Hosts and Services Basics

This guide gives administrators the standard procedures for add and configure hosts and services in NetWitness Platform. After introducing you to the basic purpose of hosts and services and how they function within in the NetWitness Platform network, this guide covers:

- Tasks you must complete to set up hosts and services in your network
- Additional procedures that you complete based on the long-term and daily, operational needs of your enterprise
- Reference topics that describe the user interface

Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

What Is a Host

A host is the machine on which a service runs and can be a physical or virtual machine. See the "NetWitness Platform Detailed Host Deployment Diagram" in the *NetWitness PlatformDeployment Guide* for an illustration of how host are deployed.

What Is a Host Type

A host type assigns a service or services to a host when you install a host from the Hosts view. You choose a **Host Type** in the **Install Services** dialog which is displayed when you select a host in the Hosts view and click 
. The following table lists each host type and the services it installs. See the "NetWitness Platform Detailed Host Deployment Diagram" in the *NetWitness Platform Deployment Guide* for an illustration of how host are deployed.

Host Type	Services Installed
Archiver	Workbench and Archiver
Broker	Broker
Cloud Gateway	Cloud Gateway
Concentrator	Concentrator
Endpoint Hybrid	Log Decoder, Endpoint, and Concentrator
Endpoint Log Hybrid	Log Collector, Log Decoder, Endpoint, and Concentrator
ESA Primary	Context Hub, Entity Behavior Analysis, and Event Stream Analysis
ESA Secondary	Event Stream Analysis, and Entity Behavior Analysis
Log Collector	Log Collector

Host Type	Services Installed
Log Decoder	Log Collector and Log Decoder
Log Hybrid	Log Collector, Log Decoder, and Concentrator
Malware Analysis	Malware Analysis and Broker
Network Decoder	Decoder (Packets)
Network Hybrid	Concentrator and Decoder
UEBA	UEBA
Warehouse Connector	Warehouse Connector

What Is a Service

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host.

You must configure the following core services first:

- Decoder
- Concentrator
- Broker
- Log Decoder

All the services are listed below and each service except the Log Collector has its own guide or shares a guide in the *Host and Services Configuration Guides*. The Log Collector has its own set of configuration guides to handle the configuration for all the supported event collection protocols. For Log Collector information, see *Log Collection Guides*.

Service	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
Admin	N/A	N/A	Implemented with the NW Server
Archiver	50008	56008	
Broker	50003	56003	Core Service
Cloud Gateway	N/A	N/A	
Concentrator	50005	56005	Core Service
Config	N/A	N/A	Implemented with the NW Server.

Service	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
Content	N/A	N/A	Implemented with the NW Server
Context Hub	N/A	N/A	
Decoder (Packets)	50004	56004	Core Service
Endpoint	N/A	N/A	
Entity Behavior Analysis	N/A	N/A	
Event Stream Analysis	N/A	50030	
Integration	N/A	N/A	Implemented with the NW Server.
Investigate	N/A	N/A	Implemented with the NW Server.
Log Collector	50001	56001	
Log Decoder	50002	56002	Core Service
Malware Analysis	N/A	60007	
Orchestration	N/A	N/A	Implemented with the NW Server.
Reporting Engine	N/A	51113	Implemented with the NW Server.
Respond	N/A	N/A	Implemented with the NW Server.
Security	N/A	N/A	Implemented with the NW Server.
Source	N/A	N/A	Implemented with the NW Server
UEBA	N/A	N/A	
Warehouse Connector	50020	56020	
Workbench	50007	56007	

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.

Setting Up a Host

You use the Hosts view to add a host to NetWitness Platform. See Step 1. Deploy a Host for detailed instructions.

Maintaining Hosts

You use the main ADMIN > Hosts view to add, edit, delete, and perform other maintenance tasks for the hosts in your deployment. You use the Task List dialog to perform tasks relating to a host and its communications with the network. See Hosts and Services Procedures for detailed instructions.

After initial implementation of NetWitness Platform, the major task you perform from the Hosts view is updating your NetWitness Platform deployment to a new version.

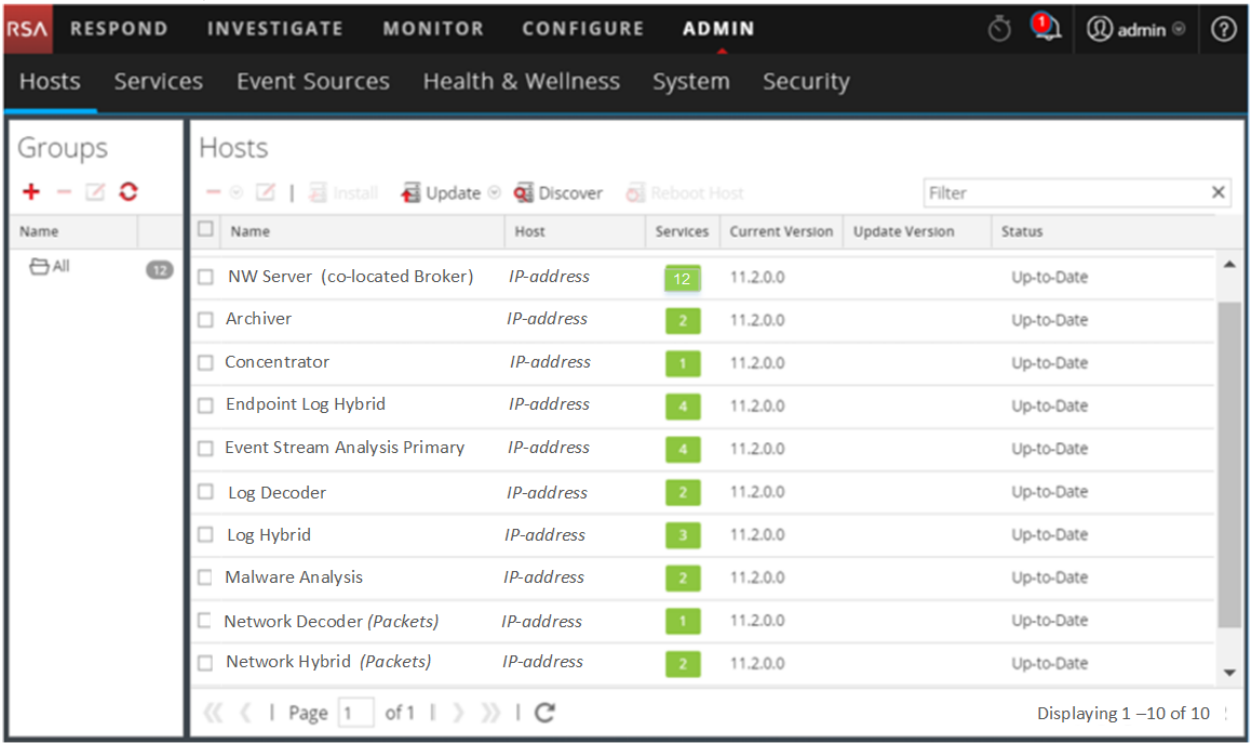
Update Version Naming Convention

You use the Hosts view to apply the latest version updates from your Populate Local Update Repository. You must understand the update version naming convention to know which version you want to apply to the host. The naming convention is ***major-release.minor-release.service-pack.patch***. For example, if you choose 11.6.1.2, you apply the following version to the host.

- 11 = major release
- 6 = minor release
- 1 = service pack
- 2 = patch

NetWitness Platform supports multiple versions in your deployment. The NetWitness Server (NW Server Host) is updated first and all other hosts must have the same or earlier version as the NW Server Host.

The following example is a single version deployment with all hosts updated to 11.2.0.0 (latest RSA release available).



Maintaining Services

You use the ADMIN > Services view to add, edit, delete, monitor, and perform other maintenance tasks for the services in your deployment. See Hosts and Services Procedures for detailed instructions.

Services Implemented with the NetWitness Server

The services in the following table are implemented when you deploy the NW Server to support:

- the expansion of physical and virtual deployment platforms and improvements to host and service maintenance.
- Content, Investigate, Respond, and Source functionality.

Caution: You do not need to configure these services to deploy NetWitness Platform. RSA recommends that you monitor the operating status of these services using Health-and-Wellness. Do not attempt to modify the parameters in the Explore view without contacting Customer Support (https://community.rsa.com/docs/DOC-1294).

Service	Purpose
Admin	The Administration Server (**Admin server**) is the back-end service for administrative tasks in the NetWitness Platform User Interface (UI). It abstracts authentication, global preferences management, and authorization support for the UI. The **Admin server** requires the **Config server** and the **Security server** to be online to perform its role.
Config	The Configuration Server (**Config server**) stores and manages configuration sets. A configuration set is any logical configuration group that is managed independently. The **Config server** facilitates the sharing of properties among services, provides configuration backup and restore facilities, and tracks changes to properties.
Content	The Content server manages the RSA provided and user created parser rules. For more information on parser management search for "parsers" in RSA Link.
Integration	The Integration Server manages interactions with external systems. The service handles the following outbound or inbound channels. • REST API Gateway - gateway to external REST clients that assigns calls to the NetWitness Application Programming Interface (API). • Notifications Dispatcher - centralized dispatcher for all outbound notifications originating in the NetWitness deployment.
Investigate	The Investigate server supports Investigate and Malware Analysis functionality. For more information see the *NetWitness Platform Investigate and Malware Analysis User Guide*.
Orchestration	The Orchestration server provisions, installs, and configures all services in your NetWitness Platform deployment.
Respond	The Respond server supports Respond functionality. For more information see the *NetWitness Platform Respond Configuration Guide*.

Service	Purpose
Security	The NetWitness Platform Security Server (**Security server**) manages the security infrastructure of a NetWitness Platform deployment. It handles the following security-related concerns. • Users and the authentication accounts • Role Based Access Control (RBAC) • Deployment PKI infrastructure A NetWitness Platform deployment has users with authentication accounts. Independent of how you verify the identity of the analyst (for example, Active Directory), NetWitness Platform must maintain user state that is not provided by all authentication providers (for example, last login time, failed login attempts, and roles). The concept of a user is separate from the identify associated with the user and the **Security server** maintains these as separate User and Account entities. In addition to the out-of-the-box local NetWitness accounts available to all NetWitness deployments, the server supports external authentication providers. The **Security server** also implements RBAC by managing Role and Permission entities. Permissions can be assigned to roles and roles to users. Together these enable a flexible authorization policy for the deployment. The server also manages generation of cryptographically secure tokens that encode the applicable authorization for a user. These tokens form the basis for deployment wide authorization.
Source	The Source server is reserved for future use and will provide a centralized location to configure sources (for example, Endpoints and Log Sources).

Running in Mixed Mode

Mixed mode occurs when some services are updated to the latest version and some are still on older versions. This happens when you update the hosts in your deployment to the latest version in phases (or stagger the update).

Functionality Gaps Encountered During in Staggered Updates

If you stagger the update, you:

- May not have all the features operational until you update your entire deployment.
- Will not have service administrative features available until you update all the hosts in your deployment.
- May be without data capture for a period of time.

Examples of Staggered Updates

In the following examples, all the hosts are on 11.2.0.x and you want to stagger the host updates to version 11.2.1.0.

Example 1. Multiple Decoders and Concentrators, Alternative 1

In this example, the 11.2.0.x deployment includes one NW Server host, two Decoder hosts, two Concentrator hosts, one Archiver host, one Broker host, one Event Stream Analysis host, and one Malware Analysis host.

You must complete Phase 1 first and update the hosts in the order listed for Phase 1.

RSA recommends that you update the Phase 2 hosts in the order listed for Phase 1

Phase 1 - session 1

1. Update the NetWitness Server host.
2. Update the Event Stream Analysis host.
3. Update the Malware Analysis host.
4. Update the Broker or Concentrator host.

Phase 2 - session 2

1. Update 2 Decoder hosts.
2. Update 2 Concentrator hosts and Archiver host.

Phase 2 - session 3

1. Update all other hosts.

Example 2. Multiple Decoders and Concentrators, Alternative 2

In this example, the 11.2.0.x deployment includes one NW Server host, two Decoder hosts, 2two Concentrator hosts, one Broker host, one Event Stream Analysis host, and one Malware Analysis host. RSA recommends that you update the Phase 2 hosts the following sequence (you must complete Phase 1 first and update the hosts in the order listed).

Phase 1 - session 1

1. Update the NetWitness Server host.
2. Update the Event Stream Analysis host.
3. Update the Malware Analysis host.
4. Update the Broker host.

Phase 2 - session 2

1. Update one Decoder host and one Concentrator host.
   Time elapses during which NetWitness Platform processes a significant amount of data.

Phase 2 - session 3

1. Update one Decoder host, one Concentrator host, and the Broker host.
2. Update all Log Decoder hosts before you update Virtual Log Collectors.
3. Update all other hosts.

Example 3. Multiple Regions

In this example, the 11.2.0.x deployment includes one NW Server host, one Event Stream Analysis host, one Malware Analysis host, four Decoder hosts, four Concentrator hosts, two Broker hosts, (two sites, each with two Decoders, two Concentrators, and one Broker).

Phase 1 - Update Site 1

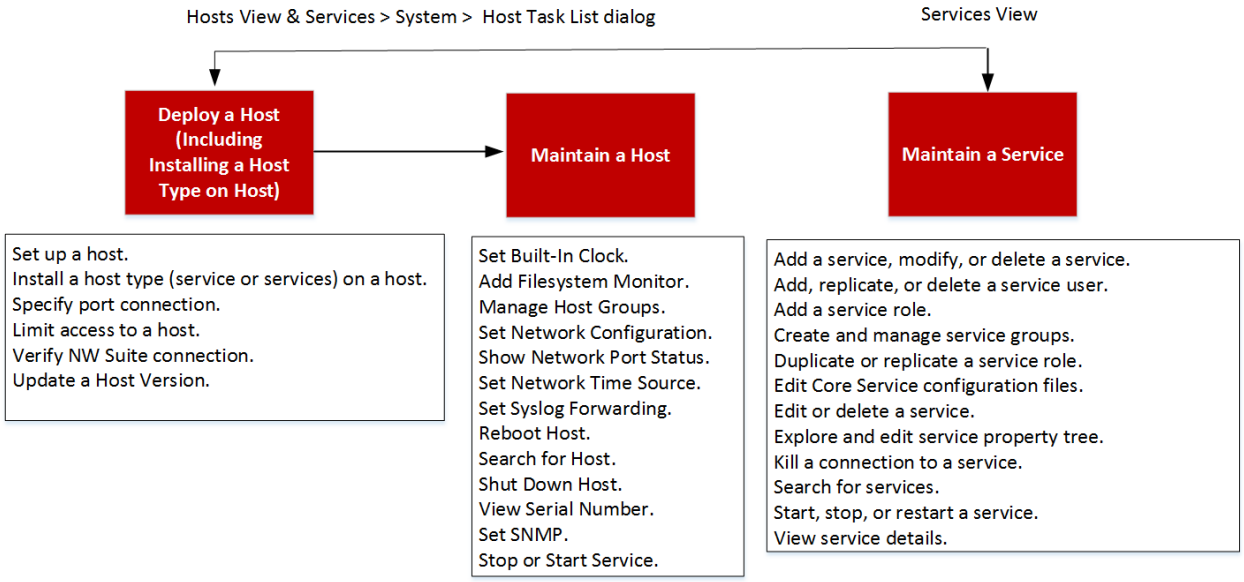
1. Update the NW Server host.
2. Update the Event Stream Analysis host.
3. Update the Malware Analysis host.
4. Update one Broker host, two Decoder hosts, and two Concentrator hosts.
5. Update all the other hosts.

Phase 2 - Update Site 2

1. Update the Broker hosts.
2. Update two Decoder hosts.
3. Update two Concentrator hosts.
4. Update all the other hosts.

Hosts and Services Procedures

Every service requires a host. After you set up a host, you can assign services to and from this host to other hosts in your NetWitness Platform deployment.



High-Level Task	Description
Set Up a Host	Complete the following tasks in the order shown to set up a host. Step 1. Deploy a host Step 2. Install a service on a host Step 3. Review SSL Ports for Trusted Connections Step 4. Manage access to a service

High-Level Task	Description

Maintain a Host - Basics	The following maintenance tasks are shown in alphabetical order.
	• Apply version updates to a host.
	  • Populate Local Update Repository
	  • Set Up an External Repository with RSA and OS Updates
	• Create and manage host groups
	• Search for hosts
	• Set network configuration
	• Set network time source
	• Show network port status
	• Show serial number
	• Shut down a host
	• Stop and start a service on a host

Maintain a Host from the Host Task List Dialog	You use the Host Task List dialog to manage tasks that relate to a host and its communications with the network. Several service and host configuration options are available for core hosts. • Execute a task from the Host Task List • Add and delete a Filesystem monitor • Reboot a host • Set host built-in clock • Set network configuration. • Set network time source • Set SNMP • Set Syslog forwarding • Show network port status • Show serial number • Shut down host • Stop and start a service on a host

High-Level Task	Description
Maintain a Service	The following procedures describe how to maintain services. • Add, replicate or delete a service user • Add a service user role • Change a service user password • Create and manage service groups • Duplicate or replicate a service role • Edit core service configuration files • Edit or delete a service • Explore and edit service property tree • Terminate a connection to a service • Search for services • Start, stop or restart a service • View service details

Step 1. Deploy a Host

Caution: If you include "." in a host name, the host name must also include a valid domain name.

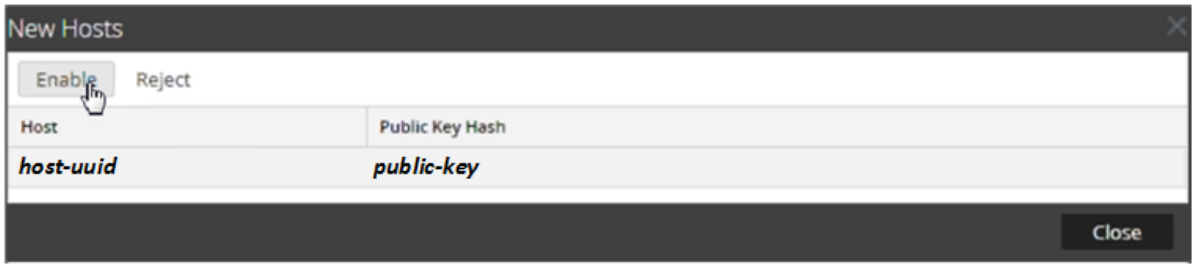
1. Deploy a host.

   You can deploy a physical host (RSA Appliance), virtual host on-prem, a virtual in AWS, or a virtual host in Azure. See the following guides for instructions on how to deploy hosts.

   - *RSA NetWitness® Platform Physical Host Deployment Guide*
   - *RSA NetWitness® Platform Virtual Host Deployment Guide*
   - *RSA NetWitness® Platform AWS Deployment Guide*
   - *RSA NetWitness® Platform Azure Deployment Guide*
2. Go to **Administration** > **Hosts**.

   The **New Hosts** dialog is displayed with the hosts that you deployed.
3. Select the hosts that you want to enable.

   The **Enable** menu option becomes active.
4. Click **Enable**.



5. Select the host you enabled.

   The host is displayed in the Hosts view. At this point, you can install a service on the host.

Step 2. Install a Service on a Host

Perform the following steps to install a service on a host.

1. In NetWitness Platform, go to **ADMIN > Hosts**.

   The **Hosts** view is displayed.

2. Select the host on which you want to install the service (for example, **Event Stream Analysis**).

3. Click 
in the toolbar.

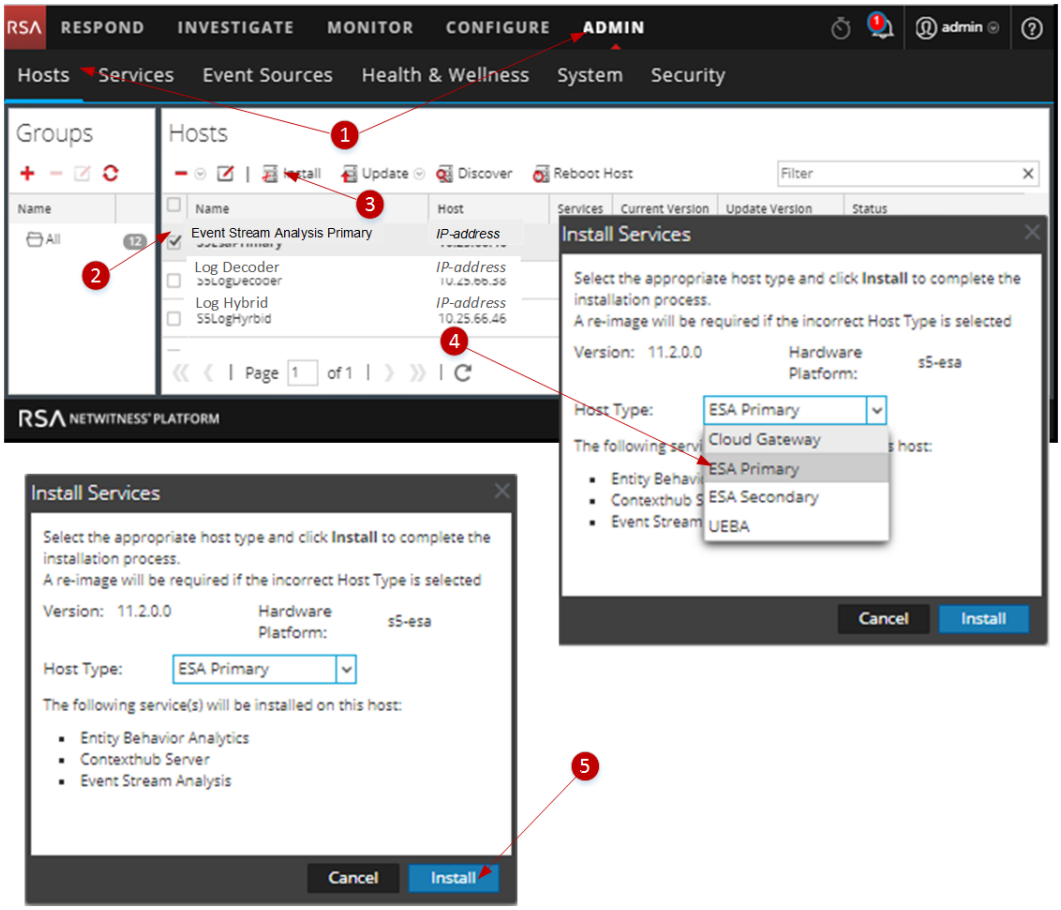
   The **Install Services** dialog is displayed.

4. Select a service from the **Host Type** drop-down list (for example, **ESA Primary**).

   The 

becomes active in the **Install Services** dialog.

5. Click Install.



Step 3. Review SSL Ports for Trusted Connections

To support trusted connections each core service has two ports, an unencrypted non-SSL port and an encrypted SSL port. Trusted connections require the encrypted SSL port.

Encrypted SSL Ports

When you install or upgrade to 10.4 or later, trusted connections are established by default with two settings:

- SSL is enabled.
- Core service is connected to an encrypted SSL port.

Each NetWitness Platform Core service has two ports:

- Unencrypted **non-SSL port**
  Example: Archiver 50008

- Encrypted **SSL port**
  Example: Archiver 56008

The SSL port is the non-SSL port + 6000.

The following table lists all NetWitness Platform services with their respective ports and shows that each core service has two ports. All port numbers listed are TCP.

Service	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
Admin	N/A	N/A	Implemented with the NW Server
Archiver	50008	56008	
Broker	50003	56003	Core Service
Cloud Gateway	N/A	N/A	
Concentrator	50005	56005	Core Service
Config	N/A	N/A	Implemented with the NW Server.
Content	N/A	N/A	Implemented with the NW Server
Context Hub	N/A	N/A	
Decoder (Packets)	50004	56004	Core Service
Endpoint	N/A	N/A	
Entity Behavior Analysis	N/A	N/A	
Event Stream Analysis	N/A	50030	
Integration	N/A	N/A	Implemented with the NW Server.
Investigate	N/A	N/A	Implemented with the NW Server.
Log Collector	50001	56001	
Log Decoder	50002	56002	Core Service
Malware Analysis	N/A	60007	
Orchestration	N/A	N/A	Implemented with the NW Server.

Service	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
Reporting Engine	N/A	51113	Implemented with the NW Server.
Respond	N/A	N/A	Implemented with the NW Server.
Security	N/A	N/A	Implemented with the NW Server.
Source	N/A	N/A	Implemented with the NW Server
UEBA	N/A	N/A	
Warehouse Connector	50020	56020	
Workbench	50007	56007	

Step 4. Manage Access to a Service

In a trusted connection, a service explicitly trusts the NW Server to manage and authenticate users. With this trust, services in **ADMIN > Services** no longer require credentials to be defined for every NetWitness Platform Core service. Instead, users who have been authenticated by the server can access the service without entering another password.

Test a Trusted Connection

Prerequisites

1. A role must be assigned to the user.
   For more information see **Add a User and Assign a Role** topic in the *System Security and User Management Guide*.
2. The user must:
   - Log in to NetWitness Platform for the server to authenticate the user.
   - Have access to the service.

Procedure

1. In NetWitness Platform, go to **ADMIN > Services**.
   The Services view is displayed.

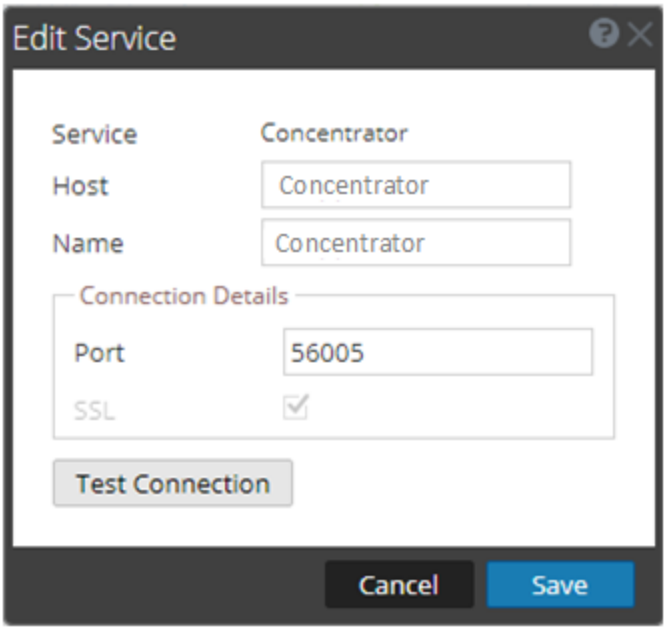
2. Select the service (for example, a Concentrator) to test and click .
   The **Edit Service** dialog is displayed.



3. Remove the **Username** to test the connection without credentials.
4. Click **Test Connection**.

   The message **Test connection successful** confirms the trusted connection is established.
   The previously authenticated user can access the service without typing a username and password on the service.
5. Click **Save**.

Apply Version Updates to a Host

Complete the following tasks to update a host to a new version update.

Use the following methods to apply version updates to a host.

Note: If you have changed your location of the repository, see Set Up an External Repository with RSA and OS Updates for instructions.

- Apply updates from the Host view (Web Access)
- Apply update from the command line (No Web Access)

Apply Updates from the Hosts View (Web Access)

Task 1. Populate Local Repo or Set Up an External Repo

When you set up your NW Server, you select the Local Repository (Repo) or an External Repository (Repo). The Hosts view retrieves version updates from the repo you selected.

If you select the Local Repo, you do not need to set it up, but you must make sure that it is populated with the latest version updates. See Populate Local Repository for instructions on how to populate it with a version update.

Note: If you selected an External Repo, you must set it up. For more information on how for instructions on how to populate it with a version update see Set Up an External Repository with RSA and OS Updates .

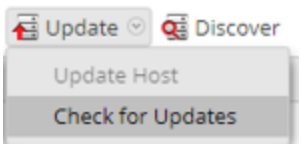
Task 2. Apply Updates from the Hosts View to Each Host

The Hosts view displays the software version updates available in your Local Update Repository and you choose and apply the updates you want from the Host view.

This procedure tells you how to update a host to a new version of NetWitness Platform.

Note: This topic uses NetWitness Platform 11.0.x.x to 11.1.0.0 as an example.

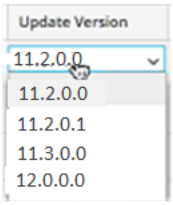
1. Log in to NetWitness Platform.
2. Go to **ADMIN > HOSTS**.
3. (Conditional) Check for the latest updates.



4. Select a host or hosts.

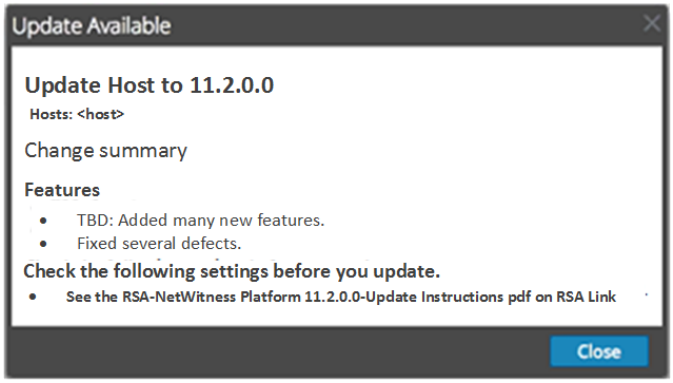
You must update the NW Server to the latest version first. You can update the other hosts in any sequence you prefer, but RSA recommends that you follow the guidelines in Running in Mixed Mode.
Update Available is displayed in the **Status** column if you have an version update in your Local Update Repository for the selected hosts.

5. Select the version you want to apply from the **Update Version** column.



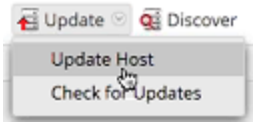
If you:

- Want to update more than one host to that version, after you update the NW Server host, select the checkbox to the left of the hosts. Only currently supported update versions are listed.
- Want to view a dialog with the major features in the update, click the ⓘ to the right of the update version number. The following is an example of this dialog.

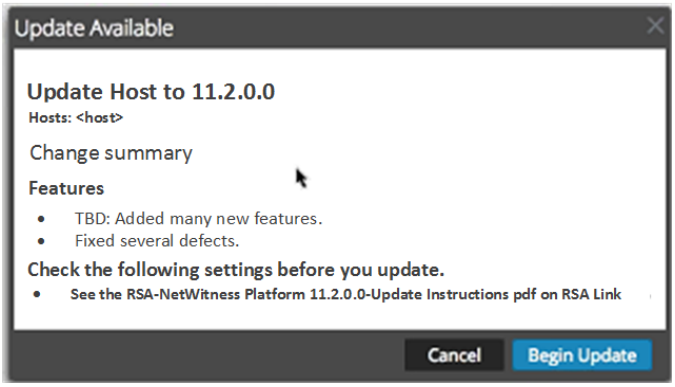


- Cannot find the version you want, select **Update > Check for Updates** to check the repository for any available updates. If an update is available, the message "New updates are available" is displayed, and the **Status** column updates automatically to show **Update Available**. By default, only supported updates for the selected host are displayed.

6. Click **Update > Update Host** from the toolbar.



A dialog is displayed with information on the selected update. Click **Begin Update**.



The **Status** column tells you what is happening in each of the following stages of the update:

- Stage 1 - **Downloading update packages** - downloads the repository artifacts to the NW Server applicable to the services on the host you chose.
- Stage 2 - **Configuring update packages** - configures update files in to correct format.
- Stage 3 - **Update in progress** - updates host to the new version.

7. When you see **Update in progress**, refresh the browser.

   This may display the NetWitness Log In screen from which you log in again and navigate back to the Host view.

   After the host is updated, NetWitness Platform prompts you to **Reboot Host**.

8. Click **Reboot Host** from the toolbar.

   NetWitness Platformshows the status as **Rebooting...** until the host comes back online and the **Status** shows **Up-to-Date**. Contact Customer Care if the host does not come back online.

Note: If you have the Defense Information Systems Agency Security Technical Implementation Guide (DISA STIG) enabled, opening core services can take approximately 5 to 10 minutes. This delay is caused by the generation of new certificates.

Apply Updates from the Command Line (No Web Access)

If your NetWitness Platform deployment does not have Web access, complete the following procedure to apply a version update.

Note: In the following procedure, 11.1.0.0 is the version update used as an example in the code strings.

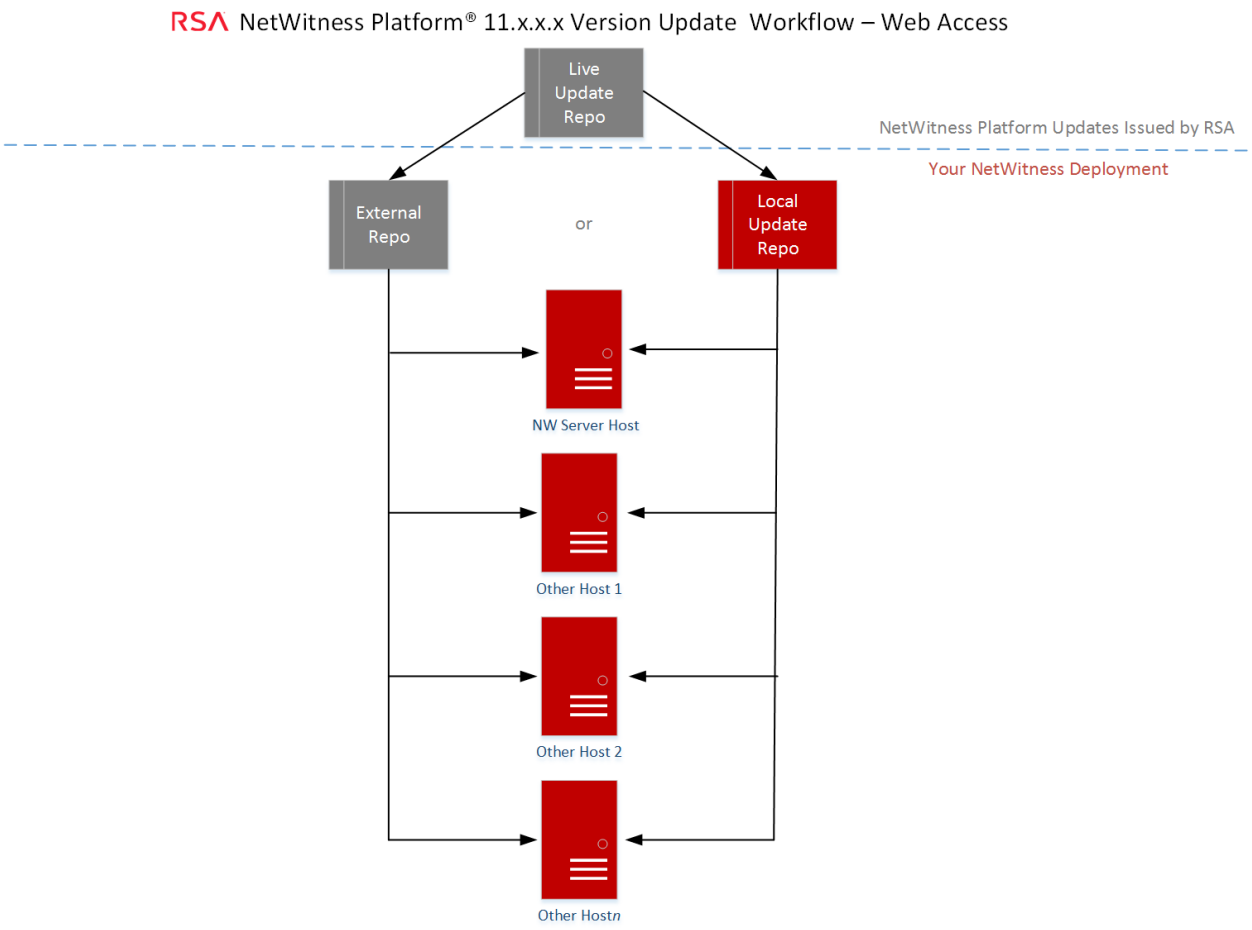
1. Download `.zip` update package for the version you want (for example, `netwitness-11.1.0.0.zip`) from RSA Link to a local directory.
2. SSH to the NW Server host.
3. Make a `tmp/upgrade/<version>` staging directory for the version you want (for example, `tmp/upgrade/11.1.0.0`).
   ```
   mkdir -p /tmp/upgrade/11.1.0.0
   ```

4. Unzip the package into the staging directory you created (for example, `tmp/upgrade/11.1.0.0`) .
   ```
   cd /tmp/upgrade/11.1.0.0
   unzip /tmp/upgrade/11.1.0.0/netwitness-11.1.0.0.zip
   ```
5. Initialize the update on the NW Server.
   ```
   upgrade-cli-client --init --version 11.1.0.0 --stage-dir /tmp/upgrade/
   ```
6. Apply the update to the NW Server.
   ```
   upgrade-cli-client --upgrade --host-addr <NW Server IP> --version 11.1.0.0
   ```
7. Log in to NetWitness Platform and reboot the NW Server host in the Host View.
8. Apply update to each non-NW Server host.
   ```
   upgrade-cli-client --upgrade --host-addr <non-NW Server IP address> --
   version 11.1.0.0
   ```
   The update is complete when the polling is completed.
9. Log in to NetWitness Platform and reboot the host in the Host View.
   You can verify the version applied to the host with the following command:
   ```
   upgrade-cli-client --list
   ```

Populate Local Update Repository

NetWitness Platform sends version updates to the Local Update Repository from the Live Update Repository. Access to the Live Update Repository requires and uses the Live Account credentials configured under **ADMIN > SYSTEM > Live**. In addition, you must check the `Automatically download information about new updates every day` checkbox under **ADMIN > SYSTEM > Updates** to populate the Local Repo daily.

The following diagram illustrates how you obtain version updates if your NetWitness Platform deployment has Web Access.



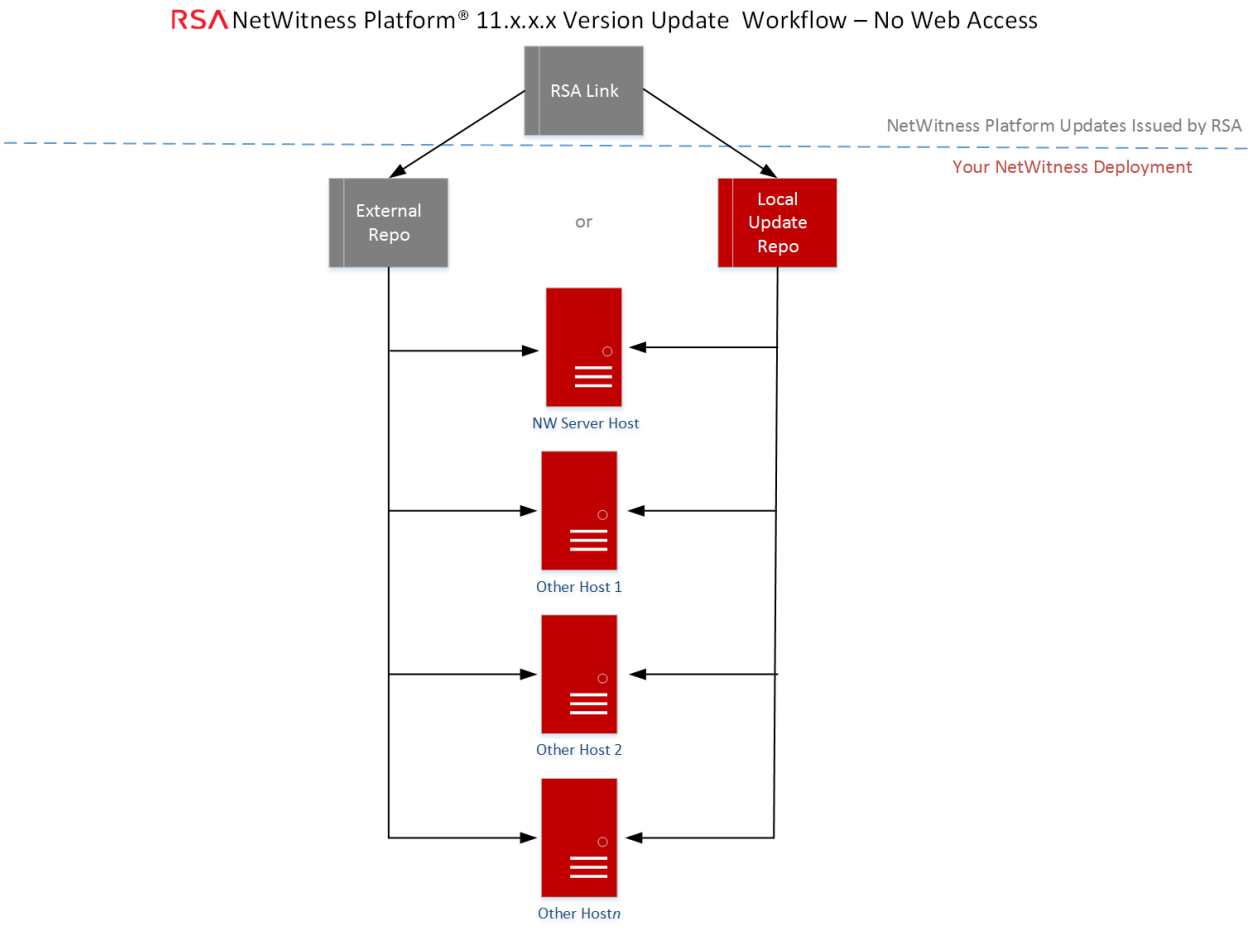
Note: When you make the initial connection with the Live Update Repository, you will be accessing all the CentOS 7 system packages and the RSA Production packages. This download of over 2.5 GB of data takes an indeterminate amount of time depending on your NW Server Internet connection and the traffic of the RSA Repository. It is not mandatory to use the Live Update Repository. Alternatively you can use an External Repo as described in Set Up an External Repository with RSA and OS Updates.

To connect to the Live Update Repository, go to the ADMIN > System view, select **Live Services** in the options panel and make sure that credentials are configured (**Connection** light should be green). If it is not green, click **Sign In** and connect.

Note: If you need to use proxy to reach out to the Live Update Repository, you can configure the Proxy Host, Proxy Username, and Proxy Password. For more information see "Configure Proxy forNetWitness Platform" in the *NetWitness Platform 1.1 System Configuration Guide*.

See Apply Updates from the Command Line (No Web Access) if your NetWitness Platform deployment does not have Web Access.

The following diagram illustrates how you obtain version updates if your NetWitness Platform deployment does not have Web Access.



Set Up an External Repository with RSA and OS Updates

Note: In the following procedure, 11.1.0.0 is the version update used as an example in the code strings.

Complete the following procedure to set up an external repository (Repo).

Note: 1.) You need an unzip utility installed on the host to complete this procedure. 2.) You must know how to create a web server before you complete the following procedure.

1. (Conditional) Complete this step if you have an external repo and you want to override it.
   - Case 1: You bootstrapped the host from an external repo and you want to upgrade using a local repo on the Admin Server.
     a. Create the `/etc/netwitness/platform/repobase` file.
        `vi /etc/netwitness/platform/netwitness/repobase`
     b. Edit the `repobase` file so that the only information in the file is the following URL.

```
https://nw-node-zero/nwrpmrepo
```

c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool.

- Case 2: You bootstrapped the host from local repo on the Admin server (NW Server host) and you want to use an external repo for the upgrade.

  a. Create the `/etc/netwitness/platform/repobase` file.
  ```
  vi /etc/netwitness/platform/netwitness/repobase
  ```

  b. Edit the `repobase` file so that the only information in the file is the following URL.
  ```
  https://<webserver-ip>/<alias-for-repo>
  ```

  c. Complete the instructions on how to run the upgrade using the `upgrade-cli-client` tool. The instructions are in the Apply Updates from the Command Line (No Web Access).

2. Set up the external repo.

   a. Log in to the web server host

   b. Create directory to host the NW repository (`netwitness-11.2.0.0.zip`), for example `ziprepo` under `web-root` of the web server. For example, /var/netwitness is the web-root, run the following command string.
   ```
   mkdir -p /var/netwitness/<your-zip-file-repo>
   ```

   c. Create the 11.2.0.0 directory under `/var/netwitness/<your-zip-file-repo>`.
   ```
   mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0
   ```

   d. Create the `OS` and `RSA` directories under `/var/netwitness/<your-zip-file-repo>/11.2.0.0`.
   ```
   mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS
   mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0/RSA
   ```

   e. Unzip the `netwitness-11.2.0.0.zip` file into the `/var/netwitness/<your-zip-file-repo>/11.2.0.0` directory.
   ```
   unzip netwitness-11.2.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0
   ```
   Unzipping `netwitness-11.2.0.0.zip` results in two zip files (`OS-11.2.0.0.zip` and `RSA-11.2.0.0.zip`) and some other files.

   f. Unzip the:

      1. `OS-11.2.0.0.zip` into the `/var/netwitness/<your-zip-file-repo>/11.2.0.0/OS` directory.
      ```
      unzip /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS-11.2.0.0.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS
      ```
      The following example illustrates how the Operating System (OS) file structure appears after

you unzip the file.

   The external url for the repo is `http://<web server IP address>/<your-zip-file-repo>`.

g. (Conditional - For Azure) Follow these steps for Azure update.

i. `mkdir -p /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS/other`

ii. `unzip nw-azure-11.2-extras.zip -d /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS/other`

iii. `cd /var/netwitness/<your-zip-file-repo>/11.2.0.0/OS`

iv. `createrepo .`

h. Use the `http://<web server IP address>/<your-zip-file-repo>` in response to **Enter the base URL of the external update repositories** prompt from NW 11.2.0.0 Setup program (`nwsetup-tui`) prompt.

Create and Manage Host Groups

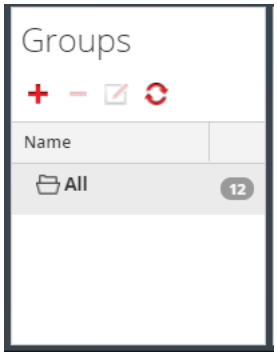
The Hosts view provides options for creating and managing groups of hosts. The Groups panel toolbar includes options for creating, editing, and deleting host groups. Once groups are created, you can drag individual hosts from the Hosts panel into a group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A host may belong to more than one group. Here are some examples of possible groupings:

- Group different host types to make it easier to configure and monitor all Brokers, Decoders, or Concentrators.
- Group hosts that are part of the same data flow; for example, a Broker, and all associated Concentrators and Decoders.
- Group hosts according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected hosts are easily identifiable.

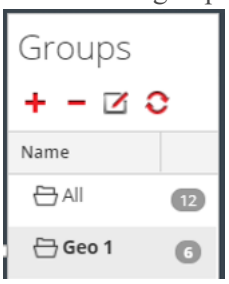
Create a Group

1. Select **ADMIN** > **Hosts**.
   The Hosts view is displayed.
2. In the **Groups** panel toolbar, click +.
   A field for the new group opens with a blinking cursor.



3. Type the name of the new group in the field (for example, **Geo 1**) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the number of

hosts in that group.



Change the Name of a Group

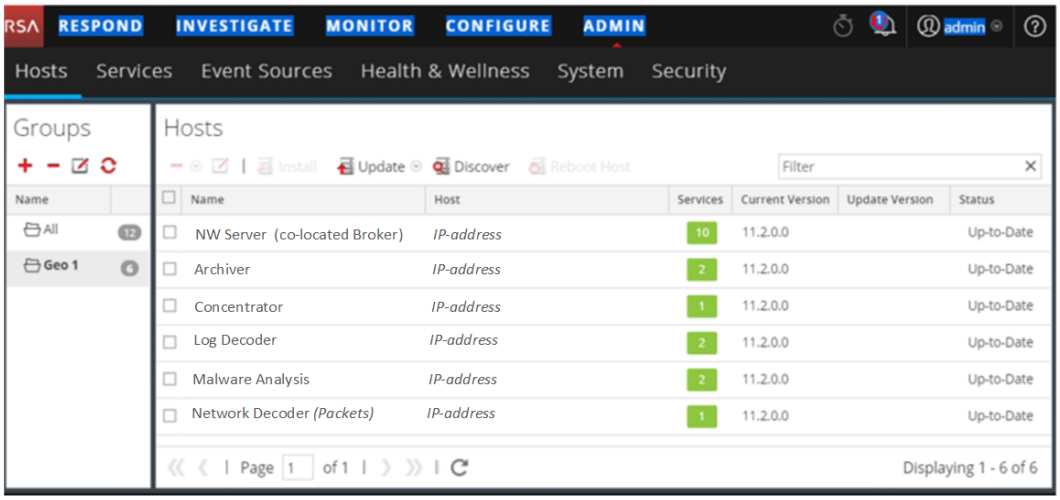
1. In the Hosts view **Groups** panel, double-click the group name or select the group and click .
   The name field opens with a blinking cursor.
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

Add a Host to a Group

In the Hosts view **Hosts** panel, select a host and drag the host to a group folder in the Groups panel. The host is added to the group.

View the Hosts in a Group

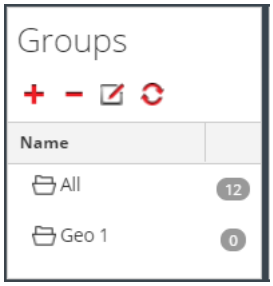
To view the hosts in a group, click the group in the **Groups panel**.
The **Hosts panel** lists the hosts in that group.



Remove a Host from a Group

1. In the Hosts view **Groups panel**, select the group that contains the host that you want to remove. The hosts in that group appear in the Hosts panel.

2. In the **Hosts panel**, select one or more hosts that you want to remove from the group, and in the toolbar, select > **Remove from Group**.
   The selected hosts are removed from the group, but are not removed from the NetWitness Platform user interface. The number of hosts in the group, which is listed near the group name, decreases by the number of hosts removed from the group. The **All** group contains the hosts that were removed from the group.
   In the following example, the host group called **Geo 1** does not contain any hosts, because all the hosts in that group are removed.



Delete a Group

1. In the Hosts view **Groups panel**, select the group that you want to delete.
2. Click .
   The selected group is removed from the Groups panel. The hosts that were in the group are not removed from the NetWitness Platform user interface. The **All** group contains the hosts from the deleted group.

Search for Hosts

You can search for hosts from a list of hosts in the Hosts view. The Hosts view enables you quickly filter the list of hosts by Name and Host. It is possible to have numerous NetWitness Platform hosts in use for various purposes. Instead of scrolling through the host list, you can quickly filter the host list to locate the hosts that you want to administer.

In the Services view, you can search for a service and quickly find the host that runs that service.

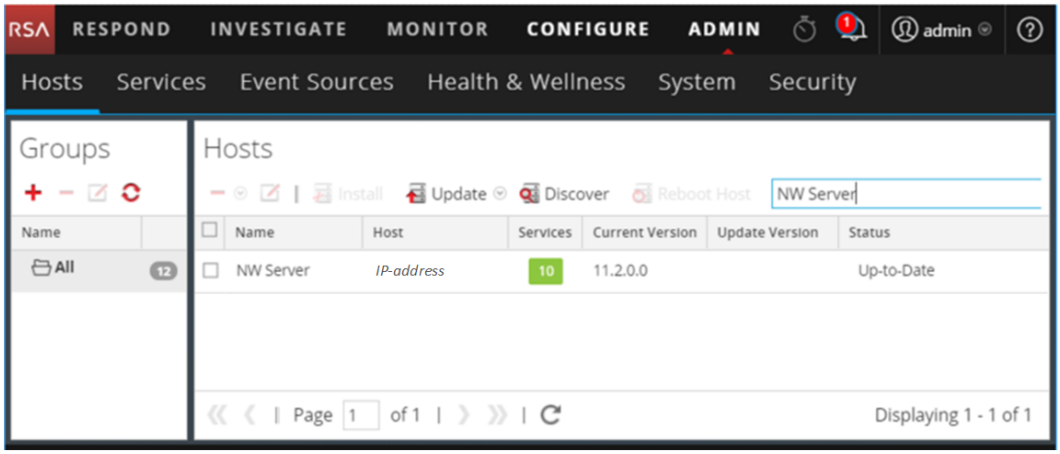
Search for a Host

1. Select **ADMIN** > **Hosts**.
2. In the **Hosts Panel** toolbar, type a host **Name** or **Hostname** in the **Filter** field.

   The Hosts panel lists the hosts that match the names entered in the Filter field.

Find the Host that Runs a Service

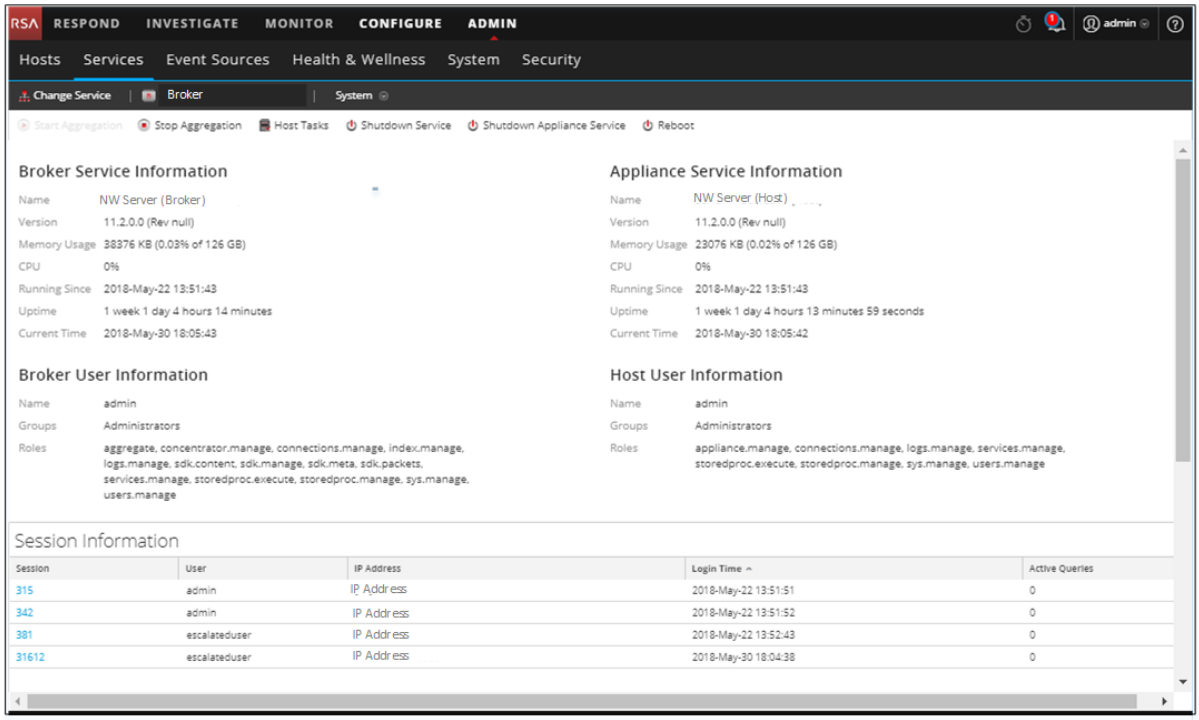
1. Select **ADMIN > Services**.
2. In the Services view, select a service. The associated host is listed in the **Host** column for that service.
3. To administer the host in the Hosts view, click the link in the **Host** column for that service. The host associated with the selected service is displayed in the Hosts view.



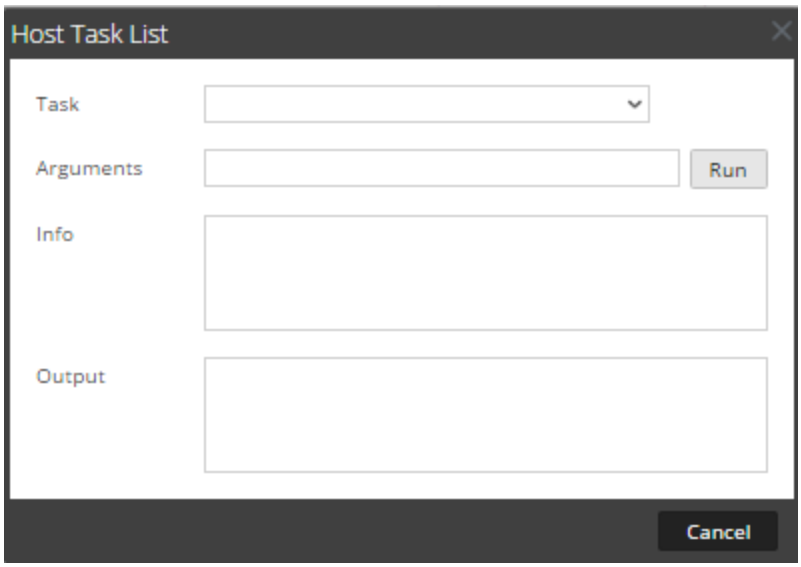
Execute a Task From the Host Task List

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.

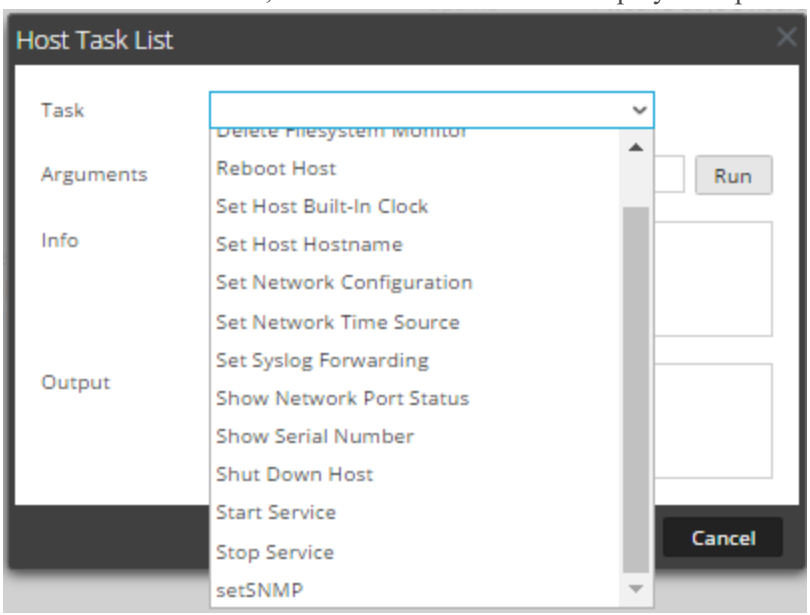
Note: The Admin, Config, Orchestration, Security, Investigate, and Respond services do have access to the System view. They only have access to the Explore view.
The System view for the service is displayed.



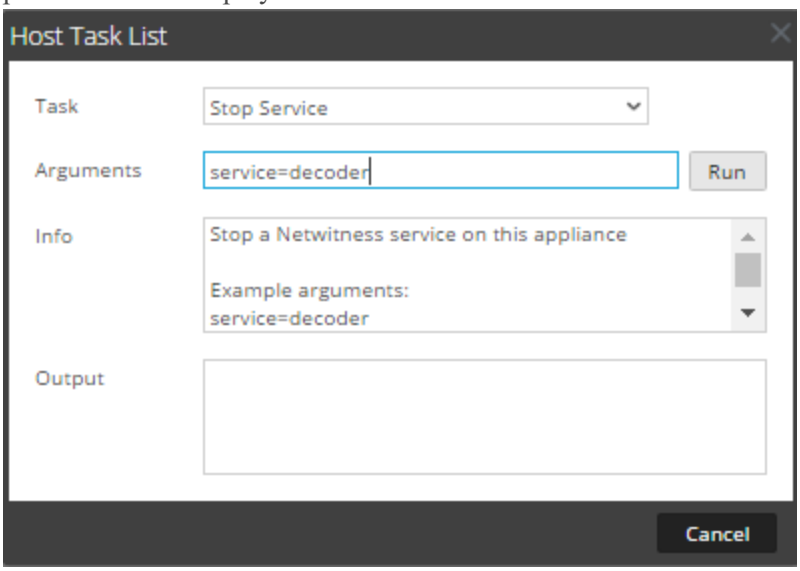
3. In the **Services System** view toolbar, click Host Tasks.



4. In the **Host Task List,** click in the **Task** field to display a drop-down list of tasks that run on a host.



5. Select a task; for example, click **Stop Service**.
   The task is displayed in the **Task** field and task description, example arguments, security roles, and parameters are displayed in the **Info** area.



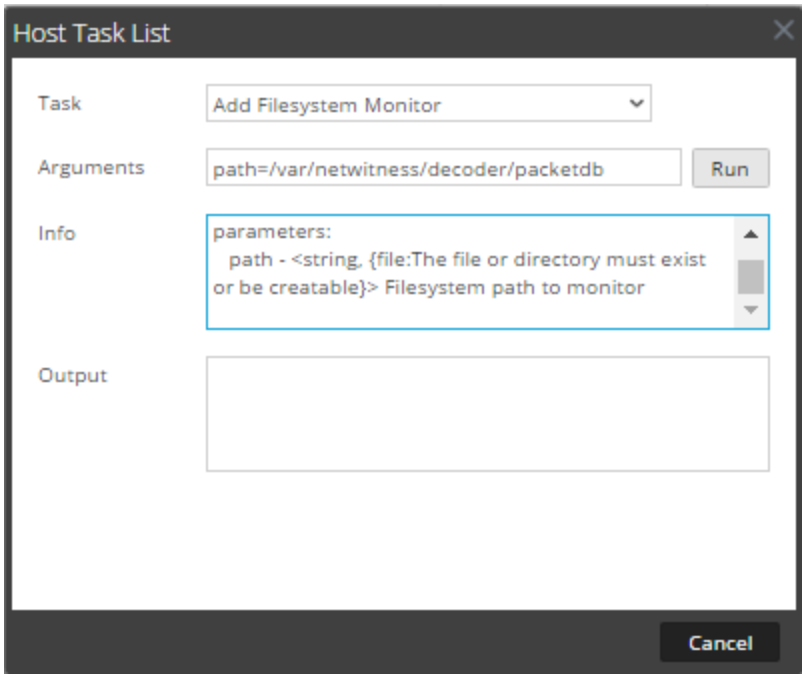
6. Type arguments if necessary and click **Run**.
   The command executes and the result is displayed in the **Output** section.

Add and Delete a Filesystem Monitor

When you want a service to monitor traffic on a specific file system, you can select the service and then specify the path. NetWitness Platform adds a filesystem monitor. Once a file system monitor is added to a service, the service continues to monitor traffic on that path until the file system monitor is deleted.

Configure the Filesystem Monitor

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Add Filesystem Monitor**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.
5. To identify the file system to monitor, type the path in the **Arguments** field. For example: **path=/var/netwitness/decoder/packetdb**

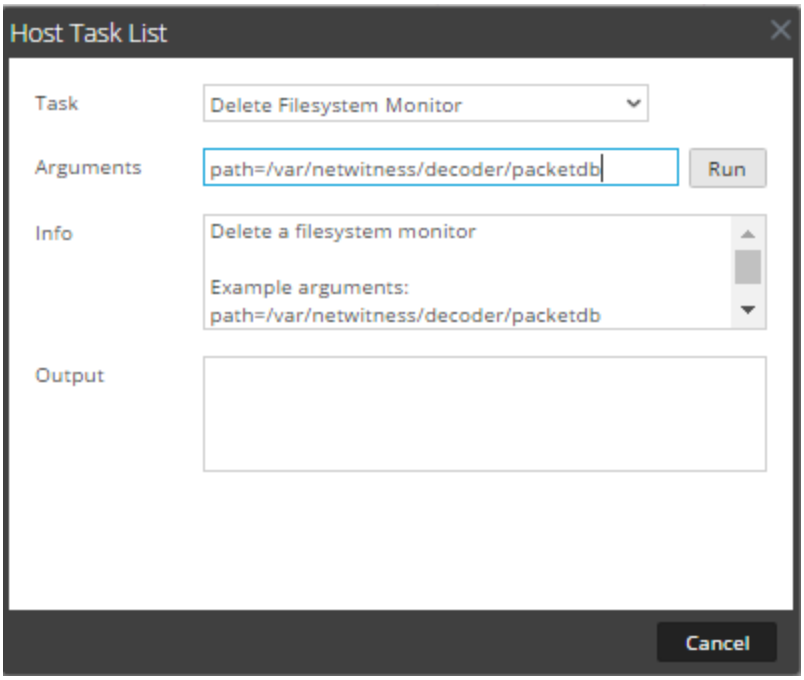


6. Click **Run**.
   The result is displayed in the **Output** area. The service begins to monitor the file system and continues to monitor it until you delete the filesystem monitor.

Delete a Filesystem Monitor

1. Navigate to the **Host Task List** dialog.
2. In the **Host Task List**, select **Delete Filesystem Monitor**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.

3. To identify the filesystem to stop monitoring, type the path in the **Arguments** field. For example: **path=/var/netwitness/decoder/packetdb**



4. Click **Run**.
   The result is displayed in the **Output** area. The service stops monitoring the file system.

Reboot a Host

Under certain conditions, you must reboot a host; for example, after installing a software upgrade. This procedure uses a Host Task List message to shut down and restart a host.

NetWitness Platform also offers other options for shutting down a host:

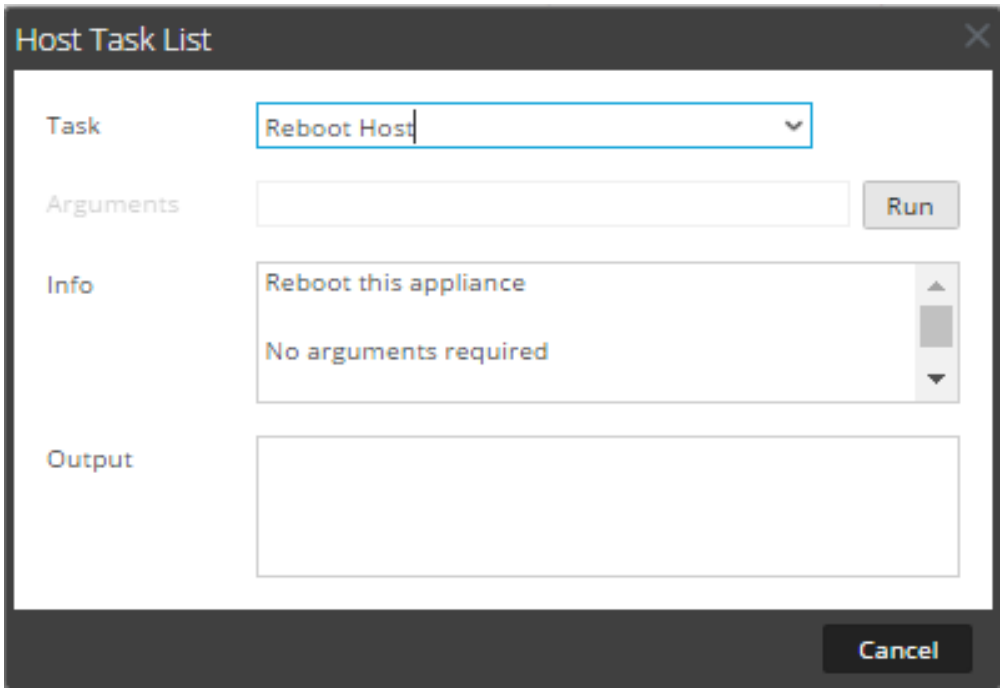
- To shut down and restart a host through an attached service, go to the Hosts view from a service in the Services view (see Search for Hosts) and then follow the *Shut Down and Restart a Host from the Hosts View* procedure below.
- To shut down the physical host without restarting, see Shut Down Host.

Shut Down and Restart a Host from the Hosts View

1. Select **ADMIN** > **Hosts**.
2. In the **Hosts** panel, select a host.
3. Select 
from the toolbar.

Shut Down and Restart a Host from the Host Task List

1. Select **ADMIN** > **Services**.
2. In the **Services** panel, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Reboot Host** in the **Task** field.
   No arguments are required.



5. Click **Run**.
   The host is rebooted and the result is displayed in the **Output** area.

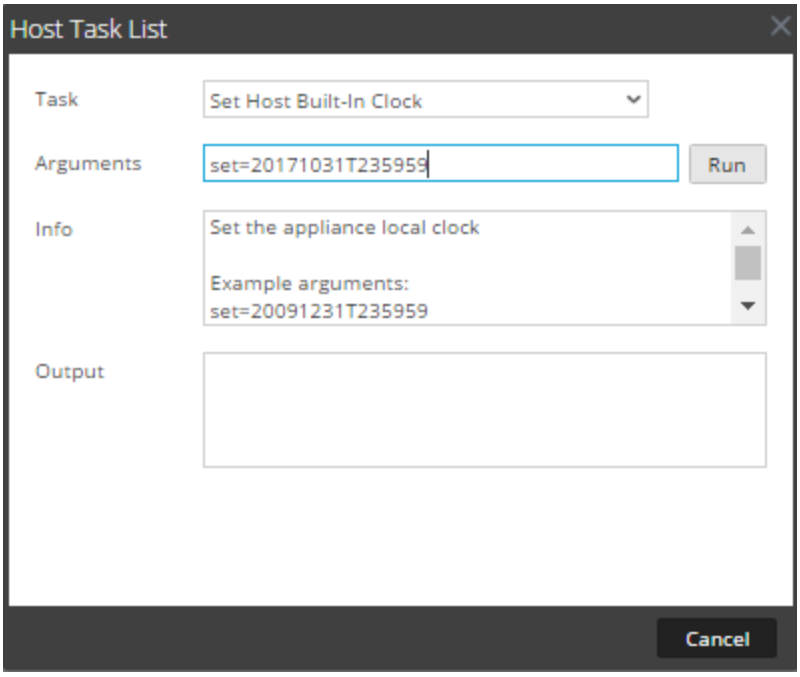
Set Host Built-In Clock

After a shutdown or battery failure, it may be necessary to set the local clock on a host. The Set Host Built-In Clock task resets the clock time.

Set the Time on the Local Clock

1. Select **ADMIN** > **Services**.
2. In the **Services** grid, select a service and > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.

4. In the **Host Task List**, select **Set Host Built-In Clock**. Help for the task is displayed in the **Info** area.
5. Enter the date and time arguments in the **Arguments** field; for example, to specify October 31, 2017 at 11:59:59 PM, type:
   set=20171031T235959



6. Click **Run**.
   The clock is set to the specified time and a message is displayed in the **Output** area.

Set Network Configuration

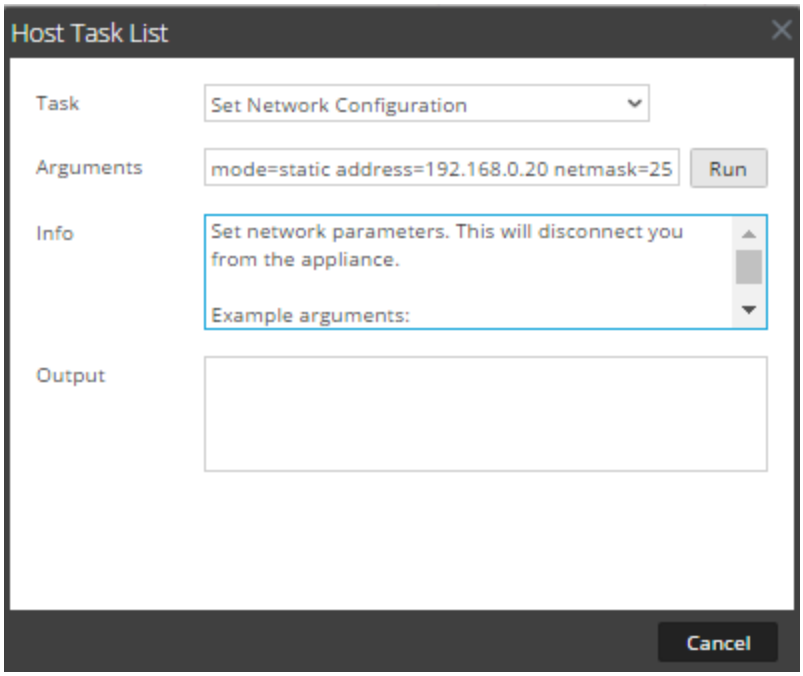
When a configured core host needs its address changed, you can set a new network address, subnet mask, and gateway for the host using the **Set Network Configuration** message in the **Host Task List**.

Caution: The change goes into effect immediately, and the host is disconnected from NetWitness Platform. You must then add the host to NetWitness Platform again using the new network address.

Specify the Network Address for a Host

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View System**.
   The System view for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Set Network Configuration**.
   The task is displayed in the **Task** field and help is displayed in the **Info** area.

5. Enter the arguments in the **Arguments** field. For example:
   mode=static address=192.168.0.20 netmask=255.255.255.0 gateway=192.168.0.1



6. Click **Run.**
   The task executes and the result is displayed in the **Output** area. The host is disconnected from NetWitness Platform. You must add the host again with the new address.

Note: If the mode is DHCP, there may be no way to determine the new address. You may have to connect to the host directly to determine the new address.

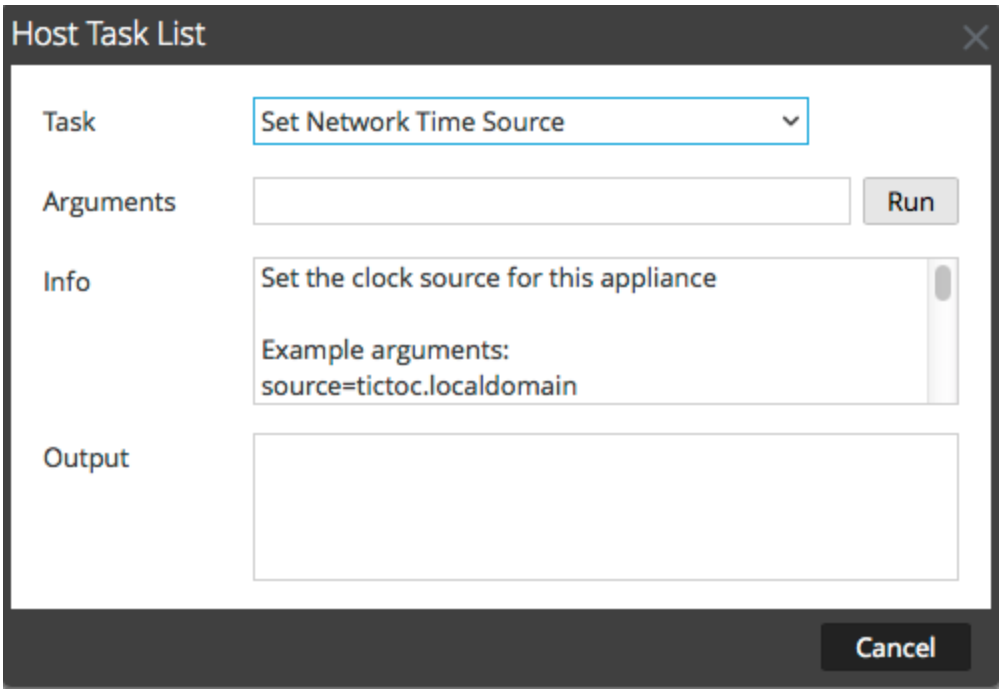
Set Network Time Source

When setting the clock source for a host, set the hostname or address of an NTP server to be the network clock source for the host. If the host is using a local clock source, you must specify **local** here to allow **Set the Local Clock Source** to be effective.

Specify the Network Clock Source

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click **View > System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.

4. In the **Host Task List**, select **Set Network Time Source**.



5. Do one of the following:
   - Type the hostname or address of the NTP server to serve as the clock source for this host; for example: **source=tictoc.localdomain**
   - If you want to use the host clock as a clock source, type: **source=local**

6. Click **Run**.
   The clock source is set and a message is displayed in the **Output** area.

Note: If you specified a NTP clock source of **local**, the host clock serves as the clock source and the time is configured using Set Host Built-In Clock.

Set SNMP

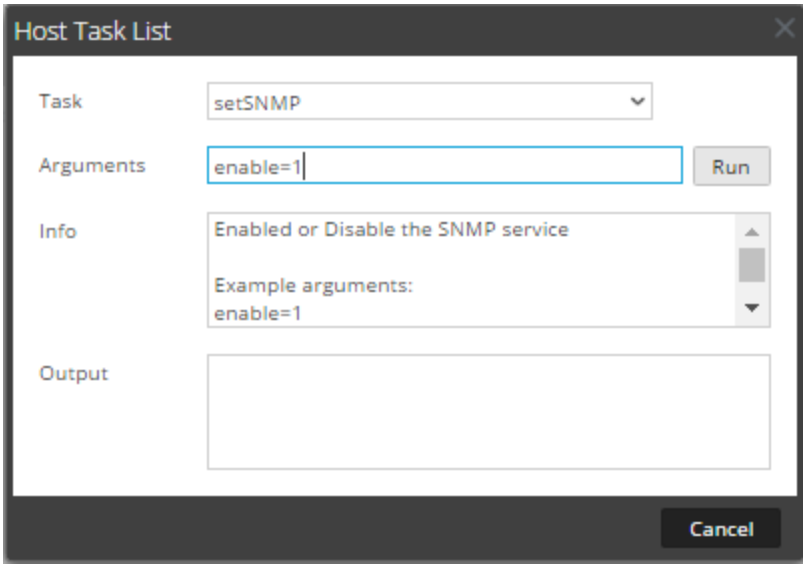
Set SNMP in the Host Task List enables or disables the SNMP service on a host. For a host to receive SNMP notifications, enable the SNMP service. If you are not using SNMP for NetWitness Platform notifications, it is not necessary to enable the service.

Toggle SNMP Service on the Host

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.

4. In the **Host Task List**, select **setSNMP**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.
5. Do one of the following:
   - If you want to disable the service, type **enable=0** in the **Arguments** field.

   - If you want to enable the service, type **enable=1** in the **Arguments** field.



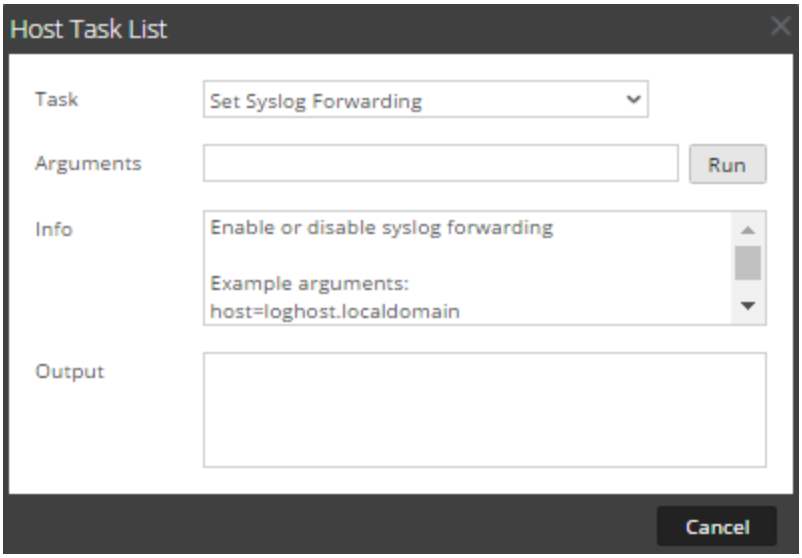
6. Click **Run**.
   The result is displayed in the **Output** area.

Set Syslog Forwarding

You can configure Syslog forwarding to forward the operating system logs of your NetWitness Platform Hosts to a remote syslog server. You can use the Set Syslog Forwarding task in the Host Task List to enable or disable syslog forwarding.

Set Up and Start Syslog Forwarding

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View** > **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Set Syslog Forwarding**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.



5. In the **Arguments** field, do any one of the following.
   - To enable syslog forwarding, specify any one of the following formats:
     - **host=<loghost>.<localdomain>** (for example, host=syslogserver.local).
     - **host=<loghost>.<localdomain>:<port>** (for example, host=syslogserver.local:514).
     - **host=<IP>** (for example, host=10.31.244.244).
     - **host=<IP>:<port>** (for example, host=10.31.244.244:514).
       The following table lists the parameters used to enable syslog forwarding.

Parameter	Description
loghost	The host name of the remote syslog server.
localdomain	The domain of the remote syslog server.
port	IP address of the remote syslog server.
IP	The port number on which the remote syslog server receives a syslog messages.

   - To disable syslog forwarding, type **host=disable**.

6. Click **Run**.
   The result is displayed in the **Output** area.

Once syslog forwarding is enabled or disabled, the `/etc/rsyslog.conf` file is updated automatically to enable or disable syslog forwarding to the remote syslog destination and the syslog service is restarted.

If you enable syslog forwarding, the logs from the configured service are forwarded to the defined syslog server and continues forwarding until disabled.

Note: You can now log in to the remote syslog server and verify if the messages are being received from the NetWitness Platform services configured for syslog forwarding.

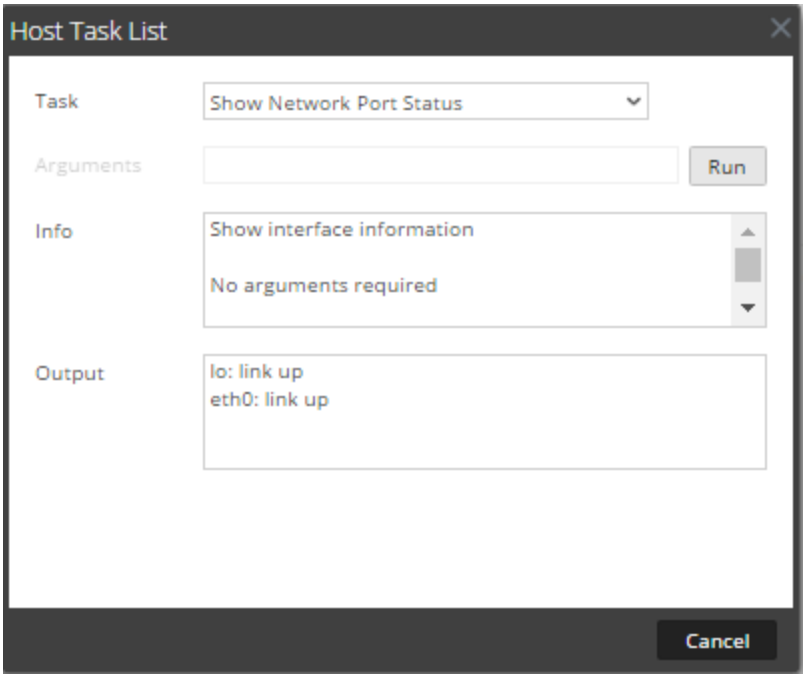
Show Network Port Status

The Show Network Port Status task in the Host Task List gives you the status of all configured ports on the host.

Display the Network Port Status

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and > **View**> **System**.
   The System view for the selected service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Show Network Port Status**.
   The task is displayed in the **Task** field, and information about the task is displayed in the **Info** area.

5. To execute the task, click **Run**.
   The status for each port on the host is displayed in the **Output** area.



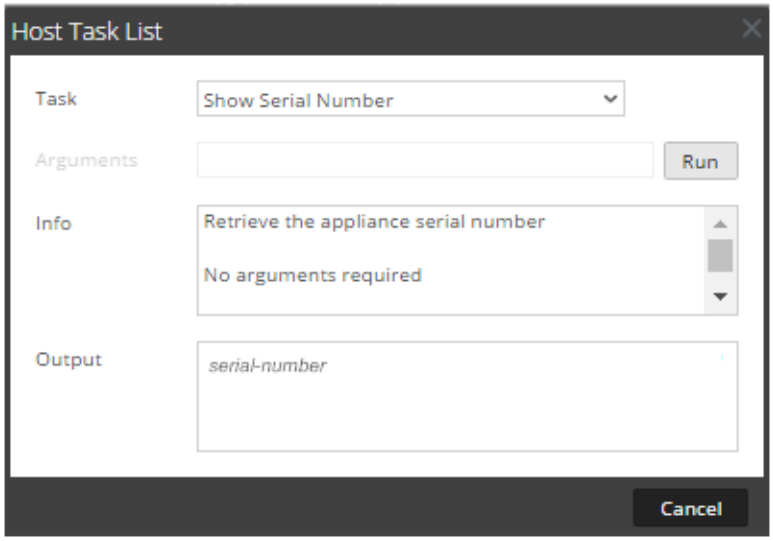
Show Serial Number

The Show Serial Number task in the Host Task List displays the serial number of a host.

Show the Serial Number

1. Select **ADMIN > Services**.
2. In the **Services** grid, select a service and click > **View> System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, select **Show Serial Number**.
   In the **Info** area, a brief explanation of the task and the task arguments is displayed.

5. No arguments are required for this task. Click **Run**.
   The serial number of the selected host is displayed in the **Output** area.



Shut Down Host

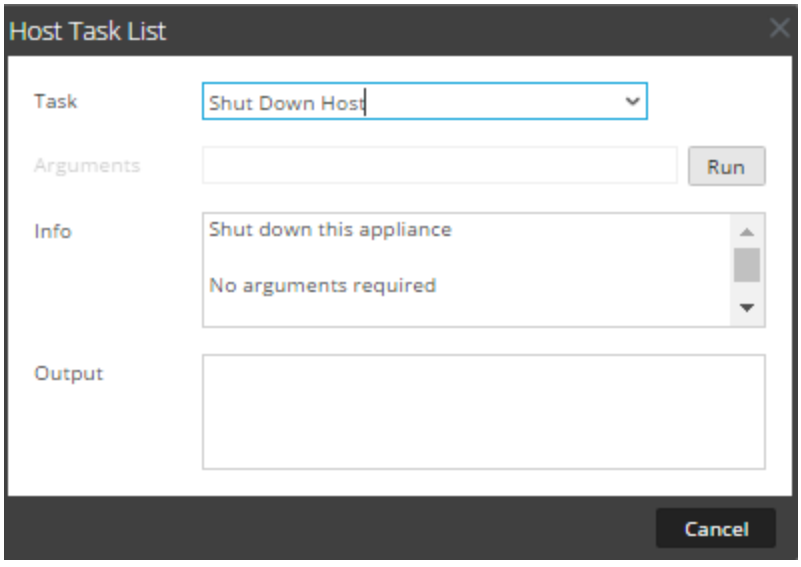
Under certain circumstances; for example, a hardware upgrade or an extended power outage that exceeds backup power capacity, it may be necessary to shut down a physical host. When you shut down a host, all services running on the host are stopped and the physical host turns off.

The physical host does not restart automatically. Use the power switch to restart the host. Once the physical host restarts, the host and services are configured to restart automatically.

Reboot a Host to start and stop a host without shutting down the host.

Shut Down the Host

1. In the Host Task List dialog, select **Shut Down Host** in the **Task** field.



2. To execute the task, click **Run**.
   The host shuts down, and the host turns off.

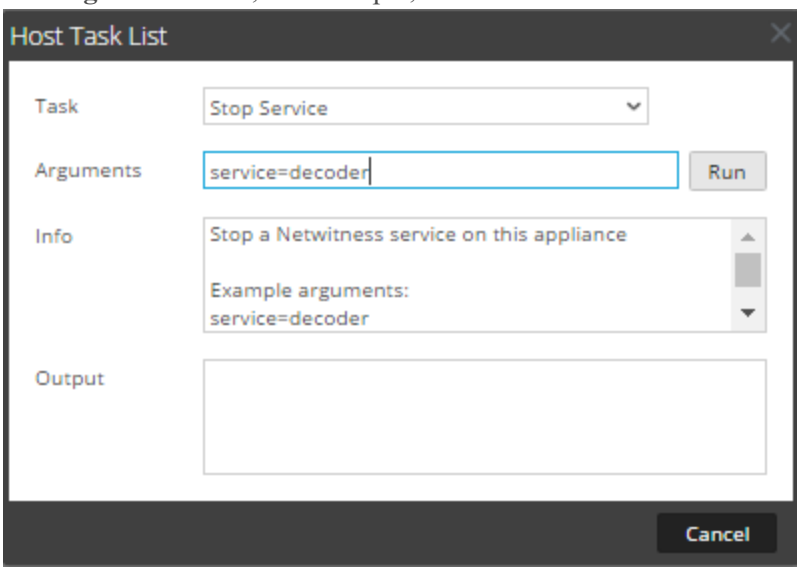
Stop and Start a Service on a Host

The Host Task List has two options for stopping and starting a service on a host. When you stop a service using the **Stop Service** message, all processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically. This is the same as the **Shutdown Service** option in the Services System view.

If a service does not restart automatically after being stopped, you can restart it manually using the **Start Service** message.

Stop a Service on a Host

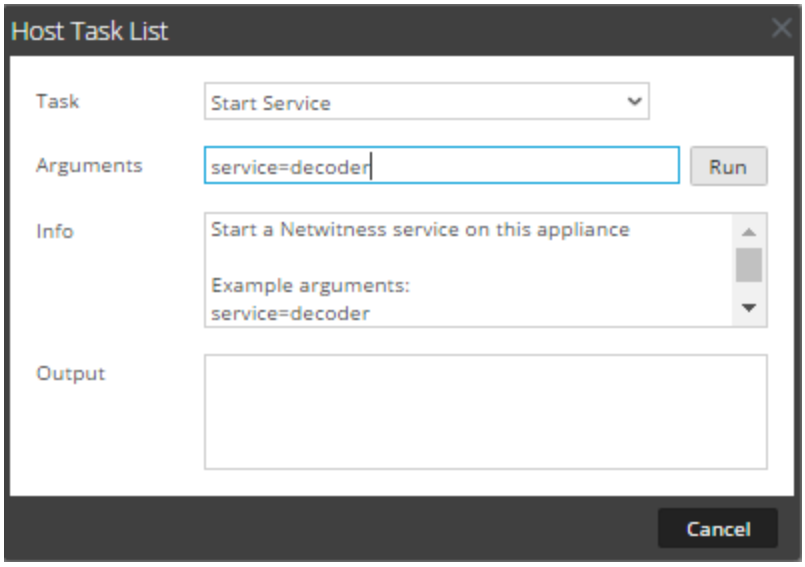
1. Select **ADMIN** > **Services**.
2. In the **Services** grid, select a service and click > **View**> **System**.
   The System view for the service is displayed.
3. In the **Services System** view toolbar, click **Host Tasks**.
4. In the **Host Task List**, click **Stop Service**.
   The task is displayed in the **Task** field, and information about the task is displayed in the **info** area.
5. Specify the service (`decoder`, `concentrator`, `broker`, `logdecoder`, `logcollector`) to stop in the **Arguments** field; for example, **service=decoder**.



6. To execute the task, click **Run**.
   The service stops and the status is displayed in the **Output** area. All processes of the service are stopped and users connecting to the service are disconnected. Unless there is a problem with the service, it restarts automatically.

Start a Service on a Host

1. In the **Host Task List**, select **Start Service** from the Task drop-down menu.
   The task is displayed in the **Task** field, and information about the task is displayed in the **info** area.
2. Specify the service (decoder, concentrator, broker, logdecoder, logcollector) to start in the **Arguments** field; for example,
   service=decoder



3. To execute the task, click **Run**.
   The service starts and the status is displayed on the **Output** area.

Add, Replicate, or Delete a Service User

You must add a user to a service for:

- Aggregation
- Accessing the service with the:
  - Thick client
  - REST API

Note: This topic does not apply to users who access services through the user interface on NetWitness Server. You must add those users to the system, not a service. For details, see the **Set Up a User** topic in *System Security and User Management*.

For each service user, you can:

- Configure user authentication and query handling properties for the service
- Make the user a member of a role, which has a set of permissions the user receives

- Replicate the user account to other services
- Change the service user password on selected services

Change a Service User Password provides instructions for changing the service user password across services.

Procedures

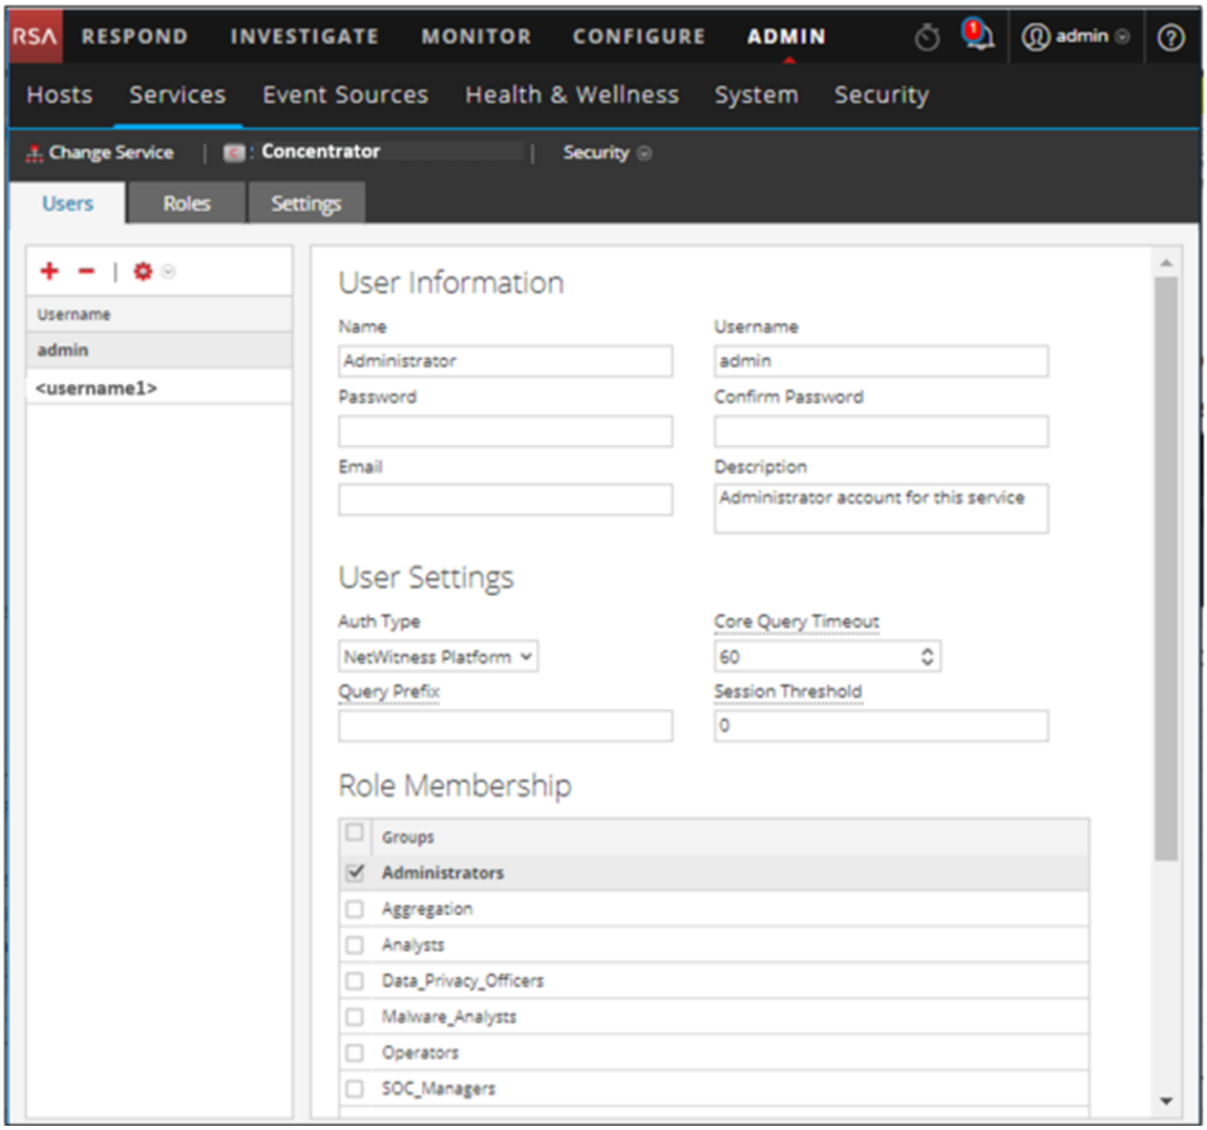
Access the Security View

Each of the following procedures starts in the Services Security view.

To navigate to the Services Security view:

1. In NetWitness Platform, go to **ADMIN > Services**.

2. Select a service, then click  > **View** > **Security**.
   The Security view for the selected service is displayed with the Users tab open.



Note: For NetWitness Platform 10.4 and earlier service versions, in the User Settings section, the **Query Level** field is displayed instead of **Core Query timeout**.

Add a Service User

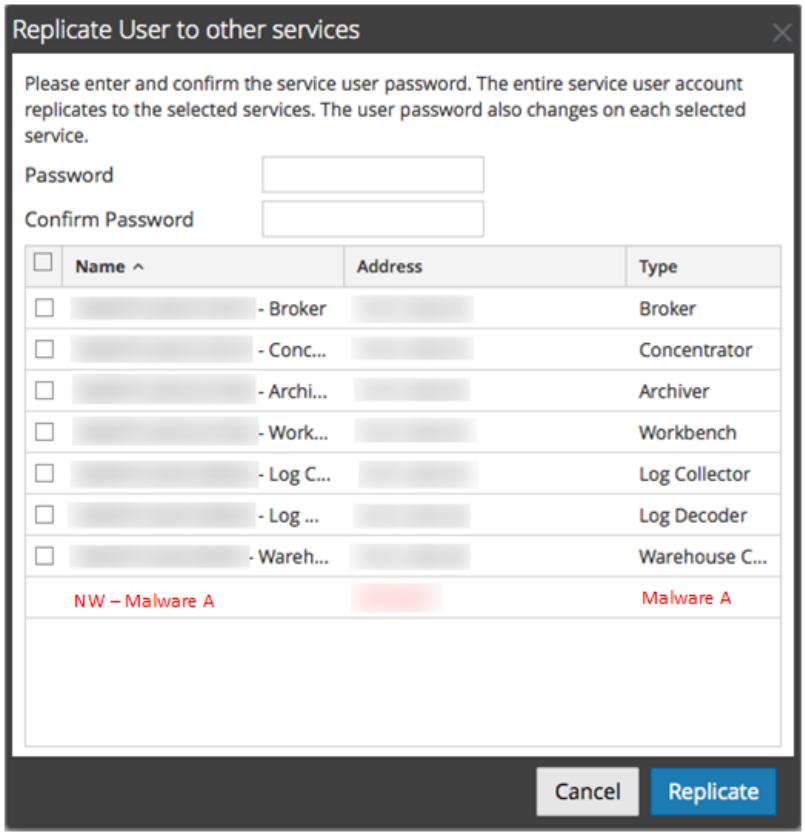
1. On the **Users** tab, click +.
2. Type the user name to access the service, then press **Enter**.
   The User Information section displays the user name and the rest of the fields are available for editing.
3. Type the password for logging on to the service in the **Password** and **Confirm Password** fields.
4. (Optional) Provide additional information:

- **Name** for logging on to NetWitness Platform
- **Email** address
- **Description** of the user

5. In the User Settings section, select the following information:
   - **Authentication Type**
     - If NetWitness Platform authenticates the user, select NetWitness.
     - If Active Directory or PAM is configured on NetWitness Server to authenticate the user, select External.
   - **Core Query Timeout** is the maximum number of minutes a user can run a query on the service. This field applies to NetWitness Platform 10.5 and later service versions and does not appear for 10.4 and earlier versions.
6. (Optional) Specify additional query criteria:
   - **Query Prefix** filters queries. Type a prefix to restrict results the user sees.
   - **Session Threshold** controls how the service scans meta values to determine session counts. Any meta value with a session count that is above the threshold stops its determination of the true session count.
7. In the **Role Membership** section, select each role to assign to the user. When a user is a member of a role on a service, the user has the permissions assigned to the role.
8. To activate the new service user, click **Apply**.

Replicate a User to Other Services

1. In the Users tab, select a user and click  **> Replicate**.
   The Replicate Users to Other Services dialog is displayed.



2. Enter and confirm the password.
3. Select each service to which you are replicating the user.
4. Click **Replicate**.

Delete a Service User

1. On the **Users** tab, select the **Username** and click −.
   NetWitness Platform requests confirmation that you want to delete the selected user.
2. To confirm, click **Yes**.

Add a Service User Role

There are pre-configured roles in NetWitness Platform that are installed on the server and on each service. You can also add custom roles. The following table lists the pre-configured system roles and their permissions.

Role	Permission
Administrators	Full system access
Operators	Access to configurations but not to meta and session content

Role	Permission
Analysts	Access to meta and session content but not to configurations
SOC_ Managers	Same access as Analysts and additional permissions to handle incidents
Malware_ Analysts	Access to malware events and to meta and session content
Data_Privacy_ Officers	Access to meta and session content and configuration options that manage obfuscation and viewing of sensitive data within the system (see Data Privacy Management).

You must add a service role when you have added a:

- **Service** user or users that requires a new set of permissions.
- **Custom role on NetWitness Server** because trusted connections require that the same custom role exists both on the server and on each service the custom role will access. The names must be identical. For example, if you add a Junior Analysts role on the server then you must add a Junior Analysts role on each service the role will access. For more information, see the **Add a Role and Assign Permissions** topic in *System Security and User Management*.

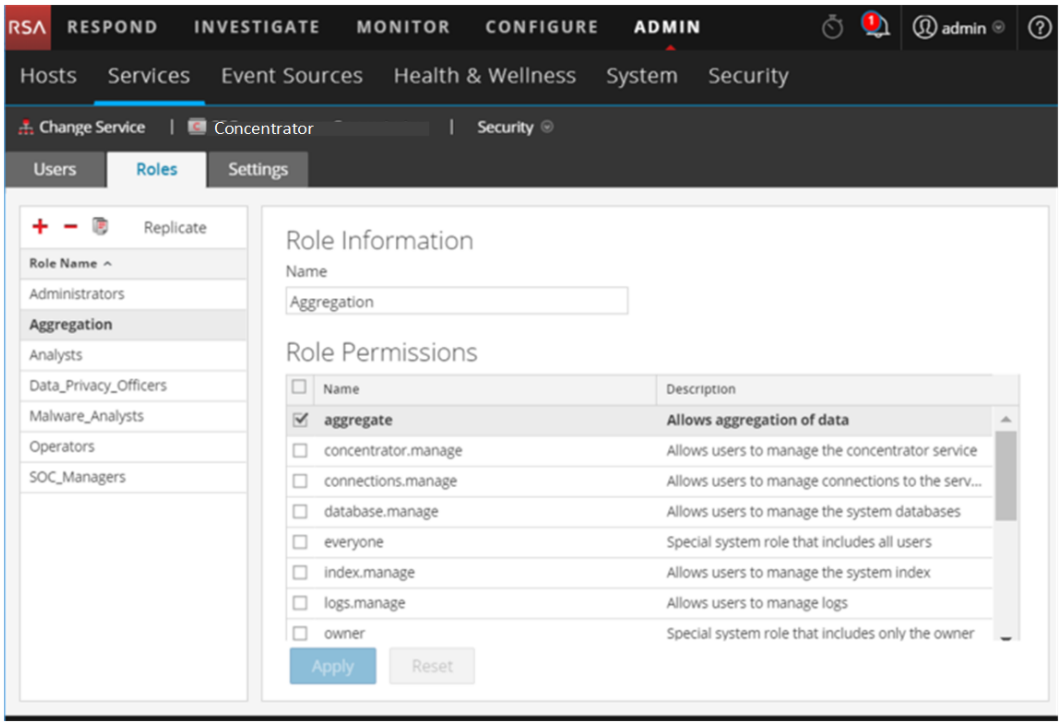
There is also a pre-configured **Aggregation** service role. Aggregation Role and Service User Roles and Permissions provide additional information.

Procedure

To add a service user role and assign permissions to it:

1. In NetWitness Platform, go to **ADMIN > Services**.
2. Select a service, then  **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.

3. Select the **Roles** tab and click +.
   The Services Security view is displayed and five pre-configured roles are already listed.



4. Click +, type the **Role Name** and press **Enter**.
   The Role Name is displayed above a list of **Role Permissions**.
5. Select each permission the role will have on the service.
6. Click **Apply**.

You can add service users to it in the **Users** tab.

Change a Service User Password

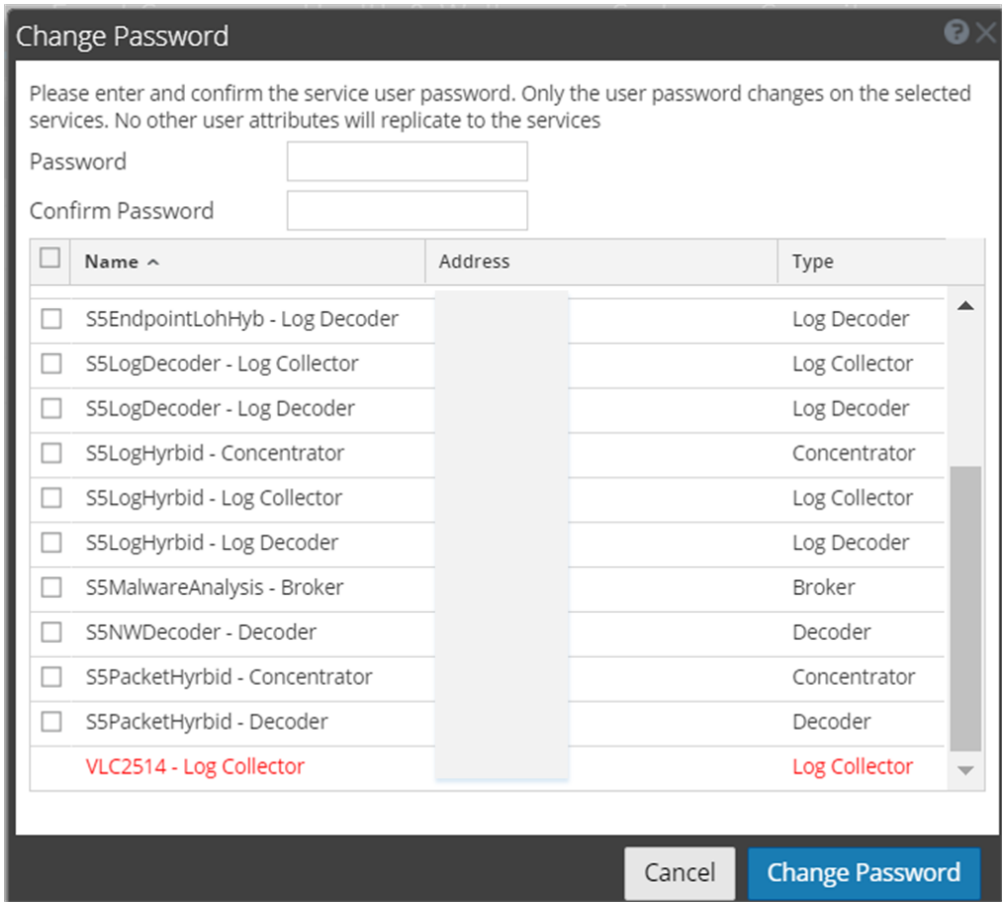
This procedure allows administrators to change the password of a service user and replicate the new password to all Core services with that user account defined. It replicates only the password change to the Core services selected and does not replicate the entire user account. Administrators can also change the password of the **admin** account on the Core services.

Note: The Change Password option does not apply to external users.

To change the password of a service user:

1. In NetWitness Platform, go to **ADMIN > Services**.
   The Administration Services view is displayed.
2. Select a service, then click  **> View > Security**.
   The Security view for the selected services is displayed.

3. In the **Users** tab, select a user and select **Change Password** from the actions icon.
   The **Change Password** dialog is displayed.



4. Type a new password for the user and confirm the password.
5. Select the services where you want the user password to change.
6. Click **Change Password**.
   The status of the password change on the selected services is displayed.

Create and Manage Service Groups

The Administration Services view provides options to create and manage groups of services. The Services panel toolbar includes options to create, edit, and delete service groups. Once groups are created, you can drag individual services from the Services panel into a group.

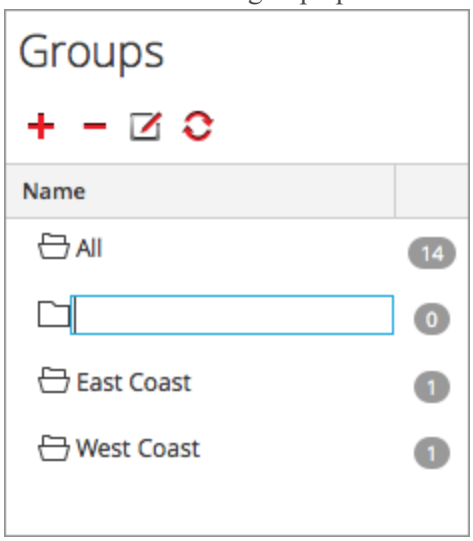
Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A service may belong to more than one group. Here are some examples of possible groupings.

- Group different service types to make it easier to configure and monitor all Brokers, Decoders, or Concentrators.

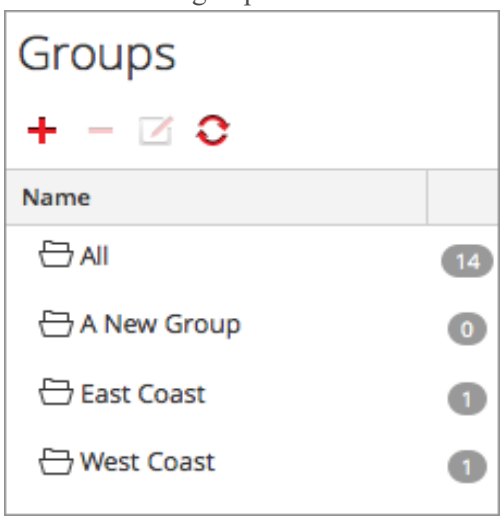
- Group services that are part of the same data flow; for example, a Broker, and all associated Concentrators and Decoders.
- Group services according to their geographic region and location within the region. If a major power outage occurs in a location, potentially affected services are easily identifiable.

Create a Group

1. In NetWitness Platform, go to **ADMIN** > **Services**.
   The Administration Services view is displayed.
2. In the **Groups** panel toolbar, click +.
   A field for the new group opens with a blinking cursor.



3. Type the name of the new group in the field (for example, **A New Group**) and press **Enter**.
   The group is created as a folder in the tree. The number next to the group indicates the number of services in that group.



Change the Name of a Group

1. In the **Services** view **Groups** panel, double-click the group name or select the group and click .
   The name field opens with a blinking cursor.
2. Type the new name of the group and press **Enter**.
   The name field closes and the new group name is displayed in the tree.

Add a Service to a Group

In the Services view **Services** panel, select a service and drag the service to a group folder in the groups panel; for example, **Log Collectors**.
The service is added to the group.

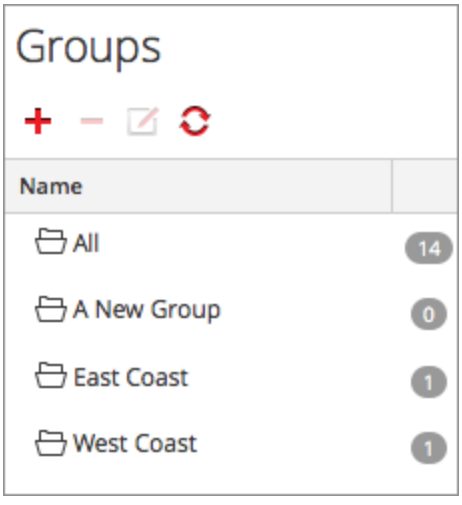
View the Services in a Group

To view the services in a group, click the group in the **Groups** panel.

The **Services** panel lists the services in that group.

Remove a Service from a Group

1. In the Services view **Groups** panel, select the group that contains the service that you want to remove. The services in that group appear in the Services panel.
2. In the **Services** panel, select one or more services that you want to remove from the group, and in the toolbar, select > **Remove from Group**.
   The selected services are removed from the group, but are not removed from the NetWitness Platform user interface. The number of services in the group, which is listed near the group name, decreases by the number of services removed from the group. The **All** group contains the services that are removed from the group.
   In the following example, the service group called **A New Group** does not contain any services, because the service in that group is removed.



Delete a Group

1. In the Services view **Groups** panel, select the group that you want to delete.
2. Click .
   The selected group is removed from the Groups panel. The services that were in the group are not removed from the NetWitness Platform user interface. The **All** group contains the services from the deleted group.

Duplicate or Replicate a Service Role

An efficient way to add a new service role is to duplicate a similar role, save it with a new name and revise the permissions that are already assigned. For example, you could duplicate the Analysts role. Then, save it as **JuniorAnalysts** and modify the permissions.

The quick way to add an existing role to other services is to replicate the role. For example, you could replicate the **JuniorAnalysts** role that exists on a broker to a concentrator and log decoder.

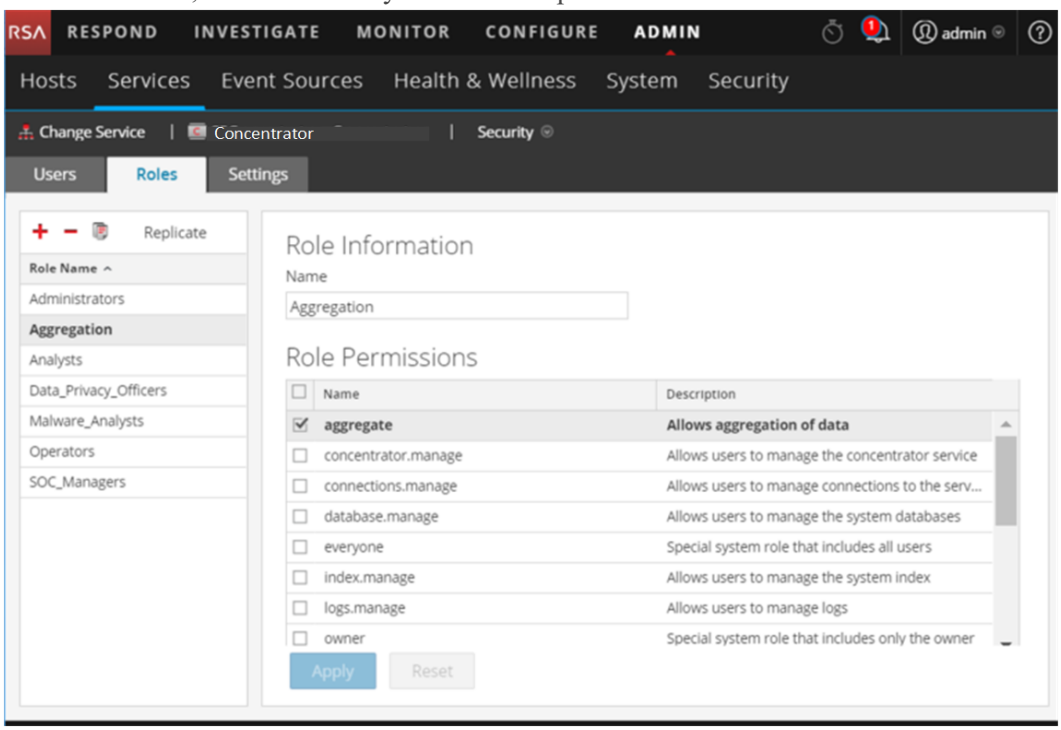
Each of the following procedures starts in the Services Security view.

To navigate to the Services Security view:

1. In NetWitness Platform, go to **ADMIN > Services**.
2. Select a service, then click  **> View > Security**.
   The Security view for the selected service is displayed with the Users tab open.
3. Select the **Roles** tab.

Duplicate a Service Role

1. In the Roles tab, select the role you want to duplicate.



2. Click **Duplicate Role.**
3. Type a new name and click **Apply**.
4. Select the new role.
5. In the **Role Permissions** section, select or deselect permissions to modify what the new role can do.

Replicate a Role

1. In the **Roles** tab, select the role you want to replicate and click **Replicate**.
2. In the **Replicate Role to Other Services** dialog, select each service on which to add the role.
3. Click **Replicate**.

Edit Core Service Configuration Files

The service configuration files for Decoder, Log Decoder, Broker, Concentrator, Archiver, and Workbench services are editable as text files. In the Service Config view > Files tab, you can:

- View and edit a service configuration file that the NetWitness Platform system is currently using.
- Retrieve and restore the latest backup of the file you are editing.

- Push the open file to other services.
- Save changes made to a file.

The files available to edit vary depending upon the type of service being configured. The files that are common to all core services are the:

- service index file
- netwitness file
- crash reporter file
- scheduler file

In addition, the Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter.

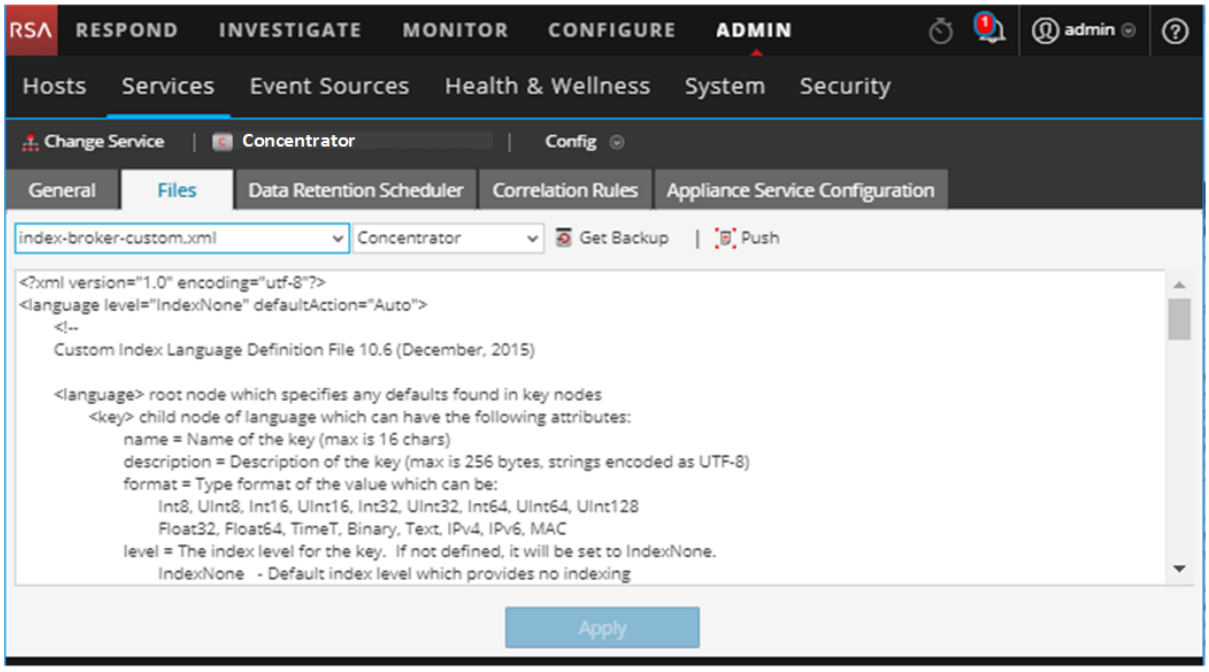
Note: The default values in these configuration files are good for the most common situations, however some editing is necessary for optional services, such as the crash reporter or scheduler. Only administrators with a good understanding of the networks and the factors that affect the way services collect and parse data should make changes to these files in the Files tab.

Edit a Service Configuration File

To edit a file:

1. In NetWitness Platform, go to **ADMIN > Services**.
2. In the Services grid, select a service.
3. Select  **> View > Config**.
   The Service Config view is displayed with the General tab open.
4. Click the **Files** tab.
   The selected service, such as Concentrator, appears in the drop-down list on the right.
5. (Optional) To edit a file for the host instead of the service, select **Host** in the drop-down list.

6. Choose a file from the **Please Select A File To Edit** drop-down list.
   The file content is displayed in edit mode.



7. Edit the file and click **Apply**.

The current file is overwritten and a backup file is created. The changes go into effect after the service is restarted.

Revert to a Backup Version of a Service Configuration File

After you make changes to a configuration file, save the file, and restart the service, a backup file is available. To revert to a backup of a configuration file:

1. Select a configuration file by completing steps 1-6 of the procedure at the beginning of this topic.
2. Click Get Backup.
   The backup file opens in the text editor.
3. To revert to the backup version, click **Save**.

The changes go into effect after the service is restarted.

Push a Configuration File to Other Services

Once you have edited a service configuration file, you can push the same configuration to other services of the same type.

1. Select a configuration file by completing steps 1-6 of the Edit Service Configuration Files procedure at the beginning of this topic.
2. Click Push. The Select Services dialog is displayed.

3. Select each service to push the configuration file on it.
   Each service must be the same type as the one you selected in the Services view.

   Caution: If you decide not to push the configuration file, click **Cancel**.

4. To push the configuration file to all selected services, click **OK**.

The configuration file is pushed to all selected services.

Configure the Task Scheduler

Scheduler file

You can edit the **scheduler** file that in the Service Config view > Files tab. This file configures the built-in task scheduler for a service. The task scheduler can automatically send messages at predefined intervals or specific times of the day.

Scheduler task syntax

A task line in the scheduler file consists of the following syntax, where **<Value>** has no spaces:

```
<ParamName>=<Value>
```

if **<Value>** has any spaces, this is the syntax:

```
<ParamName>="<Value>"
```

In each task line, these guidelines apply:

- Parameter **time** or one of the interval parameters (**seconds**, **minutes** or **hours**) is required.
- Escape special characters with a \ (backslash).

Task line parameters

The following task line parameters are accepted by the scheduler.

Syntax	Description
daysOfWeek: <string, optional, {enum-any:sun|mon|tue|wed|thu|fri|sat|all}>	The days of week to execute a task. The default value is all.
deleteOnFinish: <bool, optional>	Delete the task when it has successfully finished.
hours: <uint32, optional, {range:1 to 8760}>	The number of hours between executions.
logOutput: <string, optional>	Output the response to log using the specified module name.
minutes: <uint32, optional, {range:1 to 525948}>	The number of minutes between executions.
msg: <string>	The message to send the node.

Syntax	Description
params: <string, optional>	The parameters for the message.
pathname: <string>	The path of the node that receives the message.
seconds: <uint32, optional, {range:1 to 31556926}>	The number of seconds between executions.
time: <string>	The time of execution in HH::MM:SS format (local time of this server).
timesToRun: <uint32, optional>	How many times to run because service start, **0** = means unlimited (default).

Messages

The following are the message strings to use in the Task Scheduler **msg** parameter.

Message	Description
addInter	Add a task to run at a defined interval. For example, this message runs the **/index save** command every 6 hours: addInter hours=6 pathname=/index msg=save
addMil	Add a task to run at a specific time of day or even day(s) of the week. For example, this message runs the **/index save** command at 1 AM every business day: addMil time= 01:00:00 pathname=/index msg=save daysOfWeek=mon,tue,wed,thu,fri
delSched	Deletes an existing scheduled task. The **id** parameter of the task must be retrieved from the print message.
print	Prints all scheduled tasks.
replace	Assign all scheduled tasks in one message, deleting any existing tasks.
save	Save node

Sample Task Line

The following example task line in the scheduler file downloads the feeds package file (**feeds.zip**) to the selected Decoder every 120 minutes from the feeds host server:

```
minutes=120 pathname=/parsers msg=feed params="type\=wget
file\=http://feedshost/nwlive/feeds.zip"
```

Edit a Service Index File

This topic provides important information and guidelines for configuring service custom index files, which are editable in the Service Config view > Files tab.

The index file, along with other configuration files, controls operation of each core service. Accessing the index file through the Service Config view in NetWitness Platform opens the file in a text editor, where you can edit the file.

Note: Only administrators with a thorough and comprehensive understanding of core service configuration are qualified to make changes to an index file, which is one of the central configuration files for the appliance service. Changes made should be consistent across all core services. Invalid entries or a misconfigured file can prevent the system from starting and can require the assistance of RSA Support to bring the system back into a working state.

These are the index files:

- `index-broker.xml`, and `index-brokercustom.xml`
- `index-concentrator.xml`, and `index-concentrator-custom.xml`
- `index-decoder.xml`, and `index-decodercustom.xml`
- `index-logdecoder.xml`, and `index-logdecodercustom.xml`
- `index-archiver.xml`, and `index-archiver-custom.xml`
- `index-workbench.xml`, and `index-workbench-custom.xml`

Index and Custom Index Files

All customer-specific index changes are made in **`index-<service>-custom.xml`**. This file overrides any settings in `index-<service>.xml`, which is solely controlled by RSA.

The custom index file, **`index-<service>-custom.xml`**, allows creation of custom definitions or overrides of your own language keys that are not overwritten during the upgrade process.

- Keys that are defined in `index-<service>-custom.xml` replace the definitions found in `index-<service>.xml`.
- Keys that are added to `index-<service>custom.xml` and not found in `index-<service>.xml` are added to the language as a new key.

Some common applications for editing the index file are:

- To add new custom meta keys to add new fields to the NetWitness Platform user interface.
- To configure protected meta keys as part of a data privacy solution as described in the *Data Privacy Management* guide.
- To adjust the NetWitness Platform core database query performance as described in the *NetWitness Platform Core Database Tuning Guide*.

Caution: Never set the index level to `IndexKeys` or `IndexValues` on a Decoder if you have a Concentrator or Archiver aggregating from the Decoder. The index partition size is too small to support any indexing beyond the default `time` meta key.

Enable Crash Reporter Service

The Crash Reporter is an optional service for NetWitness Platform services. When activated for any of the core services, the Crash Reporter automatically generates a package of information to be used for diagnosing and solving the problem that resulted in the service failure. The package is automatically sent to RSA for analysis. The results are forwarded to RSA support for any further action.

The information package sent to RSA does not contain captured data. This information package consists of the following information:

- Stack trace
- Logs
- Configuration settings
- Software version
- CPU information
- Installed RPMs
- Disk geometry

The Crash Reporter crash analysis can be activated for any core product.

The crashreporter.cfg File

One of the files available for editing in the Service Config view > Files tab is **crashreporter.cfg**, the Crash Reporter Client Server configuration file.

This file is used by the script that checks, updates, and builds crash reports on the host. The list of products to monitor can include Decoders, Concentrators, hosts, and Brokers.

This table lists the settings for the **crashreporter.cfg** file.

Setting	Description
applicationlist=decoder, concentrator, host	Define the list of products to monitor.
sitedir=/var/crashreporter	Location of the site directory for the report.
webdir=/usr/share/crashreporter/Web	Location of the web directory.
devdir=/var/crashreporter/Dev	Location of the development directory.
datadir=/var/crashreporter/data	Location of the directory storing data files.
perldir=/usr/share/crashreporter/perl	Location of the perl files.
bindir=/usr/share/crashreporter/bin	Location of the binary executables.

Setting	Description
libdir=/usr/share/crashreporter/lib	Location of the binary libraries.
cfgdir=/etc/crashreporter	Location of the configuration files.
logdir=/var/log/crashreporter	Location of the log files.
scriptdir=/usr/share/crashreporter/scripts	Location of the directory containing scripts.
workdir=/var/crashreporter/work	Location of the process work directory.
sqldir=/var/crashreporter/sql	Location where created sql files are placed.
reportdir=/var/crashreporter/reports	Location where temporary reports are created.
packagedir=/var/crashreporter/packages	Location of the created package files.
gdbconfig=/etc/crashreporter/crashreporter.gdb	Location of the gdb configuration file.
corewaittime=30	Define the number of seconds to wait after finding a core to determine if the core is still being written.
cyclewaittime=10	Define the number of minutes to wait between search cycles
deletecores=1	Specify if the core files should be deleted after report. 0 = No 1 = Yes **NOTE:** Until the core file is deleted, it is reported each time crashreporter is restarted.

Setting	Description
deletereportdir=1	Specify if the report directory should be deleted after the report. Useful to view core reports on box. 0 = No 1 = Yes **NOTE:** If not deleted, the directory will be included in each subsequent package.
debug=1	Specify whether debugging messages are turned on or off in the **crashreporter** logging output. 0 = No 1 = Yes
posturl=https://www.netwitnesslive.com/crash...ter/submit.php	Define the webserver post url.
postpackages=0	Specify if the packages should be posted to the webserver. 0 = No 1 = Yes
deletepackages=1	Specify if packages should be deleted after they are posted to webserver. 0 = No 1 = Yes

Configure the Crash Reporter Service

To configure the Crash Reporter service:

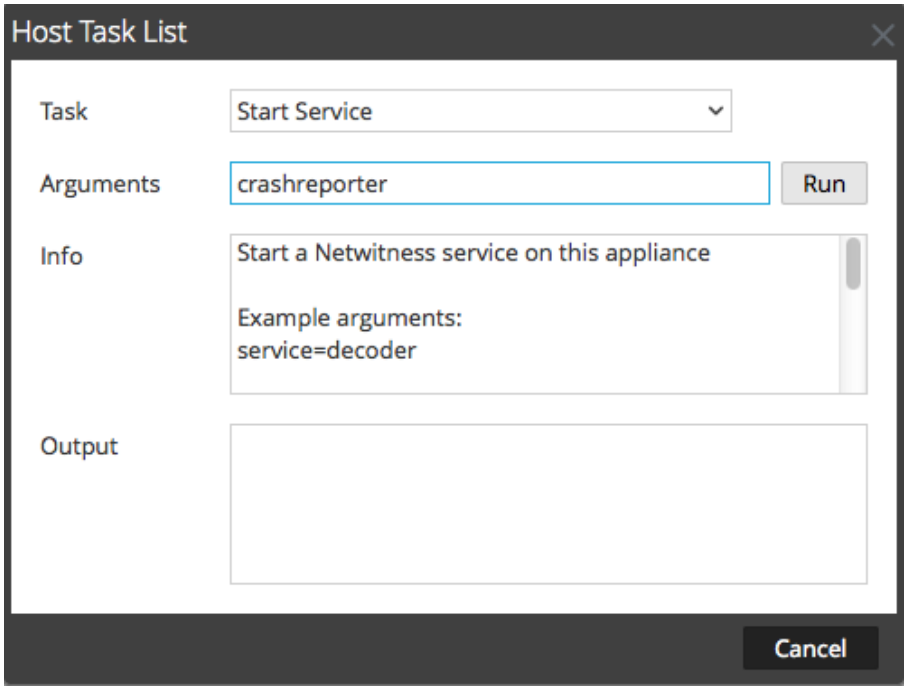
1. Select **ADMIN > Services**.
2. Select a service and click > **View** > **Config**.
3. Select the **Files** tab.
4. Edit **crashreporter.cfg**.
5. Click **Save**.

6. To display the Service System view, select **Config > System**.
7. To restart the service, click Shutdown Service.
   The service shuts down and restarts.

Start and Stop the Crash Reporter Service

To start the Crash Reporter Service:

1. Select **ADMIN > Services**.
2. Select a service and click > **View > System**.
3. In the toolbar, click Host Tasks.
   The Host Task List is displayed.
4. In the Task drop-down list, select **Start Service**.
5. In the Arguments field, type **crashreporter**, then click **Run**.



The Crash Reporter service is activated and remains active until you stop it.

To stop the Crash Reporter service, select **Stop Service** from the Task drop-down list.

Maintain the Table Map Files

The table mapping file provided by RSA, `table-map.xml`, is a very significant part of the Log Decoder. It is a meta definition file which also maps the keys used in a log parser to the keys in the metadb.

Note: Do not edit the `table-map.xml` file. If you want to make changes to the table-map, make them in the `table-map-custom.xml` file. The latest `table-map.xml` file is available on Live and RSA updates it as required. If you make changes to the `table-map.xml` file, they can be overwritten during an upgrade of service or content.

In the `table-map.xml`, some meta keys are set to `Transient` and some are set to `None`. To store and index a specific meta key, the key must be set to `None`. To make changes to the mapping, you need to create a copy of the file named `table-map-custom.xml` on the Log Decoder and set the meta keys to `None`.

For meta key indexing:

- When a key is marked as `None` in the `table-map.xml` file in the Log Decoder, it is indexed.
- When a key is marked as `Transient` in the **`table-map.xml`** file in the Log Decoder, it is not indexed. To index the key, copy the entry to the `table-map-custom.xml` file and change the keyword `flags="Transient"` to `flags="None"`.
- If a key does not exist in the `table-map.xml` file, add an entry to the `table-map-custom.xml` file in the Log Decoder.

Caution: Do not update the `table-map.xml` file because an upgrade can overwrite it. Add all of the changes that you want to make to the **`table-map-custom.xml`** file.

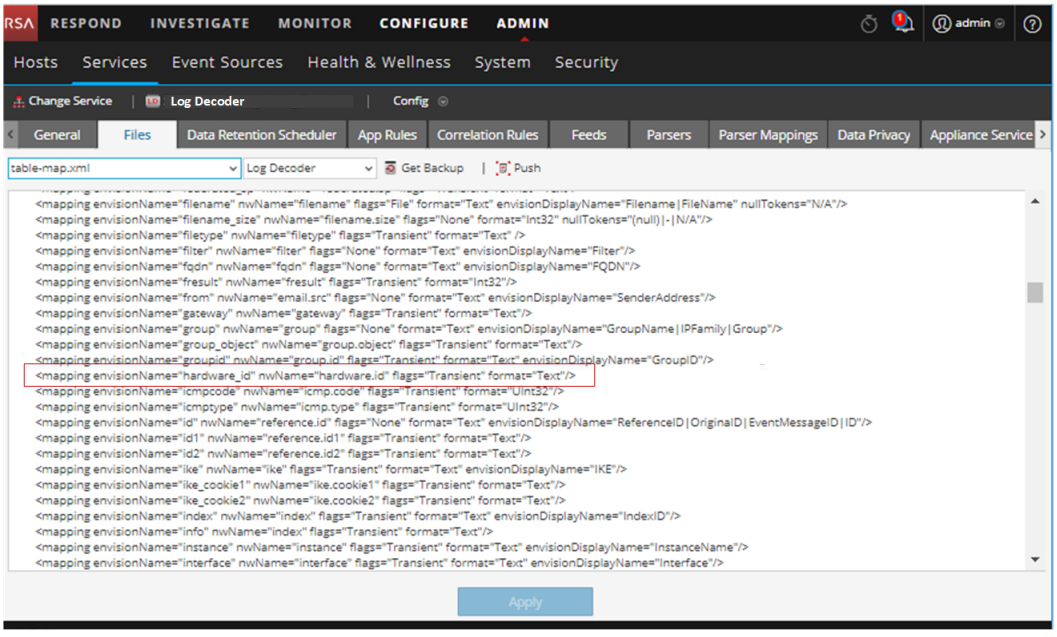
Prerequisites

If you do not have a `table-map-custom.xml` file on the Log Decoder, create a copy of `table-map.xml` and rename it to `table-map-custom.xml`.

Procedure

To verify and update the table mapping file:

1. Go to **ADMIN** > **Services**.
2. In the Services grid, select a Log Decoder and click  > **View** > **Config**.
3. Click the **Files** tab and select the **`table-map.xml`** file.



4. Verify that the flags keywords are set correctly to either `Transient` or `None`.

5. If you need to change an entry, do not change the `table-map.xml` file. Instead, copy the entry, select the `table-map-custom.xml` file, find the entry in the `table-map-custom.xml` file and change the flags keyword from `Transient` to `None`.
   For example, the following entry for the `hardware.id` meta key in the `table-map.xml` file is not indexed and the flags keyword shows as `Transient`:
   ```
   <mapping envisionName="hardware_id" nwName="hardware.id"
   flags="Transient"/>
   ```
   To index the `hardware.id` meta key, change the flags keyword from `Transient` to `None` in the `table-map-custom.xml`:
   ```
   <mapping envisionName="hardware_id" nwName="hardware.id" flags="None"/>
   ```
6. If an entry does not exist in the `table-map.xml` file, add an entry to the `table-map-custom.xml` file.
7. After making your changes to the `table-map-custom.xml` file, click **Apply**.

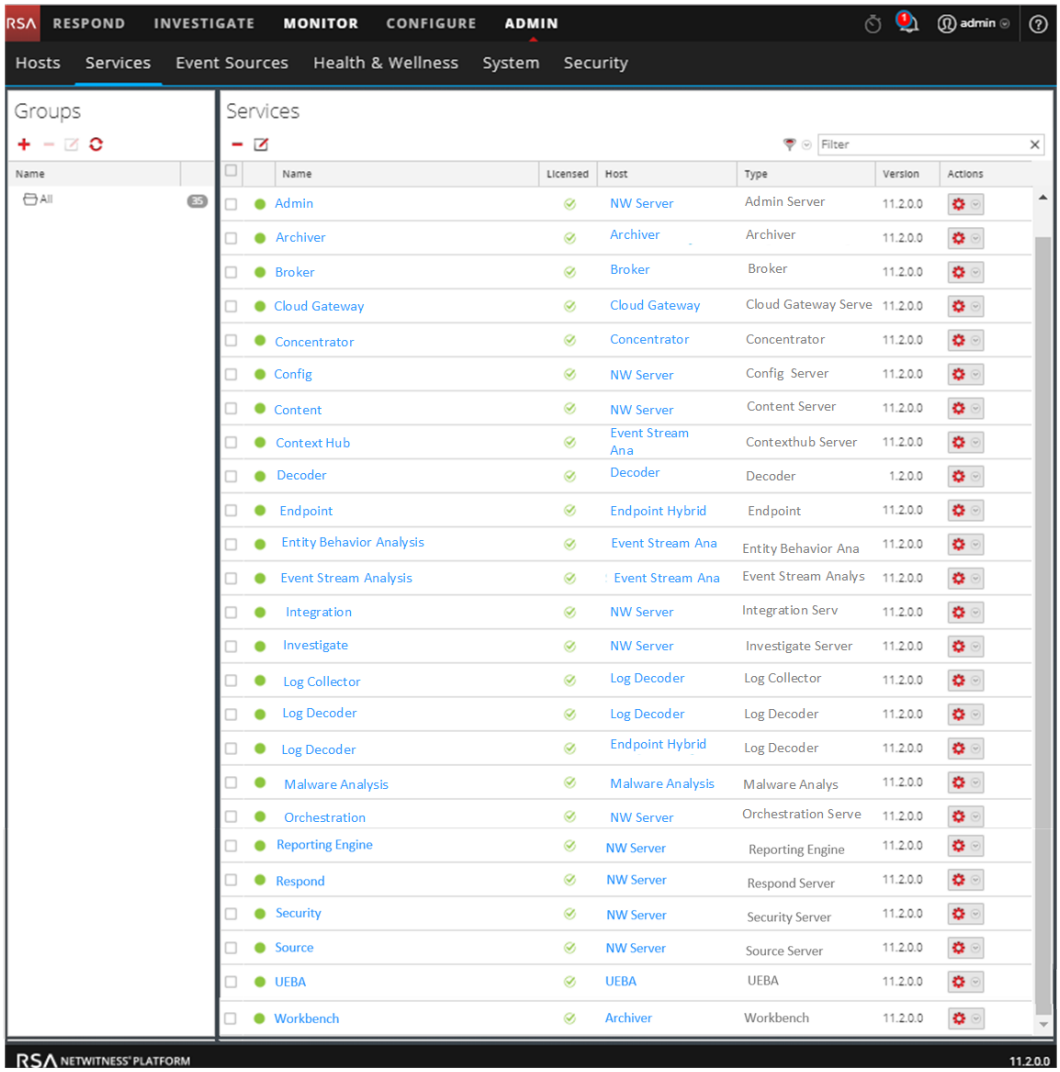
Caution: Before changing the table mapping files, carefully consider the effect of changing the index from `Transient` to `None` because it can impact the available storage and performance of the Log Decoder. For this reason, only certain meta keys are indexed out-of-the-box. Use the `table-map-custom.xml` file for different use cases.

Edit or Delete a Service

You can edit service settings, such as changing the host name or port number, or delete a service that you no longer need.

Each of the following procedures starts in the Services view.

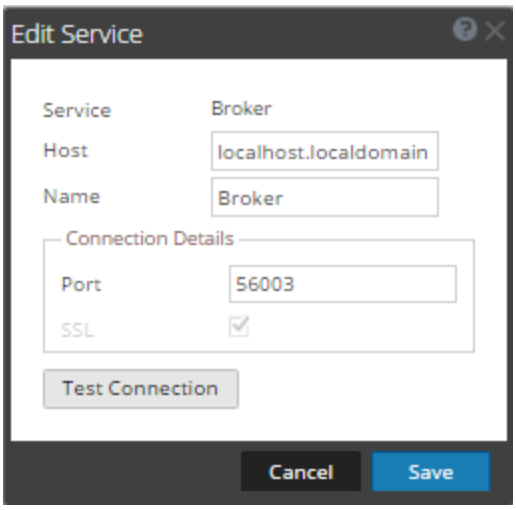
To navigate to the Services view, in NetWitness Platform, go to **ADMIN > Services**.



Procedures

Edit a Service

1. In the Services view, select a service and click or  > **Edit**.
   The **Edit Service** dialog is displayed. It shows only the fields that apply to the selected service.



2. Edit the service details by changing any of the following fields:
   - **Name**
   - **Port** - Each core service has two ports, SSL and non-SSL. For trusted connections, you must use the SSL port.
   - **SSL** - For trusted connections, you must use SSL.
   - **Username** and **Password** - Use these credentials to test the connection to a service.
     a. If you use a trusted connection, delete the username.
     If you do not use a trusted connection, type a username and password.
     b. Click **Test Connection**.
3. Click **Save**.

Delete a Service

1. In the Services view, select one or more services and click or  > **Delete**.
2. A dialog requests confirmation. To delete the service, click **Yes**.

The deleted service is no longer available to the NetWitness Platform modules.

Explore and Edit Service Property Tree

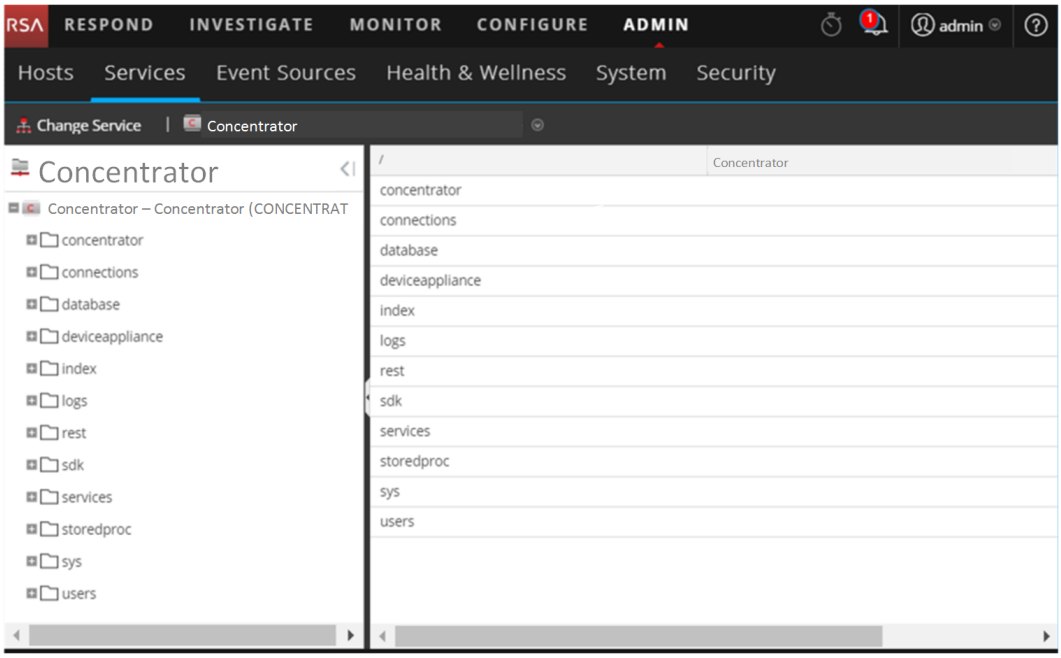
You have advanced access and control of service functionality in the Services Explore view, which consists of two parts. The Node list displays service functionality in a tree structure of folders. The Monitor panel displays properties of the folder or file selected in the Nodes list.

Each of the following procedures starts in the Explore view.

To navigate to the Explore view:

1. In NetWitness Platform, go to **ADMIN > Services**.

2. Select a service, then select  **> View > Explore**.
   The Explore view is displayed. The Node list is on the left and the Monitor panel is on the right.



Display or Edit a Service Property

To display a service property:

1. Right-click a file in the Node list or Monitor panel.
2. Click **Properties**.

To edit the value of a service property:

1. In the **Monitor** panel, select an editable property value.
2. Type a new value.

Send a Message to a Node

1. In the Properties Dialog, select a **message type**. Options vary according to the file selected in the Node list.
   A description of the selected message type is displayed in the **Message Help** field.
2. (Optional) If the message requires them, type the **Parameters**.
3. Click **Send**.
   The value or format is displayed in the **Response Output** field.

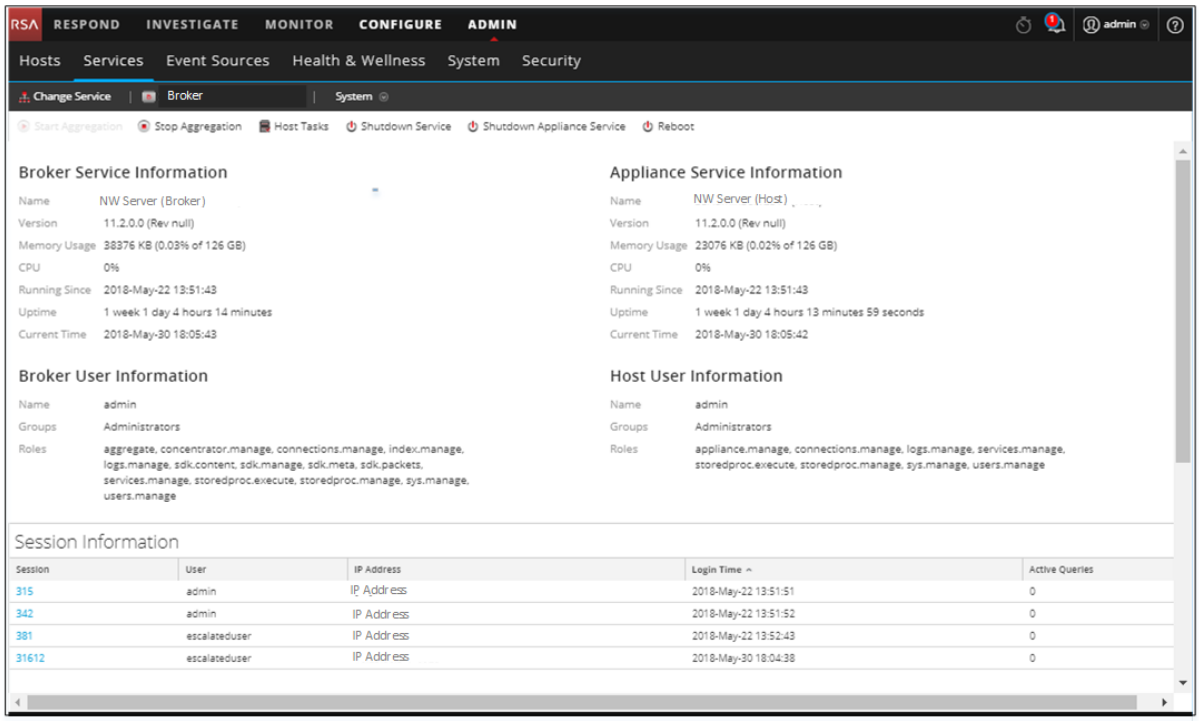
Terminate a Connection to a Service

You can view sessions that are running on a service in the Service System view. From within the list of sessions, you can terminate the session and terminate active queries in a session.

Terminate a Session on a Service

1. In NetWitness Platform, go to **ADMIN > Services**.
   The Admin Services view is displayed.

2. Select a service, and select  **> View > System**.
   The Service System view is displayed.



3. In the **Session Information** grid at the bottom, click a ***session-number***.
   The confirmation dialog is displayed.

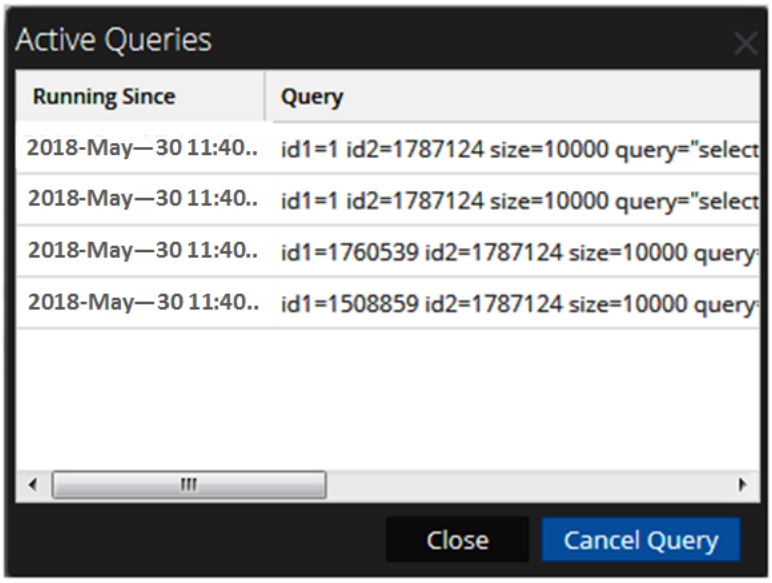
4. Click **Yes**.

Terminate an Active Query in a Session

1. Scroll down to the **Sessions** grid.

2. In the **Active Queries** column, click a non-zero count of active queries for a session. You cannot click on it if there are 0 active queries.

The Active Queries dialog is displayed.



3. Select a query and click **Cancel Query**.
   The query stops and the Active Queries column is updated.

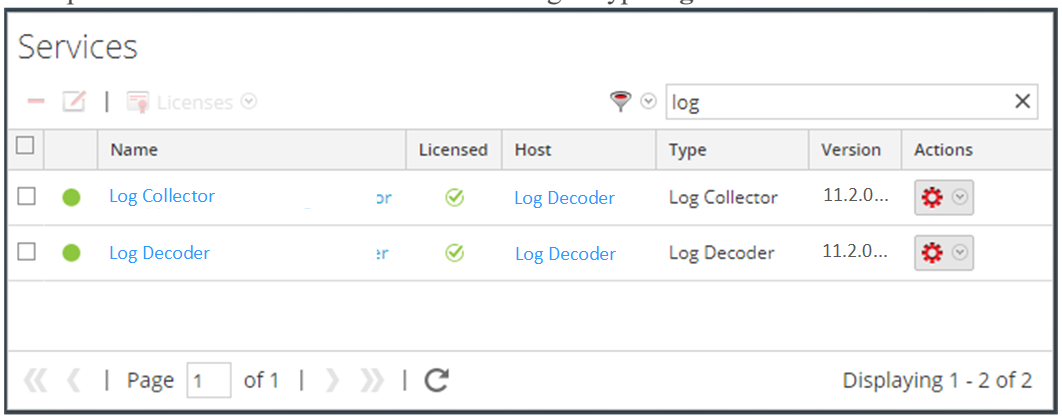
Search for Services

You can search for services from the list of services in the Services view. The Services view enables you to quickly filter the list of services by Name, Host, and Service Type. You can use the Filter drop-down menu and the Filter field separately or at the same time to filter the Services view.

Search for a Service

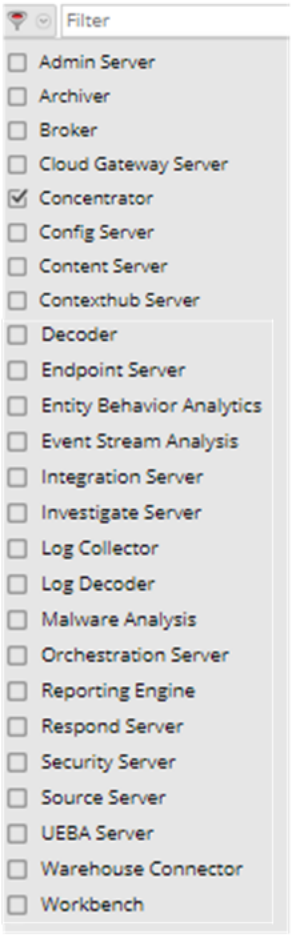
1. In NetWitness Platform, go to **ADMIN> Services**.
2. In the **Services** panel toolbar, type a service **Name** or **Host** in the **Filter** field.

The Services panel lists the services that match the names entered in the Filter field. The following example shows the search results after starting to type **log** in the filter field.

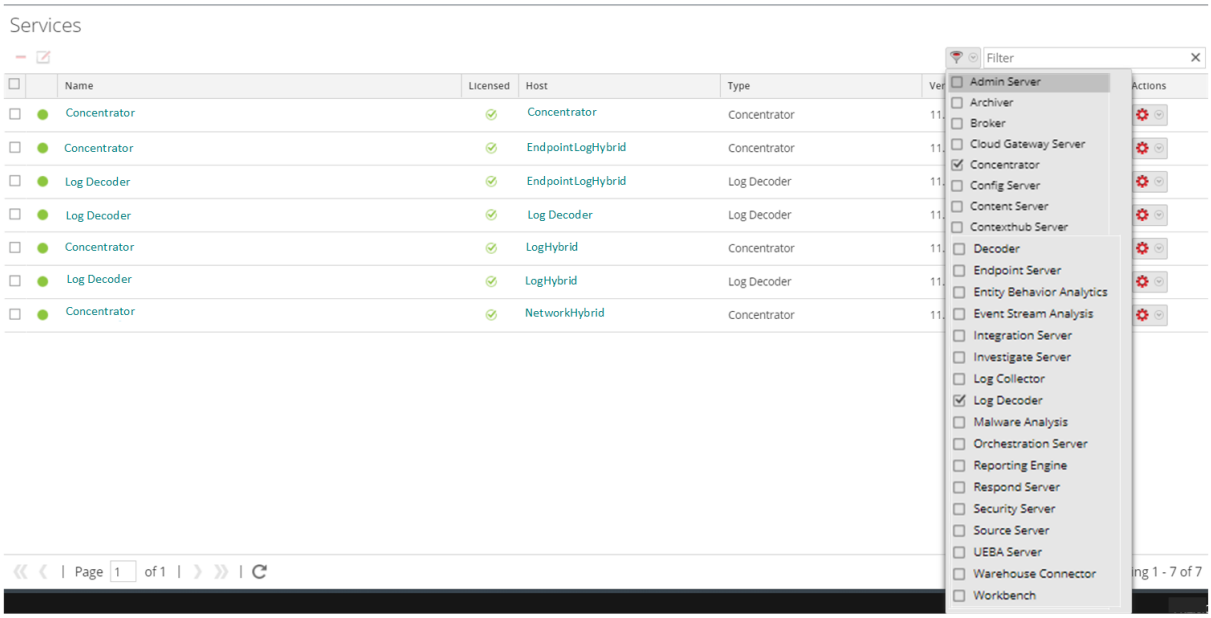


Filter Services by Type

1. In NetWitness Platform, go to **ADMIN > Services**.
2. In the Services view, click  and select the service types that you want to appear in the Services view.



The selected service types appear in the Services view. The following example shows the Services view filtered for Concentrator and Log Decoder.

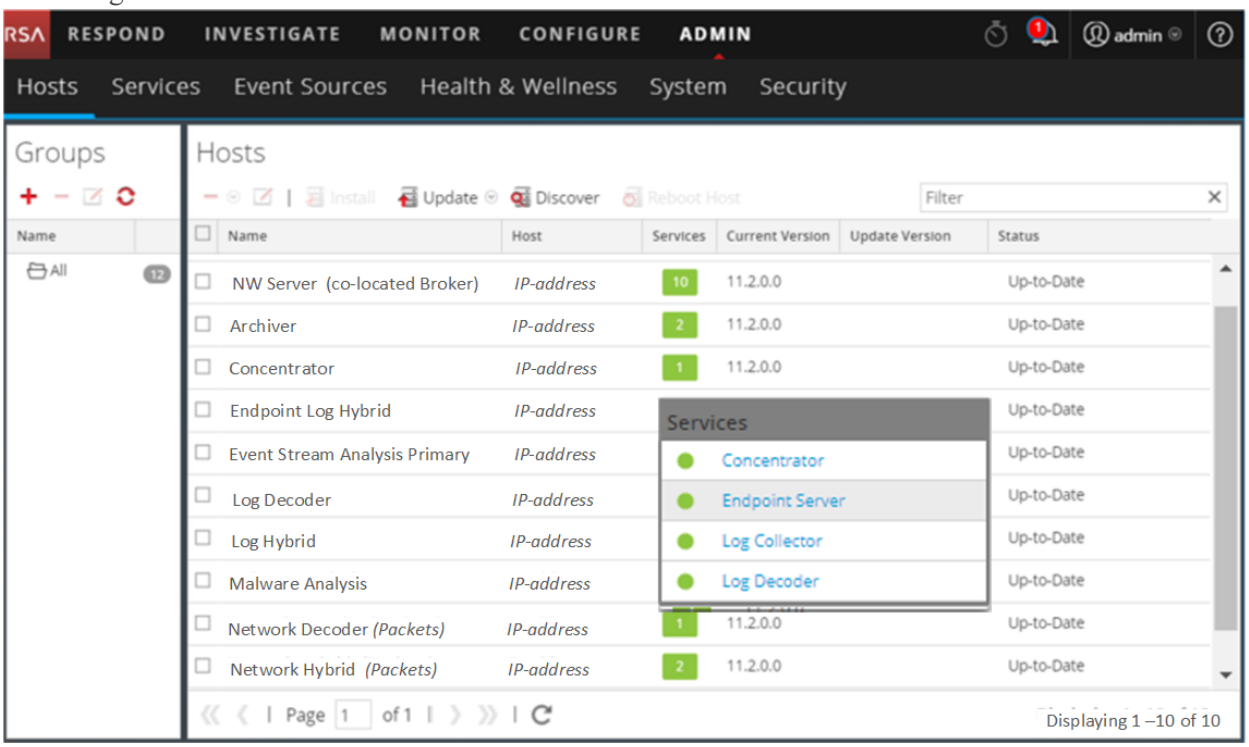


Find the Services on a Host

In addition to being able to locate the services for a host in the Services view, you can also quickly find the services that run on a host in the Hosts view.

1. In NetWitness Platform, go to **ADMIN > Hosts**.
2. In the Hosts view, select a host and click the box that contains a number (the number of services) in the **Services** column.
   A list of the services on the selected host is displayed.

In the following example, a list of four services on the selected host are listed after clicking the box containing the number 4.



3. You can click the service links to view the services in the Services view.

Start, Stop, or Restart a Service

These procedures apply to core services only.

Each of the following procedures starts in the Services view. In NetWitness Platform, go to **ADMIN > Services**.

Start a Service

Select a service and click  **> Start**.

Stop a Service

When you stop a service, all of its processes stop and active users are disconnected from it.

To stop a service:

1. Select a service and click  > **Stop**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

Restart a Service

Occasionally, you have to restart a service for changes to take effect. When you change a parameter that requires a restart, NetWitness Platform displays a message.

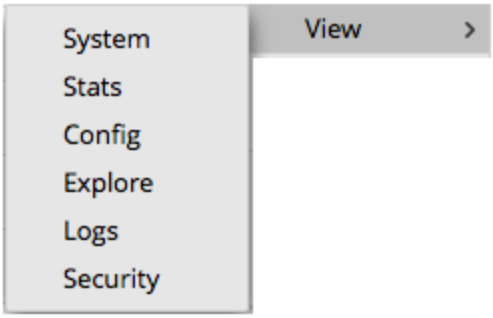
To restart a service:

1. Select a service and click  > **Restart**.
2. A dialog requests confirmation. To stop the service, click **Yes**.

The service stops, then restarts automatically.

View Service Details

You can view and edit information about services using options in the View menu for a service.



Purpose of Each Service View

Each view displays a functional piece of a service and is described in detail in its own section:

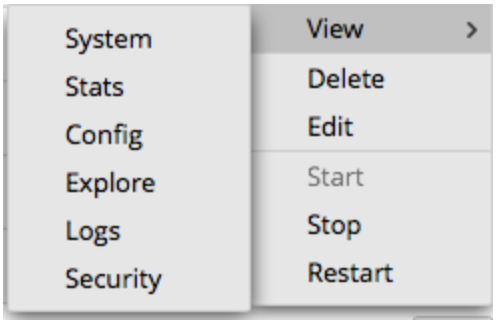
- System View shows a summary of service, appliance service, host user, and session information.
- Services Stats View provides a way to monitor service operations and status.
- Services Config View is for configuring all aspects of a service.
- Services Explore View is for viewing and editing host and service configurations.
- System Logging Panel shows service logs that you can search.
- Services Security View is a way to add NetWitness Platform Core user accounts for aggregation, thick client users, and REST API users.

Access a Service View

To access a view for a service:

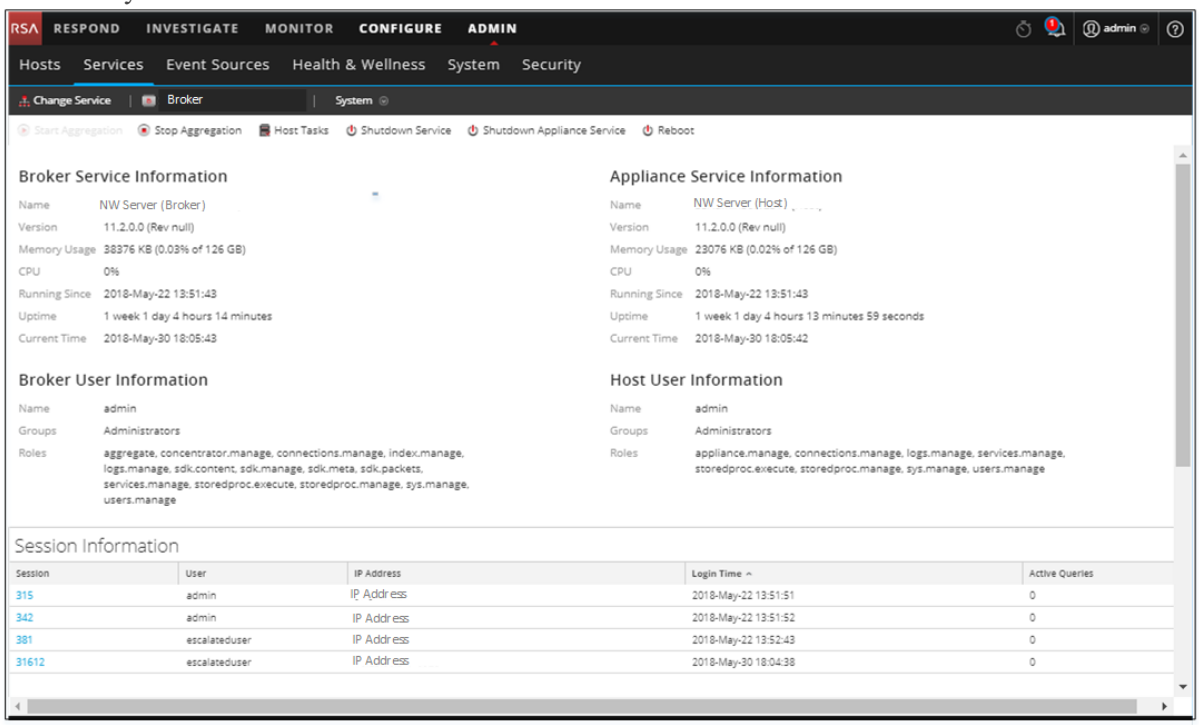
1. In NetWitness Platform, go to **ADMIN > Services**.
2. Select a service and click  **> View**.

   The View menu is displayed.



3. From the options on the left, select a view.

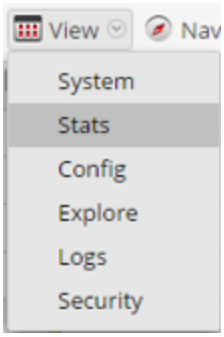
   This is a System view for a Broker.



4. Use the toolbar to navigate:

   a. Click **Change Service** to select another service.
   The **Administrate Service** dialog is displayed.

b. Select the checkbox to the left of the service that you want.
c. Select the view that you want for the service you selected in the View drop-down menu.



The new view (for example, Stats) is displayed for the service you selected.

Hosts and Services Views References

This topic is a reference for features in the NetWitness Platform ADMIN user interface.

This topic describes features available in the NetWitness Platform Admin user interface. The Admin module pulls NetWitness Platform Admin activities into a single view to monitor and manage hosts (appliances), services, tasks, and security.

Topics

Hosts View

You set up and maintain the physical or virtual machine on which NetWitness Platform services run in the **Hosts** view.

IMPORTANT: For help on resolving errors you receive during version installation and update, see Troubleshooting Version Installations and Updates .

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the Core services first.

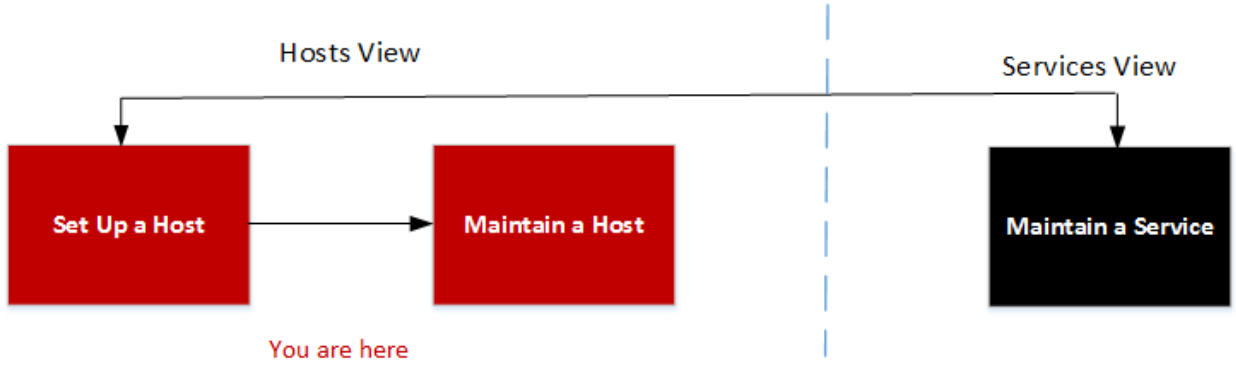
Service	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
Admin	N/A	N/A	Implemented with the NW Server
Archiver	50008	56008	
Broker	50003	56003	Core Service
Cloud Gateway	N/A	N/A	
Concentrator	50005	56005	Core Service
Config	N/A	N/A	Implemented with the NW Server.
Content	N/A	N/A	Implemented with the NW Server
Context Hub	N/A	N/A	
Decoder (Packets)	50004	56004	Core Service
Endpoint	N/A	N/A	
Entity Behavior Analysis	N/A	N/A	
Event Stream Analysis	N/A	50030	
Integration	N/A	N/A	Implemented with the NW Server.
Investigate	N/A	N/A	Implemented with the NW Server.
Log Collector	50001	56001	

Service	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
Log Decoder	50002	56002	Core Service
Malware Analysis	N/A	60007	
Orchestration	N/A	N/A	Implemented with the NW Server.
Reporting Engine	N/A	51113	Implemented with the NW Server.
Respond	N/A	N/A	Implemented with the NW Server.
Security	N/A	N/A	Implemented with the NW Server.
Source	N/A	N/A	Implemented with the NW Server
UEBA	N/A	N/A	
Warehouse Connector	50020	56020	
Workbench	50007	56007	

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.

Workflow

This workflow shows the procedures you complete to set up a host, maintain a host, and update the host with new NetWitness Platform versions. Setting up a host is the first task in this workflow. The hosts with core services are set up out-of-the-box. After that, you can set up additional hosts to enhance your NetWitness Platform deployment. The other two tasks, maintaining a host and updating versions for a host, are performed when required and do not have a specific order of completion.



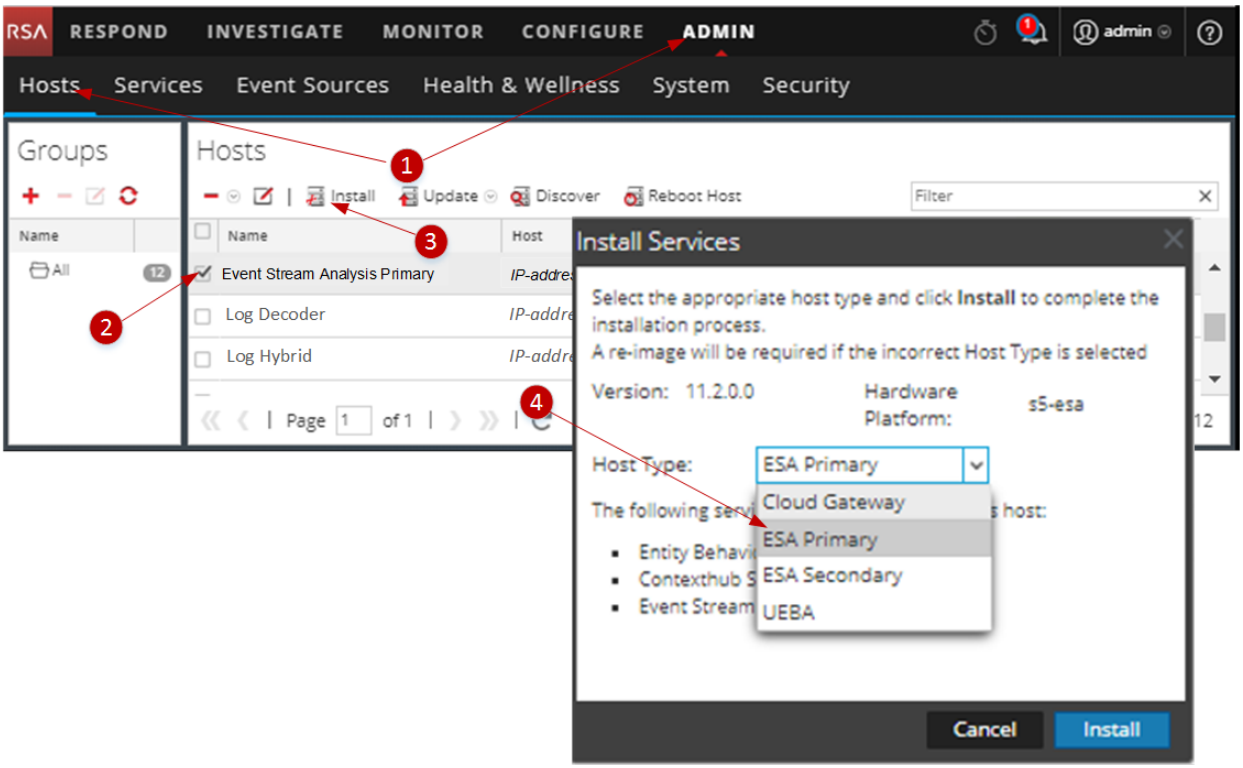
What do you want to do?

For detailed instructions of the following tasks, see Hosts and Services Procedures.

Role	I want to ...
Administrator	Setup up a host.
Administrator	Maintain a host.
Administrator	Apply version updates to a host.

* You can perform these tasks in the current view.

Quick Look



The following example shows you how to set up a host.

1. Select ADMIN > Hosts.
2. Select the host you deployed (for example, **Event Stream Analysis Primary**).
3. Click Install (Install icon).
4. Select the host type to install from the **Install Services** dialog (for example,

ESA Primary). This host type installs the Entity behavior Analytics, Context Hub, and Event Stream Analysis services on this host.

Hosts Panel Toolbar

The Hosts view toolbar contains the tools that you use to maintain the hosts in your NetWitness Platform deployment.

In NetWitness Platform, go to **Admin** > **Hosts** to access the Hosts view. The Hosts panel toolbar is at the top of the Hosts grid in the Hosts view.

Features

The following table describes the features of the Hosts panel toolbar.

Features	Description
	**Remove From Group**: If the host is part of a host group, you can remove the host from the group.
	Open the Edit Host dialog in which you edits a host or service identification and basic communication settings. This dialog has the same features as the Add Host dialog. Related procedure: Step 1. Deploy a Host
	Opens the **Install Services** dialog from which you can install a service on a deployed host. Related procedures: Step 2. Install a Service on a Host
	• **Update** - Updates the host or hosts you have selected with the version you select in the **Update Version** column. • **Check for Updates** - Checks the Local Update Repo for the latest updates available from RSA. Related procedure: Apply Version Updates to a Host
	Most of the time, the Discovery function completes automatically and you do not need to click **Discover** . For a fresh installation, click **Discover** to access the Provision dialog box so you can complete the provisioning phase. After the provisioning phase, NetWitness Platform automatically discovers services running on the host and you do not need to click Discover. For a fresh installation, click **Discover** to access the Provision dialog box so you can complete the provisioning phase. After the provisioning phase, NetWitness Platform automatically discovers services running on the host.
	Restart the host.
Filter	Filter hosts by Name or Host.

Groups Panel Toolbar

The Groups panel toolbar provides options for managing groups of hosts. Use the toolbar to create, edit, and delete groups. After you create a group, you can drag individual hosts from the Hosts panel into that group.

Use groups may to organize hosts by function, geography, project, or any other organization principle that is useful. A host may belong to more than one group.

In NetWitness Platform, go to **ADMIN > Hosts**. The Groups panel toolbar is at the top of the Groups grid in the Hosts view.

The Groups panel provides a way to create logical groups of hosts. Once hosts are grouped, it is easier to perform operations on multiple hosts by interacting with each host in a group rather than individual hosts from an non-grouped list.

Note: In NetWitness Live, groups can subscribe to resources while individual hosts cannot.

The Groups panel consists of a grid populated with a list of defined host groups and the Groups Panel Toolbar.

Column	Description
	Displays a new row in the Group grid in which you enter the name of a new group.
	Asks for confirmation that you want to delete the group or host. You can confirm or cancel the deletion.
	Opens the name field in a row of the Group grid so that you can type a new name for an existing group.
	Refreshes the selected group.
Name	The name of the host group. Click the group name to list the hosts in that group on the Hosts panel.
<Blank>	Indicates the number of hosts in the group. Click the number of hosts in the group to list the hosts in that group on the Hosts panel.

Services View

You set up and maintain the NetWitness Platform services run in the **Services** view. With the Services view, you can:

- Quickly search for and locate a specific service or type of service, such as Log Decoder or Warehouse Connector
- Use shortcuts to get to administration tasks
- Add, edit, and remove services
- Sort services by name and host
- Filter services by type and by name and host
- Start, stop, and restart services

A service performs a unique function, such as collecting logs or archiving data. Each service runs on a dedicated port and is modeled as a plug-in to enable or disable, according to the function of the host. You must configure the following Core services first.

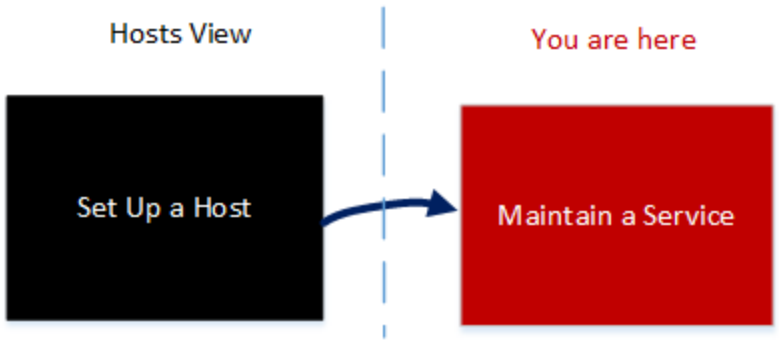
Service	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
Admin	N/A	N/A	Implemented with the NW Server
Archiver	50008	56008	
Broker	50003	56003	Core Service
Cloud Gateway	N/A	N/A	
Concentrator	50005	56005	Core Service
Config	N/A	N/A	Implemented with the NW Server.
Content	N/A	N/A	Implemented with the NW Server
Context Hub	N/A	N/A	
Decoder (Packets)	50004	56004	Core Service
Endpoint	N/A	N/A	
Entity Behavior Analysis	N/A	N/A	
Event Stream Analysis	N/A	50030	

Service	Unencrypted Non-SSL Port	Encrypted SSL Port	Notes
Integration	N/A	N/A	Implemented with the NW Server.
Investigate	N/A	N/A	Implemented with the NW Server.
Log Collector	50001	56001	
Log Decoder	50002	56002	Core Service
Malware Analysis	N/A	60007	
Orchestration	N/A	N/A	Implemented with the NW Server.
Reporting Engine	N/A	51113	Implemented with the NW Server.
Respond	N/A	N/A	Implemented with the NW Server.
Security	N/A	N/A	Implemented with the NW Server.
Source	N/A	N/A	Implemented with the NW Server
UEBA	N/A	N/A	
Warehouse Connector	50020	56020	
Workbench	50007	56007	

You must configure hosts and services to communicate with the network and each other so they can perform their functions such as storing or capturing data.

Workflow

This workflow shows the procedures you complete to set up and maintain a service. Adding a service to a host is the first task in this workflow. The hosts with core services are set up out-of-the-box. After that, you can set up additional services on hosts to enhance your NetWitness Platform deployment.



What do you want to do?

See Hosts and Services Procedures for detailed instructions of the following tasks.

Role	I want to ...
Administrator	Maintain a service.
Administrator	Set up a host.

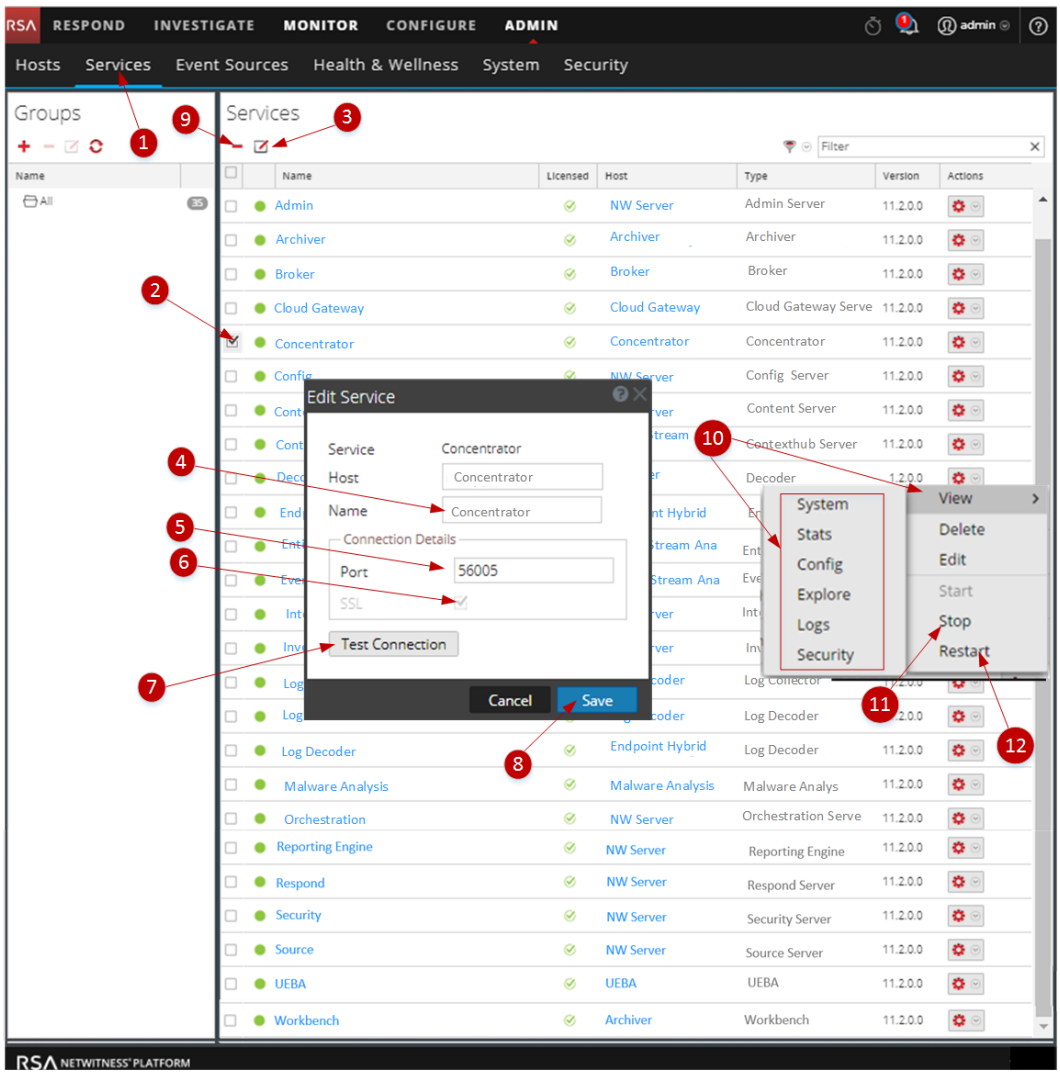
- Troubleshooting Version Installations and Updates

Quick Look

The following example shows you how to maintain a service.



Select a Service.

1. Go to **ADMIN** > **Services** view.
2. Click the checkbox to the left of the service you want to select.

Edit the Service Name and Connection.

3. Click (Alternatively, select Edit from the (Action drop-down menu).
4. Edit the **Host** name.
5. Edit the **Port** number.
6. Deselect or select SSL communication connection.

7 Click **Test Connection** .

8 Click Save.

Delete a Service.

9 **Select a Service** and click the delete icon.

View Service Statistics and Configure Parameters

10 Perform the following steps to view service statistics and configure a service parameters.

a. **Select a Service** and click the actions icon.

b. Click **View** and select:

- **System** to:
  - View current high-level information about the service and its host.
  - Access the System View toolbar.
- **Stats** to view detailed service statistics.
- **Config** to view and configure service parameters.
- **Explore** to view and configure service parameters in the NetWitness Platform Explore view.
- **Logs** to view log messages issued by the service.

11 **Select a Service**, click the actions icon, and click **Stop** a service that is running.

12 **Select a Service**, click the actions icon, and click **Restart** to restart a stopped service.

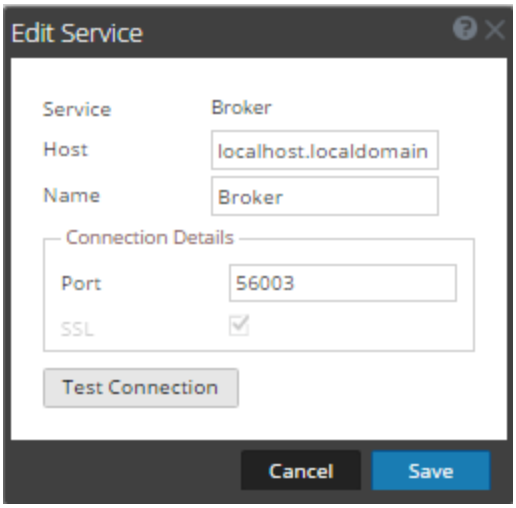
Edit Service Dialog

This topic introduces the Edit Service dialog accessible from the ADMIN Services view (ADMIN > Services).

NetWitness Platform services are automatically discovered in NetWitness Platform.

You can use the Edit Service dialog to modify services. To access the Edit Service dialog, go to **ADMIN > Services** and click in the **Services** panel toolbar.



Procedures related to services are described in Hosts and Services Procedures.

Features

This table describes the features of the Add Service or Edit Service dialogs.

Field or Option	Description
Service	Displays the service type. You can add the following services: Archiver, Broker, Concentrator, Decoder, Event Stream Analysis, Incident Management, IPDB Extractor, Log Collector, Log Decoder, Malware Analysis, Reporting Engine, Warehouse Connector, and Workbench.
Host	Specifies the host on which the service resides.
Name	Specifies the name used to identify the service; for example, **Broker**. An understandable naming convention can make administrative tasks easier. Some administrators find it convenient to use the hostname or IP address (specified in the **Host** field) for the **Name** as well.

Field or Option	Description
Port	Specifies the port used to communicate with this service. The default port based on the selected service type in the **Service** field is autofilled here. If you select **SSL** below, this port becomes an SSL port. If you do not select **SSL**, it becomes a non-SSL port. You can customize this port by opening a firewall for the port that you add. For information on ports, see the **Network Architecture and Ports** topic in the *Deployment Guide*.
SSL	Indicates that NetWitness Platform uses SSL for communications with this service.
Username	Specifies the user name used to log in to this service. The default username is **admin**.
Password	Specifies the password used to log in to this service. The default password is **netwitness**.
Test Connection	Tests the connection of a service that you are adding.
Cancel	Closes the Add Service or Edit Service dialog. If you do not save the service before closing the dialog, the service is not added or edited.
Save	Saves the new service.

Groups Panel Toolbar

This topic introduces the features and options in **ADMIN > Services** view > **Groups** panel toolbar.

The Groups panel toolbar provides options for managing groups of services. The toolbar includes options to create, edit, and delete groups. After you create a group, you can drag individual services from the Services panel into the group.

Groups may reflect functional, geographical, project-oriented, or any other organization principle that is useful. A service may belong to more than one group.

To access the Services view, in **NetWitness Platform**, go to **ADMIN > Services.** The Groups panel toolbar is at the top of the Groups grid in the Services view.

Features

This table describes toolbar features.

Option	Description
	Displays a new row in the Group grid in which you enter the name of a new group.
	Asks for confirmation that you want to delete the group or service. You can confirm or cancel the deletion.
	Opens the name field in a row of the Group grid so that you can type a new name for an existing group.
	Refreshes the selected group.

Services Panel Toolbar

This topic introduces the options in Service panel toolbar to add, remove, edit, and get a license for services. You can also filter the services listed in the Services Panel.

To access the Administration Services view, in **NetWitness Platform**, go to **ADMIN > Services.** The Services panel toolbar is at the top of the Services grid in the Services view.

Features

The table describes the features of the Services panel toolbar.

Feature	Description
	Adds a service for this instance of RSA NetWitness Platform to manage (see Step 2. Install a Service on a Host).
	Deletes a service from this instance of NetWitness Platform (see Edit or Delete a Service).
	Edits service identification and basic communication settings.
	Filters the services listed in Services view. In the Filter drop-down menu, you can filter the services by one or more selected service types. In this example, when you select Concentrator and Decoder, only the Concentrator and Decoder services appear in the Services view. In the Filter field, you can filter the services by Name and Host. You can use the Filter drop-down menu and the Filter field at the same time to filter the services listed in the Services view.

Services Config View

This topic introduces the features and functions of the Services Config view.

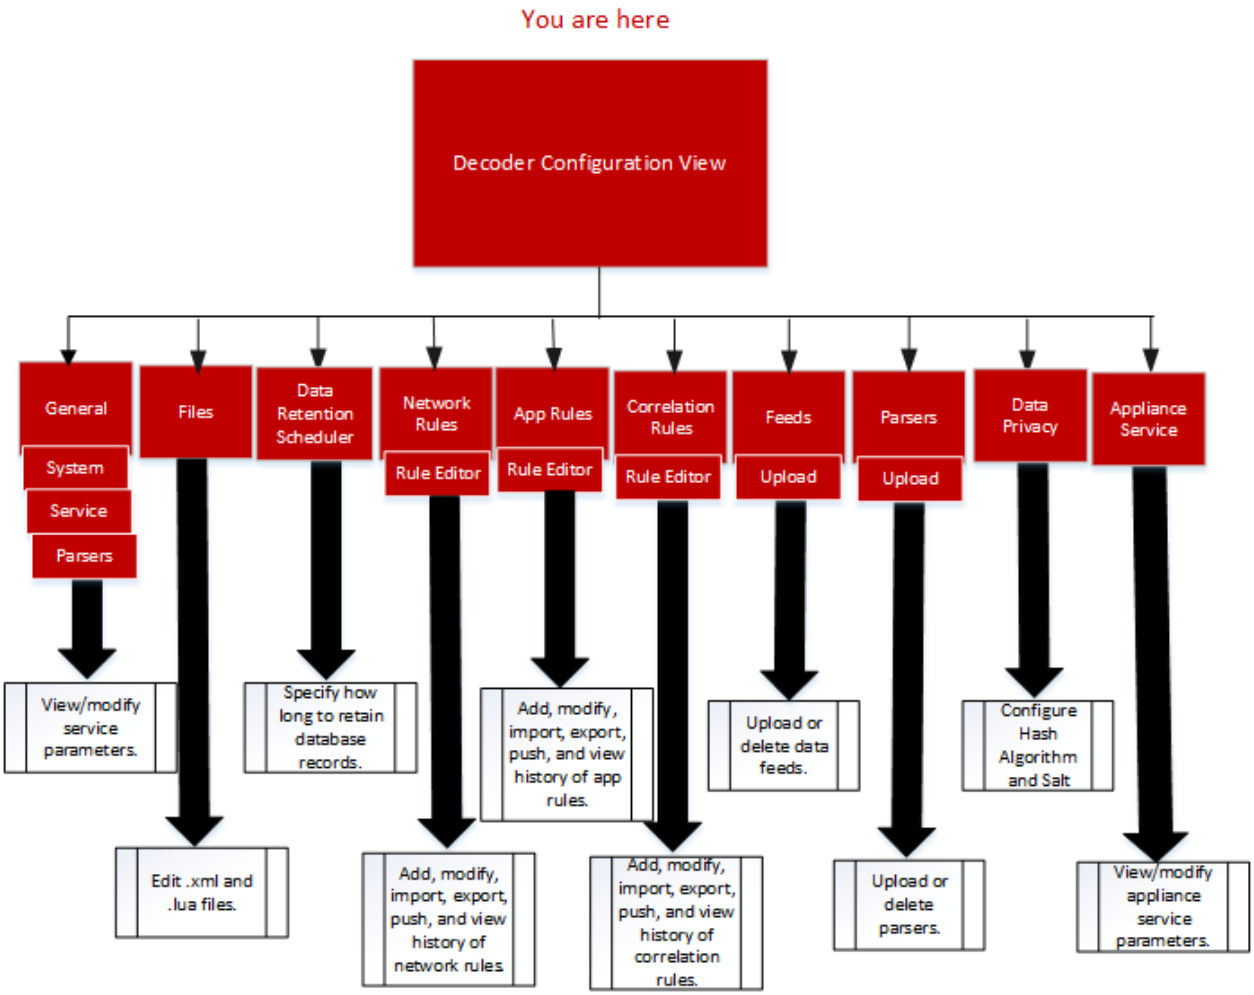
The Services Config view is one of the views available from the **Services** > Actions () menu. It provides a user interface for configuring all aspects of a core service or NetWitness Platform service.

The configuration options in the Services Config view are organized as tabs, with each tab providing a view of a set of related parameters. Unlike the Services Explore view, which offers direct access to all configuration files for a service, these tabs present the most commonly modified parameters of service configuration in a user-friendly view.

Due to configuration requirements for different services; each type of service has variations in available tabs and configuration parameters in this view. Individual topics describe configuration parameters that are specific to a host (Brokers and Concentrators, Decoders and Log Decoders) or service (for example, Reporting Engine, IPDB Extractor, Log Collector, and Warehouse Connector).

Workflows

The following workflow shows the configuration tasks for the Decoder service as an example of this view. For details on their **ADMIN > Services > Config** views, see the individual service Configuration Guides (for example, the *RSA NetWitness® Platform Broker and Concentrator Configuration Guide*) .



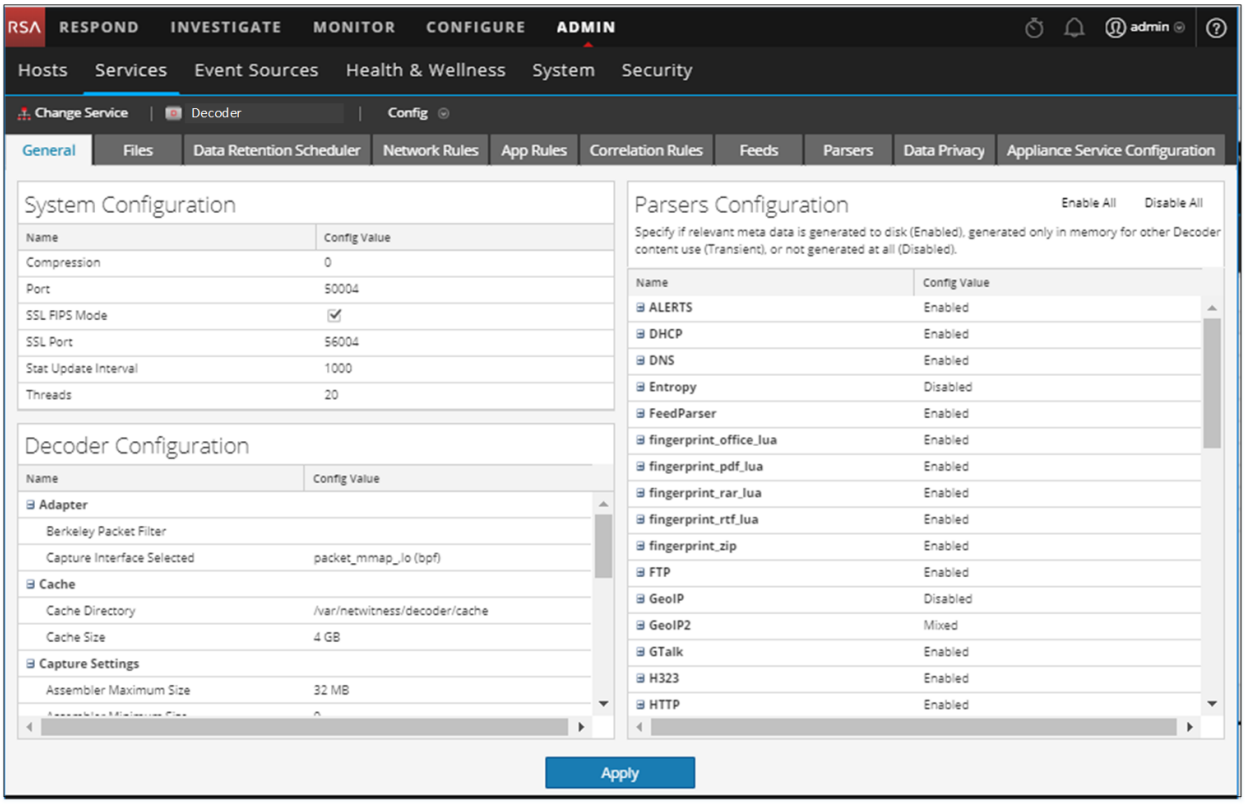
To access the Services Config view:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
   The Administration Services view is displayed.

2. Select a service and select  **>View > Config**.
   Services Config view for the selected service is displayed.

Quick Look

This is an example of the Services Config view for a Decoder.



This is an example of the Services Config view for a Concentrator.

- Edit a Service Configuration File

Appliance Service Configuration Tab

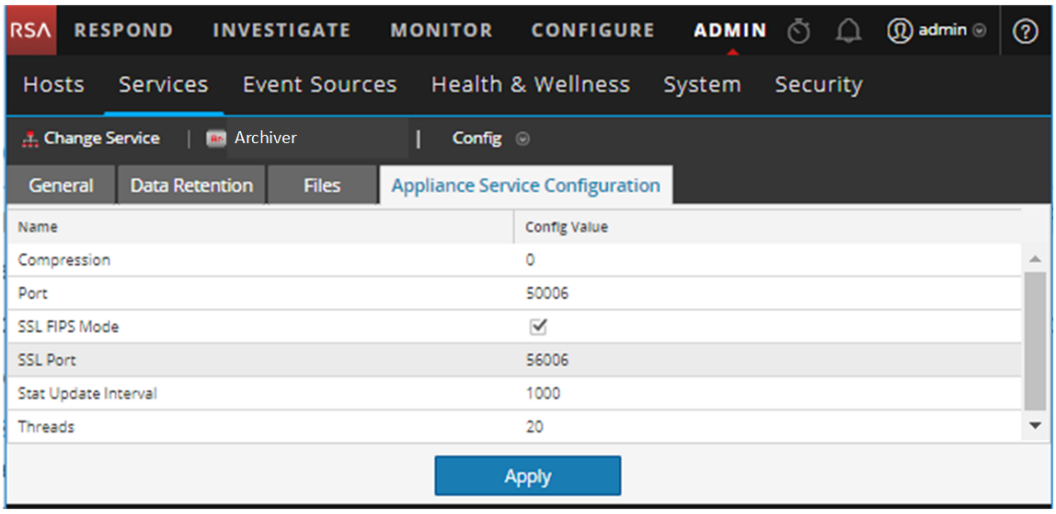
This topic lists and describes the available configuration parameters for the NetWitness Platform Core Appliance service. The NetWitness Platform Core Appliance service provides hardware monitoring on legacy NetWitness hardware.

The Configuration view for the Archiver, Broker, Concentrator, IPDB Extractor, Decoder, Log Collector, or Log Decoder service has an Appliance Service Configuration tab.

To access the Appliance Service Configuration tab:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
   The Administration Services view is displayed.
2. Select a service and select  **>View > Config**.
   Services Config view for the Archiver service is displayed.
3. Click the **Appliance Service Configuration** tab.

This is an example of the Appliance Service Configuration tab for an Archiver.



Name	Description of Configuration Value	When Changes Take Effect
Compression	Compresses a message when it reaches the positive number (in bytes) that you specify.	The next time you connect to this service.
Port	Unencrypted listening port. **0** indicates that the port is disabled.	Upon restart of the service.
SSL FIPS Mode	One of the parameters you need to enable or disable Federal Information Processing Standards (FIPS). For detailed instructions, see "Activate or Deactivate FIPS" in the *RSA NetWitness® Platform System Maintenance Guide*.	Upon restart of the service.
SSL Port	SSL (Secure Sockets Layer) listening port. **0** indicates that the port is disabled. SSL is the standard security technology for establishing an encrypted link between a web server and a browser. This link ensures that all data passed between the web server and browsers remain private and integral.	Upon restart of the service.
Stat Update Interval	How often (in milliseconds) the system updates statistic nodes for monitoring Health and Wellness.	Immediately.
Threads	Threads in thread pool required to used to handle requests. The **Threads** parameter works with the **Polling Interval** parameter for event and log threads.	Immediately.

Topic

Appliance Service Configuration Parameters

Data Retention Scheduler Tab

This topic describes the configurable options in the Data Retention Scheduler tab for Decoder, Log Decoder, and Concentrator.

In the Data Retention Scheduler tab, you can define the criteria for removing database records from primary storage on Decoder, Log Decoder, and Concentrator services, and schedule the timing for checking the threshold.

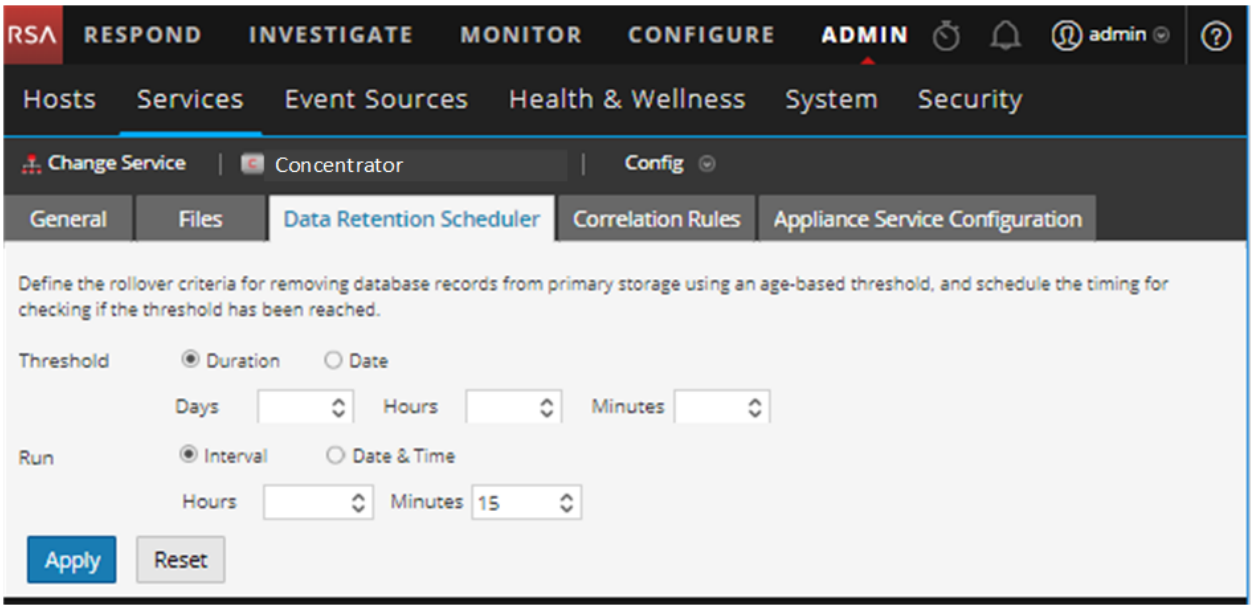
For information on the Data Retention tab for Archiver, see the **Data Retention Tab - Archiver** topic in the *Archiver Configuration Guide*.

Note: If additional customization is necessary,use the Scheduler under the Files tab in the Services Config view. For example, if you have storage available to save the RAW data versus the meta, use Capacity as the threshold and to set different thresholds per database (meta versus packet).

To access the Data Retention Scheduler tab:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. Select a Decoder, Log Decoder, or Concentrator, and then select  **> View > Config**.
3. In the **Services Config** view for the service, click the **Data Retention Scheduler** tab.

The following figure illustrates the parameters in the Data Retention Scheduler tab for a Concentrator.



Features

The Data Retention Scheduler tab has sections to specify Threshold settings and Run settings. The following table lists the parameters supported for data retention configuration.

Parameter	Description
Threshold	The threshold is based on the age of the data, the amount of time the data was stored or the date on which the data was stored. The date is from the database file, not from the actual session time. • **Duration**: The duration of time that data can be stored before removal. Specifies the number of days (365 maximum), hours (24 maximum), and minutes (60 maximum) that have elapsed since the time stamp on the data. • **Date**: The removal of data based on the date of the timestamp. Specifies the monthly date and time in the **Calendar** and **Time** fields.
Run	The schedule for running the job that checks rollover criteria. • **Interval**: Schedule the database check to occur at a regular interval. Specifies the **Hours** and **Minutes** between the scheduled checks. • **Date and Time**: Schedule the database check to occur at a regular day and time. Specifies the day from the drop-down list and the system clock time in `hh:mm:ss` format. Possible values for day are **Everyday**, **Weekdays**, **Weekends**, and **Custom**, where **Custom** allows you to select one or more specific days of the week.
Apply	Overwrites any previous schedule for this service and applies the new settings immediately. **Caution:** After you apply these settings, when the threshold is met the system deletes the old data from the database and you can no longer access it.
Reset	Resets the schedule to the last applied state.

Files Tab

This topic describes the service configuration files that are visible in the Services Config view > Files tab.

Use the Files tab in the Services Config view to edit service configuration files for Decoders, Log Decoders, Brokers, Archivers, and Concentrators as text files.

The files you can edit vary depending upon the type of service you are configuring. The following files are common to all core services.

- service index file
- netwitness file
- crash reporter file

- scheduler file
- feed definitions file

In addition, the Decoder has files that configure parsers, feed definitions, and a wireless LAN adapter.

Note: The default values in the configuration files cover most common situations. You may need to edit configuration parameters and values for optional services, such as the crash reporter or scheduler. Do not change these values in the Files tab unless you understand networks and the factors that affect the way services collect and parse data.

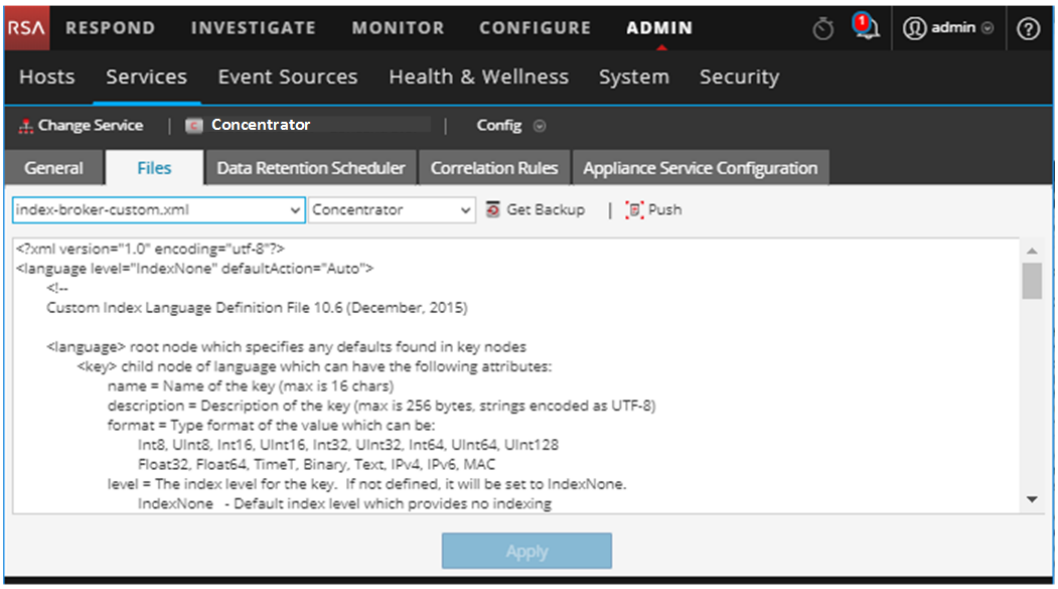
More detail on the service configuration parameters is available in the Service Configuration Settings.

To access the Files tab:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. Select a service and select  **> View > Config**.
   The Services Config view is displayed with the **General** tab open.
3. Click the **Files** tab.

Edit a Service Configuration File

This is an example of the Files tab.



Files Tab Toolbar

The Files tab has a toolbar and an edit window. This is an example of the toolbar.

These are the features of the Files tab toolbar.

Feature	Description
File drop-down list	Displays a list of files that the system is currently using. When you select a file, the text of the file is displayed in the text edit window. In the text window, you can edit the file and save the changes, or create alternate files to use.
Service / **Host** drop-down list	Displays the service type and host. You can open a file from either the service or the host for editing.
	Retrieves the latest backup of the current file, which can prove useful when you have made changes and want to go back to the previous version of the file. The backup does not replace the current file unless you click **Save**.
	Displays a dialog in which you can select services of the same type and push the currently viewed file to the services.
Apply	Overwrites the current file, creates a backup file.

Services Explore View

Use the NetWitness Platform Services Explore view, to display and edit host and service configurations.

The Services Explore View offers advanced access and control of all NetWitness Platform hosts and services. All services expose their functionality through a tree-like series of nodes, similar to the Windows Explorer view of your file system. Here you can:

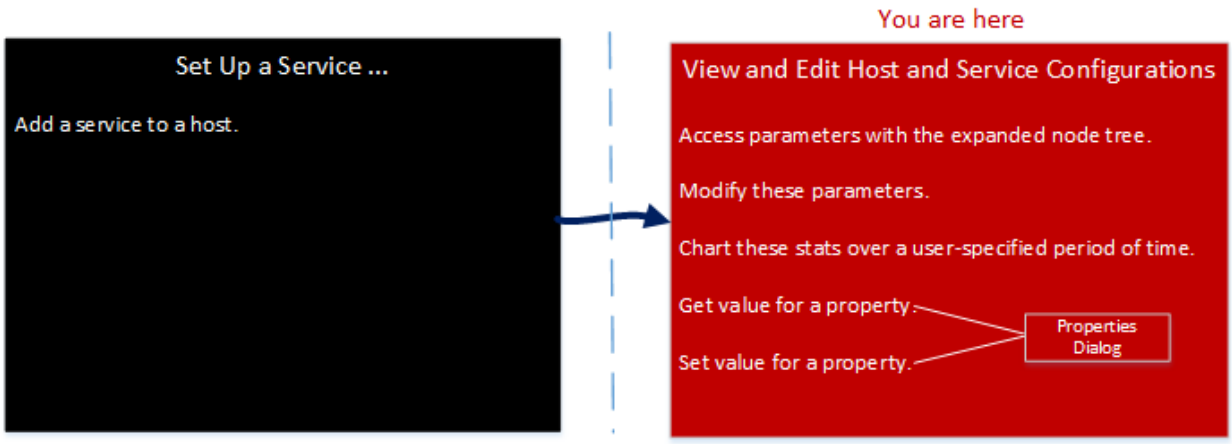
- View a directory tree showing common files for all selected services.
- Navigate down through the directory to a file.
- Open the same file for each service, and display the contents side by side.
- Select an entry in the file and edit the value.
- Apply a property value from one service to other services.

The Services Explore View can also display a Properties dialog, a simple interface for viewing properties of any node in the system and sending messages to the node, shown in the figure below.

Caution: A good understanding of the nodes and parameters is required when editing in this view. Incorrect settings can cause performance problems.

Workflow

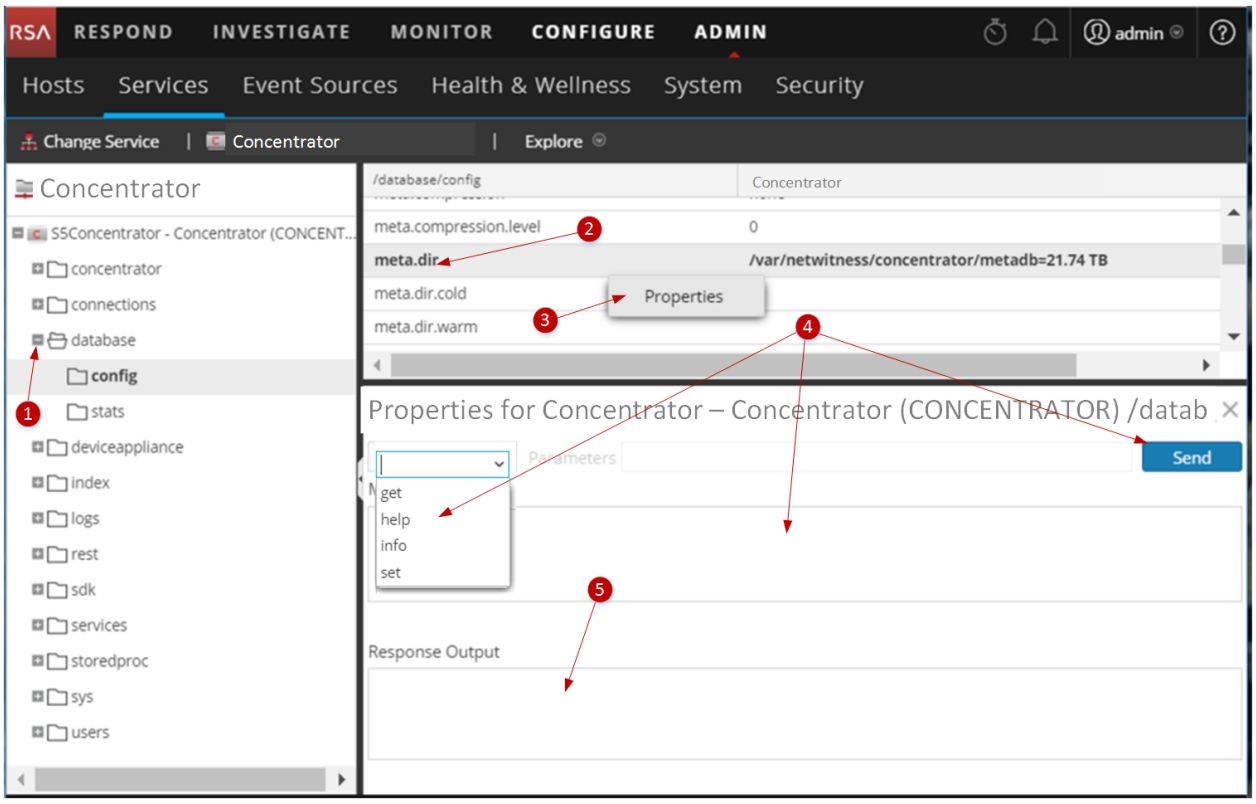
This workflow shows the tasks you perform from the Explore view.



Quick Look

To access the Services Explore view:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. Select a service and select > **View** > **Explore**.



1	Expand the node to display its parameter categories.
2	Click a property (for example, **meta.dir**) to select it.
3	Right-click a node or category and click **Properties** to display the Properties dialog.
4	Perform an operation on a node or category: a. Select a command from the drop-down list. b. Enter a command string (if required). c. Click **Send**.
5	Review the output.

Features

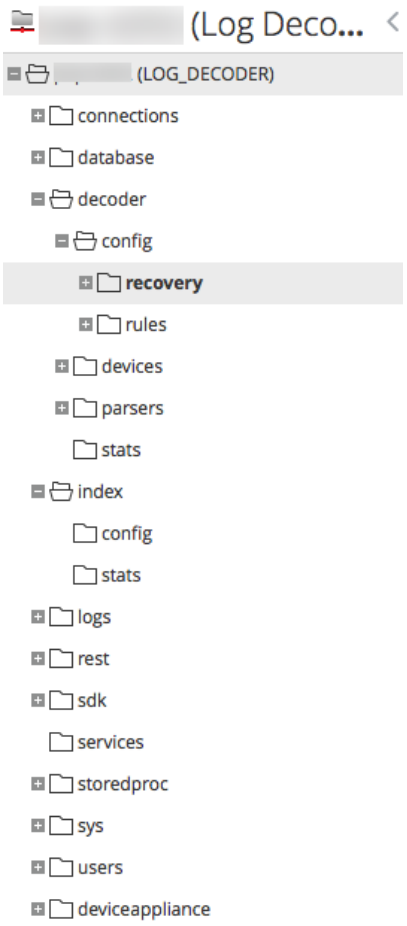
The **Services Explore View** has two main panels:

- The Node list
- The Monitor panel

Rick-click a file and select Properties to access it.

The Node List

The Node list displays the services as a tree-like series of nodes and folders. The levels in the Node list expand and collapse to display the full hierarchy.



Each root folder is named based on the functionality it exposes. For instance, the **/connections** folder shows all connected IP addresses. Underneath each **IP/Port** are two folders, **sessions** and **stats**.

- The **sessions** folder displays all authenticated user sessions originating from the IP/Port.
- The **stats** folder displays values, such as the number of messages sent/received, bytes sent/received, and others, set by the service. These are not editable.

Selecting any folder in the tree view displays its children in the **Monitor** panel. Every node in the tree is actively monitored, so when a statistic or configuration node changes value, it is immediately reflected in the tree and monitor panel.

The Monitor Panel

The **Monitor** panel displays properties and values for a selected node (such as **index**) and a child folder (such as **config**). There are two ways to edit values:

- Click the value and type a new value
- Send a **set** message in the Properties dialog

/Index/Config	(Concentrator)
index.dir	/var/netwitness/concentrator/index=7.08 GB
index.dir.cold	
index.dir.warm	
page.compression	huffhybrid
save.session.count	0

Topics

- Features
- Host GS: Log Decoder Service Configuration Parameters

Properties Dialog

Use the Services Explore view > Properties dialog to perform the following tasks.

- Send messages to a system node
- Retrieve values for a property for multiple services
- Set values for a property for multiple services

When you select Properties from the context menu, the Properties dialog opens below the Monitor panel .

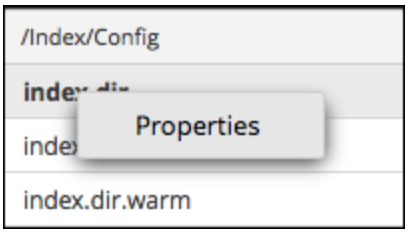
All nodes support have help that contains the following information.

- A description of the node
- The list of supported messages with a corresponding description
- Security roles needed to access the messages

The available messages vary according to the service and root folder. Many of these messages are also accessible as options with a NetWitness Platform dashboard or view.

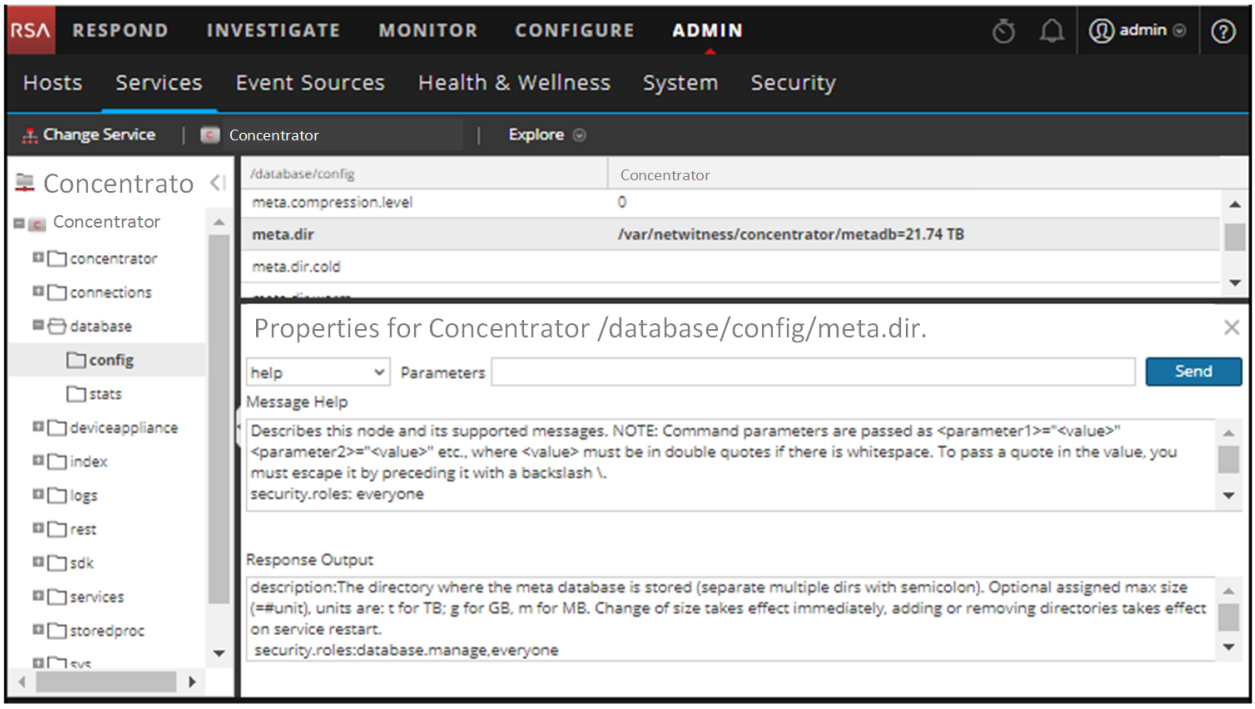
To access the Properties dialog:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. Select a service and select  **> View > Explore**.
3. In the **Node** list, select a file.
4. In the **Monitor** panel, right-click a property and select **Properties**.



The Properties dialog is displayed. You can also right-click any file in the Node list to display the Properties dialog.

The following example shows the Properties dialog with help for a message (**info**) displayed.



Features

The Properties dialog has the following features.

Feature	Description
Message drop-down list	Lists all available messages for the current node. Select a message to send the node.
Parameters input field	Type the message parameters in this field.
Send button	Sends the message to the node.
Message Help	Displays help text for the current message.

Feature	Description
Response Output	Displays the response to a message or output from a message.

Services Logs View

This topic introduces the Services Logs view.

The Services Logs view provides the ability to view and search the logs for a specific service. The Services Logs view is identical to the System Logging Panel with two exceptions:

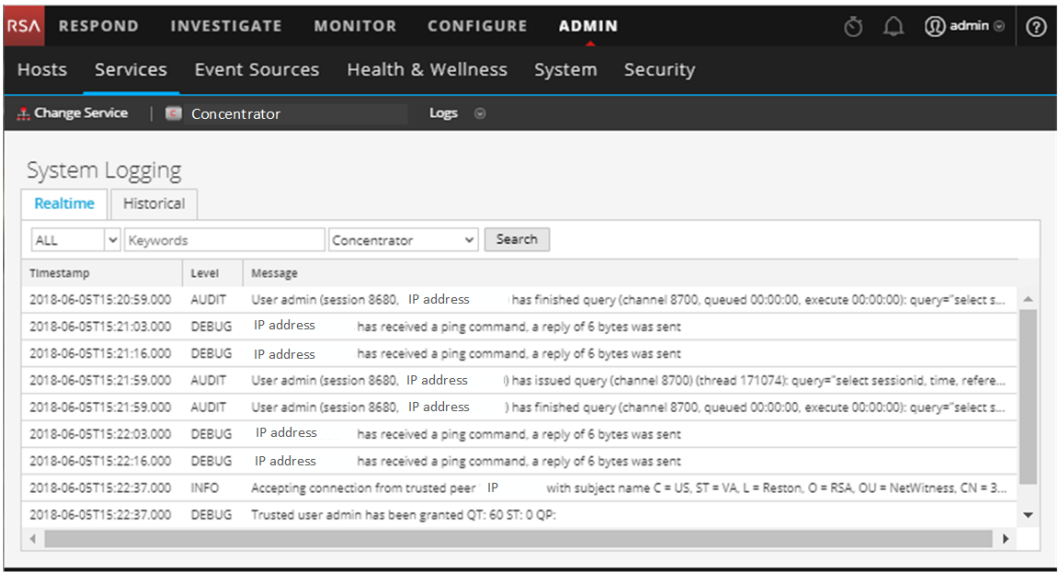
- The Services Logs view has an additional filter to select messages for the service or host.
- The System Logging panel has an additional tab for Settings.

For a complete description of NetWitness Platform logging features, see the **ADMIN** > **System**> **System Logging** panel.

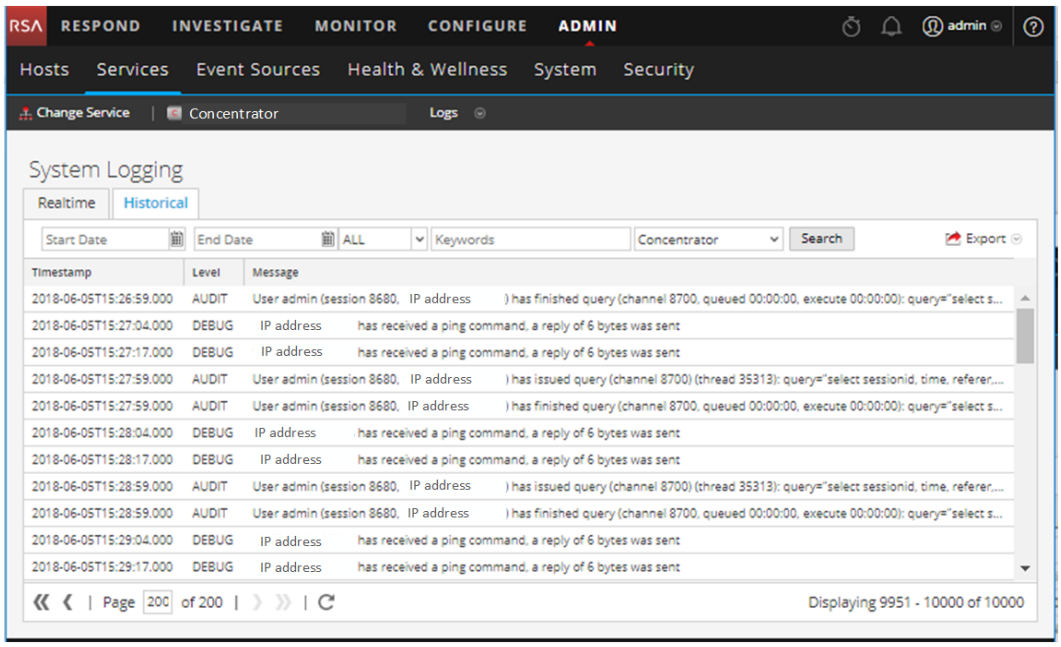
To view a service log:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. Select a service and select  **>View > Logs**.

The following figure shows the Services Logs view Realtime tab.



The following figure shows the Services Logs view Historical tab.



Features

The System Logging Panel has the following tabs, and the logging functions are described as part of system maintenance (see **Monitor Health and Wellness of NetWitness Platform** in the *System Maintenance* guide).

Feature	Description
Realtime tab	This is the monitor mode of the service log.
Historical tab	This is a searchable view of the service log.

Services Security View

This topic provides an overview of service security management in the Services Security view.

In NetWitness Platform, each service has a separate configuration of users, roles, and role permissions, which are managed in the Services Security view.

To access service information and perform service operations through NetWitness Platform, a user must belong to a role that has permissions on that service. For 10.4 or later NetWitness Platform Core services that utilize trusted connections, it is no longer necessary to create NetWitness Platform Core user accounts for users that log on through the web client. You only need to create NetWitness Platform Core user accounts for aggregation, thick client users, and REST API users.

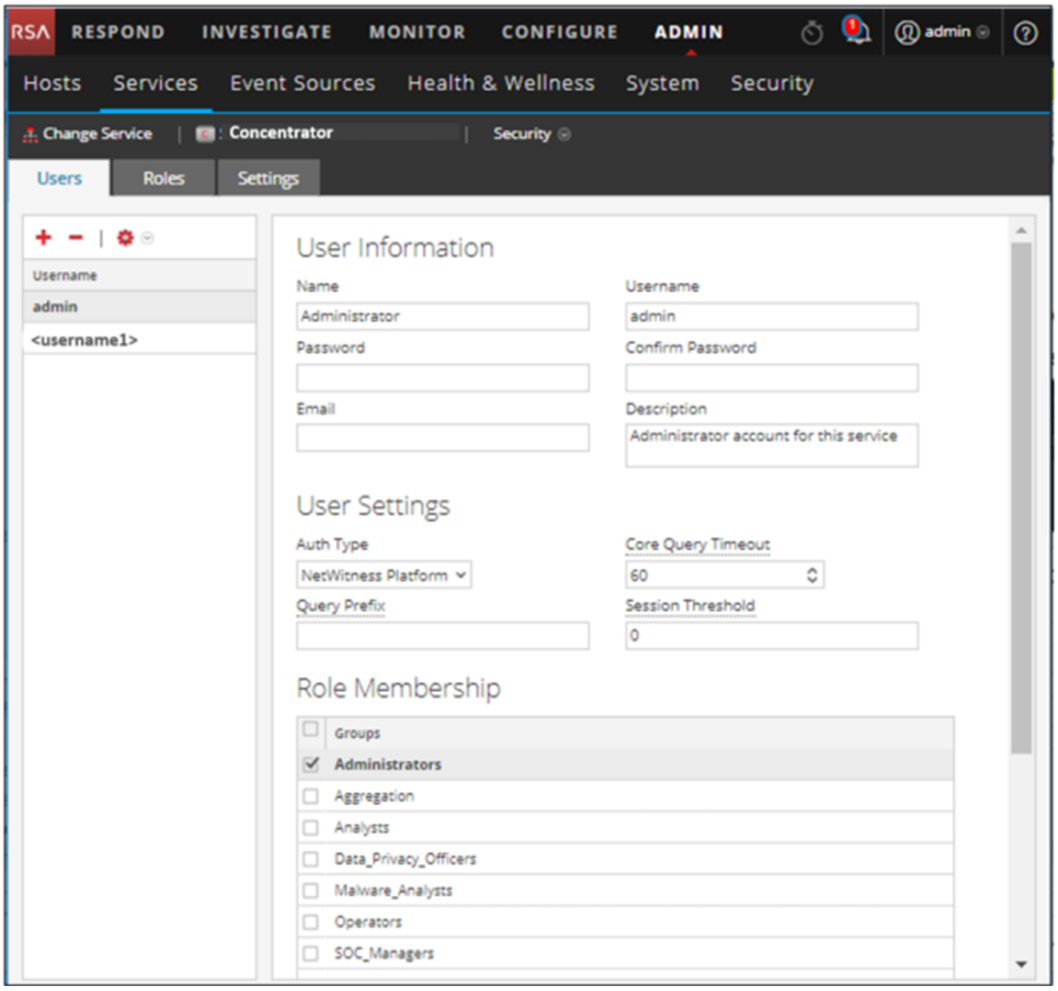
Note: Only the default admin user in NetWitness Platform is created by default on all services. As a prerequisite to managing service security, the default admin user account must be present in the NetWitness Platform Administration > Services view. For every other user, you must configure access to each particular service through NetWitness Platform.

Procedures related to this tab are described in Hosts and Services Procedures.

To access the Services Security view:

1. In **NetWitness Platform**, go to **ADMIN > Services.**

2. Select a service and select  > **View > Security**.
   The Services Security view for the selected service is displayed.



Features

The Services Security view has three tabs, Users tab, Roles tab, and Settings tab.

Roles and Service Access

Primary considerations in configuring service security are defining the roles and assigning users to the roles. The Service Security view separates these two functions into the Users tab and the Roles tab.

- In the Roles tab, you can create roles and assign permissions to the roles for a selected service.
- In the Users tab, you can add a user, edit user settings, change the user password, and edit the role membership of the user for a selected service. Although you select a single service in the Services Security view, you can apply the settings for one service to other services.

Topics

Roles Tab

This topic introduces the features of the Services Security View > Roles Tab.

The **Roles** tab enables you to create roles and assign permissions. Each role can have different permissions for different services. For example, the Analysts role can have different role permissions based on the selected service.

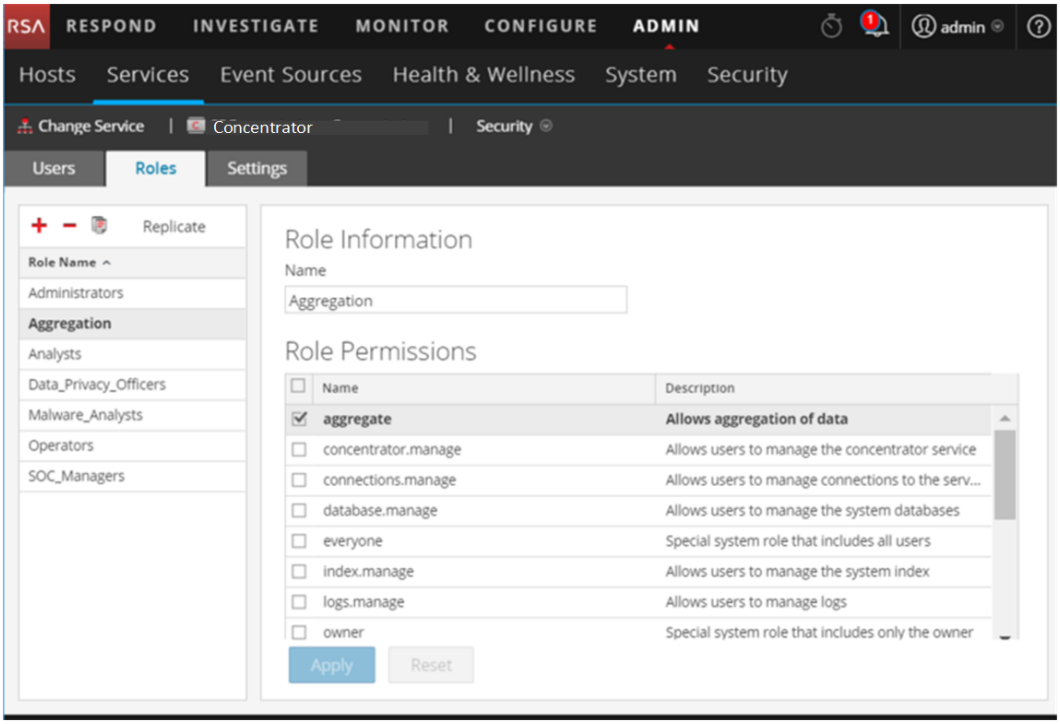
Before you can add users to roles, you need to define user roles, usually by function, and assign permissions to the roles.

Procedures related to this tab are described in Hosts and Services Procedures.

To display the **Services Security View > Roles** tab:

1. In **NetWitness Platform**, go to **ADMIN > Services.**
2. Select a service to which you want to add a user, and select  **> View > Security**.
3. Select the **Roles** tab.

The following figure shows the Roles tab in the Services Security view.



Features

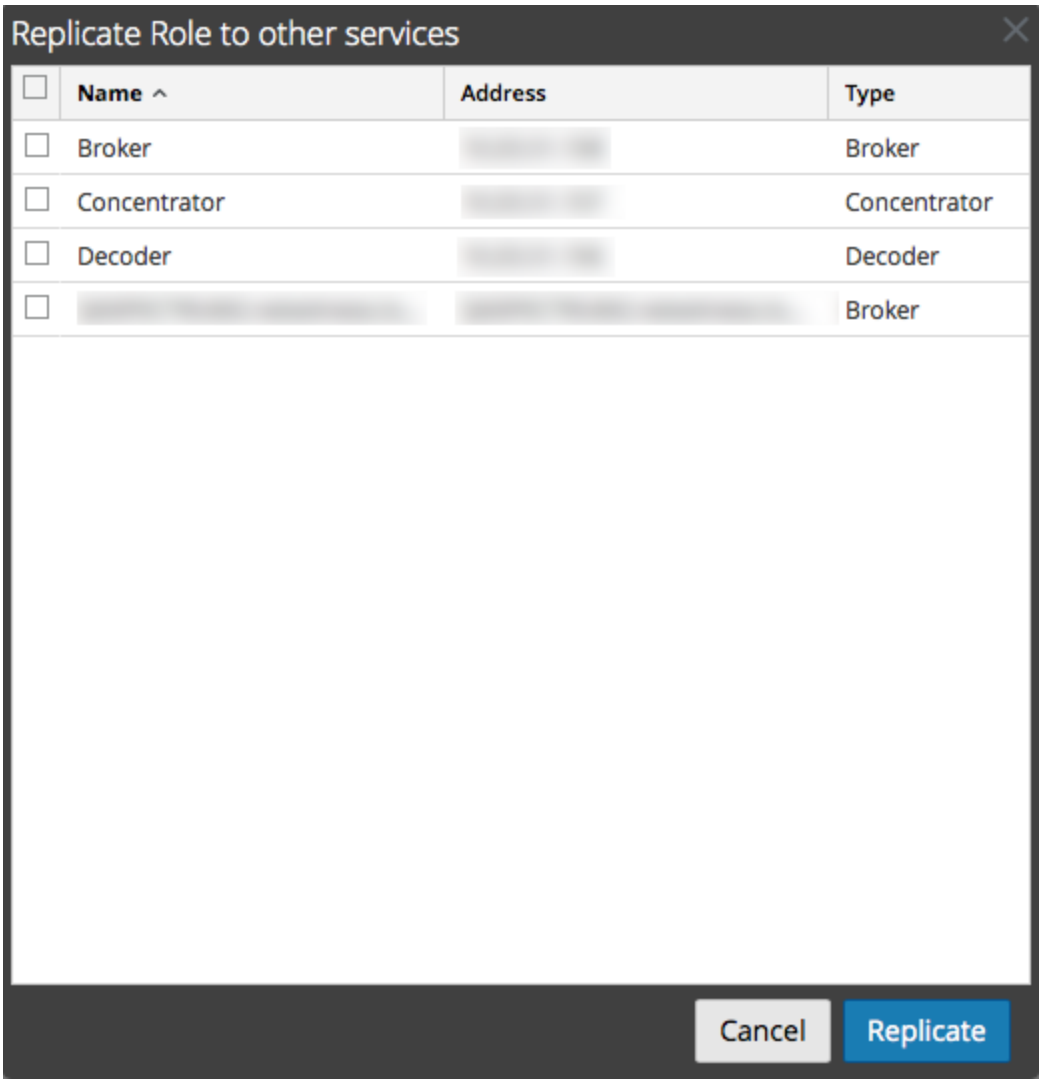
The Roles tab has a **Role Name** panel on the left. Selecting a role name shows the **Role Information** panel for the selected role on the right.

Role Name Panel

The **Role Name** panel has the following features.

Feature	Description
	Adds a new group to the current service.
	Deletes the selected group from the current service.
	Copies a role and its assigned permissions to a new role. The name of the new role must be unique. For example, you can copy the **Analysts** role and create another role with a new name, such as **Analyst_Managers**.
Replicate	Pushes a role and its assigned permissions to other services. After you select a role and click **Replicate**, the **Replicate Role to other services** dialog is displayed. In the dialog, you can select the services where you want to replicate the role.

The following figure shows the **Replicate Role to other services** dialog.



Role Information and Permissions Panel

The **Role Information and Permissions** panel defines role permissions.

There are two buttons:

- The **Apply** button saves the changes made in the Role Permissions panel and they become effective immediately.
- If you have not saved changes in the Role Permissions panel, the **Reset** button resets all fields and settings to their values before editing.

Service User Roles and Permissions

This topic describes the pre-configured service user roles and permissions.

The Services Security view Roles tab enables you to create service user roles and assign permissions. You can also use the pre-configured roles included with NetWitness Platform to assign user permissions.

Service User Roles

NetWitness Platform has the following pre-configured service user roles.

Role	Assigned Permissions	Personnel/Account
Administrators	All permissions	NetWitness Platform System Administrator
Aggregation	aggregate sdk.content sdk.meta sdk.packets	You can use this role to create an Aggregation account. This role provides the minimum permissions necessary to perform aggregation of data. It is only available on NetWitness Platform 10.5 and later services.
Analysts, Malware_ Analysts, and SOC_ Managers	sdk.meta sdk.content sdk.packets storedproc.execute	Users can use specific applications, run queries and view content for purposes of analysis.
Data_Privacy_ Officers	sys.manage users.manage sdk.meta sdk.content sdk.packets sdk.manage logs.manage database.manage index.manage dpo.manage	Data Privacy Officer Data Privacy Officers have the dpo.manage permission on Decoders and Log Decoders.

Role	Assigned Permissions	Personnel/Account
Operators	sys.manage services.manage connections.manage users.manage logs.manage parsers.manage rules.manage database.manage index.manage sdk.manage decoder.manage archiver.manage concentrator.manage storedproc.manage	Operators are responsible for the daily operation of the services.

Service User Permissions

There are many permissions that you can assign a service role in NetWitness Platform. Users can have different permissions on each service, depending on their role assignments and the permissions selected for each role. This table describes the permissions that you can assign to a role.

Permission	Definition
sys.manage	Allows the user to edit the service configuration settings.
services.manage	Allows the user to manage connections to other services.
connections.manage	Allows the user to manage connections to the service.
users.manage	Allows the user to create individual users and user roles and specify user permissions.
aggregate	Allows the user to perform aggregation of data.

Permission	Definition
sdk.meta	Allows the user to run queries in the Investigation and Reporting applications and to view the metadata returned by the query.
sdk.content	Allows the user to access raw packets and logs from any client application (Investigations and Reporting).
sdk.packets	Allows users to access raw packets and logs from any client application.
appliance.manage	Allows the user to manage the appliance (host) tasks. This permission is required by the Appliance service.
decoder. manage	Allows the user to edit the configuration settings for the Decoder service.
concentrator.manage	Allows the user to edit the configuration settings for the Concentrator/Broker service.
logs.manage	Allows the user to view the service logs and edit the logging configuration settings for the specified service.
parsers.manage	Allows the user to manage all attributes under the parsers node.
rules.manage	Allows the user to add and delete all rules.
database.manage	Allows the user to set database locations, sizes, and the various configuration settings for the session, meta and/or packet/log databases.
index.manage	Allows the user to manage all index-related attributes.
sdk.manage	Allows the user to view and set all SDK configuration items.
storedproc.execute	Allows the user to execute a Lua stored procedure.
storedproc.manage	Allows the user to manage Lua stored procedures.
archiver.manage	Allows the user to modify the Archiver configuration.
dpo.manage	Allows the user to manage the transform configuration and the applicable keys.

Aggregation Role

This topic describes the Aggregation role and permissions that allow service users to perform aggregation.

The Aggregation role is a service user role intended only for aggregation of data. It has the minimum role permissions required to do aggregation:

- aggregate
- sdk.meta
- sdk.packets
- sdk.content

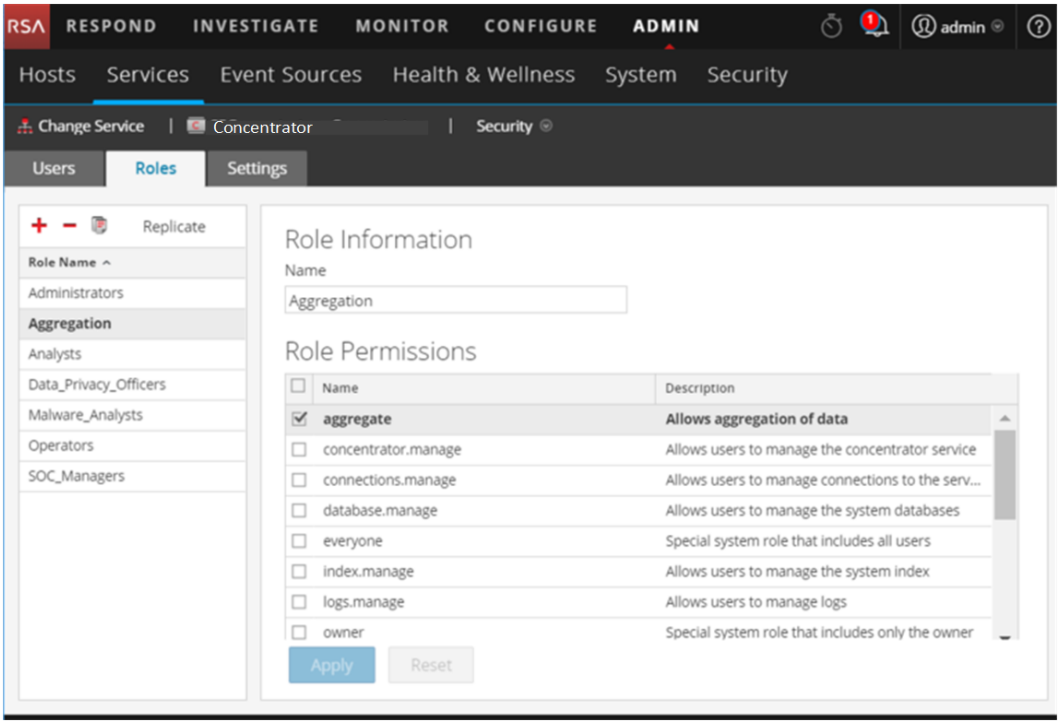
The Aggregation role is available only on NetWitness Platform 10.5 and later services and it can be used for an aggregation account. Members of this role or service users with these permissions can perform aggregation on Decoders, Concentrators, Archivers, and Brokers. The **aggregate** permission allows service users to perform aggregation of sessions and metadata along with raw packets and logs.

You can still use the decoder.manage, concentrator.manage, and archiver.manage permissions, but the Aggregation role permissions allow aggregation only and prevent the other available operations.

You access the service roles from the **ADMIN** > **Services** (select a service) > **Actions** > **View** > **Security** > **Roles** tab.

Procedures related to roles are described in Hosts and Services Procedures. Service User Roles and Permissions provides detailed information on the pre-configured roles.

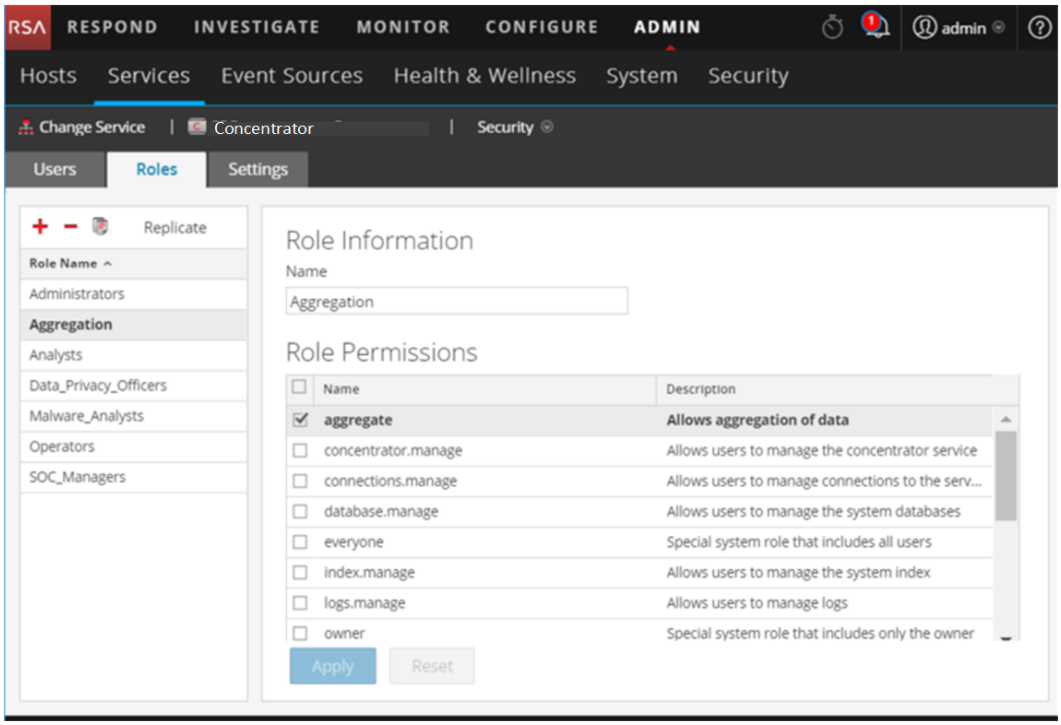
The following figure shows the permissions in the Aggregation role.



Settings Tab

This topic describes the features of the Services Security view > Settings tab.

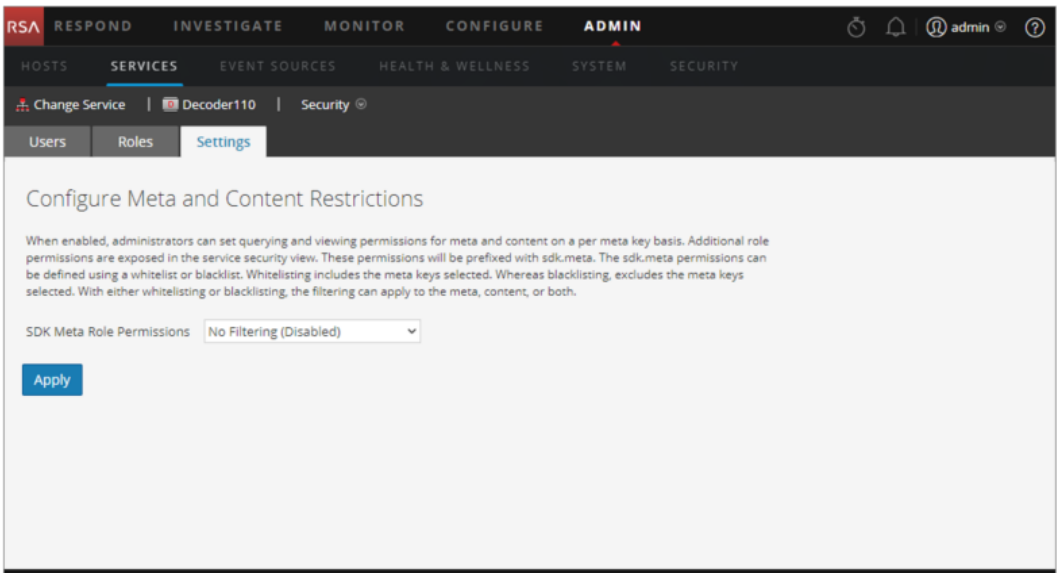
In the Services Security view Settings tab, Administrators can enable and configure system roles that define permissions on a per meta key basis for individual Brokers, Concentrators, Decoders, and Log Decoders. Configuring this feature adds configurable meta keys to the Services Security view > Roles tab so that individual meta keys can be applied to specific roles on a specific service. The following figure illustrates this.



This configuration is generally part of a data privacy plan implemented to ensure that specific types of content consumed or aggregated by a service are kept secure by limiting visibility of the meta data and content to privileged users (see *Data Privacy Management*).

To display the tab:

1. In **NetWitness Platform**, go to **ADMIN > Services**.
2. In the **Services** grid, select a Decoder or Log Decoder service, click  **> View > Security,** and click the **Settings** tab.



Features

The tab includes two features.

Feature	Description
SDK Meta Role Permissions field	Provides option for disabling or configuring meta key and content restrictions. The filtering options are described.
Apply button	Applies the selected configuration immediately. If not disabled, the meta keys are added to the Roles tab so they can be applied to specific roles.

SDK Meta Role Permissions Options

The following table lists the filtering options available in the SDK Meta Role Permissions selection list, and the numeric values used to disable (0) and the types of filtering (1 through 6).

Note: There is no need to know the numeric value unless configuring meta and content visibility manually in the system.roles node.

system.roles Node Value	Settings Tab Option	Description
0	No Filtering (Disabled)	System roles that define permissions on a per meta key basis are disabled.

system.roles Node Value	Settings Tab Option	Description
1	Whitelist meta and content	Meta and content for the specified SDK meta roles are white listed, or visible to users assigned the system role.
2	Whitelist only meta	Meta for the specified SDK meta roles is white listed, or visible to users assigned the system role.
3	Whitelist only content	Content for the specified SDK meta roles is white listed, or visible to users assigned the system role.
4	Blacklist meta and content	Meta and content for the specified SDK meta roles are black listed, or not visible to users assigned the system role.
5	Blacklist only meta	Meta for the specified SDK meta roles is black listed, or not visible to users assigned the system role.
6	Blacklist only content	Content for the specified SDK meta roles is black listed, or not visible to users assigned the system role.

Users Tab

This topic explains the features of the Services Security view > Users tab.

In the Services Security view, the Users tab enables you to configure the following for a service:

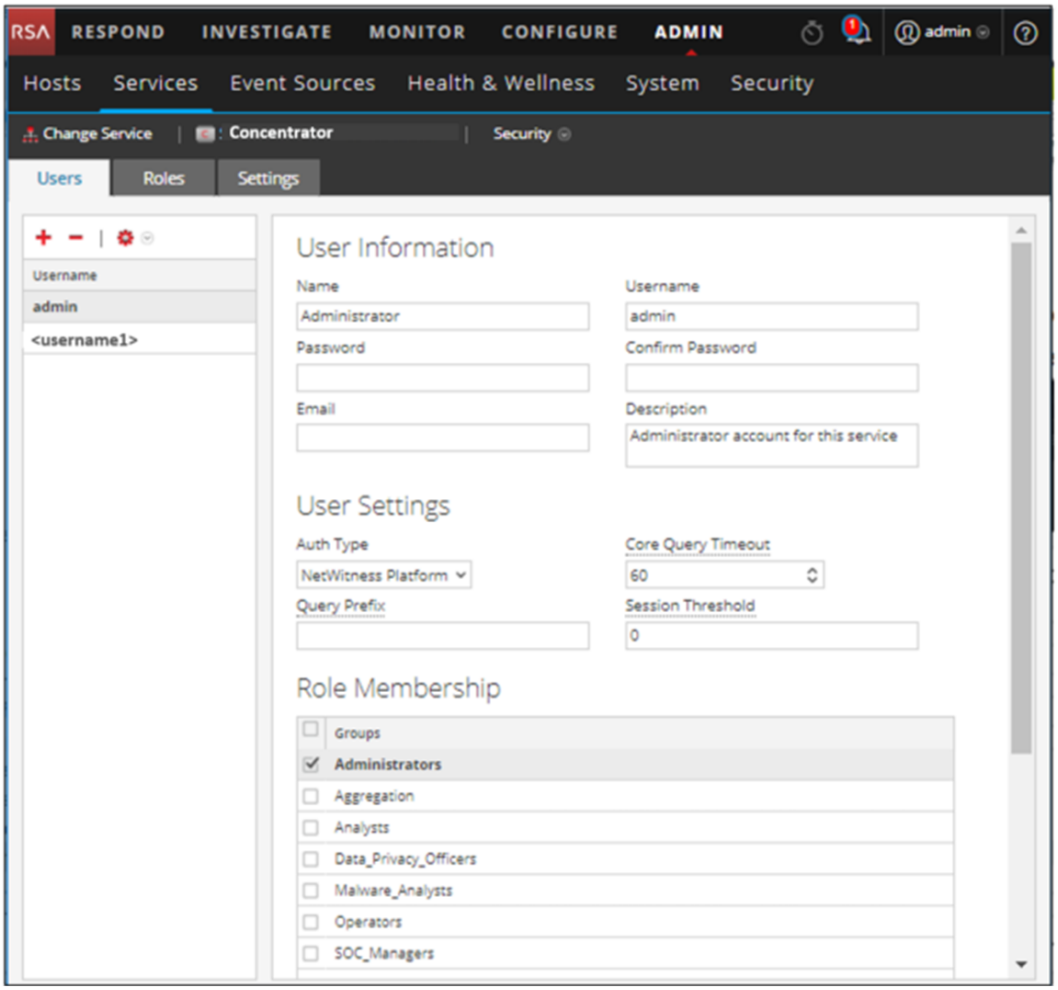
- Add user accounts.
- Change service user passwords.
- Configure user authentication properties and query handling properties for the service.
- Specify the user role membership, which specifies the roles that the user belongs to on the selected service.

Note: For 10.4 or later NetWitness Platform Core services that utilize trusted connections, it is no longer necessary to create NetWitness Platform Core user accounts for users that log on through the web client. You only need to create NetWitness Platform Core user accounts for aggregation, thick client users, and REST API users.

Procedures related to this tab are described in Hosts and Services Procedures.

To access the Services Security view > Users tab:

1. In **NetWitness Platform**, go to **ADMIN > Services.**
2. Select a service to which you want to add a user, and select  **> View > Security**.



Features

The Users tab has a User List panel on the left. Selecting a username makes the User Definition panel on the right available.

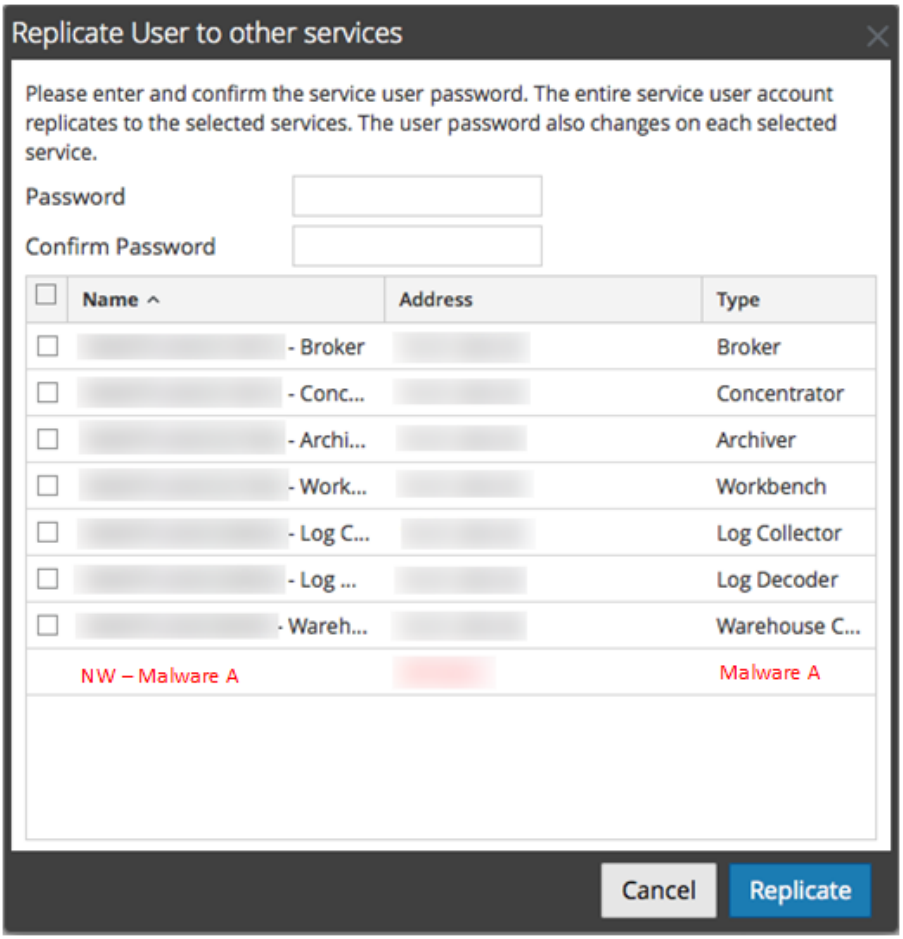
User List Panel

The User List panel has the following features.

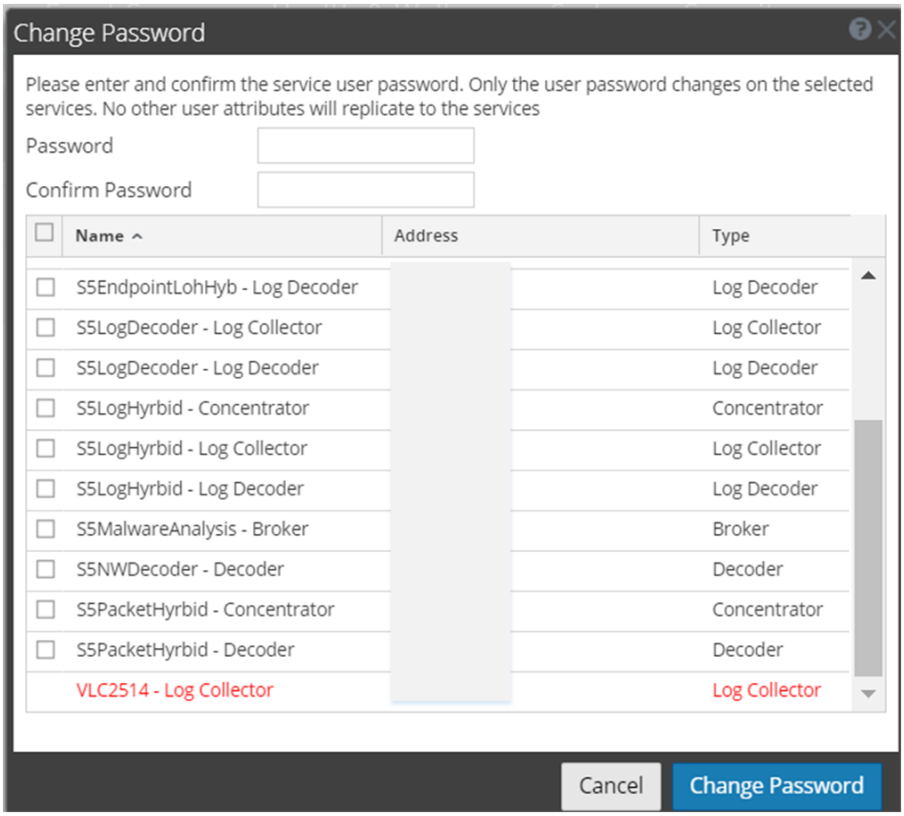
Feature	Description
+	Adds a new user to the current service.
−	Deletes the selected users from the service.

Feature	Description
	Performs one of the following actions on the selected service user account: • **Replicate:** Replicates the entire service user account to selected services. • **Change Password:** Changes the password of a service user and replicates the new password to Core services with that user account defined. The Change Password option replicates only the password change to the Core services selected and does not replicate the entire user account.
Username	The user names for all user accounts that access the service. The username must be one used to log on to NetWitness Platform.

The following figure shows the **Replicate User to other services** dialog.



The following figure shows the **Change Password** dialog.



User Definition Panel

The User Definition panel has three sections:

- User Information identifies the user as created in the Administration Security view.
- User Settings define parameters that apply to this user's access to the service.
- Role Membership defines user roles to which the user belongs.

There are two buttons:

- The **Save** button saves the changes made in the User Definition panel, and they become effective immediately.
- If you have not saved changes in the User Definition panel, the **Reset** button resets all fields and settings to their values before editing.

User Information

The User Information section has the following features.

Field	Description
Name	The name of the user.

Field	Description
Username	The username that this user enters to log in to the service. This is the NetWitness Platform username generated when the administrator added the user and the associated credentials in the **Administration Security** view (Administration > Security).
Password (and **Confirm Password**)	The password that the user enters to log on to the service. This is the NetWitness Platform password generated when the administrator added the user and the associated credentials in the **Administration Security** view. The NetWitness Platform account password and the service password must match in order to allow the user to connect to the service through NetWitness Platform.
Email	(Optional) The user's email address.
Description	(Optional) A general description field to describe this user.

User Settings

The User Settings section has the following features.

Field	Description
Auth Type	The authentication scheme for this user. The product line supports internal and external authentication. • **Netwitness** specifies internal authentication, and is enabled by default. In this mode, all users must authenticate with the user account and passwords that are generated when the administrator uses the NetWitness Platform Administration Security view (Administration > Security) to create the user and their associated credentials. • **External** specifies that authentication is enabled through the host interface with PAM (Pluggable Authentication Modules). For more information, see the **Configure PAM Login Capability** topic in the *System Security and User Management* guide.
Query Prefix	(Optional) Always append the query syntax to all queries by this user. For example, adding the query prefix **email != 'ceo@company.com'** prevents those email results from showing up in the sessions.

Field	Description
SA Core Query Timeout	**Note:** This field applies to NetWitness Platform 10.5 and later service versions and does not appear for 10.4 and earlier service versions. NetWitness Platform 10.4 and earlier services use Query Level instead of SA Core Query Timeout. Specifies the maximum number of minutes a user can run a query on the service. If this value is set to zero (0), the query timeout is not enforced for the user on the service. When replicating a user from a NetWitness Platform 10.5 or later service to a NetWitness Platform 10.4 service, Query Timeout migrates to Query Level based on the closest level. For example, if a user has a Query Timeout of 15 minutes, the user gets a Query Level of 3 after the migration. If a user has a Query Timeout of 35 minutes, the user gets a Query Level of 2 after the migration. If a user has a Query Timeout of 45 minutes, the user gets a Query Level of 2 after the migration.
Session Threshold	(Optional) Controls the behavior of the application when scanning meta values to determine session counts. Any meta value with a session count that is above the set threshold stops its determination of the true session count when the threshold is reached. If a threshold is set for a session, the Navigation view shows that the threshold was reached and the percentage of query time used to reach the threshold.

Role Membership

The Role Membership section shows the roles that a user is a member of for the selected service.

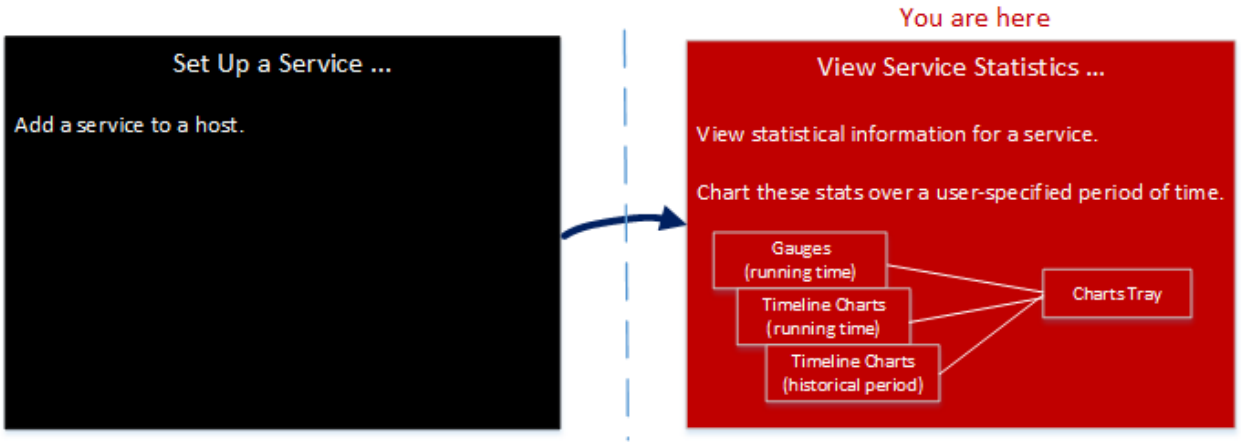
Services Stats View

This topic describes the features available in NetWitness Platform Services Stats view.

The Services Stats view provides a way to monitor the status and operations of a service. This view displays key statistics, service system information, and host system information for a service. In addition, more than 80 statistics are available for viewing as gauges and in timeline charts. In historical timeline charts, only statistics for session size, sessions, and packets are viewable.

Workflow

This workflow shows the tasks you perform from the Stats view.

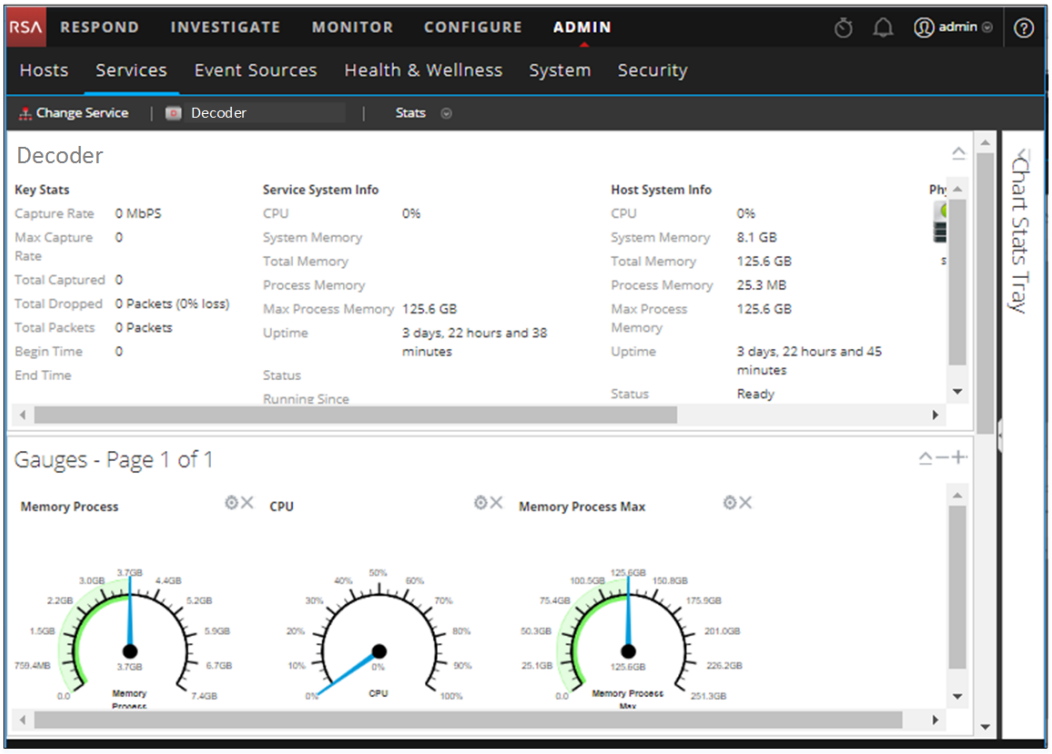


In the Stats view, you can customize the monitored statistics for individual services.

The following example shows you how to use the Stats view for a Decoder. The Stats view for all the services provide you with the same information for each service.

To access the Service Stats view:

1. In **NetWitness Platform** , go to **ADMIN > Services**.
   The Services view is displayed.
2. Select a service and select  **> View > Stats**.



Features

Although different statistics are available for different types of services, certain elements are common to the Services Stats view for any Core service:

- Summary Stats section
- Gauges section
- Timelines section
- Historical Timelines section
- Chart Stats Tray

Summary Stats Section

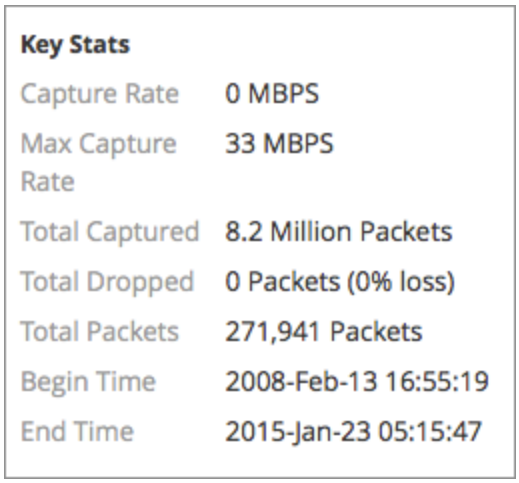
The Summary Stats section is at the top of the default view, and has no editable fields.

There are five panels in the Summary Stats section. The **Key Stats** panel displays different statistics for different types of services. The remaining panels in the Summary Stats section are the same for all types of services.

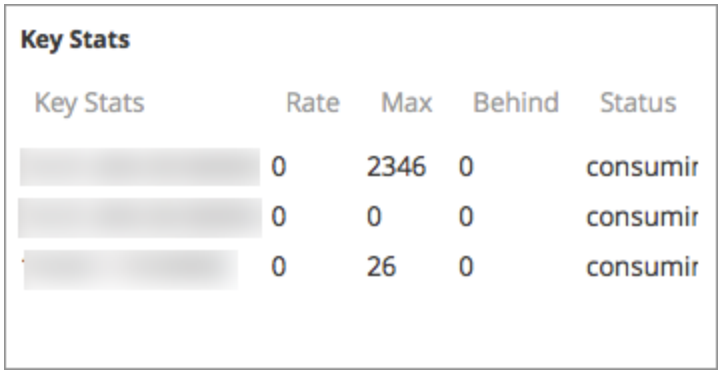
Key Stats

The Key Stats panel displays different statistics for different types of services.

- For a Decoder or Log Decoder, key statistics include capture statistics, such as capture rate, total packets or logs captured, total packets or logs dropped, the data capture begin time and end time.

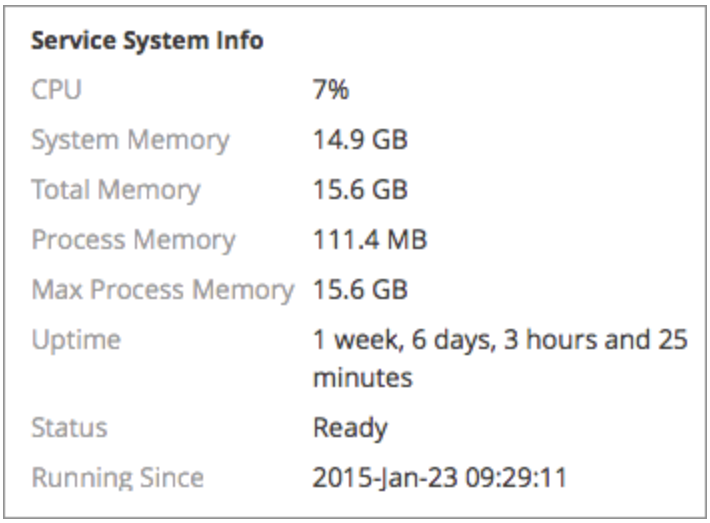


- A Broker or Concentrator aggregates data from multiple services. Therefore, the key statistics for all aggregate services are presented in a grid. The columns in the grid provide the service name, the capture rate, the maximum capture rate, the number of session behind (that need to be aggregated), and the service status.

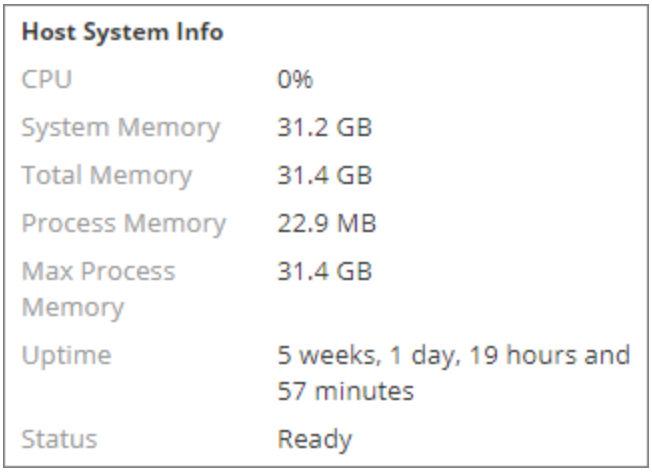


Service System Info

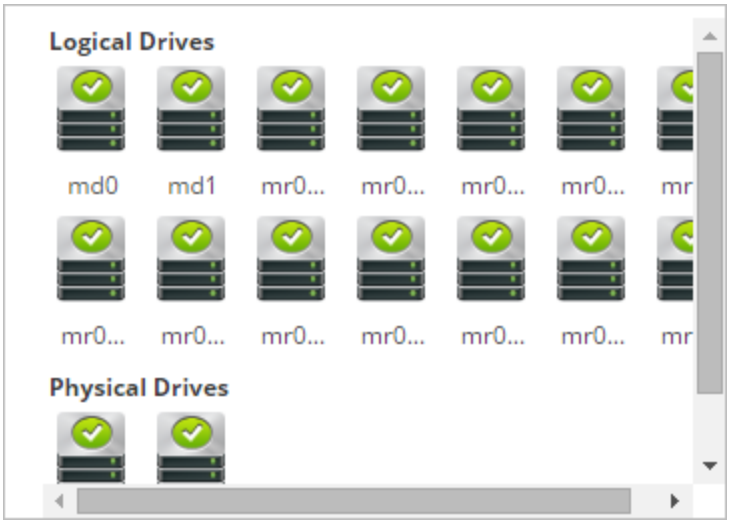
The Service System Info panel includes the percentage of CPU used by the service, the memory usage statistics (system, total, process, and maximum process), service uptime, status, running since time, and the current time.



Host System Info includes percentage of CPU used by the host, the memory usage statistics (system, total, process, and maximum), host uptime, status, running since time, and the current time.



Logical Drives and **Physical Drives** are shown with an icon for the drive name and state. Drive types used in the names and the drive status options are listed below.



Drive Types and Status

Drive Type	Description	Comment	Status Options
sd	SCSI block device	Directly connected SAS, SATA MegaRAID volumes	OK (green) FAIL (red)
ld	MegaRAID Logical Volume	Defined in BIOS or with MegaCLI tool	OK (green) DEGRADED (yellow) BUILDING (yellow) FAIL (red)
pd	MegaRAID Physical Disks	Not directly exposed to Linux	OK (green) FAIL (red)
md	Linux software RAID Volume		OK (green) DEGRADED (yellow) BUILDING (yellow) FAIL (red)

Gauges

The Gauges section in the Stats View presents statistics in the form of analog gauges. See Features for details on configuring gauges.

Timelines

Timeline charts display the selected statistics in a running timeline with focus on the current time. This is the same for all types of services, and only the display name of the timeline is editable. See Timeline Charts for details on configuring timelines.

Historical Timelines

Historical timeline charts display statistics for session size, sessions, and packets in a historical timeline. This is the same for all types of services, and has an editable display name, begin date, and end date. See Timeline Charts for details on configuring timelines.

Note: Historical Timeline charts is being deprecated for Log Collector, Virtual Log Collector (VLC) and Windows Legacy Collector services.

Chart Stats Tray

The Chart Stats Tray lists all available statistics for the selected service type. Different services have different statistics to monitor. See Components for a detailed description.

Topics

- Components
- Features
- Timeline Charts

Chart Stats Tray

This topic describes the Chart Stats Tray in the Services Stats view.

In the Services Stats view, the Chart Stats Tray provides a way to customize the monitored statistics for individual services. The Chart Stats Tray lists all available statistics for the service. The number of statistics varies according to the type of service being monitored. Any statistic in the Chart Stats Tray can be displayed in a gauge or a timeline chart. Only statistics for session size, sessions, and packets are viewable in historical timeline charts.

To access the Services Stats view:

1. In the **NetWitness Platform** menu, select **ADMIN > Services**.

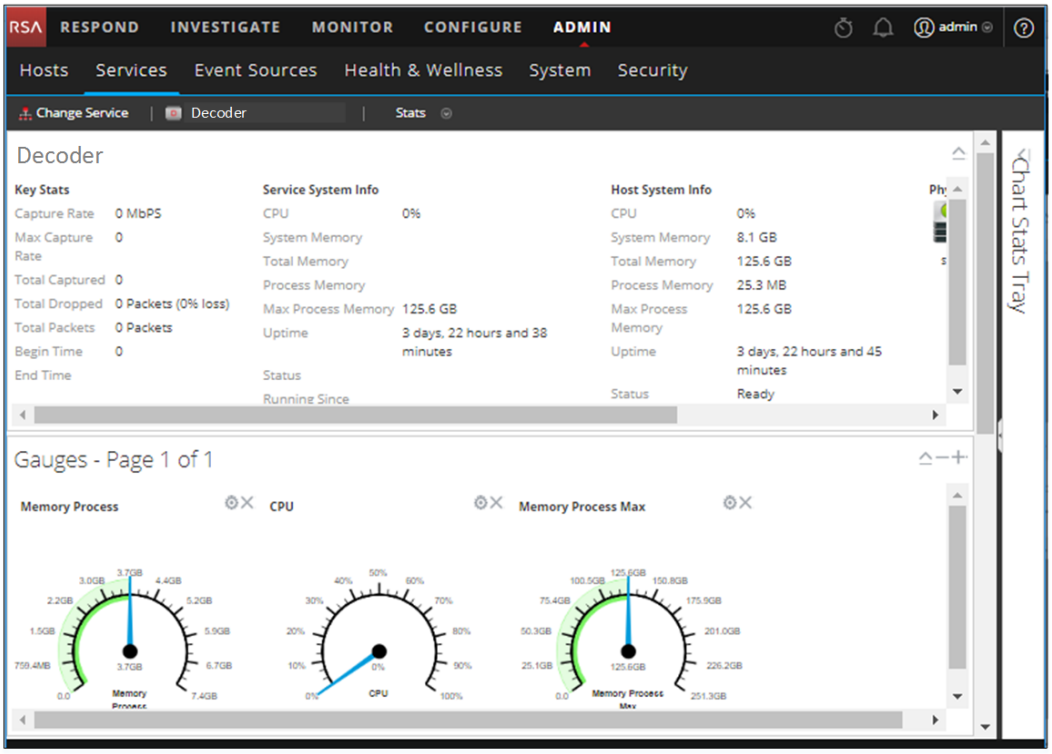
   The Administration Services view is displayed.

2. Select a service and select  **> View > Stats**.

   The Chart Stats Tray is on the right side.

3. If the tray is collapsed, click  to view the list of available statistics.

The following example shows the Services Stats view for a Decoder. The Chart Stats Tray is collapsed.



Components

The Chart Stats Tray has different statistics for different types of services. In the example above, 111 statistics are available for the Decoder. The following table describes features of the Chart Stat Tray.

Feature	Description
	Click to expand the panel horizontally.
	Click to collapse the panel horizontally.
Search	Type a search term in the field and press **RETURN**. Statistics that match are displayed with the matching word highlighted.
	Click to go to the first page.
	Click to go to the previous page.
	Type a page number in the Page field.

Feature	Description
	Click to go to the next page.
	Click to go to the last page.
	Click to refresh the view.
s 1 - 12 of	Displays the range of statistics being displayed. The total number statistics varies by service type.

Gauges

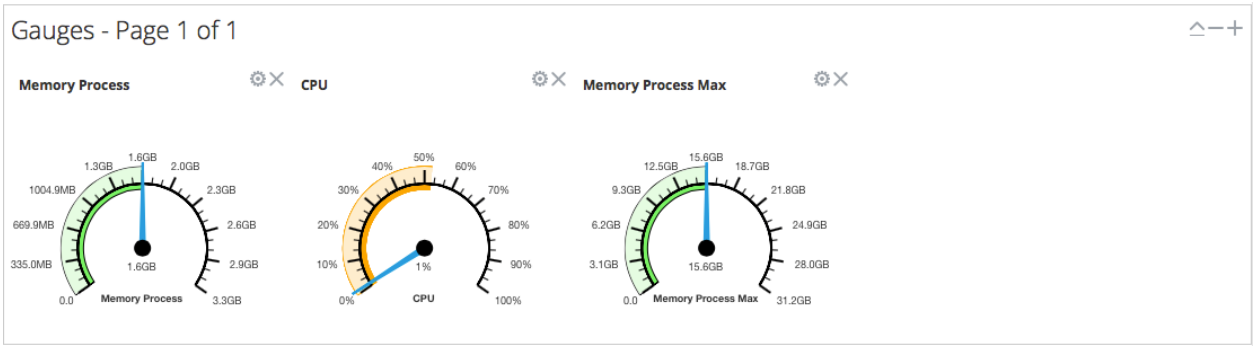
This topic introduces the features of the Gauges section in the Services Stats view.

The Gauges section of the Services Stats view presents statistics in the form of an analog gauge. You can drag any statistic available in the Chart Stats Tray to the Gauges section. The properties of each individual gauge are editable; all gauges have an editable title and some have additional editable properties.

To access the Services Stats view:

1. In the **NetWitness Platform** menu, select **ADMIN > Services**
   The Administration Services view is displayed.
2. Select a service and select  **> View > Stats**.
   The Services Stats view includes the Gauges section.

The following figure shows the default gauges in the Services Stats view for a Log Decoder.



Features

The default gauges show these statistics:

- Process memory use
- CPU use

- Maximum process memory used

The controls in the Gauges title bar and in each gauge are the standard dashlet controls.

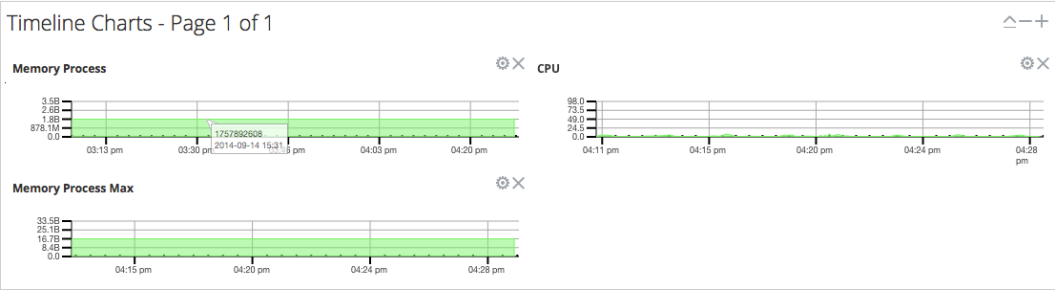
- In the Gauges title bar, you can collapse and expand the section and page forward or back.
- In each gauge, you can edit properties ( ) and delete ( ) the gauge.

Timeline Charts

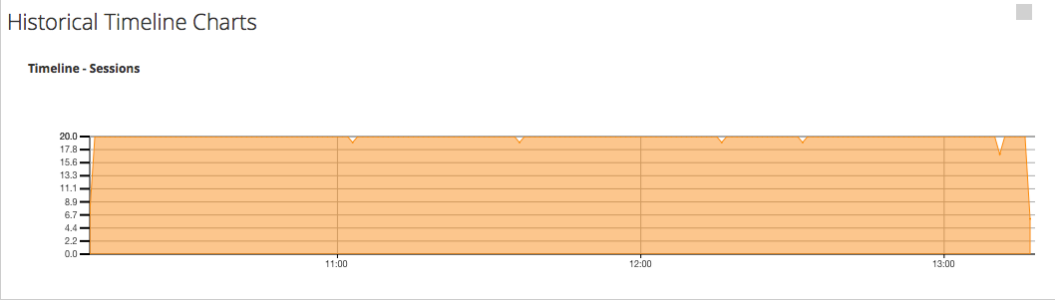
This topic describes the features of the timeline charts in the Services Stats view.

Timeline charts display statistics in a running timeline. The Services Stats view includes two types of timelines: current time and historical. You can drag any statistic available in the Chart Stats Tray to the Timeline Charts section. Only statistics for session size, sessions, and packets are viewable in historical timeline charts. The properties of an individual timeline chart are editable; all timeline charts have an editable title and some have additional editable properties.

The following figure is an example of a current timeline showing the value and timestamp of a data point.



The following figure is an example of a historical timeline chart.



The default current timeline charts show these statistics:

- Memory Process
- CPU
- Memory Process Max

The historical time charts show these statistics:

- Sessions
- Packets

- Session Size

The controls in the Timeline Charts title bar and in each timeline are the standard dashlet controls.

- In the Timeline Charts title bar, you can collapse and expand the section and page forward or back.
- In each timeline, you can edit Properties ( ) and delete ( ) the timeline.
- Hovering over a data point in the chart, displays the value and timestamp for the selected point.

System View

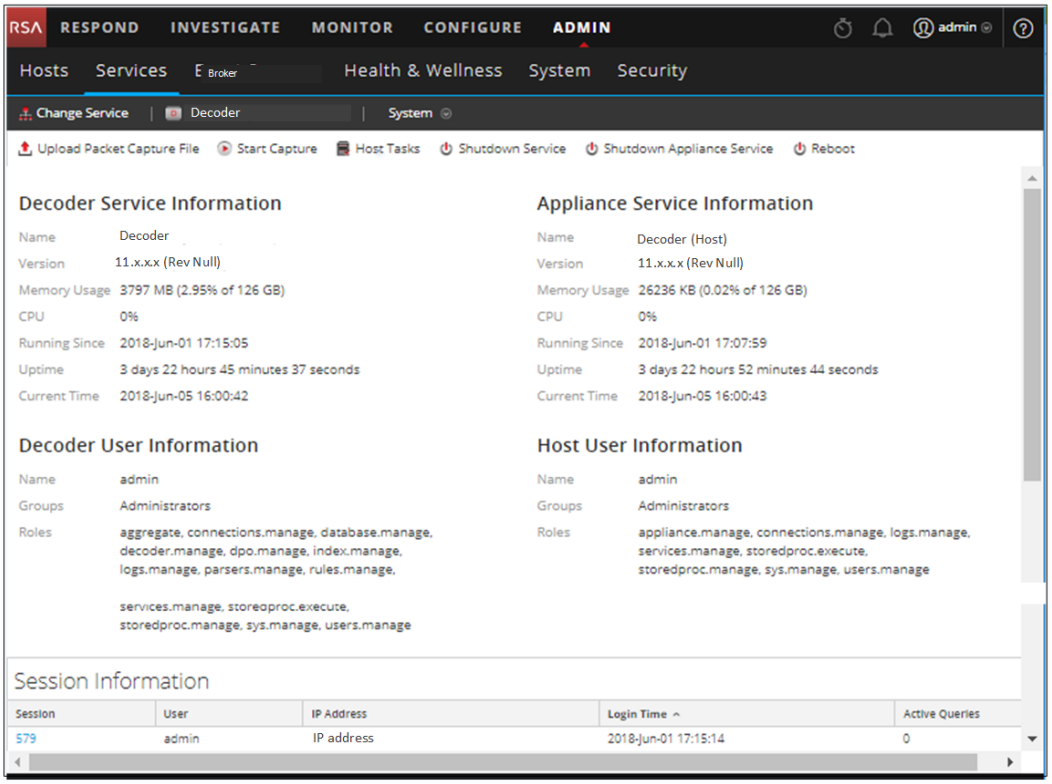
This topic introduces features in the System view using the Decoder and Log Decoder as an example. See the Configuration Guides individual services (for example for the *RSA NetWitness® Platform Broker and Concentrator Configuration Guide*) for details on their **ADMIN > Services > System** Views.

A Log Decoder is a special type of Decoder, and is configured and managed in a similar way to a Decoder. Therefore, most of the information in this section refers to both types of Decoders. Differences for Log Decoders are noted.

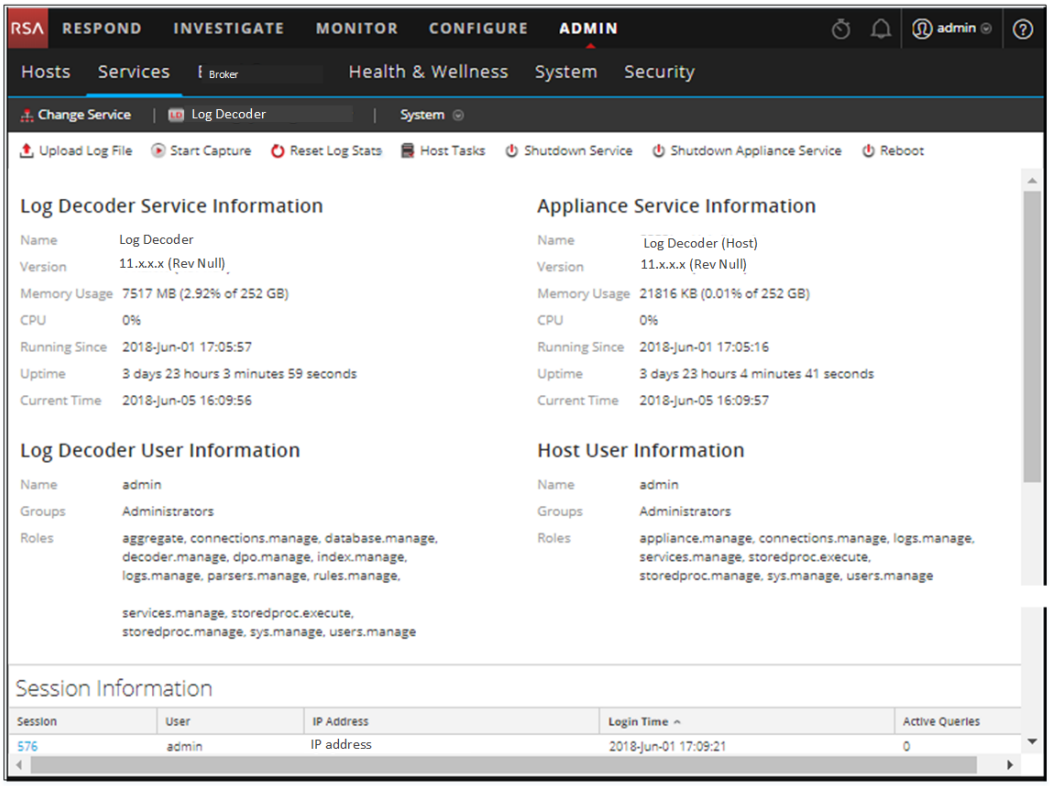
To access the Services System view for a Decoder:

1. In the **NetWitness Platform** menu, go to **ADMIN > Services**.
   The Services view is displayed.
2. Select a service and select  **> View> System**.

The following figure shows an example of the Services System view for a Decoder.



The following figure shows the Services System view for a Log Decoder.



Features

Services Info Toolbar

The following toolbars show the options specific to Log Decoders and Decoders.

In addition to the common options in the Services System view toolbar, you can start and stop capture of packets or logs. The upload file options are different for the standard Decoder (packet capture file) and the Log Decoder (log file).

Action	Description
Upload Packet Capture File	Displays a dialog that provides a way to select a packet capture (.pcap) file for upload to the selected Decoder. For more information, see the **Upload Packet Capture File** topic in the *Decoder and Log Decoder Configuration Guide*. **Note:** This option does not apply to Log Decoders.

Action	Description
Upload Log File	Displays a dialog that provides a way to select a log (.log) file for upload to the selected Log Decoder. For more information, see the **Upload Log File to a Log Decoder** topic in the *Decoder and Log Decoder Configuration Guide*.
Start/Stop Capture	Starts packet capture on the selected Decoder. When packet capture is in progress, the option in the toolbar changes to Stop Capture, and the option to upload a file is unavailable.

Host Task List Dialog

This topic introduces the Services System view > Host Task List dialog.

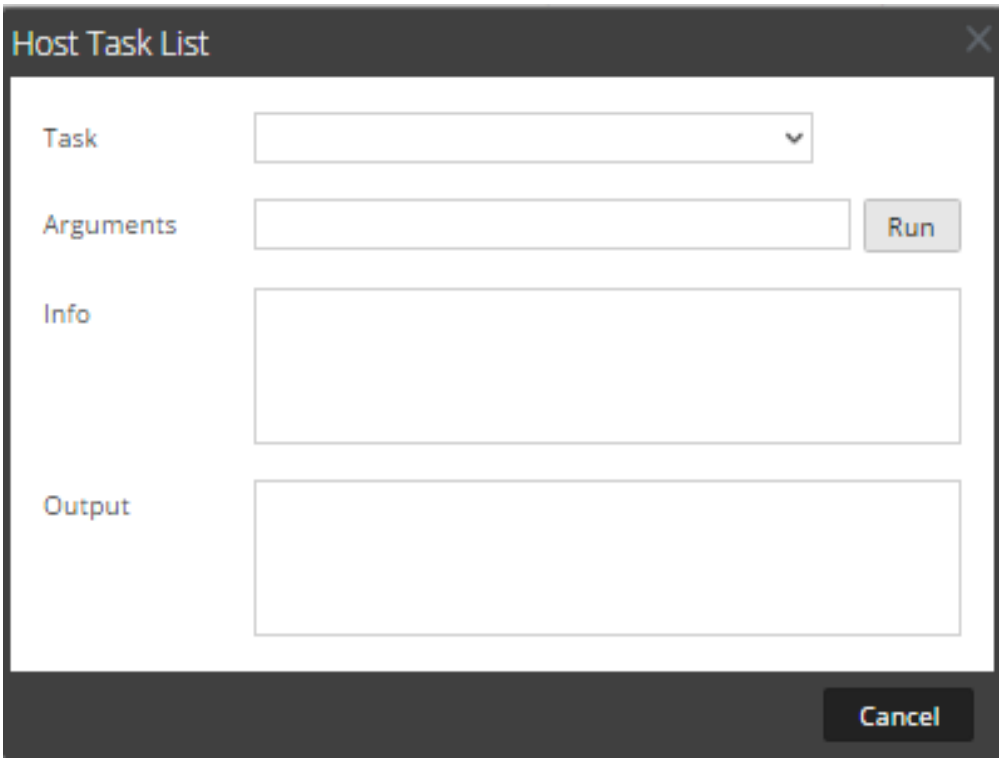
In the RSA NetWitness Platform Services System view, you can use the Host Tasks option to manage tasks that relate to a host and its communications with the network. Several service and host configuration options are available for Core services.

To access the Host Tasks dialog:

1. In **NetWitness Platform** , select **ADMIN >Services**.
2. Select a service and select  > **View> System**.

   The System View for the service is displayed.
3. In the **Services System view** toolbar, click **Host Tasks**.

   The Host Task List dialog is displayed. The **Task** list offers a list of supported messages for the associated host.



Features

The table below describes the dialog features.

Field	Description
Task	An entry field in which you type or select a message for a Core host. When you click in this field a drop-down list of available host tasks is displayed.

Field	Description
Arguments	An entry field in which you enter the arguments, if any, for the message.
Run	Executes the task and arguments in the entry fields.
Info	Information about the message purpose and syntax.
Output	The output or result of an executed task.
Cancel	Closes the Host Task list dialog.

Host Task Selection List

These tasks are displayed as a drop-down list in the Task field. The available options are regulated by the security role required to execute the option.

Task	Description
Add Filesystem Monitor	Starts monitoring the storage services attached to the specified filesystem (see Add and Delete a Filesystem Monitor.
Delete Filesystem Monitor	Stops monitoring the storage services attached to the specified filesystem.
Reboot Host	Shuts down and restarts the host (see Reboot a Host).
Set Host Built-in Clock	Sets the host local clock (see Set Host Built-In Clock).
Set Host Hostname	This method of changing the hostname is deprecated in NetWitness Platform 10.6; replaced by the procedure described in Hosts and Services Procedures
Set Network Configuration	Sets network address parameters (see Set Network Configuration).
Set Network Time Source	Sets the clock source for this host (see Set Network Time Source).

Task	Description
Set Syslog Forwarding	Enables or disables syslog forwarding from a remote server to the selected service (see Set Syslog Forwarding).
Show Network Port Status	Shows the network interface information for a host (see Show Network Port Status).
Show Serial Number	Gets the host serial number (see Show Serial Number).
Shut Down Host	Shuts down the physical host and the host remains off (see Shut Down Host).
Start Service	Starts a service on this host (see Start, Stop, or Restart a Service).
Stop Service	Stops a service on this host.
setSNMP	Enables or disables the SNMP service on a host (see Set SNMP).

Service Configuration Settings

This topic introduces the available service configuration settings for RSA NetWitness Platform Core services.

NetWitness Platform Core services include Brokers, Concentrators, Decoders, Log Decoders, Archivers, and the Appliance service. The service configuration parameters listed in these tables constitute all viewable and configurable parameters. Some parameters are configurable in various parts of the NetWitness Platform user interface and others are viewable or configurable only on the Services Explore view.

Appliance Service Configuration Parameters

This topic lists and describes the available the configuration parameters for the NetWitness Platform Core Appliance service.

The NetWitness Platform Core Appliance service provides hardware monitoring on legacy NetWitness hardware.

This table describes the Appliance Configuration parameters.

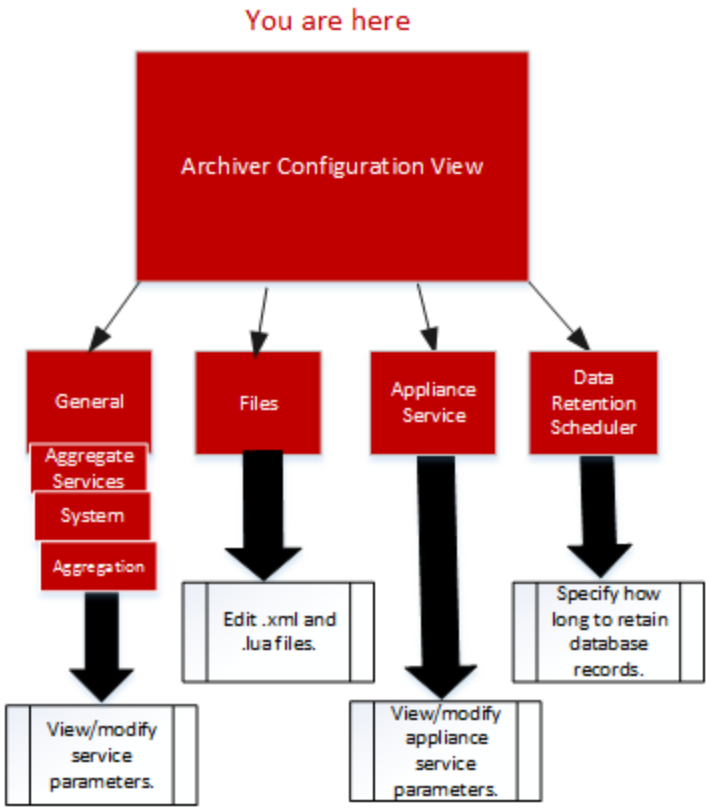
Appliance Parameter Field	Description
Logs	/logs/config, see Core Service Logging Configuration Parameters
REST	/rest/config, see REST Interface Configuration Parameters
Services	/services/<service name>/config, see Core Service-to-Service Configuration Parameters
System	/sys/config, see Core Service System Configuration Parameters

Archiver Service Configuration View

This topic lists and describes the available configuration settings for NetWitness Platform Archivers.

Workflow

The following workflow show the configuration tasks for the Archiver service.



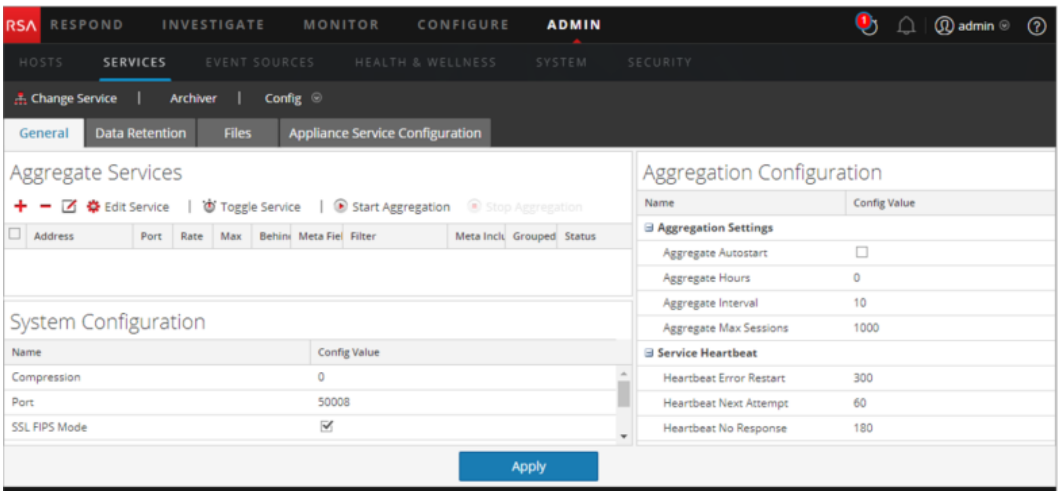
Role	I want to ...
Administrator	Configure Meta Filters for Aggregation. Refer to "(Optional) Configure Meta Filters for Aggregation" in the *RSA NetWitness Platform Archiver Configuration Guide* for instructions.
Administrator	Configure Group Aggregation. Refer to "Configure Group Aggregation" in the *RSA NetWitness Platform Deployment Guide* for instructions.

Quick Look

To access the Services Config view:

1. In **NetWitness Platform**, select **ADMIN > Services**.
   The Admin Services view is displayed.
2. Select an Archiver service and select  **>View > Config**.
   Services Config view for the Archiver service is displayed.

This is an example of the Services Config view for an Archiver.



Broker Service Configuration Parameters

This topic lists and describes the configuration parameters for NetWitness Platform Brokers.

This table lists and describes the Broker configuration parameters.

Broker Parameter Field	Description
Broker	/broker/config refer to Aggregation Configuration Parameters
aggregate.interval.behind	Minimum number of milliseconds before another round of aggregation is requested when the broker is behind. Change takes effect immediately.
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness Platform Core Services Database Tuning Guide*
Index	/index/config
index.dir	The directory where the broker device mapping files are stored. Change takes effect on service restart.
language.filename	The index language specification (XML) that is loaded on startup. Change requires service restart.
Logs	/logs/config refer to Core Service Logging Configuration Parameters
REST	/rest/config refer to REST Interface Configuration Parameters

Broker Parameter Field	Description
SDK	/sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Platform Core Services Database Tuning Guide* and Host GS: NetWitness Platform Core Srevice system.roles Modes
Services	/services/<service name>/config refer to Core Service-to-Service Configuration Parameters
System	/sys/config refer to Core Service System Configuration Parameters

Aggregation Configuration Parameters

This topic lists and describes the available configuration parameters that are common to services that perform aggregation, such as NetWitness Platform Concentrators and Archivers.

This table lists and describes the parameters that control aggregation on an aggregating service.

Configuration Path	/concentrator/config or /archiver/config
aggregate.autostart	Automatically restarts aggregation after a service restart, if enabled. Change takes effect immediately.
aggregate.buffer.size	Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact query performance. Change takes effect after aggregation restart.
aggregate.crc	If enabled, all aggregation streams will be CRC validated. Change takes effect immediately.
aggregate.hours	Displays the maximum number of hours behind a service will be allowed to start aggregation. Change takes effect immediately.
aggregate.interval	Lists the minimum number of milliseconds before another round of aggregation is requested. Change takes effect immediately.
aggregate.meta.page.factor	Lists the allocated number meta pages per session used for aggregation. Change takes effect on service restart.

Configuration Path	/concentrator/config or /archiver/config
aggregate.meta.perpage	Lists the allocated number of meta stored on one page of data. Change takes effect on service restart.
aggregate.precache	Determines if the concentrator will precache the next round of aggregation for upstream services. Can improve aggregation performance but could impact query performance. Change takes effect immediately.
aggregate.sessions.max	Lists the number of sessions to aggregate on each round. Change takes effect after aggregation restart.
aggregate.sessions.perpage	Lists the number of sessions stored on one page of data. Change takes effect on service restart.
aggregate.time.window	Displays the maximum +/- time window, in seconds, that all services must be inside before another round of aggregation is requested. Zero turns off time window. Change takes effect immediately.
consume.mode	Determines if the concentrator can only aggregate locally or over a network, based on licensing restrictions. Change takes effect on service restart.
export.enabled	Allows export of session data, if enabled. Change takes effect on service restart.
export.expire.minutes	Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately.
export.format	Determines the file format used during data export. Change takes effect on service restart.
export.local.path	Displays the local location to cache exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.

Configuration Path	/concentrator/config or /archiver/config
export.meta.fields	Determines which meta fields are exported. Comma list of fields. Star means all fields. Star plus field list means all fields BUT listed fields. Just field list says just include those fields. Change takes effect immediately.
export.remote.path	Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.rollup	Determines the rollup interval for export files. Change takes effect on service restart.
export.session.max	Displays the maximum sessions per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.size.max	Displays the maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.usage.max	Displays the maximum percentage of cache space used before stopping aggregation. Zero is no limit. Change takes effect immediately.
heartbeat.error	Lists the number of seconds to wait after a service error before attempting a service reconnect. Change takes effect immediately.
heartbeat.interval	Lists the number of milliseconds between heartbeat service checks. Change takes effect immediately.
heartbeat.next.attempt	Lists the number of seconds to wait before attempting a service reconnect. Change takes effect immediately.
heartbeat.no.response	Lists the number of seconds to wait before taking unresponsive service offline. Change takes effect immediately.

Concentrator Service Configuration Parameters

This topic lists and describes the available configuration parameters for NetWitness Platform Concentrators.

This table lists and describes the Concentrator configuration parameters .

Concentrator Parameter Field	Description
Concentrator	/concentrator/config refer to Aggregation Configuration Parameters
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*
Index	/index/config refer to the **Index Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*
Logs	/logs/config refer to Core Service Logging Configuration Parameters
REST	/rest/config refer to REST Interface Configuration Parameters
SDK	sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*and Host GS: NetWitness Platform Core Srevice system.roles Modes
Services	/services/<service name>/config refer to Core Service-to-Service Configuration Parameters
System	/sys/config refer to Core Service System Configuration Parameters

Core Service Logging Configuration Parameters

This topic lists and describes the logging configuration parameters for all NetWitness Platform Core services.

Logging configuration is the same on all NetWitness Platform Core services.

The following table describes the logging configuration parameters:

Logs Configuration Folder	/logs/config
log.dir	Displays the directory where the log database is stored. Optional assigned max size (=#) is in MBs. Change takes effect on service restart.
log.levels	Controls what types of log messages are stored (comma separated). Module specific settings are defined like this: <Module>= [debug|info|audit|warning|failure|all|none]. Change takes effect immediately.
log.snmp.agent	Sets a remote SNMP Trap Receiving agent.
snmp.trap.version	Sets the SNMP version to be used for gets and traps (2c or 3).
snmpv3.engine.boots	Displays the SNMPv3 engine boots count. This field auto-increments on startup and should not normally need to be set by the user.
snmpv3.engine.id	Sets the SNMPv3 engine ID, which is 10-64 hexadecimal digit number optionally preceded by 0x. You can add suffix values at the end of the engine ID for each of the SA Core services running on the same host. For example, if the generated Engine ID for the SA Core host is 0x1234512345, you can set the Engine ID for the Decoder service as 0x123451234501 and set 0x123451234504 for the Appliance service.
snmpv3.trap.auth.local.key	Sets the SNMPv3 Trap Authentication Local Key, which is a 16 or 20 hexadecimal digit number (depending on which authentication protocol is used) preceded by 0x. For MD5, the key is 16 hexadecimal digits, while SHA uses 20 hexadecimal digits. You can use any desired algorithm to generate the local keys. It is recommended that a generation method involving randomness be used as opposed to selecting key values manually.
snmpv3.trap.auth.protocol	Displays the SNMPv3 Trap Authentication Protocol (none, MD5 or SHA).

Logs Configuration Folder	/logs/config
snmpv3.trap.priv.local.key	Sets the SNMPv3 Trap Privacy Local Key, which is a 16 hexadecimal digit number preceded by 0x.
snmpv3.trap.priv.protocol	Displays the SNMPv3 Trap Privacy Protocol (none or AES).
snmpv3.trap.security.level	Displays the SNMPv3 Trap Security Level, which indicates whether authentication and privacy are used or not. Possible values are noAuthNoPriv, authNoPriv or authPriv.
snmpv3.trap.security.name	Sets the SNMPv3 Trap Security Name used during SNMPv3 trap authentication.
syslog.size.max	Displays the maximum size of a log sent to syslog (some syslog daemons have issues with very large messages). Zero means no limit. Change takes effect immediately.

Core Service-to-Service Configuration Parameters

This topic lists and describes the configuration parameters that control how a Core service connects to another Core service. For example, when a Concentrator connects to a decoder, the parameters of that connection are controlled by these settings.

Whenever a Core service establishes a connection to another Core service, the service that acts as the **client** creates a new sub-folder in the /services folder of the configuration tree. The name of the sub-folder corresponds to the name of the service and has the form `host:port`. For example, the service connection folder for a Concentrator connection to a Decoder could be `/services/reston-va-decoder:50004`. Inside each service connection folder, there is a `config` sub-folder that holds configurable parameters.

The following table describes the Service Configuration parameters:

Services	/services/host:port/config
allow.nonssl.to.ssl	Allows a non-SSL connection to connect to a SSL service, when set to true. Otherwise, if false, non-secure to secure connections will be denied. Change takes effect immediately.

Services	/services/host:port/config
compression	Displays a config node that determines if data is compressed before sending. A positive value determines the number of bytes that need to be sent before it will be compressed. Zero means no compression.
crc.checksum	Displays a config node that determines if data streams are validated with a CRC checksum. A positive value determines the number of bytes that need to be sent before it will be CRC validated. Zero means no CRC validation.
ssl	Displays a config node that enables or disables SSL encryption on the connection.

Core Service System Configuration Parameters

This topic lists and describes the configuration parameters that are common to all NetWitness Platform Core services.

The following table lists and describes the System configuration parameters:

System Configuration Folder	/sys/config
compression	Displays the minimum amount of bytes before a message is compressed, when set to a positive value. Zero means no compression for any message. Change takes effect on subsequent connections.
crc.checksum	Displays the minimum bytes before a message is sent over the network with a CRC checksum (to be validated by the client), when set to a positive value. Zero means no CRC checksum validation with any message. Change takes effect on subsequent connections.
drives	Displays drives to monitor for usage stats. Change takes effect on service restart.
port	Displays the port this service will listen on. Change takes effect on service restart.
scheduler	Displays the folder for scheduled tasks.

System Configuration Folder	/sys/config
service.name.override	Displays an optional service name used by upstream services for aggregation in lieu of hostname.
ssl	Encrypts all traffic using SSL, if enabled. Change takes effect on service restart.
stat.compression	Compresses stats as they are written to the database, if enabled. Change takes effect on service restart.
stat.dir	Displays the directory where the historical stats database is stored (separate multiple dirs with semicolon). Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
stat.exclude	Lists stat pathnames to be excluded from the stat database. The following wildcards are permitted: ? match any single character, * match zero or more characters to delimiter /, ** match zero or more characters including delimiter. Change takes effect immediately.
stat.interval	Determines how often (in milliseconds) statistic nodes are updated in the system. Change takes effect immediately.
threads	Lists the number of threads in the thread pool to handle incoming requests. Change takes effect immediately.

Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for NetWitness Platform Decoders.

Decoder Parameter Field	Description
Decoder	/decoder/config refer to Decoder and Log Decoder Configuration Parameters

Decoder Parameter Field	Description
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*
Index	/index/config refer to the **Index Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*
Logs	/logs/config refer to Core Service Logging Configuration Parameters
REST	/rest/config refer to REST Interface Configuration Parameters
SDK	/sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*and Host GS: NetWitness Platform Core Srevice system.roles Modes
System	/sys/config refer to Core Service System Configuration Parameters

Decoder and Log Decoder Configuration Parameters

This topic lists and describes the configuration parameters that are identical on both Decoder and Log Decoder services.

Configuration Path	<service>/config
aggregate.buffer.size	Displays the size of the buffer (default unit is KB) used per round of aggregation. Larger buffers may improve aggregation performance but could impact capture performance. Change takes effect after capture restart.
aggregate.precache	Determines if the decoder will pre-cache the next round of aggregation for upstream services. Can improve aggregation performance but could impact capture performance. Change takes effect immediately.
assembler.pool.ratio	Displays the percentage of pool pages that assembler manages and uses for the assembly process. Change takes effect on service restart.

Configuration Path	<service>/config
assembler.session.flush	Flushes sessions when they are complete (1) or flushes sessions when they are parsed (2). Change takes effect on service restart.
assembler.session.pool	Lists the number of entries in the session pool. Change takes effect on service restart.
assembler.size.max	Lists the maximum size that a session will obtain. A setting of 0 removes the session size limit. Change takes effect immediately.
assembler.size.min	Lists the minimum size that a session must be before persisting. Change takes effect immediately.
assembler.timeout.packet	Lists the number of seconds before packets are timed out. Change takes effect immediately.
assembler.timeout.session	Lists the number of seconds before sessions are timed out. Change takes effect immediately.
assembler.voting.weights	Displays the weights used to determine which session stream is marked client and server. Change takes effect immediately.
capture.autostart	Determines if capture begins automatically when the service starts. Change takes effect on service restart.
capture.buffer.size	Displays capture memory buffer allocation size (default unit is MB). Change takes effect on service restart.

Configuration Path	<service>/config
capture.device.params	Displays capture service specific parameters. Change takes effect on service restart. The parameters understood by this field are specific to the currently selected capture device. If any of the parameters are not recognized by the current capture device, they are ignored. On Log Decoders, there is only the Log Events capture device. It accepts some optional parameters. • **use-envision-time**: If this is set to 1, the time meta for each event will be imported from the Log Collector stream. If this is 0 or not set, the imported event time will be stored in the event.time meta. • **port**: This parameter can be set to a numeric value to override the default syslog port listener, 514.
capture.selected	Displays current capture service and interface. Change takes effect immediately.
export.expire.minutes	Lists the number of minutes before export cache files are expired and flushed. Change takes effect immediately.
export.packet.enabled	Allows export of packet data, if enabled. Change takes effect on service restart.
export.packet.local.path	Displays the local location to cache packet exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.packet.max	Displays the maximum packets per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.packet.remote.path	Lists the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.packet.size.max	Displays the packet maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.

Configuration Path	<service>/config
export.rollup	Determines the rollup interval for export files. Change takes effect on service restart.
export.session.enabled	Allows export of session data, if enabled. Change takes effect on service restart.
export.session.format	Determines the file format used during session export. Change takes effect on service restart.
export.session.local.path	Displays the local location to cache session exported data. Optional assigned max size (=#unit), units are: t for TB; g for GB, m for MB. Change takes effect on service restart.
export.session.max	Displays the maximum sessions per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.session.meta.fields	Determines which meta fields are exported. Comma list of fields. Star means all fields. Star plus field list means all fields BUT listed fields. Just field list says just include those fields. Change takes effect immediately.
export.session.remote.path	Displays the remote protocol (nfs://) and location to export data. Change takes effect on service restart.
export.session.size.max	Lists the session maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
export.usage.max	Lists the session maximum bytes per exported file. For export file types that cache this determines cached memory sizes. Zero is no limit. Change takes effect immediately.
parse.threads	Lists the number of parse threads to use for session parsing. Zero means let server decide. Change takes effect on service restart.

Configuration Path	<service>/config
pool.packet.page.size	Displays the size of a packet page (default is KB). Change takes effect on service restart.
pool.packet.pages	Lists the number of packet pages decoder will allocate and use. Change takes effect on service restart.
pool.session.page.size	Displays the size of a session page (default is KB). Change takes effect on service restart.
pool.session.pages	Lists the number of session pages decoder will allocate and use. Change takes effect on service restart.

Host GS: Log Decoder Service Configuration Parameters

This topic lists and describes the available configuration parameters for RSA NetWitness Platform Log Decoders.

Log Decoder Configuration Settings

This table lists and describes the Log Decoder configuration settings.

Log Decoder Setting Field	Description
Database	/database/config refer to the **Database Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*.
Decoder	/decoder/config refer to Decoder and Log Decoder Configuration Parameters
Index	/index/config refer to the **Index Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*.
Logs	/logs/config refer to Core Service Logging Configuration.
REST	/rest/config refer to REST Interface Configuration
SDK	/sdk/config refer to the **SDK Configuration Nodes** topic in the *NetWitness Platform Core Database Tuning Guide*and Core Service system.role Modes.
System	/sys/config refer to Core Service System Configuration.

Log Tokenizer Configuration Settings

The log decoder has a set of configuration items that control how the automatic log tokenizer creates meta items from unparsed logs. The log tokenizer is implemented as a set of built-in parsers that each scan for a subset of recognizable tokens. The functionality of each of these native parsers is shown in the table below. These word items form a full-text index when they are fed to the indexing engine on the Concentrator and Archiver. By manipulating the parsers.disabled configuration entry, you can control which Log Tokenizers are enabled.

Parser Name	Description	Configuration Parameters
Log Tokens	Scans for runs of consecutive characters to produce 'word' meta items.	token.device.types, token.char.classes, token.max.length, token.min.length, token.unicode
IPSCAN	Scans for text that appears to be an IPv4 address to produce 'ip.addr' meta items.	token.device.types
IPV6SCAN	Scans for text that appears to be an IPv6 address to produce 'ipv6' meta items.	token.device.types
URLSCAN	Scans for text that appears to be a URI to produce 'alias.host', 'filename', 'username', and 'password' meta items.	token.device.types
DOMAINSCAN	Scans for text that appears to be a domain name to produce 'alias.host', 'tld', 'cctld', and 'sld' meta items.	token.device.types
EMAILSCAN	Scans for text that appears to be an email address to produce 'email' and 'username' meta items.	token.device.types

Parser Name	Description	Configuration Parameters
SYSLOGTIMESTAMPSCAN	Scans for text that appears to be syslog-format timestamps. Syslog is missing the year and time zone. When such text is located, it is normalized into UTC time to create 'event.time' meta items.	token.device.types
INTERNETTIMESTAMPSCAN	Scans for text that appears to be RFC 3339-format timestamps to create 'event.time' meta items.	token.device.types

These are the Log Tokenizer configuration parameters.

Log Decoder Parser Setting Field	Description
token.device.types	The set of device types that will be scanned for raw text tokens. By default, this is set to `unknown`, which means only logs that were not parsed will be scanned for raw text. You can add additional log types here to enrich parsed logs with text token information. If this field is empty, then log tokenization is disabled.
token.char.classes	This field controls the type of tokens that are generated. It can be any combination of the values `alpha`, `digit`, `space`, and `punct`. The default value is `alpha`. • **alpha**: Tokens may contain alphabetic characters • **digit**: Tokens may contain numbers • **space**: Tokens may contain spaces and tabs • **punct**: Tokens may contain punctuation marks

Log Decoder Parser Setting Field	Description
token.max.length	This field puts a limit on the length of the tokens. The default value is 5 characters. The maximum length setting allows the Log Decoder to limit the space needed to store the word metas. Using longer tokens requires more meta database space, but may provide slightly faster raw text searches. Using shorter tokens causes the text query resolver to have to perform more reads from the raw logs during searches, but it has the effect of using much less space in the metadb and index.
token.min.length	This is the minimum length of a searchable text token. The minimum token length will correspond to the minimum number of characters a user may type into the search box in order to locate results. The recommended value is the default, 3.
token.unicode	This boolean setting controls whether unicode classification rules are applied when classifying characters according to the token.char.classes setting. When this is set to true, each log is treated as a sequence of UTF-8 encoded code points and then classification is performed after the UTF-8 decoding is performed. When this is set to false, each log is treated as ASCII characters and only ASCII character classification is done. Unicode character classification requires more CPU resources on the Log Decoder. If you do not need non-English text indexing, you can disable this setting to reduce CPU utilization on the Log Decoder. The default is enabled.

REST Interface Configuration Parameters

This topic lists and describes the available configuration parameters for the REST interface built in to all NetWitness Platform Core Services.

Settings

The following table lists and describes the REST configuration parameters:

REST Configuration Path	/rest/config
cache.dir	Displays the host directory to use for temporarily creating and storing files. Change takes effect on service restart.
cache.size	Displays the total maximum size (default unit is MB) of all files in the cache directory before the oldest are deleted. Change takes effect on service restart.
enabled	Switches to enable or disable REST services, 1 is on, 0 is off. Change takes effect on service restart.
port	Displays the port the REST service will listen on. Change takes effect on service restart.
ssl	Encrypts all REST traffic using SSL, if enabled. The default 'system' means use setting from /sys/config/ssl. Change takes effect on service restart.

Host GS: NetWitness Platform Core Srevice system.roles Modes

All NetWitness Platform Core services offer role-based authorization modes. This topic describes the modes that are available, and how they are configured within every service.

The configuration node `/sdk/config/system.roles` sets querying and viewing permissions for meta and content on a per key basis. This parameter supports the data privacy management function and when enabled using one of the non-zero values helps a data privacy officer to control access to specific meta keys and content. This parameter is configurable in the NetWitness Platform user interface (see the **Data Privacy Tab** topic in the *Data Privacy Management Guide* for details). When the value is edited, change takes effect immediately.

Zero means that service permissions based on SDK meta keys are disabled.

- 0 - disabled

When one of the non-zero values is specified, the data privacy officer can select a meta key to whitelist or blacklist the display of the associated meta, content, or both, for a specific user role on a service.

- 1 - whitelist meta and content filtered
- 2 - whitelist meta filtered
- 3 - whitelist content filtered
- 4 - blacklist meta and content filtered

- 5 - blacklist meta filtered
- 6 - blacklist content filtered

Troubleshooting Version Installations and Updates

This section describes the error messages displayed in the **Hosts** view when it encounters problems updating host versions and installing services on hosts in the **Hosts** view. If you cannot resolve an update or installation issue using the following troubleshooting solutions, contact Customer Support (https://community.rsa.com/docs/DOC-1294).

Update for Host fails

Error Message	Problem	When you select an update version and click **Update** > **Update Host**, the download process is successful, but the update process fails.

Solution	1. **Try to apply the version update to the host again.**
	Often this is all you need to do.
	2. f you still cannot apply the new version update, try the following:
	a. Monitor the following logs on NW Server as it progresses (for example, use submit the `tail -f` command string from the command line):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error will appear in one or more of these logs.
	b. Try to resolve the issue and reapply the version update.
	• Cause 1: `deploy_admin` password has expired.
	Solution: Reset your `deploy_admin` password. To reset your `deploy_admin` password, see the procedure decribed below in deploy_admin Password Expired

	• Cause 2: The `deploy_admin` password was changed on NW Server host but not changed on non-NW Server hosts. In this case, on all non-NW Server hosts on 11.x , run the following command using the matching `deploy_admin` password from NW Server host: `/opt/rsa/saTools/bin/set-deploy-admin-password` 3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support: https://community.rsa.com/docs/DOC-1294.

Update for Service Fails

Error Message	Problem	When you select a host and click **Install** the install service process fails.

Solution	1. **Try to install the service again.**
	Often this is all you need to do.
	2. f you still cannot install the service, try the following:
	a. Monitor the following logs on NW Server as it progresses (for example, use submit the `tail -f` command string from the command line):
	`/var/netwitness/uax/logs/sa.log`
	`/var/log/netwitness/orchestration-server/orchestration-server.log`
	`/var/log/netwitness/deployment-upgrade/chef-solo.log`
	`/var/log/netwitness/config-management/chef-solo.log`
	`/var/lib/netwitness/config-management/cache/chef-stacktrace.out`
	The error will appear in one or more of these logs.
	b. Try to resolve the issue and reapply the service.
	• Cause 1: Entered the worong `deploy_admin` password in nwsetup-tui.
	Solution: Retrieve your `deploy_admin` password.

To retrieve your `deploy_admin` password:

1. In the NetWitness Platform menu, select **ADMIN** > **Security** > **Users** tab.
2. Select the `deploy_admin` and click **Reset Password**.
3. (Conitional) If NetWitness Platform does not allow you to reset expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps.
   a. SSH to the NW Server host.

   ```
   security-cli-client --get-config-prop --prop-hierarchy
   nw.security-client --prop-name
   platform.deployment.password -quiet
   ```

   b. SSH to the host that failed installation/orchestration.
   c. Run the nwsetup-tui again using correct `deploy_admin` password.

- Cause 2: `deploy_admin` password has expired.

  Solution: Reset your `deploy_admin` password. To reset your `deploy_admin` password, see the procedure decribed below in deploy_admin Password Expired

3. If you still cannot apply the update, gather the logs from step 2 and contact Customer Support: https://community.rsa.com/docs/DOC-1294.

Update for Host Download Error

Error Message	Problem	When you select an update version and click **Update** >**Update Host**, the download starts but fails to complete.
Cause	Version download files can be large and take a long time to download. If there are communication issues during the download it will fail.
Solution	1. Try to download it again. 2. If the download still fails, try to download it outside of NetWitness Platform as

	described in Apply Updates from the Command Line (No Web Access). 3. If you still cannot download the update file, contact Customer Support: https://community.rsa.com/docs/DOC-1294.

deploy_admin Password Expired

Error Message	Cause	The `deploy_admin` user password has expired.
Solution	Reset your `deploy_admin` password password. 1. In the NetWitness Platform menu, select **ADMIN** > **Security** > **Users** tab. 2. Select the **deploy_admin** and click **Reset Password**. • If NetWitness Platform allows you to enter the expired `deploy_admin` password in the **Reset Password** dialog, complete the following steps. a. Enter the expired `deploy_admin` password. b. Uncheck the **Force password change on next login** checkbox. c. Click **Save** • If NetWitness Platform does not allow you to enter the expired `deploy_admin` password in the **Reset Password** dialog. a. On the NW Server host and all other hosts on 11.x , run the following command using the new `deploy_admin` password: `/opt/rsa/saTools/bin/set-deploy-admin-password` b. On the host that failed installation/orchestration, run the nwsetup-tui and use the new `deploy_admin` password.

RSA NETWITNESS® PLATFORM

Getting Started with NetWitness Platform

Overview

RSA NetWitness® Platform is a powerful threat detection suite that enables Security Operation Centers (SOCs) to quickly locate, prioritize, and triage threats. NetWitness Platform helps you to isolate and remediate known threats as well as those that were previously unknown. It provides deep insight into packets, logs, and endpoints that provide you with an unparalleled view into your enterprise or business.

NetWitness Platform is powerful, but it is easier for Tier 1 Analysts to use because it automates the process of identifying and prioritizing suspicious threats. Tier 2 and Tier 3 analysts can hunt for and locate threats by searching and filtering events and then examining events using reconstruction and analysis tools.

Architecture

RSA NetWitness Platform is a distributed and modular system that enables highly flexible deployment architectures that scale with the needs of the organization. NetWitness Platform allows administrators to collect three types of data from the network infrastructure, packet data, log data, and endpoint data. If NetWitness Endpoint 4.4, 4.4.0.0, or later is installed and configured, endpoint event data is also collected. The key aspects of the architecture are:

- **Distributed Data Collection**. The **Decoder** ingests packet data while the **Log Decoder** ingests log data. Decoders parse and reconstruct all collected network traffic from Layers 2 - 7, or log and event data from hundreds of devices and event sources, including NetWitness Endpoint data (if installed and configured). The **Concentrator** indexes metadata extracted from network or log data and makes it available for enterprise-wide querying and real-time analytics while also facilitating reporting and alerting. The **Broker** aggregates data captured by other devices and event sources. Brokers aggregate data from configured Concentrators; Concentrators aggregate data from Decoders. Therefore, a Broker bridges the multiple real-time data stores held in the various Decoder/Concentrator pairs throughout the infrastructure.
- **Real-time Alerting**. The NetWitness Platform **Event Stream Analysis (ESA)** service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It can process large volumes of disparate event data from Concentrators. ESA uses an advanced Event Processing Language (EPL) that allows analysts to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. Event Stream Analysis helps to perform powerful incident detection and alerting.
- **Real-time Analytics** (Automatic analysis of events) The RSA Automated Threat Detection functionality includes preconfigured ESA analytics modules for detecting Command and Control traffic.
- **NetWitness Server**. The NetWitness Server provides reporting, investigation, administration, and other aspects of the user interface.
- **Capacity**. NetWitness Platform has a modular-capacity architecture enabled with direct-attached capacity (DACs) or storage area networks (SANs), that adapts to the organization's short-term investigation and longer-term analytic and data-retention needs.

NetWitness Platform provides large deployment flexibility. You can design its architecture using as many as multiple dozens of physical hosts or a single physical host, based on the particulars of the customer's performance and security-related requirements. In addition, the entire NetWitness Platform system has been optimized to run on virtualized infrastructure.

The System Architecture comprises these major components: Decoders, Brokers, Concentrators, Archivers, ESA, and Warehouse Connectors. NetWitness Platform components can be used together as a system or can be used individually.

- In a security information and event management (SIEM) implementation, the base configuration requires these components: Log Decoder, Concentrator, Broker, Event Stream Analysis (ESA), and the NetWitness Server.
- In a forensics implementation, the base configuration requires these components: Decoder, Concentrator, Broker, ESA, Malware Analysis, and Endpoint Hybrid or Endpoint Log Hybrid. The Response-Server service is also required and is used to prioritize alerts.

The table provides a synopsis of each major component:

System Component	Description
Decoder / Log Decoder	• NetWitness Platform collects packet, log, and endpoint data. • Packet data, that is, network packets, are collected using the Decoder through the network tap or span port, which is typically determined to be an egress point on an organization's network. • A Log Decoder can collect four different log types - Syslog, ODBC, Windows eventing, and flat files. • Windows eventing refers to the Windows 2008 collection methodology and flat files can be obtained via SFTP. • Both types of Decoders ingest raw transactional data that is enriched, closed out, and aggregated to other NetWitness Platform components. • The process for ingesting and parsing transactional data is a dynamic and open framework.
Endpoint Hybrid or Endpoint Log Hybrid	• Collects and manages endpoint data from hosts. • Generates metadata for investigation, analysis, alerting, and reporting. • Collects logs from Windows hosts, and all other event sources that are supported for log collection in NetWitness Platform.
Concentrator	• Provides index and query capability to NetWitness Collections. • Can optionally forward data to ESA.

System Component	Description
Broker	• Distributes NetWitness Collection access across many Concentrators or Archivers, making the entire NetWitness Platform enterprise appear as a single collection.
Archiver	• The Archiver service enables long-term log archiving by indexing and compressing log data and sending it to archiving storage. • The archiving storage is optimized for long-term data retention, and compliance reporting. • Archiver stores raw logs and log metadata from Log Decoders for long term-retention, and it uses Direct-Attached Capacity (DAC) for storage. **Note:** Raw packets and packet metadata are not stored in the Archiver.
Event Stream Analysis (ESA)	• The Event Stream Analysis service provides event stream analytics such as correlation and complex event processing at high throughputs and low latency. It can process large volumes of disparate event data from Concentrators. • ESA uses advanced Event Processing Language that allows users to express filtering, aggregation, joins, pattern recognition, and correlation across multiple disparate event streams. • ESA helps to perform powerful incident detection and alerting. • The RSA Automated Threat Detection functionality includes preconfigured ESA analytics modules for detecting Command and Control traffic.

Core Versus Downstream Components

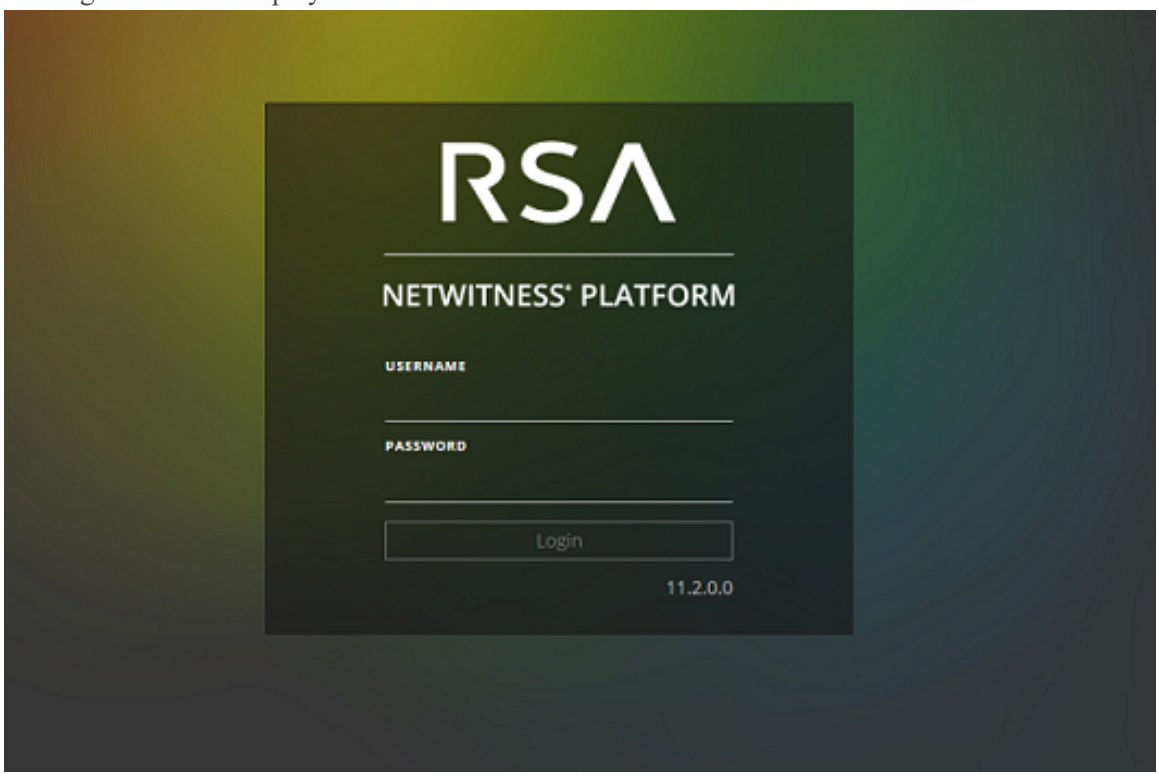
In NetWitness Platform, the Core services ingest and parse data, generate metadata, and aggregate generated metadata with the raw data. The Core services are Decoder, Log Decoder, Concentrator, and Broker. Downstream systems use data stored on Core services for analytics; therefore, the operations of downstream services are dependent on Core services. The downstream systems are Archiver, ESA, Malware Analysis, Investigate, and Reporting.

Although the Core services can operate and provide a good analytics solution without the downstream systems, the downstream components provide additional analytics. ESA provides real-time correlation across sessions and events as well as between different types of events, such as log, packet, and endpoint data. Investigate provides the ability to drill into data, examine events and files, and reconstruct events in a safe environment. The Malware Analysis service provides real-time, automated inspection for malicious activity in network sessions and associated files.

Logging in to NetWitness Platform

Logging in to RSA NetWitness® Platform can vary based on your environment. You may have an internal user account or an external user account. Internal user accounts are local to the NetWitness Platform and internal users can log in to NetWitness Platform and receive role-based permissions. External user accounts authenticate outside of the NetWitness Platform and are mapped to NetWitness Platform roles. If you are an external user and you cannot access NetWitness Platform or view the information that you need, contact your System Administrator. Your Administrator can assign the appropriate roles to your account.

1. Use an icon provided by your Administrator, or type the following in your web browser:
   `https://<hostname or IP address>/login`
   Where `<hostname or IP address>` is the hostname or IP address of your NetWitness server.
   The login screen is displayed.



2. Type your username and password, and then click **Login**.
   If your login is successful, you will be logged in to the landing page specified in your user preferences.

Note: NetWitness Platform supports modern (or current) versions of the latest browsers.

If you are locked out:

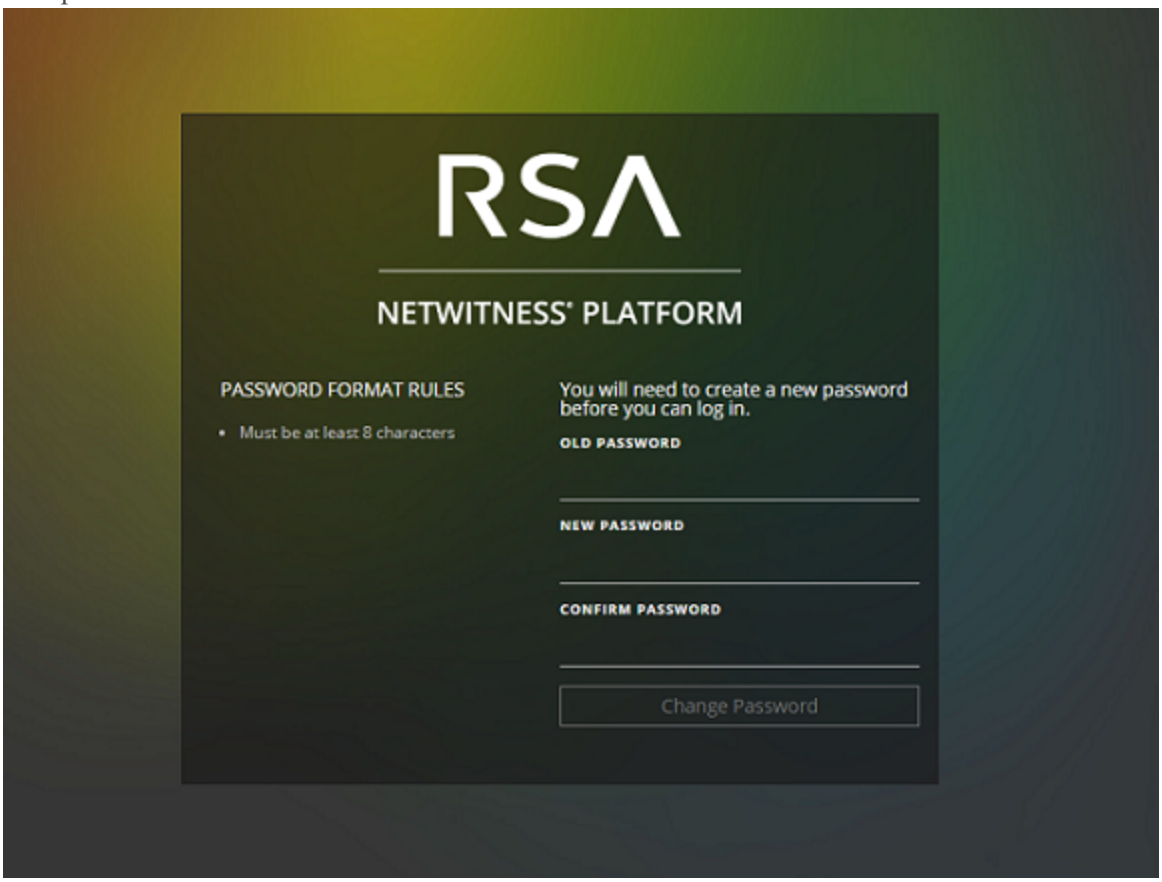
Note: This information applies to internal accounts only. It does not apply to Active Directory or PAM accounts.

If you try too many times to log in with an incorrect username or password, your account will be locked. Contact your Administrator to unlock your account.

If you have a new account or your account is expired:

Note: This procedure applies to internal accounts only. It does not apply to Active Directory or PAM accounts.

1. In the dialog to create a new password, enter your old password, type a new password, and confirm it. Password format rules (as defined by your system administrator) are provided on the left and your new password must conform to the indicated format rules.



2. Click **Change Password**.

If you do not have the appropriate access to NetWitness Platform:

If you are able to log in successfully, but you are not able to view the information that you need, it is possible that you need a user role assigned to your user account. Contact your Administrator for assistance.

Log Off NetWitness Platform

To log off from the Respond and some Investigate views:

1. In the main menu bar, select  .
2. In the User Preferences, click **Sign Out**.

To log off from the other views:

In the main menu bar, select  **> Sign Out**.

Changing Your Password

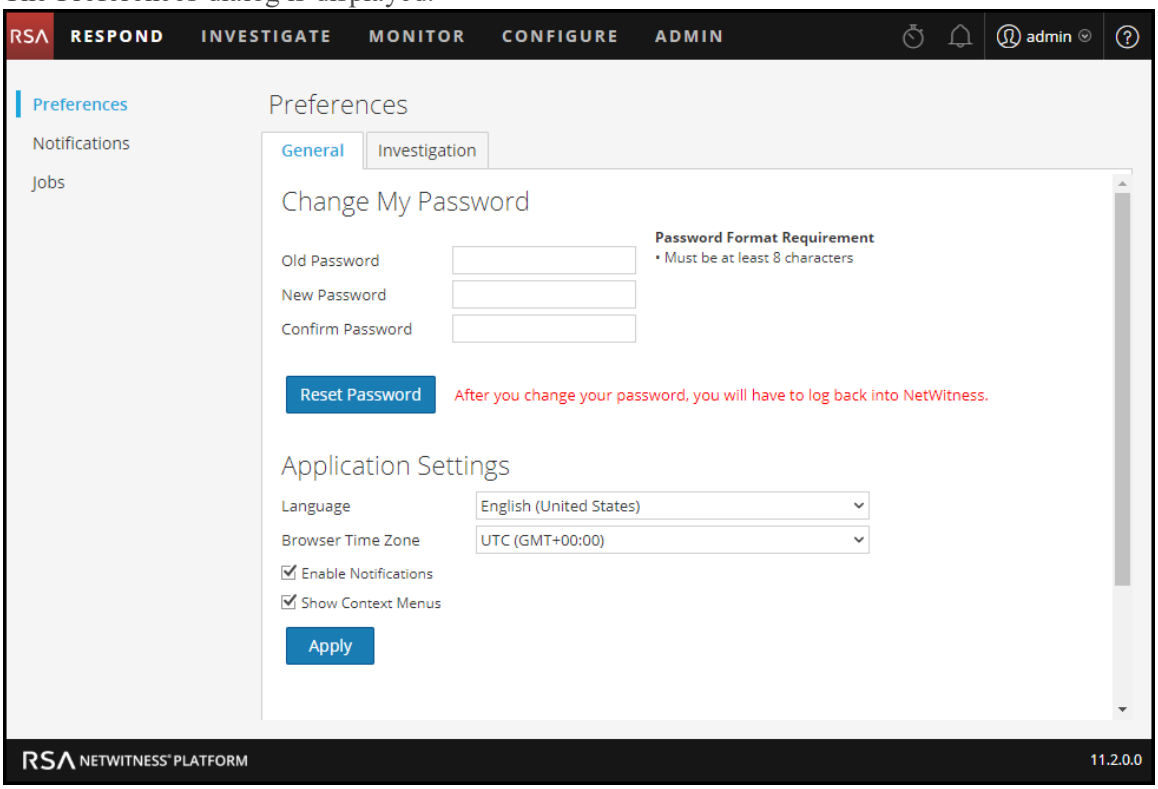
You can change the password that you use for RSA NetWitness® Platform authentication at any time in your user preferences. Your administrator defines the appropriate password strength requirements for your NetWitness Platform password, such as minimum password length and minimum number of uppercase, lowercase, decimal, non-Latin alphabetic, and special characters. These requirements are then displayed when changing your password.

Note: This procedure applies to internal accounts only. It does not apply to Active Directory or PAM accounts.

To change your password:

1. Do one of the following:
   - For most views, such as Monitor, Configure, Admin, or Investigate, select > **Profile**.
   - In the Respond and some Investigate views (Event Analysis, Hosts, Files, and Users), select and in the User Preferences dialog click **Change my password**.

   The Preferences dialog is displayed.



2. In the **Change My Password** section, enter the password that you used to authenticate to NetWitness Platform in the **Old Password** field.
3. In the **New Password** field, enter the password that you want to use for the next login.
4. In the **Confirm Password** field, retype the new password.

5. Click **Reset Password**.
   You will be logged out of NetWitness Platform for the changes to take effect. The new password becomes effective the next time you log in to NetWitness Platform.

Identify Your Role

The roles listed here are the typical roles or functions of a Security Operations Center (SOC). Determine the role or roles that you perform in the SOC. You can use these functions as a guide to decide how to set up and navigate RSA NetWitness® Platform so that you can efficiently perform your job tasks.

SOC Team

SOC Manager
(SOC Management and Reporting)

- Manage SOC readiness
- Respond to incidents
- Respond to data breaches

Data Privacy Officer

- Monitor and protect privacy and sensitive information

Incident Reponder
(T1 Analyst)

- Respond to incidents
- Remediate incidents

Threat Hunter
(T2/T3 Analyst)

- Hunt for threats
- Conduct forensic analysis
- Recommend issues for remediation
- Remediate issues

Content Expert
(Threat Intelligence)

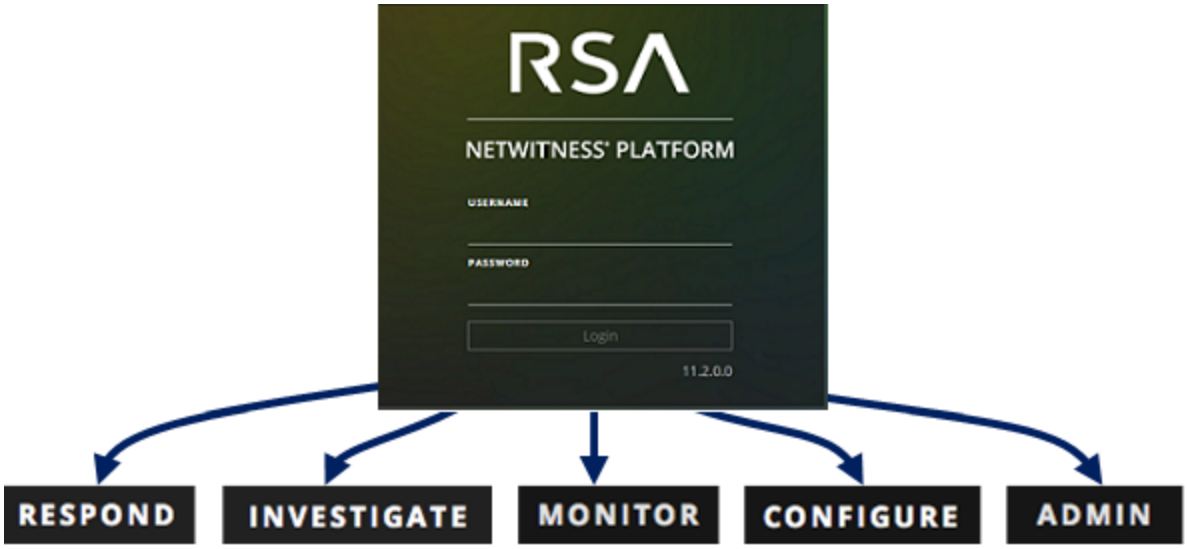
- Investigate new threat intelligence
- Evaluate and create new feeds
- Create correlation rules to flag indicators of compromise

System Administrator

- Install and configure equipment and software
- Manage user access
- Monitor and fine tune performance
- Backup and restore data
- Manage storage and archives
- Update software
- Create reports for regulatory compliance

NetWitness Platform Basic Navigation

The RSA NetWitness® Platform application is divided into five main functional areas, known as views, that are based on typical Security Operation Center (SOC) roles.



