.txt`, and should contain the following entries:
	`DEVICE=<devicename> ; # from the host's primary ethernet interface config file`
	`BOOTPROTO=<bootprotocol> ; # from the host's primary ethernet interface config file`
	`IPADDR=<value> ; # from the host's primary ethernet interface config file`
	`NETMASK=<value> ; # from the host's primary ethernet interface config file`
	`GATEWAY=<value> ; # from the host's primary ethernet interface config file`
	`search <value> ; # from the host's /etc/resolv.conf file`
	`nameserver <value> ; # from the host's /etc/resolv.conf file`

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.2.0.0 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESA Primary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA.
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6.x to 11.2.0.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Reporting Engine Service

Reporting Engine Update logs are posted to to/var/log/re_install.log file on the host running the Reporting Engine service.

Error Message	<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [><existing-GB] is less than the required space [<required-GB>]
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NetWitness UEBA

Problem	The User Interface is not accessible.
Cause	You have more than one NetWitness UEBA service existing in your NetWitness deployment and you can only have NetWitness UEBA service in your deployment.

Solution	Complete the following steps to remove the extra NetWitness UEBA service.
	1. SSH to NW Server and run the following commands to query the list of installed NetWitness UEBA services.
	`# orchestration-cli-client --list-services|grep presidio-airflow`
	`... Service: ID=7e682892-b913-4dee-ac84-ca2438e522bf, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	`... Service: ID=3ba35fbe-7220-4e26-a2ad-9e14ab5e9e15, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	2. From the list of services, determine which instance of the `presidio-airflow` service should be removed (by looking at the host addresses).
	3. Run the following command to remove the extra service from Orchestration (use the matching service ID from the list of services):
	`# orchestration-cli-client --remove-service --id <ID-for-presidio-airflow-form-previous-output>`
	4. Run the following command to update node 0 to restore NGINX:
	`# orchestration-cli-client --update-admin-node`
	5. Log in to NetWitness Platform, go to **ADMIN** > **Hosts**, and remove the extra NetWitness UEBA host.

Appendix B. Create an External Repository

Complete the following procedure to set up an external repository (Repo).

1. Log in to the web server host.
2. Create the `ziprepo` directory to host the NW repository (`netwitness-11.2.0.0.zip`) under `web-root` of the web server. For example, if `/var/netwitness` is the web-root, submit the following command string.
   ```
   mkdir /var/netwitness/ziprepo
   ```
3. Create the 11.2.0.0 directory under `/var/netwitness/ziprepo`.
   ```
   mkdir /var/netwitness/ziprepo/11.2.0.0
   ```
4. Create the `OS` and `RSA` directories under `/var/netwitness/ziprepo/11.2.0.0`.
   ```
   mkdir /var/netwitness/ziprepo/11.2.0.0/OS
   mkdir /var/netwitness/ziprepo/11.2.0.0/RSA
   ```
5. Unzip the `netwitness-11.2.0.0.zip` file into the `/var/netwitness/ziprepo/11.2.0.0` directory.
   ```
   unzip netwitness-11.2.0.0.zip -d /var/netwitness/ziprepo/11.2.0.0
   ```
   Unzipping `netwitness-11.2.0.0.zip` results in two zip files (`OS-11.2.0.0.zip` and `RSA-11.2.0.0.zip`) and some other files.
6. Unzip the:
   a. `OS-11.2.0.0.zip` into the `/var/netwitness/ziprepo/11.2.0.0/OS` directory.
      ```
      unzip /var/netwitness/ziprepo/11.2.0.0/OS-11.2.0.0.zip -d
      /var/netwitness/ziprepo/11.2.0.0/OS
      ```

Virtual Host Setup Guide

This document provides instructions on the installation and configuration of RSA NetWitness® Platform 11.2.0.0 hosts running in a virtual environment.

Basic Virtual Deployment

This topic contains general guidelines and requirements for deploying RSANetWitness Platform 11.2.0.0 in a virtual environment.

Abbreviations Used in the Virtual Deployment Guide

Abbreviations	Description
CPU	Central Processing Unit
EPS	Events Per Second
VMware ESX	Enterprise-class, type-1 hypervisor, Supported versions - 6.5, 6.0 and 5.5
GB	Gigabyte. 1GB = 1,000,000,000 bytes
Gb	Gigbit. 1Gb = 1,000,000,000 bits.
Gbps	Gigabits per second or billions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
GHz	GigaHertz 1 GHz = 1,000,000,000 Hz
IOPS	Input/Output Operations Per Second
Mbps	Megabits per second or millions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
NAS	Network Attached Storage
OVF	Open Virtualization Format
OVA	Open Virtual Appliance. For purposes of this guide, OVA stands for Open Virtual Host.
RAM	Random Access Memory (also known as memory)
SAN	Storage Area Network
SSD/EFD HDD	Solid-State Drive/Enterprise Flash Drive Hard Disk Drive
SCSI	Small Computer System Interface
SCSI (SAS)	Point-to-point serial protocol that moves data to and from computer storage devices such as hard drives and tape drives.
vCPU	Virtual Central Processing Unit (also known as a virtual processor)
vRAM	Virtual Random Access Memory (also known as virtual memory)
RSA NetWitness UEBA	RSA NetWitness User and Entity Behavior Analysis

Supported Virtual Hosts

You can install the following NetWitness Platform hosts in your virtual environment as a virtual host and inherit features that are provided by your virtual environment:

- NetWitness Server
- Event Stream Analysis - ESA Primary and ESA Secondary
- Archiver
- Broker
- Concentrator
- Log Decoder
- Malware Analysis
- Decoder
- Remote Log Collector
- Endpoint Hybrid
- Endpoint Log Hybrid
- User and Entity Behavior Analysis (UEBA)

You must be familiar with the following VMware infrastructure concepts:

- VMware vCenter Server
- VMware ESXi
- Virtual machine

For information on VMware concepts, refer to the VMware product documentation.

The virtual hosts are provided as an OVA. You need to deploy the OVA file as a virtual machine in your virtual infrastructure.

Installation Media

Installation media are in the form of OVA packages, which are available for download and installation from Download Central (https://download.rsasecurity.com). As part of your order fulfillment, RSA gives you access to the OVA.

Virtual Environment Recommendations

The virtual hosts installed with the OVA packages have the same functionality as the NetWitness Platform hardware hosts. This means that when you implement virtual hosts, you must account for the back-end hardware. RSA recommends that you perform the following tasks when you set up your virtual environment.

- Based on resource requirements of the different components, follow best practices to use the system and dedicated storage appropriately.
- Make sure that back-end disk configurations provide a write speed of 10% greater than the required sustained capture and ingest rate for the deployment.
- Build Concentrator directories for meta and index databases on the SSD/EFD HDD.
- If the database components are separate from the installed operating system (OS) components (that is, on a separate physical system), provide direct connectivity with either:
  - Two 8-Gbps Fiber Channel SAN ports per virtual host,
    or
  - 6-Gbps Serial Attached SCSI (SAS) connectivity.

Note: 1.) Currently, NetWitness Platform does not support Network Attached Storage (NAS) for Virtual deployments.
2.) The Decoder allows any storage configuration that can meet the sustained throughput requirement. The standard 8-Gbps Fiber Channel link to a SAN is insufficient to read and write packet data at 10 Gb. You must use multiple Fiber Channels when you configure to the connection from a **10G Decoder** to the SAN.

Virtual Host Recommended System Requirements

The following tables list the vCPU, vRAM, and Read and Write IOPS recommended requirements for the virtual hosts based on the EPS or capture rate for each component.

- Storage allocation is covered in Step 3 “Configure Databases to Accommodate NetWitness Platform”.
- vRAM and vCPU recommendations may vary depending on capture rates, configuration and content enabled.
- The recommendations were tested at ingest rates of up to 25,000 EPS for logs and two Gbps for packets, for non SSL.
- The vCPU specifications for all the components listed in the following tables are Intel Xeon CPU @2.59 Ghz.
- All ports are SSL tested at 15,000 EPS for logs and 1.5 Gbps for packets.

Note: The above recommended values might differ for 11.2.0.0 installation when you install and try the new features and enhancements.

Scenario One

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder, Concentrator, and Archiver.

- The Packet Stream included a Network Decoder and Concentrator.
- The background load included hourly and daily reports.
- Charts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	6 or 15.60 GHz	32 GB	50	75
5,000	8 or 20.79 GHz	32 GB	100	100
7,500	10 or 25.99 GHz	32 GB	150	150

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	4 or 10.39 GHz	32 GB	50	150
100	4 or 10.39 GHz	32 GB	50	250
250	4 or 10.39 GHz	32 GB	50	350

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	4 or 10.39 GHz	32 GB	300	1,800
5,000	4 or 10.39 GHz	32 GB	400	2,350
7,500	6 or 15.59 GHz	32 GB	500	4,500

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
50	4 or 10.39 GHz	32 GB	50	1,350
100	4 or 10.39 GHz	32 GB	100	1,700
250	4 or 10.39 GHz	32 GB	150	2,100

Archiver

EPS	CPU	Memory	Read IOPS	Write IOPS
2,500	4 or 10.39 GHz	32 GB	150	250
5,000	4 or 10.39 GHz	32 GB	150	250
7,500	6 or 15.59 GHz	32 GB	150	350

Scenario Two

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder, Concentrator, Warehouse Connector, and Archiver.
- The Packet Stream included a Network Decoder, Concentrator, and Warehouse Connector.
- Event Stream Analysis was aggregating at 90K EPS from three Hybrid Concentrators.
- Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
- The background load Included reports, charts, alerts, investigation, and Respond.
- Alerts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	16 or 41.58 GHz	50 GB	300	50
15,000	20 or 51.98 GHz	60 GB	550	100

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	8 or 20.79 GHz	40 GB	150	200
1,000	12 or 31.18 GHz	50 GB	200	400
1,500	16 or 41.58 GHz	75 GB	200	500

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	10 or 25.99 GHz	50 GB	1,550 + 50	6,500
15,000	12 or 31.18 GHz	60 GB	1,200 + 400	7,600

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	12 or 31.18 GHz	50 GB	250	4,600
1,000	16 or 41.58 GHz	50 GB	550	5,500
1,500	24 or 62.38 GHz	75 GB	1,050	6,500

Warehouse Connector - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	8 or 20.79 GHz	30 GB	50	50
15,000	10 or 25.99 GHz	35 GB	50	50

Warehouse Connector - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
500	6 or 15.59 GHz	32 GB	50	50
1,000	6 or 15.59 GHz	32 GB	50	50
1,500	8 or 20.79 GHz	40 GB	50	50

Archiver - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
10,000	12 or 31.18 GHz	40 GB	1,300	700
15,000	14 or 36.38 GHz	45 GB	1,200	900

Event Stream Analysis with Context Hub

EPS	CPU	Memory	Read IOPS	Write IOPS
90,000	32 or 83.16 GHz	94 GB	50	50

NWS1: NetWitness Server and Co-Located Components

The NetWitness Server, Jetty, Broker, Respond, and Reporting Engine are in the same location.

CPU	Memory	Read IOPS	Write IOPS
12 or 31.18 GHz	50 GB	100	350

Scenario Three

The requirements in these tables were calculated under the following conditions.

- All the components were integrated.
- The Log stream included a Log Decoder and Concentrator.
- The Packet stream included a Network Decoder and the Concentrator.
- Event Stream Analysis was aggregating at 90K EPS from three Hybrid Concentrators.
- Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
- The background load included hourly and daily reports.
- Charts were configured.

Log Decoder

EPS	CPU	Memory	Read IOPS	Write IOPS
25,000	32 or 83.16 GHz	75 GB	250	150

Network Decoder

Mbps	CPU	Memory	Read IOPS	Write IOPS
2,000	16 or 41.58 GHz	75 GB	50	650

Concentrator - Log Stream

EPS	CPU	Memory	Read IOPS	Write IOPS
25,000	16 or 41.58 GHz	75 GB	650	9,200

Concentrator - Packet Stream

Mbps	CPU	Memory	Read IOPS	Write IOPS
2,000	24 or 62.38 GHz	75 GB	150	7,050

Log Collector (Local and Remote)

The Remote Log Collector is a Log Collector service running on a remote host and the Remote Collector is deployed virtually.

EPS	CPU	Memory	Read IOPS	Write IOPS
15,000	8 or 20.79 GHz	8 GB	50	50
30,000	8 or 20.79 GHz	15 GB	100	100

Scenario Four

The requirements in these tables were calculated under the following conditions for Endpoint Hybrid.

- All the components were integrated.
- Endpoint Server is installed.
- The Log stream included a Log Decoder and Concentrator.

Endpoint Hybird

Agents	CPU	Memory	IOPS Values		
				Read IOPS	**Write IOPS**
5000	16 or 42 GHz	32 GB	Log Decoder	250	150
			Concentrator	150	7,050
			MongoDb	250	150

Log Collector (Local and Remote)

The Remote Log Collector is a Log Collector service running on a remote host and the Remote Collector is deployed virtually.

EPS	CPU	Memory	Read IOPS	Write IOPS
15,000	8 or 20.79 GHz	8 GB	50	50
30,000	8 or 20.79 GHz	15 GB	100	100

Legacy Windows Collectors Sizing Guidelines

Refer to the *RSA NetWitness Platform Legacy Windows Collection Update & Installation* for sizing guidelines for the Legacy Windows Collector.

UEBA

CPU	Memory	Read IOPS	Write IOPS
16 or 2.4GHz	64 GB	500MB	500MB

Install NetWitness Platform Virtual Host in Virtual Environment

Complete the following procedures according to their numbered sequence to install RSA NetWitness® Platform in a virtual environment.

Prerequisites

Make sure that you have:

- A VMware ESX Server that meets the requirements described in the above section. Supported versions are 6.5, 6.0, and 5.5.
- vSphere 4.1, 5.0, or 6.0 Client installed to log on to the VMware ESX Server.
- Administrator rights to create the virtual machines on the VMware ESX Server.

Step 1. Deploy the Virtual Host to create VM

Complete the following steps to deploy the OVA file on the vCenter Server or ESX Server using the vSphere client.

Prerequisites

Make sure that you have:

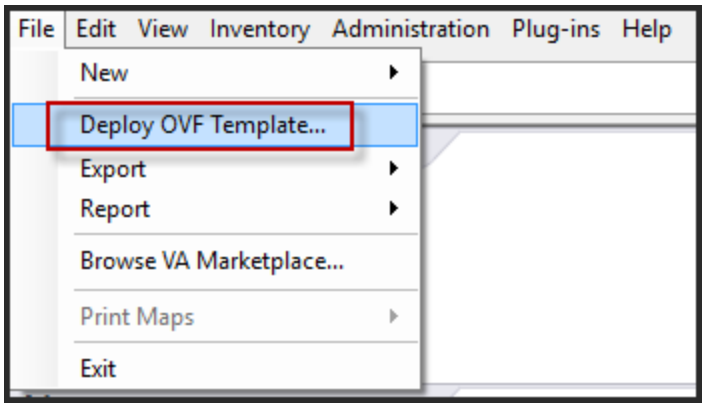
- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.
- Password for virtual host access. The default username is `root` and the default password is `netwitness`.
- The NetWitness Platform virtual host package file for example, rsanw-11.2.0.xxxx.el7-x86_64.ova. (You download this package from Download Central (https://community.rsa.com).)

Procedure

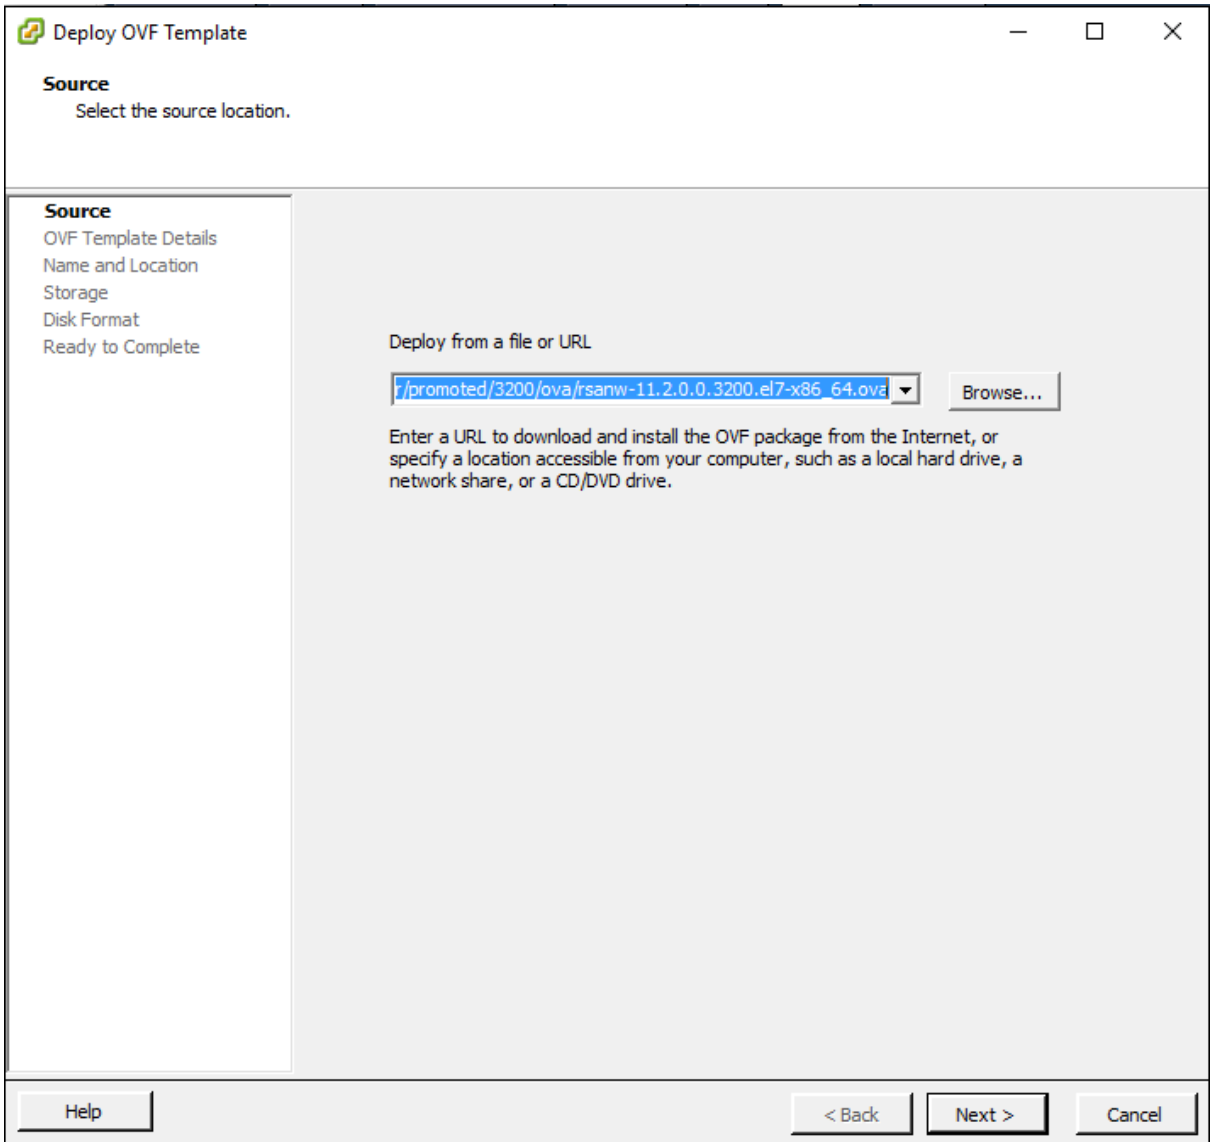
Note: The following instructions illustrate an example of deploying an OVA host in the ESXi environment. The screens you see may be different from this example.

To deploy the OVA host:

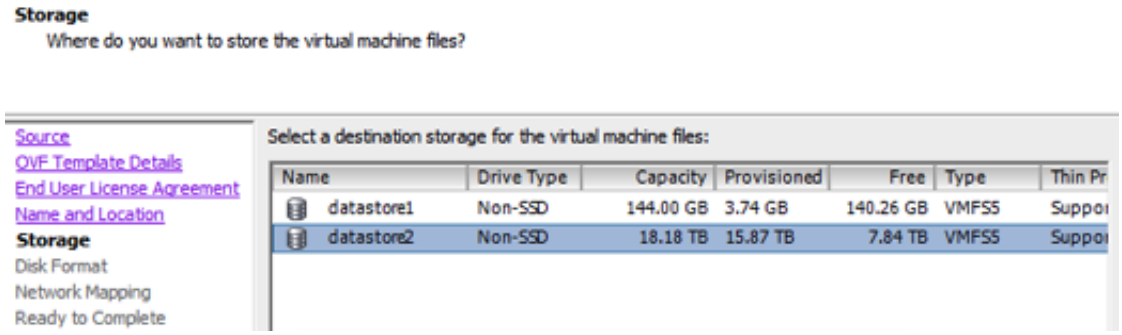
1. Log on to the ESXi environment.
2. In the **File** drop-down, select **Deploy OVF Template**.



3. The Deploy OVF Template dialog is displayed. In the **Deploy OVF Template** dialog, select the OVF for the host that you want to deploy in the virtual environment (for example, **V11.2 GOLD\\rsanw-11.2.0.0.1948.el7-x86_64.ova**), and click **Next**.



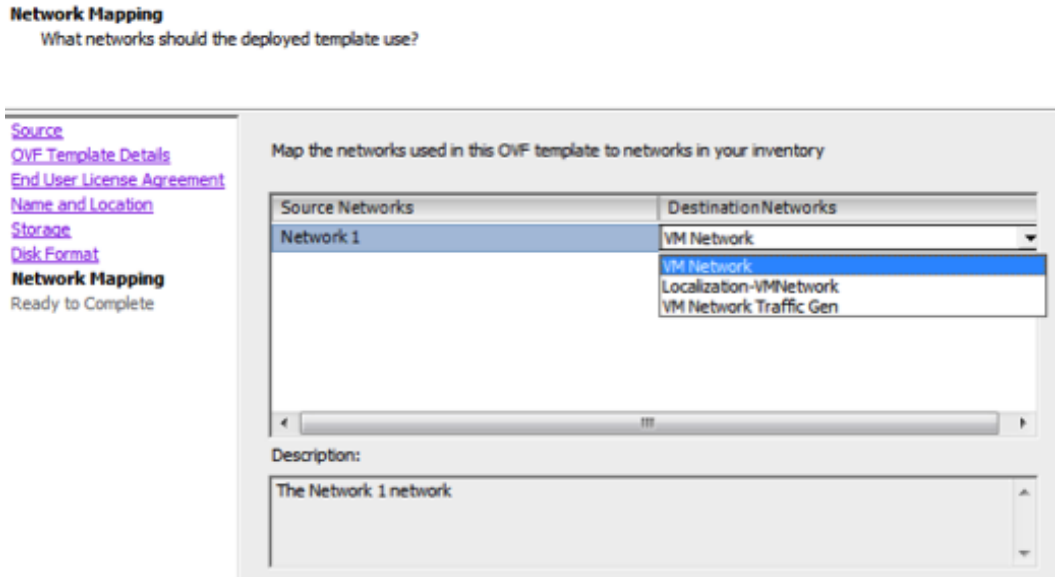
4. The Name and Location dialog is displayed. The designated name does not reflect the server hostname. The name displayed is useful for inventory reference from within ESXi.
5. Make a note of the name, and click **Next**.
   Storage Options are displayed.



6. For Storage options, designate the datastore location for the virtual host.

> **Note:** This location is for the host operating system (OS) exclusively. It does not have to be the same datastore needed to set up and configure additional volumes for the NetWitness Platform databases on certain hosts (covered in the following sections).

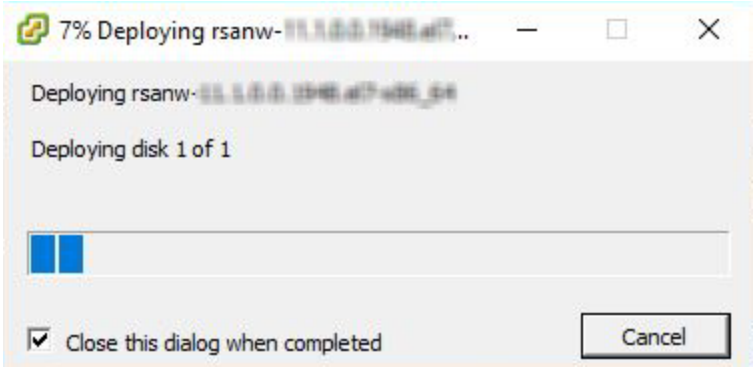
7. Click **Next**.
   The Network Mapping options are displayed.



8. Leave the default values, and click **Next**.

> **Note:** If you want to configure Network Mapping now, you can select options, but RSA recommends that you keep the default values and configure network mapping after you configure the OVA. You configure the OVA in Step 4: Configure Host-Specific Parameters.

A status window showing deployment status is displayed.



After the process is complete, the new OVA is presented in the designated resource pool visible on ESXi from within vSphere. At this point, the core virtual host is installed, but is still not configured.

Step 2. Configure the Network

Complete the following steps to configure the network of the Virtual Appliance.

Prerequisites

Make sure that you have:

- Network IP addresses, netmask, and gateway IP addresses for the virtual host.
- Network names for all virtual hosts, if you are creating a cluster.
- DNS or host information.

Procedure

Perform the following steps for all virtual hosts to get them on your network.

Review Open Firewall Ports

Review the ***Network Architecture and Ports*** topic in the ***Deployment Guide*** in the NetWitness Platform help so that you can configure NetWitness Platform services and your firewalls. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Caution: Do not proceed with the installation until the ports on your firewall are configured.

Step 3. Configure Databases to Accommodate NetWitness Platform

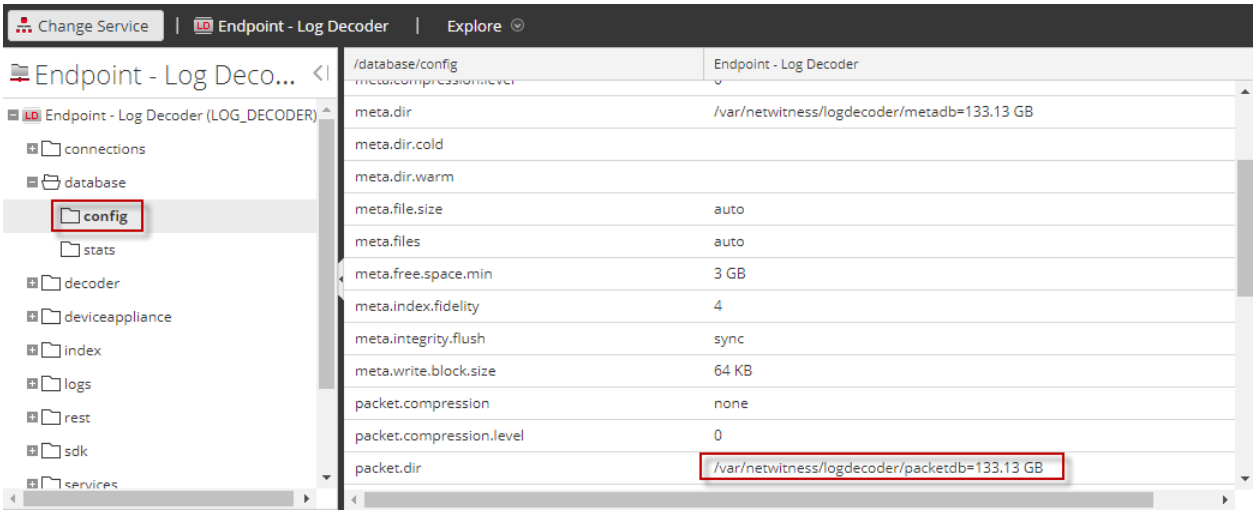
When you deploy databases from OVA, the initial database space allocation may not be adequate to support NetWitness Server. You need to review the status of the datastores after initial deployment and expand them.

Task 1. Review Initial Datastore Configuration

Review the datastore configuration after initial deployment to determine if you have enough drive space to accommodate the needs of your enterprise. As an example, this topic reviews the datastore configuration of the PacketDB on the Log Decoder host after you first deploy it from an Open Virtualization Archive (OVA) file.

Initial Space Allocated to PacketDB

The allocated space for the PacketDB is about 133.13 GB). The following NetWitness Platform Explore view example shows the size of the PacketDB after you initially deploy it from OVA.



Initial Database Size

By default, the database size is set to 95% of the size of file system on which the database resides. SSH to the Log Decoder host and enter the `df -k` command string to view the files system and its size. The following output is an example of the information that this command strings returns.

```
[root@LogDecoder ~]# df -kh
Filesystem                          Size  Used Avail Use% Mounted on
/dev/mapper/netwitness_vg00-root     30G  3.0G   27G  10% /
devtmpfs                             16G     0   16G   0% /dev
tmpfs                                16G   12K   16G   1% /dev/shm
tmpfs                                16G   25M   16G   1% /run
tmpfs                                16G     0   16G   0% /sys/fs/cgroup
/dev/mapper/netwitness_vg00-usrhome  10G   33M   10G   1% /home
/dev/mapper/netwitness_vg00-varlog   10G   42M   10G   1% /var/log
/dev/mapper/netwitness_vg00-nwhome  141G  396M  140G   1% /var/netwitness
/dev/sda1                          1014M   73M  942M   8% /boot
tmpfs                               3.2G     0  3.2G   0% /run/user/0
[root@LogDecoder ~]#
```

PacketDB Mount Point

The database is mounted on the `packetdb` logical volume in `netwitness_vg00` volume group. `netwitness_vg00` and this is where you start your expansion planning for the file system.

Initial Status of netwitness_vg00

Complete the following steps to review the status of `netwitness_vg00`.

1. SSH to the Log Decoder host.
2. Enter the `lvs` (Logical Volumes Show) command string to determine which logical volumes are grouped in `netwitness_vg00`.
   `[root@nwappliance32431 ~}# lvs netwitness_vg00.`

   The following output is an example of the information that this command strings returns.

```
[root@LogDecoder ~]# vgs
  VG              #PV #LV #SN Attr   VSize    VFree
  netwitness_vg00   1   5   0 wz--n- <194.31g 100.00m
```

3. Enter the pvs (Physical Volumes Show) command string to determine which physical volumes belong to a specific group.

   `[root@nwappliance32431 ~}# pvs`

   The following output is an example of the information that this command strings returns.

```
[root@LogDecoder ~]# pvs
  PV         VG              Fmt  Attr PSize    PFree
  /dev/sda2  netwitness_vg00 lvm2 a--  <194.31g 100.00m
```

4. Enter the `vgs` (Volume Groups Show) command string to display the total size of specific volume group.

   `[root@nwappliance32431 ~}# vgs`

   The following output is an example of the information that this command strings returns.

```
[root@LogDecoder ~]# vgs
  VG              #PV #LV #SN Attr   VSize    VFree
  netwitness_vg00   1   5   0 wz--n- <194.31g 100.00m
```

Task 2. Review Optimal Datastore Space Configuration

You need to review the datastore space configuration options for the different hosts to get the optimal performance from your virtual NetWitness Platform deployment. Datastores are required for virtual host configuration, and the correct size is dependent on the host.

Note: (1.) Refer to the "**Optimization Techniques**" topic in the RSA NetWitness PlatformCore Database Tuning Guide for recommendations on how to optimize datastore space. (2.) Contact Customer Care for assistance in configuring your virtual drives and using the Sizing & Scoping Calculator.

Virtual Drive Space Ratios

The following table provides optimal configurations for packet and log hosts. Additional partitioning and sizing examples for both packet capture and log ingest environments are provided at the end of this topic.

Decoder			
Persistent Datastores	Cache Datastore		
PacketDB	SessionDB	MetaDB	Index
100% as calculated by Sizing & Scoping Calculator	6 GB per 100Mb/s of traffic sustained provides 4 hours cache	60 GB per 100Mb/s of traffic sustained provides 4 hours cache	3 GB per 100Mb/s of traffic sustained provides 4 hours cache

Concentrator		
Persistent Datastores	Cache Datastores	
MetaDB	SessionDB Index	Index
Calculated as 10% of the PacketDB required for a 1:1 retention ratio	30 GB per 1TB of PacketDB for standard multi protocol network deployments as seen at typical internet gateways	5% of the calculated MetaDB on the Concentrator. Preferred High Speed Spindles or SSD for fast access

Log Decoder			
Persistent Datastores	Cache Datastores		
PacketDB	SessionDB	MetaDB	Index
100% as calculated by Sizing & Scoping Calculator	1 GB per 1000 EPS of traffic sustained provides 8 hours cache	20 GB per 1000 EPS of traffic sustained provides 8 hours cache	0.5 GB per 1000 EPS of traffic sustained provides 4 hours cache

Log Concentrator		
Persistent Datastores	Cache Datastores	
MetaDB	SessionDB Index	Index
Calculated as 100% of the PacketDB required for a 1:1 retention ratio	3 GB per 1000 EPS of sustained traffic per day of retention	5% of the calculated MetaDB on the Concentrator. Preferred High Speed Spindles or SSD for fast access

Task 3. Add New Volume and Extend Existing File Systems

After reviewing your initial datastore configuration, you may determine that you need to add a new volume. This topic uses a Virtual Packet/Log Decoder host as an example.

Complete these tasks in the following order.

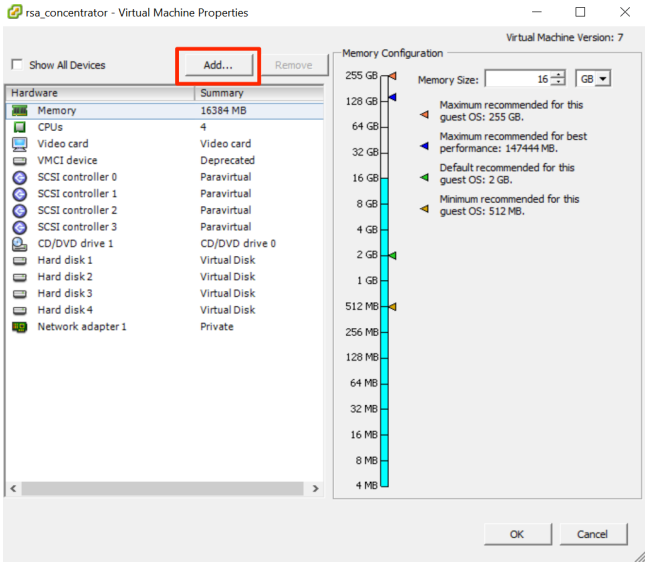
1. Add New Disk
2. Create New Volumes on the New Disk
3. Create LVM Physical Volume on New Partition
4. Extend Volume Group with Physical Volume
5. Expand the File System
6. Start the Services
7. Make Sure the Services Are Running
8. Reconfigure LogDecoder Parameters

Add New Disk

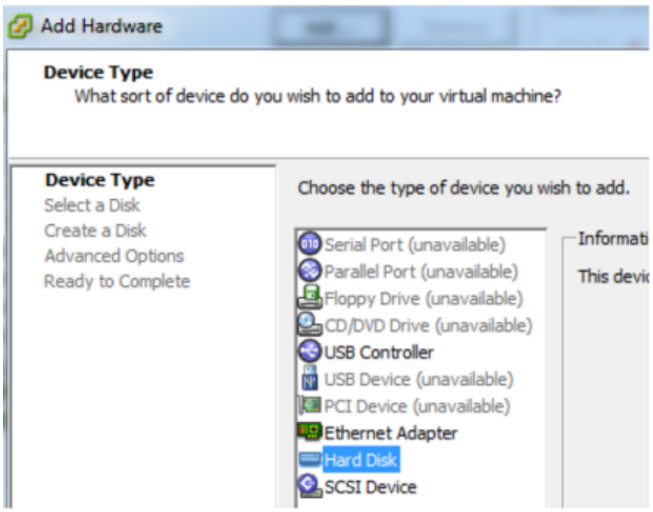
This procedure shows you how to add a new 100GB disk on the same datastore.

Note: The procedure to add a disk on different datastore is similar to the procedure shown here.

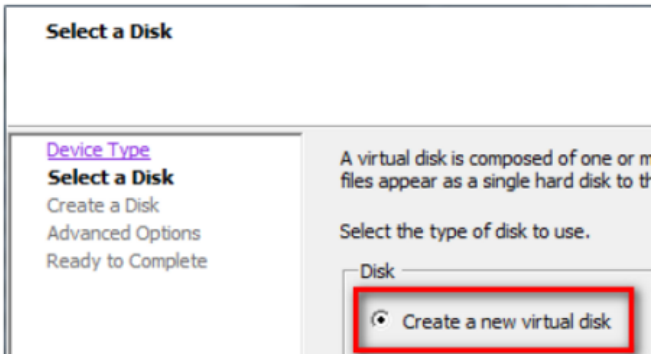
1. Shut down the machine, edit **Virtual Machine Properties**, click **Hardware** tab, and click **Add**.



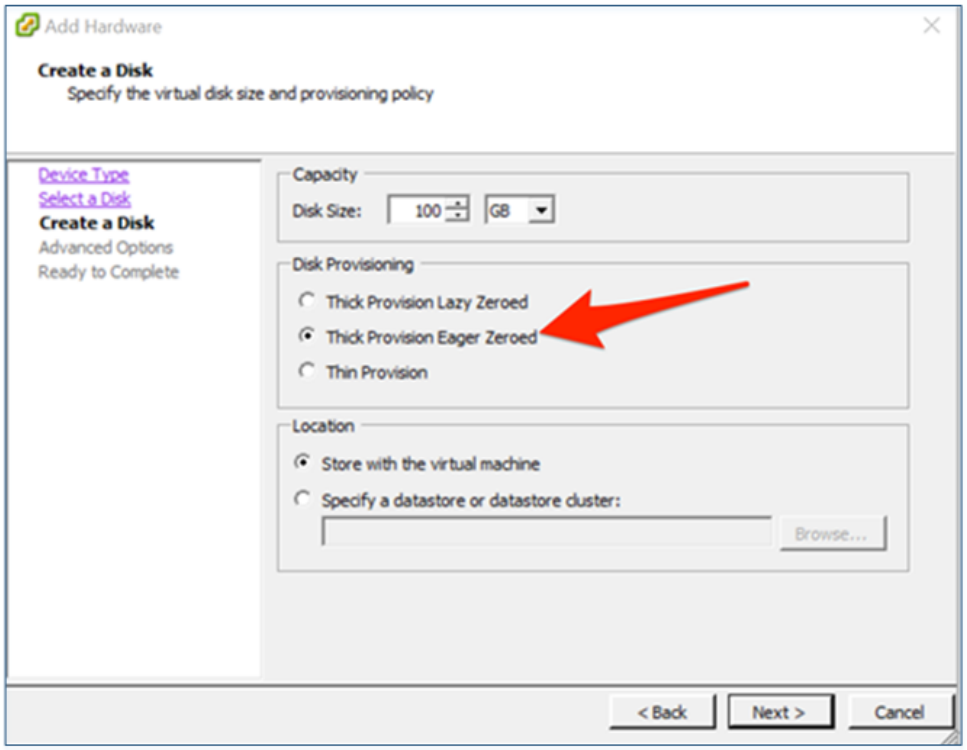
2. Select **Hard Disk** as the device type.



3. Select **Create a new virtual disk**.

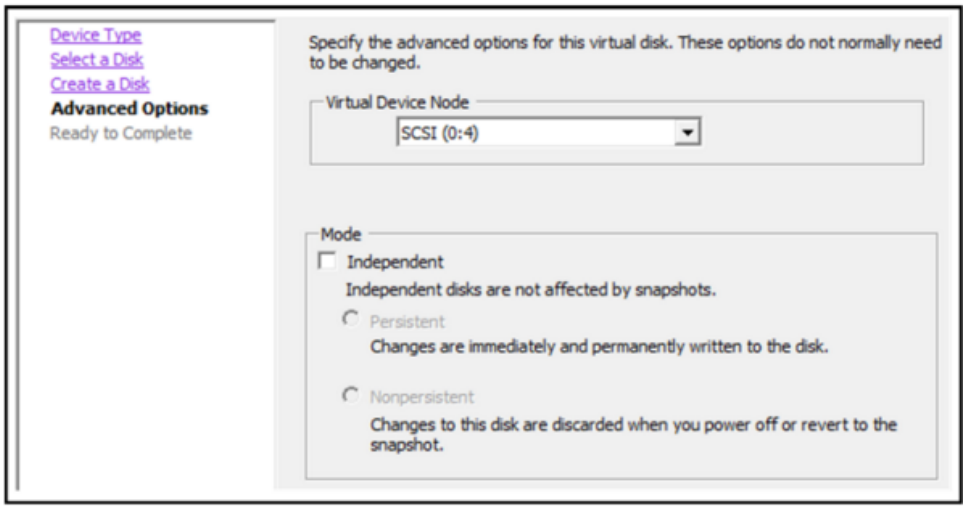


4. Choose the size of the new disk and where you want to create it (on the same datastore or a different datastore).



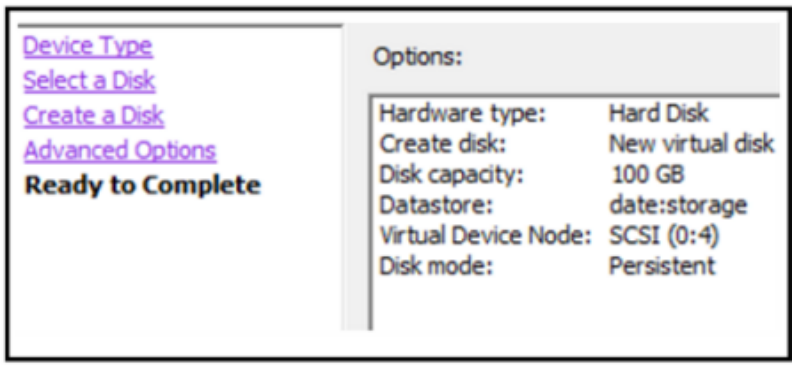
Caution: Allocate all the space for performance reasons.

5. Approve the proposed Virtual Device Node.



Note: The Virtual Device Node can vary, but it is pertinent to `/dev/sdX` mappings.

6. Confirm the settings.



Folder	LVM	Volume Group
`/var/netwitness/concentrator/index`	index	index

Install RSA NetWitness Platform

There are two main tasks that you must complete in the order listed below to install NetWitness Platform11.2

1. Task 1 - Install 11.2.0.0 on the NetWitness (NW) Server Host
2. Task 2 - Install 11.2.0.0 on Other Component Hosts

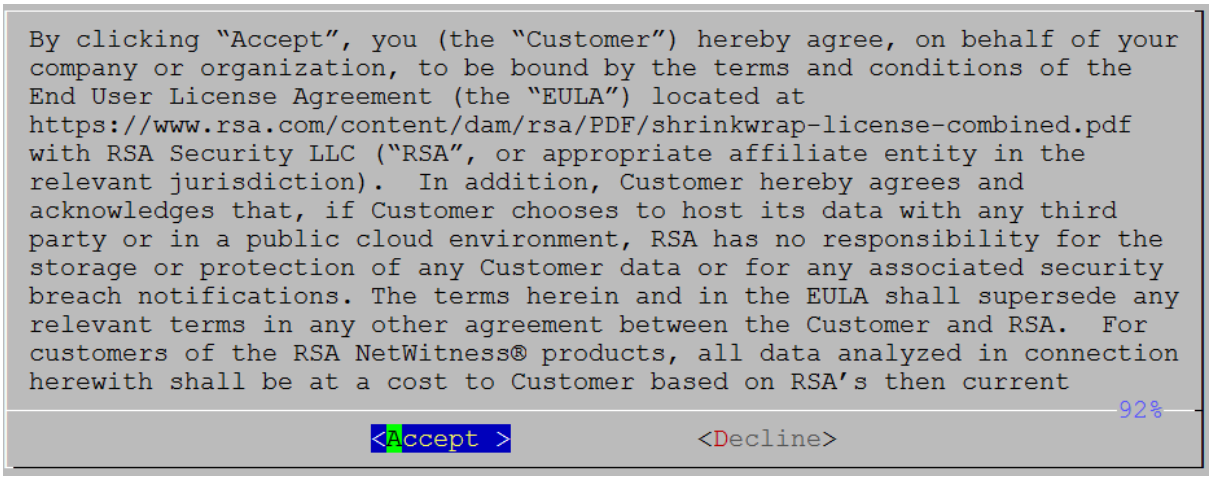
Task 1- Install 11.2.0.0 on the NW Server Host

On the host you have deployed for the NW Server, this task installs:

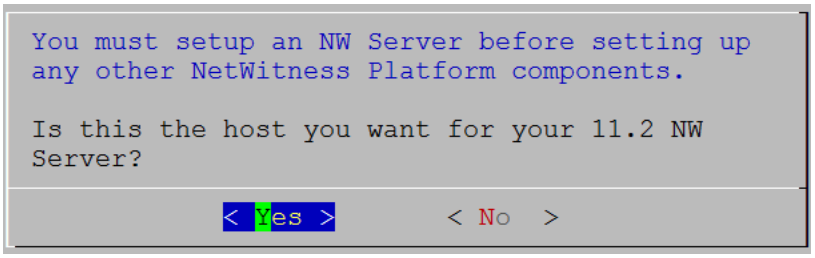
- The 11.2.0.0 NW Server environmental platform.
- The NW Server components (that is, Admin Server, Config Server, Orchestration Server, Integration Server, Broker, Investigate Server, Reporting Engine, Respond Server and Security server).
- A repository with the RPM files required to install the other functional components or services.

1. Deploy your 11.2.0.0 environment:
   a. Add new VM.
   b. Configure storage.
   c. Set up firewalls.
2. Run the `nwsetup-tui` command. This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as <Yes>, <No>, <OK>, and <Cancel>. Press Enter to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see (Optional) Task 1 - Re-Configure DNS Servers Post 11.2 in Post Installation Tasks.
If you do not specify DNS Servers during `nwsetup-tui` , you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



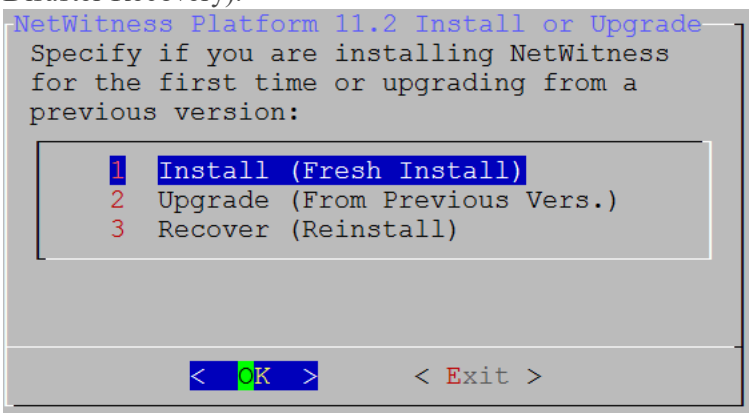
3. Tab to **Accept** and press Enter.
   The **Is this the host you want for your 11.2 NW Server** prompt is displayed.



4. Tab to **Yes** and press Enter.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must start the Setup Program (step 3) and complete all the subsequent steps to correct this error.

   The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.2 Disaster Recovery).



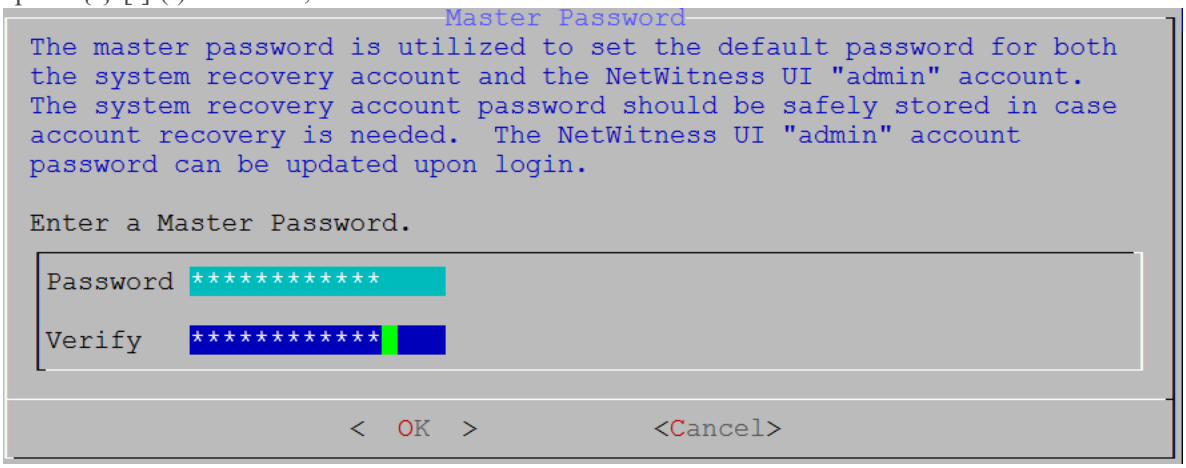
5. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **Host Name** prompt is displayed.

   Caution: If you include "." in a host name, the host name must also include a valid domain name.

6. Press **Enter** if want to keep this name. If not edit the host name, Tab to **OK**, and press Enter to change it.
7. The **Master Password** prompt is displayed.
   The following list of characters are supported for Master Password and Deployment Password:
   - Symbols : ! @ # % ^ + ,
   - Numbers : 0-9

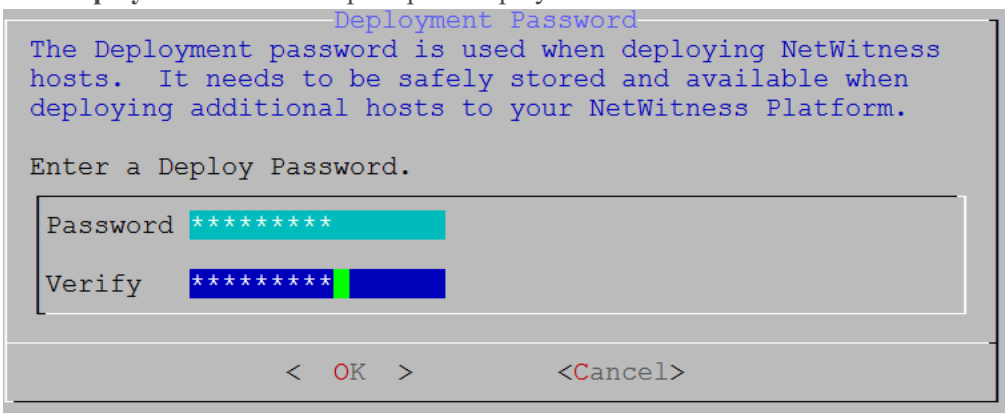
- Lowercase Characters : a-z
- Uppercase Characters : A-Z

No ambiguous characters are supported for Master Password and Deployment Password. For example:
space { } [ ] ( ) / \ ' " ` ~ ; : . < > -



8. The **Master Password** prompt is displayed.
   The following list of characters are supported for Master Password and Deployment Password:
   - Symbols : ! @ # % ^ +
   - Numbers : 0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

   No ambiguous characters are supported for Master Password and Deployment Password. For example:
   space { } [ ] ( ) / \ ' " ` ~ ; : . < > -
9. Down arrow to **Password** and type it in, down arrow to **Verify** and retype the password, Tab to **OK**, and press Enter.
   The **Deployment Password** prompt is displayed.



10. Type in the **Password**, down arrow to **Verify**, retype the password, Tab to **OK**, and press Enter.

One of the following conditional prompts is displayed.

- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

  Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** If you want to change the IP configuration found on the host.

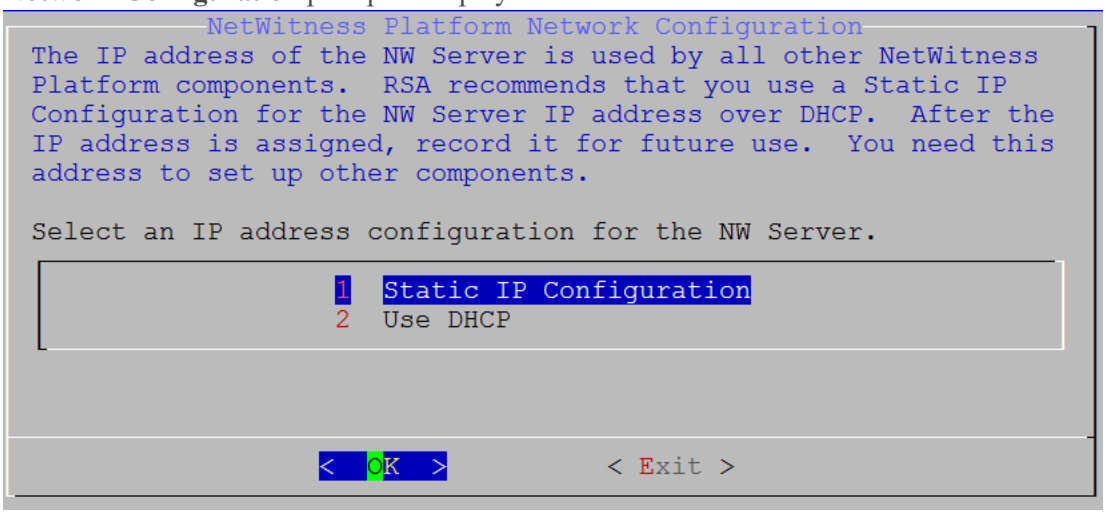
- If you are using an SSH connection, the following warning is displayed.

  Note: If you connect directly from the host console, the following warning will not be displayed.

  Press **Enter** to close warning prompt.

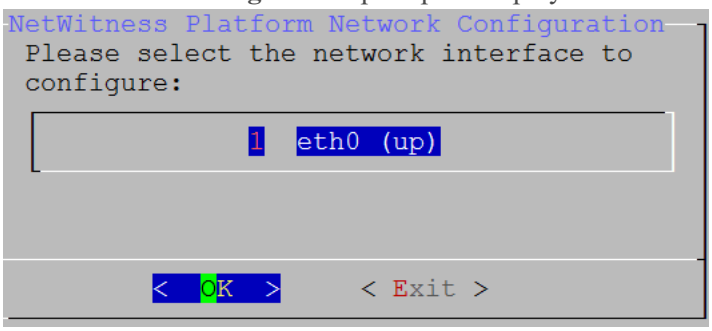
  Note: If you connect directly from the host console, the above warning will not be displayed.

- If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 12 to and complete the installation.
- If no IP configuration was found or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

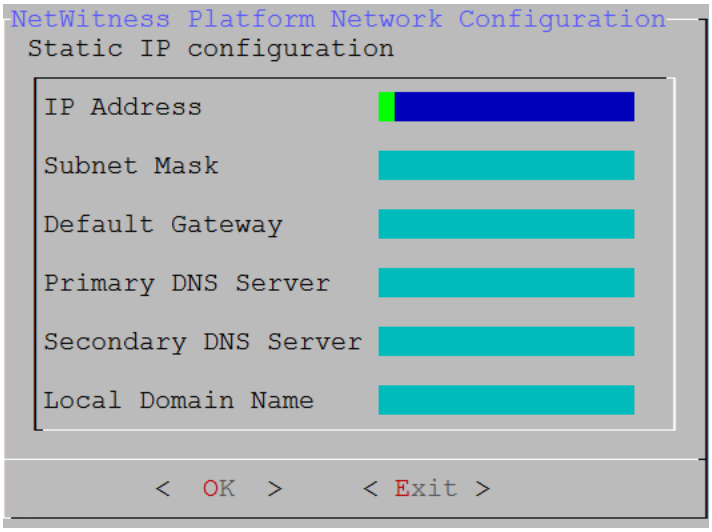


11. Tab to **OK** and press **Enter** to use **Static IP**.
    If you want to use **DHCP**, down arrow to 2 Use DHCP and press **Enter**.

The **Network Configuration** prompt is displayed.



12. Down arrow to the network interface you want, Tab to **OK**, and press **Enter**. If you do not want to continue, Tab to **Exit**
The **Static IP Configuration** prompt is displayed.

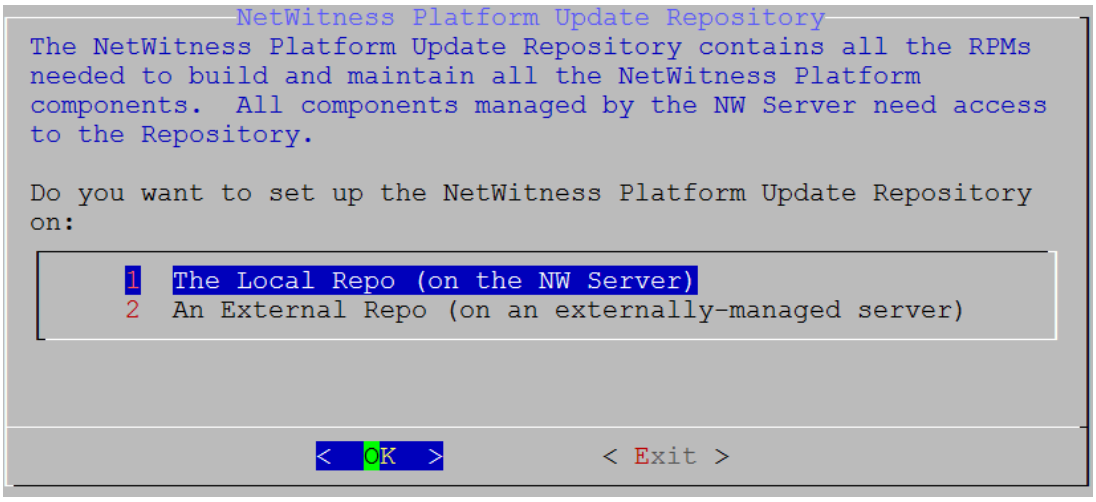


13. Type the configuration values (using the down arrow to move from field to field), Tab to **OK**, and press **Enter**.
If you do not complete all the required fields, an an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required.)
If you use the wrong syntax or character length for any of the fields, an Invalid <field-name> error message is displayed.

Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

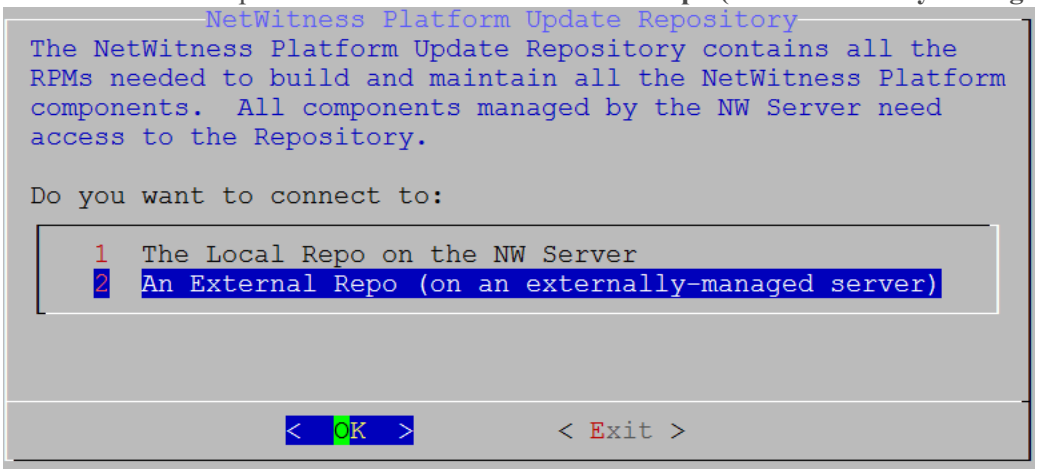
The **Update Repository** prompt is displayed.

14. Select the same repo you selected when you installed the NW Server Host for all hosts.



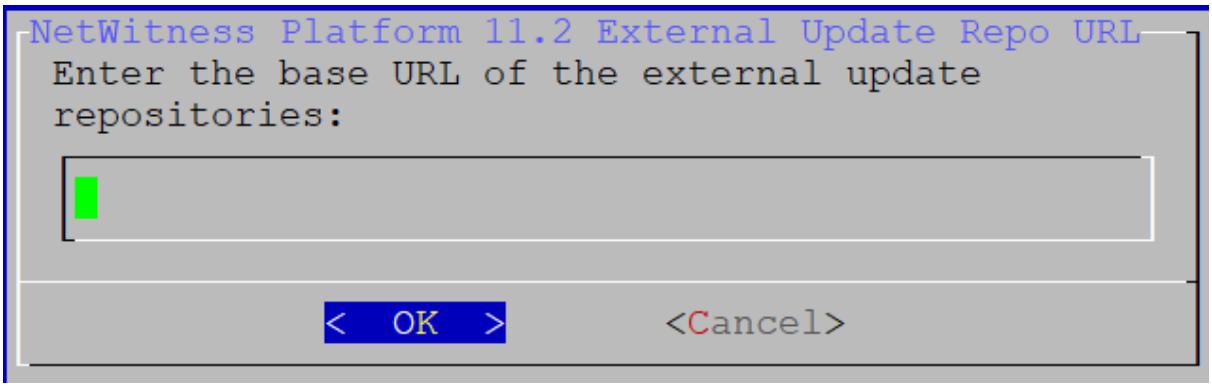
Press **Enter** to choose the **Local Repo** on the NW Server. If you want to use an external repo, down arrow to **External Repo**, tab to **OK**, and press **Enter**. If you select **1 The Local Repo (on the NW Server)** in the setup program, make sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can install NetWitness Platform 11.2.0.0.

15. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**.



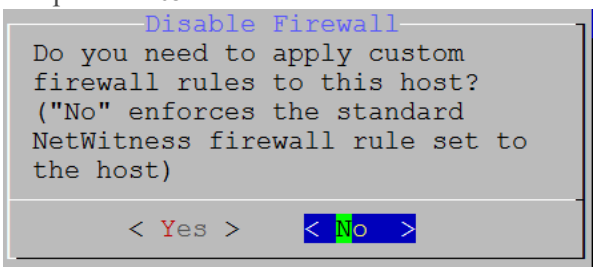
The **External Update Repo URl** prompt is displayed.
Refer to Appendix B. Create External Repository for instructions to set up an external repository. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

16. Enter the base URL of the NetWitness Platform external repo from the instructions followed in Appendix B. Create External Repository (for example, **http:/testserver/netwitness-repo**) and click **OK**.

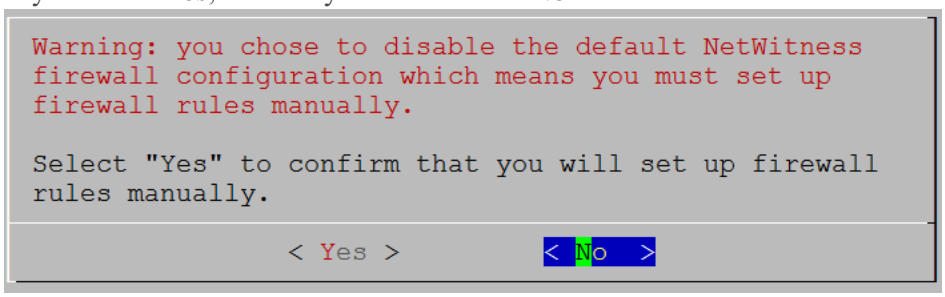


The **Disable** or use standard **Firewall** configuration prompt is displayed.

17. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

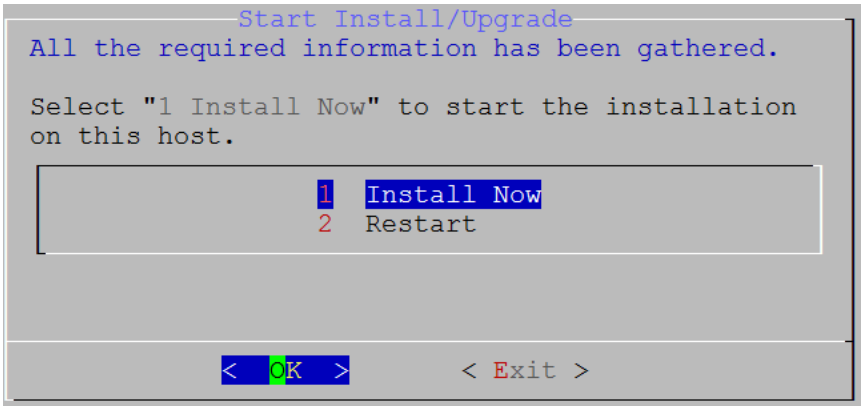


- If you select **Yes**, confirm your selection or **No** to use the standard firewall configuration.



The **Start Install/Upgrade** prompt is displayed.

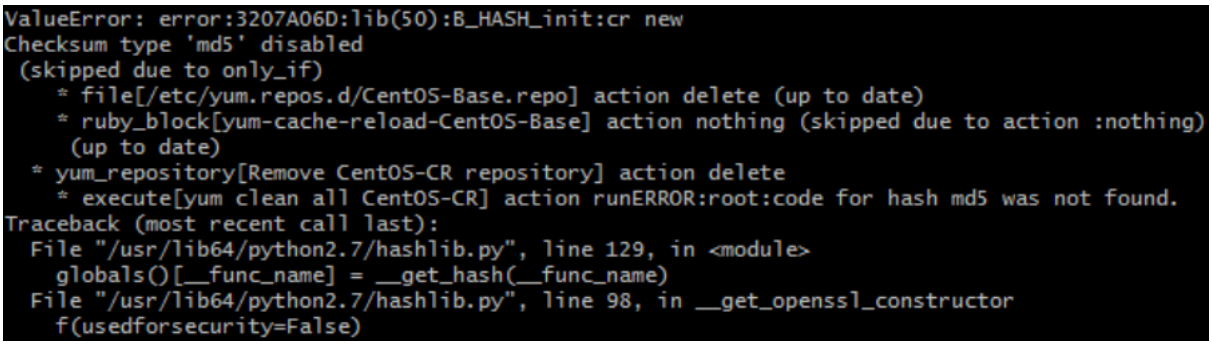
18. Press **Enter** to install 11.2.0.0 on the non-NW Server (**Install Now** is the default value).



When **Installation complete** is displayed, you have upgraded the 10.6.6 NW Server to the 11.2 NW

Server.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



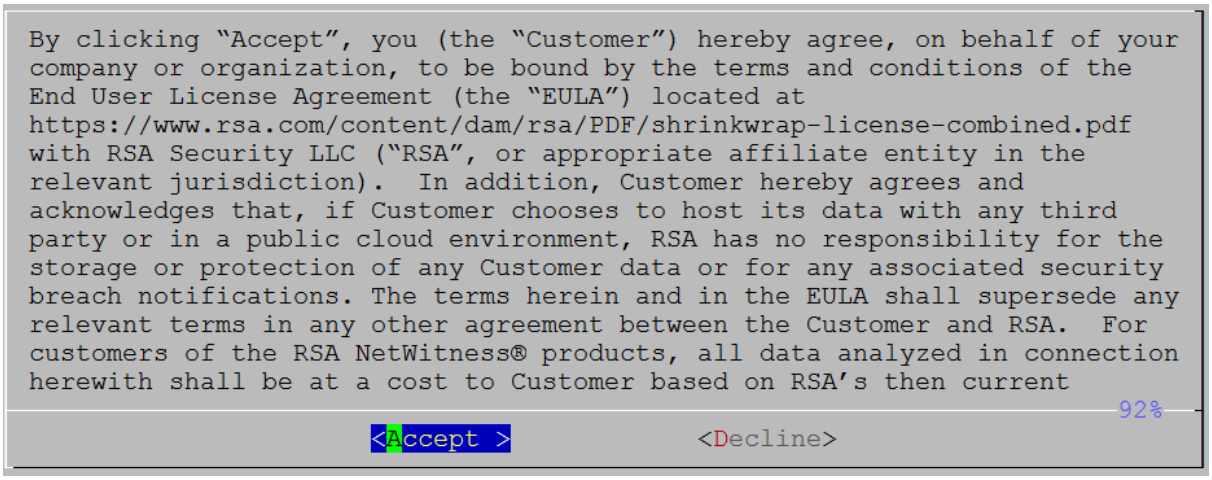
Task 2 - Install 11.2 for on Other Component Hosts

For a functional service, complete the following tasks on a non-NW Server host.

- Install the 11.2.0.0 environmental platform.
- Apply the 11.2.0.0 RPM files to the service from the NW Server Update Repository.

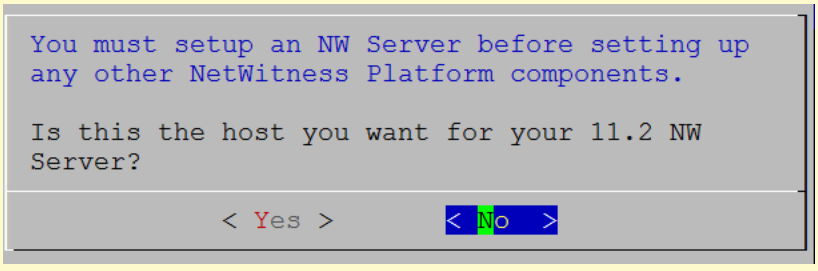
1. Deploy 11.2.0.0 OVA.
2. Run the `nwsetup-tui` command to set up the host..
   This initiates the Setup program and the EULA is displayed.

   Note: If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see (Optional) Task 1 - Re-Configure DNS Servers Post 11.2 in Post Installation Tasks.
   If you do not specify DNS Servers during `nwsetup-tui` , you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).

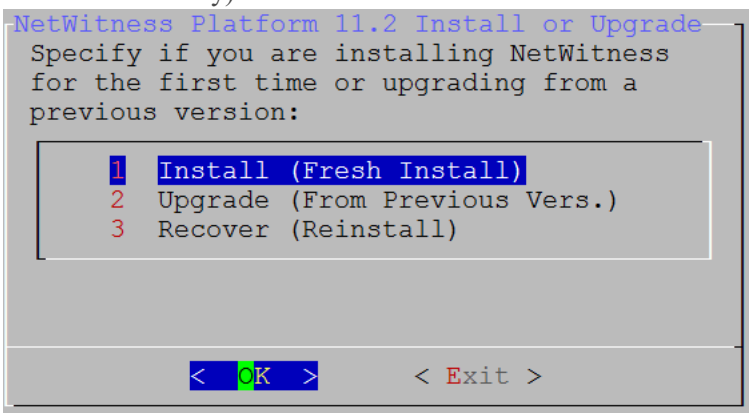
   


3. Tab to **Accept** and press Enter.
   The **Is this the host you want for your 11.2 NW Server** prompt is displayed.

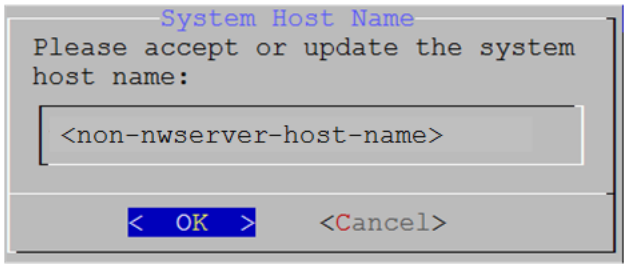
   Caution: If you choose the wrong host for the NW Server and complete the installation, you must restart the step up program and complete (steps 2 - 14) of Task 1- Install 11.2.0.0 on the NW Server Host to correct this error.

4. Press **Enter** (No).
   The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.2 Disaster Recovery).



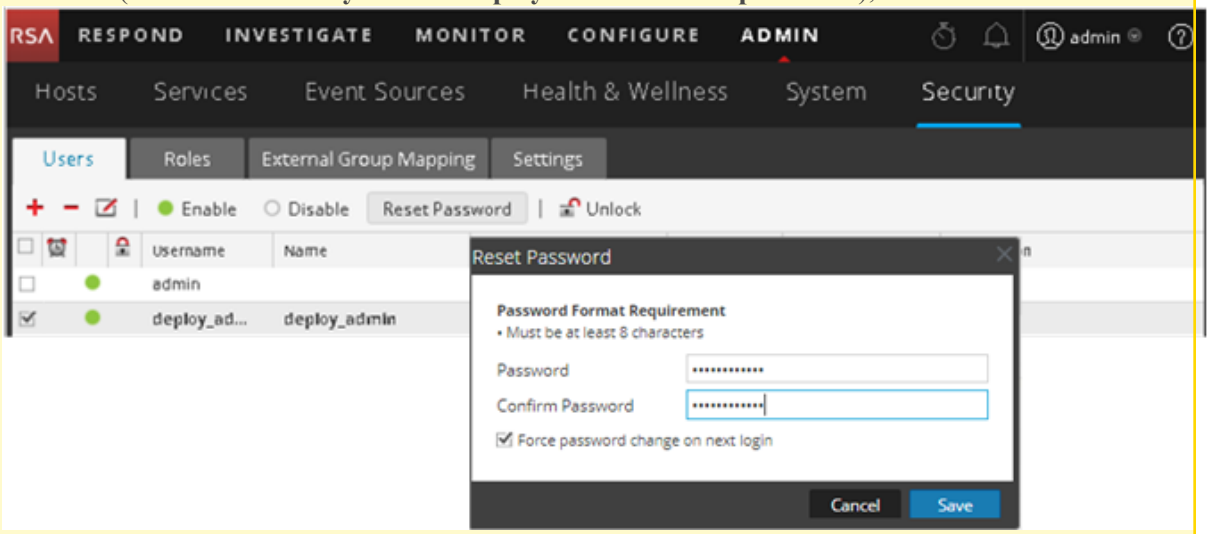
5. Press Enter. **Install (Fresh Install)** is selected by default).
   The **Host Name** prompt is displayed.



Caution: If you include "." in a host name, the host name must also include a valid domain name.

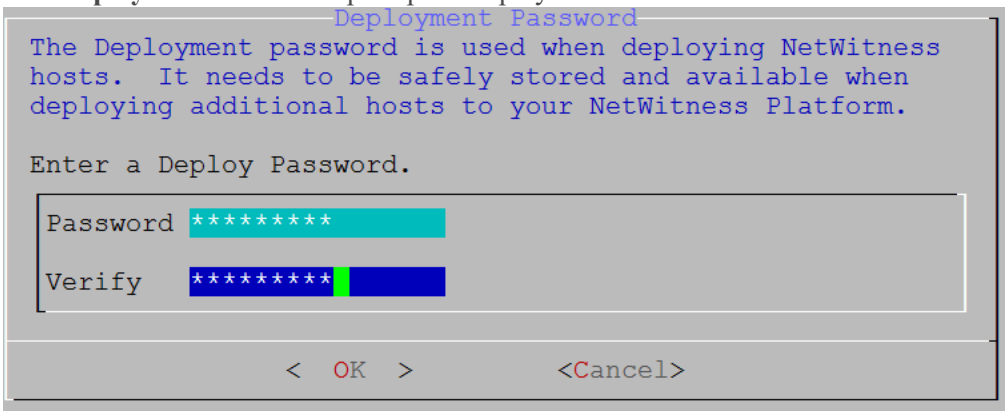
6. If want to keep this name, press **Enter**. If you want to change this name, edit it, tab to **OK**, and press **Enter**

Caution: If you change the **deploy_admin** user password in the NetWitness Platform User Interface (**ADMIN**>**Security** >Select **deploy-admin - Reset password**),



you must:
1. SSH to the NW Server host.
2. Run the `(/opt/rsa/saTools/bin/set-deploy-admin-password` script.
3. Use the new password when installing any new non-NW Server hosts.
4. Run `(/opt/rsa/saTools/bin/set-deploy-admin-password` script on all non-NW Server hosts in your deployment.
5. Write down the password because you may need to refer to it later in the installation.

The **Deployment Password** prompt is displayed.



Note: You must use the same deployment password that you used when you installed the NW Server.

7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

One of the following conditional prompts is displayed.

- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

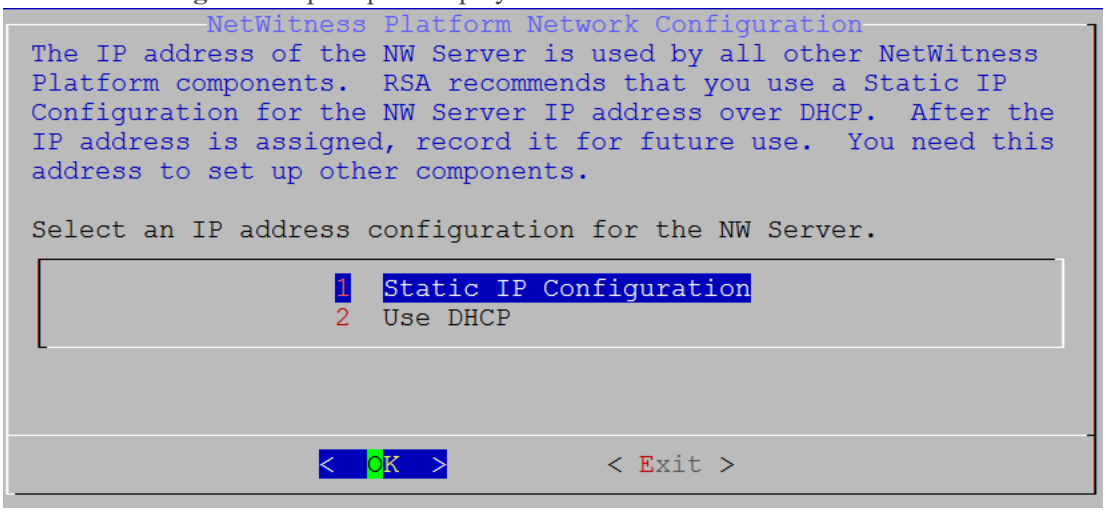
  Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** If you want to change the IP configuration found on the host.

- If you are using an SSH connection, the following warning is displayed.

  Press **Enter** to close warning prompt.

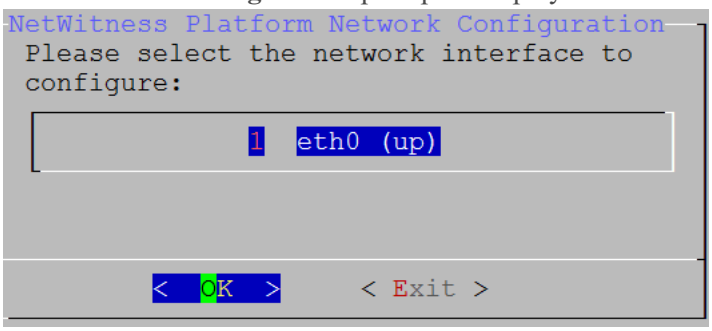
Note: If you connect directly from the host console, the above warning will not be displayed.

- If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 11 to and complete the installation.
- If no IP configuration was found or If you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

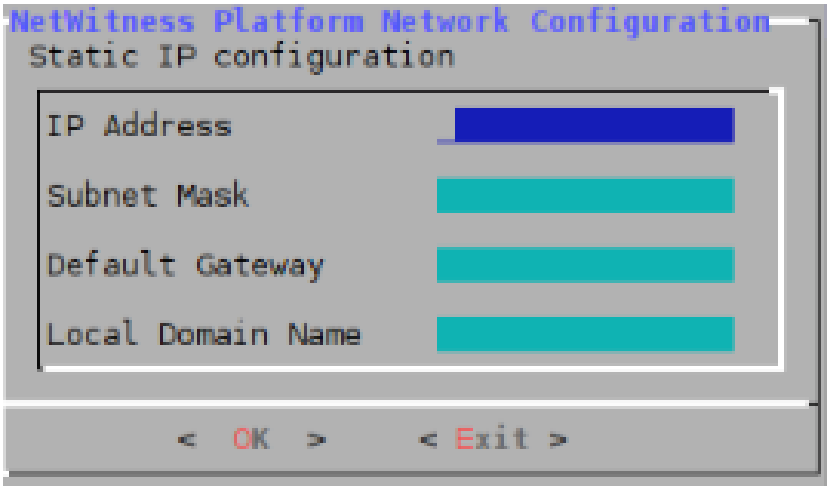


8. Tab to **OK** and press **Enter** to use **Static IP**.
   If you want to use **DHCP**, down arrow to **2 Use DHCP** and press **Enter**.

The **Network Configuration** prompt is displayed.



9. Down arrow to the network interface you want, Tab to **OK**, and press **Enter**. If you do not want to continue, Tab to **Exit**
   The **Static IP Configuration** prompt is displayed.

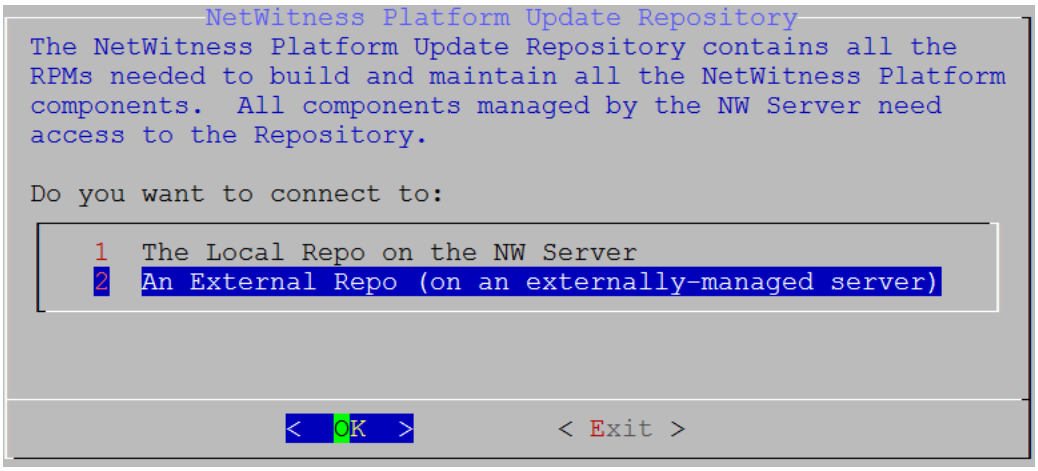


10. Type the configuration values (using the down arrow to move from field to field), Tab to **OK**, and press **Enter**.
    If you do not complete all the required fields, an an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required.)
    If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

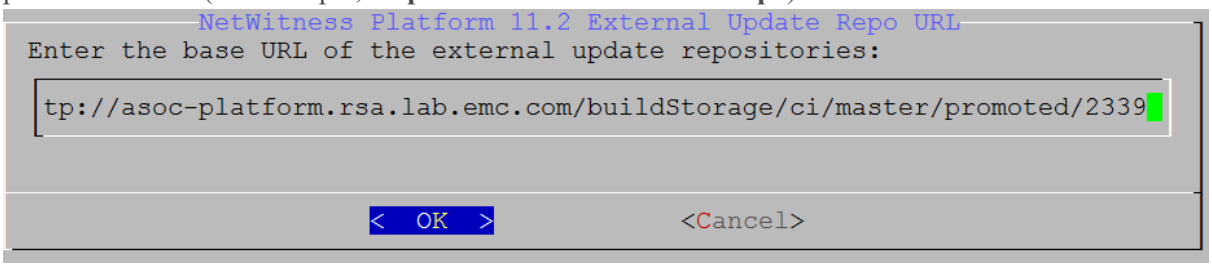
    The **Update Repository** prompt is displayed.

11. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, tab to **OK**, and press **Enter**.



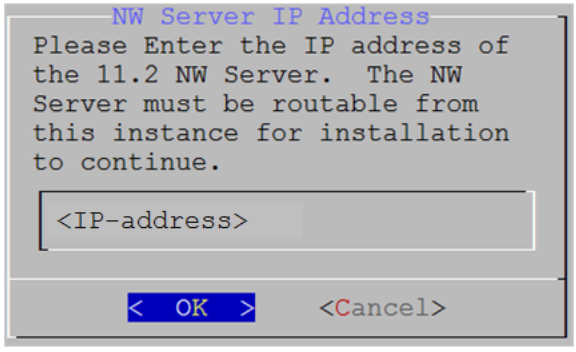
The **External Update Repo URL** prompt is displayed.
The repositories give you access RSA updates and CentOS updates.

12. Enter the base URL of the NetWitness Platform external repo used to setup NW server in the previous section (for example, **http://testserver/netwitness-repo**) and click **OK**.



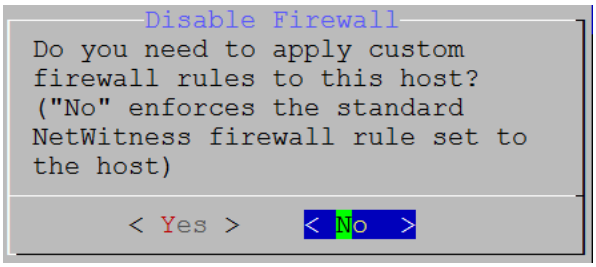
The **NW Server IP Address** is displayed.

13. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.

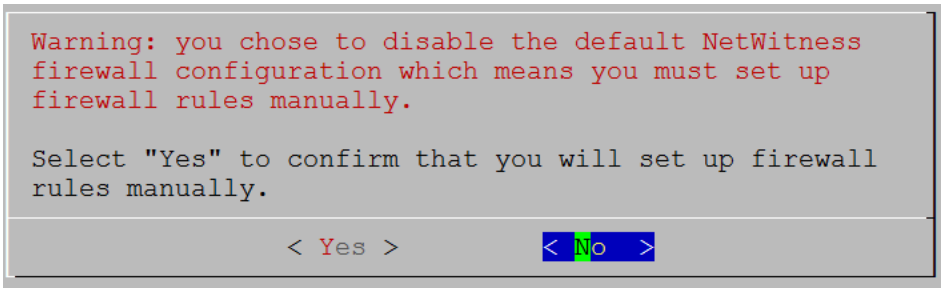


The **Disable** or use standard **Firewall** configuration prompt is displayed.

14. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.



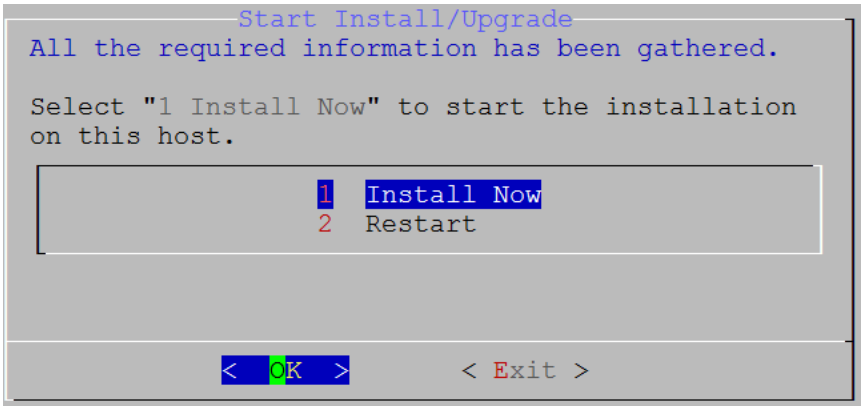
- If you select **Yes**, confirm your selection.



- If you select **No**, the standard firewall configuration is applied.

The **Start Install** prompt is displayed.

15. Press **Enter** to install 11.2.0.0 on the non-NW Server (**Install Now** is the default value).



When **Installation complete** is displayed, you have a generic host with an operating system compatible with NetWitness Platform 11.2.0.0.

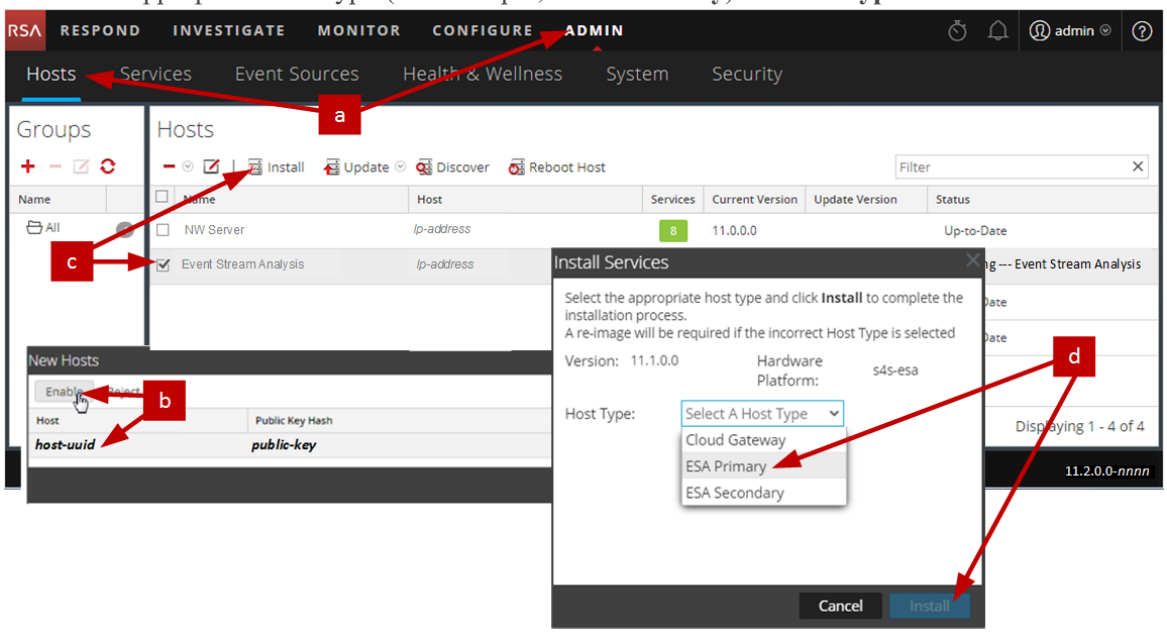
16. Install a component service on the non-NW Server host.
    a. Log into NetWitness Platform and click **ADMIN** > **Hosts**.
    The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

    Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    b. Select the host in the **New Hosts** dialog and click **Enable**.
    The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

    c. Select that host (for example, **Event Stream Analysis**) and click Install
    The **Install Services** dialog is displayed.

d. Select the appropriate host type (for example, **ESA Primary**) in **Host Type** and click **Install**.



You have completed the installation of the non-NW Server host in NetWitness Platform.

17. Complete licensing requirements for installed services.
    See the *NetWitness Platform 11.2 Licensing Management Guide* for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
18. Complete steps 1 through 16 for the rest of the NetWitness Platform non-NW Server components.

Step 4. Configure Host-Specific Parameters

Certain application-specific parameters are required to configure log ingest and packet capture in the Virtual Environment.

Configure Log Ingest in the Virtual Environment

Log ingest is easily accomplished by sending the logs to the IP address you have specified for the Decoder. The Decoder's management interface allows you to then select the proper interface to listen for traffic on if it has not already selected it by default.

Configure Packet Capture in the Virtual Environment

There are two options for capturing packets in a VMWare environment. The first is setting your vSwitch in promiscuous mode and the second is to use a third-party Virtual Tap.

Set a vSwitch to Promiscuous Mode

The option of putting a switch whether virtual or physical into promiscuous mode, also described as a SPAN port (Cisco services) and port mirroring, is not without limitations. Whether virtual or physical, depending on the amount and type of traffic being copied, packet capture can easily lead to over subscription of the port, which equates to packet loss. Taps, being either physical or virtual, are designed and intended for loss less 100% capture of the intended traffic.

Promiscuous mode is disabled by default, and should not be turned on unless specifically required. Software running inside a virtual machine may be able to monitor any and all traffic moving across a vSwitch if it is allowed to enter promiscuous mode as well as causing packet loss due to over subscription of the port..

To configure a portgroup or virtual switch to allow promiscuous mode:

1. Log on to the ESXi/ESX host or vCenter Server using the vSphere Client.
2. Select the ESXi/ESX host in the inventory.
3. Select the **Configuration** tab.
4. In the **Hardware** section, click **Networking**.
5. Select **Properties** of the virtual switch for which you want to enable promiscuous mode.
6. Select the virtual switch or portgroup you want to modify, and click **Edit**.
7. Click the **Security** tab. In the **Promiscuous Mode** drop-down menu, select **Accept**.

Use of a Third-Party Virtual Tap

Installation methods of a virtual tap vary depending on the vendor. Please refer to the documentation from your vendor for installation instructions. Virtual taps are typically easy to integrate, and the user interface of the tap simplifies the selection and type of traffic to be copied.

Virtual taps encapsulate the captured traffic in a GRE tunnel. Depending on the type you choose, either of these scenarios may apply:

- An external host is required to terminate the tunnel, and the external host directs the traffic to the Decoder interface.
- The tunnel send traffic directly to the Decoder interface, where NetWitness Platform handles the de-encapsulation of the traffic.

Step 5. Post Installation Tasks

This topic contains the task you complete after you install 11.2.

- General
- RSA NetWitness® Endpoint Insights
- FIPS Enablement
- RSA NetWitness User Entity Behavior Analytics (UEBA)

General

(Optional) Task 1 - Re-Configure DNS Servers Post 11.2

On the NetWitness Server, complete the following steps to re-configure the DNS servers in NetWitness Platform 11.2.

1. Login to the server host with your `root` credentials.
2. Edit the `/etc/netwitness/platform/resolv.dnsmasq` file:
   a. Replace the IP address corresponding to `nameserver`.
   If you need to replace both DNS servers , replace the IP entries for both the hosts with valid addresses.
   The following example shows both DNS entries.

   The following example shows the new DNS values.

   b. Save the `/etc/netwitness/platform/resolv.dnsmasq` file.
   c. Restart the internal DNS by running the following command:
   `systemctl restart dnsmasq`

RSA NetWitness Endpoint Insights

(Optional) Task 2 - Install Endpoint Hybrid or Endpoint Log Hybrid

You must install one of the following services to install NetWitness Platform Endpoint Insights in your deployment:

- Endpoint Hybrid
- Endpoint Log Hybrid

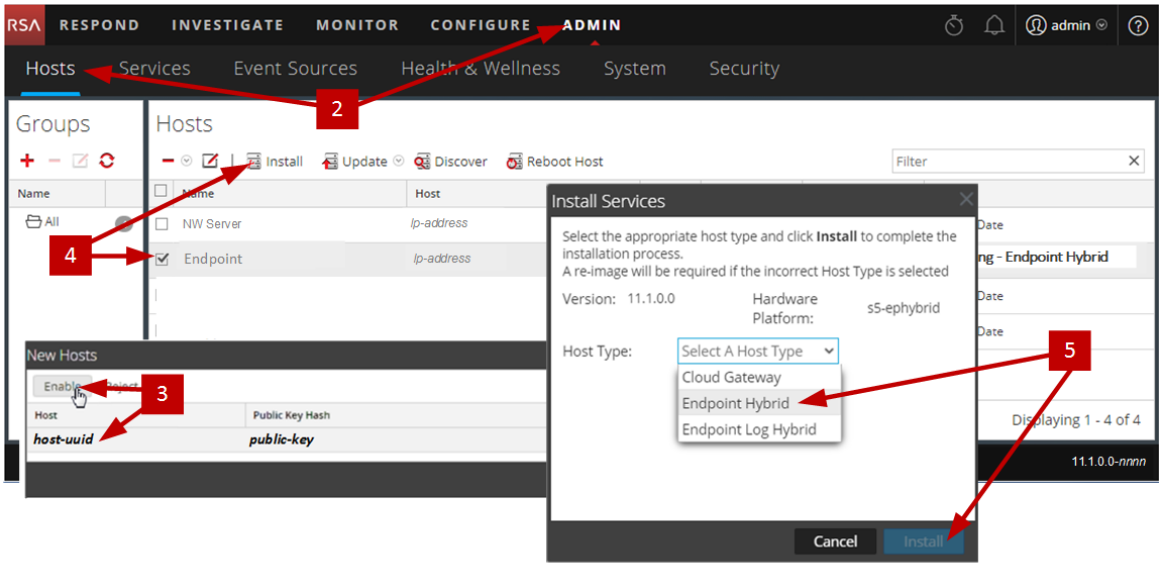
Caution: You can only install one instance of the above services in your deployment.

Note: You must install the Endpoint Hybrid or Endpoint Log Hybrid on the S5 or Dell R730 appliance.