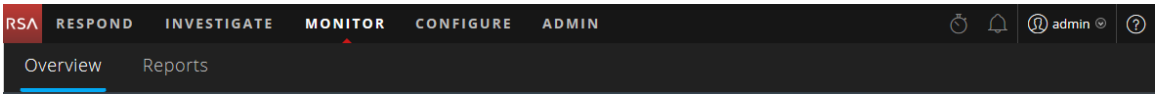
- **RESPOND**: This view is for Incident Responders, who can view a list of prioritized incidents to triage. These incidents come from sources such as ESA rules, NetWitness Endpoint, or ESA Analytics modules for Automated Threat Detection. You can also view all of the alerts received by NetWitness Platform here.
  For legacy 10.6 users, this view was known as the Incident Management view. The Alerts List in the Respond view replaces the ESA 10.6 Alerts > Summary view.
- **INVESTIGATE**: This view is primarily for advanced Threat Hunters, who prefer to manually hunt for threats using NetWitness Platform metadata, raw event data, and event reconstruction and analysis. Incident Responders also use this view to get details about events associated with an incident being investigated. Both Threat Hunters and Incident Responders can use the forensic event reconstruction and event analysis features in this view.
- **MONITOR**: This view is for all users. You can view dashboards and reports on different areas of interest depending on your user permissions. NetWitness Platform opens to this view by default.
  For legacy 10.6 users, this is the Dashboard view.
- **CONFIGURE**: This view is for Threat Intel personnel (Content Experts), who configure data sources and inputs to NetWitness Platform. Content Experts use this area to download and manage Live content. They can also create and manage incident and ESA rules.
  For legacy 10.6 users, this view contains Live, Incidents > Configure, and Alerts > Configure from the previous version.
- **ADMIN**: This view is for System Administrators, who set up and maintain the overall application.
  For legacy 10.6 users, this is the Administration view less the sections added to the Configure view.

Accessing Main Views

The options that open each of the main views are listed at the top of the browser window. With the appropriate permissions, you can access any of these views at the top of every browser window at any time.

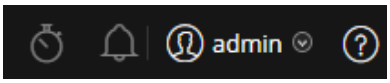
Secondary Menus

Some views have secondary menus with additional views that you can select, which vary according to the tasks that you can complete. The following example shows the MONITOR menu.



Additional Options

In addition to the main views, there are additional options at the top of the browser window that are common to the entire application.



The following table describes these common options:

Common Option	Name	Description
	Jobs	In the INVESTIGATE, MONITOR, CONFIGURE, and ADMIN views, click this icon to view and manage your jobs in the Jobs tray. Jobs are on-demand or scheduled tasks that take some time to complete in the NetWitness Platform application.
	Notifications	Click this icon to view notifications from the application.

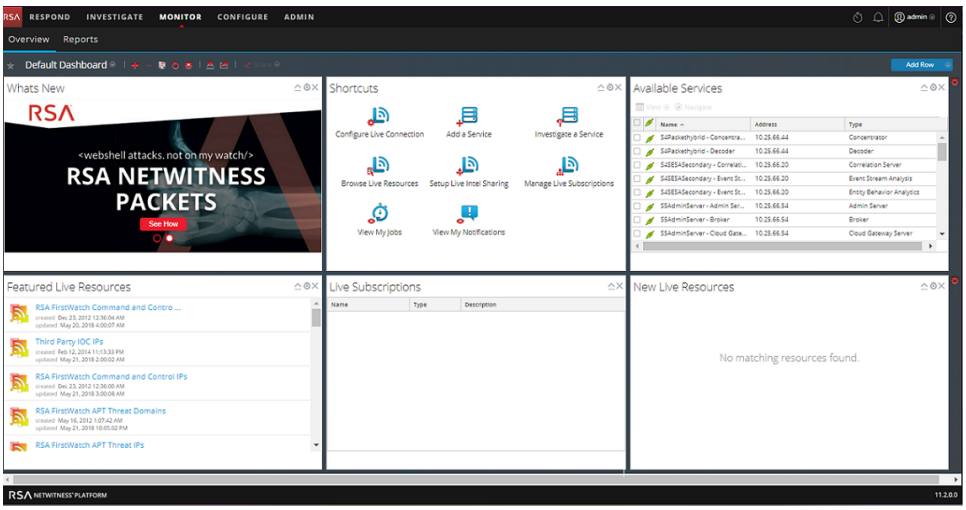
Common Option	Name	Description
	User Preferences	Click this icon to view your available user preference options. You can manage your user preferences and log out of NetWitness Platform.
	User Profile	Click your user profile to view the available options. You can manage your user preferences, change your password, and log out of NetWitness Platform.
	Help	Click this icon to view NetWitness Platform help topics.

Main Views

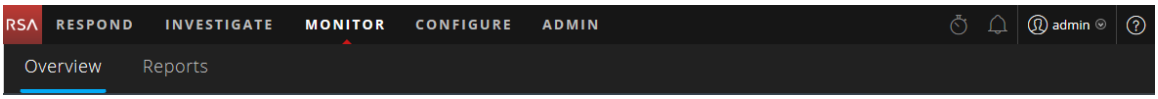
The following sections explain the main views.

MONITOR

The MONITOR view contains the NetWitness Platform dashboard. Monitor offers preconfigured dashboards and reports that you can use and you can also create your own.



MONITOR Menu



The MONITOR menu has the following options:

- **Overview**: The Overview view enables you to view and manage your dashboards. You can select the following preconfigured dashboards:
  - Default
  - Identity
  - Investigation
  - Operations - File Analysis
  - Operations - Logs
  - Operations - Network
  - Operations - Protocol Analysis
  - Overview
  - RSA SecurID
  - Threat - Hunting
  - Threat - Intrusion
  - Threat - Malware Indicators

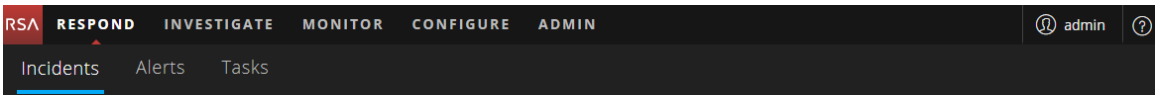
  For legacy 10.6 users, this was the Dashboard view.
- **Reports**: The Reports view enables you to view and manage reports relevant to your SOC role according to your assigned permissions.

What can I do here?	Path	Show me how
Select a Dashboard	MONITOR > Overview	See Managing Dashboards.
Create a Dashboard	MONITOR > Overview	See Managing Dashboards.
Manage Dashboards	MONITOR > Overview	See Managing Dashboards.
View a Report	MONITOR > Reports > View	See the *Reporting Guide*.
Manage Reports	MONITOR > Reports > Manage	See the *Reporting Guide*.

RESPOND

The Respond view presents analysts with a queue of incidents in severity order. When you take an incident from the queue, you receive relevant supporting data to help you investigate the incident. From there, you can determine the incident scope and escalate or remediate it as appropriate.

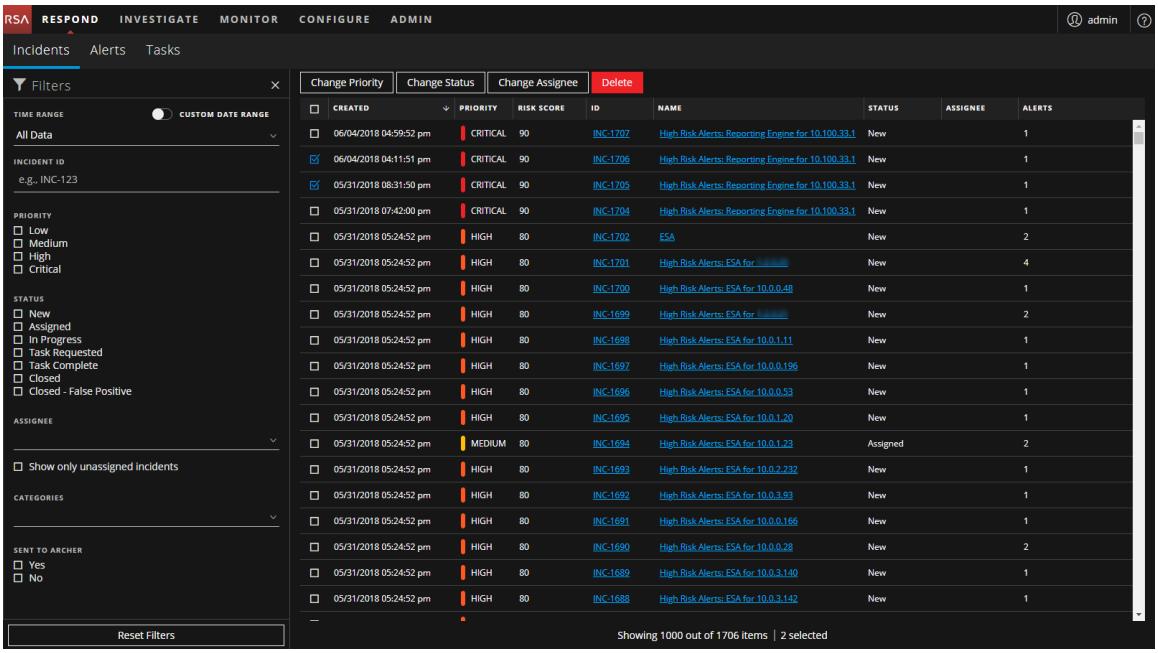
RESPOND Menu



The RESPOND menu has the following options:

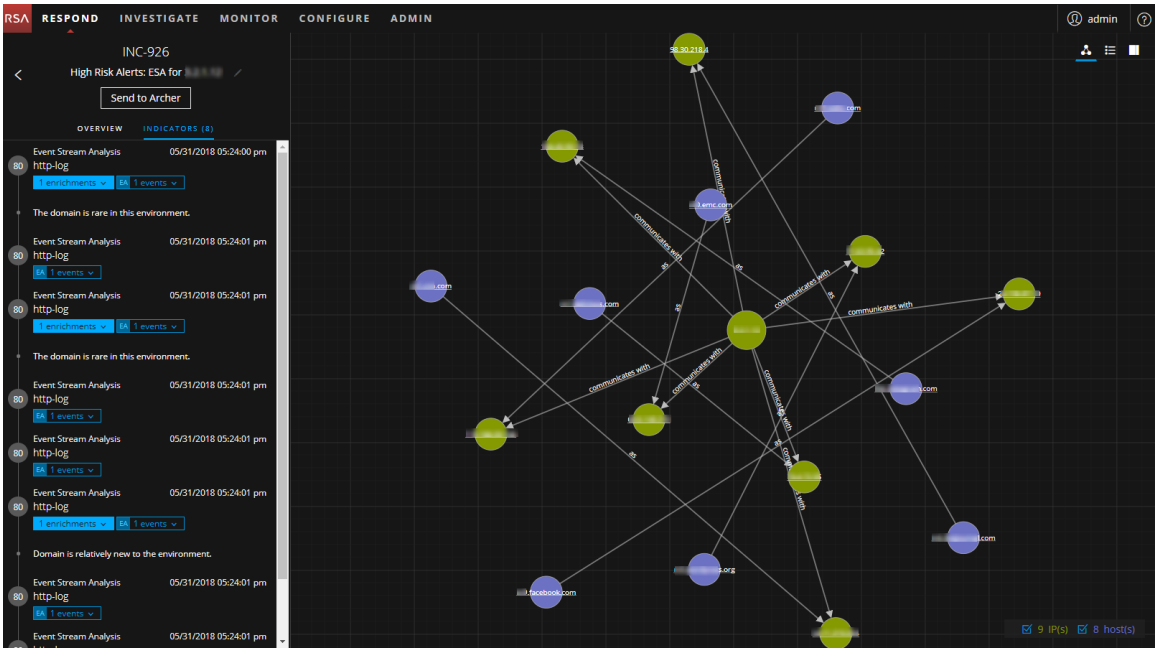
- **Incidents**: The Incidents List view contains a list of all incidents with basic information. The Incident Details view provides extensive details about the incident.
- **Alerts**: The Alerts List and Alert Details views provide information about all of the threat alerts and indicators received by NetWitness Platform in one location.
- **Tasks**: The Tasks List view enables you to create tasks and track them to completion.

The following figure shows the Respond view - Incident List view, which shows a list of prioritized incidents.

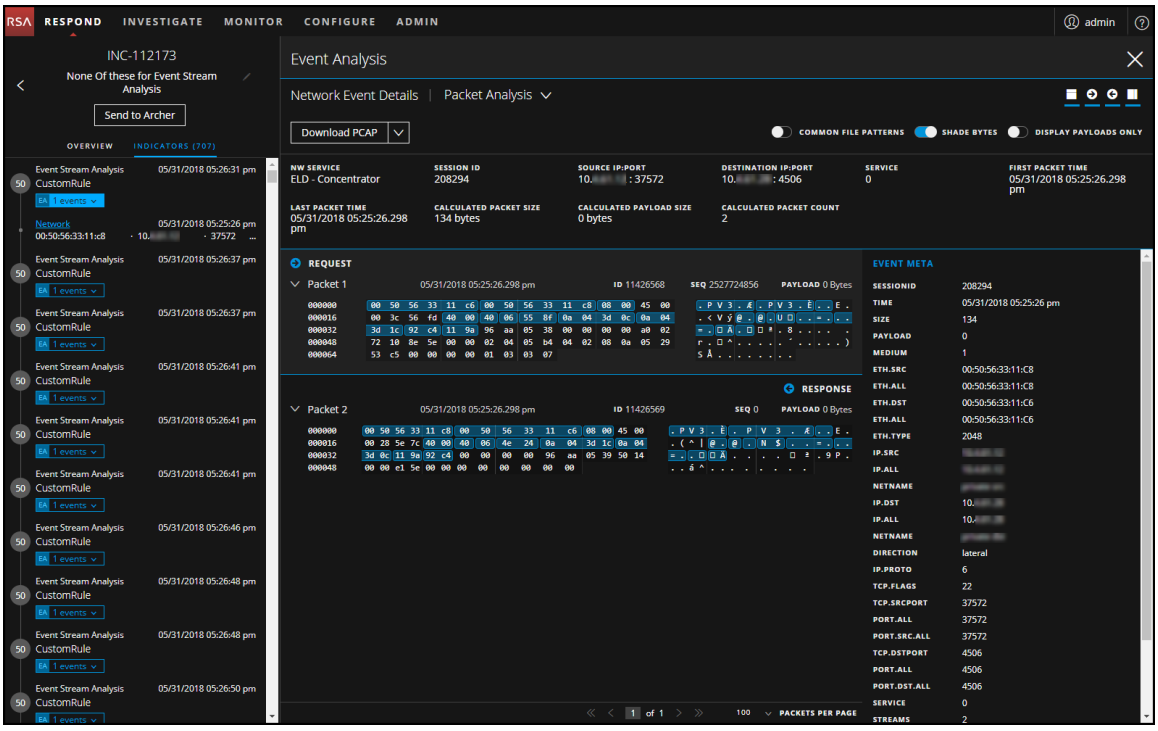


When using NetWitness Platform as your case management tool, you can also manage incidents from this view. New incidents appear at the top of the incident queue.

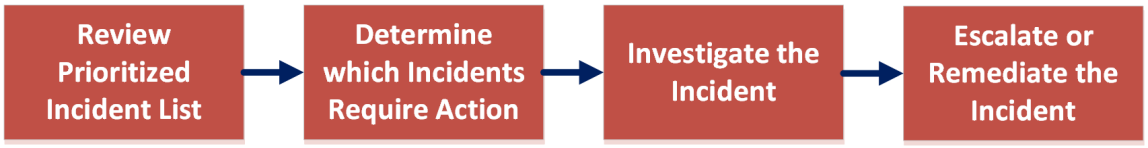
The following figure shows an example of the Respond view - Incident Details view, which shows details for a selected incident.



The Respond view is designed to make it easy to evaluate incidents, contextualize that data, collaborate with other analysts, and pivot to a deep-dive investigation as needed. The following figure shows an example of an event analysis in the Incident Details view.



The following figure shows a high-level Respond view workflow.



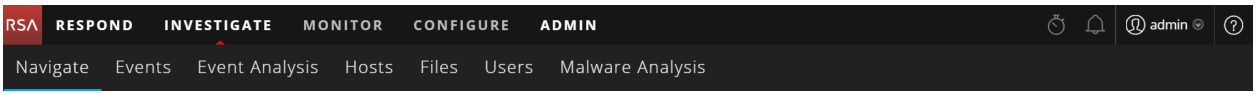
In the Respond view, analysts look at the prioritized list of incidents and determine which incidents require action. They click an incident for a clear picture of the incident with supporting details and they can investigate the incident further. Analysts can then determine how to respond to the threat, by escalating or remediating it.

What can I do here?	Path	Show me how
View prioritized incident lists	RESPOND > Incidents (Incident List view)	See the *NetWitness Respond User Guide*.
Determine which incidents require action (Triage an incident)	RESPOND > Incidents (Incident Details view)	See the *NetWitness Respond User Guide*.
Investigate the incident	RESPOND > Incidents (Incident Details view)	See the *NetWitness Respond User Guide*. (You can also pivot to the Investigate view.)
Escalate or Remediate the Incident	RESPOND > Incidents (Incident Details view) and RESPOND > Tasks (Tasks List view)	See the *NetWitness Respond User Guide*.
Review Alerts	RESPOND > Alerts (Alerts List and Alert Details views)	See the *NetWitness Respond User Guide*.

INVESTIGATE

The Investigate view presents seven different views into a set of data, allowing analysts to see metadata and raw data for endpoints, logs, and events, as well as potential indicators of compromise. In addition to investigating data on a specific service, you can pivot into Investigate from Respond, the Monitor view, an entry in a report generated by the Reporting Engine, or a properly configured third-party application. You can begin your investigation in any of the seven Investigate views, then continue the investigation in another Investigate view; the manner in which you proceed is determined by the question that needs to be answered. If you find an event that needs a response, you can create an incident in Respond where an incident responder will take further action. The *NetWitness Investigate User Guide* provides detailed information.

INVESTIGATE Menu



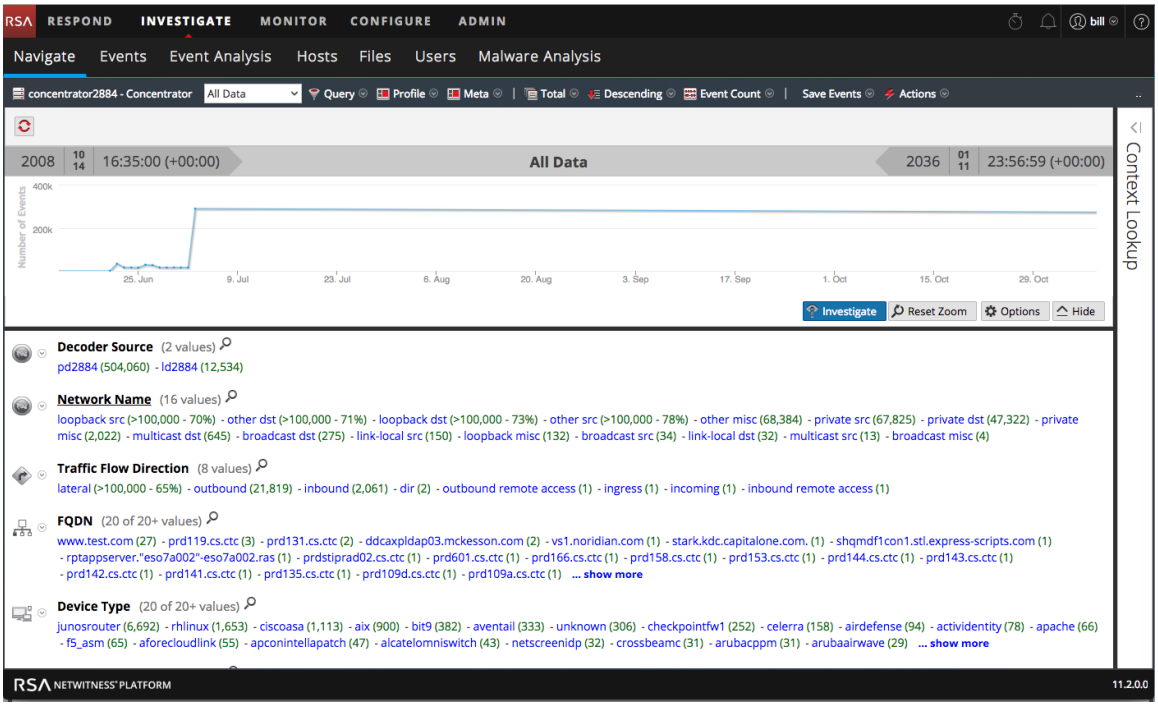
The INVESTIGATE menu has the following options:

- **Navigate**: The Navigate view provides a list of meta keys and meta values with a focus on metadata. You can drill into the data, open a selected event in the Events view or the Event Analysis view, view a reconstruction of an event, search for events, look up additional context from the Context Hub service, and configure Navigate view preferences.
- **Events**: The Events view provides a list of events with a focus on raw data. You can browse a simple list of events, a detailed list, and a log list. You can search for events, open a selected event in the Event Analysis view, view a reconstruction of the event, look up additional context from the Context Hub service, and configure Events view preferences.
- **Event Analysis**: The Event Analysis view provides a list of events with focus on metadata and raw data. You can view a reconstruction that offers helpful cues to identify points of interest in a reconstruction, jump to the Hosts view, pivot to standalone Endpoint, look up additional context from the Context Hub service (Version 11.2 and later), look up data in Live, and do external lookups.
- **Hosts view**: (Version 11.1 and later) The Hosts view lists all hosts with a NetWitness Endpoint Insights Agent running. For every host, you can view processes, drivers, DLLs, files (executables), services, and autoruns that are running, and information related to logged-in users. From the Hosts view, you can go to the Navigate and Event Analysis views.
- **Files view**: (Version 11.1 and later) If you have a NetWitness Endpoint Insights Agent running on a host, the Files view lists all unique files found in your deployment and their associated properties. For each file, you can view details such as file size, entropy, format, company name, signature, and checksum. From the Files view, you can go to the Navigate and Event Analysis views.
- **Users view**: (Version 11.2 and later) The Users view provides visibility into risky user behaviors across your enterprise with RSA NetWitness UEBA. You can view a list of high-risk users and a summary of the top alerts for risky behavior for your environment, and then select a user or an alert and view details about the risky behavior and a timeline during which the behaviors occurred.

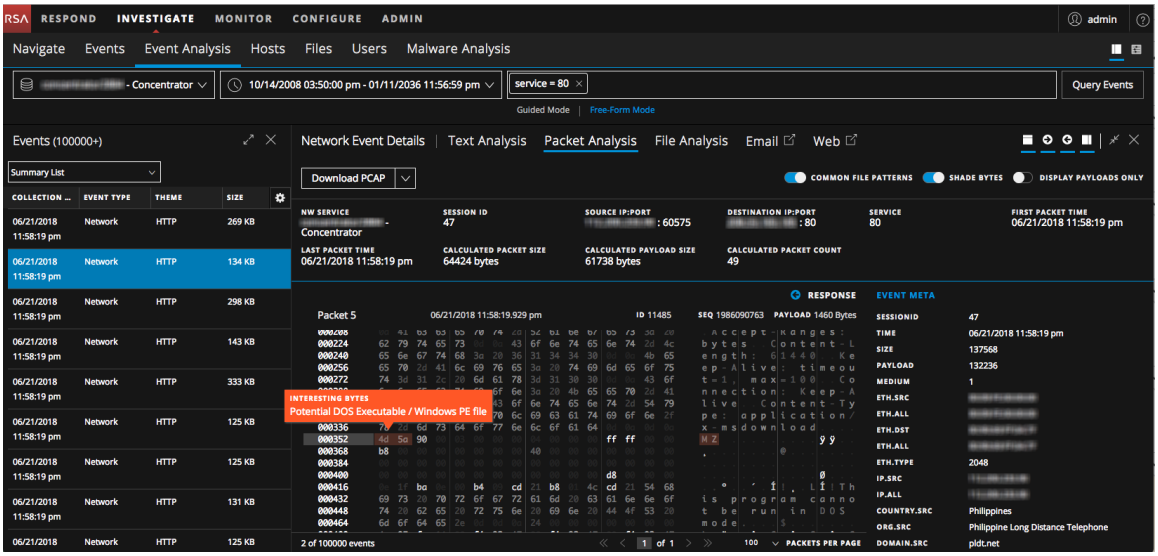
Note: The Users view is only available if you are assigned the role of Administrators or UEBA Analyst.

- **Malware Analysis**: Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows PE, PDF, and MS Office) to assess the likelihood that a file is malicious. Using Malware Analysis, you can prioritize the massive number of files captured in order to focus analysis efforts on the files that are most likely to be malicious.

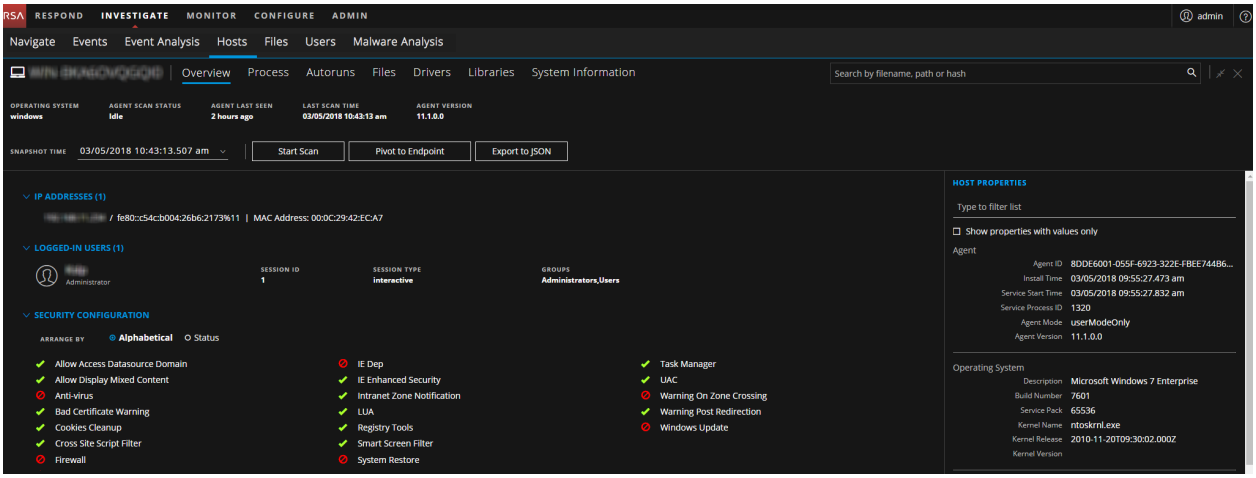
The following figure shows the Investigate view - Navigate view.



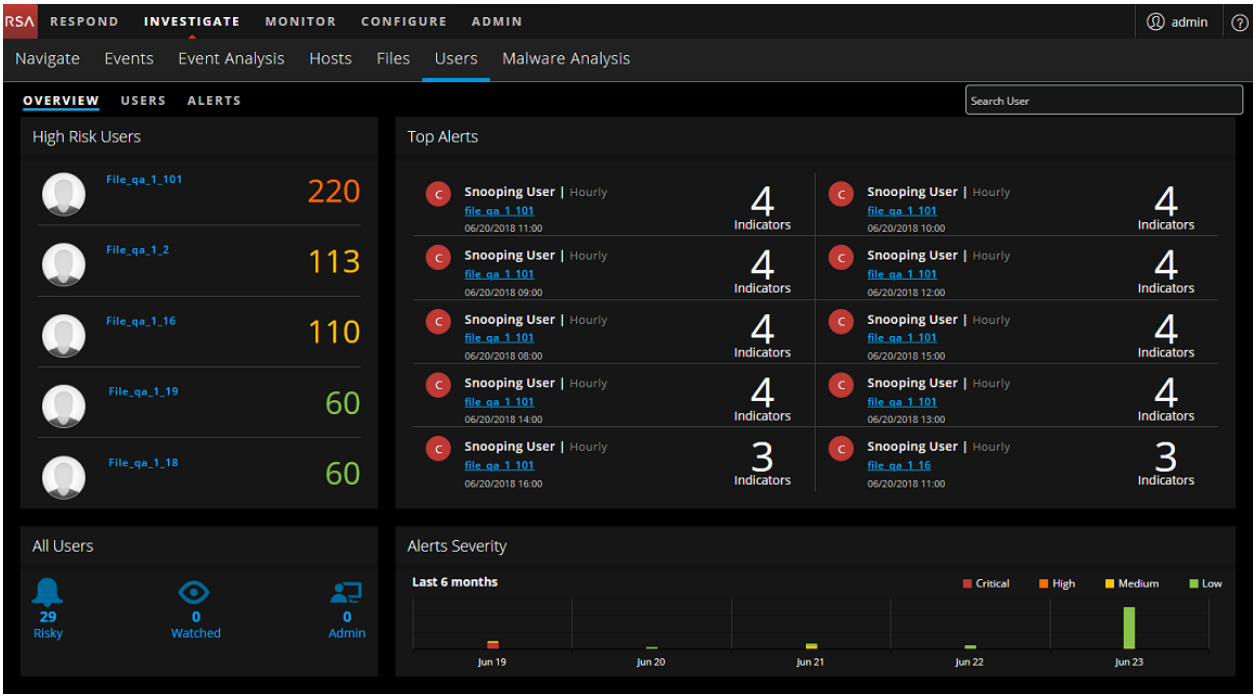
The following figure shows the Investigate view - Event Analysis view.



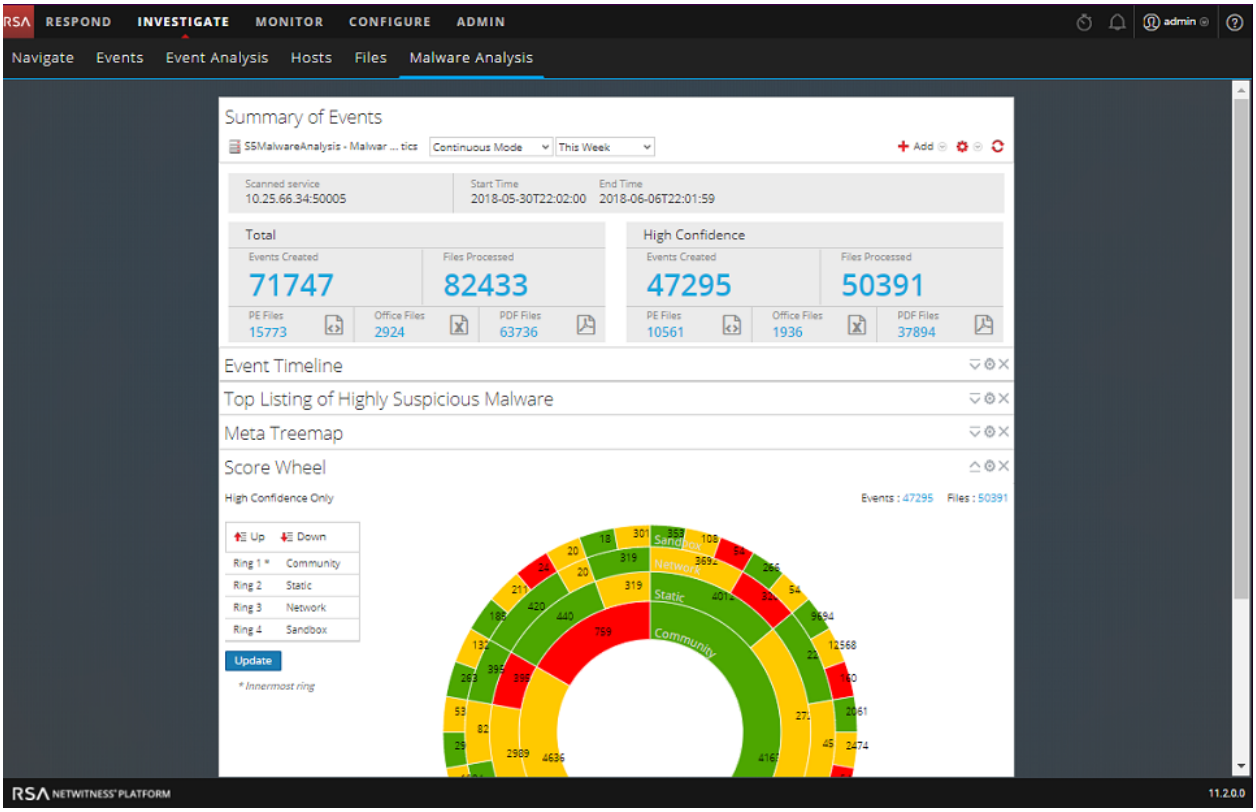
The following figure shows the Hosts view - Host Details view.



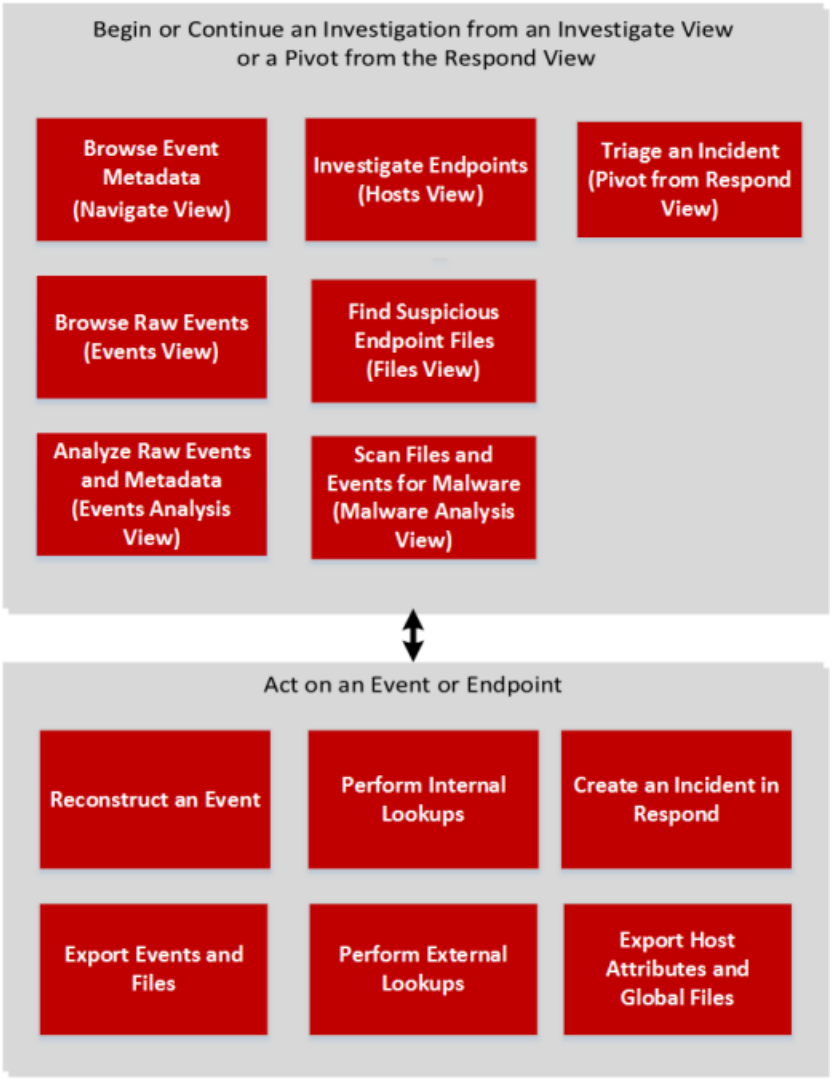
The following figure shows the Users view.



The following figure shows the Malware Analysis Summary of Events.



The following figure shows a high-level workflow of the Investigate view.



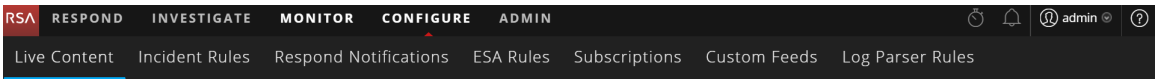
What can I do here?	Path	Show me how
Browse Event Metadata	Navigate view	See "Investigating Metadata in the Navigate View" in the *NetWitness Investigate User Guide*.
Browse Raw Events	Events view	See "Examining Raw Events in the Events View" in the *NetWitness Investigate User Guide*.
Analyze Raw Events and Metadata	Event Analysis view	See "Examining Metadata and Raw Events in the Event Analysis View" in the *NetWitness Investigate User Guide*.

What can I do here?	Path	Show me how
Investigate Endpoints	Hosts view	See "Investigating Hosts and Files" in the *NetWitness Investigate User Guide*.
Find Suspicious Endpoint Files	Files view	See "Investigating Hosts and Files" in the *NetWitness Investigate User Guide*.
Scan Files and Events for Malware	Malware Analysis view	See "Conducting Malware Analysis" in the *NetWitness Investigate User Guide*.
Detect Suspicious User Behavior	Users view	See the *RSA NetWitness UEBA User Guide*.

CONFIGURE

The Configure view enables Threat Intel personnel (Content Experts) to configure data sources and inputs to NetWitness Platform in one convenient location.

CONFIGURE Menu



The CONFIGURE menu has the following options:

- **Live Content**: (Live Services) The Live Content view enables you to search for and subscribe to Live Services resources. Live Services is the component of the NetWitness Platform that manages communication and synchronization between NetWitness Platform services and a library of Live content available to RSA NetWitness Platform customers. You can view, search, deploy, and subscribe to content from the RSA Live Content Management System (CMS) to NetWitness Platform services and software. When you subscribe to a resource, you agree to receive updates on a regular basis from RSA Live Services.
  For Legacy 10.6 users, this was Live > Search.
- **Incident Rules**: The Incident Rules view enables you to create incident rules with various criteria to automatically create incidents. You can view prioritized incidents in the Respond view.
  For Legacy 10.6 users, this was Incidents > Configure. In 11.1 and later, Aggregation Rules are known as Incident Rules.

- **Respond Notifications**: The Respond Notifications view enables you to automatically send email notifications to SOC Managers and the Analysts assigned to the incidents when incidents are created or updated.
- **ESA Rules**: The ESA Rules view enables you to manage the Event Stream Analysis (ESA) rules that specify criteria for problem behavior or threatening events in your network. When ESA detects a threat that matches the rule criteria, it generates an alert.
  You can create ESA rules yourself or download them from Live Services. The Rule Library shows all ESA rules created or downloaded. To activate rules, you have to add them to a deployment. Deployments map rules from your rule library to the appropriate ESA services.
  For Legacy 10.6 users, this was Alerts > Configure.
- **Subscriptions**: (Live Services) The Subscriptions view enables you manage the Live content that you subscribed to in the Live Content view. To set up Live Services on NetWitness Platform, you configure the connection and synchronization between the CMS server and NetWitness Platform.
  For Legacy 10.6 users, this was Live > Configure.
- **Custom Feeds**: (Live Services) The Custom Feeds view streamlines the task of creating and managing custom feeds, as well as populating the feeds to selected Decoders and Log Decoders. You can set up and maintain custom and identity feeds.
  NetWitness Platform uses feeds to create metadata based on externally defined metadata values. A feed is a list of data that is compared to sessions as they are captured or processed. For each match, additional metadata is created.
  You can create custom feeds to provide extra metadata extraction, for example, to accommodate custom network applications.
  For Legacy 10.6 users, this was Live > Feeds.
- **Log Parser Rules**: The Log Parser Rules tab displays information about individual log parsers, as well as the default, "parse all" parser that can parse logs that are not associated with a particular log parser. This tab contains the following information:
  - You can view the rules for a particular event source type, including the default parser.
  - You can view the Names, Literals, patterns, and meta for each configured log parser.
  - You can add log parsers.
  - You can add, edit, and delete custom rules for log parsers.

  Note: The Log Parser Rules tab is available in the Configure menu in versions 11.2 and later. For earlier versions, it is located in Admin > Event Sources.

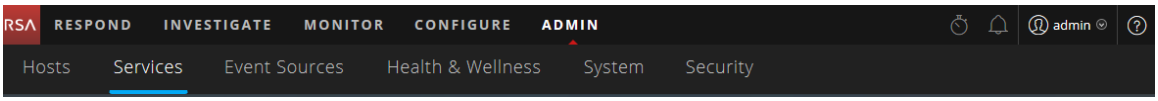
What can I do here?	Path	Show me how
Create a Live Services account	RSA Live Registration Portal: https://cms.netwitness.com/registration/	See the *Live Services Management Guide*.

What can I do here?	Path	Show me how
Find and deploy Live Services resources.	CONFIGURE > Live Content	See the *Live Services Management Guide*.
Create incidents automatically.	CONFIGURE > Incident Rules	See the *NetWitness Respond Configuration Guide*.
Configure Respond notifications.	CONFIGURE > Respond Notifications	See the *NetWitness Respond Configuration Guide*.
Configure alerts.	CONFIGURE > ESA Rules	See the *Alerting with ESA Correlation Rules User Guide*.
Set up Live Services Services on NetWitness Platform	CONFIGURE > Subscription	See the *Live Services Management Guide*.
Set up and maintain custom and identity feeds.	CONFIGURE > Custom Feeds	See the *Live Services Management Guide*.
View and edit log parsers and log parser rules.	CONFIGURE > Log Parser Rules	See the *Log Parser Customization Guide*.

ADMIN

In the Admin view, administrators can manage network hosts and services; monitor the health and Wellness of NetWitness Platform; and manage system-level security. They can also configure global system resources and manage event sources.

ADMIN Menu



The ADMIN menu has the following options:

- **Hosts**: The Hosts view is where you set up and maintain hosts. A host is the machine on which services run and a host can be a physical or virtual machine.
- **Services**: The Services view enables you to manage services, manage service users and roles, maintain service configuration files, and explore and edit service properties. A service performs a unique function, such as a Decoder service, which captures network data in packet form.
- **Event Sources**: The Event Sources view enables you to manage event sources and configure alerting policies for them. Organizations typically monitor event sources in groups based on the criticality of the event sources. You can create monitoring policies for each event source group and order them based on priority.
- **Health & Wellness**: The Health & Wellness view enables you to monitor the health of the NetWitness Platform hosts and services in your network environment.
- **System**: The System view enables you to set global NetWitness Platform configurations. You can configure global audit logging, email, system logging, jobs, RSA Live Services, URL integration, Investigation, Event Stream Analysis (ESA), ESA Analytics, and advanced performance settings. In addition, you can manage NetWitness Platform versions and configure the local licensing server.
- **Security**: The Administration Security view provides the capability to manage user accounts, manage user roles, map external groups to NetWitness Platform roles, and modify other security-related system parameters. These apply to the NetWitness Platform system and are used in conjunction with the security settings for individual services.

Note: For versions 11.2 and later, the Event Sources > Log Parser Rules tab can be found in the Configure view.

What can I do here?	Path	Show me how
Manage hosts.	ADMIN > Hosts	See the *Host and Services Getting Started Guide*.
Manage services including managing service user access and security.	ADMIN > Services	See the *Host and Services Getting Started Guide*.

Manage system users with roles and permissions.	ADMIN > Security	See the *System Security and User Management Guide*.

Setting up Your Default View by SOC Role

After logging in to RSA NetWitness® Platform, you can make navigating the application easier by setting up your default view based on your Security Operations (SOC) role. You set your default view, also known as a landing page, in your user preferences.

The following figure shows the main NetWitness Platform views.

- **Respond**: This view is for Incident Responders, who can view a list of incidents to triage and alerts. For legacy 10.6 users, this view was known as the Incident Management view and the Respond > Alerts view replaces the ESA 10.6 Alerts > Summary view.
  Respond is the default opening view. If you do not have permission to see the Respond view, you will have Monitor as your default view.
- **Investigate**: This view is for Threat Hunters, who investigate and hunt for advanced threats.
- **Monitor**: This view is for all users and it is the classic view for previous application versions. You can view dashboards and reports on different areas of interest depending on your user permissions. You have the option to select a preconfigured dashboard, import a dashboard, or create your own custom dashboard.
- **Configure**: This view is for Threat Intel personnel (Content Experts), who configure data sources and inputs to NetWitness Platform. Content Experts use this area to download and manage Live content. They can also create and manage incident and ESA rules.
  For legacy 10.6 users, this view was Live, Incidents > Configure, and Alerts > Configure.
- **Admin**: This view is for System Administrators, who set up and maintain the overall application.

You can select any of the main NetWitness Platform views as your default view. In addition to the main views, NetWitness Platform has predefined dashboards that you can select in the Monitor view depending on the tasks you perform:

- Default Dashboard
- Identity Dashboard
- Operations - Logs Dashboard
- Operations - Network Dashboard
- Overview Dashboard
- Threat - Indicators Dashboard
- Threat - Intrusion Dashboard

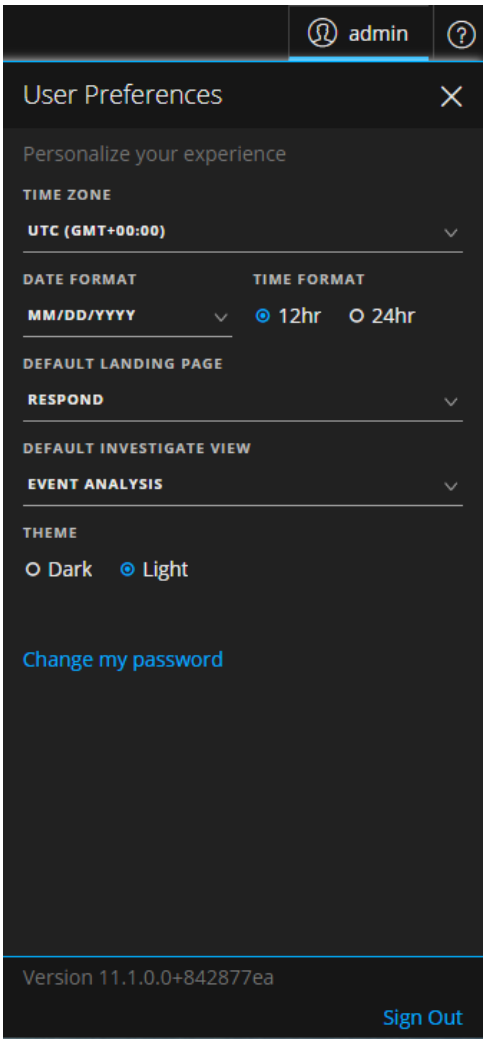
The following table shows typical SOC roles and the available views you can select as your landing page in your user preferences based on your SOC role. If you have more than one role, select the view that is most appropriate for you to start with when you log in to NetWitness Platform.

SOC Roles	Role Description	Consider this Default Landing Page
Incident Responder (Tier 1 Analyst)	Addresses incidents and alerts queued for them to review and mitigate.	**RESPOND**
Threat Hunter (Tier 2/Tier 3 Analyst)	Investigates and hunts for advanced threats.	**INVESTIGATE** For information on selecting the default Investigate view, see the *NetWitness Investigate User Guide*.
SOC Manager (SOC Management and Reporting)	Manages SOC readiness and responds to incidents and data breaches.	**MONITOR** (Dashboard is in the MONITOR view.) When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard.)
Content Expert (Threat Intelligence)	Configures data sources and inputs to NetWitness Platform.	**MONITOR** or **CONFIGURE** (Dashboard is in the MONITOR view. When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard. If you choose MONITOR as your default view, you can navigate to the CONFIGURE view from the main menu.)
Data Privacy Officer (DPO)	Similar to an Administrator, but a DPO monitors and protects privacy-sensitive information.	**MONITOR** (Dashboard is in the MONITOR view. When you log in, select the appropriate predefined dashboard for your SOC role. You can also import a dashboard or create your own dashboard.)
System Administrator	Focuses on the configuration and stability of the overall application. Manages user access.	**ADMIN**

Setting Your Default View

1. (Respond view and some Investigate views) On the main menu bar, select  .

   The User Preferences dialog shows your current preferences.



2. In the **Default Landing Page** field, select the default view that you would like to see when you log in to NetWitness Platform. Use the above table to make your selection based on your SOC role. For example, if you are an Incident Responder, you can select **Respond** and if you are a Threat Hunter, you can select **Investigate**.

   Your preferences become effective immediately. You can change your default landing page at any time. For information on other preferences, see Setting User Preferences.

3. To verify that you can see the correct default view, click **Sign Out** to log out and then log back in to NetWitness Platform.

Basic Troubleshooting Tips for User Setup

The following table provides basic troubleshooting tips that may be helpful for user setup in NetWitness Platform.

Problem	Troubleshooting Tip
When I log in to NetWitness Platform, I see the wrong default view.	Verify that the correct default view is set in the Default Landing Page field in your user preferences. If you select the MONITOR view, you can select the predefined dashboard that is most appropriate for your SOC role. You can also import or create your own dashboard.
I see the correct view, but the metadata does not load.	Make sure that you are using the latest version of the browser. If that does not work, try using another browser. For example, if you are using Safari, try using Firefox or Chrome.
I am using Internet Explorer 10 and I get the following error: `The page can't be displayed.`	NetWitness Platform supports modern (or current) versions of the latest browsers. Try installing a newer browser version. If you cannot upgrade your browser, you can try enabling the TLS 1.2 protocol in your browser: Navigate to **Internet options > Advanced > Settings > Security**. In addition to your other protocols, ensure that the TLS 1.2 protocol is enabled. Click **Apply**. Reload the page.
When I log in, I cannot see anything.	See your administrator, you may need a user role assigned to your account or additional troubleshooting.
I can't see where to change my default landing page.	Go to the User Preferences in the Respond view or see your administrator.

Setting User Preferences

You can view and manage your RSA NetWitness® Platform global application preferences from your user profile. There are two global user preference dialogs that have different options. The user Preferences dialog is accessible from Respond and the following Investigate views: Event Analysis, Hosts, Files, and Users. The Preferences dialog is accessible from most other views. The dialog that you see depends on where you access the user preferences.

You can:

- Change the application language
- Set the application time zone
- Set the application date and time format*
- Select your default NetWitness Platform starting location*
- Select your default Investigate view*
- Choose a dark or light theme for the application*
- Change your password (See Changing Your Password for more information.)
- Enable or disable notifications**
- Enable or disable context menus**

* You can make this change from the **User Preferences** dialog accessible from Respond and some Investigate views: Event Analysis, Hosts, Files, and Users.

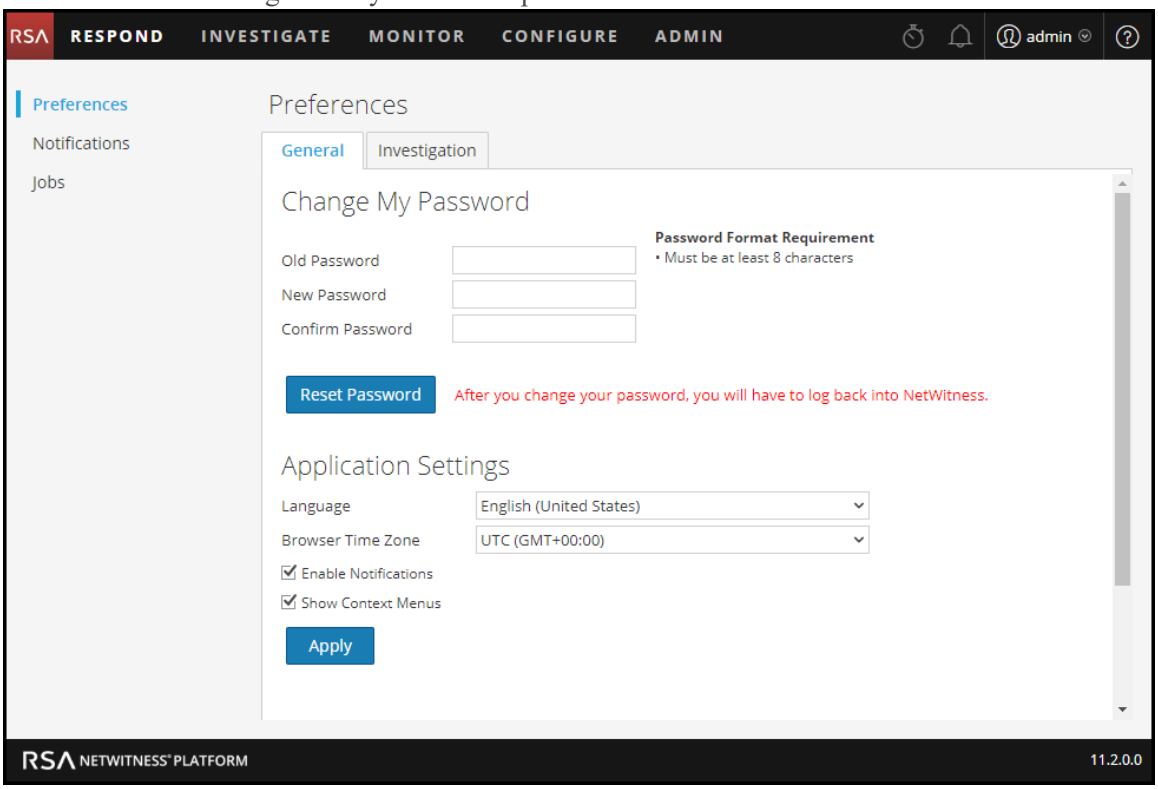
** You can make this change from the **Preferences** dialog accessible from most views (except Respond and some Investigate views: Event Analysis, Hosts, Files, and Users).

Preferences (Most Views except Respond and some Investigate Views)

This section gives instructions for various tasks that can be performed in the Preferences dialog that is accessible in most views except for Respond and some Investigate views.

View your Preferences

In the upper right corner of the NetWitness Platform browser window, select > **Profile**.
The Preferences dialog shows your current preferences.



Set the Language and Time Zone

Note: The Language preference option applies to NetWitness Platform 11.2 and later.

You can change your preferred language for the entire NetWitness Platform. The default language is English (United States).

1. In the User Preferences dialog, select your localization preferences:
   a. **Language**: Select your preferred language for NetWitness Platform.
   b. **Time Zone**: Set the time zone to use in the NetWitness Platform.
2. Click **Apply**.
   Your preferences become effective immediately.

Note: When Daylight Saving Time (DST) starts or ends, if the selected time zone for the currently logged in user observes DST, the user interface automatically updates to reflect the correct time.

Enable or Disable System Notifications for Your User Account

By default, NetWitness Platform system notifications are enabled when a new user account is created. You can disable and enable these notifications at any time.

1. In the Preferences dialog:
   - To enable notifications for your user account, select the **Enable Notifications** checkbox.
   - To disable notifications, clear the **Enable Notifications** checkbox.
2. Click **Apply**.
   Your preference becomes effective immediately.

Enable or Disable Context Menus for Your User Account

By default, context menus are enabled when a new user account is created. Context menus provide additional functions for specific views when you right-click a view.

1. In the Preferences dialog:
   - To enable context menus for your user account, select the **Enable Context Menus** checkbox.
   - To disable context menus, clear the **Enable Context Menus** checkbox.
2. Click **Apply**.
   Your preference becomes effective immediately.

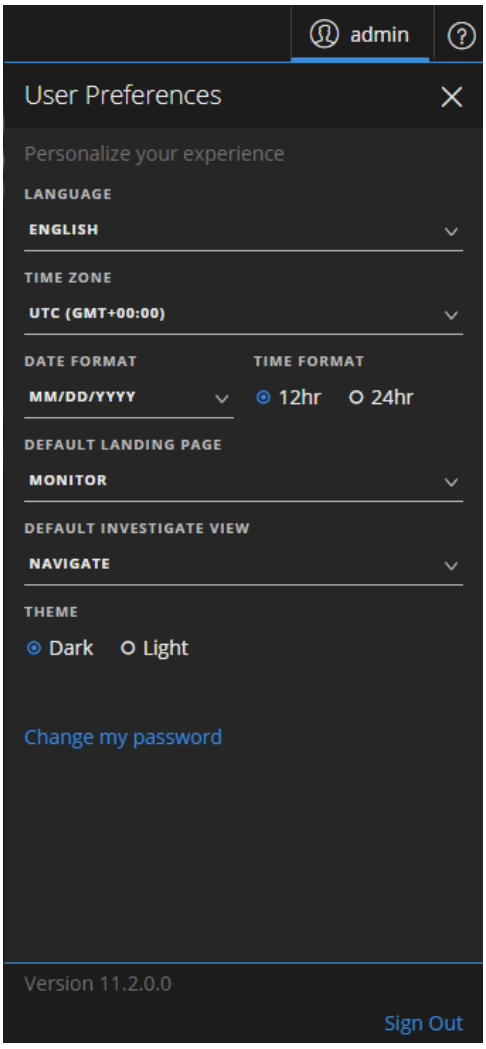
Note: Settings available on the Investigate tab in the Preferences dialog are documented in the *NetWitness Investigate User Guide*.

User Preferences (Respond and Some Investigate Views)

This section gives instructions for various tasks that can be performed in the User Preferences dialog that is accessible in the Respond and some Investigate views.

View Your User Preferences

In the upper right corner of the NetWitness Platform browser window, select  .
The User Preferences dialog shows your current preferences when accessed through the Respond view and the following Investigate views: Event Analysis, Hosts, Files, and Users.



Any selections that you make become effective immediately.

Set the Language, Time Zone, and Date and Time Format

Note: The Language preference option applies to NetWitness Platform 11.2 and later.

You can change your preferred language for the entire NetWitness Platform. The default language is English (United States). You can also change the time zone and the format of the date and time for your location.

1. In the User Preferences dialog, select your localization preferences:
    a. **Language**: Select your preferred language for NetWitness Platform.
    b. **Time Zone**: Set the time zone to use in the NetWitness Platform.
    c. **Date Format**: Set the format for the order of the display of the month (MM), day (DD), and year (YYYY). For example, the MM/DD/YYYY format shows the date as 05/11/2017.

d. **Time Format**: Set the time as 12-hour or 24-hour time. For example, 2:00 PM in 12-hour time is 14:00 in 24-hour time.

Changes in the Respond view become effective immediately.

Note: When Daylight Saving Time (DST) starts or ends, if the selected time zone for the currently logged in user observes DST, the user interface automatically updates to reflect the correct time.

Select the Default NetWitness Platform Starting Location

1. Open the User Preferences dialog.
2. In the **Default Landing Page** field, select the opening view that you would like to see when you log in to NetWitness Platform. You can choose Respond, Investigate, Monitor, Configure, and Admin according to your user role. For example, you can choose Respond to go directly to the relevant section of the application for Incident Responders. See Setting up Your Default View by SOC Role to help you select the appropriate default view.
   This selection sets the default view for the entire application. Changes become effective immediately.

Select the Default Investigate View

1. Open the User Preferences Dialog.
2. In the **Default Investigate View** field, select the default landing page when you log in to NetWitness Platform and navigate to Investigate. You can choose Navigate, Events, Event Analysis, Hosts, Files, Users, or Malware Analysis as the default Investigate view. For example, you can choose Events for the default Investigate view to go directly to the Events page to view the events generated for a service. See Setting up Your Default View by SOC Role to help you select the appropriate default view. For more information, see the *NetWitness Investigate User Guide*.

Note: After you have applied the change in the drop-down, sometimes it takes few seconds for the changes to come in effect.

Choose the Appearance of NetWitness Platform

Note: This option is only available for NetWitness Platform versions 11.1 and later.

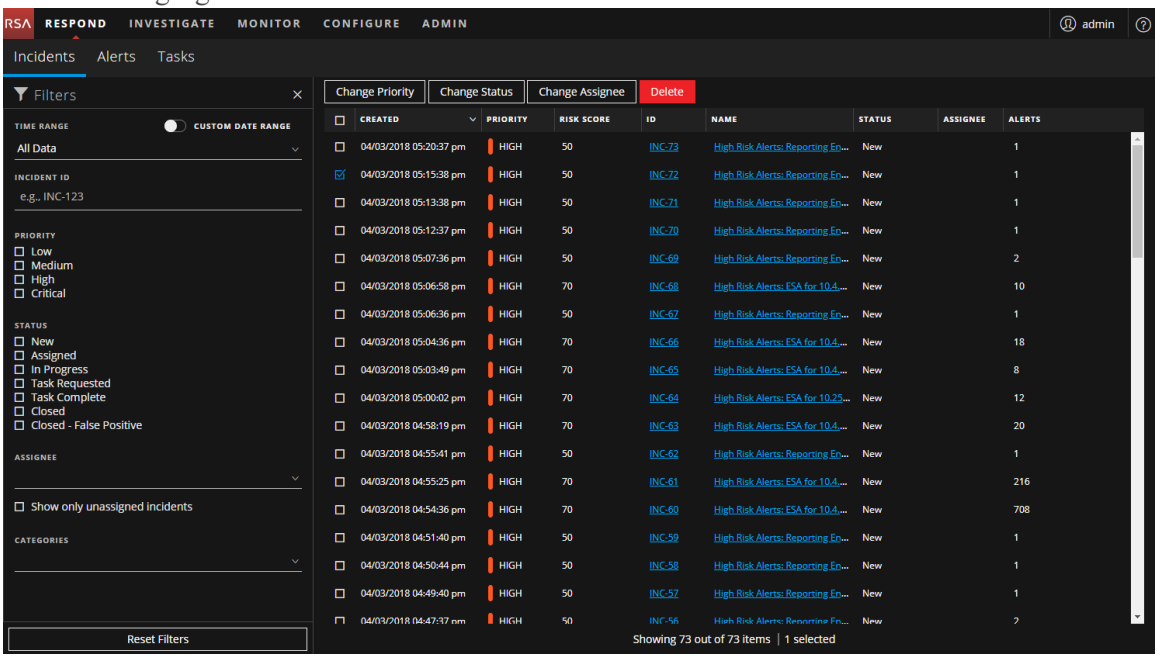
You can choose a dark theme or a light theme for your application, depending on your personal preference. When you change the theme, the Respond view and some Investigate views change to the light or dark theme. Your selection only changes how NetWitness Platform appears to you, not other users.

1. Open the User Preferences dialog.
2. Under **THEME**, select one of the following options:
   - **Dark**: The dark theme is best for darker environments or when you do not need as much contrast.

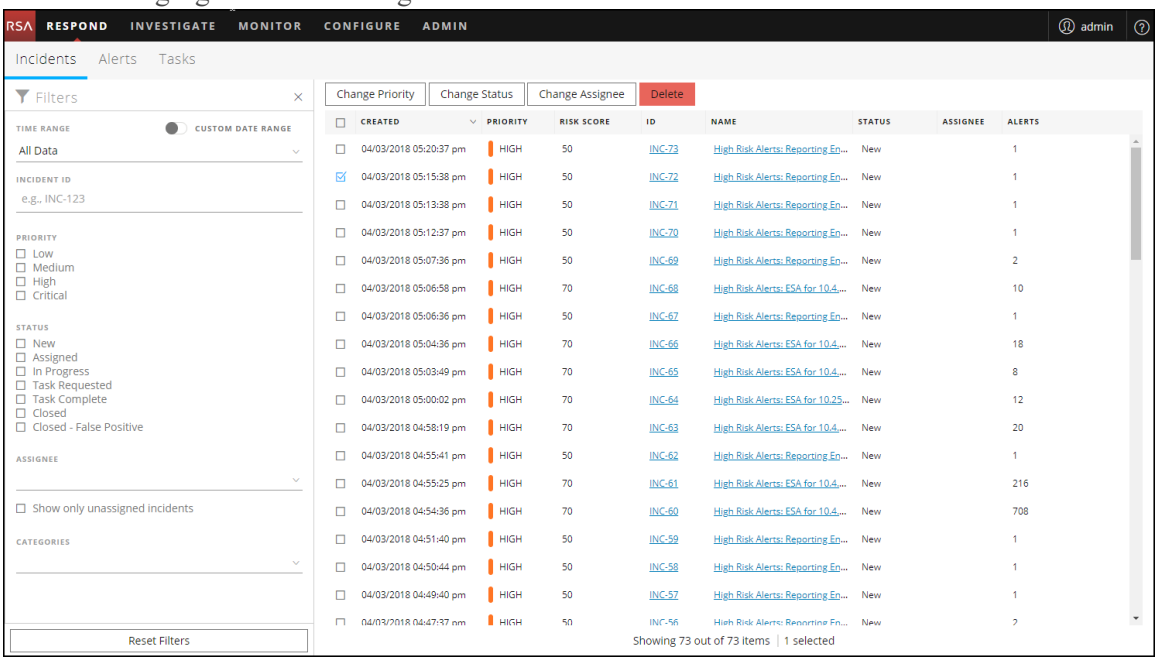
- **Light**: The light theme is best for lighter environments, when you need more contrast, or when you are projecting the application for others to view. Since some views are not affected by the theme changes, you may want to choose the light theme for a more cohesive viewing experience.

Changes become effective immediately.

The following figure shows the dark theme.



The following figure shows the light theme.



Managing Dashboards

A dashboard is a group of dashlets that give you the ability to view in one space, the key snapshots of the various components that you consider important. In RSA NetWitness® Platform, you can compose dashboards to obtain high-level information and metrics that portray the overall picture of a NetWitness Platform deployment, displaying only the information that is most relevant to the day-to-day operations.

By default, the NetWitness Platform default dashboard is displayed when you log in to NetWitness Platform, and it is populated with a few useful dashlets to get you started with your own customizations. The dashboards for all NetWitness Platform components are available to add to the default NetWitness Platform dashboard or a custom NetWitness Platform dashboard.

You can view dashboards and reports on different areas of interest depending on your user permissions. You have the option to select a preconfigured dashboard, import a dashboard, or create your own custom dashboard. The dashboards help you to quickly and easily view reports. You can configure your dashboards to display the information that supports your workflow. This topic explains the high-level tasks that can be done when you are setting up a dashboard.

Dashboard Basics

If the Monitor view is your default landing page following logging in to NetWitness Platform you always see either the default dashboard or the currently configured dashboard immediately after completing the login process. To return to the dashboard from another NetWitness Platform component, go to **MONITOR** > **Overview**.

Dashboard Title

The dashboard title reflects the currently active dashboard; for example, Default Dashboard.

Dashboard Selection List

You can access preconfigured and custom dashboards on the dashboard selection list. When you select a dashboard, its title is displayed below the NetWitness Platform toolbar.

A dashboard has:

- The dashboard toolbar
- The dashboard title and the dashboard selection list.

Dashboard Toolbar

The dashboard toolbar is available next to the title of the selected dashboard. The dashboard toolbar allows various operations on dashboards and dashlets.

Note: The Copy, Delete, Import, Export, Share, and Add Row options are disabled for preconfigured dashboards.

Option	Description
★	Sets the selected dashboard as the Favorite.
Default Dashboard	Displays the list of available dashboards from which you can make a selection.

Option	Description
	Displays the Create a Dashboard dialog, where you define or add a custom dashboard.
	Deletes a custom dashboard. The default dashboard cannot be deleted.
	Allows you to copy a dashboard.
	Displays the Manage Dashlet dialog.
	Exports a dashboard as a .zip file.
	Imports a dashboard as .zip or.cfg file.
	Allows you to share a dashboard with another user.
	Enables user to add rows and columns to the dashboard based on the requirement. Click the  icon in a row to add a dashlet.

The Default Dashboard

The default dashboard is configured to display specific dashlets in specific positions. The default dashboard serves as an example of dashboard composition and a starting point for customization.

- You can customize the information on the default dashboard by editing, adding, moving, maximizing, and deleting dashlets.
- After modifying the default dashboard, you can restore the default dashboard () to its original layout.
- The default dashboard cannot be deleted or shared.

Selecting a Preconfigured Dashboard

On installation of NetWitness Platform Suite, the following preconfigured dashboards are automatically activated and are available to you:

- Default
- Identity
- Investigation

- Operations - File Analysis
- Operations - Logs
- Operations - Network
- Operations - Protocol Analysis
- Overview
- RSA SecurID
- Threat - Hunting
- Threat - Intrusion
- Threat - Malware Indicators

You cannot perform the following actions on a preconfigured dashboard:

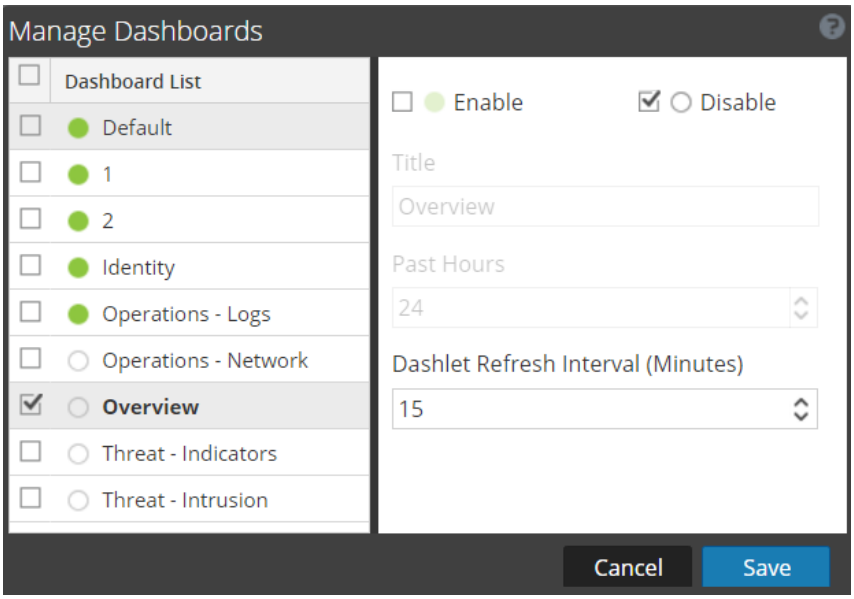
- Edit a dashboard
- Export a dashboard
- Share a dashboard
- Delete a dashboard

For more information on each Preconfigured dashboard, see the Dashboards Catalog in the RSA Content space on RSA Link.

Enabling or Disabling Dashboards

When you enable or disable a dashboard, all the dashlets within the dashboard are enabled or disabled along with the associated charts, unless they are used in any other dashboard.

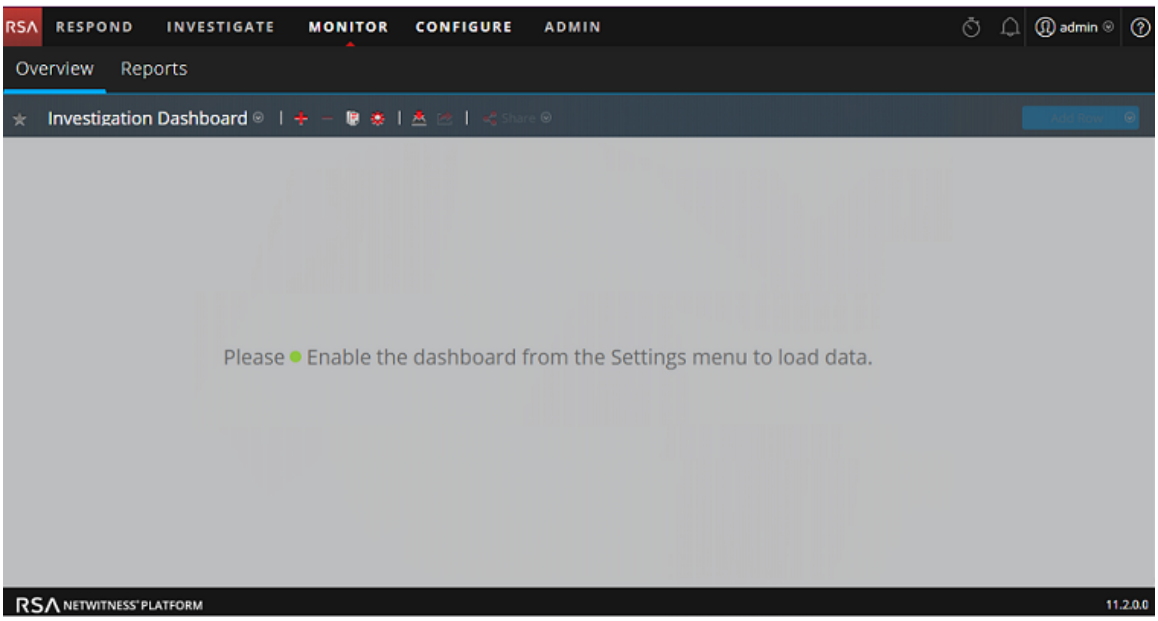
NetWitness Platform modules can display only those dashlets presented in the Manage Dashlet dialog. The main dashboard offers all NetWitness Platform dashlets. This is an example of currently available dashlets.



Name	Description
Dashboard List	Displays a list of the default, preconfigured, and custom dashboards.
Enable	Indicates if the selected dashlet is enabled.
Disable	Indicates if the selected dashlet is disabled.
Title	Displays the title of the selected dashlet and you can also rename the dashboard.
Past Hours	Displays the time for which the data is collected.
Dashlet Refresh Intervals (Minutes)	Displays the refresh interval time of a dashlet.

Enable a Dashboard

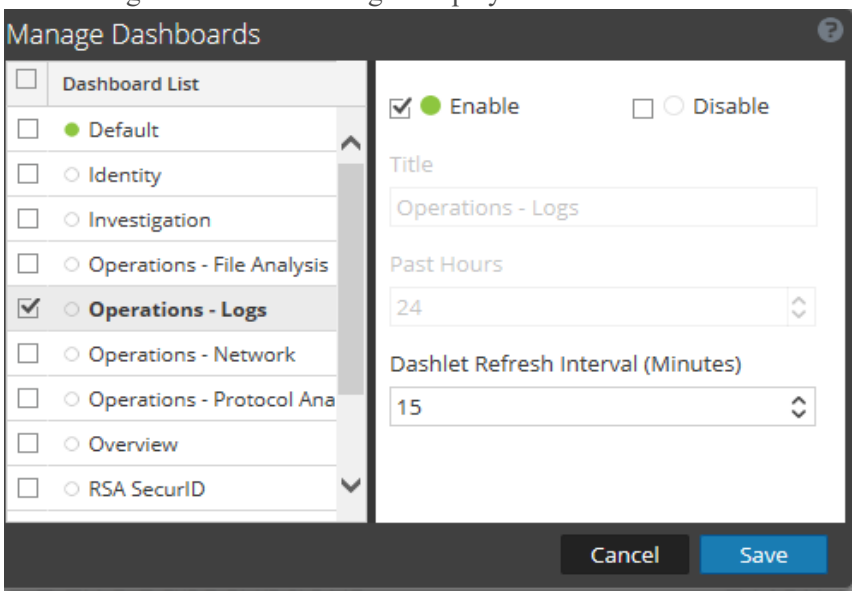
If you select a dashboard that is not enabled, a masked screen is displayed.



To enable one or more dashboard(s):

1. Navigate to the dashboard to be enabled.

2. In the dashboard toolbar, click  (Manage Dashboards).
   The Manage Dashboards dialog is displayed.



3. From the dashboard list, select the dashboards to be enabled.

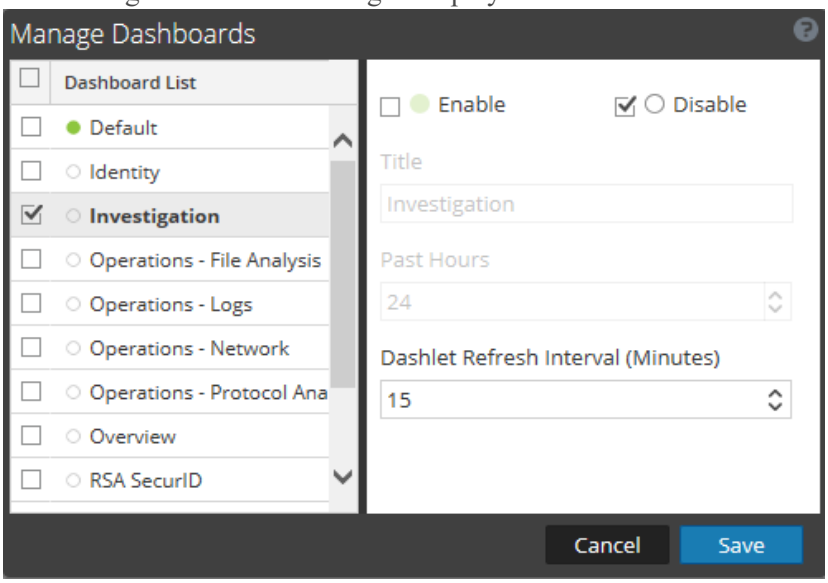
4. Select the **Enable** checkbox.

5. Click **Save**.

Disable a Dashboard

To disable one or more dashboards:

1. Navigate to the dashboard to be disabled.
2. In the dashboard toolbar, click  (Manage Dashboards).
   The Manage Dashboards dialog is displayed.



3. From the dashboard list, select the dashboards to be disabled.
4. select the **Disable** checkbox.
5. Click **Save**.

Setting a Dashboard as a Favorite

To customize the views in NetWitness Platform, you can set a preconfigured or custom dashboard as a Favorite. The NetWitness Platform dashboard offers all NetWitness Platform dashlets. The Favorite dialog sets a specific dashboard as your favorite dashboard and is listed as favorite every time you log in to NetWitness Platform.

1. Navigate to any dashboard.
2. In the dashboard toolbar, click 

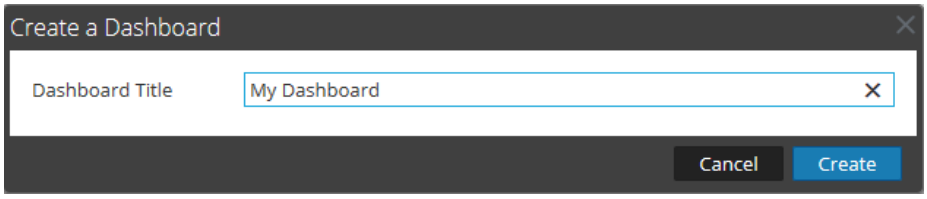
   If the favorite icon is red in color, it indicates that selected dashboard is set as a Favorite and is listed on top above the line.

Creating Custom Dashboards

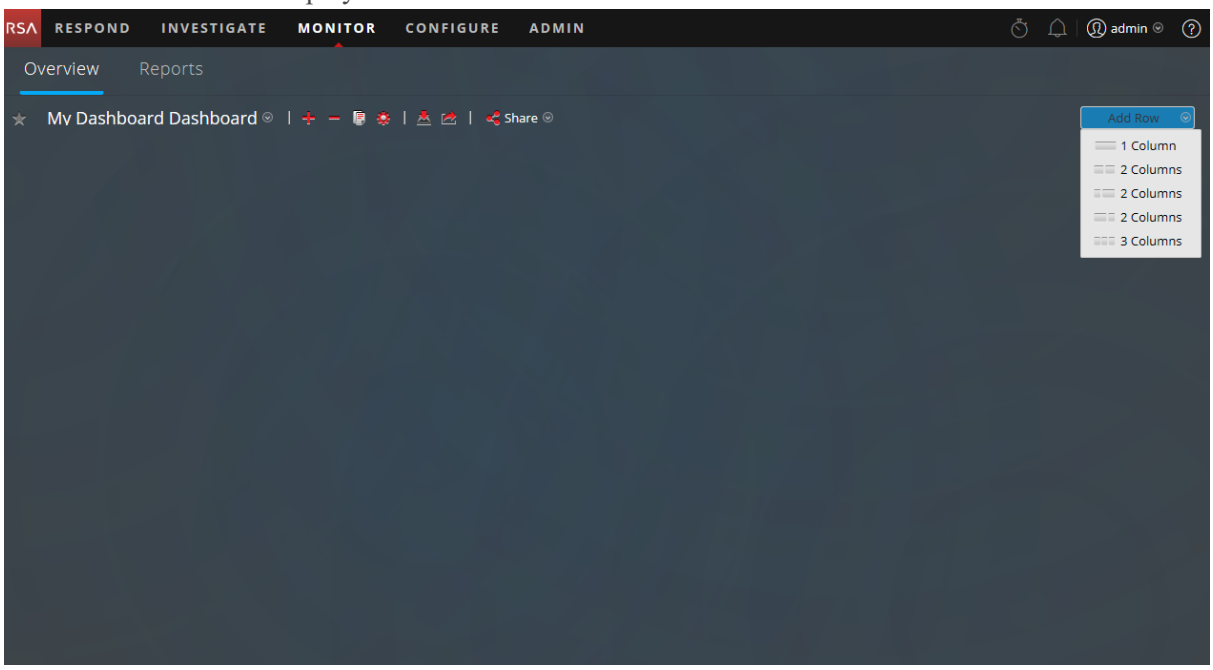
You can create custom dashboards to serve a particular purpose; for example, to represent a specific geographical or functional area of the network. Each custom dashboard is appended to the dashboard selection list.

To create a custom dashboard:

1. In the dashboard toolbar, click  .
   The Create a Dashboard dialog is displayed.

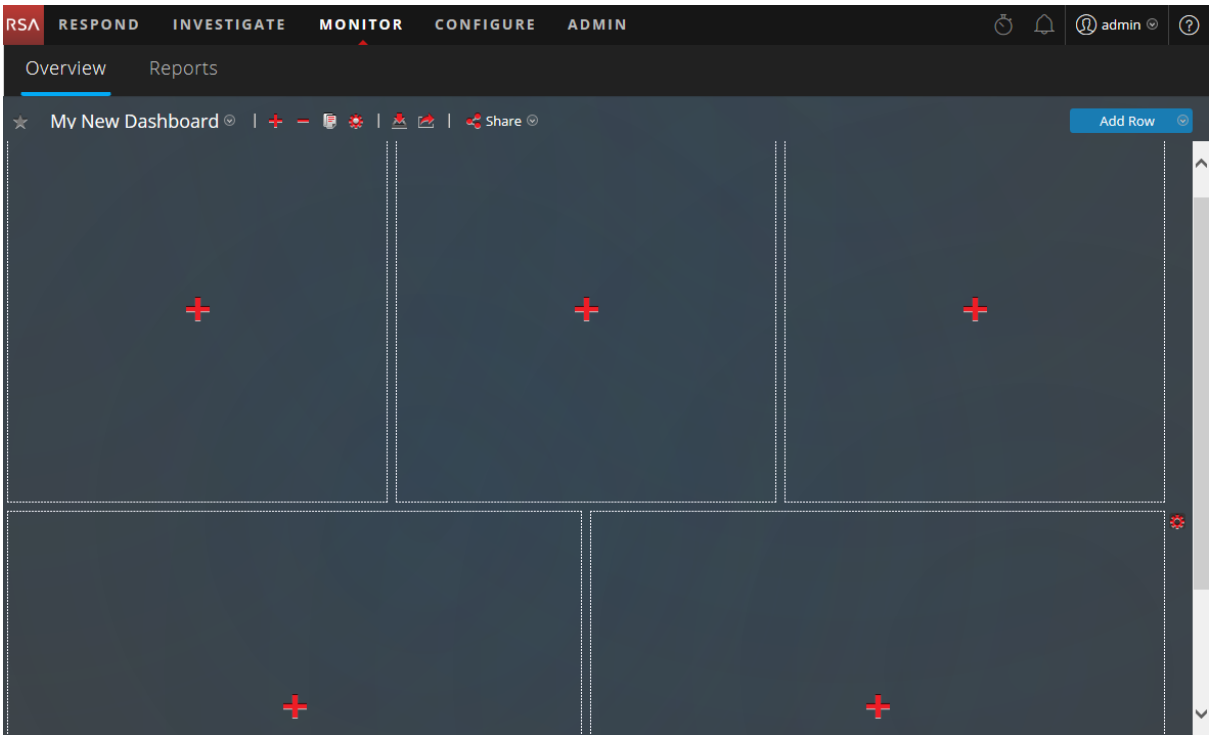


2. Enter a title for the new dashboard and click **Create**.
   The new dashboard is displayed as a blank screen.



3. Add rows to the dashboard, which can contain one or more columns, using the **Add Row** option on the right side of the screen (). Click the desired column configuration in the drop-down list to add one row to the dashboard with the selected number of columns. Repeat the process

to add more rows.



4. You can add any desired dashlets to the dashboard by clicking  in an empty placeholder in a row. For complete details on adding and managing dashlets, see Working with Dashlets.

Once custom dashboards are created, you can:

- Switch between dashboards by selecting an option from the dashboard selection list.
- Delete any custom dashboard.
- Import or export a dashboard.

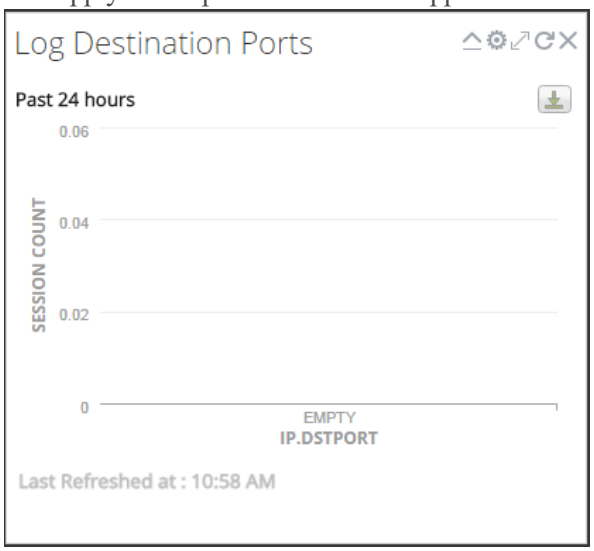
Each dashboard has:

- The dashboard toolbar.
- The dashboard title and the dashboard selection list.
- Zero or more dashlets.

Working with Dashlets

NetWitness Platform uses dashlets to display focused subsets of system information, services, jobs, resources, subscriptions, rules, and other information.

The controls for a dashlet are in the title bar. All dashlets use a common set of controls, and only those that apply to the particular dashlet appear in the title bar of the dashlet.



The following table displays the description of each icon on the dashlet.

Icon	Name	Description
	Collapse vertically	Collapses the dashlet vertically so that only the title is visible.
	Expand vertically	Expands the dashlet to its original size.
	Reload	Reloads the dashlet.
	Settings	Displays configurable settings for the dashlet.
	Maximize	In some dashlets with content that does not fit horizontally within the width of the dashlet, maximizes a chart or a dashlet to full screen.
	Delete	Deletes the dashlet from the dashboard.
Last Refreshed at		Displays the time at which the data is polled from the related chart.

Icon	Name	Description
View More		When clicked, navigates to the corresponding dashboard which is linked to the main dashlet and displays more details. If you have not linked the dashboard to an existing dashlet, this link with not be available on the dashlet. To configure this option, click ⚙, and in the Dashboard Link field select a related dashboard view more details of the specific dashlet. **Note:** This feature is only available for the realtime chart dashlet and the preconfigured dashboards in NetWitness Platform 11.0 or later.

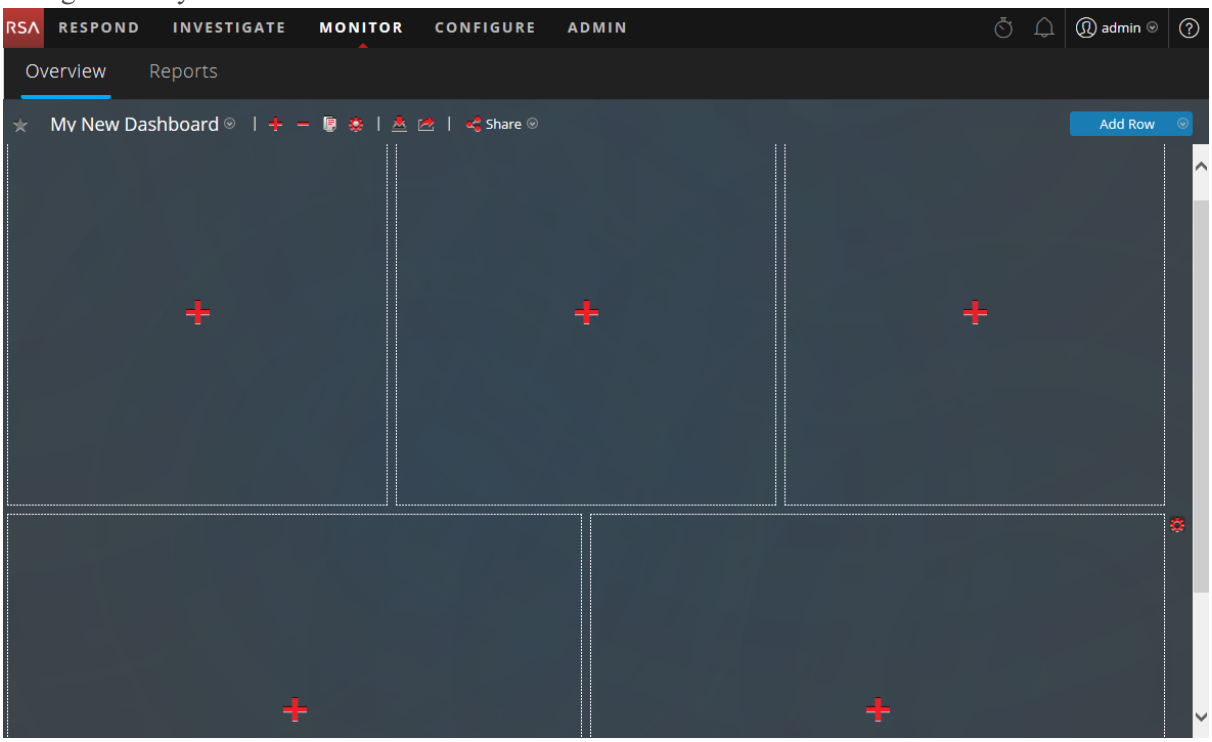
You can add dashlets to the default dashboard or construct a custom dashboard with your own useful set of dashlets to make your workflow more efficient.

Add a Dashlet

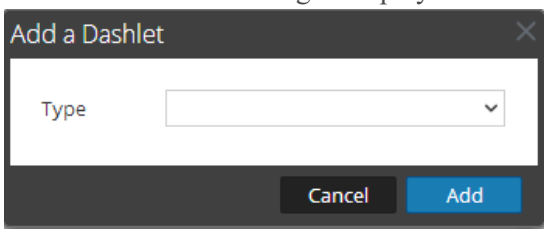
To customize the views in NetWitness Platform, you can add dashlets to a default dashboard or create custom dashboards. However, you cannot add dashlets to preconfigured dashboards.

To add a dashlet:

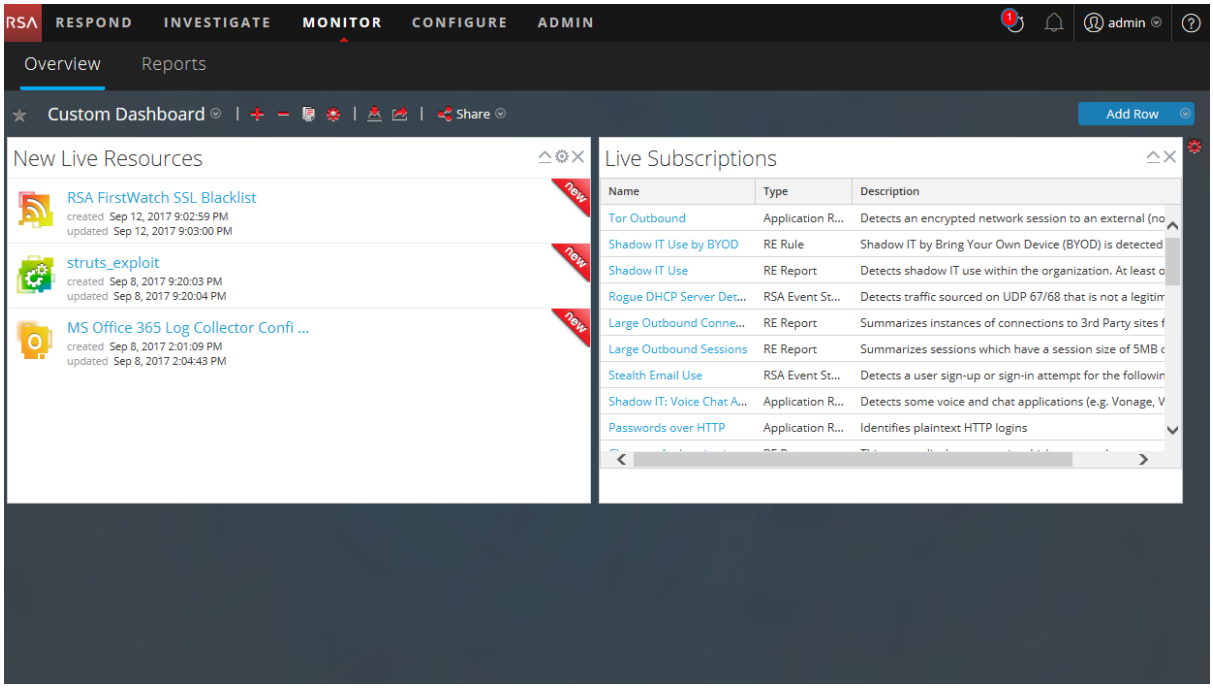
1. Navigate to any dashboard or create a new dashboard.



2. Click  on the placeholder where you want to add the dashlet.
   The Add a Dashlet dialog is displayed.



3. Click the **Type** selection list to view the available dashlets, and select the type of dashlet you want to add. Depending on the type of dashlet you are adding, some configurable fields will be displayed in the **Add a Dashlet** dialog.
4. Type a title for the dashlet. The title can include letters, numbers, special characters, and spaces.
5. If there are additional configurable fields for the dashlet, set appropriate values.
6. When all required fields have been configured, click **Add**.
   The dashlet is added to the dashboard in the selected placeholder and is automatically saved.



Edit Dashlet Properties

All preconfigured dashlets are read-only and their properties cannot be edited. Other dashlets are editable and allow users to customize some aspect of the data displayed in the dashlet. A dashlet with editable properties has a settings (⚙) option that displays all the editing options.

After the dashlets are added, you can drag and drop them and they can be swapped.

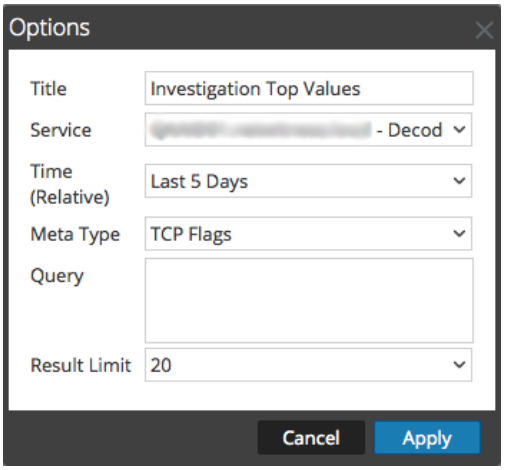
A dashlet without editable properties, such as the Live Subscriptions dashlet, does not display the settings option in the title bar. Many dashlets have an editable title where you can edit the following properties:

- Dashlet display title.
- Type of services to monitor; for example, you can monitor only Decoders, or you can monitor Decoders and Concentrators.

Other dashlets have parameters that you define to specify the kind and amount of information you want to see in the dashlet. For example, a Realtime Chart Dashlet has the settings option.

1. To display and modify the options for a dashlet, click settings (⚙) in the dashlet title bar.

   The Options dialog is displayed.

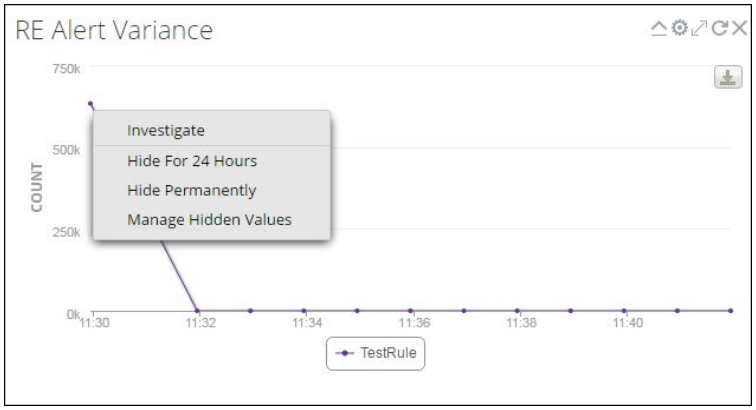


2. Edit any of the displayed properties. For example, in an Investigation Top Values dashlet, you can edit the Result Limit from 20 to 40.
3. Click **Apply**.

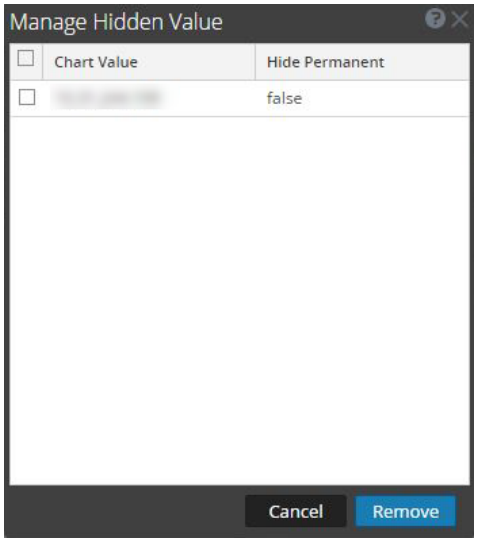
Some dashlets have configuration options to tailor the appearance or the contents of the dashlet. The following options are available for RE Top Alerts, RE Alert Variance, and RE Realtime Charts dashlets on left-click:

- **Hide For 24 Hours**: This option allows you to hide the selected value for the next 24 hours. After 24 hours, the data is automatically displayed on the dashlet, if the value is configured and listed on top.
- **Hide Permanently**: This option allows you to hide the selected value permanently until you add it

back using the Manage Hidden Values option.



- **Manage Hidden Values**: This option displays a list of all the hidden values. You can select the checkbox for a value and click **Remove** to view the data back on the chart.



Note: The options to Hide for 24 Hours, Hide Permanently, and Manage Hidden Values are not available for Geomap charts.

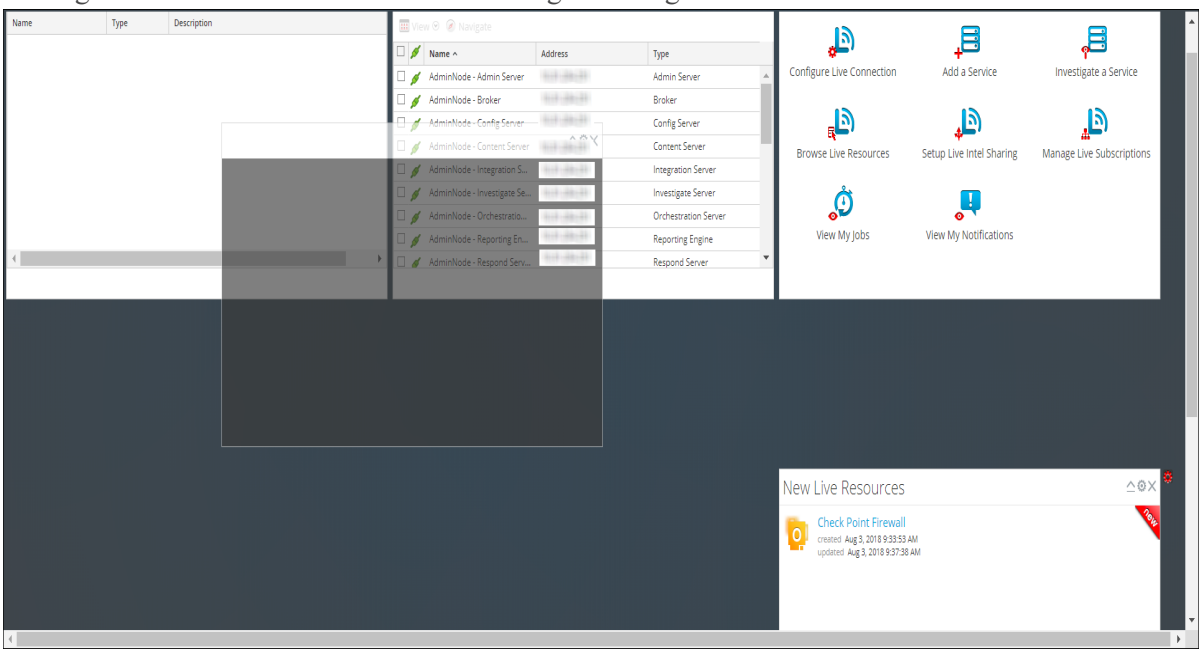
Note: When you edit a value in a preconfigured dashboard, it is a user-specific change. The changes made to a preconfigured dashboard are applicable only to your dashboard and cannot be viewed by other users who use the same preconfigured dashboard. For example, if you hide a value in an overview dashboard, the change is applicable only to your dashboard. If another user views the same overview dashboard, the value is still displayed. The same applies to a custom dashboard. When you hide a value in the custom dashboard and share the same dashboard with another user, the values are still displayed even though the dashboard is shared.

For more information on available dashlets, see the Dashboards Catalog in the RSA Content space on RSA Link.

Rearrange a Dashlet

You can arrange dashlets according to your preference by dragging and dropping them into a different order on the dashboard.

1. To move a dashlet, hover in the header of the dashlet that you want to move.
   The directional cursor appears over the dashlet. Click and hold in the header of the dashlet that you want to move.
2. Continue to hold the left mouse button and drag the window toward the new location.
   The figure below shows a dashlet as it is being re-arranged.



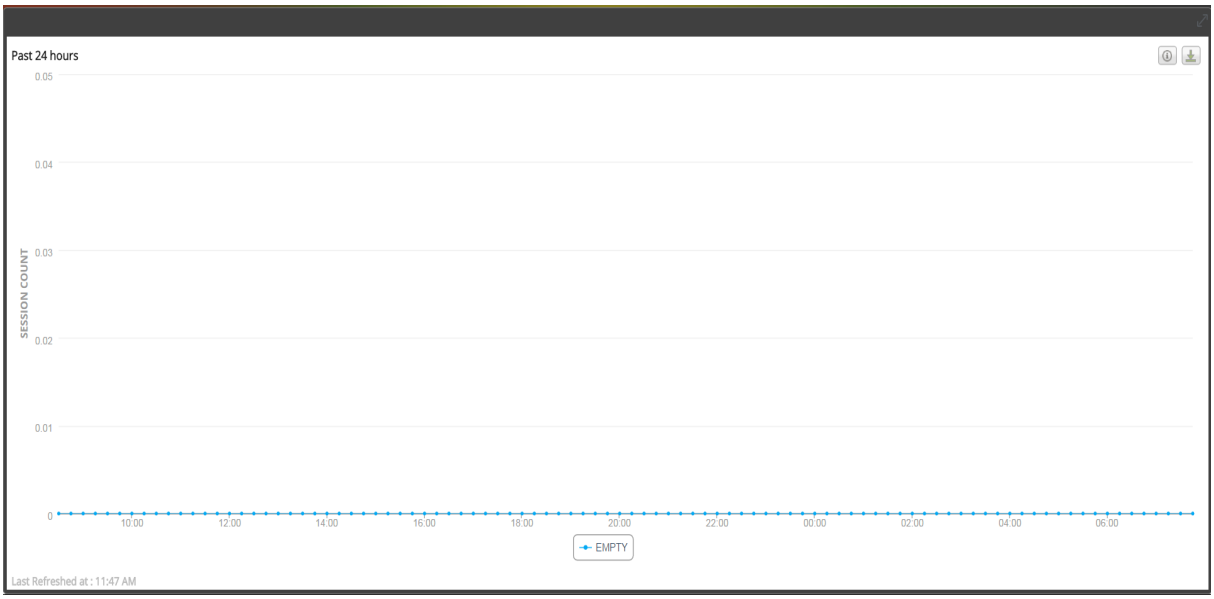
3. Release the mouse button when the dashlet is in the desired location.
   The dashlet that currently occupies that position moves down.

Maximize a Single Dashlet

This section explains how to open a dashlet on the entire area of the main NetWitness Platform dashboard with the same dashlet title. Dashlets that have a lot of columns or charts, for example some Reporting dashlets, are easier to view when maximized so that the entire contents is visible without scrolling.

To maximize a dashlet, click the maximize control icon in the dashlet title bar: ⤢. The dashlet is displayed on full screen.

To minimize a dashlet, click the same control icon in the dashlet title bar: ⤢. The dashlet is restored to previous size.



Delete a Dashlet

1. Click ✕ in the dashlet title bar:
   A confirmation pop-up is displayed to confirm if you want to delete the dashlet.
2. Click **Yes**, if you want to delete. The dashlet is removed from the dashboard.
   Click **No**, if you do not want to delete.

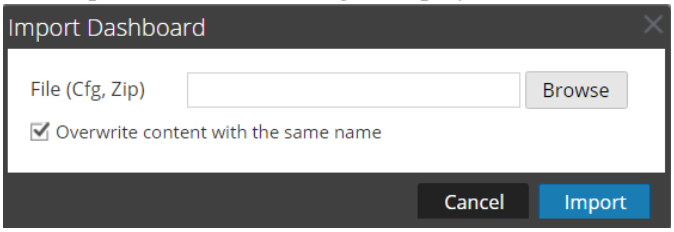
Note: After you remove the dashlet, the empty space is replaced by a placeholder where you can add another dashlet using the above Add a Dashlet procedure.

Importing and Exporting Dashboards

The ability to customize dashboards to changing circumstances and conditions could result in a large number of dashboards that are not needed on a daily basis. Rather than reinvent the wheel each time you want to recreate a particular custom dashboard, you can export your dashboards that are not currently in use. When you are ready to use a previously exported dashboard, import the dashboard into NetWitness Platform.

Import a Dashboard

1. In the dashboard toolbar, click (Import Dashboard).
   The Import Dashboard dialog is displayed.



2. Browse to the dashboard file in the **Import Dashboard** dialog. You can import .cfg and .zip files.
3. Click **Import**.
   The dashboard is displayed in NetWitness Platform

Note: If you import a dashboard from Security Analytics 10.6. x into NetWitness Platform11.x, the dashboard and the associated rules and charts must be imported separately. But when you import a dashboard from NetWitness Platform11.x into NetWitness Platform, the dashboard and all the rules and charts associated with it are imported in .zip format.

Export a Dashboard

Note: When you export a Reporter Realtime dashboard, the corresponding Reporting Engine contents is also exported.

Exported dashboards are designed to work within the same NetWitness Platform instance. It is also possible to share your custom dashboards with other users in your organization, provided they have equivalent permissions.

To export a dashboard, you must have the dashboard open to access the Export Dashboard option under the Edit drop-down menu in the dashboard toolbar.

1. Navigate to the dashboard that you want to export. All existing dashboards appear in the drop-down **Dashboard Selection List** in the currently displayed dashboard.
2. In the dashboard toolbar, click  (Export Dashboard).
   The exported file is saved in .zip format.

Note: The Export feature is not applicable for preconfigured dashboards.

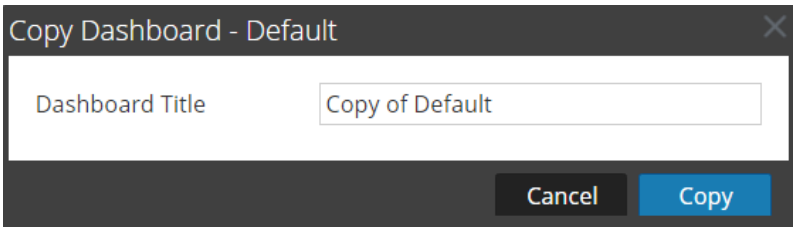
Copying a Dashboard

To customize the views in NetWitness Platform, you can copy dashboards to the NetWitness dashboard or a custom dashboard. The NetWitness Platform dashboard, as the name suggests, offers all NetWitness Platform dashlets. The Copy Dashboard dialog creates a duplicate dashboard, which can be customized. When you copy a dashboard, the default name is prefixed with `Copy of`. For example, if the name of the original dashboard is `XYZ`, the default title of the copied dashboard will be `Copy of XYZ`.

To copy a dashboard:

1. Navigate to any dashboard.
2. In the dashboard toolbar, click  .
   The Copy Dashboard dialog is displayed. The following screenshot is an example of copying a

dashboard.



3. Enter the Dashboard Title.
4. Click **Copy**.

Sharing a Dashboard

In NetWitness Platform, as an administrator you can share dashboards for viewing purposes with other roles such as Administrators, Analysts, Operators and so on. When you share a dashlet, the users can only view the dashboard, make dashboard as favorite, copy the dashboard, and export the dashboard. In case of other roles such as Analysts, Operators, and so on, you can share the dashboard only with similar roles. For example, an analyst can share a dashboard with other analysts only.

1. Navigate to any dashboard.
2. In the dashboard toolbar, click 

and select the checkbox of the role with whom you want to share the dashboard.

Note: If you do not want to share the dashboard, clear the checkbox of the role.

Managing Jobs

Inevitably, there are on-demand or scheduled tasks in RSA NetWitness® Platform that take a few minutes to be completed. The NetWitness Platform jobs system lets you begin a long-running task and continue using other parts of NetWitness Platform while the job is running. Not only can you monitor the progress of the task, but you can also receive notifications when the task has completed and whether the result was a success or failure.

While you are working in NetWitness Platform, you can open a quick view of your jobs from the toolbar. You can look anytime, but when a job status has changed, the Jobs icon ( ) is flagged with the number of running jobs. Once all jobs are completed, that number disappears.

You can also see the jobs in these two views:

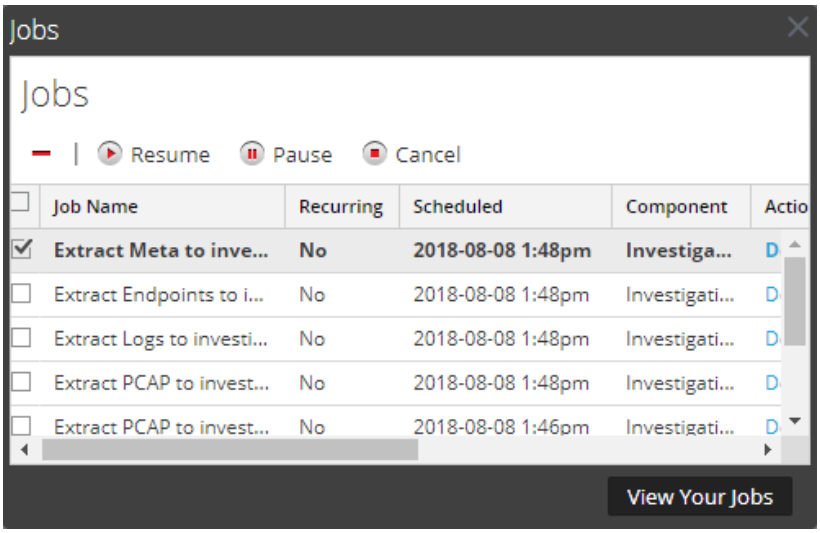
- In the user Profile Jobs panel, you see the same jobs in a full panel. These are only your jobs.
- In the System view, users with administrative privileges can view and manage all jobs for all users in a single jobs panel.

The structure of the jobs panel is the same in all views.

Display the Jobs Tray

In the NetWitness Platform toolbar, click the Jobs icon ( ).

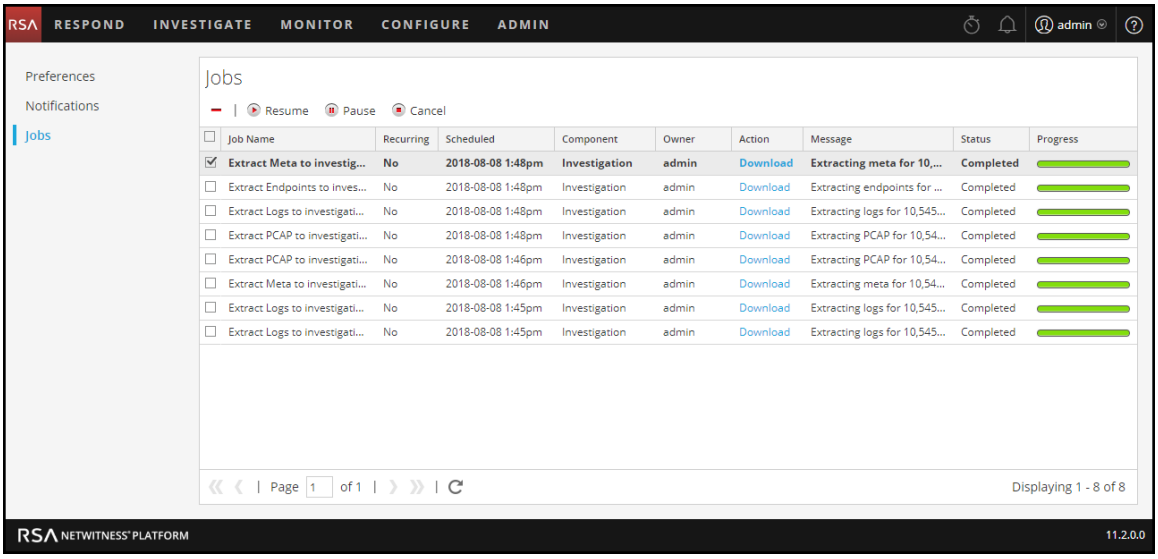
The Jobs Tray is displayed.



The Jobs Tray lists all recurring and non-recurring jobs that you own, using a subset of the columns available in the Jobs panel. Otherwise the Jobs Tray and the user Profile view Jobs panel are the same. In the Admin System view, the Jobs panel lists information about all NetWitness Platform jobs for all users.

View All of Your Jobs

To see a complete view of your jobs, in the Jobs tray, click **View Your Jobs**.
The Jobs panel is displayed.



Pause and Resume Scheduled Execution of a Recurring Job

The Pause and Resume options apply only to recurring jobs. You can pause a recurring job that is running; however, it has no effect on that execution. The next execution (assuming the job is still paused) is skipped.

1. To stop the next execution of a recurring job, in any **Jobs panel**, select the job, and click **Pause**.
   The next execution of the job is skipped, and the schedule is paused until you click Resume.
2. To restart execution of paused recurring jobs, select the job and click **Resume**.
   The next execution of the job occurs as scheduled, and the schedule for the job resumes.

Cancel a Job

To cancel jobs that are executing or in the queue to execute:

1. In the **Jobs Tray** or either **Jobs** panel, select one or more jobs.
2. Click **Cancel**.
   A confirmation dialog is displayed.
3. Click **Yes**.
   The jobs are canceled, and the entries remain in the list with a status of **canceled**.

   If you cancel a recurring job, it cancels that execution of the job. The next time the job is scheduled to run, it executes normally.

Delete a Job

Caution: When you delete a job, the job is instantly deleted from the list. No confirmation dialog is offered. If you delete a recurring job, all future executions are removed as well.

Users can delete their own jobs before, during, or after execution. Administrators can delete any job. To delete jobs:

1. Select one or more jobs.
2. Click .
   The jobs are deleted from the list.

Download a Job

When a job has the Download status in the Action column, you can download the result of the job. If you are working in the Investigate view and extract the packet data for a session as a PCAP file or extract the payload files (for example, Word documents and images) from a session, a file is created. To download the file to your local system, click **Download**.

Viewing and Deleting Notifications

While you are working in RSA NetWitness® Platform, you can view recent system notifications without leaving the area where you are working. You can open a quick view of notifications from the NetWitness Platform toolbar. You can look anytime, but when a new notification is received, the Notifications icon is flagged ( ).

Examples of notifications include:

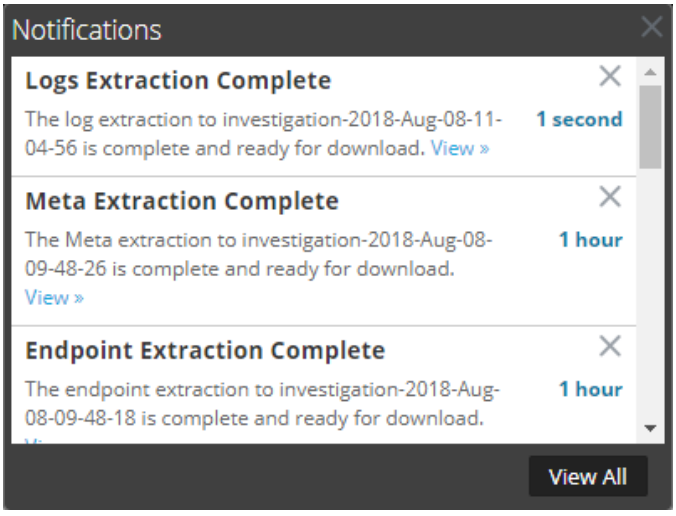
- A host upgrade completed.
- A parser push to decoders completed.
- A newer software version is available.

You can see notifications in these two views:

- In the Notifications tray, you can see your recent notifications.
- In the user Profile Notifications panel, you can view all of your notifications.

View Recent Notifications

To display recent notifications, click the Notifications icon ( ).
The Notifications tray is displayed.

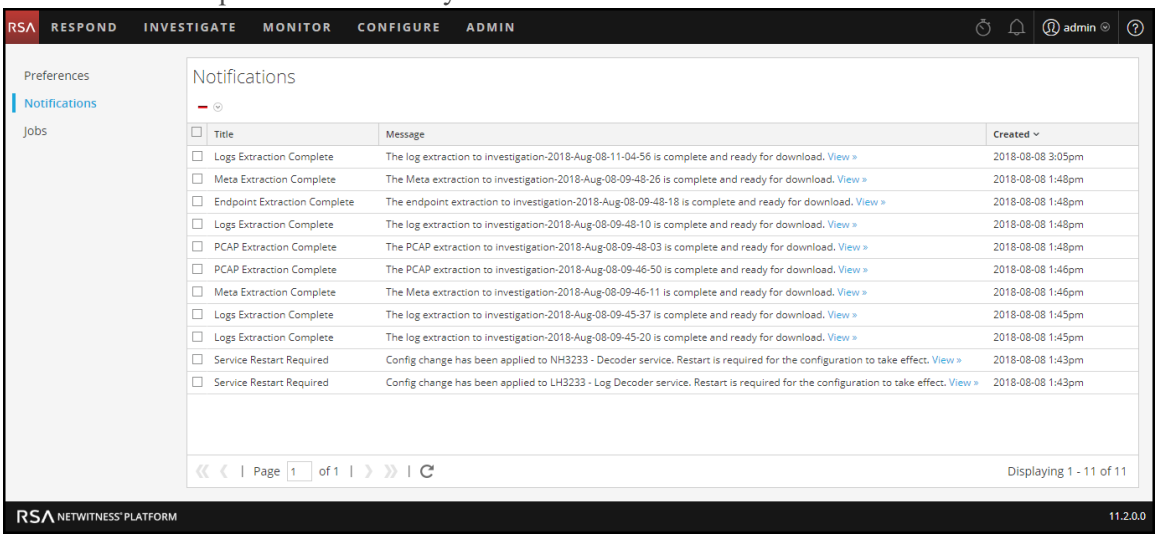


View All of Your Notifications

To view all of your notifications, do one of the following:

- Click  to open the Notifications tray and then click **View All** in the Notifications tray.
- In the upper right corner of the NetWitness Platform browser window, select  **> Profile** and then in the options panel of the Preferences dialog, select **Notifications**.

The Notifications panel shows all of your notifications.



Delete Notification Records

To delete notification records:

1. In the **Profile Notifications** list, select the notifications that you want to delete.
2. Click .

   The selected notifications are deleted from this list and from the Notifications tray.

Viewing Help in the Application

There are different ways available to get help while using RSA NetWitness® Platform. You can use inline help, tooltips, and online help links.

View Inline Help

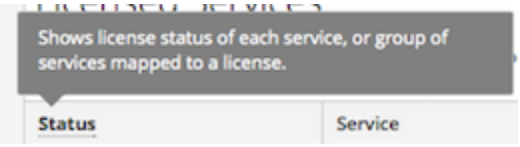
Inline help provides additional information about what to do in sections or fields that you are currently viewing in the NetWitness Platform user interface. To display inline help, hover over . The inline help shows a brief description of the element.

Inline help example:

View Tooltips

Tooltips are a quick way for you to see a description of the text or additional information about an action, field, or parameter. Tooltips appear as underlined text. To display the tooltip and see a brief description of the term, hover over the underlined text.

Tooltip example:

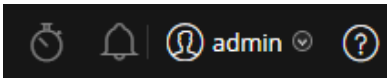


View Online Help

Online help links take you outside of NetWitness Platform to the RSA Link online documentation. This site has a complete documentation set for NetWitness Platform, and the links take you directly to the topic that describes the part of the user interface currently in view.

To view the online help topic for the current location, click in the NetWitness Platform toobar or in a dialog. The relevant help topic is displayed in a separate browser window. The topic describes the features and functions of the current view or dialog. From that topic, you can quickly navigate to the related procedures.

The following figure is an example of the online help icon in the NetWitness Platform toobar.



Finding Documents on RSA Link

The RSA NetWitness® Platform documentation is located on RSA Link, the RSA support portal and community. RSA Link brings all of your RSA resources together in one place. It includes advisories, product documentation, knowledge base articles, downloads, and training. To view a *Guided Tour of RSA Link*, see https://community.rsa.com/videos/21554.

Locate NetWitness Platform Documentation

NetWitness Platform Logs and Networks documentation is at the following link: https://community.rsa.com/docs/DOC-40370

To navigate to NetWitness Platform Logs and Networks documentation:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. On the RSA NetWitness Platform page, click **DOCUMENTATION** and select **RSA NETWITNESS LOGS AND NETWORK**.

To navigate to NetWitness Endpoint 4.x documentation:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. On the RSA NetWitness Platform page, click **DOCUMENTATION** and select **RSA NETWITNESS ENDPOINT**.

Locate RSA Content

RSA Content is at the following link: https://community.rsa.com/community/products/netwitness/rsa-content

To navigate to RSA Content:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. On the RSA NetWitness Platform page, click **DOCUMENTATION** and select **ADDITIONAL RESOURCES** > **RSA LIVE CONTENT**.

Locate RSA Supported Event Sources

RSA Supported Event Sources are at the following link: https://community.rsa.com/community/products/netwitness/parser-network/event-sources

To navigate to RSA Supported Event Sources:

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. On the RSA NetWitness Platform page, click **DOCUMENTATION** and select **ADDITIONAL RESOURCES** > **EVENT SOURCE CONFIGURATION**.

Locate Hardware Setup Guides

The Hardware Setup Guides are at the following link:
https://community.rsa.com/community/products/netwitness/hardware-setup-guides

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. On the RSA NetWitness Platform page, click **DOCUMENTATION** and select **ADDITIONAL RESOURCES** > **HARDWARE SETUP GUIDES**.

Find Documents Using NetWitness Navigator

You can search for desired RSA NetWitness Platform documentation in RSA Link using the NetWitness Navigator tool.

1. On the RSA Link homepage (https://community.rsa.com), click **RSA NETWITNESS PLATFORM**.
2. Under PRODUCT RESOURCES (right side of page) click **RSA NetWitness Navigator**.
3. Select desired search criteria from the available options. When searching for documentation, you should select **User Documentation** as the Content Type. Also, the Cost option is ignored for user documentation.
4. Click **VIEW RESULTS** to view a list of matching documents.
5. Click **RESET OPTIONS** to clear your previous search options.

Follow Content for Updates

You can follow pages or documents to be notified of changes.

1. Log in to RSA Link.
2. Navigate to a page or a document and in the top right corner select either **Follow** or **Actions** > **Follow**.

Send Your Feedback to RSA

Your feedback is very important to us and helps us to provide a better experience for our customers. Please send your suggestions to sahelpfeedback@rsa.com.

NetWitness Platform Getting Started References

The following section contains user interface reference information related to getting started with the NetWitness Platform application.

- User Preferences
- Notifications Panel and Notifications Tray
- Jobs Panel and Jobs Tray

User Preferences

To adjust RSA NetWitness® Platform to best fit your environment and work practices, you can set your own global application preferences. You can:

- Change the application language
- Set the application time zone
- Set the date and time formats
- Select your default NetWitness Platform starting location
- Select your default Investigate view
- Choose a dark or light theme for the application
- Change your password
- Enable notifications
- Enable context menus
- Change Investigate preferences - Described in the *NetWitness Investigate User Guide*.

Your global preference options vary depending on whether you access them from the Respond view or other views, such as Investigate, Monitor, Configure, and Admin. There are two global user preferences dialogs accessible from the main menu bar:

- **User Preferences** dialog: Accessible from Respond and the following Investigate views: Event Analysis, Hosts, Files, and Users.
- **Preferences** dialog: Accessible from most other views.

What do you want to do?

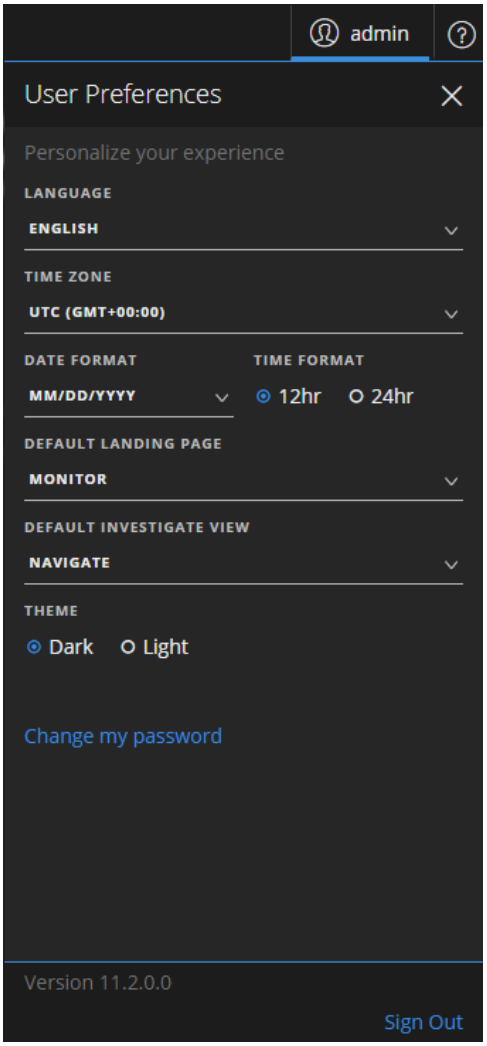
Role	I want to ...	Show me how
All	Change my Password	Change My Password
All	Choose my Default Landing Page	Setting up Your Default View by SOC Role
All	Set my User Preferences	Setting User Preferences

Related Topics

- NetWitness Platform Basic Navigation

User Preferences (Respond and Some Investigate views)

To access your user preferences, click .
The User Preferences dialog shows your current preferences and the NetWitness Platform version.



The following table describes the global application preference options that you can access from the User Preferences dialog.

Option	Description
Language	(This option applies to NetWitness Platform 11.2 and later.) Sets the preferred language for the entire NetWitness Platform. The default language is English (United States).
Time Zone	Sets the time zone to use in NetWitness Platform.

Option	Description
Date Format	Sets the format for the order of the display of the month (MM), day (DD), and year (YYYY). For example, the MM/DD/YYYY format shows the date as 05/11/2017.
Time Format	Sets the time as 12-hour or 24-hour time. For example, 2:00 PM in 12-hour time is 14:00 in 24-hour time.
Default Landing Page	Enables you to select the default view when you log in to NetWitness Platform. You can choose Respond, Investigate, Monitor, Configure, and Admin according to your user role. For example, you can choose Respond to go directly to the relevant section of the application for Incident Responders. This selection sets the default view for the entire application.
Default Investigate View	(This option applies to NetWitness Platform 11.1 and later.) Select the default landing page for the Investigate view. You can choose Navigate, Events, Event Analysis, Hosts, Files, Users, or Malware Analysis as the default Investigate view. For example, you can choose Events for the default Investigate view to go directly to the Events page to view the events generated for a service.
Theme	(This option applies to NetWitness Platform 11.1 and later.) Changes the appearance of the Respond view and some Investigate views that you see in the application. You can choose between light and dark themes: • **Dark**: The dark theme is best for darker environments or when you do not need as much contrast. • **Light**: The light theme is best for lighter environments, when you need more contrast, or when you are projecting the application for others to view. Since some views are not affected by the theme changes, you may want to choose the light theme for a more cohesive viewing experience. Your selection only changes how NetWitness Platform appears to you, not other users.
Change my password	Opens the Preferences dialog where you can change your password.
Version	Shows the NetWitness Platform version.
Sign Out	Enables you to log out of NetWitness Platform.

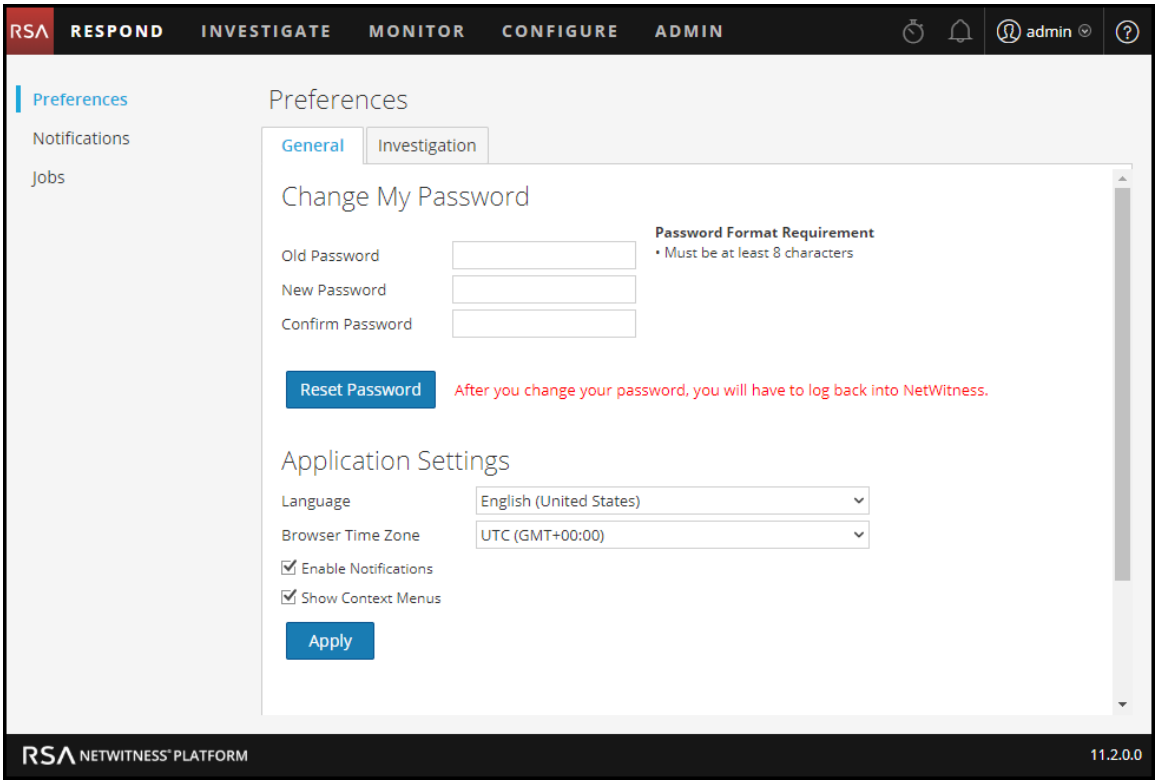
Any selections that you make become effective immediately.

Preferences

To access additional global user preferences, do one of the following:

- For most views, such as Investigate, Monitor, Configure, or Admin, go to > **Profile**.
- In the Respond and some Investigate views (Event Analysis, Hosts, Files, and Users), select and in the User Preferences dialog click **Change my password**.

The Preferences dialog shows your current preferences.



The following tables describe the global application preference options that you can access from the Preferences dialog.

Change My Password

This section enables you to change your password. Your administrator defines the appropriate password strength requirements for your NetWitness Platform password, such as minimum password length and minimum number of uppercase, lowercase, decimal, non-Latin alphabetic, and special characters. These requirements are then displayed when changing your password.

The following tables describes the options in the Change My Password section.

Option	Description
Old Password	Enter the password that you used to log in to NetWitness Platform.
New Password	Enter the password that you want to use for the next login.

Option	Description
Confirm Password	Retype the new password.
Reset Password	Updates your user profile with the new password. You will be logged out of NetWitness Platform for the changes to take effect. The new password becomes effective the next time you log in to NetWitness Platform. The password change is applied to your system login and to all NetWitness Platform services on which your account has been added.

If you changed your password, you will be logged out of NetWitness Platform for the changes to take effect. The new password becomes effective the next time you log in to NetWitness Platform.

Application Settings

The following tables describes the options in the Application Settings section.

Option	Description
Language	(This option applies to NetWitness Platform 11.2 and later.) Sets the preferred language for the entire NetWitness Platform. The default language is English (United States).
Browser Time Zone	Sets the time zone to use in NetWitness Platform. Your time zone preference is displayed on the toolbar.
Enable Notifications	This checkbox enables and disables notifications for your user account. By default, NetWitness Platform system notifications are enabled when a new user account is created.
Enable Context Menus	This checkbox enables and disables context menus for your user account. By default, context menus are enabled when a new user account is created. Context menus provide additional functions for specific views when you right-click in a view.
Apply	Updates your preferences and applies the changes immediately.

Notifications Panel and Notifications Tray

RSA NetWitness® Platform provides system notifications to advise users about certain actions or conditions:

- A host upgrade completed.
- A parser push to decoders completed.
- A service went down (critical log of a certain type).
- A visualization completed.
- A report completed.
- A newer software version is available.

While you are working in NetWitness Platform, you can view recent system notifications without leaving the area where you are working. You can open a quick view of notifications from the NetWitness Platform toolbar. You can look anytime, but when a new notification is received, the Notifications icon is flagged ().

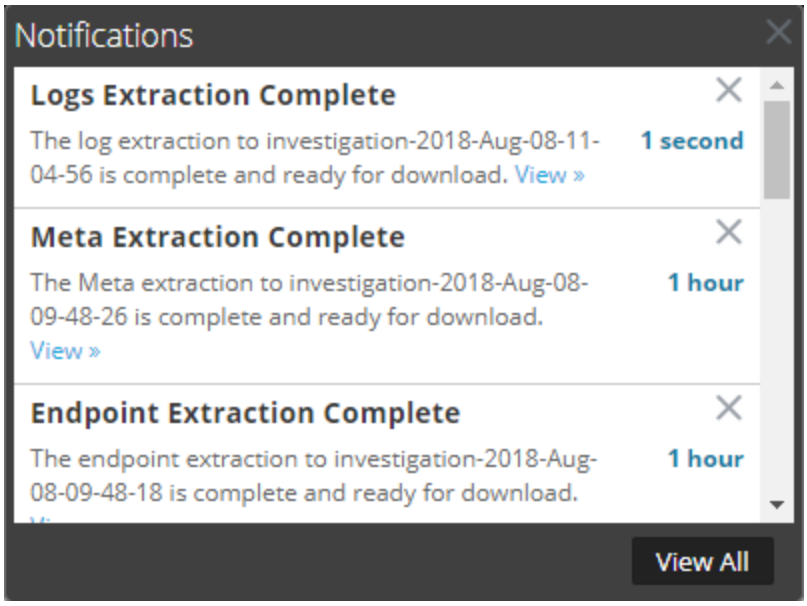
When you are viewing notifications in the Notifications tray, only recent notifications are displayed. You can access all of your notifications from your user Profile and from the Notifications tray by selecting the View All option. Procedures for viewing notifications are provided in Viewing and Deleting Notifications.

What do you want to do?

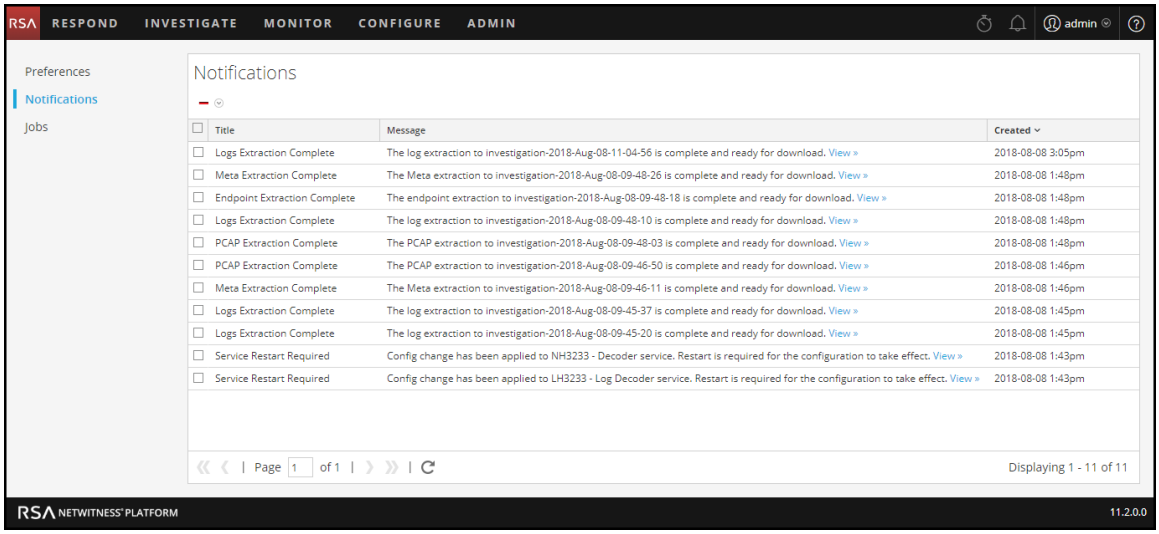
Role	I want to ...	Show me how
All	View all notifications	Viewing and Deleting Notifications
All	Delete notifications	Viewing and Deleting Notifications

To access the Notifications panel, do one of the following:

- Click  to open the Notifications tray and then click **View All** in the Notifications tray.



- In the upper right corner of the NetWitness Platform browser window, select  > **Profile** and then in the options panel of the Preferences dialog, select **Notifications**.
  The Notifications panel is displayed.



The Notifications tray shows your recent notifications. It contains a subset of the information in the Notifications panel. The Notifications panel shows all of your notifications. The following table describes the Notifications panel and Notifications tray features.

Feature	Description
	(Notifications panel only) Displays a drop-down menu where you can delete the selected notification or all of your notifications in the Notifications panel and in the Notifications tray.
Title	The title of the notification, for example, **Logs Extraction Complete**.
Message	The entire message, for example, **The log extraction to Investigation is complete and ready for download.**
View	Some messages include a **View** link that displays a view where you can take action. For example, if there is a file to download, clicking this link opens the Jobs panel, the view where you can download the file.
Created	The date and time the notification was created. In the Notifications tray, it shows the number of hours or days since the notification was created.
View All	(Notification tray only) Opens the Notifications panel, which lists all of your notifications.

Jobs Panel and Jobs Tray

Jobs are started by various RSA NetWitness® Platform components; for example, downloading Content Management System (CMS) resources from Live Services and extracting logs, meta, and PCAP files from NetWitness Investigate.

In the ADMIN > System view, Administrators can manage all NetWitness Platform jobs in the Jobs panel. Other non-administrative users can view their own jobs in the user Profile Jobs panel.

In addition, while working in NetWitness Platform, you can open a quick view of your jobs from the NetWitness Platform toolbar. When a job status has changed, the Jobs icon () is flagged with the number of running jobs. Once all jobs are completed, that number disappears.

In the Jobs panel, you can:

- View and sort the jobs
- Pause or resume a job
- Cancel a job
- Delete a job
- Download a job

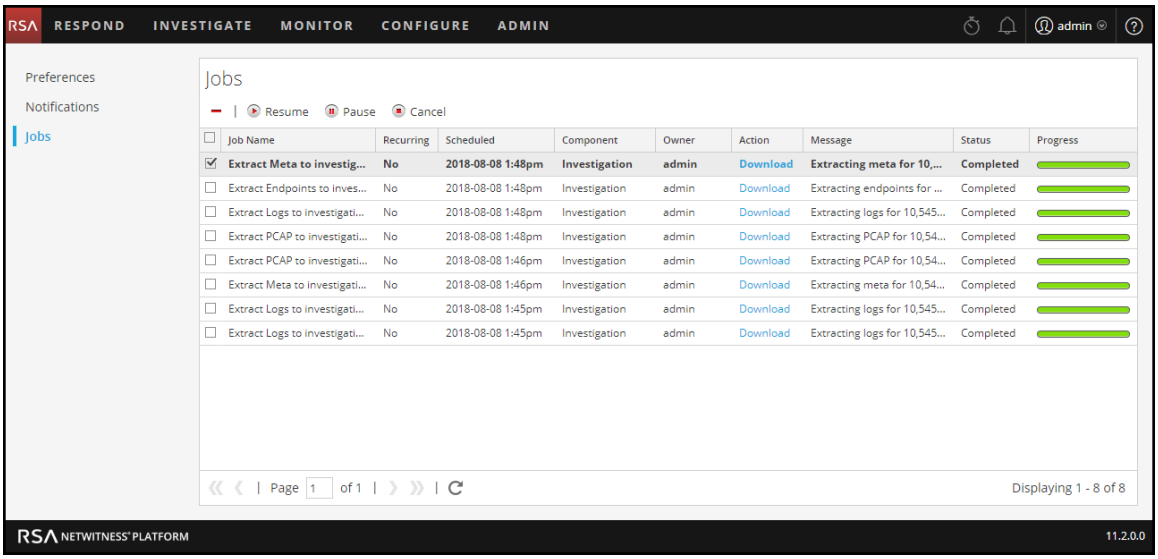
The structure of the jobs panel is the same in all views.

What do you want to do?

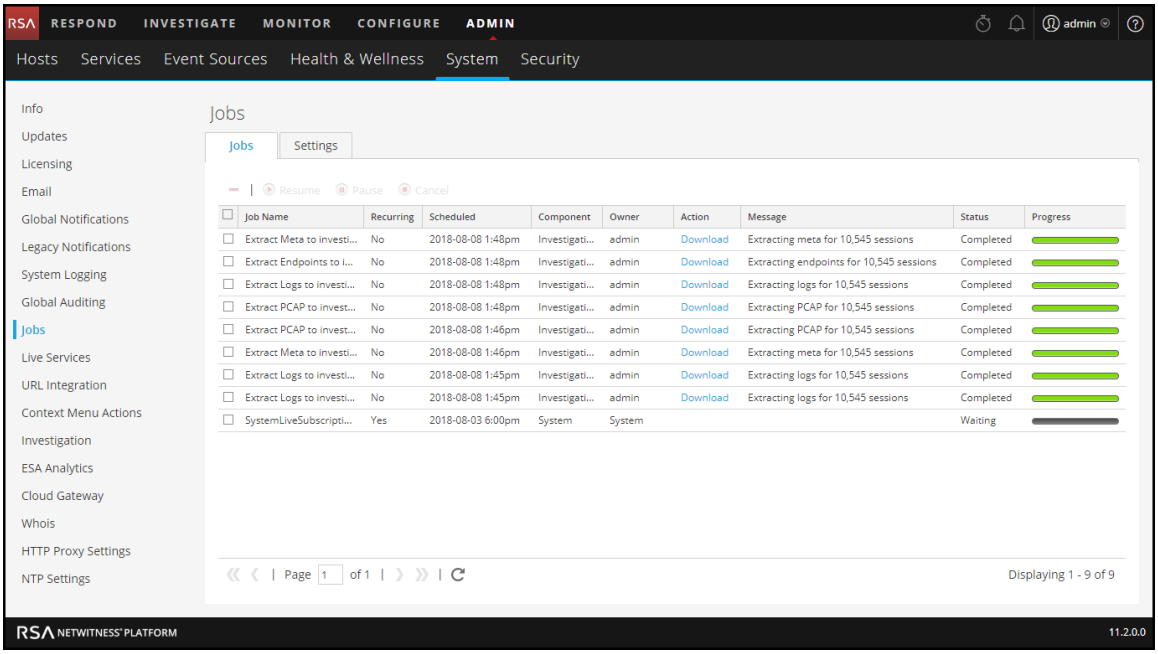
Role	I want to ...	Show me how
All	Pause and Resume a Scheduled Job	Managing Jobs
All	Cancel or Delete a Job	Managing Jobs
	Download a Job	Managing Jobs

To access the Jobs panel, do one of the following:

- In the upper right corner of the NetWitness Platform browser window, select  > **Profile** and then in the options panel of the Preferences dialog, select **Jobs**.
  The Jobs panel is displayed. It shows the jobs of a particular user.

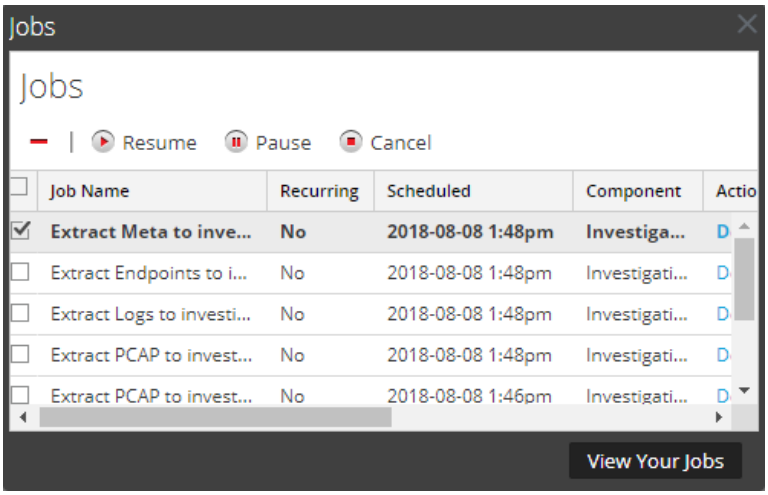


- Go to **ADMIN > System**, and in the options panel, select **Jobs**.
  The Jobs panel in the Admin System view is displayed. It shows the jobs for all users.



The Jobs panel organizes information about jobs into a list. The columns present a job progress bar, the job name, an indication that the job is recurring or not recurring, the NetWitness Platform component that is controlling the job, the owner of the job, the status, any associated message, and a download button to allow downloading of a job's packet capture files or payload files.

To display the Jobs tray, click the **Jobs** icon  .



The Jobs tray lists all jobs that you own, recurring and non-recurring, using a subset of the columns available in the **Jobs** panel. Otherwise the Jobs tray and the user Profile Jobs panel are the same. In the Admin System view, the Jobs panel lists information about all NetWitness Platform jobs for all users.

The following table describes the available options in the Jobs panel.

Option	Description
Resume	The Resume option applies only to recurring jobs that have been paused. When you resume a paused job, the next execution of the job executes as scheduled.
Pause	The Pause option applies only to recurring jobs. When you pause a recurring job that is running, it has no effect on that execution. The next execution (assuming the job is still paused) is skipped.
Cancel	Cancels a recurring or non-recurring job. You can cancel a job while it is running. If you cancel a recurring job, it cancels that execution of the job. The next time the job is scheduled to run, it executes normally.
—	Deletes a recurring or non-recurring job from the Jobs panel. When you delete a job, the job is instantly deleted from the Jobs panel. No confirmation dialog is offered. If you delete a recurring job, all future executions are removed as well.

The following table describes the Jobs tray and Jobs panel columns.

Feature	Description
Selection box	Enables you to select one or more jobs.
Job Name	Displays the name of the job; for example, **Extract Files** or **Upgrade Service**.
Recurring	Indicates whether the job is recurring or non-recurring. **Yes** = recurring, **No** = non-recurring.
Scheduled	Indicates the date and time at which the job was scheduled to begin.
Component	Indicates the component in which the job originated; for example, **Investigation** or **Administration**.
Owner	Indicates the owner of the job. The owner of the job is not included in the default **Jobs Tray**, because only the current user's jobs are displayed here. The column is available to add.
Action	Views the job in another view or downloads job files for the job to the default **Downloads** directory on the local system. Only successfully completed jobs have the **View** link in the **Action** column. Only jobs that create a file have the **Download** link in the **Action** column.
Message	Displays additional information about the job; for example, **Extracting files** or **No sessions found.**
Status	Indicates the status of the job. Common values for status are **Paused**, **Running**, **Canceled**, **Failed**, **Completed**, and other status values are possible.
Progress	Shows the percentage complete for a job.
View Your Jobs	(Jobs tray only) Displays your jobs in the **Jobs panel.**

AWS Deployment Overview

Before you can deploy RSA NetWitness® Platform in the Amazon Web Services (AWS), you need to:

- Understand the requirements of your enterprise.
- Know the scope of a NetWitness Platform deployment.

When you are ready to begin deployment:

- Make sure that you have a NetWitness Platform "Throughput" license.
- For packet capture in AWS, you can purchase either of the following Third-Party solutions. If you engage one of these third-parties, they will assign an account representative and a professional services engineer who will work closely with RSA Support.
  - Gigamon® GigVUE
  - f5BIG-IP

AWS Environment Recommendations

AWS instances have the same functionality as the NetWitness Platform hardware hosts. RSA recommends that you perform the following tasks when you set up your AWS environment.

- Based on the resource requirements of the different components, follow best practices to use the system and dedicated storage Elastic Block Store (EBS) Volumes appropriately.
- Make sure that compute capacity provides a write speed of 10% greater than the required sustained capture and ingest rate for the deployment.
- Build Concentrator directory for index database on the Provisioned IOPS SSD.

Abbreviations and Other Terminology Used in this Guide

Abbreviation	Description
AMI	Amazon Machine Image
AWS	Amazon Web Services
BYOL	Bring your own licensing
CPU	Central Processing Unit

Abbreviation	Description
Dedicated Instance	AWS dedicated instances run in a VPC on hardware that is dedicated to a single customer. Dedicated instances are physically isolated at the host hardware level from instances that belong to other AWS accounts. Dedicated instances may share hardware with other instances from the same AWS account that are not dedicated instances. For more information on dedicated instances, see the AWS "Amazon EC2 Dedicated Instance" documentation (https://aws.amazon.com/ec2/purchasing-options/dedicated-instances/).
Elastic Block Store (EBS) Optimization	An Amazon EBS–optimized instance uses an optimized configuration stack and provides additional, dedicated capacity for Amazon EBS I/O. This optimization provides the best performance for your EBS volumes by minimizing contention between Amazon EBS I/O and other traffic from your instance. For more information on EBS-optimized instances, see the AWS "Amazon EBS–Optimized Instances" documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSOptimized.html).
EBS Volume	EBS volume is a highly available and reliable storage volume that you can attach to any running instance that is in the same availability zone. For more information on EBS Volumes, see the AWS "Amazon EBS Volumes" documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumes.html) .
EC2 instance	Virtual server in AWS Elastic Compute Cloud (EC2) for running applications on the AWS infrastructure. See also **Instance**.
Enhanced Networking Enabled	Enhanced networking provides higher bandwidth, higher packet-per-second performance, and consistently lower inter-instance latencies. If your packets-per-second rate appears to have reached its ceiling, you should consider moving to enhanced networking because you have likely reached the upper thresholds of the virtual machine network interface (VIF) driver. For more information on enhanced networking, see the AWS "How do I enable and configure enhanced networking on my EC2 instances" documentation (https://aws.amazon.com/premiumsupport/knowledge-center/enable-configure-enhanced-networking/).

Abbreviation	Description
EPS	Events Per Second
GB	Gigabyte. 1 GB = 1,000,000,000 bytes
Gb	Gigbit. 1 Gb = 1,000,000,000 bits.
Gbps	Gigabits per second or billions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
GHz	GigaHertz 1 GHz = 1,000,000,000 Hz
HDD	Hard Disk Drive
Instance	A virtual host in the AWS (that is, virtual machine or server in the AWS infrastructure on which you run services or applications). See also **EC2 Instance**.
Instance Type	Specifies the required CPU and RAM for an instance. For more information on the instance types, see the AWS "Amazon EC2 Instance Types" documentation (https://aws.amazon.com/ec2/instance-types/).
IOPS	Input/Output Operations Per Second
Mbps	Megabits per second or millions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
On-Premise	On-premise hosts are installed and run on computers on the premises (in the building) of the organization using the hosts, rather than in the AWS.
PPS	Packets Per Second
RAM	Random Access Memory (also known as memory)
Security Group	Set of firewall rules. For a comprehensive list of the ports you must set up for all NetWitness Platform components. For more information, see the "Network Architecture and Ports" documentation on RSA Link (https://community.rsa.com/docs/) .

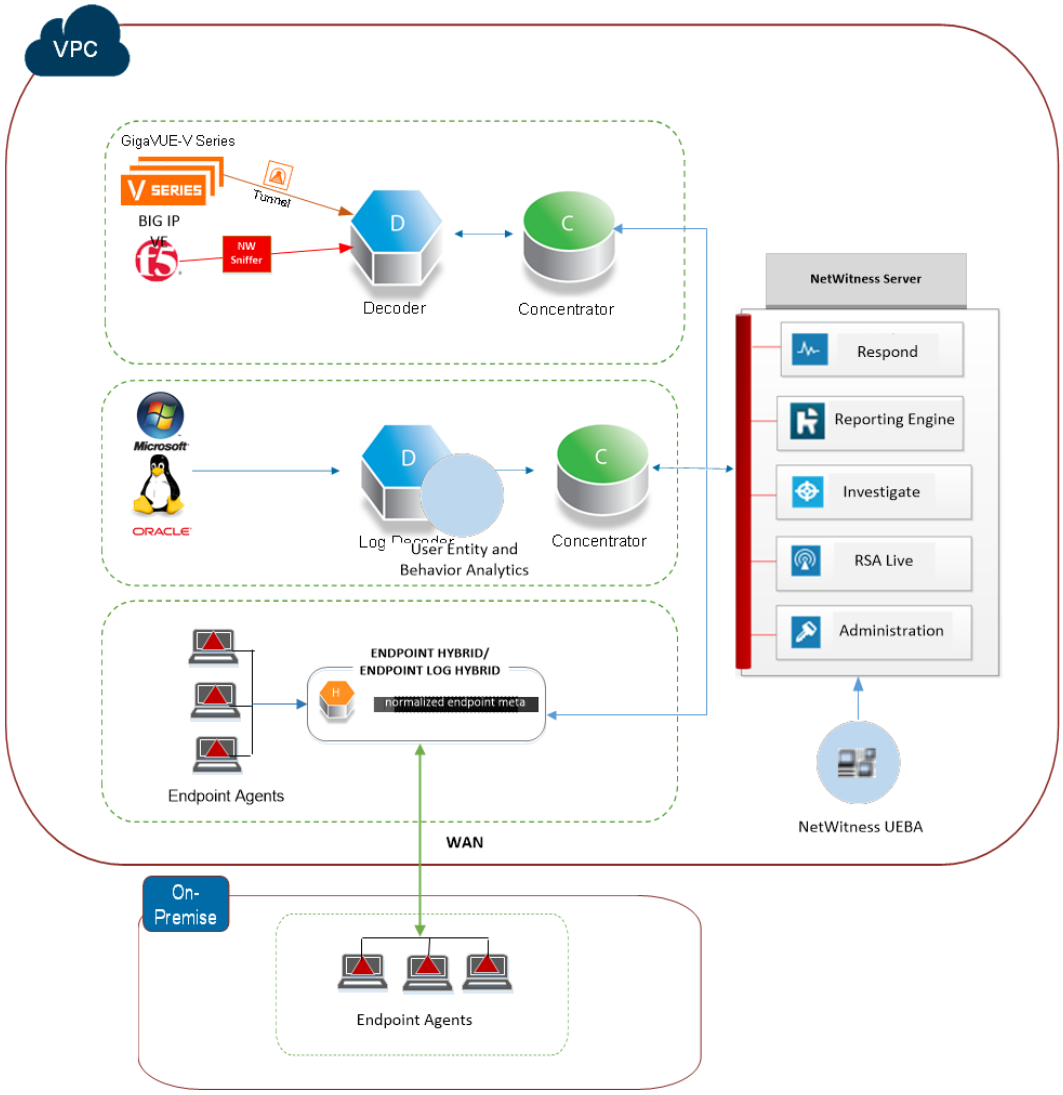
Abbreviation	Description
SSD	Solid-State Drive
Tag	Meaningful identifier for AWS instance.
Tap Vendor	Network Tapping Vendor
vCPU	Virtual Central Processing Unit (also known as a virtual processor)
VM	Virtual Machine
VPC	Virtual Public Cloud
vRAM	Virtual Random Access Memory (also known as virtual memory)

AWS Deployment Scenarios

The following diagrams illustrate some common AWS deployment scenarios.

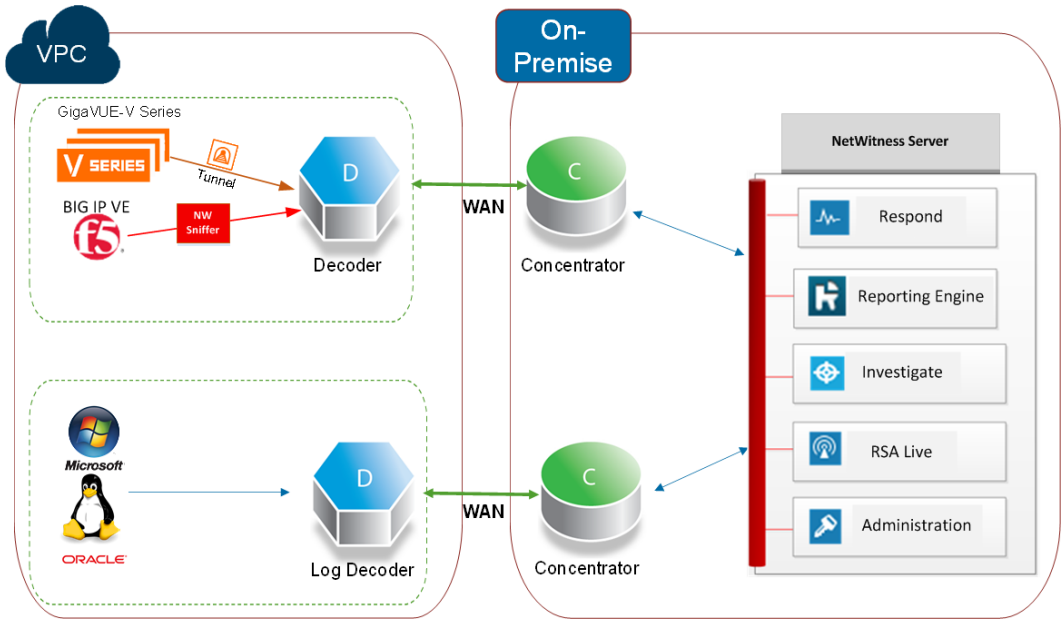
Full NetWitness Platform Stack VPC Visibility

This diagram shows all NetWitness Platform components (full stack) deployed in AWS.



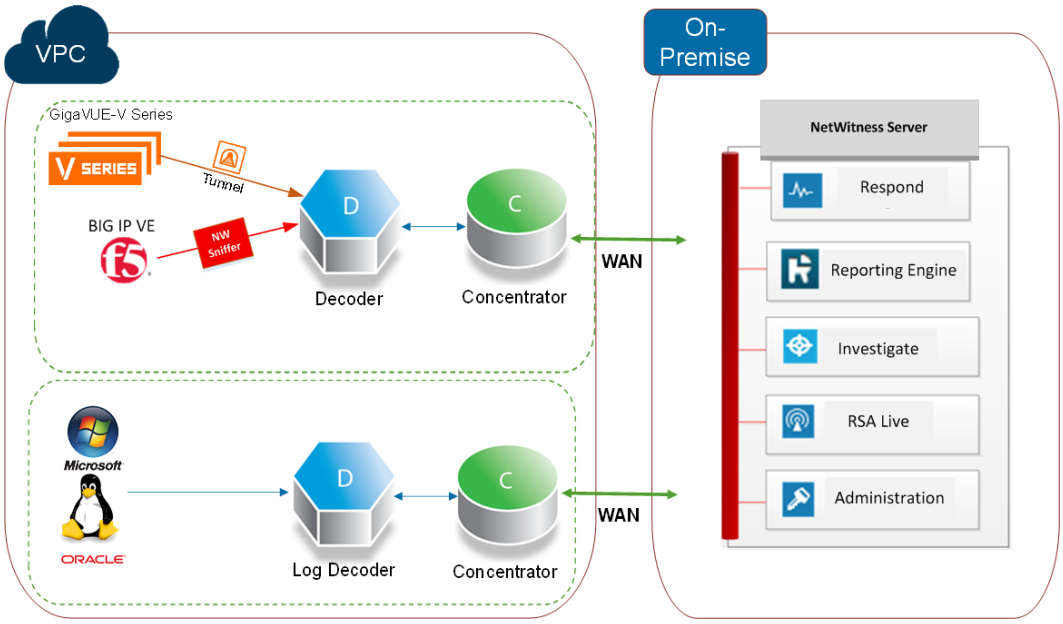
Hybrid Deployment - Decoder and Log Decoder

This diagram shows the Decoder, and Log Decoder deployed in AWS with all other NetWitness Platform components deployed on your premises.



Hybrid Deployment - Decoder, Log Decoder, and Concentrator

This diagram shows the Decoder, Log Decoder, and the Concentrator deployed in AWS with all other NetWitness Platform components deployed on your premises.



In the diagrams, the:

- **GigaVUE Series** (Gigamon® Solution) is an agent-based solution that uses **Tunneling** (implemented by the NetWitness Platform administrator) to facilitate packet data capture in AWS.
- **BIG-IP** (f5® Solution) is a load balancing solution that uses a Network Decoder acting as a sniffer (customized by the NetWitness Platform administrator) to facilitate packet capture in AWS.
- **Decoder** collects packet data. The **Decoder** captures, parses, and reconstructs all network traffic from Layers 2 – 7.
- **Log Decoder** collects logs. The **Log Decoder** collects log events from hundreds of devices and event sources.
- **Concentrator** indexes metadata extracted from network or log data and makes it available for enterprise-wide querying and real-time analytics while facilitating reporting and alerting.
- **Endpoint Hybrid** - collects endpoint data. The Endpoint Hybrid comprises of Endpoint Server, Log Decoder, and Concentrator. For more information, see *NetWitness Endpoint Insights Configuration Guide*.
- NetWitness Server hosts **Respond**, **Reporting**, **Investigate**, **RSA Live Content Management**, **Administration**, **Endpoint Hybrid/Log Hybrid** and other aspects of the user interface.
- **User Entity and Behavior Analytics (UEBA)** provides comprehensive user and entity behavioral analytics to better detect, investigate, and respond to advanced internal attacks and identity-based anomalies.

Prerequisites

You need the following before you begin the integration process:

- Access to AWS console
- Network rout-able (and proper AWS Security Groups) for the containers to transfer data to the NetWitness Platform Decoder.

Supported Services

RSA provides the following NetWitness Platform services.

- NetWitness Server
- Admin Server
- Archiver
- Broker
- Concentrator
- Config Server
- Event Stream Analysis
- Investigate Server
- Orchestration Server
- Reporting Engine
- Respond Server
- Security Server
- Log Decoder
- Decoder
- Remote Log Collector
- Endpoint Server
- User and Entity Behavior Analytics (UEBA)

AWS Deployment

This topic contains the rules and high-level tasks you must follow to deploy RSA NetWitness® Platform components in the AWS.

Rules

You must adhere to the following rules when deploying NetWitness Platform in AWS.

- SSH to the NetWitness Platform instance at least once after deployment to initialize the system.
- Before you enable the out-of-the-box (OOTB) dashboards, set the default data source in the Reporting Engine configuration screen.
- If you reboot the Network Decoder instance, the tunnel is not retained. Create the tunnel on Network Decoder again and restart the decoder service.
- Always use private IP addresses when you provision AWS NetWitness Platform instances.

Note: If you assign a public IP to the Netwitness Server Host, update the `/etc/nginx/conf.d/nginx.conf` configuration file as follows:

```
location /nwrpmrepo
{
alias /var/lib/netwitness/common/repo;
index index.html index.htm;
allow <Subnet-Gateway>/Subnet mask ;
#example
# allow 10.0.0.1/25;
deny all;
autoindex on;
}
```

Checklist

Step	Description
1	Establish AWS Environment
2	Find NetWitness Platform AMIs
3	Launch an Instance and Configure a Host
4	Configure Hosts (Instances) in NetWitness Platform
5	Configure Packet Capture

Establish AWS Environment

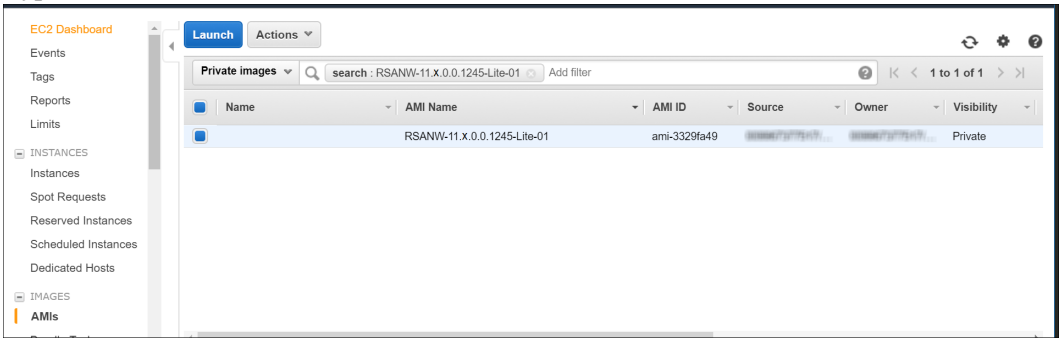
1. Make sure that you have an AWS environment with the capacity to meet or exceed the NetWitness Platform performance guidelines described in AWS Instance Configuration Recommendations.
2. Go to Find NetWitness Platform AMIs.

Find NetWitness Platform AMIs

Search for NW- AMI files within the Public/Shared/Community repository. Use "RSANW" for a key word to search for the AMI files.

Note: For additional instructions, see the AWS **Finding Shared AMIs** documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/usingsharedamis-finding.html).

1. Open the Amazon EC2 console (New Subscriber Account) at https://console.aws.amazon.com/ec2/.
2. In the Navigation pane, choose AMIs.
3. In the first filter, choose Public images.
4. Type "**RSANW**" in the search field to find the NetWitness Platform AMIs.



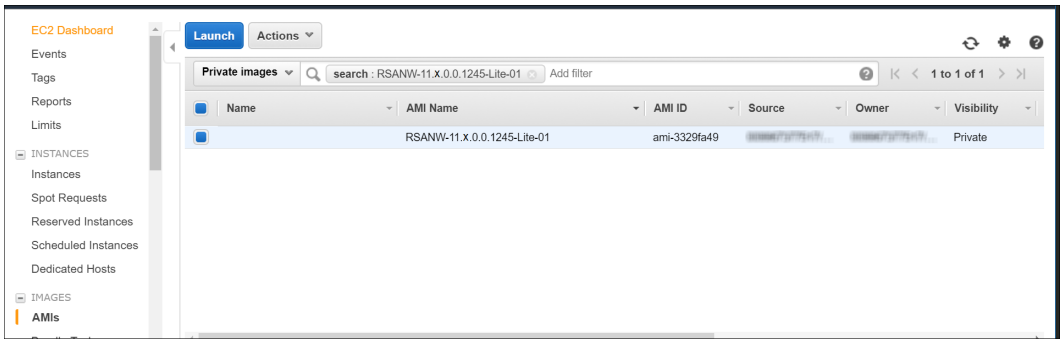
Note: Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) to obtain access to the **RSANW-11.2.0.0.1245-Full-01**.

5. Go to Launch an Instance and Configure a Host.

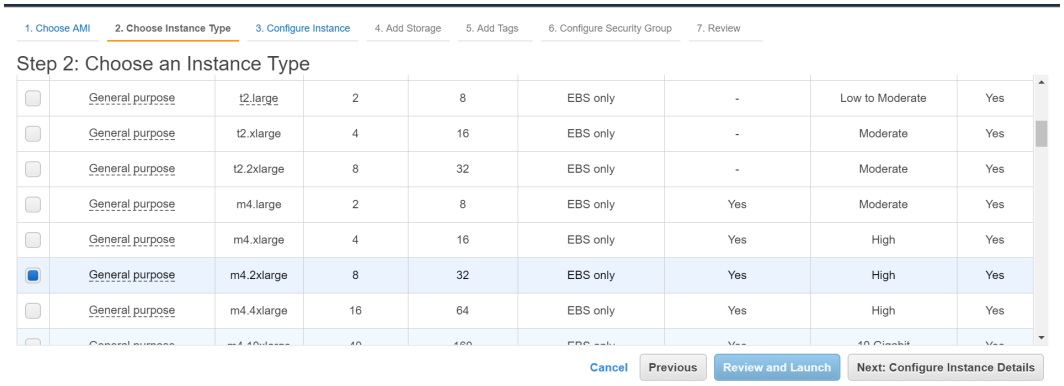
Launch an Instance and Configure a Host

Note: For additional instructions Refer to the AWS "Launching an Instance" documentation (http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/launching-instance.html).

1. Select an instance from the grid (for example, **RSA-NW-Concentrator-11.2.0.0-01**) and click **Launch**.

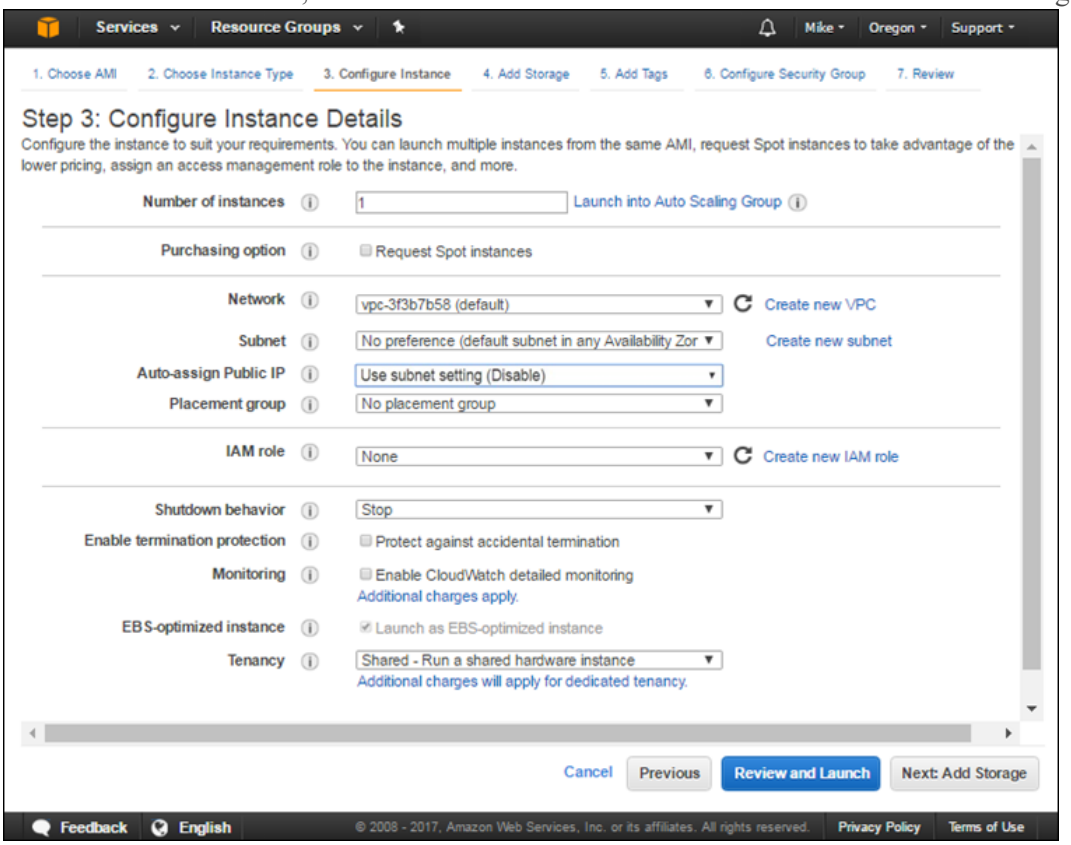


2. Choose the RAM and CPUs by selecting instance type.
   Refer to AWS Instance Configuration Recommendations for guidelines on how to configure the EC2 Instance based on the requirements of the NetWitness Platform component (that is, service) for which you are launching an instance. The following example has the **m4.2xlarge** instance type selected with **8** CPUs and **32** GB of RAM.

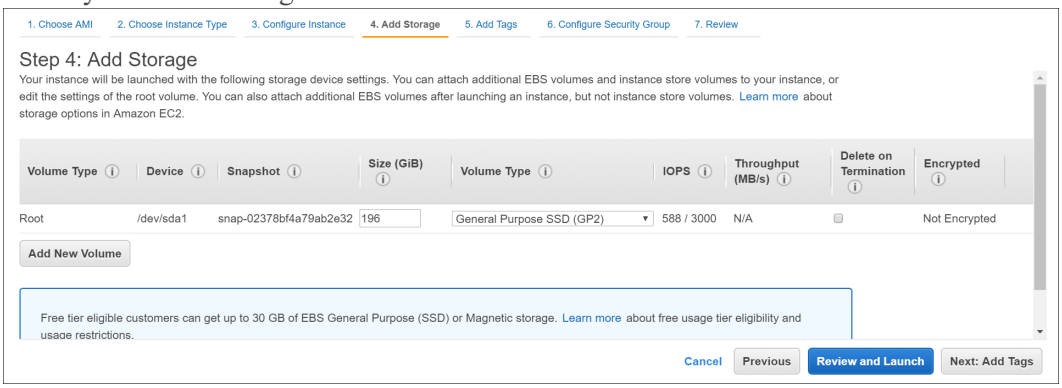


3. Click **Next: Configure Instance Details** at the bottom right of the **Step 2: Choose an Instance Type** page.
   The **Step 3. Configure Instance Details** page is displayed.

For NetWitness Platform, the subnet and VPC are defaulted to the values in the following example.



4. Click **Next: Add Storage** at the bottom right of the **Step 3: Configure Instance Details** page.
   The **Step 4. Add Storage** page is displayed.
   Refer to AWS Instance Configuration Recommendations for guidelines on how to configure storage based on based on the requirements of the NetWitness Platform component (that is, service) for which you are launching an instance.

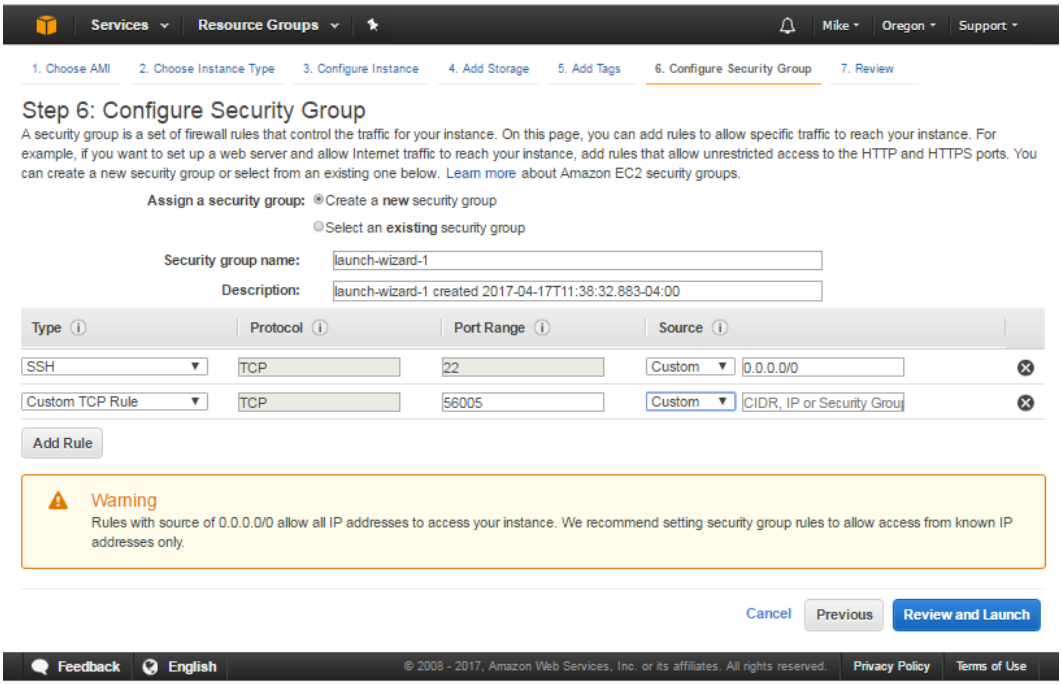


5. Click **Next: Add Tags** at the bottom right of the **Step 4: Add Storage** page.
   The **Step 5. Add Tags** page is displayed. Enter the name of your Instance.
6. Click **Next: Configure Security Group** at the bottom right of the **Step 5: Add Tags** page.
   The **Step 6. Configure Security Group** page is displayed.

a. Select the Create a new security group option.

b. Create a rule that opens all the firewall for the NetWitness Platform component.
You must configure the security group correctly to configure the instance (host) from the NetWitness Platform) User Interface and SSH to it.

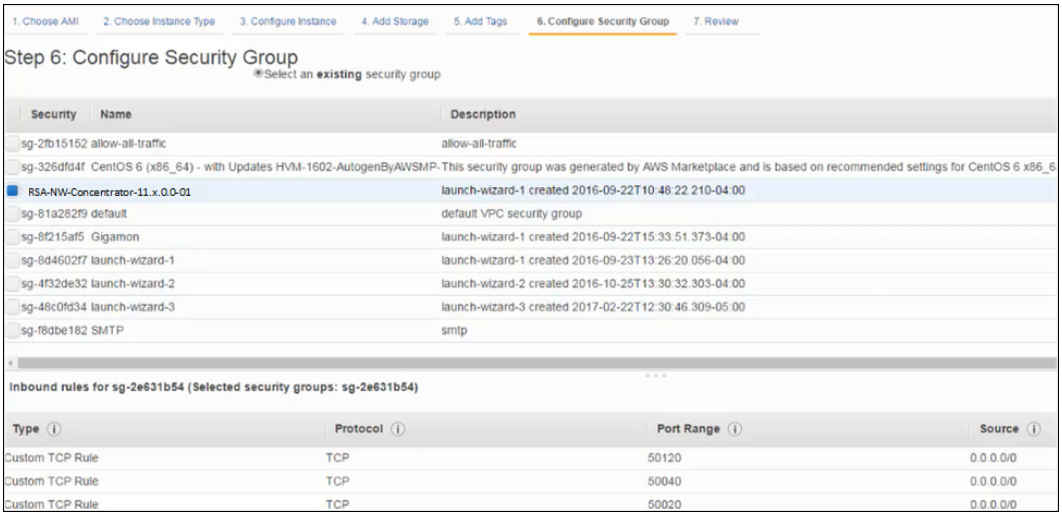
Note: See the "Network Architecture and Ports" documentation in RSA Link (https://community.rsa.com/docs/DOC-83050) for a comprehensive list of the ports you must set up for all NetWitness Platform components..



Note: After you configure a Security Group, you can change it at any time.

7. Click **Review and Launch** at the bottom right of the **Step 6: Configure Security Group** page.
The **Step 7. Review Instance Launch** page is displayed.
8. Click **Launch** at the bottom right of the **Step 7. Review Instance Launch** page.
The **Select an existing key pair or create a new key pair** dialog is displayed.
9. Choose **Proceed without key pair**.

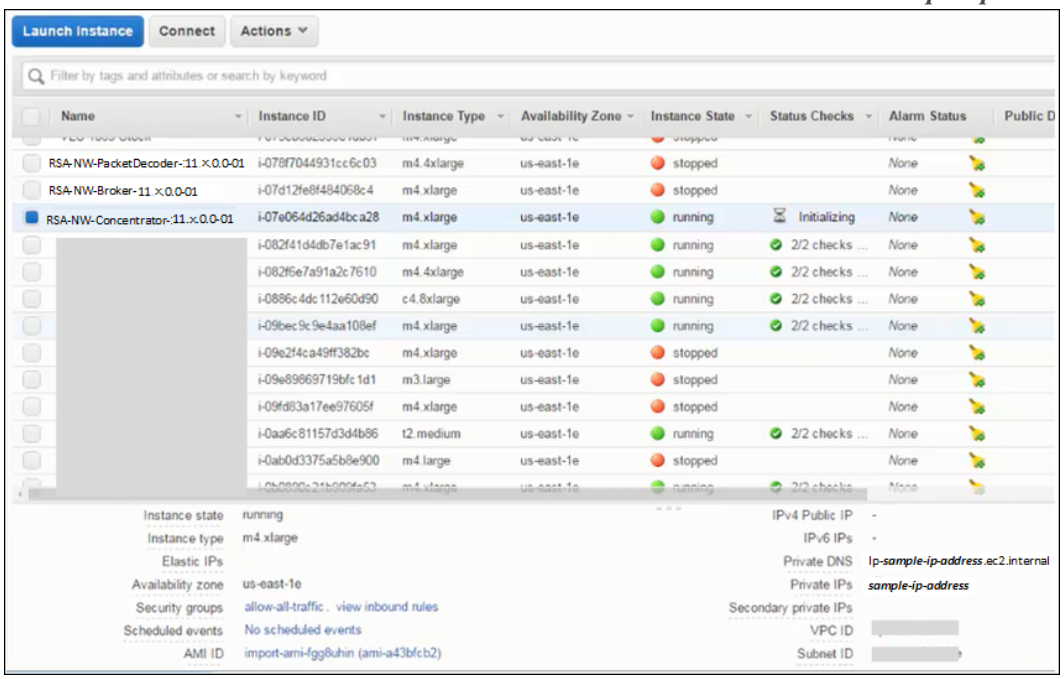
10. Click **Launch Instance**.
    AWS displays the following information as it builds the instance.



11. Click **View Instances**.

12. Select **Instances** in the left navigation panel to review all instances that AWS is initializing (for example, the **NW-Concentrator**) .

The IP Address for the new **RSA-NW-Concentrator-11.2.0.0-01** host is ***sample-ip-address***.



13. SSH to newly-created instance using the default NetWitness Platform credentials.
14. Create the recommended partitions. For more informaiton, see Partition Recommendations.
15. Go to Configure Hosts (Instances) in NetWitness Platform.

Partition Recommendations

This topic contains the recommended AWS partition.

Admin Server, ESA Primary, ESA Secondary and Malware Analysis

For an extension of `/var/netwitness/` partition, attach an external volume.

Run `lsblk` to get the physical volume name.

If you attach 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `/dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.

Log Collector

For an extension of `/var/netwitness/` partition, attach an external volume

Run `lsblk` to get the physical volume name.

If you attach one 500 GB volume, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 600G /dev/netwitness_vg00/nwhome`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.

Decoder

For an extension of `/var/netwitness/` partition, attach an external volume and other external volumes for the Decoder database partitions.

Note: No other partition should reside on this Decoder partition and should be used only for /var/netwitness/ partition.

Run `lsblk` to get the physical volume name.

If you attach 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`

Other Partition Required

The following partition should be on the volume group **decodersmall**.

Folder	LVM	Volume Group
/var/netwitness/decoder	decoroot	decodersmall

Folder	LVM	Volume Group
/var/netwitness/decoder/index	index	decodersmall
/var/netwitness/decoder/metadb	metadb	decodersmall
/var/netwitness/decoder/sessiondb	sessiondb	decodersmall

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md0`
2. `vgcreate -s 32 decodersmall /dev/md0`
3. `lvcreate -L <disk_size> -n <lvm_name> decodersmall`
4. `mkfs.xfs /dev/decodersmall/<lvm_name>`
5. Repeat the above steps for all the LVMs mentioned above.

The following partition should be on the volume group **decoder**.

Folder	LVM	Volume Group
/var/netwitness/decoder/packetdb	packetdb	decoder

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md1`
2. `vgcreate -s 32 decoder /dev/md1`
3. `lvcreate -L <disk_size> -n packetdb decoder`
4. `mkfs.xfs /dev/decoder/packetdb`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_ vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.
/dev/decodersmall/decoroot	/var/netwitness/decoder	Refer to the EBS Volume (storage) tables.
/dev/decodersmall/index	/var/netwitness/decoder/index	Refer to the EBS Volume (storage) tables.

LVM	Folder	EBS
/dev/decodersmall/metadb	/var/netwitness/decoder/metadb	Refer to the EBS Volume (storage) tables.
/dev/decodersmall/sessiondb	/var/netwitness/decoder/sessiondb	Refer to the EBS Volume (storage) tables.
/dev/decoder/packetdb	/var/netwitness/decoder/packetdb	Refer to the EBS Volume (storage) tables.

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/decodersmall/decoroot /var/netwitness/decoder xfs noatime,nosuid 1 2`
2. `/dev/decodersmall/index /var/netwitness/decoder/index xfs noatime,nosuid 1 2`
3. `/dev/decodersmall/metadb /var/netwitness/decoder/metadb xfs noatime,nosuid 1 2`
4. `/dev/decodersmall/sessiondb /var/netwitness/decoder/sessiondb xfs noatime,nosuid 1 2`
5. `/dev/decoder/packetdb /var/netwitness/decoder/packetdb xfs noatime,nosuid 1 2`

Log Decoder

For an extension of `/var/netwitness/` partition, attach an external volume and other external volumes for the Log Decoder database partitions.

Note: No other partition should reside on this Log Decoder partition and should be used only for /var/netwitness/ partition.

Run `lsblk` to get the physical volume name.

If you attach 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`

Other Partition Required

The following partition should be on the volume group **logdecodersmall**.

Folder	LVM	Volume Group
/var/netwitness/logdecoder	decoroot	logdecodersmall
/var/netwitness/logdecoder/index	index	logdecodersmall
/var/netwitness/logdecoder/metadb	metadb	logdecodersmall
/var/netwitness/logdecoder/sessiondb	sessiondb	logdecodersmall

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md0`
2. `vgcreate -s 32 logdecodersmall /dev/md0`
3. `lvcreate -L <disk_size> -n <lvm_name> logdecodersmall`
4. `mkfs.xfs /dev/logdecodersmall/<lvm_name>`
5. Repeat the above steps for all the LVMs mentioned above.

The following partition should be on the volume group **logdecoder**.

Folder	LVM	Volume Group
/var/netwitness/logdecoder/packetdb	packetdb	logdecoder

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md1`
2. `vgcreate -s 32 logdecoder /dev/md1`
3. `lvcreate -L <disk_size> -n packetdb logdecoder`
4. `mkfs.xfs /dev/logdecoder/packetdb`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.
/dev/logdecodersmall/decoroot	/var/netwitness/logdecoder	Refer to the EBS Volume (storage) tables.
/dev/logdecodersmall/index	/var/netwitness/logdecoder/index	Refer to the EBS Volume (storage) tables.

LVM	Folder	EBS
/dev/logdecodersmall/metadb	/var/netwitness/logdecoder/metadb	Refer to the EBS Volume (storage) tables.
/dev/logdecodersmall/sessiondb	/var/netwitness/logdecoder/sessiondb	Refer to the EBS Volume (storage) tables.
/dev/logdecoder/packetdb	/var/netwitness/logdecoder/packetdb	Refer to the EBS Volume (storage) tables.

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/logdecodersmall/decoroot /var/netwitness/logdecoder xfs noatime,nosuid 1 2`
2. `/dev/logdecodersmall/index /var/netwitness/logdecoder/index xfs noatime,nosuid 1 2`
3. `/dev/logdecodersmall/metadb /var/netwitness/logdecoder/metadb xfs noatime,nosuid 1 2`
4. `/dev/logdecodersmall/sessiondb /var/netwitness/logdecoder/sessiondb xfs noatime,nosuid 1 2`
5. `/dev/logdecoder/packetdb /var/netwitness/logdecoder/packetdb xfs noatime,nosuid 1 2`

Concentrator

For an extension of `/var/netwitness/` partition, attach an external disk and other external disks for the Concentrator database partitions.

Note: No other partition should reside on this Concentrator partition and should be used only for /var/netwitness/ partition.

Run `lsblk` to get the physical volume name.

If you attach 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`

Other Partition Required

The following partition should be on the volume group concentrator.

Folder	LVM	Volume Group
/var/netwitness/concentrator	root	concentrator
/var/netwitness/concentrator /sessiondb	index	concentrator
/var/netwitness/concentrator /metadb	metadb	concentrator

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md0`
2. `vgcreate -s 32 logdecodersmall /dev/md0`
3. `lvcreate -L <disk_size> -n <lvm_name> logdecodersmall`
4. `mkfs.xfs /dev/logdecodersmall/<lvm_name>`
5. Repeat the above steps all the LVMs mentioned

The following partition should be on volume group index.

Folder	LVM	Volume Group
/var/netwitness/concentrator/index	index	index

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md1`
2. `vgcreate -s 32 lindex /dev/md1`
3. `lvcreate -L <disk_size> -n index index`
4. `mkfs.xfs /dev/index/index`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_ vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.
/dev/concentrator/decoroot	/var/netwitness/concentrator	Refer to the EBS Volume (storage) tables.
/dev/concentrator/metadb	/var/netwitness/concentrator/metadb	Refer to the EBS Volume (storage) tables.

LVM	Folder	EBS
/dev/concentrator/sessiondb	/var/netwitness/concentrator/sessiondb	Refer to the EBS Volume (storage) tables.
/dev/index/index	/var/netwitness/concentrator/index	Refer to the EBS Volume (storage) tables.

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/concentrator/root /var/netwitness/concentrator xfs noatime,nosuid 1 2`
2. `/dev/concentrator/sessiondb /var/netwitness/concentrator/sessiondb xfs noatime,nosuid 1 2`
3. `/dev/concentrator/metadb /var/netwitness/concentrator/metadb xfs noatime,nosuid 1 2 2`
4. `/dev/index/index /var/netwitness/concentrator/index xfs noatime,nosuid 1 2`

Archiver

For an extension of `/var/netwitness/` partition, attach an external volume and other external disks for the Archiver database partitions.

Note: No other partition should reside on this Archiver partition and should be used only for /var/netwitness/partition.

Run `lsblk` to get the physical volume name.

If you attach 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`

Other Partition Required

The following partition should be on the volume group archiver.

Folder	LVM	Volume Group
/var/netwitness/archiver	archiver	archiver

Run `lsblk` to get the physical volume name and run the following commands:

1. `pvcreate /dev/md0`
2. `vgcreate -s 32 archiver /dev/md0`

3. `lvcreate -L <disk_size> -n archiver archiver`
4. `mkfs.xfs /dev/archiver/archiver`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	
/dev/netwitness_vg00/nwhome	/var/netwitness/	
/dev/archiver/archiver	/var/netwitness/archiver	

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/archiver/archiver /var/netwitness/archiver xfs noatime,nosuid 1 2`

Endpoint Hybrid or Endpoint Log Hybrid

For an extension of /var/netwitness/ partition, attach an additional volume,

and make sure that no other partition resides on this Endpoint Hybrid or Endpoint Log Hybrid. Also, attach

other additional volumes for the endpoint database partitions

Run lsblk to get the physical volume name.

If you attach 1 TB disk, run the following commands:

1. pvcreate <pv_name> (for example, pv_name is dev/sdc)
2. vgextend netwitness_vg00 /dev/sdc
3. lvextend –L 1T /dev/netwitness_vg00/nwhome
4. xfs_growfs /dev/netwitness_vg00/nwhome

Other Partition Required

The following partition should be on the volume group endpoint and should be in a single RAID 0 array.

Folder	LVM	Volume Group
/var/netwitness/mongo	hybrid-mongo	endpoint
/var/netwitness/concentrator	concentrator-concroot	endpoint
/var/netwitness/concentrator/index	hybrid-concinde	endpoint
/var/netwitness/logdecoder	hybrid-ldecroot	endpoint

Run lsblk to get the physical volume name and run the following commands:

1. pvcreate /dev/md0
2. vgcreate –s 32 endpoint /dev/md0
3. lvcreate –L <disk_size> -n <lvm_name> endpoint
4. mkfs.xfs /dev/ endpoint /<lvm_name>
5. Repeat the above steps for all the LVMs mentioned.

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	EBS
/dev/netwitness_vg00/nwhome	/var/netwitness/	Refer to the EBS Volume (storage) tables.
/dev/endpoint/hybridmongo	/var/netwitness/mongo	Refer to the EBS Volume (storage) tables.
/dev/endpoint/concentratorconcroot	/var/netwitness/concentrator	Refer to the EBS Volume (storage) tables.
/dev/endpoint/hybridconcinde	/var/netwitness/concentrator/index	Refer to the EBS Volume (storage) tables.
/dev/endpoint/hybridldecroot	/var/netwitness/logdecoder	Refer to the EBS Volume (storage) tables.

Installation Tasks

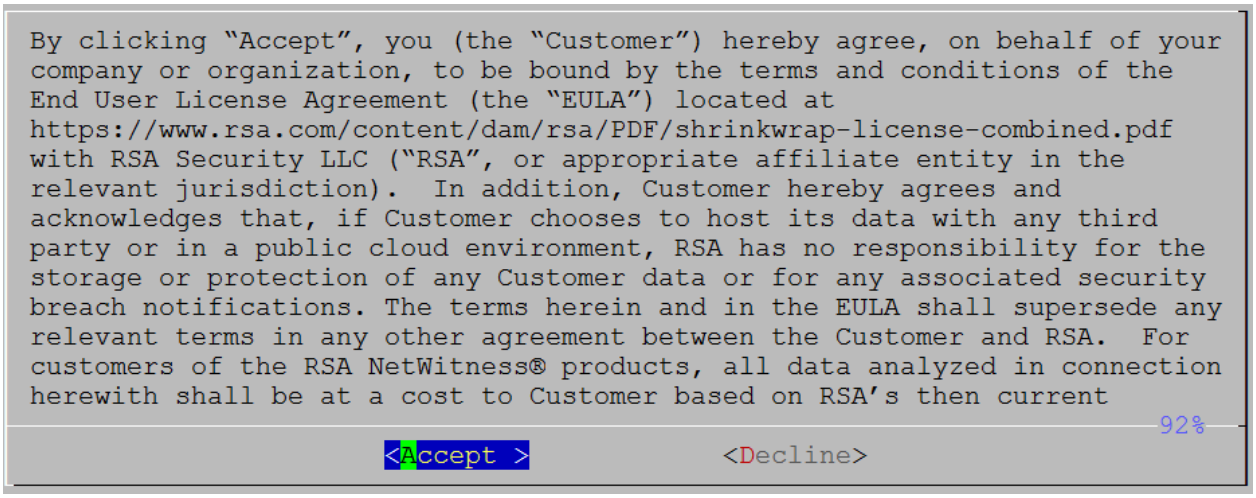
Task 1 - Install 11.2.0.0 on the NetWitness Server (NW Server) Host

Note: You can perform this task for RSANW-11.2.0.0.1245-Full-01 instance.

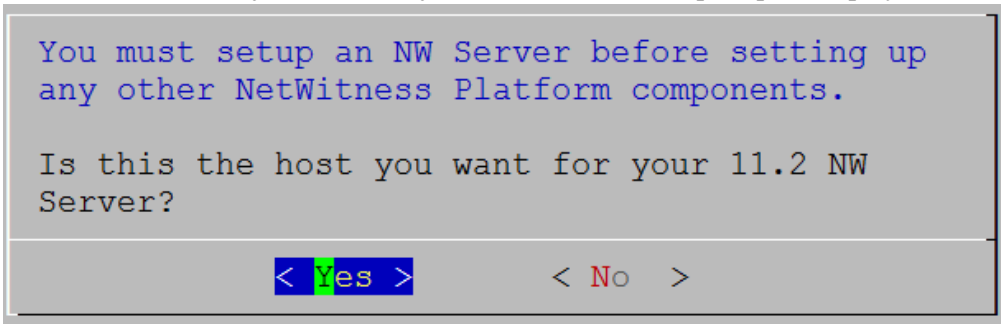
1. Run the `nwsetup-tui` command to set up the host.

This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see the "Post Installation Tasks" topic in the *Physical Host Installation Guide*.
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



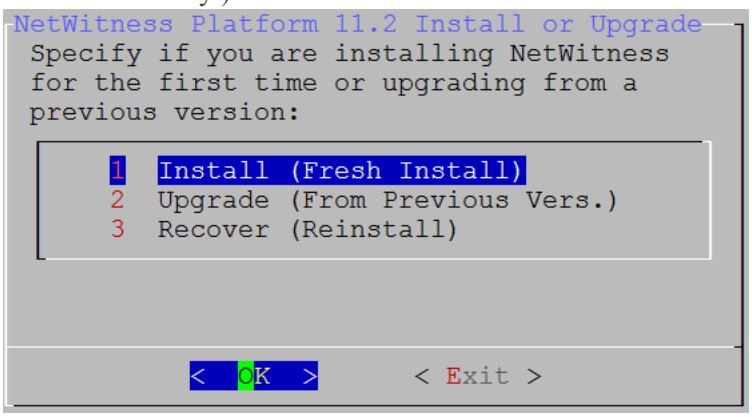
2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.2 NW Server** prompt is displayed.



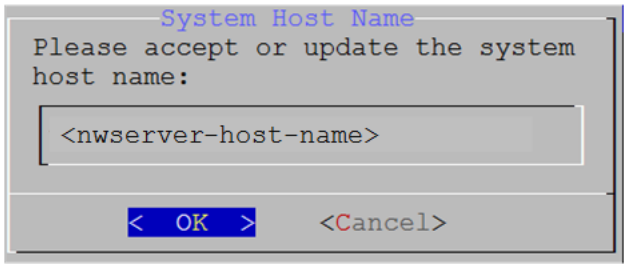
3. Tab to **Yes** and press **Enter**.
   Choose **No** if you already installed 11.2 on the NW Server.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete all the subsequent steps to correct this error.

The **Install** or **Upgrade** prompt is displayed. (**Recover** does not apply to the installation. It is for 11.2 Disater Recovery.).



4. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **Host Name** prompt is displayed.

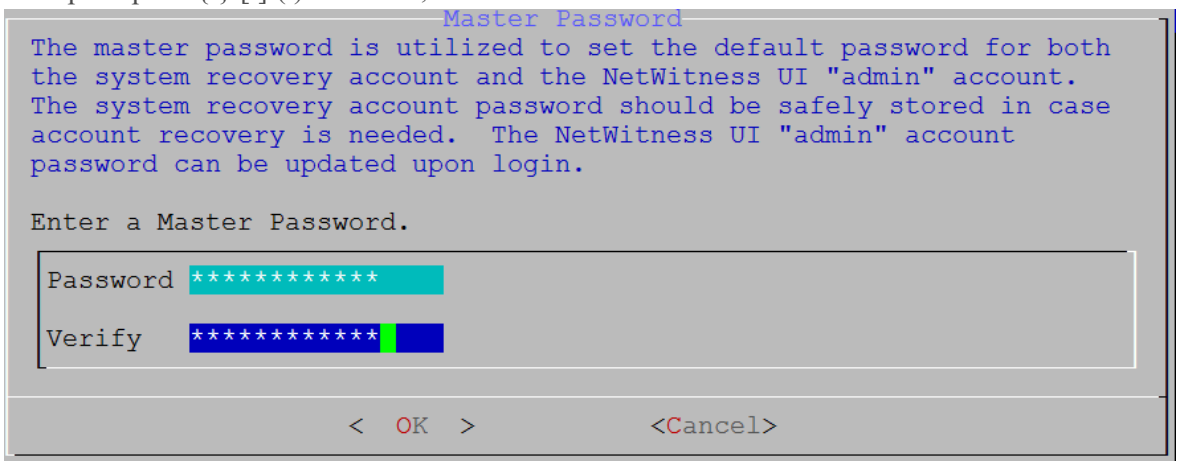


Caution: If you include "." in a host name, the host name must also include a valid domain name.

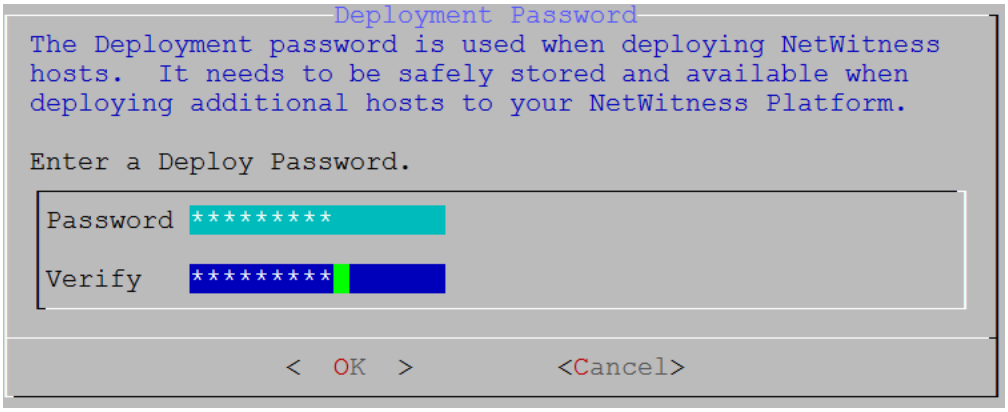
5. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.
   The **Master Password prompt** is displayed.
   The following list of characters are supported for Master Password and Deployment Password:

   - Symbols : ! @ # % ^ + ,
   - Numbers :0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z
     No ambiguous characters are supported for Master Password and Deployment Password (for

example: space { } [ ] ( ) / \ ' " ` ~ ; : . < > -.



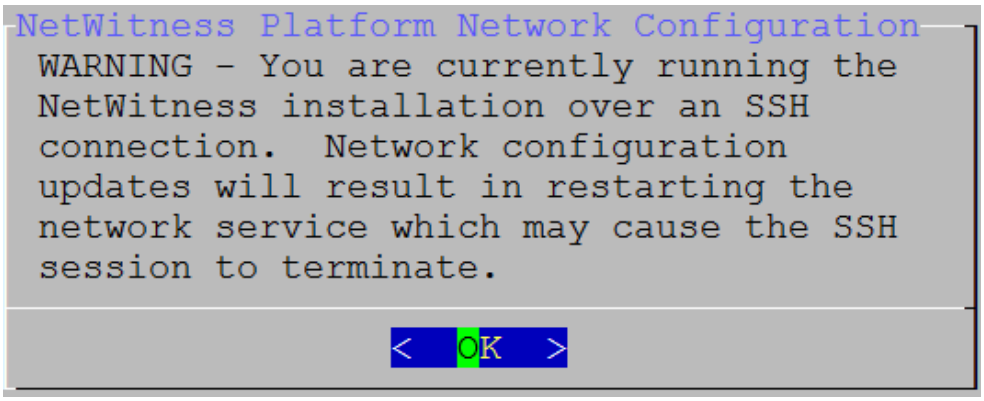
6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The **Deployment Password** prompt is displayed.



7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. If:

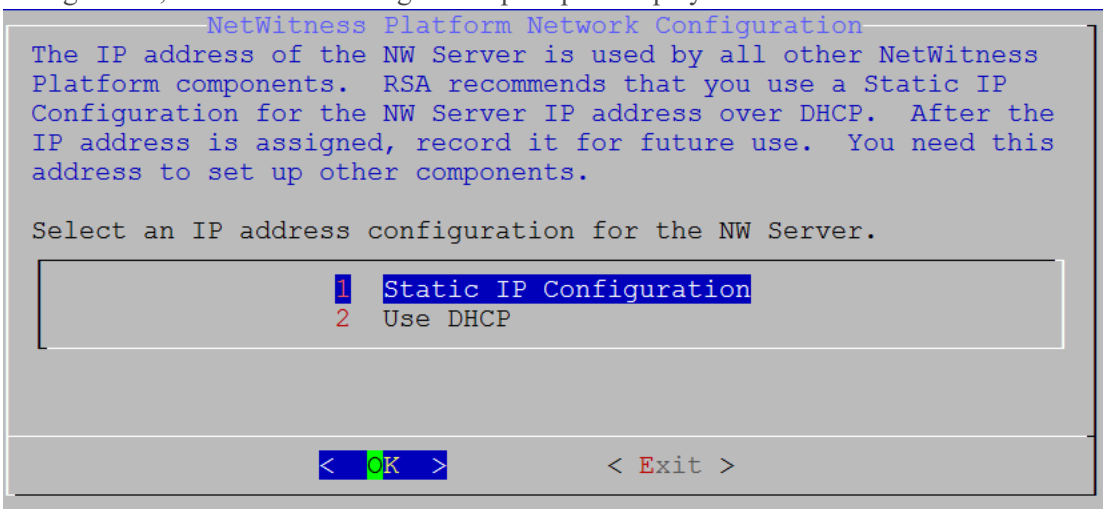
   - The Setup program finds a valid IP address for this host, the following prompt is displayed.

   - Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.
   - If you are using an SSH connection, the following warning is displayed. Press **Enter** to close warning prompt.

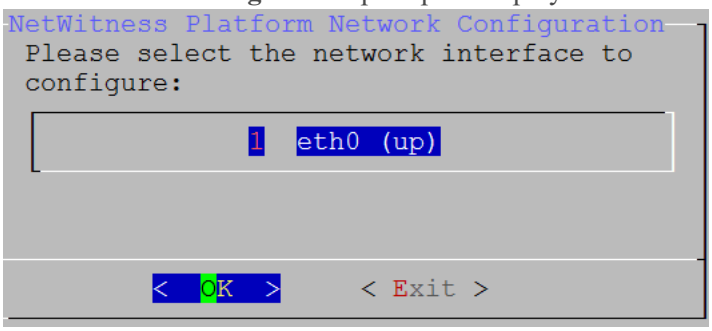


Note: If you connect directly from the host console, the following warning will not be displayed.

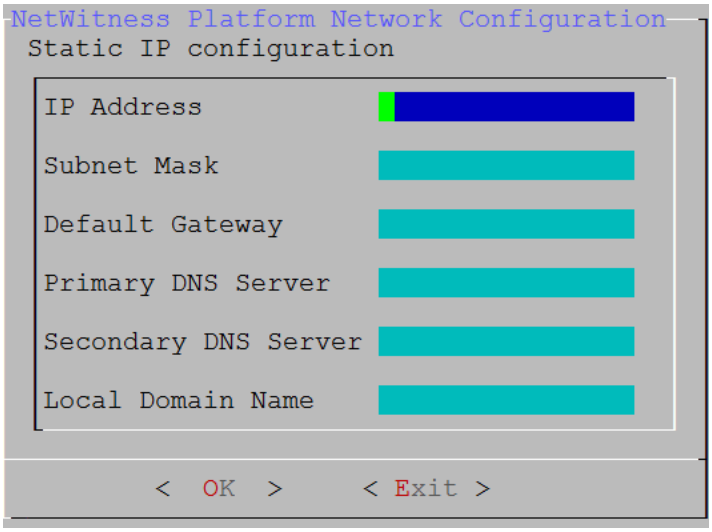
- If the Setup Program found an IP configuration and you chose to use it, the Update Repository prompt is displayed. Go to step 10 to and complete the installation.
- If the Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the Network Configuration prompt is displayed.



8. Tab to **OK** and press **Enter** to use **Static IP**.
   If you want to use **DHCP**, down arrow to 2 Use DHCP and press **Enter**.
   The **Network Configuration** prompt is displayed.



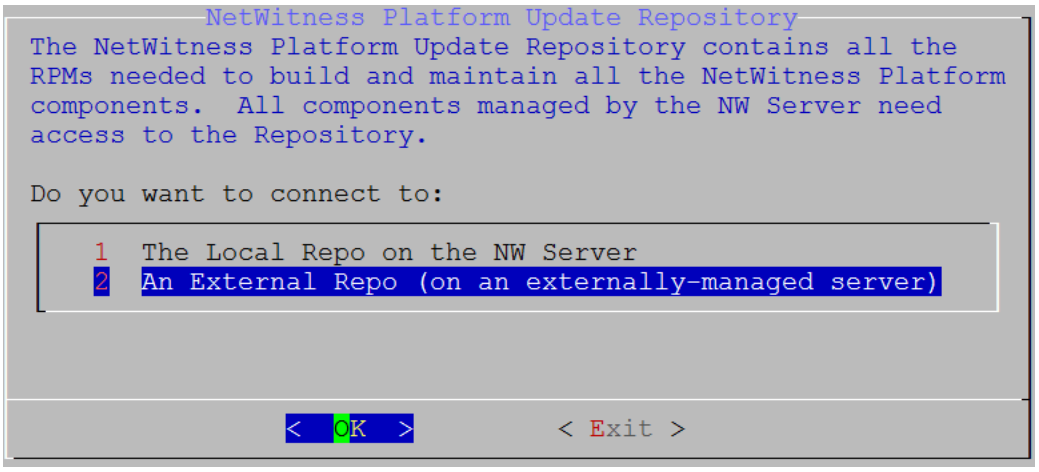
9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.
   The **Static IP Configuration** prompt is displayed.



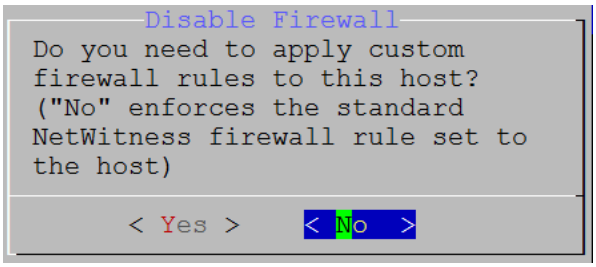
10. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**.
    If you do not complete all the required fields, an **All fields are required** error message is displayed (**Primary DNS Server**, **Secondary DNS Server**, and **Local Domain Name** fields are not required.)
    If you use the wrong syntax or character length for any of the fields, an **Invalid *field-name*** error message is displayed.

Caution: If you select DNS Server, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

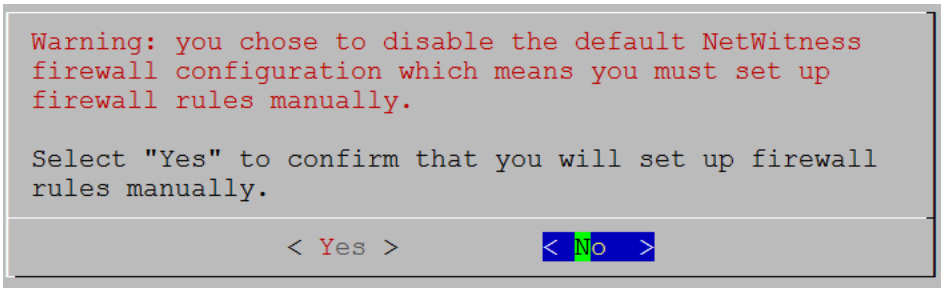
The **Update Repository** prompt is displayed.



11. Apply the standard firewall configuration, press **Enter**.
    - Disable the standard configuration, tab to **Yes** and press **Enter**.
      The Disable firewall prompt is displayed.

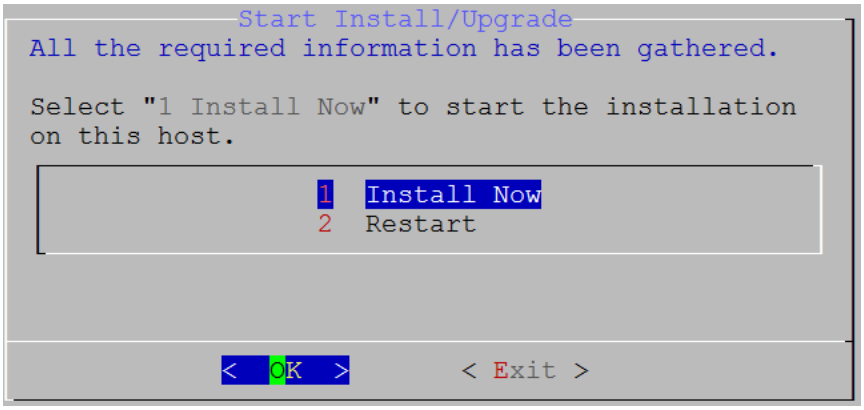


The disable firewall configuration confirmation prompt is displayed.



- Tab to **Yes** and press **Enter** to confirm (press **Enter** to use standard firewall configuration).

12. Press **Enter** to install 11.2 on the NW Server.
    The **Start Install** prompt is displayed.



When **Installation complete** is displayed, you have installed the 11.2 NW Server on this host.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

```
ValueError: error:3207A06D:lib(50):B_HASH_init:cr new
Checksum type 'md5' disabled
 (skipped due to only_if)
    * file[/etc/yum.repos.d/CentOS-Base.repo] action delete (up to date)
    * ruby_block[yum-cache-reload-CentOS-Base] action nothing (skipped due to action :nothing)
     (up to date)
  * yum_repository[Remove CentOS-CR repository] action delete
    * execute[yum clean all CentOS-CR] action runERROR:root:code for hash md5 was not found.

    f(usedforsecurity=False)
```

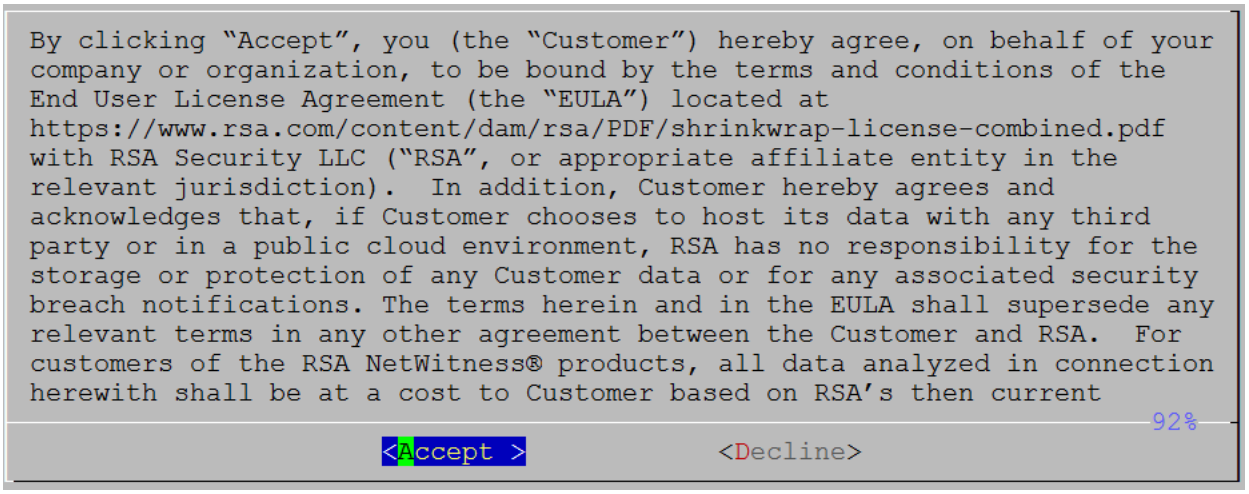
Task 2 - Install 11.2 on Other Component Hosts

Note: You can perform this task for RSANW-11.2 1245-Lite-01 instance.

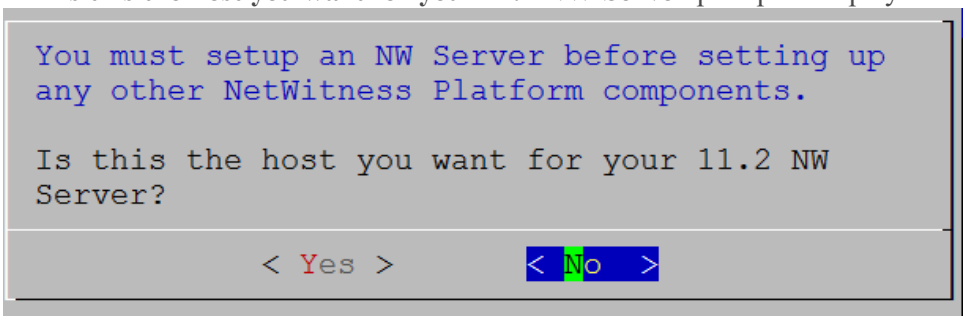
1. Run the `nwsetup-tui` command to set up the host.

This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see the "Post Installation Tasks" topic in the *Physical Host Installation Guide*..
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).

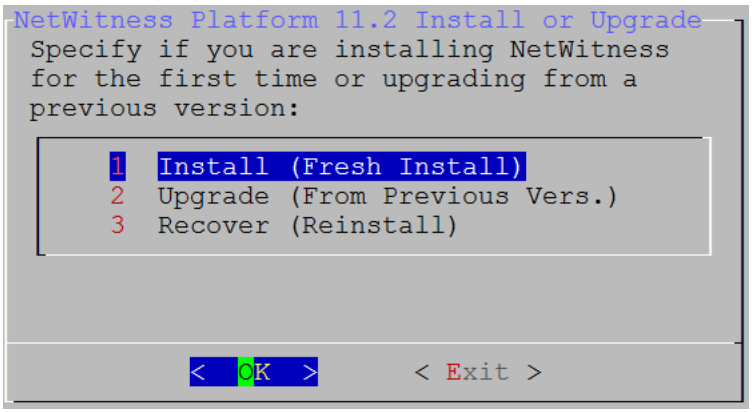


2. Tab to **Accept** and press **Enter**.
The **Is this the host you want for your 11.2 NW Server** prompt is displayed.

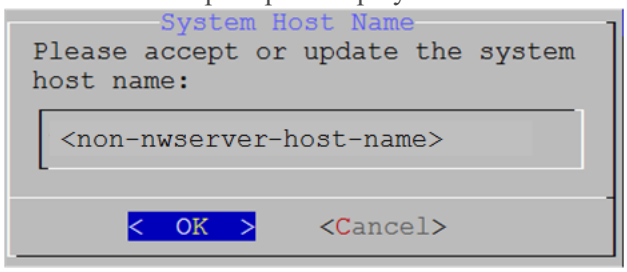


Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete all the subsequent steps to correct this error.

3. Press **Enter**(No).



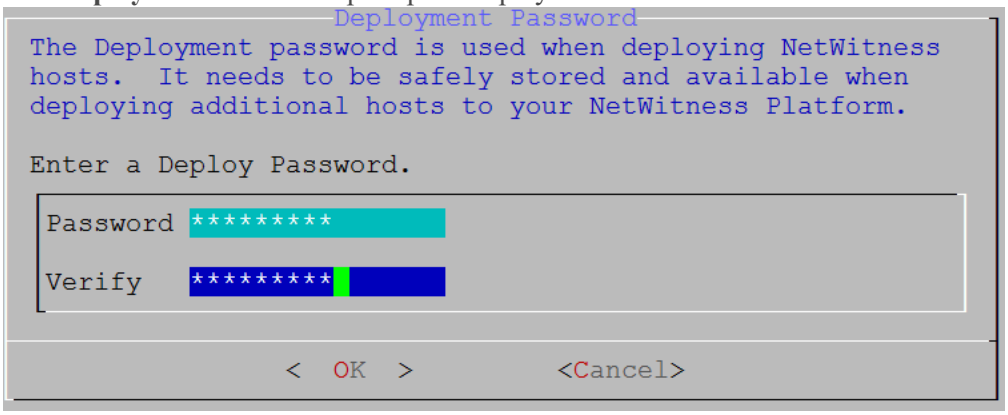
4. Press **Enter**. **Install (Fresh Install)** is selected by default.
   The **Host Name** prompt is displayed.



Caution: If you include "." in a host name, the host name must also include a valid domain name.

5. If want to keep this name, press **Enter**. If you want to change this name, edit it, tab to **OK**, and press **Enter**.

   The **Deployment Password** prompt is displayed.

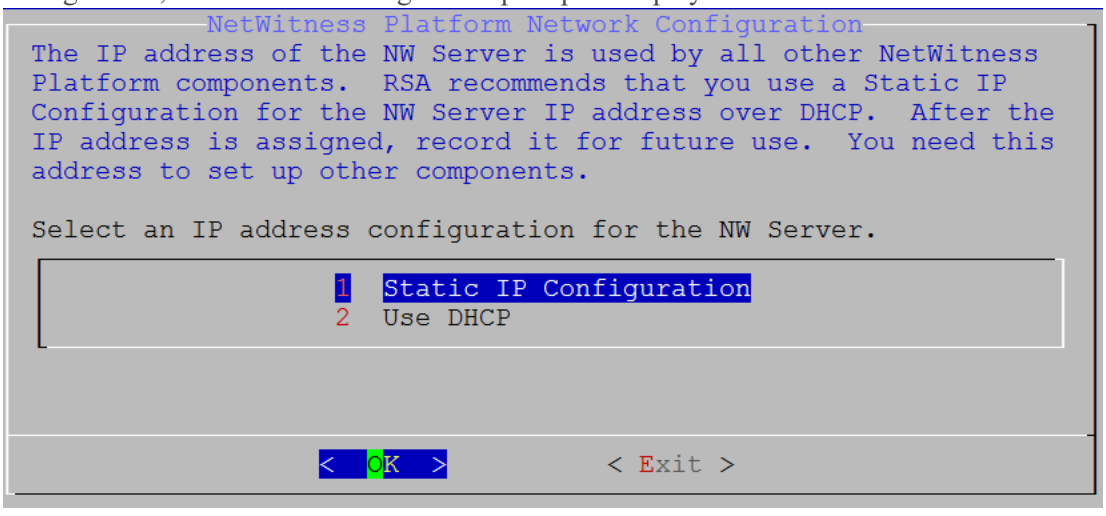


6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.
   - If the Setup program finds a valid IP address for this host, the following prompt is displayed.

   - Press **Enter** if you want to use this IP and avoid changing your network settings.
   - Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.
     If you are using an SSH connection, the following warning is displayed. Press **Enter** to close warning prompt.

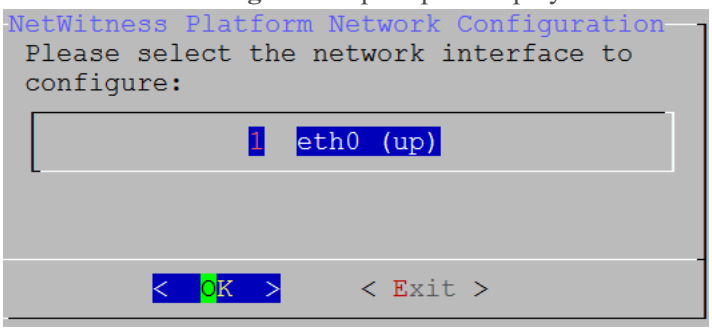
     The Setup Program found an IP configuration and you chose to use it, the Update Repository prompt is displayed. Go to step 10 to and complete the installation.

   The Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the Network Configuration prompt is displayed.

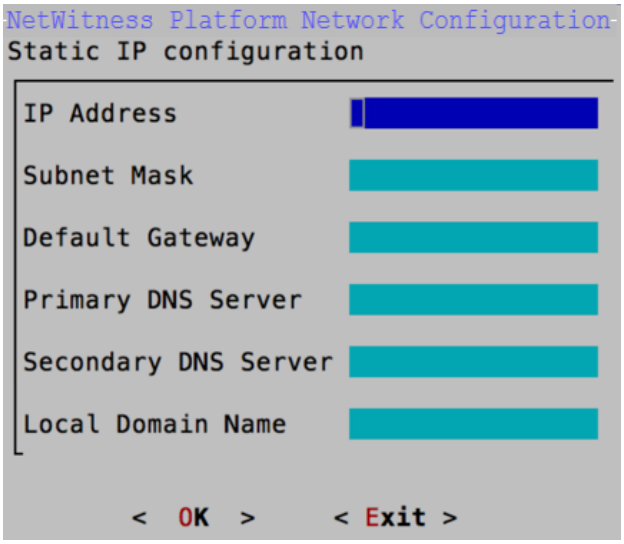


7. Tab to **OK** and press **Enter** to use **Static IP**.
   If you want to use **DHCP**, down arrow to 2 Use DHCP and press **Enter**.

The **Network Configuration** prompt is displayed.



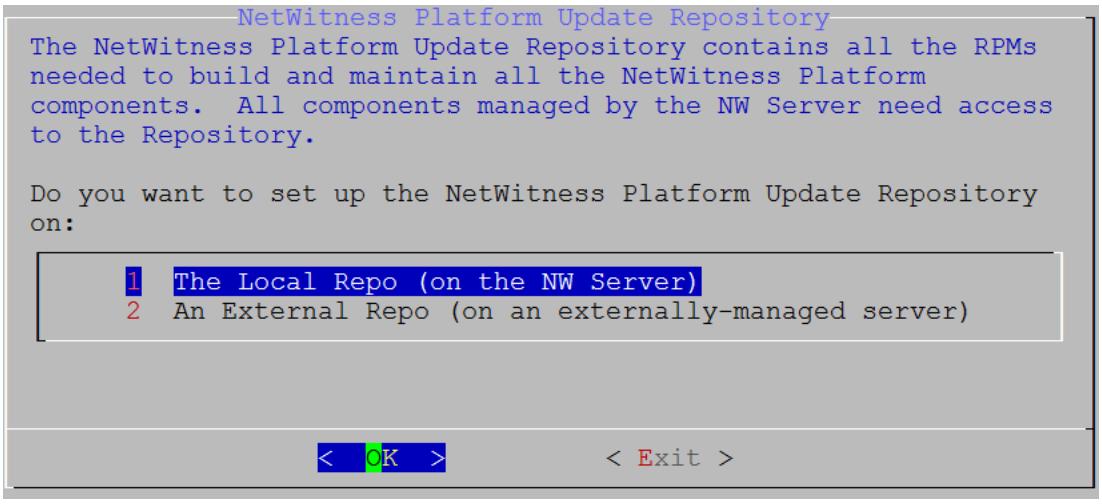
8. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.
   The **Static IP Configuration** prompt is displayed.



9. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**.
   If you do not complete all the required fields, an **All fields are required** error message is displayed (**Primary DNS Server**, **Secondary DNS Server**, and **Local Domain Name** fields are not required.)
   If you use the wrong syntax or character length for any of the fields, an **Invalid *field-name*** error message is displayed.

   Caution: If you select DNS Server, make sure that the DNS Server is correct and the host can access it before proceeding with the install.

10. The **Update Repository** prompt is displayed. Press **Enter** to choose the **Local Repo** on the NW Server.



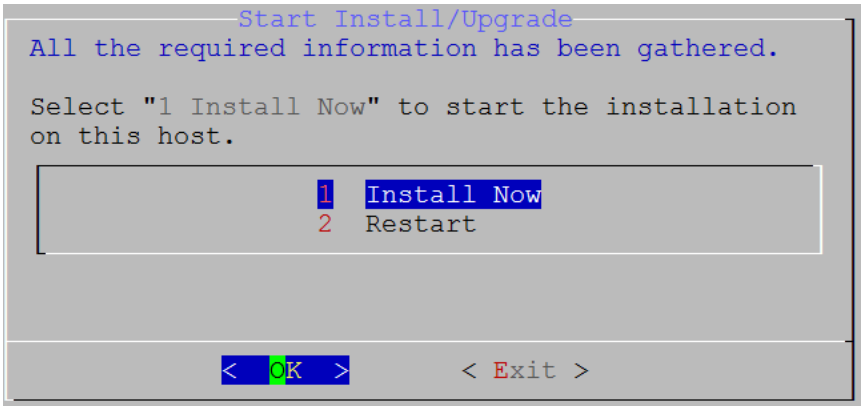
NetWitness Platform Update Repository
The NetWitness Platform Update Repository contains all the RPMs needed to build and maintain all the NetWitness Platform components. All components managed by the NW Server need access to the Repository.
Do you want to set up the NetWitness Platform Update Repository on:
1 The Local Repo (on the NW Server)
2 An External Repo (on an externally-managed server)
< OK >
< Exit >

11. To:
    - Apply the standard firewall configuration, press **Enter**.
    - Disable the standard configuration, tab to **Yes** and press **Enter**.
      The Disable firewall prompt is displayed.

      The disable firewall configuration confirmation prompt is displayed.

    - Tab to **Yes** and press **Enter** to confirm (press **Enter** to use standard firewall configuration).

12. The **Start Install** prompt is displayed.



13. Press **Enter** to install 11.2 on the NW Server.
    When **Installation Complete** is displayed, you have installed the 11.2 NW Server on this host.

> **Note:** Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

```
ValueError: error:3207A06D:lib(50):B_HASH_init:cr new

Configure Hosts (Instances) in NetWitness Platform

Configure individual hosts and services as described in RSA NetWitness® Platform *Host and Services Configuration Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.

Note: After you successfully launch an instance, AWS assigns a default hostname to it. See the "Change the Name and Hostname of a Host" documentation in RSA Link (https://community.rsa.com) for instructions on changing a hostname.

Configure Packet Capture

You can integrate any of the following Third-Party solutions with the Network Decoder to capture packets in the AWS cloud:

- Gigamon® GigaVUE
- f5® BIG-IP

Integrate Gigamon GigaVUE with the Network Decoder

There are two main tasks to configure the Gigamon® third-party Tap vendor packet capture solution:

Task 1. Integrate the Gigamon Solution

Gigamon® Visibility Platform on AWS is available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on the Gigamon® solution refer to the "Gigamon® Visibility Platform for AWS Data Sheet" (https://www.gigamon.com/sites/default/files/resources/datasheet/ds-gigamon-visibility-platform-for-aws-4095.pdf).

For deployment details, see the "Gigamon® Visibility Platform for AWS Getting Started Guide" (https://www.gigamon.com/sites/default/files/resources/deployment-guide/dg-visibility-platform-for-aws-getting-started-guide-4111.pdf).

After the “Monitoring Session” is deployed within the Gigamon GigaVUE-FM, you can configure the Network Decoder Tunnel.

Task 2. Configure Tunnel on the Network Decoder

1. SSH to the Decoder.
2. Enter the following command strings.

```
$ sudo ip link add tun0 type gretap local any remote <ip_address_of_
VSERIES_NODE_TUNNEL_INTERFACE> ttl 255

$ sudo ip link set tun0 up mtu <MTU-SIZE>

$ sudo ifconfig (to verify if the tunnel tun0 is being listed in the list
of interfaces)

$ sudo lsmod | grep gre ( to make sure if the below kernel modules are
running:

ip_gre 18245 0

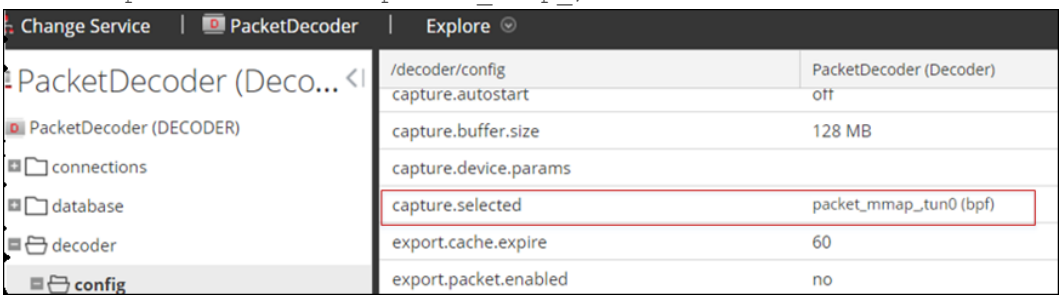
ip_tunnel 25216 1)

If they are not running then execute the below commands to enable the
modules

$ sudo modprobe act_mirred

$ sudo modprobe ip_gre
```

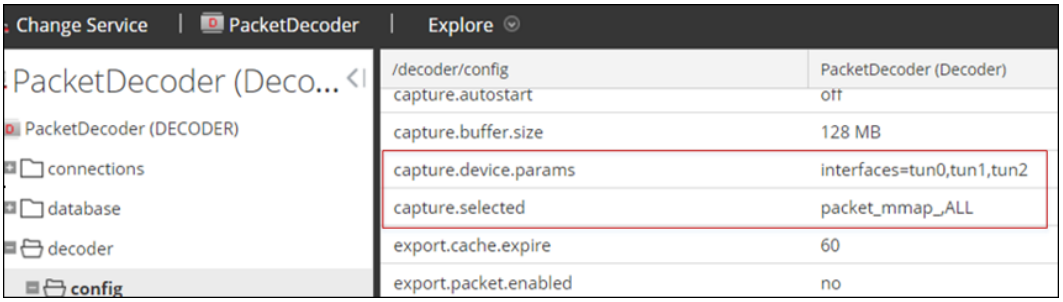
3. Create a firewall rule in the Network Decoder to allow traffic through the tunnel.
   a. Open the `iptables` file.
      `vi /etc/sysconfig/iptables`
   b. Append the line `-A INPUT -p gre -j ACCEPT` before the `commit` statement
   c. Restart `iptables` by executing the following commands.
      `service iptables restart`
4. Set the interface in the Network Decoder.
   a. Log in to NetWitness Platform, select the `decoder/config` node in Explorer view for the Network Decoder service.
   b. Set the `capture.selected` = `packet_mmap_,tun0`.



5. (Conditional) - If you have multiple tunnels on the Network Decoder.
   a. Restart Decoder service after you create the tunnel in Network Decoder.
   b. Log in to NetWitness Platform, select the `decoder/config` node in Explorer view for the Network Decoder service, and set the following parameters.

      `capture.device.params = interfaces=tun0,tun1,tun2`