1. Complete steps 1 - 14 for Physical Host or steps 1 - 15 for Virtual Hosts under "Task 2 - Install 11.2 on Other Component Hosts" in "Installation Tasks" of the *NetWitness Platform Physical Host Installation Guide for Version 11.2*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
2. Log into NetWitness Platform and click **ADMIN** > **Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.
3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.
4. Select that host in the **Hosts** view (for example, **Endpoint**) and click Install.
   The Install Services dialog is displayed.

5. Select the appropriate service, either **Endpoint Hybrid** or **Endpoint Log Hybrid**, and click **Install**.
   Endpoint Hybrid is used as an example in the following screen shot.



6. Make sure that all Endpoint Hybrid or Endpoint Log Hybrid services are running.
7. Configure Endpoint Meta forwarding.
   See *Endpoint Insights Configuration Guide* for instructions on how to configure Endpoint Meta forwarding. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
8. Install the Endpoint Insights Agent.
   See *Endpoint Insights Agent Installation Guide* for detailed instructions on how to install the agent. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

FIPS Enablement

(Optional) Task 3 - Enable FIPS Mode

Federal Information Processing Standard (FIPS) is enabled on all services except Log Collector, Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder. For information about how to enable FIPS for these services, see the "Activate or Deactivate FIPS" topic in the *RSA NetWitness Platform System Maintenance Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NetWitness User Entity Behavior Analytics (UEBA)

(Optional) Task 3 - Install NetWitness UEBA

Prerequisite: Increase Memory for Virtual Deployment

Virtual Machines are deployed with approximately 104 GB in the storage mount by default. To install NetWitness UEBA, you must increase the storage space in your virtual environment to at least 800 GB.

Install NetWitness UEBA

To set up NetWitness UEBA in NetWitness Platform 11.2, you must install and configure the NetWitness UEBA service.

Note: The `ueba-server-config` script referred to in these instructions is in the `/opt/rsa/saTools/` directory.

The following procedure shows you how to install the NetWitness UEBA service on a NetWitness UEBA Host Type and configure the service.

1. Complete steps 1 - 14 for Physical Host or steps 1 - 15 for Virtual Hosts under "Task 2 - Install 11.2 on Other Component Hosts" in "Installation Tasks" of the *NetWitness Platform Physical Host Installation Guide for Version 11.2*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

   Note: The Kibana and Airflow webserver User Interface password is the same as the deploy admin password. Make sure that you record this password and store it in a safe location.

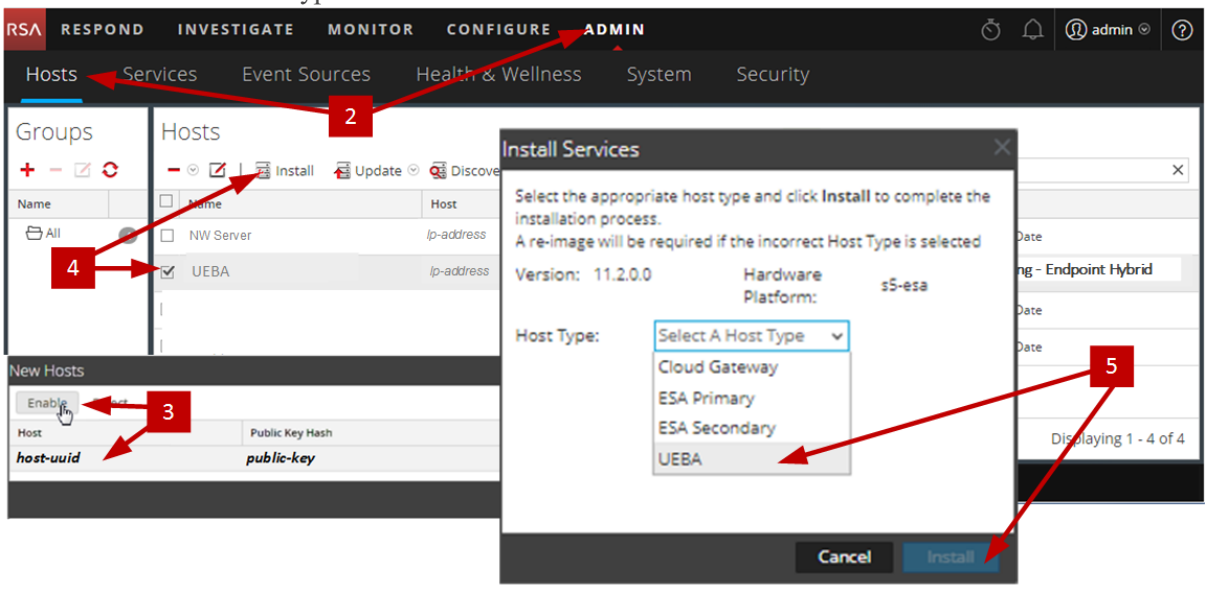
2. Log into NetWitness Platform and go to **ADMIN** > **Hosts**.
   The New Hosts dialog is displayed with the Hosts view grayed out in the background.

   Note: If the New Hosts dialog is not displayed, click **Discover** in the **Hosts** view toolbar.

3. Select the host in the **New Hosts** dialog and click **Enable**.
   The New Hosts dialog closes and the host is displayed in the Hosts view.

4. Select that host in the **Hosts** view (for example, **UEBA**) and click Install.
   The Install Services dialog is displayed.

5. Select the **UEBA** Host Type and click **Install**.



6. Make sure that the UEBA service is running.

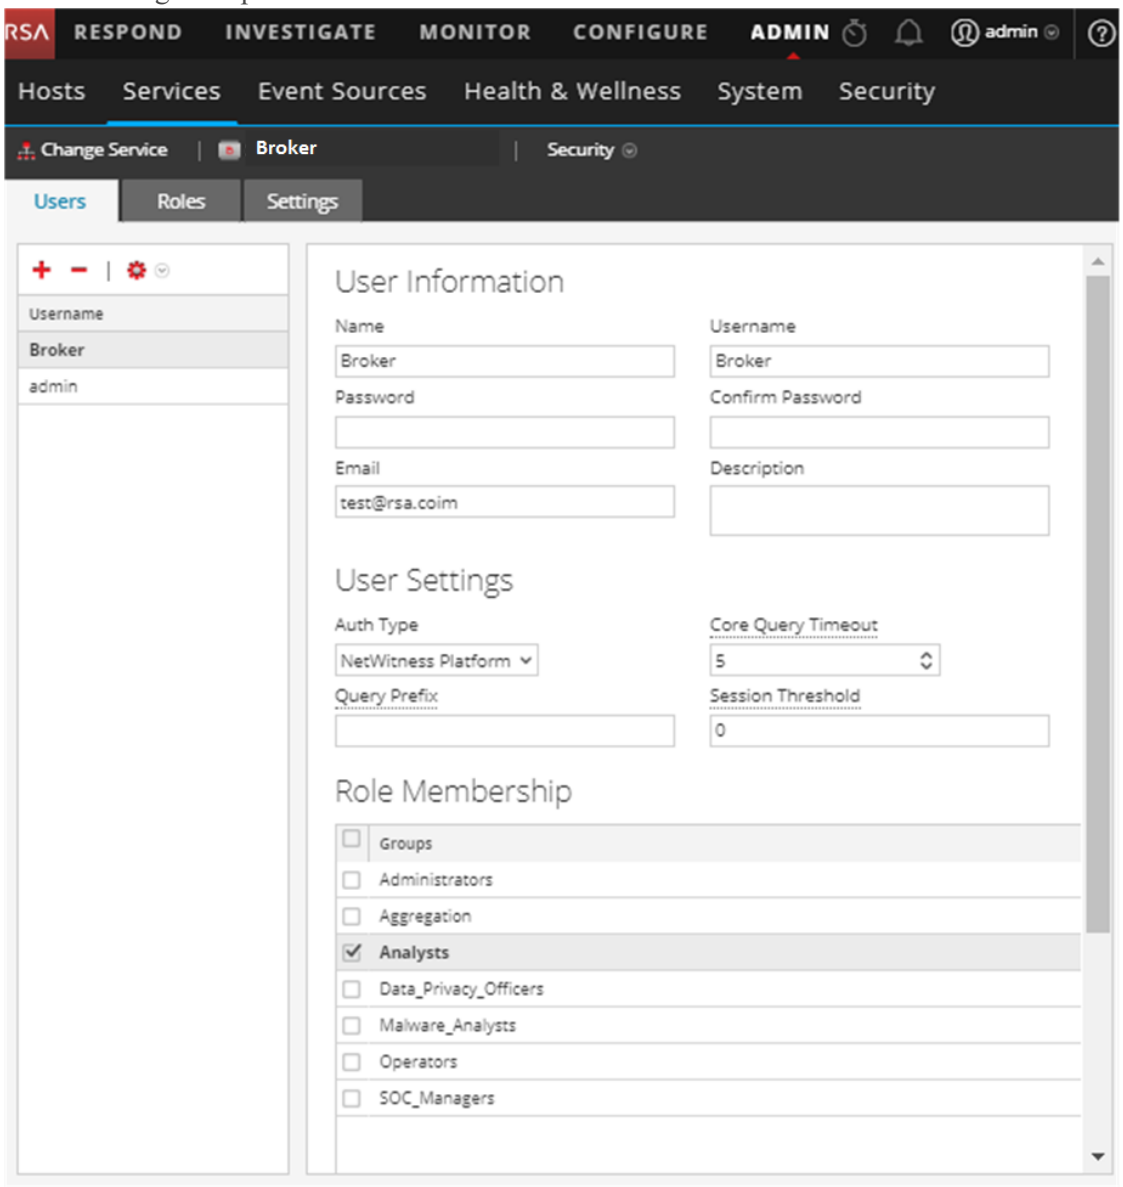
7. Complete licensing requirements for NetWitness UEBA.
   See the *NetWitness Platform 11.2 Licensing Management Guide* for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
8. Configure NetWitness UEBA.
   You need to configure a data source (Broker or Concentrator), historical data collection start date, and data schemas.

   IMPORTANT: If your deployment has multiple Concentrators, RSA recommends that you assign the Broker at the top of your deployment hierarchy for the NetWitness UEBA data source.

   a. Determine the earliest date in the NWDB of the data schema you plan to choose (`AUTHENTICATION`, `FILE`, `ACTIVE_DIRECTORY`, or any combination of these schemas) to specify in `startTime` in step c. If you plan to specify multiple schemas, use the earliest date among all the schemas. You can use one of the following methods to determine the data source date.
      - Use the Data Retention date (that is, if the Data Retention duration is 48 hours, `startTime` = <48 hours earlier than the current time>).
      - Search the NWDB for the earliest date.

   b. Create a user account for the data source (Broker or Concentrator) to authenticate to the data source.
      i. Log into NetWitness Platform.
      ii. Go to **Admin** > **Services**.
      iii. Locate the data source service (Broker or Concentrator).
      Select that service, and select  (Actions) > **View** > **Security**.
      iv. Create a new user and assign the “UEBA_Analysts” role to that user.

The following example shows a user account created for a Broker.



c. SSH to the NetWitness UEBA server host.

d. Submit the following commands.

```
./ueba-server-config.sh -u <user> -p <password> -h <host> -o <type> -t
<startTime> -s <schemas> -v
```

Where:

Argument	Variable	Description
`-u`	`<user>`	User name of the credentials for the Broker or Concentrator instance that you are using as a data source.
`-p`	`<password>`	Password of the credentials for the Broker or Concentrator instance that you are using as a data source.
`-h`	`<host>`	IP address of the Broker or Concentrator used as the data source.
`-o`	`<type>`	Data source host type (`broker` or `concentrator`).
`-t`	`<startTime>`	Historical start time as of which you start collecting data from the data source in YYYY-MM-DDTHH-MM-SSZ format (for example, `2018-08-15T00:00:00Z`).
`-s`	`<schemas>`	Array of data schemas. If you want to specify multiple schemas, use a space to separate each schema (for example, `'AUTHENTICATION FILE ACTIVE_ DIRECTORY'`).
`-v`		verbose mode.

9. Complete NetWitness UEBA configuration according to the needs of your organization. See the *RSA NetWitness UEBA User Guide* for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Appendix A. Troubleshooting

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Backup Script
- Event Stream Analysis
- Log Collector Service (`nwlogcollector`)
- Orchestration
- NW Server
- Reporting Engine
- NetWitness UEBA

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed. 2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health.AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Backup (`nw-backup` script)

Error Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA Mongo admin password back to the original default of 'netwitness' before running backup.

Error	Backup errors caused by the `immutable` attribute setting. Here is an example of an error that can be displayed: Cause	If you have any files that have the immutable flag set (to keep the Puppet process from overwriting a customized file), the file will not be included in the backup process and an error will be generated.
Solution	On the host that contains the files with the immutable flag set, run the following command to remove the immutable setting from the files: `chattr -i <filename>`

Error	Error creating Network Configuration Information file due to duplicate or bad entries in primary network configuration file: `/etc/sysconfig/network-scripts/ifcfg-em1` Verify contents of `/var/netwitness/logdecoder/packetdb/nw-backup/2018-02-23/S5-BROK-36-10.25.53.36-network.info.txt`
Cause	There are incorrect or duplicate entries for any one of the following fields: DEVICE, BOOTPROTO, IPADDR, NETMASK or GATEWAY, that were found from reading the primary Ethernet interface configuration file from the host being backed up.

Solution	Manually create a file at the backup location on the external backup server, as well as the backup location local to the host where other backups have been staged. The file name should be of the format `<hostname>-<hostip>-network.info.txt`, and should contain the following entries:
	`DEVICE=<devicename> ; # from the host's primary ethernet interface config file`
	`BOOTPROTO=<bootprotocol> ; # from the host's primary ethernet interface config file`
	`IPADDR=<value> ; # from the host's primary ethernet interface config file`
	`NETMASK=<value> ; # from the host's primary ethernet interface config file`
	`GATEWAY=<value> ; # from the host's primary ethernet interface config file`
	`search <value> ; # from the host's /etc/resolv.conf file`
	`nameserver <value> ; # from the host's /etc/resolv.conf file`

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.2.0.0 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESA Primary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA.
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6.x to 11.2.0.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Reporting Engine Service

Reporting Engine Update logs are posted to to/var/log/re_install.log file on the host running the Reporting Engine service.

Error Message	<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [><existing-GB] is less than the required space [<required-GB>]
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NetWitness UEBA

Problem	The User Interface is not accessible.
Cause	You have more than one NetWitness UEBA service existing in your NetWitness deployment and you can only have NetWitness UEBA service in your deployment.

Solution	Complete the following steps to remove the extra NetWitness UEBA service.
	1. SSH to NW Server and run the following commands to query the list of installed NetWitness UEBA services.
	`# orchestration-cli-client --list-services|grep presidio-airflow`
	`... Service: ID=7e682892-b913-4dee-ac84-ca2438e522bf, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	`... Service: ID=3ba35fbe-7220-4e26-a2ad-9e14ab5e9e15, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	2. From the list of services, determine which instance of the `presidio-airflow` service should be removed (by looking at the host addresses).
	3. Run the following command to remove the extra service from Orchestration (use the matching service ID from the list of services):
	`# orchestration-cli-client --remove-service --id <ID-for-presidio-airflow-form-previous-output>`
	4. Run the following command to update node 0 to restore NGINX:
	`# orchestration-cli-client --update-admin-node`
	5. Log in to NetWitness Platform, go to **ADMIN** > **Hosts**, and remove the extra NetWitness UEBA host.

Appendix B. Create External Repository

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. Log in to the web server host.
2. Create a directory to host the NW repository (`netwitness-11.2.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, if `/var/netwitness` is the `web-root`, submit the following command string.
   `mkdir -p /var/netwitness/<your-zip-file-repo>`
3. Create the 11.2.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0`
4. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.2.0.0`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS`
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0/RSA`
5. Unzip the `netwitness-11.2.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.2.0.0` directory.
   `unzip netwitness-11.2.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0`
   Unzipping `netwitness-11.2.0.0.zip` results in two zip files (`OS-11.2.0.0.zip` and `RSA-11.2.0.0.zip`) and some other files.
6. Unzip the:
   a. `OS-11.2.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.2.0.0/OS` directory.
      `unzip /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS-11.2.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS`
      The following example illustrates how the Operating System (OS) file structure will appear after you unzip the file.

March 2018

Contents

Create Host Build Stick

These instructions tell you how to image an RSA NetWitness Suite host with the NetWitness Suite software image.

Resources Required

You need the following tools to complete these instructions.

- Automated tool to create a build stick [for example Universal Netboot (UNetbootin) installer tool]
- NetWitness Suite USB file
- USB drive with 8GB capacity

Automated Tool to Create Build Stick

You can use an automated tool to create the build stick. The UNetbootin tool is used in the examples in this document.

Note: Make sure that you have all of the resources listed above before starting the process.

Build Stick Installation Media

Installation media is in the form of ISO files, which are available for download from Download Central (https://download.rsasecurity.com). As part of your order fulfillment, RSA gives you access to the ISO files that pertain to each customer order.

NetWitness Suite ISO Files

The `rsa-<release number>.<build-number>.<OS number>-usb.iso` is the file naming convention for ISO files. When installing software on your NetWitness Suite host, make sure you are using the correct release. This document uses `rsa-11.x.x.x.<build-number>.el7-usb.iso` as an example of an ISO file.

Contact Customer Care at nwsupport@rsa.com for assistance.

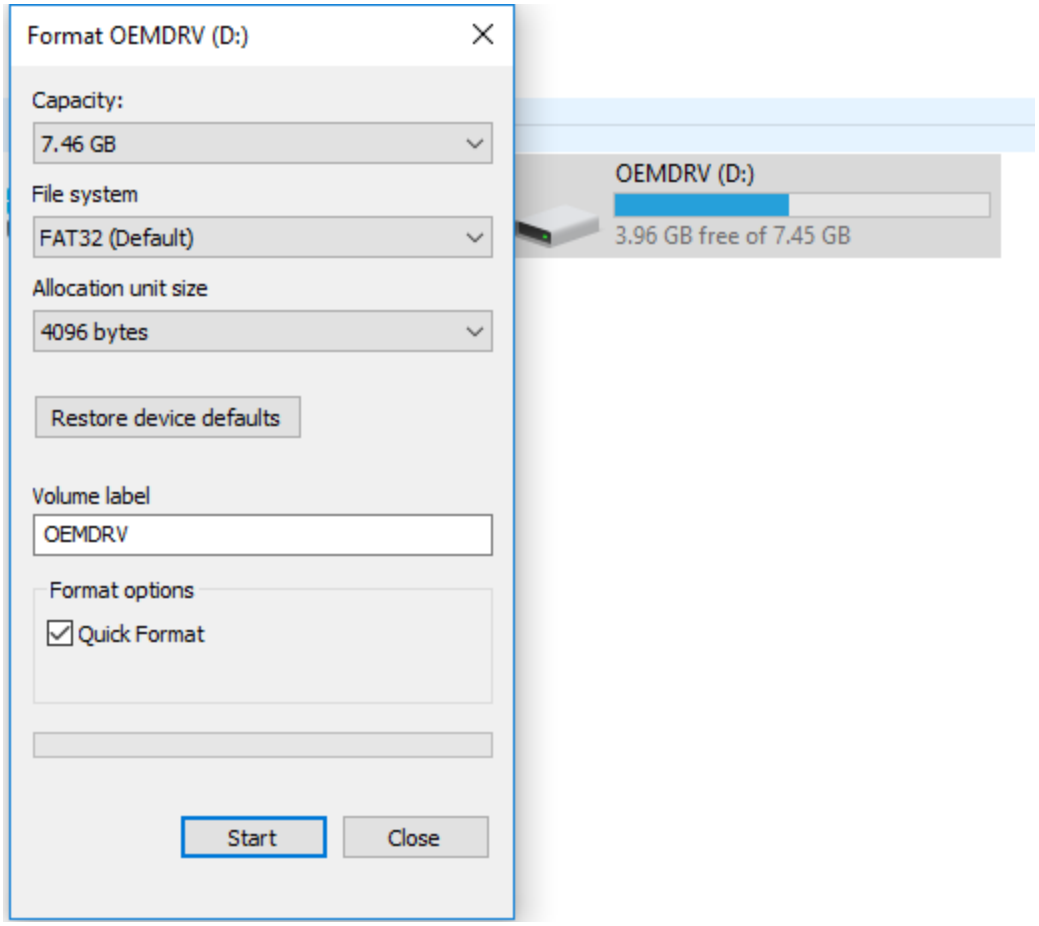
Create a NetWitness Suite USB Build Stick

Note: You must use a USB drive that is 8GB or larger and is formatted as FAT32.

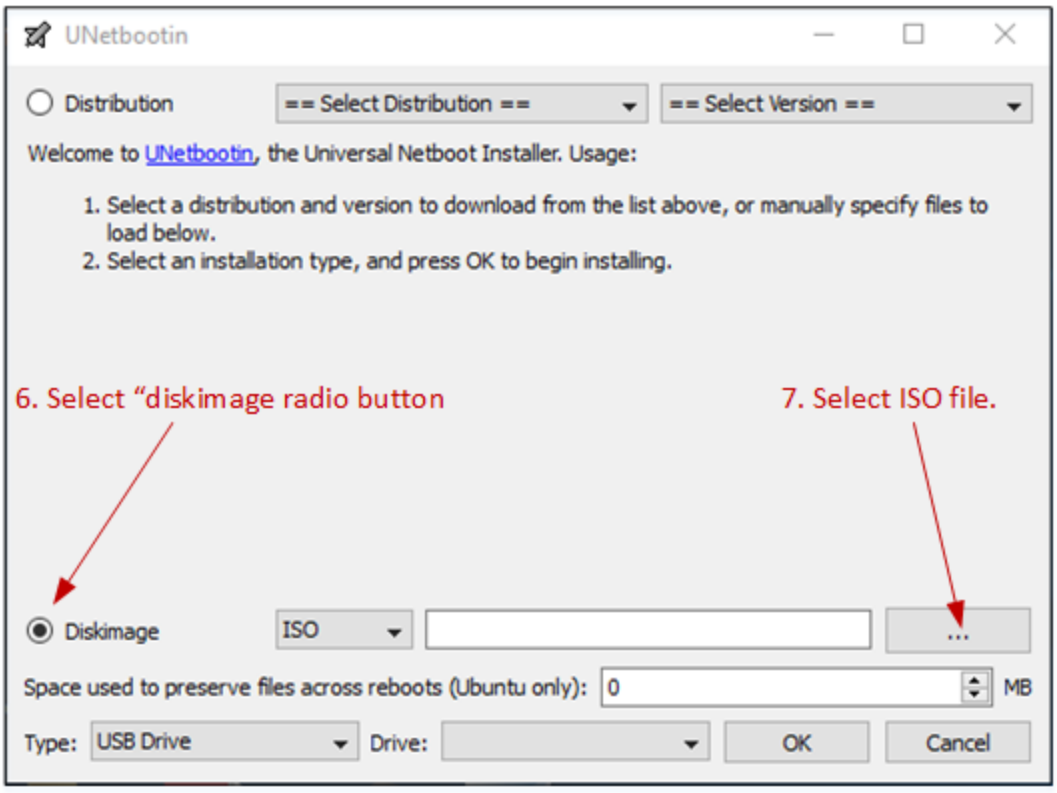
These instructions tell you how to create a USB "build-stick" to load the operating system and NetWitness Suite software onto your NetWitness Suite host.

Caution: All existing data on the USB drive will be destroyed.

1. Insert the USB drive that you will use as the build stick.
2. Format the USB drive.
   a. In Microsoft Windows Explorer, go to "**This PC**" for Windows 10 or **Computer** for older Windows Operating Systems.
   b. Right click the USB device, and click **Format**.
   c. In the format menu, make sure that your drive has **OEMDRV** for the **Volume label**, check the **Quick Format** checkbox, and click **Start**.

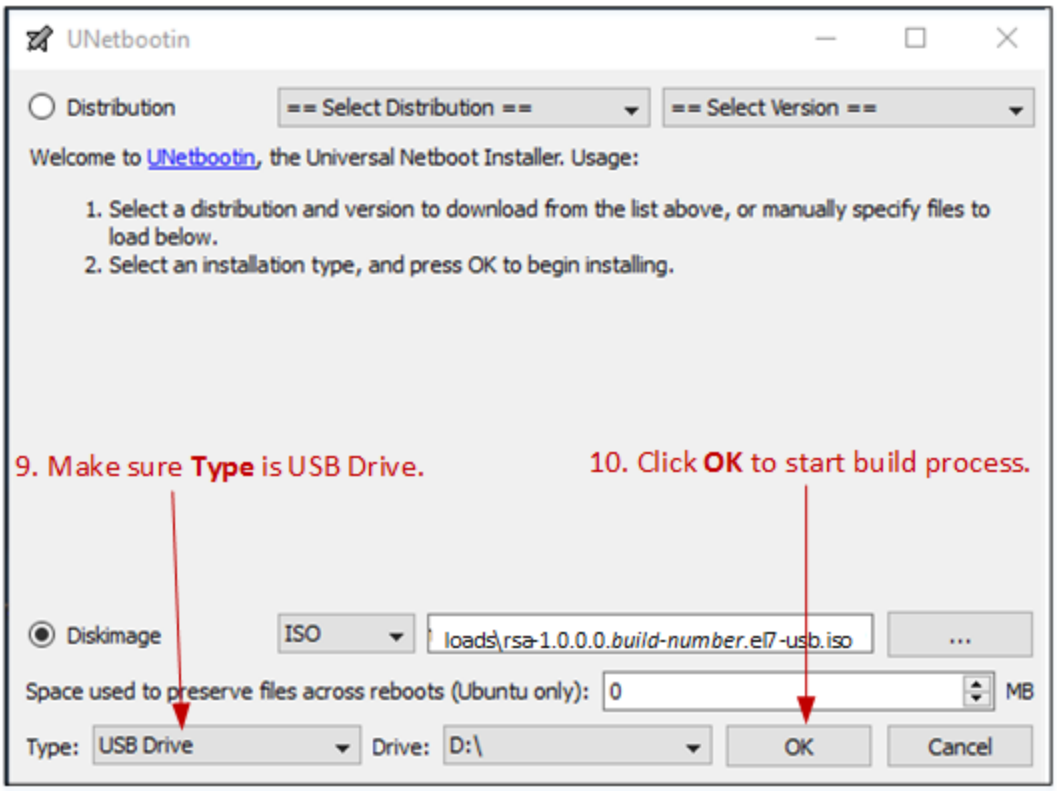


3. Download the NetWitness Suite USB ISO image.
4. Download an automated tool to create a build stick (for example UNetbootin).
5. Launch the tool.



6. Select the **Diskimage** radio button.
7. Select the appropriate version of the NetWitness Suite ISO by clicking on ... and navigating to the ISO file in your Local directory (for example, **C:/temp/rsa-11.x.x.x.<build-number>.el7-usb.iso**).

8. Highlight the usboot file and click **Open** to select the ISO file.



9. Confirm the **Type** is set to USB Drive and the **Drive** is set to the appropriate USB drive.
10. Click **OK** to start the build process.
11. After the process completes, **Exit** to complete the automated file extraction. (Do not click **Reboot Now** unless you want to reboot your Windows computer.)
12. Go to My Computer, right click **USB** and click **Safely Remove or Eject**.
13. After the USB drive is ejected, unplug the USB device.
    The bootable USB is now ready.

Contents

Introduction

Note: The information in this guide applies to Version 11.1 and later.

Hosts can be laptops, workstations, servers, tablets, routers, or any system, physical or virtual, where a supported operating system is installed. An Endpoint Insights Agent can be deployed on a host with either a Windows, Mac, or Linux operating system. The installation process involves:

1. Generating an agent packager to collect only endpoint data or to collect both endpoint and log data (Windows only)
2. Generating the agent installer

You can run the agent installer specific to your operating system to deploy agents on the hosts. The agents collect endpoint data and Windows logs (if enabled) from these hosts. It monitors activities and reports data and scan results to the Endpoint Hybrid or Endpoint Log Hybrid over HTTPs.

Supported Operating Systems

Windows

The agent software runs on the following Windows operating systems:

- Windows Vista (32 and 64-bit)
- Windows 7 (32 and 64-bit)
- Windows 8 (32 and 64-bit)
- Windows 8.1 (32 and 64-bit)
- Windows 10 (32 and 64-bit)
- Windows 2008 Server (32 and 64-bit)
- Windows 2008 R2 (32 and 64-bit)
- Windows 2012 Server
- Windows 2012 Server R2
- Windows 2016 Server

Linux

The agent software runs on either i386 or x84_64 architecture and on the following Linux operating systems:

- CentOS 6.x and 7.x
- Red Hat Linux 6.x and 7.x

Mac

The agent software runs on the following Mac operating systems:

- Mac OS X 10.9 (Mavericks)
- Mac OS X 10.10 (Yosemite)
- Mac OS X 10.11 (El Capitan)
- Mac OS X 10.12 (Sierra)

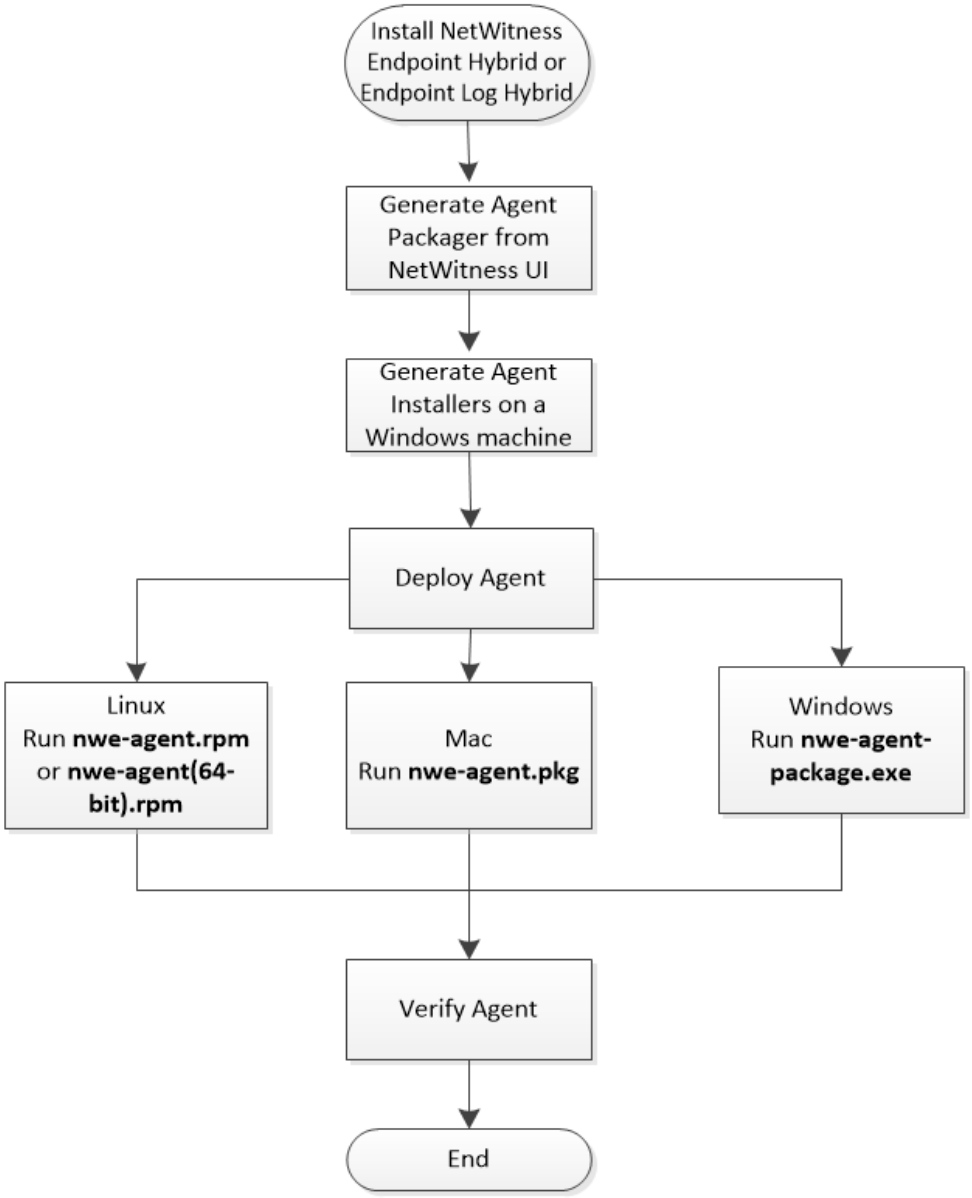
Hardware Requirements

The following are the minimum hardware requirements to deploy an agent:

- 256 MB RAM
- 100 MB disk space
- Single-core CPU

Installation Flowchart

The following flowchart illustrates the Endpoint agent installation process:



Install NetWitness Endpoint Hybrid or Endpoint Log Hybrid
Generate Agent Packager from NetWitness UI
Generate Agent Installers on a Windows machine
Deploy Agent
Linux
Run **nwe-agent.rpm** or **nwe-agent(64-bit).rpm**
Mac
Run **nwe-agent.pkg**
Windows
Run **nwe-agent-package.exe**
Verify Agent
End

Prerequisites

- Install RSA NetWitness Platform. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*.
- Configure NetWitness Endpoint Hybrid or Endpoint Log Hybrid. For more information, see the *Endpoint Insights Configuration Guide*.
- Configure Metadata Forwarding for the NetWitness Endpoint 11.1 Agents. For more information, see the *Endpoint Insights Configuration Guide*.

Generate an Endpoint Agent Packager

Generating an Agent Packager for Endpoint Data Collection

To generate an agent packager for collecting only endpoint data from hosts:

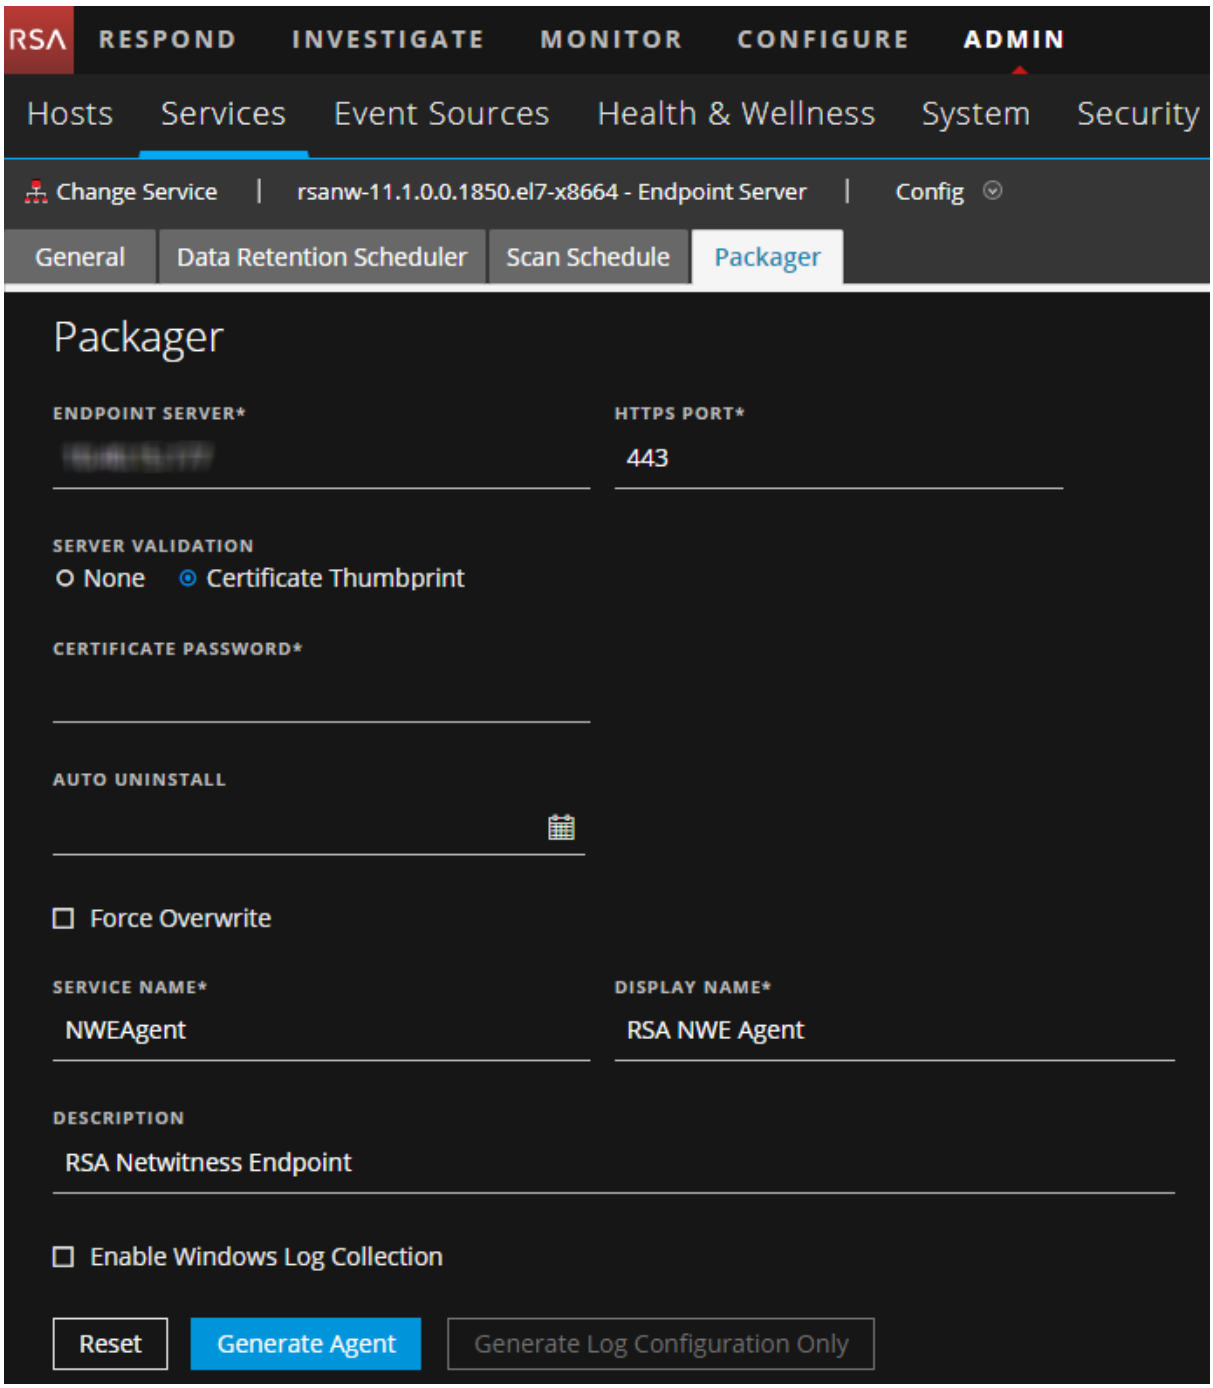
1. Log in to NetWitness Platform.

   Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Platform Login screen.

2. Click **ADMIN > Services**.

3. Select the **Endpoint Server** service and click  **> View > Config > Packager** tab. The

Packager tab is displayed.



4. Enter the values in the following fields:

Field	Description
Endpoint Server	Host name or IP address of the Endpoint Server. For example, 10.10.10.3.
HTTPS Port	Port number. For example, 443.
Server Validation	Determines how the agent validates the Endpoint Server certificate: • None – The agent will not validate the server certificate. • Certificate Thumbprint – default selection. The agent identifies the server by validating the thumbprint of the Root CA of the server certificate.
Certificate Password	Password used to download the packager. The same password is used while generating the agent installer. For example, netwitness.
Auto Uninstall	Date and time the agent automatically uninstalls. You can leave it blank if not required.
Force Overwrite	Overwrites the installed Windows agent regardless of the version. If this option is not selected, the same installer can be run multiple times on a system, but installs the agent only once. If you enable this option, make sure that you provide the same service name as the previously installed agent, while creating a new agent. **Note:** If you want to force overwrite with MSI, run the following command: `msiexec /fvam <msifilename.msi>`
Service Name	Name of the agent. This field is applicable only for Windows. For example, NWEAgent.
Display Name	Display name of the agent. This field is applicable only for Windows. For example, NWE.
Description	Description of the agent. This field is applicable only for Windows. For example, RSA NetWitness Endpoint.
Generate Agent	Generates an agent packager.

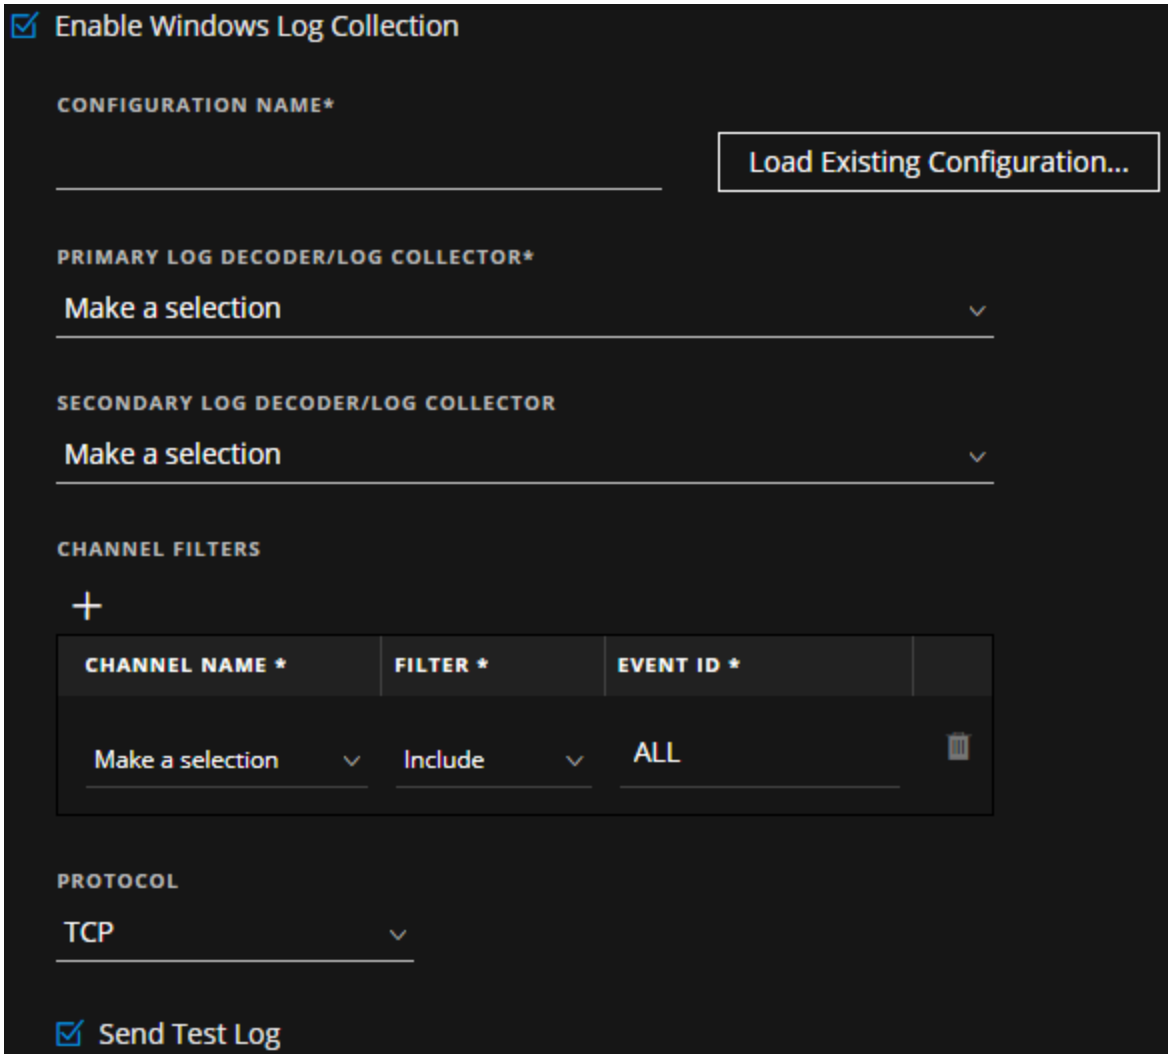
5. Click **Generate Agent**.

This downloads an agent packager (**AgentPackager.zip**)on the host where you are accessing the NetWitness Platform user interface.

Generating an Agent Packager with Windows Log Collection

You can enable the Windows Log Collection feature in the agent while generating the agent packager. By enabling this option, a Log Configuration file is generated, and the agent can collect and forward Windows logs. To enable the Windows Log Collection:

1. Perform steps 1 to 4 in Generating an Agent Packager for Endpoint Data Collection.
2. Select **Enable Windows Log Collection**.



3. Enter or select the values in the following fields:

Field	Description
Configuration Name	Name of the configuration. Configuration name can have special characters, alphanumeric values, hyphens, spaces, and underscores.
Load Existing Configuration	Loads an existing configuration from the user system. The Windows Log Collection fields get populated with the information on a successful upload. **Note:** Warning messages are displayed during upload if there are any errors or warning.
Primary Log Decoder/Log Collector	Primary Log Decoder or Log Collector for forwarding logs. This displays the list of Log Decoders or Remote Log Collectors in the current deployment. This field is a combination of display name of service, host name, and service type.
(Optional) Secondary Log Decoder/Log Collector	Secondary Log Decoder or Log Collector for forwarding logs. The secondary Log Decoder or Log Collector receives the Windows events if the agent cannot reach the primary Log Decoder or Log Collector. **Note:** When the Endpoint Agent is configured to use the UDP protocol and the Primary Log Decoder/ Remote Log Collector is not reachable, the secondary Log Decoder or Log Collector is not functional. The logs are not forwarded to the secondary Log Decoder or Log Collector when the primary is down, thus resulting in the event loss.
Protocol	Select the protocol from the drop-down menu. The available options are UDP, TCP, and TLS. By default, the protocol is TCP.

Field	Description
Channel Filters	Channels from which the logs are collected. You can add or remove a channel filter. There should be at least one channel filter to collect the logs. • **Channel Name**: Select the channel from the drop-down menu. The available options are System, Security, Application, Setup, and Forwarded Events. You can also create a custom channel by entering a custom channel name path. This is added to the channel name list. To find custom channels, go to the **Windows Event Viewer** on your computer. • **Filter**: Click  to add a channel filter. Click the drop-down menu to Include or Exclude the event IDs from a particular channel when generating the agent packager or the Log Configuration file. By default, for the Include option, the Event ID is set to **ALL**. For the Exclude option, the Event ID is set to blank. Click  to remove a channel filter. • **Event ID**: Enter the Event IDs for this channel. These are specific to channels and are the IDs that need to be collected. The event IDs can be numeric or a range. For example, use it in a range, 15-32. But, a reverse range is not allowed, for example, 32-15. Event IDs can also be used as combinations, for example, list of event IDs separated by commas, such as 248, 903, 16384, and so on. **Note:** When you enter ALL, it implies all event IDs for that channel. You can use Windows Event Viewer to identify event IDs and channel name to be configured in the UI. The following example displays the navigation to get event ID and channel name for Windows Powershell. To view the information, go to Run and type `Event Viewer`, go to **Applications and Services Logs** > **Windows Powershell**. The event IDs and channel name in Application and Services Logs for Windows Powershell are displayed.

Field	Description
	Send test log	Sends a test log message. By default, this option is enabled. A test log message is sent on a new agent deployment or configuration change from the agent to the Log Decoder. It contains all the fields configured for the agent. These events can help understand agents' connectivity to the destination.
Generate Agent	Generates an agent packager. The Log Configuration file is created in the **AgentPackager.zip** file.
Generate Log Configuration Only	Generates the Log Configuration file as per the parameters specified above or if uploaded using the Load Existing Configuration option. **Note:** The content of the generated Log Configuration file should not be tampered. If any changes are made, the agent does not read the information from the file.

Note: You can enable the Windows Log Collection feature later by downloading and deploying the Log Configuration file. For more information, see "Add/Update Windows Log Collection file using Endpoint Agent" in the *Log Collection Configuration Guide*.

Generate Endpoint Agent Installers

To generate endpoint agent installers to deploy on hosts:

Note: Use a Windows machine to execute the agent packager file.

1. Unzip the **AgentPackager.zip** file. It includes the following:
   - **agents** folder – Contains executables for Linux, Mac, and Windows.
   - **config** folder – Contains configuration file and the certificates required to communicate between the Endpoint Server and the agent.
   - **AgentPackager.exe** file.
2. Run the **AgentPackager.exe** file.
3. Enter the same password used while generating the agent packager and press **Enter**.
   This creates the following installers in the root folder:
   - nwe-agent-package.exe (for Windows)
   - nwe-agent.pkg (for Mac)
   - nwe-agent.rpm (for Linux 32-bit)
   - nwe-agent(64-bit).rpm (for Linux 64-bit)

Deploy and Verify Endpoint Agents

This section provides instruction on how to deploy and verify agents.

Deploying Agents (Windows)

To deploy the agent, run the **nwe-agent-package.exe** file on the hosts you want to monitor.

Verifying Windows Agents

After deploying the Windows agents, you can verify if a Windows agent is running by using any of the following methods:

- Using the NetWitness UI

  The Investigate > Hosts view contains the list of all hosts with an agent. You can look for the host name on which the agent is installed.

  Note: Click **Investigate** > **Hosts** or press F5 to refresh the list for latest data.

- Using Task Manager

  Open Task Manager and look for service name that you configured while generating the agent packager.

- Using Services.msc

  Open `Services.msc` in run and look for NWEAgent.

Deploying Agent (Linux)

To deploy the agent, run the **nwe-agent.rpm** (for 32-bit) or **nwe-agent(64-bit).rpm** (for 64-bit) file on the hosts you want to monitor. Use the 32-bit rpm for i386 and 64-bit rpm for x84_64 machines.

Verifying Linux Agents

After deploying the Linux agents, you can verify if a Linux agent is running by using any of the following methods:

- Using the NetWitness UI

  The Investigate > Hosts view contains the list of all hosts with an agent.

  Note: Click **Investigate > Hosts** or press F5 to refresh the list for latest data.

- Using Command Line

  Run the following command to get the PID:

  ```
  pgrep nwe-agent
  ```

- To check the NetWitness Endpoint version, run the following command:

  ```
  cat /opt/rsa/nwe-agent/config/nwe-agent.config | grep version
  ```

Deploying Agent (Mac)

To deploy the agent, run the **nwe-agent.pkg** file on the hosts you want to monitor.

Verifying Mac Agents

After deploying the Mac agents, you can verify if a Mac agent is running by using any of the following methods:

- Using the NetWitness UI

  The Investigate > Hosts view contains the list of all hosts with an agent.

  Note: Click **Investigate > Hosts** or press F5 to refresh the list for the latest data.

- Using Activity Monitor

  Open Activity Monitor (/Applications/Utilities/Activity Monitor.app) and look for NWEAgent.

- Using Command Line

  Run the following command to get the PID

  ```
  pgrep NWEAgent
  ```

- To check the NetWitness Endpoint version, run the command:

  ```
  grep a /var/log/system.log | grep NWEAgent | grep Version
  ```

Configuring the Communication Between Endpoint Server and Endpoint Agents on Windows Vista, 2008 Server, Mac OS X 10.9 and 10.10

By default, the FIPS mode is enabled on the Endpoint Server, which means that agents installed on Windows Vista, 2008 Server, Mac OS X 10.9 and 10.10 cannot communicate with the Endpoint server.

To resolve this, perform the following steps on the Endpoint Hybrid or Endpoint Log Hybrid to disable the FIPS mode:

1. Go to `/etc/pki/tls/owb.cnf` and edit the file to disable the FIPS mode.

```
# FIPS Mode
#   Configures the BSAFE Libraries to be in FIPS Mode.
#
#   Values: "on", "off".
#   Default: "off"
fips mode = off
```

2. Go to `/etc/nginx/conf.d/nginx.conf` and edit the file to comment the following lines:

```
#    ssl_ciphers AES256+EECDH:AES256+EDH:!aNULL;
#    ssl_prefer_server_ciphers on;
```

3. Restart the Nginx server using the following command:

```
systemctl restart nginx
```

Uninstall Agents

This section provides the commands to uninstall the agent.

Uninstalling Windows Agent

Run the following command:

```
msiexec /x{63AC4523-5F19-42F0-BC43-97C8B5373589}
```

Uninstalling Linux Agent

Run the following command:

```
rpm –ev nwe-agent
```

Uninstalling Mac Agent

Run the following commands:

1. `sudo launchctl unload /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
2. `sudo rm -Rf /usr/local/nwe`
3. `sudo rm -Rf '/Library/Application Support/NWE'`
4. `sudo rm –Rf /Library/LaunchDaemons/com.rsa.nwe.agent.daemon.plist`
5. `sudo pkgutil --forget com.rsa.pkg.nwe`

RSA NETWITNESS® PLATFORM

Physical Host Upgrade Guide

for Version 10.6.6.x to 11.2

Contact Information

RSA Link at https://community.rsa.com contains a knowledgebase that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

Contents

Introduction

The instructions in this guide apply to the upgrade of physical hosts to RSA NetWitness® Platform 11.2 exclusively. See the *NetWitness Platform 10.6.6.x to 11.2 Virtual Host Upgrade Guide* for instructions on how to upgrade your virtual hosts to 11.2.

NetWitness Platform 11.2 is a major release that affects all products in the NetWitness Platform. The components of the platform are the NetWitness Server (Admin server, Config server, Integration server, Investigate server, Orchestration server, Respond server, Security sever, and Source server), Archiver, Broker, Concentrator, Context Hub, Decoder, Endpoint Hybrid, Endpoint Log Hybrid, ESA Primary, ESA Secondary, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, UEBA, Warehouse Connector, and Workbench.

Refer to the *NetWitness Platform Getting Started Guide* to become familiar with the major changes to the 11.x User interface. Refer to the *NetWitness Platform Deployment Guide* to become familiar with the major platform changes in 11.x.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: The Reporting Engine is installed on the NW Server host, Workbench is installed on the Archiver host, and Warehouse Connector can be installed on the Decoder host or Log Decoder host.

CentOS6 to CentOS7 Upgrade

NetWitness Platform 11.2 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.2 platform environment has been improved greatly to accommodate current and future physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Platform 11.2 Upgrade Path

The earliest supported upgrade path for RSA NetWitness® Platform 11.2 is Security Analytics 10.6.6.x. If you are running a version of NetWitness Platform that is prior to 10.6.6.x, you must update to 10.6.6.x before you can upgrade to 11.2. See the *RSA Security Analytics 10.6.6 Update Guide* (https://community.rsa.com/docs/DOC-85119) on RSA Link.

Supported Host Upgrade Path

You must upgrade a host to the same host type:

- Same Series RSA Physical Appliance to Same Series RSA Physical Appliance (that is, Series 4 to Series 4, Series 5 to Series 5).
  RSA does not support third-party physical hosts in 11.2.
- On-Prem Virtual to On-Prem Virtual

Caution: The 11.2 upgrade does not support mixed-platform upgrades (for example, it does not support physical to virtual).

Hardware, Deployments, Services, and Features Not Supported in 11.2

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.2.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- IPDB service
- Malware Analysis service co-located on the SA Server (upgrade of Malware Analysis Enterprise is supported in 11.2.)
- Standalone Warehouse Connector service (Upgrade of a co-located Warehouse Connector is supported in 11.2.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.2, your custom policy is not present. In its place, there is the out-of-the-box Context Hub Server Monitoring Policy in the user interface, which is specific for version 11.2.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Platform 11.2, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.2, ESA sends all alerts to a central Alert system. The local MongoDB storage in ESA 10.6.6.x has been removed.

Caution: If you do not use Incident Management in 10.6.6.x, carefully consider whether or not to upgrade to version 11.2.

The following guidelines should help you determine whether or not to upgrade your ESA hosts to 11.2.

In your 10.6.6.x deployment, if you have:

- One ESA host, with or without Incident Management configured: Upgrade to 11.2.
- Multiple ESA hosts configured to use Incident Management: The system will continue to aggregate alerts centrally. If the system is correctly sized and operating as intended in 10.6.6.x, you can upgrade to version 11.2.
- Multiple ESA hosts without configuration to use Incident Management and you are connecting to individual ESA hosts to view alerts: Do not upgrade to version 11.2.

Note: If you did not use Incident Management in 10.6.6.x, you cannot view the 10.6.6.x ESA alerts in the 11.2 Respond component without running a migration script. Use the ESA Alert Migration script to migrate these alerts to the location in 11.2 that will allow Respond to view them. See the *ESA Alert Migration Instructions* knowledge base article (https://community.rsa.com/docs/DOC-84102) in RSA Link for instructions on how to run this script.

Upgrade Phases

RSA recommends that you stagger host upgrades as described in this section. The update to CentOS7 and the need of a physical or iDRAC access cause the 11.2 upgrade to take more time than most upgrades.

Caution: If you stagger the upgrade, you:
• Must upgrade the hosts in Phase 1 first, in the order shown.
• May not have all the features operational until you update your entire deployment.
• Will not have service administrative features available until you upgrade all the hosts in your deployment.

Phase 1

You perform Phase 1 first. You must upgrade the hosts in the following order:

1. Security Analytics Server host
2. Event Stream Analysis hosts
3. Malware Analysis hosts

4. Broker hosts (if you do not have a Broker, upgrade your Concentrator hosts)
   The 11.2 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2

Upgrade the rest of your hosts.

RSA recommends that you follow the order in Phase 2 to reduce:

- Functionality loss during investigation.
- Downtime that results in the loss of network and log capture.

Note: Other than Log Collection hosts with downstream event destinations, there is no technical reason to upgrade your hosts in the order shown in Phase 2.

This is the Phase 2 host upgrade order recommended by RSA.

1. Decoder hosts
2. Concentrator hosts
3. Archiver hosts
4. Log Collection hosts - Log Collectors on Log Decoder hosts (LDs), Virtual Log Collectors (VLCs) and Legacy Windows Collectors (LWCs)
   Before you upgrade a log collection host, you must prepare it for the upgrade. Part of this preparation ensures that no event data remains in the queues. This requires you to keep the downstream destinations of event data (Log Collectors, Virtual Log Collectors and Log Decoders) up and functioning properly.

   If you have event data destinations downstream from the Log Decoder, you must prepare and upgrade Log Collectors in the following order.

   a. LDs (one LD at a time)

   b. VLCs and LWCs

   If you do not have event data destinations downstream from the Log Decoder, you can prepare and upgrade multiple LDs, VLCs, and LWCs together.
5. All other hosts

See "Running in Mixed Mode" under "The Basics" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for:

- Functionality gaps encountered while running in this mode.
- Examples of staggered upgrades.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Investigate in Mixed Mode

Mixed mode occurs when some services are upgraded to 11.2 and some are still on 11.0.0.x or 10.6.6.x This happens when you upgrade to 11.2 in phases.

Note: You must follow the host upgrade sequence as shown in Upgrade Phases to ensure complete Investigate functionality. The 11.2 Investigate server is installed when you upgrade the SA Server, but Broker hosts need to be upgraded to 11.2 to access the Event Analysis view. If the Broker is not upgraded, analysts see a warning icon next to the Broker, and no data aggregated to that Broker can be displayed.

After you upgrade all services to 11.2, when an analyst conducts an investigation, Role-Based Access Control (RBAC) of downloads works consistently to limit access to restricted data.

In mixed mode (that is, some services are upgraded to 11.2 and some are still at 11.0.0.x or 10.6.6.x), when an analyst conducts an investigation, RBAC is not applied uniformly to viewing and downloads.

If the `sdk.packets` setting has not been disabled on the 10.6.6.x or 11.0.0.x services, analysts with SDK meta and roles permissions in place to restrict viewing and reconstructing an event's content can download the PCAP of an event that has content restrictions. Other types of downloads appear to be successful, then generate errors due to insufficient permissions, and the data is still protected.

During a phased update, you can disable the `sdk.packets` setting on 10.6.6.x and 11.0.x.x services to limit the analyst from downloading any PCAPs or logs during mixed mode. After you update all services to 11.2 and re-enable `sdk.packets`, RBAC works consistently across all services.

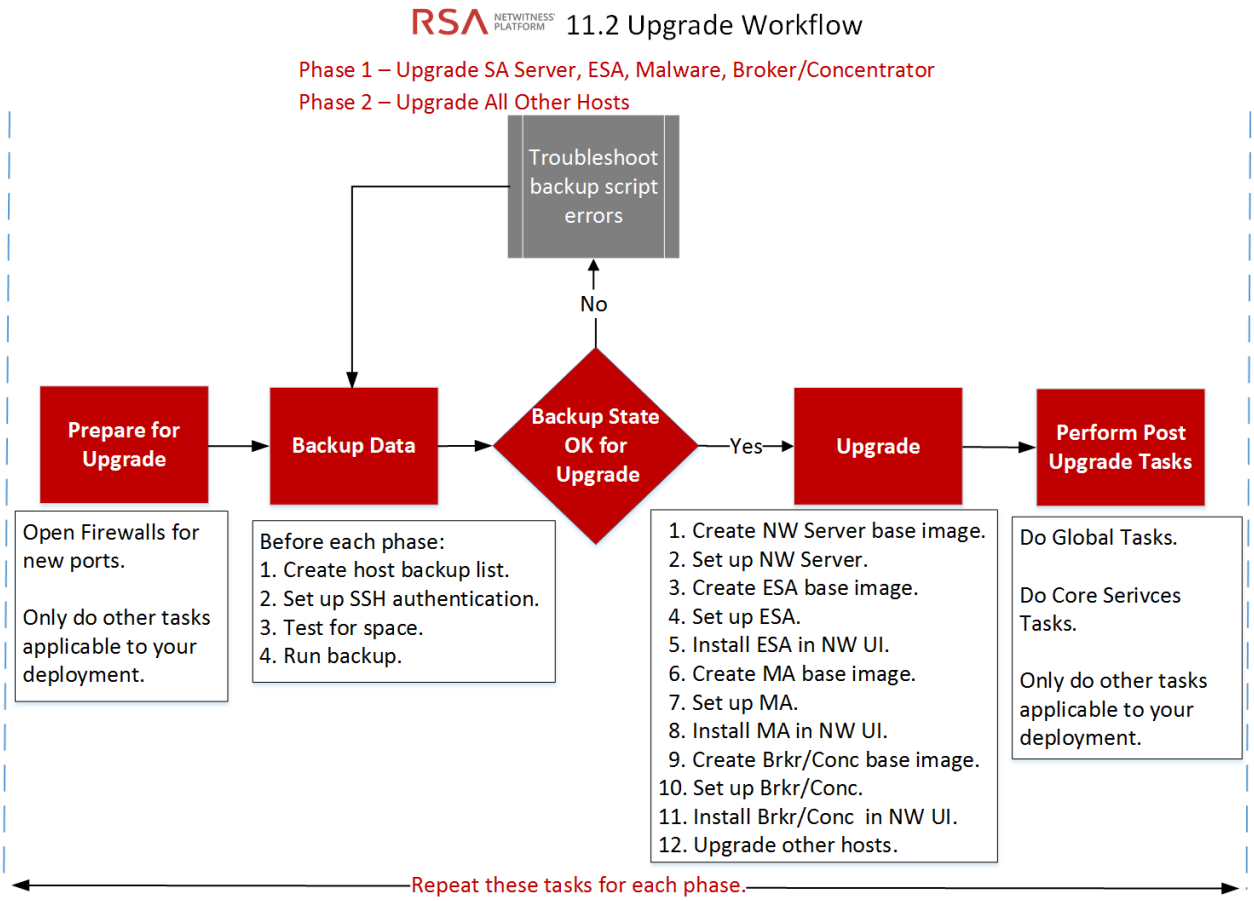
The following table identifies what you can see and download in Investigate when your NW Server at version 11.2 is connected to services at a lower version.

Connecting Service Version	Affected View	User Role With Restricted Content	Can See	Can Download Restricted Content Successfully	Can Download Restricted Content with Errors
11.2 Broker -> 10.6.6.x Concentrator -> 10.6.6.x Network Decoder/Log Decoder	Events View	Analyst	RBAC permitted items	PCAP	File archive is downloaded but cannot unzip
	Event Reconstruction View	Analyst	RBAC permitted items	PCAP	File archive is downloaded but cannot unzip
	Event Analysis View	Analyst	RBAC permitted items	PCAP	Error Retrieving Payload from Service for Payload, Request Payload, Response Payload
11.2 Broker -> 11.2 Concentrator ->11.2 Decoder/Log Decoder	Event Reconstruction View	Analyst and Data Privacy Officer	RBAC permitted items	PCAP	Files archive is downloaded but cannot unzip PCAPs and logs are downloaded as zero bytes

Connecting Service Version	Affected View	User Role With Restricted Content	Can See	Can Download Restricted Content Successfully	Can Download Restricted Content with Errors
11.2 Broker -> 11.0.0.x Concentrator -> 11.0.0.x Network Decoder/Log Decoder	Events View	Analyst	RBAC permitted items	None	Files archive is downloaded but cannot unzip PCAPs and logs are downloaded as zero bytes
	Event Reconstruction View	Analyst	RBAC permitted items	None	File archive is downloaded but cannot unzip PCAPs and logs are downloaded as zero bytes
	Event Analysis View	Analyst	RBAC permitted items	None	Error Retrieving Payload from Service for Payload, Request Payload, Response Payload PCAPs and logs are downloaded as zero bytes

Upgrade Workflow

The following diagram illustrates the RSA NetWitness® Platform 11.2 upgrade workflow.



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Platform 11.2.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness Platform 11.2. These tasks are organized by the following categories.

Global

You must complete these tasks regardless of how you deploy NetWitness Platform and which components you use.

Task 1 - Review Core Ports and Open Firewall Ports

The following tables list new ports in 11.2.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

Endpoint Hybrid or Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Hybrid or Endpoint Log Hybrid	NW Server	TCP 5672	Message Bus
Endpoint Server	NW Server	TCP 27017	MongoDB

All NetWitness Platform core ports are listed in the "Network Architecture and Ports" topic in the *RSA NetWitness® Platform Deployment Guide* in case you need to reconfigure NetWitness Platform services and firewalls. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 2 - Record Your 10.6.6.x `admin user` Password

Record your 10.6.6.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of the `/etc/fstab` File

Copy the `/etc/fstab` file from all the physical hosts and into your local machine (backup host or remote machine).

Note: You need this file to restore a physical host with external storage mounts.

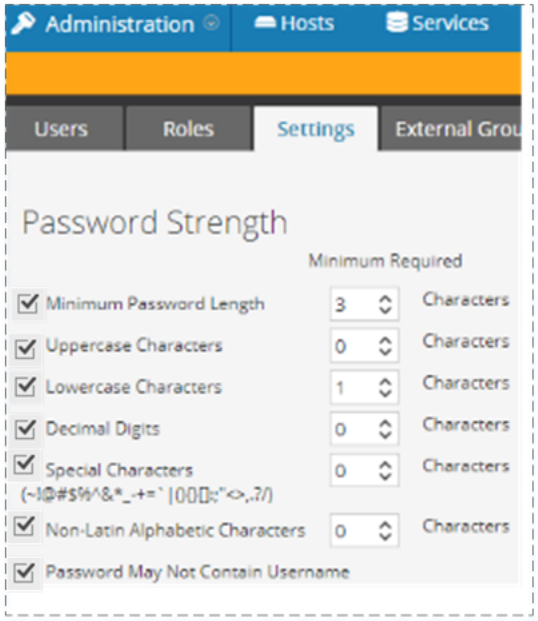
Task 4 - Make Sure Password Strength Settings Check Boxes Are Set in 10.6.6.x

The check box to the left of the **Password Strength Settings** in the **Administration** > **Security** > **Settings** tab must be set in 10.6.6.x or these settings will not be migrated to 11.2.

Complete the following task to make sure that the Password Strength Settings check boxes are set in 10.6.6.x.

1. In Security Analytics 10.6.6.x, go to the **Administration** > **Security** > **Settings** tab.
2. Make sure that all of the check boxes to the left of the **Password Strength Settings** are set. If they are not, set them and click **Apply**.

The following example shows all check boxes as set (required in 10.6.6.x before upgrading to 11.2).



Respond

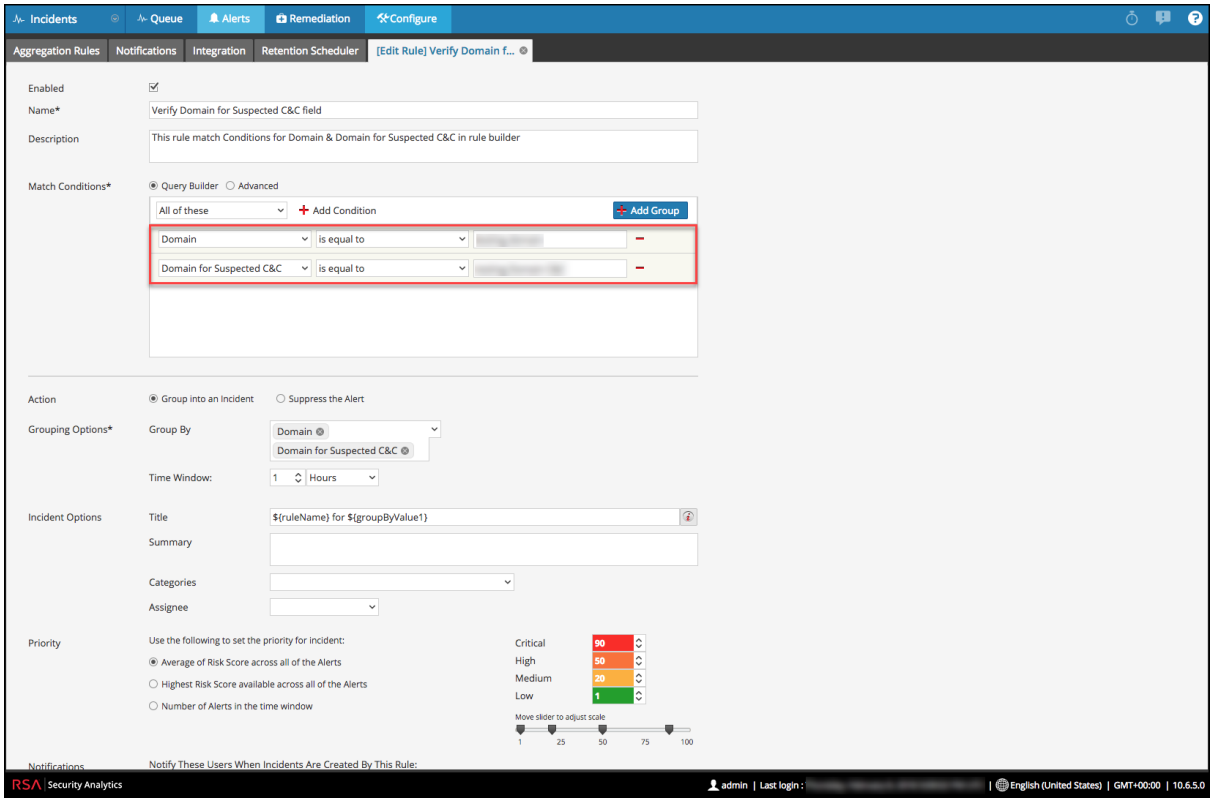
Task 5 - Check Aggregation Rules Match Conditions for “Domain” or “Domain for Suspected C&C”

Make a note of any Incident Management aggregation rules that have match conditions using Domain or Domain for Suspected C&C in the drop-down list in the rule builder. You will need to add back these conditions after you upgrade to 11.2 as described in the "Respond" Post Upgrade Tasks tasks .

Complete the task for each aggregation rule.

1. In Security Analytics 10.6.6.x, go to **Incidents** > **Configure** > **Aggregation Rules** tab and edit the rules to view the matching conditions.

2. In the **Match Conditions** section, look for **Domain** or **Domain for Suspected C&C** listed in the drop-down lists for the conditions.



3. Make a note of the rule name and the entire condition that uses **Domain** or **Domain for Suspected C&C**, including operators and values.

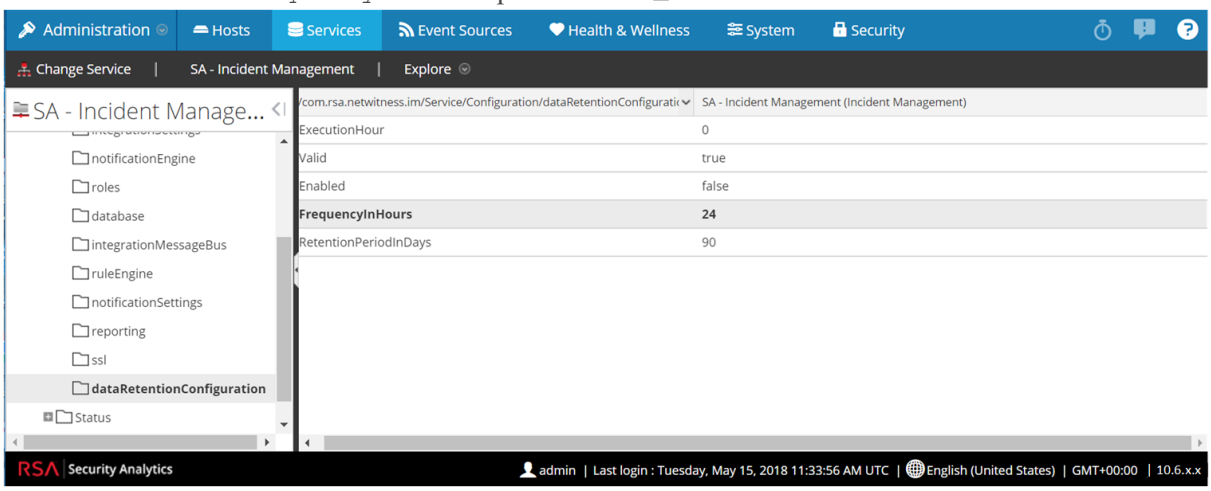
Task 6 - Set Data Retention Run Interval to ≥ 24 Hours

In Security Analytics 10.6.x, the Data Retention run interval does not have any minimum value check. In 11.2, RSA added a validation check to make sure that it is run at least every 24 hours. When you upgrade to 11.2, if this value is less than 24 hours, the Respond service will not start.

Complete the following task to ensure that the Respond service starts after upgrading to 11.2.

1. In Security Analytics 10.6.6.x, go to **ADMIN** > **Services**.
2. Select the **Incident Management** service, and then select  > **View** > **Explore**.
3. In the Incident Management **Explore** view, go to **`Service` > `Configuration` > `dataRetentionConfiguration`.**

4. Make sure that the `FrequencyInHours` parameter is ≥ **24**.



Reporting Engine

(Conditional) Task 7 - Unlink External Storage

If the Reporting Engine has external storage [such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports] complete the following task to unlink the storage.

Note: In these steps:
`/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
`/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Warehouse Connector

(Conditional) Task 8 - Copy `keytab` files in `root` or `etc` Directory Stored in Other Directory

Complete the following task to copy the `keytab` files in the `root` or `etc` directory if it is stored in another directory.

1. Record the absolute path of NFS mount directory and the `keytab` file.
   You need this information to restore the Warehouse Connector after upgrade.
2. Unmount the NFS directory.
   a. SSH to the Warehouse Connector and log in with `root` credentials.
   b. Submit the following command to unmount the NFS directory.
      ```
      umount <NFS-absolute-path>
      ```

Hardware

Task 9 - Check for BAD-INDEX BIOS Error before Upgrading

Complete the following steps to detect a `BAD-INDEX` BIOS error before you upgrade to 11.2.

1. SSH to each host appliance.
2. Run the following command.
   ```
   dmidecode
   ```
3. If you receive a `BAD-INDEX` error in the output, contact RSA Customer (https://community.rsa.com/docs/DOC-1294).

Backup Instructions

Backing up your configuration data for all your hosts from 10.6.6.x is the first step in upgrading from Security Analytics 10.6.6.x releases to NetWitness Platform 11.2.

Note: 1.) It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directory will be automatically restored during the upgrade process. After upgrading to 11.2, your custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types. 2.) Disable your Public Key Infrastructure (PKI) settings before starting the backup.

Caution: These services are not supported in the 10.6.6.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the Security Analytics Server
- Standalone Warehouse Connector
- Warehouse Analytics (Datascience)

The following types of hosts can be backed up and are automatically restored during the upgrade process:

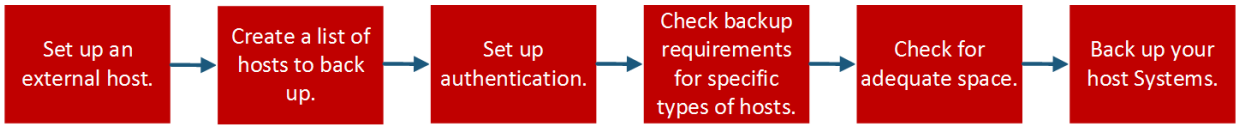
- **Security Analytics Admin Server**
- **Standalone Malware Analysis**
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and Incident Management database)
- **Concentrator**
- **Log Decoder** (including Local Log Collector and Warehouse Connector, if installed)
- **Log Hybrid**
- **Network Decoder** (including Warehouse Connector, if installed)
- **Network Hybrid**
- **Virtual Log Collector**

The following types of files are automatically backed up but must be restored manually after the upgrade process:

- PAM configuration files: For information about restoring the PAM configuration files, refer to "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.2.", in the "Global" section of the *Post Upgrade Tasks*.
- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the `/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-`

`backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see " (Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of *Post Upgrade Tasks*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



The following sections describe each of these tasks:

- Task 1 - Set up an External Host for Backing up Files
- Task 2 - Create a List of Hosts to Back up
- Task 3 - Set up Authentication Between Backup and Target Hosts
- Task 4 - Check for Backup Requirements for Specific Types of Hosts
- Task 5 - Check for Adequate Space for the Backup
- Task 6 - Back up Your Host Systems
- Post Backup Tasks

Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running CentOS 6 with connectivity through SSH to the Security Analytics stack of hosts.

Note: If you are not able to use an external host for backing up files, contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

Ensure that the host names for the systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

There are several scripts that you run during the backup process. You must download the zip file that contains the scripts (`nw-backup-v4.0.zip` or later) from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your Security Analytics Servers and host systems to be backed up.

  Caution: When performing a mixed-mode upgrade, retain a master copy of the `all-systems` file upgrade until all the hosts in your deployment are upgraded to 11.2. You cannot run the `get-all-systems.sh` a second time because the NW Server, the first host that must be upgraded in mixed mode, will have CentOS7 as an operating system .

- `ssh-propagate.sh`: Automates sharing keys between the systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.
- `azure-mac-retention.ps1`: Applies only if you are using AZURE. See the *AZURE Deployment Guide* on for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

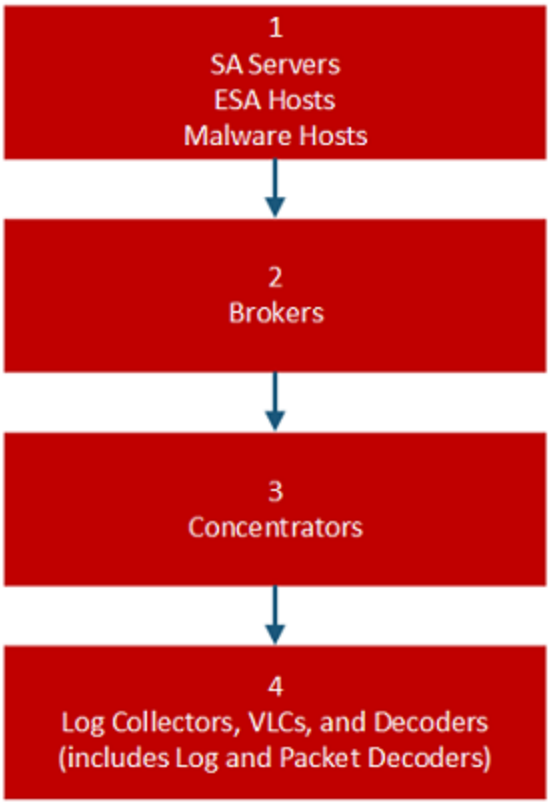
Note: If you have used the 10.6.x versions of the backup and restore scripts on your 10.6.6 hosts, you must still run all the scripts listed here.

Note: Do NOT use the scripts in the `nw-backup-v4.0.zip` file for regular backups. These scripts are specifically designed for upgrading from 10.6.6.x to 11.2.

Note: The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of the hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to ensure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference and then manually editing the `all-systems` file to contain specific hosts.

To generate the `all-systems` and the `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:
   ```
   chmod u+x get-all-systems.sh
   ```
2. At the root level, run the `get-all-systems.sh` script:
   ```
   ./get-all-systems.sh <IP-Address-of-SA-Admin-Server>
   ```
   You will be prompted for the password for each host system once per host.
   This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nw-backup/`.

3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.
4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up. RSA recommends that you comment out the hosts that you do not want to back up (add the number sign (#) to the beginning of the line that contains the host that will not be backed up).
   The following examples shows how to comment out the 10.6.6 Security Analytics Server:
   `loghybrid,loghyb,172.16.0.1,45fe9de1-1a82-49d7-9bb1-7ac5fa1d18d8,10.6.6.0`
   `#nwserver,nwserv106,172.31.255.23,67a9a0eb-1300-4fba-838f-7be4d8cf5e65,10.6.6.0`

> **Note:** If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.6.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-8ea837074bd0,10.6.6.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.6.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.6.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.6.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.6.0
packetdecoder,my-nw-packetdecoder,10.0.0.7,a8f2f574-3dd0-4b65-9cf7-
d8141b78a192,10.6.6.0
vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.6.0
broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-c56ccfb0f737,10.6.6.0
```

And here is an example of an `all-systems` file that could be used in the first backup session, where only the Security Analytics Server, ESA host, and Malware Analysis host are backed up:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.6.0
#archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-
8ea837074bd0,10.6.6.0
#concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.6.0

#packetdecoder,my-nw-packetdecoder,10.0.0.7,a8f2f574-3dd0-4b65-9cf7-
d8141b78a192,10.6.6.0
#vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.6.0
#broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-c56ccfb0f737,10.6.6.0
```

Troubleshooting Information

- Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location. Follow these recommendations:

  - Do not edit the `all-systems-master-copy` file.
  - If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure that each version of the file lists only those hosts that are currently being backed up, and the other hosts are commented out. For more information, see Post Backup Tasks.

- If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.

- The `get-all-systems.sh` script generates a list of hosts that were defined in the Security Analytics user interface. Ensure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to Security Analytics, you use the Security Analytics user interface to ensure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.

- At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the Security Analytics Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence of those systems, that their services are all running, and that they are properly communicating with the Security Analytics Server. (Any Windows Legacy Collectors or AWS Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)
- If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the man page for `ssh-agent`.

Complete the following task to set up authentication between backup and target hosts.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:
   `chmod u+x ssh-propagate.sh`
2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:
   `ssh-propagate.sh <path-to-all-systems-file>`
3. You are prompted for the password once per host, but you will not need to enter it repeatedly later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types.

1. On the Security Analytics Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.2, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the Security Analytics Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   `openssl x509 -inform der -in certificate.cer -out certificate.pem`
   Convert a PEM file to DER
   `openssl x509 -outform der -in certificate.pem -out certificate.der`
   Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)
   `openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in certificate.crt -certfile CACert.crt`
   Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM
   `openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes`

> **Note:** Add the following qualifier to the command string to:
> `-nocerts` convert private keys exclusively.
> `-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For ESA Hosts with Mongo Databases

The default 10.6.x Mongo database password is `netwitness`. If you have customized this password, you could encounter an error while running the backup script. You can either use your custom Mongo database password during the backup, or you could change that password back to `netwitness` before running the `nw-backup.sh` script.

1. Find out if the Mongo database password is `netwitness` or if it has been modified.
2. If it has been modified, either change it back to `netwitness`, or be sure you know what the customized password is so that you can enter it during the backup.

For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Decoder, Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to "Appendix B. Stopping and Restarting Data Capture and Aggregation."

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

> **Caution:** This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after the upgrade.
- If you set the password for `logcollector` user for RabbitMQ, you must know the password so you can set it again after the upgrade.

Prepare LCs and VLCs for Upgrade

Complete the following task to prepare Log Collectors and Virtual Log Collectors for the upgrade.

1. SSH to the Log Collector.
2. Submit the following command string.
   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```
   This command:

- Stops the Puppet Agent service.
- Disables the file collection accounts ("sftp" and all users in the group "upload") used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgraded to 11.2.
- Stops all the collection protocols in the Log Collector service.
- Saves the list of Plugin accounts and RabbitMQ accounts.
- Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.
- Waits until the Log Collector queues are empty.
- Stops the Log Collector service.
- Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting.

For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint - List RabbitMQ Usernames and Passwords

On the 10.6.6.x Security Analytics Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.2. upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to "Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL" in *Post Upgrade Tasks*.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The event source documentation contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in the `/root/vsftpd/` directory in 10.6.6.x, this material area will be backed up and restored. **If the material was in another location, you must back it up and restore it manually.**
- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.6.x, it is backed up and restored.

Task 5 - Check for Adequate Space for the Backup

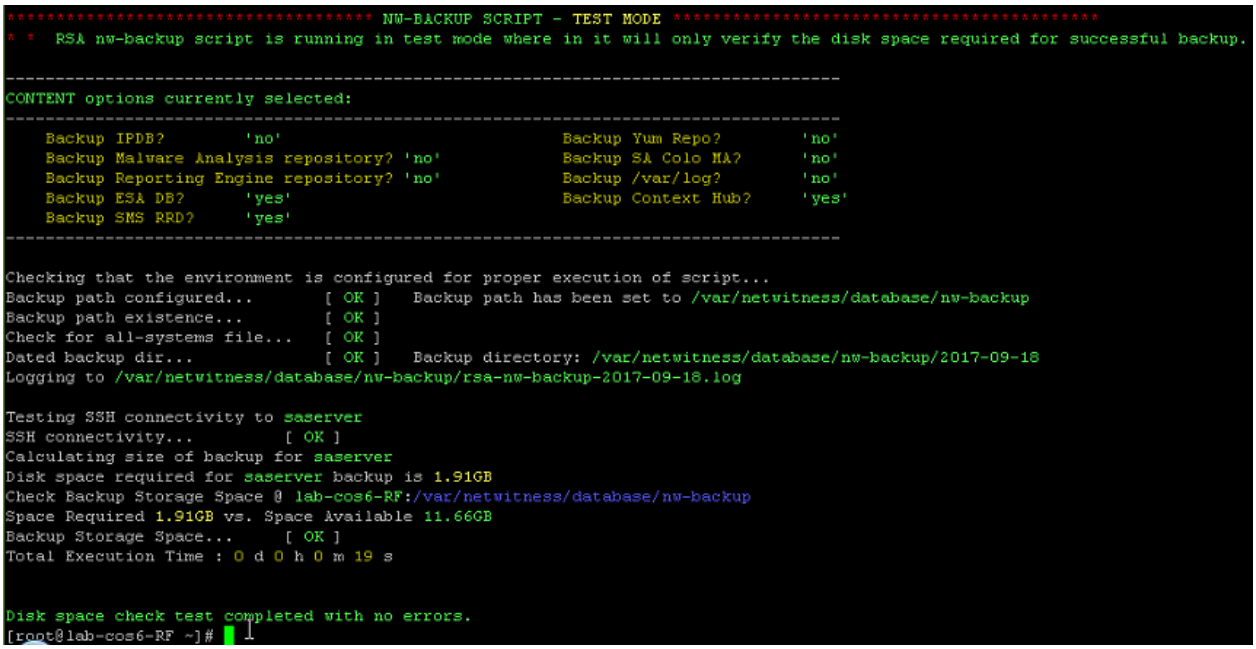
You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to ensure that you provide adequate space for the backup so that the backup captures all your data.

Complete the following task to check for adequate disk space.

1. Make the backup script executable by running the following command:
   ```
   chmod u+x nw-backup.sh
   ```
2. Run the following command at the root directory level:
   ```
   ./nw-backup.sh -t
   ```
   The output displays the amount of disk space that is required for the backup.

> **Note:** The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the `-d` option by using `-D`. Using the `-D` option will show how much space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the `-D` option will throw an error. If you want to know how much space is available on the target host, you must run the `df -h` command on the host.

The following figure shows an example of the output from using the `-t` option.



Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the `nw-backup.sh` script using the `-u` option. This option is required for upgrading to 11.2.

Note: The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage

```
./nw-backup.sh [-u -t -d -D -l -x -e] <external-mnt> -b <backup file path>
```

General Options

`-u : This option is required for upgrading to 11.2. Enables the upgrade flag to run backup for upgrading to 11.2. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)`

`-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)`

`-D : enables disk space check in 'full' mode (estimate of space using compressed data, ~10X slower). Default: (no)`

`-l : stores backup content locally on each host (automatically set if -u is used). Default: (no)`

`-e <path to mount point> : copies backup files of all devices onto an external mount point. Default: (/mnt/external_backup)`

`-x : move all backup files to an external mount point. Default: (no) - COPY`

```
-b <path to write backups> : path to the location for storing backup files on
a backup server. For upgrading to 11.2, please use the default location!
Default: (/var/netwitness/database/nw-backup)
```

Note: Do **not** change the backup path in upgrade (-u) mode.

Note: When you run a backup with the `-u` option, all services are stopped. If you need to continue to use the 10.6.x machine after running the backup, reboot the 10.6.x system so that services are restarted.

Advanced Content Selection Options

```
-c : back up Colocated Malware Analysis on SA servers. Default: (no)

-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)

-m : back up Malware Analysis File Repository. Default: (no)

-r : back up Reporting Engine Report Repository (automatically set if -u is
used). Default: (no)

-v : back up system logs (/var/log). Default: (no)

-y : back up YUM Web Server & RPM Repository. Default: (no)

-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)

-C : If set: DISABLES back up of Context-Hub configuration and database.
Default: (not-set)

-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)
```

Test Options

```
 -t : performs script test run for disk space check only. Services are not
stopped and excludes execution of backup. Can be combined with (-d) or (-D)
and other flags. Default: (-t)
```

For example, the command:
`./nw-backup.sh`
would run the backup with options as set in the Header of the script itself.
OR, the command:
`./nw-backup.sh -ue /mnt/external_backup`
would run a normal backup using the backup path defined in the script, with the following options:

```
-u : enables the upgrade flag to run backup for upgrading to 11.2. It also
enables disk space check (-d), backing up reporting engine reports (-r) and
stores backup content locally (-l). Default: (no)

-e : Copy the backup files to external mount point, mounted on /mnt/external_
backup

For Help: ./nw-backup.sh -h
```

When you run the script, the following text is displayed at the top of the script:

Caution: RSA `nw-backup` script backs up configuration files, data, and logs on the options provided in the script. It tars the content, with options to store the backup files on the backup server, move or copy them to external storage on a mount point (USB/NFS/SMB), or SCP them back to the target host. This backup script has been qualified on the following versions of Security Analytics:
10.6.6.x
Use of this script on any other versions of the product may not give expected results and may not be supported by RSA Customer Service.
Note: All non-RSA custom files, scripts, Cronjobs and other important files should be placed in `/root`, `/home/'user'`, OR `/etc` to be included in the backup.

Complete the following task to back up your hosts.

1. Ensure that the `all-systems` file contains only the hosts to back up. For information, see Task 2 - Create a List of Hosts to Back up.
2. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
3. Begin the backup process by running the following command at the root directory level:
   `./nw-backup.sh -u`

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.2. Do NOT make any changes to the header of the backup script for the backup path because the path is specific to the upgrade, and that data needs to be in a specific place.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   `rsa-nw-backup-2018-03-15.log`
4. When the backup has completed, to ensure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:
   `tar -tzvf hostname-ip-address-backup.tar.gz`
   The following archive files are created:
   For all hosts:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`
   For Security Analytics Servers:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `<hostname-IPaddress>-mongodb.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`
   For ESA Hosts:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `<hostname-IPaddress>-mongodb.tar.gz`
   `<hostname-IPaddress>-controldata-mongodb.tar.gz`

`tar checksum` files
`<hostname-IPaddress>-network.info.txt`

The archived files are located in the `/var/netwitness/database/nw-backup` directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the `all-systems` File and the Backup Tar files

Make copies of the `all-systems` file, the `all-systems-master-copy` file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the Security Analytics Server (specifically the Admin service) to 11.2.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.2 upgrade process. Before you begin the upgrade process, you must ensure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- `all-systems`
- `all-systems-master-copy`
- `appliance_info`
- `service_info`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

In addition to the files listed above, the following files will be generated on the Security Analytics Server and ESA hosts:

- `<hostname>-<host IP address>-mongodb.tar.gz`
- `<hostname>-<host IP address>-mongodb.tar.gz.sha256`

The backup script will also generate the following `controldata-mongodb.tar.gz` files.

Note: The backup script copies the following files from all ESA hosts to the Security Analytics Server's backup path .

- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz`
- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256`

Task 3 - (Conditional) For Multiple ESA Hosts, Copy `mongodb tar` files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the `/opt/rsa/database/nw-backup/` directory on the Primary ESA host system (the host that has the ContextHub service running on it) :

- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.2., ensure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

Note: The default paths for backup files are:
- Security Analytics Servers:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`
- Malware hosts: `/var/lib/rsamalware/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256`

Required Files for ESA Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Required Files for All Other Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

Note: The following files are located in the <hostname>-<host-IP-address>-backup.tar.gz tar on all hosts:
appliance_info
service_info

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
`BUPATH=/opt/rsa/database/nw-backup` for the ESA Correlation Engine
`BUPATH=/var/lib/rsamalware/nw-backup` for the Malware Service
`BUPATH=/var/netwitness/database/nw-backup` for all other services
Restore locations:
`BUPATH/restore/etc/sysconfig` for Iptable rules
`BUPATH/restore/etc/sysconfig` for NAT configurations
`BUPATH/restore/etc` for Crontab entries
`BUPATH/restore/etc` for User Accounts (users are located in the `passwd` file, and groups are located in the `group` file. These are not restored during the upgrade process but can be restored manually.
`BUPATH/restore/etc/ntp.conf` for NTP configurations (must be restored using the NetWitness Platform UI)

Upgrade Tasks

This topic contains the tasks you must complete to upgrade Security Analytics 10.6.6.x to NetWitness Platform 11.2.

Caution: 1.) Make sure that you backed up your Security Analytics 10.6.6.x data before attempting to upgrade to NetWitness Platform 11.2.
2). Run the backup immediately before upgrading the hosts for each phase so that the data to avoid restoring stale data.
3.) This guide applies to physical host upgrades exclusively. If have physical and virtual hosts in your deployment, see the *RSA NetWitness® Platform 11.2 Virtual Host Upgrade Guide* for the steps to upgrade virtual hosts. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

There are two phases that you must complete in the order shown.

- Phase 1 - Upgrade SA Server, Event Stream Analysis (ESA), and Malware Analysis Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.2 and they will not be available until the warm up completes.

- Phase 2 - Upgrade All Other Hosts

Phase 1 - Upgrade SA Server, Event Stream Analysis, Malware Analysis Hosts, and Broker or Concentrator

Task 1 - Upgrade the 10.6.6.x SA Server to 11.2 NW Server

Follow the instructions under Upgrade 10.6.6.x SA Server Host to 11.2 NW Server Host.

Task 2 - Upgrade 10.6.6.x ESA to 11.2

Caution: If you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.2 and they will not be available until the warm up completes.

Follow the instructions under Upgrade a 10.6.6.x non-SA Server Host to 11.2 to upgrade your ESA hosts. When you upgrade 10.6.6.x ESA to 11.2 :

1. Create the base image on your primary ESA host, set it up through the Setup program, and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, create the base image on your secondary ESA host, set it up through the Setup program, and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Upgrade 10.6.6.x Malware Analysis to 11.2

Follow the instructions under Upgrade a 10.6.6.x non-SA Server Host to 11.2.

Task 4 - Upgrade 10.6.6.x Broker or 10.6.6.x Concentrator to 11.2

Follow the instructions under Upgrade a 10.6.6.x non-SA Server Host to 11.2.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.2 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Upgrade All Other Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Decoder and Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Upgrade Non-NW Server Host to 11.2.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in "Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh" in the Backup Instructions.
2. Stop data capture on the Log Decoder.
3. Complete the steps in Upgrade Non-NW Server Host to 11.2.
4. Restart data capture on Log Decoder.