```
capture.selected = packet_mmap_,All
```



6. Restart decoder service.

   ```
   $ sudo restart nwdecoder
   ```

   The user should be all set to capture the network traffic in Decoder.

Complete the following steps to create a new project and get your project key.

Integrate f5® BIG-IP with the Network Decoder

IG-IP Virtual Edition (VE) is an inline virtual server and load balancer. A common use case would be for the f5® box to be a virtual web server that presents a single IP address and host name that manages requests to a pool of web servers in the cloud.

All traffic to RSA NetWitness® Platform flows through the f5® BIG-IP VE virtual server.

The virtual server functions of the BIG-IP clone all traffic to a designated computer by re-writing mac addresses and loading them into a subnet shared with the destination sniffer. This section describes how to set up the Decoder as the sniffer.

f5® BIG-IP VE Deployment Information

f5® BIG-IP VE on AWS is available through the AWS Marketplace and activated by a BYOL license. A thirty-day free trial is also available.

For more information on this solution refer to the f5® BIG-IP DNS Data Sheet (https://www.f5.com/pdf/products/big-ip-dns-datasheet.pdf).

Task 1: Set Up a BIG-IP VE Virtual Server Instance

Set up a BIG-IP VE Virtual Server Instance according to the instructions in the "BIG-IP Virtual Edition 12.1.0 and Amazon Web Services: Multi-NIC Manual" (https://support.f5.com/kb/en-us/products/big-ip_ltm/manuals/product/bigip-ve-multi-nic-setup-amazon-ec2-12-1-0.html). Complete all the steps through the last steps, "Creating a virtual server."

This virtual server performs packet capture. You may need to create multiple virtual servers to depending on your volume.

As part of creating the virtual server, you must have at least one server in your NetWitness Platform domain to handle the traffic routed by the virtual server (for example, you can create another instance in AWS to host the internal server).

Task 2: Create a Clone Pool

1. Make sure that your Decoder has a network interface on the same subnet as one of the network interfaces on the BIG-IP VE instance.

   The clone pool sends packets to the Decoder by rewriting MAC addresses and sending them out a

network interface. MAC address rewriting can be used to route packets to another subnet.

2. Set up the clone pool within the BIG-IP VE virtual server according to the instructions in "K13392: Configuring the BIG-IP system to send traffic to an intrusion detection system (11.x - 13.x)" article (https://support.f5.com/kb/en-us/solutions/public/13000/300/sol13392.html).
   This document explains how to create the clone pool, and how to make an existing virtual server copy traffic to the clone pool. In this case, we will place the Decoder instance in the clone pool.

Guidelines

The following guidelines help you to configure packet capture correctly using BIG-IP VE.

- The Decoder instance must have its own IP address on one of the same subnets as BIG-IP VE. BIG-IP uses that IP address to identify the Decoder as being part of the clone pool.
- When adding the Decoder instance to the clone pool, BIG-IP asks for a port number in addition to the IP address. This port number does not matter for the cloned traffic. The Decoder will receive all the cloned traffic, regardless of what port number was used here.
- By default, the AWS subnet shared by the Decoder and BIG-IP VE does not allow the cloned traffic to travel from the BIG-IP VE interface to the Decoder interface. You must disable the **`source/dest. check`** on both the Decoder and BIG-IP VE network interfaces in AWS.
- The Decoder instance must have a single network interface, eth0, by default. The Decoder captures traffic on this interface, but it may also receive administrative traffic on this interface. RSA recommends using network rules to filter out ssh and nwdecoder traffic from the capture stream. These are ports 22 (ssh) and 50004/56004 (nwdecoder).

Troubleshooting Tips

There are areas to troubleshoot if packets are not being accepted by the Decoder.

- Make sure that the BIG-IP VE is sending the packets out of the correct interface.
  The BIG-IP VE instance contains tcpdump. Use it to verify the cloned packets are being sent out the expected interface. If they are not, there is a problem in the setup of the clone pool or the virtual server.
- Make sure that the Decoder is receiving packets.
  The Decoder has `tcpdump` installed on it. Use it to verify that the Decoder is receiving packets. If the Decoder is not capturing packets, make sure that:
  - The AWS **`source/dest. check`** is turned off.
  - The Decoder is on the same subnet as the interface the BIG-IP VE is using to clone packets.

AWS Instance Configuration Recommendations

Note: These recommendations can be used as a baseline for 11.2.0.0 and adjusted as needed.

Note: For a description of terms and abbreviations used in this topic, see Abbreviations and Other Terminology Used in this Guide.

This topic contains the minimum AWS instance configuration settings recommended for the RSA NetWitness® Platform virtual stack components.

- EC2 Instance:
  - Minimum instance type - **m4-2xlarge** is the minimum instance type required for any NetWitness Platform component AMI so that it can function.
  - Instance type adjustments you must adjust instance types according to your ingestion rate, content and parsers, dashboard reports, scheduled reports, investigations, and active users.
  - Recommended settings - the recommended settings in the SA component instance tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS and 1.5 Gbps were used.
    - All the components were integrated.
    - The Log stream includes a Log Decoder, Concentrator, and Archiver.
    - The Packet stream includes a Network Decoder and Concentrator.
    - The Endpoint Hybrid stream includes a Endpoint Server, Concentrator and Log Decoder.
    - Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load includes reports, charts, alerts, investigation, and respond.
- EBS Volumes (Storage)

  Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) for assistance on how to increase the number of volumes based on your storage requirements using the RSA Sizing and Scoping Calculator.

  Note: The Concentrator index volume must be allocated on Provisioned IOPS SSD.

RSA NETWITNESS® PLATFORM

Azure Deployment Guide

for Version 11.2

Contact Information

RSA Link at https://community.rsa.com contains a knowledgebase that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

Trademarks

For a list of RSA trademarks, go to www.emc.com/legal/emc-corporation-trademarks.htm#rsa.

License Agreement

Third-Party Licenses

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on RSA Link. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

Distribution

Dell believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

September 2018

Contents

Deployment Overview

Before you can deploy RSA NetWitness® Platform in Azure, you need to:

- Understand the requirements of your enterprise.
- Know the scope of a NetWitness Platform deployment.

When you are ready to begin the deployment:

- Make sure that you have a NetWitness Platform "Throughput" license.
- Use Chrome for your browser (Internet Explorer is not supported).

Azure Environment Recommendations

Azure instances have the same functionality as the NetWitness Platform hardware hosts. RSA recommends that you perform the following tasks when you set up your Azure environment.

- Based on the resource requirements of the different components, follow best practices to use the system and dedicated storage appropriately.
- Build Concentrator directory for index database on SSD.

Abbreviations and Other Terminology Used in this Guide

Abbreviation	Description
Azure	Azure is Microsoft's public cloud computing platform. It provides a range of cloud services, including those for compute, analytics, storage and networking. You can pick and choose from these services to develop and scale new applications, or run existing applications, in the public cloud.
BYOL	Bring Your Own Licensing
CPU	Central Processing Unit
EPS	Events Per Second
GB	Gigabyte. 1GB = 1,000,000,000 bytes
Gb	Gigbit. 1Gb = 1,000,000,000 bits.
Gbps	Gigabits per second or billions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
GHz	GigaHertz 1 GHz = 1,000,000,000 Hz
HDD	Hard Disk Drive
IOPS	Input/Output Operations Per Second

Abbreviation	Description
Mbps	Megabits per second or millions of bits per second. It measures bandwidth on a digital data transmission medium such as optical fiber.
On-Premise	On-premise hosts are installed and run on computers on the premises (in the building) of the organization using the hosts, rather than in the Azure.
RAM	Random Access Memory (also known as memory)
Security	Set of firewall rules. Refer to Deployment: Network Architecture and Ports (https://community.rsa.com/docs/DOC-83050) for a comprehensive list of the ports you must set up for all NetWitness Platform components.
SSD	Solid-State Drive
vCPU	Virtual Central Processing Unit (also known as a virtual processor)
VHD	Virtual Hard Disk
VM	Virtual Machine
vRAM	Virtual Random Access Memory. This is the memory for a virtual machine.

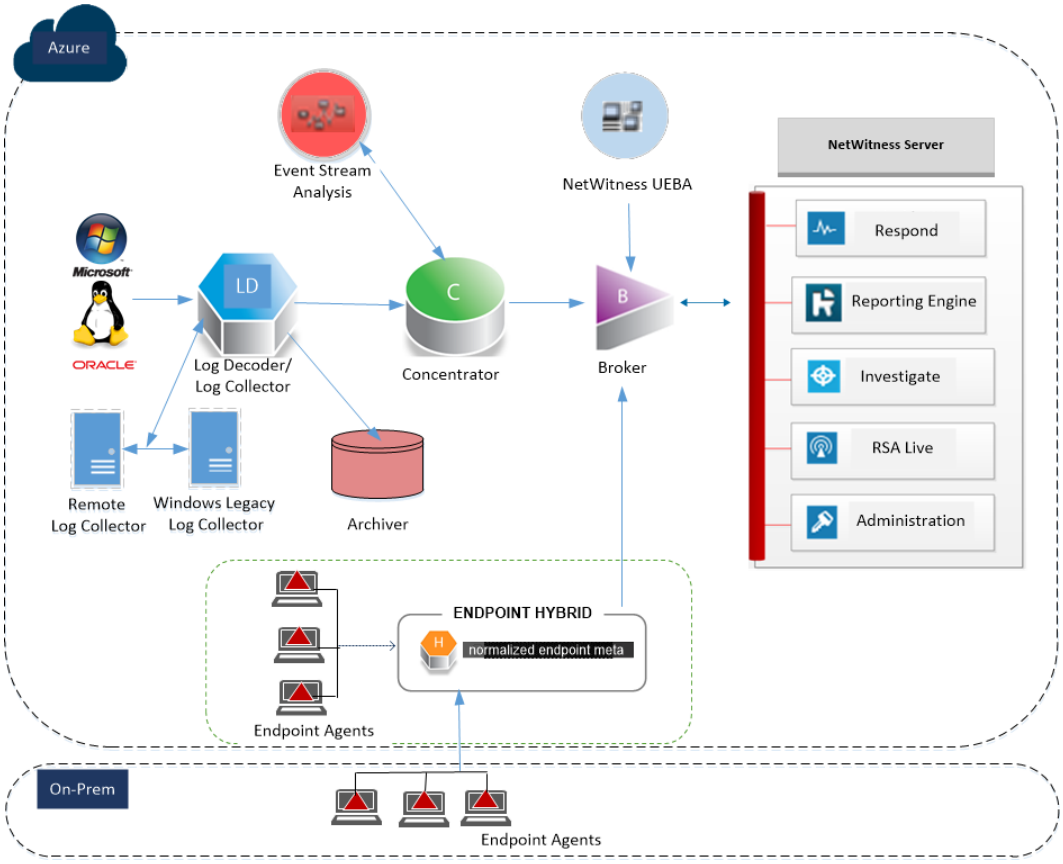
Azure Deployment Scenarios

The following diagrams illustrate some common Azure deployment scenarios. In the diagrams, the:

- **Log Decoder** receives logs collected by the Log Collector. The Log Collector collects log events from hundreds of devices and event sources.
- **Concentrator** indexes metadata extracted from network or log data and makes it available for enterprise-wide querying and real-time analytics while facilitating reporting and alerting.
- **UEBA** provides comprehensive user and entity behavioral analytics to better detect, investigate, and respond to advanced internal attacks and identity-based anomalies.
- **Endpoint Hybrid or Endpoint Log Hybrid** is used for collection of endpoint data. The Endpoint Hybrid comprises of an Endpoint Server, Log Decoder, and a Concentrator.
- NetWitness Server hosts **Respond**, **Reporting Engine**, **Investigate**, **RSA Live**, **Administration**, **Endpoint Hybrid/Log Hybrid** and other aspects of the user interface.

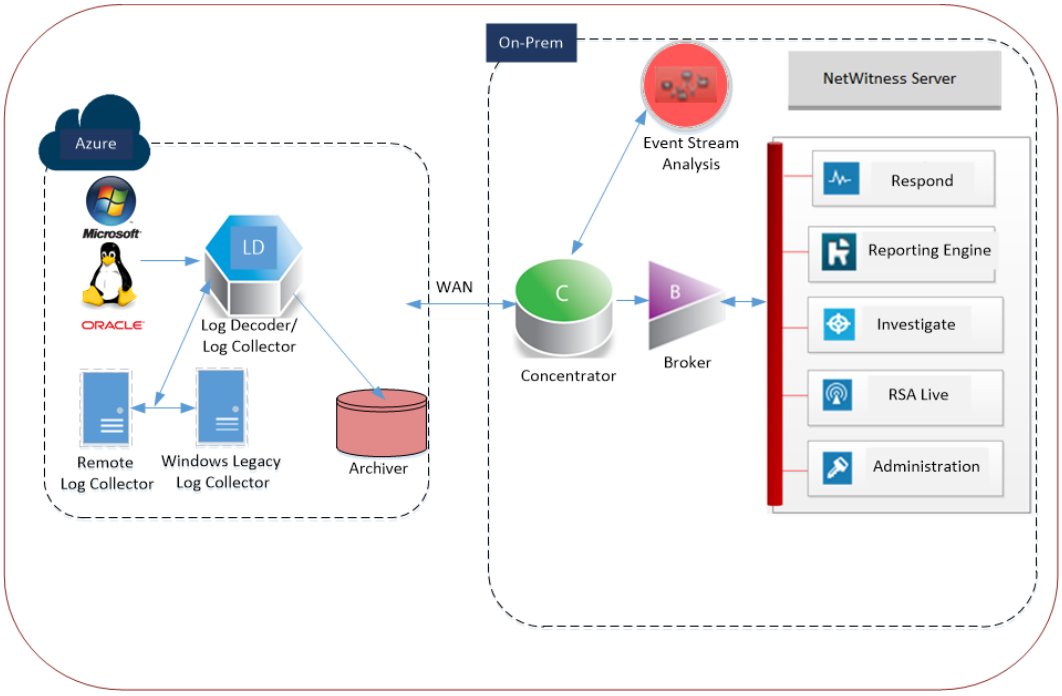
Full NetWitness Platform Stack Azure Visibility

This diagram shows all NetWitness Platform components (full stack) deployed in Azure.



Hybrid Deployment - Log Decoder

This diagram shows the Log Decoder and Archiver deployed in Azure with all other NetWitness Platform components deployed on your premises.



Supported Services

RSA provides the following NetWitness Platform services.

- NetWitness Server
- Archiver
- Admin Server
- Config Server
- Investigate Server
- Orchestration Server
- Reporting Engine
- Respond Server
- Security Server
- Broker
- Concentrator
- Event Stream Analysis

- Log Decoder
- Decoder
- Remote Log Collector
- Endpoint Server
- UEBA

Deployment Flow

The following list the flow for Azure deployment:

1. VM Configuration Recommendations
2. Deployment Rules and Checklist
3. Partition Recommendations
4. Installation Tasks

VM Configuration Recommendations

Note: For a description of terms and abbreviations used in this topic, refer to Deployment Overview.

This topic contains the minimum Azure VM configuration settings recommended for the NetWitness Platform (NW) virtual stack components.

- VM:
  - The recommended settings in the NetWitness Platform component VM tables below were calculated under the following conditions.
    - Ingestion rates of 15,000 EPS were used.
    - All the components were integrated.
    - The Log stream included a Log Decoder, Concentrator, and Archiver.
    - Respond was receiving alerts from the Reporting Engine and Event Stream Analysis.
    - The background load included reports, charts, alerts, investigation, and respond.
- **Note:** For higher EPS rates, the Concentrator index volume must be allocated SSDs.

Azure Instance Recommendations

Following are the instance recommendations for NetWitness Azure VMs.

Azure Image Type	Rate (EPS)	CPU (Cores)	RAM (GB)	Instance Type (Azure Name)	Cache
NW Admin Server	Does not apply	16	112	Standard D14_ v2	Read/ Write
Log Decoder	15,000	32	128	Standard D32s_ v3	Read/ Write
Concentrator	15,000	16	112	Standard DS14_ v2	Read/ Write
Archiver	15,000	16	112	Standard D14_ v2	Read/ Write
ESA	15,000	20	140	Standard D15_ v2	Read/ Write
UEBA	-	16	64	-	-

Azure Image Type	Rate (EPS)	CPU (Cores)	RAM (GB)	Instance Type (Azure Name)	Cache
Log Collector	15,000	8	32	Standard D8s_ v3	Read/ Write
Endpoint Hybrid	25,000	16	32	Standard DS14_ v2	Read/ Write

Deployment Rules and Checklist

This topic contains the rules and high-level tasks provides you must follow to deploy RSA NetWitness® Platform components in the Azure.

Rules

You must adhere to the following rules when deploying NetWitness Platform in Azure.

- Always use private IP addresses when you provision Azure NetWitness Platform VMs.
- Before you enable the out-of-the-box (OOTB) dashboards, set the default data source in Reporting Engine configuration page.

Checklist

Step	Description	√
1.	Step 1. Deploy NW Server Host	
2.	Step 2. Deploy Other NetWitness Components	

Step 1. Deploy NW Server Host

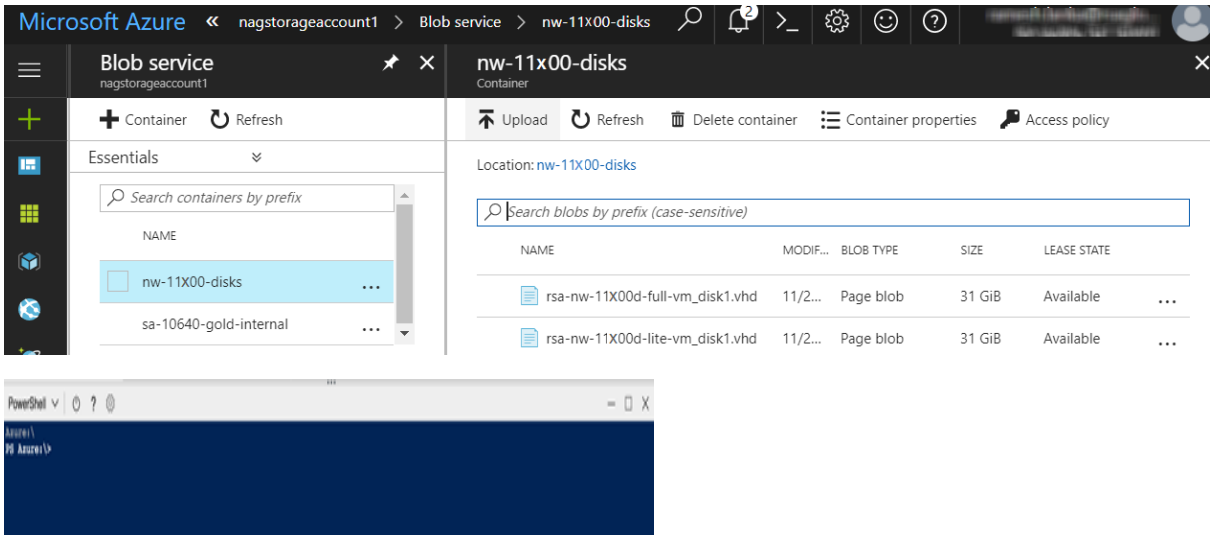
Complete the following tasks to deploy a NetWitness Server (NW Server) on a virtual machine (VM) in the Azure Cloud environment.

Note: It is not mandatory to deploy the NetWitness Server in the Azure Cloud environment to deploy other components (see Azure Deployment Scenarios).

Task 1. - Upload NW Server VHDs

Complete the following steps to upload NW Server VHDs to Azure.

1. Contact RSA Customer Support (https://community.rsa.com/docs/DOC-1294) to open a support case requesting the NW Server VHDs. A valid throughput license will be required.
2. Customer Support will update the case with VHD URI's.
3. In the Azure Portal, open the Powershell CLI.



You will need a storage account, blob service and container setup. This is where the VHD's will be copied to. After these are in place, you can execute the following command within the Azure Portal Powershell CLI. Alternatively, you can also run these commands from the Powershell in your workstation:

a. Run this command from Powershell to install AzureRM: `Install-Module -Name AzureRM -AllowClobber`

b. Execute this command to verify the installation process has been successfully done: `Import-Module -Name AzureRM`

c. If you find any error regarding execution policy, execute this command: - `Set-ExecutionPolicy -ExecutionPolicy RemoteSigned` (then repeat step b)

d. (Optional) If you are running the commands from the Powershell in your workstation, login to your Azure account using this command: `Login-AzureRmAccount`

e. Select the Subscription: `Select-AzureRmSubscription -SubscriptionId <subscriptionid>`

f. Create a target context: `$targetStorageContext = (Get-AzureRmStorageAccount -ResourceGroupName <resource-group-name> -Name <storage-account-name>).Context`

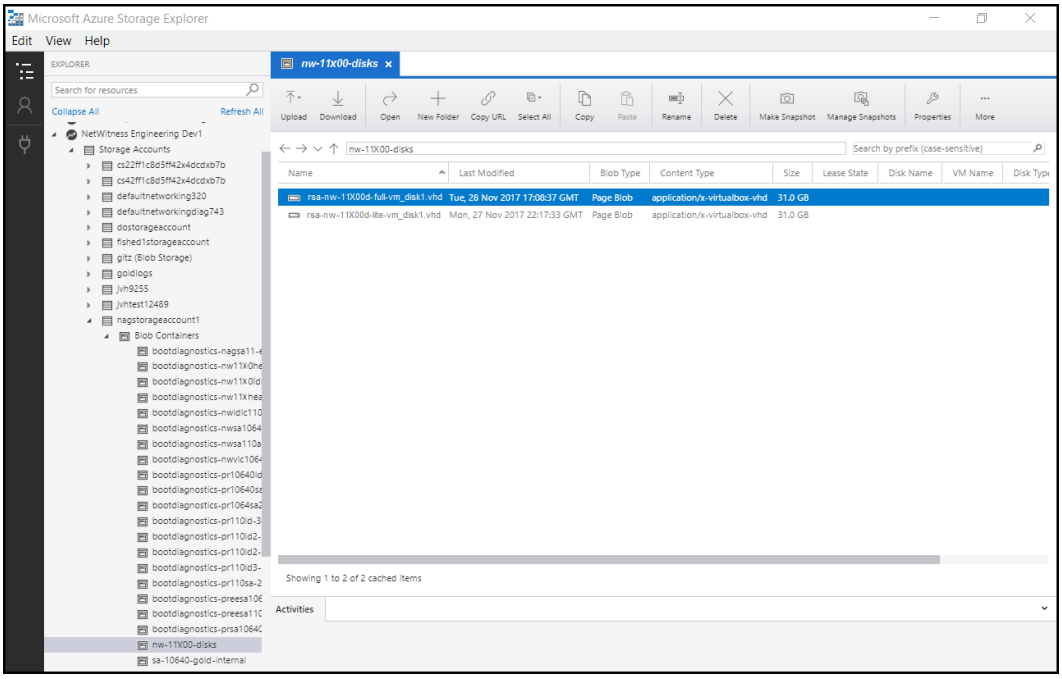
g. Start the copy: `Start-AzureStorageBlobCopy -AbsoluteUri "<SAS-URL>" -DestContainer <container-name> -DestBlob <destination-blob-name> -DestContext $targetStorageContext`

h. You can get the Blob copy status by executing this command: `Get-AzureStorageBlobCopyState -Blob "< destination-blob-name>" -Container "<container-name> " -Context $targetStorageContext`

4. Once the VHD's are successfully copied. You'll need to create an image and VM.

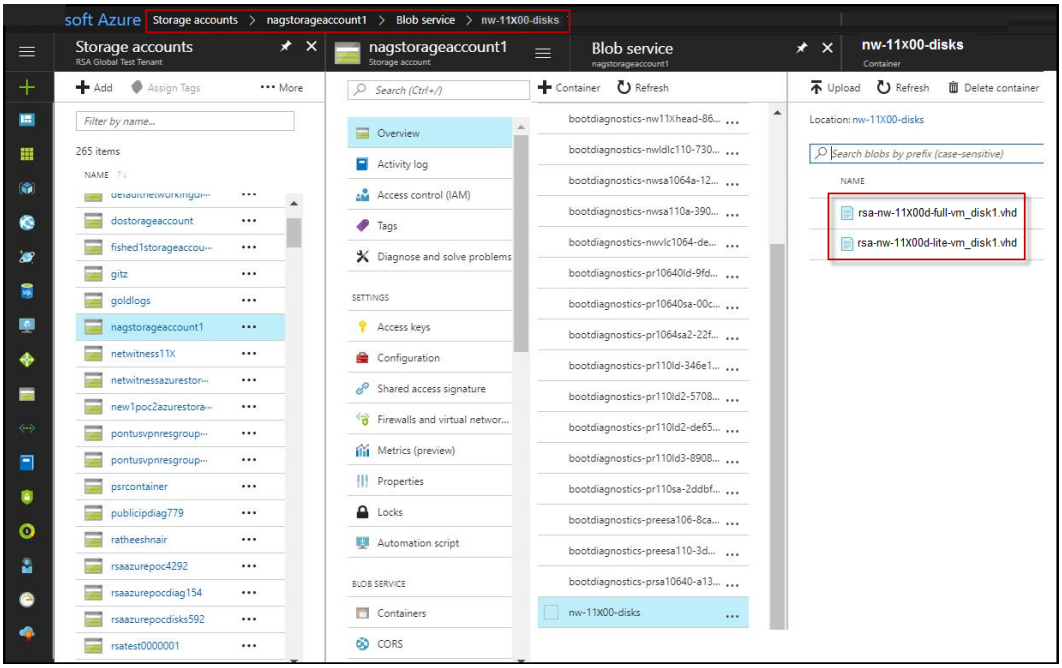
5. Verify that all the NW Server VHDs are uploaded into the Azure Cloud.

Note: Alternatively, you can use the Microsoft Azure Storage Explorer windows utility (http://storageexplorer.com/) to verify that all the VHDs from the following location subscription exist. This utility helps you manage the contents your storage.

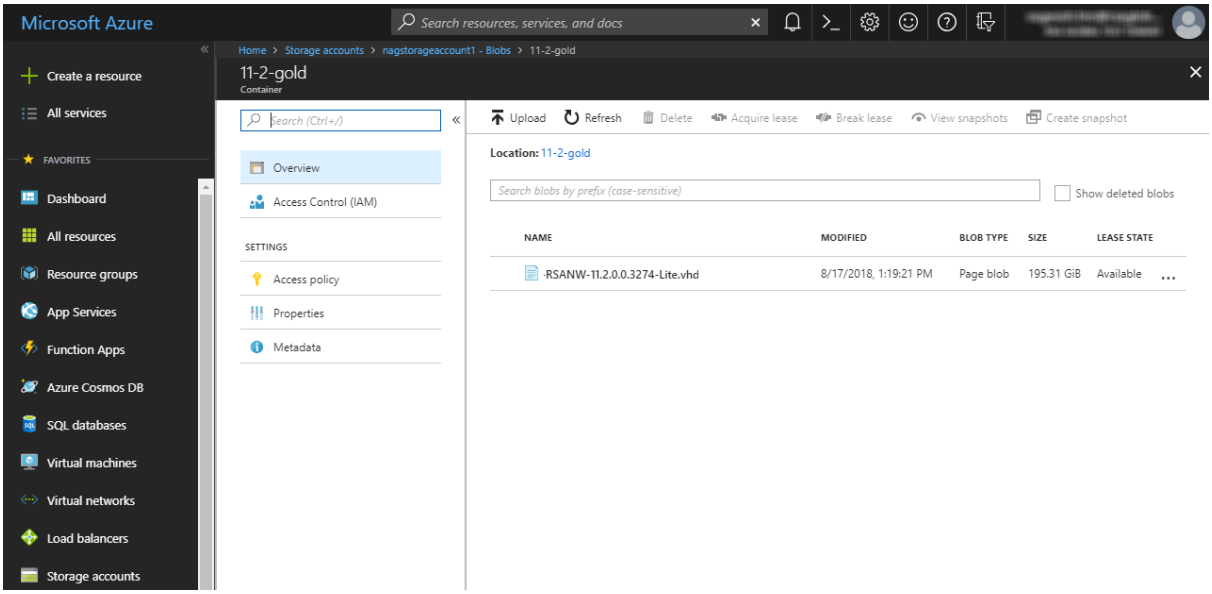


a. Log in to the Azure portal (https://portal.azure.com).

b. In the right panel, click **Storage accounts** > **netwitnessazurestorage1** > **Blob service** > **nwazurevhdstore**.



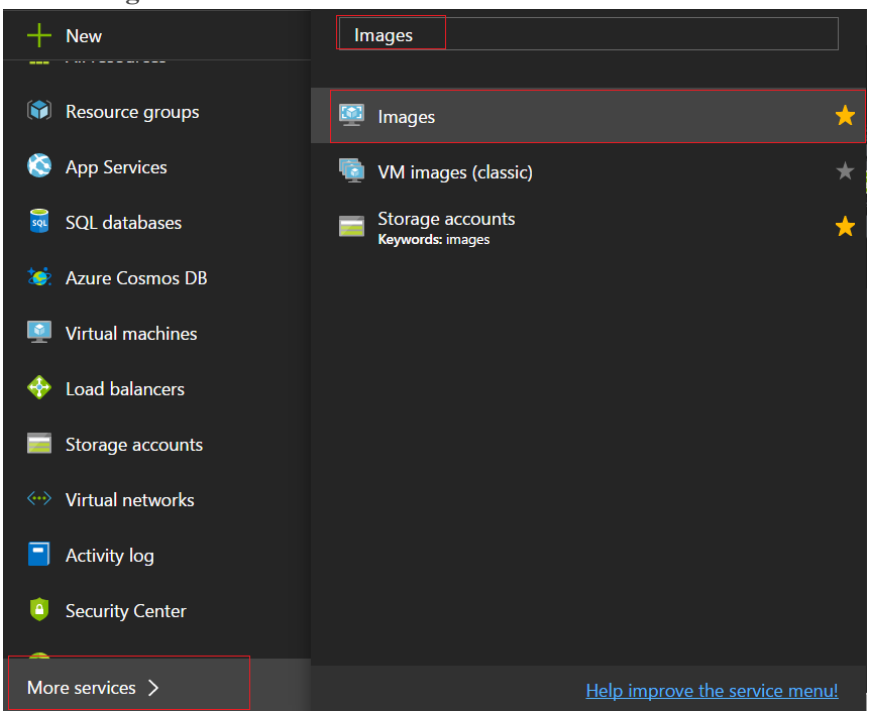
6. (Optional) In the Azure Explorer, go to the **NetWitness** group > **Storage Accounts** > **netwitnessazurestorage1**) > **Blob Containers** > **nwazurevhdstore**). The following screen shot shows you an example of the contents of a storage container.



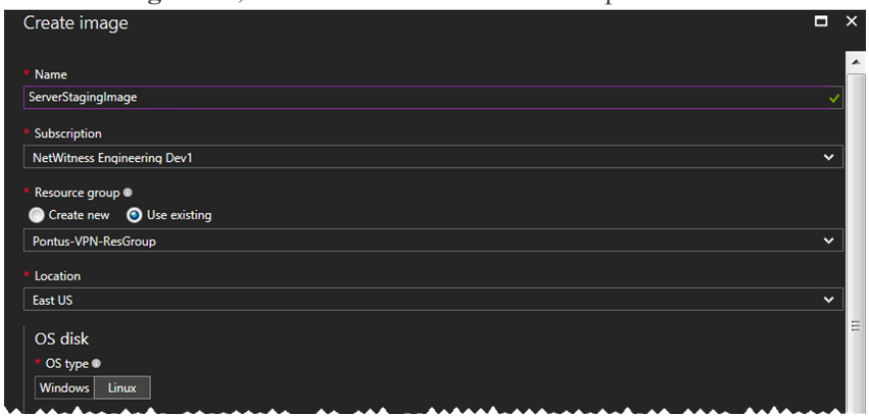
Task 2. - Create NW Server Image

Complete the following steps to create an NW Server image in Azure from upload VHDs.

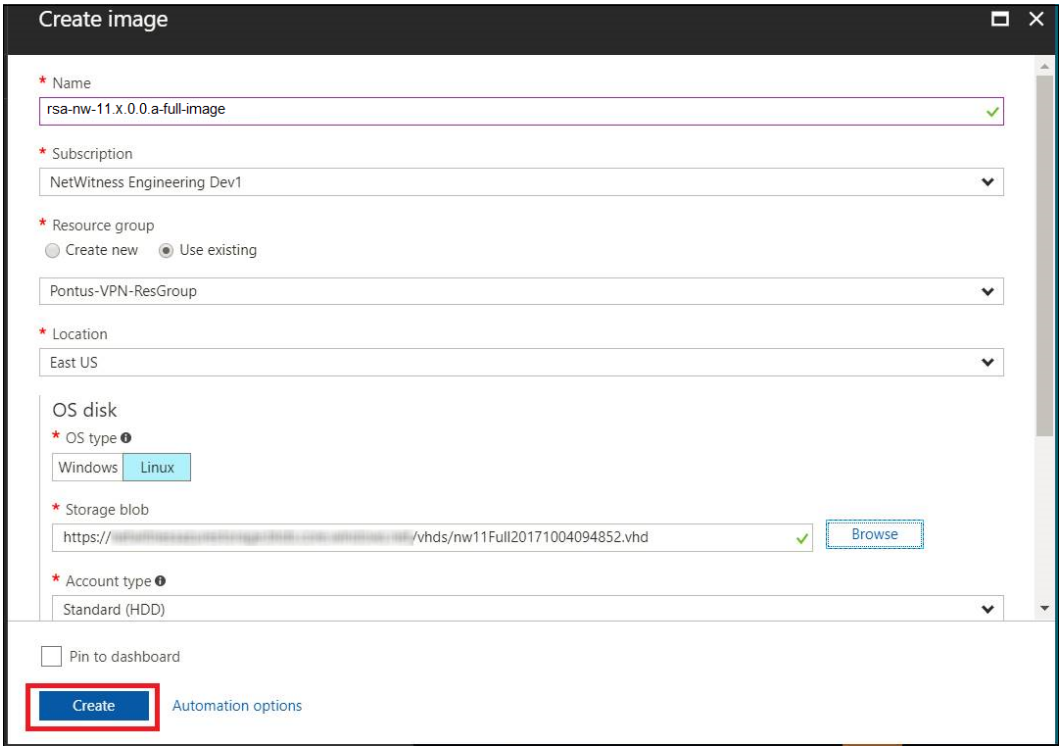
1. Log in to https://portal.azure.com.
2. In the left panel, click **More Services** and filter by Images.
3. Click **Images**.



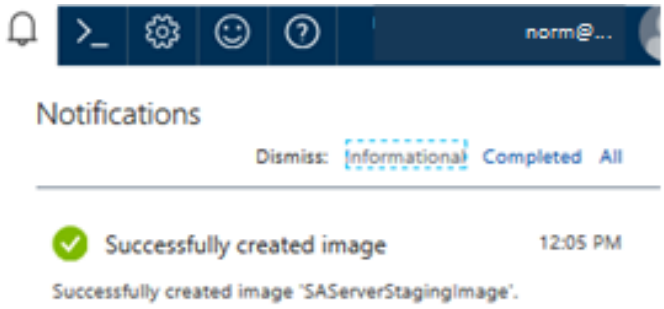
4. Create and configure the Image.
   a. Click **Add**.
   b. Enter an Image Name, select the correct Resource Group, select a valid Location, and set the OS Disk to Linux.
   In the **Storage blob**, browse to where VHDs are uploaded.



c. Make sure that **Standard (HDD)** is selected for **Account Type**.
The following screen shot illustrates a completed **Create Image** view.



d. Click **Create** to create the Image.
The following confirmation is displayed when the image is created.



Task 3. Create Virtual Machine (VM)

Complete the following steps to create a VM in Azure using the NetWitness Server image.

1. Go to **Images** and click **Create VM**.

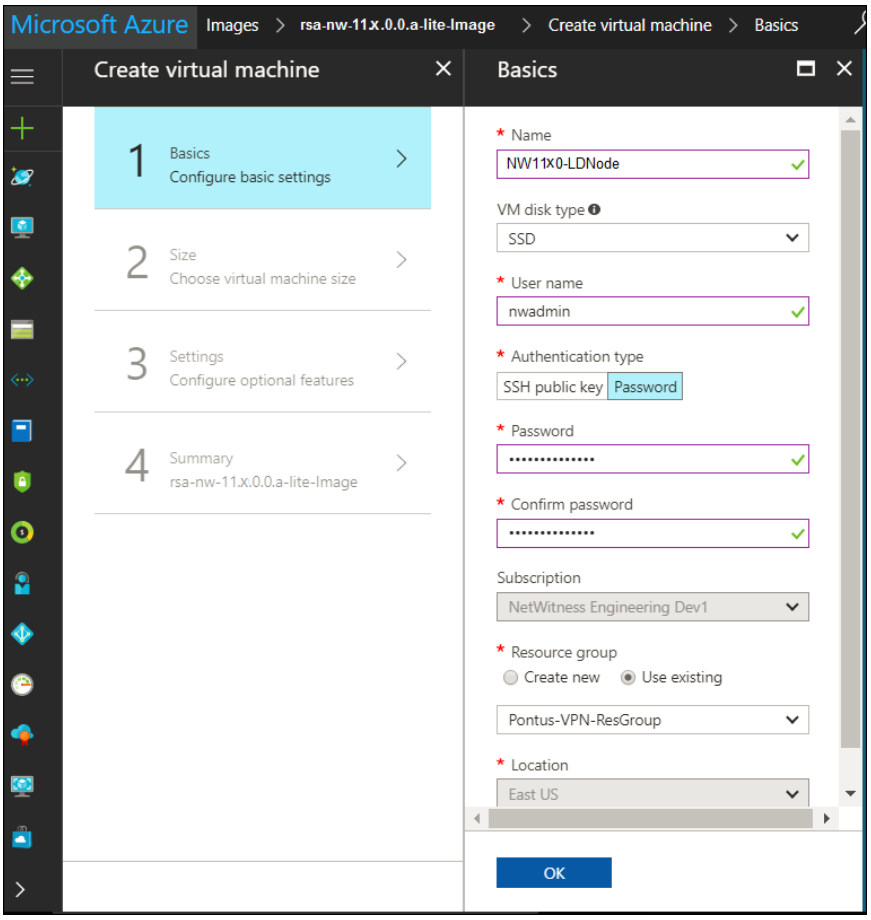
   The **1 Basics - Configure basic settings** section is in focus.

2. Define values for all of the fields.
   a. In the **Name** field, enter a user-defined name (for example, **NWServer1100**).
   b. In the **VM disk type** field, select **HDD** from the drop-down list.

      Caution: The username and password that you define is used to login to the system as a non-administrator user. Do not use the root user (the login does not have superuser permissions). You must change the root password the first time that you log in to the VM by executing the `su passwd root` command. This is a critical step and should not be missed. You cannot use `root` for a username (Azure-specific).

   c. In the **User name** field, enter a valid username.
   d. In the **Authentication type** field, click **Password** and enter a strong password that is a combination of lowercase, uppercase, numeral and a symbol (for example, **Password@123**).
   e. Make sure that the values selected in the **Subscription**, **Resource group and Location** fields are correct.

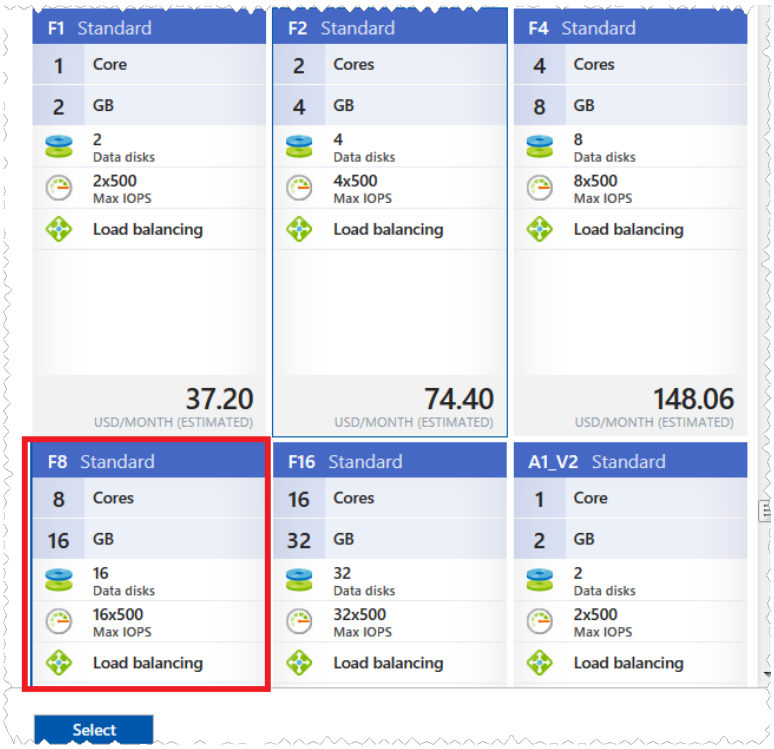
f. Click **OK**.



The **2 Size - Choose virtual machine size** section is in focus.

3. Click ***size-required-based-on-capacity*** (for example, **F8 Standard**), and click **Select**.

Note: Sizing is based upon the capacity requirements of your enterprize (see VM Configuration Recommendations for RSA VM size recommendations based on log capture rates. The minimum size RSA recommends for the NetWitness Server is **F8 Standard**.



The **3 Settings – Configure optional features** section is in focus.

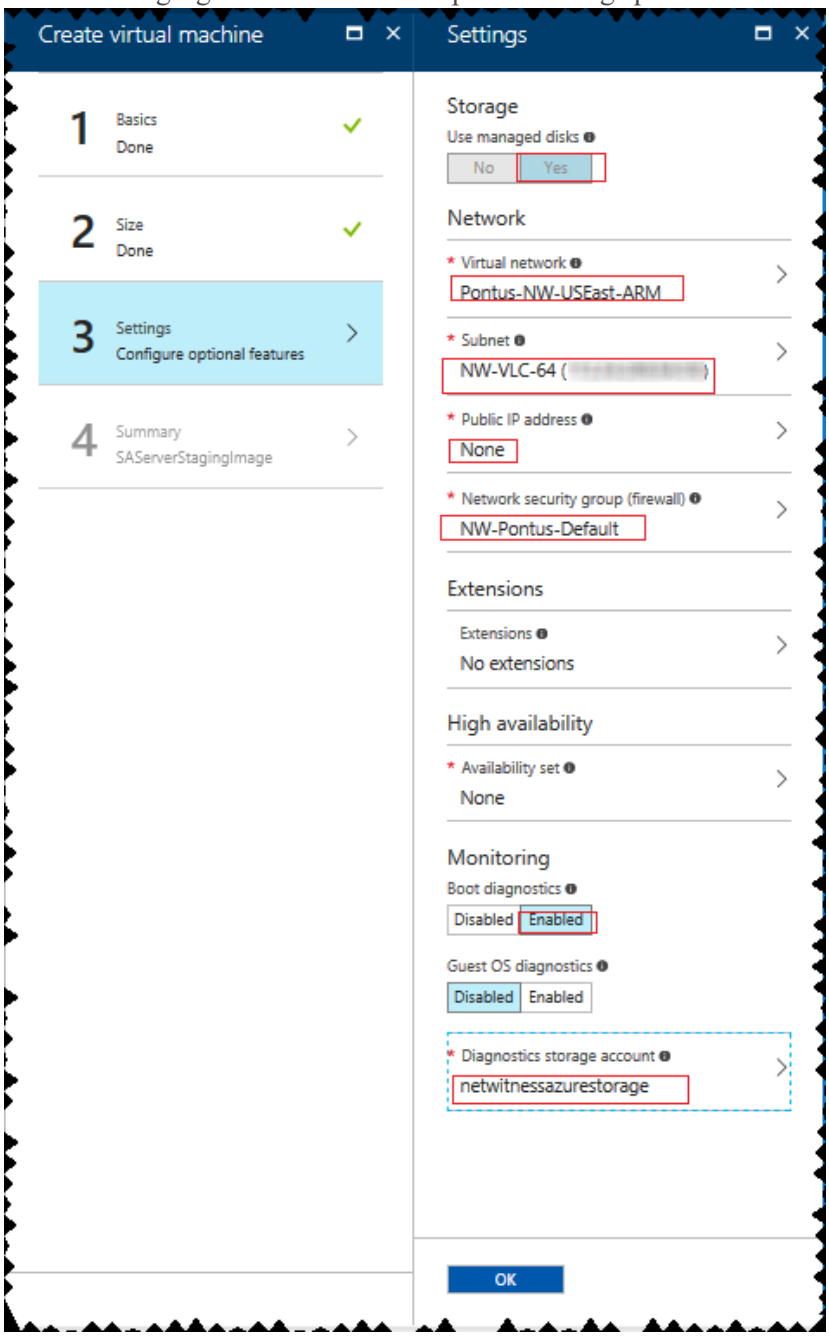
4. Click and define the fields.
   a. In the **Storage** field, make sure that **Use manage disks** is set to **Yes**.
   b. In the **Network** field, select:
      - A valid **Virtual network** and **Subnet**.

      - **None** for the **Public IP address**.
        RSA recommends **None** for the **Public IP address** (this is not mandatory). You can assign a public IP address, but it countermands Best Practices to assign a public IP to something that is based in the Azure Cloud.
      - A valid **Network security group**.
        For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg).

c. In the Monitoring field, select:

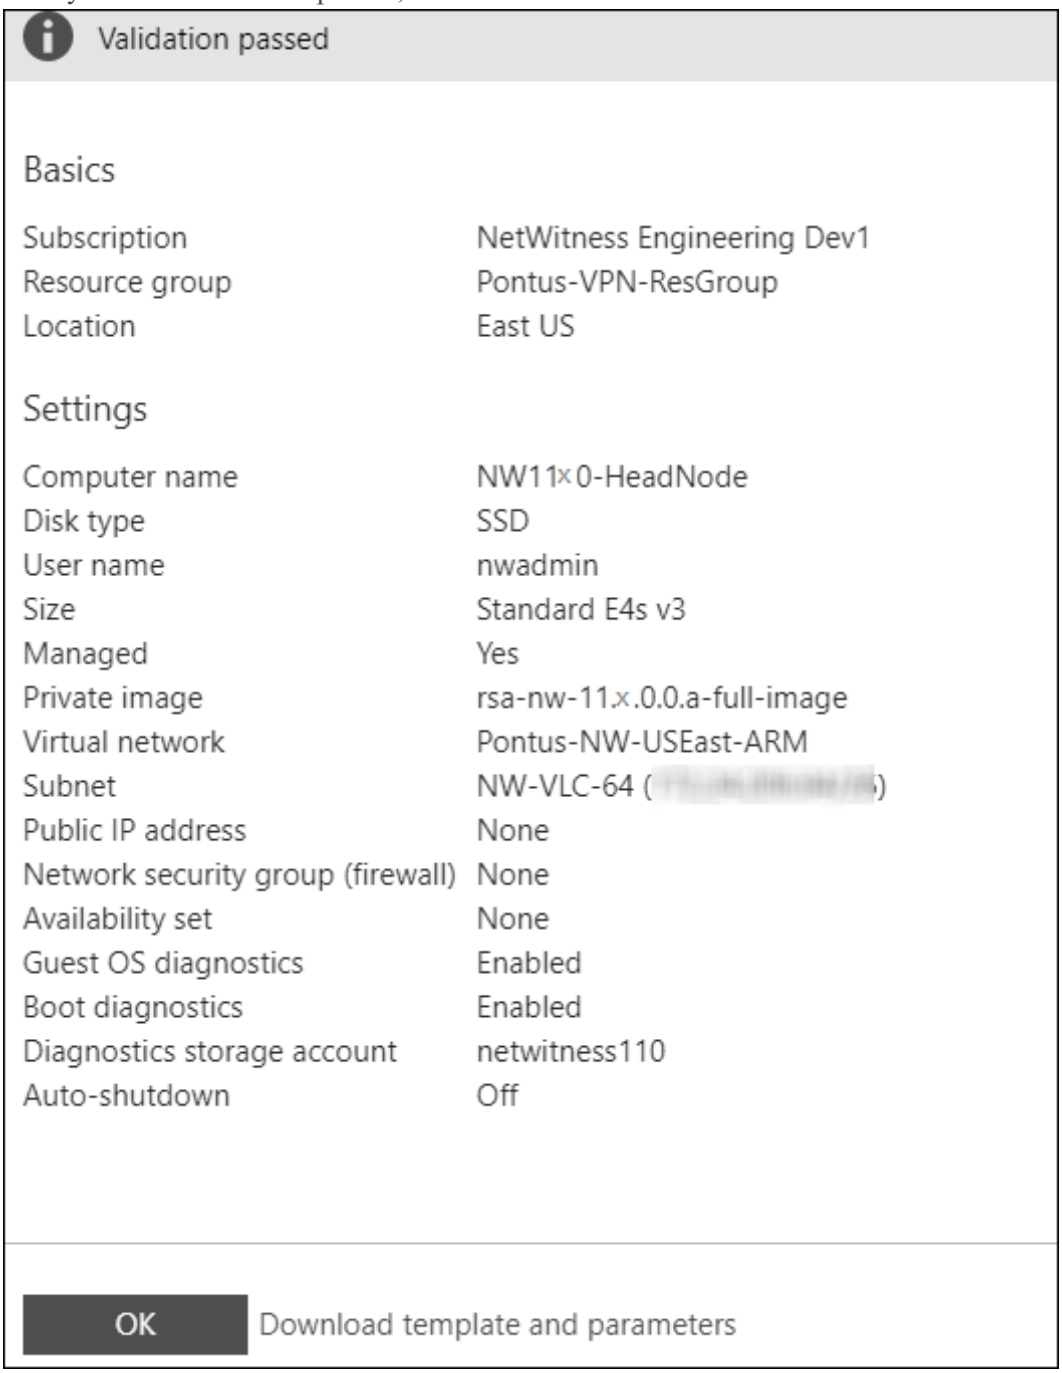
- **Enabled** for **Boot Diagnostics**
- **Enabled** for **Guest OS diagnostics**
- Valid **Diagnostics storage account**

The following figure illustrates a completed Settings panel.



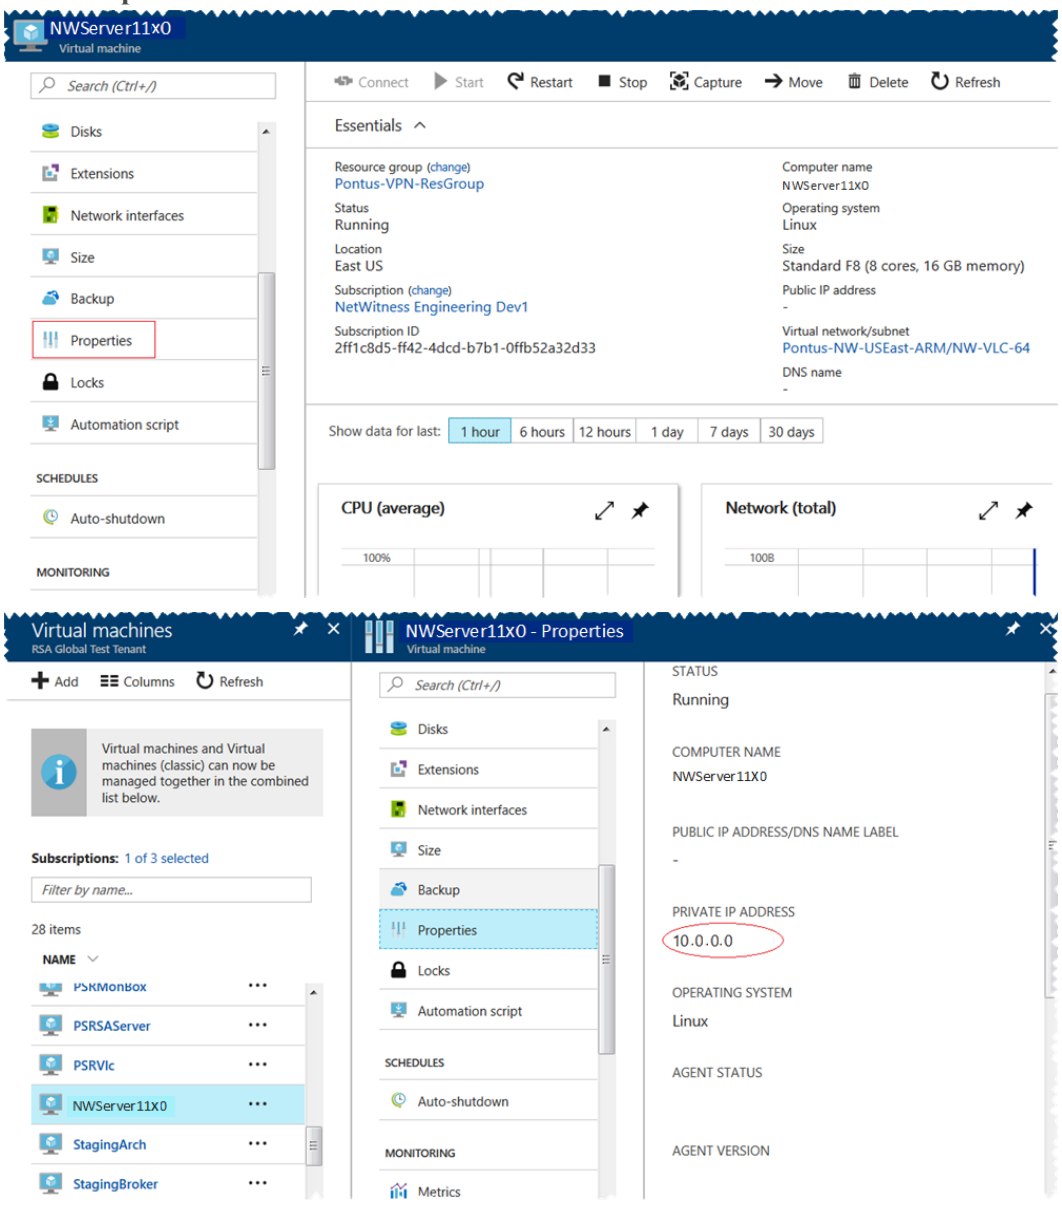
d. Click **OK**.

5. Verify that the Validation passed, and click **OK**.



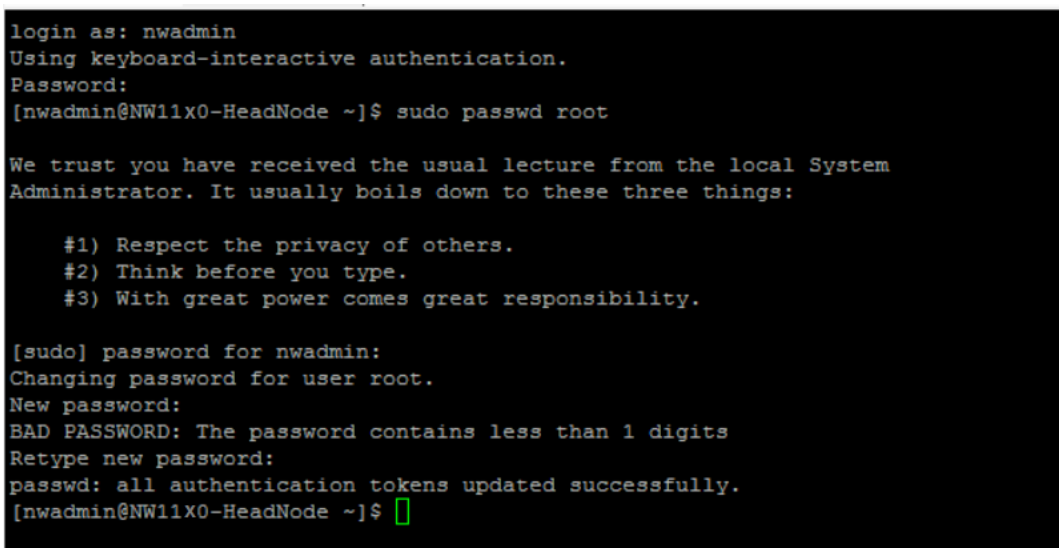
You know that the NW Server VM Deployment is successful when you see the VM status as **Running**.

6. Click **Properties** to view the **IP Address** details.



7. SSH to the VM using the username that you specified in Step 2d of Task 3 and reset the **root** password. Use the `su passwd root` command string to reset the root password as shown in the

following screen shot.



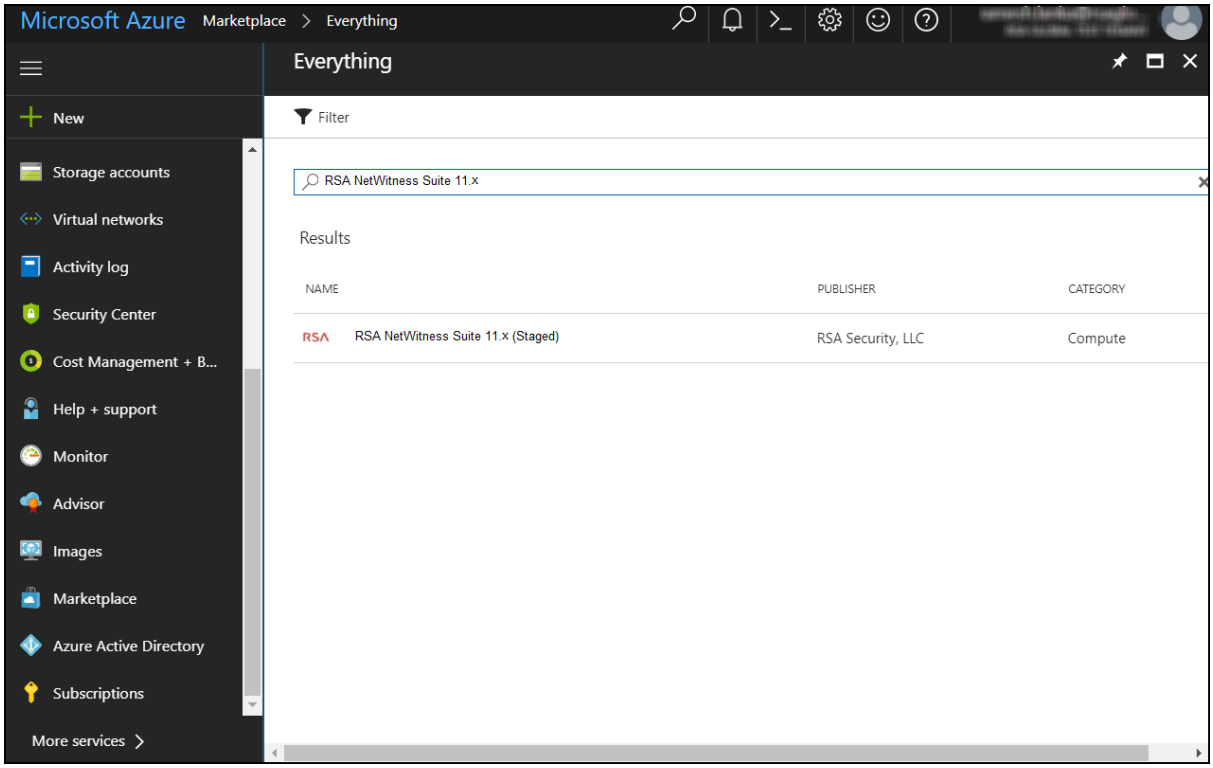
8. Close the current SSH session and open a new SSH session with **root** as the username and the password created in the previous step.

Note: Step 8 is a critical one-time step for a new deployment. If you do not complete this step, the NetWitness User Interface will not load.

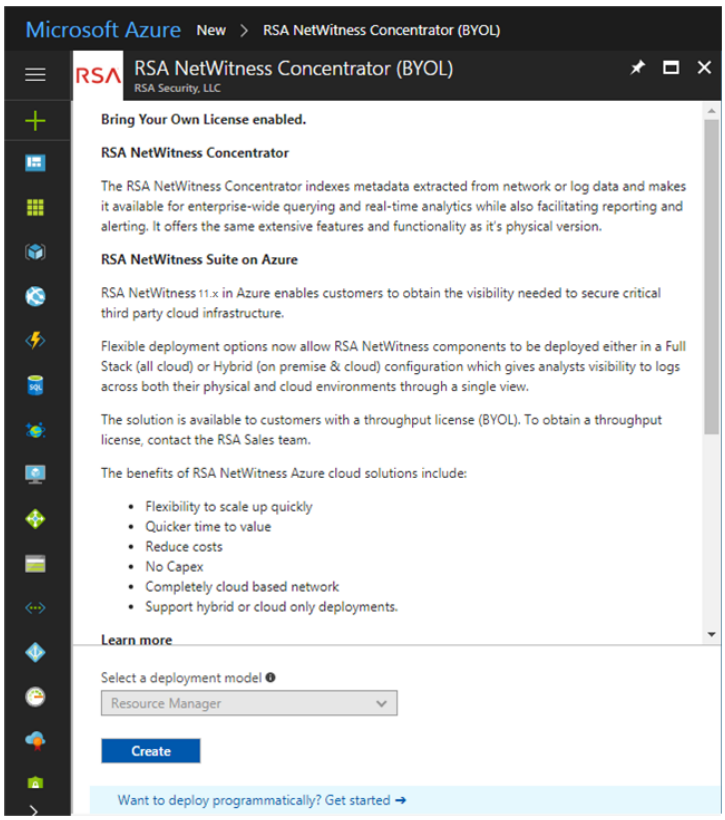
Step 2. Deploy Other NetWitness Components

Complete the following procedure to configure core RSA NetWitness® Platform component services on a virtual machines (VMs) in the Azure Cloud environment.

1. Go to azuremarketplace.microsoft.com and sign in with your credentials.
2. Search for RSA.

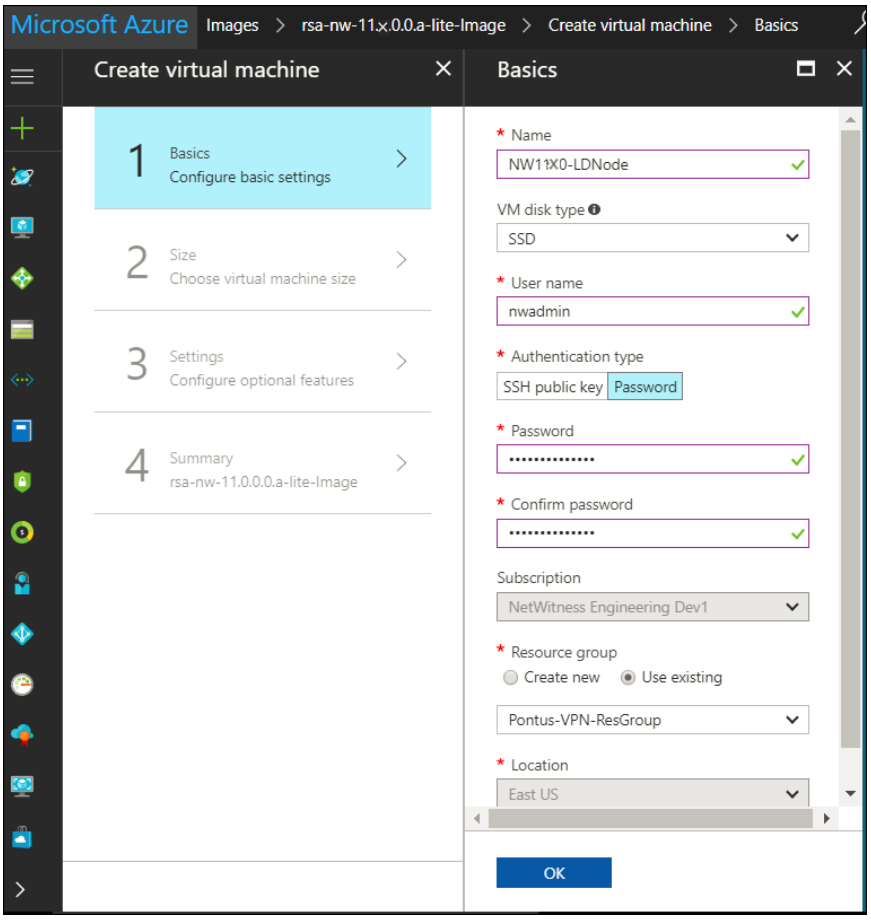


3. Click RSA NetWitness® Platform core service (for example, **RSA NetWitness Concentrator**) and click **Create**.



The **Create virtual machine** wizard is displayed with the **1 Basics** section is in focus.

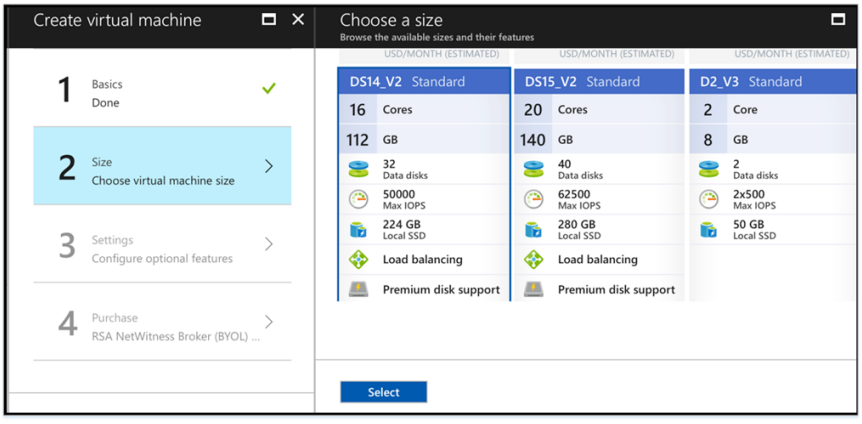
4. Complete Basics.
   a. Specify a VM **Name** (for example, **Concentrator**).
   b. Select **SSD** for the **VM disk type**of the Concentrator. Select HDD for all other components. Solid State Disk (SSD) performs better than a Hard Drive (HDD).
   c. Select **Password** for **Authentication type**.
   d. Enter your credentials (that is **User name** and **Password**) and **Confirm Password**.
   e. Click **OK**.



Azure validates your **Basic** specifications and the **2 Size** section is in focus.

5. Click on the appropriate VM size (for example, **Standard DS14 v2** for the Concentrator) for the service and click **Select** for a VM **Size**.

   See VM Configuration Recommendations for the VM sizes RSA recommends for each service.



Azure validates your **Size** specifications and the **3 Settings** section is in focus.

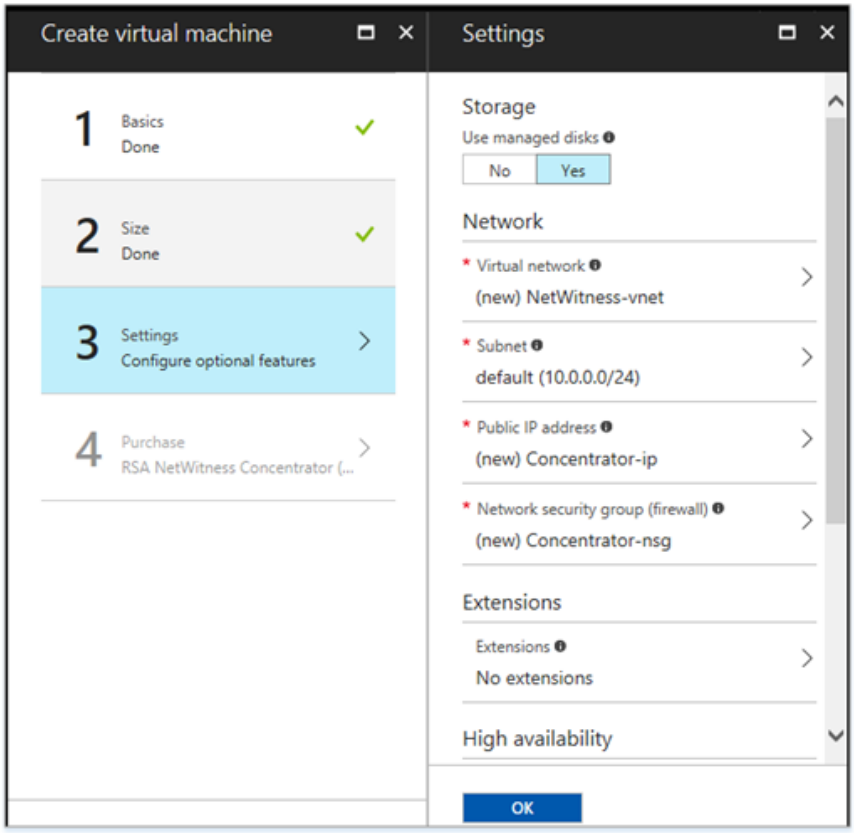
6. Specify **Settings**.

a. In the **Storage** field, make sure **Use manage disks** is set to **Yes** .

b. Under **Network**:

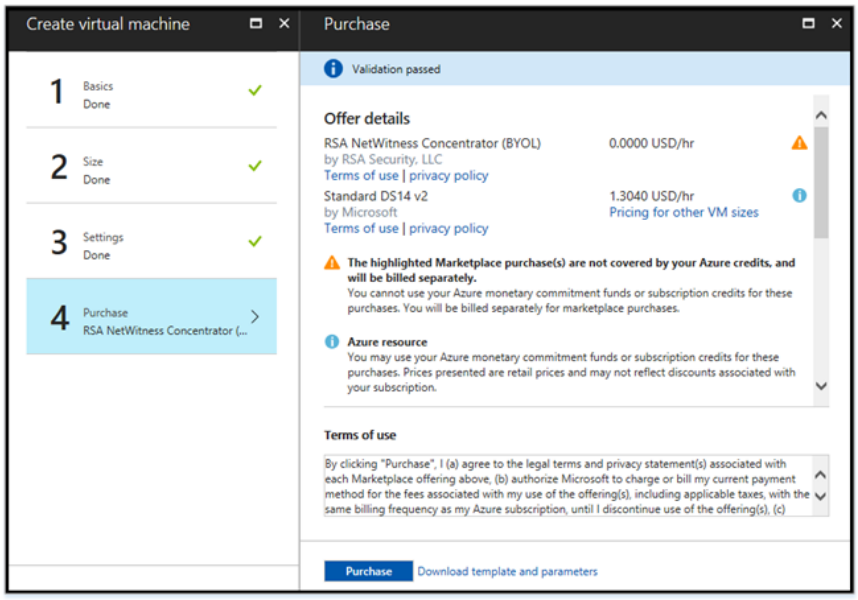
- Adjust **Virtual network**, **Subnet** and **Public IP address** according to the requirements of your network.
- Specify a valid **Network security group**.

  For information on Network security groups, see the Microsoft Azure documentation (https://docs.microsoft.com/en-us/azure/virtual-network/virtual-networks-nsg). Refer to Deployment: Network Architecture and Ports (https://community.rsa.com/docs/DOC-83050) for a comprehensive list of the ports you must set up for all RSA NetWitness® Platform components.



c. Click **OK**.

Azure validates your VM and the **4 Purchase** section is in focus.



7. Click **Purchase** to create the core RSA Security Analytics component service (for example, **Concentrator**) VM in Azure.
8. Configure the host VM in RSA NetWitness® Platform 11.2.0.0.
9. Repeat steps 1 through 8 inclusive for the rest of the core RSA NetWitness component services.

Partition Recommendations

This topic contains the recommended Azure partition.

Admin Server or Broker

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`. If there are multiple disk, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `/dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

If you attach two 1 TB disk, run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf`
2. `pvcreate /dev/md0`
3. `vgextend netwitness_vg00 /dev/md0`
4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/netwitness_vg00/nwhome`
6. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_vg00/nwhome	/var/netwitness/	2 TB	SSD	Read/Write

ESA Primary or ESA Secondary

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`. If there are multiple disk, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 6 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 5.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

If you attach two 3 TB disk, run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf`
2. `pvcreate /dev/md0`
3. `vgextend netwitness_vg00 /dev/md0`
4. `lvextend -L 5.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/netwitness_vg00/nwhome`
6. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_vg00/nwhome	/var/netwitness/	6 TB	HDD	Read/Write

Log Collector

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`.

Run `lsblk` to get the physical volume name.

If you attach one 500 GB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 600G /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_vg00/nwhome	/var/netwitness/	500 GB	HDD	Read/Write

Log Decoder

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`, and make sure that no other partition resides on this Log Decoder. Attach additional disks for the Log Decoder database partition with the name suffix `external`. If there are multiple disk, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

If you attach two 1 TB disk, run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf`
2. `pvcreate /dev/md0`
3. `vgextend netwitness_vg00 /dev/md0`
4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/netwitness_vg00/nwhome`
6. `mdadm --detail --scan > /etc/mdadm.conf`

Other Partition Required

The following partition should be on the volume group **logdecodersmall** and should be in a single RAID 0 array.

Note: The following disks should have a suffix `external`.

Folder	LVM	Volume Group
/var/netwitness/logdecoder	decoroot	logdecodersmall
/var/netwitness/logdecoder/index	index	logdecodersmall
/var/netwitness/logdecoder/metadb	metadb	logdecodersmall
/var/netwitness/logdecoder/sessiondb	sessiondb	logdecodersmall

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md0`

3. `vgcreate -s 32 logdecodersmall /dev/md0`
4. `lvcreate -L <disk_size> -n <lvm_name> logdecodersmall`
5. `mkfs.xfs /dev/logdecodersmall/<lvm_name>`
6. Repeat steps 4 and 5 for all the LVMs mentioned.
7. `mdadm --detail --scan > /etc/mdadm.conf`

The following partition should be on the volume group **logdecoder** and should be in a single RAID 0 array:

Folder	LVM	Volume Group
/var/netwitness/logdecoder/packetdb	packetdb	logdecoder

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md1 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md1`
3. `vgcreate -s 32 logdecoder /dev/md1`
4. `lvcreate -L <disk_size> -n packetdb logdecoder`
5. `mkfs.xfs /dev/logdecoder/packetdb`
6. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

Note: Create the /var/netwitness/logdecoder partition, mount it, and then create the remaining partition.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_vg00/nwhome	/var/netwitness/	1 TB	HDD	Read/Write
/dev/logdecodersmall/decoroot	/var/netwitness/logdecoder	10 GB	HDD	Read/Write
/dev/logdecodersmall/index	/var/netwitness/logdecoder/index	30 GB	HDD	Read/Write
/dev/logdecodersmall/metadb	/var/netwitness/logdecoder/metadb	370 GB	HDD	Read/Write
/dev/logdecodersmall/sessiondb	/var/netwitness/logdecoder/sessiondb	3 TB	HDD	Read/Write
/dev/logdecoder/packetdb	/var/netwitness/logdecoder/packetdb	18 TB	HDD	Read/Write

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/logdecodersmall/decoroot /var/netwitness/logdecoder xfs noatime,nosuid 1 2`
2. `/dev/logdecodersmall/index /var/netwitness/logdecoder/index xfs noatime,nosuid 1 2`
3. `/dev/logdecodersmall/metadb /var/netwitness/logdecoder/metadb xfs noatime,nosuid 1 2`
4. `/dev/logdecodersmall/sessiondb /var/netwitness/logdecoder/sessiondb xfs noatime,nosuid 1 2`
5. `/dev/logdecoder/packetdb /var/netwitness/logdecoder/packetdb xfs noatime,nosuid 1 2`

Concentrator

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`, and make sure that no other partition resides on this Concentrator. Attach additional disks for the Concentrator database partition with the name suffix `external`. If there are multiple disk, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

If you attach two 1 TB disk, run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf`
2. `pvcreate /dev/md0`
3. `vgextend netwitness_vg00 /dev/md0`
4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/netwitness_vg00/nwhome`
6. `mdadm --detail --scan > /etc/mdadm.conf`

Other Partition Required

The following partition should be on the volume group **concentrator** and should be in a single RAID 0 array.

Note: The following disks should have a suffix `external`.

Folder	LVM	Volume Group
/var/netwitness/concentrator	root	concentrator
/var/netwitness/concentrator /sessiondb	index	concentrator
/var/netwitness/concentrator /metadb	metadb	concentrator

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md0`
3. `vgcreate -s 32 concentrator /dev/md0`
4. `lvcreate -L <disk_size> -n <lvm_name> concentrator`
5. `mkfs.xfs /dev/concentrator /<lvm_name>`
6. Repeat steps 4 and 5 for all the LVMs mentioned
7. `mdadm --detail --scan > /etc/mdadm.conf`

The following partition should be on volume group index and should be in single RAID 0 array:

Folder	LVM	Volume Group
/var/netwitness/concentrator/index	index	index

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md1 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md1`
3. `vgcreate -s 32 index /dev/md1`
4. `lvcreate -L <disk_size> -n index index`
5. `mkfs.xfs /dev/index/index`
6. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

Note: Create the /var/netwitness/concentrator partition, mount it, and then create the remaining partition.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_ vg00/nwhome	/var/netwitness/	1 TB	HDD	Read/Write
/dev/concentrator/root	/var/netwitness/concentrator	30 GB	HDD	Read/Write
/dev/concentrator/metadb	/var/netwitness/concentrator/metadb	8 TB	HDD	Read/Write
/dev/concentrator/sessiondb	/var/netwitness/concentrator/sessiondb	2 TB	HDD	Read/Write
/dev/index/index	/var/netwitness/concentrator/index	2 TB	SSD	Read/Write

Create each directory and mount the LVM on it, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/concentrator/root /var/netwitness/concentrator xfs noatime,nosuid 1 2`
2. `/dev/concentrator/sessiondb /var/netwitness/concentrator/sessiondb xfs noatime,nosuid 1 2`
3. `/dev/concentrator/metadb /var/netwitness/concentrator/metadb xfs noatime,nosuid 1 2 2`
4. `/dev/index/index /var/netwitness/concentrator/index xfs noatime,nosuid 1 2`

Archiver

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`, and make sure that no other partition resides on this Archiver. Attach other addititional disks for the Archiver database partition with the name suffix `external`. If there are multiple disk, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 2 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

If you attach two 1 TB disk, run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf`
2. `pvcreate /dev/md0`
3. `vgextend netwitness_vg00 /dev/md0`

4. `lvextend -L 1.9T /dev/netwitness_vg00/nwhome`
5. `xfs_growfs /dev/netwitness_vg00/nwhome`
6. `mdadm --detail --scan > /etc/mdadm.conf`

Other Partition Required

The following partition should be on the volume group **archiver** and should be in a single RAID 0 array.

Note: The following disks should have a suffix `external`.

Folder	LVM	Volume Group
/var/netwitness/archiver	archiver	archiver

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md0`
3. `vgcreate -s 32 archiver /dev/md0`
4. `lvcreate -L <disk_size> -n archiver archiver`
5. `mkfs.xfs /dev/archiver/archiver`
6. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_ vg00/nwhome	/var/netwitness/	1 TB	HDD	Read/Write
/dev/archiver/archiver	/var/netwitness/archiver	4 TB	HDD	Read/Write

Create each directory and mount the LVM on it in a serial manner, except `/var/netwitness`, which is already created.

After mounting the directory, add the following entries in `/etc/fstab` in the same order:

1. `/dev/archiver/archiver /var/netwitness/archiver xfs noatime,nosuid 1 2`

Endpoint Hybrid or Endpoint Log Hybrid

For an extension of `/var/netwitness/` partition, attach an addititional disk with name suffix `nwhome`, and make sure that no other partition resides on this Endpoint Hybrid or Endpoint Log Hybrid. Attach other addititional disks for the endpoint database partition with the name suffix `external`. If there are multiple disk, create a RAID 0 array.

Run `lsblk` to get the physical volume name.

If you attach one 1 TB disk, run the following commands:

1. `pvcreate <pv_name>` (for example, `pv_name` is `dev/sdc`)
2. `vgextend netwitness_vg00 /dev/sdc`
3. `lvextend -L 1T /dev/netwitness_vg00/nwhome`
4. `xfs_growfs /dev/netwitness_vg00/nwhome`

Other Partition Required

The following partition should be on the volume group **endpoint** and should be in a single RAID 0 array.

Note: The following disks should have a suffix `nwhome`.

Folder	LVM	Volume Group
/var/netwitness/mongo	hybrid-mongo	endpoint
/var/netwitness/concentrator	concentrator-concroot	endpoint
/var/netwitness/concentrator/index	hybrid-concinde	endpoint
/var/netwitness/logdecoder	hybrid-ldecroot	endpoint

Run `lsblk` to get the physical volume name and run the following commands:

1. `mdadm --create /dev/md0 --assume-clean --level 0 --raid-devices=2 /dev/sde /dev/sdf` (depending on the number of disk attached)
2. `pvcreate /dev/md0`
3. `vgcreate -s 32 endpoint /dev/md0`
4. `lvcreate -L <disk_size> -n <lvm_name> endpoint`
5. `mkfs.xfs /dev/ endpoint /<lvm_name>`
6. Repeat steps 4 and 5 for all the LVMs mentioned.
7. `mdadm --detail --scan > /etc/mdadm.conf`

RSA recommends the following partition. However, you can change these values based on the retention days.

LVM	Folder	Size	Disk Type	Cache
/dev/netwitness_ vg00/nwhome	/var/netwitness/	1 TB	HDD	Read/Write
/dev/endpoint/hybrid-mongo	/var/netwitness/mongo	2 TB	HDD	Read/Write
/dev/endpoint/concentrator-concroot	/var/netwitness/concentrator	4 TB	HDD	Read/Write
/dev/endpoint/hybrid-concinde	/var/netwitness/concentrator/index	500 GB	SSD	Read/Write
/dev/endpoint/hybrid-ldecroot	/var/netwitness/logdecoder	2 TB	HDD	Read/Write

Installation Tasks

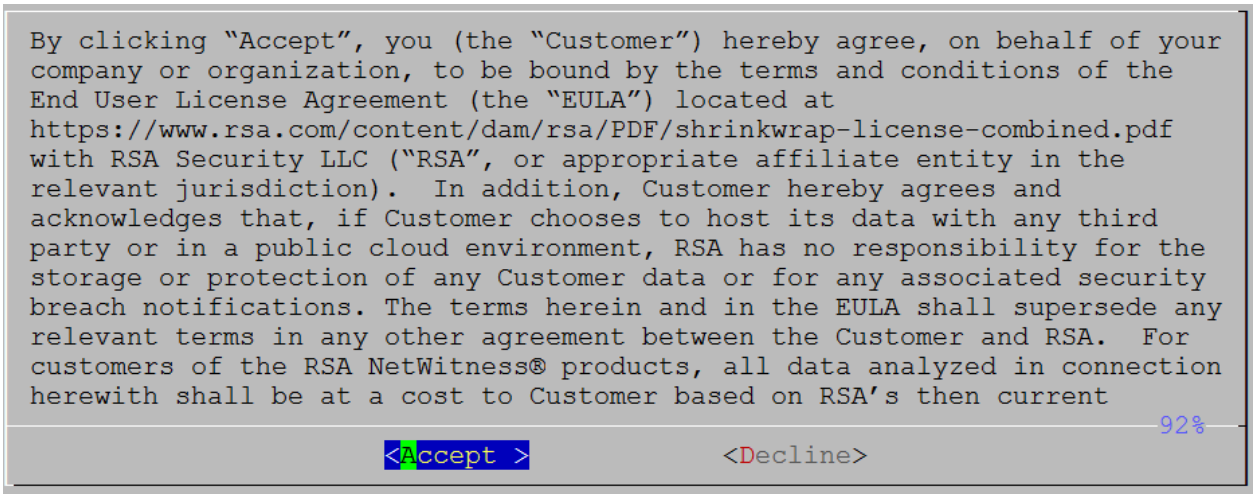
Task 1 - Install 11.2.0.0 on the NetWitness Server (NW Server) Host

Note: You can perform this task for INTERNAL-RSANW-11.2.0.0.3274-Full instance.

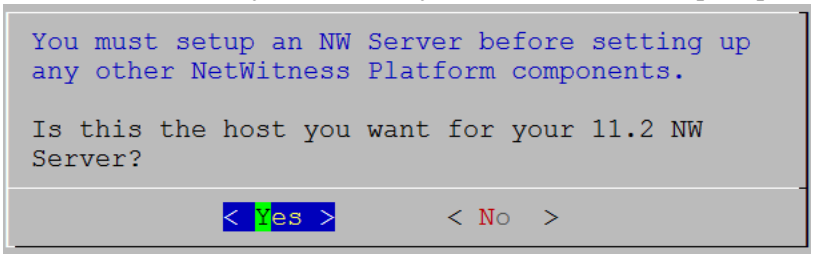
1. Run the `nwsetup-tui` command to set up the host.

   This initiates the `nwsetup-tui` (Setup program) and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see the "Post Installation Tasks" topic in the *Physical Host Installation Guide*.
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



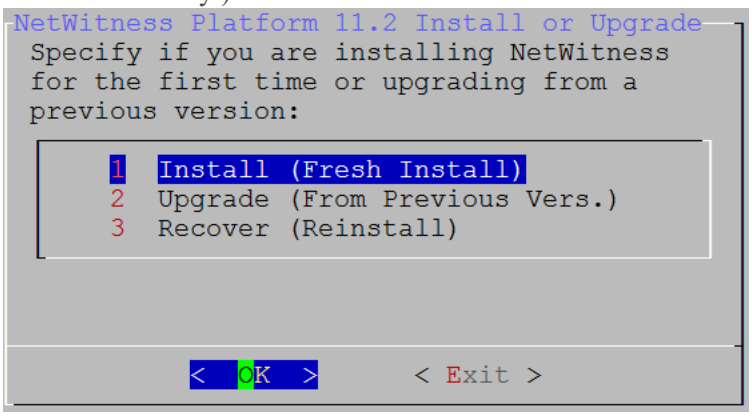
2. Tab to **Accept** and press **Enter**.
   The **Is this the host you want for your 11.2 NW Server** prompt is displayed.



3. Tab to **Yes** and press **Enter**.
   Choose **No** if you already installed 11.2 on the NW Server.

   Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete all the subsequent steps to correct this error.

   The **Install or Upgrade** prompt is displayed (**Recover** does not apply to the installation. It is for 11.2 Disater Recovery.).



4. Press **Enter Install (Fresh Install)** is selected by default.
   The **Host Name** prompt is displayed.

   Caution: If you include "." in a host name, the host name must also include a valid domain name.

5. Press **Enter** if want to keep this name. If not edit the host name, tab to **OK**, and press **Enter** to change it.

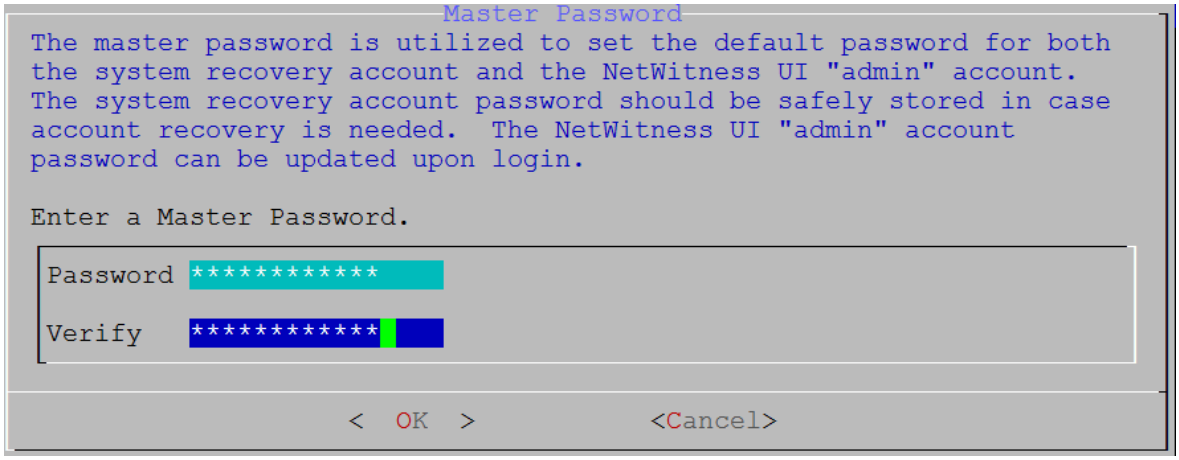
   The **Master Password** prompt is displayed.

   The following list of characters are supported for Master Password and Deployment Password:

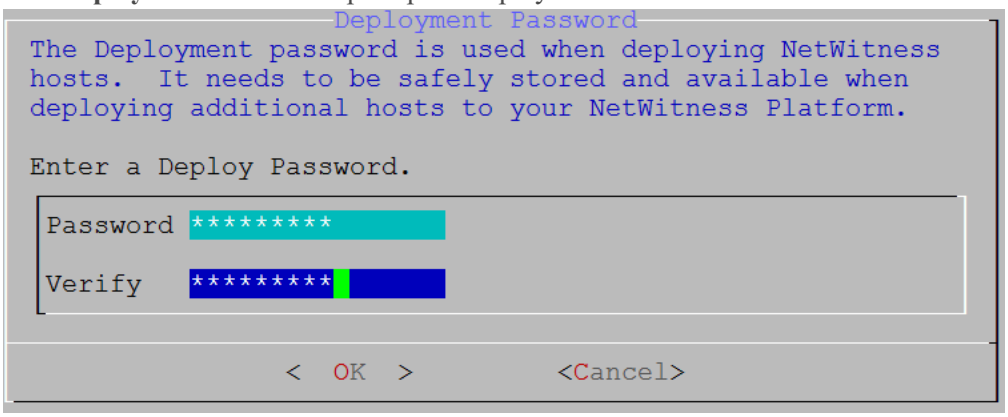
   - Symbols : ! @ # % ^ + ,
   - Numbers :0-9
   - Lowercase Characters : a-z
   - Uppercase Characters : A-Z

     No ambiguous characters are supported for Master Password and Deployment Password (for

example: space { } [ ] ( ) / \ ' " ` ~ ; : . < > -.

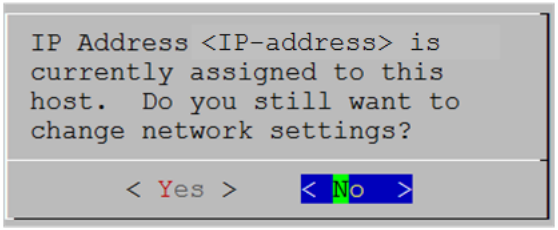


6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. The **Deployment Password** prompt is displayed.



7. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**. One of the following conditional prompts is displayed.

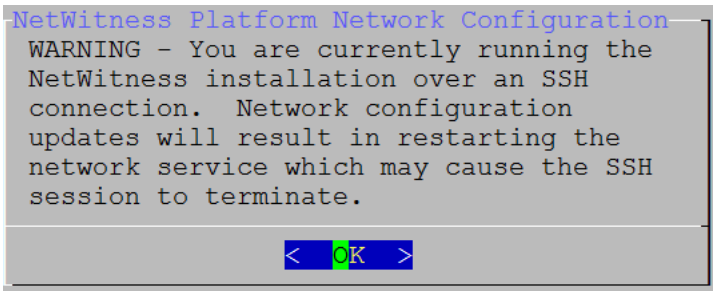
- The Setup program finds a valid IP address for this host, the following prompt is displayed.



Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter** if you want to change the IP configuration found on the host.

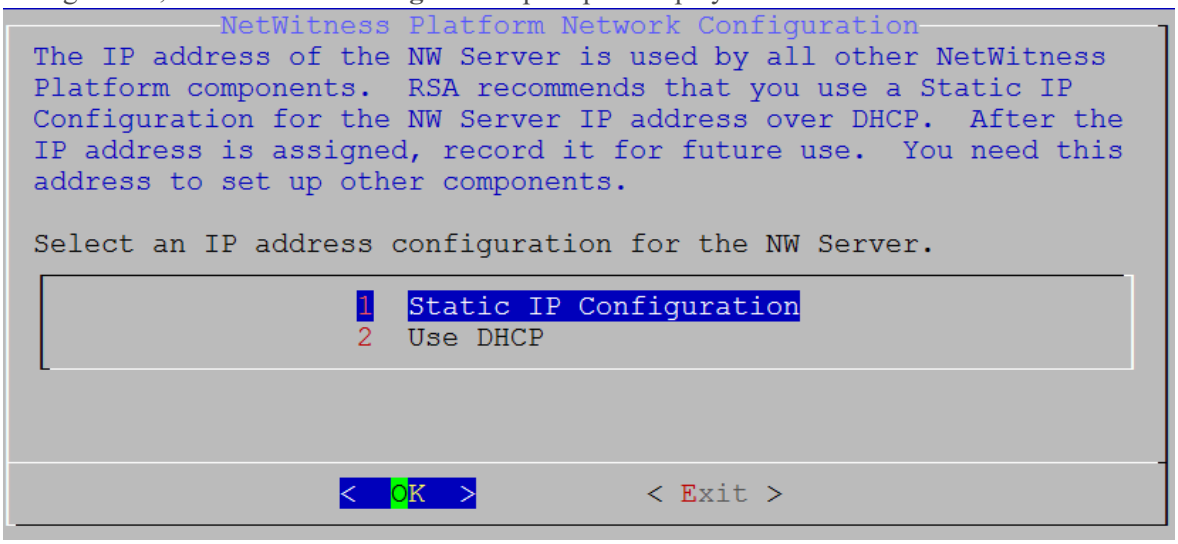
- If you are using an SSH connection, the following warning is displayed.

Note: If you connect directly from the host console, the following warning will not be displayed.



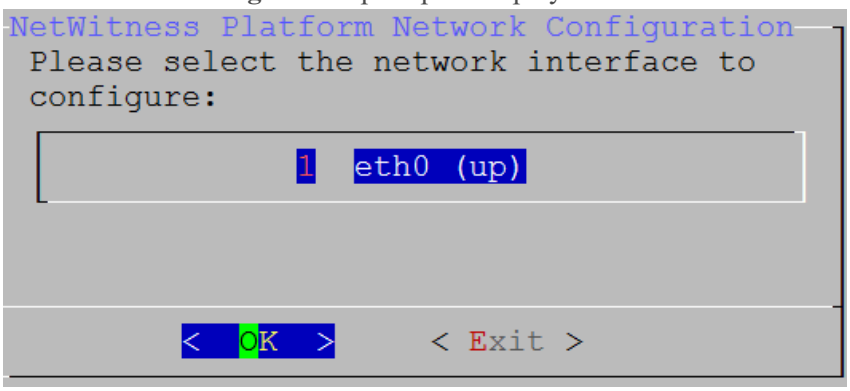
Press **Enter** to close warning prompt.

- If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 10 to and complete the installation.
- If the Setup Program did not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

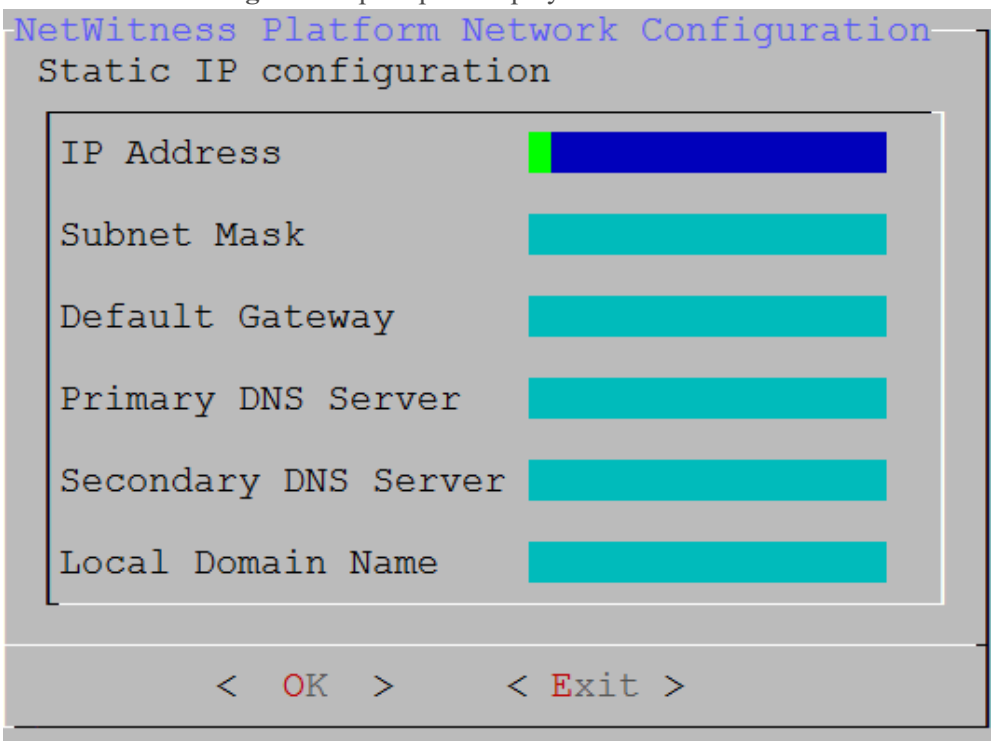


8. Tab to **OK** and press **Enter** to use **Static IP**.
   If you want to use **DHCP**, down arrow to 2 Use DHCP and press **Enter**.

The **Network Configuration** prompt is displayed.



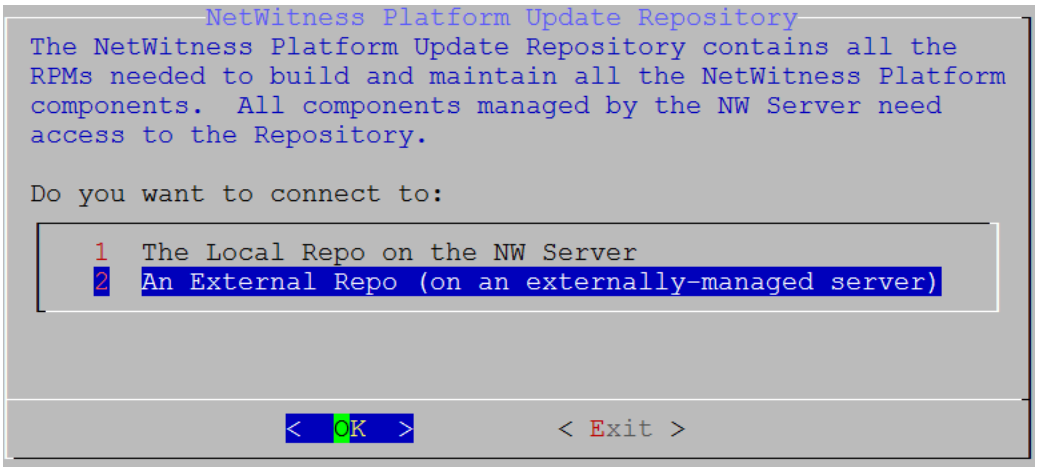
9. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.
   The **Static IP Configuration** prompt is displayed.



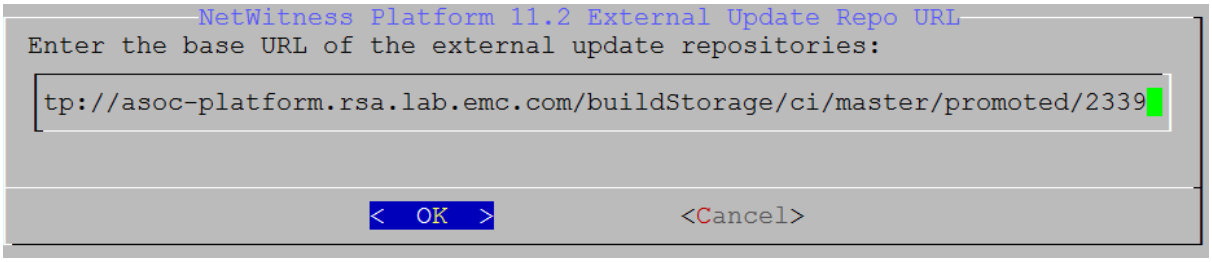
10. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**. If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required). If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

    Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

    The **Update Repository** prompt is displayed.



11. If you select **2 An External Repo (on an externally-managed server)**, the UI prompts you for a URL.



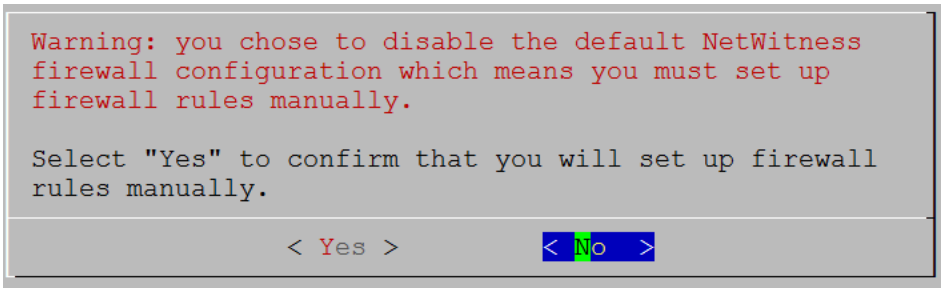
Enter the base URL of the NetWitness Platform external repo and click OK. The Start Install prompt is displayed.

12. Apply the standard firewall configuration, press **Enter**.
    - Disable the standard configuration, tab to **Yes** and press **Enter**.

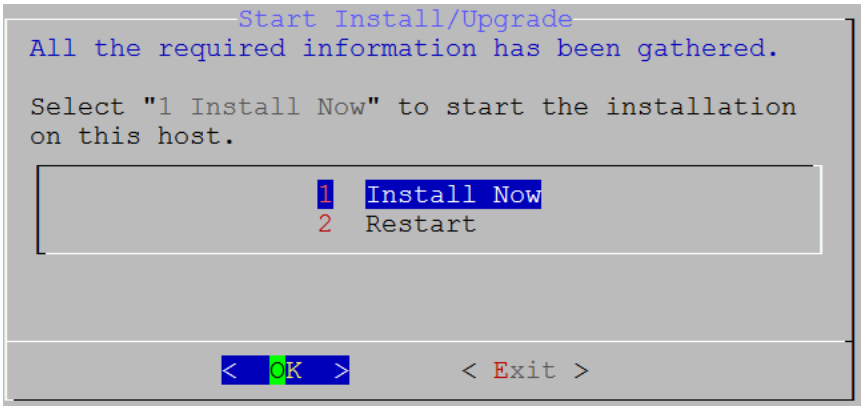
      The Disable firewall prompt is displayed.

      Tab to **No** (default), and press **Enter** to use the standard firewall configuration. Tab to **Yes**, and press **Enter** to disable the standard firewall configuration. If you select **Yes**, confirm your

selection or **No** to use the standard firewall configuration.

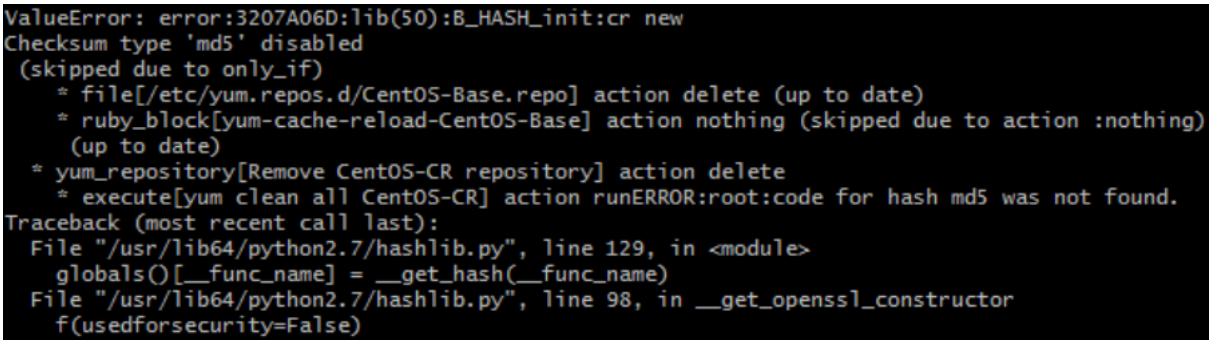


13. Press **Enter** to install 11.2 on the NW Server.
The **Start Install/Upgrade** prompt is displayed.

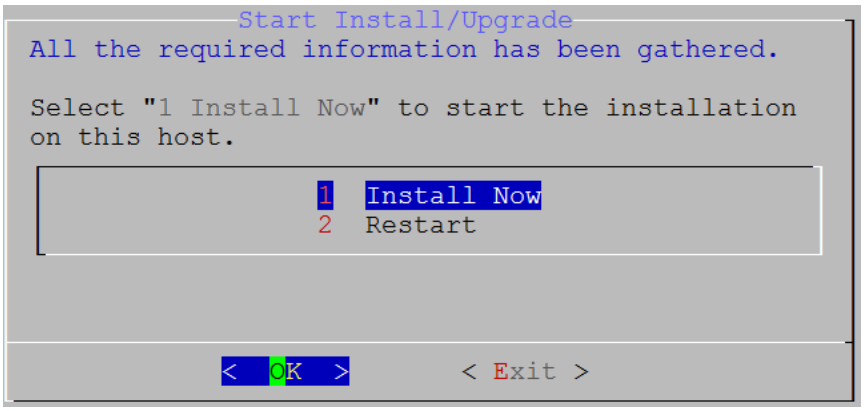


When **Installation complete** is displayed, you have installed the 11.2 NW Server on this host.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.

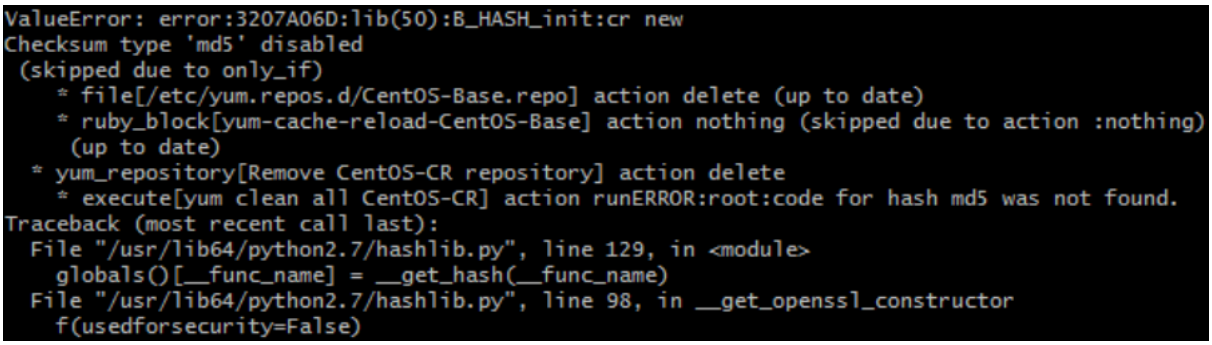


14. Press **Enter** to install 11.2 on the NW Server.
The **Start Install/Upgrade** prompt is displayed.



When **Installation complete** is displayed, you have installed the 11.2 NW Server on this host.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



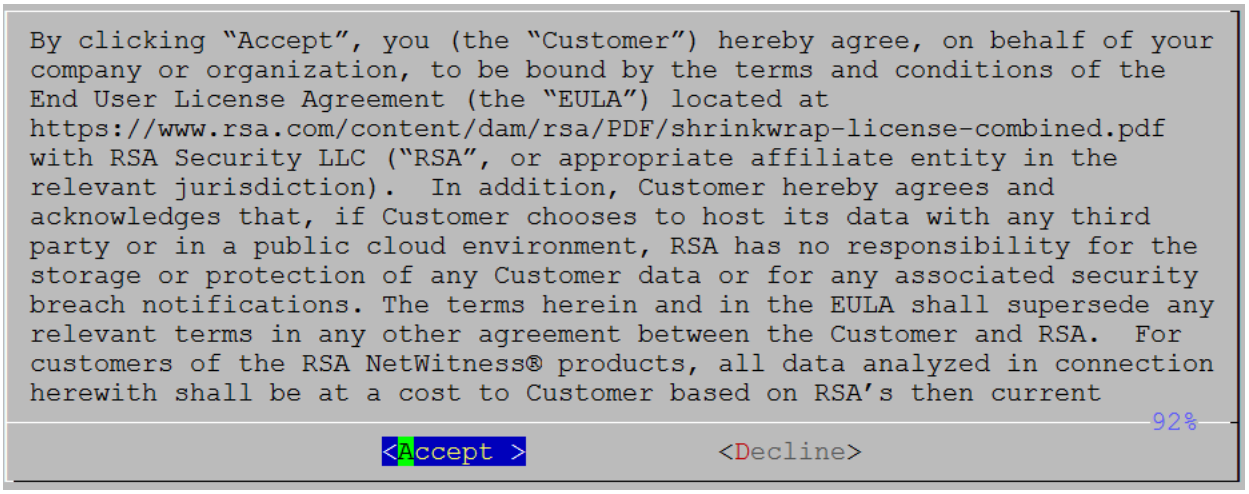
Task 2 - Install 11.2 on Other Component Hosts

Note: You can perform this task for INTERNAL-RSANW-11.2.0.0.3274-Lite instance.

1. Run the `nwsetup-tui` command to set up the host.

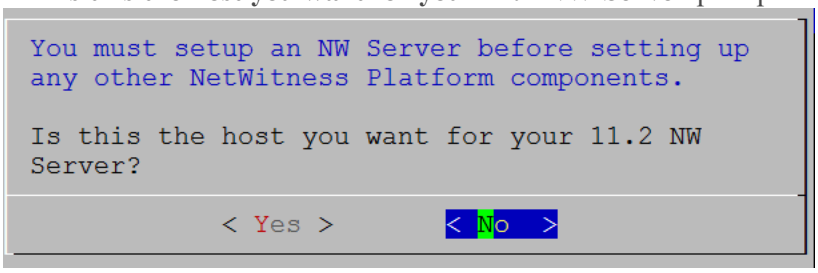
   This initiates the Setup program and the EULA is displayed.

Note: 1.) When you navigate through the Setup program prompts, use the down and up arrows to move among fields, use Tab key to move to and from commands (such as **<Yes>**, **<No>**, **<OK>**, and **<Cancel>**. Press **Enter** to register your command response and move to the next prompt.
2.) The Setup program adopts the color scheme of the desktop or console you use access the host.
3.) If you specify DNS servers during Setup program (`nwsetup-tui`) execution, they MUST be valid (valid in this context means valid during setup) and accessible for the `nwsetup-tui` to proceed. Any misconfigured DNS servers cause the Setup to fail. If you need to reach DNS server after setup that unreachable during setup, (for example, to relocate a host after setup that would have a different set of DNS Servers), see the "Post Installation Tasks" topic in the *Physical Host Installation Guide*.
If you do not specify DNS Servers during setup (`nwsetup-tui`), you must select **1 The Local Repo (on the NW Server)** in the **NetWitness Platform Update Repository** prompt in step 12 (the DNS servers are not defined so the system cannot access the external repo).



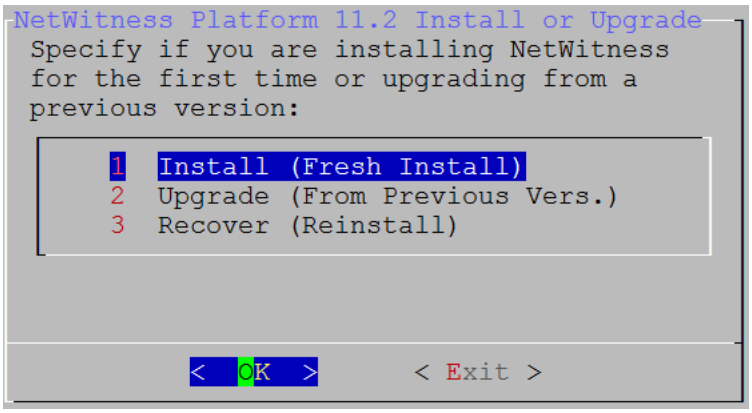
2. Tab to **Accept** and press **Enter**.

   The **Is this the host you want for your 11.2 NW Server** prompt is displayed.



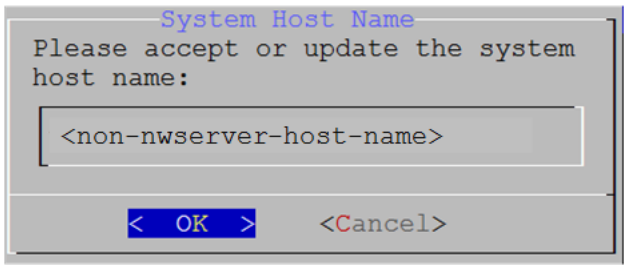
Caution: If you choose the wrong host for the NW Server and complete the Setup, you must restart the Setup Program (step 2) and complete all the subsequent steps to correct this error.

3. Press **Enter** (No).



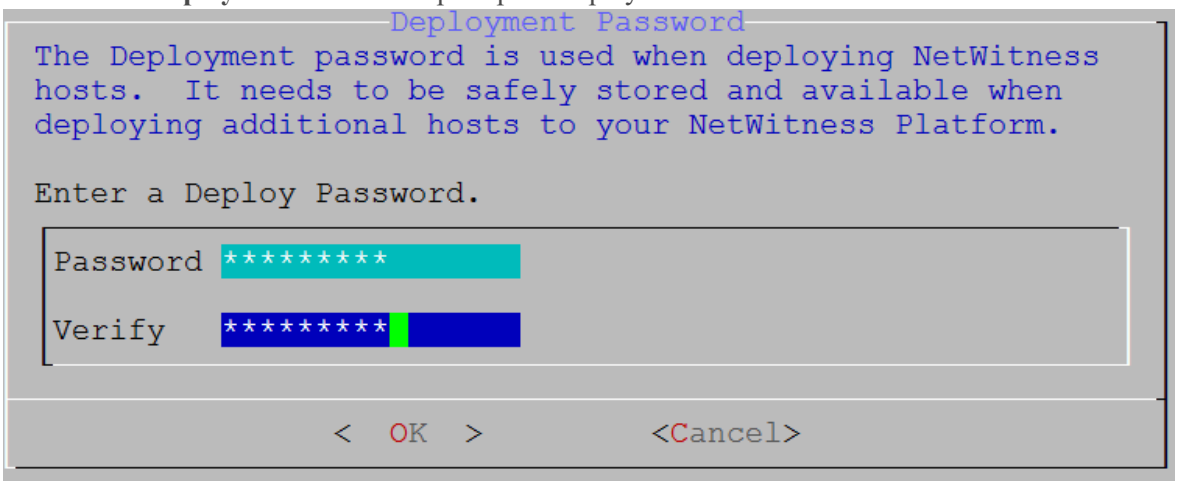
4. Press **Enter**. **Install (Fresh Install)** is selected by default.

   The **Host Name** prompt is displayed.



Caution: If you include "." in a host name, the host name must also include a valid domain name.

5. If want to keep this name, press **Enter**. If you want to change this name, edit it, tab to **OK**, and press **Enter**. The **Deployment Password** prompt is displayed.



6. Type in the **Password**, down arrow to **Verify**, retype the password, tab to **OK**, and press **Enter**.

- If the Setup program finds a valid IP address for this host, the following prompt is displayed.

  Press **Enter** if you want to use this IP and avoid changing your network settings. Tab to **Yes** and press **Enter**. If you want to change the IP configuration found on the host.

- If you are using an SSH connection, the following warning is displayed.

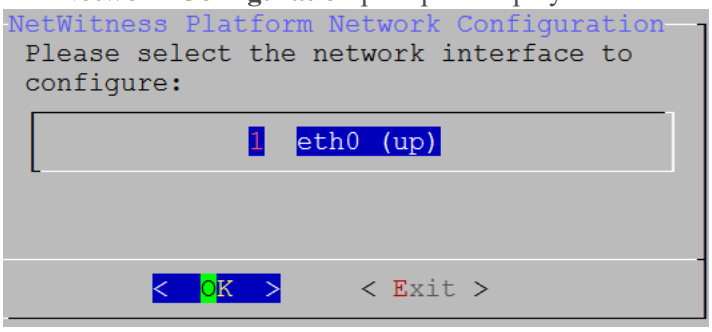
  Press **Enter** to close warning prompt.

- If the Setup Program found an IP configuration and you chose to use it, the **Update Repository** prompt is displayed. Go to step 10 to and complete the installation.
- If the Setup Program could not find an IP configuration or if you chose to change the existing IP configuration, the **Network Configuration** prompt is displayed.

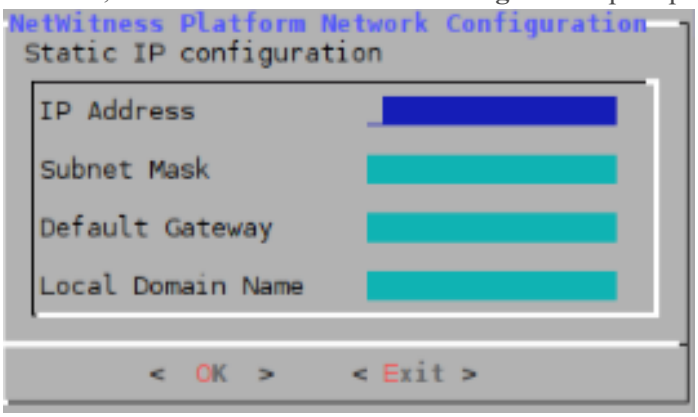
  Tab to **OK** and press **Enter** to use **Static IP**.If you want to use **DHCP**, down arrow to 2 Use DHCP and press **Enter**.

7. Tab to **OK** and press **Enter** to use a **Static IP**.

If you want to use **DHCP**, down arrow to **2 Use DHCP** and press **Enter**.
The **Network Configuration** prompt is displayed.



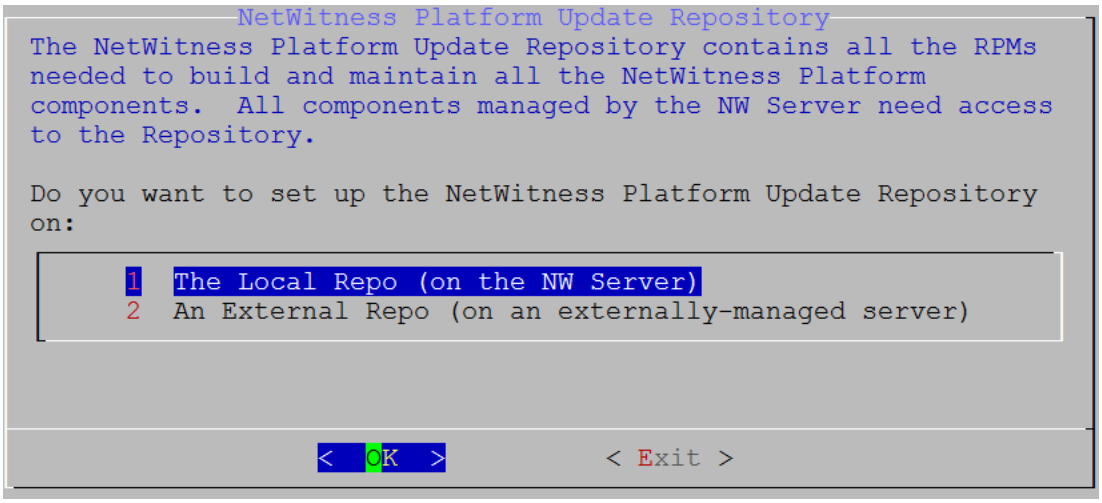
8. Down arrow to the network interface you want, tab to **OK**, and press **Enter**. If you do not want to continue, tab to **Exit**.The **Static IP Configuration** prompt is displayed.



9. Type the configuration values (using the down arrow to move from field to field), tab to **OK**, and press **Enter**.
   If you do not complete all the required fields, an `All fields are required` error message is displayed (**Secondary DNS Server** and **Local Domain Name** fields are not required).
   If you use the wrong syntax or character length for any of the fields, an `Invalid <field-name>` error message is displayed.

   Caution: If you select **DNS Server**, make sure that the DNS Server is correct and the host can access it before proceeding with the installation.

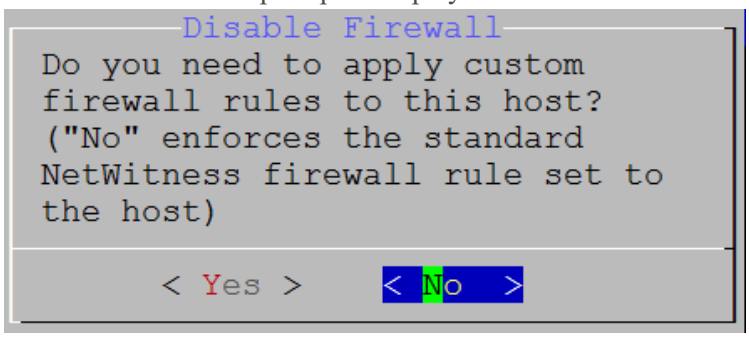
10. The Update Repository prompt is displayed.



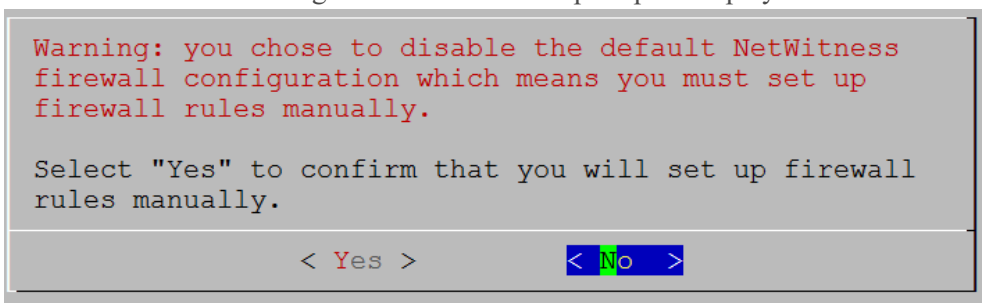
Press **Enter** to choose the **Local Repo** on the NW Server.

11. To:

- Apply the standard firewall configuration, press **Enter**.
- Disable the standard configuration, tab to **Yes** and press **Enter**.
  The Disable firewall prompt is displayed.

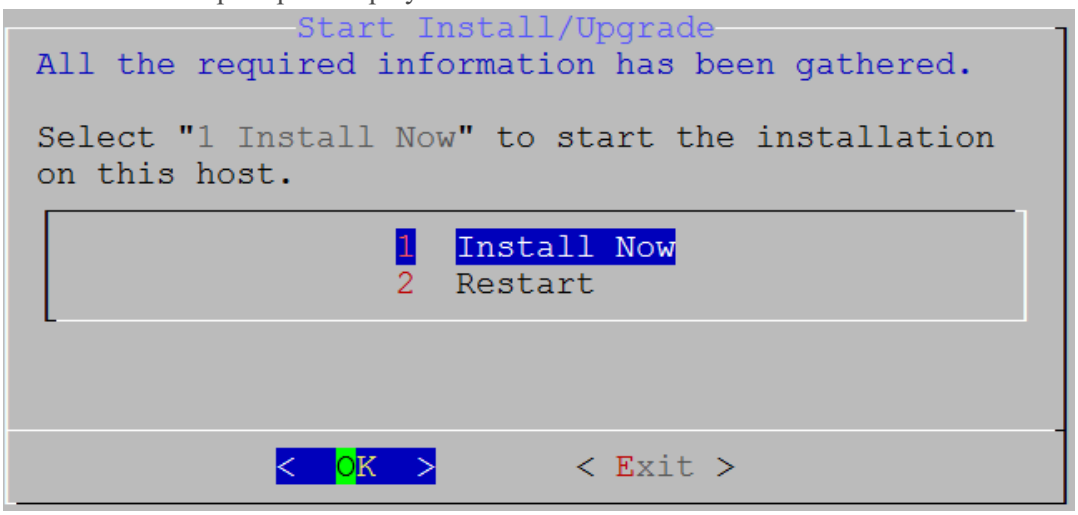


The disable firewall configuration confirmation prompt is displayed.



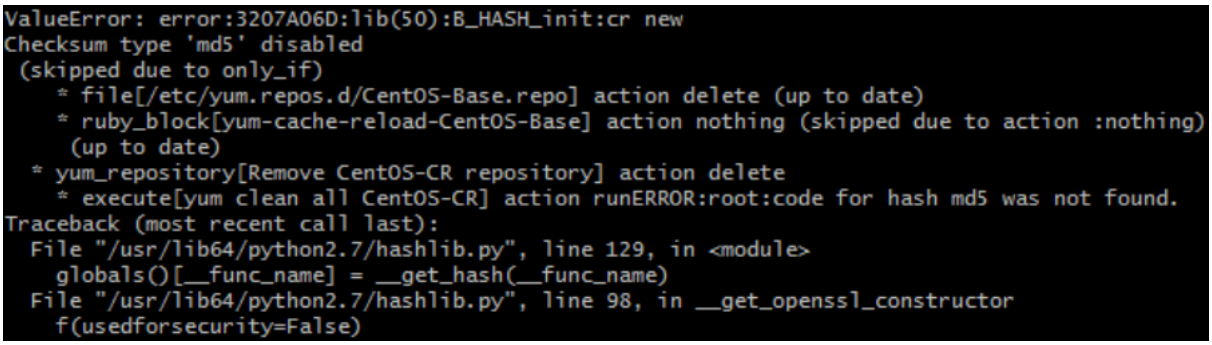
Tab to **Yes** and press **Enter** to confirm (press **Enter** to use standard firewall configuration).

12. The **Start Install** prompt is displayed.



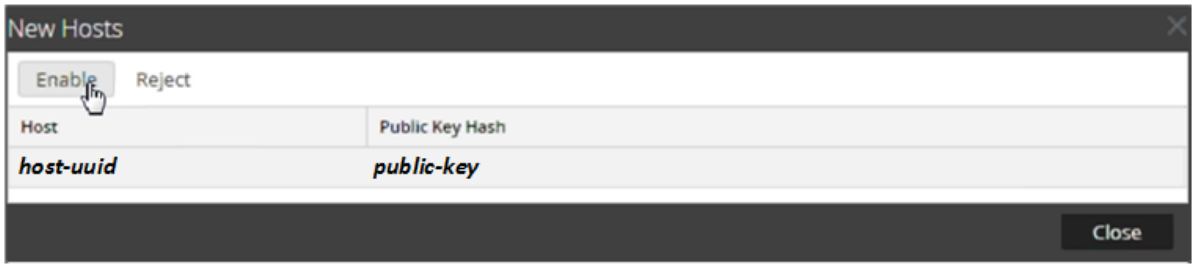
13. Press **Enter** to install 11.2 on the NW Server.
When **Installation complete** is displayed, you have installed the 11.2.0.0 NW Server on this host.

Note: Ignore the hash code errors similar to the errors shown in the following screen shot that are displayed when you initiate the `nwsetup-tui` command. Yum does not use MD5 for any security operations so they do not affect the system security.



Log in to NetWitness Platform

1. Log in to RSA NetWitness Platform.
2. Go to **Administration** > **Hosts**.
The **New Hosts** dialog is displayed with the host VMs that you created in Azure.
3. Select the hosts that you want to enable.
The **Enable** menu option becomes active.
4. Click **Enable**.



5. Select the host you enabled.
6. Click Install and select the component you deployed in Azure (for example, Event Stream Analysis). For more information, see the *Hosts and Services Getting Started Guide for Version 11.2*.

Note: For post installation tasks, see *Physical Host Installation Guide*.

Contents

The Basics

This guide describes the basic requirements of a NetWitness Platform deployment and outlines optional scenarios to address needs of your enterprise. Even in small networks, planning can ensure that all goes smoothly when you are ready to bring the hosts online.

Note: This document refers to several additional documents available on RSA Link. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

There are many factors you must consider before you deploy NetWitness Platform. The following items are just some of these factors. You need to estimate growth and storage requirements when you consider these factors

- The size of your enterprise (that is, the number of locations and people that will use NetWitness Platform)
- The volume of network data and logs you need to process
- The performance each NetWitness Platform user role needs to do their jobs effectively.
- The prevention of downtime (that is, how to avoid a single point of failure).
- The environment in which you plan to run NetWitness Platform
  - RSA Physical Hosts (software running on hardware supplied by RSA)
    See the *RSA NetWitness® PlatformPhysical Host Installation Guide* for detailed instructions on how to deploy RSA Physical Hosts.
  - Software Only provided by RSA:
    - On-Premises (On-Prem) Virtual Hosts
      See the *RSA NetWitness® PlatformVirtual Host Installation Guide* for detailed instructions on how to deploy on-prem virtual hosts.
    - VCloud:
      - Amazon Web Services (AWS)
        See the *RSA NetWitness® PlatformAWS Deployment Guide* for detailed instructions on how to deploy virtual hosts in AWS.
      - Azure
        See the *RSA NetWitness® PlatformAzure Deployment Guide* for detailed instructions on how to deploy virtual hosts in Azure.

Basic Deployment

Before you can deploy NetWitness Platform you need to:

- Consider the requirements of your enterprise and understand the deployment process.
- Have a high-level picture of the complexity and scope of a NetWitness Platform deployment.

Process

The components and topology of a NetWitness Platform network can vary greatly between installations, and should be carefully planned before the process begins. Initial planning includes:

- Consideration of site requirements and safety requirements.
- Review of the network architecture and port usage.
- Support of group aggregation on Archivers and Concentrators, and virtual hosts.

When ready to begin deployment, the general sequence is:

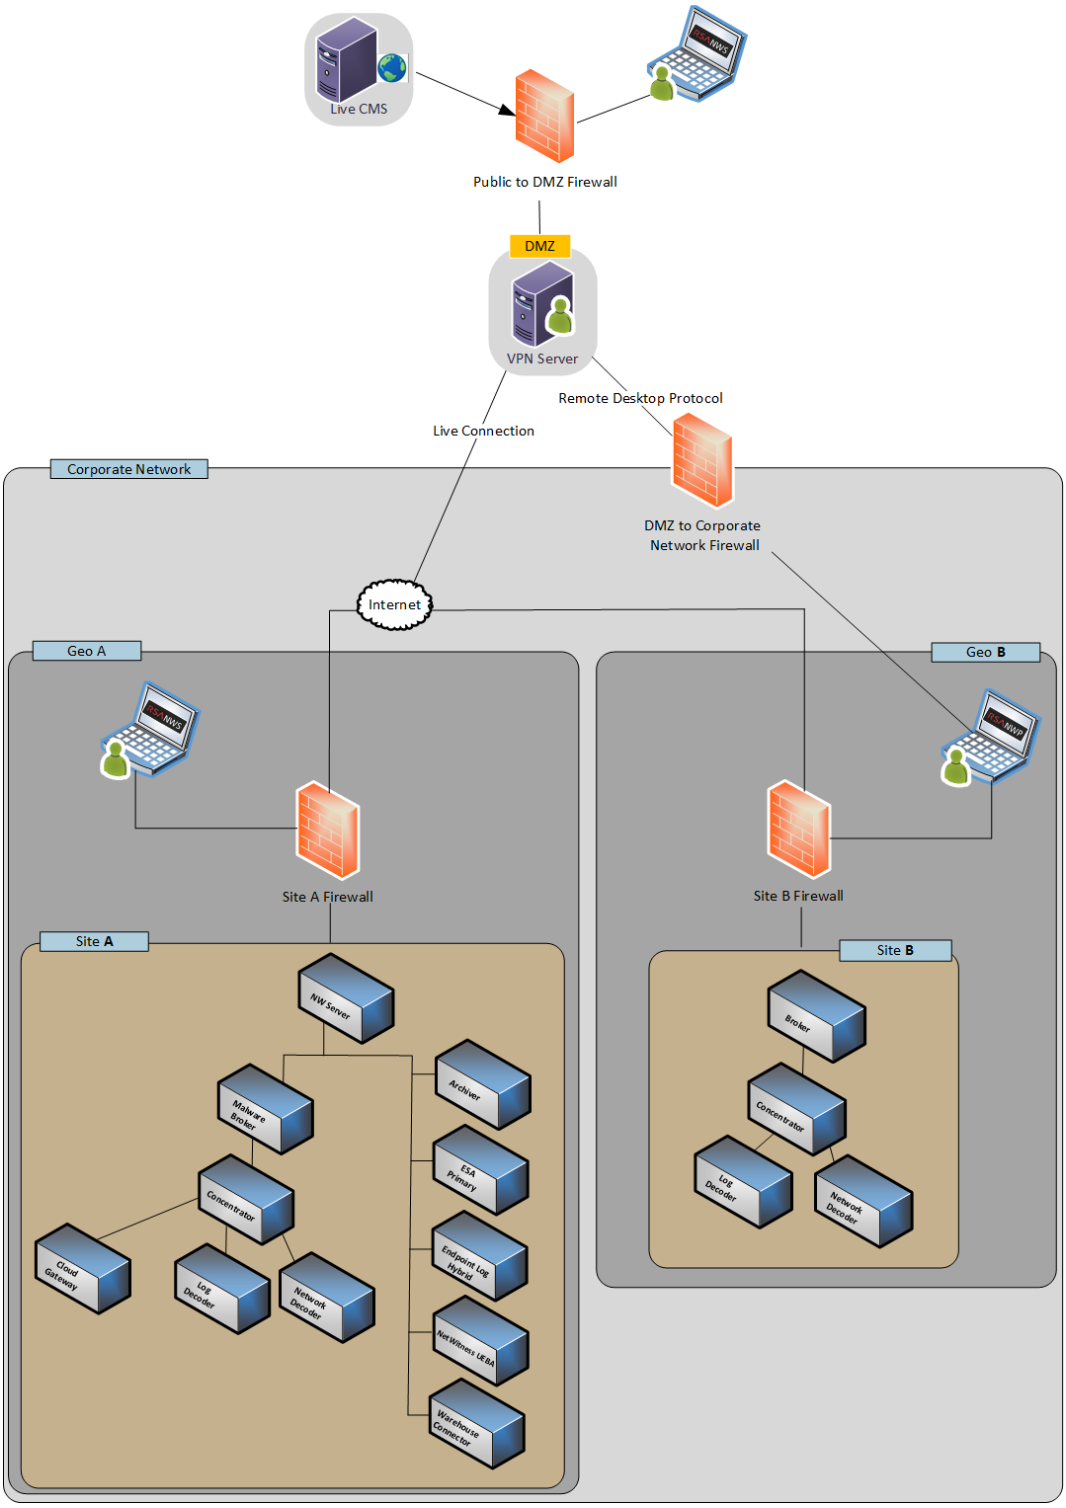
- For RSA Physical Hosts:
  1. Install physical hosts and connect to the network as described in the RSA NetWitness® Platform Hardware Setup Guides and the *RSA NetWitness® Platform Physical Host Installation Guide*.
  2. Set up licensing for NetWitness Platform as described in the *RSA NetWitness® Platform Licensing Guide*.
  3. Configure individual physical hosts and services as described in *RSA NetWitness® Platform Host and Services Getting Started Guide*. This guide also describes the procedures for applying updates and preparing for version upgrades.
- For On-Prem virtual hosts, follow the instructions in the *RSA NetWitness® Platform Virtual Host Setup Guide*.
- For AWS, follow the instructions in the *RSA NetWitness® Platform AWS Deployment Guide*.
- For Azure, follow the instructions in the *RSA NetWitness® Platform Azure Deployment Guide*.

When updating hosts and services, follow recommended guidelines under the "Running in Mixed Mode" topic in the *RSA NetWitness Platform Host and Services Getting Started Guide*.

You should also become familiar with Hosts, Host Types, and Services as they are used in the context of NetWitness Platform also described in the *RSA NetWitness Platform Host and Services Getting Started Guide*.

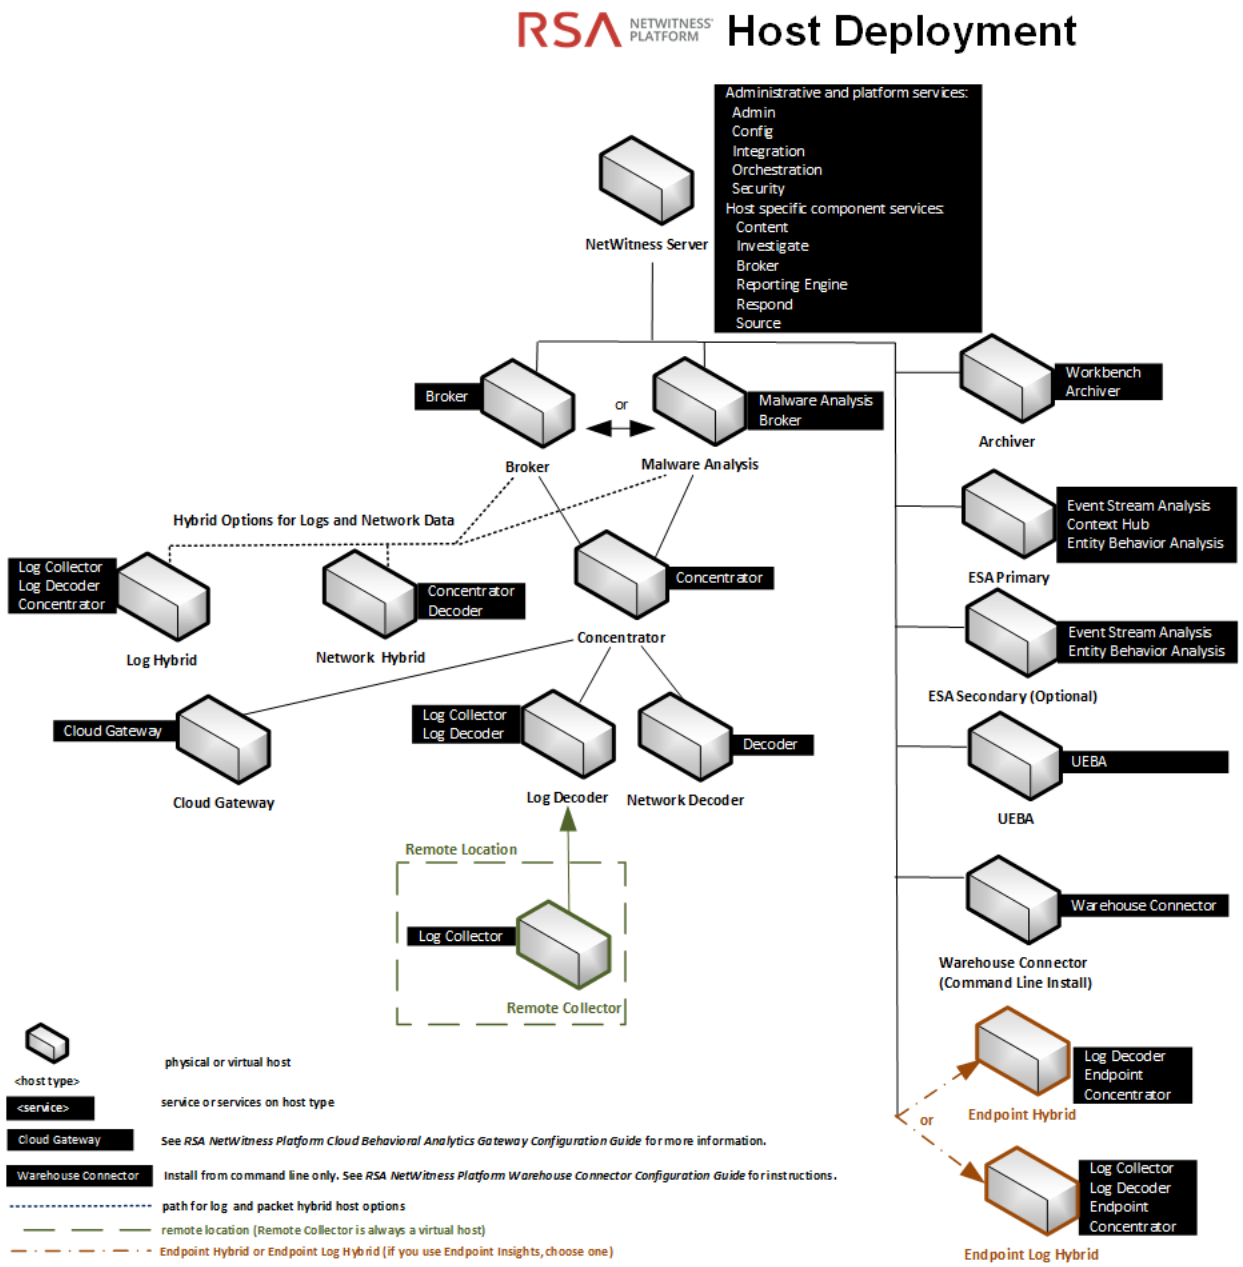
NetWitness Platform High-Level Deployment Diagram

The following diagram illustrates a basic, multi-site NetWitness Platform Deployment.



RSA NetWitness Platform Detailed Host Deployment Diagram

The following diagram is an example of a NetWitness Platform deployment hosted on physical or virtual machines. For instructions on how to install NetWitness Platform see the *Physical Host Installation Guide*, *Virtual Host Installation Guide*, *AWS Deployment Guide*, or *Azure Deployment Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.



Network Architecture and Ports

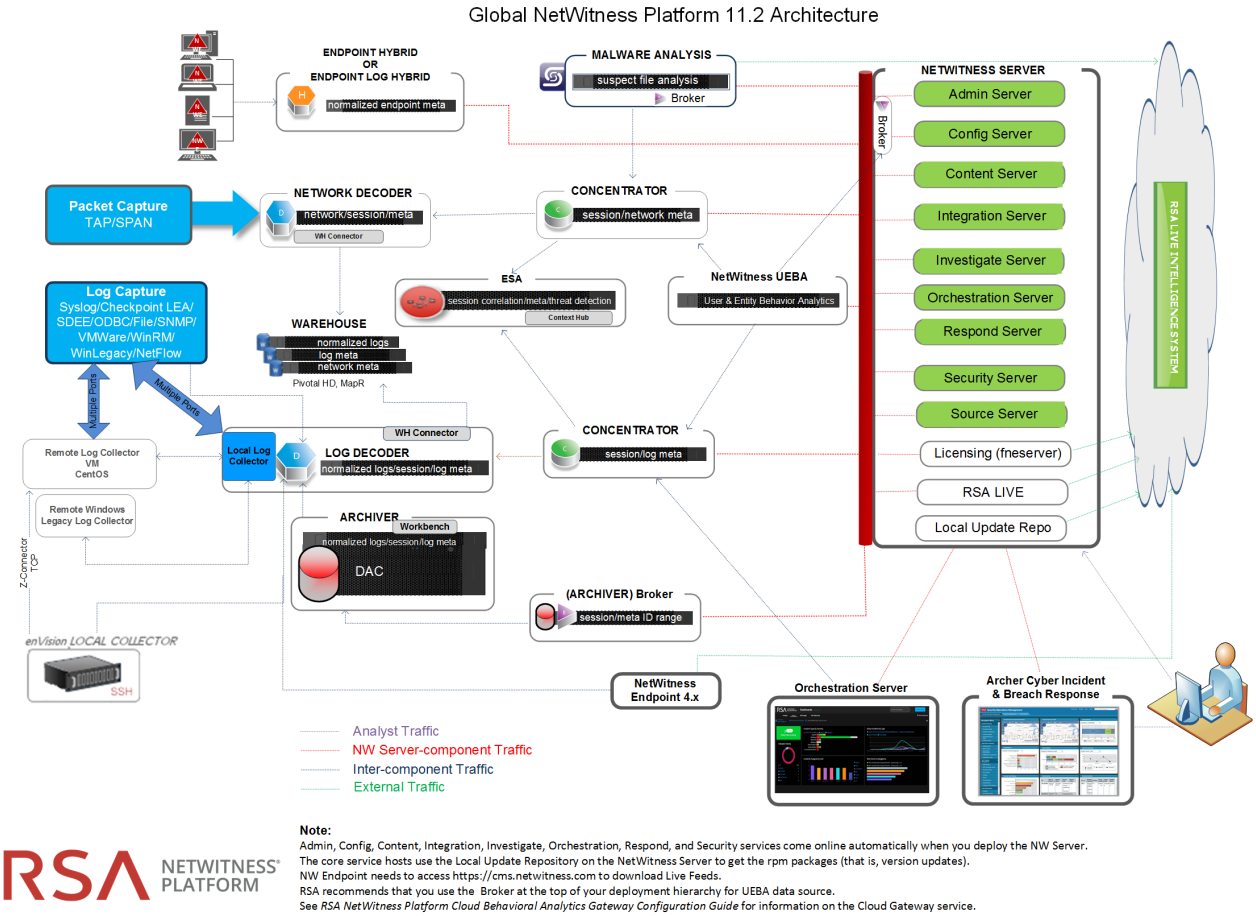
Refer to the following diagram and port table to ensure that all the relevant ports are opened for components in your NetWitness Platform deployment to communicate with each other.

See NetWitness Endpoint Insights Architecture at the end of this topic for individual Endpoint Architectural diagrams.

NetWitness Platform Network Architecture Diagram

The following diagram illustrates the NetWitness Platform network architecture including all of its component products.

Note: NetWitness Platform core hosts must be able to communicate with the NetWitness Server (Primary Server in a multiple server deployment) through UDP port 123 for Network Time Protocol (NTP) time synchronization.



Comprehensive List of NetWitness Platform Host and Service Ports

Note: For ports used in event collection through the NetWitness Logs, see the "The Basics" in the *RSA NetWitness Suite Log Collection Deployment Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

This section contains the port specifications for the following hosts.

NW Server Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	NW Server	TCP 443, 80	nginx - NetWitness UI
NW Hosts	NW Server	TCP 443	RSA Update Repository
Admin Workstation	NW Server	TCP 15671	RabbitMQ Management UI
NW Hosts	NW Server	TCP 15671	RabbitMQ Management UI
Admin Workstation	NW Server	TCP 22	SSH
NW Hosts	NW Server	TCP 4505, 4506	Salt Master Ports
NW Hosts	NW Server	TCP 5671	RabbitMQ-amqp
NW Server	NW Server	UDP 50514	Audit Ports
NW Hosts	NW Server	UDP 123	NTP
NW Hosts	NW Server	TCP 27017	MongoDB
NW Server	NW Server	UDP 123	NTP
NW Server	NFS Server	TCP 111 2049 UDP 111 2049	iDRAC Installations
NW Server	NW Endpoint	TCP 443, 9443	For NW Endpoint 4.x integrations

Archiver Host

Source Host	Destination Host	Destination Ports	Comments
Admin Workstation	Archiver	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 15671	RabbitMQ Management UI
Archiver	NW Server	TCP 443	RSA Update Repository
Admin Workstation	Archiver	TCP 22	SSH
NW Server	Archiver	TCP 56008 (SSL), 50008 (Non-SSL), 50108 (REST)	Archiver Application Ports

Site Requirements and Safety

Make sure that you read this topic thoroughly and observe all warnings and precautions prior to installing or maintaining your RSA devices.

Intended Application Uses

This product was evaluated as Information Technology Equipment (ITE) that may be installed in offices, schools, computer rooms, and similar indoor commercial type locations. This device is not intended for any connection to an outdoor type cable.

Service

There are no user-serviceable components inside of this device. Please contact Customer Care in the event of a malfunction. In a fault condition, high temperatures may arise inside the system causing an alarm signal. In the event of the alarm signal, immediately disconnect the device from the power source and contact Customer Care. Further operation of the device will be unsafe and may cause personal injury or property damage.

Safety Information

Site Selection

The system is designed to operate in a typical office environment. Choose a site that is:

- Clean, dry, and free of airborne particles (other than normal room dust).
- Well-ventilated and away from sources of heat, including direct sunlight and radiators.
- Away from sources of vibration or physical shock.
- Isolated from strong electromagnetic fields produced by electrical devices.
- In regions that are susceptible to electrical storms, we recommend you plug your system into a surge suppressor.
- Provided with a properly grounded wall outlet.
- Provided with sufficient space to access the power supply cords, because they serve as the product′s main power disconnect.

Equipment Handling Practices

Reduce the risk of personal injury or equipment damage by:

- Conforming to local occupational health and safety requirements when moving and lifting equipment.
- Using mechanical assistance or other suitable assistance when moving and lifting equipment.

- Reducing the weight for easier handling by removing any easily detachable components.

Power and Electrical Warnings

Caution: The power button, indicated by the standby power marking, DOES NOT completely turn off the system AC power; 5V standby power is active whenever the system is plugged in. To remove power from system, you must unplug the AC power cord(s) from the wall outlet.

- Do not attempt to modify or use an AC power cord if it is not the exact type required. A separate AC cord is required for each system power supply.
- This product contains no user-serviceable parts. Do not open the system.
- When replacing a hot-plug power supply, unplug the power cord to the power supply being replaced before removing it from the server.

Rack Mount Warnings

- The equipment rack must be anchored to an unmovable support to prevent it from tipping when a server or piece of equipment is extended from it. The equipment rack must be installed according to the rack manufacturer's instructions.
- Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.
- Extend only one piece of equipment from the rack at a time.
- To avoid risk of potential electric shock, a proper safety ground must be implemented for the rack and each piece of equipment installed in it.

Cooling and Air Flow

Installation of the equipment should be such that the amount of air flow required for safe operation of the equipment is not compromised.

Antenna Placement

This equipment should be installed and operated with a minimum distance of 7cm between the radiator and your body. The antennas used for this transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

Configure Group Aggregation

You use Group Aggregation to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them. You can configure multiple Archiver services or Concentrator services to efficiently aggregate from multiple Log Decoder services to improve query performance on the data:

- Stored in the Archiver.
- Processed through the Concentrator.

RSA Group Aggregation Deployment Recommendations

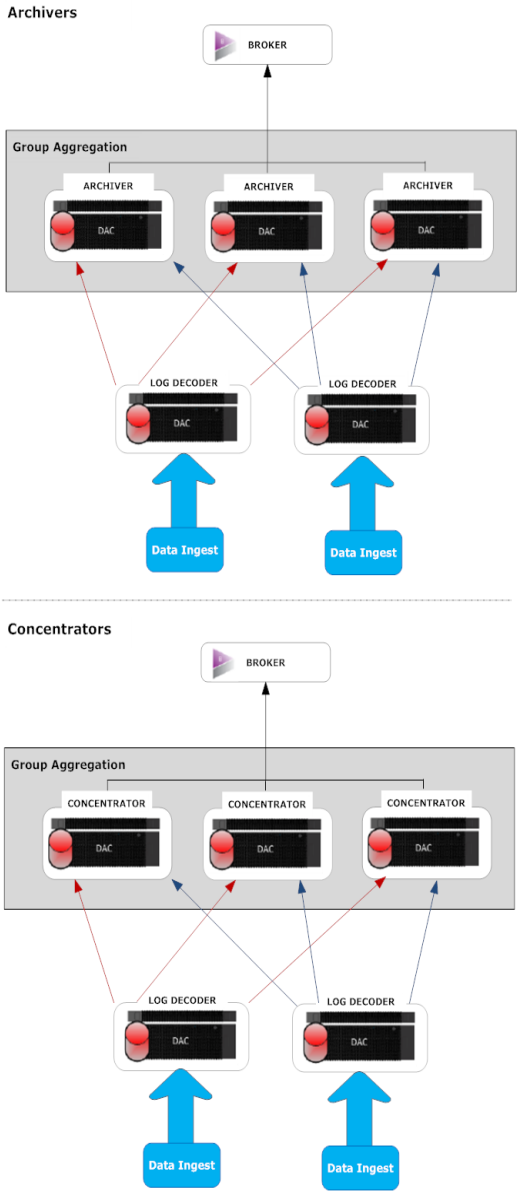
RSA recommends the following deployment for Group Aggregation:

- 1 - 2 Log Decoders
- 3 - 5 Archivers or Concentrators

Advantages of Using Group Aggregation

- Increases the speed of RSA NetWitness® Platform queries.
- Improves the performance of aggregate queries (Count and Sum) on the environment.
- Enhances investigation service performance.
- Gives you the option of storing data for a longer duration for investigation purposes.

The following diagram illustrates Group Aggregation.



You can have any number of Archivers or Concentrators grouped together and form an aggregation group. The Archiver or Concentrator services in the group divide all the aggregated session between them based on the number of sessions defined in the Aggregate Max Sessions parameter.

For example, in an aggregation group containing two Archiver services or two Concentrator services with the Aggregate Max Sessions parameter, set to 10000 the services would divide the session between themselves as illustrated in the following table.

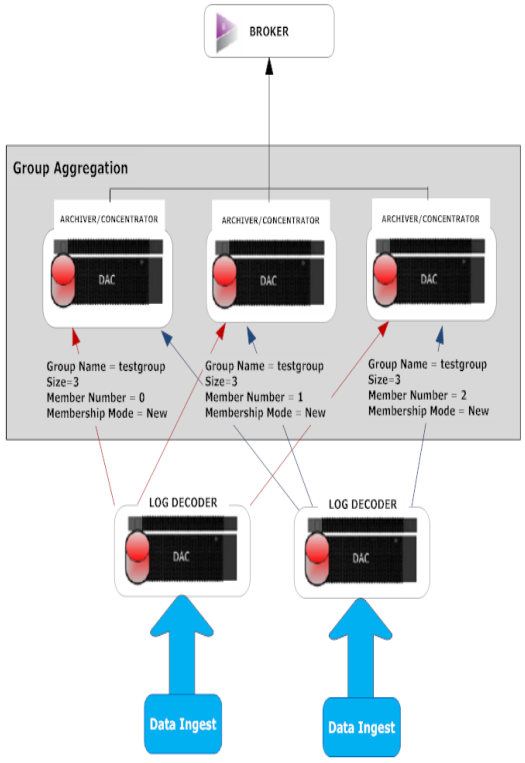
Archiver 0 or Concentrator 0	Archiver 1 or Concentrator 1
1 - 9,999	10,000 - 19,999
20,000 - 29,999	30,000 - 39,999
40,000 - 49,999	50,000 - 59,999

Configure Group Aggregation

Complete this procedure to configure multiple Archiver or Concentrator services as a group and share the aggregation tasks between them.

Prerequisites

Plan the network design for group aggregation. The following figure is an example of a group aggregation setup.



Ensure that you understand the Group aggregation parameters in the following table, and create a group aggregation plan.

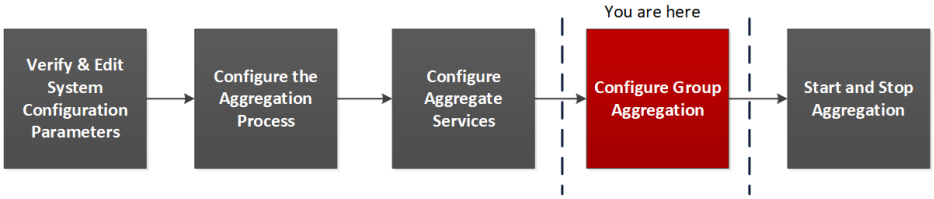
Parameter	Description
Group Name	It determines the group to which the Archiver or Concentrator belongs. You can add any number of groups aggregating data from a Log Decoder. The Group Name parameter is used by the Log Decoder to identify which Archiver or Concentrator services are working together. All Archiver or Concentrator services in the group should have the same group name.
Size	It determines the number of Archiver or Concentrator services in the aggregation group.

Parameter	Description
Member Number	It determines the position of the Archiver or Concentrator in the aggregation group. For a group of size N, member number from 0 to N-1 must be set on each of the Archiver or Concentrators services in the aggregation group. For example: If the size of the aggregation group is 2, the member number of one of the Archiver or Concentrator service should be set to 0 and the member number of the other Archiver or Concentrator should be set to 1.
Membership Mode	There are two membership modes: • New: Adding a new Archiver or Concentrator service as a member to the existing aggregation group or creating an aggregation group. The Archiver or Concentrator service does not aggregate any existing sessions from the service as other members of the group would have already aggregated all the sessions on the service. This Archiver or Concentrator service will only aggregate new sessions as they appear on the service. • Replace: Replacing an existing aggregation group member. The Archiver or Concentrator will begin aggregation from the oldest session available on the service it is aggregating from.

Note: Membership mode parameter has an effect only when no sessions have been aggregated from the service. After some sessions are aggregated, this parameter has no effect.

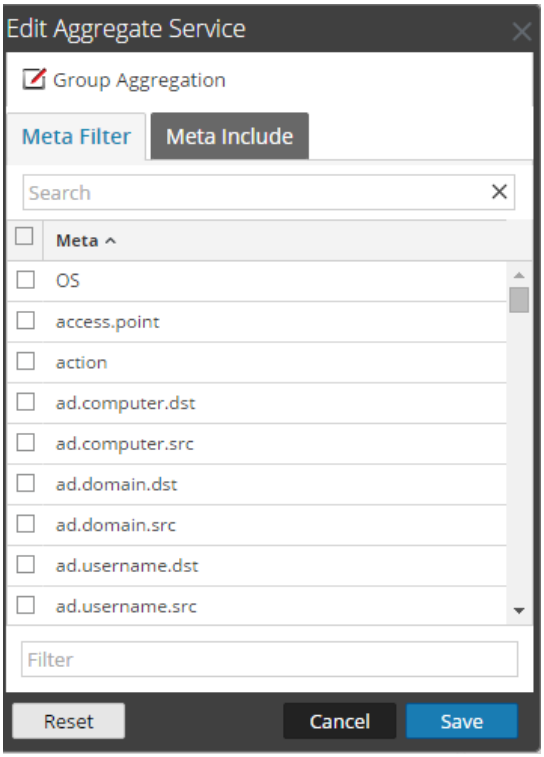
Set up Group Aggregation

This workflow shows the procedures you complete to configure group aggregation.



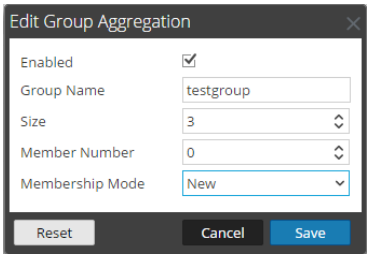
To set up group aggregation:

1. Configure multiple Archiver or Concentrator services in your environment. Make sure that you add the same Log Decoder as data source to all the services.
2. Perform the following on all the Archiver or Concentrator services that you want to be part of aggregation group:
   a. Go to **ADMIN > Services**.
   b. Select the Archiver or Concentrator service, and in the **Actions** column, select **View > Config**. The Service Config view of the Archiver or Concentrator is displayed.
   c. In the **Aggregate Services** section, select **Log Decoder**.
   d. Click Toggle Service to change the status of the Log Decoder to offline if it is online.
   e. Click .
   The **Edit Aggregate Service** dialog is displayed.



f. Click Group Aggregation.

The **Edit Group Aggregation** dialog is displayed.



g. Select the **Enabled** checkbox and set the following parameters:

- In the **Group Name** field, type the group name.
- In the **Size** field, select the number of Archiver or Concentrator services in the aggregation group.
- In the **Member Number** field, select the position of the Archiver or Concentrator in the aggregation group.
- In the **Membership Mode** drop-down menu, select the mode.

h. Click **Save**.

i. In the Service Config View page, click **Apply**.

j. Perform **Step b** to **Step i** on all other Archiver or Concentrator services that need to be part of group aggregation.

3. In the **Aggregation Configuration** section, set the **Aggregate Max Sessions** parameter set to **10000**.

Getting Started with ESA

This topic covers quick start topics for RSA NetWitness® Platform Event Stream Analysis (ESA) to help you get started in using ESA. The following topics are designed to assist you in working with ESA Correlation Rules.

- Best Practices helps you to understand how to best set up, deploy, and create rules.
- Troubleshoot ESA helps you to troubleshoot different aspects of ESA, including rule writing and deployment.
- View Memory Metrics for Rules helps you to work with memory metrics to understand memory usage for ESA services.

There are two ESA services that can run on an ESA host:

- Event Stream Analysis (ESA Correlation Rules)
- Event Stream Analytics Server (ESA Analytics)

The first service is the Event Stream Analysis service that creates alerts from ESA rules, also known as ESA Correlation Rules, which you create manually or download from Live.

This user guide covers alerting using ESA Correlation Rules. For information on configuring ESA Correlation Rules, see the "Configure ESA Correlation Rules" section of the *ESA Configuration Guide*.

The second service is the ESA Analytics service, which is used for Automated Threat Detection. Because the ESA Analytics service uses preconfigured ESA Analytics modules for Automated Threat Detection, you do not have to create or download rules to use it. For information on the ESA Analytics service, see the *Automated Threat Detection Configuration Guide* and the "Configure ESA Analytics" section of the *ESA Configuration Guide*.

Best Practices

Best practices provide guidelines to help you write and manage rules, deploy rules, and maintain system health for your ESA services.

Understand Event Stream Analysis Rule Types

The Event Stream Analysis service provides advanced stream analytics such as correlation and complex event processing at high throughputs and low latency. It is capable of processing large volumes of disparate event data from Concentrators. However, when working with Event Stream Analysis, you should be aware of the factors that affect resource usage in order to create effective rules.

Each event that is received by ESA is evaluated to determine if it may trigger a rule. There are three types of rules that can be deployed in order to determine what the ESA engine should do with the incoming event. Each of these rule types have different impacts on system resource utilization. All three rule types may be created via the Rule Builder, Advanced Event Processing Language (EPL) rules, or downloaded via RSA Live. The table below lists the rule type and the impact this rule may have on system resources.

Rule Type	Description
Simple Filter Rule	This rule has no correlation to other events. At ingestion time, this rule is evaluated against a set of conditions, and if those conditions are met an alert is generated. If no conditions match, the event is quickly released by the engine to free up memory usage. These rules do not take up memory since the events are not retained beyond the initial evaluation. The memory resource usage does not increase as more simple filter rules are deployed. However, if the filter condition is too generic, it is possible that this rule can generate too many alerts, which will strain the system resources for the storage and retrieval of these alerts. For example, you might write a rule to generate an alert when HTTP network activity arrives over a non-standard HTTP port.
Event Window Rule	This rule evaluates a set of events over a time period for specific conditions. At ingestion time, the rule is evaluated against a set of conditions. If those conditions are met, the event is retained in memory for a specific amount of time. After the specified time passes, the events are removed from the time window if the number of events collected does not meet the threshold to trigger an alert. The memory consumption of such rules are highly dependent on the incoming event rate (traffic), the amount of data per event, and the time length specified in the event window. Each matching event is retained in memory until the time window has passed, so the longer the time window, the greater the potential volume. For example, you might write a rule that generates an alert if a user fails to log in to any system five times within a ten minute time frame.

Rule Type	Description
Followed By Rule	This rule evaluates a chain of incoming events to determine if the sequence of events matches a particular condition. At ingestion time, the rule is evaluated against a set of conditions. If the conditions are met, one of two actions occurs: • If this is the first event of the sequence, a new event thread is started, and the event is retained as the head of the sequence. • If the event belongs to an existing event thread, it is added to that sequence. In both cases, the event is retained in memory. The amount of resource usage is particularly sensitive to the customer environment for this type of rule. If the filter condition generates many event threads, resources are consumed for each new thread (in addition to the event). Additionally, if the end of the event thread is never met (that is, an alert is never generated), then the entire event is saved in memory indefinitely. For example, you might write a rule to generate an alert when a user fails to log in to a server, then performs a successful login, and then creates a new account.

In addition to the memory usage discussed above, alert generation also consumes system resources. Each alert that is generated must be stored for retrieval and must also be processed by NetWitness Respond. This process uses disk space for storage, requires database memory to be consumed, and increases CPU utilization running queries.

When writing and deploying rules, you should be aware that each of these actions "cost" you system resources. The sections below are designed to help you keep your usage at a healthy level and monitor for problems if systems are becoming overloaded.

Best Practices for Writing Rules

These are general guidelines for writing rules.

- **Create alerts for actionable events.** The purpose of an alert should be to notify you of an event that requires immediate and specific action. For events that do not require action, or only require you to have awareness of the event, you can create a report.
- **Configure new rules as trial rules so you can observe how they react in your environment**. If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded. You can also use the memory snapshot feature to see how much memory was being used when a trial rule was disabled. For more details, see Work with Trial Rules.

- **Configure Alert notifications only after your rule testing and tuning is complete**. This can help ensure you do not get flooded with notifications if a rule behaves differently than you expect.
- **Rules need to be specific so that you limit resource usage**. Use the following guidelines to limit usage:
  - Make the filters on the rule exclude all but the necessary events for the rule to fire accurately.
  - Make the size of your windows (window time for correlation) as small as possible.
  - Limit the events that you include in the window: For example, if you only want to see IDS events, ensure that you only include those events in your time window.
- **Rules need to be tuned to an alert level that is manageable**. If you are flooded with alerts, then the purpose and utility of an alert is lost. For example, maybe you want to know about encrypted traffic to other countries. But, you could limit the list to countries that are known risks. This limits the volume of alerts to a level you can manage.

Best Practices for Working with RSA Live Rules

These are guidelines for RSA Live Rules.

- **Deploy RSA Live rules in small batches**. Not every rule is suited to every environment. The best way to ensure your RSA Live rules are successful is to deploy them in small batches so you can test them in your environment. If you deploy small batches, it's much easier to tell if a particular rule has an issue.
- **Read the rule descriptions provided with RSA Live rules**. ESA rules are not “one size fits all.” Not all rules will work in your environment. The rule descriptions tell you which parameters you will need to modify to successfully deploy a rule in your environment.
- **Set your parameters**. RSA Live rules have parameters that need to be modified. If you do not modify your parameters, the rule may not work or it may exhaust your memory.
- **Deploy new rules as trial rules so you can observe how they react in your environment.** If you deploy new rules as trial rules, they will be disabled if the configured memory threshold is exceeded. For more details, see Work with Trial Rules.

Best Practices for Deploying Rules

These are general guidelines for deploying rules.

- **Deploy rules in small batches so you can observe how they react in your environment.** Not all environments are the same, and a rule will need to be tuned for memory usage, alert volume, and

effective detection of events.

- **Test rules before you configure alert notifications**. Configure Alert notifications only after your rule testing and tuning is complete. This can help ensure you do not get flooded with alerts if a rule behaves differently than you expect.

- **Monitor system health as a part of your deployment process**. When you deploy rules, monitor your system's health as a part of your deployment process. You can view total memory utilization for your ESA in the Health and Wellness tab. For more information, see "Viewing Health and Wellness statistics" in Troubleshoot ESA.

Best Practices for System Health

These are general guidelines for system health.

- **Set up new rules as trial rules**. A common issue is that new rules may cause memory issues. To prevent this, you can set up new rules as trial rules. If the configured memory threshold is met, all trial rules are disabled to prevent the system from running out of memory. For more information about trial rules, see Work with Trial Rules.
- **Set up thresholds in the Health & Wellness module to alert you if memory usage is too high**. There are metrics in the Health & Wellness module that track memory usage. You can set up alerts and notifications to send you an email if those thresholds are crossed. For more information about the memory statistics you can view, see "Viewing Health and Wellness statistics" in Troubleshoot ESA.
- **Monitor memory metrics for each rule in the Health & Wellness module**. For each rule, you can view the estimated memory usage in the Health & Wellness module. You can use this information to ensure that rules do not use too much memory. For more information about the memory statistics you can view, see "Viewing Health and Wellness statistics" in Troubleshoot ESA.

Troubleshoot ESA

This section describes common issues that may occur while using ESA, and it suggests common solutions to these problems.

Troubleshoot ESA Services

Problem	Possible Causes	Solutions
On the NetWitness Platform Dashboard, the ESA service appears in red to indicate it is offline. In the **CONFIGURE** > **ESA Rules** view, the following message appears: "The Service is either offline or not reachable."	Several	When an ESA service is offline, there are many possible causes. However, a common issue is that you have created a rule that uses excessive memory and causes the ESA service to fail. To troubleshoot this problem, see Steps to Troubleshoot Memory Issues with an ESA Service Offline. Other common causes might be that your firewall is blocking the connection between the ESA and NetWitness Platform, or the ESA service machine may be down.
		To bring up ESA Services: Go to **ADMIN** > **Services**, select your ESA service, and then select  > **Start**. If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.
After a recent upgrade, the ESA service appears in red on the NetWitness Platform Dashboard to indicate it is offline. In the **CONFIGURE** > **ESA Rules** view, the following message appears: "The Service is either offline or not reachable."	Configuration issues	If your system has been recently upgraded, you may have made a configuration error. Go to **ADMIN** > **Services**, select your ESA service, and then select  > **Edit**. In the Edit Service dialog, click **Test Connection**. If the connections fails, you likely have a configuration error. Attempt to fix your configuration error and try again.

Problem	Possible Causes	Solutions
The ESA appears to be running slowly.	Configuration issues	You may be able to improve performance by modifying the buffer (the default value is 1048576 bytes), or setting the TCP setting to TCPNoDelay to prevent a delay in receiving TPC acknowledgments (Acks). You can modify these settings (*readBufferSize* and *tcpNoDelay*) by going to */Workflow/Source/nextgenAggregation* in the Explore view.

Troubleshoot RSA Live Rules for ESA

Problem	Possible Causes	Solutions
I imported a group of rules from RSA Live, and now my ESA service is crashing. Why?	You may not have configured the parameters for the RSA Live rule to tune it for your environment.	Each rule in RSA Live has a description that includes the parameters you must configure and prerequisites for your environment. Review this description to see if the rule is appropriate for your environment. To ensure that you deploy rules safely in your environment, configure new rules as trial rules to test them in your environment. Trial rules add a safeguard for testing new rules. For details on this, see Deploy Rules as Trial Rules.

Problem	Possible Causes	Solutions

I imported a group of rules from RSA Live, and while the rules deployed without errors, they were later disabled.	Not all RSA Live rules are meant for every environment. You may not have the correct meta in your ESA for the rule to run.	You can verify that a rule was disabled by going to **CONFIGURE > ESA Rules > Services > Deployed Rule Stats**. If the rule is disabled, the green icon does not display next to the rule.
		If a rule deployed correctly but was disabled, check the logs for exceptions related to the rule. Specifically, check to see if the rules were disabled due to missing meta. To do this, go to **ADMIN > Services**, select your ESA service, and then select  **> View > Logs**.
		Then, search for a message similar to the following:
		`"Property named '<meta_name>' is not valid in any stream"`
		For example, you might see:
		`Failed to validate filter expression '(medium=1 and streams=2 or medium=3... (238 chars)': Property named 'tcp_flags_seen' is not valid in any stream`
		If a similar message displays, you may need to add a custom meta key to the Log Decoder or Concentrator. To do this, follow these instructions: "Create Custom Meta Keys Using Custom Feed" in the *Decoder and Log Decoder Configuration Guide*.

Troubleshoot Deployments

Problem	Possible Causes	Solutions
I created a rule, and I checked the syntax. The rule looked fine. When I went to deploy the rule, I got an error. Why?	You may not have the correct meta to deploy the rule.	Check the Meta key references. You may not have the correct meta to deploy the rule.

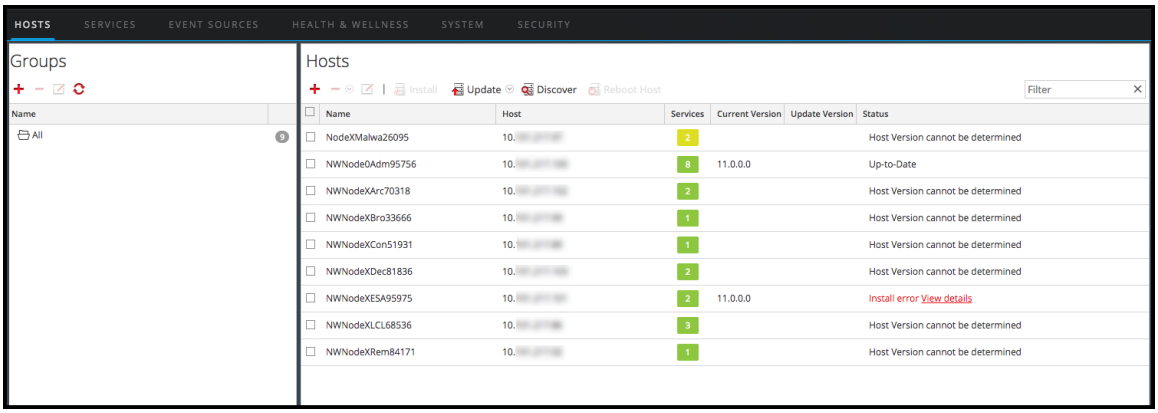
Troubleshoot Rules

Problem	Possible Causes	Solutions
I created a custom rule (via the Rule Builder or Advanced EPL), and my rule is not firing. Why?	You may have connectivity issues.	Check the Offered Rate statistic on the **CONFIGURE > ESA Rules > Services** tab. If the offered rate is zero, then the ESA service is not receiving data from Concentrators. Validate the Concentrator connectivity. Go to **ADMIN > Services**, select your ESA service, and then select  **> View > Config**. Ensure the Concentrator is enabled. Select the Concentrator and click **Test Connection**. If the offered rate is not zero, the meta key name and type used in the rule likely doesn't match the meta key present in events. Check to see if the meta key name and type used in the rule is valid by searching for the meta key name in **CONFIGURE > ESA Rules > Settings** tab (Meta key references search).
	There may be a problem with the rule.	**If a specific rule is not firing**, go to **CONFIGURE > ESA Rules > Services** to see if the rule was disabled. In the **Deployed Rule Stats** section, a rule that is disabled displays a clear enabled button (instead of the green enabled button). You can also check Events Matched field. Go to **CONFIGURE > ESA Rules > Services**. From there, you can see the number of events that were matched in the **Events Matched** column. If no events matched, check the logic of your rule for errors. For example, check the syntax for uppercase and lowercase errors, and check the time window. If the rule still doesn't fire, consider simplifying the logic of the rule to see if it fires when there is less complexity.

Steps to Troubleshoot Memory Issues with an ESA Service Offline

Step 1: Verify that your Host Is Running

The first step to troubleshooting is to ensure that your host is running. To do this, go to **ADMIN > Hosts**. If the host is down, the system parameters will not display (updating host information can sometimes be delayed), the **Services** display in red, and the **Updates** field displays an error message.



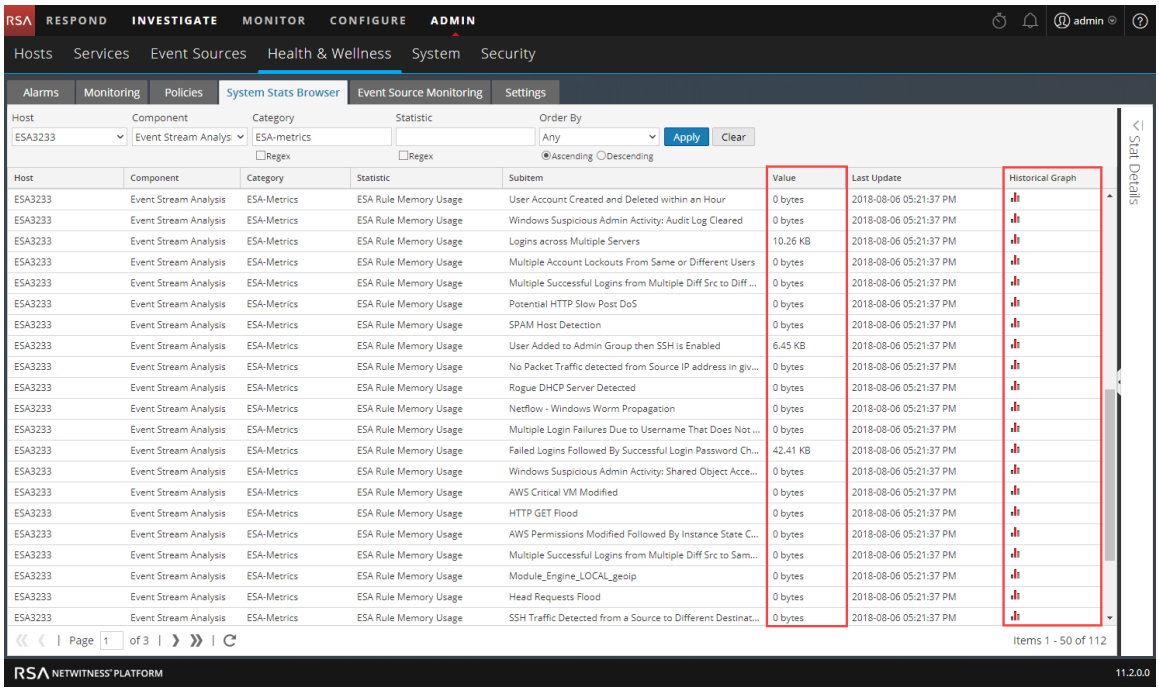
If your host is down, contact your NetWitness Platform Administrator to restart it. Otherwise, go to Step 2.

Step 2: View Detailed Statistics in Health & Wellness

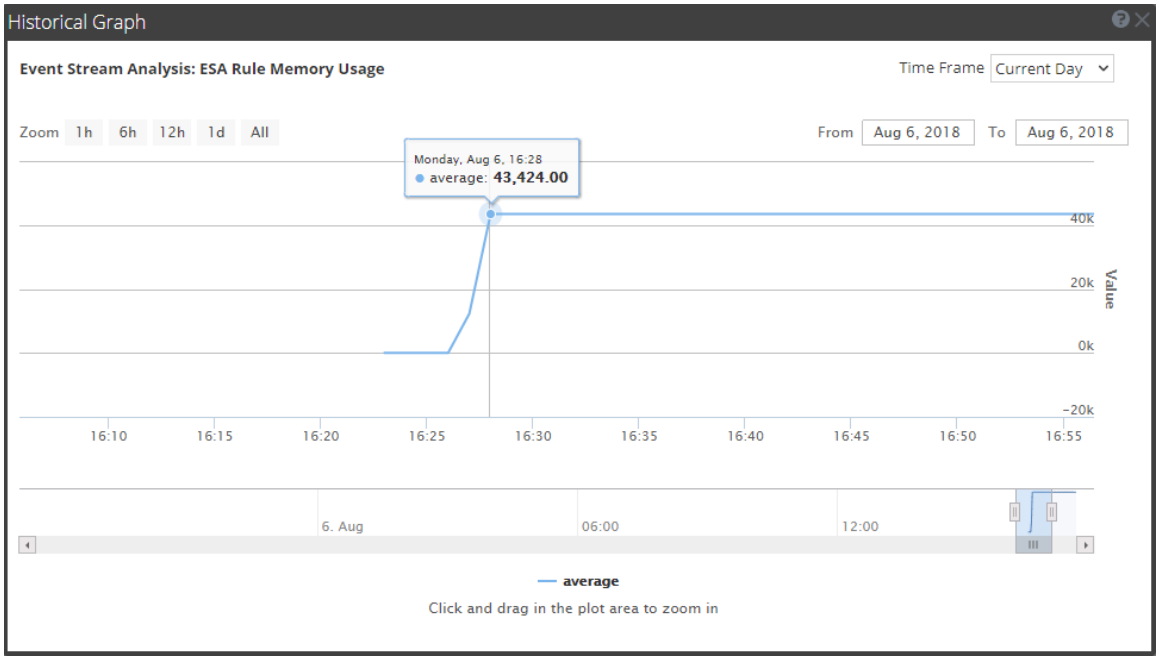
When you are sure your ESA service is down, you can go to Health & Wellness to see where potential issues are occurring. The most common problem is that your ESA service is exceeding memory thresholds, which causes it to stop or fail.

1. Go to **ADMIN > Health & Wellness > Alarms** to see if the ESA triggered any alarms. Look for the following alarms:
   - ESA Overall Memory Utilization > 85%
   - ESA Overall Memory Utilization > 95%
   - ESA Service Stopped
2. Go to **ADMIN > Health & Wellness > System Stats Browser** to see the memory metrics for each rule's performance. To view the metrics, enter the following:

Host	Component	Category
<your host>	Event Stream Analysis	ESA-metrics

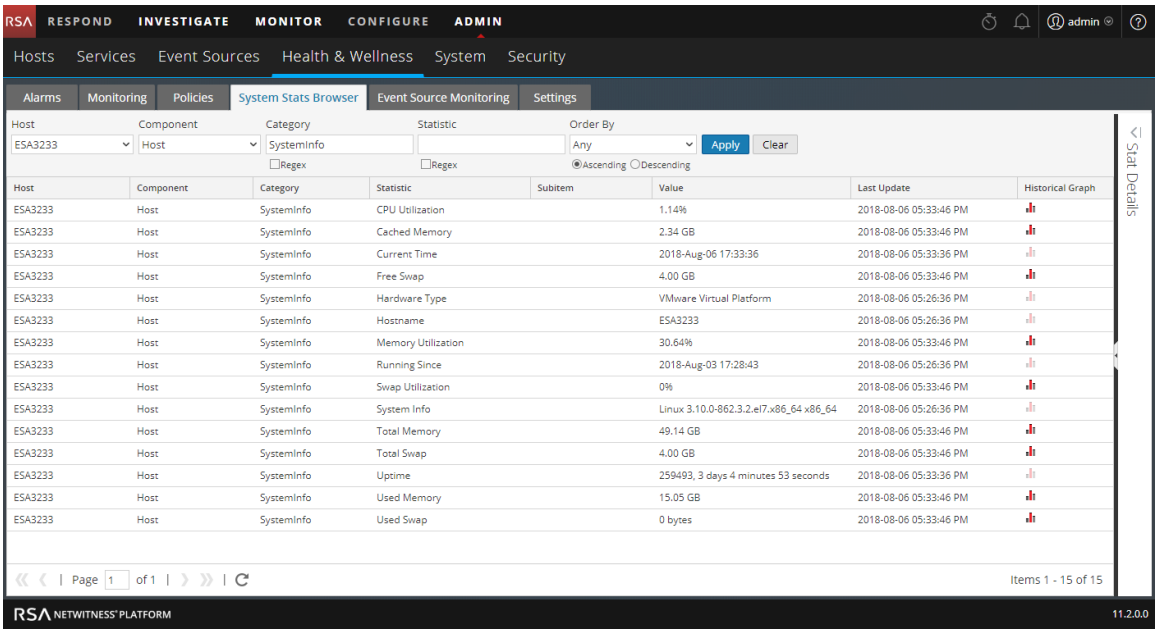


The memory for each rule is displayed in the **Value** column, and the value is displayed in bytes. You can view a historical view of memory usage in the **Historical Graph** column.



3. Go to **ADMIN > Health & Wellness > System Stats Browser** to see details of your ESA performance. Select your host, and use the following filters to view the following statistics:

Host	Component	Category	Statistic	Example
<your host>	Host	SystemInfo	CPU Utilization	1.14%
<your host>	Host	SystemInfo	Memory Utilization	30.64%
<your host>	Host	SystemInfo	Used Memory	15.05 GB
<your host>	Host	SystemInfo	Total Memory	49.14 GB
<your host>	Host	SystemInfo	Uptime	259493, 3 days 16 minutes 53 seconds
<your host>	Event Stream Analysis	ProcessInfo	Memory Utilization	5.67 GB
<your host>	Event Stream Analysis	ProcessInfo	CPU Utilization	0.6%
<your host>	Event Stream Analysis	JVM.Memory	all	Committed Heap Memory Usage 8.0.0 GB
<your host>	Event Stream Analysis	ESA-Metrics	Total ESA Memory Usage %	1.98%



If you are having a problem with memory or CPU utilization, continue to step 3.

Step 3: Bring up your ESA Services

1. Go to **ADMIN > Services**, select your ESA service, and then select > **Start**.
2. Return to the ESA Service to troubleshoot which rules have created memory issues.

If your ESA service is stopping and restarting in a loop, you may need to call Customer Support to get the services to start.

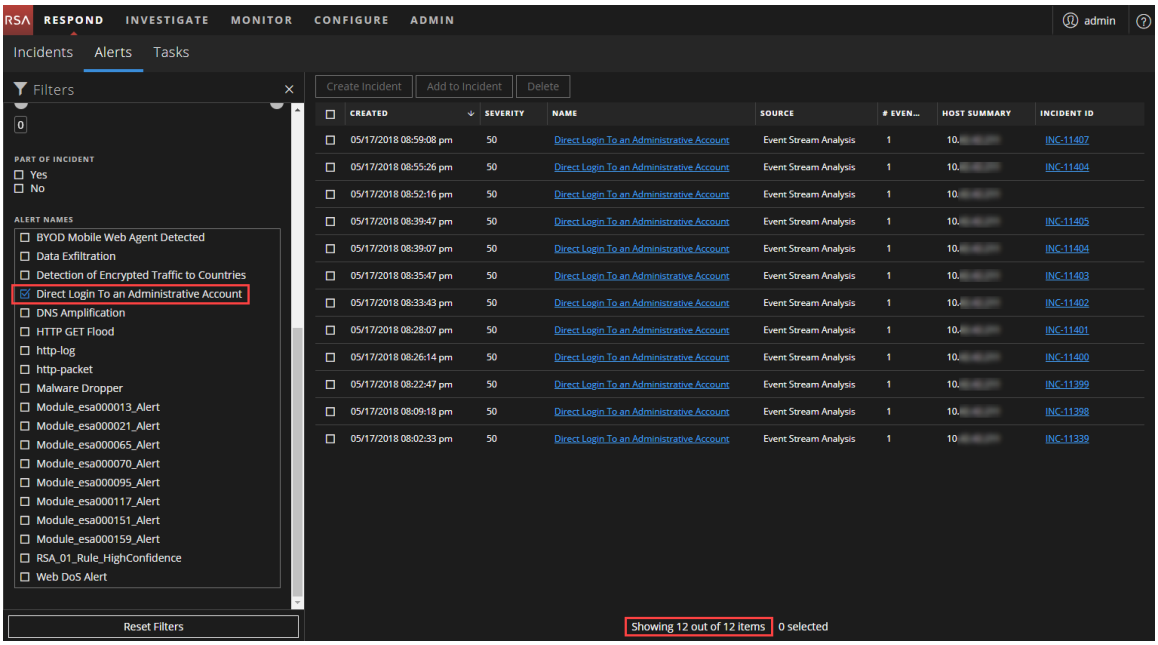
If you are able to start your ESA service without a shutdown, continue to step 4.

Step 4: Check the Alerts and Events Volume

After you are able to restart your ESA service without an immediate shutdown, you can review the stats for your rules to see which rules are consuming too many resources. Sometimes, ESA services fail because a rule is generating too many alerts or a rule is matching too many events. Check for both of these issues if you have determined that memory usage is causing your ESA service to shut down.

View Alert Summaries

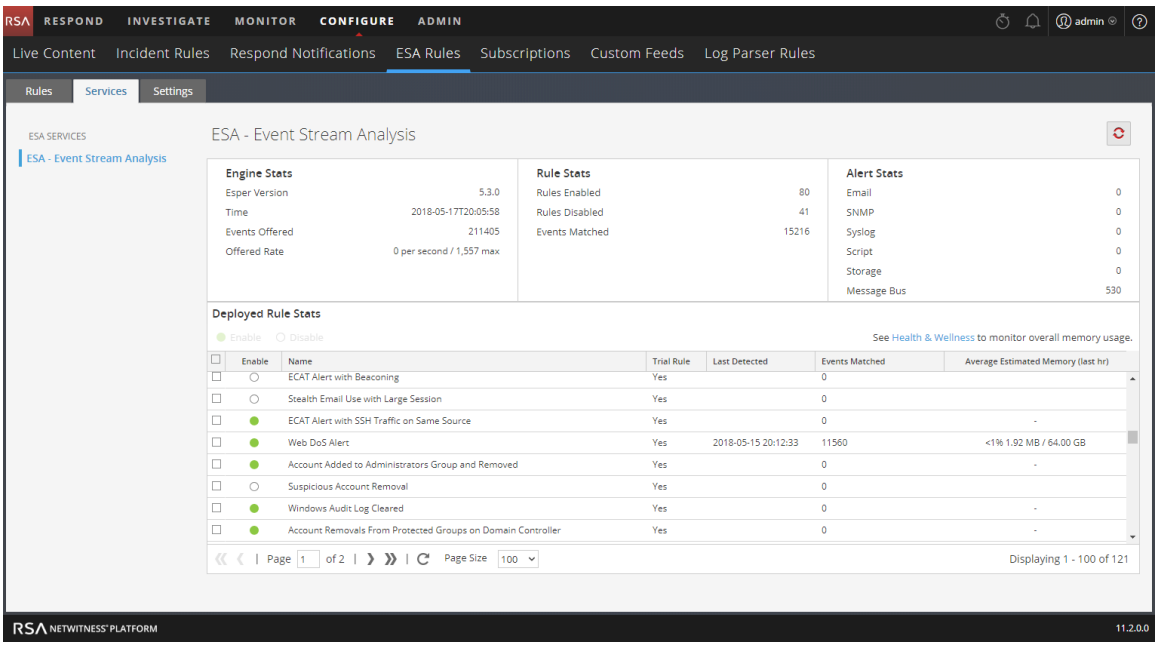
Rules that generate a high volume of alerts can overwhelm the system and cause it to fail or restart. To view the alert summaries, go to **RESPOND > Alerts**. In the **Filters** panel on the left, in the **ALERT NAMES** section, select the alert name for the rule. The number of alerts with that name appears at the bottom of the Alerts list results. If the number is significantly high for a particular rule, you need to disable the rule and rewrite it to be more efficient.



To clear your filter, click **Reset Filters**.

View Events Matched

Sometimes a rule matches too many events, which can use up excessive memory. This typically occurs if you create a large event window where a great number of events accumulate without triggering an alert. These are a problem because each event is stored in memory while the rule waits for the alert to trigger. To check for this issue, go to **CONFIGURE > ESA Rules > Services.** From there, you can see the number of events that were matched in the **Events Matched** column. If there was a high number of events matched for a given rule, you can investigate the rule further to see if you can make it more efficient.



Step 5: Disable and Repair the Rule that Caused Issues

Once you have determined the rules that need to be rewritten, disable them and rewrite rules so that they don't generate such a high volume of alerts or events. For pointers on how to write more efficient rules, see Best Practices.

Disable Rules

1. To disable rules, go to **CONFIGURE > ESA Rules > Services**, and select the rules you want to disable in the **Deployed Rules Stats** field.
2. Select **Disable** to disable the rules.

Edit Rules

1. To repair the rules, go to **CONFIGURE > ESA Rules > Rules tab> Rule Library**.
2. Select the rule to edit and then select  **> Edit**.
3. Edit the rule to be more efficient. For instructions on creating rules, see Add Rules to the Rule Library
4. When you are satisfied with your rule, you can save the rule as a trial rule to ensure that any memory issues do not affect ESA services performance. To do this, follow the steps listed in Work with Trial Rules.

Enable Rules

1. To enable rules, go to **CONFIGURE > ESA Rules > Services**, and select the rules you want to enable in the **Deployed Rules Stats** field.
2. Select **Enable** to enable the rules.

(Optional) Check the ESA Log Files for More Information

Once you verify that your services are down and some potential causes for the system going down, check to see if the service is stopping and restarting in a loop. To do this, go to the ESA logs. From the **ADMIN > Services** view, select your ESA service, and then select  **> View > Logs**.

If you cannot access the ESA logs from the NetWitness Platform interface, you can use SSH to get in the system and go to: `/opt/rsa/esa/logs/esa.log`.

View Memory Metrics for Rules

This topic tells ESA rule writers how to view memory metrics for rules. You can see estimated memory usage for each rule running on a server, and you can use this information to modify your rule statements and conditions if they use too much memory.

Rules can sometimes consume more memory than you expect, causing your ESA to slow down or stop. To see approximately how much memory a rule is using, you can configure memory metrics. Memory metrics allow you to view an estimated memory usage for each rule in the Health & Wellness System Stats browser (so you will need permissions to access this module). You can use this information to modify your rules to be more efficient.

At a high level, you will need to complete the following steps to use the memory metrics to troubleshoot memory usage for rules:

1. Ensure that the memory metrics feature is enabled (via Explorer > CEP > Metrics > EnableStats). The Memory Metrics feature is enabled by default.
2. Ensure you have the correct permissions to view the Health & Wellness module. For information on roles and permissions, see Role Permissions.
3. View the memory statistics in Health & Wellness.
4. (Recommended) Configure Health & Wellness ESA policies to send an email if memory thresholds are exceeded. See "Manage Policies" in the *System Maintenance Guide* for instructions on sending email notifications.
5. Use the memory metrics data to modify rules to be more efficient, if necessary.

Prerequisites

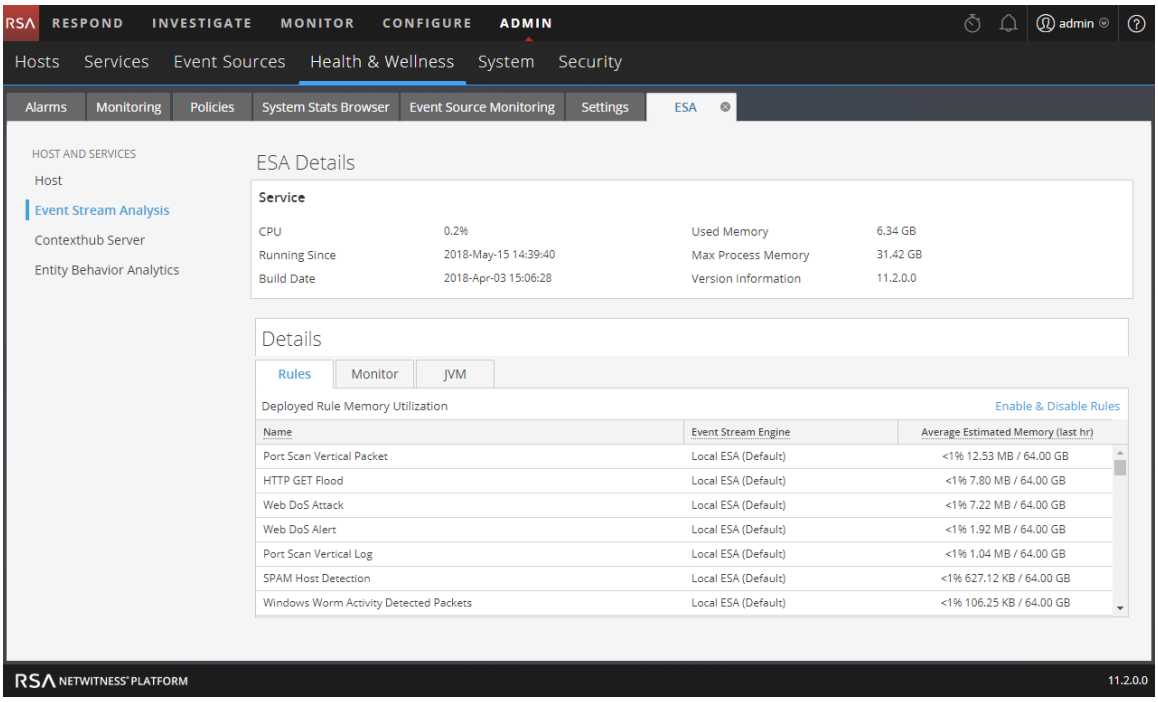
The following are requirements for using memory metrics:

- Memory Metrics feature is enabled (via **Explorer** > **CEP** > **Metrics** > **EnableStats**).
- The user must have the appropriate permissions to view Health & Wellness statistics.
- (Recommended) Configure the ESA Health & Wellness policy to send an email when memory thresholds are exceeded.

Procedures

View Memory Metrics in the Health & Wellness System Monitoring Module

1. Go to **ADMIN > Health & Wellness > Monitoring**.
2. View the details for your ESA service.
3. Click the **Rules** tab.
4. You can view the average memory usage for each rule for the previous hour.



View Memory Metrics in the Health & Wellness System Stats Browser

1. Go to **ADMIN > Health & Wellness > System Stats Browser**.
2. For component, select **Event Stream Analysis**. For category, enter **ESA-Metrics**.

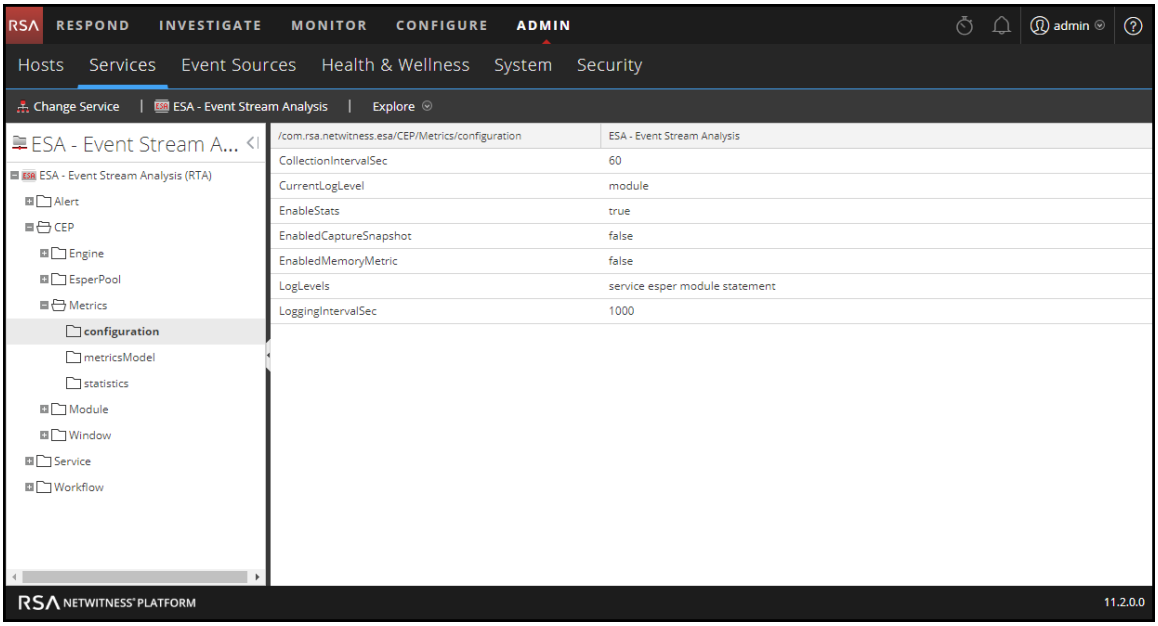
   The name of the rule is displayed in the **Subitem** field, and the memory usage is displayed in the **Value** column.

3. To view the historical memory usage for the rule, click on the **Historical Graph** icon.

Note: The **Last Update** field reflects when Health & Wellness polls ESA. However, the Memory Metrics is not synchronized with the Health & Wellness polling. For example, if the memory threshold is exceeded on 10/10/18 at 12 p.m., but Health & Wellness polls at 10/10/18 at 12:10 p.m., the **Last Update** field will display a timestamp of 10/10/18 12:10 p.m.

Enable or Disable the Memory Metrics Feature

1. Go to **ADMIN > Services**, select your ESA service, and then select > **View > Explore**.
2. Navigate to **CEP > Metrics > configuration** as shown below.



3. Change the field **EnableStats** to **true** or **false** depending on whether you want to enable or disable the memory metrics feature.

How ESA Generates Alerts

This topic provides a brief description of how an Event Stream Analysis (ESA) service runs rules to generate alerts. The Event Stream Analysis (ESA) service runs rules that specify criteria for problem behavior or threatening events in your network. When ESA detects a threat that matches rule criteria, it generates an alert.

To generate alerts, ESA performs the following functions:

1. Gathers data
2. Runs ESA rules against the data
3. Captures events that meet rule criteria
4. Generates alerts for those captured events

Sensitive Data

This topic explains how ESA treats sensitive data, such as usernames or IP address, that it receives from Core services. The Data Privacy Officer (DPO) role can identify meta keys that contain sensitive data and should display obfuscated data. ESA will not display or store sensitive meta. Consequently, ESA will not pass sensitive data to NetWitness Respond.

Optionally, ESA can add an obfuscated version of the sensitive data to an event. For example, the DPO identifies `user_dst` as sensitive. ESA can add an obfuscated version, such as `user_dst_hash`, to an event. The obfuscated meta is not sensitive, so ESA will display and store it the same way as any other non-sensitive meta.

For more information on the strategy and benefits of obfuscating data, see the *Data Privacy Management Guide*.

This topic explains the following:

- How ESA treats sensitive data it receives from Core services
- How to prevent sensitive data leaks in an Advanced EPL rule

How ESA Treats Sensitive Data from Core Services

When ESA receives sensitive data from Core services, ESA passes on only the obfuscated version of the data. ESA does not store or show sensitive data.

The following features are impacted:

- Outputs – ESA does not forward sensitive data to outputs, which include alerts, notifications, and MongoDB storage.

- Advanced EPL rules – If an EPL statement creates an alias for a sensitive meta key, sensitive data will leak. This topic illustrates how this happens so you can avoid it.
- Enrichments – If a sensitive meta key is used in the join condition, sensitive data will leak. This topic illustrates how this happens so you can avoid it.

Advanced EPL Rule

If an EPL query statement renames a sensitive meta key, the data will not be protected.

ESA identifies a sensitive meta key by the name:

- `ip_src` is the sensitive meta key.
- `ip_src_hash` is the non-sensitive, obfuscated version.

To support data privacy, the sensitive meta key must not be renamed in an EPL query. If a sensitive meta key is renamed, the data will no longer be protected.

For example, in a rule such as select `ip_src as ip_alias...`, `ip_alias` contains the sensitive data but it is not protected because ESA only knows about `ip_src`, not `ip_alias`. In this case, IP addresses would not be obfuscated. Real values would be displayed.

Enrichment Source

When a sensitive meta key is used in a join condition, sensitive data can be displayed.

The enrichment database, which is the other part of the join condition, has one column that matches the sensitive meta key. This cross reference is to actual values not obscured values. Consequently, actual values are displayed.

In the following example, both parts of the join condition are highlighted.

- `ip_src` contains sensitive data.
- `ipv4` will be added to the alert and exposed as non-sensitive data.

Because the `ipv4` value is the same as the `ip_src` value, `ipv4` contains and displays sensitive data.

ESA Rule Types

This topic describes each type of ESA rule, when to use them and the permissions each role has with them. The following table lists each type, describes it, and explains when to use it.

Rule Type	Description	When to Use
RSA Live ESA	RSA Live has a catalog of ESA rules that you can download and modify to run in your network.	Download RSA Live ESA rules to leverage rules that are already built. Modify the configurable parameters to customize to meet your requirements.
Rule Builder	In the rule builder, you define rule criteria in an easy-to-use interface.	Use the rule builder to create your first rules. You choose many of the rule conditions from lists.
Advanced EPL	With the Event Processing Language (EPL), you define rule criteria by writing a query.	Use advanced EPL rules to define rule criteria in the EPL syntax.

Starter Pack Rules

A few sample Rule Builder rules come with NetWitness Platform and appear in the Rule Library. Use starter pack rules to get comfortable working with rules before creating your own. You can safely edit and deploy these sample rules.

Trial Rules Mode

For any type of rule, you can select the Trial Rule setting as an additional safeguard. Trial rules get disabled if they exceed a memory threshold the administrator sets. Run a rule in trial mode to monitor memory usage and to disable the rule automatically if it uses more memory than the threshold allows.

Role Permissions

This topic lists all ESA permissions and shows which permissions are assigned to each pre-configured NetWitness Platform role. User access is restricted based on roles and permissions assigned to roles.

- Administrators
- Operators
- Analyst
- Security Operations Center (SOC) Managers
- Malware Analysts (MA)
- Data Privacy Officer

There are four permissions for ESA:

- **Access Alerting Module**: Is required for any permission
- **View Rules**: Allows view-only permission for rules in the Rule Library
- **View Alerts**: Allows view-only permission for alerts ESA generates
- **Manage Rules**:Allows you to view, create, edit, and delete rules

The following table lists permissions for ESA and the roles to which they are assigned. Use this table to see how each role can work with rules and alerts.

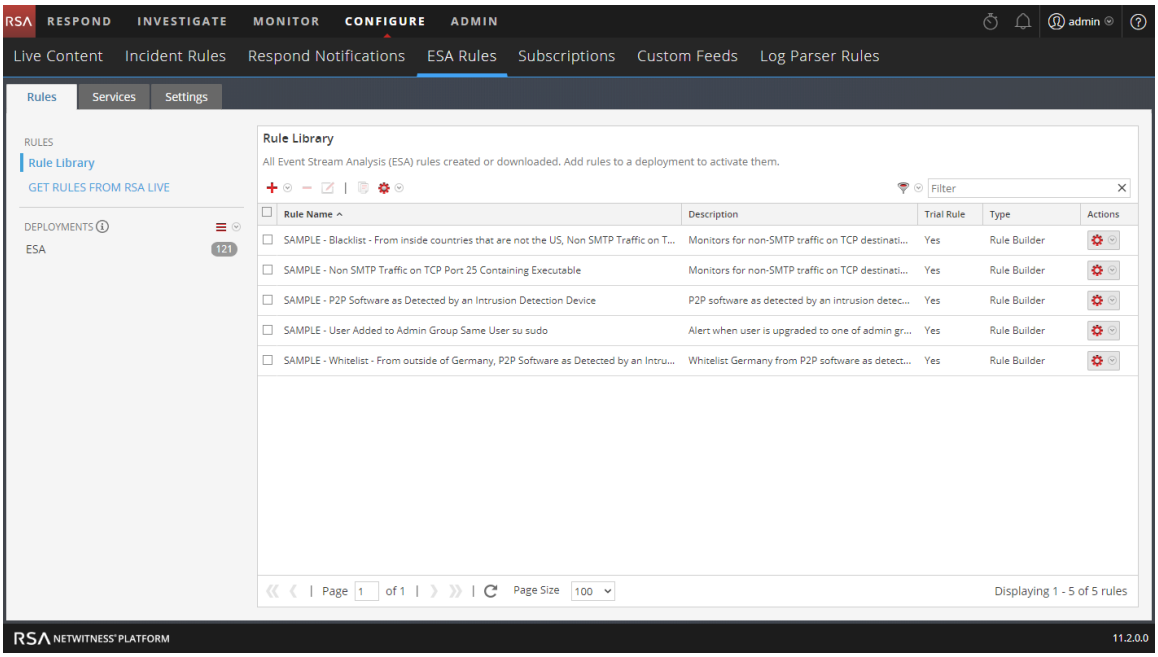
Permission	Administrators	Operators	Analysts	SOC Mgrs	MAs	DPOs
Access Alerting Module	Yes	Yes	Yes	Yes		Yes
View Rules	Yes	Yes		Yes		Yes
View Alerts	Yes		Yes	Yes		Yes
Manage Rules	Yes	Yes		Yes		Yes

For more information on roles and permissions, see the *System Security and User Management Guide*.

Practice with Starter Pack Rules

NetWitness Platform comes with starter pack rules so analysts can become familiar with how rules look before you create your own rules. Use the starter pack rules to become familiar with the Rule Builder and to practice editing and deploying a rule.

Starter pack rules are installed in the Rule Library, which will contain every rule you download or create. The following figure shows sample rules in the Rule Library.



These are the available starter pack rules:

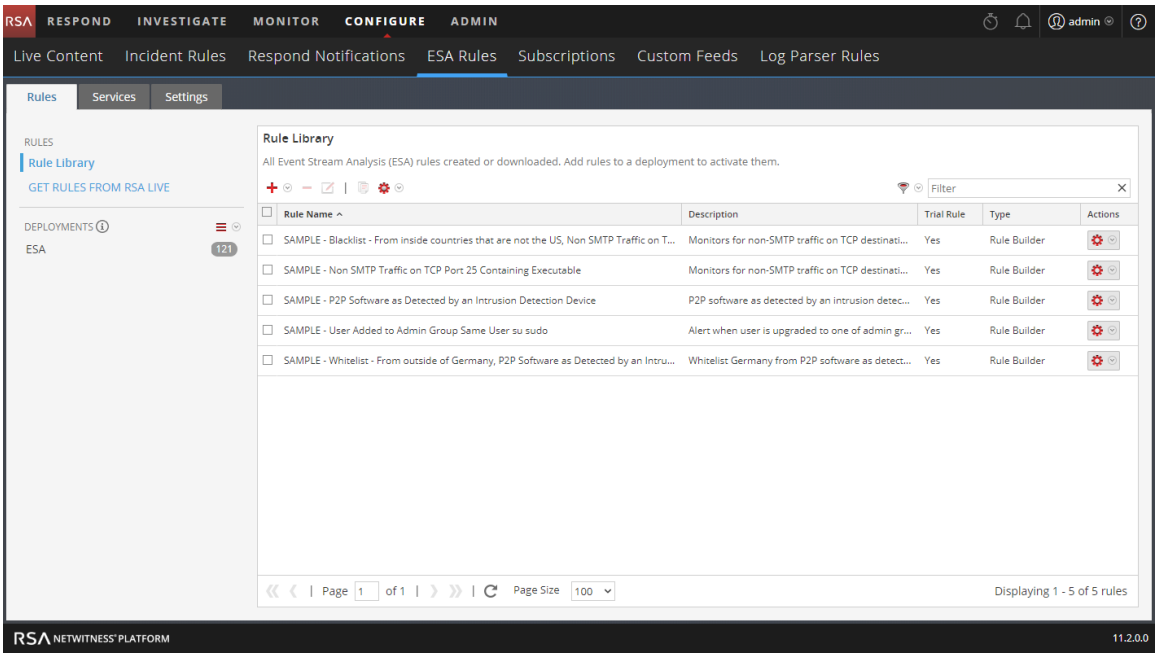
- SAMPLE: P2P Software as Detected by an Intrusion Detection Device
- SAMPLE: Non SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE: Whitelist - From outside of Germany, P2P Software as Detected by an Intrusion Detection Device.
- SAMPLE: Blacklist - From inside countries that are not the US, Non-SMTP Traffic on TCP Port 25 Containing Executable
- SAMPLE: User Added to Admin Group Same User su Sudo

Each name begins with SAMPLE to distinguish the rules that are installed with NetWitness Platform from the rules you download and create.

Rule Library

The Rule Library shows the following information for a rule:

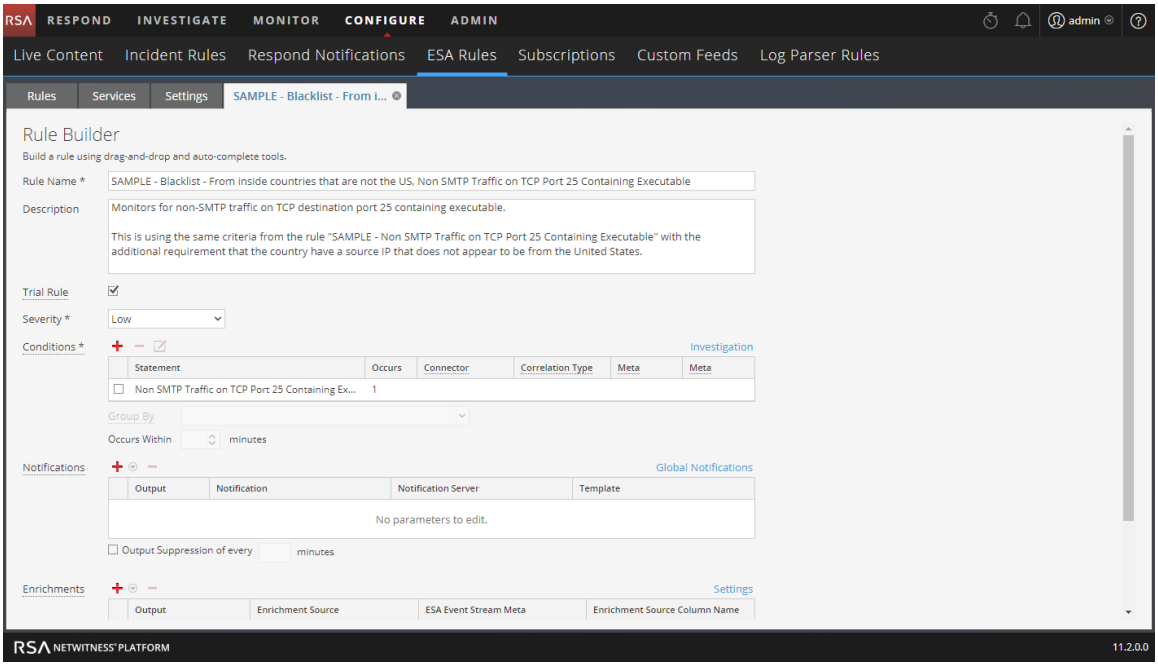
- **Name** summarizes the data or events the rule collects.
- **Description** explains the rule in more detail, although only the beginning shows in the Rule Library.
- **Trial Rule** indicates if trial mode is enabled or disabled for the rule.
- **Type** shows the origin of the rule, built in Rule Builder or Advanced EPL, or downloaded from RSA Live.



Practice with Starter Pack Sample Rules

1. Go to **CONFIGURE > ESA Rules**.
   The ESA Rules view is displayed with the Rules tab open.r

2. In the **Rule Library**, select a sample rule and click , or double-click a rule.
   The rule is opened in Rule Builder.



3. To practice with a starter pack rule, refer to the following topics for detailed descriptions and procedures:
   - To familiarize yourself with the Rule Builder user interface, see Rule Builder Tab for a description of each field.
   - To learn how to edit a rule, see Add a Rule Builder Rule for a step-by-step procedure.
   - To deploy a starter pack rule, see Deploy Rules to Run on ESA to learn how to associate the rule with an ESA service.

After you practice with starter pack rules, you will be able to download, create, and deploy your own rules.

Work with Trial Rules

When rules use too much memory, your ESA service can become slow or unresponsive. To ensure rules do not use excessive memory, you can enable trial rules for any type of rule. By default, new rules you create and RSA Live rules you import are configured to be trial rules. RSA recommends you disable the trial rule setting only after testing the new rule in your environment during normal and peak network traffic. When you create a trial rule, you set a global threshold of the percentage of memory that rules may use. If that configured memory threshold is exceeded, all trial rules are disabled.

The NetWitness Platform Event Stream Analysis (ESA) service is capable of processing large volumes of disparate event data from Concentrators. However, when working with Event Stream Analysis, it is possible to create rules that use excessive memory. This can slow your ESA service or even cause it to shut down unexpectedly. To ensure that this doesn't happen, you can configure your rule as a trial rule. When you configure a trial rule, you also set a global threshold of the percentage of memory that rules may use. If that configured memory threshold is exceeded, all trial rules are disabled automatically.

For suggestions on creating more efficient rules, see "Best Practices for Writing Rules" in Best Practices.

By default, new rules and RSA Live rules are configured as trial rules. As a best practice, when you edit an existing rule, select the Trial Rule option, which allows you to:

- Deploy the rule with an added safeguard.
- Optionally, view a snapshot of memory utilization to understand if the rule creates memory issues.
- Know if you must modify the rule criteria to improve performance.

Note: Run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.

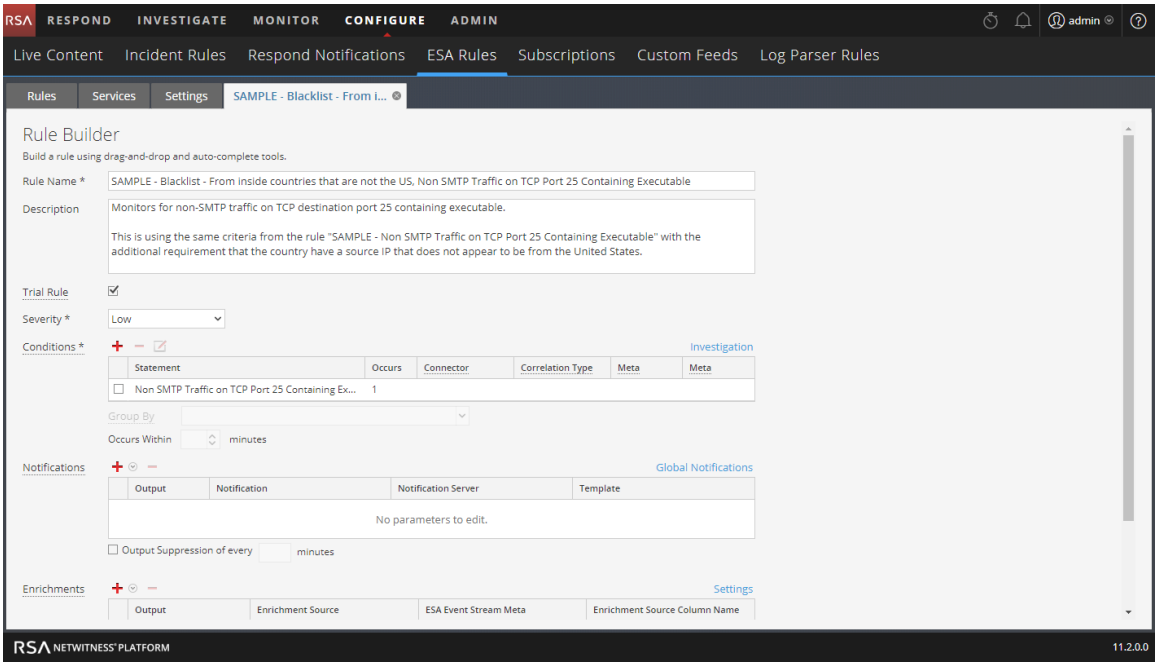
Deploy Rules as Trial Rules

This topic explains to administrators how to enable trial rules when creating new rules or editing rules. Trial rules are automatically disabled if a specified total JVM memory utilization threshold is exceeded.

1. Go to **CONFIGURE > ESA Rules**.

   The Configure ESA Rules view is displayed with the Rules tab open.

2. From the Rule Library, choose to add or edit a rule. The rule builder is displayed in a new tab.



3. To make a new or existing rule a trial rule, select the **Trial Rule** checkbox.
4. Add the rule conditions or modify the rule as needed. For instructions on editing rules, see Add Rules to the Rule Library.
5. Click **Save**.
6. Ensure that trial rules are enabled for your ESA and that you are satisfied with the thresholds configured for trial rules.
   The memory threshold is set in the configuration file. To configure it, see "Change Memory Threshold for Trial Rules" in the *ESA Configuration Guide*.
   The threshold is configured per ESA and is a percentage of Java Virtual Memory.
   The configuration parameter, MemoryThresholdforTrialRules default is 85.
7. Optionally, you can set up the policies in Health and Wellness to send you an email notification if the total JVM memory utilization threshold is exceeded.

The next time you deploy the rule, it runs in trial rule mode.

Note: If a trial rule is disabled, you will need to go to the **CONFIGURE > ESA Rules > Services** tab to re-enable the trial rules. For more instructions on re-enabling trial rules on a service, see View ESA Stats and Alerts.

View Memory Metrics for Rules Using Trial Mode

This topic tells ESA rule writers how to view memory metrics when the memory threshold configured for trial rules is exceeded. If the memory threshold is exceeded, you can configure a snapshot to be taken of the memory usage for ESA rules at the time that trial rules are disabled, allowing you to investigate memory usage and edit the rules to be more efficient.

When you configure trial rules and enable the Memory Snapshot feature, if the memory threshold is exceeded, all trial rules are disabled and a snapshot of the memory usage for all ESA rules is taken at the time of disablement. This allows you to see how much memory was used so that you can modify your ESA rules to be more efficient. The memory snapshot can be viewed in the Health & Wellness System Stats browser, so you will need permissions to access this module. Once you view the details in the System Stats browser, you can modify the trial rule syntax and re-enable the trial rules.

At a high level, you will need to complete the following steps to use the Memory Snapshot to troubleshoot memory usage for rules:

1. Enable trial rules for any new rules you deploy. See Deploy Rules as Trial Rules.
2. Ensure that you have configured Health & Wellness ESA policies to send an email if memory thresholds are exceeded.
3. Ensure you have the correct permissions to view the Health & Wellness module. For information on roles and permissions, see Role Permissions.
4. Ensure that the Memory Snapshot feature is enabled (via the EnabledCaptureSnapshot parameter via NetWitness Platform Explorer). The Memory Snapshot feature is disabled by default. See "Enabling and Disabling the Memory Snapshot Feature" below. RSA recommends that you disable the feature once you have completed testing new rules.
5. View the memory threshold statistics in Health & Wellness if the memory threshold is triggered for trial rules.
6. Modify the rule or rules that triggered the alarm. For best practices for rule writing, see Best Practices.
7. Re-enable the trial rules that were disabled when the memory threshold was triggered. For instructions on re-enabling trial rules on a service, see View ESA Stats and Alerts.
8. Continue to test the trial rules.

Caution: Like any Debug tool, there can be exceptional overhead associated with using the Memory Snapshot feature. When actively taking a snapshot, the Memory Snapshot feature can add delays to your ESA services. **The ESA service stops generating alerts while taking a snapshot**. RSA recommends you disable the feature once you have completed testing new rules. If you disable the Memory Snapshot feature, trial rules will still be disabled when memory usage exceeds configured thresholds, but the memory snapshot will not be taken, and the statistics will not appear in the Health & Wellness System Stats browser.

Prerequisites

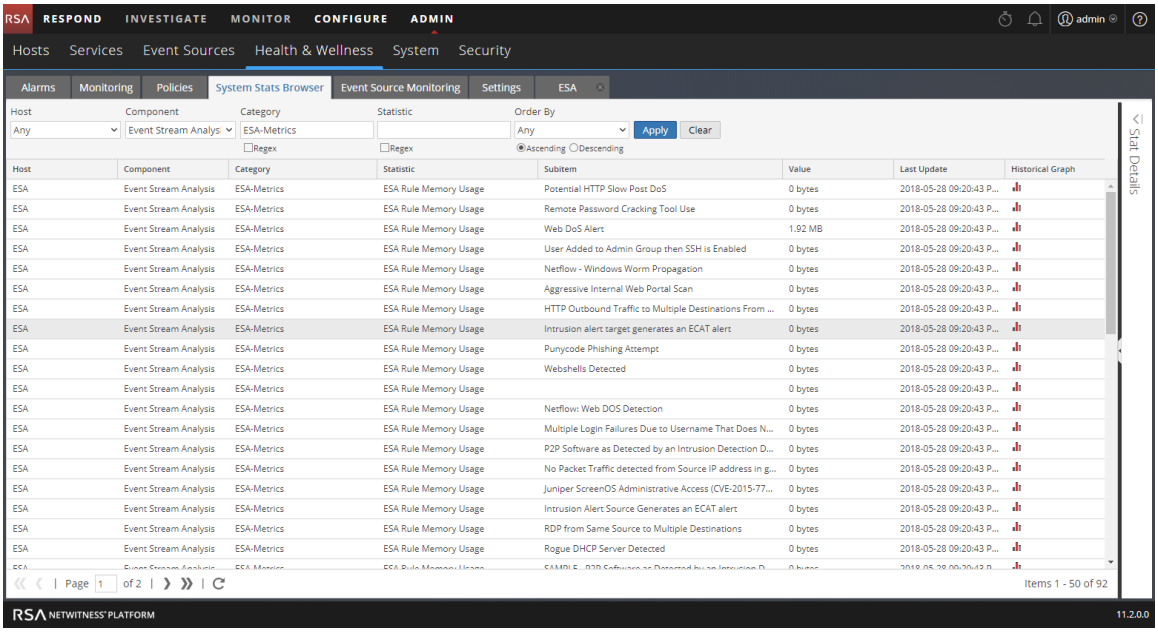
These are the requirements for viewing memory metrics:

- One or more ESA rules must be configured as a trial rule.
- Memory Snapshot must be enabled (via the EnabledCaptureSnapshot parameter via NetWitness Platform Explorer).
- The user must have the appropriate permissions to view Health & Wellness statistics.
- The user must have configured the ESA Health & Wellness policy to send an email when memory thresholds are exceeded.

Procedures

View Memory Metrics

1. Go to **ADMIN > Health & Wellness > System Stats Browser**.
2. For component, select **Event Stream Analysis**. For category, enter **ESA-Metrics**.

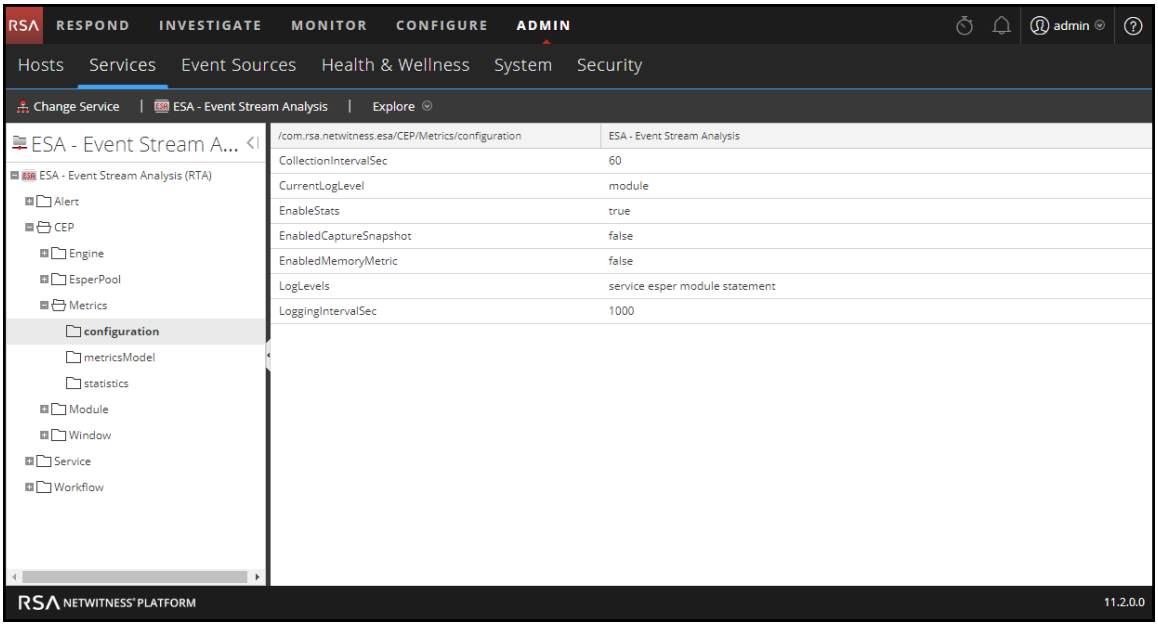


The name of the rule is displayed in the **Subitem** field, and the memory usage is displayed in the **Value** column.

Note: The **Last Update** field reflects when Health & Wellness polls ESA. However, the Memory Snapshot only occurs when memory thresholds are exceeded, so this field does not reflect when the snapshot was taken or updated. The snapshot remains static until the memory threshold is exceeded again. For example, if the memory threshold is exceeded on 10/10/18 at 12 p.m., but Health & Wellness polls at 10/10/18 at 3 p.m., the **Last Update** field will display a date of 10/10/18 3 p.m.

Enable or Disable the Memory Snapshot Feature

1. Go to **ADMIN > Services** and select your ESA service.
2. Select  **> View > Explore**, and navigate to **CEP > Metrics > configuration** as shown below.



3. Change the field **EnabledCaptureSnapshot** to **true** or **false** depending on whether you want to enable or disable the Memory Snapshot feature.

Add Rules to the Rule Library

This topic explains how to add each type of rule to the rule library. You must add a rule to the Rule Library before you can deploy it. Permission to manage rules is required for all tasks in this section. To add rules, you can download them from ESA Live, create a rule via the Rule Builder, or write advanced EPL rules.

For more details on each of these procedures, see:

- Download Configurable RSA Live ESA Rules
- Add a Rule Builder Rule
- Add an Advanced EPL Rule

In addition to deploying a rule, you can edit, duplicate, import, export, and remove a rule in the Rule Library. For details on these procedures, see Working with RulesWorking with Rules

Download Configurable RSA Live ESA Rules

This topic explains how to download configurable rules from the NetWitness Platform Live Content Management System so you can customize them to meet your needs.

RSA Live contains a catalog of rules. Each rule has configurable parameters so you can customize the rule for your environment. If RSA Live has a rule to detect events that you want to detect in your network, download the rule to save time. You can edit the configurable parameters and save the rule in your Rule Library.

This is a sample of how each RSA Live ESA rule is described on RSA Live:

Rule Name	Description
Logins across Multiple Servers	Detects logins from the same user across 3 or more separate servers within 5 minutes. The time window and number of unique destinations are configurable.

As the name shows, the rule looks for logins across multiple servers. The description explains the rule criteria in more detail and specifies which parameters you modify.

Note: When a rule description includes a configurable parameter, the default setting for the parameter is used. In the sample rule, the description states 5 minutes. However, the time window is configurable so 5 is the default number of minutes.

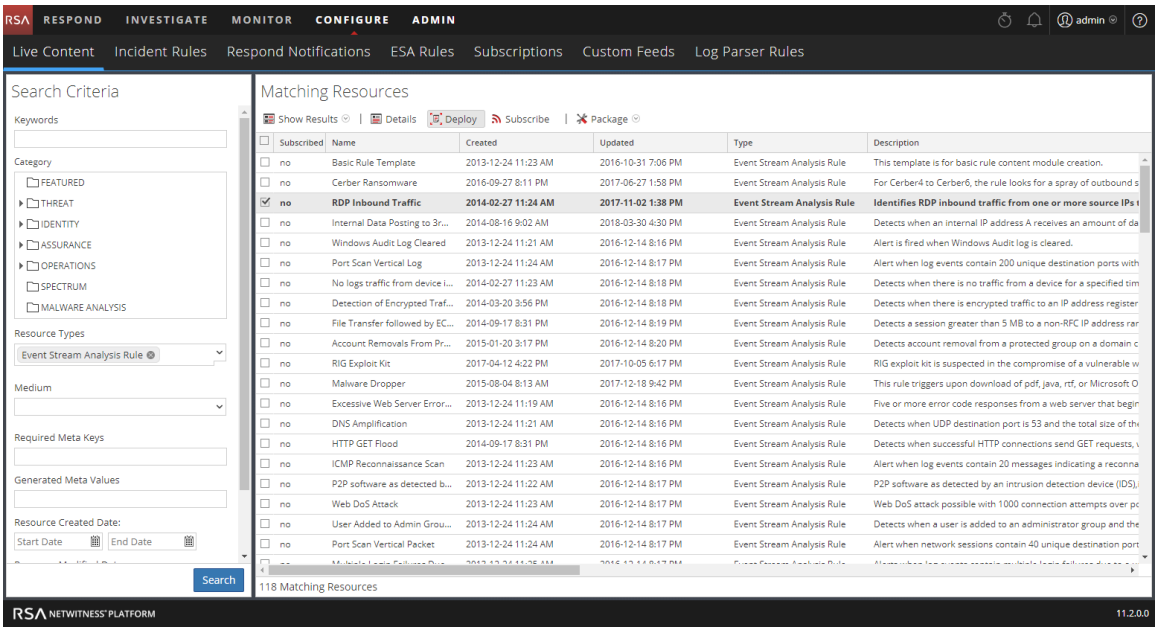
Prerequisites

These are the prerequisites for downloading configurable RSA Live ESA rules;

- Have permission to manage rules
- Create a Live Account. See the *Live Services Management Guide* for details.
- Set up Live on NetWitness Platform. See the *Live Services Management Guide*for details.

Download RSA Live ESA Rules

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed.
2. In the options panel, click **Get Rules from RSA Live**.
   The Live Content Search view is displayed.



3. In **Search Criteria**, for **Resource Types** select **Event Stream Analysis Rule**.
4. Specify any of the following criteria to find a rule to configure for your environment.
   For a detailed description of the search criteria, see "The Live Search View" in the *Live Services Management Guide*.
   a. Keywords
   b. Tags
   c. Required Meta Keys
   d. Generated Meta Values

e. Resource Created Date

f. Resource Modified Date

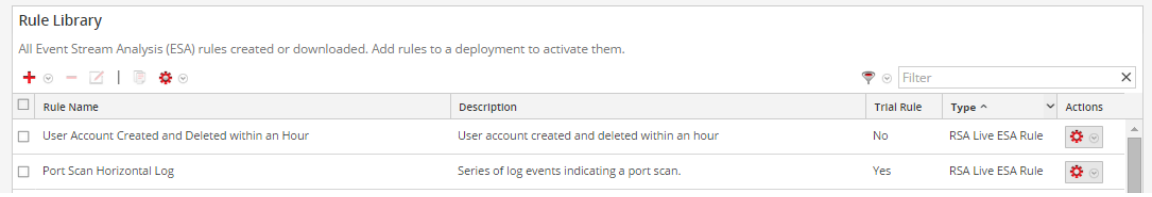
5. Click **Search**. Rules that match the search criteria are displayed in Matching Resources.
6. Select each rule to download and click **Deploy**.
   The Deployment Wizard is displayed
7. Follow the steps in the wizard. If you need more information, see "Deploy Resources in Live" in the *Live Services Management Guide*.

When you finish the steps in the wizard, the selected rules are displayed in the Rule Library.

Customize an RSA Live ESA Rule

This topic explains how to configure parameters in an RSA Live ESA rule. When you download an RSA Live ESA rule, the rule appears in the Rule Library which includes the following columns:

- Rule Name
- Description
- Trial Rule
- Type



The type is RSA Live ESA Rule.

Prerequisites

- Administrator, Operator, SOC Manager, or DPO role permissions are required.
- Rules must be downloaded to the Rule Library.

Configure Parameters for an RSA Live ESA Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the **Rule Library**, select an RSA Live ESA Rule and click .
   The RSA Live ESA Rule tab is displayed.
3. (Optional) Change the following fields:

- Rule Name
- Description
- Trial Rule (Enabled by default. RSA recommends you run a rule as a trial rule long enough to assess the performance during normal and peak network traffic.)
- Severity

4. To configure the rule for your environment, in the **Parameters** section replace the default in the **Value** Column.

5. Click **Save**

Add a Rule Builder Rule

This topic introduces a set of end-to-end procedures for adding a Rule Builder type rule.

Each ESA rule is designed to detect something in your network and to generate an alert for it:

- User activity that is not allowed, such as attempting to download software that is not sanctioned
- Suspicious behavior, such as mass audit clearing
- Known malicious threats, such as worm propagation or a password-cracking tool

There are two methods to design a rule in ESA:

- Rule Builder is an easy-to-use interface. You provide a meta key and value, then select choices from lists to complete the criteria.
- Advanced EPL allows you to write queries in the Event Processing Language. You must know EPL syntax.

If you know EPL, you can use either method. If you do not know EPL, you must use Rule Builder. These topics explain the Rule Builder.

Step 1. Name and Describe the Rule

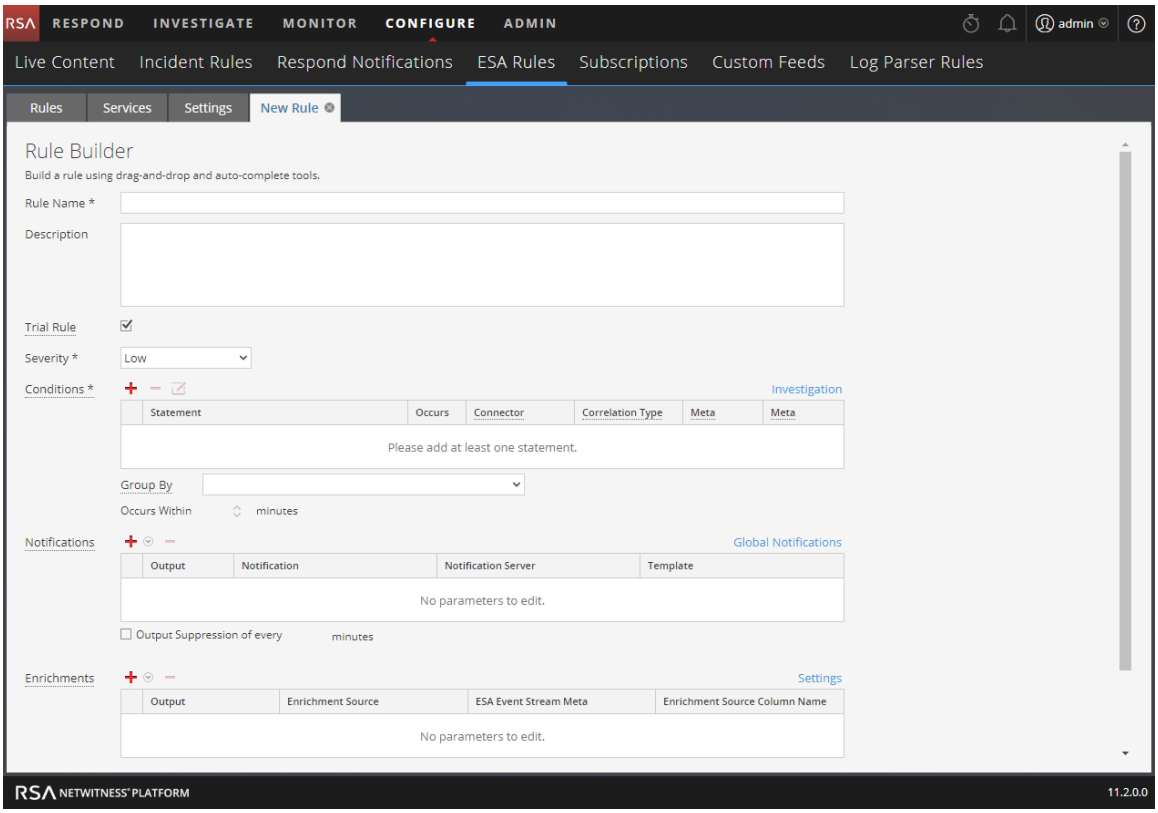
This topic provides instructions to identify a rule, indicate if it is a trial rule and assign a severity level. When you add a new rule, the first information to provide is a unique name and description of what the rule detects. After you save the rule, this information is displayed in the Rule Library.

Prerequisites

You must have permission to manage rules. See Role Permissions.

Name and Describe a Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the **Rule Library**, select + > **Rule Builder**.
   The New Rule tab is displayed.



3. Type a unique, descriptive name in the **Rule Name** field.
   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.
4. In the **Description** field, explain which events the rule detects.
   The beginning of this description will appear in the Rule Library.
5. By default, new rules are configured as a Trial Rule. A trial rule automatically disables the rule if all trial rules collectively exceed the memory threshold. If you are editing an existing rule, you can select **Trial Rule** to safely test the rule edits.
   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by

running out of memory. For more information, see Work with Trial Rules.

6. For **Severity**, classify the rule as Low, Medium, High or Critical.

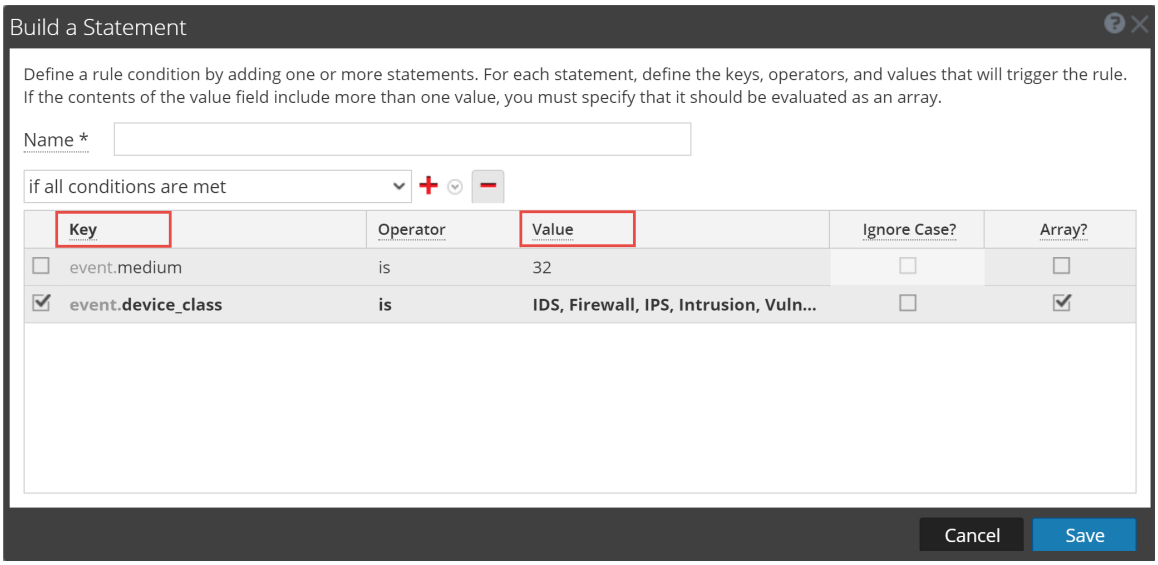
Step 2. Build a Rule Statement

This topic provides instructions to define rule criteria in Rule Builder by adding statements. A statement is a logical grouping of rule criteria in the Rule Builder. You add statements to define what a rule detects.

Example

The following graphic shows an example of a Rule Builder statement.

Every statement contains a key and value. Then, you build logic around the pair by selecting an option in each other field.



Prerequisites

To build a rule statement, you must know the meta key and the meta value.
For a complete list of meta keys, go to **CONFIGURE > ESA Rules > Settings > Meta Key References**.

Build a Rule Statement

1. Go to **CONFIGURE > ESA Rules**.

   The Rules tab is displayed by default.

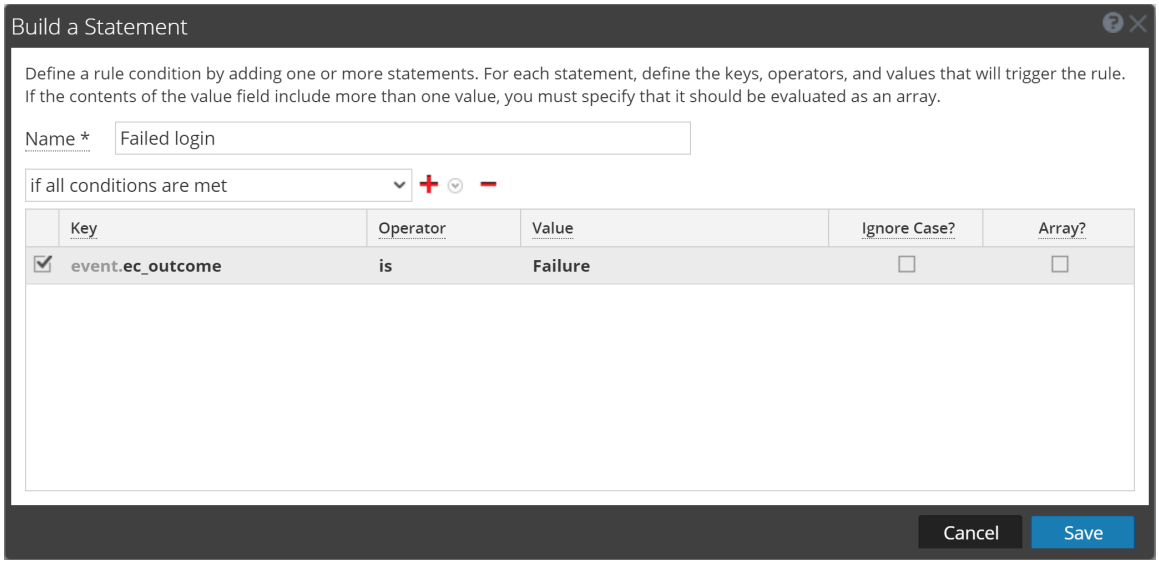
2. In the **Rule Library**, click > **Rule Builder** or edit an existing Rule Builder rule.

   The Rule Builder view is displayed.

3. In the **Conditions** section, click

+ .

The Build Statement dialog is displayed.



4. **Name** the statement. Be clear and specific. The statement name will appear in the Rule Builder.
5. From the drop-down list, select which circumstances the rule requires:
   - if **all conditions** are met
   - if **one of these conditions** are met
6. Specify the criteria for the statement:
   a. For **Key,** type the name of the **Meta Key**.
   b. For **Operator** specify the relationship between the meta key and the value you will provide for it. The choices are: is, is not, is not null, is greater than (>), is greater than or equal to (>=), is less than (<), is less than or equal to (<=), contains, not contains, begins with, ends with
   c. Type the **Value** for the meta key.
   Do not add quotes around a value. Separate multiple values with a comma.
   d. The **Ignore Case?** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN."
   e. The **Array?** field indicates if the contents of the Value field represent one or more than one value.
   Select the Array checkbox if you entered multiple, comma-separated values in the **Value** field. For example, "ec_activity is Logon, Logoff" requires you to select the Array checkbox.

7. To use another meta key in the statement, click  , select **Add Meta Condition** and repeat step 6.
8. To add a whitelist, click  and select **Add Whitelist Condition**.
9. To add a blacklist, click  and select **Add a Blacklist Condition**.
10. To save the statement, click **Save**.

To Add a Whitelist

You use a whitelist to ensure that specified events are excluded from triggering the rule. Whitelists can be based on geographic location, or customer-defined enrichment CSV or Context Hub list sources. For example, if you want to create a rule that only triggers for IP addresses outside of the US, you can create a whitelist of US IP addresses.

1. After you add a meta condition, click  and select **Add Whitelist Condition**.
2. In the **EnterWhitelist Name** field, select an enrichment source. Any enrichment source loaded from a CSV or Context Hub list, or a named window in Esper, can be used as the source for a whitelist.
3. For the subcondition:
   a. If you used a GeoIP source for the whitelist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter *ipv4 is ip_src* to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the whitelist, you might want to add a subcondition to specify the geographic region to exclude from the rule results. For example, to specify that the country code must be USA, enter "*CountryCode is US*".
   b. If you used a Context Hub list for the whitelist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

To Add a Blacklist

You use a blacklist to ensure that specified events trigger the rule. Blacklists can be based on geographic location, or customer-defined enrichment CSV or Context Hub list sources. For example, you can specify that the rule only includes results from Germany.

1. After you add a meta condition, click  and select **Add Blacklist Condition**.
2. In the **Enter Blacklist Name** field, select an enrichment source. Any enrichment source loaded from a CSV or a Context Hub list, or a named window in Esper, can be used as a source for a blacklist.

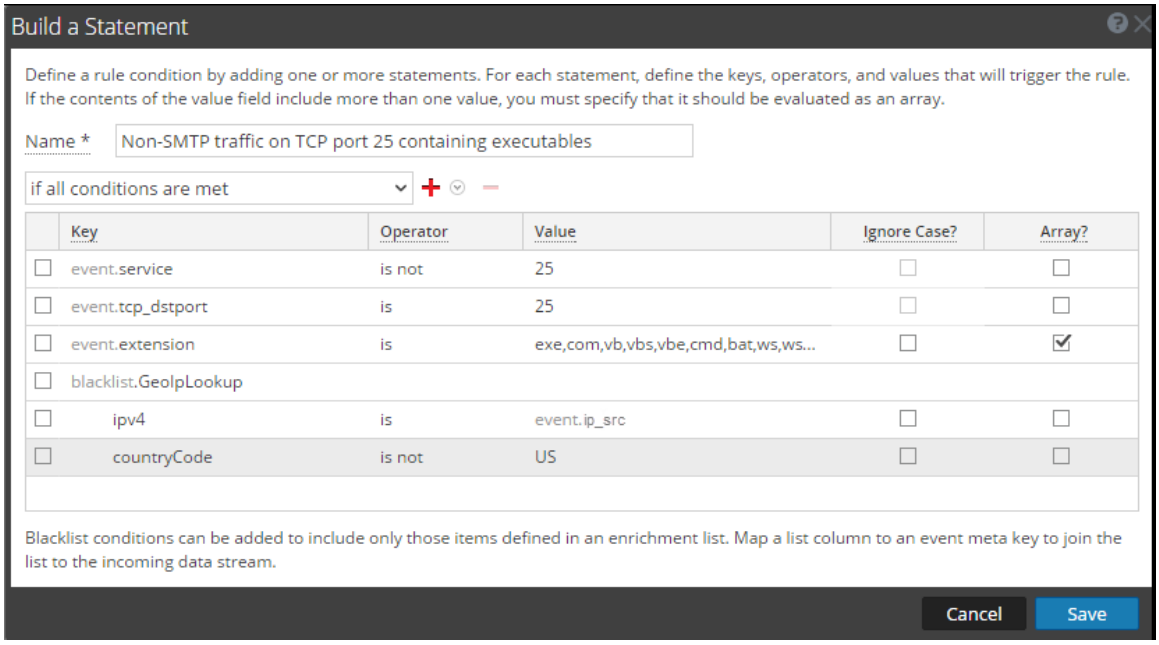
3. For the subcondition:

   a. If you used a GeoIP source for the blacklist, ipv4 is automatically entered for the subcondition. Enter the meta value for the corresponding value field. For example, enter ipv4 is ip_src to ensure the GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database. In addition, if you used a GeoIP source for the blacklist, you might want to add a subcondition to specify the geographic region to include in the rule results. For example, to specify that the rule only includes results for Germany, enter "*CountryCode is DE*".

   b. If you used a Context Hub list for the blacklist, select a column name from the list, then select an operator and enter the meta value for the corresponding value field.

Example: Blacklist

The following statement shows a blacklist statement for a rule that monitors for non-SMTP traffic on TCP destination port 25 containing an executable from countries that are outside of the United States.

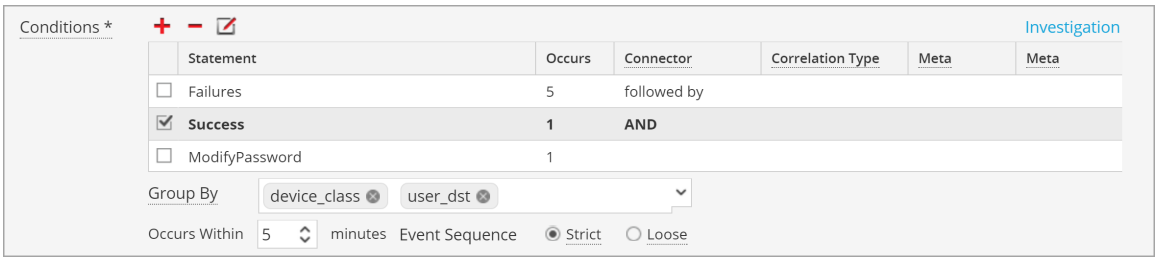


Statement	Description
service is not 25	The traffic is not SMTP traffic.
tcp_dstport is 25	The traffic is running on TCP port 25.
extension is exe, com,vb,vbs,vbe,cmd,bat,ws,wsf,src,sh	The file extension is an executable.

Statement	Description
GeoIpLookup	The blacklist is based on a GeoIPLookup source.
ipv4 is ip_src	The GeoIP records are selected based upon the ip_src being found in the GeoIP lookup database.
countryCode is not US	When looking up the IP address Event.ip_src in the GeoIP database, the record it returns does not contain "US" in the countryCode field.

Example: Ignoring Case, Strict Pattern Matching, and Using The *Is Not Null* Operator

The following example uses the ability to ignore case, exclude null values, and create a strict pattern match to ensure that it returns the expected rule results. The following conditions make up the rule:

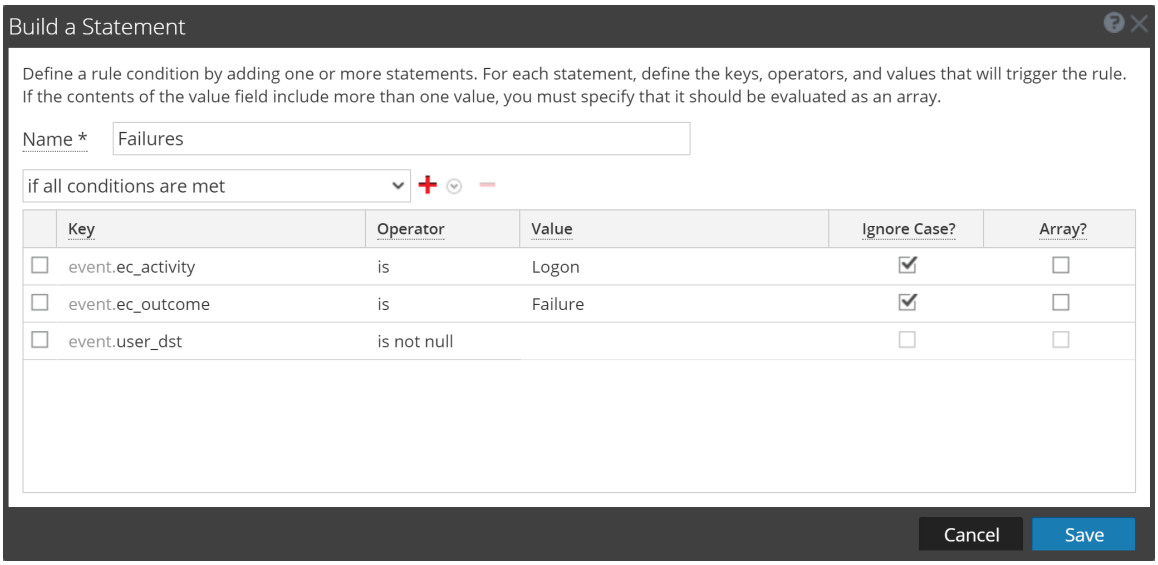


Rule Condition	Description
Failures	This condition searches for five failed logins with a "followed by" connector, meaning that the condition (Failures) must be followed by the next condition (Success).
Success	This condition searches for one successful login.
ModifyPassword	This condition searches for an instance where the password is modified.

Rule Condition	Description
GroupBy: user_dst, device class	The GroupBy field ensures that all the previous conditions are grouped by the user_dst meta (the user destination account) and device class. This is important to the construction of the rule because the rule attempts to find a case where a user has attempted to log into the same destination account multiple times, finally logged in successfully, and then changed the password. Grouping by device class ensures that the user logged in from the same machine attempted to log into an account multiple times. The rule may give unexpected results if you do not group the results.
Occurs within 5 minutes	The time window for the events to occur is five minutes. If the events occur outside of this time window, the rule does not trigger.
Event Sequence: Strict	The event sequence is configured for a strict pattern match. This means that the pattern must match exactly as it is specifiedwith no intervening events. Strict pattern matching allows you to ensure that the Esper engine only generates alerts for rules that exactly match the pattern you want to find. For example, a common rule might be to search for five failed logins followed by a successful login. If you select a loose pattern match, this rule will trigger if there are any number of successful logins between the failed logins. Since the point of the rule is to find frequent *and* sequential login attempts, a strict match is required to ensure that you get the results you expect.

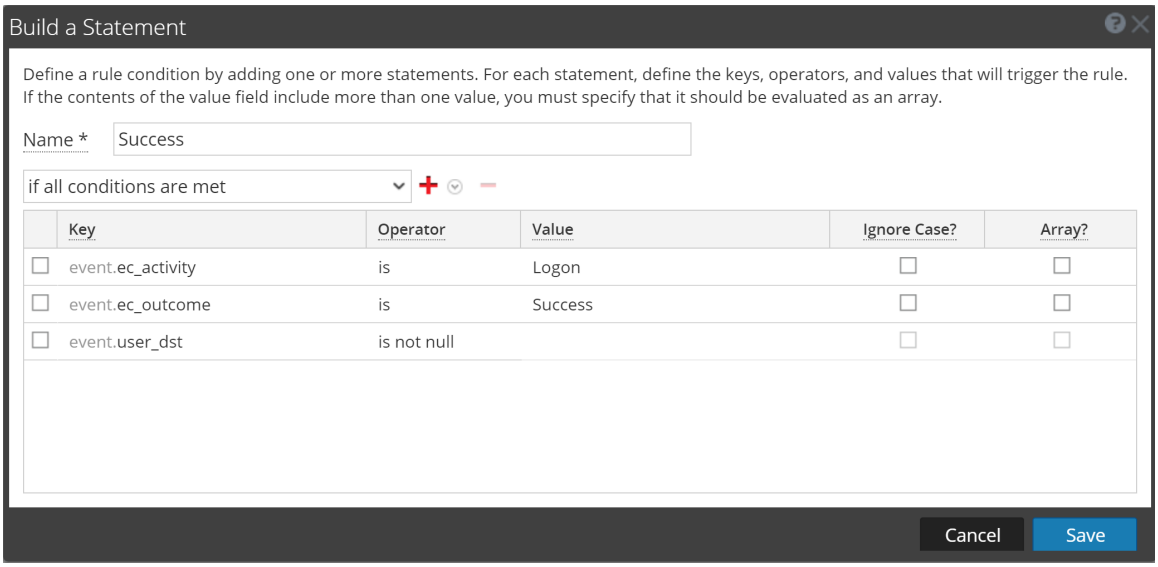
Note: Each of these conditions is explained in further detail in the sections below.

For each condition, a statement is built in the Rule Builder. The following statement makes up the Failures condition:



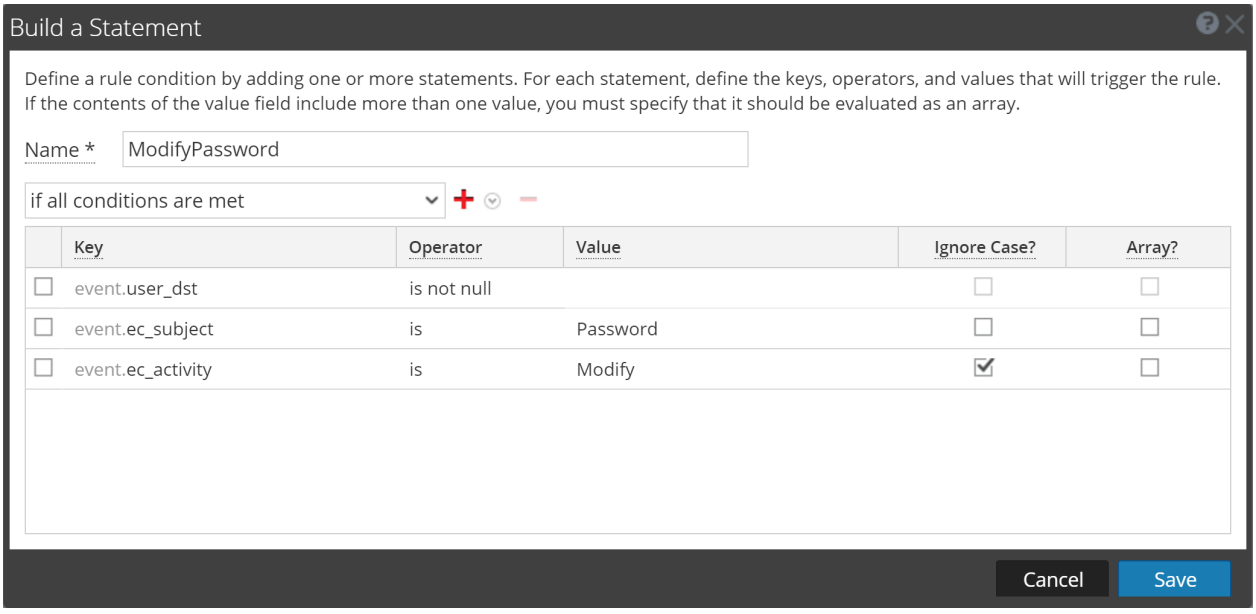
Rule Statement	Description
ec-activity is Logon (ignore case)	Identifies activity that attempts to log on to a system. The **Ignore Case** field is designed for use with string and string array values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. You may want to use this field if you are unsure what case may be used when logging a particular event. Because the case is ignored, the rule can trigger if the activity is logged as Logon, logon, or LoGoN.
ec_outcome is Failure (ignore case)	Identifies activity outcome logged as "failure." Because the case is ignored, the rule can trigger if the activity is logged as "failure", "Failure," or "FaiLuRe."
user_dst is not null	Ensures that the condition is only true if user_dst is populated. The **is not null** operator allows you to ensure that a field returns a value. You may want to use this field when a rule depends on a particular field returning a value. For example, you want to create a rule that identifies the same user attempting to log into the same destination account multiple times (potentially a password-guessing attack). If the field that represents the user destination account is empty, you don't want the rule to trigger. To ensure the field contains a value, you use the **is not null** operator.

The following statement makes up the Success condition:



Rule Statement	Description
ec_activity is Logon	Identifies logon activity.
ec_outcome is Success	Identifies a logon that is successful.
user_dst is not null	Ensures that user destination account field must be populated for the condition to be true.

The following statement makes up the ModifyPassword condition:

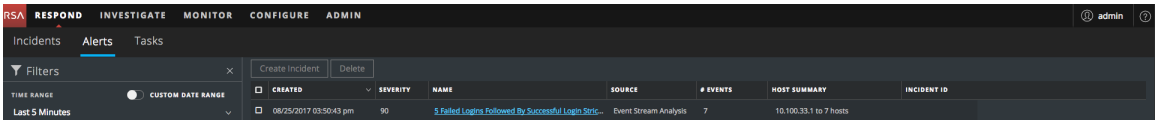


Rule Statement	Description
user_dst is not null	Ensures the user destination account field must be populated for the condition to be true.
ec_subject is Password	Identifies a subject of Password.
ec_activity is Modify	Identifies activity where the password was modified.

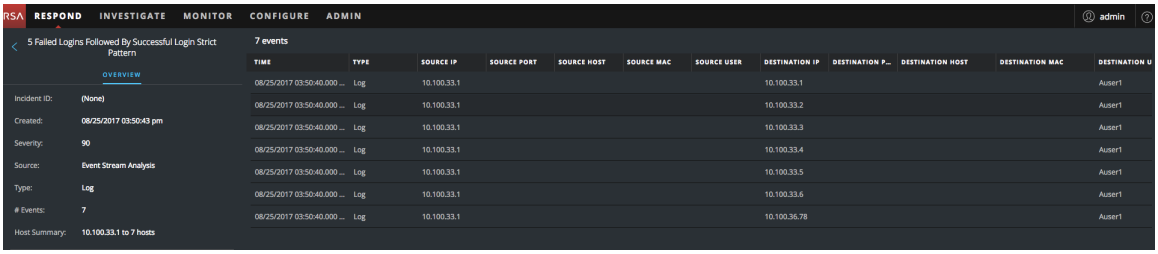
Example Results

When the alert fires for the example rule, you can see that the rule triggered for seven events, and that each event contains a user. You can also see that the events follow a strict pattern: five failed login events, followed by a successful login event, followed by a modification to the account.

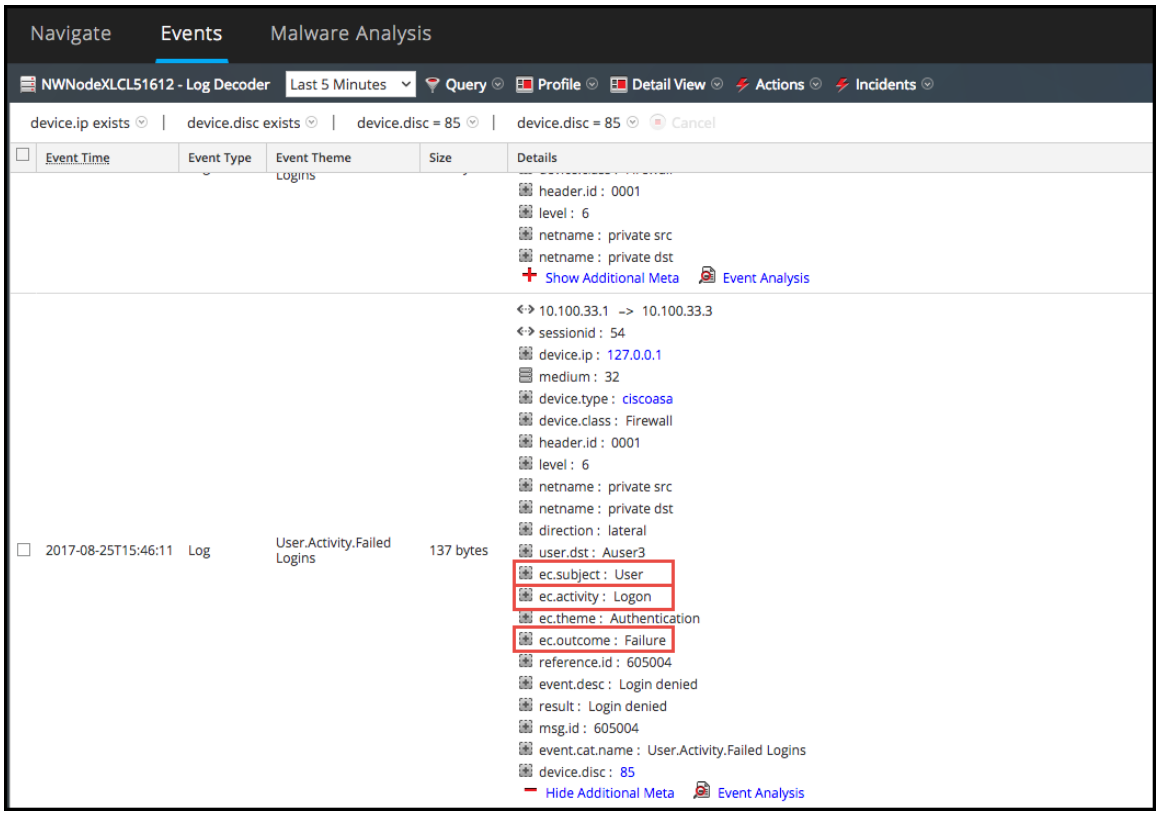
The following figure shows the alert in the Respond Alerts List view.



The next figure shows the events in the alert in the Respond Alert Details view.



Drilling down into the Investigation module by clicking on the source for one of the events, you can see the case for each of the string values. Because you used **Ignore Case**, the rule would trigger if the string values were upper or lower case.

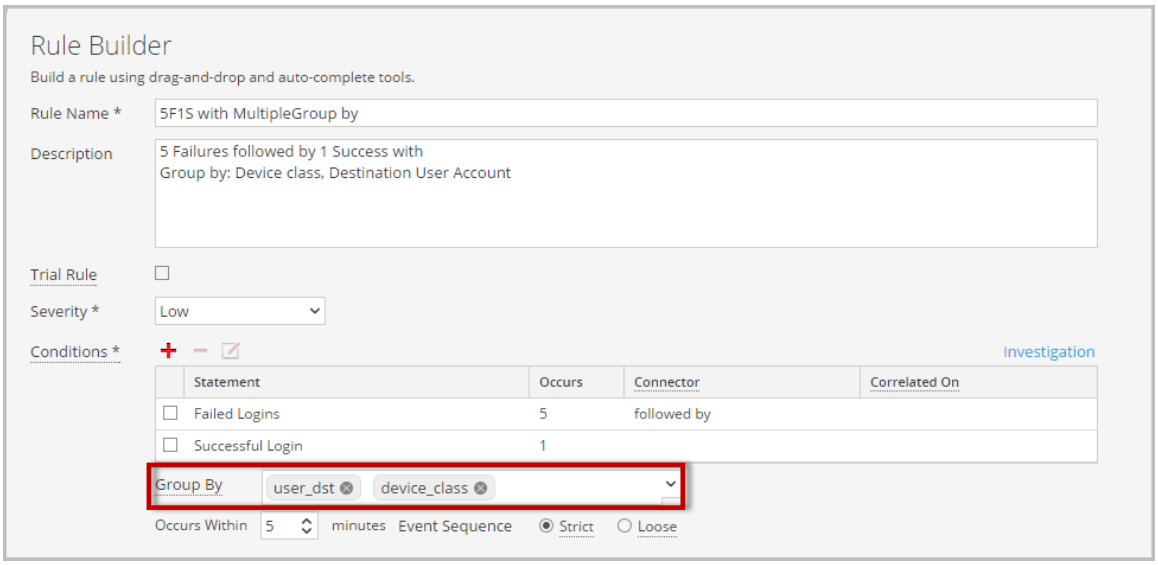


Example: Grouping the Rule Results

The **Group By** field allows you to group and filter rule results. For example, suppose that there are three user accounts; Joe, Jane, and John and you use the **Group By** meta, user_dst. The result will show events grouped under the accounts for Joe, Jane, and John.

You can also group by multiple keys, which can further filter rule results. For example, you might want to group by user destination account and machine to see if a user logged into the same destination account from the same machine attempts to log into an account multiple times. To do this, you might group by device_class and user_dst.

The following example shows a rule grouped by device_class and user_dst.

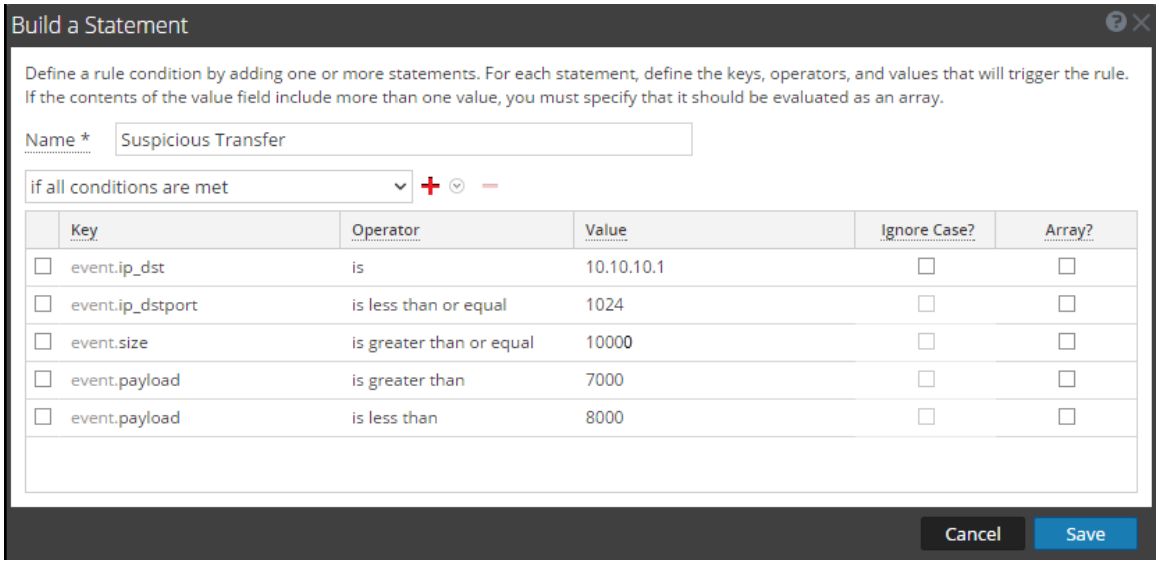


Rule Condition	Description
Failed Logins	Identifies five failed login attempts (must be followed by the next condition; that is, the five failed logins must be followed by a successful login).
Successful Login	Identifies one successful login.
Group By: user_dst and device_class	Groups the rule results by user_dst (user destination account) and device_class (type of machine the user is logging in from). This allows the rule to look for a user logged in from the same machine to the same destination account, resulting in a much more targeted rule result.
Occurs within 5 minutes with a strict pattern match	The events must occur within five minutes, and the pattern matching is strict, meaning it must follow the pattern exactly for the rule to trigger.

Example: Working with Numeric Operators

Numeric operators allow you to write rules against numeric values, such as specifying that a value is greater than, less than, or equal to a specific value. This is useful particularly for cases where you might want to specify a numeric threshold, that is, *payload is greater than 7000*.

The following example attempts to identify a data transfer to a particular destination through the common ports where the transfer size is high and the payload is in a suspicious range.



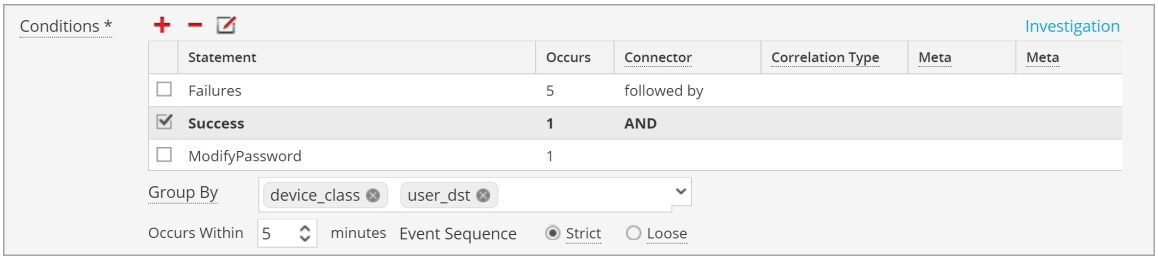
Rule Statement	Description
ip_dst is 10.10.10.1	The destination port is 10.10.10.1.
ip_dstport is greater than or equal to 1024	The destination port is in a commonly used port range, 1024 or greater.
size is greater than or equal to 10000	The size of the transfer is 10000 or greater, which is a suspiciously large transfer.
payload is greater than 7000	The payload is between 7000 and 8000, which is a suspiciously large payload.
payload is less than 8000	The payload is between 7000 and 8000, which is a suspiciously large payload.

Step 3. Add Conditions to a Rule Statement

This topic provides instructions to add conditions, such as specifying a certain time frame, to a rule statement. When you build a statement, you specify what a rule detects. You add conditions to make further stipulations, such as how many times or when the criteria must occur.

Example

The following graphic shows an example of the conditions for Rule Builder statements. Combined, the statements and conditions comprise the rule criteria.



This rule detects 5 failed logon attempts followed by one successful logon, which could be the sign that someone has hacked into user account. This is the criteria for the rule:

A. 5 failed logons are required.

B. 1 successful logon must follow the failures

C. A password was changed.

D. All events must occur within 5 minutes.

E. Group alerts by user (user_dst), because steps A and B must be performed on the same user destination account. Also, group by machine (device_class) to ensure that the user logged in from the same machine attempts to log into an account multiple times.

F. The match is a strict pattern, meaning that the pattern must match exactly with no intervening events.

Add Conditions to a Rule Statement

1. In the **Conditions** section, select a statement and click  .
2. For **Occurs**, enter a value to specify how many occurrences are required to meet the rule criteria.
3. If you have multiple statements, in the **Connector** field select a logical operator to join one statement to another:
   - followed by
   - not followed by
   - AND
   - OR
4. **Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two

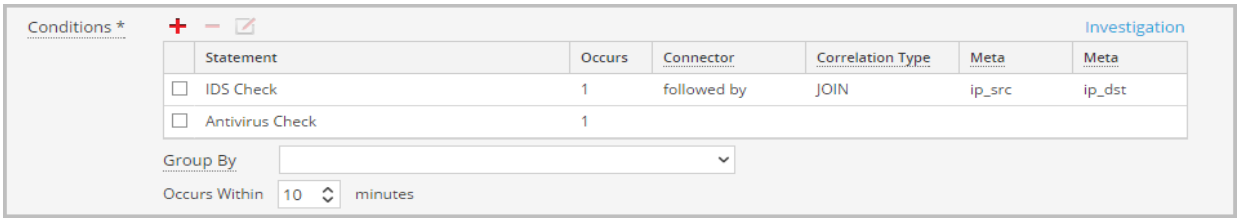
different data sources. For example, say you want to correlate an AV alert with an IDS alert. See the examples below for a use case where two meta from different sources are joined.

5. If events must happen within a specific timeframe, enter a number of minutes in the **Occurs Within** field.
6. Choose whether the pattern must follow a **Strict** match or a **Loose** match. If you specify a strict match, this means that the pattern must occur in the exact sequence you specified with no additional events occurring in between. For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.
7. Choose the fields to group by from the dropdown list. The **Group by** field allows you to group and evaluate the incoming events. For example, in the rule that detects 5 failed logon attempts followed by 1 successful attempt, the user must be the same, so user_dst is the **Group By** meta key. You can also group by multiple keys. Using the previous example, you might want to group by user and machine to ensure that the same user logged in from the same machine attempts to log into an account multiple times. To do this, you might group by device_class and user_dst.

Example

The following graphic shows an example of the conditions for a rule that allow you to evaluate the same entities across multiple devices so you can accomplish complex use cases. For example, you can create a rule that triggers if an IDS (Intrusion Detection System) alert is followed by an AV(Anti-virus) alert for the same workstation. The work station key is not the same between the two (IDS & AV) sources, so you can perform a JOIN in order to evaluate the different entities.

In the IDS alert, the workstation is identified by the source IP address from the IDS alert, and would be compared to the destination IP address from the AV alert.



This is the criteria for the rule:

A. An IDS alert occurs.

B. The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.

C. An Antivirus alert follows the IDS alert.

Add an Advanced EPL Rule

This topic provides instructions to define rule criteria by writing an EPL query. EPL is a declarative language for handling high-frequency time-based event data. It is used to express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events.

Write an advanced EPL rule when rule criteria is more complex than what you can specify in Rule Builder.

It is outside the scope of this guide to explain EPL syntax.

- For EPL Documentation, see http://www.espertech.com/esper/esper-documentation/
- For the EPL Online Tool, see http://esper-epl-tryout.appspot.com/epltryout/mainform.html

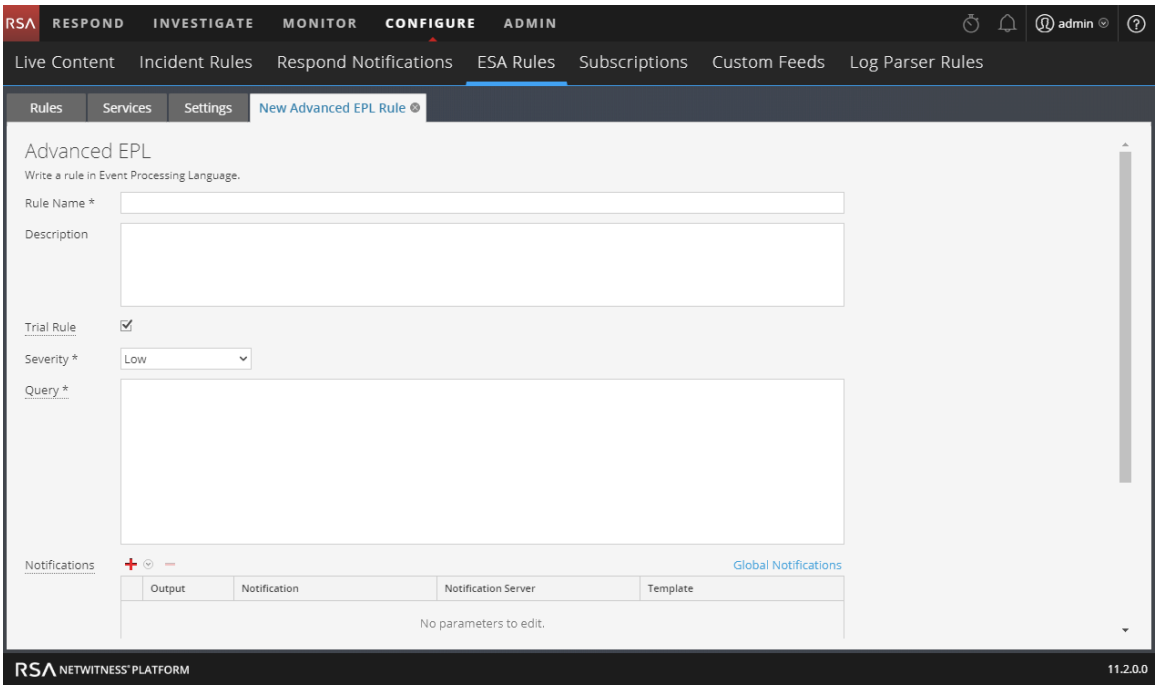
Prerequisites

The following are prerequisites for adding an advanced rule:

- You must know Event Processing Language (EPL).
- You must understand ESA Annotations to mark which EPL statements are linked to generating alerts.

Add an Advanced EPL Rule

1. Go to **CONFIGURE > ESA Rules**.
2. In the **Rule Library**, select  **> Advanced EPL**.



3. Type a unique, descriptive name in the **Rule Name** field.

   This name will appear in the Rule Library so be specific enough to distinguish the rule from others.

4. In the **Description** field, explain which events the rule detects.

   The beginning of this description will appear in the Rule Library

5. Select **Trial Rule** to automatically disable the rule if all trial rules collectively exceed the memory threshold.

   Use trial rule mode as a safeguard to see if a rule runs efficiently and to prevent downtime caused by running out of memory. For more information, see Work with Trial Rules.

6. For **Severity**, classify the rule as Low, Medium, High or Critical.

7. To define rule criteria, write a **Query** in EPL.

   Note: For all meta key names, use an underscore not a period. For example, `ec_outcome` is correct but `ec.outcome` is not.

8. For dynamic statement name generation in ESA, you must enclose the meta keys in curly brackets and include this annotation in the syntax:

   ```
   @Name("RIG {ip_src} {alias_host} {ec_activity}")
   ```

   where,

- RIG is the static part of the statement name
- {ip_src}, {alias_host}, {ec_activity} is the dynamic part of the statement name

Note: If any of the metas in the dynamic part of the statement name has a null value, it is displayed as a static text.

If a rule should generate an alert, include this ESA annotation in the syntax:

```
@RSAAlert
```

For more information on ESA Annotations, see ESA Annotations.

Event Processing Language (EPL)

This topic describes Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. ESA uses Event Processing Language (EPL), a declarative language for dealing with high frequency time-based event data. It is used for express filtering, aggregation, and joins over possibly sliding windows of multiple event streams. EPL also includes pattern semantics to express complex temporal causality among events. It can perform, but is not limited to, the following functions:

- Filter Event
- Alert Suppression
- Compute percentages or rations
- Average, count, min and max for a given time window
- Correlate events arriving in multiple stream
- Correlate events that arrive out of order
- On-Off Windows
- Followed-by and Not Followed-by support
- Regex filter support

Databases require explicit querying to return meaningful data and are not suited to push data as it changes. The developer must implement the temporal and aggregation logic himself. By contrast, the EPL engine provides a higher abstraction and intelligence and can be thought of as a database turned upside-down. Instead of storing the data and running queries against stored data, EPL allows applications to store queries and continuously run the data through. Response from the EPL engine is real-time when conditions occur that match user defined queries.

Advanced ESA rules require correct character case, but in the Investigation view all characters are converted to lowercase. However, the meta may not be lowercase despite appearances in the Investigation view. To ensure you are using the correct case, RSA recommends you use the *toLowerCase()* function. For example,

```
@RSAAlert(oneInSeconds=0)
SELECT * FROM Event(
/* Statement: Download PDF File */
(filetype.toLowerCase() IN ( 'pdf' ) AND medium IN ( 1 ))
OR
/* Statement: Download EXE File */
(filetype.toLowerCase() IN ( 'windows_executable' , 'x86 pe' , 'windows
executable' ) AND medium IN ( 1 ))
).win:time(5 Minutes)
MATCH_RECOGNIZE (
PARTITION BY ip_src
MEASURES E1 as e1_data , E2 as e2_data
PATTERN (E1+ E2)
DEFINE
E1 as (E1.filetype.toLowerCase() IN ( 'pdf' ) AND E1.medium IN ( 1 )),
E2 as (E2.filetype.toLowerCase() IN ( 'windows_executable' , 'x86 pe' ,
'windows executable' ) AND E2.medium IN ( 1 ))
```

For the purposes of online help, basic statements are used to illustrate how to set up ESA; however, for more information about writing EPL statements, the http://www.espertech.com site provides tutorials and examples.

Note: ESA supports Esper version 5.3.0.

ESA Annotations

This topic describes annotations that NetWitness Platform provides to use in advanced EPL rules.

@RSAAlert Annotation

The @RSAAlert annotation is used to mark which EPL statements are linked to generating alert notifications. It is designed to work with the alert notification suppression feature in the Rule Builder user interface.

The @RSAAlert annotation can be useful when working with alert notifications, especially if you want to filter notifications, such as sending one notification for each user that triggers an alert.

For example, suppose you want to generate alert notifications for login failures. You could add the following statement:

*@RSAAlert select * from event(msg_id="login_fail")*

Event number	Message ID	username	src_ IP	Time
1	login_fail	alice	1.2.3.4	10:00
2	login_fail	alice	1.2.3.4	10:01
3	login_fail	alice	6.7.8.9	10:01
4	login_fail	bob	1.2.3.4	10:01
5	login_fail	alice	1.2.3.4	10:03

For the above statement, five alert notifications are generated.

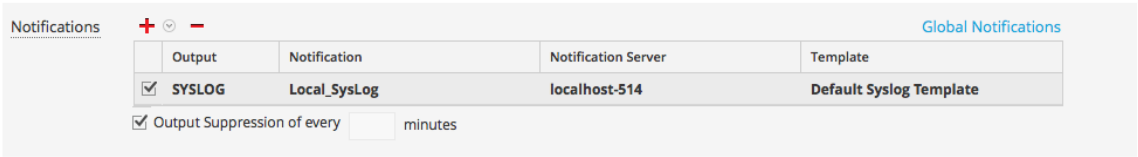
However, suppose you wanted to modify the statement to generate one alert for each separate username. You can use the *identifier* attribute. For example, the statement *@RSAAlert(identifier={"username"}) SELECT* FROM Event(msg_id="login_fail")* generates one notification for the first alert for "bob" and one for the first alert for "alice." Subsequent alerts for "bob" and "alice" are ignored.

You can further distinguish the users by adding details via the identifier variable. For example, you can distinguish by user and IP address using the following statement: *@RSAAlert(identifier={"username", "src_ip"}) SELECT* FROM Event(msg_id="login_fail")*. Then, you would see notifications generated by user name and IP address (one alert for "alice" at 1.2.3.4, another alert for "alice" at 6.7.8.9, and an alert for "bob" at 1.2.3.4).

To use identifiers with Alert Notification Suppression:

The @RSAAlert annotation is designed to work with the alert notification suppression feature in the Rule Builder user interface. To do this:

1. Create a rule in the Rule Builder user interface, and select the alert suppression feature when configuring notifications.



2. Copy the code from the Rule Builder rule into a new advanced rule.
3. Configure the advanced rule to include identifiers (as described above) and save the advanced rule.
4. Delete the original rule builder rule.

@RSAPersist Annotation

The @RSAPersist annotation is used to mark a named window as an ESA managed window for persistence. By marking the named window as an ESA managed window, ESA periodically writes the contents of the window to disk and restores them back if the window is un-deployed and re-deployed. The systems take a snapshot just before the module is un-deployed and the window is removed. Conversely, it restores the window contents from the snapshot just after the module is re-deployed. This ensures that the contents of the window are not lost if the module state is altered or if the ESA service goes down.

For example, consider a named window, `DHCPTracker` that holds a mapping from IP addresses to each assigned hostname.You can annotate the statement with the @RSAPersist annotation as:

```
@RSAPersist
 create window DHCPTracker.std:unique(ip_src) as (ip_src string, alias_
host string);
 insert into DHCPTracker select IP as ip_src, HostName as alias_host from
DHCPAssignment(ID=32);
```

Note: All windows definitions are not suitable for persistence. `@RSAPersist` annotation must be used with care. If the window has timed-records or if it depends on time based constraints it is very likely that the reverted snapshots will not restore it to the correct state. Also, any changes to the window definition will invalidate the snapshots and reset the window to a blank state. The system does not do any semantic analysis to determine if the changes to the window definition are conflicting or not. Note that other parts of a module (that is, other than the particular CREATE WINDOW call that defines the window) may change, without invalidating the snapshots.

@UsesEnrichment (10.6.1.1 and later)

The @UsesEnrichment can be used in advanced EPL rules to reference enrichments. In order to synchronize enrichments with ESA, all enrichment dependencies in EPL rules must be referenced with the @UsesEnrichment annotation.

The @UsesEnrichment annotation uses the following format:

```
@UsesEnrichment(name= '<enrichment_name>')
```

For example, the following EPL references a whitelist enrichment:

```
@UsesEnrichment(name = 'Whitelist')

@RSAAlert

SELECT * FROM Event(ip_src NOT IN (SELECT ip_address FROM Whitelist))
```

@Name

The @Name is the statement name defined in ESA advanced rules. It is used to dynamically generate statement names in ESA alerts. The statement name of only an alert triggering statement is displayed. This annotation has meta keys enclosed in curly brackets.

The @Name annotation uses the following format:

```
@Name("<static_part_of_statement_name> {meta_key1} {meta_key2}…")
```

For example, the following EPL references meta keys *ip_src* and *user_name* whose values will be dynamically generated.

@Name("Login Event to {ip_src} by {user_name}")

Note: You can specify any number of meta keys in the statement for dynamic statement name generation.
The length of individual meta key is limited to 64, after which the value is truncated and appended with "…".
The length of the dynamic generation of statement name is limited to 128, after which the value is truncated to 128 and appended with "…". All the remaining values post truncation will be treated as static values.

Sample Advanced EPL Rules

Following are the examples of Advanced ESA rules. Each example has multiple ways of implementing the same use-case.

Example #1:

Create an user account and delete the same user account in 300s. User information is stored in user_src meta.

EPL #1:

Rule Name	CreateuseraccountFollowedbyDeletionof Useraccount1
Rule Description	Create a user account followed by an action to delete the same user account in 300 seconds.

Rule Code	`SELECT * FROM Event(ec_subject='User'`
	`  AND ec_outcome='Success'`
	`  AND user_src is NOT NULL`
	`  AND ec_activity IN ('Create', 'Delete')`
	`  ).win:time(300 seconds)`
	`match_recognize (partition by user_src`
	`   measures C as c, D as d`
	`   pattern (C D)`
	`  define`
	`   C as C.ec_activity='Create' ,`
	`   D as D.ec_activity='Delete');`

Note	• Filter events needed for pattern in given time frame. Filter conditions should be such that only required events are passed to match recognize function. In this case, they are create and delete user account Events. That is, Event(ec_subject='User' AND ec_outcome='Success' AND user_src is NOT NULL AND ec_activity IN ('Create',

	'Delete') • Partition by creates buckets. In this case, esper creates buckets per value of user_src. And hence value of user_src is common between both events. • Define pattern you want. Right now it is set to Create Followed by Delete. You can do multiple creates followed by delete (C+ D). Pattern is very similar to regular expression. • Most efficient use case.

EPL #2:

Rule Name	CreateuseraccountFollowedbyDeletionof Useraccount2
Rule Description	Create a user account followed by an action to delete the same user account in 300 seconds.

Rule Code	`SELECT * from pattern[every (a= Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create'))`
	`->`
	`( Event(ec_subject='User' AND ec_outcome='Success' AND user_dst is NOT NULL AND ec_activity IN ('Create') AND user_src = a.user_src)`
	`) )where timer:within(300 Sec) ];`

Note	• Lets say same user is created twice and deleted once in that order. Then the above pattern will fire 2 alerts. • A thread is created for every User creation. • There is no way to control threads. It is important to have time bonds and preferably small intervals.

Example #2:

Detect pattern where user created followed by login by same user and user is deleted in end. In case of windows logs user info is stored in either user_dst or user_src depending on event.

user_src(create) = user_dst(Login) = user_src(Delete)

EPL #3:

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.

Rule Code	`SELECT * FROM Event(ec_subject='User'`
	`and ec_activity in ('Create','Logon','Delete')`
	`and ec_theme in ('UserGroup', 'Authentication')`
	`and ec_outcome='Success'`
	`).win:time(300 seconds)`
	`match_recognize (measures C as c, L as l, D as d`
	`pattern (C L D)`
	`define`
	`C as C.ec_activity = 'Create',`
	`L as L.ec_activity = 'Logon' AND L.user_dst = C.user_src,`
	`D as D.ec_activity = 'Delete' AND D.user_src = C.user_src`
	`);`

Note	• Since user_src/user_dst is not common across all events we can't use partition. It will be 1 single bucket running 1 pattern at a time. For example, for user 1 and 2 if the stream of events are C1C2L1D1, C1L1C2D1, there will be no alert because C1 thread got reset by C2. Alert will be fired only if C1L1D1 are in order and no other event either from same user or other user falls in between. • Another solution would be to use Named Window and merge user_dst and user_src into single column and then run match recognize. (EPL #3). • Pattern can also be used. You might get more alerts than expected. (EPL #4).

EPL #4: Using NamedWindows and match recognize

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.
Rule Code	`@Name('NormalizedWindow') create window FilteredEvents.win:time (300 sec) (user String, ecactivity string, sessionid Long);` `@Name('UsersrcEvents') Insert into FilteredEvents select user_src as user, ec_activity as ecactivity, sessionid from Event ( ec_subject='User' and ec_activity in ('Create','Delete') and ec_theme in ('UserGroup', 'Authentication') and ec_outcome='Success' and user_src is not null );`

```
@Name('UsrdstEvents')  Insert into FilteredEvents  select user_
dst as user, ec_activity

as ecactivity, sessionid from Event(  ec_subject='User' and ec_
activity in (Logon') and ec_theme in ('UserGroup',
'Authentication') and ec_outcome='Success' and user_dst is not
null  );

@Name('Pattern')

@RSAAlert(oneInSeconds=0, identifiers={"user"})

select * from FilteredEvents
    match_recognize (
  partition by user
  measures C as c, L as l, D as d
  pattern (C L+D)
   define  C as C.ecactivity= 'Create',
    L as L.ecactivity= 'Logon',
   D as D.ecactivity='Delete'
  );
```

EPL #5: Using Every @RSAAlert(oneInSeconds=0, identifiers={"user_src"})

SELECT a.time as time,a.ip_src as ip_src,a.user_dst as user_dst,a.ip_dst as ip_dst,a.alias_host as alias_host from pattern[every (a=Event (`ec_subject`='User' and `ec_activity`='Create' and `ec_theme`='UserGroup' and `ec_outcome`='Success') -> (Event(`ec_subject`='User' and `ec_activity`='Logon' and `ec_theme`='Authentication' and `user_src`=a.user_dst) -> b=Event(`ec_subject`='User' and `ec_activity`='Delete' and `ec_theme`='UserGroup' and `user_dst`=a.user_dst))) where timer:within(300 sec)];

Rule Name	CreateUserLoginandDeleteUser
Rule Description	Detect a pattern where a user creates a User account followed by login by the same user followed by deletion of the User account.

Example #3:

Excessive login failures from same sourceIP

EPL #6: @RSAAlert(oneInSeconds=0, identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule Description	The same user tried logging in from the same Source IP and faced login failures
Rule Code	`SELECT * FROM`

```
  Event(
   ip_src IS NOT NULL AND ec_activity='Logon' AND ec_
outcome = 'Failure' ).std:groupwin(ip_src).win:time_
length_batch(300 sec, 10) GROUP BY ip_src HAVING COUNT(*)
= 10;
```

Note

- Creates window per ip_src
- Uses time_length_batch: Looks at events in batches(tumbling window). Every event will be part of only 1 window. Window releases events either when time elapses or count is reached.
- One of issues with tumbling windows that events occurring towards end of batch might not lead to an alert.

In below sequence of events at t=301 even though 10 login failures occurred for same login in last 300 secs there will be no alert because batch of events was dropped at t=300

Time t	Login Failures for Specific Users	Alert	Time Batch
0	0	0	1
295	6	0	1
299	3	0	1
301	1	0	2
420	6	0	2
550	3	0	2
600	0	0	3
720	6	0	3
850	3	0	3
900	1	1	3 ends and 4 begins

- Above problem can be resolved using win:time windows (EPL#7)instead of win:time_length_batch windows.
- Outer group by is to control events when time elapses. Say you have 9 events at end of 60 secs, esper engine will push those 9 events to listener. Group by and count will restrict it since count is not equal to 10.
- Time and count can be modified as needed.

EPL #7: @RSAAlert(oneInSeconds=0, identifiers={"ip_src"})

Rule Name	ExcessLoginFailure
Rule Description	The same user tried logging in from the same Source IP and faced login failures
Rule Code	`SELECT * FROM Event( ip_src IS NOT NULL AND ec_activity=’Logon’ AND ec_outcome = ‘Failure’ ).std:groupwin(ip_src).win:time (300 sec) GROUP BY ip_src HAVING COUNT(*) = 10`
Note	• This is sliding window and hence once alert is fired for a set of events they can be used for another alert as well till time has passed. • If 10 events were involved in causing alert only last event will appear • If < or > are used then you might see more than 1 alert. You should use alert suppression accordingly.

Example #4:

Multiple failed logins from multiple different users from same source to same destination, a single user from multiple different sources to same destination.

EPL #8: using groupwin , time_length_batch and unique

Rule Name	MultiplefailedLogins
Rule Description	There are multiple failed logins for the following cases: - From multiple users from same source to same destination. - Single user from multiple sources to the same destination.
Rule Code	`SELECT * FROM Event( ec_activity='Logon' AND ec_outcome='Failure' AND ip_src IS NOT NULL AND ip_dst IS NOT NULL AND user_dst IS NOT NULL ).std:groupwin(ip_src,ip_dst).win:time_length_batch(300 seconds, 5}).std:unique(user_dst) group by ip_src,ip_dst having count(*) = 5;`
Note	• ip.dst and ip.src are common across all events. • user_dst is unique for all events. • Alert is fired when there are atleast 5 different users try to login from same ip.src

	and ip.dst combination.

Example #5:

No Log traffic from a device in a given timeframe.

EPL #9: using groupwin , time_length_batch and unique

Rule Name	NoLogTraffic
Rule Description	There is no log traffic observed from a device in a given time frame.
Rule Code	`SELECT * FROM pattern [every a = Event(device_ip IN ('10.0.0.0','10.0.0.1') AND medium = 32) -> (timer:interval (3600 seconds) AND NOT Event(device_ip = a.device_ip AND device_type = a.device_type AND medium = 32))];`
Note	• Rule only detects sudden loss of traffic. It won't alert if there is no traffic to begin with. You need at least 1 event for rule to alert. • List of device ip address or device hostnames as input. Only these systems will be tracked. • Time input is required. Alert is fired when time interval between events exceeds input time.

Example #6:

Multiple Failed Logins NOT followed by a Lockout event by the same user.

EPL #10: using groupwin , time_length_batch and unique

Rule Name	FailedloginswoLockout
Rule Description	There are multiple failed logins that are not followed by Lockout event by the same user.
Rule Code	`SELECT * FROM pattern [every-distinct(a.user_dst, a.device_ip, 1 msec) (a= Event(ec_activity='Logon' and ec_outcome='Failure' and user_dst IS NOT NULL) -> [2]( Event ( device_ip =a.device_ip and ec_activity='Logon' and ec_outcome='Failure' and user_dst=a.user_dst)` `AND NOT Event( ( ec_activity='Logon' and ec_outcome='Success' and device_ip = a.device_ip and user_`

	dst=a.user_dst) or (ec_activity='Lockout' and device_ip = a.device_ip and user_dst=a.user_dst)))) where timer:within(60 seconds) -> (timer:interval(30 seconds) and not Event(device_ip=a.device_ip and user_dst=a.user_dst and ec_activity='Lockout'))];
Note	• Above query detects the absence of a Lockout Event after the occurrence of 2 failed logins from same user. • The occurrence of the multiple failed logins are timed and are assumed to occur within a certain period of time. Also, in-practice the Lockout event is assumed to occur within a short time after the occurrence of the last failed login event because the threshold value of Failed logins per user is set in a given domain. • In current query, every distinct will suppress new thread for combination of user and device for 1 millisec. • Time allowed for 3 failed logins is 60 secs since 1st failed attempt. Wait period for lockout event to occur is 30 secs

Example #7:

Custom functions to perform LIKE and REGEX operations for ARRAY elements.

EPL #11: @RSAAlert(oneInSeconds=0)

Rule Name	MatchLikeRegex
Rule Description	There are custom functions to perform LIKE and REGEX comparisons of array meta keys.
Rule Code	SELECT * FROM pattern[e1=Event(matchLike(alias_host, "10.0.0.%")) AND e2=Event(matchRegex(alias_host, "10\.0\.0\.1[0-9][0-9]")) where timer:within(5 Minutes)];

Note:
1. “.” in meta keys should be replaced with (”_”).
2. All patterns should be time bound.
3. Use of appropriate tags in front of statements
 a) @RSAPersist:
 b) @RSAAlert:

For additional details you can refer to:

- EPL Documentation: http://www.espertech.com/esper/esper-documentation/
- EPL Online Tool: http://esper-epl-tryout.appspot.com/epltryout/mainform.html

Working with Rules

This topic discusses additional procedures you can perform on rules. You may want to perform any of the following procedures:

- Edit, Duplicate or Delete a Rule
- Filter or Search for Rules
- Import or Export Rules

Edit, Duplicate or Delete a Rule

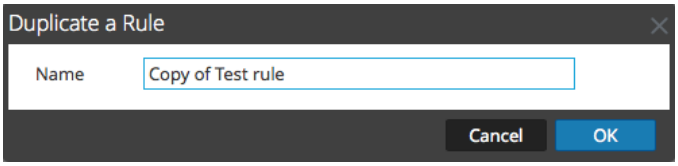
This topic provides instructions to edit, duplicate, or delete an Event Stream Analysis (ESA) rule. When you edit a rule, ESA applies the updated criteria going forward. No changes are made to previously generated alerts.

Edit a Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the **Rule Library**, select the rule you want to edit and click  .
   Depending on the rule type, the respective rule tab is displayed.
3. Modify the required parameters.
4. Click **Save**.

Duplicate a Rule

1. In the **Rule Library**, select the rule you want to duplicate and click  .
2. The Duplicate a Rule dialog is displayed. The system adds **Copy of** in front of the rule name.

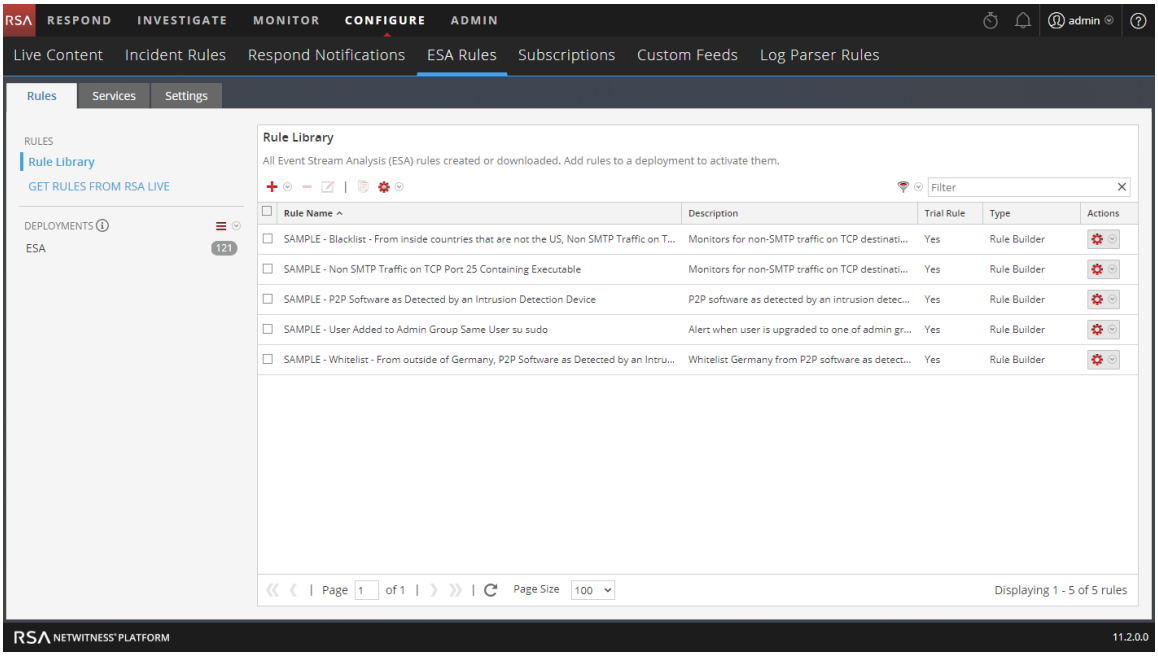


3. In the **Name** field, type a unique name for the duplicate rule and click **OK**.

A duplicate rule with the new name is added to the Rule Library.

Delete a Rule

1. Go to **CONFIGURE > ESA Rules > Rules**.
   The Rules tab is displayed.



2. In the Rule Library, select one or more rules and click .
   A warning dialog is displayed.
3. Click **Yes**.
   A confirmation message that the rule is deleted successfully is displayed and the selected rule is deleted from the Rule Library.

Filter or Search for Rules

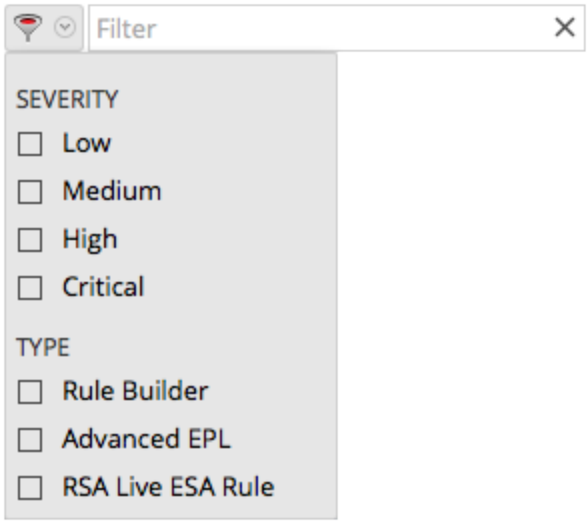
This topic shows analysts how to specify the type of rules that display in the Rule Library.

Prerequisites

Make sure that you understand the Rule Library view components. For more information, see Rule Library Panel.

Filter Rules

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library** panel toolbar, click and select the severity and type of rules that you would like to appear in the Rule Library list. The following figure shows the Filter drop-down list.



The selected rule types appear in the list.

Search for Rules

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed by default.
2. In the **Rule Library** panel toolbar, type a rule name in the Filter field.
   The Rule Library panel lists the rules that match the names entered in the Filter field.

Import or Export Rules

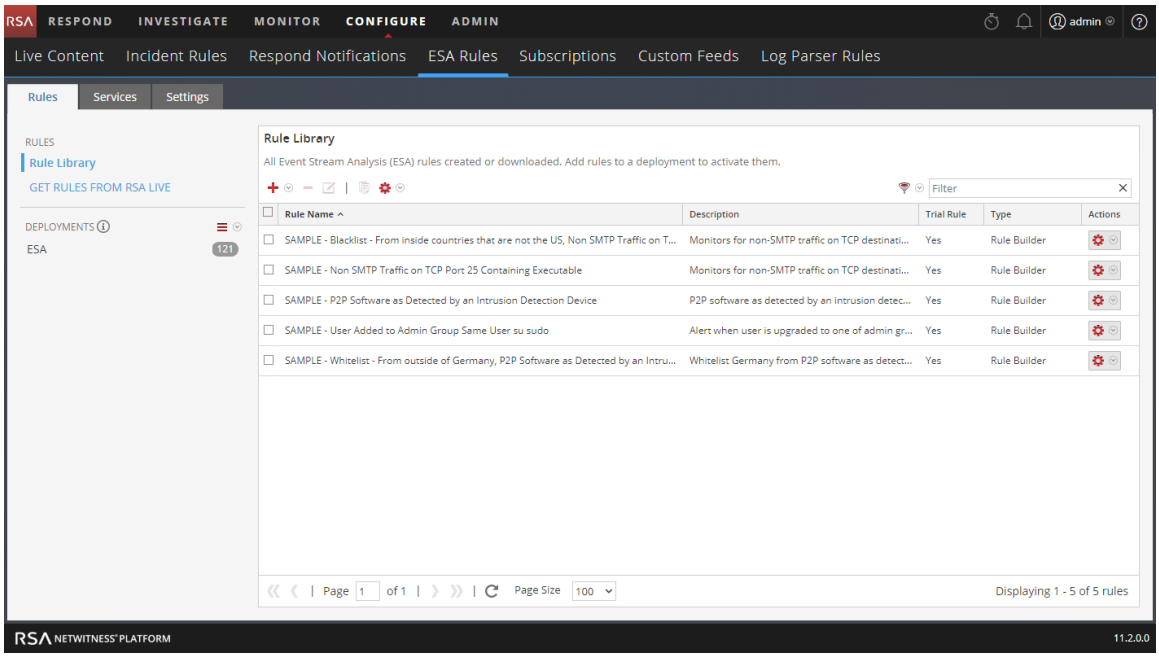
The topic provides instructions to import ESA rules from a NetWitness Platform instance and to export ESA rules to your hard drive so you can keep a local copy.

If you exported a rule in an earlier version of NetWitness Platform, the following conditions apply when you import the rule in version 10.5 or later:

- Exported in version 10.3 – You cannot import rules to version 10.5 or later.
- Exported in version 10.4 – You can import rules to version 10.5 or later.

Import ESA Rules

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.



2. In the **Rules Library** toolbar, select > **Import**.
   The Import ESA Rules dialog is displayed.

3. Click **Browse** to browse and select the file containing the ESA rules.
4. Click **Import**.

Export ESA Rules

1. Select an ESA rule or multiple rules and select > **Export** in the Rule Library toolbar.
   A warning dialog is displayed.
2. Click **Yes**.
   The Export Rules dialog is displayed.
3. In the **Enter File Name** field, type a filename for the file with the ESA rules and click **Export**.
   The file is exported as a binary file to your machine.

Note: The binary file cannot be edited.

Choose How to be Notified of Alerts

This topic explains the different notification methods and how to add a notification method to a rule. Administrator, SOC Manager or DPO role permissions are required for all tasks in this section.

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- SNMP
- Syslog
- Script

To configure a notification, you configure these components:

- Notification server – After you configure a notification server, you can add it to a rule. When the rule triggers an alert, the rule will use that server to send alert notifications.
- Notifications – These are the outputs, which can be email, script, SNMP, and Syslog. When you design a rule, you can specify the notification for an alert.
- Templates – The format of an alert notification is defined in a template.

Alert suppression and alert rate regulation are two features that Event Stream Analysis provides. Alert suppression ensures that multiple emails are not sent out for the same alert. For example, consider a rule to detect failed user logins. If you set the alert suppression to three minutes, you will see only the alerts generated in that time frame. This is fewer than the number of alerts you would see without alert suppression. Some alerts can be duplicates. With alert suppression, emails are not sent for duplicate alerts. This ensures the inbox is not flooded with redundant alert notifications.

Alert rate regulation is a preventive measure to ensure that alerts from misconstrued rules do not flood the system. This ensures that ESA does not send more than the configured limit of emails within one minute.

Notification servers, notifications, and templates are configured in the Administration System view. For more information, see "Configure Notification Servers", "Configure Notification Outputs", and "Configure Templates for Notifications" in the *System Configuration Guide*.

Notification Methods

When a rule triggers an alert, ESA can send a notification in the following ways:

- Email
- SNMP

- Syslog
- Script

Email Notifications

Event Stream Analysis can send notifications to users through email about various system events.

To configure these email notifications, you need to:

- Configure the SMTP email server as an output provider. For instructions, see "Configure the Email Settings as Notification Server" in the *System Configuration Guide*.
- Set up an email account to receive notifications. For instructions, see "Configure Email as a Notification" in the *System Configuration Guide*.
- Configure a template for email notification. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

SNMP

Event Stream Analysis can send events as an SNMP trap to a configured SNMP trap host.

Note:
The MIB file **NETWITNESS-MIB.txt** is located on the ESA RPM at the following location */usr/share/snmp/mibs*. With the MIB file, you will be able to identify the SNMP alerts trigerred from ESA. And, the Trap OID value for ESA is 20.

To configure these SNMP notifications, you need to:

- Configure SNMP trap host settings as an output provider. For instructions, see "Configure the SNMP Settings as Notification Server" in the *System Configuration Guide*.
- Configure SNMP trap settings as an output action. For instructions, see "Configure SNMP as a Notification" in the *System Configuration Guide*.
- Configure a template for SNMP. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Syslog

Event Stream Analysis can send events and consolidate logs in Syslog format to a Syslog server.

To configure these Syslog notifications, you need to:

- Configure Syslog server settings as an output provider. For instructions, see "Configure a Syslog Notification Server" in the *System Configuration Guide*.

- Configure Syslog message format as an output action. For instructions, see "Configure Syslog as a Notification" in the *System Configuration Guide*.
- Configure a template for Syslog. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Script Alerter

Apart from the alert notifications ESA allows users to run scripts in response to ESA alerts.

Scripts enable you to do custom integration with applications that exist in your environment. For example, if you want to open an incident ticket from an application when a specific alert is triggered, Script Alerter lets you write a script that calls the application API and has ESA invoke it when the specific ESA rule is triggered. You can configure a FreeMarker template to define what details you want to extract from the output of the ESA rule and pass it as command line arguments to the script.

To use the Script Alert, you need to:

- Configure the user identity and other details that are required to execute the script. For instructions, see "Configure Script as a Notification Server" in the *System Configuration Guide*.
- Define the Script. For instructions, see "Configure Script as a Notification" in the *System Configuration Guide*.
- Configure a template for the script. For instructions, see "Configure Global Notifications Templates" in the *System Configuration Guide*.

Add Notification Method to a Rule

This topic tells administrators how to add a notification, such as email, to a rule. ESA uses the notification method when it generates an alert for an event that meets rule criteria.

You add a notification to a rule so ESA can let you know when a rule triggers an alert. Although the notification fields are not required, it is a best practice to add a notification to a rule.

When you add a notification method to a rule, you select the following information:

- Output
- Notification
- Notification Server
- Template

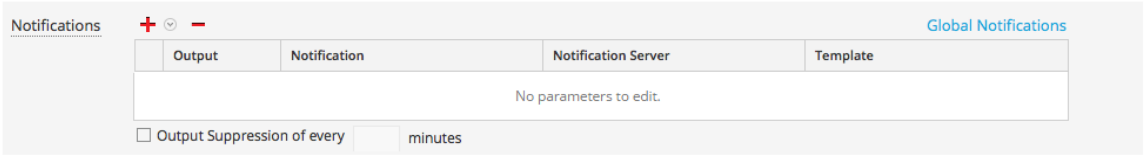
Prerequisites

- Your role must have permission to manage rules.
- The rule must exist.
- The notification method must be configured with a supported server and template:
  Go to **ADMIN** > **System > Global Notifications**.

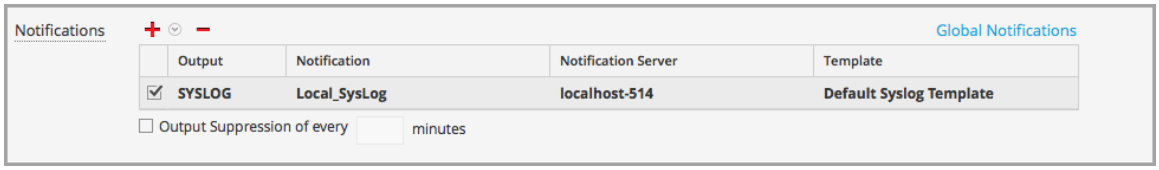
  For detailed procedures, see the *System Configuration Guide*.

Add a Notification Method to a Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
2. In the **Rule Library**, click  to add a new rule or select an existing rule and click  .
   Depending on the rule type, the Rule Builder or Advanced EPL tab is displayed.
   The Notifications section is the same for both tabs.



3. Click  and select the **Output** for the alert:
   - Email
   - SNMP
   - Syslog
   - Script
4. Double-click the **Notification** field and select the name of a previously configured output.
   For example, Level 1 Analyst could be the name of an email notification that goes to the L1-Analysts email distribution group.
5. Double-click the **Notification Server** field and select the server that sends the notification.
6. Double-click the **Template** field and select a format for the alert.
   The following figure shows the settings for a Syslog notification.

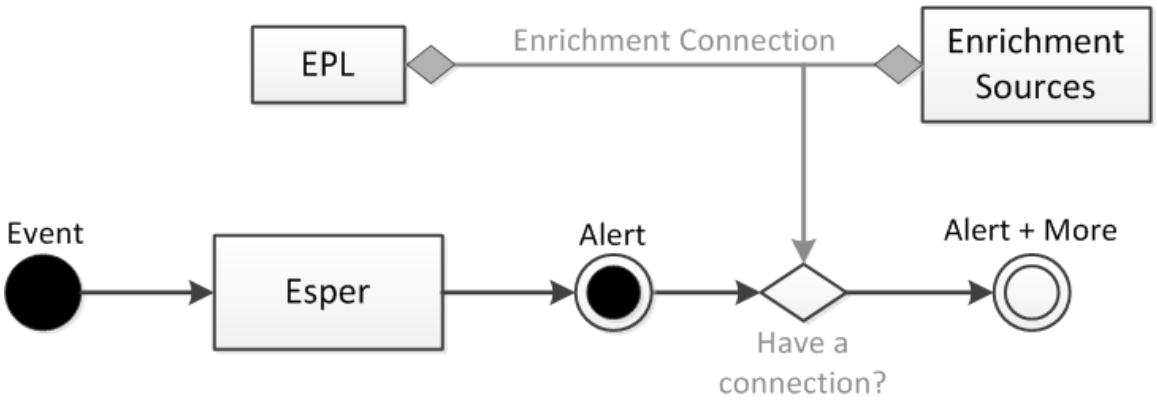


7. If you want to specify frequency, select **Output Suppression**, then enter the number of **minutes**.
8. If you want to add another notification, repeat steps 3-7.
9. Click **Save**.
   When ESA generates an alert for an event that matches the rule criteria, you will be notified of the alert via each notification method added to the rule.

Add a Data Enrichment Source

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Enrichments provide the ability to include contextual information into correlation logic and alert output. Without enrichments, all information included in an ESA alert is from a Core service. With enrichments, you can request for look ups into a variety of sources and include the results into the outgoing alerts. The following figure illustrates the enrichment feature.



Enrichment configuration is made up of two logical units:

- Enrichment Sources – These are data stores of contextual information.
- Enrichment Connections – These act as connectors between alert meta and source columns.

ESA allows you to make connections between Event Processing Language (EPL) statements and enrichment sources. Once the connections are established, the system joins the selected fields from the alert output with the information in the sources and uses the matching data to enrich the alert that is sent out. ESA can connect with the following sources:

- Esper Named Windows
- Relational Database tables
- MaxMindGeoIP Database
- RSA Warehouse Analytics Watchlists

Note: The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

Sample Rule with Enrichment

The following sample rule illustrates the enrichment feature provided by ESA:

```
@RSAAlert @Name("simple") SELECT * FROM CoreEvent(ec_theme='Login Failure')
```

The rule generates an alert for every logon failure and thus if the following (simplified) event stream is received at ESA:

sessionid	ec_theme	username	ip_src	ip_dst	host_dst
1	Login Success	dshrute	23.xx.23x.16		
2	Login Failure	jhalpert	23.xx.23x.16	31.1x.x9.1x8	www.facebook.com

An alert with the following constituent `events` might be generated in response to the second session:

```
{
     "events": [
         {
             "username": "jhalpert",
             "host_dst": "www.facebook.com",
             "ip_dst": "31.1x.x9.1x8",
             "sessionid": 2,
             "ec_theme": "Login Failure",
             "esa_time": 1406148964130,
             "ip_src": "23.xx.23x.16"
         }
     ]
 }
```

The JSON output shows all the information available for inclusion into an ESA notification using an appropriate FreeMarker template. For instance, the template expression `${events[0].username}` would evalute to `jhalpert`.

With enrichments, the same module, with the same event stream, can generate the alert shown below. The system can make multiple enrichment connections and pull contextual data to make the alert more meaningful.

For example:
`${events[0]["RSADataScienceLookup"][0].score}` gives the **"risk"** score of the destination domain computed by the RSA Warehouse Analytics module while `${events[0]["orgchart"][0].supervisor}` gives the name of the supervisor of the employee that the alert pertains to (pulled from an HR database) and `${events[0]["LoginRegister"][0].username}` gives the name of the user with the last successful logon from the same `ip_src` (using a stream based Named Window).

```
{"events": [
     {
         "username": "jhalpert",
         "host_dst": "www.facebook.com",
         "GeoIpLookup": [
         {
             "city": "Cambridge",
             "longitude": -71,
             "countryCode": "US",
             "areaCode": 617,
             "metroCode": 506,
             "region": "MA",
             "dmaCode": 506,
             "ipv4Obj": "/23.62.236.16",
             "countryName": "United States",
             "postalCode": "02142",
             "ipv4": "23.62.236.16",
             "latitude": 42,
             "organization": "Verizon Business"
         }
     ],
     "RSADataScienceLookup": [
         {

Configure a Database Connection

This topic provides information to configure a connection to an external database that can provide additional information in alerts. You configure a database connection so you can then configure the database as an enrichment source, to add further details to alerts. There are three steps in the process:

1. Configure a connection to a database.
2. Configure the external database as an enrichment source.
3. Add the enrichment source to a rule

This topic explains Step 1.

Example

This example illustrates how adding a database as an enrichment source adds value to alerts.

A rule detects users that attempt to sign up for a stealth email service. Twenty-five users match the rule criteria. Without the enrichment, the alert contains 25 User IDs. With the enrichment, the alert also includes the following information for each User ID:

- Name
- Title
- Department
- Office Location

Dependencies

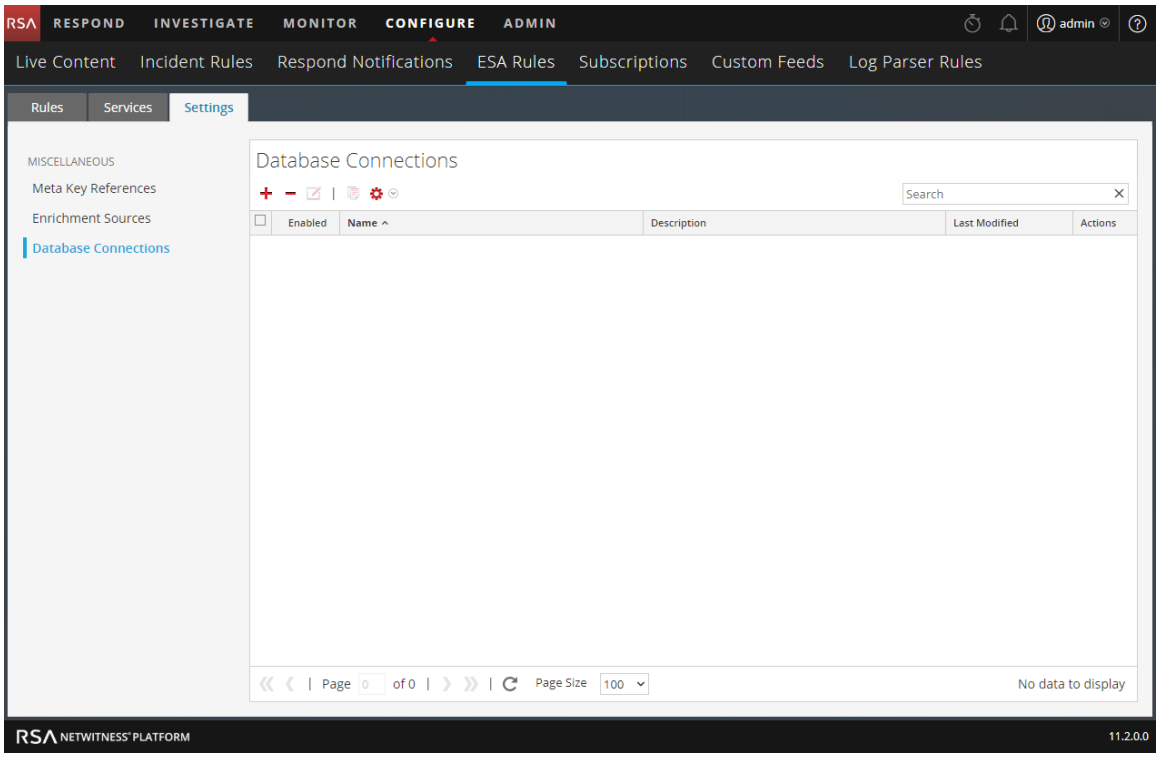
When you configure a database, the following conditions apply:

- A reference to the database is deployed on every ESA, even if the ESA does not deploy rules that use the database as an enrichment source.
- If the server that hosts the database goes down, it impacts a deployment.
  - An active deployment will continue to gather data and run rules but enrichments will not appear in alerts.
  - A new deployment will fail until you restart the host.

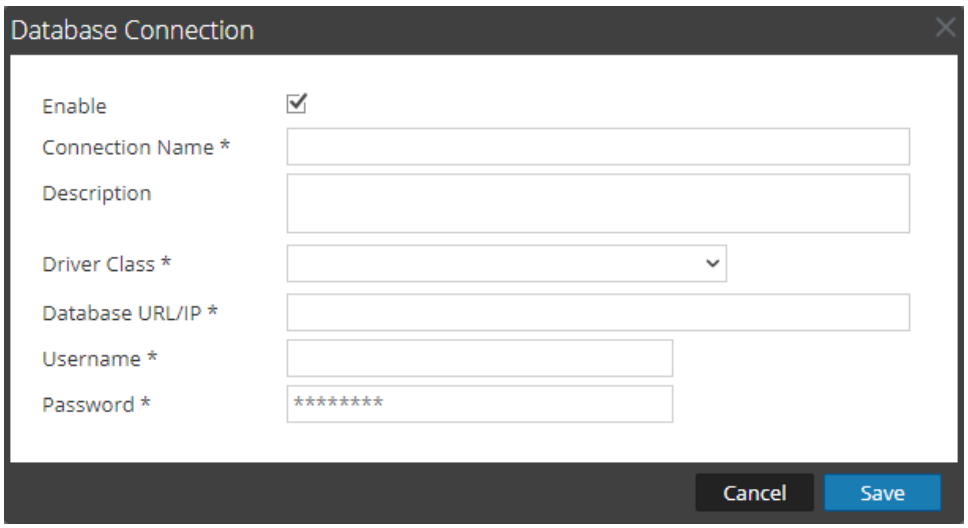
Configure a Database Connection

1. Go to **CONFIGURE > ESA Rules**.
2. Click the **Settings** tab.
3. In the options panel, select **Database Connections**.

   The Database Connections panel is displayed.



4. Click + to add a database connection.



5. In the **Database Connection** dialog, provide the following information.

Field	Description
Enable	Select Enable to enrich the alert with additional data. By default, Enable is selected. Deselect Enable to exclude additional data from the alert.
Connection Name	Type a name to identify the connection. When you add a database as an enrichment source, this name appears in the list of Database Connections.
Description	(Optional) Type a brief description about the database connection.
Driver Class	Select an appropriate driver class for the database. Two drivers come with NetWitness Platform, MongoDB and Postgres.
Database URL or IP address	Type the URL or the IP address of the database to configure.
Username	Type the username to access the Database.
Password	Type the password to access the Database.

6. Click **Save**.

For related information, see Settings Tab.

Enrichment Sources

This topic explains options for adding an external data source to provide additional information in alerts. Enrichment sources provide additional information in alerts. For example, an in-memory table can provide a full name, title, office location, and employee number if a user matches rule criteria. The following types of enrichment sources are available:

- External DB Reference
- In-Memory Table
- Warehouse Analytics
- Context Hub List
- GeoIP

Note: The geoIP enrichment source can neither be created nor deleted. It is provided out of the box to the user.

Configure a Database as Enrichment Source

You can configure a database as an enrichment source so you can add it to a rule. Then the Esper engine that analyzes events can access the information in the database to provide additional information in the alert.

For example, a rule detects users that attempt to sign up for a stealth email service. Twenty-five users match the rule criteria. The alert contains 25 User IDs. An external database would enhance the alert by providing the following additional information for each User ID:

- Name
- Title
- Department
- Office Location
- Reports To

You can edit, duplicate, import or export a database connection.

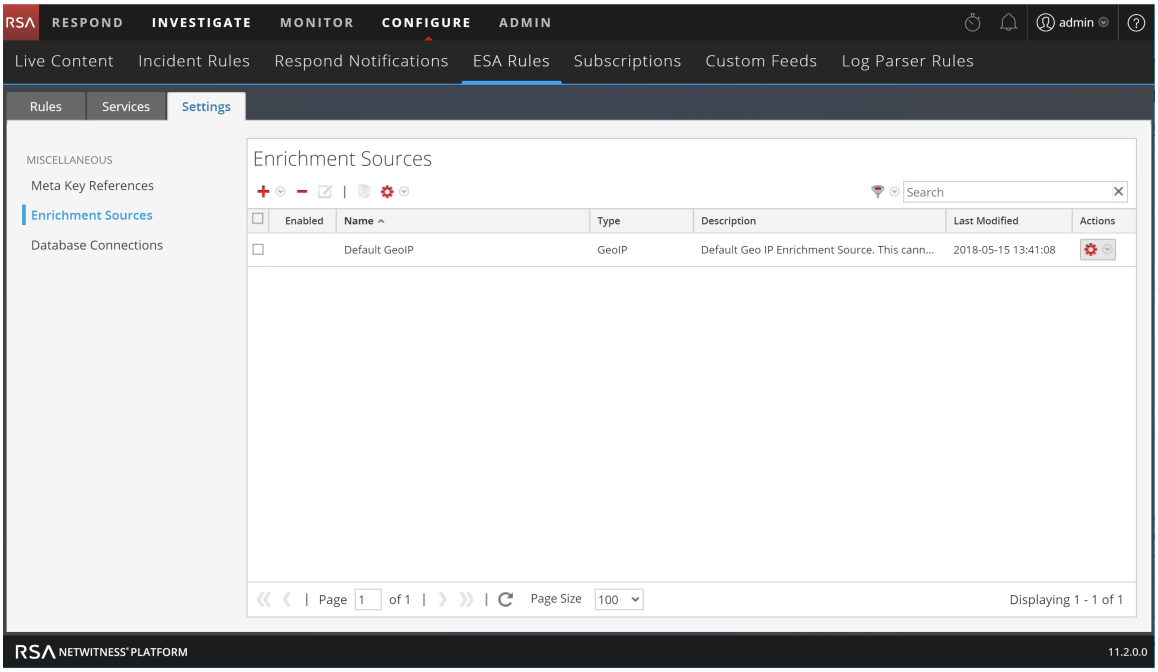
Prerequisites

You must configure a database connection. For more information, see Configure a Database Connection.

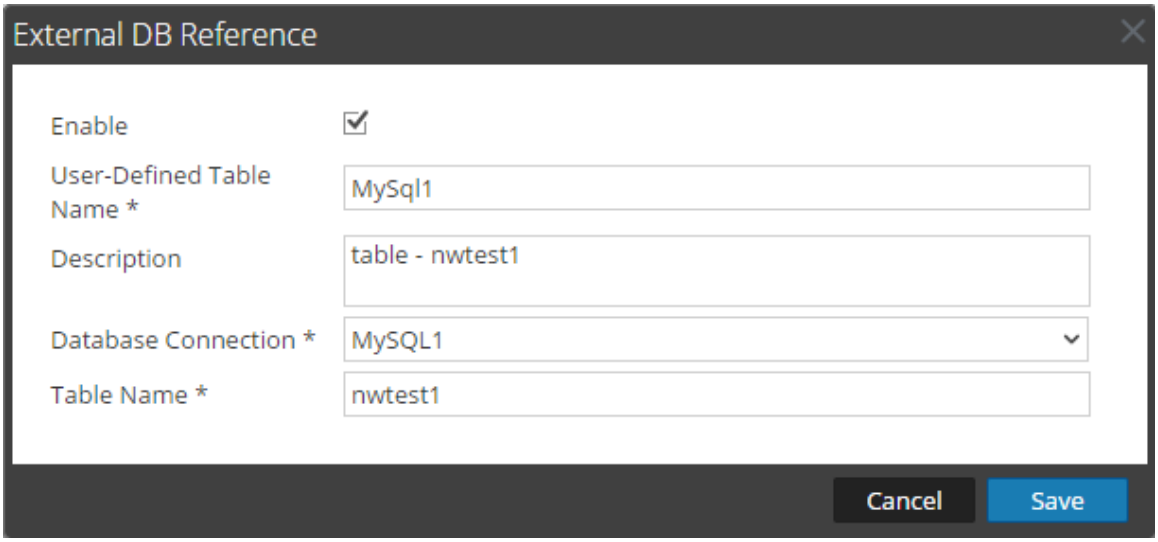
Configure a Database as an Enrichment Source

1. Go to **CONFIGURE > ESA Rules**.
2. Click the **Settings** tab.
   The Settings tab is displayed.

3. In the options panel, select **Enrichment Sources**.
   The Enrichment Sources panel is displayed.



4. From the  drop-down menu, select **External DB Reference**. You have to add a DB reference in order for the DB to be listed.
   The External DB Reference dialog is displayed.



5. Select **Enable** to enrich alert with additional data. This is selected by default. If disabled, the alert will not be enriched with additional data.
6. In the **User-Defined Table Name** field, type a name to identify or label the database configuration.

7. In the **Description** field, type a brief description about the database configuration.
8. In the **Database Connection** drop-down menu, select the database connections defined.
9. In the **Table Name** field, enter database table name.
10. Click **Save**.

For details on parameters and their descriptions, see Settings Tab.

Configure In-Memory Table as an Enrichment Source

This topic provides instructions on how to configure an in-memory table. When you configure an in-memory table, you upload a .CSV file as an input to the table. You can associate this table with a rule as an enrichment source. When the associated rule generates an alert, ESA will enrich the alert with relevant information from the in-memory table.

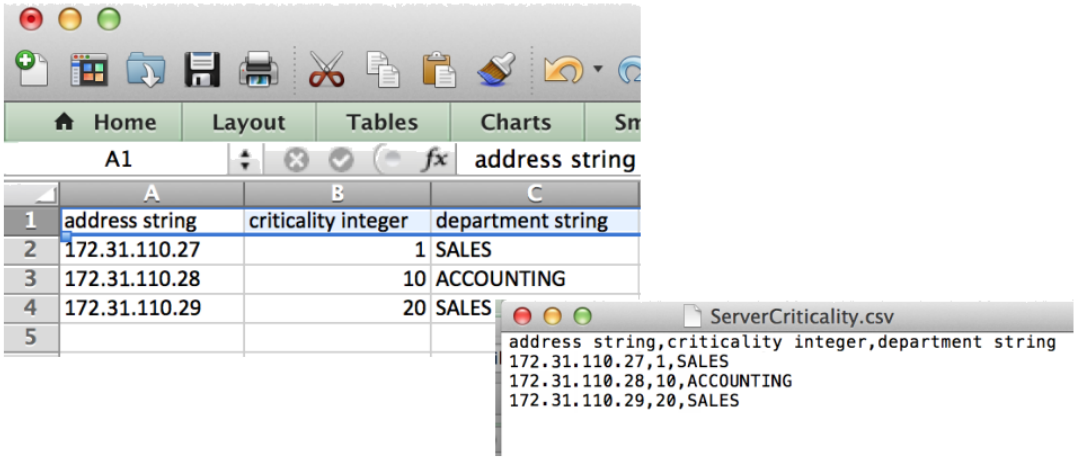
For example, a rule could be configured to detect when a user tries to download freeware and to identify the person by user ID in the alert. The alert could be enriched with additional information from an in-memory table that contains details such as full name, title, office location and employee number.

An in-memory table is ideal for handling lightweight data. It is easy to set up and requires less maintenance than a database. For example, the AllTech Company is a small organization so the system administrator can maintain employee information in a .CSV file. If AllTech grows into a very large company, the administrator would have to configure an external database reference as an enrichment and associate the database with a rule.

Prerequisites

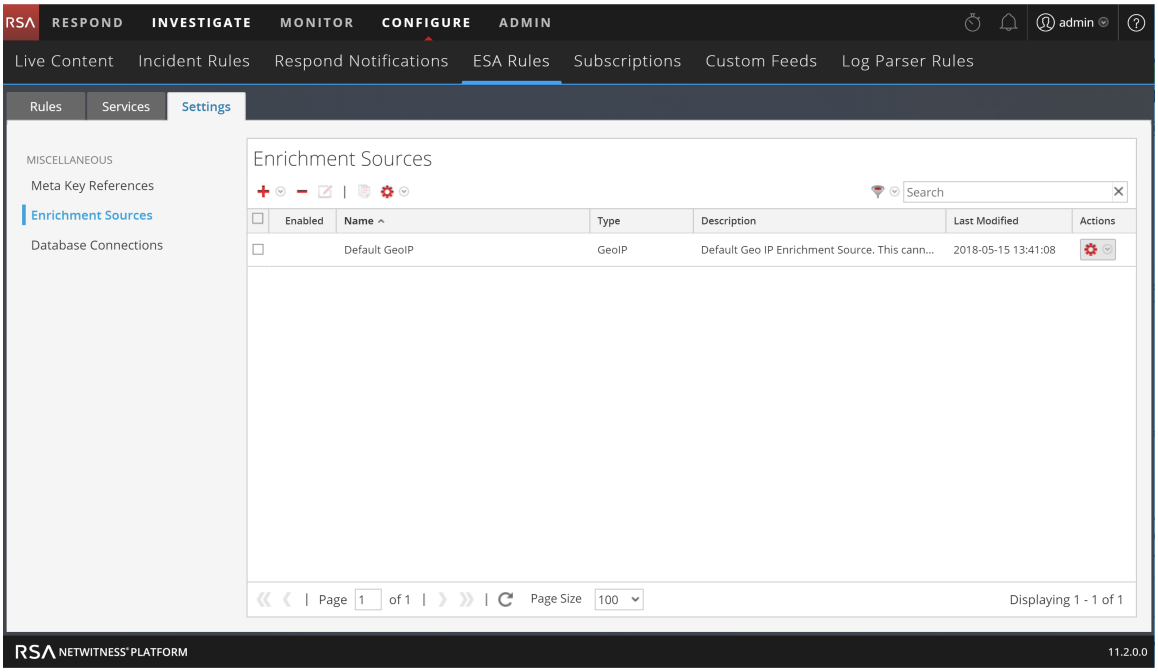
- The column name in the .CSV file cannot have whitespace characters.
  For example *Last_Name* is correct, and *Last Name* is incorrect.
- The .CSV file must begin with a header line that defines fields and types.
  For example, *address string* would define the header field as *address*, and the type as *string*.

The following shows a valid .CSV file represented as a .CSV and as a table.

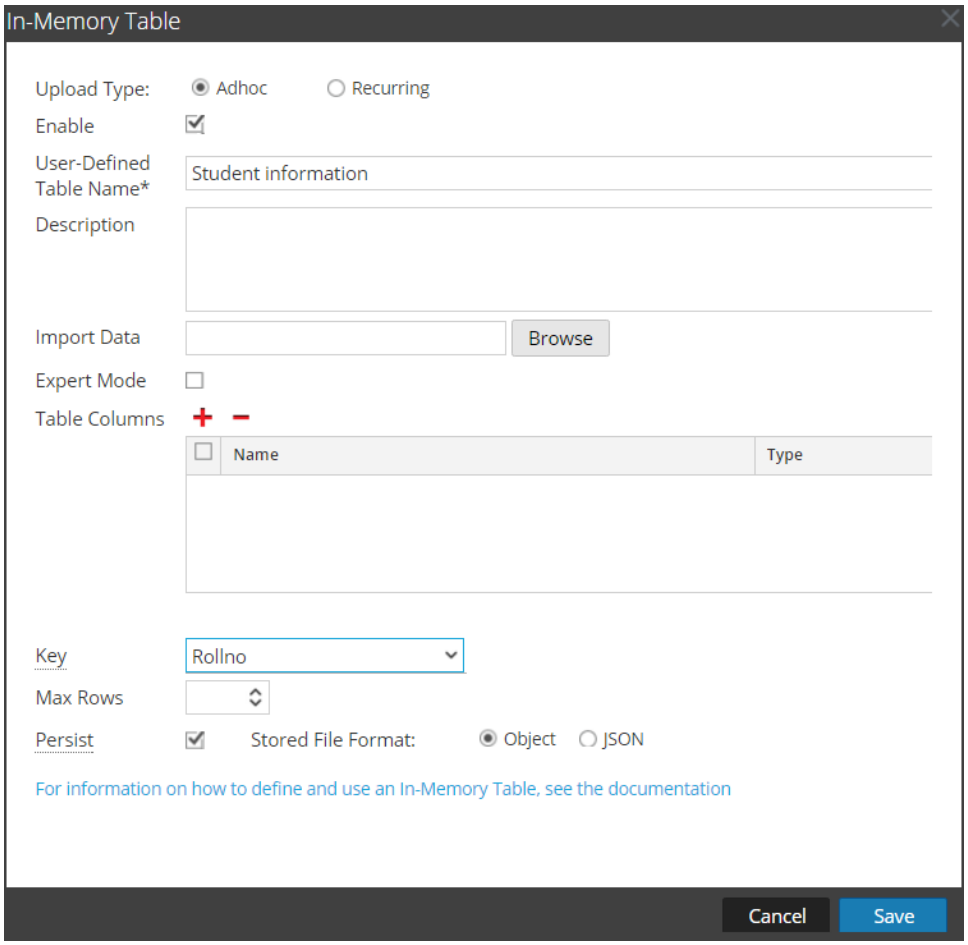


Configure an Ad hoc In-Memory Table

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the ESA Rules tab open.
2. Click the **Settings** tab.
3. In the options panel, select **Enrichment Sources**.



4. In the **Enrichment Sources** section, click > **In-Memory Table**.



5. Describe the in-memory table:

   a. Select **Ad hoc**.

   b. By default, **Enable** is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
   If you add an in-memory table to a rule but do not want alerts to be enriched, deselect the checkbox.

   c. In the **User-Defined Table Name** field, type a name, such as Student Information, for the in-memory table configuration.

   d. If you want to explain what the enrichment adds to an alert, type a **Description** such as:
   When an alert is grouped by Rollno, this enrichment adds student information, such as name and marks.

6. In the **Import Data** field, select the .CSV file that will feed data to the in-memory table.

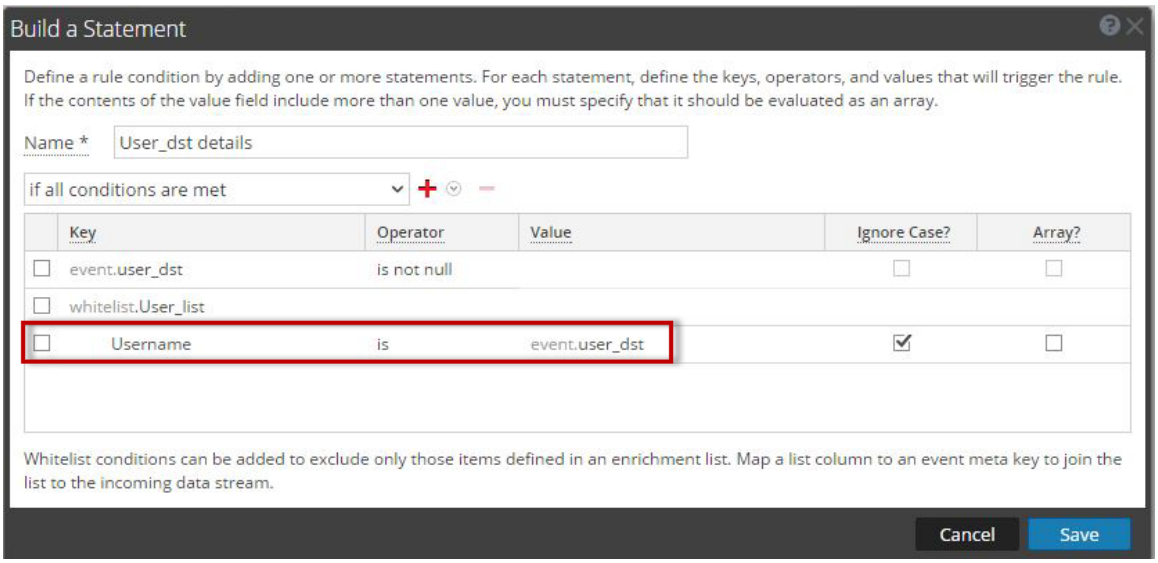
7. If you want to write an EPL query to define an advanced in-memory table configuration, select **Expert Mode**.
   The Table Columns are replaced by a **Query** field.
8. In the **Table Columns** section, click + to add columns to the in-memory table.
9. If a valid file is selected in the Import Data field, the columns populate automatically.

Note: If you selected Expert mode, a Query field is displayed instead of Table Columns.

10. In the **Key** drop-down menu, select the field to use as the default key to join incoming events with the in-memory table when using a CSV-based in-memory table as an enrichment. By default, the first column is selected. You can also later modify the key when you open the in-memory table in enrichment sources.
11. In **Max Rows** drop-down menu, select the number of maximum number of rows that can reside in the in-memory table at a particular instance.
12. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
13. In **Stored File Format** field, do one of the following:
    - Select **Object**, if you want to store the file in a binary format.
    - Select **JSON**, if you want to store the file in a text format.
      By default, **Object** is selected.
14. Click **Save**.
    The adhoc in-memory table is configured. You can add it to rule as an enrichment or part of the rule condition. See Add an Enrichment to a Rule.

When you add an in-memory table, you can add it to a rule as an enrichment or as a part of the rule condition. For example, the following rule uses an in-memory table as a part of the rule condition to create a whitelist, and it also uses an in-memory table of details in the user_dst file to enrich the alert that is displayed.

The rule shows the in-memory table as a whitelist rule condition:



Next, the alert is enriched with the User_list in-memory table:

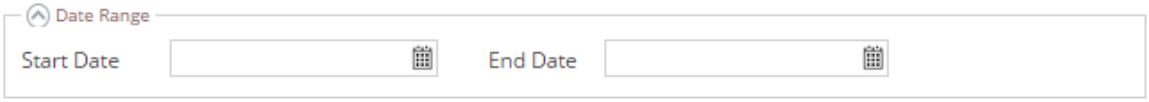
Therefore, the user_dst in-memory table is used to create a whitelist, and it is also used to enrich the data in the alert if the alert is triggered.

Add a Recurring in-Memory Table

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the ESA Rules tab open.
2. Click the **Settings** tab.
3. In the options panel, select **Enrichment Sources**.
4. Click > **In-Memory Table**.
5. Describe the in-memory table:
   a. Click **Recurring**.
   b. By default, **Enable** is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
   If you add an in-memory table to a rule but do not want alerts to be enriched, deselect the checkbox.
   c. In the **User-Defined Table Name** field, type a name, such as Student Information, for the in-memory table configuration.

d. If you want to explain what the enrichment adds to an alert, type a **Description** such as:
When an alert is grouped by Rollno, this enrichment adds student information, such as name and marks.

6. Type the URL of the .CSV file that will feed data to the in-memory table. Click Verify to validate the link and populate the columns in the .CSV file. You can add or remove columns using the plus or minus button.
7. If the server is configured behind another server, select **Use Proxy**.
8. If the server requires logon credentials, select **Authenticated**
9. For **Recur Every**, indicate how frequently ESA must check for the most recent .CSV:
   a. Select Minute(s), Hour(s), Day(s), or Week.
   b. If you select Week, select a day of the week.
   c. Click **Date Range** to select a **Start Date** and **End Date** for the recurring schedule.



10. In the **Key** drop-down menu, select the field to use as the default key to join incoming events with the in-memory table when using a CSV-based in-memory table as an enrichment. By default, the first column is selected. You can also later modify the key when you open the in-memory table in enrichment sources.
11. In **Max Rows** drop-down menu, select the number of rows that can reside in the in-memory table at a particular instance.
12. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.
13. In **Stored File Format** field, do one of the following:
    - Select **Object**, if you want to store the file in a binary format.
    - Select **JSON**, if you want to store the file in a text format.
      By default, **Object** is selected.
14. Click **Save**.
    The recurring in-memory table is configured. You can add it to rule as an enrichment or part of the rule condition. See Add an Enrichment to a Rule.

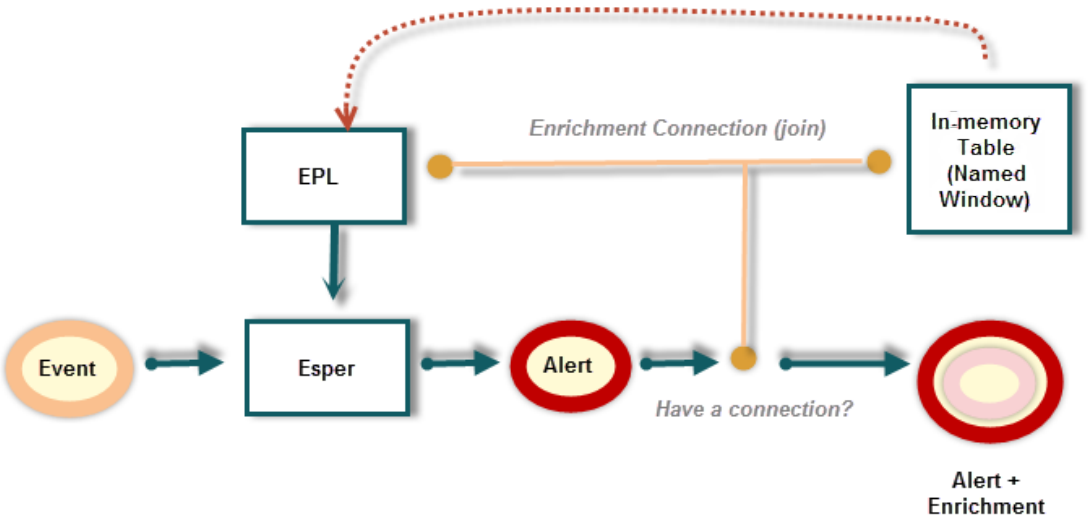
Configuring an Esper Query as an Enrichment Source

When you use "expert mode," you can create an enrichment source or named window based on an Esper query. This allows you to have more control over the content and create more dynamic content. When you do this, an EPL query constructs the named window to capture interesting state from event stream.

Workflow

The following shows the workflow for creating a query using a named window:

1. The event is sent to the Esper Engine.
2. An EPL query is generated.
3. An alert is triggered.
4. The query checks to see if there is a connection between the event and the Named Window.
5. If there is a connection, the query that populates the Named Window is run and populated.
6. The content from the Named Window is added to the alert content and sent or displayed (depending on your settings).



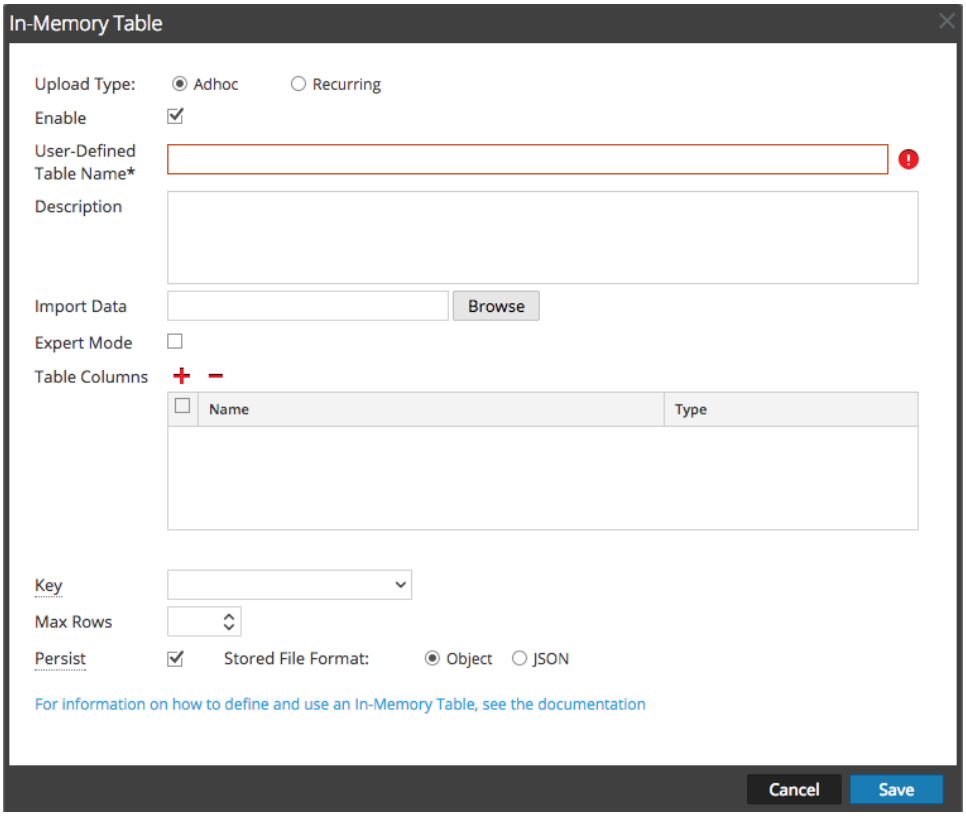
Prerequisites

- The meta used in the EPL statement must exist in the data.
- You must create well-formed EPL statements.

Configure an In-Memory Table Using an EPL Query

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the Rules tab open.
2. Click the **Settings** tab.

3. In the options panel, select **Enrichment Sources**.
4. In the **Enrichment Sources** section, click > **In-Memory Table**.



5. Select **Adhoc**.
   By default, Enable is selected. When you add the in-memory table to a rule, alerts will be enriched with data from it.
6. In the **User-Defined Table Name** field, type a descriptive name to describe the in-memory table.
7. If you want to explain what the enrichment adds to an alert, enter information in the **Description** field.
   This description displays when you view the list of enrichments from the Enrichment Sources view, so it's a good idea to enter a thorough description as a best practice. Doing this allows other users to understand the content of the enrichment without opening it to examine its contents.
8. Select **Expert Mode** to define an advanced in-memory table configuration by writing an EPL query. The Table Columns are replaced by a **Query** field.
9. Select **Persist** to preserve the in-memory table on disk when the ESA service stops and to re-populate the table when the service restarts.

10. Enter the EPL query in the **Query** field. The query should be well-formed, and it's a good idea to test it before entering it in the field.
11. Click **Save**.

Example

For example, you created a rule that searches for five failed attempted logins followed by a successful login. When that rule is triggered, you may want the notification to contain information about the last user logged into the system when this successful login occurred. To add this enrichment to the notification, you might choose to create a stream-based in-memory lookup table that is populated from incoming events to maintain a mapping of IP addresses to the last user logged in from that address. To do this, you create an enrichment using a query as your source.

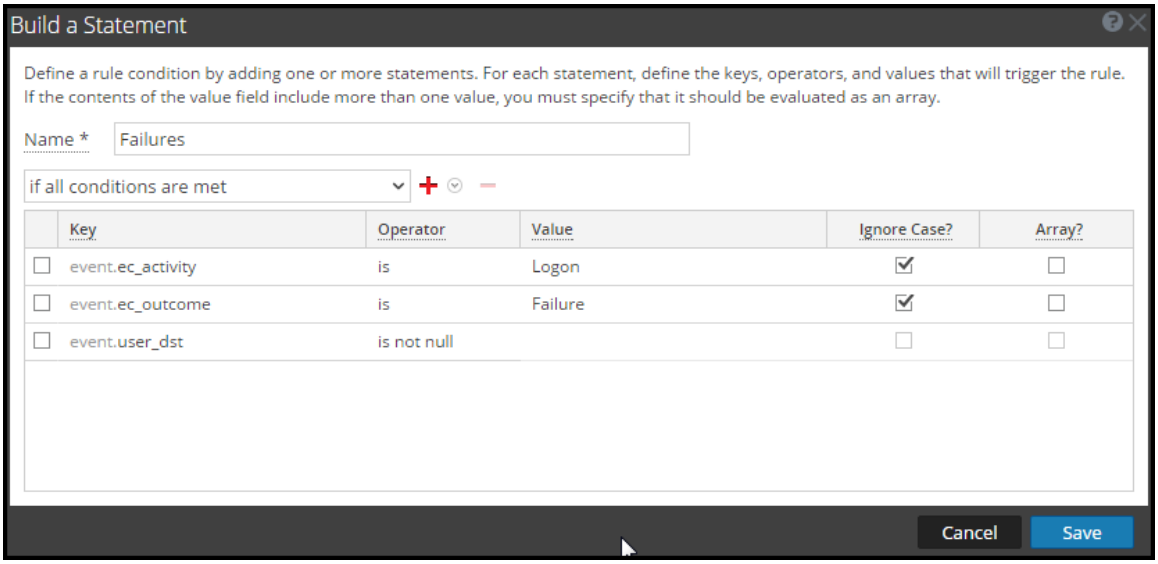
Step 1: Create Your Rule

First, you need to create your correlation rule. In this case, you create failure and success rule conditions, and group by the ip_src.

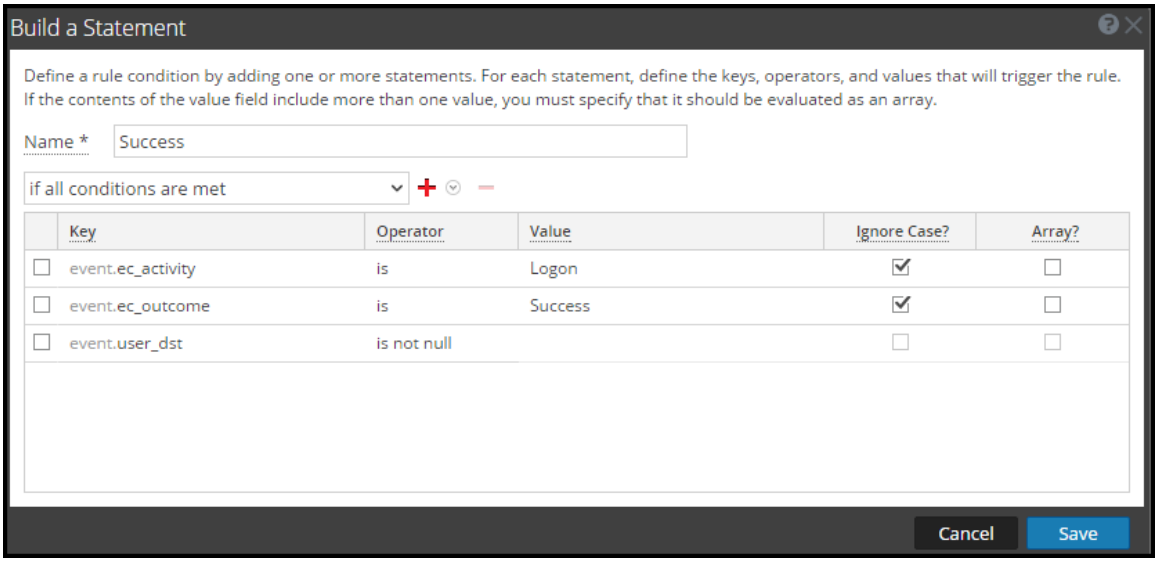
Rule Condition	Description
Failures	This condition searches for five failed logins with a "followed by" connector, meaning that the condition (Failures) must be followed by the next condition (Success).
Success	This condition searches for one successful login.
GroupBy: ip_src, device class	The GroupBy field ensures that all the previous conditions are grouped by the ip_srcand device class. This is important to the construction of the rule because the rule attempts to find a case where a user has attempted to log into the same destination account multiple times, and finally logged in successfully. Grouping by device class ensures that the user logged in from the same machine attempted to log into an account multiple times. The rule may give unexpected results if you do not group the results.
Occurs within 5 minutes	The time window for the events to occur is five minutes. If the events occur outside of this time window, the rule does not trigger.
Event Sequence: Strict	The event sequence is configured for a strict pattern match. This means that the pattern must match exactly as it is specifiedwith no intervening events.

For the rule conditions, you create the following statements:

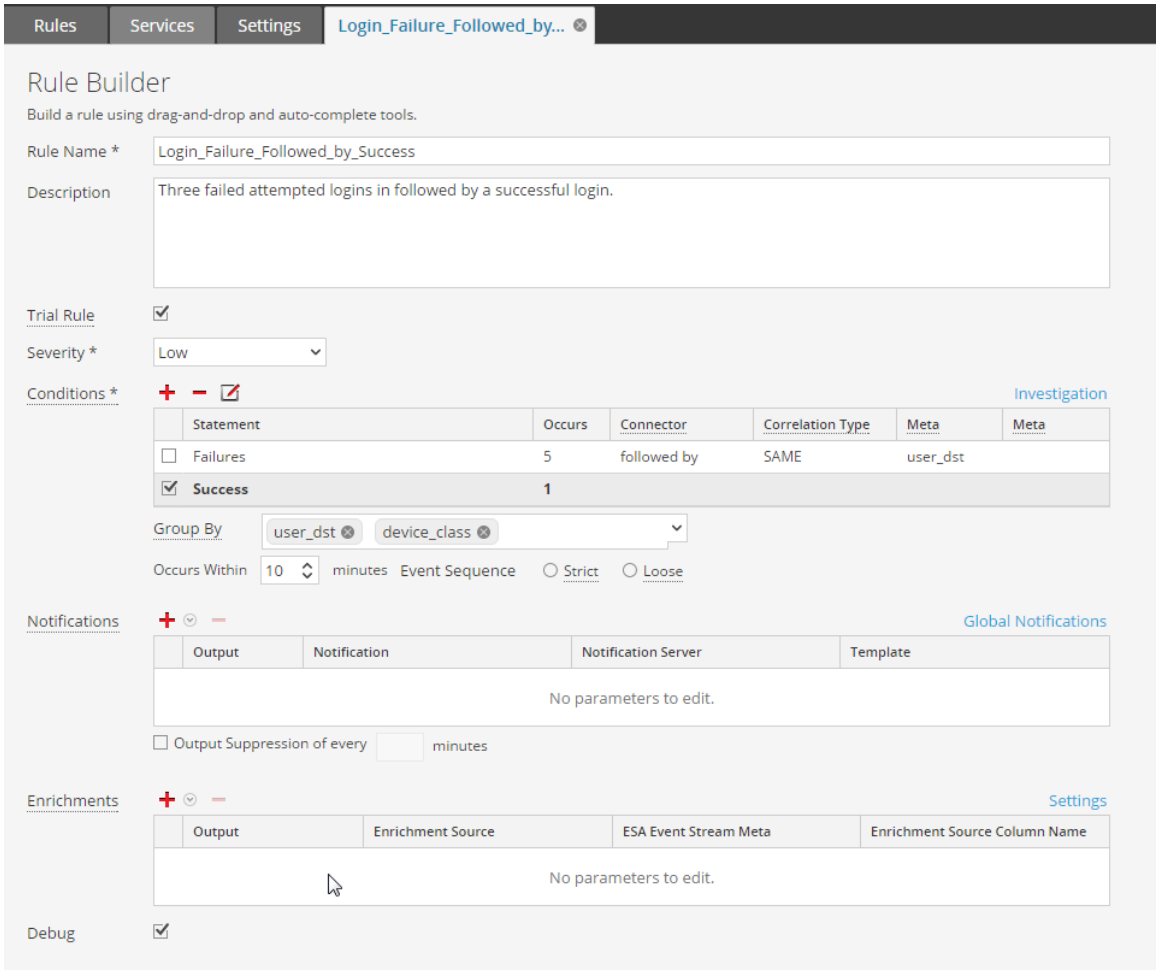
- The "Failures" statement searches for failed login attempts:



- The "Success" statement searches for one successful login:



- Combined, you have the following correlation rule:



Step 2: Create the Enrichment

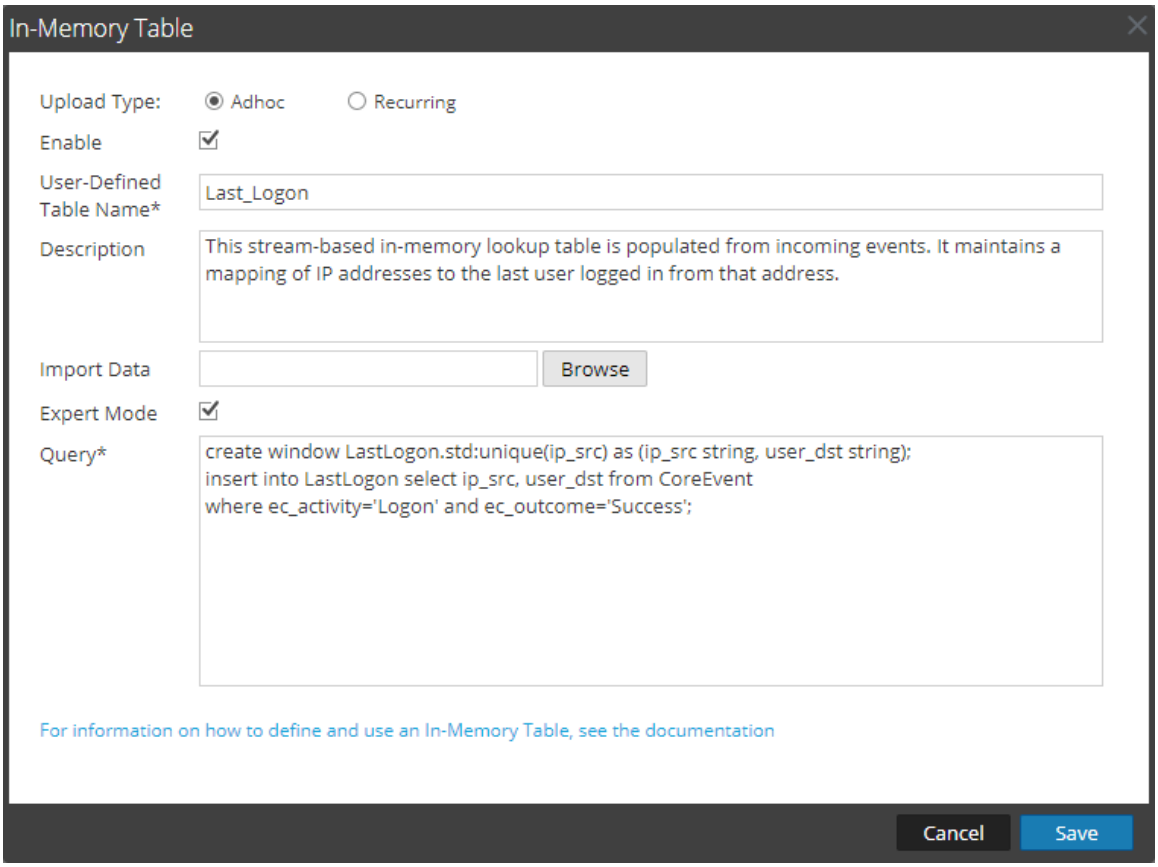
Now that you have created your rule, you need to create the enrichment to add to the notification output. Follow the steps above to create the enrichment, name it *Last_Logon*, and add the following query:

```
create window LastLogon.std:unique(ip_src) as (ip_src string, user_dst
string);

insert into LastLogon select ip_src, user_dst from CoreEvent

where ec_activity='Logon' and ec_outcome='Success';
```

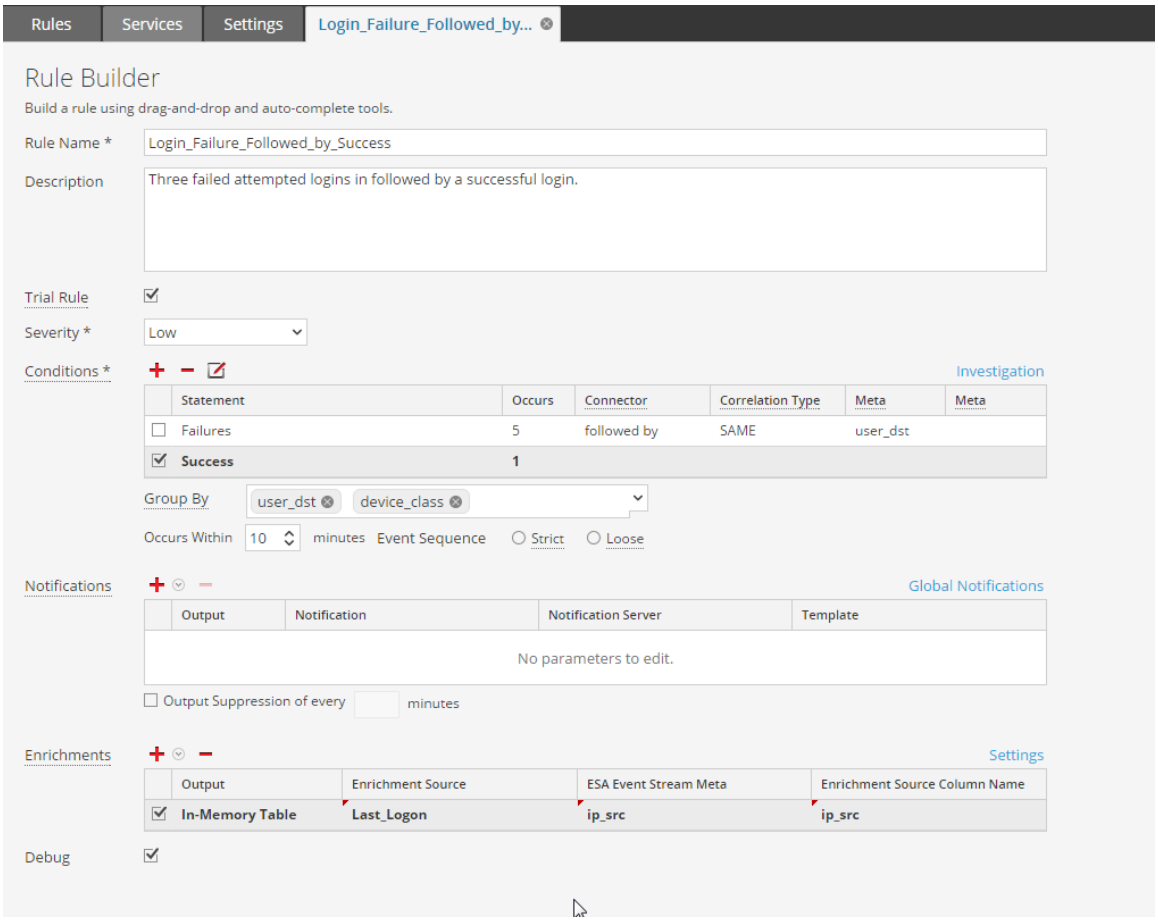
The enrichment should look like the following:



Step 3: Add the Enrichment to the Rule

Now that you have created your basic rule and your enrichment, you'll need to add the enrichment to the rule and join (or connect) the enrichment to the meta in the rule.

Open the Login_Failure_Followed_by_Success rule for editing.



Field	Enter	Description
Output	In-Memory Table	The In Memory Table option creates a Named Window, which can be populated with the EPL query data.
Enrichment Source	Last_Logon (the enrichment you created above).	This is the stream-based in-memory lookup table that is populated from incoming events to maintain a mapping of IP addresses to the last user logged in from that address.
ESA Event Stream Meta	ip_src	This is an event stream meta that you can join to the enrichment data you are populating. Essentially, ip_src is the join condition .
Enrichment Source Column Name	ip_src	This is the meta from the enrichment that you can join to the event stream data. It must be the same as join condition from the Event Stream Meta field.

Once you have added the enrichment, you can save the rule.

When the rule is triggered, the ESA runs the query in the enrichment and populates the Named Window with the data. If the data in the Named Window matches the join condition, the data is added to the output you can view in Email, SNMP, Syslog or Script, depending on how you configured notifications.

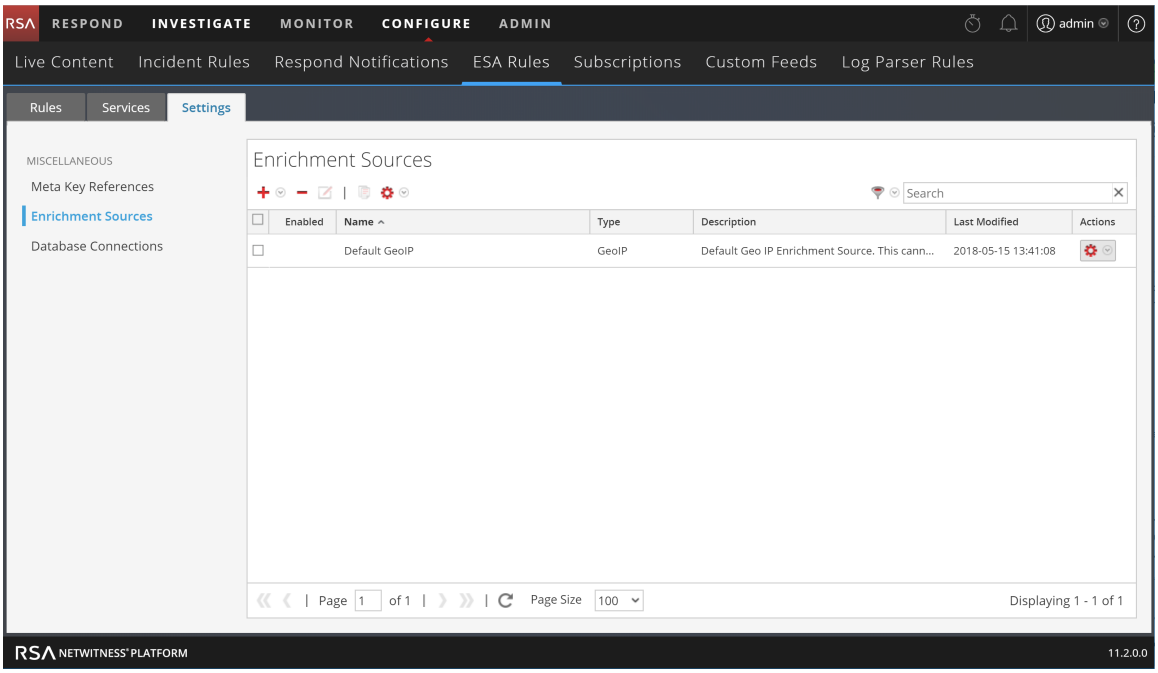
Configure Warehouse Analytics as an Enrichment Source

This topic provides instructions on how to configure RSA Warehouse Analytics as an enrichment source for ESA. Data analysts can leverage Warehouse Analytics data to analyze session and log data.

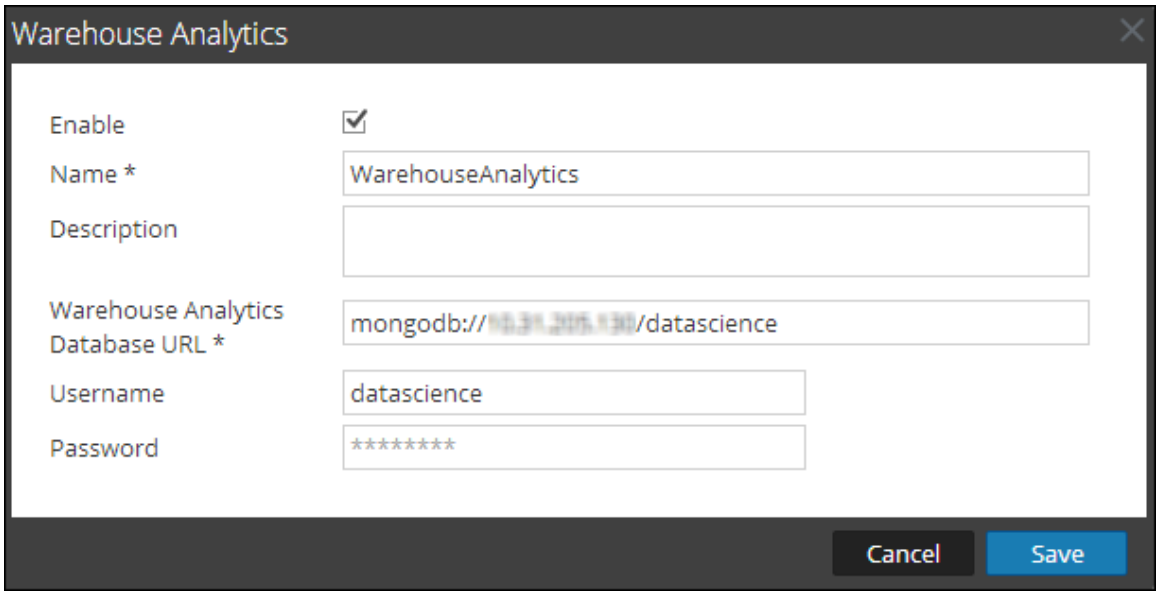
To configure Warehouse Analytics as an enrichment source:

1. Go to **CONFIGURE > ESA Rules > Settings** tab.
2. In the options panel, select **Enrichment Sources**.

   The Enrichment Sources panel is displayed.



3. From the  drop-down menu, select **Warehouse Analytics**.



4. Select **Enable** to enrich alerts with additional data. This is selected by default. If disabled, the alerts will not be enriched with additional data.
5. In the **Name** field, type a name to identify or label the Warehouse Analytics configuration.
6. In the **Description** field, type a brief description about the Warehouse Analytics configuration.
7. In the **Warehouse Analytics Database URL** field, type theMongoDb URL to the Warehouse Analytics database.
8. In the **Username** field, type the username to access the MongoDB.
9. In the **Password** field, type the password to access the MongoDB.
10. Click **Save**.

For more information, see Settings Tab.

Configure Context Hub List as an Enrichment Source

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

This topic provides instructions on how to configure a Context Hub list as an enrichment source for ESA. Once a Context Hub list is added as an enrichment source, analysts can use the configured list as a statement condition when creating an ESA rule. Any changes made to the list from within Context Hub are automatically reflected in the enrichment source in real-time. For example, you could create a list of IP addresses in Context Hub and then use that list as either a blacklist or whitelist as part of a correlation rule condition. Any subsequent changes made to the IP list in Context Hub will be reflected in the enrichment source in real-time, to ensure the correlation rule operates with a constantly updating set of information.

Prerequisites

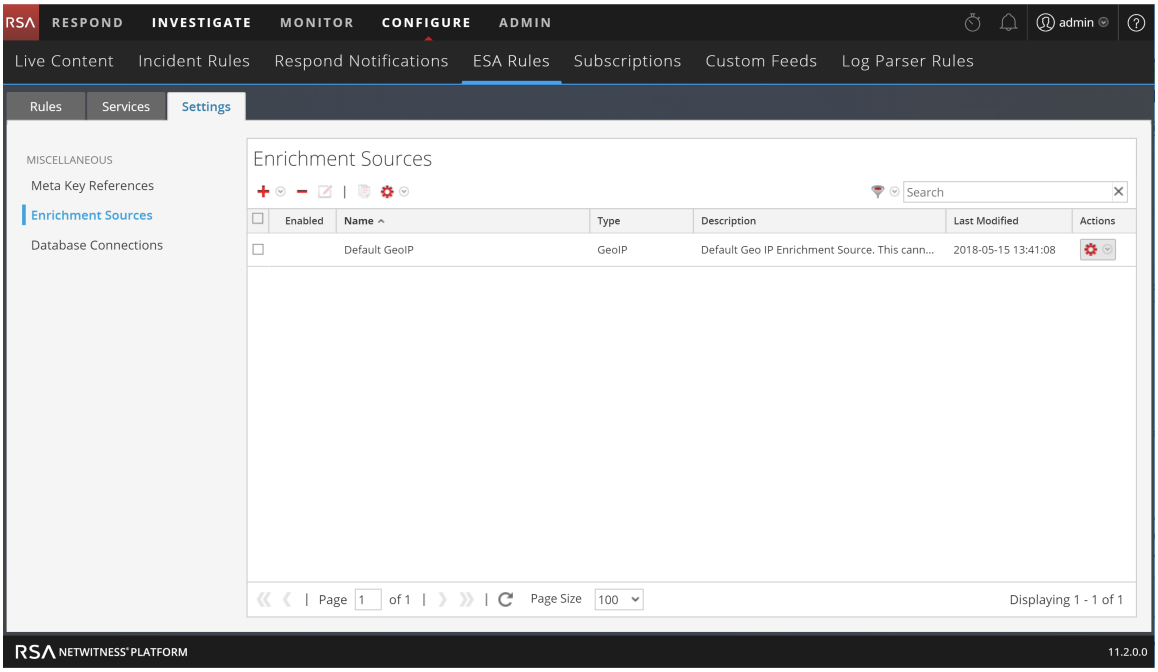
Before configuring a Context Hub list as an enrichment source, the list must first be created as a data source in Context Hub. Any list created in Context Hub is supported and the lists may contain string or numeric values, including IP addresses. For information on creating a list as a data source in Context Hub, see the *RSA NetWitness Context Hub Configuration Guide*.

Caution: When creating a Context Hub list for use as an enrichment source, the list name and its field names cannot include any spaces or special characters, or start with a number. If you do not follow this naming convention, when you attempt to add the list as an enrichment source in ESA, an error message will be displayed and you will not be allowed to add the list.

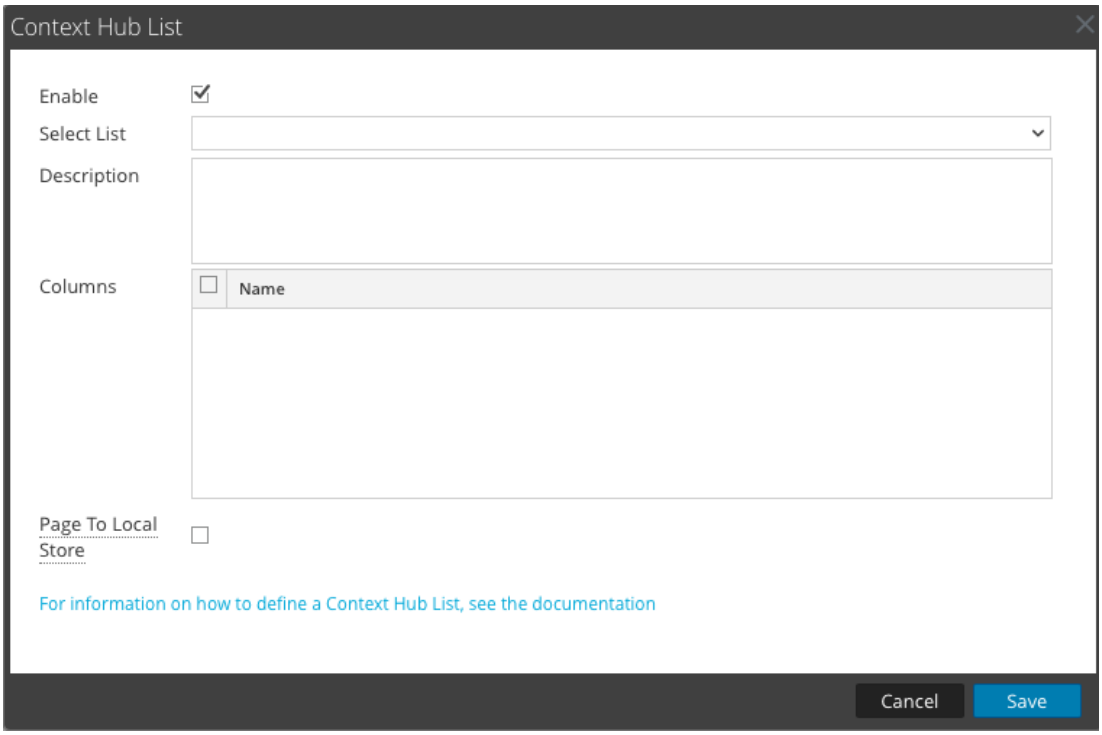
Configure a Context Hub List as an Enrichment Source

1. Go to **CONFIGURE > ESA Rules > Settings** tab.
2. In the options panel, select **Enrichment Sources**.

   The Enrichment Sources panel is displayed.

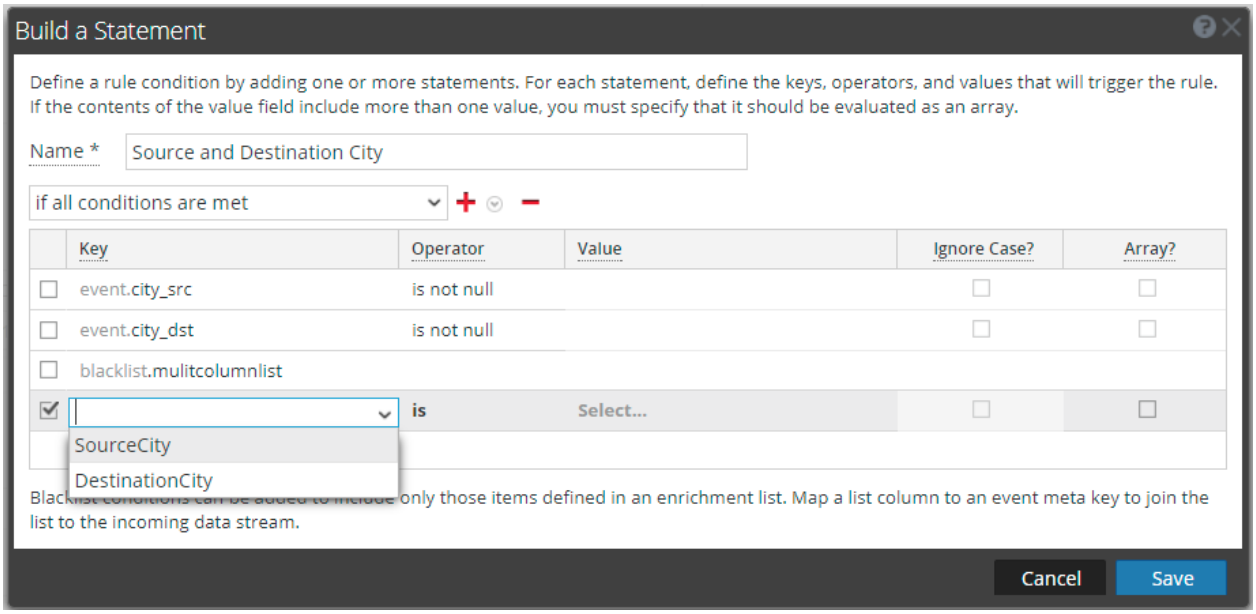


3. From the  drop-down menu, select **Context Hub**.



4. Select **Enable** to enrich alerts with a Context Hub list. This is selected by default. If disabled, the alerts will not be enriched with the configured Context Hub list.
5. Select the desired Context Hub list from the **Select List** drop-down menu of pre-configured lists.
6. (Optional) In the **Description** field, type a brief description about the selected Context Hub list. The text entered here is displayed on the Enrichment Sources panel.
7. In the **Columns** field, all columns included in the selected Context Hub list are listed. Click to enable or disable the columns in the list that you wish to include when using this list as an enrichment source in an alert.
8. (Optional) Click to enable the **Page To Local Store** option. This option is useful if you have a very large list and performance is affected. If this is the case, enabling this option will write a copy of the Context Hub list to the local disk to improve performance.
9. Click **Save**.
   The Context Hub list is configured. You can now add it to an ESA rule as part of a condition statement as either a blacklist or a whitelist condition.

The following figure illustrates adding a Context Hub list as part of a condition statement. In this example, a context Hub list named "multicolumnlist" was added as a blacklist condition. The list contains two columns, SourceCity and DestinationCity. The next step would be to select one of the column names as the subcondition and then specify the operator and enter the meta value for the corresponding value field.



For complete details for adding a whitelist or blacklist to a condition statement, see Step 2. Build a Rule Statement.

To add a Context Hub list as a condition to an existing rule, select to edit the desired rule in the Rule Library, then add a condition in the Conditions section and select to add a whitelist or blacklist condition to the new condition statement.

Add an Enrichment to a Rule

This topic tells how to add a previously configured enrichment source to a rule. When ESA creates an alert, information from the source gets included in it.

Adding an enrichment to a rule allows you to request for look ups into a variety of sources and include the results in the outgoing alerts, giving you a more detailed alert. This procedure requires role permissions for Administrator, DPO, and SOC Manager.

Note: This procedure does not apply to adding a Context Hub list as an enrichment to a condition statement in an existing rule. For information see Configure Context Hub List as an Enrichment Source.

To add an enrichment to a rule:

1. Go to **CONFIGURE > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   - Double-click a rule.
   - Select a rule and click in the **Rule Library** toolbar.

   The Rule Builder panel is displayed in a new NetWitness Platform tab.
3. In the **Enrichments** section, click and select any of the following enrichment types:
   - In-Memory Table
   - External DB Reference
   - Warehouse Analytics
   - GeoIP

   Note: If you use a GeoIP source, ipv4 is automatically populated, and is not editable.

   The enrichment types that you have selected are displayed in the table.
4. For the added enrichment type, perform the following:
   - In the **Output** column, select the type that you have configured.
   - In the **Enrichment Source** drop-down list, select the enrichment source defined.
   - In the **ESA Event Stream Meta** field, type the event stream meta key whose value will be used as one operand of join condition.

   - In the **Enrichment Source Column Name** field, type the enrichment source column name whose value will be used as another operand of the join condition.
5. Select **Debug**. This will add a @Audit('stream') annotation to the rule. This is useful when debugging the esper rules.
6. Click **Show Syntax** to test if the defined ESA rule is valid.
7. Click **Save**.

For details on parameters and their descriptions, see Rule Builder Tab.

Deploy Rules to Run on ESA

This topic explains how to select an ESA and the rules to run on it. Administrator, SOC Manager or DPO role permissions are required for all tasks in this section.

To create a deployment, you need to perform the steps described in Deployment Steps

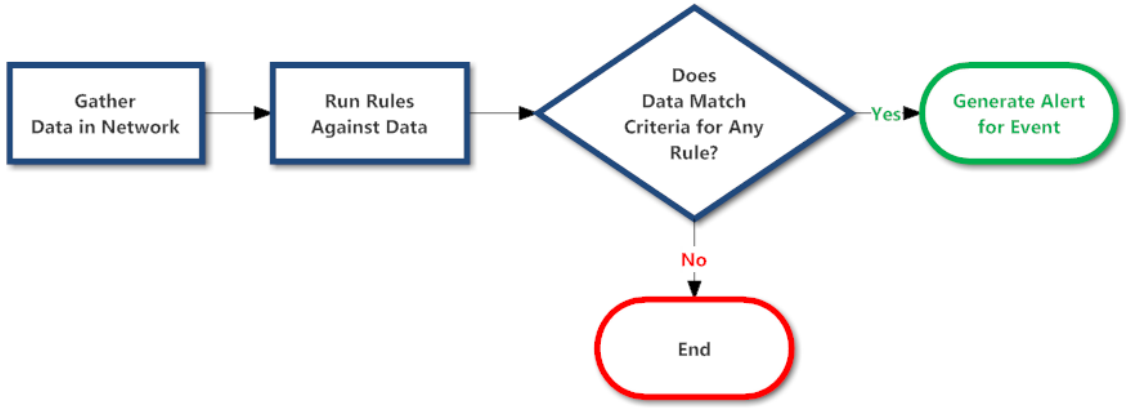
How Deployment Works

A deployment consists of an ESA service and a set of ESA rules. When you deploy rules, the ESA service runs them to detect suspicious or undesirable activity in your network. Each ESA rule detects a different event, such as when a user account is created and deleted within one hour.

The ESA service performs the following functions:

1. Gathers **data** in your network
2. Runs ESA **rules** against the data
3. Applies rule **criteria** to data
4. Generates an **alert** for the captured event

The following graphic shows this workflow:



In addition, you may want to perform other steps on your deployment, such as deleting an ESA service in your deployment, editing or deleting a rule from your deployment, editing or deleting a deployment, or showing updates to a deployment. For descriptions of these procedures, Additional Deployment Procedures.

Deployment Steps

This topic explains how to add a deployment, which includes an ESA service with its associated data sources and a set of ESA rules. You can add a deployment to organize and manage ESA services and rules. Think of the deployment as a container for these components:

1. An ESA service
2. A set of ESA rules

For example, if you add a Spam Activity deployment it could include an ESA London service, Concentrators with the appropriate data, and a set of ESA rules to detect suspicious email activity.

To add a deployment, you need to complete the following procedures:

- Step 1. Add a Deployment
- Step 2. Add an ESA Service
- Step 3. Add and Deploy Rules

Step 1. Add a Deployment

Prerequisites

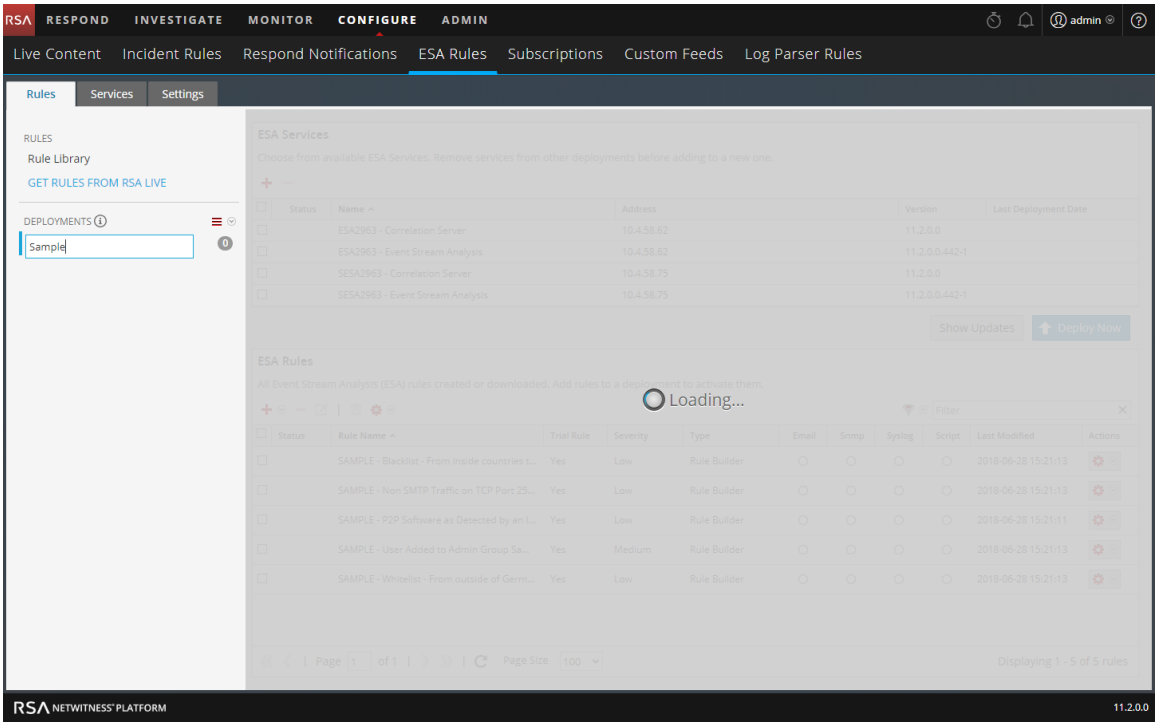
The following are required to add a deployment:

- The ESA service must be configured on the host.
- Rules must be in the Rule Library. See Add Rules to the Rule Library.

Add a Deployment

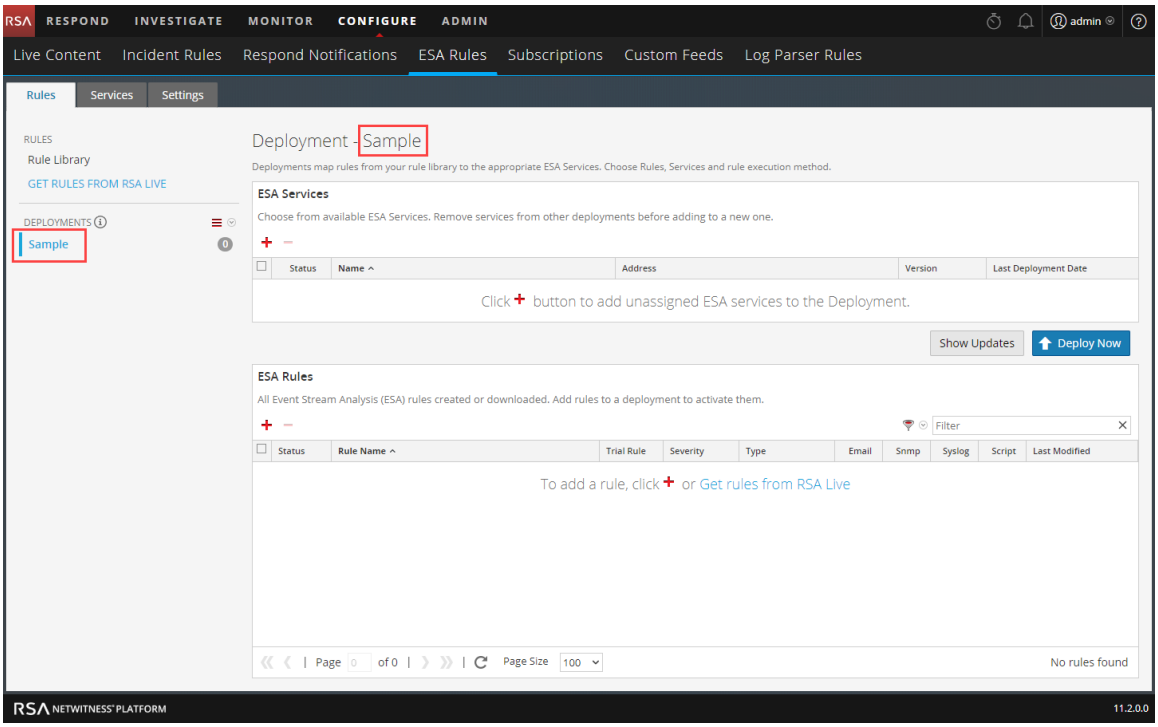
1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed.
2. In the options panel on the left, next to Deployments, select  > **Add** and type a **name** for the deployment. The naming convention is up to you. For example, it could indicate the purpose or

identify an owner.



3. Press **Enter**.

The deployment is added. The Deployment view is displayed on the right.



Step 2. Add an ESA Service

The ESA service in a deployment gathers data in your network and runs ESA rules against the data. The goal is to capture events that match rule criteria, then generate an alert for the captured event.

You can add the same ESA service to multiple deployments. For example, ESA London could be in these deployments simultaneously:

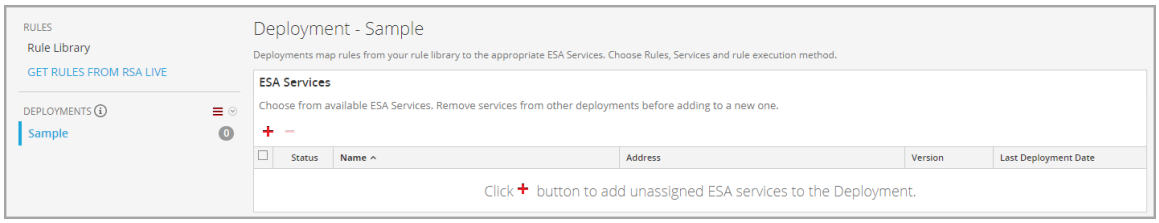
- Deployment EUR, which includes one set of rules
- Deployment CORP, which includes another set of rules.

Changes made to a deployment do not take effect until you click Deploy. For example, Deployment EUR could include the ESA London service and a set of 25 rules. If you replace the ESA London service with the ESA Paris service, the next time you deploy Deployment EUR, the 25 rules will be removed from ESA London and added to ESA Paris.

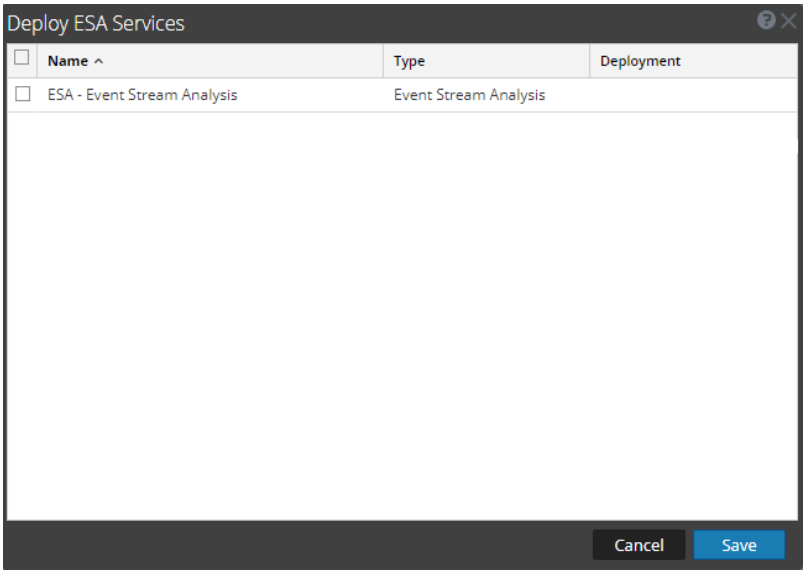
Deleting a deployment immediately removes the rules from the ESA service. If an ESA service is not part of any deployment, the ESA service does not have any rules.

To add an ESA service:

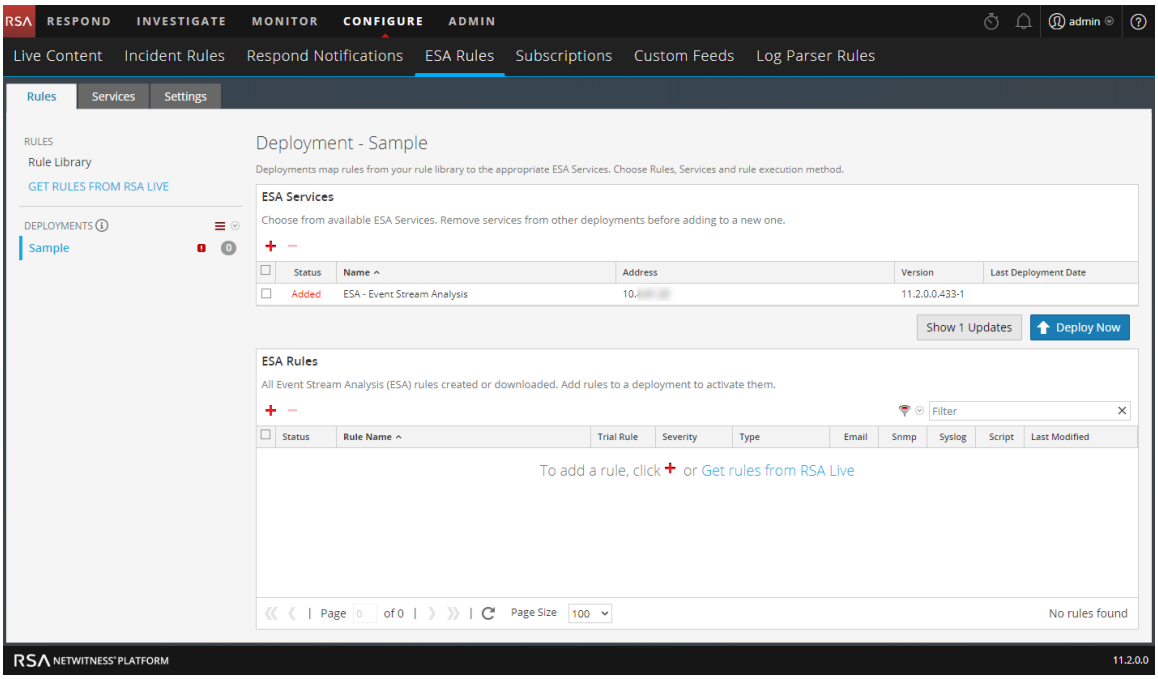
1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab is displayed.
2. In the options panel, select a **deployment**:



3. In the **Deployment** view, click + in **ESA Services**.
   The Deploy ESA Services dialog lists each configured ESA.



4. Select an ESA service and click **Save**.
   The Deployment view is displayed. The ESA service is listed in the **ESA Services** section, with the status **Added**.



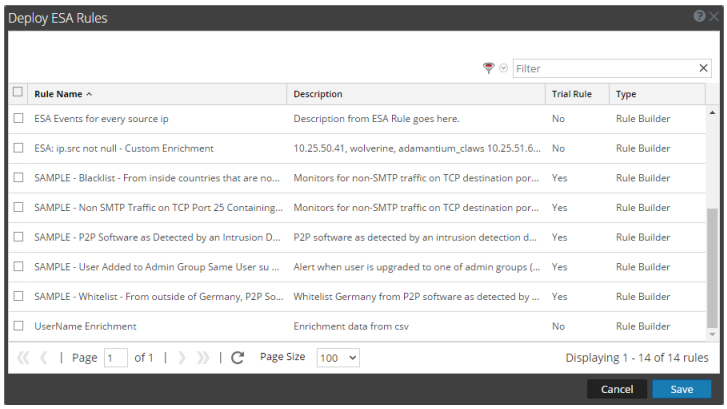
Step 3. Add and Deploy Rules

This topic explains how to add ESA rules to a deployment and then deploy the rules on ESA. Each ESA rule has unique criteria. The ESA rules in a deployment determine which events ESA captures, which in turn determine the alerts you receive.

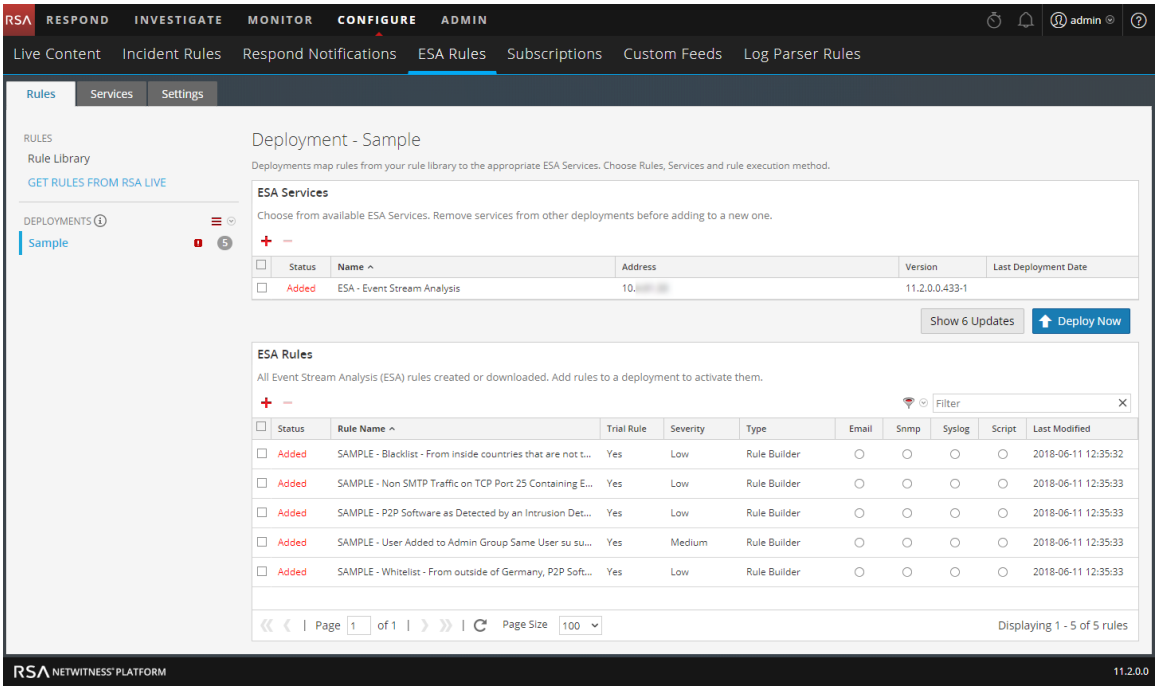
For example, Deployment A includes ESA Paris and, among others, a rule to detect file transfer using a non-standard port. When ESA Paris detects a file transfer that matches the rule criteria, it captures the event and generates an alert for it. If you remove this rule from Deployment A, ESA will no longer generate an alert for such an occurrence.

To add and deploy rules:

1. Go to **Configure > ESA Rules**.
   The Rules tab is displayed.
2. In the options panel, select a deployment.
3. In the **Deployment** view, click + in **ESA Rules**.
   The Deploy ESA Rules dialog is displayed and shows each rule in your Rule Library:



4. Select rules and click **Save**.
   The Deployment view is displayed.



5. The rules are listed in the ESA Rules section.
   - In the Status column, **Added** is next to each new rule.
   - In the Deployments section,  indicates there are updates to the deployment.
   - The total number of rules in the deployment is on the right.

6. Click **Deploy Now**.
   The ESA service runs the rule set.

Additional Deployment Procedures

In addition to deploying an ESA service and rules, you may want to perform other steps on your deployment, such as removing an ESA service from your deployment, editing or deleting a rule from your deployment, editing or deleting a deployment, or showing updates to a deployment.

- Remove an ESA Service from a Deployment
- Edit or Delete a Rule in a Deployment
- Edit the Deployment Name or Delete a Deployment
- Show Updates to a Deployment

Each of the following procedures starts in the Rules tab **(CONFIGURE > ESA Rules > Rules tab)**.

Remove an ESA Service from a Deployment

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the options panel, under **Deployments**, select a deployment.
3. In the **ESA Services** secion, select a service and click − in the toolbar.
   A confirmation dialog is displayed.
4. Click **Yes**.
   The service is removed from the deployment.

Edit or Delete a Rule in a Deployment

On a deployment with rules, you can edit and delete rules to customize the deployment.

Edit a Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the Rules tab options panel, under Deployments, select a deployment.
3. In the **ESA Rules** panel, double-click a rule to open it in a new tab.
4. Modify the rule, then click **Save**.
   The rule is saved.

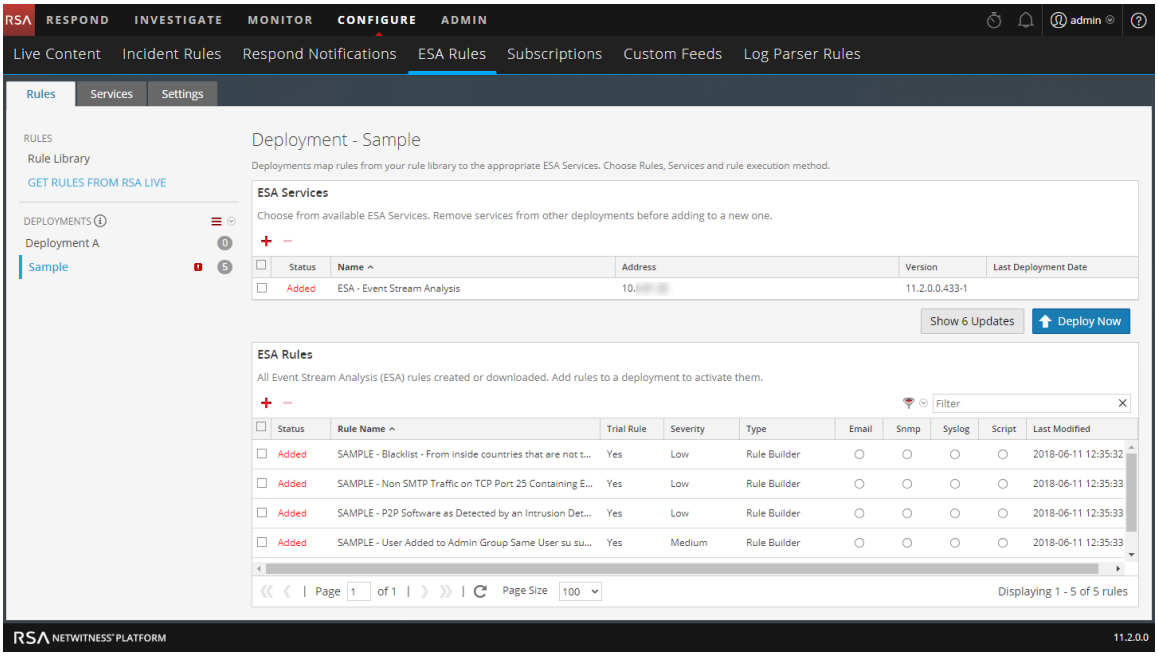
Delete a Rule

1. Go to **CONFIGURE > ESA Rules > Rules** tab.
   The Rules tab is displayed.
2. In the options panel, under **Deployments**, select a deployment.
3. In the **ESA Rules** panel, select a rule and click − in the toolbar.
   A confirmation dialog is displayed.
4. Click **Yes**.
   The rule is deleted.

Edit the Deployment Name or Delete a Deployment

To access the deployments:

1. Go to **CONFIGURE > ESA Rules**.
   The Configure view is displayed with the Rules tab open.
2. In the options panel, under **Deployments**, select a deployment.
   The Deployment view is displayed.



Edit the Deployment Name

1. In the options panel, under **Deployments**, select a deployment.

   The Deployment view is displayed.

2. Select  > **Edit**.

   The deployment name is made available for editing.

Delete a Deployment

1. In the options panel, under **Deployments**, select a deployment.

   The Deployment view is displayed.

2. Select  > **Delete**.

   A confirmation dialog is displayed.

3. Click **Yes**.

   The deployment is deleted.

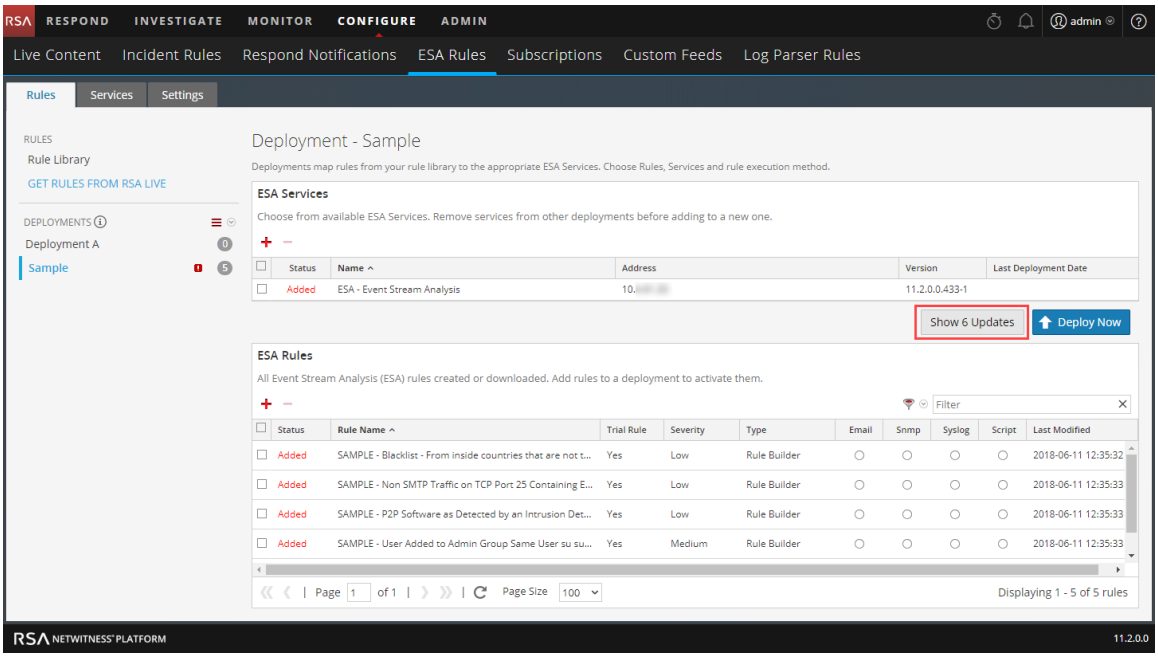
Show Updates to a Deployment

You can view changes to a deployment, such as adding or removing rules. When there is a change to a deployment, the update icon () appears next to the name of the deployment in the Rules tab options panel.

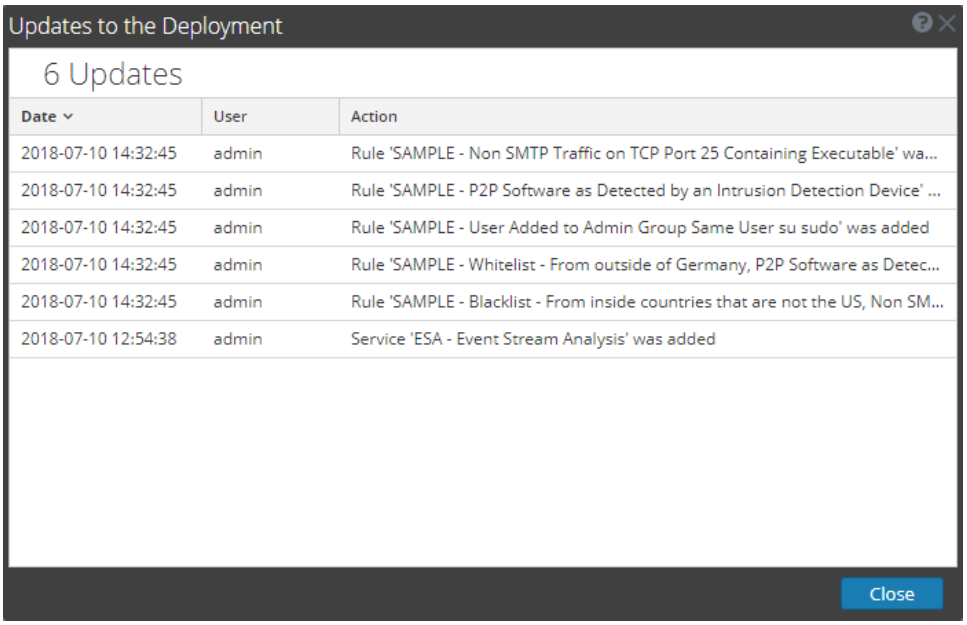
1. Go to **CONFIGURE > ESA Rules.**

   The Rules tab is displayed.

2. In the options panel, under **Deployments** click **Show Updates** on the far right.



The Updates to the Deployments dialog opens and shows the changes to the deployment.



3. Click **Close**.

View ESA Stats and Alerts

When ESA generates alerts, you can view details about how the rules performed, such as statistics on the engine, rule, and alert, and you can also view information on which rules are enabled or disabled. For instructions on viewing ESA stats, see View Stats for an ESA Service

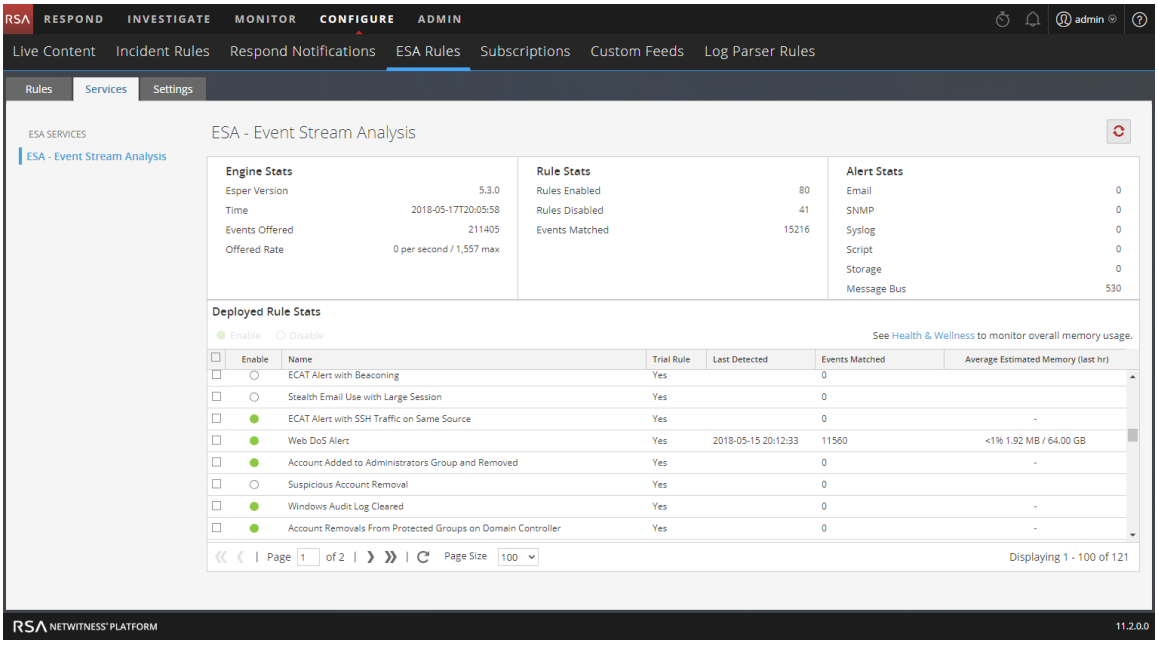
When your ESA generates alerts, you can view the results in the Respond Alerts List view. This enables you to see trends and understand both the volume and frequency of alerts. For instructions on viewing alerts, see View a Summary of Alerts

View Stats for an ESA Service

This topic describes how to view the deployment stats for an ESA service. This procedure is useful when you are attempting to determine the effectiveness of a rule or troubleshoot a deployment.

View ESA Stats

1. Go to **CONFIGURE > ESA Rules > Services** tab.
2. From the **ESA Services** list on the left, select a service.
   The deployment stats for the selected service are displayed.



3. Review the following sections of ESA stats.
   For a complete description of each statistic in each section, see Services Tab.

- **Engine Stats**
- **Rule Stats**
- **Alert Stats**

4. In the **Deployed Rule Stats**, review details about the rules deployed on the ESA.
   For a complete description of each column in each section, see Services Tab.
   - If the rule is enabled or disabled
   - What the rule name is
   - If the rule is running in Trial Rule mode
   - Last detected
   - Events matched
5. To get a snapshot of the rule memory, click **Health & Wellness**.

Enable or Disable Rules

1. In the **Deployed Rule Stats** panel, select a rule from the grid.
2. Click Enable to enable the rule, or click Disable to disable the rule.
   The Services tab is refreshed to show the changes, which take effect immediately.

Refresh the Statistics

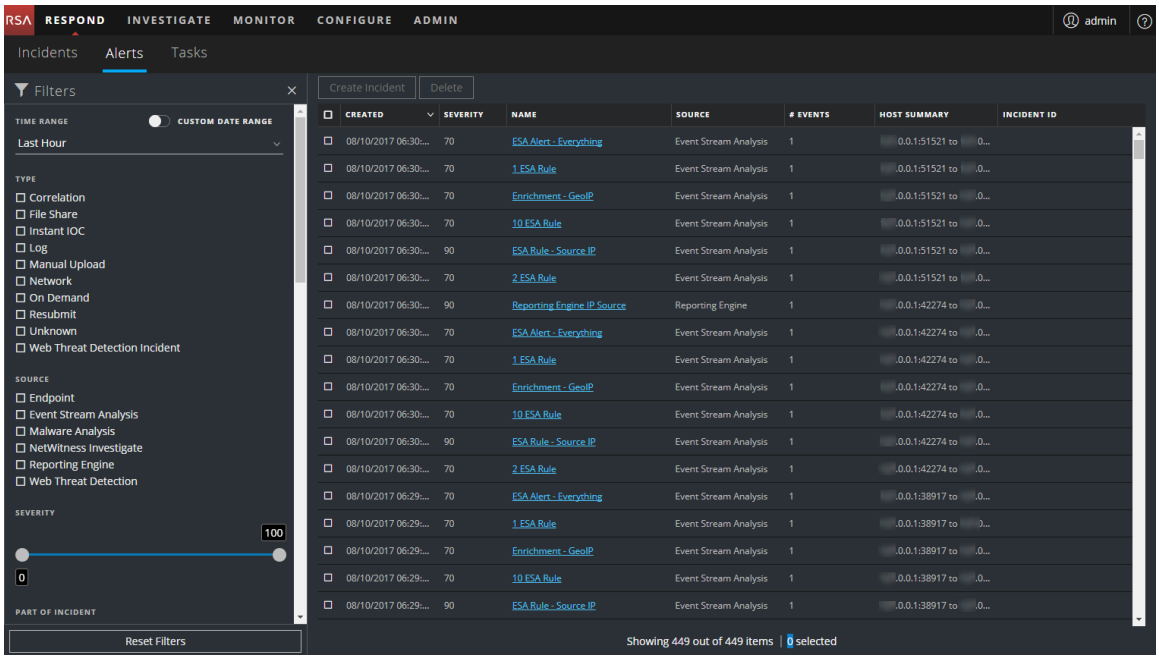
The Services tab does not update statistics automatically unless you enable or disable a rule. To ensure you view current statistics:

1. Click in the upper right corner to refresh the information.
2. View the updated information.

View a Summary of Alerts

In the Repond view, you can browse through various alerts from multiple sources. You can filter the alerts list to show only alerts of interest, such as by Alert Name, alert source, and a specific time range.

1. Go to **RESPOND > Alerts**.
   The Respond Alerts List view displays a list of all NetWitness Platform alerts.

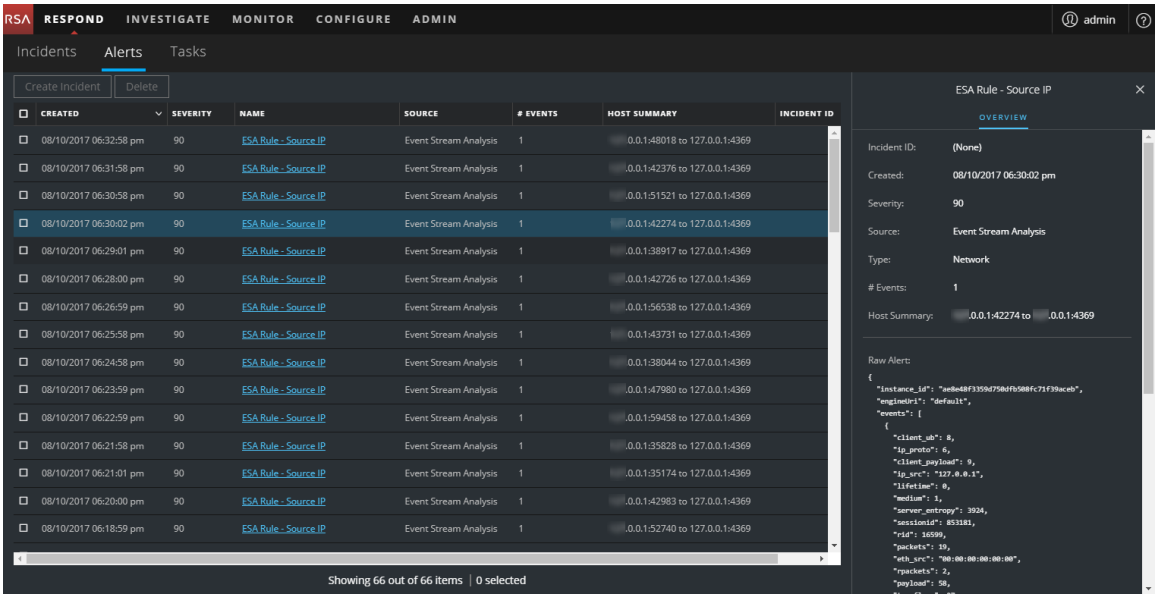


2. In the **Filters** panel on the left, you can filter the alerts list to view specific alerts for a specific time frame. For example, in the ALERT NAMES section, you can select an alert for an ESA rule, such as Direct Login to an Administrative Account, and leave the TIME FRAME set to Last Hour.
   The alerts list to the right shows a list of alerts that match your filter selection along with a count of the alerts at the bottom of the alerts list.

   The alerts list shows information about each of the alerts.

- **Created**: Displays the date and time when the alert was created in the source system.
- **Severity**: Displays the level of severity of the alert. The values are from 1 to 100.
- **Name**: Displays a basic description of the alert.
- **Source**: Displays the original source of the alert.
- **# of Events**: Indicates the number of events contained within an alert.
- **Host Summary**: Displays details of the host, like the host name from where the alert was triggered.
- **Incident ID**: Shows the incident ID of the alert. If there is no incident ID, the alert does not belong to an incident.

3. You can click an alert in the list to open an **Overview** panel on the right where you can view raw alert metadata.



For more information about filtering alerts and viewing alert details, see the *NetWitness Respond User Guide*.

ESA Alert References

In the Alerts module, you configure and deploy ESA rules to get alerted about potential network threats. These topics explain the user interface in the Alerts module.

New Advanced EPL Rule Tab

The Advanced EPL Rule tab enables you to define rule criteria with an Event Processing Language (EPL) query.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Define an Advanced EPL rule.	Add an Advanced EPL Rule
Content Expert	See examples of an Advanced EPL Rule.	Sample Advanced EPL Rules

Related Topics

- Add a Rule Builder Rule
- Enrichment Sources

Advanced EPL Rule

To access the Advanced EPL Rule tab:

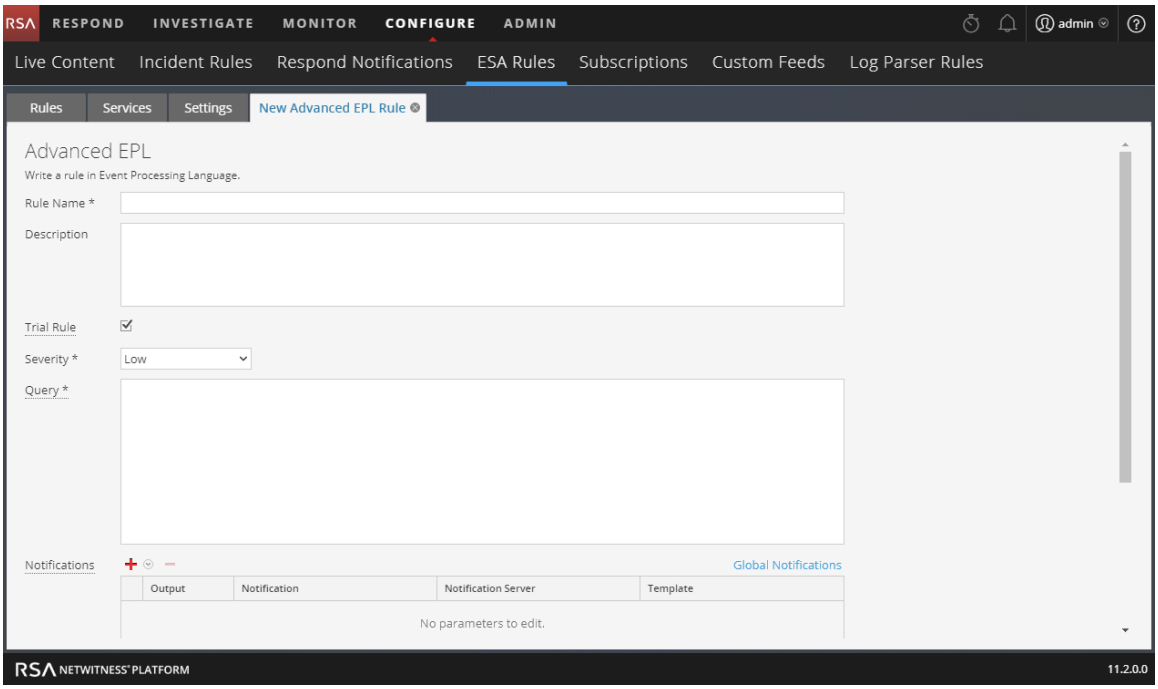
1. Go to **CONFIGURE > ESA Rules**.

   The Configure view is displayed with the Rules tab open by default.

2. In the **Rule Library** toolbar, select  **> Advanced EPL**.

   The Advanced EPL Rule tab is displayed.

Below is a screen shot of the Advanced EPL Rule tab.



The following table lists the parameters in the Advanced EPL Rule tab.

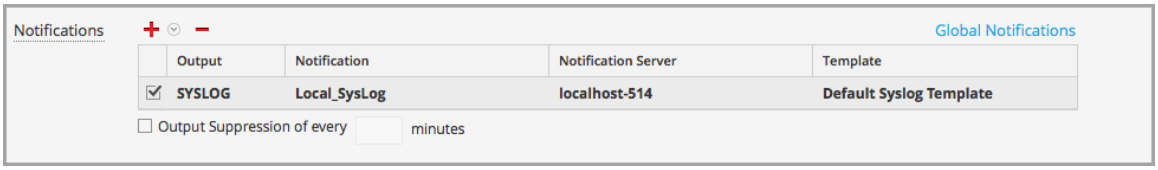
Parameters	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Severity	Threat level of alert triggered by the rule.
Query	EPL query that defines rule criteria.

Notifications

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.



Parameter	Description
+	To add an alert notification type.
−	To delete the selected alert notification type.
Output	Alert notification type. Options are: • Email • SNMP • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

Enrichments

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.
The following figure shows the Enrichments section.

Parameter	Description
+	To add an enrichment.
−	To delete the selected enrichment.

Parameter	Description
Output	Enrichment source type. Options are: • In-Memory Table • External DB Reference • Warehouse Analytics • GeoIP
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition.

Build a Statement Dialog

The Build a Statement dialog allows you to construct a condition statement when creating a new Rule Builder rule.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Configure a rule statement.	Add an Advanced EPL Rule
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement

Related Topics

- Add a Rule Builder Rule

Build a Statement Dialog

To access the Build a Statement dialog:

1. Go to **CONFIGURE > ESA Rules**.

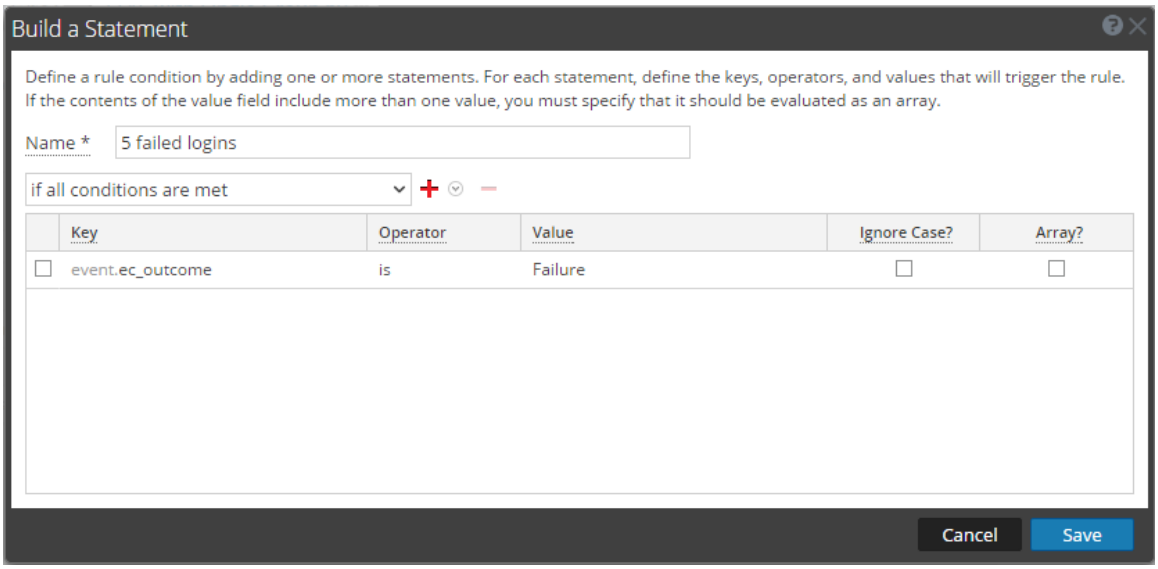
   The Configure ESA Rules view is displayed with the Rules tab open.

2. In the **Rule Library** toolbar, select  **> Rule Builder**.

   A New Rule tab is displayed..

3. In the **Conditions** section, click  .

   The Build a Statement dialog is displayed.



The following table describes the parameters in the Build a Statement dialog.

Parameter	Description
Name	Purpose of the statement.
Select	Conditions the rule requires. There are two options: • If all conditions are met • If any of these conditions are met
Key	Key for ESA to check in the rule statement.

Parameter	Description
Evaluation Type	Relationship between the meta key and value for the key: • is • is not • is not null • is greater than (>) • is greater than or equal to (>=) • is less than (<) • is less than or equal to (<=) • contains • not contains • begins with • ends with
Value	Value for ESA to look for in the key.
Ignore Case?	This field is designed for use with string and array of string values. By choosing the **Ignore Case** field, the query will treat all string text as a lowercase value. This ensures that a rule that searches for the user named Johnson would trigger if the event contains "johnson," "JOHNSON," or "JoHnSoN."
Array?	Choice to indicate if contents of Value field represent one value or multiple values: • Select the box to indicate multiple values. • Clear the box to indicate one value.
+	Add a statement. You can add a meta condition, whitelist condition, or blacklist condition.
−	Delete selected statement.
Save	Add statement to the Conditions section of the Rule Builder tab.

The following table shows the operators you can use in the Rule Builder:

Operator	Required Value	Usage	Example	Meaning
is	Singular string value	The meta key is equal to the *value* field.	***user_dst*** is John Doe.	***user_dst*** is equal to the string *"John Doe"*.
is	Array string value	The meta key is equal to one of the elements of the *value* field.	*user_dst* is John, Doe, Smith.	*user_dst* is equal either to the string *"John"* or to the string *"Doe"* or to the string *"Smith*" (Note, the spaces are stripped.).
is not	Singular string value	The meta key is not equal to the *value* field.	***size*** is not 200.	***size*** is not equal to the number 200 (size is a numeric value).
is not	Array string value	The meta key is not equal to any of the elements of the *value* field.	***size*** is not 200, 300, 400.	***size*** is equal neither to *200* nor to *300* nor to *400*.
is not null	N/A (looks for any value)	The meta key value is not null.	***user_dst*** is not null.	***user_dst*** is a meta that contains a value.
is greater than (>)	Number	The numeric value of the meta key is greater than the number in the *value* field.	***payload*** is greater than 7000.	***payload*** is a numeric value that is greater than 7000.
is greater than or equal to (>=)	Number	The numeric value of the meta key is greater than or equal to the number in the *value* field.	***payload*** is greater than or equal to 7000.	***payload*** is a numeric value that is greater than or equal to 7000.

Operator	Required Value	Usage	Example	Meaning
is less than (<)	Number	The numeric value of the meta key is less than the number in the *value* field.	***ip_dstport*** is less than 1024.	***ip_dstport*** is a numeric value that is less than the numeric value 1024.
is less than or equal to (<=)	Number	The numeric value of the meta key is less than or equal to the number in the *value* field.	***ip_dstport*** is less than or equal to 1024.	***ip_dstport*** is a numeric value that is less than or equal to numeric value 1024.
contains	String	The *value* field is a substring of the meta key. (This operator is only available for a string-valued meta key).	***ec_outcome*** contains failure.	***ec_outcome*** is a string that contains the substring *"failure"*.
not contains	String	The *value* field is not a substring of the meta key (This operator is only available for a string-valued meta key).	***ec_outcome*** not contains failure.	***ec_outcome*** is a string that does not contain the substring*"failure"*.
begins with	String	The *value* field is the beginning of the meta key (This operator is only available for a string-valued meta key).	***ip_dst*** begins with 127.0.	***ip_dst*** is a string that starts with *"127.0"*.
ends with	String	The *value* field is the end of the meta key (This operator is only available for a string-valued meta key).	***user_dst*** ends with son.	***user_dst*** is a string that ends in*"son"*.

Note: Terms in ***bold italics*** are Meta that may not exist in all customer environments.

Deploy ESA Rules Dialog

The Deploy ESA Rules dialog enables you to filter and select rules to deploy to an ESA service.

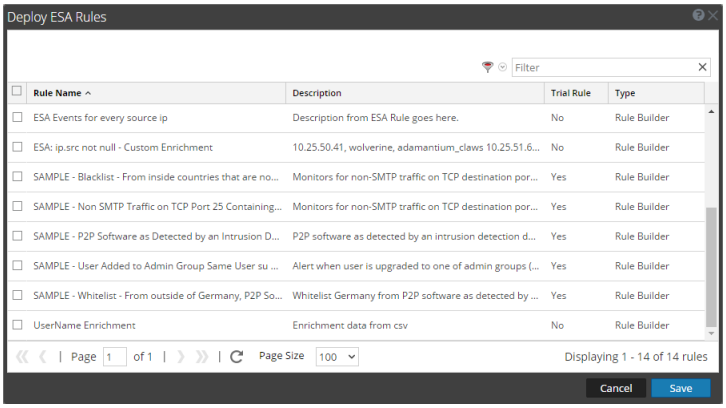
Deploy ESA Rules Dialog

To access this dialog:

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab opens by default.
2. In the options panel, under the **Deployment** section, select or add a new deployment by clicking  **> Add**.
3. If you add a new deployment, type the name of the deployment in the box in the options panel.
4. In the **ESA Rules** panel, click  .
   The Deploy ESA Rules dialog is displayed.

The following figure shows an example of this dialog.



The following table describes the parameters of the Deploy ESA Rules dialog.

Parameters	Description
	Filters the list of rules based on severity and type. The text box beside this icon filters based on rule name.
Rule Name	Displays the name of the rule.
Description	Describes the rule.
Trial Rule	Indicates whether or not the rule is a trial rule.
Type	Indicates the type of rule: RSA Live ESA, Advanced EPL, or Rule Builder.

Deploy ESA Services Dialog

The Deploy ESA Services dialog displays all ESA services available to be added to a deployment.

What do you want to do?

Role	I want to ...	Show me how

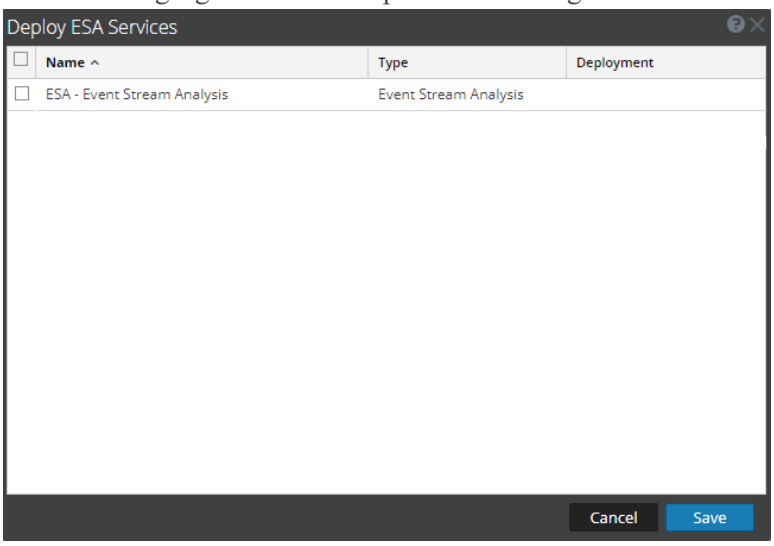
Deploy ESA Services Dialog

To access this dialog:

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab opens by default.
2. In the options panel, under the **Deployment** section, select or add a deployment.
3. In the **ESA Services** panel, click  .
   The Deploy ESA Services dialog is displayed.

The following figure is an example of this dialog.



The following table describes the parameters of the Deploy ESA Services dialog.

Parameters	Description
Name	Displays the name of configured ESA services.
Deployment	Displays the deployments to which the service has already been added.

Rule Builder Tab

The Rule Builder tab enables you to define a Rule Builder rule.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Define a Rule Builder rule.	Add a Rule Builder Rule
Content Expert	Define rule criteria.	Step 2. Build a Rule Statement
Content Expert	Add conditions to the rule.	Step 3. Add Conditions to a Rule Statement

Related Topics

- Add an Advanced EPL Rule

Rule Builder

To access the Rule Builder tab:

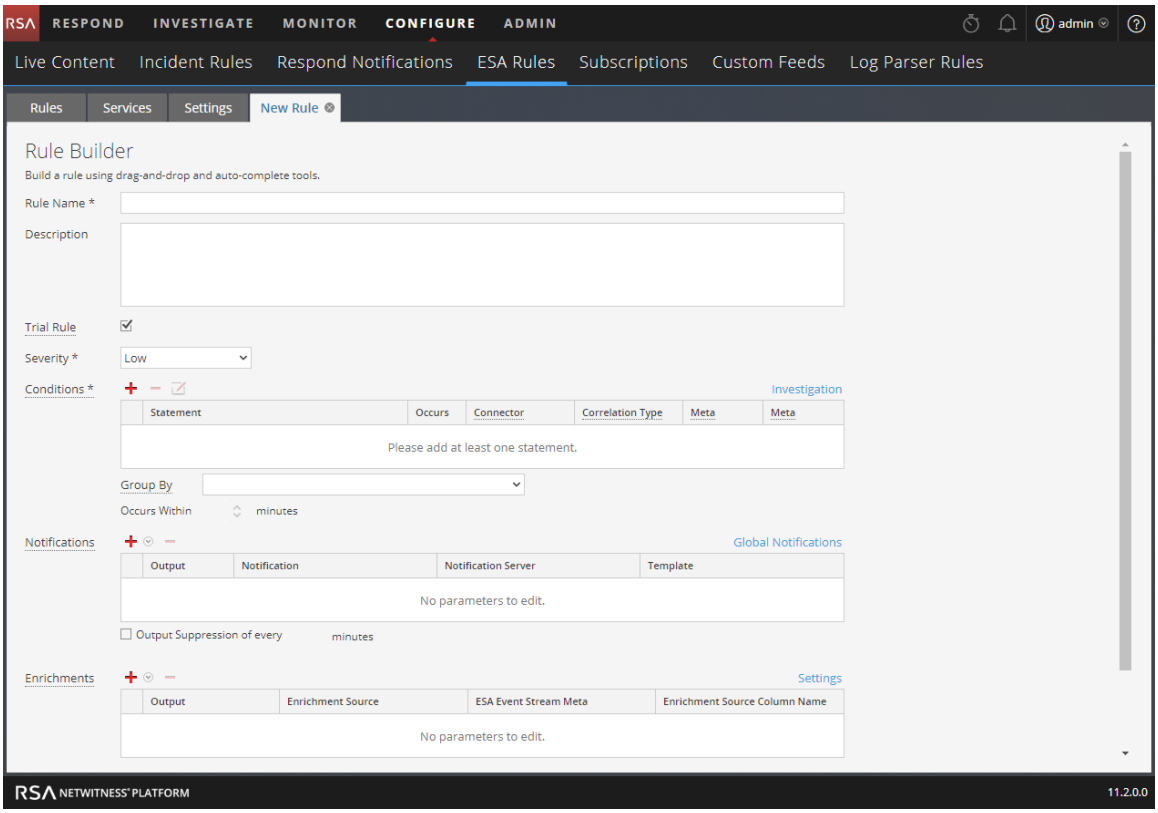
1. Go to **CONFIGURE** > **ESA Rules**.

   The Rules tab opens by default.

2. In the **Rule Library** toolbar, select  > **Rule Builder**.

   The Rule Builder tab is displayed.

The following figure shows the Rule Builder tab.



The following table lists the parameters in the Rule Builder tab.

Parameters	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Severity	Threat level of alert triggered by the rule.

The Rule Builder includes the following components:

- Conditions section
- Notifications section
- Enrichments section

Conditions Section

In the Conditions section of the Rule Builder tab, you define what the rule detects.

The following figure shows the Conditions section.

The following table lists the parameters of the Conditions section.

Parameter	Description
+	Add a statement.
−	Remove selected statement.
✎	Edit selected statement.
Statement	Logical group of conditions for one operation.
Occurs	Alert frequency if the condition is met. This specifies that there must be at least that many events that satisfy the criteria in order to trigger an alert. The time window in minutes binds the Occurs count.
Connector	Options to specify relationship among the statements: • followed by • not followed by • AND • OR The Connector joins two statements with AND, OR, followed by, or not followed by. When followed by is used, it specifies that there is a sequencing of those events. AND and OR build one large criteria. The followed by creates distinct criteria that occurs in sequence.

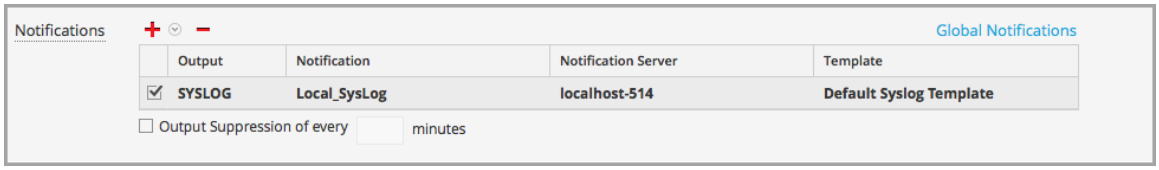
Parameter	Description
Correlation Type	**Correlation Type** applies only to **followed by** and **not followed by**. If you choose a correlation type of SAME, select one meta to correlate on, and if you choose a correlation type of JOIN, select two meta to correlate on. You may want to use JOIN if you are trying to correlate on meta from two different data sources. For example, say you want to correlate an AV alert with an IDS alert.
Meta	Enter the meta condition if choosing a correlation type of SAME or JOIN (as described above).
Meta	Enter the second meta condition if choosing a correlation type of JOIN (as described above). For example, The destination IP address from the AV alert and source IP address for the workstation from the IDS alert are joined to allow you to view the same entities across different sources.
occurs within minutes	Time window within which the conditions must occur.
Event Sequence	Choose whether the pattern must follow a *strict* match or a *loose* match. If you specify a strict match, this means that the pattern must occur in the *exact* sequence you specified with no additional events occurring in between. For example, if the sequence specifies five failed logins (F) followed by a successful login (S), this pattern will only match if the user executes the following sequence: F,F,F,F,F,S. If you specify a loose match, this means that other events may occur within the sequence, but the rule will still trigger if all of the specified events also occur. For example, five failed login attempts (F), followed by any number of intervening successful login attempts (S), followed by a successful login attempt might create the following pattern: F,S,F,S,F,S,F,S,F,S which would trigger the rule despite the intervening successful logins.
Group By	Select the meta key by which to group results from the dropdown list. For example, suppose that there are three users; Joe, Jane, and John and you use the Group By meta, **user_dst** (user_dst is the meta field for the user destination account). The result will show events grouped under the user destination accounts, Joe, Jane, and John. You can also group by multiple keys. For example, you might want to group by user and machine to see if a user logged in from the same machine attempts to log into an account multiple times. To do this, you might group by device_class and user_dst.

Notifications

In the Notifications section, you can choose how to be notified when ESA generates an alert for the rule.

For more information on the alert notifications, see Add Notification Method to a Rule.

The following figure shows the Notifications section.



Parameter	Description
+	To add an alert notification type.
−	To delete the selected alert notification.
Output	Alert notification type. Options are: • Email • SNMP • Syslog • Script
Notification	Name of previously configured output, such as an email distribution list.
Notification Server	Name of server that sends the output.
Template	Name of template for the alert notification.
Output Suppression of every	Option to specify alert frequency.
Minutes	Alert frequency in minutes.

Enrichments

In the Enrichments section, you can add a data enrichment source to a rule.

For more information on the enrichments, see Add an Enrichment to a Rule.

The following figure shows the Enrichments section.

Parameter	Description
	To add an enrichment.
	To delete the selected enrichment.
Output	Enrichment source type. Options are: • In-Memory Table • External DB Reference • Warehouse Analytics • GeoIP
Enrichment Source	Name of previously configured enrichment source, such as a .CSV filename for an In-Memory Table.
ESA Event Stream Meta	ESA meta key whose value will be used as one operand of join condition.
Enrichment Source Column Name	Enrichment source column name whose value will be used as the other operand of the join condition. For an in-memory table, If you configured a key when creating a .CSV-based enrichment, this column automatically populates with the selected key. However, you can change it if you like. For a GeoIP enrichment source, ipv4 is automatically selected.

Debug

Select the Debug option to print alerts to the ESA logs for troubleshooting.

Rules Tab

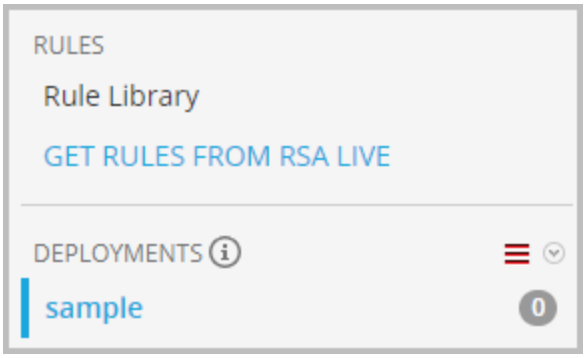
Options Panel

The following figure shows the options panel in the **Rules** tab.



There are two sections in the options panel: Rules and Deployments.

Rules Section

The Rules section contains two options. **Rule Library** is selected by default, and when it's selected, the Rule Library view is displayed within the tab. **Get Rules From RSA Live** navigates to the Live Search view, where you can search for rules.

Deployments Section

The Deployments section lists deployments and indicates whether there are updates to the deployments. From this section, deployments can be added, deleted, edited, and refreshed. Selecting a deployment from the list displays the Deployment panel within the tab. The following table describes the features of this section.

Feature	Description
	Displays a drop-down menu from which you can choose to add, edit, or delete a deployment. You can also refresh the list of deployments to see if there are any new updates to the list.
	Indicates whether there are any updates to the deployment.
	Indicates the number of rules in the deployment.

Rule Library Panel

The Rule Library panel allows you to manage rules.

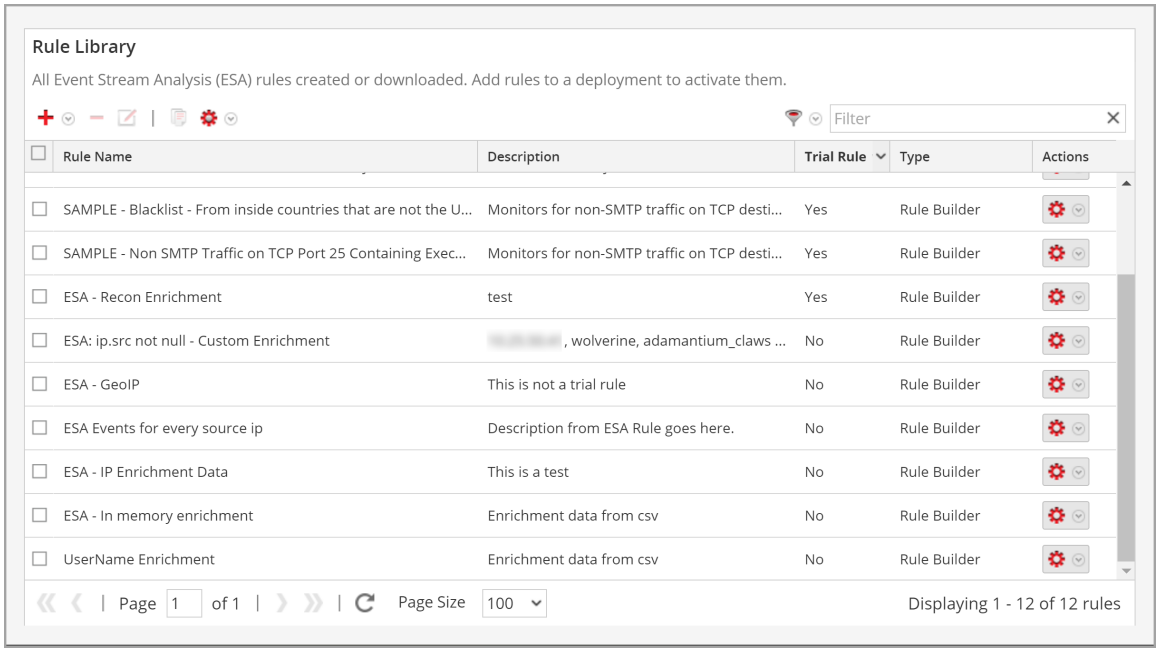
Related Topics

- Add an Advanced EPL Rule

Rule Library Panel

To access this view, go to **CONFIGURE > ESA Rules**. The Rules tab is displayed and the Rule Library panel is on the right.

The following figure shows the Rule Library panel.



The Rule Library panel includes the following components:

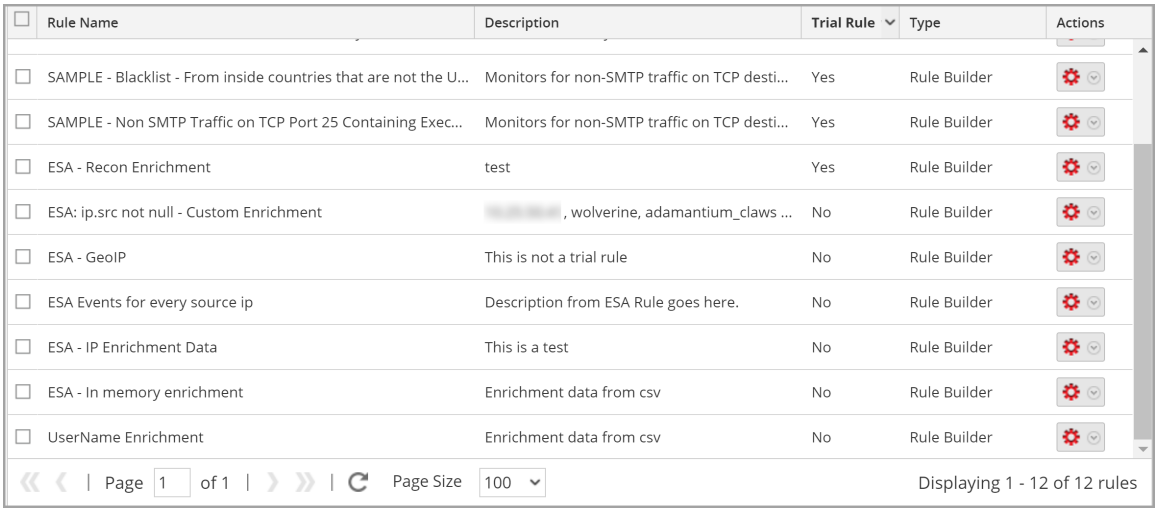
- Rule Library toolbar
- Rule Library list

Rule Library Toolbar

The Rule Library toolbar allows you to add, delete, edit, duplicate, filter, export, and import ESA rules. The following figure shows the icons for these actions.

Rule Library List

The following figure shows the Rule Library list.

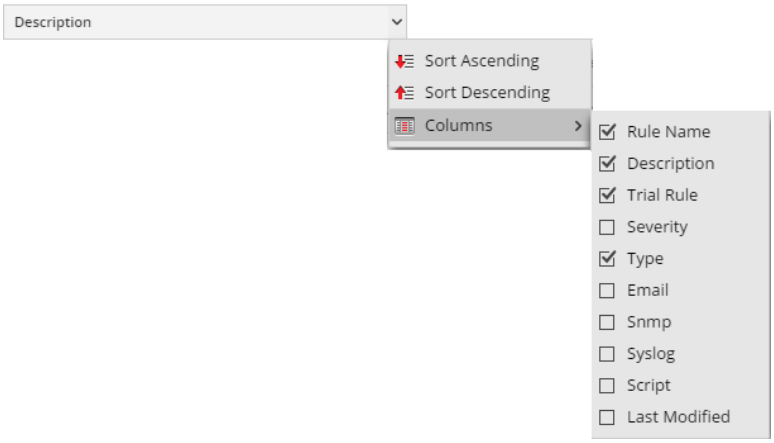


The Rule Library list shows all the ESA rules that have been downloaded from RSA Live or created in the Advanced EPL and Rule Builder tabs. The following table lists the columns in the Rule Library list and their description.

Column	Description
Rule Name	Purpose of the ESA rule.
Description	Summary of what the ESA rule detects.
Trial Rule	Deployment mode to see if the rule runs efficiently.
Type	The type of rule.
Actions ()	Menu to delete, edit, duplicate, or export the selected rule.