Note: After you upgrade, you will restart log collection after completing the Task 29 - Update Incident Rules Identified in the Domain in the Matching Conditions Upgrade Preparation Task in the **Post Upgrade Tasks**.

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described the "Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh" in the Backup Instructions.
2. Back up your 10.6.6.x VLC by editing the `all-systems` file on host where you performed the

backup.

a. Make sure your `all-systems` file contents has this information before you perform this step.
`vlc,<host-name>,<IP-address>,<UUID>,10.6.6.x`

b. Run the following command to create backup.
`./nw-backup.sh -u`
See Backup Instructions for detailed procedures on how to back up the host.

3. Make sure the backup host contains the VLC backup in the following format.
```
<hostname>-<IPaddress>-root.tar.gz
<hostname>-<IPaddress>-root.tar.gz.sha256
<hostname>-<IPaddress>-backup.tar.gz
<hostname>-<IPaddress>-backup.tar.gz.sha256
<hostname-IPaddress>-network.info.txt
all-systems-master-copy
```
4. Power off the 10.6.6.x VLC so that a new 11.2 VM can be created with the same network configuration.
5. Deploy a fresh NetWitness 11.2 Non-NW Server host using the 11.2 NetWitness Platform ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.6.x VLC.
This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.6.x VLC backup file.

Note: Make sure IPv6 is disabled.

a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings.
Contents of `ifcfg-eth0` should be as follows.
```
TYPE=Ethernet
DEFROUTE=yes
NAME=eth0
UUID=<uuid>
DEVICE=eth0
DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
BOOTPROTO=static
IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
NM_CONTROLLED=no
ONBOOT=yes
```

b. Submit the following command string.
`systemctl restart network.service`

8. Create the backup directory.
`# mkdir -p /var/netwitness/database/nw-backup/`
9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new

VLC in the `/var/netwitness/database/nw-backup` directory.

10. Complete the steps 2 through 12 inclusive in Upgrade a 10.6.6.x non-SA Server Host to 11.2 for the rest of the NetWitness Platform components. Make sure that you select **Log Collector** for the service in step 12.

All Other 10.6.6.x Hosts to 11.2

Follow the instructions under Upgrade a 10.6.6.x non-SA Server Host to 11.2.

Upgrade the 10.6.6.x SA Server Host to the 11.2 NW Server Host

Make sure that you have backed up 10.6.6.x data for the SA Server host. **You must follow the instructions in Backup Instructions to back up the host.**

Caution: Run the backup immediately before upgrading the SA Server to 11.2 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.2.

Complete the following steps to upgrade the 10.6.6.x SA Server host to the 11.2 NW Server host.

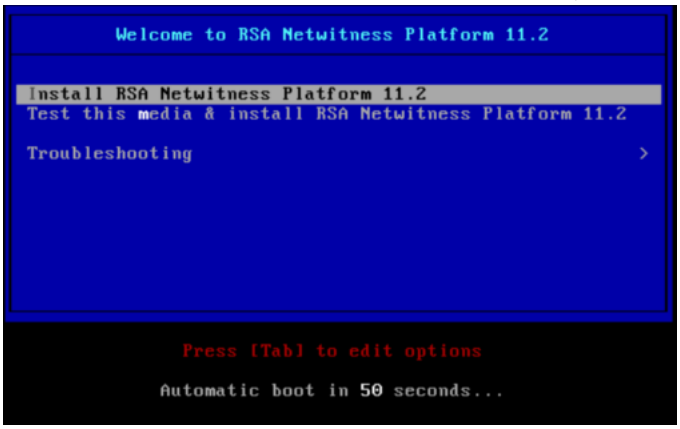
1. Create a base image on the host.
   a. Attach media (media that contains the ISO file, for example, a build stick) to the host.
   You must use the build stick labeled "OEMDRV".
   See the *RSA NetWitness Platform Build Stick Instructions* for more information.
      - Hypervisor installations - use the ISO image.
      - Physical media - use the ISO file to create bootable flash drive media using the Universal Netboot Installer (UNetbootin) or another suitable imaging tool. See the *RSA NetWitness® Platform Build Stick Instructions* for information on how to create a build stick from the ISO file. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
      - iDRAC installations - the virtual media type is:
         - **Virtual Floppy** for mapped flash drives.
         - **Virtual CD** for mapped optical media devices or ISO file.

   b. Log in to the host with and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```

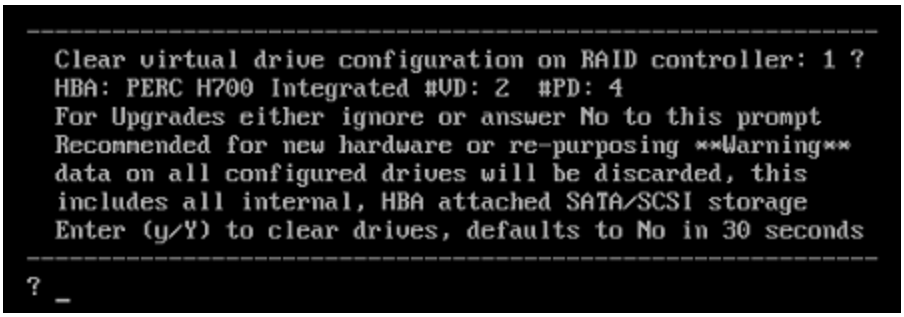
   c. Select **F11 (boot menu)** during reboot to select a boot device and boot to the connected media. After system checks during booting, the following **Welcome to RSA NetWitness® Platform 11.2** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.

d. Select **Install RSA Netwitness Platform 11.2** (default selection) and press **Enter**.



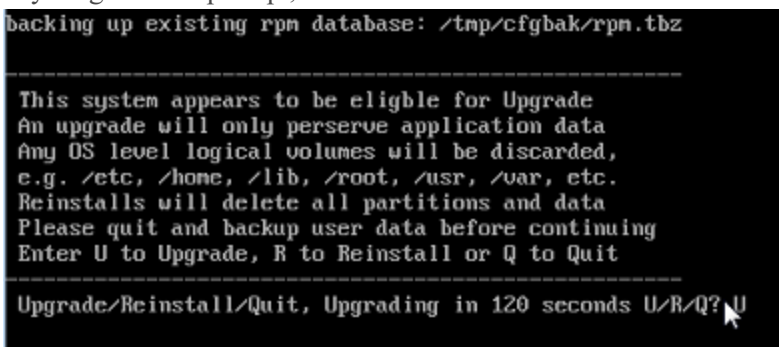
The Operating System installation runs and stops at the **Enter (y/Y) to clear drives**.

e. Enter **n** (No).
The default action is No, so if you ignore the prompt, it will select No in 30 seconds and will not clear the drives.



The **Upgrade/Reinstall/Quit(U/Q/R)?** prompt is displayed.

f. Type **U** to upgrade the host.
If you ignore the prompt, it will select U in 120 seconds.



It takes a few minutes for CentOS7 components to install. The installation program displays the components as they are installed, which varies depending on the appliance. When CentOS7 installation is complete, the **Continue (Y/N)?** prompt is displayed.

g. Type **Y** and press **Enter** to confirm that you want to upgrade this host.

```
-----------------------------------------------------
 Steps to be executed listed below.   Warning:
 this is irreversible.
-----------------------------------------------------
lvremove -f /dev/VolGroup00/rabmq
lvremove -f /dev/VolGroup00/root
lvremove -f /dev/VolGroup00/swap
lvremove -f /dev/VolGroup00/tmp
lvremove -f /dev/VolGroup00/usrhome
lvremove -f /dev/VolGroup00/var
lvremove -f /dev/VolGroup00/vartmp
lvremove -f /dev/mapper/VolGroup01-uax
lvremove -f /dev/mapper/VolGroup01-rsasoc
vgrename VolGroup00 netwitness_vg00
vgchange -a n VolGroup01
vgmerge netwitness_vg00 VolGroup01
vgchange -a y netwitness_vg00
 Continue (Y/N)? Y
```

The old operating system is about to be removed. Continue (Y/N)? warning is displayed.

h. Type **Y** and press **Enter** to confirm that you want to replace the operating system.

```
Warning: The old operating system is about to be removed.  Continue (Y/N)?
```

When the host is upgraded to CentOS7, the host automatically reboots and prompts you to log in.

Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).

i. Log in to the host with the `root` credentials.

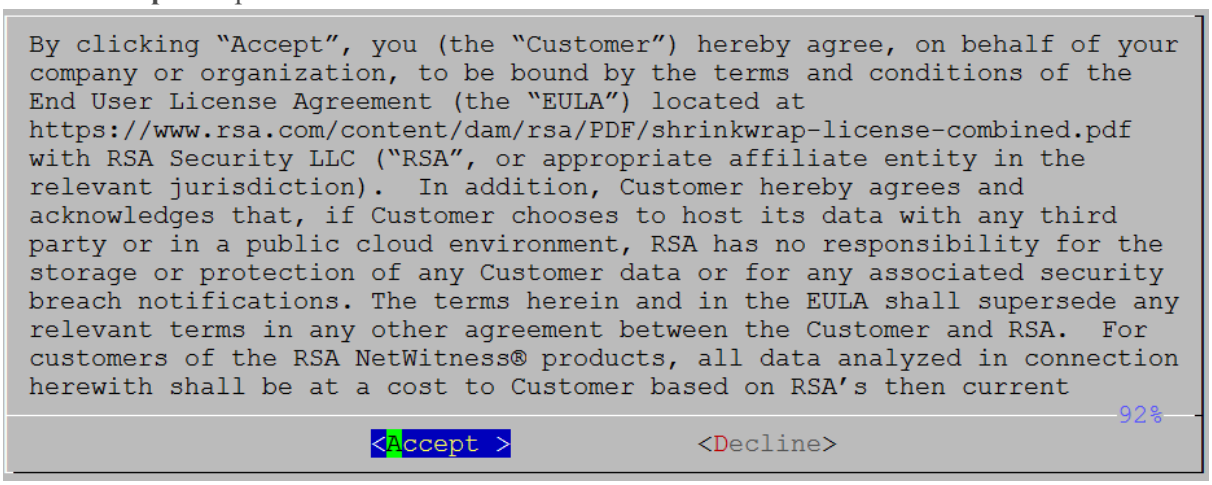
```
CentOS Linux 7 (Core)
Kernel 3.10.0-514.26.1.el7.x86_64 on an x86_64

NWAPPLIANCE9240 login: root
Password:
[root@NWAPPLIANCE9240 ~]#
```

2. Run the `nwsetup-tui` command to set up the host.
   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.

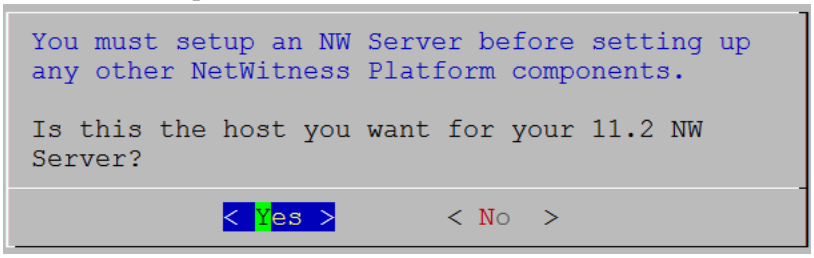
3. Tab to **Accept** and press **Enter**.



The **Is this the host you want for your 11.2 NW Server** NW Server prompt is displayed.

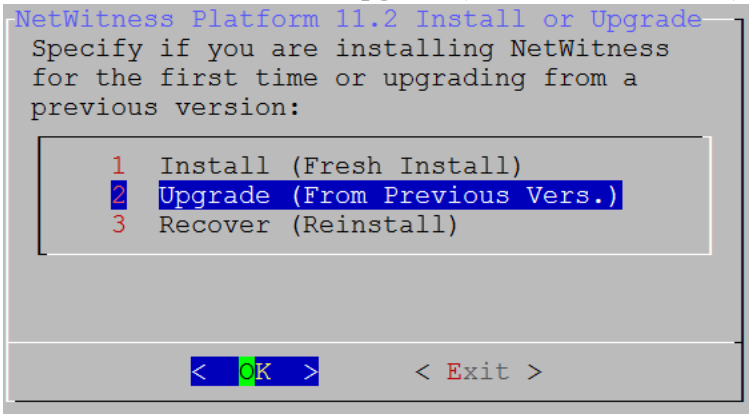
Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must restart the step up program and complete the all the steps (steps 2 through 11) to correct this error.

4. Tab to **Yes** and press **Enter**.



Choose **No** if you already upgraded the NW Server to 11.2.
The **Install** or **Upgrade** prompt is displayed.

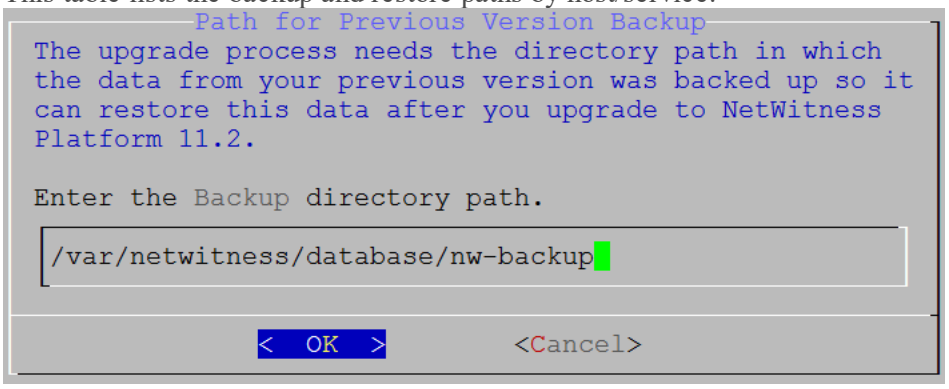
5. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.



The **Backup** path prompt is displayed.

Caution: The backup path in the following prompt must be the same as the path in which your backup is stored. For example, the backup script assigns `/var/netwitness/database/nw-backup` as the default path. If you used the default backup path during backup and did not change it subsequently, you must keep `/var/netwitness/database/nw-backup` as the path in the following prompt.

6. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
This table lists the backup and restore paths by host/service.



Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

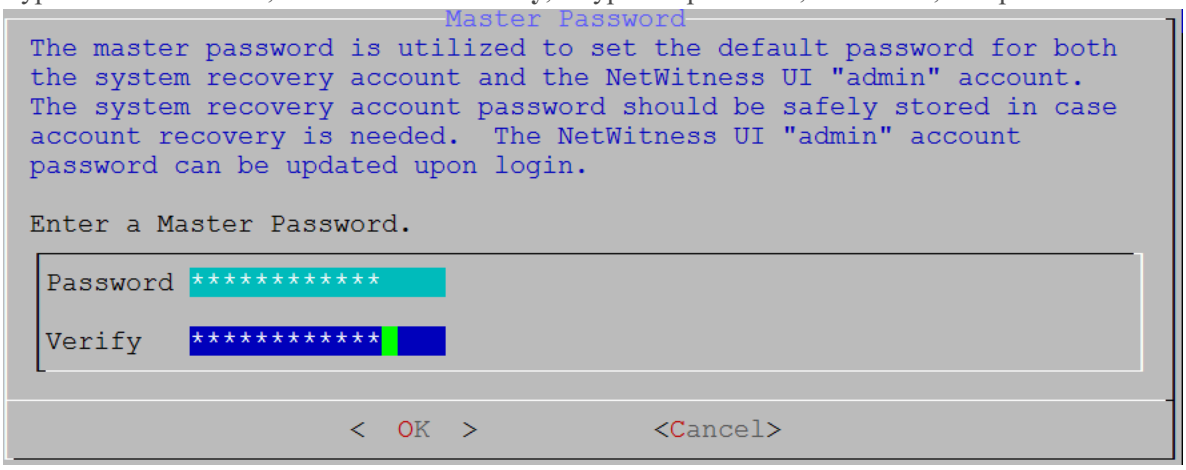
The **Master Password** prompt is displayed.

The following list of characters are supported for Master Password and Deployment Password:

Symbols	! @ # % ^ + ,
Numbers	0-9
Lowercase Characters	a-z
Uppercase Characters	A-Z

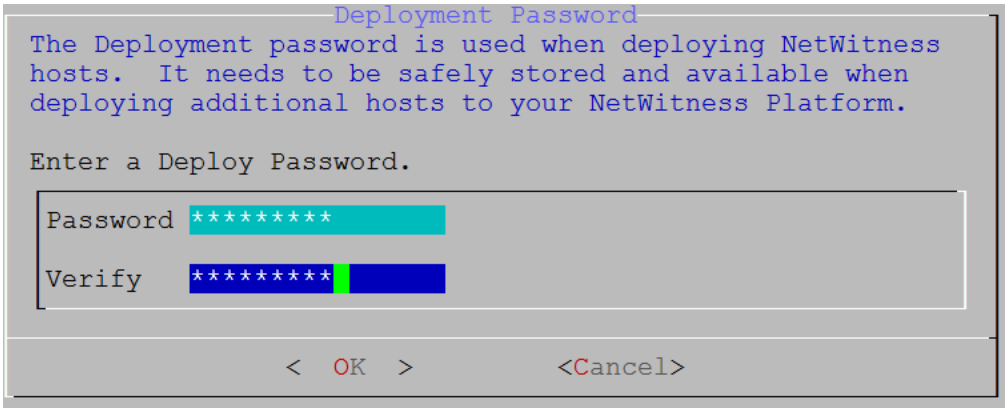
No ambiguous characters are supported for Master Password and Deployment Password. For example:
space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



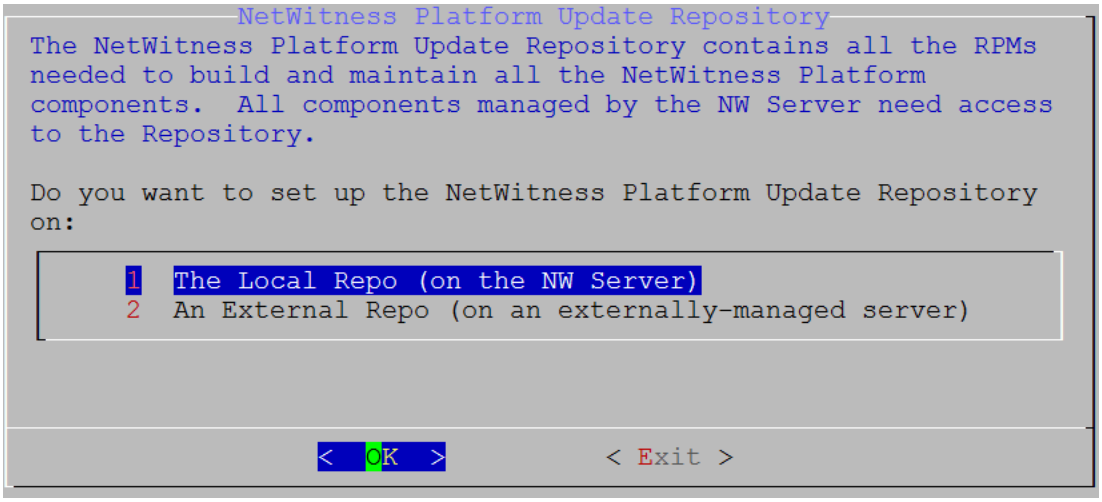
The **Deployment Password** prompt is displayed.

8. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

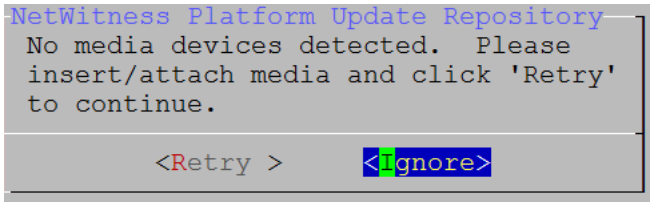


The **Update Repository** prompt is displayed.

9. Use the down and up arrows to select the location from which you want to apply version updates to your hosts, tab to **OK**, and press **Enter**.



- If you select **1 The Local Repo (on the NW Server)** the setup program makes sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which upgrade to NetWitness Platform 11.2. If the program cannot find the attached media, you receive the following prompt.

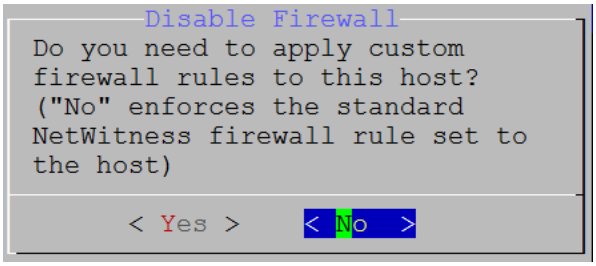


- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access RSA updates and CentOS updates. Refer to Appendix D. Create External Repository for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

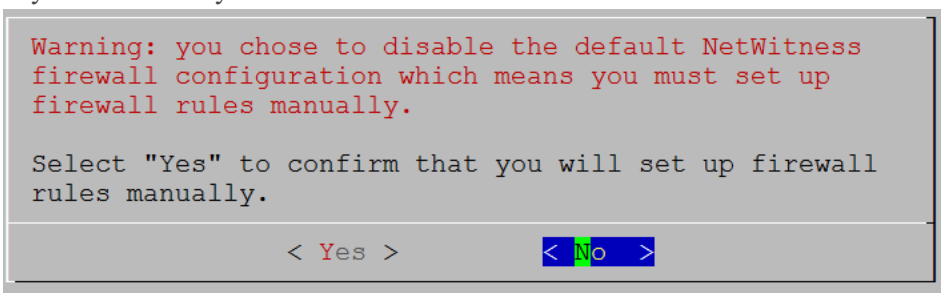
  Enter the base URL of the NetWitness Platform external repo and click **OK**.
  See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

The **Disable** or use standard **Firewall** configuration prompt is displayed.

10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.



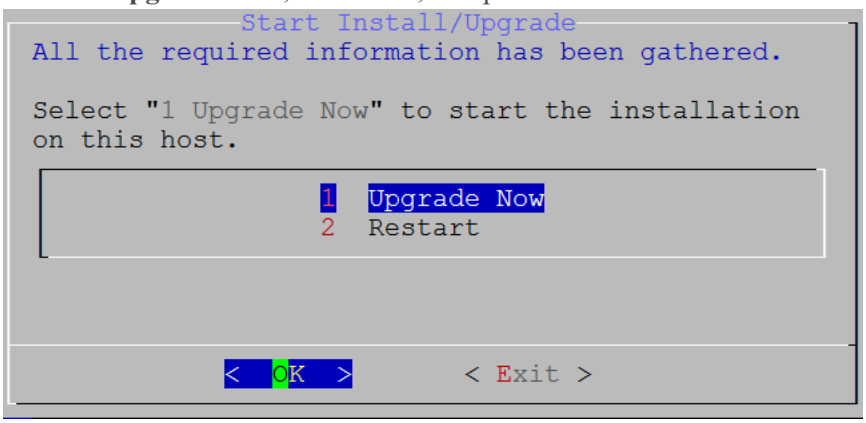
- If you select **Yes** your selection is confirmed.



- If you select **No**, the standard firewall configuration is applied.

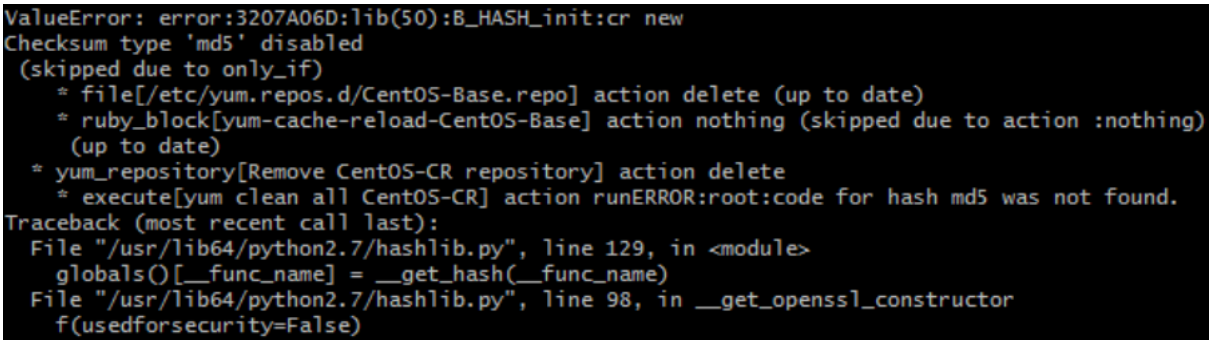
The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.2 Disaster Recovery).

11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.



When **Installation complete** is displayed, you have upgraded the 10.6.6.x SA Server to the 11.2 NW Server.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



12. Complete the NW Server before you upgrade any of the non-SA Server hosts to 11.2.

Upgrade a 10.6.6.x non-SA Server Host to 11.2

Make sure that you backed up 10.6.6.x data for the host. **You must follow the instructions in** Backup Instructions **to back up the host.**

Caution: Run the backup immediately before upgrading the host to 11.2 so that the data is as recent as possible.

Complete the following steps to upgrade a 10.6.6.x non-SA Server Host to 11.2.

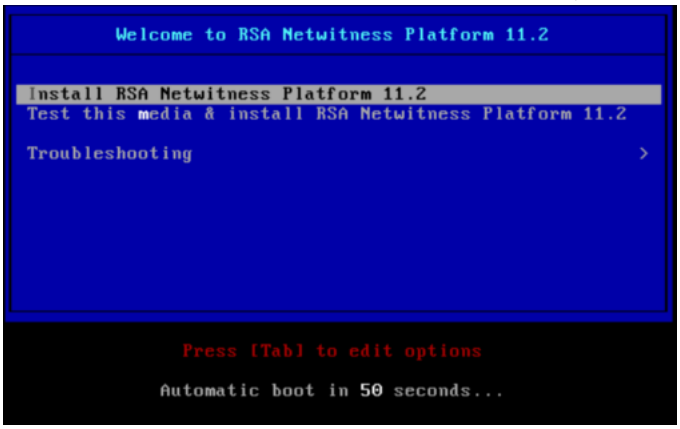
1. Create a base image on the host.
   a. Attach media (media that contains the ISO file, for example a build stick) to the host.
   See the *RSA NetWitness Platform Build Stick Instructions* for more information.
      - Hypervisor installations - use the ISO image.
      - Physical media - use the ISO to create bootable flash drive media using the Universal Netboot Installer (UNetbootin) or another suitable imaging tool. See the *RSA NetWitness® PlatformBuild Stick Instructions* for information on how to create a build stick from the ISO. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.
      - iDRAC installations - the virtual media type is:
        - **Virtual Floppy** for mapped flash drives.
        - **Virtual CD** for mapped optical media devices or ISO file.

   b. Log in to the host and reboot it.

```
login: root
Password:
Last login: Tue Sep 19 13:27:15 on tty1
[root@saserver ~]# reboot
```

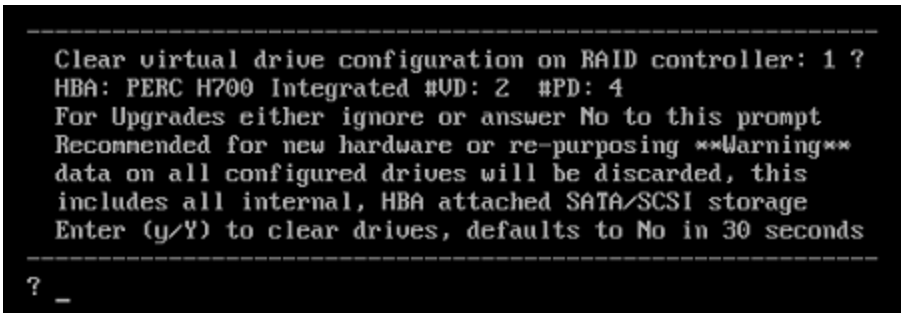
   c. Select **F11 (boot menu)** during reboot to select a boot device and boot to the connected media. After some system checks during booting, the following **Welcome to RSA NetWitness® Platform 11.2** installation menu is displayed. The menu graphics will render differently if you use a physical USB flash media.

d. Select **Install RSA Netwitness Platform 11.2** (default selection) and press **Enter**.



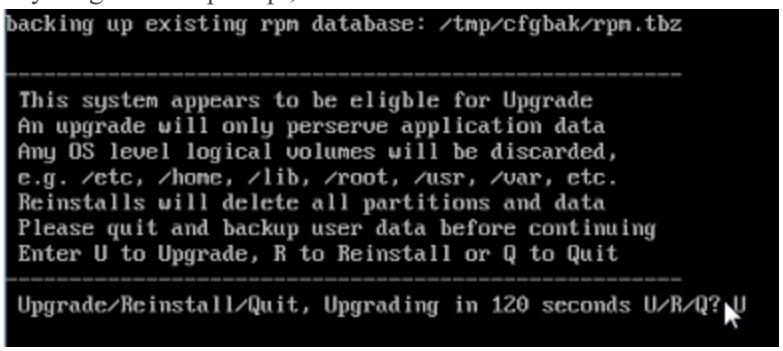
The Operating System installation runs and stops at the **Enter (y/Y) to clear drives**.

e. Enter **n** (No).
The default action is **No**. If you ignore the prompt, it will select **No** in 30 seconds and will not clear the drives.



The **Upgrade/Reinstall/Quit (U/R/Q?)** prompt is displayed.

f. Type **U** to upgrade the host.
If you ignore the prompt, it will select **U** in 120 seconds.



It takes a few minutes for CentOS7 components to install. The installation program displays the components as they are installed which varies depending on the appliance. When CentOS7 installation is complete, the **Continue (Y/N)?** prompt is displayed.

g. Type **Y** and press **Enter** to confirm that you want to upgrade this host.

```
-----------------------------------------------------
 Steps to be executed listed below.   Warning:
 this is irreversible.
-----------------------------------------------------
lvremove -f /dev/VolGroup00/rabmq
lvremove -f /dev/VolGroup00/root
lvremove -f /dev/VolGroup00/swap
lvremove -f /dev/VolGroup00/tmp
lvremove -f /dev/VolGroup00/usrhome
lvremove -f /dev/VolGroup00/var
lvremove -f /dev/VolGroup00/vartmp
lvremove -f /dev/mapper/VolGroup01-uax
lvremove -f /dev/mapper/VolGroup01-rsasoc
vgrename VolGroup00 netwitness_vg00
vgchange -a n VolGroup01
vgmerge netwitness_vg00 VolGroup01
vgchange -a y netwitness_vg00
 Continue (Y/N)? Y
```

The old operating system is about to be removed. Continue (Y/N)? warning is displayed.

h. Type **Y** and press **Enter** to confirm that you want to replace the operating system.

```
Warning: The old operating system is about to be removed.  Continue (Y/N)?
```

When the host is upgraded to CentOS7, the host automatically reboots and prompts you to log in.

Caution: Do not reboot the attached media (media that contains the ISO file, for example a build stick).

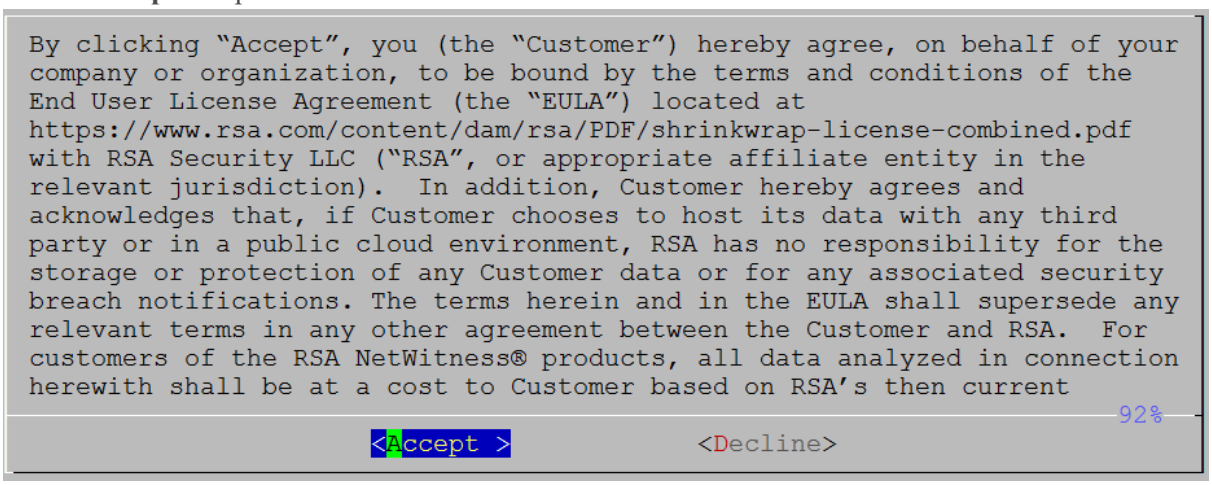
i. Log in to the host with the `root` credentials.

```
CentOS Linux 7 (Core)
Kernel 3.10.0-514.26.1.el7.x86_64 on an x86_64

NWAPPLIANCE9240 login: root
Password:
[root@NWAPPLIANCE9240 ~]#
```

2. Run the `nwsetup-tui` command to set up the host.
   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

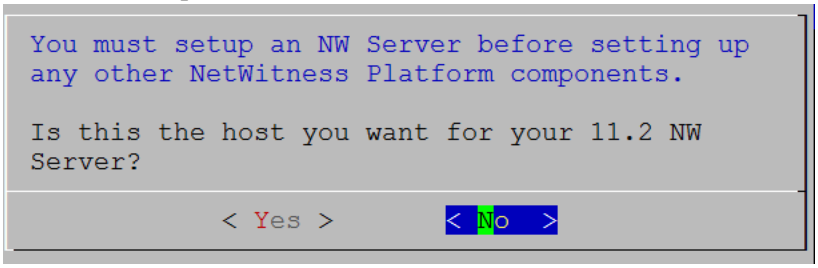
3. Tab to **Accept** and press **Enter**.



The **Is this the host you want for your 11.2 NW Server** prompt is displayed.

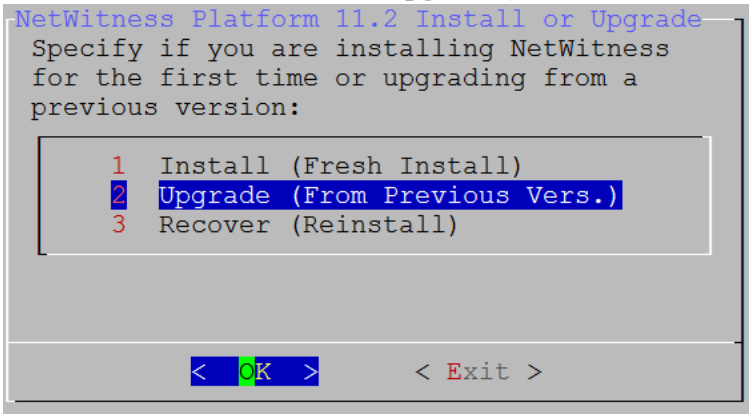
Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must restart the step up program and complete the all the steps (steps 2 through 11) of Upgrade the 10.6.6.x SA Server Host to the 11.2 NW Server Host to correct this error.

4. Tab to **No** and press **Enter**.



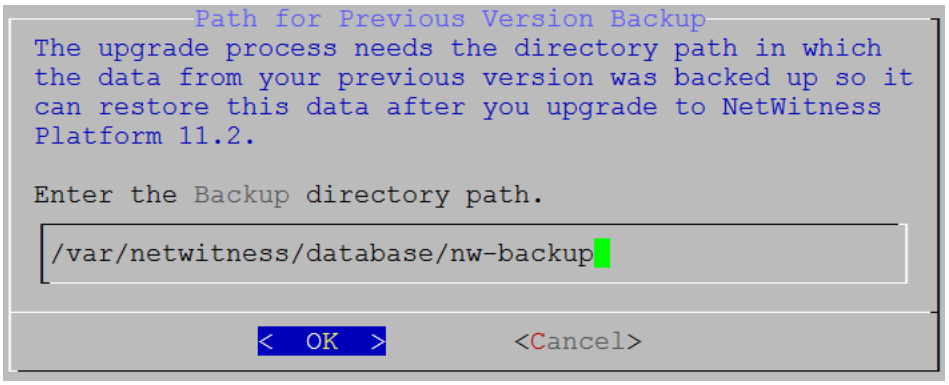
The **Install** or **Upgrade** prompt is displayed.

5. Use the down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.



The **Backup** path prompt is displayed.

6. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.



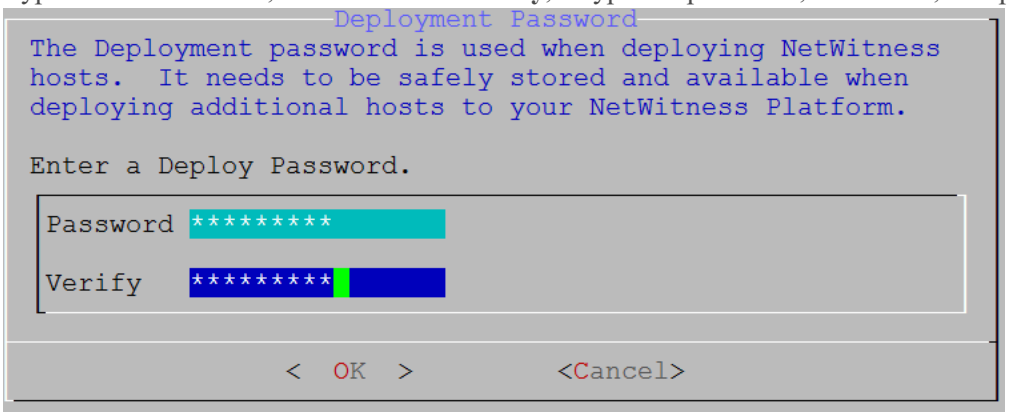
This table lists the backup and restore paths by host/service.

Host	Backup Path	Restore Path
Malware	/var/lib/rsamlware/nw-backup	/var/netwitness/malware_analytics_server/nw-backup/restore
Event Stream Analysis	/opt/rsa/database/nw-backup	/var/netwitness/database/nw-backup/restore
NW Server	/var/netwitness/database/nw-backup	/var/netwitness/restore
All Other Hosts	/var/netwitness/database/nw-backup	/var/netwitness/database/nw-backup/restore

The **Deployment Password** prompt is displayed.

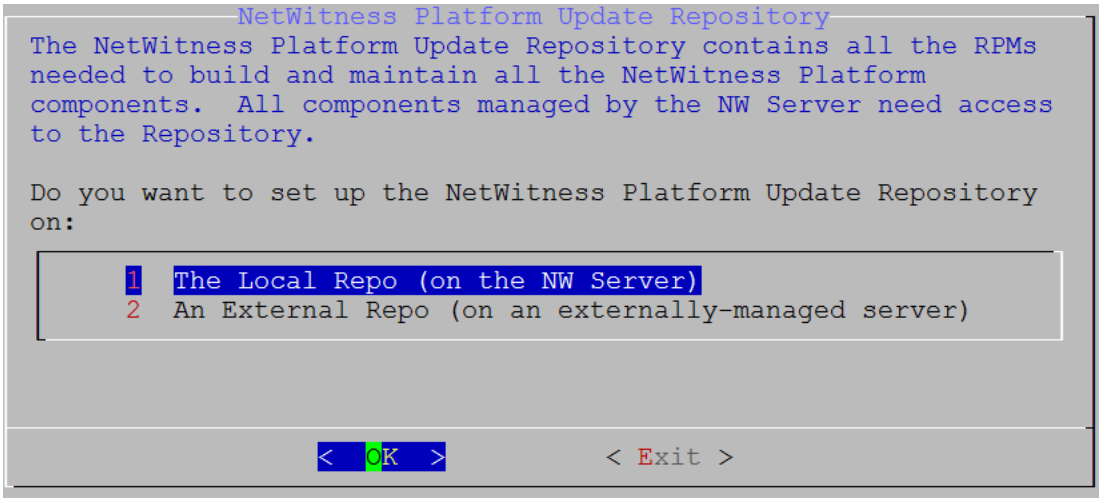
Note: You must use the same deployment password that you used when you upgraded the NW Server.

7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



The **Update Repository** prompt is displayed.
Select the same repo you selected when you upgraded the NW Server Host for all hosts.

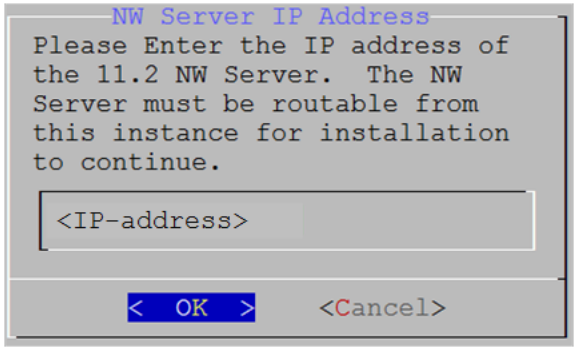
8. Use the down and up arrows to select the location from which you want to apply version updates to your hosts (for example, **1 The Local Repo (on the NW Server)** , tab to **OK**, and press **Enter** .



- If you select **1 The Local Repo (on the NW Server)** the setup program makes sure that you have the appropriate media attached to the host (media that contains the ISO file, for example a build stick) from which it can upgrade to NetWitness Platform 11.2.
- If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL. The repositories give you access RSA updates and CentOS updates. Enter the base URL of the NetWitness Platform external repo and click **OK**. The repositories give you access RSA updates and CentOS updates. Refer to Appendix D. Create External Repository for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.

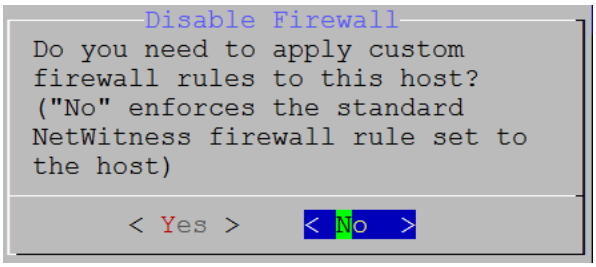
The **NW Server IP Address** prompt is displayed.

9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.

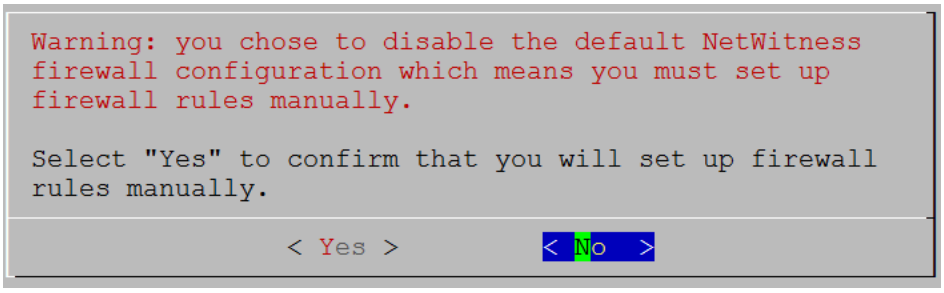


The **Disable** or use standard **Firewall** configuration prompt is displayed.

10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration. The following example shows **No** with the standard firewall configuration selected.



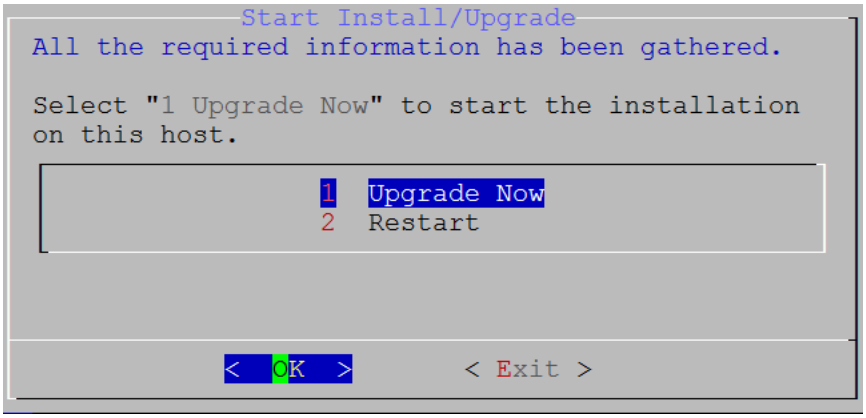
- If you select **Yes**, confirm your selection.



- If you select **No**, the standard firewall configuration is applied.

The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.2 Disaster Recovery).

11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.



When **Installation complete** is displayed, you have upgraded the host to the 11.2.

12. Install the service on this host:

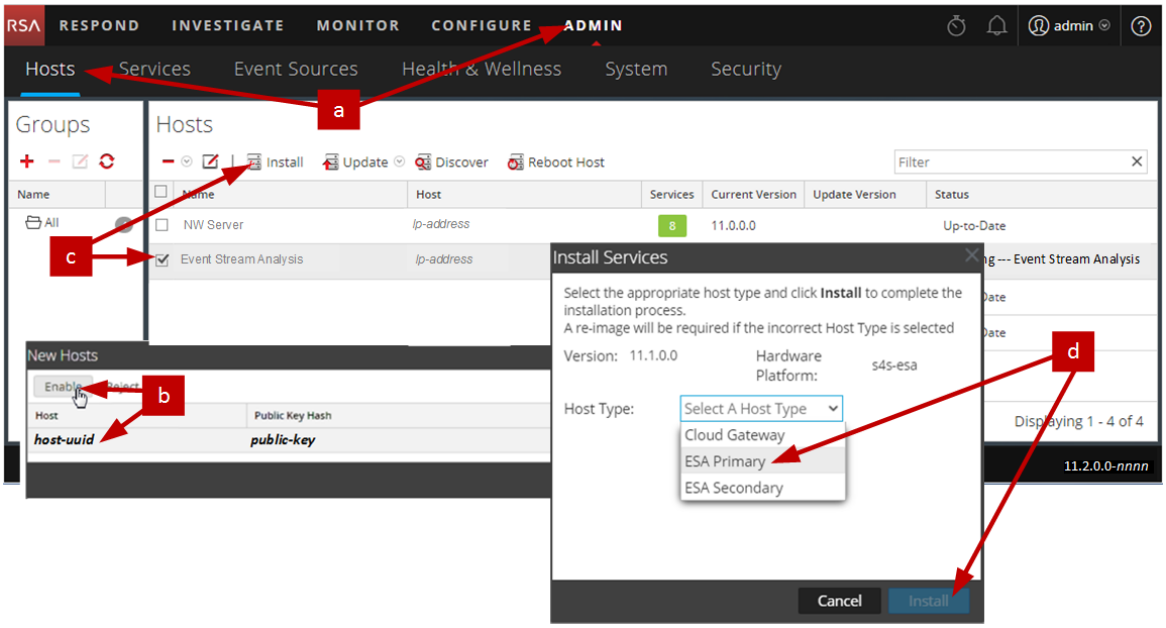
    a. Log into NetWitness Platform and go to **ADMIN** > **Hosts**.
    The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

    Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    b. Click on the host in the **New Hosts** dialog and click **Enable**.
    The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

    c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click Install.
    The **Install Services** dialog is displayed.

d. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



You have completed the upgrade of the non-NW Server host in NetWitness Platform

Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness Legacy Windows Collection Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

This topic contains the tasks you must complete after you upgrade your hosts from 10.6.6.x to 11.2. These tasks are organized by the following categories.

General

Task 1 - Make Sure Port 15671 Is Configured Correctly

Port 15671 is new in 11.x, but you do not need to open a firewall for this port. Make sure that port 15671, and all ports, are configured as shown in the "Network Architecture and Ports" topic in the *RSA NetWitness® Platform Deployment Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

(Conditional) Task 2 - Restore Custom Analysts Roles

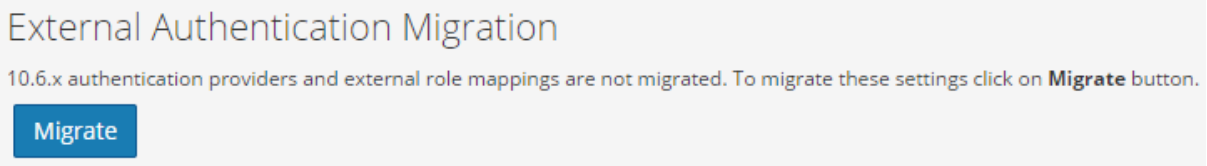
If you had custom analyst roles in 10.6.6.x, you must reinstate them in 11.2. See "Add a Role and Assign Permissions" in the *RSA NetWitness PlatformSystem Security and User Management Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NW Server

Task 3 - Migrate Active Directory (AD)

The first time you log into the NetWitness Platform 11.2 User Interface, you must click on the Migrate button to complete the migration of AD.

1. Log in to NetWitness Platform 11.2 with your `admin user` credentials.
2. Go to **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 4 - Modify Migrated AD Configuration to Upload Certificate

If you authenticated through Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.6.x, you must modify the migrated AD configuration to upload the Active Directory server certificate.

Complete the following procedure to modify the migrated AD configuration to upload the certificate.

1. Log in to **NetWitness Platform** 11.2, go to **ADMIN** > **Security** and click the **Settings** tab.
2. Under **Active Directory Settings**, select an AD configuration and click  .
   The Edit Configuration dialog is displayed.
3. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
4. Click **Save**.

Task 5 - Reconfigure Pluggable Authentication Module (PAM) in 11.2

You must reconfigure PAM after you upgrade to 11.2. See "Configure PAM Login Capability" in the *RSA NetWitness® Platform System Security and User Management Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

You can refer to your 10.6.6.x PAM configuration files in the **/etc** directory in the your 10.6.6.x backup data for guidance.

Task 6 - Restore NTP Servers

You must use the NetWitness Platform 11.2 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *RSA NetWitness® PlatformSystem Configuration Guide* for detailed instructions on how to add NTP servers. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 7 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Platform licenses. Refer to "Step 1. Register the NetWitness Server" in the *RSA NetWitness Platform Licensing Management Guide* for instructions on how to re-download licenses. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

(Conditional) Task 8 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   ```
   /etc/sysconfig/iptables
   /etc/sysconfig/ip6tables
   ```
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 9 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

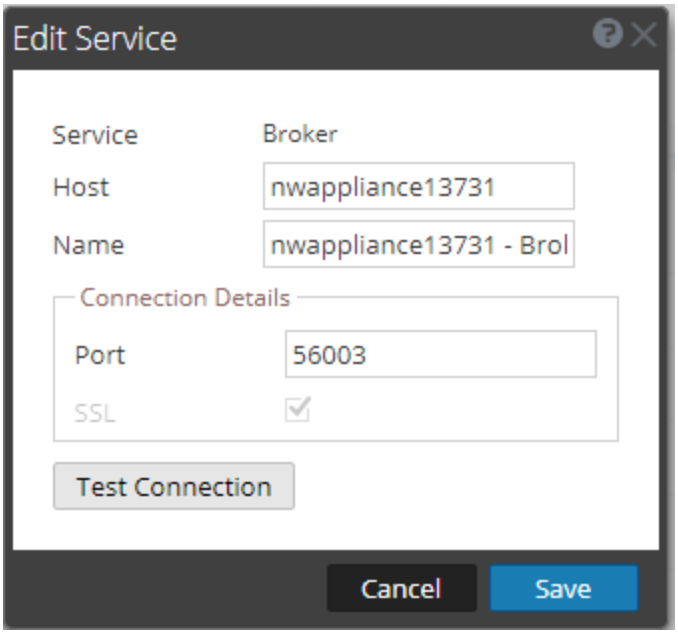
- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.6.x.

NetWitness Platform 11.2 cannot communicate with the Core services if you are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
2. Select each core service and change the ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005
Decoder	50004	56004
Log Decoder	50002	56002

3. Click (Edit icon) from the SERVICES view toolbar.
   The Edit Service dialog is displayed.
4. Change the port from Non-SSL to SSL as shown in the table and click **Save** (for example, change the Broker port from 50003 to 56003).



Task 10 - (Conditional) Correct Audit Log Templates That Are Not Updated in Logstash Output Conf File

If you had global auditing configured in 11.0.x, you must complete the following procedure to apply the latest Global Auditing configuration.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **System** > **Global Notifications**.
   The **Global Notifications** view is displayed.
2. Click the **Servers** tab and select any syslog server.
3. Click (Edit icon), and in the Define Syslog Notification Server dialog, click **Save**.

RSA NetWitness® Endpoint

Task 11 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Platform 11.2, the virtual host is `/rsa/system`. For 10.6.6.x and earlier versions, the virtual host is `/rsa/sa`.
2. Restart the API Server and Console Server.
3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.
6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Task 12 - Reconfigure Recurring Feed Configured from Legacy Endpoint Because Java Version Changed

You must reconfigure the Legacy Endpoint recurring feed due to the change in Java version. Complete the following step to fix this problem.

- Import the NetWitness Endpoint CA certificate into the NetWitness Platform Trusted store as described in "Export the NetWitness Endpoint SSL Certificate" under the "Configure Contextual Data from Endpoint via Recurring Feed" topic in the *RSA NetWitness Endpoint Integration Guide* to import the certificate.
  Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

RSA NetWitness® Endpoint Insights

(Optional) Task 13 - Install Endpoint Hybrid or Endpoint Log Hybrid

See:

RSA NetWitness Platform 11.2 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.2 Virtual Host Installation Guide for instructions for installation on a virtual host.

Event Stream Analysis Tasks

Task 14 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.6.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.2.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Network data and C2 for Logs, require a whitelist named "**domains_whitelist**".
2. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Go to **ADMIN** > **Services**, select the Context Hub service, in the action commands () drop-down menu, click **View** > **Config** > **Lists** tab.
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *NetWitness Platform Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *NetWitness Platform ESA Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 15 - For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint Configure Mutually Authenticated SSL

If you integrate with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.6.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Platform by logging into the host and running the following `rabbitmqctl` command.
   ```
   > rabbitmqctl add_user <username> <password>
   ```
   For example:
   ```
   > rabbitmqctl add_user wtd-incidents incidents
   ```
2. Set permissions for users by running the following command (use the username from step 1):
   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*", ".*"
   ```
   For example:
   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*", ".*", ".*"
   ```

Task 16 - Enable Threat - Malware Indicators Dashboard

In 11.2, the 10.6.6.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.6.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.2.
2. Set datasource for new dashlets.
   See "Dashlets" in RSA Link (https://community.rsa.com/docs/DOC-81463) for a description of Dashlets in the context of NetWitness Platform.

Note: After upgrading to 11.2, both the Threat-Indicators and the Threat-Malware Indicators dashboards can be displayed in the User Interface. If this is the case, disable the Threat-Indicators dashboard, and enable the Threat-Malware Indicators report charts and dashboard. For information about disabling dashboards, see the "Managing Dashboards" topic in the *RSA NetWitness Platform Getting Started Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Investigate

Task 17 - Make Sure Customized User Roles Have `Investigate-server` Permissions for Event Analysis Access

After you upgrade to 11.2.0.0, any customized user role does not have `investigate-server.*` permission enabled by default. Complete the following procedure to make sure that the appropriate user roles have permission to access Event Analysis.

1. Log in to NetWitness Platform 11.2.0.0 with your `Admin user` credentials and go to **ADMIN** > **Security**.
2. Click the **Roles** tab.
3. Select the roles that need `investigate-server.*` permissions and click (Edit icon).
4. Select the **Investigate-server** tab under under **Permissions**.
5. If the **investigate-server** checkbox is not set, set it for the users that require Event Analysis access.

6. Click **Save**.

Log Collection

Task 18 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.2 to ensure that all collection protocols resume normal operation.

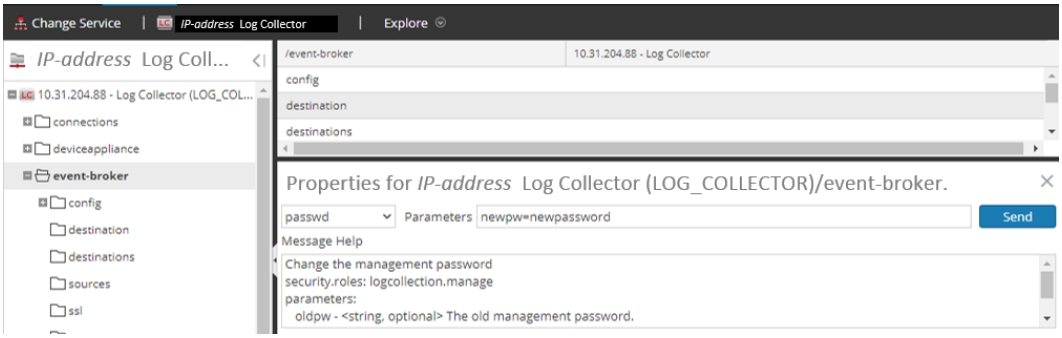
Reset Stable System Values for the Lockbox

The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *RSA NetWitness® PlatformLog Collection Configuration Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Update Log Collector Service RabbitMQ User Account Password

If the `logcollector` service RabbitMQ user account password was changed, you must reenter it after the 11.2 upgrade.

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
2. Select the Log Collector service.
3. Click  (Actions) > **View** > **Explore**.
4. Right click `event-broker` > **Properties** .
5. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



(Optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Network Decoders)

Task 19 - Enable FIPS Mode

FIPS is enabled on all services except Log Collector, Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder. For information about how to enable FIPS for these services, see the "Activate or Deactivate FIPS" topic in the *RSA NetWitness® PlatformSystem Maintenance Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Decoder and Log Decoder

(Conditional) Task 20 - Enable Metadata for GeoIP2 Parser

By default, the GeoIP2 parser generates less metadata than the GeoIP parser did. After updating to 11.2, if you require any of the additional metadata, you must enable them (once only) for each Decoder. This can also be altered post-upgrade. Keep in mind that the `isp` and `org` meta fields usually produce an equivalent value to `domain`.

To enable metadata:

1. Go to **ADMIN** > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon () and select **View** > **Config**. The Parsers Configuration panel is displayed, from which you can select **GeoIP2** to enable the desired metadata.

For more information about GeoIP2 parsers, see the "GeoIP2 and GeoIP Parsers" topic in the *Decoder and Log Decoder Configuration Guide*.

Reporting Engine

(Conditional) Task 21 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the backup you made prior to the upgrade. The Backup script backs up the 10.6.6.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.2.

1. SSH to the NW Server host.
2. Export the CA certificates.
   ```
   keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file
   ```
3. Copy the CA PEM file into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 22 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *RSA NetWitness® Platform Reporting Engine Configuration Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Respond

Task 23 - Restore Respond Service Custom Keys

In 10.6.6.x, if you added custom key for use in the **groupBy** clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.
   This directory is where the `alert_rules.json` file is restored from the 10.6.6.x backup.
2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.2.
   This is the new file for 11.2.
3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 24 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.2 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.6.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.6.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.6.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Platform 11.2 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.6.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

Task 25 - Add Respond Notification Settings for Custom Roles

Respond Notification Setting permissions enable Respond Administrators, Data Privacy Officers, and SOC Managers to access Respond Notification Settings (**CONFIGURE** > **Respond Notifications**), which enable them to send email notifications when incidents are created or updated.

To access these settings, you will need to add additional permissions to your existing built-in NetWitness Platform user roles. You will also need to add permissions to your custom roles. See the "Respond Notification Settings Permissions" topic in the *NetWitness Respond Configuration Guide*. For detailed information about user permissions, see the *System Security and User Management Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 26 - Manually Configure Respond Notification Settings

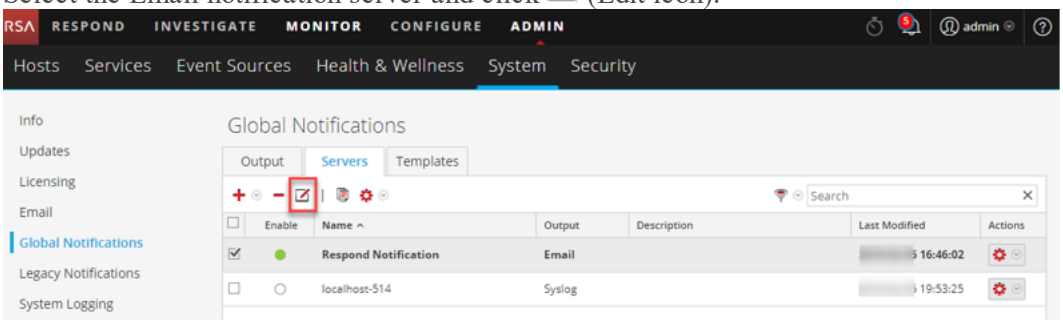
The Incident Management notification settings in NetWitness Platform 10.6.6.x are different from the Respond notification settings available in 11.2, so your existing 10.6.6.x settings will not migrate to 11.2.

NetWitness Respond notification settings enable email notifications to be sent to SOC Managers and the Analyst assigned to an incident when an incident is created or updated.

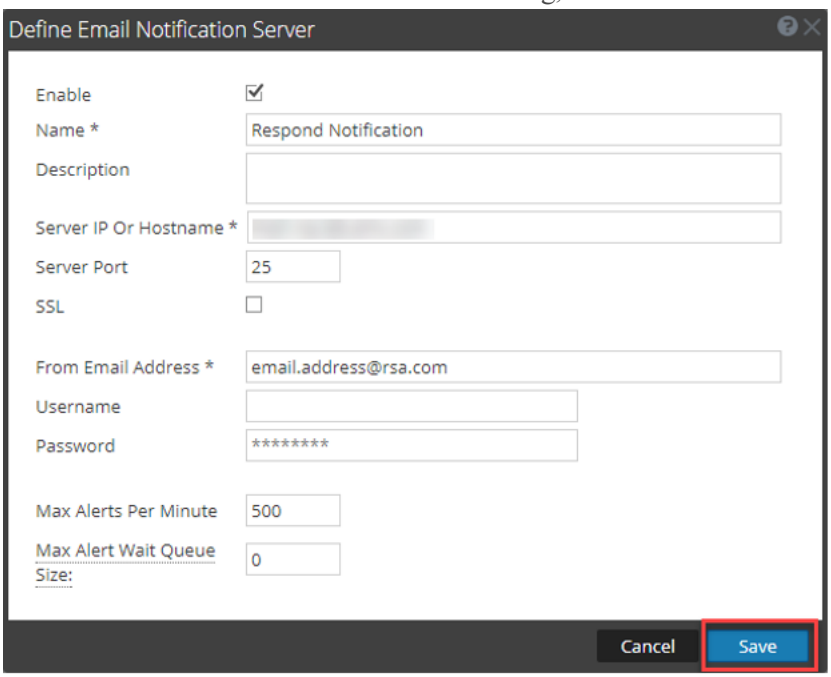
To manually configure the Respond Notification Settings, go to **CONFIGURE** > **Respond Notifications.** See the "Configure Respond Email Notification Settings" procedure in the *NetWitness Respond Configuration Guide*.

Notification Servers from 10.6.6.x will not display in the Email Server drop-down list. The email servers must be edited and saved in the Global Notification Servers panel (**ADMIN** > **System** > **Global Notifications** > **Server** tab).

1. Log in to **NetWitness Platform** and go to **ADMIN** > **System** > **Global Notifications** > **Server** tab.
2. Go to **CONFIGURE** > **Respond Notifications**. The Respond Notifications Settings view is displayed.
   Notice that the email notification servers do not appear in the EMAIL SERVER drop-down list.
3. Click the **Email Server Settings** link.
   You will see the Global Notifications panel.
4. Click the **Servers** tab.
5. For each of your email notification servers:
   a. Select the Email notification server and click (Edit icon).



b. In the Define Email Notification Server dialog, click **Save**.



6. Go back to **CONFIGURE** > **Respond Notifications**. Your servers will appear in the **EMAIL SERVER** drop-down list.
   Custom Incident Management notification templates cannot be migrated to 11.2. No custom templates are supported in 11.2.

Task 27 - Update Default Incident Rule Group By Values

Four of the default incident rules now use ”Source IP Address” as the Group By value. To update the default rules, change the Group By value of the following default rules to “Source IP Address”:

- High Risk Alerts: Reporting Engine
- High Risk Alerts: Malware Analysis
- High Risk Alerts: NetWitness Endpoint
- High Risk Alerts: ESA

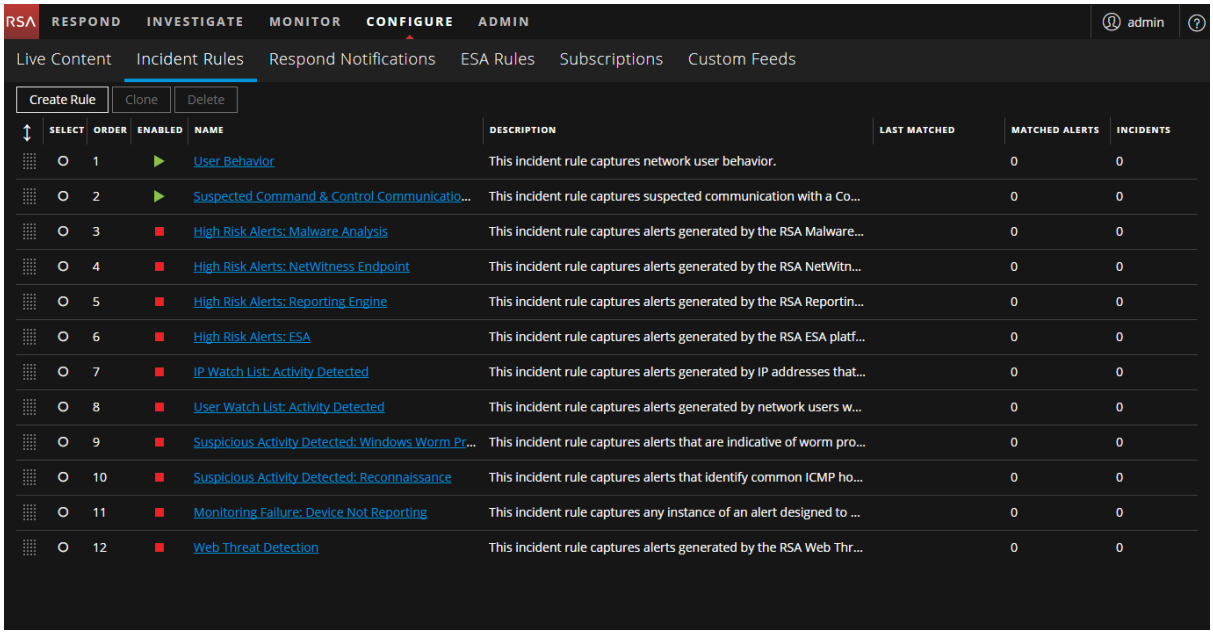
1. Go to **CONFIGURE** > **Incident Rules** and click the link in the **Name** column for the rule that you want to update. The Incident Rule Details view is displayed.
2. In the **Group By** field, select the new Group By value.
3. Click **Save** to update the rule.

Task 28 - Add Group By Field to Incident Rules

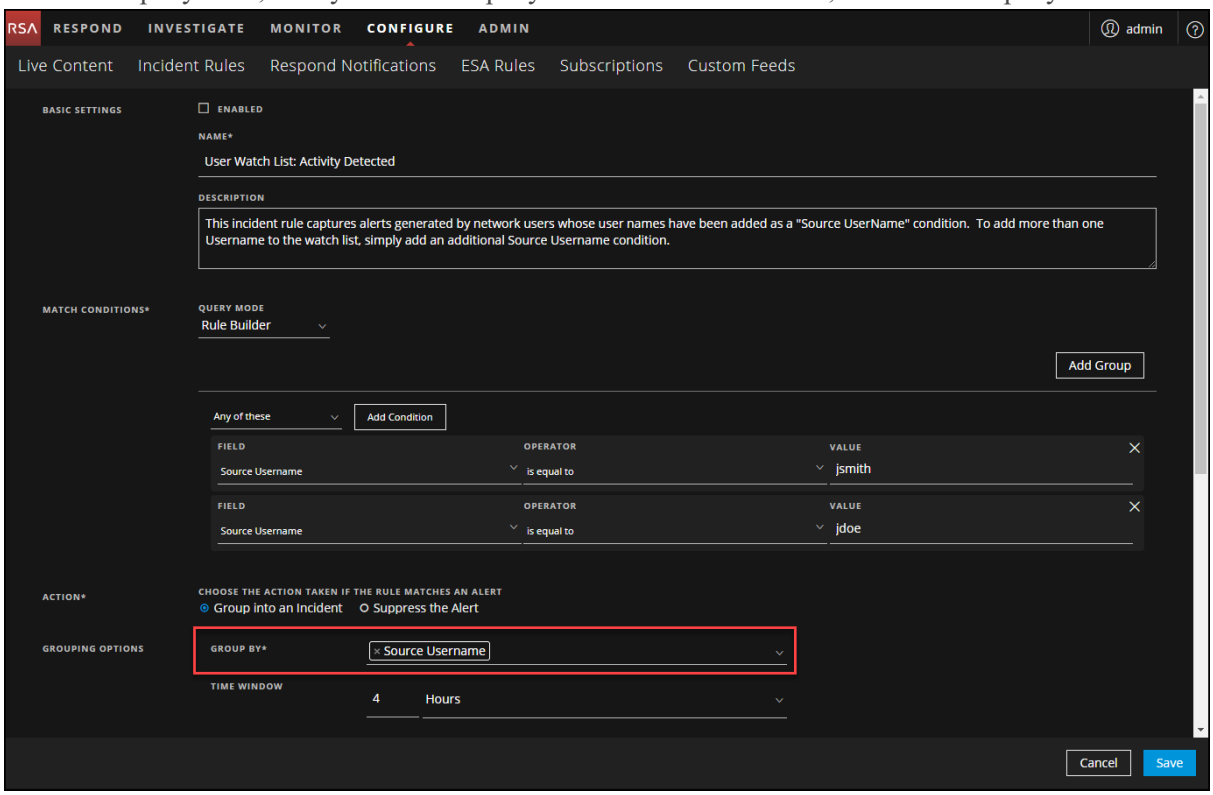
The **Group By** field is not required in 10.6.6, but it is required in 11.2. After you upgrade to 11.2, some incident rules will not have a **Group By** field, so you must add them to the rules or the rules will not work and they will not create incidents.

Complete the following steps for each incident rule:

1. Log in to NetWitness Platform.
2. Go to **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



3. In the Group By field, verify that a Group By value is selected. If not, select a Group By value.



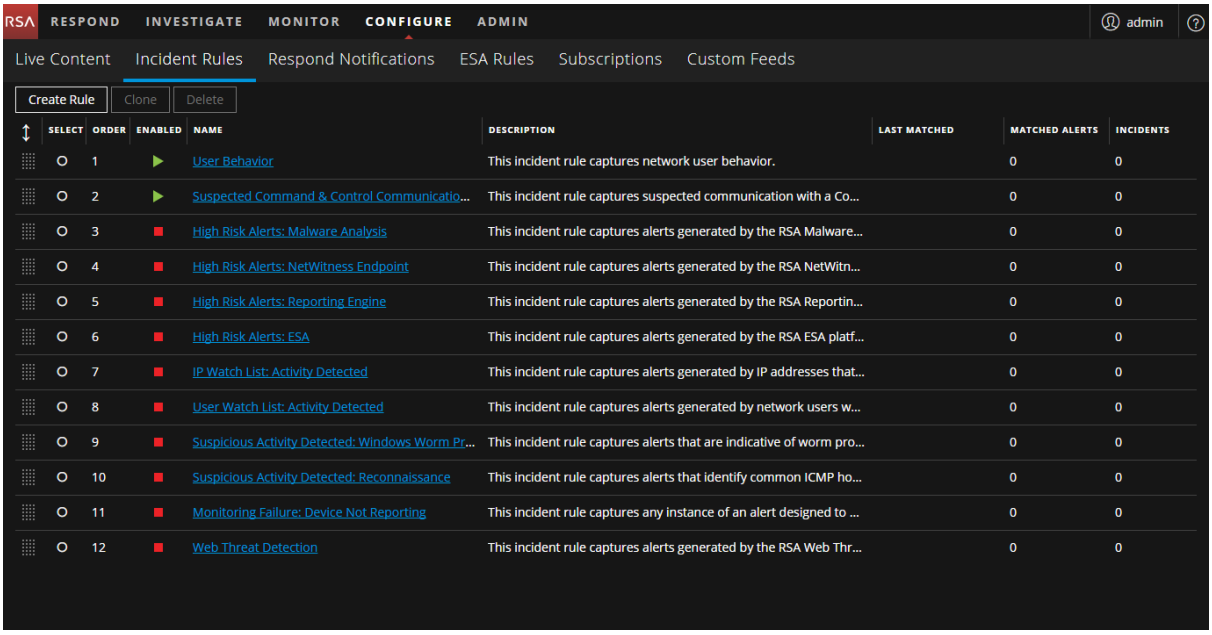
4. Click **Save** to update the rule.
   For information about incident rules, see the *NetWitness Respond Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 29 - Update Incident Rules Identified in the Domain in the Matching Conditions Upgrade Preparation Task

Modify the incident rules that you identified in the Task 5 - Check Aggregation Rules Match Conditions for "Domain" or "Domain for Suspected C&C" upgrade preparation task, which contained Domain or Domain for Suspected C&C in the matching conditions in rule builder.

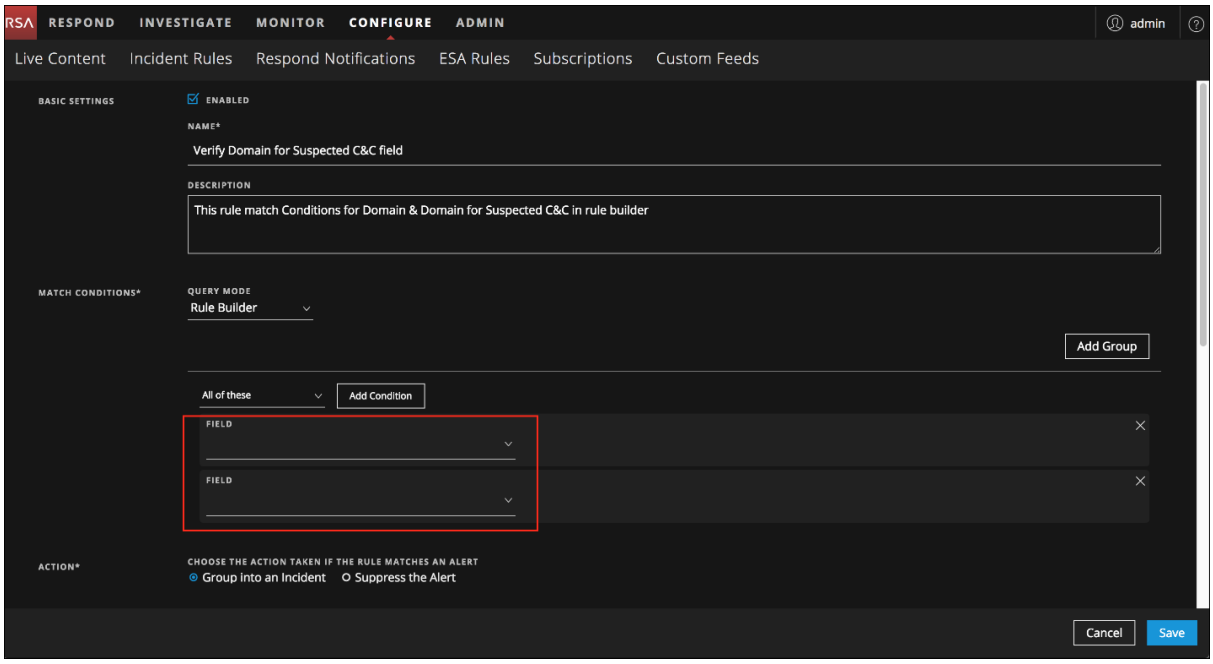
For each rule that you previously identified:

1. Log in to **NetWitness Platform**, go to **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



2. In the **Match Conditions** section, in the blank fields, select **Domain** and **Domain for Suspected CC** in the drop-down list and then select the conditions that you previously identified in the pre-upgrade

tasks.



3. Click **Save** to update the rule.
   For information about incident rules, see the *NetWitness Respond Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

RSA Archer Cyber Incident & Breach Response

Task 30 - Reconfigure RSA Archer Cyber Incident & Breach Response Integration

For information on how to reconfigure RSA Archer Cyber Incident & Breach Response for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

RSA NetWitness® UEBA

Task 31 - Install NetWitness UEBA

NetWitness UEBA is new a new feature as of NetWitness Platform 11.2.

See:

RSA NetWitness Platform 11.2 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.2 Virtual Host Installation Guide for instructions for installation on a virtual host.

RSA NetWitness UEBA User Guide for information about NetWitness UEBA.

Warehouse Connector

Task 32 - Restore `keytab` Files, Mount NFS, Install Service

1. Restore the `keytab` files from `<backup-path>/restore` directory.
2. Restore the Kerberos Realm Configuration from the `<backup-path>/restore/etc/krb5.conf` into `/etc/krb5.conf`.
3. (Conditional) If you perform the upgrade from a Non - FIPS environment and the `isCheckValidationRequired` parameter is not enabled in the destination, to configure the SFTP destination:
   a. SSH to the Warehouse Connector host and submit the following commands:
   ```
   cd /root/.ssh/
    mv id_dsa id_dsa.old
   OWB_FORCE_FIPS_MODE_OFF=1 openssl pkcs8 -topk8 -v2 des3 -in id_dsa.old -
   out id_dsa
   ```
   You are prompted for the pass phrase.
   b. Enter the Encryption password.
   c. Run the following command.
   ```
   chmod 600 id_dsa
   ```
4. Install the Warehouse Connector.
   See the *NetWitness Platform Warehouse Connector Configuration Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 33 - Refresh Warehouse Connector Lockbox and Start Stream

Note: If the streams have auto start turned on in 10.6.6.x, there will be a small delay before you will see the Warehouse Connector service in the NetWitness Platform User Interface.

1. Refresh the Lockbox of Warehouse Connector.
2. SSH to the Warehouse Connector and log in with root credentials.
3. Restart the service.
   ```
   service nwwarehouseconnector restart
   ```
4. (Conditional) If the auto start was not enabled in 10.6.6.x, you must start the stream manually after the service restarts.

Backup

Task 34 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.2. before you remove the backup-related files from the local directories on your 11.2. hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.2, you must remove:

- The backup files from the local directories on the hosts.
- All the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

Appendix A. Troubleshooting

There two sections in this appendix.

- Section 1 - General Troubleshooting Information
- Section 2 - Hardware-Related Troubleshooting Information

Section 1 - General Troubleshooting information

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Backup Script
- Event Stream Analysis
- Log Collector Service (`nwlogcollector`)
- Orchestration
- NW Server
- Reporting Engine
- NetWitness UEBA

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed. 2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health. AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Backup (`nw-backup` script)

Error Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA Mongo admin password back to the original default of 'netwitness' before running backup.

Error	Backup errors caused by the `immutable` attribute setting. Here is an example of an error that can be displayed: Cause	If you have any files that have the immutable flag set (to keep the Puppet process from overwriting a customized file), the file will not be included in the backup process and an error will be generated.
Solution	On the host that contains the files with the immutable flag set, run the following command to remove the immutable setting from the files: `chattr -i <filename>`

Error	Error creating Network Configuration Information file due to duplicate or bad entries in primary network configuration file: `/etc/sysconfig/network-scripts/ifcfg-em1` Verify contents of `/var/netwitness/logdecoder/packetdb/nw-backup/2018-02-23/S5-BROK-36-10.25.53.36-network.info.txt`
Cause	There are incorrect or duplicate entries for any one of the following fields: DEVICE, BOOTPROTO, IPADDR, NETMASK or GATEWAY, that were found from reading the primary Ethernet interface configuration file from the host being backed up.

Solution	Manually create a file at the backup location on the external backup server, as well as the backup location local to the host where other backups have been staged. The file name should be of the format `<hostname>-<hostip>-network.info.txt`, and should contain the following entries:
	`DEVICE=<devicename> ; # from the host's primary ethernet interface config file`
	`BOOTPROTO=<bootprotocol> ; # from the host's primary ethernet interface config file`
	`IPADDR=<value> ; # from the host's primary ethernet interface config file`
	`NETMASK=<value> ; # from the host's primary ethernet interface config file`
	`GATEWAY=<value> ; # from the host's primary ethernet interface config file`
	`search <value> ; # from the host's /etc/resolv.conf file`
	`nameserver <value> ; # from the host's /etc/resolv.conf file`

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.2.0.0 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESA Primary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA.
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6.x to 11.2.0.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Reporting Engine Service

Reporting Engine Update logs are posted to to/var/log/re_install.log file on the host running the Reporting Engine service.

Error Message	<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [><existing-GB] is less than the required space [<required-GB>]
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NetWitness UEBA

Problem	The User Interface is not accessible.
Cause	You have more than one NetWitness UEBA service existing in your NetWitness deployment and you can only have NetWitness UEBA service in your deployment.

Solution	Complete the following steps to remove the extra NetWitness UEBA service.
	1. SSH to NW Server and run the following commands to query the list of installed NetWitness UEBA services.
	`# orchestration-cli-client --list-services|grep presidio-airflow`
	`... Service: ID=7e682892-b913-4dee-ac84-ca2438e522bf, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	`... Service: ID=3ba35fbe-7220-4e26-a2ad-9e14ab5e9e15, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	2. From the list of services, determine which instance of the `presidio-airflow` service should be removed (by looking at the host addresses).
	3. Run the following command to remove the extra service from Orchestration (use the matching service ID from the list of services):
	`# orchestration-cli-client --remove-service --id <ID-for-presidio-airflow-form-previous-output>`
	4. Run the following command to update node 0 to restore NGINX:
	`# orchestration-cli-client --update-admin-node`
	5. Log in to NetWitness Platform, go to **ADMIN** > **Hosts**, and remove the extra NetWitness UEBA host.

Section 2 - Hardware-Related Troubleshooting Information

Error Message

When you restart a Series 4 Appliance with external storage, the following messages are displayed.

```
Foreign configuration(s) found on adapter
Press any key to continue or 'C' to load the configuration utility,
or 'F' to import foreign configuration(s) and continue.

All of the disks from your previous configuration are gone.  If this is
an unexpected message, then please power off your system and check your cables
to ensure all disks are present.
Press any key to continue, or 'C' to load the configuration utility.