Column	Description
Severity	Threat level of alert triggered by the rule.
Email	Indicates whether an alert notification for the rule is sent by email. This column is not visible by default.
SNMP	Indicates whether an alert notification for the rule is sent using SNMP. This column is not visible by default.
Syslog	Indicates whether an alert notification for the rule is sent using Syslog. This column is not visible by default.
Script	Indicates whether an alert notification for the rule executes a script. This column is not visible by default.
Last Modified	The date and time when the ESA rule was last modified. This column is not visible by default.

To display columns which aren't visible by default, hover over the title of a column and click the **v** on the right. This opens a drop-down menu in which you can sort the contents of the column or choose which columns you want to see in the Rule Library list.



Deployment Panel

ESA deployments map rules from your rule library to the appropriate ESA Services and data sources. The Deployment panel (CONFIGURE > ESA Rules > Rules tab) enables you to create and configure ESA deployments that specify:

- ESA Services
- ESA Rules

When you are ready to start aggregating data and generating alerts from an ESA deployment, you deploy the ESA deployment to activate it.

What do you want to do?

Role	I want to ...	Show me how

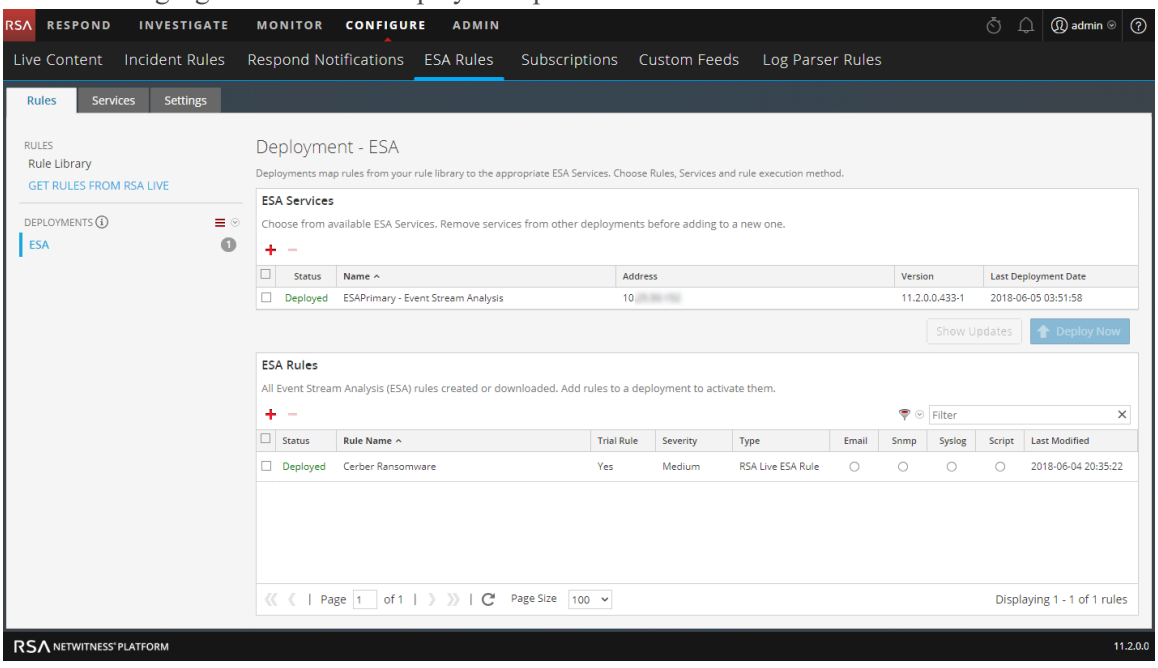
Related Topics

- View Stats for an ESA Service

Deployment Panel

The following figure shows the Deployment panel.



ESA Services

In the ESA Services section, you can manage each ESA service in the deployment.

The following table describes the actions you can perform in the ESA Services section.

Task	Description
+	Adds an ESA service to the deployment.
−	Removes the selected ESA service from the deployment.

The following table describes the columns in the ESA Services section.

Title	Description
Status	Indicates if the deployment status is **Added**, **Deployed**, **Updated**, or **Failed**.
Name	Name of the ESA service.
Address	IP address of the host where the ESA service is installed.
Version	Version of the ESA service.
Last Deployment Date	The date and time when the ESA service was last deployed.

Deployment Options

There are two deployment options below the Services section. These options apply to the entire ESA deployment.

The following table describes these deployment options.

Task	Description
Show Updates	Enables you to view a history of updates to the deployment.
Deploy Now	Activates the ESA deployment. The selected ESA service starts aggregating data and generating alerts using the specified ESA rules in the deployment. You need to add ESA Rules to the deployment before deploying the ESA deployment.

ESA Rules

In the ESA Rules section, you manage rules in the deployment. This section lists all rules that are currently in the deployment.

The following table describes the actions you can perform in the ESA Rules section.

Task	Description
	Opens the Deploy ESA Rules dialog, where you can select a rule.
	Removes the selected ESA rules from the deployment.
	Filters the list of rules.
	Enables you to search for a rule.

The following table describes the columns in the ESA Rules section.

Title	Description
Status	Indicates the rule status: • Deployed - the rule is deployed. • Updated - the rule has been updated since the last deployment. • Added - the rule has been added since the last deployment. • Failed - the deployment failed.
Rule Name	Describes the purpose of the ESA rule.
Trial Rule	Indicates whether the rule is Deployment mode to see if the rule runs efficiently.
Severity	Shows the threat level of alert triggered by the rule.
Type	Shows the type of the ESA rule: Rule Builder, Advanced EPL, or RSA Live ESA (Downloaded from RSA Live).

Title	Description
Email, SNMP, Syslog, Script	Indicates which notification types are used for alerts generated by the rules.
Last Modified	Shows the date and time when the ESA rule was last modified.

Rule Syntax Dialog

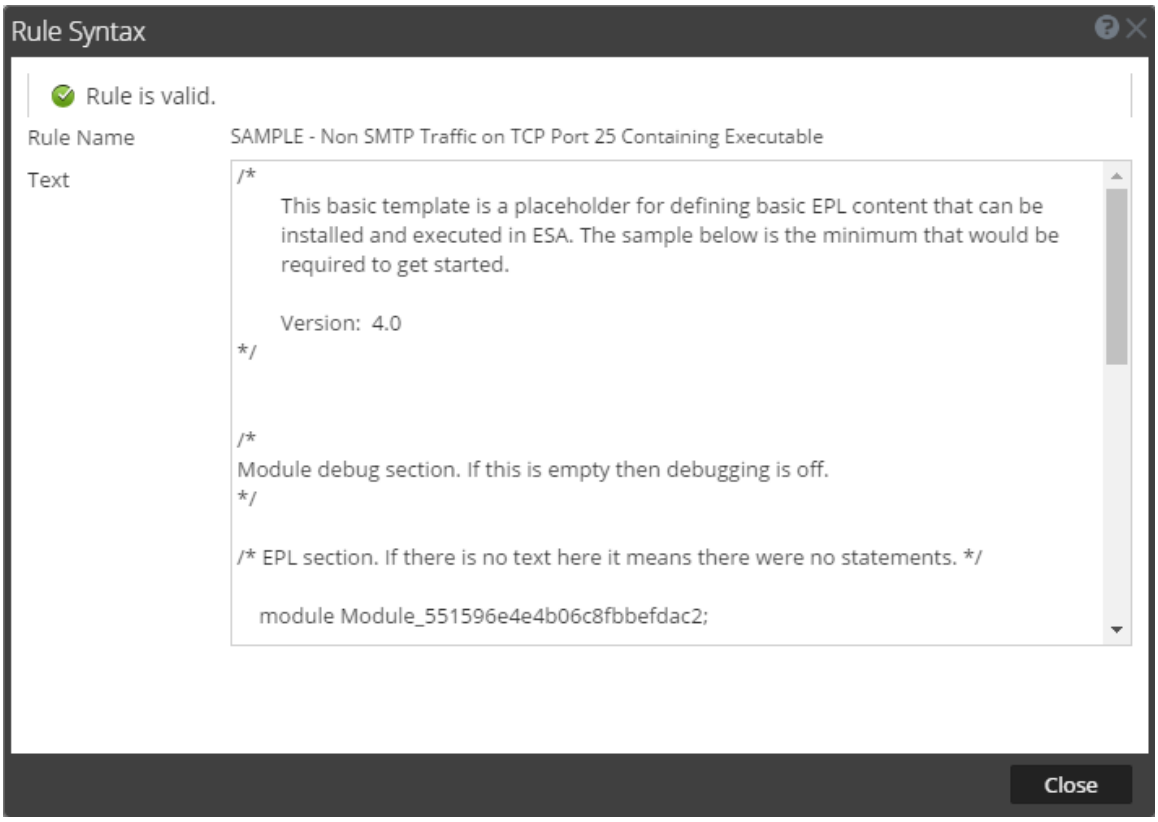
This topic describes the features of the Rule Syntax dialog. The Rule Syntax dialog displays the EPL syntax of conditions, statements, and debugging parameters, and provides a warning when the syntax is invalid.

Rule Syntax Dialog

To access this dialog:

1. Go to **CONFIGURE > ESA Rules**.
2. In the **Rule Library** view, do one of the following:
   a. Click + and select **Advanced EPL** or **Rule Builder**.
   b. Double-click an existing rule.
   c. Select an existing rule and click in the **Rule Library** toolbar.
   d. In the row of an existing rule, select > **Edit**.
   The new or existing rule is displayed in a new tab, available to edit.
3. Click **Show Syntax** at the bottom of the tab.

The following figure shows an example of the Rule Syntax dialog showing a valid rule.



The following table describes the Rule Syntax dialog parameters.

Parameters	Description
Rule is valid or **Validation error in rule**	Indicates whether the rule syntax is valid or needs to be changed.
Rule Name	Displays the name of the rule.
Text	Displays the EPL syntax of conditions, statements, and debugging parameters if the rule is valid.

Services Tab

This topic provides an overview of the **CONFIGURE > ESA Rules > Services** tab. The Services tab provides details of the ESA services added to NetWitness Platform.

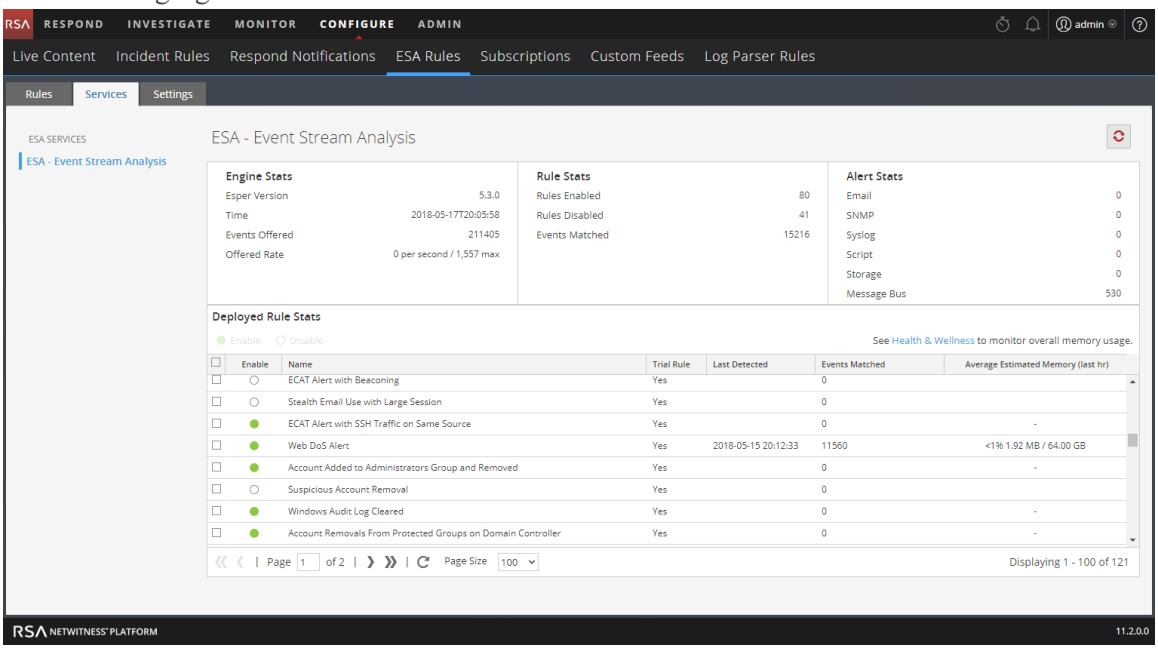
Services

The following figure shows the Services tab:



The Services tab has the following sections:

- ESA Services panel (on the left)
- General Stats panel (top right)
- Deployed Rule Stats panel (bottom right)

ESA Services Panel

The ESA Services panel lists the name of each ESA service added to NetWitness Platform.

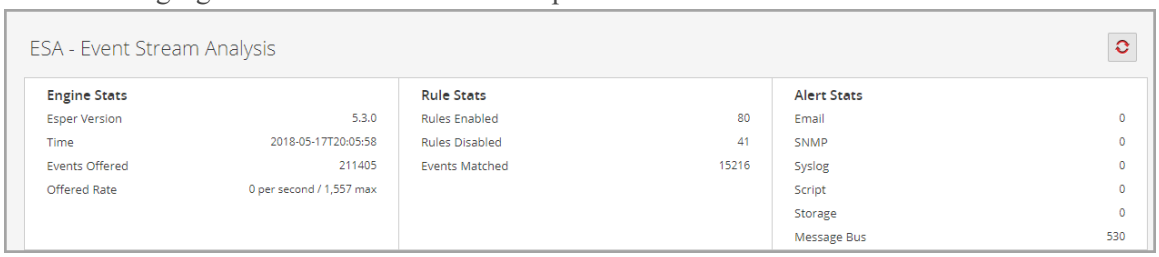
General Stats Panel

The General Stats panel provides information on the Esper engine, rules, and alerts.

The General Stats panel contains the following sections:

- Engine Stats
- Rule Stats
- Alert Stats

The following figure shows the General Stats panel.



The following table lists and describes the parameters in each section.

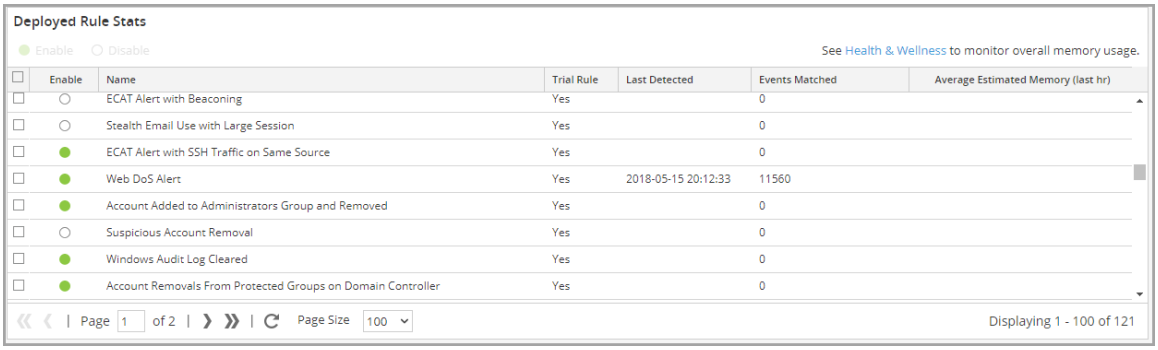
Sections	Parameter	Description
Engine Stats	Esper Version	Esper version running on the ESA service
	Time	Time when the last event was sent to Esper Engine
	Events Offered	Number of events analyzed by the ESA service since the last service start
	Offered Rate	Current events offered rate on the ESA service

Sections	Parameter	Description
Rule Stats	Rules Enabled	Number of rules enabled
	Rules Disabled	Number of rules disabled
	Events Matched	Total number of events matched to all rules on the ESA service
Alert Stats	Email	Number of email notifications sent by the ESA service
	SNMP	Number of SNMP notifications sent by the ESA service
	Syslog	Number of Syslog notifications sent by the ESA service
	Script	Number of Script notifications sent by the ESA service
	Storage	Total number of alerts stored in database
	Message Bus	Total number of alerts sent to Respond

Deployed Rule Stats Panel

The Deployed Rule Stats panel provides details on the rules that are deployed on the ESA service.

The following figure shows the Deployed Rule Stats panel.



The table lists the various parameters in the view and their description.

Parameters	Description
Enable	Enables a rule that was disabled.
Disable	Disables a rule that was enabled.

Parameters	Description
Health & Wellness	Displays a snapshot of memory usage when trial rules get disabled
Enable	Indicates whether the rule is enabled or disabled. A green circle icon indicates that the rule is enabled. A white circle icon indicates that the rule is disabled.
Name	Name of the ESA rule.
Trial Rule	Indicates if the rule is running in trial rule mode.
Last Detected	The last time alert was triggered for the rule.
Events Matched	The total number of events that matched the rule.
Average Estimated Memory (last hour)	The estimated amount of memory that the rule has been using for the last hour.

Settings Tab

This topic describes the components of the **CONFIGURE > ESA Rules > Settings** tab. In the Settings tab, you can perform the following tasks:

- View a list of meta keys
- Configure a data enrichment source
- Add a connection to an external database

What do you want to do?

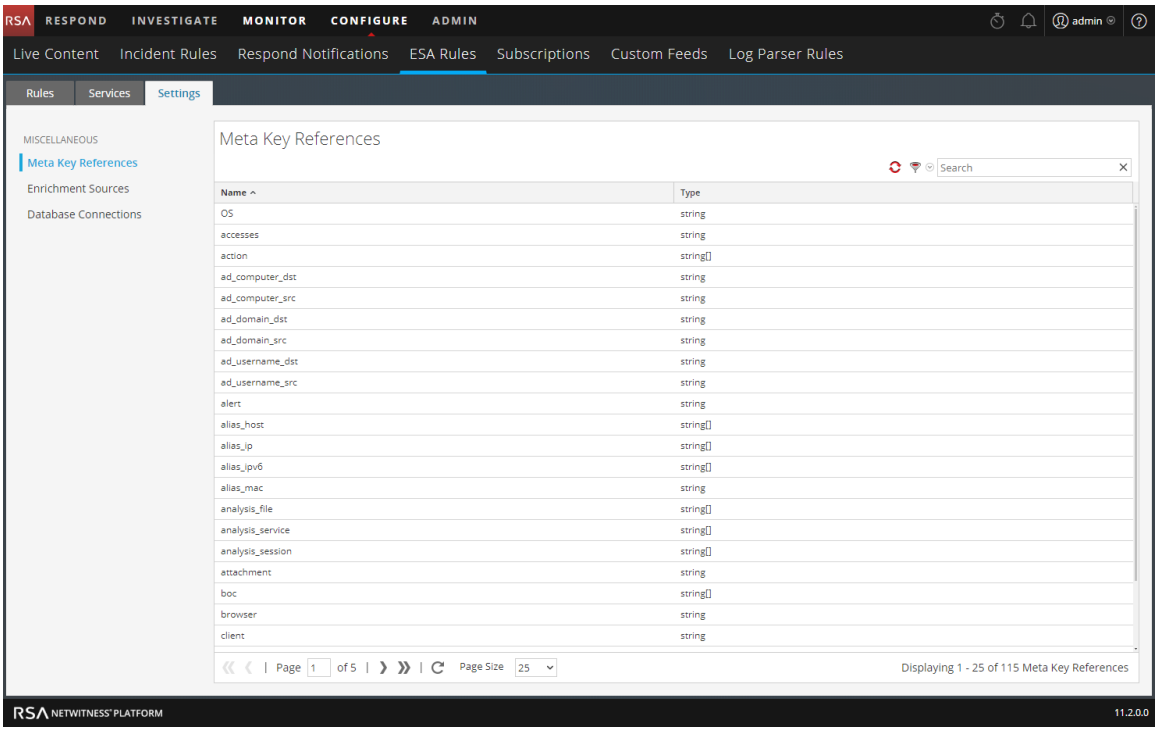
Role	I want to ...	Show me how
Content Expert	Configure a connection to an external database.	Configure a Database Connection
Content Expert	Configure a database as an enrichment source.	Enrichment Sources
Content Expert	Configure an in-memory table as an enrichment source.	Configure In-Memory Table as an Enrichment Source
Content Expert	Configure a Context Hub list as an enrichment source.	Configure Context Hub List as an Enrichment Source

Related Topics

- Add a Data Enrichment Source

Settings

The following figure shows the Meta Key References section in the Settings tab.



Meta Key References

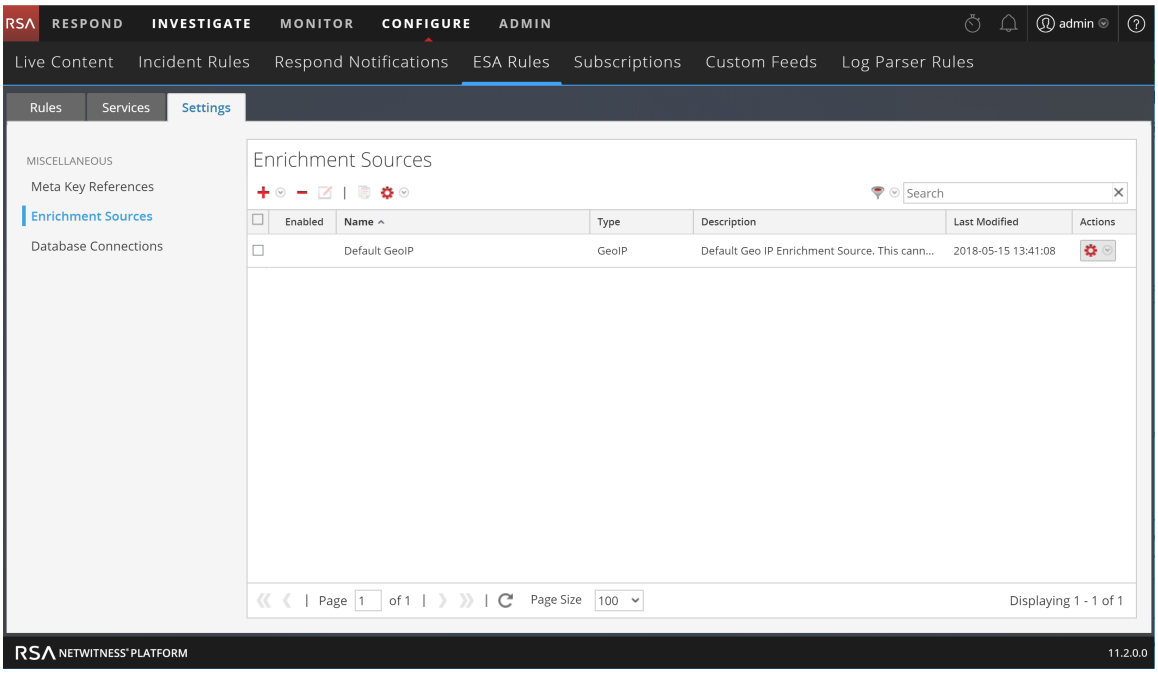
The Meta Key References section lists each meta key and the type of value the key requires.

Enrichment Sources

In the Enrichment Sources section, you can configure the following external data sources:

- GeoIP
- External Database Reference
- In-Memory Table
- Warehouse Analytics
- Context Hub List

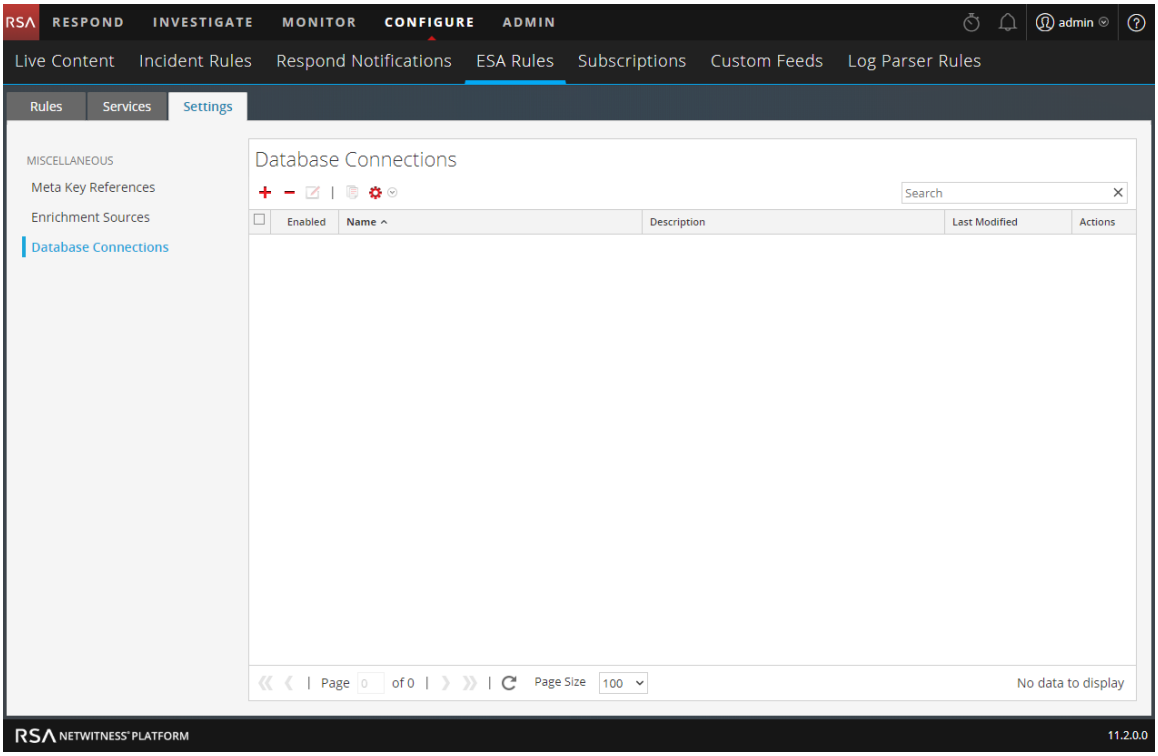
The following figure shows the Enrichment Sources section in the Settings tab.



Database Connections

In the Database Connections section, you can configure a connection to an external database so ESA can access that data.

The following figure shows the Database Connections section in the Settings tab.



In the Database Connections section you can perform the following:

- Add a Database Connection
- Delete a Database Connection
- Edit a Database Connection
- Duplicate a Database Connection
- Import a Database Connection
- Export a Database Connection

Updates to the Deployment Dialog

The Updates to the Deployment dialog displays changes to the deployment, such as adding a rule or service. Deployment updates are indicated by the update icon ( ) next to the name of the deployment in the Rules tab options panel.

What do you want to do?

Role	I want to ...	Show me how
Content Expert	Deploy rules to run on ESA.	Deployment Steps
Content Expert	Edit or delete a deployment.	Edit the Deployment Name or Delete a Deployment
Content Expert	View deployment updates.	Show Updates to a Deployment

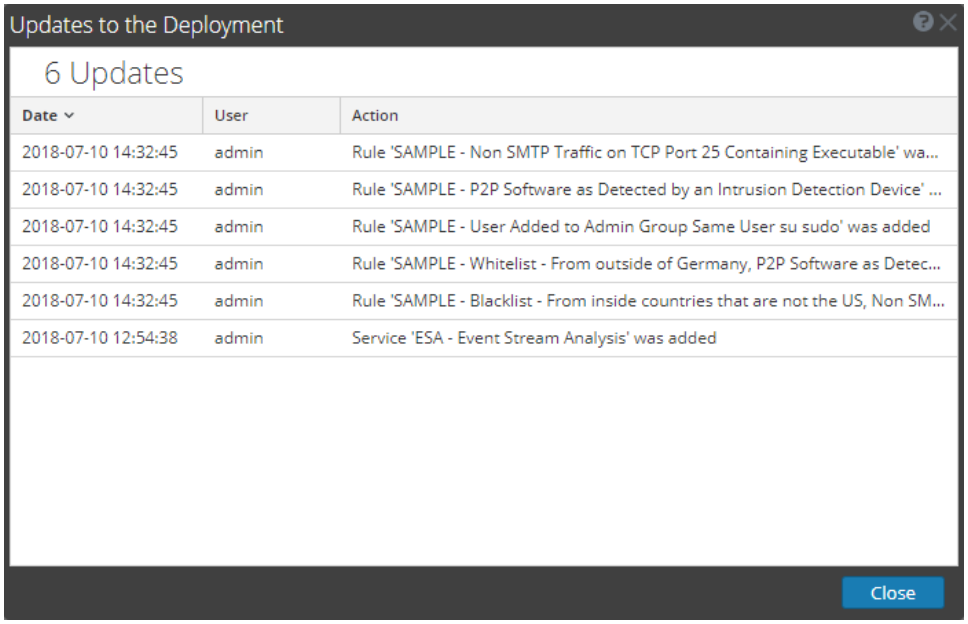
- Remove an ESA Service from a Deployment
- Additional Deployment Procedures
- Edit or Delete a Rule in a Deployment

Deployment Dialog

To access this dialog:

1. Go to **CONFIGURE > ESA Rules**.
   The Rules tab opens by default.
2. In the options panel, under the **Deployments** section, select or add a deployment.
3. In the **Deployment** panel, click **Show Updates**.
   The Updates to the Deployment dialog is displayed.

The following figure is an example of this dialog.



The Updates to the Deployment dialog displays the number of updates at the top of the dialog. The following table describes the parameters of this dialog.

Parameters	Description
Date	Displays the day and time of the update.
User	Displays the user who made the update.
Action	Describes the update.

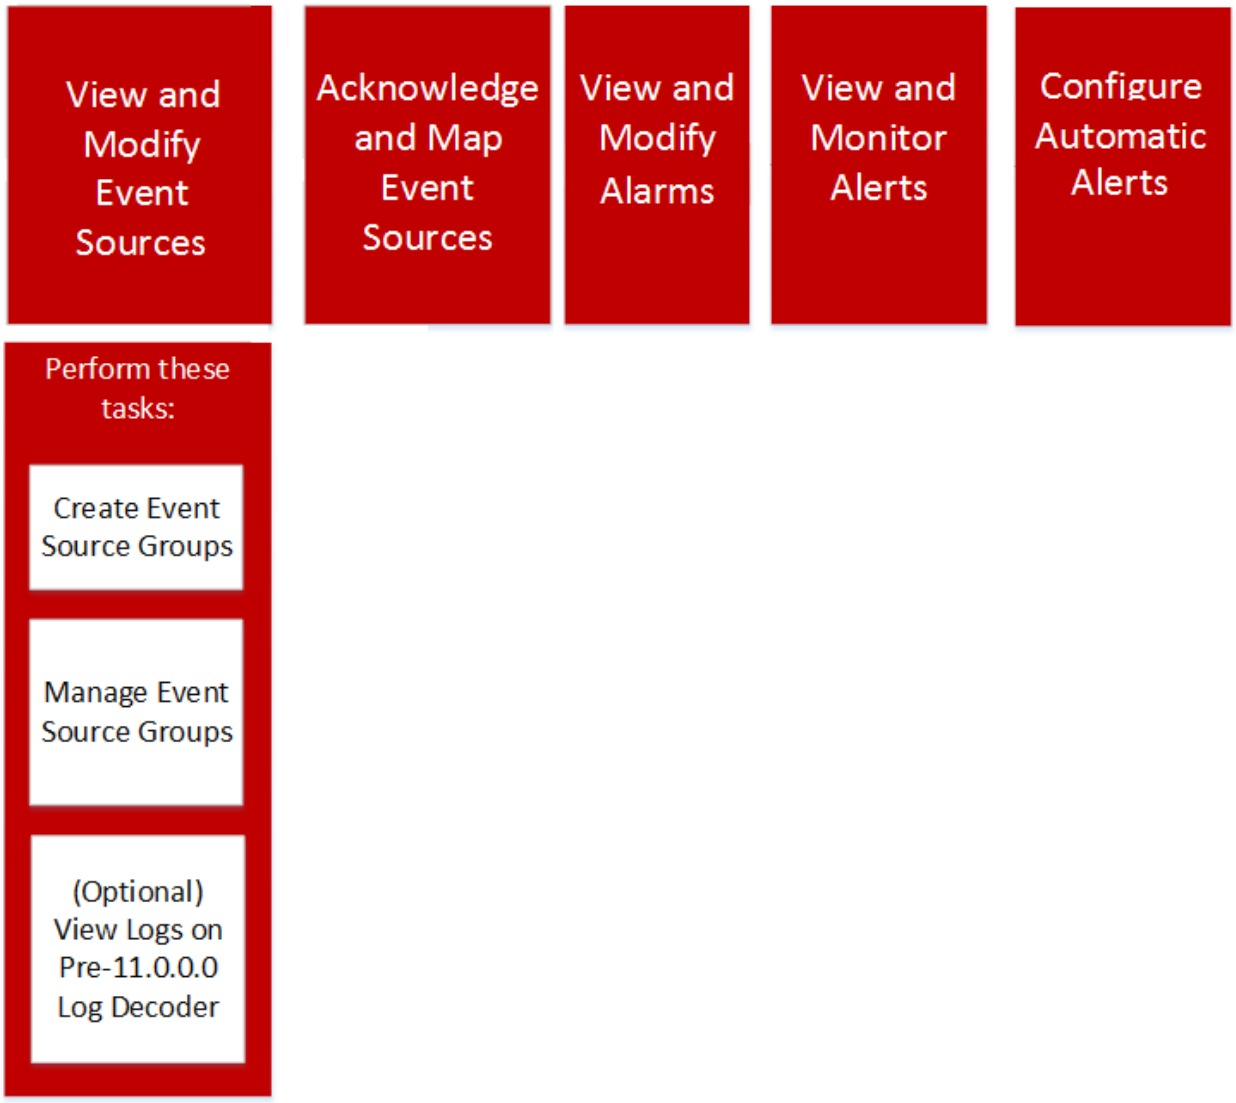
About Event Source Management

The Event Source module in NetWitness Platform provides an easy way to manage event sources and configure alerting policies for your event sources.

Workflow

This workflow shows the overall process for managing event sources, and configure monitoring for them. It also shows where configuring alarms and alerts settings are located in the process.



Prerequisites

There are two permissions that affect Event Source Management:

- **View Event Sources** is needed for users to view event sources, their attributes, and their thresholds and policies.
- **Modify Event Sources** allows users to add, edit, and otherwise update event sources.

For details, see the following topics:

- The *Roles Tab* topic available in the **System Security and User Management** guide > **References** > **Administration Security View** > **Roles Tab**.
- The *Role Permissions* topic describes the built-in NetWitness Platform system roles, which control access to the user interface. Available in the **System Security and User Management** guide > **How Role-Based Access Control Works**.
- The *Manage Users with Roles and Permissions* topic describes how to manage users in NetWitness Platform, using roles and permissions. Available in the **System Security and User Management** guide > **Manage Users with Roles and Permissions**.

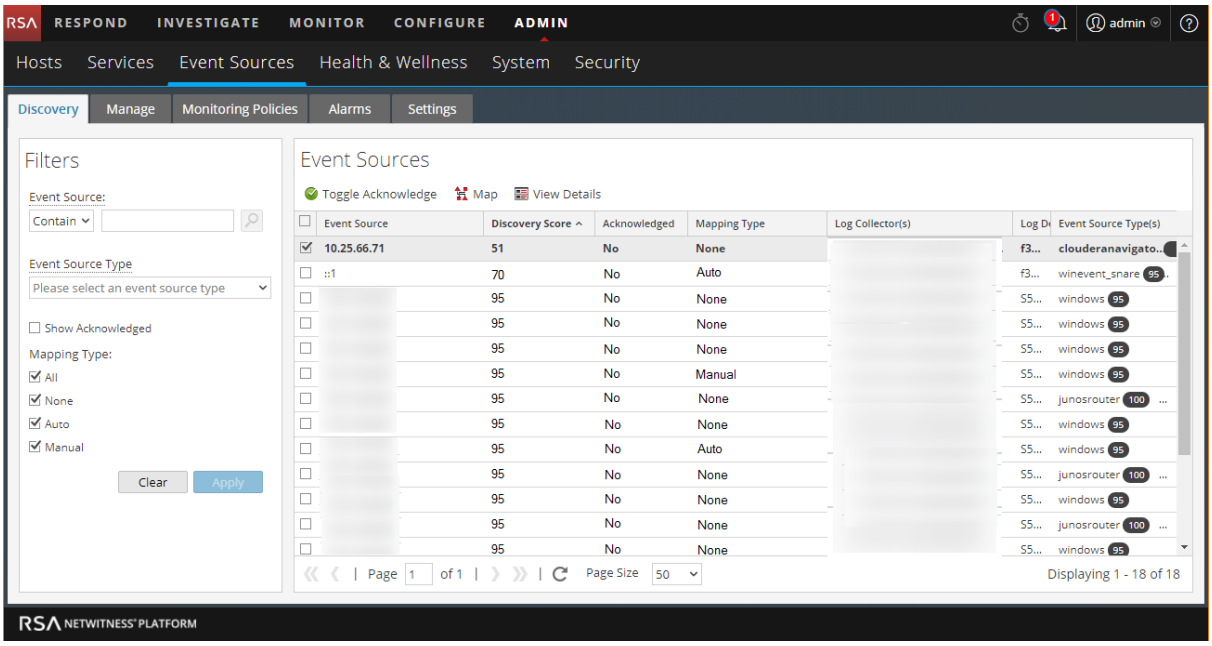
Automatic Mapping

Introduced in RSA NetWitness® Platform version 11.1, the system automatically maps incoming events to a type based on previous logs received from that address, reducing the mis-parsing of messages and reducing the number of items that need attention in the Discovery workflow. The UI indicates that an address has been auto-mapped in the Discovery workflow.

Navigate to Event Source Management

You can view the details about your existing event source groups by doing the following:

1. Go to **ADMIN > Event Sources**.



2. Click any of the following:
   - The **Discovery** tab. Use this tab to review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately.
   - The **Manage** tab. This tab allows you to add, edit, and delete event source groups as well as viewing details for your existing event source groups.
   - The **Monitoring Policies** tab. Use this tab to view or edit your event source alerting configuration.
   - The **Alarms** tab. Use this tab to see the details of the alarms that have been generated. Alarms are generated when event sources exceed or fall below their set thresholds.
   - The **Settings** tab. Use this tab to view or change the behavior for automatic alerts.
   - The **Log Parser Rules** tab. Use this tab to view log parser rules as well as viewing how those rules will parse specified logs.

Note: When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness Platform automatically adds the event source to the list. Additionally, if it matches the criteria for any existing group, it becomes part of that group.

How Alarms and Notifications Work

The Event Source module in NetWitness Platform displays alarms and sends notifications based on alarms that are triggered.

For alarms, consider the following:

Alarms are of two types: **automatic** (triggered when baselines are exceeded or not met) and **manual** (configured using thresholds).

- **Automatic**: If you turn on automatic alerts, the system reports alarms for **all** event sources that go above or below their normal baselines by the required amount. You can specify the over / under percentage on the Settings Tab.
- **Manual**: The system alerts whenever an event source exceeds the thresholds in the policy for the associated groups.
- Alarms appear on the UI, in the Alarms Tab.

For notifications, consider the following:

- To receive manual notifications (via email, SNMP or Syslog):
  - Specify a policy for an event source group.
  - Set a high or low (or both) threshold.
  - Enable the policy.
- To receive automatic (baseline) notifications:

- Baseline alerting must be on. This is turned on by default.
- You must enable notifications from automatic monitoring. See Configuring Automatic Alerting for details.
- The event source that triggers the alarm must be in a group that has a policy enabled.

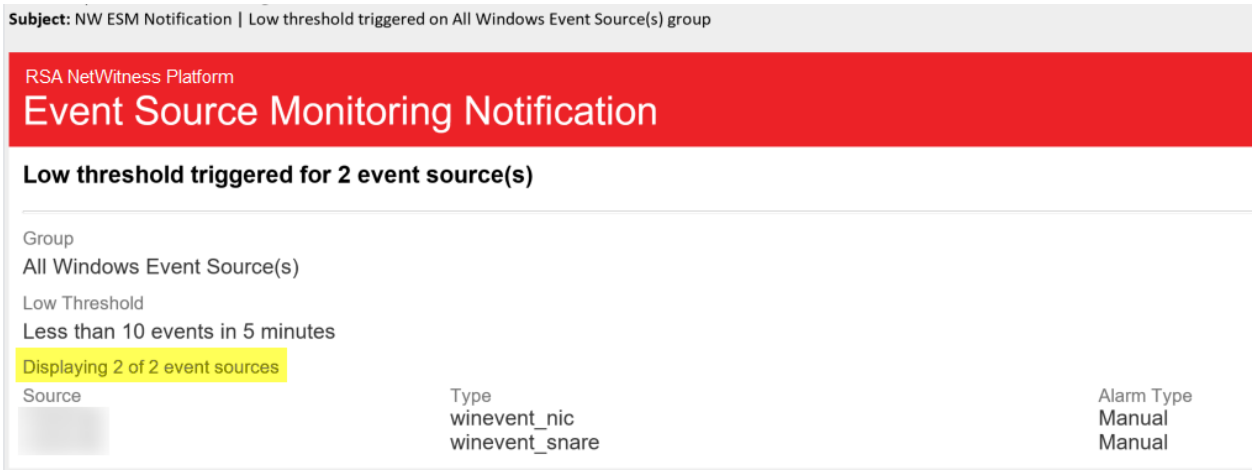
- If you have automatic alerting turned on, and you have configured a policy and threshold for a group:
  - If the event source goes outside its baseline, you see an automatic alert and receive a notification.
  - If the event source goes outside its thresholds, you see a manual alert and receive a notification.
  - If both occur (threshold and baseline exceeded or not met), you receive two alarms (visible on the Alarms tab) and a notification that indicates both alarms. That notification will list the event source that double alarmed twice; one listing indicating it was an automatic alarm.

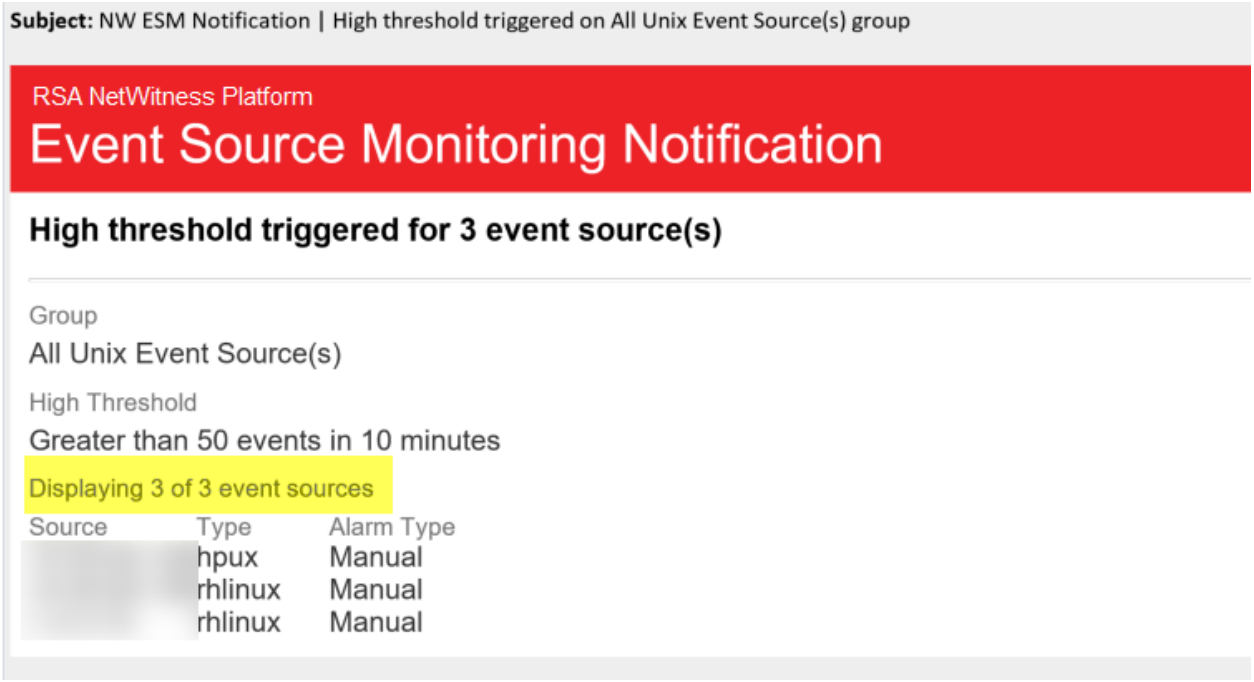
Large Email Notifications

If you have set up email notifications, keep in mind that the email can grow very large, depending on the number of event sources in the notification.

If the number of event sources in the alarmed state exceeds 10,000, then the email notification contains the details for only the first 10,000 and a total count. This is to ensure that the email is successfully delivered.

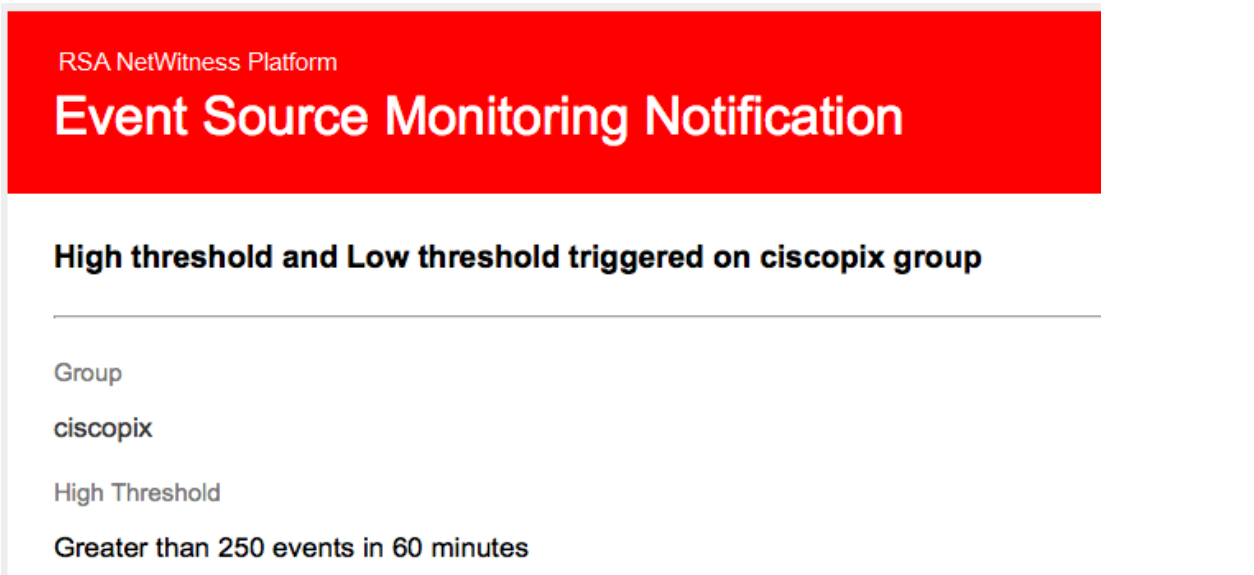
The following examples show a low threshold triggered for two event source groups and a high threshold triggered for three event source groups.





High and Low Thresholds Both Triggered

There may be occasions when both the high and low alarms are both triggered for a particular event source group. The easiest way to see when this happens is to read the email header, which clearly states when both thresholds are triggered, as shown in this image:



In this example, the header states, "High threshold and Low threshold triggered on ciscopix group." To see the details for the low threshold event sources, you may need to scroll down past hundreds, or even thousands, of the high threshold event sources.

Automatic Alerting

This topic describes automatic alerts, which are based on baseline settings.

Note: Automatic alerting, and all of the parameters that determine its behavior, are currently in Beta testing.

You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness Platform also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- Once you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.
- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time (for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.
- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

Common Scenarios for Monitoring Policies

Typically, organizations monitor their event sources in "buckets" based on how critical the event sources are. One typical example is as follows:

- There is a group of PCI devices, and it is critical to know if any of these devices stop sending messages (or send too few messages) within a half hour.
- There is a group of Windows devices, and it is useful to know if any of these devices stop sending messages after four hours.
- There is a group of quiet devices that do not typically send a lot of messages, but you would like to know if they do not send anything for 24 hours.

Many organizations may have a network that resembles this example. You may have more or different categories, but this example is used to discuss this feature.

You may have dozens or even hundreds of event source groups, and still only have a few groups for which you need to set thresholds and alerts.

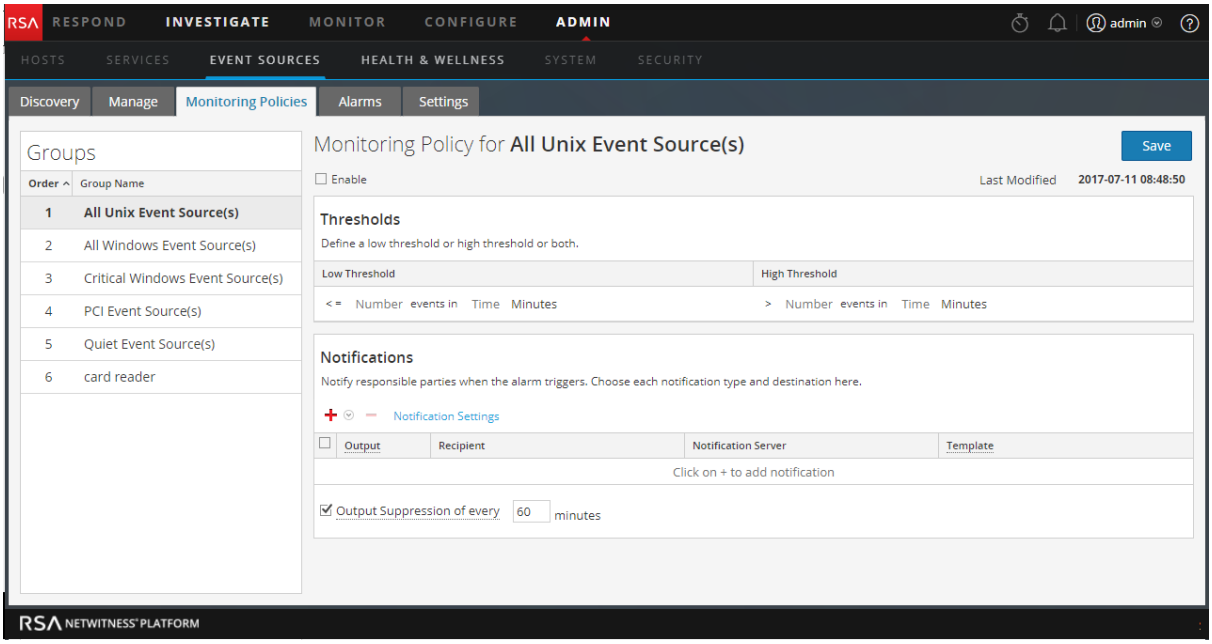
Note: If an Event Source is a member of multiple groups that have alerting configured, it will only alert on the first matching group in the ordered list. (The Monitor Policies tab presents an ordered list of your groups.)

Ordering the Groups

Note: To change the order of the groups, drag and drop a group to its new location. The higher a group is listed, the higher the precedence for that group's thresholds: RSA NetWitness Platform checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list.

The first thing to keep in mind is how to order your groups on the Monitoring Policies page. Assuming that you have the three groups mentioned above, you should order them as follows:

1. Quiet event sources. Having this group first ensures that you will not get numerous false alerts.
2. High priority PCI event sources. The highest priority devices should be after the quiet devices
3. Windows event sources. The time range is longer (four hours versus a half hour) for these devices than for the PCI devices. Therefore, they should come after the PCI devices.
4. All event sources. Optionally, you could set thresholds for all devices as a catch-all. This ensures that your entire network is operating as expected. For the catch-all group, you do not need to specify any thresholds—you can use automatic alerting to generate alarms for the event sources in this group.



In the figure above, note the following:

- The groups are ordered as discussed in the previous section.
- The threshold for PCI devices is to alert if the number of messages coming in to NetWitness Platform is fewer than 10 messages in 30 minutes.
- A low threshold is defined, but not a high threshold. This is typical for many use cases.

After you have set up and ordered your groups and begun to receive alerts, you may need to adjust the order. Use these guidelines to help you adjust the ordering:

- If you receive more notifications than you need, you can move the group down in the order. Similarly, if you are getting too few notifications, move the group up towards the top.
- If you notice that one event source is creating more alerts than it should, you can move it to another group, or create a new group for that event source.

Manage Event Source Groups

Managing Event Source Groups

Definitions

When dealing with event source groups in NetWitness Platform, note the following:

- An **event source** is essentially the combination of values for all of its attributes.
- An **event source group** is the set of event sources that match a set of criteria that are defined for that group.

For example, you might have the following groups:

- A group named **Windows Devices**, consisting of all the event source types associated with Microsoft Windows event sources (`winevent_nic`, `winevent_er`, and `winevent_snare`).
- A group named **Low Priority Services**, consisting of all services where the Priority attribute has been set lower than 5.
- A group named **U.S. Sales Servers**, where you gather event sources located in the U.S.A. and having an Organization attribute of Sales, Finance, or Marketing.

Manage Tab Details

The Manage tab in the Event Source module provides an easy way to manage event sources. In this tab, you can:

- Set up event source groups in a consistent way.
- Work with event source attributes in a consistent, straightforward manner.
- Easily search through your entire set of event sources.
- Bulk edit and update your event sources and event source groups.

You can view the details about your event source groups by doing the following:

1. Go to **ADMIN** > **Event Sources**.
2. Select the **Manage** panel to see the details for your existing event source groups.

Note: When the system receives logs from an event source that does not currently exist in the Event Source List, NetWitness Platform automatically adds the event source to the list. Additionally, if it matches the criteria for any existing groups, it becomes part of that group.

Default Groups

RSA NetWitness Platform has several default groups. You can customize these as required and use them as templates for creating new groups.

The default groups are as follows:

- All Event Sources
- All Unix Event Sources
- All Windows Event Sources
- Critical Windows Event Sources
- PCI Event Sources
- Quiet Event Sources

You can edit any of these groups to investigate the rules that define the groups.

Note: You cannot edit or delete the **All** event source group.

Creating Event Source Groups

Administrators must receive notifications when event sources are no longer being collected by NetWitness Platform. They need to be able to configure how long the event sources can be quiet (that is, not collect any log messages) before sending a notification based on different factors.

RSA NetWitness Platform provides event source groups so that you can group similarly important devices together. You can create groups based on attributes that you imported from your CMDB (configuration management database), or by manually choosing event sources to add to the group.

For example, these are some of the types of event source groups that you can create:

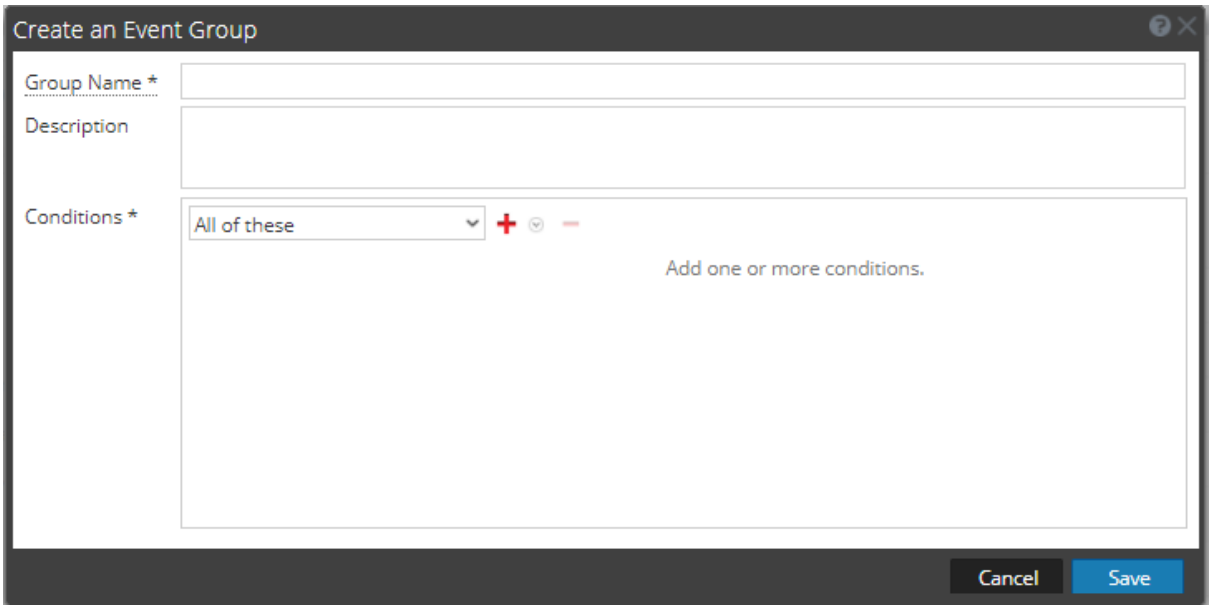
- PCI sources
- Windows Domain Controllers
- Quiet sources
- Finance Servers
- High Priority devices
- All Windows sources

Procedure

To create an Event Source group:

1. Go to **ADMIN** > **Event Sources**.
2. In the **Manage** panel, click  .

   The Create an Event Group dialog is displayed.



3. Enter a Group Name.
4. Enter a Description.
5. Click + to add a condition. Continue adding conditions as necessary. For details on constructing conditions, see Create/Edit Group Form.
6. Click **Save**.

   The new group is listed in the **Manage** panel.

Examples

This section describes a simple example, and then discusses how to set up a more complex set of rules.

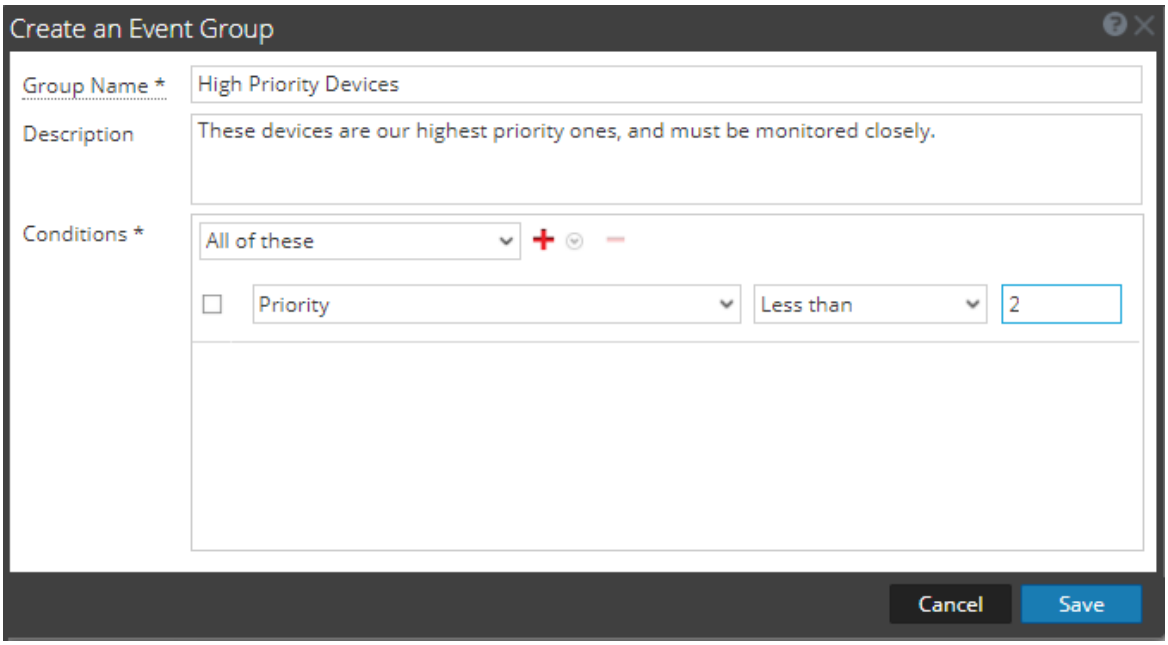
Simple Example

If you want to create an event source group that contains all of your high priority event sources, this example describes the necessary steps.

1. Go to **ADMIN > Event Sources**.
2. In the **Manage > Groups** panel, click + .
3. Enter **High Priority Devices** for the Group Name.
4. Enter a description, such as, "These devices are our highest priority ones, and must be monitored closely."
5. Leave **All of these** selected and click + to add a condition.
6. Select **Add condition** from the drop-down menu.
   a. Select an Attribute: **Priority**.
   b. Select an Operator: **Less than**.

c. Enter a value: **2**.

The following figure displays the updated Edit Event Group dialog.



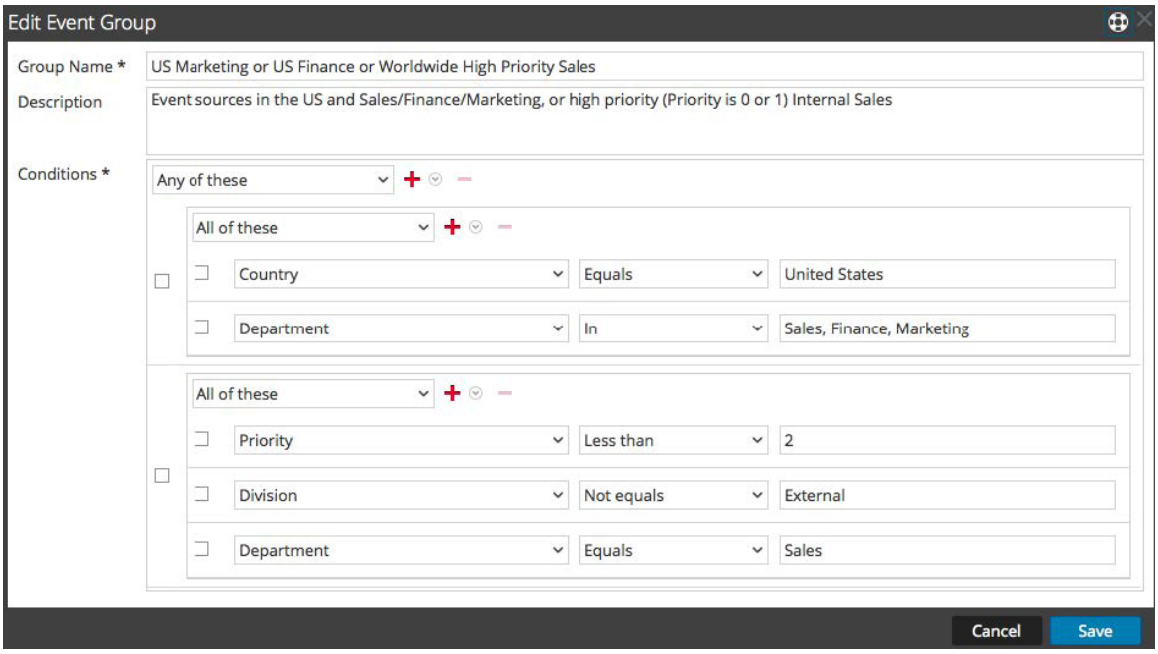
7. Click **Save**.

Complex Example

In this example, you want to create a fairly complex rule: match event sources that are in the United States, and in either the Sales, Finance, or Marketing departments. Also, match worldwide internal, high priority Sales event sources. High Priority is assumed to be where the priority is 1 or 0. Logically, the definition is as follows:

```
(Country=United States AND (Dept.=Sales OR Dept.=Finance OR
Dept.=Marketing))
 OR
 (Priority < 2 AND Division != External AND Dept.=Sales)
```

The following figure is an example of the criteria for creating such an Event Source Group.



Creating Event Source Group Form

The Create Event Source Group form is displayed when you are creating or editing an Event Source Group.

Parameters

The following table describes the fields on the Create/Edit an Event Group form.

Field	Description
Group Name	This field is required, and appears throughout the NetWitness Platform UI as the identifier for the group.
Description	An optional description to help describe the purpose or details for the group.
Tools 	The following items are available on the toolbar: • **Add (+)**: clicking the **Add** displays a menu where you can choose to add a condition or a group. • **Remove (−)**: removes the selected rule or group of rules from the list. When you add a new group, that has the effect of creating nested levels of conditions.

Field	Description
Conditions	Described below, in the **Rule Criteria** table.
Cancel / Save	**Cancel** and **Save** options are available in the form.

Rule Criteria

The rules that you specify determine the event sources that will become part of this event source group. A rule consists of the following:

- Grouping: how the rule interacts with other rules
- Attribute: which attribute the rule is matching against
- Operator: how the rule matches the attribute
- Value: the attribute value used for the rule

The following table provides details on these rule constructors.

Rule Constructor	Details
Grouping	You can group conditions, in order to create complex rules for an event source group. The following choices are available when grouping your rules: • **All of these**: logically equivalent to AND • **Any of these**: logically equivalent to OR • **None of these**: logically equivalent to NOT If you are creating a simple group, and specifying a single condition, you can leave the default value (**All of these**) selected.
Attribute	This contains a drop-down list, consisting of all event source attributes. The attributes are displayed by the section to which they belong. For example, all of the **Identification** attributes are displayed first, followed by the **Properties**, **Importance**, and so on.

Rule Constructor	Details

Operator	Choose from the following options:
	• **Equals**: matches the provided value
	• **Not equals**: returns event sources whose specified attribute not equal to the provided value
	• **In**: provide a list of values in comma separated format, and event sources that match any of the provided values are included. For example:
	`Where IP in 10.25.50.146, 10.25.50.248`
	This condition returns event sources that have either `10.25.50.146 or 10.25.50.248` as their IP attribute.
	• **Not in**: similar to **In**, except that it matches items whose attribute is not equal to any of the listed values.
	• **Like**: matches items that begin with the provided string. For example:
	`Where Event Source Type Like Apache`
	This condition returns event sources whose Event Source Type begins with `Apache`.
	• **Not like**: similar to **Like**, except that it matches items whose attribute does not begin with the provided string.
	• **Greater than**: matches items whose attribute is greater than the provided value. For example, if you specify Priority Greater than 5, the condition would match any item with a priority of 6 or higher.
	• **Less than**: similar to **Greater than**. Matches items whose attribute is less than the provided value.

Value	Enter a value or group of values. The value type depends on the attribute for the condition. For example, for IPv6, you need to specify a value in IPv6 format.

Acknowledging and Mapping Event Sources

In RSA NetWitness® Platform version 11.1, RSA introduced Automatic Mapping. The system automatically maps incoming events to a type based on previous logs received from that address, reducing the number of items that need attention in the Discovery workflow. The UI indicates that an address has been auto-mapped in the Discovery workflow.

Acknowledge Event Source Types

The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source from the view by default. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

To acknowledge event sources:

1. Go to **ADMIN > Event Sources**.

   The Discovery tab is displayed.

2. Select one or more event sources.
3. Click **Toggle Acknowledge**.

Note the following:

- Once Event Sources are Acknowledged, they are no longer displayed in the Event Source Type(s) column.
- The **Toggle Acknowledge** button behaves as follows:
  - If the Acknowledged state for all of the selected event sources is the same, all values are toggled. That is, if you select only event sources with **Yes** in Acknowledged column, the value changes to **No** for all of them. Similarly if they all have **No** in the Acknowledged column, the value changes to **Yes** for all selected event sources.
  - If you select a multiple event sources, and the value for some is **Yes** and for other it is **No**, when you click **Toggle Acknowledge**, all of the values are set to **Yes** for the selected event sources.

Note: Acknowledged Event Sources are not displayed by default.

Manually Map Event Source Types

When discovered event source types are not completely accurate, you can manually map the parsers to obtain additional information.

To map one or more event sources:

1. Go to **ADMIN > Event Sources**.

   The Discovery tab is displayed.

2. Select one or more event sources.

3. Click Map .

   The Manage Parser Mappings dialog box is displayed.

4. Add or remove parser mappings, and change the priority order, based on the needs of your organization. For more details, see Manage Parser Mappings .

Note: Discovery scores for the mapped Event Sources are listed in the Event Source Type(s) column from the lowest to highest discovery scores. Discovery scores range from 0 (least confident) to 100 (most confident).

Viewing Logs from Pre-11.0 Log Decoder

RSA NetWitness® Platform 11.0 added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available. For more details, see Viewing Logs from Pre-11.0 Log Decoder.

Editing or Deleting Event Source Groups

You may occasionally need to remove an event source group. For example, if you close an office, and you had a group consisting of all the event sources in that office, you can remove the group, since none of those event sources will send information to NetWitness Platform.

Similarly, you may need to change some of the conditions that are used to populate the group.

Note: You cannot edit the event source group name. Once you create a group, that name exists as long as the group itself exists.

Edit an Event Source Group

1. Go to **ADMIN > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click .

   The Edit Event Group dialog is displayed.

4. Modify any of the details, or add, edit or remove conditions as necessary.
5. Click **Save**.

Delete an Event Source Group

Note the following:

- You can delete any group except for the **All** group, which lists all configured event sources in the system.
- If you delete a group, the associated policy for that group also gets deleted automatically.

- If there are any event sources that belong **only** to the deleted group, they would no longer have a policy alarm associated with them. Remember that event sources can belong to multiple groups.
- Deleting a group has no effect on baseline alarms.

To delete an event source group:

1. Go to **ADMIN > Event Sources**.
2. In the **Manage** panel, select an existing Event Source Group.
3. Click − .

   A confirmation dialog is displayed.
4. Click **Yes** to delete the group.

Remove Idle Event Sources

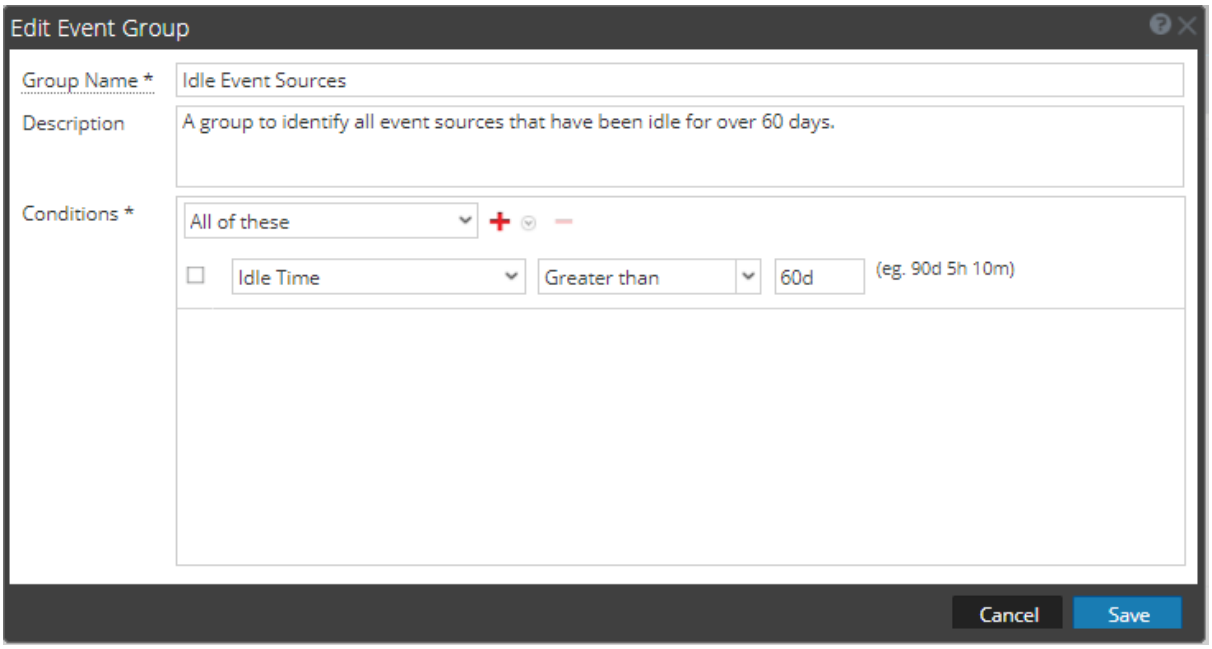
Periodically, you may want to update your set of event sources, and remove ones that are no longer being used. You can use the **Idle Time** parameter to do this.

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.2 and later.

To remove idle event sources:

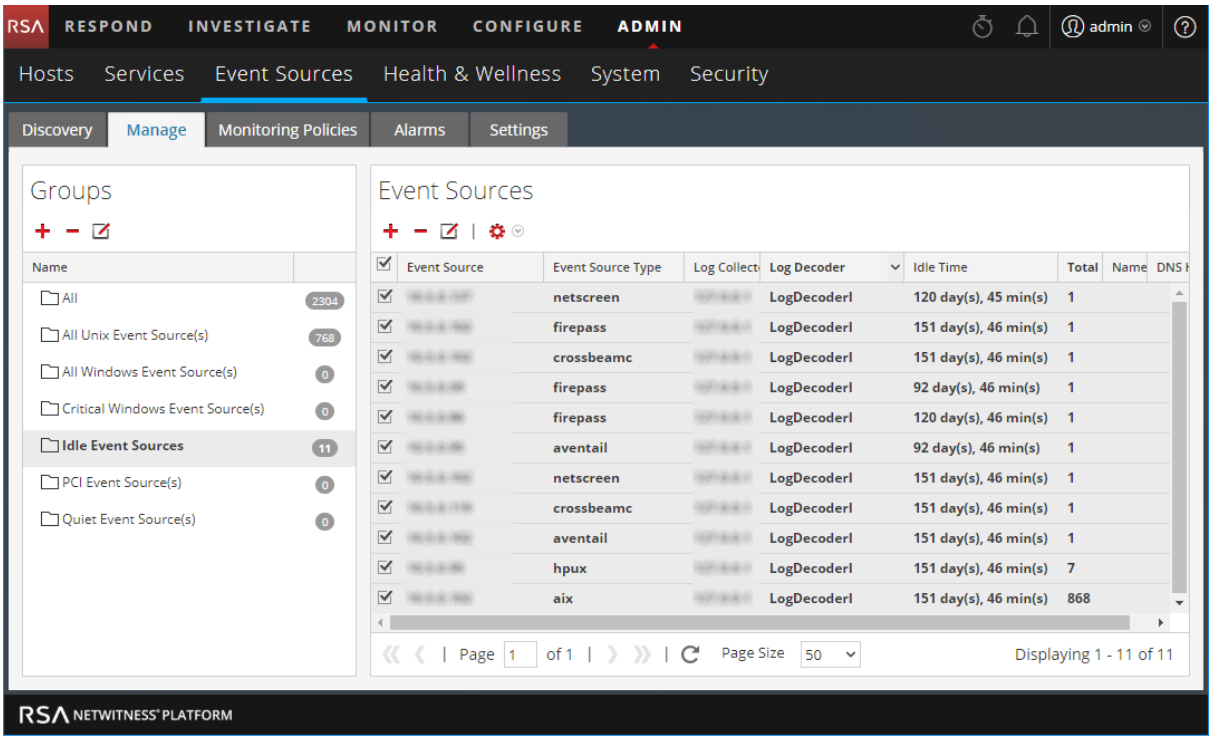
1. Go to **ADMIN > Event Sources**.
2. In the **Manage** panel, click + .

   The Create an Event Group dialog is displayed.
3. Fill in the name and description as you like, and add a condition that uses the **Idle Time** parameter, as shown here:



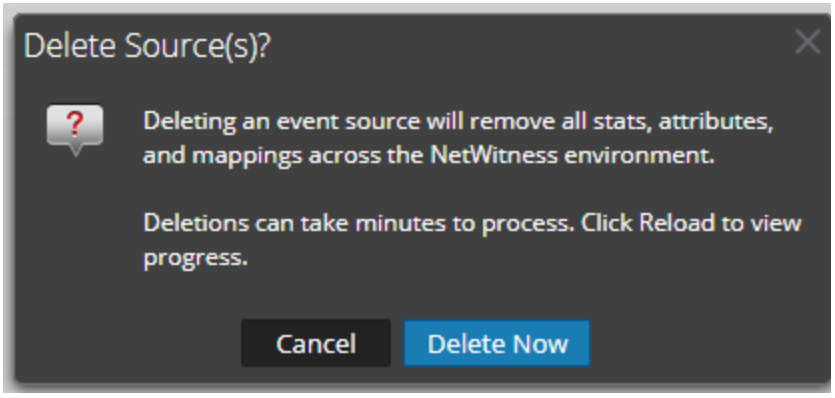
In this example, we have set the condition to identify event sources that have been idle for at least 60 days.

4. Save the new group, then select it in the Groups panel.
5. Select some or all event sources in the group. The following screen shows all event sources from this group selected.



6. In the Event Sources panel, click − to delete the selected, idle event sources.

   A confirmation message appears:



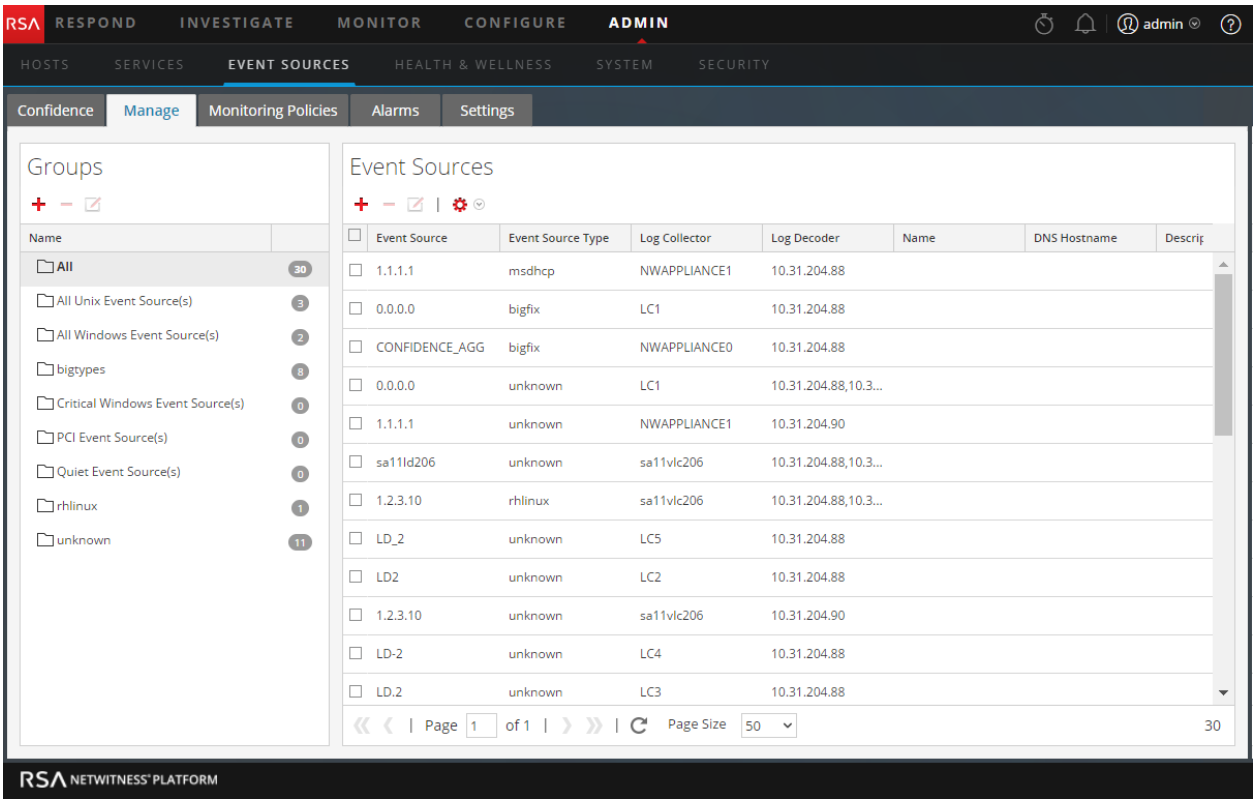
7. Click Delete Now to confirm your intention to delete the selected event sources.

If, in the future, an event source that has been removed sends logs, a new event source will be created.

Creating an Event Source and Editing Attributes

You can organize your event sources into groups. You do this by entering values for various attributes for each event source. For example, for all of your high priority event sources, you could set the **Priority** to 1. You can see details about the available attributes on the Manage Event Source Tab.

The following figure shows an example of the Event Sources panel:



Event source attributes are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness Platform, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

Mandatory Attributes

The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you create an event source manually, you can enter these values. Once you save the event source, these values can no longer be changed.

Event sources can also be auto-discovered; any event source that sends messages to the Log Decoder will be added to the list of event sources. If you edit the attributes for an auto-discovered event source, you cannot edit any of these fields.

Note that not all of these fields are mandatory. To uniquely identify an event source, the following information is required:

- IP or IPv6 or Hostname, and
- Event Source Type

Additionally, RSA NetWitness Platform uses a hierarchy for IP, IPv6, and Hostname. The order is as follows:

1. IP
2. IPv6
3. Hostname

If you enter event sources manually, then you need to keep this order in mind, otherwise, you may end up with duplicates when messages are received from the event sources that you manually added.

All other attributes (such as Priority, Country, Company, Vendor, and so on) are optional.

Create an Event Source

1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, click + to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.
4. Enter or change the values for any attributes.
5. Click **Save**.

Note: The Discovery Score is listed as **Unavailable** for manually-added event sources. The score remains as **Unavailable** until the event source begins sending information to the RSA NetWitness® Platform

Update Attributes for an Event Source

1. Go to **ADMIN> Event Sources**.
2. Select the **Manage** tab.
3. In the **Event Sources** panel, select an event source from the list.
4. In the **Event Sources** panel, click + to open the details screen, which contains all of the event source attributes.

   The Manage Event Source Tab is displayed.
5. Enter or change the values for any attributes, except for certain attributes that cannot be altered once entered.
6. Click **Save**

Bulk Editing Event Source Attributes

You can select multiple event sources, or an entire group, or even all event sources for bulk editing. For example, you might want to change the Priority or the Manager for a large number of your event sources.

Note: You cannot select individual event sources across displayed pages. For example, if you have a group with 225 event sources, and your Page Size is 50, you can only select event sources from the currently displayed 50 items.

If you want to edit items that span multiple pages, you can do the following:

- In the browser, increase the page size (the maximum is 500 entries on a single page). If your page size is small, you might be able to get all of your items on a single page.
- Create a new event source group that contains only the items that you want to bulk edit. Then, you can select all items for that group, rather than selecting individual items.
- Bulk edit incrementally. On the first page, select the items that you want to edit. Make your edits, then go to the next page and repeat the process, until you have made all of your changes.

Note: Mandatory fields cannot be edited; IP, IPv6, Hostname, Event Source Type, Log Collector, and Log Decoder.

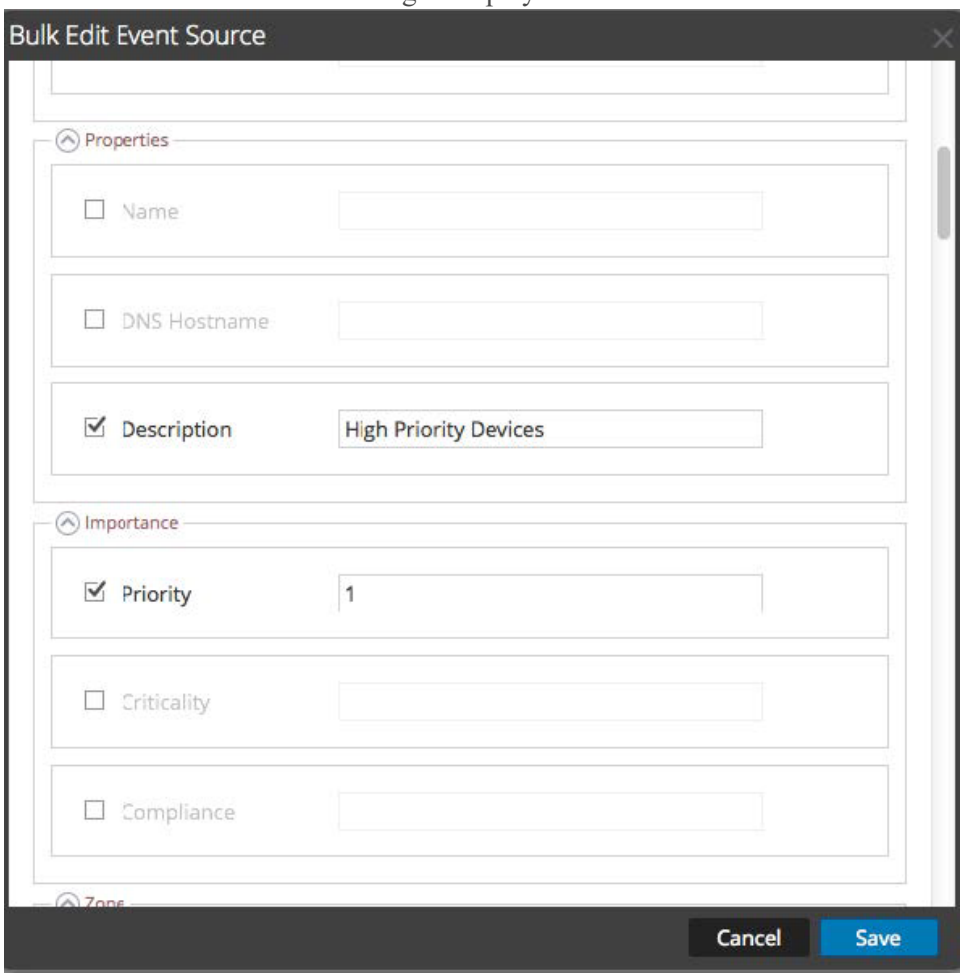
To bulk edit attributes for Event Sources:

1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.
3. Optionally, select an event source group.
4. In the **Event Sources** panel, select one or more event sources to edit.

   Note: To select all event sources, select the box next to the **Actions** column in the last (far-right) column of the list table.

5. Select the **Edit** icon  from the menu bar.

The Bulk Edit Event Source dialog is displayed.



6. Enter values for any of the available attributes. In the screen shot above, the Name and Priority attributes have been updated.
7. When you have updated as many attributes as required, click **Save**.

Importing Event Sources

You can import event source attributes from a CSV-formatted file. To import information from a configuration management database (CMDB), a spreadsheet, or other type of file, first convert or save the information to a CSV file.

Note: The following identification attributes are handled specially: **IP**, **IPv6**, **Hostname**, **Event Source Type**, **Log Collector**, and **Log Decoder**. If you import an event source that includes a different value for any of these fields (when compared with the value in NetWitness Platform), the original value in NetWitness Platform will **not** be overwritten.

The imported attributes are associated with the matched Event Source and are available for use in rules to create Event Source Groups.

RSA NetWitness Platform treats the import file as the correct, complete record. This assumption leads to the following behaviors related to importing event source attributes:

- By default, when you import attributes, the system updates attributes for existing event sources only.
- If the event source exists in the import file, but not in NetWitness Platform, the attributes for that event source are ignored. That is, NetWitness Platform does **not** create a new event source for these attributes.
- If the event source exists in both the import file and NetWitness Platform, values for that event source are overwritten.
- If an attribute is blank in the import file, it clears the corresponding attribute in NetWitness Platform.
- If an attribute is not specified in the import file, then the corresponding attribute is ignored in NetWitness Platform (that is, it is **not** cleared).

Note: There is a difference between a blank attribute vs. one that is not specified at all. If an attribute is specified but blank, the assumption is that it is meant to be blank, and NetWitness Platform clears that attribute for the corresponding event source. However, if an attribute is not specified at all, it is assumed that no change is expected.

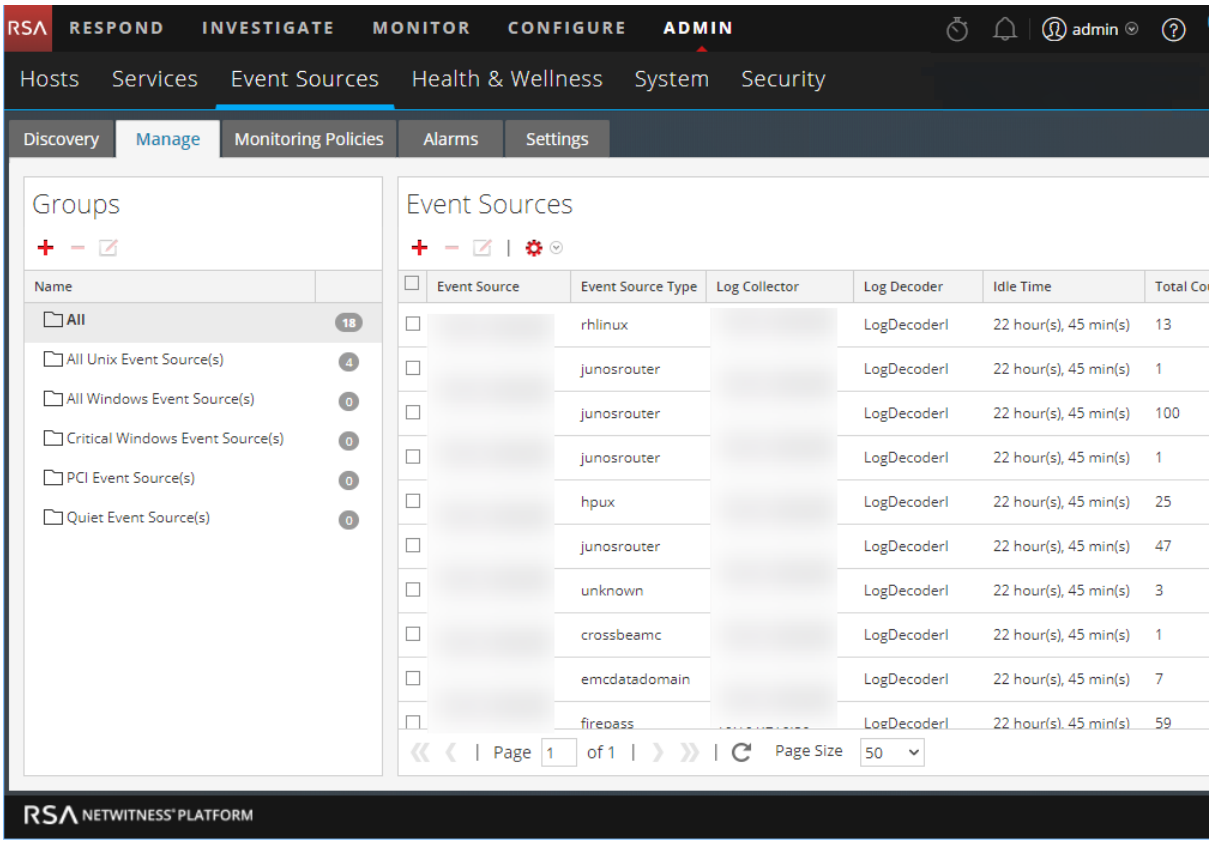
The above behaviors are the defaults—you can change the behavior as specified in the following procedure.

Import Event Source Attributes

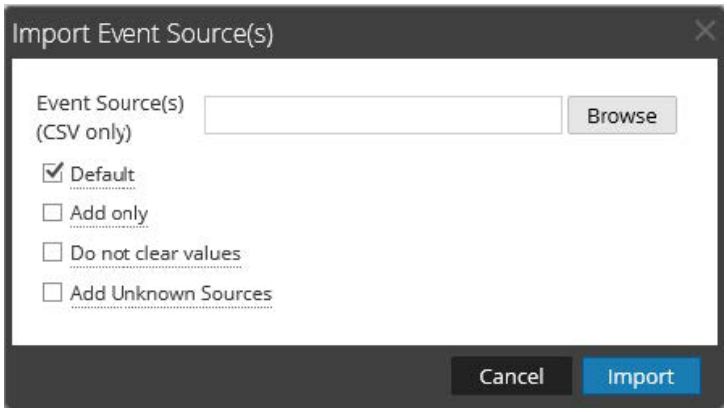
To import Event Source attributes from a file:

1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.



3. From the Import/Export menu in the toolbar ( ), select **Import** (Import).
   The Import Event Sources dialog is displayed.



4. Navigate to the import file, and select the appropriate boxes:
   - **Default**: The default behavior is described above.
   - **Add only**: Imports an attribute only if the corresponding field in NetWitness Platform is blank. Thus, no existing values will be overwritten.

- **Do not clear values**: Does not clear attribute values in NetWitness Platform for items in the import file that are blank.
- **Add Unknown Sources**: Adds new event sources based on items in the import file.

Note: You can select multiple options.

5. Click **Import**.
6. Click **Yes** in the confirmation dialog to perform the import.

Troubleshooting the Import File

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Check the following:

- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:
  - IP or IPv6 or Hostname, and
  - Event Source Type
- The first line of the file must contain header names, and the names must match the names in NetWitness Platform. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Exporting Event Sources

You can export all or some of your event sources, along with their corresponding attributes, to a CSV file.

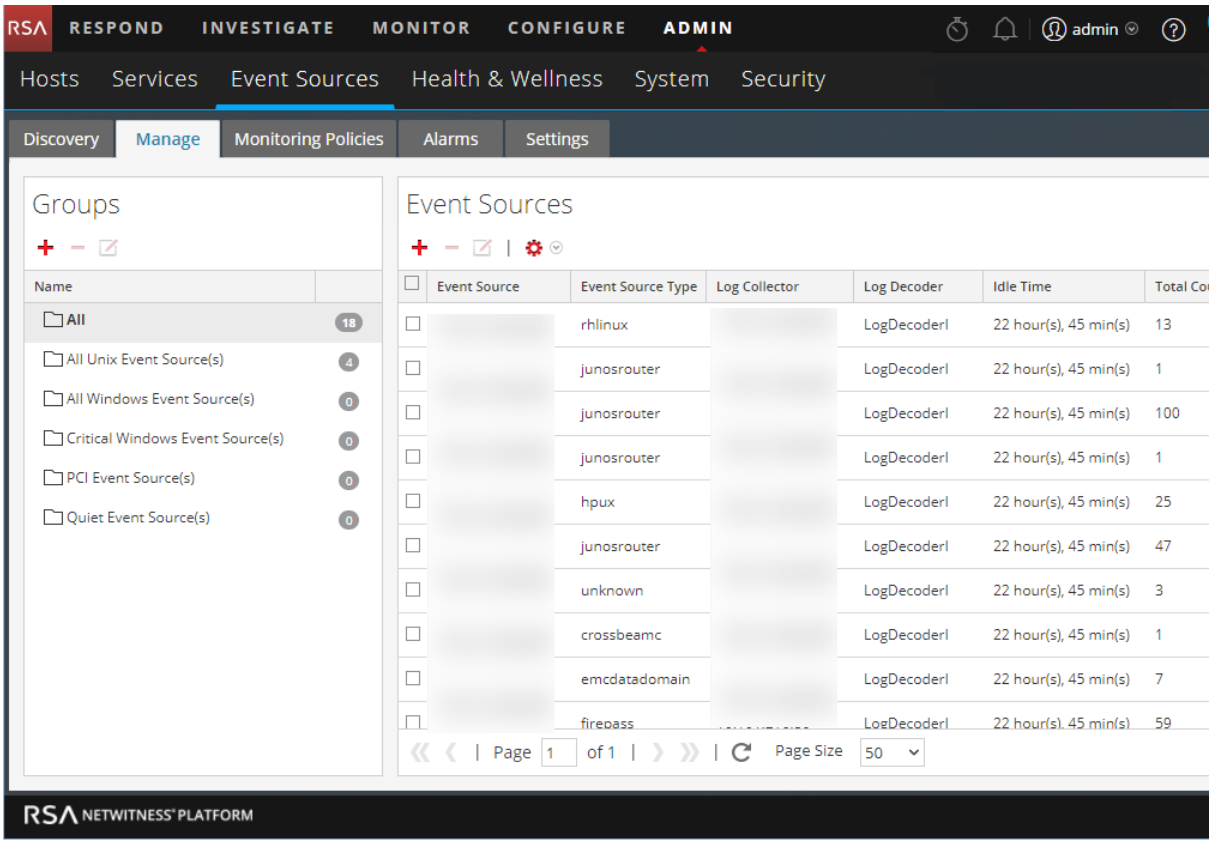
Note the following:

- The exported CSV includes all attribute columns.
- The exported CSV includes a header line at the top, listing each column name.
- You can export all entries in a group.
- You can export all entries (select the **All** group).
- You can select entries and export only those entries.

To export your Event Sources:

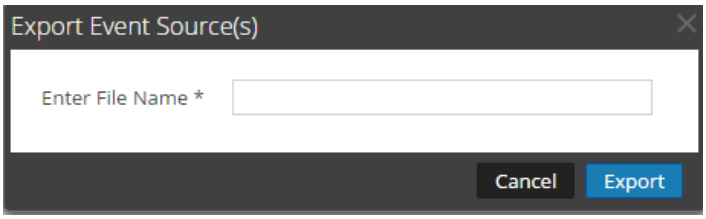
1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.



3. Select the group that contains the event sources to export.
4. Select as many event sources as you need. Alternatively, you can export the entire group: to export the entire group, you do not need to select any individual event sources.
5. From the Import/Export menu in the toolbar (), select **Export (.csv)** or **Export Group (.csv)**.

   The Export Event Sources dialog is displayed.



6. Enter a file name and click **Export**.

The event source attributes are saved to the file name you specified, in a CSV format.

Sorting Event Sources

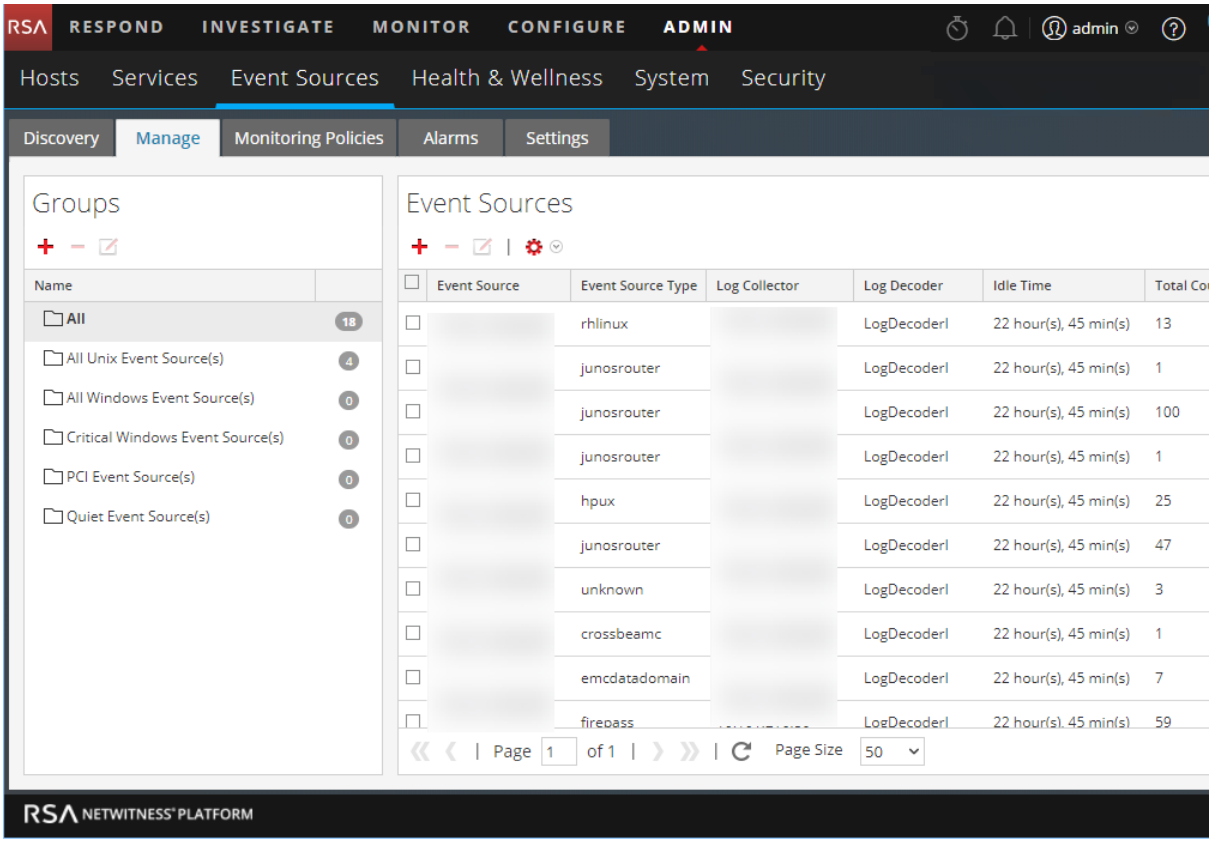
The event sources panel displays attributes for the currently selected event source group. You can configure the list of attributes that are displayed, as well as sort the list on any of the displayed attributes.

Note: The entire list is sorted, not just the items displayed on the current page. (The navigation bar at the bottom of the page shows how many pages exist for this list of event sources.)

To sort your event sources:

1. Go to **ADMIN > Event Sources**.
2. Select the **Manage** tab.

   The Event Sources Manage tab is displayed.



3. To sort a column, click + in the column header.

   The Sort Options drop-down menu is displayed.

4. Select the sort order that you want.

Manage Policies

Monitoring Policies

Use the Monitoring Policies view to manage alert configuration for your event source groups.

You can create policies that alert on event source groups, by setting thresholds and notifications:

- Thresholds set ranges for frequency of log messages. You can specify a low threshold, a high threshold, or both.
- Notifications describe how and where to send alerts when thresholds are not met.
- You combine thresholds and notifications to create alerts based on the frequency you specify.
- If automatic alerting is enabled (it is by default), you can create and enable a policy ***without*** setting any thresholds. If you then turn on automatic notifications, notifications will be sent whenever an event source in the group is above or below its baseline by the specified amount.

For example, let's say that you have created an event source group that consists of all your Windows event sources based in the United Kingdom. You could specify a policy that alerts you whenever fewer than 1000 events per 30 minutes arrive.

Note: In addition to, or instead of setting up monitoring policies for your event source groups, you can Configuring Automatic Alerting to view alarms when the number of messages for an event source are outside of the normal bounds.

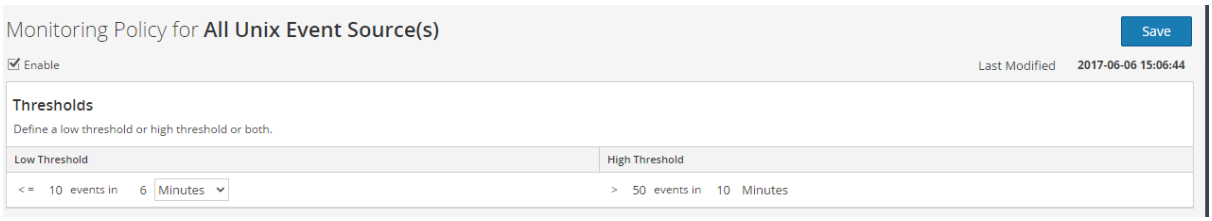
Configuring Event Source Group Alerts

Each event source group can have its own alerting policy. This includes setting the thresholds for when to alert, and setting the notification type when an alert is triggered. This topic describes the steps involved in creating an alert policy for an event source group.

Create an Alert Policy for an Event Source Group

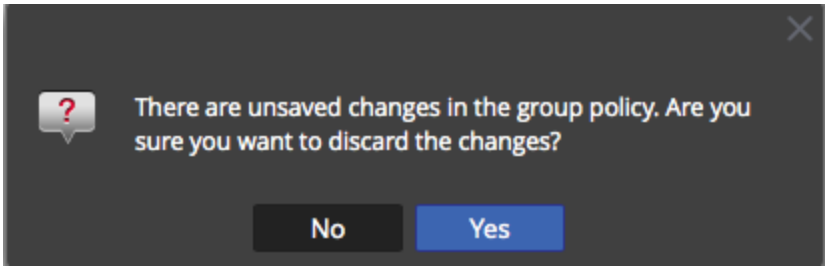
1. Go to **ADMIN > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Enter values for the Low Threshold and High Threshold fields.

   This is an example of alert thresholds.



5. Select **Enable** and click **Save** to enable the alert policy that you have configured.

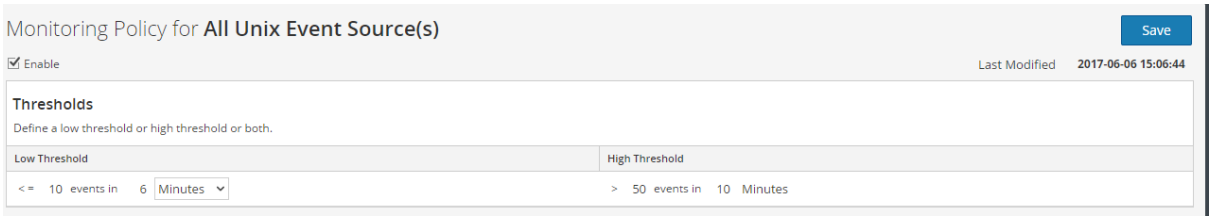
Note: If you make changes to a policy, and attempt to exit the page before you save your changes, an Unsaved Changes warning message is displayed:



Set and View the Thresholds for an Alert Policy

Every event source group is also an alert policy. Thresholds are part of an alert policy. You can set thresholds for each alert policy. For each policy, you can set a low threshold, a high threshold, or both. Additionally, you can enable a policy without setting any thresholds; this allows you to receive notifications based on automatic alerts. Automatic alerts are generated when the baseline for an event source is out of normal bounds.

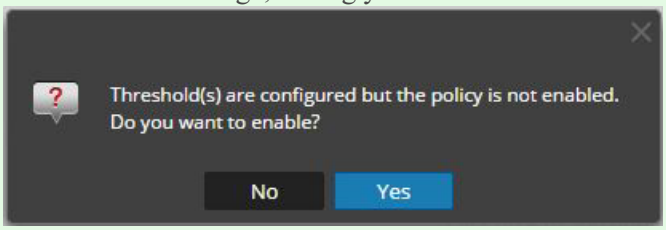
1. Go to **ADMIN > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
   Any thresholds set for the selected group are displayed in the **Thresholds** panel.



4. Edit the values in either the Low or High Threshold as follows:
   a. Enter the number of events for the threshold.
   b. Enter the number of minutes or hours for the threshold. The minimum value is 5 minutes.

   Note: For each threshold, you can set either the low values, the high values, or both.
5. Select **Enable** to enable alarms when thresholds are not met.

Note: If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy: ddd



For example, suppose you enter 10 and 30 for the values for the low threshold: `10 events in 30 minutes`, and 20 and 30 for the values for the high threshold: `20 events in 30 minutes`. This means that you expect between 10 to 20 events are logged in 30 minutes (for the selected event source group). That is, anything between the low and high threshold is considered normal, and does not trigger an alarm.

Note: Once you add a threshold for a policy, you cannot delete it. You can disable the policy, or set the low or high threshold to 0 events in 5 minutes. Five minutes is the minimum duration for a threshold.

Setting Up Notifications

This topic describes how to configure notifications for event source groups. Notifications are sent when thresholds are not met.

Notifications go hand-in-hand with Thresholds. Before you configure notifications, you should set up Thresholds for an event source group.

Note: After configuring the thresholds for an event source group, if you do not set any notifications, then even if an alarm is triggered, users are not notified. However, all alarms are visible on the Alarms Tab.

Prerequisites

Before you set up notifications for an event source group, you should review the available notification items:

- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP, and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.
- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

Add Notifications for an event source group

To add notifications for an event source group:

1. Go to **ADMIN > Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.

   Note: You should have already set a threshold for the group. If not, see Set and View the Thresholds for an Alert Policy to set a threshold, and then return to this procedure. Alternatively, if you have automatic alerting turned on, then you do not need to set thresholds for a policy. Automatic alarms generate notifications without the need to set thresholds.

4. In the Notifications panel, click +, and from the drop-down menu, select the type of notification you want to add:
   - Email
   - SNMP
   - Syslog

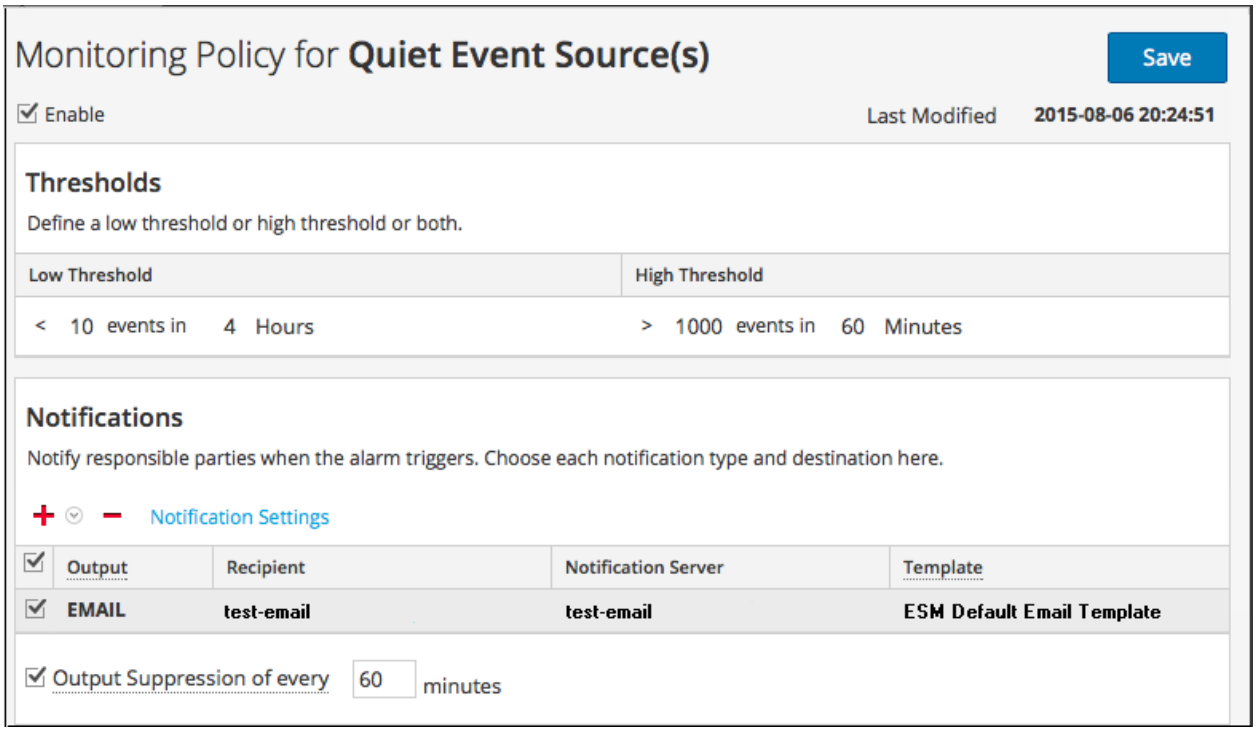
   Note: Default ESM (Event Source Monitoring) templates are provided for each type of notification.

5. Enter values for the Notification, Notification Server, and Template fields.
   a. For Notification, select from the list, or add a suitable notification type in **Notifications**, and then select it here.
   b. For the Server, select one from the list, or add a suitable server in **Notifications**, and then select it here.
   c. For Template, select an available template, or create a suitable template in **Notifications**, and then select it here.

   Note: If you need to add or edit one of these items, click **Notification Settings**. A new browser window opens on the **Administration > System > Global Notifications** page. Use this page to view or update the available Notification items.

6. Optionally, you can limit the rate of notifications for a policy.
   a. Select **Output Suppression** to enable setting a limit.
   b. Enter a value, in minutes, for the suppression rate. For example, if you enter **30**, notifications for this policy are limited to one notification every 30 minutes.
   c. Click **Save**.

Here is an example of a monitoring policy that contains a threshold and notification for an event source group.



Disabling Notifications

Notifications are sent when thresholds are not met. Additionally, automatic notifications are sent when baselines are not met. However, you may determine that you no longer require notifications for the event sources in a particular group. In this case, you can disable notifications for the event source group.

Note: Even if you disable all notifications, the details for alarms are still visible on the Alarms Tab.

Prerequisites

You must have configured thresholds and notifications for an event source group, and enabled them. For automatic notifications, you must have selected **Enable Notifications From Automatic Monitoring** on the Alarms Tab

Disable Notifications

To disable notifications (both manual and automatic) for an event source group:

1. Go to **ADMIN> Event Sources**.
2. Select the **Monitoring Policies** tab.
3. In the **Event Groups** panel, select a group.
4. Click **Enable** to remove the check mark. Clearing this option means that notifications are not sent for this event source group, even if thresholds are not met or exceeded.
5. Additionally, you can remove all notifications. However, this is not required to stop the notifications.

Additional Procedures

Configuring Automatic Alerting

Note: Automatic alerting, and it settings, are currently in Beta testing.

Prerequisites

Before you set up notifications for an event source group, you should review the available notification items:

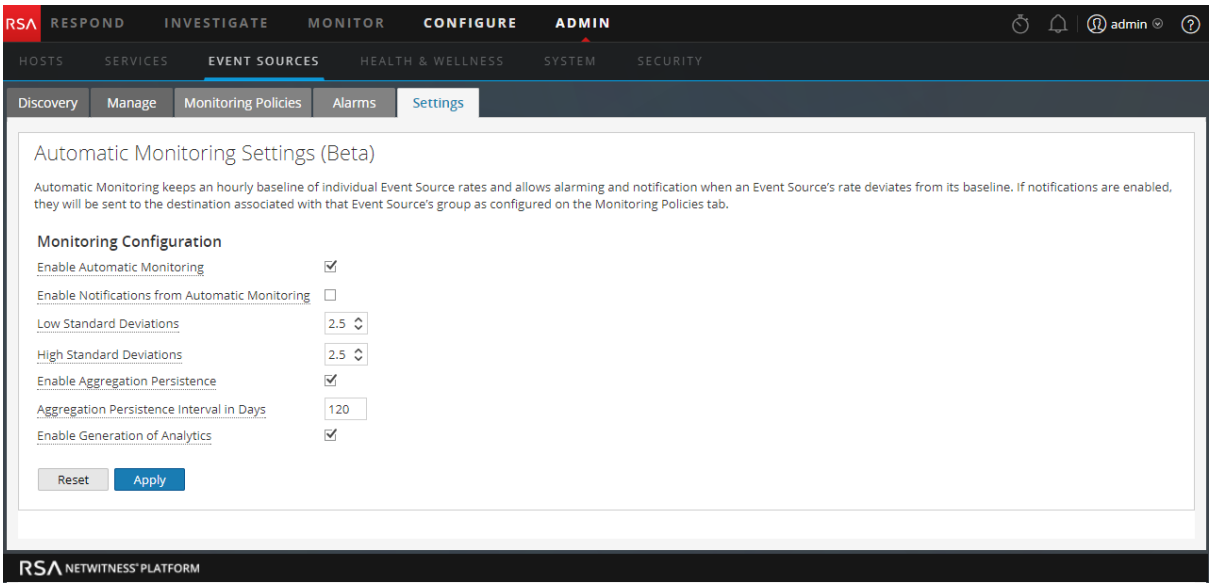
- **Notification Servers:** These are the servers that you want to receive notifications from the system. For more details, see the **Notification Servers Overview** topic in the *System Configuration Guide*.
- **Notification Templates:** These are the available templates for each type of notification. For Event Source Management, default templates are supplied for Email (SMTP), SNMP, and Syslog. You can use these templates as supplied, or customize them if necessary. For more details, see the **Templates Overview** topic in the *Systems Configuration* Guide.
- **Notification Output:** The outputs contain the parameters for the notification type. For example, an email notification type contains the email addresses and subject for the notification. For more details, see the **Notification Outputs Overview** topic in the *Systems Configuration* Guide.

Configure Automatic Alerting

To configure automatic alerting:

1. Go to **ADMIN > Event Sources**.
2. Select the **Settings** tab.

   The Settings tab is displayed.



3. By default, automatic monitoring is turned on. To turn off automatic alerting, clear the **Enable Automatic Monitoring** option.
4. By default, notifications for automatic alerts is turned off. To turn on automatic notifications, select the **Enable Notifications From Automatic Monitoring** option.
5. Configure the parameters, based on your usage patterns:
   - **Low Standard Deviations**: standard deviations below which to receive alerts. Default is **2.5** (95% confidence).
   - **High Standard Deviations**: standard deviations above which to receive alerts. Default is **2.5** (95% confidence).

   Note: You can adjust the standard deviation settings in increments of 0.1 (one tenth) of a standard deviation.
6. Click **Save** to close the dialog and save your settings.

Viewing Event Source Alarms

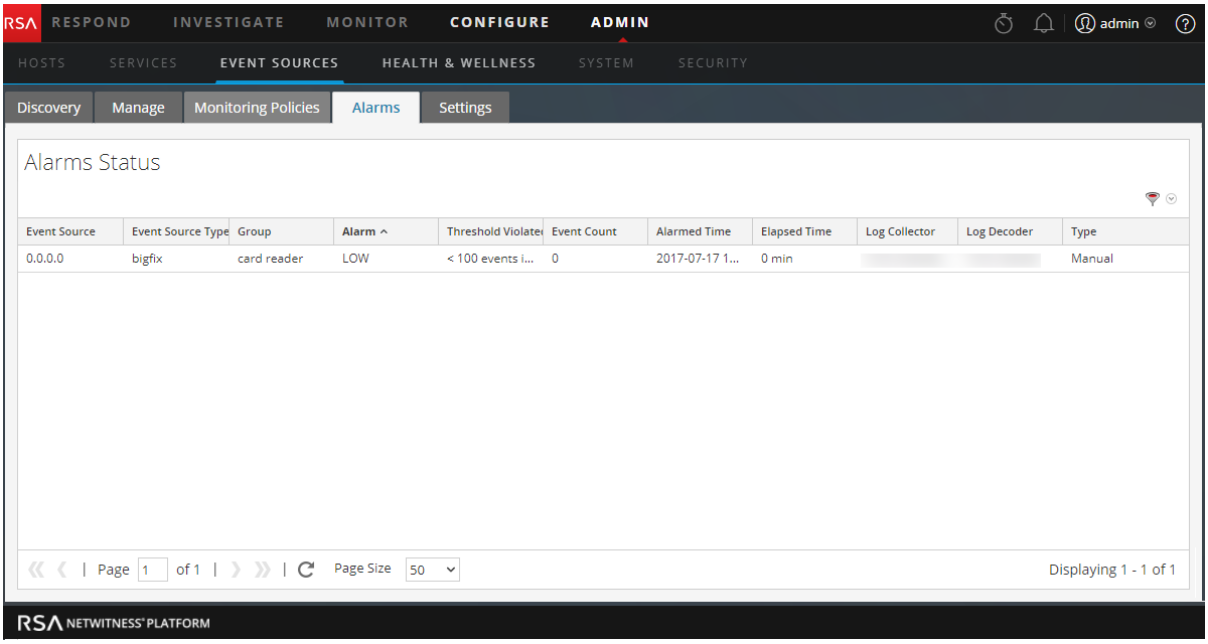
This topic describes how to view alarms for your event source groups. Once you have configured and set alerts, you can view all of the generated alarms in the **Alarms** tab of the **Event Sources** view.

Sort the Alarms Information

When you first access this view, the data is sorted by most recent alarm (the Alarmed time column). You can sort by any column.

1. Go to **ADMIN> Event Sources**.
2. Mouse over a column that you want to sort.
3. Click the Select the **Alarms** tab.
4. Mouse over the column that you want sorted, and click the icon.

   This is an example when you mouse over the Alarm column.



5. Select either **Sort Ascending** or **Sort Descending** to sort the column in the way you wish.

   The data is sorted across all pages.

Note: You can also sort by two columns. To do this, first sort by the secondary column, then sort by the primary column. For example, if you want to see all the HIGH alarms by their group order, first sort on **Group**, then sort on **Alarm**.

Filter Alarms by Type

You can also filter the alarms by their type: you can display only the Manual or Automatic (baseline) alarms. To filter by alarm type, select the filter icon on the right side of screen, in the heading area:

Select either Automatic or Manual:

- If you select Automatic, only the alerts based on baselines are displayed.
- If you select Manual, only the alarms for which you have set thresholds are displayed.

Event Source Management References

The following topics contain reference information for Event Source Management:

- Discovery Tab
- Manage Tab
- Manage Event Source Tab
- Event Sources View
- Create/Edit Group Form
- Details View
- Manage Parser Mappings
- Alarms Tab
- Monitoring Policies Tab
- Settings Tab

Discovery Tab

To access the Discovery tab, go to NetWitness ADMIN> Event Sources. The Discovery tab is displayed.

The Discovery tab lets you review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified completely accurately. If the discovered event source types are correct, you can acknowledge to filter out that event source. If incorrect, you can set the allowed event source types for a particular address so that future logs will parse against the correct parsers.

Note: The following features apply to RSA NetWitness® Platform version 11.1 and later:
- Acknowledging multiple event sources
- Filtering by event source type
- (for 11.2 and later) Mapping filter options include None, Auto, and Manual
- Mapping multiple event sources
- Searching for event sources on the Event Source Discovery page

RSA NetWitness® Platform, version 11.2 and later, automatically maps incoming events to a type based on previous logs received from that address, reducing the mis-parsing of messages and reducing the number of items that need attention in the Discovery workflow. A value of **Auto** in the **Mapping Type** column indicates that an address has been auto-mapped.

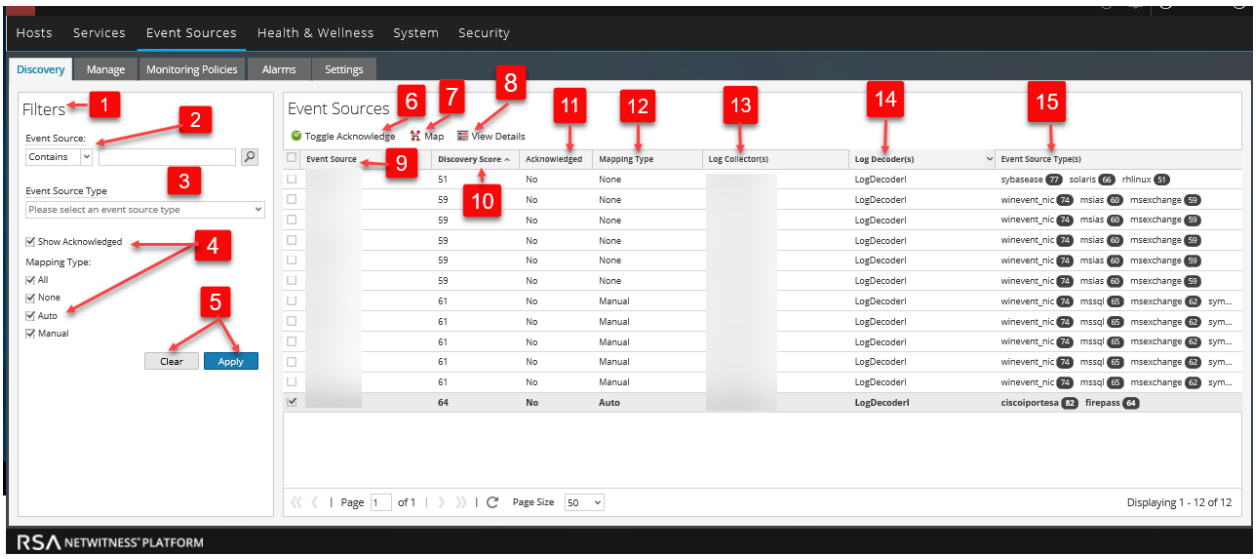
Details View

Quick Look

The following example displays a list of addresses and their discovered Event Source types. The Event Source types display the Event Sources that have been discovered.

This is an example of the tab.



1	Displays the Filters and Event Sources panels with the Discovery tab open.
2	Displays the Event Source Filter field with a drop-down menu that offers the following options: • Enter the full or partial address (IP, IPv6 or Hostname) of the source(s) you want to review. You can also enter multiple entries that are separated by commas. For example, **10.10.10.10,10.10.10.11,host1.company.com** • **Exact:** Returns sources that completely match the search term. For example, **10.10.10.10** only returns **10.10.10.10**, not **10.10.10.101**.

	• **Starts With:** Returns sources that start with the search term. For example,**10.10.10.** returns the whole **10.10.10.x subnet**. • **Contains:** Returns sources that start with the search term. For example, **exch** returns all terms such as **us-exch-1.company.com**, or **lab21** returns all **hostx.lab21.company.com** terms. • **Ends With:** Returns sources that end with the search term. For example, **lab21.company.com** returns all hosts. **Note:** When specifying the search string, you can use **. - :** (period, dash, colon).
3	The Event Source Type drop-down menu filters for addresses containing all of the selected event source types.
4	• Select the **Show Acknowledged** checkbox to display acknowledged Event Sources. • Mapping filter options can include just one of the mapping types listed in the Filter Panel, or multiple Mapping Types can be selected. **Note:** If no mapping filter options are selected, the default is to display **All**, **None**, **Manual**, and **Auto** mapping types.
5	• The **Apply** button uses all criteria that is set in all filters. • The **Clear** button clears all filters from the panel.
6	Toggles the event sources between acknowledged and not acknowledged states.
7	Maps the selected event sources.
8	View Details button to view details of the selected Event Source.
9	Displays the addresses of the selected Event Sources.
10	Displays the discovery scores of the selected Event Sources.
11	Displays whether or not the selected Event Sources have been acknowledged.
12	Displays the selected Event Source Mapping type as Auto, Manual, or None. Any changes to the mapping are only displayed here.
13	Displays the host names of the Log Collectors where the Event Sources are located.
14	Displays the host names of the Log Decoders where the Event sources are located.
15	Displays the discovered Event Source Types and their associated discovery scores.

Toolbar and Features

The Discovery tab contains the following features:

Field	Description
Tools   	The following items are available on the toolbar: • **Toggle Acknowledge**: Toggles the acknowledged state for the selected Event Source between **Yes** and **No**. • **Map**: Opens the Manage Parser Mappings dialog box, where you can map an event source to the correct log parser. • **View Details**: Provides details on the selected Event Source.
Event Source	The IP, IPv6, or Hostname of the Event Source.
Discovery Score	Displays the overall discovery score associated with that particular address. Higher scores indicate better confidence. Discovery scores range from 0 (least confident) to 100 (most confident).
Acknowledged	Selections are either **Yes** (you have acknowledged the Event Source) or **No** (you have not acknowledged the Event Source).
Mapping Type	Selections are **Manual** (you mapped the Event Source), **Auto** (the system automatically mapped the Event Source), or **None** (you have not mapped the Event Source). Auto mapping is content aware. When a log message is parsed to a high confidence header or message that has been tagged, an auto mapping will be set for that address and type. This auto-mapping is valid for 24 hours and will be renewed every time a log message matches a tagged header of a message. Log messages are first parsed against auto-mapped parsers, and only fall back to discovery if there is no match amongst the mapped parsers. Log messages that fall back to discovery can match the tagged headers or messages from other event sources: this results in multiple types being mapped. For example, an address could eventually be mapped to Windows, MS SQL, and Apache, and these parsers are evaluated first. If an event source is decommissioned, and its IP re-purposed, the 24-hour timer ages out the mappings for the decommissioned types. **Note:** This features applies to RSA NetWitness version 11.2 and later.
Log Collector(s)	Log Collectors that have received logs from this Event Source address.
Log Decoder(s)	Log Decoders that have received logs from this Event Source address.

Field	Description
Event Source Type(s)	The parsed type(s) of the Event Source address and the corresponding Discovery Score for each type.

Note: Discovery Scores are only available for 11.0 and above Log Decoders. Discovery Scores for pre-11.0 Log Decoders display as Unavailable.

The following table describes the sorting order for discovery scores. To access the Sorting Order drop-down menu, click on the down arrow in the Event Sources column.

Field	Description
Sort Ascending	Sort the column by discovery score in ascending order.
Sort Descending	Sort the column by discovery score in descending order.
Columns	Used to hide or show one or more columns.

Manage Tab

The Manage tab organizes event sources into groups, and displays attributes for each event source.

To access this tab, go to **ADMIN > Event Sources > Manage**.

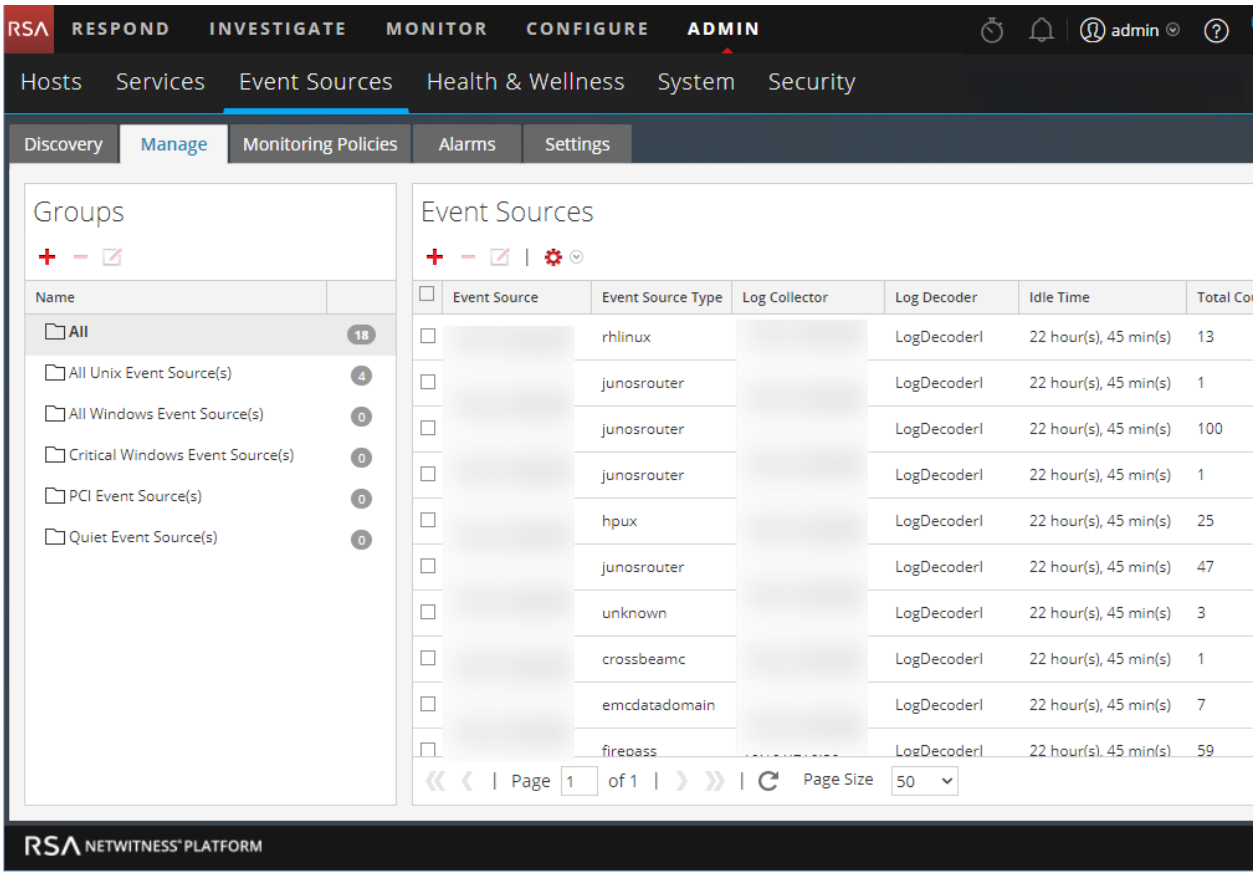
Creating Event Source Groups

[Creating an Event Source and Editing Attributes]

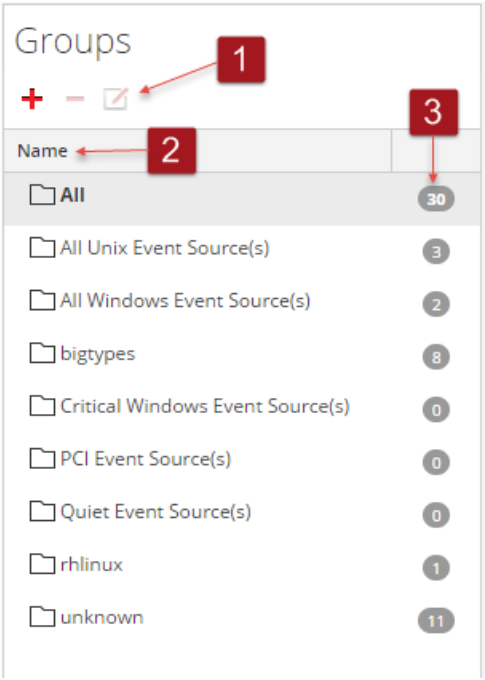
Quick Look

The Manage tab organizes event sources into groups, and displays attributes for each event source. The Manage tab consists of two panels, Groups and Event Sources.



Groups Panel

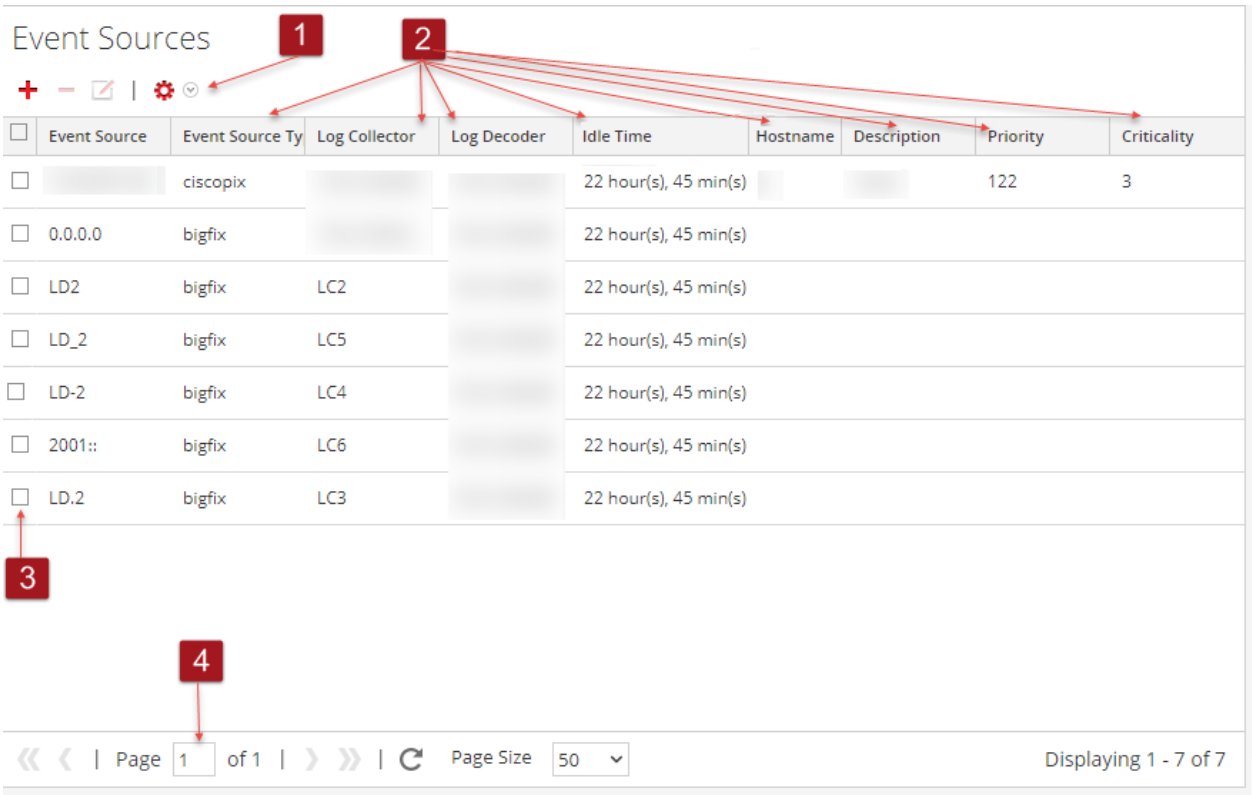
The Groups Panel lists the event source groups, as well as a count of the members for each group. To see all event sources, select **All** from the groups list. This is an example of the Groups panel.



1	Displays the standard NetWitness Platform icons for adding, removing, or editing groups.
2	Lists the identifier for each group in the Name column. You can use the group names to quickly identify some of the criteria used to form the group. For example, if you create a group that consists of Windows event sources for the Sales organization, you could name the group **Windows Sales Sources**. **Note:** The event source group name is not editable. Once you create a group, that name exists as long as the group itself.
3	The count for an event source group indicates the number of event sources in that group. That is, the number of event sources that match the criteria used to define the group. **Note:** The count is not dynamically updated when new event sources are added. Thus, you may need to refresh to see an updated group count.

Event Sources Panel

The Event Sources panel displays the attributes for the event sources in the selected group. Or, if All is selected in the Groups panel, the Event Sources panel lists all event sources.



1 The toolbar contains the following tools:

- **Add**: manually add an event source
- **Remove**: remove an event source
- **Edit**: Update attributes for an existing event source
- **Import / Export** menu: Displays a menu with the following options:
  - **Import**: Import event sources from a Content Management Database (CMDB), spreadsheet, or other tool.
  - **Export**: Export selected event sources and their attributes in CSV format.
  - **Export Group**: Export the entire group that is currently selected.

2 Columnar display of attributes. You can choose which attributes to display.

3 Checkboxes: Select rows to use when performing tasks on multiple event sources, such as bulk editing.

4 Navigation Tools:

At the bottom of the screen, there are items that help in navigating your group:

- **Page *x* of *y***: indicates which page you are currently displaying, and how many total pages exist for this group.
- **<<**, **<**, **>** and **>>**: click these icons to move between pages either one at a time (< and >) or to the first (<<) or last (>>) page.
- **Page Size**: use this selector to choose your page size.
- **Displaying *x* - *y* of *z***: quick check of which event sources are currently displayed out of the total number for the group.

Sorting

In the Event Sources panel, the list of items is presented in a sorted order. You can choose which column on which to sort. Note, however, that the sort order depends on capitalization.

For any string column, if the values contains a mix of lower case and upper case, the upper case appear in the list before the lower case values.

For example, assume the Event Source Type column contains the following entries: Netflow, APACHE, netwitnessspectrum, ciscoasa. The sort order would be as follows:

- APACHE
- Netflow
- ciscoasa
- netwitnessspectrum

Manage Event Source Tab

The Manage Event Source screen has several integrated components that present different perspectives of an event source.

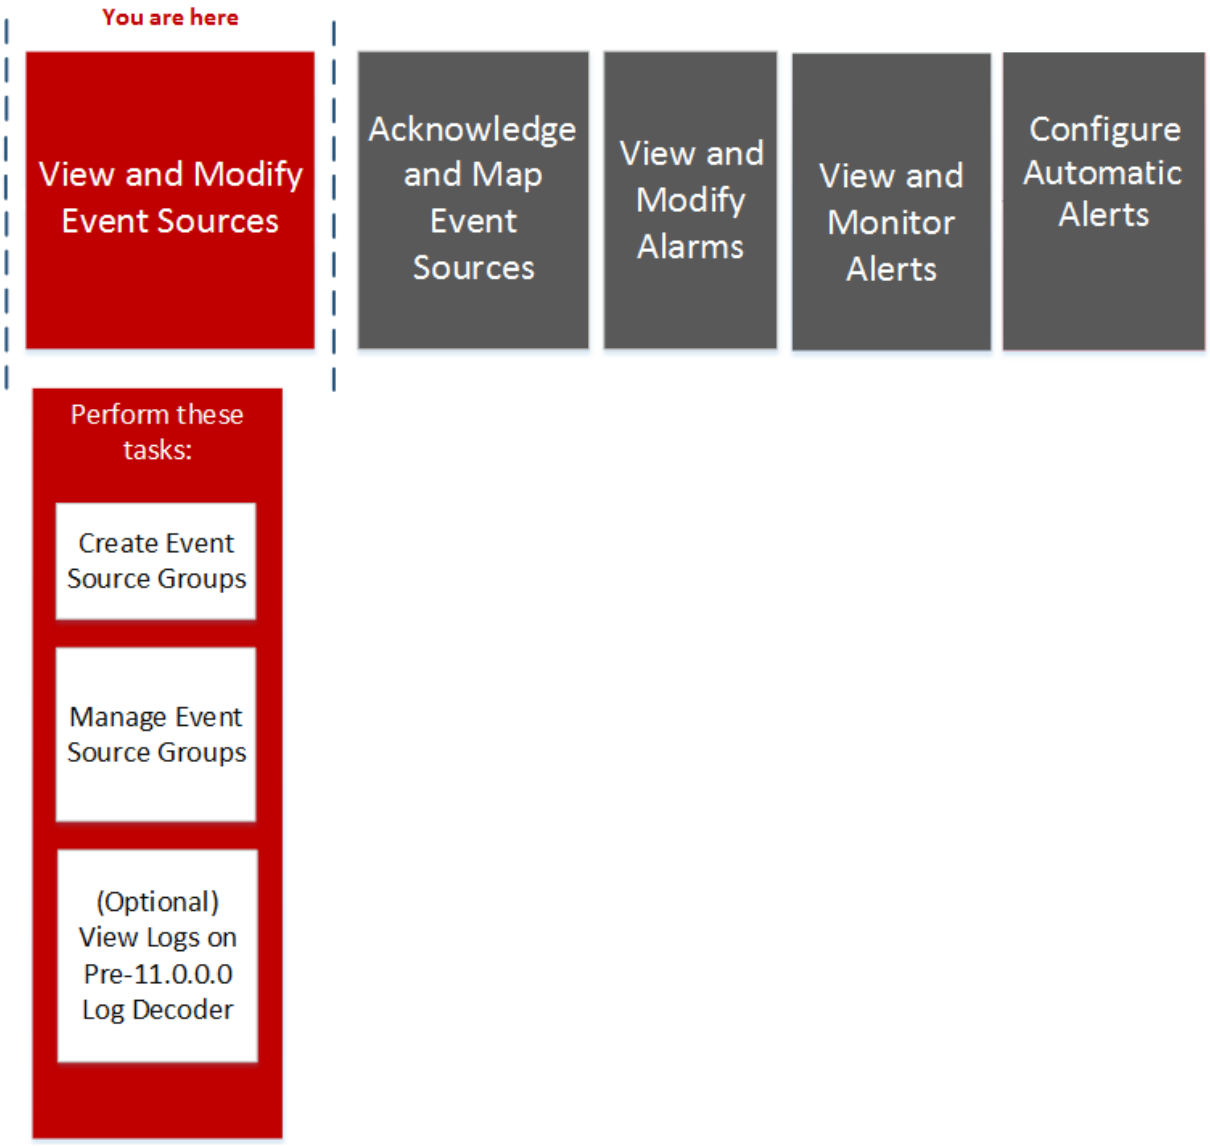
- Show Event Source Details
- Add attribute values to an event source
- Remove attribute values for an event source

To view the Manage Event Source screen for an event source:

1. Go to **ADMIN> Event Sources**.
2. Select the **Manage** tab.
3. From the Event Sources pane, select an event source from the list and click + .

Workflow

This workflow shows the end-to-process for modifying, acknowledging, mapping, and configuring event sources, along with viewing and configuring event source alarms and alerts.



What do you want to do?

Role	I want to...	Documentation
Administrator	Create an event source group that contains all the high priority event sources.	Creating Event Source Groups
Administrator	Edit event source attributes.	Creating an Event Source and Editing Attributes

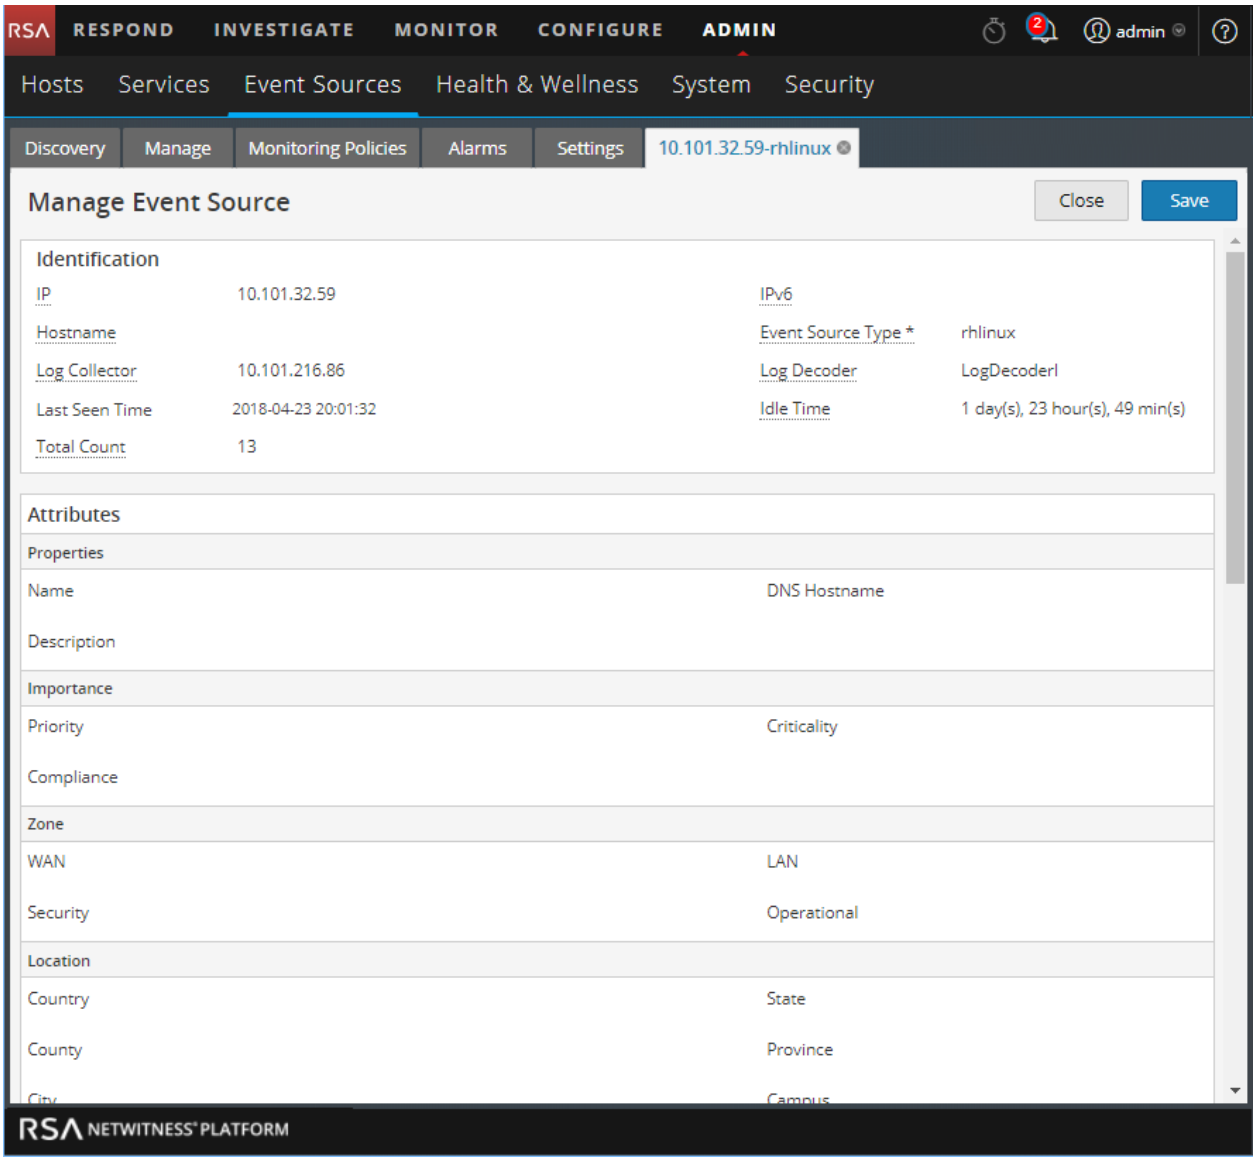
Related Topics

Creating an Event Source and Editing Attributes

Creating Event Source Groups

Quick Look

This is an example of the Event Source tab:



This table describes event source attribute categories.

Attribute Section	Description
Identification	These attributes are the main attributes that collectively identify an event source. You can only change these attributes when you are specifying the details for a new event source. For an existing event source, the attributes in this section are auto-populated, and cannot be changed while on this screen. Attributes available for a new event source: • IP • IPv6 • Hostname • Event Source Type • Log Collector • Log Decoder The following attributes are displayed when viewing the details for an existing event source: • Last Seen Time: this is the last time there was communication between NetWitness Platform and the event source • Idle Time: this is the amount of time elapsed since the **Last Seen Time**. This time can be useful if you want to filter event sources that have been inactive for a certain duration. • Total Count: total count of all event sources for this **Event Source Type**.
Properties	These attributes provide the name and description. • Name • DNS Hostname • Description
Importance	These attributes can be used for grouping by priority. • Priority • Criticality • Compliance

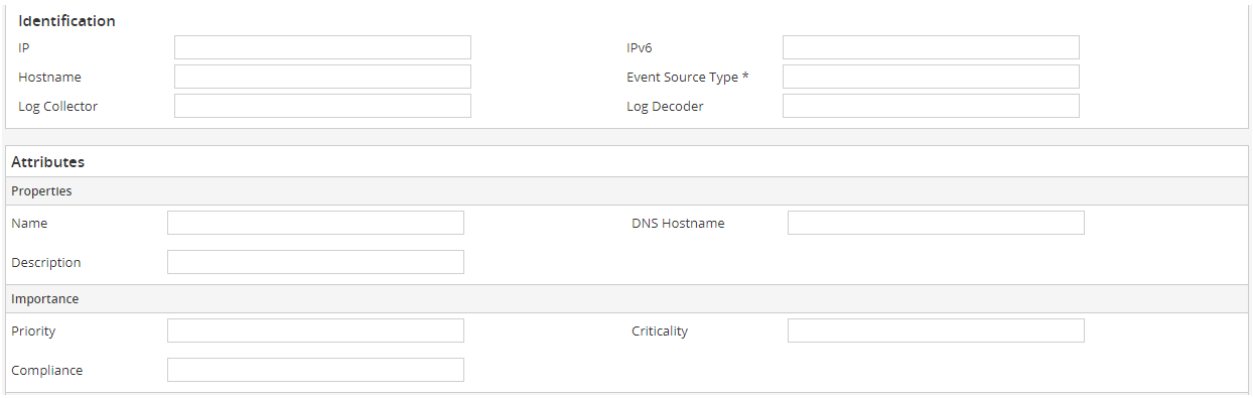
Attribute Section	Description
Zone	These attributes can be used for grouping by zone. • WAN (Wide Area Network) • LAN (Local Area Network) • Security • Operational
Location	These attributes can be used to group by the physical or geographical location. • Country • State • County • Province • City • Campus • Postal Code • Building • Floor • Room
Organization	These attributes can be used to group by organization, and also to provide contact information. • Company • Division • Business Unit • Department • Group • Contact • Contact Phone • Contact Ema
Owner	These attributes specify those responsible for the event source. • Manager • Primary Administrator • Backup Administrator

Attribute Section	Description
Physical	These attributes specify the physical properties for the event source. • Vendor • Serial Number • Asset Tag • Voltage • UPS Protected • Rack Height • Depth • BTU Output • Color
Function	These attributes can be used to group by function. • Primary Role • Sub Role 1 • Sub Role 2
System Information	These attributes specify system information. • Domain Name • System Name • Identifier • System Description
Custom	This section provides eight custom attributes, for any other attributes that your organization might need.

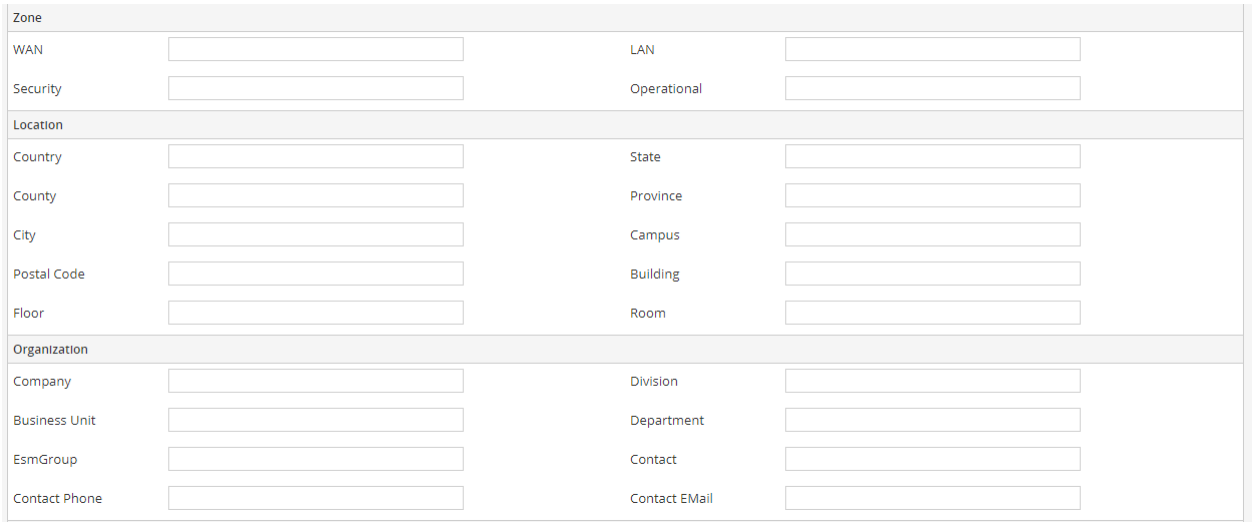
Features

The settings in the Manage Event Source tab are a combination of auto-populated and user-entered information. When an event source sends log information to NetWitness Platform, it is added to the list of event sources, and some basic information is auto-populated. At any time after that, users can add or edit details for other event source attributes.

This figure shows an example of the **Identification**, **Properties**, and **Importance** sections.



This figure shows an example of the **Zone**, **Location**, and **Organization** sections.



Event Sources View

The Event Source Attributes panel has the following tabs.

To access this panel, go to **ADMIN > Event Sources**.

Workflow

This workflow shows the end-to-process for modifying, acknowledging, mapping, and configuring event sources, along with viewing and configuring event source alarms and alerts.

Use this tab to review the event source types that NetWitness has discovered for each address and the system's confidence of how likely it is that they were identified accurately.

2 [Manage Tab]

Use this tab to create, edit, and delete Event Source Groups. It presents a customizable, searchable view of all of your event sources and groups.

3 [Monitoring Policies Tab]

Use this tab to manage alert configuration for event sources.

4 [Alarms Tab]

Use this tab to see the details of the alarms that have been generated.

5 [Settings Tab]

Use this tab to view or change the behavior for automatic (baseline) alerts.

Create/Edit Group Form

This Create Event Source Group form is displayed when you are creating or editing an Event Source Group.

Creating Event Source Group Form

Managing Event Source Groups

Details View

The **Details** view allows you to see details about the Event Source, as well as viewing a sample of the logs identified for each type in order to verify their accuracy.

You can access the **Details** view in a couple of ways.

- From the Toolbar, click the **View Details** button. Or, you can
- Double-click on the Event Source you selected.

Workflow

This workflow shows the overall process for configuring event sources.

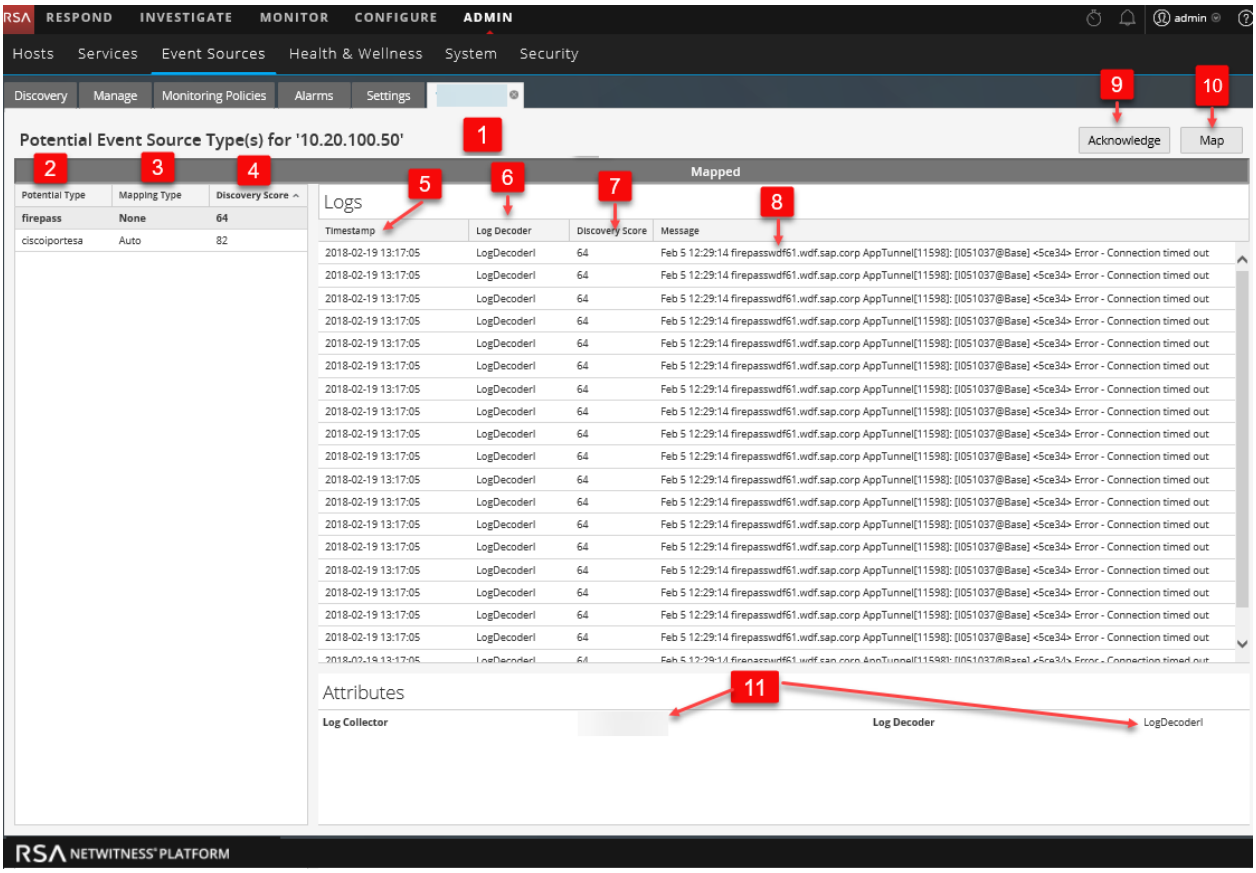
Viewing Logs from Pre-11.0 Log Decoder

Quick Look

The following example shows the discovery scores, event source types, logs, and attributes that correspond with the Event Source you selected in the Event Sources panel for a single Log Decoder.

Note: Device logs are only available for 11.0.0.0 and above Log Decoders.



1	Displays the address of the selected Event Source.
2	Displays the potential type of the selected Event Source.
3	Displays the selected Event Source Mapping Type as Auto-Mapped, Manually Mapped, or None. Any changes to the Event Source Mapping are only displayed here.
4	Displays the discovery score for the selected Event Source type from least confident (0) to most confident (100).
5	Displays timestamps for the last few logs that have been parsed to the selected Event Source Type.
6	Displays the address of the Log Decoder that is parsing event sources.

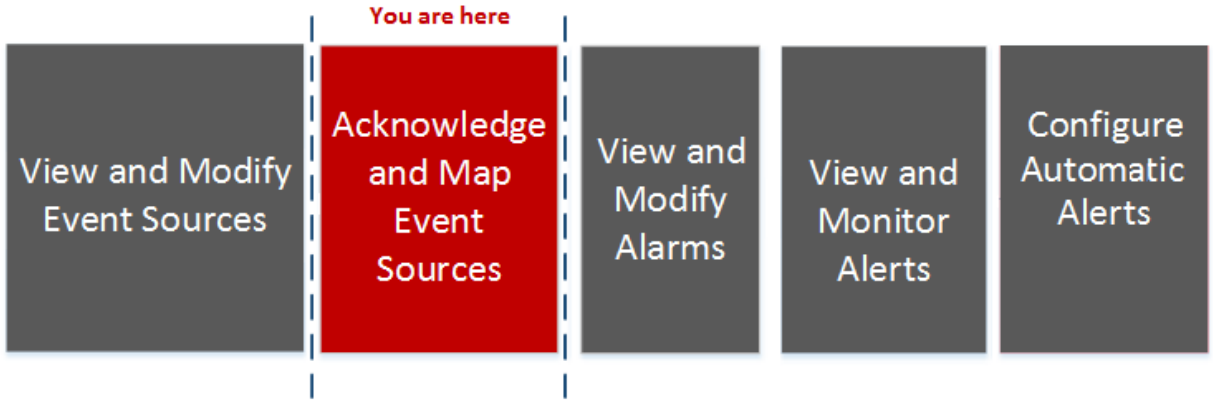
7	Displays the discovery score of the corresponding log.
8	Displays logs for the selected Event Source type.
9	Allows you to acknowledge that all the discovered Event Source types are correct.
10	Allows you to set the appropriate parsers for selected Event Source addresses.
11	Displays the Event Source Management attributes for the selected Event Source Type.

Manage Parser Mappings

The **Manage Parser Mappings** dialog allows you to map the appropriate parsers for selected Event Source addresses. From the **Details** view, select the **Map** button.

Workflow

This workflow shows the overall process for configuring event sources.



What do you want to do?

Role	I want to...	Documentation

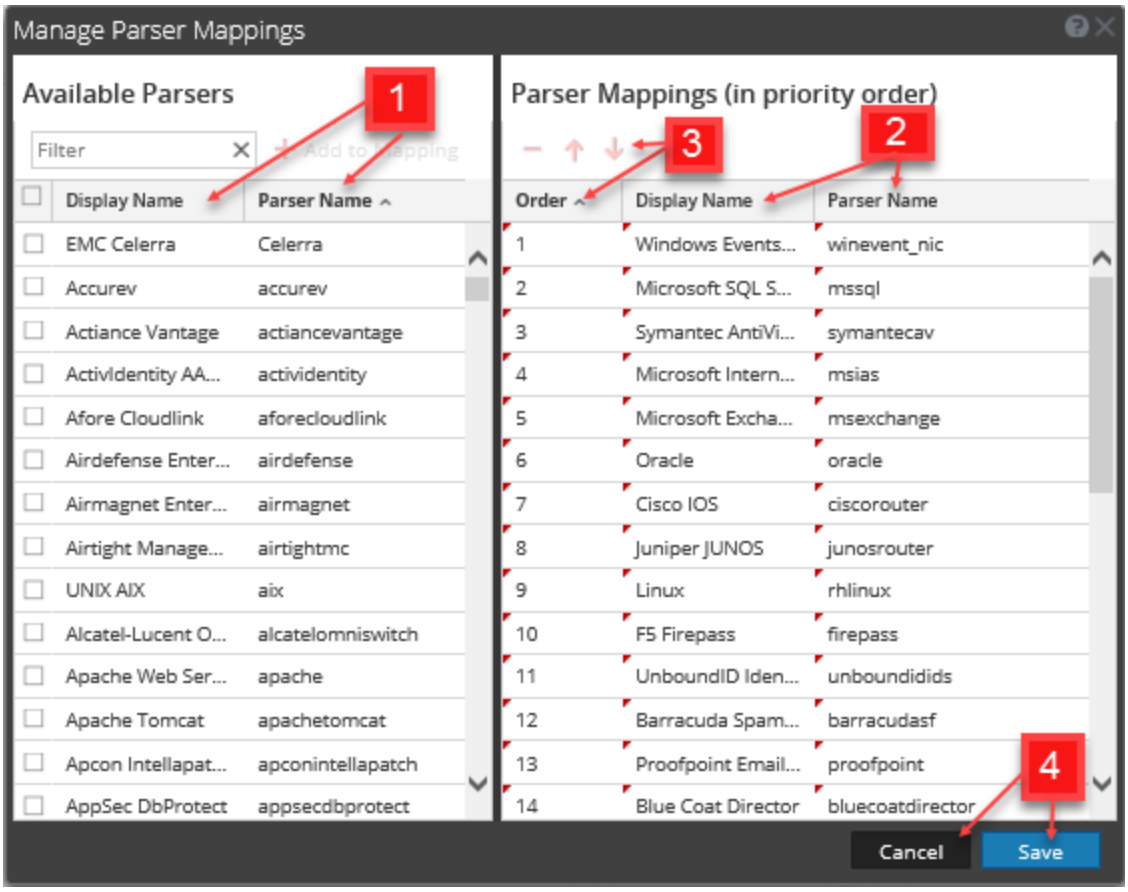
Related Topics

Viewing Logs from Pre-11.0 Log Decoder

Quick Look



1	Displays all the available parsers that you can map based on the event sources that you selected from the **Discovery** view. Also displays the mappings that are already present in the Log Decoders for the selected event source or the parsers that have been discovered. To filter your available parsers, type the first few letters of the parser name that you want to map. Click the **Add to Mapping** button to add the parser to the parser mappings listed in the right panel. You need to select parsers before the **Add toMapping** button is enabled. Add the selected parser by clicking the **Add to Mapping** button in the right panel. You can rearrange the order of the parser mappings using the up and down arrow keys and you can also drag and drop selected parser mappings. You can select multiple mappings by pressing the **Ctrl** key.
2	Displays the names of the selected parsers that you want to map.
3	Displays the order of the selected parser mappings. You can delete parser mappings by selecting the minus sign ( ). Press the **Ctrl** key to select multiple mappings to perform group operations on them.
4	Click **Save** to save your mappings to all the Log Decoders. A pop-up message informs you that your mappings are successfully saved. When the window is closed, the banner on the **Details** tab

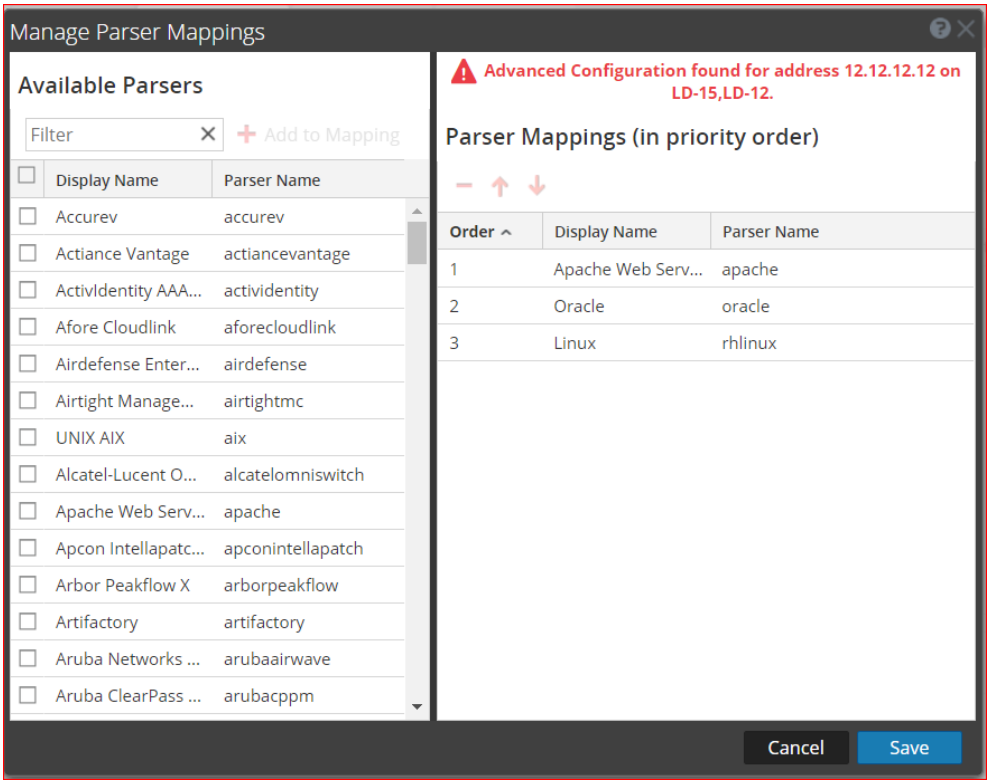
is updated to reflect the status. If mapped, the text displayed is **Mapped**.
Click **Cancel** to return to the **Details** tab.

Advanced Configuration

Mapping configurations with the Log Collector are not displayed in the Parser Mappings window. If the mapping is saved, it is saved for the corresponding IP address, not for the corresponding Log Collector entry. If no mappings are found for the corresponding IP address, the discovered event source types are displayed in the Parser Mappings window.

If advanced Log Decoder configurations are discovered, a message similar to the one below displays in the Manage Parser Mappings dialog.

Note: If you want to edit the advanced configuration, you need to navigate to the Log Decoder service's parser mappings configuration.



Alarms Tab

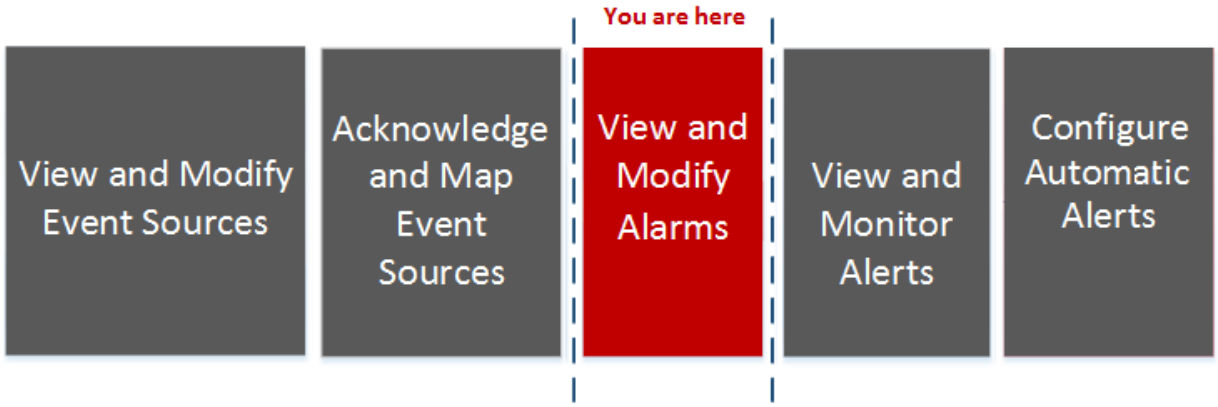
From the Alarms tab you can view details of the alarms that have been generated.

The Alarms tab has one panel that displays Alarm status.

To access this tab, go to ADMIN > Event Sources > Alarms.

Workflow

This workflow shows the overall process for configuring event sources. It also shows where configuring alarms and alerts settings are located in the process.



What do you want to do?

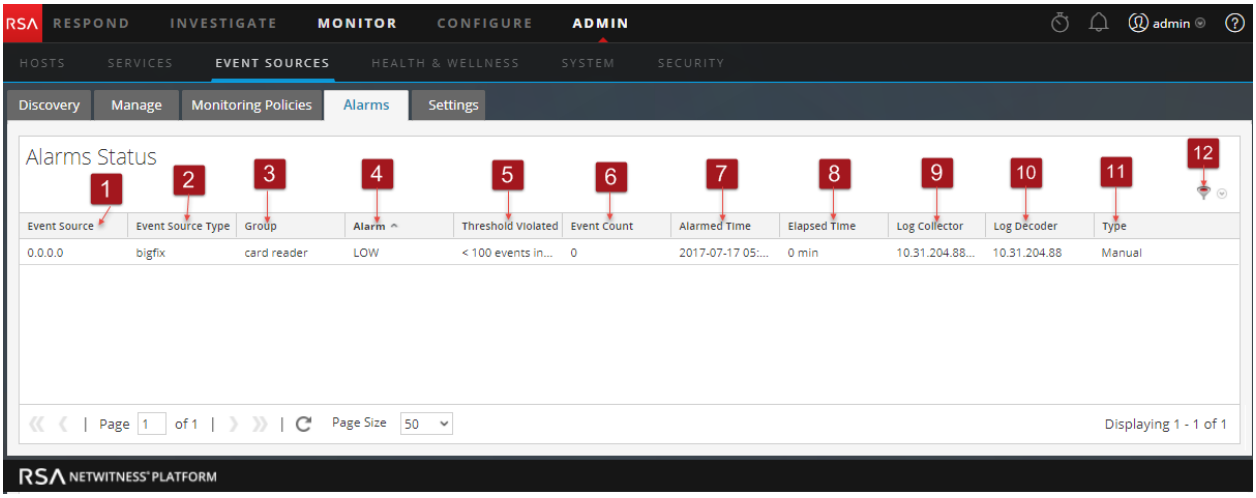
Related Topics

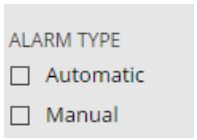
Configuring Automatic Alerting

Quick Look

The Alarms tab presents the details for Event Sources that are currently in violation of a policy and threshold. Only Event Sources in violation of a policy appear in the list. Once the event source returns to a normal state, the corresponding alarm disappears from the list.



1	Displays the IP, IPv6, or Hostname of the event source that is alarmed.
2	Displays the type of the alarmed event source. For example, **winevent_nic** (for Microsoft Windows) or **rhlinux** (for Linux).
3	Displays the event source group that contains the event source for which the alarm has been triggered.
4	Displays the type of threshold that was triggered: **High** or **Low**
5	Displays the conditions of the threshold that was triggered. For example: `5,000,000 events in 5 minutes`
6	Displays the number of events in the threshold time period causing the alarm.
7	Displays the initial time the event source went into an alarmed state. **Note:** When you first access this view, the data is sorted by this column (most recent alarm first).
8	Displays the elapsed time since the event source entered an alarmed state.
9	Displays the Log Collector last collecting from this event source.
10	Displays the Log Decoder last receiving from this event source.
11	Displays the alarm type. Alarm type is either **Manual** or **Automatic**: • **Manual**: these are alarms that violate the configured threshold policy. • **Automatic**: these are alarms that deviate from the baseline for the alarmed event source.
12	Select the **Filter** icon to display the **Filter** menu:



Select either **Automatic** or **Manual**:

- If you select **Automatic**, only the alerts that are based on baselines are displayed.
- If you select **Manual**, only the alarms for which you have set thresholds are displayed.

Note: You can hide or show columns by right-clicking in the table header and choosing **Columns** from the drop-down menu. Select a column to display it, or clear the column to hide it.

Monitoring Policies Tab

The Monitoring Policies tab organizes thresholds by event source group.

To access this tab, go to **ADMIN > Event Sources**. The **Manage** tab is displayed. Select the **Monitoring Policies** tab.

Workflow

Setting Up Notifications

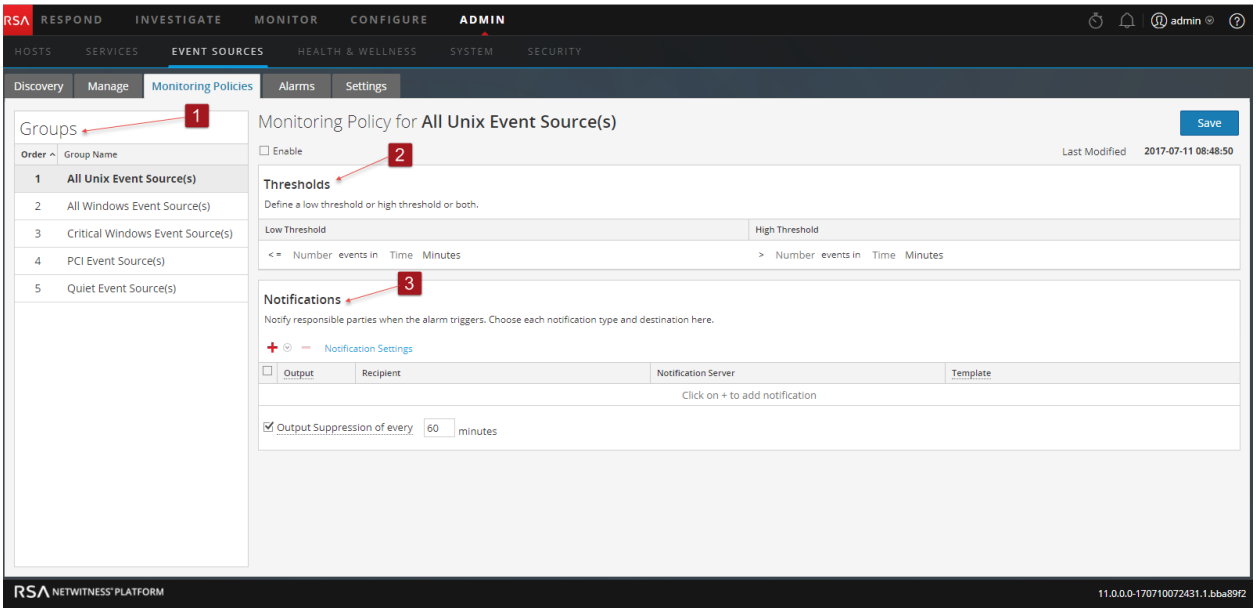
Disabling Notifications

Quick Look

The **Monitoring Policies** tab consists of three panels:

- Event Groups Panel
- Thresholds Panel
- Notifications Panel

This is an example of the **Monitoring Policies** tab.



1	Displays the Groups panel.
2	Displays the Thresholds panel.
3	Displays the Notifications panel.

Event Groups Panel

The group selected in this panel determines which thresholds appear in the Thresholds panel. You can define a set of thresholds for each event source group. Notice that the groups are listed in a specific order:

- Drag and drop groups to change the specified order.
- The higher a group is listed, the higher the precedence for that group's thresholds: RSA NetWitness Platform checks the thresholds in the order provided in this panel. Thus, your highest priority groups should be at the top of this list

Thresholds Panel

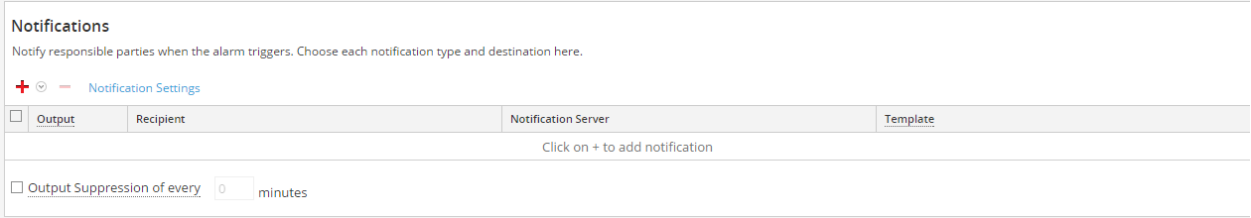
This is an example of the Thresholds panel for an event source group.

The Thresholds Panel contains the following features.

Feature	Description
Enable	The Enable checkbox designates whether or not the thresholds that you define for a group are enabled. If so, notifications are sent whenever the thresholds for that group are outside of the defined range. If not, then no monitoring of that event source group is occurring. **Note:** If you configure a threshold and attempt to save the page without enabling it, you receive a confirmation message, asking you whether or not to enable the policy. If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic notifications. See below for more details on the look of notifications.
Low number of events Low number of minutes or hours	This is the low end of the threshold. Enter the fewest number of events and the time range. If the event source group receives fewer messages than specified here, the threshold is not met, and notifications are sent.
High number of events High number of minutes or hours	Works similarly as for the low values: If more messages than specified here are received, the threshold is not met, and notifications are sent.
Last Modified date and time	This field indicates the last time and date that the thresholds were changed.
Save	Saves the changes you have made to the thresholds.

Notifications Panel

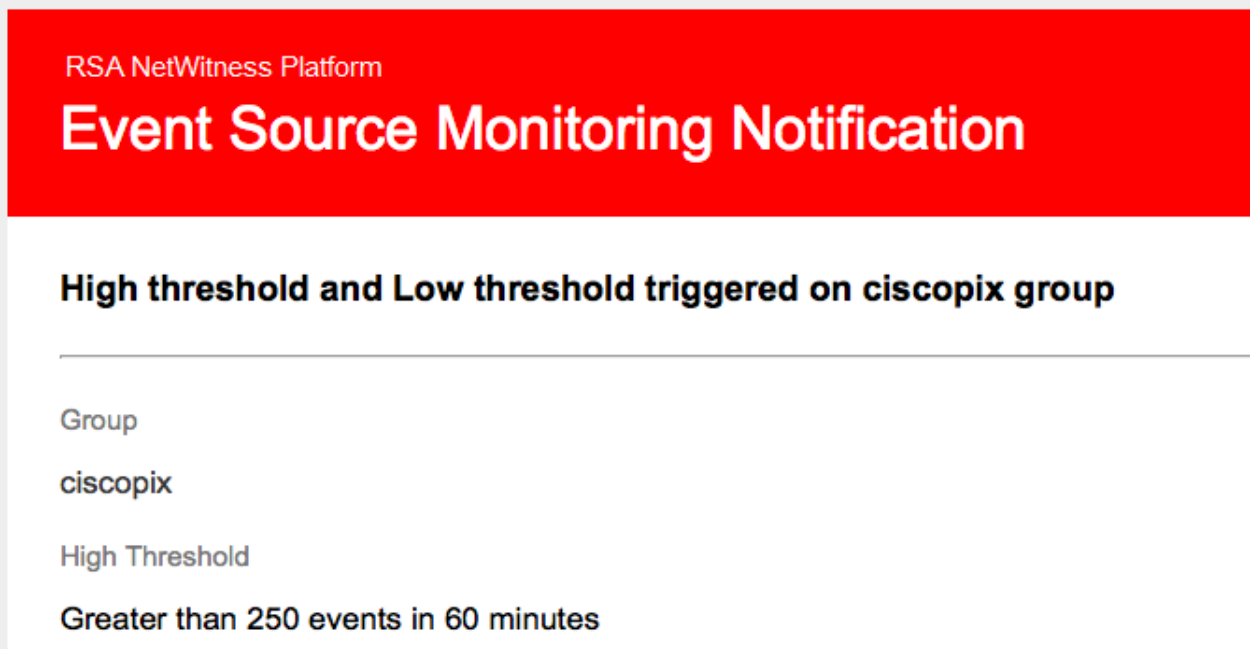
This is an example of the Notifications panel for an event source group.



The following table describes the fields on the Notifications panel

Field	Description
Tools + -	The following items are available on the toolbar: • **Add (+)**: clicking the **Add** presents a menu where you can choose the type of the notification • **Remove (-)**: removes the selected row from the list.
Notification Settings	Clicking this link opens a new browser tab, and takes you to the **Admin** > **System** > **Notifications** page in NetWitness Platform.
Type	Displays the type of the notification that you have chosen. The available options are as follows: • Email • SNMP • Syslog
Notification	See the **Configure Notification Outputs** topic in the *System Configuration Guide* for more details.
Notification Server	See the **Configure Notification Servers** topic in the *System Configuration Guide* for more details
Template	For Event Source Management, RSA provides three out-of-the-box templates for notifications. You can use the following templates as delivered, or customize them based on the needs of your organization: • **Email template**: sends notifications to the specified email addresses. • **SNMP template**: sends notifications to the specified SNMP server • **Syslog** template: sends notifications to the specified Syslog server. See the **Configure /Templates for Notifications** topic in the *System Configuration Guide* for more details.
Output Suppression	Use this item to limit how often notifications are received for this policy, in case a lot of alerts are triggered in a short period of time.

The following are sample notifications, based on the supplied Templates.



- Email:

  For email notifications, the third column, **Alarm Type**, specifies whether the triggered alarm was based on a user threshold, or the baseline data being out of normal bounds. If you have automatic monitoring or notifications turned off, you will not receive any **Automatic** notifications. The same is true for Syslog and SNMP, except those notifications are formatted differently.

- SNMP trap:

```
11-11-2015 11:57:33 Local7.Debug 127.0.0.1 community=public,
enterprise=1.3.6.1.4.1.36807.1.20.1, uptime=104313, agent_

Automatic Alerting

Disabling Notifications

Quick Look

You can set up policies and thresholds for your event source groups. You do this so that you can receive notifications when the thresholds are not met. NetWitness Platform also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

About Automatic Alerting

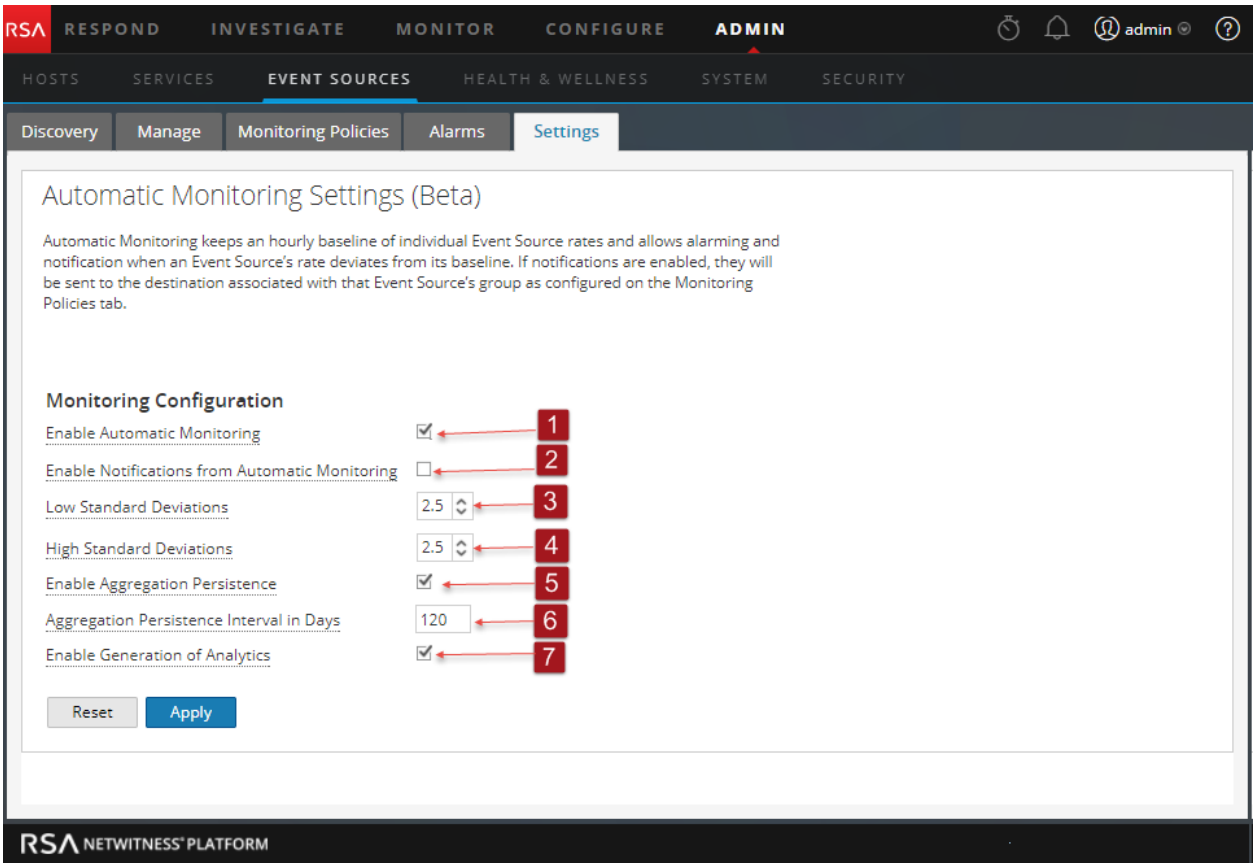
You can set up policies and thresholds for your event source groups. You do this so that you receive notifications when the thresholds are not met. NetWitness Platform also provides an automatic way to receive alarms, if you do not want to set up thresholds to generate alarms.

To trigger automatic alerts, you can use baseline values. This way, you do not need to set up numerous group thresholds and policies in order to receive alerts. Any anomalous amount of messages trigger alerts, without needing to do any configuration (except for turning on automatic alerting).

Note the following:

- Once you begin collecting messages from an event source, it takes the system approximately a week to store a baseline value for that event source. After this initial period, the system alerts you when the number of messages for a period are above or below the baseline by a set amount. By default, this amount is 2 standard deviations above or below the baseline.
- Base your high and low deviation settings on how "regular" your event sources behave. That is, if you expect little or no variance in the number of messages that arrive for a given time (for example, 8 to 9 am on a weekday), then you can set a low value for the Deviation. Conversely, if you often see peaks and valleys, set the Deviation value higher.
- If you enable a policy, but do not have any thresholds set, then you can still receive automatic (baseline) notifications, as long as you have turned on automatic alerting.

Note: Automatic alerting, and it settings, are currently in Beta testing.



1	Determines whether automatic alerting is on or off. By default, this option is selected (automatic alerting turned on)
2	Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered)
3	The standard deviations below which to receive alerts. Default is **2.0** (95% confidence)
4	The standard deviations above which to receive alerts. Default is **2.0** (95% confidence)
5	When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source. • **Enabled (default)**: one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source. • **Disabled**: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source
6	Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source

7 When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**.

The data retained includes baseline value over time and the alerting history for each event source. Note, however, the event source address and type is anonymized, so only your event rate information is revealed.

Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality

8 The **Reset** option discards any unsaved changes for all settings on the page.

9 Click **Apply** to save any changes you made to the values on the page.

Features

The Settings tab contains the following features.

Feature	Description
Enable Automatic Monitoring	Determines whether automatic alerting is on or off. By default, this option is selected (automatic alerting turned on)
Enable Notifications From Automatic Monitoring	Determines whether notifications for automatic alerts are on or off. By default, this option is cleared (automatic notifications are not sent when automatic alerts are triggered)
Low Standard Deviations	The standard deviations below which to receive alerts. Default is **2.0** (95% confidence)
High Standard Deviations	The standard deviations above which to receive alerts. Default is **2.0** (95% confidence)
Enable Aggregation Persistence	When selected, this option stores event source counts per one-hour interval. The data that is collected is used to form the baseline values for each event source. • Enabled (default): one count per hour per event source is stored in the underlying database. These one-hour counts (or aggregations) form the historical basis for computing the normal range for each event source. • Disabled: when the SMS Server is restarted, Event Source Monitoring will have no historical data with which to compute the normal range and the user will have to wait until enough data (about a week's worth) is collected to form a new basis for each event source

Feature	Description
Aggregation Persistence Interval in Days	Controls how much historical data (see **Enable Aggregation Persistence**) to maintain for each event source. The default value of 120 days means roughly 4 months of history is kept and used when reconstructing the basis for each event source
Enable Generation of Analytics	When enabled, data about the behavior of the automatic alerting is stored to disk. The default value is **Enabled**. The data retained includes baseline value over time and the alerting history for each event source. Note, however, the event source address and type is anonymized, so only your event rate information is revealed. Since automatic alerting is a beta feature, this data is important to measure the efficacy of the feature. This can be disabled without affecting the automatic alerting functionality
Reset	This option discards any unsaved changes for all settings on the page.
Apply	Click **Apply** to save any changes you made to the values on the page.

ESM Troubleshooting & Appendix

Troubleshooting Topics:

Alarms and Notifications Issues

This topic describes how to address problems you may encounter with alarms or notifications.

Alarms

If you are not seeing alarms that you expect to see, make sure that you have configured all the necessary items, as discussed below.

Automatic Alarms

To see automatic alarms appear on the Alarms screen, the **Enable Automatic Monitoring** option must be selected.

This option is on the **Setting** tab (**ADMIN** > **Event Sources** > **Settings**), and is selected by default. However, at some point someone may have cleared this option.

Manual Alarms

To see manual alarms appear on the Alarms screen, all of the following conditions must be met:

- The event source must be part of a Group.
- The Group must have a policy with either a low or high (or both) threshold defined.
- The Group Policy must be enabled.

Notifications

If you are seeing alarms, but are not receiving the expected notifications, make sure that you have configured all the necessary items, as discussed below.

Also, make sure that you have correctly configured the Notification Servers and Notification Outputs. Much of the preliminary configuration for Notifications is done from **ADMIN > System > Global Notifications**. For details, see the **Global Notifications Panel** topic in the *System Configuration Guide*.

Automatic Notifications

To have the system send automatic notifications, all of the following conditions must be met:

- The **Enable Automatic Monitoring** option must be selected (this option is selected by default).
- The **Enable Notifications From Automatic Monitoring** option must be selected. This option is cleared by default, so you or someone in your organization must select it. Navigate to **ADMIN** > **Event Sources** > **Settings** to see this option.
- The event source that triggered the alarm must be in a group that has a policy enabled: note that no thresholds need to be set for automatic notifications.
- The policy must at least one notification configured (either email, SNMP or Syslog).

Manual Notifications

To have the system send manual notifications (that is, a notification which says that a manual alarm was triggered):

- The event source that triggered the alarm must be in a group that has a group policy enabled.
- There must be a threshold set for the policy.
- At least one notification has been configured for the policy.

Duplicate Log Messages

It is possible that you are collecting messages from the same event source on two or more Log Collectors. This topic describes the problem and ways to troubleshoot the issue.

Details

If the ESM aggregator detects the same events for the same event source on multiple Log Collectors, you receive a warning similar to the following:

```
2015-03-17 15:25:29,221 [pool-1-thread-6] WARN
com.rsa.smc.esm.groups.events.listeners.EsmStatEventListener -
 192.0.2.21-apache had a previous event only 0 seconds ago; likely because it
exists on multiple log collectors
```

This warning message means the `192.0.2.22-apache` event source is being collected by multiple hosts. You can see the list of hosts in the Log Collector column in the **Manage** tab in the Administration > Event Sources view.

Clean Up Duplicate Messages

1. Stop collectd on NetWitness Platform and Log Decoders:

   ```
   Service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness Platform:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.

   a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`.

   b. Click **decoder(*)** to view the properties for the decoder.

c. In the Properties drop-down menu, select **reset**, then click **Send**.

4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.

Troubleshooting Feeds

The purpose of the feed generator is to generate a mapping of an event source to the list of groups to which it belongs.

If you have an event source from which you are collecting messages, and yet it is not displayed in the correct event source groups, then this topic provides background and information to help you track down the problem.

Details

The ESM Feed maps multiple keys to single value. It maps the DeviceAddress, Forwarder, and DeviceType attributes to groupName.

The purpose of the ESM feed is to enrich event source Meta with the groupName collected on the Log Decoder.

How it Works

The feed generator is scheduled to update every minute. However, it is triggered only if there are any changes (create, update, or delete) in event sources or groups.

It generates a single feed file with event source to group mapping, and pushes the same feed to all of the Log Decoders that are connected to NetWitness Platform.

Once the feed file is uploaded on the Log Decoders, for any new events, it enriches events Meta data with groupName, and appends this groupName to logstats.

Once the groupName is in logstats, the ESM Aggregator groups information and sends it to ESM. At this point, you should see the **Group Name** column under the **Event Source Monitoring** tab.

The entire process can take some time. Therefore, you may need to wait for several seconds after you add a new group or event source, before the Group name is displayed.

Note: If the event source type attribute changes when the feed is updated, NetWitness Platform adds a new logstats entry, rather than updating the existing one. Thus, there will be two different logstats entries in logdecoder. Previously existing messages would have been listed under the previous type, and all new messages are logged for the new event source type.

Feed File

The format of the feed file is as follows:

```
DeviceAddress, Forwarder, DeviceType, GroupName
```

The `DeviceAddress` is either `ipv4`, `ipv6`, or `hostname`, depending on which of these have been defined for the event source.

The following is a sample of the feed file:

```
"12.12.12.12","d6","NETFLOW","grp1"
"12.12.12.12","ld4","netflow","grp1"
"12.12.12.12","d6","netfow","grp1"
"0:E:507:E6:D4DB:E:59C:A","10.25.50.243","apache","Apachegr
p"
"1.2.3.4","LCC","apache","Apachegrp"
"10.100.33.234","LC1","apache","Apachegrp"
"10.25.50.248","10.25.50.242","apache","Apachegrp"
"10.25.50.251","10.25.50.241","apache","Apachegrp"
"10.25.50.252","10.25.50.255","apache","Apachegrp"
"10.25.50.253","10.25.50.251","apache","Apachegrp"
"10.25.50.254","10.25.50.230","apache","Apachegrp"
"10.25.50.255","10.25.50.254","apache","Apachegrp"
"13.13.13.13","LC1","apache","Apachegrp"
"AB:F255:9:8:6C88:EEC:44CE:7",,"apache","Apachegrp"
"Appliance1234",,"apache","Apachegrp"
"CB:F255:9:8:6C88:EEC:44CE:7","10.25.50.253","apache","Apach
egrp"
```

Troubleshooting Feeds

You can check the following items to narrow down where the problem is occurring.

10.5 Log Decoders

Are your NetWitness Platform Log Decoders at version 10.5 or later? If not, you need to upgrade them. For NetWitness Platform version 10.6, feeds are sent only to version 10.5 and later Log Decoders.

Feed File Existence

Verify that the feeds ZIP archive exists in the following location:

`/opt/rsa/sms/esmfeed.zip`

Do not modify this file.

Group Meta Populated on LD

Verify that the group meta is populated on the Log Decoder. Navigate to the Log Decoder REST and check logstats:

`http://LogDecoderIP:50102/decoder?msg=logStats&force-content-type=text/plain`

This is a sample logstats file with group information:

```
device=apache forwarder=NWAPPLIANCE10304 source=1.2.3.4
count=338 lastSeenTime=2015-Feb-04 22:30:19
lastUpdatedTime=2015-Feb-04 22:30:19
groups=IP1234Group,apacheGroup
device=apachetomcat forwarder=NWAPPLIANCE10304
source=5.6.7.8 count=1301 lastSeenTime=2015-Feb-04 22:30:19
lastUpdatedTime=2015-Feb-04 22:30:19
groups=AllOtherGroup,ApacheTomcatGroup
```

In the above text, the group information is bolded.

Device Group Meta on Concentrator

Verify that the **Device Group** meta exists on the Concentrator, and that events have values for the `device.group` field.

SMS Log File

Check the SMS log file in the following location to view informational and error messages: `/opt/rsa/sms/logs/sms.log`

The following are example *informational* messages:

```
Feed generator triggered...

Created CSV feed file.

Created zip feed file.

Pushed ESM Feed to LogDeocder : <logdecoder IP>
```

The following are example *error* messages:

```

Verify Logstats data is getting Read & Published by ESMReader & ESMAggregator

These are the steps to verify that logstats are collected by **collectd** and published to Event Source Management.

ESMReader

1. On Log Decoders add **debug "true"** flag in **/etc/collectd.d/NwLogDecoder_ESM.conf**:

```
#
# Copyright (c) 2014 RSA The Security Division of EMC
#
<Plugin generic_cpp>    PluginModulePath "/usr/lib64/collectd"
    debug "true"

    <Module "NgEsmReader" "all">
        port      "56002"
        ssl       "yes"
        keypath   "/var/lib/puppet/ssl/private_keys/d4c6dcd4-6737-
4838-a2f7-    ba7e9a165aae.pem"
        certpath  "/var/lib/puppet/ssl/certs/d4c6dcd4-6737-4838-a2f7-
 ba7e9a165aae.pem"
        interval  "600"
        query     "all"
        <stats>
        </stats>
    </Module>
    <Module "NgEsmReader" "update">
        port      "56002"
        ssl       "yes"
        keypath   "/var/lib/puppet/ssl/private_keys/d4c6dcd4-6737-
4838-a2f7-    ba7e9a165aae.pem"
        certpath  "/var/lib/puppet/ssl/certs/d4c6dcd4-6737-4838-a2f7-
 ba7e9a165aae.pem"
        interval  "60"
        query     "update"
        <stats>
        </stats>
    </Module>
</Plugin>
```

2. Run the command:

```
collectd service restart
```

3. Run the following command:

```
tail -f /var/log/messages | grep collectd
```

Verify that ESMReader is reading logstats and there are no errors. If there are any read issues, you will see errors similar to the following:

```
Apr 29 18:47:45 NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_all:
error getting ESM data for field "groups" from logstat device=checkpointfw1
forwarder=PSRTEST source=1.11.51.212. Reason: <reason>Apr 29 18:58:36
NWAPPLIANCE15788 collectd[14569]: DEBUG: NgEsmReader_update: error getting
ESM data for field "forwarder" from logstat device=apachetomcat
source=10.31.204.240. Reason: <reason>
```

ESMAggregator

1. On NetWitness Platform, uncomment the verbose flag in **/etc/collectd.d/ESMAggregator.conf**:

```
# ESMAggregator module collectd.conf configuration file
#
# Copyright (c) 2014 RSA The Security Divsion of EMC
#
<Plugin generic_cpp>
PluginModulePath "/usr/lib64/collectd"
<Module "ESMAggregator">
        verbose 1
        interval "60"
        cache_save_interval "600"
        persistence_dir "/var/lib/netwitness/collectd"
</Module>
</Plugin>
```

2. Run the following:

   ```
   collectd service restart.
   ```

3. Run the following command:

   ```
   run “tail –f /var/log/messages | grep ESMA
   ```

   Look for ESMAggregator data and make sure your logstat entry is available in logs.

Sample output:

```

aggregated from 1 log
```

Configure JMX Feed Generator Job Interval

Although the feed generation job is scheduled to execute every minute by default, you can change this by using **jconsole**, if necessary.

To change the feed generator job interval:

1. Open **jconsole** for the SMS service.
2. On the MBeans tab, navigate to **com.rsa.netwitness.sms** > **API** > **esmConfiguration** > **Attributes**.
3. Modify the value for the property **FeedGeneratorJobIntervalInMinutes**.
4. Go to **Operations** under the same navigation tree, an click **commit()**. This persists the new value in the corresponding json file under **/opt/rsa/sms/conf**, and uses the value if SMS is restarted.

Setting a new value reschedules the feed generator job for the new interval.

Import File Issues

If your import file is not formatted correctly, or is missing required information, an error is displayed, and the file is not imported.

Check the following:

- If you are adding unknown sources, each line in the file must contain a combination of the required attributes:

- IP or IPv6 or Hostname, and
- Event Source Type

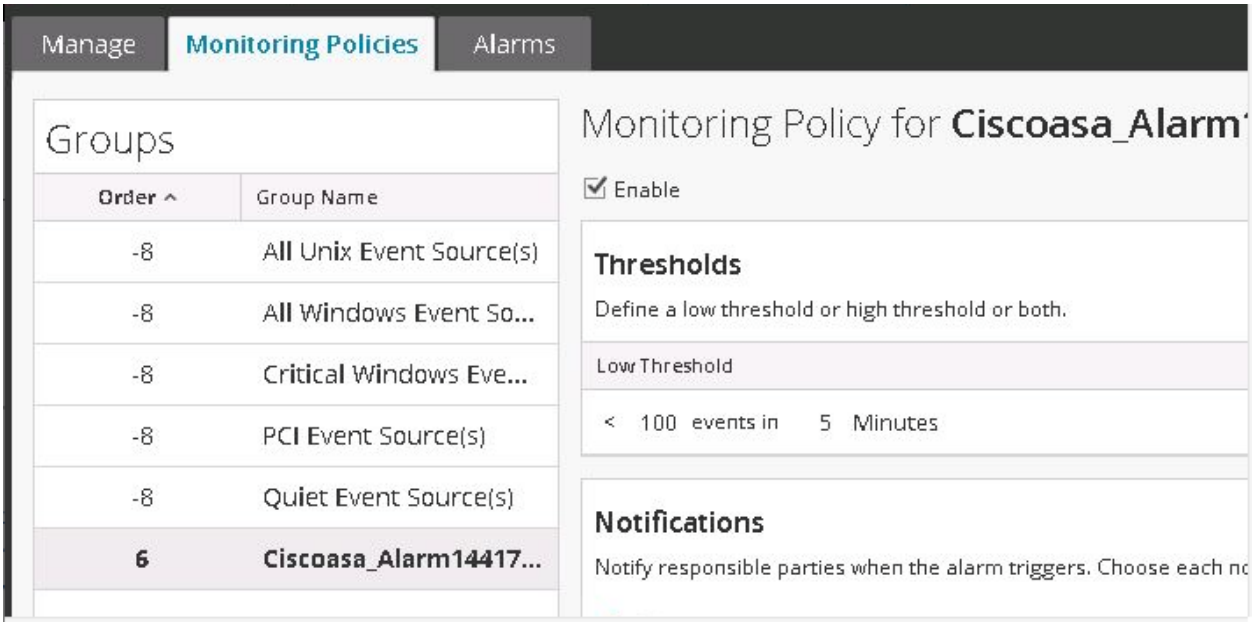
- The first line of the file must contain header names, and the names must match the names in NetWitness Platform. To get a list of correct column names, you can export a single event source. Examine the exported CSV file: the first row of the file contains the correct set of attribute/column names.

Negative Policy Numbering

You may see negative numbers in the Order field in the Groups section of the Monitoring Polices tab. This topic describes a workaround to restore the correct numbering scheme for your policies.

Details

The following screen shows an example of the situation where the numbers of group policies become negative.



If you encounter this situation, drag and drop the top group (**All Unix Event Source(s)** in the above image) to after the last group (**Ciscoasa_Alarm14417**). This restores normal, ordinal numbering. You can then continue to drag and drop groups until you have them in their proper order for your organization.

Clean Up Duplicate Messages

1. Stop collectd on NetWitness Platform and Log Decoders:

   ```
   Service collectd stop
   ```

2. Remove the ESM Aggregator persisted file on NetWitness Platform:

   ```
   rm /var/lib/netwitness/collectd/ESMAggregator
   ```

3. Reset the Log Decoder.

a. Navigate to the Log Decoder REST, at `http://<LD_IP_Address>:50102`

b. Click **decoder(*)** to view the properties for the decoder.

c. In the Properties drop-down menu, select **reset**, then click **Send**.

4. In the Event Sources panel from the Event Sources Manage tab, select all event sources and then click − to remove them.

Viewing Logs from Pre-11.0 Log Decoder

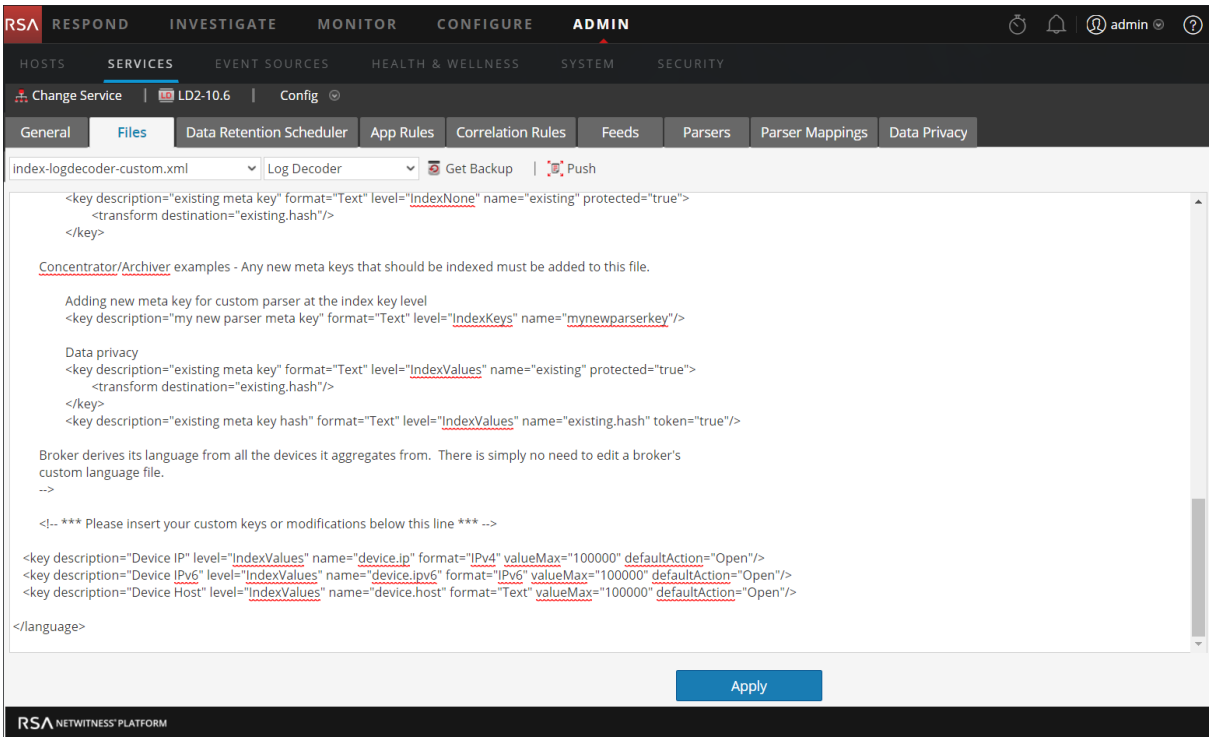
RSA NetWitness® Platform 11.0 added the capability to view a small sampling of recent logs for specific devices through detail tabs of the Discovery View. By default, Log Decoders prior to 11.0 do not have the necessary configuration to enable this feature, but a few minor changes can make it available.

To enable logs preview for a pre-11.0.0.0 Log Decoder, follow these steps on the Log Decoder:

1. Go to **ADMIN > Services >** select a Log Decoder, then select ⚙ **> View > Config**.
2. Click **Files** tab, then select **index-logdecoder-custom.xml** from the drop-down menu.
3. Add the following three lines at the end of the file (before the closing language tag):

```
<key description="Device IP" level="IndexValues" name="device.ip" format="IPv4" valueMax="100000"
defaultAction="Open"/>
<key description="Device IPv6" level="IndexValues" name="device.ipv6" format="IPv6"
valueMax="100000" defaultAction="Open"/>
<key description="Device Host" level="IndexValues" name="device.host" format="Text"
valueMax="100000" defaultAction="Open"/>
```

4. Click **Apply**.



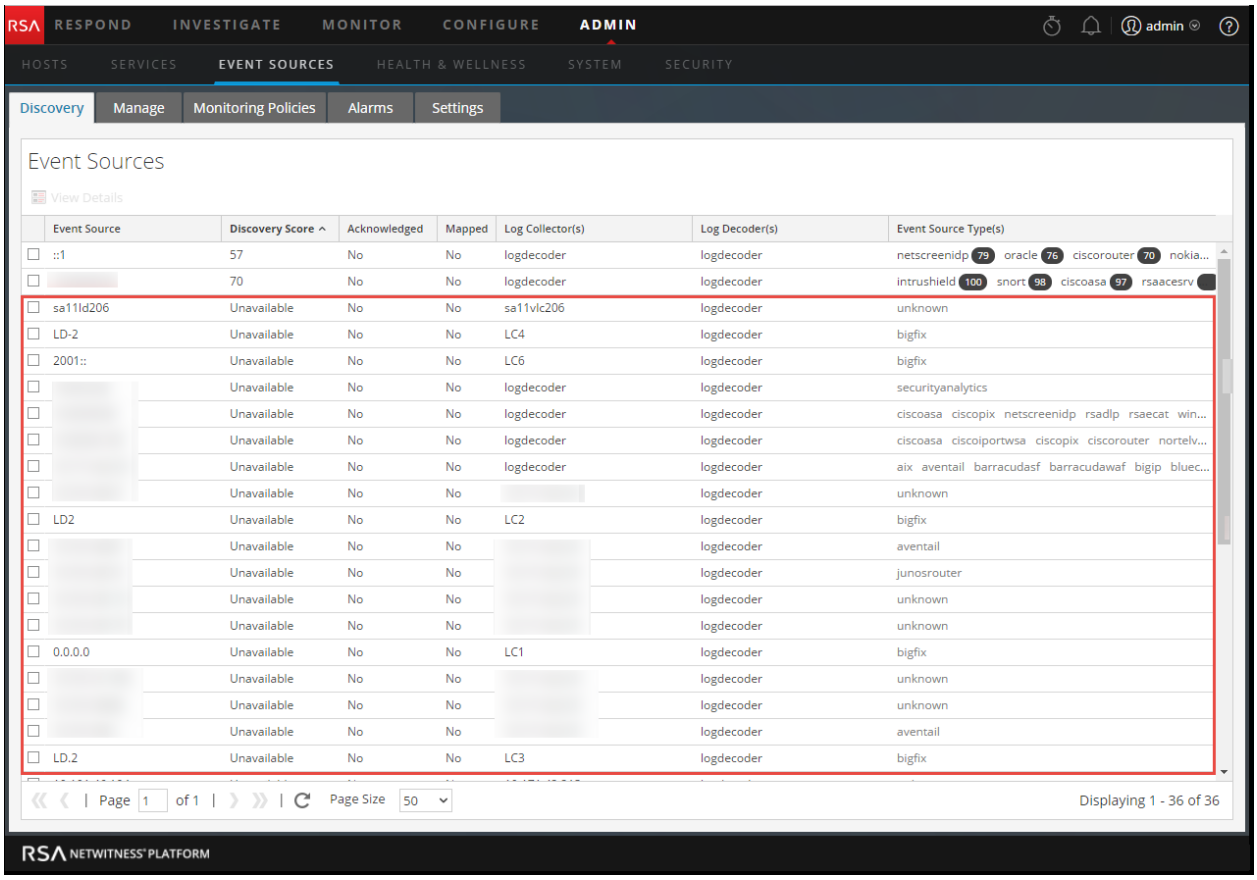
5. Restart the Log Decoder as follows.

   Select **Log Decoder > Explore > sys > Properties > shutdown**

This is an example of the **index-logdecoder-custom.xml** file.

Note: Discovery Scores are only available for 11.0 and above Log Decoders. Discovery Scores for pre-11.0 Log Decoders display as Unavailable.

The following example displays the Discovery Score as **Unavailable** in the **Details** view for a pre-11.0 Log Decoder.



Note: Device logs are only available for 11.0 and above Log Decoders.

The following example shows the message that displays in the displays in the Logs panel for a pre-11.0 Log Decoder.

Log Parser Rules Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

Introduction

This tab contains details about the rules for the default log parser, as well as any other custom rules and log parsers that have been defined.

The *default log parser* parses logs that do not match any installed log parsers. The information contained in such a log is processed against the default log parser's rules, and metadata is then extracted by those rules and is available for Enrichment, Investigation, Reporting, and Alerting. This provides immediate visibility into logs from custom or unsupported sources.

You can also add or extend a log parser. For example, you may need to parse certain fields differently than in the manner provided by the log parser for a particular event source. You can add rules that change the way meta information is extracted from the logs for the event source.

Finally, you can view and test sample log messages and rules for your log parsers, including the default log parser.

The Log Parser Rules tab displays information about log parsers that use dynamic log parser rules. This includes the following:

- The default log parser that parses logs that are not associated with a particular log parser
- Native XML-defined device parsers that have been extended with dynamic log parser rules, and
- User-created custom device parsers used to parse unsupported custom event sources

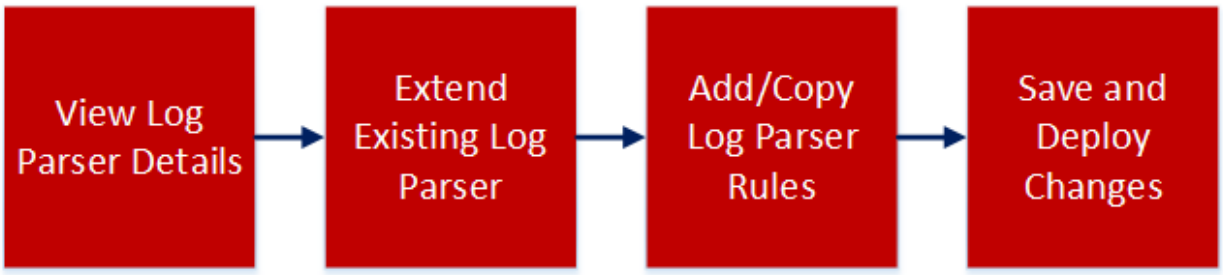
This tab contains the following information:

- You can view the rules for a particular event source type, including the default parser.
- You can view the Names, Literals, patterns, and meta for each configured log parser.
- You can add log parsers
- You can add, edit, and delete custom rules for log parsers

To access this tab, go to **CONFIGURE > Log Parser Rules**.

Workflow

This workflow shows processes available from the Log Parser Rules view.



What do you want to do?

Role	I want to...	Documentation
Administrator	*View log parser rules.	Default Log Parser and Log Parser Rules
Administrator	*Add, edit or delete a log parser rule (version 11.2 and later)	Add or Delete a Log Parser Rule
Administrator	*Add or remove a log parser (version 11.2 and later)	Add or Delete a Log Parser

*You can perform this task here.

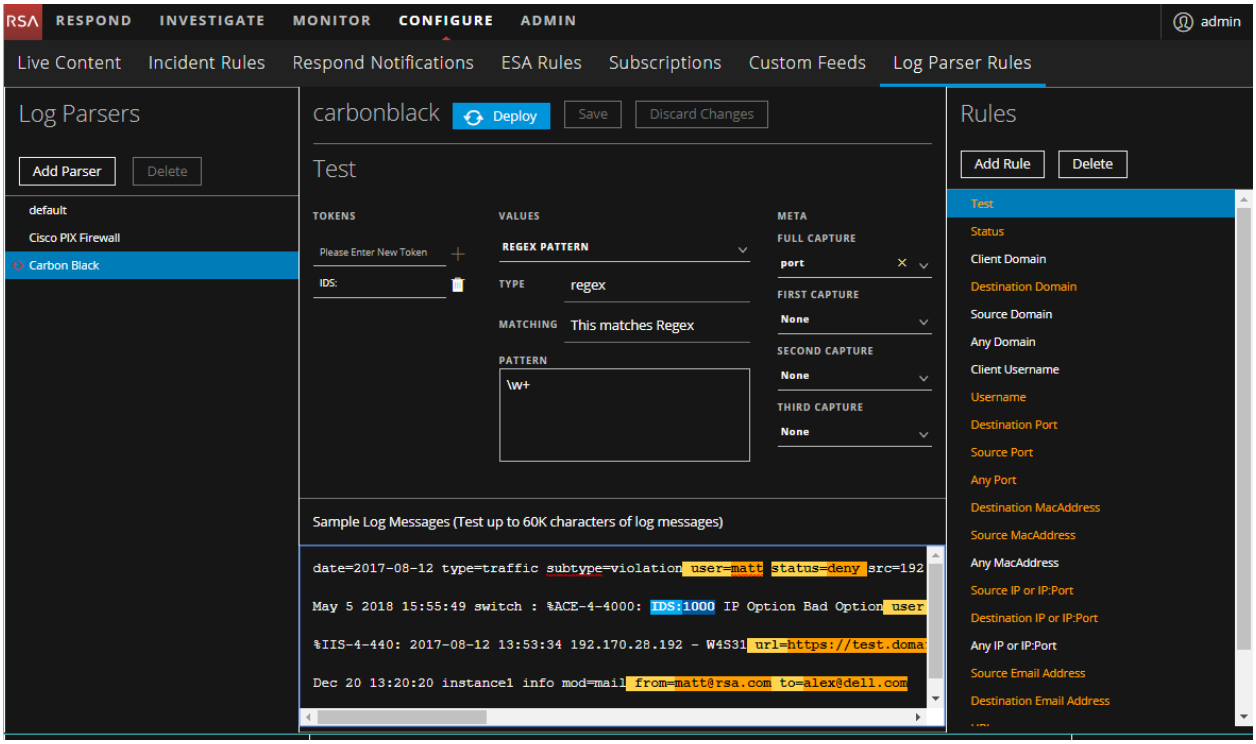
Related Topics

Default Log Parser and Log Parser Rules

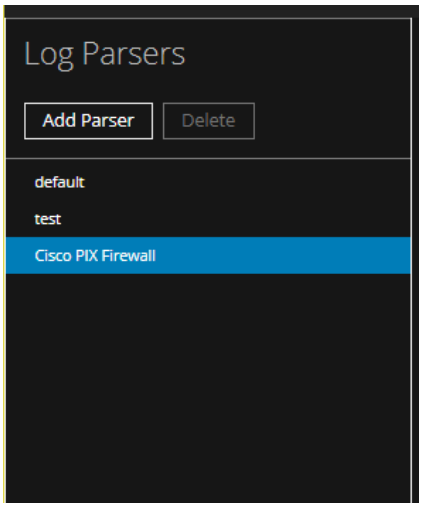
Quick Look

Note: The list of log parsers is based on the first Log Decoder that is installed or registered by the Orchestration Server. If you have more than one Log Decoder, this tab only lists log parsers that have been configured on the first one.

The Log Parser Rules tab organizes and displays information about the configured log parsers in your system. This tab consists of three panels: Log Parsers list, Details for the selected log parser, and Rules for the selected log parser.



Log Parsers Panel

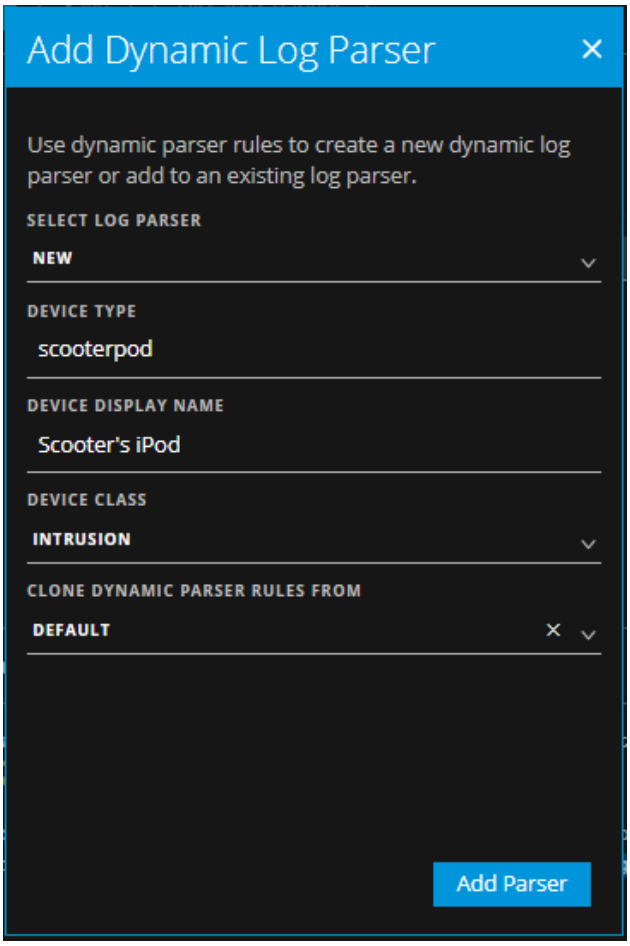


The Log Parsers Panel lists the configured log parsers.

- Until you add rules to existing XML parsers on your reference Log Decoder, (or add a new, custom log parser) only the **default** parser is listed here.
- Select a specific log parser to view its details in the Details and Rules panels.
- Click **Add Parser** to open the Add Dynamic Log Parser dialog box.
- Click **Delete** to delete a log parser.

IMPORTANT: Once you deploy a log parser, you can no longer delete it through this interface. The **Delete** button is not available for deployed parsers. To manually delete a log parser, see Delete a Log Parser Manually.

The Add Dynamic Log Parser dialog box allows you to add a custom log parser.



When you are adding a log parser, the following parameters are available.

Field	Details
SELECT LOG PARSER	Select NEW, or choose an existing log parser. By choosing an existing log parser, you can add rules to that parser, essentially extending its parsing capabilities. **Note:** If you select an existing log parser, the remaining fields are auto-filled based on the values for selected log parser.
DEVICE TYPE	Enter a string to define the device type. The name must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers.
DEVICE DISPLAY NAME	Enter the display name for the log parser. **Note:** The display name must be 64 characters or fewer, and must not match the name of any other device display name.
DEVICE CLASS	Select a device class.
CLONE DYNAMIC PARSER RULES FROM	Leave blank to start with no rules, or select one of the existing log parsers to clone its rules.

Details Panel

The details panel shows the three pieces for the selected rule:

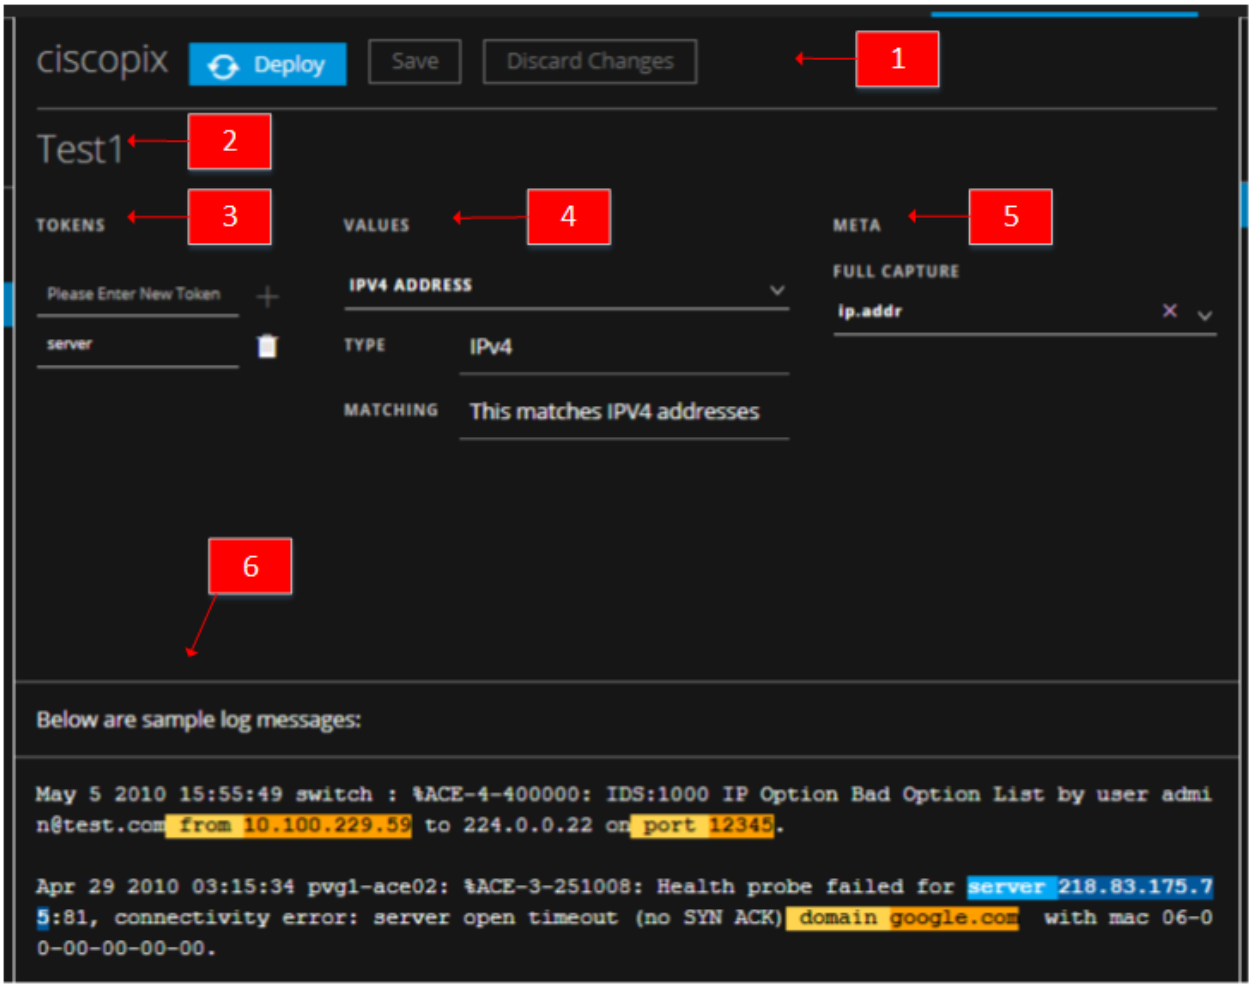
- **Tokens:** one or more tokens to match in the message. For example, the Any Port rule looks for the following strings to match against: **port** , **port:**, **port=**, and others.
- **Values:** the value that follows the token. This is a string that is captured as meta. For example, assume a log contains the following string:

  ```
  port 12345
  ```

  The Any Port rule has a token that matches "port ". When it encounters that string, it assigns the token value, "12345" to a meta key.
- **Meta:** the meta keys to which the value is mapped. For example, the Any Port rule maps the port value to the **port** meta key.

Essentially, a rule says, "when you are parsing a message, if you match one of my tokens, assign the value that follows the token to the meta key that I want it stored as."

The bottom section of the Details panel contains sample log messages, and how they would be parsed for the selected log parser.



1	Displays the name of the selected log parser, and the buttons for deploying, saving, and discarding changes. This value changes when you select a different parser.
2	Displays the name of the selected rule. This value changes when you select a different rule for this parser.
3	Displays the list of tokens defined for the selected rule.
4	Displays the type and pattern of the value matching for the selected parser. The values here are determined by the type of the selected value. You can also use the Regex option to define a custom regular expression.
5	Displays the NetWitness meta to which the selected rule maps any matched tokens. The values here are determined by the selected Rule.
6	Displays a sample log message, and highlights strings that match tokens in the selected log parser. You can edit this field, and add in your own logs to preview how the selected parser will parse your logs. **Note:** The sample section refreshes whenever a rule is changed or updated, as well as when you paste in samples from your logs.

For example, consider the following scenario:

- The **default** parser is selected.
- The **Any Domain** rule is selected.
- The Tokens matching list displays all of the tokens that are matched when found in a log message: **Domain**, **Domain Name**, **domain**, **ADMIN_DOMAIN**, and so on.
- The Meta list displays the NetWitness meta to which the value for the token is mapped: **domain**.

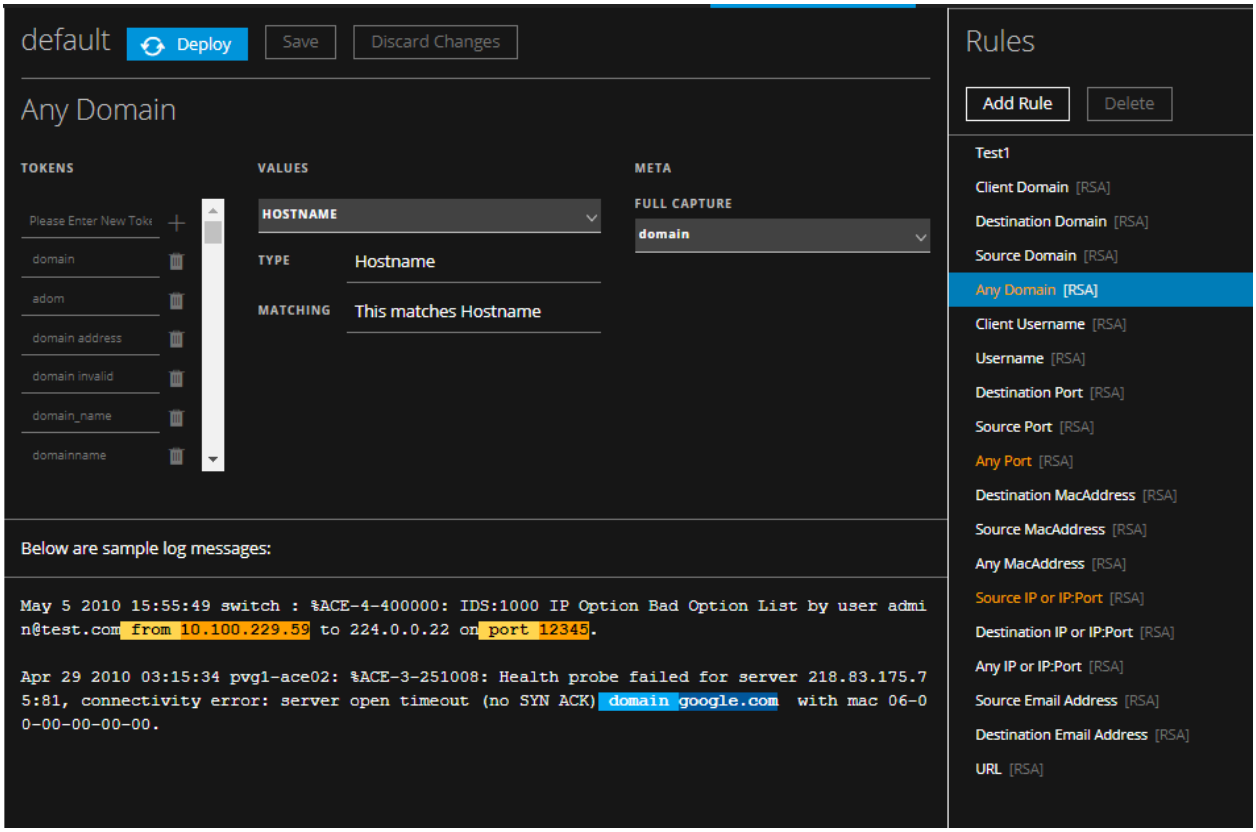
So, let's say the sample log message area has the following text:

```
Below are sample log messages:

May 5 2010 15:55:49 switch : %ACE-4-400000: IDS:1000 IP Option Bad Option
List by user admin@test.com from 10.100.229.59 to 224.0.0.22 on port 12345.

Apr 29 2010 03:15:34 pvg1-ace02: %ACE-3-251008: Health probe failed for
server 218.83.175.75:81, connectivity error: server open timeout (no SYN ACK)
domain google.com with mac 06-00-00-00-00-00.
```

In this case, the Sample Log Message area looks like this:



Note that some strings are highlighted, and that there are two "pairs" of highlight colors:

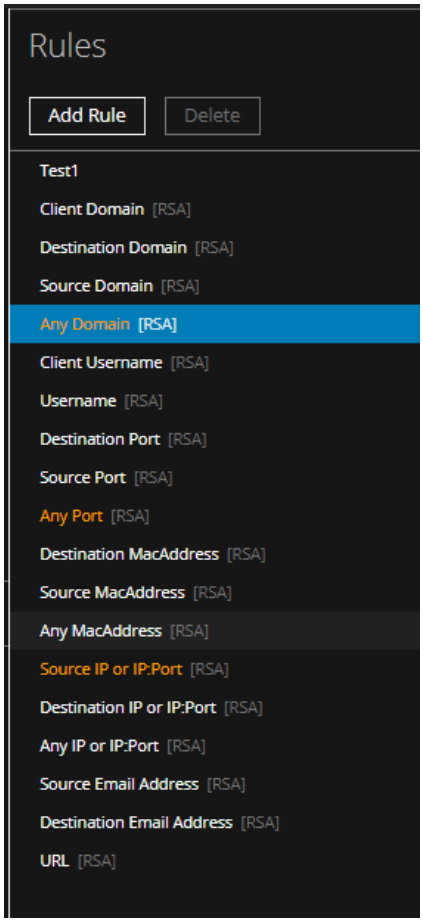
- Dark blue and light blue highlighting is applied to the strings that match the currently selected rule.
  - Dark Blue highlighted strings match a token in the selected rule. In this case, **domain** is the token that is matched for the **Any Domain** rule.

  - Light Blue highlighted strings are the values that correspond to the tokens in dark blue. For example, **google.com** is highlighted in light blue, because it corresponds to the **domain** token.
- Orange and yellow highlighting is applied to the strings that match rules for the current parser that are *not* currently selected.
  - Orange highlighted strings match a token in a rule that is not currently selected.
  - Yellow highlighted strings are the values that correspond to the tokens in orange. For example, the **user** token matches the **Username** rule (which is not currently selected).

In this example, the **domain** meta would be assigned a value of **google.com** for this log message, if it was parsed using the default log parser.

Rules Panel

The Rules panel displays the list of rules used by the selected log parser. When you select a rule, you change the values that are displayed in both the **Tokens** and **Values** areas of the panel.



Note the highlighted rules:

- The currently selected rule is highlighted in blue.
- Other rules that match tokens in the sample log message area are highlighted in orange.

Other notes for the Rules panel:

- RSA rules (the rules provided out-of-the-box for each log parser) are identified by **[RSA]** following the rule name.

  You can copy these rules when adding a new log parser, and then change them as needed.
- The **Delete** button is only available for custom rules; for RSA rules, it is greyed out.
- Use the **Add Rule** button to add a custom rule.

Disable log Parser Rules

You can disable log parser rules, so that none of them are processed by the Log Decoder. You might have your log parsers working as you like, and do not want any extra processing that you do not need.

You disable them from the reference Log Decoder.

1. Go to**ADMIN > Services**.
2. In the **Administration Services view**, select the Decoder and  **> View > Config.**

   The Services Config view is displayed with the General tab open.
3. Under **Parsers Configuration**, look at the Config Value for **PARSERULESCAN**.

   If it is **Enabled**, log parser rules are processed. If it is **Disabled**, they are not processed.
4. If the rules are Enabled, click Enabled and select Disabled to disable the log parser rules.

   To save the changes, click **Apply**.

Add or Delete a Log Parser

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.2 and later.

For version 11.2, RSA has added the ability to add log parsers through the UI. You can also delete log parsers, as long as they have never been deployed to a Decoder. You can create a new log parser definition from scratch, or extend an existing one.

You can add a log parser to extend the functionality for an existing parser. For example, if you have some unknown messages for the Cisco Pix parser, you could add rules to match your unknowns.

IMPORTANT: If you are adding a new log parser, for example when onboarding an event source, you must map the event source IP to the new log parser in order for messages to be parsed. For details, see "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

Add a Log Parser

1. In the NetWitness Platform UI, navigate to **CONFIGURE > Log Parser Rules**.
2. From the **Log Parsers** pane, click **Add Parser**.

   The Add Dynamic Log Parser dialog box is displayed.
3. Fill in details for this dialog box. For details, see Add Dynamic Log Parser Parameters below.
4. Click **Save** to save the new log parser.

   This updates the definition file in the file system. It *does not* deploy the changes.
5. To deploy your changes to all of your Decoders, click **Deploy**.

Delete a Log Parser using the UI

You can use the UI to delete a log parser that has never been deployed.

To delete a log parser:

Note: You cannot delete a log parser through the UI, if it has ever been deployed to a Decoder.

1. In the NetWitness Platform UI, navigate to **CONFIGURE > Log Parser Rules**.
2. From the **Log Parsers** pane, select a log parser.

   Delete Parser dialog box is displayed.
3. Click **Delete** to remove the log parser from the system.

Delete a Log Parser Manually

To manually delete a log parser that has been deployed at any time, you can use NwConsole.

To delete a log parser that has been deployed:

1. Access the RSA NetWitness Console, using the **NwConsole** command. For details, see "Access NwConsole and Help" in the *NwConsole User Guide*.
2. Run the following command:

   ```
   [localhost:50002] /decoder/parsers> send . delete file=filename.xml
   type=device
   ```

   where ***filename*** is the name of the XML file for the log parser. For example, to delete the log parser for Oracle Access Manager, run the following command:

   ```
   [localhost:50002] /decoder/parsers> send . delete file=oracleam.xml
   type=device
   ```

Notes about the log parser filename:

- Log parser files are located on the Log Decoder in the following path:

  `/etc/netwitness/ng/envision/etc/devices`

- Each log parser has its own sub-folder. For example, the Cisco ASA parser files are in the following folder:

  `/etc/netwitness/ng/envision/etc/devices/ciscoasa`

- Some log parser file names begin with **v20_**, while others do not—the only way to tell is by examining the `devices` folders. For Cisco ASA, the log parser file name is **v20_ciscoasamsg.xml**. However, in the previous command, when you specify the filename, do ***not*** use the **v20_** prefix.

Add Dynamic Log Parser Parameters

When you are adding a log parser, the following parameters are available.

Field	Details
SELECT LOG PARSER	Select NEW, or choose an existing log parser. By choosing an existing log parser, you can add rules to that parser, essentially extending its parsing capabilities. **Note:** If you select an existing log parser, the remaining fields are auto-filled based on the values for selected log parser.
DEVICE TYPE	Enter a string to define the device type. The name must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers.
DEVICE DISPLAY NAME	Enter the display name for the log parser. **Note:** The display name must be 64 characters or fewer, and must not match the name of any other device display name.
DEVICE CLASS	Select a device class.
CLONE DYNAMIC PARSER RULES FROM	Leave blank to start with no rules, or select one of the existing log parsers to clone its rules.

Add or Delete a Log Parser Rule

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.2 and later.

For version 11.2, RSA has added the ability to create custom rules for log parsers. You can create rules to change how meta values are parsed for a particular log parser. Prior to version 11.2, you could only view the out-of-the-box log parser rules.

About Log Parser Rules

Parsers are described within their XML files. Each log parser has an XML file that contains rules on how to parse messages for that parser. The out-of-the-box rules are contained within these XML files. For details, see the Log Parser Customization topic in the RSA Link space for RSA Content.

Custom Log Parser Rules

When you create a new log parser rule, it is saved to another XML definition file for the parser. These files are known as token files. This is important, since the out-of-the-box rules are overwritten if you update the parser through RSA Live, but any custom log parser rules are not overwritten, since Live does not update the token files for log parsers.

To create a custom log parser rule:

1. In the NetWitness Platform UI, navigate to **CONFIGURE > Log Parser Rules**.
2. From the **Log Parsers** pane, select a log parser.
3. From the **Rules** pane, click **Add**.

   The Add Rules dialog box is displayed.

   IMPORTANT: If you click outside of the Add Rule dialog box before you save your rule, your changes will be lost.
4. Add at least one meta key and a value to match, in order to create a valid rule.
5. Click **Save** to save your new rule.

   This updates the definition file in the file system. It *does not* deploy the changes.
6. To deploy your changes to all of your Decoders, click **Deploy**.

Guidelines for Custom Rules

When you are creating a custom rule, keep in mind the following:

- For the list of tokens that match strings from the log file, very short tokens are not useful. For example, a one- or two-character string can match more items than desired.

- Remember to add the delimiter (especially if it is a space) as part of the token. For example "domain=" or "email ".
- When constructing regular expressions, the more complexity you add, the more performance overhead added to the system to compare against the rule.
- To see examples of good tokens and regular expressions, examine the rules that are provided for the default log parser.

Default Log Parser and Log Parser Rules

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

This tab displays information about pattern matching and rules for the parsers in your system. The features on this tab apply to all log parsers, including the Default Log Parser

Default Log Parser

The NetWitness Platform default log parser is used to parse logs coming from the Log Decoder that do not match any of the configured log parsers. This default parser parses these logs by using a default set of rules and tokens.

You can view the default log parser and its details by going to **ADMIN > Event Sources > Log Parser Rules** and selecting **default** from the Log Parsers panel.

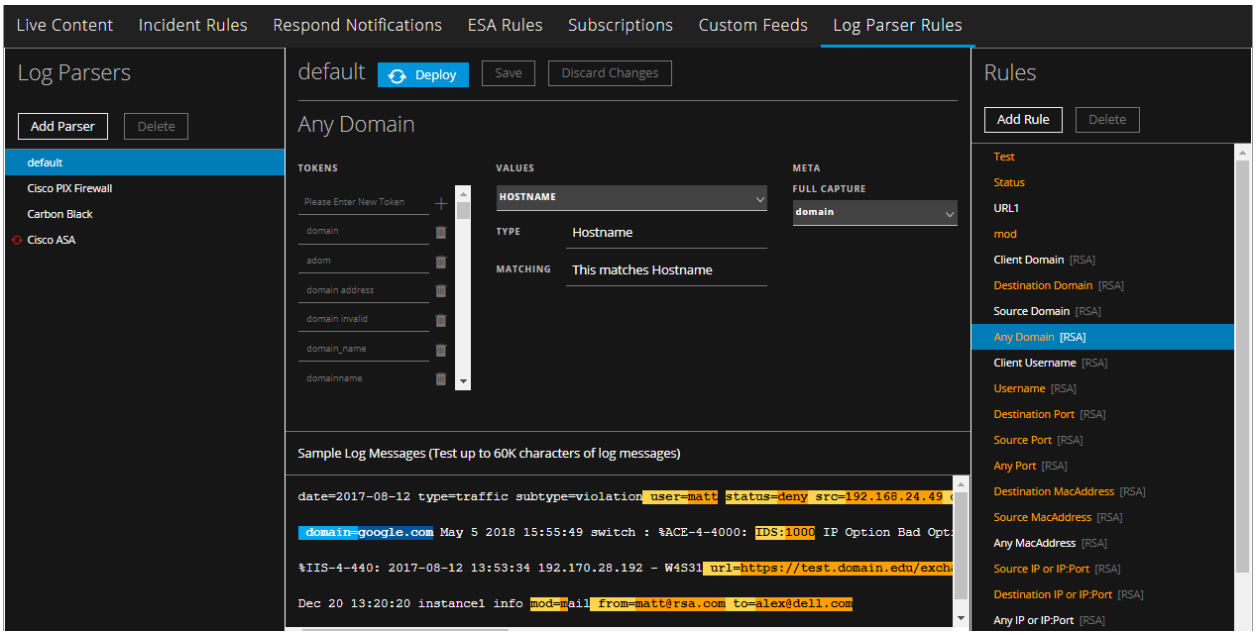
Note: If you do not see the default log parser and its rules, you might need to go to Live and deploy the RSA Content to your log decoders. Additionally, you must have at least one Log Decoder at version 11.2 to view the default log parser.

You can view the default log parser and its details, depending on your version:

- For RSA NetWitness® Platform version 11.1, go to **ADMIN > Event Sources > Log Parser Rules**, then select **default** from the Log Parsers panel.
- For RSA NetWitness® Platform version 11.2 and later, go to **CONFIGURE > Log Parser Rules**, then select **default** from the Log Parsers panel.

Note: The list of log parsers is based on the first Log Decoder that is installed or registered by the Orchestration Server. If you have more than one Log Decoder, this tab only lists log parsers that have been configured on the first one.

This is a view of the Log Parser Rules tab, showing the **Default Log Parser** and **Any Domain** rule selected:



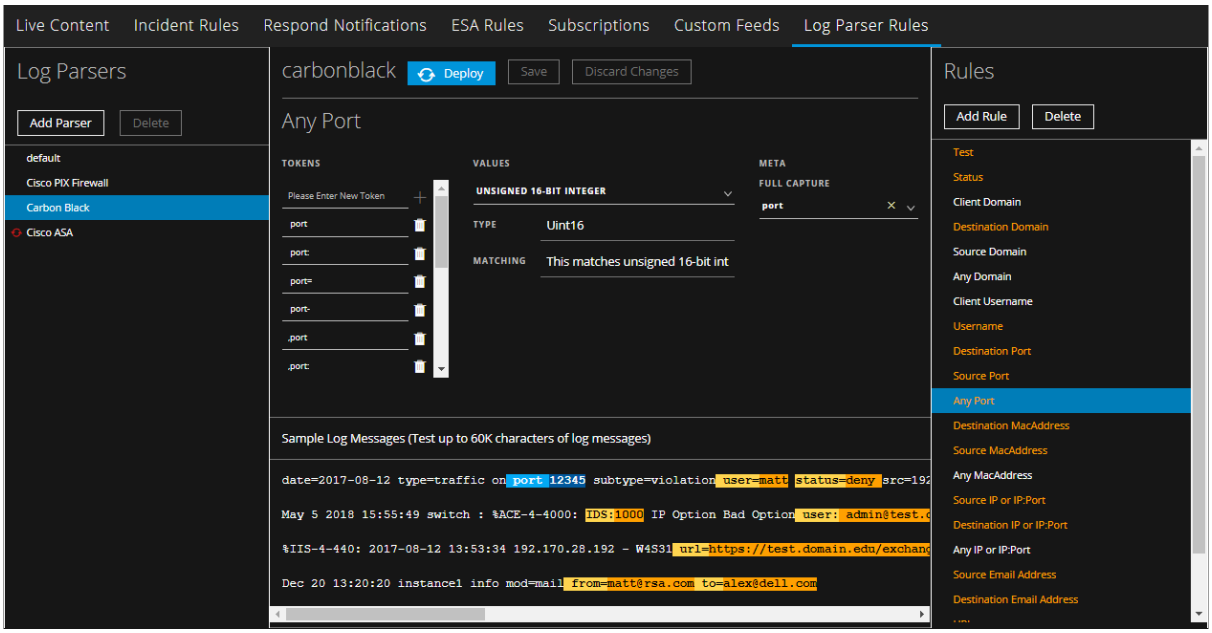
The Log Parser Rules Tab topic describes the items available for the Log Parsers tab.

Highlight Matching Patterns

You can paste logs into the Log Messages text box, and the system highlights the matching literals and patterns for the rules for the selected event source type. Use this feature to confirm that the parser is behaving as expected.

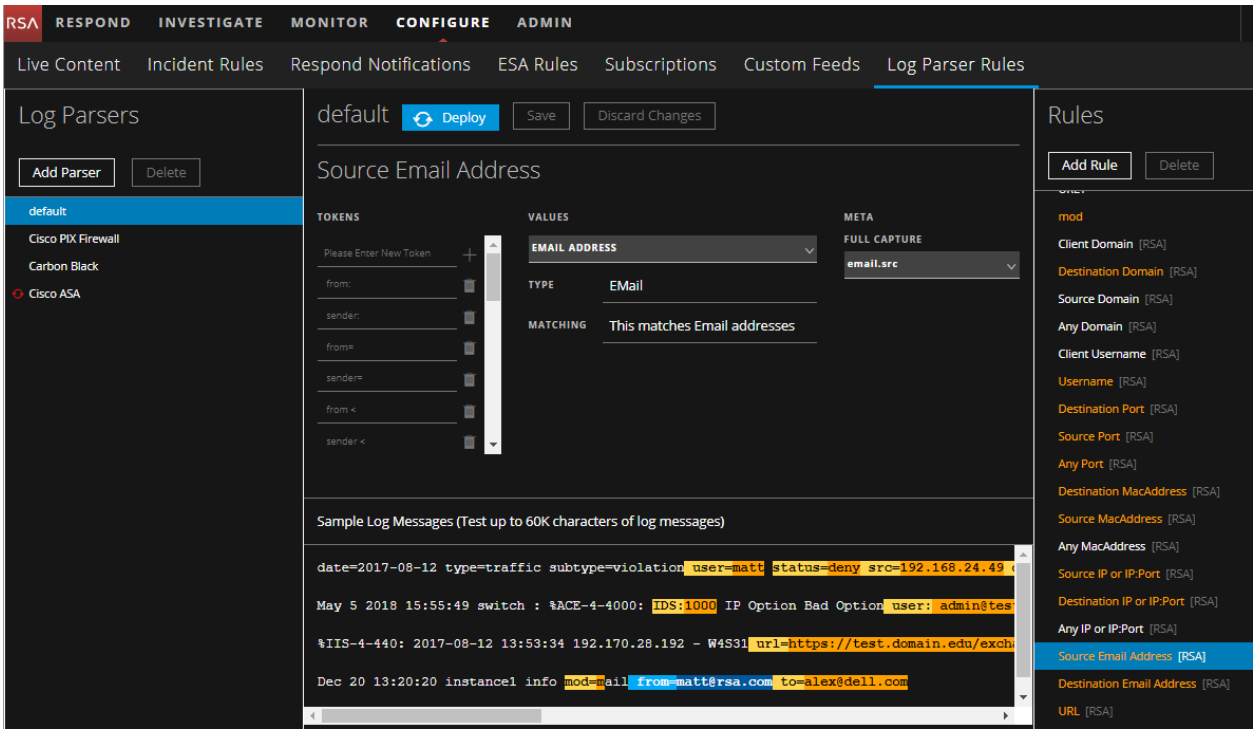
1. n the NetWitness Platform UI, navigate to **ADMIN > Event Sources > Log Parser Rules**.
2. In the NetWitness Platform UI, navigate as follows, depending on your version:
   - For RSA NetWitness® Platform version 11.1, go to **ADMIN > Event Sources > Log Parser Rules**.
   - For RSA NetWitness® Platform version 11.2 and later, go to **CONFIGURE > Log Parser Rules**.
3. From the **Log Parsers** pane, select a log parser.
4. From the **Rules** pane, select a rule.

   For example, this screen shows the **Any Port** rule for the **carbonblack** log parser:



5. Add text or paste in a sample log message.

Strings that match tokens for the selected rule are highlighted in blue. Strings that match other rules for the parser (and the rules themselves) are highlighted in orange.



For example, in the previous screen, note:

- The source email address, matching the **from** token, is highlighted in blue. The token is in dark blue, and the matching string is highlighted in light blue. This is because the **Source Email Address** is the

currently selected Rule.

- The strings highlighted in orange match tokens for rules for **Any MacAddress**, **Any Port** and **Source Port**. This is because they are in rules for the default parser that are not currently selected.

Use Cases

This topic describes the procedures you use to either on board a new event source, or to extend the parsing capabilities for an existing log parser.

Use Case 1: On Board a New Event Source

In this case, a customer has an event source and wants to add it into the RSA NetWitness® Platform. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the **CONFIGURE > Log Parser Rules** view, add the Log Parser.

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules.

- If the new rules apply to all parsers, you can add them to the Default parser.
- If not, add them only to the new log parser you are creating.

VI. Save the new rules, and deploy them to all Log Decoders.

VII. Map the IP address for the newly added event source to the newly-created log parser. For details, see "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

Use Case 2: Modify an Existing Parser

In this case, a customer wants to parse some items from the logs that are not currently being parsed by the existing log parser. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the **CONFIGURE > Log Parser Rules** view, add the Log Parser.

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules.

VI. Save the new rules, and deploy them to all Log Decoders.

For a detailed walk through of some of the steps in these use cases, see Extend an Existing Log Parser Example.

Extend an Existing Log Parser Example

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.2 and later.

One typical use case is for extending the capabilities of an existing log parser. In RSA NetWitness® Platform 11.2, you can add rules to a log parser to extend its parsing capabilities. In this topic, we walk through an example of this.

Task Overview

In this example, a customer wants to parse some items from the logs that are not currently being parsed by the existing log parser. Perform the following tasks:

I. For your event source, get examples of the logs.

II. In the CONFIGURE > Log Parser Rules view, Add the Log Parser

III. From your sample logs, paste applicable sections into the Sample Log Messages section of the **Log Parser Rules** screen.

IV. Use the sample area to understand which items are being parsed by the current parser, and note the items that are not being parsed.

V. For anything that is not currently being parsed, add rules as described in Add Rules and Deploy.

VI. Save the new rules, and deploy them to all Log Decoders.

Notes

Note: All the procedures in the topic use the CONFIGURE > Log Parser Rules view.

In the Log Parser Rules tab, you may see the Refresh icon () next to an item. This indicates that the item has undeployed changes.

Add the Log Parser

The first step in the process is to add a log parser, based on an existing log parser that you want to customize.

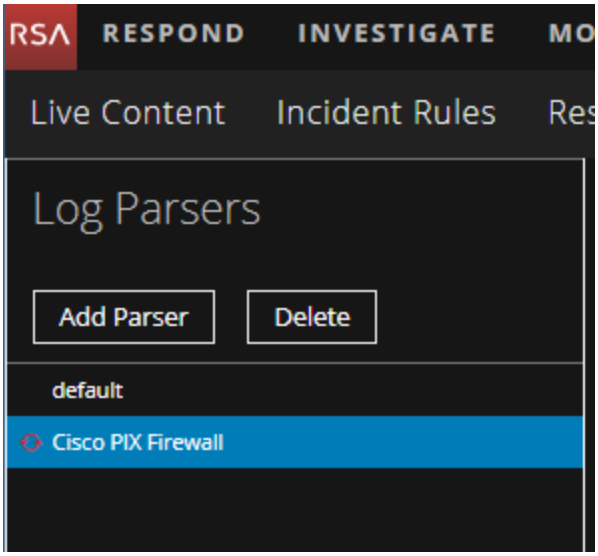
To add a log parser

1. In the RSA NetWitness® Platform menu, navigate to **CONFIGURE > Log Parser Rules**.
2. In the Log Parsers panel, click **Add Parser**.

   The Add Dynamic Log Parser dialog box is displayed.
3. In the **SELECT LOG PARSER** field, select the existing parser to extend. In this example, we use Cisco Pix Firewall.

4. You can clone the rules from any of your existing parsers, including the **default** parser. For simplicity, in this example we leave this field blank: thus, only the rules we create are added to the new parser.
5. Click **Add Parser** to create the new parser.

The new parser is listed in the Log Parsers panel. Note the symbol next to the new parser—this indicates that your changes have not yet been saved.



About Custom Rules

When you create a new log parser rule, it is saved to an XML definition file for the parser. These files are known as token files. This is important, since the out-of-the-box rules are overwritten if you update the parser through RSA Live, but any custom log parser rules are not overwritten, since Live does not update the token files for log parsers.

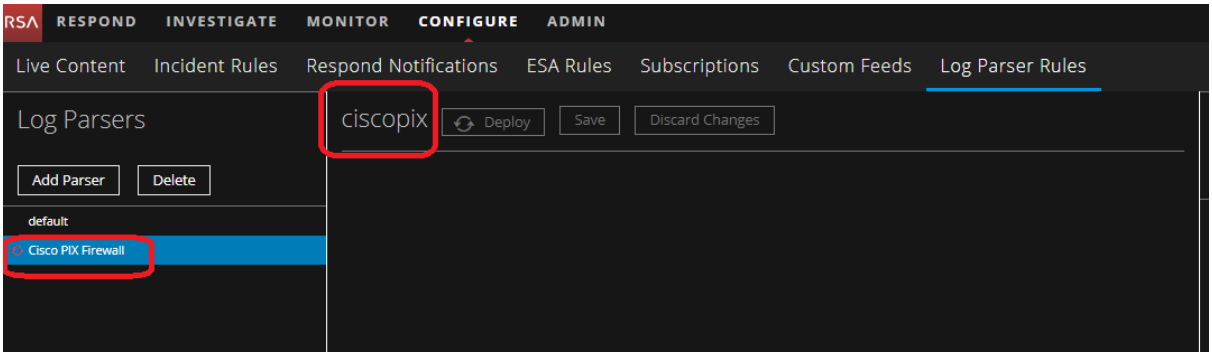
Add Rules and Deploy

Once you have added the parser, the next step is to add one or more rules.

Let's say you know that your log messages have some email addresses that follow a "source_mail" string. You could add the following rule to parse these strings:

IMPORTANT: If you click on another parser in the **Log Parsers** panel, before you save your rule, your changes will be lost.

1. Make sure the Cisco Pix Firewall parser is selected.



2. In the Rules panel, click **Add Rule**.

   The Add New Rule dialog box is displayed.

3. Enter a name for the rule, and click **Add New Rule**.

   The center panel is updated to reflect that you are working on a new rule.

   In the TOKENS section, enter a string for the token that you want to match, then click +.

   In this example, we entered **email** .

> **Note:** Make sure to include a delimiter for your token. For example, in this case, the token consists of 6 characters: the string "email," and then a space. Some tokens might use a colon, semicolon, or some other character as the delimiter, but it can be easy to forget to add the space character when that is the delimiter.

4. You can enter more tokens, or continue to add values.
5. In the VALUES section, choose the value for the rule. If you choose to match a Regex Pattern, you

need to enter the pattern in the PATTERN field. Other values do not require any options.

In this example, we selected **Email**.

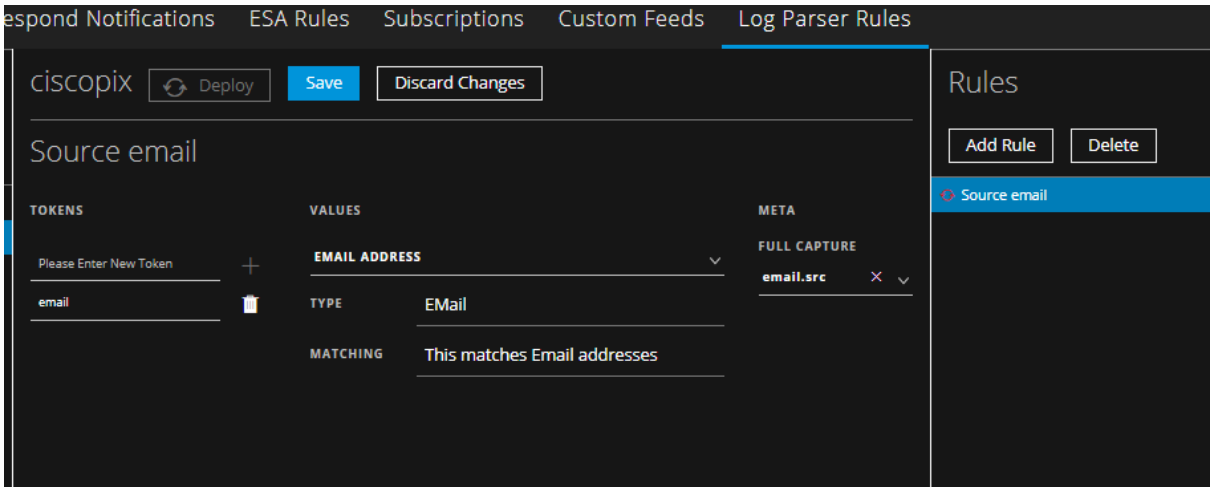
6. In the META section, click to select a meta key to which the rule stores its information. Some notes:

   - Enter characters to filter the list of available meta keys.
   - For Regex values, you can select "pieces" of the value, and store each piece to its own meta key.

   Note: If any new meta keys are added to the Log Decoder, they do not appear in the list of Meta immediately. They appear automatically after 24 hours, or you can restart the **content server** service to view them.

   In this example, we selected the **email.src** meta key.

   The following image shows an example rule:



7. Click **Save** to save the rule. Repeat this procedure to continue adding rules.
8. Once you have added all of your rules, click **Deploy** to deploy the new parser to your Log Decoders. Some notes about deploying rules:

   - You deploy an entire set of rules for a parser. That is, you can continue adding rules for a specific parser until you have all of your rules, and then you can deploy them all at once.
   - Once you deploy a custom parser, you can no longer delete it. You can only delete parsers that you have not yet deployed.

Note: In this example, we extended an existing log parser. However, if you are creating a new log parser for a new event source, make sure to map the new log parser to the IP address of the event source, as described in "Acknowledging and Mapping Event Sources" in the *Event Source Management User Guide*.

Regex Values

Custom Log Parser Rules can match regular expression patterns. If you select a Regex pattern for your Value, you can capture the entire matched token, or sections of it:

- Full capture: the entire matched string is stored to your selected meta key.
- First capture: the first portion of the string, up to the period character, is stored to the meta key.
- Second capture: the second portion of the string, starting after the first period character, is stored to the meta key.
- Third capture: the third portion of the string, starting after the second period character, is stored to the meta key.

You can choose any or all four of these captures, depending on the token you are matching.

For example, we examine the **Source IP or IP:Port** RSA rule:

- Regex Pattern: \s*(\b(?:[0-9]{1,3}\.){3}[0-9]{1,3}\b):?(\d*)
- Full capture: none
- First capture: **ip.src**
- Second capture: **port.src**
- Third capture: none
- Assume example string of "src=192.168.24.4:8080", where **src** is one of the tokens defined for this rule:
  - **192.168.24.4** is saved to the **ip.src** meta key.
  - **8080** is saved to the **port.src** meta key.

For more details, see any online reference that describes PERL regular expressions. There are many tutorials available online.

IMPORTANT: Be careful when constructing regular expressions in your custom rules. Badly constructed regular expressions could impact your performance.

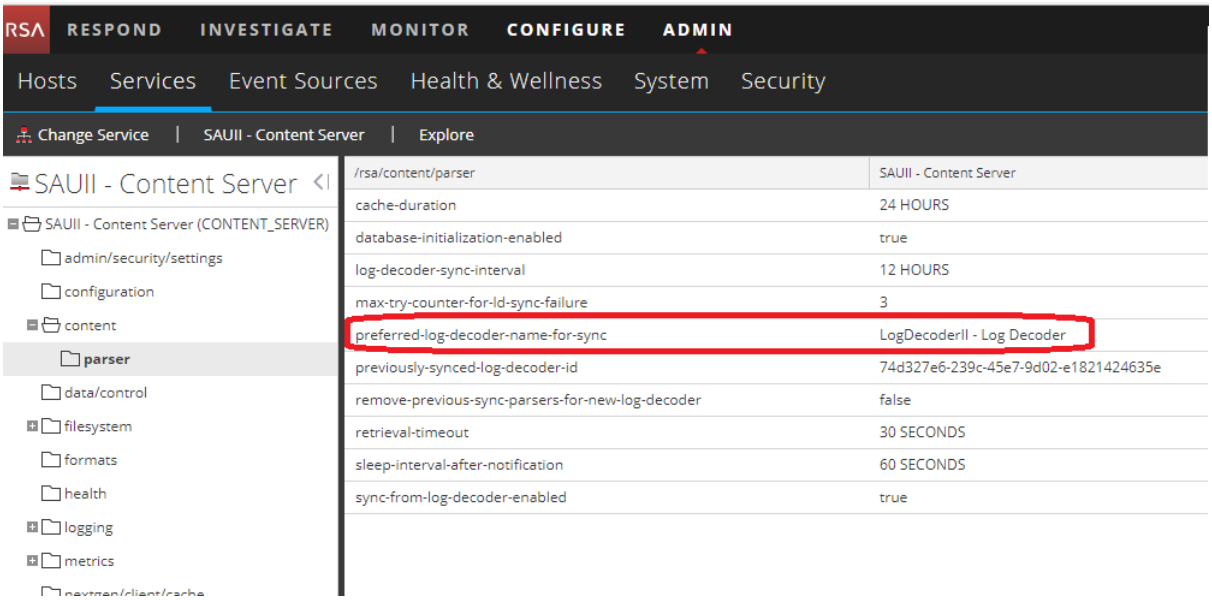
Appendix A: Select the Reference Log Decoder

For version 11.2, RSA has added the ability to add log parsers and log parsing rules through the UI, using the Log Parsers view. The Log Parsers tab is populated based on your reference Log Decoder. If you have more than one Log Decoder, you can select which acts as the reference one for populating the tab in the UI. This topic describes the procedure to do so.

To change the reference log decoder:

1. In the NetWitness Platform UI, navigate to **ADMIN > Services**.
2. For the **Content Server**, select **View > Explore**.
3. From the left navigation panel, expand **content > parser**.
4. To set the reference log decoder, enter a value for `preferred-log-decoder-name-for-sync`.

   Enter the name listed in the **Name** column on the **ADMIN > Services** screen for your preferred log decoder.



5. The change takes effect during the next system sync, based on the `log-decoder-sync-interval`. To sync sooner, you can do either of the following:

   - To sync immediately, restart the Content Sever: in the **ADMIN > Services** view, from the **Actions** menu for the Content Server, select  **> Restart**.
   - Change the `log-decoder-sync-interval` parameter from its default of 12 hours to your preferred interval. Note that the minimum value for this parameter is **1 HOUR**.

Appendix B: Move Log Parsers to Production

You may have a development or test environment where you work on new and updated log parsers and log parser rules. In this case, at some point you need to move your new and updated log parsers into your production environment. This topic describes how to do this.

To move custom log parsers and log parser rules from development to production environment:

1. On the development system, do the following:
   a. SSH to the NetWitness Server
   b. Export the log parser information by running the following command:

      ```
      mongodump --host localhost --port 27017 --db "content-server" --username
      "deploy_admin" --password "netwitness" --authenticationDatabase admin
      ```

   c. Copy the "dump" folder to your production NetWitness Server.
2. On the production system, do the following:
   a. SSH to the NetWitness Server
   b. Drop the content-server table from Mongo by running below commands in the order listed:

      ```
      mongo --username deploy_admin --password netwitness --
      authenticationDatabase admin
      use content-server
      db.logDeviceParser.drop()
      db.patternFormatType.drop()
      exit
      ```

   c. Run the following restore command:

      ```
      mongorestore --host localhost --port 27017 --db "content-server" --
      username "deploy_admin" --password "netwitness" --authenticationDatabase
      admin PATH_TO_DUMP_FOLDER
      ```

      Make sure to replace *PATH_TO_DUMP_FOLDER* with the actual path to the "dump" folder.
   d. Restart the content-server by running the following command:

      ```
      systemctl restart rsa-nw-content-server
      ```

Appendix C: Troubleshooting and Limitations

This section describes some common issues that can occur when you customize log parsers and log parser rules.

Troubleshooting

You do not see any log parsing against a newly created parser.	You may have forgotten to map the new parser. To map a parser, go to **Admin > Event Sources > Discovery** tab. See the "Discovery Tab" topic in the *Event Source Management Guide* for details.
Deployment fails	If you click Deploy to deploy a new or updated log parser, and it fails, you should check the log for your reference log decoder. You access this log in the following location on the NetWitness Server: `/var/log/netwitness/content-server/content-server.log`

Limitations

Please note the following limitations when using the Log Parser Rules tab:

- **Log Decoder must be at version 11.2:** For the functionality in the Log Parser Rules tab to work, your installation must have at least one Log Decoder running NetWitness version 11.2.
- **Mixed Mode:** If any Log Decoders are at version 11.2, and the NetWitness Server is at version 11.2, the Log Decoders will have parseall rules enabled by default, and thus will begin to parse logs accordingly. However, the 11.2 NetWitness Server does not support Log Decoders with versions less than 11.2, so the Log Parser Rules tab in the UI stays blank.
- **Meta key fields list refresh:** If any new meta keys are added to the Log Decoder, they do not appear in the list of Meta in the Log Parser Rules tab immediately. They appear automatically after 24 hours, or you can restart the **content server** service to view them.
- **Field Restrictions:** Note the following field restrictions:
  - **Rule name** must be 64 characters or fewer.
  - **Parser Name** must be between 3 and 30 alphanumeric characters (including underscores), and must not match the name of any existing log parsers.
  - **Parser Display Name** must be 64 characters or fewer, and cannot match any other parser display name.
  - **Regex Expression** must be 1-255 characters, and a valid regex (closed capture list allowed).
  - **Tags** cannot be duplicates.
- **Deploy only to 11.2 Log Decoders:** The Deploy operation only deploys log parsers to version 11.2 Log Decoders.
- **Cannot Remove Deployed Parsers:** Once deployed, you cannot delete a log parser using the UI.

- **See log for errors:** Refer to content-server logs for more details on deploy failure details and log decoder names.

NetWitness Log Parser Tool Overview

NetWitness Log Parser Tool (NwLPT) is a graphical tool that enables you to create and edit log parsers that run on the NetWitness Log Decoder. Using the NetWitness Log Parser Tool, you can define how a NetWitness Log Decoder identifies, parses, and extracts information from the events of a specific event source. These parser definitions are stored as an XML file, called a log parser XML file, which is deployed on the NetWitness platform.

You can create a new log parser for an event source that is not currently supported by NetWitness. You can also edit an existing log parser to add or edit definitions for events, or to correct errors. You may need to edit an log parser in one of the following situations:

- Upgrade to a new version of an event source that contains new, updated, or deprecated log messages.
- Include additional definitions in existing events.
- Update the definition for an existing event in a log parser.

Parser Structure

The NetWitness Log Parser Tool uses the device type of the log parser to create the structure for the parser. The NetWitness Log Parser Tool also appends the device type to the directory that you specify for your parser.

When you create a log parser, you select a device type for it. The device type must start with a letter. The RSA naming convention is to make the device type all lowercase and remove the spaces. For example, Cisco ASA would have the device type **ciscoasa**. It is not necessary to follow the RSA naming convention to use this tool.

In your log parser directory, the NetWitness Log Parser Tool creates two files with the correct name for NetWitness:

- **INI file.** This is the parser configuration file. (Example: ciscoasa.ini)
- **XML file.** This is the log parser XML file that contains the parser definitions. (Example: ciscoasamsg.xml). The device type is appended with **msg**.

Both of these files are required to deploy your parser in NetWitness.
When you finish creating or updating your parser, you have the option of retrieving the completed parser in four formats:

- **Individual Files: Parser (.XML) and Configuration (.INI)** (In the main menu, select **File > Save** or **Save As**). This option creates a device type folder containing an XML file and a configuration INI file. These individual files are viewable as the raw parser and configuration files, but they cannot be imported directly in the NetWitness Log Decoder.

- **Parser Package: .envision** (In the main menu, select **Actions > Export Parser**). This option creates an event source package that consists of the log parser XML and configuration INI file. This format is used to import the event source to a Log Decoder directly.
- **Live Resource: .zip** (In the main menu, select **Actions > Export Resource**). This option creates an event source package in a .zip format that consists of all the log parser XMLs and configuration INI files. The .zip format can be used to deploy parsers through RSA Live. It enables deployment of parsers to multiple Log Decoders simultaneously.
- **To deploy a parser on a Log Decoder** (In the main menu, select **Actions > Deploy Parser**). This option enables you to deploy the parser directly to the Log Decoder. It also supports deployment of parsers to multiple Log Decoders simultaneously. For more information, see Deploying Parsers on a Log Decoder.

For more information, see the "Download Log Parsers from Live and Deploy from Local Network" topic in the *RSA Content and Resources* on how to upload the event source log parsers from your local network to the NetWitness Log Decoder.

For more information, see the "Resource Package Deployment Wizard" topic in the *Live Services Management Guide* for Version 11.1 for information on how to upload the event source log parsers from your local network to the NetWitness Log Decoder at the following location: https://community.rsa.com/docs/DOC-79989

For more information, see the "Enable and Disable Parsers and Log Parsers" topic in the 11.0 *Decoder and Log Decoder Configuration Guide* for Version 11.1 at the following location: https://community.rsa.com/docs/DOC-80190.

Obtaining a Log File

To create a log parser that a NetWitness Log Decoder can use to identify, parse, and extract information from a specific event source, you must obtain a log file from the event source that you want to integrate with NetWitness. After you obtain the log file, you can use NetWitness Log Parser Tool to create a log parser.

Before getting started with NetWitness Log Parser Tool, you must know the log collection protocol that was configured when the event source was deployed with NetWitness.

If the log collection protocol that you configured when you set up the event source in NetWitness is Syslog, you can use a log file generated by the event source to create or edit a log parser.

If you configured any other log collection protocol, you must export a log file from NetWitness in text format.

RSA recommends that you compile a log file that contains all the unique events generated by the event source that you want to integrate with NetWitness. While compiling the log file, ensure that:

- All the events are from a single event source.
- Each event is listed in a single line, without any line breaks.
- The maximum size of any event is 64 KB.
- The log file contains one or two instances of each unique event.

Note: The recommended maximum size of the log file is 25 MB. A larger file can be used, but it will take more time to load and parse.

For events transmitted by Syslog, you can put the raw logs directly in the NetWitness Log Parser Tool. For all other event formats, you need to get the log data from NetWitness.
To get log data from NetWitness, see Understanding Events.

Understanding Events

Typically an event consists of two main elements, a header and a payload. The following figure shows an example of an event with a header and a payload.

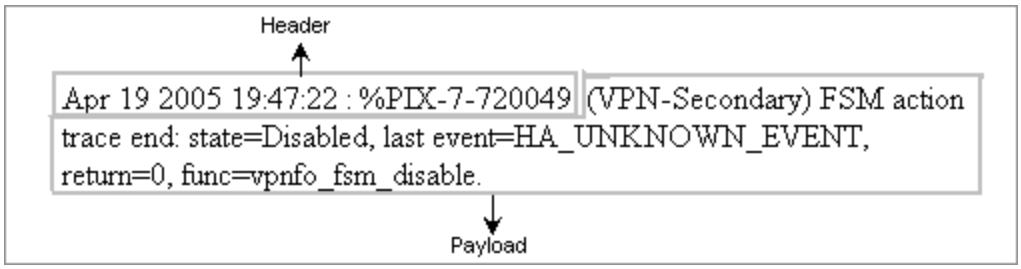

Figure 1.

In some events, you may define the entire event as payload as shown in the following figure.

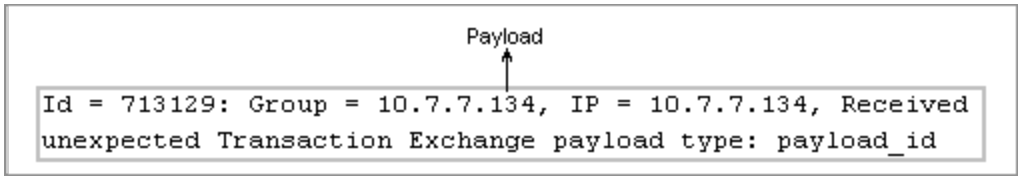

Figure 2.

In some events, you may define the payload to begin from the header, and the header and payload may overlap.

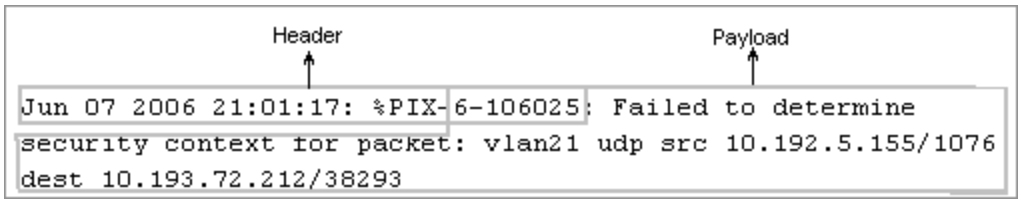

Figure 3.

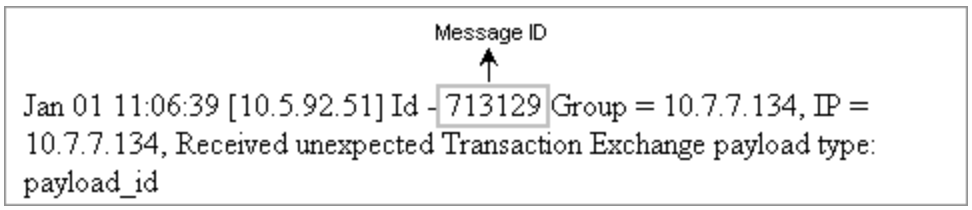
Header

The header consists of the following elements, which are common across multiple events:

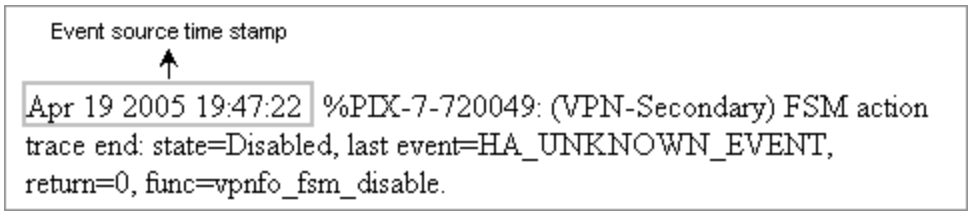
MessageID . Indicates a unique identifier for the message in the event. In the examples in the following figures, the MessageID is unique to the event.

Note: Make sure to define a single MessageID for each header.

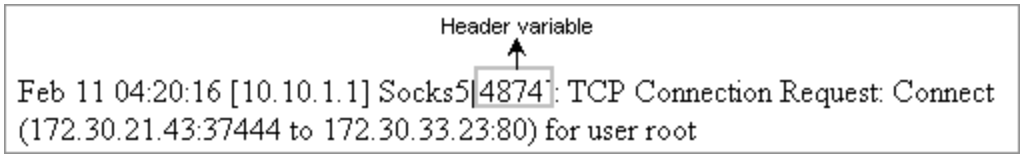


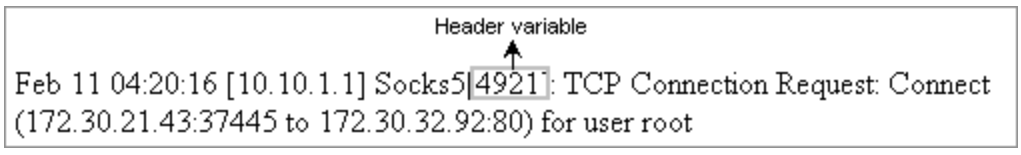
Caution: If you create a header that is too generic and can be used to identify a wide variety of logs, it could match logs that are currently parsed through other parsers.

. (Optional) Consists of the date and time when the event was generated by the event source. Some events may not contain an event source time stamp.



Header Variable. (Optional) Contains a value in the event header that varies across similar types of events. In the examples in the following figures, 4874 and 4921 are header variables that indicate the session ID in the events.





Payload

The payload is everything in the event that is not the header. It contains detailed information about the event. The payload is the message in the event. NetWitness uses this information for analysis and reporting. The payload consists of message variables and static text.

A message variable is a value in the payload that varies across similar types of events. In the examples in the following figures, Up and Down are message variables that indicate the link status of the INTNAME interface.

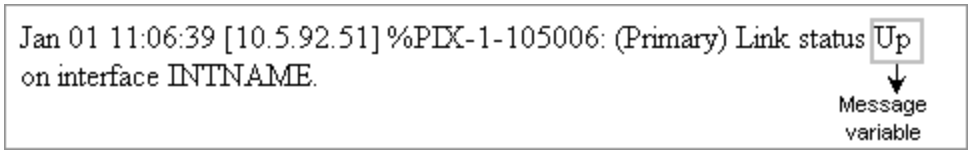


Figure 4.

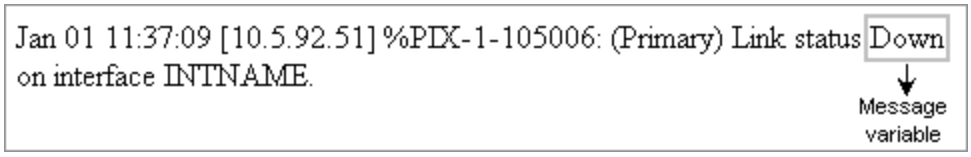

Figure 5.

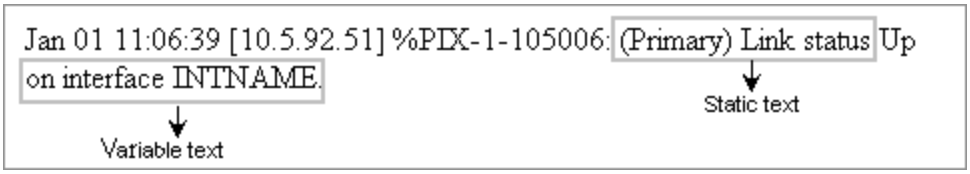
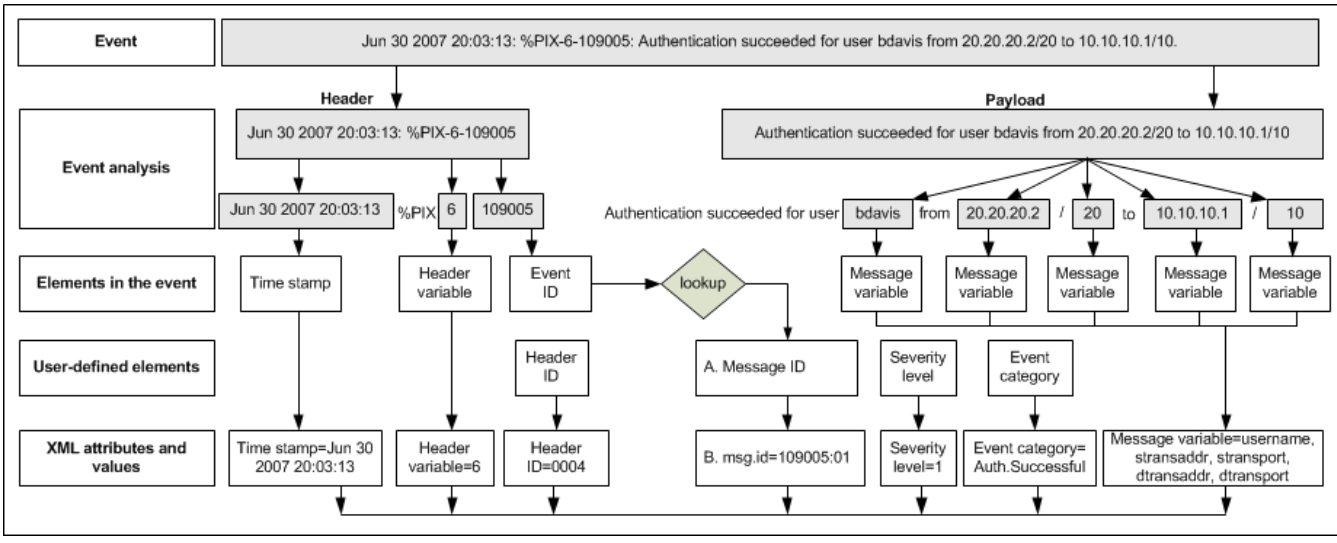
NetWitness Log Parser Tool classifies all the values in the payload that are not message variables as static text. The following figure shows an example of values that NetWitness Log Parser Tool classifies as static text.



How Logs are Parsed in NetWitness

The following figure shows an example of how you can create an XML definition that makes the event data available for analysis and reporting in NetWitness. It also shows the various elements in an XML definition.



Getting Started with NetWitness Log Parser Tool

The following table provides a high-level overview of the tasks that you can perform using NetWitness Log Parser Tool.

Goal	Task	Reference
Integrate an event source that is not supported by NetWitness.	1. Create a parser file that contains definitions for the events generated by the event source.	Creating a Log Parser File
	2. (Optional) View events that are parsed by a header or message definition.	Viewing Parsed Events and Associated Definitions
	3. (Optional) View the header and message definition that parse a selected event.	Viewing Parsed Events and Associated Definitions
	4. Create an event source package for deployment to a NetWitness Log Decoder.	Parser Structure
	5. In NetWitness, deploy the event source package.	Deploying Parsers on a Log Decoder See the "Add or Update Supported Event Source Log Parsers" topic in the *RSA Content and Resources* documentation. The "Download Log Parsers from Live and Deploy from Local Network" section provides information on how to upload the event source log parsers from your local network to the NetWitness Log Decoder.

Goal	Task	Reference
Upgrade an event source that is already supported by NetWitness.	1. Edit the existing log parser file.	Editing a Log Parser File
	2. (Optional) View events that are parsed by a header or message definition.	Viewing Parsed Events and Associated Definitions
	3. (Optional) View the header and message definition that parse a selected event.	Viewing Parsed Events and Associated Definitions
	4. In NetWitness, deploy the event source package.	Deploying Parsers on a Log Decoder See the "Add or Update Supported Event Source Log Parsers" topic in the *RSA Content and Resources* documentation. The "Download Log Parsers from Live and Deploy from Local Network" section provides information on how to upload the event source log parsers from your local network to the NetWitness Log Decoder.

Getting a Log File from NetWitness

1. In the **NetWitness** menu, go to **Investigate > Events**.
2. In the **Investigate** dialog, select a Log Decoder, Archiver, Concentrator, or Broker service and click **Events**In the **Events** view, select the events and in the Actions menu, select **Export > Export All Logs**.
3. In the **Enter file name for extraction** dialog, enter a name for your log file and click **OK**.
4. In the **Export Log Format** dialog, select **Text** and click **Export**.
   You will receive a Scheduled Job notice.
5. Check the Job Notifications tray to view the status of the log file. Click the **View** link to go the Jobs panel in the Profile view to download the log file.

Creating a Log Parser File

Creating a log parser file involves creating a definition for each type of event in the log file generated by an event source. Creating an event definition involves the following tasks:

- Selecting an Event from the Log File
- Defining a Header
- Defining a Message

Selecting an Event from the Log File

Select an event from the log file to define the various elements of the header and message in the event.

Defining a Header

Define the header by assigning the values in the event to header elements. The purpose of defining a header is to identify the event source from which the event is generated. When you define a header with all its elements, the definition can parse similar types of events in the log file.

RSA recommends that you define a generic header definition that will parse multiple events that follow similar formats. The NetWitness Log Parser Tool generates a unique identifier, the HeaderID, for each header definition to identify the header definitions available in the log parser XML file. However, you can change the generated identifier to provide a unique HeaderID of your choice.

You can include the following elements when defining how to locate the MessageID in the header:

- MessageID, used in the Event ID lookup, which enables you to specify one of the following options:
  - MessageID variable
  - Variable suffix
  - Concatenation

Header Order

Header order determines the precedence of the headers. In general, headers should be ordered from specific to generic (see Validating the Precedence of Pattern Definitions).

A header's position can be changed by selecting the header and using **Move Up/Down** menu items on the **Edit** menu (or using the keyboard shortcuts for the up and down arrow keys (**Ctrl+Up**  and **Ctrl+Down** ). You can also right click on a header or message to bring up a popup Context menu that has options to move up and down.

For more information on these elements, see Understanding Events.

Defining a Message

Define the message by assigning the values in the payload to message variables and defining message elements. A single message definition may parse one or more similar events in your log file.

The following table lists the message elements that you must define.

Message Element	Description
MessageID	Indicates the identifier by which NetWitness identifies the event uniquely. The MessageID can be defined in one of the following ways: • Same as the event ID. • A combination of the event ID defined in the header definition and a unique variant. For example, if the event ID is 109801, the MessageID can be defined as 109801:02. • A brief description that identifies the event. For example, in the following event, the event ID is 187698, and the MessageID can be defined as CableFailover. `Jan 01 11:06:39 [10.5.92.51] %PIX-1-101001: (PRIORITY) Error reading failover cable status.` **Note:** Make sure to define a single MessageID for each header.
Event category	Indicates the category to which the event belongs, based on the NetWitness taxonomy.

Message Element	Description
Functions	(Optional) Define actions to be performed on variables in an event to generate user-defined values. The NetWitness Log Parser Tool supports the following functions: • **Assign Constant** assigns user-defined values to variables. • **Assign Message Variable** assigns the value of a message variable to another variable. • **Calculation** performs a calculation on values and variables in the event. • **Convert Domain** converts domain names to IP addresses. • **Event Time** assigns the date and time information in the event to a message variable. • **Remove Quotes** removes quotes from a variable. • **URL Part** extracts parts of a URL string.

Message Order

All messages are displayed in order by message group. Messages with differing message group values cannot be re-ordered. However, messages with the same group can be re-ordered, as order determines the precedence within the group. In general, messages within a group should be ordered from specific to generic (see Validating the Precedence of Pattern Definitions

When applicable, a message's position within its message group can be changed by selecting the message and using the **Move Up/Move Down** menu items on the **Edit** menu (or using the keyboard shortcuts for the up and down arrow keys (**Ctrl+Up**  and **Ctrl+Down** ). You can also right-click to open a context menu with the **Move Up/Move Down** options.

When creating a new message or editing the group of an existing message, the message is (re)positioned based on the new message group value. If there are existing messages with that group value, the message is positioned at the end of the message group.

Editing a Log Parser File

Before you edit a log parser file, identify and analyze the events in the corresponding log file. You can edit a log parser file that was created by the NetWitness Log Parser Tool or any other source.

Editing a log parser file involves the same header and message definition tasks as creating a log parser file. However, you may not need to define the header pattern if the headers are all defined. For example, you may want to edit a parser to add new messages to Windows or other platforms. You may also want to adjust an existing parsed message. For example, you may need to change IP source to IP destination in a particular event.

Validating the Precedence of Pattern Definitions

It is important to consider the precedence of pattern definitions when defining headers and messages with the same event ID.

You must arrange the definitions in the log parser file in order from specific to generic so that events are parsed against the specific header or message definition.

For example, suppose that a log parser file contains the following message definitions:

- Message 10123 < A B C >, where A, B, and C are elements in the message
- Message 10124 < A B C D >, where A, B, C, and D are elements in the message

If the order of the message definitions is as shown, NetWitness parses an A B C event from the event source using the Message 10123 definition. NetWitness also parses an A B C D event from the event source using the Message 10123 definition. The A B C D event must be parsed against the Message 10124 definition, which is specific. Therefore, you must ensure that the specific definition, Message 10124, appears before the generic definition, Message 10123, in the log parser file, as follows:

- Message 10124 <A B C D>
- Message 10123 < A B C >

After validating the log parser for data pattern warnings, you must validate the precedence of the header and message definitions in the log parser file.

The NetWitness Log Parser Tool displays the errors that occur in the header and message definition order. For better analysis and reporting, you must resolve all the precedence errors.

Viewing Parsed Events and Associated Definitions

After defining the log parser , you can view the highlighted header and message definitions in the parsed logs within the NetWitness Log Parser Tool. You can also view the header and message definition for a selected event in the log file.

While defining the log parser, you can view parsed events and the associated header and message definitions. For example, if you have defined two header definitions and one message definition in the log parser file, you can view parsed events for these definitions, and then continue to define more header and message definitions depending on the parsed events already viewed.

Custom Table Map Files

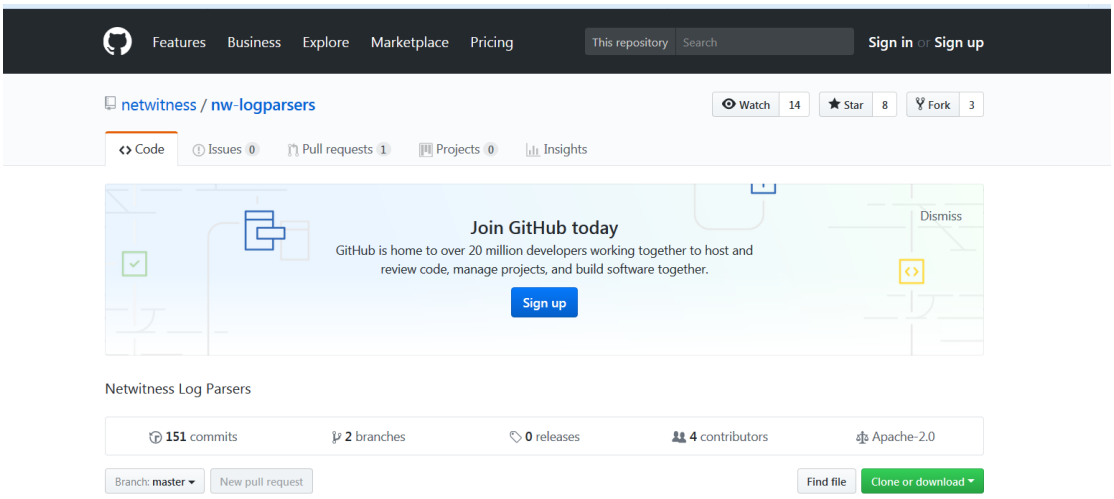
If you changed the table map file (**table-map.xml**) or created a custom table map file (**table-map-custom.xml**), get the changed table mapping files from NetWitness. You can add these custom table map files to the NetWitness Log Parser Tool.

GitHub Community Link

The GitHub Community link provides access to a repository where you can share and contribute event source log parsers for the NetWitness Log Decoder.

To access the GitHub Community Link:

1. From the GitHub Welcome screen, go to **Help > Parser Community**. You can also use the keyboard shortcut **F3** to access the GitHub Community Link.
   The GitHub Welcome screen is displayed.



GitHub members can contribute to the repository by adding or editing a log parser by raising a Pull Request that is reviewed by NetWitness Engineers. As a member of the GitHub community, you can create a new log parser for an event source that is not currently supported by NetWitness and share it with the NetWitness community. You can also edit an existing log parser to add or edit definitions for events, or to correct errors.

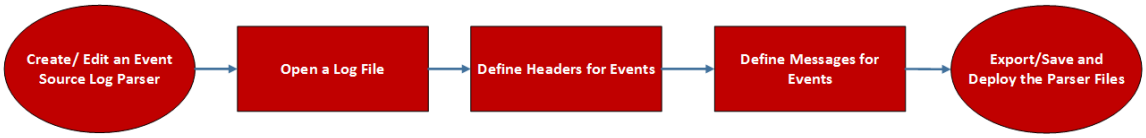
You may need to edit an log parser in one of the following situations:

- You upgrade to a new version of an event source that contains new, updated, or deprecated event messages.

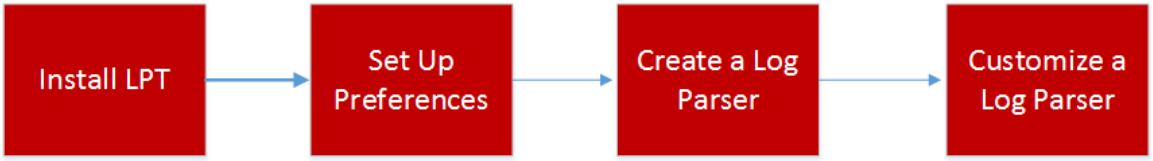
- You want to include additional definitions for existing events.
- You want to update the definition for an existing event in a log parser.

NetWitness Log Parser Tool Workflow

The following figure shows the workflow of the NetWitness Log Parser Tool 1.1 user interface.



This workflow shows the procedures to install LPT and create a log parser.



What do you want to do?

User Role	I want to ...	LPT Documentation
Administrator	Install LPT	Installing the NetWitness Log Parser Tool
Administrator	Set up Preferences	Setting Preferences
Content Expert	Create a Log Parser	Creating a Log Parser
Content Expert	Customize a Log Parser	(For 1.1 version) Creating a Custom Parser

Installing the NetWitness Log Parser Tool

You can download the Windows and MacOS versions of the NetWitness Log Parser Tool from the following location:

https://community.rsa.com/docs/DOC-85202

If you are using a Beta version of the Event Source Integrator Tool, you need to uninstall and download the new NetWitness Log Parser Tool installer from the following location:

https://community.rsa.com/docs/DOC-85202

Note: The Recent Parsers and Open Recent sections are empty, since this is a new installer.

Setting Preferences

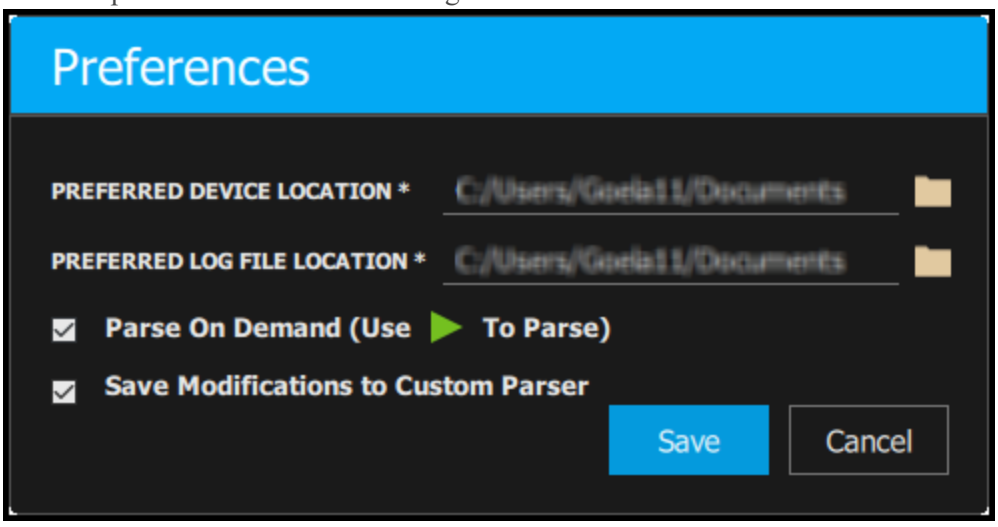
The Preferences dialog allows you to provide paths for logs and parsers, and to select a parsing mode for the application.

Note: The default path is your Documents folder and the default parsing mode is Auto.

To access the Preferences settings:

- For Windows systems: From the main menu, go to **File > Preferences**.
- For MacOS systems: From the NetWitness Log Parser Tool menu, select **Preferences**.

An example of the Preferences settings is shown below.



The default paths and modes are explained in the following table.

Field	Description
Preferred Device Location	• Default directory that is opened when you open an existing parser. • The default directory is the location where a new parser is created. • Imported parsers are saved in this directory by default.
Preferred Log File Location	Directory that the NetWitness Log Parser Tool opens when you want to load a log file.

Field	Description
Parsing Mode	By default, the NetWitness Log Parser Tool uses **Continuous Parse** mode, which means the log file is reparsed whenever there is a change to the parser. **Note:** You can change the mode to **Parse On Demand** if you notice that it is taking a while to parse the log file. A Play icon () is displayed in the middle divider that can be used to parse the log when a sufficient number of changes is complete. You can also use the **F5** keyboard shortcut to facilitate log file parsing.
(For 1.1 version) Save Modifications to Custom Parser	When this check box is enabled, all the changes in the log parser file will be saved in custom parser file. This option will be ignored if the custom parser already exists and all the changes are saved in the custom file.

Note: When a custom parser file is opened, the tool displays the merged entries of the log parser and the custom parser.

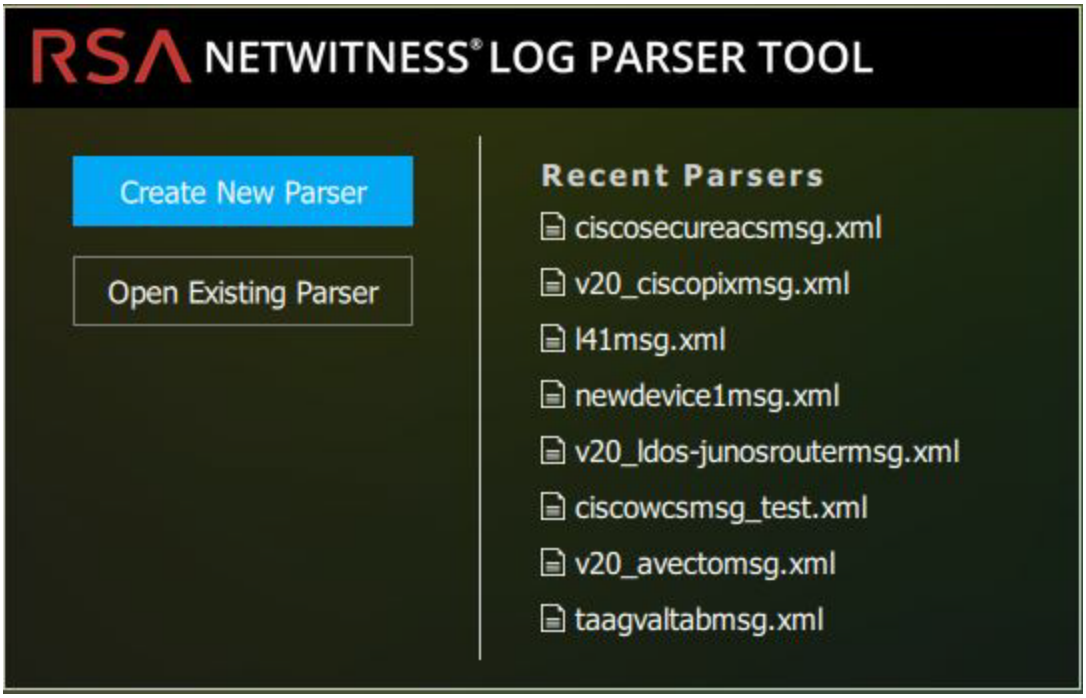
Caution: A user cannot open a custom parser file when log parser file is not available.

Creating a Log Parser

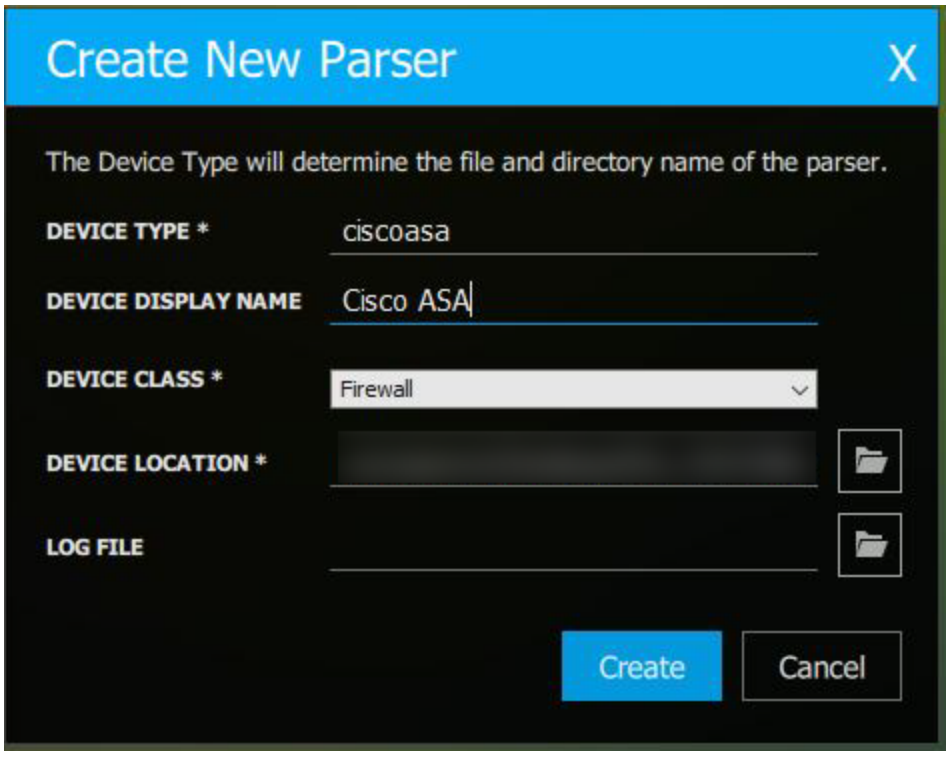
Note: All parsers opened in the tool are automatically saved at 30 seconds intervals as serves as a backup. You can view the last saved time in the Status Bar.

To create a new parser, follow these steps.

1. Select **Create New Parser**.



The **Create New Parser dialog** is displayed.



2. In the **Create New Parser** dialog:
   a. Enter the **Device Type**. The **Device Type** must start with a letter. The RSA naming

convention is to make the device type all lowercase and remove the spaces. For example, Cisco ASA would have the device type **ciscoasa** and Actiance Advantage would be **actianceadvantage**. It is not necessary to follow the RSA naming convention to use this tool. The device type provides additional information about the event.

Note: Special characters are not allowed for the Device Type.

b. Enter the **Device Display Name**. For example, Cisco ASA.
c. Select a **Device Class** from the drop-down menu. For example, Firewall.
d. In the **Device Location** field, specify the directory where you want to create the parser. In the directory that you specify, the NetWitness Log Parser Tool creates two files with the correct name for NetWitness:

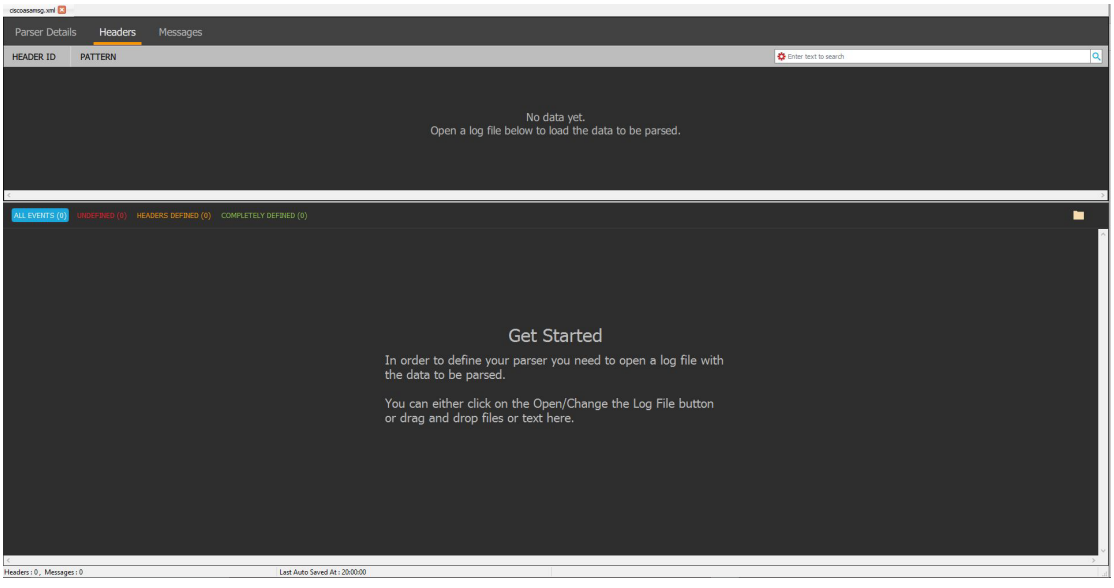
INI file (Example: ciscoasa.ini)

XML file (Example: ciscoasamsg.xml) The device type is appended with **msg**.

Note: The parser path that is set in the **Preference** page is auto-populated here.

e. In the **Log File** field, select a log file. This field is optional and can be selected at a later time.

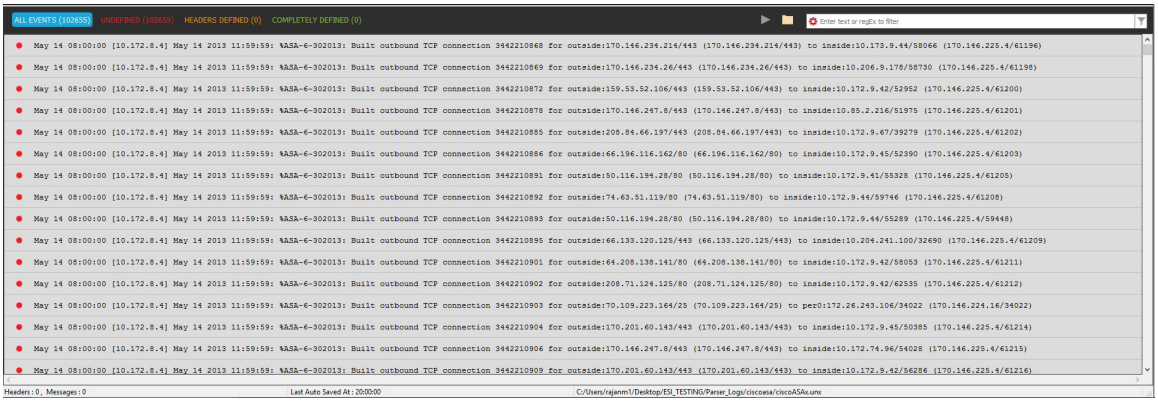
3. Click **Create** to create a new parser, or click **Cancel** to return to the **Welcome** page. The following screen is displayed after you select **Create New Parser**.



4. Click the **Open/Change Log File** icon ( ). Browse to find the log file that you want to open and click **Open**.

For more information, see Opening a Log File

All the events in the selected log file are displayed, as shown in the following example.



(For 1.1 version) Creating a Custom Parser

Log Parsers can be customized by adding new parser elements or modifying existing ones. On customization, you can save it as a separate custom parser file, such that the base parser can be updated independently and customizations are applied on top of it.

Note: The custom parser is not deleted or overwritten during Log Decoder upgrades or RSA Live Content updates.

By default, log parser files of Log Decoder are located at

`/etc/netwitness/ng/envision/etc/devices`

The custom parser files are saved in the respective folder where the log parser files exists. For example, **ciscoasa parser** file will be saved in following folder.

`/etc/netwitness/ng/envision/etc/devices/ciscoasa`

The custom parser file is an XML file and should be saved with a device name followed by "-custom". For example **ciscoasamsg-custom.xml**

Note: Custom Parser is not supported in 11.0 version and is available in 10.6.5 or later and 11.1 and later versions.

Make sure you have enabled "Save Modifications to Custom Parser". For more information see *Preferences* section

For more information, see "Log Parser Customization" at https://community.rsa.com/docs/DOC-83425

Editing an Existing Parser

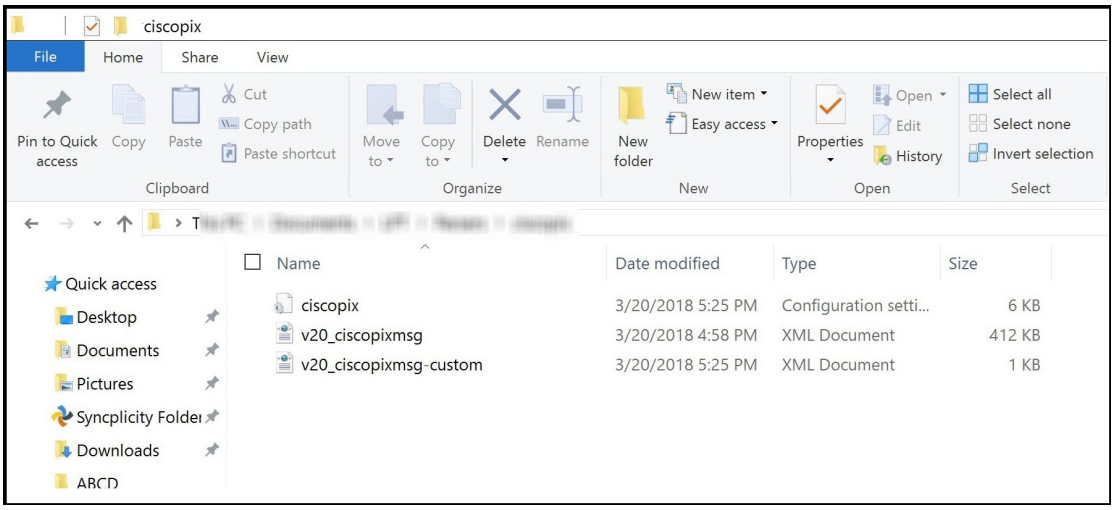
To edit an existing parser, follow these steps.

Note: If you opened your parser previously in the NetWitness Log Parser Tool, you can open the parser from the **Recent Parsers** section of the Welcome screen.

1. Select **Open Existing Parser** and click **Open**.

   The directory which is set as the default device location under **Preferences** is opened when **Open Existing Parser** is selected.

   The directory for NetWitness Log Parser Tool parsers is displayed.

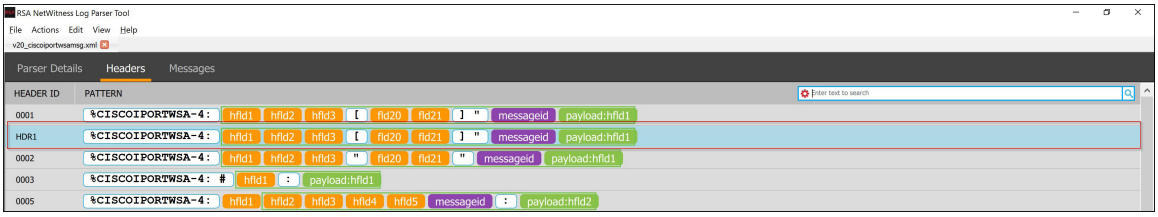


2. Type or select the name of the parser that you want to edit and click **Open**. For example, ciscoasamsg.xml.

3. Edit the parser entries such as headers, messages or tagval for customization.

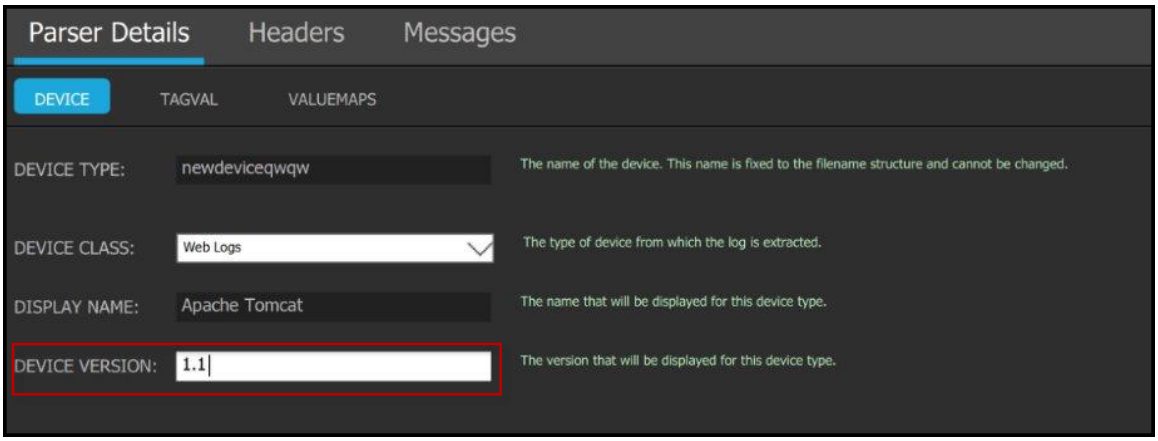
4. Go to **File** and click **Save.**

Note: All the custom parsers entries are highlighted in blue color as displayed in the image



Parser Version

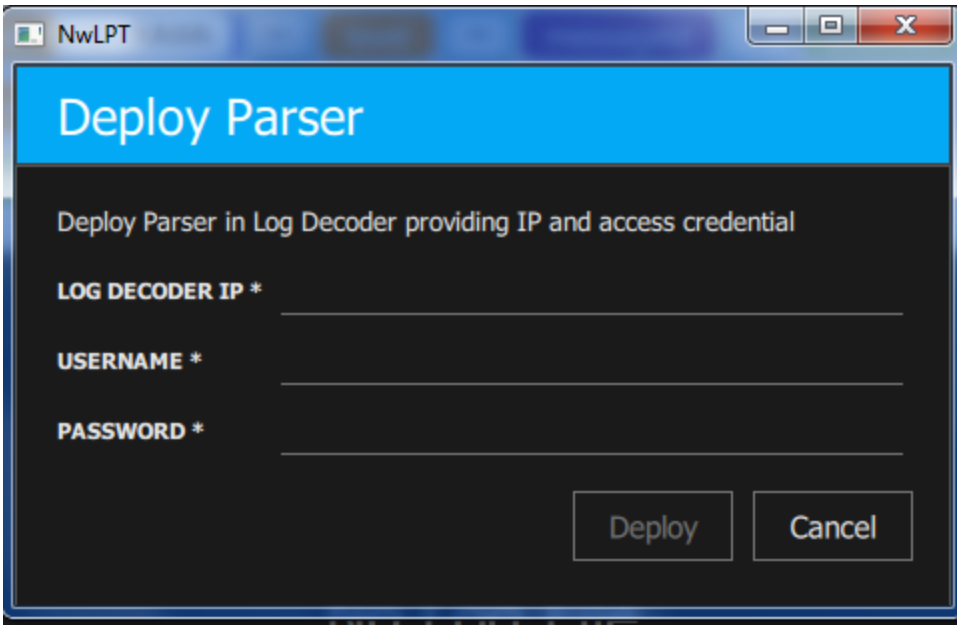
In the Parser Details section there is a Parser Version field. If there is a specific version associated with the parser, that version is displayed in the Parser Version field. You can also manually change the Parser Version in the Parser Version field.



Deploying Parsers on a Log Decoder

Using the NetWitness Log Parser Tool, you can deploy parsers on a Log Decoder by following these steps:

1. Open the parser that you want to deploy on the Log Decoder.
2. Go to **Actions > Deploy Parser**.
   The following pop-up dialog is displayed.



3. Enter the IP address of the Log Decoder where you want to add the parser, along with the credentials of the Log Decoder.

4. Click **Deploy** to add the parser to the Log Decoder, or click **Cancel** to return to the previous screen. After you click **Deploy**, the parser is added to the Log Decoder. And subsequently, all log parsers are reloaded.

Note: These entries are not retained, all the fields must be re-entered every time this dialog is opened.

Opening a Log File

Note: The first time you open the log file for a parser, the location that is set in **Preferences** is the default location.

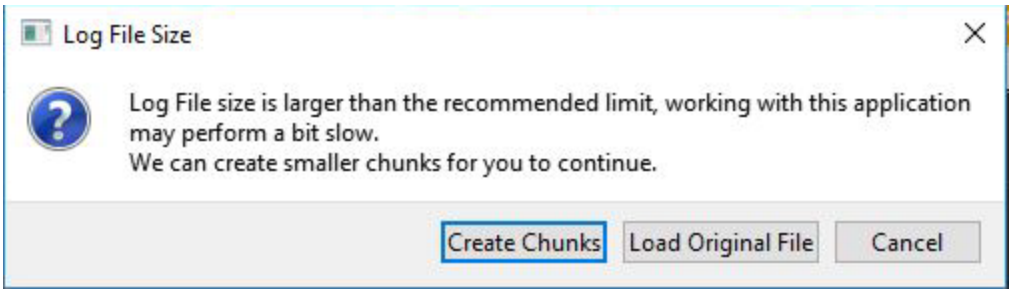
In the **Log Data** section, do one of the following to add a log file for parsing:

- Click **Open/Change Log File** icon.
- Drag and drop the log file.
- Drag and drop the text of a plain log.

Note: When a log file is open, you can change to a different log file using the **Open/Change Log File** icon.

Auto Splitting Log Files

When you upload a log file, the following dialog is displayed if your log file exceeds 25 MB.



The Log File Auto Splitting option allows you to split the size of a log file that exceeds 25 MB.

- If you select **Create Chunks**, the log file is split into smaller sized files without affecting the original log file.
- If you select **Load Original File**, the log file may load slowly, because it exceeds the recommended maximum size of 25 MB.
- If you select **Cancel**, you can select a different log file to load.

Note: If a file larger than 25 MB is used, it is recommended that you use On-Demand Parsing so that the parser does not attempt to parse a large log file after every change.

Generating Parsing Summary Report

You can generate a report on the parsing details of the parser and log file that you loaded. This report provides detailed information about the parsed messages and headers, as well as information about unused headers and messages and top 10 meta values. The report opens automatically in your default browser and is saved your Documents folder on your computer.

Note: Each time you generate a Parsing Summary Report, the existing report is overwritten. If you want to retain the existing report, it is recommended that you re-name the generated report.

To generate a report, follow these steps:

1. Open the parser associated with the report that you want to generate.
2. Open the log file that is associated with your selected parser. Note that if your log file is extremely large, a dialog is displayed that asks if you want the log file broken into smaller chunks.
3. Go to **Actions > Generate Parsing Summary**.

An example of the Generate Parsing Summary Report is shown below.

NwLPT Parsing Summary Report

Device Parser : C:/[redacted]
Device Log File : C:/[redacted]

Overall Parsing Summary

This section gives the summary of the overall parsing for the selected log file against the device parser

Total Log(s)	Parsed Log(s)	UnParsed Log(s)	Only Header Parsed Log(s)
20	20	0	0

Header Parsing Summary

This section gives the summary for the Header(s) in the device parser. Primarily it summarizes the Top 10 used HeaderId(s) and the list of HeaderId (s) that were unsed for this selected log file

Header Utilization** = **18.18%

#	HeaderId	Matching Log Count	Matching Log Percentage
1	0001	19	95.00
2	0004	1	5.00

Unused HeaderId(s)
0002, 0003, 0005, 0006, 0007, 0008, 0009, 0010, 0033

Message Parsing Summary

This section gives the summary for the Message(s) in the device parser. Primarily it summarizes the Top 10 used MessageId(s) and the list of MessageId(s) that were unsed for this selected log file

Message Utilization** = **1.73%

#	MessageId	Matching Log Count	Matching Log Percentage
1	104002:01	2	10.00
2	101001	1	5.00
3	101002	1	5.00
4	101003	1	5.00
5	101004	1	5.00
6	101005	1	5.00
7	102001	1	5.00
8	103001	1	5.00
9	103002	1	5.00
10	103003	1	5.00

Unused MessageId(s)
105001, 105002, 105003, 105004, 105005, 105006, 105007, 105008, 105009, 105010, 105011, 105020, 105021, 105031, 105032, 105034,

Metas Parsing Summary

This section gives the summary for the metas in the device parser. Primarily it summarizes the Top 10 used metas

#	Meta Name	Meta Count
1	context	20
2	event_description	20
3	level	20
4	messageid	20
5	result	5
6	day	1
7	month	1
8	resultcode	1
9	time	1
10	year	1

Status Bar

Within the NetWitness Log Parser Tool user interface, there is a status bar located at the bottom of the page that displays the following information:

- Header and Message count
- Latest auto-save time
- Progress Bar that displays that Custom Parser is enabled or disabled.

The following example Status Bar shows the most recent time that a log file was auto-saved.

Understanding the Log Data Section Workflow

The following figure shows the workflow of the Log Data section.

After you have defined a new parser or opened a parser to edit, work from the Log Data section to define the headers and messages. Events move from **Undefined** (Header and Message not defined) to **Header Defined** (Message not defined) and then to **Completely Defined** (Header and Message defined).

Note: All defined Headers and Messages can be duplicated. This allows a simplified parser development where a similar pattern is needed for a Message or Header.

Determining the Parser Definition Method

There are two main methods to specify a parser definition depending upon the type of information that you need to collect in the logs:

- Identify events with a specific type and extract generic information.
- Extract as much detailed information as possible from an event.

Example: Extract Generic Information

The following example shows how to create a parser that extracts generic information from a Cisco ASA log. It uses the following event from the Cisco ASA log:

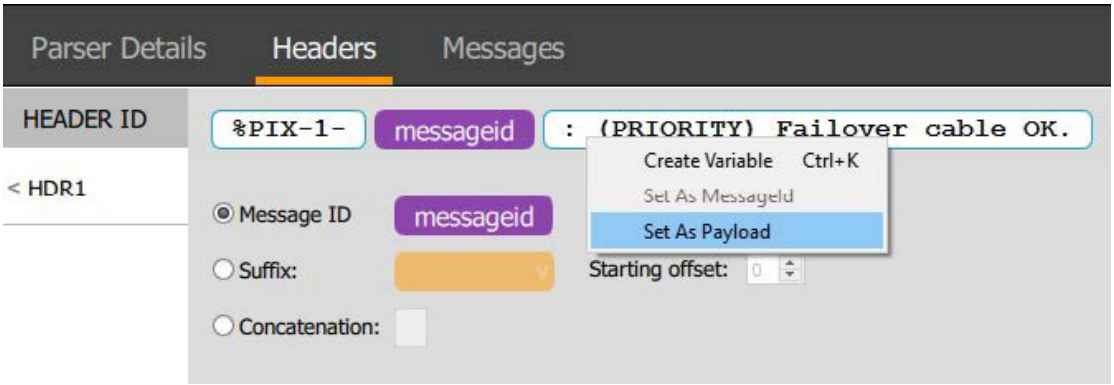
```
%ASA-1-101001: (PRIORITY) Failover cable OK.
```

Defining the Header Pattern

To define the header pattern, follow these steps:

1. Select an undefined event.
2. Identify the text as the MessageID and highlight it.
3. Click **Create Header** to create the header.
4. If you want to change the log file, then click the **Open/Change Log File** icon.

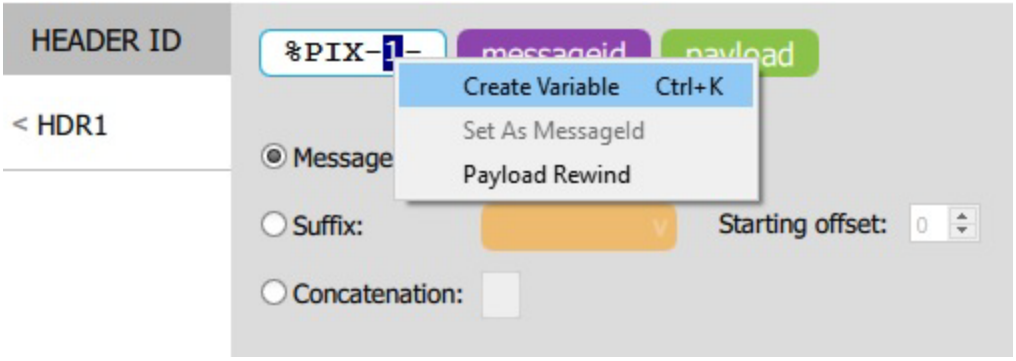
5. To start the payload, select the text to be marked as payload, right-click, then click **Set as Payload**. Alternatively, place your cursor at the start of the payload, right-click, and select **Set as Payload**.



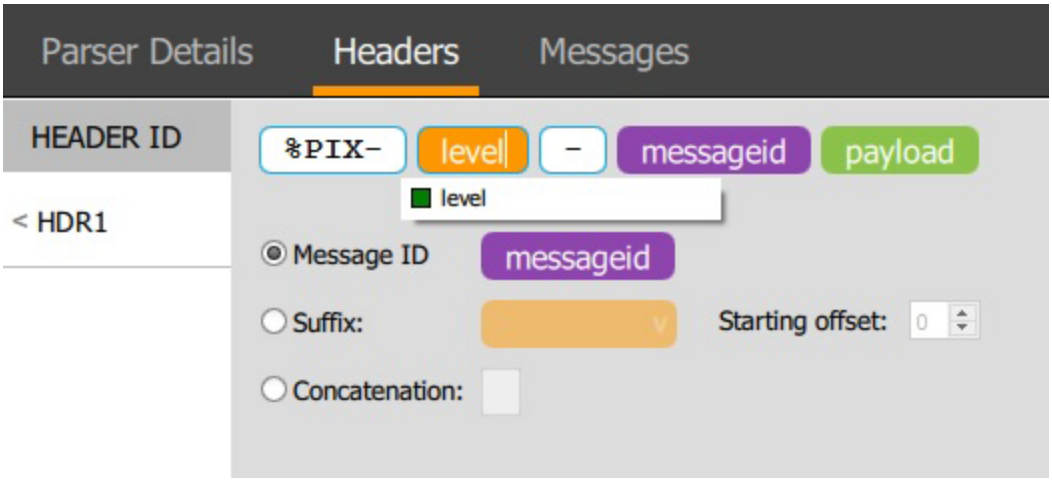
6. Define a variable for anything that can change. To define a variable:
   a. Highlight the text that you want to change to a variable.
   b. Press **CTRL+K** (**COMMAND+K** for MacOS). You can also right-click to get a context menu that provides an option to create a variable. The background changes to orange,

which indicates a variable.

This example shows changing 1 to a variable.

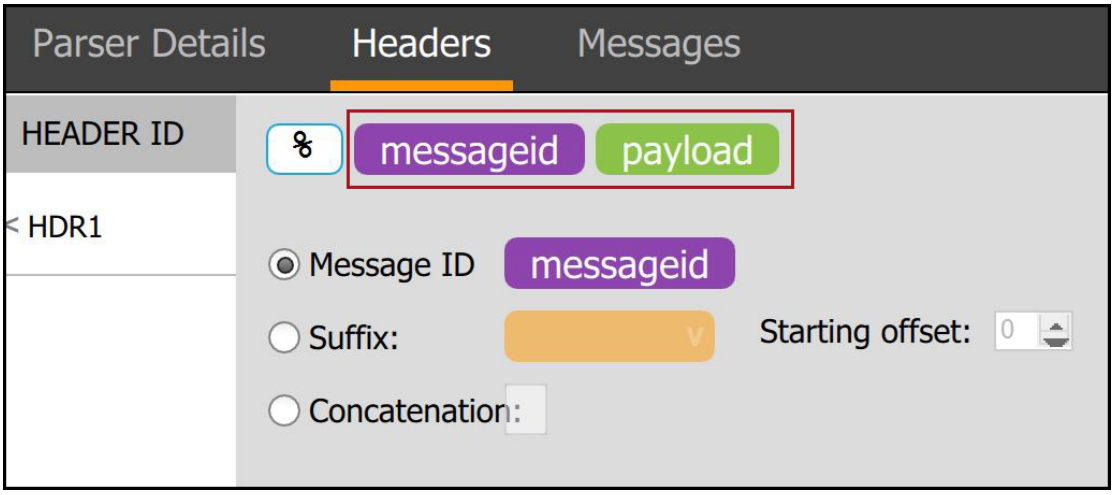


c. Start typing the name of the variable in the variable field, use the down and up arrow keys to select the variable, and press **ENTER** or you can also double-click the variable to select it.



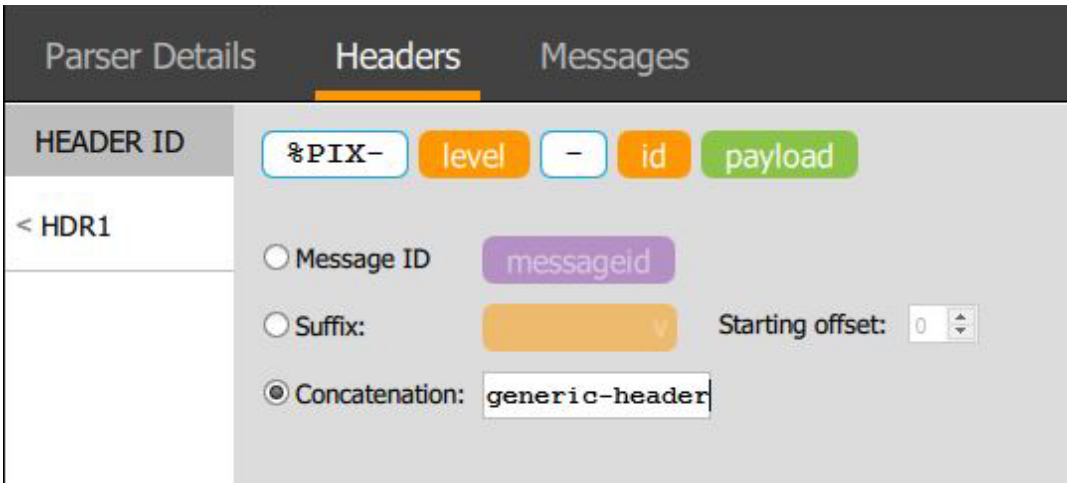
7. To change where the payload starts, or to start at the header, right-click a variable and select **Payload Rewind**. For example, right-click the **Level** variable and select **Payload Rewind**.

The red box indicates a complete payload with a Message Header.



8. To change the MessageID to a generic value:

   a. Select **Concatenation**, type a generic text string in the text field, and press **ENTER**.



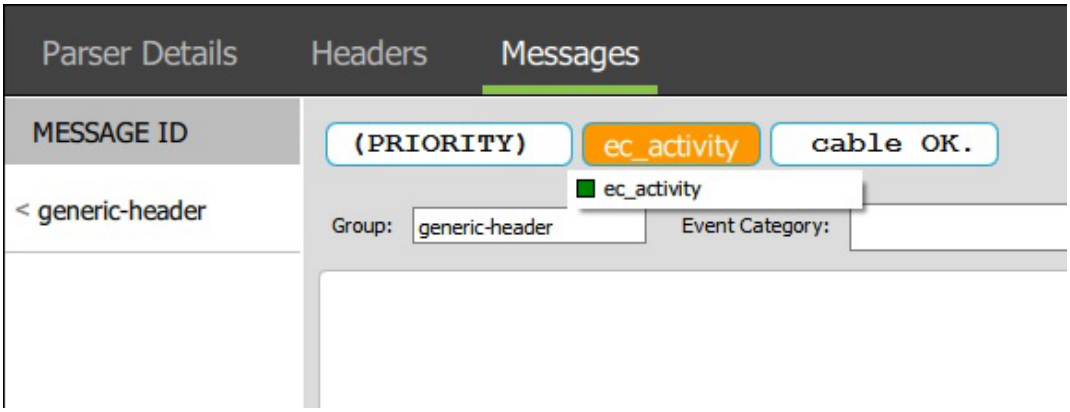
Note: Each Header needs a MessageID and a payload. Make sure to define a single MessageID for each header.

Note: The **Create Message** button in the log section is only enabled when the MessageID and Payload are defined.

Note: If you want to change your MessageID, you may need to delete the header and recreate it.

Defining the Message Pattern

1. After the MessageID and payload are defined in the event, the **Create Message** button is enabled.
   Click on the **Create Message** button. This takes you to the **Messages** tab with the payload populated as the message.
2. In the message pattern, define variables for the values that you want to extract as meta. To define a variable:
   a. Highlight the text that you want to change to a variable and press **CTRL+K** (**COMMAND+K** for MacOS). Or you can select the **Create Variable** option from the context menu. The background changes to orange, which indicates a variable.
   b. Start typing the name of variable in the variable field, use the down and up arrow keys to select the variable, and press **ENTER**.



Note: The variables that you define create meta in the Log Decoder.

3. In the **Event Category** field, select a generic category for the message. For example, Other.Default.

   The **Group** field populates from the header. The event shows as completely defined in the **Select an Event** section.
4. To save your changes, select **File > Save** or **File > Save As**, or press **Ctrl+S** (**COMMAND+S** for MacOS).
5. After you complete and save your changes, retrieve the completed parser.
   You have a choice of three formats:

- **.envision** (In the menu, select **Actions > Export Parser**) This option creates an event source package that consists of the event source XML and configuration (INI) file.
- **.zip** (In the menu, select **Actions > Export Resource**) This option creates an event source package in a .zip format that consists all the event source XMLs and configuration INI files.
- Deploy the parser directly deployed from the Log Parser Tool to the Log Decoder. From the main menu, select **Actions > Deploy Parser**.

6. Deploy the event source package in the NetWitness platform to integrate the event source. RSA recommends that you first deploy the parser to a test system to verify that it parses log traffic correctly.

Defining a Throw-away Variable

To add a throw-away field variable for information that you do not care about, create a variable and give it a name that is not defined in the variable list, such as **fld1**, **fld2**, or **fld3**.

1. Highlight the text that you want to change to a variable and press **CTRL+K** (**COMMAND+K** for Mac). You can also right-click to get a context menu that provides an option to create a variable. The background changes to orange, which indicates a variable.
2. Type the name of the throw-away field. For example, **fld1**
   Since throw-away fields are not in the mapping, the information contained will be removed when parsing.

Adding a Constant Function

1. Right-click the box below the **Group** field and select **Add Function > Assign Constant**.
2. In the **value** field, type the value that you want to assign to the variable.
3. In the **Set Variable** field, type the name of a variable that was not previously selected.

Adding an Event Time Function

Use the Event Time function to change the format of an event source timestamp.

1. Right-click the box below the **Group** field and select **Add Function > Event Time**.
2. In the **Set Value** field, type the format that you want to assign to the time variable. For example, **%B %F %W %N:%U:%O**, which appears in the format **Jan 27 2015 23:55:29**.
3. In the **from** field, select whether to parse event time in this format from the message (MSG) or from the header (HDR).
4. Right-click the **Select Variable** fields and select a variable from the list. To add additional variables as required, right-click a variable and select **Add**.

Event time example:

Event Time Function Formatting Characters

The following table shows the format characters that Log Decoder supports for the Event time function.

Format Character	Description
%C	Dates of this format: 04/20/05 14:01:57
%R	Full Month Name, fixed width field: January, February, March, April, May, June, July, August, September, October, November, December
%B	Abbreviated Month Name, fixed width field: Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec
%M	Numeric Month, fixed width field: 01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12
%G	Numeric Month Variable width field: 01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12
%D	Numeric Month Day, fixed width field: 01, 02, 03, 04, 05, 06, 07, 08, 09, 10, ... , 23, 24, 25, 26, 27, 28, 29, 31
%F	Numeric Month Day Variable width field: 01, 02, 03, 04, 05, 06, 07, 08, 09, 10, ... , 23, 24, 25, 26, 27, 28, 29, 31
%H	Hour, fixed width field: 00-23
%I	Hour, fixed width field: 00-12
%N	Hour: Variable width field: 00-12 , 00-24

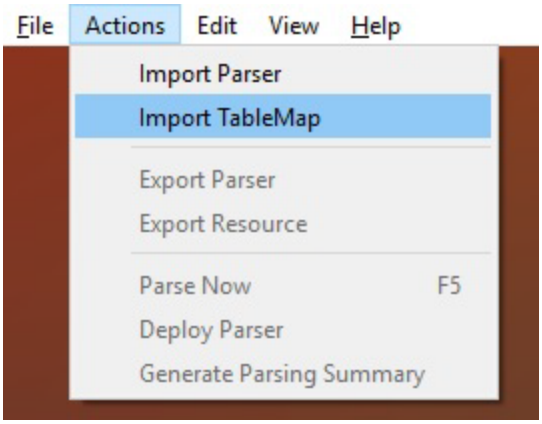
%T	Minute, fixed width field: 00-59
%U	Minute: Variable width field: 00-59
%J	Julian day, fixed width field: 001-365
%P	Alpha, fixed width field: AM or PM
%Q	A.M./P.M.
%S	Seconds, fixed width field: 00-59
%O	Variable width field: Seconds: 00-59
%Y	Year: 00-99
%W	Year, fixed width field: 0000-9999
%Z	Hours:Min:Sec
%A	Days
%X	Unix Time-Stamp (for example: 1424849941)

Adding a Custom Table Map

Note: If you changed the table mapping file (**table-map.xml**), or created a custom table mapping file (**table-map-custom.xml**), you can upload this updated file to the NetWitness Log Parser Tool.

To create a custom table map:

From the Welcome screen, select **Actions > Import TableMap** and choose the **table-map** that you want to upload.



Note: Before your file is overwritten, a confirmation message is displayed in the dialog box if you have already created a custom table map with the same name. This message does not display if you are a uploading a **table-map-custom.xml** file for the first time.

Using Delete for a header or message

The Delete option allows you to delete a single header or message.

- To delete a header or message, press **Ctrl+Del** for Windows and **Fn+Ctrl+Del** for Mac OS or from the main menu, select **Edit>Delete**.
- Select a log you want to delete, right click and select **Delete**

Using Move Up or Move down

The Move up and Move down options allow you to move a header or a message up and down as per requirement. Using a Move Up option allows a message or a header to jump a position. Using a Move Down option allows a message or a header to step down.

- To Move Up a header or a message, press **Ctrl+Up** for Windows and **Fn+Ctrl+Up**for Mac OS or from the main menu, select **Edit>Move Up**.
- To Move Down a header or a message, press **Ctrl+Down** for Windows and **Fn+Ctrl+Down**for Mac OS or from the main menu, select **Edit>Move Down**.
- Select a message definition or header definition, you want to move up or move down, right click and select **Move Up** or **Move Down**

Using Duplicate for a header or message

The Duplicate options allows you to create a new message or header with identical information to the original record.

- To duplicate a header or message, press **Ctrl+D** for Windows and **Fn+Ctrl+D** for Mac OS or from the main menu, select **Edit>Duplicate**.
- Select a log you want to duplicate, right click and select **Duplicate**

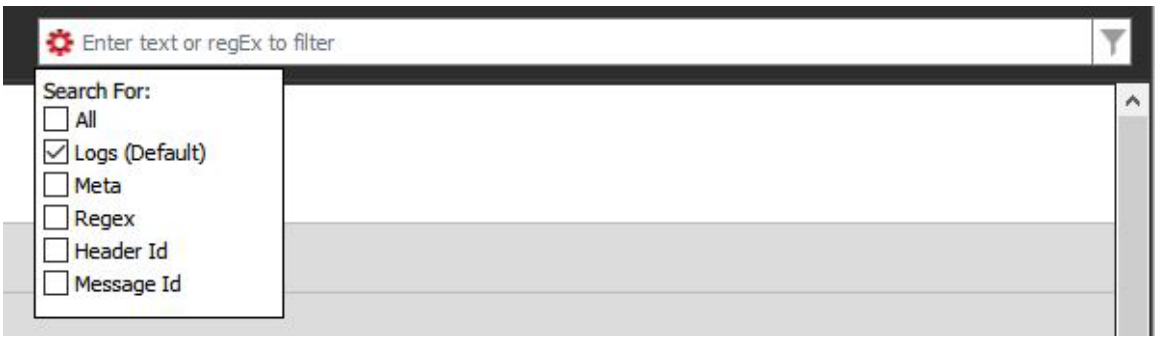
Using Undo and Redo

The Undo and Redo options allow you to undo and redo any number of commands while the parser is being built or updated. Using the Undo option reverts to the last change that you made to a single message or header. Using the Redo option allows you to make changes to a single message or header.

- To Undo your changes, press **CTRL + Z**, or from the main menu, select **Edit > Undo**.
- To Redo your changes, press **CTRL + Y**, or from the main menu, select **Edit > Redo**.

Log Filter Functionality

The following example shows the filter options that are available from the Log Filter drop-down menu.



Log filter options are described in the following table.

Log Filter Option	Description
Logs	Searches for the selected value for log search. Searches for any log that contains the selected search text. For example, you can search for **Bangalore**. Search results include any logs that contain **Bangalore** as part of a log.
Meta	Searches for any meta in the logs section. For example, you can search for the term **username**. Search results include logs that contain **username** as part of a log.
Regex	Searches for the selected regex pattern in the logs section. For example, you can search for **\d+\.\d+.*** and the search results include logs that contain IP addresses as part of the logs.
Header ID	Searches for the selected HeaderID. For example, you can search for a HeaderID that is listed as **0008**. The search results include the number of headers that contain **008*** defined as part of the header.

Message ID	Searches for the selected MessageID. For example, you can search for a MessageID such as **04_TACACSAcc**. The search results include the number of messages that contain **04_TACACSAcc*** defined as part of the message.
All	Searches for any logs, HeaderIDs, MessageIDs, variables, meta, or regex that matches the selected search text. For example, you can search for the text **syslog**, and the search results include any logs, HeaderIDs, MessageIDs, variables, meta, or regex that matches **syslog**.

The following example shows the search results for logs. The Search field and the Status Bar Message Count fields are highlighted.

Parser Header and Message Search Functionality

Within the Parser section, you can search on a HeaderID or Message Group by entering the value in the search field.

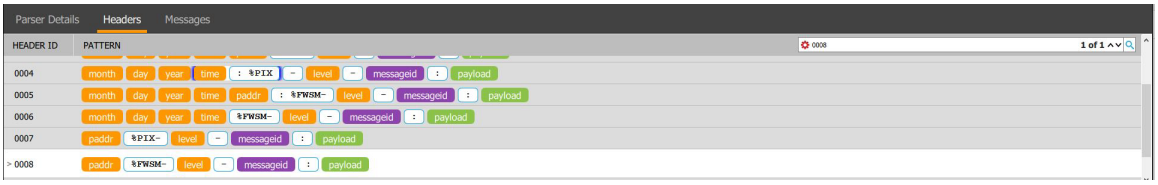
Header Search Functionality

The following example shows the search options that are available from the Header Search drop-down menu.

Header Search options are described in the following table.

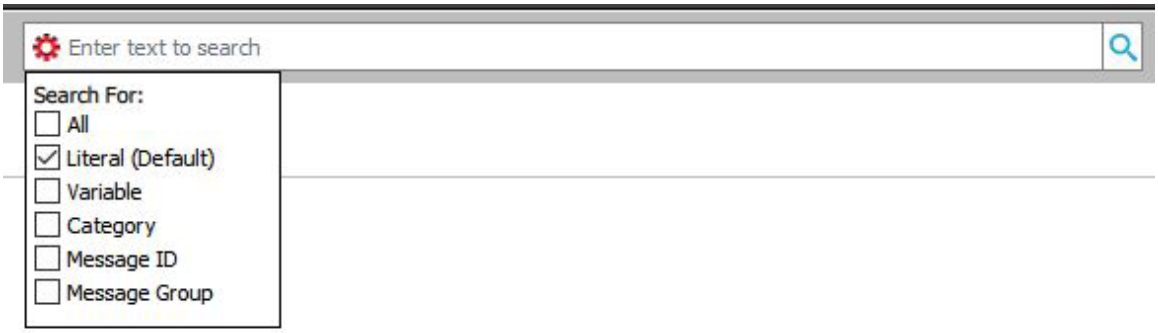
Header Search Option	Description
Literal	Default search option that matches literals. This option searches for any literal within the Header section. For example, you can search for **Bangalore** with this option selected. The search results include the number of headers that contain **Bangalore** as part of a literal.
Variable	Searches for any variable or meta defined in the Header section. For example, you can search for **saddr** with this option selected. The search results include the number of headers that contain **saddr** defined as part of the header.
HeaderID	Searches for the selected HeaderID. For example, you can search for a HeaderID that is listed as **0008**. The search results include the number of headers that contain **008*** defined as part of the header.
All	Searches for any selected text. For example, you can search for the text **syslog**, and a search is performed on any literal, HeaderID, or variable that matches the selected search text.

The following example shows the header search results.



Message Search Functionality

The following example shows the message search drop-down menu with the Literal option selected.

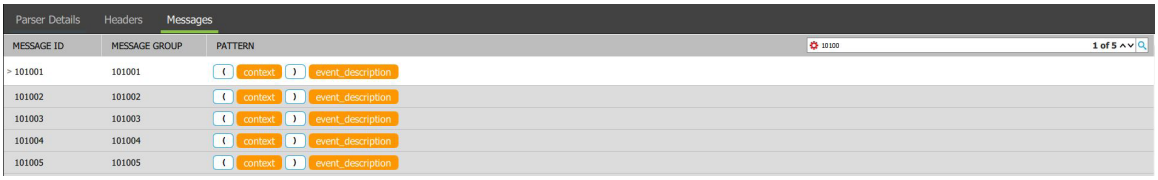


Message Search options are described in the following table.

Message Search Option	Description
Literal	Default search option that matches literals. Default selected value for Message searches. This option searches for any literal within the Message section. For example, you can search for **Bangalore** with this option selected. The search results include the number of messages that contain **Bangalore** as part of a literal.
Variable	Searches for any variable or meta defined in the Message section. For example, you can search for **saddr** with this option selected. The search results include the number of messages that contain **saddr** defined as part of the message.

Category	Searches for a particular event category that is part of the selected message. the search results include the number of messages that contain **Auth.Successful.*** defined as part of the selected message.
MessageID	Searches for the selected MessageID. For example, you can search for a MessageID such as **04_TACACSAcc**. The search results include the number of messages that contain **04_TACACSAcc*** defined as part of the message.
Message Group	Searches for the selected Message Group. For example, you can search for the text **syslog**. The search results include any literal, MessageID, variable, category, or Message Group that contain **syslog**.
All	Searches for any selected text. For example, you can search for the text **syslog**, and a search is performed on any literal, MessageID, variable, category, or Message Group that matches the selected search text.

The following example shows message search results.



Advanced Search Options

Note: To perform an advanced search, use **&&**, which is an **AND** condition that helps drill down to your exact search pattern. This applies to all three advanced header and message search options.

Note: When you are performing a combination search, it is an **OR** condition for the search. The search begins after you press **ENTER**.

Note: The context menu for Headers and Messages has a new option called **Parsed Logs** that displays all the logs parsing from the selected Header or Message.

Note: All search options listed below can be used individually, as well as with other search options. The advanced search options can be used also be used in the logs section.

Advanced Log Filter Options

Note: When using the Advanced Search, you must select **All** from the Log Filter drop-down menu.

The following table shows the advanced log filter options.

Message Search Option	Description
Header Search	If you need to filter logs that parse with a specific header, use the **@hid** option, followed by the HeaderID (for example, **@hid:0001**).
Message Search	If you need to filter logs that parse with a specific header, use the **@hid** option, followed by the HeaderID (for example, **@hid:0001**).
Variable Name Search	If you want to filter logs that contain a specific variable or meta item, use the **@<Variable-name> @saddr** option. This option lists all logs that contain **saddr** meta keys.
Variable Value Search	If you want to filter logs that have a specific variable value, use the **@<variable-name>:<variable-value>** option (for example, **@dport:10**). This option lists all logs with a value of meta key **dport** as **10**.

Message Search Option	Description
Regex Search	If you want to search the logs using a regex, use the **@regex** option (for example, **@regex:\d+\.\d+.*** This option displays all logs that contain an IP address.
Free Text Search	If you use this option, any text provided will be searched in the logs. If two words are provided, both of them are searched separately (similar to the way that Google performs text searches). As an example, if you enter the words **rsa bangalore**, **rsa** and **bangalore** are searched separately and all logs containing either word are displayed.

Note: If you want to search on terms as though they are in a sentence, you need to enclose your search query in quotation marks (for example, **"rsa bangalore"**).
If the search query is not properly enclosed within quotation marks, the error is not automatically corrected, and no error message is displayed.

Note that when you search on a header, message, variable name or variable value, by default all searches only perform a contains match. For example, if you enter the search text **@hid:0001**, all headers containing **id 0001, 0001:01, 0001:02**, and so on will be displayed. If you want an exact match, the query should be entered as **@hid:"0001"** so that only logs that match **header-id 0001** are displayed.

Advanced Header Search

The following table shows the advanced header search options.

Advanced Header Search Option	Description
@id:	Searches for the selected HeaderID. Syntax: **@id:<header>id>**, where **header_id** is the HeaderID that you are searching for. For example, **@id:0008** displays the number of headers that contain **0008*** defined as headers that you can search.

Advanced Header Search Option	Description
@var:	Searches for any variable or meta defined in the header section. Syntax: **@var:<variable>**, where variable is the variable or meta to search. For example: **@var:saddr** displays the number of headers that contain **saddr** defined as a part of the header that you can search.
@literal:	Searches for any literal content in the header section. Syntax: **@literal:<text>**, where text is the literal to search. For example, **Bangalore** displays the number of headers that contain **Bangalore** as part of the literal that you can search.

Advanced Message Search

Advanced message search options are explained in the following table.

Advanced Message Search Option	Description
@id:	Searches for the selected MessageID. Syntax: **@id:<message_id>**, where **message_id** is the MessageID that you are searching for. For example, **@id:04_TACACSAcc** displays the number of messages that contain **04_TACACSAcc*** defined as messages that you can search.
@var:	Searches for any variable or meta defined in the header section. Syntax: **@var:<variable>**, where variable is the variable or meta to search. For example: **@var:saddr** displays the number of headers that contain **saddr** defined as a part of the header that you can search.
@literal:	Searches for any literal content in the message section. Syntax: **@literal:<text>**, where text is the literal to search. For example, **Bangalore** displays the number of messages that contain **Bangalore** as part of the literal that you can search.

TAGVALMAP Feature

The **<TAGVALMAP>** feature is an advanced feature that enables easy parsing of event logs using the **<TAGVAL>** format. The parsing of **<TAGVAL>** logs is different from other logs, as the Log Decoder allows listing all **Tag=value** in a single MessageID where the tags can display in any order in the log.

Using the TAGVALMAP Feature

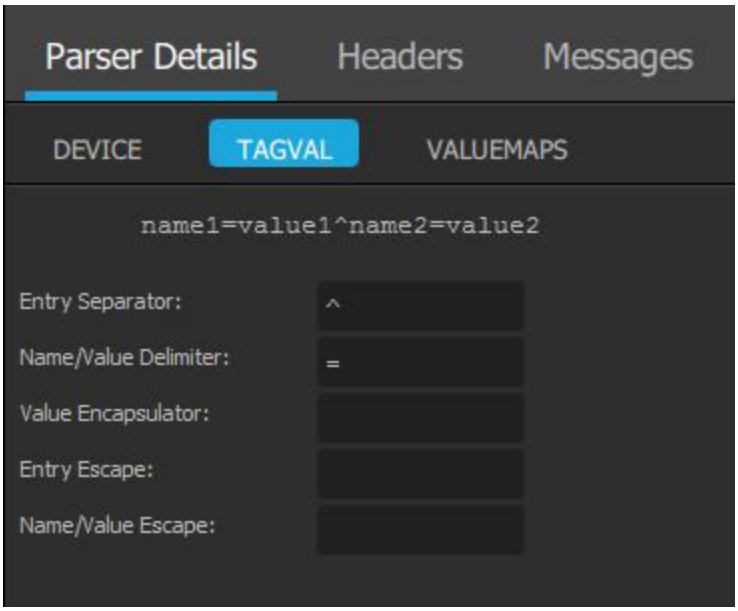
Using the **<TAGVALMAP>** feature saves you from writing different messages for the same MessageID if your log messages only differ in the order of variables within the payload, or if some parameters do not show up in the payload.

When you define your delimiters, the parser does not work the same way by matching the payload character by character, but the payload string is split around the delimiters into ><*key-value* pairs. For every <*key-value*> pair, the static text is matched against the appropriate key and the value goes to the corresponding parameter in the table.

There are types of event logs where the part logs have a pattern of <*tag-value*> (<*name-value*), which means the the tag parts remain the same, but the value is changed.

The Entry Separator has a maximum limit of three characters, while Entry Escape and Name Value Escape allow only one character.

The following example shows a **TAGVAL** parameter in the Parser Details section.



After you save the data, the corresponding XML file content looks similar to the following example:

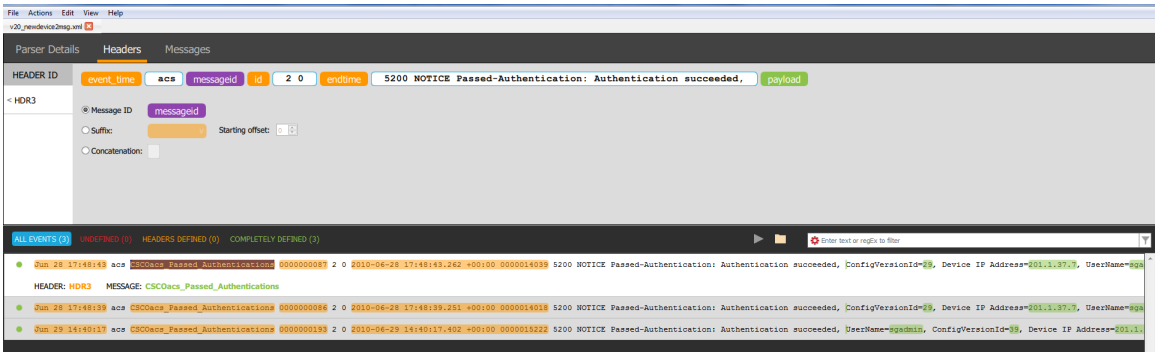
```
<TAGVALMAP
```