Entering the configuration utility in this state will result in drive
configuration changes. Press 'Y' to continue loading the configuration utility
or please power off your system and check your cables to ensure all disks are
present and reboot.
```

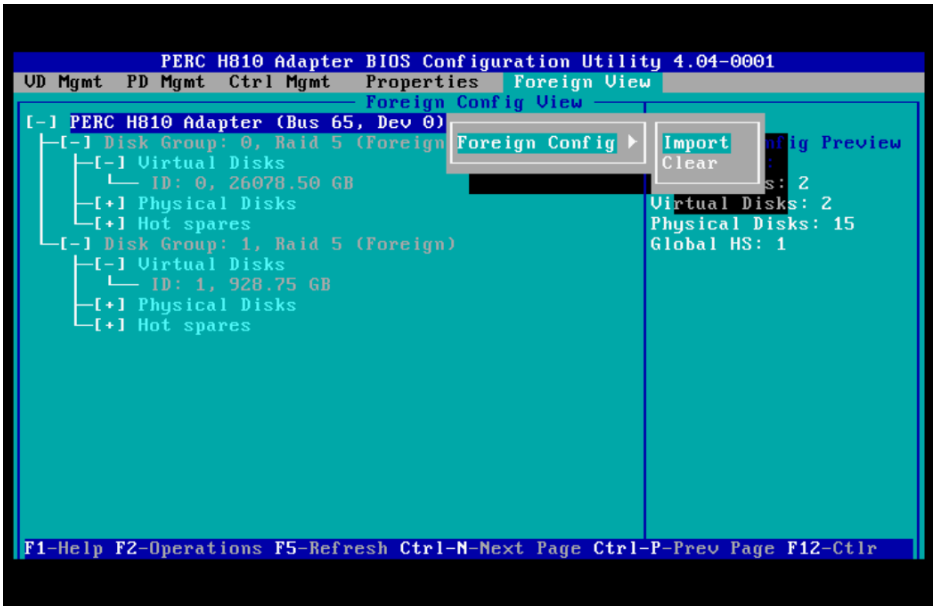
Cause

If you upgrade a Series 4 Appliance host with an external storage (for example, a DAC) to 11.2 and try to restart the appliance, the system may recognize it as having a foreign configuration.

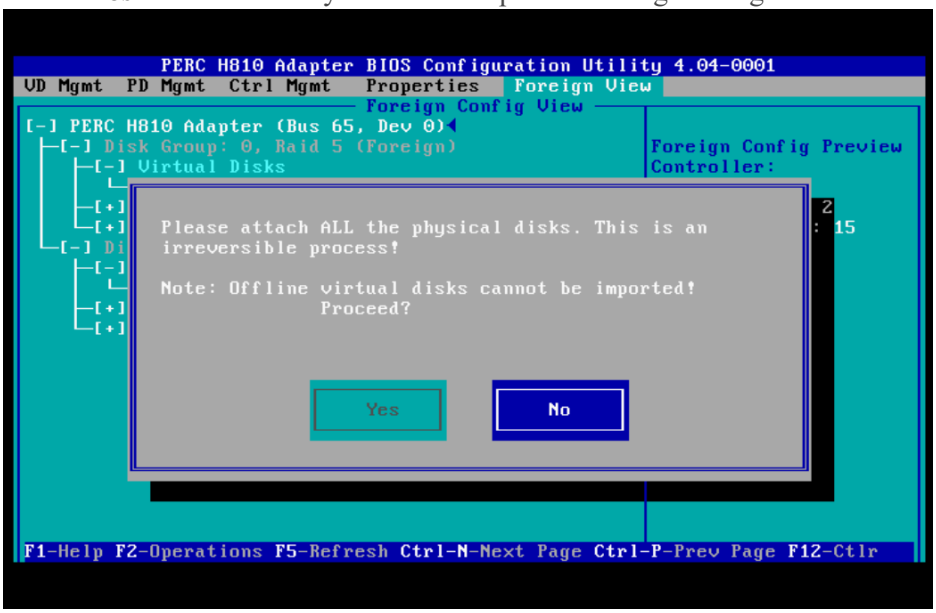
Solution

1. Press the **F** key and restart the appliance.
   If this successfully imports the configuration and restarts the appliance, you are finished. If it does not work, go to step 3.
2. Press **C** to start the Configuration utility.
   a. Select the **PERC H8x0 Adapter**.

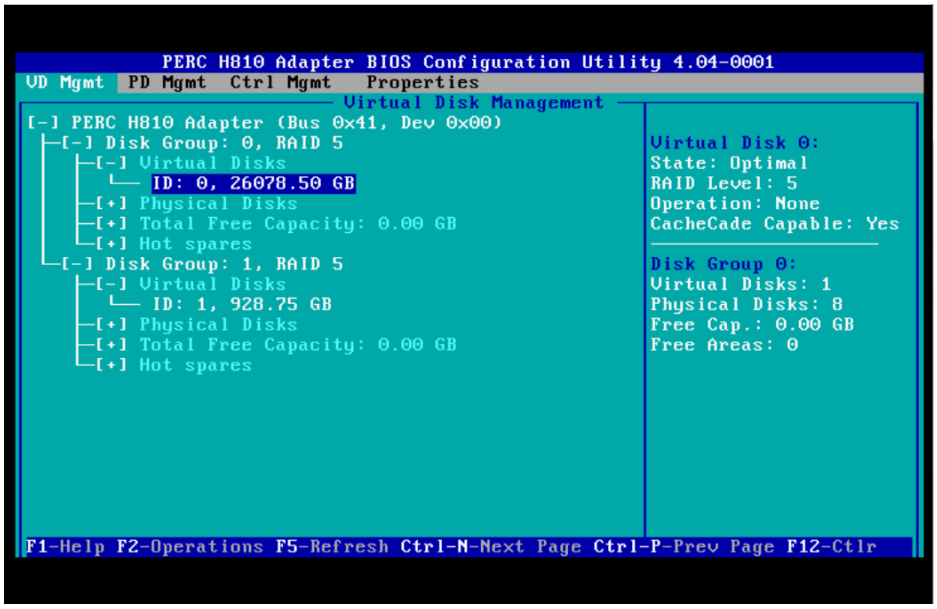
   b. Highlight the top row [for example, **PERC H810 Adapter (Bus 65, Dev 0)**].
   c. Select **Foreign View** from the menu bar.
   d. Press **F2** to display the **Foreign Config** drop down menu and select **Import**.



e. Select **Yes** to confirm that you want to import the foreign config.

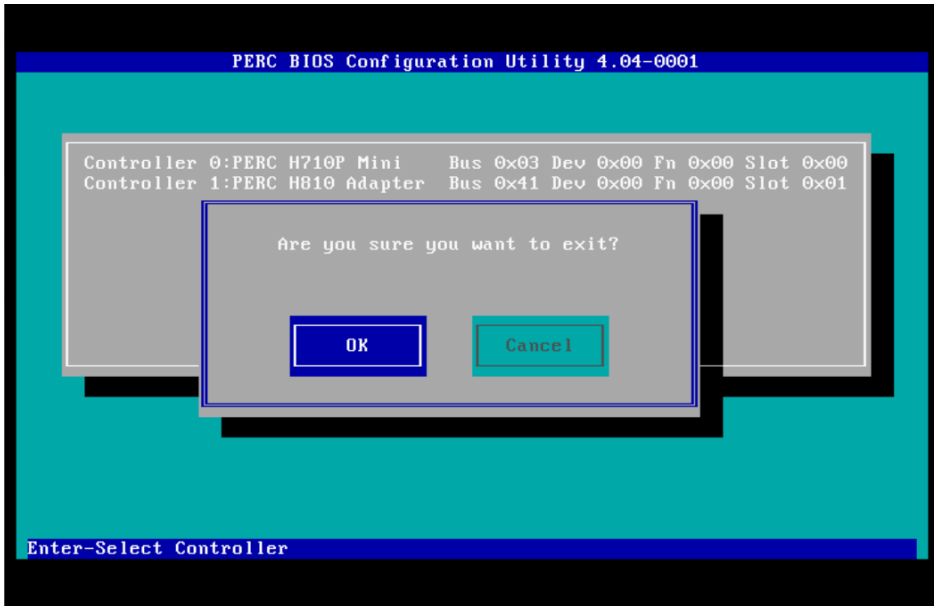


f. Verify that there are no more foreign configs present on the system.



g. Press the **Esc** key to exit.

h. Select **Yes** to confirm that you want to exit.



3. Press **Ctrl-Alt-Delete** to restart (reboot) the appliance.

Caution: If the foreign config fails, Contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Problem	The `mtu.conf` and `pf_ring` files for the 10G Decoder were not restored from the `./etc/init/pfring_bkup` directory after upgrade.
Cause	If you use the 10G Decoder hardware driver and you customized the `/etc/init.d/pf_ring` script to use MTU from the `/etc/pf_ring/mtu.conf` file, the `mtu.conf` and `pf_ring` files from the `./etc/init/pfring_bkup` directory are not restored after upgrade.
Solution	Complete the following steps to restore the files. 1. Restore the `pf_ring` file to `/etc/init.d/` directory in 11.2. `/etc/init.d/pf_ring` 2. Restore the `mtu.conf` file to `/etc/pf_ring/` directory in 11.2. `/etc/pf_ring/mtu.conf`

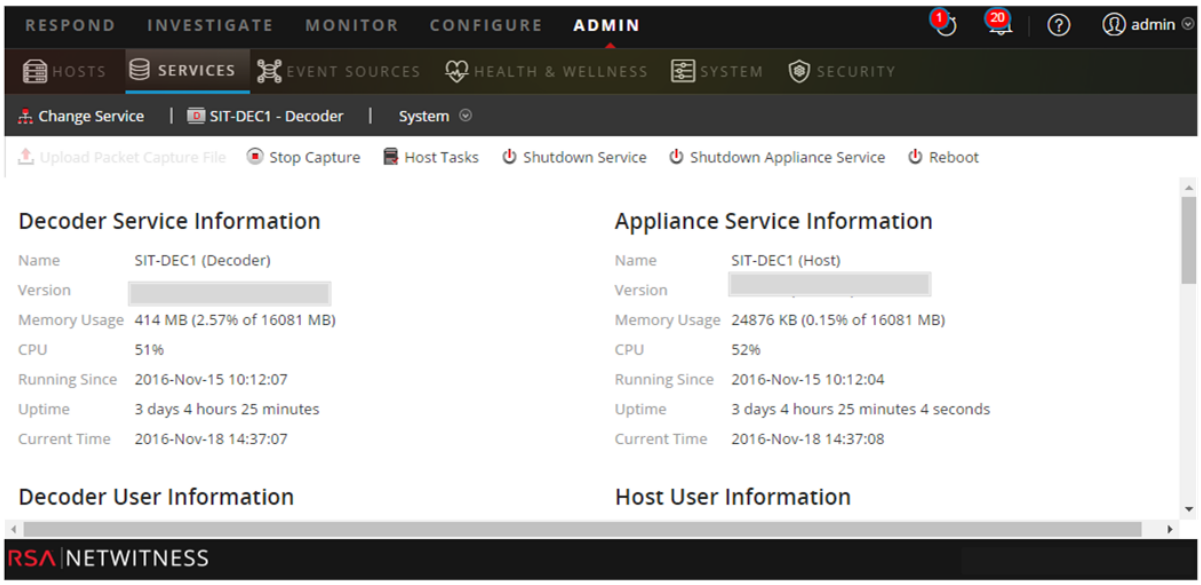
Appendix B. Stopping and Restarting Data Capture and Aggregation

RSA recommends that you stop network and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.2.0.0. If you do this, you must restart network and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Network Capture

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



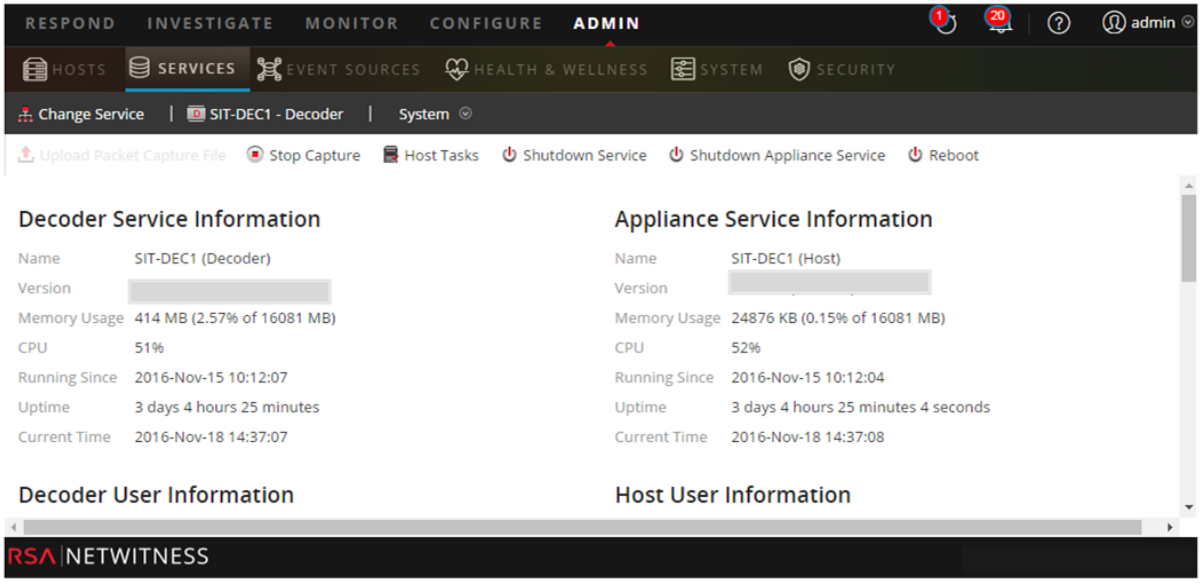
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

.

Stop Log Capture

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.



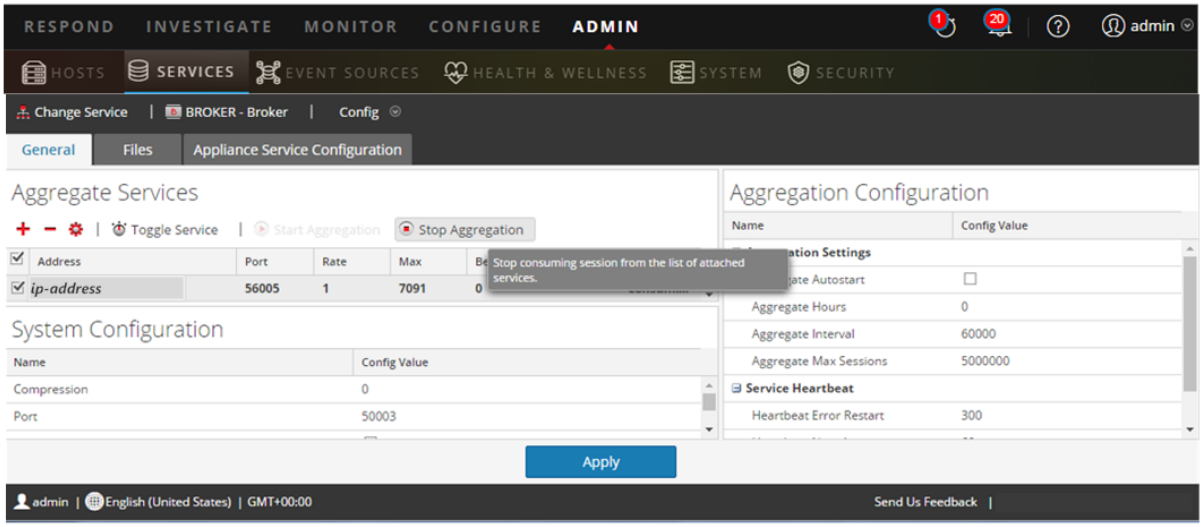
3. Under  (actions), select **View** > **System**.

4. In the toolbar, click 

.

Stop Aggregation

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
2. Select the **Broker** service.
3. Under  (actions), select **View** > **Config**.
4. The **General** tab is displayed.



5. Under **Aggregated Services** click 
.

Start Data Capture and Aggregation

Restart network and log capture and aggregation after updating to 11.2.0.0.

Start Network Capture

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click  .

Start Log Capture

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click  .

Start Aggregation

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. For each Concentrator and Broker service.
   a. Select the service.
   b. Under  (actions), select **View** > **Config**.
   c. In the toolbar, click  .

Appendix C. Using iDRAC with the DVD ISO Image

Many customers have remote sites with limited physical access and limited bandwidth from the administrator's desktop. If this the case, you may want to use iDRAC with the ISO Image shared out from an NFS share that is local to the devices being upgraded or installed. This also gives you the ability to use an existing NetWitness device as the sharing host.

For example:

- You have a Concentrator and Decoder at a site in a remote geographic location.
- The bandwidth is relatively low to that site from the administrator's site.
- Shipping a USB stick and arranging to have person to go plug it into the boxes while you upgrade is not practical.

In this situation, you can:

1. Install the nfs-utils RPM.
2. Configure the NFS share.
3. Configure iDRAC to connect to that share.
   Make sure that you update your iDRAC firmware supported Windows and Linux operating systems. Download and run the Dell Update Packages for supported Windows and Linux operating systems from the Dell Support website at http://www.support.dell.com. For more information, see the Dell Update Package User's Guide available on the Dell Support website at http://topics-cdn.dell.com/pdf/dell-update-packages-v17.10.00_User's%20Guide_en-us.pdf.
4. Boot to the virtual media that contains the ISO file and continue with the upgrade.

Configure NFS Server - NFS Server config File

1. Install NFS and its common utilities using yum.
   ```
   yum install nfs-utils
   ```
2. Configure the NFS service to run at boot.
   ```
   chkconfig nfs on
   ```
3. Configure the rpcbind service to run at boot.
   This service is required by NFS and must be running before NFS can be started.
   ```
   chkconfig rpcbind on
   ```
4. Start the rpcbind service.
   ```
   service rpcbind start
   ```
5. Start the NFS service.
   ```
   service nfs start
   ```
6. Create a directory for our first export.
   ```
   mkdir /exports/files
   ```
7. Open the NFS exports file into a text editor.
   ```
   vi /etc/exports
   ```

8. To export the directory to everyone with read-only access, add the following line.
   `/exports/files *(ro)`
9. Save your changes and exit the editor.
   `:wq!`
10. Export the directory defined above.
    `exportfs -a`
11. Disable firewall rules while performing upgrades.
    `service iptables stop`
12. Copy install media that contains the ISO file to `/exports/files` directory.

Boot iDRAC to NFS Configuration

Note: You must verify that the iDRAC firmware is at least 1.57.57 for Series 4 (R620).

1. Log in to the iDRAC interface.
2. Attach media using Remote File Share.
   `<server ip>:/export/files/11.2.0.0.iso`
   For example: `10.10.10.10:/exports/files/rsa-11.2.0.0.1948.el7-usb.iso`
3. Click **Connect**.
4. Launch **Console**.
5. From the **next boot** menu, select **Virtual DVD/CD**.
6. Reboot the device.

Appendix D. Create External Repository

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. Log in to the web server host.
2. Create a directory to host the NW repository (`netwitness-11.2.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, if `/var/netwitness` is the `web-root`, submit the following command string.
   `mkdir -p /var/netwitness/<your-zip-file-repo>`
3. Create the 11.2.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0`
4. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.2.0.0`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS`
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0/RSA`
5. Unzip the `netwitness-11.2.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.2.0.0` directory.
   `unzip netwitness-11.2.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0`
   Unzipping `netwitness-11.2.0.0.zip` results in two zip files (`OS-11.2.0.0.zip` and `RSA-11.2.0.0.zip`) and some other files.
6. Unzip the:
   a. `OS-11.2.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.2.0.0/OS` directory.
      `unzip /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS-11.2.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS`
      The following example illustrates how the Operating System (OS) file structure will appear after you unzip the file.

Physical Host Upgrade Checklist
for Version 10.6.6.x to 11.2

RSA NETWITNESS® PLATFORM

Task	Description	√
Prepare for Upgrade		
1.	Download **RSANW-11.2-PhysUpgradeGde.pdf** from RSA Link and review it.	
2.	Carefully read the sections on Event Stream Analysis (ESA) Upgrade Considerations and Investigate in Mixed Mode.	
3.	Be aware of the hardware, deployments, services, and features not supported in 11.2.	
4.	Perform the upgrade preparation tasks for the features you use. **Caution:** Make sure that you implement and test the new ports so that upgrade does not fail due to missing ports.	
5.	Create CentOS 6 external host to save backup tar files.	
6.	Download the `nw-backup-v4.0.zip` (or later) file from RSA Link (https://community.rsa.com/docs/DOC-81514) to external host.	
7.	Execute `get-all-systems.sh` and `ssh-propagate.sh` script from external host.	
8.	Preserve a copy of the `get-all-systems-master` file for future reference.	
9.	Execute `nw-backup.sh` in `TEST` mode to evaluate the space requirements from external host (for example: `nw-backup -t -l -D`).	
10.	Review the back up options for `nw-backup.sh` by displaying the help menu (`nw-backup.sh -h`) .	

Physical Host Upgrade Checklist
for Version 10.6.6.x to 11.2

RSA NETWITNESS® PLATFORM

Task	Description	√
Phase 1 - Upgrade SA Server, ESA, Malware Analysis, and Broker/Concentrator Hosts		
11.	Update the contents of the `all-systems` so they consist of SA, ESA's, MA and Broker/Concentrator backup data.	
12.	For ESA hosts, reset the Mongo Database admin password to 'netwitness' if it contains special characters .	
13.	Execute `nw-backup.sh` with `-u` flag for all Phase 1 hosts and confirm that it completes with no errors.	
14.	If your environment has multiple ESA appliances, designate a primary ESA (Where the Context Hub service is running) and copy `mongodb.tar.gz.*` files from the secondary ESAs to designated primary ESA default backup path.	
15.	Confirm that backup tar files are saved locally and remotely.	
16.	Attach media (media that contains the ISO file, for example a build stick) to the SA Server host. See **RSANW-11.x-BuildStickInstr.1.pdf** for instructions on how to get ISO and prepare it. **Caution:** You must use the build stick labeled “OEMDRV”.	
17.	Create base image on the host from the attached media.	
18.	Upgrade the host to 11.2 by running the `nwsetup-tui` program on the host.	
19.	Repeat steps 17, 18, and 19 on the: a. ESA Primary host (and other ESA hosts if you have any). b. Malware Analysis host. c. Broker or Concentrator host.	
20.	Install the ESA, Malware Analysis, and Broker or Concentrator services in the NetWitness 11.2 User Interface.	

Task	Description	√
Phase 2 - Upgrade All Other Hosts		
21.	Update the contents of the `all-systems` so they consist of Phase 2 host backup data.	
22.	Execute `nw-backup.sh` in `TEST` mode to evaluate the space requirements from external host (for example: `nw-backup -t -l -D`).	
23.	Execute `nw-backup.sh` with `-u` flag for all Phase 2 hosts and confirm that it completes with no errors.	
24.	Confirm that backup tar files are saved locally and remotely.	
25.	For all other hosts: a. Attach media (that is Build Stick or DVD ISO) to the SA Server host. See **RSANW-11.x-BuildStickInstr.pdf** for instructions on how to get ISO and prepare it. b. Create base image on the host from the attached media. c. Upgrade the 10.6.6.x host to 11.2 by running the `nwsetup-tui` program on the host. d. Install the host service in the NetWitness 11.2 User Interface:	
Preform Post Upgrade Adjustments		
26.	Perform the post upgrade tasks for the features you use.

Contents

Introduction

The instructions in this guide apply to the upgrade of virtual hosts to RSA NetWitness Platform11.2 exclusively. See the *RSA NetWitness Platform Physical Host Upgrade Guide* for instructions on how to upgrade your 10.6.6.x physical hosts to 11.2. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NetWitness Platform 11.2 is a major release that affects all products in the NetWitness Platform. The components of the platform are the NetWitness Server (Admin server, Config server, Integration server, Investigate server, Orchestration server, Respond server, Security sever, and Source server), Archiver, Broker, Concentrator, Context Hub, Decoder, Endpoint Hybrid, Endpoint Log Hybrid, ESA Primary, ESA Secondary, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, UEBA, Warehouse Connector, and Workbench.

Refer to the *NetWitness Platform Getting Started Guide* to become familiar with the major changes to the 11.x User interface. Refer to the *NetWitness Platform Deployment Guide* to become familiar with the major platform changes in 11.x.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: The Reporting Engine is installed on the NW Server host, Workbench is installed on the Archiver host, and Warehouse Connector can be installed on the Decoder host or Log Decoder host.

CentOS6 to CentOS7 Upgrade

NetWitness Platform 11.2 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.2 platform environment has been improved greatly to accommodate current and future physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Platform 11.2 Upgrade Path

The earliest supported upgrade path for RSA NetWitness® Platform 11.2 is Security Analytics 10.6.6.x. If you are running a version of NetWitness Platform that is prior to 10.6.6.x, you must update to 10.6.6.x before you can upgrade to 11.2. See the *RSA Security Analytics 10.6.6 Update Guide* (https://community.rsa.com/docs/DOC-85119) on RSA Link.

Supported Host Upgrade Path

You must upgrade a host to the same host type:

- Same Series RSA Physical Appliance to Same Series RSA Physical Appliance (that is, Series 4 to Series 4, Series 5 to Series 5).
  RSA does not support third-party physical hosts in 11.2.
- On-Prem Virtual to On-Prem Virtual

Caution: The 11.2 upgrade does not support mixed-platform upgrades (for example, it does not support physical to virtual).

Hardware, Deployments, Services, and Features Not Supported in 11.2

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.2.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- IPDB service
- Malware Analysis service co-located on the SA Server (upgrade of Malware Analysis Enterprise is supported in 11.2.)
- Standalone Warehouse Connector service (Upgrade of a co-located Warehouse Connector is supported in 11.2.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.2, your custom policy is not present. In its place, there is the out-of-the-box Context Hub Server Monitoring Policy in the user interface, which is specific for version 11.2.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Platform 11.2, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.2, ESA sends all alerts to a central Alert system. The local MongoDB storage in ESA 10.6.6.x has been removed.

Caution: If you do not use Incident Management in 10.6.6.x, carefully consider whether or not to upgrade to version 11.2.

The following guidelines should help you determine whether or not to upgrade your ESA hosts to 11.2.

In your 10.6.6.x deployment, if you have:

- One ESA host, with or without Incident Management configured: Upgrade to 11.2.
- Multiple ESA hosts configured to use Incident Management: The system will continue to aggregate alerts centrally. If the system is correctly sized and operating as intended in 10.6.6.x, you can upgrade to version 11.2.
- Multiple ESA hosts without configuration to use Incident Management and you are connecting to individual ESA hosts to view alerts: Do not upgrade to version 11.2.

Note: If you did not use Incident Management in 10.6.6.x, you cannot view the 10.6.6.x ESA alerts in the 11.2 Respond component without running a migration script. Use the ESA Alert Migration script to migrate these alerts to the location in 11.2 that will allow Respond to view them. See the *ESA Alert Migration Instructions* knowledge base article (https://community.rsa.com/docs/DOC-84102) in RSA Link for instructions on how to run this script.

Upgrade Phases

RSA recommends that you stagger host upgrades as described in this section. The update to CentOS7 and the need of a physical or iDRAC access cause the 11.2 upgrade to take more time than most upgrades.

Caution: If you stagger the upgrade, you:
• Must upgrade the hosts in Phase 1 first, in the order shown.
• May not have all the features operational until you update your entire deployment.
• Will not have service administrative features available until you upgrade all the hosts in your deployment.

Phase 1

You perform Phase 1 first. You must upgrade the hosts in the following order:

1. Security Analytics Server host
2. Event Stream Analysis hosts
3. Malware Analysis hosts

4. Broker hosts (if you do not have a Broker, upgrade your Concentrator hosts)
   The 11.2 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2

Upgrade the rest of your hosts.

RSA recommends that you follow the order in Phase 2 to reduce:

- Functionality loss during investigation.
- Downtime that results in the loss of network and log capture.

Note: Other than Log Collection hosts with downstream event destinations, there is no technical reason to upgrade your hosts in the order shown in Phase 2.

This is the Phase 2 host upgrade order recommended by RSA.

1. Decoder hosts
2. Concentrator hosts
3. Archiver hosts
4. Log Collection hosts - Log Collectors on Log Decoder hosts (LDs), Virtual Log Collectors (VLCs) and Legacy Windows Collectors (LWCs)
   Before you upgrade a log collection host, you must prepare it for the upgrade. Part of this preparation ensures that no event data remains in the queues. This requires you to keep the downstream destinations of event data (Log Collectors, Virtual Log Collectors and Log Decoders) up and functioning properly.

   If you have event data destinations downstream from the Log Decoder, you must prepare and upgrade Log Collectors in the following order.

   a. LDs (one LD at a time)

   b. VLCs and LWCs

   If you do not have event data destinations downstream from the Log Decoder, you can prepare and upgrade multiple LDs, VLCs, and LWCs together.
5. All other hosts

See "Running in Mixed Mode" under "The Basics" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for:

- Functionality gaps encountered while running in this mode.
- Examples of staggered upgrades.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Investigate in Mixed Mode

Mixed mode occurs when some services are upgraded to 11.2 and some are still on 11.0.0.x or 10.6.6.x This happens when you upgrade to 11.2 in phases.

Note: You must follow the host upgrade sequence as shown in Upgrade Phases to ensure complete Investigate functionality. The 11.2 Investigate server is installed when you upgrade the SA Server, but Broker hosts need to be upgraded to 11.2 to access the Event Analysis view. If the Broker is not upgraded, analysts see a warning icon next to the Broker, and no data aggregated to that Broker can be displayed.

After you upgrade all services to 11.2, when an analyst conducts an investigation, Role-Based Access Control (RBAC) of downloads works consistently to limit access to restricted data.

In mixed mode (that is, some services are upgraded to 11.2 and some are still at 11.0.0.x or 10.6.6.x), when an analyst conducts an investigation, RBAC is not applied uniformly to viewing and downloads.

If the `sdk.packets` setting has not been disabled on the 10.6.6.x or 11.0.0.x services, analysts with SDK meta and roles permissions in place to restrict viewing and reconstructing an event's content can download the PCAP of an event that has content restrictions. Other types of downloads appear to be successful, then generate errors due to insufficient permissions, and the data is still protected.

During a phased update, you can disable the `sdk.packets` setting on 10.6.6.x and 11.0.x.x services to limit the analyst from downloading any PCAPs or logs during mixed mode. After you update all services to 11.2 and re-enable `sdk.packets`, RBAC works consistently across all services.

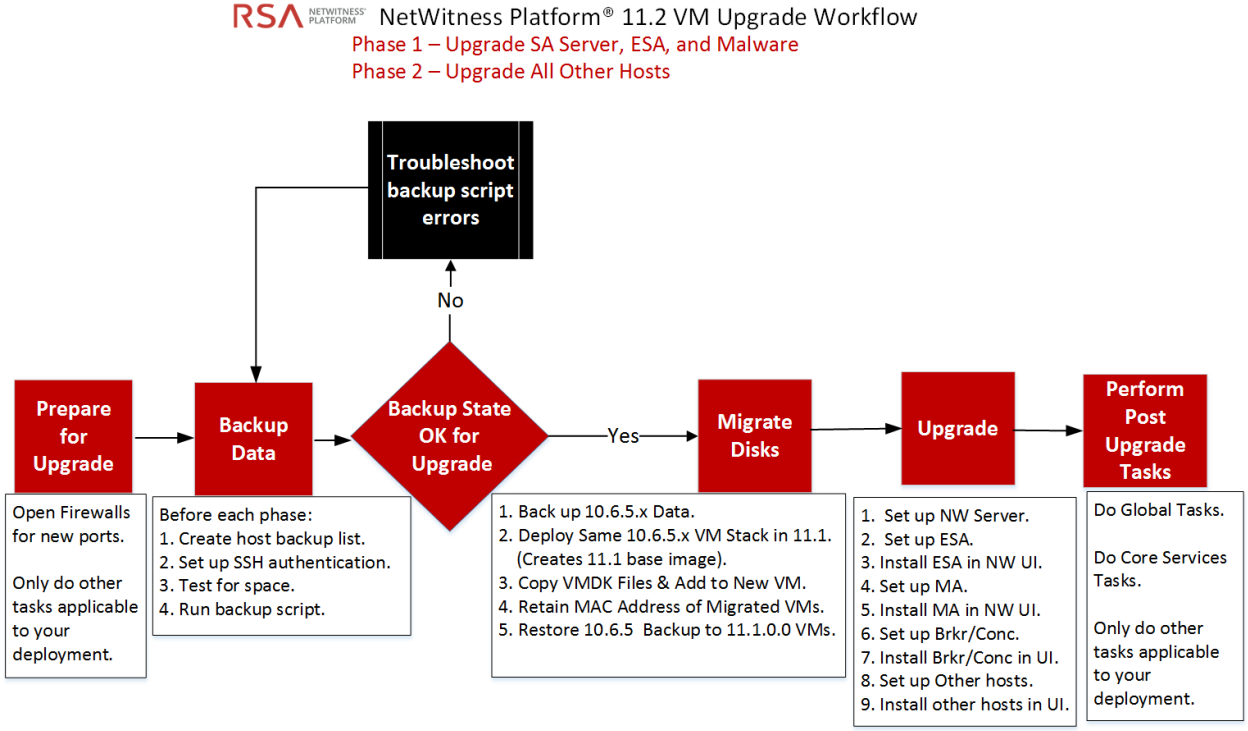
The following table identifies what you can see and download in Investigate when your NW Server at version 11.2 is connected to services at a lower version.

Connecting Service Version	Affected View	User Role With Restricted Content	Can See	Can Download Restricted Content Successfully	Can Download Restricted Content with Errors
11.2 Broker -> 10.6.6.x Concentrator -> 10.6.6.x Network Decoder/Log Decoder	Events View	Analyst	RBAC permitted items	PCAP	File archive is downloaded but cannot unzip
	Event Reconstruction View	Analyst	RBAC permitted items	PCAP	File archive is downloaded but cannot unzip
	Event Analysis View	Analyst	RBAC permitted items	PCAP	Error Retrieving Payload from Service for Payload, Request Payload, Response Payload
11.2 Broker -> 11.2 Concentrator ->11.2 Decoder/Log Decoder	Event Reconstruction View	Analyst and Data Privacy Officer	RBAC permitted items	PCAP	Files archive is downloaded but cannot unzip PCAPs and logs are downloaded as zero bytes

Connecting Service Version	Affected View	User Role With Restricted Content	Can See	Can Download Restricted Content Successfully	Can Download Restricted Content with Errors
11.2 Broker -> 11.0.0.x Concentrator -> 11.0.0.x Network Decoder/Log Decoder	Events View	Analyst	RBAC permitted items	None	Files archive is downloaded but cannot unzip PCAPs and logs are downloaded as zero bytes
	Event Reconstruction View	Analyst	RBAC permitted items	None	File archive is downloaded but cannot unzip PCAPs and logs are downloaded as zero bytes
	Event Analysis View	Analyst	RBAC permitted items	None	Error Retrieving Payload from Service for Payload, Request Payload, Response Payload PCAPs and logs are downloaded as zero bytes

Virtual Host Upgrade Workflow

The following diagram illustrates the RSA NetWitness® Platform 11.2 Virtual Host upgrade workflow.



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Platform 11.2.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness Platform 11.2. These tasks are organized by the following categories.

Global

You must complete these tasks regardless of how you deploy NetWitness Platform and which components you use.

Task 1 - Review Core Ports and Open Firewall Ports

The following tables list new ports in 11.2.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

Endpoint Hybrid or Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Hybrid or Endpoint Log Hybrid	NW Server	TCP 5672	Message Bus
Endpoint Server	NW Server	TCP 27017	MongoDB

All NetWitness Platform core ports are listed in the "Network Architecture and Ports" topic in the *RSA NetWitness® PlatformDeployment Guide* in case you need to reconfigure NetWitness Platform services and firewalls. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 2 - Record Your 10.6.6.x `admin user` Password

Record your 10.6.6.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of `/etc/fstab` File

Copy the `/etc/fstab` file from all VMs to your local machine (backup host or remote machine).

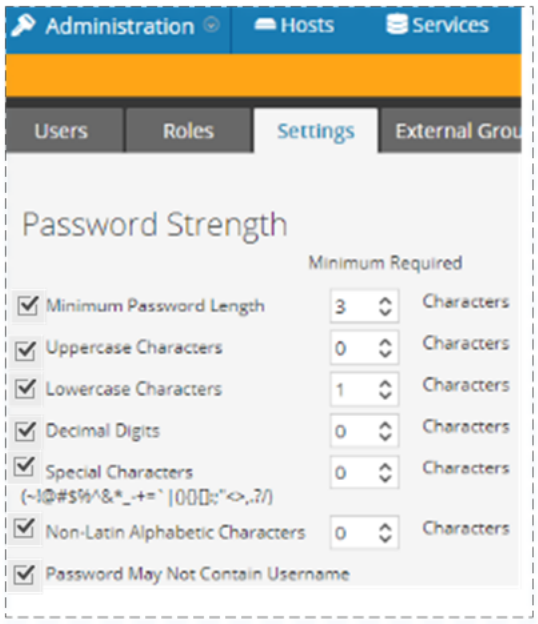
Note: You need this file to restore a VM with external storage mounts.

Task 4 - Make Sure Password Strength Settings Check Boxes Are Set in 10.6.6.x

The check box to the left of the **Password Strength Settings** in the **Administration** > **Security** > **Settings** tab must be set in 10.6.6.x or these settings will not be migrated to 11.2.

Complete the following task to make sure that the Password Strength Settings check boxes are set in 10.6.6.x.

1. In Security Analytics 10.6.6.x, go to the **Administration** > **Security** > **Settings** tab.
2. Make sure that all of the check boxes to the left of the **Password Strength Settings** are set. If they are not, set them and click **Apply**.
   The following example shows all check boxes as set (required in 10.6.6.x before upgrading to 11.2).



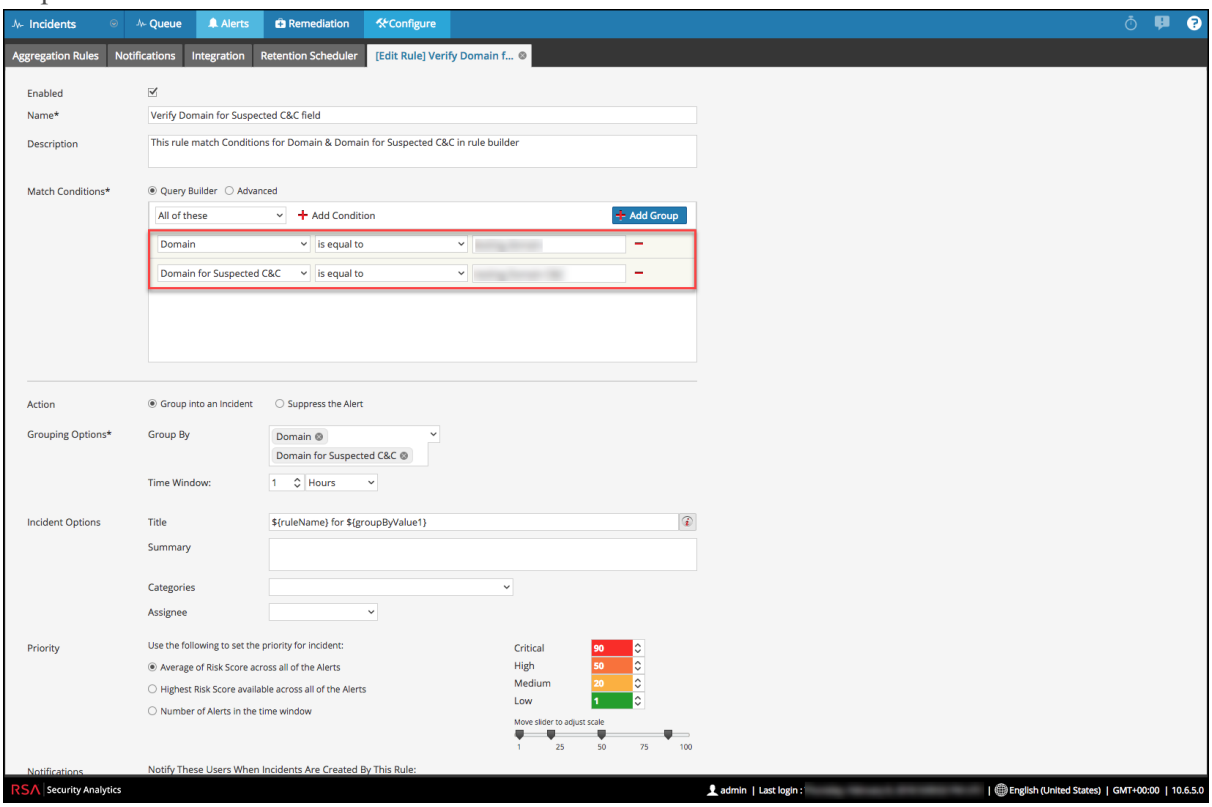
Respond

Task 5 - Check Aggregation Rules Match Conditions for “Domain” or “Domain for Suspected C&C”

Make a note of any Incident Management aggregation rules that have match conditions using Domain or Domain for Suspected C&C in the drop-down list in the rule builder. In NetWitness Platform 11.2, you will need to add back these conditions after you after you upgrade to 11.2 as described in the Respond Post Update Tasks.

Check the following for each aggregation rule:

1. In Security Analytics 10.6.6.x, go to **Incidents** > **Configure** > **Aggregation Rules** tab and edit the rules to view the matching conditions.
2. In the **Match Conditions** section, look for **Domain** or **Domain for Suspected C&C** listed in the drop-down lists for the conditions.



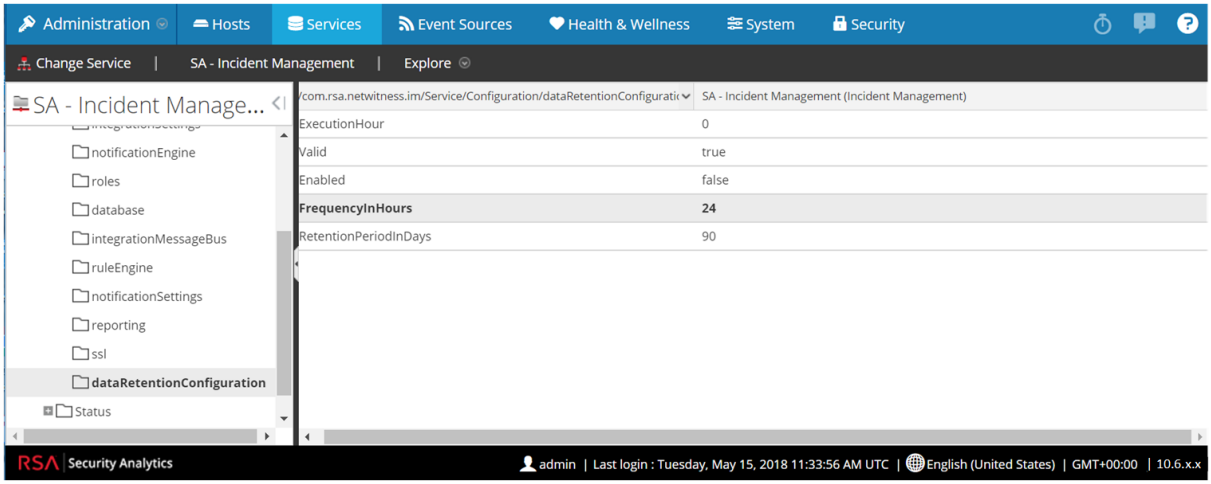
3. Make a note of the rule name and the entire condition that uses **Domain** or **Domain for Suspected C&C**, including operators and values.

Task 6 - Set Data Retention Run Interval to ≥ 24 Hours

In Security Analytics 10.6.x , the Data Retention run interval does not have any minimum value check. In 11.2, RSA added a validation check to make sure that it is run at least every 24 hours. When you upgrade to 11.2, if this value is less than 24 hour, the Respond service will not start.

Complete the following task to ensure that the Respond service starts after upgrading to 11.2.

1. In Security Analytics 10.6.6.x, go to **ADMIN** > **Services**.
2. Select the **Incident Management** service, and then select  > **View** > **Explore**.
3. In the Incident Management **Explore** view, go to `Service` > `Configuration` > `dataRetentionConfiguration`.
4. Make sure that the `FrequencyInHours` parameter is ≥ **24**.



Reporting Engine

(Conditional) Task 7 - Unlink External Storage

If the Reporting Engine has external storage [such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports] you must perform the follow steps to unlink the storage.

In these steps:

- `/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
- `/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Backup Instructions

Backing up your configuration data for all your hosts from 10.6.6.x is the first step in upgrading from Security Analytics 10.6.6.x releases to NetWitness Platform 11.2.

Note: 1.) It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directory will be automatically restored during the upgrade process. After upgrading to 11.2, your custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types. 2.) Disable your Public Key Infrastructure (PKI) settings before starting the backup.

Caution: These services are not supported in the 10.6.6.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the Security Analytics Server
- Standalone Warehouse Connector
- Warehouse Analytics (Datascience)

The following types of hosts can be backed up and are automatically restored during the upgrade process:

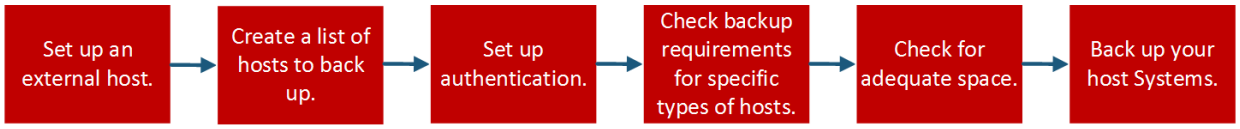
- **Security Analytics Admin Server**
- **Standalone Malware Analysis**
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and Incident Management database)
- **Concentrator**
- **Log Decoder** (including Local Log Collector and Warehouse Connector, if installed)
- **Log Hybrid**
- **Network Decoder** (including Warehouse Connector, if installed)
- **Network Hybrid**
- **Virtual Log Collector**

The following types of files are automatically backed up but must be restored manually after the upgrade process:

- PAM configuration files: For information about restoring the PAM configuration files, refer to "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.2.", in the "Global" section of the *Post Upgrade Tasks*.
- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the `/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-`

`backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see " (Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of *Post Upgrade Tasks*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



The following sections describe each of these tasks:

- Task 1 - Set up an External Host for Backing up Files
- Task 2 - Create a List of Hosts to Back up
- Task 3 - Set up Authentication Between Backup and Target Hosts
- Task 4 - Check for Backup Requirements for Specific Types of Hosts
- Task 5 - Check for Adequate Space for the Backup
- Task 6 - Back up Your Host Systems
- Post Backup Tasks

Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running CentOS 6 with connectivity through SSH to the Security Analytics stack of hosts.

Note: If you are not able to use an external host for backing up files, contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

Ensure that the host names for the systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

There are several scripts that you run during the backup process. You must download the zip file that contains the scripts (`nw-backup-v4.0.zip` or later) from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your Security Analytics Servers and host systems to be backed up.

  Caution: When performing a mixed-mode upgrade, retain a master copy of the `all-systems` file upgrade until all the hosts in your deployment are upgraded to 11.2. You cannot run the `get-all-systems.sh` a second time because the NW Server, the first host that must be upgraded in mixed mode, will have CentOS7 as an operating system .

- `ssh-propagate.sh`: Automates sharing keys between the systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.
- `azure-mac-retention.ps1`: Applies only if you are using AZURE. See the *AZURE Deployment Guide* on for more information. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

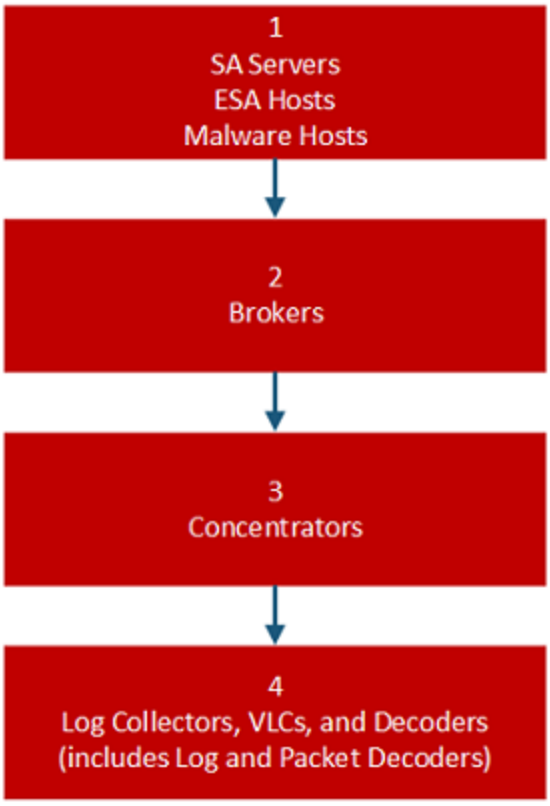
Note: If you have used the 10.6.x versions of the backup and restore scripts on your 10.6.6 hosts, you must still run all the scripts listed here.

Note: Do NOT use the scripts in the `nw-backup-v4.0.zip` file for regular backups. These scripts are specifically designed for upgrading from 10.6.6.x to 11.2.

Note: The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of the hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to ensure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference and then manually editing the `all-systems` file to contain specific hosts.

To generate the `all-systems` and the `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:
   ```
   chmod u+x get-all-systems.sh
   ```
2. At the root level, run the `get-all-systems.sh` script:
   ```
   ./get-all-systems.sh <IP-Address-of-SA-Admin-Server>
   ```
   You will be prompted for the password for each host system once per host.
   This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nw-backup/`.

3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.
4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up. RSA recommends that you comment out the hosts that you do not want to back up (add the number sign (#) to the beginning of the line that contains the host that will not be backed up).
   The following examples shows how to comment out the 10.6.6 Security Analytics Server:
   `loghybrid,loghyb,172.16.0.1,45fe9de1-1a82-49d7-9bb1-7ac5fa1d18d8,10.6.6.0`
   `#nwserver,nwserv106,172.31.255.23,67a9a0eb-1300-4fba-838f-7be4d8cf5e65,10.6.6.0`

> **Note:** If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.6.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-8ea837074bd0,10.6.6.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.6.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.6.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.6.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.6.0
packetdecoder,my-nw-packetdecoder,10.0.0.7,a8f2f574-3dd0-4b65-9cf7-
d8141b78a192,10.6.6.0
vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.6.0
broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-c56ccfb0f737,10.6.6.0
```

And here is an example of an `all-systems` file that could be used in the first backup session, where only the Security Analytics Server, ESA host, and Malware Analysis host are backed up:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.6.0
#archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-
8ea837074bd0,10.6.6.0
#concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.6.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.6.0
#logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.6.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.6.0
#packetdecoder,my-nw-packetdecoder,10.0.0.7,a8f2f574-3dd0-4b65-9cf7-
d8141b78a192,10.6.6.0
#vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.6.0
#broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-c56ccfb0f737,10.6.6.0
```

Troubleshooting Information

- Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location. Follow these recommendations:

  - Do not edit the `all-systems-master-copy` file.
  - If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure that each version of the file lists only those hosts that are currently being backed up, and the other hosts are commented out. For more information, see Post Backup Tasks.

- If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.

- The `get-all-systems.sh` script generates a list of hosts that were defined in the Security Analytics user interface. Ensure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to Security Analytics, you use the Security Analytics user interface to ensure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.

- At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the Security Analytics Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence of those systems, that their services are all running, and that they are properly communicating with the Security Analytics Server. (Any Windows Legacy Collectors or AWS Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)
- If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the man page for `ssh-agent`.

Complete the following task to set up authentication between backup and target hosts.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:
   `chmod u+x ssh-propagate.sh`
2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:
   `ssh-propagate.sh <path-to-all-systems-file>`
3. You are prompted for the password once per host, but you will not need to enter it repeatedly later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types.

1. On the Security Analytics Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.2, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the Security Analytics Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   `openssl x509 -inform der -in certificate.cer -out certificate.pem`
   Convert a PEM file to DER
   `openssl x509 -outform der -in certificate.pem -out certificate.der`
   Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)
   `openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in certificate.crt -certfile CACert.crt`
   Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM
   `openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes`

> **Note:** Add the following qualifier to the command string to:
> `-nocerts` convert private keys exclusively.
> `-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For ESA Hosts with Mongo Databases

The default 10.6.x Mongo database password is `netwitness`. If you have customized this password, you could encounter an error while running the backup script. You can either use your custom Mongo database password during the backup, or you could change that password back to `netwitness` before running the `nw-backup.sh` script.

1. Find out if the Mongo database password is `netwitness` or if it has been modified.
2. If it has been modified, either change it back to `netwitness`, or be sure you know what the customized password is so that you can enter it during the backup.

For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Decoder, Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to "Appendix B. Stopping and Restarting Data Capture and Aggregation."

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

> **Caution:** This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after the upgrade.
- If you set the password for `logcollector` user for RabbitMQ, you must know the password so you can set it again after the upgrade.

Prepare LCs and VLCs for Upgrade

Complete the following task to prepare Log Collectors and Virtual Log Collectors for the upgrade.

1. SSH to the Log Collector.
2. Submit the following command string.
   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```
   This command:

- Stops the Puppet Agent service.
- Disables the file collection accounts ("sftp" and all users in the group "upload") used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgraded to 11.2.
- Stops all the collection protocols in the Log Collector service.
- Saves the list of Plugin accounts and RabbitMQ accounts.
- Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.
- Waits until the Log Collector queues are empty.
- Stops the Log Collector service.
- Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting.

For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint - List RabbitMQ Usernames and Passwords

On the 10.6.6.x Security Analytics Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.2. upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to "Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL" in *Post Upgrade Tasks*.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The event source documentation contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in the `/root/vsftpd/` directory in 10.6.6.x, this material area will be backed up and restored. **If the material was in another location, you must back it up and restore it manually.**
- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.6.x, it is backed up and restored.

Task 5 - Check for Adequate Space for the Backup

You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to ensure that you provide adequate space for the backup so that the backup captures all your data.

Complete the following task to check for adequate disk space.

1. Make the backup script executable by running the following command:
   ```
   chmod u+x nw-backup.sh
   ```
2. Run the following command at the root directory level:
   ```
   ./nw-backup.sh -t
   ```
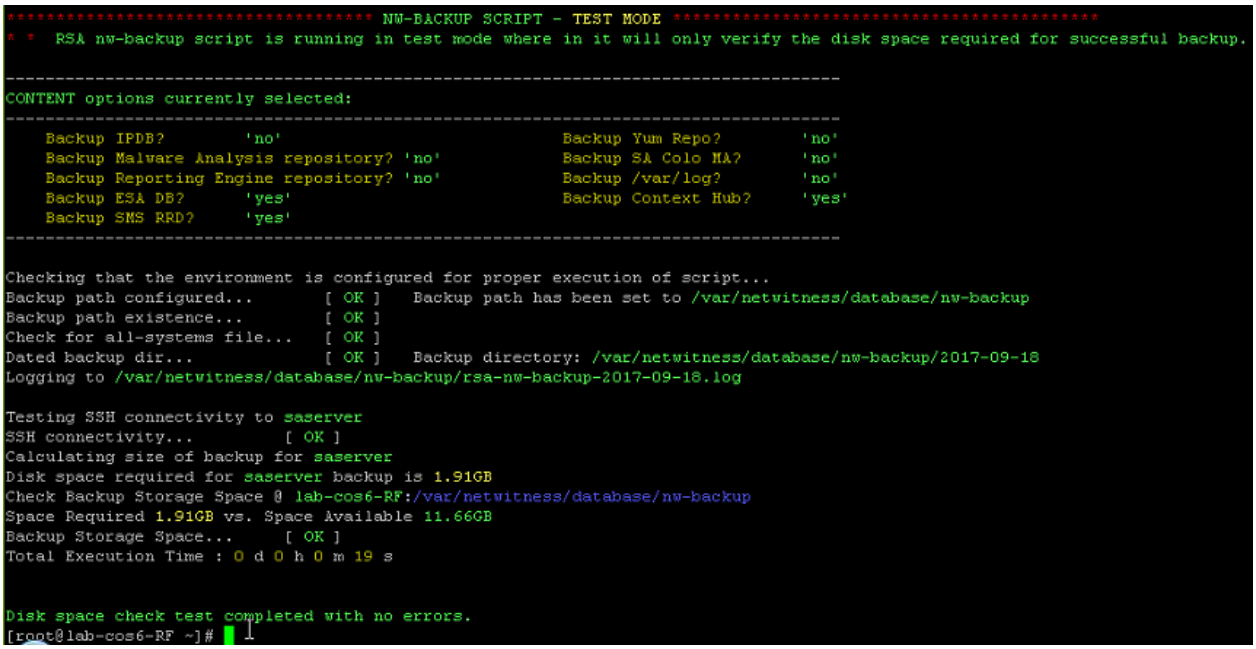
   The output displays the amount of disk space that is required for the backup.

> **Note:** The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the `-d` option by using `-D`. Using the `-D` option will show how much space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the `-D` option will throw an error. If you want to know how much space is available on the target host, you must run the `df -h` command on the host.

The following figure shows an example of the output from using the `-t` option.



Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the `nw-backup.sh` script using the `-u` option. This option is required for upgrading to 11.2.

Note: The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage

```
./nw-backup.sh [-u -t -d -D -l -x -e] <external-mnt> -b <backup file path>
```

General Options

`-u : This option is required for upgrading to 11.2. Enables the upgrade flag to run backup for upgrading to 11.2. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)`

`-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)`

`-D : enables disk space check in 'full' mode (estimate of space using compressed data, ~10X slower). Default: (no)`

`-l : stores backup content locally on each host (automatically set if -u is used). Default: (no)`

`-e <path to mount point> : copies backup files of all devices onto an external mount point. Default: (/mnt/external_backup)`

`-x : move all backup files to an external mount point. Default: (no) - COPY`

```
-b <path to write backups> : path to the location for storing backup files on
a backup server. For upgrading to 11.2, please use the default location!
Default: (/var/netwitness/database/nw-backup)
```

Note: Do **not** change the backup path in upgrade (-u) mode.

Note: When you run a backup with the `-u` option, all services are stopped. If you need to continue to use the 10.6.x machine after running the backup, reboot the 10.6.x system so that services are restarted.

Advanced Content Selection Options

```
-c : back up Colocated Malware Analysis on SA servers. Default: (no)

-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)

-m : back up Malware Analysis File Repository. Default: (no)

-r : back up Reporting Engine Report Repository (automatically set if -u is
used). Default: (no)

-v : back up system logs (/var/log). Default: (no)

-y : back up YUM Web Server & RPM Repository. Default: (no)

-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)

-C : If set: DISABLES back up of Context-Hub configuration and database.
Default: (not-set)

-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)
```

Test Options

```
 -t : performs script test run for disk space check only. Services are not
stopped and excludes execution of backup. Can be combined with (-d) or (-D)
and other flags. Default: (-t)
```

For example, the command:
`./nw-backup.sh`
would run the backup with options as set in the Header of the script itself.
OR, the command:
`./nw-backup.sh -ue /mnt/external_backup`
would run a normal backup using the backup path defined in the script, with the following options:

```
-u : enables the upgrade flag to run backup for upgrading to 11.2. It also
enables disk space check (-d), backing up reporting engine reports (-r) and
stores backup content locally (-l). Default: (no)

-e : Copy the backup files to external mount point, mounted on /mnt/external_
backup

For Help: ./nw-backup.sh -h
```

When you run the script, the following text is displayed at the top of the script:

Caution: RSA `nw-backup` script backs up configuration files, data, and logs on the options provided in the script. It tars the content, with options to store the backup files on the backup server, move or copy them to external storage on a mount point (USB/NFS/SMB), or SCP them back to the target host. This backup script has been qualified on the following versions of Security Analytics:
10.6.6.x
Use of this script on any other versions of the product may not give expected results and may not be supported by RSA Customer Service.
Note: All non-RSA custom files, scripts, Cronjobs and other important files should be placed in `/root`, `/home/'user'`, OR `/etc` to be included in the backup.

Complete the following task to back up your hosts.

1. Ensure that the `all-systems` file contains only the hosts to back up. For information, see Task 2 - Create a List of Hosts to Back up.
2. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
3. Begin the backup process by running the following command at the root directory level:
   `./nw-backup.sh -u`

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.2. Do NOT make any changes to the header of the backup script for the backup path because the path is specific to the upgrade, and that data needs to be in a specific place.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   `rsa-nw-backup-2018-03-15.log`
4. When the backup has completed, to ensure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:
   `tar -tzvf hostname-ip-address-backup.tar.gz`
   The following archive files are created:
   For all hosts:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`
   For Security Analytics Servers:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `<hostname-IPaddress>-mongodb.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`
   For ESA Hosts:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `<hostname-IPaddress>-mongodb.tar.gz`
   `<hostname-IPaddress>-controldata-mongodb.tar.gz`

`tar checksum` files
`<hostname-IPaddress>-network.info.txt`

The archived files are located in the `/var/netwitness/database/nw-backup` directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the `all-systems` File and the Backup Tar files

Make copies of the `all-systems` file, the `all-systems-master-copy` file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the Security Analytics Server (specifically the Admin service) to 11.2.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.2 upgrade process. Before you begin the upgrade process, you must ensure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- `all-systems`
- `all-systems-master-copy`
- `appliance_info`
- `service_info`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

In addition to the files listed above, the following files will be generated on the Security Analytics Server and ESA hosts:

- `<hostname>-<host IP address>-mongodb.tar.gz`
- `<hostname>-<host IP address>-mongodb.tar.gz.sha256`

The backup script will also generate the following `controldata-mongodb.tar.gz` files.

Note: The backup script copies the following files from all ESA hosts to the Security Analytics Server's backup path .

- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz`
- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256`

Task 3 - (Conditional) For Multiple ESA Hosts, Copy `mongodb tar` files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the `/opt/rsa/database/nw-backup/` directory on the Primary ESA host system (the host that has the ContextHub service running on it) :

- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.2., ensure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

Note: The default paths for backup files are:
- Security Analytics Servers:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`
- Malware hosts: `/var/lib/rsamalware/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256`

Required Files for ESA Hosts

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Required Files for All Other Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

Note: The following files are located in the <hostname>-<host-IP-address>-backup.tar.gz tar on all hosts:
appliance_info
service_info

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
`BUPATH=/opt/rsa/database/nw-backup` for the ESA Correlation Engine
`BUPATH=/var/lib/rsamalware/nw-backup` for the Malware Service
`BUPATH=/var/netwitness/database/nw-backup` for all other services
Restore locations:
`BUPATH/restore/etc/sysconfig` for Iptable rules
`BUPATH/restore/etc/sysconfig` for NAT configurations
`BUPATH/restore/etc` for Crontab entries
`BUPATH/restore/etc` for User Accounts (users are located in the `passwd` file, and groups are located in the `group` file. These are not restored during the upgrade process but can be restored manually.
`BUPATH/restore/etc/ntp.conf` for NTP configurations (must be restored using the NetWitness Platform UI)

Migrate Disk Drives from 10.6.6.x to 11.2

These instructions tell you how to upgrade virtual hosts from 10.6.6.x to 11.2.

Caution: 1) You cannot perform the migration if you have a snapshot for your VM.
2). Run the backup immediately before you upgrade hosts for each phase so that the data is not out-dated.
3.) This guide applies to virtual host upgrades exclusively. If have both physical and virtual hosts in your deployment, see the *RSA NetWitness® Platform 11.2 Physical Host Upgrade Instructions* for the steps you must complete to upgrade physical hosts. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: The machines must be in VMware ESX.

There are five tasks you must complete to migrate your Virtual Machine (VM) deployment disk drives from 10.6.6.x to 11.2:

Task 1 - Back up data in your 10.6.6.x VMs.

Task 2 - Deploy the same VM Stack in 11.2 as you have in 10.6.6.x.

Task 3 - Copy the VMDK Files and add them as a hard disk to the new VMs.

Task 4 - Retain MAC address of upgraded SA Server VM.

Task 5 - Restore backup data in 10.6.6.x to 11.2 VMs.

Task 1 - Back Up Data in 10.6.6.x VMs

1. Prepare Log Collector for the migration:
   a. Log in to the Log Collector using root credentials.
   b. Go to the `/opt/rsa/nwlogcollector/nwtools/` directory and run the following command.
   `sh prepare-for-migrate.sh --prepare`
   See Virtual Log Collector Host (VLC) for detailed instructions on how to upgrade the VLC.
2. Download the `.zip` file that contains the 10.6.6.x backup scripts from RSA Link https://community.rsa.com/docs/DOC-81514)) to the external backup host.

   Note: You must set up an external host to use for backing up files. The host must be running CentOS 6 with connectivity through SSH to the NetWitness Platform stack of hosts.
3. Run the following commands from the `nw-backup/scripts` directory (see Backup Instructions for a detailed descriptions of the backup scripts).
   `./get-all-systems.sh <SA-IP>`
   `./ssh-propagate.sh <path-to-backup-directory/all-systems>`
   `./nw-backup.sh -u`
   (if you have a Malware VM, substitute `-m -u` for `-u` in this command string (for example, `./nw-backup.sh -m -u`).

Task 2 - Deploy Same 10.6.6.x VM Stack in 11.2

You must set up the same virtual host stack in 11.2 that you had in 10.6.6.x. See the *RSA NetWitness® Platform 11.2 Virtual Host Installation Guide* for instructions.Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

The following steps are the high-level steps on how to deploy an OVA host in the ESXi environment.

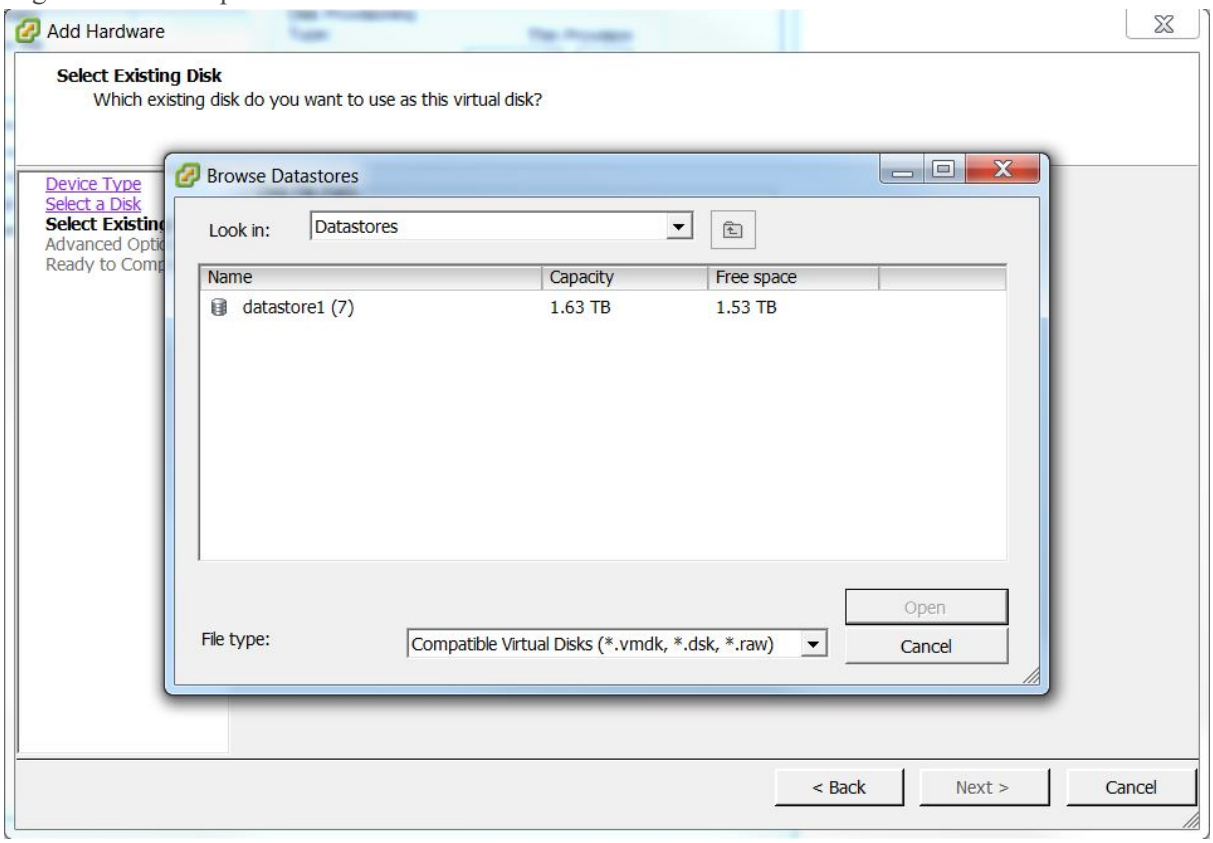
Download the 11.2 OVA, from RSA Link Download Central to a local directory.

1. Log on to the ESXi environment.
2. In the **File** drop-down, select **Deploy OVF Template**.
   The Deploy OVA Template dialog is displayed.
3. Browse your local directory for the 11.2 OVAs you downloaded.
4. Select the to deploy in the virtual environment , and click **Next**.
5. Select the appropriate Configuration for the VM and click **Next**.
6. Power on the VM, go to Console, and log in to the machine.
   The VM now has the 11.2 base image required to run the Setup Program (that is, `nwsetup-tui`).

Task 3 - Copy VMDK Files and Add Them as Hard Disk to New VMs

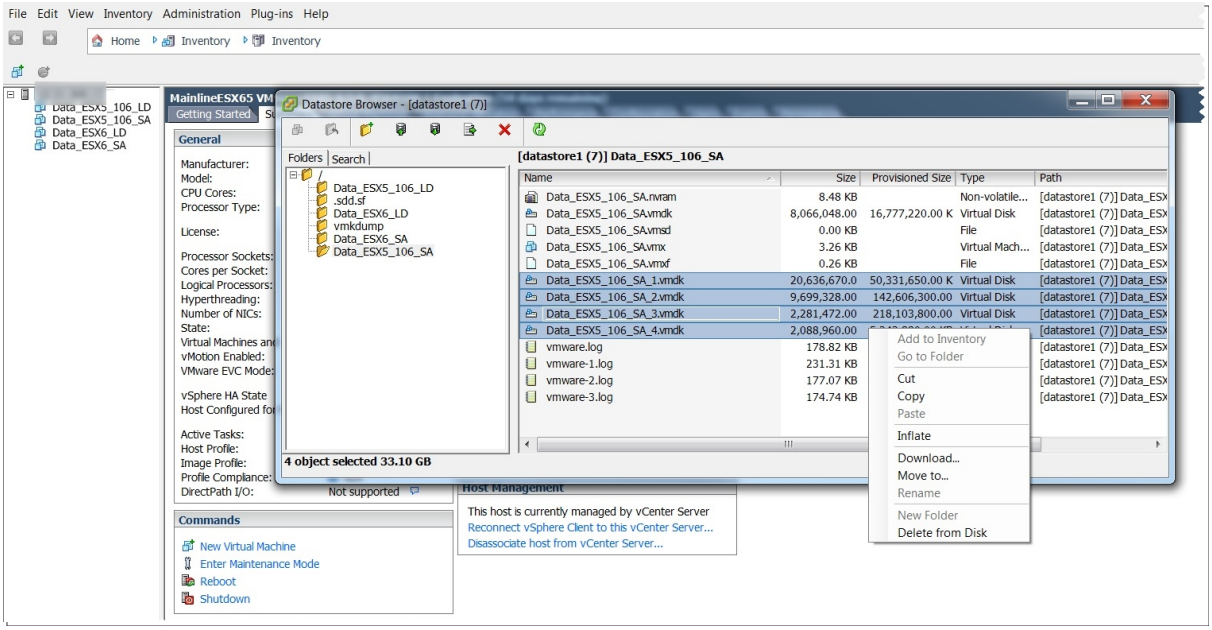
1. Power off both the 10.6.6.x and 11.2 VMs.
2. Go to the desired ESX server, click the **Configuration** tab > **Storage**.

3. Right-click the required datastore and click **Browse Datastore**.



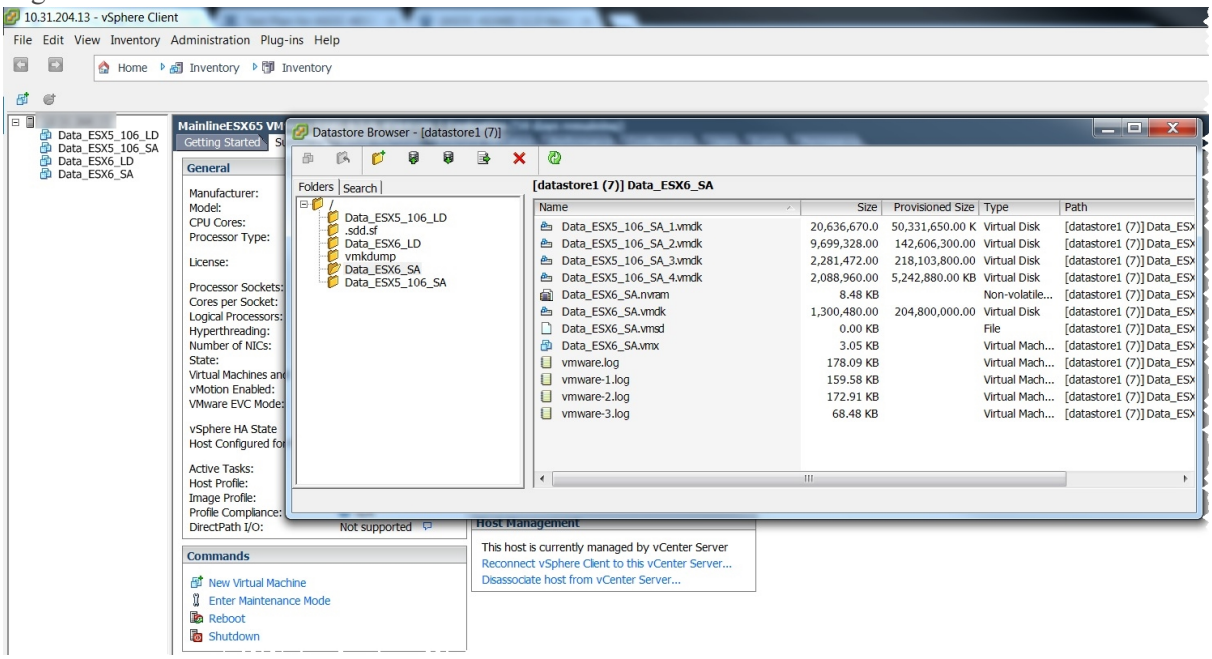
4. Navigate to the existing 10.6.6.x VM in the datastore.
5. Select all the VMDK files in the datastore, right-click, and click **Copy**.

> **Caution:** Do not copy the base VMDK file (for example, `Data_106_SA`) because it contains CentOS6.
>
> You must copy all the numbered VMDK files. For example, if the 10.6.6.x VM name is `Data_106_SA`, you would copy all the `Data_106_SA_1`, `Data_106_SA_2`, `Data_106_SA_3`, etc files.



6. Navigate to the new 11.2 VM in the datastore.

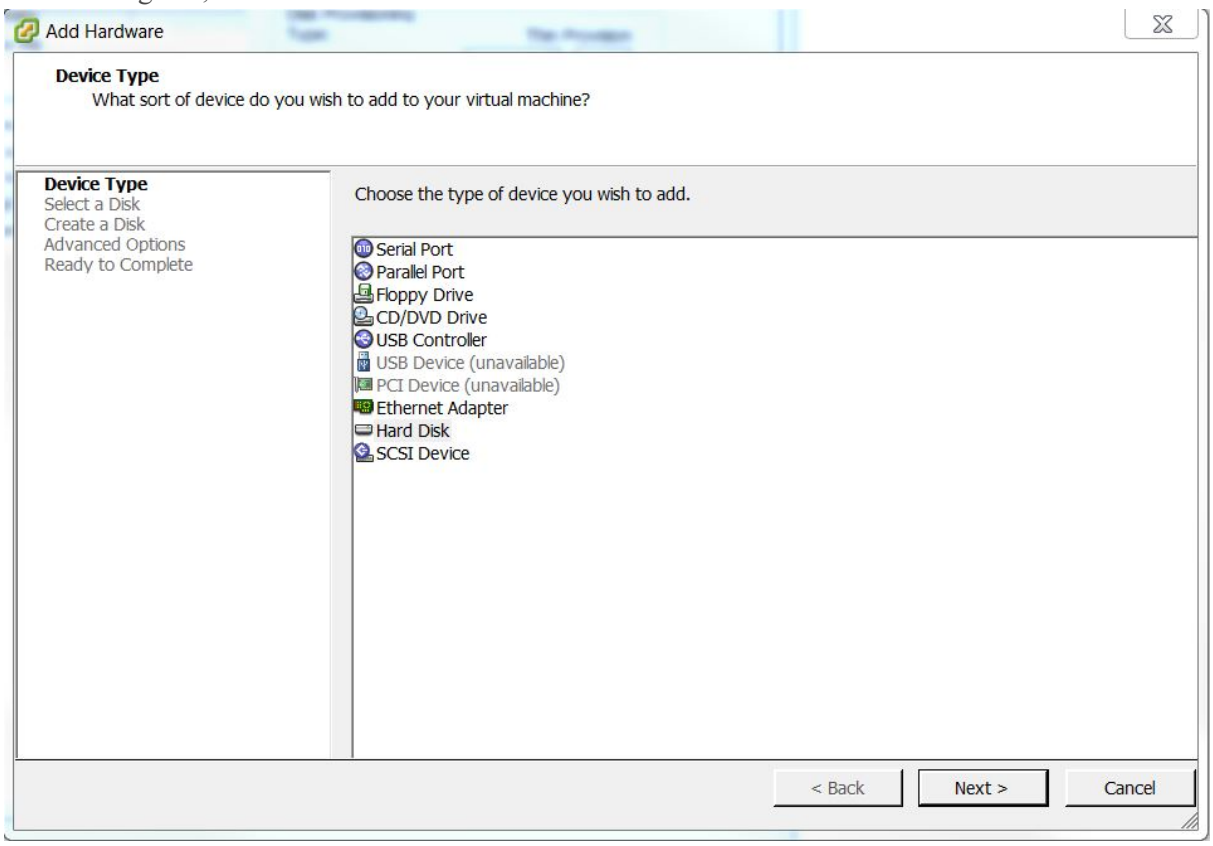
7. Right-click and click **Paste**.



Note: You must wait until all the VMDK files from the previous VM are completely copied into the datastore of the new VM.

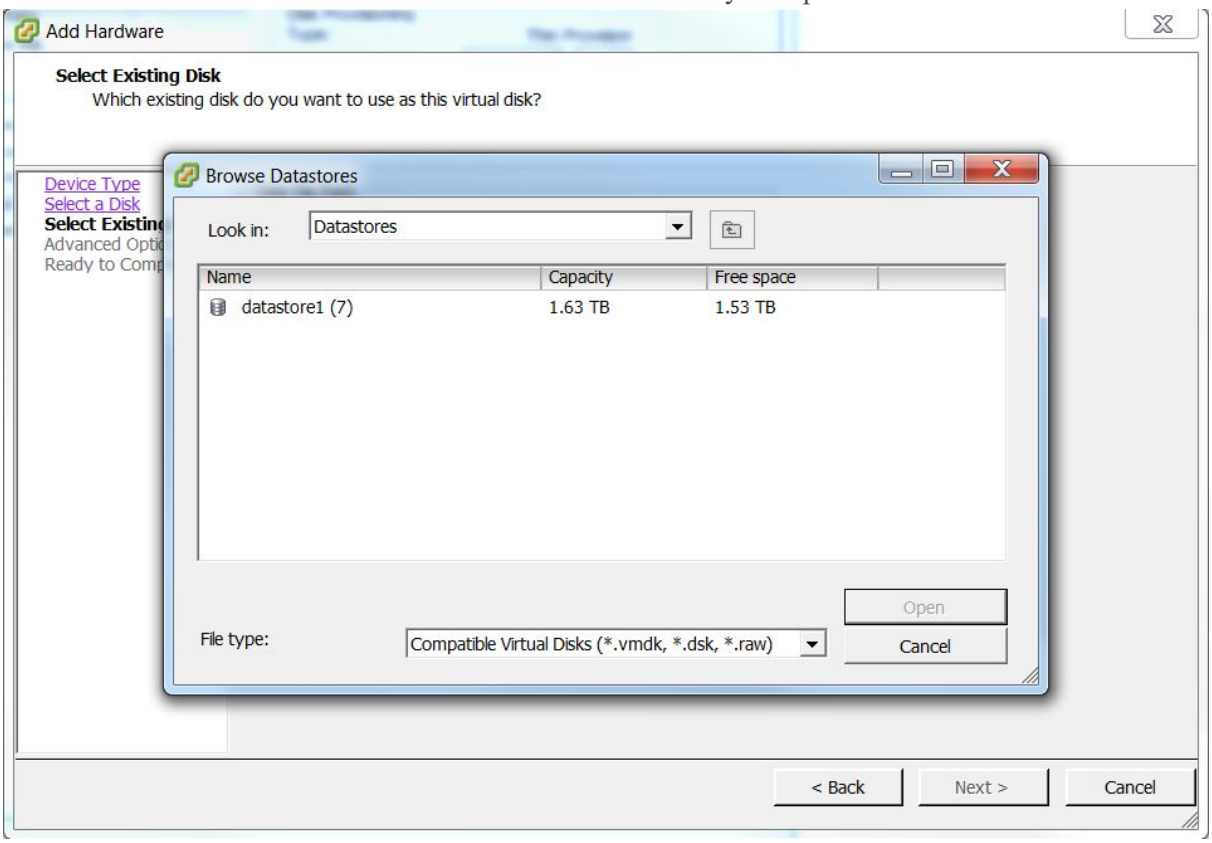
8. Select the 11.2 VM, click **Edit Settings** > **Add**.

9. In the dialog box, click **HardDisk** > **Next**.

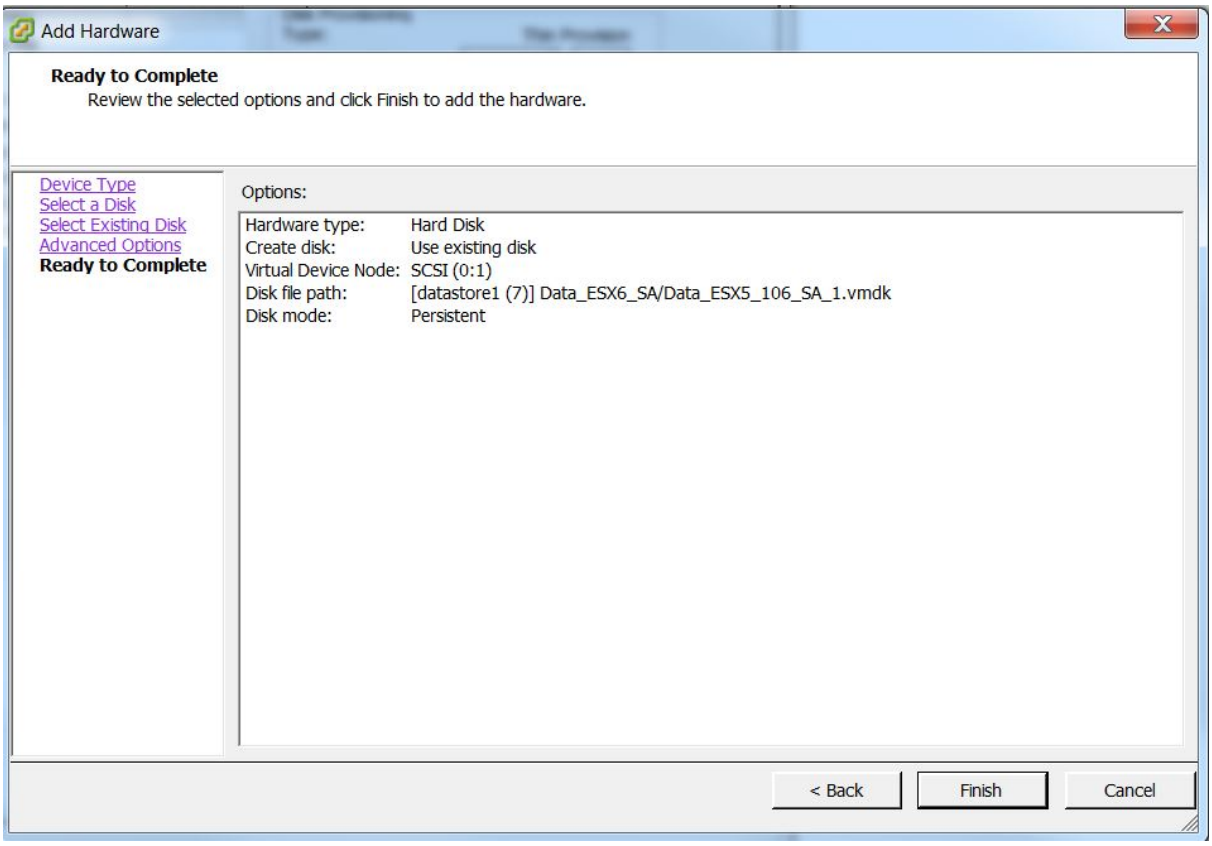


10. Click **Already existing hard disk** > **Next**.

11. Click **Browse** and browse to the datastore location to which you copied the vmdk files.



12. Select the VMDK file from the 11.2 VM that you want to add as a disk.



13. Repeat steps 8 through 12 for each disk you want to add.

Task 4 - Retain MAC Address of Upgraded SA Server VM

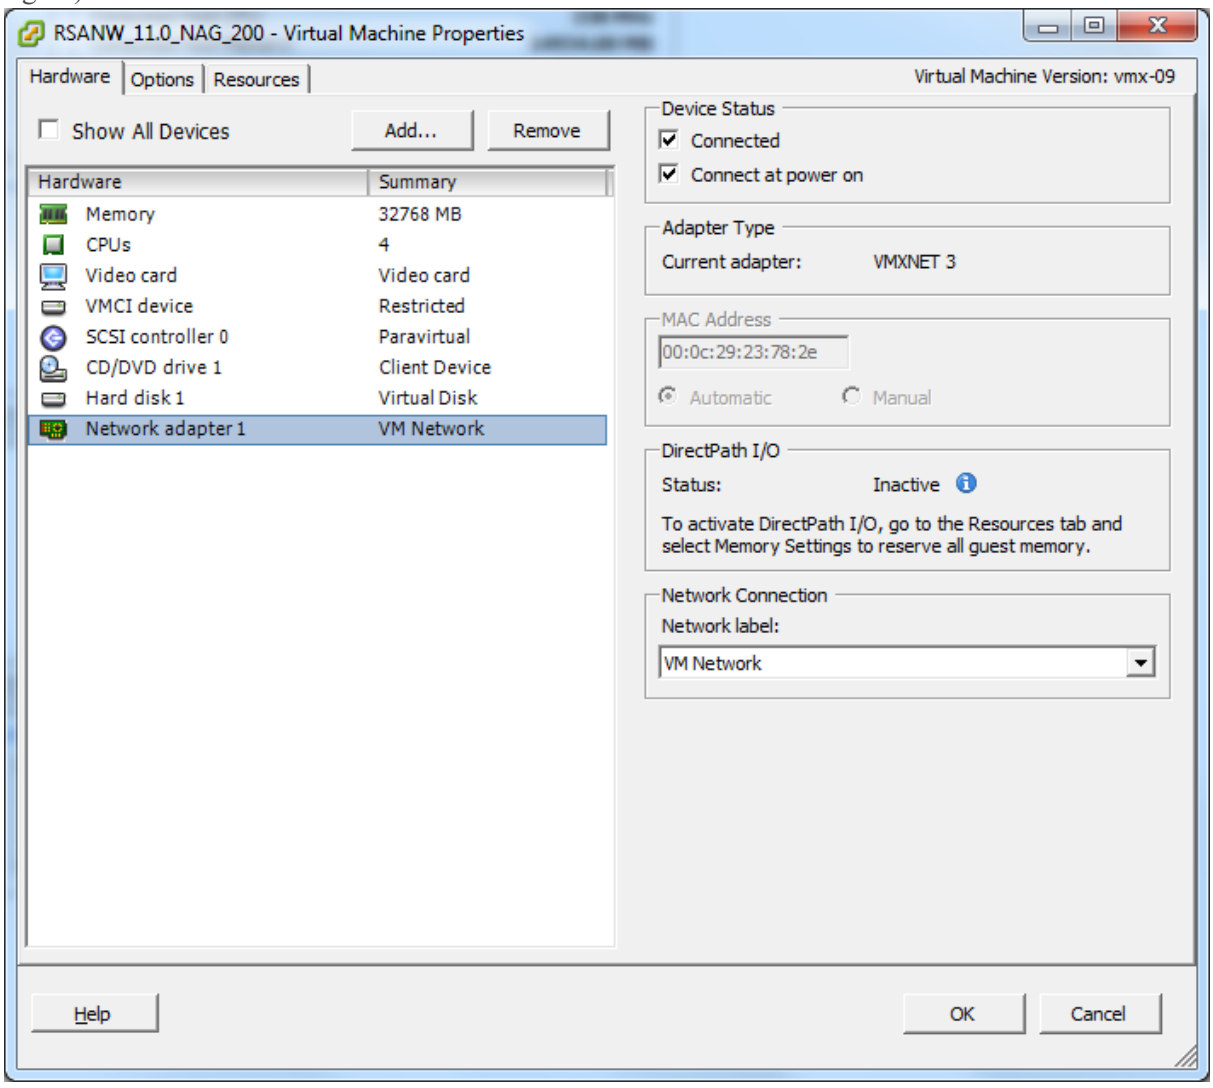
To retain the MAC address of migrated Security Analytics (SA) Server Virtual Machine (VM):

Note: These steps apply to the SA Server VM (created with "Automatic" MAC address assignment selected) to the 11.2 NetWitness Server. For VMs with a Static MAC address, you can change the MAC address by going to Edit Settings for a VM and typing in the MAC address.

1. Log in to vCenter server.

   Note: The supported versions of vCenter is 5.5 through 6.5 inclusive.

2. (Conditional) If they are powered on, **Power Off** both VMs (NetWitness 10.6.6.x and 11.2).
3. Click **Summary** tab, right-click **Datastore** and browse for the datastore location.
4. Go to the VM folder and download the `.vmx` file of 10.6.6.x and 11.2 to the local repository.
   By default, the VM generated with the MAC address is created in the format (as shown in the below figure).

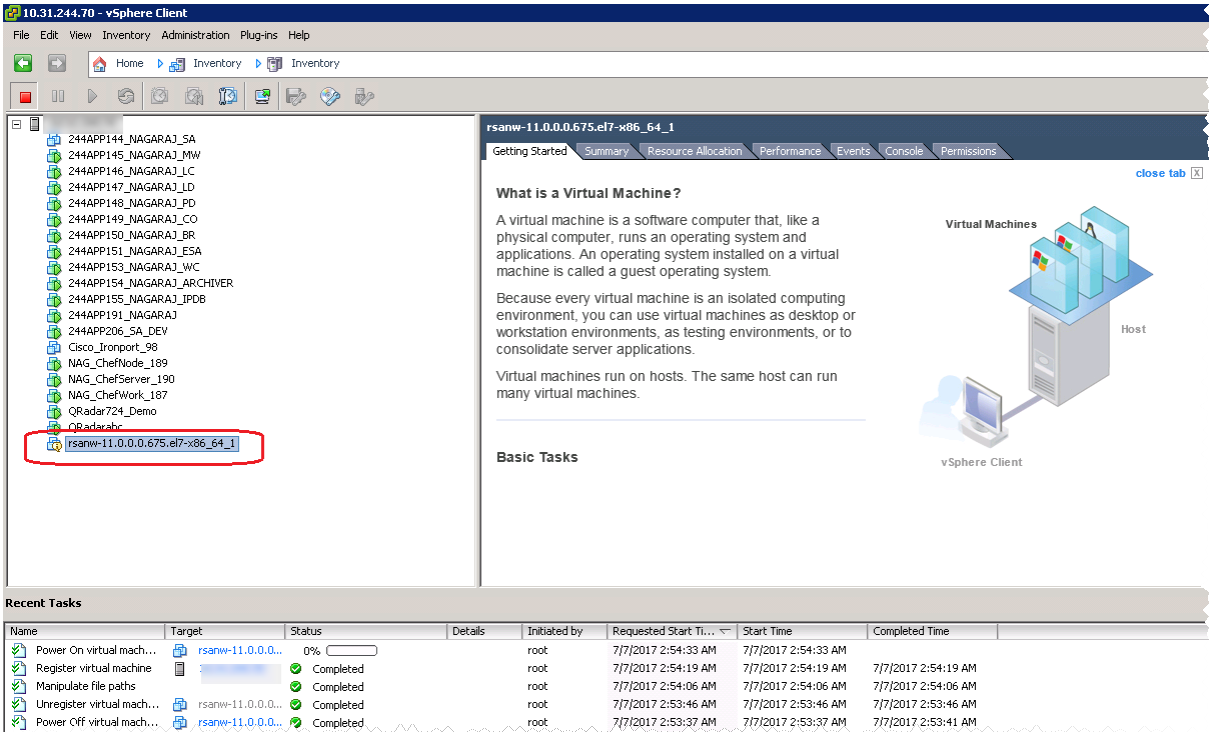


Note: 00:0c:29:XX:YY:ZZ – 00:0c:29 is the unique identifier for an automatically generated MAC address. **00:50:56:XX:YY:ZZ – 00:50:56** is the unique identifier for a static or manually generated MAC address. This is valid only if the vCenter is not deployed. If vCenter is deployed, this MAC address denotes the unique identifier for an automatically generated MAC address.

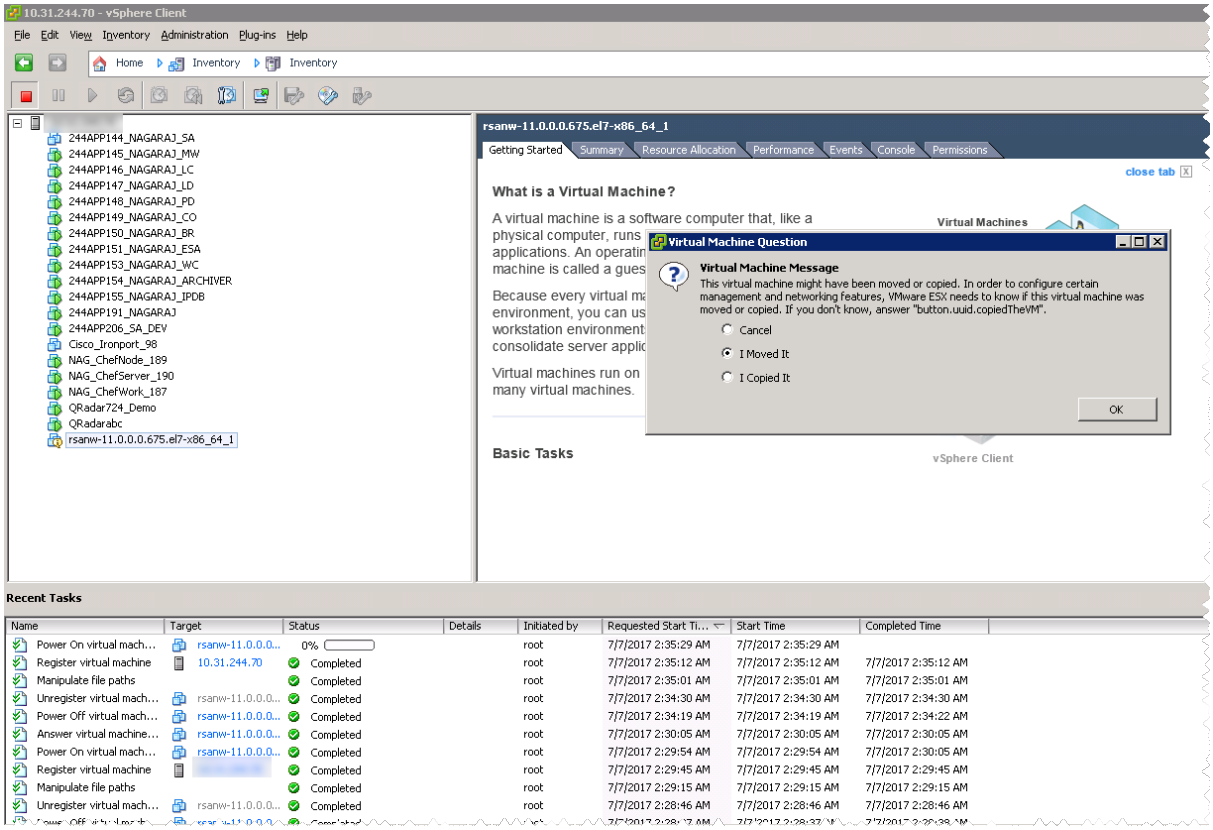
5. Using a text editor, copy the `uuid.location` and `ethernet0.generatedAddress` values from 10.6.6.x **.vmx** file into the 11.2 **.vmx** file.

   Note: If you deployed the 10.6.6.x stack on the ESX server directly (not through VCenter), you must copy the value for `uuid.bios` in addition to `uuid.location` and `ethernet0.generatedAddress` from 10.6.6.x **.vmx** file into the 11.2 **.vmx** file.

6. Remove both the 10.6.6.x and the 11.2 VMs from inventory.
   a. Navigate to the vCenter server.
   b. Right-click both the 10.6.6.x and the 11.2 VMs.
   c. Select Remove from Inventory.
7. Upload the modified 11.2 **.vmx** file to the datastore location by replacing it with the existing **.vmx** file.
8. From the datastore, right- click the 11.2 **.vmx** file and select Add to Inventory.
9. Navigate to the vCenter server and **Power On** the 11.2 VM.
   The following message is displayed.
   The virtual machine might have been moved or copied. In order to configure certain management and networking features, VMware ESX needs to know if this virtual machine was moved or copied. If you don't know, answer "I Copied it."



10. Right-click the VM and select **Guest** > **Answer Question**.
    The following figure is displayed.



11. Select **I Moved It**.
12. Click **OK**.
    The MAC address is retained to the MAC address from 10.6.6.x to 11.2.

Task 5 - Restore Backup Data in 10.6.6.x to 11.2 VMs

Complete the following steps to **Power On** the 11.2 VM.

1. Copy backed-up data from the `nw-backup` directory to the 11.2 VMs.
   - For the NW Server (SA Server in 10.6.6.x):

     Note: See Virtual Log Collector Host (VLC) for detailed instructions on how to upgrade the VLC.

     a. Create the `nwhome` directory under `/tmp`.

     b. Mount `VolGroup00-nwhome` on `/tmp/nwhome/`.
     ```
     mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
     ```

     c. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`.
     ```
     cp -r /tmp/nwhome/* /var/netwitness/
     ```

     d. Mount `VolGroup02-redb` on `/var/netwitness/database`.
     ```
     mount /dev/mapper/VolGroup02-redb /var/netwitness/database/
     ```

     Note: Make sure that the `/var/netwitness/database/nw-backup` directory exists with backup tarballs of the appliance.

     e. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`.
     ```
     umount /tmp/nwhome
     ```

   - For the Archiver, Broker, Concentrator, Log Decoder/Log Collector, and Network Decoder:

     Note: If your 10.6.6.x Decoder or Log Decoder had multiple network interfaces:
     1. **Power Off** the 11.2 VM 11.2 Decoder or Log Decoder VM.
     2. Go to **Edit Settings** for the VM and add the required number of Ethernet Adapters.
     3. **Power On** the VM.
     4. Add the ethernet adapters before restoring the backup data.

     a. Create the `nwhome` directory under `/tmp`.

     b. Create a temporary mount `VolGroup00-nwhome` on `/tmp/nwhome/`.
     ```
     mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
     ```

     c. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`.
     ```
     cp -r /tmp/nwhome/* /var/netwitness/
     ```

     d. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`.
     ```
     umount /tmp/nwhome
     ```

   - For Malware Analysis (Co-located Malware Not Supported in 11.2 Upgrade):

     a. Create the `apps` directory under `/tmp/`.

     b. Create a temporary mount `VolGroup01-apps` on `/tmp/apps/`.
     ```
     mount /dev/mapper/VolGroup01-apps /tmp/apps/
     mkdir /var/netwitness/database
     ```

     c. Copy the `nw-backup` directory to `/var/netwitness/`.
     ```
     cp -r /tmp/apps/nw-backup /var/netwitness/database
     ```

d. Unmount `VolGroup01-apps` from `/tmp/apps/`.
```
umount /tmp/apps
```

- For Event Stream Analysis:

a. Create the `apps` directory under `/tmp/`

b. Create a temporary mount `VolGroup01-apps` on `/tmp/apps/`.
```
mount /dev/mapper/VolGroup01-apps /tmp/apps/
mkdir /var/netwitness/database
```

c. Copy the `nw-backup` directory to `/var/netwitness`.
```
cp -r /tmp/apps/nw-backup /var/netwitness
```

d. Unmount `VolGroup01-apps` from `/tmp/apps/`.
```
umount /tmp/apps
```

2. Mount the disks.

Note: If you have configured any external mount points on the VMs in the stack for any of the following directories, re-mount the external mount points in place of the following mounts.

- For the NW Server:
```
mount /dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/
mount /dev/mapper/VolGroup02-redb /var/netwitness/database/
```

Note: Make sure that the `/var/netwitness/database/nw-backup` directory exists with backup tarballs of the appliance.

- For the Log Decoder/Log Collector:

Note: The following mounts are not required for the Virtual Log Collector.

```
mount /dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder
mount /dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index
mount /dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb
mount /dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb
mount /dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector
mount /dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb
```

- For the Network Decoder:
```
mount /dev/mapper/VolGroup01-decoroot /var/netwitness/decoder
mount /dev/mapper/VolGroup01-sessiondb /var/netwitness/decoder/sessiondb
mount /dev/mapper/VolGroup01-index /var/netwitness/decoder/index
mount /dev/mapper/VolGroup01-metadb /var/netwitness/decoder/metadb
mount /dev/mapper/VolGroup01-packetdb /var/netwitness/decoder/packetdb
```

- For the Concentrator:
```
mount /dev/mapper/VolGroup01-concroot /var/netwitness/concentrator
mount /dev/mapper/VolGroup01-sessiondb
/var/netwitness/concentrator/sessiondb
mount /dev/mapper/VolGroup01-index /var/netwitness/concentrator/index
mount /dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb
```

- For the Archiver:
  ```
  mount /dev/mapper/VolGroup01-archiver /var/netwitness/archiver
  mount /dev/mapper/VolGroup02-workbench /var/netwitness/workbench
  ```
- For the Broker:
  ```
  mount /dev/mapper/VolGroup01-broker /var/netwitness/broker
  ```

3. Add the following mount entries to `/etc/fstab`.
   - For the NW Server:
     ```
     /dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/ xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup02-redb /var/netwitness/database/ xfs
     defaults,noatime,nosuid 1 2
     ```
   - For the Log Decoder/Log Collector:

     Note: The following mounts are not required for the Virtual Log Collector.

     ```
     /dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder ext4
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb xfs
     defaults,noatime,nosuid 1 2
     ```
   - For the Network Decoder:
     ```
     /dev/mapper/VolGroup01-decoroot /var/netwitness/decoder ext4
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-sessiondb /var/netwitness/decoder/sessiondb xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-index /var/netwitness/decoder/index xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-metadb /var/netwitness/decoder/metadb xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-packetdb /var/netwitness/decoder/packetdb xfs
     defaults,noatime,nosuid 1 2
     ```
   - For the Concentrator:
     ```
     /dev/mapper/VolGroup01-concroot /var/netwitness/concentrator ext4
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-sessiondb /var/netwitness/concentrator/sessiondb
     xfs defaults,nosuid,noatime 1 2
     /dev/mapper/VolGroup01-index /var/netwitness/concentrator/index xfs
     defaults,noatime,nosuid 1 2
     /dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb xfs
     defaults,noatime,nosuid 1 2
     ```

- For the Archiver:
  ```
  /dev/mapper/VolGroup01-archiver /var/netwitness/archiver xfs
  defaults,nosuid,noatime 1 2
  /dev/mapper/VolGroup02-workbench /var/netwitness/workbench xfs
  defaults,nosuid,noatime 1 2
  ```
- For the Broker:
  ```
  /dev/mapper/VolGroup01-broker /var/netwitness/broker xfs
  defaults,nosuid,noatime 1 2
  ```

Set Up Virtual Hosts in 11.2

There two phases to set up your 11.2 virtual stack that you must complete in the order shown.

- Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.2 and they will not be available until the warm up completes.

- Phase 2 - Set Up The Rest of the Component Hosts

Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

Task 1 - Set Up 11.2 NetWitness Server

Follow the instructions under Set Up 11.2 NW Server Host.

Task 2 - Set Up 11.2 ESA

Caution: If you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.2 and they will not be available until the warm up completes.

Follow the instructions under Set Up 11.2 Non-NW Server Host to set up your ESA hosts.

1. Set up your primary ESA host through the Setup program and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, set it up through the Setup program and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Set Up 11.2 Malware Analysis

Follow the instructions under Set Up 11.2 Non-NW Server Host.

Task 4 - Set Up 11.2 Broker or Concentrator

Follow the instructions under Set Up 11.2 Non-NW Server Host.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.2 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Set Up The Rest of the Component Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Decoder and Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Set Up 11.2 Non-NW Server Host.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in the "Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh" in the **Backup Instructions**.
2. Stop data capture on the Log Decoder.
3. Complete the steps in Set Up 11.2 Non-NW Server Host.
4. Restart data capture on Log Decoder.

   Note: After you upgrade, you will restart log collection after completing the Task 30 - Update Incident Rules Identified in the Domain in the Matching Conditions Upgrade Preparation Task in the **Post Upgrade Tasks**

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described in the "Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh" in the **Backup Instructions**.
2. Back up your 10.6.6.x VLC by editing the `all-systems` file on host where you performed the backup.
   a. Make sure your `all-systems` file contents has this information before you perform this step.
      `vlc,<host-name>,<IP-address>,<UUID>,10.6.6.x`
   b. Run the following command to create backup.
      `./nw-backup.sh -u`
      See Backup Instructions for detailed procedures on how to back up the host.
3. Make sure the backup host contains the VLC backup in the following format.
   `<hostname>-<IPaddress>-root.tar.gz`
   `<hostname>-<IPaddress>-root.tar.gz.sha256`
   `<hostname>-<IPaddress>-backup.tar.gz`

```
<hostname>-<IPaddress>-backup.tar.gz.sha256
<hostname-IPaddress>-network.info.txt
all-systems-master-copy
```

4. Power off the 10.6.6.x VLC so that a new 11.2 VM can be created with the same network configuration.
5. Deploy a fresh Non-NW Server host using the 11.2 NetWitness Platform ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.6.x VLC.
   This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.6.x VLC backup file.

   Note: Make sure IPv6 is disabled.

   a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings.
   Contents of `ifcfg-eth0` should be as follows.

```
TYPE=Ethernet
DEFROUTE=yes
NAME=eth0
UUID=<uuid>
DEVICE=eth0
DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
BOOTPROTO=static
IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
NM_CONTROLLED=no
ONBOOT=yes
```

   b. Submit the following command string.

```
systemctl restart network.service
```

8. Create the backup directory.

```
# mkdir -p /var/netwitness/database/nw-backup/
```

9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new VLC in the `/var/netwitness/database/nw-backup` directory.
10. Complete the steps 2 through 12 inclusive in Set Up 11.2 Non-SA Server Host for the rest of the NetWitness Platform components . Make sure that you select **Log Collector** for the service in step 12.

Set Up 11.2 NW Server Host

Make sure that you have backed up 10.6.6.x data for the SA Server host. **You must follow the instructions in Backup Instructions to back up the host**.

Caution: Run the backup immediately before upgrading the SA Server to 11.2 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.2.

Complete the following steps to set up the 11.2 NW Server host.

1. Log in to 11.2 NW Server VM's console and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

   Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press the Enter key to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use access the host.

2. Tab to **Accept** and press **Enter**.

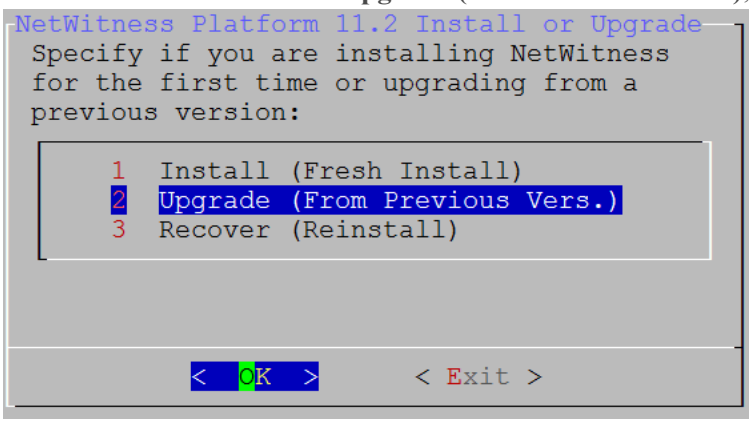
   
   The **Is this the host you want for your 11.2 NW Server** prompt is displayed.

   Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.2 NW Server Host to correct this error.

3. Tab to **Yes** and press **Enter**.

   
   Choose **No** if you already upgraded the NW Server to 11.2.
   The **Install or Upgrade** prompt is displayed.

4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.

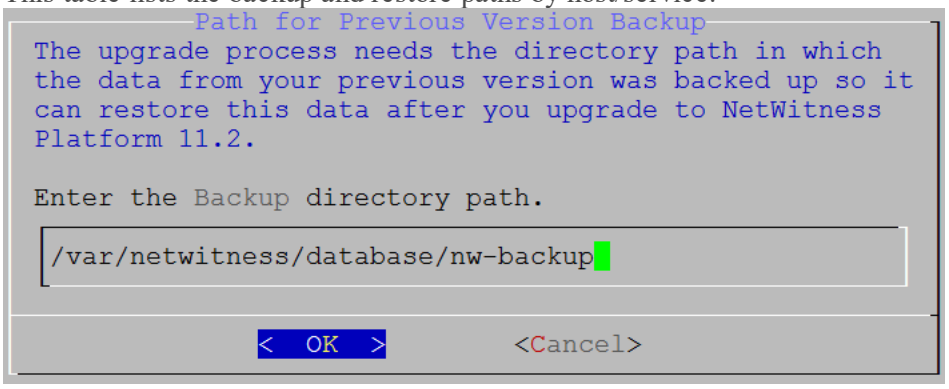


The **Backup** path prompt is displayed.

Caution: The backup path in the following prompt must be the same as the path in which your backup is stored. For example, the backup script assigns **/var/netwitness/database/nw-backup** as the default path. If you used the default backup path during backup and did not change it subsequently, you must keep **/var/netwitness/database/nw-backup** as the path in the following prompt.

5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.

This table lists the backup and restore paths by host/service.



Host	Backup Path	Restore Path
Malware	/var/lib/rsamlware/nw-backup	/var/netwitness/malware_analytics_server/nw-backup/restore
Event Stream Analysis	/opt/rsa/database/nw-backup	/var/netwitness/database/nw-backup/restore
NW Server	/var/netwitness/database/nw-backup	/var/netwitness/restore

Host	Backup Path	Restore Path
All Other Hosts	/var/netwitness/database/nw-backup	/var/netwitness/database/nw-backup/restore

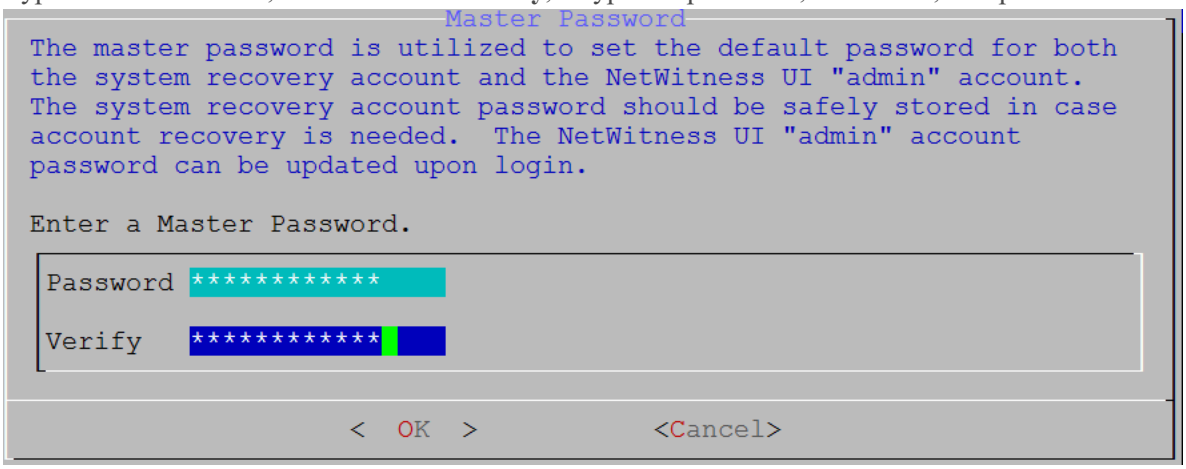
The **Master Password** prompt is displayed.

The following list of characters are supported for Master Password and Deployment Password:

- Symbols : ! @ # % ^ + ,
- Numbers : 0-9
- Lowercase Characters : a-z
- Uppercase Characters : A-Z

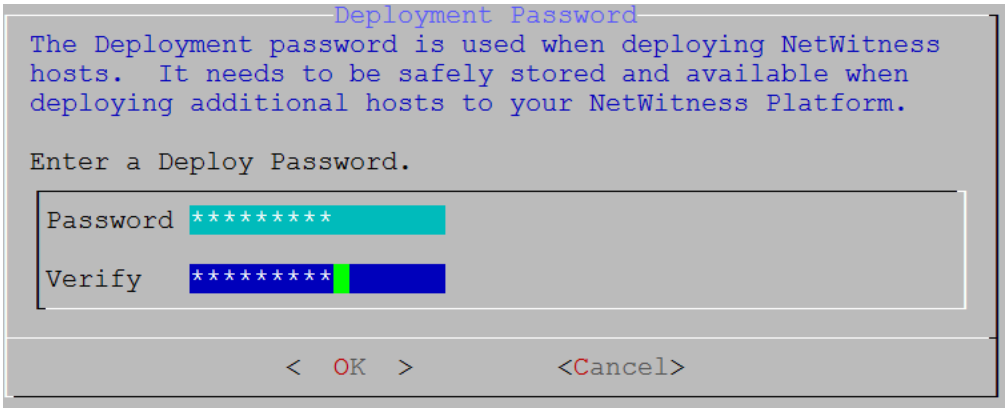
No ambiguous characters are supported for Master Password and Deployment Password. For example:
space { } [ ] ( ) / \ ' " ` ~ ; : . < > -

6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



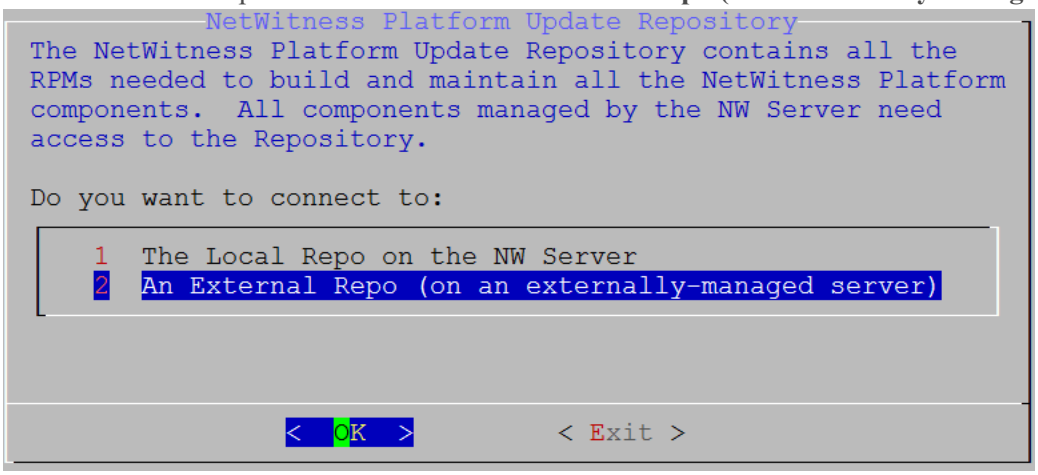
The **Deployment Password** prompt is displayed.

7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



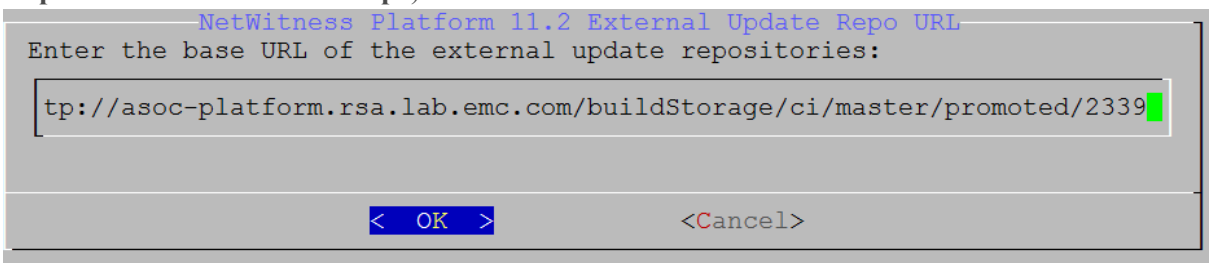
The **Update Repository** prompt is displayed.
You must use the same repo that you used for the NW Server hosts for all hosts.

8. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**.



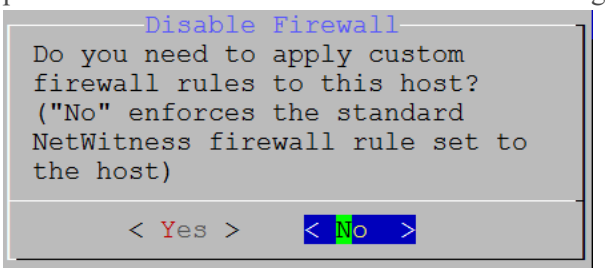
The **External Update Repo URl** prompt is displayed.
Refer to Appendix D. Create External Repository for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

9. Enter the base URL of the NetWitness Platform external repo (for example, **http:/testserver/netwitness-repo**)and click **OK**.

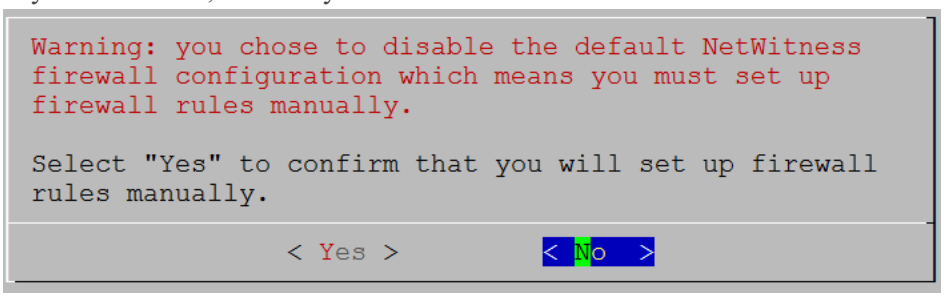


The **Disable** or use standard **Firewall** configuration prompt is displayed.

10. Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

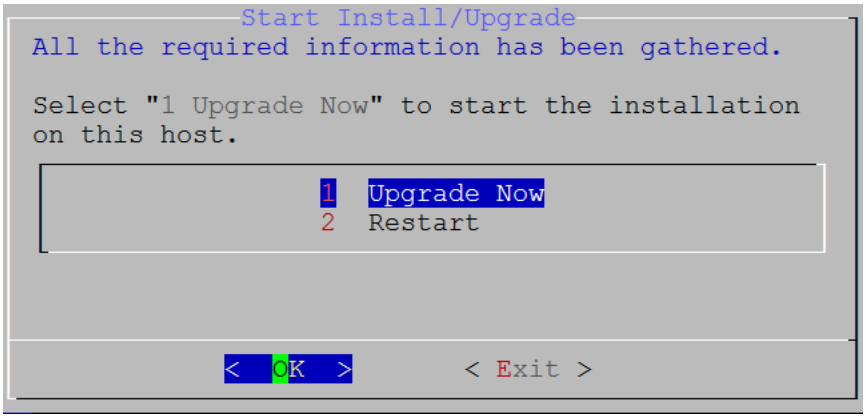


- If you select **Yes**, confirm your selection or **No** to use the standard firewall configuration.



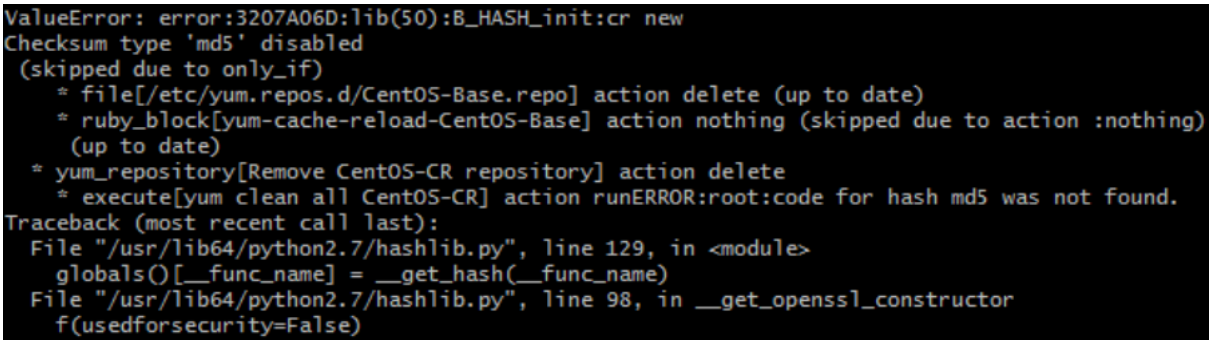
The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.2 Disaster Recovery).

11. Select 1 **Upgrade Now**, tab to **OK**, and press Enter.



When **Installation complete** is displayed, you have upgraded the 10.6.6.x SA Server to the 11.2 NW Server.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



12. Complete the NW Server before you upgrade any of the non-SA Server hosts to 11.2.

Set Up 11.2 Non-NW Server Host

Make sure that you Back up your 10.6.6.x data for the host. **You must follow the instructions in** Backup Instructions **to back up the host.**

Caution: Run the backup immediately before upgrading the host to 11.2 so that the data is as recent as possible.

Complete the following steps to set up an 11.2 Non-NW Server host.

1. Log in to 11.2 non-NW Server VM console and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.
2. Tab to **Accept** and press **Enter**.

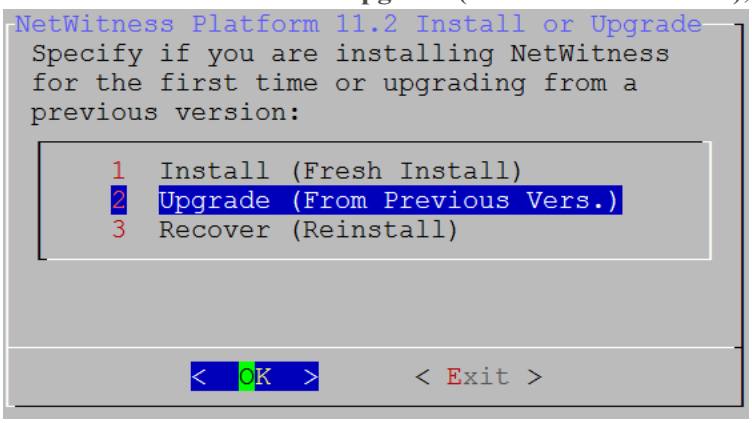
   The **Is this the host you want for your 11.2 NW Server** prompt is displayed.

   Caution: If you choose the wrong the host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.2 NW Server Host to correct this error.

3. Tab to **No** and press **Enter**.

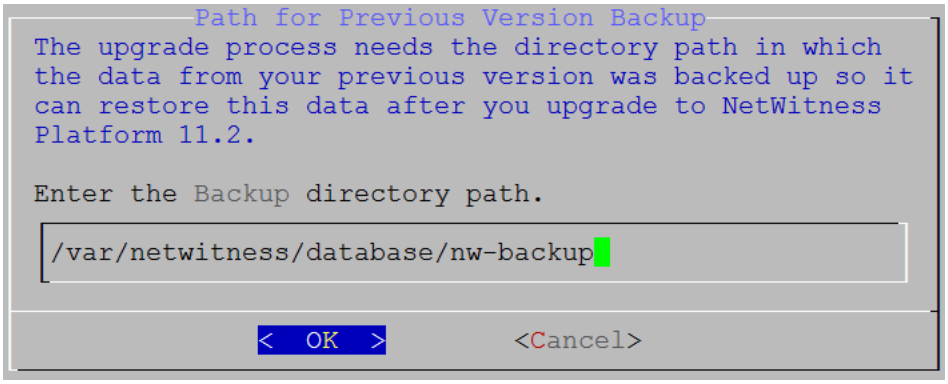
   The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.2 Disaster Recovery).

4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.



The **Backup** path prompt is displayed.

5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.



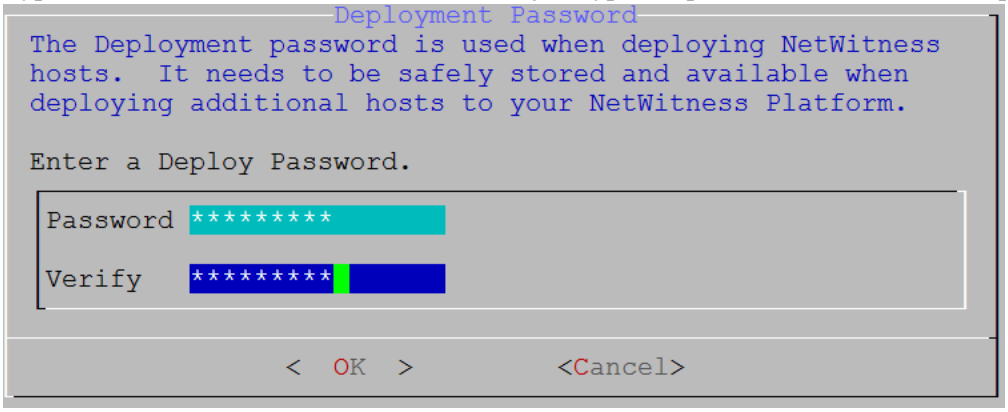
This table lists the backup and restore paths by host/service.

Host	Backup Path	Restore Path
Malware	/var/lib/rsamlware/nw-backup	/var/netwitness/malware_analytics_server/nw-backup/restore
Event Stream Analysis	/opt/rsa/database/nw-backup	/var/netwitness/database/nw-backup/restore
NW Server	/var/netwitness/database/nw-backup	/var/netwitness/restore
All Other Hosts	/var/netwitness/database/nw-backup	/var/netwitness/database/nw-backup/restore

The **Deployment Password** prompt is displayed.

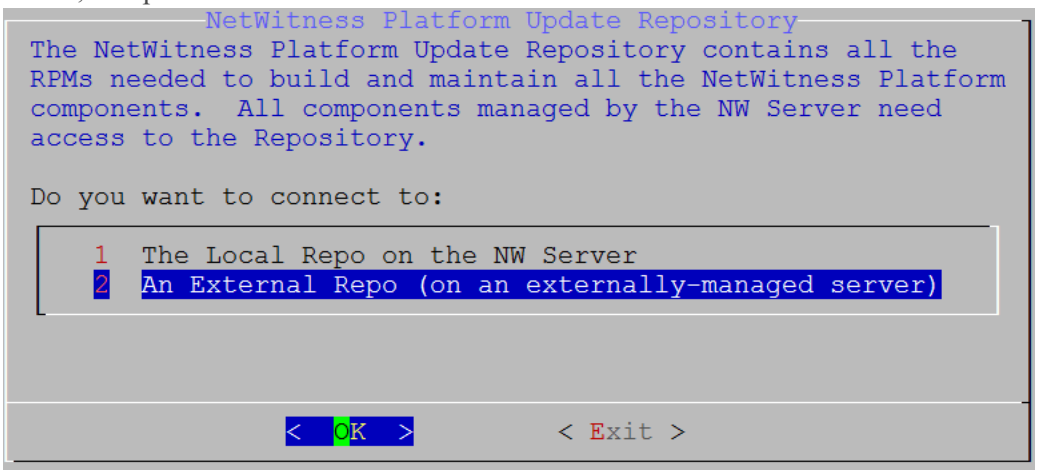
Note: You must use the same deployment password that you used when you upgraded the NW Server.

6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.



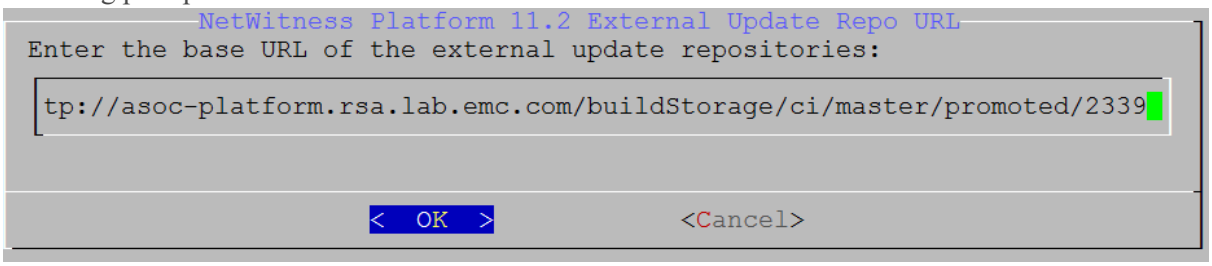
The **Update Repository** prompt is displayed.

7. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, tab to **OK**, and press **Enter**.



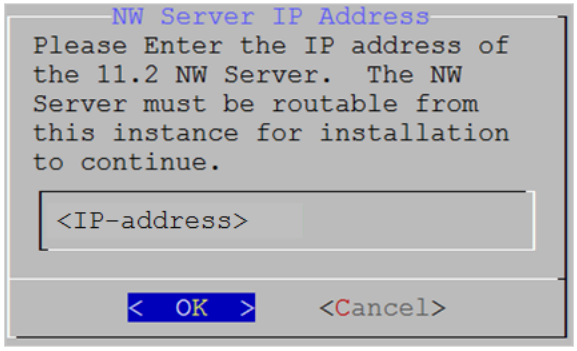
The **External Update Repo URL** prompt is displayed.
The repositories give you access RSA updates and CentOS updates.

8. Enter the base URL of the NetWitness Platform external repo (for example, **http://testserver/netwitness-repo**)and click **OK**. Refer to Appendix D. Create External Repository for instructions on how to create this repo and its external repo URL so you can enter it in the following prompt.



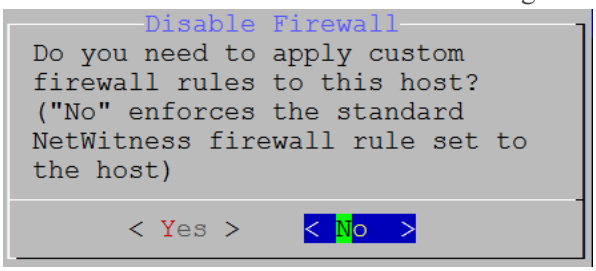
The **NW Server IP Address** is displayed.

9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.

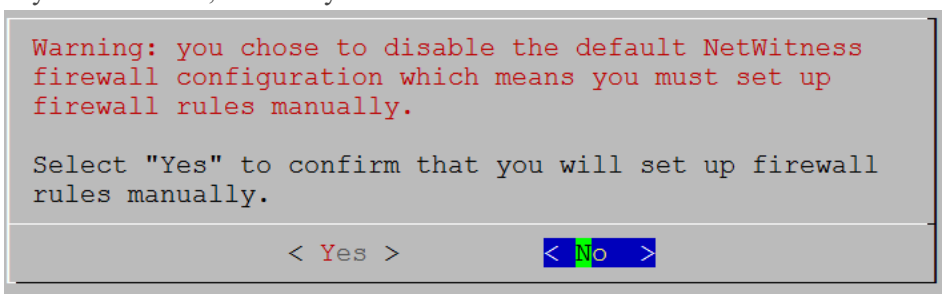


The **Disable** or use standard **Firewall** configuration prompt is displayed.

10. Tab to **No** (default), and press Enter to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.



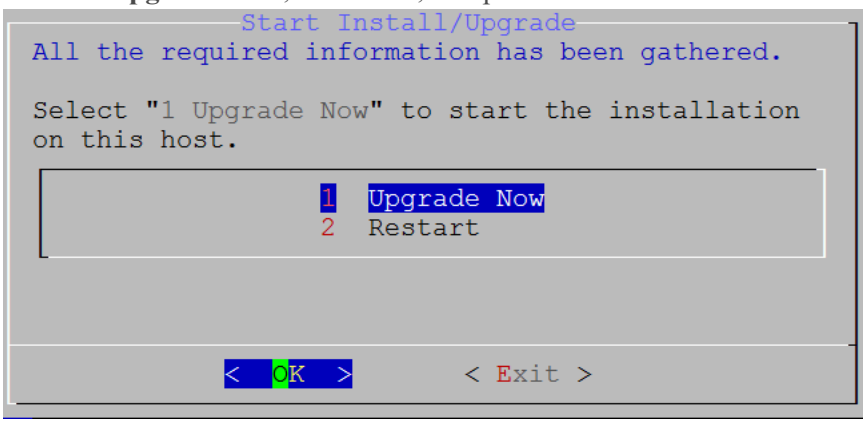
- If you select **Yes**, confirm your selection.



- If you select **No**, the standard firewall configuration is applied.

The **Install** or **Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.2 Disaster Recovery).

11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.



When **Installation complete** is displayed, you have upgraded the host to the 11.2.

12. Install the service on this host:

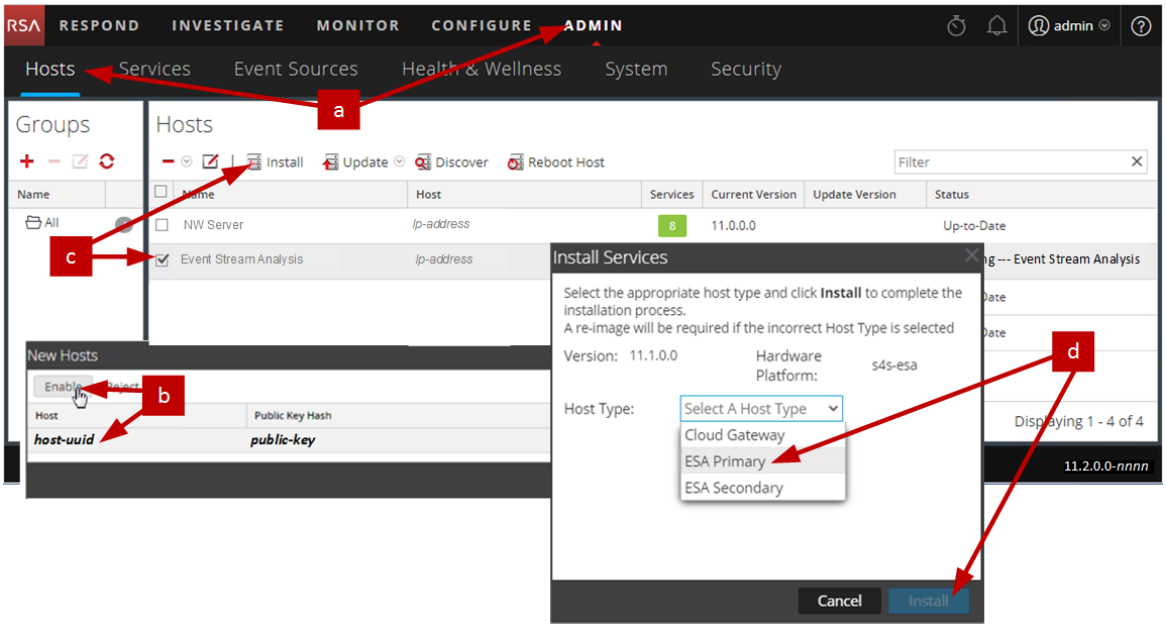
    a. Log into NetWitness Platform and click **ADMIN** > **Hosts**.
    The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

    Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    b. Click on the host in the **New Hosts** dialog and click **Enable**.
    The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.

    c. Select that host in the **Hosts** view (for example, **Event Stream Analysis**) and click Install.
    The **Install Services** dialog is displayed.

    d. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



You have completed the upgrade of the non-NW Server host in NetWitness Platform

Note: When you upgrade a Respond host from 10.6.6.x to 11.2, it takes a period of time for Respond to come back online. This is caused by Respond indexing data while it is restored. The size of the data in the Mongo database will determine the time.

Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness Legacy Windows Collection Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

This topic contains the tasks you must complete after you upgrade your hosts from 10.6.6.x to 11.2. These tasks are organized by the following categories.

General

Task 1 - Make Sure Port 15671 Is Configured Correctly

Port 15671 is new in 11.x, but you do not need to open a firewall for this port. Make sure that 15671, and all ports, are configured as shown in the "Network Architecture and Ports" topic in the *RSA NetWitness® Platform Deployment Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

(Conditional) Task 2 - Restore Custom Analysts Roles

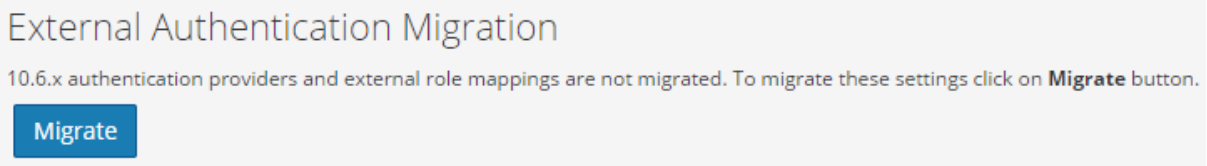
If you had custom analyst roles in 10.6.6.x, you must reinstate them in 11.2. See "Add a Role and Assign Permissions" in the *RSA NetWitness PlatformSystem Security and User Management Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NW Server

Task 3 - Migrate Active Directory (AD)

The first time you log into the NetWitness Platform 11.2 User Interface, you must click on the Migrate button to complete the migration of AD.

1. Log in to NetWitness Platform 11.2 with your `admin user` credentials.
2. In the **NetWitness Platform** 11.2 menu, select **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 4 - Modify Migrated AD Configuration to Upload Certificate

If you authenticated through Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.6.x, you must modify the migrated AD configuration to upload the Active Directory server certificate.

Complete the following procedure to modify the migrated AD configuration to upload the certificate.

1. In the **NetWitness Platform** 11.2 menu, select **ADMIN** > **Security** and click the **Settings** tab.
2. Under **Active Directory Settings**, select an AD configuration and click .
   The Edit Configuration dialog is displayed.
3. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
4. Click **Save**.

Task 5 - Reconfigure Pluggable Authentication Module (PAM) in 11.2

You must reconfigure PAM after you upgrade to 11.2. See "Configure PAM Login Capability" in the *RSA NetWitness® Platform System Security and User Management Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

You can refer to your 10.6.6.x PAM configuration files in the **/etc** directory in the your 10.6.6.x backup data for guidance.

Task 6 - Restore NTP Servers

You must use the NetWitness Platform 11.2 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *RSA NetWitness® Platform System Configuration Guide* for detailed instructions on how to add NTP servers. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 7 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Platform licenses. Refer to "Step 1. Register the NetWitness Server" in the *RSA NetWitness Platform Licensing Management Guide* for instructions on how to re-download licenses. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 8 - Remap Virtual NW Server License to 10.6.6.x MAC Address

If you are upgrading a Security Analytics server running on a virtual machine, change the 11.2 NW Server virtual host to the 10.6.6.x MAC address to retain licensing. Refer to "Licensing: Step 1. Register the NetWitness Server" in the *RSA NetWitness Platform Licensing Management Guide* for instructions on remapping a license to a new MAC address." Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

(Conditional) Task 9 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create a user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   ```
   /etc/sysconfig/iptables
   /etc/sysconfig/ip6tables
   ```
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 10 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

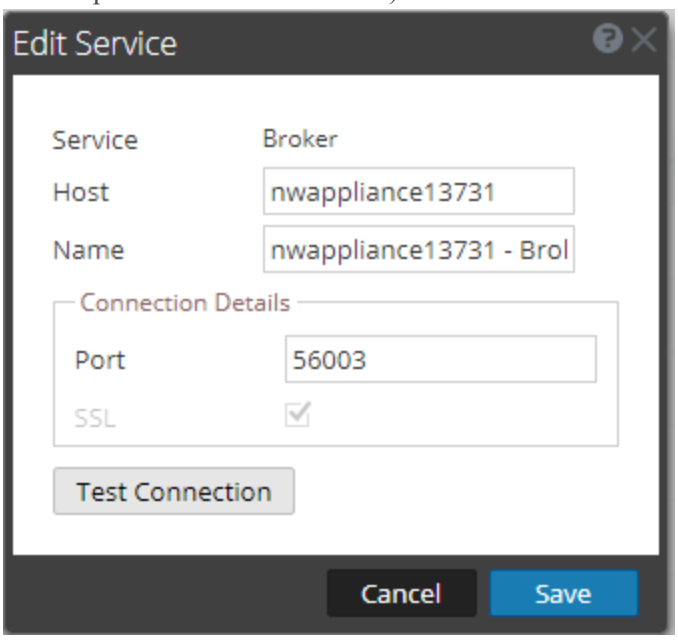
- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.6.

NetWitness Platform 11.2 cannot communicate with the core services for these customers because they are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. In the **NetWitness Platform** 11.2 menu, select **ADMIN** > **Services**.
2. Select each core service and change there ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005
Decoder	50004	56004
Log Decoder	50002	56002

3. Click (Edit) from the **Services** view toolbar.
   The Edit Service dialog is displayed.
4. Change the port from Non-SSL to SSL as shown in the table and click **Save** (for example, change the Broker port from 50003 to 56003).



Task 11 - (Conditional) Correct Audit Log Templates That Are Not Updated in Logstash Output Conf File

Problem: When a user updates from 10.6.6 to 11.2 and 11.0.0.0 to 11.2, if they have a global auditing set up, audit log templates are not getting updated in Logstash output conf file.

Workaround: If global auditing is configured, you need to edit one of the syslog entries in the Global notifications servers and click save to apply the latest Audit log configuration.

If you had global auditing configured in 11.0.x, you must complete the following procedure to apply the latest Global Auditing configuration.

1. In the **NetWitness Platform** 11.2 menu, select **ADMIN** > **System** > **Global Notifications**.
   The **Global Notifications** view is displayed.
2. Click the **Servers** tab, select any syslog server.
3. Click  (edit icon) and click **Save**.

RSA NetWitness® Endpoint

Task 12 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Platform 11.2, the virtual host is `/rsa/system`. For 10.6.6.x and earlier versions, the virtual host is `/rsa/sa`.
2. Restart the API Server and Console Server.
3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.
6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Task 13 - Reconfigure Recurring Feed Configured from Legacy Endpoint Because Java Version Changed

You must reconfigure the Legacy Endpoint recurring feed due to the change in Java version. Complete the following step to fix this problem.

1. Import the NetWitness Endpoint CA certificate into the NetWitness Platform Trusted store as described in "Export the NetWitness Endpoint SSL Certificate" under the "Configure Contextual Data from Endpoint via Recurring Feed" topic in the *RSA NetWitness Endpoint Integration Guide* to import the certificate.
   Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

RSA NetWitness® Endpoint Insights

(Optional) Task 14 - Install Endpoint Hybrid or Endpoint Log Hybrid

See:

RSA NetWitness Platform 11.2 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.2 Virtual Host Installation Guide for instructions for installation on a virtual host.

Event Stream Analysis Tasks (ESA)

Task 15 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.6.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.2.

1. In the **NetWitness Platform** 11.2 menu, select **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Network data and C2 for Logs, require a whitelist named "**domains_whitelist**".
2. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Click **ADMIN** > **Services**, select the Context Hub service, in the action commands () drop-down menu, click **View** > **Config** > **Lists** tab).
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *NetWitness Platform Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *NetWitness Platform ESA Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 16 - For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint Configure Mutually Authenticated SSL

If you integrate with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.6.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Platform by logging into the host and running the following `rabbitmqctl` command.
   ```
   > rabbitmqctl add_user <username> <password>
   ```
   For example:
   ```
   > rabbitmqctl add_user wtd-incidents incidents
   ```
2. Set permissions for users by running the following command (use the username from step 1):
   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*", ".*"
   ```
   For example:
   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*", ".*", ".*"
   ```

Task 17 - Enable Threat - Malware Indicators Dashboard

In 11.2.0, the 10.6.6.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.6.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.2.
2. Set datasource for new dashlets.
   See "Dashlets" in RSA Link (https://community.rsa.com/docs/DOC-81463) for a description of Dashlets in the context of NetWitness Platform.

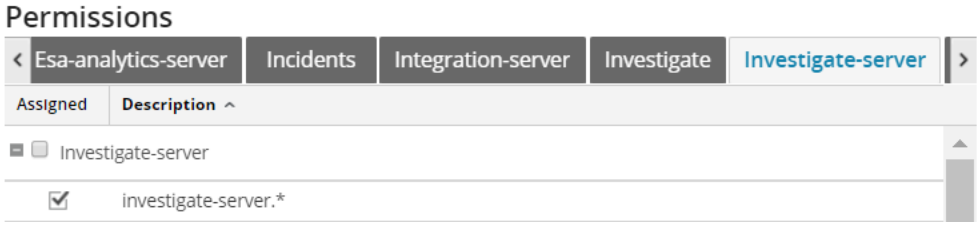
Investigate

Task 18 - Make Sure Customized User Roles Have `Investigate-server` Permissions for Event Analysis Access

After you upgrade to 11.2.0.0, any customized user role does not have `investigate-server.*` permission enabled by default. Complete the following procedure to make sure that the appropriate user roles have permission to access Event Analysis.

1. Log in to NetWitness Platform 11.2.0.0 with your `Admin user` credentials and go to **ADMIN** > **Security**.
2. Click the **Roles** tab.
3. Select the roles that need `investigate-server.*` permissions and click (Edit icon).
4. Select the **Investigate-server** tab under under **Permissions**.

5. If the **investigate-server** checkbox is not set, set it for the users that require Event Analysis access.



6. Click **Save**.

Log Collection

Task 19 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.2 to ensure that all collection protocols resume normal operation.

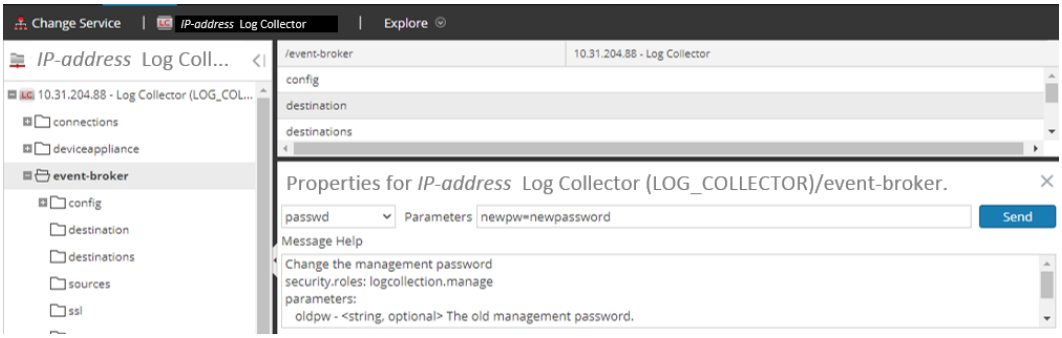
Reset Stable System Values for the Lockbox

The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *RSA NetWitness® PlatformLog Collection Configuration Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Update Log Collector Service RabbitMQ User Account Password

If the logcollector service RabbitMQ user account password was changed, you must reenter it after the 11.2 upgrade.

1. In the **NetWitness Platform** 11.2 menu, select **ADMIN > Services**.
2. Select the Log Collector service.
3. Click  (Actions) > **View** > **Explore**.
4. Right click `event-broker` > **Properties**.
5. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



(Optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Network Decoders)

Task 20 - Enable FIPS Mode

FIPS is enabled on all services except Log Collector, Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder. For information about how to enable FIPS for these services, see the "Sys Maintenance: Activate or Deactivate FIPS" topic in the *RSA NetWitness® PlatformSystem Maintenance Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Decoder and Log Decoder

(Conditional) Task 21 - Enable Metadata for GeoIP2 Parser

By default, the GeoIP2 parser generates less metadata than the GeoIP parser did. After updating to 11.2, if you require any of the additional metadata, you must enable them (once only) for each Decoder. This can also be altered post-upgrade. Keep in mind that the `isp` and `org` meta fields usually produce an equivalent value to `domain`.

To enable metadata:

1. Go to **ADMIN** > **Services**.
2. In the **Administration services** view, select a Log Decoder or a Decoder.
3. Click the settings icon ( ) and select **View** > **Config**. The Parsers Configuration panel is displayed, from which you can select **GeoIP2** to enable the desired metadata.

For more information about GeoIP2 parsers, see the "GeoIP2 and GeoIP Parsers" topic in the *Decoder and Log Decoder Configuration Guide*.

Reporting Engine

Task 22 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the back up you made prior to the upgrade. The Backup script backs up the 10.6.6.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.2.

1. SSH to the NW Server host.
2. Export the CA certificates.
   ```
   keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file
   ```
3. Copy the CA pem into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 23 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *RSA NetWitness® Platform Reporting Engine Configuration Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Respond

Task 24 - Restore Respond Service Custom Keys

In 10.6.6.x, if you added custom key for use in the **groupBy** clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.
   This directory is where the `alert_rules.json` file is restored from the 10.6.6.x backup.
2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.2.
   This is the new file for 11.2.
3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 25 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.2 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.6.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.6.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.6.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Platform 11.2 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.6.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

Task 26 - Add Respond Notification Settings for Custom Roles

Respond Notification Setting permissions enable Respond Administrators, Data Privacy Officers, and SOC Managers to access Respond Notification Settings (**CONFIGURE** > **Respond Notifications**), which enable them to send email notifications when incidents are created or updated.

To access these settings, you will need to add additional permissions to your existing built-in NetWitness Platform user roles. You will also need to add permissions to your custom roles. See the "Respond Notification Settings Permissions" topic in the *NetWitness Respond Configuration Guide*. For detailed information about user permissions, see the *System Security and User Management Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 27 - Manually Configure Respond Notification Settings

The Incident Management notification settings in NetWitness Platform 10.6.6.x to 11.2 are different from the Respond notification settings available in 11.2, so your existing 10.6.6.x to 11.2 settings will not migrate to 11.2.

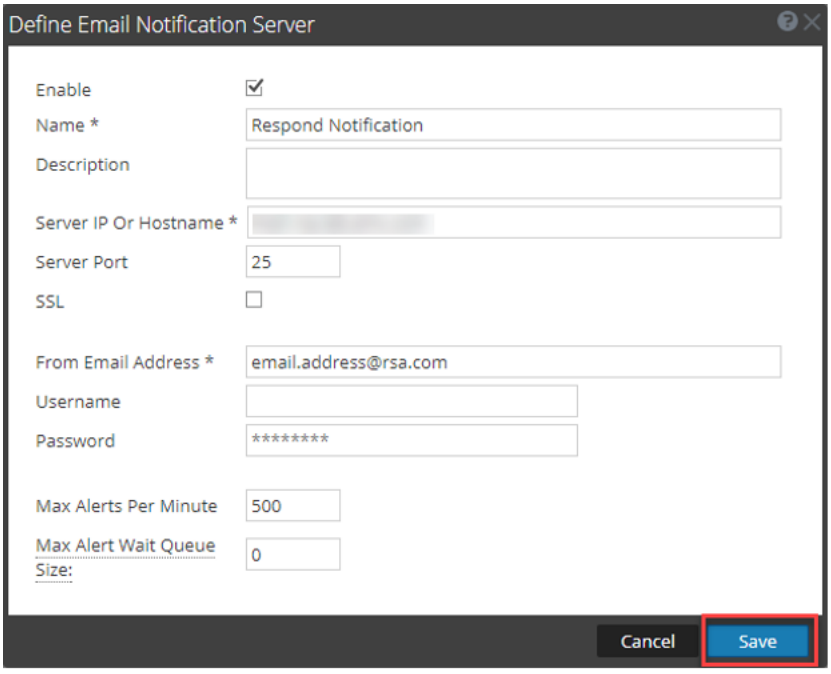
NetWitness Respond notification settings enable email notifications to be sent to SOC Managers and the Analyst assigned to an incident when an incident is created or updated.

To manually configure the Respond Notification Settings, go to **CONFIGURE** > **Respond Notifications.** See the "Configure Respond Email Notification Settings" procedure in the *NetWitness Respond Configuration Guide*.

Notification Servers from 10.6.6.x to 11.2 will not display in the Email Server drop-down list. The email servers must be edited and saved in the Global Notification Servers panel (**ADMIN** > **System** > **Global Notifications** > **Server** tab).

1. In the **NetWitness Platform** 11.2 menu, select **ADMIN** > **System** > **Global Notifications** > **Server** tab.
2. Go to **CONFIGURE** > **Respond Notifications**. The Respond Notifications Settings view is displayed.
3. Notice that the email notification servers do not appear in the EMAIL SERVER drop-down list.
4. Click the **Email Server Settings** link. You will see the Global Notifications panel.
5. Click the **Servers** tab.
6. For each of your email notification servers:
   a. Select the Email notification server and click  .

   b. In the Define Email Notification Server dialog, click **Save**.



7. Go back to **CONFIGURE** > **Respond Notifications**. Your servers will appear in the **EMAIL SERVER** drop-down list.

Custom Incident Management notification templates cannot be migrated to 11.2. No custom templates are supported in 11.2.

Task 28 - Update Default Incident Rule Group By Values

Four of the default incident rules now use ”Source IP Address” as the Group By value. To update the default rules, change the Group By value of the following default rules to “Source IP Address”:

- High Risk Alerts: Reporting Engine
- High Risk Alerts: Malware Analysis
- High Risk Alerts: NetWitness Endpoint
- High Risk Alerts: ESA

1. Go to **CONFIGURE** > **Incident Rules** and click the link in the **Name** column for the rule that you want to update. The Incident Rule Details view is displayed.
2. In the **Group By** field, select the new Group By value.
3. Click **Save** to update the rule.

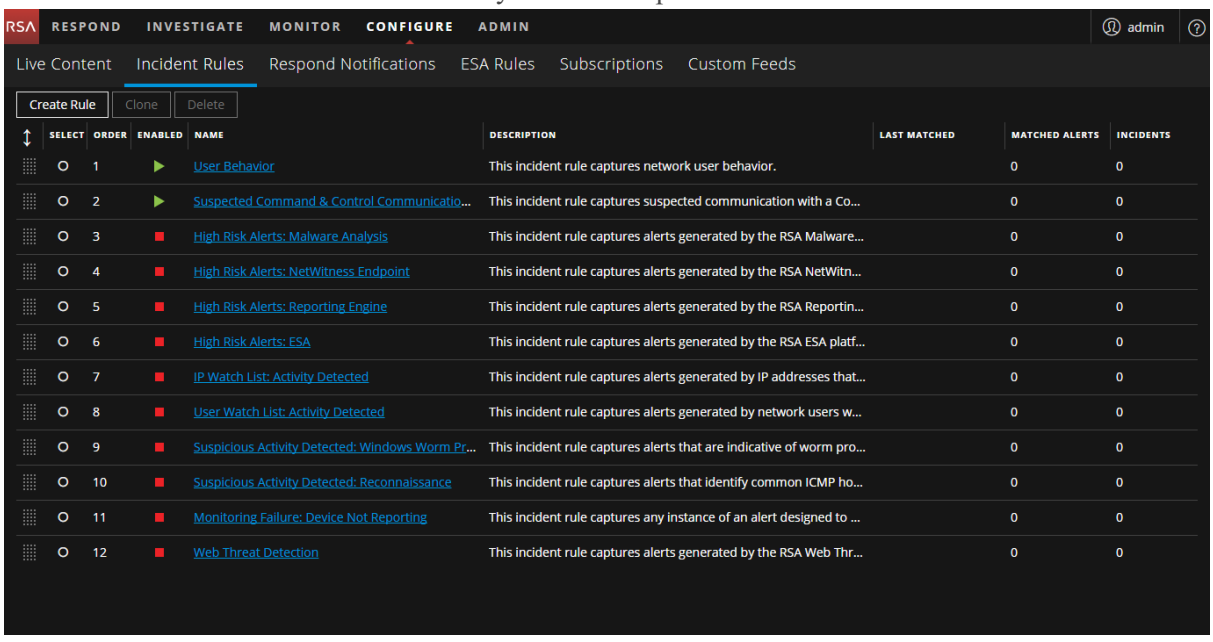
Task 29 - Add Group By Field to Incident Rules

The **Group By** field is not required in 10.6.6, but it is required in 11.2. After you upgrade to

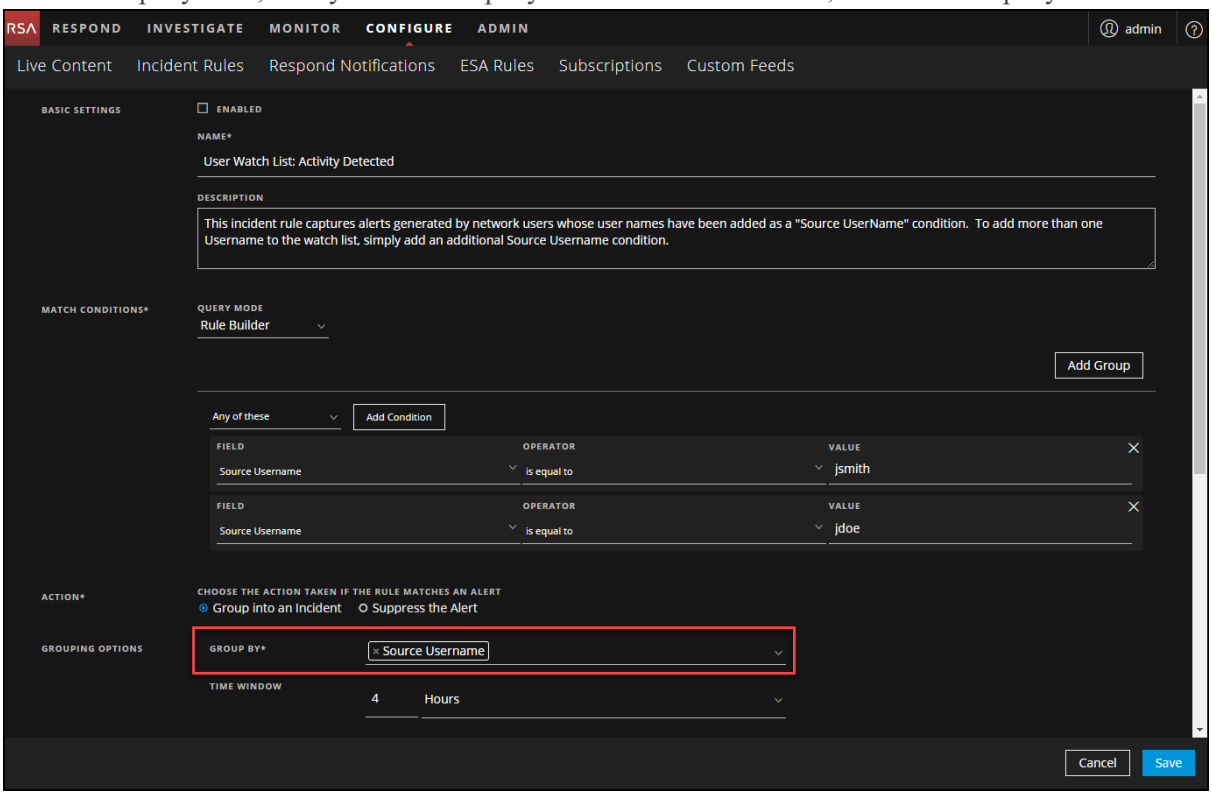
11.2, some incident rules will not have a **Group By** field, so you must add them to the rules or the rules will not work and they will not create incidents.

Complete the following steps for each incident rule:

1. In the **NetWitness Platform** 11.2 menu, select Go to **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



2. In the Group By field, verify that a Group By value is selected. If not, select a Group By value.



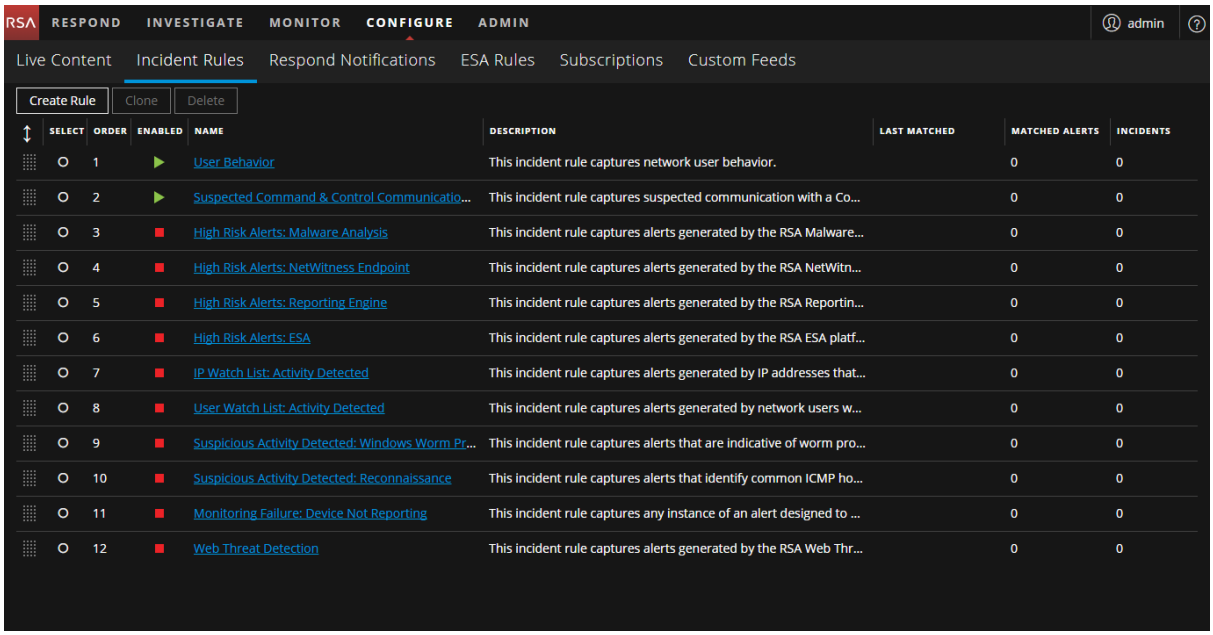
3. Click **Save** to update the rule.
   For information about incident rules, see the *NetWitness Respond Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 30 - Update Incident Rules Identified in the Domain in the Matching Conditions Upgrade Preparation Task

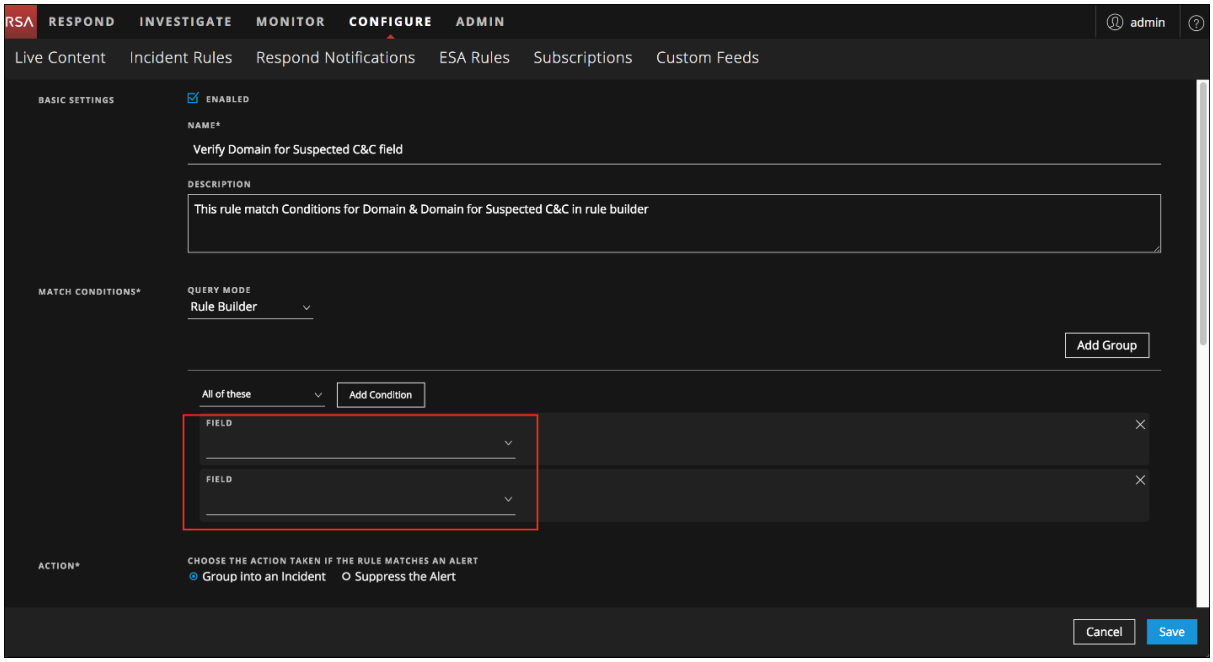
Modify the incident rules that you identified in the Task 5 - Check Aggregation Rules Match Conditions for "Domain" or "Domain for Suspected C&C" upgrade preparation task, which contained Domain or Domain for Suspected C&C in the matching conditions in rule builder.

For each rule that you previously identified:

1. In the **NetWitness Platform** 11.2 menu, select **CONFIGURE** > **Incident Rules** and click the link in the Name column for the rule that you want to update.



2. In the **Match Conditions** section, in the blank fields, select **Domain** and **Domain for Suspected CC** in the drop-down list and then select the conditions that you previously identified in the pre-upgrade tasks.



3. Click **Save** to update the rule.
For information about incident rules, see the *NetWitness Respond Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

RSA Archer® Cyber Incident & Breach Response

Task 31 - Reconfigure Archer® Cyber Incident & Breach Response Integration

For information on how to reconfigure Archer® Cyber Incident & Breach Response for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

User and Entity Behavior Analytics (UEBA)

(Optional) Task 32 - Install UEBA

UEBA is new a new feature as of NetWitness Platform 11.2.

See:

RSA NetWitness Platform 11.2 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.2 Virtual Host Installation Guide for instructions for installation on a virtual host.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Backup

Task 33 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.2 before you remove the backup-related files from the local directories on your 11.2 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.2, you must remove:

- the backup files from the local directories on the hosts.
- all the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

Host	Backup Path	Restore Path
NW Server	/var/netwitness/database/nw-backup	/var/netwitness/restore
All Other Hosts	/var/netwitness/database/nw-backup	/var/netwitness/database/nw-backup/restore

Appendix A. Troubleshooting

This section describes solutions to problems that you may encounter during installations and upgrades. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve an upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

This section has troubleshooting documentation for the following services, features, and processes.

- Command Line Interface (CLI)
- Backup Script
- Event Stream Analysis
- Log Collector Service (`nwlogcollector`)
- Orchestration
- NW Server
- Reporting Engine
- NetWitness UEBA

Command Line Interface (CLI)

Error Message	Command Line Interface (CLI) displays: "Orchestration failed." `Mixlib::ShellOut::ShellCommandFailed: Command execution failed. STDOUT/STDERR suppressed for sensitive resource in/var/log/netwitness/config-management/chef-solo.log`
Cause	Entered the wrong `deploy_admin` password in `nwsetup-tui`.
Solution	Retrieve your `deploy_admin` password password. 1. SSH to the NW Server host. `security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name deployment.password` SSH to the host that failed. 2. Run the `nwsetup-tui` again using correct `deploy_admin` password.

Error Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health. AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service. `systemctl restart rsa-sms`

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Backup (`nw-backup` script)

Error Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA Mongo admin password back to the original default of 'netwitness' before running backup.

Error	Backup errors caused by the `immutable` attribute setting. Here is an example of an error that can be displayed: Cause	If you have any files that have the immutable flag set (to keep the Puppet process from overwriting a customized file), the file will not be included in the backup process and an error will be generated.
Solution	On the host that contains the files with the immutable flag set, run the following command to remove the immutable setting from the files: `chattr -i <filename>`

Error	Error creating Network Configuration Information file due to duplicate or bad entries in primary network configuration file: `/etc/sysconfig/network-scripts/ifcfg-em1` Verify contents of `/var/netwitness/logdecoder/packetdb/nw-backup/2018-02-23/S5-BROK-36-10.25.53.36-network.info.txt`
Cause	There are incorrect or duplicate entries for any one of the following fields: DEVICE, BOOTPROTO, IPADDR, NETMASK or GATEWAY, that were found from reading the primary Ethernet interface configuration file from the host being backed up.

Solution	Manually create a file at the backup location on the external backup server, as well as the backup location local to the host where other backups have been staged. The file name should be of the format `<hostname>-<hostip>-network.info.txt`, and should contain the following entries:
	`DEVICE=<devicename> ; # from the host's primary ethernet interface config file`
	`BOOTPROTO=<bootprotocol> ; # from the host's primary ethernet interface config file`
	`IPADDR=<value> ; # from the host's primary ethernet interface config file`
	`NETMASK=<value> ; # from the host's primary ethernet interface config file`
	`GATEWAY=<value> ; # from the host's primary ethernet interface config file`
	`search <value> ; # from the host's /etc/resolv.conf file`
	`nameserver <value> ; # from the host's /etc/resolv.conf file`

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.2.0.0 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESA Primary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA.
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Error Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Error Message	`<timestamp> NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Error Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the `sa.log`. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6.x to 11.2.0.0.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Orchestration

The orchestration server logs are posted to `/var/log/netwitness/orchestration-server/orchestration-server.log` on the NW Server Host.

Problem	1. Tried to upgrade a non-NW Server host and it failed. 2. Retried the upgrade for this host and it failed again. You will see the following message in the `orchestration-server.log`. `"'file' _virtual_ returned False: cannot import name HASHES""`
Cause	Salt minion may have been upgraded and never restarted on failed non-NW Server host

Solution	1. SSH to the non-NW Server host that failed to upgrade.
	2. Submit the following commands.
	`systemctl unmask salt-minion`
	`systemctl restart salt-minion`
	3. Retry the upgrade of the non-NW Server host.

Reporting Engine Service

Reporting Engine Update logs are posted to to/var/log/re_install.log file on the host running the Reporting Engine service.

Error Message	<timestamp> : Available free space in /var/netwitness/re-server/rsa/soc/reporting-engine [><existing-GB] is less than the required space [<required-GB>]
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NetWitness UEBA

Problem	The User Interface is not accessible.
Cause	You have more than one NetWitness UEBA service existing in your NetWitness deployment and you can only have NetWitness UEBA service in your deployment.

Solution	Complete the following steps to remove the extra NetWitness UEBA service.
	1. SSH to NW Server and run the following commands to query the list of installed NetWitness UEBA services.
	`# orchestration-cli-client --list-services|grep presidio-airflow`
	`... Service: ID=7e682892-b913-4dee-ac84-ca2438e522bf, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	`... Service: ID=3ba35fbe-7220-4e26-a2ad-9e14ab5e9e15, NAME=presidio-airflow, HOST=xxx.xxx.xxx.xxx:null, TLS=true`
	2. From the list of services, determine which instance of the `presidio-airflow` service should be removed (by looking at the host addresses).
	3. Run the following command to remove the extra service from Orchestration (use the matching service ID from the list of services):
	`# orchestration-cli-client --remove-service --id <ID-for-presidio-airflow-form-previous-output>`
	4. Run the following command to update node 0 to restore NGINX:
	`# orchestration-cli-client --update-admin-node`
	5. Log in to NetWitness Platform, go to **ADMIN** > **Hosts**, and remove the extra NetWitness UEBA host.

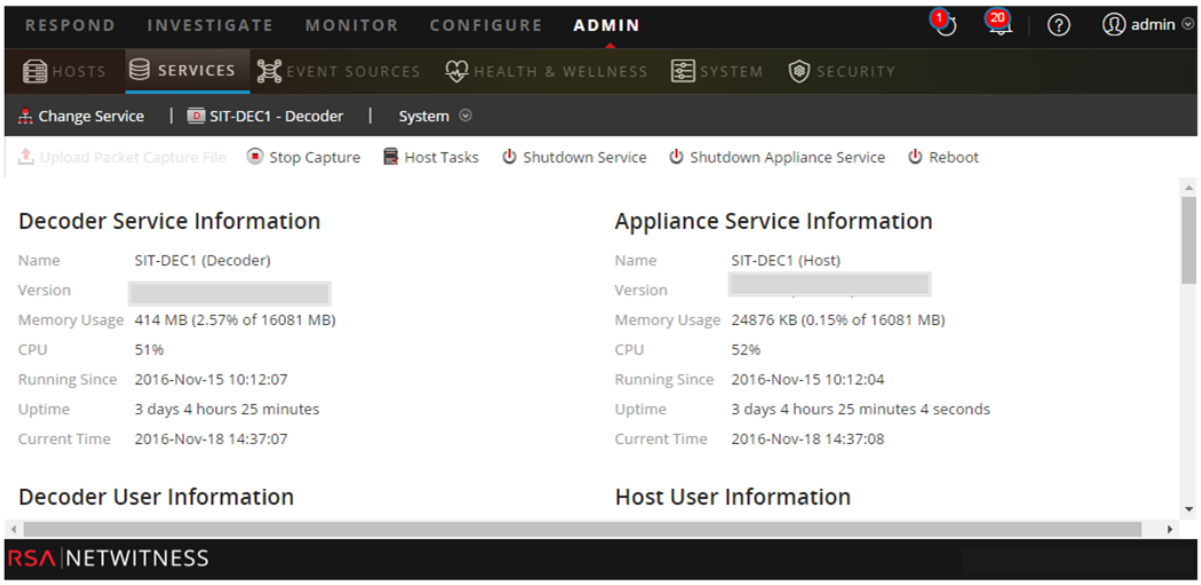
Appendix B. Stopping and Restarting Data Capture and Aggregation

RSA recommends that you stop network and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.2.0.0. If you do this, you must restart network and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Network Capture

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



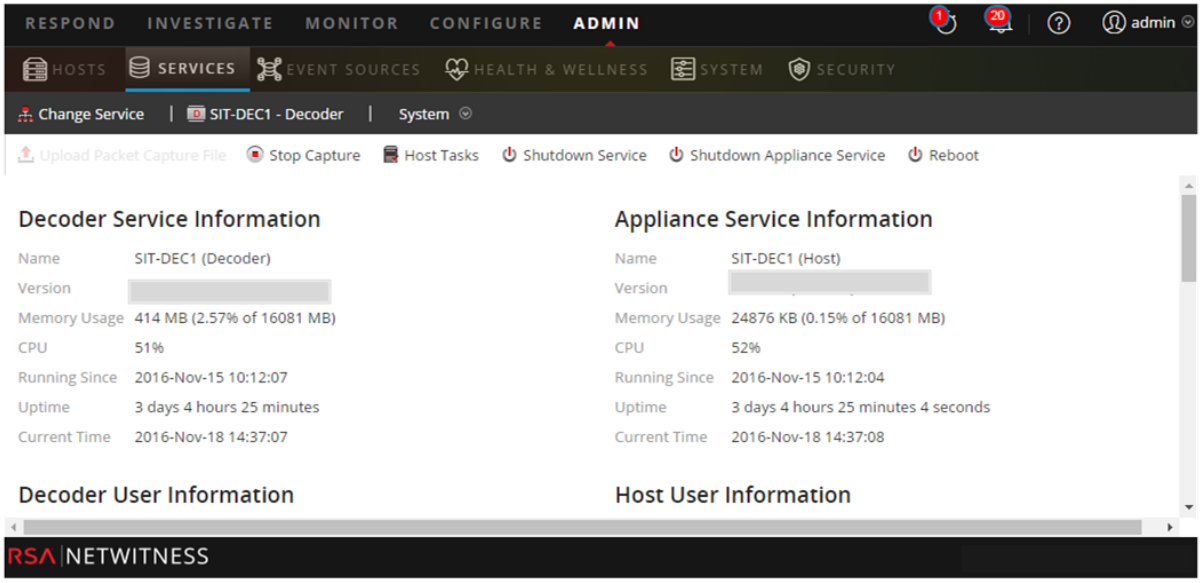
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

.

Stop Log Capture

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.



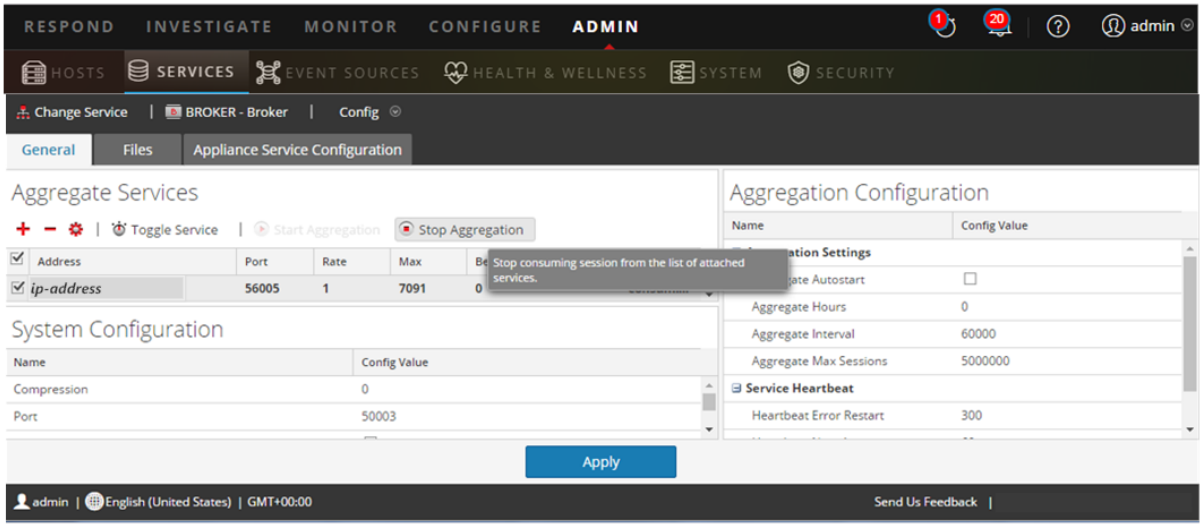
3. Under  (actions), select **View** > **System**.

4. In the toolbar, click 

.

Stop Aggregation

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
2. Select the **Broker** service.
3. Under  (actions), select **View** > **Config**.
4. The **General** tab is displayed.



5. Under **Aggregated Services** click 
.

Start Data Capture and Aggregation

Restart network and log capture and aggregation after updating to 11.2.0.0.

Start Network Capture

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click  .

Start Log Capture

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click  .

Start Aggregation

1. Log in to **NetWitness Platform** and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. For each Concentrator and Broker service.
   a. Select the service.
   b. Under  (actions), select **View** > **Config**.
   c. In the toolbar, click  .

Appendix C. Using iDRAC

Many customers have remote sites with limited physical access and limited bandwidth from the administrator's desktop. If this the case, you may want to use iDRAC with the ISO Image shared out from an NFS share that is local to the devices being upgraded or installed. This also gives you the ability to use an existing NetWitness device as the sharing host.

For example:

- You have a Concentrator and Decoder at a site in a remote geographic location.
- The bandwidth is relatively low to that site from the administrator's site.
- Shipping a USB stick and arranging to have person to go plug it into the boxes while you upgrade is not practical.

In this situation, you can:

1. Install the nfs-utils RPM.
2. Configure the NFS share.
3. Configure iDRAC to connect to that share.
   Make sure that you update your iDRAC firmware supported Windows and Linux operating systems. Download and run the Dell Update Packages for supported Windows and Linux operating systems from the Dell Support website at http://www.support.dell.com. For more information, see the Dell Update Package User's Guide available on the Dell Support website at http://topics-cdn.dell.com/pdf/dell-update-packages-v17.10.00_User's%20Guide_en-us.pdf.
4. Boot to the virtual media that contains the ISO file and continue with the upgrade.

Configure NFS Server - NFS Server config File

1. Install NFS and its common utilities using yum.
   ```
   yum install nfs-utils
   ```
2. Configure the NFS service to run at boot.
   ```
   chkconfig nfs on
   ```
3. Configure the rpcbind service to run at boot.
   This service is required by NFS and must be running before NFS can be started.
   ```
   chkconfig rpcbind on
   ```
4. Start the rpcbind service.
   ```
   service rpcbind start
   ```
5. Start the NFS service.
   ```
   service nfs start
   ```
6. Create a directory for our first export.
   ```
   mkdir /exports/files
   ```
7. Open the NFS exports file into a text editor.
   ```
   vi /etc/exports
   ```

8. To export the directory to everyone with read-only access, add the following line.
   `/exports/files *(ro)`
9. Save your changes and exit the editor.
   `:wq!`
10. Export the directory defined above.
    `exportfs -a`
11. Disable firewall rules while performing upgrades.
    `service iptables stop`
12. Copy install media that contains the ISO file to `/exports/files` directory.

Boot iDRAC to NFS Configuration

Note: You must verify that the iDRAC firmware is at least 1.57.57 for Series 4 (R620).

1. Log in to the iDRAC interface.
2. Attach media using Remote File Share.
   `<server ip>:/export/files/11.2.0.0.iso`
   For example: `10.10.10.10:/exports/files/rsa-11.2.0.0.1948.el7-usb.iso`
3. Click **Connect**.
4. Launch **Console**.
5. From the **next boot** menu, select **Virtual DVD/CD**.
6. Reboot the device.

Appendix D. Create External Repository

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. Log in to the web server host.
2. Create a directory to host the NW repository (`netwitness-11.2.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, if `/var/netwitness` is the `web-root`, submit the following command string.
   `mkdir -p /var/netwitness/<your-zip-file-repo>`
3. Create the 11.2.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0`
4. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.2.0.0`.
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS`
   `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0/RSA`
5. Unzip the `netwitness-11.2.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.2.0.0` directory.
   `unzip netwitness-11.2.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0`
   Unzipping `netwitness-11.2.0.0.zip` results in two zip files (`OS-11.2.0.0.zip` and `RSA-11.2.0.0.zip`) and some other files.
6. Unzip the:
   a. `OS-11.2.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.2.0.0/OS` directory.
      `unzip /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS-11.2.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS`
      The following example illustrates how the Operating System (OS) file structure will appear after you unzip the file.

1.0	17-Aug-18	Release to Operations	IDD

Virtual Host Upgrade Checklist
for Version 10.6.6.x to 11.2

RSA NETWITNESS® PLATFORM

Task	Description	√
Prepare for Upgrade		
1.	Download **RSANW-11.2-VirtUpgradeGde.pdf** from RSA Link and review it. a. Be aware of the unsupported components and services in 11.x. b. Carefully read the sections on Event Stream Analysis (ESA) Upgrade Considerations and Investigate in Mixed Mode. c. Review the new required ports .	
2.	Be aware of the hardware, deployments, services, and features not supported in 11.1.	
3.	Make sure Data Retention run interval is ≥ 24 hours so Respond service will activate in 11.2.	
4.	Perform the upgrade preparation tasks for the features you use. **Caution:** Make sure that you implement and test the new ports so that upgrade does not fail due to missing ports.	
5.	Create CentOS 6 external host to save backup tar files.	
6.	Download the `nw-backup-v4.0.zip` file from RSA Link (https://community.rsa.com/docs/DOC-81514) an extract the files to an external host.	
7.	Execute `get-all-systems.sh` and `ssh-propagate.sh` script from external host.	
8.	Preserve a copy of the `get-all-systems-master` file for future reference.	
9.	Execute `nw-backup.sh` in `TEST` mode to evaluate the space requirements from external host (for example: `nw-backup -t -l -D`).	
10.	Review the back up options for `nw-backup.sh` by displaying the help menu (`nw-backup.sh -h`) .	

Virtual Host Upgrade Checklist
for Version 10.6.6.x to 11.2

RSA NETWITNESS® PLATFORM

Task	Description	√
Migrate Disk Drives		
11.	Back up data in 10.6.6.x virtual machines (VMs).	
12.	Download 11.2 OVA from RSA Link.	
13.	Deploy the same 10.6.6.x VM stack in 11.2.	
14.	Power off both 10.6.6.x VM and 11.2 VM .	
15.	Copy VMDK files from the 10.6.6.x and add them to 11.2 OVA deployed in step 12.	
16.	Retain the MAC Address of upgraded SA Server VM.	
17.	Remove 10.6.6.x VM from inventory (Do not delete the VM).	
18.	Power on 11.2 VM.	
19.	Mount the file system from VMDK.	
20.	Restore Backup data in 10.6.6.x to 11.2 VMs.	
Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts		
21.	Update the contents of the `all-systems` so they consist of SA, ESA's, MA and Broker/Concentrator backup data.	
22.	For ESA hosts, reset the Mongo Database admin password to 'netwitness' if it contains special characters .	
23.	Execute `nw-backup.sh` with `-u` flag for all Phase 1 hosts and confirm that it completes with no errors.	
24.	If your environment has multiple ESA appliances, designate a primary ESA (Where the Context Hub service is running) and copy `mongodb.tar.gz.*` files from the secondary ESAs to designated primary ESA default backup path.	
25.	Confirm that backup tar files are saved locally and remotely.	
26.	Set up the 10.6.6.x SA Server host to 11.2 NW Server host by running the `nwsetup-tui` program on the host.	
27.	Install the ESA, Malware Analysis, and Broker or Concentrator services in the NetWitness 11.2 User Interface.	

Task	Description	√
Phase 2 - Upgrade All Other Hosts		
28.	Update the contents of the `all-systems` so they consist of Phase 2 host backup data.	

Task	Description	√
29.	Execute `nw-backup.sh` in `TEST` mode to evaluate the space requirements from external host (for example: `nw-backup -t -l -D`).	
30.	Execute `nw-backup.sh` with `-u` flag for all Phase 2 hosts and confirm that it completes with no errors.	
31.	Confirm that backup tar files are saved locally and remotely.	
32.	Set up the all othe hosts host to 11.2 NW Server host by running the `nwsetup-tui` program on the host.	
33.	Install the host service in the NetWitness 11.2 User Interface:	
Preform Post Upgrade Adjustments		
34.	Perform the post upgrade tasks for the features you use.

September 2018

Contents

Introduction

The instructions in this guide apply to the upgrade of AWS for RSA NetWitness Platform 10.6.6.x to 10.6.6.x to 11.2 exclusively. See the *RSA NetWitness Platform Physical Host Upgrade Guide* for instructions on how to upgrade your 10.6.6.x physical hosts to 11.2. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents. This document assumes that the appliances are in AWS cloud.

NetWitness Platform 11.2 is a major release that affects all products in the NetWitness Platform suite. The components of the suite are the NetWitness Server (NW Server), Archiver, Broker, Concentrator, Context Hub, Decoder, Entity Behavior Analytics, Event Stream Analysis, Investigate, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Response, and Workbench.

CentOS6 to CentOS7 Upgrade

NetWitness Platform 11.2 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.2 platform environment has been improved greatly to accommodate current and future physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Platform 11.2 Upgrade Path

The supported Upgrade path for RSA NetWitness® Platform 11.2 is Security Analytics 10.6.6.x. If you are running a version of NetWitness Platform that is prior to 10.6.6.x, you must update to 10.6.6.x before you can upgrade to 11.2. See the *RSA Security Analytics 10.6.6 Update Guide* on RSA Link.

Caution: There is a known issue if you have Active Directory users configured in 10.6.6.x. You have two options to address this issue:
• Apply the 10.6.4.2 patch before you back up your data for the 11.2 upgrade.

Note: If you are updating from 11.0 to 11.2, see to the *Update Guide for Version 11.01 to 11.2* on RSA link.

Hardware, Deployments, Services, and Features Not Supported in 11.2

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.2.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- Malware Analysis service co-located on the SA Server (Upgrade of Malware Analysis Enterprise is supported in 11.0.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.2, your custom policy is not present. In its place, there is the out-of-the-box Context hub Server Monitoring Policy in the user interface, which is specific for version 11.2.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Platform 11.2, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.0, ESA sends all alerts to a central Alert system. The local mongo storage in ESA 10.6.4.x has been removed.

Caution: If you do not use Incident Management in 10.6.4.x, carefully consider whether or not to upgrade to version 11.0.

The following guidelines should help you determine whether or not to upgrade your ESA hosts to 11.2.

In your 10.6.4.x deployment, if you have:

- One ESA host, with or without Incident Management configured, upgrade to 11.0.
- Multiple ESA hosts configured to use Incident Management – The system will continue to aggregate

alerts centrally. If the system is correctly sized and operating as intended in 10.6.4.x, you can upgrade to version 11.0.

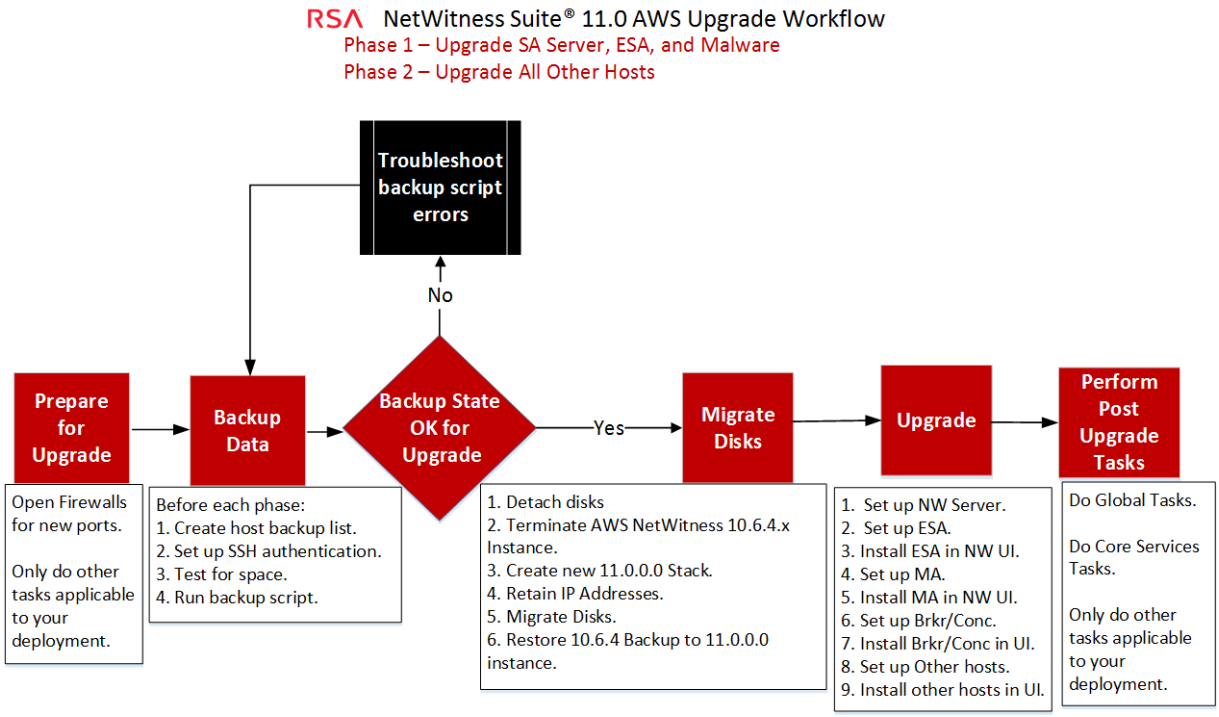
- Multiple ESA hosts without configuration to use Incident Management and you are connecting to individual ESA hosts to view alerts, do not upgrade to version 11.0.

Note: If you did not use Incident Management in 10.6.4.x, you cannot view the 10.6.4.x ESA alerts in the 11.0 Respond component without running a migration script. Use the ESA Alert Migration script to migrate these alerts to the location in 11.0 that will allow Respond to view them. See the *ESA Alert Migration Instructions for 10.6.4.x to 11.0* knowledge base article (https://community.rsa.com/docs/DOC-81680) in RSA Link for instructions on how to run this script.

User Attribute and Role Changes Affecting Investigate

The following changes affect how NetWitness Platform 11.2 handles user and role attributes in the Investigate component.

- User Attributes
  When you upgrade to 11.2, the user attributes (query prefix, session timeout, and query threshold) available in SA 10.6.6.x no longer exist. The same attributes are available at the role level for use.
- User and Role Attributes (Query Prefix) is not applicable to Investigate Event Analysis. The user and role attributes, most importantly the query prefix, do not apply to the new Investigate Event Analysis. Any user can modify the URL in browser to access data that should be restricted from viewing even when query prefix is applied.



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Platform 11.2.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness Platform 11.2. These tasks are organized by the following categories.

- Global
- Reporting Engine
- Respond and Incident Management

Global

You must complete these tasks regardless of how you deploy NetWitness Platform and which components you use.

Task 1 - Review Core Ports and Open Firewall Ports

The following table lists new ports in 11.2.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

All NetWitness Platform core ports are listed in the "Network Architecture and Ports" topic in the *RSA NetWitness® Platform Deployment Guide* in case you need to reconfigure NetWitness Platform services and firewalls. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 2 - Record Your 10.6.6.x `admin user` Password

Record your 10.6.6.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of `/etc/fstab` File

Copy the `/etc/fstab` file from all VMs to your local machine (backup host or remote machine).

Note: You need this file to restore a VM with external storage mounts.

Reporting Engine

(Conditional) Task 4 - Unlink External Storage

If the Reporting Engine has external storage [such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports] you must perform the following steps to unlink the storage.

In these steps:

- `/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
- `/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Respond and Incident Management

Task 5 - Set Data Retention Run Interval to ≥ 24 Hours

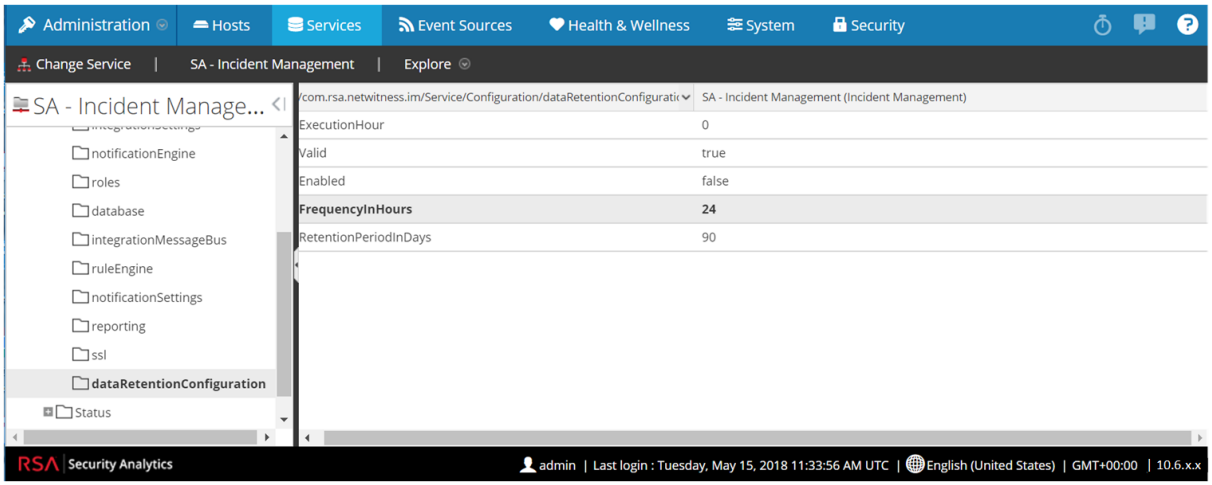
In Security Analytics 10.6.x , the Data Retention run interval does not have any minimum value check. In 11.2, RSA added a validation check to make sure that it is run at least every 24 hours. When you upgrade to 11.2, if this value is less than 24 hour, the Respond service will not start.

Complete the following task to ensure that the Respond service starts after upgrading to 11.2.

1. In Security Analytics 10.6.6.x, go to **ADMIN** > **Services**.
2. Select the **Incident Management** service, and then select  > **View** > **Explore**.
3. In the Incident Management **Explore** view, go to `Service` > `Configuration` >

`dataRetentionConfiguration`.

4. Make sure that the `FrequencyInHours` parameter is ≥ **24**.



Backup Instructions

Backing up your configuration data for all your hosts from 10.6.6.x is the first step in upgrading from 10.6.6.x releases to 11.2.0.0.

Note: It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directory will be automatically restored during the upgrade process. After upgrading to 11.2.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types

Caution: 1) These services are not supported in the 10.6.6.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the NetWitness Server
- Standalone Warehouse Connector

2) There is a known issue if you have Active Directory users configured in 10.6.6.x. You have two options to address this issue:
• Apply the 10.6.6.2 patch before you back up your data for the 11.2 upgrade.
• If you failed to apply the 10.6.6.2 patch, you can apply the 11.0.0.1 patch immediately after you upgrade to 11.2.

The following types of hosts can be backed up and are automatically restored during the upgrade process:

- **NetWitness Server** (may include Malware Analysis, NetWitness Respond, Health and Wellness, and Reporting Engine)
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and NetWitness Respond database)
- **Concentrator**
- **Log Decoder**
- **Packet Decoder**
- **Virtual Log Collector**

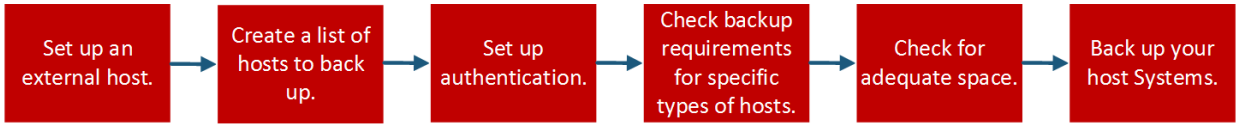
The following types of files are automatically backed up but must be restored manually after the upgrade process:

- PAM configuration files: For information about restoring the PAM configuration files, refer to "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.2.0.0", in the "Global" section of the Post Upgrade Tasks.
- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the `/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-`

`backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see "(Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of Post Upgrade Tasks.

Note: If you have problems during the backup or upgrade processes and you lose data, you can recover the data and start the process again. For information about recovering lost data, see "Recover Data After System Failure" in the *System Maintenance Guide*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



The following sections describe each of these tasks:

- Task 1 - Set up an External Host for Backing up Files
- Task 2 - Create a List of Hosts to Back up
- Task 3 - Set up Authentication Between Backup and Target Hosts
- Task 4 - Check for Backup Requirements for Specific Types of Hosts
- Task 5 - Check for Adequate Space for the Backup
- Task 6 - Back up Your Host Systems
- Post Backup Tasks

Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running Centos 6 with connectivity through SSH to the NetWitness Platform stack of hosts.

Ensure that the host names for the systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

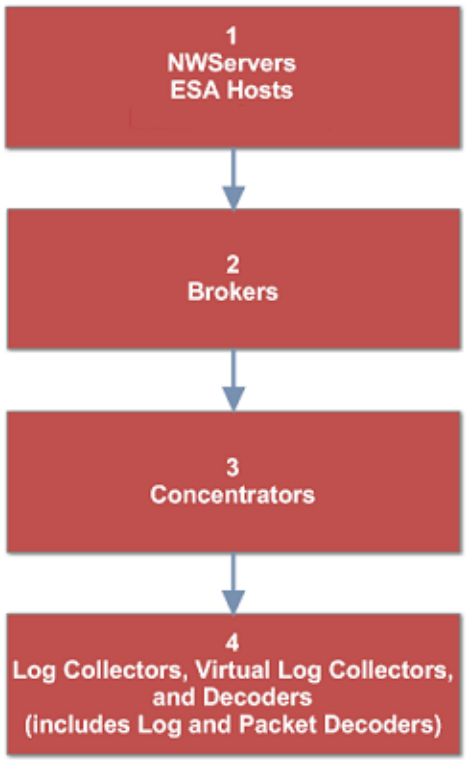
There are several scripts that you run during the backup process.You must download the zip file that contains the scripts `(nw-backup-v4.0.sh)` from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your NetWitness Servers and host systems to be backed up.
- `ssh-propagate.sh`: Automates sharing keys between the systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.

Note: The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of the hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to ensure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference and then manually editing the `all-systems` file to contain specific hosts.

To generate the `all-systems` and the `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:

   ```
   chmod u+x get-all-systems.sh
   ```

2. At the root level, run the `get-all-systems.sh` script:

   ```
   ./get-all-systems.sh <IP-Address-of-NetWitness-Admin-Server>
   ```

   You will be prompted for the password for each host system once per host.
   This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nw-backup/`.

3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.

4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up.

   Note: If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.6.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-8ea837074bd0,10.6.6.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.6.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.6.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.6.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.6.0
packetdecoder,my-nw-packetdecoder,10.0.0.7,a8f2f574-3dd0-4b65-9cf7-
d8141b78a192,10.6.6.0
vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.6.0
broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-c56ccfb0f737,10.6.6.0
```

And here is an example of an `all-systems` file based on the `all-systems-master-copy` file that could be used in the first backup session:

```
saserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.6.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.6.0
malwareanalysis,my-nw-malwareanalysis,10.0.0.6,2edc9585-7081-48c3-8f8c-
e0d02aa0a2fd,10.6.6.0
```

Troubleshooting Information

- Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location.

  Follow these recommendations:

  - Do not edit the `all-systems-master-copy` file.
  - If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure to remove pre-existing entries from the file so that the file contains only those hosts that are currently being backed up.

    For more information, see Post Backup Tasks.

- If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.
- The `get-all-systems.sh` script generates a list of hosts that were defined in the NetWitness Platform user interface. Ensure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to NetWitness Platform, you use the NetWitness Platform user interface to ensure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.

- At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the NetWitness Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence of those systems, that their services are all running, and that they are properly communicating with the NetWitness Server. (Any Windows Legacy Collectors or AWS Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)
- If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the man page for `ssh-agent`.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:

   ```
   chmod u+x ssh-propagate.sh
   ```

2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:

   ```
   ssh-propagate.sh <path-to-all-systems-file>
   ```

3. You are prompted for the password once per host, but you will not need to enter it repeatedly later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types:

1. On the NetWitness Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.2.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the NetWitness Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   ```
   openssl x509 -inform der -in certificate.cer -out certificate.pem
   ```
   Convert a PEM file to DER
   ```
   openssl x509 -outform der -in certificate.pem -out certificate.der
   ```
   Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)
   ```
   openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in
   certificate.crt -certfile CACert.crt
   ```
   Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM
   ```
   openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes
   ```

> **Note:** Add the following qualifier to the command string to:
> `-nocerts` convert private keys exclusively.
> `-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For Decoder, Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Decoder, Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to Appendix B. Stopping and Restarting Data Capture and Aggregation

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

> **Caution:** This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after upgrade.
- If you set the password for `logcollector` user for RabbitMQ , you must know the password so you can set it again after the upgrade.

Prepare LCs and VLCs for Upgrade

1. SSH to the Log Collector.
2. Submit the following command string.

   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```

   This command:

   - Stops the Puppet Agent service.
   - Disables the file collection accounts (“sftp” and all users in the group “upload”) used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgrade to 11.2.0.0.
   - Stops all the collection protocols in the Log Collector service.
   - Saves the list of Plugin accounts and RabbitMQ accounts.
   - Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.

- Waits until the Log Collector queues are empty.
- Stops the Log Collector service.
- Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting

For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint: List RabbitMQ Usernames and Passwords

On the 10.6.6.x host, on the NetWitness Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.2.0.0 upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to *Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL* in Post Upgrade Tasks.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The event source documentation contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in `/root/vsftpd/` directory in 10.6.6.x, this material area will be backed up and restored. **If the material was in another location, you must back it up and restore it**

manually.

- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.6.x, it is backed up and restored.

Task 5 - Check for Adequate Space for the Backup

You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to ensure that you provide adequate space for the backup so that the backup captures all your data.

To check for adequate disk space:

1. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
2. Run the following command at the root directory level:
   `./nw-backup.sh -t`
   The output displays the amount of disk space that is required for the backup.

> **Note:** The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the `-d` option by using `-D`. Using the `-D` option will show how much space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the `-D` option will throw an error. If you want to know how much space is available on the target host, you must run the `df -h` command on the host.

The following figure shows an example of the output from using the `-t` option.

```
********** NW-BACKUP SCRIPT - TEST MODE **********
* *  RSA nw-backup script is running in test mode where in it will only verify the disk space required for successful backup.

--------------------------------------------------------------------------------
CONTENT options currently selected:

Backup Storage Space...     [ OK ]
Total Execution Time : 0 d 0 h 0 m 19 s

Disk space check test completed with no errors.
[root@lab-cos6-RF ~]#
```

Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the `nw-backup.sh` script using the `-u` option. This option is required for upgrading to 11.2.0.0.

Note: The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage:
`./nw-backup.sh [-u -t -d -D -l -x -e] <external-mnt> -b <backup file path>`

General Options

`-u : This option is required for upgrading to 11.2. Enables the upgrade flag to run backup for upgrading to 11.2. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)`

`-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)`

`-D : enables disk space check in 'full' mode (estimate of space using compressed data, ~10X slower). Default: (no)`

`-l : stores backup content locally on each host (automatically set if -u is used). Default: (no)`

`-e <path to mount point> : copies backup files of all devices onto an external mount point. Default: (/mnt/external_backup)`

`-x : move all backup files to an external mount point. Default: (no) - COPY`

`-b <path to write backups> : path to the location for storing backup files on a backup server.` **`For upgrading to 11.2, please use the default location!`** `Default: (/var/netwitness/database/nw-backup)`

Note: Do **not** change the backup path in upgrade (-u) mode.