```
pairdelimiter=","
encapsulator="'"
valuedelimiter="="
escapeValueDelim=" "
escapePairDelim=" "/>
```

Note: Press **ENTER** after you change each delimiter.

Setting Up a Header and Creating a Message

The following example shows a header and message that is created.



The corresponding Header XML definition is shown below:

```
<HEADER
id1="HDR3"
id2="HDR3"
content="&lt;event_time&gt; acs&lt;messageid&gt;&lt;id&gt; 2 0
&lt;endtime&gt; 5200 NOTICE Passed-Authentication: Authentication
succeeded, &lt;!payload&gt;"/>
```

Create Message

When you create a message, the **Name Value Pair** check box should be checked in order for the messages to be parsed. Note that if you do not select the **Name Value Pair** check box, the parser does not parse **<TAGVAL>** messages with a different order. The **Name Value Pair** is disabled by default and it is enabled for user input only if the message definitions satisfy the **<TAGVAL>** format, as shown in the following examples.

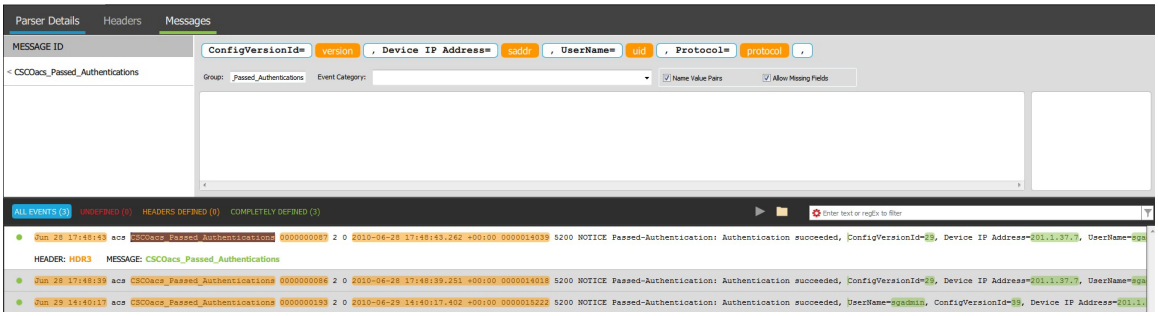
The **TAGVAL** format is either:

```
<literal><valuedelimiter><variable><pairdelimiter>….<literal><valuedeli
miter><variable> format
```

Or

```
<literal><valuedelimiter><variable><pairdelimiter>….<literal><valuedeli
miter><variable><pairdelimiter> format
```

The **Allow Missing Fields** option is used to parse event logs that missed some **<TAGVALUE>** pairs defined in the message definition. This means not all **<TAGVALUE>** pairs defined in the message definition need to be parsed.



The corresponding Message XML definition is shown below:

```
<MESSAGE

id1="CSCOacs_Passed_Authentications"

id2="CSCOacs_Passed_Authentications"

tagval="true"

missField="true"

content="ConfigVersionId=&lt;version&gt;, Device IP
Address=&lt;saddr&gt;, UserName=&lt;uid&gt;,
Protocol=&lt;protocol&gt;,"/>
```

Listed below are sample payload parts of event logs that are parsed:

```
ConfigVersionId=29, Device IP Address=201.1.37.7, UserName=sgadmin,
Protocol=Radius,

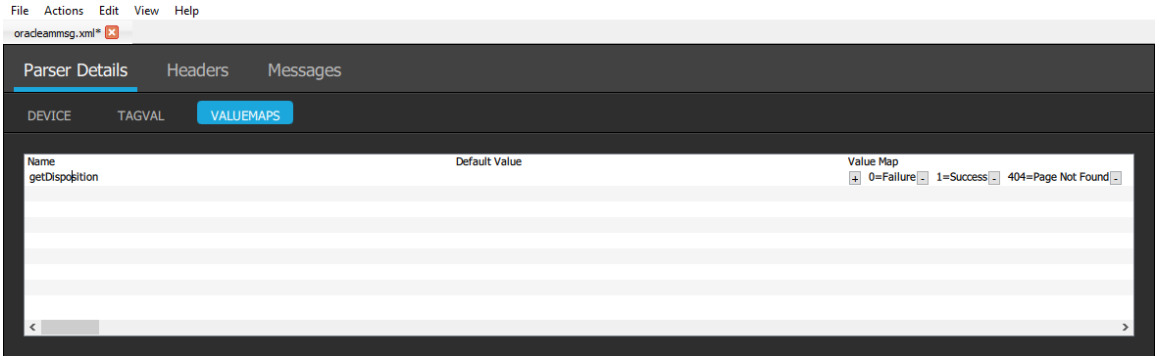
ConfigVersionId=29, Device IP Address=201.1.37.7, UserName=sgadmin,

Authentication succeeded, UserName=sgadmin, ConfigVersionId=39, Device
IP Address=201.1.37.7, Protocol=Radius
```

(For 1.1 version) VALUMAPS

VALUEMAPS functionality allows mapping of a value that is parsed in a meta to another corresponding meta.

For example, if you have a new event saved with a code “404” and a relevant information defined is “page not found error.” With VALUEMAPS, you can map 404 to "page not found error" so that whenever 404 is seen, it also shows another mapped meta key.



VALUEMAPS consists of three columns.

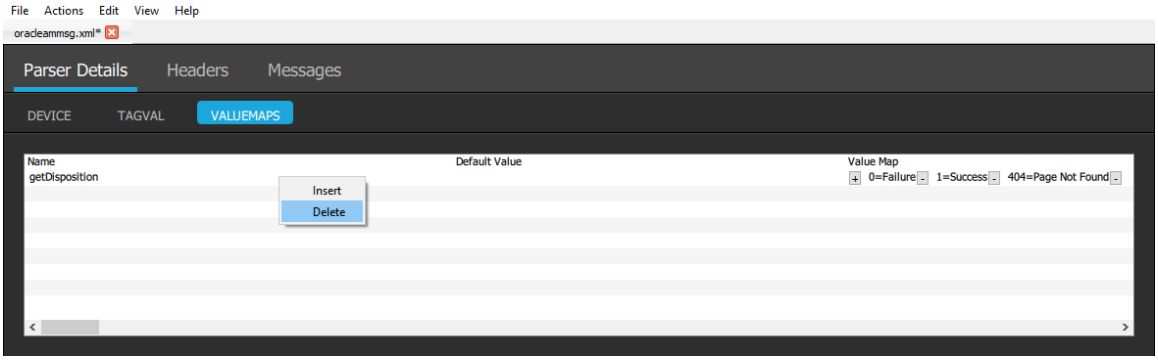
Field	Description
Name	It is a unique identity of a VALUEMAPS.
Default Value	When there is no value relevant to a defined specific key, it will use default value
Value Map	It is a set of key value pair where a meta is found in the parser it is replaced by the value.

VALUEMAPS can be edited as per the requirements, you can insert new VALUEMAPS containing the default values and delete any unwanted VALUEMAPS.

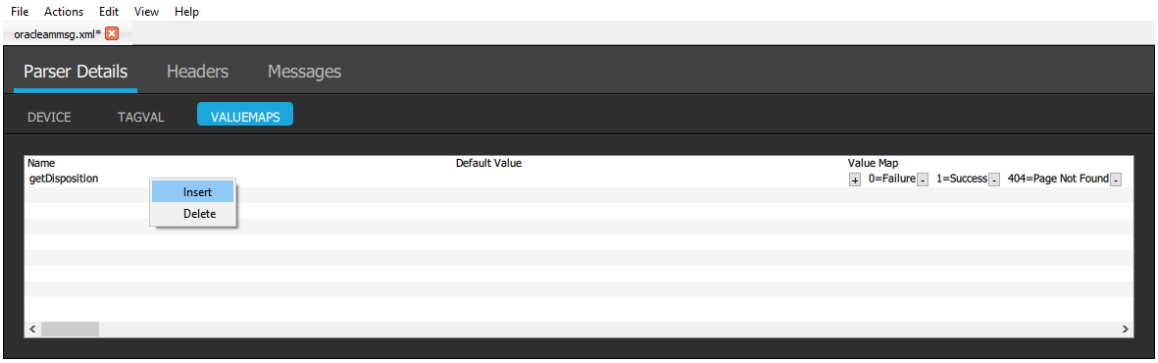
To edit an existing VALUEMAPS click on it to make changes.

- Add - Click on + button to add a new key value pair
- Delete- click on - to delete an existing key value pair

To delete an unwanted VALUEMAPS right click on the name column and select the “delete” option you want to delete.



To Insert a new VALUEMAPS right click on the name column and select the Insert option you want to insert.



New VALUEMAPS will be created with new name VALUEMAPS 1, VALUEMAPS 2 and so on which will contain default values.

How NetWitness Investigate Works

NetWitness Investigate provides the data analysis capabilities in RSA NetWitness® Platform, so that analysts can analyze packet, log, and endpoint data and identify possible internal or external threats to security and the IP infrastructure.

Note: In Version 11.1 and later, the Hosts and Files views provide a view into endpoint data. Earlier versions offer access to endpoint data using standalone a NetWitness Endpoint server.

Metadata, Meta Keys, Meta Values, and Meta Entities

RSA NetWitness Platform audits and monitors all traffic on a network. One type of service--a Decoder--ingests, parses, and stores the packets, logs, and endpoint data traversing the network.

The configured parsers and feeds on the Decoder create *metadata* that analysts can use to investigate the ingested logs and packets. Another type of service, called a Concentrator, indexes and stores the metadata.

The metadata is in the form of a *meta key* and *meta values* for the key. For example, `ip.src` is a meta key, and an IP address that is the source of the traffic is tagged as `ip.src`. When you view data in Investigate, you see the meta key `ip.src` and all of the IP addresses (values) that are tagged with that key. Some meta keys are built-in and others may be custom keys defined by the administrator.

Meta entities are available in Version 11.1 and later. A *meta entity* is an alias that groups together the results from other meta keys. Meta entities organize similar meta keys into a single, easier to use, meta type. Some meta entities are already included by default, and the administrator can create custom meta entities. Analysts can use a meta entity in a query, a meta group, a column group, and a profile. Parallel coordinates visualizations do not support meta entities. Administrators can use meta entities to define a query prefix to apply to a user role and a user. The *Decoder Configuration Guide* provides additional information about creating meta entities and how they can be used in rules.

For example, the default Core database language includes distinct meta keys for IP source and IP destination. One of the built-in meta entities named `ip.all` represents the combined set of all IP sources and destinations.

Analysts usually query the Concentrator to discover threats. The Concentrator handles queries, only going to the Decoder when a full reconstruction of sessions or raw logs is required. ESA, Malware Analysis, and Reporting Engine also query the Concentrator, where they can quickly get all the pertinent metadata associated with an event and generate information on the event without having to go to each Decoder. In some special cases, analysts may query a Decoder.

Note: While a hybrid appliance can perform the Concentrator function, a separate Concentrator appliance is required for any large environment that needs greater bandwidth or events per second (EPS). The Concentrator appliance has storage layout that uses solid state drives for the index, which increases read performance.

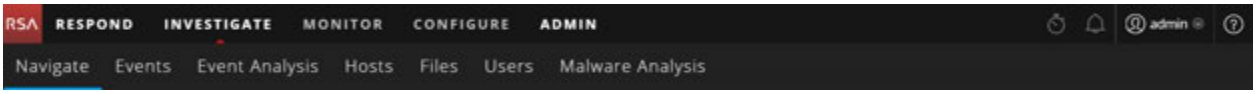
Triggers for an Investigation

These are a few examples of triggers for an investigation:

- You receive intelligence from a third party about a new active directory hack. Starting in the Events view, you use that intelligence to run a search across all of your raw Active Directory log data for the last 24 hours.
- You are asked by the SOC manager to find any Pokemon Go malware due to its current popularity. Starting in the Navigate view, you craft a query to look for an HTTP session using a specific user agent related to the malware he found on a security blog.
- An incident responder escalates a ticket that shows some odd indicators related to a host. Starting in the Hosts view, you examine that host to find specific details.
- You are looking for the next zero day attack and start pivoting through network metadata in the Navigate view to find any abnormal automated sessions leaving the enterprise.
- You are asked by your SOC manager to find any information related to user `jarvis`, an employee who was just let go. Starting in the Hosts view, you query against the past week for that username.

Workflow of an Investigation

Analysts can investigate data captured by NetWitness Platform, and deep dive from information on a NetWitness Platform dashboard, a NetWitness Respond incident or alert, a report created by the NetWitness Platform Reporting Engine, or a third-party application. During the course of an investigation, analysts can move seamlessly between the views in Investigation: the Navigate view, the Events view, the Event Analysis view, the Hosts view, the Files view, the Users view, and the Malware Analysis view. This figure illustrates the NetWitness Investigate submenus.

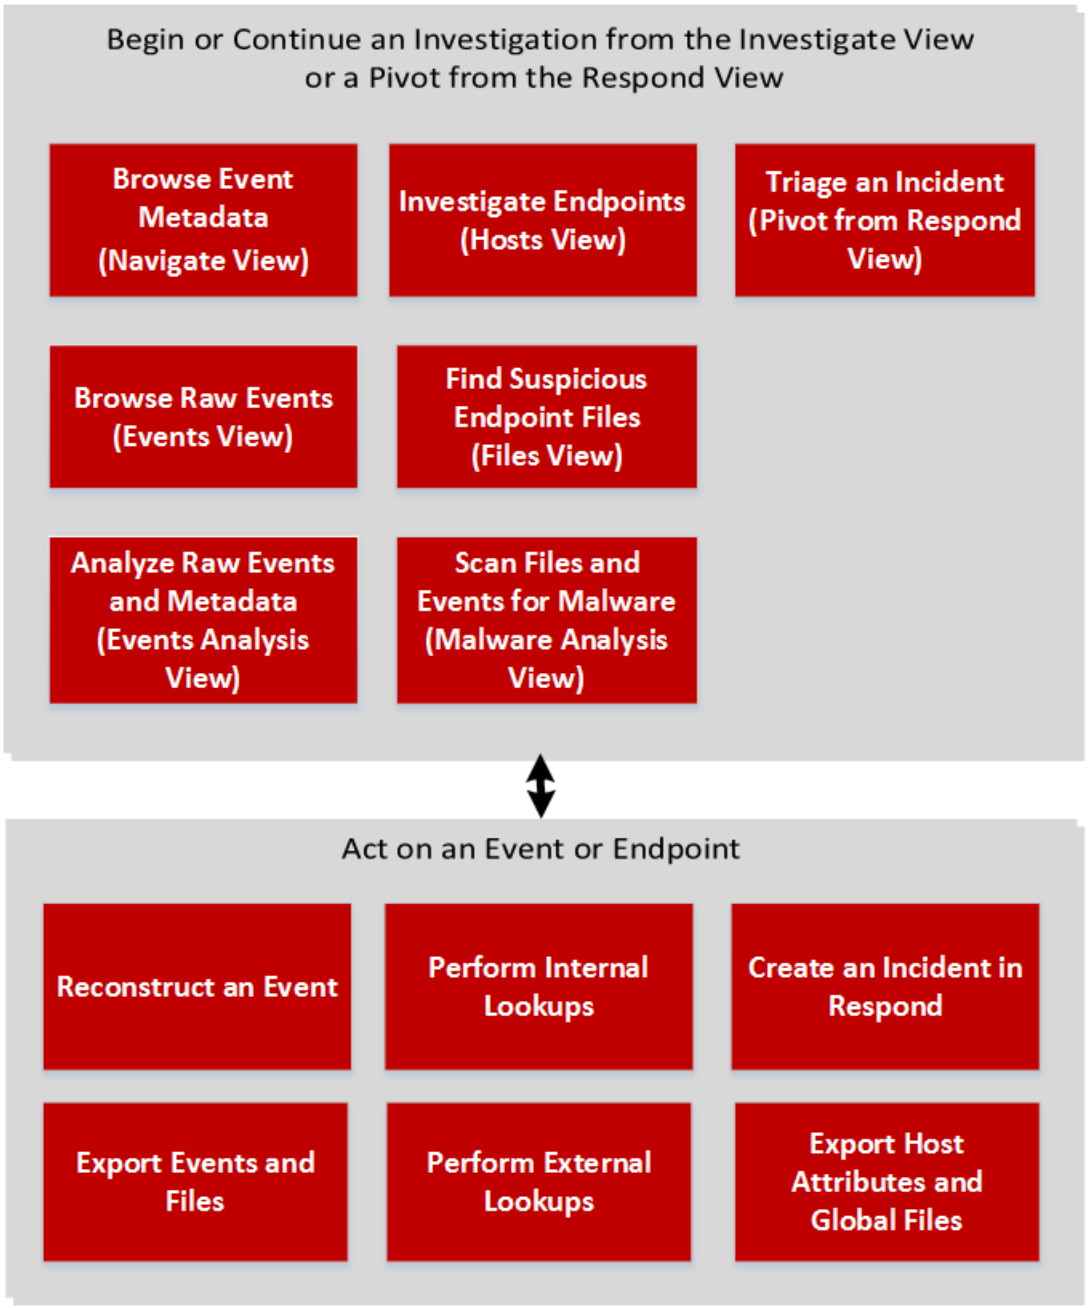


Note: The Files and Hosts views are available in Version 11.1 and later. The Users view is available in Version 11.2 and later. Specific user roles and permissions are required for a user to conduct investigations and malware analysis in NetWitness Platform. If you cannot perform an analysis task or see a view, the administrator may need to adjust the roles and permissions configured for you.

You can access each view from the Investigate submenu and from other Investigate views. You can also go directly into an Investigate view from NetWitness Respond, and go directly from NetWitness Investigate to NetWitness Respond and standalone NetWitness Endpoint. Your use case determines the starting point for your investigation. This table provides general guidance on the starting view for different use cases.

Go to...	Focus
Navigate view	All meta keys and meta values for logs, endpoints, and packets are grouped by meta key. You can pivot through the data to refine results, then go to the Events view or Event Analysis view, or look up in Malware Analysis or Live. This is the default NetWitness Investigate view. (See Investigating Metadata in the Navigate View.)
Events view	Events are listed in order by time. You can view the raw event and related metadata, view a reconstruction, and download events and files. You can go to the Event Analysis view. (See Examining Raw Events in the Events View.)
Event Analysis view	Events are listed in the order by time. You can view all meta keys and meta values for logs, endpoints, and packets. You can view the raw event and related metadata, view a reconstruction that offers helpful cues to identify points of interest in a reconstruction. You can go to the Hosts view, pivot to standalone Endpoint, look up in Live, and do external lookups. External lookups allow you to search the internet for meta values with which you interacted, determine passive DNS information related to an IP address, ascertain if a URL is blacklisted, and other third-party context integrations. (See Analyzing Raw Events and Metadata in the Event Analysis View)Analyzing Raw Events and Metadata in the Event Analysis View
(Version 11.1 and later) Hosts view	Hosts on which the NetWitness Endpoint Insights Agents are running are listed. For every host, you can view processes, drivers, DLLs, files (executables), services, and autoruns that are running, and information related to logged-in users. From the Hosts view, you can go to the Navigate and Event Analysis views. (See Investigate Hosts)
(Version 11.1 and later) Files view	Unique files such as PE, Macho, and ELF in your deployment are listed. For each file, you can view details such as file size, entropy, format, company name, signature, and checksum. From the **Files** view, you can go to the Navigate and Event Analysis views. (See Investigate Files)
Malware Analysis view	If you are running a Malware Analysis appliance, you can automatically or manually scan files and see the results of four types of analysis: network, static, community, and sandbox. If a file is malware, you can go to the Hosts view to see which hosts downloaded the file. (See Conducting Malware Analysis
(Version 11.2 and later) Users view	Visibility into risky user behaviors across your enterprise is provided using NetWitness UEBA. You can view a list of high-risk users and a summary of the top alerts for risky behavior for your environment, and then select a user or an alert and view details about the risky behavior and a timeline during which the behaviors occurred. NetWitness Platform users assigned the Administrators or UEBA Analysts role have access to this view. For information about this feature, refer to the *NetWitness UEBA User Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Every situation is unique in terms of the types of information the analyst is attempting to find. Many investigations start in one view, and end in a different view as the analyst learns something and then needs to follow that result to a different line of questioning. This figure shows the high-level workflow of an investigation.



Focus on Metadata, Query, and Time

Analysts use NetWitness Investigate to hunt for events that drive the incident response workflow and to do strategic analysis after another tool has generated an event. Beginning in the Navigate view, Events view, or Event Analysis view:

- You start by executing a query on a service for a specific time range, then filter using metadata to a subset of events, reconstruct or analyze an event, and repeat the process to reconstruct or analyze another event.
- When you encounter an event that bears a closer look, you view the context around the event, and decide whether to create an incident or add the event to an incident. If you decide not to add the event to an incident, you run another query to gain further insight, which starts again at the beginning of the workflow.
- If you notice suspicious activity or files on a specific host in the network, you can gather additional information about the host and files found on the host in the Hosts and Files view, or in a standalone NetWitness Endpoint server.
- If you find a file or event that potentially contains malware, you can do a Malware Analysis scan of the file or you can open Malware Analysis and start a scan of the service on which the event was seen.

For example, if there is a concern regarding suspicious traffic with foreign countries, the Destination Country meta key reveals all destinations and the frequency of the contact. Drilling into those values yields the specifics of the traffic, such as the IP address of the originator and the recipient. Checking other metadata can expose the nature of attachments exchanged between the two IP addresses.

Focus on Endpoint Analysis

Analysts use the Hosts and Files view to investigate or perform analysis on the hosts or files using attributes such as IP address, host name, Mac address, and so on.

- During an incident triage in the Respond view, review the key information (such as, hostname, filename), and view the context highlights.
- Pivot to Investigate to open the Navigate view. Select the Endpoint Analysis meta group and review the metadata created.
- View the metadata in the Event Analysis view to analyze the events. Select the host lookup using the Event Meta panel.
- In the Hosts view, click on the hostname to view the summary of the endpoint data, snapshots, security configurations, and so on.
- Perform an on-demand scan to get the most recent information (if required).
- Search on all snapshots for a specific filename, path, or hash to narrow the search.
- Review the processes, autoruns, files, libraries, drivers, and system information to investigate further.

- In the Files view, filter the files using a few indicators (such as, file name, file size, entropy, format, company name, signature, checksum) and pivot to the Navigate view to see if it exists on other hosts in the network.

Focus on NetWitness Respond Incidents and Alerts

An analyst who is working on an incident or an alert in NetWitness Respond can open the incident in NetWitness Investigate (Navigate view) to do a deeper analysis of the event or alert.

- The workflow to respond to an incident typically begins in the Respond view, where the analyst who is investigating an incident needs to gather intelligence about the incident in NetWitness Investigate. You can hover over an underlined entity in an incident or alert, such as an IP address, and then select the action Pivot to Investigate > Navigate. The Navigate view opens and is filtered for the selected entity. After you launch an investigation from NetWitness Respond, defined meta keys are queried and the content of captured packets, logs, and endpoint events is displayed in the Navigate view.
- If you find events that are relevant to the incident, you can add the events to the incident in Respond. You can also create a new incident in Respond based on one or more events found in Investigate.
- (Version 11.2 and later) From the Incident Details view Indicators panel in Respond, you can open the Event Analysis view to get a better understanding of an indicator event.

NetWitness Investigate Views

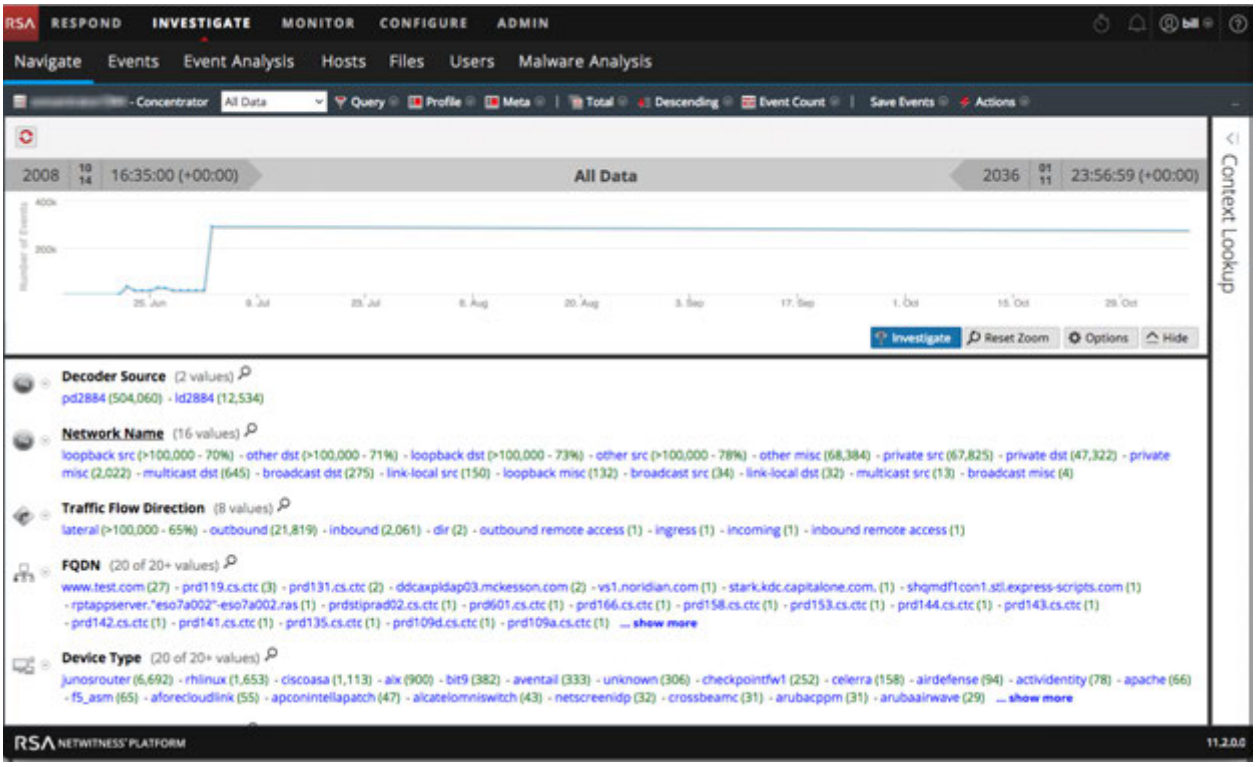
This section provides a brief description and example of each main view (Navigate, Events, Event Analysis, Hosts, Files, and Malware Analysis) and views that provide additional context for data found; the Context Lookup panel and the Event Reconstruction view.

Navigate View

The Navigate view provides the capability to drill into and query contents of captured packets, logs, and endpoint events on a Broker, Concentrator, or Decoder (though investigating a Decoder is not typical).

- When you select a service, the defined meta keys for that service are queried, and values are returned along with the number of events. Clicking on a value at any given level, reveals the results in detail.
- For certain configured meta keys, such as IP address, or hostname, you can search for additional context information around a value using the Context Hub. The additional context may include incidents, alerts, and other sources where the value was mentioned.
- The Navigate view also provides a sequential visualization of the data in a timeline. Here you can zoom in on a selected time period.

This figure illustrates the Navigate view.

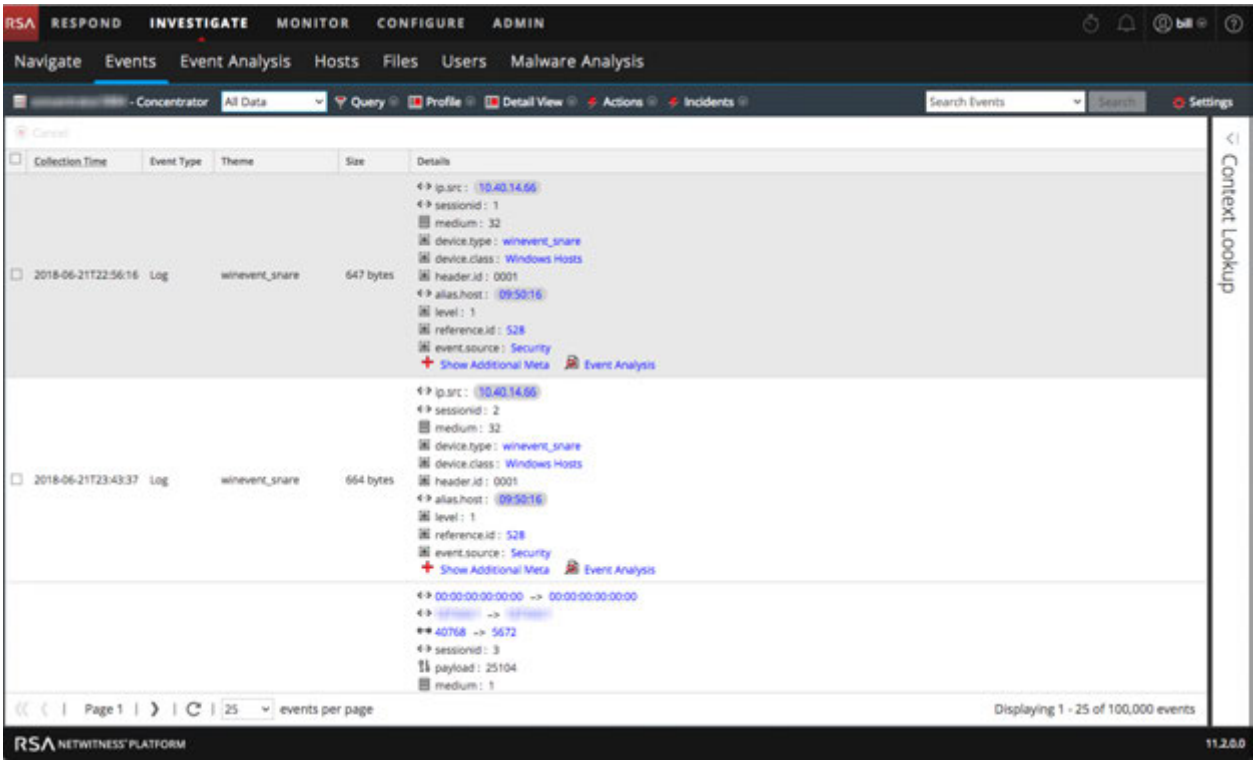


Events View

The Events view provides a view of packet, log, and endpoint events in list form so that you can view events sequentially and reconstruct events safely.

- You can open the Events view for a meta value that you see in the Navigate view.
- For analysts without sufficient privilege to navigate a service, the Events view is a standalone investigation view in which analysts can access a list of network, log, and endpoint events from a NetWitness Platform Core service without having to drill down through metadata first.
- The Events view presents event information in three standard forms, a simple list of events, a detailed listing of events, and a log view.
- For certain configured meta keys, such as IP address, or hostname, you can search for additional context information around a value using the Context Hub. The additional context may include incidents, alerts, and other sources where the value was mentioned.
- You can export events and associated files, and create an incident from an event.

This figure illustrates the Events view.

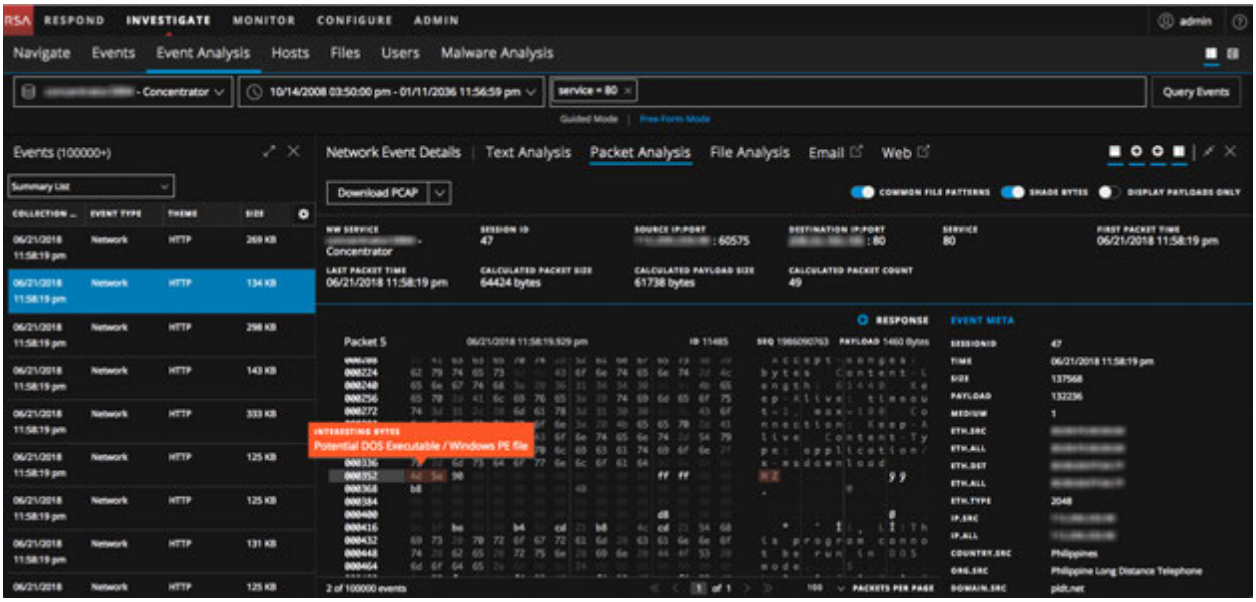


Event Analysis View

The Event Analysis view is an interactive tool to help analysts see the packets, text, or files in an event with visual cues to highlight certain types of information. Depending on the type of reconstruction--packets, text, or files--different information is relevant.

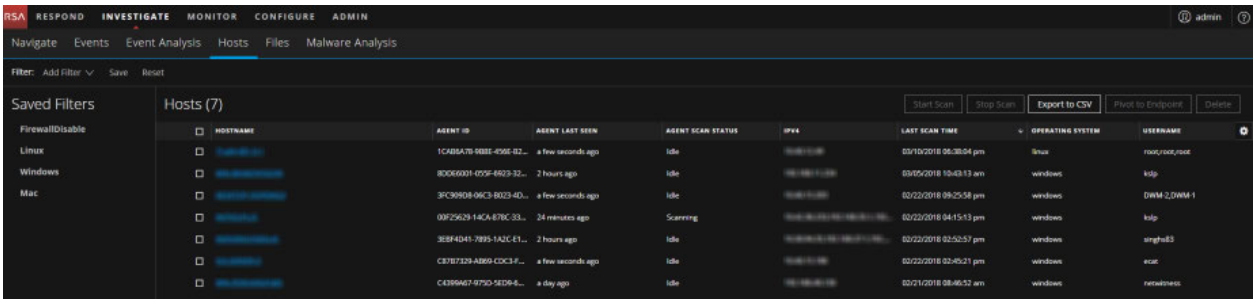
- For certain configured meta keys, such as IP address, or hostname, you can search for additional context information around a value using the Context Hub. The additional context may include incidents, alerts, and other sources where the value was mentioned.
- When viewing files, you can export files in a zip archive to your local file system.
- You can download logs from the Text view, and export packets from the Packet view.

This figure is an example of the Event Analysis view.



Hosts View

The Investigate > Hosts view lists all hosts with an agent. By default, the hosts are listed based on the last scan time, with the most recently scanned hosts at the top of the list. It provides the capability to drill into the details of the host. This figure is an example of the Hosts view.

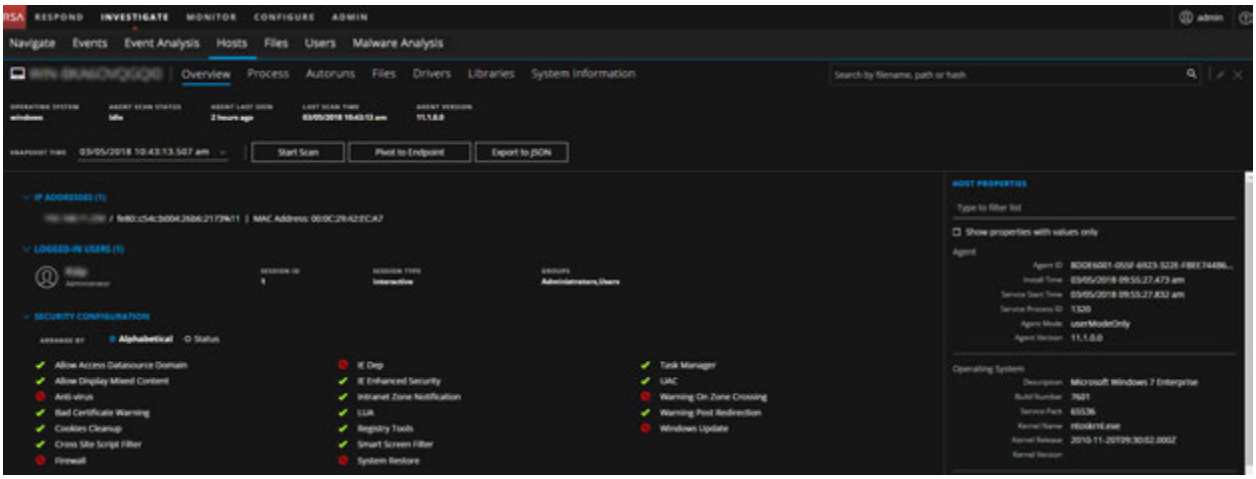


In this view, you can:

- Filter and sort hosts to refine the host investigation, view host details, and delete hosts.
- Export host attributes to a CSV file.
- Start or stop a scan for the selected hosts.
- Pivot to the Navigate or Event Analysis view to investigate the host.

Note: If you have NetWitness Endpoint 4.4.0.2 or later in your deployment, the hosts on which the 4.4.0.2 agent is installed are listed, and can be identified using the agent version. For more information on how you can investigate these hosts, see Investigate NetWitness Endpoint 4.4.0.2 or Later Hosts.

You can view detailed scan results for a host by clicking the hostname. This figure is an example of the detailed scan results in the Overview tab.



You can:

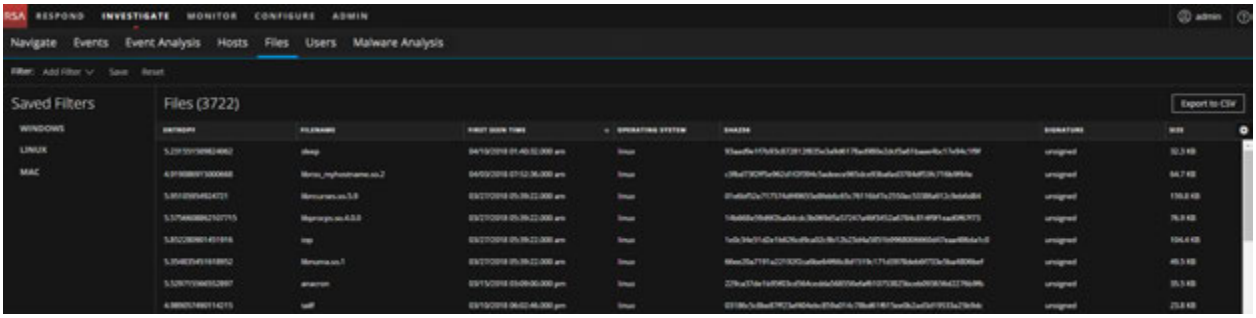
- Search on all snapshots; file name, file path, and file SHA-256 checksum are the supported search fields.
- View multiple snapshots. By default, the data for the latest snapshot is displayed.
- View additional host information in the following tabs: Overview, Processes, Autoruns, Files, Driver, Libraries, and System Information.
- Export all categories of endpoint data for the selected host for a specific snapshot in the JSON format.

Files View

The Files view provides a list of unique files found in your deployment and their associated properties. By default, the files are listed based on the time they were first seen. The following file types, loaded in the memory, are collected during the scan.

- Portable Executable (PE) (Windows) - These are `exe`, `dll`, and `sys` files. You can view the following properties for each file: checksum, compile details, different sections present in the file, imported libraries, and certificate details (signer, thumbprint, and company name).
- Macho (Mac) - These are app bundles, dylibs, and kernel extensions. You can view the following properties for each file: checksum, different sections present in the file, imported libraries, and certificate details (signer, thumbprint, and company name).
- Executable and Linkable Format (ELF) (Linux) - Each file contains information about checksum, different sections present in the file, and imported libraries.

This figure is an example of the Files view.

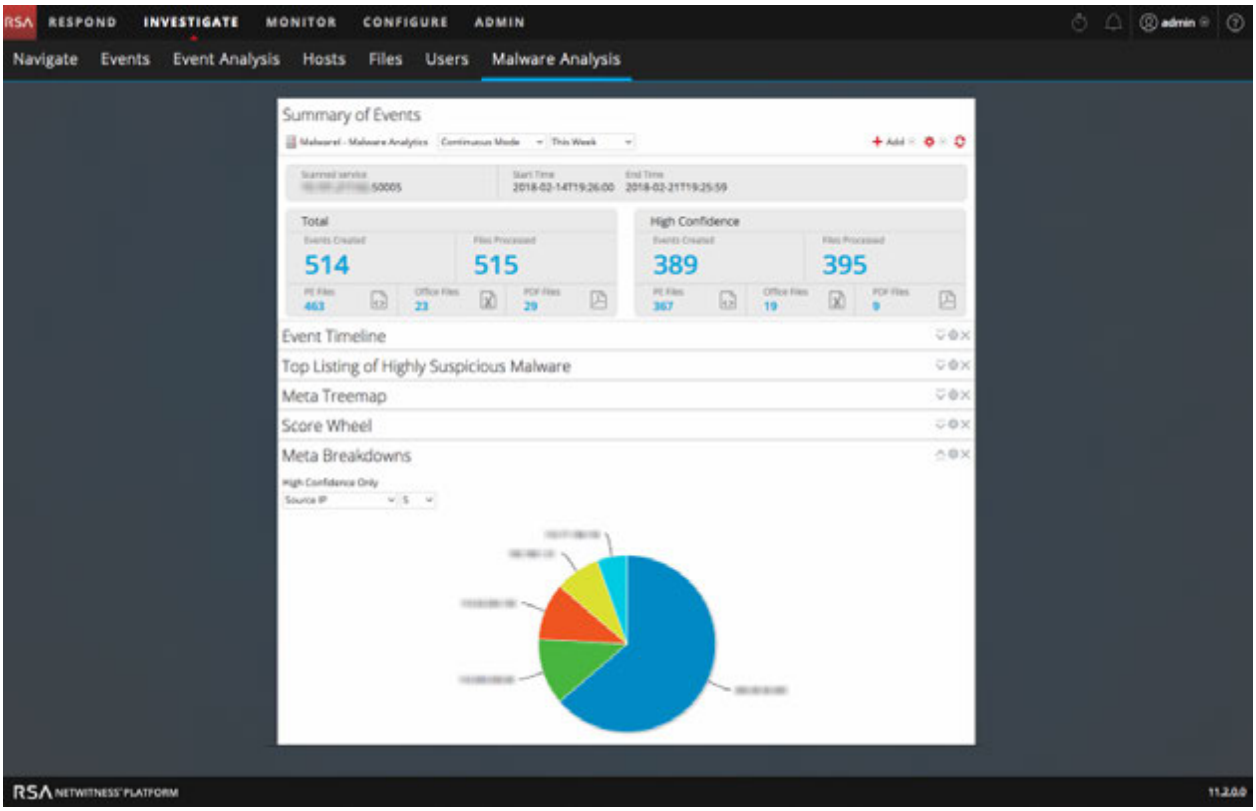


In the Files view, you can:

- Filter and sort files to narrow down on the investigation.
- Pivot to the Navigate or Event Analysis view to investigate on the file.
- Export the files to a CSV file.

Malware Analysis View

The Malware Analysis view provides a means to analyze certain types of file objects (for example, Windows portable executable (PE), PDF, and MS Office) to assess the likelihood that a file is malicious. This figure illustrates the Malware Analysis view.



You can open the Malware Analysis view directly or you can use a right-click menu action to Scan for Malware from a meta value in a current drill point from the Navigate view. You can leverage the multilevel scoring modules to prioritize the massive number of files captured in order to focus analysis efforts on the files that are most likely to be malicious.

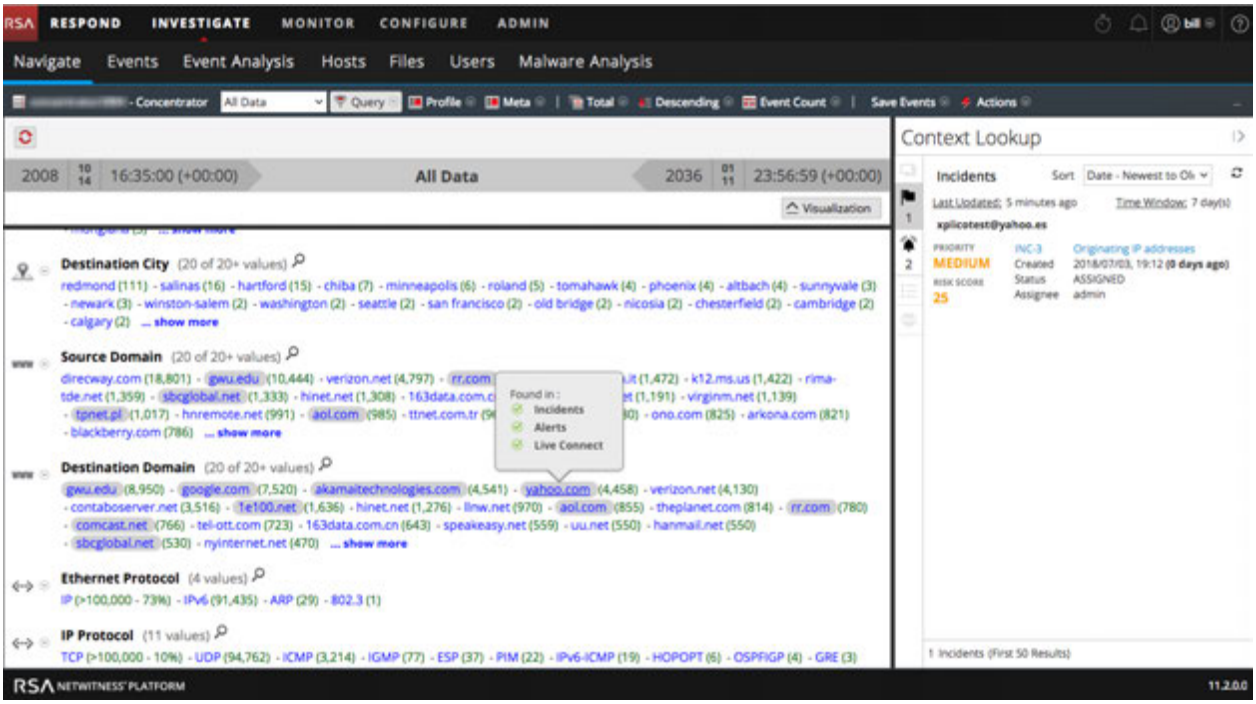
Contextual Information for an Event

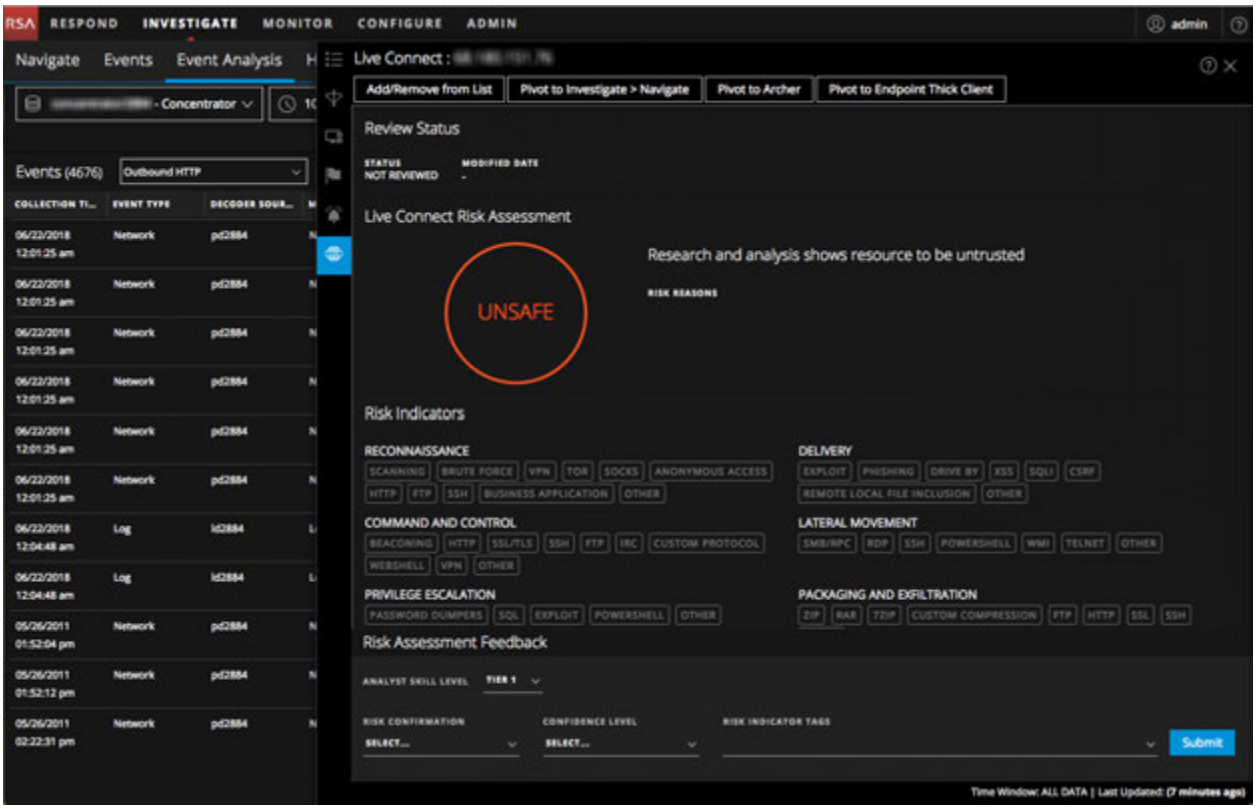
In the Navigate view, Events view, and Event Analysis view (Version 11.2 and later), the Context Lookup panel shows details about elements associated with an event (IP Address, User, Host, Domain, MAC Address, Filename, and File hash) in the Context Hub.

- You can interact with the elements of an event to get further insight including related incidents, alerts, custom lists, Archer assets, active directory details, and NetWitness Endpoint IIOCs.
- You can click on a data point to go to the Navigate view.

Note: Archer assets and active directory details are available in the Event Analysis view context lookup. Endpoint context lookup is available for NetWitness Endpoint 4.4.0.2 or later hosts, but not for the NetWitness Endpoint 11.1 hosts.

The following figures show the Context Lookup panel in the Navigate view and the Event Analysis view.

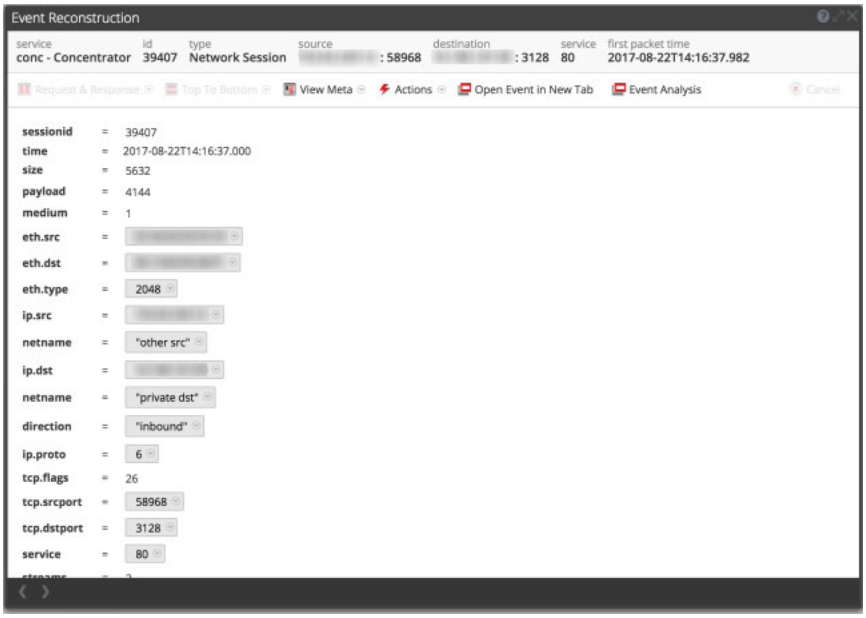




Event Reconstruction

Three NetWitness Investigate views offer the ability to reconstruct an event: Navigate view, Events view, and Event Analysis view. When you discover an event that merits additional investigation, you can reconstruct an event safely in a form similar to its native form. The rendering of events restricts the use of dynamic or active code that might be contained in the event to limit any adverse outcome to your system or browser. Cache is used to improve performance when viewing previously viewed events. Each analyst has a separate cache of reconstruction data, and you can only access reconstructed events in your own cache.

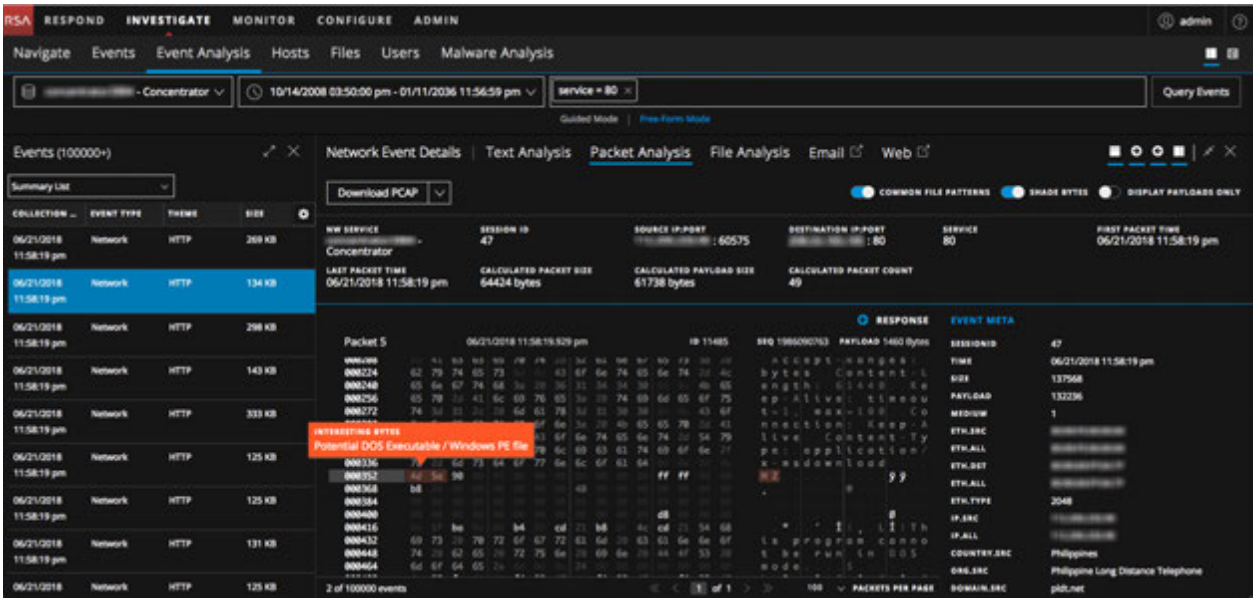
The Event Reconstruction in the Events view or the Navigate view presents the raw data and the meta keys and meta values for an event in a list form. This figure is an example of the Event Reconstruction.



In the Event Reconstruction from the Navigate view or the Events view:

- You can page through the reconstruction to view the next event in this form.
- Events can be reconstructed using different methods to suit the type of data: metadata, text, hexadecimal, packets, web, mail, files, or the best reconstruction selected automatically.
- You can export packet capture files, extract files, and export the meta values for the event.

The Event Analysis view presents a interactive event reconstruction, which includes raw data, meta keys, and values. This figure is an example of a reconstruction in the Event Analysis view.



In the Event Analysis view reconstruction:

- Events can be reconstructed using different methods to suit the type of data: metadata, text, hexadecimal, packets, and files.
- Information in headers and payloads is highlighted.
- You can view decoded and encoded payloads and see common file signatures.
- You can search for locations of meta keys or values in the reconstruction.
- You can export events and files.

Configuring NetWitness Investigate Views and Preferences

Analysts can configure some aspects of NetWitness Investigate views and behavior. You can customize the way that Investigate views appear, the types of information displayed, and factors that affect performance in returning results and reconstructing events. All configurable settings have default values that are effective in most deployments; however, analysts have the option to adjust these if necessary.

Analysts who conduct analysis using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in the *System Security and User Management Guide*. (Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.)

These topics provide details:

- Configure the Navigate View and Events View
- Configure the Event Analysis View
- Configure the Malware Analysis Summary of Events View

Configure the Navigate View and Events View

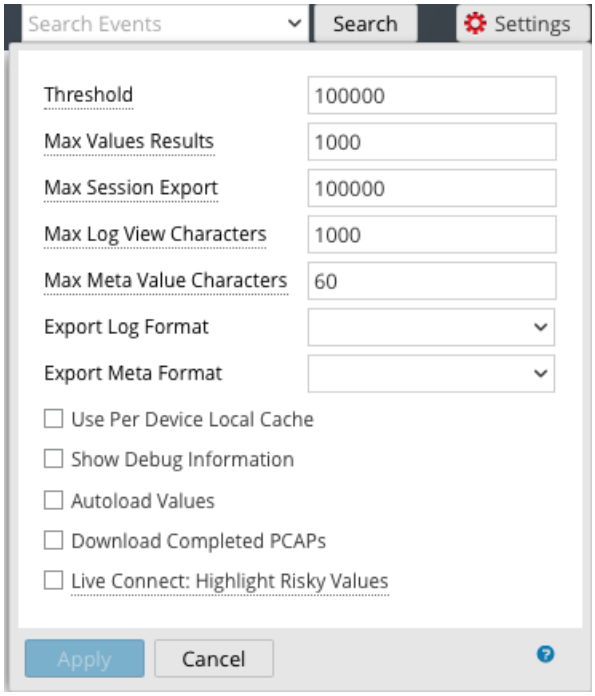
Analysts can set preferences that affect performance and behavior of NetWitness Platform when analyzing data using the Navigate view and Events view. Some of the same settings are available in two places in NetWitness Platform, and changes made in either location are applied in the other view:

- Investigate view > Settings dialog for the Navigate view and the Events view.
- Profiles > Preferences panel > Investigation tab.
- Navigate view and Events view Search Options drop-down.

Access the Navigate View and Events View Settings

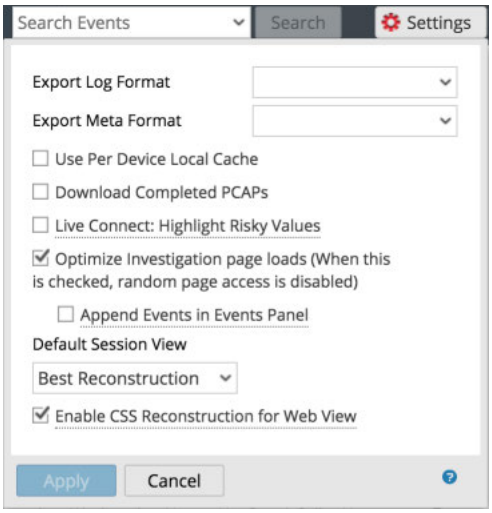
To access the settings, do one of the following:

- In the **Navigate** view toolbar, select the **Settings** option.
  The Settings dialog for the Navigate view is displayed.



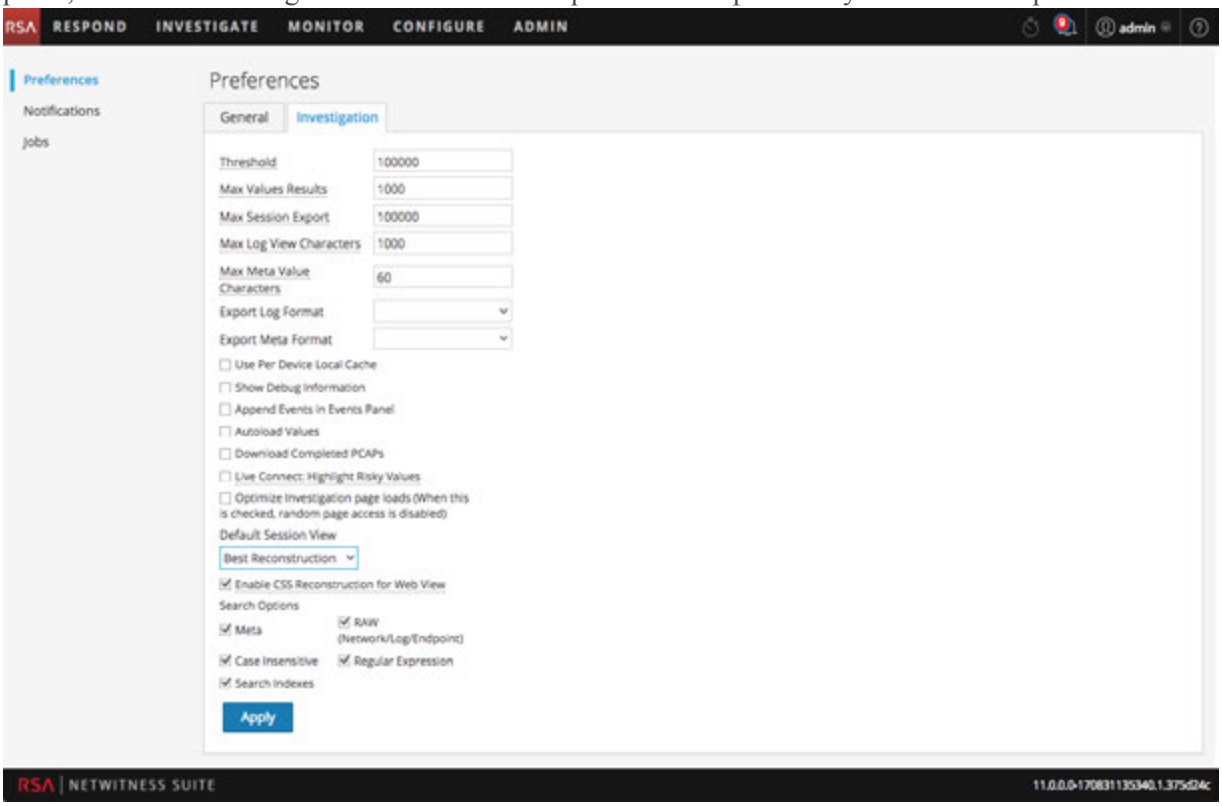
Note: Version 11.0 included a setting to Append Events in Events Panel, which was moved to the Events view settings panel in Version 11.1.

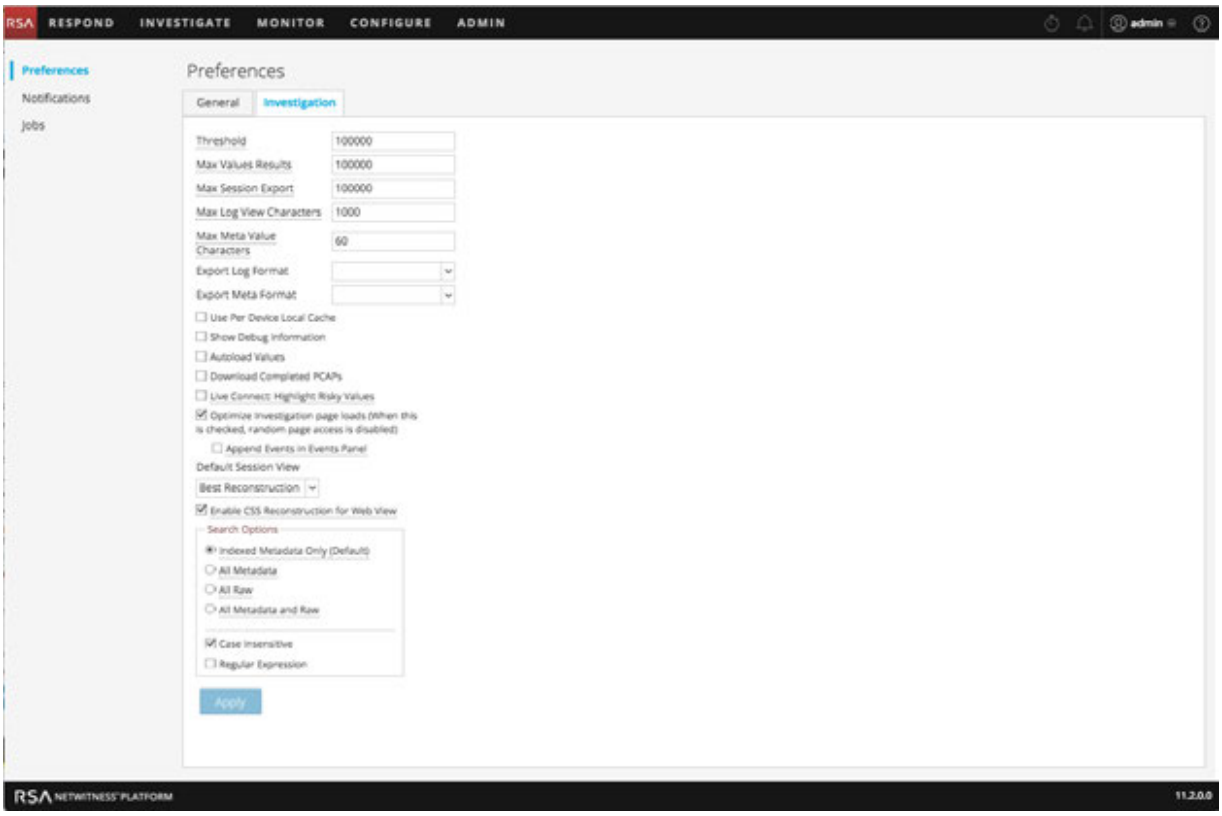
- In the **Events** view toolbar, select the **Settings** option.
  The Settings dialog for the Events view is displayed.



Note: Version 11.1 and later includes the Append Events in Events Panel setting.

- In the top right corner of NetWitness Platform, go to > , Profile, and in the **Preferences** panel click the **Investigation** tab.
  The Investigation panel is displayed. The first figure below illustrates the Version 11.1 Investigation panel, and the second figure illustrates the 11.2 panel with improved layout of search options.





Calibrate Navigate View Value Loading Parameters

Several settings influence the performance of NetWitness Platform when loading values in the Values panel. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. To adjust these settings:

1. Go to the **Investigation** tab or to the **Settings** dialog for the Navigate view.
2. Adjust the following parameters:
   - **Threshold:** Set the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The default value is **100000**.
   - **Max Values Results:** Set the maximum number of values to load in the Navigate View when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The default value is **1000**.
   - **Max Session Export:** Specify the number of events that can be exported in a single PCAP or Log file.
   - **Max Log View Characters:** Set the maximum number of characters to be displayed on **Investigate > Events > Log Text**. The default value is **1000**.
   - **Max Meta Value characters:** Set the maximum number of characters in a meta value name displayed in the Navigate view Values panel. The default value is **60**.

- **Show Debug Information:** If you want NetWitness Platform to display the `where` clause beneath the breadcrumb in the Navigate view and the elapsed load time for each aggregated service on a Broker, check this option. The default value is **Off.**
- **Append Events in Events Panel:** This option affects paging in the Events view and is described below under "Calibrate Events View Retrieval and Default Reconstruction."
- **Autoload Values:** If you want NetWitness Platform to automatically load values for the selected service in the Navigate view, check this option. When not selected, NetWitness Platform displays a **Load Values** button, allowing the opportunity to modify options. The default value is **Off**.

3. Click **Apply**.

The settings become effective immediately and are visible the next time you load values.

Configure Navigate View and Events View Parameters

Several settings influence the performance of NetWitness Platform when loading values in the Navigate view and the Events view. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. You can set these parameters separately in the Navigate view and the Events view. When configured in one view, the setting does not automatically apply to the other view. To adjust these settings:

1. Go to the **Investigation** tab or to the **Settings** dialog for the Navigate view or the Events view.
2. Adjust the following parameters:
   - **Live Connect: Highlight Risky Values:** If you want NetWitness Platform to highlight and display only IP addresses that are considered as risky by RSA community, check this option. When not selected, NetWitness Platform displays all IP addresses. By default, this option is not selected (**Off**).
   - **Use Per Device Local Cache:** You can specify the use of locally cached data from the selected service. By default, this option is not selected **(Off)**. When unchecked, Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If checked, Investigate uses the data from local cache.
   - **Download Completed PCAPs:** You can automate the downloading of extracted PCAPs in the Navigate view and Events view so that the browser downloads the extracted PCAP and opens it in the default application for opening PCAP files, such as Wireshark. By default, this option is not selected (**Off**). If you are going to enable this option, ensure that an application that can open PCAPs is installed on your local file system and that the application is set as the default application to handle PCAP file formats.
   - **Live Connect: Highlight Risky Values:** If this option is unchecked, all the meta values that have context available in Live Connect are highlighted in the Navigate view Values panel. If the option is checked, among the values that have context in Live Connect, only those values deemed Risky/Suspicious/Unsafe by the community are highlighted. By default this option is unchecked (**Off**).
3. Click **Apply**.
   The settings become effective immediately.

Configure the Default Log Export Format

You can export logs from the Navigate view and the Events view in different formats. Available options are Text, XML, comma-separated values (CSV), and JSON. There is no built-in default value for the log export format. If you do not select a format here, NetWitness Platform displays a selection dialog when you invoke export of logs. To select the format for exported logs:

1. Go to the **Investigation** tab or to the **Settings** dialog for the Navigate view or Events view.
2. Select one of the options from the **Export Log Format** drop-down menu.
3. Click **Apply**.
   The setting goes into effect immediately.

Configure the Default Meta Export Format

You can export meta values from the Navigate view and Events view in different formats. Available options are Text, CSV, tab-separated values (TSV), and JSON. There is no built-in default value for the meta export format. If you do not select a format here, NetWitness Platform displays a selection dialog when you invoke export of meta values. To select the format for exported meta values:

1. Go to the **Investigation** tab or to the **Settings** dialog for the Navigate view or Events view.
2. Select one of the options from the **Export Meta Format** drop-down menu.
3. Click **Apply.**
   The setting goes into effect immediately.

Calibrate Events View Retrieval and Default Reconstruction

You can configure several parameters that control the how NetWitness Platform retrieves events and reconstructs events in the Events view. To adjust these paramaters:

1. Go to the **Investigation** tab or to the **Settings** dialog for the Events view.
2. Configure the following parameters.
   - **Optimize Investigation page loads**: Set a paging option. When optimized, results are returned as quickly as possible, sacrificing the original ability to go to a specific page in the event list. Unchecking this box changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). The default value is **enabled**.
   - **Default Session View:** Selects the default reconstruction type for the initial reconstruction in the Events view. The default value is**Best Reconstruction** in which events are reconstructed using the reconstruction method most appropriate to the event.
3. Navigate to the **Investigation** tab, or to the **Settings** dialog for the Navigate view (11.1) or the Events view (11.2), and set the **Append Events in Events Panel** option. When this option is selected, the events displayed in the **Events Panel** are added incrementally. For example, each time you click the next page icon, the next increment of events is added, at first you see 1 to 25, then 1 to 50, then 1 to 75 and so on. This option is available only if the **Optimize Investigation Page Loads**

option is enabled.

4. To activate the changes immediately, click **Apply**.

Enable or Disable Cascading Style Sheet Rendering in Web Content Reconstructions

Analysts can enable the use of cascading style sheets (CSS) when reconstructing web content. If enabled, the web reconstruction includes CSS styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for style sheets and images used in the target event. The option is enabled by default. Disable this option if there are problems viewing specific websites.

Note: The appearance of the reconstructed content may not match the original web page perfectly if related images and style sheets could not be found or were loaded from the web browser's cache. Also, any layout or styling that is performed dynamically through the client side javascript is not rendered in the reconstruction because all client side javascript is removed for security purposes.

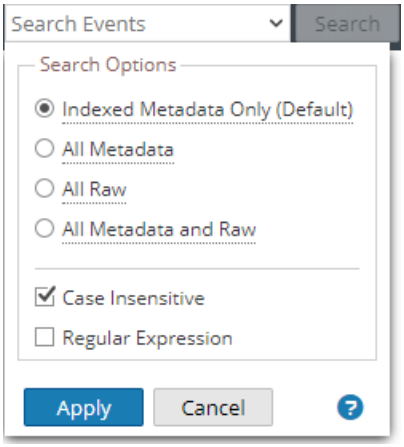
To enable or disable this option:

1. Go to the **Investigation** tab .
2. Select the **Enable CSS Reconstruction for Web View** checkbox.
3. Click **Apply**.
   The setting becomes effective immediately and is visible in the next web content reconstruction.

Configure Search Options

You can configure search options to apply when you type a search string in the Search field. Edit the Search Options in the Profile > Preferences panel > Investigation tab or in the Navigate and Events view Search Options drop-down menu. To configure search options:

1. Navigate to the Search Options.
   The following figure illustrates the Search Options drop-down menu for Version 11.2.



2. Select one or more search options to apply to the search. Search for Text Patterns provides detailed information about each option.

3. To save the search settings, click **Apply**.
   The preferences are saved and effective immediately.

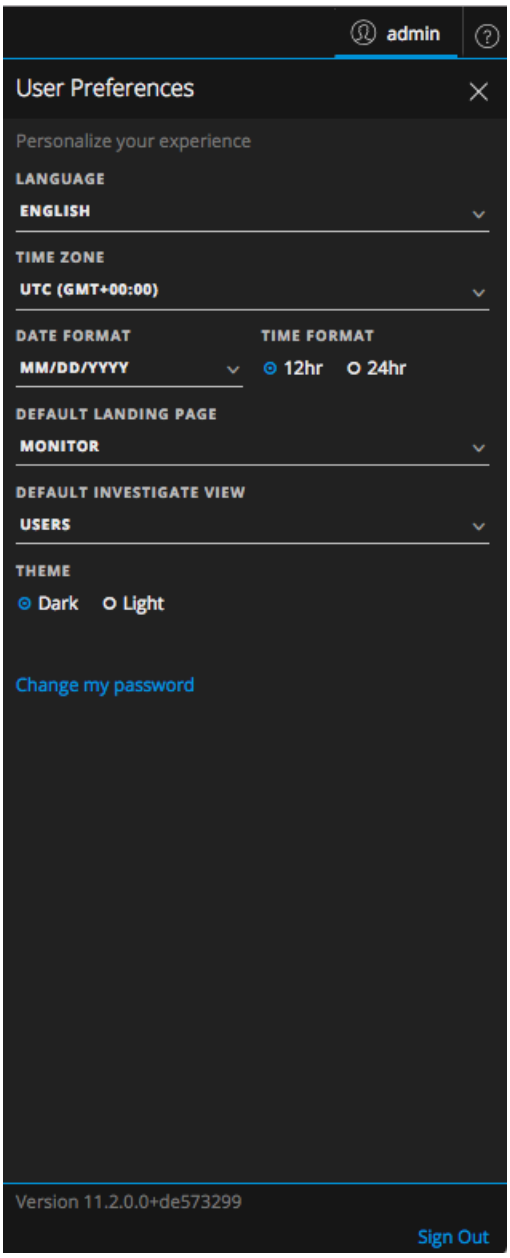
Configure the Event Analysis View

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

Beginning with Version 11.1, analysts can set preferences that affect the behavior of NetWitness Platform when analyzing data using the Investigate > Event Analysis view. The main toolbar in Investigate has a different appearance when the Event Analysis view is open; these two buttons give access to preferences dialogs: and . The User menu ( ) is focused on global user preferences such as time zone, while the Event Analysis preferences menu ( ) is focused on user preferences for behavior in the Event Analysis view. The rest of this section describes both sets of preferences.

Set the Default Investigate View

The default Investigate view is set in the global User Preferences dialog (in the upper right corner of the NetWitness Platform browser window, select).
The User Preferences dialog shows your current preferences for the Investigate view. You can select the default view when you open Investigate here: Event Analysis view, Hosts view, or Files view.



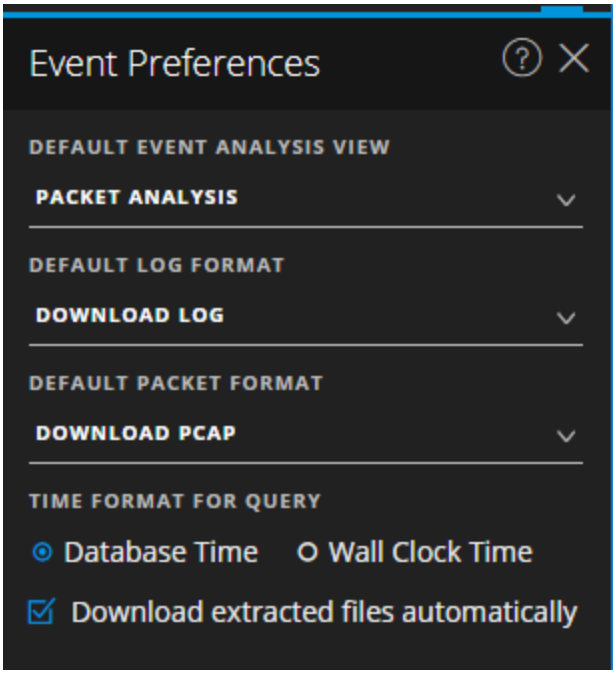
The global user preferences are described in detail in the *NetWitness Platform Getting Started Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Set User Preferences for the Event Analysis View

In Version 11.1 and later, you can set preferences relevant to the Event Analysis view. The preferences selected here persist per user and are available whenever the specific user logs in to the application.

To set default values for working in the Event Analysis view:

1. With the Event Analysis view open, click .



2. In the **Default Event Analysis View** drop-down menu, select the default reconstruction type when you open an event in the Event Analysis panel: **Text Analysis**, **Packet Analysis**, **File Analysis**. If you have not selected a default analysis type, when you open an event, the default reconstruction type is the Packet Analysis, except for log and endpoint events, which open to the Text Analysis. If you select a default reconstruction type, the reconstruction type is the default reconstruction that you specified. In both cases, the default is the starting point, and if you change the type while you are working, the type you choose is used for the next reconstruction.
3. In the **Default Log Format** drop-down, select the download format for exporting logs: **Download Log**, **Download XML**, **Download CSV**, or **Download JSON**. If you do not select a format here, the default download format is **Download Log**. These options are also available at the time of download in a drop-down menu.
4. In the **Download PCAP** drop-down menu, select the default format for downloading packets. These options are also available at the time of download in a drop-down menu:
   - **Download PCAP** to download the entire event as a packet capture (*.pcap) file
   - **Download All Payloads** to download the payload as a *.payload file
   - **Download Request Payload** to download the request payload as a *.payload1 file
   - **Download Response Payload** to download the response payload as a *.payload2 file
5. Under **Time Format for Query**, choose either **Database Time** or **Wall Clock Time**. The Event Analysis view can display results based on the database time or the current clock time. When you set the time format here, your individual user preference is saved until changed again. The default setting for this preference is **Database Time**, which is the same time format used to display query

results in the Navigate view and Events view.

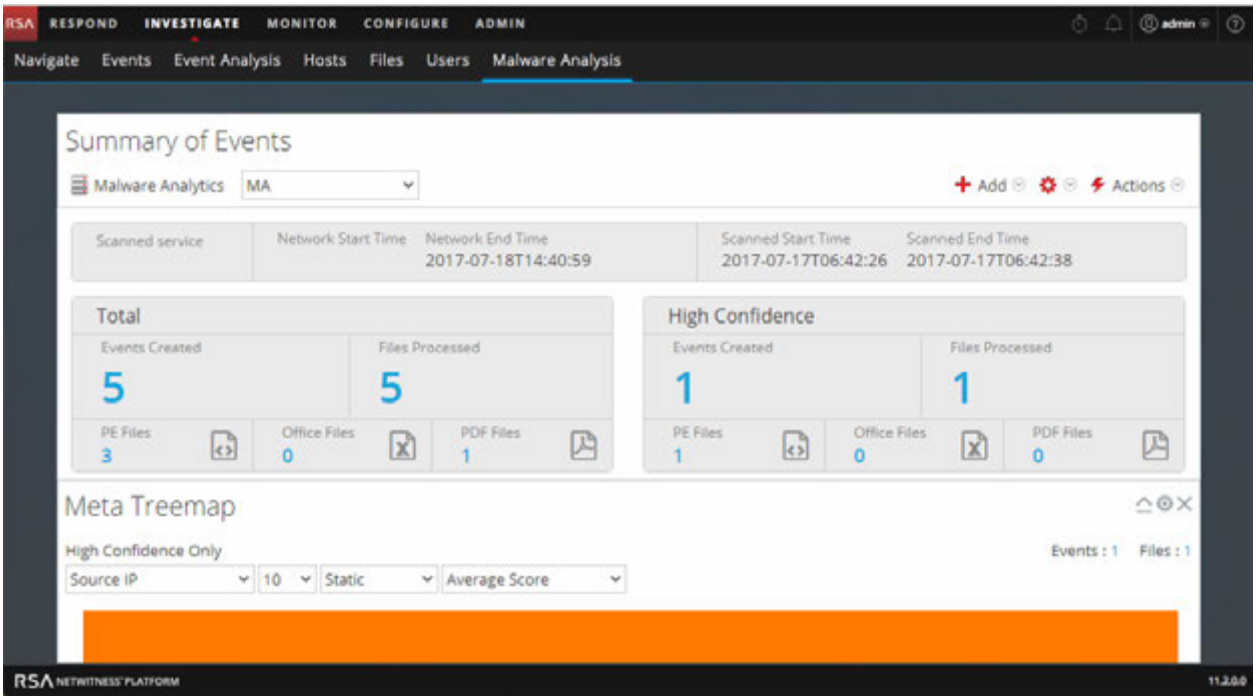
- When **Database Time** is selected, the start and end time for a query is based on the time that the event was stored.
- When **Wall Clock Time** is selected, the query is executed with current time in accordance with the timezone set in user preferences.

Configure the Malware Analysis Summary of Events View

The Summary of Events provides a summary of the scan being investigated, and below the summary are configurable dashlets such as visualization charts and listings. By default, the Summary of Events for a scan opens with the default dashlets displayed. You can customize the view by adding, modifying, and deleting default dashlets. The configured customization of dashlets persists through different scan investigations, and you can restore default dashlets at any time. The default dashlets are:

- Summary of Events (Fixed)
- Event Timeline
- Top Listing of Highly Suspicious Malware
- Meta Treemap
- Score Wheel
- Meta Breakdowns

The following figure is an example of the default Summary of Events.



The rest of this topic provides instructions for managing and configuring dashlets.

Add a Dashlet

You can add multiple copies of dashlets in the Malware Analysis Summary of Events. To add a dashlet:

1. In the toolbar, select **Add**.
   The drop-down list of dashlets is displayed. There are four visualization options: Score Wheel, Meta

Treemap, Meta Breakdowns, and Event Timeline. The other three dashlets are the same dashlets available in the NetWitness Platform dashboard: Malware with high Confidence IOCs and High Scores, Top Listing of Highly Suspicious Malware, Top Listing of Possible Zero Day Malware. Details for these common dashlets are provided in "Dashlets" in RSA Content for RSA NetWitness Platform.

2. Select a dashlet.
   The new dashlet is added as the last dashlet below the existing dashlets.
3. If the dashlet is a duplicate of an existing dashlet, change the name of the new dashlet so that it is unique.

Modify or Delete a Dashlet Using Toolbar Options

Each dashlet has a toolbar that offers options for modifying the dashlet. The visualization charts have the same configuration settings, while some of the other dashlets have different additional settings.

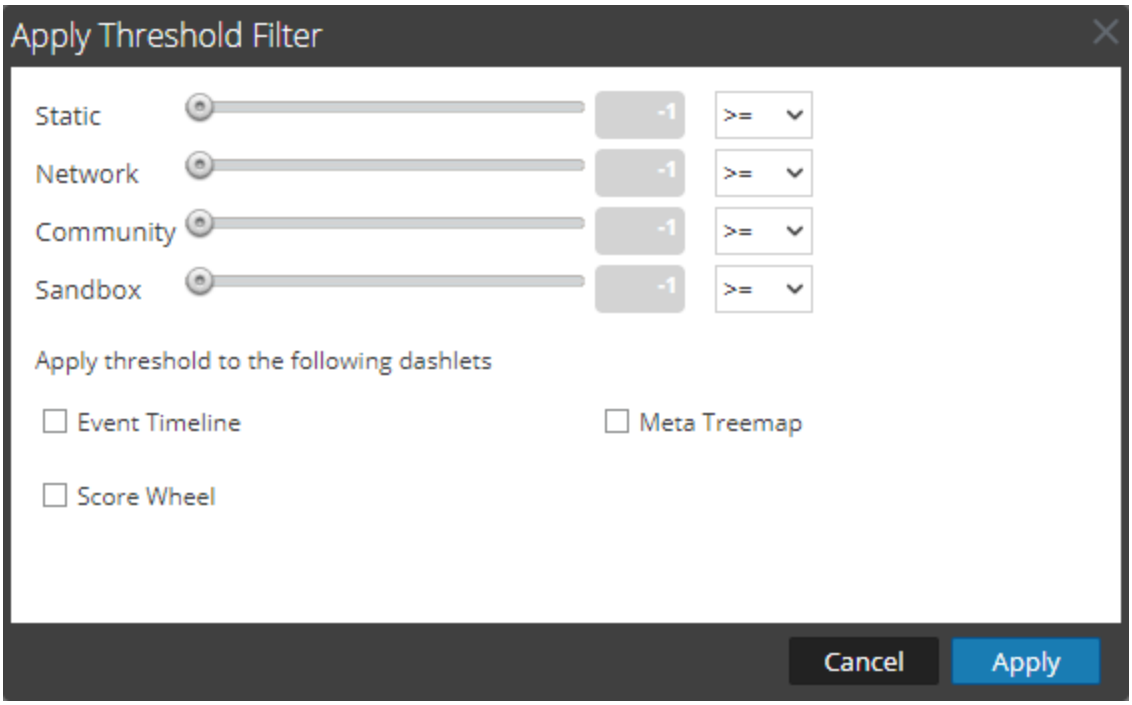
To use the toolbar options:

- To close a dashlet so that only the title bar is displayed, click .
- To open a dashlet that is closed, click .
- To display the configurable settings for a dashlet, click .
  The settings dialog for the dashlet is displayed.
- To delete a dashlet, click .

Apply Threshold Filter to Multiple Dashlets

Within dashlets, you can set a threshold to show only events equal to, above, or below a certain score in the four categories (Static, Network, Community, and Sandbox). This procedure sets the thresholds by dashlet type for these dashlets: Event Timeline, Score Wheel, and Meta Treemap. You can also set the threshold for individual dashlets.

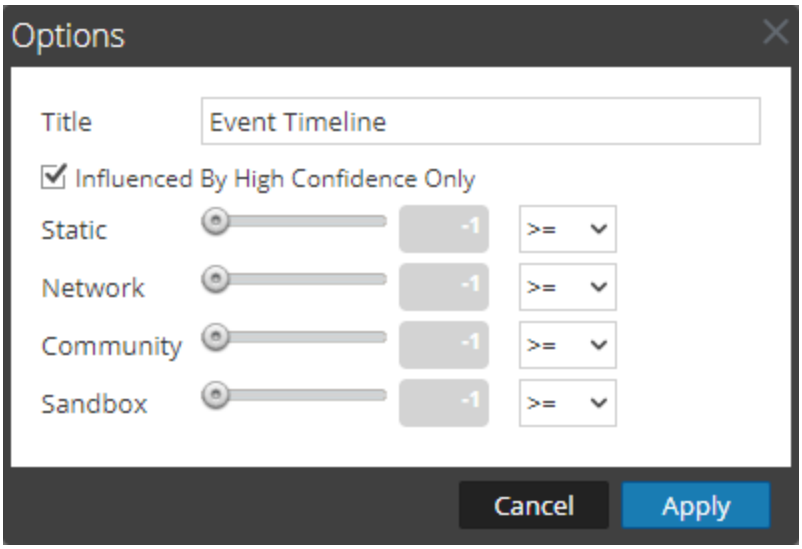
1. In the toolbar, select > **Apply Threshold Filter**.
   The Apply Threshold Filter dialog is displayed.



2. Select one or more dashlet types: Event Timeline, Score Wheel, and Meta Treemap.
3. Drag the corresponding slider or enter a numeric value, then select an operator in the drop-down list: =, >=, or <=.
4. Click **Apply**.
   The threshold filters are applied to the selected dashlet types in the Summary of Events.

Set Title and Category Options for a Dashlet

1. To display the configurable settings for a dashlet, click ⚙.
   The Options dialog for the dashlet is displayed.

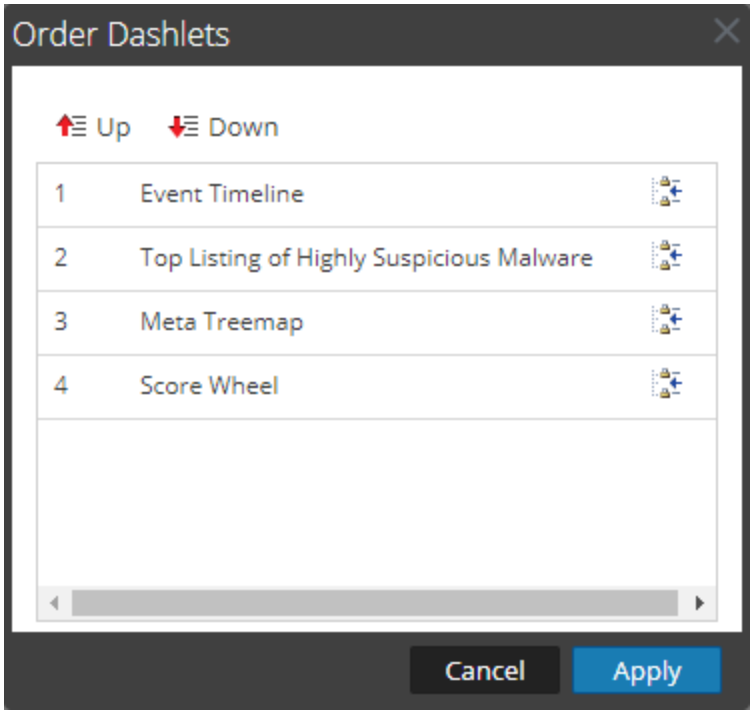


2. Type a new title for the dashlet in the **Title** field.
3. If you want to see only events that are influenced by a High Confidence tag, which means there is high confidence that the event contains harmful code, check the **Influenced By High Confidence Only** option.
4. If you want to see only events that were given a score above a certain score in the four categories (Static, Network, Community, and Sandbox), drag the corresponding slider or enter a numeric value, then select an operator in the drop-down list: =, >=, or <=.
5. Click **Apply**.
   The title and filters are applied to the dashlet.

Order Dashlets

To change the order of dashlets as they appear beneath the Summary of Events:

1. In the toolbar, select > **Order Dashlets**.
   The Order Dashlets dialog is displayed.



2. Select a dashlet that you want to move up or down, and click Up or Down.
3. When you are satisfied with the order, click **Apply**.
   The dialog closes and the order of dashlets below the Summary of Events is changed to match your choices.

Restore Default Dashlets

After you have added, modified, and arranged dashlets, you can revert to the default settings for dashlet display. To restore the default dashlets:

1. In the toolbar, select  > **Restore Default Configuration**.
   A dialog requests confirmation that you want to restore the configuration.
2. Do one of the following:
   a. If you decide to keep the dashlet arrangement you have configured, click **No**.
   b. If you are sure that you want to restore the defaults, click **Yes**,
      The dashlet display reverts to the default display.

Beginning an Investigation

NetWitness Platform offers different starting points based on the question you are attempting to answer: Navigate view, Events view, Event Analysis view, Hosts view, Files view, and Malware Analysis view.

Note: Specific user roles and permissions are required for a user to conduct investigations in NetWitness Platform. If you cannot perform an analysis task or see a view, the administrator may need to adjust the roles and permissions configured for you. The Hosts view and Files view are available in Version 11.1 and above. The Event Analysis view was available in Version 11.0, but the method of accessing it was through the Events view. In Version 11.1 and later, the Event Analysis view is accessible directly.

Focus on Metadata, Raw Events, and Event Analysis

To hunt for events that drive the incident response workflow and to do strategic analysis after another tool has generated an event, you should begin in the Navigate view, Events view, or Events Analysis view. You investigate the metadata for a single Broker or Concentrator. In each of these views, you start the investigation by opening the view, where you can execute a query and filter the results by narrowing the time range and querying metadata. These topics provide details about beginning an investigation in each view:

- Begin an Investigation in the Navigate or Events View
- Begin an Investigation in the Event Analysis View

Focus on Hosts and Files

To hunt for information on hosts that have the agent running, begin the investigation in the Hosts view (**Investigate > Hosts**). For every host, you can see processes, drivers, DLLs, files (executables), services, and autoruns that are running, and information related to logged-in users. (See Investigate Hosts)

You can begin the investigation on files in your deployment in the Files view (**Investigate > Files**). (See Investigate Files.)

Note: To load the Hosts and Files view, you must have the `endpoint-server.filter.manage` permission.

Focus on Scanning Files for Malware

To scan files for potential malware, or set up a continuous scan of a service, you begin in the Malware Analysis view. Results are expressed as four types of analysis: network, static, community, and sandbox with an indicator of compromise (IOC) rating. There are several ways to begin working in Malware Analysis:

- You can begin Malware Analysis from the Malware Analysis dashlets in the Monitor view to quickly see the riskiest potential threats.
- You can go to **Investigate > Malware Analysis** to opne the Malware Analysis Summary of Events.
- You can right-click a meta key in the Navigate view, and select **Scan for Malware**.

See Conducting Malware Analysis for details on working in the Malware Analysis view.

Begin an Investigation in the Navigate or Events View

The Navigate view is the default view for Investigate unless you have selected a different view as your opening view. This user preference is set on the application level as described in Configuring NetWitness Investigate Views and Preferences. In the Navigate view and Events view, you are hunting for events of interest based on a query. In the Navigate view you can also refine results by clicking on meta keys and meta values. When you find interesting events, you can take a closer look at the event in the other Investigate views.

To begin an investigation in the Navigate view or Events view, a service must be specified.

- NetWitness Platform opens the Navigate view or the Events view with the user-specified default service selected.
- If no default service is currently specified and the service id is not in the URL, NetWitness Platform presents a dialog for selecting the service or collection to investigate.
- When a service has been selected manually or by default in the Navigate view or Events view, you can change the service or collection to investigate by selecting the service name in the toolbar. NetWitness Platform presents the dialog for selecting the service to investigate.

Note: The Archiver service does not appear in the Navigate view to minimize user experience of slow performance when performing investigations. The Archiver is available in the Events view for log exports and enhanced search capabilities.

With a service or collection selected, NetWitness Platform is ready to load data for the service or collection. It is recommended that you also select a time range so that results load faster. Several settings in the Navigate View and Events View Settings dialog or the Profiles > Preferences panel > Investigations tab affect the loading process: Threshold, Max Values Results, Show Debug Information, Autoload Values, and Optimize Investigation page loads (see Configuring NetWitness Investigate Views and Preferences).

Note: In the Events view data loads automatically. If you specified Autoload Values in the Navigate view preferences, NetWitness Platform populates the data automatically. Otherwise, you must select the Load Values button. NetWitness Platform populates the meta data in the Navigate view Values panel and results become visible almost immediately.

The rest of this topic provides instructions for beginning the investigation of data on a service.

Note: Only users with the administrator role can create a collection, and only the creator of the collection is able to investigate a collection.

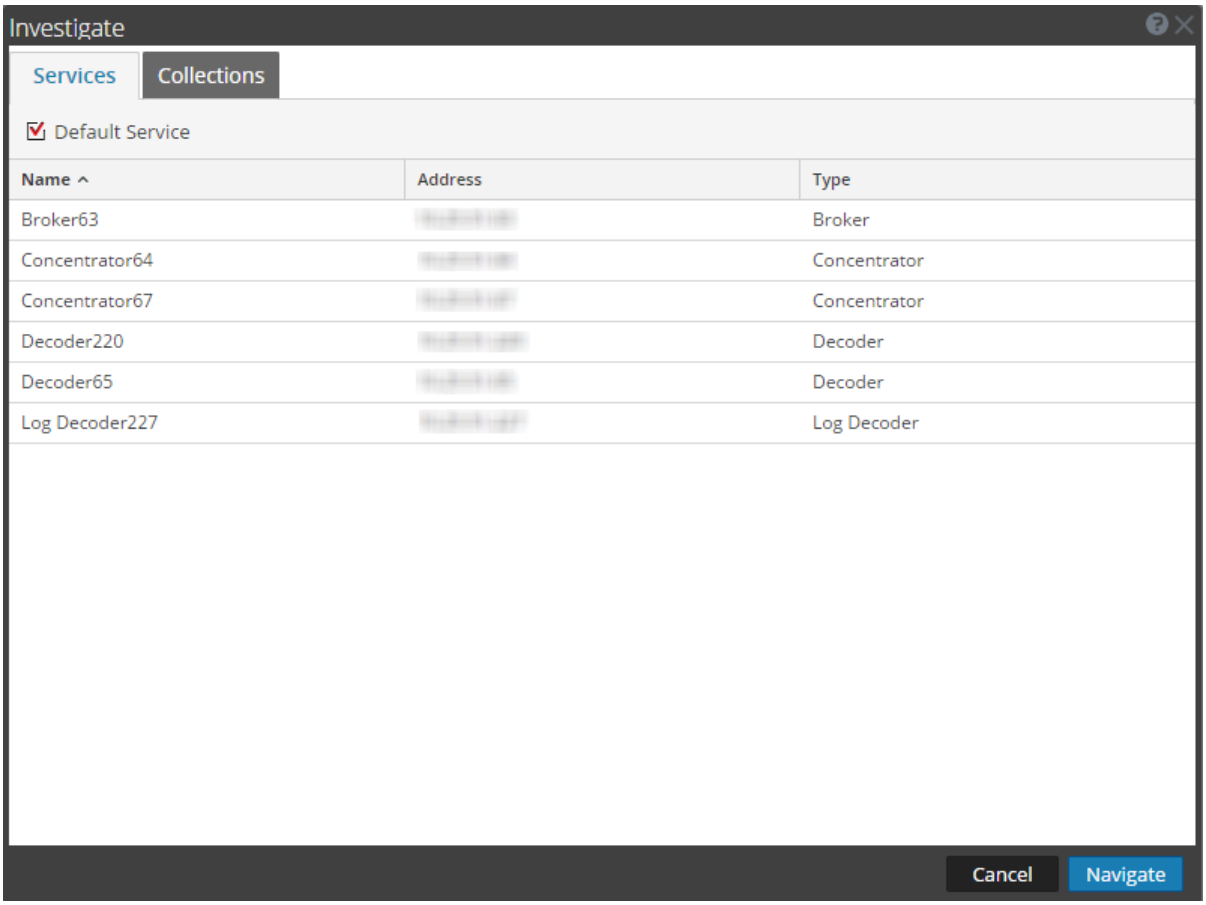
After loading data in the Navigate or the Events view:

1. Refine results, visualize data, and act on a drill point (see Investigating Metadata in the Navigate View) and Examining Raw Events in the Events View). For example, you can Look Up Additional Context in the Navigate and Events Views, Launch a Malware Analysis Scan from the Navigate View, or Add Events to an Incident for Response.

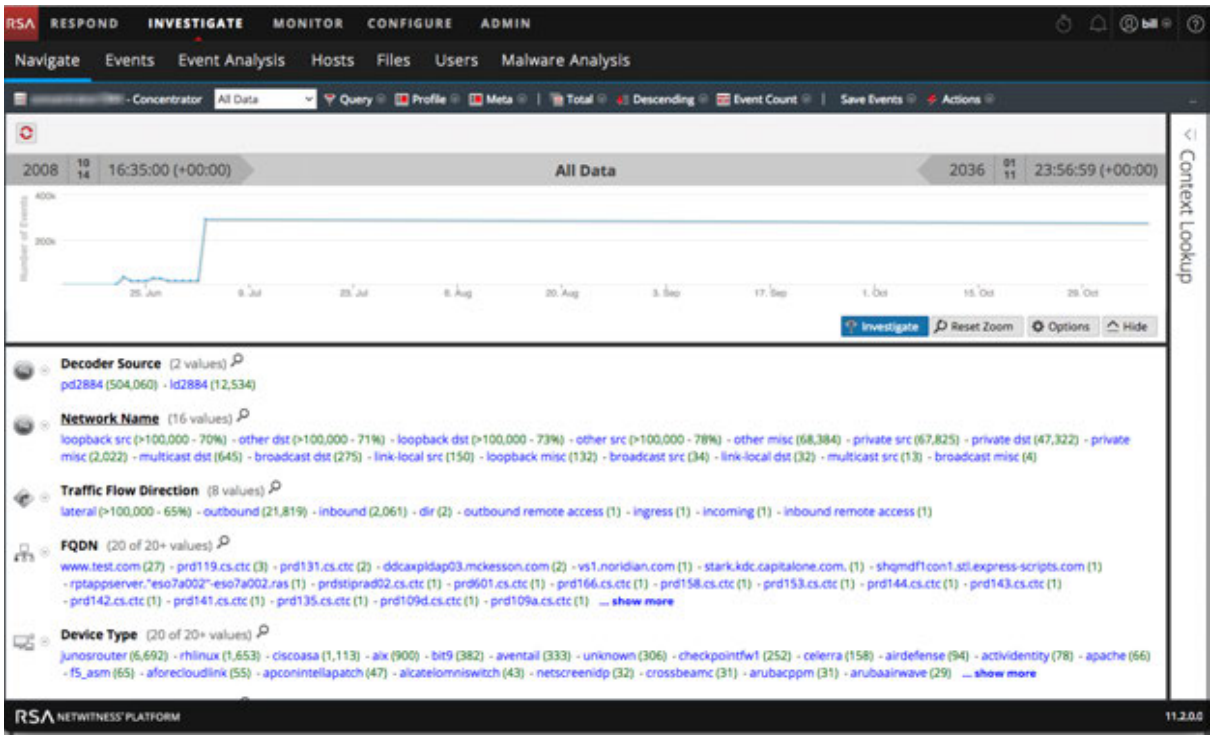
2. Reconstruct an event (see Reconstruct an Event) or view the interactive Event Analysis of an event (see Begin an Investigation in the Event Analysis View).

Begin an Investigation (No Default Service)

1. Go to **INVESTIGATE > Navigate** or **Events**.
   The Investigate dialog is displayed.



2. Double-click a service or select a service, usually a Concentrator, and click **Navigate**.
   The data loads automatically in the Events view. If you are working in the Navigate view, the resulting panel displays the activity for the selected service, but the data is not loaded automatically.
3. (Recommended) Select a specific time range so that results load faster.
4. If you want to modify investigation options before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query as described in Querying and Acting on Data in the Navigate and Events Views You can also modify options at any time during the investigation.
5. To load data in the Navigate view, click Load Values.
   The data for the selected service begins loading.

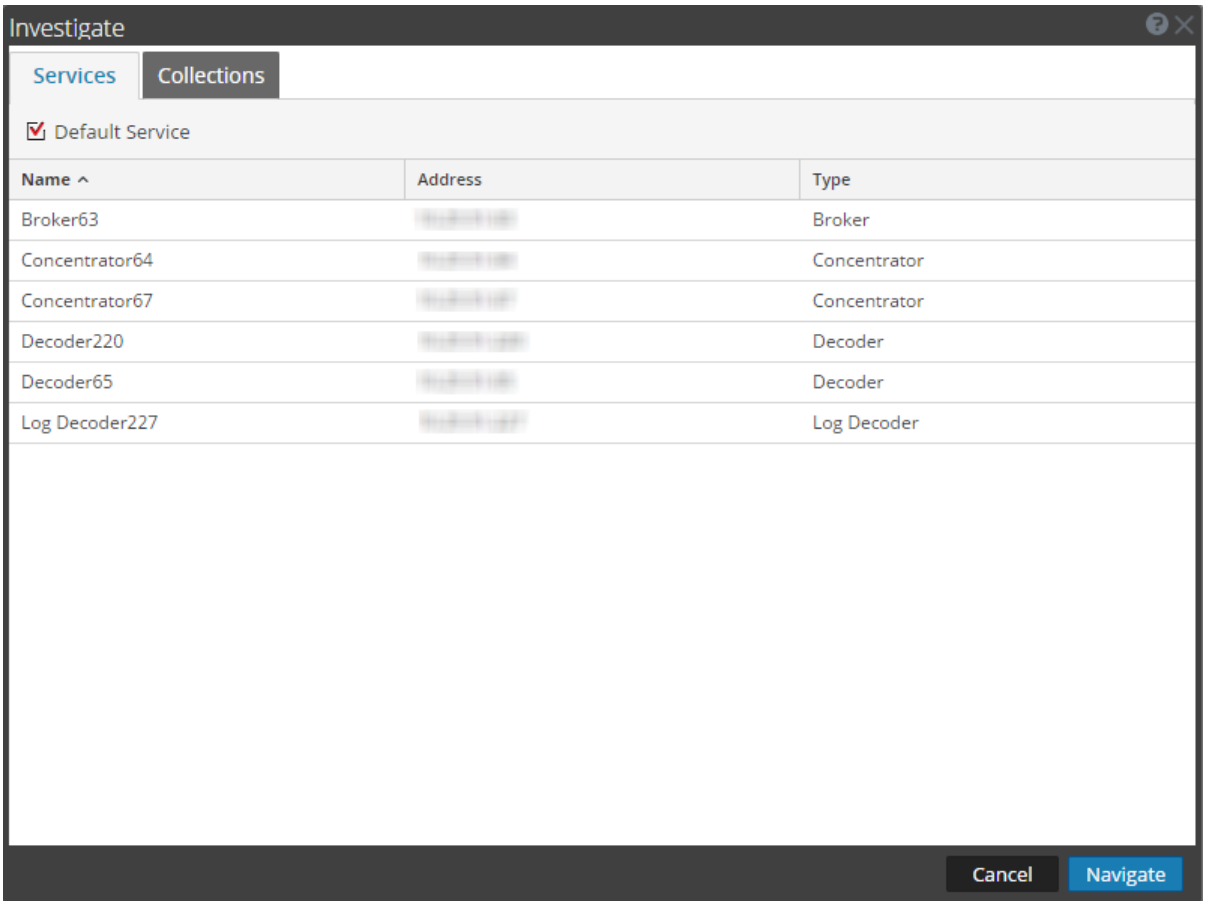


With the service selected and data loaded, you are ready to begin analyzing the data.

Set or Clear the Default Service

You can set the default service and clear the default service in the Investigate a Service dialog.

1. Click the service name in the toolbar.
   The Investigate dialog is displayed.



2. Select a service on the **Services** grid, and click Default Service.
   The service becomes the default, (indicated by **Default** in parentheses after the service name).

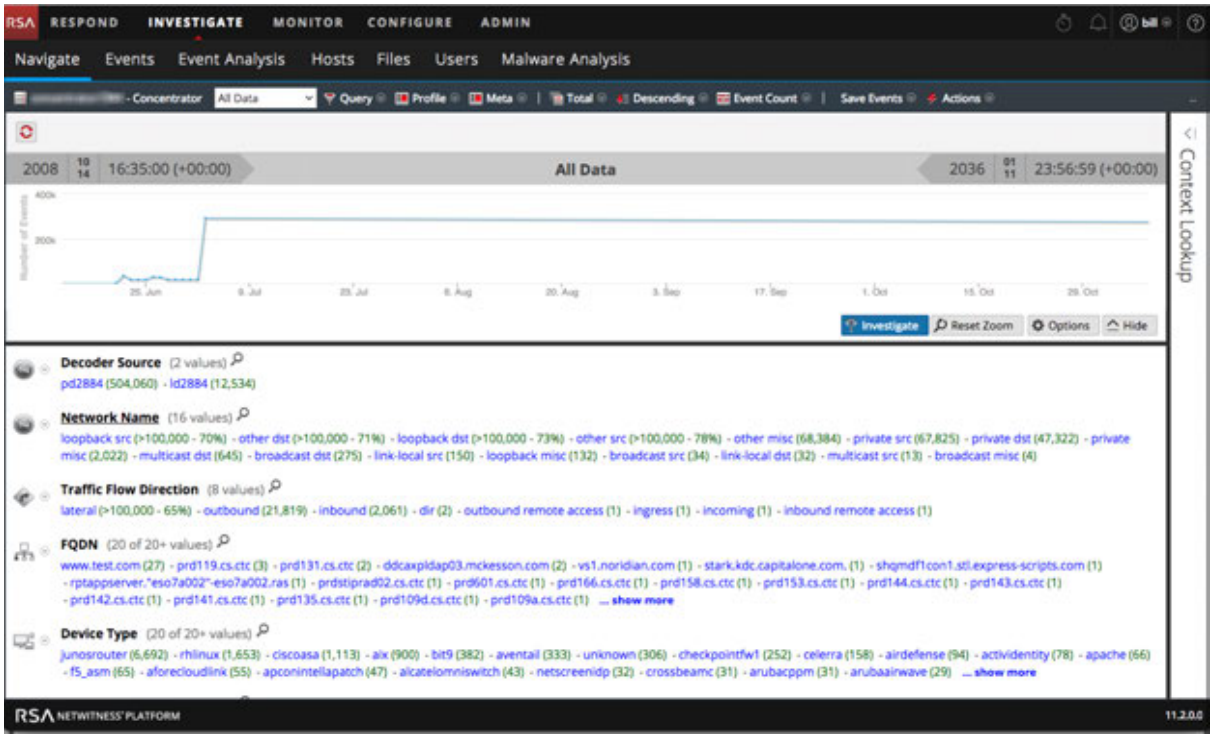
3. To clear the default service, select the default service in the grid, click Default Service, and click **Cancel** to close the dialog.
   No default service is set.

> **Note:** The Cancel button does not cancel your selection of the default service. It simply closes the dialog without navigating to the currently selected service in the grid. Setting a default service that is different from the service currently being investigated, does not refresh the Navigate view. You must explicitly select and Navigate to a different service.

Begin an Investigation (Default Service Specified)

1. Go to **INVESTIGATE > Navigate** or **Events**.
   If the Autoload Values setting is set to off, the Navigate view is displayed with the default service selected, and ready to load data. If the Autoload Values setting is on, the values are loaded as shown in Step 3. In the Events view, the data is loaded automatically.

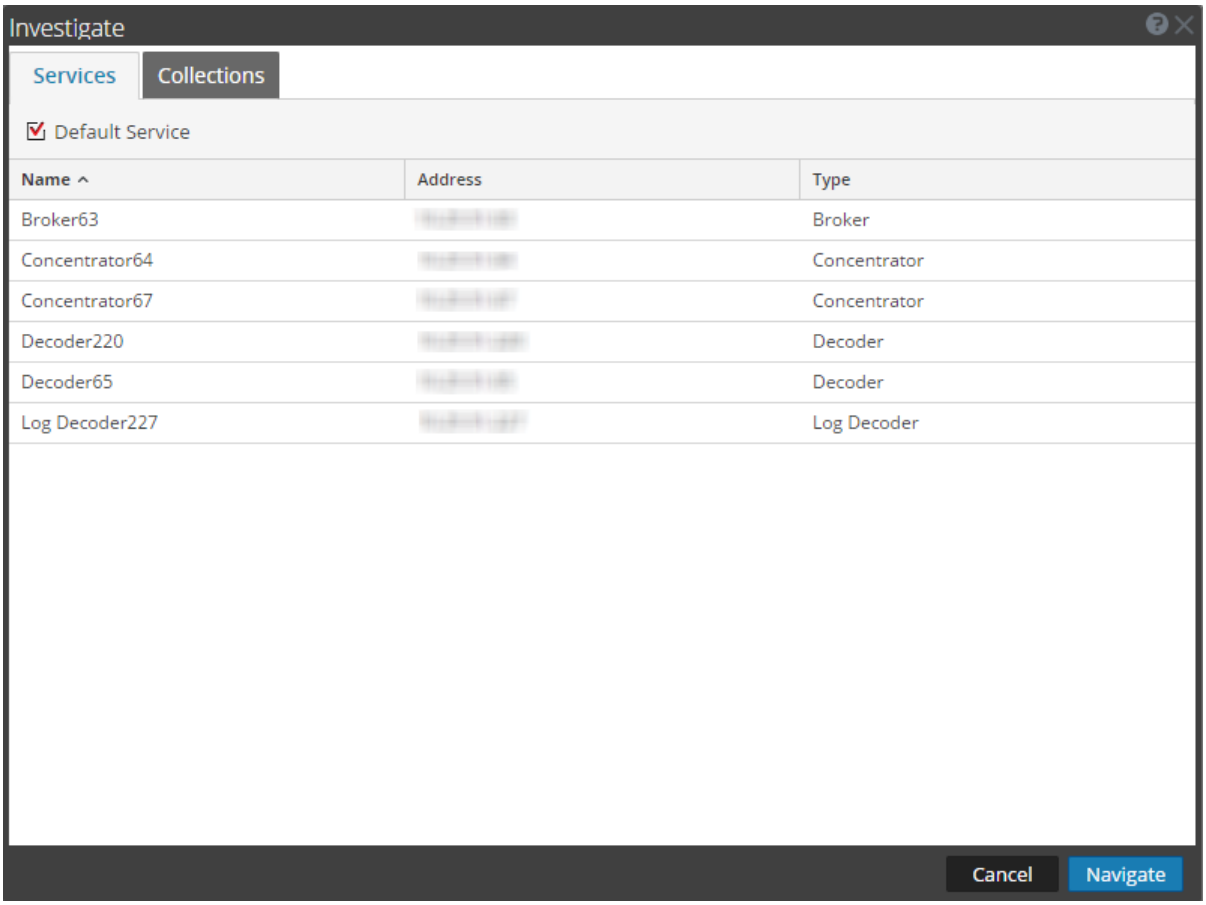
2. If you want to modify investigation options in the Navigate view before loading, you can create or modify a custom profile, apply a different time range, create or apply a meta group, and perform a custom query.
3. When ready, click Load Values.
   The values for the service are loaded in accordance with the selected options.



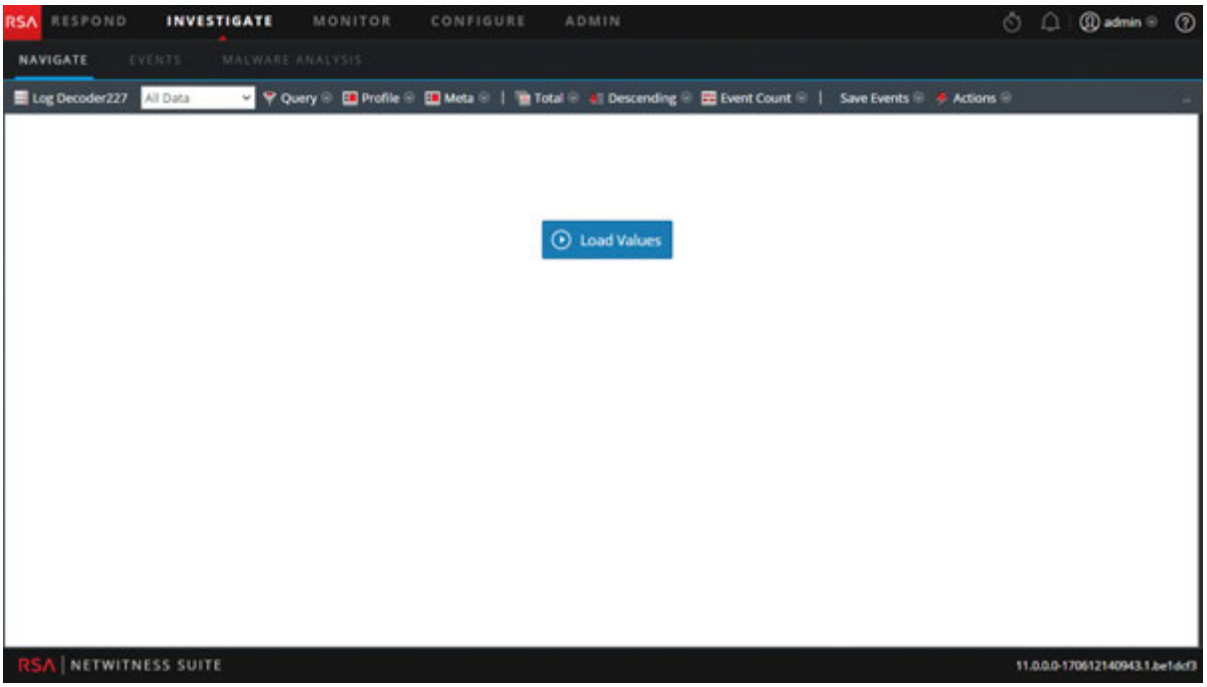
With the service selected and data loaded you are ready to begin analyzing the data.

Change the Service or Collection to Investigate

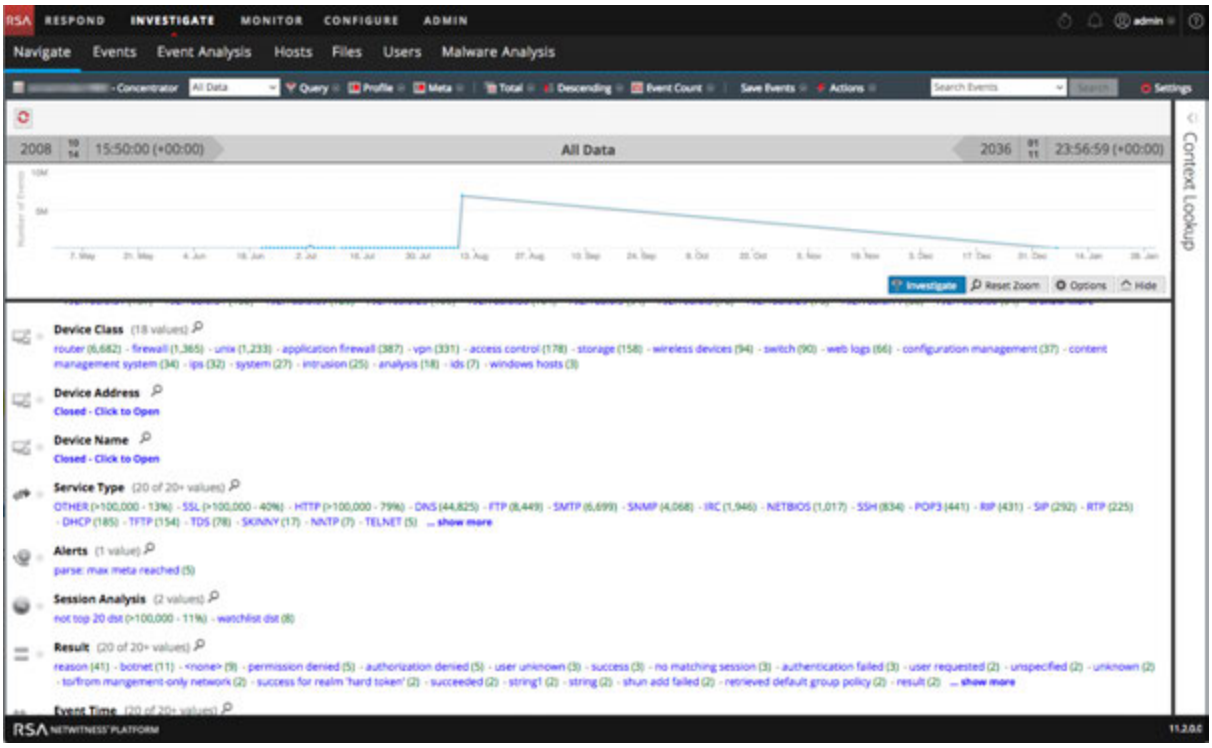
1. In the Navigate view or the Events view, click the service name at the top of the options panel.
   The Investigate dialog is displayed.



2. Double-click a service or select a service and click **Navigate**. The resulting panel displays the activity for the selected service.
   If the Autoload Values setting is on, the values are loaded as shown in Step 3. Otherwise, the Navigate view is displayed with the default service selected, and data ready to load. In the Events view the data is loaded automatically.



3. When ready, click Load Values.
   The values for the service begin loading in accordance with the selected options.



With the service selected and data loaded you are ready to begin analyzing the data.

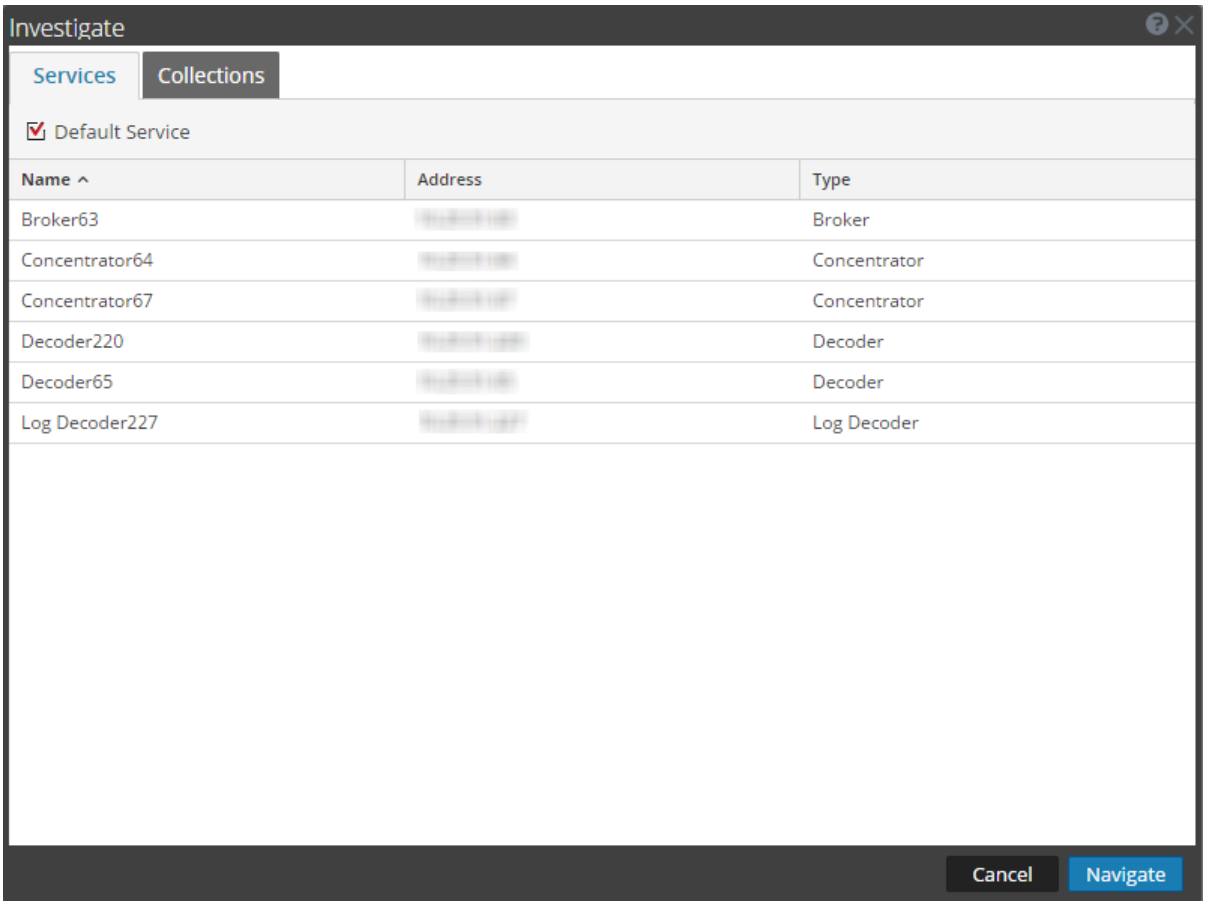
Investigate Workbench Restoration Collections

This procedure enables administrators to select content from an existing collection to reprocess for further investigation. This applies to Decoders that use Workbench services.

Note: Only a user with administrative privileges can create a collection, and you can view only those collections that you created.

To reprocess data for further investigation:

1. Go to **INVESTIGATE > Navigate** or **Events**.
   The Investigate dialog is displayed.



2. Select a workbench service and workbench name that you want to investigate.
3. Click **Navigate** to perform an investigation on your selected workbench service.
   Click **Cancel** to select a different workbench service to investigate.
   The Investigation view is displayed.
   With the collection selected and data loaded you are ready to begin analyzing the data.

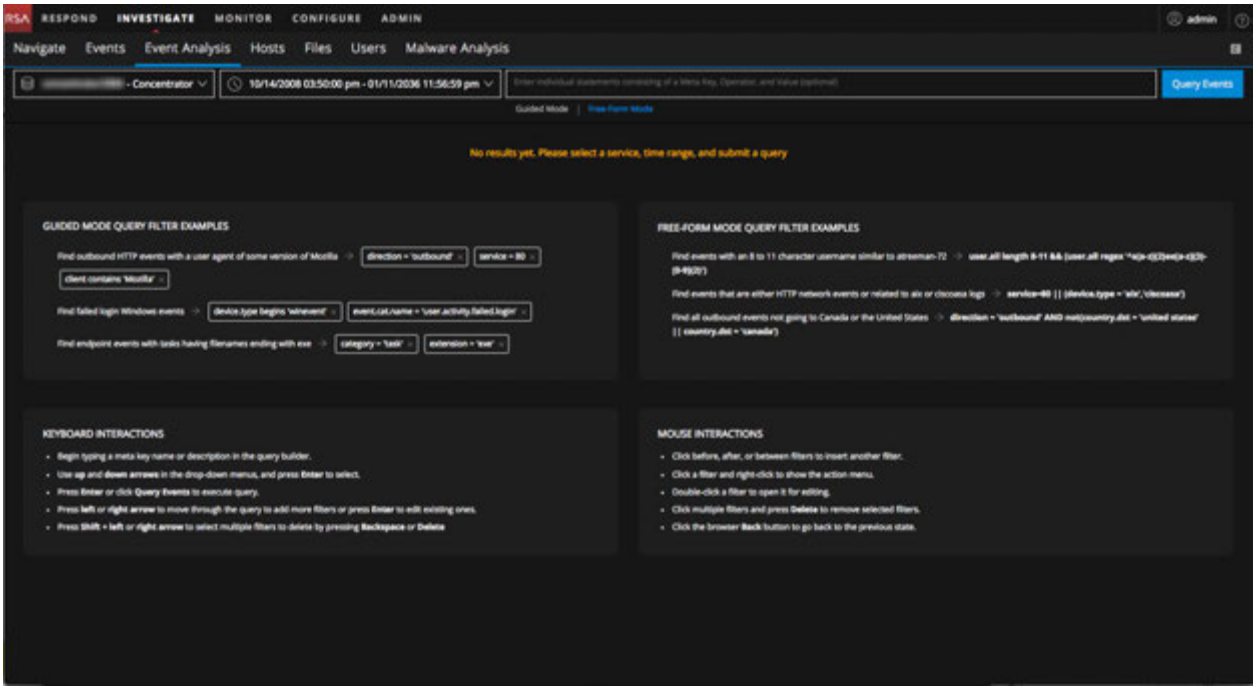
Begin an Investigation in the Event Analysis View

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Event Analysis view offers most of the features that are available in both the Navigate view and the Events view. Similar to the Navigate view, there is a view into meta keys and meta values for logs, endpoints, and packets. Like the Events view, an events list shows events listed in the order by time, and you can view the raw event, related meta data, and a reconstruction of an event. The Event Analysis reconstruction has some helpful cues to identify points of interest in a reconstruction. See Analyzing Raw Events and Metadata in the Event Analysis View

Note: In Version 11.0 you cannot begin an investigation in the Event Analysis view. Instead, you begin the investigation in the Navigate or Events view, and then open an event in the Event Analysis view. In Version 11.1, an INVESTIGATE submenu gives you direct access to the Event Analysis view along with the ability to select a different service, time range, and create a query.

The following figure shows the initial Event Analysis view with a tooltip that provides examples of queries.



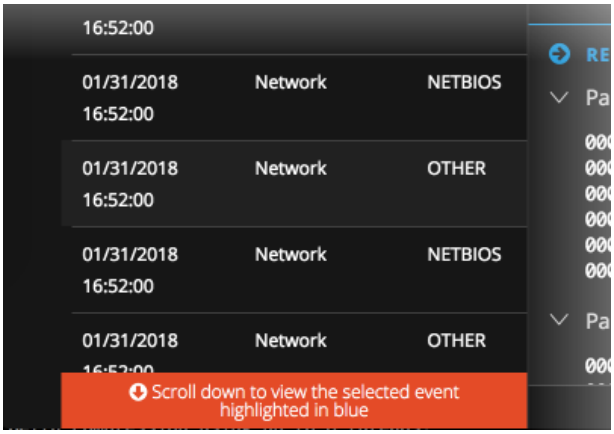
Access the Event Analysis View (Version 11.1 and Later)

Several ways to access the Event Analysis view are available in Version 11.1.

- When you use the **Actions > Go to event in Event Analysis** option in the Navigate view, and enter an event ID, the Event Analysis view opens the single event as a reconstruction. To simplify the view, the toolbar does not include the unnecessary options to expand, contract, and close windows. You can begin working as described in Analyzing Raw Events and Metadata in the Event Analysis

View.

- When you hover over a count (the green number after a meta value) in the Navigate view and click **Open Event Analysis in new tab**, the Event Analysis view opens with the list of events for the selected drill point, and you can begin working as described in Analyzing Raw Events and Metadata in the Event Analysis View. The list of events can be very large, and there is a chance that the event you selected is not visible in the current page of events. In this case, a message advises you to scroll down to view the event.

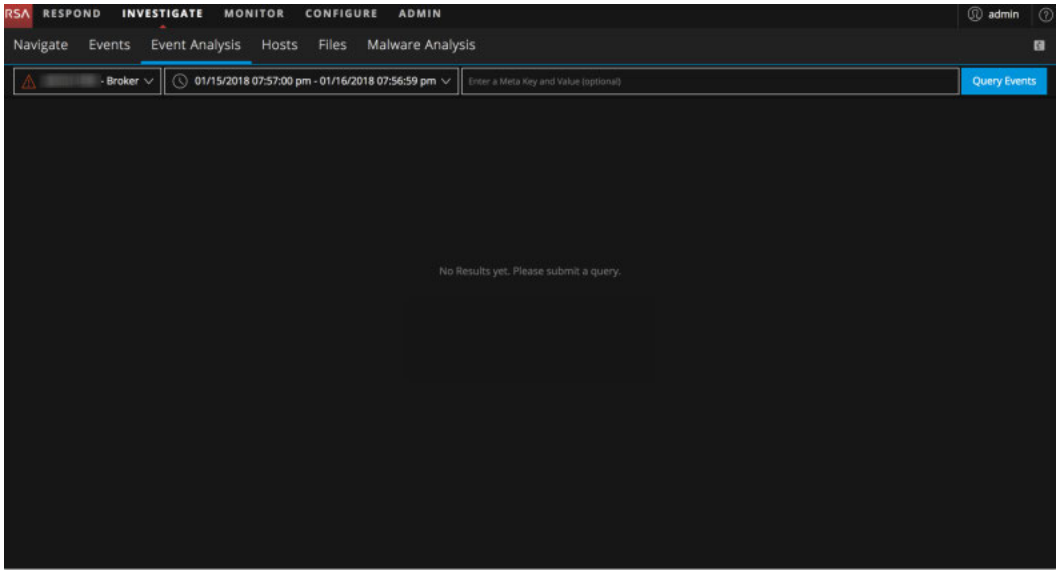


- You can also access the Event Analysis view directly by going to **INVESTIGATE > Event Analysis** or going to **INVESTIGATE** if you have made the Event Analysis view your opening Investigate view. When you land on the Event Analysis view for the first time, you need to select a service to begin analysis. If this is not the first time you opened Event Analysis, the last used service is remembered the browser cache is cleared.
  When you open the Event Analysis view from one of the other Investigate views, the service and query from that view are in effect. You can change the service, select a time range, and enter a query if you want to refine the results before opening the Event Analysis view as described in Filter Results in the Event Analysis View.

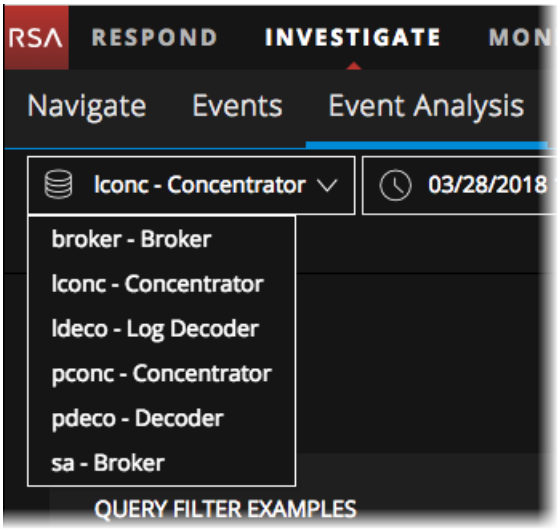
To access the Event Analysis view directly:

1. Go to **INVESTIGATE** > **Event Analysis**.
   The Event Analysis view opens with the first service in the service list selected and no data displayed. The **Select a service** field is populated initially with the first service in the list or the last selected service. A drop-down menu offers a list of available services in alphabetical order. By default the list of available services is retrieved every twelve hours and cached on the NetWitness server. If a service is added or removed from the NetWitness server, the cache is updated with the latest list of services. At the beginning of the field an icon provides the status of the query.
   - and no service name = no service is selected.
   - and selected service name= the service is selected.
   - = Investigate is attempting to connect to the selected service.

- ⚠ = Investigate cannot connect to the selected service or there is no data. In this state, the service selector control also turns red, and a tooltip explains why the connection attempt failed and advises you to choose another service.

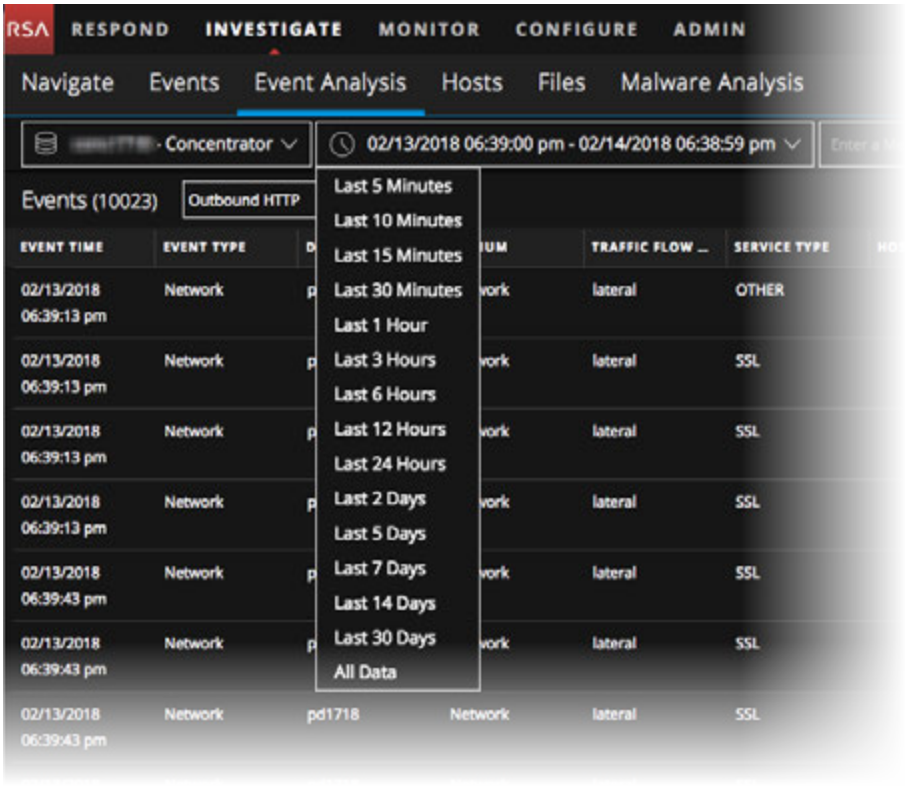


2. (Optional) Select a service, usually a Concentrator, from the drop-down list.



The time range selector shows either the default time range of 24 hours, or the time range that you last selected for this service. The Query Events button becomes active and you can enter filters. If you launch a query now, the selected time is used.

3. (Optional) To select a time range from the Time Range selector, click in the **Time Range** selector and select a time range from the drop-down list. Options are Last 5, 10, 15 or 30 Minutes; the Last 1, 3, 6, 12, or 24 hours; the Last 2, 5, 7, 14 or 30 days; or all Data. (The time range is based on preferences set for the Event Analysis view. The default basis for time range is database time; you can change it to wall clock.)
   The selected time range is stored in your browser for this service; you can set different time ranges for different services.



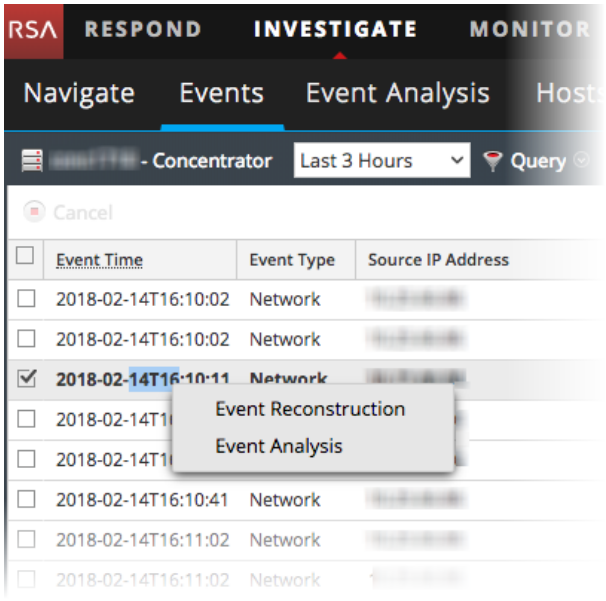
4. Type a query by creating one or more filters that contain at a minimum a meta key or meta entity, operator, and optional value. See Filter Results in the Event Analysis View for details on entering queries.

5. Click **Query Events**.
   The Event Analysis view displays the activity for the selected service and time range, in accordance with permissions assigned to your role by the administrator. With the service selected and data loaded, you are ready to begin analyzing the data. Refer to Analyzing Raw Events and Metadata in the Event Analysis View to learn how to work in the Event Analysis view.

Access the Event Analysis View (Version 11.0)

To open an event in the Event Analysis view:

1. Go to **INVESTIGATE** > **Events**.
2. Right-click an event in the listed events, and select **Event Analysis**.



Refer to Analyzing Raw Events and Metadata in the Event Analysis View to learn how to work in the Event Analysis view.

Investigating Metadata in the Navigate View

When conducting an investigation in the Navigate view, analysts have multiple methods, specific to the Navigate view, to refine the results, visualize data, and act on data.

- Filter Results in the Navigate View
- Manage Meta Groups
- Visualize Metadata as Parallel Coordinates
- Open an Event in the Events List
- Export or Print a Drill Point
- Launch an External Lookup of a Meta Key
- Launch a Malware Analysis Scan from the Navigate View
- Visualize the Current Drill Point in Informer

In addition, you can use these methods of querying data and acting on results that are common to the Navigate view and the Events view.

- Search for Text Patterns
- Create a Custom Query
- View and Modify Queries Using URL Integration
- Use Profiles to Encapsulate Custom Views
- Manage Context Hub Lists and List Values in the Navigate and Events Views
- Look Up Additional Context in the Navigate and Events Views
- Reconstruct an Event

Filter Results in the Navigate View

When conducting an investigation in the Navigate view, there are several methods available to refine the results displayed when meta key values are loaded in the Navigate view. Basic filtering methods available to analysts are:

- Set the Time Range
- Set the Quantification Method and Sort Sequence of Meta Key Results
- Manage and Apply Default Meta Keys in an Investigation
- Drill into Data in the Navigate View Time Chart
- Drill into Data in the Values Panel

The rest of this topic is focused on the basic methods of filtering data. In addition, more advanced methods allow configuration of meta groups, profiles, and parallel coordinates visualizations.

- Visualize Metadata as Parallel Coordinates
- Manage Meta Groups
- Use Profiles to Encapsulate Custom Views

A separate topic is provided for each of the more advanced methods.

Set the Time Range

When conducting an investigation in the Navigate view, the time range options limit the results returned. You can select:

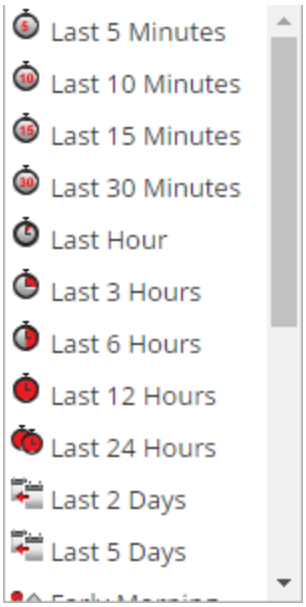
- A time range relative to the collection. Ranges relative to the collection are based on the last collection time for data.
- A time range relative to the calendar.
- A custom date range.
- All data.

The selected Date Range is shown in the Navigate view tool bar as the Time Range label; by default the label is **Last 3 Hours**. The Time Range displayed in the timeline banner shows the first and last timestamp for the date range being used for the metadata.

Note: Time range is based on the Time Zone configured in the Profile Preferences panel as described in "Setting User Preferences" in the *RSA NetWitness PlatformGetting Started Guide*.

To select a built-in time range:

1. Click the **Time Range** option in the Navigate view toolbar. The default time range is for the **Last 3 Hours**, but a different value from the selection list, for example, **All Data** or **Last Hour,** may already be selected and used as the label in the options panel.
   The Time Range selection list is displayed.



2. Do one of the following:
   - If you want to see all data, select **All Data**.
   - If you want to set a time range in minutes, hours, or days that is relative to the collection, select a value such as **Last 10 minutes**, **Last 3 Hours**, or **Last 5 days**.
   - If you want to set a time range relative to today, select **Yesterday**, **This Week**(Version 11.1), **Last Week** (Version 11.1), **All Day**, or a part of the day such as **Early Morning**, **Morning**, **Afternoon**, or **Evening**.
   - If you want to set a unique date range, select **Custom** in the **Time Range** menu and follow the procedure below.
     The selected time range is applied to the current results in the Values panel.

To specify a custom time range:

1. Select **Custom** in the **Time Range** menu.
   Date selection options are displayed in the toolbar.

2. Within the time **Start Date** and **End Date** fields, do the following to specify the date and time:
   a. Click a date from the calendar.
   b. (Optional) Select the time from the Hour and minute fields or click **Now**. The time selection defaults to the current time of day.

Note: The value for start time in seconds always defaults to :00, and the value for end time in seconds always defaults to :59. For example, if you are using time to drill down into an issue, the drill time is interpreted as "HH:MM:00 - HH:MM:59."

3. To apply the range, click **Go**.
   The selected time range is applied to the current results in the Values panel.

Set the Quantification Method and Sort Sequence of Meta Key Results

You can select the way results for each meta key are quantified and sequenced in the Navigate view.

Note: If meta entities (Version 11.1 and later) are used in meta groups, the results will show the top 20 values that matched any of the meta keys contained in the meta entity.

Each meta key section in the Navigate view contains an ordered list of values showing each meta key value (Value) and its count (Total). You can specify whether:

- The results in each meta key section are sorted based on Value or Total.
- The results are sorted in ascending or descending order.
- The values shown for each meta key are quantified by number of packets (Packet Count), number of sessions or logs (Quantify by Event Count) or by the size of events (Quantify by Event Size).

Note: If you have both a log decoder and a packet decoder for which you are viewing the metadata, the calculation of what is actually being counted is dependent on the type of key. If you select to Quantify by Packet Count and are looking at logs, the Navigate view output is the same output as if you had selected Quantify by Event Count (see Navigate View for details).

This image shows the `Event Type` meta key presented in order by **Total** in **Descending** order. The value with the greatest count of matches is presented first. The value `failure audit` has 71 matches and is listed first. The value `logon` has only one match and is presented last. The quantification method is **Event Count**.

This image shows the `Event Type` meta keys presented in order by **Value** in **Descending** order. The value names are presented in alphabetical order starting at the end of the alphabet. The value `success audit` is listed first. The value `connect` is presented last. The quantification method is **Event Count**.

To select the quantification method of meta key count and ordering of meta key results displayed in the Navigate view:

1. In the toolbar, select **Event Count**, **Event Size**, or **Packet Count** and choose one of the quantification options in the drop-down menu. The label for the menu displays the selected option.

   The current view is reloaded according to your selection.
2. In the toolbar, select **Total** or **Value** and choose one of the ordering methods in the drop-down menu. The label for the menu displays the selected option.

The current view is reloaded according to your selection.

3. In the toolbar, select **Ascending** or **Descending** and choose one of the sort order options in the drop-down menu. The label for the menu displays the selected option.
   The current view is reloaded according to your selection.

Manage and Apply Default Meta Keys in an Investigation

When analysts are conducting an investigation of captured data in Investigation, a default set of meta keys is loaded and displayed in a default sequence in the Navigate view > Values panel. The default content and sequence is based on the meta keys for the service being investigated. Analysts can specify the meta keys to display during navigation by selecting the default meta keys or by selecting a user-defined group of meta keys, which provides great flexibility to define meta keys. This can help to drill down more directly to the desired data and to reduce the load time by preventing the loading of meta that is not of interest in the current investigation.

Note: In Version 11.1 and later, wherever meta keys are used, you can also use configured meta entities.

If no custom meta groups are in effect, the Navigate view is displayed with the meta key visibility specified in the Default Meta Keys dialog. To optimize loading of meta keys in the Navigate view > Values panel, NetWitness Platform does not open non-indexed meta keys by default. When you open a non-indexed meta key in the Values view, NetWitness Platform begins loading values for that meta key. If the load time is excessive, the load of the meta key times out with a message. Title, values, and counts for non-indexed meta keys are not drillable in the Values panel. Additional labeling in Investigation identifies the non-indexed meta keys.

To select the meta keys to apply to your investigation, you can:

- Select the default meta keys.
- Select a set of meta keys, called a meta group.

Note: Investigate has built-in meta groups and user-defined meta groups. Once created, user-defined meta groups can be edited, deleted, exported for use on other services, and imported to the service you are investigating. All of these procedures are provided in a separate topic: Manage Meta Groups.

The Default Meta Keys dialog allows you to specify the default view and display sequence for meta keys during navigation in the Investigate > Navigate view for a specific service. For each key or for all keys, you can set the default view to:

- Hidden: Results for default meta key are hidden and are not available to load.
- Open: Results for default meta key are open with all values and counts displayed.
- Close: Results for default meta key are closed with only the meta name visible.
- Auto: The loading of default meta keys is controlled by the index level, which must be Indexed By Value.

When using the default meta keys, be aware that these can be modified for different services, and you may not be seeing the same set of default meta keys when navigating to a drill point on different services. If you do not see the expected data, you may need to change the initial view of the default meta keys.

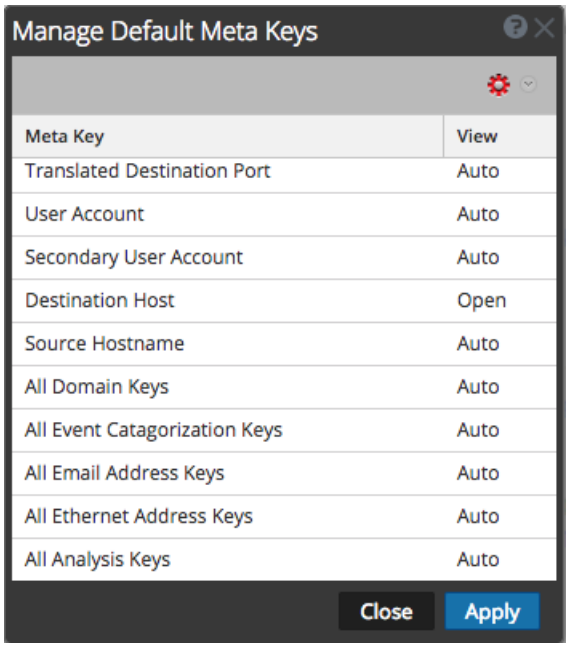
When you change the initial state of default meta keys from within the Navigate view, the change persists for that service. When new keys are added to the custom index file for a Core service (for example, `concentrator-custom-index.xml` or `decoder-custom-index.xml`), the new keys are added to the default meta keys list. The changes made in the Navigate view apply only to the current service.

To specify that the initial Navigate view opens using default meta keys:

1. Go to **INVESTIGATE** > **Navigate**.
2. Select a service and select **Navigate**.
3. In the **Meta** menu, select **Use Default Meta Keys**.
   If an investigation is already in progress, the data is reloaded in the current view and an icon highlights the selected option. If no data is loaded yet, the default meta keys are used for the next load.

To configure the default view of default meta keys in the Navigate view:

1. In the **Navigate** view toolbar, select **Meta** > **Manage Default Meta Keys**.
   The Manage Default Meta Keys dialog is displayed with the list of available meta keys for the service.



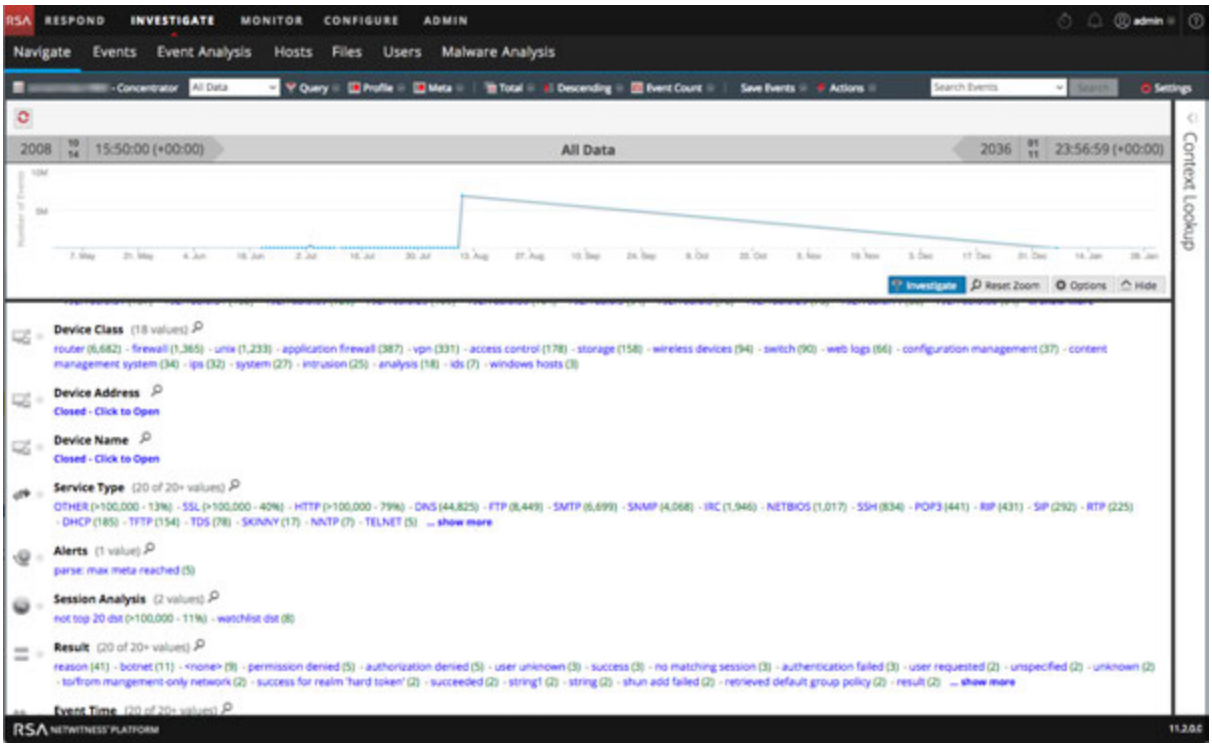
2. (Optional) To change the order of the keys, select one or more keys, and drag the values up or down through the list of keys.

3. Do one of the following:
   - (Optional) To change the default view for all meta keys, make sure that no keys are selected and in the toolbar, select  .
   - (Optional) To change the default view for one or more keys, select the keys and in the toolbar, select  .
     A drop-down of possible initial views for all default meta keys is displayed.
   - (Optional) To revert to the default view for meta keys as specified in the service index file, make sure that no keys are selected and in the toolbar, select  > **Auto**.
     When you modify the default view for a non-indexed meta key, you cannot set the key to OPEN. If you change the default view for a group of meta keys to OPEN and some of the meta keys are non-indexed, the non-indexed meta keys revert to AUTO. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are CLOSED until opened manually.
4. Select one of the views.
5. To save the changes, click **Apply**.
   The meta keys displayed in the Navigate view are set to your specifications. If the default meta keys are hidden, values for the meta keys are not shown in the investigation at all. If the default meta keys are closed, the values for the meta keys are not loaded by default, but you can load individual meta keys manually in the Navigate view.

Drill into Data in the Navigate View Time Chart

The Time Chart visualization allows analysts to visualize activity over time. You can zoom into the data by selecting a time window then selecting the Investigate option. You can then reset the navigation to the time range that was in effect before zooming.

1. Go to **INVESTIGATE > Navigate**.
   The Time Chart for the current drill point and selected time range is displayed.



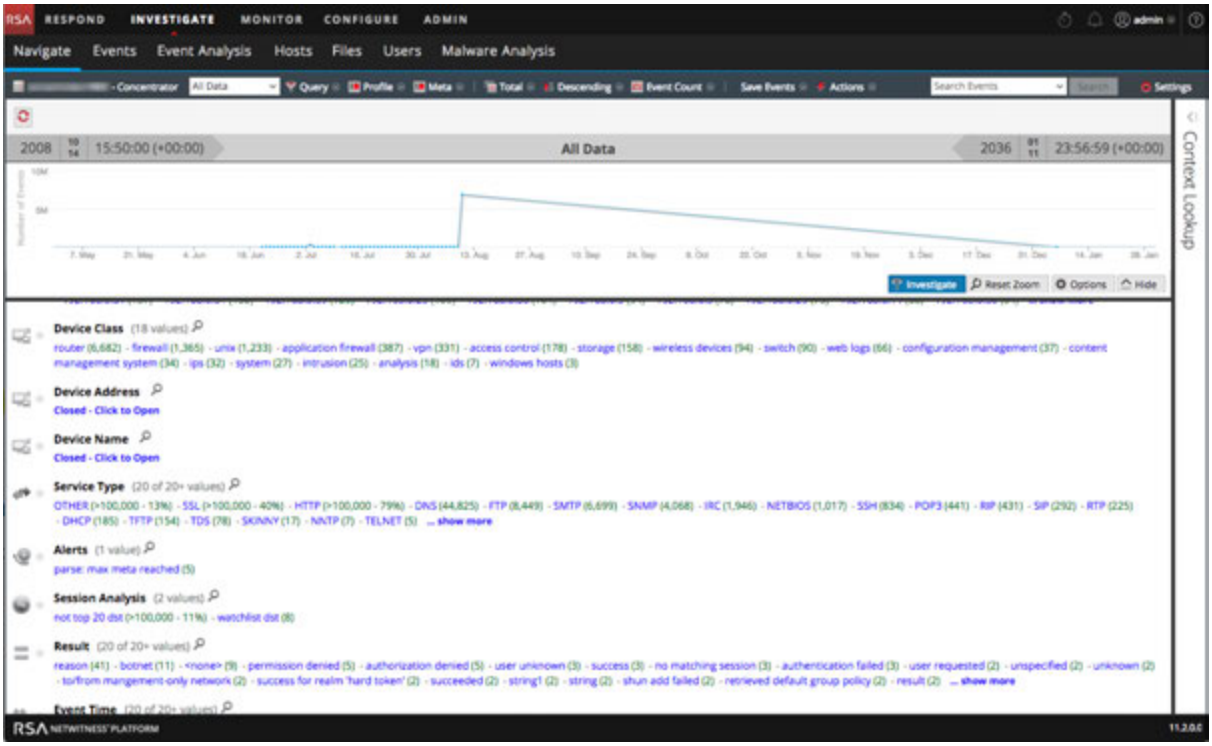
2. To highlight a period of time on the Time Chart, click over the desired time period and drag the mouse.
   The Time Chart is redrawn for the selected time range; however, the meta values are unchanged.
3. To drill into the data for the selected time range, click **Investigate**.
   The URL is updated to reflect the time range override, and the Investigation options panel is updated to reflect the custom time range. The Time Chart is redrawn and the meta values are loaded for the selected time range.
4. To reset the Time Chart to the original time range, click **Reset Zoom**.
   The URL is updated to reflect the original URL prior to zooming into the data, and the Investigation options panel is updated to reflect the time range selected before zoom. The Time Chart is redrawn for the selected time range and the meta values are loaded for that time range.

Drill into Data in the Values Panel

NetWitness Platform displays the activity and values for the selected service in the Investigation > Navigate view. To investigate data, analysts drill into data by clicking on a meta key or a meta value, which is treaty as a query. In the Values panel, each query is added to the breadcrumb data in the Values panel. This results in a breadcrumb at the top with a crumb for each query. You can edit the breadcrumb to insert or remove a query.

To drill into a subset of the metadata:

1. Begin an investigation so that metadata is displayed in the Navigate view.

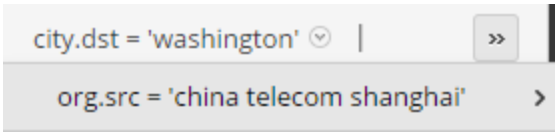


2. To drill down into the metadata, do any combination of the following:

   a. Click a **meta key**, for example, **Service Type**.

   b. Click a **meta value**, the blue text in the results. For example, **OTHER**.
   Each time you click a meta key or meta value, the investigation query pivots to a narrowed focal point, or drill point, in the data. At each drill point, the Values panel is updated and the new drill point is displayed in the breadcrumb. Below is an example of the first breadcrumb.

   This is an example of a long breadcrumb that does not fit in the toolbar. The last query that fits is followed by a drop-down menu that lists additional queries. To select a drill point within the overflow, click the overflow icon and a query in the drop-down list.

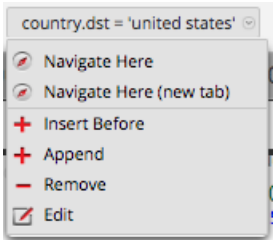


To add a query in the breadcrumb:

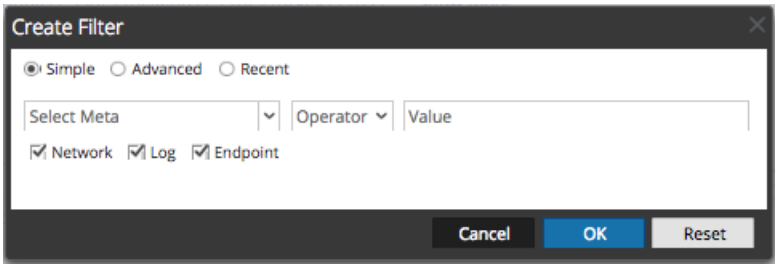
In the breadcrumb, you can click any of the crumbs to display the Query menu. You can insert a new query before a crumb, and append a new query to the end of breadcrumb. After each edit in the breadcrumb, NetWitness Platform refreshes the results.

To add a query in the breadcrumb:

1. Click a crumb.
   The Breadcrumb menu is displayed.



2. To add a query in the breadcrumb, select **Append** or **Insert Before**.
   The Create Filter dialog is displayed.



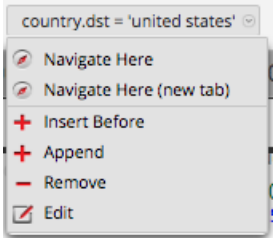
3. Create the Query as described in Create a Custom Query.

To edit a query in the breadcrumb:

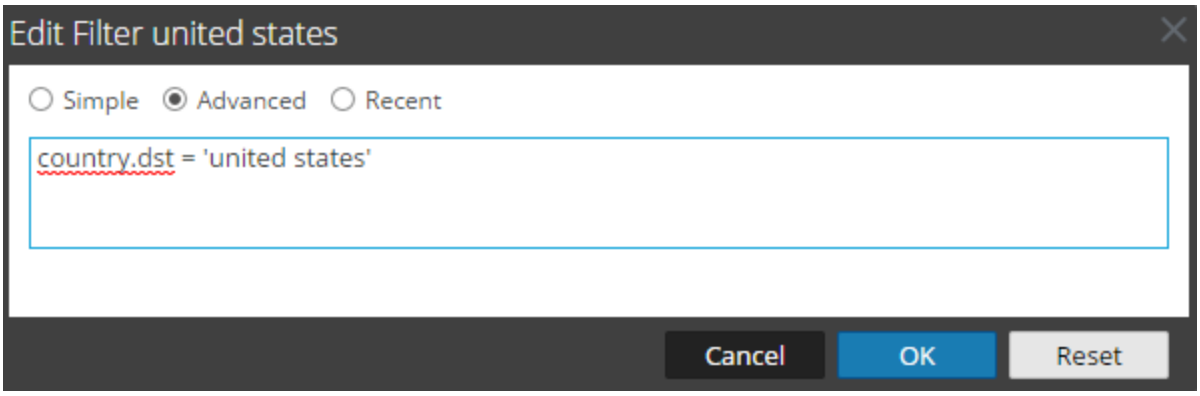
In the breadcrumb, you can click any of the crumbs to display the Query menu. You can delete a crumb and edit a query in a crumb. After each edit in the breadcrumb, NetWitness Platform refreshes the results.

To work with queries in the breadcrumb:

1. Click a crumb.
   The Breadcrumb menu is displayed.



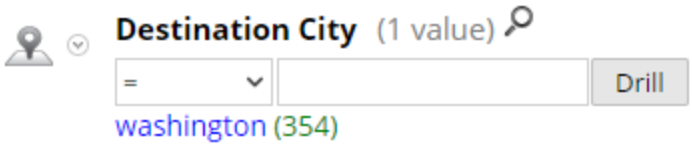
2. To edit a query in the breadcrumb, select **Edit**.
   The Create dialog is displayed with the selected query open for editing.



3. Edit the fields as described in Create a Custom Query.

To quick search within a meta key:

1. Move the mouse over a meta key section and click the magnifying glass.
   The Quick Search form, which contains a comparator and an optional operand for the search, is displayed.

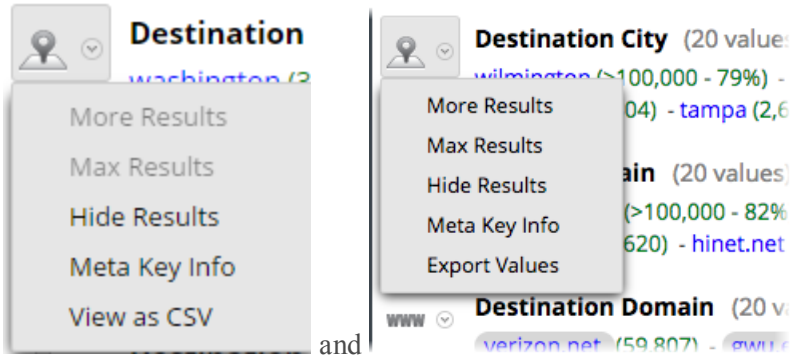


2. (Optional) If you want to close the search form, click the magnifying glass again.
3. Select the operation from the drop-down list on the left and type the text value to search for. Then click **Drill** to perform the execution.
   The metadata for that meta key is used to drill down in the current metadata.

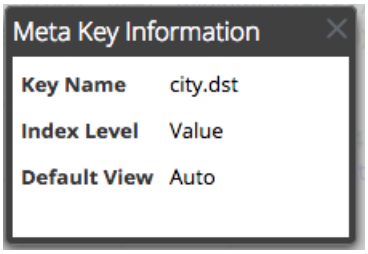
To view meta key Information:

To view details about a meta key, specifically the key name, index level set for displaying the meta key, and the default view set for the meta key:

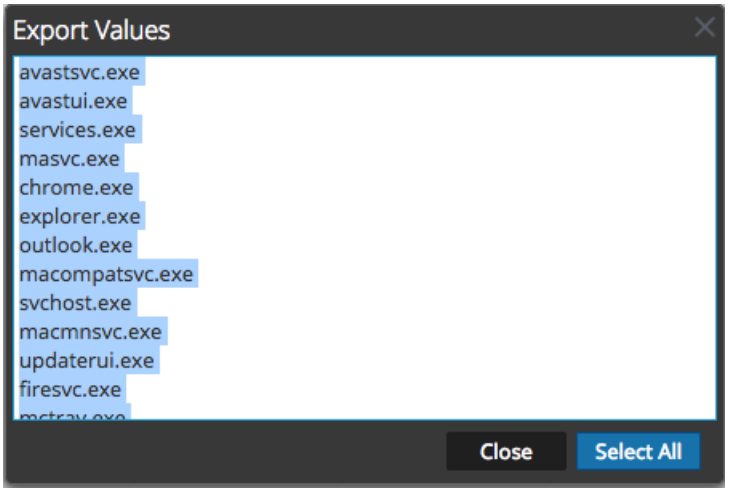
1. Click the drop-down menu next to the meta key. These two figures show the drop-down menu for Version 11.0.0.x and 11.1 and later.



2. Select **Meta Key Info**.
   The Meta Key Info dialog is displayed.



3. When finished viewing, click ■.
4. (Optional for Version 11.0) To view meta names found for the meta key as a comma-separated value list, click the drop-down menu next to the meta key and select **View as CSV**.
   The Showing Values in CSV Format dialog is displayed. When finished viewing, click **Close**.
5. (Optional for Version 11.1) To view meta names found for the meta key in a list, click the drop-down menu next to the meta key and select **Export Values**.
   The Export Values dialog is displayed.



6. (Optional) If you want to hide the results for the meta key in the current drill point, click the drop-down menu next to the meta key and click **Hide Results**.

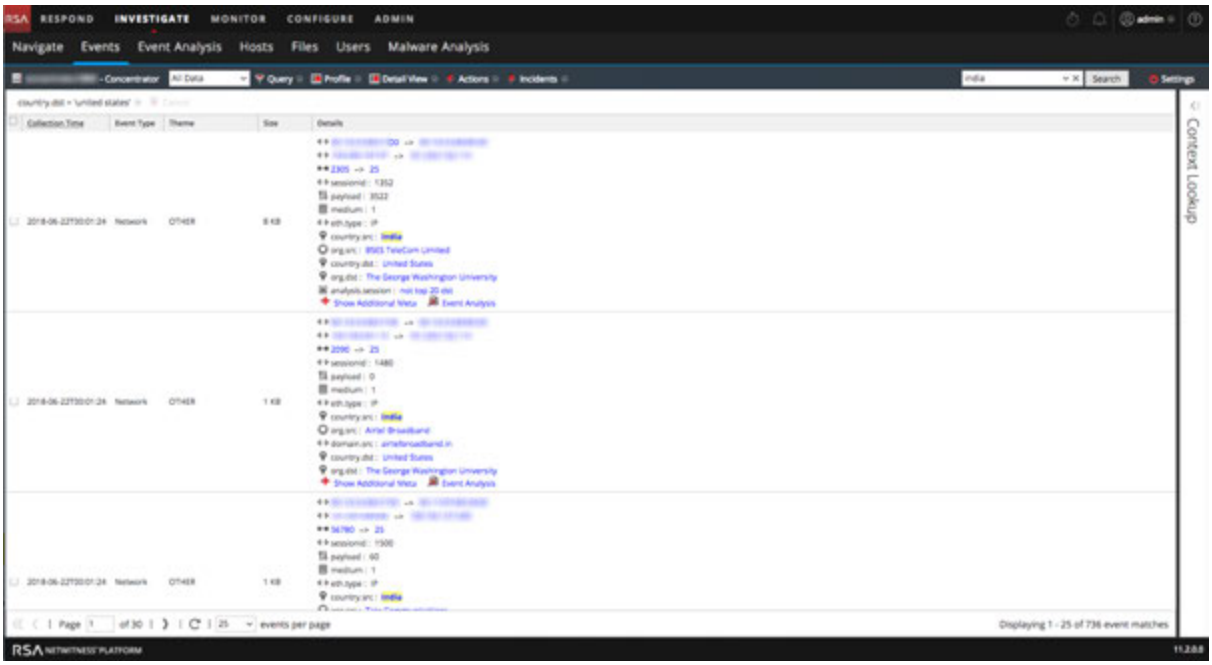
To display events associated with a meta value:

The Events view provides additional details for an event in two different views: Events List and Detail View.

1. In the Navigate view, drill into metadata that is the focus of your investigation.
2. Click the count (the number in green) next to a blue meta value.
   The Events view corresponding to the current drill point is displayed.
   The operations that you can perform in the events view are described in Examining Raw Events in the Events View.

To search for specific events associated with a meta value:

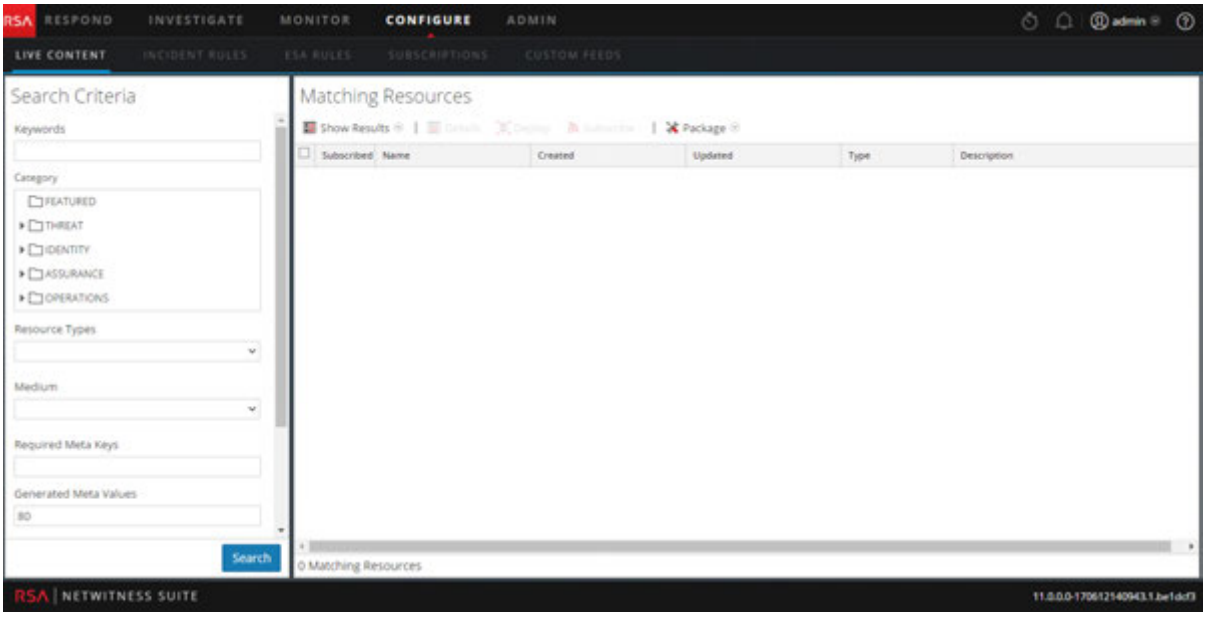
1. In the Navigate view, drill into metadata that is the focus of your investigation (click a meta value or add a query).
2. Type a search string in the Search box and press **Enter** or click **Search**.
   You can also select and set search mode preferences. See Search for Text Patterns for detailed search information.
   The Events view opens in a new tab and shows the search results. If you do not see the search term highlighted, click **Show Additional Meta**. Your time range selection and drills (queries) carry forward to the Events view.



To view a selected meta value in RSA Live:

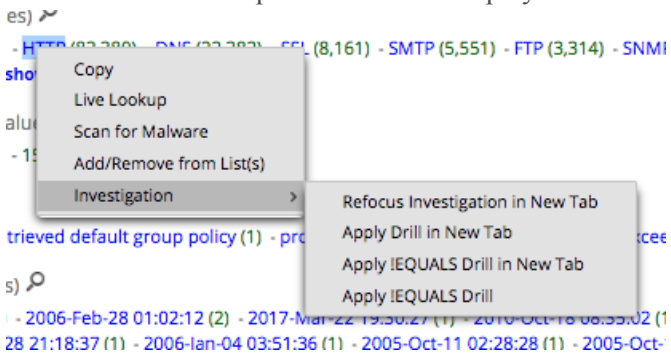
1. In the Navigate view, drill into metadata that is the focus of your investigation.
2. Right-click a meta value (the text in blue).
   The Meta Value drop-down menu is displayed.

3. To look up the meta value in RSA Live, select **Live Lookup**.
   The Live Search view is displayed with the meta value entered in the Generated Meta Value(s) field, and ready for a search.



To refocus the investigation in a drill point:

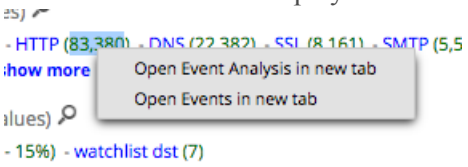
1. Right-click a meta value (the text in blue).
   The Meta Value drop-down menu is displayed.



2. Choose one of the refocus options.
   The drill is refocused according to your choice.

To look at a specific count in a new tab:

To view a count for a meta value in the Events view or the Event Analysis view, right-click a count for a meta value (the green number following the blue meta value).
The context menu is displayed.



Manage Meta Groups

A meta group combines selected meta keys into a group to show only data in which the meta keys and meta entities were found.

Note: In Version 11.1 and later, you can also use configured meta entities in meta groups.

In the Investigate > Navigate view, you can use meta groups to filter data displayed in an investigation. A fresh installation of NetWitness Platform includes out-of-the-box (OOTB) meta groups to help you find interesting data sets in Investigate. The OOTB meta groups are prefixed with RSA for identification and can be duplicated but cannot be edited or deleted. You can create your own groups and you can duplicate and edit an OOTB group to create a custom group.

With a meta group in effect during an investigation, the information in the Values panel shows only the meta keys in the selected group. When you open a Parallel Coordinates visualization, the meta keys and meta entities in a group appear as axes from left to right. It may be useful to create two versions of each custom meta group; one for analysis of meta values and one for creating a parallel coordinates chart focusing on a smaller subset of the same use case.

Custom meta groups are visible to all users of a service and may be exported for import to any service, limited by the available meta keys for that service.

Note: When an administrator adds custom meta groups manually by editing the custom index file for a service, the new groups become available to Investigate after the service is restarted.

This section describes how to add, edit, import, export, and delete custom meta groups to be used during navigation on a specific service.

Out-of-the-Box Meta Groups

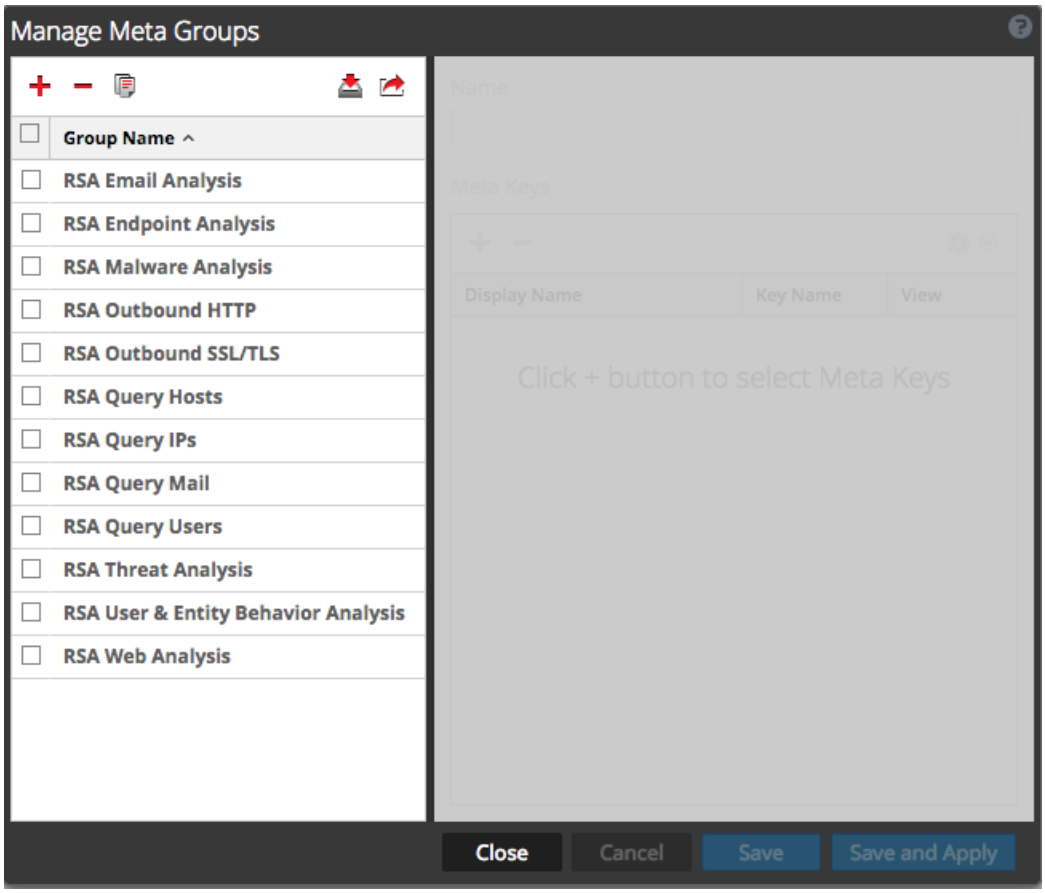
Out-of-the-box meta groups are built in to RSA NetWitness Platform. The OOTB meta groups are useful to focus an investigation on common use cases and to support threat detection using the RSA Hunting Pack. These are the OOTB meta groups:

- RSA Email Analysis includes meta keys that outline email interactions.
- RSA Endpoint Analysis contains meta keys that provide insight on processes, files, users, and connections from NetWitness Endpoint (NWE) hosts.
- RSA Malware Analysis includes meta keys that mark indicators of compromise in files contained in events.
- RSA Outbound HTTP includes meta keys that provide insight into outbound web traffic.
- RSA Outbound SSL/TLS includes meta keys that focus on encrypted web traffic.
- RSA Query Hosts includes a meta keys that encompass all the meta keys to find hosts.
- RSA Query IPs includes meta keys that encompass all the meta keys to find IP addresses.
- RSA Query Mail includes meta keys that encompass all the meta keys to find email.
- RSA Query Users includes meta keys that encompass all the meta keys to find users.

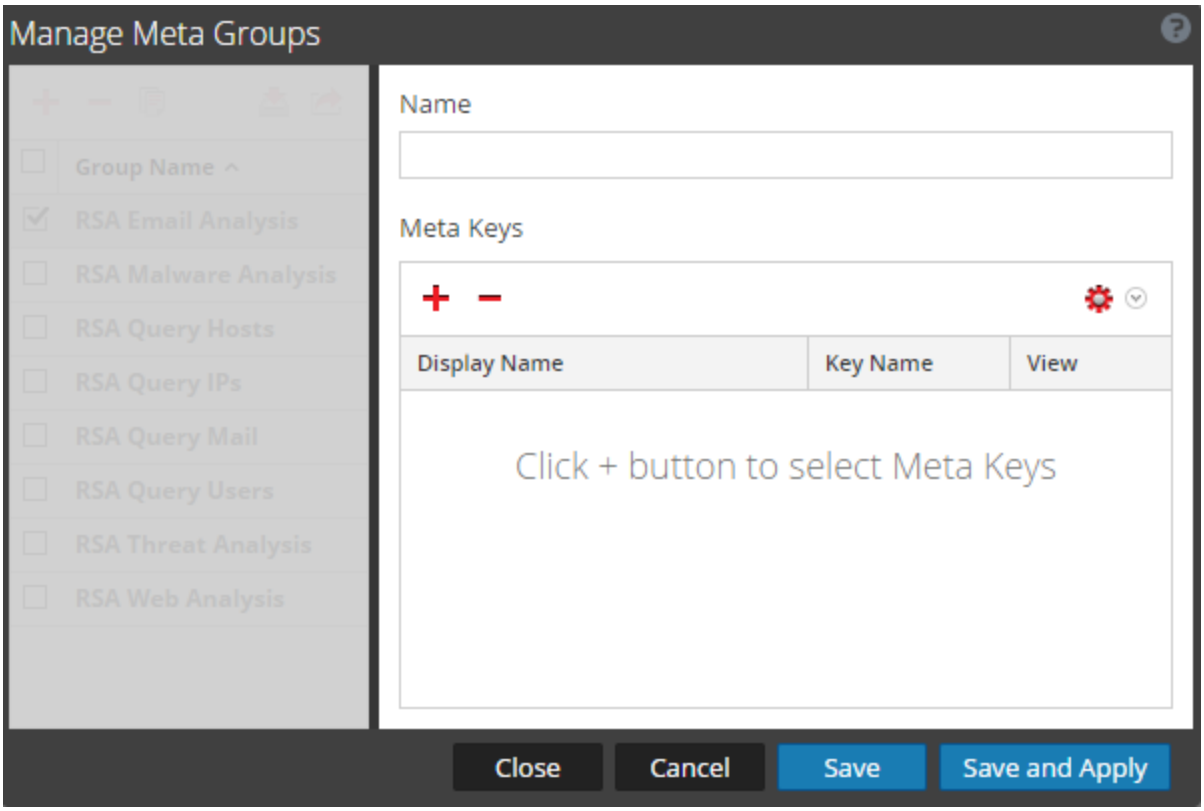
- RSA Threat Analysis includes meta keys that mark potential threats in the data set.
- RSA User and Entity Behavior Analysis includes meta keys that encompass all the meta keys to analyze user and entity behavior.
- RSA Web Analysis includes meta keys that mark anomalies in web traffic.

Create a Meta Group and Add Meta Keys

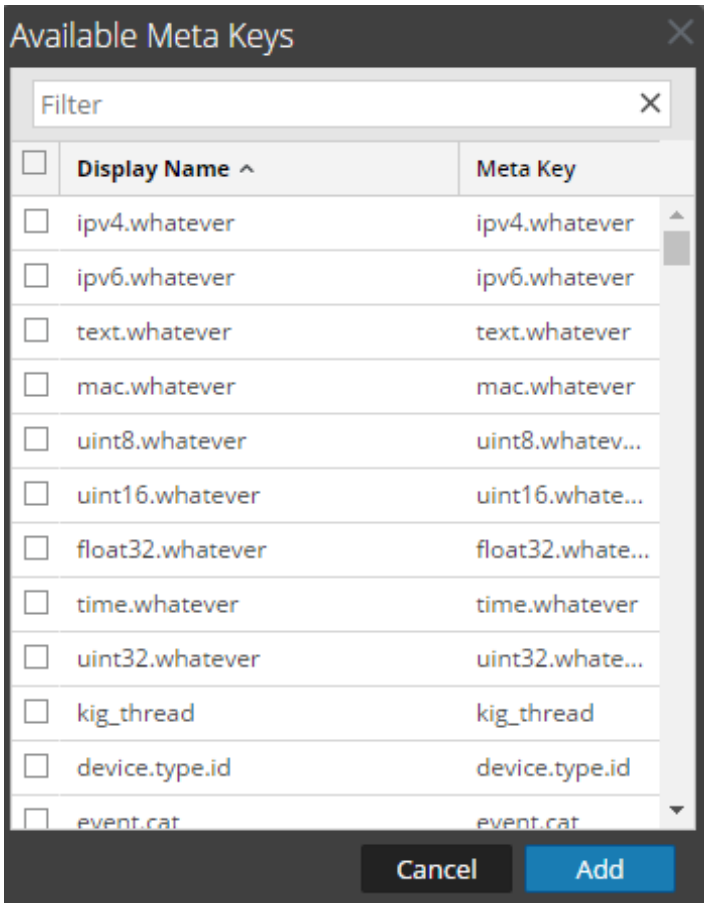
1. While investigating a service in the **Investigate > Navigate** view, select **Meta > Manage Meta Groups** in the toolbar.
   The Manage Meta Groups dialog is displayed. Initially only OOTB groups are configured for a service and listed under Group Name. If other custom groups have been configured, they are also listed under Group Name.



2. In the toolbar at the top of the Meta Groups list, click +.
   A new row is inserted at the top of the Meta Groups list.
3. Type a name for the new meta group, and press **Enter**.
   The form to the right opens for editing.



4. (Optional) If you want to change the name of meta group, type a new value in the **Name** field.
5. In the **Meta Keys** toolbar, click +.
   The Available Meta Keys dialog is displayed, with keys in alphabetical order.

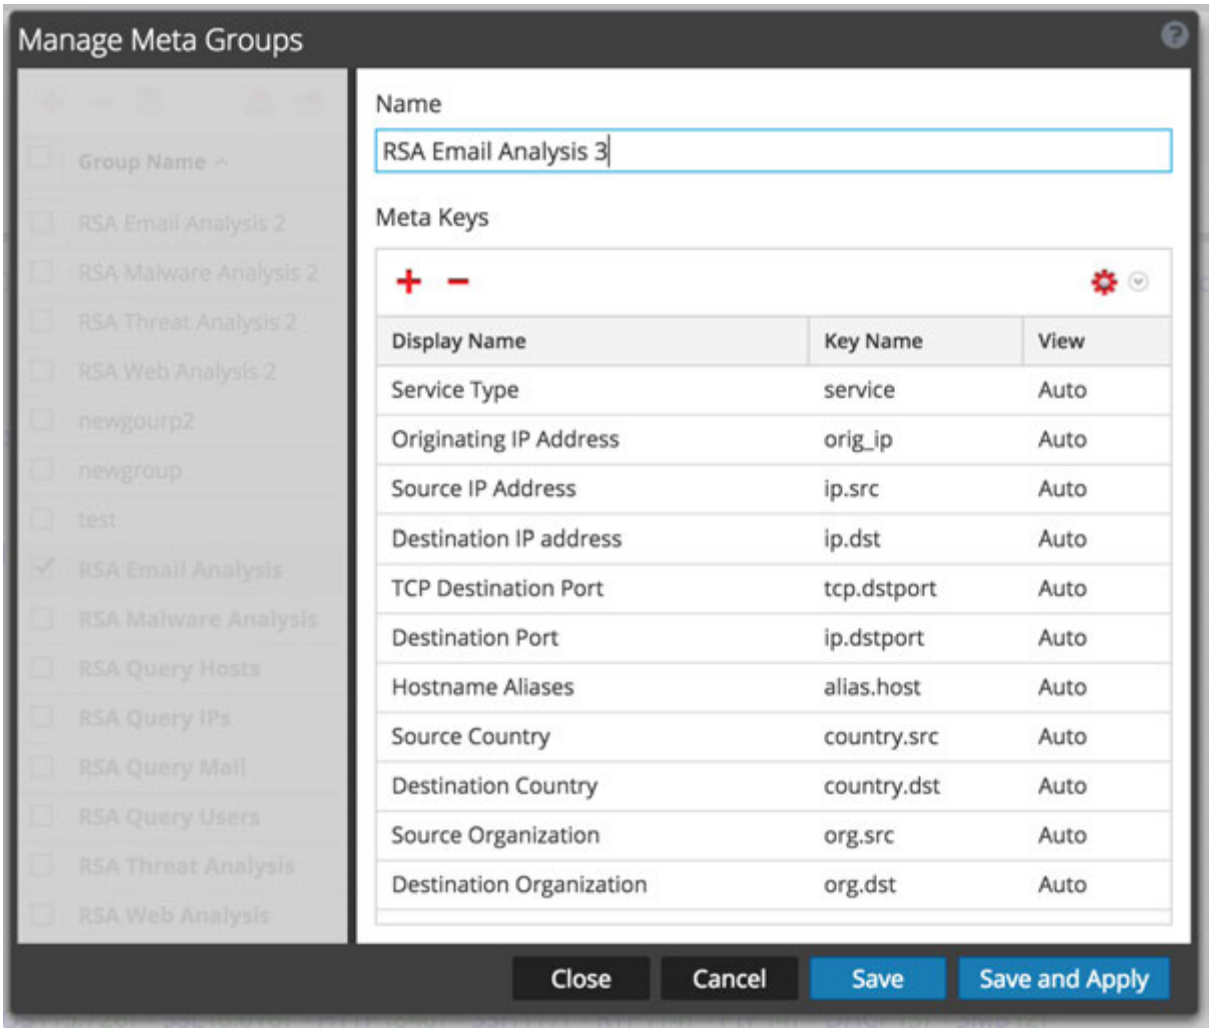


6. To filter the list of meta keys, type a word or phrase in the **Filter** field and select **Enter**.
   The list displays matching meta keys based on a case-insensitive search. Delete the filter text and press **Enter** to remove the filter.
7. To select meta keys to include in the meta group, select the checkboxes. To select all meta keys, select the checkbox in the title bar and click **Add**.
   The selected meta keys are added to the meta keys list.
8. (Optional) If you want to change the order in which the meta keys load and are listed in an investigation, click and drag one or more meta keys to a new position.
9. To finish creating the meta group do one of the following:
   a. To save the meta group, click **Save**.
      The group is created and available for use.
   b. To save and apply the meta group to the current Investigation view, click **Save and Apply**.
      The group is created and applied immediately to the current Investigation view.
10. Click **Close**.

Duplicate and Edit an Out-of-the-Box Meta Group

If you want to customize an OOTB meta group, you need to duplicate the group and then edit the duplicate.

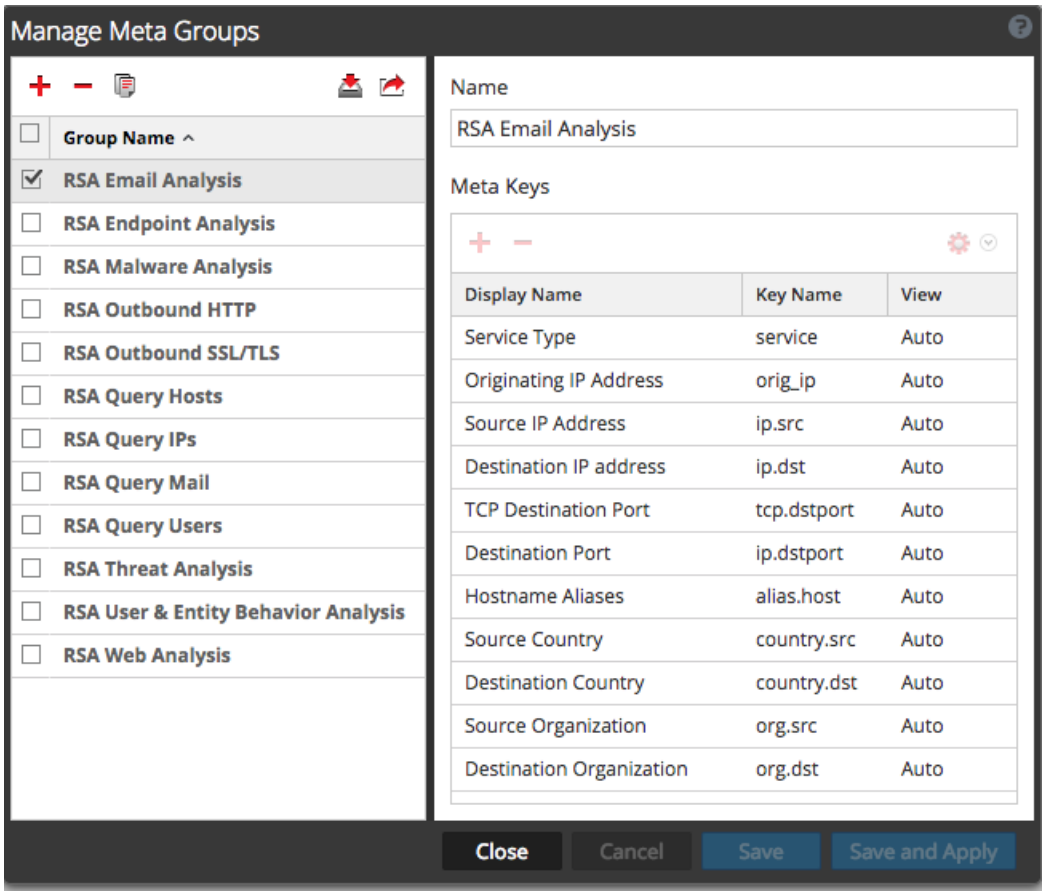
1. Select an OOTB meta group from the Manage Meta Groups list and click .
   The form to the right opens for editing with all of the meta keys as they are in the OOTB group.



2. Enter a name for the new group and continue editing as described in "Edit a Meta Group" below.

Edit a Meta Group

1. Select a group from the **Meta Groups** list.
   The form to the right opens for editing.



2. (Optional) Edit the Name of the group.
3. (Optional) Add new meta keys, as described above in "Create a Meta Group and Add Meta Keys."
4. (Optional) To set the order for the keys, drag and drop one or more keys.
5. (Optional) To change the initial view of a meta key, click and choose one of the possible views. When you modify the meta group, you cannot set the key to OPEN. If you change the default view for a group of meta keys to OPEN and some of the meta keys are non-indexed, the non-indexed meta keys revert to AUTO. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are CLOSED until opened manually.
   The value for the initial view is displayed in the View column.
6. To save, the changes, click **Save**.
7. To apply the changes to the current Navigate view, click **Save and Apply**.

Delete a Meta Group

1. In the **Meta Groups** list, select the group to be removed.
2. Click .
   A confirmation dialog provides an opportunity to cancel or complete the request.

3. Click **OK**.
   The meta group is deleted. When you close the window, if the deleted group was the currently applied meta group, it is removed and the default meta keys are used to build the view.

Export a Meta Group

User-defined meta groups are created on individual services. To make meta groups available to another service, you must export them to your local file system. To export one or more meta groups:

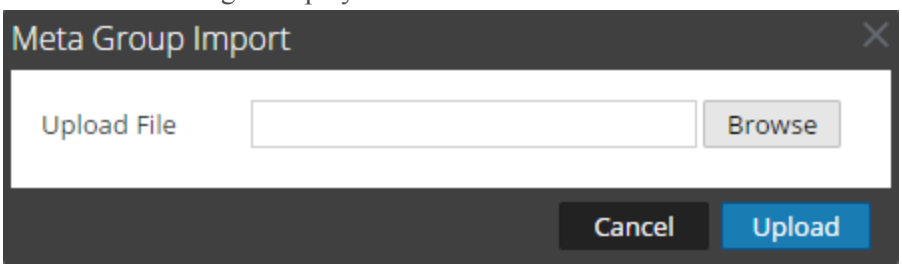
1. In the **Meta Groups** list, select one or more groups to be exported.
2. Click .
   The selected groups are downloaded to your local file system as a **MetaGroups.jsn file**. Every download of meta groups has the same name with a numeral appended to avoid overwriting previous downloads.

Import a Meta Group

To make user-defined meta groups from another service available to the currently investigated service, you must import the `MetaGroups.jsn` file from the local file system. When you import meta groups, an error message is displayed if any of the groups are already present. To import a group that is a duplicate, you must first delete the existing group. If you want to delete a meta group, it cannot be in use by a profile.

To import meta groups:

1. In the **Meta Groups** list, select a file to import and click .
   The selection dialog is displayed.



2. Click **Browse** and navigate to the directory on your local file system where the downloaded `MetaGroups.jsn` files are stored. Select a file and click **Open**.
   The filename is displayed in the Upload File field.
3. Click **Upload**.
   The upload process begins, and a message indicates that the upload was successful. The meta groups are added to Meta Group list. If the file is a duplicate of an existing meta group, a dialog tells you that the meta group already exists.

Visualize Metadata as Parallel Coordinates

Analysts can use the parallel coordinates visualization in the Navigate view to focus the investigation on combinations of meta keys and values that may indicate events are abnormal and worth investigation.

Note: In Version 11.1 and later, wherever meta keys are used, you can also use configured meta entities.

The parallel coordinates chart is a way of visualizing the current drill point in Investigate to examine more than two meta keys simultaneously. Visualizing multiple meta keys simultaneously can help in identifying security issues associated with multivariate patterns and comparisons, such as when individual meta keys and values may not be of concern, but combining them together may bring an abnormal pattern or relationship to light. Meta groups (see Manage Meta Groups) can be used effectively to define a collection of meta keys that you want to visualize as parallel coordinates.

Best Practices for Effective Parallel Coordinates Charts

To create effective parallel coordinates charts, follow these recommendations:

- Start from a drill point rather than attempting to visualize all data.
- Limit the time range if necessary.
- Choose the smallest useful set of meta keys to display as axes.
- Specify the sequence of axes to highlight anomalies between the meta values as you follow a line across the chart.
- When you can identify a useful set of meta keys and sequence, create a custom meta group to use for future investigations. For example, you can create a custom meta group for Windows executable file types.
- Use the RSA out-of-the-box (OOTB) meta groups that are included in a new installation.
- Re-use and share custom meta groups by importing and exporting groups as `.jsn` files.
- It may be useful to create two versions of each custom meta group. One for analysis of meta values and one for creating a parallel coordinates chart focusing on a smaller subset of the same use case.

Note: When you import meta groups, an error message is displayed if any of the groups are already present. To import a group that is a duplicate, you must first delete the existing group. If you want to delete a meta group, it cannot be in use by a profile.

To help build better parallel coordinates charts, several optimizations are included in NetWitness Platform.

- Analysts can specify that only sessions in which all meta keys exist are rendered in the chart.
- The administrator can increase the number of meta values rendered in the Parallel Coordinates Settings in the Administration System view > Investigation panel > Navigate tab.

RSA Meta Groups for Parallel Coordinates Use Cases

A set of predefined meta groups is included with NetWitness Platform. If you want to get the latest version, you can import the meta groups file, `MetaGroups_ootb_w_query.jsn`, in the Manage Meta Groups dialog. Some of the targeted activities that lend themselves well to Parallel Coordinates visualizations are:

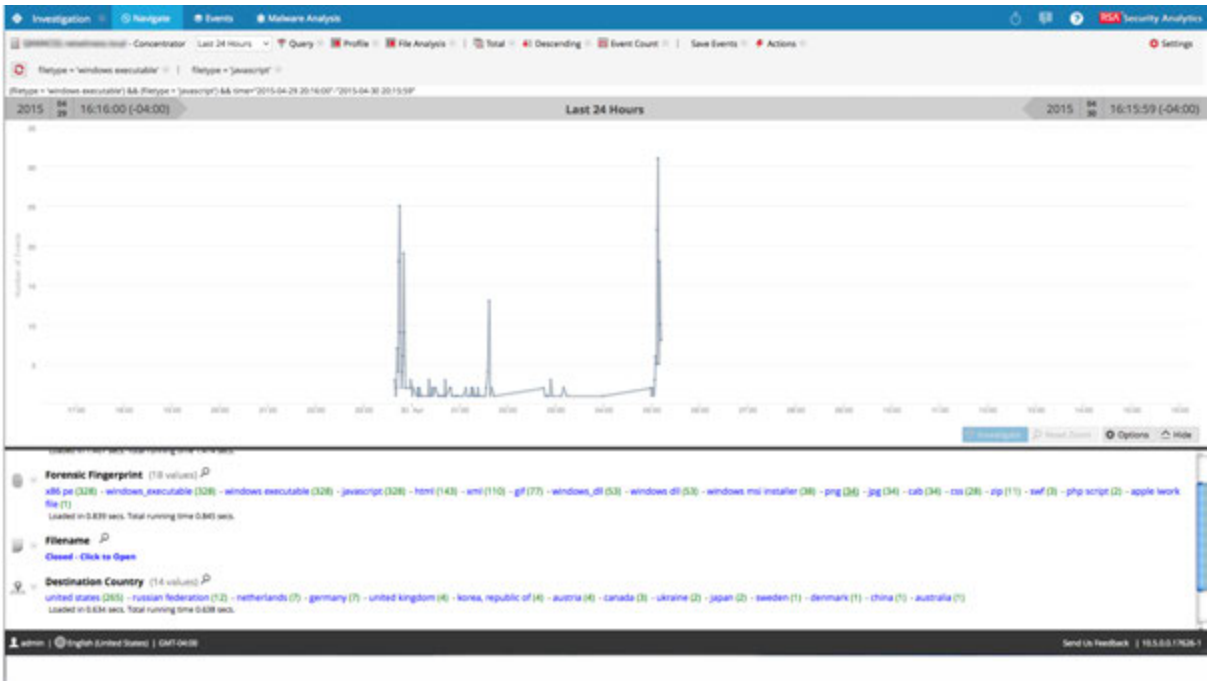
- Botnet Beaconing
- Covert Channels
- Email
- Encrypted Sessions
- Endpoint Analysis
- File Analysis
- Malware Analysis
- Outbound HTTP
- Outbound SSL/TLS
- SQL Injection Attacks
- Threat Analysis
- Web Analysis

View a Parallel Coordinates Visualization

From an investigation in the Investigate > Navigate view:

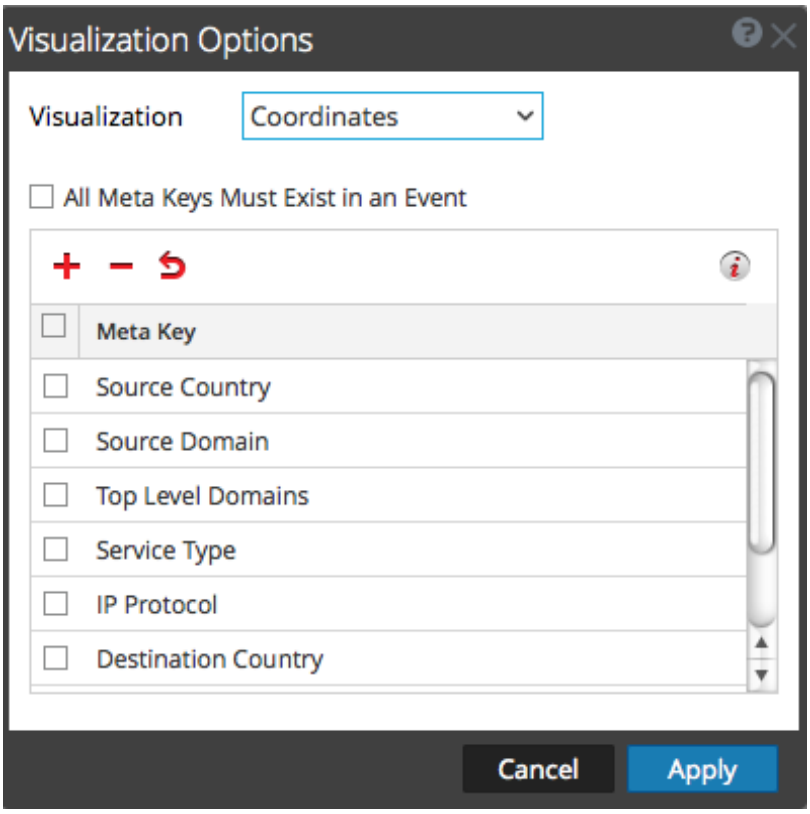
1. If the Visualization panel above the Values panel is closed, select **Visualization**.
2. In the toolbar, select **Meta** > **Use Meta Group > File (Malware) Analysis**.
3. In the **Values** panel, in the **Forensic Fingerprint** meta key, click `windows_executable` and then `x86 pe`, so that the breadcrumb reads `filetype = 'windows_executable' | filetype = 'x86 pe'`.

4. A default visualization for the current drill point is displayed as a timeline.



5. In the **Visualization** panel, select **Options**.
   The Visualization Options dialog is displayed.

6. In the **Visualization** drop-down list, select **Coordinates** and click **Apply**.

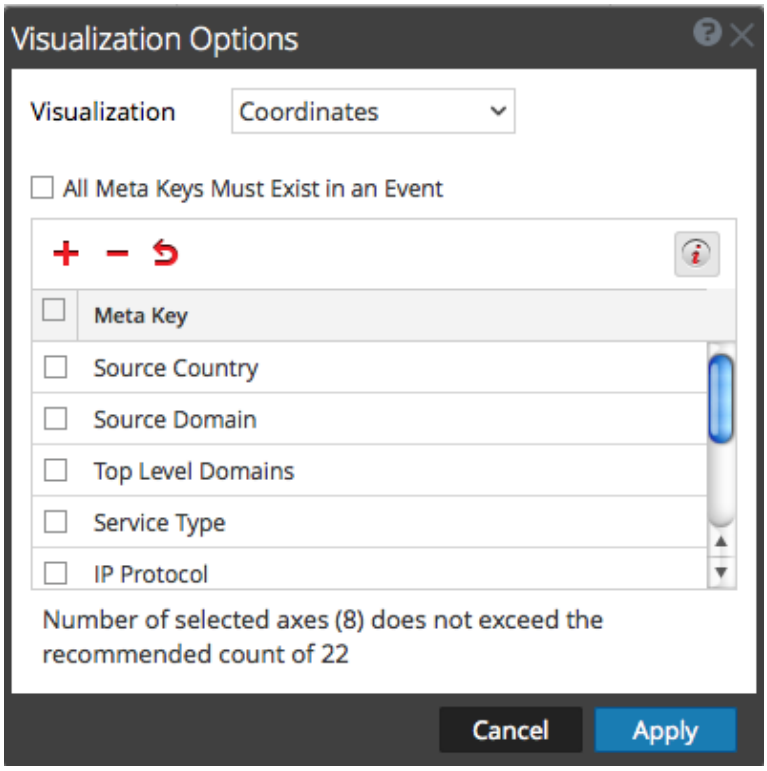


The visualization is loaded. In this example, 249 events are found and 199 unique paths are visualized.

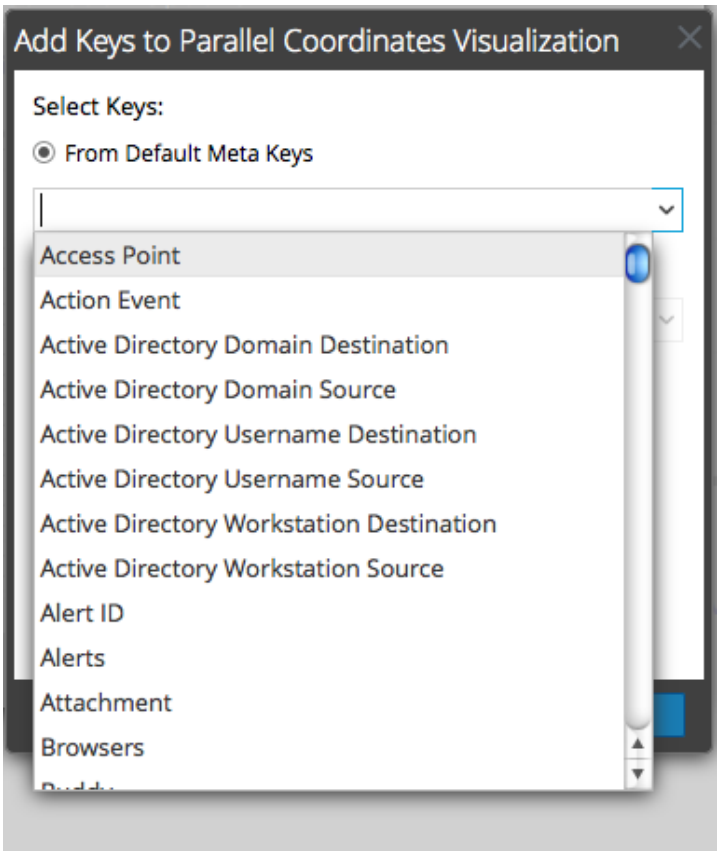
Select Meta Keys for a Parallel Coordinates Visualization

With a Parallel Coordinates visualization open, do the following:

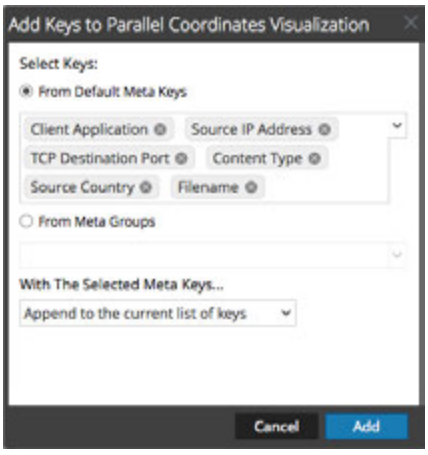
1. In the Visualization panel, select **Options**.
   The Visualization Options dialog is displayed. In the toolbar, click to display the recommended number of axes for a readable visualization. When a recommended count of keys is displayed, the count changes based on the browser size. If you make the browser window larger, the recommended count is increased.



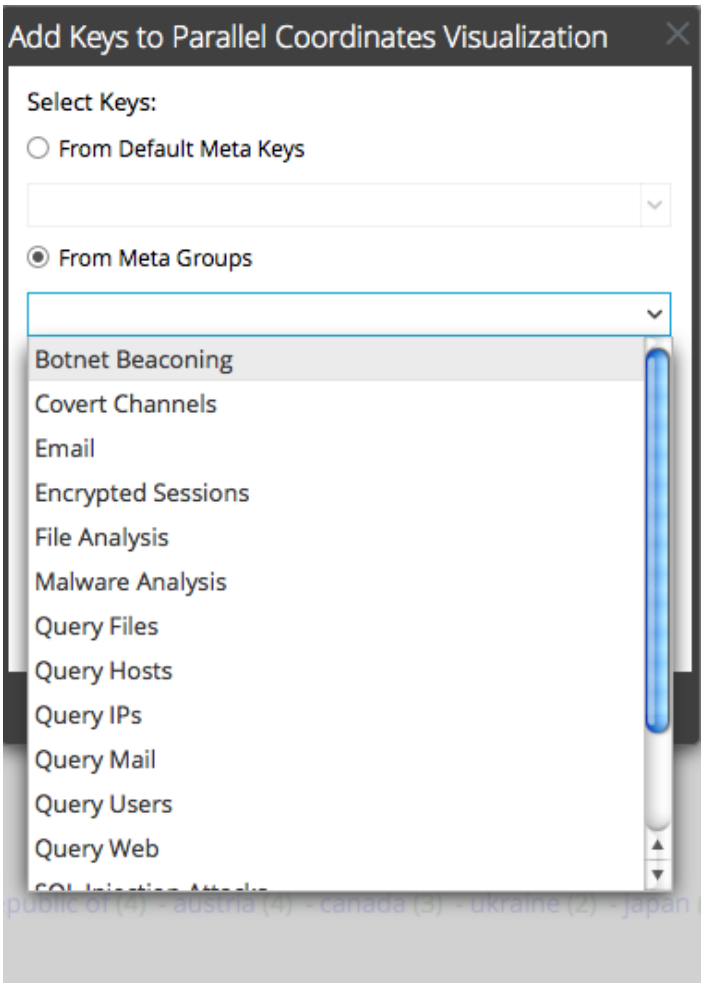
2. If you want to change the sequence of the meta keys, drag meta keys up or down to the desired sequence.
3. If you want to delete any meta keys, click in the selection box, and click .
   The meta keys are removed, but the change has not been applied.
4. If you want to revert to the previous state, click .
   Any meta keys you have deleted are restored and any changes that you made are removed.
5. If you want to select individual meta keys, click , select **From Default keys**, and in the drop-down list, select the meta keys.



The selected keys are listed.

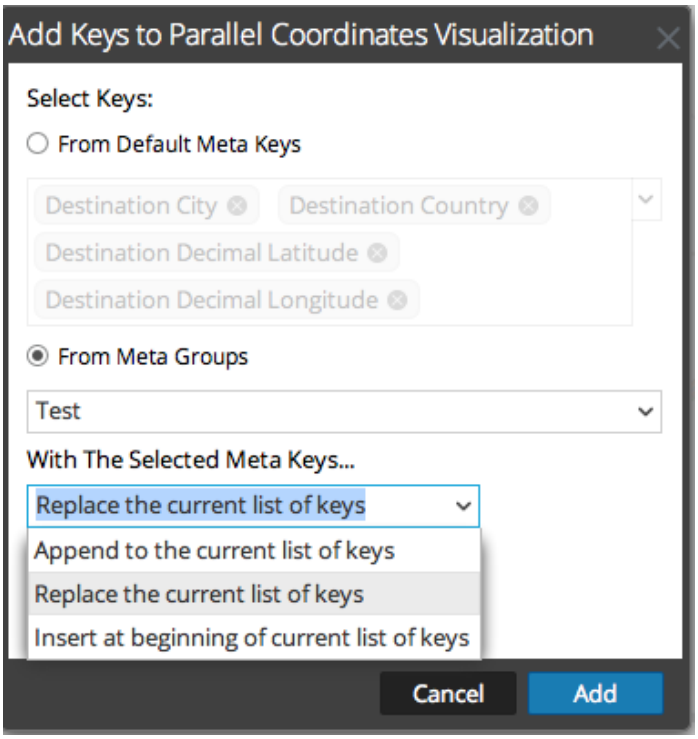


6. If you want to add all the keys in a meta group, you cannot add individual meta keys. Select **From Meta Groups**, and select a group from the drop-down list.



The selected meta groups are listed in the field.

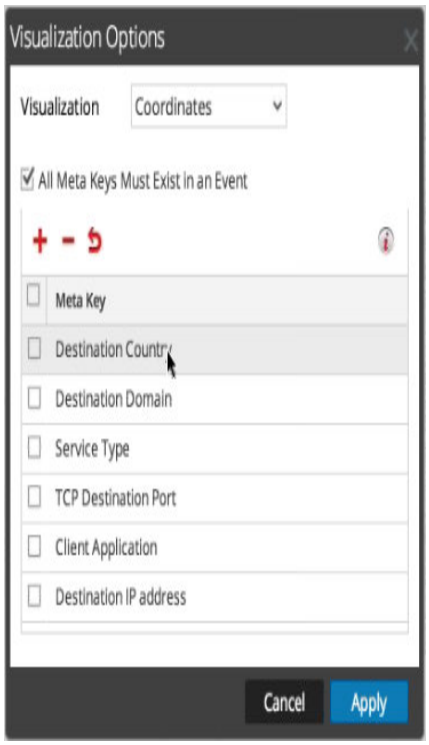
7. Select the method of adding the keys or groups: **Replace the current list of keys**, **Append to the current list of keys** (at the end), or **Insert at the beginning of current list of keys.**



8. To complete the procedure, click **Add**.
   The Visualization Options dialog is displayed with the meta keys or groups you selected.
9. To display the new visualization chart, click **Apply**.

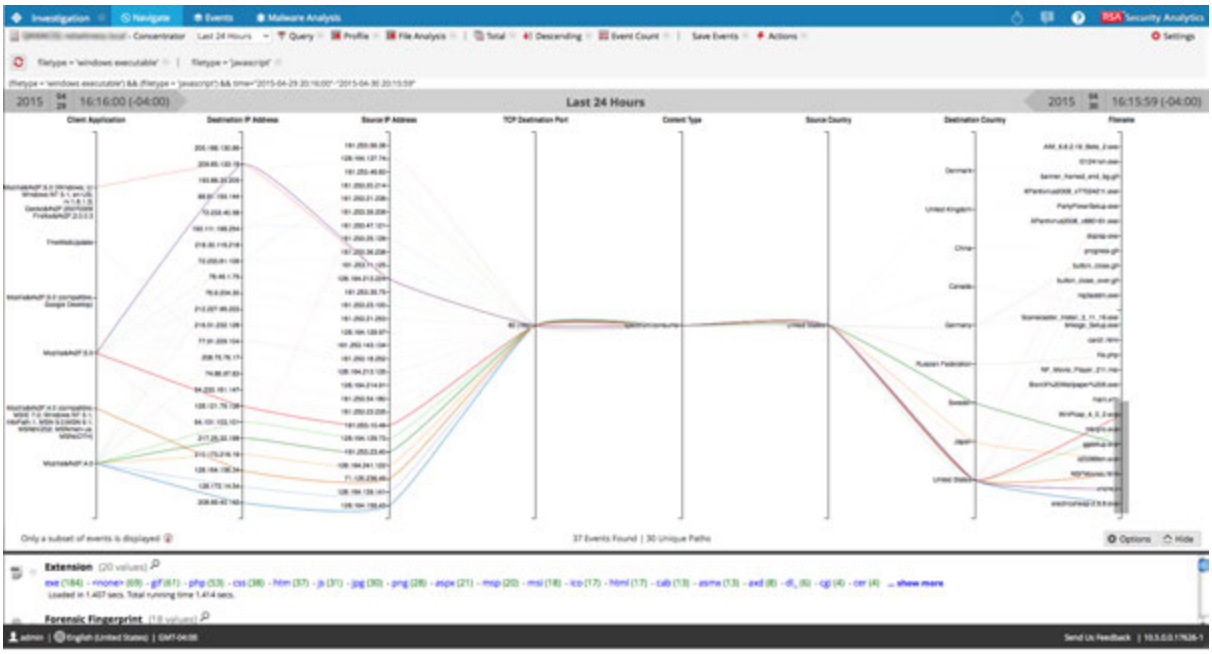
Optimize a Parallel Coordinates Visualization

1. To optimize the visualization by removing events in which not all meta keys exist, select **Options.**



2. In the Visualization Options dialog, select **All Meta Keys Must Exist in an Event**. Click **Apply**. The resulting graph is more readable and useful and has fewer unique paths.

3. If you want to highlight a small set of points to see the path of the line from right to left, click on an axis. The cursor changes to cross hairs, which you can drag to select one or more values. When you let go of the mouse, the lines are highlighted. In the example below, the SSL service type is highlighted by a gray box.



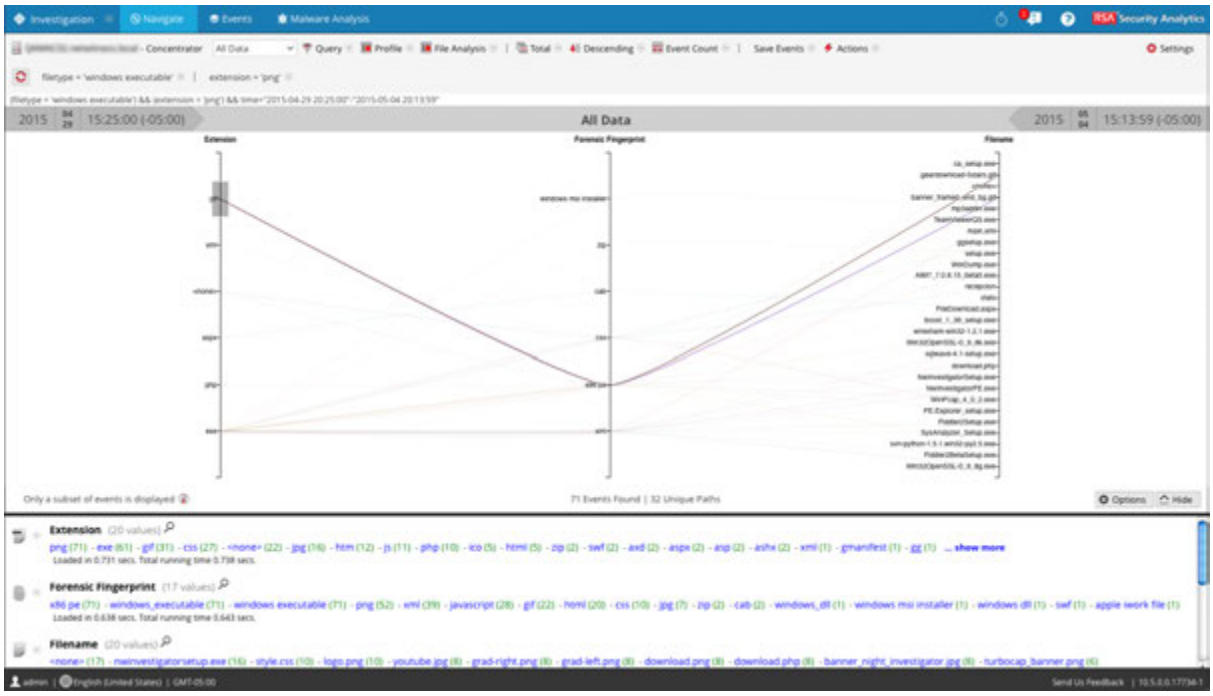
4. If you want to enlarge the visualization, drag the bottom edge of the panel down and drag the right edge of the browser window wider.

Sample Use Case

Below is an example of a parallel coordinates visualization of meta keys representing file metadata in a session. There are three meta keys or axes from left to right: Extensions, Forensic Fingerprint, and Filename with values listed along each axis. Values on the Extension axis show the file extension, and values on the Forensic fingerprint axis are windows executables. Normally the file type matches the expected forensics fingerprint; however, it is abnormal for a `gif` file type to be combined with the Windows executable fingerprint. The `gif` file type is selected to highlight the correlations of that file type, `x86pe` , and two filenames in the third axis so that an analyst can quickly identify the files that merit investigation.

To reach this view:

1. Order by Value and Sort in Ascending order.
2. Apply two filters (file type = 'windows executable' and extension = 'gif') in the Navigate view to limit the amount of data.
3. Configure a parallel coordinates chart by choosing three axes: `file extension`, `forensic fingerprint`, and `filename`.



Sample Visualization of a Large Data Set

This example of a parallel coordinates visualization applied to a larger set of data illustrates several messages that help analysts to understand what has been charted.

- To create a chart, NetWitness Platform begins scanning meta values and returning results. A typical time range could have up to 10,000,000 meta values. When the number of meta values returned reaches the Meta Values Result Limit, the chart is rendered even if NetWitness Platform has not scanned a number of meta values equal to the Meta Values Scan Limit.
- There is a fixed limit on the amount of data that can be rendered as a parallel coordinates chart. In NetWitness Platform 10.4 and prior, the limit is based on the number of axes times data values: 1000 x the number of axes to protect performance, but in NetWitness Platform 10.5 and above the administrator configures parallel coordinates limits as part of the Investigation settings In the Administration System view.

With a larger set of data, the parallel coordinates chart takes longer to process than the smaller set of data and meta keys. To preserve performance, NetWitness Platform renders the meta values from the Values panel below until the limits set by the Administrator are reached. An informational message tells you: **Only a subset of events is displayed.**

Of all the data visualized for 249 events, there were only 199 unique parallel coordinates paths. Some events are included though they do not include some of the meta keys; these are labeled **DNE** because the meta does not exist in the event.

Open an Event in the Events List

Analysts can view a list of events associated with a session in the Investigate > Events view or in the Event Analysis view.

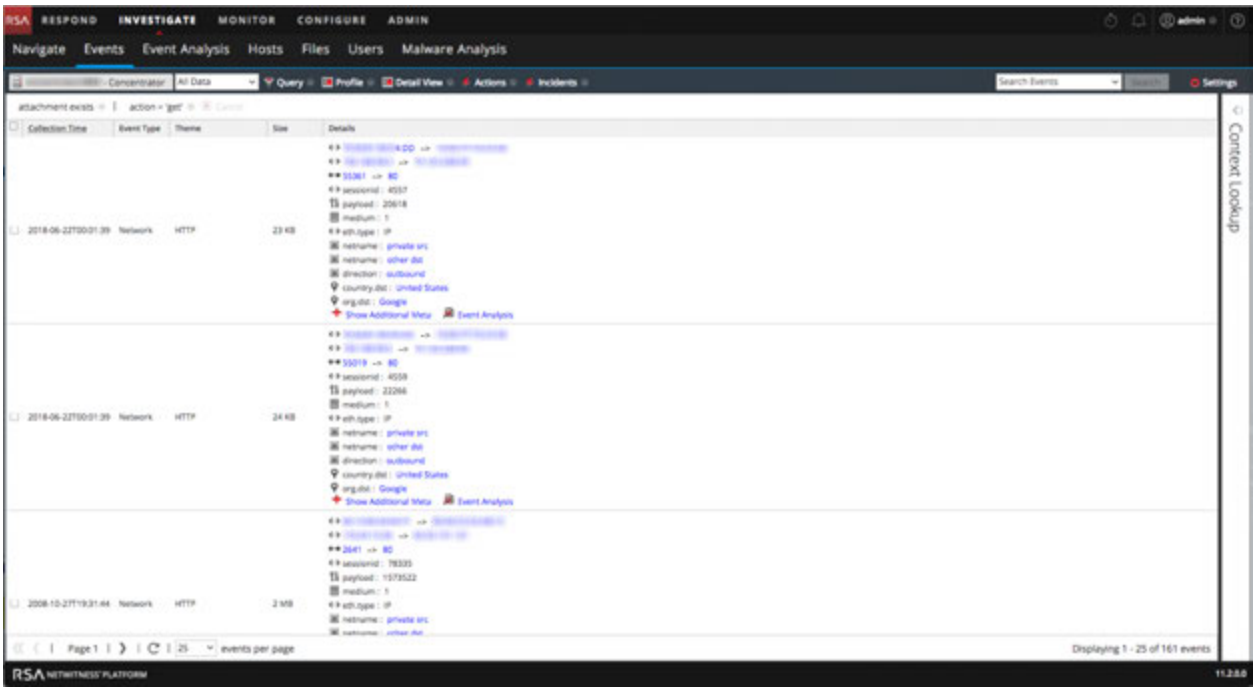
To display events in the Events view do one of the following:

1. To use the default query for the default service, go to **INVESTIGATE** > **Events**. NetWitness Platform runs a default query on the last three hours for the default service (if one is set) or displays a dialog in which you can select a service and then runs the default query. The default query selects all events and the Events view displays events on the selected service, with the oldest events first.
2. To view events for a specific meta value, go to **INVESTIGATE > Navigate** and when events are loaded in the Values panel, click a meta count (the meta count is in green text). You can also right-click the meta count for a meta value . When the context menu is displayed, click **Open Events in new tab**. (The Open Event Analysis in new tab option is available in Verison 11.1 and later.)

   The Events view displays the events for the selected meta value.

The Events view provides three built-in presentations of event data: the Detail view, the List view, and the Log view.

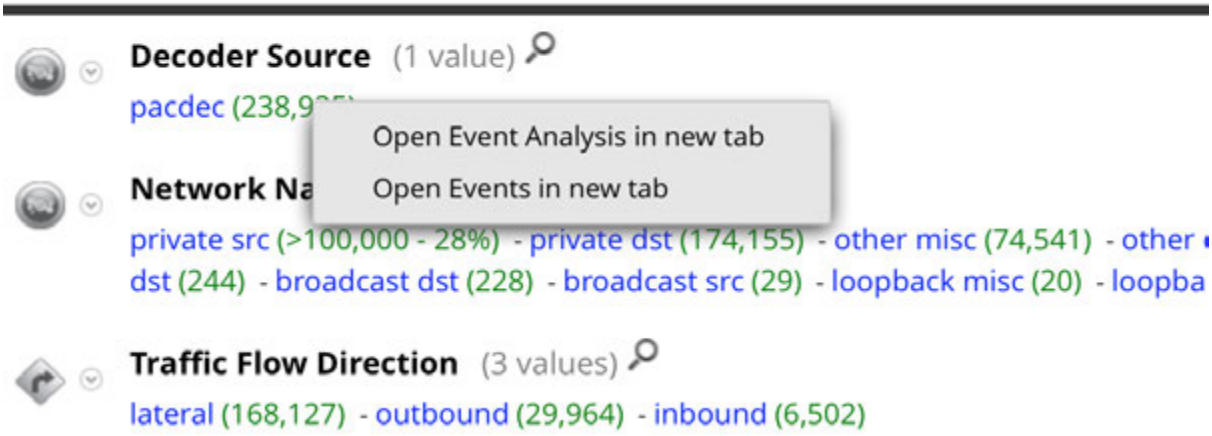
This figure is an example of the Detail view.



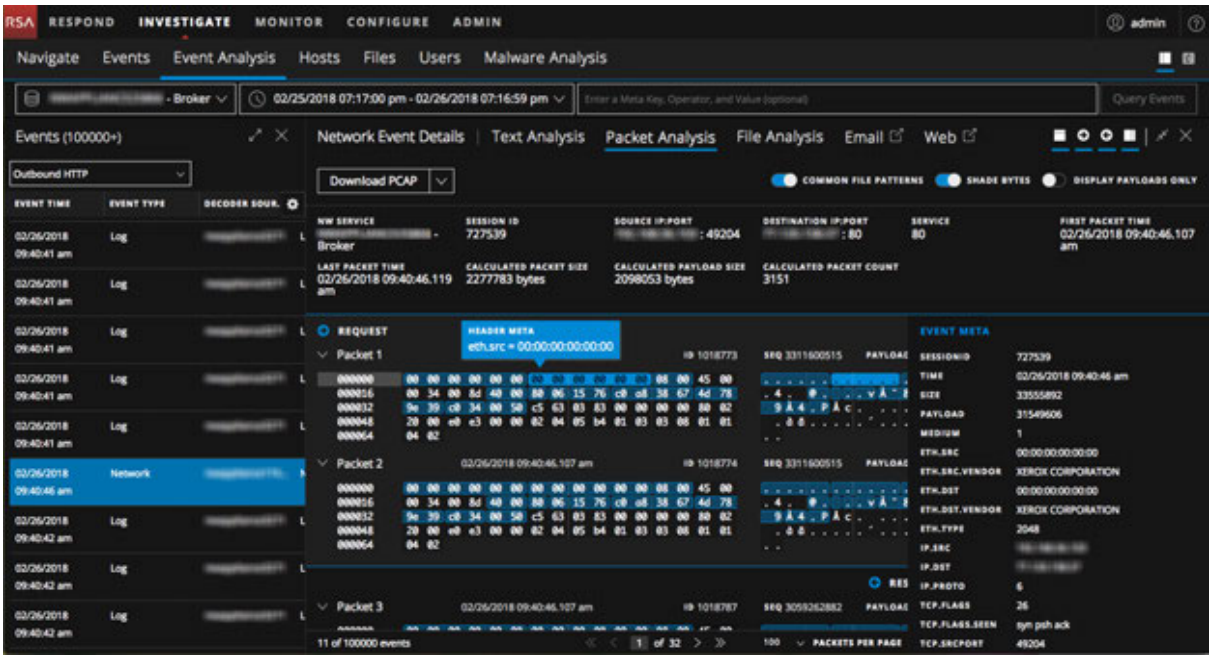
You can use queries, the time range setting, and profiles to filter the events listed in the Events view. From any view type in Events view, you can extract files, export events, export logs, and open the Event Reconstruction panel by double-clicking an event. See Examining Raw Events in the Events View for detailed information about these capabilities.

To display events in the Event Analysis view, do one of the following:

1. In Version 11.0 and later, go to **INVESTIGATE > Navigate**, right-click the meta count for a meta value (the meta count is in green text). When the context menu is displayed, select **Open Event Analysis** in new tab.



The Event Analysis view displays the events for the selected meta value.



For detailed information about the types of analysis that you can use in this view, see Analyzing Raw Events and Metadata in the Event Analysis View .

Export or Print a Drill Point

In NetWitness Investigate, when the data for a drill point is displayed in the Navigate view, you can:

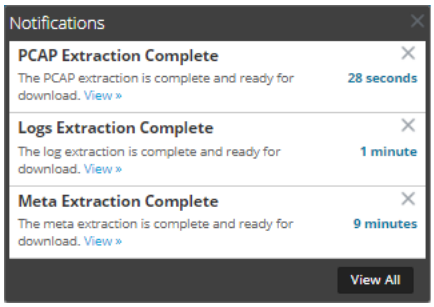
- Extract files from a session and choose the type of files to extract: archives, audio BitTorrent, documents, executable, images, other, video, and web.
- Export the drillpoint as a packet capture (PCAP) file, a log file, or a meta data file.
- Print the drillpoint.

The details being exported are affected by both the time range and drill point at the time of exporting.

Note: When you export the drill point as a log file, only the log sessions are exported. The job queue message refers to the total number of sessions in the drill point rather than the number of logs. For example, if the drill point has 505 sessions and only five log sessions, the job queue message states that NetWitness Platform is extracting logs for 505 sessions.

To export a drill point from the Navigate view:

1. Conduct an investigation until you reach the desired drillpoint.
2. For Version 11.0, In the toolbar, select **Actions > Export** and select one of the export options: **PCAP**, **Logs**, or **Meta**.
   The drill point is extracted, and a message advises that the job is scheduled. You can check the jobs page for the status.
3. For Version 11.1, in the toolbar, select **Save Events** > and select one of the export options: **PCAP**, **Logs**, **Files**, or **Meta**.
   A dialog gives you an opportunity to edit the default filename for the file. The default is in the form `investigation-Feb-21-15-44-33`. When you are exporting a PCAP, the file is exported with no choice of formats. If you are using one of the other export options, a dialog is displayed.
4. In the dialog, select:
   - The export log format: **Text**, **XML**, **CSV**, or **JSON**.
   - The file types to export: Archives, Audio, BitTorrent, Documents, Executables, Images, Other, Video, and Web.
   - The Meta format: **Text**, **CSV**, **TSV**, **JSON**.
5. When the scheduled file extraction is complete, it is displayed in the Job Notifications tray.



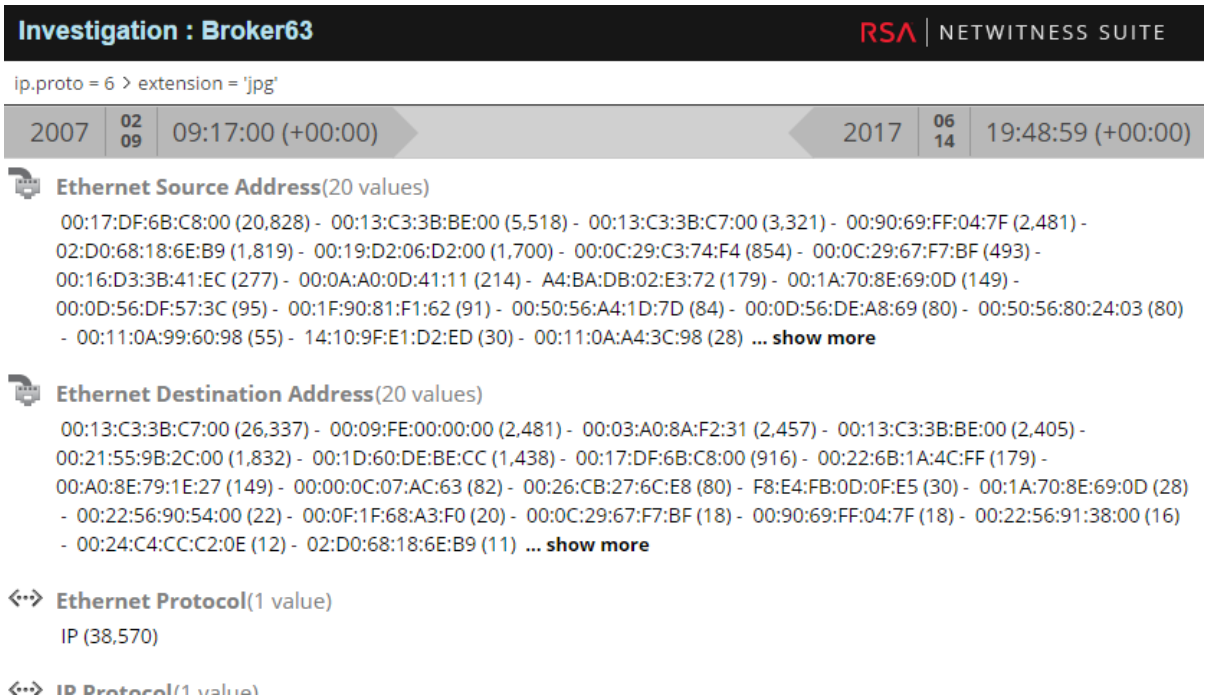
6. Click the **View** link in the Jobs tray and download the specific extraction file requested.

To print the current drill point:

In the Navigate view, you can display the contents of the current drill point in printer friendly format in the browser window.

To display the current drill point in a print view:

1. With a drill point open in the **Navigate** view, select **Actions** > **Print** in the toolbar.
   A new tab is created with the print view of the current drill point.



2. Use the print option in your browser to send the printable view to the printer.

Launch an External Lookup of a Meta Key

This topic provides instructions for using out-of-the-box Investigate plugins to launch an external lookup of specific meta keys using tools external to NetWitness Platform while investigating data in the Navigate view or Events view.

Analysts can use out-of-the-box NetWitness Platform Investigate external lookups to save time during investigations. The out-of-the-box lookups are available by right-clicking one of the these meta keys: IP address (`ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip`), `host (alias-host, domain.dst)`, `client`, and `file-hash`.

For all `IP` and `host` meta keys, the following lookups are built in to NetWitness Platform:

- Google Malware: Opens a Google Malware search in a new tab.
- SANS IP History: Opens a SANS IP History search in a new tab.
- McAfee SiteAdvisor: Opens a McAfee SiteAdvisor search in a new tab.
- Endpoint Thick Client Lookup: Opens a search in the NetWitness Endpoint Thick Client in a new tab.
- BFK Passive DNS Collection: Opens a BFK Passive DNS collection search in a new tab.
- CentralOps Whois for IPs and Hostnames: Opens a CentralOps Whois search for IPs and hostnames in a new tab.
- Malwaredomainlist.com Search: Opens a Malwaredomainlist.com search in a new tab
- Robtex IP Search: Opens a RobtexIP search in a new tab.
- ThreatExpert Search: Opens a ThreatExpert search in a new tab
- IPVoid Search: Opens a UrlVoid Search in a new tab n a new tab

For the `file-hash` and `alias-host` meta keys, the Google lookup opens a Google search in a new tab.

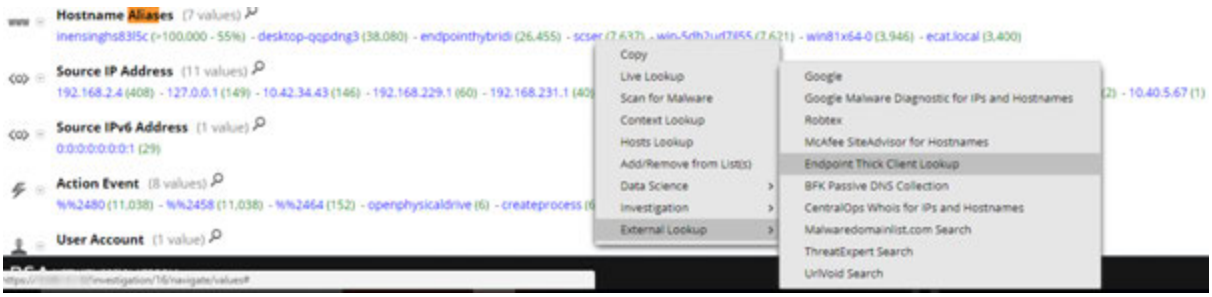
For the `client` meta key, the NetWitness Endpoint Lookup option opens an Endpoint Thick Client in a new tab if the client is installed on the same system on which the browser is being used.

Administrators can add additional external lookups and other custom actions as described in "Add Custom Context Menu Actions" in the *System Configuration Guide*.

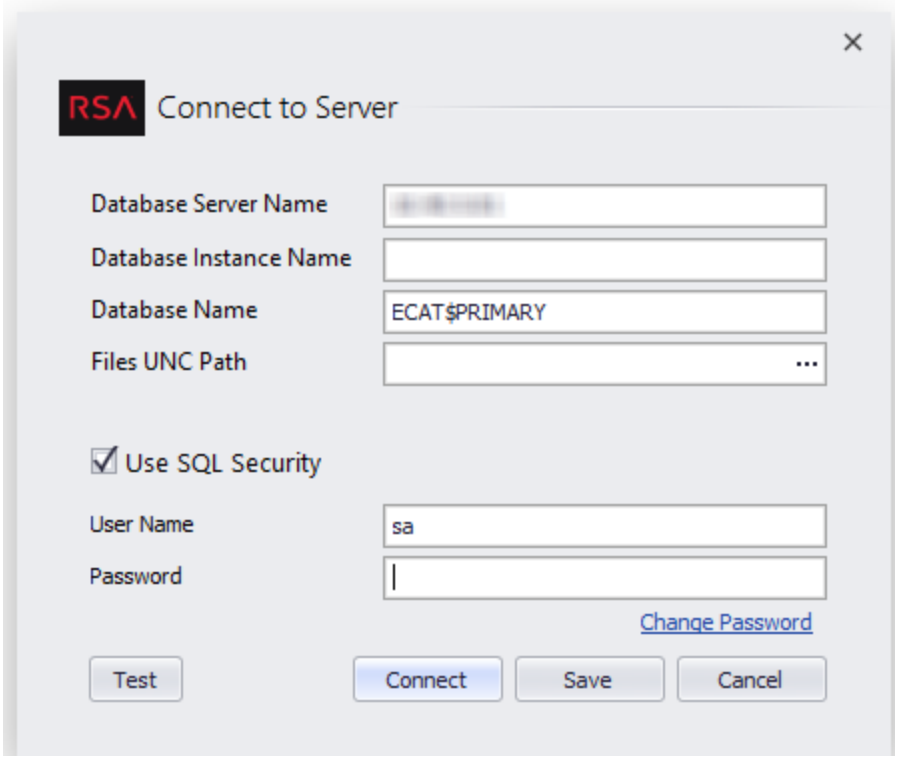
Launch an Endpoint Thick Client Lookup

To launch an Endpoint Thick Client lookup of data from the Navigate view:

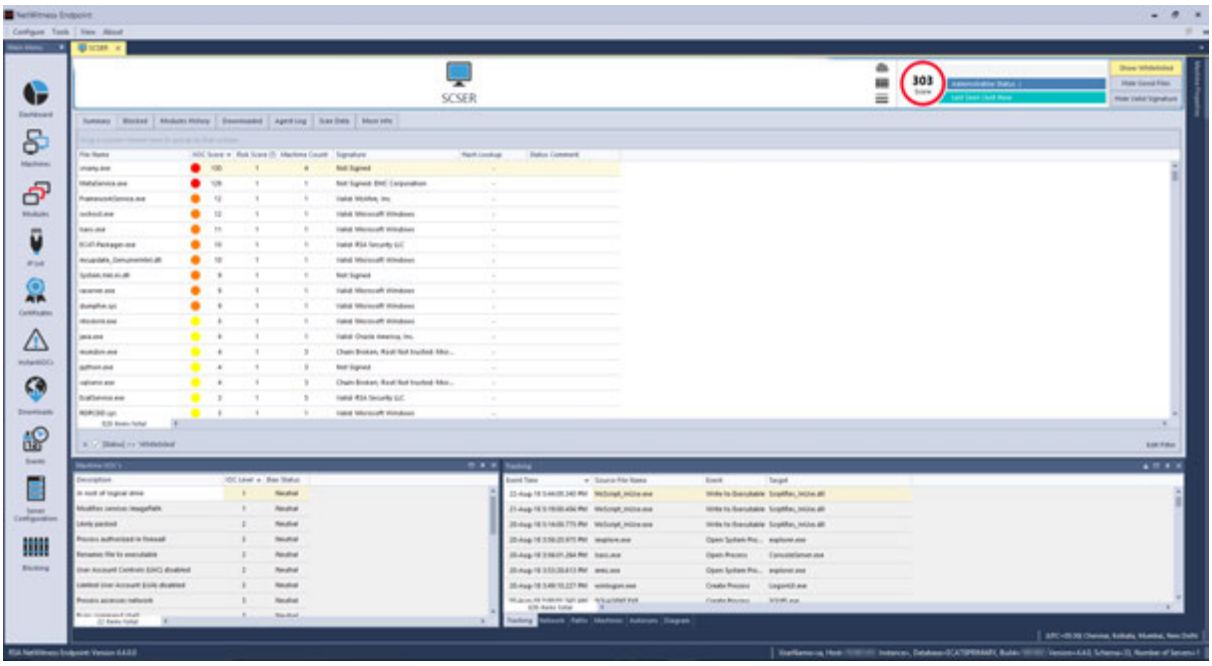
1. Right-click a meta value for one of the following meta keys: `ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip, alias-host, domain.dst, client.`
2. Select **External Lookup** in the context menu.
   A submenu of external lookup options is displayed.



3. Select **Endpoint Thick Client Lookup**.
   The Connect to Server dialog is displayed.



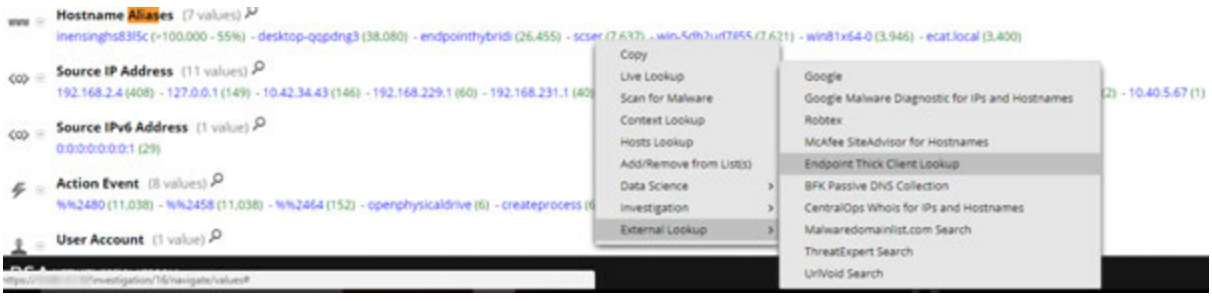
4. Enter the user name and password required to log in to the Endpoint Thick Client, and click **Connect.**
   The drill point opens in NetWitness Endpoint.



Lauch Other External Lookups

To launch an external lookup (other than NetWitness Endpoint Thick Client Lookup) of data from the Navigate view:

1. Right-click a meta value for one of the following meta keys: `ip-src, ip-dst, ipv6-src, ipv6-dst, orig_ip, alias-host, domain.dst, client.`
2. Select **External Lookup** in the context menu.
   A submenu of external lookup options is displayed.



3. Select one of the lookup options.
   The selected meta value opens in the selected lookup, for example, if you selected SANS IP History, the drill point information is displayed in SANS Internet Storm Center.

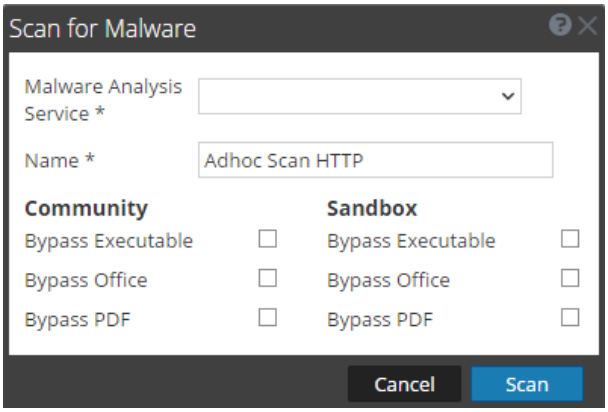
Launch a Malware Analysis Scan from the Navigate View

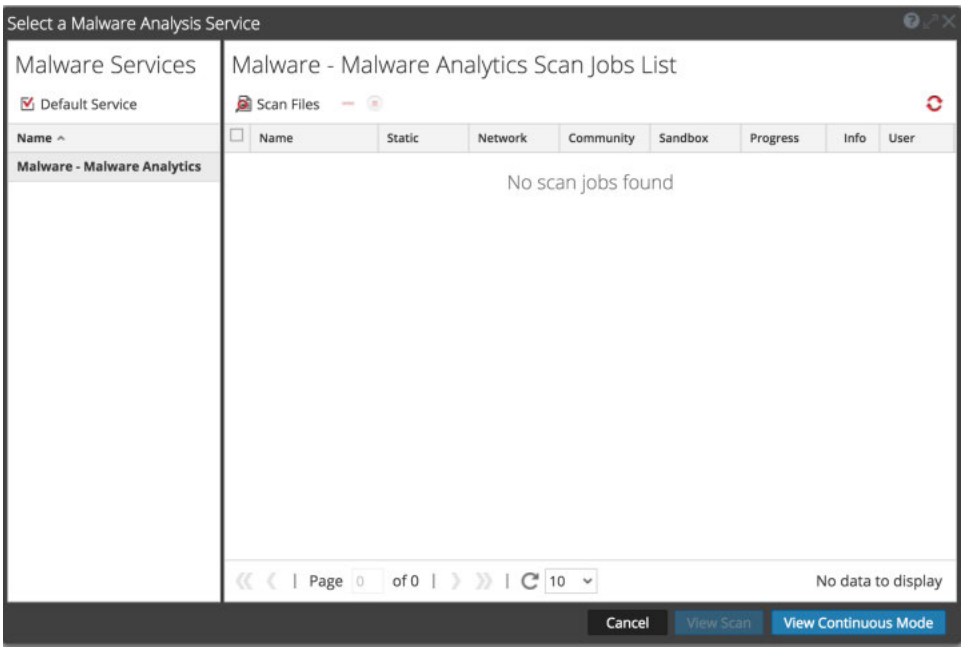
From within Investigate, analysts can launch an on-demand Malware Analysis scan by selecting a service and meta value, and choosing an option from the context menu. When polling is complete, the scanned data is available for malware analysis.

To launch a Malware Analysis scan of data from the INVESTIGATE > Navigate view:

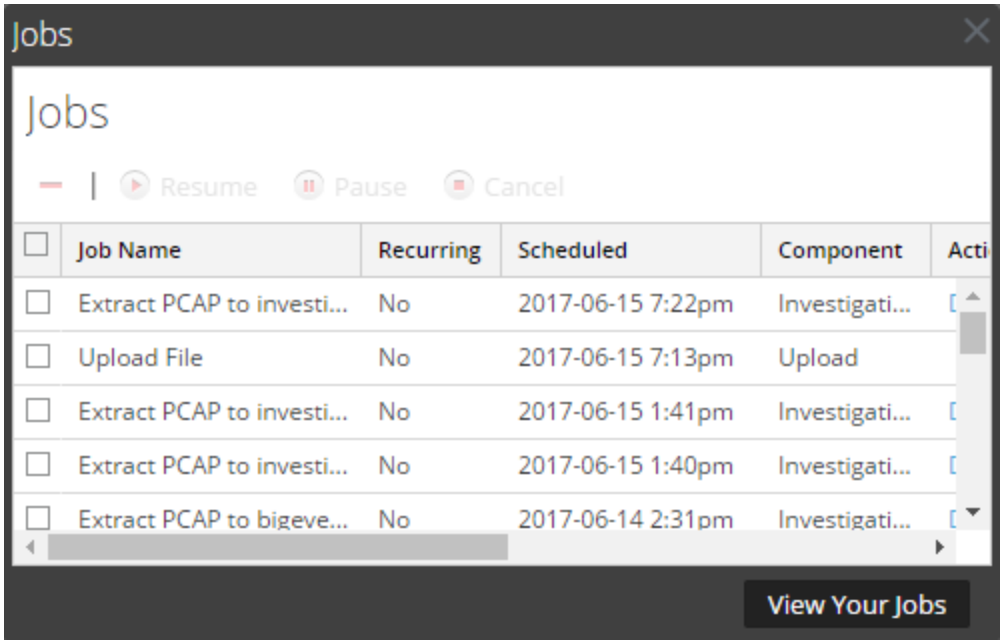
1. Right-click a meta value (for example, OTHER, DNS, or FTP) and select **Scan for Malware** in the context menu.
   The Scan for Malware dialog is displayed with a suggested name for the on-demand scan and no service selected.
2. In the Scan for Malware dialog, select a service to perform the scan, edit the name, and select the types of files to bypass under community and sandbox.



3. Click **Scan**.
   The scan request is added to the Scan Jobs List dashlet and the Jobs Tray. The bypass settings in this dialog override the default settings in the basic Malware Analysis configuration settings.
4. To view the jobs, do one of the following:
   a. Go to the Scan Jobs List in the Malware Analysis view or in the Unified dashboard. Double-click a scan to view the scan.



b. To view the job in the Jobs tray, click  in the NetWitness Platform toolbar. When the job is complete, scroll to the left and click **View**.



The Malware Summary of Events for the selected scan is displayed. The scan is also added to the list of available scans in the dialog for selecting scans in the Investigation > Malware tab.

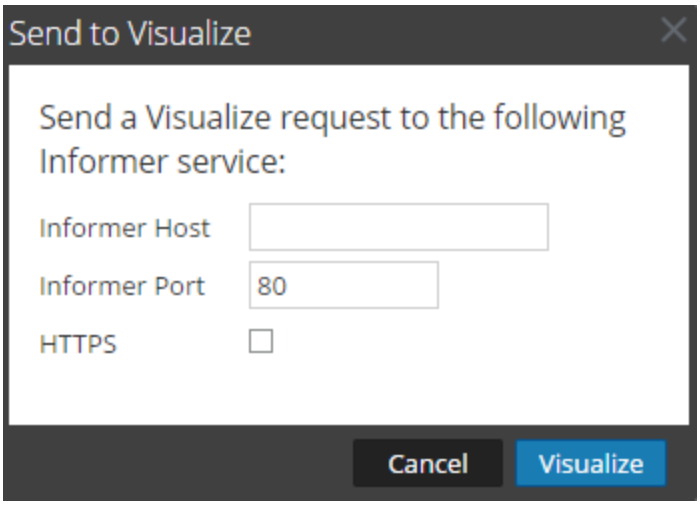
Visualize the Current Drill Point in Informer

This topic provides instructions for sending a drill point in the Navigate view to an Informer visualization.

Informer must be installed in your network and accessible by the service being investigated. You need to supply the host name and the port used on the Informer host to communicate with NetWitness Platform.

To display a visualization in Informer of the current drill point:

1. With a drill point open in the Navigate view, click **Actions > Visualize**.
   The Send to Visualize dialog is displayed.



2. Type the Informer hostname or IP address, and verify the NetWitness Platform server port used to communicate with the Informer host.
3. (Optional) Select the HTTPS option if the Informer host uses secured communications.
4. Click **Visualize**.
   The visualization is displayed in a new tab.

Examining Raw Events in the Events View

Analysts who are investigating data in Investigate can view and reconstruct events associated with a session.

- Analysts who conduct analysis using NetWitness Platform Investigate, and have the appropriate system roles and permissions set up for their user accounts, can go from a Navigate view drill point to the Events view.
- Analysts who do not have access to the Navigate view or want to go directly to the Events view, can open sessions and examine the events that make up the session in the Events view.
- Analysts can select queries from their "query history" window.

Separate topics describe methods of working in the Events view:

- Filter and Search Results in the Events View
- Manage Column Groups in the Events View
- Export Events in the Events View
- Add Events to an Incident for Response
- Combine Events from Split Sessions

In addition, you can use these methods of querying data and acting on results that are common to the Navigate view and the Events view.

- Search for Text Patterns
- Create a Custom Query
- View and Modify Queries Using URL Integration
- Use Profiles to Encapsulate Custom Views
- Manage Context Hub Lists and List Values in the Navigate and Events Views
- Look Up Additional Context in the Navigate and Events Views
- Reconstruct an Event

Filter and Search Results in the Events View

Analysts can filter the results in the Events view and, by searching for events or selecting the service on which to view events, setting the time range, and querying meta data.

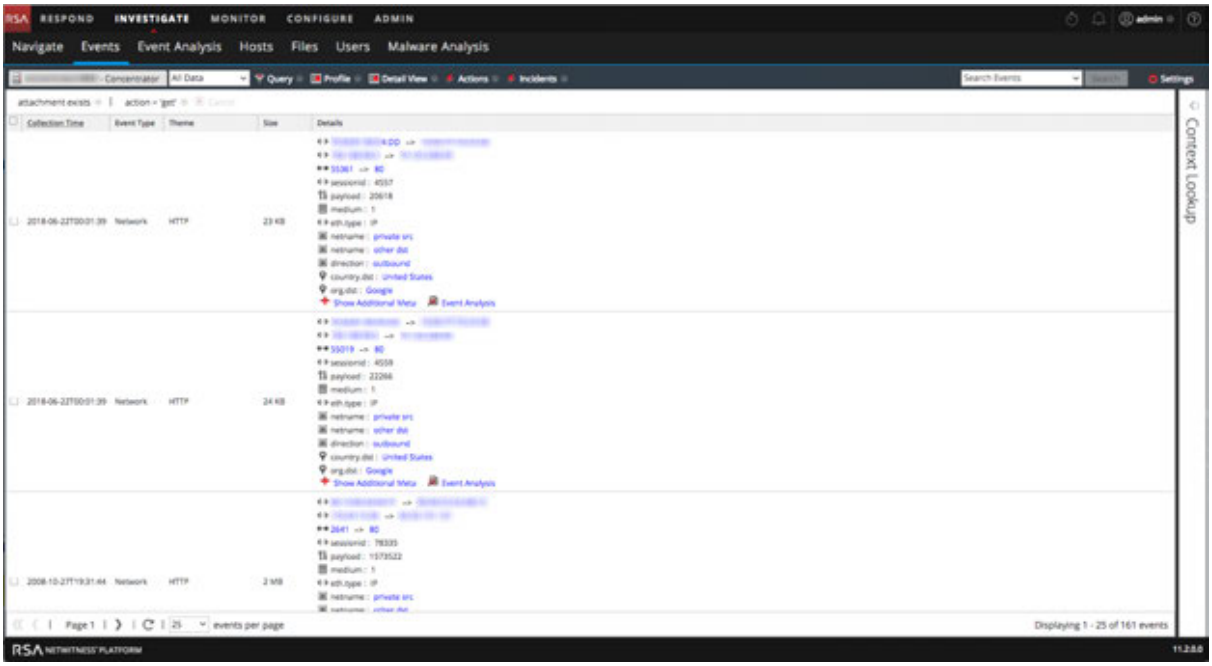
If you opened the Events view from a Navigate view drill point, the view opens to the Detail view of events by default. Analysts who do not have permissions to use the Navigate view can query services directly from the Events view. There are several configuration options to filter the information displayed in the Events view.

Note: When an Archiver is the currently selected service in the Events view and you are searching against a Broker or Concentrator, the search is slower than if searching against a Broker or Concentrator because the data on the Archiver is compressed and there is typically more data.

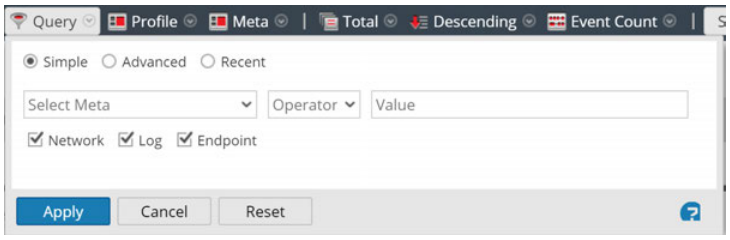
Filter Events Displayed in the Events View

To filter the data displayed in the Events view:

1. Go to **INVESTIGATE** > **Events**.
   The Events view is displayed showing the Detail view by default.

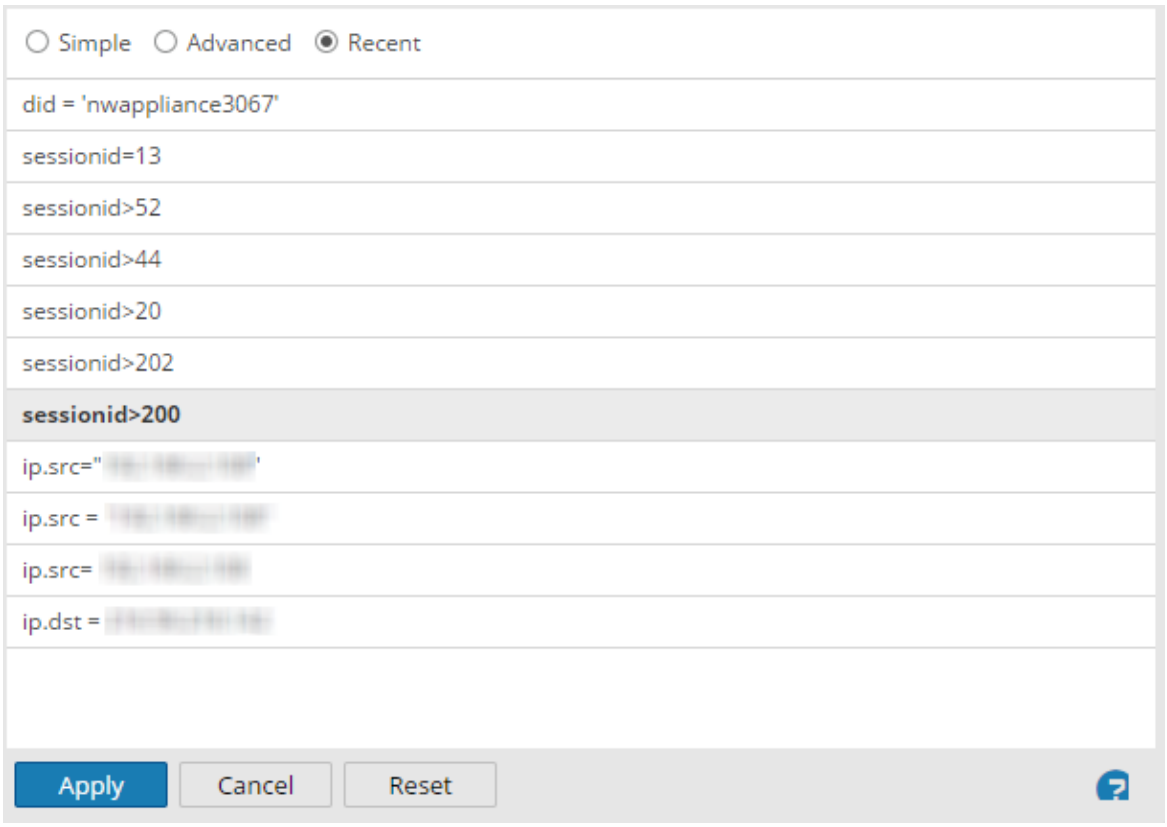


2. To select a time range other than the default (**Last 3 Hours**), in the toolbar, click the time range field and select a value. For example, **Last Hour**.
   The Events view is refreshed with the selected time range.
3. To enter a query for the selected service and time range, in the toolbar, click **Query**.
   The Simple Query dialog is displayed.



4. If you want to enter a simple query using the auto-complete feature to select meta and operators, do one of the following:
   a. Click in the **Select Meta** field and select a meta key from the drop-down list.
   b. Select an operator from the drop-down list in the **Operator** field.
   c. Type a value to match in the **Value** field.
   d. Select **Network, Log**, or **Endpoint** data, and click **Apply**.
      The matching data is displayed in the Events view.
5. If you want to enter a more complex query based on your knowledge of the meta and operators:
   a. Click **Advanced**.
      The Advanced Query dialog is displayed.

   b. Type a query. As you type the query, beginning with the meta key, drop-down lists of available meta keys and operators are displayed. When finished, click **Apply**.
6. If you want to select a query from a list of recent queries:
   a. Select **Recent**.
      The Recent Query dialog is displayed.



b. Select a query and click **Apply**.
The matching results for the query are displayed in the Detail view in the Events view. The breadcrumb reflects the query.

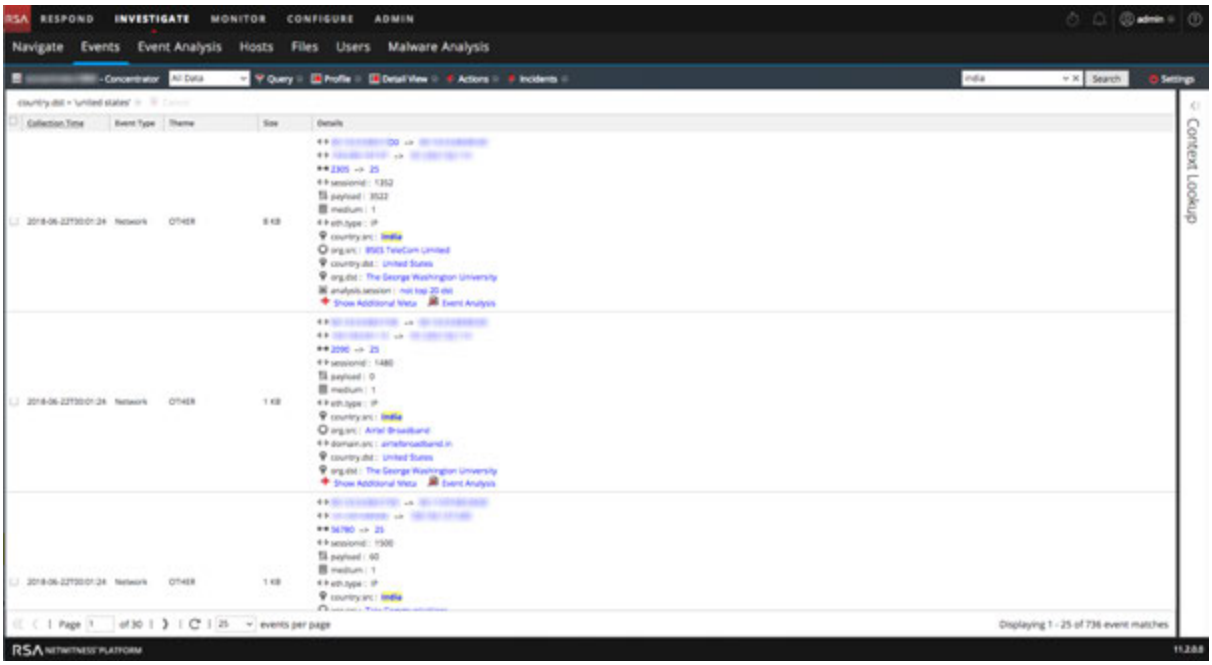
c. In the breadcrumb, you can click any of the crumbs to display the Query menu. You can insert a new query before a crumb, and append a new query to the end of breadcrumb. After each edit in the breadcrumb, NetWitness Platform refreshes the results.

Search for Events in the Events View

You can search the currently displayed data in the Events view by entering a search string in the Search field. The search string can be a regex (Regular Expression) or it can be a simple text search. provides detailed information on these search types.

To search within the currently displayed data in the Events view:

1. To execute the search, place the cursor in the Search box, type a search string, and press **Enter** or click **Search**.
The search results are displayed in the Events view. Events that match the search criteria are displayed in the Event view grid. In the Details view and List view, matches are highlighted in the Details column. In addition, when searching RAW, matches are highlighted in the Log view Logs column. Below is an example of the search results for the search term **India** in the Events Detail view. Note that search matches are not highlighted in any Event Reconstruction.



2. If you want to narrow the search, change the query and time as described above in Filter Events Displayed in the Events View.
3. If you want to stop the search and return to the Events view, click **Cancel**.
   Any results that are displayed remain.
4. To clear the search box and return to the normal Events view, click **X** in the search box.

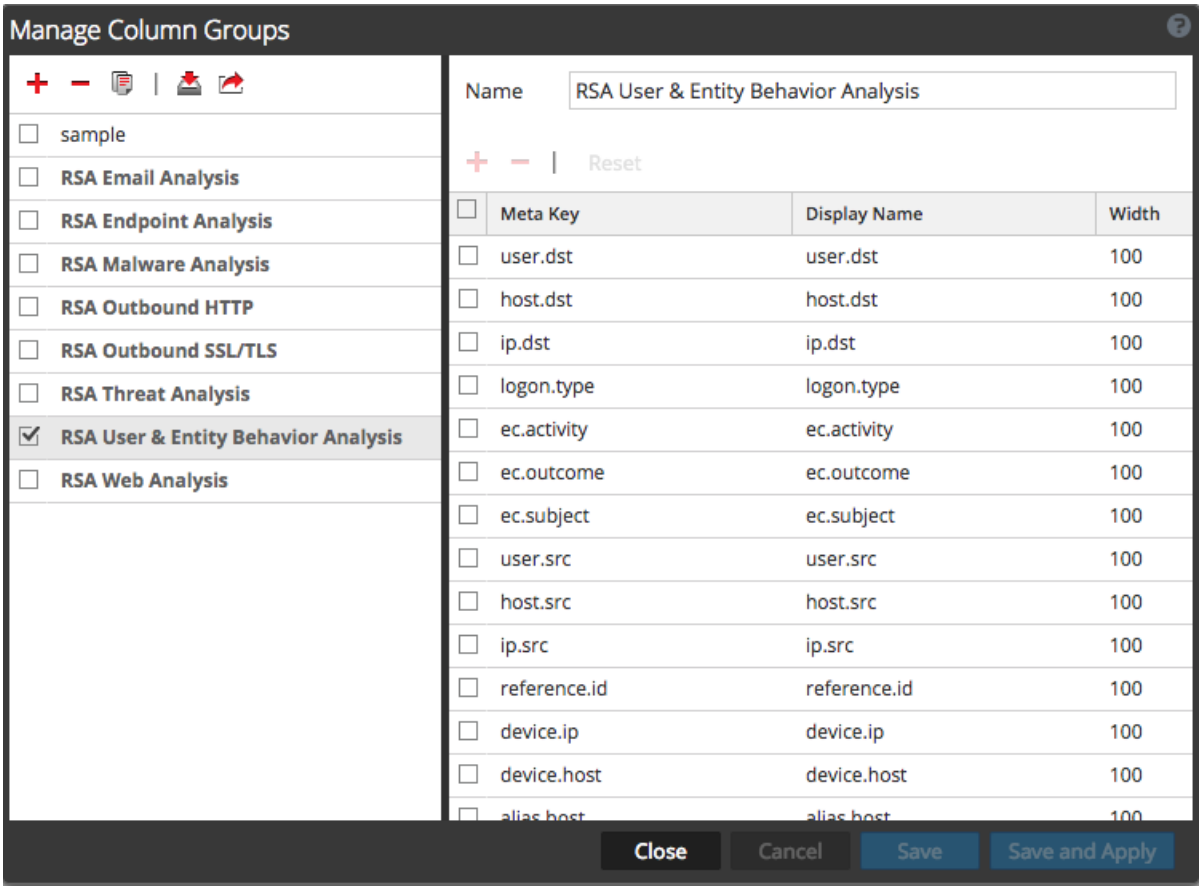
Manage Column Groups in the Events View

When viewing a list of events in Events view, you can customize the way data is displayed by defining the meta key to display in a column, the position of the column in the grid, and the default width of the column.

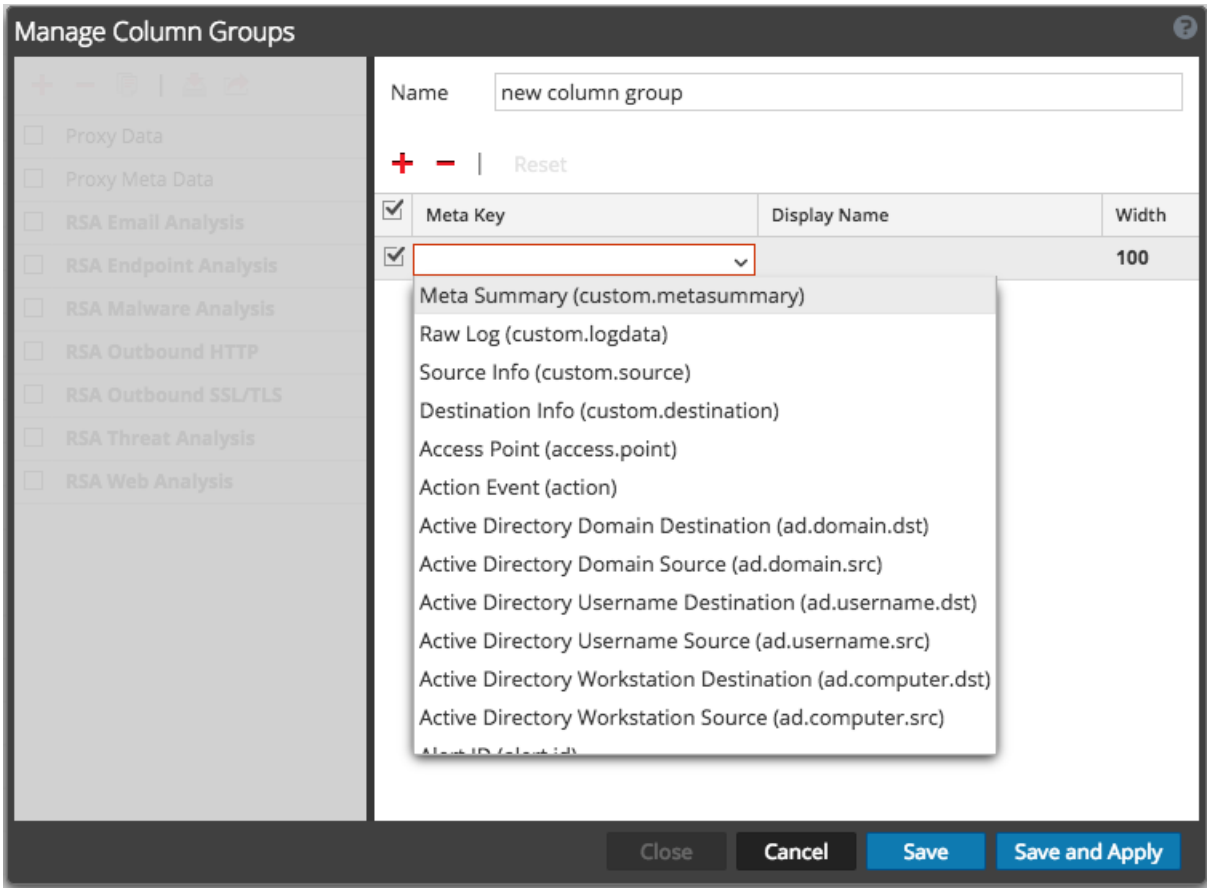
Note: In Version 11.1 and later, wherever meta keys are used, you can also use configured meta entities.
Investigate profiles can include custom column groups. If a custom column group is used in a profile and you are viewing events in the Events view using a custom column group, you cannot change the view type (Detail, List, or Log).

Create Custom Column Group

1. Go to **NAVIGATE** > **Events**.
2. Select **Manage Column Groups** in the **View** drop-down menu. The View option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.
   The Manage Column Groups dialog is displayed.

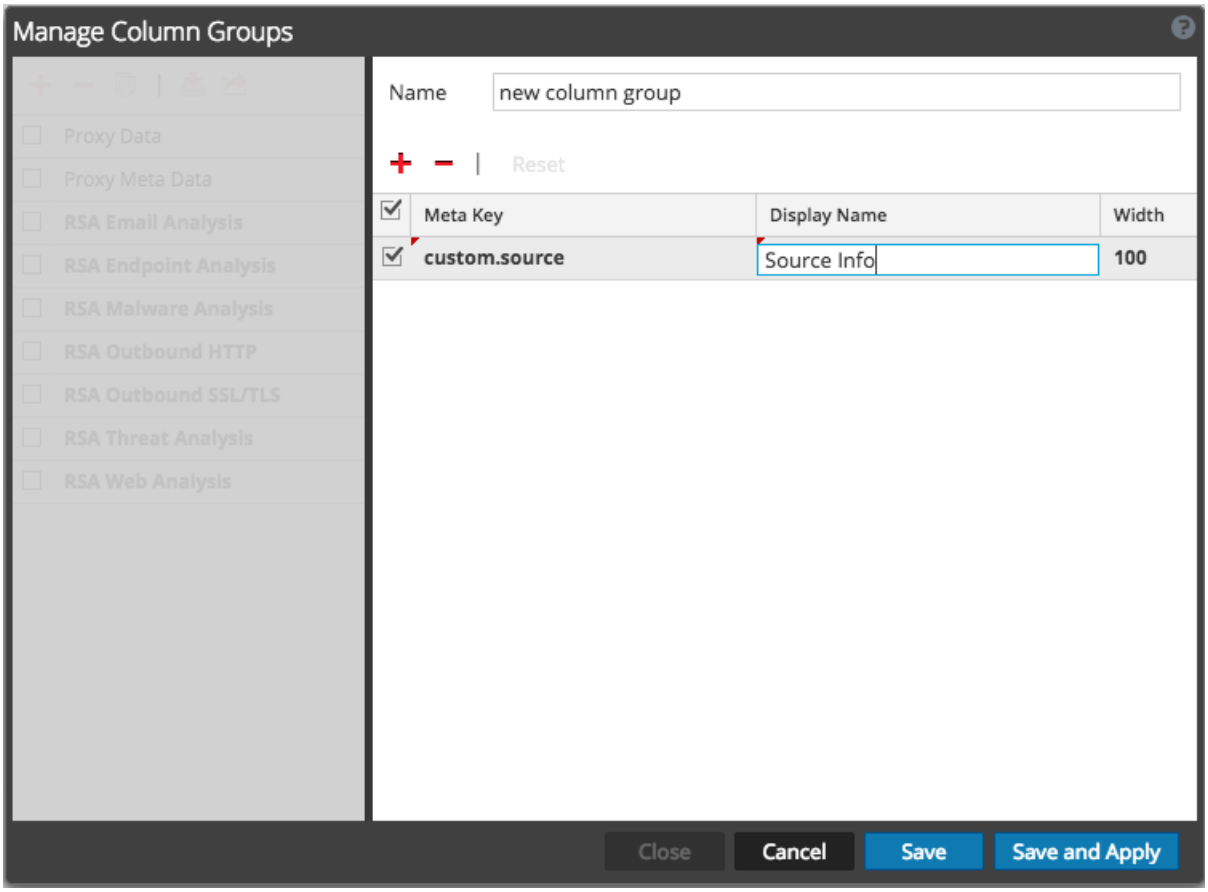


3. To add a new column group in the column group panel, click + and type the name of the new group in the resulting field.
   The column definition panel opens on the right with the group name filled in. You can edit the group name.
4. To add a column to the group, click +, and click in the empty **Meta Key** field to display the **Meta Key** drop-down list. Select a meta key field from the list, and repeat this step until the column set is complete.



5. (Optional) To delete a meta key from the column group, click −.
6. (Optional) To rearrange the sequence in which the columns appear in the Events list, drag meta keys to the desired position.

7. (Optional) To set the default width for a column, click in the corresponding value in the **Width** column, and type a new column width.

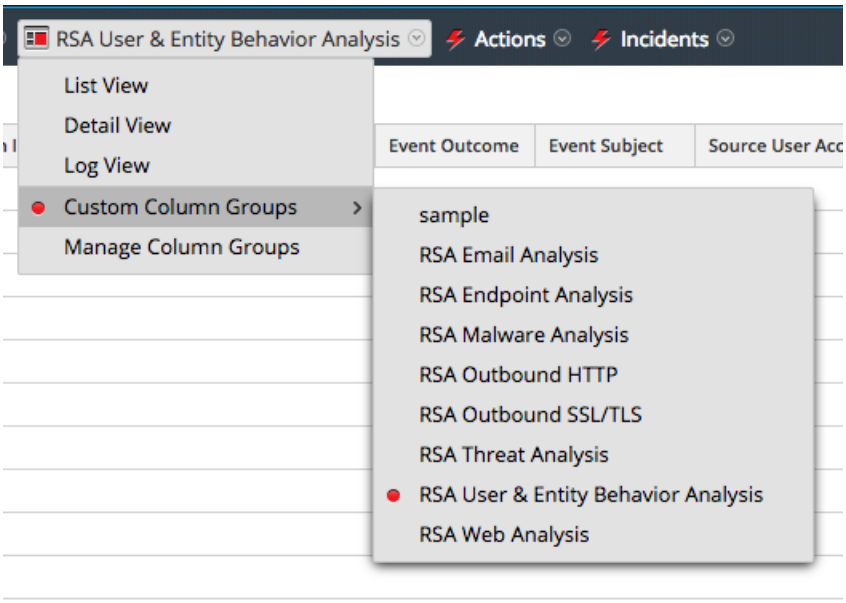


8. (Optional) To revert to the previous settings for the column group, and undo all of your changes, click **Reset**.
9. When ready to save, do one of the following:
   a. To save the edited column group and refresh the Events view with the column group settings, click **Save and Apply**.
   b. To save the edited column group without refreshing the Events view, click **Save**.

Select a Column Group

To select a column group:

1. With the Events view open, select **Custom Column Groups** in the **View** drop-down menu. The option name is the default value (Detail View or the current value).



2. Select one of the column groups from the submenu.
   The Events view is refreshed to reflect the custom column group.

Export Events in the Events View

In the Events view, the Actions menu has an option to export events from the event being viewed to an archive.

Note: You can only export files that you have permission to view or access.

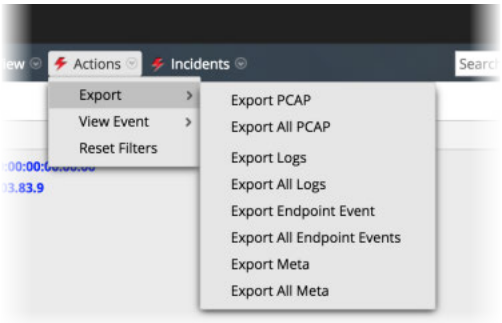
The export function queries the service for all sessions inside the selected time range and drill point to extract the content of each session. The details being exported are affected by both the time range and drill point at the time of exporting. In the File Extraction dialog, you can choose to export:

- PCAPs
- Logs
- NetWitness Endpoint event
- Meta values

The format of the exported archive: ZIP or GZIP file. After you send the request, a job is scheduled and you can track the job in in the Jobs tray. If there is an error retrieving the log or PCAP from the service, NetWitness Platform displays an error notification.

To extract files from an event:

1. While in the **Event view**, click an event.
2. Click **Actions** > **Export**.



3. Select the export option and the file format.
   A message informs you that the selected data is being downloaded.

Add Events to an Incident for Response

When conducting an investigation in the Events view , you can select one or more events and create an incident that is available for incident responders in Respond. You can also add events to an existing incident in Respond to which you have access.

Note: An administrator must configure the required roles and permissions as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

1. Go to **INVESTIGATE** > **Events**.
2. In the Events view, select one or more events, and then **Incidents** > **Create New Incident**.

3. Complete the information in the Create an Incident dialog.

   a. Select the severity, an integer between 1 and 100, with 100 being the most severe.
   b. Type a name for the incident and describe the incident in the **Summary** field.
   c. Select an assignee for the incident from the drop-down list. This list includes the built-in roles that have access to Respond as well as any custom roles that have been added to your system. For example, this list might include roles for admin, analyst, dpo, operator and roles for incident responders.

d. From the **Categories** drop-down list, select one of more categories of alerts that apply to this incident.

e. From the **Priorities** drop-down list, select a category for the incident. For example, an incident may be critical, high, medium, or low priority.

f. Click **Save**.
The new incident is created and is available immediately in the incident queues for the selected role in Respond.

4. To add one or more events to an incident, select one or more events, and then **Incidents** > **Add to Existing Incident**.

5. In the Add Events to an Incident dialog, select the severity, and select one or more incidents to which the events will be added. You can Search for an existing incident by Incident-ID or Incident Name. When ready, click **Add to Incident**.
The events are added to the selected incidents and updated in Respond.

Combine Events from Split Sessions

Analysts can identify sessions that have been split due to session size in the Events view, and combine the fragmented sessions so that the complete session is viewable as a single query result in the Events view. When split sessions are recombined, a single packet export of the session in the Events view includes all of the session fragments.

Version 10.4 and earlier Decoders are configured with a default session size of 32 MB. When a session exceeds the 32 MB limit, the Decoder splits the session and all subsequent packets become part of a new session, fragmenting the actual network session across multiple Decoder sessions. Split sessions are parsed without the context that it is a fragment of the larger network session, sometimes resulting in session fragments with source and destination addresses and ports reversed and with unidentified application protocols. Another result of split sessions can be difficulty viewing all of the session fragments as a single query result or creating a single packet export of all the session fragments.

Decoder enhancements in NetWitness Platform 10.5 provide improved processing of fragmented sessions:

- Contextual fragment parsing.
- Session fragments highlighting.
- Finding session fragments.
- Exporting all packets to a single PCAP.

Contextual Fragment Parsing

The Decoder completes session parsing before splitting the session based on the configured maximum session size (32 MB) or the configured timeout (60 seconds). When parsing is complete, the parsed results include the proper address directionality and application protocol, which are propagated to each subsequent session fragment to ensure consistency with the logical network session they represent.

Note: All of the necessary Decoder configuration changes are made when upgrading to 10.5. However, Find Session Fragments requires that the tcp and udp source port meta keys (tcp.srcport and udp.srcport) be fully indexed, which was not the default configuration prior to 10.5. This functionally limits the ability to find session fragments to sessions captured after the Decoder was upgraded to 10.5.

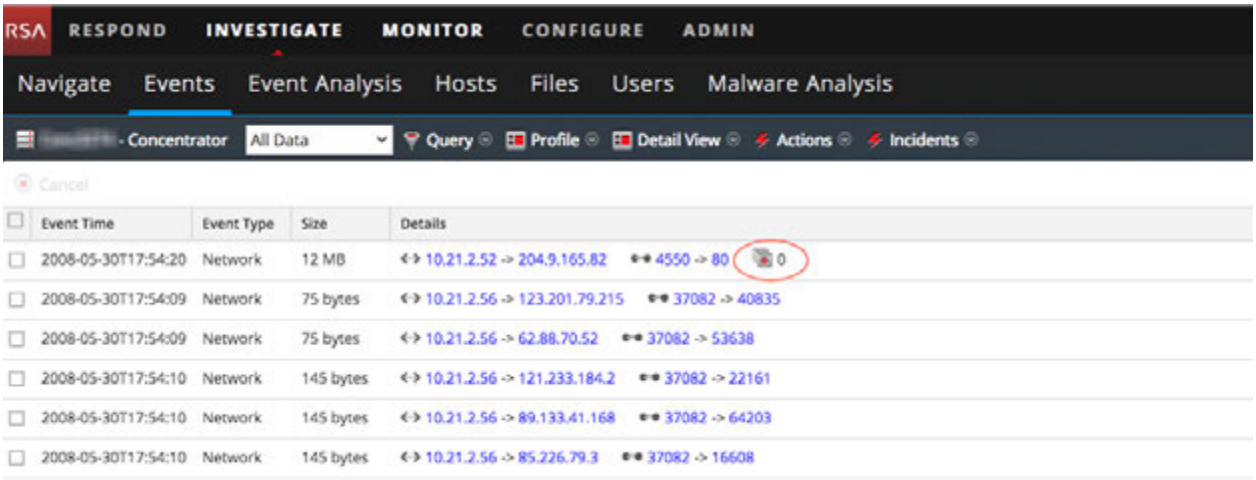
Session Fragments Highlighting

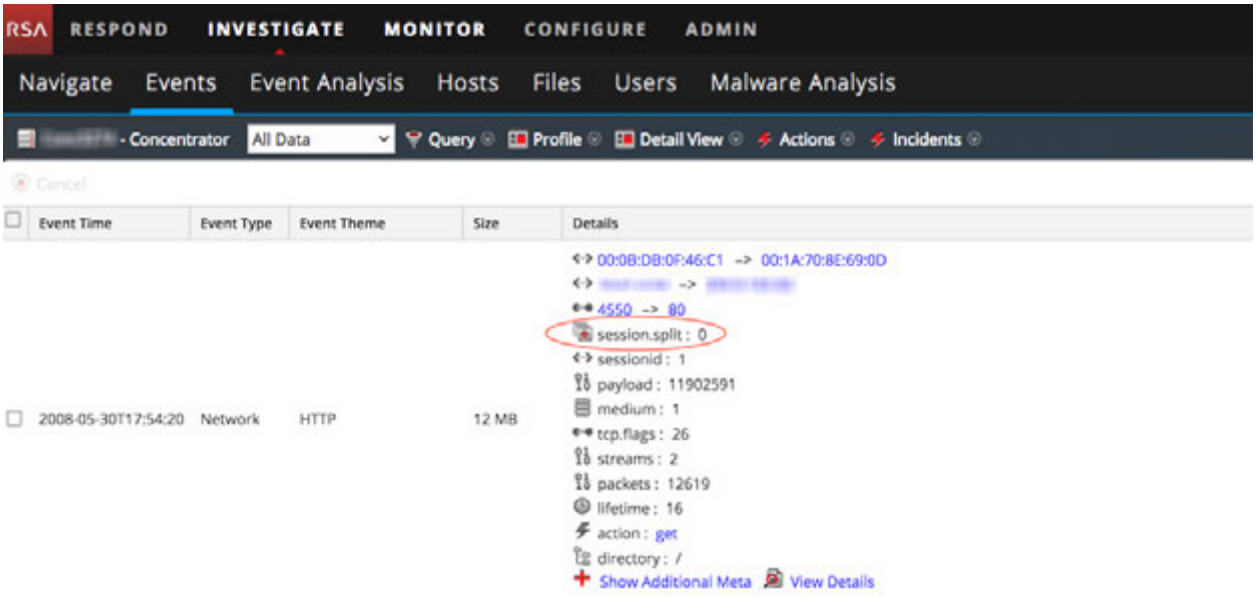
Each session fragment has an additional meta item, `session.split`. The value of the `session.split` meta item for a particular session fragment indicates how many fragments precede that fragment. When viewing sessions in the Events view, the `session.split` meta item clearly identifies sessions that are fragments in the Events List view and the Events Detail view.

The session split happens when the configured Decoder `assembler.size.max` or `assembler.timeout.session` (latency between sessions) is reached. The earliest fragment is session 0 and sessions with a later time stamp are incrementally numbered 1, 2, 3, and so on. The `session.split` meta indicates the number of preceding sessions fragments; however, it does not always indicate that there are subsequent session fragments, even with a value of 0. It is also possible for the first fragment of the session to not have `session.split` meta item if the session is parsed before exceeding the maximum session size.

Once you view the session fragments, you can determine the maximum session size or session timeout necessary for parsing to combine the split sessions into one again. For example, if you have four fragments at 32 MB, you need to configure your test Decoder (usually a virtual machine set up separate from main production service) with a maximum session size greater than 128 MB. The steps are the same to find all fragments based on a session timeout. The figures below show the Events List view and the Events Detail view with fragmented session information highlighted.

Note: A maximum session size of 12 MB was configured at the time the screen captures below were created.





The `session.split` metadata is always displayed immediately following the address and port metadata in the details view. It is never hidden as additional metadata. These enhancements make it possible to quickly:

- Identify sessions that are fragments of a network sessions.
- View all of the session fragments of a network session given a single session fragment.

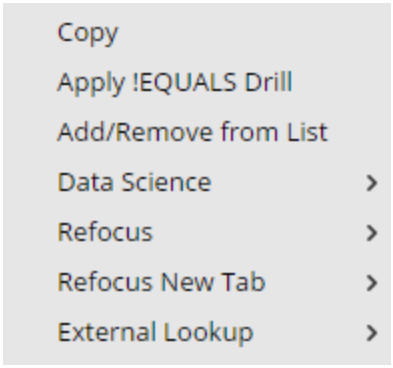
- Export the packets for the entire network session as a single PCAP file.

Find and Combine Fragments

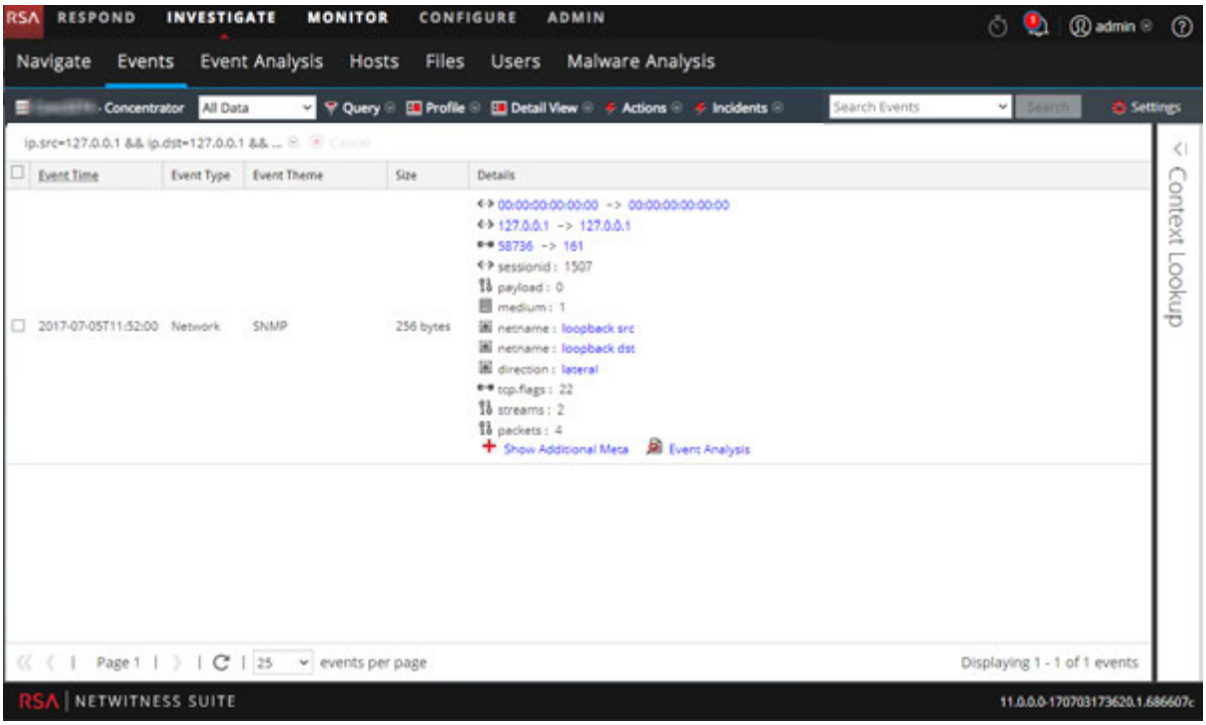
From within the Events view, you can find fragments of a session using the Refocus > Find Session Fragments context menu option. NetWitness Platform composes a query using the source and destination addresses and ports of the selected session and displays all sessions that match that query within the current time window.

To find session fragments:

1. In the **Events** view, right-click any of the source and destination address and port values: `ip.src`, `ip.dst`, `ipv6.src`, `ipv6.dst`, `tcp.srcport`, `tcp.dstport`, `udp.srcport`, and `udp.dstport`) as well as `session.split` values.
   The context menu is displayed.



2. Select **Refocus > Find Session Fragments** or **Refocus New Tab > Find Session Fragments**.
   NetWitness Platform repopulates the Events list with session fragments for a single session within the current time range. Depending on the option you selected, the refocus replaces the current view or opens in a new tab. (All data is used in these examples but is not recommended on production systems).



3. If necessary, adjust the time range to include any session fragments that may precede or follow the current time window. You can tell that the time range needs to be expanded if the fragments occur near the time boundary, especially if the first visible fragment does not have a split value of 0 (or none). Alternately, inspecting the packets of the last visible session may lead you to believe that the session continues. Here is an example:

   a. If you are looking at fragments that are obviously not the first fragment, for example, 1, 2, 3, and 4 in time range 10:30 to 10:35, there should be a fragment 0. You can increase the time range to start earlier (for this example, 10:25) to find the additional fragment.

   b. If the session size of last fragment is close to maximum session size (12 MB in this example), look for additional fragments by increasing the time window to include a later time (for this example, 10:40).
   When all of the session fragments of a network session are included within a single Events list, the list can span multiple pages.

4. (Optional) To export the packets for every session fragment to a single PCAP file, select **Actions > Export All PCAP**.
   A message informs you that the PCAP is being downloaded. When download is complete, PCAP file includes the entire network session that was fragmented.

Querying and Acting on Data in the Navigate and Events Views

This topic describes methods of querying data and acting on results that are common to the Navigate view and the Events view. Analysts can:

- Search for Text Patterns
- Create a Custom Query
- View and Modify Queries Using URL Integration
- Use Profiles to Encapsulate Custom Views
- Manage Context Hub Lists and List Values in the Navigate and Events Views
- Look Up Additional Context in the Navigate and Events Views
- Reconstruct an Event

Create a Custom Query

In the Investigate > Navigate view or the Events view, you can create a query rather than clicking through the meta keys and values to drill down into the meta data. The dialogs for creating a query offer syntax help with drop-down lists of applicable meta keys and operators. When viewing the drop-down list, you can expand and collapse each meta group to view or hide the individual meta keys in that group.

Note: In Version 11.1 and later, you can query meta entities as well as meta keys.

When you select a meta group, NetWitness Platform generates the complex query equal to a query with all of the meta keys in that group ORed together. So if a meta group contains `ip.src` and `ip.dst`, the query generated is `ip.src = <value> OR ip.dst = <value>`. If the meta group contains meta keys that have different meta value types, the value input is disabled and the query uses `exists` statements. For example, a meta group that contains `ip.src`, `ip.dst`, and `alias.host` includes meta keys that have different value types; `ip.src` and `ip.dst` are ip addresses and `alias.host` is text. The generated query is `ip.src exists OR ip.dst exists OR alias.host exists`.

A basic query is in the following form:

```
<metakey> <operator> [<metavalue>]
```

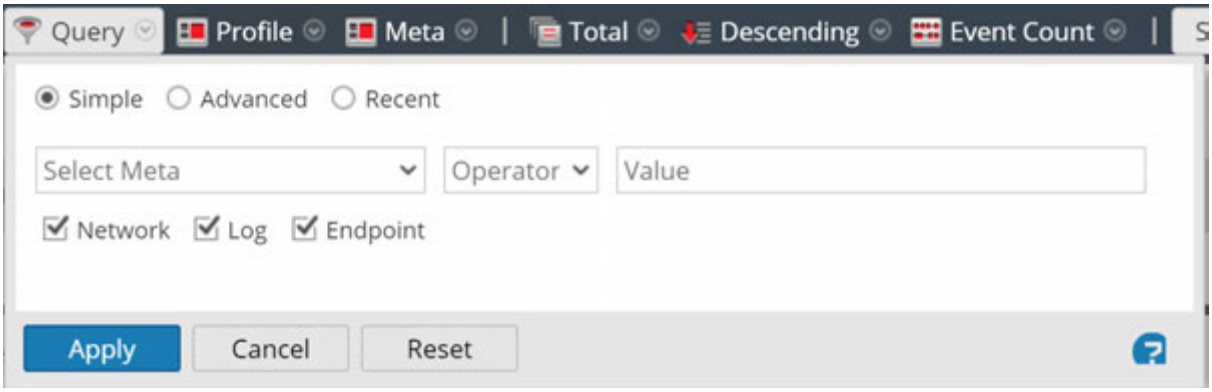
These are a few examples:

```
action exists
action = 'get'
alias.host = '10.25.55.115'
extension = 'exe'
orig_ip != "10.0.0.0" - "10.255.255.255"
```

Create a Query Using the Basic Method

When you create a query using the basic method, NetWitness Platform provides drop-down lists of meta and operators.

1. In the **Navigate view** or the **Events view** toolbar, select **Query.**
   The Query dialog is displayed, with the Simple option selected.

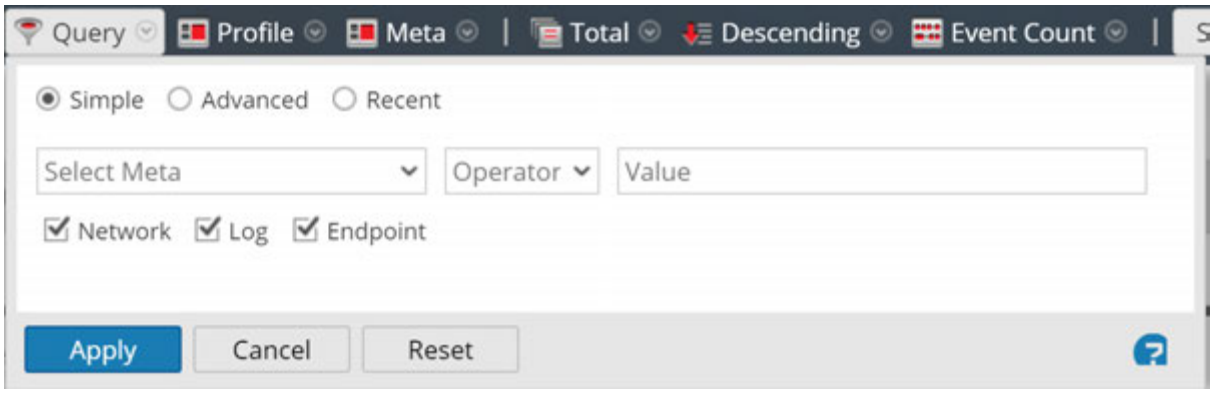


2. In the **Select Meta** field, click to display the drop-down list. The drop-down list has two sections: Meta Groups and All Meta.

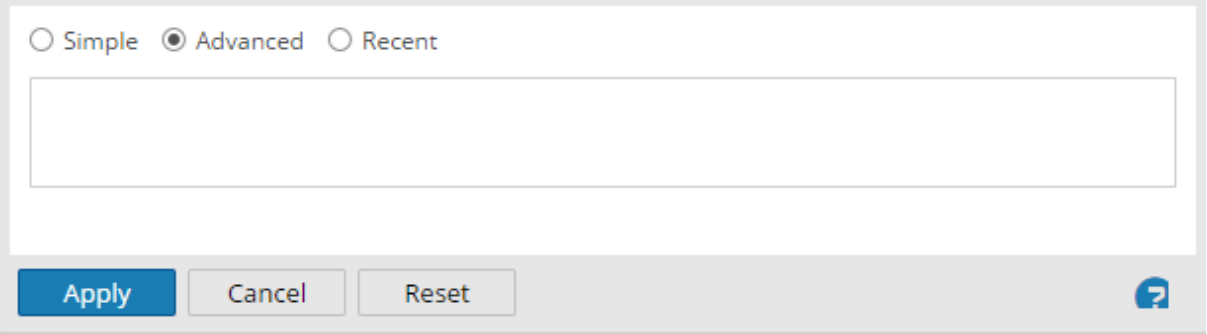
3. Select a single meta key under **All Meta** or select a meta group under **Meta Groups**. You can also type in a meta key or meta group in the field.
4. In the **Operator** field, type an operator or click on the drop-down list to select a valid operator.
5. (Optional) If you selected an operator that requires a value, for example, begins, in the third field type the value for the meta key.
6. In the Network, Log, and Endpoint checkboxes, choose the type of data to query. Do one of the following:
   a. To limit the query to packets select **Network** and de-select **Log** and **Endpoint**.
   b. To limit the query to logs, select **Log** and de-select **Network** and **Endpoint**.
   c. To limit the query to endpoint events, select **Endpoint** and de-select **Network** and **Log**.
   d. To apply the query to packets, logs, and endpoints, select **Network**, **Log**, and **Endpoint**.
7. Do one of the following:
   a. Click **Apply**.
      The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   b. Click **Cancel**.
      The window is closed and no changes are made to the view or current query.

Create a Query Using the Advanced Method

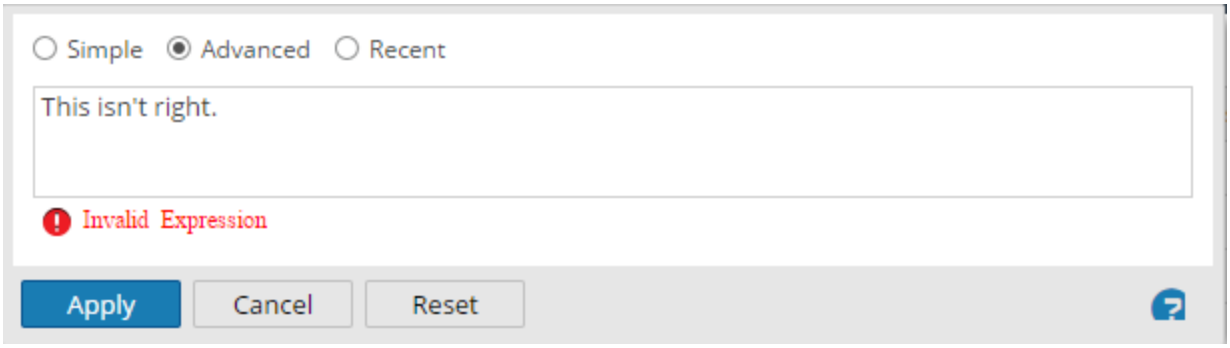
1. In the **Navigate view** or the Events view toolbar, select **Query.**
   The Query dialog is displayed.



2. Select **Advanced**.
   The advanced query field is displayed.



3. In the field, create a query, which can include the meta key, operator, and value. When you begin typing a meta key in the field a drop-down list of available meta keys for the selected service is displayed.
4. Select the meta key for your query.
   The display is updated. If the expression is not yet complete, the status indicates that the query is invalid.
5. Continue with an operator, from the drop-down list, then a value if necessary. The display is updated as you continue to enter the query. If you enter an operator, such as **exists** or **!exists**, which does not use the value field, the value field is disabled and the invalid status is cleared. If you enter an operator, such as =, which requires the value field, the invalid status remains until you enter a value. When the query is valid the invalid status is no longer displayed.

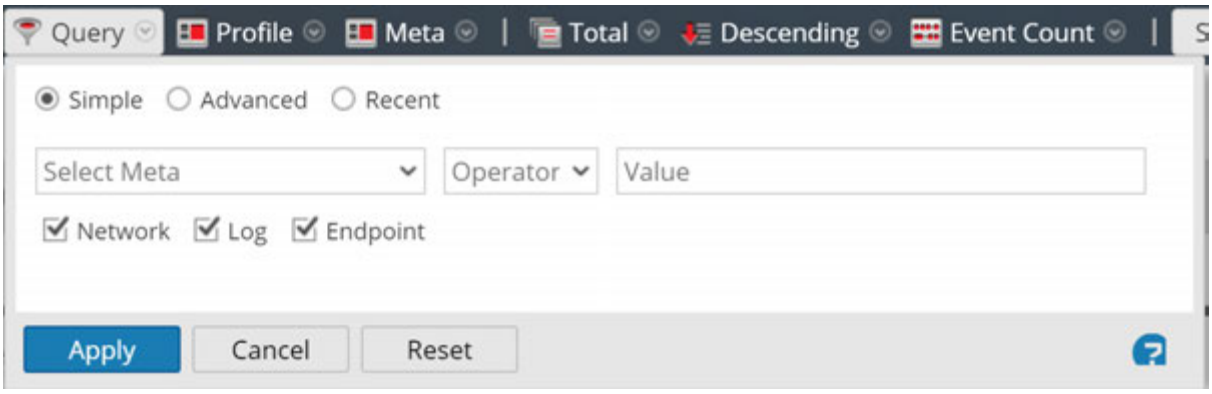


6. Do one of the following:
   - Click **Apply**.
     The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   - Click **Cancel**.
     The window is closed and no changes are made to the view or current query.

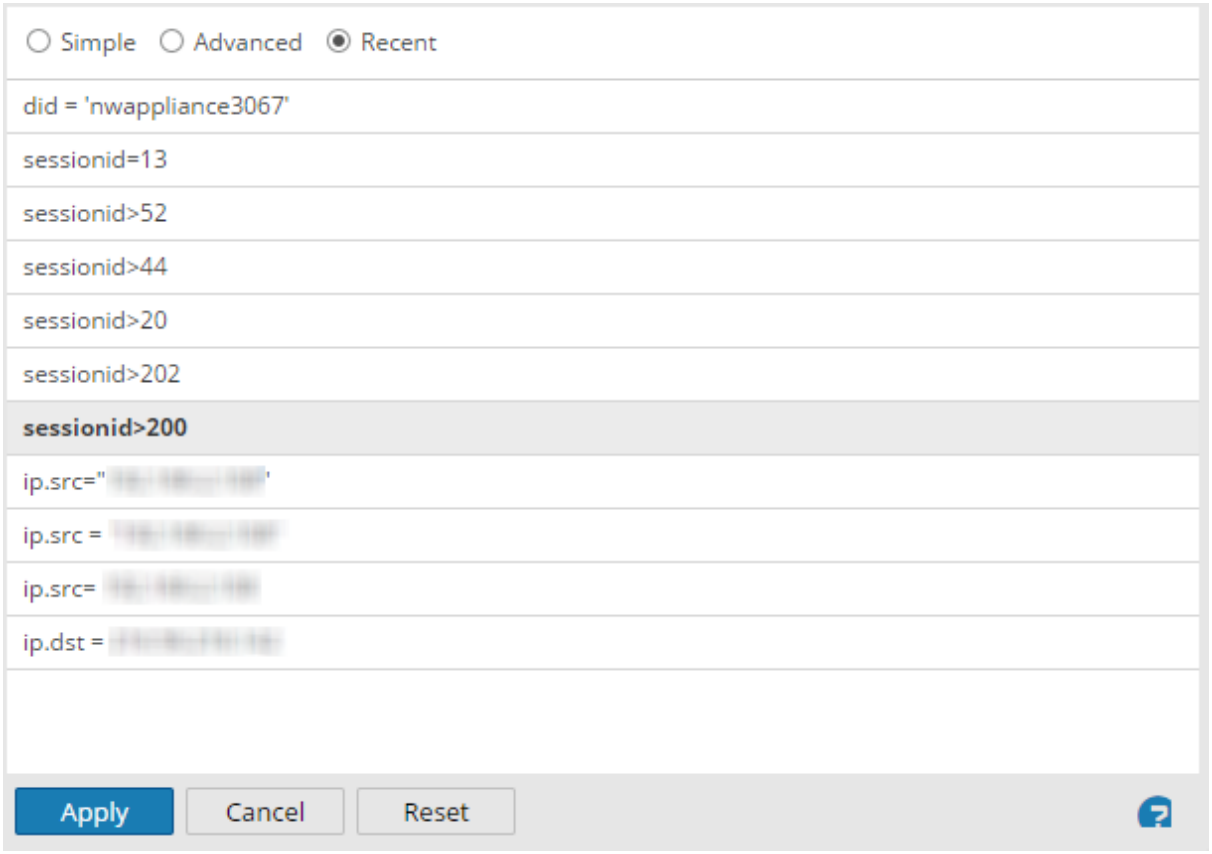
Apply a Recent Query

You can view recent queries and select one to apply to the current service being investigated. To select a recent query:

1. In the **Navigate view** or the Events view toolbar, select **Query.**
   The Query dialog is displayed, with the Simple option selected.



2. Select the **Recent** option.
   The list of recent queries is displayed in the bottom portion of the dialog.



3. In the list of recent queries, click to select a query.
4. Do one of the following:
   - Double-click a query.
   - Select a query and click **Apply**.
     The window is closed and the view is updated with the results of the new query. The query is displayed in the breadcrumb.
   - Click **Cancel**.
     The window is closed and no changes are made to the view or current query.

Manage Context Hub Lists and List Values in the Navigate and Events Views

Analysts can add lists and list values for Context Hub enrichment in the Navigate view and the Events view. (In Version 11.2 and later, analysts can add lists and lists values in the Event Analysis view as described in Look Up Additional Context in the Event Analysis View.)

When the Context Hub service is enabled and configured, NetWitness Platform provides enrichment data from Incident Management, custom lists, and NetWitness Endpoint directly in the Navigate view and Events view. A visual cue highlights meta values for which enrichment data is available in the Investigate views, and you can click on the highlighted value to look up the contextual information and intelligence.

In addition, from the Values panel in the Navigate view and from the Events view, you can view lists, edit meta values in an existing list, or create a new list. When you add meta values to a list, you can investigate the meta values using the context lookup option.

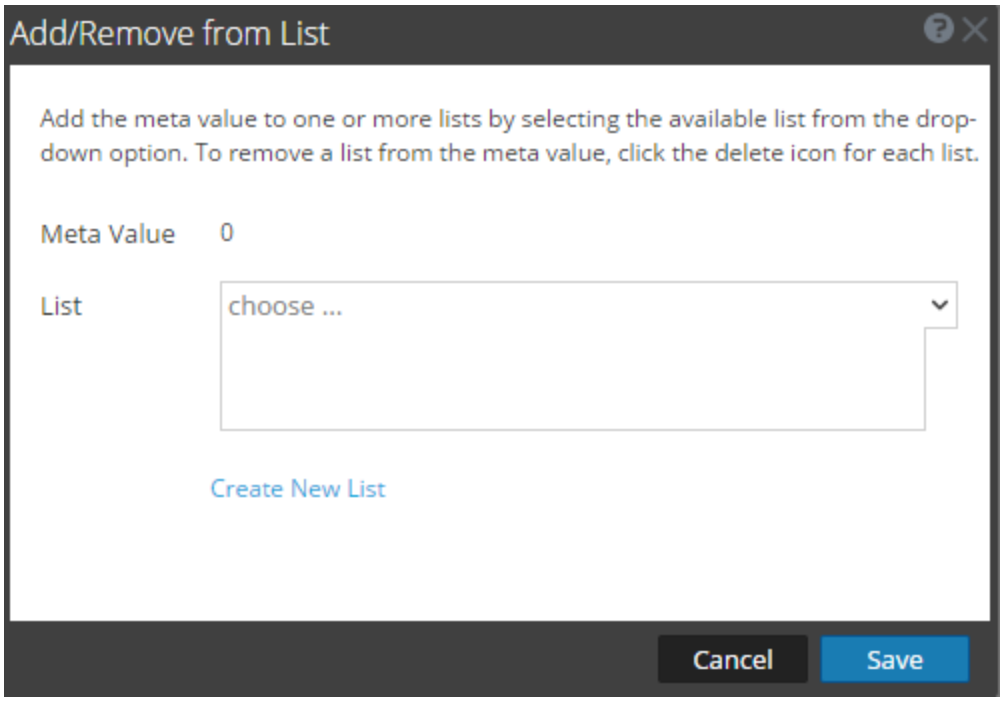
For an analyst to manage lists in Investigate, the administrator must:

- Enable the Context Hub service.
- Assign an analyst role with permission `Manage List from Investigation` to the user who will perform Context Lookup from Investigation views.
- Configure appropriate roles and permissions as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*.

Add Meta Values to an Existing List

To add a meta value to an existing list in Context Hub:

1. While investigating a service in the **Navigate** view or the **Events** view, right-click a meta value (for example, values under Source IP, Destination IP, or Username) and select **Add/Remove from List** in the context menu.
   The Add/Remove from List dialog is displayed.



2. In the **List** field, select one or more lists from the drop-down option to which the meta value must be added.
3. Click **Save**.
   The meta value is added to the selected lists.

Remove a Meta Value from a Context Hub List

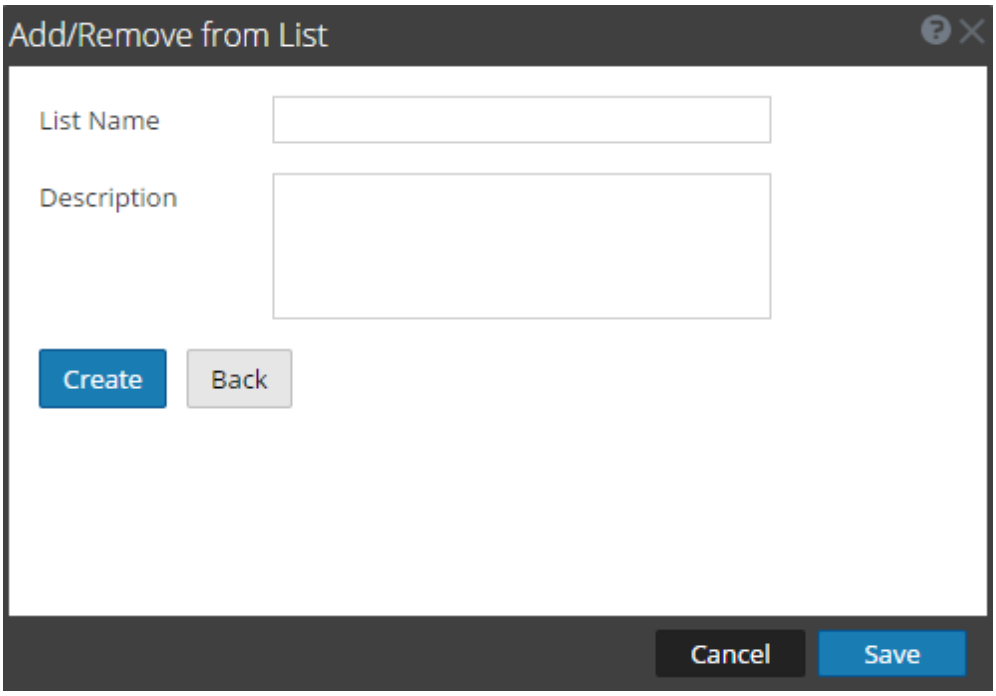
To remove a meta value from list:

1. In the **Add/Remove from List** dialog, in the **List** field, view the lists which include the meta value.
2. Click the delete icon (x) for each list that should not include the meta value.
3. Click **Save**.
   The meta value is removed from the deleted list.

Create a New List

To create a Context Hub list in Investigate:

1. In the **Add/Remove from List** dialog, click **Create New List**.



2. In the **List Name** field, enter an unique name for the list.
3. In the **Description** field, enter the description of the list.
4. Click **Create** to create the list.
5. Click **Save** to add the meta value to the created list.
   These lists are considered as data sources for retrieving context information.

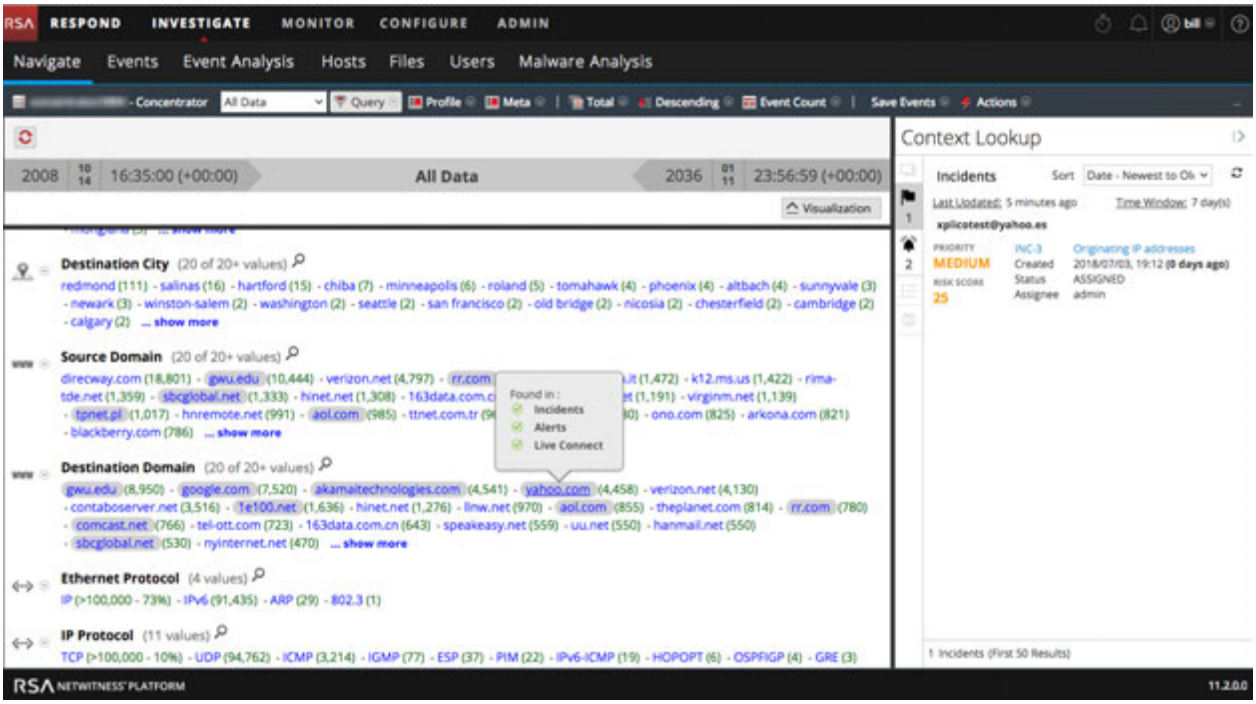
Look Up Additional Context in the Navigate and Events Views

From the Events view and the Navigate view, you can look up details and intelligence about elements associated with an event in the Context Hub. (In Version 11.2 and later, you can also look up additional context in the Event Analysis view as described in Look Up Additional Context in the Event Analysis View.) These elements, or entities, are identifiers, such as an IP address, a user name, a host name, a domain name, a file name, or a file hash. The data from configured sources, such as RSA NetWitness Endpoint, can help you understand what is happening.

Note: To enable viewing of contextual information, your administrator must add the Context Hub service in RSA NetWitness Platform and configure data sources for the Context Hub service as described in the *Context Hub Configuration Guide*. Analysts also need a role with the permission `Context Lookup` as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

The Context Hub is a centralized service that aggregates data about entities from multiple configurable data sources. This data can extend your investigation with additional context beyond the immediate results of a specific query. For example, the Context Hub can tell you if a given entity has been mentioned in any incidents, alerts, feeds, or community intelligence publications.

In the Navigate view and Events view, entities that have associated context data available are highlighted with a gray background; hovering over an entity displays a hover box giving a summary of the available data. When you right-click the entity, the Context Hub queries the configured data sources for relevant information, and the Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available. You can perform another lookup by right-clicking on another entity, and the Context Lookup panel is updated with that entity's information.



In the Context Lookup panel, you can view and explore individual data sources for further investigation. For a detailed description of the information displayed for each data source, see Context Lookup Panel.

To view information in the Context Lookup panel in the Navigate view or the Events view:

1. Hover over different meta values to see the data sources for which data is available.
   A hover box displays a list of the data sources that have context data available for meta value. These are the possible data sources: NetWitness Endpoint, Incidents, Alerts, Hosts, Files, Feeds, and Live Connect.
2. Right-click a meta value, and click **Context Lookup** in the drop-down menu to open the Context Lookup panel.

   
   The Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available.
3. To perform actions from the Context Lookup panel, right-click an entity such as IP address.
   The following options are available: Open Link in New tab, Query in Investigate, Copy Link, Paste, Google Lookup, Virus Total Lookup, and Query in Endpoint.
4. To close the Context Lookup panel, click ■ in the panel.

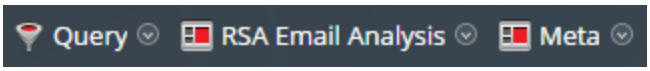
Use Profiles to Encapsulate Custom Views

Using profiles is a quick and easy way to customize which data is displayed in the Navigate view and the Events view. In the Manage Profiles dialog, you can use a profile to specify which meta groups and column groups are displayed by default, to append queries to an investigation, and to import or export profiles.

Note: Profiles are shared across users in the same NetWitness Platform network. If one user modifies or deletes a profile it has an affect on what is available to the other users.

If you have multiple profiles, you can switch between them to quickly change to the selected profile's preferences. If a profile is currently active, the title of the Profile menu is replaced with the profile name.

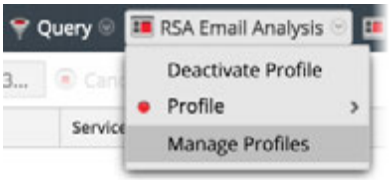
The following figure illustrates this in the Navigate view. The profile name is displayed to the right of the Query option. This is also true for the Events view.



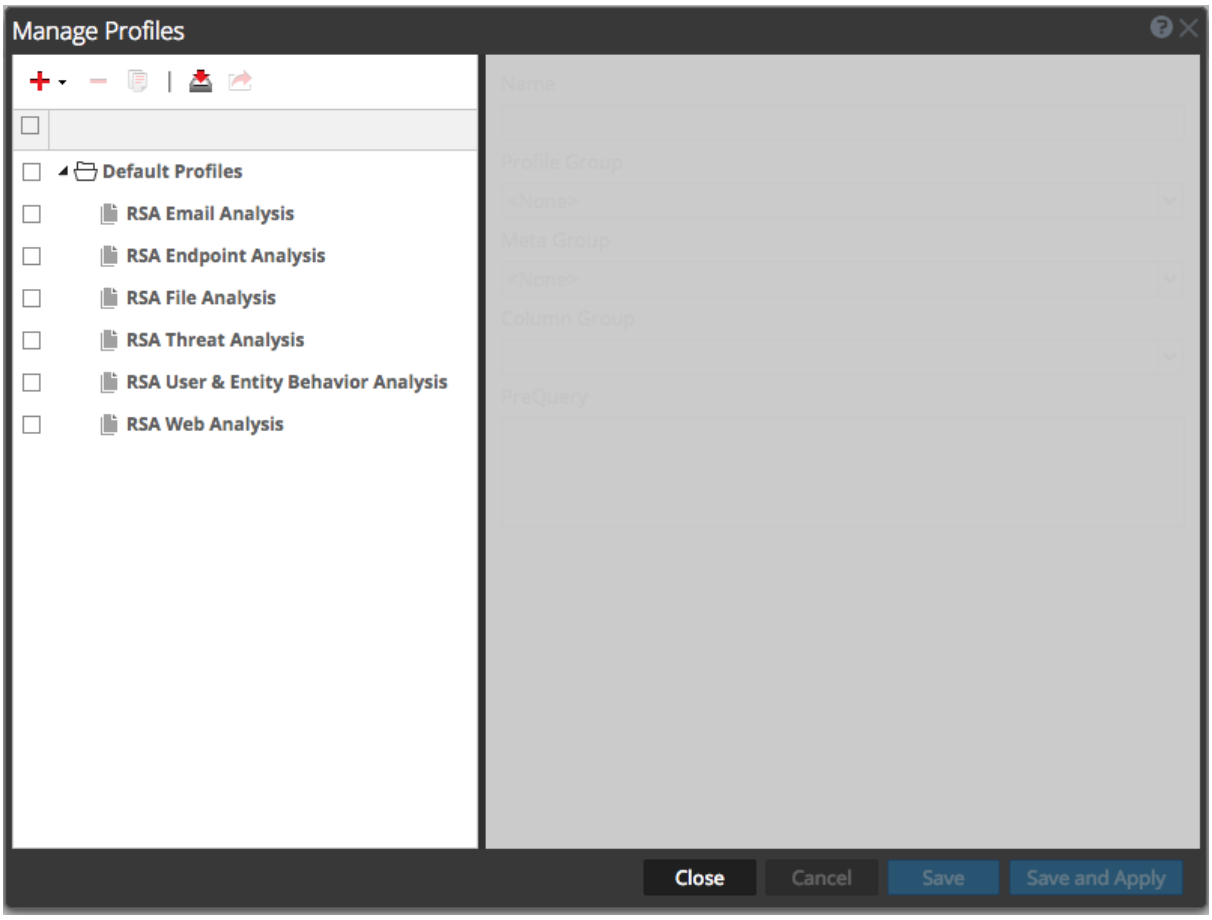
Beginning with Version 11.2, profiles are organized into profile groups. The built-in profiles are in the Default Profiles group, which cannot be edited. Analysts can create new profile groups, which anyone can use. Once created, you can edit a profile group to add profiles, remove profiles, or move profiles from one group to another. When you create a profile, it is not added to any profile group by default. When exporting profiles, information about the profile group is saved, and profiles are imported to the same group from which they were exported.

Navigate to the Manage Profiles Dialog

1. Go to INVESTIGATE > **Events** or **INVESTIGATE** > **Navigate**. (If the **Investigate** dialog is displayed, select a service and click **Navigate**.)
2. In the toolbar, select **Profile > Manage Profiles**.



The Manage Profiles dialog is displayed.



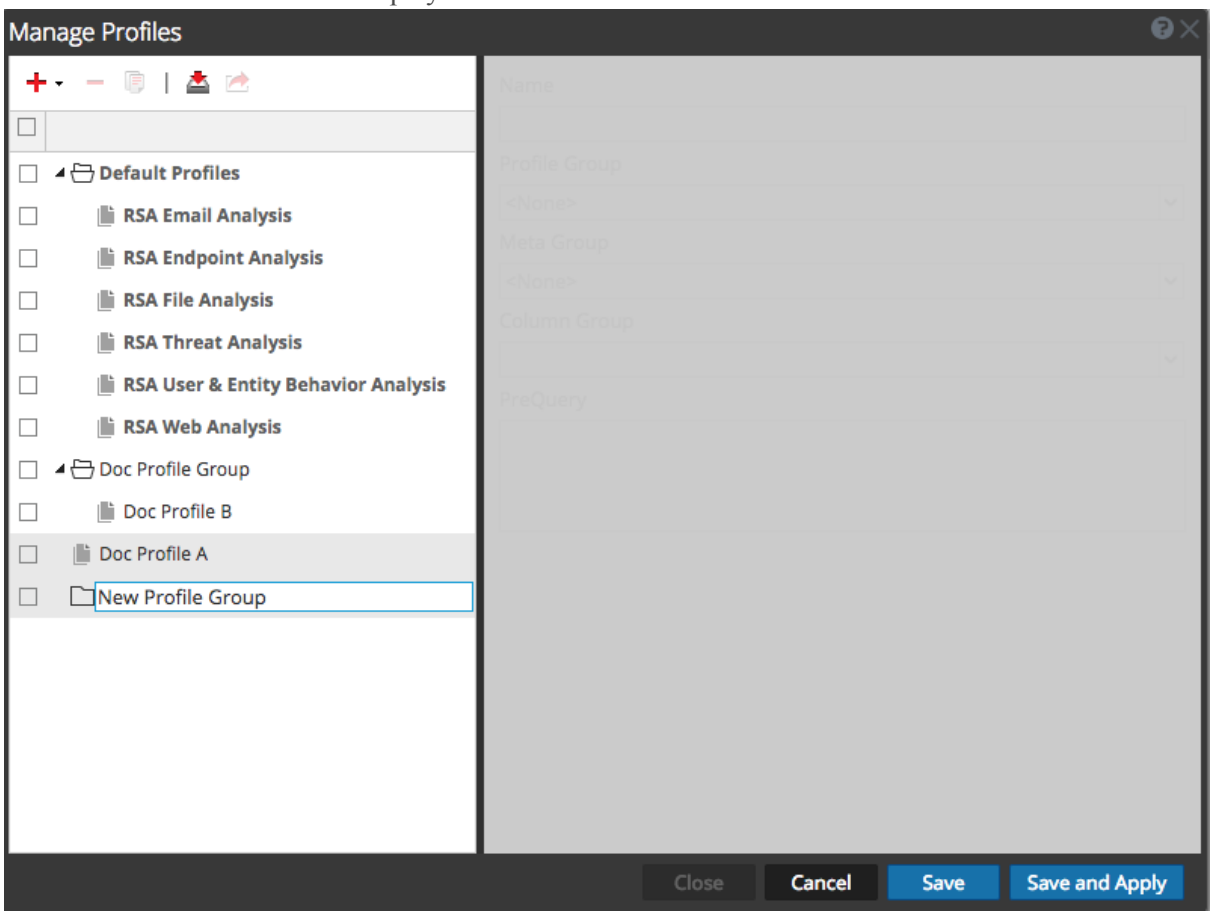
Create, Edit, or Delete a Profile Group (Version 11.2 and Above)

You can create a custom profile group to organize different profiles. Once created, the only edit you can make directly to a profile group is to edit the name of the profile group. To add or remove a profile in a group, edit the profile and assign it to a different profile group as described in Create and Edit Profiles.

1. In the **Manage Profiles** dialog, do one of the following:
   - To select an existing profile group to edit, double-click the profile group.
   - To add a new profile group, click + and select **Add New Profile Group**.

Note: If you want to edit one of the built-in profile groups, click to make an editable copy.

A folder with a blank field is displayed at the bottom of the Profiles list in the left column.



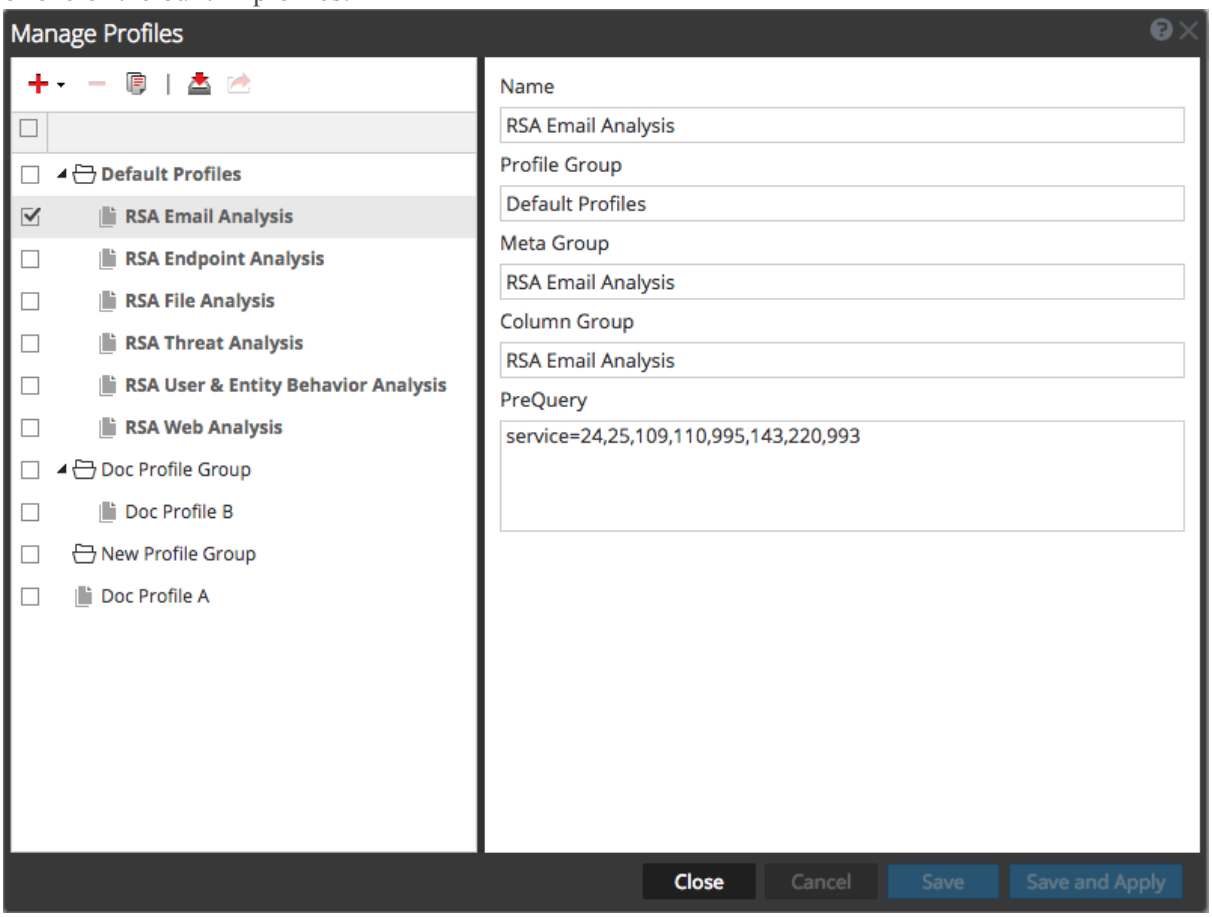
2. To edit or enter the name of the profile group, double-click the Profile Group and type in the entry field. The name must be between 2 and 80 characters.
   The profile group name is applied to a new profile group or to the profile group you edited. The profile group is now available when configuring a profile.
3. To delete a profile group do one of the following:
   - If you want to delete a profile group but keep the profiles, select the checkbox to select the group, clear the checkboxes for profiles in the group, and click delete.
   - If you want to delete a profile group and the profiles that the group contains, select the checkbox to select the group, and do not clear the checkboxes for the profiles that you want to delete.
     A dialog asks for confirmation that you want to delete the group. If you did not clear the mark in the checkbox next to the profiles, the group and the profiles in the group are deleted. If you cleared the checkboxes for the profiles, only the profile group is deleted and the profiles are moved out of the group and available to add to another profile group.

Create and Edit Profiles

1. In the **Manage Profiles** dialog, do one of the following:
   - To select an existing profile to edit, select the checkbox beside the name.
   - To add a new profile in Version 11.2 and above, click + or click the down arrow next to + and select **Add New Profile**.
   - To create a new profile in versions prior to 11.2, click +.

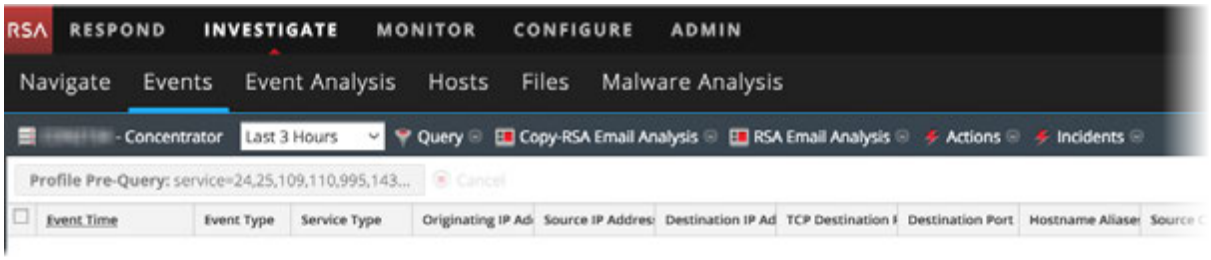
   Note: If you want to edit one of the built-in profiles, click to create a copy, and edit the copy.

   The definition of the profile is available to edit in the right panel. This figure illustrates the definition of one of the built-in profiles.



2. Edit or enter the profile name by typing in the **Name** field. The name must be between 2 and 80 characters.
3. (Optional for Version 11.2 and above) If you want to add the profile to a profile group, select a profile group from the **Profile Group** drop-down list.
   If you select a profile group, the profile is added to the group when you save the changes. If you do not select a profile group, the profile is not part of a group.

4. Select a meta group from the **Meta Group** drop-down list. You can add custom meta groups as described in Manage Meta Groups.
5. Select a column group for the **Column Group** drop-down list. You can add custom column groups as described in Manage Column Groups in the Events View.
6. Type queries to filter results in the **PreQuery** field. PreQuery follows the same syntax as the Query builder. The PreQuery in the figure uses a meta group called **service = 24,25,109,110,995,143,220,993**.
7. Click **Save** to save the profile without using it, or click **Save and Apply** to save the profile and use it immediately.
   If you click **Save and Apply**, a confirmation dialog is displayed before applying the selected profile. For Version 11.2 and above, the PreQuery that you entered in the Manage Profiles dialog is displayed in the breadcrumb.



Delete a Profile

1. In the **Manage Profiles** dialog, select a profile by selecting the checkbox beside the name.

   Note: You cannot delete any of the built-in profiles.

2. Click −.
   A prompt requests confirmation that you want to delete the profile, and the profile is deleted. The option name in the toolbar reverts to **Profile** to show that no profile is in effect.

Change the Active Profile

If you do not see enough results or the right results in the Navigate or Events views, you may have an active profile that is applying a PreQuery. If you do not want to use any profiles, you can click **Deactivate Profile** in the **Profile** drop-down menu.

To use a different profile:

1. In the **Navigate** or **Events** view toolbar, open the **Profiles** drop-down menu.
2. Hover over the **Profile** option to display a drop-down list of available profiles.
3. Select the profile you want to use.
   The profile settings are applied immediately.

If you want to change the active profile from the Manage Profile dialog:

1. In the **Navigate** or **Events** view toolbar, select **Profiles > Manage Profiles**.
   The Manage Profiles dialog is displayed.

2. Select a profile from the left panel and click **Save and Apply**.
   A confirmation dialog is displayed.
3. Click **Yes**.
   The profile settings are applied immediately.

Import Profiles

You can upload or import `.jsn` files that have been downloaded from another service. When profile groups are exported and then imported, the grouping of profiles is maintained.

1. In the **Manage Profiles** dialog, click  in the left panel toolbar.
   The Profile Import dialog is displayed.
2. Click **Browse** or the **Upload File** field to select a file from your computer.
3. When the file is selected, click **Upload**.
   The profile is displayed in the left panel.

Download Profiles

Profiles are downloaded as .jsn files.

1. In the **Manage Profiles** dialog, select one or more profiles from the left panel.
2. In the left panel toolbar, click  .
   The download begins immediately.

Search for Text Patterns

You can search for text patterns within the current set of events in both the Navigate view and the Events view. You can perform a keyword text search or do regex (Regular Expression) matching. In the Navigate view, you can click a meta value, such as HTTP, to drill into the data and then enter a search string in the Search field to search for events within that subset of data. The search opens a tab in the Events view, brings your drill and time range forward, and shows your search results. You can also drill into the data using queries before starting a search. To execute the search, enter a search string in the Search box, and press **Enter** or click **Search**.

Keyword Text Search

The text search provides these capabilities:

- Each white space delimited word is ANDed, so that every word must be found, but the order or location position in relation to the other words is irrelevant. For example, if you search on `Mark Albert`, both Mark and Albert must be found in the session, but they need not be together or in any specific order.
- The word OR is special. If you search `Mark OR Albert`, either Mark or Albert must be found in the session to match; both are not required.
- You can mix or match implicit ANDs and ORs together in the search string. The explicit OR has higher precedence than the implicit (whitespace) AND. The following examples make the same logical statement, which requires that both the terms cheese and dumplings be present in a match and one of toaster bread:

  ```
  cheese toast OR bread dumplings
  cheese AND (toast OR bread) AND dumplings
  ```
- You can exclude words from search results using the `-` operator. For example, searching for `cheese -toast` would return any result that has the word cheese, unless the word toast is also present.
- The keyword search can match metadata stored in the following patterns:
  - **IPv4 and IPv6 addresses**. Any term that can be recognized as an IP address will be converted to the native metadata format so that it can be found in indexed metadata.
  - **IPv4 CIDR ranges**. You can use CIDR notation to locate IPv4 addresses within a range.
  - **Timestamps**. Timestamps are matched against the native time meta, and any additional time meta fields stored with the Time type.
  - **Numbers**. The search function will attempt to automatically identify decimal search terms and match them against numeric meta data fields.

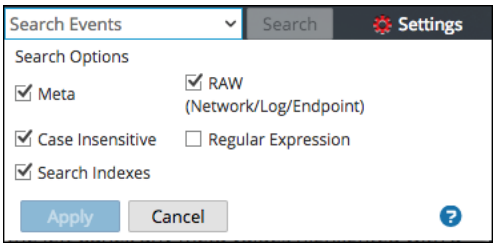
Options Controlling Search Behavior

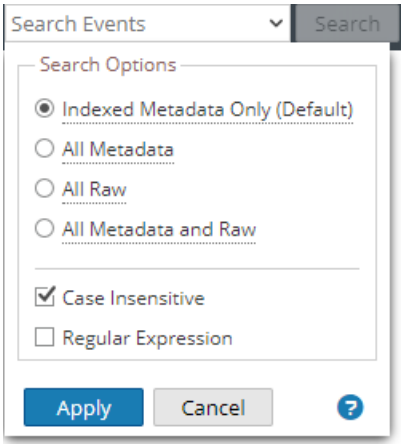
To access the Search box and search options in the Navigate or Events views:

1. You can see the Search Events field in the toolbar.

Troubleshooting: If you cannot see the Search Events field in the toolbar, click  on the right side of the toolbar.

2. Click in the Search field to view the Search Options drop-down menu. In Version 11.2 and above, the menu options are slightly different. The first figure illustrates the menu for 11.1 and below; the second figure illustrates the menu for Version 11.2 and above.





The options selected in this box change how the search is executed. The default search mode is to search indexes for indexed metadata and raw data only.

Note: Because the Index or Indexed Metadata Only (default) checkbox is selected by default, the search returns results based on data that is indexed. If you want to search for a complete set of metadata or raw data, select those checkboxes and clear the Index or Indexed Metadata Only (default) checkbox. This type of search takes longer, but it contains a more complete set of data.

The following table describes the Investigation search options.

Feature	Description
Indexed Metadata Only (default) checkbox (Version 11.2) **Index** radio button (Version 11.1)	This search only returns results on indexed data. Searching the index is the fastest way to locate keywords within a large data set. The index search uses any relevant indexes present within your data collection. **Caution:** Substring matches are not located by index searches. If you require substring matches, clear this checkbox and use a non-index search mode.

Feature	Description
All Metadata radio button (Version 11.2) **Meta** checkbox (Version 11.1)	Searches the metadata. Your keyword or regex pattern is matched against any parsed metadata.
All Raw radio button (Version 11.2) **RAW** (Network/Log/Endpoint) checkbox (Version 11.1)	Searches the network, log, and endpoint event text. Every event is decoded and content is searched for matches on the keyword or regex pattern. If you select all data with no filters on an Archiver, execution time may be excessive and a warning may be displayed. **Caution:** Searching raw network sessions causes sessions to be decoded, which is very time intensive. You may want to disable raw searches when looking at network-only collections.
All Metadata and Raw radio button (Version 11.2)	Searches the metadata and the log or event text. This option is a combination of two options in Version 11.1: Meta and RAW (Network/Log/Endpoint), which you could select together. In Version 11.2, you can select only one radio button.
Case Insensitive	Ignores case when searching.
Regular Expression	Searches using a Perl regular expression, rather than text. By default executes a text search. To execute a regular expression search, select the Regular Expression option. **Caution:** - Regular expression searches can be very slow. - When combining regular expressions and index search options, the regular expression pattern is matched against unique index values instead of meta values. This produces results faster, but it is not an exhaustive search of all the meta data or raw data.
Apply	Sets the default search options to apply to a search in the Navigate and Events views. This also updates your Investigation preferences in your Profile (Profile > Preferences > Investigation tab). The preferences are saved and effective immediately. You can select search options to use for a particular search without changing your default search preferences.

Regular Expression Search Syntax

A regular expression search uses Perl regular expression syntax, which is documented in detail in http://perldoc.perl.org/perlre.html.

Raw Text Keyword Search

The Log Decoder has the capability to create a raw text index for unparsed log events. This functionality creates metadata items that form a full-text index on downstream services such as Concentrators and Archivers. When you enable the Search Indexes option in your search preferences, your search automatically utilizes the text index. Note that the text index produces meta items that have a coarse granularity. For example, the default text indexer configuration truncates text terms. By comparing the index matches against raw data, the search engine will find accurate results for your search. However, you can improve search times by disabling the raw search checkbox. If you do so, results will be returned faster, but you may see false positive hits in your search results.

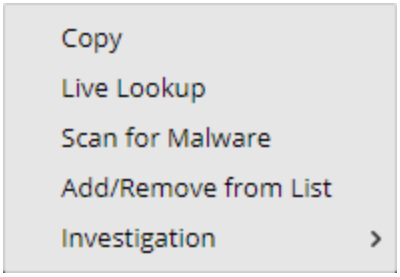
Search Examples

The following examples show searches from the Navigate and Events views.

Search in the Navigate View

To search within the currently displayed data in the Navigate view:

1. To drill into the data, click a meta value, such as HTTP, in the Values panel.



2. Type a search string in the Search field and press **Enter** or click **Search**.
3. To clear the search box and return to the normal Events view, click the **X** in the search box.

Search in the Events View

To search within the currently displayed data in the Events view:

1. Type a search string in the Search box, and press **Enter** or click **Search**.
   The search results are displayed in the Events view. Events that match the search criteria are displayed in the events list. In the Details view and List view, matches are highlighted in the Details column. In addition, when searching RAW, matches are highlighted in the Log view Logs column.
2. If you want to narrow the search, change the query and time.
3. If you want to stop the search and return to the Events view, click **Cancel**.
   Any results that are displayed remain.
4. To clear the search box and return to the normal Events view, click **X** in the search box.

View and Modify Queries Using URL Integration

NetWitness Investigate includes an External URL Integration that facilitates integration with third-party products by allowing a search against the NetWitness Platform architecture. By using a query in a URI, you can pivot directly from any product that allows custom links, into a specific drill point in the Investigate view. This integration provides an internal presentation of the user's query.

URL Integration allows the user to identify the service either by the host id or by the service and port, as defined in NetWitness Platform. If NetWitness Platform is unable to resolve the service, the analyst is redirected to the Navigate view, showing the Service selection dialog. Once the service is selected, the Navigate view is loaded with the drill point, defined by the query.

Service Id Known

When the ID of the service to use for an investigation is known, the format for entering a URI using a URL-encoded query is:

```
http://<sa host:port>/investigation/<deviceId>/navigate/query/<encoded query>/date/<start date>/<enddate>
```

where

- `<sa host: port>` is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is needed only if access is configured over a non-standard port through a proxy.
- `<deviceId>` is the internal Service ID in the NetWitness Platform instance for the service to query against. The service ID can be represented only as an integer. You can see the relevant service ID from the URL when accessing the Investigation view within NetWitness Platform. This value changes based on the service being connected to for analysis.
- `<encoded query>` is the URL-encoded NetWitness Platform query. The length of query is limited by the HTML URL limitations.
- `<start date>` and `<end date>` define the date range for the query. The format is `<yyyy-mm-dd>T<hh:mm:ss>Z`. The start and end dates are required. If no date is provided then the user defaults for that service are used. Relative ranges (for example, Last Hour) are not supported. All times are run as UTC.
  For example:
  `http://localhost:9191/investigation/12/navigate/query/alias%20exists/date/2012-09-01T00:00:00Z/2012-10-31T00:00:00Z`

Host and Port Known

When the host and port of the service to use for investigation is known, the format for entering a URI using a URL-encoded query is:

```
http://<sa host:port>/investigation/<device host:port>/navigate/query/<encoded query>/date/<start date>/<enddate>
```

where

- <sa host: port> is the IP address or DNS, with or without a port, as appropriate (ssl or not). This designation is needed only if access is configured over a non-standard port through a proxy.
- <device host:port> is the host and port of a service defined in NetWitness Platform instance for the service to query against. NetWitness Platform attempts to resolve the host and port as a service ID defined in NetWitness Platform.
- <encoded query> is the URL-encoded NetWitness Platform query. The length of query is limited by the HTML URL limitations.
- <start date> and <end date> define the date range for the query. The format is <yyyy-mm-dd>T<hh:mm:ss>Z. The start and end dates are required. If no date is provided then the user defaults for that service are used. Relative ranges (for example, Last Hour) are not supported in this version. All times are run as UTC.
  For example:
  `http://localhost:9191/investigation/concentrator:50105/navigate/query/alias%20exists/date/2012-09-01T00:00:00Z/2012-10-31T00:00:00Z`

Examples

These are query examples where the NetWitness Server is 192.168.1.10 and the deviceID is identified as 2.

All activity on 03/12/2013 between 5:00 and 6:00 AM with a hostname registered

- Custom Pivot: `alias.host exists`
- `https://192.168.1.10/investigation/2/navigate/query/alias%2Ehost%20exists/date/2013-03-12T05:00:00Z/2013-03-12T06:00:00Z`

All activity on 3/12/2013 between 5:00 and 5:10 PM with http traffic to and from IP address 10.10.10.3

- Custom Pivot: `service=80 && (ip.src=10.10.10.3 || ip.dst=10.0.3.3)`
- Encoded Pivot Dissected:
  - `service=80 => service&3D80`
  - `ip.src=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3`
  - `ip.dst=10.10.10.3 => ip%2Esrc%3D10%2E10%2E10%2E3`
  - `https://192.168.1.10/investigation/2/navigate/query/service%3D80%20%26%26%20%28ip%2Esrc%3D10%2E10%2E10%2E3%20%7C%7C%20ip%2Edst%3D10%2E10%2E10%2E3%29/date/2013-03-12T17:00:00Z/2013-03-12T17:10:00Z`

Additional Notes

Some values may not need to be encoded as part of the query. For example, commonly the IP src and dst is used for this integration point. If leveraging a third-party application for integration of this feature, it is possible to reference those without encoding applied.

Reconstruct an Event

When viewing a list of events in Events view, you can safely create a reconstruction of the event in a readable form that matches the original. By default, the initial view of a reconstructed event is the most suitable format (Best Reconstruction); for example, web content is reconstructed as a web page; an IM conversation is displayed with both parts of the conversation. Each user can select a different default reconstruction in the Profile > Preferences view.

You can also open a reconstruction from the Navigate view if you know the Event ID of the event.

In the reconstruction, you can:

- Select event information to view. Possible values are: request data, response data, both request and response data.
- Select the reconstruction type: details, text, hex, packets, web, mail, or IM.
- Export raw logs.
- Export the event as a PCAP file.
- Extract any files available in the event.
- Extract all the meta data associated with the event.

  Caution: Be careful when clicking a link to a file in the Reconstruction. If your system has an application associated with the file, or the browser is capable of opening them, and the attachments are malicious, they can negatively affect your system.

- Display the event in a separate window or tab (depending on your browser configuration).
- If you are viewing the reconstruction as a preview in the current view, you can page forward to the next event and back to the previous using the navigation buttons in the bottom left corner.

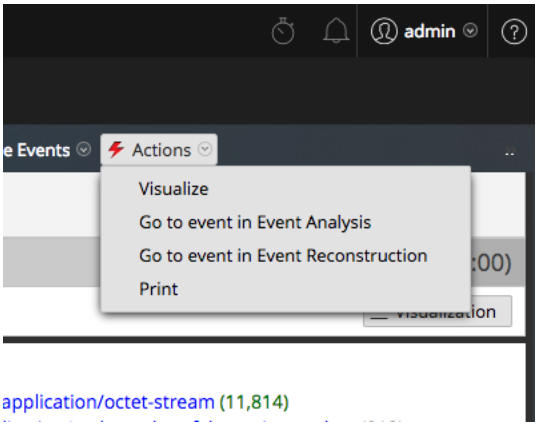
Note: Reconstruction Settings and Reconstruction Cache Settings allow an administrator to manage application performance for Investigation. As analysts reconstruct sessions that they are investigating, two situations can affect performance and results.
-Some events can be very large and contain many thousands of source packets. Reconstructing these types of sessions can degrade application performance.
- In some cases, the reconstruction cache can present incorrect content; for this reason, NetWitness Platform cleans cache that is older than a day every 24 hours. Between the daily cache cleanings, certain actions my result in stale cache being used for a reconstruction, and if the need arises, administrators can manually clear cache for one or more services that are connected to the current NetWitness Server.

Reconstruct an Event from the Navigate View

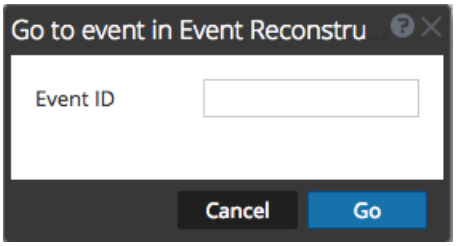
You can reconstruct an event directly from the Navigate view given a known Event ID. You can use this option without executing a query as you usually do when beginning an investigation. A service and time range must be selected to be able to jump directly to an event using just its `eventid`.

To view a reconstruction or event analysis directly from the Navigate view:

1. Go to **INVESTIGATE** > **Navigate** and select **Actions** > **Go to event in Event Analysis** or **Go to event in Event Reconstruction**.



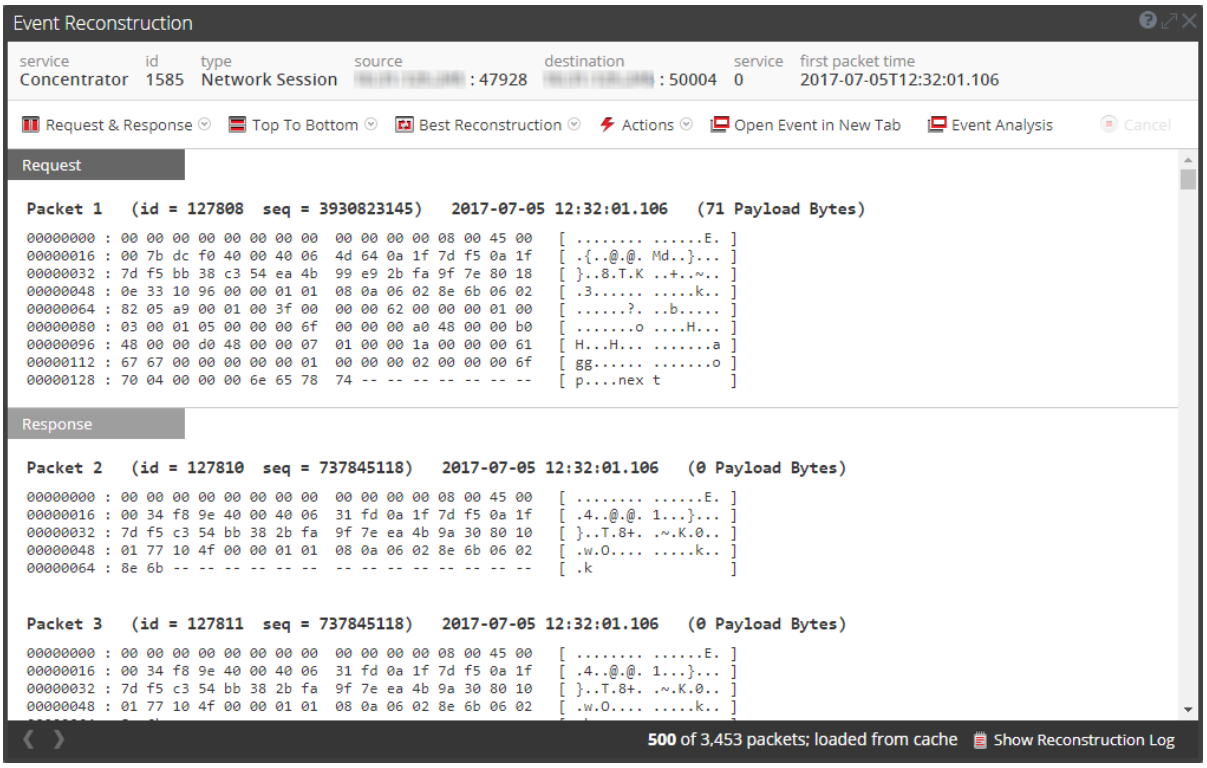
The Go to event dialog is displayed. There are two dialogs, one for Event Analysis and one for Event reconstruction. Both ask for the Event ID.



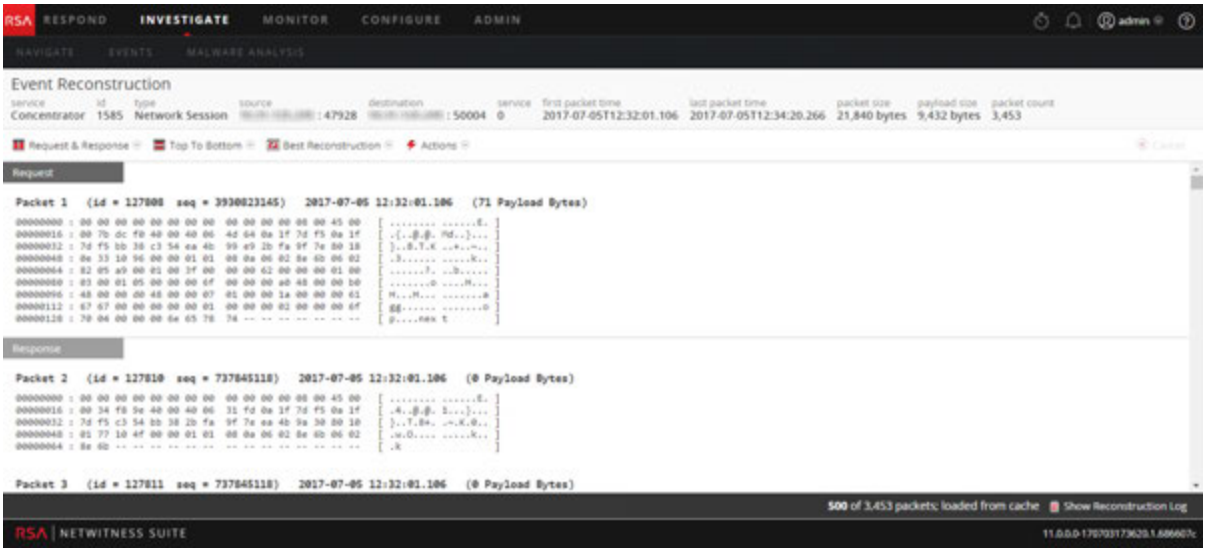
2. In the **Event ID** field, type the ID and click **Go**.
   The specified event is reconstructed in the Event Reconstruction view or the Event Analysis view.

Reconstruct an Event from the Events View

1. Open a drill point in the **Events** view.
2. To show all meta data, click + Show Additional Meta .
3. To open an event reconstruction in the current view, select an event to reconstruct and select **Actions** > **View Event** > **Preview Inline**.
   The Event Reconstruction opens in a popup window in the same view. By default, NetWitness Platform displays the best reconstruction for the event determined by the event content or the reconstruction that you have selected in the Default Session View setting for Investigation. You can use the options in the Event Reconstruction toolbar to change the reconstruction method, view side-by-side results, export an event, open an email attachment, extract files, and open the event in a new tab. The toolbar options vary depending on the type of event being reconstructed (network event, log event, or endpoint event). This is an example of the reconstruction for a network event.



4. To preview a reconstruction of the next event, click  or to preview a reconstruction of the previous event, click  .
5. To open an event reconstruction in a new tab, do one of the following:
   a. In the **Events** view, select an event to reconstruct and select **Actions** > **View Event** > **Open in New Tab**.
   b. In the **Event Reconstruction** toolbar of previewed reconstruction, click **Open Event in New Tab** in the toolbar.
   The Event Reconstruction opens in a new tab.



View Side by Side or Top to Bottom

To select the way requests and responses for an event are displayed:

1. In the **Event Reconstruction** toolbar, click **Top to Bottom** or **Side by Side**.
2. In the drop-down menu, select the information you want to see in the event: **Side by Side** or **Top to Bottom.**
   The reconstruction is refreshed with the selected information.

Select Event Information to View

To select what event information to view:

1. In the **Event Reconstruction** toolbar, click **Request & Response**.
2. In the drop-down menu, select the information you want to see in the event: **Request & Response**, **Request**, or **Response**.
   The reconstruction is refreshed with the selected information.

Select Event Reconstruction Type

To select the reconstruction type for an event:

1. In the **Event Reconstruction** toolbar, click **Best Reconstruction**.
2. In the drop-down menu, select the reconstruction type to view: **meta**, **text**, **hex**, **packets**, **web**, **mail**, or **files**.
   The reconstruction is refreshed with the selected reconstruction type.

Open or Download an Email Attachment

When viewing a reconstruction of an email that has attachments, you can open supported file types or download the files to the local system.

Caution: Be careful when selecting file attachments. If your system has an application associated with the file attachments, or the browser is capable of opening them, and the attachments are malicious, they can negatively affect your system.

To open or download email attachments:

1. In the **Event Reconstruction** toolbar, select the **View** drop-down and select **View Mail**.
   The Event Reconstruction is displayed.
2. In the **Event Reconstruction** section of the email, click the Attachment.
   If the file type is supported by the browser, the attachment will open in a new tab.
   If the file type is not supported, the Download dialog is displayed so that you can download the attachment.

Export an Event as a PCAP File

The PCAP export option downloads the sessions for the current time range and drill point to a PCAP file. To export an event as a pcap file:

1. In the **Event Reconstruction** toolbar, click **Actions**.
2. Click **Export PCAP**.
3. A confirmation dialog is displayed.
4. Click **OK**.
   The job is scheduled and when complete the PCAP is downloaded to the local file system. In the Profile > Jobs tab, you can download the PCAP.

Extract Files from a Reconstructed Event

The Extract Files option extracts and downloads the files associated with the event. To extract files:

1. In the **Event Reconstruction** toolbar, click **Actions**.
2. Click **Extract Files**.
   The File Extraction dialog is displayed.
3. Select the types of files to extract, and click **OK**.
4. The job is scheduled and when complete the selected file types are downloaded to the local file system. In the Profile > Jobs tab, you can download the files.

Analyzing Raw Events and Metadata in the Event Analysis View

Analyzing raw events and data in the same view is possible when working in the Event Analysis view. After you understand Recontruction Types in the Event Analysis View, you can:

- Filter Results in the Event Analysis View
- Examine Events in the Event Analysis View
- Look Up Additional Context in the Event Analysis View
- Download Data in the Event Analysis View
- Act on Data in the Event Analysis View

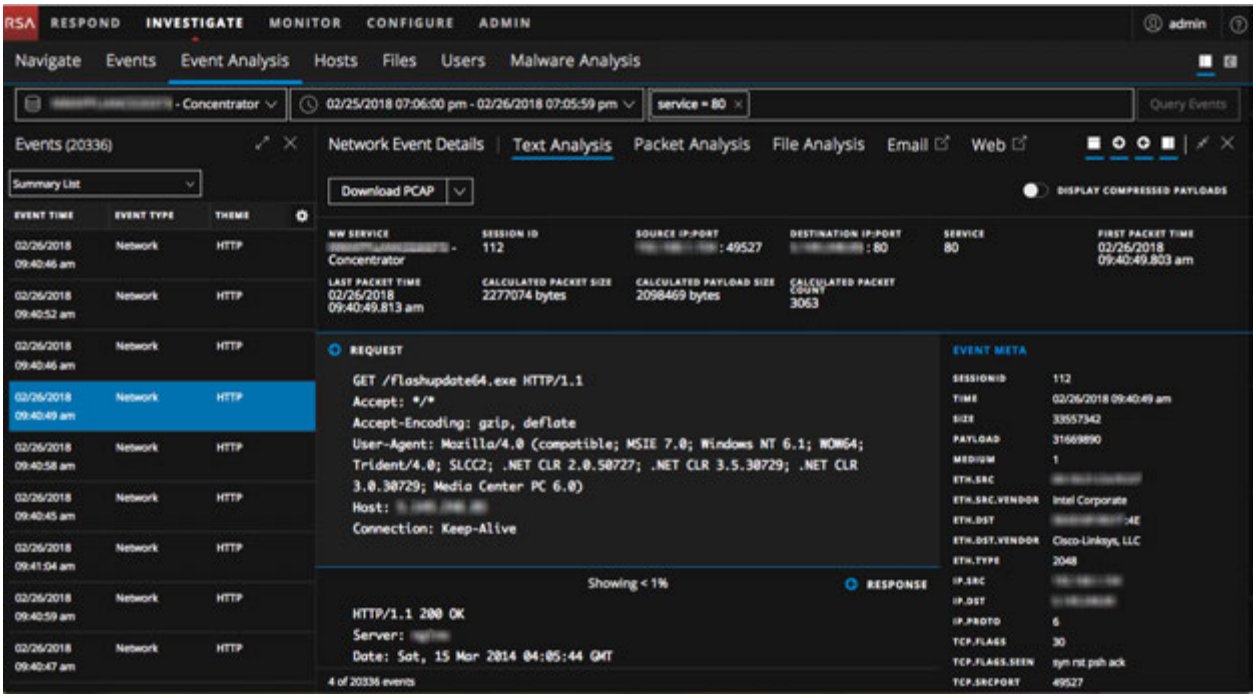
Recontruction Types in the Event Analysis View

When hunting for possible threats in captured network data, you can drill into different points of interest in the data. If a session contains suspicious events, you can examine the list of events for the session and you can also safely view a reconstruction of the event with features that help to identify patterns. (See Beginning an Investigation for the different methods to access the Event Analysis view.)

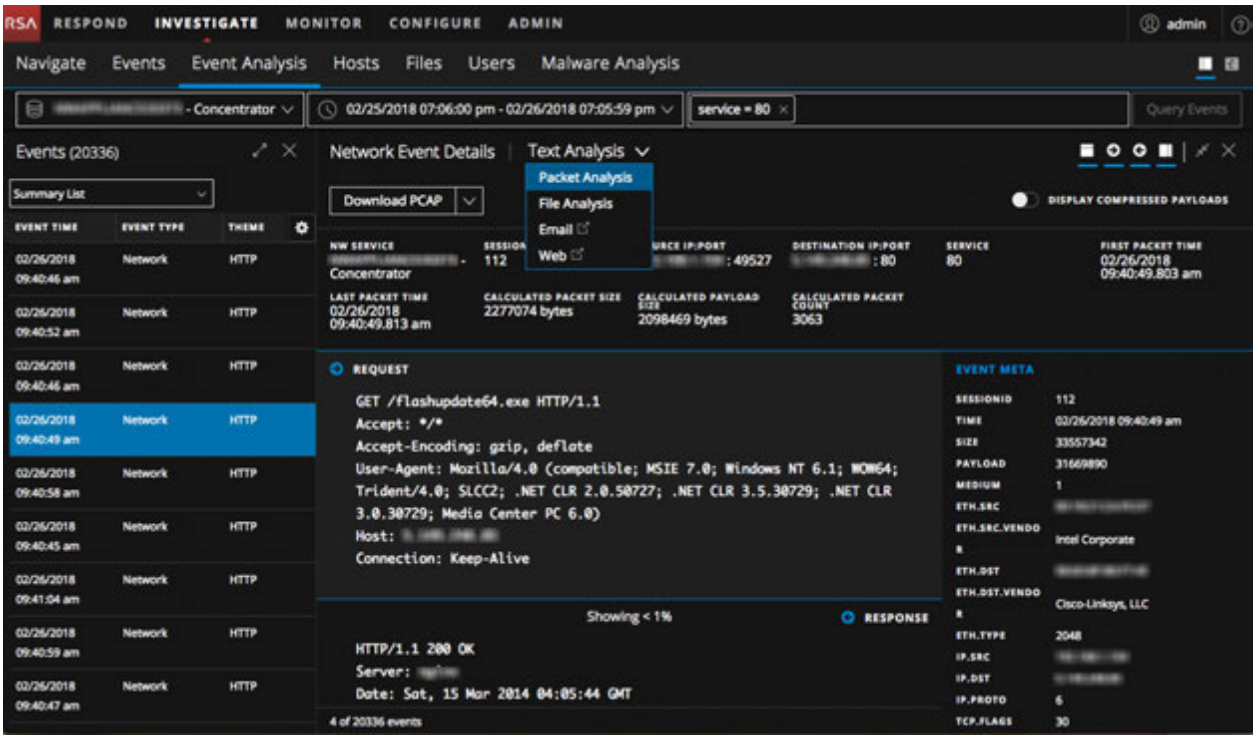
Note: If you are analyzing events on a 10.6.x or 11.0.0.x service from an 11.1 or 11.2 NetWitness Server, the download behavior in the Event Analysis view varies for files, PCAPs, logs, payloads, and meta values. You may see an event payload on a 10.6.x or 11.0.0.x service to which you do not have permission, but you will not be able to download files or payloads.

In the Event Analysis view, you can select the format for the reconstruction: Packet Analysis, File Analysis, or Text Analysis, **Email** (Version 11.1 and later), and **Web** (Version 11.1 and later). When the `medium` meta key tags an event as a log event or endpoint event , only the Text Analysis is available. The default reconstruction for network events is Text Analysis; however, for a network event the last reconstruction format that was open overrides the default. The Email and Web reconstructions open the event in the Events view and are described in "Select the Event Analysis Type" in Examine Events in the Event Analysis View

This figure is an example of the Network Event Details: Text Analysis panel in a web browser window that is wide enough to display the reconstruction format options in a row.



When the browser window is too narrow to display all the view options horizontally, the options are presented in a drop-down list.



Within each type of analysis, settings are available to enhance your analysis. If you change a setting, the setting is preserved between browser refreshes and logins within the same browser. These are the preserved settings:

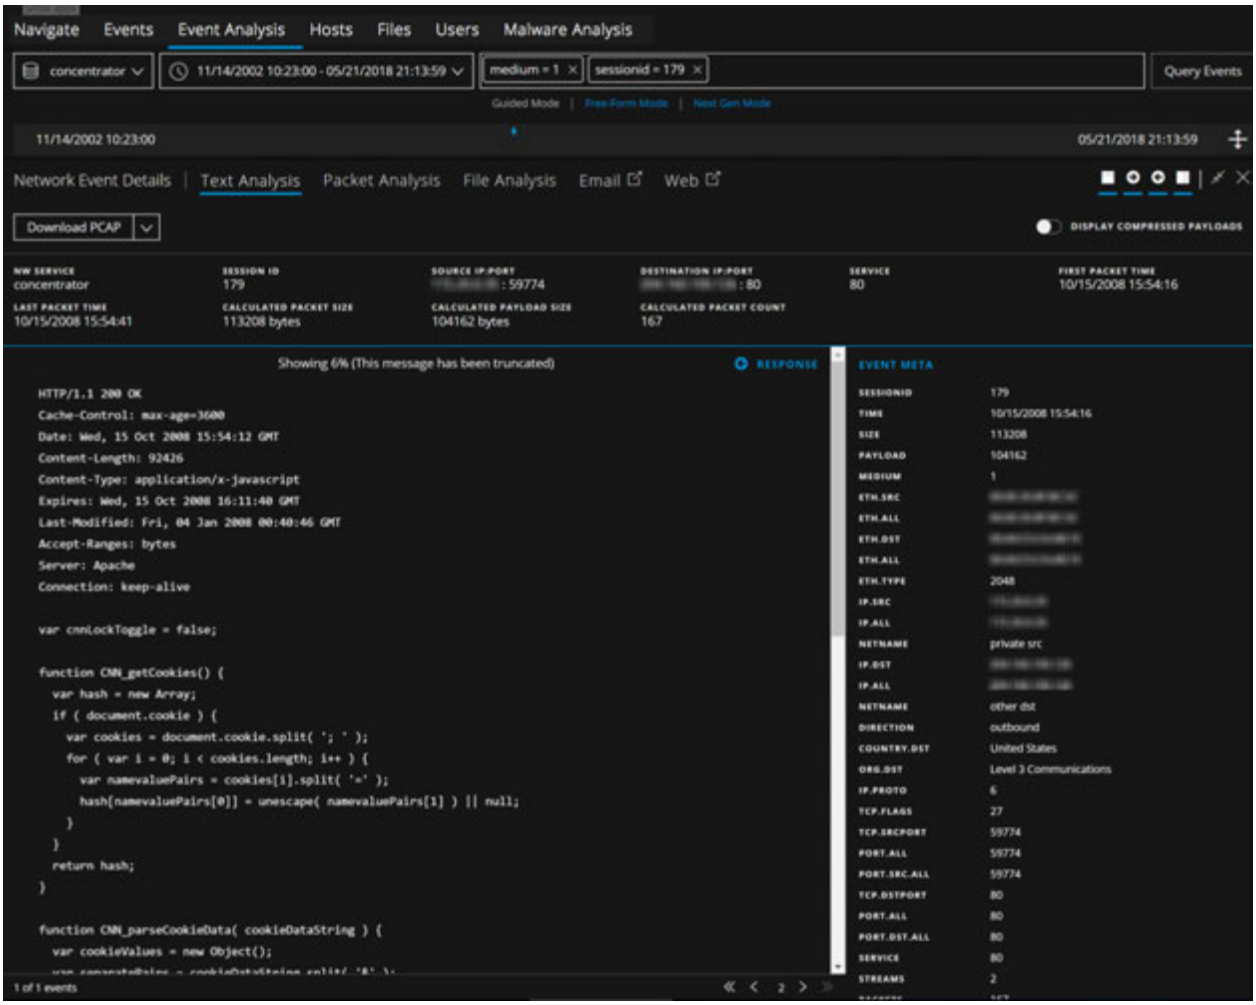
- The currently selected reconstruction: Text Analysis, Packet Analysis, or File Analysis.
- Whether the Event Meta panel is open or closed.
- Whether the Event header is open or closed.
- Whether the Request or Response, or both are displayed.
- Whether packet payloads are displayed in the Packet Analysis panel.
- Whether shaded bytes are displayed in the Packet Analysis panel.
- Whether other common file types are highlighted in the Packet Analysis panel.
- The number of packets per page in the Packet Analysis panel.
- Whether compressed or uncompressed text is displayed in the Text Analysis panel.
- The text decode setting in the Text Analysis panel of a network event.

The Text Analysis Panel

You can view all types of events (network events, log events, and endpoint events) in their original text format in the Text Analysis panel. Pagination controls add flexibility when paging through the reconstructed text of an event.

Note: Endpoint events are available for investigation in Version 11.1 and later. Pagination controls are available in Version 11.2 and later.

The Text Analysis panel for some network events can be quite large. To ensure the best rendering, an excessively large payload is truncated to fit. If a single reconstructed request or response in the reconstructed event exceeds the maximum number of bytes, the header indicates that the message has been truncated. This figure illustrates a single response that has been truncated because it exceeds the maximum number of bytes (Version 11.2).



Version 11.1 handles large payloads differently; the payload for a single event is limited to 2500 packets. When the packet limit is reached, a warning in the footer advises the limit has been reached and provides the total number of packets in the event. This figure shows the tooltip displayed when you hover over the warning.

Note: The Show More option is still available for messages that are truncated; however, the entire text of the message is not visible without downloading the raw payload.

In the Text Analysis panel, network events, log events, and endpoint events are presented differently.

- For network events, Investigate provides the direction of the packet (Request or Response) and contents of each packet in text format. If you are reconstructing a network event, the Text Analysis panel is scrollable. When you scroll, the text identification information as well as the Request and

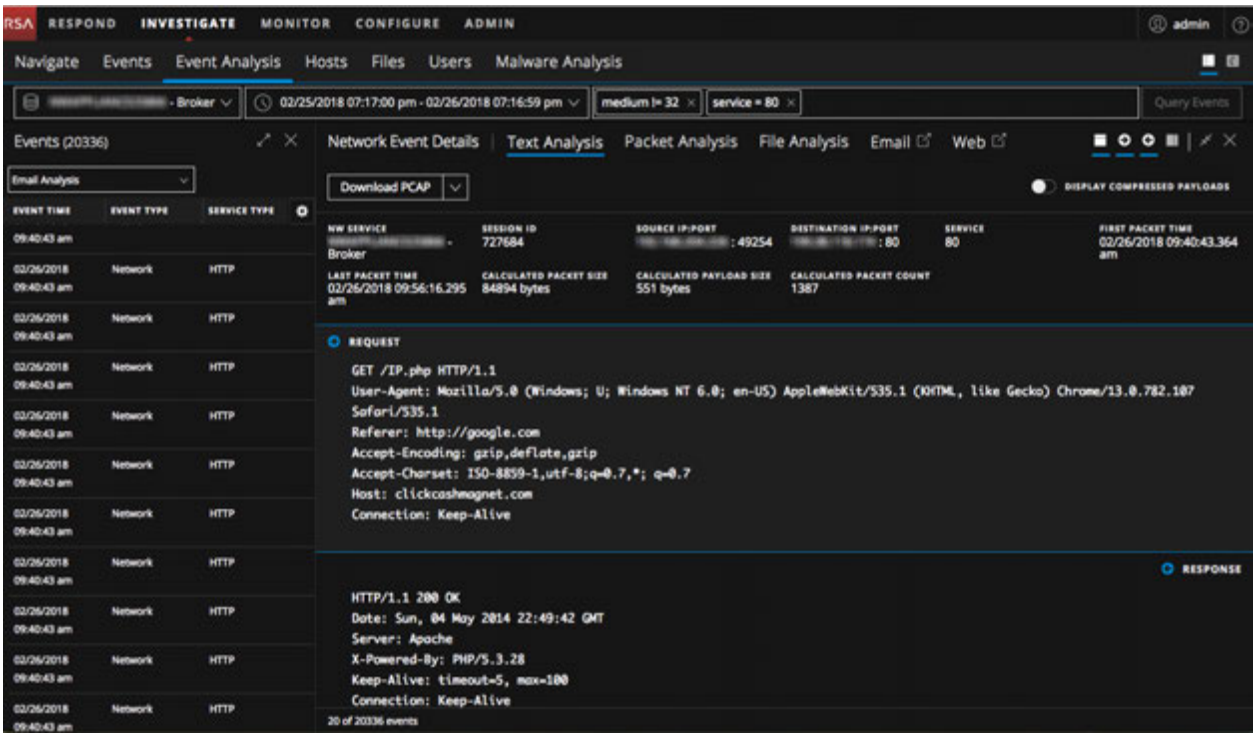
Response labels remain visible rather than scrolling out of view.

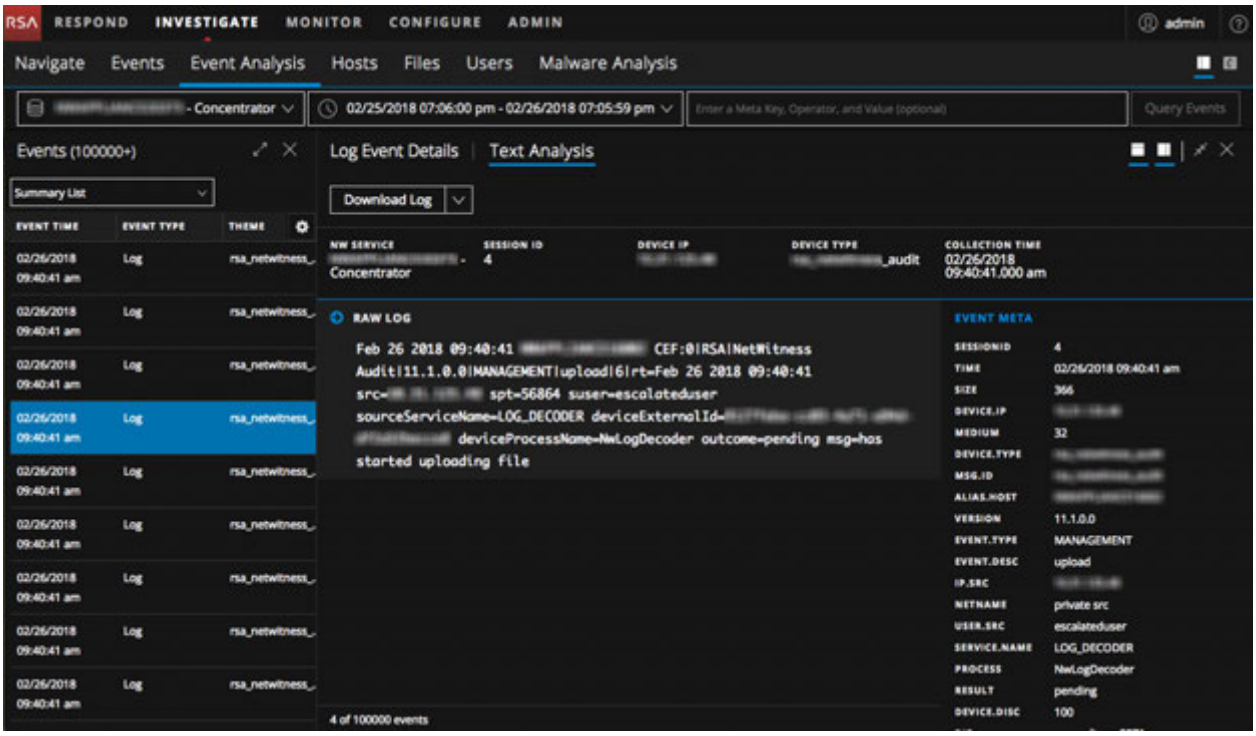
- Log events and endpoint events have no request or response; only the raw event is displayed in the Text Analysis panel.

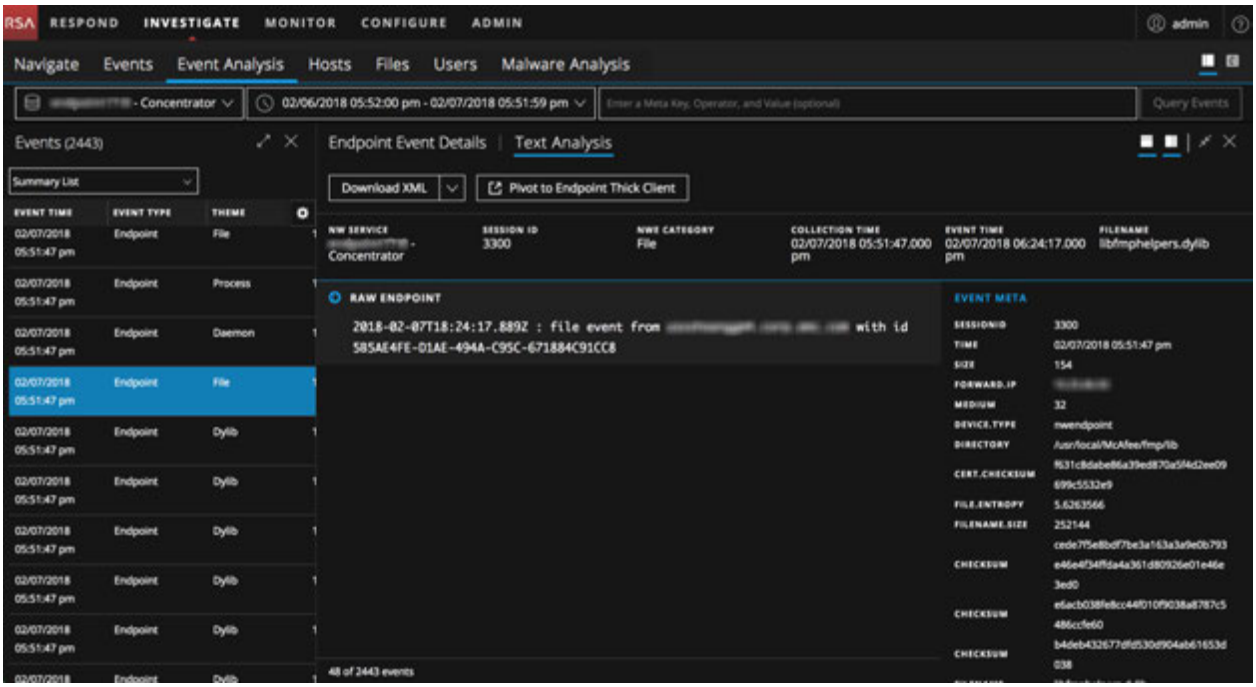
For each type of event (network, log, or endpoint), there are several differences:

- The Event header includes information relevant to each type of event.
- There are different options for exporting.

Below is an example of the Text Analysis panel for each type of event, a network event, a log event, and an endpoint event.



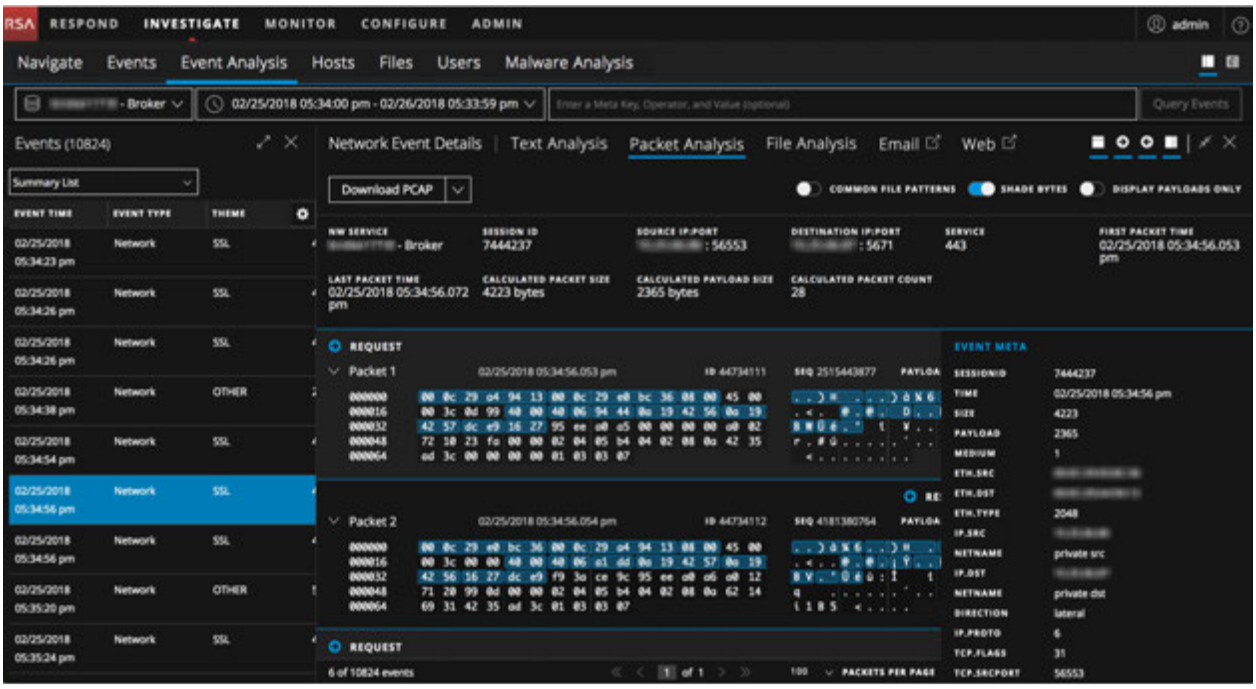




Note: The calculated packet count, calculated packet size, and calculated payload size in the Event header may be different than the same statistics in the Event Meta panel because the metadata is sometimes written before event parsing completes and may include packet duplicates.

The Packet Analysis Panel

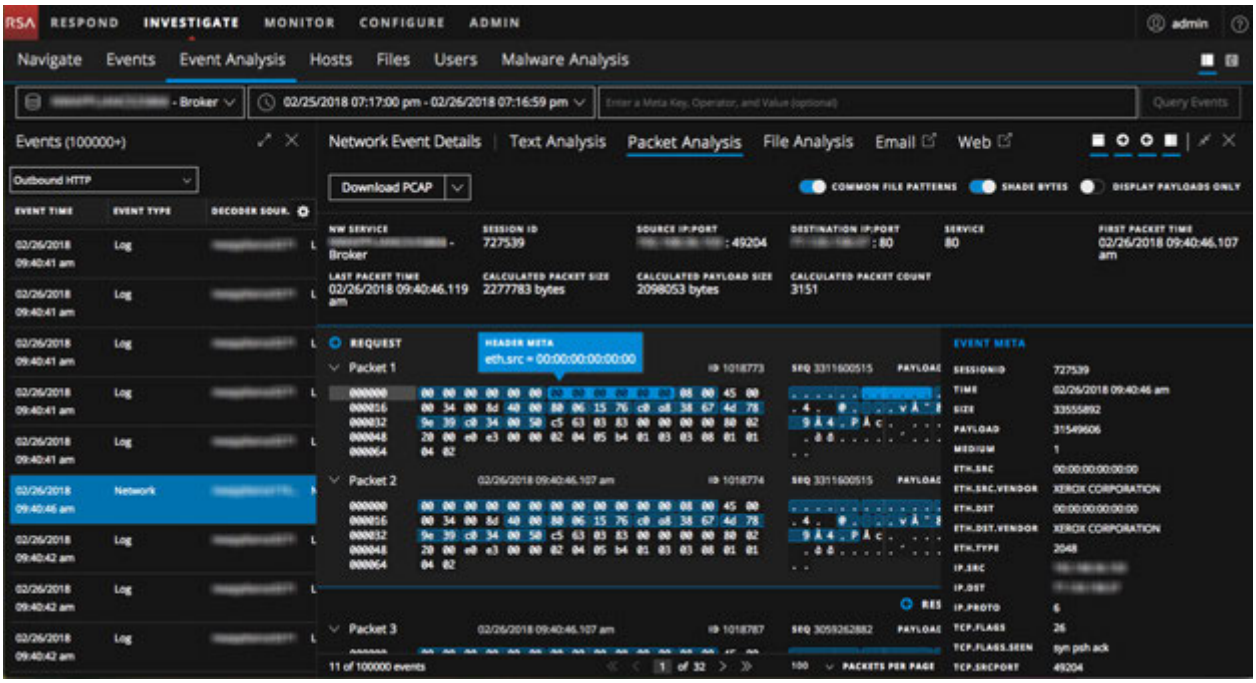
The Packet Analysis panel is for network events only. The Packet Analysis panel is scrollable, and the packet identification information as well as the Request and Response labels remain visible rather than scrolling out of view.



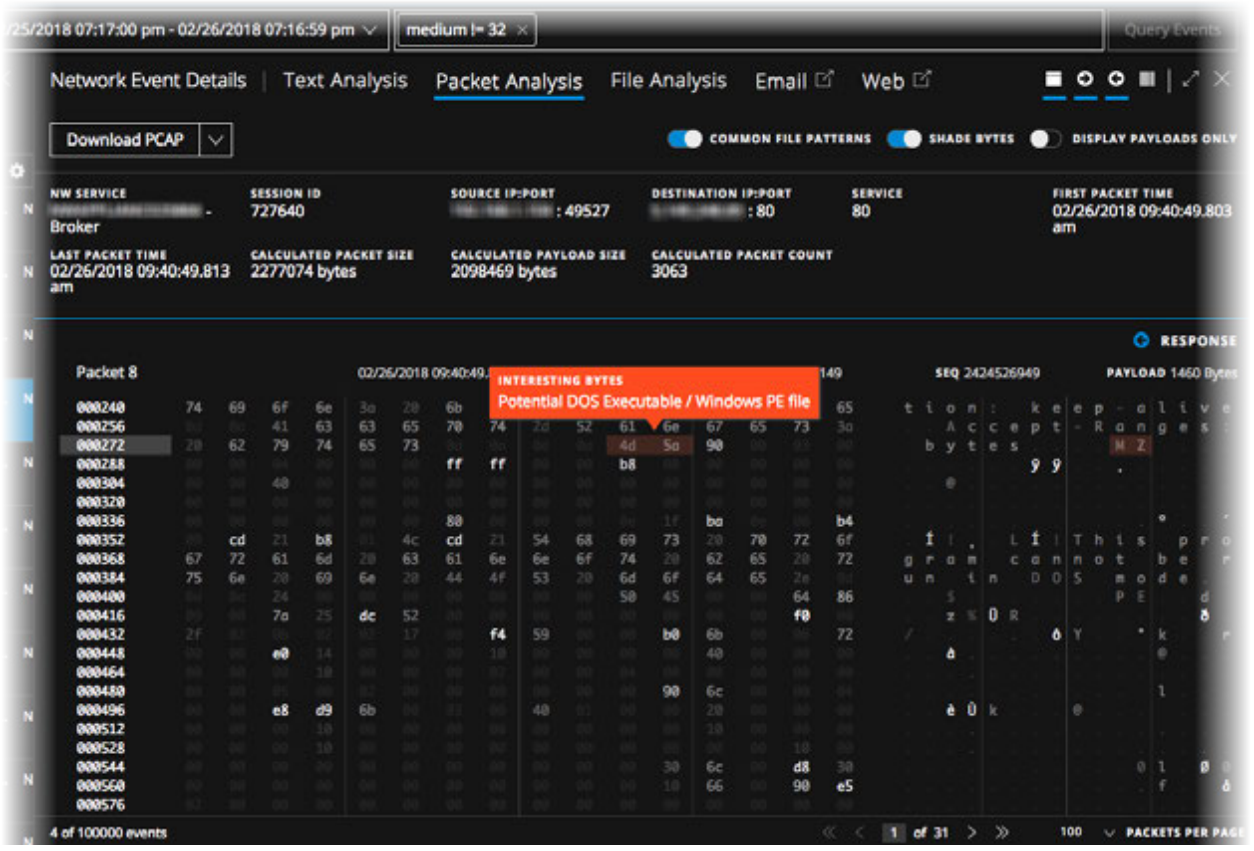
In the Packet Analysis panel, the headings provide the direction of the packet (Request or Response), the packet number, the packet start time, the packet ID and the sequence, and the payload size. All packets begin with a header, and some packets have a footer. Some packets have a payload.

In Version 11.1 pagination controls add flexibility when paging through packets.

The metadata in the hexadecimal and ASCII data is highlighted in blue; when you place the cursor over the highlighted metadata, the meta key/meta value information is displayed in a hover box.

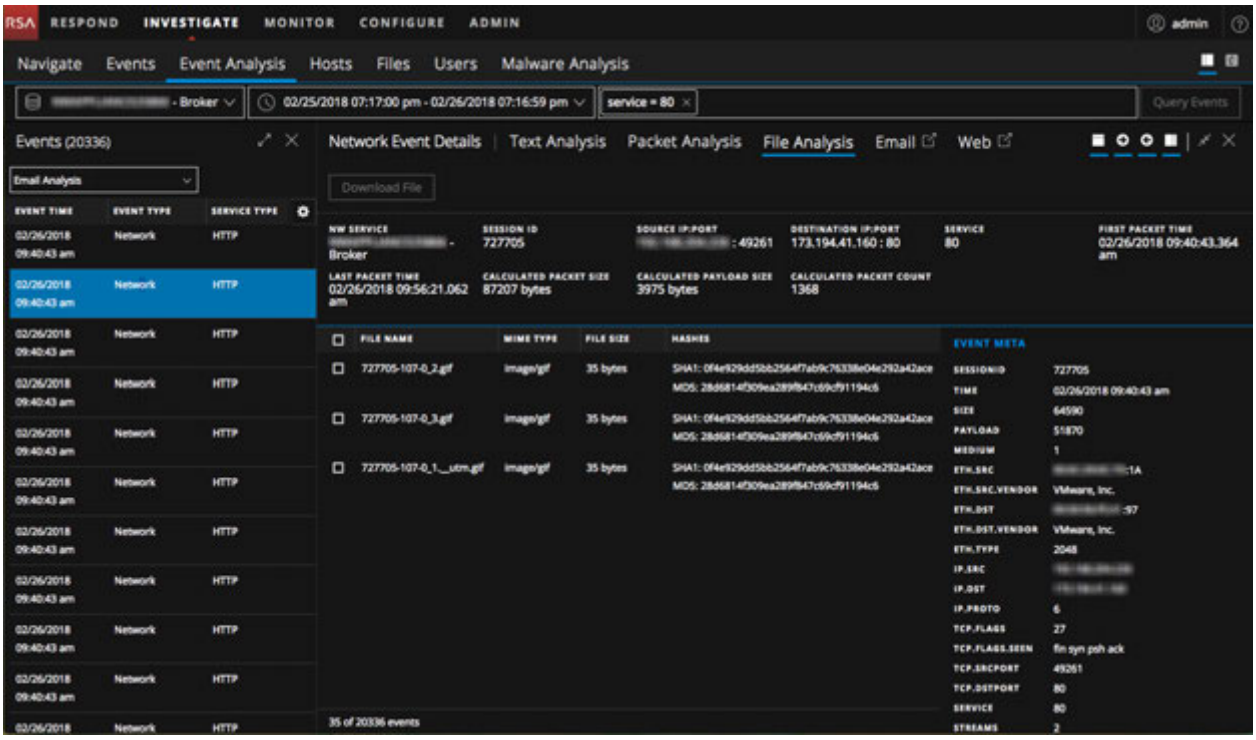


Common file signatures are highlighted with an orange background. When you place the cursor over the highlighted text, the description of the file type is displayed in a hover box.

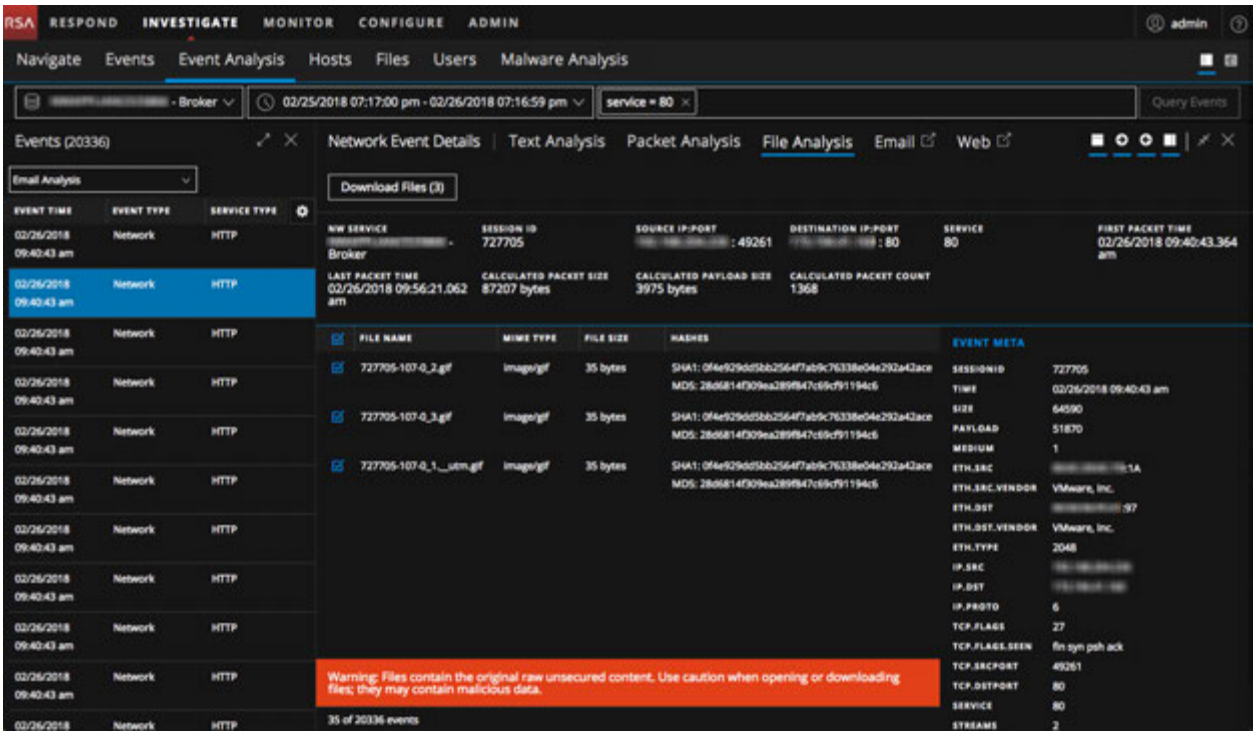


The File Analysis Panel

The File Analysis panel shows a list of files associated with the selected network event. This is an example of the File Analysis panel.



You can select one file, one or more files, or all files to export to your local file system. When files are selected, the Export Files button becomes active and reflects the number of files selected.



Caution: Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

Analytical Tools for Each Type of Event Analysis

The analytical tools in the Event Analysis view are designed to help analysts find the relevant information for different types of events (network event, log event, and endpoint event). This table lists the actions you can take by event type. The rest of this section provides procedures for performing the actions.

Action	Network Event	Log Event	Endpoint Event
View the Text Analysis panel	✓	✓	✓
View the File Analysis panel	✓		
View the Packet Analysis panel	✓		
Open, close, and adjust the size of panels	✓	✓	✓
Adjust the display of requests and responses	✓		
Show or hide the Event Header in the Text Analysis panel	✓	✓	✓
Expand truncated text entries in the Text Analysis panel	✓		

Action	Network Event	Log Event	Endpoint Event
Switch between a compressed and decompressed view of payloads in the Text Analysis panel	✓		
View highlighted bytes in the Packet Analysis panel	✓		
Highlight common file types in the Packet Analysis panel	✓		
Display only the payload in the Packet Analysis panel	✓		
Shade bytes in the Packet Analysis panel when viewing payload only	✓		
Perform URL and Base64 encoding and decoding in the Text Analysis panel	✓		
View decompressed text for an HTTP network session in the Text Analysis panel	✓		
View event metadata for an event in the Text Analysis panel	✓	✓	✓
Download a network event (as a PCAP file, payload only, request only, or response only) in the Packet Analysis panel or the Text Analysis panel	✓		
Export files from a network event in the File Analysis panel	✓		
Download the file for a log event in the Text Analysis panel		✓	
Download the file for an endpoint event in the Text Analysis panel			✓
Open the current endpoint event in Text Analysis panel			✓

Filter Results in the Event Analysis View

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

In NetWitness PlatformVersion 11.0, you submit a query in the Navigate view or the Events view, and when you go to the Event Analysis view, a read-only breadcrumb shows the submitted query. You need to go to back to the Events view or Navigate view if you want to enter a different query.

In Version 11.1 and later, a query builder populates the interactive breadcrumb in the Event Analysis view so that you can create and edit each `<meta key> <operator> <meta value>` filter in the breadcrumb. In addition, you can select a different service and time range without going back to the Navigate view or the Events view. The remainder of this section provides information about using the query builder features.

How the Breadcrumb Works

When you click the Event Analysis option in Investigate to open the view, the service and time range selector is displayed. By default, the first service is auto selected (unless you previously selected a service and the selected service is remembered in the browser). If you do not select a time range, the default time range (3 hours) is used. The query builder field is an empty field to the right of the time range.

When you open the Event Analysis view from the Events view or the Navigate view, the service, time range, and any filters that were selected in the Events view or Navigate view are displayed in the breadcrumb. The service, time range, and individual filters can be modified.

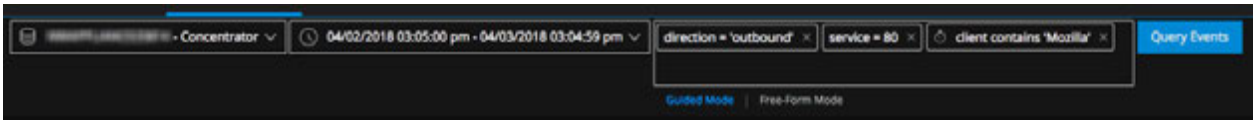
Beginning with Version 11.2, in addition to building a query in Guided Mode, advanced analysts can enter a query in Free-Form Mode. The default mode is Guided Mode, which includes auto-suggest and validation options. Free-Form Mode allows you to type a complex query; validation is performed when you run the query.

Note: A complex query is any query other than a basic <meta key> <operator> <value> filter that contains `()`, `||`, `&&`, `length`, or `regex` operators.

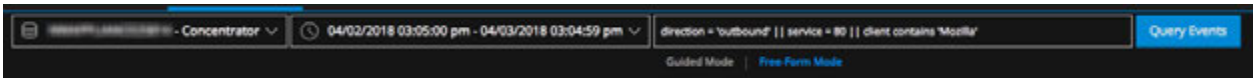
Two buttons switch between the modes, and place a cursor in the query bar so that you can begin creating a query immediately. If you selected Free-Form Mode the last time you logged in, this choice is in effect the next time you log in.

- When you switch from Guided Mode to Free-Form Mode, filters that you created in Guided Mode are transformed to a text query in the Free-Form field.
- When you switch from Free-Form Mode to Guided Mode, the query you were typing is added to the query builder as a single uneditable filter.
- If you start building a query with multiple filters in Guided Mode, then switch to Free-Form mode, and back to Guided Mode with no changes, the multiple filters are in the same state that you left them.

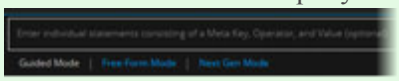
The following figure is an example of the Event Analysis view with the Guided Mode query builder in effect.



The following figure is an example of the Free-Form query builder.

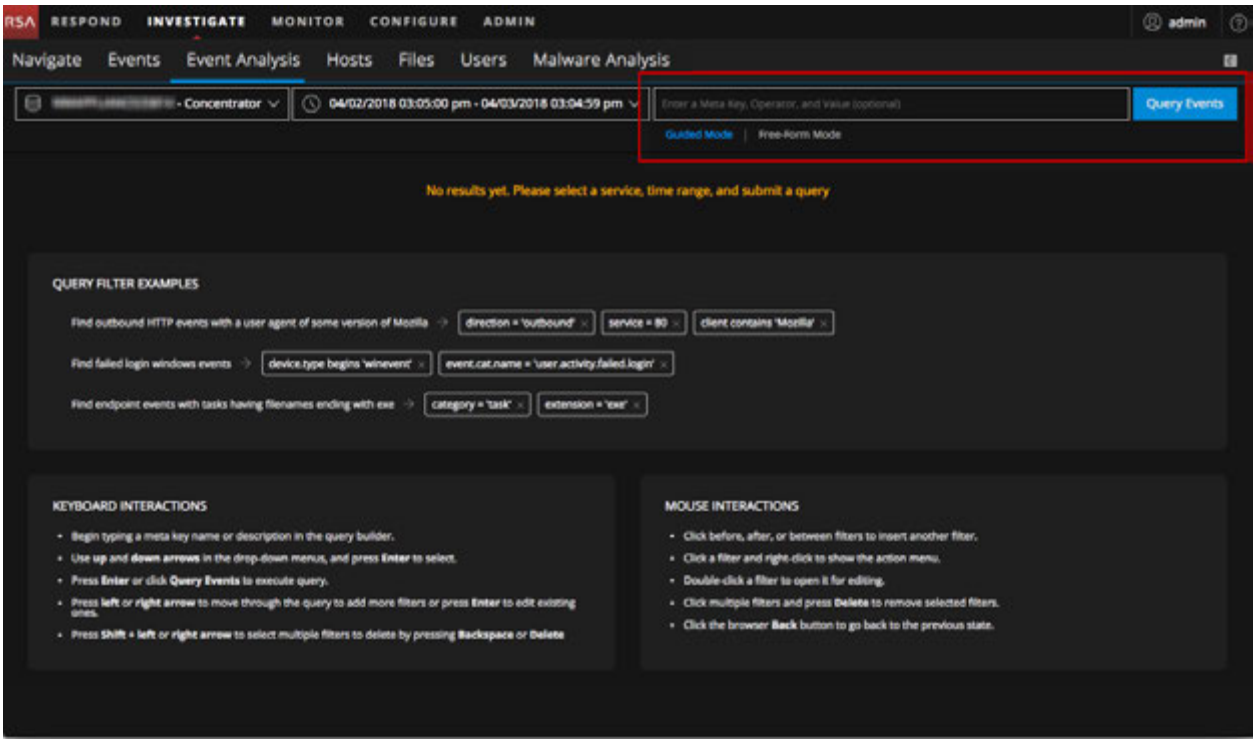


Note: Version 11.2 included an undocumented beta feature, called Next Gen mode, in the Event Analysis view query builder that was still being developed and tested. Next Gen mode was disabled in the 11.2.0.1 patch. If you see Next Gen mode do not use it; you should use only the Guided Mode and Free-Form Mode in the query builder to ensure consistent and predictable results.



Guided Mode Query Builder

Guided Mode is the easiest way to create a query with features to help analysts enter valid queries. The following figure illustrates the initial Event Analysis view with the Guided Mode query builder in effect.



Note: The Guided Mode query builder supports only simple filters in the form `<meta key><operator><meta value>`. If the Events view or Navigate view has a filter with more than one operator, `not`, `>`, `<`, `<=`, `>=`, `||`,`&&`, `()`, `REGEX`, or `LENGTH`, the filter is added, but editing is not supported in the Event Analysis view. The same is true for a filter brought in from the Free-Form query builder.

As you create filters in the Guided Mode query builder, the breadcrumb is updated with each filter in an editable field. When you submit the query, all of the filters are AND'd to generate results. The query is not submitted until you click Query Events. Filters line up from left to right, representing the sequence in which the filters were created. Each filter is a simple expression of the form `<meta key> <operator> <optional value>`. As more filters are added and they cannot be displayed in a single line, they wrap to another line and the input area expands vertically so that all filters are visible without scrolling to the right.

As you create and edit filters, you are assisted with suggestions for auto-complete that show only valid meta keys and operators in the drop-down list. You can type or select from the drop-down list. In the drop-down list, operations that take more time to execute are marked by a stopwatch icon. Invalid filters are marked by a red outline, and if you hover the mouse over the filter, a tool tip that explains the error is displayed.

The Query Events button is on the right side of the breadcrumb input, and becomes active as needed to submit a query. A query is submitted when you click Query Events or press Enter after creating a filter. When you have a set of results loaded and you change the service, time range, or a filter, the Query Events button turns blue as an indicator that the data in the view is now stale. In Version 11.2 and later, the Query Events button will also turn blue if more than a minute has passed because the original query's time range no longer generates the same result set.

Note: If you change the service, a network call for data for reconstructions or more data in the Events panel (for example, Load More) uses the previous service/time range/metadata filters. The network call continues to use these previous query parameters until you submit the new query.

Keyboard Actions to Use in Guided Mode

In Guided Mode, the query builder allows entry, editing, and deletion of filters from the keyboard without having to use a pointer. Although you can use the pointer, you have the option to keep your fingers on the keyboard. This table identifies the available keyboard actions when the cursor is located in the Guided Mode query builder portion of the breadcrumb; these do not apply to the service selector and time range.

Action	Keyboard Entry
Submit a query.	With focus on the query builder and no pending filters, press **Enter.**
Select the filter to the immediate left if one exists.	With no selection in the query builder, press the **Left Arrow** key.
Select the filter to the immediate right if one exists.	With no selection in the query builder, press the **Right Arrow** key
Insert a new filter to the immediate left of the selected filter.	With a filter selected, press the **Left Arrow key**
Insert a new filter to the immediate right of the selected filter.	With a filter selected, press the**Right Arrow** key.
Insert a new filter to the immediate left of the selected filter, and open for editing.	With a filter selected, press the **Shift + Left Arrow** keys.
Insert a new filter to the immediate left of the selected filter, and open for editing.	With a filter selected, press the **Shift + Right Arrow** keys.

Action	Keyboard Entry
Select all filters to the right of the current filter.	With a filter selected, press the **Shift + Down Arrow** keys.
Select all filters to the left of the current filter.	With a filter selected, press the **Shift + Up Arrow** keys.
Edit a selected filter	With a single filter selected, press the **Enter** key.
Deselect all filters.	With a filter selected, press the **ESC** key.
Delete all selected filters.	With filters selected, choose the **right-click > Delete selected filters** option, press **Delete**, or press **Backspace**.
Update query with only the selected filters.	With filters selected, choose the **right-click > query with selected filters** option.
Open a new tab with the selected filters.	With filters selected, choose the **right-click > query with selected filters in a new tab** option.

Feedback in Guided Mode

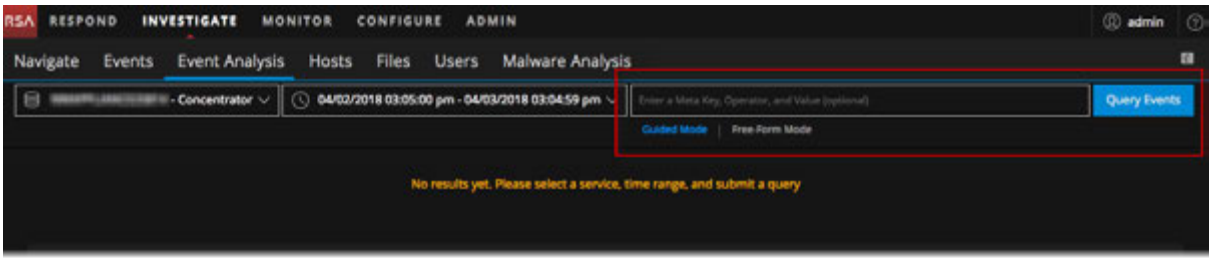
Guided Mode provides visual feedback during query construction. This table identifies and describes the possible feedback.

Feedback	Icon	Description
Green Circle		The cursor has been placed between two existing filters. Clicking inserts a new filter at this location.
Red Outline of a Filter		The value-type is not valid for the selected meta key, for example, a string value for a meta key that expects an integer. A tool tip that explains the error is displayed.
Stopwatch		The selected meta key/operator combination requires extra time to process. While the query is still executable, a more efficient meta key or operator is recommended.

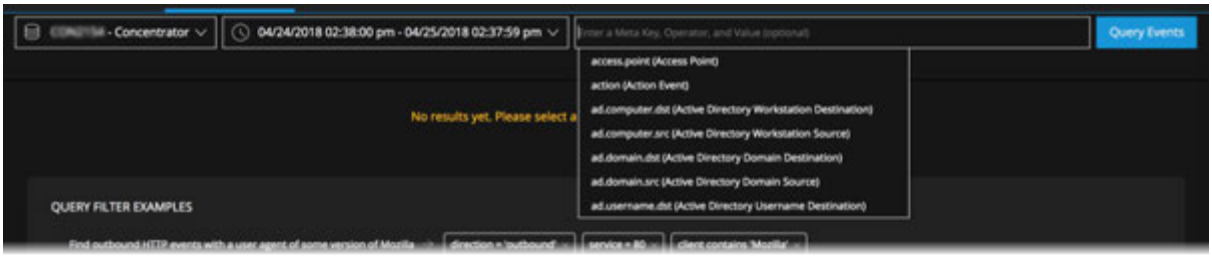
Add a Filter in Guided Mode

To filter the data displayed in the Event Analysis view in Guided Mode:

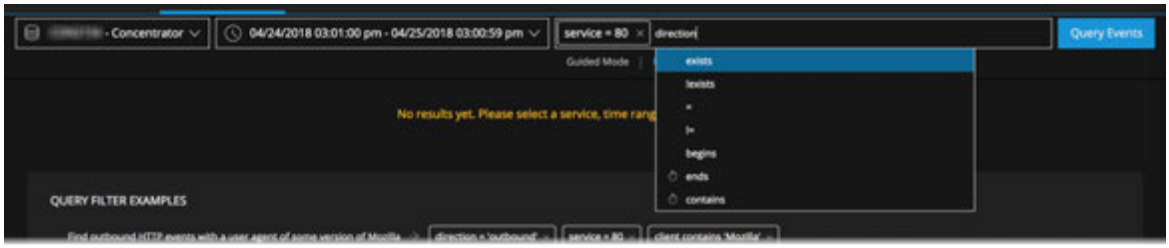
1. Go to the **Event Analysis** view, and select **Guided Mode** below the query builder.
   This is an example of the empty query builder in Guided Mode before you begin entering a filter.



2. To insert a filter, click in the query builder field, or before or after an existing filter.
   If the insertion point is between two filters, a green dot marks the insertion point. If the insertion point is at the end of the existing breadcrumb, the filter entry field opens with a blinking cursor at the entry point. A drop-down menu lists available meta keys for the selected service in alphabetical order. The available meta keys are passed from the service being investigated, and meta keys that require more time to process are marked by a stopwatch icon.



3. To select a meta key do one of the following:
   a. If there is only one option in the drop-down menu, press the **Enter**.
   b. If there are two or more options in the drop-down menu, click on the meta key or use the up/down arrow and press **Enter**.
   c. Start typing the meta key. As you type the meta key, the list is further updated. To select the meta key, press **Enter**.
   d. If you want to edit or delete the meta key, press **Backspace** or **Delete**.
      As you backspace and delete a character, the meta key drop-down list is filtered to include meta keys that begin with those characters. To select a meta key, press **Enter**.
      The meta key is added to the query builder, a list of valid operators for the selected meta key is displayed. Operations that require more time to process are marked by a stopwatch icon.

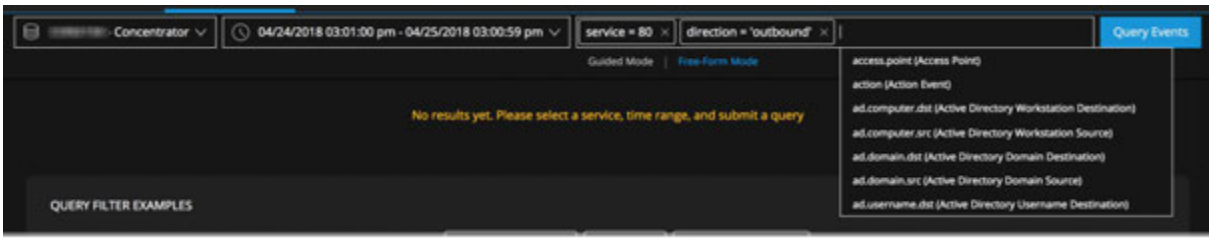


4. To select an operator do one of the following:
   a. If there is only one option in the drop-down menu, press **Enter**.
   b. If there are two or more options in the drop-down menu, click on the operator or use the up/down arrow and press **Enter**.

c. Type the operator and press **Enter**.
The drop-down list closes and you can add a value if the operator accepts a value.

5. (Optional) Type a value and press **Enter**.

6. To create the filter, press **Enter**. If you click anywhere outside the box before pressing **Enter**, the filter is not created.
The new filter is inserted, and the blinking cursor is refocused after the last filter, the meta keys drop-down is displayed. If there is an error in the filter, it is outlined in red. You can hover over the filter to see a tool tip explaining the error. This figure shows a query being created with no errors.



7. Correct any filters that have errors.

8. When you are ready to execute the query in the breadcrumb, click **Query Events**.

9. The Events List is refreshed to reflect the query.

Edit a Filter in Guided Mode

With a query in the Guided Mode query builder, you can edit a filter. To edit a filter:

1. Double-click the filter, or click the filter and press **Enter**.

2. Edit the filter. When finished editing, press **Enter** to update the filter.

3. If you want to execute the query again, click the **Query** button.
The Events List is refreshed to reflect the updated filter.

Query Using Selected Filters in Guided Mode

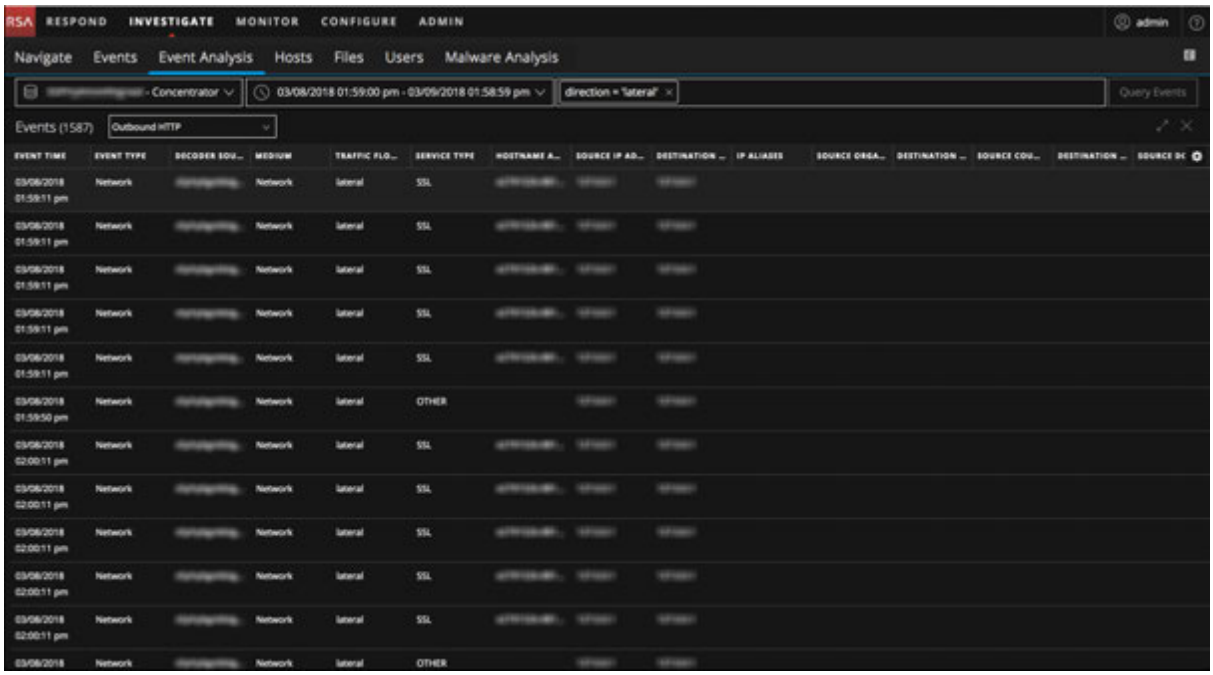
With one or more filters in the Guided Mode query builder, you can refocus the same query to include only selected filters. The results are displayed in the current browser tab or a new browser tab. To update the query using only selected filters:

1. Begin with a Guided Mode query that includes one or more filters, for example a query has three filters: `risk.info = exists`, `direction ="lateral"`, and `threat.category exists`.

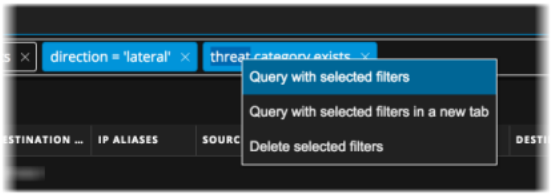
2. To open a new tab with the selected filters, select `direction = "lateral"`, right-click the filter and select **Query with selected filters in a new tab** in the drop-down menu.

A new tab opens with the results for the selected filter and the original query is left intact on the

previous tab.



3. To query the selected filters in the same tab, select `direction = "lateral"` and `threat.category exists`. Then right-click and select **Query with selected filters** in the drop-down menu.



A query with only the selected filters is submitted and all remaining filters are removed.

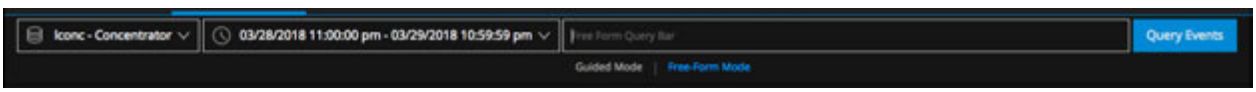
Delete a Filter in Guided Mode

To delete a filter:

1. Click **X** in a filter, click on the filter to select it and press **Delete** , or right-click one or more filters and select **Delete selected filters** in the drop-down menu.
2. If you want to execute the query again, click the **Query** button.
   The selected filter is deleted and the Events List is refreshed.

Free-Form Query Builder

Free-form queries are most useful when you have a complex query in mind that you want to enter quickly, and you know the meta keys, valid operators, and valid syntax for entering values. The following figure illustrates the initial Event Analysis view with the empty Free-Form query builder field.



The blinking cursor indicates that it is ready for you to enter a query. You can enter free text here. As more expressions are added and they cannot be displayed in a single line, they wrap to another line and the input area expands vertically so that all filters are visible without scrolling to the right.

These are some examples of queries that you can enter in Free-Form mode:

To find events with an 8- to 11- character username similar to atreeman-72:

```
user.all length 8-11 && (user.all regex '^a[a-z]{2}ee[a-z]{3}-[0-9]{2}')
```

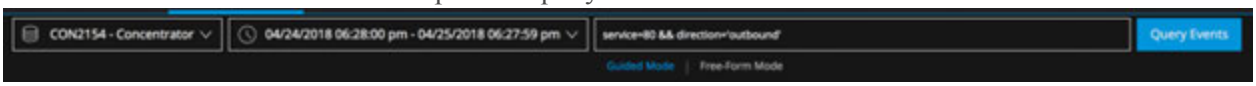
To find events that are either HTTP network events or related to aix or ciscoasa logs:

```
service=80 || (device.type = 'aix','ciscoasa')
```

To find all outbound events not going to Canada or the United States:

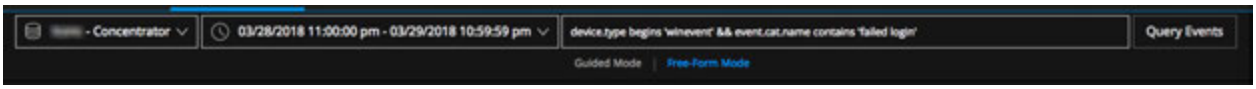
```
direction = 'outbound' AND not(country.dst = 'united states' || country.dst = 'canada')
```

If you have a submitted query in Guided Mode, the query is transformed into text when you click switch to Free-Form mode. This is an example of a query submitted in Guided Mode.



You can enter free text here. As more expressions are added and they cannot be displayed in a single line, they wrap to another line and the input area expands vertically so that all filters are visible without scrolling to the right.

The Query Events button is on the right side of the breadcrumb input, and is highlighted in blue as needed to input a query. The query is applied when you click Query Events. At that time the query is validated to show syntax and logic errors.



Operations that require more processing time are not highlighted as they are in Guided Mode, but this table provides a summary of expensive operations for reference.

Index Method	Non-Text Value	Text Value	Regular Operations	Expensive Operations
By Key	✓		`exists, !exists`	`eq, !eq`
By Key		✓	`exists, !exists`	`eq, !eq, begins, ends, contains`
By Value	✓		`exists, !exists, eq, !eq`	no expensive operators
By Value		✓	`exists, !exists, eq, !eq, begins`	`ends, contains`
By None	special case for `sessionid`		`exist, !exits, eq, !eq`	no expensive operators

Examine Events in the Event Analysis View

When examining raw events and meta data in the Event Analysis view, you can make simple adjustments in the visibility and size of the panels. Within the Packet Analysis panel and the Text Analysis panel, you use additional features to adjust the way the reconstruction is displayed and bring interesting data into focus.

Select the Event Analysis Type

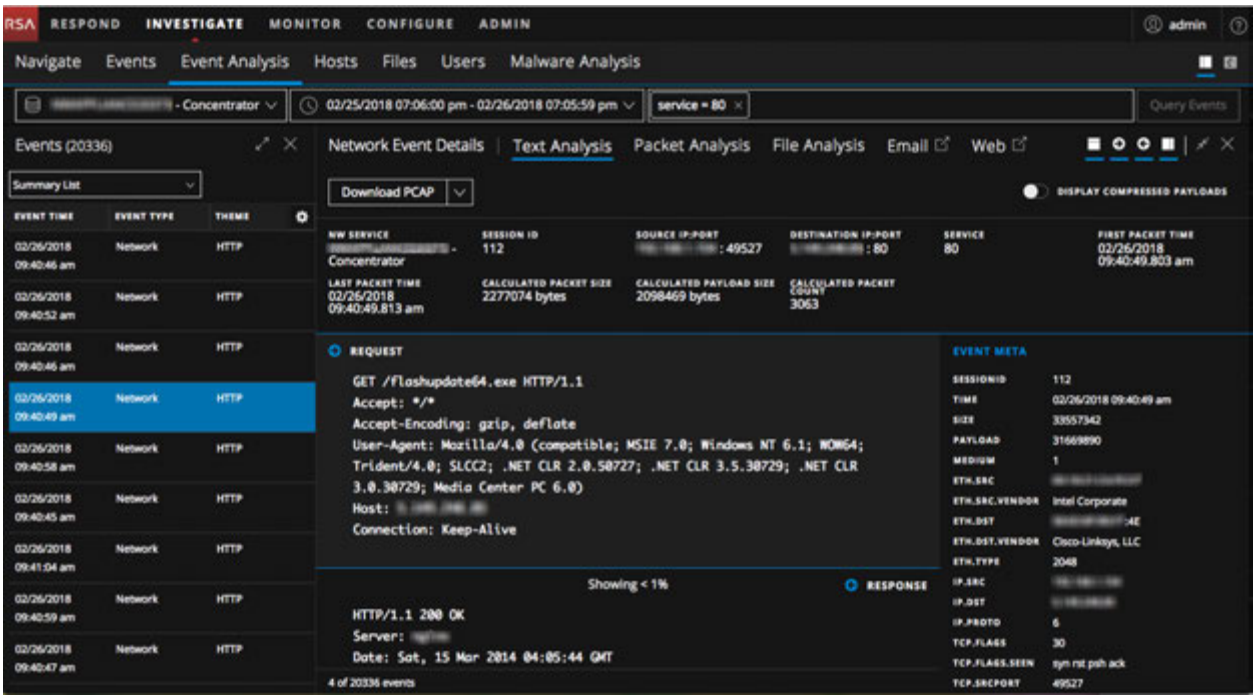
To select the event analysis type for an event, do one of the following:

1. In the **Event Analysis view** toolbar, click the analysis type in the toolbar.
2. In the drop-down menu, select the analysis type: **File Analysis**, **Text Analysis**, **Packet Analysis**, **Email** (Version 11.1 and later), or **Web** (Version 11.1 and later).
   If you chose **File Analysis**, **Text Analysis**, or **Packet Analysis**, the view is refreshed with the Packet Analysis panel, File Analysis panel, or Text Analysis panel open.
   If you chose **Email** or **Web**, the Events view email or web recontruction of the single event opens in a new tab. This is the same reconstruction of an email or web session used in the Events view. The Events view provides more functionality when viewing an email or web reconstruction, allowing you to page through events in that view instead of viewing only one event (see Reconstruct an Event).

Note: The Packet Analysis panel is only available for network events.

Open, Close, and Adjust the Size of the Panels in the Event Analysis View

The Event Analysis view opens with the Event list and no event selected or reconstructed. When you select an event, the Network Event Details, Log Event Details, or Endpoint Event Details panel opens on the right. Initially, the Network Event Details, Log Event Details, or Endpoint Event Details panel occupies 75% of the window width by default.



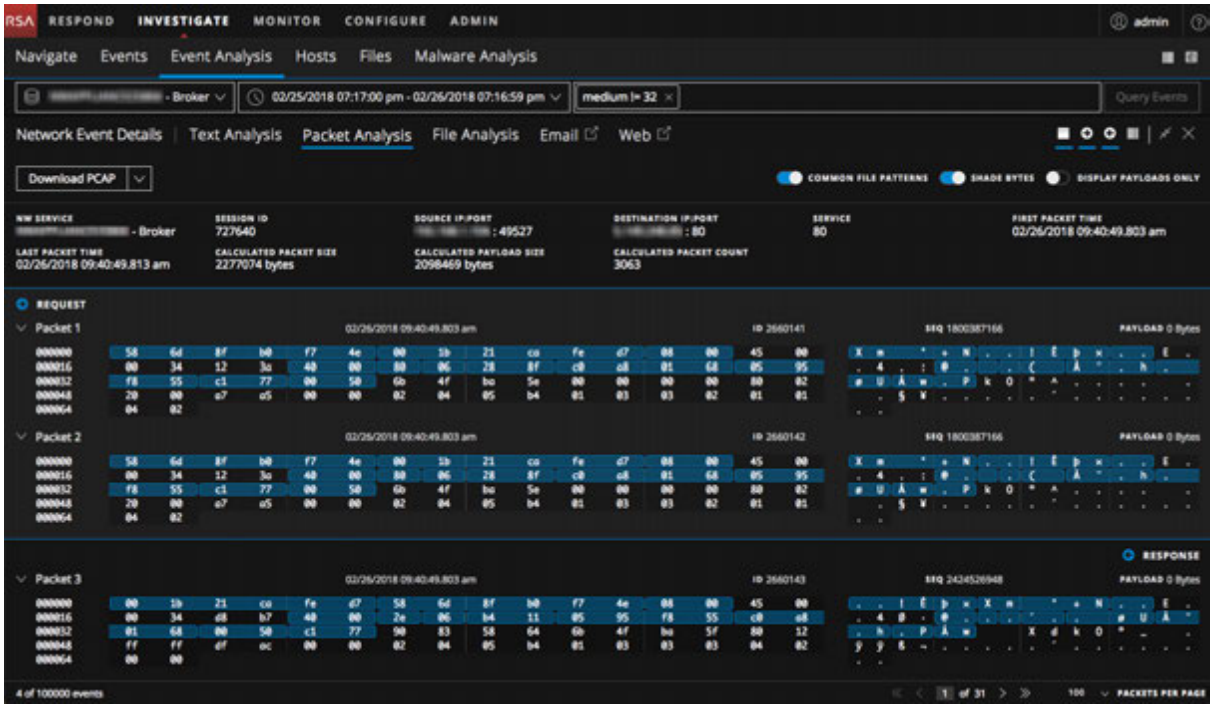
You can adjust the size ratio of the two panels to improve readability by expanding one of the panels, contracting one of the panels, and closing one of the panels. After closing either panel you can reopen it. The ratio you select persists until you change it or refresh the browser.

- To reopen the Events panel, click ☐ in the upper right corner.

To optimize your view:

1. To adjust the size ratio of the two panels, do any of the following:
   a. Click ■ in the tool bar of the panel that you want to expand.
   b. Click ■ in the tool bar of the panel that you want to contract.

2. To close either panel, restoring the open panel to its full width, click ■.
   This is an example of the reconstruction displayed using the full width of the browser window.



3. To reopen the Events panel after closing, click ◫ in the top right corner of the Navigate view.
   The Events panel opens to the last state (25%:75% or 50%:50%).
4. To reopen the Event Details panel, click an event in the Events panel.

Select a Column Group and Columns in Event Analysis

In Version 11.1 and later, you can use built-in or custom column groups in the Events panel. The column groups are created and managed in the Events view (see Manage Column Groups in the Events View); these groups are reflected in the Event Analysis view. When you change the column group, the changes you make to a column group are for the current view only. When you navigate away and come back to the Event Analysis view, the column changes do not persist in the Events panel.

These are the built-in column groups.

- **Email Analysis**: Includes meta keys that are useful when investigating email-related metadata.
- **Endpoint Analysis**: Includes meta keys that are useful when investigating endpoint-related metadata.
- **Malware Analysis**: Includes meta keys that are useful when investigating malware-related metadata.
- **Outbound HTTP**: Includes meta keys that are useful when investigating Outbound HTTP- related metadata.
- **Outbound SSL/TLS**: Includes meta keys that are useful when investigating Outbound SSL/TTS analysis-related metadata.
- **Summary List**: Includes meta keys that are useful in a general investigation. **This is the default column group.**

- **Threat Analysis**: Includes meta keys that mark potential threats in the data set.
- **Web Analysis**: Includes meta keys that mark anomalies in web traffic.

A column group may contain more columns than are visible without scrolling to the right. In Version 11.1, you can select the columns that appear in Event Analysis view. The order of the columns reflects the order in the Events view of the default column group. By default, the first 15 columns are displayed when you select a column group. For optimized viewing, it is advised to view only 15 columns at a time; however, you can select additional columns to display and remove columns displayed.

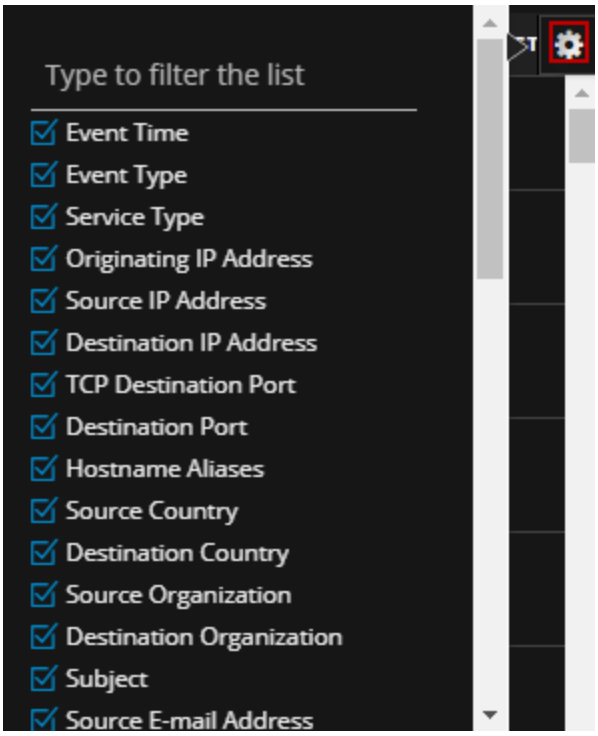
To select a column group:

1. From the drop-down menu next to Events, select a column group (for example, **Summary List**). You can also start typing the name of the column group and select a group as the groups appear in the drop-down menu.

   The Events panel displays data in the columns that belong to the selected column group.

To select columns to display:

1. While working in the Event Analysis view, with a column group selected, click ⚙ to display the column selector.



2. Select the meta keys or enter the name of a meta key that you want to display in additional columns.
3. If you do not want to see a meta key displayed in a column, de-select the meta key.
   The data is re-displayed using the selected columns.

Adjust the Display of Requests and Responses

For Event types that have requests and responses in them, you can make several adjustments.

Note: If the analysis type does not have requests and responses, the option is not selectable. The File Analysis panel is an example of a reconstruction type without requests and responses. A reconstructed log event in the Text View is another example.

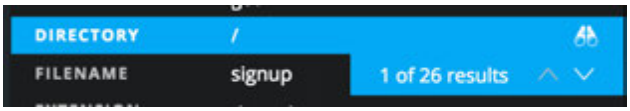
To select which side of the conversation to show (Request, Response, or both) click one or both of the direction icons ( ). The reconstruction is refreshed with the selected information.

Note: If you do not see any data, you may have deselected both Request and Response. You must select one of the two to see data displayed.

View Event Metadata for an Event

When examining events in the Text Analysis panel, Packet Analysis panel, or File Analysis panel, you can click to show the associated metadata in an adjacent panel, the Event Meta panel.

When viewing Text Analysis and the Event Meta panel, hovering over the meta key/meta value pairs reveals a pair of binoculars if the meta value is searchable in the raw text. This is an example of the binoculars icon when hovering over the **Directory** and / meta key/meta value pair.



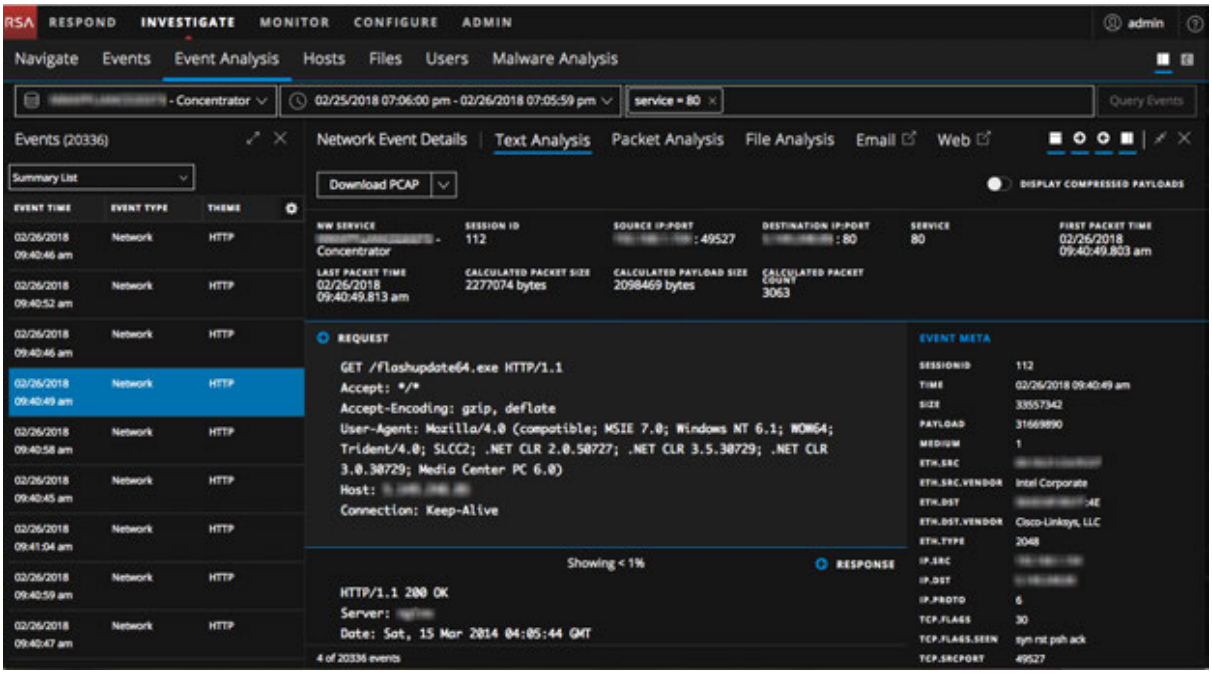
Clicking on the icon triggers a search for the meta key/meta value pair (case-insensitive) in the Text Analysis panel and each instance is highlighted. In the Event Meta panel, the highlighted row has a count of the results and a scroller that you can use to quickly find each result in the Text Analysis panel. You can view each highlighted location of the data that triggered generation of the meta key, going forward to view the next, and back to view the previous.

Only meta keys that have relevant values inside the RAW text are searchable. You can search only one meta key at a time. If the value is currently hidden due to truncation of a text entry with more than 3000 characters, the text entry is expanded to reveal the found meta value.

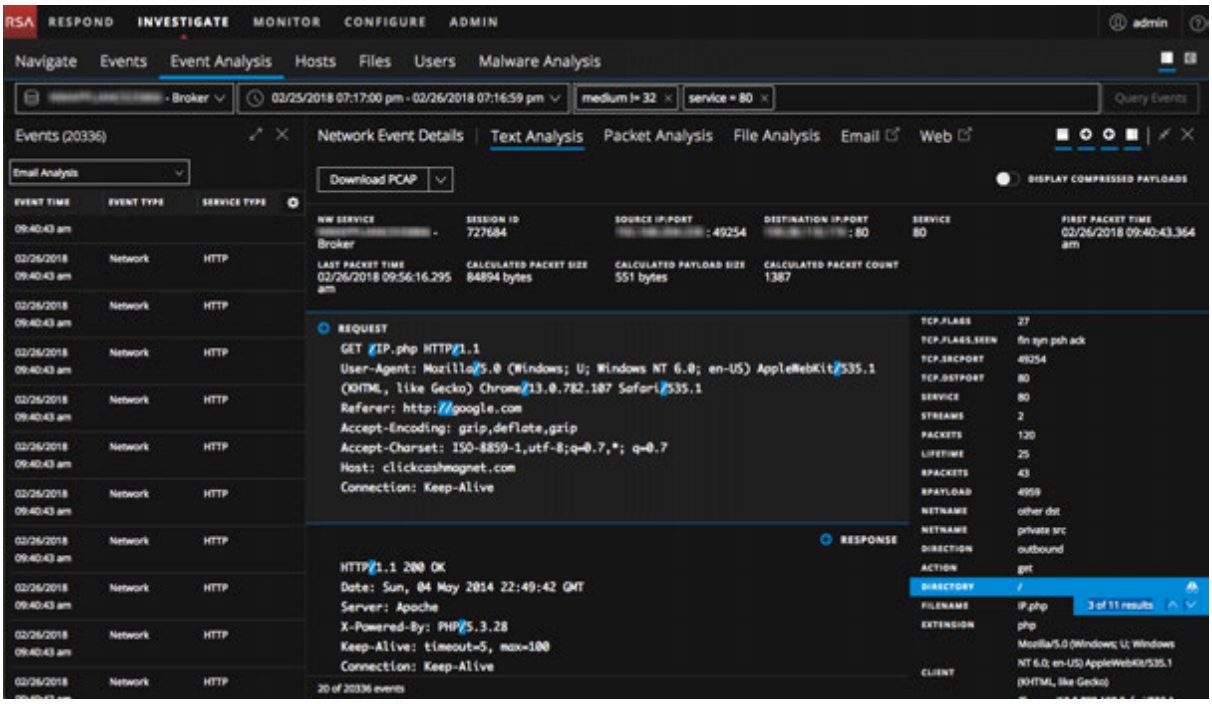
Clicking on the same meta key/meta value pair or a different meta key:value pair in the Event Meta panel removes the highlighting from the raw text. The highlighting is also removed if you close the Event Meta panel.

To search the raw text for meta values that triggered a meta key:

1. Open a network event in the Text Analysis panel.



2. In the toolbar, click  to open the Event Meta panel. As you hover over the meta key:meta value pairs in the list, a binoculars icon identifies values that are searchable in the Text Analysis panel.
3. To search for the value in the raw text, click a row that has the binoculars icon, indicating it is searchable.
   If no relevant occurrence of the value is in the text, the value that you are searching for is highlighted in the Event Meta panel and nothing is highlighted in the Text Analysis panel.
   If one or more relevant instances of the value is found in the Text Analysis panel, each occurrence is highlighted. The value that you are searching for is highlighted in the Event Meta panel and the scroller is visible.



4. To remove the highlighting, close the Event Meta panel, click the same meta key/meta value pair in the Event Meta panel, or click a different meta key/meta value pair in the Event Meta panel.
   The highlighting is removed from the raw text.

Show or Hide the Event Header

To hide the Event Header in the Packet Analysis panel, Text Analysis panel, or File Analysis panel, providing more vertical space for the data, click .

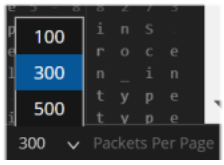
Page Through Events in the Packet and Text Analysis Panels

Pagination controls allow more flexibility in paging through a list of packets or text. In the Packet Analysis panel, you can select the number of packets to display per page, and your selection is saved across logins to the NetWitness application. When a control is unavailable, the control is dimmed; for example, when you are viewing page 1, the and controls are dimmed.

Note: For Packet Analysis, pagination controls are available in Version 11.1 and later. For Text Analysis, pagination controls are available in Version 11.2 and later.

To use pagination controls:

1. (Packet Analysis only) With an event open in the Event Analysis view, click the current number of packets per page (**100**, **300**, or **500**), and select the new number of packets per page from the drop-down menu.

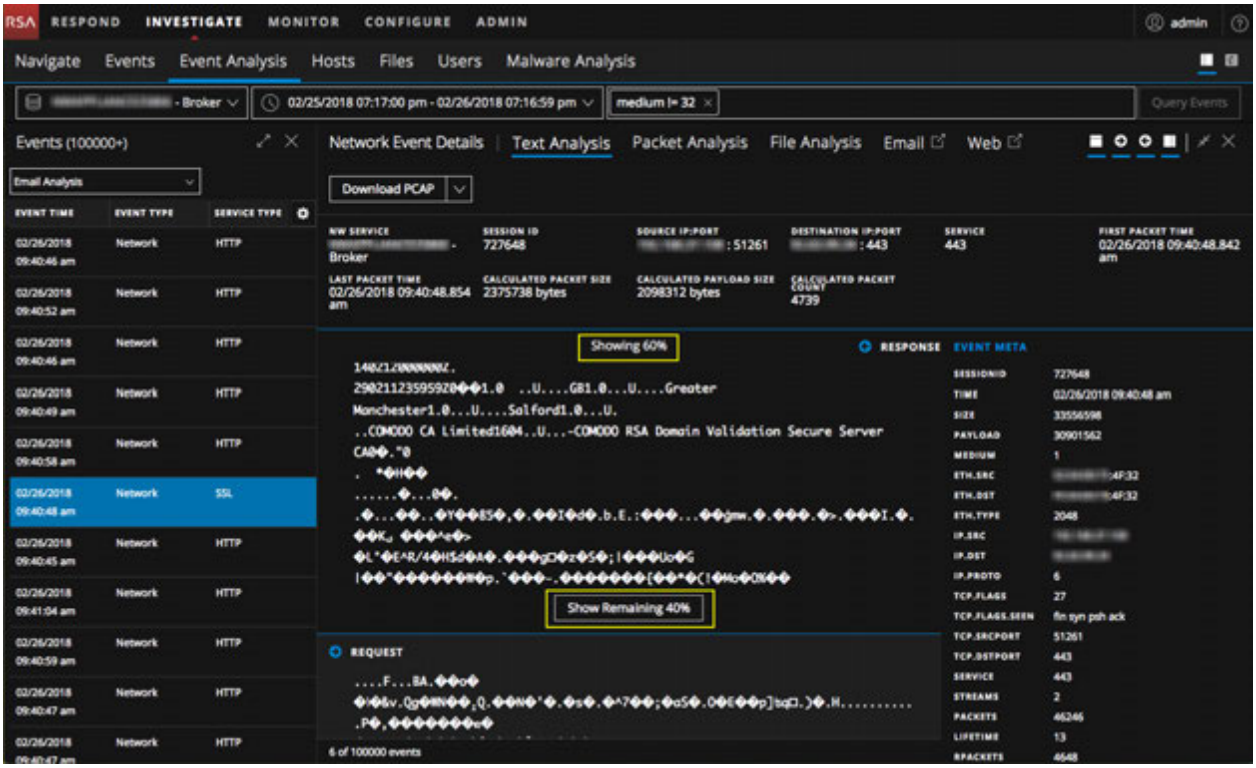


2. To page forward or back, use the page control icons:
   Click ▶ to go to the next page.
   Click ⏭ to go to the last page.
   Click ◀ to go the previous page.
   Click ⏮ to go to the first page.
3. (Packet Analysis only) To go to a specific page, type a page number in the page number field
   

Note: When in the Text Analysis panel, you must navigate manually to the last page before the last page control icon is available.

Expand Truncated Text Entries in the Text Analysis Panel

A reconstruction of a network event in the Text Analysis panel may include requests and responses of many hundred thousands of characters and scrolling through a long entry of more than 6000 characters that is not of interest can waste time. To improve the experience for analysts, all text entries that have more than 6000 characters are truncated to show only the first 2000 characters. This example shows an entry that has more than 2000 characters and a message in the header indicates the percentage of total characters that is being displayed.



You can see that 60% of the characters (the first 2000) are displayed, and click **Show Remaining 40%** to reveal the rest of the entry.

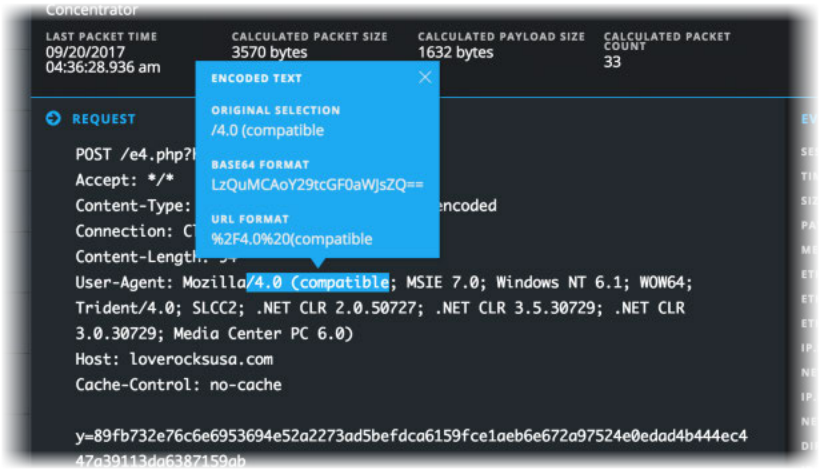
If you search for metadata seen in the Event Meta panel while text is truncated in the Text Analysis panel, the truncated text is searched. If the metadata exists inside hidden text, the text entry expands to reveal the text with the found metadata.

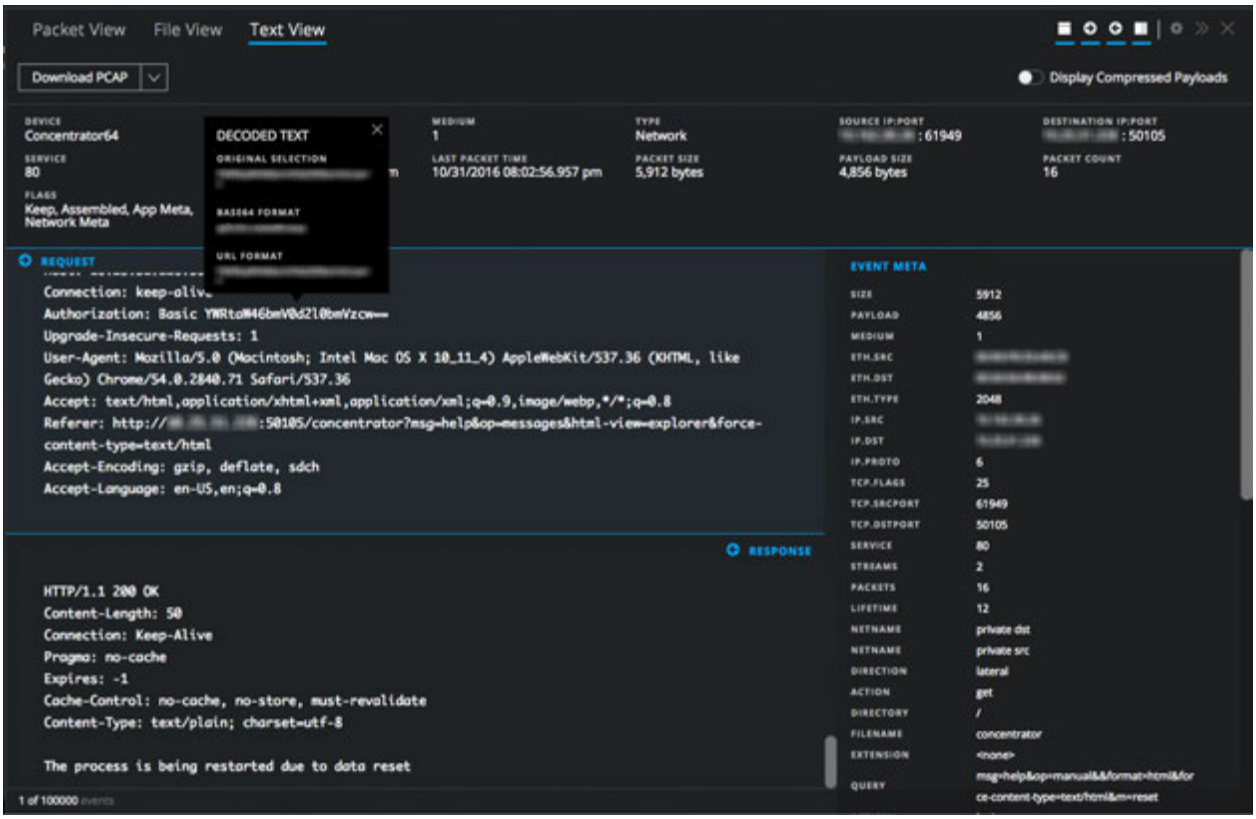
Perform URL and Base64 Encoding and Decoding in the Text Analysis Panel

If a network session being reconstructed in the Text Analysis panel contains Base64 or URL encoded strings, you can decode a string to better understand the session. If the session contains decoded strings for Base64 or URL, you can view a string in its encoded form in order to search for additional instances of the encoded text in other sessions.

When viewing any network session that contains encoded text in the Text Analysis panel, you can select a subset of the text within a single Request or Response to view in either encoded or decoded form. Depending on the content loaded on the Decoder, there may be additional metadata outlining that Base64 or URL encoded data is contained within the session.

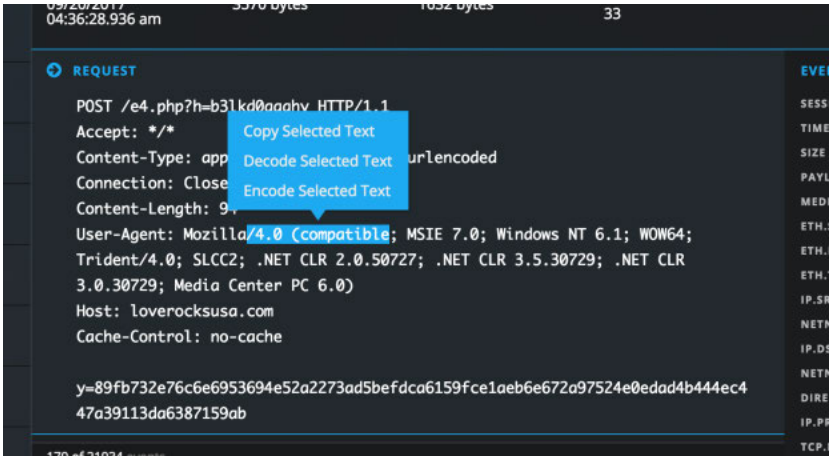
Below are examples of a hover box that is displaying URL encoding and Base 64 encoded text.





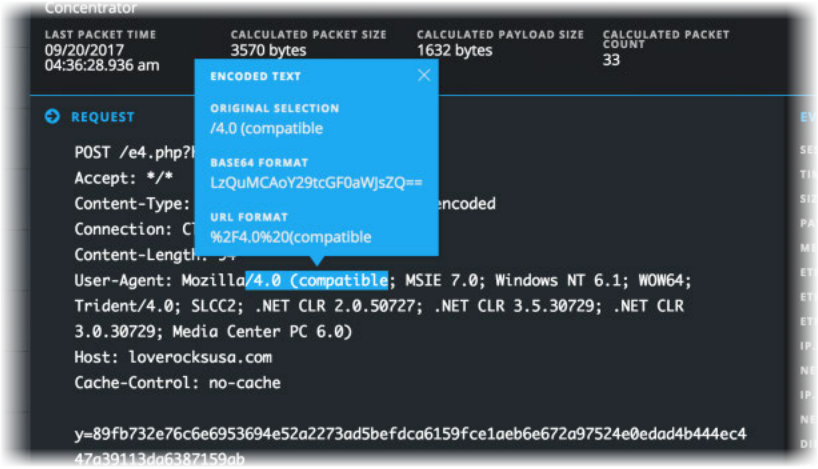
To perform encoding and decoding in the Text Analysis panel:

1. In the **Event Analysis view**, go to the Text Analysis panel of a session that contains encoded or decoded content.
2. To view some decoded text in encoded form, drag to select the text within a single Request or Response.
   A menu offers options to encode and decode.



3. Click **Encode Selected Text.**
   The encoded text is displayed in a hover box, which remains in place until you click the ✉, select different text in the Text Analysis panel, close the Events panel, select another event for

reconstruction, or switch to a different reconstruction view.



When a longer text is selected, the hover box is scrollable and large enough to fit the entire selected text as well as the decoded text.

4. If the session contains encoded text that you want to see in decoded form, drag to select the text within a single Request or Response.
   A menu offers options to encode and decode.
5. Click **Decode Selected Text.**
   The decoded text is displayed in a hover box, which remains in place until you click ✕, select different text in the Text Analysis panel, close the Events panel, select another event for reconstruction, or switch to a different reconstruction view.
6. If you want to copy some text from the text reconstruction do one of the following:
   a. Drag to select some text, right-click, and select **Copy Selected Text** from the menu.

   b. Drag to select some text, then select either **Decode Selected Text** or **Encode Selected Text**.
   Within the hover box, select the desired text and type **Control-C**.
   The selected text is copied to the clipboard and available to paste in a query.
7. When finished, click ✕ to close the hover box.

View Decompressed Text in an HTTP Network Session in the Text Analysis Panel

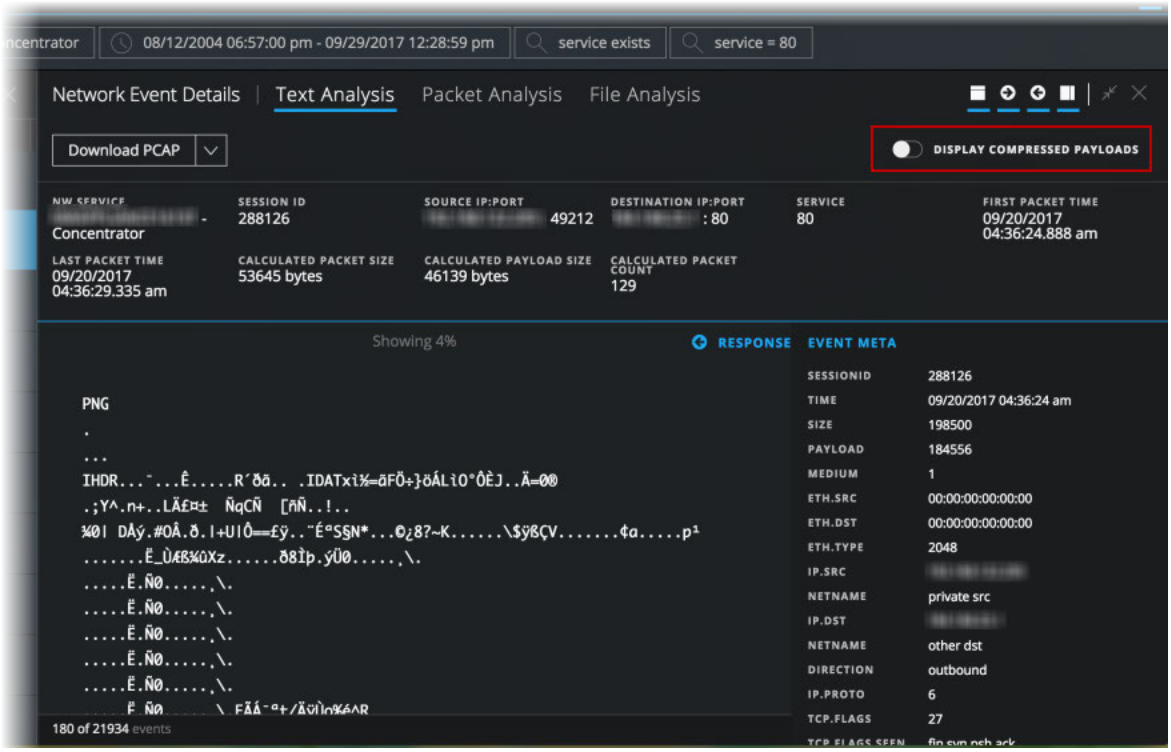
When the content of an HTTP network session is compressed and you are viewing the Text Analysis panel, NetWitness Platform displays decompressed content by default. This helps you to determine if there are any patterns and view the readable characters. You can switch between a compressed and decompressed view of compressed text.

Note: Decompressed text is not available for the Packet Analysis panel, the File Analysis panel, non-HTTP network sessions, and log data.

The toggle for changing between compressed and decompressed text is only displayed in the Text Analysis panel, and is enabled only if there is compressed text content.

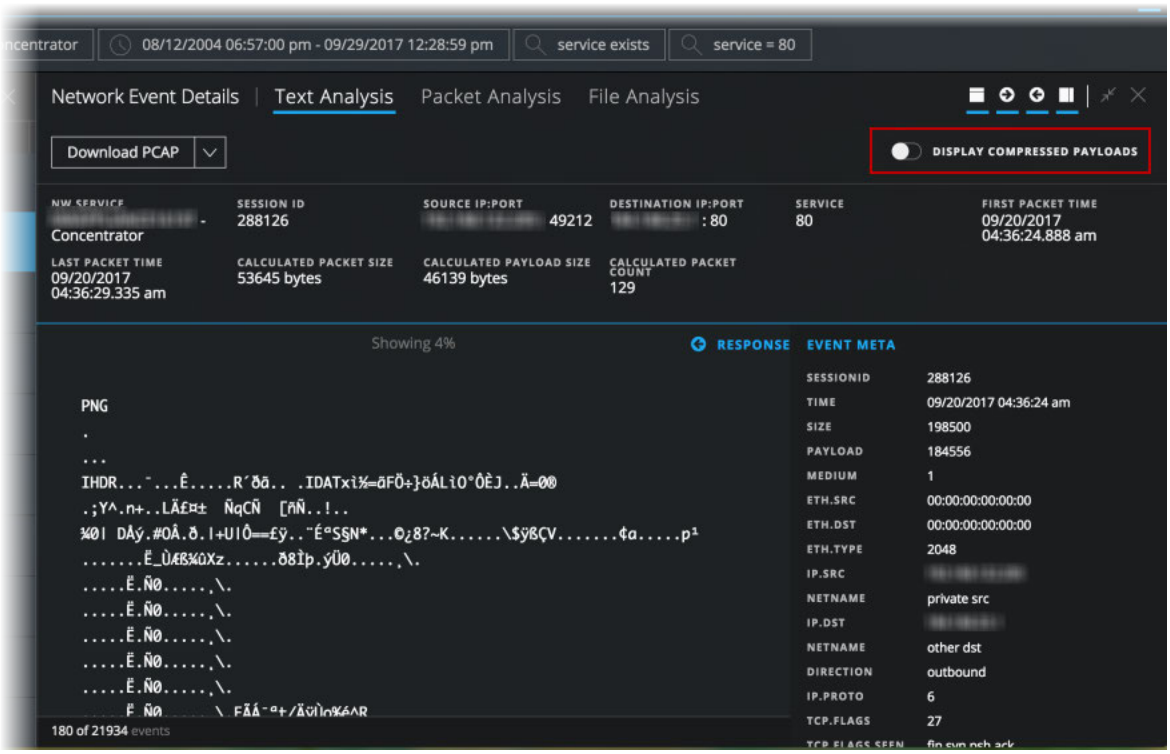
To view decompressed text:

1. Open the Text Analysis panel of an HTTP session that contains compressed content.
   By default the session is reconstructed with the text decompressed, and above the reconstruction, is the **Display Compressed Payloads** toggle switch.



2. To view the same text in its compressed form, click the toggle switch.
   The view changes so that the compressed text is no longer readable, and the switch indicates the

Display Compressed Packets is on.



3. To return to the view of decompressed text, click the switch again.

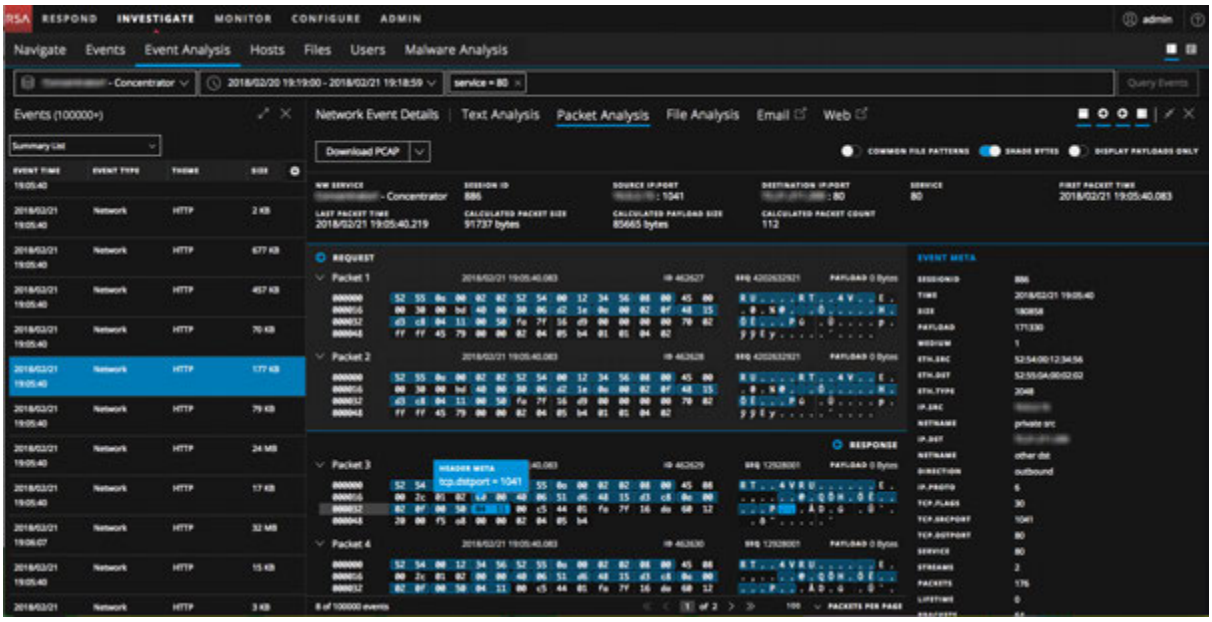
Use the Payload Only Option in the Packet Analysis Panel of a Network Session

When viewing a reconstruction of a network session in the Packet Analysis panel, you can choose to view only the main payload for each packet. By default, packet header and footer bytes are displayed for each packet. You can hide these by clicking the Display Payloads Only toggle switch. If you are viewing only the payload bytes, you can revert to the default setting by setting the Display Payloads Only toggle switch to on. This setting persists until you change it or refresh the browser.

- With the Display Payloads Only option off, the number of packets, packet header, packet footer, and payload are displayed.
- With the Display Payloads Only option on, no packet header and footer bytes are displayed. Only the packet content of 16 hexadecimal bytes per line and the corresponding ASCII per line is displayed.

To view payload only:

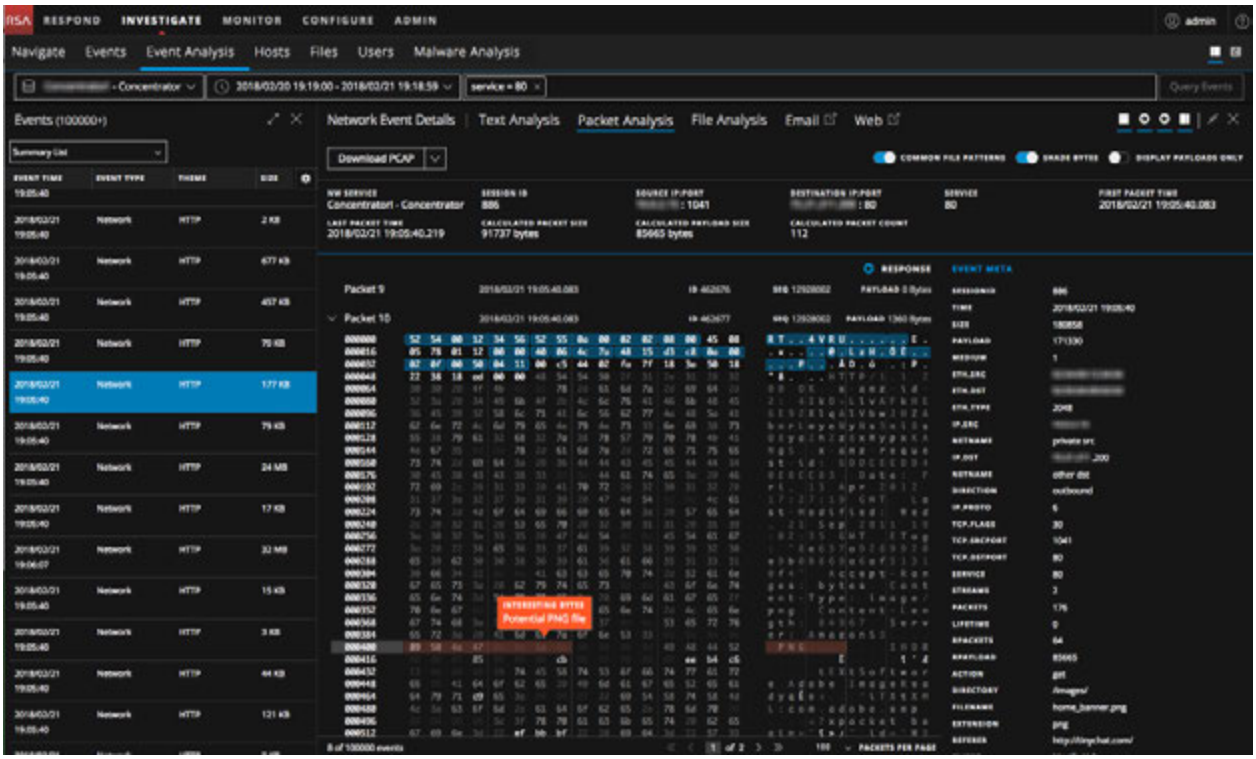
1. In the **Event Analysis** view, go to the Packet Analysis panel of a network session.
   By default the session is reconstructed with the packet header, footer, and payload displayed.



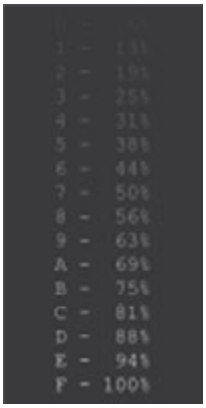
2. To change the view to show only the payload for each packet, click the **Display Payloads Only** toggle switch.
   The view changes to that only the payload is visible and contiguous same-side packets are concatenated together to make the payload more readable and understandable.

View Highlighted Bytes in the Packet Analysis Panel

When you first open a reconstruction in the Packet Analysis panel, the significant header bytes in each packet are highlighted in blue, and the payload bytes are distinguished using shading to help you understand the contents of the packet. This figure shows the default Packet Analysis with highlighting and byte shading.



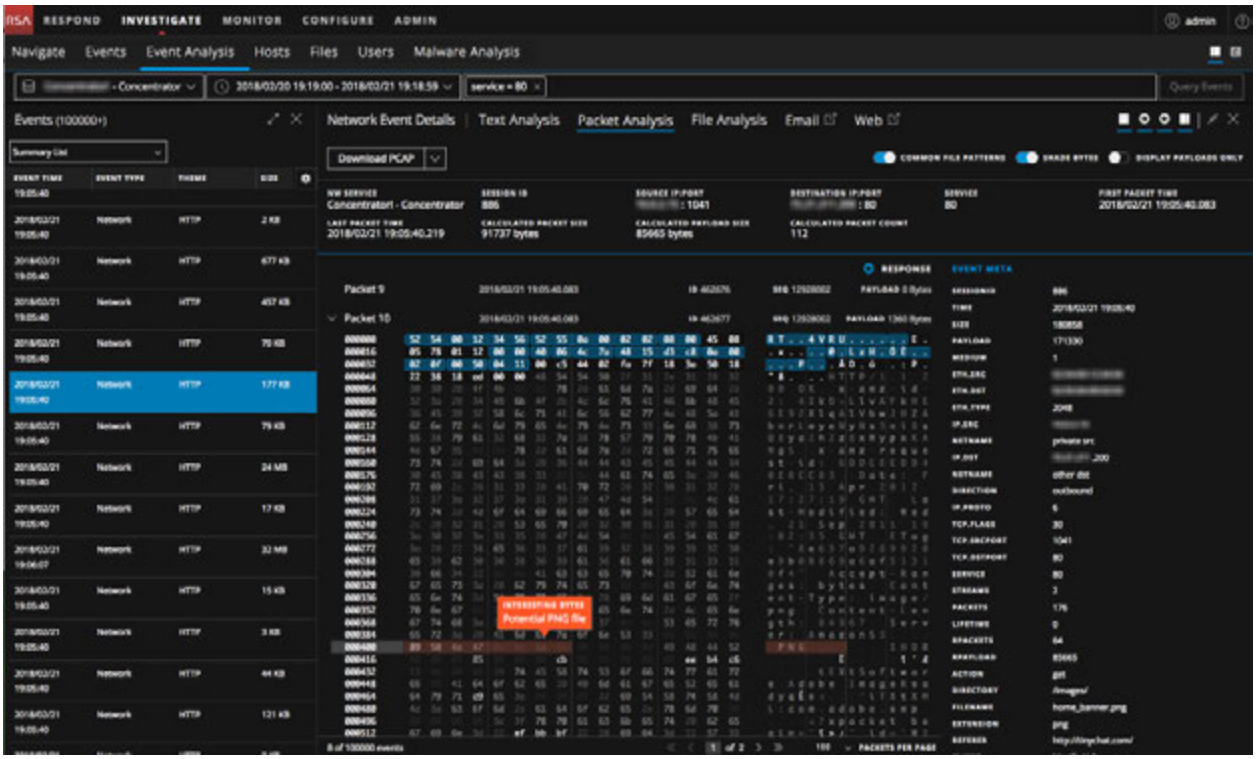
The Shade Bytes option adds shading to identify the different hexadecimal bytes (00 to FF) using degrees of highlighting. Bytes near the lower range are more transparent, and bytes near 255 are more opaque. Both hexadecimal and ASCII bytes are shaded. This is an example of the shading applied to each hexadecimal byte.



The Shade Bytes switch controls the shading of bytes. When you set Shade Bytes on or off, your setting persists until you change it or refresh the browser.

Highlight Common File Types in the Packet Analysis Panel

In the Packet Analysis panel, analysts can show or hide highlighting of certain common file types based on the file signature. When the Common File Patterns feature is turned on, the magic number bytes in the file signature are highlighted in the payload and you can hover over the highlighting to see the potential type of file. In this example, `89 50 4e 47` is highlighted in the hexadecimal payload and `PNG` is highlighted in the ASCII payload. When you hover over the highlighted bytes, the potential file type associated with the magic number is provided in a hover box.



These are the files types and corresponding magic numbers that are highlighted if present in the payload:

File Type	Hexadecimal Signature	ASCII Encoding
DOS Executable / Windows PE	4D 5A	MZ
Portable Network Graphics (PNG)	89 50 4E 47 0D 0A 1A 0A	PNG
JPEG	FF D8 FF	JPEG
JPEG/JFIF	4A 46 49 46	JFIF
JPEG/Exif	45 78 69 66	Exif
GIF	47 49 46 38 37 61	GIF87a
GIF	47 49 46 38 39 61	GIF89a
Non-portable Executable	5A 4D	ZM
BMP	42 4D	BM
PDF	25 50 44 46	%PDF
Old Office Document (doc, xls, ppt, msg, and other)	D0 CF 11 E0 A1 B1 1A E1	ÐÏ.à¡±.á

File Type	Hexadecimal Signature	ASCII Encoding
ZIP file formats and formats based on it, such as JAR, ODF, OOXML	50 4B	PK..
7-Zip File Format (7z)	37 7A BC AF 27 1C	7z¼¯'
Java Class File, Mach-O Fat Binary	CA FE BA BE	Êþº¾
Postscript	25 21 50 53	%!PS
Unix/Linux Shell script	23 21	#!
Executable and Linkable Format (ELF) executables	7F 45 4C 46	.ELF

To view common file signatures in the Packet Analysis panel:

1. Go to the Packet Analysis panel, and turn on the **Common File Patterns** option. If there is more then one highlight in view, all are shown.
2. To view the hover box, place the cursor over the highlighting.

Look Up Additional Context in the Event Analysis View

The information in this topic applies to RSA NetWitness® Platform Version 11.2 and later. In earlier versions, you can also look up additional context in the Navigate view or the Events view as described in Look Up Additional Context in the Navigate and Events Views.

From the Event Analysis view, you can look up details and intelligence about elements associated with an event in the Context Hub. These elements, or entities, are identifiers, such as an IP address, a user name, a host name, a domain name, a file name, or file hash. The data from configured sources, such as RSA NetWitness Endpoint, can help you understand what is happening.

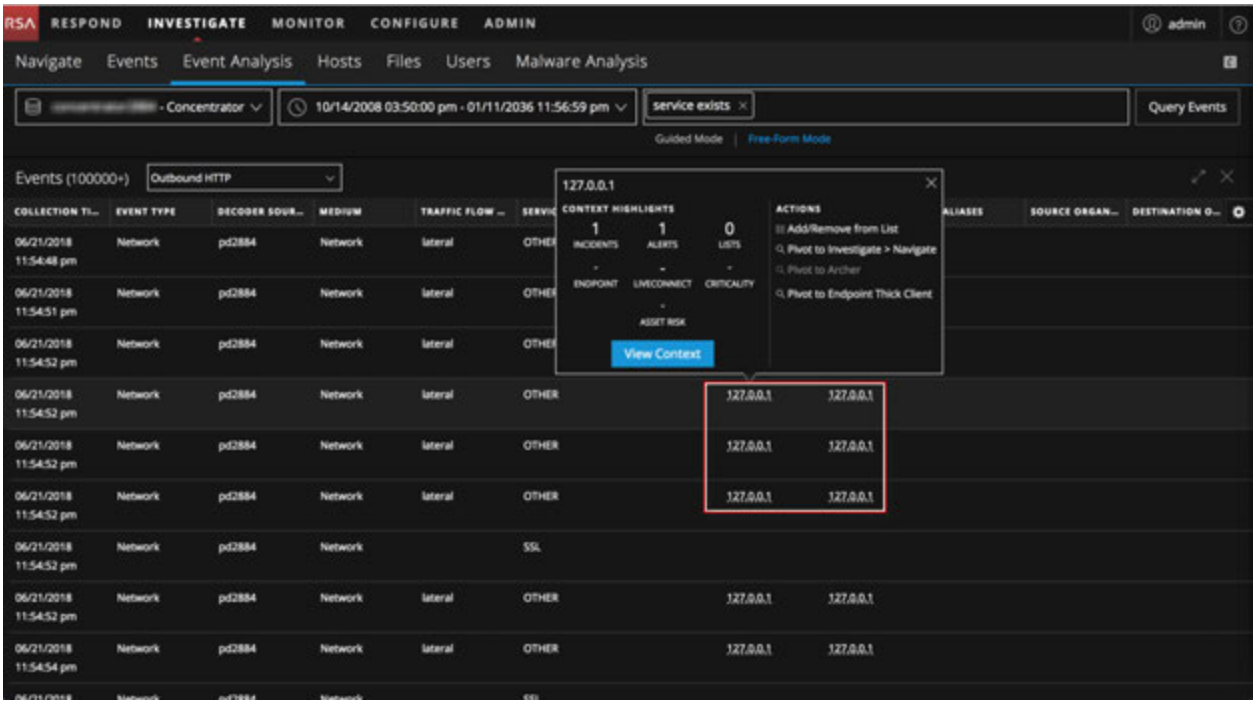
Note: To enable viewing of contextual information, your administrator must add the Context Hub service in RSA NetWitness Platform and configure data sources for the Context Hub service as described in the *Context Hub Configuration Guide*. Analysts also need a role with the permission `Context Lookup` as described in "Role Permissions" and "Manage Users with Roles and Permissions" in the *System Security and User Management Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

The Context Hub is a centralized service that aggregates data about entities from multiple configurable data sources. This data can extend your investigation with additional context beyond the immediate results of a specific query. For example, the Context Hub can tell you if a given entity has been mentioned in any incidents, alerts, feeds, or community intelligence publications.

In the Events panel, the Event Header, or the Event Meta panel, you can see underlined entities. If an entity is underlined, NetWitness Platform is populating information about that entity type in the Context Hub. There may be additional information available about that entity in the Context Hub.

Note: Active Directory entities with available context information are not underlined, but you can hover over these entities to see if any context information is available.

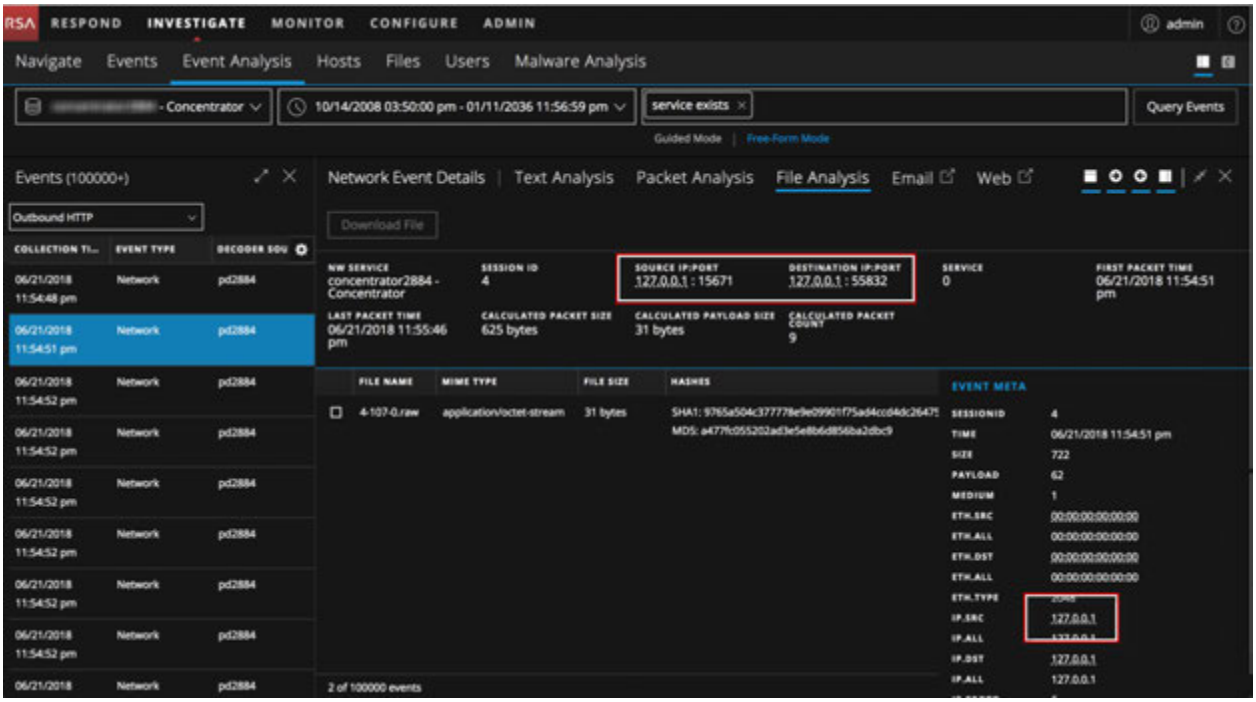
The following figure shows underlined entities in the Events panel with the context tooltip open.



The context tooltip has two sections: Context Highlights and Actions.

- The information in the Context Highlights section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint, Live Connect, Criticality and Asset Risk. Depending on your data, you may be able to click these items for more information.
- The Actions section lists the available actions. In the example, the Add/Remove from List, Pivot to Investigate > Navigate, Pivot to Archer, and Pivot to Endpoint Thick Client options are available.

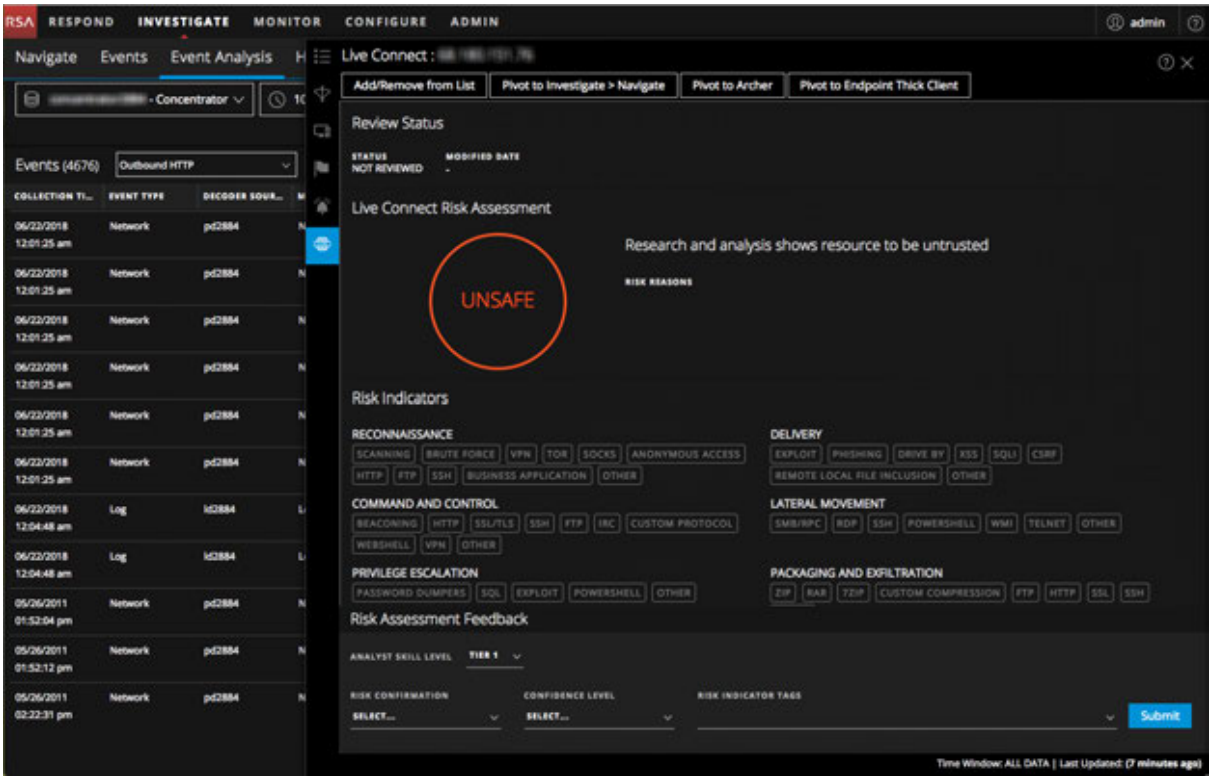
The following figure shows underlined entities in the Event Header and the Event Meta panel.



When you click View Context in the context tooltip, the Context Hub queries the configured data sources for relevant information, and the Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available. In the Context Lookup panel, you can view and explore individual data sources for further investigation. For a detailed description of the information displayed for each data source on the Context Lookup panel, see Context Lookup Panel. You can also take any available action in the Actions section.

To view information in the Context Lookup panel in the Event Analysis view:

1. Hover over different meta values to see the data sources for which data is available.
   A context tooltip displays a list of the context data available for the selected meta value.
2. Click **View Context** in the context tooltip to open the Context Lookup panel.
   The Context Lookup panel opens from the right side of the browser window. The Context Lookup panel is populated with the information from the Context Hub as it becomes available.



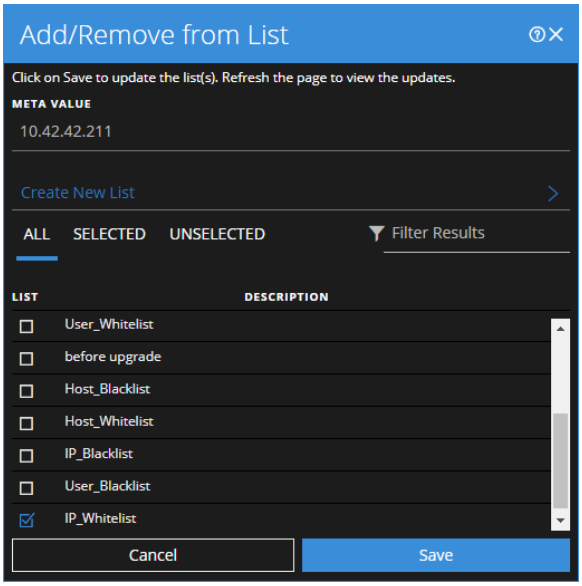
3. To perform actions on an entity, select one of the available actions in the context tooltip: Add /Remove from List, Pivot to Investigate > Navigate, Pivot to Archer, Pivot to Endpoint Thick Client. For more information, see Pivot to Investigate > Navigate, Pivot to Archer, Pivot to NetWitness Endpoint Thick Client, and Add an Entity to a Whitelist.

Note: The Pivot to Archer action is disabled when Archer data is not available or when the Archer data source is not responding. Check that the RSA Archer configuration is enabled and configured properly. The same is true for the Pivot to NetWitness Endpoint Thick Client; if the option is disabled, verify that the NetWitness Endpoint Thick Client is installed and configured correctly.

Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over the underlined entity that you would like to add to a Context Hub list. (Active Directory entities with context data can also be added, but they are not underlined.)
   A context tooltip showing the available actions is displayed.
2. In the **ACTIONS** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove from List dialog shows the available lists.



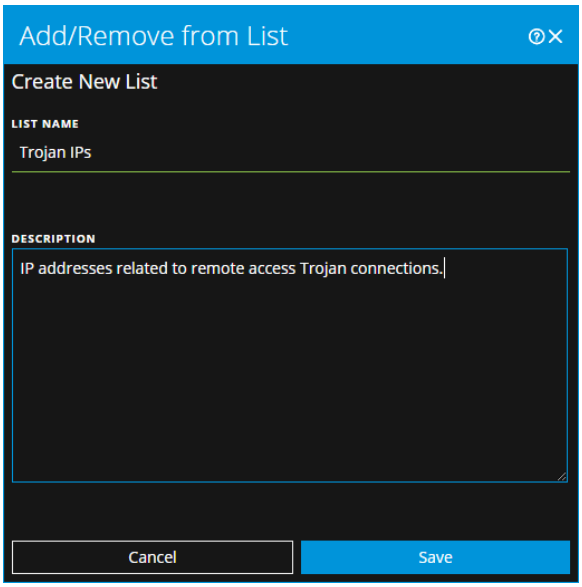
3. Select one or more lists and click **Save**.
   The entity is added to the selected lists. Add/Remove from List Dialog provides additional information.

Create a List

You can create lists in Context Hub from the Event Analysis view. In addition to using lists to whitelist and blacklist entities, you can use lists to monitor entities for abnormal behavior. For example, to improve the visibility of a suspicious IP address and Domain under investigation, you may want to include them in two separate lists. One list could be for domains suspected of being related to command and control connections, and another list could be for IP addresses related to remote access Trojan connections. You can then identify indicators of compromise using these lists.

To create a list in Context Hub:

1. In the Events panel, the Event Header, or the Event Meta panel, hover over the underlined entity that you would like to add to a Context Hub list. (Active Directory entities with context data can also be added to a new list, but they are not underlined.)
   A context tooltip showing the available actions is displayed.
2. In the **ACTIONS** section of the tooltip, click **Add/Remove from List**.
3. In the Add/Remove from List dialog, click **Create New List**.



4. Type a unique **LIST NAME** for the list. The list name is not case sensitive.
5. (Optional) Type a **DESCRIPTION** for the list.
   Analysts with the appropriate permissions can also export lists in CSV format to send to other analysts for further tracking and analysis. The *Context Hub Configuration Guide* provides additional information.

Pivot to Investigate > Navigate

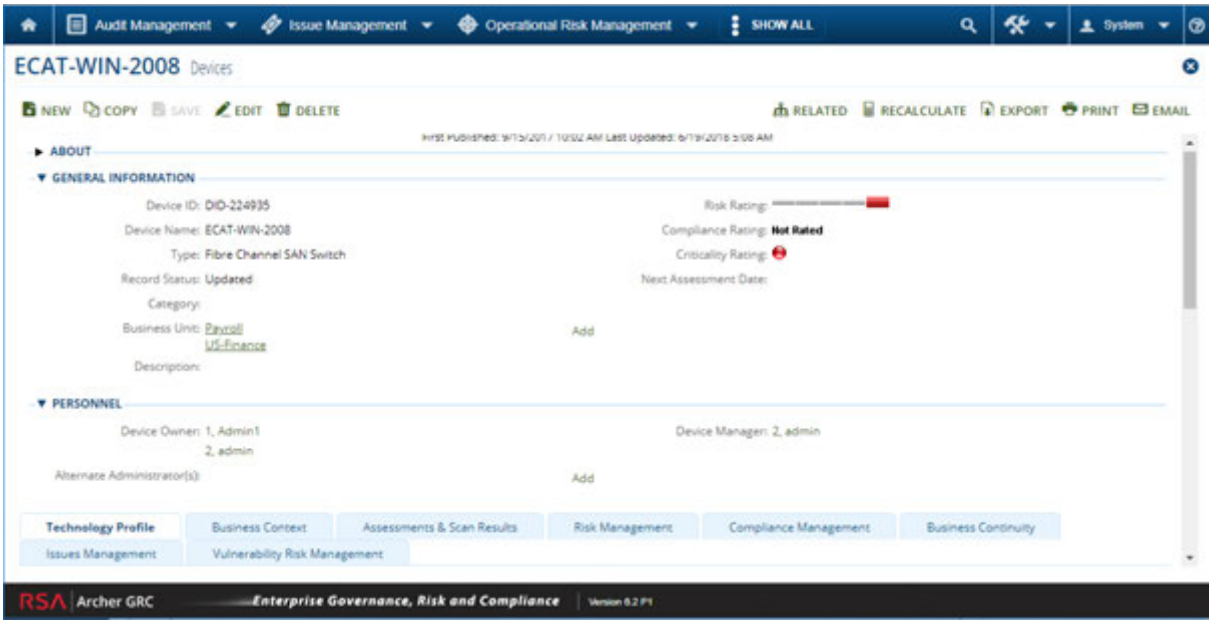
For a more thorough investigation of an entity, you can open the the Navigate view.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over any underlined entity. (Active Directory entities with context data can also be investigated, but they are not underlined.)
2. In the **ACTIONS** section of the tooltip, select **Pivot to Investigate > Navigate**.
   The Navigate view opens, enabling you to perform a deeper dive investigation. For more information, see Investigating Metadata in the Navigate View.

Pivot to Archer

For viewing more details about the device in RSA Archer® Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over any underlined entity (IP address, host, and Mac address).
2. In the **ACTIONS** section of the context tooltip, select **Pivot to Archer**.
3. The device details page in **RSA Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.



Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the RSA Archer configuration is enabled and configured properly.

For more information, see the *Archer Integration Guide*.

Pivot to NetWitness Endpoint Thick Client

If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.

1. In the Events panel, the Event Header, or the Event Meta panel, hover over any underlined entity.
2. In the **ACTIONS** section of the tooltip, select **Pivot to Endpoint Thick Client**.
   The NetWitness Endpoint thick client application opens outside of your web browser.

Note: Version 4.4 of the NetWitness Endpoint (NWE) thick client must be installed on the same server, the NWE meta keys must exist in the `table-map.xml` file on the Log Decoder, and the NWE meta keys must exist in the `index-concentrator-custom.xml` file. The NWE thick client is a Windows only application. Complete setup instructions are provided in the *NetWitness Endpoint User Guide* for Version 4.4.

Download Data in the Event Analysis View

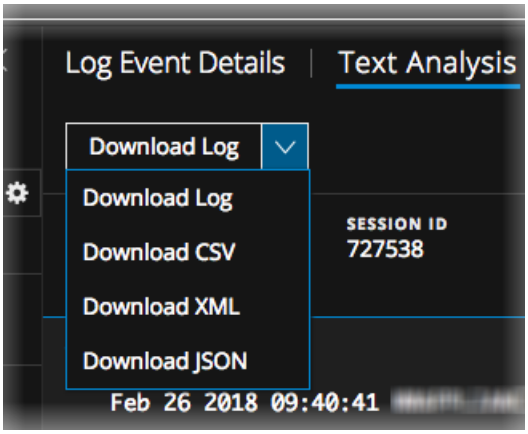
In the Event Analysis view, you can download events, logs, and files.

Download a Log in the Text Analysis Panel

When viewing a log reconstruction in the Text Analysis panel, you can download a log file in the following formats using options in the Download Log drop-down menu:

- Raw log (log) using the **Download Log** option
- Comma-separated values (CSV) using the **Download CSV** option
- Extensible Markup Language (XML) using the **Download XML** option
- JavaScript Object Notation (JSON) using the **Download JSON** option

This is an example of a log reconstruction with the Download Log menu options displayed.



Note: The Download Log option is applicable only for endpoint events that have at least one meta value exceeding 256 characters. For an endpoint event, the raw log is populated only when the meta value exceeds 256 characters. Long running or historically downloaded files are not downloadable. For example, the meta values like launch arguments can exceed 256 characters. In this case, 256 characters are available as meta value while the full value is available in the raw log to view.

The downloaded log file contains the log and is named to help identify the service on which the log was collected, the session ID, and the file type. This is an example of the filename for a raw log: **Concentrator_SID2.log**. The exported log file is named using the following convention:

`<service-ID or host name>_SID<n>.<filetype>`

where:

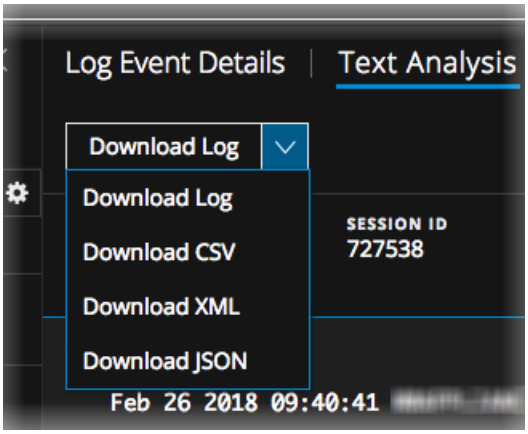
- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.

- `<filetype>` identifies the format of the downloaded log. These are the possible log types: raw log, CSV, XML, and JSON. By default the format is a raw log.

Note: Some formats do not have time stamps or the device IP where the event was generated, so a log downloaded in CSV, XML, or JSON format has an extra value called `timestamp` along with the raw log content. The additional information inside the log is in this form: `Log timestamp="1490824512" source="10.12.35.65".`

To download the log for a session:

In the Text Analysis panel of a log event, select one of the file formats for the downloaded log.
-To download the log as a raw log (the default format), click **Download Log**.
-To download the log in one of the other formats, click the downward arrow on the **Download Log** button, and select one of the file formats for the downloaded log.



The log file is downloaded to your local file system in the format specified. If you initiate a download and move away from the view while the log is being extracted and before the log starts to download, the log is not downloaded in your browser. A message notifies you that you can find the downloaded log in the job queue.

Download Network Event Data in the Text Analysis Panel or the Packet Analysis Panel

When viewing a reconstructed network event in the Packet Analysis panel or the Text Analysis panel, you can export network data files for further analysis. The download includes events for the current time range and drill point. You can download the data in these forms:

- The entire event as a packet capture (`*.pcap`) file using the **Download PCAP** option.
- The payload as a `*.payload` file using the **Download All Payloads** option.
- The request payload as a `*.payload1` file using the **Download Request Payload** option.
- The response payload as a `*.payload2` file using the **Download Response Payload** option.

This is an example of the filename for a PCAP file: `C01 - Concentrator_SID1697309.pcap`. The exported network data file is named using the following convention:

`<service-ID or host name>_SID<n>.<filetype>`

where:

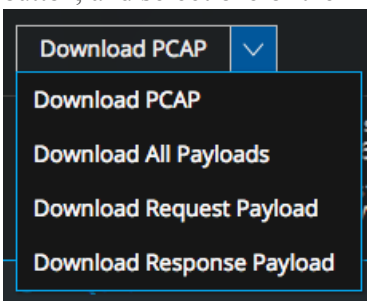
- <service-ID or host name> is the name of the service (for example a Concentrator or Broker) where the session was saved.
- SID<n> is the session ID number.
- <filetype> is pcap, payload, payload1, or payload2.

The network data is downloaded directly into your browser if the download is quick. If the download takes longer due to network factors or file size, the file is downloaded in the background and the task is tracked in the Jobs queue. In this case, you can check your jobs in the queue and get the file when the download is complete.

Note: If you initiate a download and move away from the view while the file is being extracted and before the file starts to download, the file is not downloaded in your browser. A message notifies you that you can find the downloaded document in the job queue.

To export an event as a network data file:

Go to the Packet Analysis panel of a network event, and select one of the file formats for the downloaded file.
-To download the event as a PCAP file (the default format), click **Download PCAP**.
-To download the event in one of the other formats, click the downward arrow on the **Download PCAP** button, and select one of the file formats for the downloaded event data.



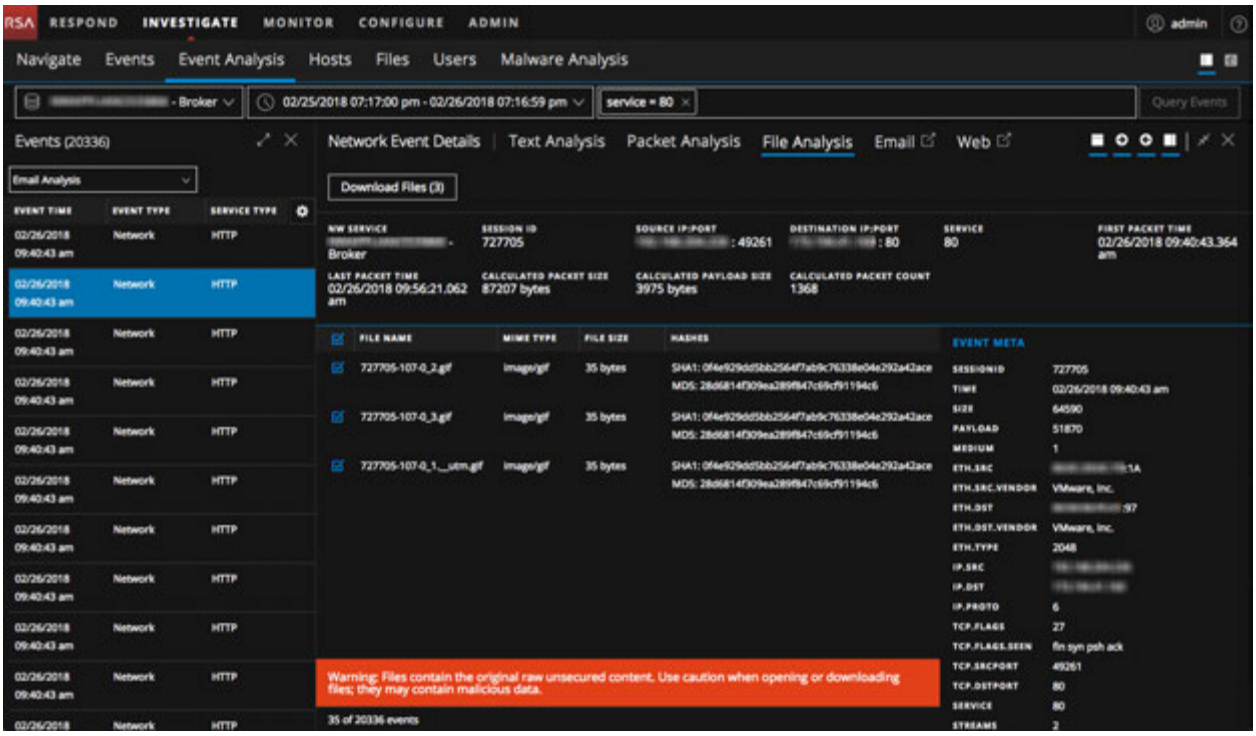
The network data file is downloaded to your local file system in the format specified.

Download Files from a Network Event in the File Analysis Panel

When viewing reconstructed network events that contain files in the File Analysis panel, you can select one file, one or more files, or all files to download to your local file system.

Note: If you initiate a download and move away from the view while the file is being extracted and before the file starts to download, the file is not downloaded in your browser. A message notifies you that you can find the downloaded file in the job queue.

When files are selected, the Download Files button becomes active and reflects the number of files selected.



Clicking the button exports the selected files as a password-protected zip archive. The password to open the exported archive is `netwitness`. Exporting the files in this form ensures that:

- The archive is not quarantined by antivirus software.
- Potentially malicious files are not automatically opened by the default application and executed.

This is an example of the filename for an archive: `C01 - Concentrator_SID1697309_FC1.zip`. The exported archive is named using the following convention:

`<service-ID or host name>_SID<n>_FC<n>.zip`

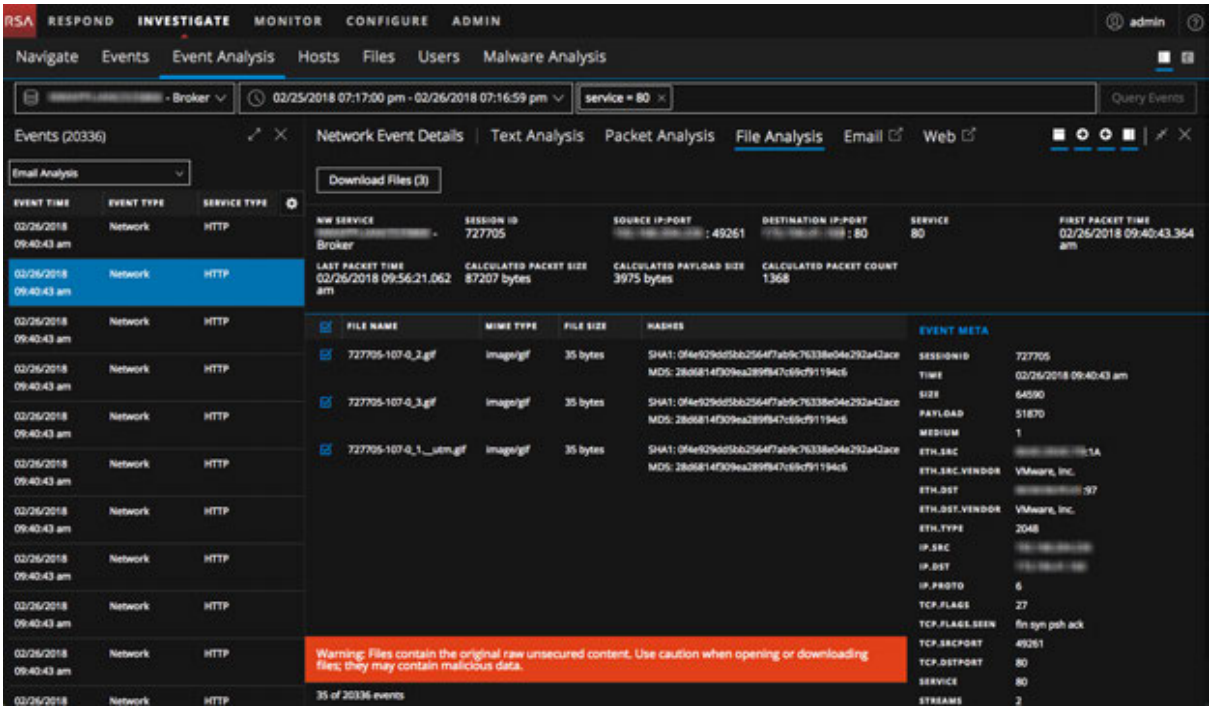
where:

- `<service-ID or host name>` is the name of the service (for example a Concentrator or Broker) where the session was saved.
- `SID<n>` is the session ID number.
- `FC<n>` is the file count or number of files in the archive.

Caution: Caution is advised when unzipping and opening files that are associated with a default application; for example, an Excel spreadsheet may automatically open in Excel before you have a chance to verify it is safe.

To export files in a reconstructed event:

1. In the **Event Analysis** view, go to the File Analysis panel of an event that contains files.



2. Click one or more files that you want to extract, and click **Download Files**.
   The job is scheduled and when complete the selected file are downloaded, in the form of a password-protected zip archive, to the local file system.
3. To open the archive on your local file system, enter the following password when prompted: `netwitness`.

Act on Data in the Event Analysis View

When you have found data of interest in the Event Analysis view, you can do internal lookups to NetWitness Endpoint and RSA Live, as well as external lookups of meta values in community resources such as SANS IP History and ThreatExpert Search.

Open an Endpoint Event in the NetWitness Endpoint Thick Client

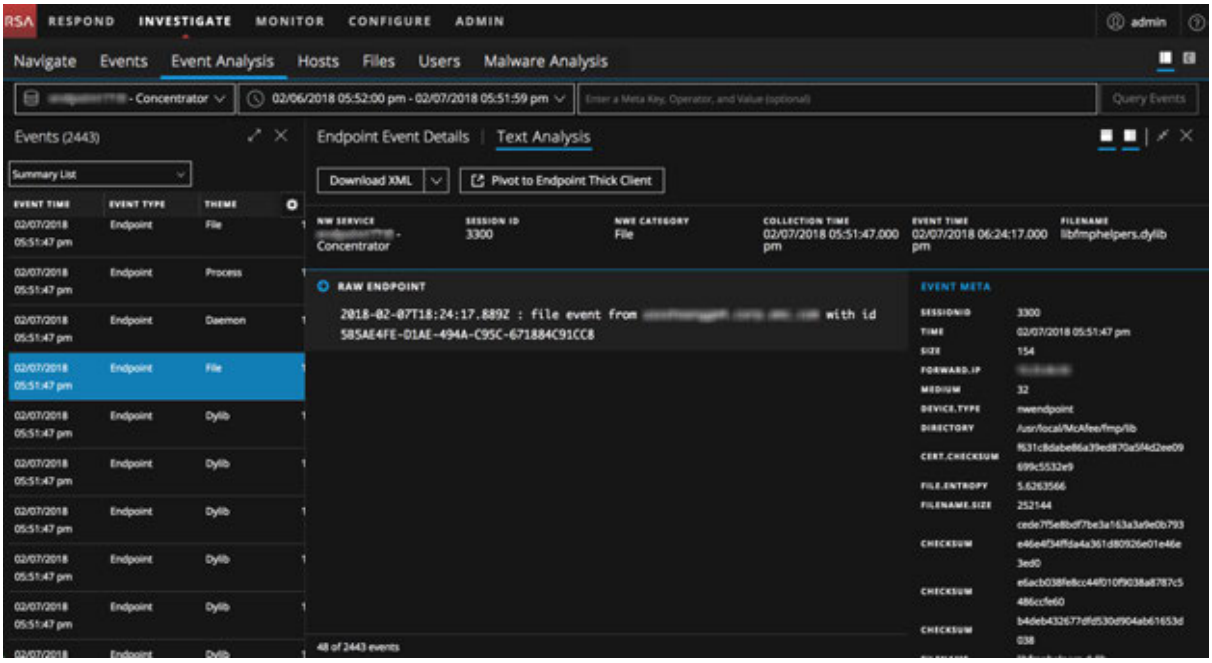
When viewing an endpoint event in the Text Analysis panel, you can pivot to analyze the same event in NetWitness Endpoint. The NWE thick client offers additional features beyond the built-in capabilities in NetWitness Endpoint Insights.

Note: Version 4.4 of the NetWitness Endpoint (NWE) thick client must be installed on the same server, the NWE meta keys must exist in the `table-map.xml` file on the Log Decoder, and the NWE meta keys must exist in the `index-concentrator-custom.xml` file. The NWE thick client is a Windows only application. Complete setup instructions are provided in the *NetWitness Endpoint User Guide* for Version 4.4.

To open an event in NetWitness Endpoint:

1. (Version 11.0 and later) Go to **INVESTIGATE** > **Navigate** and perform these steps:
   a. In the **Query** drop-down, select **Advanced**, and enter one of the following queries:
   `nwe.callback_id exists` or `device.type='nwendpoint'`
   Endpoint data is displayed in the Values panel.
   b. Right-click an event, and select **Event Analysis** in the menu.
2. (Version 11.1 and later) Go to **INVESTIGATE** > **Events Analysis**. In the **Query** drop-down, select **Advanced**, and enter one of the following queries: `nwe.callback_id exists` or `device.type='nwendpoint'`
   Endpoint data is displayed in the Events panel.

3. Select an event.
   The Event Analysis view opens with the selected event displayed in the Text Analysis.

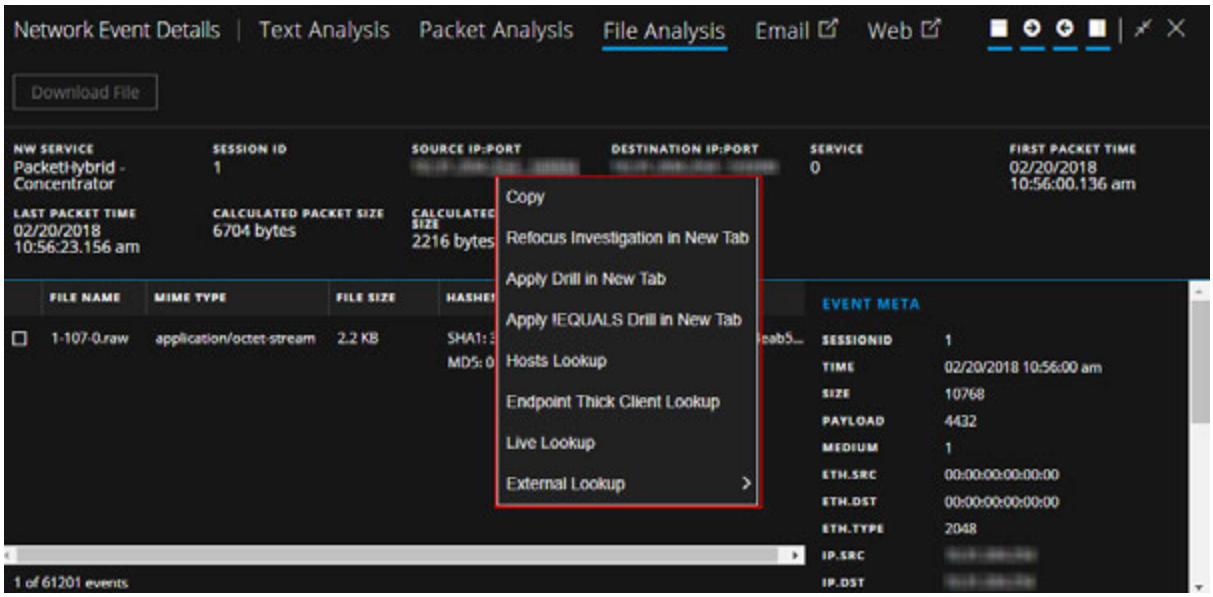


4. In the Event Header click **Pivot to Endpoint.** A new browser tab with the url `ecatui://<id>` opens and the NWE Thick Client is launched . If the NetWitness Endpoint Thick Client is not installed, no data is displayed and the following message is displayed: `Applicable for hosts with 4.x Endpoint agents installed, please install the NetWitness Endpoint Thick Client.`

Perform Lookups of Meta Values in Event Analysis

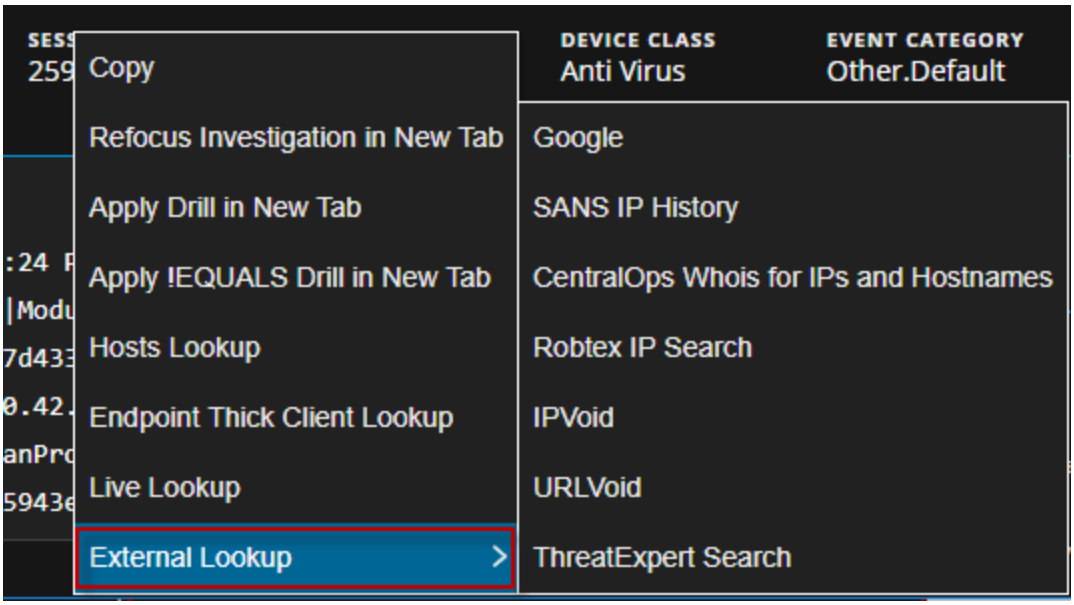
In the Event Analysis view you can further investigate meta values in an event by right-clicking certain meta values and using the options in a drop-down menu. Not all fields have right-click actions. To perform internal and external lookups:

1. In the Event Analysis view, right-click a meta value in the Events List, the Event Meta panel, or the Event Header. Some meta values have a drop-down menu.



2. Select one of the following internal actions:
   - **Copy**: Copies the meta value to the clipboard.
   - **Refocus Investigation in New tab**: Launches another investigation in a new tab with the focus on the selected meta value.
   - **Apply Drill in New Tab**: Applies the drill and launches it in a new tab to drill the data in Navigate view.
   - **Apply !EQUALS Drill in New Tab**: Applies (!EQUALS) to the meta value and launches a new tab, effectively excluding the meta value from the results.
   - **Hosts Lookup**: Looks up the value in the Investigate > Hosts view.
   - **Endpoint Thick Client Lookup**: Analyzes the meta value in the Endpoint Thick Client (for clients that have Endpoint Agent).
   - **Live Lookup**: Looks up a meta value on RSA Live for further analysis.

3. For an external lookup, hover over a meta value, right-click and select **External Lookup**.



4. In the submenu select one of the available external lookups:
   - **Google**: Looks up a meta value on Google.com.
   - **SANS IP History**: Looks up a meta value on SANS IP History, domain = `http://isc.sans.org/ipinfo.html?ip=ipaddress`
   - **CentralOps Whois for IPs and Hostnames**: Looks up a meta value on CentralOps Whois for IPs and Hostnames, domain = `http://centralops.net/co/DomainDossier.aspx?addr=domain&dom_whois=true&dom_dns=true&net_whois=true`
   - **Robtex IP Search**: Looks up a meta value on Robtext IP Search, domain = `https://www.robtex.com/cidr/domain.ipaddress`
   - **IPVoid**: Looks up a meta value on IPVoid, domain = `http://www.ipvoid.com/scan/domain/`
   - **URLVoid**: Looks up a meta value on URLVoid, domain = `http://www.urlvoid.com/scan/ipaddress/`
   - **ThreatExpert Search**: Looks up an IP meta value on ThreatExpert Search, domain = `http://www.threatexpert.com/reports.aspx?find=IP address`

Investigating Hosts and Files

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

Analysts can use the RSA NetWitness Platform Hosts and Files views to investigate hosts or files.

Analysts who conduct analysis using Investigate need to have the appropriate system roles and permissions set up for their user accounts. An administrator must configure roles and permissions as described in Roles and Permissions for Endpoint Analysts. For more information on roles and permissions, see *System Security and User Management Guide*.

Analysts can:

- Investigate Hosts
- Investigate NetWitness Endpoint 4.4.0.2 or Later Hosts
- Investigate Files

Investigate Hosts

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

To conduct an investigation on hosts:

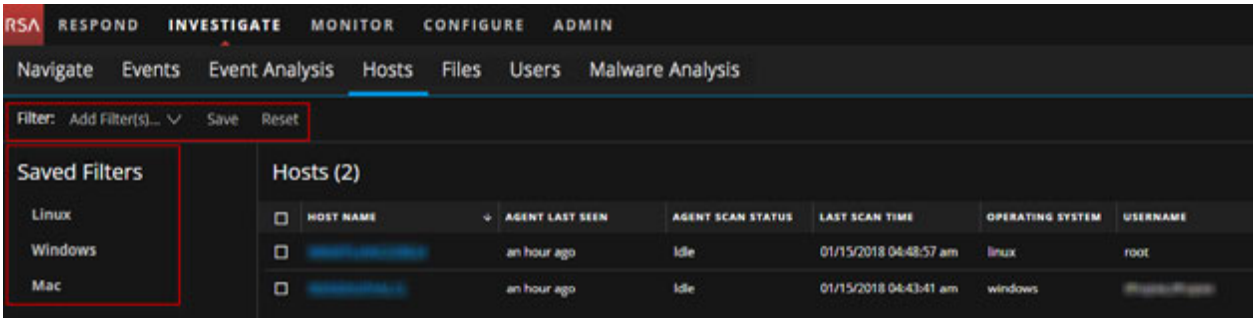
1. Go to **INVESTIGATE** > **Hosts**.
   A list of hosts with an Endpoint agent installed is displayed.
2. Select the hosts that you want to scan and click **Start Scan**. For more information, see Scan Hosts.
3. After completing the process of scanning the hosts, click the host name to investigate the scan results. For more information, see Investigate Host Details.

Note: To investigate NetWitness Endpoint 4.4 hosts, see Investigate NetWitness Endpoint 4.4.0.2 or Later Hosts.

Filter Hosts

You can filter hosts on the operating system or select the fields in the Add Filter drop-down menu.

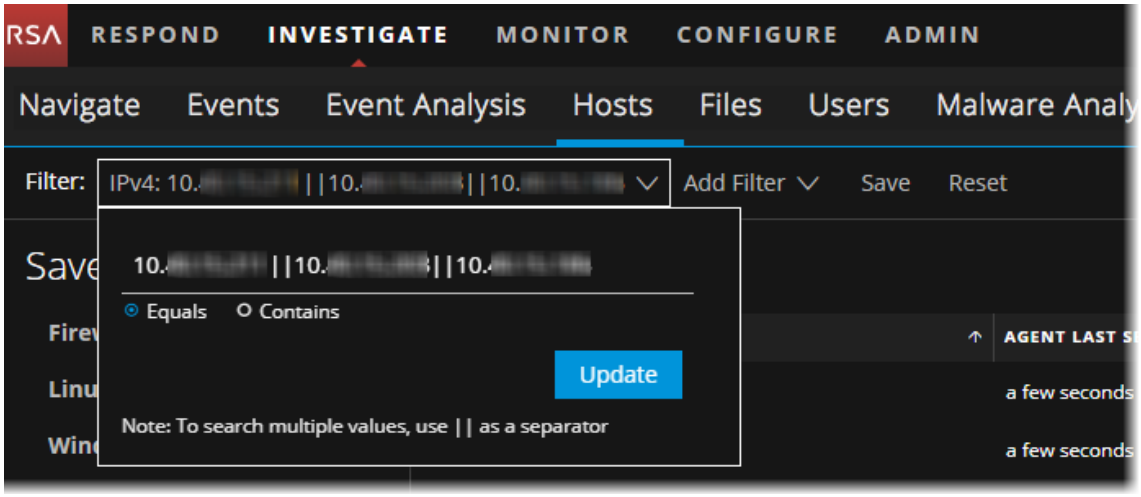
Note: While filtering a large amount of data, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - `Hostname`, `IPV4`, `Operating System`, and `Last Scan Time`.



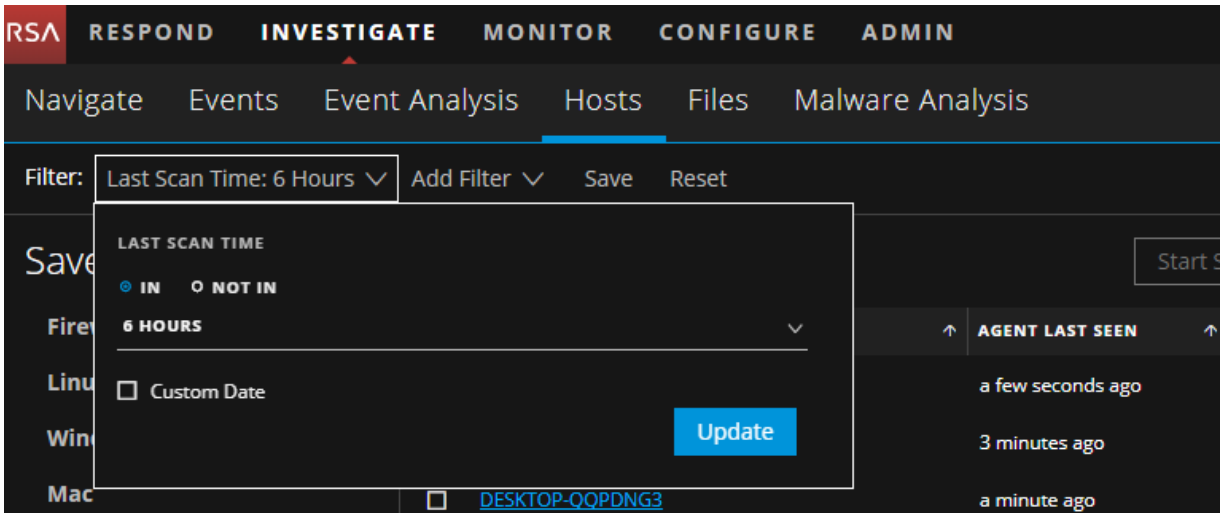
To search multiple values within a field, set the filter option to `Equals`, and use `||` as a separator.

These are examples:

- Using `Equals` operator for multiple IPV4 values with a separator `||`.



- Using `IN` operator for Last Scan Time to filter agents that are scanned in the last 6 hours.



Click **Save** to save the search and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the name and click  .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

Scan Hosts

You can either perform an on-demand scan or schedule a scan to run daily or weekly. For information on scheduling a scan, see *Endpoint Insights Configuration Guide*.

Note: You cannot perform a scan for the NetWitness Endpoint 4.4 agents from NetWitness Platform user interface.

On-demand Scan

You may want to perform an on-demand scan if:

- A file in the Global Files section is found to be malicious.
- A malicious file is present on different hosts in the network.
- You want to investigate a host that is infected.
- You want to get the latest snapshot of the host.

When the hosts are scanned, the Endpoint Agent retrieves the following data that can be used for investigation:

- Drivers, processes, DLLs, files (executables), services, and autoruns running on the host.
- Host file entries and scheduled tasks.
- System information such as network share, installed Windows patches, Windows tasks, logged-in users, bash history, and security products installed.

To start a scan:

1. Go to **INVESTIGATE** > **Hosts**.
2. Select one or more hosts (up to 100) at a time for on-demand scan, and click **Start Scan**.
3. Click **Start Scan** in the dialog.
   This performs a quick scan of all executable modules loaded in memory. It takes approximately 10 minutes.

The following are the scan statuses:

Status	Description
Idle	No scan is in progress.
Scanning	Scan is in progress.
Starting Scan	Scan request is sent to the server but the agent will receive the request the next time it communicates with the server.
Stopping Scan	Stop request is sent to the server but the agent will receive the request the next time it communicates with the server.

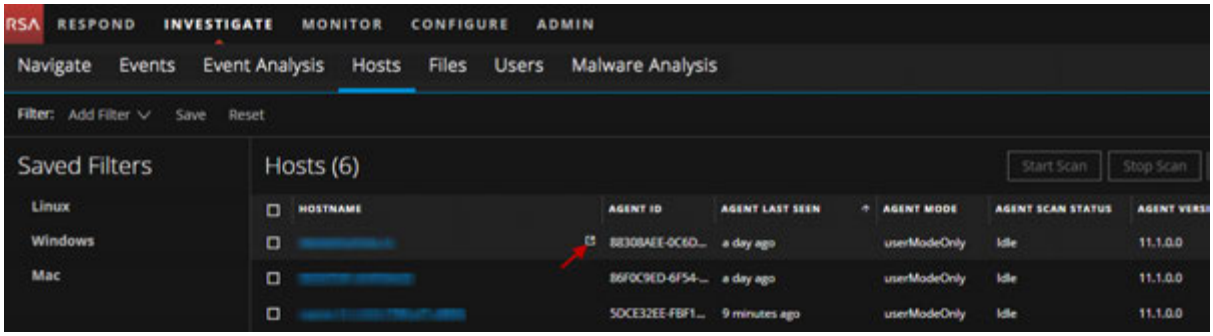
Pivot to the Navigate and Event Analysis Views

If you need to investigate a particular host, IP address (IPV4), or username to look for related activity across a time range, you can pivot to both the Navigate and Event Analysis views to get the entire context of the activity. By default the time range is set to 1 day. You can change the time range.

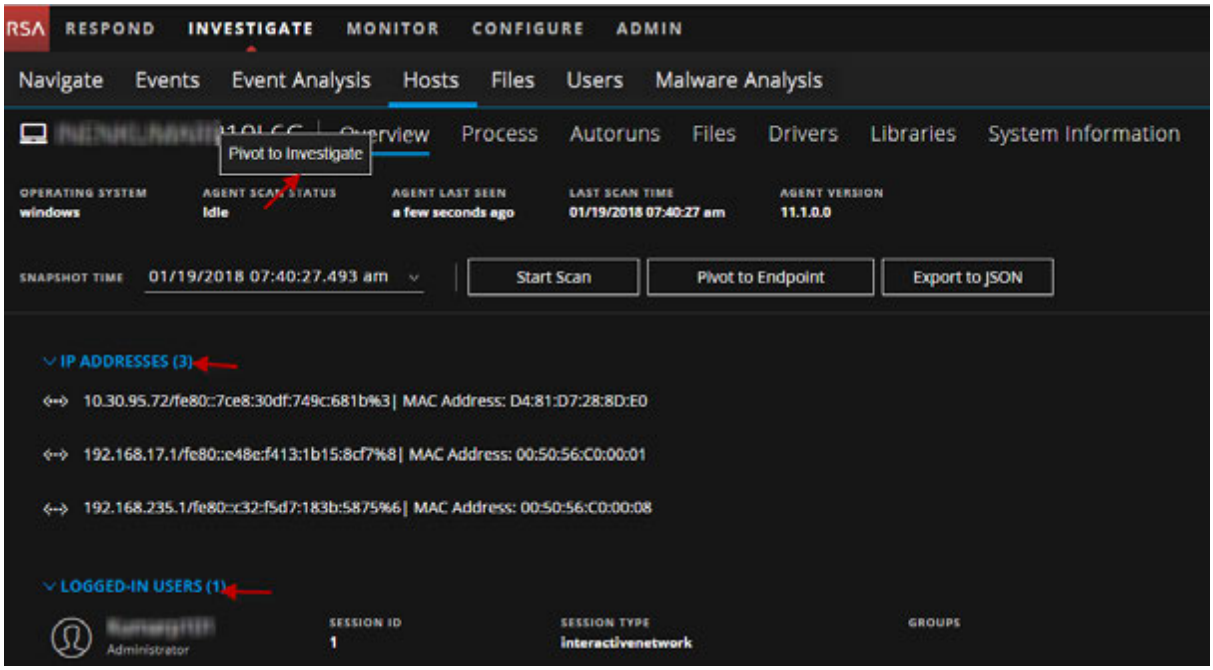
Note: Pivoting to the Navigate or Event Analysis view is not supported for IPV6.

To pivot to the Navigate or Event Analysis view:

1. Go to **INVESTIGATE** > **Hosts** or **INVESTIGATE** > **Files**.
2. Click  beside the Hostname.



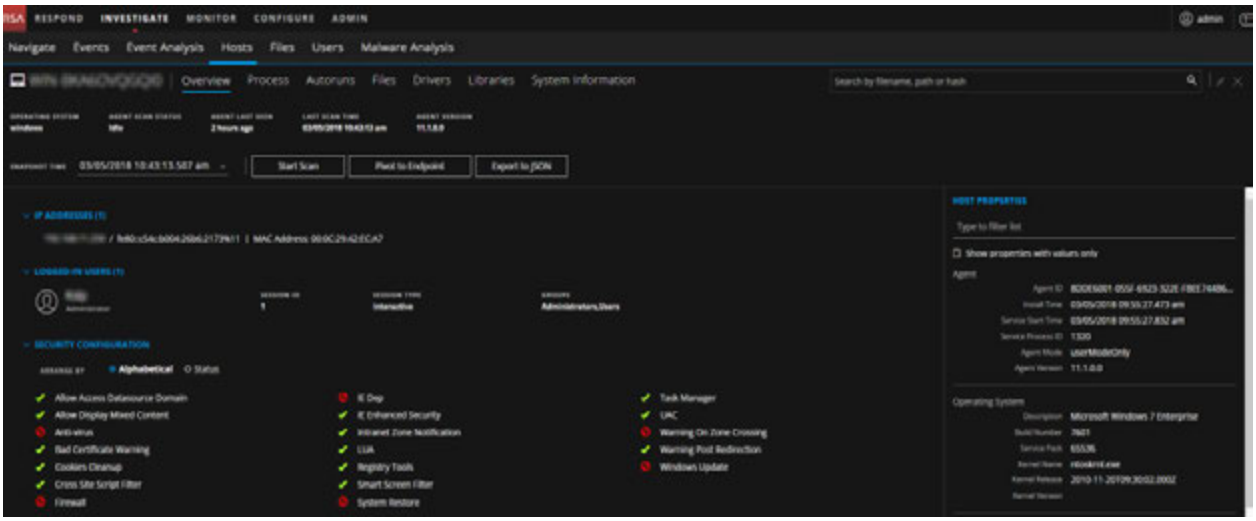
Alternately, in the Overview tab, you can right-click on host name, IP address (IPV4), or logged-in users to pivot.



3. In the Select Service dialog, select any of the services required for investigation.
4. Click **Navigate** or **Event Analysis** to analyze the data.

Investigate Host Details

To look for suspicious files on a host, click the host name and view the details of the host, or start an on-demand scan to get the most recent information.



Search on Snapshots

To investigate a host or to check if it is infected with a known malware, you can search for occurrences of the file name, file path, or SHA-256 checksum.

Note: To search for a SHA-256 checksum, provide the entire hash string in the search box.

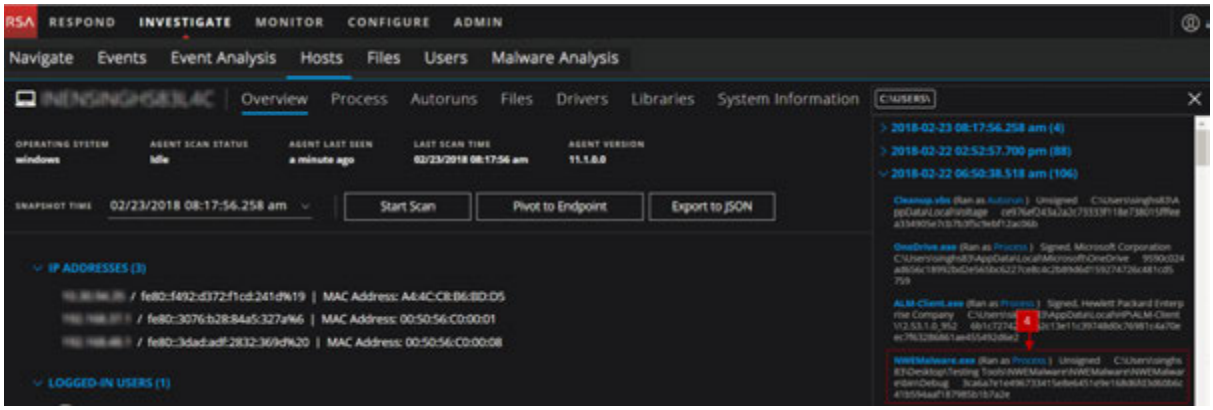
The result displays details, such as file name, signature information, along with its interaction with the system (ran as process, library, autorun, service, task, or driver). To view more details for these results, click on the category.

For example, a user has clicked and executed a malicious attachment through a phishing email, and downloaded it to `C:\Users`. To investigate this file:

1. Go to **INVESTIGATE** > **Hosts**.
2. Select the host that you want to investigate.
3. In the **Overview** tab, enter the file path `C:\Users` in the search box.
   The search displays all the executables in this folder. In this example, the file `NWEMalware.exe`, is an unsigned file that might be malicious.

   This file has run as a Process.

4. To view details of this file, click **Process** in the result.
   This opens the Process tab where you can view the process details.



Analyze Processes

In the Hosts view, select the **Process** tab. You can view the processes that were running for the selected host at the time of scan. The process name and process ID (PID) columns are displayed either as a:

- Tree view - You can drill down to each process and view the child or parent process associated with it.
- List view - You can sort the process name and PID columns.

Click ▪ to switch the views.

The following is an example of the tree view:

When reviewing processes, it is important to see the Launch Arguments. Even legitimate files can be used for malicious purposes, so it is important to view all of them to determine if there is any malicious activity.

For example,

- `rundll32.exe` is a legitimate Windows executable that is categorized as a good file. However, an adversary may use this executable to load a malicious DLL. Therefore, when viewing processes, you must view the arguments of the `rundll32.exe` file.
- `LSASS.EXE` is a child to `WININIT.EXE`. It should not have child processes. Often malware use this executable to dump passwords or mimic to hide on a system (`lass.exe`, `lssass.exe`, `lsasss.exe`, and so on).
- Most legitimate user applications like Adobe, Web browsers, and so on do not spawn child processes like `cmd.exe`. If you encounter this, investigate the processes.

Analyze Autoruns

In the Hosts view, select the **Autoruns** tab. You can view the autoruns, services, tasks, and cron jobs that are running for the selected host.

For example, in the Services tab, you can look for the file creation time. The compile time is found within each portable executable (PE) file in the PE header. The time stamp is rarely tampered with, even though an adversary can easily change it before deploying to a victim's endpoint. This time stamp can indicate if a new file is introduced. You can compare the time stamp of the file against the created time on the system to find the difference. If a file was compiled a few days ago, but the time stamp of this file on the system shows that it was created a few years ago, it indicates that the file is tampered.

Analyze Files

In the Hosts view, select the **Files** tab. You can view the list of files scanned on the host at the time of scan. By default, the table displays 100 files. To display more files, click **Load More** at the bottom of the page.

For example, many trojans write random filenames when dropping their payloads to prevent an easy search across the endpoints in the network based on the filename. If a file is named `svch0st.exe`, `scvhost.exe`, or `svchosts.exe`, it indicates that the legitimate Windows file named `svchost.exe` is being mimicked.

Analyze Libraries

In the Hosts view, select the **Libraries** tab. You can view the list of libraries loaded at the time of scan.

For example, a file with high entropy gets flagged as packed. A packed file means that it is compressed to reduce its size (or to obfuscate malicious strings and configuration information).

Analyze Drivers

In the Hosts view, select the **Drivers** tab. You can view the list of drivers running on the host at the time of scan.

For example, using this panel, you can check if the file is signed or unsigned. A file that is signed by a trusted vendor such as Microsoft and Apple, with the term `valid`, indicates that it is a good file.

Analyze System Information

In the Hosts view, select the **System Information** tab. This panel lists the agent system information. For Windows operating system, the panel displays the host file entries and network shares of that host.

For example, malware might use host file entries to block antivirus updates.

Delete a Host

To delete hosts manually from the UI:

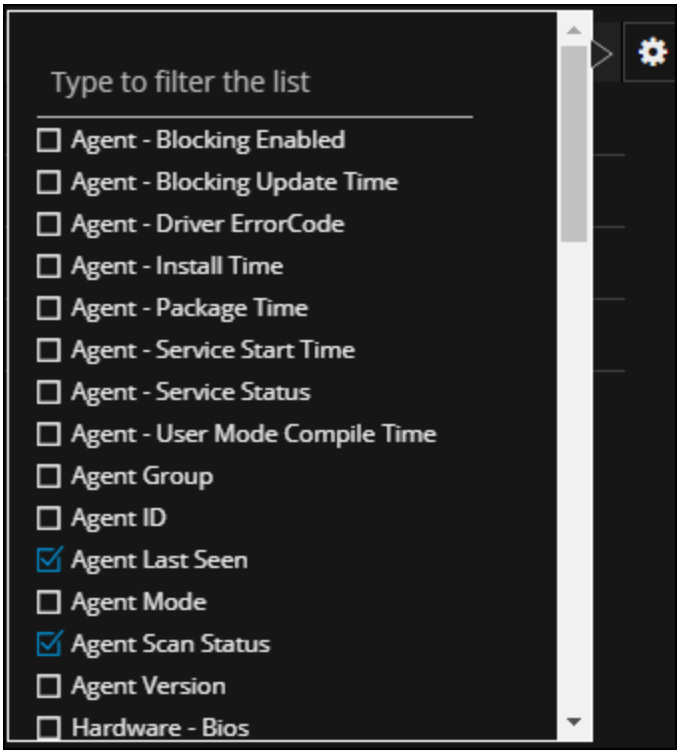
1. Go to **INVESTIGATE > Hosts**.
2. Select the hosts that you want to delete from the Hosts view and click **Delete**.
   This deletes all the collected Endpoint data for the selected hosts.

Note: If you accidentally delete a host from the Hosts view, the Endpoint Server forbids all requests from this agent. The agent must be uninstalled manually from the host and reinstalled for it to appear on the Hosts view.

Set Hosts Preference

By default, the Hosts view displays a few columns and the hosts are sorted based on the last scan time. If you want to view specific columns and sort data on a specific field:

1. Go to **INVESTIGATE > Hosts** view.
2. Select the columns by clicking in the right-hand corner. The following example shows the screen displayed while adding columns:



3. Sort the data on the required column.

Note: This is set as your default view every time you log in to the Hosts view.

Export Host Attributes

You can export up to 100,000 host attributes at a time. To extract the host attributes to a comma-separate values (csv) file.

1. Go to **INVESTIGATE > Hosts**.
2. Filter the hosts by selecting the required filter options.
3. Add columns by clicking in the right-hand corner.
4. Click **Export to CSV**.

You can either save or open the csv file.

Investigate NetWitness Endpoint 4.4.0.2 or Later Hosts

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

If you have NetWitness Endpoint 4.4.0.2 or later in your deployment, you can view the endpoint data of these hosts in the **INVESTIGATE > Hosts** and **INVESTIGATE > Files** views.

If you do not see the NetWitness Endpoint 4.4.0.2 hosts listed here, see "Integrating NetWitness Endpoint 4.4.0.2 or Later with NetWitness Endpoint 11.1" in the *Endpoint Insights Configuration Guide*.

The NetWitness Endpoint 4.4.0.2 hosts can be identified in the Hosts View using the Agent Version. You cannot perform an on-demand scan on these hosts. To investigate these hosts, you must use the NetWitness Endpoint 4.4.0.2 or later user interface.

Note: To pivot to the thick client from the NetWitness Suite user interface, the NetWitness Endpoint 4.4.0.2 or later must be installed.

To investigate a host in the NetWitness Endpoint user interface:

1. Go to **INVESTIGATE** > **Hosts**.
2. Select the 4.4 host from the table.
3. Click **Pivot to Endpoint**.

Note: The **Pivot to Endpoint** option is not applicable for the NetWitness Endpoint Insights 11.1 hosts.

Investigate Files

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

Analysts can use the Files view (**INVESTIGATE > Files**) to identify suspicious files by examining the file name, file size, entropy, format, company name, signature, and checksum.

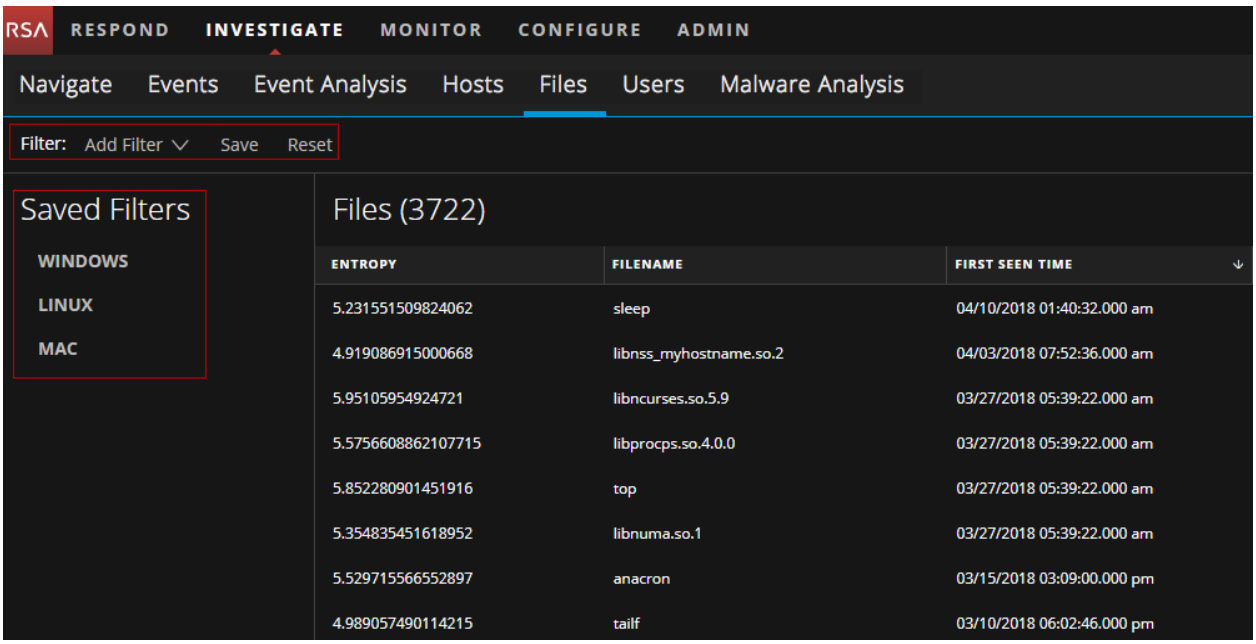
For example, when looking at a file name, if an environment is infected by the WannaCry ransomware, using this file name, the analyst can filter the list. You can also look for this ransomware using the checksum.

The file size can be an indicator when assessing a file. Trojans are usually less than 1 MB, and the majority of them are less than 500 KB.

Filter Files

You can either filter the files on the operating system, or select the fields in the Add Filter drop-down menu.

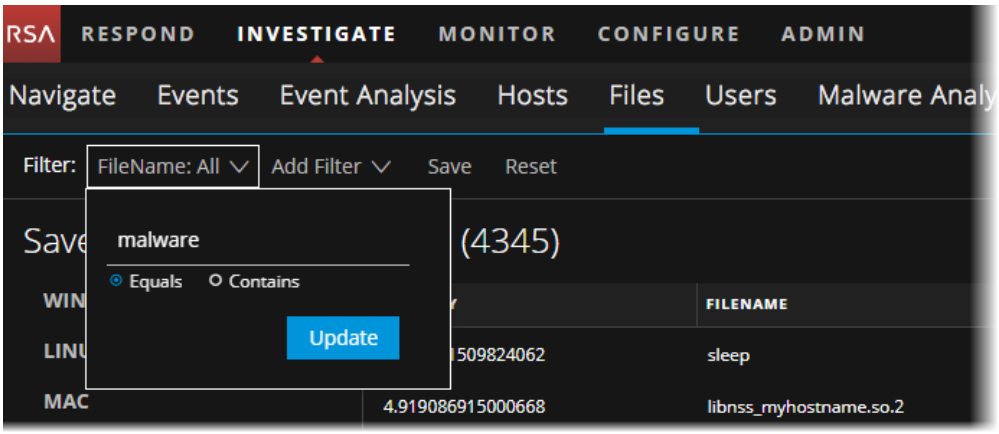
Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. The following fields are indexed in the database - Filename, MD5, Operating System, First Seen Time, and Format.



Click **Save** to save the search and provide a name (up to 250 alphanumeric characters). The filter is added to the Saved Filters panel on the left. To delete a filter, hover over the name and click  .

Note: Special characters are not allowed except underscore (_) and hyphen (-) while saving the filter.

For example, filtering files with the filename `malware` using the `Equals` operator.



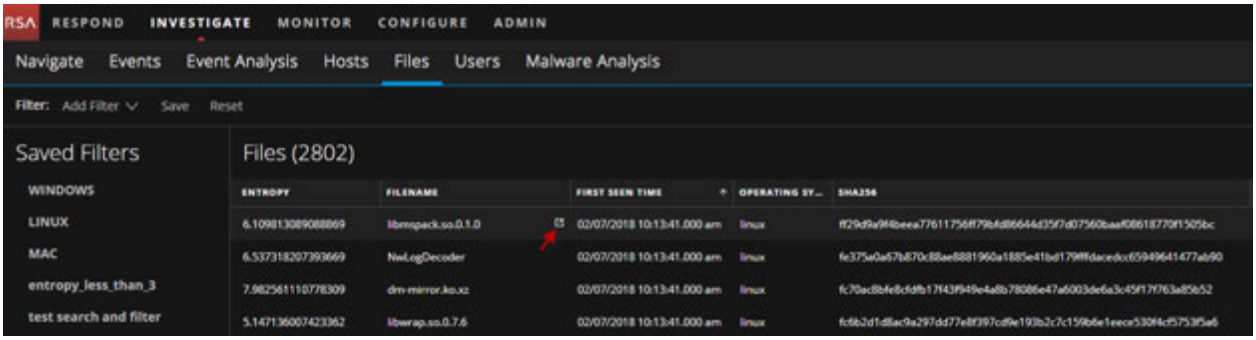
Note: For the file size, 1 KB is calculated as 1024 bytes. For example, if the actual size of the file is 8421 bytes, the UI will display it as 8.2 KB instead of 8.22 KB. It is recommended to search using the bytes format when using the `Equals` operator.

Pivot to Navigate and Event Analysis Views

If you need to investigate a particular filename or hash (SHA256 and MD5) in the global files to look for related activity across a time range, you can pivot to both the Navigate and Event Analysis views to get the entire context of the file. By default the time range is set to 1 day. You can change the time range accordingly.

To pivot to Navigate or Event Analysis view:

1. Go to **INVESTIGATE > Files**.
2. Click  beside the Filename or Hash.



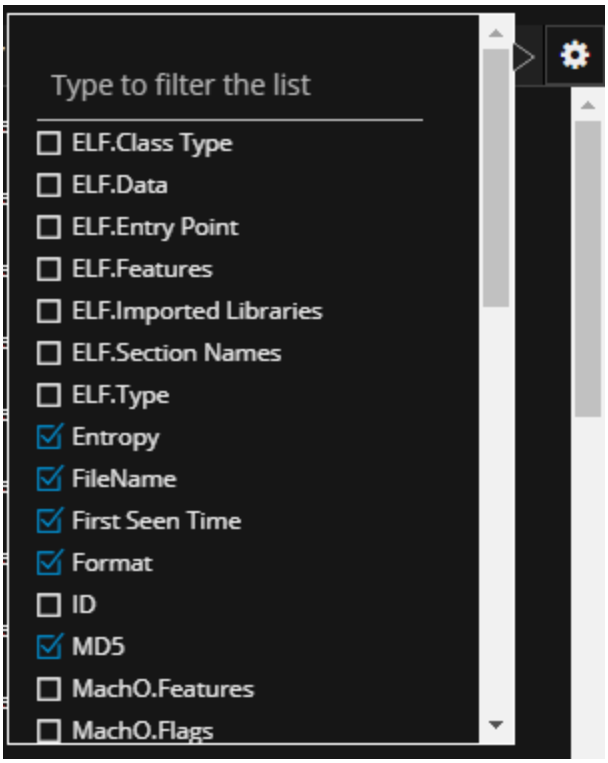
3. In the Select Service dialog, select any of the services required for investigation.
4. Click **Navigate** or **Event Analysis** to analyze the data.

Note: While pivoting to the Navigate or Event Analysis view, if the values are not indexed, the results take time to load. For more information, see Troubleshooting NetWitness Investigate.

Set Files Preference

By default, the Files view displays a few columns and the files are sorted based on the first seen time. If you want to view specific columns and sort data on a specific field:

1. Go to **INVESTIGATE > Files**.
2. Select the columns by clicking in the right-hand corner. The following example shows the screen displayed while adding columns:



3. Sort the data on the required column.

Note: This is set as your default view every time you log in to the Files view.

Export Global Files

To extract the list of global files to a CSV file.

Note: While filtering on a large data set, use at least one indexed field with the `Equals` operator for better performance. You can export up to 100k files at a time.

1. Go to **INVESTIGATE > Files**.
2. Filter the files by selecting the required filter option.
3. Add columns by clicking in the right-hand corner.
4. Click **Export to CSV**.

You can either save or open the CSV file.

Conducting Malware Analysis

Analysts can use the RSA NetWitness Platform Malware Analysis service to detect malware in selected data and files.

Analysts who conduct analyses using NetWitness Platform Malware Analysis need to have the appropriate system roles and permissions set up for their user accounts.

The following procedures provide instructions for using Malware Analysis:

- Begin a Malware Analysis Investigation.
- Upload Files for Malware Analysis Scanning.
- Implement Custom YARA Content.
- Filter Dashlet Data in the Summary of Events View.
- Examine Scan Files and Events in List Form
- View Detailed Malware Analysis of an Event.

Malware Analysis Functions

NetWitness Platform Malware Analysis is an automated malware analysis processor designed to analyze certain types of file objects (for example, Windows portable executable (PE), PDF, and MS Office) to assess the likelihood that a file is malicious.

Malware Analysis detects indicators of compromise using four distinct analysis methodologies:

- Network Session Analysis (network)
- Static File Analysis (static)
- Dynamic File Analysis (sandbox)
- Security Community Analysis (community)

Each of the four distinct analysis methodologies is designed to compensate for inherent weaknesses in the others. For example, Dynamic File Analysis can compensate for Zero-Day attacks that are not detected during the Security Community Analysis phase. By avoiding malware analysis that strictly focuses on one methodology, the analyst is more likely to be shielded from false negative results.

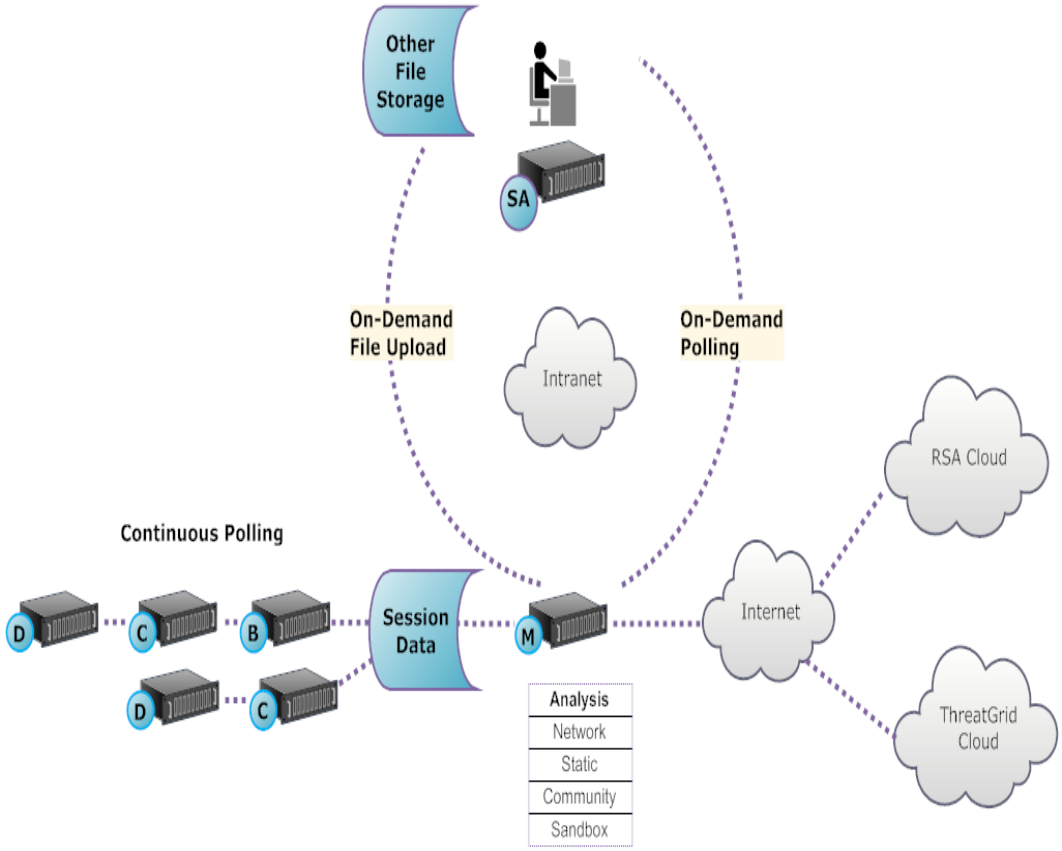
In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language, which allows malware researchers to identify and classify malware samples. This allows IOC authors to add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live. These YARA-based IOCs in RSA Live will automatically be downloaded and activated on the subscribed host, to supplement the existing analysis that is performed in each analyzed file.

Malware Analysis also has features that support alerts for Incident Management.

Functional Description

This figure depicts the functional relationship between the Core services (the Decoder, Concentrator, and Broker), the Malware Analysis service, and the NetWitness Server.

Daily Quota (Number of Files)	Free	Standard	Enterprise
Malware Analysis	100	unlimited	unlimited
ThreatGrid Analysis	5	1000	5000



The Malware Analysis service analyzes file objects using any combination of the following methods:

- **Continuous automatic polling of a Concentrator or Broker** to extract sessions identified by a parser as potentially carrying malware content.
- **On-demand polling of a Concentrator or Broker** to extract sessions identified by a malware analyst as potentially carrying malware content.
- **On-demand upload of files** from a user-specified folder.

When automatic polling of a Concentrator or Broker is enabled, the Malware Analysis service continuously extracts and prioritizes executable content, PDF documents, and Microsoft Office documents on your network, directly from data captured and analyzed by your Core service. Because the Malware Analysis service connects to a Concentrator or Broker to extract only those executable files that are flagged as possible malware, the process is both rapid and efficient. This process is continuous and does not require monitoring.

When on-demand polling of a Concentrator or Broker is chosen, the malware analyst uses Investigation to drill into captured data and choose sessions to be analyzed. The Malware Analysis service uses this information to automatically poll the Concentrator or Broker and to download the specified sessions for analysis.

On-demand upload of files provides a method for the analyst to review files captured external to the Core infrastructure. The malware chooses a folder location and identify one or more files to be uploaded and analyzed by Malware Analysis. These files are analyzed using the same methodology as files automatically extracted from network sessions.

Analysis Method

For the Network analysis, the Malware Analysis service looks for characteristics that seem to deviate from the norm, much as an analyst does. By looking at hundreds to thousands of characteristics and combining the results into a weighted scoring system, legitimate sessions that coincidentally have a few abnormal traits are dismissed, while the actual bad ones are highlighted. A user can learn patterns that indicate anomalous activity in the sessions as indicators that warrant further investigation, Indicators of Compromise.

The Malware Analysis service can perform Static analysis against suspicious objects it finds on the network and determine whether those objects contain malicious code. For Community analysis, new malware detected on the network is pushed to the RSA Cloud for checking against RSA's own malware analysis data and feeds from the SANS Internet Storm Center, SRI International, the Department of the Treasury and VeriSign. For Sandbox analysis, the services can also push data into major security, information and event management (SIEM) hosts (the ThreatGrid Cloud).

Malware Analysis has a unique method for analysis that is partnered with industry leaders and experts, so their technologies can enrich the Malware Analysis scoring system.

NetWitness Server Access to the Malware Analysis Service

The NetWitness Server is configured to connect to the Malware Analysis service and import tagged data for deeper analysis in Investigation. Access is based on three subscription levels.

- Free subscription: All NetWitness Platform customers have a free subscription, with a free trial key for ThreatGrid analysis. The Malware Analysis service is rate-limited to 100 file samples per day. The number of samples (within the set of files from above) submitted to the ThreatGrid Cloud for sandbox analysis is limited to 5 per day. If one network session had 100 files in it, customers would hit the rate limit after processing the one network session. If 100 files were manually uploaded, that would cause the rate limit to be reached.
- Standard subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 1000 per day.
- Enterprise subscription tier: The number of submissions to the Malware Analysis service is unlimited. The number of samples submitted to the ThreatGrid Cloud for sandbox analysis is 5000 per day.

Scoring Method

By default, the Indicators of Compromise (IOC) are tuned to reflect industry best practices. During analysis, the IOCs that trigger cause the score to move upward or downward to indicate the likelihood that the sample is malicious. The tuning of IOCs is exposed in NetWitness Platform so that the malware analyst can choose to override the assigned score or to disable an IOC from being evaluated. The analyst has the flexibility to either use the default tuning, or to completely customize the tuning to specific needs.

YARA-based IOCs are interleaved with the built-in IOCs within each built-in category and are not distinguished from native IOCs. When viewing IOCs in the Service Configuration view, administrators can select YARA from the Module selection list to see a list of YARA rules.

After a session is imported into NetWitness Platform, all of the viewing and analysis capabilities in Investigation are available to further analyze Indicators of Compromise. When viewed in Investigation, YARA IOCs are distinguished from the built-in native IOCs by the tag `Yara rule`.

Deployment

The Malware Analysis service is deployed as a separate RSA Malware Analysis host. The dedicated Malware Analysis host has an onboard Broker which connects to the Core infrastructure (either another Broker or a Concentrator). Prior to this connection, a collection of parsers and feeds must be added to the Decoders that are connected to the Concentrators and Brokers from which the Malware Analysis service pulls data. This allows suspicious data files to be marked for extraction. These files are `malware analysis` tagged content available through the RSA Live content management system.

Malware Scoring Modules

RSA NetWitness Platform Malware Analysis analyzes and scores sessions and the embedded files within these sessions by scoring four categories: Network, Static Analysis, Community, and Sandbox. Each category comprises many individual rules and checks that are used to calculate a score between 1-100. The higher the score, the more likely the session is to be malicious and worthy of more in-depth follow-on investigation.

Malware Analysis can facilitate a historical investigation into events leading up to a network alarm or incident. If you know that a certain type of activity is taking place on your network, you can select only the reports of interest to examine the content of data collections. You can also modify behavior for each scoring category based on the scoring category or the file type (Windows PE, PDF, and Microsoft Office).

Once you become familiar with data navigation methods, you can explore the data more completely through:

- Searching for specific types of information
- Reviewing specific content in detail.

Category scores for Network, Static Analysis, Community, and Sandbox are maintained and reported independently. When events are viewed based on the independent scores, as long as one category detects malware, it is evident in the Analysis section.

Network

The first category examines each core network session to determine if the delivery of the malware candidates was suspicious. For example, benign software being downloaded from a well-known safe site, using proper ports and protocols, is considered less suspicious than downloading software known to be malicious from a known dubious download site. Sample factors used in the scoring of this criteria set may include sessions that:

- Contain threat feed information
- Connect to well-known bad sites
- Connect to high-risk domains/countries (for example, .cc domain)
- Use well-known protocols on non-standard ports
- Contain obfuscated JavaScript

Static Analysis

The second category analyzes each file in the session for signs of obfuscation in order to predict the likelihood of the file behaving maliciously if allowed to run. For example, software that links to networking libraries is more likely to perform suspicious network activity. Sample factors used in the scoring of this criteria set may include:

- Files found to be XOR encoded
- Files found embedded within non-EXE formats (for example, PE file found embedded in a GIF format)
- Files linking to higher risk import libraries
- Files highly deviating from the PE Format

Community

The third category scores the session and files based on the collective knowledge of the security community. For example, files whose fingerprint/hash is already known to be good or bad by respected anti-virus (AV) vendors is scored accordingly. Files are also scored based on knowledge that a file was delivered from a site known to be good or bad by the security community.

Community scoring also indicates whether the AV on your network flagged the files as malicious. It does not indicate that the resident AV product acted to protect your system.

Sandbox

The fourth category examines the behavior of the software by actually running it in a sandbox environment. By running the software to watch its behavior, a score can be calculated by identifying well-known malicious activity. For example, software that configures itself to autostart on each reboot and make IRC connections would score higher than a file with no known bad behavior.

Begin a Malware Analysis Investigation

You can investigate data that has been scanned, flagged, and rated by Malware Analysis as containing Indicators of Compromise. This includes all types of Malware Analysis scans: continuous mode polling, on-demand polling, and on-demand uploaded files. Continuous mode polling must be enabled when the administrator configures basic settings for the Malware Analysis service.

NetWitness Platform provides several methods of launching a Malware Analysis investigation.

Fastest: Instant Launch from Malware Analysis Dashlets

The fastest way to begin a Malware Analysis investigation is an Instant launch from the NetWitness Platform Dashboard using one of the Malware Analysis dashlets that lists events or files that are likely to contain malware. The dashlets are described as part of the RSA NetWitness Content in Dashlets. From one of these dashlets, you can go directly to the Analysis Results for a specific event that has been listed as worthy of investigation:

- Top Listing of Highly Suspicious Malware
- Top Listing of Possible Zero Day Malware
- Malware with High Confidence IOCs and High Scores Dashlet

On-Demand Polling from a Meta Value in the Navigate View

You can initiate on-demand polling from within an investigation by right-clicking a meta value in the Navigate view, and choosing an option from the context menu. When polling is complete, the scanned data is available for malware analysis (see Launch a Malware Analysis Scan from the Navigate View).

Investigate a Specific RSA Service

You can also begin a Malware Analysis investigation of a service in the Investigate > Malware Analysis view. For Malware Analysis investigation on a service basis, a service must be specified in the Investigate > Malware Analysis view:Inve

1. Investigate opens the Malware Analysis view with the user-specified default service selected.
2. If no default service is currently specified, a dialog allows you to select the Malware Analysis service to investigate.
3. When a service has been selected in the Malware Analysis view, the Summary of Events for the selected service and continuous scan data for the service is displayed.

This topic provides instructions for all methods of launching a Malware Analysis investigation.

Launch a Malware Investigation from a Malware Analysis Dashlet

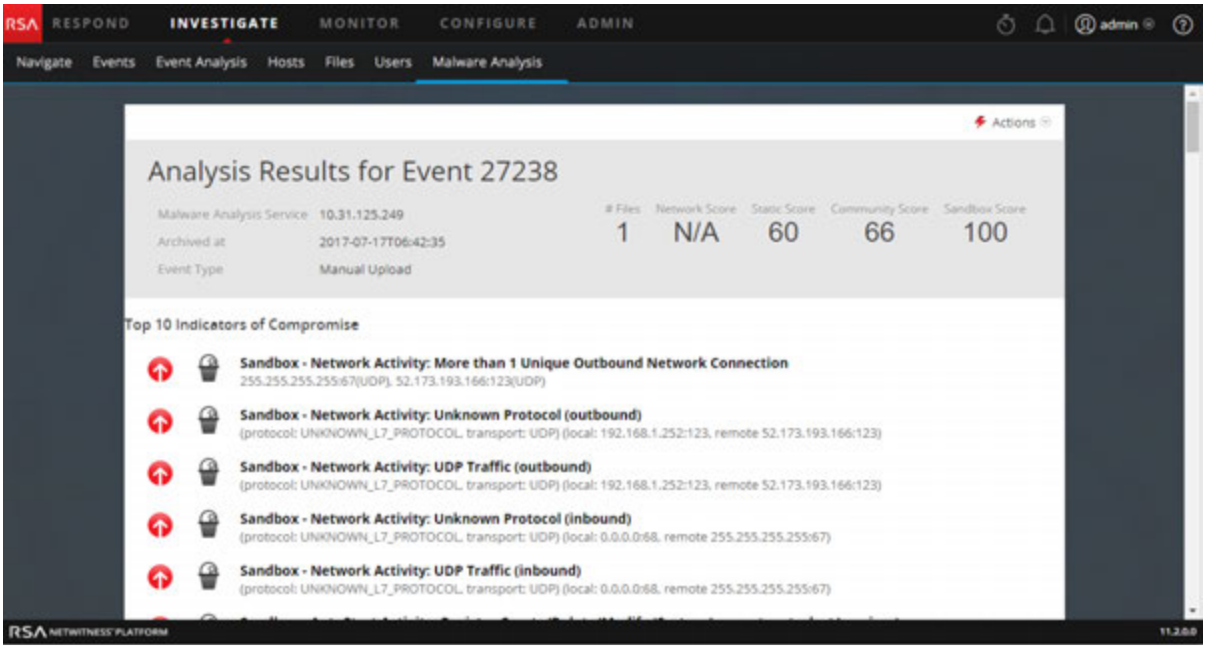
A prerequisite for this procedure is that one of the following dashlets must be visible in the NetWitness Platform dashboard or in the Malware Analysis view, and must be populated with listed events or files. If you do not see the dashlets, add them and configure the dashlets.

- Top Listing of Highly Suspicious Malware
- Top Listing of Possible Zero Day Malware

- Malware with High Confidence IOCs and High Scores Dashlet

To launch a Malware Analysis investigation from a dashlet:

1. Log in to NetWitness Platform and look for one of the above dashlets in the Monitor view or in the Malware Analysis view
2. In the dashlet, double-click an event or file for deeper analysis. A detailed analysis of the event in the Events List or the event with which the file in the File List is associated is displayed in the Malware Analysis view.



To learn more about configuring the Malware Analysis dashlets in the Monitor dashboard, see "Dashlets" in the *Getting Started with NetWitness Platform Guide*.

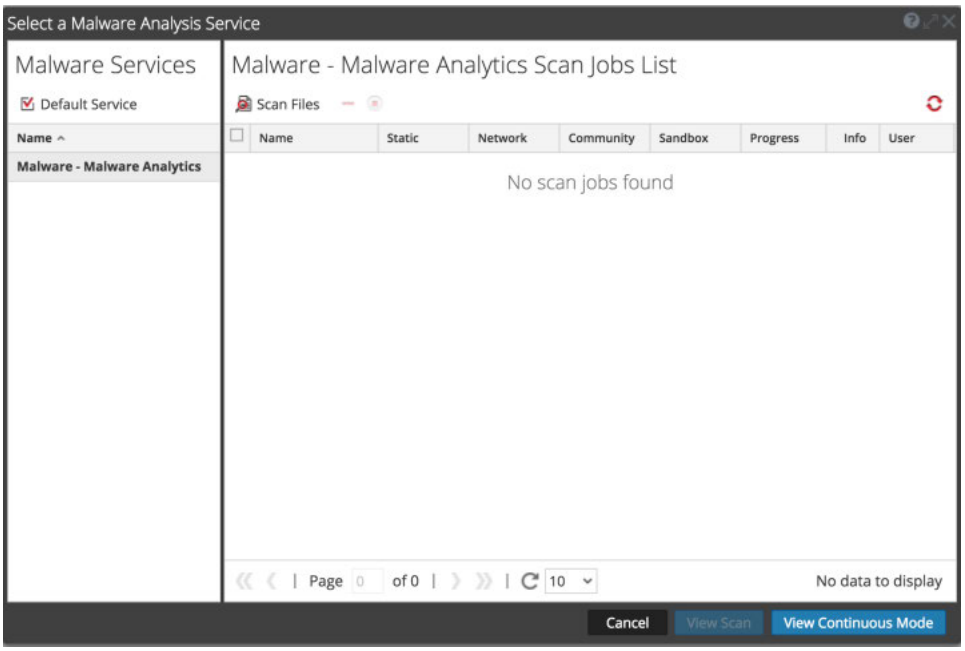
To learn about the ways you can configure and filter information in dashlets in the Malware Analysis view, refer to Filter Dashlet Data in the Summary of Events View.

To learn about the actions you can perform in the Analysis Results, refer to View Detailed Malware Analysis of an Event.

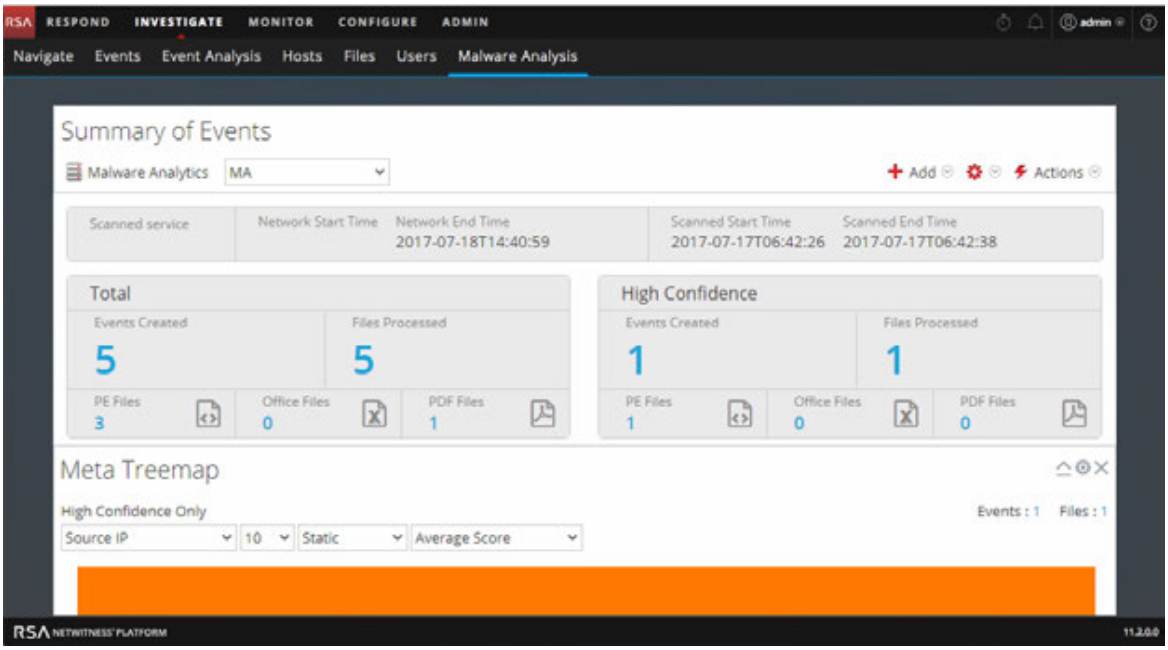
Begin a Malware Analysis Investigation (No Default Service)

To begin an investigation with no default service specified:

1. Go to **INVESTIGATE** > **Malware Analysis**.
   The Select a Malware Analysis Service dialog is displayed, with available Malware Analysis hosts and services for the current user in the left panel and available scan jobs in the right panel. This scan jobs panel contains the same columns as the Malware Scan Jobs dashlet in the Unified dashboard. In addition, it has a toolbar and View options, which are described in Select a Malware Analysis Service Dialog.



2. In the list of Malware Analysis hosts, select a host and a list of scan jobs is displayed in the right panel. These jobs are created when you scan an event or a file (see Upload Files for Malware Analysis Scanning and Launch a Malware Analysis Scan from the Navigate View.
3. To begin analyzing a scan, do one of the following:
   a. Select a scan and click **View Scan**.
   b. Click **View Continuous Mode**.
      The Summary of Events for the selected scan is displayed with the default dashlets open. Each user can add, modify, and delete default dashlets, which persist through different scan investigations. Users can also restore default dashlets as described in Filter Dashlet Data in the Summary of Events View.

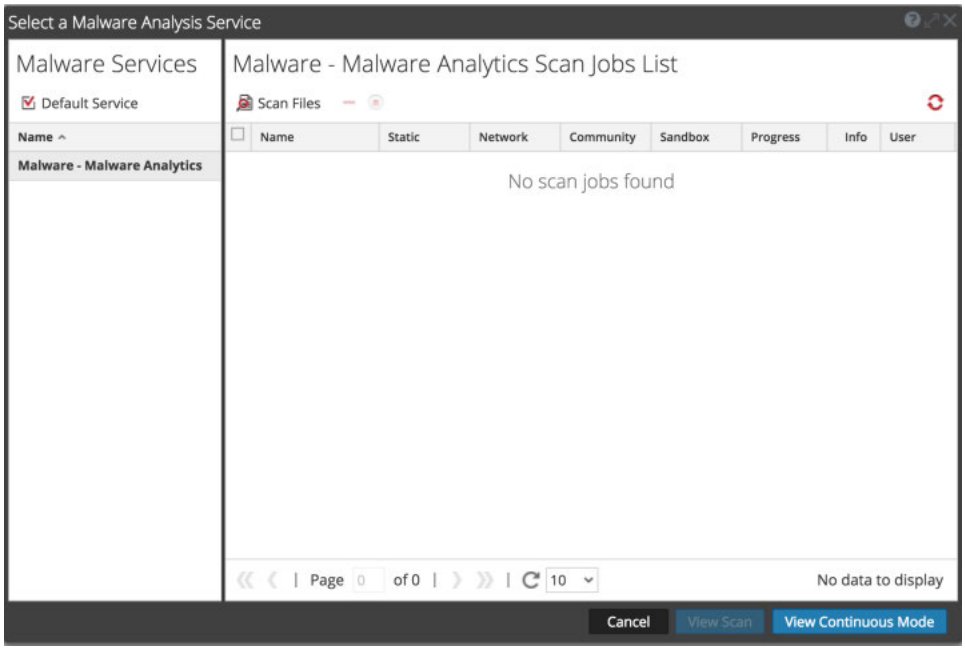


Set or Clear the Default Service

You can set the default service and clear the default service in the Select a Malware Analysis Service dialog.

To set a default service:

1. Click the service name in the Summary of Events toolbar.
   The Select a Malware Analysis Service dialog is displayed.



2. Select a service on the list of available Malware services, and click Default Service.
   The service becomes the default, (indicated by ☑ in front of the host name).
3. To clear the default service, select the default service in the grid, and click Default Service.
   No default service is set.

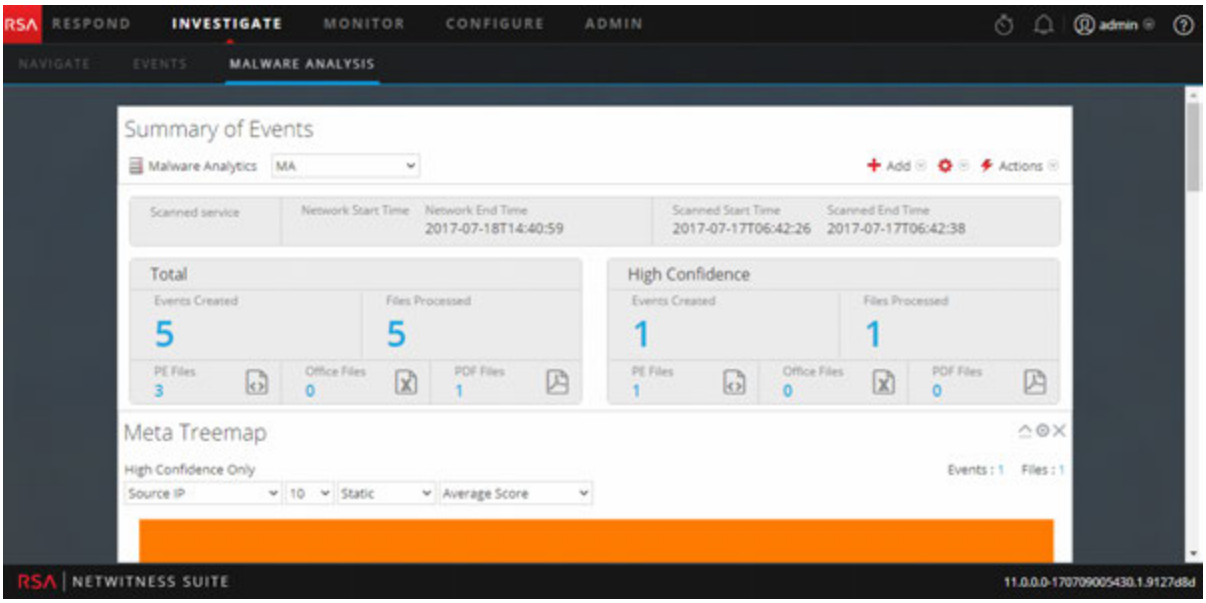
Upload and Scan Files

A Malware Analyst with permission to `Initiate Malware Analysis Scan` can upload files to scan using the Scan Files option in the Select a Malware Analysis Service dialog (see Upload Files for Malware Analysis Scanning. An administrator can upload packet capture files to a Decoder for Malware Analysis in the Services System view as described in "Upload Packet Capture File" in the *Decoder and Log Decoder Configuration Guide*.

Begin an Investigation (Default Service Specified)

To begin an investigation with a default service specified:

1. Go to **INVESTIGATE** > **Malware Analysis**.
   The Summary of Events for a continuous scan of the selected service is displayed with the default dashlets open. Each user can add, modify, and delete default dashlets, which persist through different scan investigations. Users can also restore default dashlets as described in Filter Dashlet Data in the Summary of Events View.

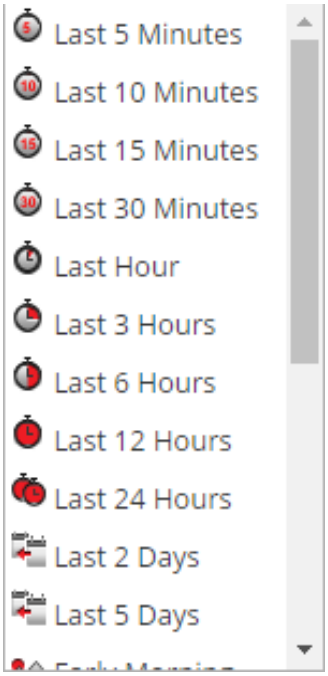


Apply Time Parameters Filter for Results

You can apply a Threshold filter to refresh the results of the chosen dashlets.

1. To select a different time range, select either **Continuous Mode** or a different scan from the toolbar.
   The Malware Summary of Events for the selected scan is displayed.

2. To select a new time range for the scan, click in the range selection list in the toolbar. Ranges available are: Last 5 minutes, Last 10 minutes, Last 15 minutes, Last 30 minutes, Last Hour, Last 3 Hours, Last 6 Hours, Last 12 Hours, Last 24 Hours, Last 2 Days, Last 5 Days, Early Morning, Morning, Afternoon, Evening, All Day, Yesterday, This Week, Last Week, or Custom.



The results are updated immediately.

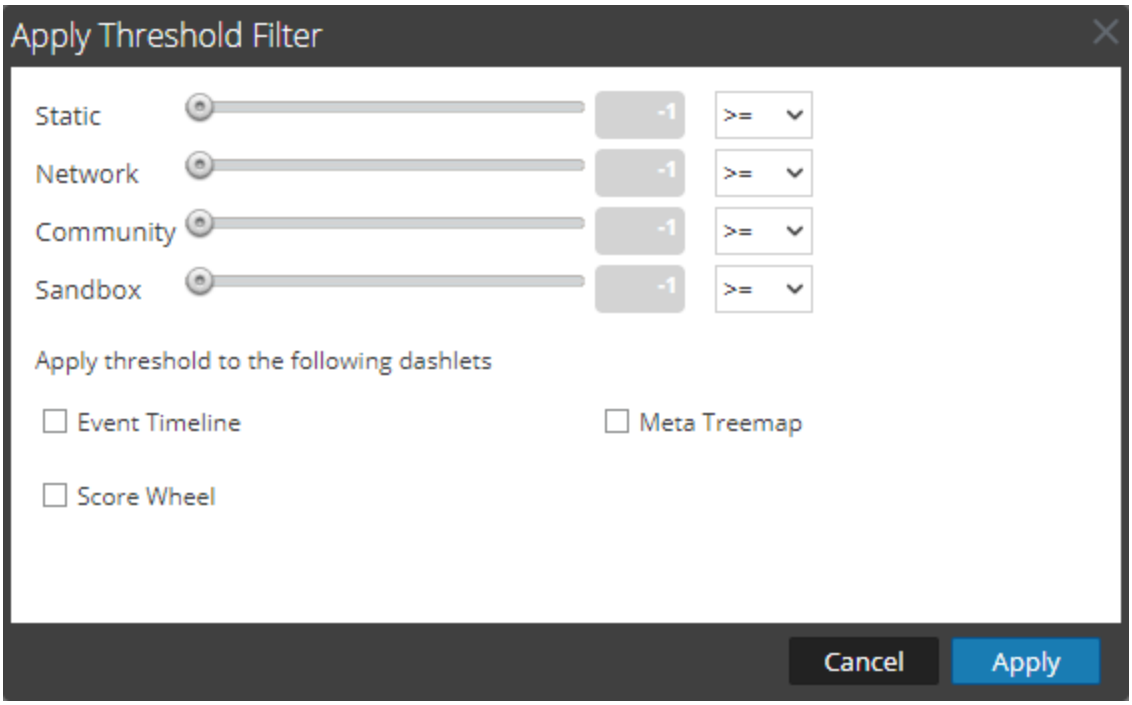
3. To refresh a continuous mode scan with new data, click .

Apply a Threshold Filter to Continuous Mode Results

You can apply a new threshold filter to an instance of the Malware with High Confidence IOCs and High Scores dashlet, the Meta Treemap dashlet, the Score Wheel dashlet, and the Event Timeline dashlet.

To customize the scoring applied to the scan, in the toolbar, do the following:

1. Select > **Apply Threshold Filter.**
   The Apply Threshold Filter dialog is displayed.



2. If you want to limit the number of events displayed to events that were given a score above a certain number, do the following:
   a. Drag the slider in the Static, Network, Community, and Sandbox slider bars.
   b. To select the dashlets in which the thresholds apply, select the appropriate checkboxes.
   c. Click **Apply**.

Delete or Resubmit an On-Demand Scan with New Bypass Settings

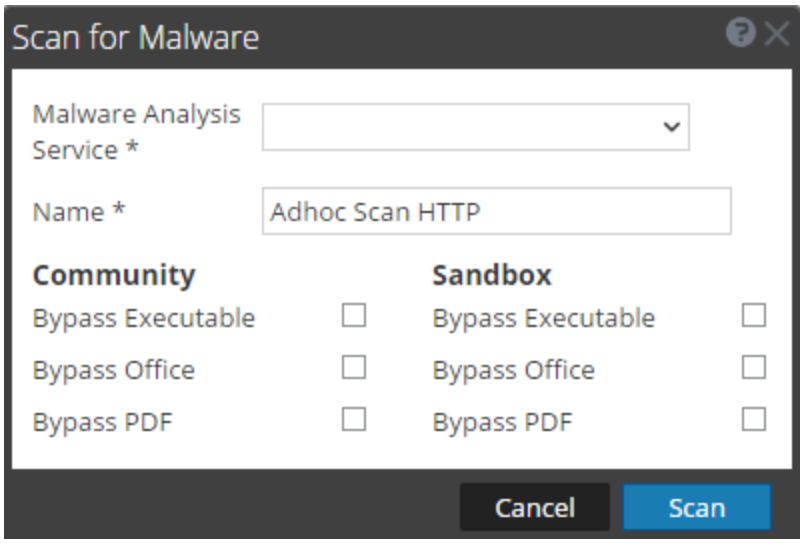
You can delete an on-demand scan or resubmit an on-demand scan with different bypass settings than those specified in the Service Configuration view for a Malware Analysis service.

To delete a scan while viewing an on-demand scan, do the following:

1. Select **Actions** > **Delete Scan**.
   A dialog asks for confirmation that you want to delete the scan.
2. Click **Yes**.
   The selected scan is deleted.

To apply different bypass settings to the current scan:

1. Select **Actions > Resubmit Scan**.
   The Scan for Malware dialog is displayed.



2. Select the bypass settings that you want to use on the new scan, and click **Scan**.
   Malware Analysis resets cache and resubmits the file for a new scan, and the scan jobs are added to the jobs queue.
3. When the job is complete, scroll to the left and select **View**.
   The Malware Summary of Events for the selected scan is displayed.

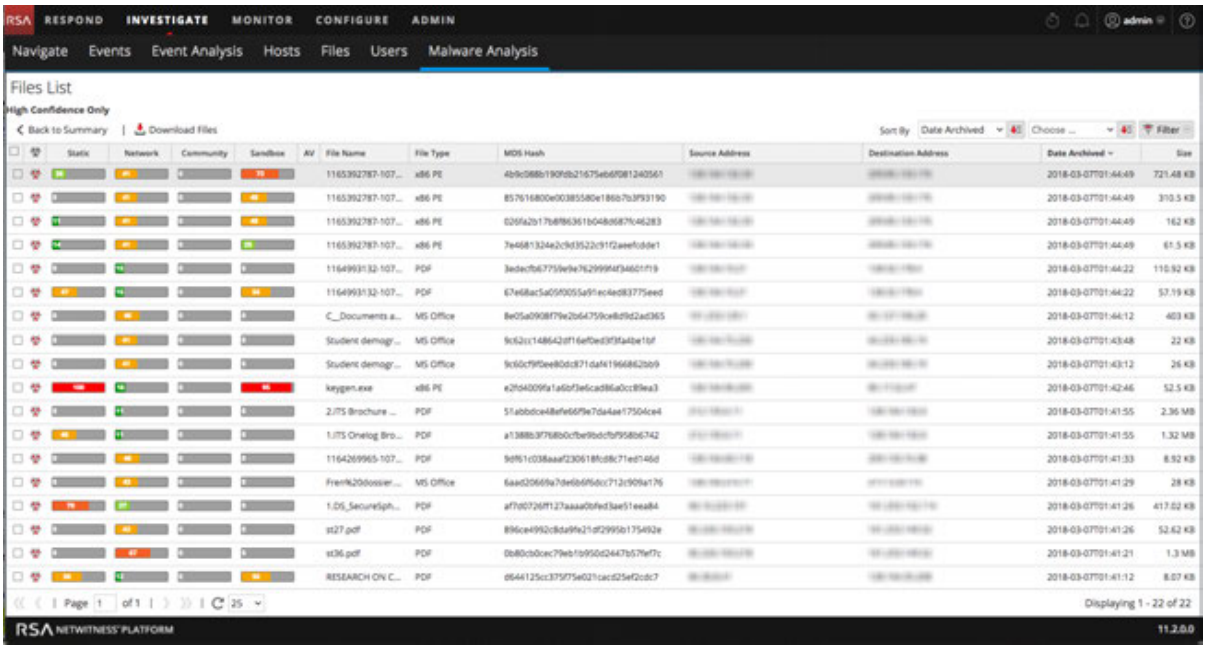
View the Files List

You can view a list of files for an event from the Malware Analysis Summary of Events and from each of the Visualization charts: Event Timeline, Meta Breakdowns, Meta Treemap, and Score Wheel.

To view the Files List, do one of the following:

- In the Summary of Events, click on the number of files in the **Total** row or the **High Confidence** row under **Files Processed**, **PE Files**, **Office Files**, or **PDF Files**. The Files List is displayed.
- In any visualization dashlet, click the number next to the **Files** field in the top right corner of the dashlet.

The Files List for the selected drill point is displayed.



From the Files List, you can search for a file by filename or MD5 file hash, sort the list using two criteria and ascending or descending order, and download files as described in Examine Scan Files and Events in List Form.

To return to the Summary of Events, click **Back to Summary**.

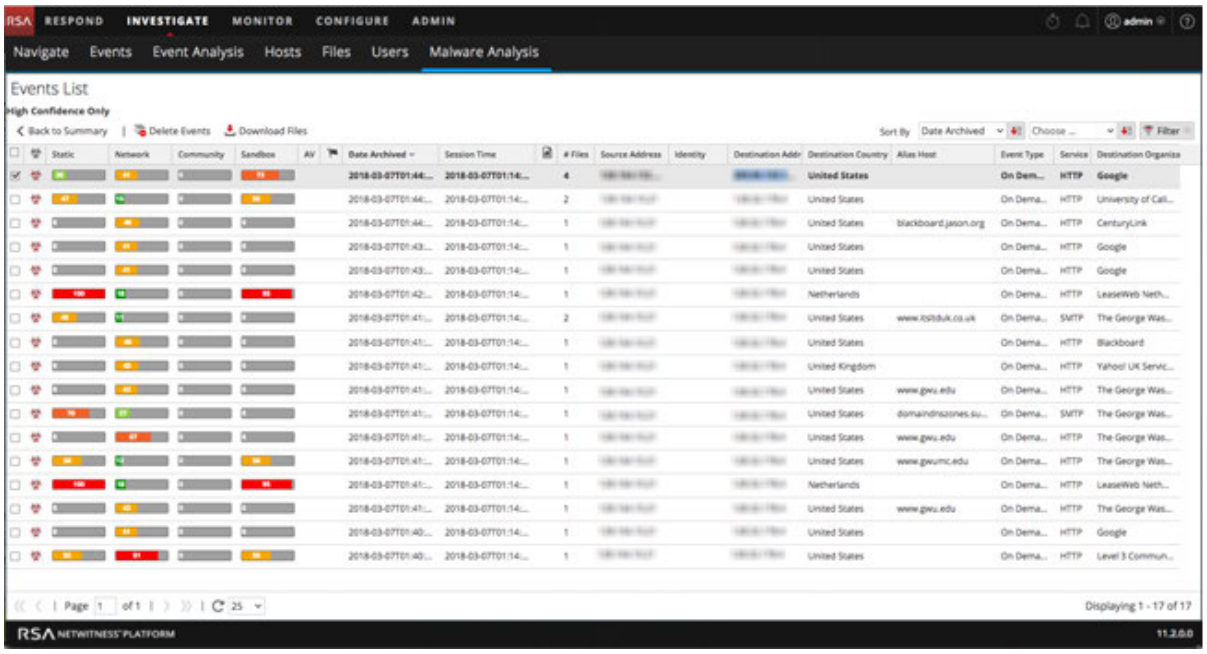
View the Events List

From the Malware Analysis Summary of Events and from each of the visualization charts (Event Timeline, Meta Breakdowns, Meta Treemap, and Score Wheel), you can select events to view in the Events grid.

To view the Events List, do one of the following:

- In the Summary of Events, click the number of Events Created in the **Total** row or the **High Confidence** row. The Events List is displayed.
- In any visualization dashlet, click the number next to the Events field in the top right corner of the dashlet.

The Events List for the selected time is displayed.



Implement Custom YARA Content

In addition to the built-in indicators of compromise, Malware Analysis supports indicators of compromise written in YARA. YARA is a rule language that allows malware researchers to identify and classify malware samples. RSA makes built-in YARA-based Indicators of Compromise (IOCs) available in RSA Live; these are automatically downloaded and activated on subscribed hosts.

Customers with advanced skills and knowledge can add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live or placing YARA rules in a watched folder for the host to consume.

As malware and the threat landscape evolve, it is important to review and examine existing custom rules. Updates are often necessary to incorporate new detection methods. RSA also updates YARA rules in Live from time to time. To receive updates, you can subscribe to the RSA Blog and RSA Live at http://blogs.rsa.com/feed.

This document provides information to help customers implement custom YARA rules in Malware Analysis.

Prerequisites

The host on which you are adding custom rules must be configured to support authoring of YARA rules as described in "Enable Custom YARA Content" in the *Malware Analysis Configuration Guide*.

YARA Version and Resources

RSA Malware Analysis is packaged with YARA version 1.7 (rev:167). To find out the exact version, you can run `yara -v` on the Malware Analysis host as shown in this example:

```
[root@TESTHOST yara] # yara -v
 yara 1.7 (rev:167)
```

Meta Keys in YARA Rules

Malware Analysis is compliant with other sources of YARA rules, and it also consumes additional meta keys that are specific to Malware Analysis. Each YARA rule is equivalent to an Indicator of Compromise (IOC) within Malware Analysis. The example below illustrates the meta definitions in a rule:

```
meta:
 iocName = "FW.ecodedGenericCLSID"
        fileType = "WINDOWS_PE"
        score = 25
        ceiling = 100
        highConfidence = false
```

Meta Key	Description
iocName	(Required) This is the name that MA uses as the rule name. It is specific to Malware Analysis and is required to add the rule to the IOC list.
fileType	Specifies the files type. Possible values are: WINDOWS_PE, MS_OFFICE, and PDF. If not specified, the default value is WINDOWS_PE.

Meta Key	Description
score	This value that is added to the static score if the YARA rule is triggered. If not specified, the default value is 10.
ceiling	This is the maximum amount that is added to the static scores when a rule is triggered multiple times in one session. For example, if each time a rule is triggered, 20 points are added to the static, and you do not want more that 40 points added when the rule is triggered more than two times, you can specify a ceiling of 40. If not specified, the default value is 100.
highConfidence	This sets the High Confidence flag, which is set on IOCs when there are high confidence indicators that malware is present. If not specified, the default file value is false.

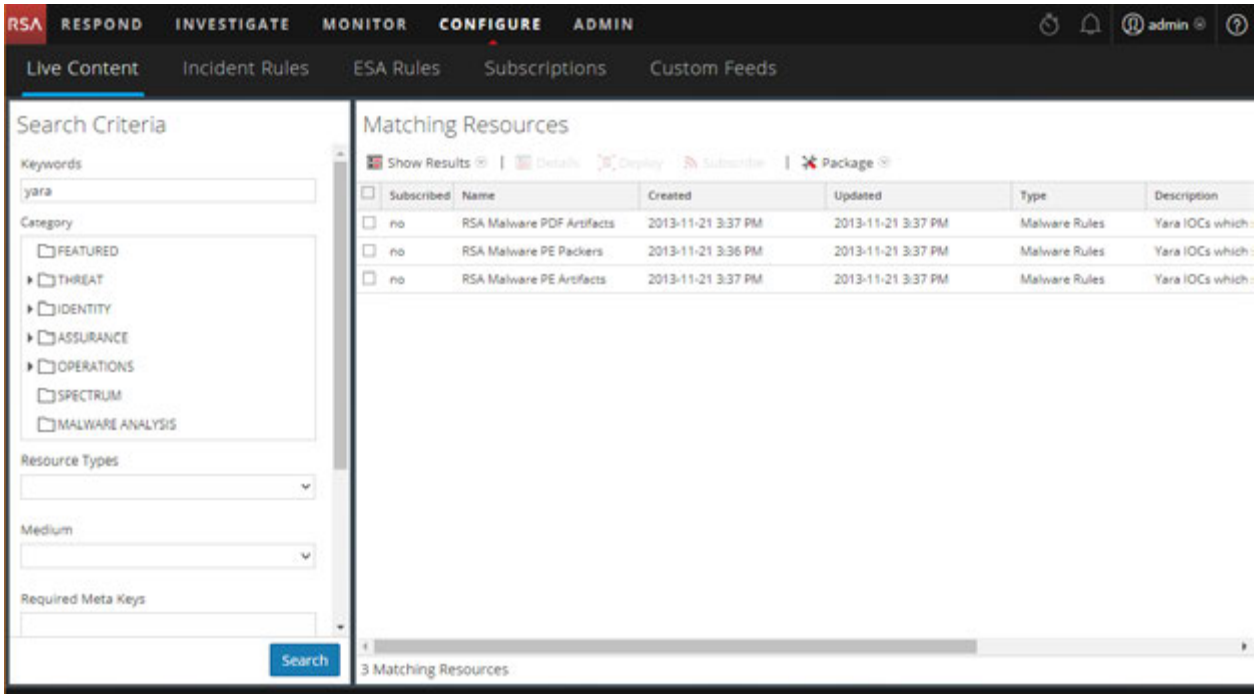
Note: Refer to the following URL for YARA resources: https://code.google.com/p/yara-project/downloads/list. NetWitness Platform uses YARA 1.7, not YARA 2.0.

YARA Content

RSA Live contains 3 sets of Yara rules:

- PE Packers
- PDF Artifacts
- PE Artifacts

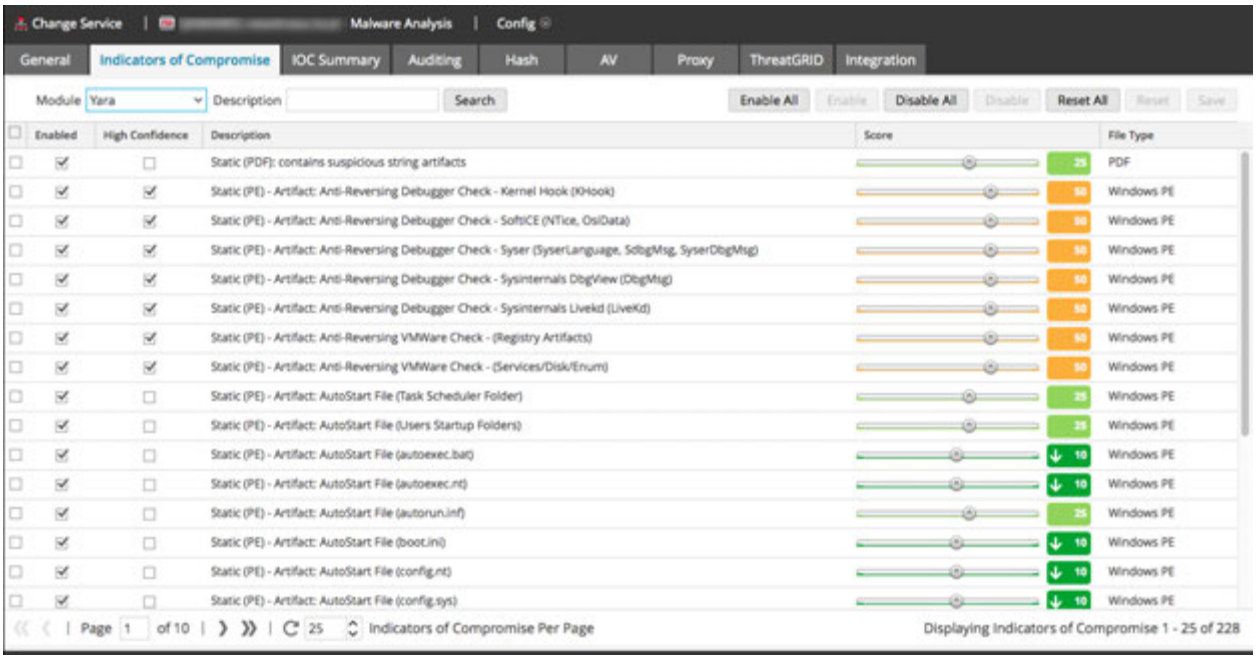
The following figure illustrates YARA content available as YARA rules in NetWitness Platform Live.



On the Malware Analysis host, the YARA rules reside in `/var/lib/netwitness/malware-analytics-server/spectrum/yara`, as shown in the example below.

```
[root@TESTHOST yara]# pwd
 /var/lib/netwitness/malware-analytics-server/spectrum/yara
 [root@TESTHOST yara]# ls *.yara
 rsa_mw_pdf_artifacts.yara rsa_mw_pe_artifacts.yara rsa_mw_pe_packers.yara
```

The individual rules are listed as IOCs in the Malware Analysis Service Config view > Indicators of Compromise tab. To view them, use the Yara module as the filter. You can adjust the configuration of an individual in the same way that you configure other IOCs.



Add Custom YARA Rules

To introduce custom YARA rules from other sources:

1. To ensure that the YARA rules follows the correct format and syntax, use the YARA command to compile the YARA rule as shown in the following example. If the rule compiles with no errors, this indicates that the YARA rule has the correct syntax.

   ```
   [root@TESTHOST yara]# yara rsa_mw_pe_packers.yara dummy.txt
    [root@TESTHOST yara]#
   ```

2. Ensure that custom rules do not duplicate existing YARA rules from RSA or other sources. All YARA rules are in `/var/lib/netwitness/malware-analytics-server/spectrum/yara`

3. Ensure that the meta keys that RSA supports are included to organize the YARA rules as part of the configurable IOCs, and name the file with the yara extension (<filename>.yara). For better organization, make sure that the `iocName` meta is included in the meta section as shown in the following example.

   Example:

   ```
   rule HEX_EXAMPLE
   ```