Advanced Content Selection Options

`-c : back up Colocated Malware Analysis on SA servers. Default: (no)`

`-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)`

`-m : back up Malware Analysis File Repository. Default: (no)`

`-r : back up Reporting Engine Report Repository (automatically set if -u is used). Default: (no)`

`-v : back up system logs (/var/log). Default: (no)`

`-y : back up YUM Web Server & RPM Repository. Default: (no)`

`-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)`

`-C : If set: DISABLES back up of Context-Hub configuration and database. Default: (not-set)`

`-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)`

Test Options

```
 -t : performs script test run for disk space check only. Services are not
stopped and excludes execution of backup. Can be combined with (-d) or (-D)
and other flags. Default: (-t)
```

For example, the command:
`./nw-backup.sh`
would run the backup with options as set in the Header of the script itself.
OR, the command:
`./nw-backup.sh -ue /mnt/external_backup`
would run a normal backup using the backup path defined in the script, with the following options:

```
-u : enables the upgrade flag to run backup for upgrading to 11.2. It also
enables disk space check (-d), backing up reporting engine reports (-r) and
stores backup content locally (-l). Default: (no)
```

```
-e : Copy the backup files to external mount point, mounted on /mnt/external_
backup
```

```
For Help: ./nw-backup.sh -h
```

When you run the script, the following text is displayed at the top of the script:

Caution: `RSA nw-backup script backs up configuration files, data, and logs on the options provided in the script. It tars the content, with options to store the backup files on the backup server, move or copy them to external storage on a mount point (USB/NFS/SMB), or SCP them back to the target host. This backup script has been qualified on the following versions of Security Analytics:`
`10.6.6.x`
`Use of this script on any other versions of the product may not give expected results and may not be supported by RSA Customer Service.Note: All non-RSA custom files, scripts, Cronjobs and other important files should be placed in /root, /home/'user', OR /etc to be included in the backup.`

To run the backup script to back up your hosts:

1. Ensure that the `all-systems` file contains only the hosts to back up. For information, see Task 2 - Create a List of Hosts to Back up.
2. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
3. Begin the backup process by running the following command at the root directory level:
   `./nw-backup.sh -u <additional options as needed>`

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.2.0.0.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   `rsa-nw-backup-2017-03-15.log`
4. When the backup has completed, to ensure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:
   `tar -tzvf hostname-ip-address-backup.tar.gz`
   The following archive files are created:
   For all hosts:
   `<hostname-IPaddress>-root.tar.gz`

<hostname-IPaddress>-backup.tar.gz
tar checksum files
<hostname-IPaddress>-network.info.txt
For NetWitness Servers:
<hostname-IPaddress>-root.tar.gz
<hostname-IPaddress>-backup.tar.gz
<hostname-IPaddress>-mongodb.tar.gz
tar checksum files
<hostname-IPaddress>-network.info.txt
For ESA Hosts:
<hostname-IPaddress>-root.tar.gz
<hostname-IPaddress>-backup.tar.gz
<hostname-IPaddress>-mongodb.tar.gz
<hostname-IPaddress>-controldata-mongodb.tar.gz
tar checksum files
<hostname-IPaddress>-network.info.txt

The archived files are located in the /var/netwitness/database/nw-backup directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the all-systems File and the Backup Tar files

Make copies of the all-systems file, the all-systems-master-copy file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the NetWitness Server (specifically the Admin service) to 11.2.0.0.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.2.0.0 upgrade process. Before you begin the upgrade process, you must ensure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- all-systems
- all-systems-master-copy
- appliance_info
- service_info
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz

- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`

In addition to the files listed above, the following files will be generated on NetWitness Server and ESA hosts:

- *<hostname>-<host IP address>*-mongodb.tar.gz
- *<hostname>-<host IP address>*-mongodb.tar.gz.sha256

The backup script will also generate the following `controldata-mongodb.tar.gz` files.

Note: The backup script copies the following files from all ESA hosts to the NetWitness Server host's backup path .

- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz`
- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256`

Task 3 - (Conditional) For Multiple ESA Hosts, Copy `mongodb tar` files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the `/opt/rsa/database/nw-backup/` directory on the Primary ESA host system (the host that has the ContextHub service running on it) :

- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.2.0.0, ensure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

There should be note here mentioning default backup path locations for that user knows where to go and check these files.

Note: The default paths for backup files are:
- NetWitness Server hosts:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`
- Malware hosts: `/var/lib/rsamalware/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`

- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt
- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256
- <esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz
- <esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256

Required Files for ESA Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt
- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Required Files for All Other Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

Note: The following files are located in the <hostname>-<host-IP-address>-backup.tar.gz tar on all hosts:
appliance_info
service_info

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
`BUPATH=/opt/rsa/database/nw-backup` for the ESA Correlation Engine
`BUPATH=/var/lib/rsamalware/nw-backup` for the Malware Service
`BUPATH=/var/netwitness/database/nw-backup` for all other services
Restore locations:
`BUPATH/restore/etc/sysconfig` for Iptable rules
`BUPATH/restore/etc/sysconfig` for NAT configurations
`BUPATH/restore/etc` for Crontab entries
`BUPATH/restore/etc` for User Accounts (users are located in the `passwd` file, and groups are located in the `group` file. These are not restored during the upgrade process but can be restored manually.
`BUPATH/restore/etc/ntp.conf` for NTP configurations (must be restored using the NetWitness Platform UI)

Migrate Disk Drives from 10.6.6.x to 11.2

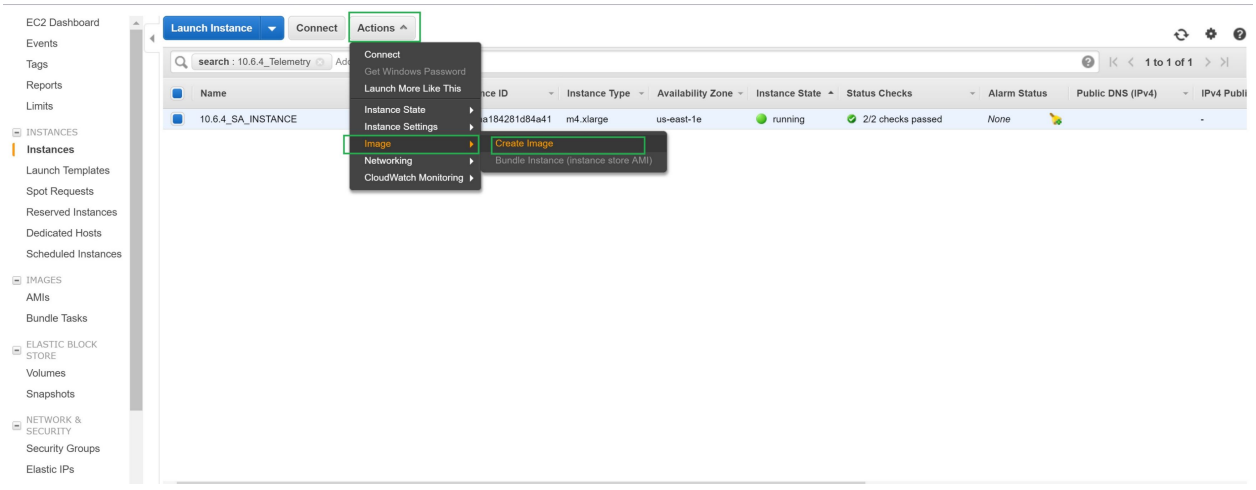
These instructions tell you how to upgrade virtual hosts from 10.6.6.x to 11.2.

Caution: 1.) Run the backup immediately before you upgrade hosts for each phase so that the data is not out-dated.
2.) This guide applies to AWS host upgrades exclusively. If have physical and virtual hosts in your deployment, see the *RSA NetWitness® Platform 11.0 Physical Host Upgrade Instructions* for the steps you must complete to upgrade physical hosts. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

There are five tasks you must complete to migrate from 10.6.6.x to 11.2:

Task 1 - Backup the 10.6.6.x EC2 appliance

Select the 10.6.6.x EC2 Instance and navigate to Actions. Click Image and then select Create Image.



(Optional)Task 2 - Run the backup script to take backup data of 10.6.6.x instance

Note: If you have not taken a backup of the 10.6.6.x instance, follow these steps, otherwise skip to Task 3 - Stop the instances and detach volumes from 10.6.6.x instances.

If the stack contains Log Collector then prepare **Log Collector** for the migration:

1. Navigate to `/opt/rsa/nwlogcollector/nwtools/` and run the below command:

```
sh prepare-for-migrate.sh --prepare
```

2. Download backup scripts from GitHub: https://github.rsa.lab.emc.com/asoc/nw-backup (maintenance-11.0) and place it anywhere in a computer running an RPM-based Linux distribution (RHEL or CentOS for example) with a large amount of free hard drive space. In many cases the SA server will suffice. Now, navigate to `scripts` directory inside '`nw-backup-master`' and run the following commands:

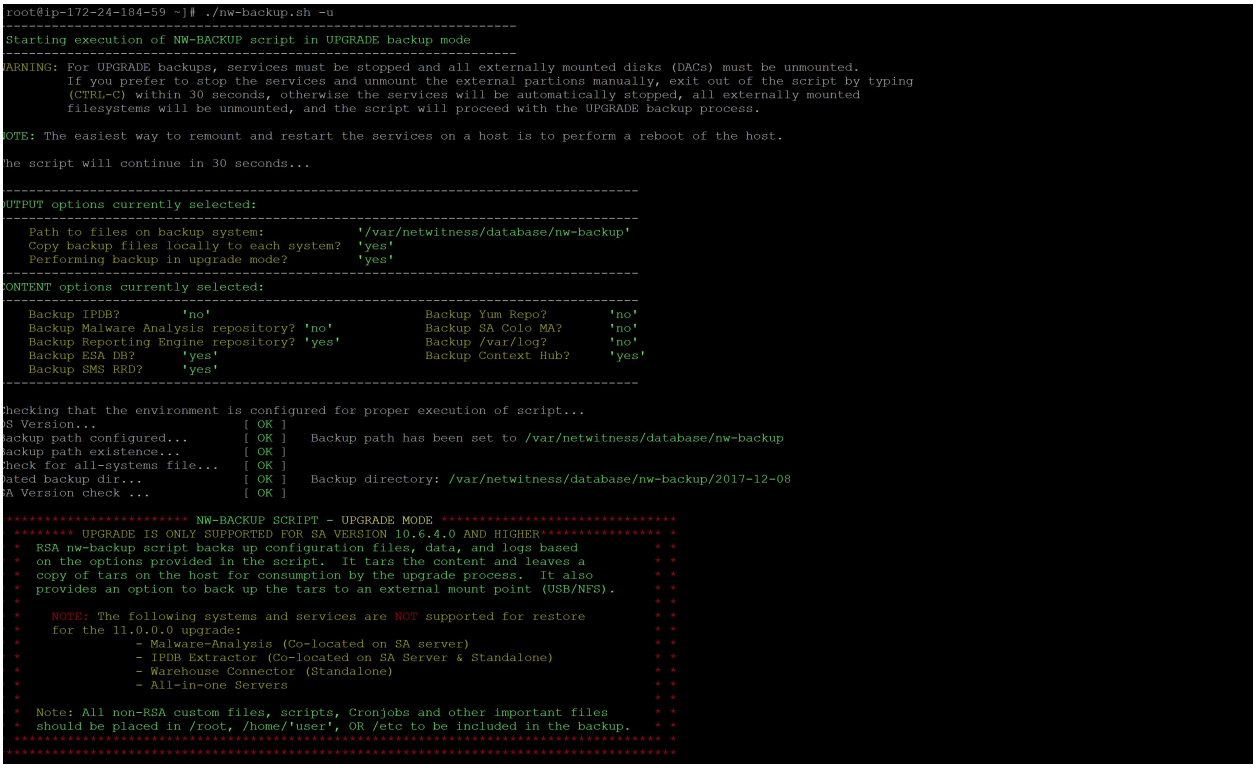
```
./get-all-systems.sh <SA server-IP>
```

```
./ssh-propagate.sh <path-to-backup-directory/all-systems>
```

```
./nw-backup.sh -u
```

Its safe to copy a backup of the tar balls created at `/var/netwitness/database`, in some safe location (not mandatory).

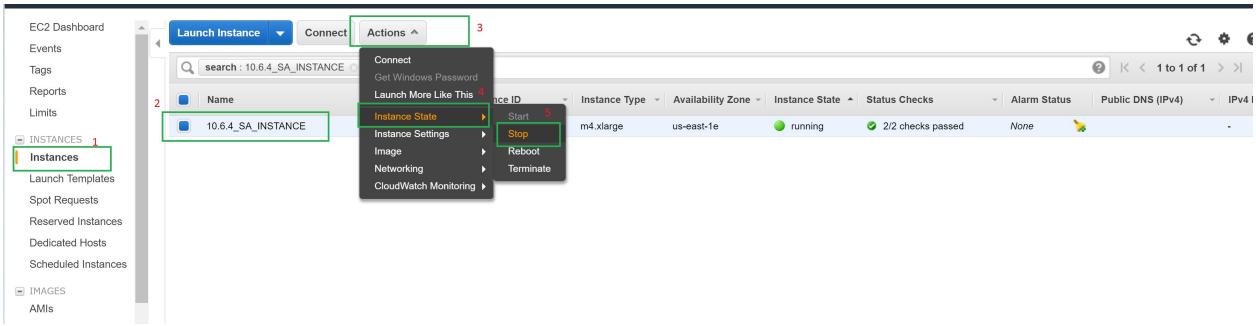
Before starting the restore process, if you have ESA deployment then copy the files `<hostname>-<IP>-controldata-mongodb.tar.gz` & `<hostname>-<IP>-controldata-mongodb.tar.gz.sha256` from the location `/opt/rsa/database/nw-backup` of ESA VM to `/var/netwitness/database/nw-backup/` of SA VM.



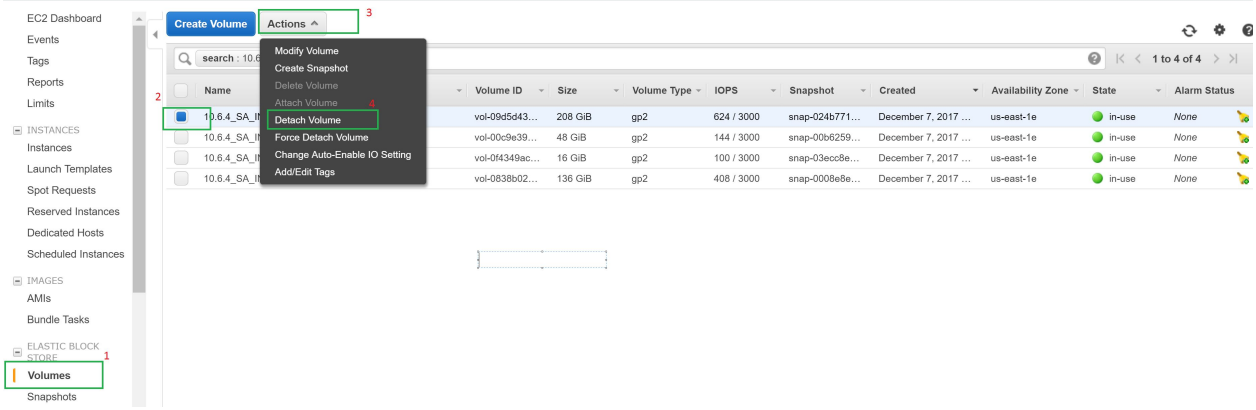
Task 3 - Stop the instances and detach volumes from 10.6.6.x instances

Note: If detach fails, do a forced detach on the volume.

Select the 10.6.6.x EC2 instance and navigate to Actions and then click Stop.



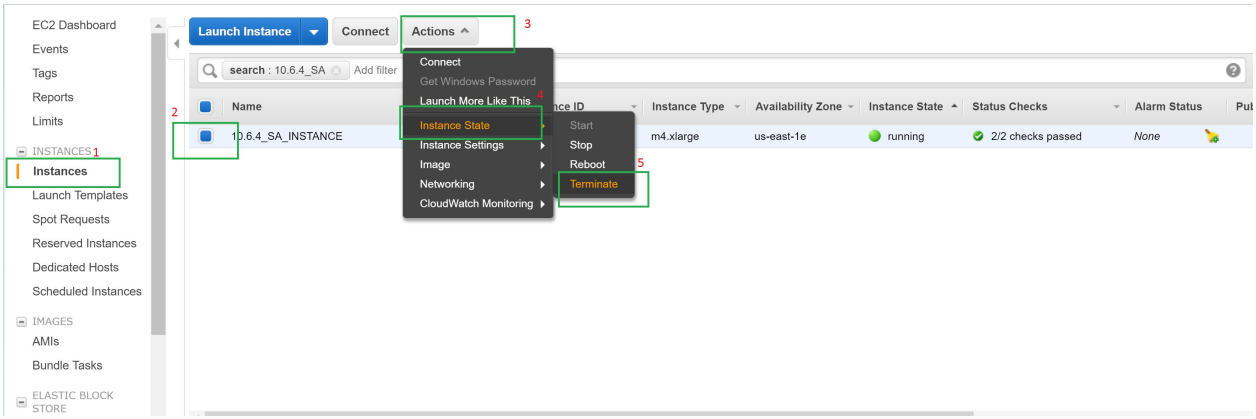
Click on Volumes and then select the 10.6.6.x instance volumes to detach Actions and then select Detach Volume.



Task 4 - Note the IP addresses of 10.6.6.x instances and then terminate the EC2 instances

Note: Termination is required to free the IP address.

1. Click on Instances and then select the Instance.
2. Click Actions and navigate to Instance State.
3. Click Terminate

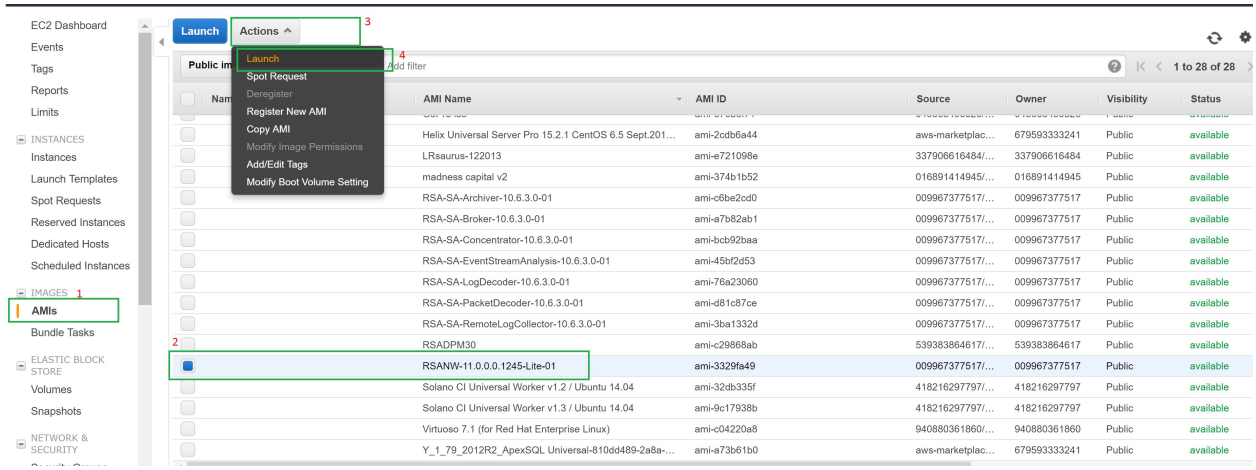


Task 5 - (IP retention) Create 11.2 instances using 11.2 AMI.

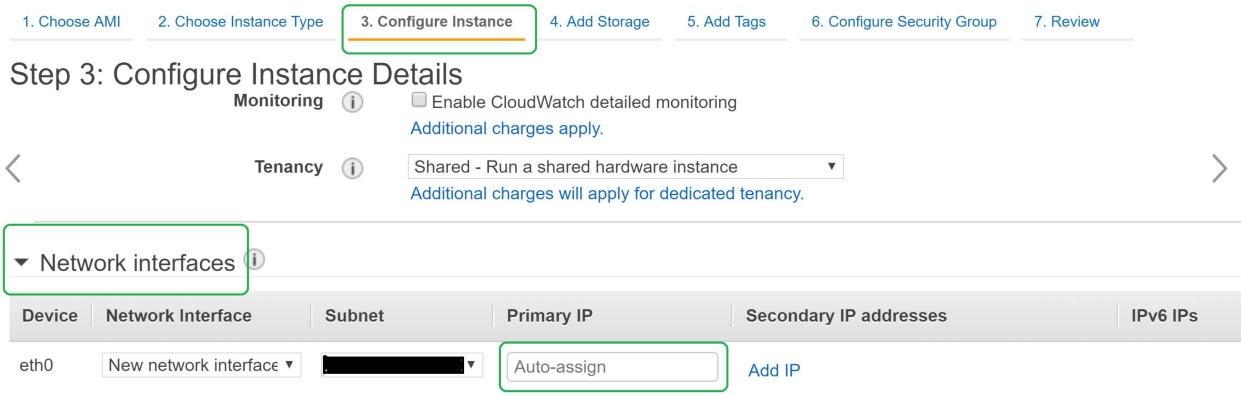
1. During the creation of EC2 instance, provide the IP address from task4. Click on AMIs and select 11.0 AMI.

Note: Refer to the *AWS Deployment Guide for version 11.0* for installing RSA NetWitness Platform11.0.0.0

2. Click Actions and then click Launch.



3. Assign the retained IP for the appropriate instances (IP retention). For example, If 10.6.1.xSA instance IP is 172.24.184.63 . Then assign the same IP(172.24.184.63) for 11.2 Instance.



Note: To deploy components other than NW, select the image(RSANW-11.0.0.0.1245-Lite-01) which is available under community AMIs section.

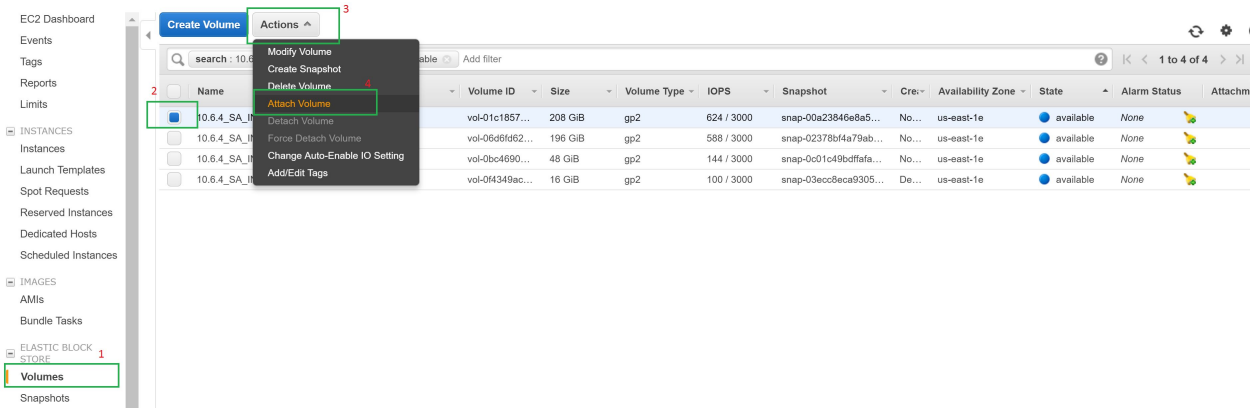
Task 6 - Attach volumes to the corresponding 11.2 instance

After NW 11.2 instance is deployed, stop the 11.0 instance and attach the available 10.6.1.x volumes (except the 'OS disk') to 11.2 instances.

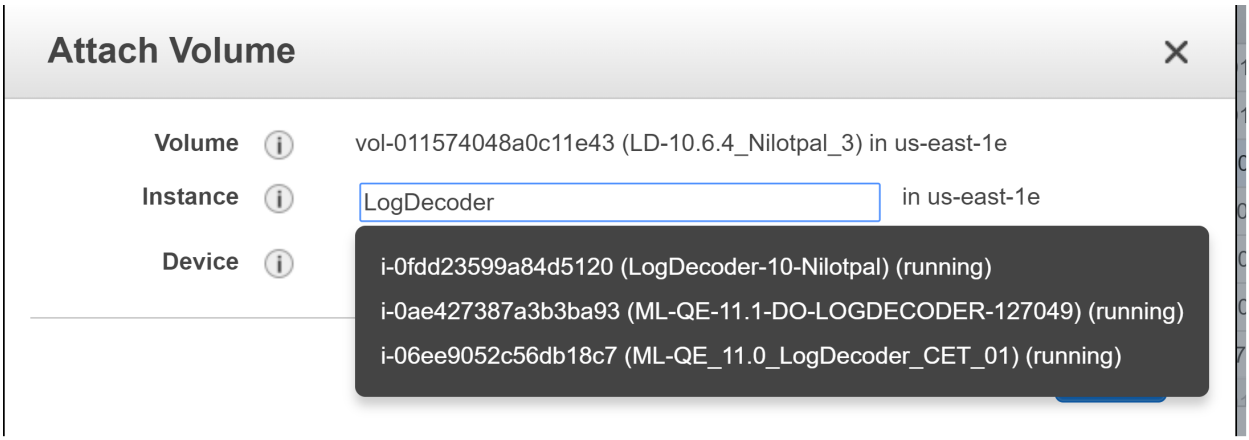
1. Click on Volumes.

2. Select the 10.6.6.x instance volume to attach.

3. Click Actions and then select Attach Volume.



4. Enter the 11.2 instance ID to which the volume has to be attached.



5. Power ON all the 11.2 instances once all the disks are attached.

Task 7 - Restore backup data in 10.6.6.x to 11.2 Instances (Data Restoration)

Execute the following steps for copying the backup data on SA, LD/LC, PD, Concentrator, Archiver, Broker:

1. Create a directory under `/tmp/` by the name `nwhome`.
2. Mount `VolGroup00-nwhome` on `/tmp/nwhome/` and make sure `/var/netwitness/database/` directory is present.

```
mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

3. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`.
4. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`

```
umount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

Follow these steps for **ESA**:

1. Create a directory under `/tmp/` by the name `apps`.
2. Mount `VolGroup01-apps` temporarily on `/tmp/apps/`

```
mount /dev/mapper/VolGroup01-apps /tmp/apps/
```

3. Copy nw-backup directory from here to `/var/netwitness`

```
cp -r /tmp/apps/database/nw-backup /var/netwitness
```

4. Unmount VolGroup01-apps from `/tmp/apps/`

```
umount /tmp/apps
```

5. Add the following entries in `/etc/fstab` for `mounts`:(Disk Mounting) and then run mount `-a`

For SA:

```
/dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/ xfs
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup02-redb /var/netwitness/database/ xfs
defaults,noatime,nosuid 1 2
```

For LogDecoder/LogCollector:

```
/dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder ext4
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index xfs
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb xfs
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb xfs
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb xfs
defaults,noatime,nosuid 1 2
```

For PacketDecoder:

```
dev/mapper/VolGroup01-decoroot /var/netwitness/decoder ext4
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-sessiondb /var/netwitness/decoder/sessiondb xfs
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-index /var/netwitness/decoder/index xfs
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-metadb /var/netwitness/decoder/metadb xfs
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-packetdb /var/netwitness/decoder/packetdb xfs
defaults,noatime,nosuid 1 2
```

For Concentrator:

```
/dev/mapper/VolGroup01-concroot /var/netwitness/concentrator ext4
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-sessiondb /var/netwitness/concentrator/sessiondb xfs
defaults,nosuid,noatime 1 2

/dev/mapper/VolGroup01-index /var/netwitness/concentrator/index xfs
defaults,noatime,nosuid 1 2

/dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb xfs
defaults,noatime,nosuid 1 2
```

For Archiver:

```
/dev/mapper/VolGroup01-archiver /var/netwitness/archiver xfs
defaults,nosuid,noatime 1 2

/dev/mapper/VolGroup02-workbench /var/netwitness/workbench xfs
defaults,nosuid,noatime 1 2
```

For Broker:

```
/dev/mapper/VolGroup01-broker /var/netwitness/broker xfs
defaults,nosuid,noatime 1 2
```

6. Then run mount command
   `mount -a`

Task 8 Run nwsetup-tui script.

Note: Please provide appropriate host names for all the 11.2 instances after launching. (for 10.6.6.x instance names refer all-systems-master-copy file, which contains 10.6.6.x instance names with IP address)

Execute the command to set the hostname: `hostnamectl set-hostname <hostname>`

Login to SA Sever CLI and run `nwsetup-tui` script for rest of the process completion.

Run 'nwsetup-cli' on rest of the components for Bootstrap and Orchestration. For more information, refer to the Set Up Virtual Hosts in 11.2 section.

Set Up Virtual Hosts in 11.2

There two phases to set up your 11.2 virtual stack that you must complete in the order shown.

- Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.5 and they will not be available until the warm up completes.

- Phase 2 - Set Up The Rest of the Component Hosts

Phase 1 - Set Up NW Server, Event Stream Analysis, Malware Analysis, and Broker or Concentrator Hosts

Task 1 - Set Up 11.2 NetWitness Server

Follow the instructions under Set Up 11.2 NW Server Host.

Task 2 - Setup 11.2 ESA

Caution: If you had C2 modules enabled in 10.6.4.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.0 and they will not be available until the warm up completes.

Follow the instructions under Set Up 11.2 Non-NW Server Host to set up your ESA hosts.

1. Set up your primary ESA host through the Setup program and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, set it up through the Setup program and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Set Up 11.2 Malware Analysis

Follow the instructions under Set Up 11.2 Non-NW Server Host.

Task 4 - Set Up 11.2 Broker or Concentrator

Follow the instructions under Set Up 11.0 Non-NW Server Host.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.2 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Set Up The Rest of the Component Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Decoder and Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Set Up 11.2 Non-NW Server Host.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in the *Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh* in the **Backup Instructions**.
2. Stop data capture on the Log Decoder.
3. Complete the steps in Set Up 11.2 Non-NW Server Host.
4. Restart data capture on Log Decoder.

   Note: After you upgrade, you will restart log collection after completing the Task 11 - Reset Stable System Values for Log Collector after Upgrade in the **Post Upgrade Tasks**

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described in the *Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh*.
2. Back up your 10.6.6.x VLC by editing the `all-systems` file on host where you performed the backup.

   a. Make sure your `all-systems` file contents has this information before you perform this step.
   `vlc,<host-name>,<IP-address>,<UUID>,10.6.6.0`

   b. Run the following command to create backup.
   `./nw-backup.sh -u`
   See Backup Instructions for detailed procedures on how to back up the host.

3. Make sure the backup host contains the VLC backup in the following format.
   `<hostname>-<IPaddress>-root.tar.gz`
   `<hostname>-<IPaddress>-root.tar.gz.sha256`
   `<hostname>-<IPaddress>-backup.tar.gz`
   `<hostname>-<IPaddress>-backup.tar.gz.sha256`

`<hostname-IPaddress>-network.info.txt`
`all-systems-master-copy`

4. Power off the 10.6.6.x VLC so that a new 11.2 VM can be created with the same network configuration.
5. Deploy a fresh Non-NW Server host using the 11.0 NetWitness Platform ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.6.x VLC.
   This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.6.x VLC backup file.

   Note: Make sure IPv6 is disabled.

   a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings.
      Contents of `ifcfg-eth0` should be as follows.
      ```
      TYPE=Ethernet
      DEFROUTE=yes
      NAME=eth0
      UUID=<uuid>
      DEVICE=eth0
      DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
      DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
      BOOTPROTO=static
      IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
      NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
      GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
      NM_CONTROLLED=no
      ONBOOT=yes
      ```
   b. Submit the following command string.
      ```
      systemctl restart network.service
      ```
8. Create the backup directory.
   ```
   # mkdir -p /var/netwitness/database/nw-backup/
   ```
9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new VLC in the `/var/netwitness/database/nw-backup` directory.
10. Complete the steps 2 through 12 inclusive in Set Up 11.2 Non-SA Server Host for the rest of the NetWitness Platform components . Make sure that you select **Log Collector** for the service in step 12.

Set Up 11.2 NW Server Host

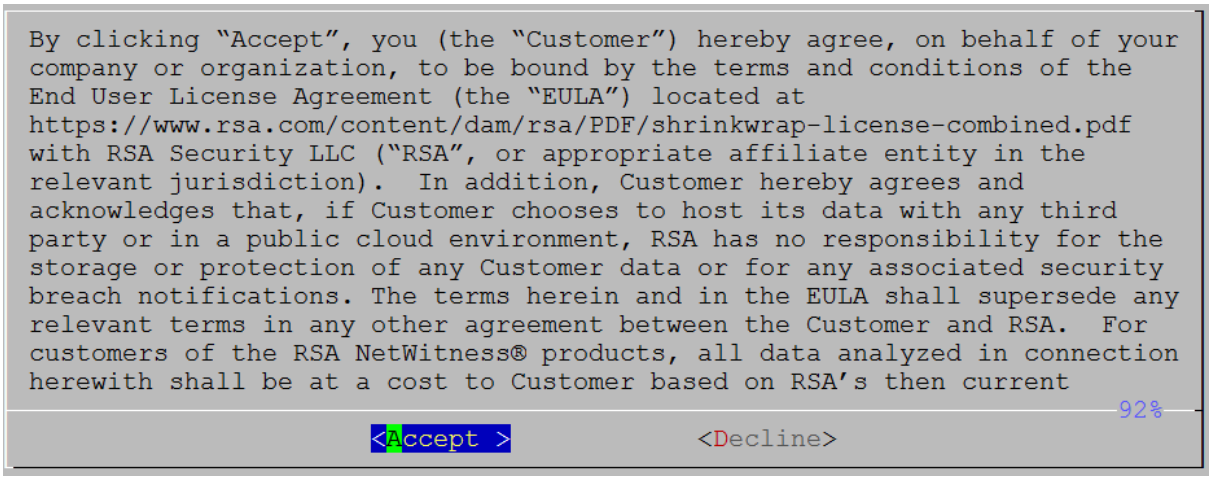
Make sure that you have backed up 10.6.6.x data for the SA Server host. **You must follow the instructions in Backup Instructions to back up the host.**

Caution: Run the backup immediately before upgrading the SA Server to 11.2 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.2.

Complete the following steps to set up the 11.2 NW Server host.

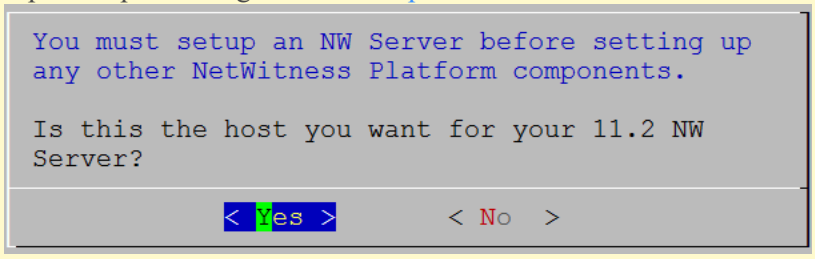
1. Power on the NW Server VM and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

   Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press the Enter key to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use access the host.

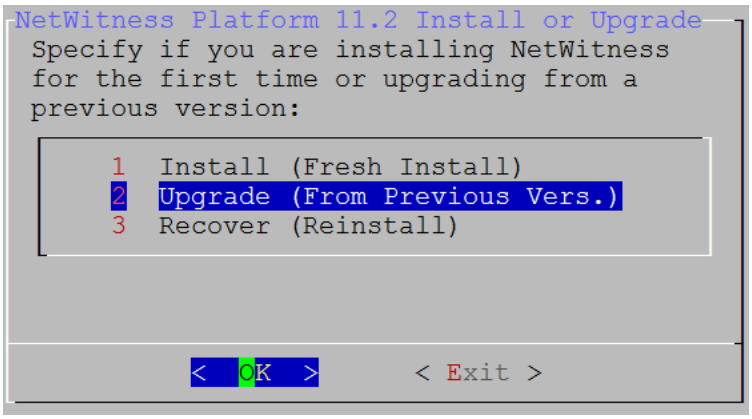
   


2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

   Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.2 NW Server Host to correct this error.

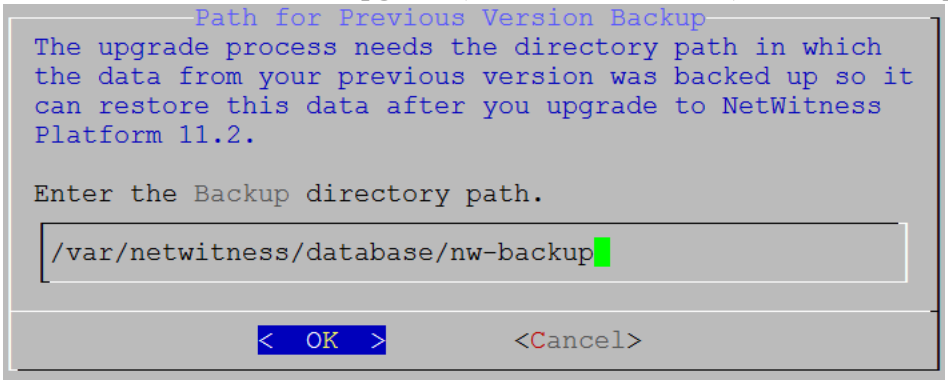
3. Tab to **Yes** and press **Enter**.
   Choose No if you already upgraded the NW Server to 11.2.
   The Install or Upgrade prompt is displayed.



The backup path is displayed.

Caution: The backup path in the following prompt must be the same as the path in which your backup is stored. For example, the backup script assigns **/var/netwitness/database/nw-backup** as the default path. If you used the default backup path during backup and did not change it subsequently, you must keep **/var/netwitness/database/nw-backup** as the path in the following prompt.

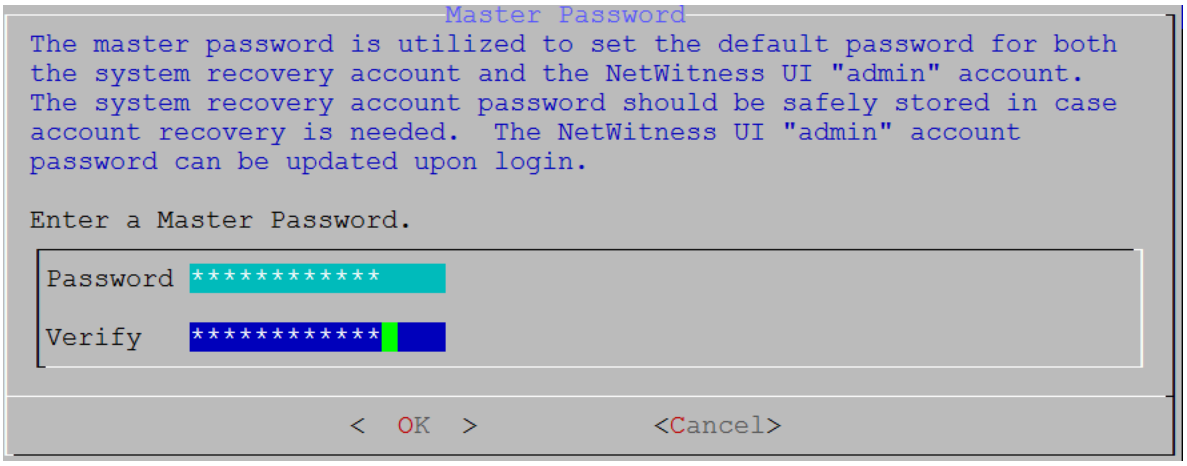
4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.



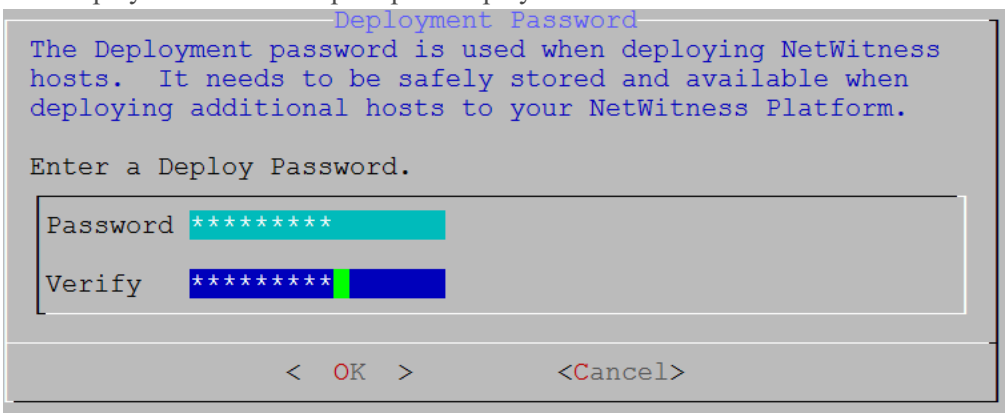
5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Master Password prompt is displayed.
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols : ! @ # % ^ + ,
   - Numbers :0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

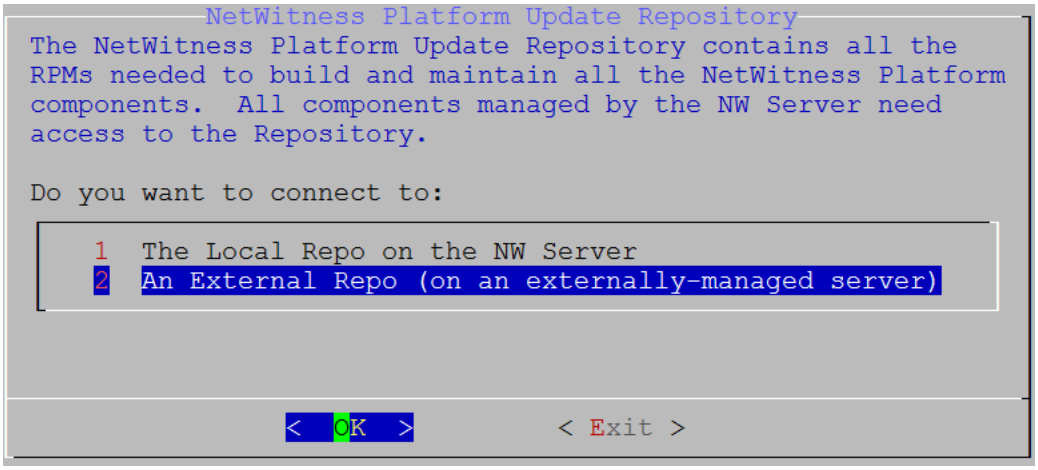
   No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ ; : . < > -.



6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The Deployment Password prompt is displayed.

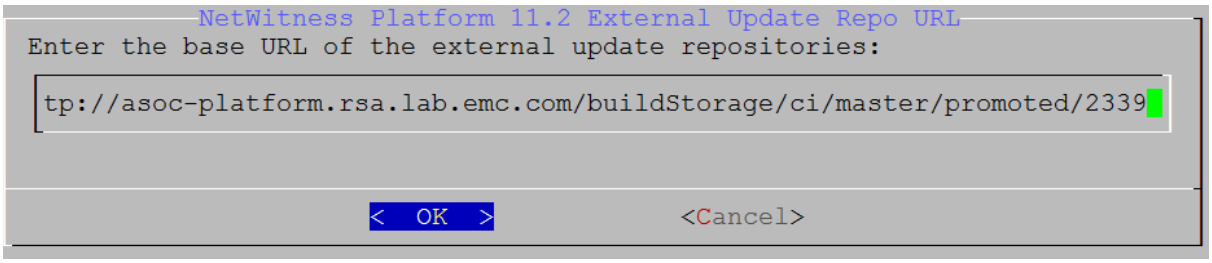


7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The Update Repo prompt is displayed.



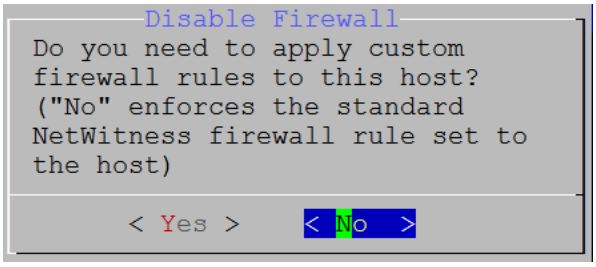
You must use the same repo that you used for the NW Server hosts for all hosts.

8. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL.



See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *Hosts and Services Getting Started Guide for Version 11.2* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

9. Enter the base URL of the NetWitness Platform external repo and click **OK**.
   The disable or use standard firewall configuration prompt is displayed.

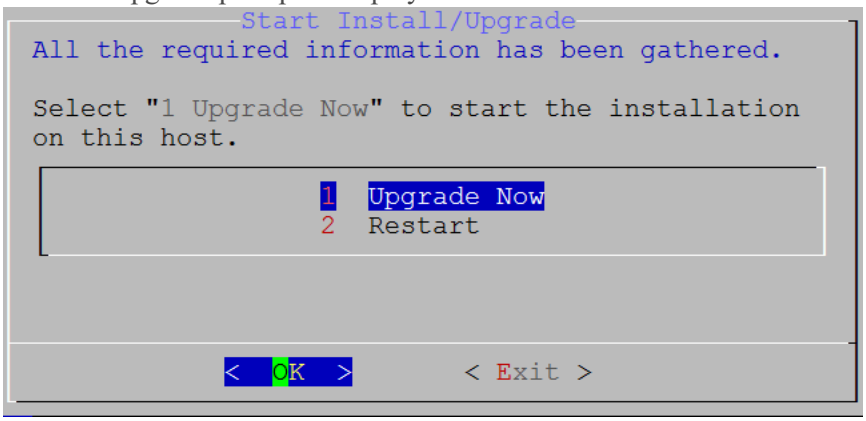


10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

    - If you select Yes, confirm your selection.

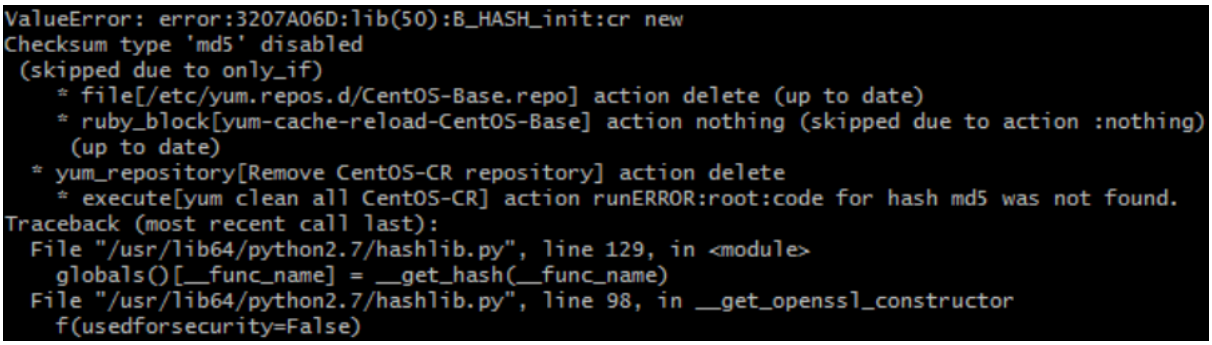
    - If you select No, the standard firewall configuration is applied.

    The start upgrade prompt is displayed.



11. Select 1 **Upgrade Now**, tab to **OK**, and press Enter.
    When "Installation complete" is displayed, you have upgraded the 10.6.6.x SA Server to the 11.2 NW Server.

    Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



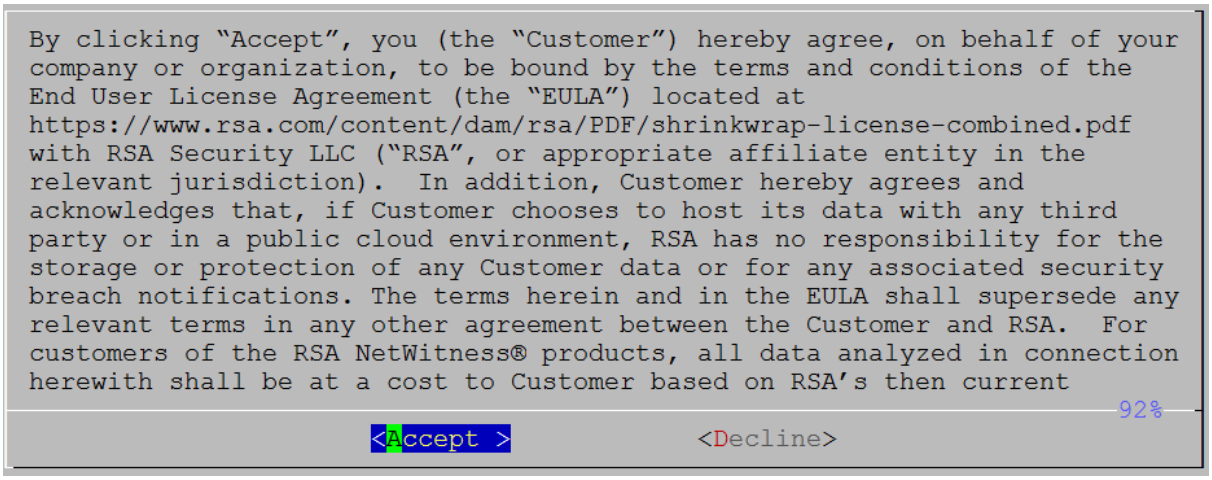
Set Up 11.2 Non-NW Server Host

Make sure that you Back up your 10.6.6.x data for the host. You must follow the instructions in Backup Instructions to back up the host.

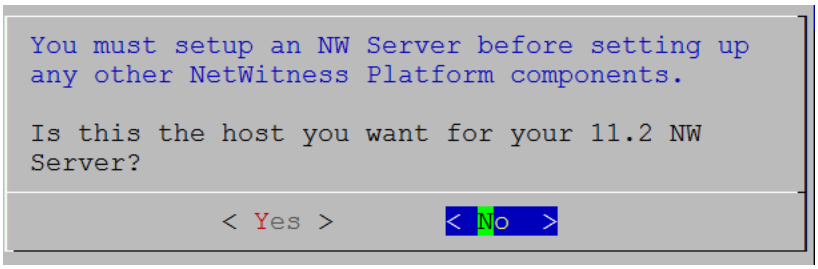
Caution: Run the backup immediately before upgrading the host to 11.2 so that the data is as recent as possible.

Complete the following steps to set up an 11.2 Non-NW Server host.

1. **Power On** the non-NW Server VM and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

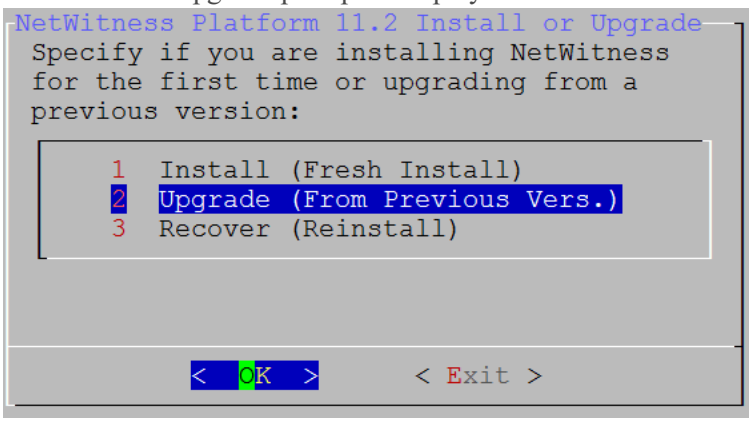


2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

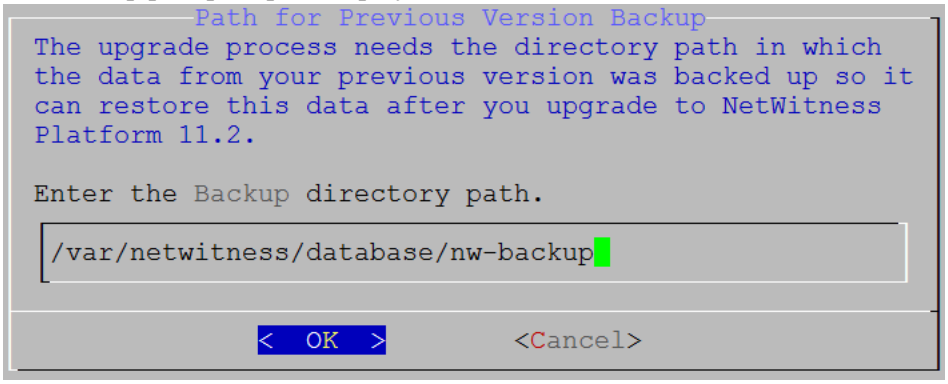


Caution: If you choose the wrong the host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.2 NW Server Host to correct this error.

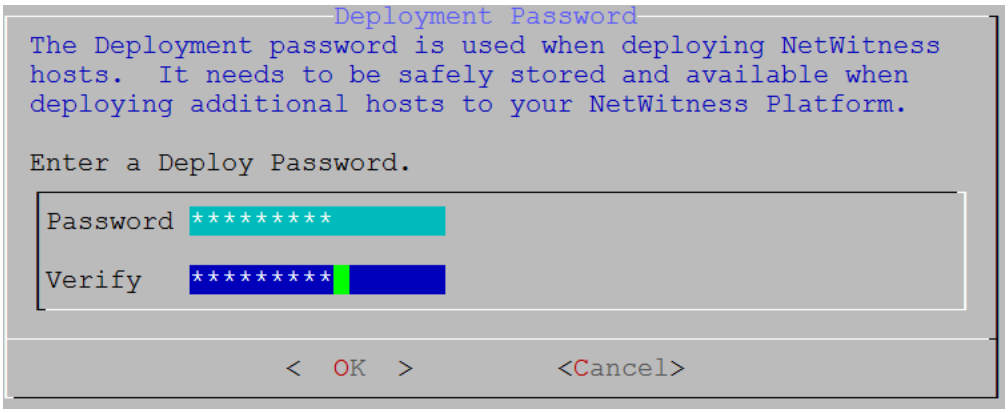
3. Tab to **No** and press **Enter**.
   The Install or Upgrade prompt is displayed.



4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.
   The backup path prompt is displayed.

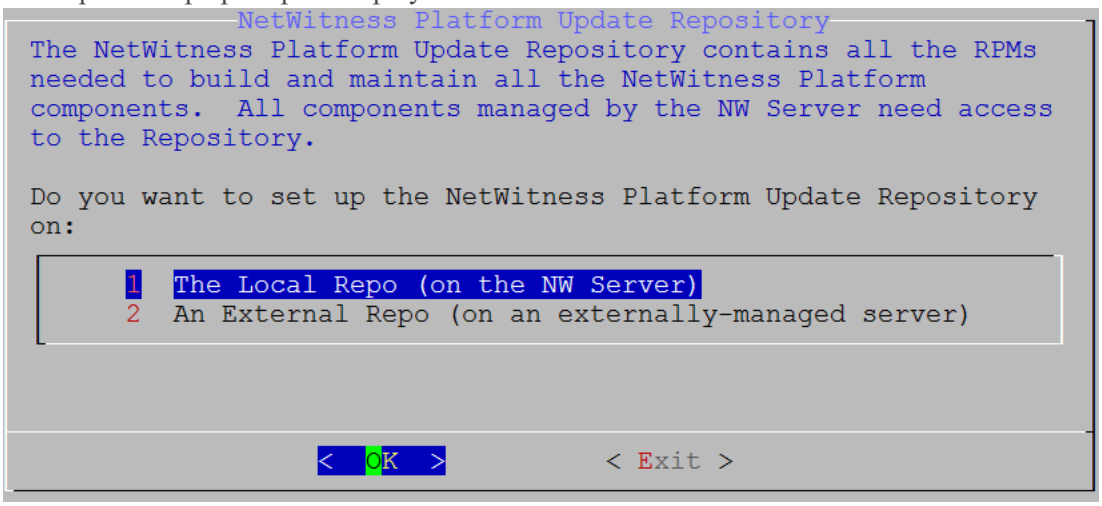


5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Deployment Password prompt is displayed.

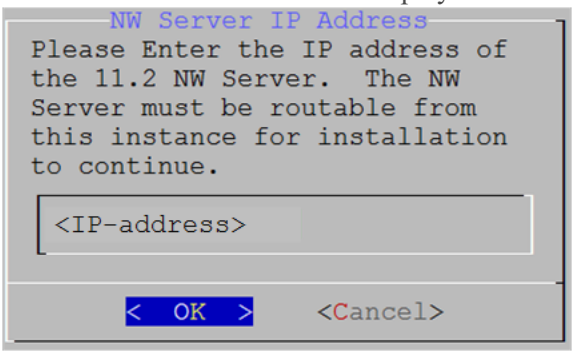


Note: You must use the same deployment password that you used when you upgraded the NW Server.

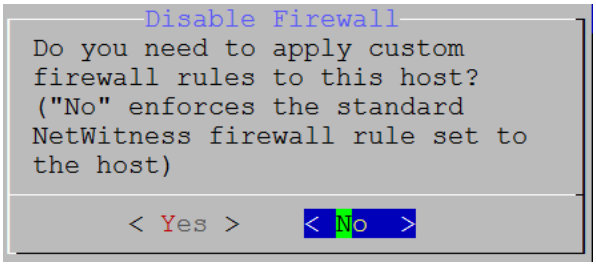
6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The Update Repo prompt is displayed.



7. Use the down and up arrows to select **1 The Local Repo on the NW Server**, tab to **OK**, and press **Enter**.
8. The NW Server IP Address is displayed.



9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.
   The disable or use standard firewall configuration prompt is displayed.

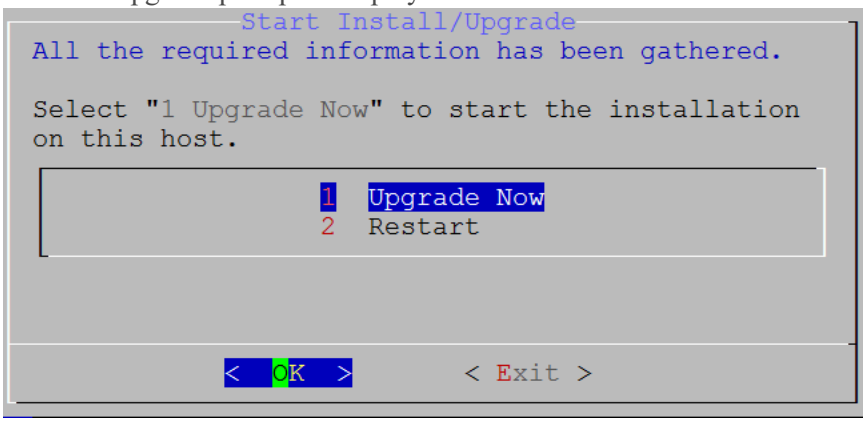


10. Tab to **No**, and press Enter to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

    - If you select **Yes**, confirm your selection.

    - If you select **No**, the standard firewall configuration is applied.

    The start upgrade prompt is displayed.



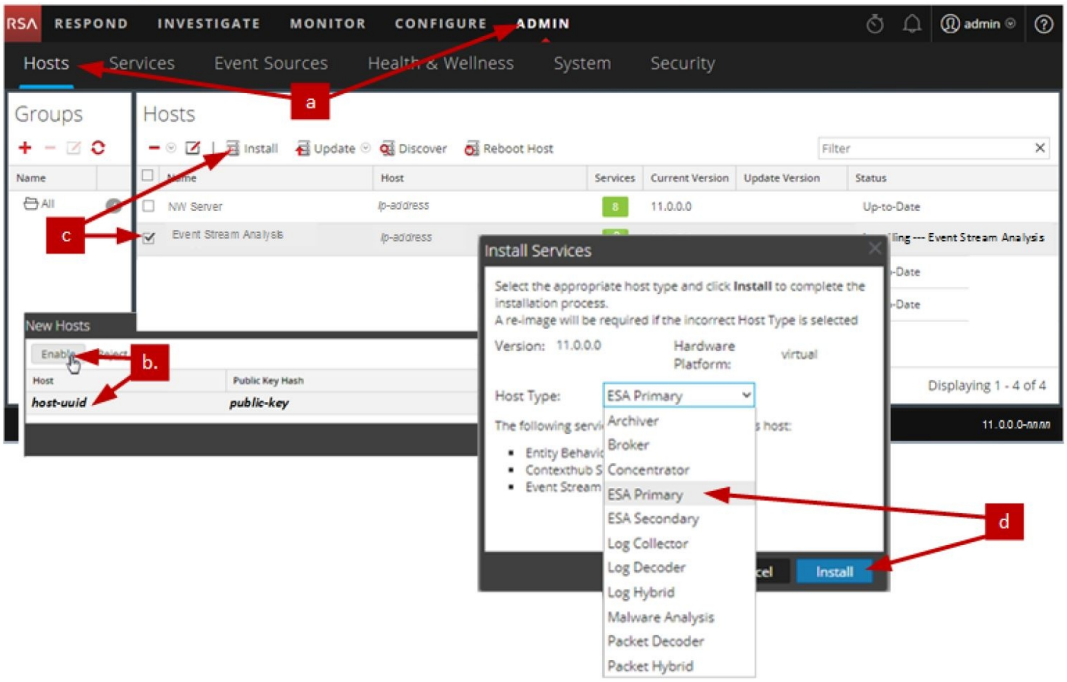
11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.
    When "Installation complete" is displayed, you have upgraded the host to the 11.2.

Once 'nwsetup-cli' script ran successfully on all the components, follow the below steps to complete NW 11.2 Upgrade or Migration:

1. Log into NetWitness Platform. (Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Platform Login screen)
2. Click ADMIN > Hosts. The New Hosts dialog is displayed with the Hosts view grayed out in the background. Note: If the New Hosts dialog is not displayed, click Discover in the Hosts view toolbar.

3. Click on the host in the New Hosts dialog and click Enable. The New Hosts dialog closes and the host is displayed in the Hosts view.
4. Select that host (for example, ESA Primary) and click The Install Services dialog is displayed.

e. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness 11.2 Legacy Windows Collection Guide* on RSA Link (https://community.rsa.com/docs/DOC-75593) for details about how to install or update Legacy Windows collection.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

This topic contains the tasks you must complete after you upgrade your hosts from 10.6.6.x to 11.2. These tasks are organized by the following categories.

- Global
- NetWitness Endpoint
  RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, and 4.4 only for NetWitness Platform 11.2.
- Event Stream Analysis
- Log Collection
- Reporting Engine
- Respond
- NetWitness SecOps Manager
- Security

Global Tasks

Task 1 - Make Sure Port 15671 Is Configured Correctly

Port 15671 is new in 11.x, but you do not need to open a firewall for this port. Make sure that 15671, and all ports, are configured as shown in the "Network Architecture and Ports" topic in the *RSA NetWitness® Platform Deployment Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 2 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.2 before you remove the backup-related files from the local directories on your 11.2 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.2, you must remove:

- the backup files from the local directories on the hosts.
- all the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Malware	`/var/lib/rsamlware/nw-backup`	`/var/netwitness/malware_analytics_server/nw-backup/restore`

Host	Backup Path	Restore Path
Event Stream Analysis	/opt/rsa/database/nw-backup	/var/netwitness/database/nw-backup/restore
NW Server	/var/netwitness/database/nw-backup	/var/netwitness/restore
All Other Hosts	/var/netwitness/database/nw-backup	/var/netwitness/database/nw-backup/restore

Task 3 - Restore NTP Servers

You must use the NetWitness Platform 11.2 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *RSA NetWitness® Platform 11.2 System Configuration Guide* for detailed instructions on how to add NTP servers. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 4 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Platform licenses. Refer to "Step 1. Register the NetWitness Server" in the *Licensing Management Guide* for instructions on how to re-download licenses. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

(Conditional) Task 5 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create a user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.

   ```
   /etc/sysconfig/iptables
   /etc/sysconfig/ip6tables
   ```

3. Reload the `iptables` and `ip6tables` services.

```
service iptables reload
service ip6tables reload
```

(Conditional) Task 6 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.6.

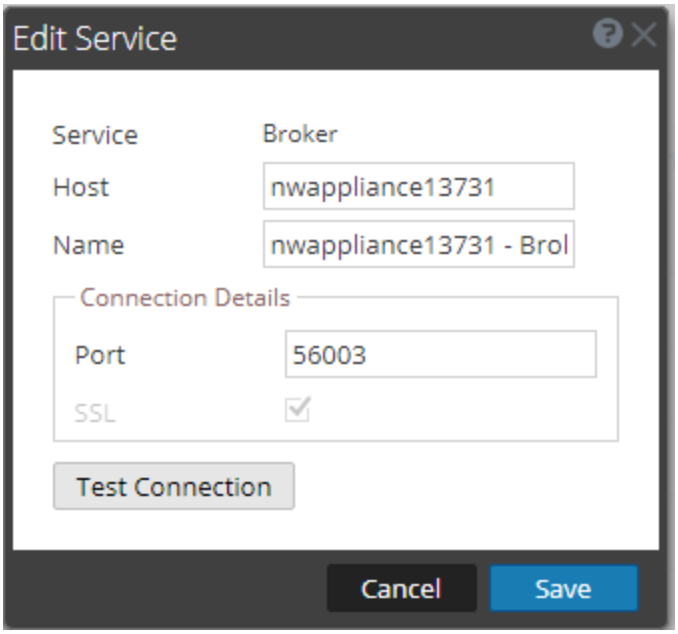
NetWitness Platform 11.2 cannot communicate with the core services for these customers because they are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to NetWitness Platform
2. Go to **ADMIN** > **Services**.
3. Select each core service and change there ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005
Decoder	50004	56004
Log Decoder	50002	56002

4. Click (Edit) from the **Services** view toolbar.
   The Edit Service dialog is displayed.
5. Change the port from Non-SSL to SSL as shown in the table and click **Save**(for example, change the

Broker port from 50003 to 56003).



NetWitness Endpoint

Task 7 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Platform 11.2, the virtual host is `/rsa/system`. For 10.6.6.x and earlier versions, the virtual host is `/rsa/sa`.

2. Restart the API Server and Console Server.
3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.

   ```
   orchestration-cli-client --update-admin-node
   ```

5. Submit the following command to restart the RabbitMQ server.

   ```
   systemctl restart rabbitmq-server
   ```

   The NetWitness Endpoint account should automatically be available on RabbitMQ.

6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Event Stream Analysis Tasks (ESA)

Task 8 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.6.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.2.

1. Log in to NetWitness Platform 11.2
2. Click **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Packets and C2 for Logs, require a whitelist named "**domains_whitelist**".
3. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:

   a. Click **ADMIN**> **Services**, select the Context Hub service, in the action commands () drop-down menu, click **View** > **Config** > **Lists** tab).

   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *NetWitness Platform ESA Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 9 - For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint Configure Mutually Authenticated SSL

If you integrate with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.6.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Platform by logging into the host and running the following `rabbitmqctl` command.

   ```
   > rabbitmqctl add_user <username> <password>
   ```

   For example:

   ```
   > rabbitmqctl add_user wtd-incidents incidents
   ```

2. Set permissions for users by running the following command (use the username from step 1):

   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*", ".*"
   ```

   For example:

   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*", ".*", ".*"
   ```

Task 10 - Enable Threat - Malware Indicators Dashboard

In 11.2.0, the 10.6.6.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.6x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.2.
2. Set datasource for new dashlets.
   See "Dashlets" in the RSA Link (https://community.rsa.com/docs/DOC-81463).

Log Collection

Task 11 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.2 to ensure that all collection protocols resume normal operation.

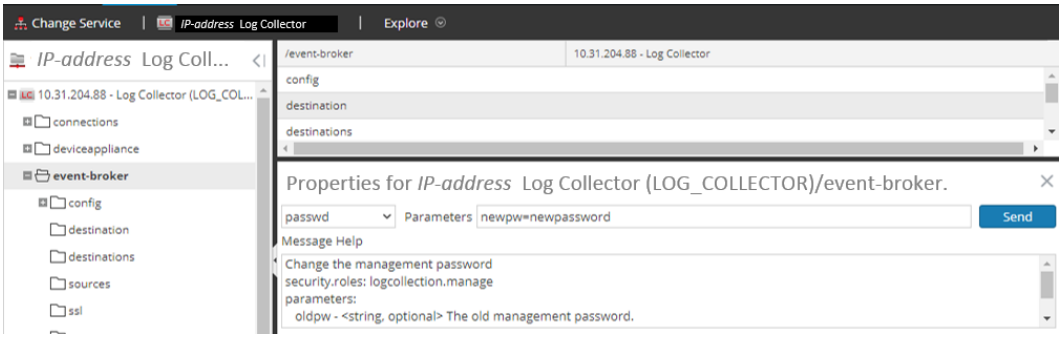
Reset Stable System Values for the Lockbox

The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *RSA NetWitness® PlatformLog Collection Configuration Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Update Log Collector Service RabbitMQ User Account Password

If the logcollector service RabbitMQ user account password was changed, you must reenter it after the 11.2 upgrade.

1. Log in to NetWitness Platform.
2. Go to **ADMIN > Services**.
3. Select the Log Collector service.
4. Click  (Actions) > **View** > **Explore**.
5. Right click `event-broker` > **Properties**.
6. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



(Optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Packet Decoders) Task 12 - Enable FIPS Mode

FIPS is enabled on all services except Log Collector Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder. For information about how to enable FIPS for these services, see the "Sys Maintenance: Activate or Deactivate FIPS" topic in the *RSA NetWitness® PlatformSystem Maintenance Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Reporting Engine

Task 13 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the back up you made prior to the upgrade. The Backup script backs up the 10.6.6.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.2.

1. SSH to the NW Server host.
2. Export the CA certificates.
   `keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file`
3. Copy the CA pem into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 14 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *RSA NetWitness® Platform Reporting Engine Configuration Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Respond

Task 15 - Restore Respond Service Custom Keys

In 10.6.6.x, if you added custom key for use in the groupBy clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.
   This directory is where the `alert_rules.json` file is restored from the 10.6.6.x backup.

2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.2.
   This is the new file for 11.2.
3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 16 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.2 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.6.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.6.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.6.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Platform 11.2 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.6.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

(Conditional) Task 17 - Enable Disabled 10.6.6.x Incident Management Data Retention

Complete the following procedure to enable the Incident Management data retention jobs you disabled prior to upgrade.

1. Log in to RSA NetWitness® Platform.
2. Go to **ADMIN** > **Services** and select the **Respond server**.
3. Click the  (Actions), **View** > **Explore**.
4. Go to the `respond/dataretention` node.
5. Set the `enable` parameter to `true`.

(Conditional) Task 18 - Restore Custom Analysts Roles

If you had custom analyst roles in 10.6.6.x, you must reinstate them in 11.2. See *Adding Roles and Assigning Permissions for the Roles* in the *RSA NetWitness Platform Warehouse Analytics Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NetWitness SecOps Manager

Task 19 -Reconfigure NW SecOps Manager Integration

For information on how to reconfigure NW SecOps for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

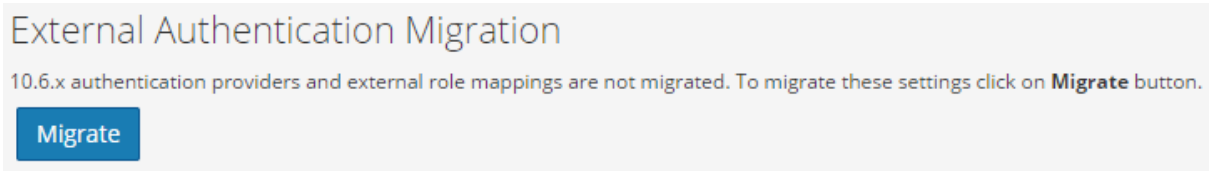
Security

Task 20 - Migrate Active Directory (AD)

The first time you log into the NetWitness Platform 11.2 User Interface, you must click on the Migrate button to complete the migration of AD.

Caution: If you did not upgrade from 10.6.4.2, you must apply the 11.0.0.1 patch immediately before you first log into NetWitness Platform 11.2 and migrate Active Directory. You do not need to apply the 11.0.0.1 patch if you upgraded to 11.2 from 10.6.4.2.

1. Log in to NetWitness Platform with your `admin user` credentials.
2. Click **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 21 - Modify Migrated AD Configuration to Upload Certificate

If the you used a self-signed certificate in Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.4.x, you must modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

Complete the following procedure to modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

1. Log in to NetWitness Platform.
2. Go to **ADMIN** > **Security** and click the **Settings** tab.
3. Under **Active Directory Settings**, select an AD configuration and click .
   The Edit Configuration dialog is displayed.
4. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
5. Click **Save**.

Task 22. Address Authentication Failure in 11.2

Users cannot log in to NetWitness Platform User Interface after you upgrade to 11.2 because the Interface cannot retrieve user account information from MongoDB.

- Apply the 11.0.0.1 patch to fix this issue immediately after you upgrade to 11.2.

Task 23 - Reconfigure Pluggable Authentication Module (PAM) in 11.2

You must reconfigure PAM after you upgrade to 11.2. See "Configure PAM Login Capability" in the *RSA NetWitness® Platform System Security and User Management Guide*for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

You can refer to your 10.6.6.x PAM configuration files in the **/etc** directory in the your 10.6.6.x backup data for guidance.

Appendix A. Troubleshooting

This section describes problems that you may encounter during the upgrade with solutions. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve any upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294)

This section has troubleshooting documentation for the following services, features, and processes.

- 11.2 Setup Program (`nwsetup-tui`)
- Backup
- Event Stream Analysis
- General
- Log Collector Service (`nwlogcollector`)
- NW Server
- Reporting Engine

11.2 Setup Program (`nwsetup-tui`)

Problem	Host Setup Program (`nwsetup-tui`) exits and creates the following error message in `/var/log/netwitness/bootstrap/launch/security-server/security-server.log`: `<yyyy-mm-dd hh:mm:ss,nnn> [main] ERROR SystemOperation|Service startup failed. Running in safe mode org.h2.jdbc.JdbcSQLException: The database is read only [90097-193] at org.h2.message.DbException. getJdbcSQLException(DbException.java:345) ... at org.springframework.jdbc.datasource. AbstractDriverBasedDataSource.getConnection (AbstractDriverBasedDataSource.java:159) at com.rsa.asoc.security.upgrade.legacy. MigrationDatabase.<init>(MigrationDatabase.java:113)`
Cause	The H2 database needs write permission to complete the host setup.

Solution	From the NW Server command line, provide write permission to `H2.db`, restart the NW Server, and restart nwsetup-tui Setup Program.
	`chmod o+w /var/lib/netwitness/uax/db/platform.h2.db`
	`systemctl restart rsa-nw-security-server.service`
	`nwsetup-tui`

Backup (`nw-backup` script)

Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA mongo admin password back to the original default of 'netwitness' before running backup. See "ESA Config: Change MongoDB Password for admin Account" the the *RSA NetWitness® Platform Event Stream Analysis Configuration Guide. Go to the* Master Table of Contents *to find all NetWitness Platform Logs & Network 11.x documents.*

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.2 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESAPrimary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA .
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

General

Logs referred to in this section are posted to `/var/log/install/install.log` on the NW Server Host.

Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health.AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service using below command. `systemctl restart rsa-sms`

Message	`<timestamp> <host>: SMS_PostInstall: INFO: Free disk space on /opt is nGB` `<timestamp> <host>: SMS_PostInstall: WARN: Disk space check failed on /opt. The available disk space nGB is less than the recommended minimum disk space of 10GB.`
Cause	Low or insufficient disk space allocated for the SMS service.
Solution	RSA recommends that you provide a minimum of 10 GB of disk space for the SMS service to run optimally.

Problem	After you run the Setup Program for a non-NW Server host, you must go in to the UI, enable the host, and install the service on the host from the Hosts View. If you see "Install error View Details" in the **Status** column of the Hosts view, the host lost connectivity due to network issues.
Solution	Re-install the service on the host from the Hosts view.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Message	*timestamp* `NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	(Conditional) If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the"Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents..

Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the sa.log. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6 to 11.2.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Message	`<timestamp> : Available free space in /home/rsasoc/rsa/soc/reporting-engine [ existing-GB ] is less than the required space [ required-GB ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Appendix B. Stopping and Restarting Data Capture and Aggregation

RSA recommends that you stop packet and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.2. If you do this, you must restart packet and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Packet Capture

To stop packet capture:

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.

3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 
   .

Stop Log Capture

To stop log capture:

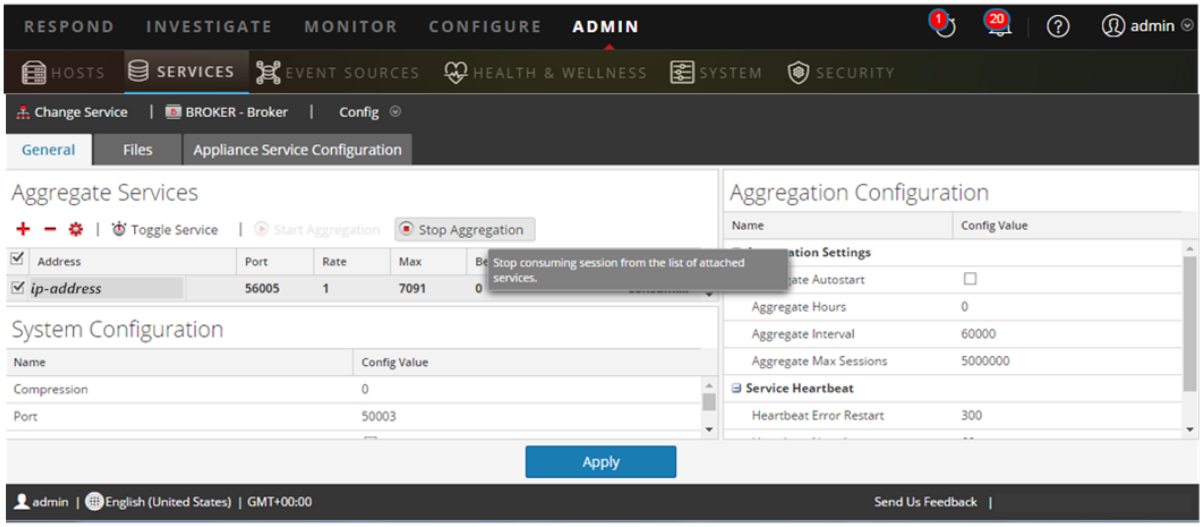
1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.

3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 
   .

Stop Aggregation

1. Log in to NetWitness Platform
2. Go to **ADMIN** > **Services**.
3. Select the **Broker** service.
4. Under  (actions), select **View** > **Config**.
5. The **General** tab is displayed.



6. Under **Aggregated Services** click 
.

Start Data Capture and Aggregation

Restart packet and log capture and aggregation after updating to 11.2.

Start Packet Capture

To start packet capture:

1. Login to **NetWitness Platform**.
2. Go to **ADMIN** > **Services**.

   The Services view is displayed.
3. Select each **Decoder** service.
4. Under  (actions), select **View** > **System**.
5. In the toolbar, click 

.

Start Log Capture

To start log capture:

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

.

Start Aggregation

1. Log in to .NetWitness Platform.
2. Go to **ADMIN** > **Services**.
3. Select the **Broker** service.
4. Under  (actions), select **View** > **Config**.
5. The **General** tab is displayed.
6. Under **Aggregated Services** click 
.

September 2018

Contents

Introduction

The instructions in this guide apply to the upgrade of Azure for RSA NetWitness Platform 10.6.6.x to 10.6.6.x to 11.2 exclusively. See the *RSA NetWitness Platform Physical Host Upgrade Guide* for instructions on how to upgrade your 10.6.6.x physical hosts to 11.2. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents. This document assumes that the appliances are in Azure cloud.

NetWitness Platform 11.2 is a major release that affects all products in the NetWitness Platform in Azure. The components of the suite are the NetWitness Server (NW Server), Archiver, Broker, Concentrator, Context Hub, Entity Behavior Analytics, Event Stream Analysis, Investigate, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Response, and Workbench.

CentOS6 to CentOS7 Upgrade

NetWitness Platform 11.2 is a major release that involves upgrading to a newer version of the operating system (CentOS6 to CentOS7). In addition, the 11.2 platform environment has been improved greatly to accommodate current and future, physical and virtual deployment types. These changes require an upgrade to the new environment and an upgrade of the functionality.

RSA NetWitness® Platform 11.2 Upgrade Path

The supported Upgrade path for RSA NetWitness® Platform 11.2 is Security Analytics 10.6.6.x. If you are running a version of NetWitness Platform that is prior to 10.6.6.x, you must update to 10.6.6.x before you can upgrade to 11.2. See the *RSA Security Analytics 10.6.6 Update Guide* (https://community.rsa.com/docs/DOC-85119) on RSA Link.

For updating from RSA NetWitness® Platform 11.0.0.0 to RSA NetWitness® Platform 11.2.0.0, please see the *Update Guide from 11.0.x to 10.6.6.x to 11.2Guide*.

Hardware, Deployments, Services, and Features Not Supported in 11.2

RSA does not support upgrade of the following hardware, deployments, services, and features to 11.2.

- RSA All-in-One (AIO) Appliance
- Multiple NetWitness Server Deployment
- IPDB service
- Malware Analysis service co-located on the SA Server (Upgrade of Malware Analysis Enterprise is supported in 11.2.)
- Standalone Warehouse Connector service (Upgrade of a co-located Warehouse Connector is supported in 11.2.)
- Custom Health & Wellness policy in 10.6.x for the Context Hub Service
  After you upgrade to NetWitness 11.2, your custom policy is not present. In its place, there is the out-of-the-box Context hub Server Monitoring Policy in the user interface, which is specific for version 11.2.
- Defense Information Strategic Agency-Security Technical Information Guide (DISA-STIG) hardened deployments.
- Warehouse Analytics (Data Science)
- Malware Analysis
- Packet Decoder

Event Stream Analysis (ESA) Upgrade Considerations

In RSA NetWitness® Platform 11.2, RSA changed how ESA Correlation Rules store and transmit the alerts the system generates. In 11.2, ESA sends all alerts to a central Alert system. The local mongo storage in ESA 10.6.6.x has been removed.

Caution: If you do not use Incident Management in 10.6.6.x, carefully consider whether or not to upgrade to version 11.2.

The following guidelines should help you determine whether or not to upgrade your ESA hosts to 11.2.

In your 10.6.6.x deployment, if you have:

- One ESA host, with or without Incident Management configured, upgrade to 11.2.
- Multiple ESA hosts configured to use Incident Management – The system will continue to aggregate alerts centrally. If the system is correctly sized and operating as intended in 10.6.6.x, you can upgrade to version 11.2.
- Multiple ESA hosts without configuration to use Incident Management and you are connecting to individual ESA hosts to view alerts, do not upgrade to version 11.2.

Upgrade Phases

RSA recommends that you stagger host upgrades as described in this section. The update to CentOS7 and the need of a physical or iDRAC access cause the 11.2 upgrade to take more time than most upgrades.

Caution: If you stagger the upgrade, you:
• must upgrade the hosts in Phase 1 first, in the order shown.
• may not have all the features operational until you update your entire deployment.
• will not have service administrative features available until you upgrade all the hosts in your deployment.

Phase 1

You perform Phase 1 first and you must upgrade the hosts in the following order:

1. Security Analytics Server host
2. Event Stream Analysis hosts
3. Broker hosts (if you do not have a Broker, upgrade your Concentrator hosts)
   The 11.2 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2

Upgrade the rest of your hosts.

In Phase 2, (other than Log Collection hosts with downstream event destinations) there is no technical reason to upgrade your hosts in the following order. RSA recommends that you follow the order in Phase 2 to reduce:

- functionality loss during investigation.
- downtime that results in the loss of packet and log capture.

1. Concentrator hosts
2. Archiver hosts
3. Log Collection hosts - Log Collectors on Log Decoder hosts (LDs), Virtual Log Collectors (VLCs) and Legacy Windows Collectors (LWCs)
   Before you upgrade a log collection host , you must prepare it for the upgrade. Part of this preparation ensures that no event data remains in the queues. This requires you to keep the downstream destinations of event data (Log Collectors, Virtual Log Collectors and Log Decoders) up and functioning properly.

If you have event data destinations downstream from the Log Decoder, you must prepare and upgrade log collectors in the following order.

a. LDs (one LD at a time)

b. VLCs and LWCs

If you do not have event data destinations, downstream from the Log Decoder, you can prepare and upgrade multiple LDs, VLCs, and LWCs together.

4. All other hosts

See "Running in Mixed Mode" under "The Basics" in the RSA 11.2 *NetWitness Platform Hosts and Services Getting Started Guide* for:

- Functionality gaps encountered while running in this mode.
- Examples of staggered upgrades.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Investigate in Mixed Mode

Mixed mode occurs when some services are upgraded to 11.2 and some are still on 10.6.x. This happens when you upgrade to 11.2 in phases.

Note: You must follow the host upgrade sequence as shown in Upgrade Phases to ensure complete Investigate functionality. The 11.2 Investigate server is installed when you upgrade the SA Server, but Broker hosts need to be upgraded to 11.0 to access the Event Analysis View.

After you upgrade all services to 11.2, when an analyst conducts an investigation, Role-Based Access Control (RBAC) of downloads works consistently to limit access to restricted data.

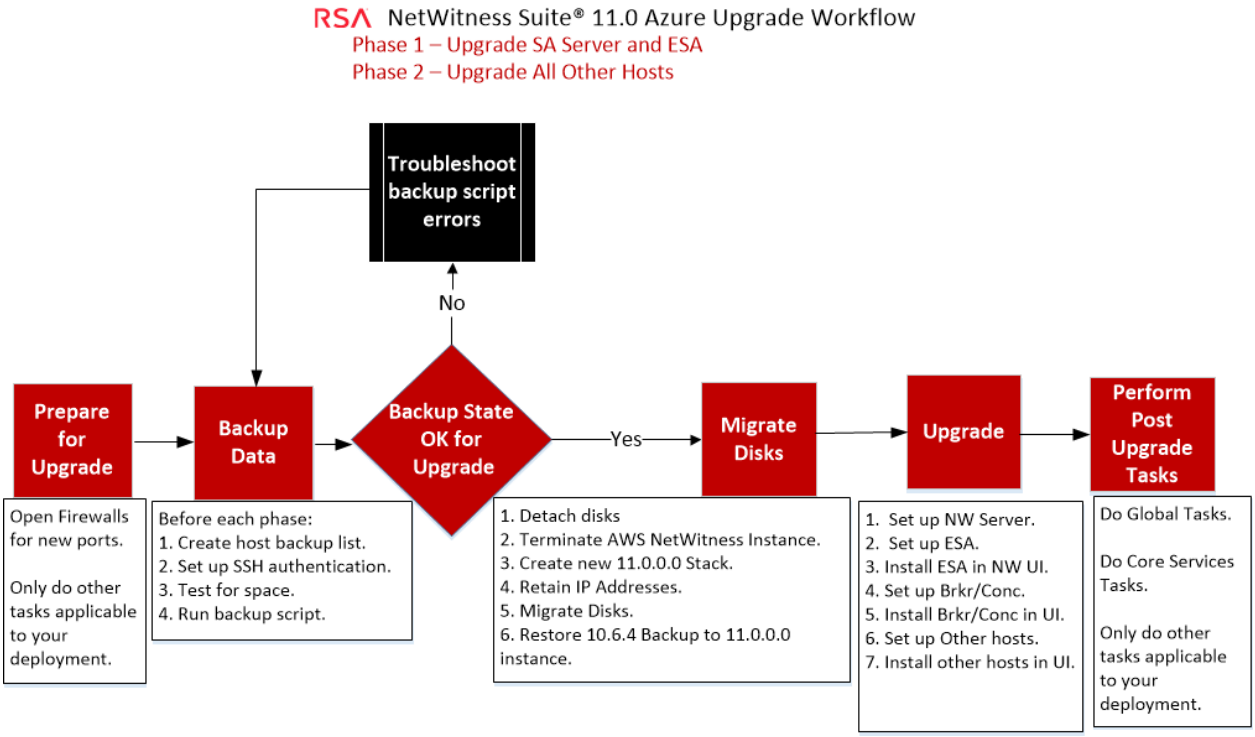
In mixed mode (that is, some services are upgraded to 11.2 and some are still on 10.6.x), when an analyst conducts an investigation, RBAC is not applied uniformly to viewing and downloads.

If the `sdk.packets` setting has not been disabled on the 10.6.x services, analysts with SDK meta and roles permissions in place to restrict viewing and reconstructing an event's content can download the PCAP of an event that has content restrictions. Other types of downloads appear to download, then generate errors due to insufficient permissions, and the data is still protected.

During a phased update, you can disable the `sdk.packets` setting on 10.6.x services to limit the analyst from downloading any PCAPs or logs during mixed mode. After you update all services to 11.2, RBAC works consistently across all services.

This table identifies what you can see and download in Investigate when your NetWitness Server is on version 11.2 connected to services at a lower version.

Connecting Service Version	Affected View	User Role	Can See	Can Download Successfully	Can Download with Errors
11.2 Broker -> 10.x Concentrator	Events View	Analyst		PCAP	File archive is downloaded but cannot unzip
	Event Reconstruction View	Analyst		PCAP	File archive is downloaded but cannot unzip
	Event Analysis View	Analyst		PCAP	Error Retrieving Payload from Service for Payload, Request Payload, Response Payload
	Event Reconstruction View	Admin			Files archive is downloaded but cannot unzip
11.2 Broker -> 11.2 Concentrator	Event Reconstruction View	Analyst and Data Privacy Officer	RBAC permitted items		Files archive is downloaded but cannot unzip PCAPs and logs are downloaded as zero bytes
	Event Reconstruction View				



Contact Customer Support

Refer to the Contact RSA Customer Support page (https://community.rsa.com/docs/DOC-1294) in RSA Link for instructions on how to get help on RSA NetWitness Platform 11.2.

Upgrade Preparation Tasks

Complete the following tasks to prepare for the upgrade to NetWitness Platform 11.2. These tasks are organized by the following categories.

- Global
- Reporting Engine
- Respond and Incident Management

Global

You must complete these tasks regardless of how you deploy NetWitness Platform and which components you use.

Task 1 - Review Core Ports and Open Firewall Ports

The following table lists new ports in 11.2.

Caution: Make sure that the new ports are implemented and tested before upgrading so that upgrade does not fail due to missing ports.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 27017	MongoDB

ESA Host

Source Host	Destination Host	Destination Ports	Comments
NW Server, NW Endpoint, ESA Secondary	ESA Primary	TCP 27017	MongoDB

All NetWitness Platform core ports are listed in the "Network Architecture and Ports" topic in the *RSA NetWitness® Platform Deployment Guide* in case you need to reconfigure NetWitness Platform services and firewalls. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 2 - Record Your 10.6.6.x `admin user` Password

Record your 10.6.6.x `admin user` password. You will need it to complete the upgrade.

Task 3 - Create a Backup of `/etc/fstab` File

Copy the `/etc/fstab` file from all VMs to your local machine (backup host or remote machine).

Note: You need this file to restore a VM with external storage mounts.

Reporting Engine

(Conditional) Task 4 - Unlink External Storage

If the Reporting Engine has external storage [such as Storage Area Network (SAN) or Network Attached Storage (NAS) for storing reports] you must perform the follow steps to unlink the storage.

In these steps:

- `/home/rsasoc/rsa/soc/reporting-engine/` is the Reporting Engine home directory.
- `/externalStorage/` is where the external storage is mounted.

1. SSH to the Reporting Engine host and log in with your `root` credentials.
2. Stop the Reporting Engine service.
   ```
   stop rsasoc_re
   ```
3. Switch to `rsasoc` user.
   ```
   su rsasoc
   ```
4. Change to the Reporting Engine the home directory.
   ```
   cd /home/rsasoc/rsa/soc/reporting-engine/
   ```
5. Unlink the `resultstore` directory mounted to external storage.
   ```
   unlink /externalStorage/resultstore
   ```
6. Unlink the `formattedReports` directory mounted to external storage.
   ```
   unlink /externalStorage/formattedReports
   ```

Respond

Task 5 - Set Data Retention Run Interval to ≥ 24 Hours

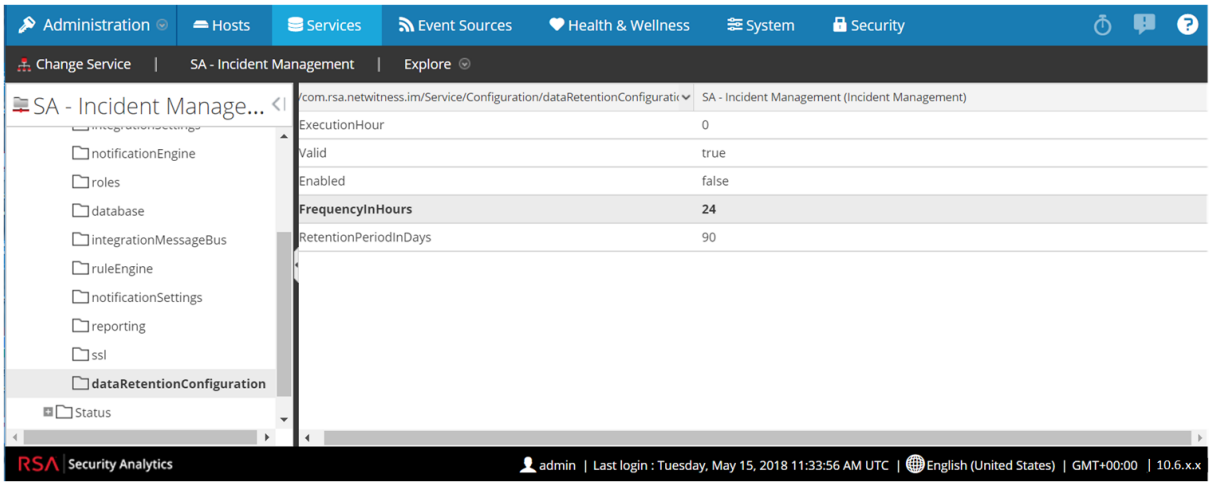
In Security Analytics 10.6.x , the Data Retention run interval does not have any minimum value check. In 11.2, RSA added a validation check to make sure that it is run at least every 24 hours. When you upgrade to 11.2, if this value is less than 24 hour, the Respond service will not start.

Complete the following task to ensure that the Respond service starts after upgrading to 11.2.

1. In Security Analytics 10.6.6.x, go to **ADMIN** > **Services**.
2. Select the **Incident Management** service, and then select  > **View** > **Explore**.
3. In the Incident Management **Explore** view, go to `Service` > `Configuration` >

`dataRetentionConfiguration`.

4. Make sure that the `FrequencyInHours` parameter is ≥ **24**.



Backup Instructions

Backing up your configuration data for all your hosts from 10.6.6.x is the first step in upgrading from 10.6.6.x releases to 11.2.0.0.

Note: It is important that you place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directory will be automatically restored during the upgrade process. After upgrading to 11.2.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`. For more information about backing up these types of files, see step 1 in For All Host Types

Caution: 1) These services are not supported in the 10.6.6.x backup and upgrade process.
- IPDB
- All in One servers
- Malware Analysis Co-Located on the NetWitness Server
- Standalone Warehouse Connector

The following types of hosts can be backed up and are automatically restored during the upgrade process:

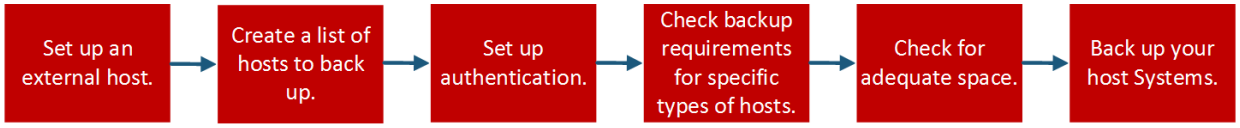
- **NetWitness Server** (may include Malware Analysis, NetWitness Respond, Health and Wellness, and Reporting Engine)
- **Archiver**
- **Broker**
- **Event Stream Analysis** (including Context Hub and NetWitness Respond database)
- **Concentrator**
- **Log Decoder** (including Local LogCollector and Warehouse Connector, if installed)
- **Virtual Log Collector**

The following types of files are automatically backed up but must be restored manually after the upgrade process:

- PAM configuration files: For information about restoring the PAM configuration files, refer to "Task 5 - Reconfigure Plugable Authentication Module (PAM) in 11.2.0.0", in the "Global" section of the Post Upgrade Tasks.
- `/etc/pfring/mtu.conf` and `/etc/init.d/pf_ring`: To restore these files you must manually retrieve them. The `/etc/pfring/mtu.conf` files will be located in `/var/netwitness/database/nw-backup/restore/etc/pfring/mtu.conf`, and the `/etc/init.d/pf_ring` files will be located in `/var/netwitness/database/nw-backup/restore/etc/init.d/pf_ring`. For information about how to restore these files, see " (Conditional) Task 2 - Restore Files for 10G Decoder" in the "Hardware Related Tasks" section of Post Upgrade Tasks.

Note: If you have problems during the backup or upgrade processes and you lose data, you can recover the data and start the process again. For information about recovering lost data, see "Recover Data After System Failure" in the *System Maintenance Guide*.

The following diagram shows the high-level task flow of the steps you perform to back up your hosts.



The following sections describe each of these tasks:

Task 1 - Set up an External Host for Backing up Files

You must set up an external host to use for backing up files. The host must be running Centos 6 with connectivity through SSH to the NetWitness Platform stack of hosts.

Ensure that the host names for the systems to be backed up are resolvable on the backup host machine, either by DNS or listed in the `/etc/hosts` file.

Note: These scripts are designed to run on CentOS 6 only. You must execute these scripts on CentOS 6 machines.

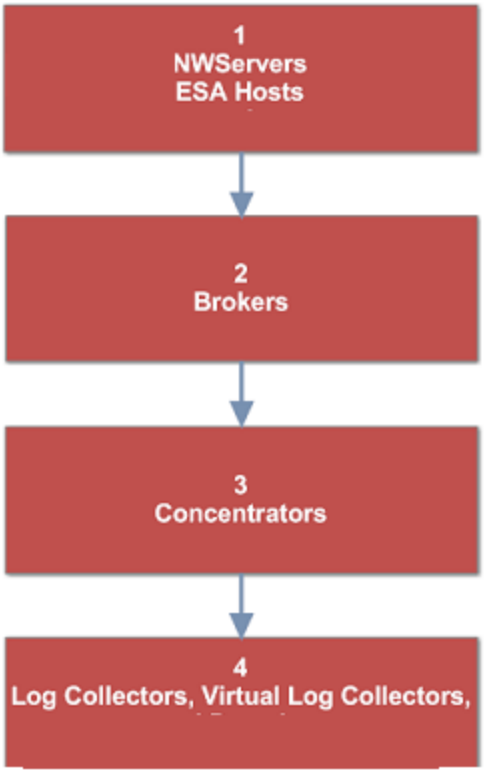
There are several scripts that you run during the backup process. You must download the zip file that contains the scripts (`nw-backup-v3.0.zip`) from RSA Link at this location: https://community.rsa.com/docs/DOC-81514 and copy it over to your CentOS 6 backup system. Click the **RSA NetWitness Logs & Packets 11.2 Backup Script (nw-backup-v3.0.sh)** link and extract the zip file to access the scripts. The scripts are:

- `get-all-systems.sh`: Creates the `all-systems` file, which contains a list of all your NetWitness Servers and host systems to be backed up.
- `ssh-propagate.sh`: Automates sharing keys between the systems you are backing up and the backup host system so that you are not prompted for passwords multiple times.
- `nw-backup.sh`: Performs the backup of your hosts.

Note: The backup scripts do not support backing up data for STIG-hardened hosts.

Task 2 - Create a List of Hosts to Back up

The script that you use to back up your files depends on the `all-systems` and `all-systems-master-copy` files, which contain a list of the hosts that you want to back up. The `all-systems-master-copy` file contains a list of all your hosts. The `all-systems` file is used for each backup session, and contains only those hosts which are being backed up for a particular session. You run the `get-all-systems.sh` script to generate these files. RSA recommends that you back up your hosts in groups, and not all at once. The recommended order and grouping of hosts for backup sessions is shown in the following diagram:



Limit each backup session to five hosts to ensure that you do not run out of space for the backup files. You create `all-systems` files for your backup sessions by using the `all-systems-master-copy` file as a reference and then manually editing the `all-systems` file to contain specific hosts.

To generate the `all-systems` and the `all-systems-master-copy` files:

1. From the host on which you are running the backup process, make the `get-all-systems.sh` script executable by running the following command:
   `chmod u+x get-all-systems.sh`
2. At the root level, run the `get-all-systems.sh` script:
   `./get-all-systems.sh <IP-Address-of-NetWitness-Admin-Server>`
   You will be prompted for the password for each host system once per host.
   This script saves the `all-systems` file and the `all-systems-master-copy` file to `/var/netwitness/database/nw-backup/`.
3. Validate that the `all-systems` and `all-systems-master-copy` files were generated and that they contain the right hosts.

4. Edit the `all-systems` file to contain only the systems you are backing up. You can do this by using the `all-systems-master-copy` file as a reference, and then opening the `all-systems` file in an editor (such as vi) and modifying it to include only the systems you want to back up.

> **Note:** If you use vi, be sure to include the path to the location of the `all-systems` file.

Here is an example of an `all-systems-master-copy` file:

```
nwserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.4.0
archiver,my-nw-archiver,10.0.0.2,a65c1236-5e46-4117-8529-8ea837074bd0,10.6.4.0
concentrator,my-nw-concentrator,10.0.0.3,dc620e94-bcf5-4d51-83fe-
c003cdfcd7a6,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
logdecoder,my-nw-logdecoder,10.0.0.5,c8be5d45-e19e-4a8d-90ce-
1cb2fe60077a,10.6.4.0
vlc,my-nw-vlc,10.0.0.8,3ffefc4e-0b31-4951-bb77-dea5869fa98c,10.6.4.0
broker,my-nw-broker,10.0.0.9,0b65e7ce-61d5-4177-9647-c56ccfb0f737,10.6.4.0
```

And here is an example of an `all-systems` file based on the `all-systems-master-copy` file that could be used in the first backup session:

```
saserver,my-nw-server,10.0.0.1,af922b9f-cd61-49cd-afdc-a48e558cec3e,10.6.4.0
esa,my-nw-esa,10.0.0.4,8b608c0d-a7f9-40c0-baee-8407dec774ab,10.6.4.0
```

Troubleshooting Information

- Be sure to save copies of the `all-systems` and `all-systems-master-copy` files in a safe location. Follow these recommendations:
  - Do not edit the `all-systems-master-copy` file.
  - If you create several different versions of the `all-systems` file (for example, for several backup sessions), be sure to remove pre-existing entries from the file so that the file contains only those hosts that are currently being backed up.
    For more information, see Post Upgrade Tasks.

- If any host systems are down while you are running the `get-all-systems.sh` script, the script creates a list of hosts for which it cannot find information. After the script completes and the `all-systems` file is created, you must edit the `all-systems` file manually and add the missing information for these hosts.

- The `get-all-systems.sh` script generates a list of hosts that were defined in the NetWitness Platform user interface. Ensure that all hosts and services are provisioned properly. If any hosts or services are not provisioned properly, they will not be backed up. RSA recommends that when you add hosts and services to NetWitness Platform, you use the NetWitness Platform user interface to ensure that they are provisioned properly. However, if there are any hosts or services that were not defined in the user interface, you must add them to the `all-systems` file manually.

- At the end of the `get-all-systems.sh` script, the script will check for any differences between the systems that the NetWitness Server has listed, and the ones for which the script was able to find all the required information. If any Node ID's or system names are listed as missing, verify the existence

of those systems, that their services are all running, and that they are properly communicating with the NetWitness Server. (Any Windows Legacy Collectors or Azure Cloud Collectors will not be added to the `all-systems` file, and may account for discrepancies. **DO NOT add these items to the `all-systems` file manually**.)

- If the syntax in the `all-systems` file is incorrect, the script will fail. For example, if there is an extra space at the beginning or the end of a host entry, the script will fail.

Task 3 - Set up Authentication Between Backup and Target Hosts

RSA recommends that you run the `ssh-propagate.sh` script to automate sharing keys between the backup host and the host systems.

Note: If you have SSH keys that are protected with pass phrases, you can use `ssh-agent` to save time. For more information, refer to the man page for `ssh-agent`.

1. On the external backup host system, make the `ssh-propagate.sh` script executable by running the following command:
   `chmod u+x ssh-propagate.sh`
2. At the root directory, run the following command, where `<path-to-all-systems-file>` is the path to the directory where the `all-systems` file is stored:
   `ssh-propagate.sh <path-to-all-systems-file>`
3. You are prompted for the password once per host, but you will not need to enter it again later during the backup process.

Task 4 - Check for Backup Requirements for Specific Types of Hosts

After you create the `all-systems` file to use for backup, you must check to see if any of the hosts listed in the file have requirements that must be met before you run the backup process.

For All Host Types

Perform the following steps for all host types:

1. On the NetWitness Server, place Custom Certificate files and any other certificate authority (CA) files in the `/root/customcerts` folder to ensure that these certificate files are backed up. Your custom certificate files that are placed in this directories will be automatically restored during the upgrade process. After upgrading to 11.2.0.0, your custom certificate files will be located in `/etc/pki/nw/trust/import`.
   You can convert CA certificates and keys to different formats to make them compatible with specific types of servers or software using OpenSSL. For example, you can convert a normal PEM file that would work with Apache to a PFX (PKCS#12) file and use it with Tomcat or IIS. To convert the files, SSH to the NetWitness Server and run the following command strings to perform the conversions listed.
   Convert a DER file (.crt .cer .der) to PEM
   `openssl x509 -inform der -in certificate.cer -out certificate.pem`
   Convert a PEM file to DER
   `openssl x509 -outform der -in certificate.pem -out certificate.der`
   Convert a PEM Certificate File and a Private Key to PKCS#12 (.pfx .p12)
   `openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in certificate.crt -certfile CACert.crt`
   Convert a PKCS#12 File (.pfx .p12) Containing a Private Key and Certificates to PEM
   `openssl pkcs12 -in keyStore.pfx -out keyStore.pem -nodes`

> **Note:** Add the following qualifier to the command string to:
> `-nocerts` convert private keys exclusively.
> `-nokeys` convert certificates exclusively.

2. Manually record any custom configurations made to CentOS 6 (for example, driver customizations) for restoration after you update to CentOS 7. Custom configurations to CentOS 6 are not automatically backed up and restored.

For Concentrator, or Broker Hosts: Stop Data Capture and Aggregation

In addition to the tasks described in For All Host Types, for Concentrator, or Broker hosts, stop data capture and aggregation on all the systems that you are backing up. For instructions, refer to Appendix B. Stopping and Restarting Data Capture and Aggregation

Log Collectors (LC) and Virtual Log Collectors (VLCs): Run `prepare-for-migrate.sh`

> **Caution:** This task stops log collection so you must perform this step immediately before you upgrade to minimize the loss of event collection. Complete this task in accordance with the backup and upgrade tasks in this guide.

Prerequisites

You need the following information before you prepare LCs and VLCs for upgrade.

- If Lockbox was initialized on the LC and VLC, you must know the Lockbox password. It is required to reconfigure the Lockbox after upgrade.
- If you set the password for `logcollector` user for RabbitMQ , you must know the password so you can set it again after the upgrade.

Prepare LCs and VLCs for Upgrade

1. SSH to the Log Collector.
2. Submit the following command string.
   ```
   # /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --prepare
   ```
   This command:
   - Stops the Puppet Agent service.
   - Disables the file collection accounts (“sftp” and all users in the group “upload”) used for uploading log files to the Log Collector. The log files accumulate on the event sources until the Log Collector has been upgrade to 11.2.0.0.
   - Stops all the collection protocols in the Log Collector service.
   - Saves the list of Plugin accounts and RabbitMQ accounts.
   - Configures the RabbitMQ server so that new events cannot be published to it any longer. Consumers of events in the queues, such as shovels and Log Decoder Event Processors, will continue to run.
   - Waits until the Log Collector queues are empty.

- Stops the Log Collector service.
- Creates a marker file indicating that the Log Collector has been successfully prepared for upgrade.

Troubleshooting Information

The `prepare-for-migrate.sh` script:

- Sends informational, warning, and error messages to the console.
- Saves a session log in the `/var/log/backup/` directory.

You must fix any of the following errors and resume the preparation. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance.

- Log Collector queues with events but without consumers are found.
- Unable to stop the Puppet Agent service.
- Unable to stop a collection protocol in the Log Collector service.
- Unable to block event publishers to the RabbitMQ server.
- Unable to or taking too long for queue events to be consumed. The script makes 30 attempts waiting for the events to be consumed. After each attempt, it sleeps for 30 seconds.
- Unable to stop the Log Collector service.

For more information about troubleshooting, see Appendix A. Troubleshooting

For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint: List RabbitMQ Usernames and Passwords

On the 10.6.6.x host, on the NetWitness Server host, you must get a list of all RabbitMQ usernames and passwords so that after you perform the 11.2.0.0 upgrade, you can restore RabbitMQ user accounts.

To get a list of RabbitMQ usernames and passwords, run the following command:

```
rabbitmqctl list_users >> /root/rabbitmq_users.txt
```

To restore RabbitMQ user accounts, refer to *Task 2 - For Integrations with Web Threat Detection, NetWitness SecOps Manager or NetWitness Endpoint Configure Mutually Authenticated SSL* in Post Upgrade Tasks.

For Bluecoat Event Sources

Bluecoat ProxySG event sources use FTPS protocol to upload log files to the Log Collector (LC) and Virtual Log Collector (VLC). The event source documentation contains the steps to configure VSFTPD service on the LC and VLC.

- If key material exists in `/root/vsftpd/` directory in 10.6.6.x, this material area will be backed up and restored. **If the material was in another location, you must back it up and restore it manually.**
- If the `/etc/vsftpd/vsftpd.conf` file exits in 10.6.6.x, it is backed up and restored.

Task 5 - Check for Adequate Space for the Backup

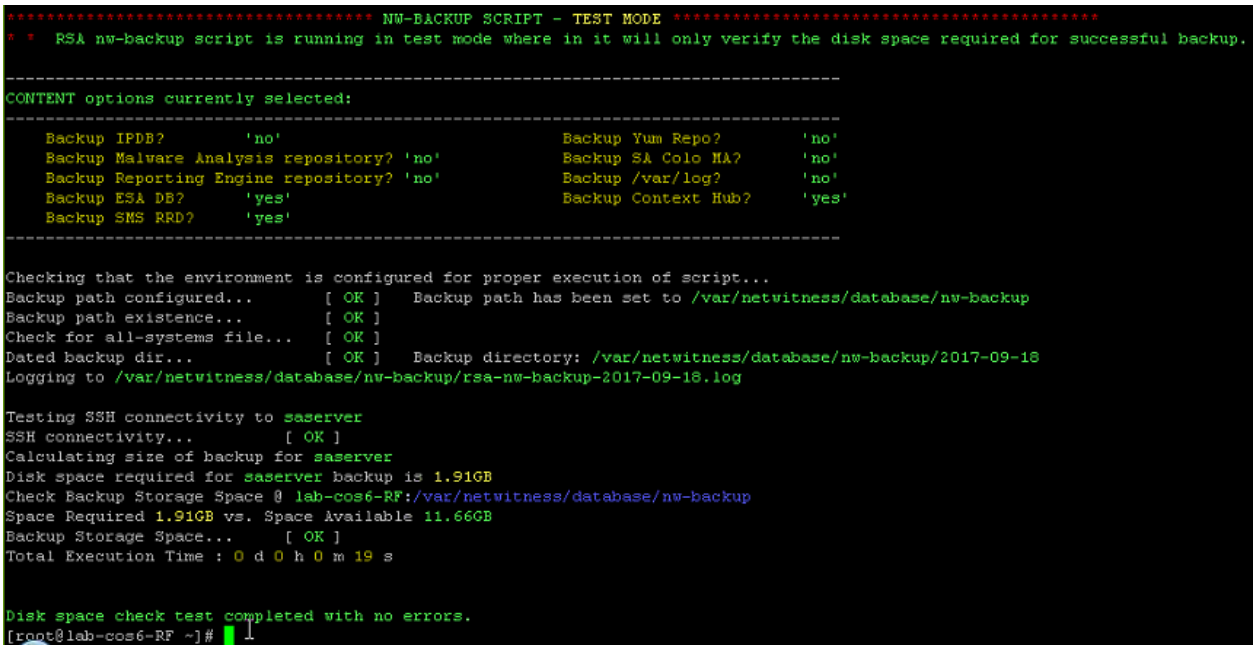
You can run the backup test script to check the amount of disk space that is required for the backup using the `-t` option described in Test Options. You run the script without actually backing up files or stopping any services. RSA recommends that you perform this step to ensure that you provide adequate space for the backup so that the backup captures all your data.

To check for adequate disk space:

1. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
2. Run the following command at the root directory level:
   `./nw-backup.sh -t`
   The output displays the amount of disk space that is required for the backup.

> **Note:** The `./nw-backup.sh -t` command runs with the `-d` option by default. However, if you are looking for more accurate disk space results, you can override the `-d` option by using `-D`. Using the `-D` option will show how much space is required on each host for the data that will be backed up, but does not show how much space is available. If there is not enough space available, the `-D` option will throw an error. If you want to know how much space is available on the target host, you must run the `df -h` command on the host.

The following figure shows an example of the output from using the `-t` option.



Task 6 - Back up Your Host Systems

Before you run the backup script to do the actual backup, be sure that you have plenty of space. To back up your hosts, you run the `nw-backup.sh` script using the `-u` option. This option is required for upgrading to 11.2.0.0.

Note: The script will stop services as it runs. However, you can stop services manually before you run the script if needed.

When you run the backup script, you can choose from several options that are described in the following sections.

Usage:
```
./nw-backup.sh [-u -t -d -D -u -l -x -e <external-mnt> -b <backup file path>
```

General Options

-u : This option is required for upgrading to 11.2. Enables the upgrade flag to run backup for upgrading to 11.2. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)

-d : enables disk space check in 'fast' mode (quick estimate of space using uncompressed data). Default: (no)

-D : enables disk space check in 'full' mode (estimate of space using compressed data, ~10X slower). Default: (no)

-l : stores backup content locally on each host (automatically set if -u is used). Default: (no)

-e <path to mount point> : copies backup files of all devices onto an external mount point. Default: (/mnt/external_backup)

-x : move all backup files to an external mount point. Default: (no) - COPY

-b <path to write backups> : path to the location for storing backup files on a backup server. **For upgrading to 11.0, please use the default location!** Default: (/var/netwitness/database/nw-backup)

Note: Do **not** change the backup path in upgrade (-u) mode.

Advanced Content Selection Options

-c : back up Colocated Malware Analysis on SA servers. Default: (no)

-i : back up IPDB data (/var/netwitness/ipdbextractor). Default: (no)

-m : back up Malware Analysis File Repository. Default: (no)

-r : back up Reporting Engine Report Repository (automatically set if -u is used). Default: (no)

-v : back up system logs (/var/log). Default: (no)

-y : back up YUM Web Server & RPM Repository. Default: (no)

-S : If set: DISABLES back up of SMS RRD files. Default: (not-set)

-C : If set: DISABLES back up of Context-Hub configuration and database. Default: (not-set)

-E : If set: DISABLES back up of ESA Mongo database. Default: (not-set)

Test Options

-t : performs script test run for disk space check only. Services are not stopped and excludes execution of backup. Can be combined with (-d) or (-D) and other flags. Default: (-t)

For example, the command:
```
./nw-backup.sh
```
would run the backup with options as set in the Header of the script itself.
OR, the command:
```
./nw-backup.sh -ue /mnt/external_backup
```
would run a normal backup using the backup path defined in the script, with the following options:

-u : enables the upgrade flag to run backup for upgrading to 11.2. It also enables disk space check (-d), backing up reporting engine reports (-r) and stores backup content locally (-l). Default: (no)

-e : Copy the backup files to external mount point, mounted on /mnt/external_backup

For Help: ./nw-backup.sh -h

When you run the script, the following text is displayed at the top of the script:

Caution: RSA nw-backup script backs up configuration files, data, and logs on the options provided in the script. It tars the content, with options to store the backup files on the backup server, move or copy them to external storage on a mount point (USB/NFS/SMB), or SCP them back to the target host. This backup script has been qualified on the following versions of Security Analytics:
10.6.3.x and 10.6.4.x
Use of this script on any other versions of the product may not give expected results and may not be supported by RSA Customer Service.Note: All non-RSA custom files, scripts, Cronjobs and other important files should be placed in /root, /home/'user', OR /etc to be included in the backup.

To run the backup script to back up your hosts:

1. Ensure that the `all-systems` file contains only the hosts to back up.
2. Make the backup script executable by running the following command:
   `chmod u+x nw-backup.sh`
3. Begin the backup process by running the following command at the root directory level:
   `./nw-backup.sh -u <additional options as needed>`

   Note: You must use the `-u` option so that your files will be restored correctly during the upgrade to 11.2.0.0.

   When the text "`Backup completed with no errors`" is displayed, the backup has completed successfully.

   A log file, with a name similar to the following example, is created in the backup directory which provides information on the files being backed up:
   `rsa-nw-backup-2017-03-15.log`
4. When the backup has completed, to ensure that the intended files were backed up, you can run the following command to see a list of all the files that were backed up:
   `tar -tzvf hostname-ip-address-backup.tar.gz`
   The following archive files are created:
   For all hosts:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`
   For NetWitness Servers:
   `<hostname-IPaddress>-root.tar.gz`
   `<hostname-IPaddress>-backup.tar.gz`
   `<hostname-IPaddress>-mongodb.tar.gz`
   `tar checksum` files
   `<hostname-IPaddress>-network.info.txt`

For ESA Hosts:
<hostname-IPaddress>-root.tar.gz
<hostname-IPaddress>-backup.tar.gz
<hostname-IPaddress>-mongodb.tar.gz
<hostname-IPaddress>-controldata-mongodb.tar.gz
tar checksum files
<hostname-IPaddress>-network.info.txt

The archived files are located in the /var/netwitness/database/nw-backup directory. If any of the tar files appear smaller than expected, open them to be sure that the files were properly backed up.

Post Backup Tasks

Task 1 - Save a Copy of the all-systems File and the Backup Tar files

Make copies of the all-systems file, the all-systems-master-copy file, and the backup tar files and put the copies in a secure location. You cannot regenerate these files after you upgrade the NetWitness Server (specifically the Admin service) to 11.2.0.0.

Task 2 - Ensure Required Backup Files Were Generated

After you run the backup scripts, several files are generated. These files are required for the 11.2.0.0 upgrade process. Before you begin the upgrade process, you must ensure that the required backup files are on the hosts that you are upgrading, and that you perform the following tasks.

The following files are generated on all hosts by the backup scripts:

- all-systems
- all-systems-master-copy
- appliance_info
- service_info
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

In addition to the files listed above, the following files will be generated on NetWitness Server and ESA hosts:

- <*hostname*>-<*host IP address*>-mongodb.tar.gz
- <*hostname*>-<*host IP address*>-mongodb.tar.gz.sha256

The backup script will also generate the following controldata-mongodb.tar.gz files.

Note: The backup script copies the following files from all ESA hosts to the NetWitness Server host's backup path .

- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz`
- `<esa hostname>-<esa hostip>-controldata-mongodb.tar.gz.sha256`

Task 3 - (Conditional) For Multiple ESA Hosts, Copy `mongodb tar` files to Primary ESA Host

If you have multiple ESA host systems in your enterprise, copy the following two files from each ESA host to the `/opt/rsa/database/nw-backup/` directory on the Primary ESA host system (the host that has the ContextHub service running on it) :

- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`

Task 4 - Ensure All Required Backup Files are on Each Host

Before you upgrade to 11.2.0.0, ensure that the appropriate files exist on the hosts that you are upgrading as described in the following lists.

There should be note here mentioning default backup path locations for that user knows where to go and check these files.

Note: The default paths for backup files are:
- NetWitness Server hosts:`/var/netwitness/database/nw-backup`
- ESA hosts:`/opt/rsa/database/nw-backup`

Required Files for NetWitness Servers

- `all-systems-master-copy`
- `<hostname>-<host-IP-address>-backup.tar.gz`
- `<hostname>-<host-IP-address>-backup.tar.gz.sha256`
- `<hostname>-<host-IP-address>-root.tar.gz`
- `<hostname>-<host-IP-address>-root.tar.gz.sha256`
- `<hostname>-<host-IP-address>-network.info.txt`
- `<hostname>-<host-IP-address>-mongodb.tar.gz`
- `<hostname>-<host-IP-address>-mongodb.tar.gz.sha256`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz`
- `<esa-hostname>-<esa-host-IP-address>-controldata-mongodb.tar.gz.sha256`

Required Files for ESA Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt
- <hostname>-<host-IP-address>-mongodb.tar.gz
- <hostname>-<host-IP-address>-mongodb.tar.gz.sha256

Required Files for All Other Hosts

- all-systems-master-copy
- <hostname>-<host-IP-address>-backup.tar.gz
- <hostname>-<host-IP-address>-backup.tar.gz.sha256
- <hostname>-<host-IP-address>-root.tar.gz
- <hostname>-<host-IP-address>-root.tar.gz.sha256
- <hostname>-<host-IP-address>-network.info.txt

Note: The following files are located in the <hostname>-<host-IP-address>-backup.tar.gz tar on all hosts:
appliance_info
service_info

Note: The paths to the location of the backup and restore files for iptables, NAT configurations, user accounts, and crontab entries are shown in the following list:
Backup paths:
BUPATH=/opt/rsa/database/nw-backup for the ESA Correlation Engine
BUPATH=/var/lib/rsamalware/nw-backup for the Malware Service
BUPATH=/var/netwitness/database/nw-backup for all other services
Restore locations:
BUPATH/restore/etc/sysconfig for Iptable rules
BUPATH/restore/etc/sysconfig for NAT configurations
BUPATH/restore/etc for Crontab entries
BUPATH/restore/etc for User Accounts (users are located in the passwd file, and groups are located in the group file. These are not restored during the upgrade process but can be restored manually.
BUPATH/restore/etc/ntp.conf for NTP configurations (must be restored using the NetWitness Platform UI)

Migrate Disk Drives from 10.6.6.x to 11.2

These instructions tell you how to upgrade Azure NetWitness VMs from 10.6.6.x to 11.2.0.0 on Azure Cloud Platform.

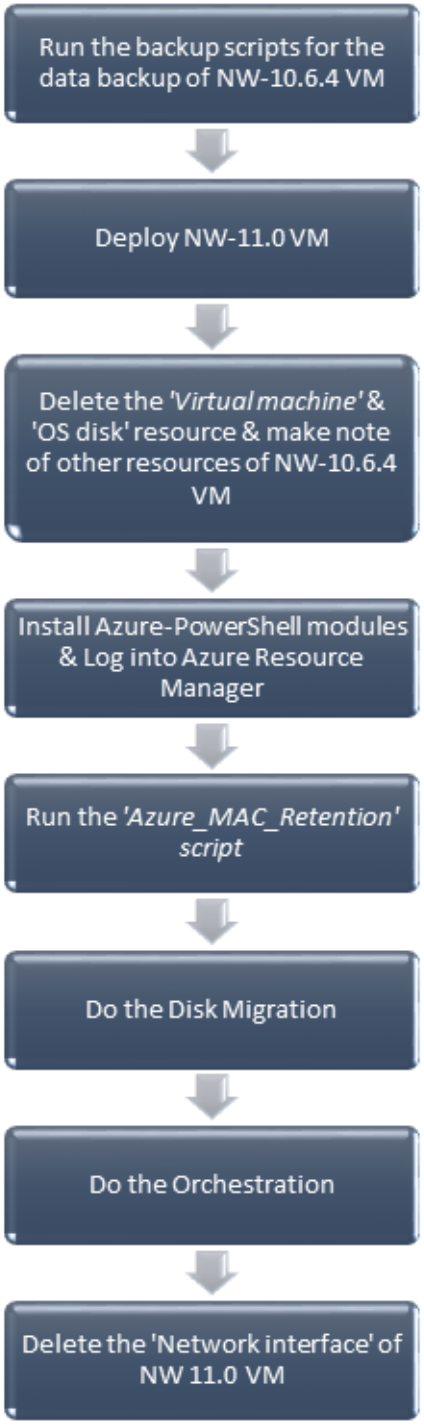
Prerequisites:

- Download and install the latest version of Azure PowerShell from https://github.com/Azure/azure-powershell/releases on a Windows machine.
- Upload the same latest version of Azure modules in automation account. [https://docs.microsoft.com/en-us/azure/automation/automation-update-azure-modules]

Note: Azure PowerShell 4.4.1 was used for qualification.

Note: Both versions of VMs must be on the same Virtual Network and Resource Group for the migration.

Caution: 1) You cannot perform the migration if you have a snapshot for your VM.
2). Run the backup immediately before you upgrade hosts for each phase so that the data is not out-dated.
3.) This guide applies to virtual host upgrades exclusively. If have physical and virtual hosts in your deployment, see the *RSA NetWitness® Platform Physical Host Upgrade Instructions* for the steps you must complete to upgrade physical hosts. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.



Complete the following tasks to migrate your Virtual Machine (VM) deployment disk drives from 10.6.6.x to 11.2:

Task 1 - Deploy NW 11.2 VM

Task 2 - Delete Virtual Machine and OS disk resource of NW 10.6.6 VM

Task 3 - Install Azure PowerShell modules on a local Windows machine

Task 4 - IP Retention: Run the PowerShell script

Task 1 - Deploy NW 11.2 VM

1. Deploy NW 11.2 VMs. [Refer to the Azure deployment guide for v 10.6.6.x to 11.2.
2. Power OFF all the NW 10.6.6 and 11.2 VMs.
3. In the Azure Portal, navigate to Virtual machines.
4. Click on the <Name_of_the_VM>.
5. Click Overview and then click Stop.

Task 2 - Delete Virtual Machine and OS disk resource of NW 10.6.6 VM

Note the other resources like Data disks and Network Interface.

1. Delete the ‘Virtual machine’ and the 'OS disk' (usually disk1 of VM) resource of NW 10.6.6 VM and make a note of these Network interface and Data disks.

Note: Delete only these 2 resources and retain all other resources of NW 10.6.6 VMs like 'Network interface', 'Network security group' and 'Data disks') and make a note of these 'Network interface' and 'Data disks'.

2. In the Azure Portal, navigate to All resources. Select the Name_of_NW_10.6.6_VM.
3. Click Delete.

Azure now supports additional premium disk sizes: 32 GiB (P4), 64 GiB (P6), 2048 GiB (P40), and 4095 GiB (P60). Disks created be
15, 2017 retain their existing performance and billing rates.
Azure now supports premium disk size 256 GiB (P15). Managed disks (<=256 GiB) created before October 1, 2017 will retain the
P20 tier performance and billing rates.

Task 3 - Install Azure PowerShell modules on a local Windows machine

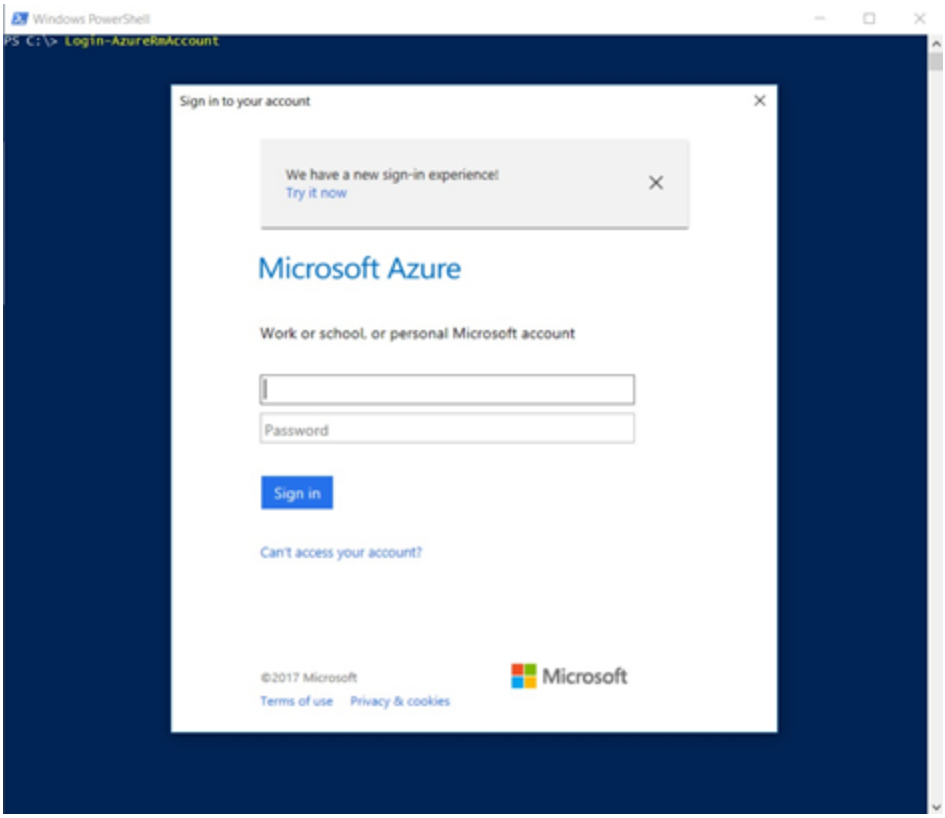
Install the Azure PowerShell modules on a local Windows machine and Login to Azure Resource Manager.

Navigate to Azure PowerShell on the Windows machine where you have installed the Azure PowerShell modules and log in to Azure Resource Manager using the below command

Note: Make sure you have followed the steps mentioned in the Prerequisites section above before executing the below command.

```
Login-AzureRmAccount
```

Login using the Azure credentials in the window that appears.



Task 4 - IP Retention: Run the PowerShell script

Run the PowerShell script for MAC retention for all NW Components. MAC address and IP retention:

MAC address and IP are bound to the 'Network interface' resource of a VM.

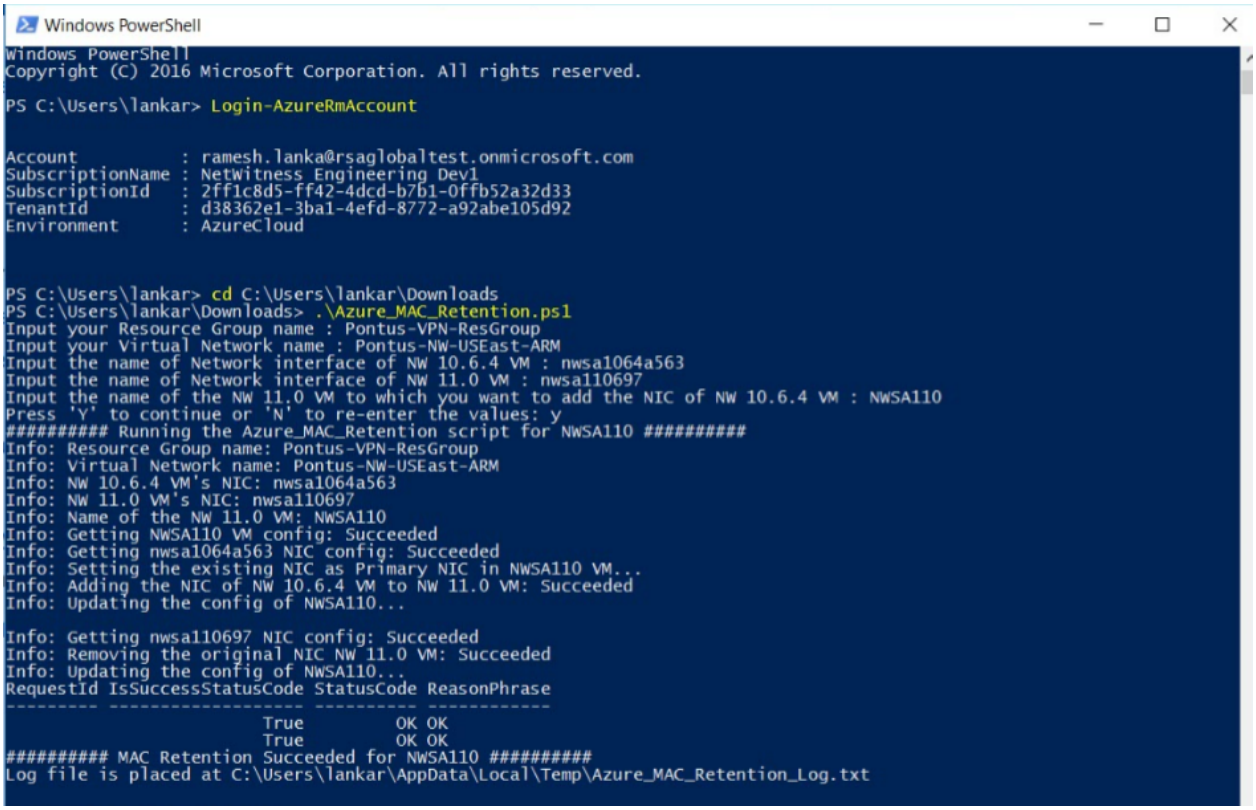
The Azure portal doesn't allow us to

- Specify an existing network interface to add when creating the VM
- Create a VM with multiple network interfaces

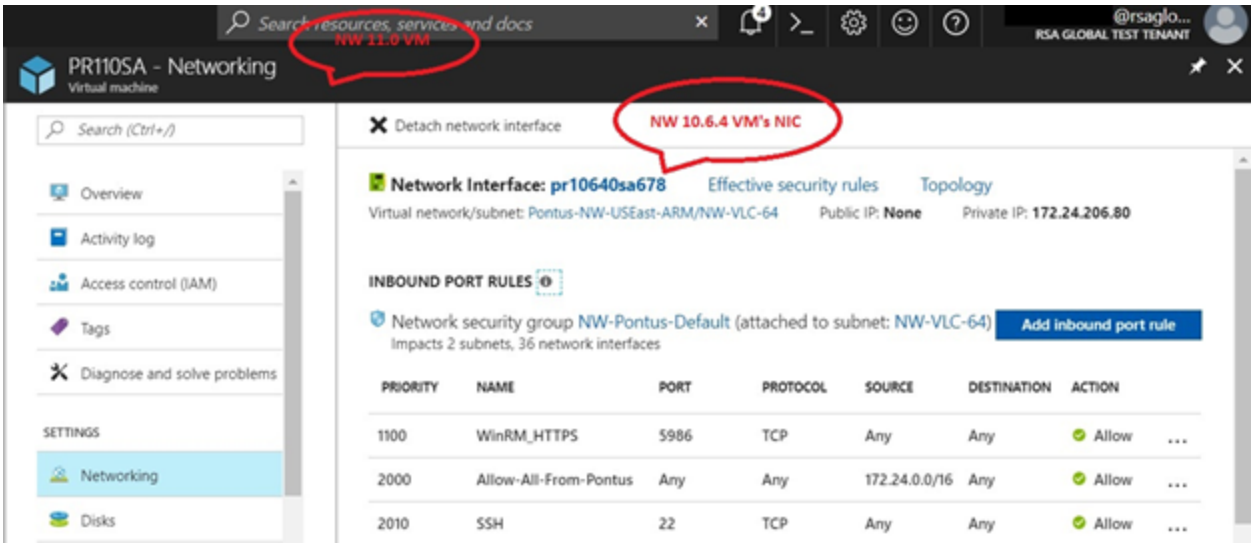
- Specify a name for the network interface (the portal creates the network interface with a default name)

This can be achieved using the Azure PowerShell. [https://docs.microsoft.com/en-us/azure/virtual-network/virtual-network-network-interface-vm]

Click here to download and run the script by providing the requested parameters on the Windows machine installed with Azure PowerShell to retain the 'Network interface' from NW 10.6.6 VM to 11.2 VM.



You should be able to see NW 10.6.6 VM's NIC attached to 11.2 VM under 'Networking' settings after successful execution of the script.

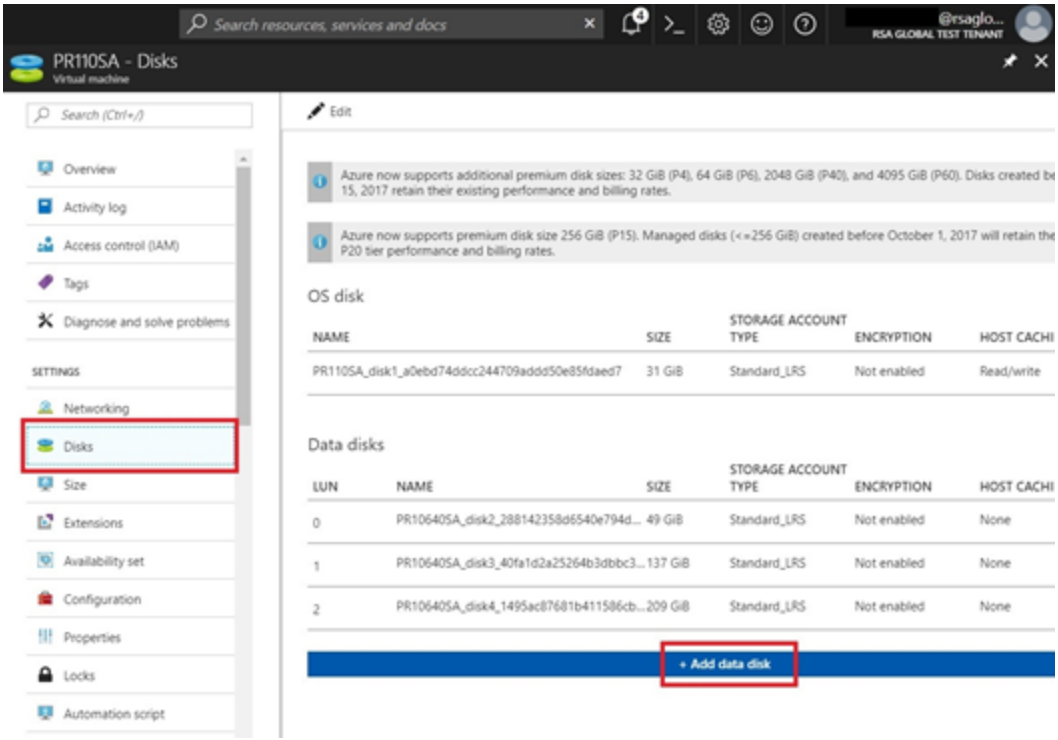


Task 5 - Perform Disk Migration

Add all the disks (except the 'OS disk') of NW 10.6.6 VM to the corresponding NW 11.2 VM under the 'Disks' settings.

In Azure Portal, navigate to Virtual machines and then Name_of_the_11.2_VM. Click **Disks** and then click + **Add data disk**. Select all disks of corresponding NW-10.6.6 VM which you had noted down earlier in the dropdown list that appears.

Click **Save**.



Power ON the NW 11.2 VM and login with the credentials provided during VM deployment and set the root password as netwitness.

Task 6 - Data Restoration

Copy NW 10.6.6 VM's backed up data (nw-backup) to NW 11.2 VM.

Note: Do the Data Restoration for SA Server first followed by other components

For SA, LD/LC, Virtual Log Collector, Concentrator, Archiver, Broker:

1. Create a directory under `/tmp/` by the name `nwhome`.
2. Mount `VolGroup00-nwhome` on `/tmp/nwhome/`.

```
mount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

3. Copy the contents of `/tmp/nwhome/` directory to `/var/netwitness/`

```
cp -R /tmp/nwhome/* /var/netwitness/
```

4. Unmount `VolGroup00-nwhome` from `/tmp/nwhome/`

```
umount /dev/mapper/VolGroup00-nwhome /tmp/nwhome/
```

For ESA:

1. Create a directory under `/tmp/` by the name apps.
2. Mount `VolGroup01-apps` temporarily on `/tmp/apps/`

```
mount /dev/mapper/VolGroup01-apps /tmp/apps/
```

3. Copy `nw-backup` directory from here to `/var/netwitness`

```
cp -r /tmp/apps/database/nw-backup /var/netwitness
```

4. Unmount `VolGroup01-apps` from `/tmp/apps/`

```
umount /tmp/apps/
```

Perform disk mounting by running the below commands:

For NW Server:

```
mount /dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/
mount /dev/mapper/VolGroup02-redb /var/netwitness/database/
```

Add below entries for these mounts in `/etc/fstab`:

```
/dev/mapper/VolGroup01-ipdbext /var/netwitness/ipdbextractor/ xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup02-redb /var/netwitness/database/ xfs
defaults,noatime,nosuid 1 2
```

For LogDecoder/LogCollector:

```
mount /dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder
mount /dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index
mount /dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb
mount /dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb
mount /dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector
mount /dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb
```

Add below entries for these mounts in /etc/fstab:

```
/dev/mapper/VolGroup01-decoroot /var/netwitness/logdecoder ext4
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-index /var/netwitness/logdecoder/index xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-sessiondb /var/netwitness/logdecoder/sessiondb xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-metadb /var/netwitness/logdecoder/metadb xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-packetdb /var/netwitness/logdecoder/packetdb xfs
defaults,noatime,nosuid 1 2
```

For Virtual LogCollector:

```
mount /dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector
```

Add below entry for these mounts in /etc/fstab:

```
/dev/mapper/VolGroup01-logcoll /var/netwitness/logcollector xfs
defaults,noatime,nosuid 1 2
```

For Concentrator:

```
mount /dev/mapper/VolGroup01-concroot /var/netwitness/concentrator
mount /dev/mapper/VolGroup01-sessiondb /var/netwitness/concentrator/sessiondb
mount /dev/mapper/VolGroup01-index /var/netwitness/concentrator/index
mount /dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb
```

Add below entries for these mounts in /etc/fstab:

```
/dev/mapper/VolGroup01-concroot /var/netwitness/concentrator ext4
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-sessiondb /var/netwitness/concentrator/sessiondb xfs
defaults,nosuid,noatime 1 2
/dev/mapper/VolGroup01-index /var/netwitness/concentrator/index xfs
defaults,noatime,nosuid 1 2
/dev/mapper/VolGroup01-metadb /var/netwitness/concentrator/metadb xfs
defaults,noatime,nosuid 1 2
```

For Archiver:

```
mount /dev/mapper/VolGroup01-archiver /var/netwitness/archiver
mount /dev/mapper/VolGroup02-workbench /var/netwitness/workbench
```

Add below entries for these mounts in /etc/fstab:

```
/dev/mapper/VolGroup01-archiver /var/netwitness/archiver xfs
defaults,nosuid,noatime 1 2
/dev/mapper/VolGroup02-workbench /var/netwitness/workbench xfs
defaults,nosuid,noatime 1 2
```

For Broker:

```
mount /dev/mapper/VolGroup01-broker /var/netwitness/broker
```

Add below entry for these mounts in /etc/fstab:

```
/dev/mapper/VolGroup01-broker /var/netwitness/broker xfs
defaults,nosuid,noatime 1 2
```

Task 7 - Delete all NW 11.2 Deployment 'Network interface' Resources

1. In Azure Portal, go to All resources.
2. Click on <Name_of_NW_11.2_Network_interface> and select Delete.

Set Up Virtual Hosts in 11.2

There two phases to set up your 11.2 virtual stack that you must complete in the order shown.

- Phase 1 - Set Up NW Server, Event Stream Analysis, and Broker or Concentrator Hosts

  Note: For Event Stream Analysis, if you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.2 and they will not be available until the warm up completes.

- Phase 2 - Set Up The Rest of the Component Hosts

Phase 1 - Set Up NW Server, Event Stream Analysis, and Broker or Concentrator Hosts

Task 1 - Set Up 11.2 NetWitness Server

Follow the instructions under Set Up 11.2 NW Server Host.

Task 2 - Setup 11.2 ESA

Caution: If you had C2 modules enabled in 10.6.6.x, the modules will enter a warm-up after you upgrade the Event Stream Analysis service to 11.2 and they will not be available until the warm up completes.

Follow the instructions under Set Up 11.2 Non-NW Server Host to set up your ESA hosts.

1. Set up your primary ESA host through the Setup program and install **ESA Primary** on the host in the user interface on the **Admin Hosts** view.

   Note: If you have multiple ESA hosts in your enterprise, you must upgrade the ESA Primary host, where all the `mongodb` (Mongo Database) backup tar files are located, first, before you upgrade ESA Secondary hosts.

2. (Conditional) If you have a secondary ESA host, set it up through the Setup program and install **ESA Secondary** on the host in the user interface on the **Admin Hosts** view.

Task 3 - Set Up 11.2 Broker or Concentrator

Follow the instructions under Set Up 11.2 Non-NW Server Host.

Note: If you do not have a Broker, upgrade your Concentrator hosts. The 11.2 NW Server cannot communicate with 10.6.6.x core services for the new Investigate functionality. This is why you must upgrade the Broker or Concentrator hosts in Phase 1.

Phase 2 - Set Up The Rest of the Component Hosts

See Appendix B. Stopping and Restarting Data Capture and Aggregation for instructions on how to stop and restart data capture and aggregation when upgrading the Decoder, Concentrator, and Log Collection hosts.

Concentrator Hosts

1. Stop data capture and aggregation.
2. Complete the steps in Set Up 11.2 Non-NW Server Host.
3. Restart data capture and aggregation.

Log Decoder Host

1. Make sure you have prepared the Log Collector as described in the Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh.
2. Stop data capture on the Log Decoder.
3. Complete the steps in Set Up 11.2 Non-NW Server Host.
4. Restart data capture on Log Decoder.

> **Note:** After you upgrade, you will restart log collection after completing the Task 12 - Reset Stable System Values for Log Collector after Upgrade in the **Post Upgrade Tasks**

Virtual Log Collector Host

1. Make sure you have prepared the Virtual Log Collector as described in the Log Collectors (LC) and Virtual Log Collectors (VLCs): Run prepare-for-migrate.sh.
2. Back up your 10.6.6.x VLC by editing the `all-systems` file on host where you performed the backup.
   a. Make sure your `all-systems` file contents has this information before you perform this step.
   `vlc,<host-name>,<IP-address>,<UUID>,10.6.6.0`
   b. Run the following command to create backup.
   `./nw-backup.sh -u`
   See Backup Instructions for detailed procedures on how to back up the host.
3. Make sure the backup host contains the VLC backup in the following format.

```
<hostname>-<IPaddress>-root.tar.gz
<hostname>-<IPaddress>-root.tar.gz.sha256
<hostname>-<IPaddress>-backup.tar.gz
<hostname>-<IPaddress>-backup.tar.gz.sha256
<hostname-IPaddress>-network.info.txt
all-systems-master-copy
```

4. Power off the 10.6.6.x VLC so that a new 11.2 VM can be created with the same network configuration.
5. Deploy a fresh Non-NW Server host using the 11.2 NetWitness Suite ova.
6. Connect to the VM console of the new VLC.
7. Update the network configuration to be the same as the 10.6.6.x VLC.
   This information is stored in the `<hostname-IPaddress>-network.info.txt` 10.6.6.x VLC backup file.

   Note: Make sure IPv6 is disabled.

   a. Edit the `/etc/sysconfig/network-scripts/ifcfg-eth0` file and update the settings.
   Contents of `ifcfg-eth0` should be as follows.

```
TYPE=Ethernet
DEFROUTE=yes
NAME=eth0
UUID=<uuid>
DEVICE=eth0
DNS1=<nameserver from <hostname>-<ipaddress>-network-info.txt>
DNS2=<nameserver from <hostname>-<ipaddress>-network-info.txt>
BOOTPROTO=static
IPADDR=<ipaddress from <hostname>-<ipaddress>-network-info.txt>
NETMASK=<netmask from <hostname>-<ipaddress>-network-info.txt>
GATEWAY=<gateway from <hostname>-<ipaddress>-network-info.txt>
NM_CONTROLLED=no
ONBOOT=yes
```

   b. Submit the following command string.

```
systemctl restart network.service
```

8. Create the backup directory.

```
# mkdir -p /var/netwitness/database/nw-backup/
```

9. Copy the backup from the backup host from `/var/netwitness/database/nw-backup` to the new VLC in the `/var/netwitness/database/nw-backup` directory.
10. Complete the steps 2 through 12 inclusive in Set Up 11.2 Non-SA Server Host for the rest of the NetWitness Platform components . Make sure that you select **Log Collector** for the service in step 12.

Set Up 11.2 NW Server Host

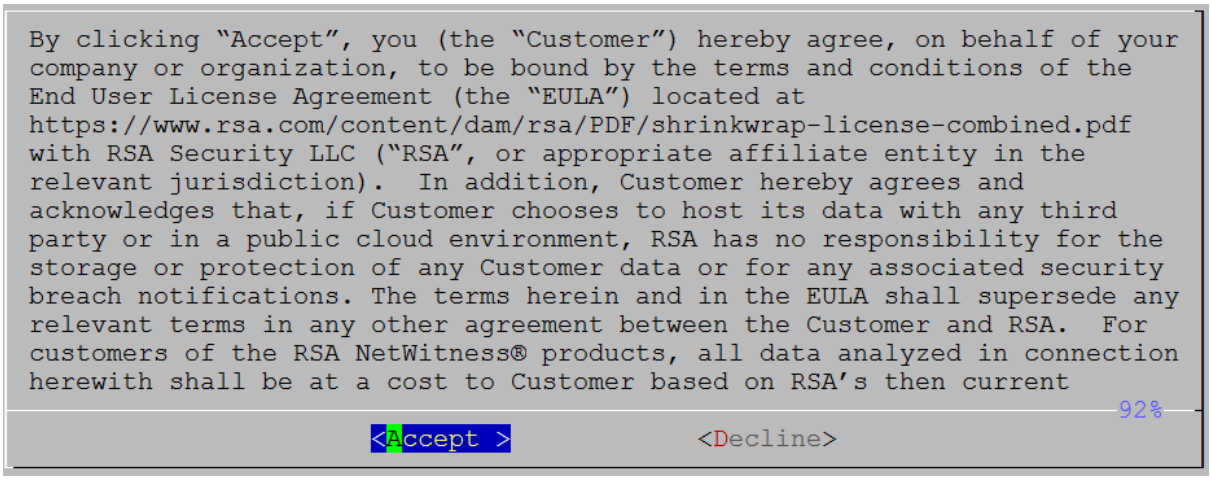
Make sure that you have backed up 10.6.6.x data for the SA Server host. **You must follow the instructions in Backup Instructions to back up the host.**

Caution: Run the backup immediately before upgrading the SA Server to 11.2 so that the data is as recent as possible. You must create the **all-systems** file before you upgrade the SA Server because you cannot do this after the SA Server has been upgraded to 11.2.

Complete the following steps to set up the 11.2 NW Server host.

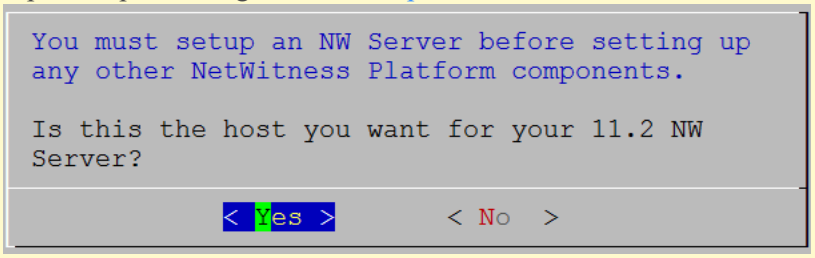
1. Power on the NW Server VM and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

   Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press the Enter key to register your command response and move to the next prompt.
   2.) The Setup program adopts the color scheme of the desktop or console you use access the host.

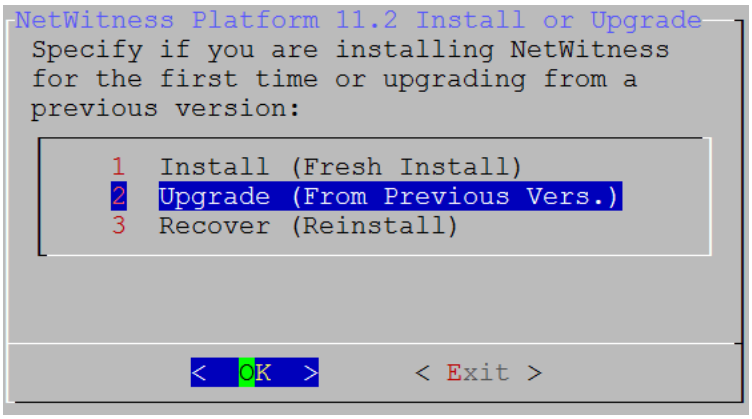


2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

   Caution: If you choose the wrong host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.2 NW Server Host to correct this error.



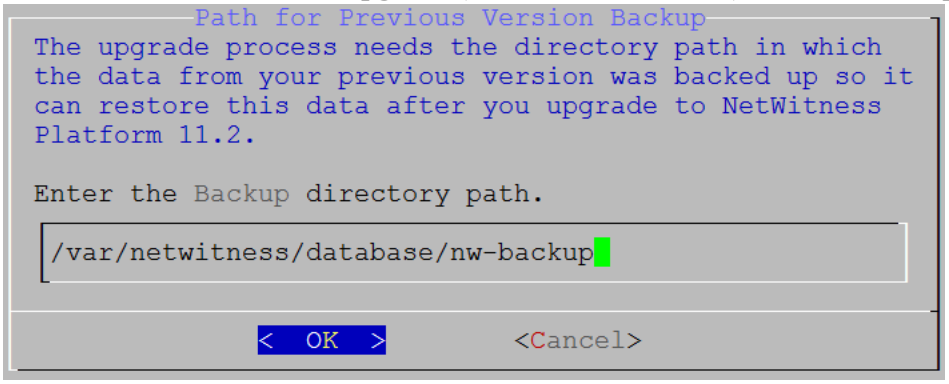
3. Tab to **Yes** and press **Enter**.
   Choose No if you already upgraded the NW Server to 11.2.
   The Install or Upgrade prompt is displayed.



The backup path is displayed.

Caution: The backup path in the following prompt must be the same as the path in which your backup is stored. For example, the backup script assigns **/var/netwitness/database/nw-backup** as the default path. If you used the default backup path during backup and did not change it subsequently, you must keep **/var/netwitness/database/nw-backup** as the path in the following prompt.

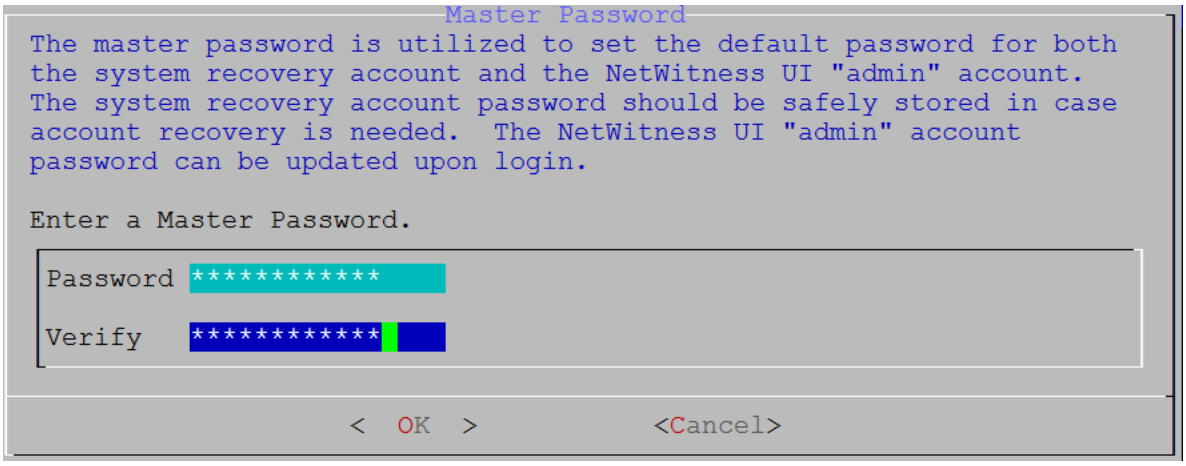
4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.



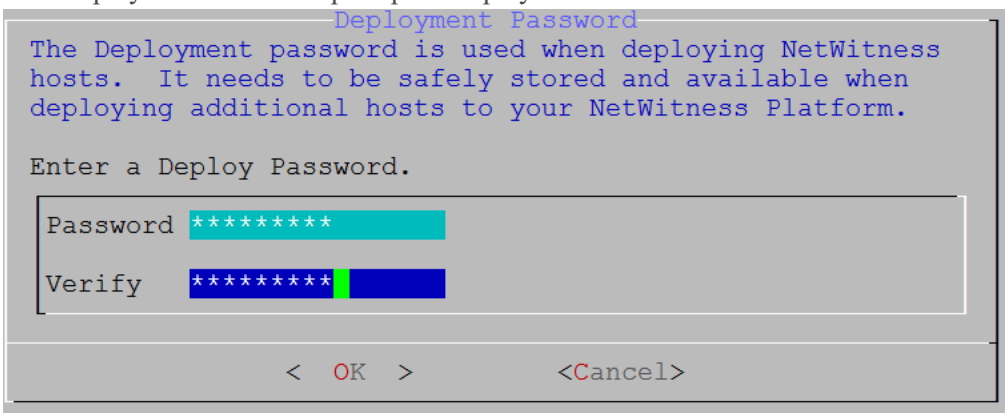
5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Master Password prompt is displayed.
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols : ! @ # % ^ +,
   - Numbers :0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

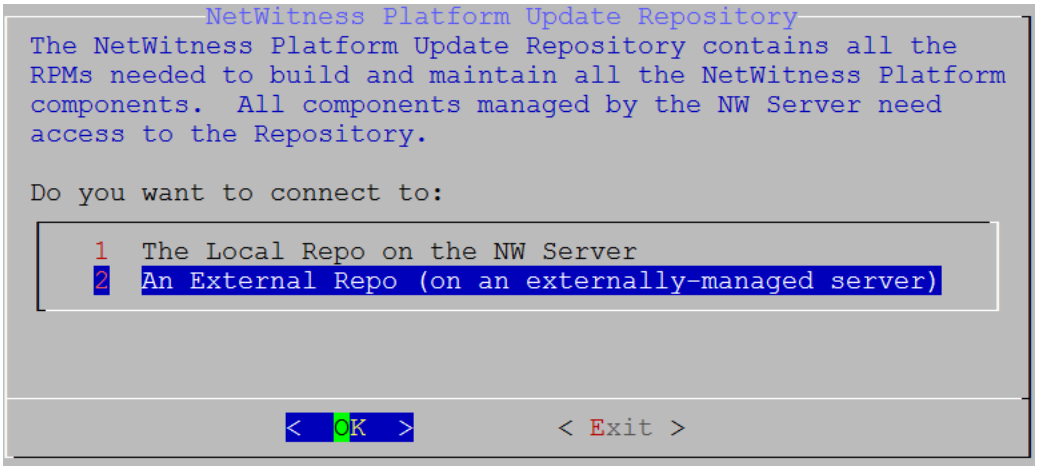
   No ambiguous characters are supported for Master Password and Deployment Password (for example: space { } [ ] ( ) / \ ' " ` ~ ; : . < > -).



6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The Deployment Password prompt is displayed.

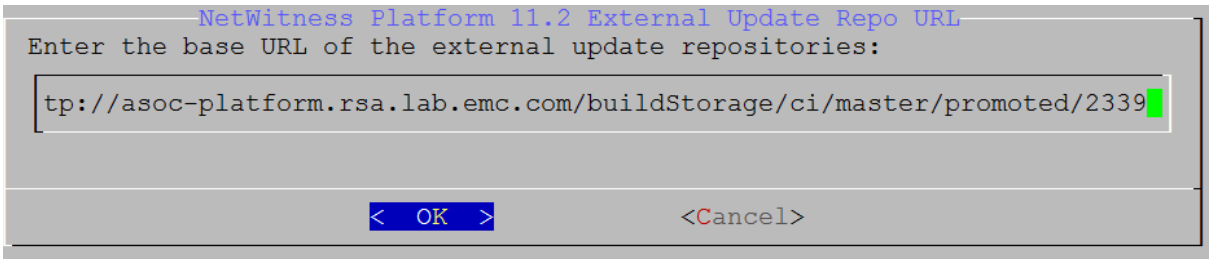


7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The Update Repo prompt is displayed.



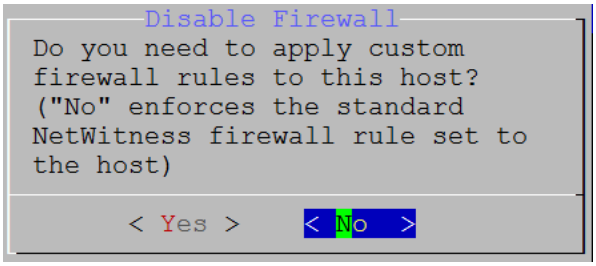
You must use the same repo that you used for the NW Server hosts for all hosts.

8. Use the down and up arrows to select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL.



See "Set Up an External Repository with RSA and OS Updates" under "Hosts and Services Procedures" in the *RSA NetWitness Suite 11.2 Hosts and Services Getting Started Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

9. Enter the base URL of the NetWitness Platform external repo and click **OK**.
   The disable or use standard firewall configuration prompt is displayed.

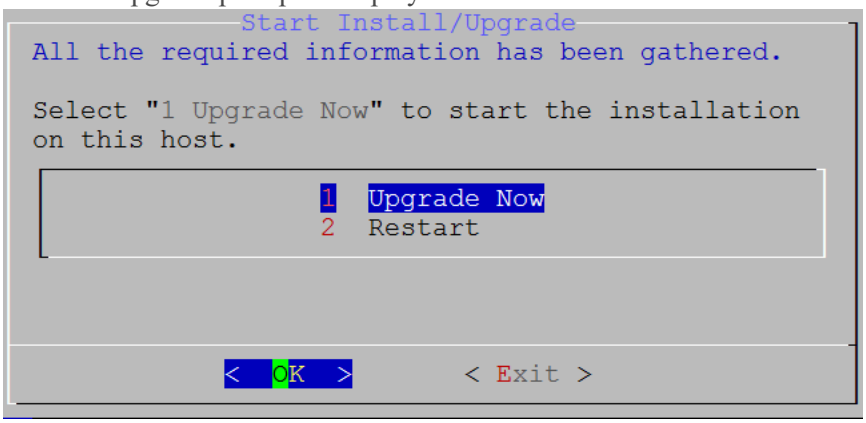


10. Tab to **No**, and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.

    - If you select Yes, confirm your selection.

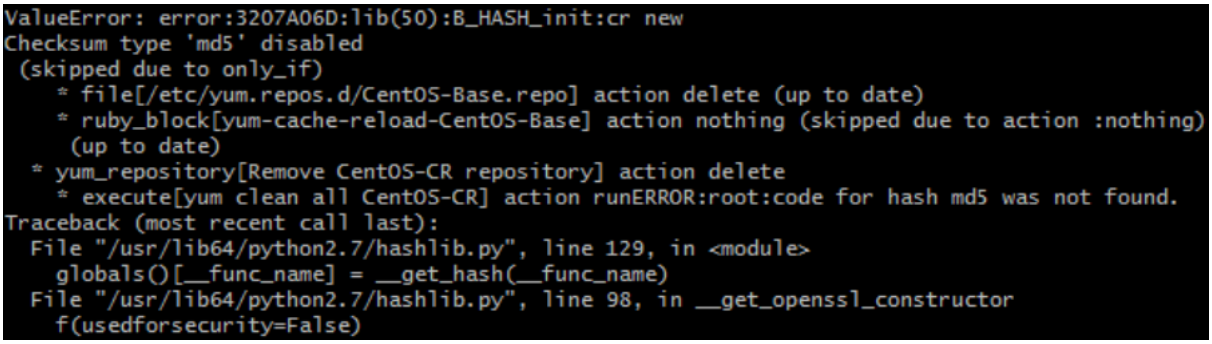
    - If you select No, the standard firewall configuration is applied.

The start upgrade prompt is displayed.



11. Select 1 **Upgrade Now**, tab to **OK**, and press Enter.
    When "Installation complete" is displayed, you have upgraded the 10.6.6.x SA Server to the 11.2 NW Server.

> **Note:** Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



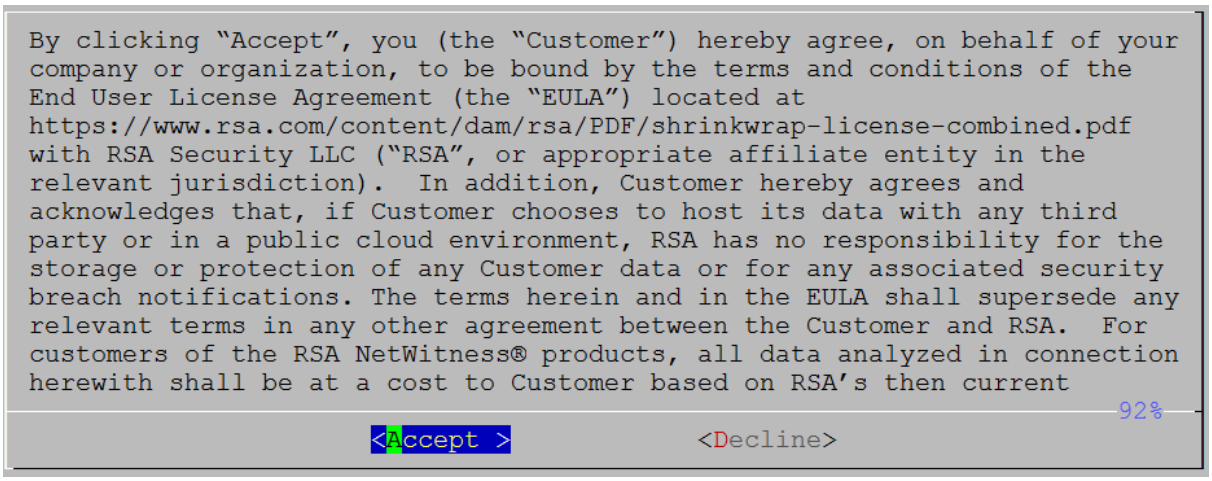
Set Up 11.2 Non-NW Server Host

Make sure that you Back up your 10.6.6.x data for the host. **You must follow the instructions in Backup Instructions to back up the host.**

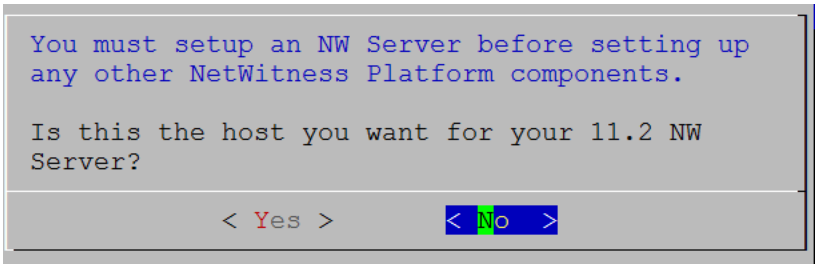
> **Caution:** Run the backup immediately before upgrading the host to 11.2 so that the data is as recent as possible.

Complete the following steps to set up an 11.2 Non-NW Server host.

1. **Power On** the non-NW Server VM and run the `nwsetup-tui` command.
   This initiates the Setup program and the EULA is displayed.

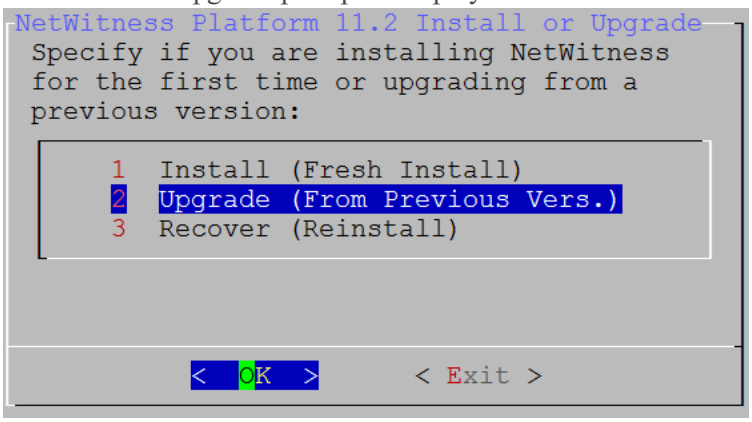


2. Tab to **Accept** and press **Enter**.
   The "Is this the NW Server" prompt is displayed.

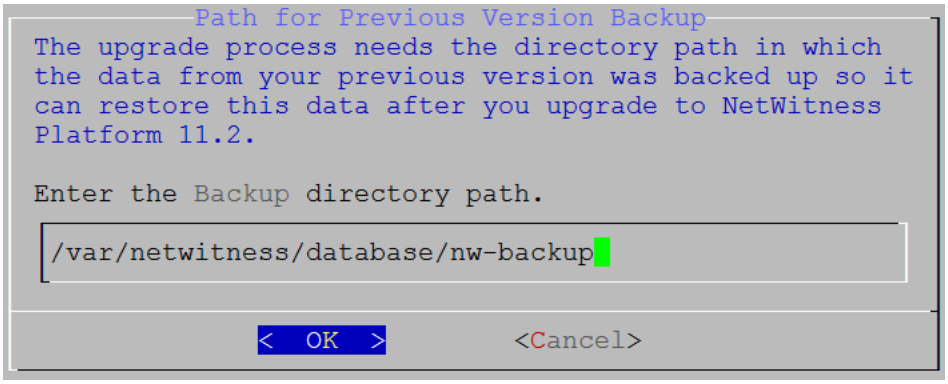


Caution: If you choose the wrong the host for the NW Server and complete the upgrade, you must repeat steps 1 through 11 of Set Up 11.2 NW Server Host to correct this error.

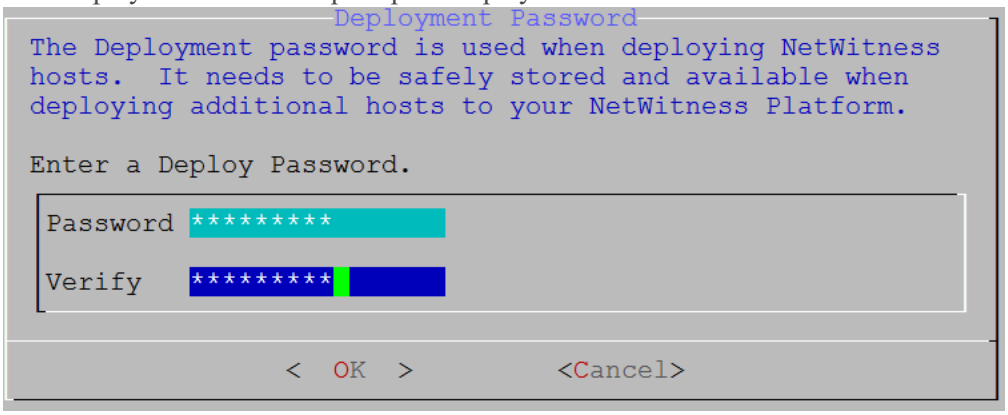
3. Tab to **No** and press **Enter**.
   The Install or Upgrade prompt is displayed.



4. Use down arrow to select **2 Upgrade (From Previous Vers.)**, tab to **OK**, and press **Enter**.
   The backup path prompt is displayed.

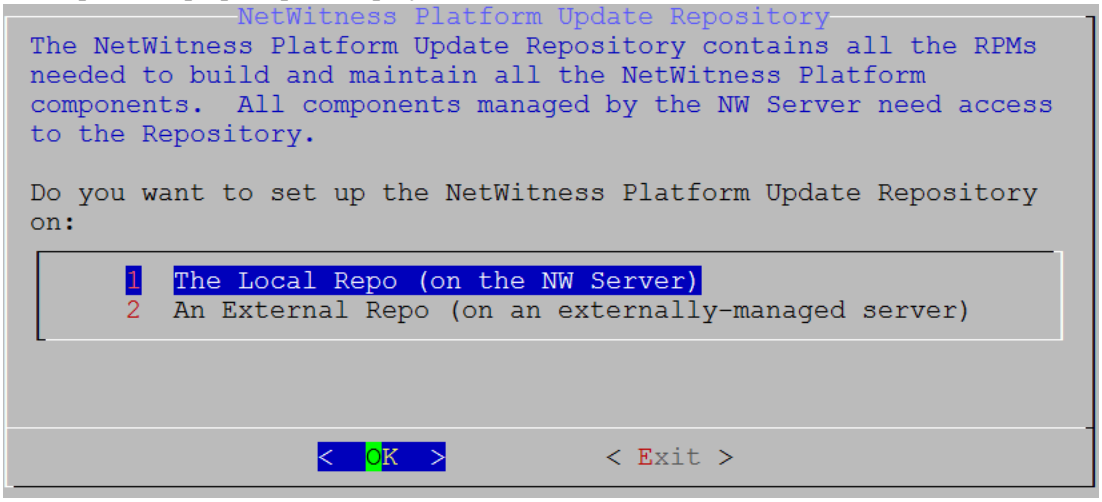


5. Tab to **OK** and press **Enter** if want to keep this path. If not, edit the path, tab to **OK** and press **Enter** to change it.
   The Deployment Password prompt is displayed.

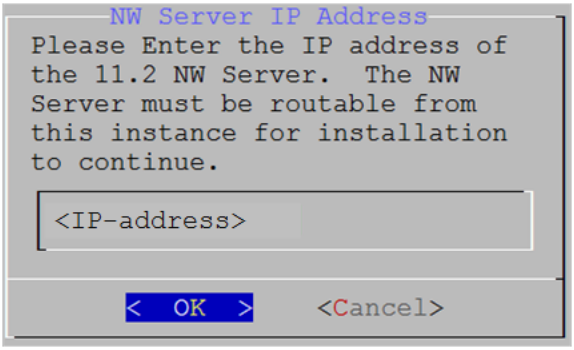


Note: You must use the same deployment password that you used when you upgraded the NW Server.

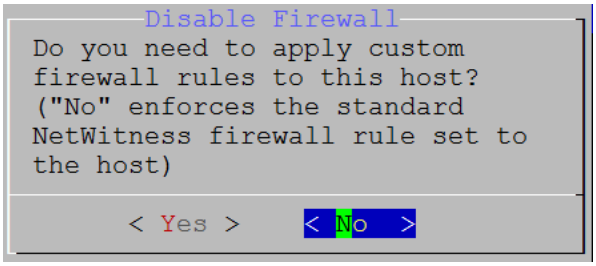
6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   The Update Repo prompt is displayed.



7. Use the down and up arrows to select the **2 The Local Repo (on the NW Server)**, tab to **OK**, and press **Enter**.
8. Enter the base URL of the NetWitness Platform external repo and click **OK**.
   The NW Server IP Address is displayed.



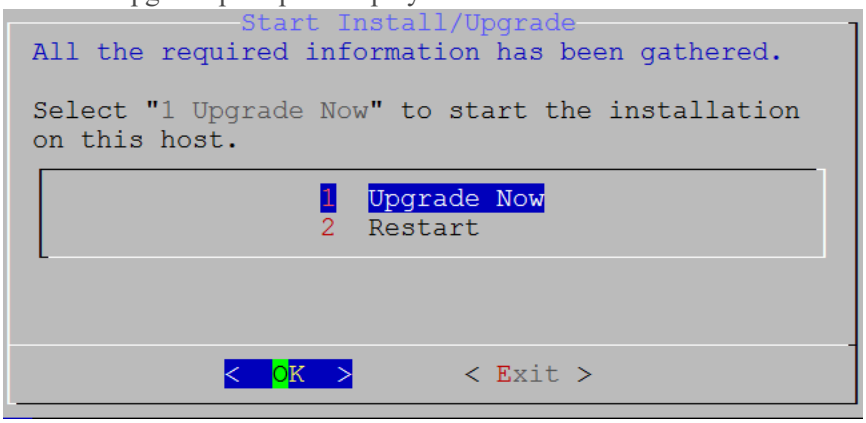
9. Type the IP address of the NW Server, tab to **OK**, and press **Enter**.
   The disable or use standard firewall configuration prompt is displayed.



10. Tab to **No**, and press Enter to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration.
    - If you select **Yes**, confirm your selection.

    - If you select **No**, the standard firewall configuration is applied.

The start upgrade prompt is displayed.

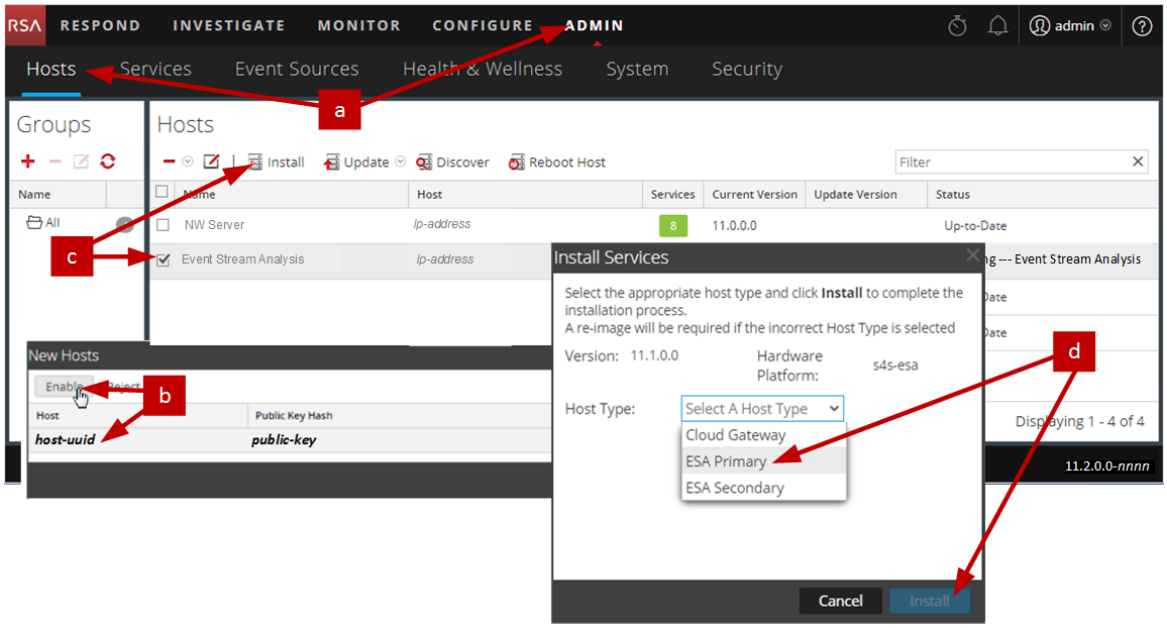


11. Select 1 **Upgrade Now**, tab to **OK**, and press **Enter**.
    When "Installation complete" is displayed, you have upgraded the host to the 11.2.
12. Install the service on this host:
    a. Log into NetWitness Platform.
       Type `https://<NW-Server-IP-Address>/login` in your browser to get to the NetWitness Platform Login screen
    b. Click **ADMIN** > **Hosts**.
       The **New Hosts** dialog is displayed with the **Hosts** view grayed out in the background.

       Note: If the **New Hosts** dialog is not displayed, click **Discover** in the Hosts view toolbar.

    c. Click on the host in the **New Hosts** dialog and click **Enable**.
       The **New Hosts** dialog closes and the host is displayed in the **Hosts** view.
    d. Select that host (for example, **Event Stream Analysis**) and click Install
       The **Install Services** dialog is displayed.

e. Select the appropriate service (for example, **ESA Primary**) and click **Install**.



You have completed the upgrade of the non-NW Server host in NetWitness Platform

Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness 11.2 Legacy Windows Collection Guide* on RSA Link (https://community.rsa.com/docs/DOC-75593) for details about how to install or update Legacy Windows collection.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Upgrade Tasks

This topic contains the tasks you must complete after you upgrade your hosts from 10.6.6.x to 11.2. These tasks are organized by the following categories.

- Global
- NetWitness Endpoint
  RSA supports NetWitness Endpoint versions 4.3.0.4, 4.3.0.5, and 4.4 only for NetWitness Platform 11.2.
- Event Stream Analysis
- Log Collection
- Reporting Engine
- Respond
- NetWitness SecOps Manager
- Security

Global Tasks

Task 1 - Make Sure Port 15671 Is Configured Correctly

Port 15671 is new in 11.x, but you do not need to open a firewall for this port. Make sure that 15671, and all ports, are configured as shown in the "Network Architecture and Ports" topic in the *RSA NetWitness® Platform Deployment Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 2 - Remove Backup-Related Files from Host Local Directories

Caution: 1) You must retain a copy of all backup files on an external host. 2) Validate that you have all your data from your backup restored in 11.2 before you remove the backup-related files from the local directories on your 11.2 hosts.

Backup `.tar` Files

After all the hosts are upgraded to 11.2, you must remove:

- the backup files from the local directories on the hosts.
- all the files from `nw-backup` and `restore` directories on the hosts.

Host	Backup Path	Restore Path
Event Stream Analysis	`/opt/rsa/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`
NW Server	`/var/netwitness/database/nw-backup`	`/var/netwitness/restore`
All Other Hosts	`/var/netwitness/database/nw-backup`	`/var/netwitness/database/nw-backup/restore`

Task 3 - Restore NTP Servers

You must use the NetWitness Platform 11.2 user interface to restore NTP server configurations. NTP server configuration information is located in `$BUPATH/restore/etc/ntp.conf`. Use the NTP server name and hostname from the `/var/netwitness/restore/etc/ntp.conf` file. See "Configure NTP Servers" in the *RSA NetWitness® Platform 11.2 System Configuration Guide* for detailed instructions on how to add NTP servers. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 4 - Restore Licenses for Environments without FlexNet Operations-On Demand Access

If your environment does not have access to FlexNet Operations-On Demand, you need to re-download your NetWitness Platform licenses. Refer to "Step 1. Register the NetWitness Server" in the *RSA NetWitness Suite Licensing Management Guide* for instructions on how to re-download licenses. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 5 - Remap Virtual NW Server License to 10.6.6.x MAC Address

If you are upgrading a Security Analytics server running on a virtual machine, change the 11.2 NW Server virtual host to the 10.6.6.x MAC address to retain licensing. Refer to "Licensing: Step 1. Register the NetWitness Server" in the *RSA NetWitness Suite Licensing Management Guide* for instructions on remapping a license to a new MAC address." Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

(Conditional) Task 6 - If You Disabled Standard Firewall Config - Add Custom IPtables

During the upgrade, you have the option of using these rules or disabling them. If you disabled them, follow these instructions as a baseline to create a user-managed firewall rule sets on all the hosts for which you disabled the standard firewall configuration.

Note: You can refer to the `$BUPATH/restore/etc/sysconfig/iptables` and `$BUPATH/restore/etc/sysconfig/ip6tables` in the restore folder of the backup to update the `ip6tables` and `iptables` files. The `/etc/netwitness/firewall.cfg` file contains the standard `iptables` firewall rules.

1. SSH to each host and log in with your root credentials.
2. Update the following `ip6tables` and `iptables` files with the custom firewall rules.
   ```
   /etc/sysconfig/iptables
   /etc/sysconfig/ip6tables
   ```
3. Reload the `iptables` and `ip6tables` services.
   ```
   service iptables reload
   service ip6tables reload
   ```

(Conditional) Task 7 - Specify SSL Ports If You Never Set Up Trusted Connections

Complete this task only if you never set up Trusted Connections. You would not have set up Trusted Connections if you:

- Used the base ISO image for 10.3.2 or earlier.
- Updated the system using RPMs exclusively to get to 10.6.6.

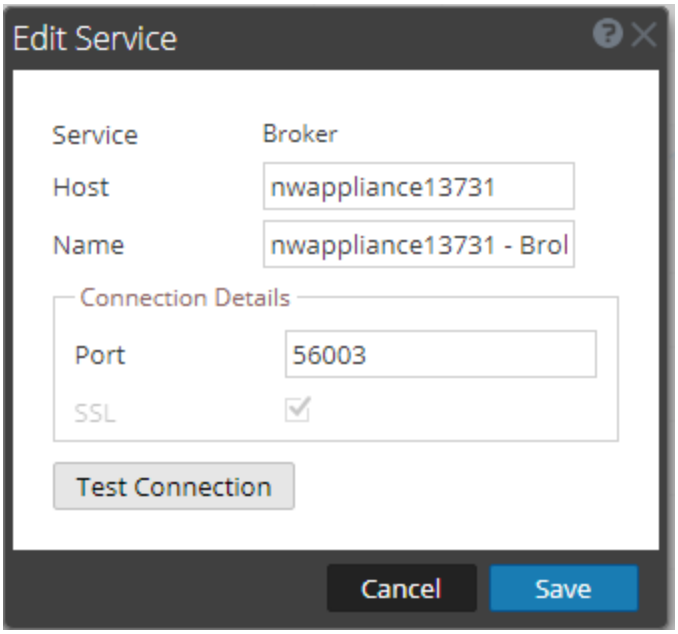
NetWitness Platform 11.2 cannot communicate with the core services for these customers because they are using a non-SSL port 500XX. You must update the Core service ports to an SSL port in the Edit Service dialog.

1. Log in to NetWitness Platform
2. Go to **ADMIN** > **Services**.
3. Select each core service and change there ports from Non-SSL to SSL ports.

Service	Non-SSL	SSL
Broker	50003	56003
Concentrator	50005	56005
Decoder	50004	56004
Log Decoder	50002	56002

4. Click (Edit) from the **Services** view toolbar.
   The Edit Service dialog is displayed.

5. Change the port from Non-SSL to SSL as shown in the table and click **Save**(for example, change the Broker port from 50003 to 56003).



NetWitness Endpoint

Task 8 - Reconfigure Endpoint Alerts Via Message Bus

1. On the NetWitness Endpoint Server, modify the virtual host configuration in the `C:\Program Files\RSA\ECAT\Server\ConsoleServer.exe` file to reflect the following configuration.
   `<add key="IMVirtualHost" value="/rsa/system" />`

   Note: In NetWitness Platform 11.2, the virtual host is `/rsa/system`. For 10.6.6.x and earlier versions, the virtual host is `/rsa/sa`.

2. Restart the API Server and Console Server.
3. SSH to the NW Server and log in with `root` credentials.
4. Submit the following command to add all certificates to the truststore.
   `orchestration-cli-client --update-admin-node`
5. Submit the following command to restart the RabbitMQ server.
   `systemctl restart rabbitmq-server`
   The NetWitness Endpoint account should automatically be available on RabbitMQ.
6. Import the `/etc/pki/nw/ca/nwca-cert.pem` and `/etc/pki/nw/ca/ssca-cert.pem` files from the NW Server and add them to the Trusted Root Certification stores in the Endpoint Server.

Event Stream Analysis Tasks (ESA)

Task 9 - Reconfigure Automated Threat Detection for ESA

If you used Automated Threat Detection in 10.6.6.x, you must complete the following steps to reconfigure it using the ESA Analytics service in 11.2.

1. Log in to NetWitness Platform 11.2
2. Click **ADMIN** > **System** > **ESA Analytics**.
   The Suspicious Domains modules, Command and Control (C2) for Packets and C2 for Logs, require a whitelist named "**domains_whitelist**".
3. Conditional - If your previous Automated Threat Detection whitelist appears on the **Lists** tab of the Context Hub service:
   a. Click **ADMIN**> **Services**, select the Context Hub service, in the action commands () drop-down menu, click **View** > **Config** > **Lists** tab).
   b. Rename your old Automated Threat Detection whitelist to "`domains_whitelist`" for the Suspicious Domains module.

For more information, see the *NetWitness Suite Automated Threat Detection Guide* and the "Configure ESA Analytics" section of the *NetWitness Platform ESA Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 10 - For Integrations with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint Configure Mutually Authenticated SSL

If you integrate with Web Threat Detection, Archer Cyber Incident & Breach Response or NetWitness Endpoint, you must configure Mutually Authenticated SSL on each integrated system so that the application can authenticate itself when connecting to the RabbitMQ message bus.

Note: Use the RabbitMQ usernames and passwords that were obtained when you backed up your 10.6.6.x data (see Backup Instructions).

1. Create a user on the host system that is integrating with NetWitness Platform by logging into the host and running the following `rabbitmqctl` command.
   ```
   > rabbitmqctl add_user <username> <password>
   ```
   For example:
   ```
   > rabbitmqctl add_user wtd-incidents incidents
   ```
2. Set permissions for users by running the following command (use the username from step 1):
   ```
   > rabbitmqctl set_permissions -p /rsa/system <username> ".*", ".*", ".*"
   ```
   For example:
   ```
   > rabbitmqctl set_permissions -p /rsa/system wtd-incidents ".*", ".*", ".*"
   ```

Task 11 - Enable Threat - Malware Indicators Dashboard

In 11.0, the 10.6.6.x **Threat -Indicators Dashboard** was renamed to **Threat - Malware Indicators Dashboard**. If you used this dashboard in 10.6.6.x, you must:

1. Enable the **Threat - Malware Indicators Dashboard** in 11.2.
2. Set datasource for new dashlets.
   See "Dashlets" in the RSA Link (https://community.rsa.com/docs/DOC-81463).

Log Collection

Task 12 - Reset Stable System Values for Log Collector after Upgrade

Complete the following tasks to reset stable system values for the Log Collector after you upgrade it to 11.0 to ensure that all collection protocols resume normal operation.

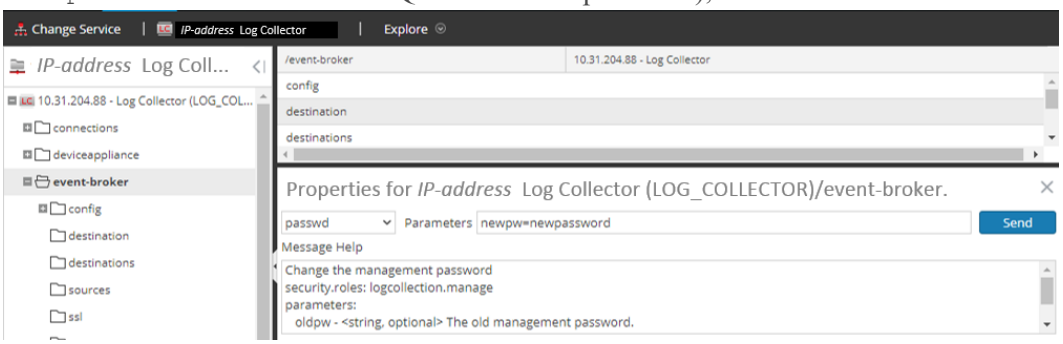
Reset Stable System Values for the Lockbox

The Lockbox stores the key for encrypting event source and other passwords for the Log Collector. The Log Collector service cannot open the Lockbox because of the stable system value changes. As a result, you must Reset Stable System Values for the Lockbox . See "Log Collection: Step 3. Set Up a Lockbox" in the *RSA NetWitness® PlatformLog Collection Configuration Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Update Log Collector Service RabbitMQ User Account Password

If the logcollector service RabbitMQ user account password was changed, you must reenter it after the 11.0 upgrade.

1. Log in to NetWitness Platform.
2. Click **ADMIN > Services**.
3. Select the Log Collector service.
4. Click  (Actions) > **View** > **Explore**.
5. Right click `event-broker` > **Properties**.
6. Select `passwd` from the drop-down list, enter `newpw=><newpassword>` in Parameters (where `<newpassword>` is the RabbitMQ user account password), and click **Send**.



(Optional for Upgrades from 10.6.6.x with FIPS enabled for Log Collectors, Log Decoders and Packet Decoders) Task 13 - Enable FIPS Mode

FIPS is enabled on all services except Log Collector Log Decoder, and Decoder. FIPS cannot be disabled on any services except Log Collector, Log Decoder, and Decoder. For information about how to enable FIPS for these services, see the "Sys Maintenance: Activate or Deactivate FIPS" topic in the *RSA NetWitness® PlatformSystem Maintenance Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Reporting Engine

Task 14 - Restore the CA certificates for External Syslog Servers for Reporting Engine

You must restore CA certificates after the upgrade from the back up you made prior to the upgrade. The Backup script backs up the 10.6.6.x CA certificates into the `/usr/lib/jvm/java-1.8.0-openjdk-1.8.0.111-0.b15.el6_8.x86_64/jre/lib/security/cacerts` directory.

Complete the following procedure to restore the CA certificates in 11.2.

1. SSH to the NW Server host.
2. Export the CA certificates.
   ```
   keytool -export -alias <alias_name> -keystorepath_to_keystore_file -rfc -file path_to_certificate_file
   ```
3. Copy the CA pem into `/etc/pki/nw/trust/import` directory.

(Conditional) Task 15 - Restore External Storage for Reporting Engine

If you have external storage for the Reporting Engine (such as SAN or NAS for storing reports), you must restore the mount you unlinked before the upgrade. See "Reporting Engine: Add Additional Space for Large Reports" in the *RSA NetWitness® Platform Reporting Engine Configuration Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Respond

Task 16 - Restore Respond Service Custom Keys

In 10.6.6.x, if you added custom key for use in the groupBy clause, the `alert_rules.json` file was modified. The `alert_rules.json` file contains aggregation rule schema. RSA moved the `alert_rules.json` file to the following new location:
`/var/lib/netwitness/respond-server/scripts`

1. Copy the custom keys from `/opt/rsa/im/fields/alert_rules.json` file in the backup directory.
   This directory is where the `alert_rules.json` file is restored from the 10.6.6.x backup.

2. Go to the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` in 11.0.
   This is the new file for 11.0.
3. Edit the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` to include the custom keys you copied in step one.

Task 17 - Restore Customized Respond Service Normalization Scripts

RSA re-factored the Respond service normalization scripts in 11.0 and moved them to the following new location:
`/var/lib/netwitness/respond-server/scripts`
If you customized these scripts in 10.6.6.x, you must:

1. Go to the to the `/opt/rsa/im/scripts` directory.
   This directory is where the following Respond service normalization scripts are restored from the 10.6.6.x backup.
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`
   `normalize_ecat_alerts.js`
   `normalize_ma_alerts.js`
   `normalize_wtd_alerts.js`
   `utils.js`
2. Copy any custom logic from the 10.6.6.x scripts.
3. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
   This directory is where NetWitness Platform 11.0 stores the re-factored scripts.
4. Edit the new scripts to include the custom logic you copied in step 2 from the 10.6.6.x scripts.
5. Copy any custom logic from `/opt/rsa/im/fields/alert_rules.json` file.
   The `alert_rules.json` file contains aggregation rule schema.

(Conditional) Task 18 - Restore Custom Analysts Roles

If you had custom analyst roles in 10.6.6.x, you must reinstate them in 11.2. See *Adding Roles and Assigning Permissions for the Roles* in the *RSA NetWitness Platform Warehouse Analytics Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NetWitness SecOps Manager

Task 19 -Reconfigure NW SecOps Manager Integration

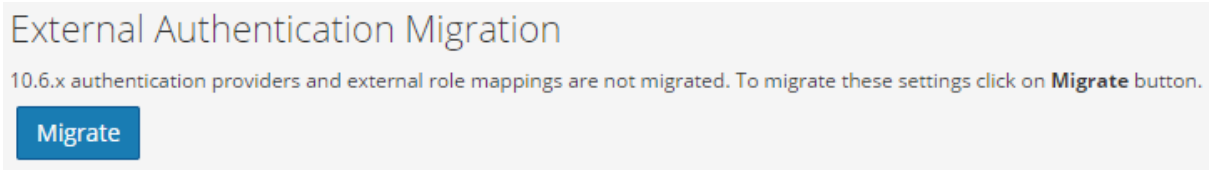
For information on how to reconfigure NW SecOps for Event Stream Analysis, Reporting Engine, and Respond, see *RSA Archer Integration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Security

Task 20 - Migrate Active Directory (AD)

The first time you log into the NetWitness Platform 11.2 User Interface, you must click on the Migrate button to complete the migration of AD.

1. Log in to NetWitness Platform with your `admin user` credentials.
2. Click **ADMIN** > **SECURITY** and click the **Settings** tab.
   The following dialog is displayed.



3. Click **Migrate**.
   The migration is complete and the dialog closes.

Task 21 - Modify Migrated AD Configuration to Upload Certificate

If the you used a self-signed certificate in Active Directory (AD) server, and enabled SSL for the AD connection in 10.6.6.x, you must modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

Complete the following procedure to modify the migrated AD configuration to upload the certificate (either the self-signed cert or the CA cert).

1. Log in to NetWitness Platform.
2. Click **ADMIN** > **Security** and click the **Settings** tab.
3. Under **Active Directory Settings**, select an AD configuration and click .
   The Edit Configuration dialog is displayed.
4. Go to the **Certificate File** field, click **Browse**, and select a certificate from your network.
5. Click **Save**.

Task 22 - Reconfigure Pluggable Authentication Module (PAM) in 11.2

You must reconfigure PAM after you upgrade to 11.2. See "Configure PAM Login Capability" in the *RSA NetWitness® Platform System Security and User Management Guide*for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

You can refer to your 10.6.6.x PAM configuration files in the **/etc** directory in the your 10.6.6.x backup data for guidance.

Appendix A. Troubleshooting

This section describes problems that you may encounter during the upgrade with solutions. In most cases, NetWitness Platform creates log messages when it encounters these problems.

Note: If you cannot resolve any upgrade issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294)

This section has troubleshooting documentation for the following services, features, and processes.

- 11.2 Setup Program (`nwsetup-tui`)
- Backup
- Event Stream Analysis
- General
- Log Collector Service (`nwlogcollector`)
- NW Server
- Reporting Engine

11.2 Setup Program (`nwsetup-tui`)

Problem	Host Setup Program (`nwsetup-tui`) exits and creates the following error message in `/var/log/netwitness/bootstrap/launch/security-server/security-server.log`: `<yyyy-mm-dd hh:mm:ss,nnn> [main] ERROR SystemOperation|Service startup failed. Running in safe mode org.h2.jdbc.JdbcSQLException: The database is read only [90097-193] at org.h2.message.DbException. getJdbcSQLException(DbException.java:345) ... at org.springframework.jdbc.datasource. AbstractDriverBasedDataSource.getConnection (AbstractDriverBasedDataSource.java:159) at com.rsa.asoc.security.upgrade.legacy. MigrationDatabase.<init>(MigrationDatabase.java:113)`
Cause	The H2 database needs write permission to complete the host setup.

Solution	From the NW Server command line, provide write permission to `H2.db`, restart the NW Server, and restart nwsetup-tui Setup Program.
	`chmod o+w /var/lib/netwitness/uax/db/platform.h2.db`
	`systemctl restart rsa-nw-security-server.service`
	`nwsetup-tui`

Backup (`nw-backup` script)

Message	`WARNING: Incorrect ESA Mongo admin password for host <hostname>.`
Cause	ESA Mongo admin password contains special characters (for example, '!@#$%^qwerty').
Solution	Change the ESA mongo admin password back to the original default of 'netwitness' before running backup. See "ESA Config: Change MongoDB Password for admin Account" the the *RSA NetWitness® Platform Event Stream Analysis Configuration Guide. Go to the* Master Table of Contents *to find all NetWitness Platform Logs & Network 11.x documents.*

Event Stream Analysis

Problem	ESA service crashes after you upgrade to 11.2 from a FIPS enabled setup.
Cause	ESA service is pointing to an invalid keystore.

Solution	1. SSH to the ESAPrimary host and log in.
	2. In the `/opt/rsa/esa/conf/wrapper.conf` file, replace the following line:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/esa/../carlos/keystore`
	with:
	`wrapper.java.additional.5=-Djavax.net.ssl.keyStore=/opt/rsa/carlos/keystore`
	3. Submit the following command to restart ESA .
	`systemctl restart rsa-nw-esa-server`
	Note: If you have multiple ESA hosts and you encounter that same problem, repeat steps 1 through 3 inclusive on each secondary ESA host.

General

Logs referred to in this section are posted to `/var/log/install/install.log` on the NW Server Host.

Message	`ERROR com.rsa.smc.sa.admin.web.controller.ajax.health.AlarmsController - Cannot connect to System Management Service`
Cause	NetWitness Platform sees the Service Management Service (SMS) as down after successful upgrade even though the service is running.
Solution	Restart SMS service using below command. `systemctl restart rsa-sms`

Message	`<timestamp> <host>: SMS_PostInstall: INFO: Free disk space on /opt is nGB` `<timestamp> <host>: SMS_PostInstall: WARN: Disk space check failed on /opt. The available disk space nGB is less than the recommended minimum disk space of 10GB.`
Cause	Low or insufficient disk space allocated for the SMS service.
Solution	RSA recommends that you provide a minimum of 10 GB of disk space for the SMS service to run optimally.

Problem	After you run the Setup Program for a non-NW Server host, you must go in to the UI, enable the host, and install the service on the host from the Hosts View. If you see "Install error View Details" in the **Status** column of the Hosts view, the host lost connectivity due to network issues.
Solution	Re-install the service on the host from the Hosts view.

Log Collector Service (`nwlogcollector`)

Log Collector logs are posted to `/var/log/install/nwlogcollector_install.log` on the host running the `nwlogcollector` service.

Message	`<timestamp>.NwLogCollector_PostInstall: Lockbox Status : Failed to open lockbox: The lockbox stable value threshold was not met because the system fingerprint has changed. To reset the system fingerprint, open the lockbox using the passphrase.`
Cause	The Log Collector Lockbox failed to open after the update.
Solution	Log in to NetWitness Platform and reset the system fingerprint by resetting the stable system value password for the Lockbox as described in the "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Message	*timestamp* `NwLogCollector_PostInstall: Lockbox Status : Not Found`
Cause	The Log Collector Lockbox is not configured after the update.
Solution	(Conditional) If you use a Log Collector Lockbox, log in to NetWitness Platform and configure the Lockbox as described in the"Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents..

Message	`<timestamp>: NwLogCollector_PostInstall: Lockbox Status : Lockbox maintenance required: The lockbox stable value threshold requires resetting. To reset the system fingerprint, select Reset Stable System Value on the settings page of the Log Collector.`
Cause	You need to reset the stable value threshold field for the Log Collector Lockbox.
Solution	Log in to NetWitness Platform and reset the stable system value password for the Lockbox as described in "Reset the Stable System Value" topic under "Configure Lockbox Security Settings" topic in the *Log Collection Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Problem	You have prepared a Log Collector for upgrade and no longer want to upgrade at this time.
Cause	Delay in upgrade.
Solution	Use the following command string to revert a Log Collector that has been prepared for upgrade back to resume normal operation. `# /opt/rsa/nwlogcollector/nwtools/prepare-for-migrate.sh --revert`

NW Server

These logs are posted to `/var/netwitness/uax/logs/sa.log` on the NW Server Host.

Problem	After upgrade, you notice that Audit logs are not getting forwarded to the configured Global Audit Setup; or, The following message seen in the sa.log. `Syslog Configuration migration failed. Restart jetty service to fix this issue`
Cause	NW Server Global Audit setup migration failed to migrate from 10.6.6 to 11.2.
Solution	1. SSH to the NW Server. 2. Submit the following command. `orchestration-cli-client --update-admin-node`

Reporting Engine Service

Reporting Engine Update logs are posted to to`/var/log/re_install.log` file on the host running the Reporting Engine service.

Message	`<timestamp> : Available free space in /home/rsasoc/rsa/soc/reporting-engine [ existing-GB ] is less than the required space [ required-GB ]`
Cause	Update of the Reporting Engine failed because you do not have enough disk space.
Solution	Free up the disk space to accommodate the required space shown in the log message. See the "Add Additional Space for Large Reports" topic in the *Reporting Engine Configuration Guide* for instructions on how to free up disk space. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Appendix B. Stopping and Restarting Data Capture and Aggregation

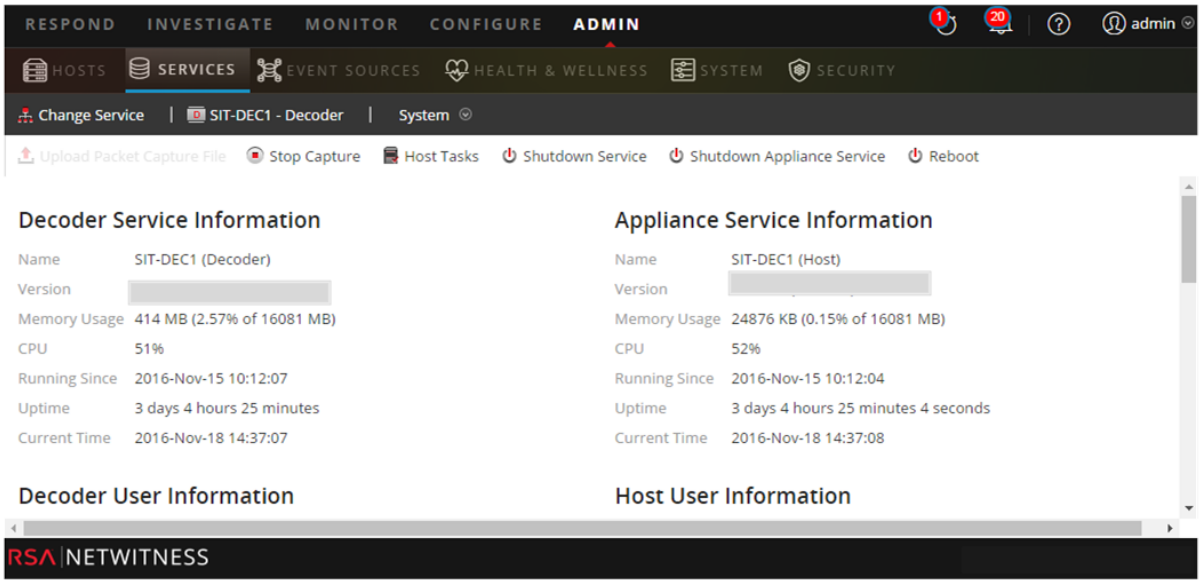
RSA recommends that you stop packet and log capture and aggregation before upgrading a Decoder, Concentrator, and Broker host to 11.2. If you do this, you must restart packet and log capture and aggregation after updating these hosts.

Stop Data Capture and Aggregation

Stop Packet Capture

To stop packet capture:

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

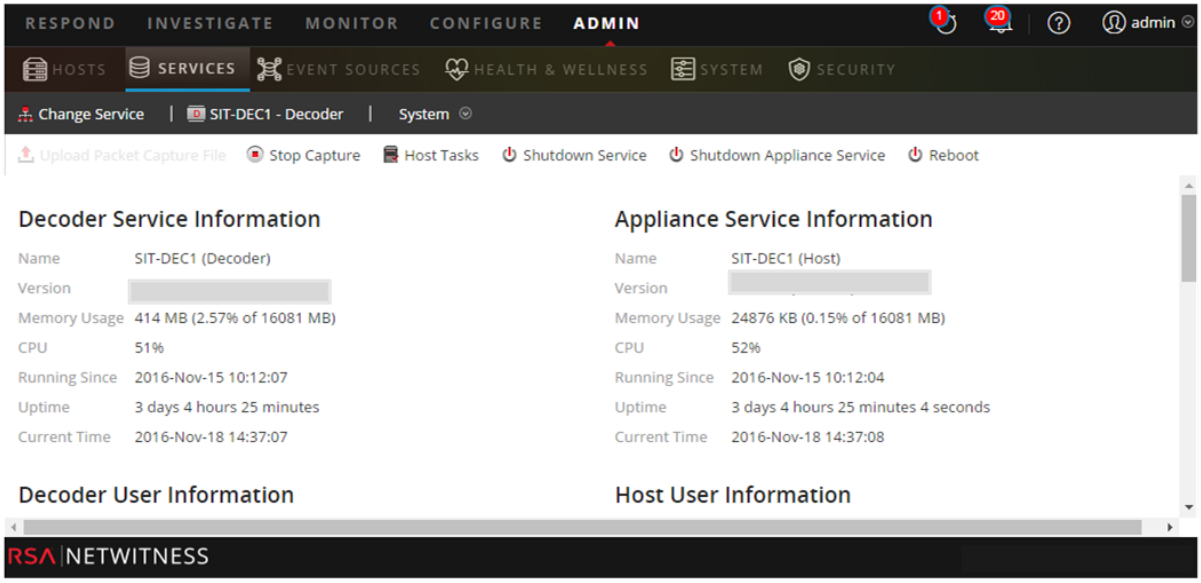
.

Stop Log Capture

To stop log capture:

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.



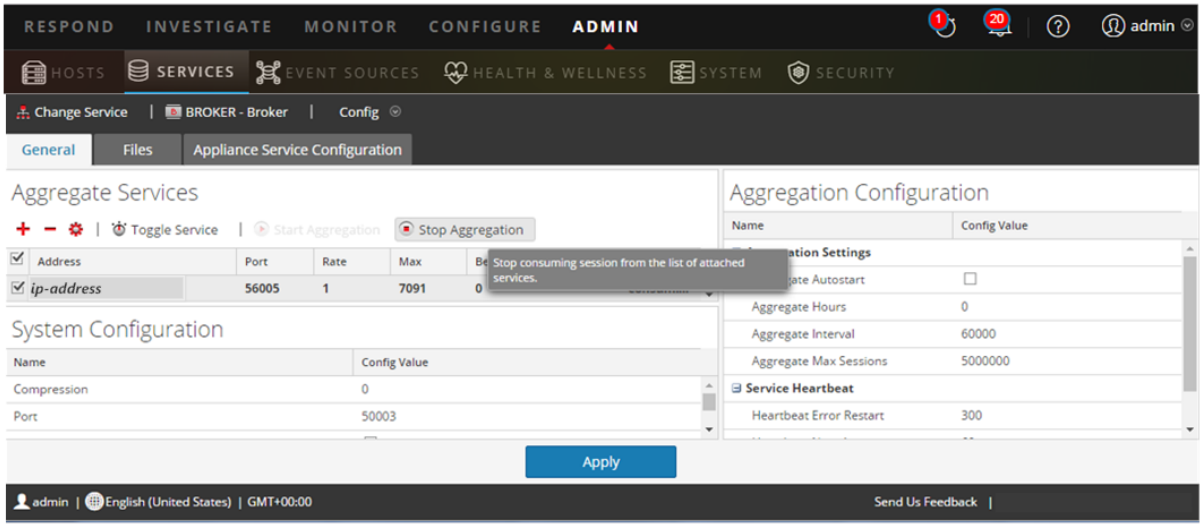
3. Under  (actions), select **View** > **System**.

4. In the toolbar, click 

.

Stop Aggregation

1. Log in to NetWitness Platform and go to **ADMIN** > **Services**.
2. Select the **Broker** service.
3. Under  (actions), select **View** > **Config**.
4. The **General** tab is displayed.



5. Under **Aggregated Services** click 
.

Start Data Capture and Aggregation

Restart packet and log capture and aggregation after updating to 11.2.

Start Packet Capture

To start packet capture:

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 
.

Start Log Capture

To start log capture:

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 
.

Start Aggregation

During the upgrade from 10.6.6.x to 11.2, the Broker Service is restarted and this automatically starts aggregation.

August 2018

Contents

Introduction

RSA NetWitness® Platform 11.2.0.0 provides fixes for all products in the Platform. The components of the Platform are the NetWitness Server (Admin server, Config server, Integration server, Investigate server, Orchestration server, Respond server, Security sever, and Source server), Archiver, Broker, Concentrator, Context Hub, Decoder, Endpoint Hybrid, Endpoint Log Hybrid, ESA Primary, ESA Secondary, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, UEBA, Warehouse Connector, and Workbench.

Note: The Reporting Engine is installed on the NW Server host, Workbench is installed on the Archiver host, Warehouse Connector can be installed on the Decoder host or Log Decoder host.

The instructions in this guide apply to both physical and virtual hosts (including AWS and Azure Public Cloud) unless stated to the contrary.

Update Path

The following update paths are supported for NetWitness Platform 11.2.0.0:

- 11.0.x to 11.2.0.0
- 11.1.x to 11.2.0.0
- 10.6.6.x to 11.2.0.0
  Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents. See the *RSA NetWitness Platform 10.6.6.x to 11.2 Physical Host Upgrade Guide* and *RSA NetWitness Platform 10.6.6.x to 11.2 Virtual Host Upgrade Guide* for instructions on how to upgrade 10.6.6.x to 11.2.0.0.

Running in Mixed Mode

Running in mixed mode occurs when some services are updated to the latest version and some services are on older versions. See "Running in Mixed Mode" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for further information.

Entropy=log2 flag Reset After Update

If your `Entropy=log2` flag is set to `false` (`Entropy="log2=false"`) in 11.0.x.x , NetWitness resets this flag to true (`Entropy="log2=true"`) after you upgrade to 11.2 to align for all sources to include packets and NetWitness Endpoint Insights. If desired, you can set the flag back to false to retain the log10 calculation: `Entropy="log2=false"`.

Update Preparation Tasks

Complete the following tasks to prepare for the update to NetWitness Platform 11.2.0.0. These tasks are organized by the following categories.

General

Task 1 - Review Core Ports and Open Firewall Ports

The following tables lists new ports in 11.2.0.0.

Caution: Make sure that the new ports are implemented and tested before updating so that update does not fail due to missing ports.

Endpoint Hybrid or Endpoint Log Hybrid

Source Host	Destination Host	Destination Ports	Comments
Endpoint Hybrid or Endpoint Log Hybrid	NW Server	TCP 5672	Message Bus
Endpoint Server	NW Server	TCP 27017	MongoDB

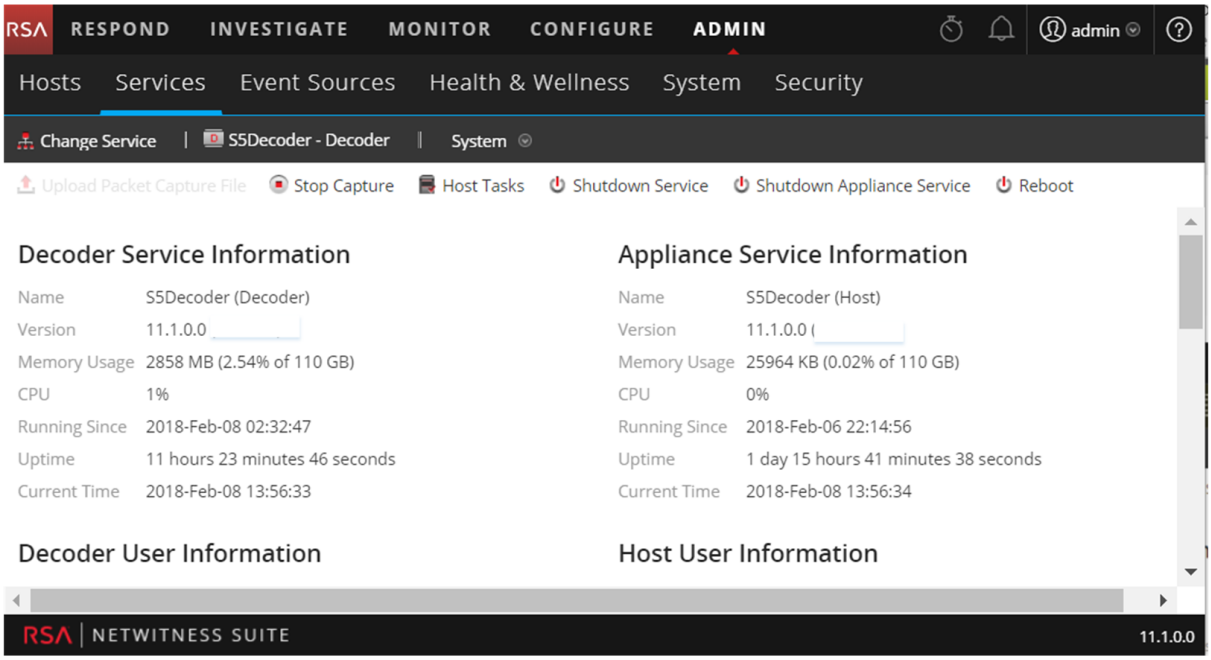
Task 2- Back Up Malware Analysis Configuration File to Another Directory

1. Make a backup of the following file to another, safe directory.
   `/var/lib/netwitness/malware-analytics-server/spectrum/conf/malwareCEFDictionaryConfiguration.xml`
   You need to retrieve your custom parameter values from this backup after you update the Malware Analysis host to 11.2.0.0. The update creates a new configuration file with all the parameters set to the default values.
2. Delete the following file.
   `/var/lib/netwitness/malware-analytics-server/spectrum/conf/malwareCEFDictionaryConfiguration.xml`

Task 3 - Stop Data Capture and Aggregation

Stop Network Capture

1. Log in to NetWitness Platform 11.0.x and go to **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.



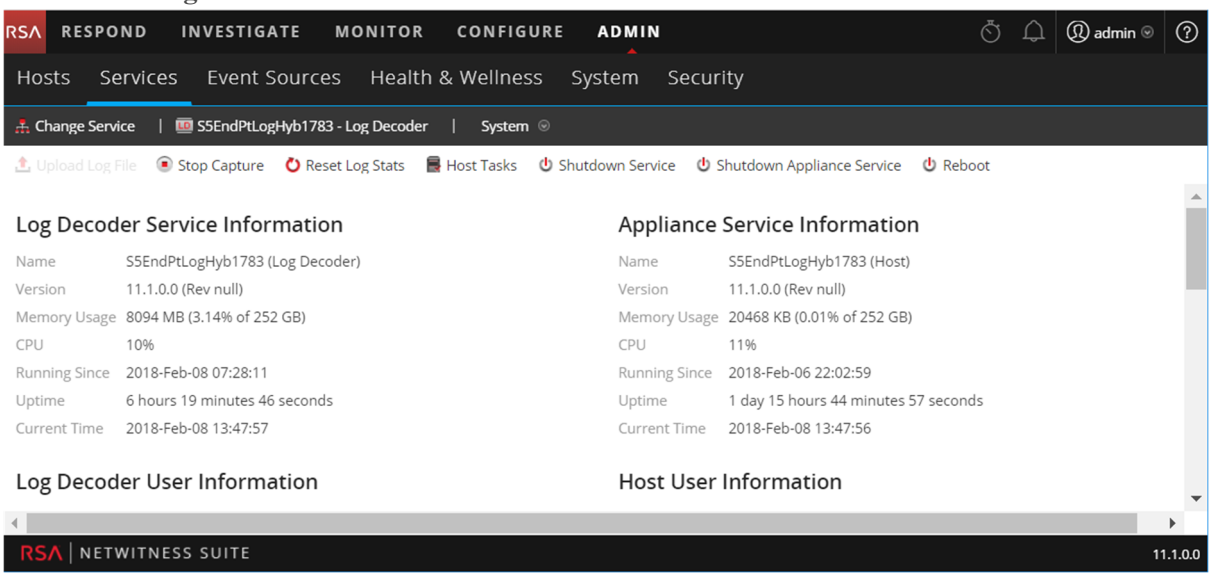
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click 

.

Stop Log Capture

1. Log in to NetWitness Platform 11.0.x and go to **ADMIN** > **Services**.
   The Services view is displayed.

2. Select each **Log Decoder** service.

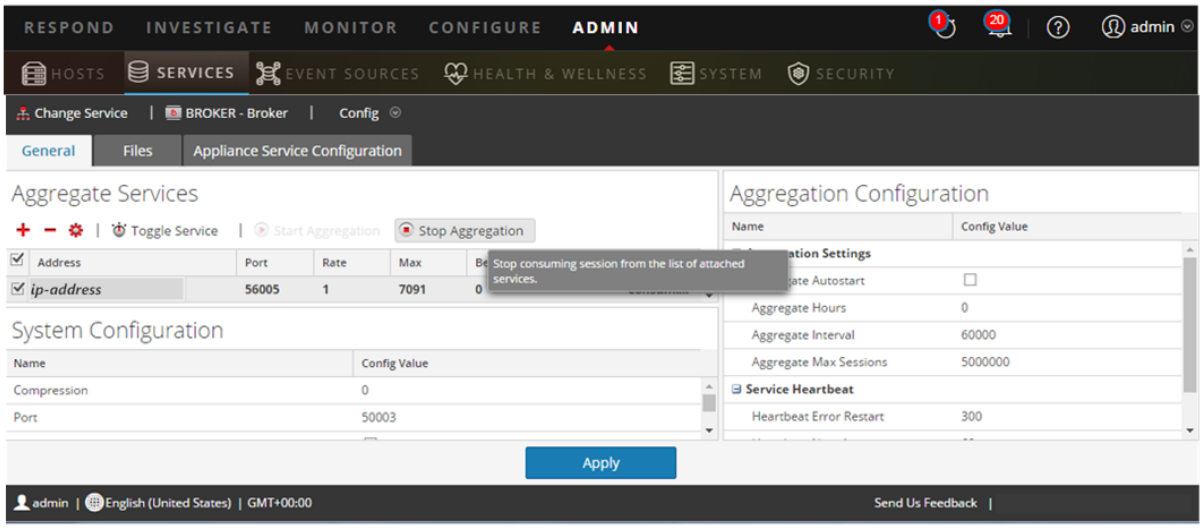


3. Under  (actions), select **View** > **System**.

4. In the toolbar, click 
.

Stop Aggregation

1. Log in to NetWitness Platform 11.0.x and go to **ADMIN** > **Services**.
2. Select the **Broker** service.
3. Under  (actions), select **View** > **Config**.
4. The **General** tab is displayed.



5. Under **Aggregated Services** click 

.

Azure Hosts

Task 4 - (Conditional) Azure Host Update Preparation Requirements

Review your Azure Host deployment for the following three conditions and complete the tasks under these conditions if required.

- If you have an 11.0.0.0 Azure base image on the host (even you updated the host to 11.1.0.x), create a Centos-Base repo.

  Caution: If the `libgudev1-219-30.el7_3.9.x86_64` RPM does not exist, do not complete the following steps.

  1. SSH to the NW Server host.
  2. Run the following command from the NW Server Host `root` directory.
     ```
     yum remove libgudev1-219-30.el7_3.9.x86_64
     ```
  3. Create a Centos-Base repo as described in step 6 in the **CentOS 7.0+** procedure (https://docs.microsoft.com/en-us/azure/virtual-machines/linux/create-upload-centos#centos-70).
  4. Run the following command strings from the NW Server Host `root` directory.
     ```
     yum clean all
     yum install WALinuxAgent
     sudo systemctl enable waagent
     ```
  5. Delete the CentOS-base repo.

- If the update path is 11.0.0.x to 11.2, populate the Repo with additional packages.
  Contact Customer Support (https://community.rsa.com/docs/DOC-1294) for the `nw-azure-11.1-extras.zip` file).

  1. SSH to the NW Server host.
  2. Go to the `root` directory of the On the NW Server host.
  3. Run the following command strings to extract the Azure zip file.
     ```
     mkdir -p /var/lib/netwitness/common/repo/11.2.0.0/OS/other+
     unzip nw-azure-11.1-extras.zip -d
     /var/lib/netwitness/common/repo/11.2.0.0/OS/other
     ```
  4. If you use an External Repo,

- If you use an External Repo to apply updates, update the External Repo with the additional packages.

  1. After you set up the 11.2.0.0 content on the external repo, go to the `<base-directory>11.2.0.0/OS/other` of the external repo.
  2. Run the following command string to extract the Azure zip file from the external repo `11.2.0.0/OS` directory.
     ```
     unzip nw-azure-11.1-extras.zip -d /<base-directory/11.2.0.0/OS/other
     ```
  3. Run the following command from the external repository's `11.2.0.0/OS` directory.
     ```
     createrepo
     ```

Endpoint Insights

Task 5 - (Conditional) Back Up Existing Custom Meta Data Mappings before Applying 11.2 Update to Endpoint Host

In 11.2, RSA enhanced the Endpoint meta data mappings to align with the current Unified Data Model (UDM) changes. When you apply the 11.2 update your Endpoint Insights host, it clears the existing custom mapping to avoid overriding the newly added default meta data mappings. If you want to use the existing custom metadata mapping, RSA recommends that you back up the existing custom mappings before you update the Endpoint Insights host to 11.2. To back up:

1. Run the `get-custom` API through nw-shell. The list of custom mappings is displayed.
2. Copy the custom mappings manually to a safe directory.

For more information, see *Endpoint Insights Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Reporting Engine

Task 6 - Configure Reporting Engine for Out-of-the-Box Charts

For Out-of-the-Box charts to run after the update, you must configure the default data source on the Reporting Engine Configuration page before you perform the update. If you do not perform this task, you must manually set up the data source after the update. For more information on Reporting Engine data sources, see the *NetWitness Platform11.2 Reporting Engine Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Respond

Task 7 - (Conditional) Restore Respond Service Custom Keys

If you added custom keys in `var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` for use in the groupBy Clause in 11.0, copy and save the custom keys in a file.

Task 8 - Back Up Customized Respond Service Normalization Scripts

RSA re-factored Respond service normalization scripts are stored in the `/var/lib/netwitness/respond-server/scripts` directory in 11.2.0.0. You need to back them up in 11.0.x before you update to 11.2.0.0 so you can restore them in 11.2.0.0 as described in the Respond Post Update Tasks.

1. Go to the `/var/lib/netwitness/respond-server/scripts` directory.
2. Back up the following files:
   `data_privacy_map.js`
   `normalize_alerts.js`
   `normalize_core_alerts.js`

```
normalize_ecat_alerts.js
normalize_ma_alerts.js
normalize_wtd_alerts.js
utils.js
```

3. (Conditional) If you have any custom logic added in 11.0.x or any previous release, copy and save this logic from the backed up scripts so you can restore it in 11.2.0.0.

Update Tasks

Complete the following tasks to update NetWitness Platform 11.0.x.x or 11.1.x.x to 11.2.0.0.

There are two methods you can use to apply version updates to a host.

Note: If you plan to use an update repository (repo) for NetWitness Platform 11.2.0.0 that is different from the repo you have set up now for 11.0.x.x or 11.1.x.x, refer to Appendix C. Set Up External Repo for instructions.

- Apply updates from the Host view (Web Access)
- Apply update from the command line (No Web Access)

Apply Updates from the Hosts View (Web Access)

There are two tasks you must complete to apply updates from the Hosts view:

- Task 1. Populate Local Repo or Set Up an External Repo - make sure that you have the latest version updates .
- Task 2. Apply updates from the Hosts View to each host.

Task 1. Populate Local Repo or Set Up an External Repo

When you set up your NW Server in 11.2.0.0, you select the Local Repo or an external repo. The Hosts view retrieves version updates from the repo you selected.

If you selected the Local Repo, you do not need to set it up, but you must make sure that it is populated with the latest version updates. See Appendix B. Populate Local Repo for instructions on how populate it with version update.

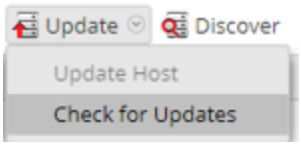
If you selected an External Repo, you must set it up. See Appendix C. Set Up External Repo for instructions on how to set up an external repo.

Task 2. Apply Updates from the Hosts View to Each Host

The Hosts view displays the software version updates available in your Local Update Repository and you choose and apply the updates you want from the Host view.

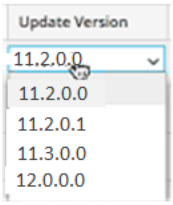
This procedure tells you how to update a host to a new version of NetWitness Platform.

1. Log in to NetWitness Platform.
2. Go to **ADMIN > HOSTS**.
3. (Conditional) Check for the latest updates.



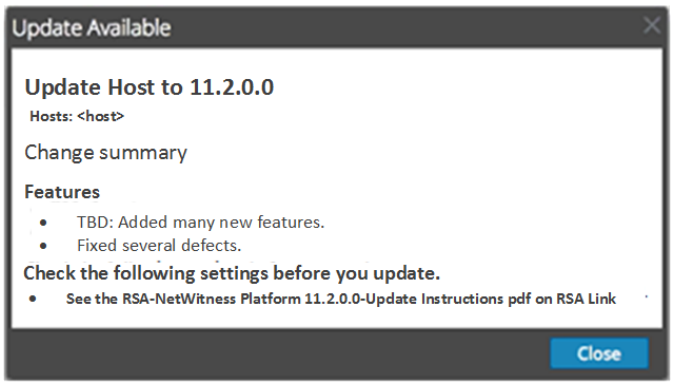
4. Select a host or hosts.
   You must update the NW Server to latest version first. You can update the other hosts in any sequence you prefer, but RSA recommends that you follow the guidelines in "Running in Mixed Mode" in the *RSA NetWitness Platform Hosts and Services Getting Started Guide* for further information.
   Update Available is displayed in the **Status** column if you have a version update in your Local Update Repository for the selected hosts.

5. Select the version you want to apply from the **Update Version** column.



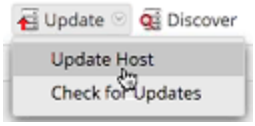
If you:

- Want to update more than one host to that version, after you update the NW Server host, select the checkbox to the left of the hosts. Only currently supported update versions are listed.
- Want to view a dialog with the major features in the update and information on the updates click the information icon ( ) to the right of the update version number. The following is an example of this dialog.

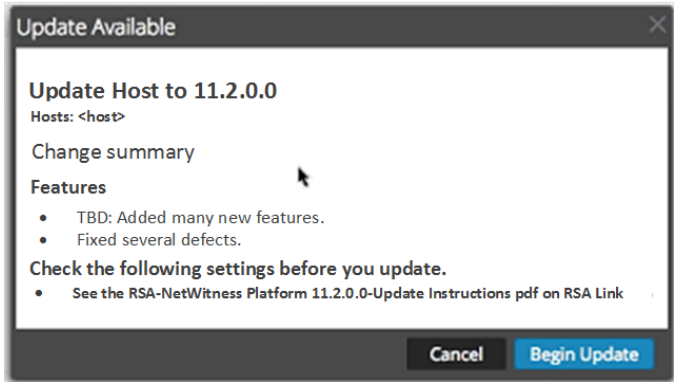


- Cannot find the version you want, select **Update > Check for Updates** to check the repository for any available updates. If an update is available, the message "New updates are available" is displayed and the **Status** column updates automatically to show Update Available. By default, only supported updates for the selected host are displayed.

6. Click **Update > Update Host** from the toolbar.



A dialog is displayed with information on the selected update. Click **Begin Update**.



The **Status** column tells you what is happening in each of the following stages of the update:

- Stage 1 - **Downloading update packages** - downloads the repository artifacts to the NW Server applicable to the services on the host you chose.
- Stage 2 - **Configuring update packages** - configures update files in to correct format.
- Stage 3 - **Update in progress** - updates host to new version.

7. When you see **Update in progress**, refresh the browser.
   This may send you to the NetWitness Log In screen. If this happens, log in and navigate back to the Host view.
   After the host is updated, NetWitness Platform prompts you to **Reboot Host**.

8. (Conditional - For Host with Unity Storage Only) If the host (for example, the Network Decoder host) has Unity storage configured with PowerPath on 11.1.x.x , and the Powerpath version installed is EMCPower.LINUX.6.3.0.b049, SSH to the host and submit the following commands to install the new PowerPath version (that is, DellEMCPower.LINUX.6.4.0.b095).

```
systemctl stop nwdecoder
umount -R /var/netwitness/decoder
yum update DellEMCPower.LINUX-6.4.0.00.00-095.RHEL7.x86_64.rpm
```

9. Click **Reboot Host** from the toolbar.
   NetWitness Platform shows the status as **Rebooting...** until the host comes back online. After the host comes back online, the **Status** shows **Up-to-Date**. Contact Customer Care if the host does not come back online.

Note: 1.) If you have DISA STIG enabled, opening Core Services can take approximately 5 to 10 minutes. This delay is caused by the generating of new certificates. 2.) If you have Unity storage, check the PowerPath status and verify the it can see the Unity device.

Apply Updates from the Command Line (No Web Access)

If your RSA NetWitness Platform deployment does not have Web access, complete the following procedure to apply a version update.

1. Download `.zip` update package for the version you want (for example, `netwitness-11.2.0.0.zip`) from RSA Link to a local directory.
2. SSH to the NW Server host.
3. Make a `tmp/upgrade/<version>` staging directory for the version you want (for example, `tmp/upgrade/11.2.0.0`).
   ```
   mkdir -p /tmp/upgrade/11.2.0.0
   ```
4. Unzip the package into the staging directory you created (for example, `tmp/upgrade/11.2.0.0`) .
   ```
   cd /tmp/upgrade/11.2.0.0
   unzip /tmp/upgrade/11.2.0.0/netwitness-11.2.0.0.zip
   ```
5. Initialize the update on the NW Server.
   ```
   upgrade-cli-client --init --version 11.2.0.0 --stage-dir /tmp/upgrade/
   ```
6. Apply the update to the NW Server.
   ```
   upgrade-cli-client --upgrade --host-addr <NW Server IP> --version 11.2.0.0
   ```
7. Log in to NetWitness Platform and reboot the NW Server host in the Host View.
8. Apply update to each non-NW Server host.
   ```
   upgrade-cli-client --upgrade --host-addr <non-NW Server IP address> --
   version 11.2.0.0
   ```
   The update is complete when the polling is completed.
9. (Conditional) If the host (for example, the Network Decoder host) has Unity storage configured with PowerPath on 11.1.x.x , and the Powerpath version installed is EMCPower.LINUX.6.3.0.b049, SSH to the host and submit the following commands to install the new PowerPath version (that is, DellEMCPower.LINUX.6.4.0.b095).
   ```
   systemctl stop nwdecoder
   umount -R /var/netwitness/decoder
   yum update DellEMCPower.LINUX-6.4.0.00.00-095.RHEL7.x86_64.rpm
   ```
10. Log in to NetWitnesss Platform and reboot the host in the Host View.
    You can verify the version applied to the host with the following command:
    ```
    upgrade-cli-client --list
    ```

    Note: 1.) If you have DISA STIG enabled, opening Core Services can take approximately 5 to 10 minutes. This delay is caused by the generating of new certificates. 2.) If you have Unity storage, check the PowerPath status and verify the it can see the Unity device.

Update or Install Legacy Windows Collection

Refer to the *RSA NetWitness Legacy Windows Collection Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Note: After you update or install Legacy Windows Collection, reboot the system to ensure that Log Collection functions correctly.

Post Update Tasks

Complete the following tasks after you update to NetWitness Platform 11.2.0.0.

- General
- NW Server
- Endpoint Insights
- Event Stream Analysis
- Respond
- NetWitness UEBA

General

These tasks apply to all NetWitness Platform 11.2.0.0 customers.

Task 1 - Start Data Capture and Aggregation

Restart network and log capture and aggregation after updating to 11.2.0.0.

Start Network Capture

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click  .

Start Log Capture

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. Select each **Log Decoder** service.
3. Under  (actions), select **View** > **System**.
4. In the toolbar, click  .

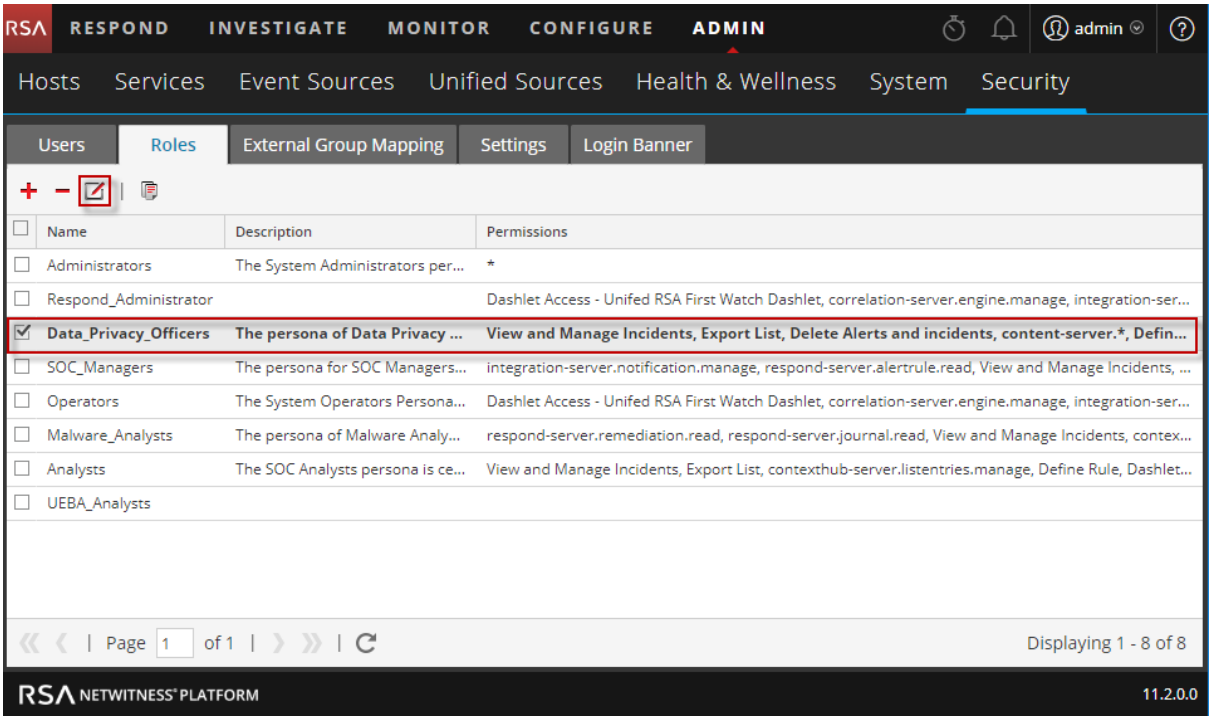
Start Aggregation

1. In the **NetWitness Platform** menu, select **ADMIN** > **Services**.
   The Services view is displayed.
2. For each Concentrator and Broker service.
   a. Select the service.
   b. Under  (actions), select **View** > **Config**.
   c. In the toolbar, click  .

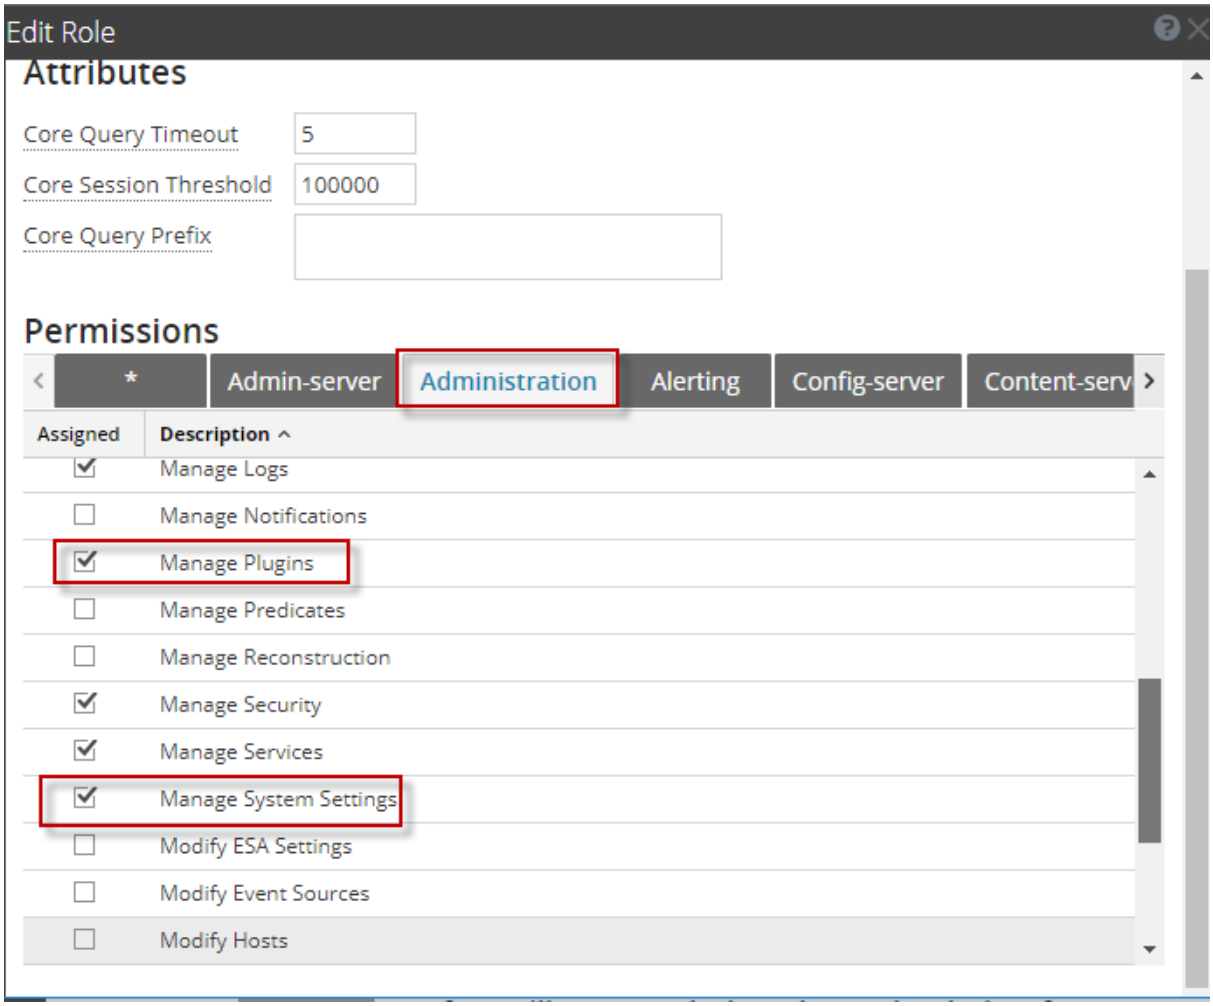
Task 2 - Set Up Context Menu Actions User Permissions

Complete the following steps for **Analysts**, **SOC Managers**, **Data Privacy Officers** roles to set up their Context Menu Actions. You must complete these steps for the **Analysts**, **SOC Managers**, and **Data Privacy Officers** roles.

1. In the **NetWitness Platform** menu, select **ADMIN** > **Security** > **Roles**.
2. Double-click on the user role (for example, **Data Privacy Officers**), or click to select the user and click (Edit).



3. In the **Edit Role** view under **Permissions**, check the **Manage Logs**, **Manage Plugins**, and **Manage System Settings** check boxes and click **Save**.



4. Complete steps 1 through 3 for the **Analysts** and **SOC Managers** roles in addition to **Data Privacy Officers**.

NW Server

Task 3 - (Conditional) Correct Audit Log Templates That Are Not Updated in Logstash Output Conf File

Problem: When a user updates from 11.0.0.0 to 11.2.0.0, if they have global auditing set up, audit log templates are not getting updated in Logstash output conf file.

Workaround: If global auditing is configured, you need to edit one of the syslog entries in the Global notifications servers and click save to apply the latest Audit log configuration.

If you had global auditing configured in 11.0.x, you must complete the following procedure to apply the latest Global Auditing configuration.

1. In the **NetWitness Platform** menu, select **ADMIN** > **System** > **Global Notifications**.
   The **Global Notifications** view is displayed.
2. Click the **Servers** tab, select any syslog server.
3. Click  (edit icon) and click **Save**.

(Conditional) Task 4 - Reconfigure PAM Radius Authentication

If you configured PAM Radius authentication in 11.0.x.x using the `pam_radius` package, you must reconfigure it in 11.2.0.0 using the `pam_radius_auth package` to achieve better performance. See "Configure PAM Login Capability" in the *RSA NetWitness® Platform 11.2 System Security and User Management Guide* for instructions. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Endpoint Insights

Task 5 - Reconfigure Recurring Feed Configured from Legacy Endpoint Because Java Version Changed

You must reconfigure the Legacy Endpoint recurring feed due to the change in Java version. Complete the following step to fix this problem.

1. Import the NetWitness Endpoint CA certificate into the NetWitness Platform Trusted store as described in "Export the NetWitness Endpoint SSL Certificate" under the "Configure Contextual Data from Endpoint via Recurring Feed" topic in the *RSA NetWitness Endpoint Integration Guide* to import the certificate.
   Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 6 - Restore Backed Up Endpoint Custom Meta Data Mappings

RSA recommends not to override any 11.2 default mappings unless required. If you backed up 11.1.x.x custom mappings, before updating to 11.2, review the list of custom mappings, and restore only those mappings that are not already in the default, using the `set-custom API` through nw-shell.

To modify any mappings, see *Endpoint Insights Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Event Stream Analysis

These tasks apply to NetWitness Platform 11.2.0.0 customers using Event Stream Analysis.

(Conditional) Task 7 - Reconfigure the "Suspected Command and Control Communication By Domain" Aggregation Rule for Automated Threat Detection

In 11.0, the "Suspected Command & Control Communication By Domain" aggregation rule Group By condition "Domain by Suspected C&C" was not functioning as expected and had to be changed to "Domain" to aggregate alerts and enable incidents to be created for "Suspected C&C." The "Domain by Suspected C&C" condition works correctly in 11.2.0.0 and should be used as the Group By condition for the "Suspected Command & Control Communication By Domain" aggregation rule (known as incident rule in 11.2.0.0).

If you changed the "Suspected Command & Control Communication By Domain" aggregation rule Group By condition to "Domain" for 11.0, you will need to change it back to "Domain by Suspected C&C" for 11.2.0.0.

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules**.
2. In the Incident Rules list, locate the Suspected Command & Control Communication by Domain rule and click the link in the NAME field to open it.
3. In the Incident Rule Details view Grouping Options section, set the Group By field to Domain for Suspected C&C and click Save.

For more information, see the NetWitness Platform Automated Threat Detection Guide and the

"Configure ESA Analytics" section of the NetWitness Platform ESA Configuration Guide. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Respond

Task 8 - Get the Latest Version of the Aggregation Rule Schema and Restore any Respond Service Custom Keys

Complete the following procedure to get the latest version of the Aggregation Rule Schema and restore any Respond service custom keys.

1. Delete the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` file.
2. Restart the Respond server to get the latest version of the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` file.
   `systemctl restart rsa-nw-respond-server`
3. If you added custom keys in `var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` file for use in the groupBy clause for 11.0, modify the `/var/lib/netwitness/respond-server/data/aggregation_rule_schema.json` file and add the custom keys that you previously saved as an Update Preparation task.

Note: New Group By fields have been added to Respond in 11.2.0.0. The new Group By fields will not be visible in the NetWitness Platform user interface if you do not get the latest version of the file from the server.

Task 9 - Get the Latest Version of the Respond Service Normalization Scripts and Restore any Customized Respond Service Normalization Scripts

RSA re-factored Respond service normalization scripts in the `/var/lib/netwitness/respond-server/scripts` directory in 11.2.0.0. You must replace the old versions.

Before the update to 11.2.0.0, you backed up the following files from the `/var/lib/netwitness/respond-server/scripts` directory.

```
data_privacy_map.js
normalize_alerts.js
normalize_core_alerts.js
normalize_ecat_alerts.js
normalize_ma_alerts.js
normalize_wtd_alerts.js
utils.js
```

Complete the following procedure to get the latest version of the normalization scripts.

1. After backing up the files listed above, delete the `/var/lib/netwitness/respond-server/scripts` directory and its contents.
2. Restart the Respond server.
   `systemctl restart rsa-nw-respond-server`
3. (Conditional) Edit the new files to include any custom logic from the 11.0 scripts that were backed up.

Note: The following files changed with the 11.2.0.0 release:
`normalize_alerts.js`
`aggregation_rule_schema.json`

Task 10 - Add Respond Notification Settings Permissions

Note: If you already configured these permissions in 11.1, you can skip this task.

Respond Notification Setting permissions enable Respond Administrators, Data Privacy Officers, and SOC Managers to access Respond Notification Settings (**CONFIGURE** > **Respond Notifications**), which enable them to send email notifications when incidents are created or updated.

To access these settings, you will need to add additional permissions to your existing built-in NetWitness Platform user roles. You will also need to add permissions to your custom roles. See the "Respond Notification Settings Permissions" topic in the *NetWitness Respond Configuration Guide*. For detailed information about user permissions, see the *System Security and User Management Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Task 11 - Update Default Incident Rule Group By Values

Four of the default incident rules now use “Source IP Address” as the Group By value:

- High Risk Alerts: Reporting Engine
- High Risk Alerts: Malware Analysis
- High Risk Alerts: NetWitness Endpoint
- High Risk Alerts: ESA

To update the default rules, change the Group By value of the above default rules to “Source IP Address.”

Note: If you already updated the Group By values for the default rules listed above in 11.1, you do not have to do it again.

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules** and click on the rule that you want to update in the **Name** column. The **Incident Rule Details** view is displayed.
2. In the **GROUP BY** field, select the new Group By value from the drop-down list.
3. Click **Save** to update the rule.

To aggregate NetWitness Endpoint alerts based on the Detector IP Address, complete the following steps to clone the default NetWitness Endpoint incident rule and change the Group By IP address.

1. In the **NetWitness Platform** menu, select **CONFIGURE** > **Incident Rules**. The **Incident Rules List** view is displayed.
2. Select the **High Risk Alerts: NetWitness Endpoint** default incident rule and click **Clone**. You will receive a message that you successfully cloned the selected rule.
3. Change the Name of the rule to an appropriate name, such as High Risk Alerts: NetWitness Endpoint Detector IP.
4. In the **GROUP BY** field, remove **Source IP Address** and add **Detector IP Address**. It is important that Detector IP Address is the only Group By value listed.
5. Click **Save** to create the rule.

For detailed information, see the *NetWitness Platform Respond Configuration Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

NetWitness UEBA

Task 12 - Install NetWitness UEBA

NetWitness UEBA is a new feature as of NetWitness® Platform 11.2.

See:

RSA NetWitness Platform 11.2 Physical Host Installation Guide for instructions for installation on a physical host.

RSA NetWitness Platform 11.2 Virtual Host Installation Guide for instructions for installation on a virtual host.

RSA NetWitness UEBA User Guide for information about UEBA.

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

6. Select **Manage System Settings** and **Manage Plugins**.

Appendix A. Troubleshooting Version Installations and Updates

This section describes the error messages displayed in the **Hosts** view when it encounters problems updating host versions and installing services on hosts in the **Hosts** view. If you cannot resolve an update or installation issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Error Message	**Host Update Failed** Problem	When you select an update version and click **Update** > **Update Host**, the download process is successful, but the update process fails.

Solution	1. Try to apply the version update to the host again.
	Often this is all you need to do.
	2. If you still cannot apply the new version update:
	a. Monitor the following logs on NW Server as it progresses (for example, run the `tail -f` command from the command line):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error appears in one or more of these logs.
	b. Try to resolve the issue and reapply the version update.
	• Cause 1 - `deploy_admin` password has expired.
	Solution - Reset your `deploy_admin` password .

Complete the following steps to resolve Cause 1.

1. In the NetWitness Suite menu, select **ADMIN** > **Security** > **Users** tab.
2. Select the `deploy_admin` and click **Reset Password**.
3. (Conitional) If NetWitness Suite does not allow you to expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps.
   a. Reset `deploy_admin` to use a new password.
   b. On all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host.
   `/opt/rsa/saTools/bin/set-deploy-admin-password`

- Cause 2 -The `deploy_admin` password was changed on NW Server host but not changed on non-NW Server hosts.
  Complete the following step to resolve Cause 2.
  - On all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host.
  `/opt/rsa/saTools/bin/set-deploy-admin-password`

3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Error Message	**Host Installation Failed** Problem	When you select a host and click **Install** the install service process fails.

Solution	1. Try to install the service again.
	Often this is all you need to do.
	2. If you still cannot install the service:
	a. Monitor the following logs on NW Server as it progresses (for example, submit the `tail -f` command string from the command line'):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error appears in one or more of these logs.
	b. Try to resolve the issue and reinstall the service.
	• Cause 1 - Entered the wrong`deploy_admin` password in the nwsetup-tui.
	Solution - Retrieve your `deploy_admin` password.
	Complete the following steps to resolve Cause 1.
	1. In the NetWitness Suite menu, select **ADMIN** > **Security** > **Users** tab.
	2. Select the `deploy_admin` and click **Reset Password**.
	3. (Conitional) If NetWitness Suite does not allow you to expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps.
	a. SSH to the NW Server host.
	`security-cli-client --get-config-prop --prop-hierarchy nw.security-client --prop-name`

```
platform.deployment.password -quiet
```

b. SSH to the host that failed installation/orchestration.

c. Run the nwsetup-tui again using correct `deploy_admin` password.

- Cause 2 -The `deploy_admin` password has expired.
  Complete the following step to resolve Cause 2.

  1. In the NetWitness Suite menu, select **ADMIN** > **Security** > **Users** tab.
  2. Select the `deploy_admin` and click **Reset Password**.
  3. (Conditional) If NetWitness Suite allows you enter the expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps.

     a. Enter the expired `deploy_admin` password.

     b. Uncheck the Force password change on next login checkbox.

     c. Click **Save**.

  4. (Conditional) If NetWitness Suite does not allow you to enter the expired `deploy_admin` password in the Reset Password dialog, complete the following steps.

     a. Reset `deploy_admin` to use a new password.

     b. On all the NW Server host and all other hosts on 11.x, run the following command using the new `deploy_admin` password.
     `/opt/rsa/saTools/bin/set-deploy-admin-password`

     c. On the host that failed installation/orchestration, run the nwsetup-tui and use the new `deploy_admin` password.

3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Error Message	**Downloading Error** Problem	When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete.
Cause	Version download files can be large and take a long time to download. If there are communication issues during the download it will fail.
Solution	1. Try to download it again. 2. If the download still fails, try to download it outside of NetWitness Suite as described in Apply Updates from the Command Line (No Web Access). 3. If you still cannot download the update file, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Error Message	**`deploy_admin` User's Password Has Expired** Cause	The `deploy_admin` user password has expired.
Solution	Reset your `deploy_admin` password password. 1. In the NetWitness Suite menu, select **ADMIN** > **Security** > **Users** tab. 2. Select the **deploy_admin** and click **Reset Password**. • If NetWitness Suite allows you to enter the expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps. a. Enter the expired `deploy_admin` password. b. Uncheck the **Force password change on next login** checkbox. c. Click **Save** • If NetWitness Suite does not allow you to enter the expired `deploy_admin` password in the **Reset Password** dialog. a. On the NW Server host and all other hosts on 11.x , run the following command using the new `deploy_admin` password. `/opt/rsa/saTools/bin/set-deploy-admin-password` b. On the host that failed installation/orchestration, run the `nwsetup-tui` and use the new `deploy_admin` password.

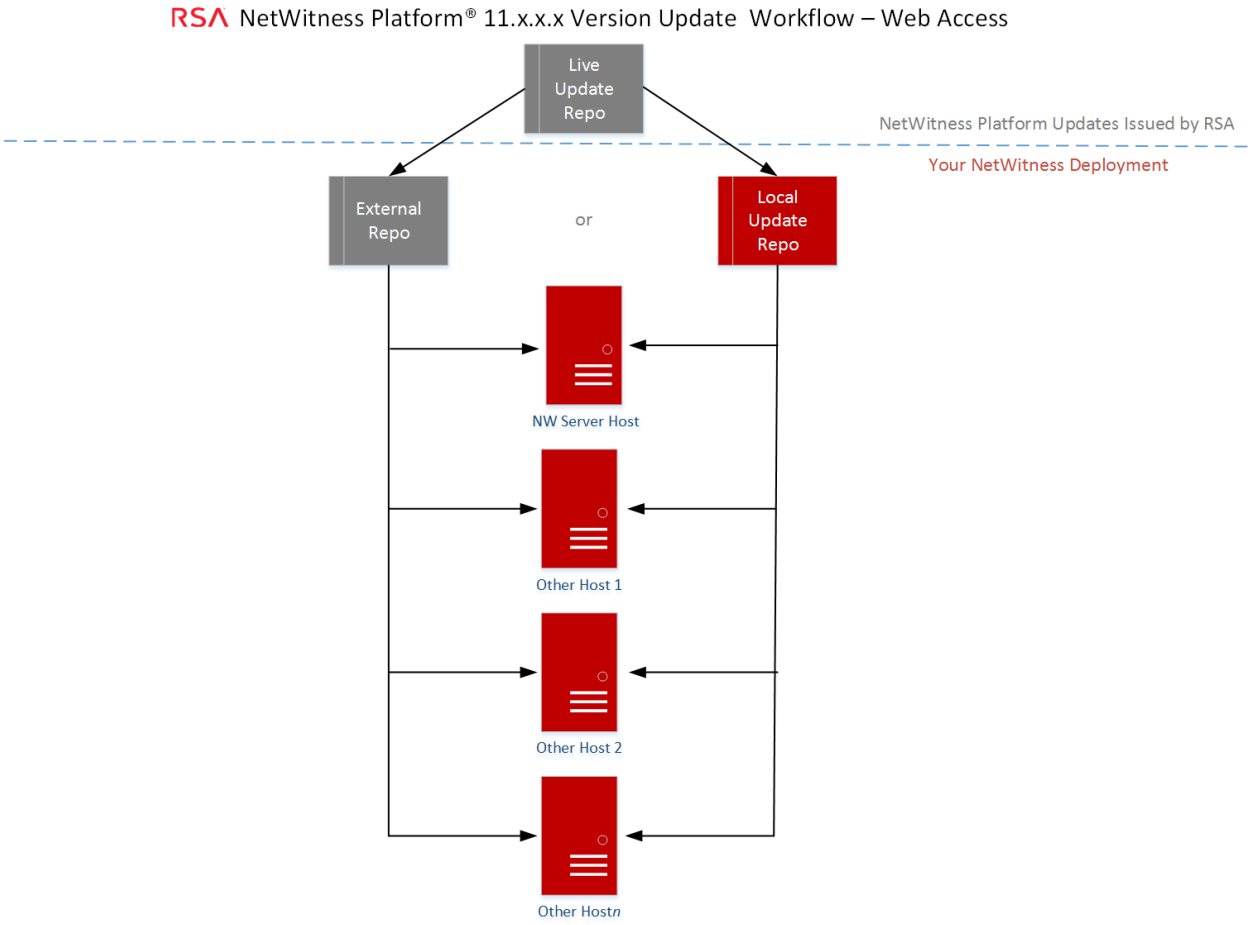
Error Message	The `/var/log/netwitness/orchestration-server/orchestration-server.log` has an error similar to the following error: `API|Failure /rsa/orchestration/task/update-config-management [counter=10 reason=IllegalArgument Exception::Version '11.0.0.n' is not supported`
Problem	After you update the NW Server host to 11.1, the only update path for the non-NW Server hosts is 11.1. If you try to update any non-NW Server host to an 11.0.0.n patch (for example from 11.0.0.0 to 11.0.0.3), you will get this error.
Solution	You have two options: • Update the non-NW Server host to 11.1, or • Do not update the non-NW Server host (keep it at its current version).

Error Message	You receive a message in the User Interface to reboot the host after you update and reboot the host offline. 
Cause	You cannot use CLI to reboot the host. You must use the User Interface.
Solution	Reboot the host in the Host View in the User Interface.

Appendix B. Populate Local Repo

NetWitness Platform sends version updates to the Local Update Repository from the Live Update Repository. Access to the Live Update Repository requires and uses the Live Account credentials configured under **ADMIN > SYSTEM > Live**. In addition, you must check the `Automatically download information about new updates every day` checkbox under **ADMIN > SYSTEM > Updates** to populate the Local Repo daily.

The following diagram illustrates how you obtain version updates if your NetWitness Platform deployment has Web Access.



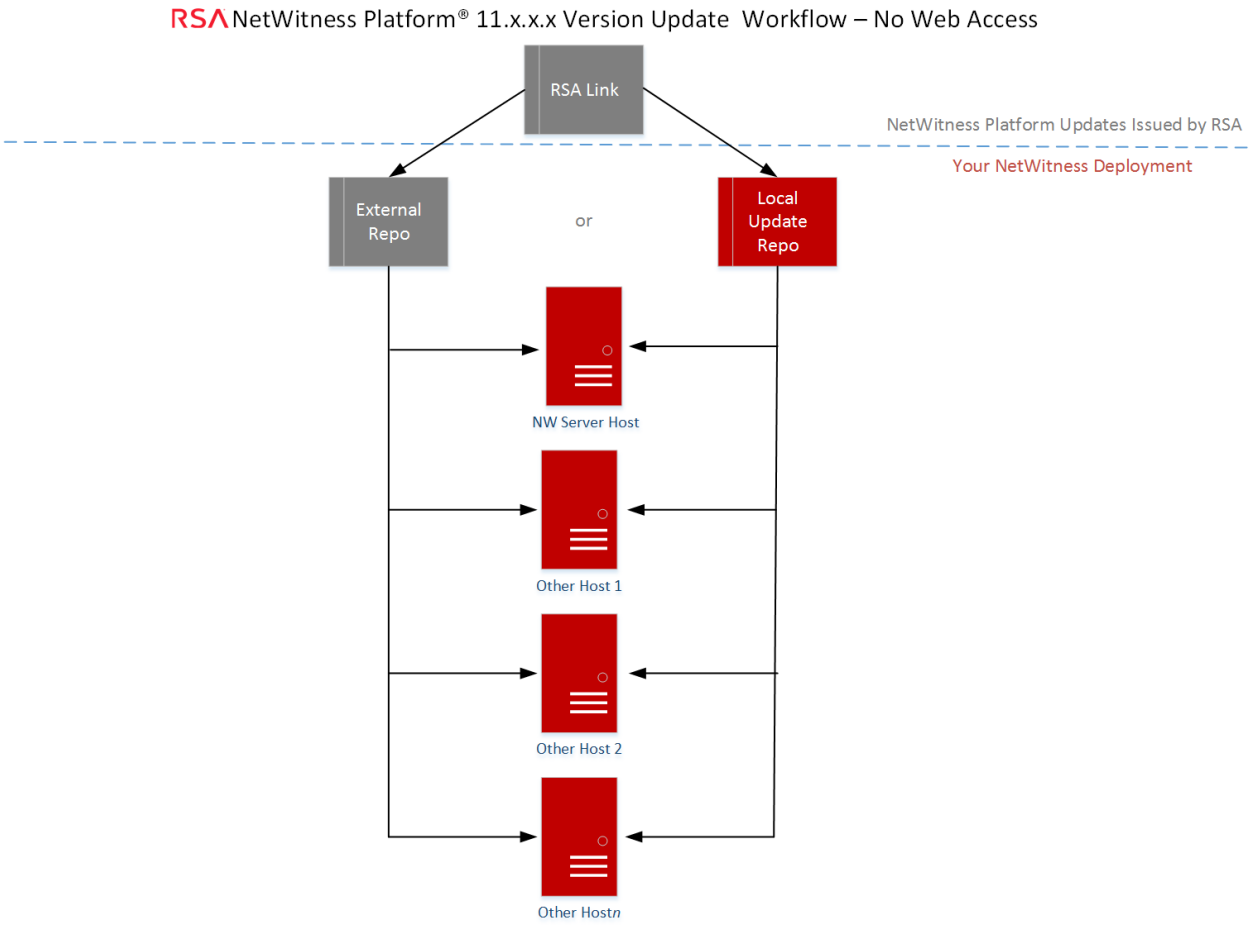
Note: When you make the initial connection with the Live Update Repository, you will be accessing all the CentOS 7 system packages and the RSA Production packages. This download of over 2.5 GB of data takes an indeterminate amount of time depending on your NW Server Internet connection and the traffic of the RSA Repository. It is not mandatory to use the Live Update Repository. Alternatively you can use an External Repo as described in Set Up an External Repository with RSA and OS Updates.

To connect to the Live Update Repository, go to the ADMIN > System view, select **Live Services** in the options panel and make sure that credentials are configured (**Connection** light should be green). If it is not green, click **Sign In** and connect.

Note: If you need to use proxy to reach out to the Live Update Repository, you can configure the Proxy Host, Proxy Username, and Proxy Password. For more information see "Configure Proxy forNetWitness Platform" in the *NetWitness Platform 1.1 System Configuration Guide*.

See Apply Updates from the Command Line (No Web Access) if your NetWitness Platform deployment does not have Web Access.

The following diagram illustrates how you obtain version updates if your NetWitness Platform deployment does not have Web Access.



Appendix C. Set Up External Repo

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. (Conditional) Complete this step if you have an external repo and you want to override it.
   - Case 1: You bootstrapped the host from an external repo and you want to upgrade using a local repo on the Admin Server.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/netwitness/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://nw-node-zero/nwrpmrepo`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool.
   - Case 2: You bootstrapped the host from local repo on the Admin server (NW Server host) and you want to use an external repo for the upgrade.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/netwitness/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.
        `https://<webserver-ip>/<alias-for-repo>`
     c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool. The instructions are in the Apply Updates from the Command Line (No Web Access).
2. Set up the external repo.
   a. Log in to the web server host
   b. Create directory to host the NW repository (`netwitness-11.2.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, /var/netwitness is the web-root, run the following command string.
      `mkdir -p /var/netwitness/<your-zip-file-repo>`
   c. Create the 11.2.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0`
   d. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.2.0.0`.
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS`
      `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0/RSA`
   e. Unzip the `netwitness-11.2.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.2.0.0` directory.
      `unzip netwitness-11.2.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0`

Unzipping `netwitness-11.2.0.0.zip` results in two zip files (`OS-11.2.0.0.zip` and `RSA-11.2.0.0.zip`) and some other files.

f. Unzip the:

1. `OS-11.2.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.2.0.0/OS` directory.
   `unzip /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS-11.2.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS`
   The following example illustrates how the Operating System (OS) file structure appears after you unzip the file.

2. `RSA-11.2.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.2.0.0/RSA` directory.
   `unzip /var/netwitness/<your-zip-file-repo>/11.2.0.0/RSA-11.2.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0/RSA`
   The following example illustrates how the RSA version update file structure appears after

you unzip the file.

NetWitness Legacy Windows Collection Update & Installation Instructions

The RSA NetWitness® Suite Legacy Windows collection collects event data from multiple Windows Event Source domains.

It supports collection from:

- Windows 2003 and earlier event sources
- NetApp ONTAP host evt files

This document contains the following sections:

Setup Requirements

This section provides the RSA NetWitness® Suite Legacy Windows Collector Setup requirements.

Caution: If you are installing or updating to version 11.x, in order to use the Security Analytics Legacy Windows Collector with NetWitness, you need to first install the following windows updates:

• KB2919355
• KB2919442
• KB2999226
• KB3173424

If these updates are not installed, you will get an error message, and the Legacy Windows Collector will not be installed.

To set up the RSA NetWitness ® Suite Legacy Windows Collector, you need:

- Any physical or virtual Windows 2008 R2 SP1 64-Bit Server that can reach the Windows 2003 event source domains.
- A minimum of 20% free disk space. For example, you need at least 20 GB of free space if your system drive is 100 GB in size.

Important! Do not install the Legacy Windows Collector on a domain controller.

Update the RSA NetWitness® Suite Legacy Windows Collector from 10.6.x to 11.x

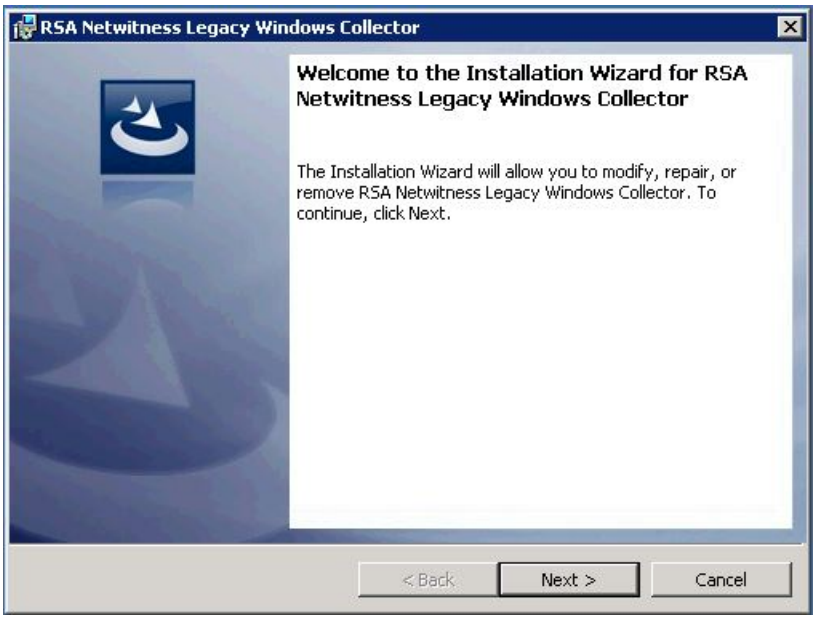
This section tells you how to update RSA NetWitness Suite 10.6.x Legacy Windows Collector to 11.

To update the RSA NetWitness® Suite 10.6.x Legacy Windows Collector to 11 on a Windows 2008 R2 SP1 64-Bit server:

1. Navigate to https://community.rsa.com/docs/DOC-83034 on RSA link. Click **RSA NetWitness Logs & Packets 11.x - Legacy Windows Collector** to download the ZIP archive.
2. Unzip the downloaded file.
3. Log on to a Windows 2008 machine.
4. Copy **NWLegacyWindowsCollector-*version-number*.exe** to the Windows 2008 server.
5. Right click on **NWLegacyWindowsCollector-*version-number*.exe** and select **Run As Administrator**.

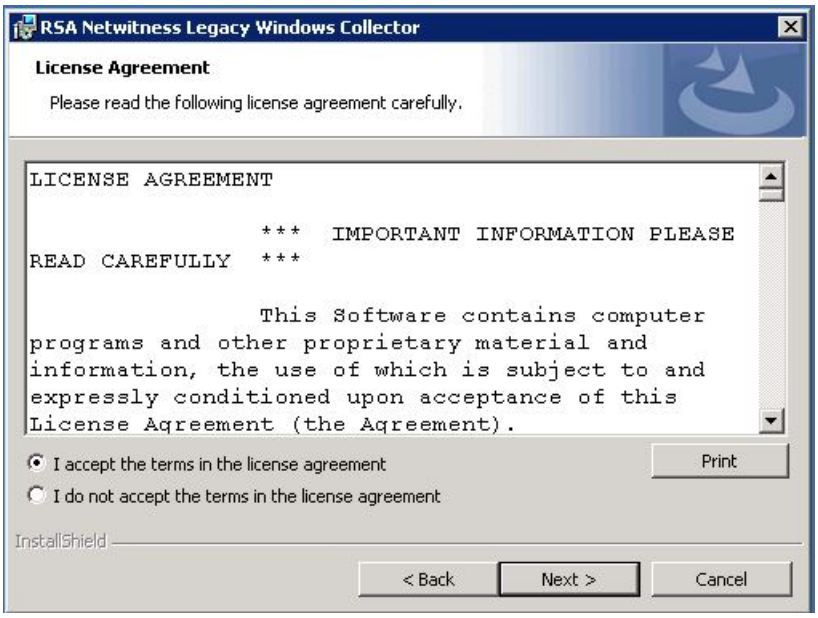
   The Preparing to Install…. page of update installation wizard is displayed.

   After the update installation program extracts RSA NetWitness® Suite Legacy Windows Collector installation files, the **Welcome** page is displayed.



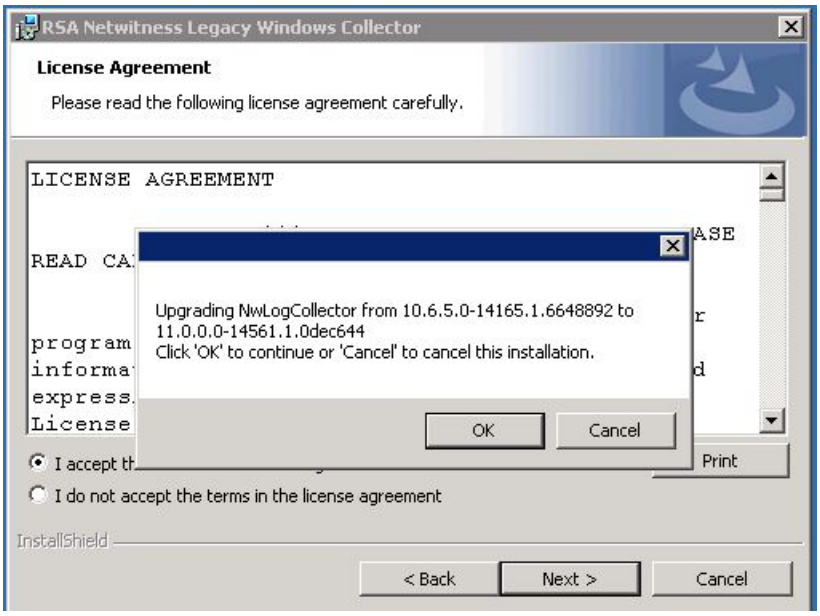
6. Click **Next**.

   The License Agreement page is displayed.



7. Read the License agreement carefully, select the **I accept the terms in the license agreement** radio button, and click **Next**.

   Before it starts the update, the wizard asks if you want to continue or cancel the installation of the update.



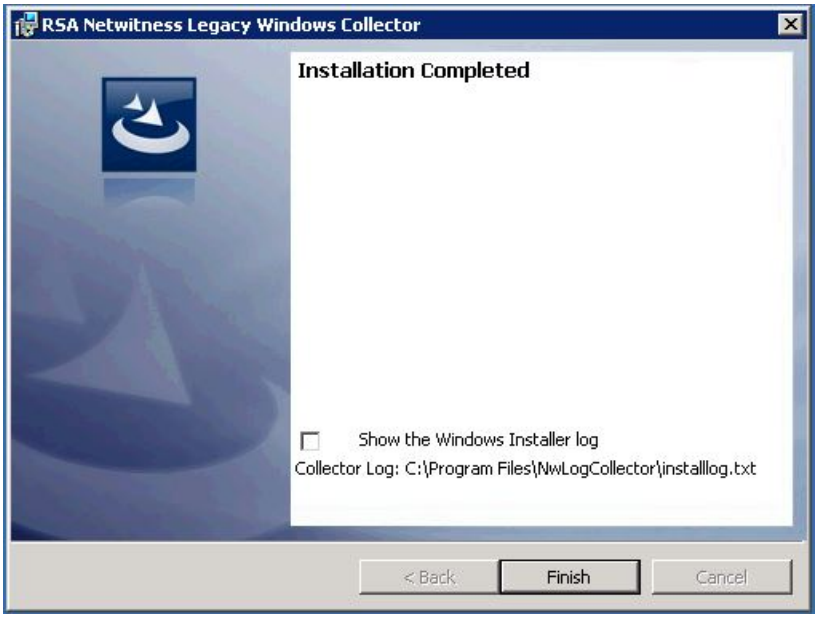
8. Click **OK** to continue installing the update.
9. Click Install.

   The Installation screens for the Legacy Windows Collector page is displayed.

After the update installation completes, the **Next** button becomes active.

10. Click **Next**.

    The Installation Completed page is displayed.



11. (Optional) If you want to review a log of the update installation, select the **Show the Windows Installer** log checkbox.
12. Click **Finish**.
13. Reboot the machine.

This completes the update of the Legacy Windows Collector to RSA NetWitness Suite 11.x.

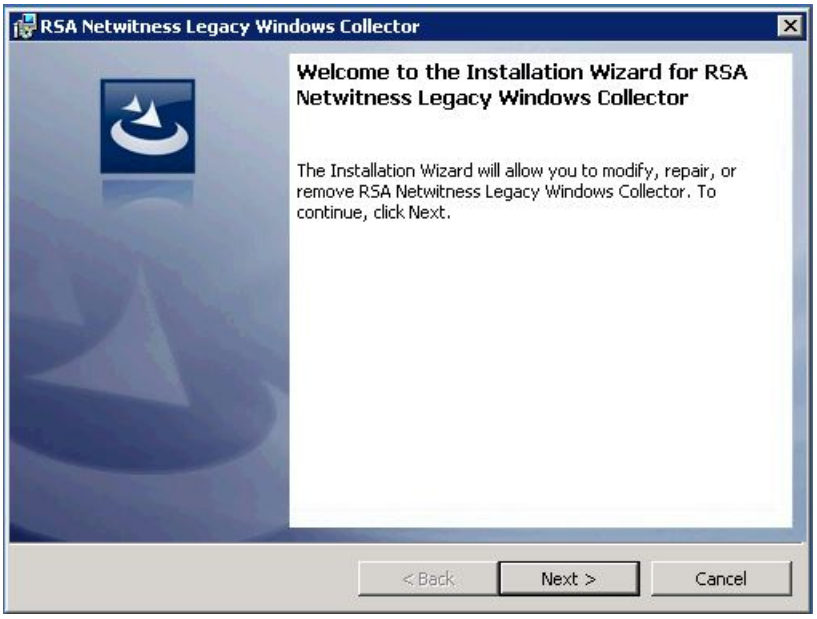
Fresh Install 11.x Legacy Windows Collector

This section describes how to install the 11.x Legacy Windows Collector on a Windows 2008 R2 SP1 64-Bit server

To install the RSA NetWitness Suite Legacy Windows Collector on a Windows 2008 R2 SP1 64-Bit server:

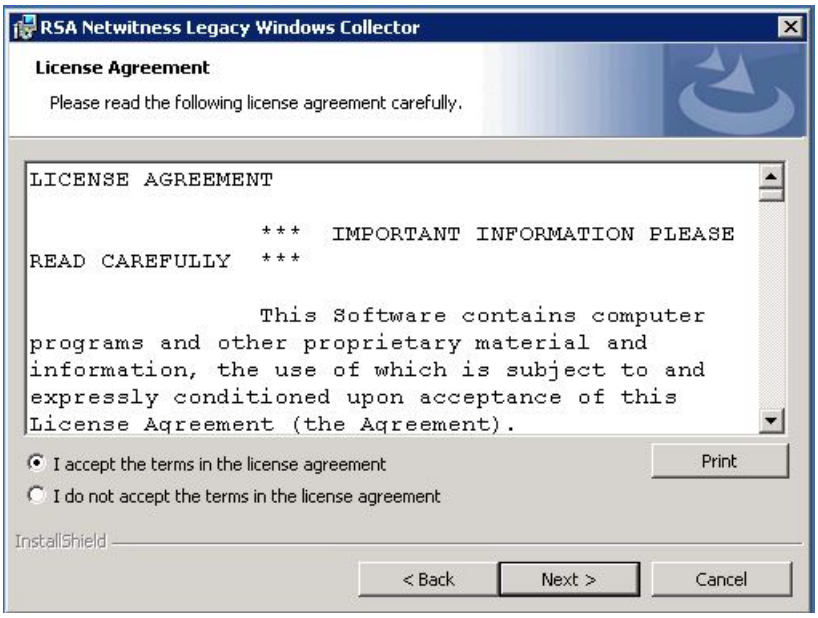
1. Navigate to https://community.rsa.com/docs/DOC-83034 on RSA link. Click **RSA NetWitness Logs & Packets 11.x - Legacy Windows Collector** to download the ZIP archive.
2. Unzip the downloaded file.
3. Copy the **NWLegacyWindowsCollector-*version-number*.exe** to the Windows 2008 server.
4. Right click on the **NWLegacyWindowsCollector-*version-number*.exe** and select **Run As Administrator**.

   The **Welcome** page of installation wizard is displayed.



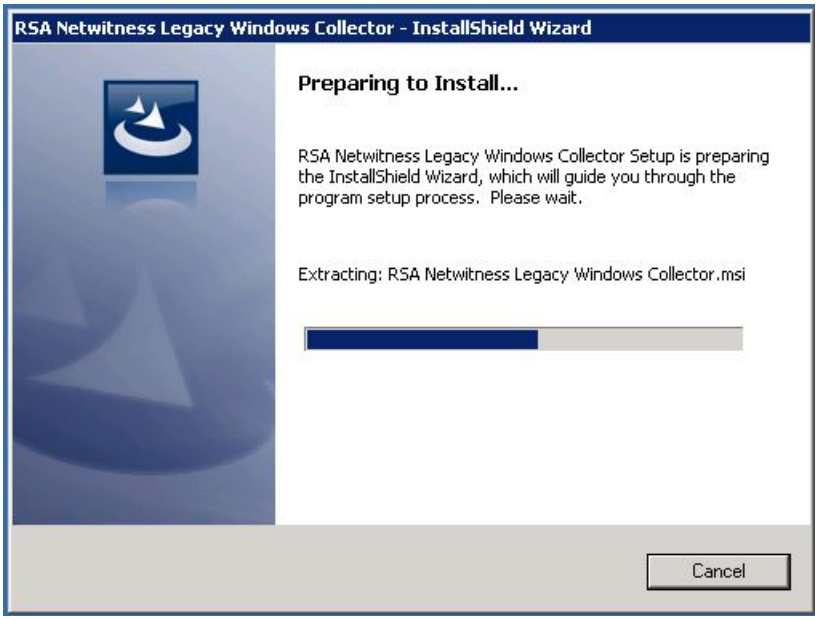
5. Click **Next**.

   The License Agreement page is displayed.



6. Read the License agreement carefully, select the **I accept the terms in the license agreement** radio button, and click **Next**.

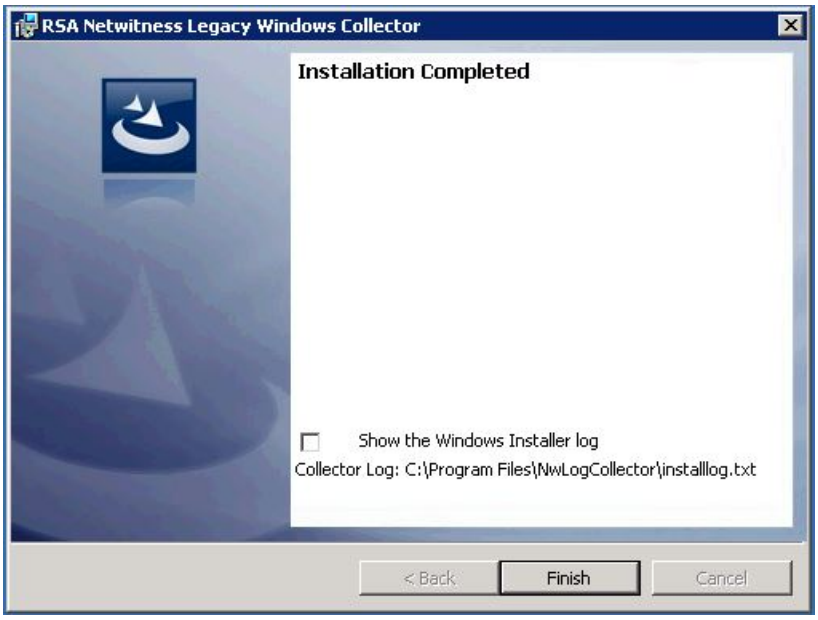
   The Ready to Install the Program page is displayed.



7. Click **Install**.

   The Installation screens for the Legacy Windows Collector page are displayed.

The Installation Completed page is displayed.



8. (Optional) If you want to review a log of the installation, select the **Show the Windows Installer** log checkbox.
9. Click **Finish**.
10. Reboot the machine.

This completes the installation of the 11.x Legacy Windows Collector. Please refer to the **Windows Legacy and NetApp Collection Configuration Guide** on RSA Link for instructions on how to configure Legacy Windows collection in RSA NetWitness Suite.

Troubleshooting for Fresh or Upgrade Install

Logs to Examine for Information

Refer to the following log files if you need to troubleshoot problems:

- `%systemDrive%\Netwitness\ng\logcollector\MessageBroker.log`
- `%systemDrive%\Program Files\NwLogCollector\installlog.txt`

Run `C:\Program Files\NwLogCollector\ziplogfiles.vbs` to generate the ***hostname***`_WLCversion_timestamp.zip` that contains all the log files and other information needed for troubleshooting.

Issues with the Lockbox

When you create a lockbox password on a new Windows Legacy Collector, you might see the following error:

failed to set secure storage password: failed to create lockbox: The Lockbox or cryptography library could not be found.

This can occur if you are running Windows Legacy Collector version 11.x.

If you encounter this issue, download and install both of the following redistributable packages:

- Visual C++ 2010: https://www.microsoft.com/en-us/download/details.aspx?id=14632
- Visual C++ 2012: https://www.microsoft.com/en-us/download/details.aspx?id=30679

(Optional) Backup and Restore Legacy Windows Collector

This section tells you how to upgrade from 10.6.4 to NetWitness 11.x for the Legacy Windows Collector.

Note: You only need to do this if you are changing the Windows VM where you run the Windows Legacy Collector.

During upgrade to RSA NetWitness Suite 11.x, the backup script for the Windows Legacy Collector is invoked automatically, and creates the 10.6.4 configuration and run-time backups. After the 11.x installation is completed, run the Restore script to restore the configuration and run-time files for the updated Windows Legacy Collection.

Restore the Windows Legacy Collection Backup after Upgrade

To restore the Windows Legacy Collection setup on a newly upgraded RSA NetWitness Suite 11 platform:

1. On the Windows Legacy Collector, open a command prompt window.
2. Navigate to **C:\Program Files\NwLogCollector**, where the scripts are stored.
3. Run the following commands for restoring a backup:
   - Backup configuration files: `WLC-Restore.bat "Config-bkup_timestamp.zip"`
   - Backup run-time files: `WLC-Restore.bat "Runtime-bkup_timestamp.zip"`
4. Once the restore is completed, set the lockbox SSV to use the password that you created during 10.6.4 setup.
   a. In the **Security Analytics** menu, select **Services**, then select your Windows Legacy Collector and choose **Explore**.
   b. From the left navigation pane, expand **logcollection > properties > crypto**.
   c. Run the following command: `op=setssv pw=password_for_10.6.x_lockbox`, and hit **Send**.

Revert Windows Legacy Collection from 11.x Back to 10.6.4

To revert the Windows Legacy Collection setup from 11.x back to 10.6.4:

1. Uninstall the 11.x Setup. Note the location of the backup folder created by the system during the uninstall procedure.
2. Install the 10.6.4 version of the Windows Legacy Collector.
3. Navigate to **C:\Program Files\NwLogCollector**, where the scripts are stored.
4. Run the Restore script from backup folder present in **C:\Program Files\NwLogCollector** to restore the configuration and run-time setup on the 10.6.4 Windows Legacy Collector.
   - Backup configuration files: `WLC-Restore.bat "Config-bkup_`***`timestamp`***`.zip"`
   - Backup run-time files: `WLC-Restore.bat "Runtime-bkup_`***`timestamp`***`.zip"`
5. Once the restore is completed, set the lockbox SSV to use the password that you created during 10.6.4 setup.
   a. In the **Security Analytics** menu, select **Services**, then select your Windows Legacy Collector and choose **Explore**.
   b. From the left navigation pane, expand **logcollection > properties > crypto**.
   c. Run the following command: `op=setssv pw=`***`password_for_10.6.x_lockbox`***, and hit **Send**.

Add a Windows Legacy Collector Host and Service in RSA NetWitness® Suite

For this version of the Windows Legacy Collector, RSA has provided a script that replaces the manual steps of adding a Windows Legacy Collector host and service in the NetWitness UI.

To create a Windows Legacy Collector Host and Service in NetWitness:

1. SSH to your NetWitness server.
2. Run the following command:

   wlc-cli-client --host-display-name ***hostDisplayName*** --service-display-name **serviceDisplayName** --host ***WLChostIPAddress*** --port 50101 --use-ssl false

   The parameters are explained below:

   - **--host-display-name**: the name for the host as it is displayed in the NetWitness Hosts page
   - ***--service-display-name***: the name for the host as it is displayed in the NetWitness Services page
   - **--host**: the IP address for the Windows Legacy Collector
   - **--port**: the port NetWitness uses to communicate with the Windows Legacy Collector. The recommended value is 50101.
3. You will be prompted to supply the following information:
   - **Windows Log Collector REST Username** and **Windows Log Collector REST Password**: you must supply admin credentials for the Windows Legacy Collector.
   - **Security Server Username** and **Security Server Password**: you must supply admin credentials for RSA NetWitness Suite.

When you complete this procedure, you should see the Windows Legacy Collector Host and Service as shown in the following screenshots.