```
{
    meta:
        author = "RSA"
        info = "HEX Detection"
       iocName = "Hex Example"
     strings:
        $hex1 = { E2 34 A1 C8 23 FB }
        $wide_string = "Ausov" wide ascii
     condition:
        $hex1 or $wide_string
}
```

4. When ready, place the custom YARA file in the folder that the Malware Analysis service watches:
   `/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`
   The file is consumed within one minute.
   Once consumed, NetWitness Platform moves the file to the `processed` folder, and the new rule is added to the Malware Analysis Services Config view > Indicators of Compromise tab.

Examine Scan Files and Events in List Form

When viewing the Summary of Events in a Malware Analysis scan, you can click a file count or an event count to view the Files List or the Events List for the scan (see Begin a Malware Analysis Investigation). In the Files List and Events List, you can search for a file by filename or MD5 file hash, sort the list using two criteria and ascending or descending order, and download files. When you find an event or file of interest in the Events List or Files List, you can view many details about the event in the Event Details view.

For each event in the Events List, NetWitness Platform provides the following information:

- Flagged as a High Confidence event, which is considered likely to contain Indicators of Compromise.
- The numeric score for each scoring module: Static, Network, Community, and Sandbox.
- Antivirus vendor scores.
- The Influenced by customized rule flag.
- The date the event was archived.
- The session time.
- The MD5 hash filter.
- The number of files in the event.
- The source IP address of the event.
- The Identity.
- The destination IP address.
- The destination country.
- The name of the alias host.
- The event type, for example, Network.
- The service used by the event.
- The destination organization

For each file in the Files List, NetWitness Platform provides the following information:

- Flagged as a High Confidence event, which is considered likely to contain Indicators of Compromise.
- The numeric score for each scoring module: Static, Network, Community, and Sandbox.
- Antivirus vendor scores.
- The filename.
- The file type.
- The MD5 hash filter.
- The source IP address of the event that contained the file.

- The destination IP address.
- The date the event that contained the file was archived.
- The file size.

Sort the Files List or Events List

You can sort the Files List and Events List by column name in ascending and descending order. You can choose one or two columns.

To sort the list:

1. In the first **Sort By** drop-down list, choose a column name and sort direction:  for descending order or  for ascending order.
2. (Optional) In the second **Sort By** drop-down list, choose a column name, and sort direction,  for descending order or  for ascending order.
   The column titles reflect the selected sort order.

Filter the List by Filename or MD5 File Hash

You can filter the Files List and Events List by filename or file hash. With this feature, you can specify a limited subset of the original data based on the search criteria.

Note: When you perform a search, you search the scan that you are currently displaying, not all scans.

1. Click 
   .
   The Filter dialog is displayed.
2. Enter a value in **File Name** or **MD5 Hash** and click **Filter**. The File Name and Hash field are not case sensitive. Wild card or regular expressions are not supported. The filter is based on exact matches. You can drag across a filename or hash to select from the Files list or Events list, then copy and paste it in the dialog.
3. Click **Filter**.
   Malware Analysis filters the list to display only files or events with the selected hash
4. To revert to the unfiltered list, click 
   . When the Filter dialog is displayed, click **Reset**.

Download Files from the Files List

NetWitness Platform lets you select and download files from the Files List or the Events List.

Caution: Use caution when downloading files from Malware Analysis; some files may contain harmful code. File Download is a specific permission that can be configured, refer to "Define Roles and Permissions for Malware Analysts" in the *Malware Analysis Configuration Guide* for more details.

To download files from the Files List or Events List:

1. In the **Files List** or **Events List**, select the checkbox next to one or more rows.
2. In the toolbar, select 
.
   The Malware File Download dialog is displayed.
3. Do one of the following:
   a. If you decide not to download the file, click **Cancel**.
   b. If you want to download the file, select click the **Download** button.
      The file or files selected are downloaded in a zip archive with the name `Malware_Files.zip`.

Delete Events from the Scan

In the Events List, you select one or more events and delete them from the scan. This is useful for removing events that are not of interest.

To remove an event from the scan being viewed:

1. In the **Events List**, select one or more events.
2. In the toolbar, click 

.
   NetWitness Platform asks for confirmation that you want to delete the events.
3. In the confirmation dialog, click **Yes**.
   The selected events are deleted.

Return to the Summary of Events

To leave the Files List or Events List and return to the Summary of Events, click **Back to Summary**.

Open the Detailed Analysis for an Event

While you examine events or files in the Files List or Events List, you can double-click any event or file to open a detailed analysis of the event in the Events List or the event with which the file in the Files List is associated (see View Detailed Malware Analysis of an Event).

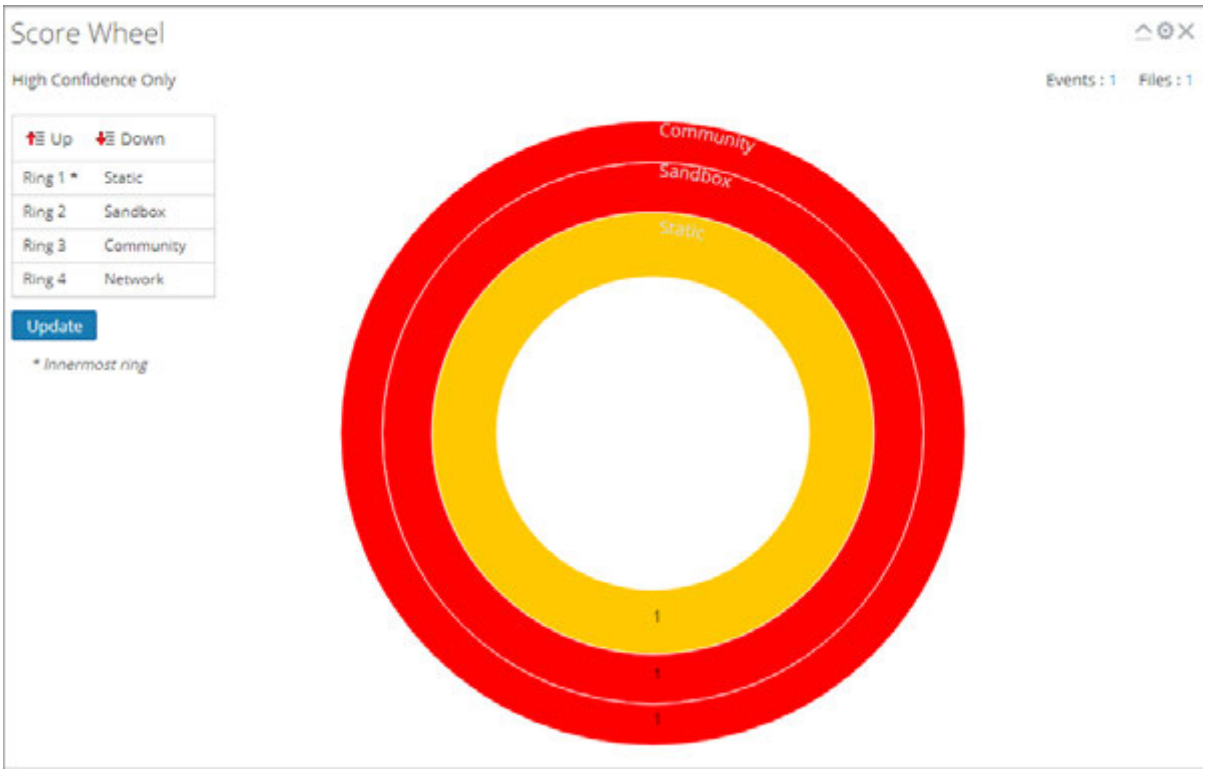
Filter Dashlet Data in the Summary of Events View

The Summary of Events provides a summary of the scan being investigated with selectable dashlets. The Summary of Events is fixed, but Analysts can configure each dashlet to filter out information and drill into the data.

The rest of this topic provides instructions for managing and configuring dashlets.

Configure the Score Wheel Dashlet

The Score Wheel is a high-level visualization of analyzed sessions that scored high, medium, or low in each of the scoring categories: Static, Network, Community, and Sandbox. The Score Wheel is a quick way to drill into sessions to review them. Each ring represents a different scoring category so that you can visually compare results by category.



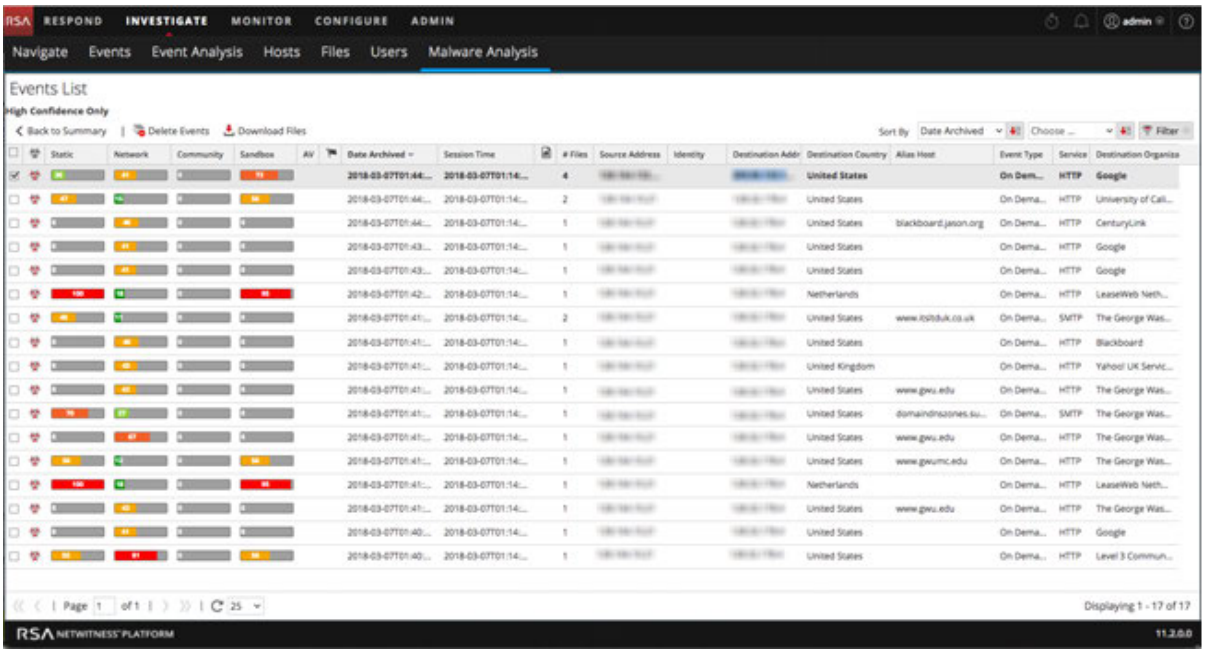
You can change the order of the rings to highlight indicators of compromise that were flagged in one category but not in another category. Comparing the same results in a different sequence of the rings provides visibility into additional vulnerabilities in a session, and you can drill into sessions of interest. The following examples show two possible use cases.

Zero-Day Candidates Example

This example shows how to drill into sessions that the Community did not flag as malicious, but all other scoring categories did. The resulting list of sessions highlights zero-day candidates.

1. Configure the Score Wheel rings in the following sequence:
   Community (innermost) > **Static** > **Network** > **Sandbox** (outermost)

2. Click the red slice in the outermost (Sandbox) ring that aligns with a green slice on the innermost ring (Community): green (innermost) -> **Static**: red -> **Network**: red -> **Sandbox**: red (outermost).



Malicious Sessions Example

This example shows how to drill into sessions in which all scoring categories identify the resulting list of sessions as malicious, indicating Malware Analysis has the most confidence that they are malware.

1. Configure the Score Wheel rings in the following sequence:
   Community (innermost) > **Static** > **Network** > **Sandbox** (outermost)
2. Click the red slice of the outermost (Sandbox) ring that aligns within a red slice on the innermost ring (Community): red (innermost) -> Static: red -> Network: red -> Sandbox: red (outermost).

Arrange the Ring Sequence by Scoring Module

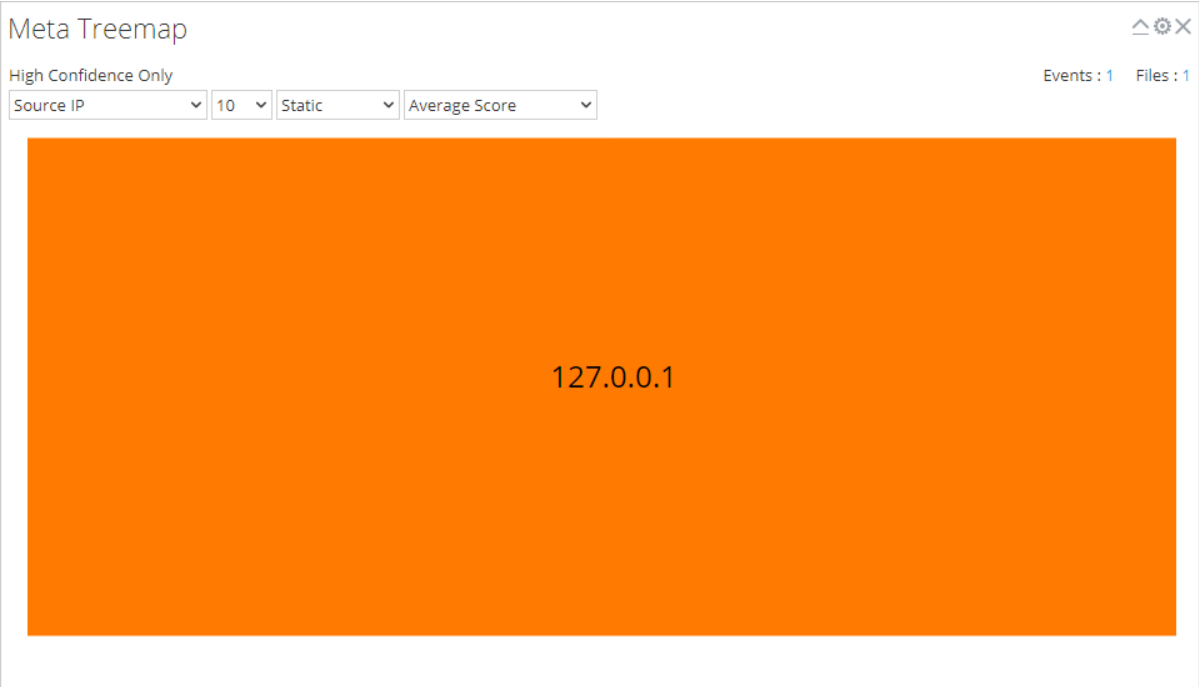
In the Score Wheel, you can arrange the sequence of the rings by scoring module. Initially, the sequence of rings from inside to outside is Static, Network, Community, and Sandbox.

To change the ring sequence:

1. Do one of the following:
   a. Click and drag each scoring module up or down.
   b. Select each scoring module and use the Up and Down buttons to move it.
2. When the ring sequence is the way you want it, click the **Update** button.
   The Score Wheel is refreshed with the new sequence.

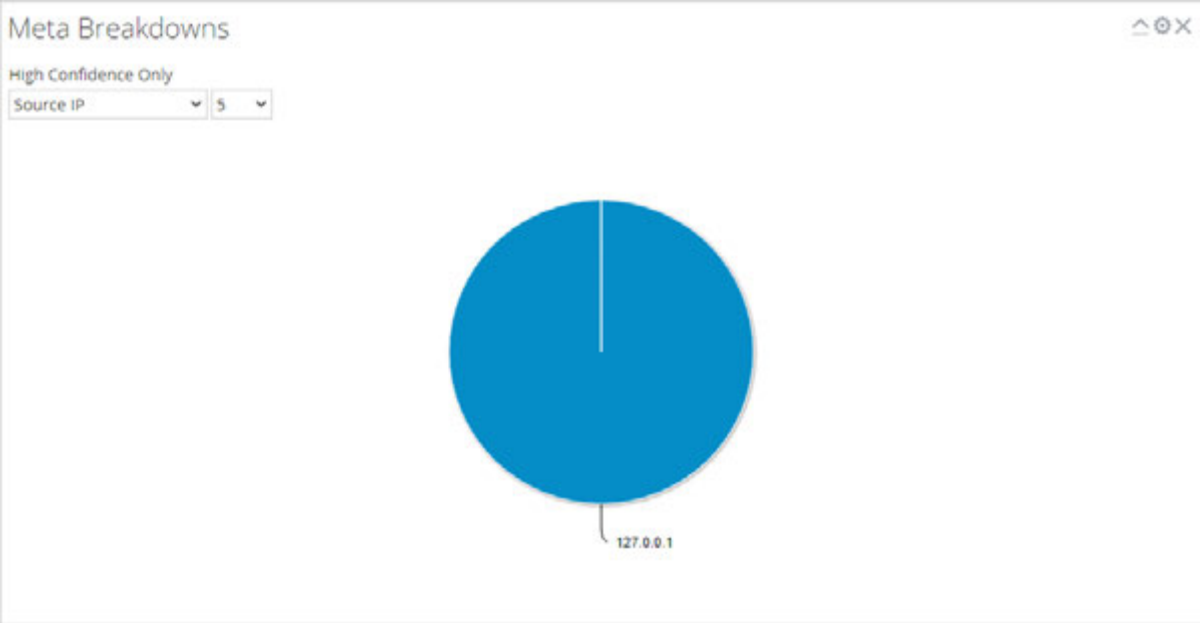
Configure the Meta Treemap Dashlet

In the Meta Treemap chart, you can visualize and filter meta breakdowns by meta type, count, and analysis type. Use the three selection lists to set the filter, and the Meta Treemap chart is refreshed immediately.



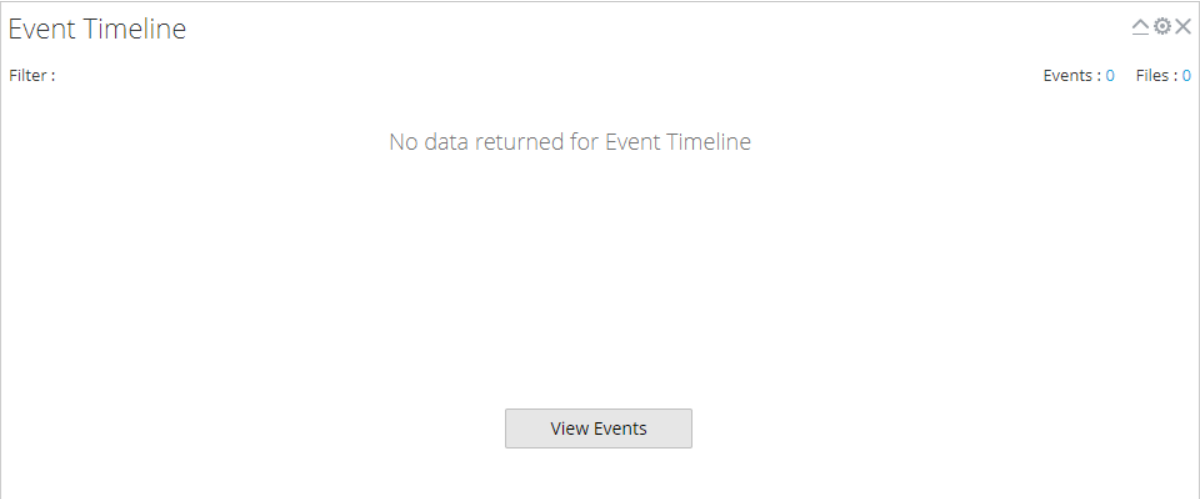
Configure the Meta Breakdowns Dashlet

The Meta Breakdowns dashlet is a visualization of values for a specific meta key in a pie chart. In the Meta Breakdowns chart, you can filter meta breakdowns by meta type and count. Use the two selection lists to set the filter, and the Meta Breakdowns chart is refreshed immediately.



Configure the Events Timeline Dashlet

The Events Timeline dashlet is a visualization of the events along a timeline. No additional filters are available for the Event Timeline.

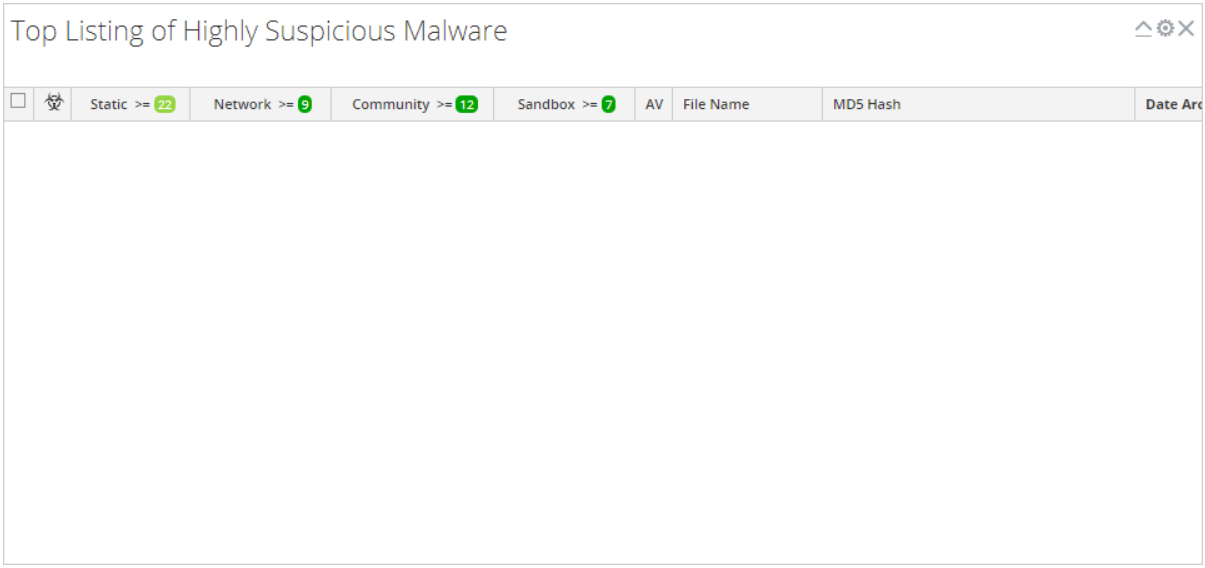


Open All Events in the Events List

From within the Event Timeline, you can open the entire list of events in the Events List. To do so, click **View Events**. This option is not the same as clicking the count next to Events, which is the same for all visualization charts and opens the current drill point in the Events List.

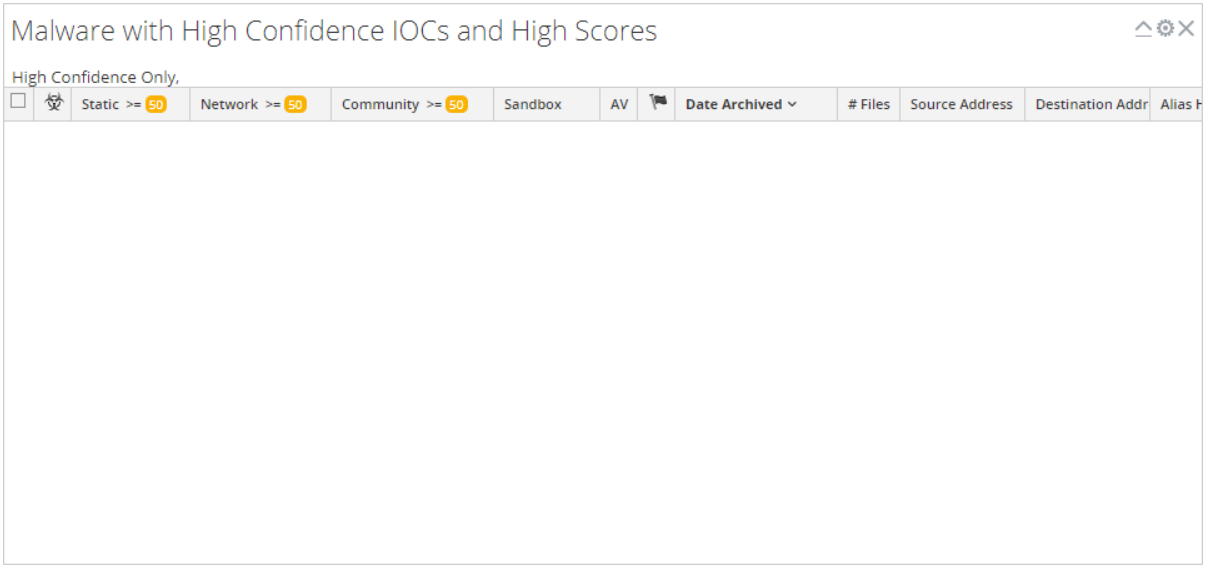
Configure the Top Listing of Highly Suspicious Malware Dashlet

The Top Listing of Highly Suspicious Malware Dashlet presents the Top 10 most suspicious events in the Events List or the Files List. This dashlet is also available in the Monitor dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets.



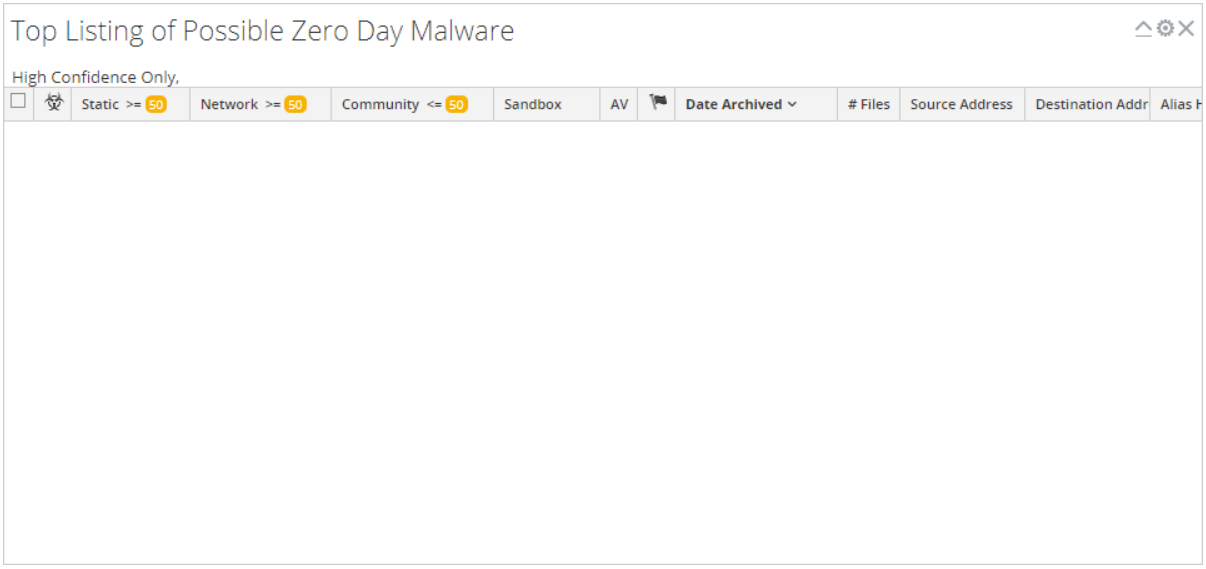
Configure the Malware with High Confidence IOCs and High Scores Dashlet

The Malware with High Confidence IOCs and High Scores dashlet presents Indicators of Compromise that have both high scores and high confidence that the events are likely to contain malware. The dashlet is also available in the Unified dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets..



Configure the Top Listing of Possible Zero Day Malware Dashlet

The Top Listing of Possible Zero Day Malware dashlet presents potential zero day events in the Events List or the Files List. The dashlet is also available in the Unified dashboard, and the configuration options are described as part of the RSA NetWitness Content in Dashlets.



Upload Files for Malware Analysis Scanning

There are two methods for analysts to upload files for Malware Analysis scanning.

A Malware Analyst with permission to Initiate Malware Analysis Scan can upload files to scan using the Scan Files option in the Select a Malware Analysis Service dialog.

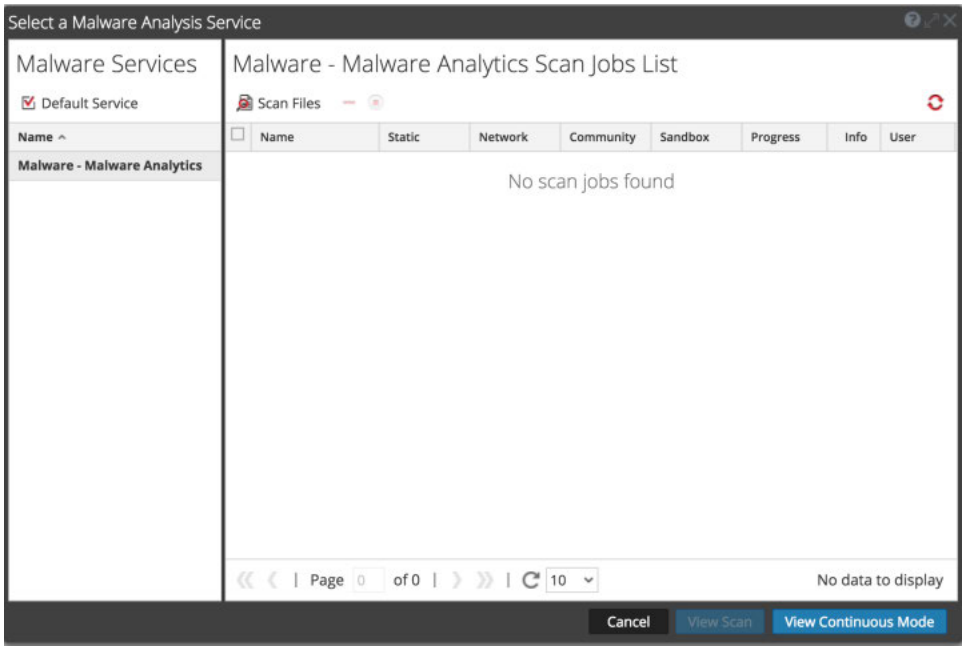
It is also possible to upload a file for scanning using a watched file share.

Upload Files Manually

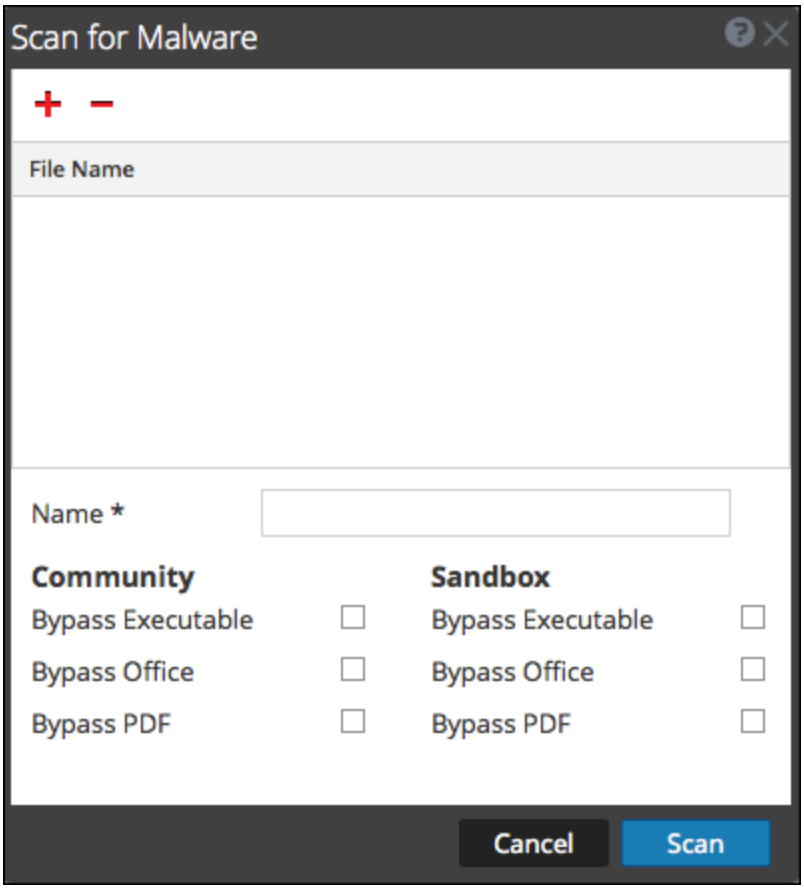
This topic provides instructions for initiating on-demand scanning of an uploaded file. When you upload a file for scanning, NetWitness Platform starts the upload job and adds it to the jobs queue. When the job is complete, you can view the scan in Malware Analysis.

To upload a file to scan:

1. Go to **INVESTIGATE > Malware Analysis**.
   The Select a Malware Analysis Service dialog is displayed, with available Malware Analysis hosts and services for the current user in the left panel.



2. Click **View Scan**.
   The Scan for Malware dialog is displayed.



3. Click +
   A view of the files system is displayed so that you can choose files to upload.
4. Select one or more files from the list and click **Open**.
   The file names are added. Malware Analysis escapes the filename characters before processing a file. The maximum number of filename characters after escaping is 200. If the filename is greater than 200 characters, Malware Analysis truncates the filename characters and displays the truncated filename in the NetWitness Platform user interface.
5. Continue adding and deleting files until you have a list of the files that you want to upload.
6. Name the scan and select the types of files to bypass. This is useful for a zip archive that contains different types of files, and overrides the default bypass settings.
7. Click **Scan**.
   The scan job is submitted and NetWitness Platform displays a confirmation message for successful submission. The scan request is added to the Scan Jobs List dashlet. The bypass settings in this dialog override the default settings in the basic Malware Analysis configuration settings.
8. The job is added to the Scan Jobs List in the Select a Malware Analysis Service dialog and in the Unified dashboard Scan Jobs List dashlet.
9. To view the scan when complete, double-click the scan.
   The Malware Summary of Events for the selected scan is displayed.

Upload Files from a Watched Folder

To upload files from a watched folder, you can drop files into a watched file share for Malware Analysis. Analysts can share YARA rules, hash files, and infected zip archives with Malware Analysis.

Malware Analysis watches a file share and automatically consumes files placed in specific folders in the file share. This feature is useful for:

- Bulk import of hash files from `/var/lib/rsamalware/spectrum/hashWatch`.
- Addition of custom-YARA rules to the Indicators of Compromise (IOC) list on the host from `/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`.
- Creation of on-demand scan jobs from a zip archive of infected zip files from `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`.

Analysts need to prepare the files for consumption in accordance with requirements, the file extension must be correct, and the file must be copied to the correct watched folder in the file share.

Import a Hash List

To import a hash list from the watched directory, the hash list must be in the specified format and must be sorted on md5. You can drop a file formatted into a folder (`/var/lib/rsamalware/spectrum/hashWatch`) on the Malware Analysis host, and it is automatically imported into the local hash database. This is described in "Configure Hash Filter" in the *Malware Analysis Configuration Guide*.

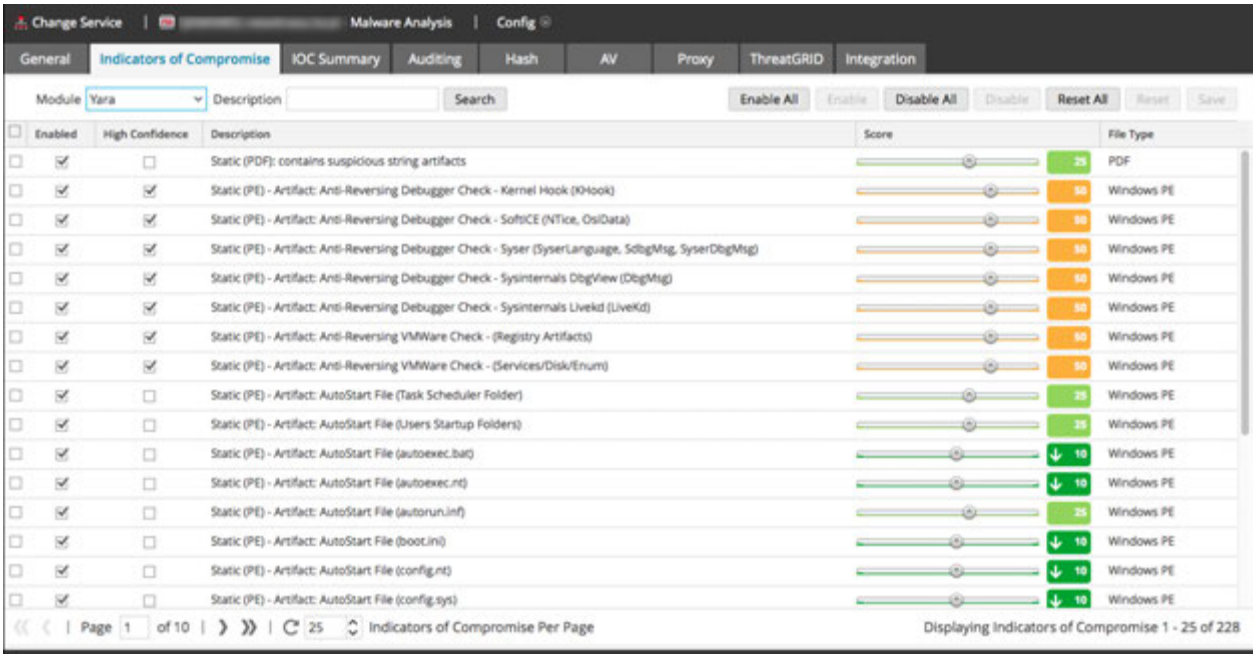
To import a hash list using the watched folder method:

1. Copy the hash lists that you want to import into the **`/var/lib/rsamalware/spectrum/hashWatch`** directory.
   NetWitness Platform Malware Analysis automatically watches this folder and processes files placed there.
   a. Malware Analysis adds every hash found in the hash lists to the hash filter.
   b. If there are processing errors, they are logged in: `/var/lib/rsamalware/spectrum/hashWatch/error`
   c. Processed files are cataloged here: `/var/lib/rsamalware/spectrum/hashWatch/processed`
   d. Processed files are not removed from the hashWatch directory.
2. After importing hashes in bulk, the System Administrator can use a cronjob to clean up old processed files.

Import YARA rules to the IOC List

Customers with advanced skills and knowledge can add detection capabilities to RSA Malware Analysis by authoring YARA rules and publishing them in RSA Live or placing YARA rules in a watched folder for the host to consume. Implement Custom YARA Contentprovides complete information on the prerequisites for using custom YARA content and authoring rules.

When the rules are ready, place the custom YARA files in the folder that the Malware Analysis service watches:
`/var/lib/netwitness/malware-analytics-server/spectrum/yara/watch`
The file is consumed within one minute.
Once consumed, NetWitness Platform moves the file to the `processed` folder, and the new rule is added to the Malware Analysis Service Config view > Indicators of Compromise tab.



Import Files into the Scan Jobs List

When you obtain samples from perimeter security solutions and would like to perform further analysis on the files, you can zip the files and password protect the archive with `infected`, then add to the watched folder for consumption by Malware Analysis. This zipped archive is ready to be placed in the watched folder: `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`.

Note: The maximum size of the archive is 100 MB.

To analyze infected, password-protected zip files, Malware Analysis consumes archives place in a watched folder and creates an on-demand job that is added to the Scan Jobs List.

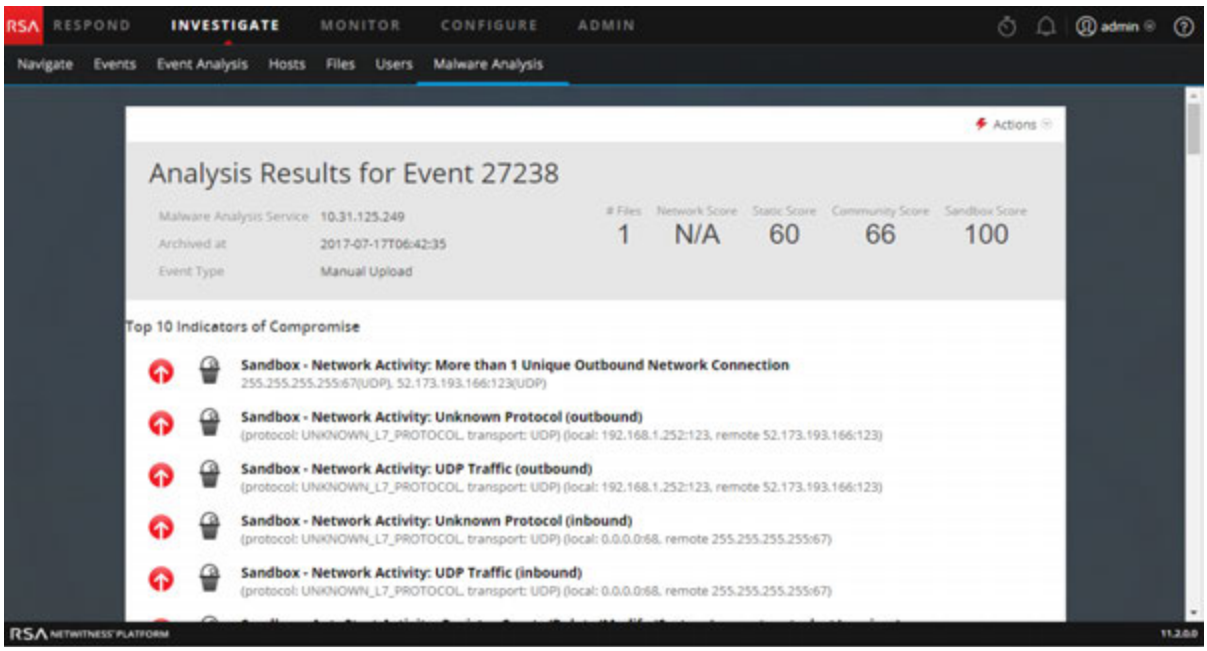
1. While logged on as administrator, place the files to be processed in a zip file with password `infected` at `/var/lib/rsamalware/spectrum/infectedZipWatch/watch`
   In a minute or two Malware Analysis consumes the archive and creates an on-demand job in the Scan Jobs List. The scan job name is the name of the file, the user is **file share**, and the Event Type is 1. The archive is moved to `/var/lib/rsamalware/spectrum/infectedZipWatch/processed`
2. After the job is added to the Scan Job List, run a script or cronjob to clean up the zip file in `/var/lib/rsamalware/spectrum/infectedZipWatch/processed`.

View Detailed Malware Analysis of an Event

When viewing the list of individual events in a Malware Analysis scan in the Malware Analysis Events grid, you can double-click an event to view the detailed analysis results for the event.

View Malware Analysis Details for an Event

1. Start an investigation in the **Malware Analysis** tab.
   The Malware Summary of Events is displayed, and includes four charts, including the Event Timeline.
2. Do one of the following:
   a. To view all events in the Event Timeline, click the **View Events** button.
   b. Double-click data in the **Meta Breakdown**, **Meta Treemap Chart**, or **Score Wheel**.
   The Events List is displayed.
3. Double-click an event.
   The Analysis Results for the event are displayed.

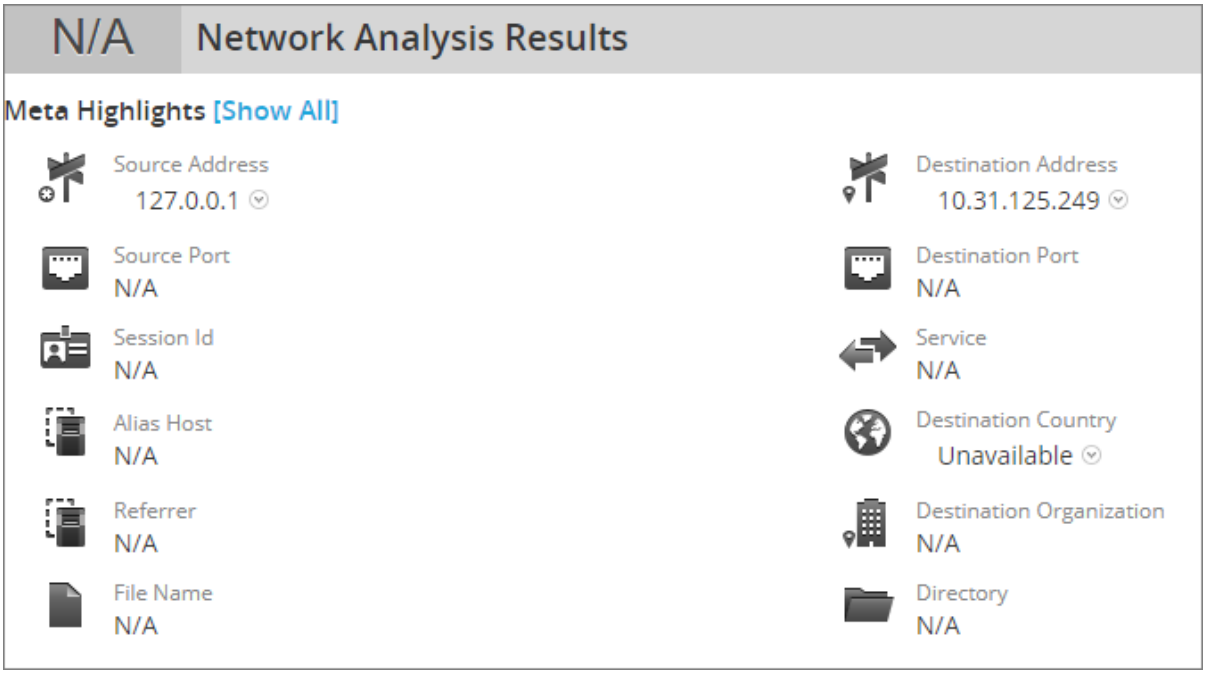


4. (Optional) If you want to delete an event, select **Actions > Delete Event**.
5. If you want to view a reconstruction of the network session, select **Actions > View Network Session**.
   The session opens in the Navigate view > Event Reconstruction.

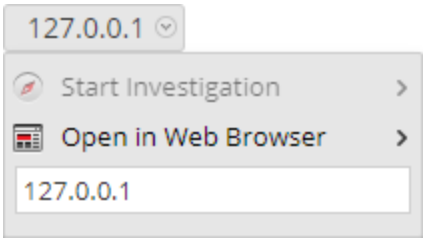
Pivot Network Analysis Results

You can pivot the Network Analysis Results in several ways:

1. Scroll down to the Network Analysis Results.



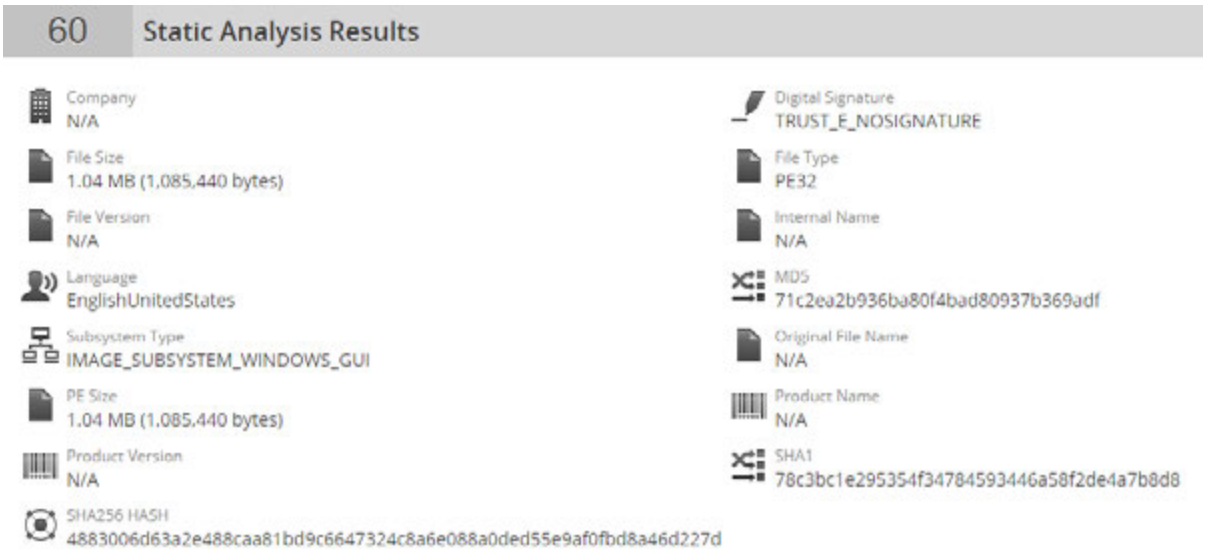
2. Hover over a meta value and left-click.
   The context menu is displayed.



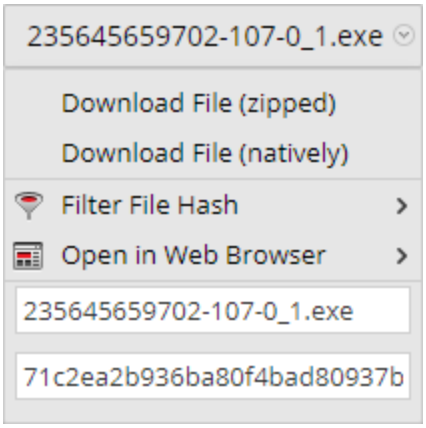
3. To view the selected meta value in the **Navigate** view, select **Start Investigation** and a time option.
4. To view the selected meta value in a browser, select **Open in Web Browser > Open in Google**.

Use File Actions in the Static Analysis Results

1. Scroll down to the Static Analysis Results.



2. If you want to download a file, select the file name and either **Download File (zipped)** or **Download File (natively)** in the drop-down menu. It is safer to download a file in zipped format.



3. If you want to mark the file as safe or unsafe in the hash list, select **Filter File Hash** and **Mark hash as good** or **Mark hash as bad**.

View Community Analysis Results Details

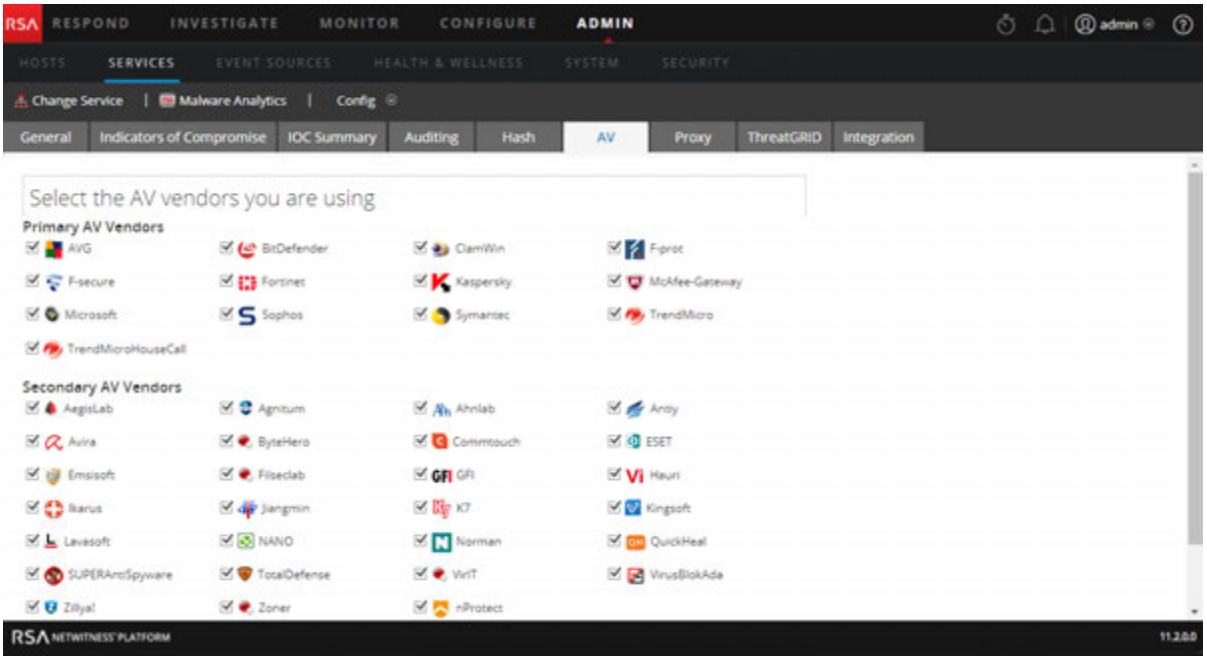
The Community Analysis Results summarizes results from the community, identifying Indicators of Compromise that were flagged as a risk or identified as good.

In addition, this view lists the results from Installed AV Vendors and Not Installed AV Vendors. You can compare results of the installed AV vendors that were configured for the current Malware Analysis service versus Community results. You can also see results from a list of AV vendors that are not configured as installed for the current Malware Analysis service.

Each row of AV vendor results includes the shield icon to show whether the IOC was discovered by a Primary ( ) or Secondary AV ( ) vendor in the community, the name of the Installed or Not Installed vendor, and the name of malware or risk detected by the community and AV vendor. If the AV vendor did not detect a risk, **-- Not detected --** is displayed instead of the name of the risk.

The Not Installed AV Vendors section is expandable to view all entries, but is collapsed by default to minimize the need to scroll. Clicking the + expands the list.

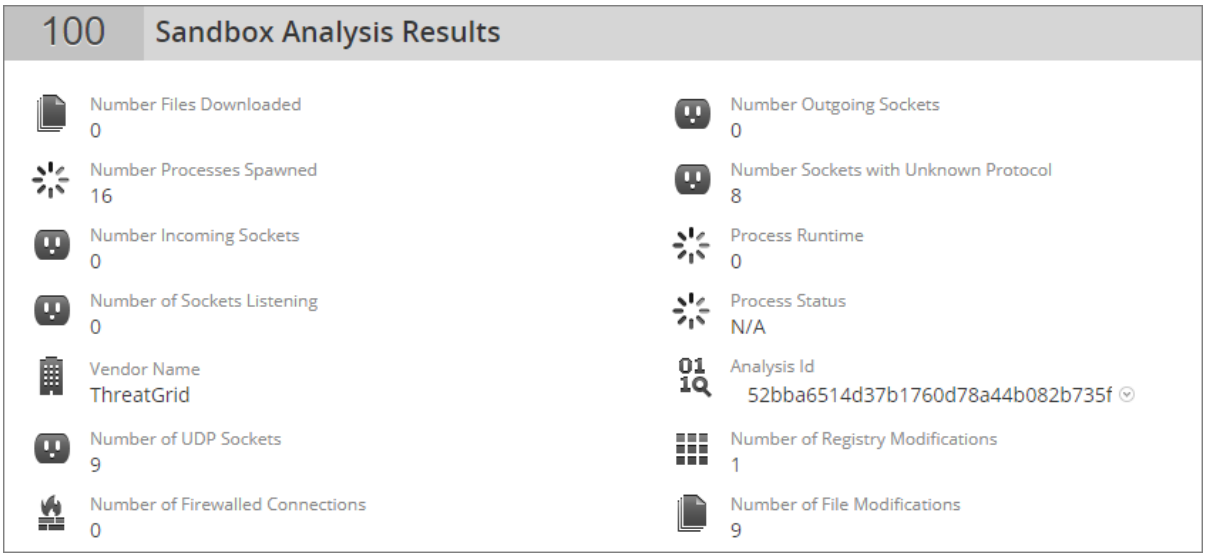
If no installed AV vendors have been configured for the current Malware Analysis service, the following message is displayed: No AV vendors were marked as installed. Please go to the Malware Analysis Service configuration page to identify installed AV vendors.



View Sandbox Analysis Results in the ThreatGrid User Interface

If you have registered with ThreatGrid, you can view the Sandbox results directly in ThreatGrid.

1. Scroll down to the Sandbox Analysis Results.



2. Click the **Analysis ID** and select **Open In ThreatGrid**.
   The analysis report in ThreatGrid is displayed.

Troubleshooting NetWitness Investigate

This section provides information about possible issues when using NetWitness Investigate.

Navigate View and Events View Issues

Message	`Not indexed; will experience longer than usual load times.` in the Manage Meta Groups dialog.
Issue	Meta keys in the Manage Meta Groups dialog are marked by a red exclamation point, and the error message is displayed. This can occur when investigating a Broker or Decoder and adding a meta group with meta keys that are not indexed in the index file or the custom index file for the service. For a Broker, it could mean that the Broker has not begun aggregating data from a Concentrator. In this case the Broker will not have the contents of the custom index file from the aggregate services and the keys will not be indexed. For a Decoder, it means that the meta keys are not indexed in the Decoder index or custom index file.
Explanation	To fix the issue on a Broker, log out, log in, and restart the Broker service so that it can aggregate the meta key information from connected Concentrators. To fix the issue on a Decoder, edit the custom index file to index the meta keys, log out, log in, and restart the Decoder service.

Behavior	When downloaded from the Event Reconstruction view, logs and metadata are always in text format irrespective of the format selected in the Events view.
Issue	When you download metadata or a log in the Event Reconstruction view, the format that you selected in the Events view is not used. The exported data is always in text format.
Explanation	Download metadata and logs from the Events view if you want to use a format other than text format.

Event Analysis View Issues

Behavior	The query builder in Version 11.2 includes Next Gen Mode, an undocumented beta feature.
Issue	Version 11.2 included an undocumented beta feature, called Next Gen mode, in the Event Analysis view query builder that was still being developed and tested. Next Gen mode was disabled in the 11.2.0.1 patch.
Explanation	If you see Next Gen mode do not use it; you should use only the Guided Mode and Free-Form Mode in the query builder to ensure consistent and predictable results.

Message	`Investigation Profiles/OOTB column groups are not present in Event Analysis`
Issue	Post upgrade to RSA NetWitness v11.1, the default column groups - Endpoint Analysis, Outbound SSL and Outbound Http are not added under column groups. Also, a few of the Investigation Profiles are missing post upgrade.
Explanation	It is observed that this issue occurs only when you have created a custom column group with the name which is same as one of the new 11.1 OOTB custom column group name. For example, if you create a custom column group in 11.0 with name **RSA Endpoint Analysis** then after upgrade to 11.1. Due to the same name already existing in 11.1, OOTB column groups and OOTB profiles will not be available in the UI. To fix this, change the name of custom column group to something else and restart the jetty server using the following command on the NetWitness server: `systemctl restart jetty`

Message	`Applicable for hosts with 4.x Endpoint agents installed, please install the NetWitness Endpoint Thick Client.`
Issue	When you click **Pivot to Endpoint** in the Event Analysis view, no data is displayed and the message is displayed.
Explanation	Version 4.4 of the NetWitness Endpoint Thick Client must be installed on the same server, the NWE meta keys must exist in the `table-map.xml` file on the Log Decoder, and the NWE meta keys must exist in the `index-concentrator-custom.xml` file. The NWE Thick Client is a Windows only application. Complete setup instructions are provided in the *NetWitness Endpoint User Guide* for Version 4.4.

Message	`Event Analysis requires all core services to be NetWitness 11.1. Connecting prior versions of services to the 11.1 NetWitness Server results in limited functionality (see "Investigate in Mixed Mode" in the Physical Host Upgrade Guide).`
Issue	When attempting to investigate a service that has not been updated to Version 11.1 in the Event Analysis view, the informational message is displayed.
Explanation	When an analyst opens the Event Analysis view in mixed mode (that is, some services are upgraded to 11.1 and some are still on 11.0.0.x or 10.6.x), Role-Based Access (RBAC) is not applied uniformly. This affects viewing and downloading content, and validation of filters in the interactive breadcrumb. You will see this informational message when you open Event Analysis. As you select a service, services that are not up to date are displayed in a red box, with the message that the service is not up to date. When your administrator has upgraded all connected services to 11.1, these features work as expected.

Message	`Forbidden. You cannot access the requested page.`
Issue	When attempting to access the Event Analysis view, the view opens with the message.
Explanation	Your administrator has prevented access to the Event Analysis view using role and permissions.

Message	`Insufficient permissions for the requested data.`
Issue	While attempting to access an event in Event Analysis by any means, the reconstruction is not displayed and the message is displayed.
Explanation	You have entered an event ID for an event that you do not have permission to view. The administrator may have placed some restrictions to limit access by role and permissions.

Message	`Invalid session ID: <<eventId>>`
Issue	No `sessionId` matches the `sessionId` that you queried.
Explanation	The reason for an invalid session ID can vary. Perhaps you edited the session ID manually, and no such session exists. Another case may be when you query a Broker, and the aggregated data has not been refreshed, you may see this error for a session that no longer exists.

Message	`No text data was generated during content reconstruction. This could mean that the event data was corrupt/invalid, or that an administrator has disabled the transmission of raw endpoint events in the Endpoint server configuration. Check the other reconstruction views.`
Issue	When you reconstruct an event as text in the Event Analysis view, no data is displayed and the message is displayed.
Explanation	If you do not see the raw text in other Event Analysis views or Events view reconstructions, and you believe the data is not corrupted or invalid, your administrator has likely disabled transmission of raw endpoint events on the NetWitness Endpoint server. Contact your administrator for additional information.

Message	`Session is unavailable for viewing.`
Issue	While querying an event ID, the reconstruction is not displayed and the message is displayed.
Explanation	The query you entered is trying to look at restricted data, for example, if you are allowed to see only log data and you are using a link to network data that you were allowed to see yesterday.

Message	`The session id is too large to be handled:<<eventId>`
Issue	The sessionId integer that you typed in, edited, or got from the Events view or Navigate view is too large.
Explanation	If you manually typed the sessionId or edited a sessionId in the Event Analysis view, you may have created an integer that is too large for Event Analysis to process.

Behavior	While creating a filter in the Event Analysis view, you cannot enter a complex expression using the `AND` or `OR` operator in Query Builder.
Issue	The query builder in the Event Analysis view supports only simple expressions in the form `<meta key><operator><meta value>`.
Explanation	If you want to enter a filter that uses the `AND` or `OR` operator, you need to enter the query it from the Navigate view or Events view and then open it in the Event Analysis view. You can enter some complex expressions as two separate filters in the Event Analysis view. The filters will be AND'd when you execute the query.

Hosts View Issues

Message	`An error has occurred. The Endpoint Server may be offline or inaccessible.`
Issue	When attempting to access the Hosts or Files view, the view opens with the message.
Explanation	Endpoint Server or Nginx Server is not running. Check the status of the Endpoint Server under **Admin** > **Service** or check if the Endpoint Server host IP address is registered with the Admin Server. For more information, see the *Physical Host Installation Guide* or *Virtual Host Installation Guide*. If the service is not running, start the Endpoint Server.

Issue	The Hosts and Files views do not load in the Safari browser.
Explanation	When you open the Ember pages in the Safari browser with a non-trusted SSL certificate, the Hosts and Files views do not load. To load the views. 1. Click the **Show Certificate** pop-up menu. 2. Enable the **Always trust NetWitness when connecting to <IP Address>** checkbox. 3. Click **Continue**. 4. Enter your username and password. 5. Click **Update Settings**.

Message	`No process information was found.`
Issue	When attempting to access the Process or Libraries tab in the Host Details view, the

Explanation	detailed host information is not available, and the view opens with the message.
	Scan data is not available due to any of the following reasons: • First time scan is not complete • Data retention policy has deleted all scan snapshots

Files View Issues

Behavior	Meta values are taking time to load.
Issue	Meta values are not set to index by values.
Explanation	During investigation, while pivoting to the Navigate or Event Analysis view from the Files view, if the filename or hash (SHA256 and MD5) are not set to index by values, the matching results take time to load as the Concentrator must generate the index by accessing the meta database and retrieving value of the meta for each event. You have to manually index the values before pivoting.

Issue	Filtering files takes a longer time to load results in the user interface.
Explanation	In the Files view, while filtering files with the `Contains` operator, the results take a few seconds to load in the user interface. You must use at least one indexed field with the `Equals` operator while filtering the files.

Investigate Reference Materials

This section is intended to help you understand the purpose and application of NetWitness Investigate views. For each view, there is a brief introduction and a What Do You Want To Do table with links to related procedures. In addition some of the reference materials include workflows and Quick Looks to highlight important features in the user interface.

These are the main views:

- Investigate View
- Navigate View
- Events View
- Event Analysis View
- Files View
- Hosts View
- Malware Analysis View

This is an alphabetical list of the other view, panels, and dialogs.

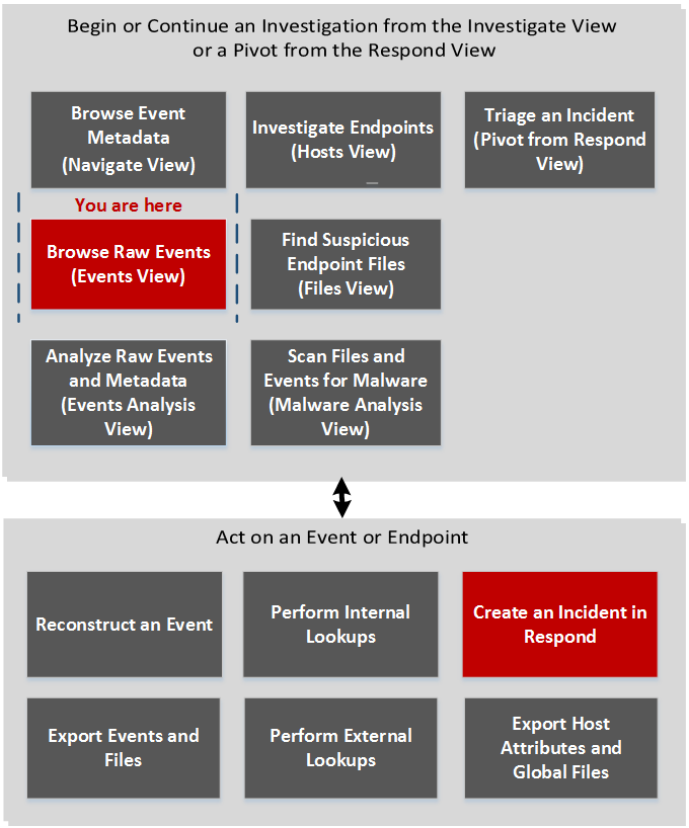
- Add/Remove from List Dialog
- Context Lookup Panel
- Create an Incident Dialog
- Event Analysis View
- Event Analysis View - Text Analysis Panel
- Event Analysis View - Packet Analysis Panel
- Event Analysis View - File Analysis Panel
- Event Reconstruction View
- Hosts View - Autoruns Tab
- Hosts View - Drivers Tab
- Hosts View - Files Tab
- Hosts View - Libraries Tab
- Hosts View - Overview Tab
- Hosts View - Process Tab
- Hosts View - System Information Tab
- Investigate Dialog
- Investigation Tab - User Preferences Panel

- Malware Analysis Events List and Files List
- Manage Column Groups Dialog
- Manage Default Meta Keys Dialog
- Manage Meta Groups Dialog
- Manage Profiles Dialog
- Navigate View
- Query Dialog
- Scan For Malware Dialog
- Select a Malware Analysis Service Dialog
- Settings Dialogs for Investigate Views

Add Events to an Incident Dialog

In the Add Events to an Incident dialog, analysts can add alerts to an existing incident so that incident responders look at the associated events as part of an incident response. To access this dialog while investigating a service in the Events view, select **Incidents > Add to Existing Incident** from the toolbar.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View
Threat Hunter	analyze raw events and metadata	Begin an Investigation in the Event Analysis View

User Role	I want to ...	Show me how
Threat Hunter	investigate endpoints (Version 11.1)	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*
Threat Hunter or Incident Responder	add one or more events to an existing incident or to a new incident*	Add Events to an Incident for Response

*You can perform this task in the current view.

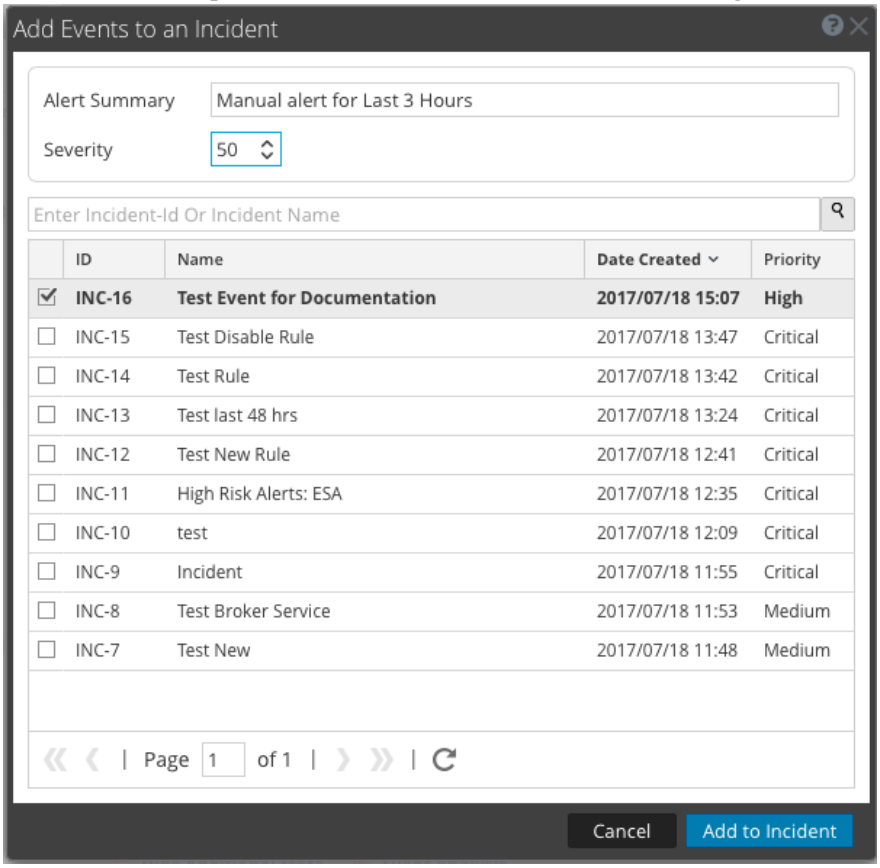
Quick Look

The following figure is an example of the Add Events to an Incident dialog. The table describes the information and options in the Add Alerts to an Incident dialog .



Feature	Description
Alert Summary	The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident. The Severity field reflects the Severity of the selected alert, an integer between 1 and 100.
Search	Allows you to search for an existing event.
ID	The ID of the incident. You can sort IDs in ascending or descending order.
Name	The incident name. You can sort the Name in ascending or descending order.
Date Created	Displays the date and time the incident was created. You can sort the dates in ascending or descending order.
Priority	Displays the priority of the incident: either low or critical.
Cancel	Closes the dialog without saving changes.
Add to Incident	Adds the alerts to the incident. A dialog confirms that alerts are successfully added

Add/Remove from List Dialog

The Add/Remove from List dialog allows you to add an entity or meta value to an existing Context Hub list, remove an entity or meta value, or create a new Context Hub list containing the entity or meta value. When you look up an IP address or other entity and you find it suspicious or interesting, you can add it to a list that has been added as a data source. An example of a commonly used list is a white list or black list. This improves the visibility of the suspicious IP addresses and reduces false positives that do not need further investigation.

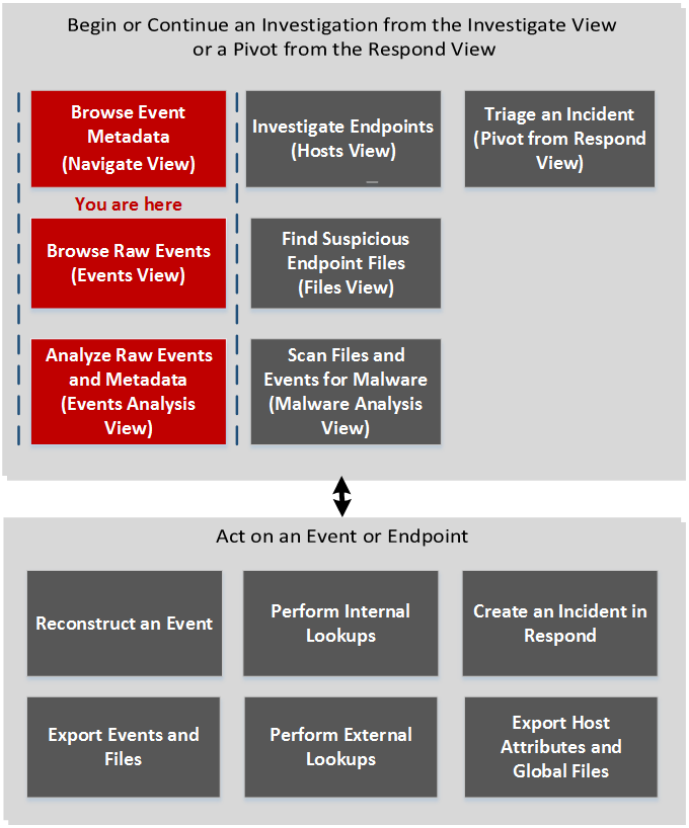
You can add entities or meta values to more than one list. For example, you can add them to one list for suspected domains related to command and control connections and to another list for Trojan connection IP addresses related to remote access. If a list is not available, you can create a list.

The dialog is available in NetWitness Investigate and in NetWitness Respond. When working in Investigate, in the Navigate view, Events view, or Event Analysis view (Version 11.2), you can add meta values for the `Source IP`, `Destination IP`, or `Username` meta keys to an existing context hub list or you can create a new list containing the meta values. When you add meta values to a list, you can look up additional context on those meta values.

- To display the dialog in the Navigate view or the Events view, right-click a meta value under `Source IP`, `Destination IP`, or `Username`) and select **Add/Remove from List** in the context menu.
- To display the dialog in the Event Analysis view, hover over a value and select **Add/Remove from List** in the Actions section of the context tooltip.

Workflow

The following workflow diagram shows the high-level workflow for Investigate with the location of the Add to List task highlighted.



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View
Threat Hunter	analyze raw events and metadata	Begin an Investigation in the Event Analysis View

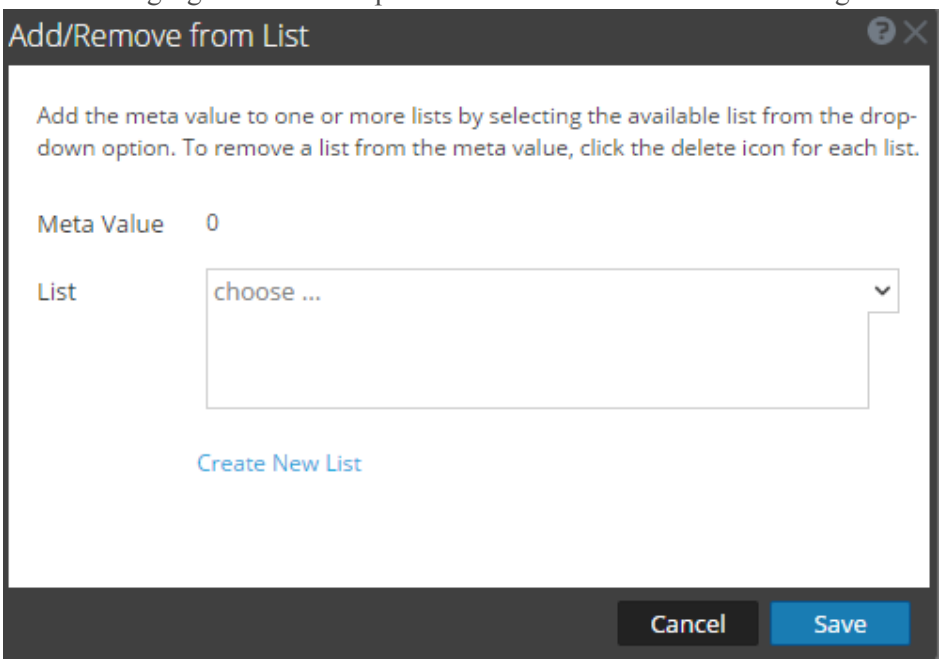
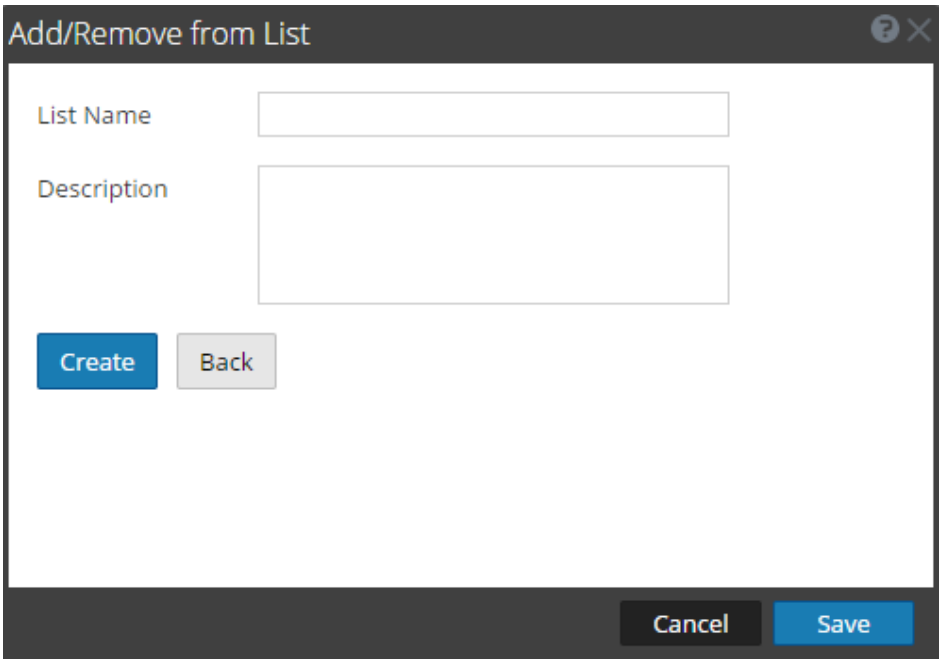
Quick Look in the Navigate and Events Views

The following figure is an example of the Add/Remove from List dialog when initially opened.



The following figure shows the dialog when you select Create New List.

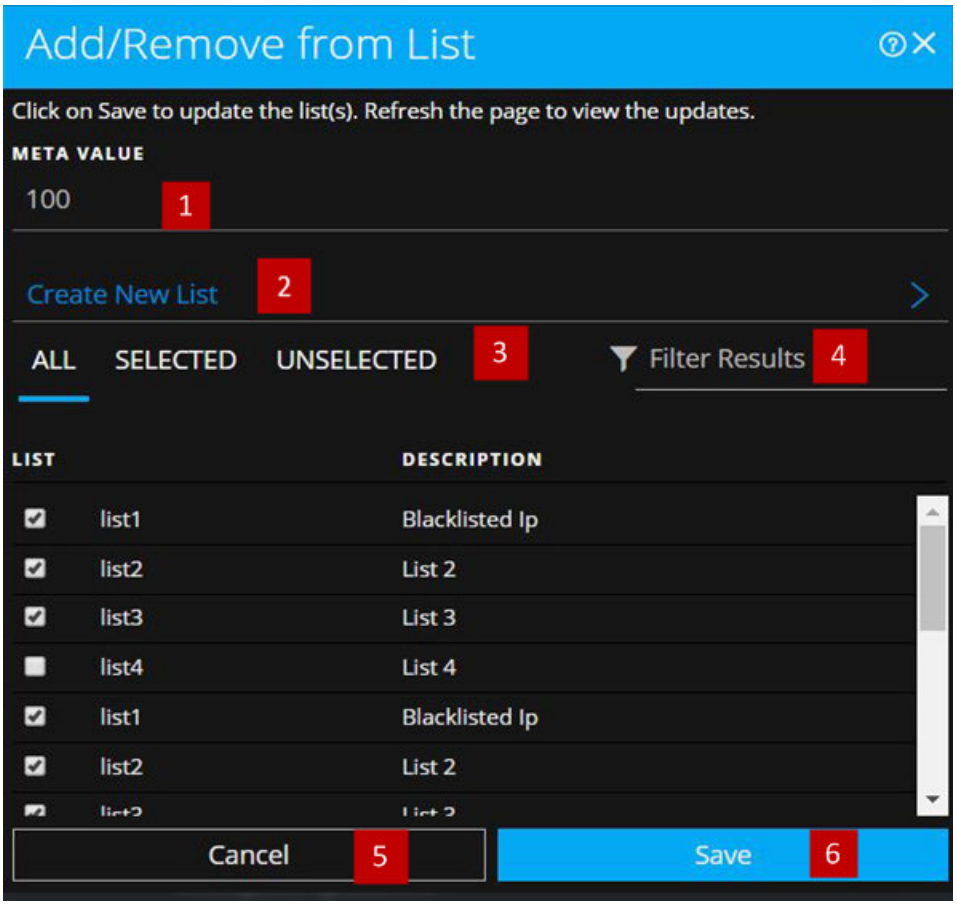


The following table describes the features of the Add/Remove from List and Create New List dialogs.

Feature	Description
Meta Value	The selected meta value to be added to the existing or new list.
List	The list to which the selected meta value must be added. A drop-down menu provides a list of available lists to which you can add the meta value.
Create New List	Opens a new dialog in which you can create a new list for the selected meta value.
List Name	The name of the new list.
Description	The description of the new list.
Create	Creates a new list after entering the required fields.
Back	In the new list mode, cancels the new list creation and returns to the original dialog.
Cancel	Cancels the addition of the meta value to a list and closes the dialog.
Save	Saves the changes made to the lists and closes the dialog.

Quick Look in the Event Analysis View (Version 11.2 and Later)

The following is an example of the **Add/Remove from List** dialog in the Event Analysis view.



1 Entities or meta values to be added or removed.
2 Create a new list using the selected meta.
3 Select any of the tabs: All, Selected, or Unselected.
4 Search using the list name or description.
5 Cancel the action.
6 Save to update lists or create a new list.

The following table shows the options in the Add/Remove from List dialog.

Option	Description
META VALUE	Displays the selected entity or meta value that needs to be added to or removed from one or more lists. You can also a create a new list using the selected value.
Create New List	Displays a dialog to create a new list using the selected meta value.
ALL	Shows all of the available Context Hub lists. The lists that contain the selected entity or meta value are selected. Select a checkbox to add an entity or meta value to a list. Clear a checkbox to remove it from the list.
SELECTED	Shows only the lists that contain the selected entity or meta value. (All lists are selected.)

Option	Description
UNSELECTED	Shows only the lists that do not contain the selected entity or meta value. (All lists are unselected.)
Filter Results	Enter the name or description of a specific list to search from multiple lists.
LIST	Displays the name of all the lists.
DESCRIPTION	Displays information about the selected list. The description that you provide when creating a list appears in this dialog. For example: This list contains all of the blacklisted IP addresses.
Cancel	Cancels the operation.
Save	Saves the changes.

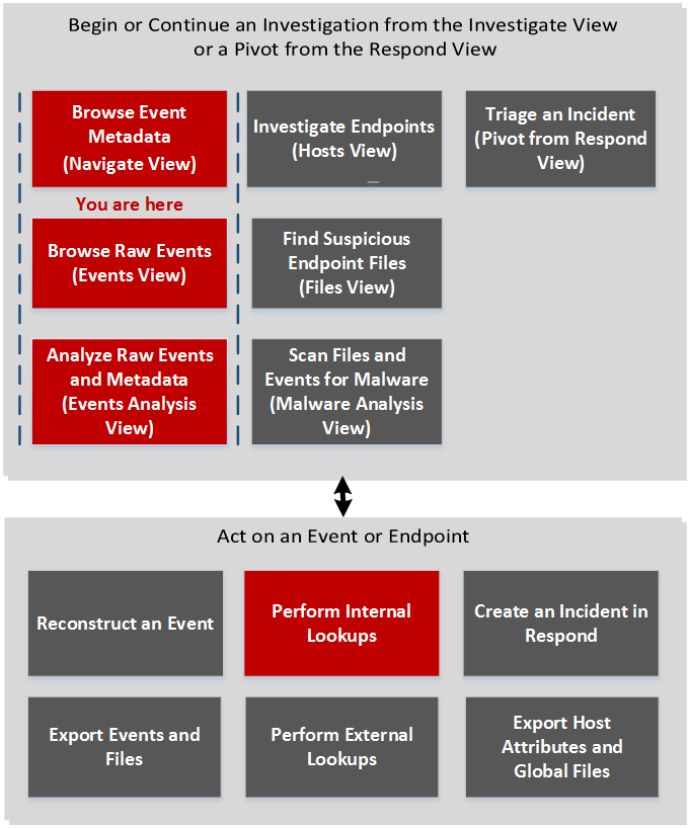
Context Lookup Panel

After an administrator configures the Context Hub service, you can view the contextual information for the meta values in the Navigate view, Events view, and Event Analysis view (Version 11.2). The Context Hub service is pre-configured with a default meta type and meta key mapping. For information about the mapping of the context hub meta value with investigation meta key, see "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*.

The Context Lookup panel is displayed on the right side of the Navigate view and Events view. Meta values that have been added to a Context Hub list are highlighted in gray in the Navigate view or Events view results. In the Event Analysis view, they are marked by an underscore. When you right-click a highlighted value and select **Context Lookup** in the resulting context menu, the lookup results are displayed in the Context Lookup panel for configured sources for the selected meta value. You can select a source in the Context Lookup panel icon bar to view the contextual information.

There are some differences between the appearance and contents of the Context Lookup panel when open in the Navigate view or Events view and when open in the Event Analysis view.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View
Threat Hunter	analyze raw events and metadata	Begin an Investigation in the Event Analysis View
Threat Hunter	investigate endpoints (Version 11.1)	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*
Threat Hunter	look up additional context for a meta value	Look Up Additional Context in the Navigate and Events Views and Look Up Additional Context in the Event Analysis View

*You can perform this task in the current view.

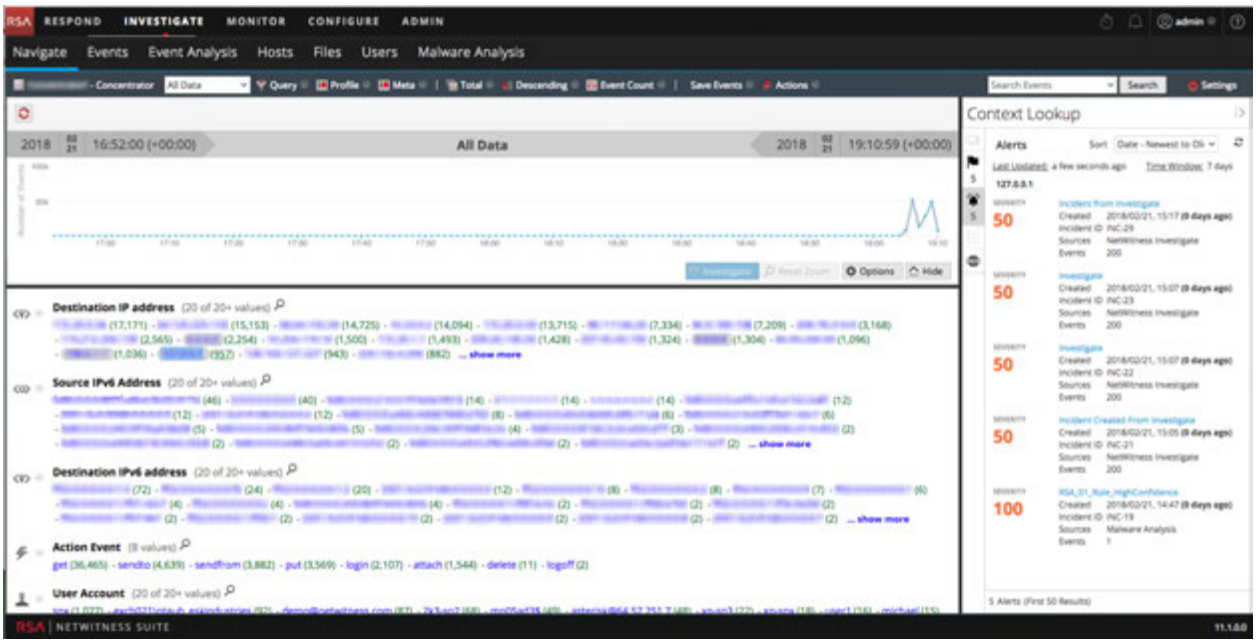
Quick Look (in the Navigate and Events Views)

The following figure is an example of the Context Lookup panel as it appears in the Navigate view and Events view. Controls and features are described in the table.



Feature	Description
Source Options Bar	Displays the icons for the available sources: Endpoint, Incidents, Alerts, and Lists.
Source Name	Displays the source name based on the selected icon: • Endpoint • Incidents • Alerts • Lists • Live Connect
Sort	Provides a drop-down of sort options for the listed context information. Possible sort options are Severity - High to Low, Severity Low to High, Date - Oldest to Newest. and Date - Newest to Oldest. The sorting options vary by source type.
	Refreshes the lookup results.
<n items> (First <n> Results)	The footer provides a count of results currently displayed and the total number of results. For example, 5 Alerts (First 50 Results).

Incidents

Incidents are displayed based on time first (Newest to Oldest) and then priority status. The following information is displayed for incident lookups:

- Incident Name and ID
- Priority status of the incidents
- Risk Score value of the incidents
- Date when the incident was created
- Status of the incident
- Assignee for the incident
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Time window: This is based on the value that is set for the "Query Last (Days)" field in the Configure Respond window. For details, see the "Configure Respond as a Data Source" topic in the *Context Hub Configuration Guide*.
- Sort: This drop-down field provides options to change the sorting of result based on time or priority.

Alerts

Alerts are displayed based on the Severity. ;The following information is displayed for alert lookups:

- Alert Name
- Severity value of the alerts
- Date when the alert was created
- Incident ID: This is the ID of the incident that the alert is associated with (If any).
- Sources: Event source name
- Number of events associated with the alert.
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Time window: This is based on the value that is set for the "Query Last (Days)" field in the Configure Respond window. For details, see the "Configure Respond as a Data Source" topic in the *Context Hub Configuration Guide*
- Sort: This drop-down field provides option to change the sorting of result based on time or priority.

Lists

The following information is displayed for list lookups.

- List Name
- Owner who created the list
- Created Date
- Last Updated Date
- Description of the list

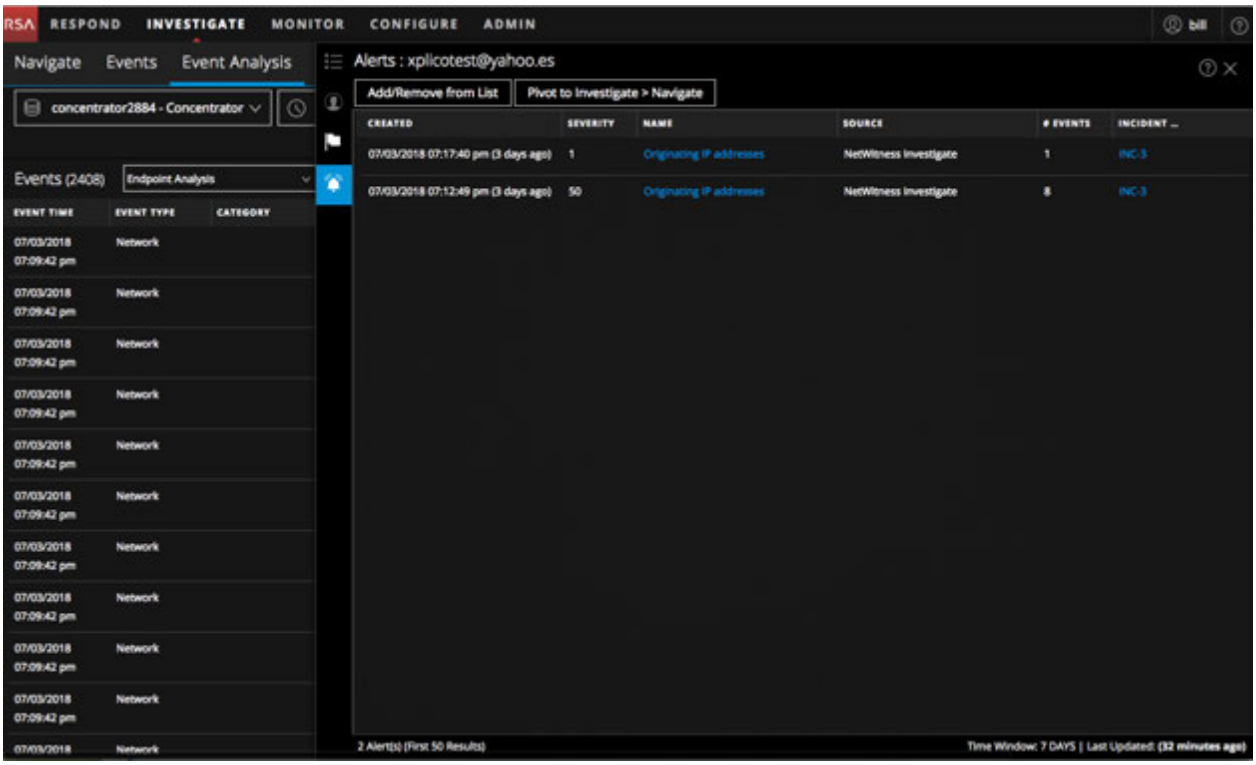
Endpoint

The following information is displayed for Endpoint lookups.

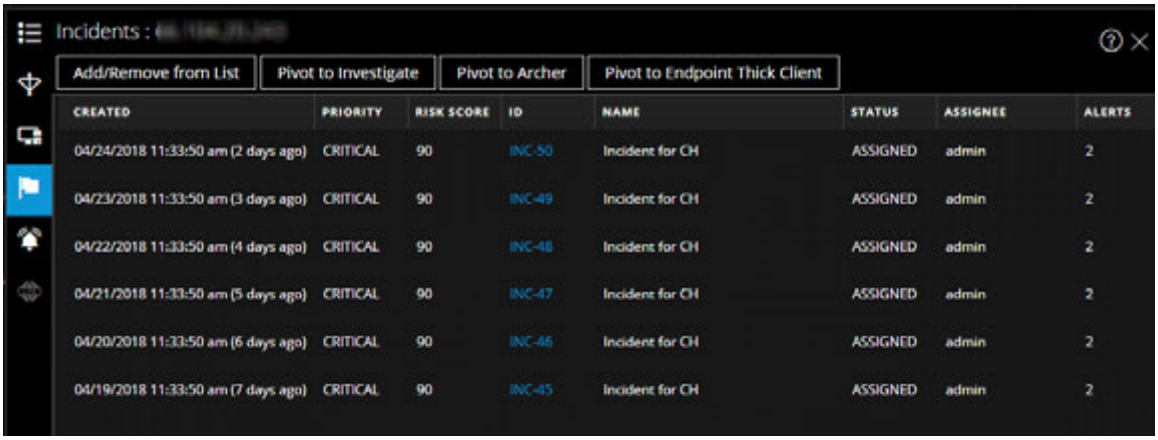
- Machine name and IP address of the machine.
  By clicking on the IP or Endpoint machine name, you will be navigated to Endpoint UI to perform further investigation.
- Last Updated: Indicates when contextual data was last fetched from data source and updated to cache.
- Machine Score: A machine IIOC score is aggregated based on the module scores.
- Number of modules: Number of active files for the selected machine.
- Last Updated: Indicates when the scan results were last updated in Endpoint database.
- Last Login User
- Machine MAC Address
- Operating System Version
- Admin Notes (if any)
- Admin Status (if any)
- Top Suspicious Modules (Modules that have an IIOC score > 500). This is based on the value set for "Minimum IIOC Score" field in the Configure Endpoint window. The default value for "Minimum IIOC Score" is 500.
- Machine IIOC Levels

Quick Look in the Event Analysis View (Version 11.2 and Later)

The following figure is an example of the Context Lookup panel as it appears in the Event Analysis view.



The contextual information or query results displayed in the Context Lookup panel depends on the selected entity and the associated data sources. The Context Lookup panel has separate tabs for each of the data sources. The tabs are: List data source, Archer, Active Directory, Endpoint, Incidents, Alerts, and Live Connect. The following figure displays the Context Lookup panel for a selected entity in the Incident Details view with the Incidents tab in view.



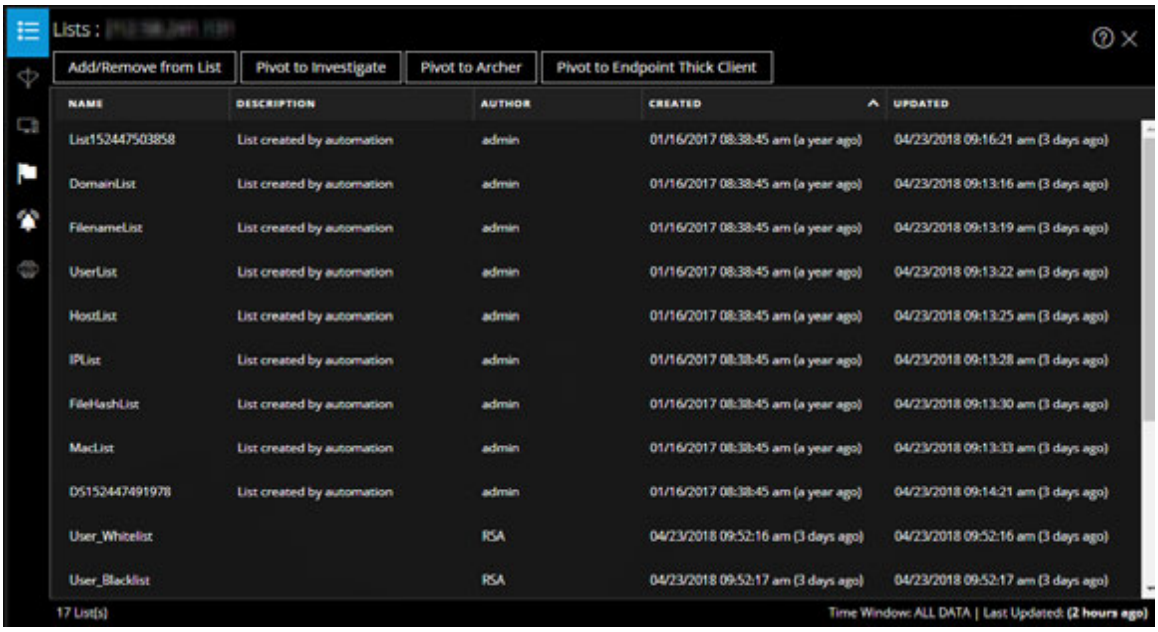
The following table describes the data available on each tab and the supported entities.

Tab	Description	Supported Entities
(Lists)	Displays all of the list data associated with the selected entity or meta value. The result is sorted by the last updated list.	All entities

Tab	Description	Supported Entities
 (Archer)	Displays asset information along with criticality ratings using the Archer data source.	IP, Host, and Mac
 (Active Directory)	Displays all user information for the selected user.	User
 (NetWitness Endpoint)	Displays the NetWitness Endpoint data source information for the selected entity or meta value, which includes the Machines, Modules, and IIOC levels. Modules are by highest IOC score to lowest IIOC score and IIOC levels are sorted by highest IOC levels to lowest IOC levels.	IP, MAC address, and Host
 (Incidents)	Displays the list of incidents associated with the selected entity or meta value. The result is sorted by newest incidents to oldest incidents.	All entities
 (Alerts)	Displays the list of alerts associated with the selected entity or meta value. The result is sorted by newest alerts to oldest alerts.	All entities
 (Live Connect)	Displays information related to Live Connect.	IP, Domain, and Filehash

Lists Tab

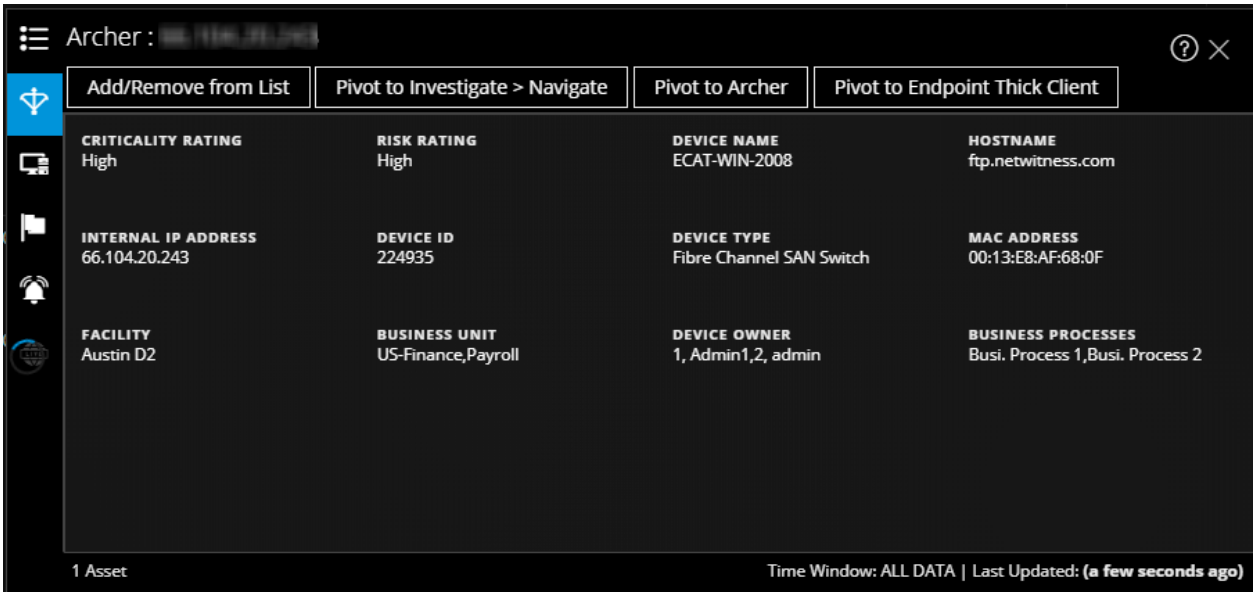
The Context Lookup panel for Lists shows one or more lists associated with the selected entity or meta value. The following figure is an example of the Context Panel for Lists, and the table describes the fields.



Field	Description
Name	The name of the list (defined while creating the list).
Description	The description of the list (defined while creating the list).
Author	The owner who created the list.
Created	The date when the list was created.
Updated	The date when the list was last updated or modifed.
Count	The number of lists in which the selected entity or meta value is available.
Time Window	The time window based on the value set for the "Query Last" field in the Configure Responses dialog. By default, all Lists data is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Archer Tab

The Context Lookup panel for Archer displays asset information along with criticality ratings using the Archer data source for IP, Host, and Mac entities. The following figure is an example of the Context Lookup panel for Archer, and the table describes each field.



Field	Description
Criticality Rating	The device operational criticality based on the applications it supports. The criticality ratings can be set as Not Rated, Low, Medium-Low, Medium, Medium-High, or High.
Risk Rating	The calculated risk rating for the device based on the most recent assessment and the average risk rating of facilities using the device. The risk rating can be set as Severe, High, Medium, Low, or Minimal.
Device Name	The unique name of the device.
Host Name	The host name of the device.
IP Address	The primary internal IP address of the device.
Device ID	The automatically populated value that uniquely identifies the record across all applications within the system.
Type	The device type, for example, server, laptop, desktop, and others.
Facilities	Links to records in the Facilities application that are related to this device.
Business Unit	Links to records in the Business Unit application that are related to this device. For more than three business unit values, you can hover over the field to view the values.
Device Owner	The person who is responsible for the device and receives read and update rights of the record.

Field	Description
Count	The number of assets available.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Responses dialog. By default, all data for Archer is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Note: In the localized versions, only these twelve fields are displayed: Criticality Rating, Risk Rating, Device Owner, Business Unit, Host Name, MAC Address, Facilities, IP Address, Type, Device ID, Device Name, and Business Processes.

Active Directory Tab

The following figure is an example of a Context Lookup panel for Active Directory.

The Context Lookup panel for Active Directory displays all the related information, incidents, and alerts for a user. You can perform a look up using the following formats:

- userPrincipalName
- Domain\UserName
- sAMAccountName

If the user exists in multi-domain or multi-forest, all the related context information is displayed for the specific user.

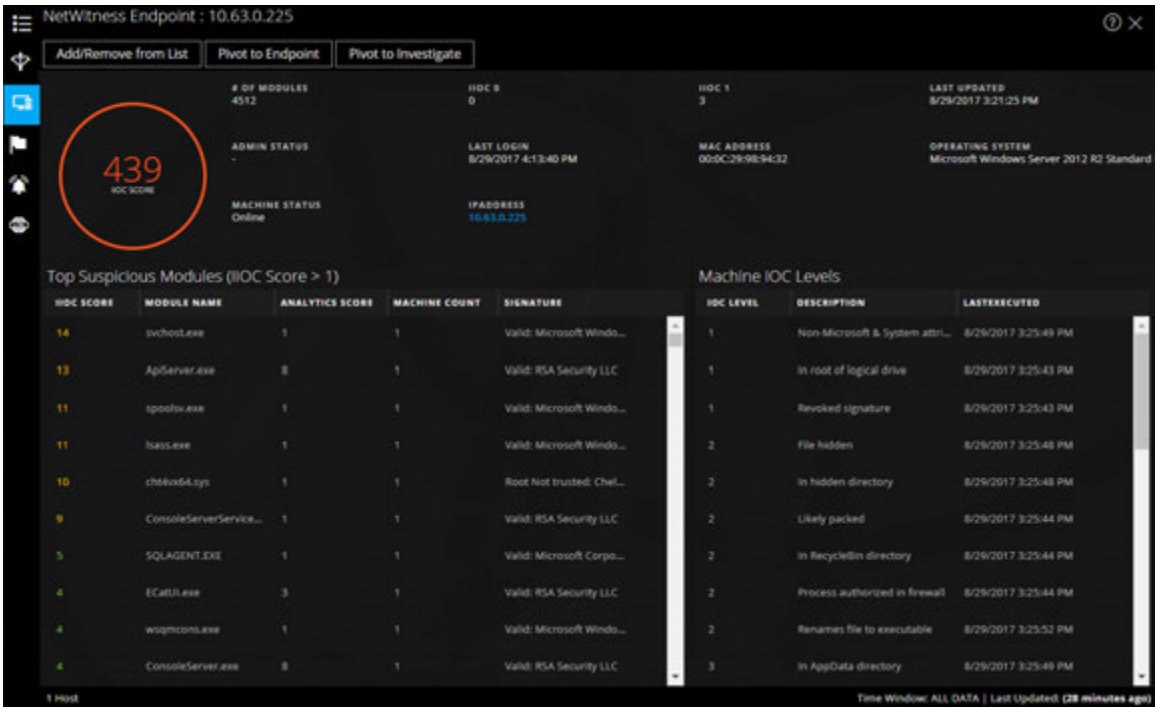
The following information is displayed for Active Directory.

Field	Description
Display Name	The name of the user.
Employee ID	The employee ID of the user.
Phone	The phone number of the user.
Email	The email ID of the user.
AD User ID	The unique identification of the user within an organization.
Job Title	The designation of the user.
Manager	The name of the user's manager.
Groups	The list of groups of which the user is a member.
Company	The name of the user's company.

Field	Description
Department	The department name to which the user belongs within the organization.
Location	The location of the user.
Last Logon	The time when the user logged into the system, only if the Global Catalogue is defined.
Last Logon TimeStamp	The time when the user logged into the system.
Distinguished Name	The unique name assigned to the user.
Count	The number of users.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, all data for Active Directory is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

NetWitness Endpoint Tab

The following figure is an example of the Context Lookup panel for NetWitness Endpoint.



The following information displayed for IIOCs.

Field	Description
# Of Modules	The number modules that are looked up.

Field	Description
Admin Status	The admin status (if any).
Last Updated	The time when the data was last refreshed.
Last Login	The time when the user last logged in.
MAC Address	The Machine MAC Address.
Operating System	The Version of the Operating System used by the NetWitness Endpoint machine.
Machine Status	The state of the module being viewed: Online, Offline, Active, or Inactive.
IP Address	The IP address of the specific module.

The following information is displayed for modules.

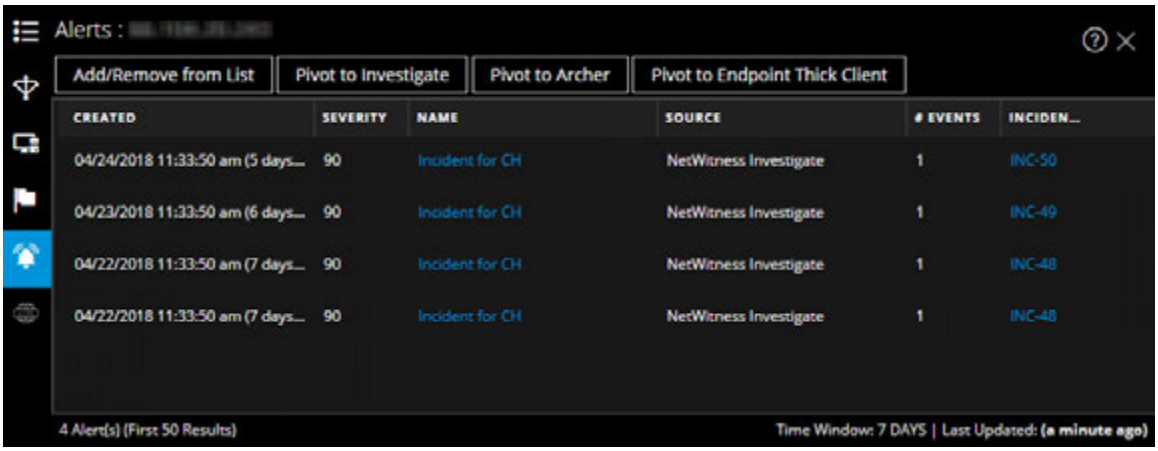
Field	Description
IIOC Score	A machine IIOC score is an aggregated score based on the module scores. This is based on the value set for Minimum IIOC Score field in the Context Hub Data Source Settings dialog. The default value for Minimum IIOC Score is 500. See "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Module Name	The name of the module that is being looked up.
Analystic Score	The number of active files for the selected machine.
Machine Count	The number of machines on which that particular IOC got triggered.
Signature	Indicator of whether the file is signed or unsigned, valid or invalid, and signatory information. For example, Google, Apple, and so on.

The following information is displayed for machines.

Field	Description
IOC Levels	The IOC levels.
Description	The description for he IOC level if available.
Last executed	The time when the action was executed.
Count	The number of hosts that are being looked up.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, all data for NetWitness Endpoint is fetched.
Last Updated	The time when scan results were last updated in NetWitness Endpoint database.

Alerts Tab

The following figure is an example of Context Panel for Alerts that is displayed based on time first (Newest to Oldest) and then severity.

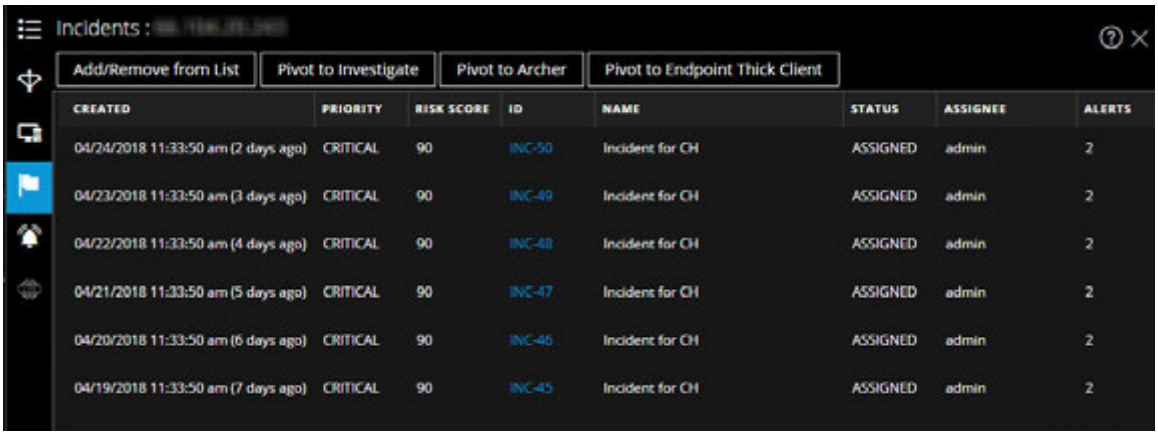


The following information is displayed in the Context Lookup panel for Alerts.

Field	Description
Created	The date and time when the alert was created.
Severity	The severity value of the alerts.
Name	The name of the alert. You can click the name to view the details of a specific alert.
Source	The alert source name from which the alert is triggered.
#Events	The number of events associated with the alert.
Incident ID	The ID of the incident (if any) with which the alert is associated. You can click the ID to view the details of a specific alert.
Count	The number of alerts. By default only the first 100 alerts are displayed. For more information on how to configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

Incidents Tab

The following figure is an example of the Context Panel for Incidents, which is based on time first (Newest to Oldest) and then priority status.

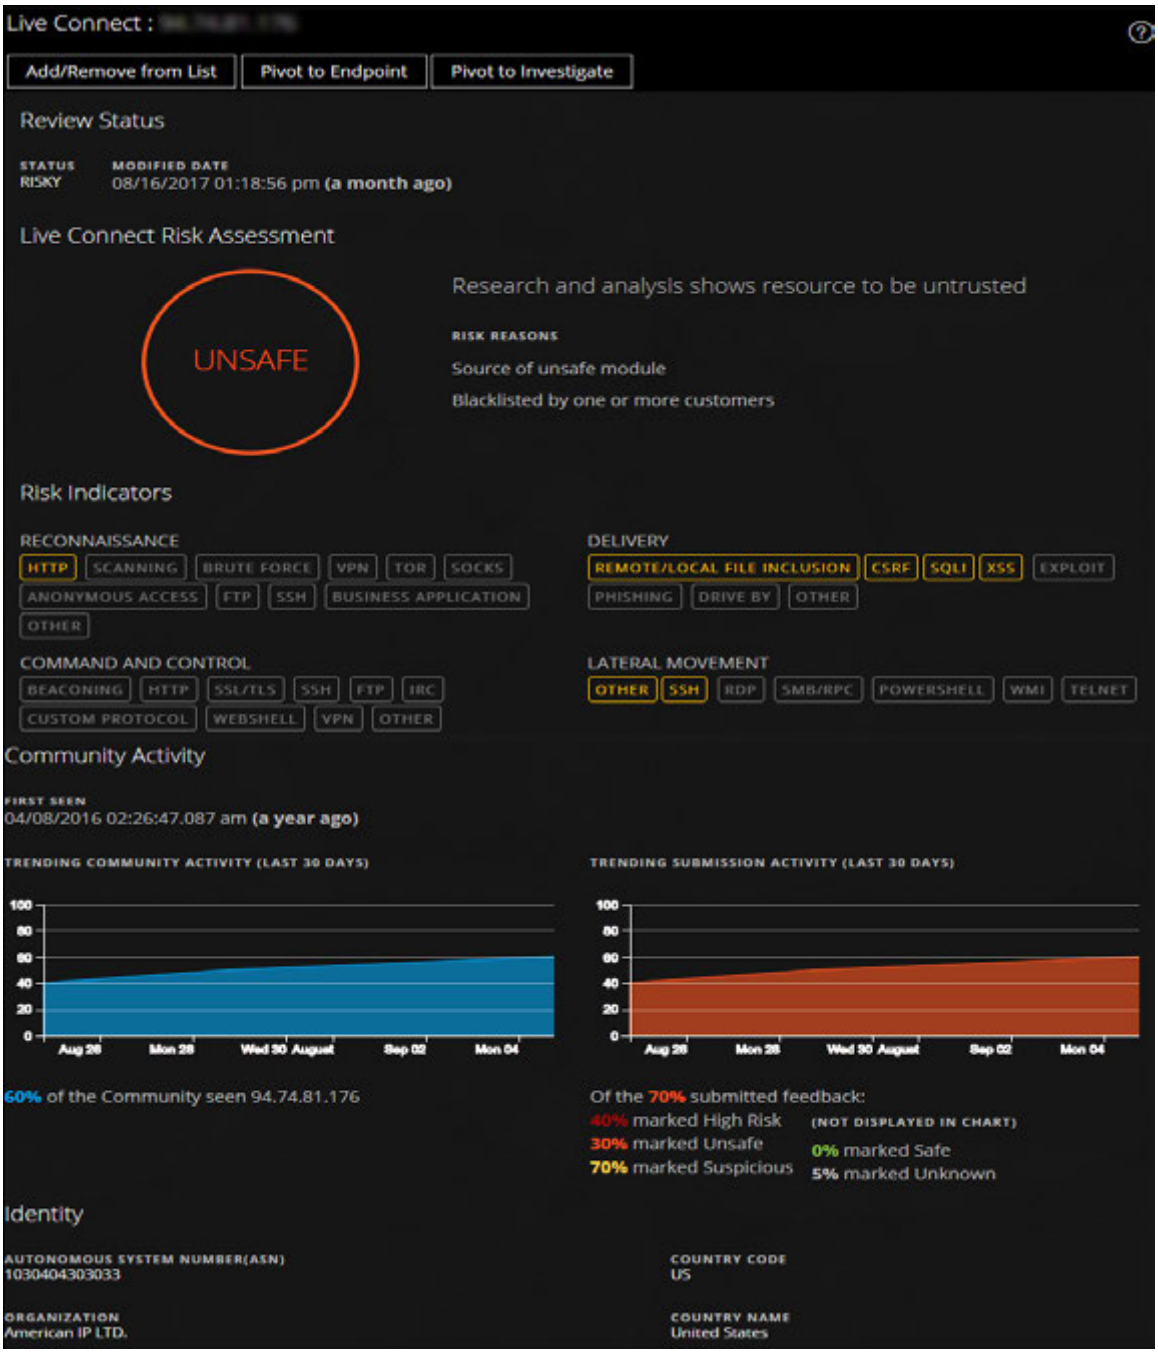


The following information is displayed in the Context Lookup panel for Incidents.

Field	Description
Created	The date when the incident was created.
Priority	The priority status of the incidents.
Risk Score	The risk score of the incidents.
ID	The Incident ID of the incident. You can click on the ID to display further details about the incident.
Name	The incident name.
Status	The status of the incident
Assignee	The current owner of the incident.
Alerts	The number of alerts associated with the incident.
Count	The number of incidents. By default only the first 100 incidents are displayed. For more information on how configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

Live Connect Tab

The following figure is an example of a Context Panel for Live Connect, and the table describes the information displayed.



Field	Description
Review Status	The review status of the selected Live Connect entity (IP, file, or domain) based on the analyst activity. This gives the visibility of the analyst activity within an organization. **Status** Below are the types of status: • **New:** Lookup results for an IP address are viewed for the first time within the organization. • **Viewed:** Any analyst within the organization has already viewed the lookup results for an IP address. • **Marked as Safe:** Any analyst within the organization has already viewed the lookup results and marked the IP address as safe. • **Marked as Risky:** Any analyst within the organization has already viewed the lookup results and marked the IP address as risky.
Risk Assessment	The risk assessment for the selected Live Connect entity (IP, file, or domain) based on the Live Connect analysis and analyst feedback. The Risk Assessment categories are: • **Safe:** The Live Connect entity is considered to be safe. • **Unknown:** Live Connect does not have enough information about this entity to calculate the risk. • **High Risk**: Marked as high risk based on the analysis and risk reasons provided by the community. Entities marked as high risk require immediate attention. • **Suspicious**: Marked as suspicious based on the analysis and risk reasons provided by the community. The analysis indicates potentially threatening activity that requires action. • **Unsafe:** Marked as unsafe based on the analysis and risk reasons provided by the community. The entity is rated as High Risk, Suspicious, or Unsafe and displays the associated risk reasons accordingly.

Field	Description
Risk Assessment Feedback	 Risk Assessment Feedback allows the analyst to submit threat intelligence feedback about an entity to the Live Connect server. • **Analyst Skill Level** Below are the Analyst skill level options: ◦ **Tier 1** - Analysts at this level define procedures for remediation, and decide if an incident should be escalated to other areas in a Security Operation center (SOC). This is the default value. ◦ **Tier 2** - Analysts who investigate incidents and capture intelligence from an investigation to feed back into the various workflows in a SOC. ◦ **Tier 3** - Analysts who share the investigation results to the SOC organization. They generally manage incidents and have a wide breadth and depth of skills and tools necessary for incident response. **Note:** While creating a new user for NetWitness Platform (Analyst), an administrator should be able to identify the user as Tier 1, Tier 2, or Tier 3 Analyst. • **Risk Confirmation** - The risk confirmation for the selected Live Connect entity (IP, file, or domain). The Risk confirmation categories are: ◦ **Safe**: The Live Connect entity is considered to be safe. ◦ **Unknown**: The analyst does not have enough information to provide a risk confirmation ◦ **High Risk**: Marked as high risk based on the analysis and risk reasons provided by the community. Entities marked as high risk require immediate attention. ◦ **Suspicious**: Marked as suspicious based on the analysis and risk reasons provided by the community. The analysis indicates potentially threatening activity that requires action. ◦ **Unsafe**: Marked as unsafe based on the analysis and risk reasons provided by the community. • **Confidence Level** - The confidence level of an analyst in providing feedback for the Live Connect entity. The confidence level categories are: High, Medium, and Low. • **Risk Indicator Tags** - Allows you to select a tag category based on the analysis.

Field	Description
Community Activity	Community activities such as: • Date first seen in the community. • Time since the IP/File/Domain was seen for the first time (Current time - First seen time). **Trending Community Activity:** If the IP address is known within the RSA community, a graphical representation of the community activity trend is displayed for the following: • Users (in %) who have viewed the IP address in the Live Connect community over time. • Users (in %) who submitted feedback for the IP address. • Users (in %) who marked the IP address as unsafe over time.
Risk Indicators	 Risk indicators are highlighted based on the tags that are assigned by the community to the entities (IPs, Files, or Domains). The tags are categorized as follows: Reconnaissance, Delivery, Command and Control, Lateral Movement, Privilege Escalation, and Packaging and Exfiltration. These tags are samples and vary based on the inputs received from the community on the Live Connect server. The analyst can choose the appropriate risk indicator tags while providing the review feedback. A highlighted tag indicates that the selected entity is associated with that particular category and tag. Clicking a highlighted tag displays the description of the tag.
Identity	Provides the following identity information for the selected entity or meta value: For IP address: Autonomous System Number (ASN), Prefix, Country Code and Country Name, Registrant (Organization), and Date. For File Hash: File Name, File Size, MD5, SH1, SH256, Compile Time, and Mime Type. For Domain: Domain Name and Associated IP Address.
Certificate Information	Provides the following certificate information for the selected file hash: Certificate Issuer, Validity of the Certificate, Signature Algorithm, and Certificate Serial Number.

Field	Description
WHO IS Information	 The **WHO IS** information provides the ownership details for a given domain. The following information about the domain owner is displayed: Created Date, Updated Date, Expired Date, Type (Registration Type), Name, Organization, Address with Postal code, Country, Phone, Fax, and Email.
Related Files	Related Files are displayed for entity types IP and Domain. A list of known associated files is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), File Name, MD5, Compile Time and Date, API Function, Import Hash, and Mime Type.
Related Domains	Related Domains are displayed for entity types IP and Files. A list of known associated domains is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), Domain Name, Country Name, Registered Date, Expired Date, and Registrant Email address.

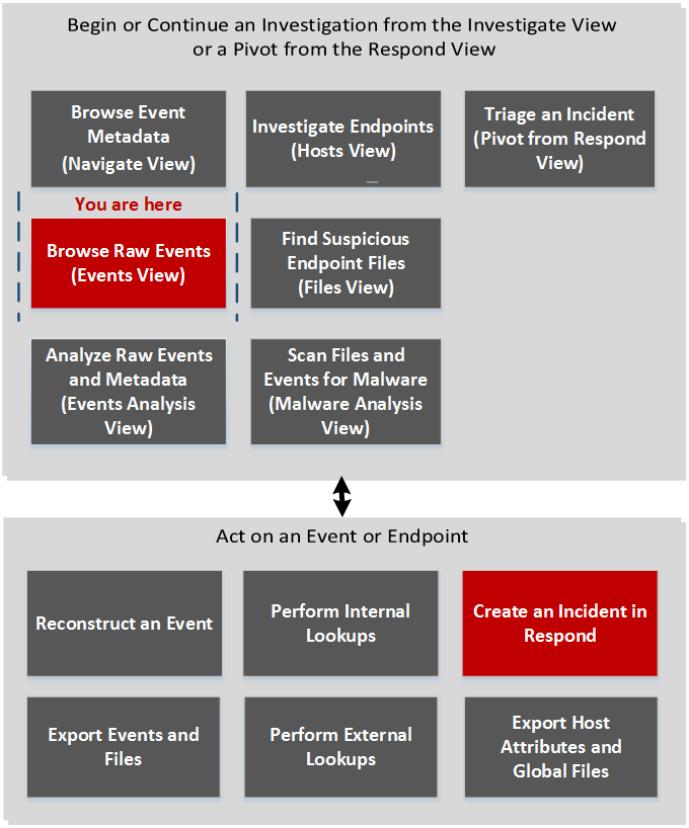
Field	Description
Related IPs	
Related IPs are displayed for entity types Domain and Files. A list of known associated IPs is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), IP Address, Domain Name, Country Code and Country Name, Country Name, Registered Date, Expired Date, and Registrant Email address.

Create an Incident Dialog

In the Create an Incident dialog, analysts can create an incident from selected events in the Events view. The incident is then available to incident responders working in Respond.

To access this dialog, while investigating a service in the Investigation > Events view, select **Incidents > Create New Incident** from the toolbar.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View
Threat Hunter	analyze raw events and metadata	Begin an Investigation in the Event Analysis View

User Role	I want to ...	Show me how
Threat Hunter	investigate endpoints (Version 11.1)	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*
Threat Hunter or Incident Responder	add one or more events to an existing incident or to a new incident*	Add Events to an Incident for Response

Related Topics

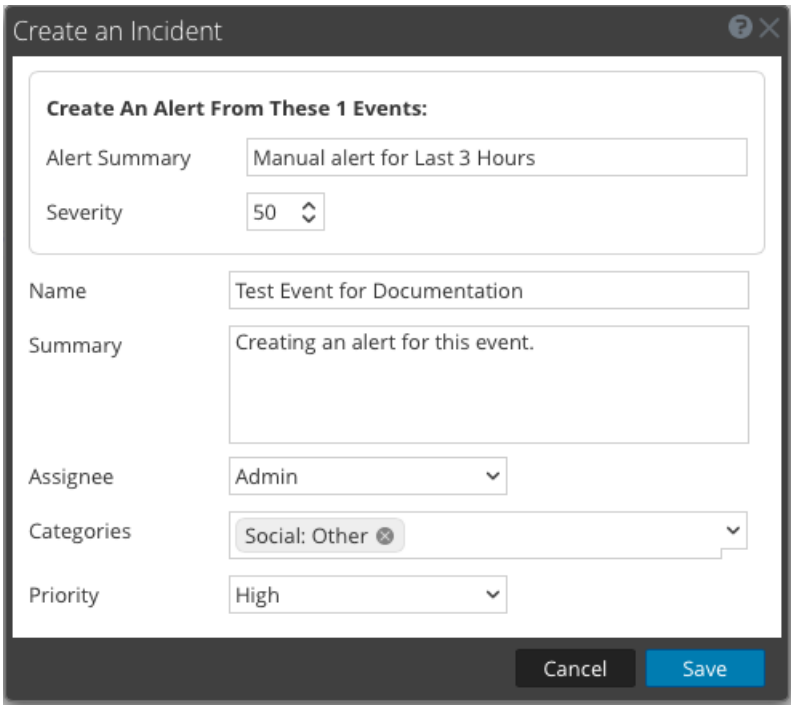
- Events View

Quick Look

The following figure is an example of the Create an Incident Dialog, and the features are described in the table.



Feature	Description
Create Summary from These Events	The Alert Summary field is filled by the query that produced the select alerts, which you selected to create this incident. The Severity field reflects the Severity of the selected alert, an integer between 1 and 100.
Name	(Required) Specifies a name to identify the incident. In the example, the name is Sample Incident. You can provide a name that clearly identifies the nature of events that will be added to this incident
Summary	(Optional) Specifies a description for the incident. A good summary clearly identifies the incident for other analysts and responders.
Assignee	(Optional) Assigns the incident to a user in the SOC. Clicking Assignee opens a drop-down list showing the user names of SOC personnel who respond to incidents.
Categories	(Optional) Identifies categories of incidents. Clicking Categories, opens a drop-down list of Incident categories and subcategories. You can select one or more categories to which the incident belongs. Categories fall into these major groups: Environmental, Error, Hacking, Malware, Misuse, and Social.
Priority	Identifies the priority for the incident. Clicking Priority opens a drop-down list of priorities: Critical, High, Medium, or Low displayed in the drop-down list.
Cancel	Closes the dialog without saving changes.
Save	Saves the incident and closes the dialog. A message confirms that the incident was created successfully.

Event Analysis View

In the Event Analysis view analysts can view raw events and meta data with interactive features that enhance the ability to find meaningful patterns in the data. This is an alternative to the static Event Reconstruction view. You can examine network, log, and endpoint events in the Event Analysis view. The Event Analysis view offers packet, text, and log reconstruction, and does not support email and web reconstruction directly. However, in Version 11.1 and later, you can open an email or web reconstruction of the current results in the Events view email or web reconstruction.

Note: The administrator sets permission for analysts to access this view. If your administrator has not given you access, and you navigate to the Event Analysis view by any means, the following message is displayed: `Forbidden. You cannot access the requested page.` For example, if you are viewing a reconstruction from the Events view and attempt to view the same reconstruction in the Event Analysis view, you will see the `Forbidden` message.

The events displayed in the Events Analysis view are for the current drill point in the Navigate view or Events view. Beginning with Version 11.1, the events can be the results of a query entered in the Event Analysis view breadcrumb. Whatever the source of the query, the Event Analysis view lists events in order by time. You can rearrange and resize the columns, In Version 11.1 and later, you can also choose the columns that you want to see and select one of the built-in column groups or a custom column group.

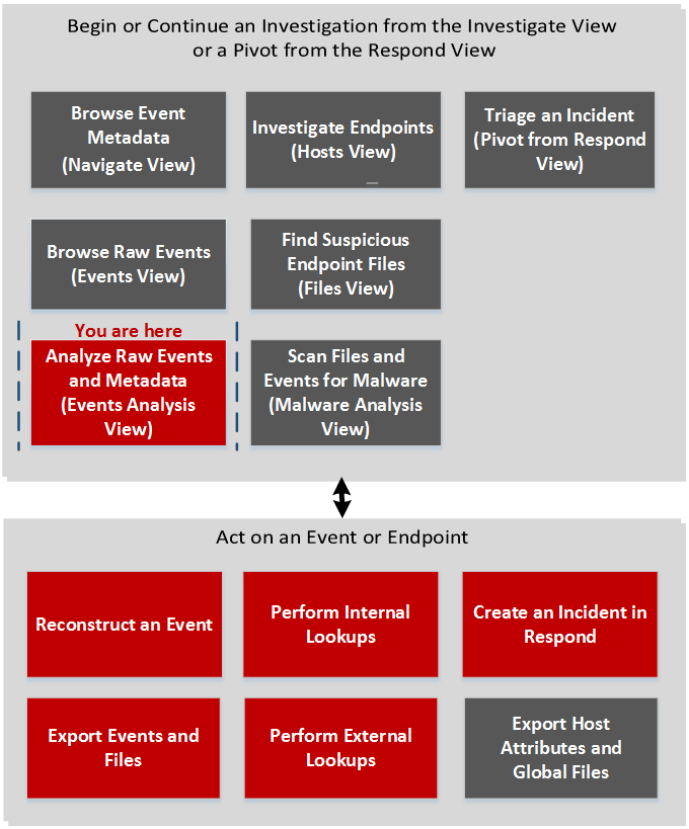
When you click an event, the Network Event Details, Log Event Details, or the Endpoint Event Details panel opens in the same browser window. Each type of event has one or more types of analysis: Text Analysis, Packet Analysis, and File Analysis.

There are multiple access points to this view, which are described in Begin an Investigation in the Event Analysis View.

Note: If you access Event Analysis from the Respond view, you can see the Event Analysis for a selected event in an incident; the options are a subset of the options available when you open an event from within the Investigate view. To get complete functionality and examine other events, you can go to the Event Analysis view directly (INVESTIGATE > Event Analysis).

Workflow

The following figure is a high-level workflow illustrating the tasks you can do in NetWitness Investigate, with the Event Analysis view tasks highlighted in red.



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View
Threat Hunter	analyze raw events and metadata*	Begin an Investigation in the Event Analysis View
Threat Hunter	query events in the Event Analysis view (Version 11.1)*	Filter Results in the Event Analysis View
Threat Hunter	export events and files in the Event Analysis view*	Download Data in the Event Analysis View

User Role	I want to ...	Show me how
Threat Hunter	reconstruct events in Event Analysis view*	Examine Events in the Event Analysis View
Threat Hunter	perform external lookups from the Event Analysis view (Version 11.1)*	Act on Data in the Event Analysis View
Threat Hunter	query events in the Navigate view	Investigating Metadata in the Navigate View
Threat Hunter	query events in the Events view	Examining Raw Events in the Events View
Threat Hunter	investigate endpoints (Version 11.1)	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*

*You can perform this task in the current view.

- Event Analysis View - Text Analysis Panel
- Event Analysis View - File Analysis Panel

Quick Look

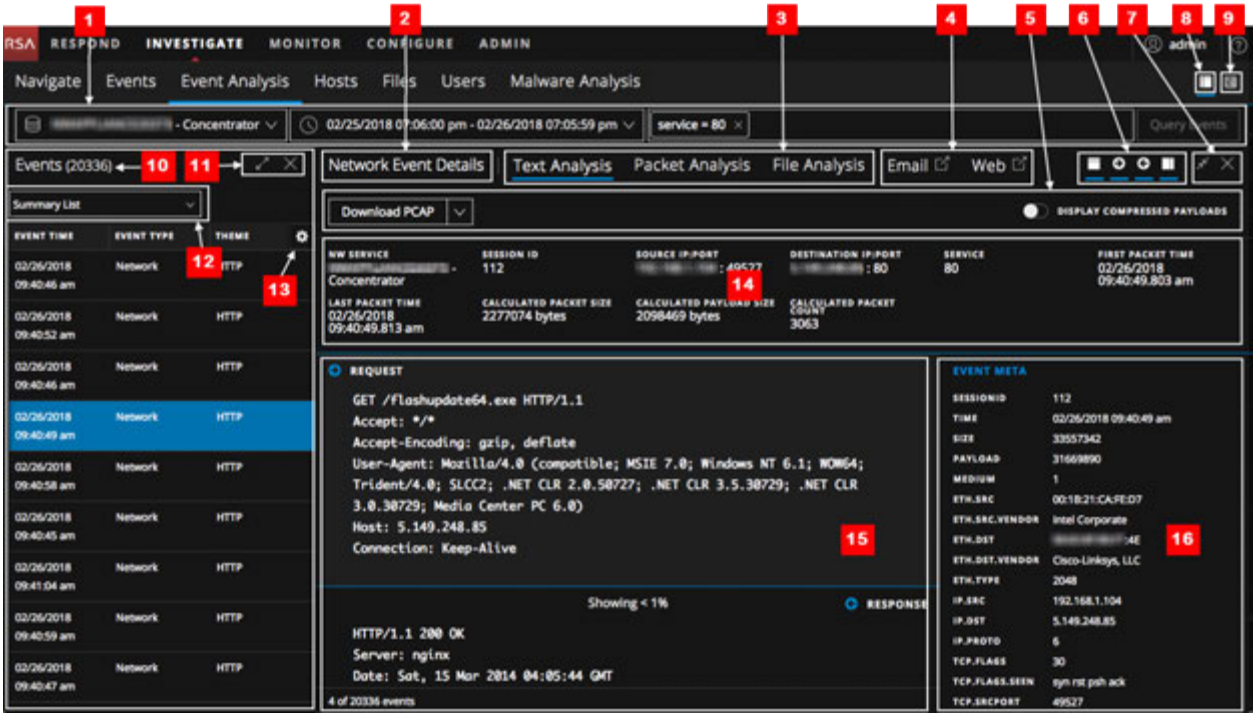
When you first open Investigate, input fields for a query are displayed so that you can select a service and time range, and type an optional query.

- Version 11.0 has the input fields in the Navigate view and the Events view.
- Version 11.1 has the input fields in the Navigate view, the Events view, and the Event Analysis view.

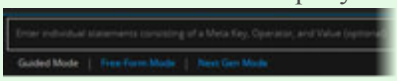
When you open a drill point in the Event Analysis view, the service being investigated counts the results of the initial query up to a limit of 100,000 events, and the first 100 events (packets, logs, and endpoint) are loaded in the Events panel. The columns in the Events panel are the Event Time, Event Type (Network, Log, or Endpoint), Event Size, and Summary. You can:

- Scroll through the list and click **Load More** to see the next 100 events.
- Select a column group (Version 11.1 and later).
- Select the columns that you want to include (Version 11.1 and later).
- Drag the columns to rearrange the order.
- Make columns wider or narrower.
- View the event analysis of an event.

The following figure highlights the major features of the Event Analysis view for Version 11.1 and later.



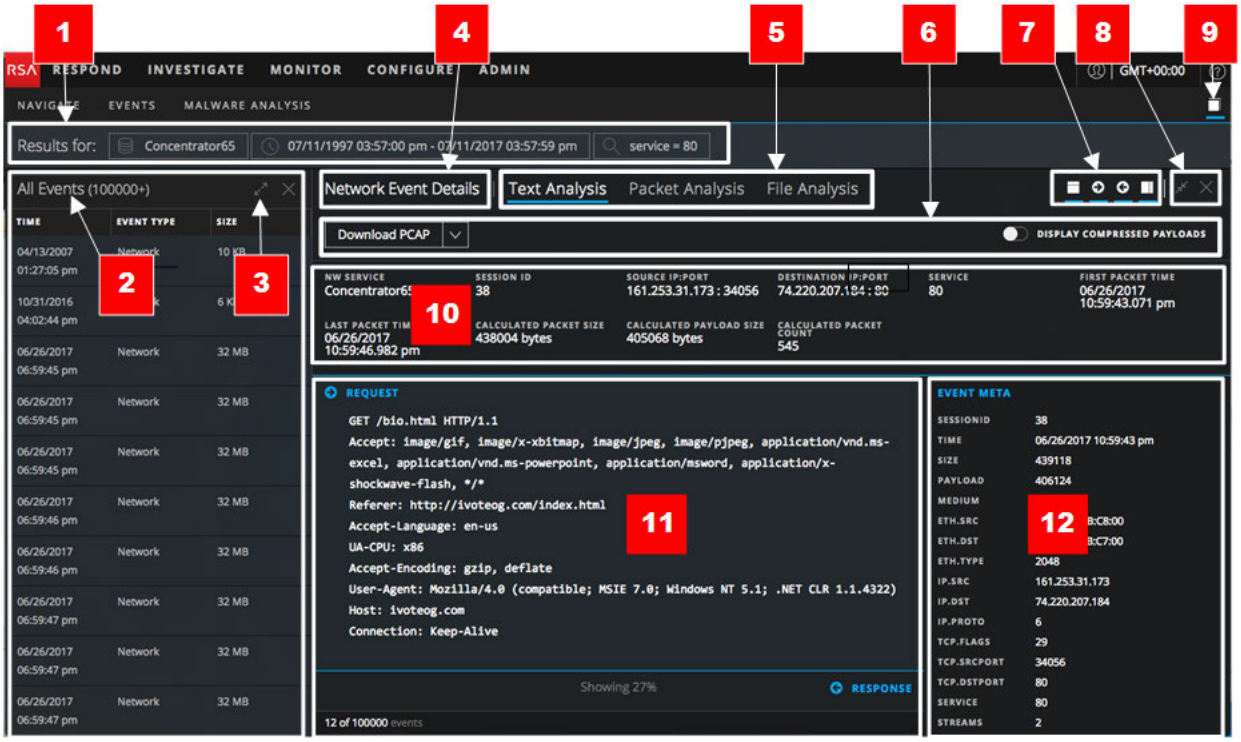
Note: Version 11.2 included an undocumented beta feature, called Next Gen mode, in the Event Analysis view query builder that was still being developed and tested; Next Gen mode was disabled in the 11.2.0.1 patch. If you see Next Gen mode do not use it; you should use only the Guided Mode and Free-Form Mode in the query builder to ensure consistent and predictable results.



1	**Interactive Breadcrumb**: When a service is selected, displays the service selector, time range selector, and the queries you have entered. In Version 11.1 and later, you can select a service as described in Begin an Investigation in the Event Analysis View and refine the query as described in Filter Results in the Event Analysis View. Clicking the **Submit Query** button submits the query and sends a request to the selected service to load the data.
2	The type of event being analyzed is reflected in the heading: **Network Event Details**, **Log Event Details**, or **Endpoint Event Details**. Each view is discussed in detail in Examine Events in the Event Analysis View.

3	The types of analysis available for the event type. Network events can use all types of analysis: text, packet, and file. Log and endpoint events use only text analysis.
4	The Email and Web analysis types open the current event as an email or web reconstruction in the Events view.
5	These options vary for the different types of analysis. They are discussed in detail in Examine Events in the Event Analysis View.
6	Controls to show or hide the Event Header, show or hide requests and responses, and open the Event Meta panel (16). These controls are described in Examine Events in the Event Analysis View.
7, 11	Controls to change the size of the panel and close the panel.
8	Reopens the Events panel or the Event Meta panel if you have closed it.
9	Sets preferences for the Event Analysis view (see Configure the Event Analysis View.
10	The Events panel for Version 11.1 is interactive, displaying query results as you submit updated queries. The Events panel includes a count of the events. You can rearrange and resize columns. You can scroll to the bottom of the list, and load more events (see Examine Events in the Event Analysis View).
12	The Column Group drop-down lists built-in and custom column groups that you can apply to the Events panel. The built-in column groups are Email Analysis, Endpoint Analysis, Malware Analysis, Outbound HTTP, Outbound SSL/TLS, and Summary List. Summary List is the default column group.
13	Settings to select the columns included in the Events panel.
14	The Event Header provides summary information about the event. This information is different for the different event types (packet, log, and endpoint).
15	The event data (sometimes called a payload for packets). The event data for a log event or endpoint event is typically a line of text from the raw log rather than request and response shown for a packet.
16	The Event Meta panel lists the meta keys and values found in the data. Some metadata are searchable; they have a binoculars icon, which you can click to see the associated data highlighted in the event data (see Examine Events in the Event Analysis View.

The following figure highlights the major features of the Event Analysis view for Version 11.0.0.x.



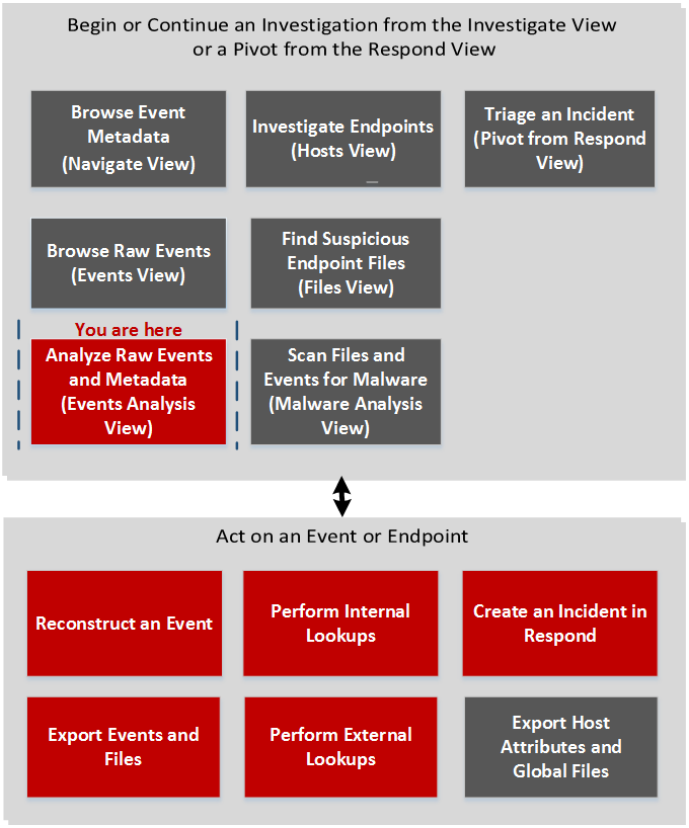
1	The read-only breadcrumb displays the selected service, time range, and query entered in the Navigate view or Events view.
2	This is a read-only list of events based on the query made in the Navigate or Events view. The Events panel includes a count of the events. You can rearrange and resize columns. You can scroll to the bottom of the list, and load more events (see Examine Events in the Event Analysis View).
3, 8	Controls to change the size of the panel and close the panel.
4	The type of event being analyzed is reflected in the heading: Network Event Details, Log Event Details, or Endpoint Event Details. Each view is discussed in detail in Examine Events in the Event Analysis View.
5	The types of analysis available for the event type. Network events can use all three types of analysis: text, packet, and file. Log and endpoint events use only text analysis.
6	These options vary for the different types of analysis. They are discussed in detail in Examine Events in the Event Analysis View.
7	Controls to show or hide the Event Header, show or hide requests and responses, and open the Event Meta panel (12). These controls are described in Examine Events in the Event Analysis View.
9	Reopens the Events panel or the Event Meta panel if you have closed it.
10	The Event Header provides summary information about the event. This information is different for the different event types (packet, log, and endpoint).
11	The event data (sometimes called a payload for packets). The event data for a log event or endpoint event is typically a line of text from the raw log rather than request and response shown for a packet.
12	The Event Meta panel lists the meta keys and values found in the data. Some meta data are

searchable; they have a binoculars icon, which you can click to see the associated data highlighted in the event data (see Examine Events in the Event Analysis View.

Event Analysis View - File Analysis Panel

In the File Analysis panel (**Event Analysis** > **File Analysis),** you can safely view a list of files and download one or more files in an event.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View

- Event Analysis View - File Analysis Panel

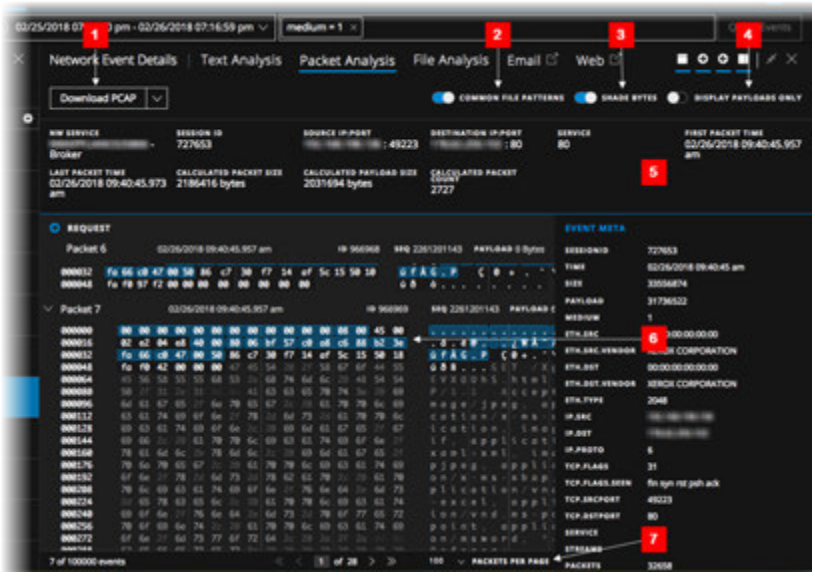
Quick Look

Only network events can be analyzed in the Packet Analysis panel. The Packet Analysis panel lists each packet in the event. The list of packets is scrollable. When you scroll, the packet or text identification information as well as the Request and Response labels remain visible rather than scrolling out of view.

In Version 11.1 and later, you can use pagination controls to go backward and forward through the pages, go to a specific page, and select the number of packets to display per page (100, 300, or 500).

Each packet is displayed with shading and highlighting to help identify common file patterns: significant header and payload bytes, hexadecimal and ascii bytes, and common file signatures. In addition, you can adjust the request/response display, and display or hide the packet summary.

Below is an example of the Packet Analysis panel with labels to identify features. For details and examples of each feature, see Examine Events in the Event Analysis View.

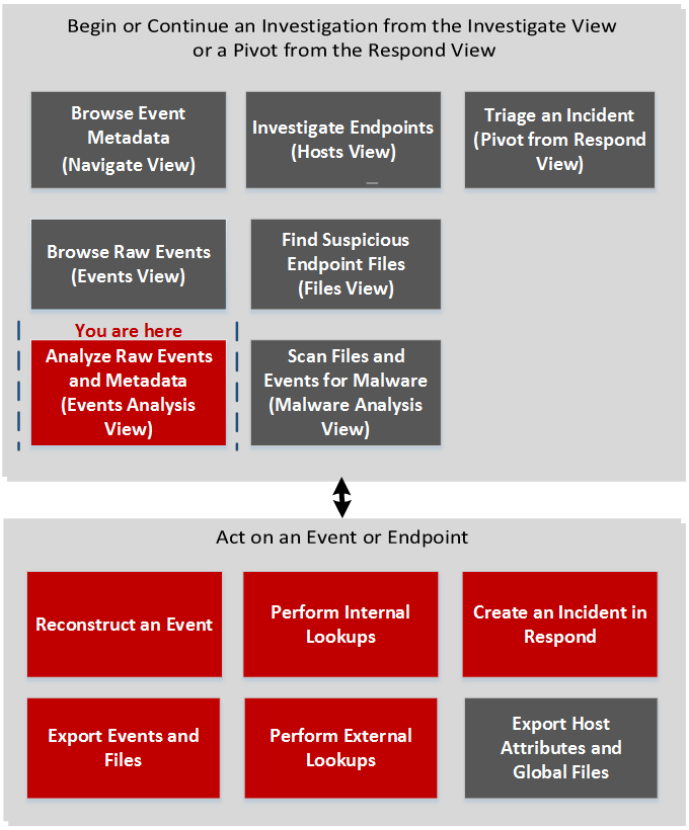


1	Options for exporting a network event. You can export a PCAP, all payloads, request payloads, or response payloads for deeper analysis and to share with others.
2	The option to identify common file signatures is activated by default. Common file signatures are highlighted in orange; hovering over the highlight reveals the file type.
3	The Shade Bytes option adds shading to identify the different hexadecimal bytes (00 to FF) using degrees of highlighting.
4	The option to display payloads only hides the packet headers, leaving more space for the payload.
5	The Event Header.
6	Significant bytes are highlighted in a blue background; as you move the cursor over the highlighting the meta data is displayed in a hover box.
7	(Version 11.1 and later) Packet pagination controls allow more flexibility in paging through a list of packets. When a control is unavailable, the image is dimmed; for example, when you are viewing page 1, the ⟪ and ⟨ controls are dimmed. ⟪ - Go to the first page ⟨ - Go to the previous page 1 of 206 - Go to a specific page ⟩ - Go to the next page ⟫ - Go to the last page  - Select the number of packets per page

Event Analysis View - Text Analysis Panel

In the Text Analysis panel (**Event Analysis > Text Analysis),** you can safely view and analyze the raw text payload of an event. The Text Analysis panel includes features that can show decompressed or compressed text, expand truncated entries, perform URL and Base64 encoding and decoding, and download network events, logs, and endpoint events. The Text Analysis panel is available for all types of events: network, log, and endpoint.

Workflow



What do you want to do?

User Role	I want to ...	Show me how

Threat Hunter	perform external lookups from the Event Analysis view (Version 11.1)*	Act on Data in the Event Analysis View
Threat Hunter	query events in the Navigate view	Investigating Metadata in the Navigate View
Threat Hunter	query events in the Events view	Examining Raw Events in the Events View
Threat Hunter	investigate endpoints (Version 11.1)	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*

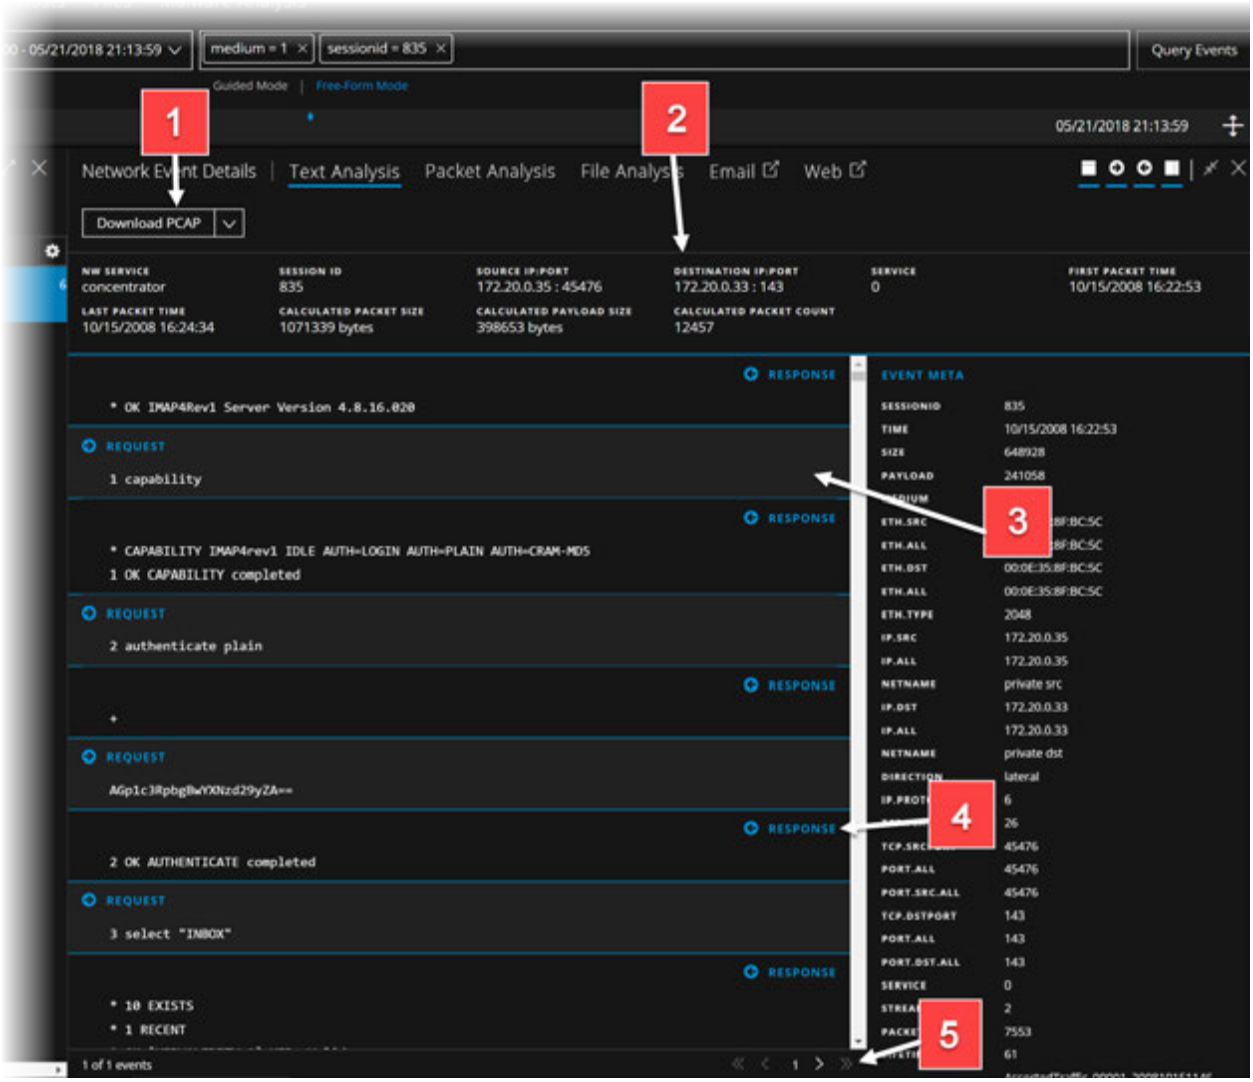
*You can perform this task in the current view.

Related Topics

- How NetWitness Investigate Works
- Event Analysis View
- Event Analysis View - Packet Analysis Panel
- Event Analysis View - File Analysis Panel

Quick Look

The Event Analysis view displays the text of a single event in the Text Analysis panel. When you click an event in the Event list panel, the adjacent panel shows the Text Analysis. Only the raw log for log events and endpoint events is shown in the Text Analysis panel. For network events, the direction of the packet (Request or Response) and contents of each packet are provided in text format. For more examples of the Text Analysis, see Analyzing Raw Events and Metadata in the Event Analysis View. For detailed procedures, see Examine Events in the Event Analysis View.



1	Options for exporting a log, a PCAP, or files for deeper analysis and to share with others. This download menu is for network data.
2	The event header information.
3	The payload for a network event includes requests and responses. This is the request side of the packet.
4	This is the response side of the packet.
5	(Version 11.2 and later) Event pagination controls allow more flexibility in paging through a list of events. When a control is unavailable, the image is dimmed; for example, when you are viewing page 1, the ⟪ and ⟨ controls are dimmed. ⟪ - Go to the first page ⟨ - Go to the previous page ⟩ - Go to the next page ⟫ - Go to last page (Only available after last page has already been navigated to)

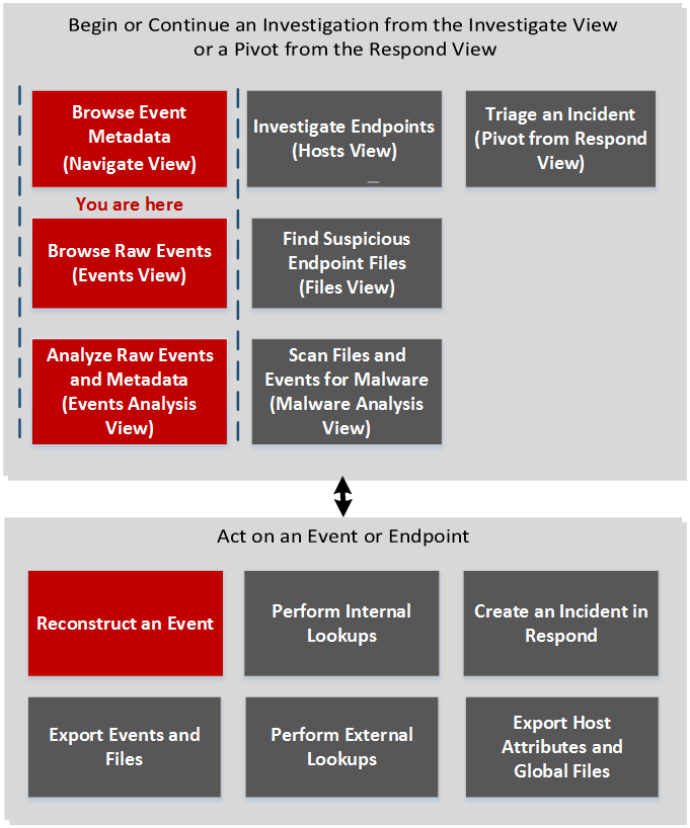
Event Reconstruction View

The Event Reconstruction view provides a reconstruction of a selected event from the Events view. By default, NetWitness Platform displays the best reconstruction for the event determined by the event content, or the default reconstruction that you have selected in the Default Session View setting for Investigate. You can use the options in the Event Reconstruction toolbar to change the reconstruction method, view top-to-bottom or side-by-side results, select request and response views, export an event, export meta values, extract files, open an email attachment, and open the event in a new tab.

To access this view, do one of the following:

- In any Events view, double-click an event.
- In the Events view with Detail View selected, right-click **Event Analysis** at the end of the event, and select **Event Reconstruction.**
- In the Event Reconstruction toolbar of previewed reconstruction, click **Open Event in New Tab**.
- In the Navigate view, select **Actions > Go to event in Event Reconstruction**, and enter an event ID.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View

Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*
Threat Hunter	reconstruct an event	Reconstruct an Event
Threat Hunter	extract files from a reconstructed event	Reconstruct an Event

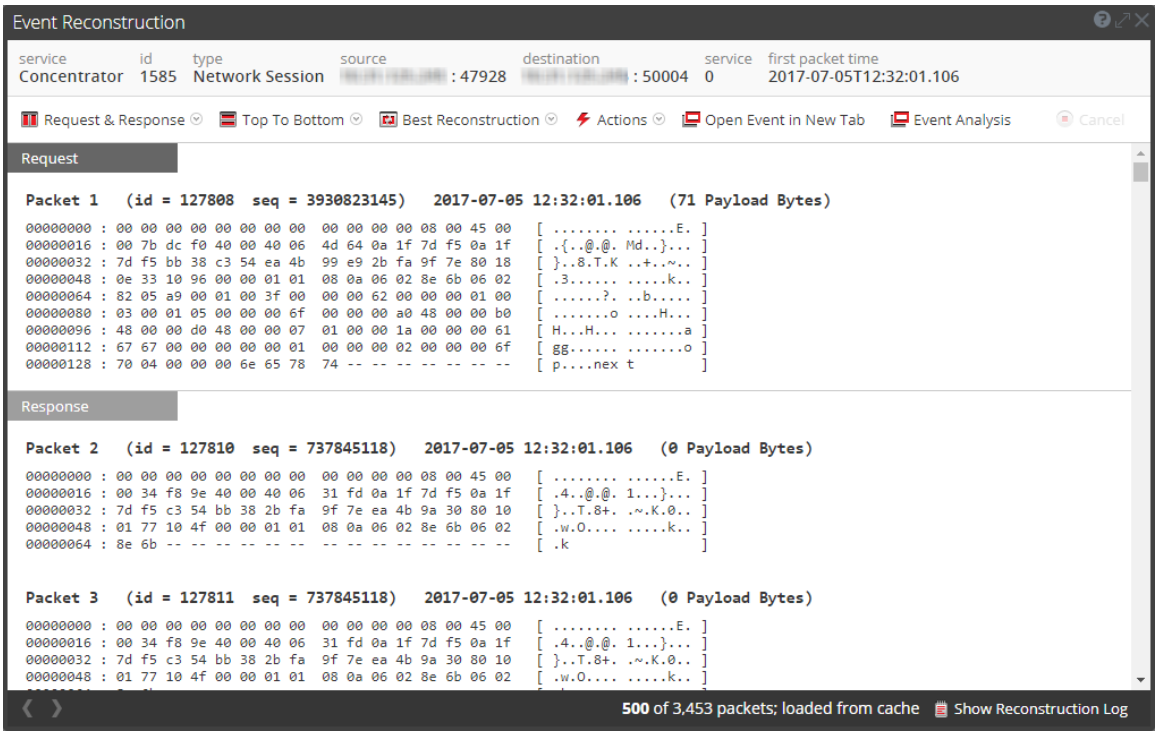
*You can perform this task in the current view.

Related Topics

- How NetWitness Investigate Works
- Event Analysis View

Quick Look

This figure is an example of the Event Reconstruction view. The following table describes the toolbar options.



Feature	Description
Request & Response	Displays a drop-down menu for selecting whether the view displays: • Request & Response • Request • Response
Organization	Displays a drop-down menu for selecting whether the information is displayed top to bottom or side by side.
View	Displays a drop-down menu for selecting what information is displayed. By default, Best Reconstruction is selected. Other options are: • View Meta • View Text • View Hex • View Packets • View Web • View Mail • View Files
Actions	Displays a drop-down menu with the actions available in the Event Reconstruction view.

Feature	Description
Open Event in New Tab	Opens the event in a new browser tab.

Beneath the toolbar is a list of meta keys and values. Some of the keys offer a drop-down menu with available actions.

The bar at the bottom of the view offers several options.

Feature	Description
	Displays the previous event.
	Displays the next event.
Show Reconstruction Log	Displays the reconstruction log at the bottom of the view. Once you click this button, it changes to Hide Reconstruction Log.

Events View

In the Events view a list of events associated with a session is available; this view is optimized for viewing raw events in sequence by time. You can display the events list in several forms, filter events, search for events, and open a reconstruction of an event.

There are two ways to display the Events view:

- Go to **INVESTIGATE > Events.** NetWitness Platform runs a default query on the last three hours for the default service (if one is set) or displays a dialog in which you can select a service and then runs the default query. The default query selects all events and the Events view displays events on the selected service, with the oldest events first.
- From within the **Navigate** view, double-click an event. The Events view displays the events on the selected service based on the drill point in the Navigate view.

Workflow

Threat Hunter	perform external lookups	Launch an External Lookup of a Meta Key
Threat Hunter or Incident Responder	add one or more events to an existing incident or to a new incident*	Add Events to an Incident for Response

*You can perform this task in the current view.

Related Topics

- How NetWitness Investigate Works
- Examining Raw Events in the Events View
- Querying and Acting on Data in the Navigate and Events Views

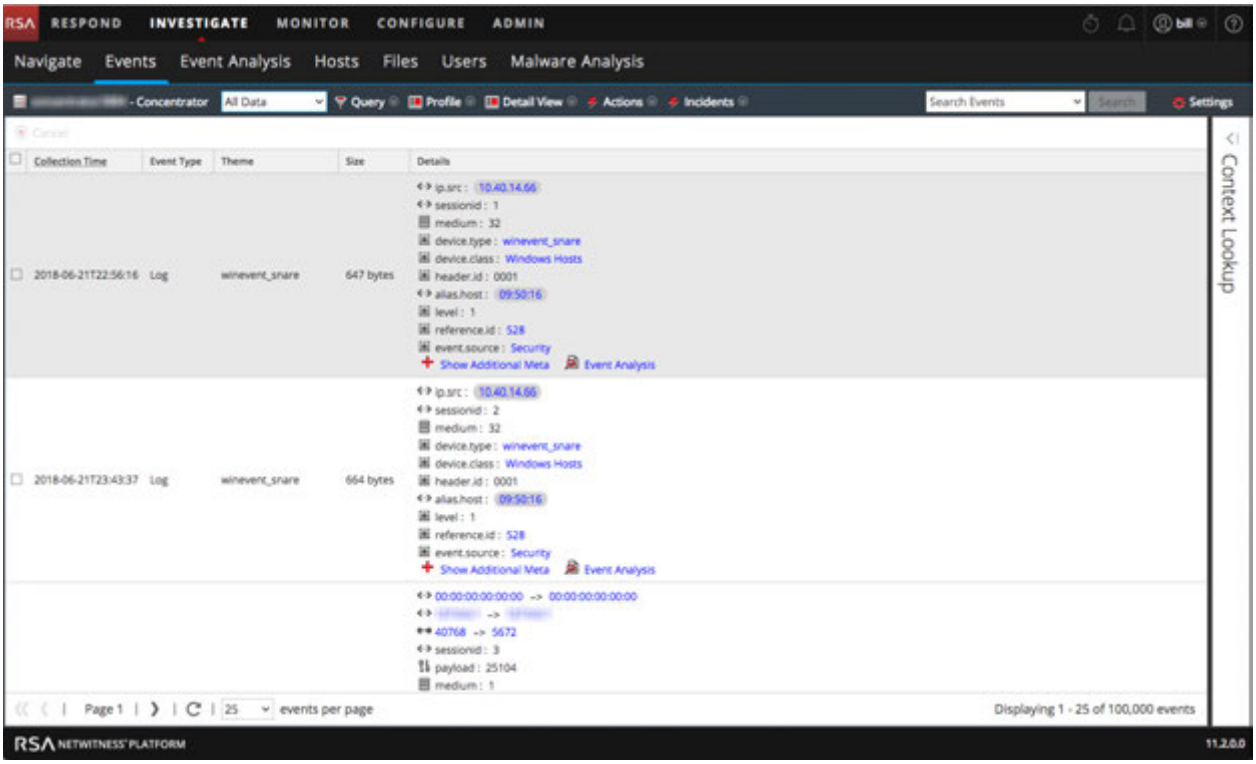
Quick Look

The Events view provides three built-in presentations of event data: the Detail view, the List view, and the Log view. The List view and Detail view are intended for viewing packet data events, and they provide more information for each event including the timestamp, event type, event theme, and size.

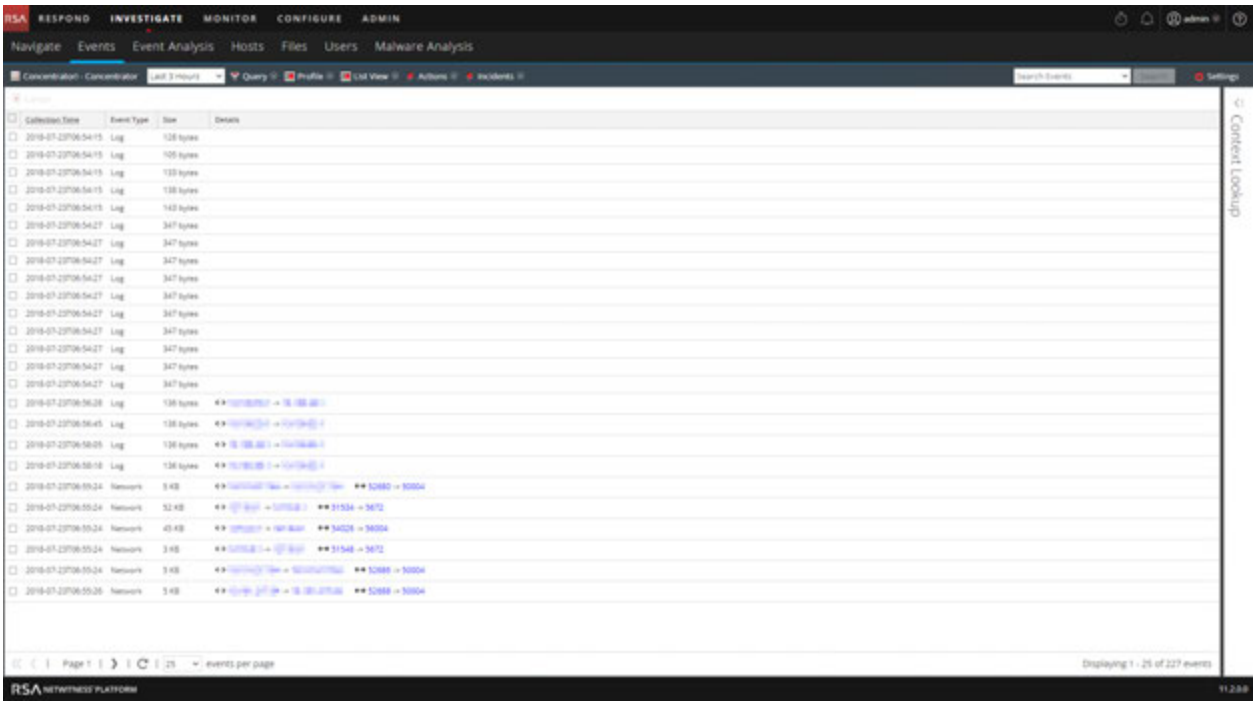
- The List View shows corresponding source and destination address and port information for events in summary form in a grid.
- The Detail View shows all metadata collected for the event in a paged view.
- The Log View is optimized for viewing log information, and provides more information for each log including the timestamp, event type, service type, service class, and the logs.

You can use queries, the time range setting, and profiles to filter the events listed in the Events view. From any view type in Events view, you can extract files; export events, logs, and meta values; open the Event Reconstruction panel, and open Event Analysis.

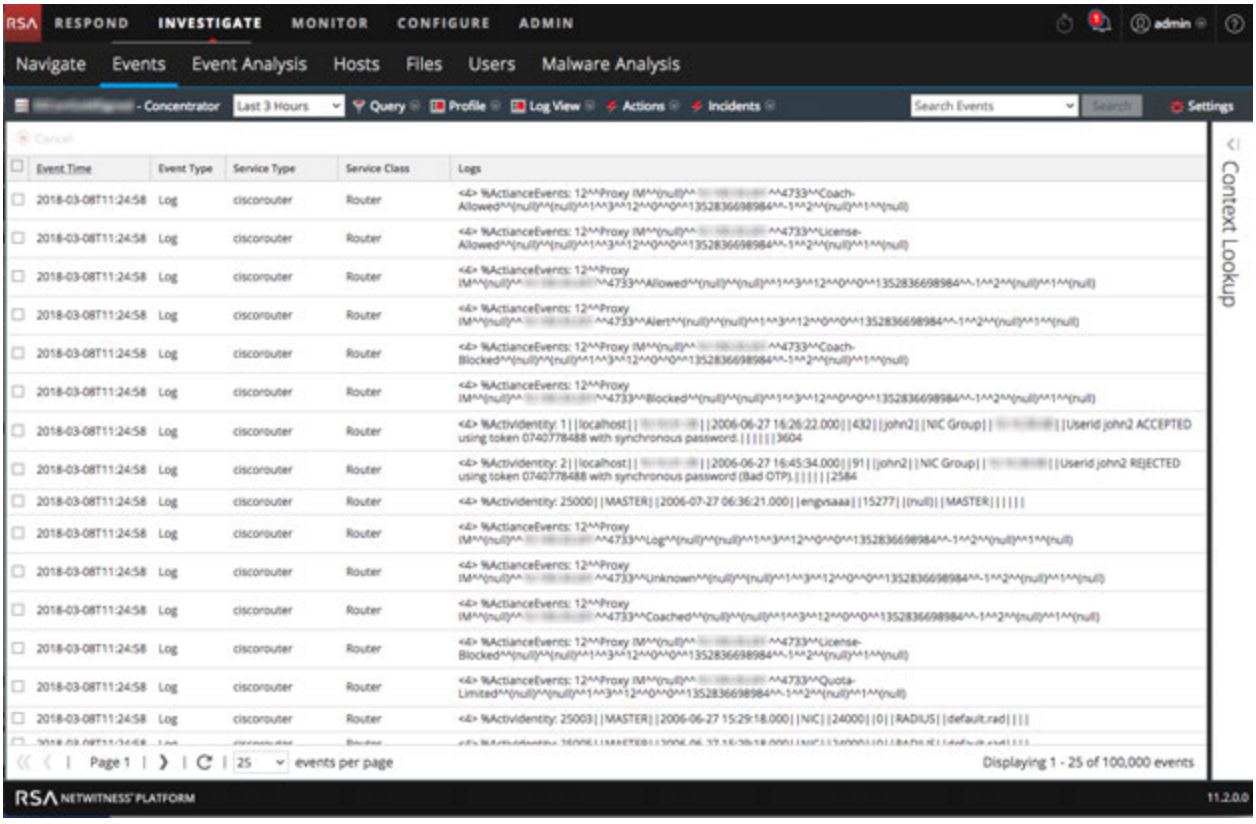
The following figure is an example of events in the Detail View. The Context Lookup panel is visible only if the Context Hub service is configured.



The following figure is an example of events in the List View.



The following figure is an example of the Log View.



Detailed Description

The Events view has a toolbar at the top with the following options.

Feature	Description
Select Service	Displays the selected service name next to the icon. Opens the Select a Service dialog, in which you can select a service for which the event list is displayed.
Time Range	Displays a drop-down menu for selecting the time range to apply to the event list. You can choose one of the standard options or specify a custom time range.
Query	Displays the Create Filter dialog, in which you can enter a custom query directly instead of drilling down the data (see Create a Custom Query)
Profile	Displays the Use Profile menu; the currently selected profile is displayed in the toolbar. A profile allows you to manage and use profiles that can include custom meta groups, a default column group, and a beginning query. The Profiles apply to the Navigate view (meta groups and queries) and the Events view (column groups and queries).
View Type Drop-down	Displays a drop-down menu for selecting the event view type. • Detail View shows events in a paged format with detailed information for each event. • List view shows the events in grid form with a summary of each event in a separate row. • Log View shows a log-oriented events grid with a summary of each log in a separate row. • Custom Column Groups displays the event list using a column group selected from a drop-down list of custom column groups. • Manage Column Groups displays the dialog for creating and editing custom column groups.
Actions	Displays a drop-down menu with actions in the Events view: • Extract Files, export events as a PCAP file, export logs, or export meta values. • View an event reconstruction in a popup window or in a new tab. • View Event Analysis • Reset all filters in the Events view.
Incidents	Create a new incident in Respond and add the selected events, or add selected events to an existing incident in Respond.

Feature	Description
Search	Displays the Search Events options, which allow you to specify the export log and export meta value format with additional options explained in Search for Text Patterns
Settings	Displays the Investigation settings for the Events view (which are also available in the Profile view) so that you can change Investigation settings without navigating away from the Events view. When you change a setting In the Events view the setting is also changed in the Profile view (see Configure the Navigate View and Events View).

Files View

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

In the **Files view**, a list of unique executable files found in the deployment is available. To access this view, go to **INVESTIGATE > Files**. By default, the Files view displays 100 files. To display more files, click **Load More** at the bottom of the page.

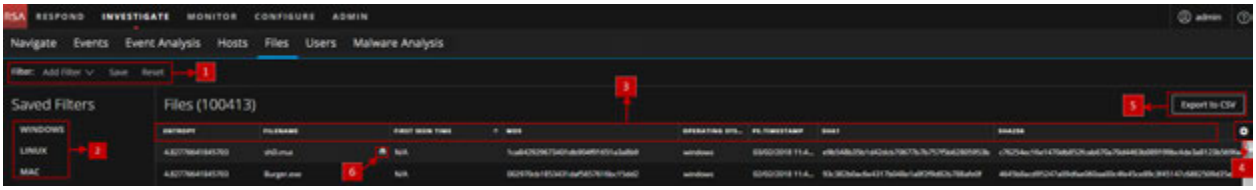
Related Topics

- How NetWitness Investigate Works
- Investigating Hosts and Files

Quick Look

Below is an example of the Files view:



1. **Add Filter Drop-down Menu**. You can filter the files by choosing an operating system (Windows, Linux, or Mac), saved filters, or by selecting the options in the Add Filters drop-down menu. For more information, see Filter Files.
2. **Saved Filters.** The Saved Filters panel lists the saved filters. For more information, see Filter Files.

3 **Sort Columns.** You can sort the list by:

Filename - Name of the file.

First Seen Time - First time the hash was seen in the host.

Signature - Indicates if the file is signed or unsigned, valid or invalid, and provides signatory information.

Size - Size of the file.

Entropy - Determines if the contents are compressed or encrypted.

Format - Format of the file - Windows (PE), Linux (ELF and scripts), and Mac (Macho).

PE.Resources.Company - Company name.

Note: Sorting on columns is case-sensitive. It sorts the number first, uppercase, and then the lowercase.

4 **Settings Menu.** You can set Files view preferences by selecting columns from the Settings menu. For more information, see Set Files Preference.

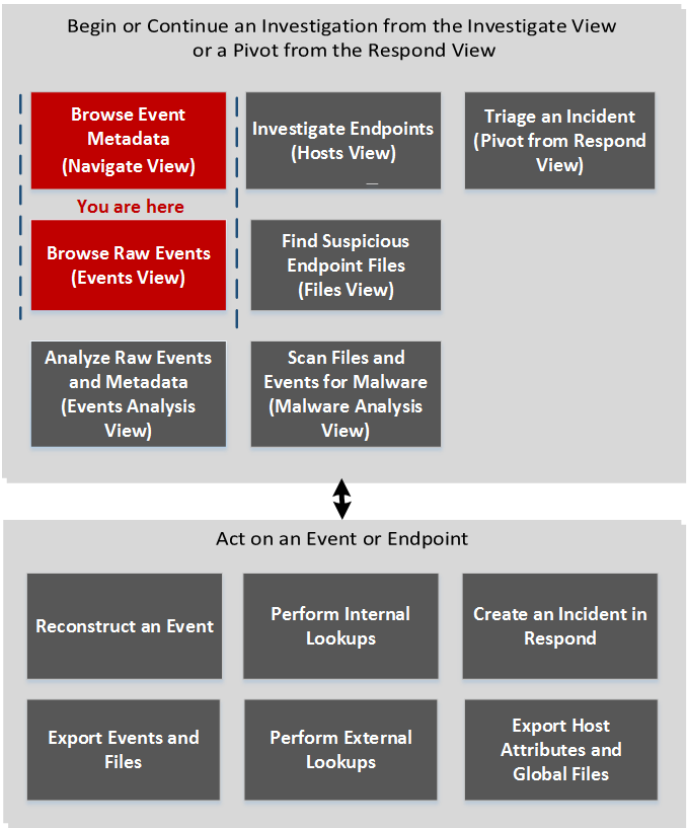
5 **Export to CSV** - Extracts global files to a CSV file. For more information, see Investigate Files.

6 **Pivot to Navigate and Event Analysis views.** To investigate a particular filename or hash (SHA256 and MD5), you can pivot to both Navigate and Event Analysis views. For more information, see Pivot to Navigate and Event Analysis Views.

Investigate Dialog

In the Investigate dialog, analysts can select a service or a collection to investigate. The dialog is automatically displayed when you first go to the Navigate view or Events view and have not selected a default service to investigate. To access the dialog from a current investigation, select the current service name in the toolbar.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View
Threat Hunter	analyze raw events and metadata	Begin an Investigation in the Event Analysis View

User Role	I want to ...	Show me how
Threat Hunter	investigate endpoints (Version 11.1)	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*
Threat Hunter	select a service to investigate*	Begin an Investigation in the Navigate or Events View

*You can perform this task in the current view.

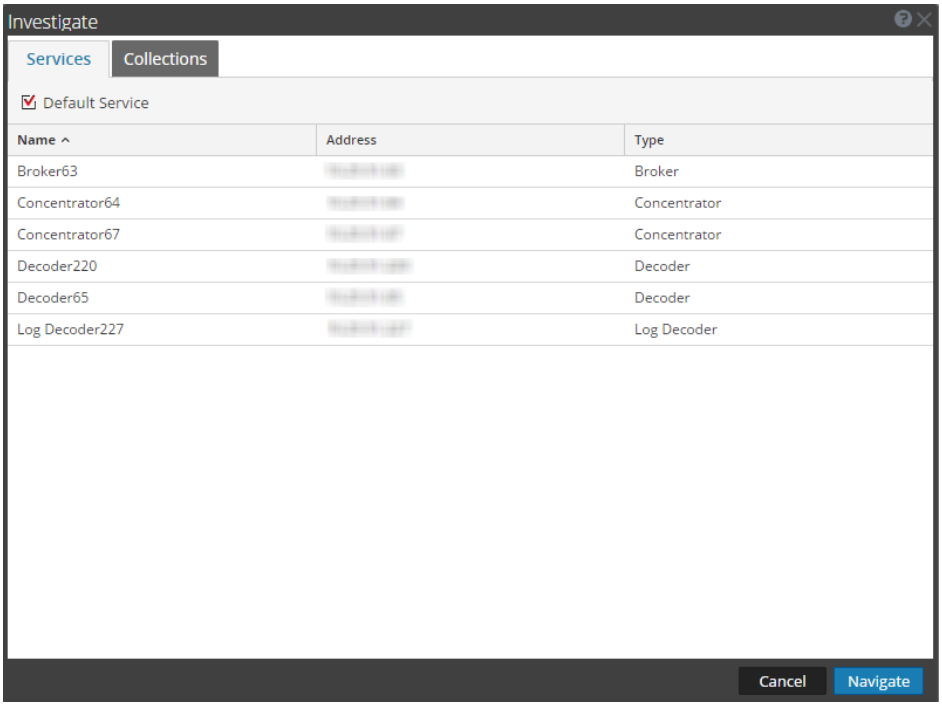
Quick Look



The Investigate dialog has two tabs: Services and Collections.

Note: Collections are also known as workbench collections. You can only view workbench collections that you have created, and only administrators can create a workbench collection.

The Services tab includes a list of services available for investigation, and three buttons. All features are described in the following table.

Feature	Description
Default Service	Clicking this button sets or clears the default service to investigate. When a service has been set as the default service, the word (Default) is appended to the service name.
Name	The name of the service.
Address	The IP address of the service.
Type	The type of service.
Cancel	Closes the dialog.
Navigate	Opens the selected service in the Navigate or Events view.

The Collections tab has two buttons and two panels: Workbench and Collections.

The Workbench panel lists available Workbench services by name. After a Workbench service is selected, you can select a collection from the Collections panel.

The Collections panel lists available collections to investigate. After a collection is selected, you can click Navigate to view the collection.

The following table describes the features of the Collections panel.

Feature	Description
Name	The name of the collection.
Type	The type of collection.
Size	The size of the collection.
Data Type	The type of data within the collection.
Date Created	The date the collection was created.

Investigation Tab - User Preferences Panel

In the Profile view > Preferences panel > Investigation tab, users can set several preferences that affect the performance and behavior of NetWitness Platform when analyzing data, viewing events, and reconstructing events in NetWitness Investigate. To access this tab, select > Profile. When the Profile view is displayed, select **Preferences > Investigation**. You can change user preferences at any time when you are working in NetWitness Platform.

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	view and change user preferences for Investigate*	Configure the Navigate View and Events View

*You can perform this task in the current view.

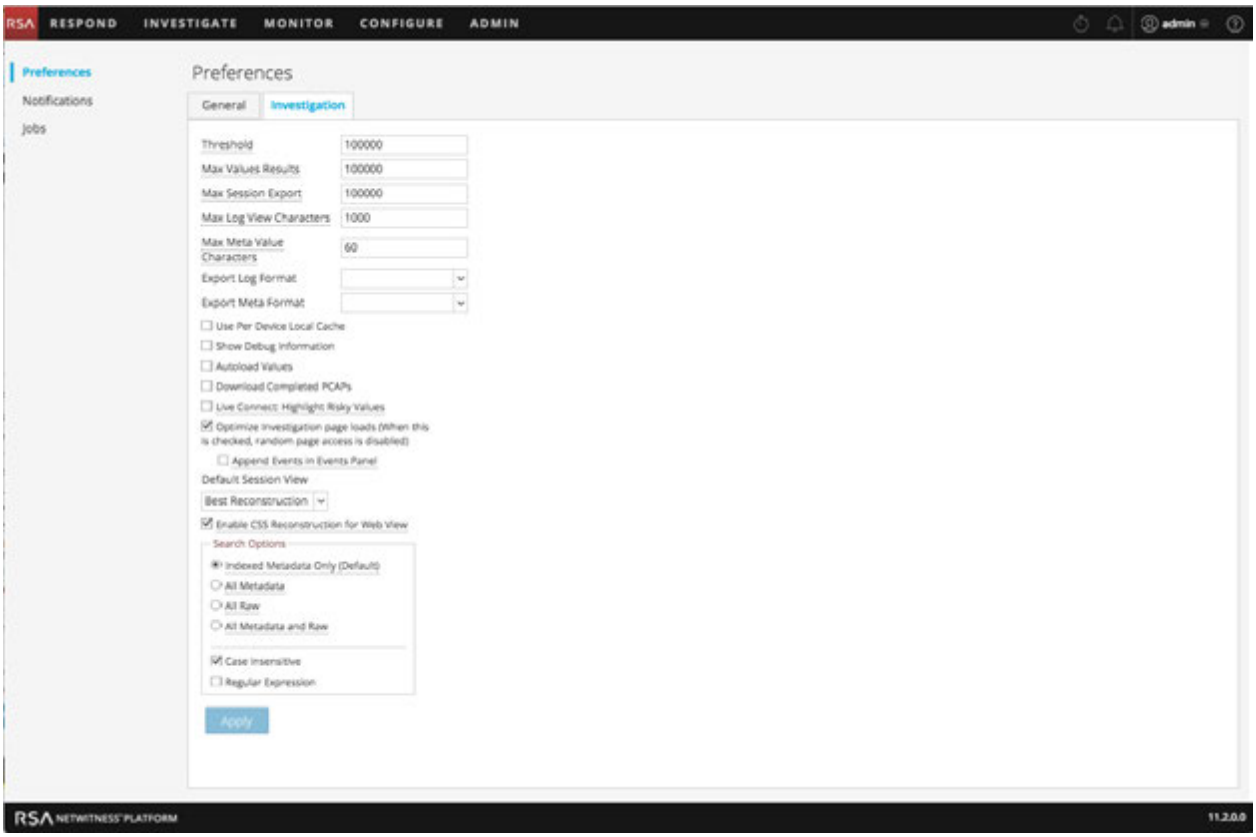
Quick Look

This figure is an example of the Investigation tab, and the following table describes the preferences that affect Investigate. There are slight differences between the 11.1 and 11.2 version of the search settings and these are explained in Search for Text Patterns.



Feature	Description
Threshold	This setting controls the count shown for a Meta Key value in the Navigate view during the load. A higher threshold allows more accurate counts for a value. However, a higher threshold causes longer load times. When the threshold is reached, NetWitness Platform displays the count and the percentage of time used to reach the count in comparison to the time necessary to load all sessions with that value. For example, **(>100000 - 18%)** indicates that the threshold was set at 100000 and this load took only 18% of the time it would have taken with no threshold set. The default value is **100000**.
Max Values Results	This setting controls the maximum number of values to load in the Navigate View when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The default value is **1000**.
Max Session Export	This setting controls the maximum number of sessions that can be exported. The default value is **100000**.
Max Log View Characters	This setting controls the maximum number of characters to be displayed on **Investigation > Events > Log Text**. The default value is **1000**.

Feature	Description
Export Log Format	This setting specifies the default format for exporting logs from Investigation. Available options are **Text**, **XML**, **CSV**, and **JSON**. There is no built-in default value for the log export format. If you do not select a format here, NetWitness Platform displays a selection dialog when you invoke export of logs. When you select one of the options from the Export Log Format drop-down menu and click Apply, the setting goes into effect immediately.
Export Meta Format	This setting specifies the default format for exporting meta values from Investigation. Available options are Text, XML, CSV, and JSON. There is no built-in default value for the meta export format. If you do not select a format here, NetWitness Platform displays a selection dialog when you invoke export of meta. When you select one of the options from the Export Meta Format drop-down menu and click Apply, the setting goes into effect immediately.
Use Per Device Local Cache	
Show Debug Information	When this option is selected, NetWitness Platform displays the `where` clause beneath the breadcrumb in the Navigate view. For each meta value load, the load time is displayed. If the service is a Broker, then the elapsed time for each aggregated service is reported. The default value is **Off.**
Append Events in Events Panel	When this option is selected, the events displayed in the **Events Panel** are added incrementally rather than overwriting the currently displayed events. Each time you click the next page icon, the additional events are appended to the previous events; 1 -25, then 1 -50, then 1 -75 and so on. **Note:** This option is available, only if the Optimize Investigation Page Loads option is enabled
Autoload Values	When this option is selected, the service values are automatically loaded in the Navigate view. When not selected, NetWitness Platform displays a **Load Values** button, allowing the user the opportunity to modify the options. The default value is **Off**.
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in the Investigate so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP format.
Live Connect: Highlight Risky Values	
Optimize Investigation Page Loads	This option is enabled by default (checked) and controls how the Events view retrieves events. When optimized, results are returned as quickly as possible. This sacrifices the original ability to go to a specific page in the event list. Unchecking this box changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). Being able to go to any page in the list sacrifices some speed in returning the results due to additional overhead determining the events in advance.

Feature	Description
Default Session View	This setting selects the default reconstruction type for the initial reconstruction view. By default events are reconstructed using the reconstruction type most appropriate to the event.
Enable CSS Reconstruction for Web View	This setting controls how web content reconstruction is performed. If enabled, the web reconstruction includes cascaded style sheet (CSS) styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for stylesheets and images used in the target event. The option is enabled by default. Uncheck this option if there are problems viewing specific websites. **Note:** The appearance of the reconstructed content may not match the original web page perfectly if related images and stylesheets could not be found or were loaded from the web browser's cache. Also, any layout or styling that is performed dynamically via client side javascript will not render in the reconstruction because all client side javascript is removed for security purposes.
Search Options	This setting sets the default search options to apply to a search in the Navigate and Events views. Search for Text Patterns provides detailed information.
Apply	Saves your preferences and puts them into effect immediately.

Investigate View

The Investigate view (INVESTIGATE) is the primary entry point to NetWitness Investigate. The Investigate view has six submenus, which open different views that allow you to analyze events from different perspectives. The submenus are: Navigate, Events, Event Analysis, Hosts, Files, Users, and Malware Analysis.

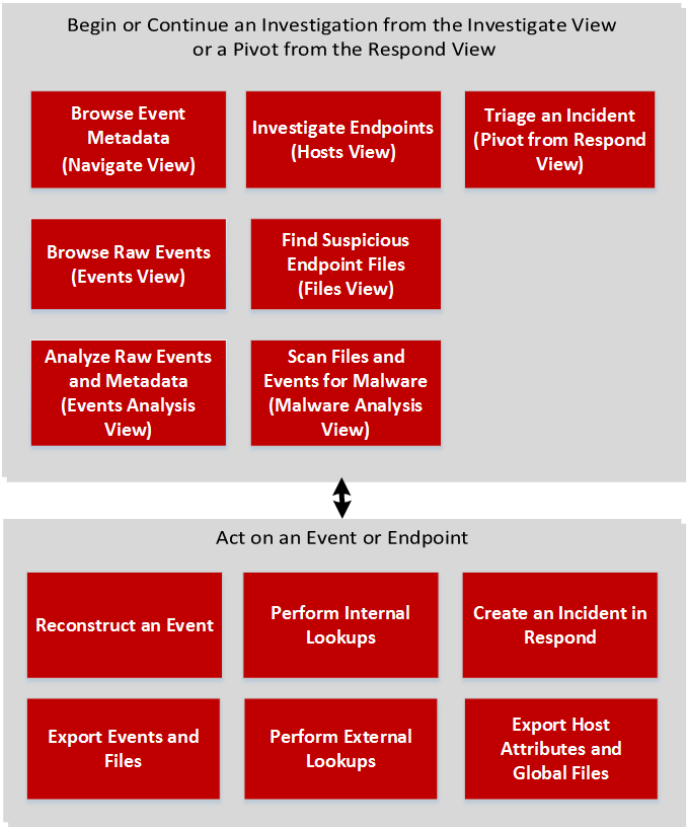
Note: The Event Analysis, Hosts, and Files submenus are available in Version 11.1 and later. The Users menu is available in Version 11.2 and later. Configured permissions per user role and user determine which submenus are displayed .

You can use the submenu options to move between the different views.

- The Navigate view, Events view, and Event Analysis view offer linkages to each other to look at the current results from a different perspective, which provides some continuity for the investigation as you move between views.
- The Hosts view and Files view integrate NetWitness Endpoint into Investigate, and provide a view of all hosts with a NetWitness Endpoint agent installed and a view of unique executable files found in the deployed environment.
- The Users view provides visibility into risky user behaviors across your enterprise using NetWitness UEBA. You can view a list of high-risk users and a summary of the top alerts for risky behavior for your environment, and then select a user or an alert and view details about the risky behavior and a timeline during which the behaviors occurred.
- The Malware Analysis view provides the ability to scan files found in one of the other views or collected by continuous scanning of network traffic.

Workflow

The workflow below depicts the high-level tasks when investigating events.



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events*	Begin an Investigation in the Navigate or Events View
Threat Hunter	analyze raw events and metadata*	Begin an Investigation in the Event Analysis View
Threat Hunter	investigate endpoints (Version 11.1)*	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)*	Investigate Files
Threat Hunter	scan files and events for malware*	Conducting Malware Analysis

*You can perform this task in the current view.

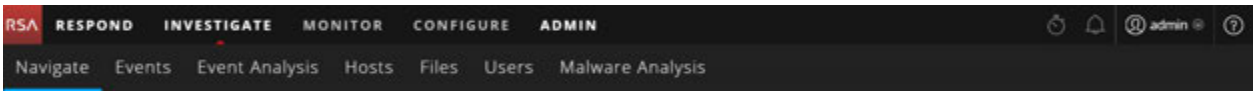
- Malware Analysis View
- *NetWitness UEBA User Guide*

Quick Look

The Investigate view consists of six views, each representing a different approach to analyzing data. By default, Investigate opens to the Navigate view. You can change the default view to one of the other views. See How NetWitness Investigate Works for an introduction to the uses for each view. The following figure illustrates the submenus under INVESTIGATE.



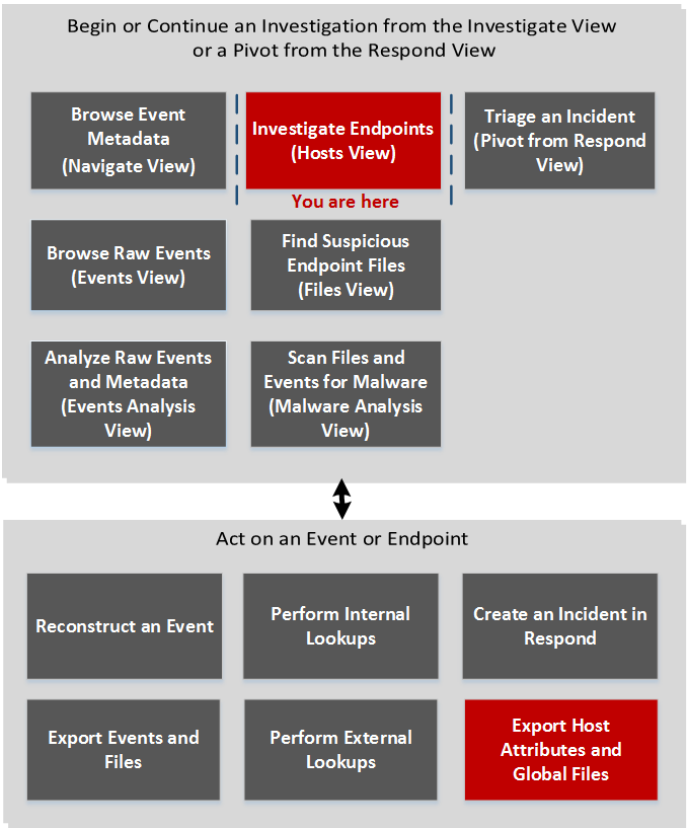
Hosts View

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

In NetWitness Investigate, the Hosts view provides a list of all hosts with an Endpoint agent installed. The table displays a set of default columns for the host. You can customize this view by setting the Hosts preferences. To access this view, go to **INVESTIGATE > Hosts**.

Workflow

The following figure shows the high-level Investigate workflow with Investigate Endpoints tasks highlighted.



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View

User Role	I want to ...	Show me how
Threat Hunter	analyze raw events and metadata	Begin an Investigation in the Event Analysis View
Threat Hunter	investigate endpoints (Version 11.1)*	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*
Threat Hunter	export host attributes and global files*	Investigate Hosts

*You can perform this task in the current view.

Related Topics

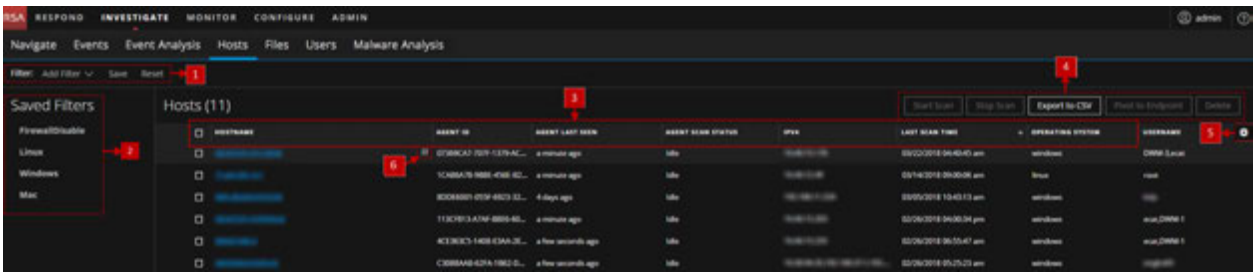
- Investigating Hosts and Files
- Hosts View - Overview Tab
- Hosts View - Process Tab
- Hosts View - Autoruns Tab
- Hosts View - Files Tab
- Hosts View - Drivers Tab
- Hosts View - Libraries Tab
- Hosts View - System Information Tab

Quick Look

In the Hosts view, you can export host attributes and global files, perform an on-demand scan, set host preferences, view a list of hosts, and investigate in the Navigate or Events view.

Below is an example of the Hosts view: s



1 **Add Filter Drop-down Menu**. You can filter the hosts by choosing an operating system (Windows, Linux, or Mac), saved filters, or by selecting the options in the Add Filters drop-down menu. For more information, see Filter Hosts.

2 **Saved Filters.** The Saved Filters panel lists the saved filters. For more information, see Filter Hosts.

3 **Sort Columns**. Lets you sort on columns.

> **Note:** Sorting on columns is case-sensitive. It sorts the number first, uppercase, and then the lowercase.
> Sorting on Agent Scan Status and Agent Last Seen fields do not display the correct order.

4 **Actions in the toolbar:**
Start Scan - Starts a scan for the selected hosts.
Stop Scan - Stops a scan for the selected hosts.
Export to CSV - Extracts host attributes to a CSV file. For more information, Export Host Attributes.
Pivot to Endpoint - Lets you investigate the NetWitness Endpoint host (version 4.4.0.2 or later). For more information, see Investigate NetWitness Endpoint 4.4.0.2 or Later Hosts.
Delete - Lets you delete hosts manually from the user interface. After deletion, the Endpoint server does not process any request from this host.

> **Note:** Make sure that the agent is uninstalled from the host before deleting it from the user interface. For more information, see Delete a Host.

5 **Settings Menu.** You can set Hosts view preferences by selecting columns from the Settings menu. For more information, see Set Hosts Preference.

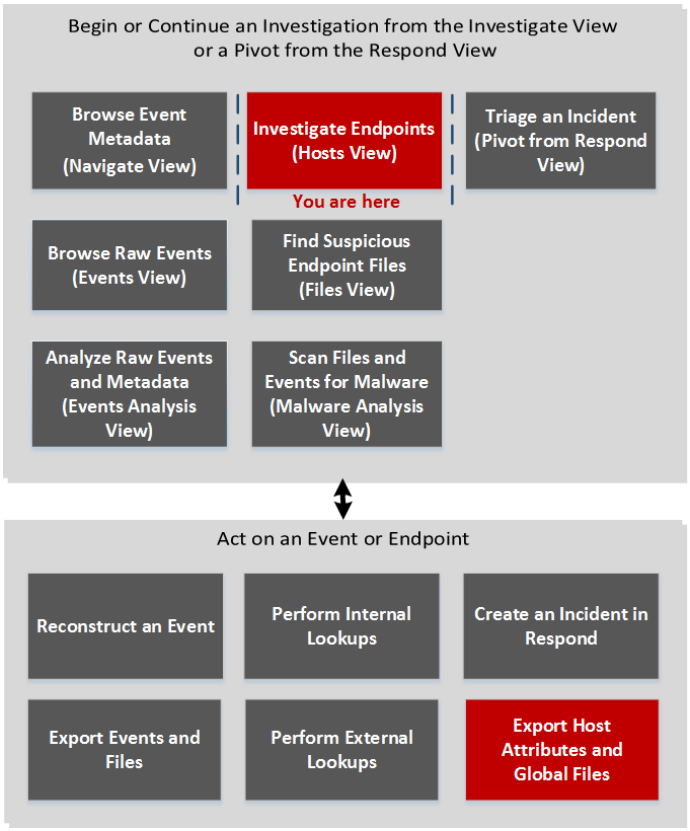
6 **Pivot to Navigate and Event Analysis views**. To investigate a particular host, IP address, or username, you can pivot to both Navigate and Event Analysis views. For more information, see Pivot to the Navigate and Event Analysis Views.

Hosts View - Autoruns Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Autoruns panel provides a list of autoruns, services, tasks, and cron jobs running on the host. To access this tab, select a host from the **Hosts** view and click the **Autoruns** tab.

Workflow



What do you want to do?

User Role	I want to ...	Show me hows
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View
Threat Hunter	analyze raw events and metadata	Begin an Investigation in the Event Analysis View

User Role	I want to ...	Show me hows
Threat Hunter	investigate endpoints (Version 11.1)*	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*
Threat Hunter	view the autoruns, services, tasks, and cron jobs running on the host*	Analyze Autoruns

*You can perform this task in the current view.

Related Topics

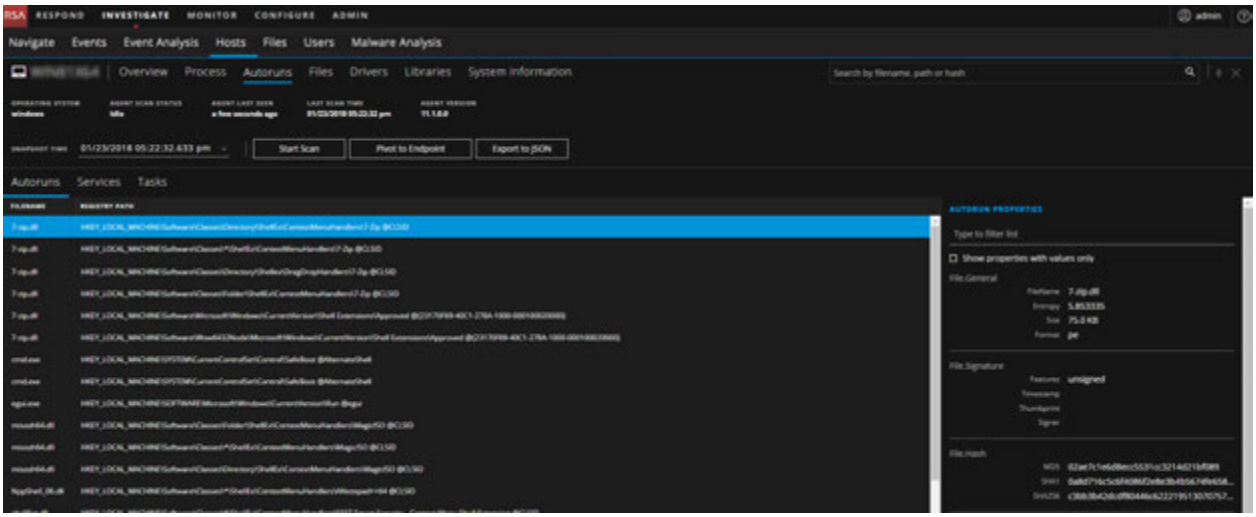
Quick Look

Below is an example of the Autoruns tab:



Category	Description
Autoruns	Files that are executed at start-up. It displays the following columns: • File name - `cmd.exe` • Registry path - `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SafeBoot @AlternateShell`
Services	Files that are running as a service for the selected host. It displays the following columns: • Service name - `acsock` • Running status - `stopped` • File creation time - `07/11/2017 11:47:00 am` • Signature - `Microsoft, signed, valid` • File path - `C:\Windows\System32\drivers`
Tasks/Cron jobs	Files that are configured to run as scheduled tasks along with the trigger. It displays the following columns: • Name - `shell32.dll` • Hash - `cafa6e7b6a9220e7c805ea476a89a78800f48bb48c66fe5f935057940df3909c` • Last run time - `01/19/2018 05:34:50 pm` • Next run time - `12/30/1899 05:30:00 am` • Trigger - `No Trigger`

Autoruns Properties Panel

This panel displays all properties of the selected file. It is grouped as follows:

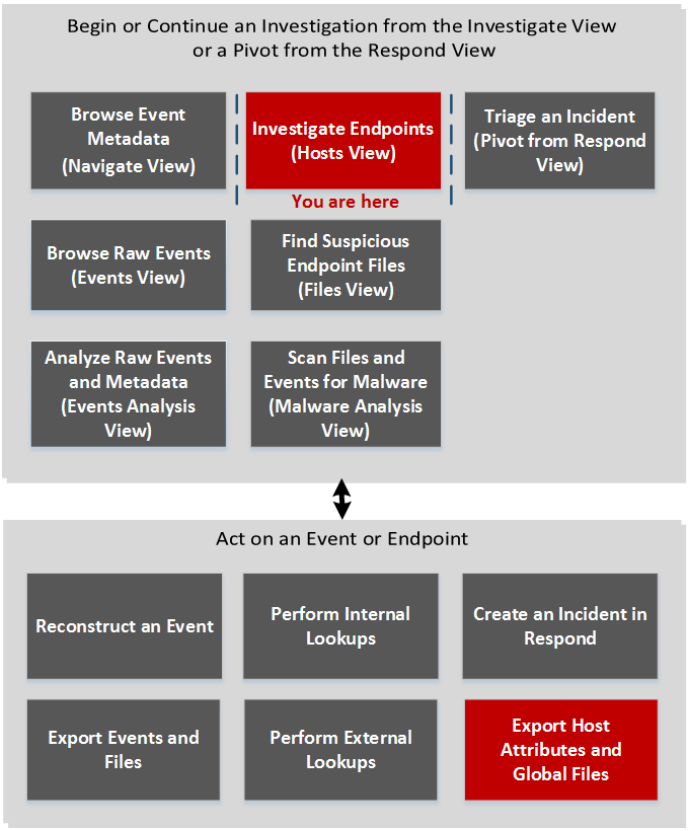
Category	Description
Signature	Provides signatory information.
Hash	Hash type of the file (MD5, SHA256, and SHA1).
Time	Time when the file was created, modified, or accessed.
Location	Location of the file.
Image	Load Image.

Hosts View - Drivers Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Drivers tab lists the drivers running on the hosts at the time of scan. To access this tab, select a host from the **Hosts** view and click the **Drivers** tab.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View
Threat Hunter	analyze raw events and metadata	Begin an Investigation in the Event Analysis View

User Role	I want to ...	Show me how
Threat Hunter	investigate endpoints (Version 11.1)*	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*
Threat Hunter	view the drivers running on the host*	Investigate Hosts

*You can perform this task in the current view.

Related Topics

- How NetWitness Investigate Works

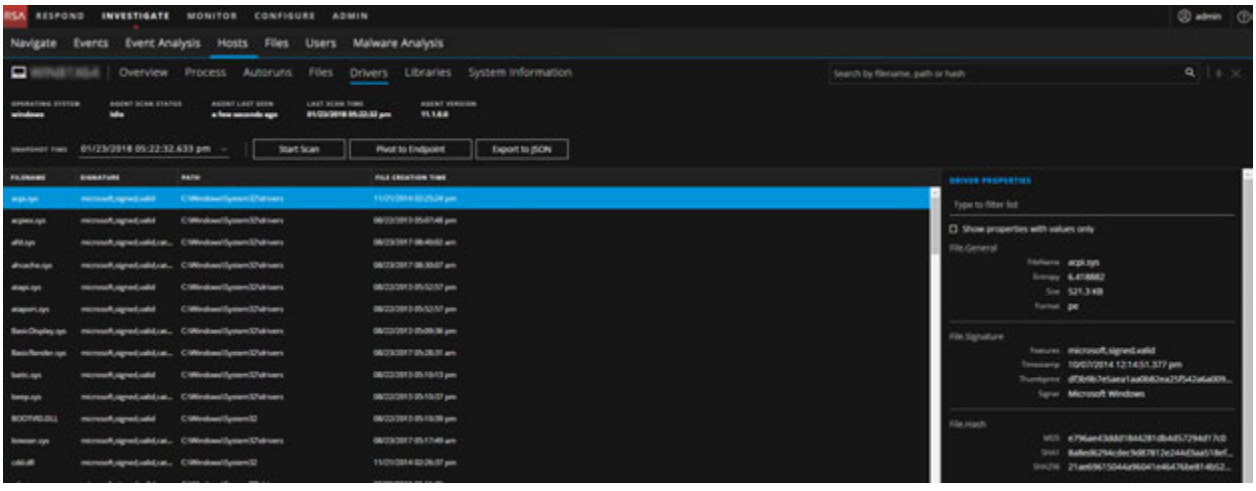
- Hosts View

Quick Look

Below is an example of the Drivers tab:



Field	Description
Filename	Name of the file. For example, `acpi.sys`.
Signature	Indicates if the file is signed or unsigned, valid or invalid, and provides signatory information.
Path	Path of the file. For example, `C:\Windows\System32\drivers`.

Field	Description
File Creation Time	Time when the file was created.

Driver Properties Panel

This panel displays all properties of the selected file. It is grouped as follows:

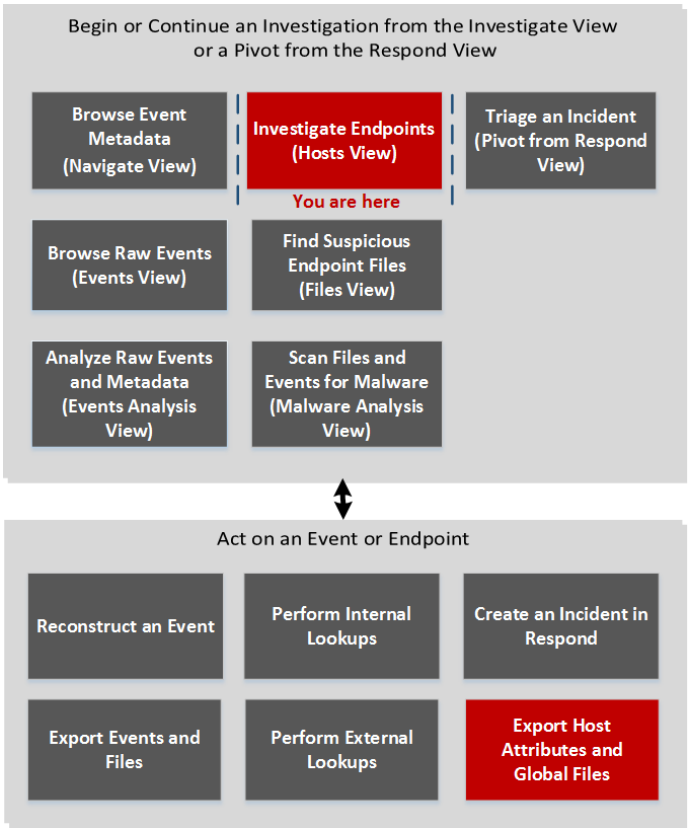
Category	Description
General	General information about the file, such as file name, entropy, size, and format.
Signature	Provides signatory information.
Hash	Hash type of the file (MD5, SHA256, and SHA1).
Time	Time when the file was created, modified, or accessed.
Location	Location of the file.
Image	Loaded image.

Hosts View - Files Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Files tab displays all files scanned on the host. To access this tab, select a host from the **Hosts** view and click the **Files** tab. By default, it displays 100 files. To display more files, click **Load More** at the bottom of the page.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View

Threat Hunter	view the files scanned on the host*	Analyze Files

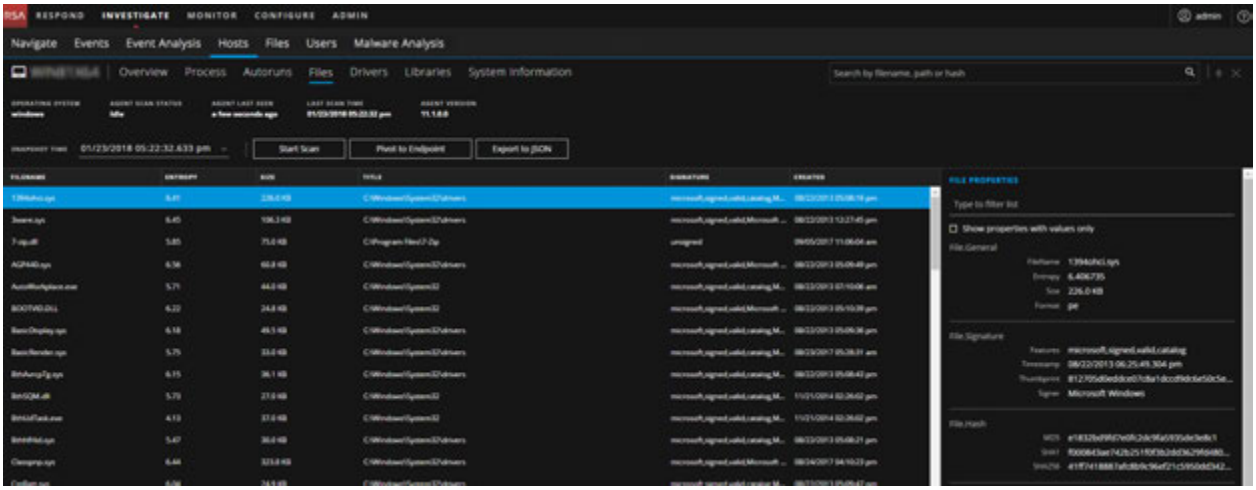
*You can perform this task in the current view.

Related Topics

- How NetWitness Investigate Works
- Investigating Hosts and Files
- Hosts View

Quick Look

Below is an example of the Files tab:



Field	Description
Filename	Name of the file. For example, `7-zip.dll`.
Entropy	Entropy of the image data, excluding the PE headers. It determines if the contents are packed (compressed or encrypted).

Field	Description
Size	Size of the file. It can be an indicator when assessing a file.
Path	Path of the file. Sometimes malware authors put the file on directories where there are typically no such files. Malicious files are typically standalone files (for example, a file in the root `C:\ProgramData`) versus a group of files in a legitimate folder (for example, files in `C:\Program Files\<folder name>\`).
Signature	Indicates if the file is signed or unsigned, valid or invalid, and provides signatory information.
Created	Time stamp of the file.
User Name	User of the file (for Linux). For example, `root`.
Group Name	Group to which the user belongs (for Linux). For example, `root (0)`.

File Properties Panel

This panel displays all properties of the selected file. It is grouped as follows:

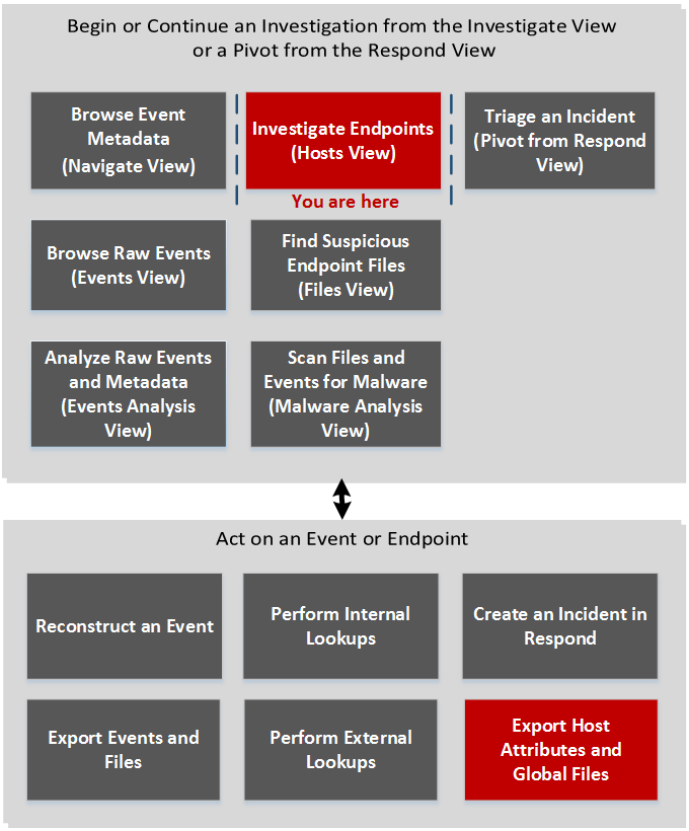
Category	Description
General	General information about the file, such as file name, entropy, size, and format.
Signature	Provides signatory information.
Hash	Hash type of the file (MD5, SHA256, and SHA1).
Time	Time when the file was created, modified, or accessed.
Location	Location of the file.

Hosts View - Libraries Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Libraries tab lists the libraries loaded at the time of scan. To access this tab, select a host from the **Hosts** view and click the **Libraries** tab.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View

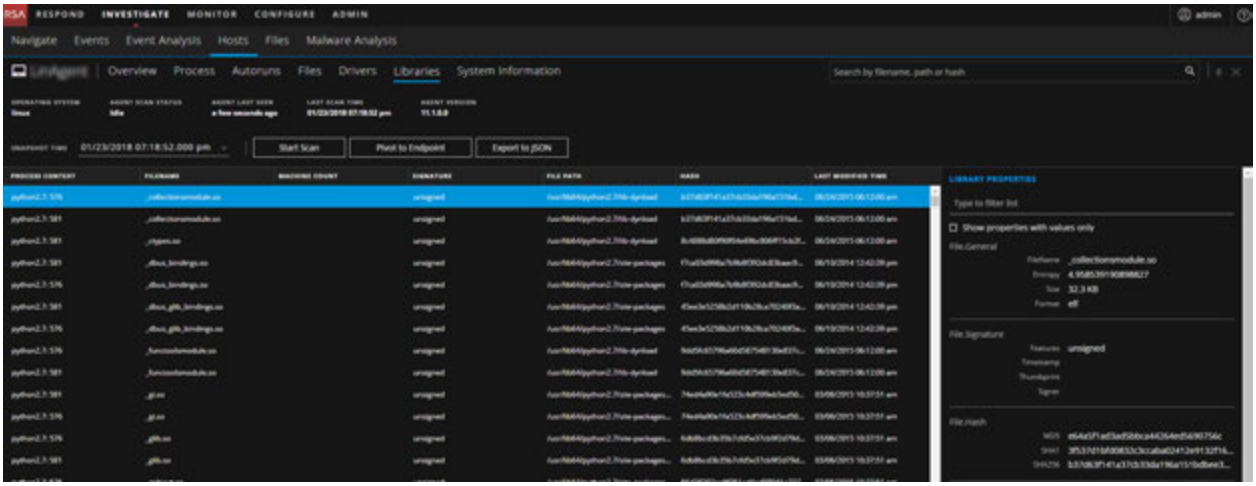
Quick Look

Below is an example of the Libraries tab:



Field	Description
Process Context	Name and PID of the process that has loaded the library in the memory. For example, `explorer.exe: 1916`.
Filename	Name of the file. For example, `7-zip.dll`.

Field	Description
Signature	Indicates if the file is signed or unsigned, valid or invalid, and provides signatory information. For example, `signed, valid`.
File Path	Path of the file. For example, `C:\Program Files\7-Zip`.
Hash	SHA256 of the file. For example, `c3bb3b42dcdf80446c622219513070757e618c06afd9ee0ac37cbce5befcb897`.
File Creation Time	Time when the file was created.
Last Modified Time	Time when the file was modified.

Library Properties Panel

This panel displays all properties of the selected file. It is grouped as follows:

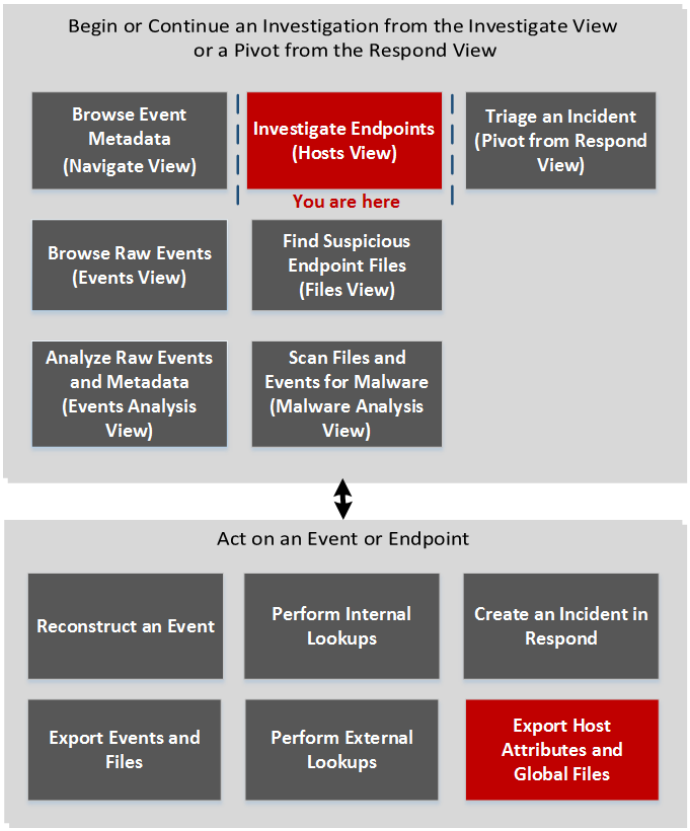
Category	Description
General	General information about the file, such as file name, entropy, size, and format.
Signature	Provides signatory information.
Hash	Hash type of the file (MD5, SHA256, and SHA1).
Time	Time when the file was created, modified, or accessed.
Location	Location of the file.
Process	Details of the process, such as image size and PID.

Hosts View - Overview Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Overview tab provides detailed scan results of the selected host. By default, the latest scan result is displayed. To access this view, go to **INVESTIGATE > Hosts**, and select a host from the **Hosts** view.

Workflow



What do you want to do?

User Role	I want to ...	Show me how

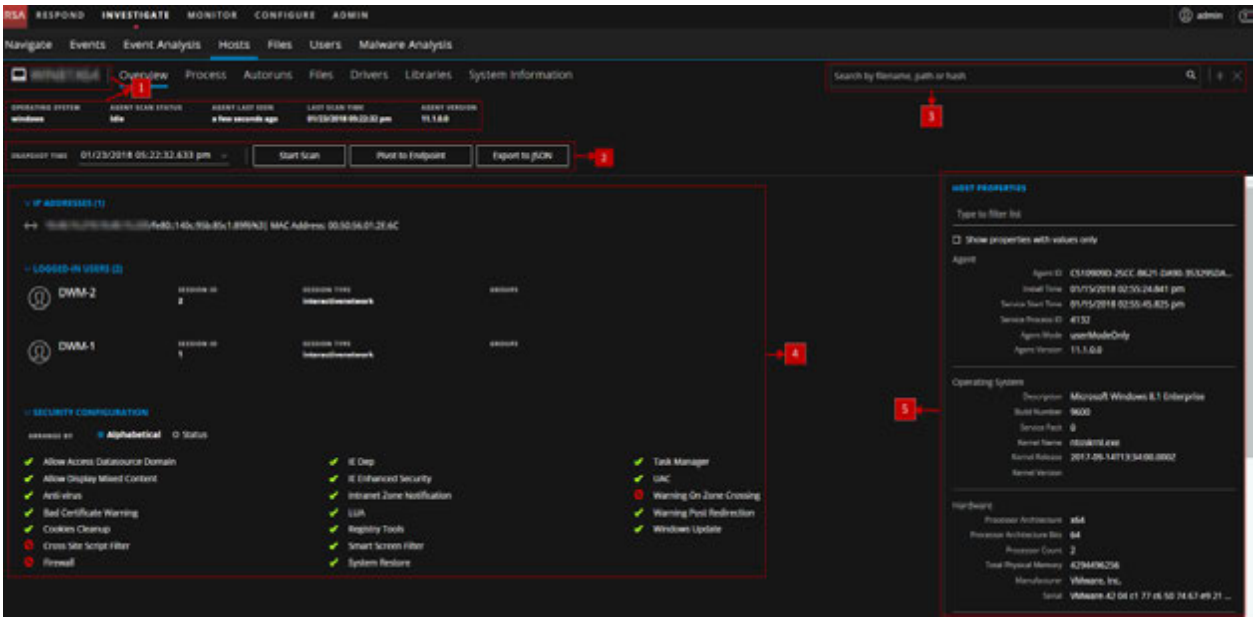
Related Topics

- How NetWitness Investigate Works
- Investigating Hosts and Files
- Hosts View

Quick Look

Below is an example of the Overview tab:



1 **Agent and Scan Details**. You can view the following agent and scan details of the selected host:

Host name - Name of the host. For example, `WIN-ABC`.
Operating System - Operating system on which the agent is running (Linux, Windows, or Mac).

Agent Scan Status - Current status of the scan - Idle, Scanning, Starting Scan, or Stopping Scan.

For more information, see Investigate Hosts.

Agent Last Seen - Time when the agent last communicated with the server.

Last Scan Time - Last time the agent was scanned. The date and time is as per the time zone set in the User Preferences and is local to the server.

Agent Version - Version of the agent. For example, `11.1.0.0`.

2 **Actions in the toolbar:**
Snapshot Time - Lists scanned time stamps. To view the scan history, select the snapshot time from the drop-down menu.
Start Scan - Starts scan for the selected hosts. For more information, see Investigate Hosts.
Export to CSV - Extracts host attributes to a CSV file. For more information, see Export Host Attributes.
Pivot to Endpoint - Lets you investigate the NetWitness Endpoint host (version 4.4.0.2 or later). For more information, see Investigate NetWitness Endpoint 4.4.0.2 or Later Hosts.
Export to JSON - Extracts host attributes and endpoint data to a JSON file of the selected snapshot.

3 **Search on Snapshots**. Lets you search on all snapshots (file name, file path, and SHA-256 checksum). For more information, see Search on Snapshots.

4 **Summary of the selected host**. Displays the following fields:

IP Addresses - IP addresses associated with the host. For example, `10.10.10.3`.

Logged-in users - Users logged in to the host. For example, `abc`.

Security Configuration - Security configuration details on the host. For example, firewall disabled or enabled, smart screen filter disabled or enabled. This field is only applicable for Windows and Mac.

Note: The Agent Version, IP Addresses, Logged-in users, and Security Configuration may change for each scan.

5 **Host Properties Panel**. Displays all properties of the selected host. It is grouped as follows:

Agent - Agent-related information, such as agent ID, driver error code, install time, and agent mode.

Operating System - Operating system version and build information.

Hardware - Information related to the architecture.

Network Interfaces - Network adapter information, such as Mac Address, Gateway.

User - Information related to the user.

Locale - Time zone and language that is local to the host.

Hosts View - Process Tab

Note: The information in this topic applies to RSA NetWitness® Platform Version 11.1 and later.

The Process panel provides a list of processes running on the host. To access this tab, select a host from the **Hosts** view and click the **Process** tab.

Workflow

Quick Look

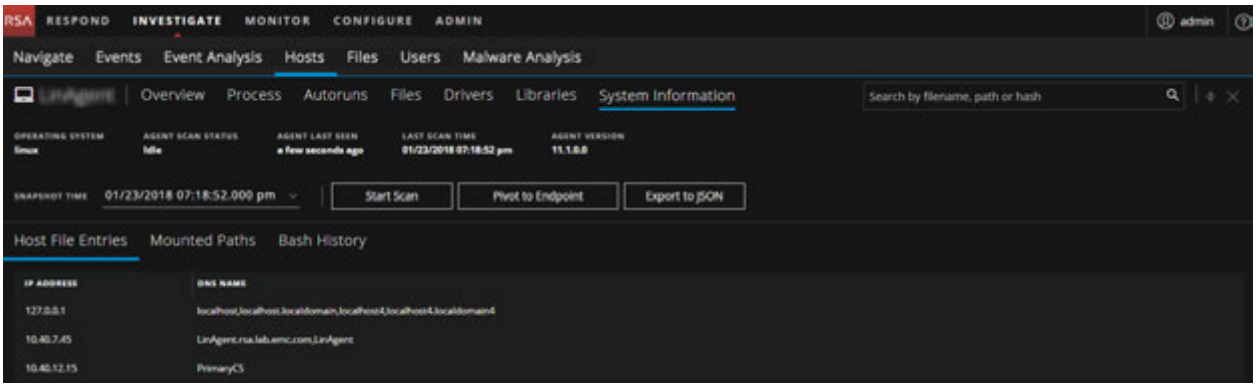
Below is an example of the System Information tab:



Field	Description
Host File Entries	All network redirections written in the host file. For example, IP Address - `10.10.10.3` and DNS Name - `localhost,localhost.localdomain,localhost4,localhost4.localdomain4`
Network Shares	Network name of the shared resource (for Windows only). For example, Name - `Admin$`, Description - `Remote Admin`, Path - `C:\`, Permissions - `None`, Type - `disk, special`, Max Users - `4294967295`, Current Users - `0`.

Field	Description
Security Products	Installed security products (for Windows only). For example, Display Name - `Windows Defender`, Instance - `D68DDC3A-831F-4FAE-9E44-DA132C1ACF46`, Features - `Enabled`, Type - `antiVirus`.
Windows Patches	List of patches applied by Windows update (for Windows only). For example, `KB2959936`.
Mounted Paths	Path mounted on. For example, Path - `/`, File System - `rootfs`, Remote Path - `rootfs`, Options - `rw`.
Bash History	User name and command run. For example, User Name - `root` and Command - `ls`.

Note: For Mac hosts, the Mounted Paths and Bash History fields are empty.

Malware Analysis View

In NetWitness Investigate, the Malware Analysis view provides the user interface for conducting a malware analysis. The Malware Analysis view is in the form of a customizable dashboard, in which default dashlets in the initial view are based on the user role (Administration or Analyst) and user customizations. Initially, the Summary of Events dashlet is displayed in the Malware Analysis view. Additional dashlets present different visualizations of the events being viewed, and each representation is configurable to further refine your view as you search for Indicators of Compromise. The Malware Analysis dashlets available in the Dashboard are also available in the Malware view.

To access this view, select **INVESTIGATE > Malware Analysis.**. If a default service has not been selected, the Select a Malware Analysis Service dialog is displayed. Select a service, then click **View Continuous Mode**.

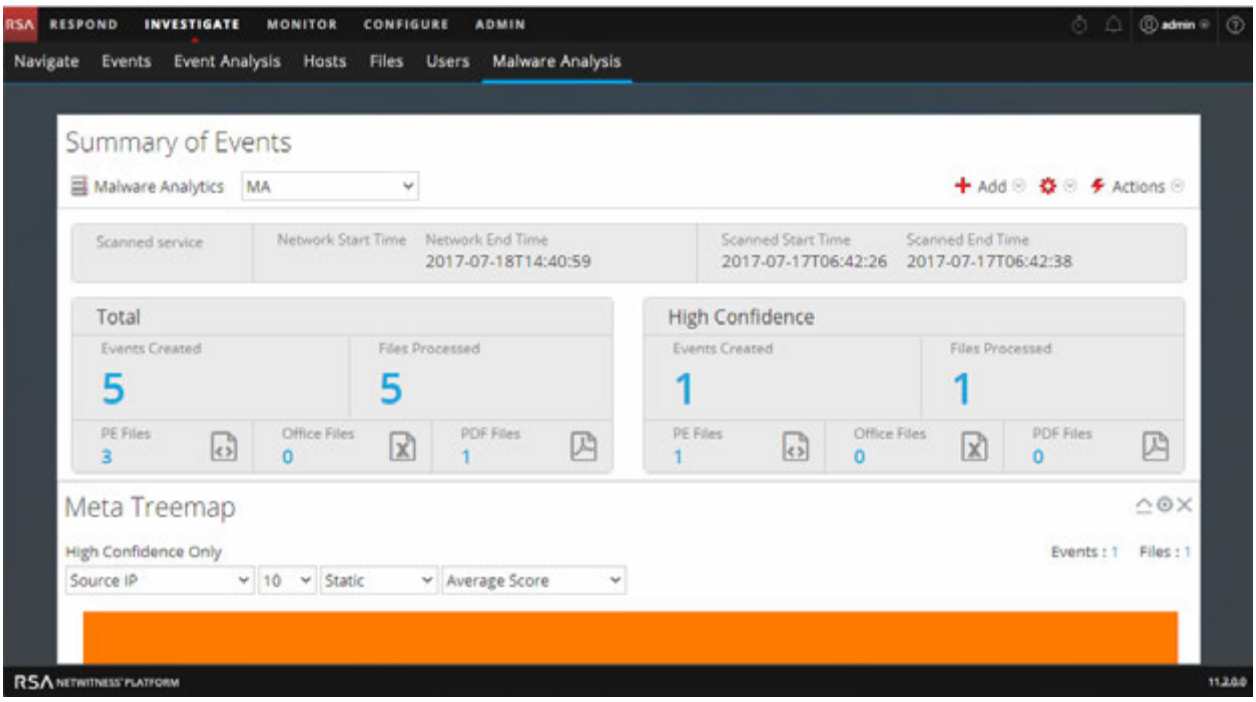
- Launch a Malware Analysis Scan from the Navigate View

Quick Look

Below is an example of the Malware Analysis view.



The Malware Analysis view consists of the Summary of Events panel and four dashlets unique to this view. Each of the unique dashlets have identical Options dialogs. The Malware Analysis dashlets in the MONITOR view are also available, and are described in the Dashlets topic in the RSA Content for the RSA NetWitness Platform space.

Summary of Events Panel

In the Summary of Events panel, you can select the service, the scan mode, and the time range. In addition, you can select a data point and view the events associated with the event.

The following table describes all features in the Summary of Events panel.

Feature	Description
	Selects a service to display.
Scan Mode	Displays a drop-down list of available scan modes.
Time Range	Displays a drop-down list of time ranges to view events.
Start Date	When Time Range is set to custom, offers a calendar from which to choose the start date of the time range.
End Date	When Time Range is set to custom, offers a calendar from which to choose the end date of the time range.
	Displays a drop-down list of dashlets you can add to the view.

Feature	Description
	Displays a drop-down list of actions you can perform in this view: • Restore Default Configuration • Order Dashlets • Apply Threshold Filter
	Refreshes the Malware Analysis view.

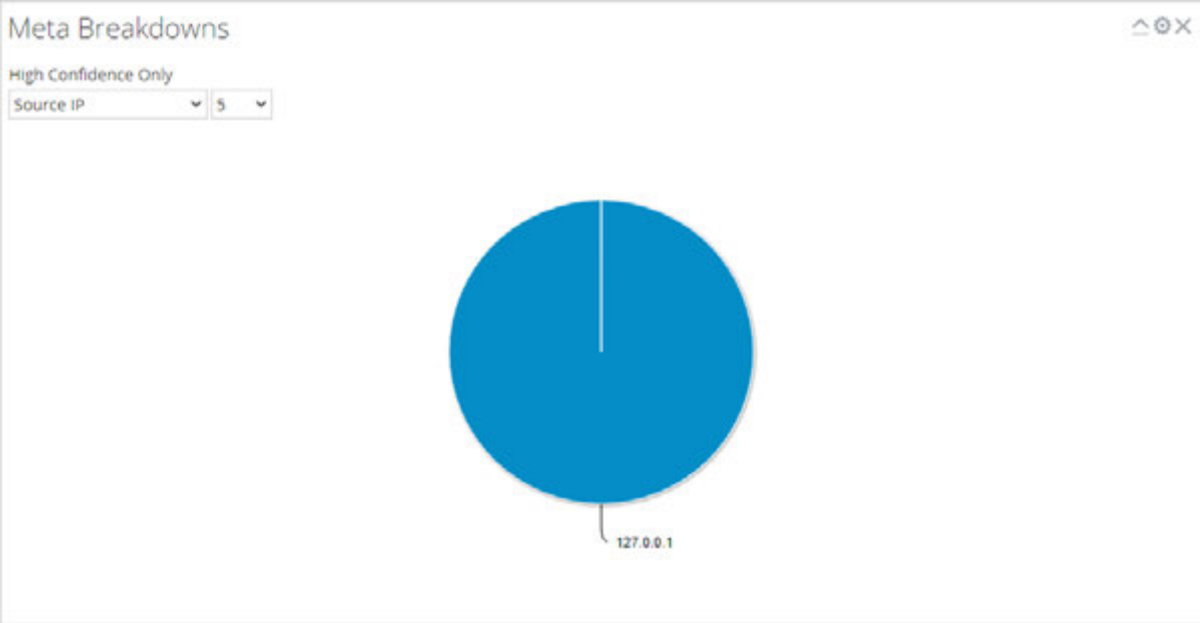
Options Dialog

In the Options dialog, you can customize the results displayed in the dashlet. This dialog can be accessed by clicking the  icon in the top right corner of each dashlet. The following table describes the features of the Options dialog.

Feature	Description
Title	Indicates whether the data shown is restricted to events flagged as high confidence or not. If the data is not restricted, this line will not be displayed.
Influenced By High Confidence Only	Indicates whether the data shown is restricted to events flagged as high confidence.
Static, Network, Community, Sandbox	Allows you to filter results based on the scores in the scoring modules.
Cancel	Closes the dialog without saving any changes.
Apply	Applies changes to the dashlet immediately and closes the dialog.

Meta Breakdowns

Meta Breakdowns presents events in the form of a pie chart, with each slice representing a meta value for the specified meta key. You can select the meta key and the count of meta values for that key to render in the chart, starting with the meta value having the most events. Hovering over an event displays the count.

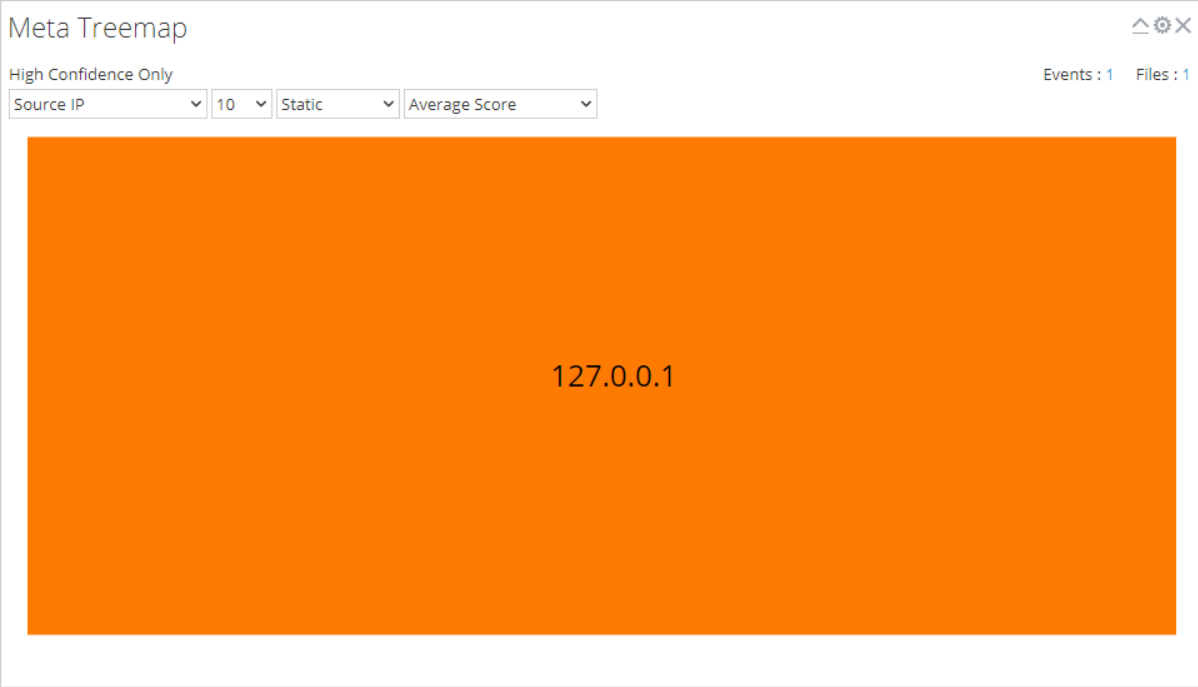


The following table describes the options in the Meta Breakdowns dashlet.

Feature	Description
High Confidence Only	Indicates whether the data shown is restricted to events flagged as high confidence or not. If the data is not restricted, this line will not be displayed.
Meta Key	Drop-down list of available meta keys.
Count	Drop-down list specifying how many of the top results are displayed.

Meta Treemap

Meta Treemap presents events in the form of a heat map. You can select the meta key and the count of meta values for that key to render in the chart, starting with the meta values having the most events. In addition, you can select the module that detected the meta value in the events: static, network community, or sandbox.

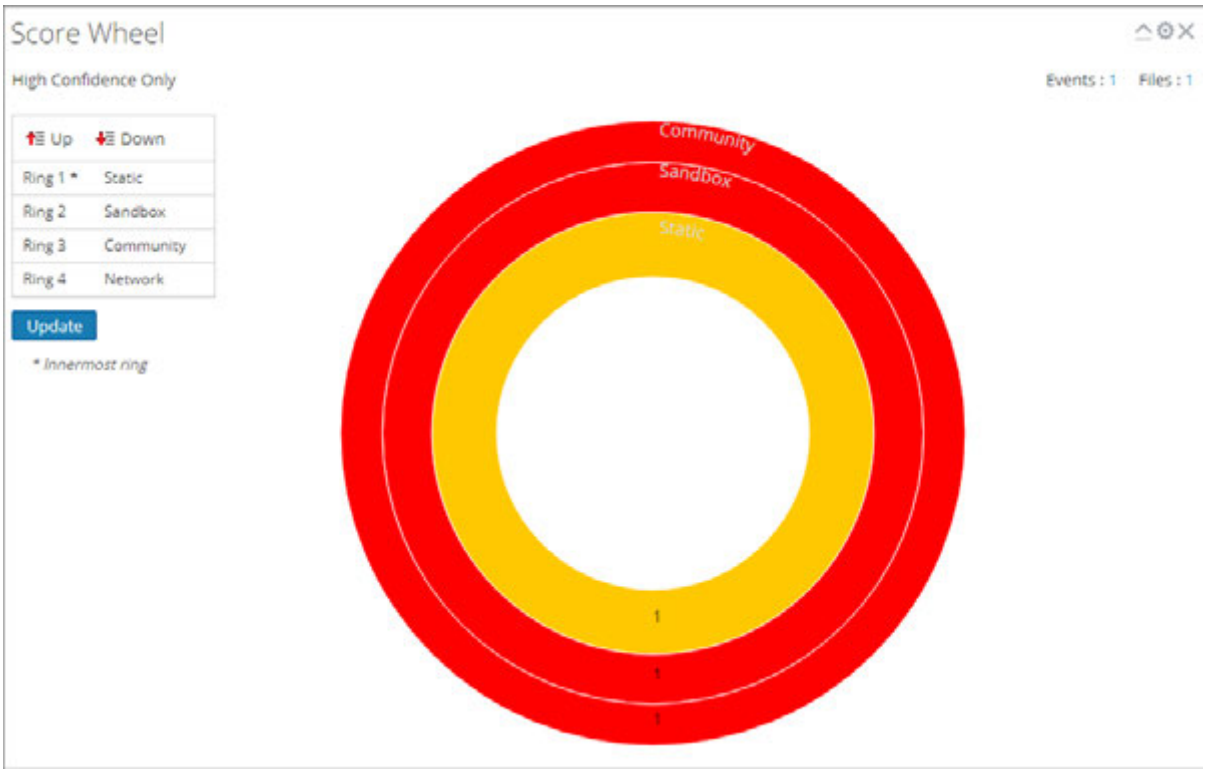


The following table describes the options in the Meta Treemap dashlet.

Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.
Meta Key	Drop-down list of available meta keys to select as a filter.
Count	Drop-down list specifying how many of the top results are displayed.
Module	Drop-down list specifying which module results will be pulled from.
Value	Drop-down list specifying what information will be displayed when the mouse is hovering over a result (for example, Average Score).

Score Wheel

The Score Wheel offers a view of events as concentric rings with colors representing scores for events based on Indicators of Compromise and the scoring module. You can arrange the position of the rings using the Up and Down arrows to obtain a view that highlights events that were detected by one scoring module (red) and not detected by other scoring modules.

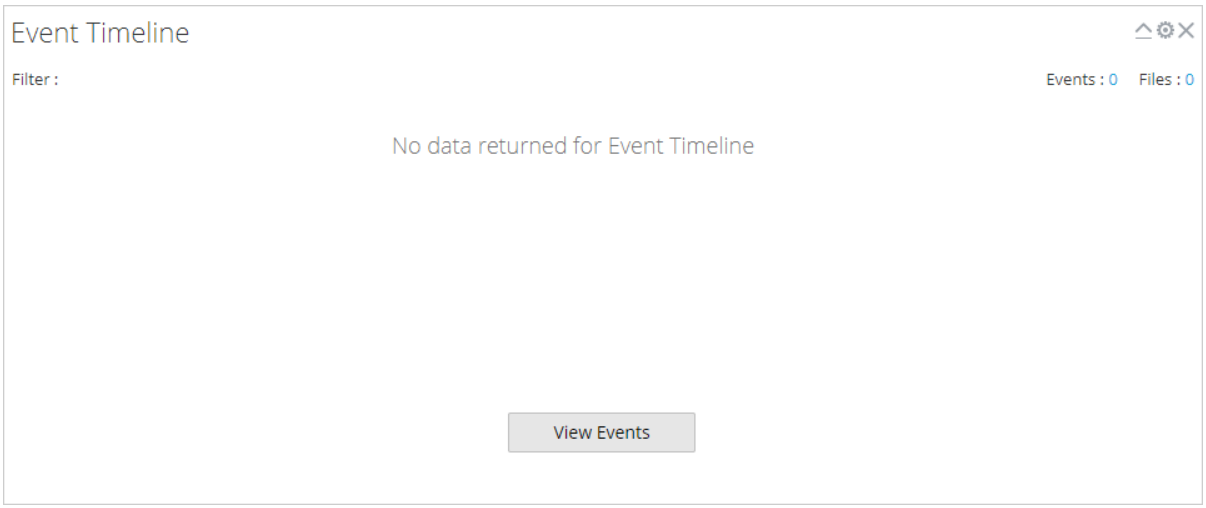


The following table describes the features of the Score Wheel dashlet.

Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.
Module Order grid	Displays the order of the rings in Score Wheel, Ring 1 being the innermost ring and Ring 4 being the outermost ring. You can click the **Up** and **Down** buttons to reorder the modules, then click **Update** to apply the changes.

Event Timeline

The Event Timeline offers a view of events organized by the time of occurrence in a bar graph. Clicking and dragging to select a time range within the chart zooms in on the selected time.



The following table describes the features of the Event Timeline dashlet.

Feature	Description
High Confidence Only	Indicates whether or not the results are restricted to events flagged as high confidence or not. If the results are not restricted, this line will not be displayed.
View Events	Displays the Investigation > Events view.

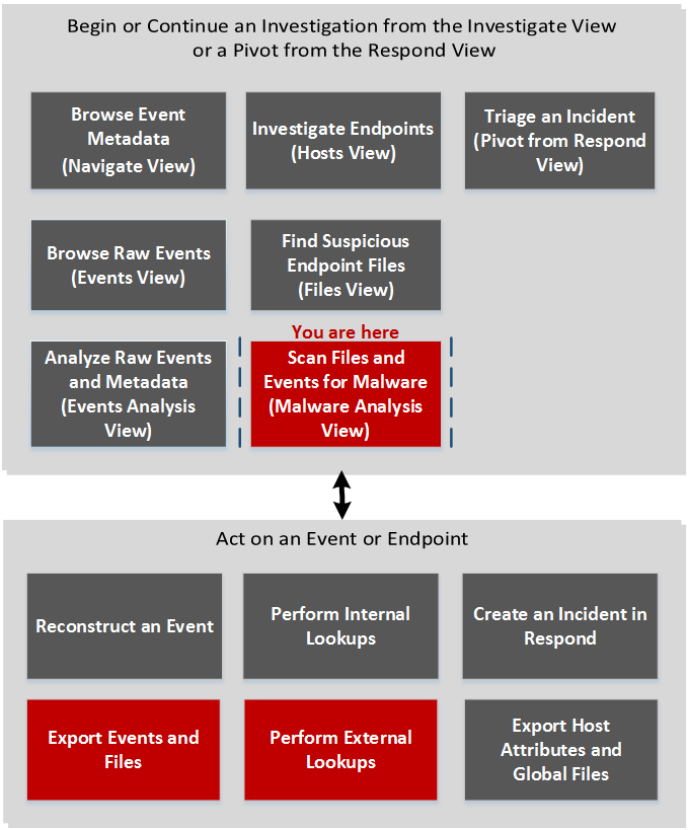
Malware Analysis Events List and Files List

The Malware Analysis Events List and Files List provide a detailed view of events or files. You can double-click on an event or file in either of the lists to display the Analysis Results view in a new browser tab.

To access this view, go to **INVESTIGATE > Malware Analysis** > **Select a Malware Analysis Service** dialog. Select a service from the left panel, then select a job from the right panel, and click **View Scan**. In the Summary of Events view do one of the following:

- In either the **Total** panel or the **High Confidence** panel, click the number in the **Events Created** section.
- If you want to view the Files List, click the number in the **Files Processed** section.

Workflow



What do you want to do?

User Role	I want to ...	Show me how

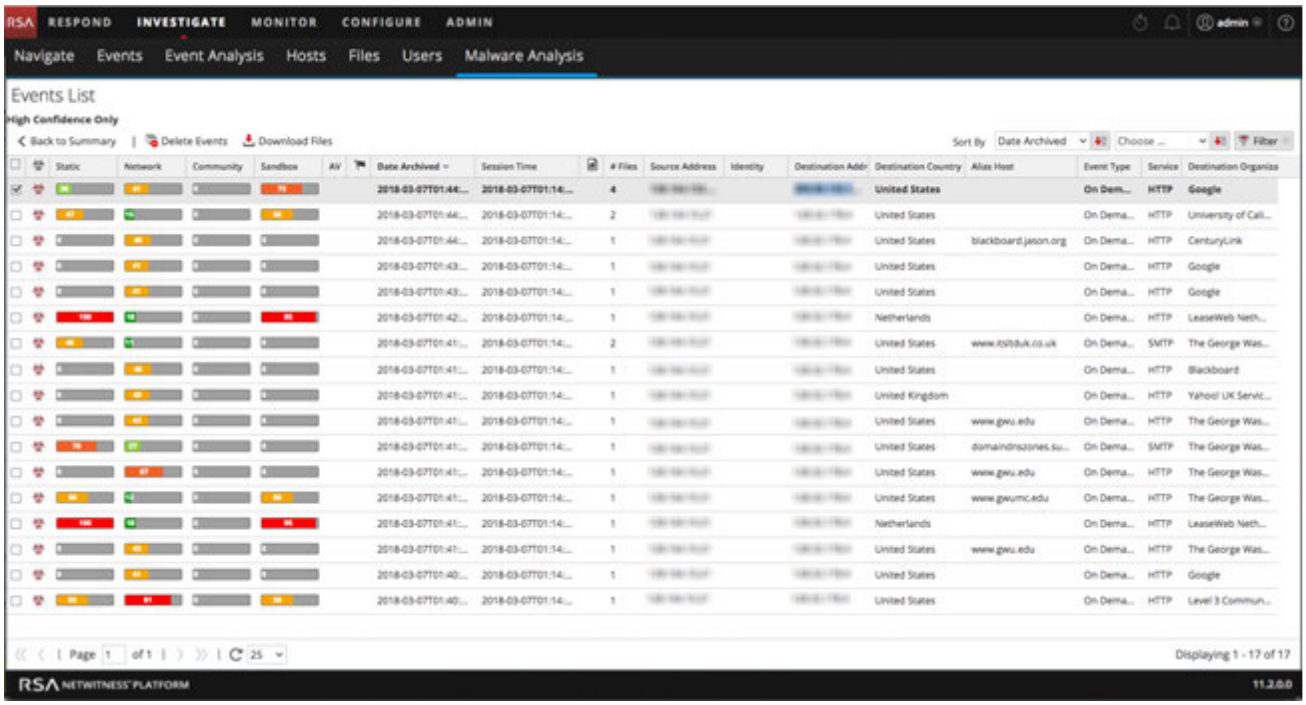
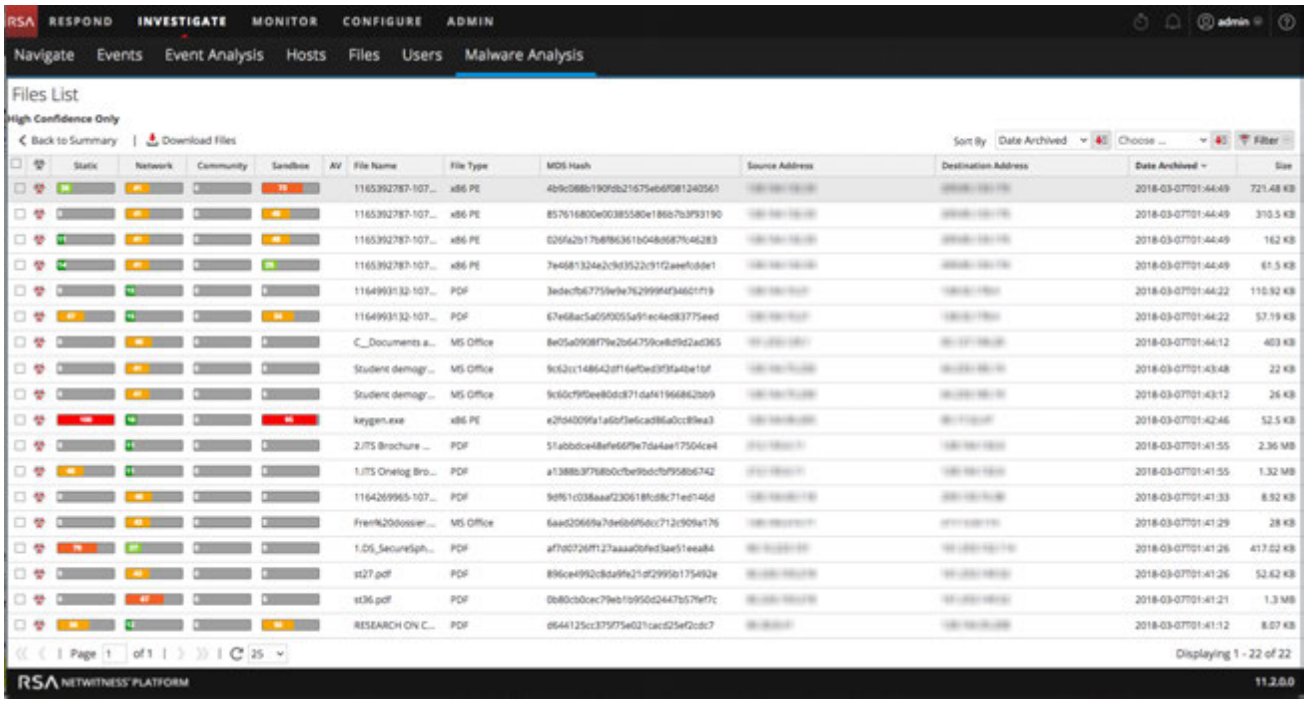
- How NetWitness Investigate Works

Quick Look

This is an example of the Events List view.



This is an example of the Files List view.



These are the features in the Events List toolbar, and the Files List toolbar is the same, except it has no option to delete events.

Feature	Description
Back to Summary	Returns to the Summary of Events view.
Delete Events	Removes the selected events from the current events list.
Download Files	Displays the Malware File Download dialog, which allows you to download available files.
	Displays a drop-down menu from which you can decide how to sort the list. These are the options for sorting: • High Confidence • Static • Network • Community • Sandbox • AV • File Name • File Type • Hash • Date Archived • Size The button directly to the right of this drop-down indicates whether the list will be sorted by ascending or descending values.
	Displays a drop-down menu from which you can select a secondary sorting order. This menu includes an option forNetWitness Platform**None**, so selecting a secondary sorting order is not necessary.
	Displays a drop-down window in which you can filter the list by filename or MD5 Hash.

These are the features in the Events List.

Feature	Description
	Indicates whether the event is influenced by the high confidence flag.
Static, Network, Community, Sandbox	Displays the scores for each scoring module.
AV	Indicates whether the AV flagged this event as suspicious.
	Indicates whether the event is influenced by a customized rule.

Feature	Description
Date Archived	Displays the date and time the event was archived.
Session Time	Displays the time of the event's session.
	Indicates whether the hash value is marked as trusted.
# Files	Displays the number of files included in the event.
Source Address	Displays the address of the event source.
Identity	Displays the identity of the event source.
Destination Address	Displays the address of the event destination.
Destination Country	Displays the country of the event destination.
Alias Host	Displays the hostname of the alias.
Event Type	Displays the type of event. For example, Manual Upload.
Service	Displays the service on which the event occurred.
Destination Organization	Displays the organization of the destination.

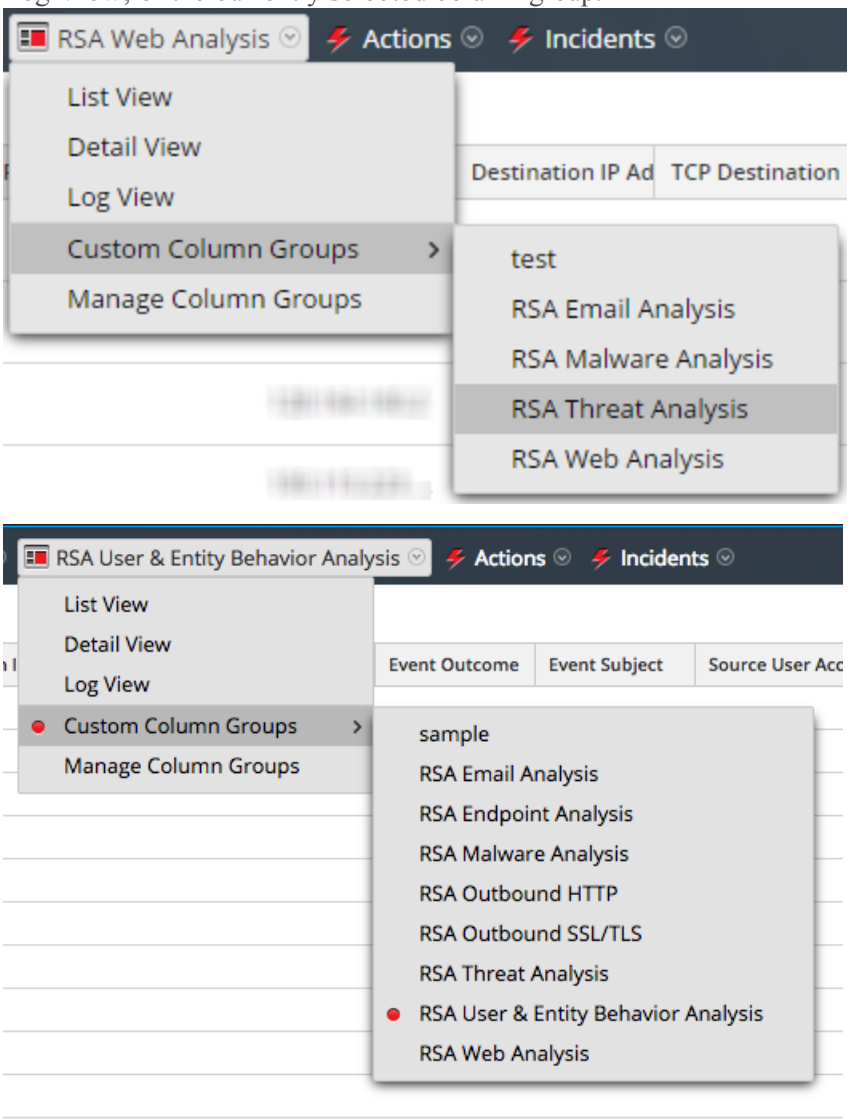
These are the features in the Files List grid.

Feature	Description
	Indicates whether the event is influenced by high confidence flag.
Static, Network, Community, Sandbox	Displays the scores for each scoring module.
AV	Indicates whether the AV flagged this event as suspicious.
File Name	Displays the name of the file.
File Type	Displays the type of the file (for example, PDF or x86 PE)
MD5 Hash	Displays the MD5 hash.
Source Address	Displays the address of the file source.
Destination Address	Displays the address of the file destination.
Date Archived	Displays the date and time the file was archived.
Size	Indicates the size of the file.

Manage Column Groups Dialog

You can customize the way data is displayed by defining the meta to display in a column, the position of the column in the grid, and the default width of the column. In the Manage Column Groups dialog, you can add, delete, import, export, and edit column groups to display specific meta keys. At fresh installation, out-of-the-box (OOTB) column groups are available for use in the Manage Column Groups dialog. The OOTB column groups are prefixed with RSA for identification and can be duplicated but cannot be edited or deleted. You can also create custom column groups.

To access this dialog, go to **INVESTIGATE > Events** and in the **View** drop-down list select **Manage Column Groups**. The **View** option is named for the current value, for example, Detail View, List View, Log View, or the currently selected column group.



Workflow

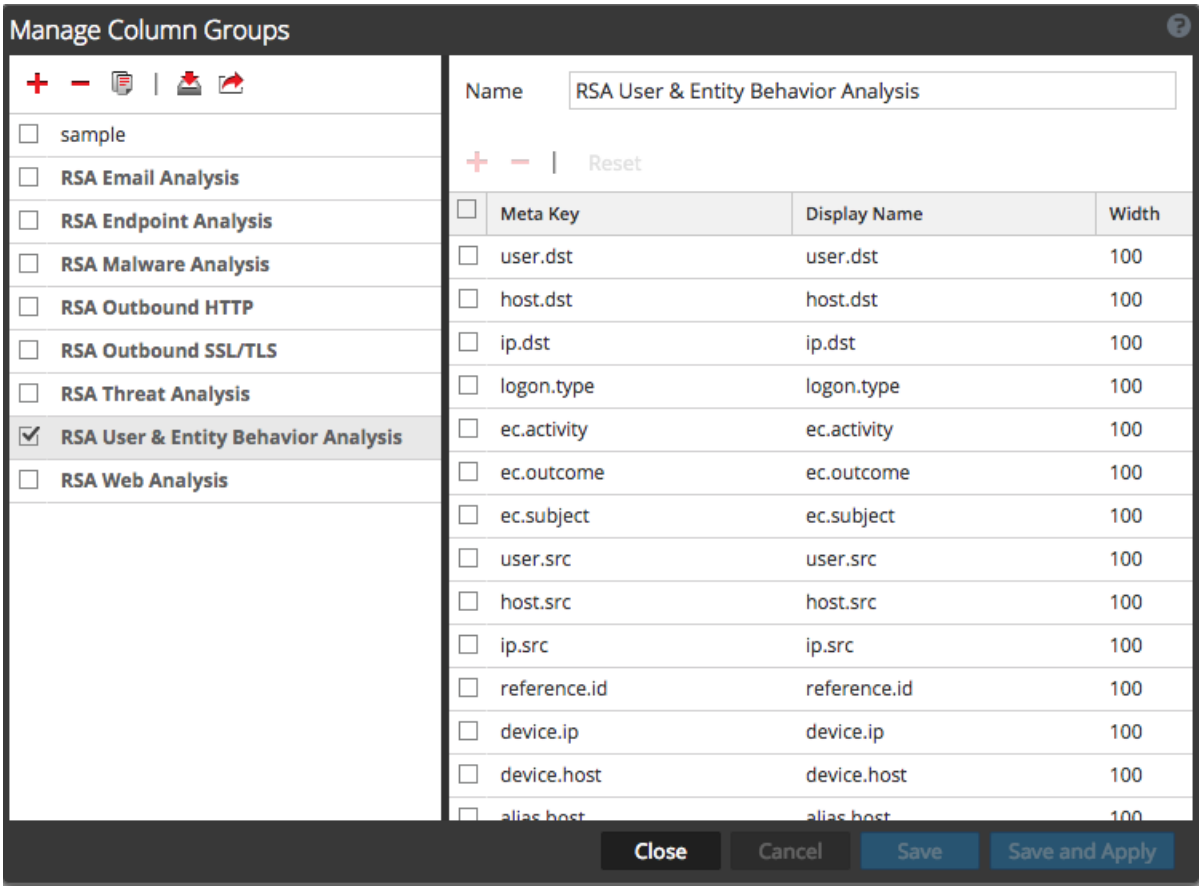
Quick Look



The Manage Column Groups dialog has two panels: Groups and Settings.

At the bottom of this dialog are four buttons: Close, Cancel, Save, and Save and Apply. The following table provides descriptions of these buttons.

Feature	Description

Feature	Description
Close	Closes the dialog without saving.
Cancel	Cancels all unsaved changes.
Save	Saves all changes without closing the dialog.
Save and Apply	Saves and applies all changes immediately, closing the dialog.

Groups Panel

The left panel is the Groups panel. This is where you can add, delete, import, or export column groups. At the top of the panel is a toolbar which provides actions. Below the toolbar is a list of added column groups, where you can select one or more groups.

The following table lists the actions in the toolbar.

Action	Description
	Adds a column group. Clicking this button highlights the Settings panel on the right, where you can name the column group and add or delete meta keys. At least one meta key is required to add a group.
	Deletes a column group. A confirmation dialog is displayed before the selected group is deleted.
	Displays the Import Column Groups dialog, where you can select a file to upload.
	Exports one or more selected groups to your computer.

Settings Panel

The right panel is the Settings panel. This is where you can create and edit column groups. This panel contains the Name field, a toolbar, and a grid.

The following table describes the features of the Settings panel.

Feature	Description
Name	The name of the selected column group.
	Adds a new row to the list of meta keys, where you can open a drop-down menu to select a new meta key.
	Deletes one or more selected meta keys. Displays a confirmation dialog before deleting.
Reset	Returns column group to its most recently saved settings.
Meta Key	Lists the meta keys added to the selected column group.
Display Name	Lists the names of the meta keys as they will be displayed in the Events view.

Feature	Description
Width	Specifies the width of each meta key's column. The width can be set between **10** and **1000**. The default width is **100**.

Manage Default Meta Keys Dialog

In the Manage Default Meta Keys dialog, analysts can specify the meta keys to be displayed during navigation for a specific service. This can help you find the desired data more quickly and prevents the loading of meta data that is not of interest. To access this dialog, in the **Navigate View** toolbar, select **Meta > Manage Default Meta Keys**.

Workflow

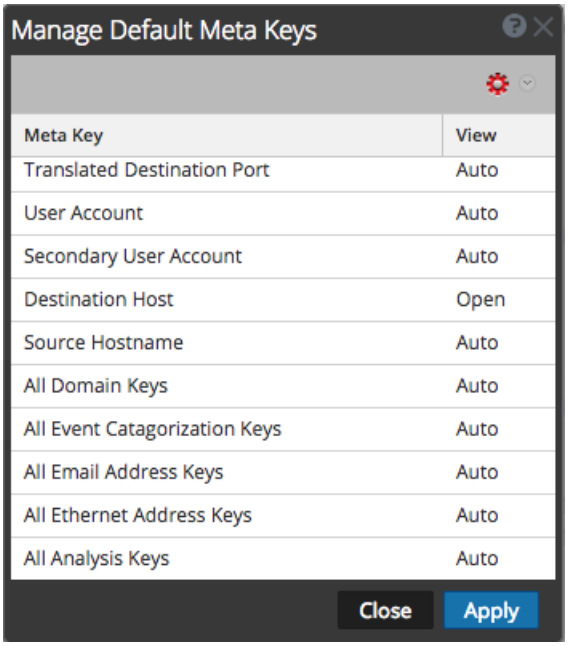
Quick Look

The following figure illustrates the Manage Default Meta Keys dialog, which has a list of meta keys, toolbar, Close button, and Apply button. In the list, you can view, sort, and manage default meta keys. If you click and drag meta keys, you can rearrange their order. The following table describes columns in the list.



Column	Description
Meta Key	This column displays the meta keys available for the service. In Version 11.1 and later, default meta entities are also included, for example All Domain Keys and All Email Address Keys.
View	This column displays the type of view assigned to each meta key. By clicking on the view in each row, you can assign the meta key a different default view. There are four views: • Auto: Reverts to the default view for meta keys as specified in the service index file. • Close: The values of this meta key are closed by default, and can be opened manually. • Hidden: These meta keys are hidden by default, and are not shown in Investigation at all. • Open: The values of this meta key are displayed by default. When you modify the default meta keys for a non-indexed meta key, you cannot set the key to **Open**. If you change the default view for a group of meta keys to **Open** and some of the meta keys are non-indexed, the non-indexed meta keys revert to **Auto**. As a result, the meta key is automatically loaded only if it is indexed, and non-indexed meta keys are **Closed** until opened manually.

The following table describes the toolbar options and buttons.

Feature	Description
	Clicking the Actions menu allows you change the default view of all the meta keys. There are four views: • Auto: Reverts to the default view for meta keys as specified in the service index file. • Close: The values of this meta key are closed by default. • Hidden: The values of this meta key are hidden by default. • Open: The values of this meta key are displayed by default.
Close	Closes the dialog. Any unsaved changes are lost.
Apply	Applies the changes, and they become effective immediately.

Manage Meta Groups Dialog

At fresh installation, OOTB meta groups are available in the Manage Meta Groups dialog. The OOTB meta groups are prefixed with RSA for identification and can be duplicated but cannot be edited or deleted. In the Manage Meta Groups dialog, you can add, delete, import, and export meta groups.

To access this dialog in the **Investigation > Navigate view** toolbar, select **Meta > Manage Meta Groups**

Workflow

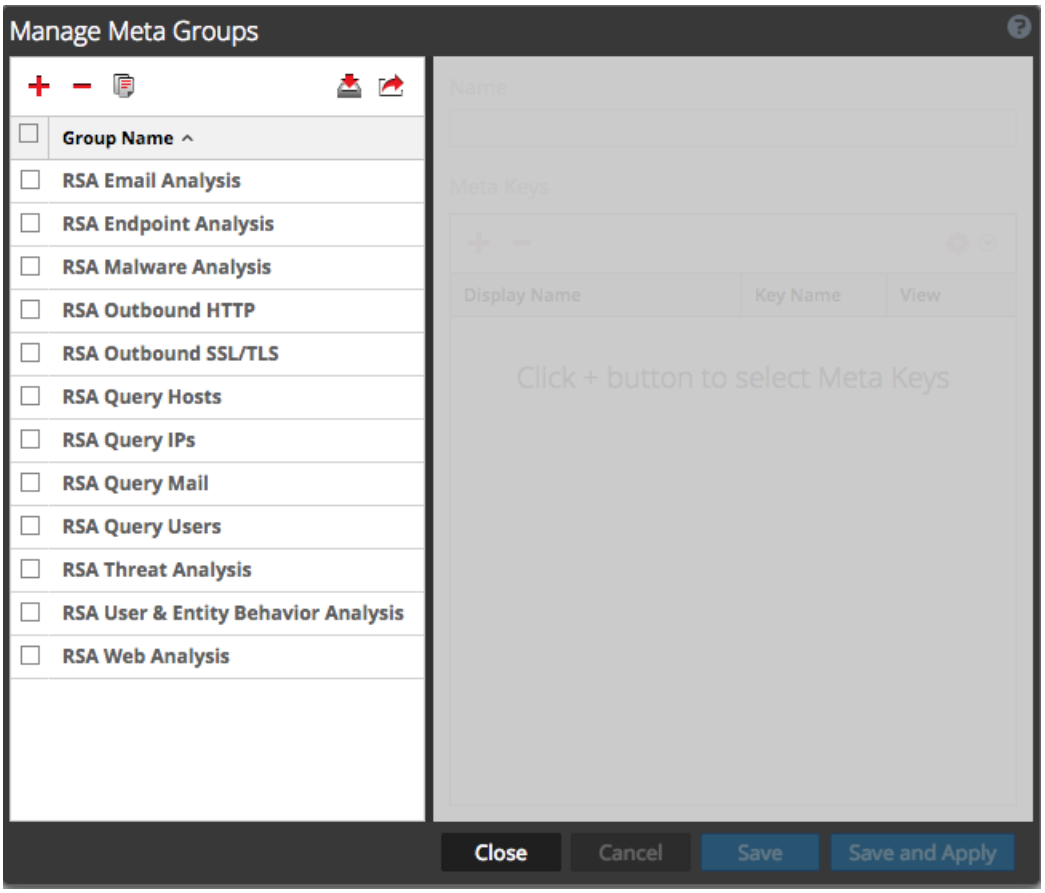
- How NetWitness Investigate Works

Quick Look

Below is an example of the dialog for Version 11.1, in which additional OOTB meta groups are available: RSA Endpoint Analysis, RSA Outbound HTTP, and RSA Outbound SSL/TLS. The Manage Meta Groups dialog has two panels. The following table describes the buttons at the bottom of the dialog.



Feature	Description
Close	Closes the dialog.
Cancel	Cancels all changes.
Save	Saves all changes.
Save and Apply	Saves and immediately applies all changes.

The Meta Groups panel is on the left side of the Manage Meta Groups dialog. This is where you can add, delete, import, and export meta groups.

The following table describes the features of the Meta Groups panel.

Feature	Description
+	Adds a meta group using the Settings panel on the right side of the Manage Meta Groups dialog.
−	Deletes the selected meta group. A confirmation dialog is displayed before the meta group is deleted.
	Displays the Meta Group Import dialog, where you can upload a file.

Feature	Description
	Exports the selected meta group to your computer.
Group Name	Lists all meta group names.

The Settings panel is on the right side of the Manage Meta Groups dialog. This is where you create and edit meta groups. Below the Name field is the Meta Keys grid.

The following table describes the features of the Settings panel.

Feature	Description
Name	Displays the name of the selected meta group.
	Displays the Available Meta Keys dialog, where you can select meta keys to add to the group.
	Deletes the selected meta keys.
	Displays a drop-down menu, where you can select the view for all meta keys. There are four options based on the possible values for the `defaultAction` property used to define a key in the custom index file for the service: • Hidden: These meta keys are hidden by default, and are not shown in Investigation at all. • Open: The values of this meta key are displayed by default. • Close: The values of this meta key are closed by default, and can be opened manually. • Auto: Reverts to the default view for meta keys as specified in the service index file.
Display Name	Indicates the name that is displayed for the key in Investigation views, and is defined by the `description` property for the key in the custom index file for the service..
Key Name	Indicates the `name` of the meta key as defined in the custom index file for the service.
View	Indicates which view the meta key is set to. You can change this by either: • Clicking **v** in the View column header, then selecting a view in order to change all meta key views. • Clicking a single meta key in the View column, then opening the drop-down menu in which all available views are displayed, in order to change an individual meta key view.

Manage Profiles Dialog

Profiles allow you to set up custom views in the Navigate view and the Events View. At fresh installation, OOTB profiles are available in the Manage Profiles dialog. The OOTB profile groups are prefixed with RSA for identification and can be duplicated but cannot be edited or deleted. In the Manage Profiles dialog, you can configure, add, delete, import, and export profiles. In Version 11.2 and later, you can organize profiles into profile groups.

To access this dialog in the **Investigation > Navigate** or **Events** view toolbar, select **Profile > Manage Profiles**.

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View

Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*
Threat Hunter	configure profiles for the Navigate view or Events view*	Use Profiles to Encapsulate Custom Views

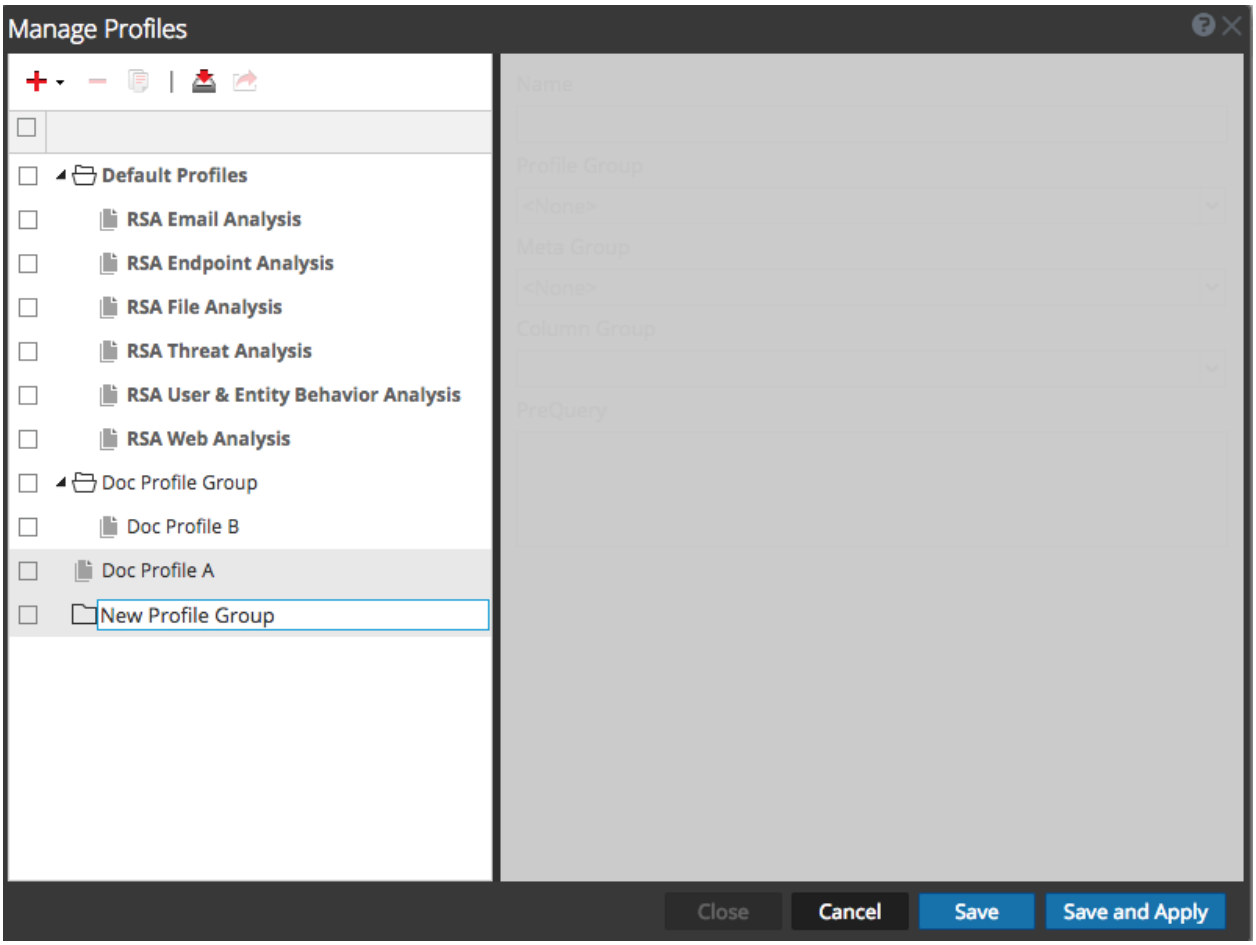
*You can perform this task in the current view.

Related Topics

- How NetWitness Investigate Works
- Navigate View
- Events View

Quick Look

This is an example of the Manage Profiles dialog showing several profile groups.



The Manage Profiles dialog has two panels. At the bottom of the dialog there is a row of buttons. The following table describes the buttons.

Field	Description
Close	Closes the dialog.
Cancel	Cancels all changes.
Save	Saves all changes.
Save and Apply	Saves and applies all changes immediately.

The Profile panel on the left side of the dialog displays available profiles and allows you to add, delete, import, and export profiles. The following table describes the fields in the Profile panel.

Field	Description
+	Adds a new profile using the Settings panel on the right side of the Manage Profiles dialog.
−	Deletes the selected profile. A confirmation dialog is displayed before the profile is deleted.

Field	Description
	Displays the Profile Import dialog, where you can upload a file.
	Exports the selected profile to your computer.
Profile Name	Lists all profile names.

The Settings panel on the right side of the dialog offers options to configure profiles. It can only be used when one profile is selected. The following table describes the fields in the Settings panel.

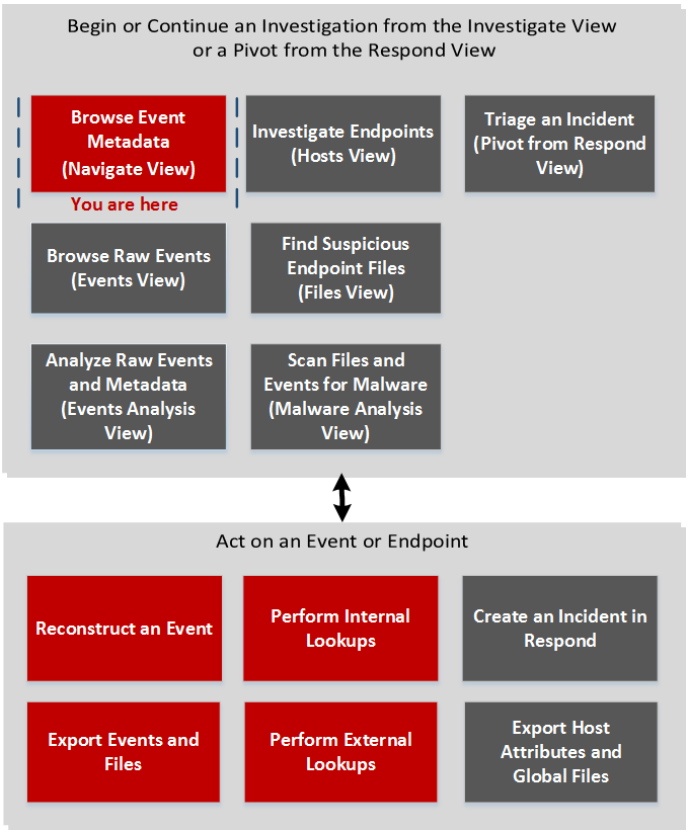
Feature	Description
Name	Displays the name of the profile.
Meta Group	Displays a drop-down menu listing available meta groups.
Column Group	Displays a drop-down menu listing available column groups. Three groups are available by default: • List View • Detail View • Log View
PreQuery	Defines a limiting query for filtering Investigation results. This query is used when the associated profile is activated and the preQuery applies to any queries used in the Investigation Navigate and Events views. This is an example of a preQuery: `'service=80,25,110'`.

Navigate View

The Navigate view (**INVESTIGATE** > Navigate) displays event metadata--the meta keys and meta values-- that were found in captured data for the selected service. The data is filtered and displayed in accordance with the options you set for profile, time range, meta group, and query. You can also drill into the data by clicking meta keys and meta values. The Navigate view is the default entry point to NetWitness Investigate; you can change the default entry point to one of the other views in the Profile preferences.

Workflow

The figure below depicts the high-level workflow for investigating event metadata.



These are the tasks that you can perform in the Navigate view:

- Select a service to investigate and load data.
- View query results and filter by time range, profile, meta group.
- Sort the results and select a quantification method.
- Save events, go to an event using the event ID, visualize an event, and print the event.
- View additional contextual data for specific meta keys and values.

- Go to the Events view or the Event Analysis view, where you can see a chronological list of events, reconstruct an event, and conduct an interactive analysis of an event. When viewing and analyzing events, you can export events, files, and logs to your local file system.

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata*	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events*	Begin an Investigation in the Navigate or Events View

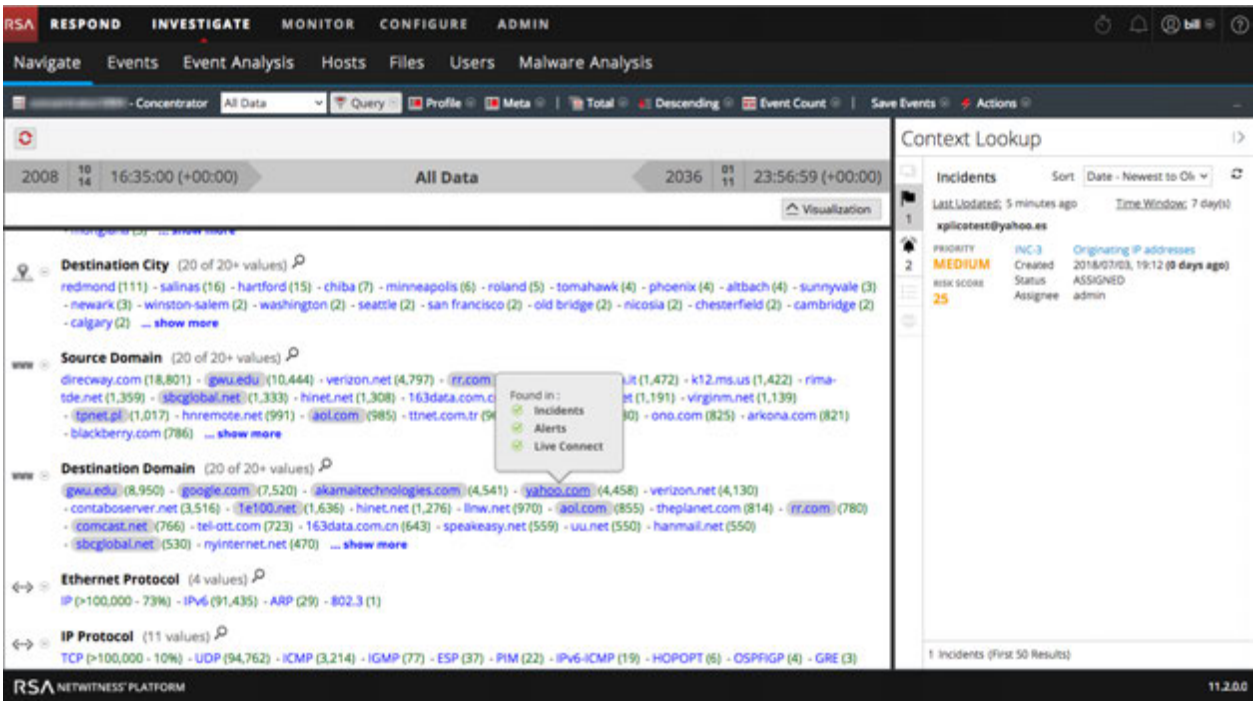
Threat Hunter	refine query results*	Querying and Acting on Data in the Navigate and Events Views
Threat Hunter	perform internal lookups*	Look Up Additional Context in the Navigate and Events Views
Threat Hunter	perform external lookups*	Launch an External Lookup of a Meta Key

*You can perform this task in the current view.

Related Topics

- How NetWitness Investigate Works
- Events View
- Event Analysis View
- Malware Analysis View

Quick Look



The Navigate view consists of these features:

- Toolbar
- Pause/reload button and breadcrumb
- Time banner
- Optional debug information.
- Collapsible Visualization panel
- Values panel
- Context Lookup panel
- Context menus

Toolbar

The toolbar provides a way to:

- Change the service being investigated.
- Control the range of data displayed: You can select use profiles, set a time range, use meta groups, and create queries to apply to the data.
- Set the quantification method and sorting method for data in the Values panel.

- Perform actions on the results. You can export and print results, open an event for which you have an event ID in the Events view or Event Analysis view, and pass a query to Informer.
- Configure Investigate settings without navigating away from the Investigate views.

Some of the toolbar options are labeled with the default value or the selected value rather than displaying the name of the option. For example, the time range option in the example above is labeled **Last 5 Minutes** to reflect the currently selected value. These are the toolbar options.

Option	Description
	Displays the selected service name next to the icon. Clicking the icon opens the Investigate a Service dialog, in which you can select a service to investigate and set the default service to investigate (see Begin an Investigation in the Navigate or Events View). Changing the service does not cause a reload of the data.
Time Range	Displays the Time Range options; the currently selected option is displayed in the toolbar (see Filter Results in the Navigate View). Possible choices are: • All Data • Last 5, 10, 15, or 30 Minutes • Last Hour, Last 3, 6, 12, or 24 Hours • Last 2 or 5 Days • Early Morning • Morning • Afternoon • Evening • All Day • Yesterday • This Week • Last Week • Custom **Note:** If you specify custom start or end times in seconds, the value for start time in seconds always defaults to :00, and the value for end time in seconds always defaults to :59. For example, if you are using time to drill down into an issue, the drill time will be interpreted as `HH:MM:00 - HH:MM:59`. Seconds display in this format in Investigate functions.
Query	Displays the Query dialog, in which you can enter a custom query directly instead of drilling down the data. See Query Dialog for a description of the dialog.

Option	Description
Profile	Displays the Profile menu; the currently selected profile is displayed in the toolbar. A profile allows you to manage and use profiles that can include custom meta groups, a default column group, and a beginning query. The Profiles apply to the Navigate view (meta groups and queries) and the Events view (column groups and queries). See Use Profiles to Encapsulate Custom Views for more information.
Meta	Displays the Meta Group menu. You can use Default Meta Keys or a custom Meta Group. You also have the option to make changes to both group types (see Manage Meta Groups).
Sort Field	Displays the Sort Field menu; the currently selected option is displayed in the toolbar. The menu has two options: Order by Total and Order by Value. The Sort Field is a complement to the Sort Order option; the data for each meta key is ordered based on the total (green number) or the meta value (blue text) (see Filter Results in the Navigate View).
Sort Order	Displays the Sort Order menu; the currently selected option is displayed in the toolbar. The menu has two options: Sort in Ascending Order and Sort in Descending. The Sort Order is a complement to the Sort Field option; the selected field for each meta key is ordered in ascending or descending order (see Filter Results in the Navigate View).
Quantification Method	Displays the Quantification Method menu; the currently selected option is displayed in the toolbar. The Quantification Method only applies to the meta key results in the Values panel. It does not apply to the timeline. The drop-down menu contains three options for calculating the quantity (green number in parentheses) for a meta value: Quantify by Event Count, Quantify by Event Size, and Quantify by Packet Count (see Filter Results in the Navigate View). These are applied differently depending on the type of data in view. For packet data: • Quantify by Event Count shows the number of sessions. • Quantify by Event Size shows the size in bytes. • Quantify by Packet Count shows the number of packets. For log data: • Quantify by Event Count shows the number of logs. • Quantify by Event Size shows the size in bytes. • Quantify by Packet Count shows the number of logs.
Save Events	Displays the Save Events menu, in which you can use options to: extract files associated with an event, export the current drill point as a PCAP file, and export the current drill point as a log file (see Export a Drill Point).

Option	Description
Actions	The Actions menu includes actions that you can perform in the Navigate view (see Investigating Metadata in the Navigate View). In Version 11.0.0.x, the options are: Visualize, Go To Event, and Print. In Version 11.1 and later, the options are Visualize, Go to event in Event Reconstruction, Go to event in Event Analysis, and Print).
Search Events	Enables you to search for text patterns within the current set of events. If you click in the Search field, it shows a drop-down menu with search options. If you click Apply, it saves the selected options and also updates the search options in the Events view and the Investigations profile (see Search for Text Patterns).
Settings	Displays the settings for the Navigate view (which are also editable in the Profile view) so that you can change Investigate settings without navigating away from the Navigate view. When you change a setting In the Navigate view the setting is also changed in the Profile view (see Configure the Navigate View and Events View).

Pause/Reload Button and Breadcrumb

The breadcrumb tracks each query as you drill down through the metadata for the service. Each query is listed with a drop-down menu in a pipe separated string. The last point is the current point, also called the tip. The icon in front of the breadcrumb allows you to pause the loading of meta values and to reload meta values.

The breadcrumb does not include the service name and appears only if a query is in effect. If too many drill points exist for display, the overflow is shown as double angle brackets, >>, at the end of the breadcrumb.

Each drop-down menu in the breadcrumb is the same, with slight variation based on the position of the crumb.

The following table describes the controls and menu options in the breadcrumb.

Feature	Description
	Pause and Reload button. Controls the loading of data in the view. It has three possible functions: pause loading, continue loading, and reload.
Navigate Here	Opens the selected drill point in the current Values panel.
Navigate Here (new tab)	Opens the selected drill point in a new tab.
Insert Before	Inserts a query before the current drill point. The Create Filter dialog opens and you can define a custom query to insert in the breadcrumb (see Create a Custom Query).
Append	Appends a query after the current drill point. The Create Filter dialog opens and you can define a custom query to append to the end of the breadcrumb (see Create a Custom Query).

Feature	Description
Remove	Removes the selected drill point from the breadcrumb.
Edit	Opens the selected drill point in the Create Filter dialog so that you can edit the query.
>>	Clicking the angle brackets displays a drop-down menu of the breadcrumb overflow.

(Optional) Debug Information

If you have activated the Show Debug Information setting and the service you are navigating is a 10.4 or later Broker, NetWitness Platform displays the debug information beneath the breadcrumb.

The debug information is the `where` clause from the current query. The only time there is no `where` clause is when the time range is all data and there are no drill points. If the Broker has at least one aggregate service that is offline, the debug information also lists the offline service.

For example:

```
(attachment exists)&&(tcp.dstport = '80')&&(risk.info exists)$$time='2014-05-04 18:50:00"-"2014-05-09 18:59:59(attachment exists) && (tcp.dstport = '80') && (risk.info exists) && time="2014-05-04 18:50:00"-"2014-05-09 18:50:59"
```

In addition, the time taken to load is displayed at the end of each meta key in the Values panel.

Time Banner

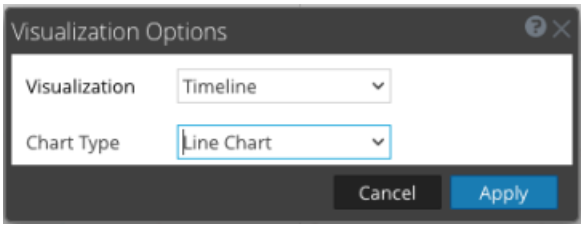
Just below the breadcrumb and debug information (if present), the time banner shows the time range used to create the chart.

Visualizations

At the top of the Navigate view is a visualization of the current drill point. You can use this to drill into data from the Visualization panel (see Filter Results in the Navigate View). You can show or hide the visualization, and choose one of the the visualization options: Timeline or Coordinates. The Visualization opens initially to the last saved Visualization.

Timeline Chart

The timeline is the count of the number of events that occur at a specific instance. The timeline provides event counts so that you can see if the number of events increases drastically at a given point in time. The timeline displays activity for the specified service and time range as a line chart or a bar chart based on your choice in the Options menu. The second figure illustrates a line chart and third figure illustrates a bar chart.

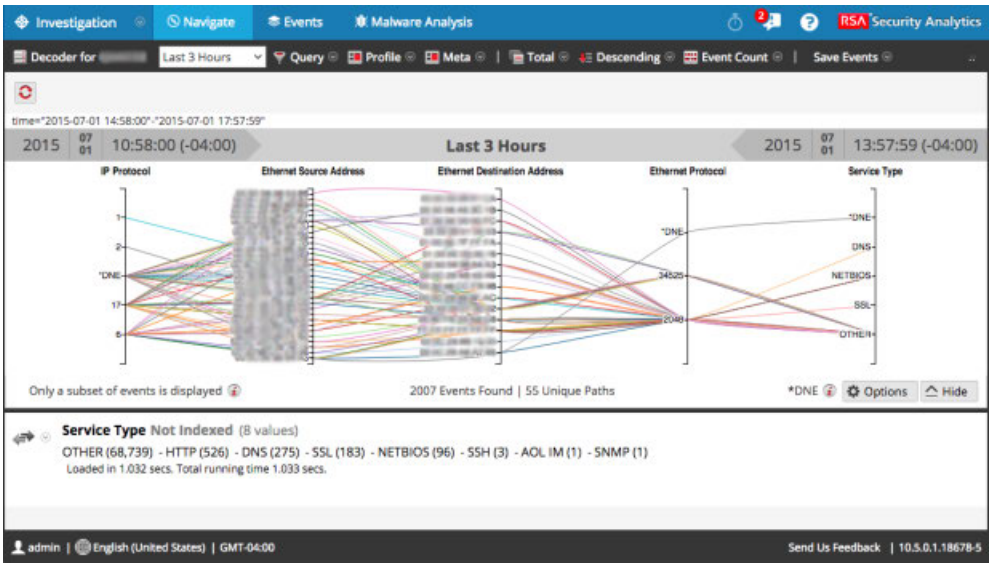


The timeline displays activity for the specified service and time range, as a line chart or a bar chart based on your choice in the Options menu.

Feature	Description
Number of Events (Timeline)	The Y axis of the chart based on thousands of events.
Time Line (Timeline)	The X axis of the chart based on the time the events occurred.
Event point (Timeline)	If you want to explore a specific section, simply select the range from the chart. The new time range will be reflected in the chart.
Investigate (Timeline)	Displays the meta values for the selected subset.
Reset Zoom (Timeline)	To return to the original time range, click Reset Zoom.
Options	Displays the Visualization Options dialog. Data points can be displayed as a Line chart (default), a Bar chart, or Coordinates chart. When a chart type is select, the relevant options are displayed.
Hide	Collapses the chart.

Parallel Coordinates Chart

The Parallel Coordinates chart is one of the choices in the Options menu for visualizing the current drill point. With Coordinates selected in the Visualization Options dialog, you can select the meta data to be displayed (see Visualize Metadata as Parallel Coordinates).



Feature	Description
Axes	Each axis is a meta key. The number of meta keys affects the load time for the chart. All meta keys are loaded, but it there the number of events per meta key is limited.
Lines	Lines represent events and they connect values on the axes to show the correlation between multiple meta keys.
Options	Displays the Visualization Options dialog. Data points can be displayed as a Line chart (default), a Bar chart, or Coordinates chart. When a chart type is select, the relevant options are displayed.
Only a subset of events is displayed.	This message is a notification that not all events in the values panel are drawn in the chart. Removing axes or filtering the data in the Values panel can help to display all events.
Events Found | Unique Paths	Displays the total number of events charted versus the number of unique paths charted. Setting the All Meta Keys Must Exist in an Event option redraws the chart so that it is more targeted and legible.
DNE	Indicates that there is no values for this meta key in the event.

In the Visualization Options dialog for Coordinates, you can select the meta keys to chart.

Feature	Description
Visualization selection	Displays a drop-down list of visualization types: Timeline and Coordinates
All Meta Keys Must Exist in an Event	Limits the data represented in the visualization to only those events that include all selected meta keys. This can result in a cleaner, more targeted visualization.

Feature	Description
	Displays the Add Keys to Parallel Coordinates Visualization dialog so that you can add axes to the visualization. This is useful if you are looking for relationships between the default meta keys and some additional ones.
	Deletes the selected keys so that they do not appear as axes in the visualization. This can help to make the visualization less cluttered and allow for more data points to be included in the visualization.
	Reverts to the default meta keys for visualization, which consist of all meta keys in the current drill point.
	Controls the display of additional information about the number of selected axes versus the recommended count. This helps to make you aware of possible performance improvements by removing axes.
Axes	Lists the meta keys selected as axes in the visualization.
Cancel	Cancels any changes made to the visualization options.
Apply	Saves the changes made to the visualization options and applies to the current visualization.

In the Add Keys to Parallel Coordinates Visualization dialog, you can select the meta keys or meta groups to use as axes the Parallel Coordinates visualization.

Feature	Description
Visualization selection	Select Keys: Two options for selecting meta keys are: • From Default Meta Keys • From Meta Groups Each option offers a drop-down list from which to select.
With the Selected Meta Keys...	The options for the method of adding meta keys allow you to: • Replace the current list of keys • Append to the current list of keys • Insert at beginning of the current list of keys
Cancel	Closes the dialog and does not add any keys.
Add	Closes the dialog and adds the selected keys as specified.

Values Panel

The major feature of the Navigate view is the Values panel, which you can use to analyze data (see Filter Results in the Navigate View).

The default view is for the last 3 hours of collection, using the default meta keys and non-indexed meta keys closed. The meta keys within the meta groups are displayed in the order that NetWitness Platform queries the keys. As the data loads into the Values panel, NetWitness Platform is optimized to show partial results, loading progress, and service status as the data loads.

The loading behavior is determined by several configuration settings. The highest level settings are configured by the administrator for each user. These are:

- The maximum amount of time allowed for this user to run a query (Query Timeout).
- The limit at which NetWitness Platform stops counting the number of meta values in a session (Session Threshold). If a threshold is set for a session, the Navigate view shows that the threshold was reached and the percentage of results loaded. Any session that does not show a percentage is accurate and was processed to completion. If there is a percentage, that reflects how much processing was completed. The percentage displayed is estimated by extrapolating from the value at the time processing finished, considering the amount of work remaining. Larger percentages are generally more accurate because they require less extrapolating
- The limit at which NetWitness Platform stops counting the number of meta values in a session (Session Threshold). If a threshold is set for a session, the Navigate view shows that the threshold was reached and the percentage of query time used to reach the threshold.

Note: The values for non-indexed meta keys take longer to load in the Values panel. To optimize loading, NetWitness Platform does not open non-indexed meta keys by default. Refer to Manage and Apply Default Meta Keys in an Investigation for a detailed description of non-indexed meta keys in Investigation.

When you have launched an investigation of a service, NetWitness Platform displays results in the Values panel.

1. NetWitness Platform loads meta keys and meta values in the Values panel. For each meta key load, the stages of load are:
   a. **Waiting to Be Loaded** or **Closed**. If Closed, no data for that key is loaded.
   b. **Loading**
      i. **Loading progress**: NetWitness Platform is receiving and displaying progress messages.
      ii. **Partial results**: NetWitness Platform is receiving values messages and partial results are displayed in the Values panel.
   c. **Load Complete**: All results are finished loading.
2. As each meta key load is completed, and final values are displayed, the next meta key is started. The number or values rendered for each meta key is specified by the Render Threads value in the Investigation Preference settings. Loading continues until all keys to be loaded have finished.
3. If **Show Debug Information** is active and the service you are navigating is a 10.4 or later Broker, NetWitness Platform displays load time information beneath the values for each meta key and displays additional load details for the aggregated services. NetWitness Platform also displays the debug information beneath the breadcrumb.

Iterative results

Iterative results provide feedback on the status of queries within the interfaces to provide additional context for how long the data load will take and if any service data is missing. For example, if you are querying a Broker that is aggregating from two Concentrators, NetWitness Platform starts displaying the results from the first Concentrator as soon as it is available, even if the second Concentrator is still waiting for results.

Iterative results also include a notification that service data is missing because the service is unreachable.

Partial results

When partial values from the Core service are returned but not completed, a message at the end of the meta key listing shows the progress of values loaded. For example, Currently looking at 38 ip.src values 71% indicates that loading of values for the meta key is 71% complete.

Debug Information

If the Show Debug Information setting is in effect, a field at the end of the values displays the status for the different systems against which you are querying within NetWitness Platform. For example, when you are querying against a 10.4 broker pulling from multiple concentrators, NetWitness Platform displays the status of the query on each of the Concentrators, which provides insight into the relative speed of data loading from each of the Concentrators. Each service that participated in the query is listed with the total elapsed time for the query.

Each service that participated in the query is listed with the total elasped time for the query. In the example above, two services returned in 3.207 seconds, localhost:50005 took 2 seconds to return the results. In addition, the where clause of the query is displayed below the breadcrumb. You can copy this syntax directly into an application rule or Reporting where clause of a rule.

Load Complete

For each meta key, there is a list of values (blue text) and counts (green text) found in the current drill point. When you click a value to drill down into a subset of the currently selected data, the display is updated and the new drill point is recorded in the breadcrumb. You can specify the sorting and quantification methods for the values list using the option in the toolbar.

Note: Title, values, and counts for non-indexed meta keys are not drillable; the Values and counts are shown in black.

Feature	Description
Meta Key	The name of the meta that is listed, for example, **Service Type** is a meta key.
Number of values rendered vs number of values available to load	The number or values rendered is specified by the Render Threads value in the Investigation Preference settings. In the example above, the meta key is **Service Type**, and 20 of 20+ values are currently displayed. You can display additional values by clicking **...show more**.

Feature	Description
	Clicking  on an indexed meta key opens the Search dialog in which you can enter a filter for the current meta key. The search function is not available for non-indexed meta keys, and is based on the actual meta value rather than the alias. Drilling in the Search dialog using aliases is not supported. NOTE: Check with your administrator to obtain a list of aliases used for a meta key in Investigation. When an alias is used, this search dialog does not provide results. Instead, you must query the meta key using the Right-click query capability or the Query dialog.
Offline Services: xxx.xxx.xxx.xxx:50004	Lists offline services queried by a 10.4 Broker.
Meta Count, for example (3)	The number of instances found for a particular meta in the session.
Meta Value, for example other src	The specific name associated with the found meta.
...show more	If the number of meta values has been limited (for example, 20), clicking this displays additional meta values for the selected meta key.
Loaded in 0.418 secs. Total running time 0.434 secs. (localhost:50005 loaded in 1 secs....	Debug stats display load times based on the Show Debug Information setting.

Meta Key Drop-Down Menus

The Meta Keys in the Values panel have drop-down menus. Next to each meta label, a drop-down arrow displays the options that can apply to that item. You can use these to change the way the results for the meta key are displayed in the current view. Changes made to meta keys are displayed in the current view and persist until you refresh the page or select a new service in the Navigate view toolbar. See Drill into Data in the Values Panel

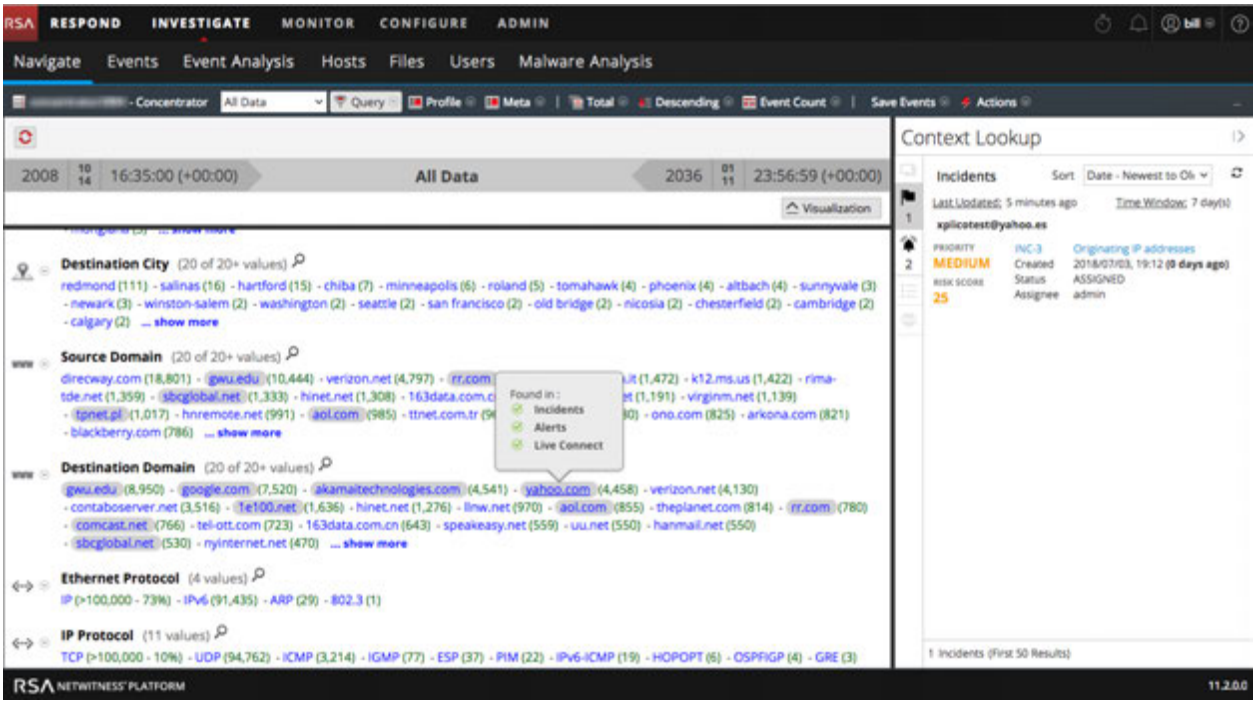
Refresh reverts to the current view of meta keys as defined in the Manage Default Meta Keys dialog (see Manage and Apply Default Meta Keys in an Investigation). If you have never made modifications in the Manage Default Meta Keys dialog, NetWitness Platform restores the default meta keys from the core service.

- More Results
- Max Results
- Hide Results
- Meta Key Info
- View as CSV (Version 11.0.0.x) or Export Values (Version 11.1 and later)

Context Lookup Panel

The Navigate view and the Events view have a Context Lookup panel on the right side. The Context Lookup panel is displayed only if you have installed and configured the Context Hub service. For more information on configuring the Context Hub service, see the *Context Hub Configuration Guide*.

The Context Lookup panel displays relevant data when an analyst looks up contextual data for a meta value in the Values panel.

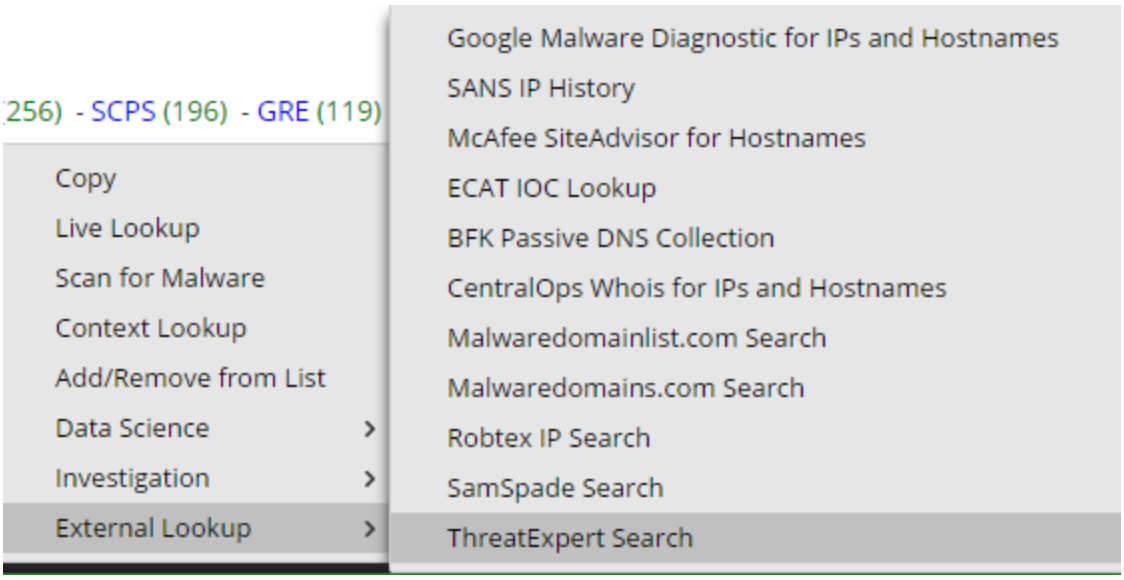


After the administrator configures the Context Hub service, you can view the contextual information for the meta values in the Navigate view and the Events view. For more information on configuring the Context Hub service, see the *Context Hub Configuration Guide*. For information about performing Context Lookup for meta values, see Look Up Additional Context in the Navigate and Events Views.

The Context Hub service is pre-configured with default meta type and meta key mapping. For information about the mapping of the context hub meta value with investigation meta key, see "Manage Meta Type and Meta Key Mapping" in the *Context Hub Configuration Guide*

You can view the type of context data that is available for a highlighted meta value by hovering the mouse over a highlighted meta value. An inline indicator shows which type of context data is available for the meta: Endpoint, Incidents, Alerts, or Lists.

Right-clicking a meta value opens a menu with the context lookup option. The following figure illustrates the Context Lookup option when you right-click a meta value.



For meta keys such as IP, Host and Mac Address, the details of the values that are flagged are collected from Endpoint, Incident, Alerts, and Lists.

For meta keys such as File, File Hash, Domain, User, the details of the values that are flagged are collected from Incidents, Alerts, and Lists.

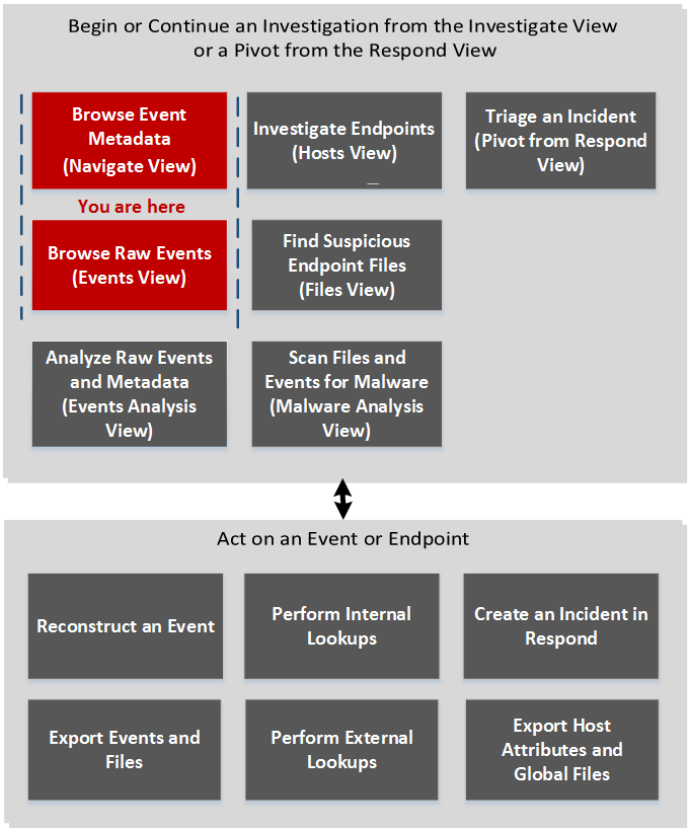
The data is displayed in the context panel, only if there is any data available .

For more information about the lookup results and contextual information for different data sources, see Context Lookup Panel.

Query Dialog

In the Navigate view or Events view, you can create a query rather than clicking through the meta keys and values to drill down into the meta data. The dialogs for creating a query offer syntax help with drop-down lists of applicable meta keys and operators. To access this dialog in the **Navigate** or **Events** view toolbar, select **Query**.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata*	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events*	Begin an Investigation in the Navigate or Events View
Threat Hunter	analyze raw events and metadata	Begin an Investigation in the Event Analysis View

User Role	I want to ...	Show me how
Threat Hunter	investigate endpoints (Version 11.1)	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis

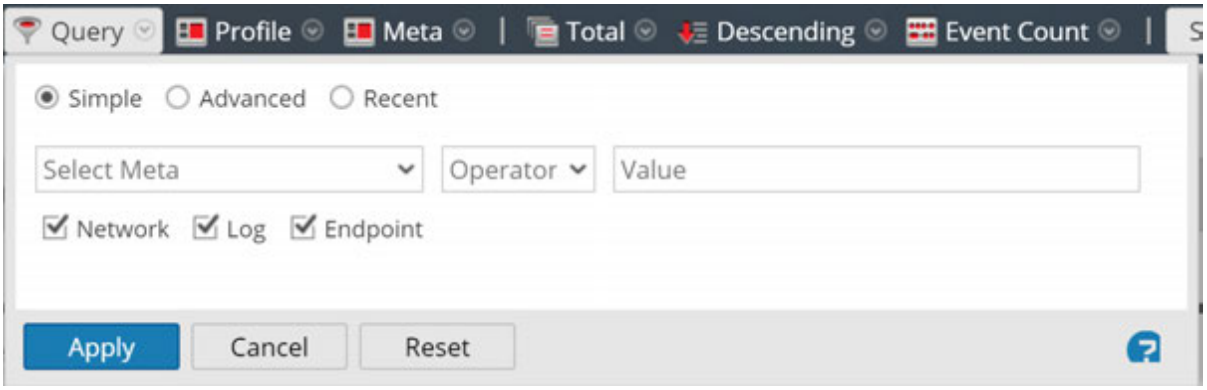
Quick Look

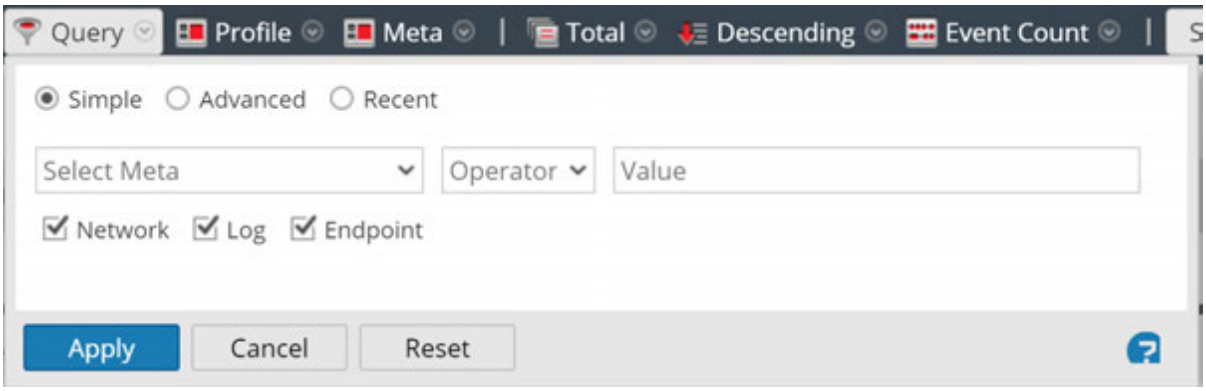


The Query dialog has three views:

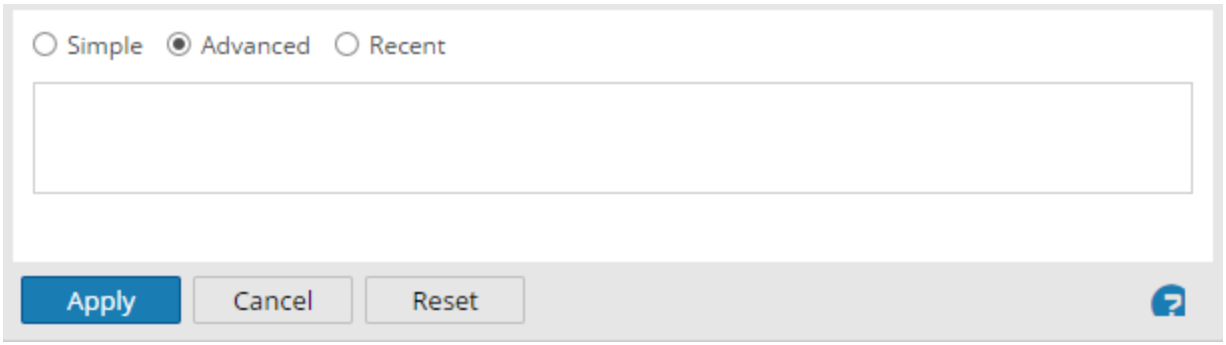
- Simple
- Advanced
- Recent

In the Simple view, you can create a query using the options displayed in the dialog. In the Advanced view, you can create a query without guidance. In the Recent view, you can select a query from a drop-down list of recent queries.

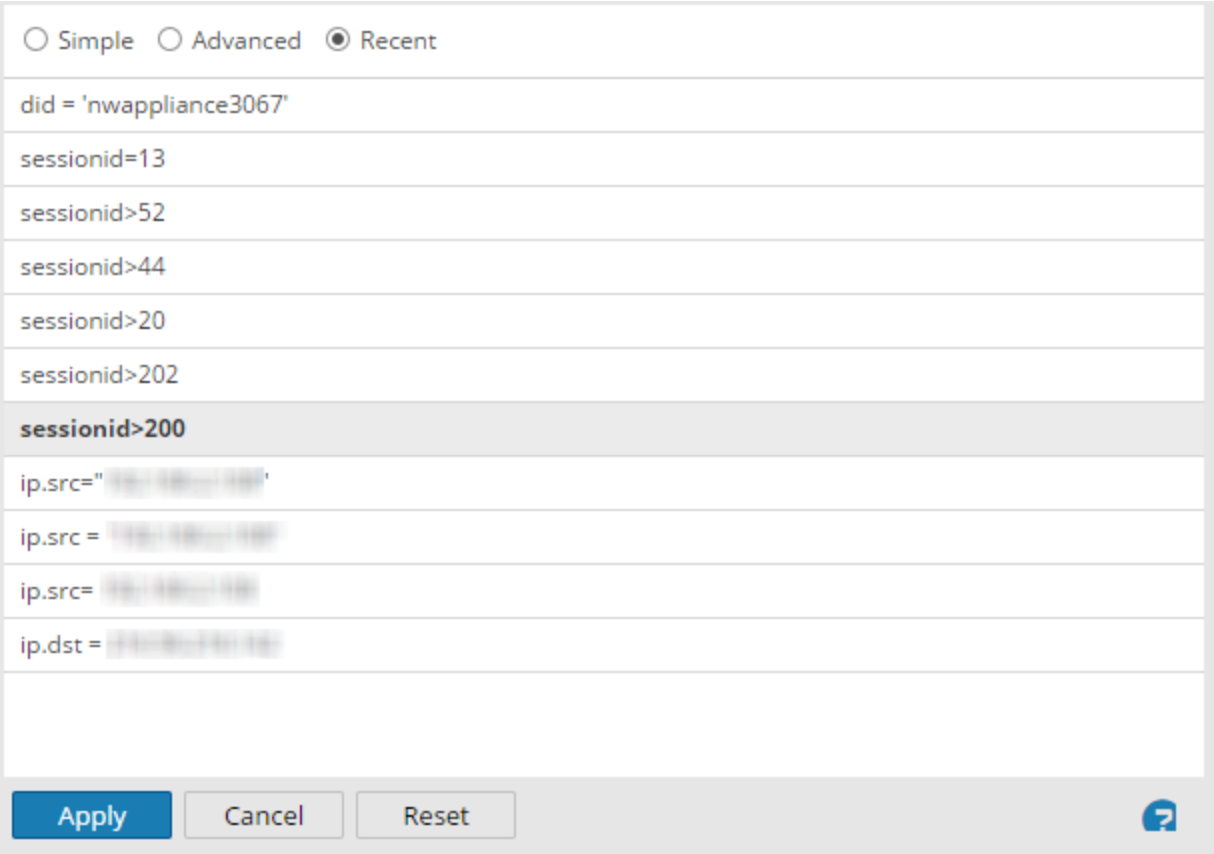
Simple View



Advanced View



Recent View



The following table describes features of the Query dialogs.

Feature	Description
Select Meta	Displays a drop-down list of meta groups.
Operator	Displays a drop-down list of operators (=,NetWitness Platform!=,NetWitness Platformexists,NetWitness Platform!exists)
Value	Allows you to enter a value to complete the query.
Network	Limits the query to packets if Log is not selected.
Log	Limits the query to logs if Network is not selected.
Query box	Allows you to enter a query in the Advanced view. When you begin typing, a drop-down list of available meta keys for the service is displayed, then a drop-down of operators is displayed as you type. If the expression currently entered in the query box is invalid, a warning appears near the box. When the query is valid, the warning is removed.
Query list	Allows you to select a query from a list of recent queries in the Recent view. Double-clicking a query automatically applies it.

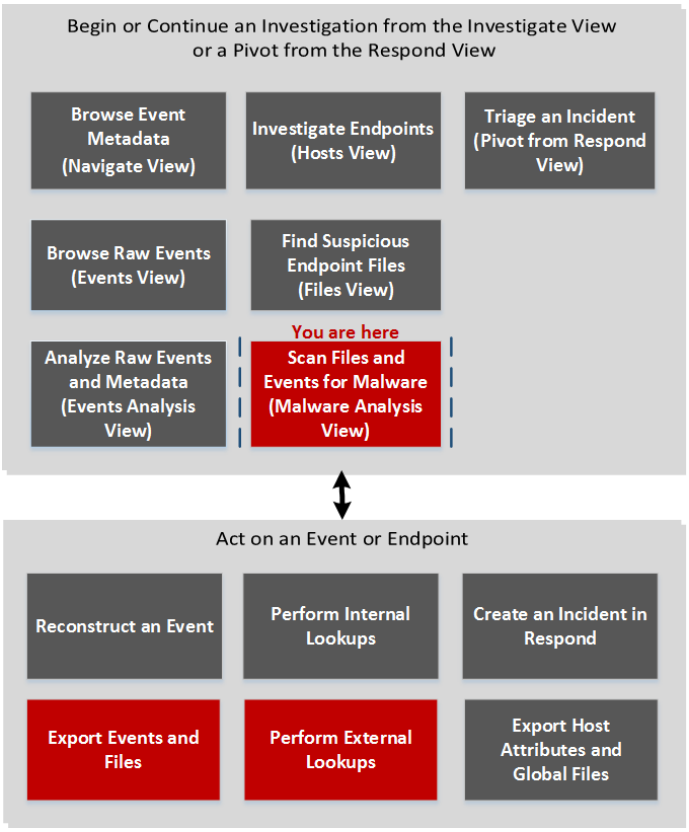
Feature	Description
Apply	Applies the new query to the current Investigation view.
Cancel	Closes the dialog without applying changes.
Reset	Resets all fields.

Scan For Malware Dialog

In the Scan for Malware dialog, Malware Analysis analysts can upload files to investigate in Malware Analysis.

To access this dialog go to the **Malware Analysis** view. In the **Select a Malware Analysis Service** dialog, select a service in the left panel, then click Scan Files in the right panel.

Workflow



What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View

Quick Look

The Select a Malware Analysis Service dialog has a Malware Services panel on the left and a Scan Jobs List on the right. The Scan Jobs List panel has a toolbar, list, and buttons to view scans.

The Malware Services panel is a list of services available for malware analysis. In this panel, you can select the service to investigate and you set a default service using the Default Service icon. When you select a service, the available scan jobs for that service are listed in the Scan Jobs list.

These are the features in the Scan Jobs List toolbar.

Feature	Description
Scan Files	Displays the Scan for Malware dialog, in which you can upload a file to the service for scanning.
Delete scan job ( )	Deletes one or more selected scan jobs, NetWitness Platform displays a confirmation dialog before deleting scan jobs.
Cancel scan job ( )	Pauses or continues one or more scan jobs.
Refresh ( )	Refreshes the list of scan jobs.

These are the columns in the Scan Jobs list. This list is also available in the Malware Scan Jobs dashlet.

Feature	Description
Name	Displays the name of the job.
Static, Network, Community, Sandbox	Filters the results based on the scores for each scoring module.
Progress	Displays the current progress made on the job. • Green: The job is finished. • Black: The job is in progress. • Red: An error occurred.
Info	Provides additional information. Displays the query for the job. If the job is not complete, it also displays more detailed description of the status.
User	Displays the name of the user who created the job.
Events	Counts the number of events for the job.
Dropped	Counts the number of files/events in the job that were dropped because the scores are below their configured threshold.
Event Type	Displays the type of job: Manual Upload, On Demand, or Resubmit.
Scheduled	Displays the date and time when the job was executed.

These are the available actions in the dialog.

Feature	Description
Cancel button	Cancels the selected scan job.
View Scan button	Displays the Summary of Events for the selected scan with the default dashlets displayed.
View Continuous Mode button	Displays the Summary of Events for the selected scan with the default dashlets displayed.

Settings Dialogs for Investigate Views

NetWitness PlatformVersion 11.0 has two settings dialogs, one for the Navigate view and one for the Events view. With the addition of the settings dialog for the Event Analysis view in Version 11.1, Investigate has three settings dialogs.

The settings in the Navigate view and Events view Settings dialogs are a subset of the Investigation settings made in the Profiles > Preferences panel > Investigations tab. By providing the settings within the Investigation view, NetWitness Platform saves time for analysts. If you change a setting here, the same setting is changed in the Profiles view, and if you change a setting in the Profiles view, the same setting is changed here.

To access this dialog, go to the **Navigate** or **Events** view, and select the **Settings** option in the toolbar.

The settings in the Event Analysis view have no corresponding settings in the Profiles > Preferences panel.

What do you want to do?

User Role	I want to ...	Show me how
Threat Hunter	browse event metadata	Begin an Investigation in the Navigate or Events View
Threat Hunter	browse raw events	Begin an Investigation in the Navigate or Events View
Threat Hunter	analyze raw events and metadata	Begin an Investigation in the Event Analysis View
Threat Hunter	investigate endpoints (Version 11.1)	Investigate Hosts
Threat Hunter	find suspicious endpoint files (Version 11.1)	Investigate Files
Threat Hunter	scan files and events for malware	Conducting Malware Analysis
Incident Responder	triage an incident in Investigate	*NetWitness Respond User Guide*
Threat Hunter	configure preferences for Investigate*	Configuring NetWitness Investigate Views and Preferences

*You can perform this task in the current view.

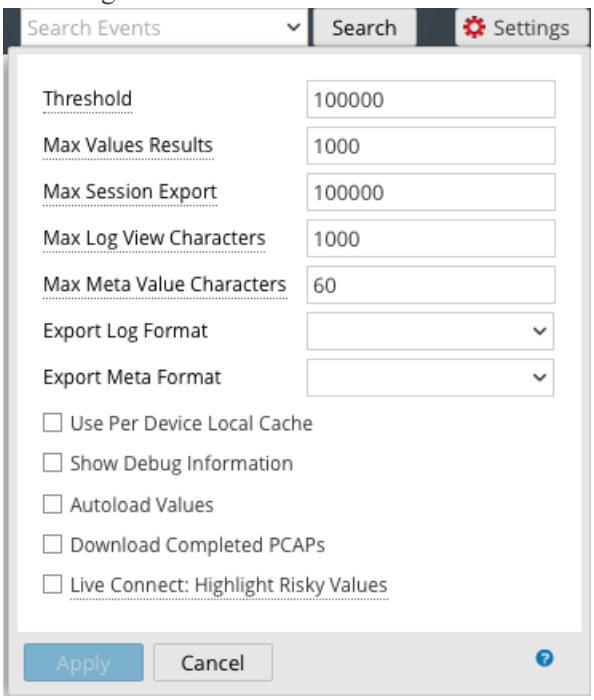
Related Topics

- How NetWitness Investigate Works

Quick Look

The Settings dialogs in the Navigate view and Events view have several features in common.

Several Investigation settings in the Navigate view influence the performance of when loading values in the Values panel. Default values are set based on common usage, and individual analysts can adjust these settings for their own investigations. The image below is an example of the dialog, and the following table describes the features.

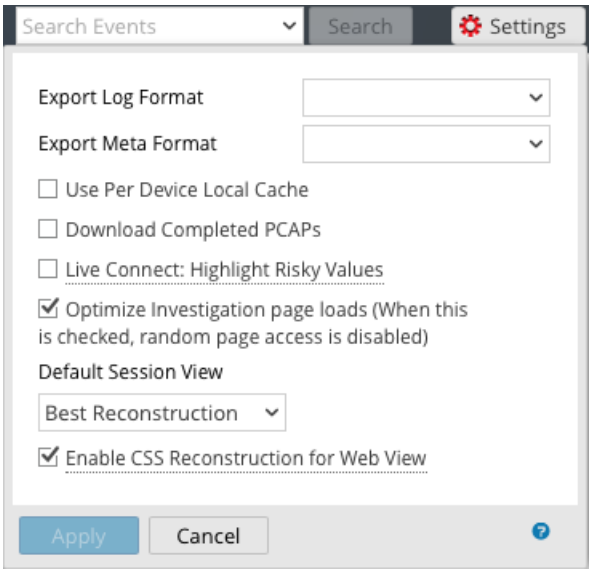


Feature	Description
Threshold	Sets the threshold for the maximum number of sessions loaded for a meta key value in the Values panel. A higher threshold allows accurate counts for a value, and also causes longer load times. The default value is **100000**.
Max Values Results	Sets the maximum number of values to load in the Navigate View when the Max Results option is selected in the Meta Key Menu for an open Meta Key. The default value is **1000**.
Max Session Export	Sets the maximum number of sessions able to be exported. The default value is **100000**.
Export Log Format	Sets the file format of exported logs. There are four formats available: • Text • SML • CSV • JSON

Feature	Description
Export Meta Format	Sets the file format of exported meta values. There are four formats available: • Text • SML • CSV • JSON
Use Per Device Local Cache	When unchecked, Investigate sends a fresh query to the database rather than displaying cached data in the Investigate views after the initial load. If checked, Investigate uses the data from local cache.
Show Debug Information	This option controls the display of the `where` clause beneath the breadcrumb in the Navigate view and the elapsed load time for each aggregated service on a Broker. When checked the debug information is displayed. The default value is **Off** (unchecked).
Append Events in Event Panel	This option affects paging in the Events panel. When checked, the next group of events is appended to the already displayed events. When unchecked, the previous page of events is replaced by the next page. The default value is **Off** (unchecked)
Autoload Values	This option controls automati loading of values for the selected service in the Navigate view. When checked, values are automatically loaded when you select a service to investigate. When not checked, Investigate displays a **Load Values** button, allowing the opportunity to modify options. The default value is **Off**.
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in the Investigation module so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP form.
Live Connect: Highlight Risky IPs	If this option is unchecked, all the meta values that have context available in Live Connect are highlighted in the Navigate view Values panel. If the option is checked, among the values that have context in Live Connect, only those values deemed Risky/Suspicious/Unsafe by the community are highlighted. By default this option is unchecked (**Off**).
Apply	Applies the settings immediately and they are visible the next time you load values. The same changes are also applied in the Profiles view.
Cancel	Cancels the editing operation and closes the dialog, leaving the settings unchanged.

Events View Settings Dialog

The following image is an example of the Settings dialog for the Events view, and the following table describes the features.

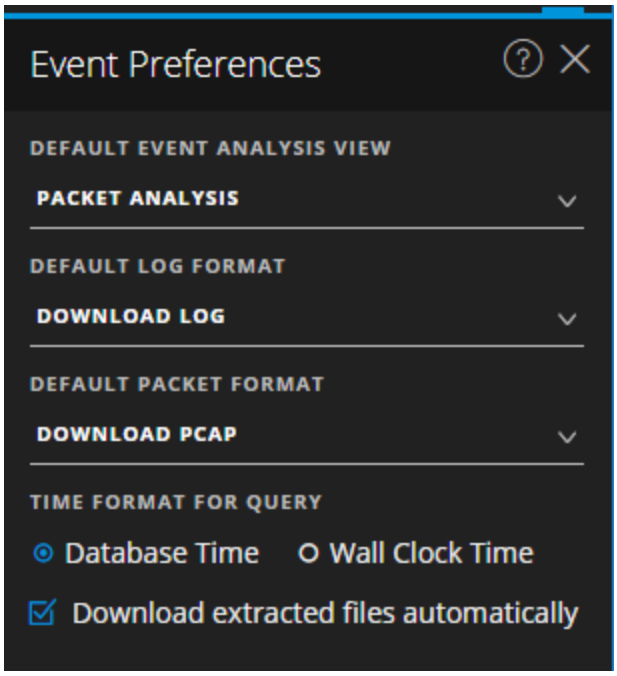


Feature	Description
Export Log Format	Sets the file format of exported logs. There are four formats available: • Text • SML • CSV • JSON
Export Meta Format	Sets the file format of exported meta values. There are four formats available: • Text • SML • CSV • JSON
Download Completed PCAPs	This setting automates the downloading of extracted PCAPs in the Investigation module so that you do not have to manually download and open extracted PCAP files in an application, such as Wireshark, that can handle viewing data in a PCAP form.
Live Connect: Highlight Risky IPs	When checked, Investigate uses a filter to fetch only IP addresses that are considered as risky by RSA community. When not selected, NetWitness Platform displays all IP addresses. By default, this option is not selected (**Off**).
Optimize Investigation page loads	Sets a paging option. When optimized, results are returned as quickly as possible, sacrificing the original ability to go to a specific page in the event list. Unchecking this box changes the Events list pagination to allow you to go to a specific page in the list (or to the last page). The default value is **enabled**.

Feature	Description
Default Session View	Selects the default reconstruction type for the initial reconstruction in the Events view. The default value is **Best Reconstruction** in which events are reconstructed using the reconstruction method most appropriate to the event.
Enable CSS Reconstruction for Web View	This setting controls how web content reconstruction is performed. If enabled, the web reconstruction includes cascaded style sheet (CSS) styles and images so that its appearance matches the original view in a web browser. This includes scanning and reconstructing related events, and searching for style sheets and images used in the target event. The option is enabled by default. Uncheck this option if there are problems viewing specific websites.
Apply	Applies the settings immediately and they are visible the next time you view events. The same changes are also applied in the Profiles view.
Cancel	Cancels the editing operation and closes the dialog, leaving the settings unchanged.

Event Analysis View Preferences Panel

Beginning with Version 11.1, the Event Analysis view has user preferences that you can configure in the Event Analysis view > Event Preferences panel. These settings persist so that they are applied each time log in and go to the Event Analysis view. The following figure is an example of the dialog, and the table below describes the options.



Feature	Description
Default Event Analysis View	Selects the default event analysis view that is displayed every time you open the Event Analysis view. For example, if you select File Analysis, the File Analysis panel is highlighted and displayed every time you investigate an event in the Event Analysis view. These are following options: • **Text Analysis**: View and analyze the raw text payload of an event. • **Packet Analysis**: View and interactively analyze the packets and payload of an event. • **File Analysis**: View a list of files and download one or more files in an event.
Default Log Format	Selects the default format for downloading logs: • **Download Log**: Raw log (log) using this option. • **Download CSV**: Comma-separated values (CSV) using this option. • **Download XML**: The Extensible Markup Language (XML) file using this option. • **Download JSON**: The JavaScript Object Notation (JSON) file using this option.
Default Packet Format	Selects the default packet format for downloading packets. • **Download PCAP**: To download the entire event as a packet capture (*.pcap) file. • **Download All Payloads**: To download the payload as a *.payload file. • **Download Request Payload**: To download the request payload as a *.payload1 file. • **Download Response Payload**: To download the response payload as a *.payload2 file.
Time Format for Query	The Event Analysis view can display results based on the database time or the current clock time. The default setting for this preference is Database Time, which is the same time format used to display query results in the Navigate view and Events view. When **Database Time** is selected, the start and end time for a query is based on the time that the event was captured. When **Wall Clock Time** is selected, the query is executed using the end time based on the current browser time; the start time is calculated based on that end time and the time range.

Feature	Description
Download extracted files automatically	Enables the automatic download of files if they are in the selected default format in the **Default Log Format** and **Default Packet format** fields from the Event Preferences panel. Select the checkbox to enable downloading the selected format automatically to local folder. Otherwise, the download job goes to the job queue, and you can download it manually.

RSA NETWITNESS® PLATFORM

NetWitness Respond User Guide

for Version 11.2

NetWitness Respond Process

NetWitness Respond collects alerts from multiple sources and provides the ability to group them logically and start an Incident Respond workflow to investigate and remediate the security issues raised. NetWitness Respond enables you to configure rules that aggregate Alerts into Incidents. Alerts are normalized by the system to a common format to provide users with a consistent view for the rule criteria regardless of the data source. You can build query criteria based on the alert data with the ability to query on fields that are common as well as specific to data sources.

The rule engine allows you to group similar alerts together into an Incident so that the investigation and remediation workflow can be shared across a set of similar alerts. You can create rules that can group alerts into incidents depending on a common value they share for one or two attributes (for example, source hostname) or if they are reported within a limited time window (for example, alerts that are within four hours of each other).

If an alert matches a rule, an incident is created using the criteria. As new alerts are ingested, if an existing incident was already created that matched those criteria, and that incident is not "in progress" yet, the new alerts continue to be added to the same incident. If there is no existing incident for the grouped value (for example, the specific hostname) or the time window, a new incident is created and the alert is added to it.

You can have multiple incident rules. The rules can either group alerts into incidents or suppress alerts from being matched by any rule, hence the rules are ranked top-to-bottom and only the first rule to match an incoming alert is used to include that alert in an incident. The Incidents provide a context for the alerts, provide tools to record the investigation status, and track the progress of associated tasks.

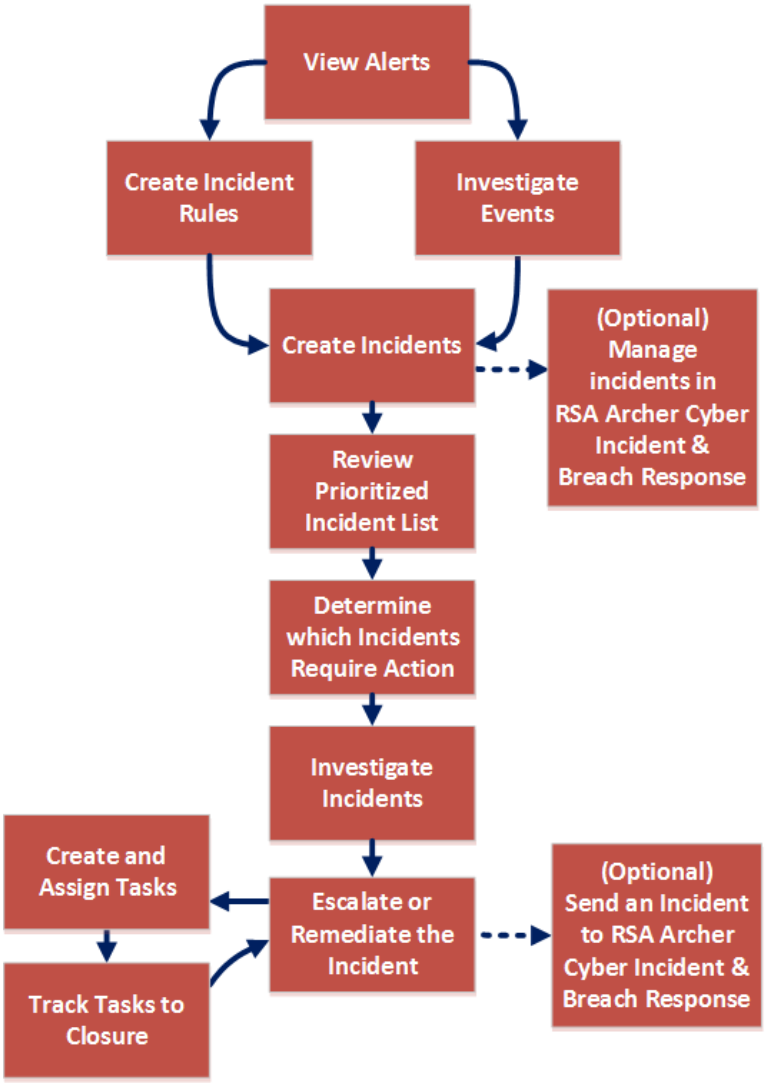
The stages in the NetWitness Respond process are:

- Review Alerts
- Create Incidents
- Respond to Incidents:
  - Review Prioritized Incident List
  - Determine which Incidents Require Action
  - Investigate Incidents
  - Escalate or Remediate the Incident (This includes creating and assigning tasks as well as tracking tasks to closure. In version 11.2 and later, if RSA Archer is configured as a data source in Context Hub, you can send incidents to RSA Archer® Cyber Incident & Breach Response.)

You also have the option of managing incidents in Archer Cyber Incident & Breach Response instead of NetWitness Respond.

NetWitness Respond Workflow

The following figure shows the high-level NetWitness Respond workflow process.



Responding to Incidents

An *Incident* is a logically grouped set of alerts created automatically by the Incident Aggregation Engine and grouped by a specific criteria. An incident, available in the Respond view, allows an Analyst to triage, investigate, and remediate these groups of alerts. Incidents can be moved between users, notated, and explored using a nodal graph. Incidents allow users to ensure that they understand the full scope of an attack or event in their RSA NetWitness® Platform system and then take action.

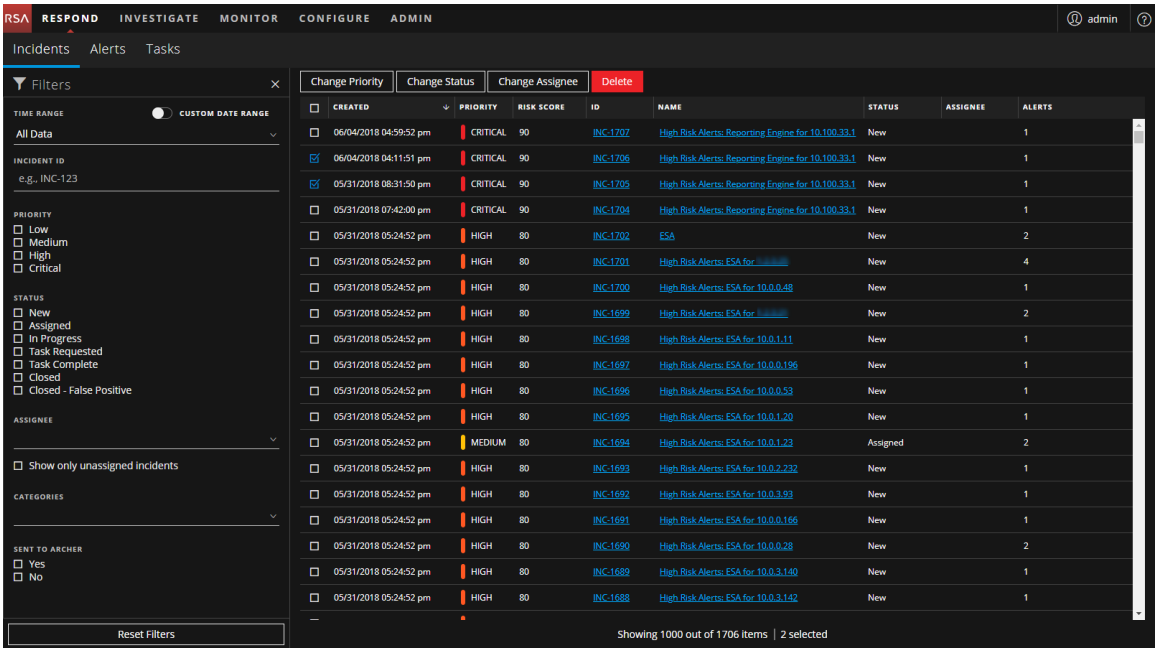
The **Respond** view is designed to help you quickly identify the ongoing issues in your network and work with other Analysts to quickly solve the issues.

The Respond view presents Incident Responders with a queue of incidents in severity order. When you take an incident from the queue, you receive relevant supporting data to help you investigate the incident. This enables you to determine the incident scope so you can escalate or remediate it as appropriate.

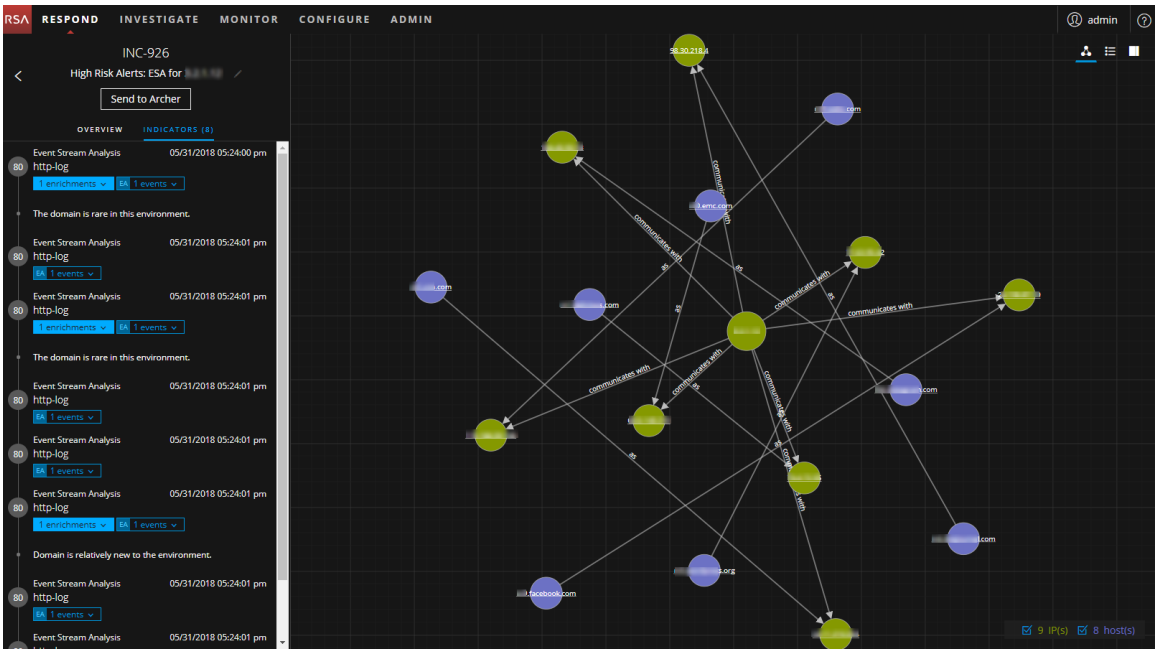
Within the Respond view, you can see Incidents, Alerts, and Tasks:

- **Incidents**: Enables you to respond to and manage incidents from start to finish.
- **Alerts**: Enables you to manage alerts from all sources received by NetWitness Platform and create incidents from selected alerts.
- **Tasks**: Enables you to view and manage the complete list of tasks created for all incidents.

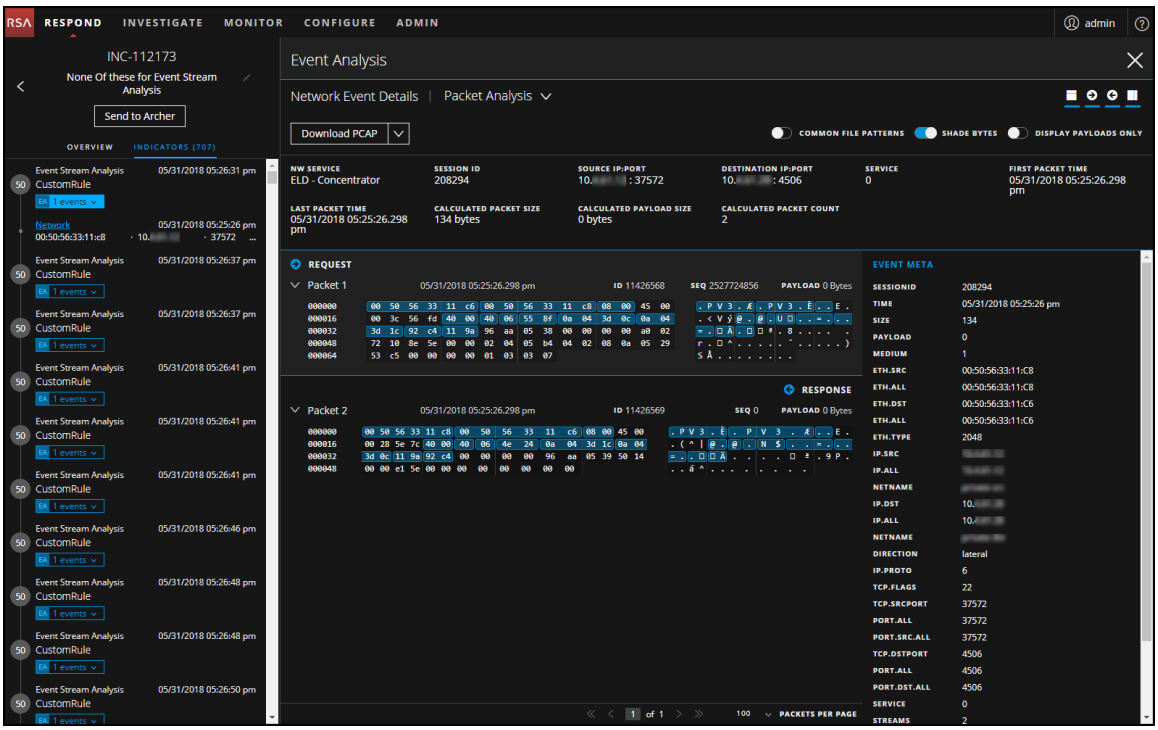
If you navigate to RESPOND > Incidents, you can see the Incidents List view and from there you can access the Incident Details view for a selected incident. These are the main views that you use to respond to incidents. The following figure shows the list of prioritized incidents in the **Incidents List** view.



The next figure shows an example of details available in the **Incident Details** view.

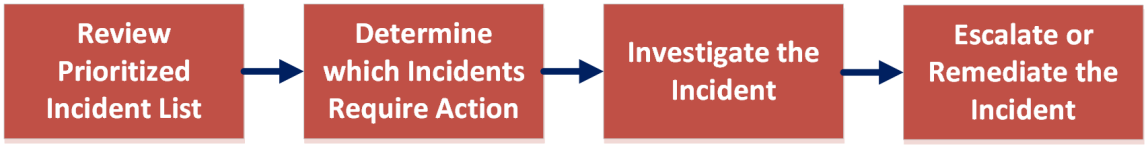


The Respond view is designed to make it easy to evaluate incidents, contextualize that data, collaborate with other analysts, and pivot to a deep-dive investigation as needed. The following figure shows an example of an event analysis in the Incident Details view.



Responding to Incidents Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness Platform.



First, you review the list of prioritized incidents, which shows basic information about each incident, and determine which incidents require action. You can click a link in an incident to get a clearer picture of the incident with supporting details in the Incident Details view. From there, you can further investigate the incident. You can then determine how to respond to the incident, by escalating or remediating it.

These are the basic steps for responding to an incident:

1. Review Prioritized Incident List
2. Determine which Incidents Require Action
3. Investigate the Incident
4. Escalate or Remediate the Incident

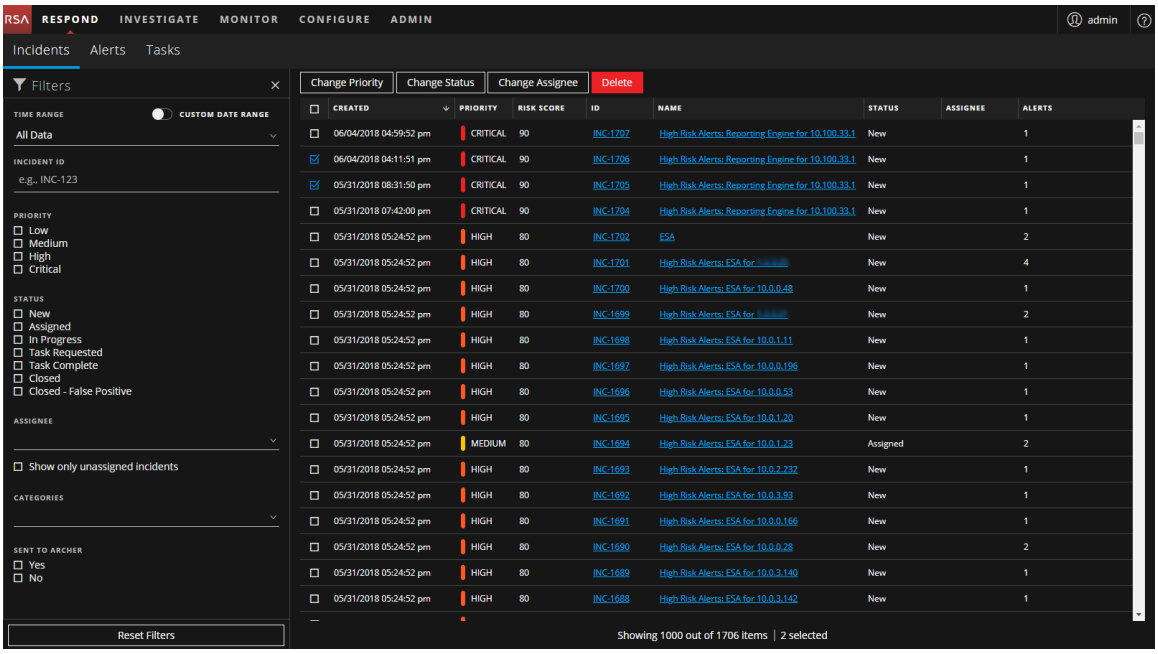
Review Prioritized Incident List

In the Respond view, you can view the list of prioritized incidents. The incident list shows both active and closed incidents.

View the Incidents List

After logging in to NetWitness Platform, most Incident Responders see the Respond view, which is set as the default view. If you have a different initial view, you can navigate to the Respond view.

1. Log in to NetWitness Platform.
   The Respond view shows the list of incidents, also referred to as the Incident List view.



2. If you do not see the incidents list in the Respond view, go to **RESPOND > Incidents**.
3. Scroll through the incidents list, which shows basic information about each incident as described in the following table.

Column	Description
CREATED	Shows the creation date of the incident.
PRIORITY	Shows the incident priority. Priority can be Critical, High, Medium or Low. The Priority is color coded, where red indicates a **Critical** incident, orange represents a **High** risk incident, yellow indicates a **Medium** risk incident, and green represents a **Low** risk incident. For example: RISK SCORE	Shows the incident risk score. The risk score indicates the risk of the incident as calculated using an algorithm and is between 0-100. 100 is the highest risk score.

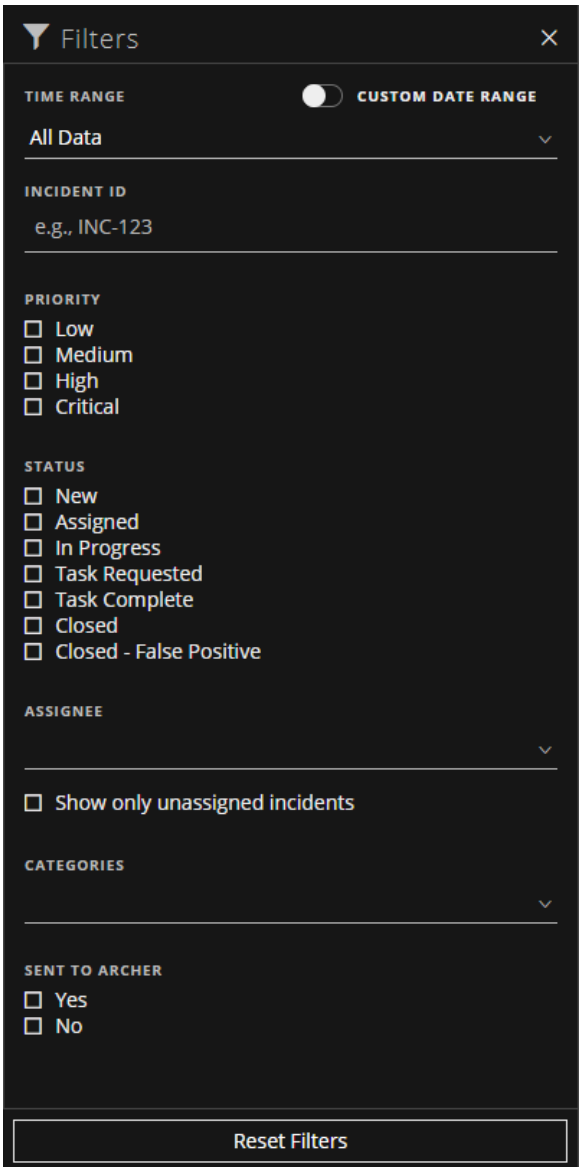
Column	Description
ID	Shows the automatically created incident number. Each incident is assigned a unique number that you can use to track the incident.
NAME	Shows the incident name. The incident name is derived from the rule used to trigger the incident. Click the link to go to the Incident Details view for the selected incident.
STATUS	Shows the incident status. The status can be: **New**, **Assigned**, **In Progress**, **Task Requested**, **Task Complete, Closed**, and **Closed - False Positive**.
ASSIGNEE	Shows the team member currently assigned to the incident.
ALERTS	Shows the number of alerts associated with the incident. An incident may include many alerts. A large number of alerts might mean that you are experiencing a large-scale attack.

At the bottom of the list, you can see the number of incidents on the current page, the total number of incidents, and the number selected. For example: **Showing 1000 out of 1115 items | 3 selected**. The maximum number of incidents that you can view at one time is 1,000.

Filter the Incident List

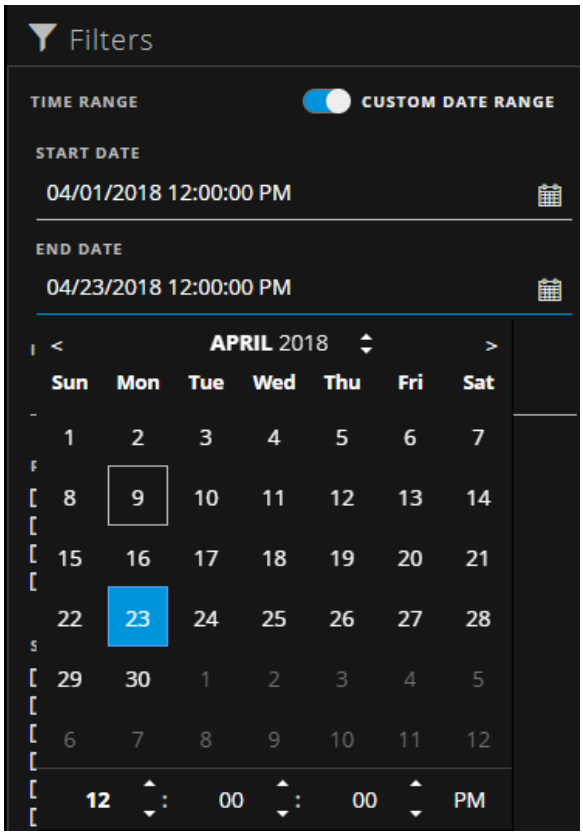
The number of incidents in the Incidents List view can be very large, making it difficult to locate particular incidents. The Filter enables you to specify those incidents that you would like to view. You can also choose the timeframe when those incidents occurred. For example, you may want to view all of the new critical incidents created within the last hour.

1. Verify that the Filters panel appears to the left of the incidents list. If you do not see the Filters panel, in the Incident List view toolbar, click  , which opens the Filters panel.



2. In the Filters panel, select one or more options to filter the incidents list:
   - **TIME RANGE**: You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the incidents. For example, if you select Last Hour, you can see incidents that were created within the last 60 minutes.
   - **CUSTOM DATE RANGE**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start

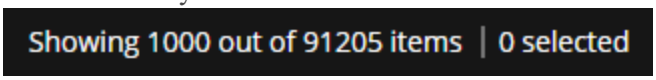
Date and End Date fields. Select the dates and times from the calendar.



- **INCIDENT ID**: Type the Incident ID for an incident you would like to locate, for example INC-1050.
- **PRIORITY**: Select the priorities that you would like to view.
- **STATUS**: Select one or more incident statuses. For example, select Closed - False Positive to view only false positive incidents, which were initially identified as suspicious, but then they were later found to be safe.
- **ASSIGNEE**: Select the assignee or assignees of the incidents that you would like to view. For example, if you only want to view the incidents assigned to Cale or Stanley, select Cale and Stanley from the Assignee drop-down list. If you want to view incidents regardless of the assignee, do not make a selection under Assignee.
  (Available in version 11.1 and later) To view only unassigned incidents, select **Show only unassigned incidents**.
- **CATEGORIES**: Select one or more categories from the drop-down list. For example, if you only want to view incidents classified with the Backdoor or Privilege abuse categories, select Backdoor and Privilege abuse.
- **SENT TO ARCHER**: (In version 11.2 and later, if RSA Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option

will be available in NetWitness Respond.) To view incidents that were sent to Archer, select **Yes**. For incidents that were not sent to Archer, select **No**.

The incidents list shows a list of incidents that meet your selection criteria. You can see the number of incidents in your filtered list at the bottom of the incident list.



3. Click  to close the Filters panel and return to the Incidents List view, which now shows your filtered incidents.

Remove My Filters from the Incident List View

NetWitness Platform remembers your filter selections in the Incident List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of incidents that you expect to see or you want to view all of the incidents in your incident list, you can reset your filters.

1. In the Incident List view toolbar, click  .
   The Filters panel appears to the left of the incidents list.
2. At the bottom of the Filters panel, click **Reset Filters**.

View My Incidents

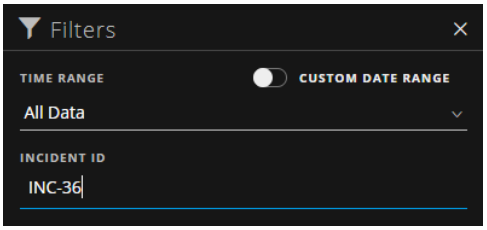
You can view your incidents by filtering the incidents by your username.

1. If you cannot see the Filter panel, in the Incident List view toolbar, click  .
2. In the Filter panel, under **ASSIGNEE**, select your username from the drop-down list.
   The incidents list shows the incidents that are assigned to you.

Find an Incident

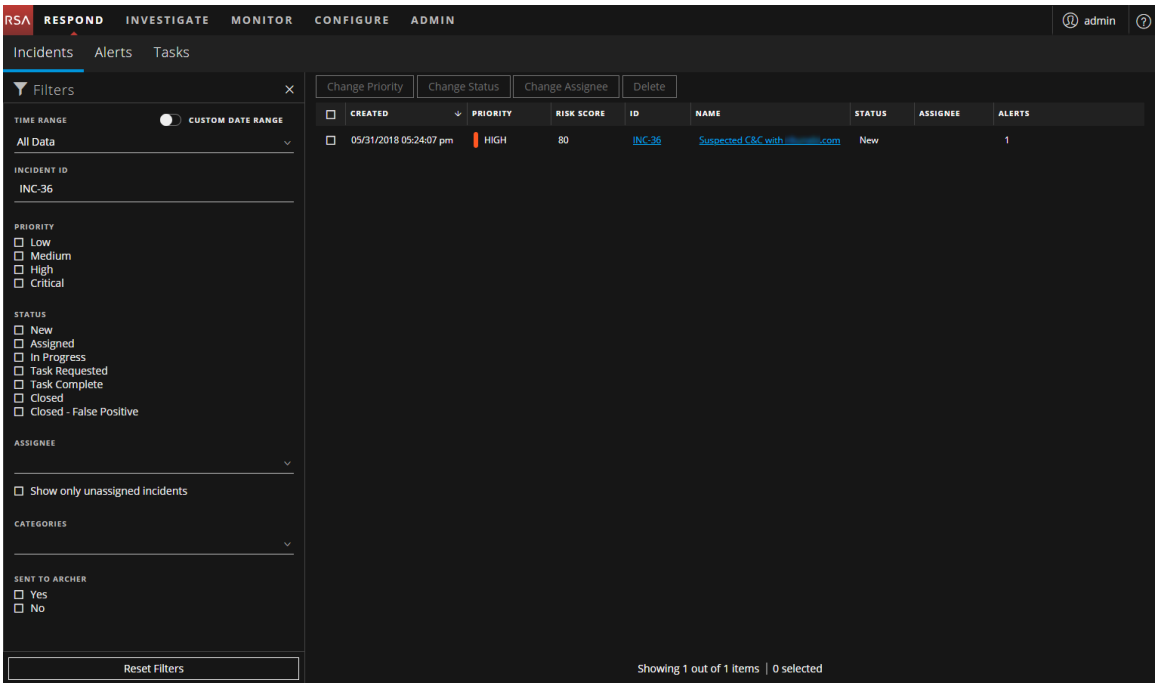
If you know the Incident ID, you can quickly locate an incident using the Filter. For example, you may want to locate a specific incident out of thousands of incidents.

1. Go to **RESPOND > Incidents**.
   The Filters panel appears to the left of the incidents list. If you do not see the Filters panel, in the Incident Lists view toolbar, click  , which opens the Filters panel.



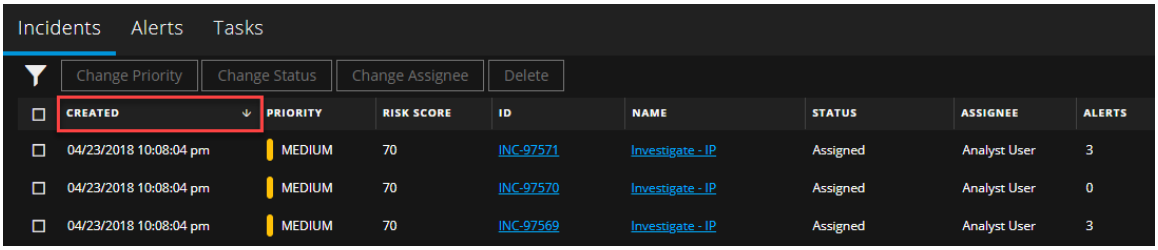
2. In the **INCIDENT ID** field, type the Incident ID for an incident that you would like to locate, for example INC-36.

The specified incident appears in your incident list. If you do not see any results, try resetting your filters.



Sort the Incidents List

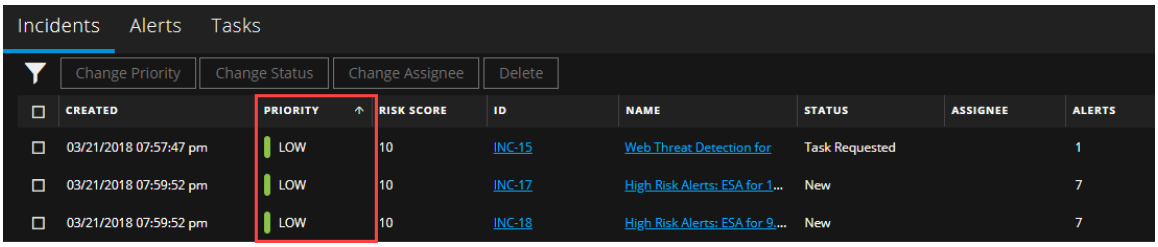
The default sort for the incidents list is by Created date in descending order (newest on the top).



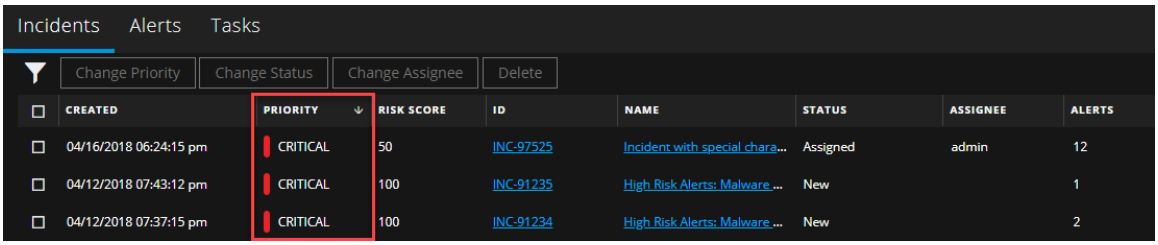
You can change the sort order of the incidents list by clicking a column header in the list.

For example, to prioritize the incidents, you can sort your view by clicking the Priority column header.

The following figure shows the incidents list sorted by Priority in ascending order (lowest priority on top).



To sort by Priority in descending order (highest priority on top), click the Priority column header again. The highest priority incidents are at the top as shown in the following figure.



View Unassigned Incidents

Note: This option is available in version 11.1 and later.

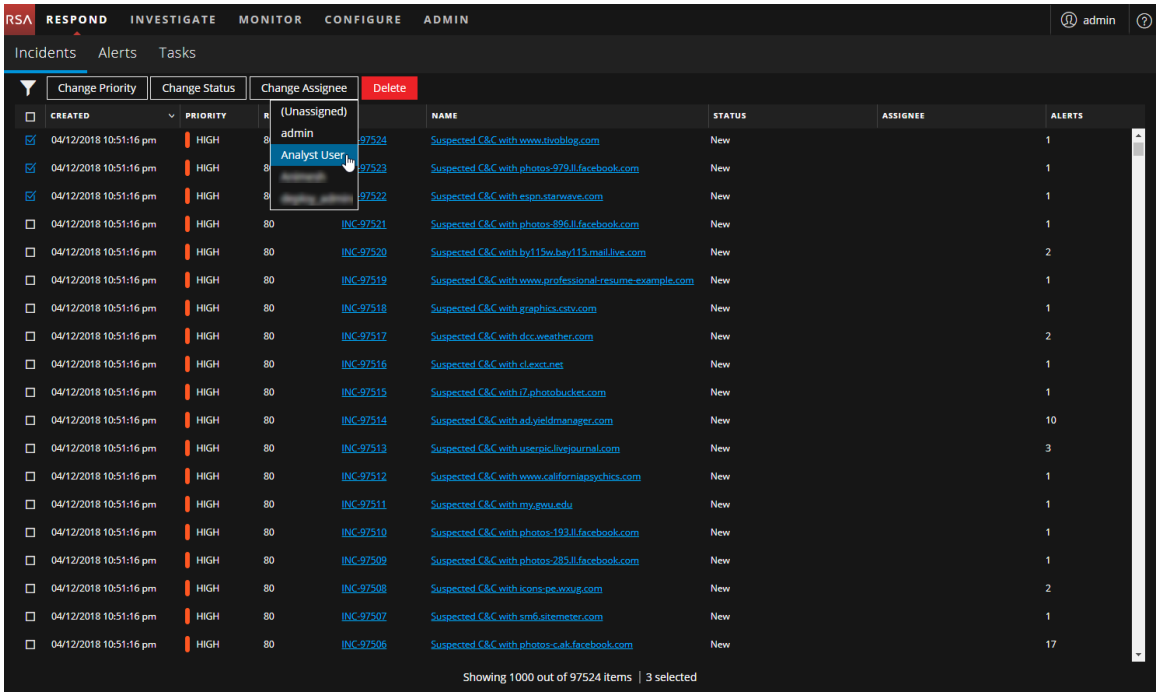
You can view unassigned incidents using the Filter.

1. If you cannot see the Filter panel, in the Incident List view toolbar, click .
2. In the Filters panel, under ASSIGNEE, select **Show only unassigned incidents**.

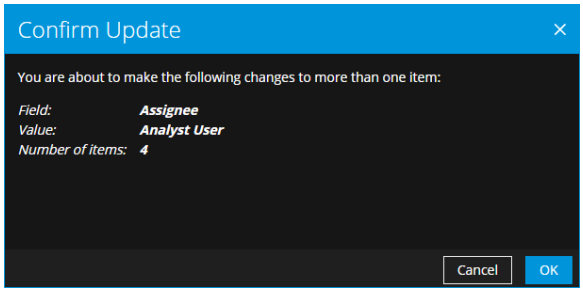
The incidents list is filtered to show unassigned incidents.

Assign Incidents to Myself

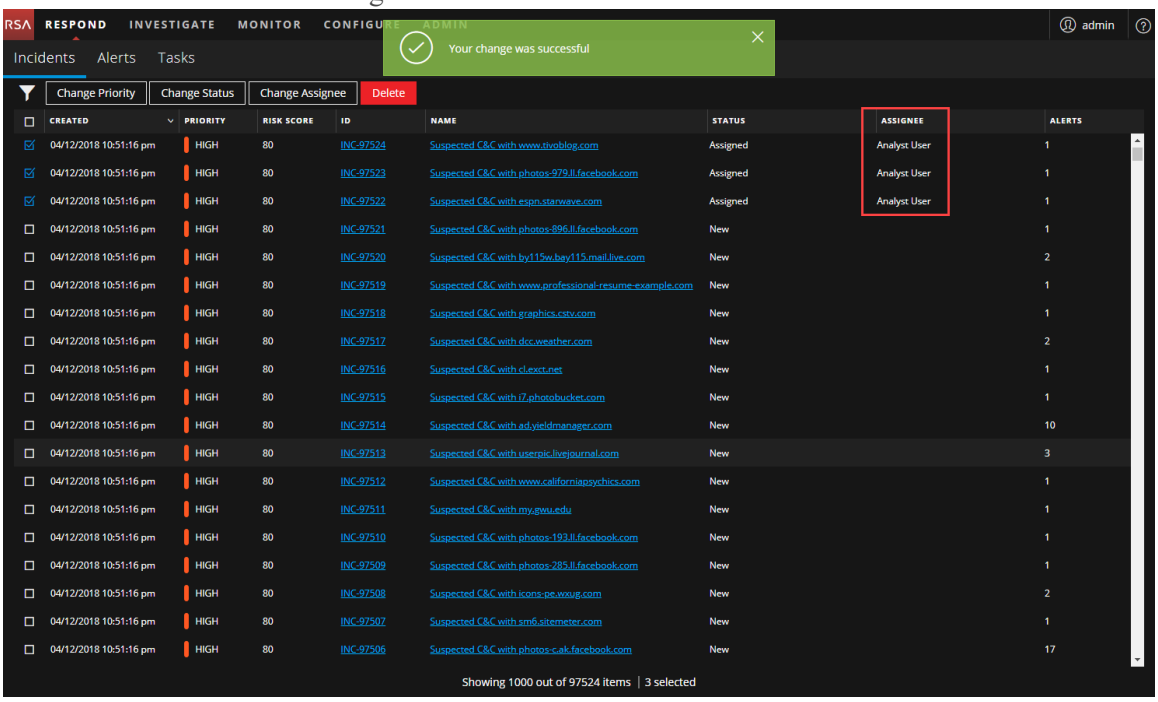
1. In the Incident List view, select one or more incidents that you want to assign to yourself.
2. Click **Change Assignee** and select your username from the drop-down list.



3. If you selected more than one incident, in the Confirm Update dialog, click **OK**.

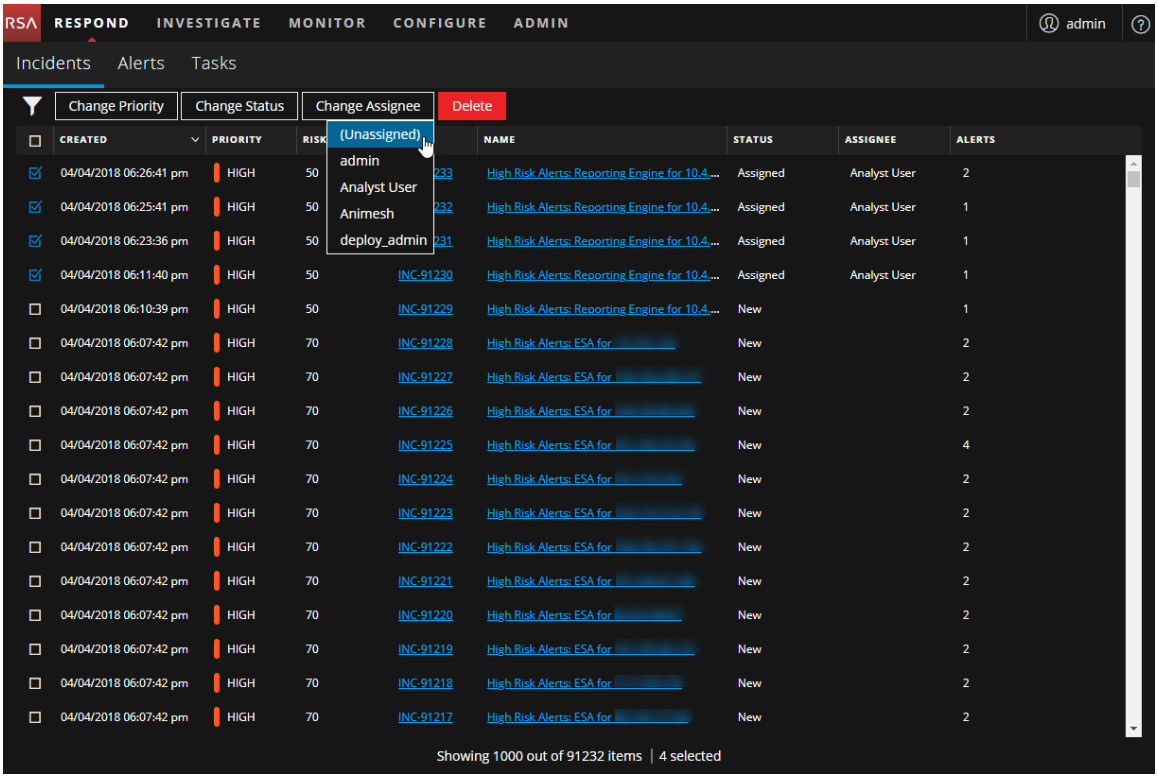


You can see a successful change notification.

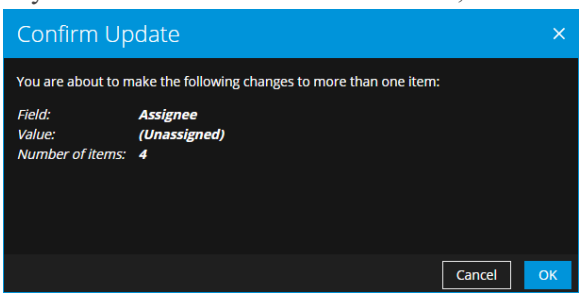


Unassign an Incident

1. In the Incident List view, select one or more incidents that you want to unassign.
2. Click **Change Assignee** and select **(Unassigned)** from the drop-down list.



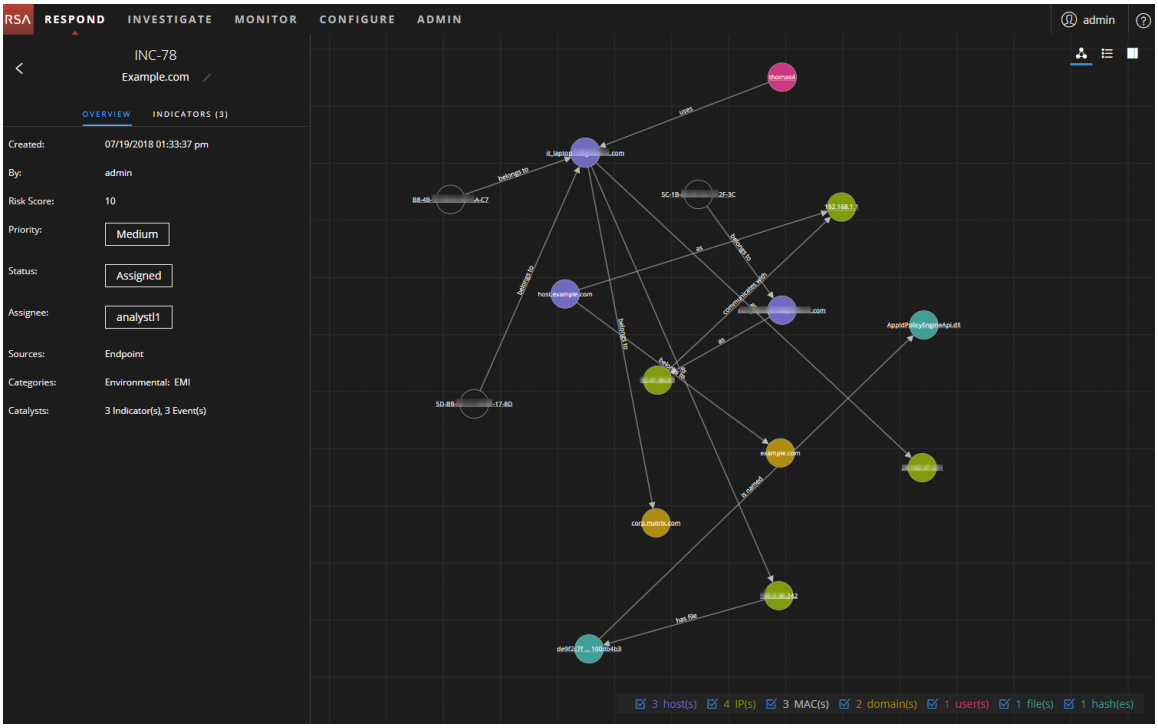
3. If you selected more than one incident, in the Confirm Update dialog, click **OK**.



4. Verify that the Status is still correct and make changes as required. To change the status, select one or more incidents, click **Change Status**, and select a new status.
   For example, if you assigned an incident to yourself by mistake, you can unassign the incident and then change the Status from Assigned back to New.

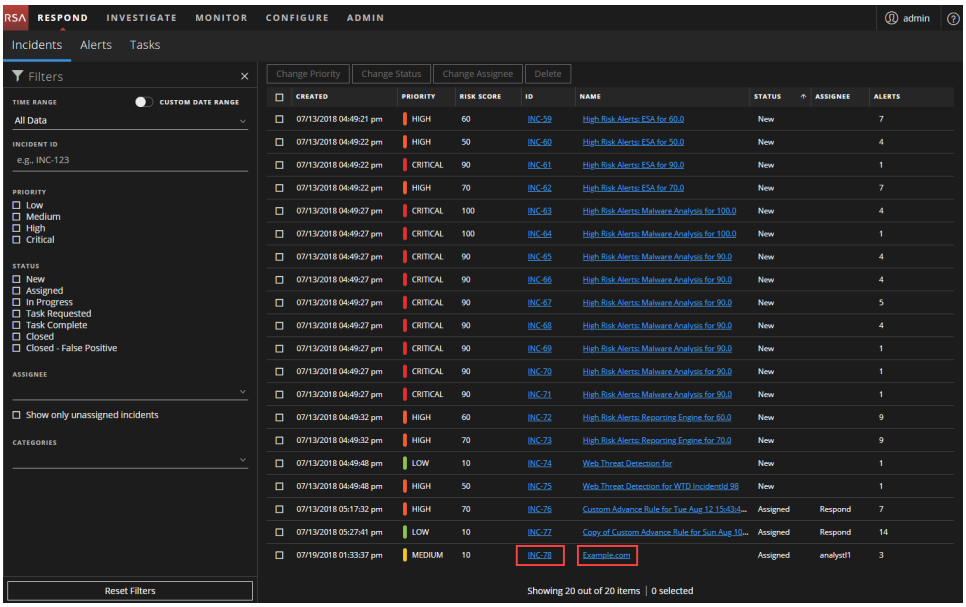
Determine which Incidents Require Action

Once you get the general information about the incident from the Incident List view, you can go to the Incident Details view for more information to determine the action required.

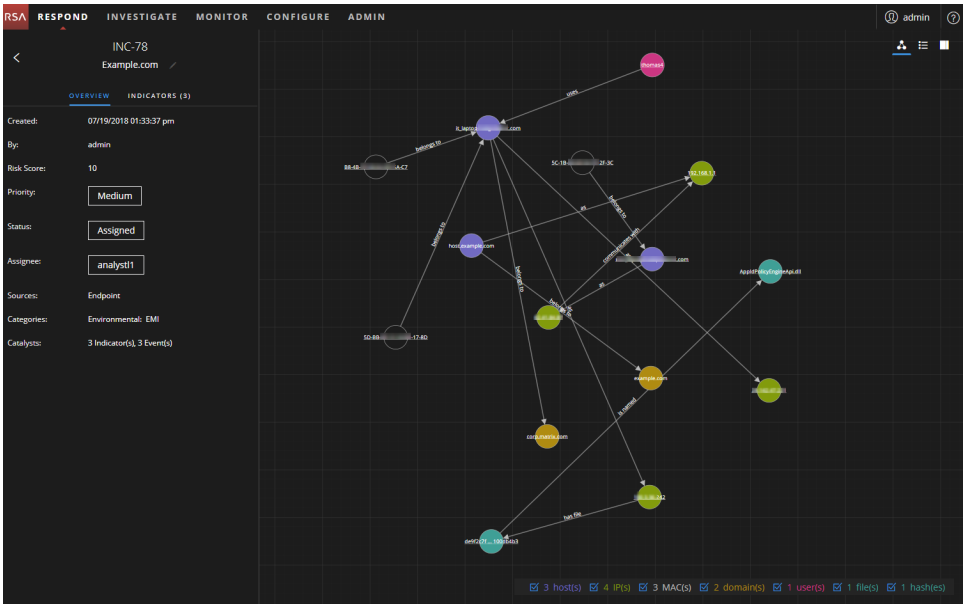


View Incident Details

To view details for an incident, in the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.



The Incident Details view for the selected incident appears with the Overview panel and Nodal Graph in view.

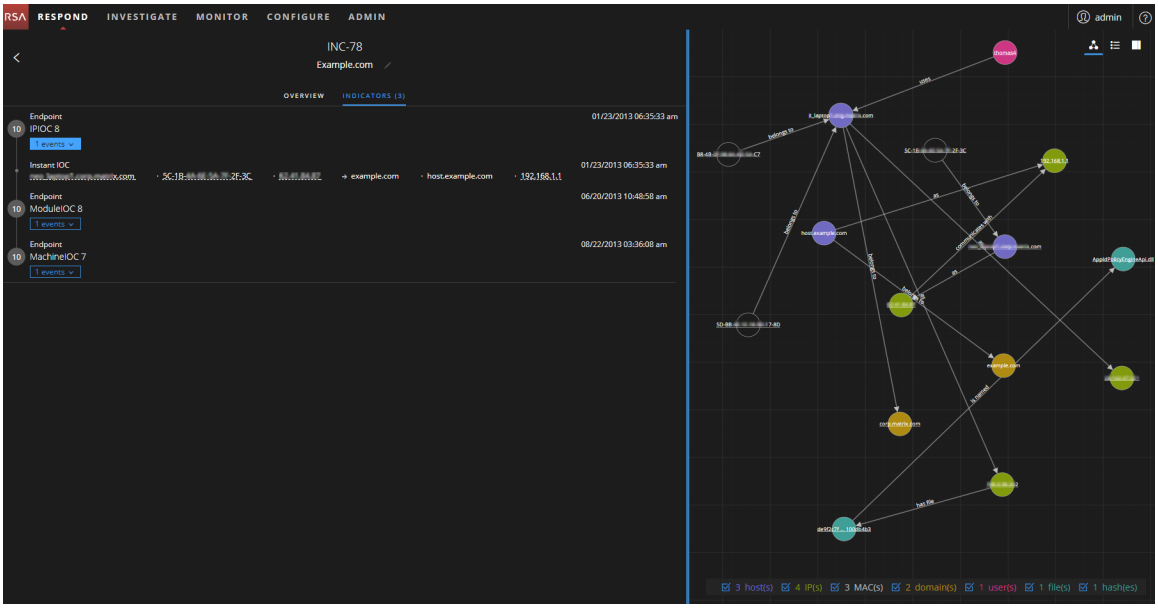


The Incident Details view has the following panels:

- **OVERVIEW**: The incident Overview panel contains high-level summary information about the incident, such as the score, priority, alerts, and status. You have the option to send the incident to RSA Archer and change the incident Priority, Status, and Assignee.
- **INDICATORS**: The Indicators panel contains a chronological listing of indicators. *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert. This listing helps you to connect indicators and notable data. For example, an IP address connected to a command and communication ESA alert might also have triggered a NetWitness Endpoint alert or other suspicious activities.

- **Nodal Graph**: The nodal graph is an interactive graph that shows the relationship between the entities involved in the incident. An *Entity* is a specified piece of meta, such as IP address, MAC address, user, host, domain, file name, or file hash.
- **Events**: The Events panel, also known as the Events table, lists the events associated with the incident. It also shows event source and destination information along with additional information depending on the event type. You can click an event in the list to view the detailed data for that event.
- **JOURNAL**: The Journal panel enables you to access the Journal for the selected incident, which allows you to communicate and collaborate with other analysts. You can post notes to a journal, add Investigation Milestone tags (Reconnassance, Delivery, Exploitation, Installation, Command and Control, Action on Objective, Containment, Eradication, and Closure), and view the history of activity on your incident.
- **TASKS**: The Tasks panel shows all of the tasks that have been created for the incident. You can also create additional tasks from here.
- **RELATED**: The Related Indicators panel enables you to search the NetWitness Platform alerts database to find alerts that are related to this incident. You can also add related alerts that you find to the incident.

To view more information in the left-side panel without scrolling, you can hover over the right edge and drag the line to resize the panel as shown in the following figure:

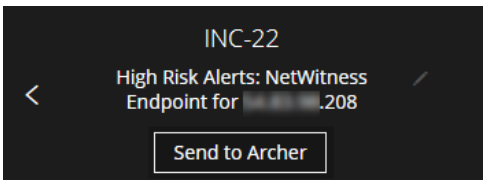


View Basic Summary Information about the Incident

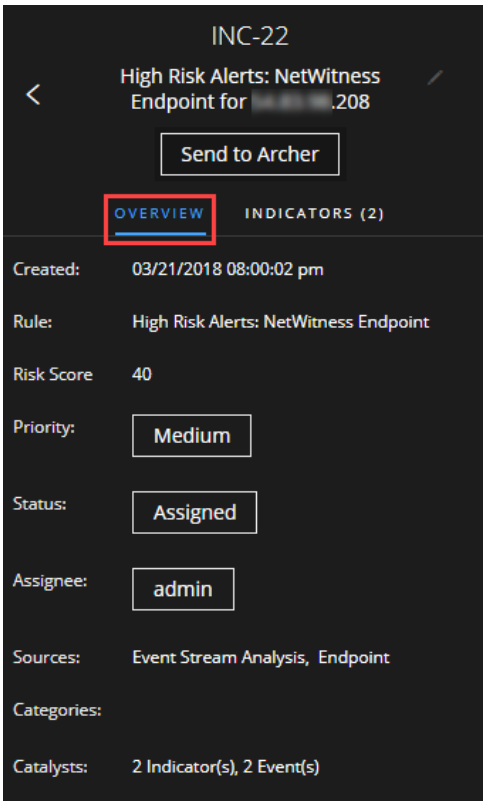
You can view basic summary information about an incident in the Overview panel.

Above the Overview panel, you can see the following information:

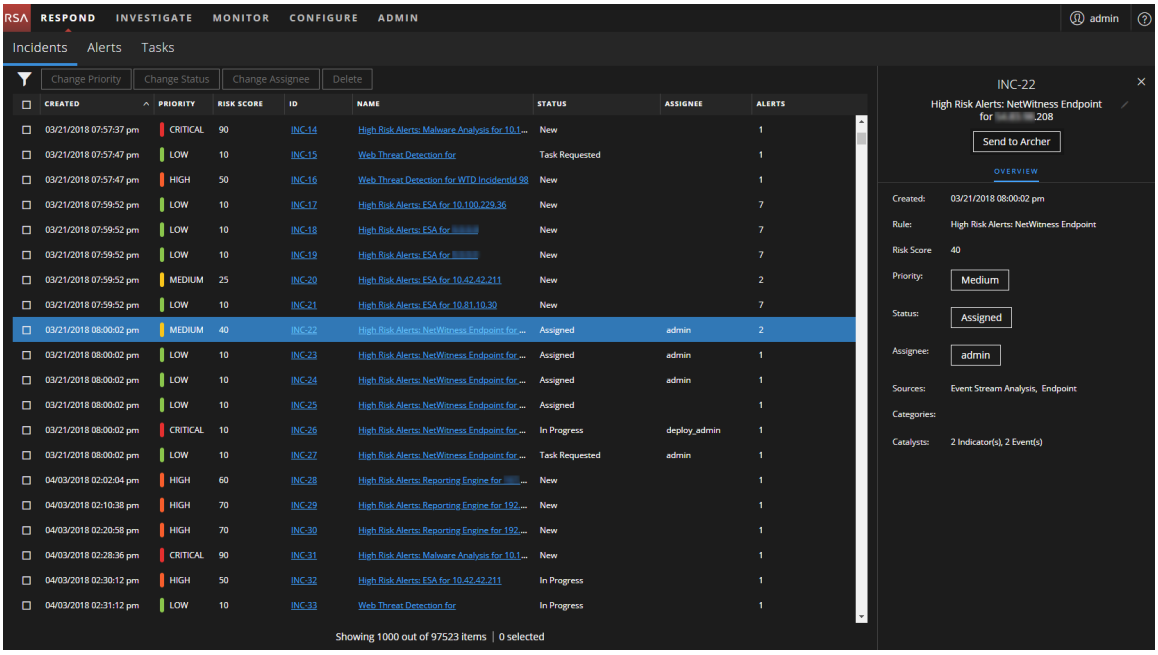
- **Incident ID**: This is an automatically created unique ID assigned to the incident.
- **Name**: The incident name is derived from the rule used to trigger the incident.
- **Send to Archer / Sent to Archer**: (In version 11.2 and later, if RSA Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option is available in NetWitness Respond.) This shows whether an incident has been sent to Archer Cyber Incident & Breach Response. An incident sent to Archer shows as Sent to Archer. An incident that has not been sent to Archer shows as Send to Archer. You can click the Send to Archer button to send the incident to Archer Cyber Incident & Breach Response.



To view the Overview panel from the Incident Details view, select **OVERVIEW** in the left panel.



To view the Overview panel from the Incidents List view, click an incident in the list. The Overview panel appears on the right.



The Overview panel contains basic summary information about the selected incident:

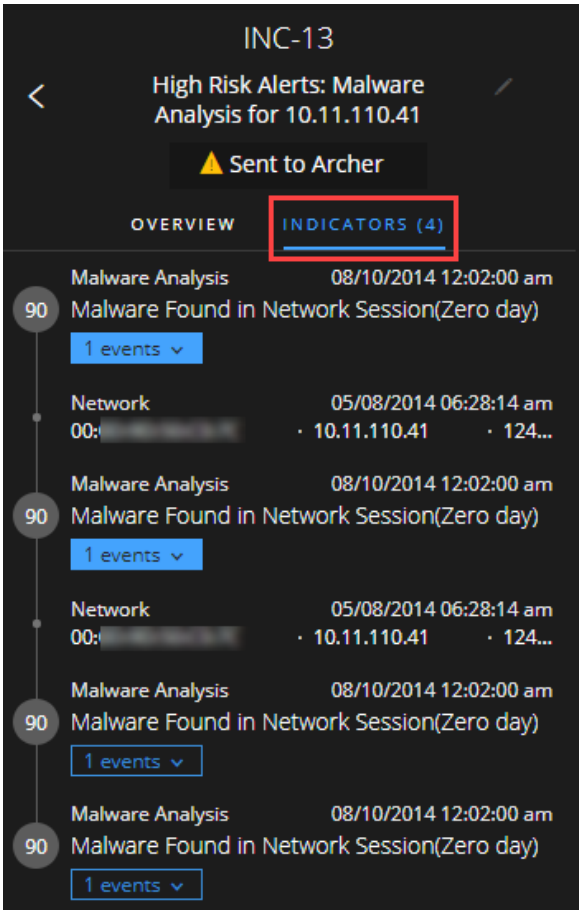
- **Created**: Shows the creation date and time of the incident.
- **Rule / By**: Shows the name of the rule that created the incident or the name of the person who created the incident.
- **Risk Score**: Indicates the risk of the incident as calculated via an algorithm and is between 0-100. 100 is the highest risk score.
- **Priority**: Shows the incident priority. Priority can be Critical, High, Medium or Low.
- **Status**: Shows the incident status. The status can be New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed - False Positive. After you create a task, the status changes to Task Requested.
- **Assignee**: Shows the team member currently assigned to the incident.
- **Sources**: Indicates the data sources used to locate the suspicious activity.
- **Categories**: Shows the categories of the incident events.
- **Catalysts**: Shows the count of indicators that gave rise to the incident.

View the Indicators and Enrichments

Note: *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert.

You can find indicators, events, and enrichments on the Indicators panel. The Indicators panel is a Chronological listing of indicators that helps you to find enrichments and events related to the triggering indicator. For example, an indicator might be a Command and Control alert, a NetWitness Endpoint alert, a Suspicious Domain (C2) alert, or an alert from an Event Stream Analysis (ESA) rule. The Indicators panel helps you to aggregate and order these indicators (alerts) from different systems so that you can see how they are related and also help you develop a timeline of a given attack.

To view the Indicators panel, in the left panel of the Incident Details view, select **INDICATORS**.



Indicators are alerts, such as an ESA alert or a NetWitness Endpoint alert. This listing helps you to connect indicators and notable data. For example, indicators can show the data found by your rules. In the Indicators panel, the risk score for an indicator is shown within a solid-colored circle.

Data source information is shown below the names of the indicators. You can also see the creation date and time of the indicator and the number of events in the indicator. When data is available, you can see the number of enrichments. You can click the event and enrichment buttons to view the details.

View and Study the Events

You can view and study the events associated with the incident from the Events panel. It shows information about the events, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

There are two types of events:

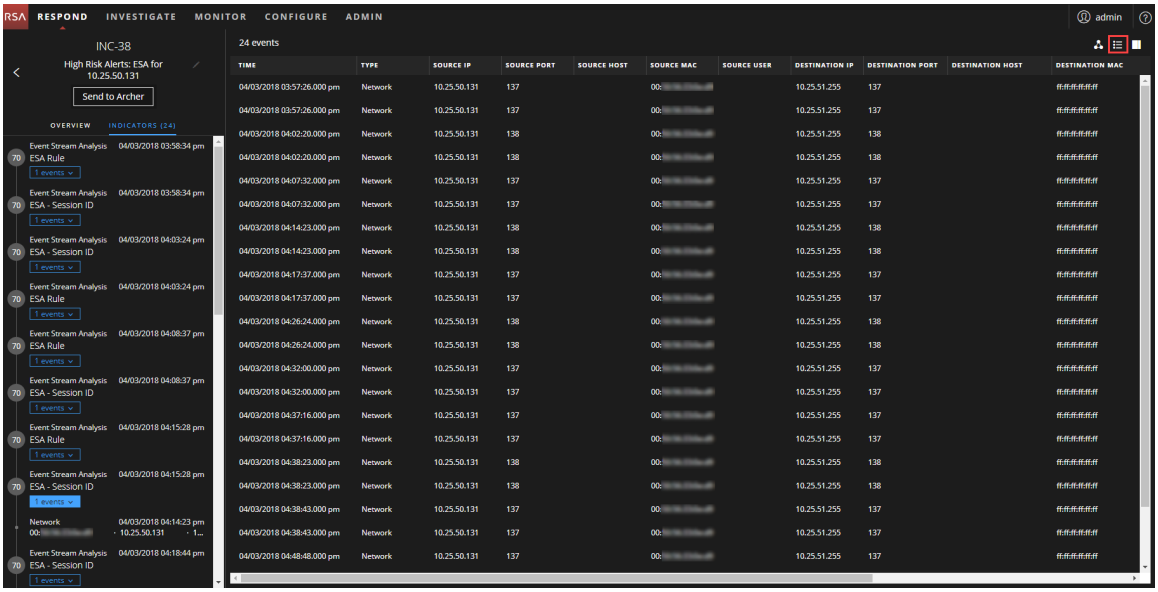
- A transaction between two machines (a Source and a Destination)
- An anomaly detected on a single machine (a Detector)

Some events will only have a Detector. For example, NetWitness Endpoint finds malware on your machine. Other events will have a Source and Destination. For example, packet data shows communication between your machine and a Command and Control (C2) domain.

You can drill further into an event to get detailed data about the event.

To view and study the events:

1. To view the Events panel, in the Incident Details view toolbar, click .



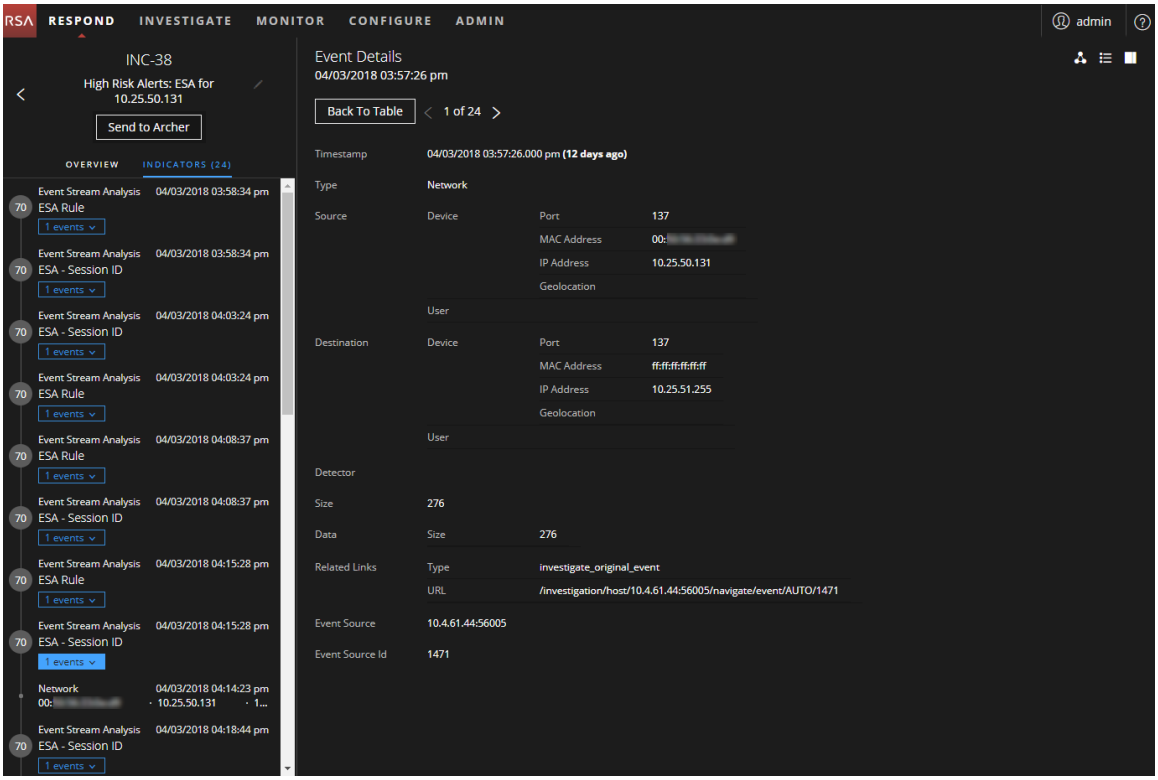
The Events panel shows a list of information about each event as shown in the following table.

Column	Description
TIME	Shows the time the event occurred.
TYPE	Shows the type of alert, such as Log and Network.

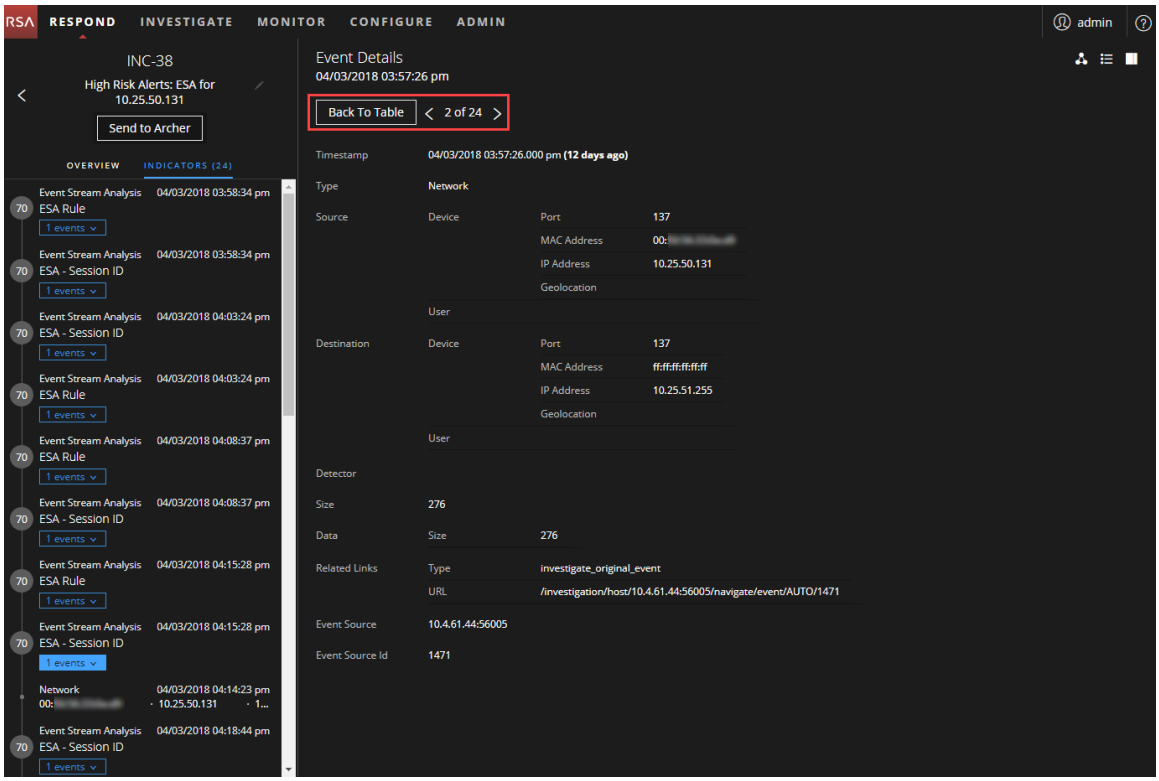
Column	Description
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
SOURCE PORT	Shows the source port of the transaction. The source and destination ports can be on the same IP address.
SOURCE HOST	Shows the source host where the event took place.
SOURCE MAC	Shows the MAC address of the source machine.
SOURCE USER	Shows the user of the source machine.
DESTINATION IP	Shows the destination IP address if there was a transaction between two machines.
DESTINATION PORT	Shows the destination port of the transaction. The source and destination ports can be on the same IP address.
DESTINATION HOST	Shows the destination host where the event took place.
DESTINATION MAC	Shows the MAC address of the destination machine.
DESTINATION USER	Shows the user of the destination machine.
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected.
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.

If there is only one event in the list, you see only the event details for that event instead of a list.

2. Click an event in the Events list to view the Event details.
   This example shows the event details for the first event in the list.



3. Use the Event Details navigation to view details for additional events.
   This example shows the second event in the list.

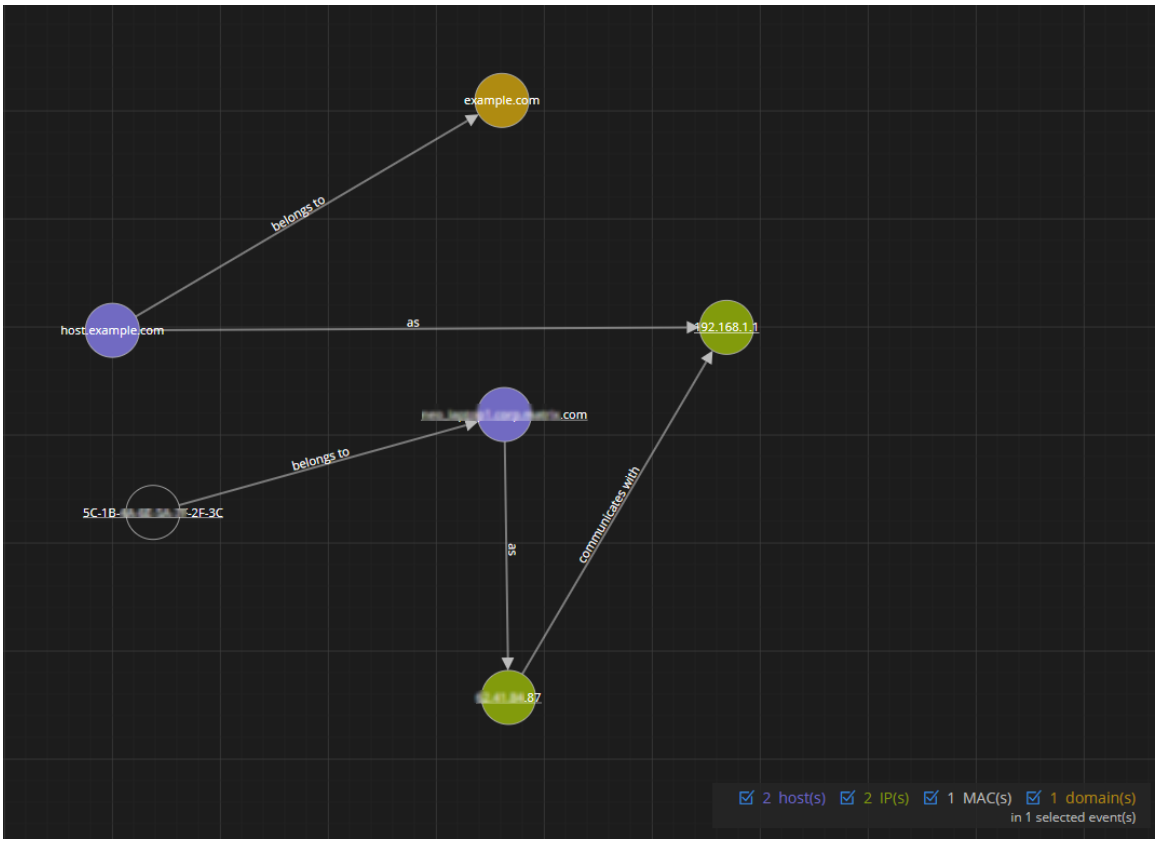


If you have additional Investigate-server permissions, you can also access Event Analysis details for events. See View Event Analysis Details for Indicators.

View and Study the Entities Involved in the Events

An *Entity* is either an IP address, MAC address, user, host, domain, file name, or file hash. The nodal graph is an interactive graph that you can move around to get a better understanding of how the entities involved in the events relate to each other. The nodal graphs look different depending on the type of event, the number of machines involved, whether the machines are associated with users, and if there are files associated with the event.

The following figure shows an example nodal graph with six nodes.



If you look closely at the nodal graph, you can see circles that represent nodes. A nodal graph can contain one or more of the following types of nodes:

- **IP address** (If the event is a detected anomaly, you can see a Detector IP. If the event is a transaction, you can see a Destination IP and a Source IP.)
- **MAC address** (You may see a MAC address for each type of IP address.)
- **User** (If the machine is associated with a user, you can see a user node.)
- **Host**
- **Domain**
- **Filename** (If the event involves files, you can see a filename.)
- **File Hash** (If the event involves files, you may see a file hash.)

The legend at the bottom of the nodal graph shows the number of nodes of each type and the color coding of the nodes.

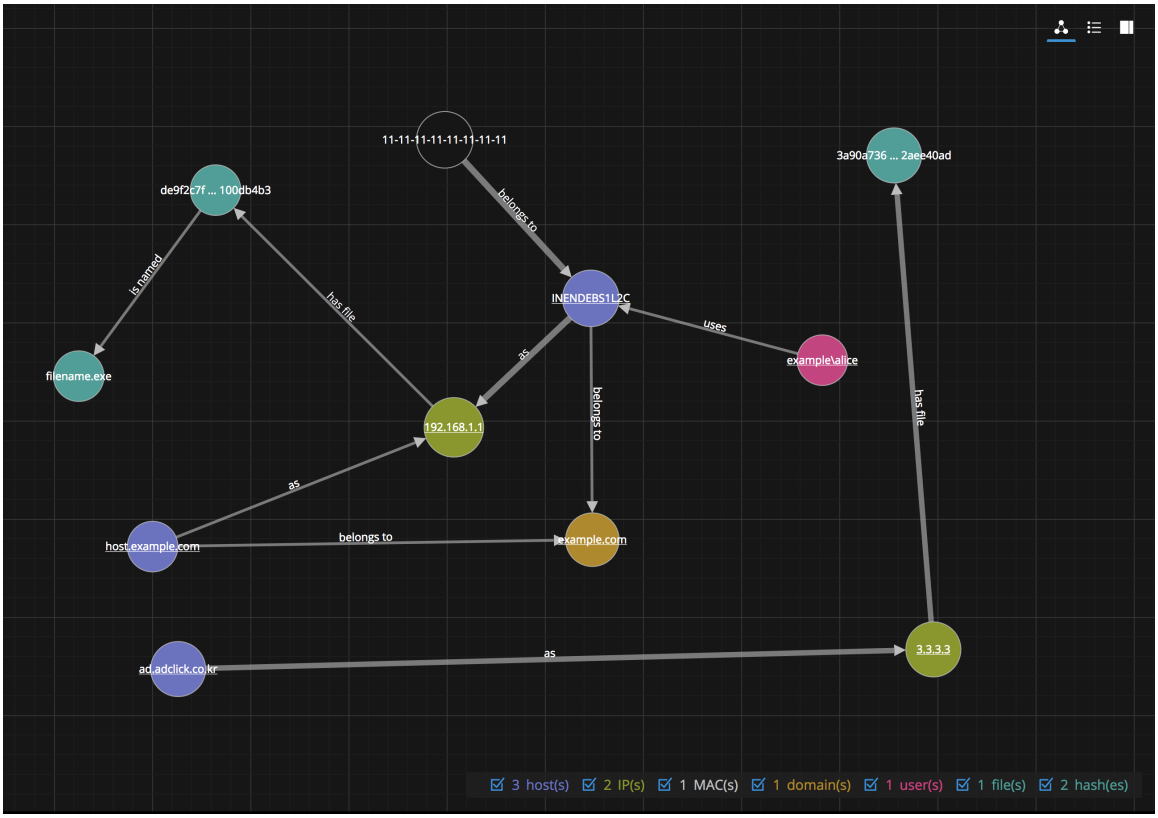
You can click any node and drag it to reposition it.

The arrows between the nodes provide additional information about the entity relationships:

- **Communicates with**: An arrow between a Source machine node (IP address or MAC address) and a Destination machine node labeled with "communicates with" shows the direction of the communication.
- **As**: An arrow between nodes labeled with "as" provides additional information about the IP address that the arrow points to. In the above example, there is an arrow from the host node circle that points to an IP address node that is labeled with "as". This indicates that the name on the host node circle is the hostname of that IP address and is not a different entity.
- **Has file**: An Arrow between a machine node (IP address, MAC address, or Host) and a file hash node labeled with "has" indicates that the IP address has that file.
- **Uses**: An arrow between a User node and a machine node (IP address, MAC address, or Host) labeled with "uses" shows the machine that the user was using during the event.
- **Is named**: An arrow from a File Hash node to a File Name node labeled with "is named" indicates that the file hash corresponds to a file with that name.
- **Belongs to**: An arrow between two nodes labeled with "belongs to" indicates that they pertain to the same node. For example, an arrow between a MAC address and a Host labeled with "belongs to" indicates that it is the MAC address for the host.

Larger line size arrows indicate more communication between the nodes. Larger nodes (circles) indicate more activity than smaller nodes. The larger nodes are the most common entities mentioned in the events.

The following nodal graph example has 11 nodes.



In this example, notice that there are two IP nodes. They both have hashed files, but they do not communicate with each other. The IP address at the top (192.168.1.1) represents one machine with two hostnames (host.example.com and INENDEBS1L2C) in the example.com domain. The MAC address of the machine is 11-11-11-11-11-11-11-11-11-11 and Alice uses it.

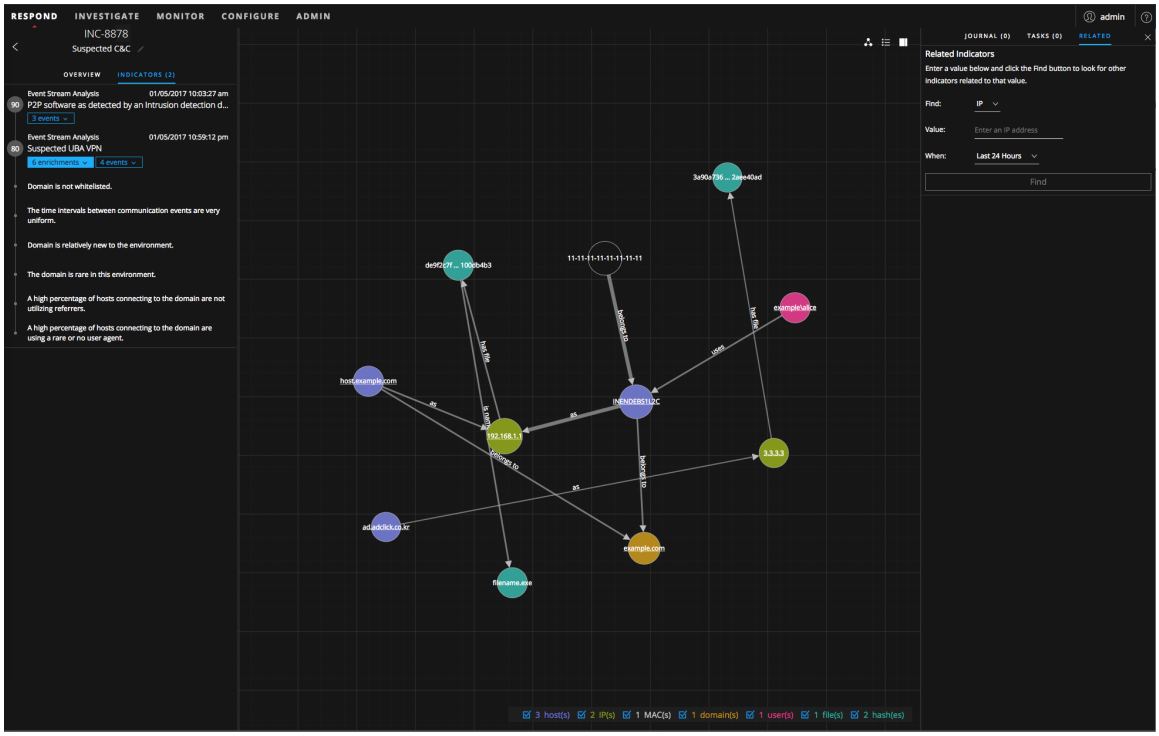
Select Node Types to View on the Nodal Graph

Note: This option is available in version 11.2 and later.

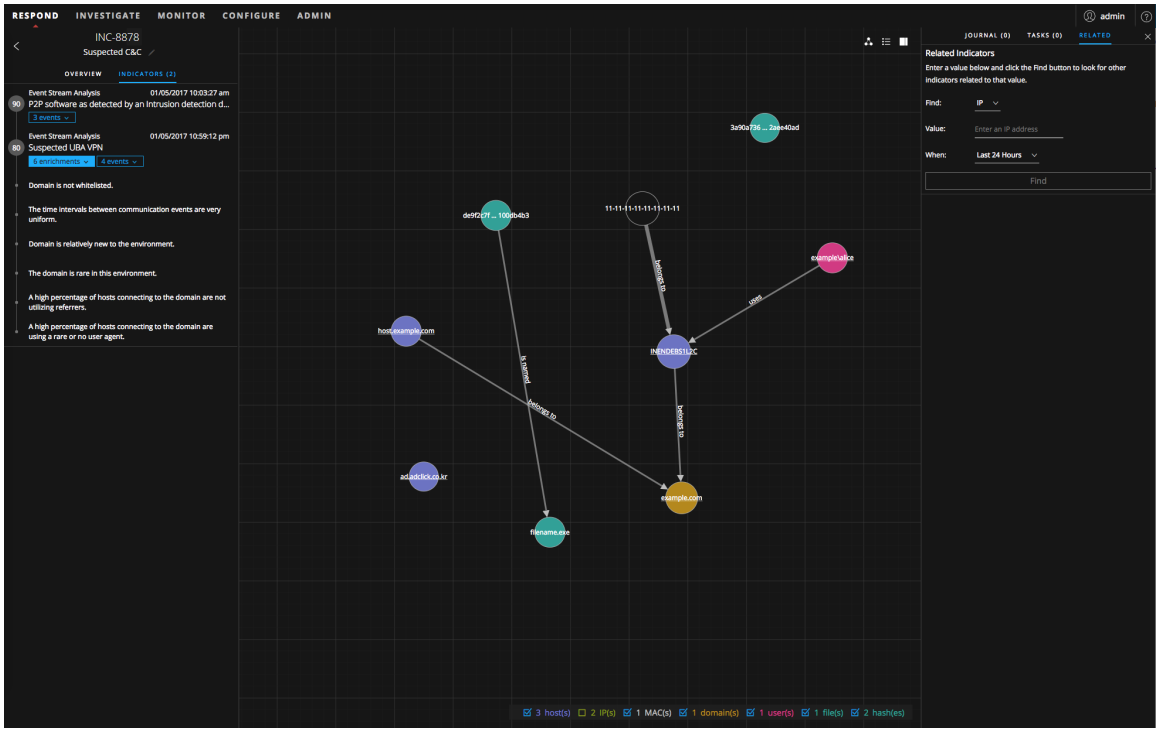
In the Incident Details view nodal graph, you can hide node types to further study the interactions between the entities on the nodal graph.

1. Go to **RESPOND > Incidents**.
2. In the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.
   The Incident Details view for the selected incident appears with the Nodal Graph in view. The legend below the nodal graph has all of the entity node types selected by default.

If you do not see the nodal graph, click the **view graph** icon  .

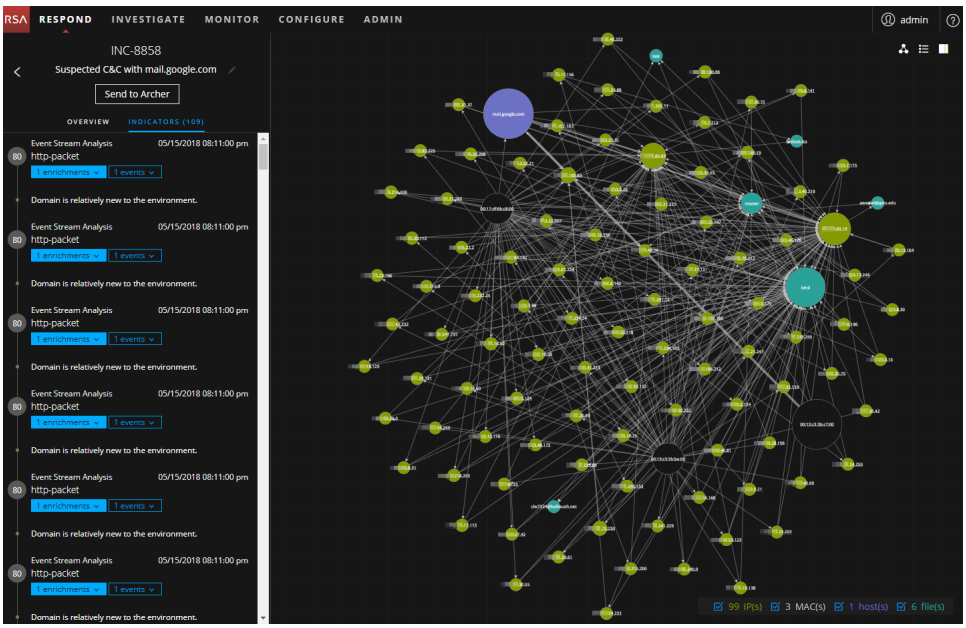


3. To hide node types, in the legend, clear the checkbox for the node types that you would like to hide in the nodal graph.
   The following example shows the **IP** address node type cleared and the IP address nodes are now hidden.



4. To include (unhide) node types, select the checkbox for the node types that you would like to appear in the nodal graph.

Hiding node types can be especially helpful if the nodal diagram includes over 100 nodes as shown in the following figure.

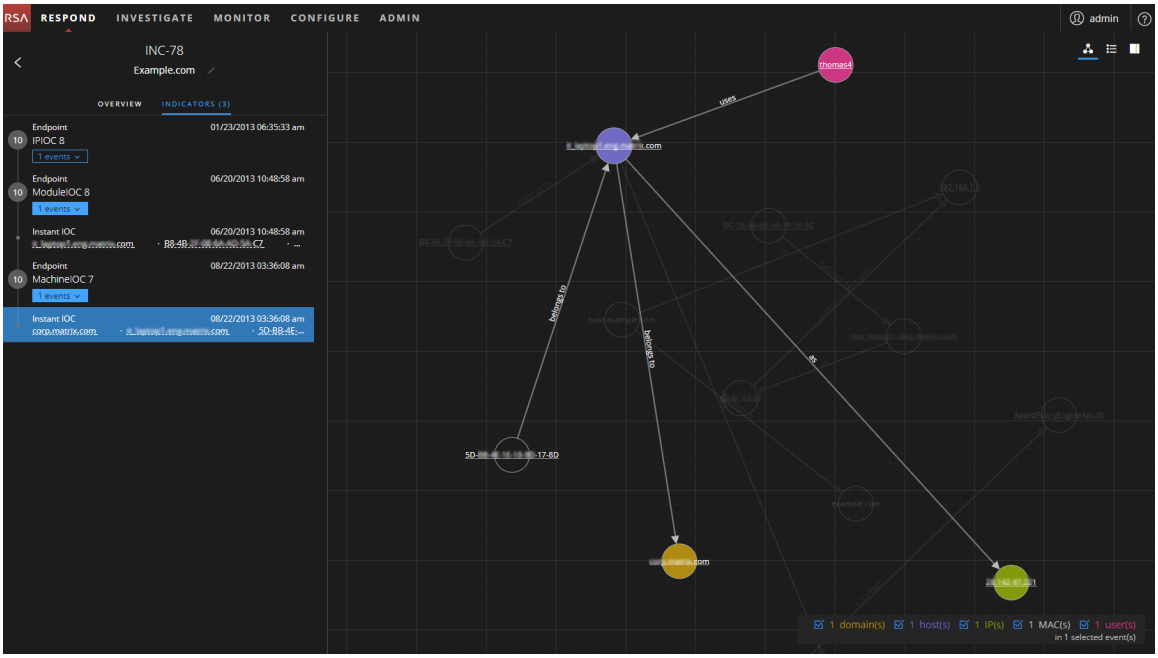


After hiding the IP node types, you can get a better understanding of what is happening with the remaining nodes.

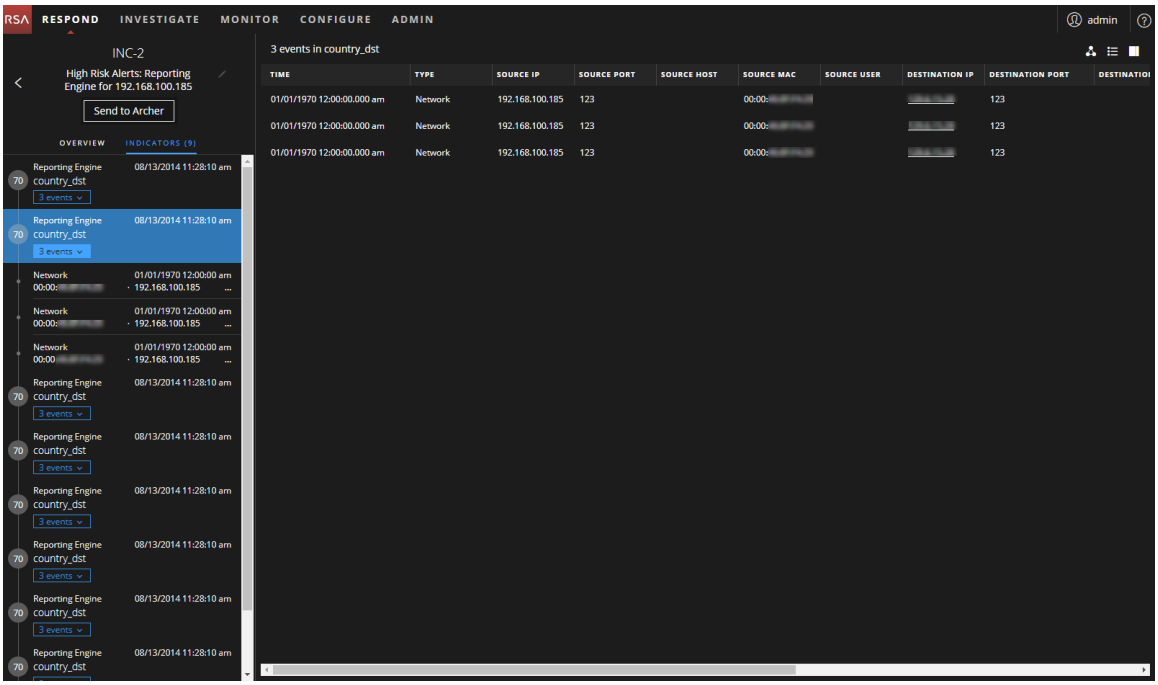
Filter the Data in the Incident Details View

You can click indicators in the Indicators panel to filter what you can see in the nodal graph and the Events list.

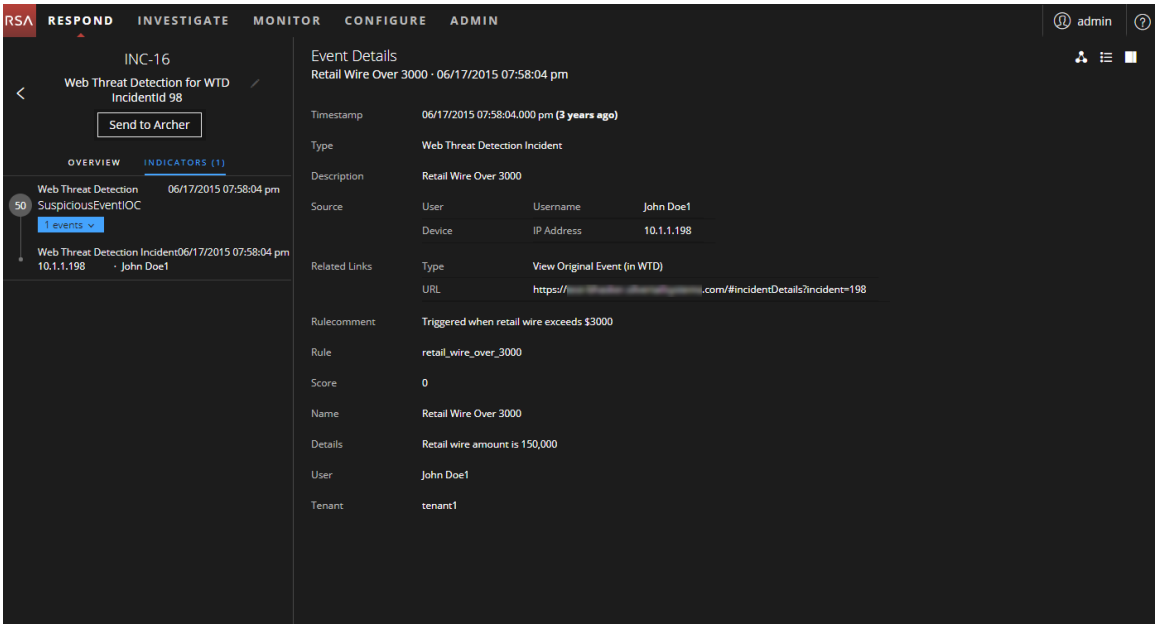
If you select an indicator to filter the nodal graph, data that is not part of your selection is dimmed, but it is still in view as shown in the following figure.



If you select an indicator to filter the events list, only the events for that indicator are shown in the list. The following figure shows an indicator selected that contains three events. The filtered Events list shows those three events.



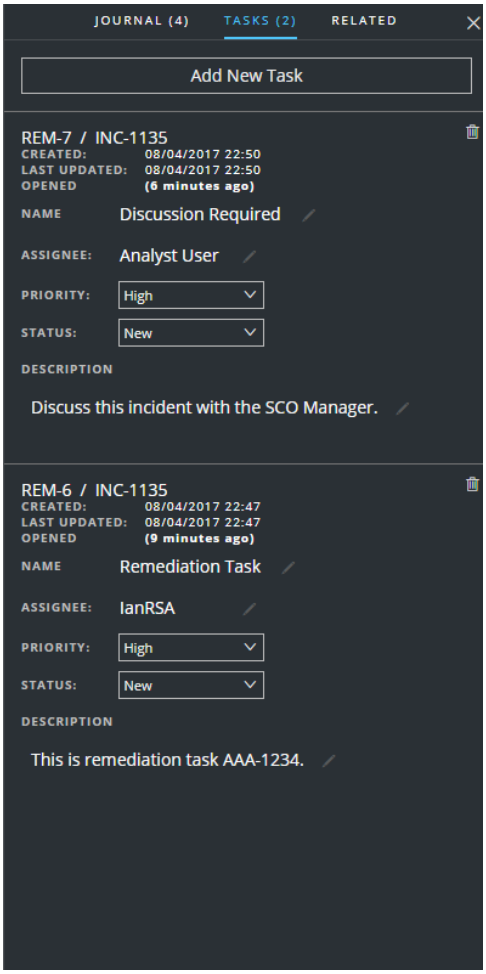
If you select an indicator to filter the events list and there is only one event for that indicator, you can see the event details for that event as shown in the following figure.



View the Tasks associated with an Incident

Threat responders and other analysts can create tasks for an incident and track those tasks to completion. This can be very helpful, for example, when you require actions on incidents from teams outside of your security operations. You can view the tasks associated with an incident in the Incident Details view.

1. Go to **RESPOND > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident to go to the Incidents Details view.
3. In the Incident Details view toolbar, click  .
   The Journal panel opens.
4. Click the **TASKS** tab.
   The Tasks panel shows all of the tasks for the incident.

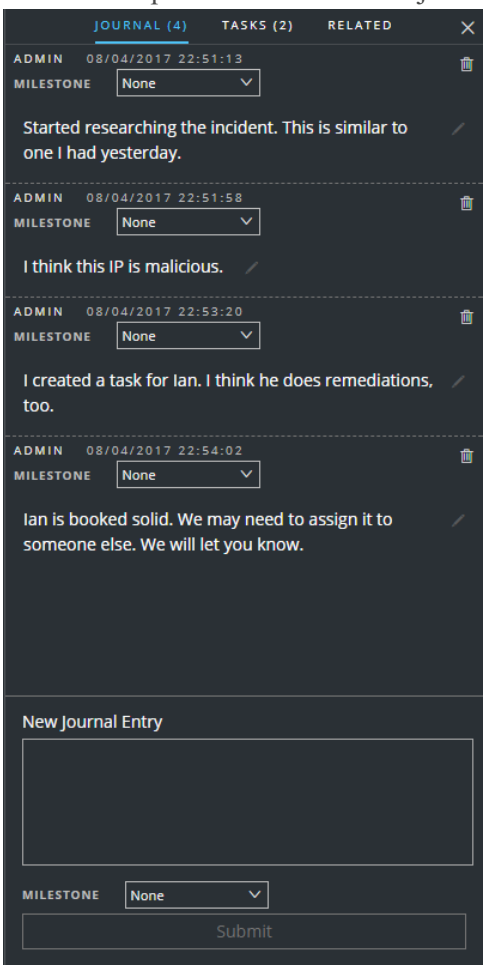


For more information about tasks, see Tasks List View, View All Incident Tasks, and Create a Task.

View Incident Notes

The incident Journal enables you to view the history of activity on your incident. You can view journal entries from other analysts and also communicate and collaborate with them.

1. Go to **RESPOND > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident to go to the Incidents Details view.
3. In the Incident Details view toolbar, click  .
   The Journal panel shows all of the journal entries for the incident.

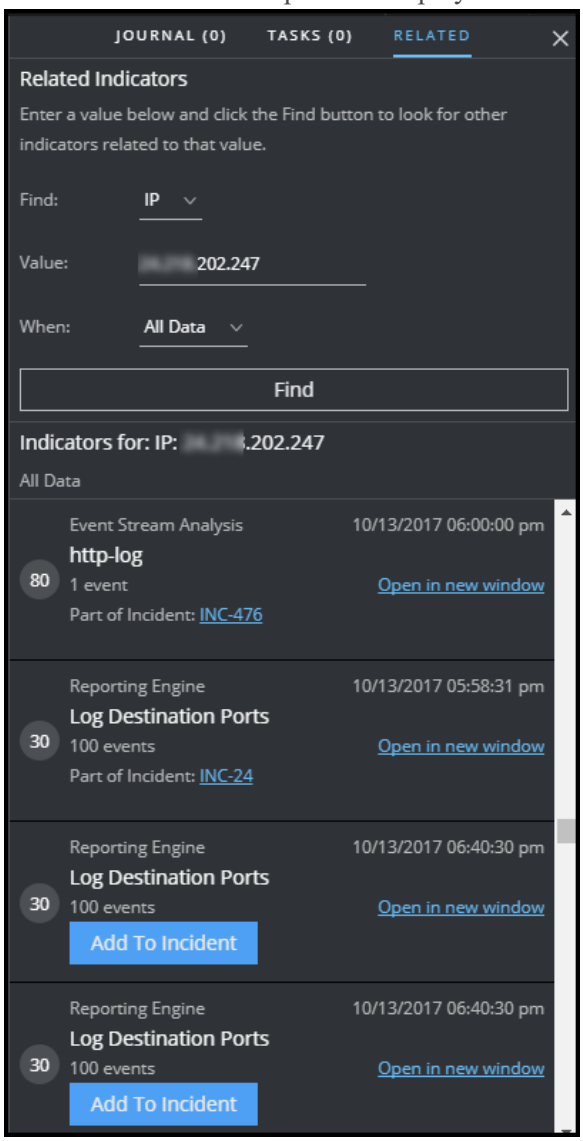


Find Related Indicators

Related Indicators are alerts that were not originally part of the selected incident, but they are related in some way to the incident. The relationship may or may not be obvious. For example, related indicators can involve one or more entities from the incident, but they can also be related due to some intelligence outside of NetWitness Platform.

In the Incident Details view Related Indicators panel, you can search for an entity (such as IP, MAC, Host, Domain, User, Filename, or Hash) in other alerts outside of the current incident.

1. Go to **RESPOND > Incidents** and locate the incident that you want to view in the Incidents List.
2. Click the link in the **ID** or **NAME** field of the incident to go to the Incidents Details view.
3. In the Incident Details view toolbar, click  .
   The Journal panel opens on the right.
4. Click the **RELATED** tab.
   The Related Indicators panel is displayed.



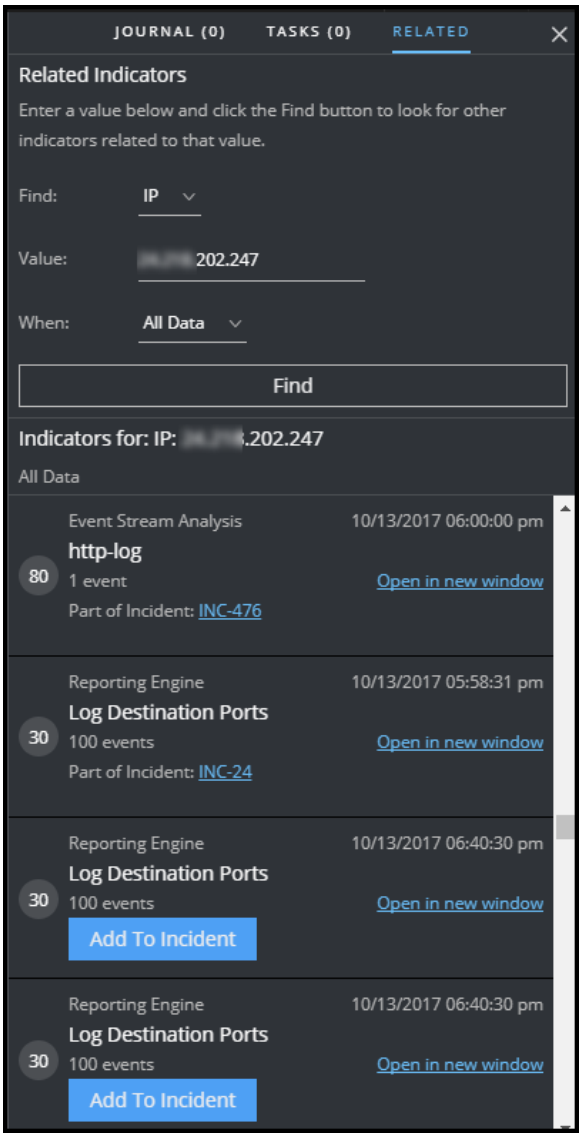
5. In the **Find** field, select the entity type to search, such as IP.
6. In the **Value** field, type a value for the entity, such as a specific IP address.
7. In the **When** field, select the time period to search, such as the Last 24 Hours.

8. Click **Find**.
   A list of related indicators (alerts) appear below the **Find** button in the **Indicators for** section. If an alert is not part of another incident, you can click the **Add to Incident** button to add the related indicator (alert) to the current incident. See Add Related Indicators to the Incident below.

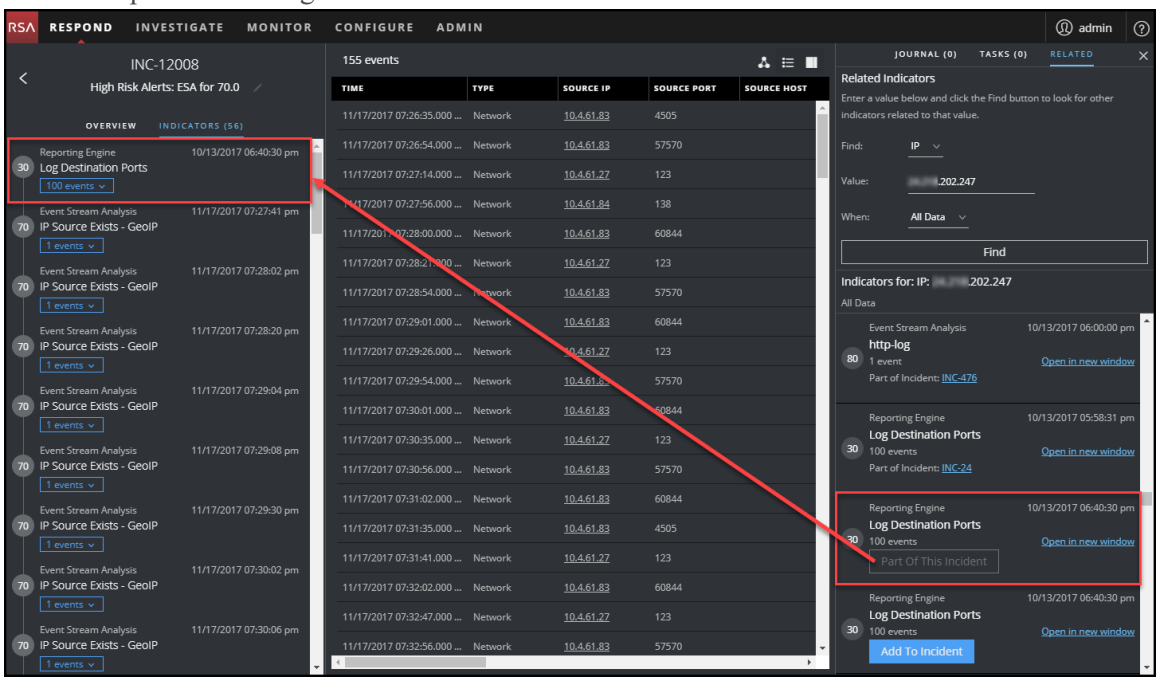
Add Related Indicators to the Incident

You can add related indicators (alerts) to the current incident from Related Indicators panel. An indicator that is already part of an incident cannot be part of another incident. In the search results, if an alert is not already part of an incident, it has an **Add to Incident** button.

1. In the Related Indicators panel, do a search to find related indicators. See Find Related Indicators above.



2. Review the alerts in the search results. The **Indicators for** section (below the Find button) lists the related indicators (alerts).
3. To inspect the details of an alert before adding it as a related indicator to the incident, you can click the **Open in New Window** link to view the alert details for that indicator.
4. For each alert that you want to add to the current incident as a related indicator, click the **Add to Incident** button.
   The selected related indicator adds to the Indicators panel on the left. The button in the Related Indicators panel on the right now shows **Part of This Incident**.



Investigate the Incident

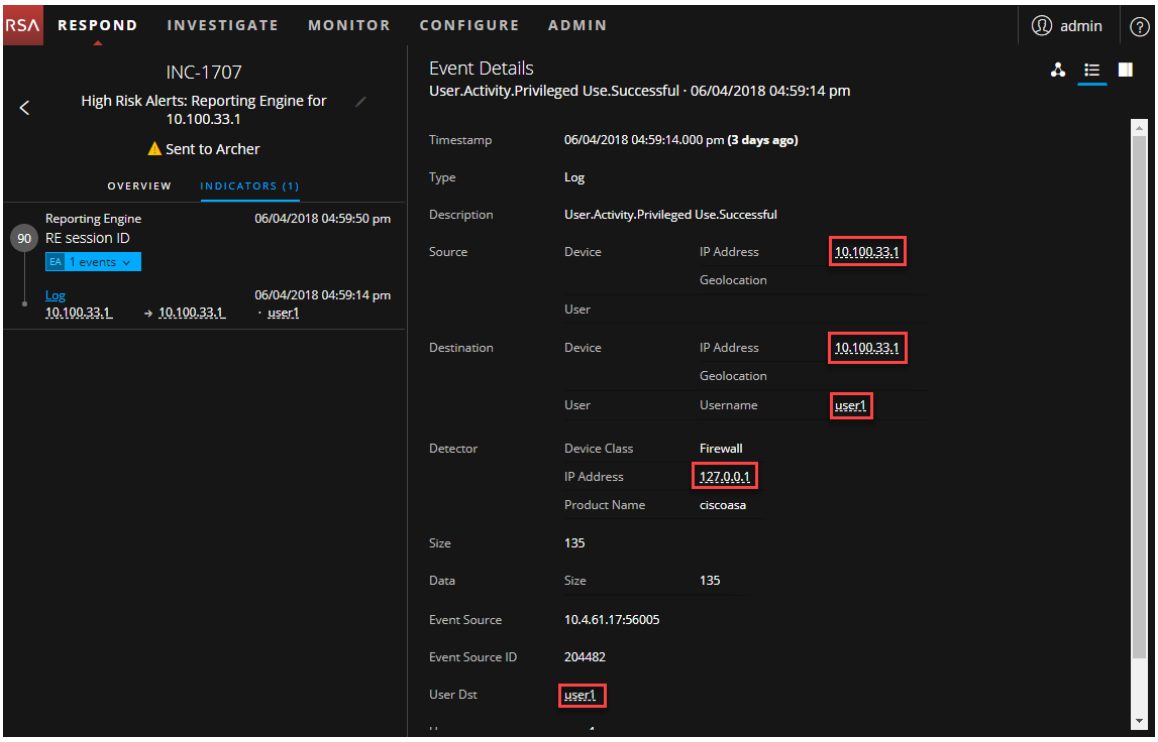
To further investigate an incident within the Incident Details view, you can find links that take you to additional contextual information about the incident when it is available. This additional context can help you understand additional technical context and business context about a specific entity in the incident. It can also provide additional information that you may want to research to ensure that you understand the full scope of the incident.

View Contextual Information

In the Indicators panel, Events List panel, Event Details panel, or the Nodal Graph, you can see underlined entities. If an entity is underlined, NetWitness Platform is populating information about that entity type in the Context Hub. There may be additional information available about that entity in the Context Hub.

The following figure shows underlined entities in the Indicators panel and the Nodal Graph.

The following figure shows underlined entities in the Event Details panel.



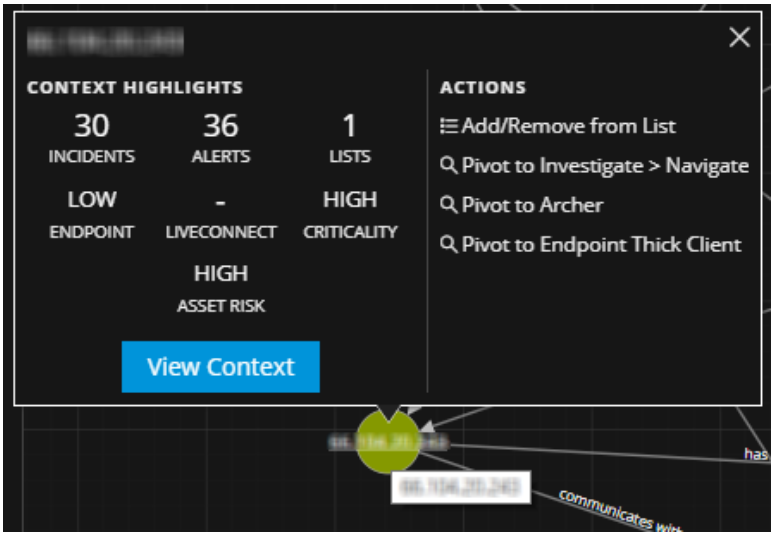
The Context Hub is preconfigured with meta fields mapped to the entities. NetWitness Respond and Respond Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, RSA recommends that when mapping meta keys in the **ADMIN > System > Investigation > Context Lookup** tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, ip.address is a meta key and ip_address is not a meta key (it is a field in the MongoDB).

To view contextual information:

1. In the Indicators panel, Events List, Event Details, or the Nodal Graph, hover over an underlined entity.
   A context tooltip appears with a quick summary of the type of context data that is available for the selected entity.

The context tooltip has two sections: Context Highlights and Actions.



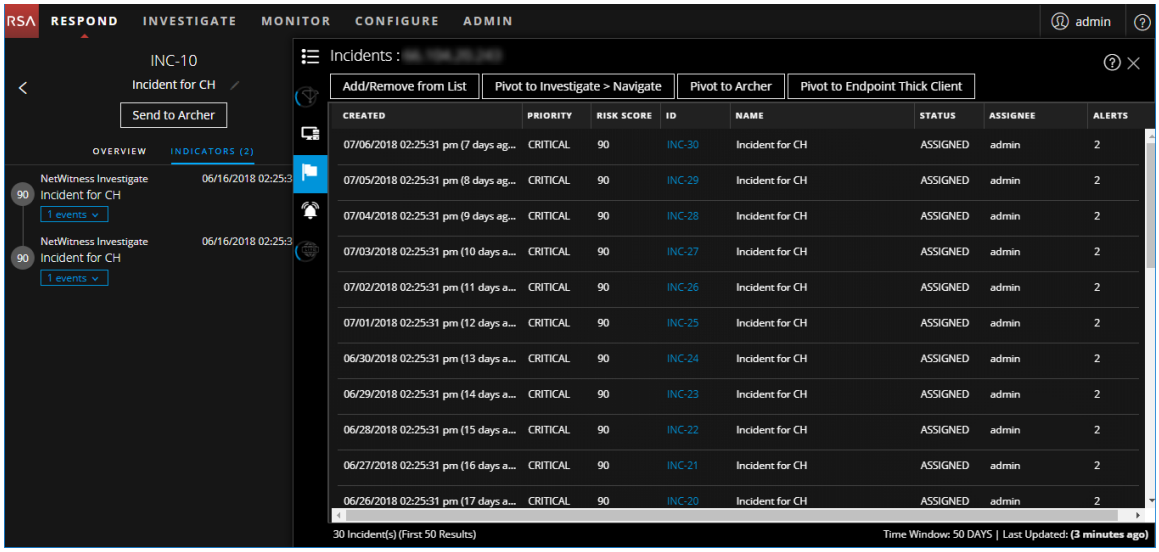
The information in the **Context Highlights** section helps you to determine the actions that you would like to take. It can show related data for Incidents, Alerts, Lists, Endpoint, Live Connect, Criticality and Asset Risk. Depending on your data, you may be able to click these items for more information. The above example shows 30 related incidents, 36 alerts, 1 list for the selected IP, LOW endpoint, HIGH criticality, and HIGH asset risk. There is no information available for Live Connect that mentions the selected IP address entity.

2. The **Actions** section lists the available actions. In the above example, the Add/Remove from List, Pivot to Investigate > Navigate, Pivot to Archer, and Pivot to Endpoint Thick Client options are available.

Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer data source is not responding. Check that the RSA Archer configuration is enabled and configured properly.

For more information, see Pivot to Investigate > Navigate, Pivot to Archer, Pivot to NetWitness Endpoint Thick Client, and Add an Entity to a Whitelist.

3. To see more details about the selected entity, click the **View Context** button.
   The Context Lookup panel opens and shows all of the information related to the entity.
   The following example shows contextual information for a selected IP address. It lists all of the incidents that mention the IP address.

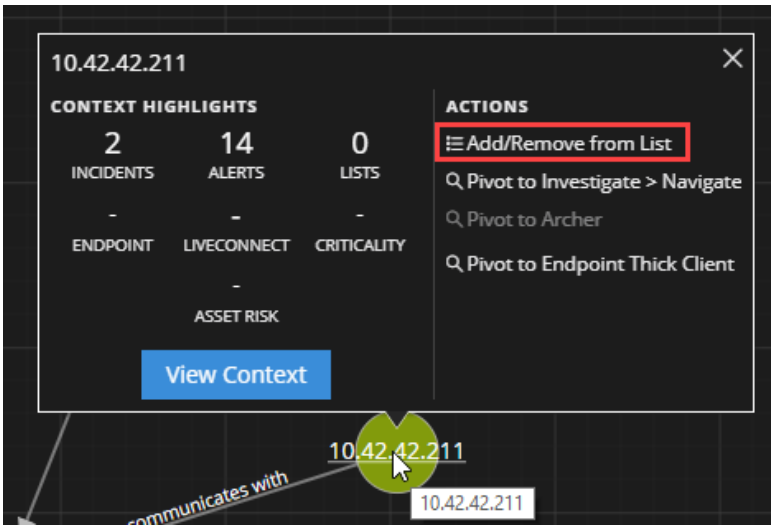


To understand the different views within the Context Hub Lookup panel, see Context Lookup Panel - Respond View .

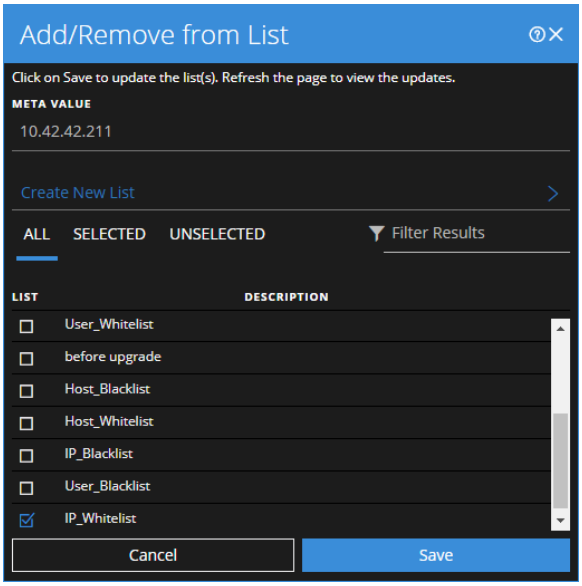
Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Indicators panel, Events List, Event Details, or the Nodal Graph, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip appears showing the available actions.



2. In the **ACTIONS** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove from List dialog shows the available lists.



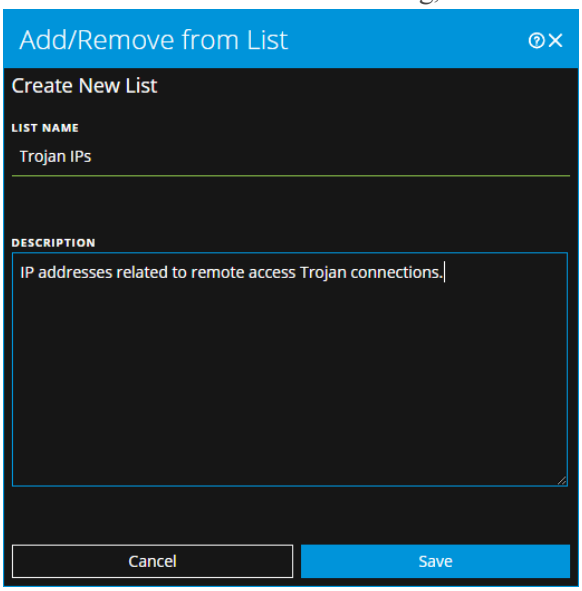
3. Select one or more lists and click **Save**.
   The entity appears on the selected lists.
   Add/Remove from List Dialog provides additional information.

Create a List

You can create lists in Context Hub from the Respond view. In addition to using lists to whitelist and blacklist entities, you can use lists to monitor entities for abnormal behavior. For example, to improve the visibility of a suspicious IP address and Domain under investigation, you may want to include them in two separate lists. One list could be for domains suspected of being related to command and control connections, and another list could be for IP addresses related to remote access Trojan connections. You can then identify indicators of compromise using these lists.

To create a list in Context Hub:

1. In the Indicators panel, Events List, Event Details, or the Nodal Graph, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip appears showing the available actions.
2. In the **ACTIONS** section of the tooltip, click **Add/Remove from List**.
3. In the Add/Remove from List dialog, click **Create New List**.



4. Type a unique **List NAME** for the list. The list name is not case sensitive.
5. (Optional) Type a **DESCRIPTION** for the list.
   Analysts with the appropriate permissions can also export lists in CSV format to send to other analysts for further tracking and analysis. The *Context Hub Configuration Guide* provides additional information.

Pivot to Investigate > Navigate

For a more thorough investigation of the incident, you can access the Investigate Navigate view.

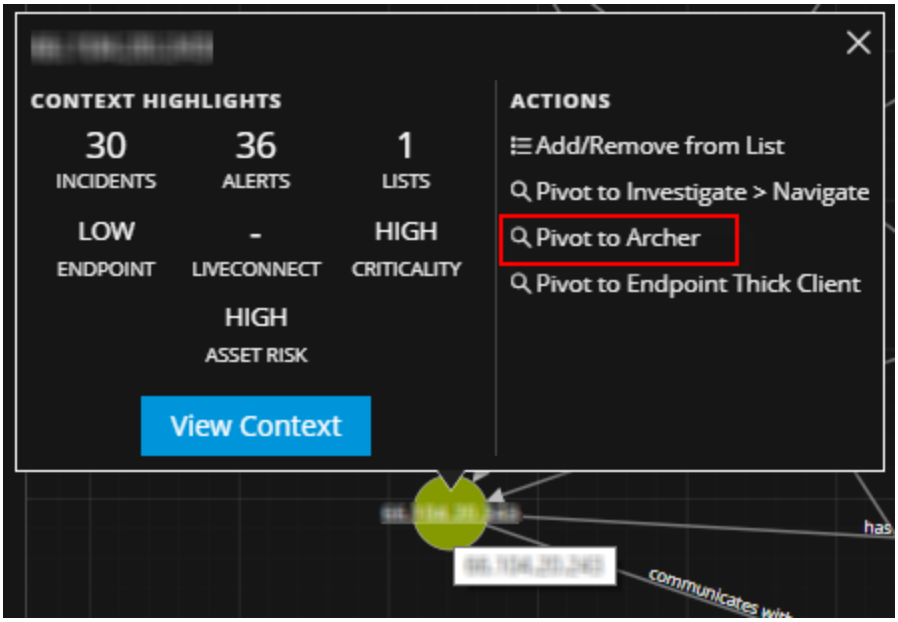
1. In the Indicators panel, Events List, Event Details, or the Nodal Graph, hover over any underlined entity to access a context tooltip.
2. In the **ACTIONS** section of the tooltip, select **Pivot to Investigate > Navigate**.
   The Investigate Navigate view opens, which enables you to perform a deeper dive investigation.

For more information, see the *NetWitness Investigate User Guide*.

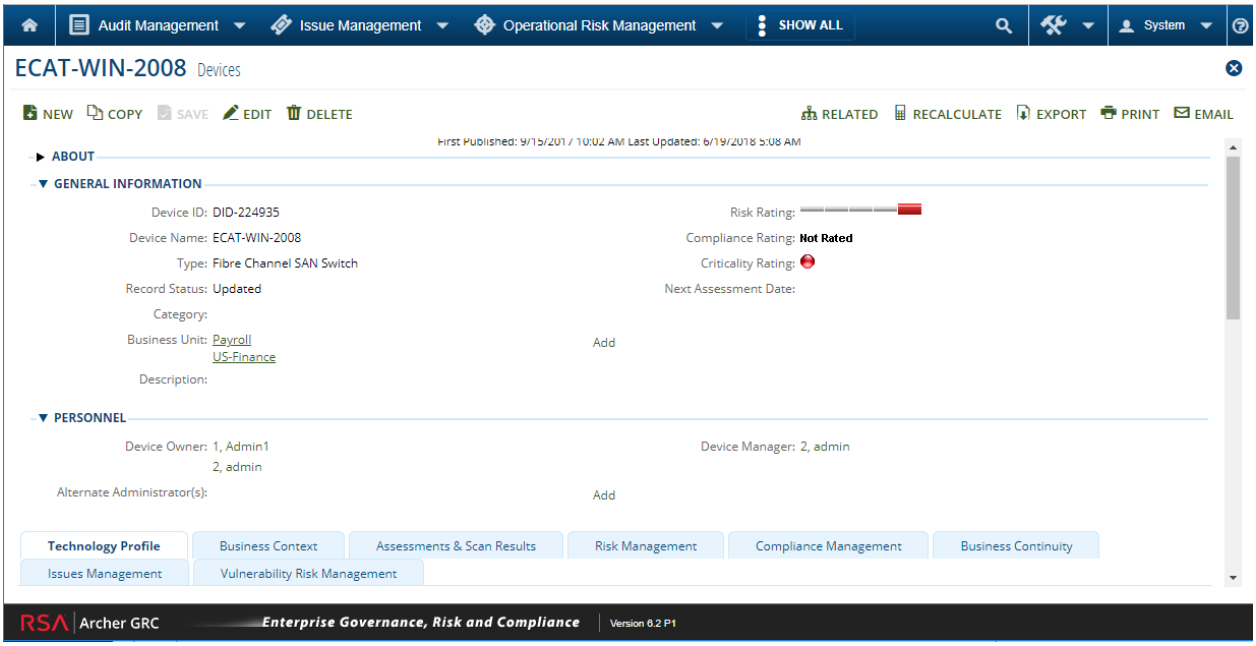
Pivot to Archer

For viewing more details about the device in RSA Archer® Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Indicators panel, Events List, Event Details, or the Nodal Graph, hover over any underlined entity (IP address, host, and Mac address) to access a context tooltip.
2. In the **ACTIONS** section, select **Pivot to Archer**.



3. The device details page in **RSA Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.



Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the RSA Archer configuration is enabled and configured properly.

For more information, see the *RSA Archer Integration Guide*.

Pivot to NetWitness Endpoint Thick Client

If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.

1. In the Indicators panel, Events List, Event Details, or the Nodal Graph, hover over any underlined entity to access a context tooltip.
2. In the **ACTIONS** section of the tooltip, select **Pivot to Endpoint Thick Client**.
   The NetWitness Endpoint thick client application opens outside of your web browser.

For more information on the thick client, see the *NetWitness Endpoint User Guide*.

View Event Analysis Details for Indicators

In the Incident Details view Indicators panel, you can drill deeper into the events associated with the listed indicators to get a better understanding of the events. In the Event Analysis panel, you can view raw events and metadata with interactive features that enhance your ability to find meaningful patterns in the data. You can examine network, log, and endpoint events in the Event Analysis panel. The Event Analysis panel in the Respond view shows the Event Analysis view from Investigate for specific indicator events. For detailed information about the Event Analysis view, see the *NetWitness Investigate User Guide*.

Note: You must have the following Investigate-server permissions to view Event Analysis in the Respond view:
event.read
content.reconstruct
content.export

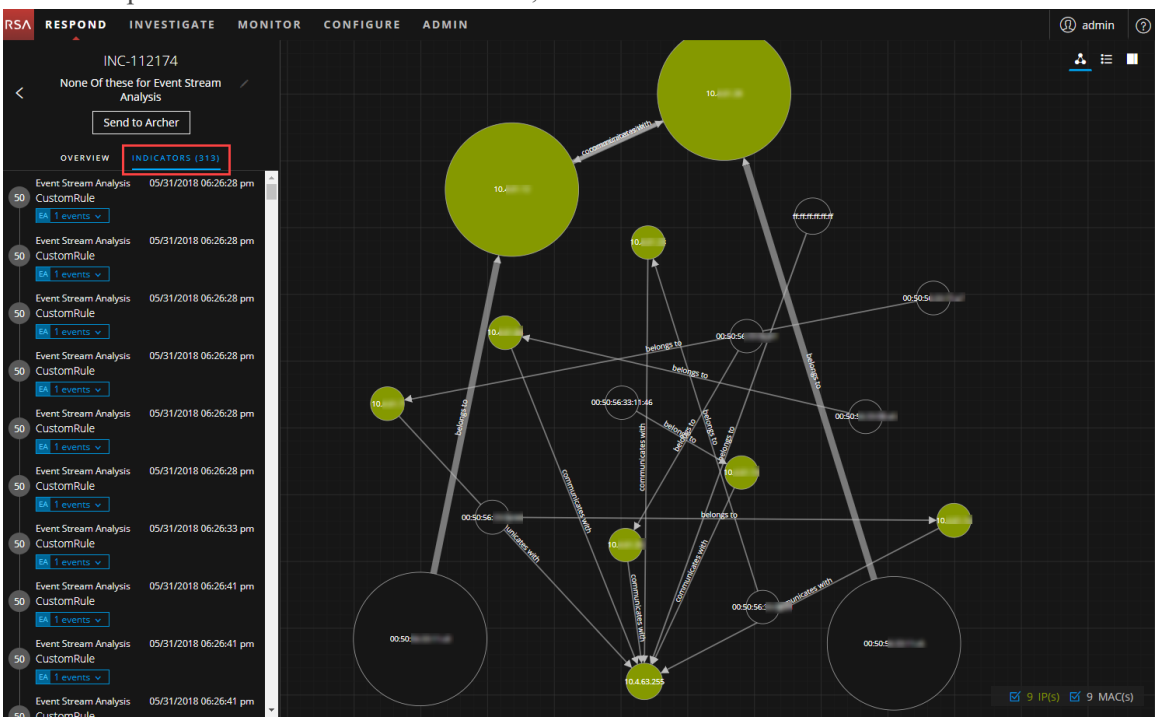
Migration Considerations

Migrated incidents from NetWitness Platform versions before 11.2 will not show the Event Analysis panel in the Respond Incident Details view Indicators panel. Likewise, if you use alerts that were migrated from versions before 11.2 to create incidents in 11.2, you will also not be able to view the Event Analysis panel in the Respond view for those incidents.

To access Event Analysis details for an event in the Indicators panel:

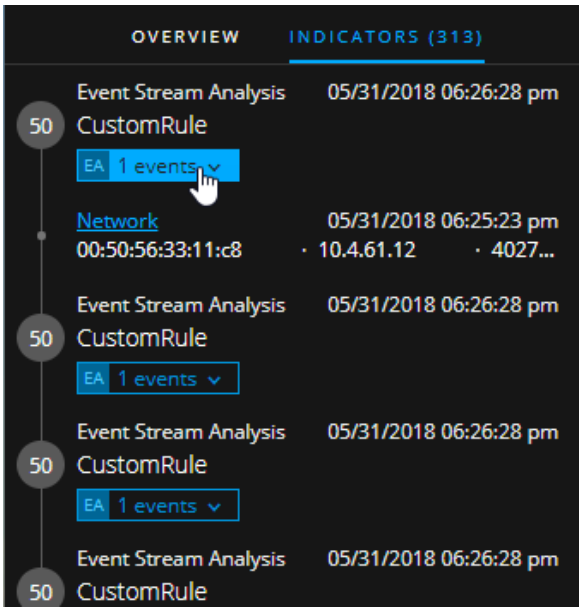
1. Go to **RESPOND > Incidents**.
2. In the Incidents List view, choose an incident to view and then click the link in the **ID** or **NAME** column for that incident.
   The Incident Details view is displayed.

3. In the left panel of the Incident Details view, select **INDICATORS**.

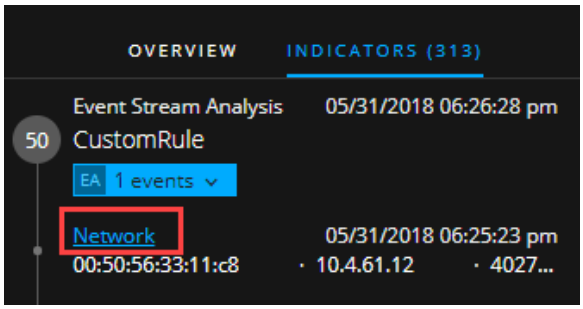


Data source information is shown below the names of the indicators. You can also see the creation date and time as well as the number of events in the indicator. If Event Analysis (EA) information is available, you can see an **EA** icon in front of the event as shown in the following figure.

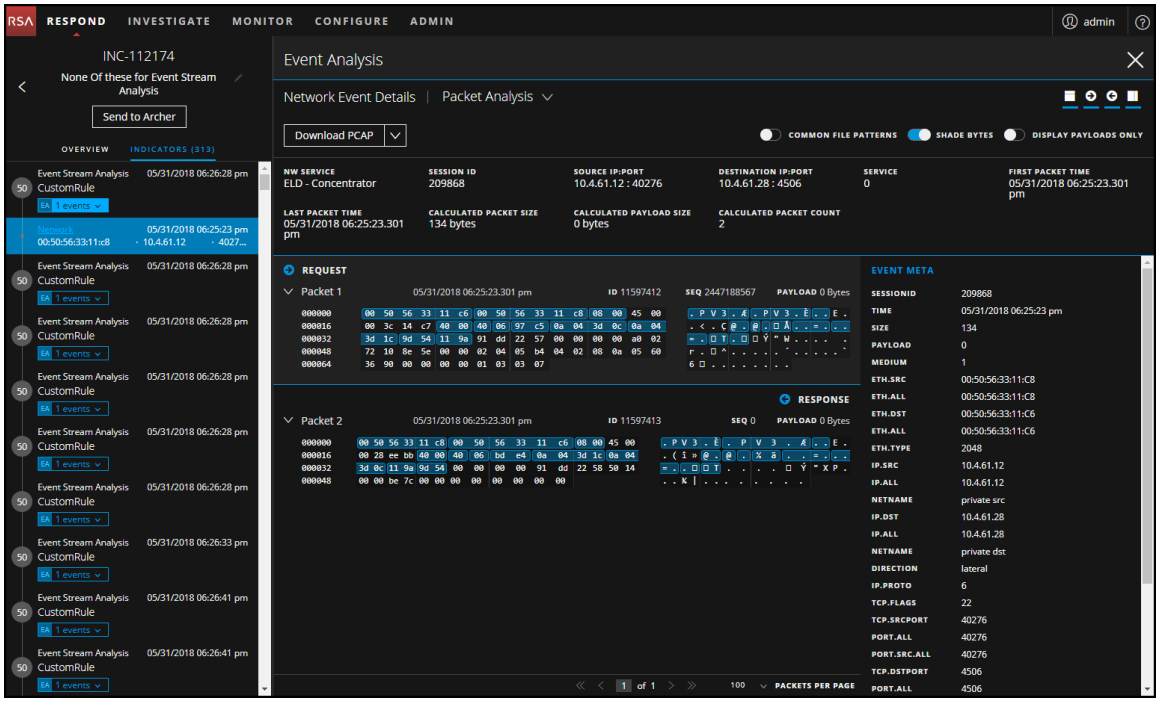
4. Click an event with an **EA** icon to view additional event information.



5. Click an event type hyperlink within the event to open the Event Analysis panel. In the following example, the event type is Network.



The Event Analysis panel shows event details for the event, such as packet analysis details. The information available can vary based on the event type.



For detailed information about the Event Analysis view, see the *NetWitness Investigate User Guide*.

Note: If you want to send the Event Analysis URL link to another analyst, you can copy the event type hyperlink.

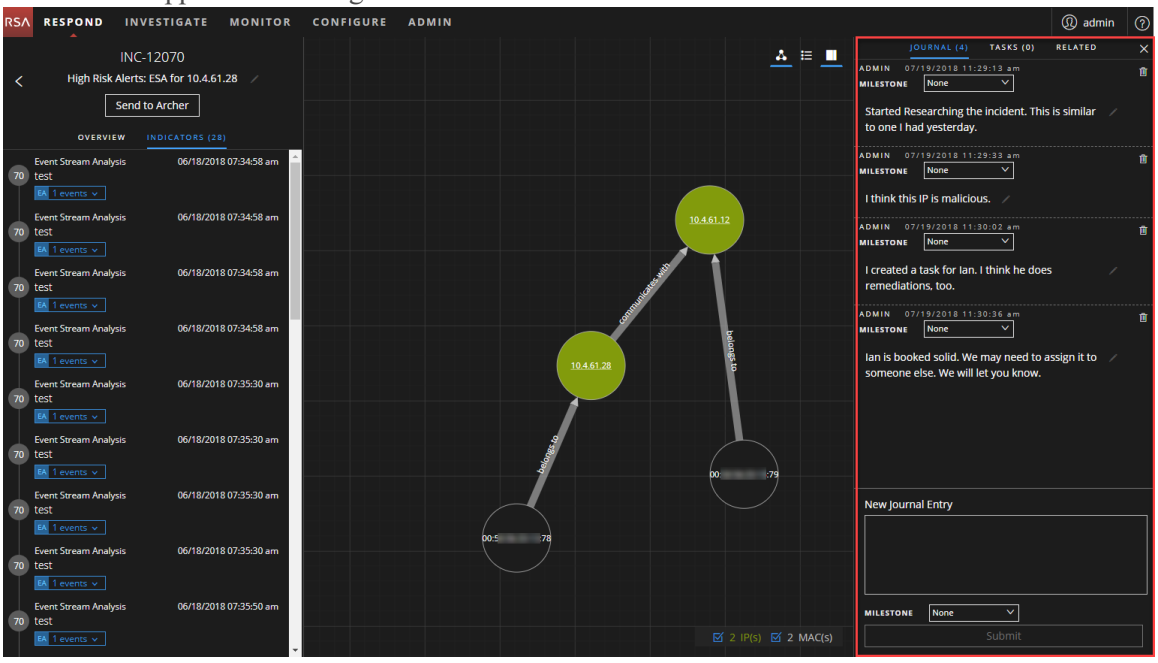
Document Steps Taken Outside of NetWitness

The journal shows notes added by analysts and it enables you to collaborate with your peers. You can post notes to a journal, add Investigation Milestone tags (Reconnaissance, Delivery, Exploitation, Installation, Command and Control, Action on Objective, Containment, Eradication, and Closure), and view the history of activity on your incident.

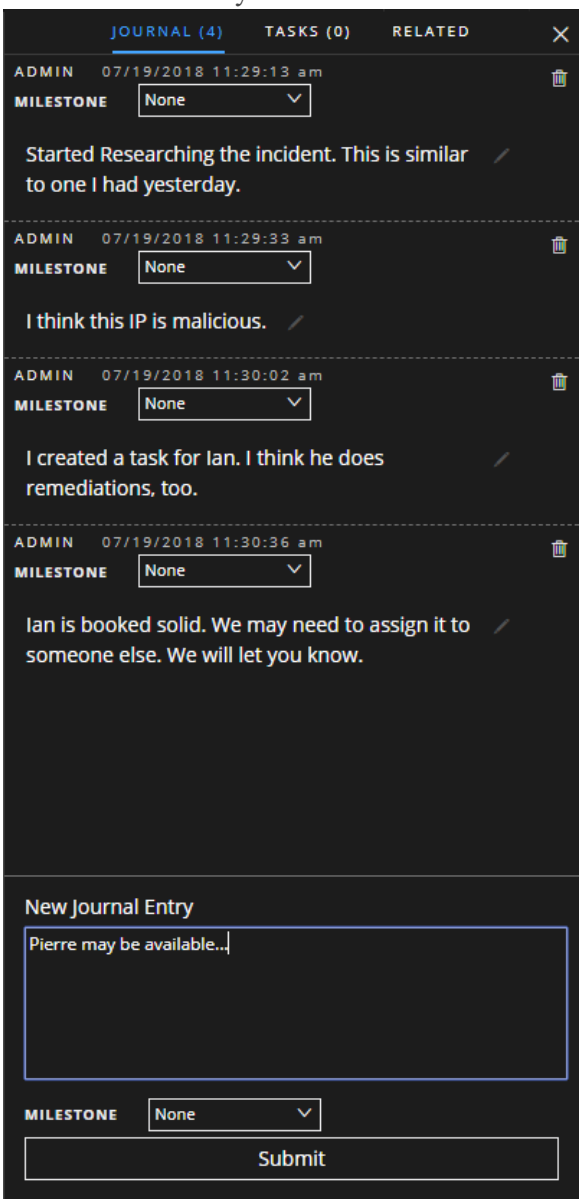
View the Journal Entries for an Incident

In the Incident Details view toolbar, click  .

The Journal appears on the right side of the Incident Details view.



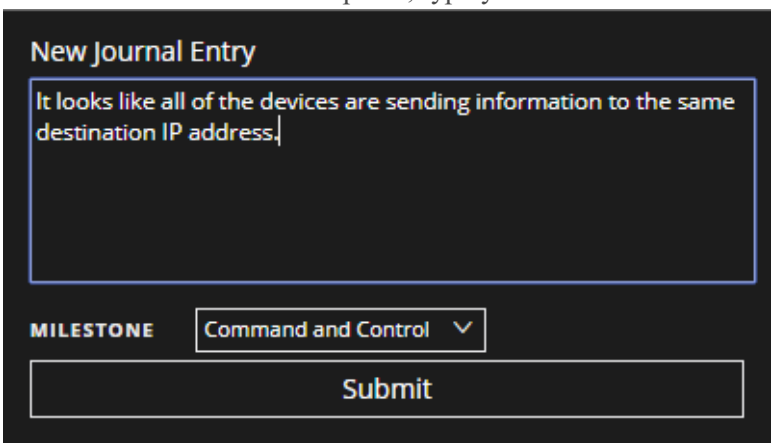
The Journal shows the history of activity on an incident. For each journal entry, you can see the author and time of the entry.



Add a Note

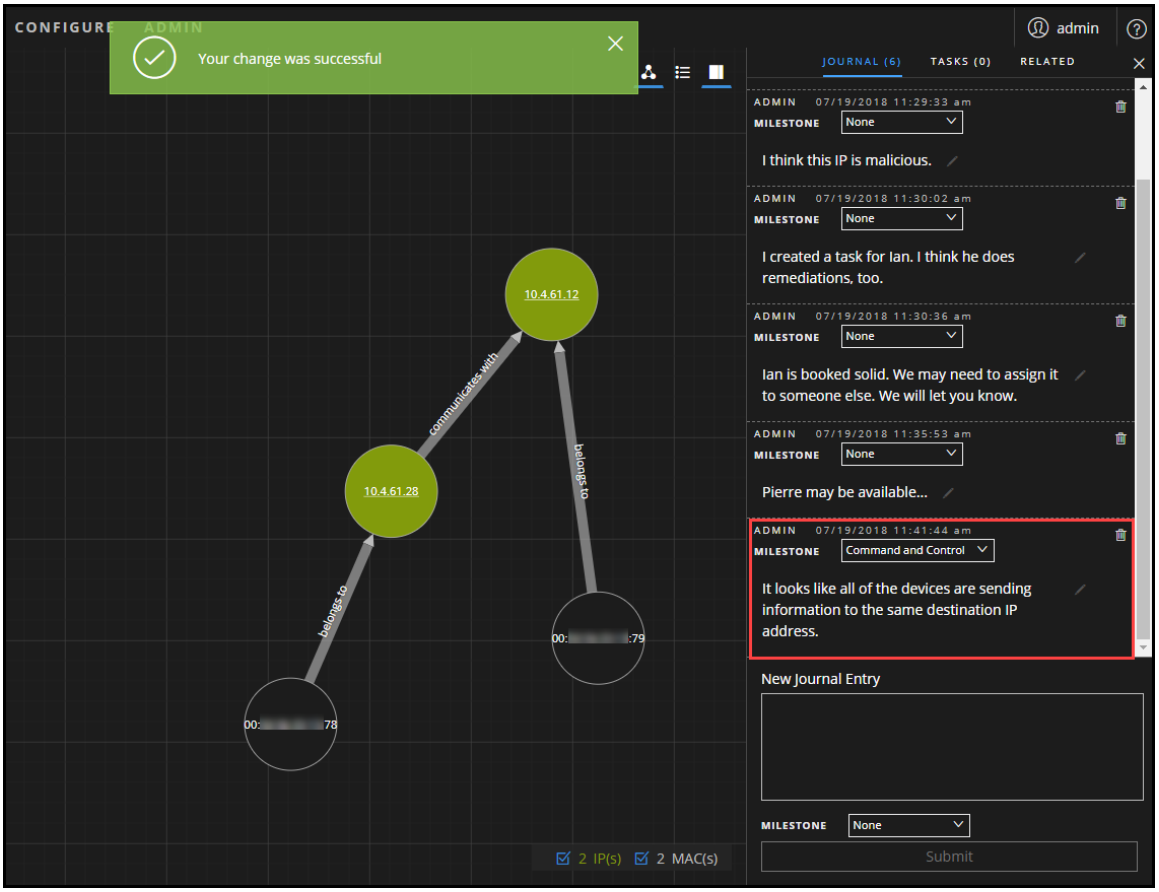
Typically, you will want to add a note to allow another analyst to understand the incident, or add a note for posterity so that your investigative steps are documented.

1. At the bottom of the Journal panel, type your note in the **New Journal Entry** box.



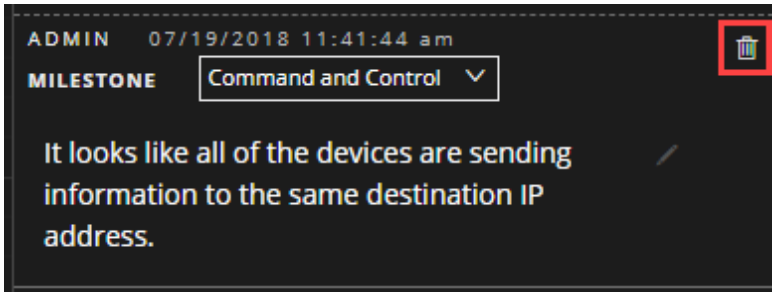
2. (Optional) Select an Investigation Milestone from the drop-down list (Reconnaissance, Delivery, Exploitation, Installation, Command and Control, Action On Objective, Containment, Eradication, and Closure).

3. After you finish your note, click, **Submit**.
   Your new journal entry appears in the Journal.



Delete a Note

1. In the Journal panel, locate the journal entry that you would like to delete.
2. Click the trash can (delete) icon next to the journal entry.



3. In the confirmation dialog that appears, click **OK** to confirm that you want to delete the journal entry. This action cannot be reversed.

View Reputation Status of Filehash

You can view the reputation status of a filehash. The information is populated about the filehash from the Context Hub. There may be additional information available about that entity in the Context Hub.

To view contextual information:

1. In the **Incidents** tab, click on an incident.
2. Hover over a filehash.
3. The Reputation Status is displayed.

Escalate or Remediate the Incident

You may want to escalate an incident, assign incidents to another Analyst, or change the status and priority of an incident as you gather more information about it. This is useful if, for example, you upgrade the priority of an incident from high to critical after determining that the incident is a major breach. You may also want to send the incident to RSA Archer® Cyber Incident & Breach Response for additional analysis and action.

Send an Incident to RSA Archer

Note: This option is available in version 11.2 and later. If RSA Archer is configured as a data source in Context Hub, you can send incidents to RSA Archer and you will be able to see the Send to Archer option and Sent to Archer Status in NetWitness Respond.

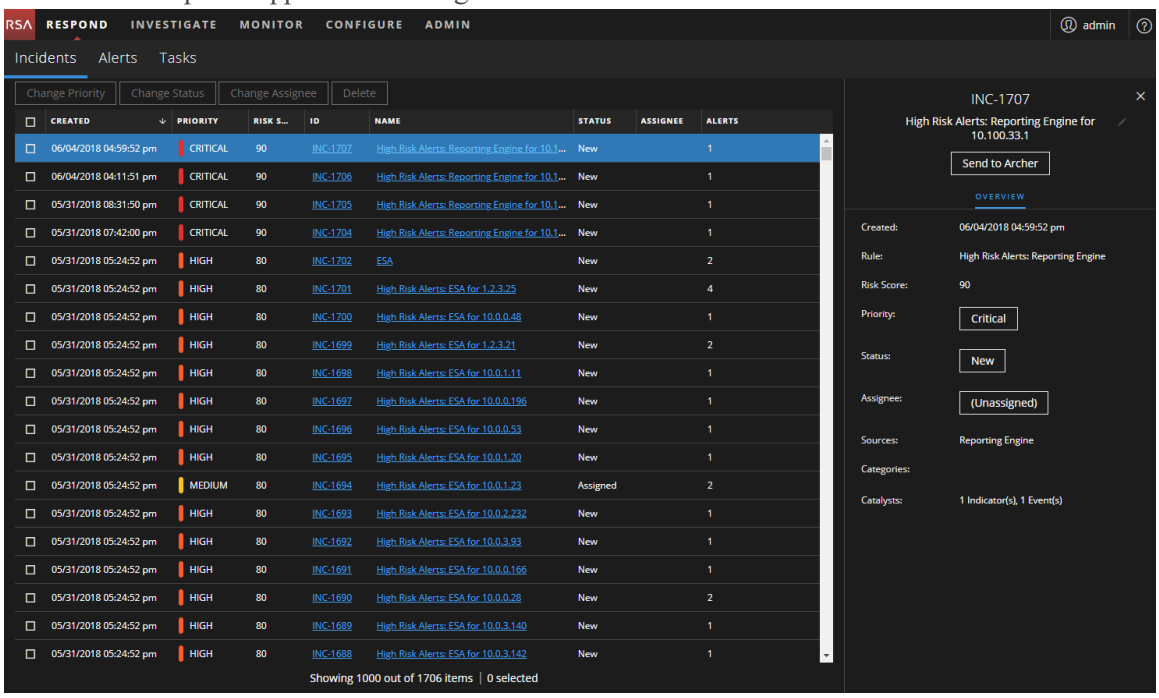
When you send an incident to Archer, a Sent to Archer notification appears within the incident. When configured, the NetWitness Platform can start additional business processes in Archer Cyber Incident & Breach Response. You can view all of the incidents that were sent to Archer Cyber Incident & Breach Response using the filter in the Incident Lists view.

You send an incident to Archer by clicking the Send to Archer button in the Overview panel in the Incident Lists view or the Incident Details view.

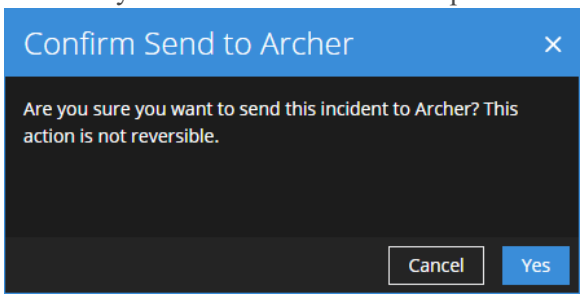
Caution: The **Send to Archer** action is not reversible.

1. Go to **RESPOND > Incidents**.
2. From the Incidents List view, click the incident that you want to send to Archer Cyber Incident & Breach Response.

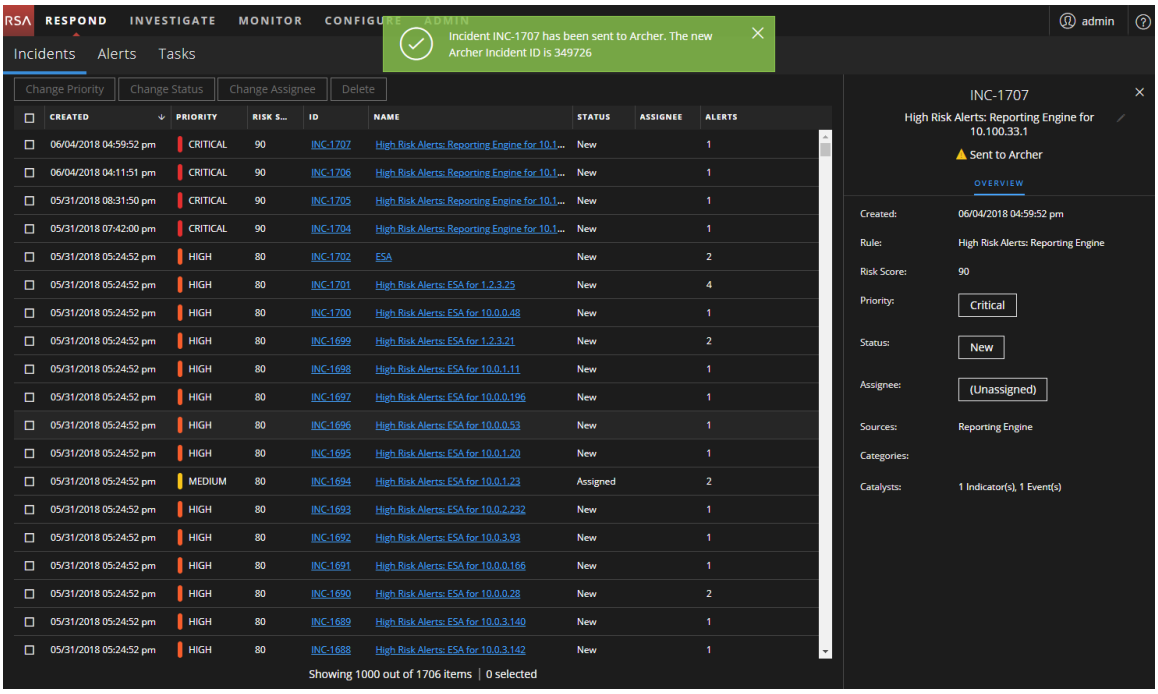
The Overview panel appears on the right.



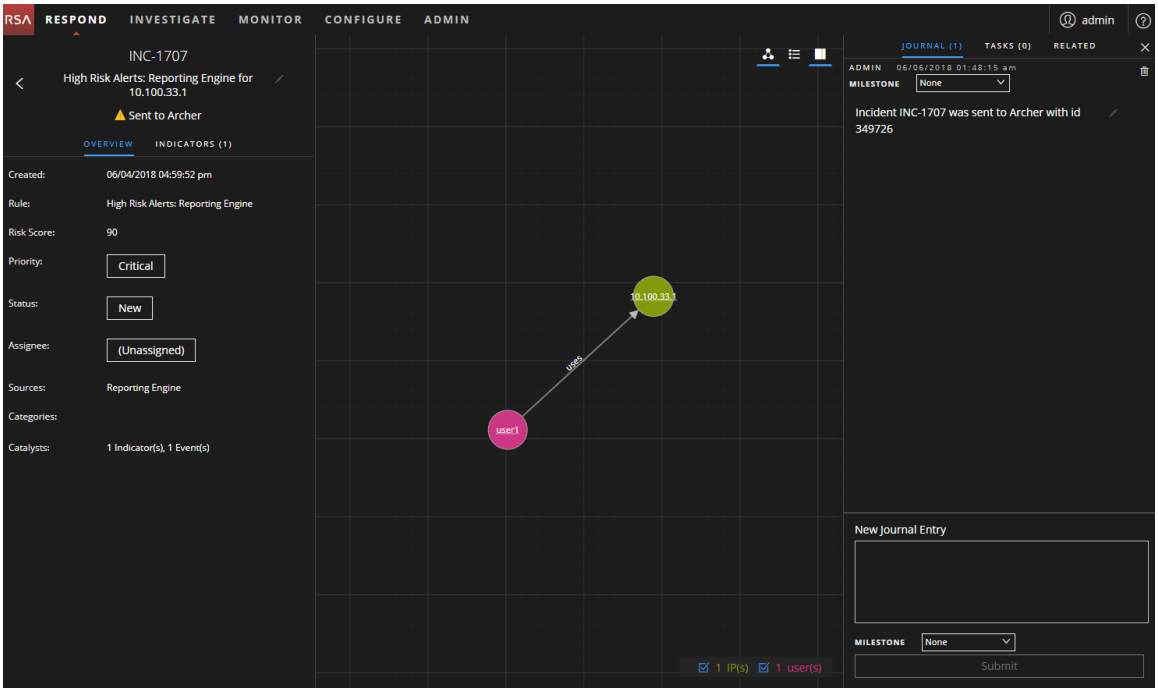
3. In the Overview panel, click **Send to Archer**.
4. Read the **Confirm Send to Archer** dialog and then click **Yes** to confirm sending the incident to Archer Cyber Incident & Breach Response. This action is not reversible.



You will receive a confirmation that the incident was sent to Archer along with an Archer incident ID. In the Overview panel, the Send to Archer button changes to Sent to Archer.



In the Incident Details view (click the link in the ID or NAME field of the incident sent to Archer) you can see the Sent to Archer notification above the Overview and Indicators panels. If you also click the  icon to open the Journal, you can see a system journal entry that shows that the incident was sent to Archer and it now has an Archer ID number.

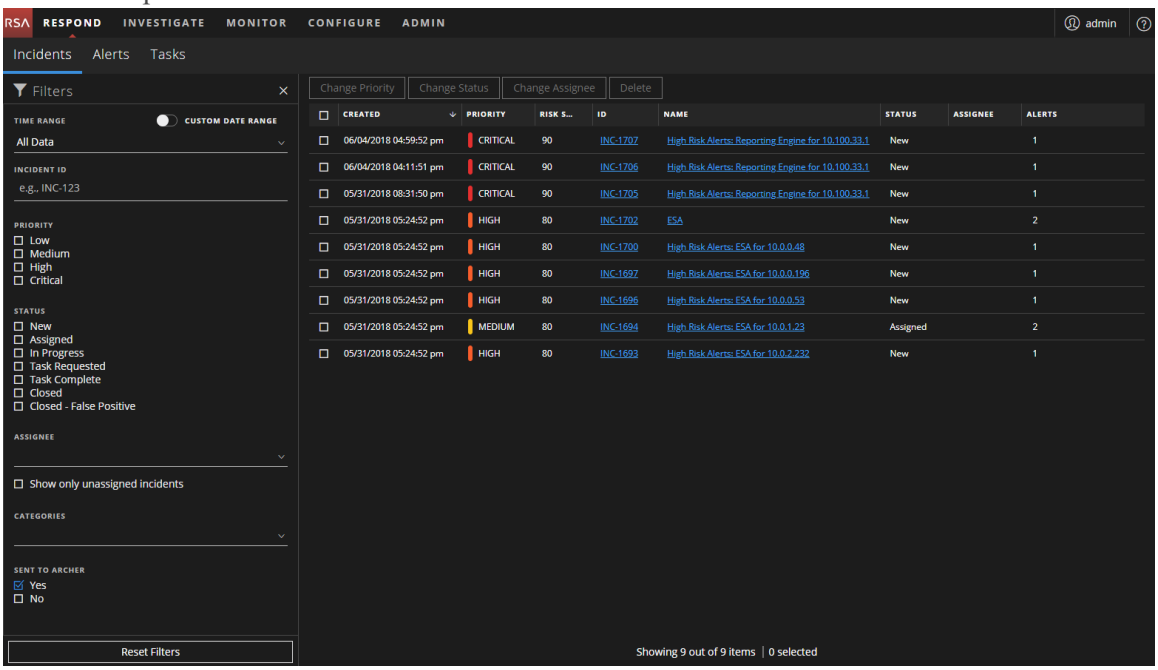


View All Incidents Sent to Archer

Note: This option is available in version 11.2 and later. If RSA Archer is configured as a data source in Context Hub, you can send incidents to RSA Archer and you will be able to see the Sent to Archer option and Sent to Archer Status in NetWitness Respond.

You can view incidents sent to Archer Cyber Incident & Breach Response using the Filter.

1. Go to **RESPOND > Incidents**.
   The Incidents List is displayed.
2. If you cannot see the Filters panel, in the Incident List view toolbar, click  .
3. In the Filters panel, under SENT TO ARCHER, select **Yes**.
   The incidents list will be filtered to show incidents that were sent to Archer Cyber Incident & Breach Response.



Update an Incident

You can update an incident from several places. You can change the priority, status, or assignee from the Incident List view and the Incident Details view. For example, if you are an Analyst, you may want to assign yourself a case from the Incident List view if you see that it is related to another case you are working on. If you are an SOC Manager or an Administrator, you may want to view unassigned incidents from the Incident List view and assign the incidents as they come in. SOC Managers and Administrators can do bulk updates of the priority, status, or assignee instead of updating them one incident at a time.

From the Details view, you might want to change the status to In Progress once you begin working on an incident, and then update it to Closed or Closed - False Positive after you resolve the issue. Or you might change the priority of the incident to Medium or High as you determine the details of the case.

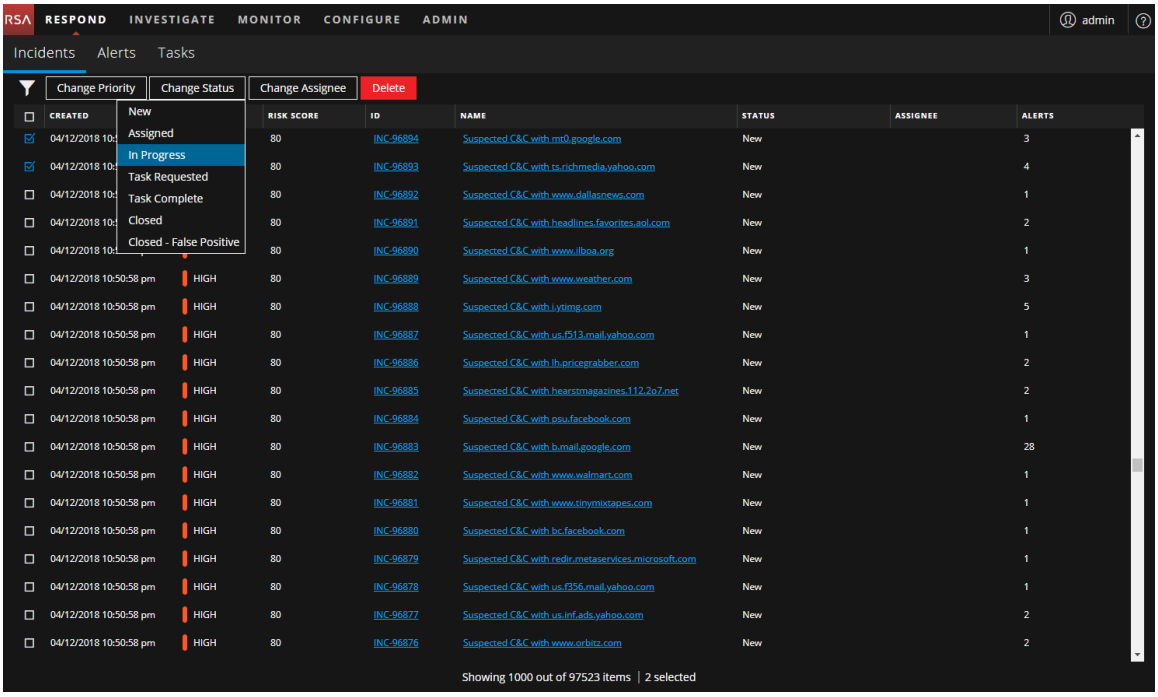
Change Incident Status

When an incident first appears in the incident list, it has an initial status of New. You can update the status as you complete your work on the incident. The following statuses are available:

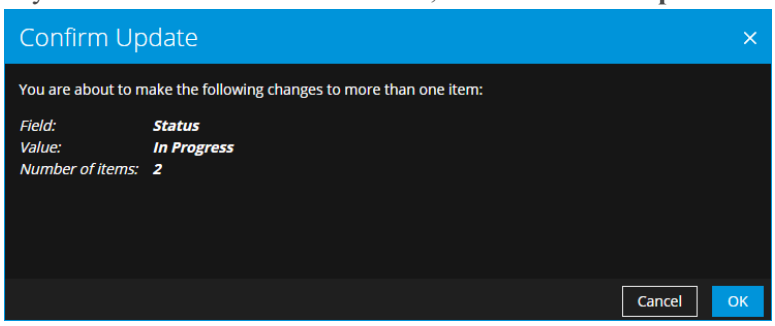
- New
- Assigned
- In Progress
- Task Requested
- Task Complete
- Closed
- Closed - False Positive

To update the status of multiple incidents:

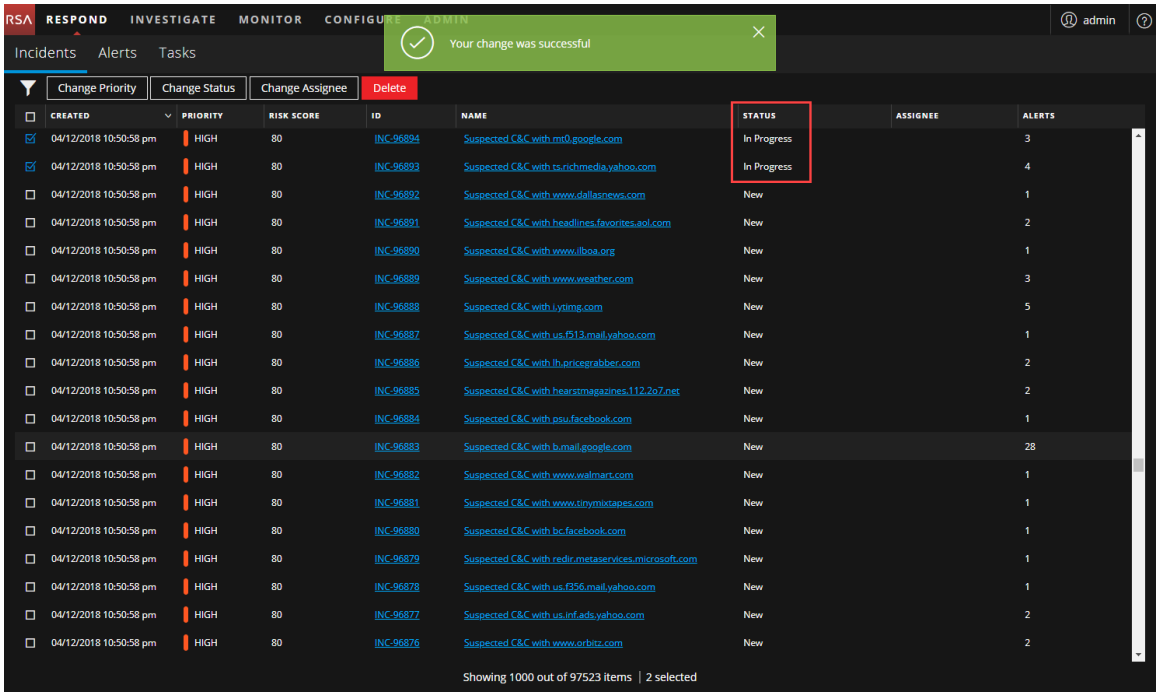
1. In the Incidents List view, select one or more incidents that you would like to change. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Status** and select a status from the drop-down list. In this example, the current status is Assigned, but the Analyst would like to change it to In Progress for the selected incidents.



3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.



You can see a successful change notification. In this example, the status of the updated incidents now show In Progress.



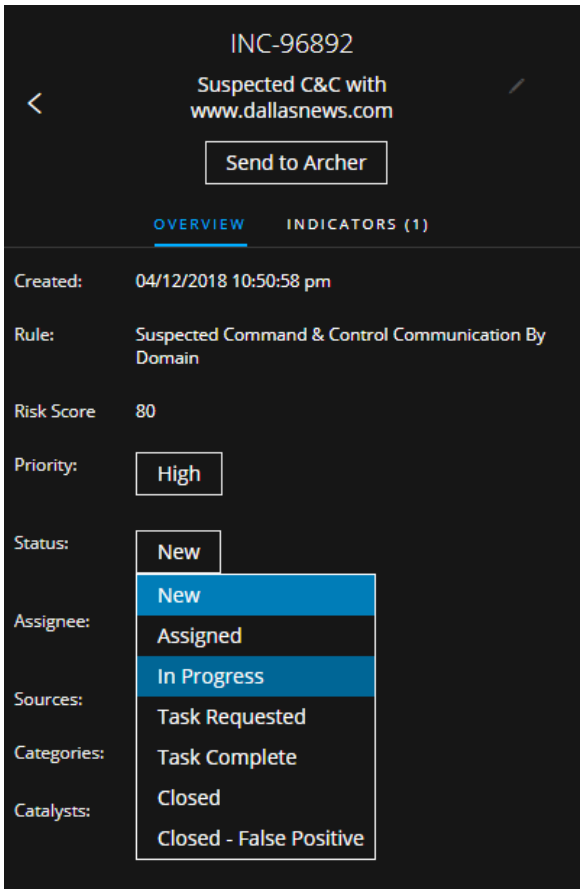
To change the status of a single incident from the Overview panel:

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click an incident that needs a status update.

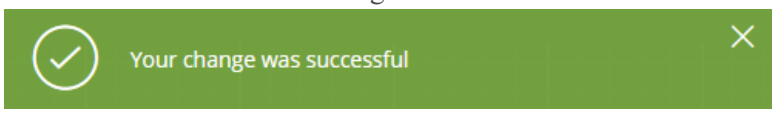
   - From the Incident Details view, click the **OVERVIEW** tab.

   In the Overview panel, the Status button shows the current status of the incident.

2. Click the **Status** button and select a status from the drop-down list.



You can see a successful change notification.



Change Incident Priority

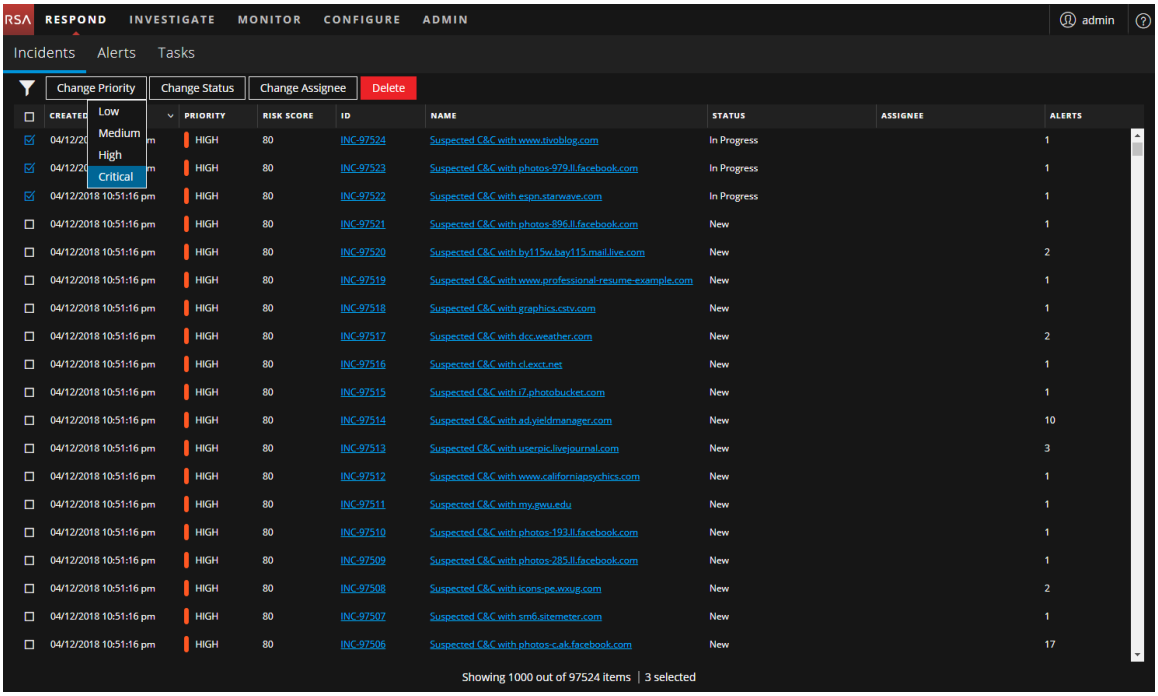
The incident list is sorted by Priority by default. You can update the priority as you study the details of the case. The following priorities are available:

- Critical
- High
- Medium
- Low

Note: You cannot change the priority of a closed incident.

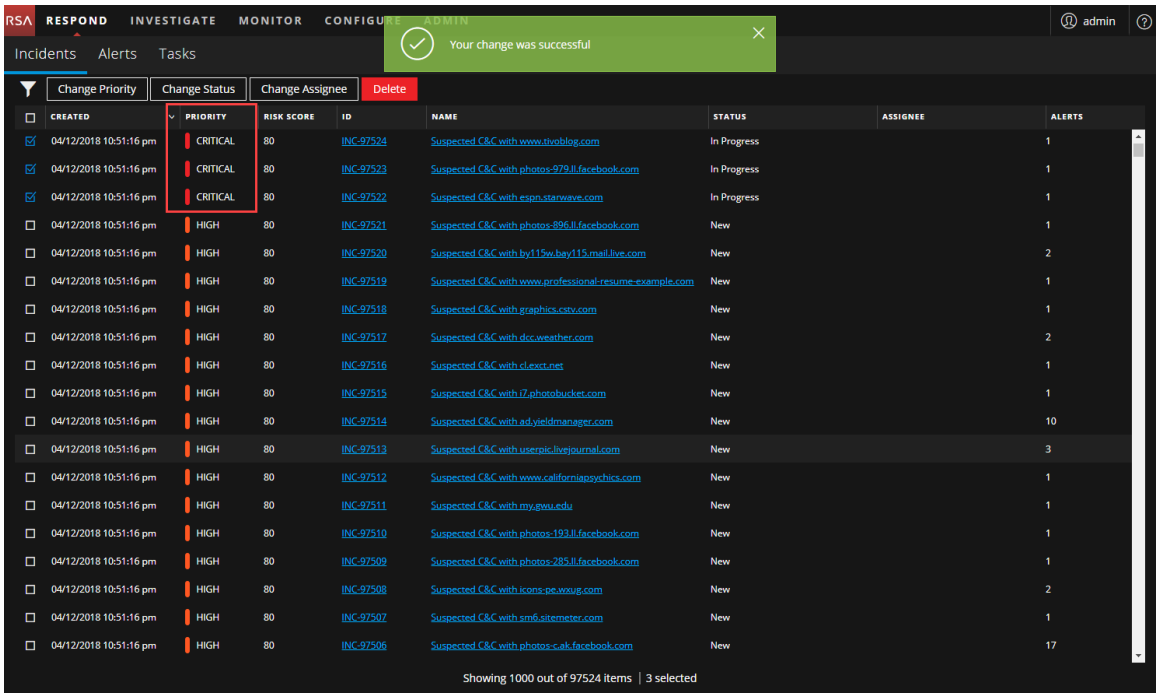
To update the priority of multiple incidents:

1. In the Incidents List view, select one or more incidents that you would like to change. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.
2. Click **Change Priority** and select a priority from the drop-down list. In this example, the current priority is High, but the Analyst would like to change it to Critical for the selected incidents.



3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.
   You can see a successful change notification. In this example, the status of the updated incidents

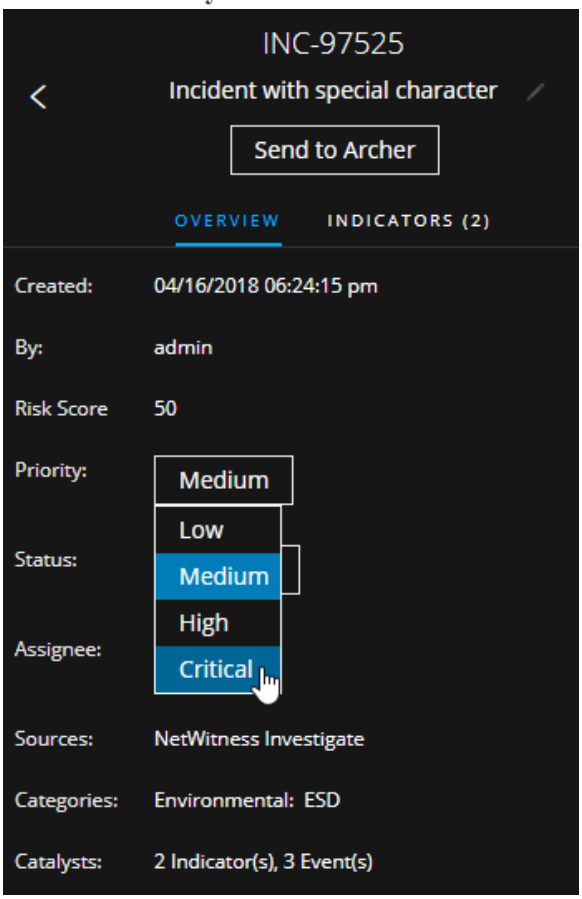
now show Critical.



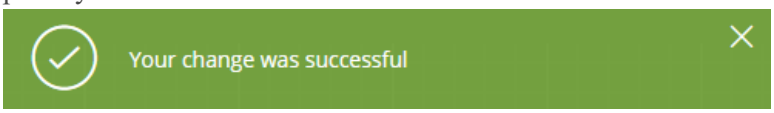
To change the priority of a single incident from the Overview panel

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click an incident that needs a priority update.
   - From the Incident Details view, click the **OVERVIEW** tab.
     In the Overview panel, the Priority button shows the current priority of the incident.

2. Click the **Priority** button and select a status from the drop-down list.



You can see a successful change notification. The Priority button changes to show the new incident priority.



Assign incidents to other Analysts

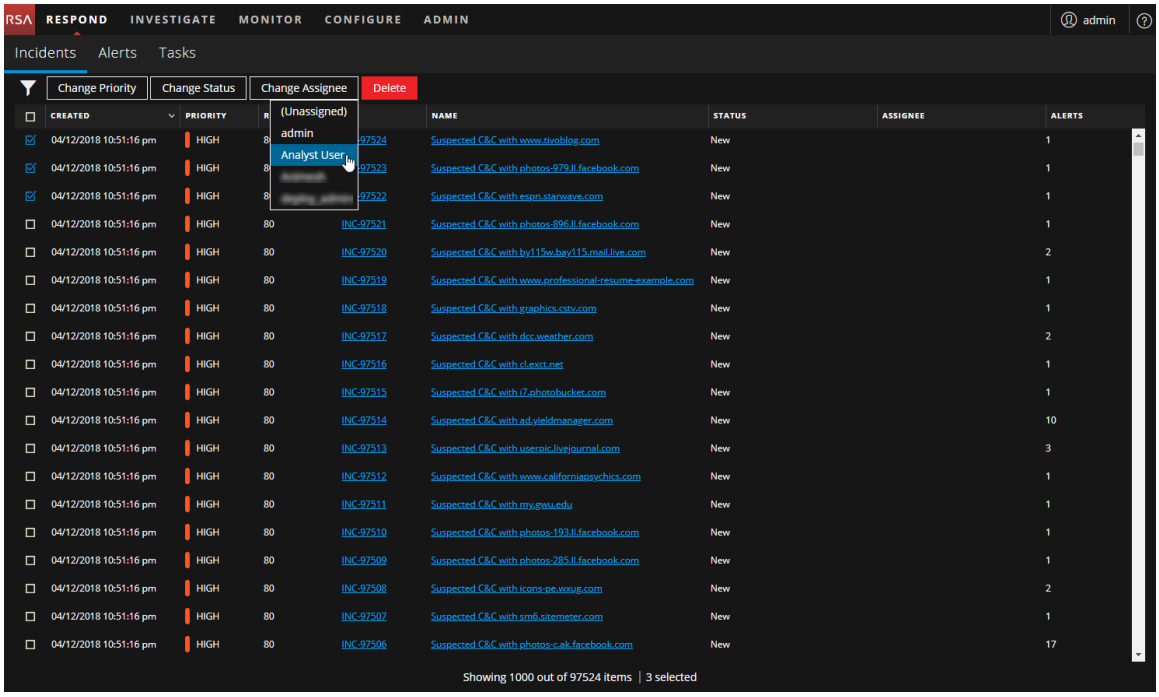
You can assign incidents to other Analysts in the same way as you assign incidents to yourself. SOC Managers and Administrators can assign multiple incidents to a user at the same time.

Note: You cannot change the assignee of a closed incident.

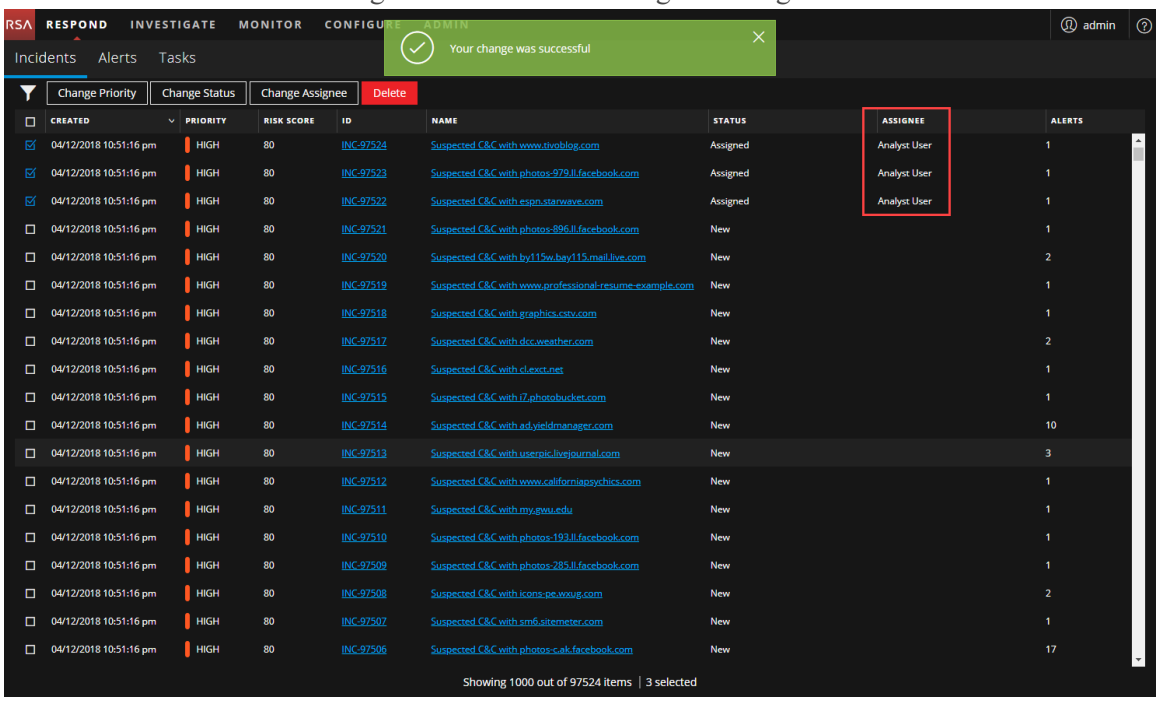
To assign multiple incidents to a user:

1. In the Incidents List view, select the incidents that you would like to assign to a user. To select all of the incidents on the page, select the box in the incidents list header row. The number of incidents selected appears in the incidents list footer.

2. Click **Change Assignee** and select a user from the drop-down list. In this example, the incidents are unassigned, but they should be assigned to an Analyst.

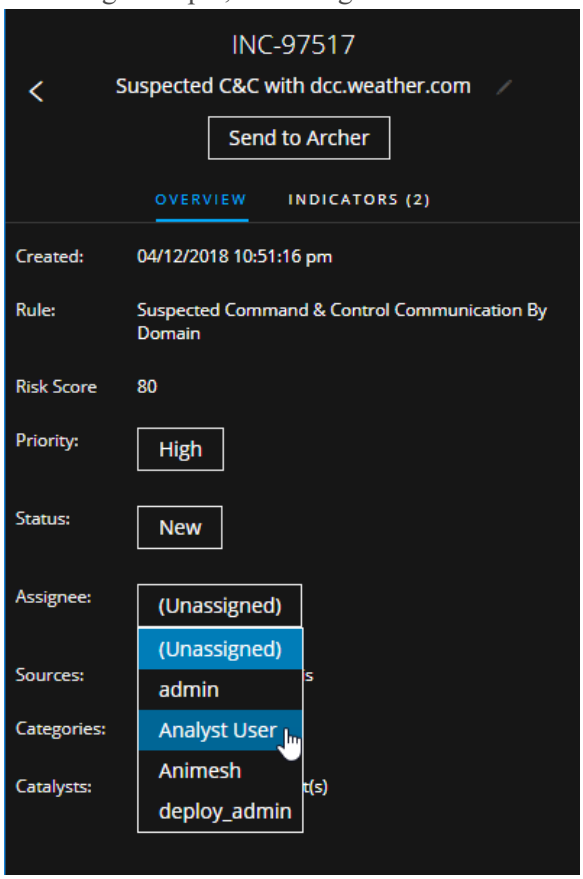


3. If you select more than one incident, in the **Confirm Update** dialog, click **OK**.
You can see a successful change notification. The assignee changes to the selected user.



To assign a user to an incident from the Overview panel:

1. To open the Overview panel, do one of the following:
   - From the Incidents List view, click an incident that you would like to assign to a user.
   - From the Incident Details view, click the **OVERVIEW** tab.
     In the Overview panel, the Assignee button shows the current assignee of the incident. In the following example, the Assignee button has a current status of Unassigned.

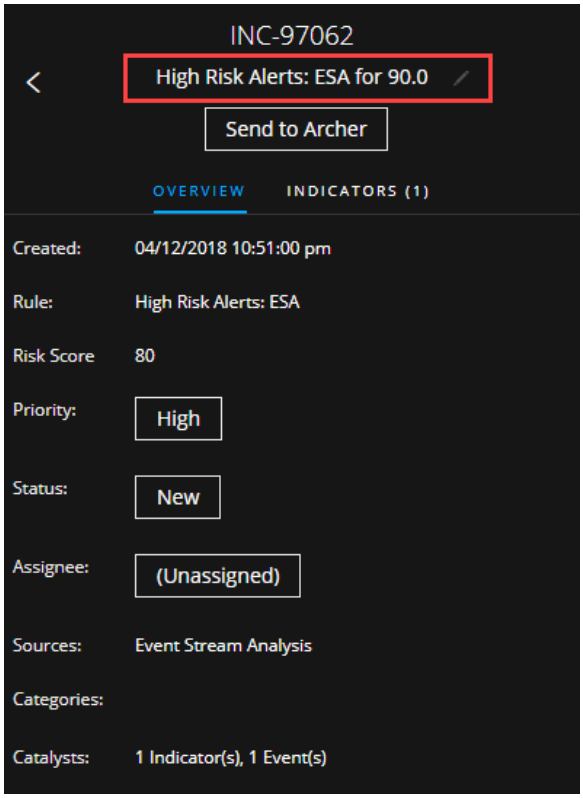


2. Click the **Assignee** button and select a user from the drop-down list.
   You can see a successful change notification. The Assignee button changes to show the assigned user.

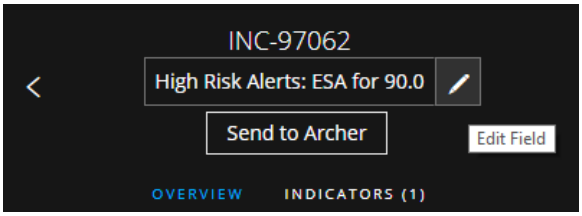
Rename an Incident

You can rename an incident from the Overview panel in the Incidents List view and the Incident Details view. For example, you may want to rename an incident to provide clarification about the issue, especially if multiple incidents have the same name.

1. Go to **RESPOND > Incidents**.
2. To open the Overview panel, do one of the following:
   - From the Incidents List view, click an incident that needs a name change.
     The Overview panel opens.
   - From the Incident Details view, go to the **OVERVIEW** panel.
     In the header above the Overview panel, you can see the incident ID and the incident name.



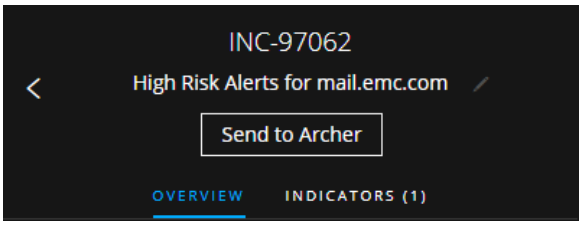
3. Click the incident name in the header to open a text editor.



4. Type a new name for the incident in the text editor and click the check mark to confirm the change.

   For example, you can change "High Risk Alerts: ESA for 90.0" to "Alerts for mail.emc.com" for more clarification.
   You can see a successful change notification.

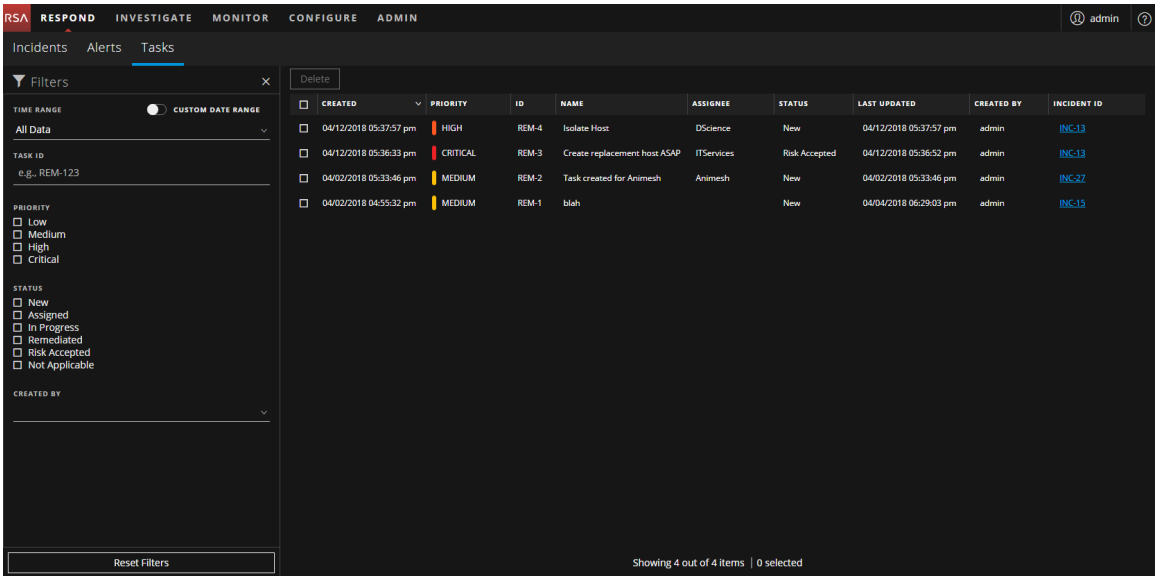
The incident name field shows the new name.



View All Incident Tasks

When additional work is required for an incident, you can create tasks for the incident and track the progress on those tasks. This is helpful, for example, when the work being done is outside security operations or you make a request for a computer reimage. In the Tasks List view, you can manage and track the tasks to closure.

1. Go to **RESPOND > Tasks**.
   The Tasks List view displays a list of all incident tasks.



2. Scroll through the tasks list, which shows basic information about each task as described in the following table.

Column	Description
CREATED	Displays the date when the task was created.

Column	Description
PRIORITY	Displays the priority assigned to the task. The priority can be any of the following: Critical, High, Medium, or Low. The Priority is also color coded, where red indicates **Critical**, orange represents **High** risk, yellow indicates **Medium** risk, and green represents **Low** risk as shown in the following figure: ID	Displays the task ID.
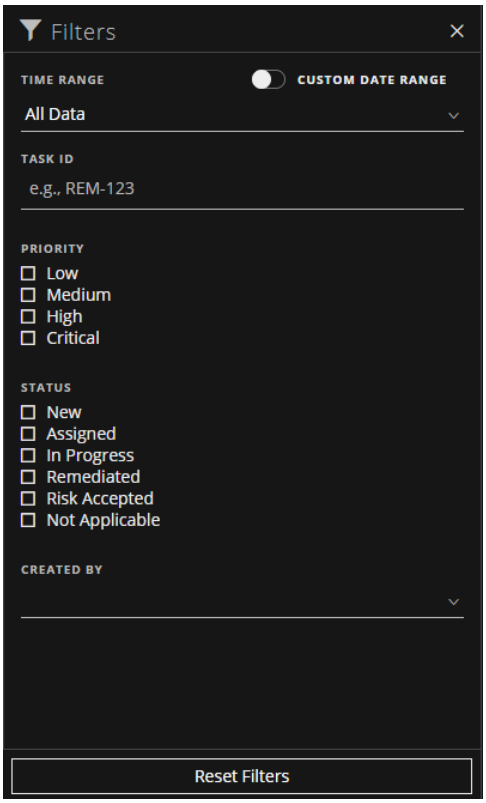
NAME	Displays the task name.
ASSIGNEE	Displays the name of the user assigned to the task.
STATUS	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
LAST UPDATED	Displays the date and time when the task was last updated.
CREATED BY	Displays the user who created the task.
INCIDENT ID	Displays the incident ID for which the task was created. Click the ID to display the details of the incident.

At the bottom of the list, you can see the number of tasks on the current page, the total number of tasks, and the number of tasks selected. For example: **Showing 6 out of 6 items | 2 selected**.

Filter the Tasks List

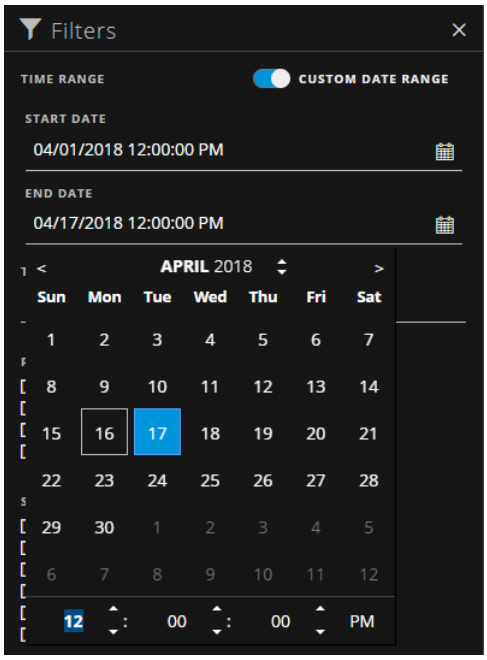
The number of tasks in the Tasks List can be very large, making it difficult to locate particular tasks. The Filter enables you to specify those tasks that you would like to view, such as tasks created within the last 7 days. You can also search for a specific task.

1. Go to **RESPOND > Tasks**.
   The Filters panel appears to the left of the Tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click  , which opens the Filters panel.



2. In the Filters panel, select one or more options to filter the incidents list:
   - **TIME RANGE**: You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the tasks. For example, if you select Last Hour, you can see tasks that were created within the last 60 minutes.
   - **CUSTOM DATE RANGE**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of CUSTOM DATE RANGE to view the

Start Date and End Date fields. Select the dates and times from the calendar.



- **TASK ID**: Type the Task ID for a task that you would like to locate, for example REM-123.
- **PRIORITY**: Select the priorities that you would like to view.
- **STATUS**: Select one or more incident statuses. For example, select Remediated to view completed remediation tasks.
- **CREATED BY**: Select the user who created the tasks that you would like to view. For example, if you only want to view the tasks created by Edwardo, select Edwardo from the CREATED BY drop-down list. If you want to view tasks regardless of the person who created the task, do not make a selection under CREATED BY.

The Tasks List shows a list of tasks that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the tasks list.
For example: **Showing 6 out of 6 items**

3. If you want to close the Filters panel, click **X**. Your filters remain in place until you remove them.

Remove My Filters from the Tasks List

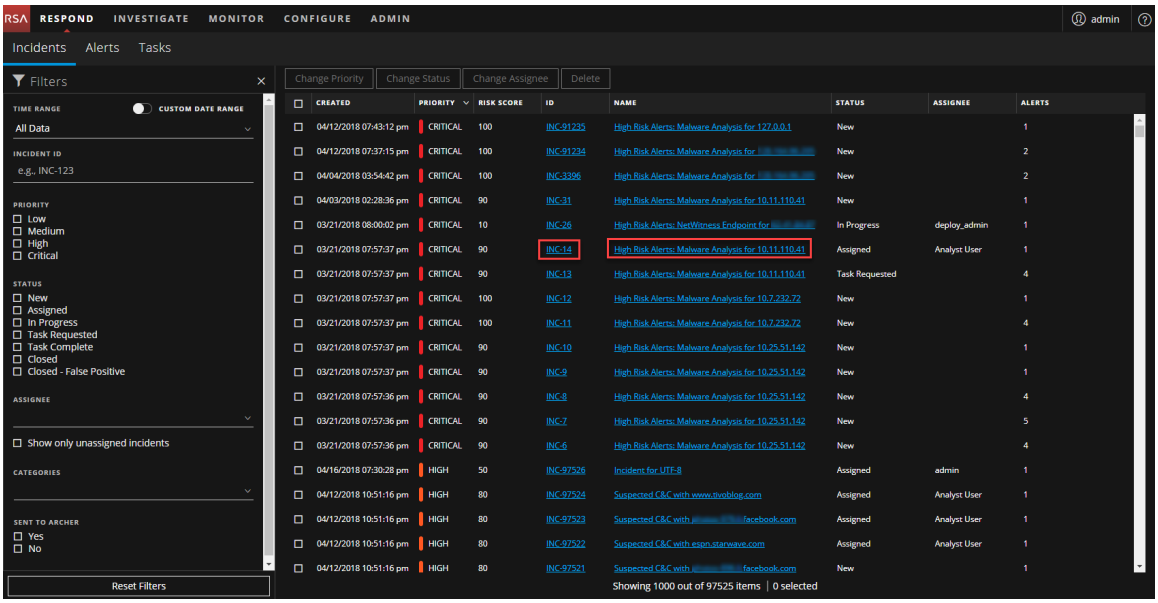
NetWitness Platform remembers your filter selections in the Tasks List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of tasks that you expect to see or you want to view all of the tasks in your tasks list, you can reset your filters.

1. Go to **RESPOND > Tasks**.
   The Filters panel appears to the left of the tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.
2. At the bottom of the Filters panel, click **Reset Filters**.

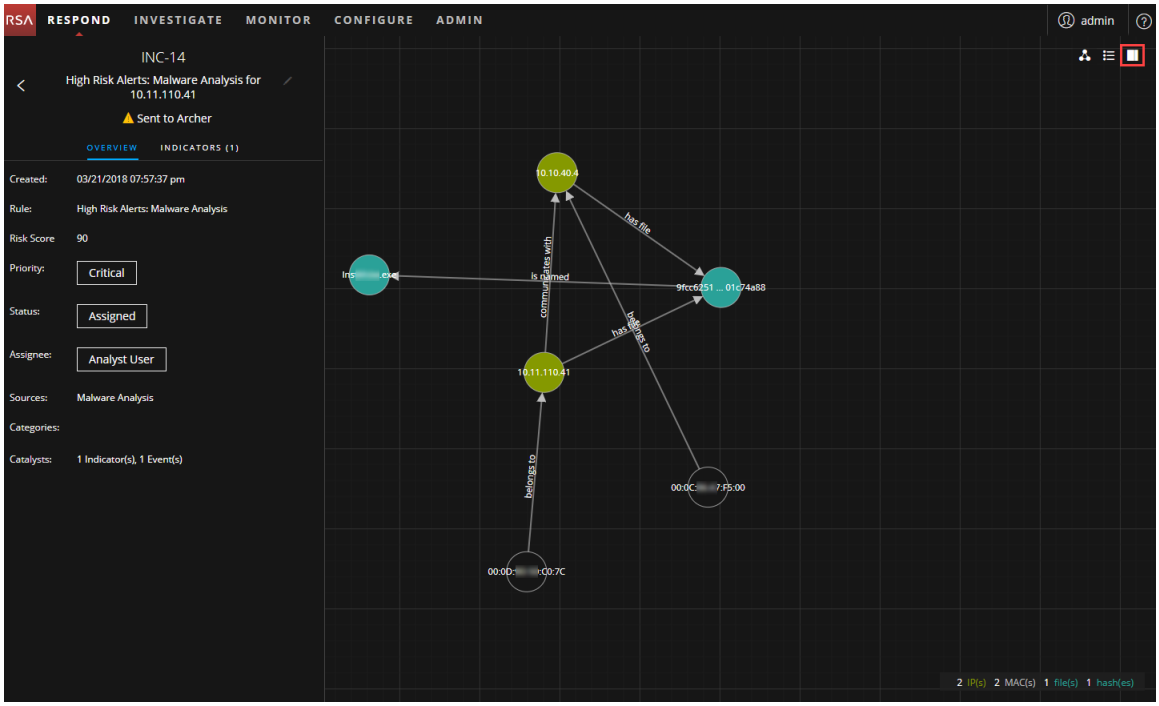
Create a Task

After you investigate an incident and know more about it, you can create a task, assign it to a user, and track it to closure. You create tasks from the Incident Details view.

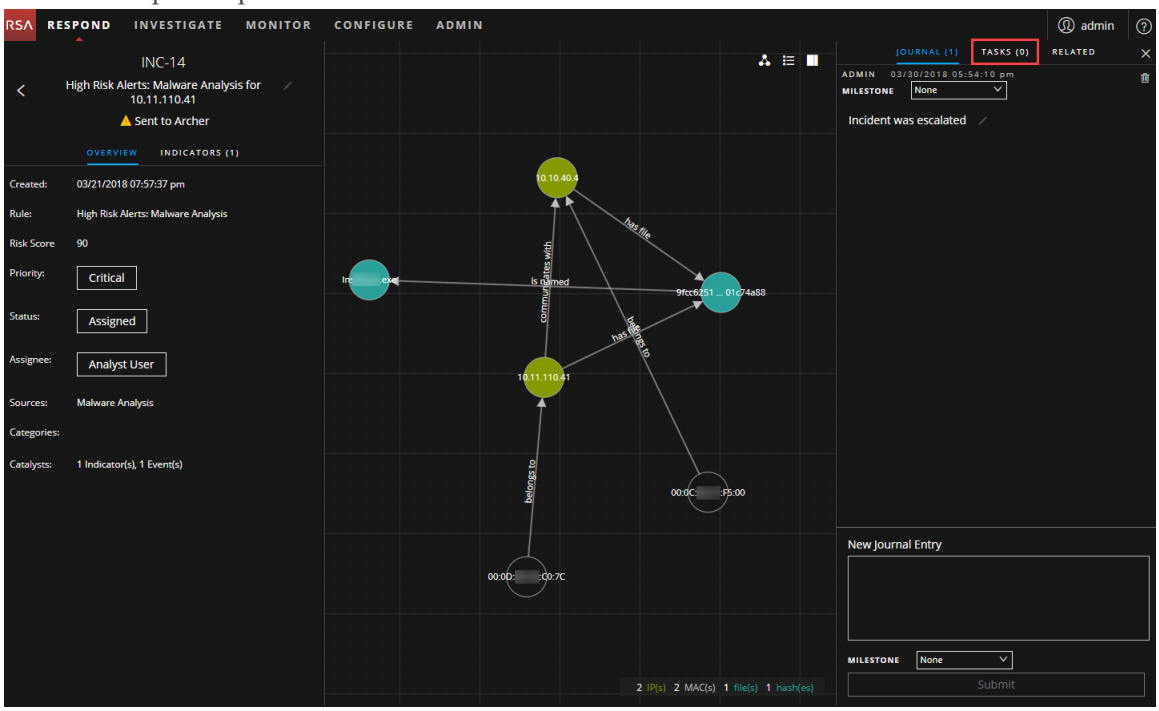
1. Go to **RESPOND > Incidents**.
   The Incidents List view displays a list of all incidents.



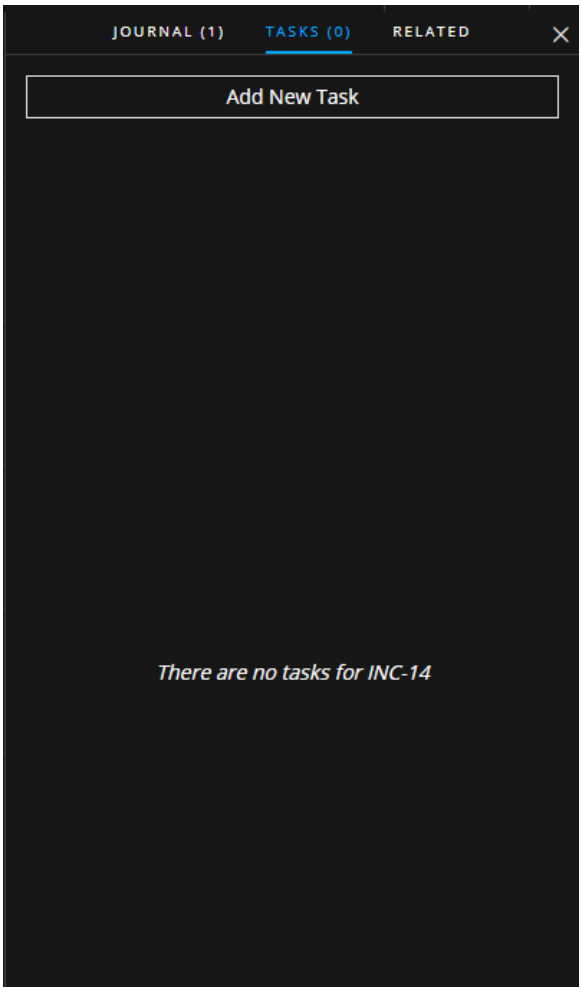
2. Locate the incident that needs a task and click the link in the **ID** or **NAME** field.
   The Incident Details view opens.



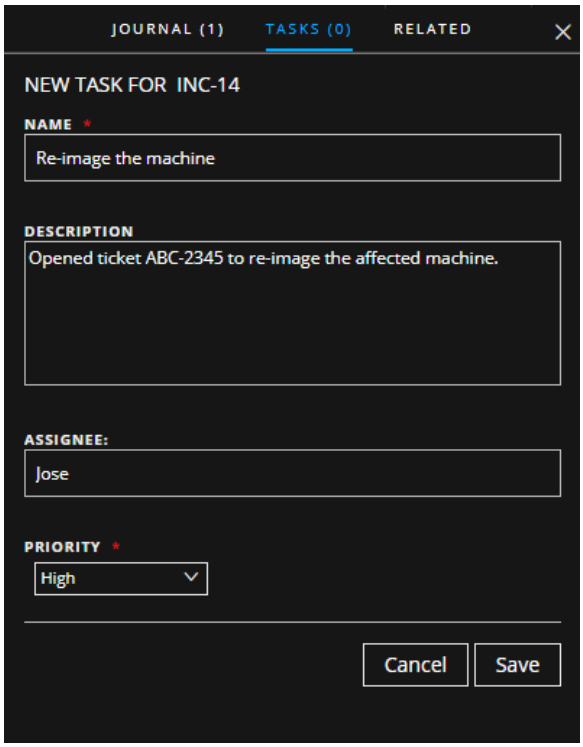
3. In the toolbar at the top right of the Incident Details view, select  .
   The Journal panel opens.



4. Click the **TASKS** tab.

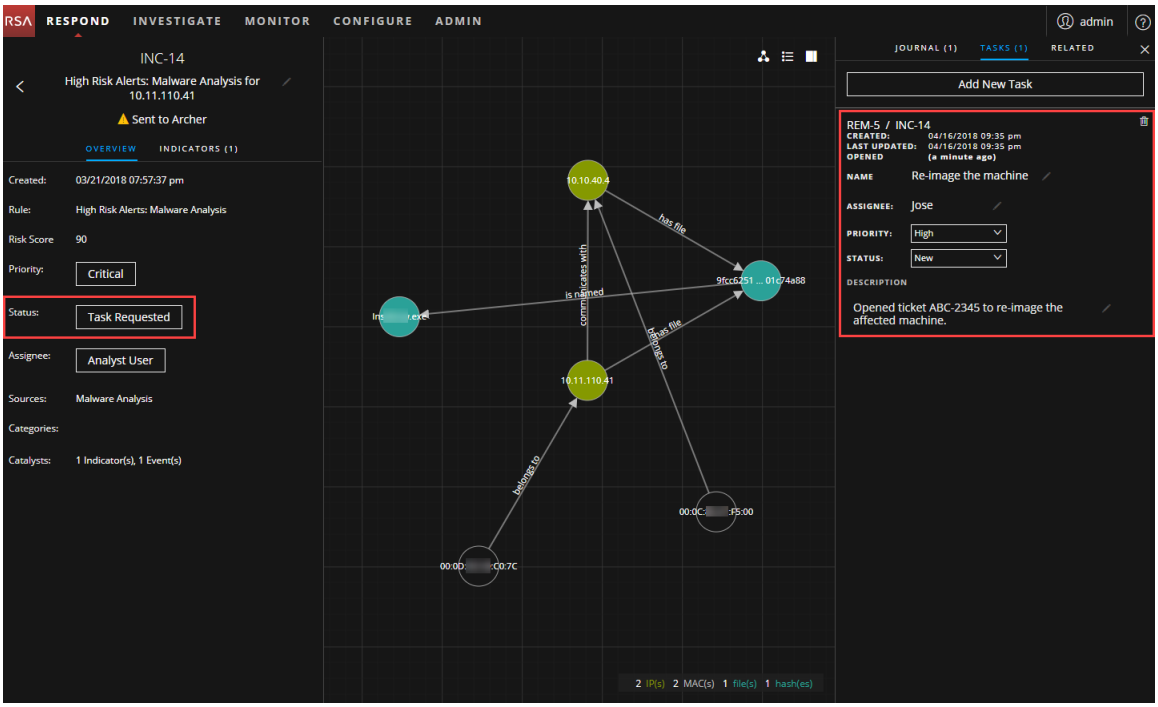


5. In the Tasks panel, click **Add New Task**.
   You can see the new task fields.

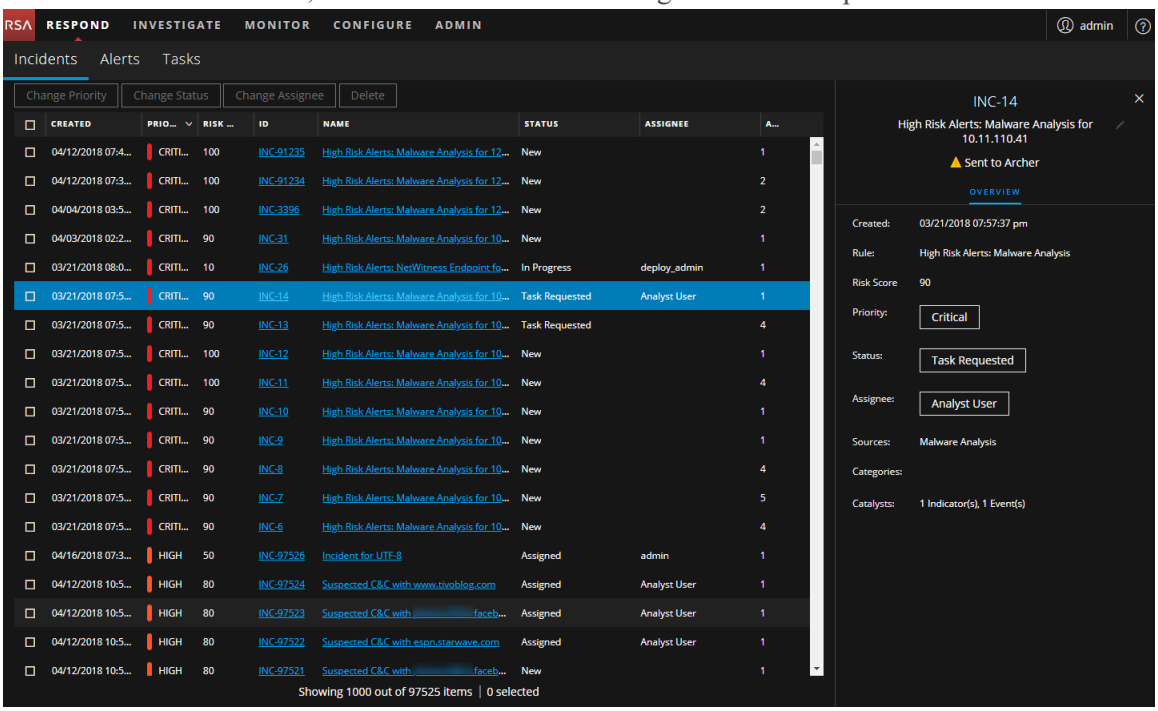


If the incident is in a closed state (Closed or Closed - False Positive), the Add New Task button is disabled.

6. Provide the following information:
   - **Name** - Name of the task. For example: Re-image the machine.
   - **Description** - (Optional) Type information that describes the task. You may want to include any applicable reference numbers.
   - **Assignee** - (Optional) Type the username of the user to whom the task is to be assigned.
   - **Priority** - Click the priority button and select a priority for the tasks from the drop-down list: Low, Medium, High, or Critical.
7. Click **Save**.
   You can see a confirmation that your change was successful. The incident status changes to **Task Requested**. The task appears in the Tasks panel for this incident.



In the Incidents List view, the incident status also changes to Task Requested.



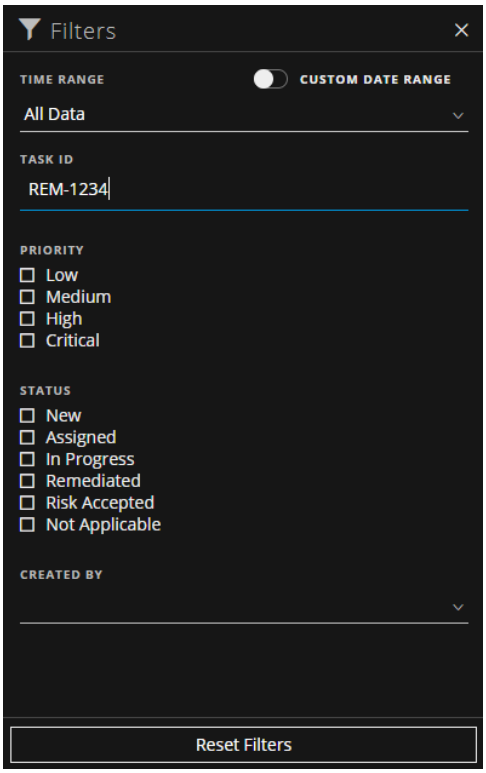
The task also appears in the Tasks list (RESPOND > Tasks), which shows a list of all incident tasks.

Note: If you do not see the status change, you may need to refresh your internet browser.

Find a Task

If you know the Task ID, you can quickly locate a task using the Filter. For example, you may want to locate a specific task out of thousands of tasks.

1. Go to **RESPOND > Tasks**.
   The Filters panel appears to the left of the Tasks list. If you do not see the Filters panel, in the Tasks List view toolbar, click , which opens the Filters panel.



2. In the **TASK ID** field, type the Task ID for a task that you would like to locate, for example REM-1234.
   The specified task appears in your task list. If you do not see any results, try resetting your filters.

Modify a Task

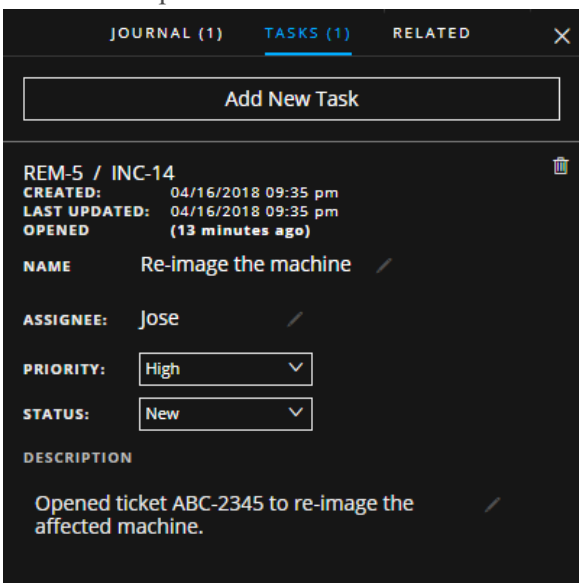
You can modify a task from within an incident and from the Tasks list. For example, you may want to show the status of the task as In Progress and add some additional information to the task. If the task is in a closed state (Not Applicable, Risk Accepted, or Remediated), you cannot modify the Priority or Assignee.

To modify a Task from within an incident:

1. Go to **RESPOND > Incidents**.
   The Incidents List view displays a list of all incidents.
2. Locate the incident that needs a task update and click the link in the **ID** or **NAME** field.

The Incident Details view opens.

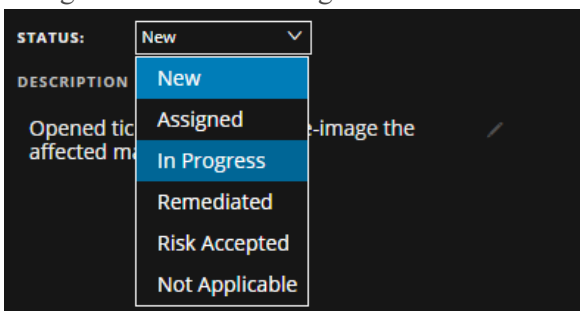
3. In the toolbar at the top right of the view, select  .
   The Journal panel opens.
4. Click the **TASKS** tab.
5. In the Tasks panel, a pencil icon indicates a text field that you can change. A button indicates that there is a drop-down list to make a selection.



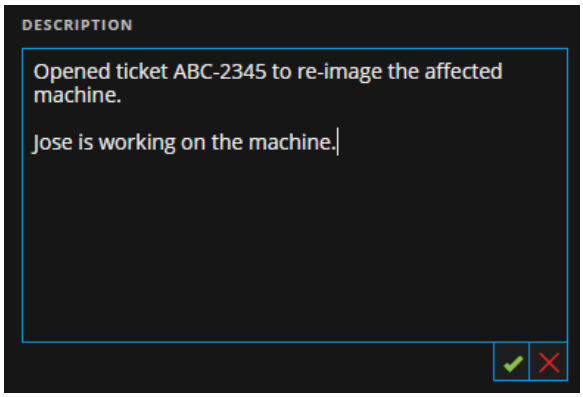
6. You can modify any of the following fields:
   - **NAME** - Click the current task name to open a text editor.

     Click the check mark to confirm the change. For example, you can change "Re-image the machine" to "Re-image the machine ASAP."
   - **ASSIGNEE** - Click (Unassigned) or the name of the previous assignee to open a text editor. Type the username of the user to whom the task is to be assigned.
     Click the check mark to confirm the change.
   - **PRIORITY** - Click the Priority button and select a priority for the task from the drop-down list: Low, Medium, High, or Critical.
   - **STATUS** - Click the Status button and select a status for the task from the drop-down list: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. For example, you can

change the status to In Progress.



- **DESCRIPTION** - Click the text underneath the description to open a text editor.

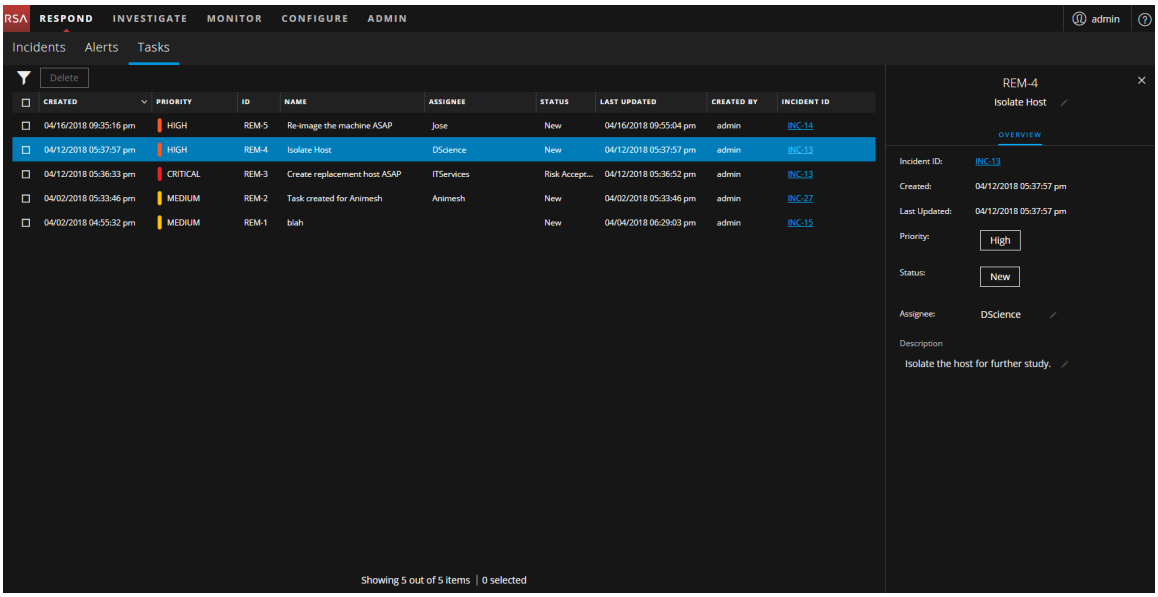


Modify the text and click the check mark to confirm the change.

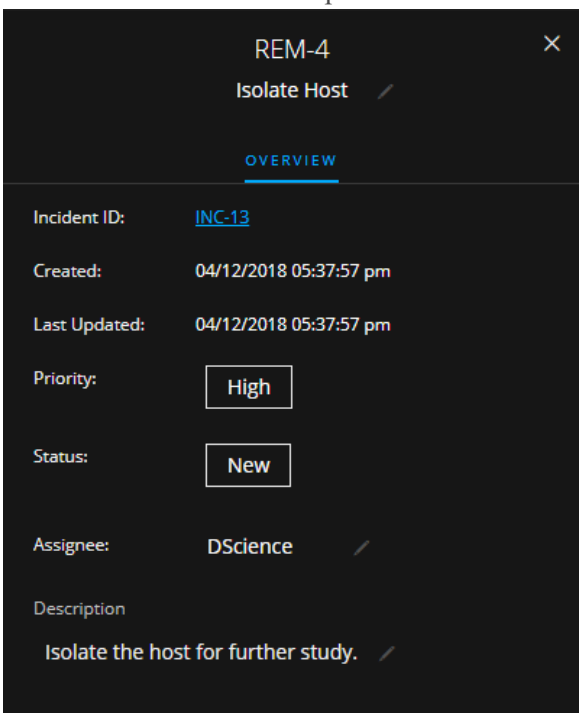
For each change that you make, you can see a confirmation that your change was successful.

To modify a Task from the Tasks list:

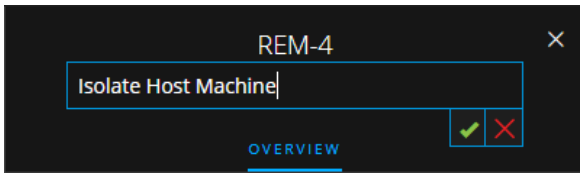
1. Go to **RESPOND > Tasks**.
   The Tasks List view displays a list of all incident tasks.
2. In the Tasks list, click the task that you want to update.
   The Task Overview panel appears to the right of the tasks list.



In the Task Overview panel, a pencil icon indicates a text field that you can change. A button indicates that there is a drop-down list to make a selection.

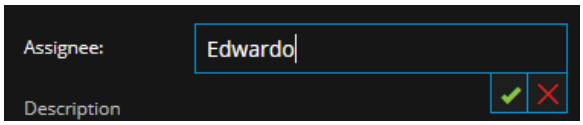


3. You can modify any of the following fields:
   - **<Task Name>** - At the top of the Task Overview panel, below the Task ID, click the current task name to open a text editor.



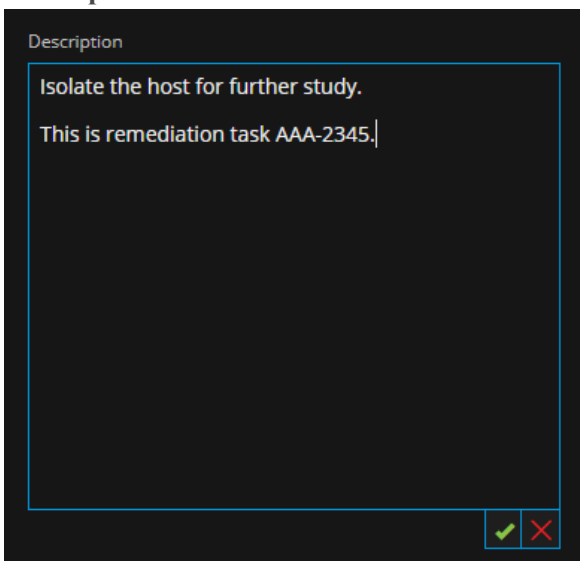
Click the check mark to confirm the change. For example, you can change Isolate Host to Isolate Host Machine.

- **Priority** - Click the Priority button and select a priority for the task from the drop-down list: Low, Medium, High, or Critical.
- **Status** - Click the Status button and select a status for the task from the drop-down list: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
- **Assignee** - Click (Unassigned) or the name of the previous assignee to open a text editor. Type the username of the user to whom the task is to be assigned.



Click the check mark to confirm the change.

- **Description** - Click the text underneath the description to open a text editor.



Modify the text and click the check mark to confirm the change.

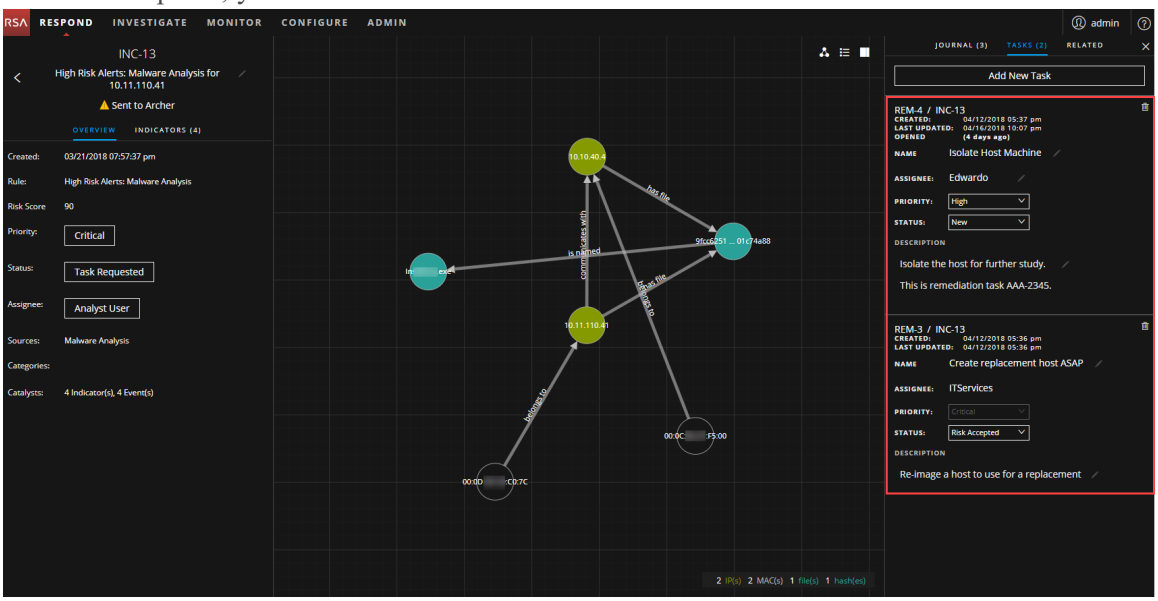
For each change that you make, you can see a confirmation that your change was successful.

Delete a Task

You can delete a task, if, for example, you created it in error or you find that it is not needed. You can delete a task from within an incident and also from the Tasks List view. In the Tasks List view, you can delete multiple tasks at the same time.

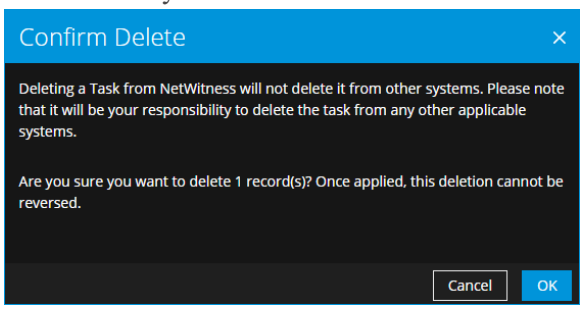
To Delete a Task from within an incident:

1. Go to **RESPOND > Incidents**.
   The Incidents List view displays a list of all incidents.
2. Locate the incident that needs a task update and click the link in the **ID** or **NAME** field.
   The Incident Details view opens.
3. In the toolbar at the top right of the view, select  .
   The Journal panel opens.
4. Click the **TASKS** tab.
5. In the Tasks panel, you can see the tasks created for the incident.



6. Click  to the right of the task that you want to delete.

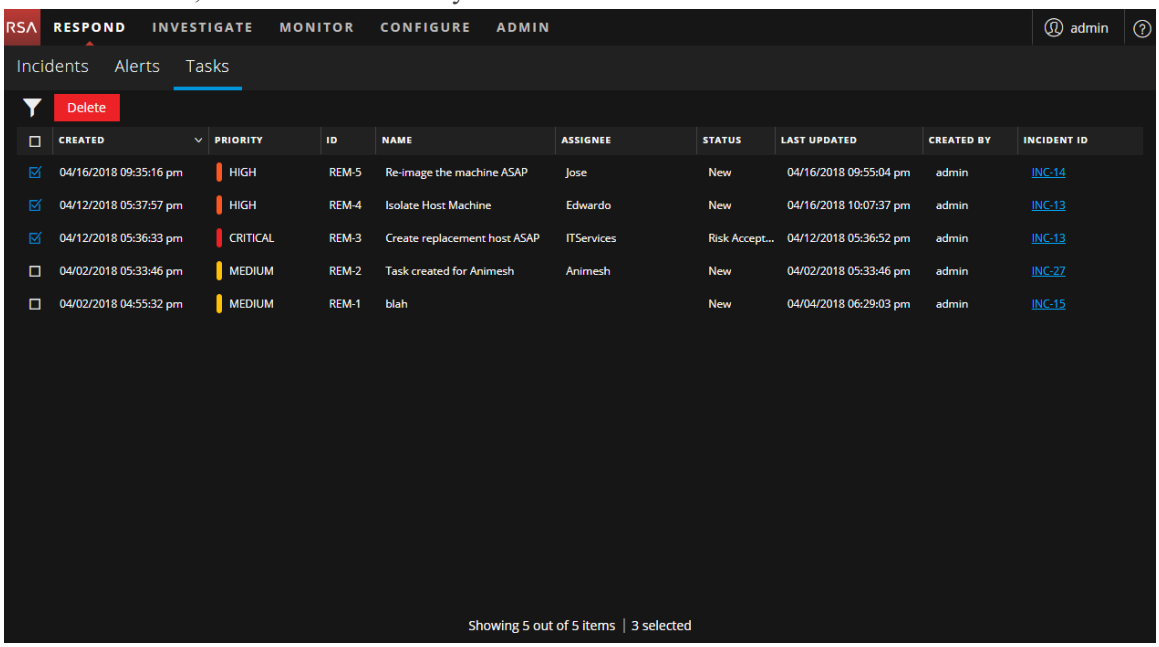
7. Confirm that you want to delete the task and click **OK**.



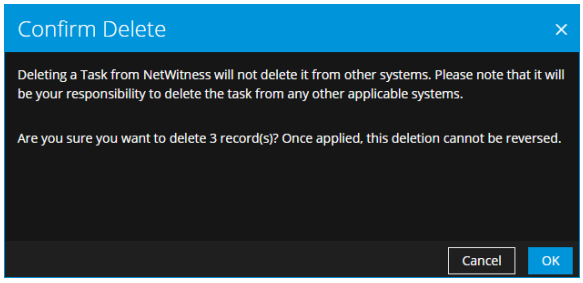
The task is deleted from NetWitness Platform. Deleting tasks from NetWitness Platform does not delete them from other systems.

To Delete Tasks from the Tasks List:

1. Go to **RESPOND > Tasks**.
   The Tasks List view displays a list of all incident tasks.
2. In the Tasks list, select the tasks that you want to delete and click **Delete**.



3. Confirm that you want to delete the tasks and click **OK**.



The tasks are deleted from NetWitness Platform. Deleting tasks from NetWitness Platform does not delete them from other systems.

Close an Incident

When you have arrived at a solution after investigating an incident and remediating it, you close the incident.

1. Go to **RESPOND > Incidents**.
2. In the Incident List view, select the incident that you want to close and click **Change Status**.
3. Select **Closed** from the drop-down list.
   You can see a successful change notification. The incident is now closed. You cannot change the priority or assignee of a closed incident.

Note: You can also close an incident in the Overview panel. You can close multiple incidents at the same time in the Incident List view. Change Incident Status provides additional details.

Reviewing Alerts

NetWitness Platform enables you to view a consolidated list of threat alerts generated from multiple sources in one location. You can find these alerts in the RESPOND > Alerts view. The source of the alerts can be ESA correlation rules, ESA Analytics, NetWitness Endpoint, Malware Analysis, Reporting Engine, as well as many others. You can see the original source of the alerts, the alert severity, and additional alert details.

Note: ESA correlation rule alerts can ONLY be found in the RESPOND > Alerts view.

To better manage a large number of alerts, you have the ability to filter the alerts list based on criteria that you specify, such as severity, time range, and alert source. For example, you may want to filter the alerts to only show those alerts with a severity between 90 and 100 that are not already part of an incident. You can then select a group of alerts to create an incident or add to an existing incident.

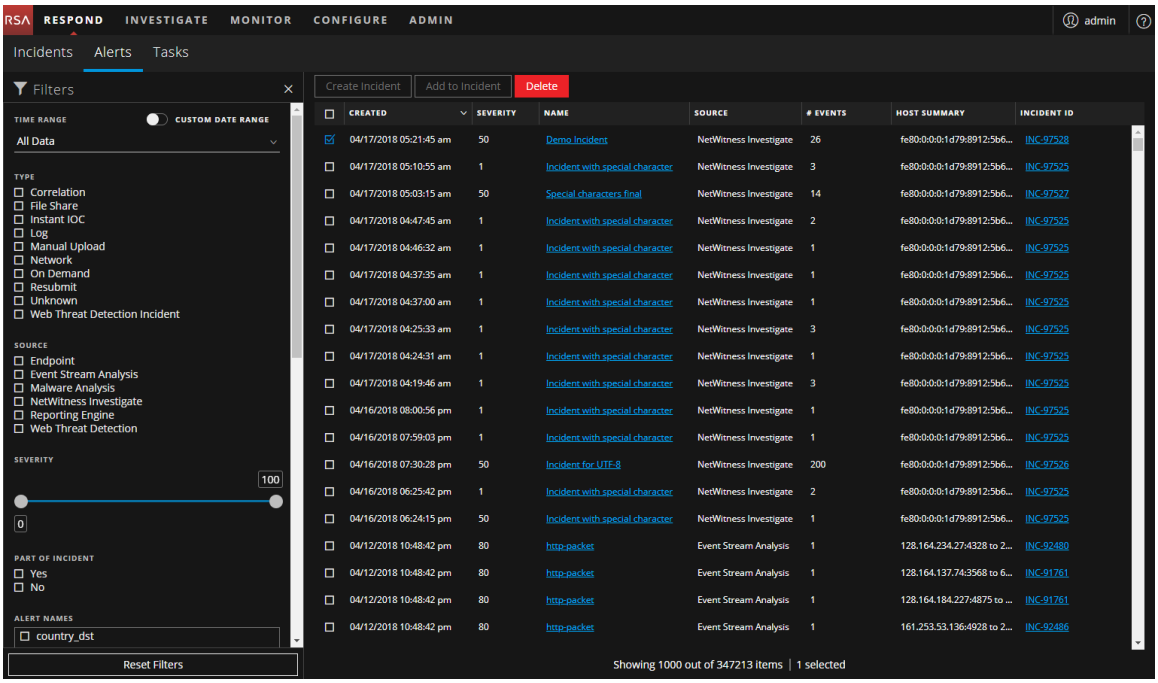
You can perform the following procedures to review and manage alerts:

- View Alerts
- Filter the Alerts List
- Remove My Filters from the Alerts List
- View Alert Summary Information
- View Event Details for an Alert
- Investigate Events
- Create an Incident Manually
- Add Alerts to an Incident
- Delete Alerts

View Alerts

In the Alerts List view, you can browse through various alerts from multiple sources, filter them, and group them to create incidents. This procedure shows you how to access the alerts list.

1. Go to **RESPOND > Alerts**.
   The Alerts List view displays a list of all NetWitness Platform alerts.



2. Scroll through the alerts list, which shows basic information about each alert as described in the following table.

Column	Description
CREATED	Displays the date and time when the alert was recorded in the source system.
SEVERITY	Displays the level of severity of the alert. The values are from 1 through 100.
NAME	Displays a basic description of the alert.
SOURCE	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, Event Stream Analysis (ESA Correlation Rules), ESA Analytics, Reporting Engine, Web Threat Detection, and many others.
# EVENTS	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.
HOST SUMMARY	Displays details of the host like the host name from where the alert was triggered. The details may include information about the source and destination hosts in an Alert. Some alerts may describe events across more than one host .

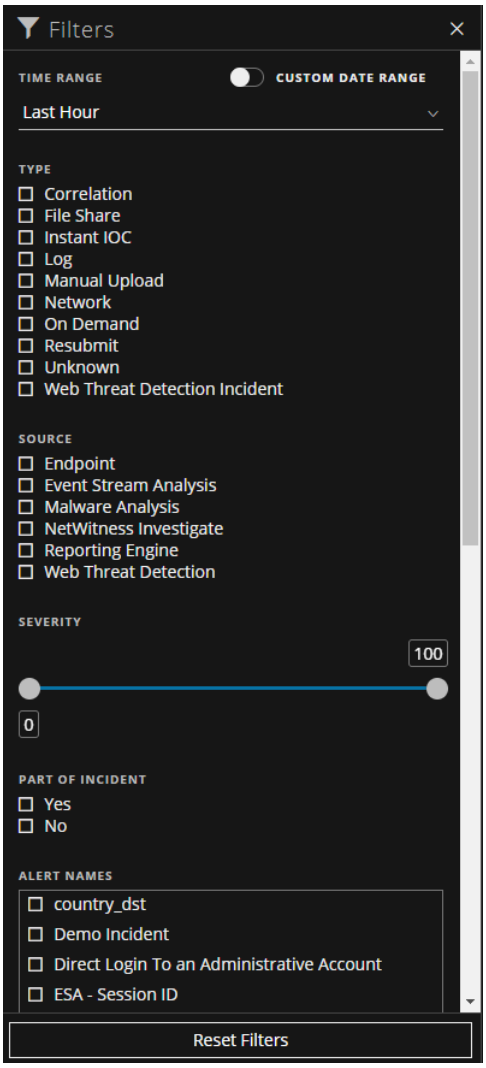
Column	Description
INCIDENT ID	Shows the Incident ID of the alert. If there is no incident ID, the alert does not belong to any incident and you can create an incident to include this alert or the alert can be added to an existing incident.

At the bottom of the list, you can see the number of alerts on the current page and the total number of alerts. For example: **Showing 377 out of 377 items**

Filter the Alerts List

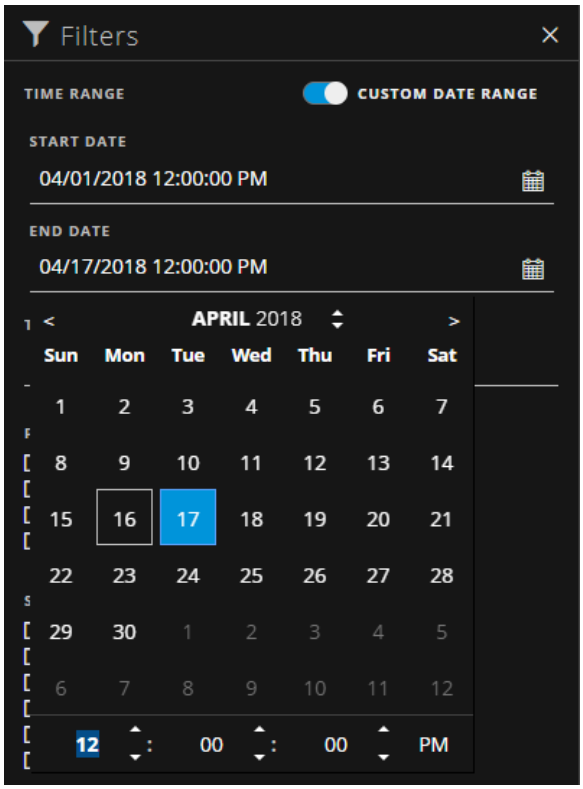
The number of alerts in the Alerts List can be very large, making it difficult to locate particular alerts. The Filter enables you to view the alerts you want to see, for example, alerts from a particular source, alerts of a particular severity, alerts that are not part of an incident, and so on.

1. Go to **RESPOND > Alerts**.
   The Filters panel appears to the left of the Alerts list. If you do not see the Filters panel, in the Alerts List view toolbar, click  , which opens the Filters panel.



2. In the Filters panel, select one or more options to filter the alerts list:
   - **TIME RANGE**: You can select a specific time period from the Time Range drop-down list. The time range is based on the date that the alerts were received. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes.
   - **CUSTOM DATE RANGE**: You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of CUSTOM DATE RANGE to view the

Start Date and End Date fields. Select the dates and times from the calendar.



- **TYPE**: Select the type of events in the alert to view, for example, logs, network sessions, and so on.
- **SOURCE**: Select one or more sources to view alerts triggered by the selected sources. For example, to view NetWitness Endpoint alerts only, select Endpoint as the source.
- **SEVERITY**: Select the the level of severity of the alerts to view. The values are from 1 through 100. For example, to concentrate on the highest severity alerts first, you may want to view only those alerts with a severity from 90 to 100.
- **PART OF INCIDENT**: To view only alerts that are not part of an incident, select **No**. To view only alerts that are part of an incident, select **Yes**. For example, when you are ready to create an incident from a group of alerts, you can select No to view only those alerts that are not currently part of an incident.
- **ALERT NAMES**: Select the name of the alert to view. You can use this filter to search for all alerts generated by a specific rule or source, for example, Malicious IP - Reporting Engine.

The Alerts List shows a list of alerts that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the alerts list.
For example: **Showing 30 out of 30 items**

3. If you want to close the Filters panel, click **X**. Your filters remain in place until you remove them.

Remove My Filters from the Alerts List

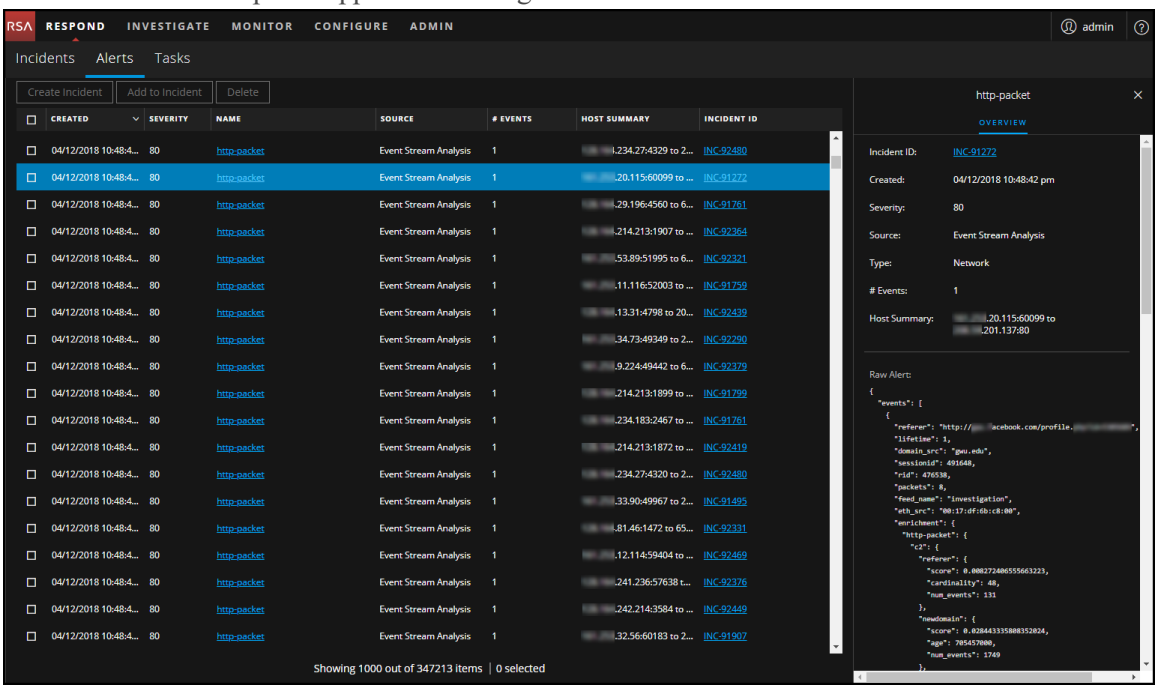
NetWitness Platform remembers your filter selections in the Alerts List view. You can remove your filter selections when you no longer need them. For example, if you are not seeing the number of alerts that you expect to see or you want to view all of the alerts in your alerts list, you can reset your filters.

1. Go to **RESPOND > Alerts**.
   The Filters panel appears to the left of the alerts list. If you do not see the Filters panel, in the Alerts List view toolbar, click , which opens the Filters panel.
2. At the bottom of the Filters panel, click **Reset Filters**.

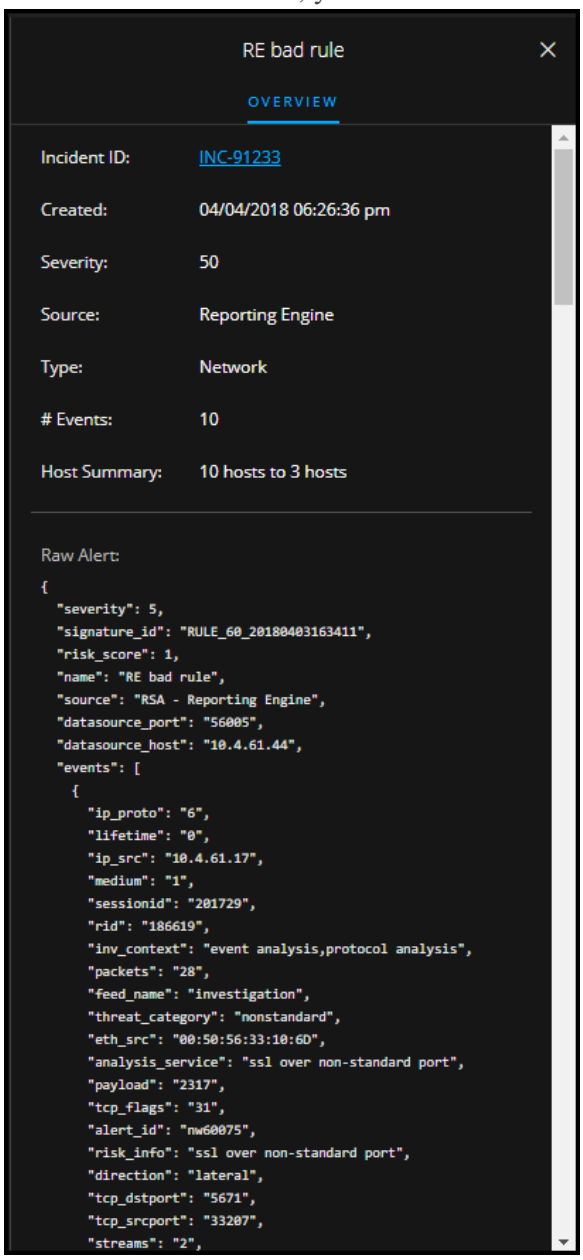
View Alert Summary Information

In addition to viewing basic information about an alert, you can also view raw alert metadata in the Overview panel.

1. In the Alerts list, click the alert that you want to view.
   The Alert Overview panel appears to the right of the Alerts list.

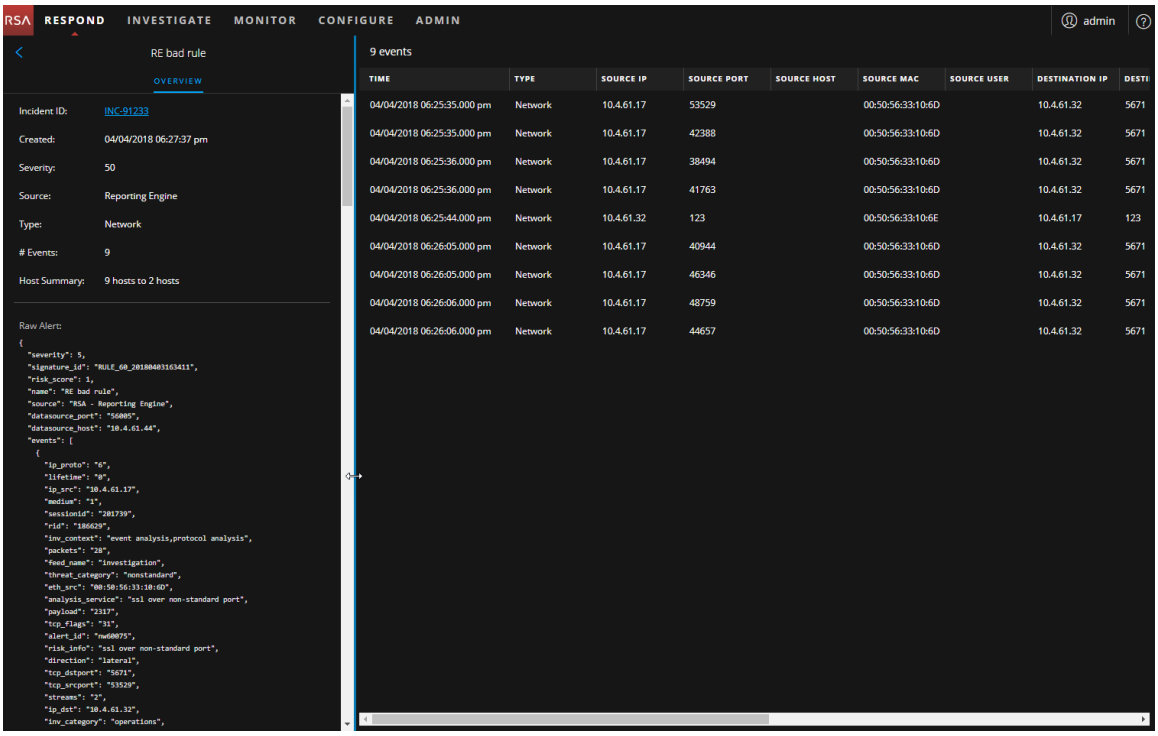


2. In the Raw Alert section, you can scroll to view the raw alert metadata.



View Event Details for an Alert

After you review the general information about the alert in the Alerts List view, you can go to the Alert Details view for more detailed information to determine the action required. An alert contains one or more events. In the Alert Details view, you can drill down into an alert to get additional event details and further investigate the alert. The following figure shows an example of the Alert Details view.



The Overview panel on the left has the same information for an alert as the Overview panel in the Alerts List view.

The Events panel on the right shows information about the events in the alert, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

There are two types of events:

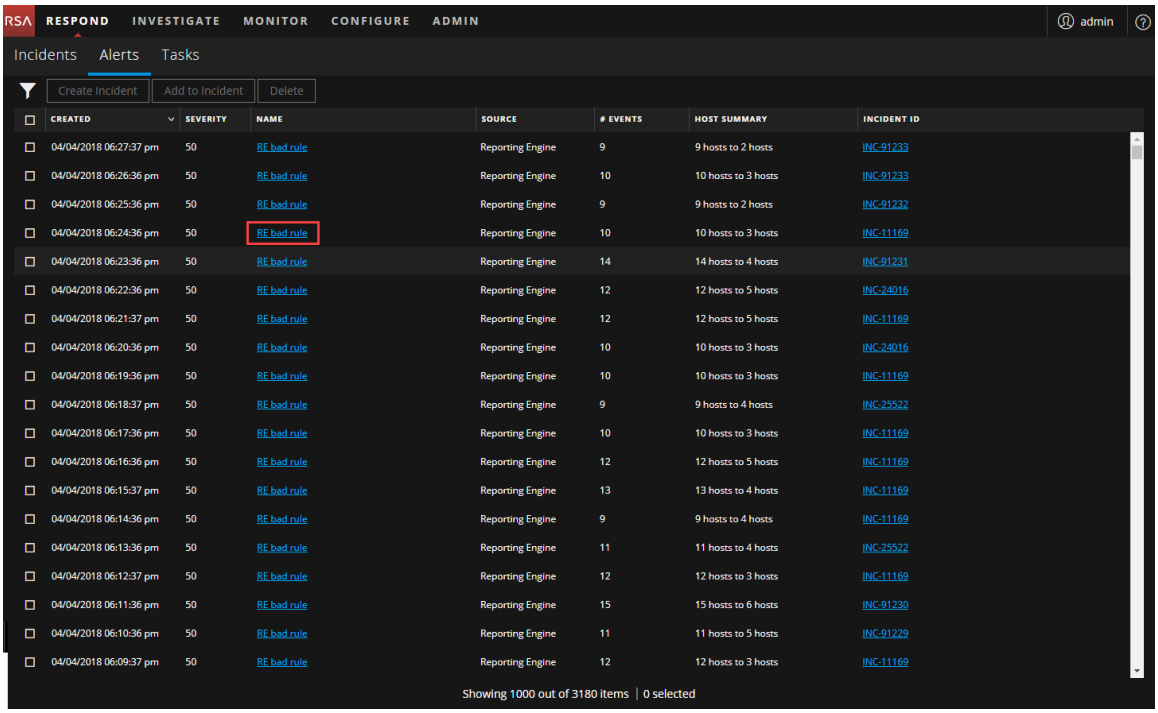
- A transaction between two machines (a Source and a Destination)
- An anomaly detected on a single machine (a Detector)

Some events will only have a Detector. For example, NetWitness Endpoint finds malware on your machine. Other events will have a Source and Destination. For example, packet data shows communication between your machine and a Command and Control (C2) domain.

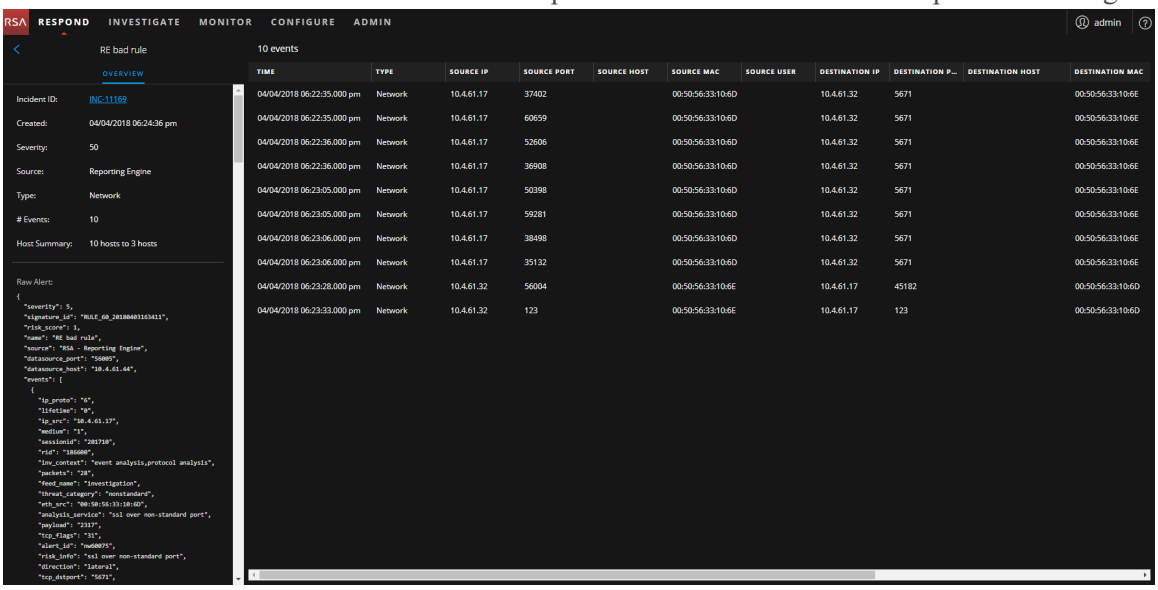
You can drill further into an event to get detailed data about the event.

To View the Event Details for an Alert:

1. To view event details for an alert, in the Alerts List view, choose an alert to view and then click the link in the **NAME** column for that alert.



The Alerts Details view shows the Overview panel on the left and the Events panel on the right.



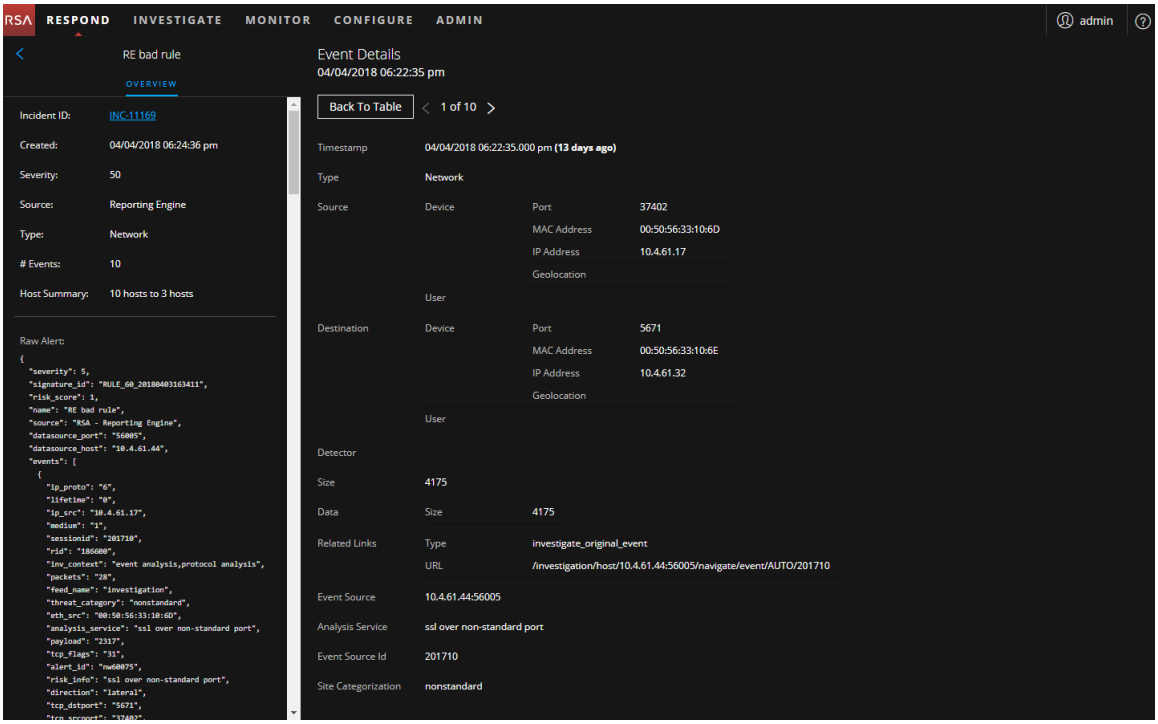
The Events panel shows a list of events with information about each event. The following table shows some of the columns that can appear in the Events List (Events Table).

Column	Description
TIME	Shows the time the event occurred.
TYPE	Shows the type of alert, such as Log and Network.

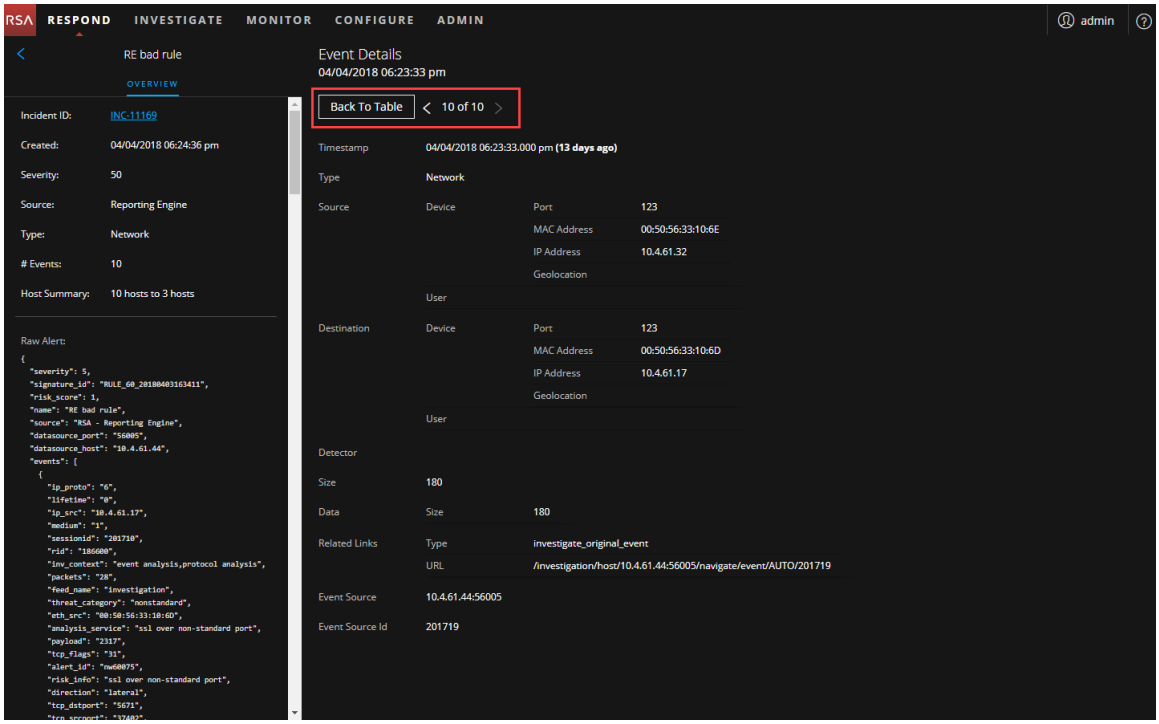
Column	Description
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
DESTINATION IP	Shows the destination IP address if there was a transaction between two machines
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected.
SOURCE USER	Shows the user of the source machine.
DESTINATION USER	Shows the user of the destination machine.
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.

If there is only one event in the list, you see only the event details for that event instead of a list.

2. Click an event in the Events list to view the Event details.
   This example shows the event details for the first event in the list.



3. Use the page navigation to the right of the Back To Table button to view other events. This example shows the event details for the last event in the list.



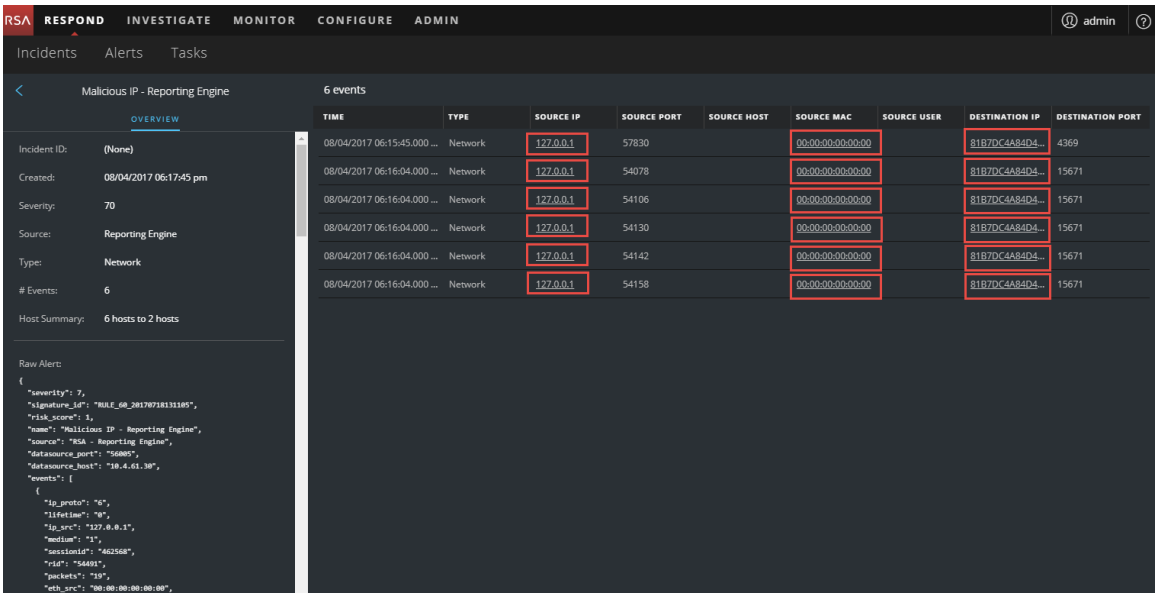
See Alert Details View for detailed information about the event data listed in the Alert Details panel.

Investigate Events

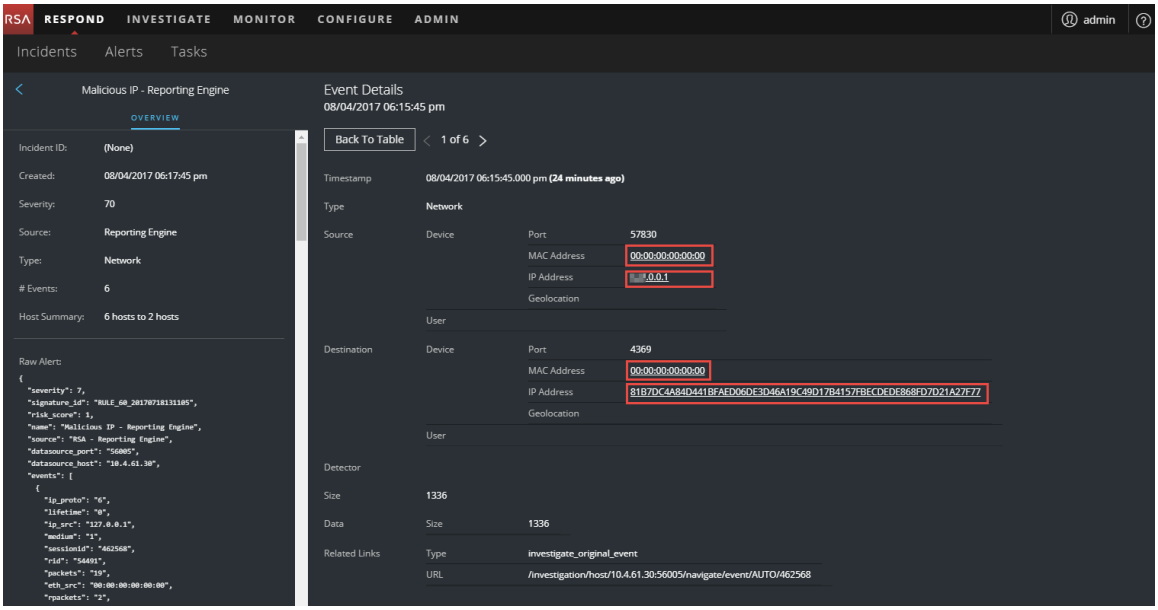
To further investigate the events, you can find links that take you to additional contextual information. From there, you have options available depending on your selection.

View Contextual Information

In the Alert Details view, you can see underlined entities in the Events panel. An underlined entity is considered an entity in the Context Hub and has additional contextual information available. The following figure shows underlined entities in the Events list.



The following figure shows underlined entities in the Events Details.



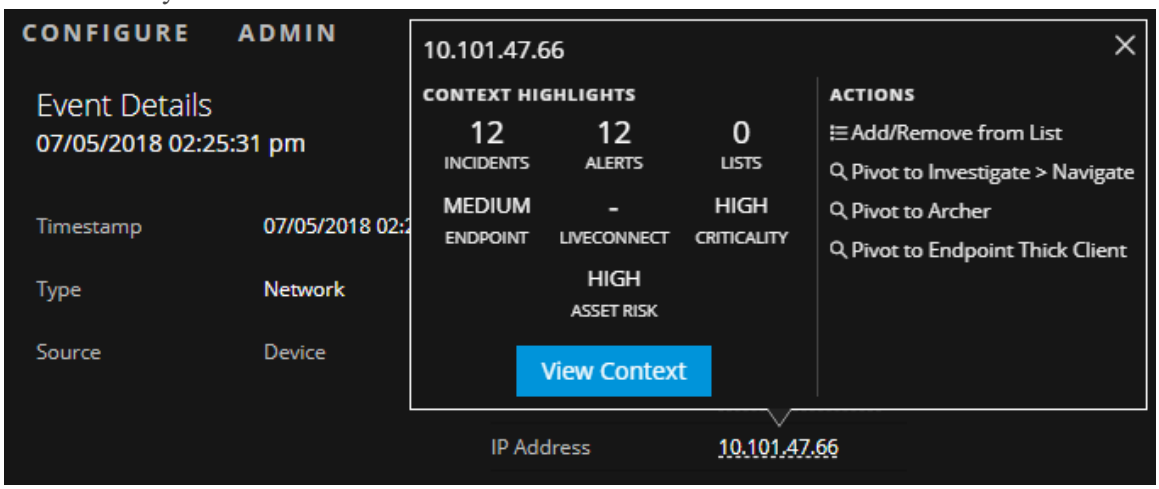
The Context Hub is preconfigured with meta fields mapped to the entities. NetWitness Respond and NetWitness Investigate use these default mappings for context lookup. For information about adding meta keys, see "Configure Settings for a Data Source" in the *Context Hub Configuration Guide*.

Caution: For the Context Lookup to work correctly in the Respond and Investigate views, RSA recommends that when mapping meta keys in the **ADMIN > System > Investigation > Context Lookup** tab, you add only meta keys to the Meta Key Mappings, not fields in the MongoDB. For example, ip.address is a meta key and ip_address is not a meta key (it is a field in the MongoDB).

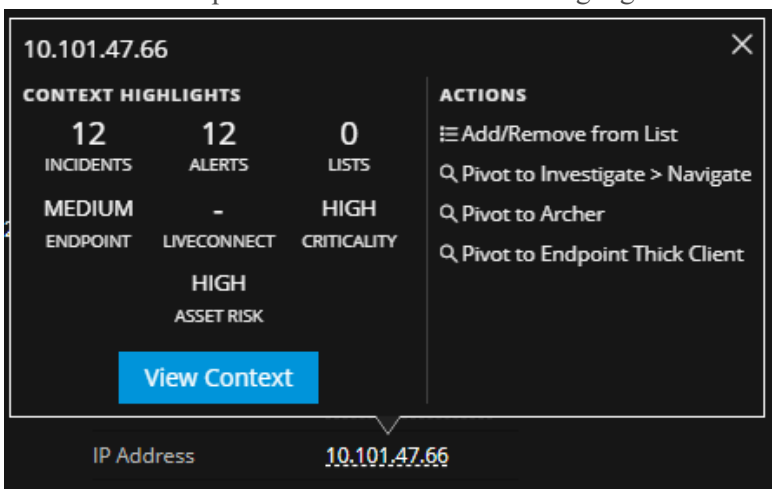
To View Contextual Information:

1. In the Alert Details view Events List or Event Details, hover over an underlined entity.
   A context tooltip appears with a quick summary of the type of context data that is available for the

selected entity.



The context tooltip has two sections: Context Highlights and Actions.



The information in the **Context Highlights** section helps you to determine the actions that you would like to take. It shows the number of related alerts and incidents. Depending on your data, you may be able to click these numbered items for more information. The above example shows 12 related incidents, 12 related alerts, Medium Endpoint, High Criticality, and a HIGH Asset Risk. There is no information from Live Connect.

The **Actions** section lists the available actions. In the above example, the Add/Remove From List, Pivot to Investigate > Navigate, Pivot to Archer, and Pivot to Endpoint Thick Client options are available.

Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the RSA Archer configuration is enabled and configured properly.

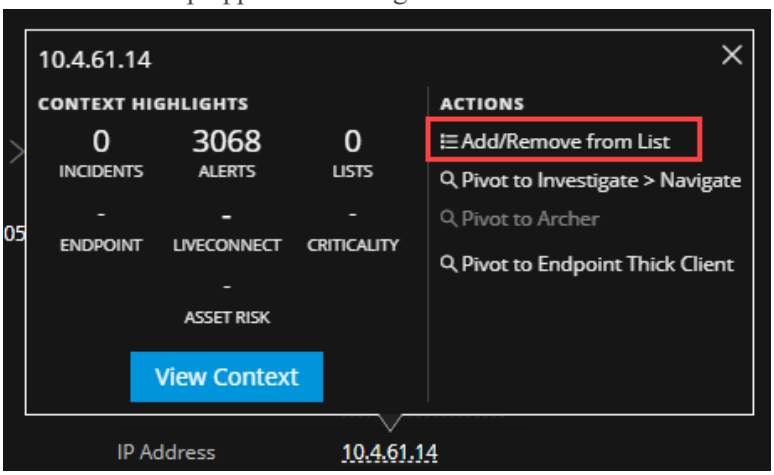
For more information, see Pivot to Investigate > Navigate, Pivot to Archer, Pivot to Endpoint Thick Client, and Add an Entity to a Whitelist.

2. To see more details about the selected entity, click the **View Context** button.
   The Context panel opens and shows all of the information related to the entity.
   Context Lookup Panel - Respond View provides additional information.

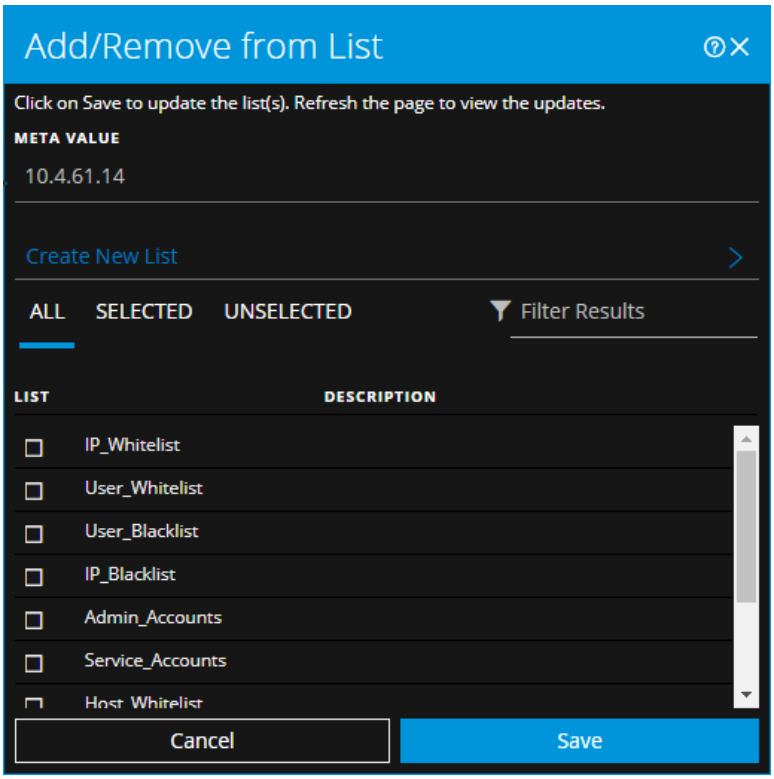
Add an Entity to a Whitelist

You can add any underlined entity to a list, such as a Whitelist or Blacklist, from a context tooltip. For example, to reduce false positives, you may want to whitelist an underlined domain to exclude it from the related entities.

1. In the Alert Details view Events List or Event Details, hover over the underlined entity that you would like to add to a Context Hub list.
   A context tooltip appears showing the available actions.



2. In the **Actions** section of the tooltip, click **Add/Remove from List**.
   The Add/Remove From List dialog shows the available lists.



3. Select one or more lists and click **Save**.
   The entity appears on the selected lists.
   Add/Remove from List Dialog provides additional information.

Create a Whitelist

You can create a whitelist in the Context Hub in the same way as you would create it in the Incident Details view, see Create a List.

Pivot to Investigate > Navigate

For a more thorough investigation of the incident, you can access the Investigate Navigate view.

1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.
2. In the **ACTIONS** section of the tooltip, select **Pivot to Investigate > Navigate**.
   The Investigate Navigate view opens, which enables you to perform a deeper dive investigation.

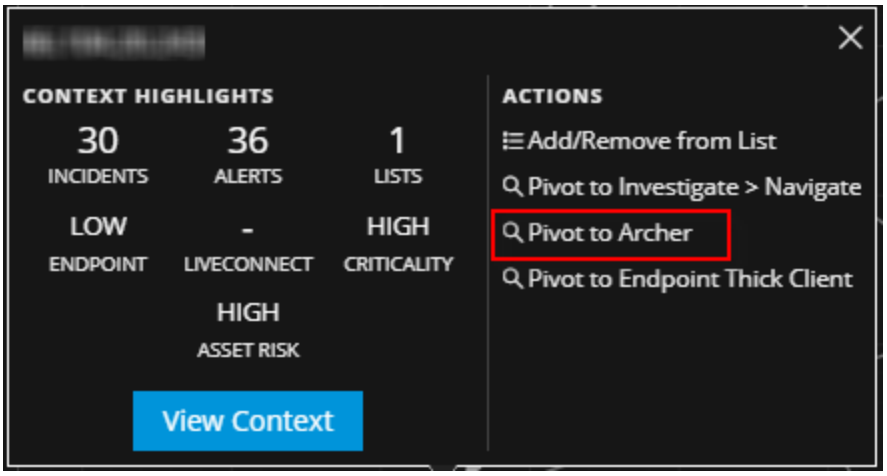
For more information, see the *NetWitness Investigate User Guide*.

Pivot to Archer

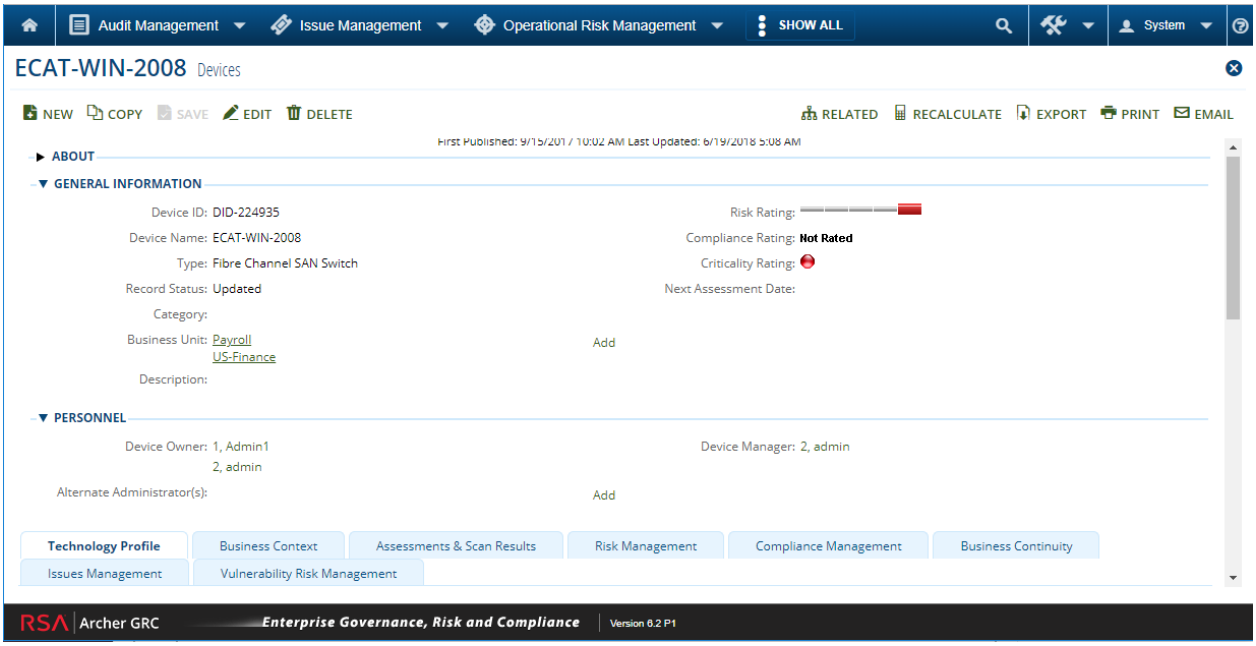
For viewing more details about a device in RSA Archer Cyber Incident & Breach Response, you can pivot to the device details page. This information is displayed only for IP address, host, and Mac address.

1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.

2. In the **ACTIONS** section, select **Pivot to Archer**.



3. The device details page in **RSA Archer Cyber Incident & Breach Response** opens if you are logged in to the application, otherwise the login screen is displayed.



Note: The Pivot to Archer link is disabled when Archer data is not available or when the Archer Datasource is not responding. Check that the RSA Archer configuration is enabled and configured properly.

For more information, see the *RSA Archer Integration Guide*.

Pivot to Endpoint Thick Client

If you have the NetWitness Endpoint thick client application installed, you can launch it through the context tooltip. From there, you can further investigate a suspicious IP address, Host, or MAC address.

1. In the Events List or Event Details in the Alert Details view, hover over any underlined entity to access a context tooltip.

2. In the **ACTIONS** section of the tooltip, select **Pivot to Endpoint Thick Client**.
   The NetWitness Endpoint thick client application opens outside of your web browser.

For more information on the thick client, see the *NetWitness Endpoint User Guide*.

Create an Incident Manually

You can create incidents manually from alerts in the Alerts List view. The alerts that you select cannot be part of another incident.

In version 11.2 and later, you can change the assignee, category, and priority when you create an incident manually from alerts.

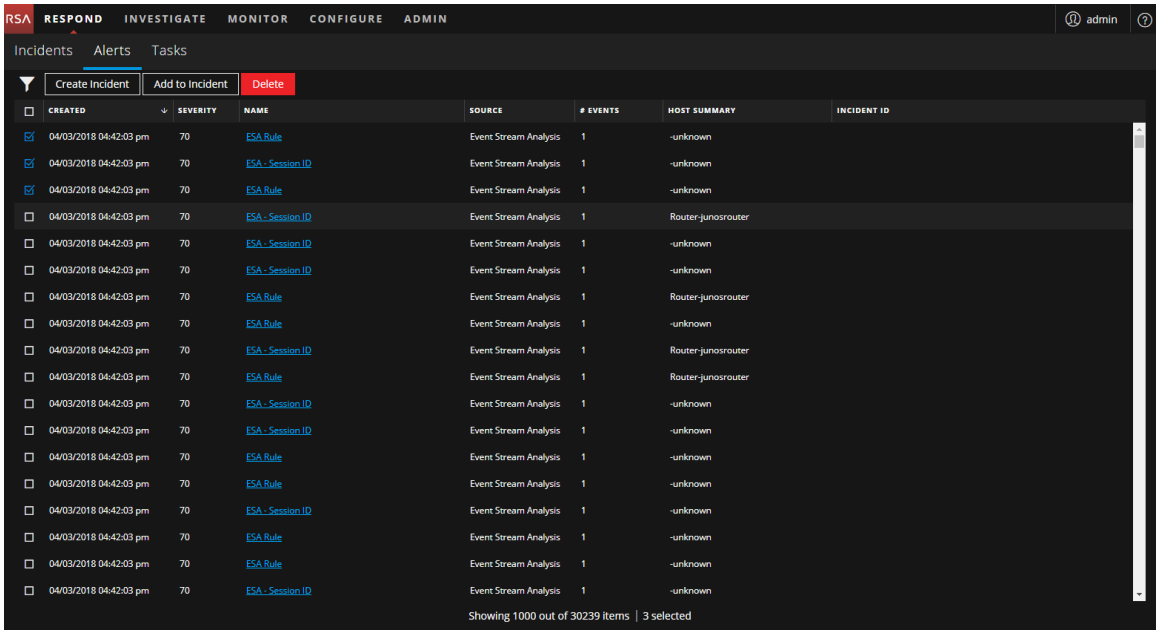
In version 11.1, incidents created manually from alerts default to Low priority, but you can change the priority after you create it. You cannot add categories to manually created incidents in version 11.1.

Note: Incidents can be created manually or automatically. An Alert can only be associated with one Incident. You can create incident rules to analyze the alerts collected and group them into incidents depending on which rules they match. For details, see the "Create an Incident Rule for Alerts" topic in the *NetWitness Respond Configuration Guide*.

To Create an Incident Manually:

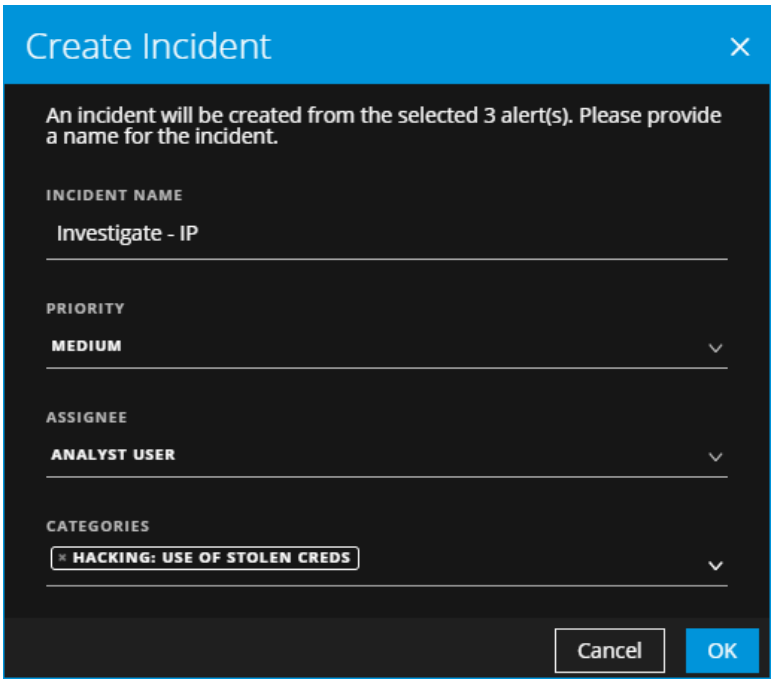
1. Go to **RESPOND > Alerts**.
2. Select one or more alerts in the Alerts List.

   Note: Selecting alerts that do not have incident IDs enable the **Create Incident** button. If the alert is already part of an incident, the button is disabled. You can filter alerts that are not part of an incident by selecting the option **PART OF INCIDENT** as **No** in the Filters panel.

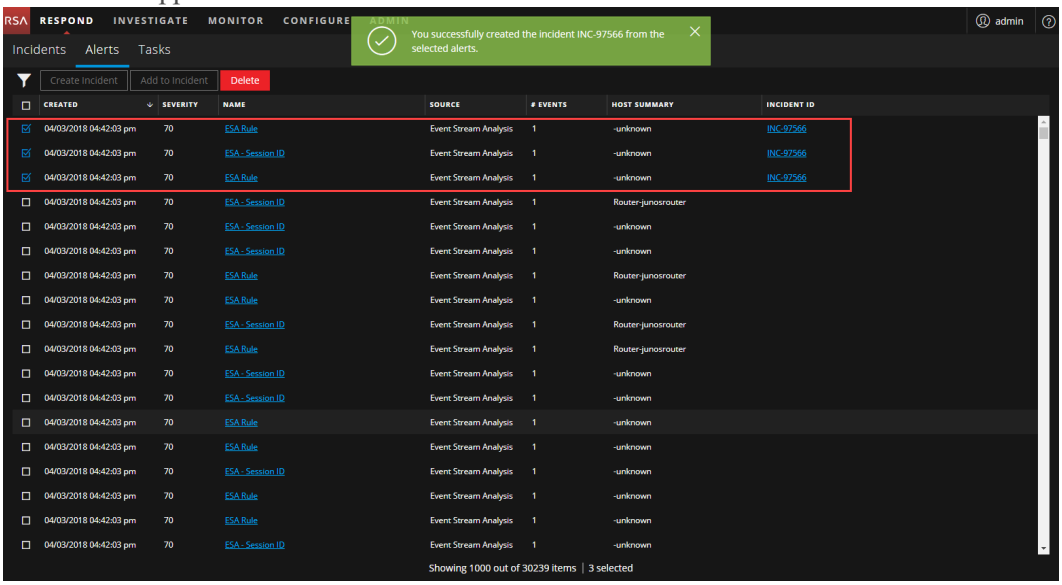


3. Click **Create Incident**.

   The **Create Incident** dialog is displayed.

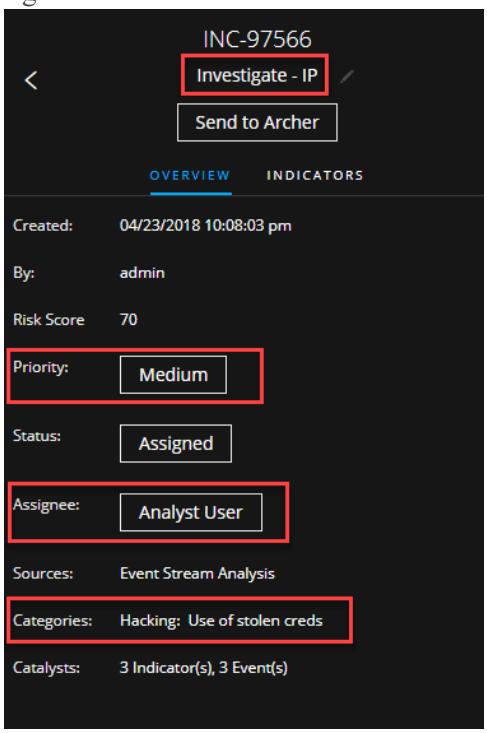


4. In the **INCIDENT NAME** field, type a name to identify the incident. For example, Investigate - IP.
5. In the **PRIORITY** field, select a priority for the incident. The priority defaults to Low.
6. (Optional) If you are ready to assign the incident, in the **ASSIGNEE** field, select a specific user.
7. (Optional) In the **CATEGORIES** field, you can select a category to classify the incident, such as Hacking: Use of Stolen Creds. This is also helpful when trying to locate the incident later using the incidents filter.
8. Click **OK**.
   You can see a confirmation message that an incident was created from the selected alerts. The new incident ID appears as a link in the INCIDENT ID column of the selected alerts.



If you click the link, it takes you to the Incident Details view for that incident, where you can update

information, such as changing Priority to high or assigning the incident to another user. The following figure shows the Incident Details view Overview panel for the new incident.



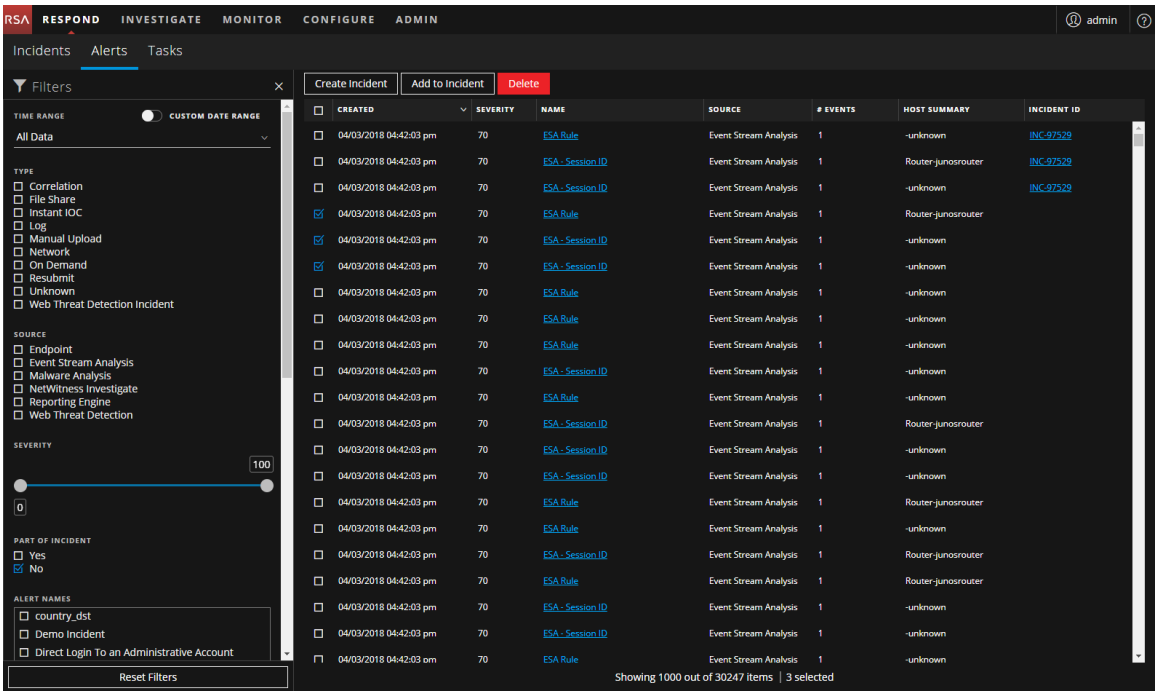
Add Alerts to an Incident

Note: This option is available in version 11.1 and later.

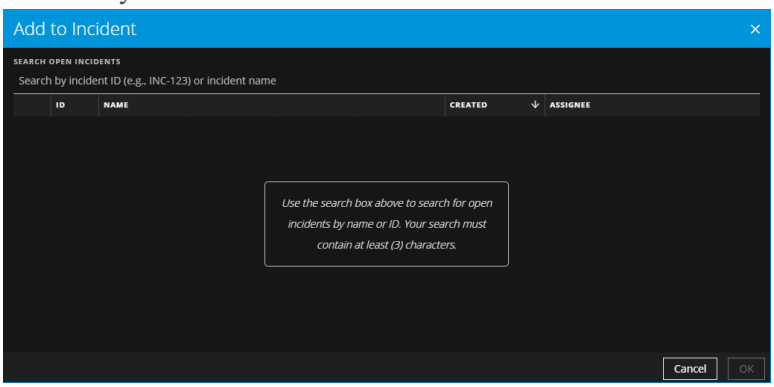
If you have alerts that fit a particular existing incident, you do not have to create a new incident. Instead, you can add alerts to that incident from the Alerts List view. The alerts that you select cannot be part of another incident.

1. Go to **RESPOND > Alerts**.
2. In the Alerts List, select one or more alerts that you want to add to an incident, and click **Add to Incident**.

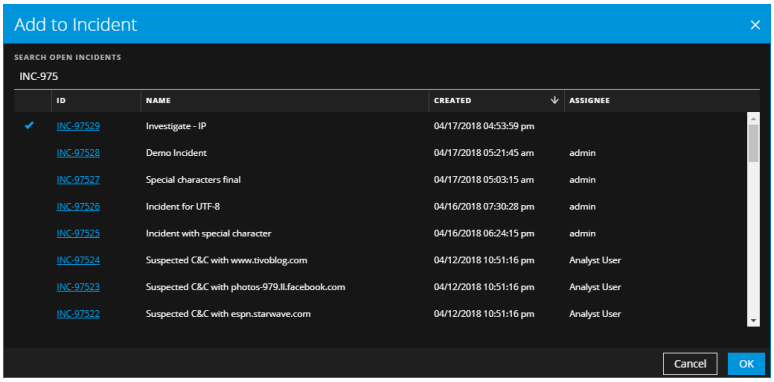
Note: Selecting alerts that do not have incident IDs enable the **Add to Incident** button. If the alert is already part of an incident, the button is disabled. You can filter alerts that are not part of an incident by selecting the option **PART OF INCIDENT** as **No** in the Filters panel.



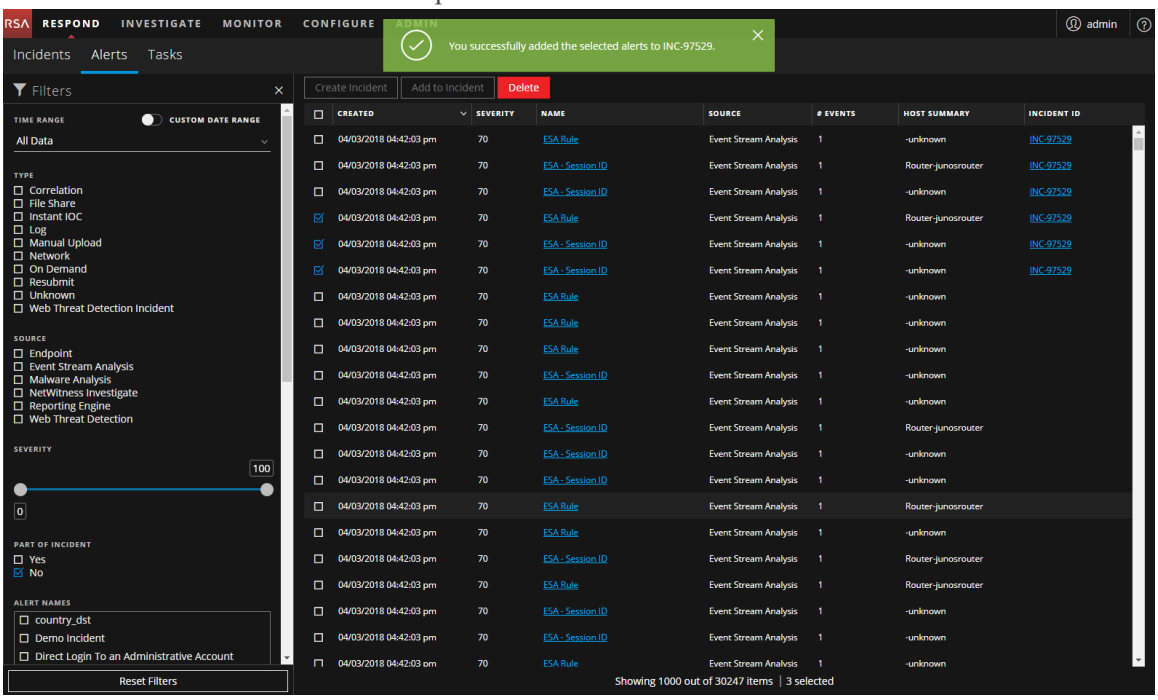
3. In the **Add to Incident** dialog, type at least three characters in the **Search** field to search for the incident by **Name** or **Incident ID**.



4. In the results list, select the incident that will receive the selected alerts and click **OK**.



The selected alert or alerts are now part of the selected incident and will have that incident ID.

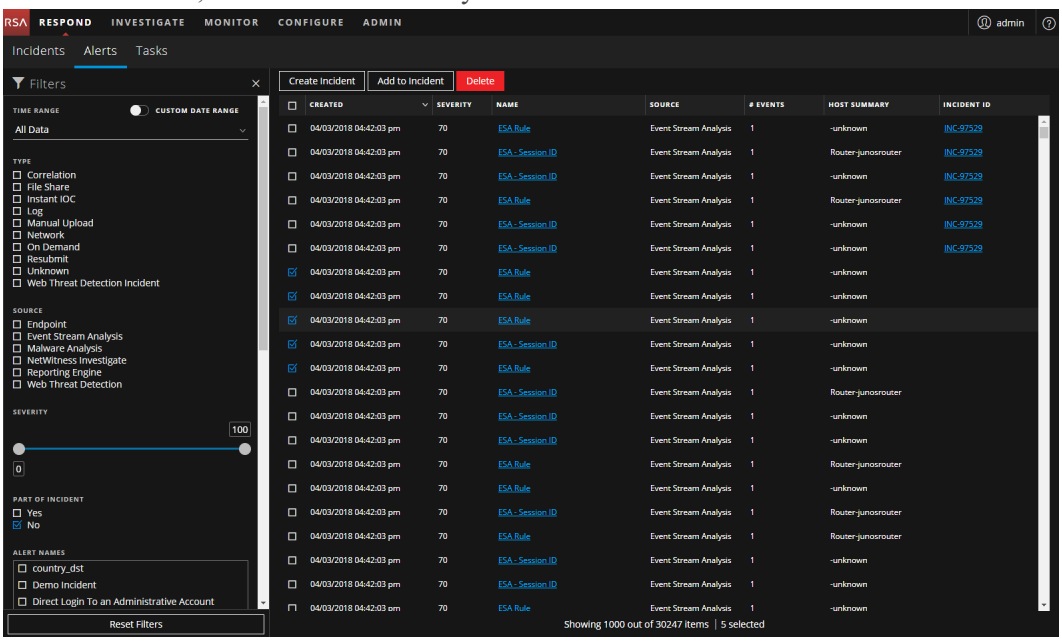


Delete Alerts

Users with the appropriate permissions, such as Administrators and Data Privacy Officers, can delete alerts. This procedure is helpful when you want to remove unnecessary or non-relevant alerts. Deleting these alerts frees up disk space.

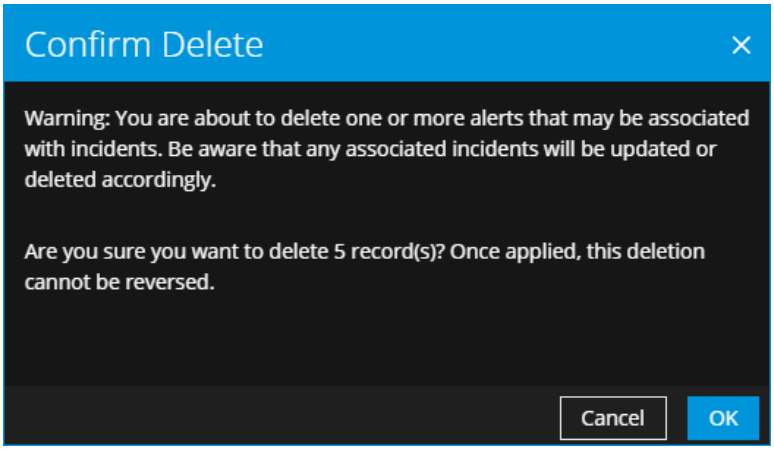
1. Go to **RESPOND > Alerts**.
   The Alerts List view displays a list of all NetWitness Platform alerts.

2. In the Alerts list, select the alerts that you want to delete and click **Delete**.



If you do not have permission to delete alerts, you will not see the Delete button.

3. Confirm that you want to delete the alerts and click **OK**.



The alerts are deleted from NetWitness Platform. If a deleted alert is the only alert in an incident, the incident is also deleted. If the deleted alert is not the only alert in an incident, the incident is updated to reflect the deletion.

NetWitness Respond Reference Information

The Respond view user interface provides access to NetWitness Respond functions. This topic contains descriptions of the user interfaces as well as other reference information to help users understand the functions of NetWitness Respond.

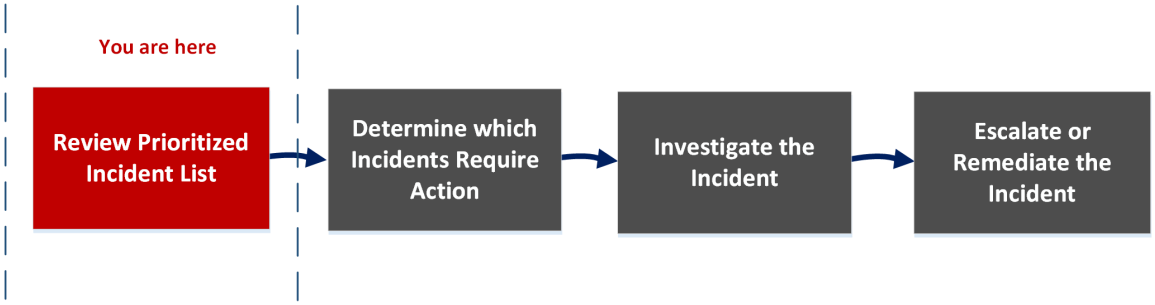
Topics

Incidents List View

The Incidents List view (RESPOND > Incidents) shows Incident Responders and other Analysts a prioritized results list of incidents created from various sources. For example, your results list could show incidents created from ESA rules, NetWitness Endpoint, or ESA Analytics modules for Automated Threat Detection, such as C2 for packets or logs. From the Incidents List view, you have easy access to the information that you need to quickly triage and manage incidents through completion.

Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness Platform.



In the Incidents List view, you can review the list of prioritized incidents, which shows basic information about each incident. You can also change the assignee, priority, and status of the incidents. Because the results can be large in the incidents list, you have the option to filter those incidents by time range, incident ID, custom date range, priority, status, assignee, and categories.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts, and SOC Manager	View prioritized incidents*	Review Prioritized Incident List
Incident Responders, Analysts, and SOC Manager	Filter and sort the incident list*	Filter the Incident List
Incident Responders, Analysts	View my incidents*	View My Incidents
Incident Responders, Analysts	Assign incidents to myself*	Assign Incidents to Myself
Incident Responders, Analysts, and SOC Manager	Find Incidents*	Find an Incident
Incident Responders, Analysts, and SOC Manager	Send an incident to Archer Cyber Incident & Breach Response or update an incident.*	Escalate or Remediate the Incident
Incident Responders, Analysts	View incident details.	Determine which Incidents Require Action
Incident Responders, Analysts	Further Investigate an incident.	Investigate the Incident
Incident Responders, Analysts, and SOC Manager	Create a task.	Escalate or Remediate the Incident

*You can complete these tasks here (that is in the Incidents List view).

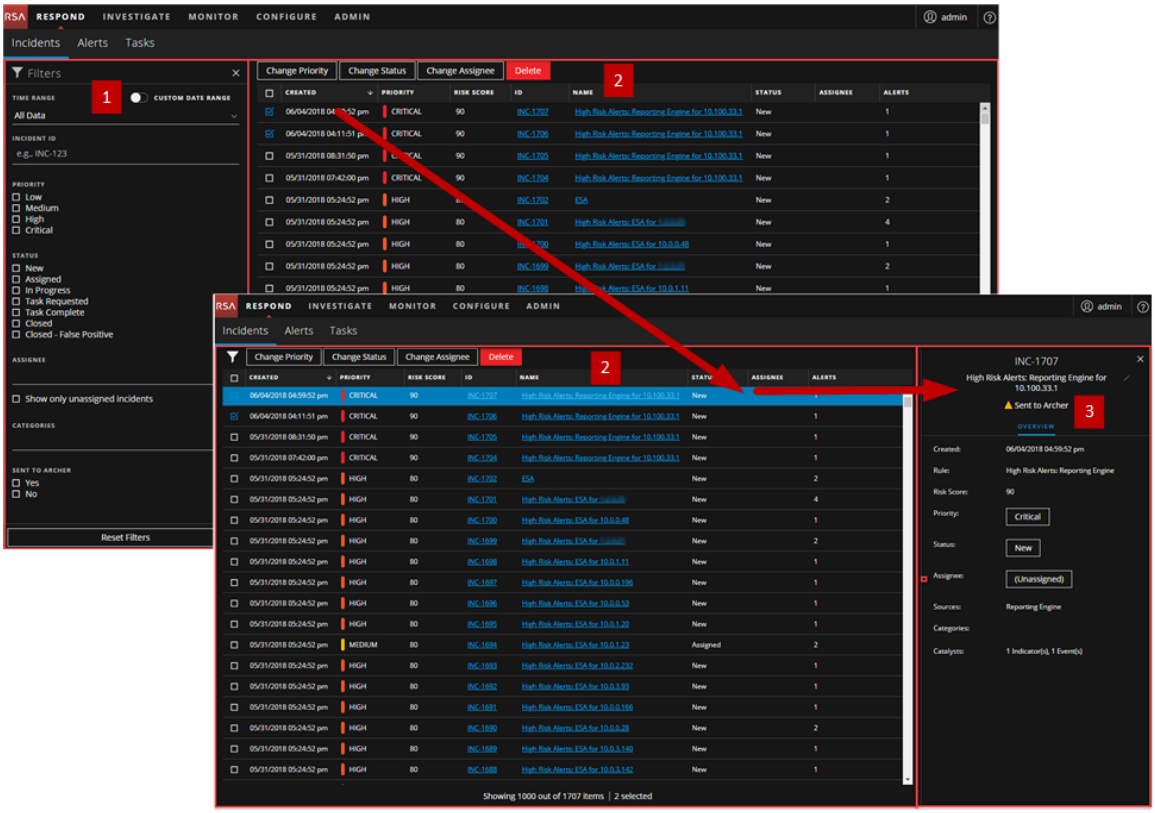
Quick Look

The following example shows the initial Incidents List view with the Filter panel. You can open the Overview panel for an incident by clicking an incident in the Incident List.



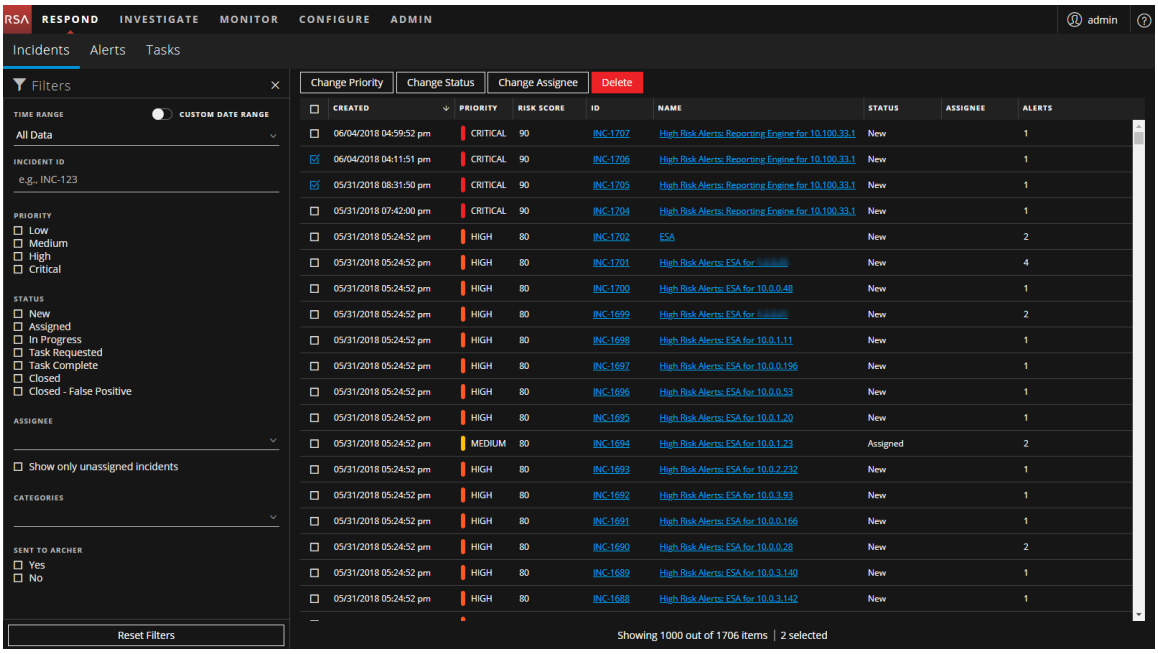
1	Filters Panel
2	Incidents List
3	Overview Panel

You can go directly to the Incident Details view from the Incidents List by clicking the hyperlinked ID or NAME. The Overview panel is also available in the Incident Details view. For more information about the Incidents Details view, see Incident Details View.

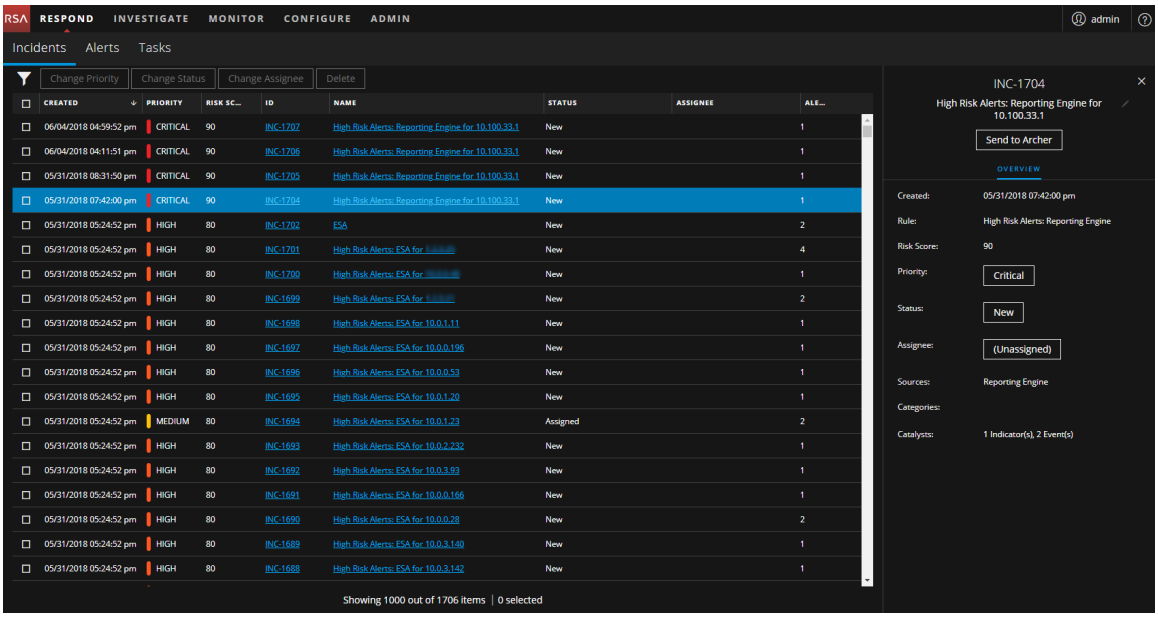
Incidents List View

To access the Incidents List view, go to **RESPOND > Incidents**. The Incidents List view displays a list of all incidents. The Incidents List view consists of a Filters panel, an Incidents List, and an Incidents Overview panel.

The following figure shows the Filter Panel on the left and the Incidents List on the right.



The following figure shows the Incidents List on the left and the Incidents Overview panel on the right.



Incidents List

The Incidents List shows a list of all of the prioritized incidents. You can filter this list to show only incidents of interest.

Column	Description
CREATED	Shows the creation date of the incident.

Column	Description
PRIORITY	Shows the incident priority. Priority can be Critical, High, Medium or Low. The Priority is color coded, where red indicates a **Critical** incident, orange represents a **High** risk incident, yellow indicates a **Medium** risk incident, and green represents a **Low** risk incident. For example: RISK SCORE	Shows the incident risk score. The risk score indicates the risk of the incident as calculated via an algorithm and is between 0-100. 100 is the highest risk score.
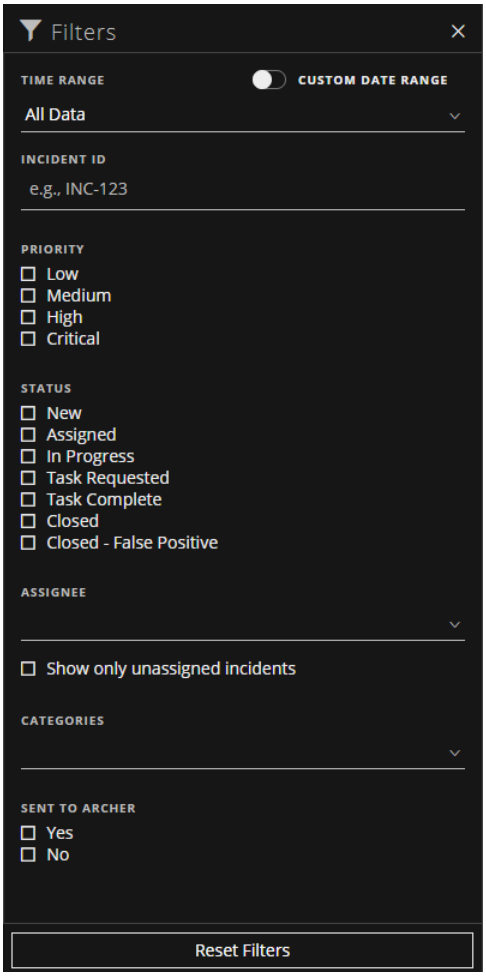
ID	Shows the automatically created incident number. Each incident is assigned a unique number that you can use to track the incident.
NAME	Shows the incident name. The incident name is derived from the rule used to trigger the incident. Click the link to go to the Incident Details view for the selected incident.
STATUS	Shows the incident status. The status can be: New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed-False Positive.
ASSIGNEE	Shows the team member currently assigned to the incident.
ALERTS	Shows the number of alerts associated with the incident. An incident may include many alerts. A large number of alerts might mean that you are experiencing a large-scale attack.

At the bottom of the list, you can see the number of incidents on the current page, the total number of incidents, and the number of incidents selected. For example: **Showing 1000 out of 2517 items | 2 selected**. The maximum number of incidents that you can view at one time is 1,000.

Filters Panel

The following figure shows the filters available in the Filters panel.



The Filters panel, on the left of the Incidents List view, has options that you can use to filter the incidents list. When you navigate away from the Filters panel, the Incidents List view retains your filter selections.

Option	Description
TIME RANGE	You can select a specific time period from the Time Range drop-down list. The time range is based on the received date of the alerts. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes.

Option	Description
CUSTOM DATE RANGE	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. INCIDENT ID	You can type the Incident ID for an incident you would like to locate, for example INC-1050.
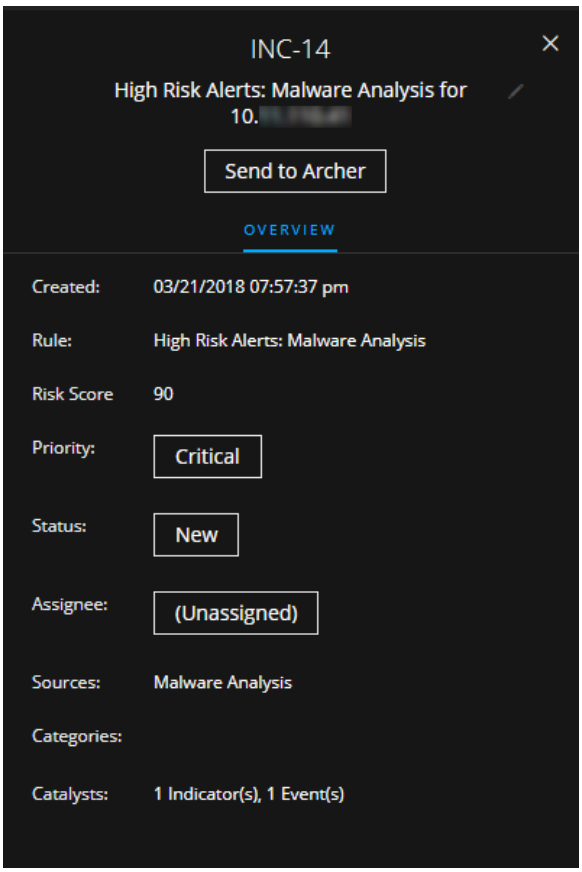
PRIORITY	Select the priorities that you would like to view.
STATUS	Select one or more incident statuses. For example, select Closed - False Positive to view only false positive incidents, which were initially identified as suspicious, but then they were later found to be safe.
ASSIGNEE	Select the assignee or assignees of the incidents that you would like to view. For example, if you only want to view the incidents assigned to Cale or Stanley, select Cale and Stanley from the Assignee drop-down list. If you want to view incidents regardless of the assignee, do not make a selection under Assignee. (Available in version 11.1 and later) To view only unassigned incidents, select **Show only unassigned incidents**.
CATEGORIES	Select one or more categories from the drop-down list. For example, if you only want to view incidents classified with the Backdoor or Privilege abuse categories, select Backdoor and Privilege abuse.

Option	Description
SENT TO ARCHER	(In version 11.2 and later, if RSA Archer is configured as a data source in Context Hub, you can send incidents to Archer Cyber Incident & Breach Response and this option will be available in NetWitness Respond.) To view incidents that were sent to Archer, select **Yes**. For incidents that were not sent to Archer, select **No**.
Reset Filters	Removes your filter selections.

Overview Panel

The Overview panel shows basic summary information about a selected incident. From the Incidents List, you can click an incident to access the Overview panel. The Overview panel in the Incident Details view contains the same information.



The following table lists the fields displayed in the Incident Overview panel.

Field	Description
<Incident ID>	Displays the Incident ID.

Field	Description
Send to Archer / Sent to Archer	(In version 11.2 and later, if RSA Archer is configured as a data source in Context Hub, you can escalate incidents to Archer Cyber Incident & Breach Response and this option will be available in NetWitness Respond.) Shows whether the incident was sent to Archer Cyber Incident & Breach Response: • **Send to Archer**: The incident was not sent to Archer. You can click the **Send to Archer** button to send the incident to Archer Cyber Incident & Breach Response for additional processing. This action is not reversible.  • **Sent to Archer**: The incident was sent to Archer Cyber Incident & Breach Response for additional analysis and action. <Incident Name>	Displays the name of the incident. You can click the incident name to change it. For example, rules can create many incidents with the same name. You can change the incident names to be more specific.
Created	Shows the creation date and time of the incident.
Rule / By	Shows the name of the rule that created the incident or the name of the person who created the incident.
RiskScore	Indicates the risk of the incident as calculated via an algorithm and is between 0-100. 100 is the highest risk score.
Priority	Shows the incident priority. Priority can be Critical, High, Medium or Low. To change the priority, you can click the Priority button and select a new priority from the drop-down list.
Status	Shows the incident status. The status can be New, Assigned, In Progress, Task Requested, Task Complete, Closed, and Closed - False Positive. To change the status, you can click the Status button and select a new status from the drop-down list.
Assignee	Shows the team member currently assigned to the incident. To change the assignee you can click the Assignee button and select a new assignee from the drop-down list.

Field	Description
Sources	Displays the data sources used to locate the suspicious activity.
Categories	Displays the categories of the incident events.
Catalysts	Displays the count of indicators that gave rise to the incident.

Toolbar Actions

This table lists the toolbar actions available in the Incidents List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the incidents that you would like to see in the Incidents list.
	Closes the panel.
Change Priority button	Allows you to change the Priority of one or more selected incidents in the Incidents List.
Change Status button	Allows you to change the Status of one or more selected incidents.
Change Assignee button	Allows you to change the Assignee of one or more selected incidents.
Delete button	Allows you to delete the selected incidents if you have the appropriate permissions, such as an Administrator or Data Privacy Officer.

Incident Details View

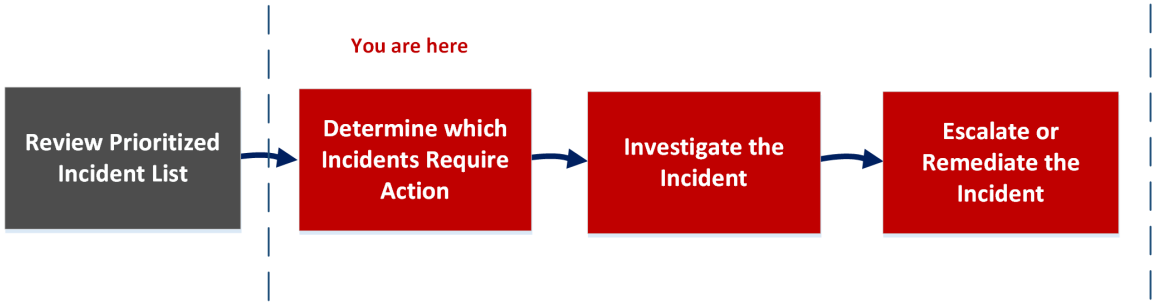
In the Incident Details view (RESPOND > Incidents > click an ID or NAME hyperlink in the Incidents List), you can view and access extensive incident details. The Incident Details view contains multiple panels that provide the following benefits:

- **Overview**: View an incident summary and update the incident.
- **Indicators**: View the indicators (alerts) involved in the incident, the events within those alerts, and available enrichment information. You can also access Event Analysis details for some events and perform event reconnaissance.
- **Nodal Graph**: Visualize the size and interactions between entities (IP address, MAC address, user, host, domain, file name, or file hash).
- **Events Datasheet**: Study the events associated with the incident.
- **Journal**: Add notes and collaborate with other analysts.
- **Tasks**: Create incident tasks and track them to closure.
- **Related Indicators**: View indicators (alerts) that are related to the incident and add them to the incident if they are not associated with an incident.

You can also filter the data in the Incident Details view to study indicators and entities of interest.

Workflow

This workflow shows the high-level process that Incident Responders use to respond to incidents in NetWitness Platform.



In the Incident Details view, you can use the extensive information provided about the incidents to determine which incidents require action. You also have the tools and information to investigate the incident, and then escalate or remediate it.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts, and SOC Manager	View prioritized incidents, filter and sort the incident list, find incidents, view my incidents, and assign incidents to myself.	Review Prioritized Incident List

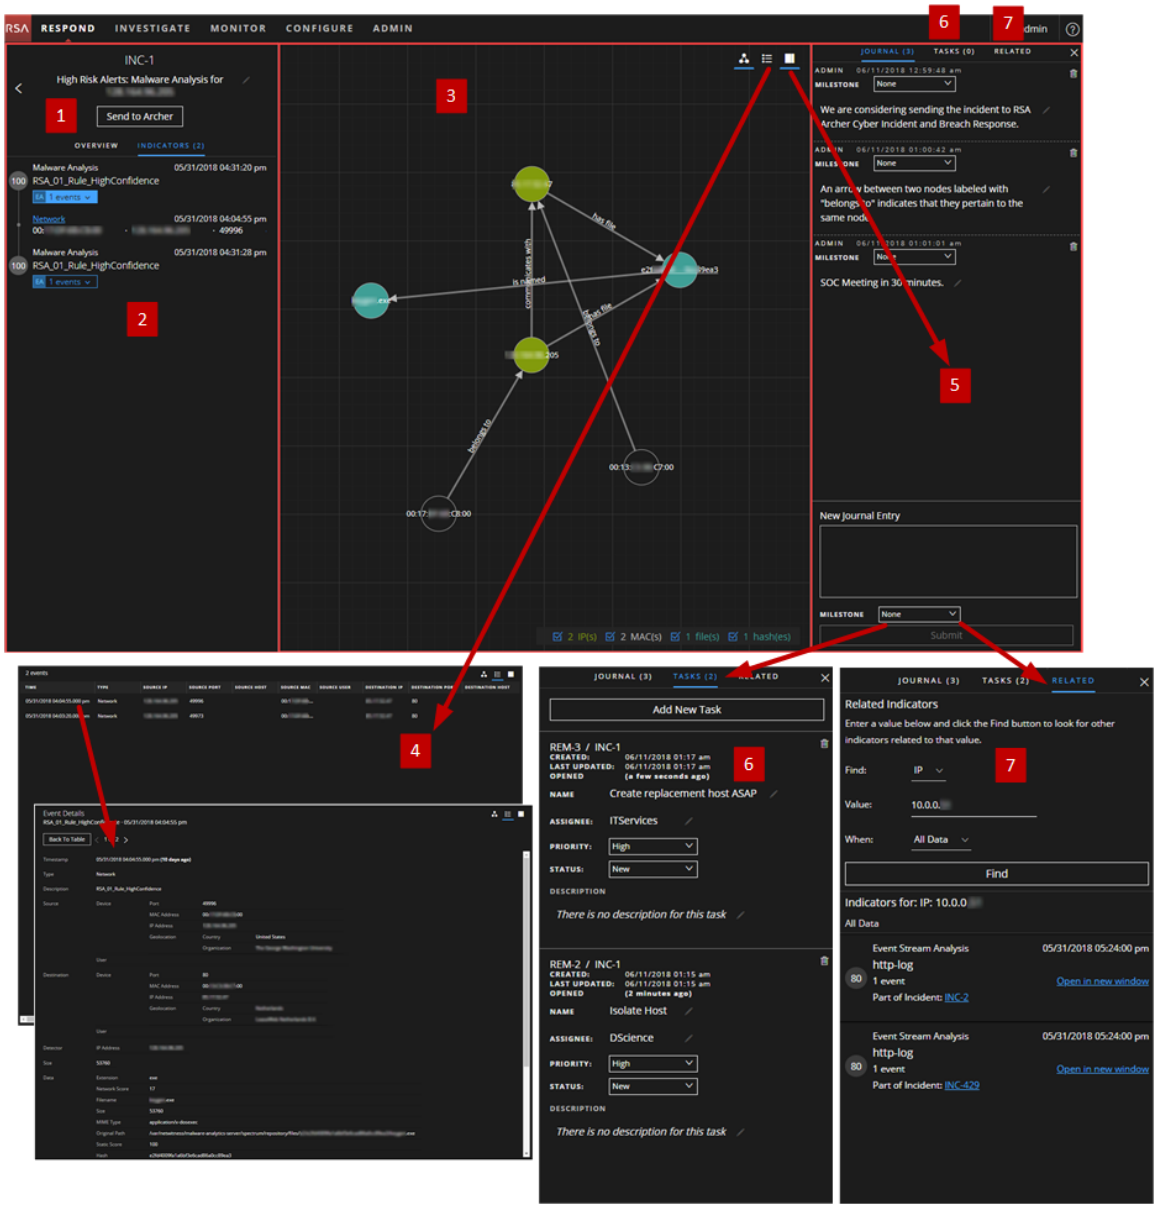
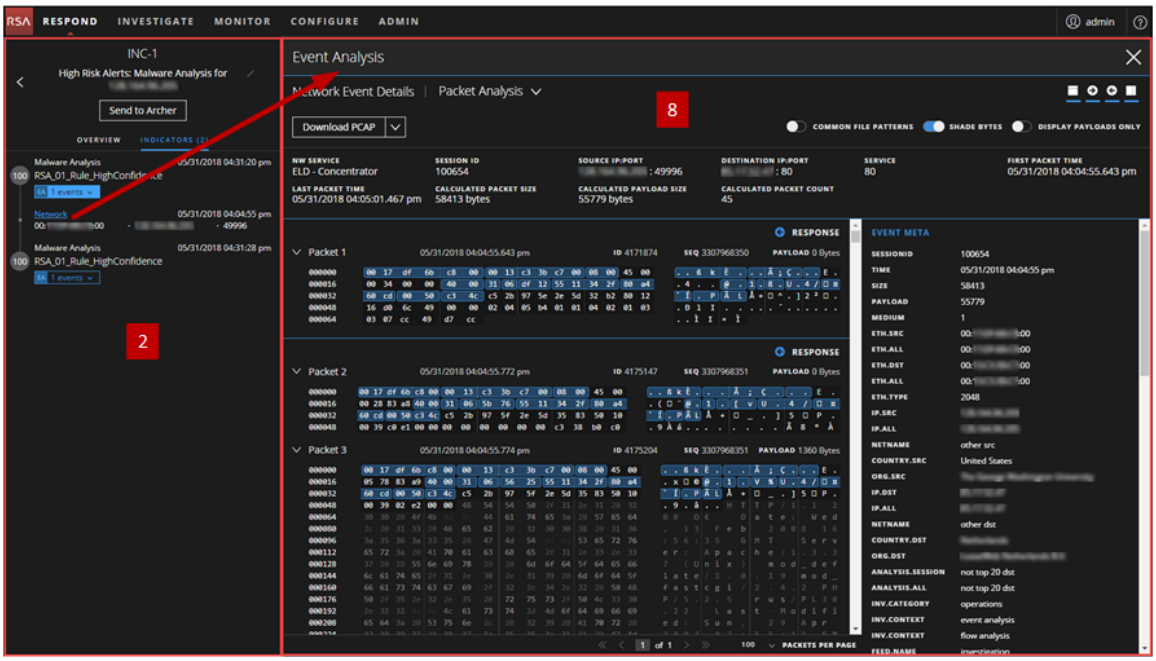
Quick Look

The following example shows the locations of the Incident Details view panels.

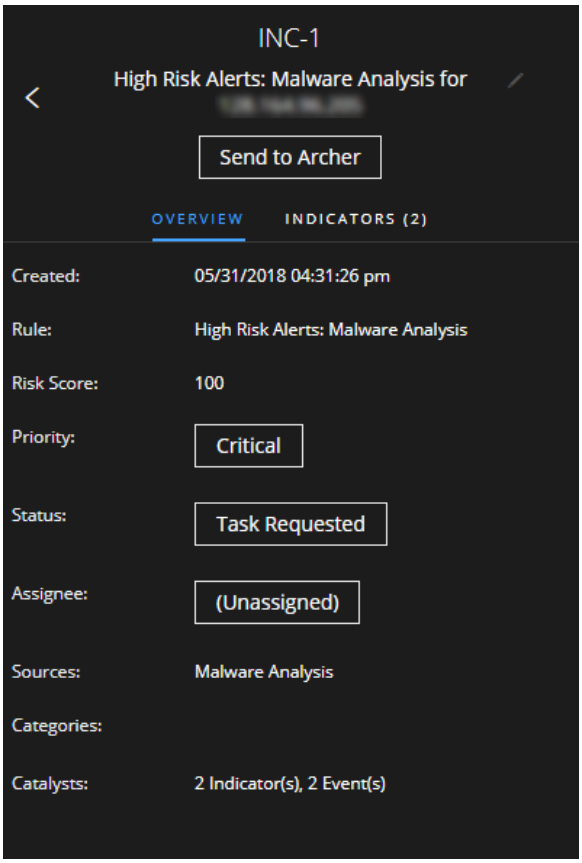




1	Overview Panel (Click the OVERVIEW tab to view it.)
2	Indicators Panel
3	Nodal Graph
4	Events Datasheet (Click an event in the Events List to view Event Details.).
5	Journal Panel
6	Tasks Panel (Click the TASKS tab to view it.)
7	Related Indicators Panel (Click the RELATED tab to view it.)
8	Event Analysis Panel (Click an event type hyperlink in the Indicators panel to view the Event Analysis.)

Overview Panel

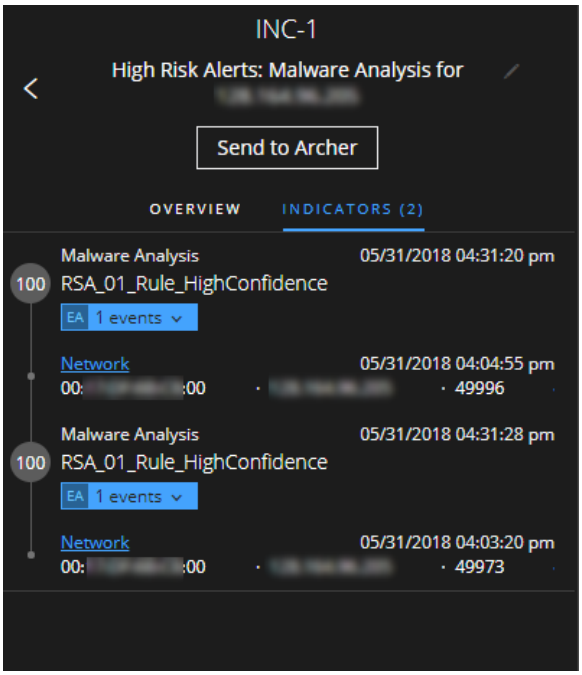
The Overview panel shows basic summary information about a selected incident. It also allows you to change the incident name and update the incident priority, status, and assignee. The Overview panel in the Incidents List view contains the same information. The Incidents List view Overview Panel topic provides details.



Indicators Panel

The Indicators panel contains a chronological listing of indicators. *Indicators* are alerts, such as an ESA alert or a NetWitness Endpoint alert. (This is different than a timeline, which provides a visual representation of the timing of the events in the incident). This listing helps you to connect indicators and notable data. For example, an IP address connected to a command and communication ESA alert might also have triggered a NetWitness Endpoint alert or other suspicious activities.

To view the Indicators panel, in the left panel of the Incident Details view, select **INDICATORS**.



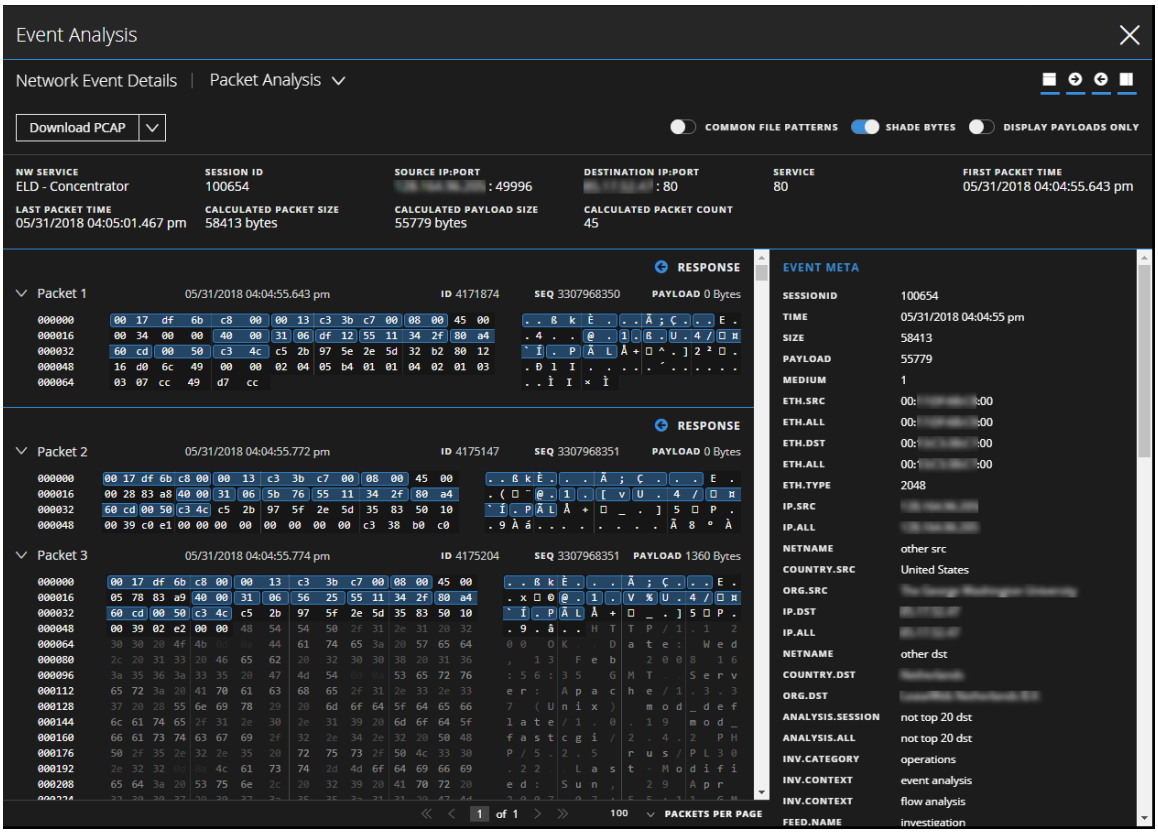
Data source information is shown below the names of the indicators. You can also see the creation date and time of the indicator and the number of events in the indicator. In the Indicators panel, you can drill deeper into the events associated with the listed indicators to get a better understanding of the events.

Event Analysis

You can perform an Event Analysis from the Indicators panel. Events preceded by an **EA** (Event Analysis) have event reconnaissance information available: 

. You can select an event type hyperlink, such as Network, to access an event analysis for the selected event.

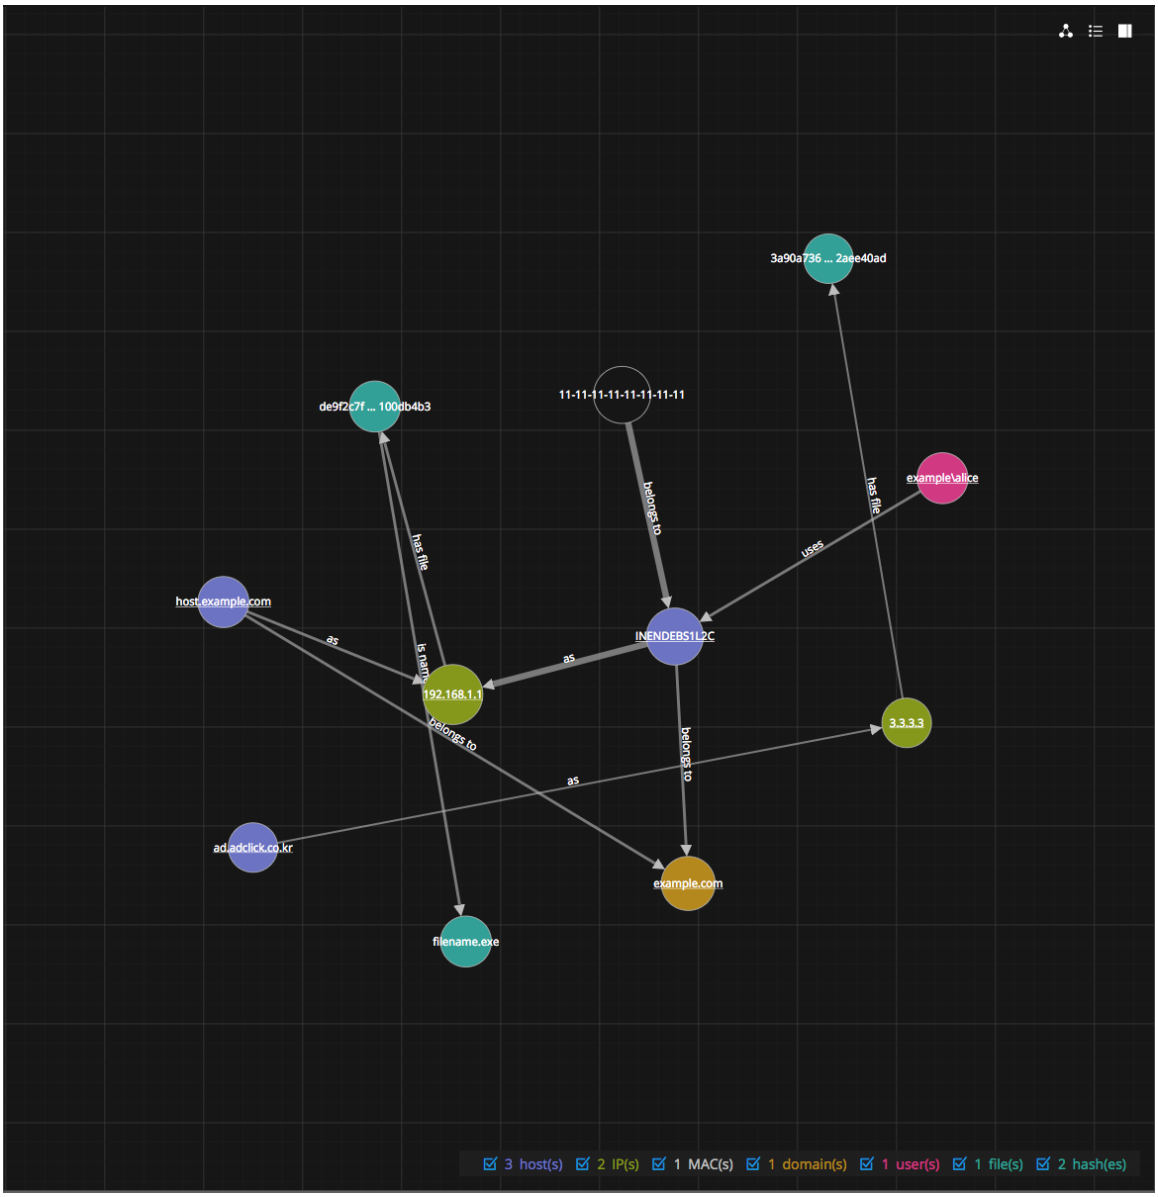
In the Event Analysis panel, you can view raw events and metadata with interactive features that enhance your ability to find meaningful patterns in the data. You can examine network, log, and endpoint events. The Event Analysis panel in the Respond view shows the Event Analysis view from Investigate for specific indicator events. For detailed information about the Event Analysis view, see the *NetWitness Investigate User Guide*.

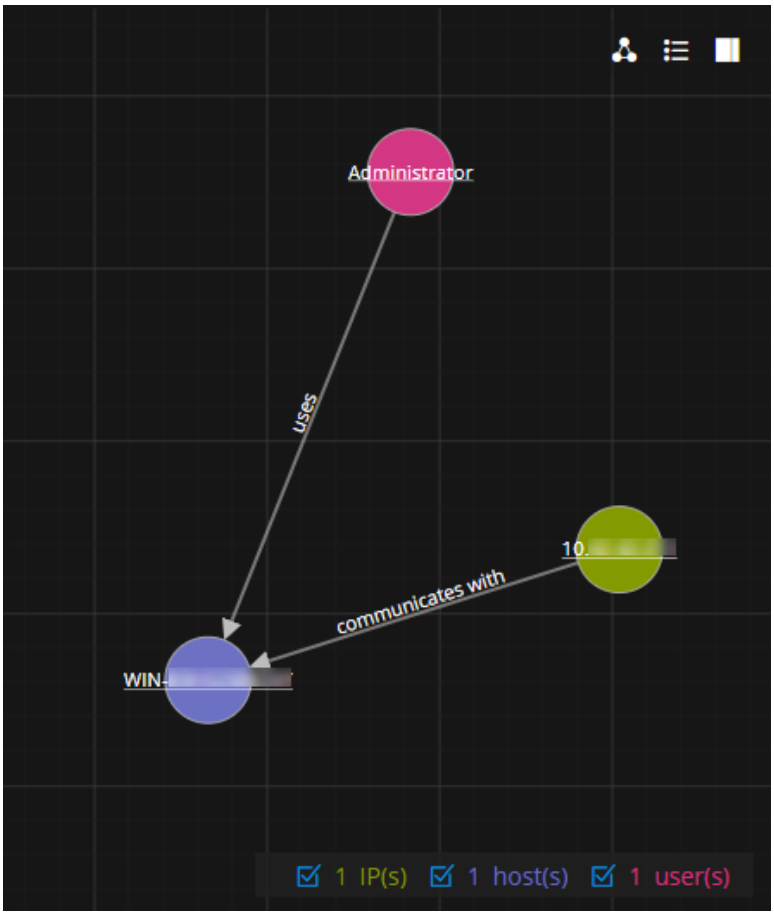


Note: Migrated incidents from NetWitness Platform versions before 11.2 will not show the Event Analysis panel in the Respond Incident Details view Indicators panel. Likewise, if you use alerts that were migrated from versions before 11.2 to create incidents in 11.2, you will also not be able to view the Event Analysis panel in the Respond view for those incidents.

Nodal Graph

The nodal graph is an interactive graph that shows the entities involved in the incident. An *Entity* is a specified piece of meta, such as IP address, MAC address, user, host, domain, file name, or file hash.





Nodes

In the nodal graph, circles represent nodes. The following table describes the nodal graph node types.

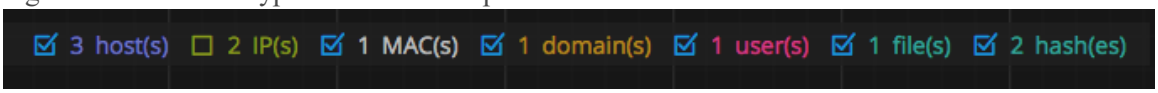
Node	Description
IP address	If the event is a detected anomaly, you can see a Detector IP. If the event is a transaction, you can see a Destination IP and a Source IP.
MAC address	You may see a MAC address for each type of IP address.
User	If the machine is associated with a user, you can see a user node.
Host	A host can be physical equipment or a virtual machine, designated by a Fully Qualified Domain Name (FQDN) or IP address, on which any service is installed.
Domain	

Node	Description
Filename	If the event involves files, you can see a filename.
File Hash	If the event involves files, you may see a file hash.

The legend at the bottom of the nodal graph shows the number of nodes of each type and the color coding of the nodes. It also helps you to locate the entities when the values, such as the IP addresses, are hashed.

You can click any node and drag it to reposition it.

In NetWitness Platform version 11.2 and later, you can select the node types that you want to view by clearing or selecting the checkboxes in the legend. The following figure shows an example nodal graph legend with all node types selected except IP.



Arrows

The arrows between the nodes provide additional information about the entity relationships. The following table describes the nodal graph arrow types.

Arrow	Description
Communicates with	An arrow between a Source machine node (IP address or MAC address) and a Destination machine node labeled with "communicates with" shows the direction of the communication.
As	An arrow between nodes labeled with "as" provides additional information about the IP address that the arrow points to. For example, if there is an arrow from the host node circle that points to an IP address node that is labeled with "as", it indicates that the name on the host node circle is the hostname of that IP address and is not a different entity.
Has file	An Arrow between a machine node (IP address, MAC address, or Host) and a file hash node labeled with "has" indicates that the IP address has that file.
Uses	An arrow between a User node and a machine node (IP address, MAC address, or Host) labeled with "uses" shows the machine that the user was using during the event.
Is named	An arrow from a File Hash node to a File Name node labeled with "is named" indicates that the file hash corresponds to a file with that name.

Arrow	Description
Belongs to	An arrow between two nodes labeled with "belongs to" indicates that they pertain to the same node. For example, an arrow between a MAC address and a Host labeled with "belongs to" indicates that it is the MAC address of the host.

Larger line size arrows indicate more communication between the nodes. Larger nodes (circles) indicate more activity than smaller nodes. The larger nodes are the most common entities mentioned in the events.

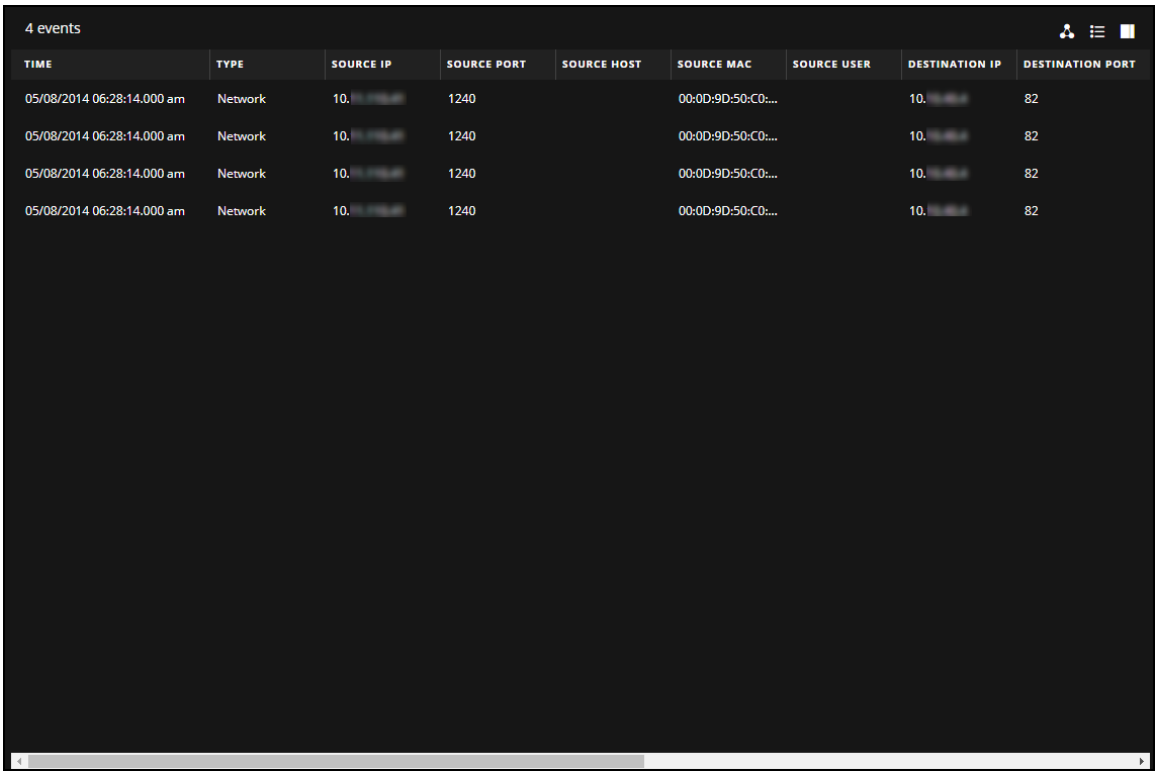
Events Datasheet

The Events datasheet shows the events associated with the incident. It shows information about the events, such as event time, source IP, destination IP, detector IP, source user, destination user, and file information about the events. The amount of information listed depends on the event type.

The Events datasheet shows an Events List for multiple events or Event Details for a single event.

Events List

The following figure shows the Events List.



The following table describes the columns in the Events list.

Column	Description
TIME	Shows the time the event occurred.
TYPE	Shows the type of alert, such as Log and Network.
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
SOURCE PORT	Shows the source port of the transaction. The source and destination ports can be on the same IP address.
SOURCE HOST	Shows the destination host where the event took place.
SOURCE MAC	Shows the MAC address of the source machine.
SOURCE USER	Shows the user of the source machine.
DESTINATION IP	Shows the destination IP address if there was a transaction between two machines
DESTINATION PORT	Shows the destination port of the transaction. The source and destination ports can be on the same IP address.
DESTINATION HOST	Shows the HOST name of the destination machine.
DESTINATION MAC	Shows the MAC address of the destination machine.
DESTINATION USER	Shows the user of the destination machine.
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected.
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.

Event Details

To view the event details, you click an event in the event list. If there is only one event in the list, you see only the event details for that event instead of a list.

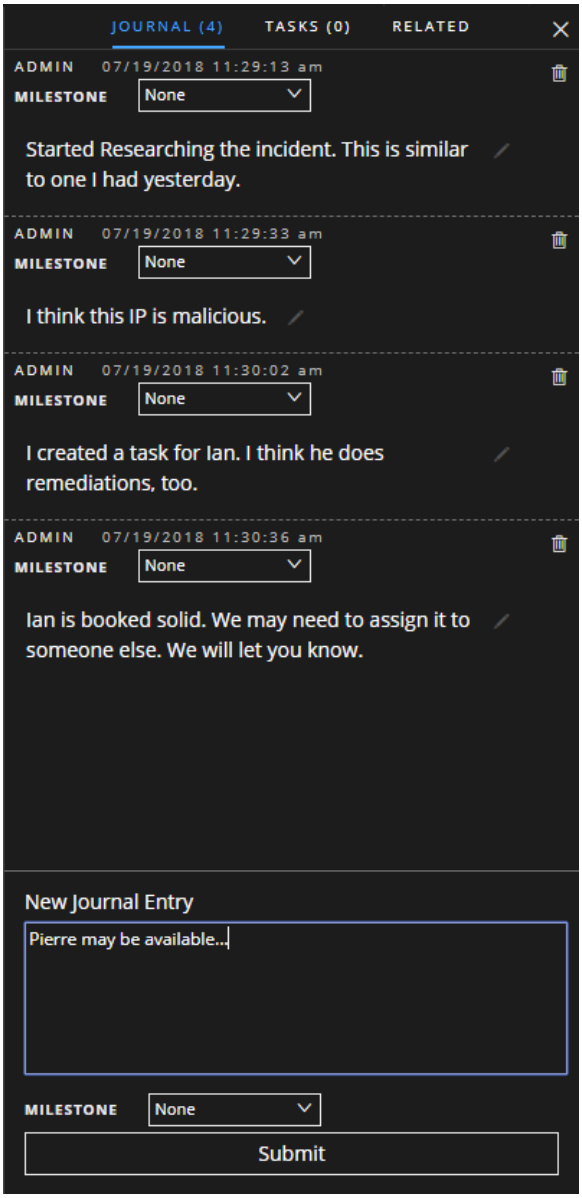
Journal Panel

The incident Journal shows the history of activity on your incident.



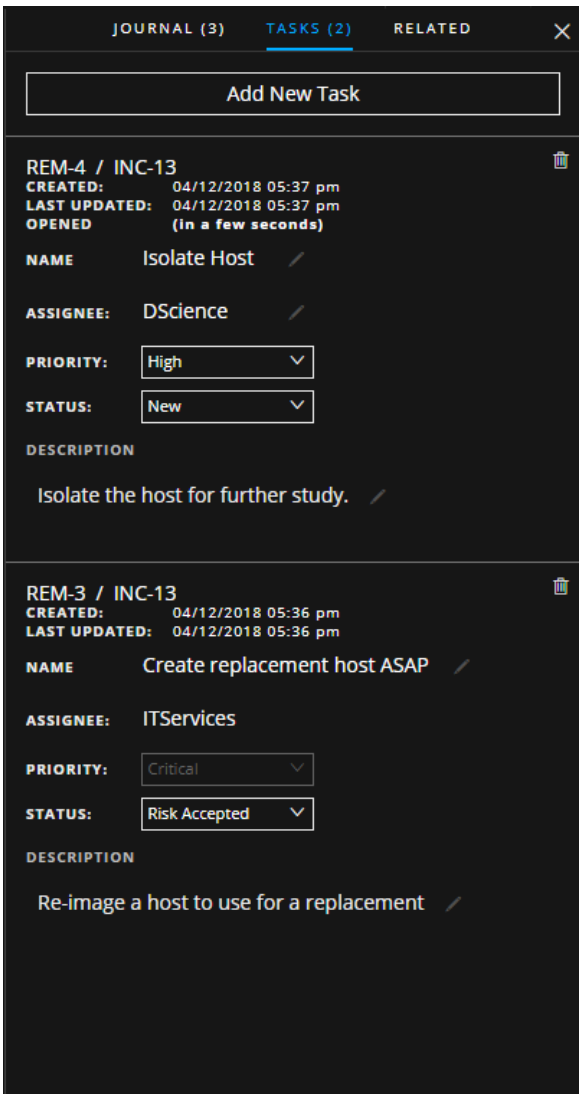
The following table describes the New Journal Entry options.

Field	Description
New Journal Entry	Type your note in the field.
Milestone	(Optional) Select a milestone, if applicable. This field is used to track significant events for the incident.

Field	Description
Submit button	Click submit to add an entry to the journal. You journal entry will be visible to anyone who views the incident.

Tasks Panel

In the Tasks panel, you can manage and track the incident tasks to closure.



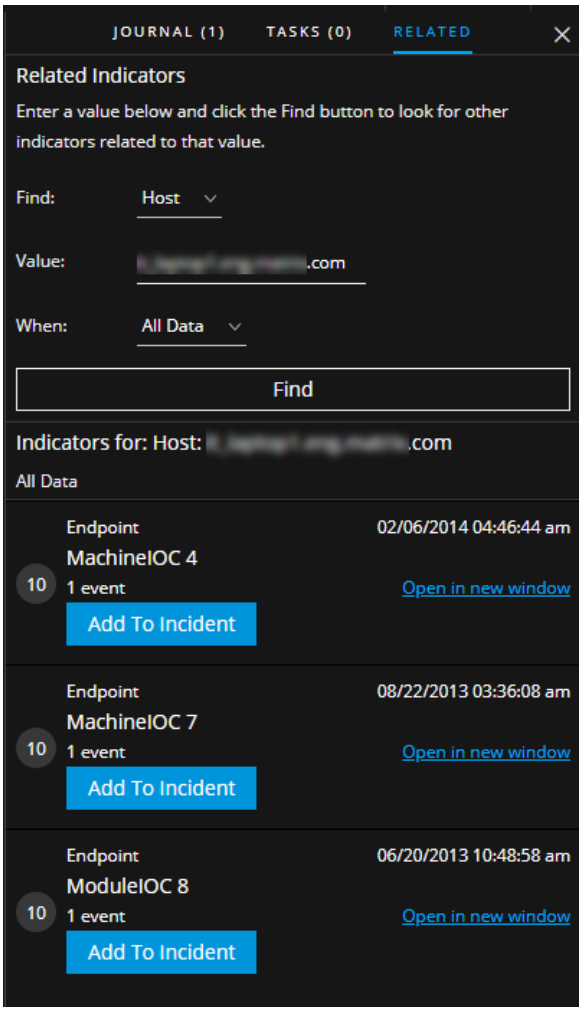
The following table describes the Task fields.

Field	Description
<Task ID / <Incident ID>	The autogenerated Task ID / The incident associated with the task.
CREATED	The created date of the task.

Field	Description
LAST UPDATED	The date that the task was last modified.
OPENED	The time that passed since the task was opened. For example, 3 minutes ago or 2 days ago.
NAME	The name of the task. For example: Re-image the machine. You can click this field to edit it.
ASSIGNEE	The username of the user assigned to the task. You can click this field to edit it.
PRIORITY	The priority of the task: Low, Medium, High, or Critical. You can click the priority button and select a new priority for the task from the drop-down list.
STATUS	The status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. You can click the status button and select a new status for the task from the drop-down list.
DESCRIPTION	Type information that describes the task. You may want to include any applicable reference numbers. You can click this field to edit it.

Related Indicators Panel

The Related Indicators panel enables you to search the NetWitness Platform alerts database to find alerts that are related to this incident. You can add alerts that you find to the incident if they are not already associated with an incident.



The following table describes the fields in the search section at the top of the panel.

Field	Description
Find	Select the entity that you would like to locate in the alerts. For example, IP.
Value	Type the value of the entity. For example, type the actual IP address of the entity.
When	Select a time range to search for the alerts. For example, Last 24 hours.
Find button	Initiates the search. A list of related indicators appear below the **Find** button in the **Indicators for** section.

The following table describes the options in the **Indicators for** (results) section at the bottom of the panel.

Option	Description
Indicators For:	Shows the search results.
Open in new window link	Shows alert details for the indicator.
Add To Incident button	Adds the related indicator to the incident. The related indicator adds to the Indicators panel.
Part Of This Incident button	Shows that the indicator is already part of the incident.

Toolbar Actions

Option	Description
	(Back to Incidents) Enables you to navigate back to the Incidents List view.
	Closes the panel.
	Deletes the entry, such as a journal entry or task.
Priority button	(In the Overview panel) Allows you to change the Priority of one or more selected incidents in the Incidents List.
Status button	(In the Overview panel) Allows you to change the Status of one or more selected incidents.
Assignee button	(In the Overview panel) Allows you to change the Assignee of one or more selected incidents.
 (View: Graph)	Enables you to view the Nodal Graph.

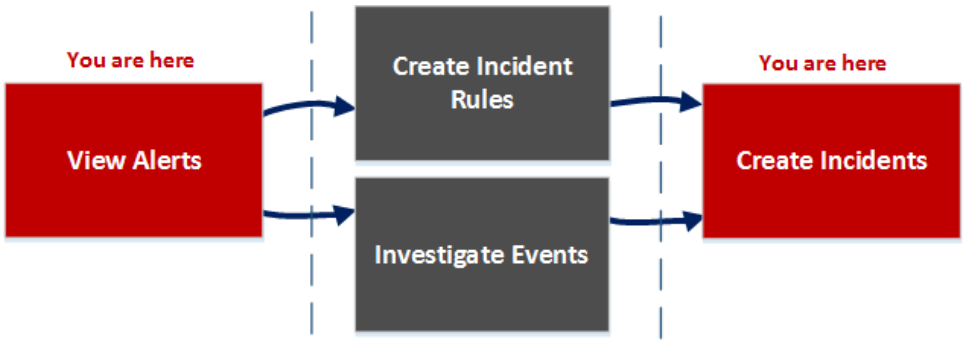
Option	Description
 (View: Datasheet)	Enables you to view the Events datasheet, which can appear as an Events List for multiple events or Event Details for a single event.
 (Journal, Tasks, and Related)	Enables you to view the Journal, Tasks, and Related Indicators panels.
	Enables you to show or hide the Header, Request, Response, or Meta in the Event Analysis panel in the Respond Incident Details view. For more information about Event Analysis, see the Event Analysis view in the *NetWitness Investigate User Guide*.

Alerts List View

The Alerts List view (RESPOND > Alerts) enables you to view all of the threat alerts and indicators received by NetWitness Platform in one location. This can include alerts received from ESA Correlation Rules, ESA Analytics, Malware Analysis, Reporting Engine, NetWitness Endpoint, as well as many others. In the Alerts List view you can browse through various alerts, filter them, and group them to create incidents.

Workflow

This workflow shows the high-level process that Analysts use to review alerts and create incidents.



In the Alerts List view, you can review a list of alerts from all sources received by NetWitness Platform. After that, you can investigate those alerts further and create incidents from the alerts or you can create incident rules to create incidents.

Note: You can use NetWitness Platform Automated Threat Detection to create incidents without manually creating rules.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts	View all alerts in NetWitness Platform.*	View Alerts
Incident Responders, Analysts	Filter alerts.*	Filter the Alerts List
Incident Responders, Analysts	View alert overview information and raw alert metadata.*	View Alert Summary Information

Role	I want to ...	Show me how
Incident Responders, Analysts	Create incidents from alerts.*	Create an Incident Manually
Incident Responders, Analysts	(Available in version 11.1 and later) Add alerts to an existing incident.*	Add Alerts to an Incident
Administrators, Data Privacy Officers	Delete alerts.*	Delete Alerts
SOC Managers, Administrators	Create incident rules.	See "Create an Incident Rule for Alerts" in the *NetWitness Respond Configuration Guide*.
Incident Responders, Analysts	Investigate the events in an alert.	View Event Details for an Alert and Investigate Events
Incident Responders, Analysts	Add related alerts to an existing incident.	Add Related Indicators to the Incident

*You can complete these tasks here (that is in the Alerts List view).

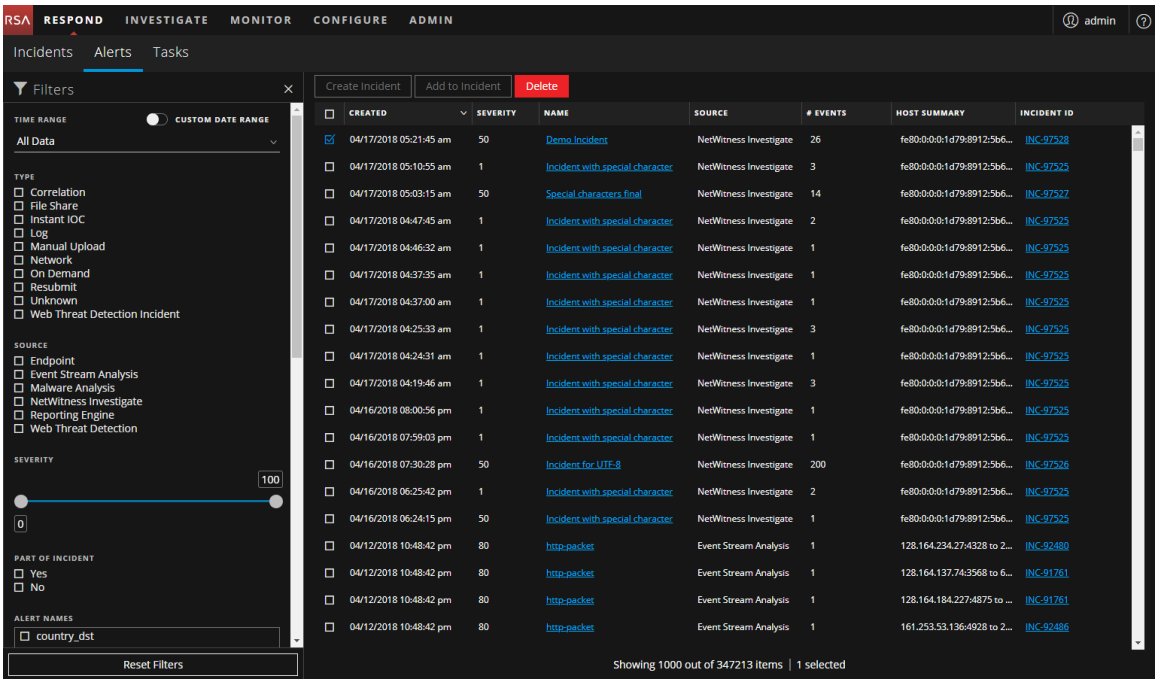
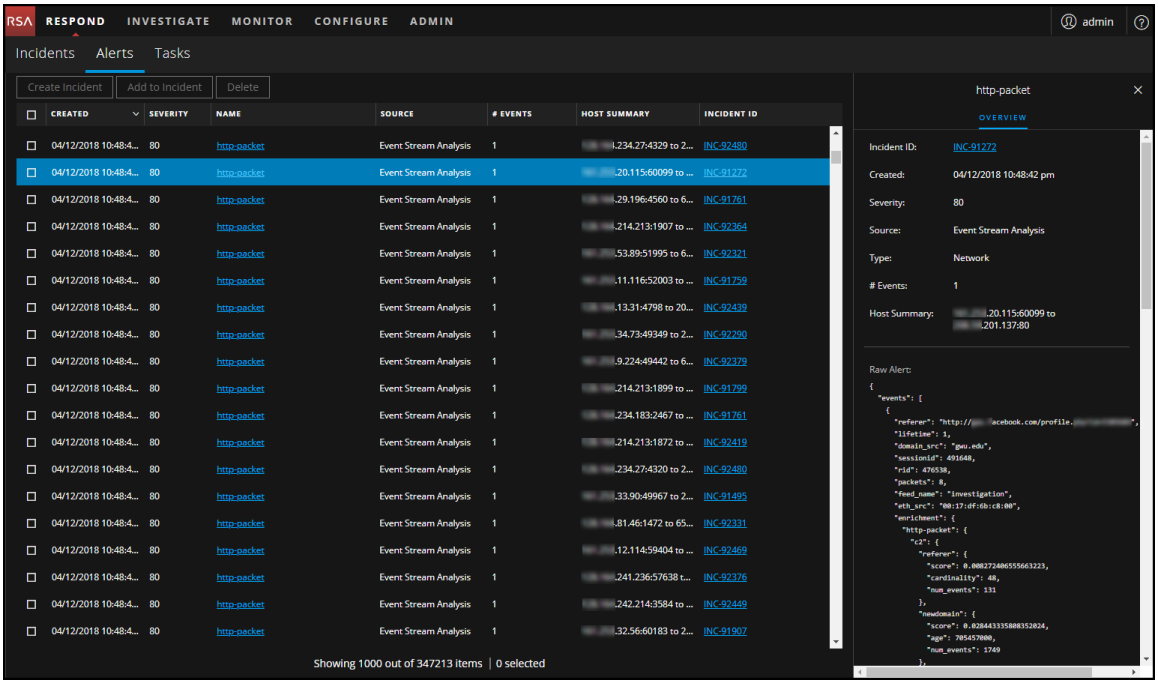
- Reviewing Alerts

Quick Look

To access the Alerts List view, go to **RESPOND > Alerts**. The Alerts List view displays a list of all alerts and indicators received by the Respond Server database in NetWitness Platform. The following figure shows the Filters panel on the left.

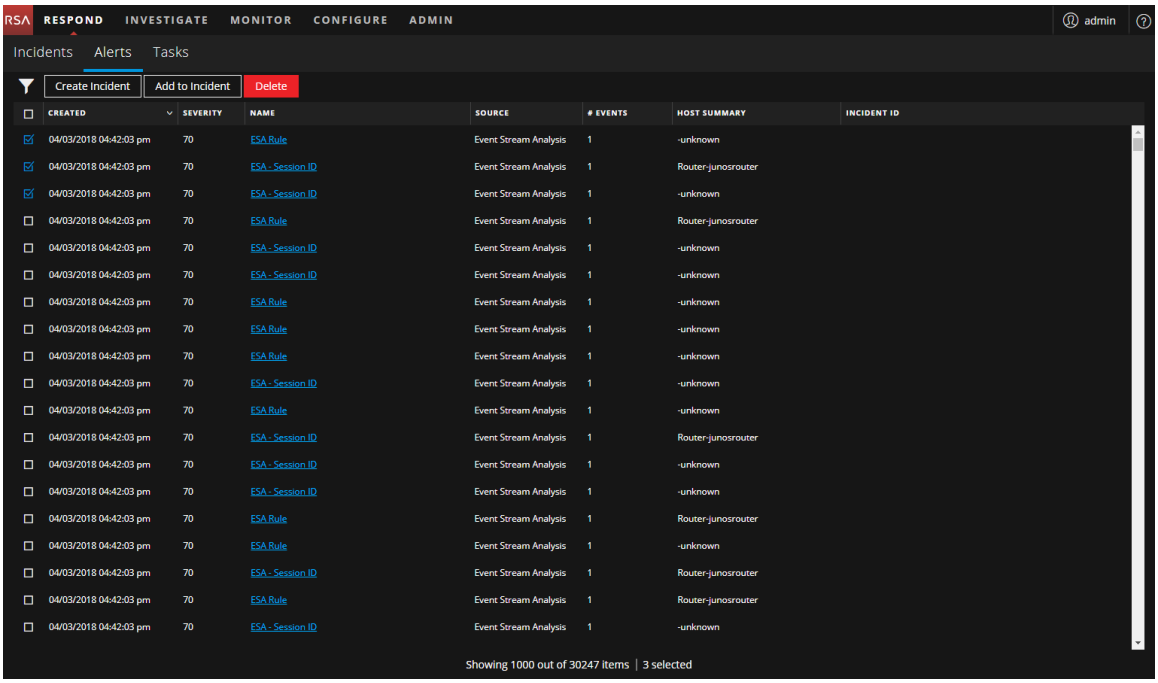


The Alerts List view consists of a Filters panel, an Alerts List, and an Alert Overview panel. You can click an alert in the Alerts list to view the Alert Overview panel on the right.



Alerts List

The Alerts List shows all of the alerts in NetWitness Platform. You can filter this list to only show alerts of interest.



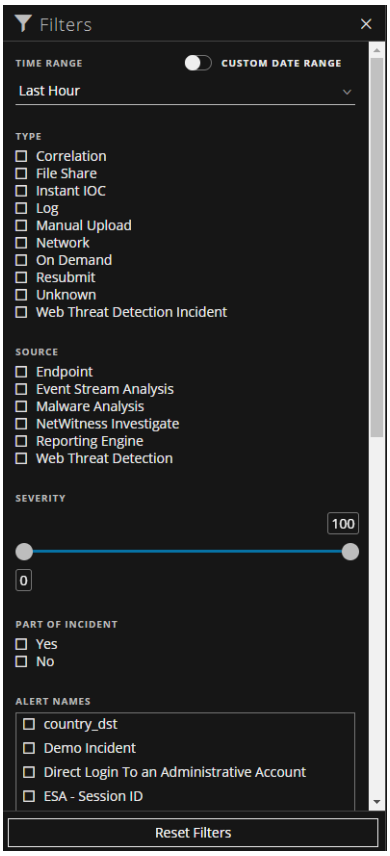
Column	Description
	Enables you to select one or more alerts to delete. Users with the appropriate permissions, such as Administrators and Data Privacy Officers, can delete alerts.
CREATED	Displays the date and time when the alert was recorded in the source system.
SEVERITY	Displays the level of severity of the alert. The values are from 1 through 100.
NAME	Displays a basic description of the alert.
SOURCE	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, ESA correlation rules, ESA Analytics, Reporting Engine, and many others.
# EVENTS	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.

Column	Description
HOST SUMMARY	Displays details of the host like the host name from where the alert was triggered. The details may include information about the source and destination hosts in an Alert. Some alerts may describe events across more than one host .
INCIDENT ID	Shows the Incident ID of the alert. If there is no incident ID, the alert does not belong to any incident and you can create an incident to include this alert or the alert can be added to an existing incident.

At the bottom of the list, you can see the number of alerts on the current page, the total number of alerts, and the number of alerts selected. For example: **Showing 377 out of 377 items | 3 selected**

Filters Panel

The following figure shows the filters available in the Filters panel.



The Filters panel, on the left of the Alerts List view, has options that you can use to filter the alerts list. When you navigate away from the Filters panel, the Alerts List view retains your filter selections.

Option	Description
TIME RANGE	You can select a specific time period from the Time Range drop-down list. The time range is based on the received date of the alerts. For example, if you select Last Hour, you can see alerts that were received within the last 60 minutes.
CUSTOM DATE RANGE	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. TYPE	Indicates the type of events in the alert, for example, logs, network sessions, and so on.
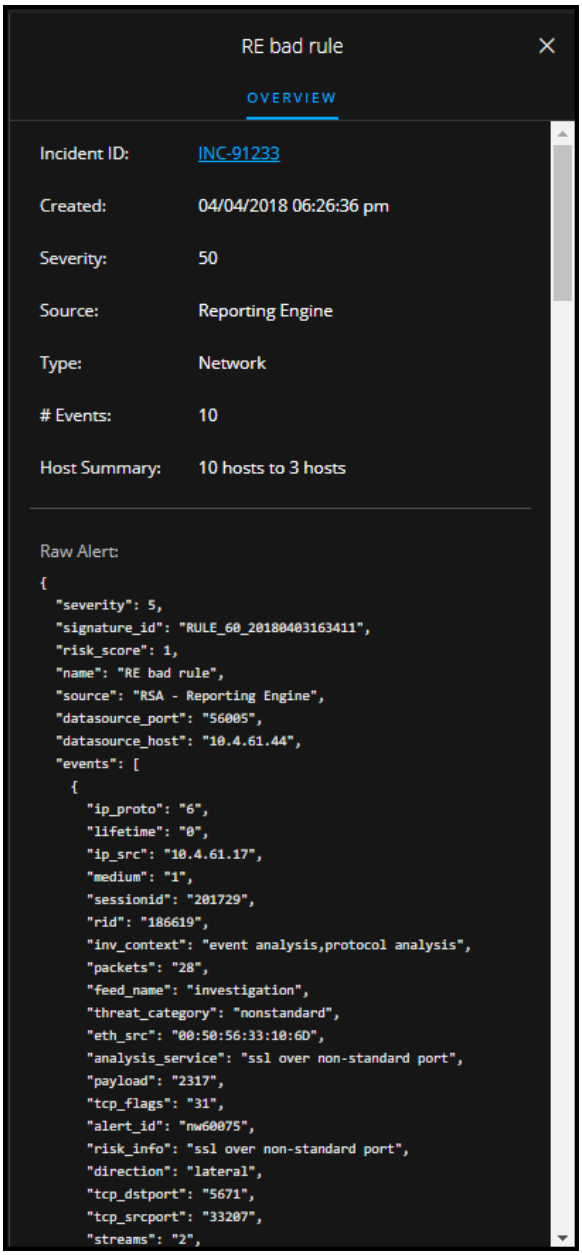
SOURCE	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, Event Stream Analysis (ESA Correlation Rules), ESA Analytics, Reporting Engine, Web Threat Detection, and many others.
SEVERITY	Displays the level of severity of the alert. The values are from 1 through 100.

Option	Description
PART OF INCIDENT	Categorizes alerts on whether or not they are associated with an incident. Select **Yes** to view alerts that are part of an incident. Select **No** to view alerts that are not part of an incident. For example, before you create incidents from alerts, you may want to select No to view only those alerts that are not already part of an incident.
ALERT NAMES	Shows the name of the alert. You can use this filter to search for all alerts generated by a specific rule or source, for example, Malicious IP - Reporting Engine.
Reset Filters	Removes your filter selections.

The Alerts List shows a list of alerts that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the alerts list. For example: **Showing 30 out of 30 items**

Overview Panel

The Overview panel shows basic summary information about a selected alert and raw alert metadata. The Overview panel in the Alert Details view contains the same information, but in the Alerts Details view, you can expand the panel to view more information.



The following table lists the fields displayed in the Alert Overview panel.

Field	Description
<Alert Name>	Displays the name of the alert.
Incident ID	Displays the Incident ID associated with the alert. You can click the incident ID link to go to the Incident Details view of the associated incident. If there is no incident ID, the alert does not belong to an incident. You can create an incident for this alert or you can add it to an incident.
Created	Displays the date and time when the alert was created.
Severity	Displays the level of severity of the alert. The values are from 1 through 100.
Source	Displays the original source of the alert. The source of the alerts can be NetWitness Endpoint, Malware Analysis, ESA correlation rules, ESA Analytics, Reporting Engine, and many others.
Type	Indicates the type of events in the alert, for example, logs, network sessions, and so on.
# Events	Indicates the number of events contained within an alert. This varies depending on the source of the alert. For example, NetWitness Endpoint and Malware Analysis alerts always have one Event. For certain types of alerts, a high number of events may mean that the alert is more risky.
Raw Alert	Shows the raw alert metadata.

Toolbar Actions

This table lists the toolbar actions available in the Alerts List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the alerts that you would like to see in the Alerts List.
	Closes the panel.
Create Incident button	Enables you to create incidents from alerts. The alerts cannot be part of an incident. To get a list of alerts without incidents, you can filter the Alerts List, In the PART OF INCIDENT section, select No.
Add to Incident button	(This option is available in version 11.1 and later.) Enables you to add selected alerts to an incident. The alerts cannot be part of an incident. To get a list of alerts without incidents, you can filter the Alerts List. In the PART OF INCIDENT section, select No.
Delete button	Allows you to delete alerts.

Alert Details View

In the Alert Details view (RESPOND >Alerts > click a NAME hyperlink in the Alerts List), you can view summary information about an alert, such as the source of the alert, the number of events within the alert, and whether it is part of an incident. You can also view detailed information about the events within the alert as well as the event metadata.

Workflow

This workflow shows the high-level process that Analysts use to review alerts and create incidents.

After reviewing the alerts list, in the Alert Details view, you can investigate those alerts further and create incidents from the alerts. In the CONFIGURE > Incident Rules view, you can create incident rules to create incidents.

Note: You can also use NetWitness Platform Automated Threat Detection to create incidents without manually creating rules.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts	View all alerts in NetWitness Platform.	View Alerts
SOC Managers, Administrators	Create incident rules.	See "Create an Incident Rule for Alerts" in the *NetWitness Respond Configuration Guide*.
Incident Responders, Analysts	View a list of events in the alert.*	View Event Details for an Alert

Role	I want to ...	Show me how
Incident Responders, Analysts	View event metadata for each event in the alert.*	View Event Details for an Alert
Incident Responders, Analysts	Further investigate the events in the alert.*	Investigate Events
Incident Responders, Analysts	Add alerts to an existing incident.	Add Alerts to an Incident Add Related Indicators to the Incident
Incident Responders, Analysts	Create incidents from alerts.	Create an Incident Manually
Data Privacy Officers, Administrators	Delete alerts.	Delete Alerts

*You can complete these tasks here (that is in the Alerts Details view).

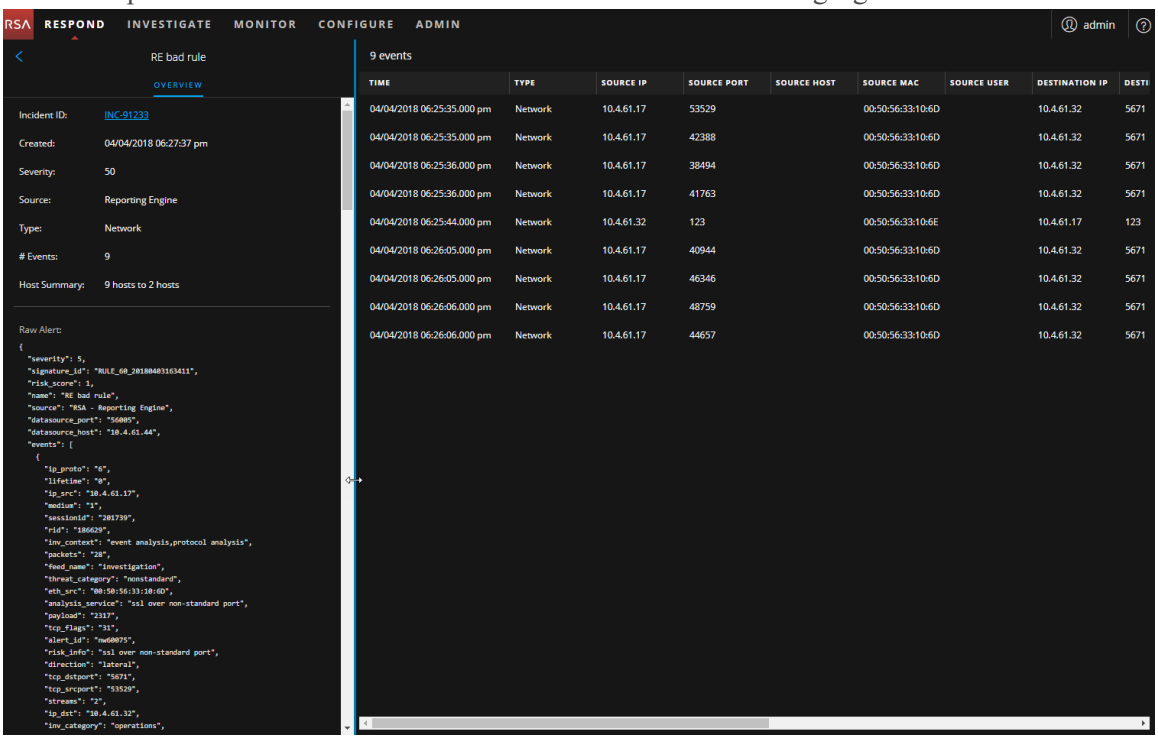
Related Topics

- Alerts List View
- Reviewing Alerts

Quick Look

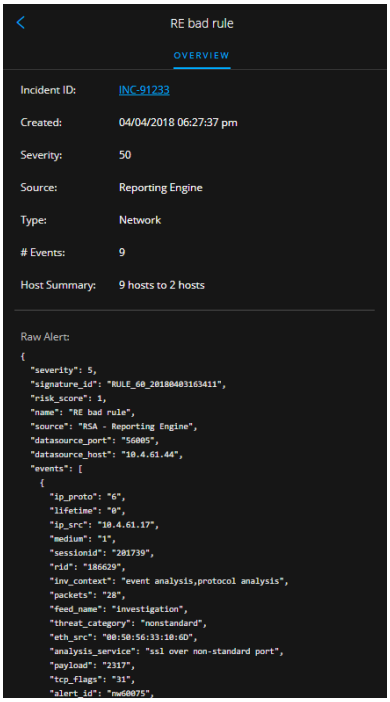
1. To access the Alert Details view, go to **RESPOND > Alerts**.
2. In the Alerts list, choose an alert to view and then click the link in the NAME column for that alert. The Alert Details view has an Overview panel on the left and the Events panel on the right. You can

resize the panels to show more information as shown in the following figure.



Overview Panel

The Overview panel shows basic summary information about a selected alert. The Overview panel on the Alerts List view contains the same information. The Alerts List view Overview Panel topic provides details.

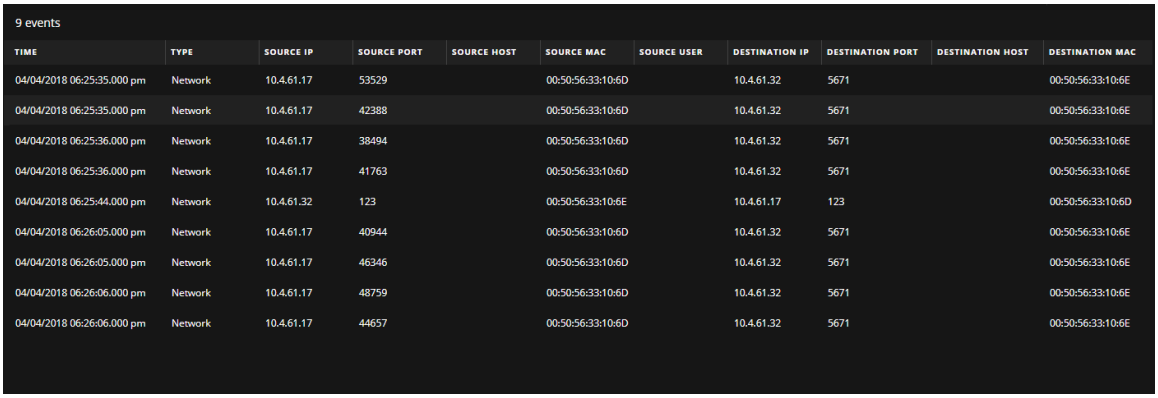


Events Panel

The Events panel can show an Events List if there is more than one event in the alert. If there is only one event in the alert, or you click an event in the Events List, you can see Event Details in the Events panel.

Events List

The Events List for a selected alert shows all of the events contained in that alert.

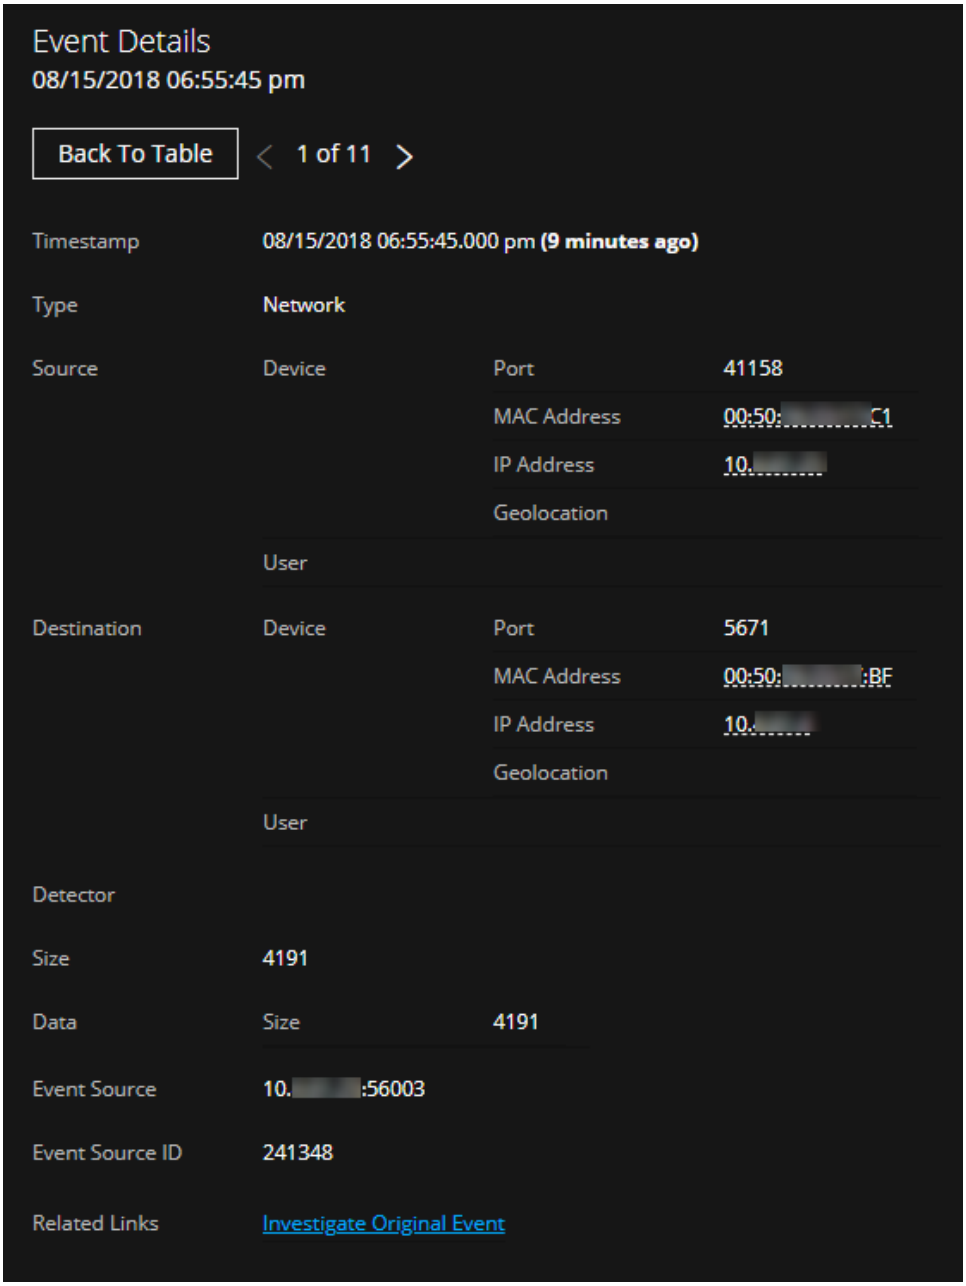


The following table lists some of the columns shown in the Events List, which provide a summary of the listed events.

Column	Description
TIME	Shows the time the event occurred.
TYPE	Shows the type of alert, such as Log and Network.
SOURCE IP	Shows the source IP address if there was a transaction between two machines.
DESTINATION IP	Shows the destination IP address if there was a transaction between two machines.
DETECTOR IP	Shows the IP address of the machine where an anomaly was detected.
SOURCE USER	Shows the user of the source machine.
DESTINATION USER	Shows the user of the destination machine.
FILE NAME	Shows the file name if a file is involved with the event.
FILE HASH	Shows a hash of the file contents.

Event Details

The Event Details in the Events panel shows the event metadata for each event in the alert.



Event Metadata

The following table lists some event metadata sections and subsections shown in the first two columns in the Event Details. This is not an extensive list.

Section	Subsection	Description
Data		Shows information about the data involved with the event, such as the files involved. There may be 0 or more per event.
	Filename	Shows the file name if a file is involved with the event.
	Hash	Shows a hash of the file contents, for example, MD5 or SHA1.
	Size	Shows the size of the transmission or file involved with the event.
Description		Displays a general description of the event.
Destination		Shows the destination device and user.
	Device	Shows information about the destination device. See Event Source or Destination Device Attributes below.
	User	Shows information about the user or users of the destinationSee Event Source or Destination User Attributes below.
Detector		Shows the host or software product that detected the issue. This is most relevant for malware scanners and logs
	Device Class	Shows the device class of the product that detected the alert.
	IP Address	Shows the IP address of the product that detected the alert.
	Product Name	Shows the name of the product that detected the alert.
Domain		Shows the domain associated with the event.
Enrichment		Shows available enrichment information.
Related Links		If available, it shows a link back to the user interface (UI) of the source product.
	Type	Shows the type of event, such as investigate_original_event.
	URL	Shows the URL link back to the UI of the source product.
Size		Shows the size of the transmission or file involved.
Source		Shows the source device and user.

Section	Subsection	Description
	Device	Shows information about the source machine. See Event Source or Destination Device Attributes below.
	User	Shows information about the user or users of the source machine. See Event Source or Destination User Attributes below.
Timestamp		Shows the time that the event occurred.
Type		Shows the type of the alert, such as log, network, correlation, Resubmit, Manual Upload, On Demand, File Share, or Instant IOC.

Event Source or Destination Device Attributes

The following table lists attributes for an event source or destination device that can be shown in the Events Details.

Name	Description
Asset Type	Displays the type of device, for example, desktop, laptop, server, network equipment, tablet, and so on.
BusinessUnit	Shows the business unit associated with the device.
Compliance Rating	Shows the compliance rating of the device. It can be Low, Medium, or High.
Criticality	Shows how critical the device is to the business (business criticality).
Facility	Shows the location of the device.
Geolocation	Shows the geographic location for the host. It can contain the following attibutes: city, country, latitude, longitude, organization, and domain.
IP Address	Shows the IP address of the device.
MAC Address	Shows the MAC address of the device.
Netbios Name	Shows the NetBIOS name for the device.
Port	Displays the TCP port, UDP port, or the IP Src port (the first one available) used to connect to and from the host.

Event Source or Destination User Attributes

The following table lists attributes for an an event source or destination user that can be shown in the Events Details.

Attribute Name	Description
AD Domain	Shows the Active Directory domain.
AD Username	Shows the Active Directory username.
Email Address	Shows the email address of the user.
Username	Shows a general name if you do not know the source of the username, such as UNIX or a username in a particular system.

Toolbar Actions

This table lists the toolbar actions available in the Alert Details view.

Option	Description
	(Back to Alerts) Enables you to navigate back to the Alerts List view.
	Click the arrows to navigate through the event meta details for each event in the alert. The numbers, such as "1 of 2" show the number of the event that you are currently viewing. Click **Back to Table** to go back to the Events List view, which is also known as the Events Table.

Tasks List View

After investigating incidents, in the Tasks List view (RESPOND > Tasks), you can create and track incident tasks. For example, you can create remediation tasks when you require actions on incidents from teams outside of your security operations. You can reference external ticket numbers within the tasks and then track those tasks to completion. You can also modify and delete tasks as required, depending on your user permissions.

What do you want to do?

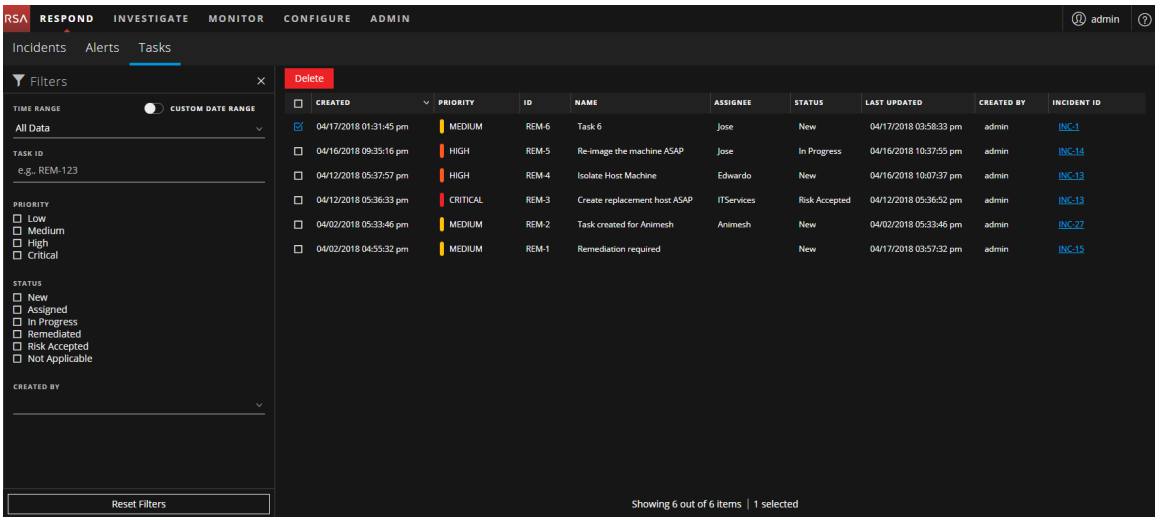
Role	I want to ...	Show me how
Incident Responders, Analysts	View tasks	View All Incident Tasks and View the Tasks associated with an Incident
Incident Responders, Analysts	Filter tasks.	Filter the Tasks List
Incident Responders, Analysts	Create a task.	Create a Task
Incident Responders, Analysts	Find and modify tasks.	Find a Task and Modify a Task
Incident Responders, Analysts	Close a task (Change the Status to Remediated, Risk Accepted, or Not Applicable).	Modify a Task
Incident Responders, Analysts, SOC Managers	Delete a task.	Delete a Task

Related Topics

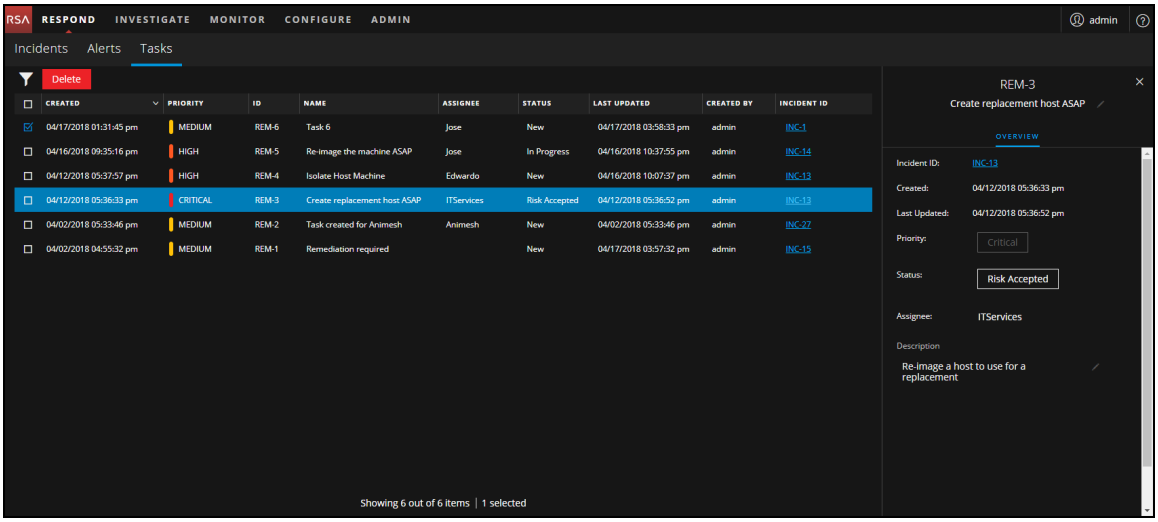
- Incident Details View
- Escalate or Remediate the Incident

Quick Look

To access the Tasks List view, go to **RESPOND > Tasks**. The Tasks List view displays a list of all incident tasks.



The Tasks List view consists of a Filters panel, a Tasks List, and a Task Overview panel. The following figure shows the Tasks List and the Overview panel.



Tasks List

The Tasks List shows all of the incident tasks. You can filter this list to show only tasks of interest.

Column	Description
	Enables you to select one or more tasks to modify or delete. Users with the appropriate permissions can make bulk updates and delete tasks, such as SOC Managers. For example, an SOC Manager may want to assign multiple tasks to a user at the same time.
CREATED	Displays the date when the task was created.

Column	Description
PRIORITY	Displays the priority assigned to the task. The priority can be any of the following: Critical, High, Medium, or Low. The Priority is also color coded, where red indicates **Critical**, orange represents **High** risk, yellow indicates **Medium** risk, and green represents **Low** risk as shown in the following figure: ID	Displays the task ID.
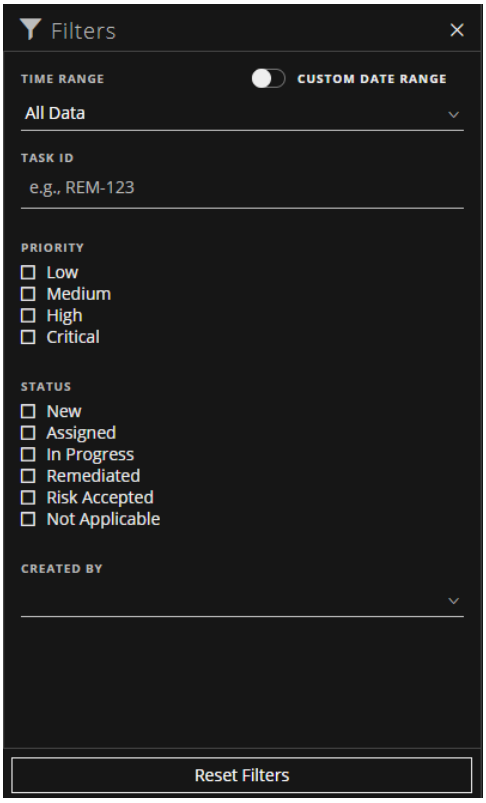
NAME	Displays the task name.
ASSIGNEE	Displays the name of the user assigned to the task.
STATUS	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable.
LAST UPDATED	Displays the date and time when the task was last updated.
CREATED BY	Displays the user who created the task.
INCIDENT ID	Displays the incident ID for which the task was created. Click the ID to display the details of the incident.

At the bottom of the list, you can see the number of tasks on the current page and the total number of tasks. For example: **Showing 23 out of 23 items**

Filters Panel

The following figure shows the filters available in the Filters panel.



The Filters panel, on the left of the Tasks List view, has options that you can use to filter the incident tasks.

Option	Description
TIME RANGE	You can select a specific time period from the Time Range drop-down list. The time range is based on the creation date of the tasks. For example, if you select Last Hour, you can see tasks that were created within the last 60 minutes.

Option	Description
CUSTOM DATE RANGE	You can specify a specific date range instead of selecting a Time Range option. To do this, click the white circle in front of Custom Date Range to view the Start Date and End Date fields. Select the dates and times from the calendar. TASK ID	You can type the Task ID for a task that you would like to locate, for example REM-123.
PRIORITY	You can select the priorities that you would like to view. If you make one or more selections, the Tasks list shows only those tasks with the selected priorities. For example: If you select Critical, the Tasks list shows only the tasks with a priority set to Critical.
STATUS	You can select the statuses that you would like to view. If you make one or more selections, the Tasks list shows only those tasks with the selected statuses. For example: If you select Assigned, the Tasks panel shows only the tasks that are assigned to users.
CREATED BY	You can select the user who created the tasks that you would like to view. For example, if you only want to view the tasks created by Edwardo, select Edwardo from the CREATED BY drop-down list. If you want to view tasks regardless of the person who created the task, do not make a selection under CREATED BY.

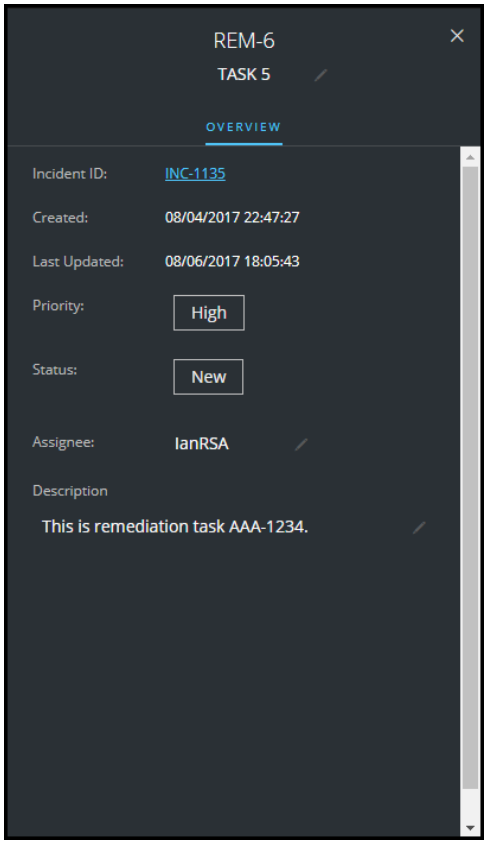
Option	Description
Reset Filters	Removes your filter selections.

The Tasks List shows a list of tasks that meet your selection criteria. You can see the number of items in your filtered list at the bottom of the tasks list. For example: **Showing 18 out of 18 items**

Task Overview Panel

To access the Task Overview panel:

1. Go to **RESPOND > Tasks**.
2. In the Task list, click the task that you want to view.
   The Task Overview panel appears to the right of the Tasks list.



The following table lists the fields displayed in the Task Overview panel.

Field	Description
<Task ID>	Displays the automatically assigned task ID.

Field	Description
<Task Name>	Displays the task name. This is an editable field. To change the task name, you can click the current task name to open a text editor. For example, you can change a task name from "Reimage a Laptop" to "Reimage a Server".
Incident ID	Displays the Incident ID for which the task was created. Click the ID to display the details of the Incident.
Created	Displays details about the date and time when the task was created.
Last Updated	Displays the date and time when the task was last updated.
Priority	Displays the priority of the task: Low, Medium, High, or Critical. To change the priority, you can click the priority button and select a priority for the task from the drop-down list.
Status	Displays the status of the task: New, Assigned, In Progress, Remediated, Risk Accepted, and Not Applicable. To change the status, you can click the status button and select a status for the task from the drop-down list.
Assignee	Displays the user assigned to the task. To change the user assigned to the task, you can click (Unassigned) or the name of the previous assignee to open a text editor.
Description	Shows task details. To modify the description, you can click the text underneath the description to open a text editor.

Toolbar Actions

This table lists the toolbar actions available in the Tasks List view.

Option	Description
	Enables you to open the Filters panel so that you can specify the tasks that you would like to see in the Tasks List.
	Closes the panel.

Option	Description
Delete button	Allows you to delete the selected tasks.

Add/Remove from List Dialog

The Add/Remove from List dialog allows you to add or remove an entity or meta value to an existing list or create a new list. For example, when you look up an IP address and you find it suspicious or interesting, you can add it to a relevant list, which has been added a data source. This improves the visibility of the suspicious IP addresses. You can also add entities or meta values to different lists. For example, you can add them to one list for suspected domains related to command and control connections and to another list for Trojan connections IP addresses related to remote access. If a list is not available, you can create a list. You can also remove the entity or meta value from a list.

Note: From the Add/Remove from List dialog, you can only add or remove entities or meta values from single column lists added as a datasource, not multi-column lists. And when you edit a list or a value in a list from the nodal view or the context lookup view, ensure to refresh the web page to view the updated data.

What do you want to do?

Role	I want to ...	Show me how
Incident Responders, Analysts	Add an entity to a list.	From the Incident Details view, see Add an Entity to a Whitelist. From the Alert Details view, Add an Entity to a Whitelist.
Incident Responders, Analysts	Create a whitelist, blacklist, or other list.	Create a List
Administrators	Add a Context Hub list as a data source.	See "Configure Lists as a Data Source" in the *Context Hub Configuration Guide*.
Administrators	Import or export a list for Context Hub.	See "Import or Export Lists for Context Hub" in the *Context Hub Configuration Guide*.

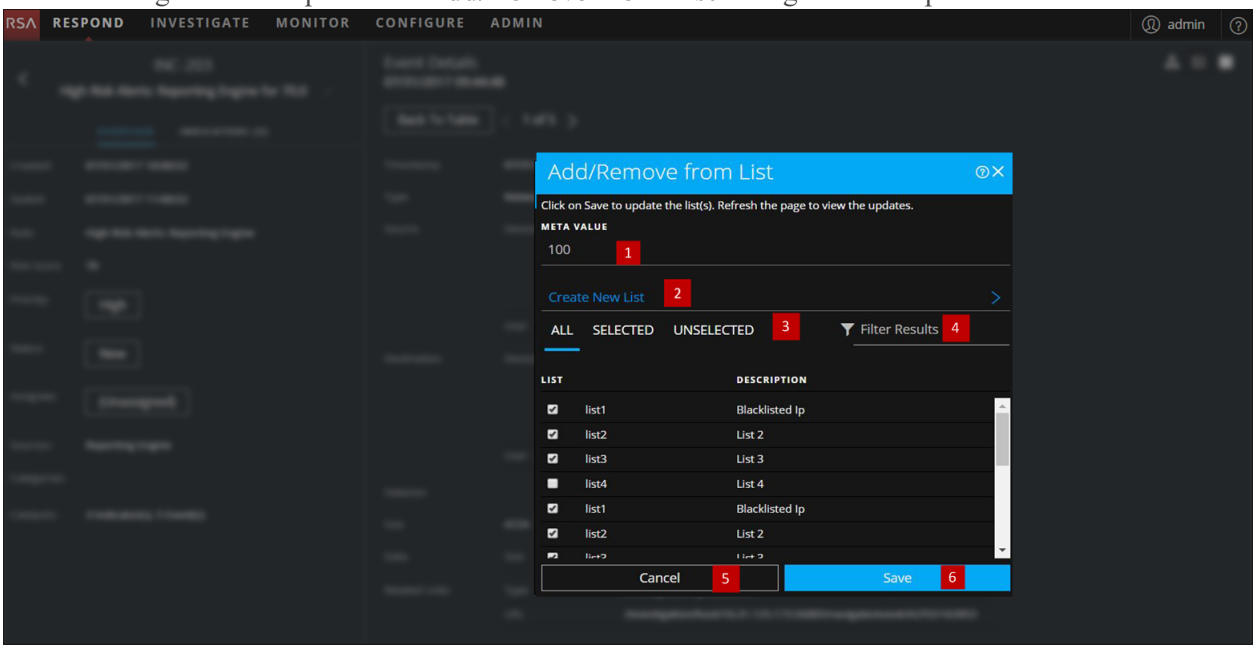
Related Topics

- Investigate the Incident
- Reviewing Alerts
- View Contextual Information (Incident Details view)
- View Contextual Information (Alert Details view)

Note: You cannot delete a list, but you can delete values within a list.

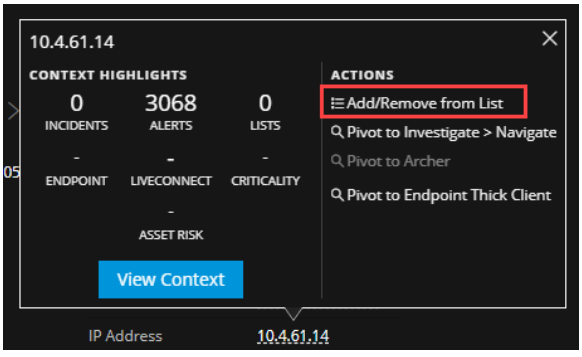
Quick Look

The following is an example of the **Add/Remove from List** dialog in the Respond view.

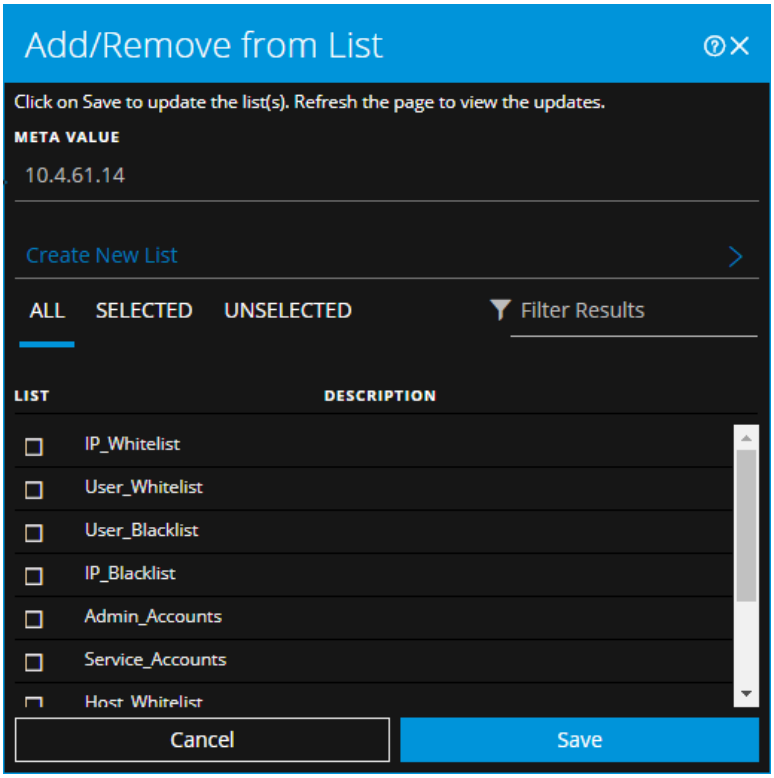


1. Entities or meta values to be added or removed.
2. Create a new list using the selected meta.
3. Select any of the tabs: All, Selected, or Unselected.
4. Search using the list name or description.
5. Cancel the action.
6. Save to update lists or create a new list.

To access the Add/Remove from List dialog, in the Incident Details view or the Alert Details view, hover over the underlined entity that you would like to add or remove from a Context Hub list. A context tooltip appears showing the available actions.



In the Actions section of the tooltip, click Add/Remove from List. The Add/Remove From List dialog shows the available lists.



The following table shows the options in the Add/Remove from List dialog.

Option	Description
META VALUE	Displays the selected entity or meta value that needs to be added to or removed from one or more lists. You can also a create a new list using the selected value.
Create New List	When clicked, it displays a dialog to create a new list using the selected meta value.
ALL	Shows all of the available Context Hub lists. The lists that contain the selected entity or meta value are selected. Select a checkbox to add an entity or meta value to a list. Clear a checkbox to remove it from the list.
SELECTED	Shows only the lists that contain the selected entity or meta value. (All lists are selected.)

Option	Description
UNSELECTED	Shows only the lists that do not contain the selected entity or meta value. (All lists are unselected.)
Filter Results	Enter the name or description of a specific list to search from multiple lists.
LIST	Displays the name of all the lists.
DESCRIPTION	Displays information about the selected list. The description that you provide when creating a list appears in this dialog. For example: This list contains all of the blacklisted IP addresses.
Cancel	Cancels the operation.
Save	Saves the changes.

Context Lookup Panel - Respond View

The Context Hub service brings together contextual information from several data sources into the Respond view so that analysts can make better decisions during their analysis and take appropriate action. Seeing the entities, meta values, and contextual information in a single interface helps analysts to prioritize and identify areas of interest. For example, recently created incidents and alerts from the Respond view involving a given entity or meta value will be displayed when the analyst queries for additional information for that entity or meta value. The Context Lookup panel displays contextual information for the selected entities or meta values such as IP address, User, Host, Domain, File Name, or File Hash. The data available depends on the configured sources in the Context Hub.

The Context Lookup panel displays the contextual information based on the data available on the configured sources in the Context Hub.

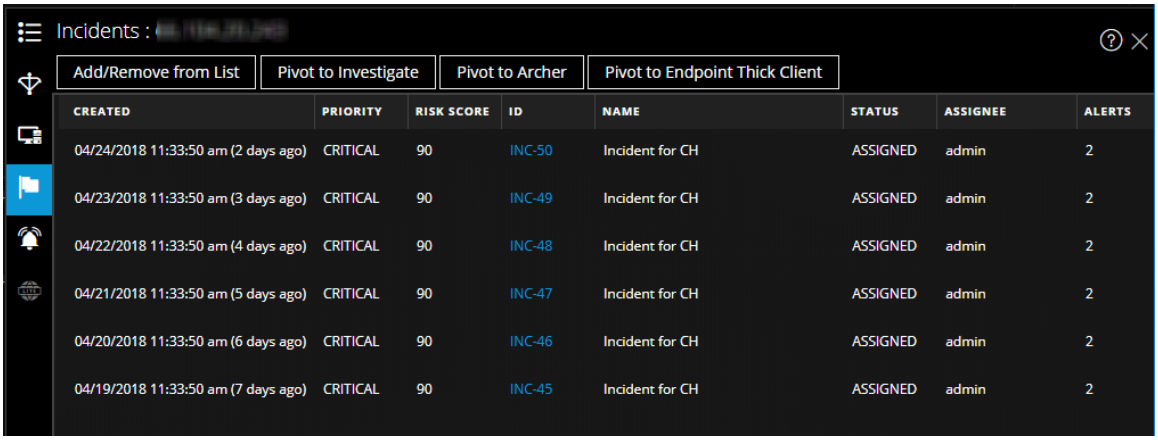
Contextual Information Displayed in the Context Lookup Panel

The contextual information or query results displayed in the Context Lookup panel depends on the selected entity and the associated data sources. The Context Lookup panel has separate tabs for each of the data sources. The tabs are: List data source, Archer, Active Directory, Endpoint, Incidents, Alerts, and Live Connect. The following figure displays the Context Lookup panel for a selected entity in the Incident Details view with the Incidents tab in view.



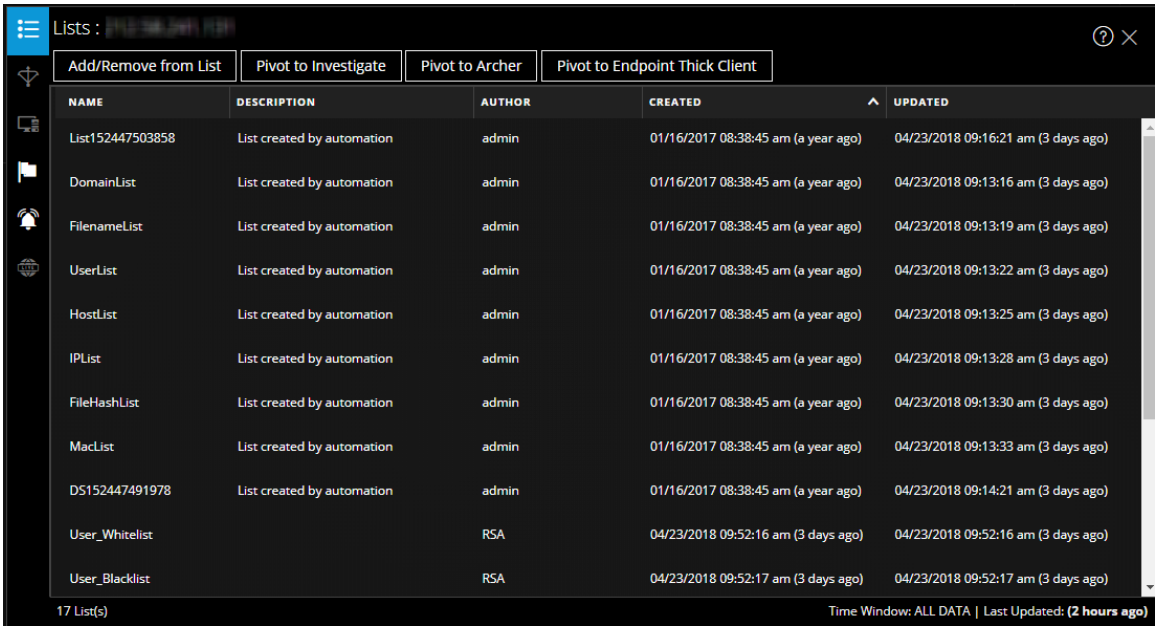
The following table describes the data available on each tab and the supported entities.

Tab	Description	Supported Entities
(Lists)	Displays all of the list data associated with the selected entity or meta value. The result is sorted by the last updated list.	All entities
(Archer)	Displays asset information along with criticality ratings using the Archer data source.	IP, Host, and Mac
(Active Directory)	Displays all user information for the selected user.	User

Tab	Description	Supported Entities
 (NetWitness Endpoint)	Displays the NetWitness Endpoint data source information for the selected entity or meta value, which includes the Machines, Modules, and IIOC levels. Modules are by highest IOC score to lowest IIOC score and IIOC levels are sorted by highest IOC levels to lowest IOC levels.	IP, MAC address, and Host
 (Incidents)	Displays the list of incidents associated with the selected entity or meta value. The result is sorted by newest incidents to oldest incidents.	All entities
 (Alerts)	Displays the list of alerts associated with the selected entity or meta value. The result is sorted by newest alerts to oldest alerts.	All entities
 (Live Connect)	Displays information related to Live Connect.	IP, Domain, and Filehash

Lists Tab

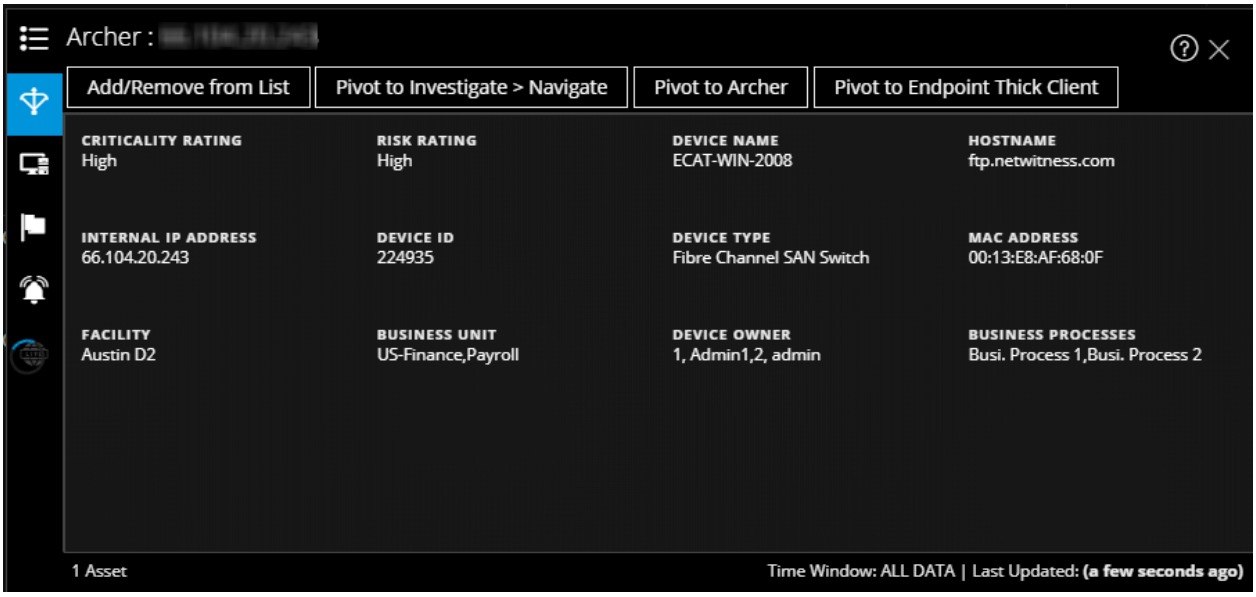
The Context Lookup panel for Lists shows one or more lists associated with the selected entity or meta value. The following figure is an example of the Context Panel for Lists, and the table describes the fields.



Field	Description
Name	The name of the list (defined while creating the list).
Description	The description of the list (defined while creating the list).
Author	The owner who created the list.
Created	The date when the list was created.
Updated	The date when the list was last updated or modifed.
Count	The number of lists in which the selected entity or meta value is available.
Time Window	The time window based on the value set for the "Query Last" field in the Configure Responses dialog. By default, all Lists data is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Archer Tab

The Context Lookup panel for Archer displays asset information along with criticality ratings using the Archer data source for IP, Host, and Mac entities. The following figure is an example of the Context Lookup panel for Archer, and the table describes each field.



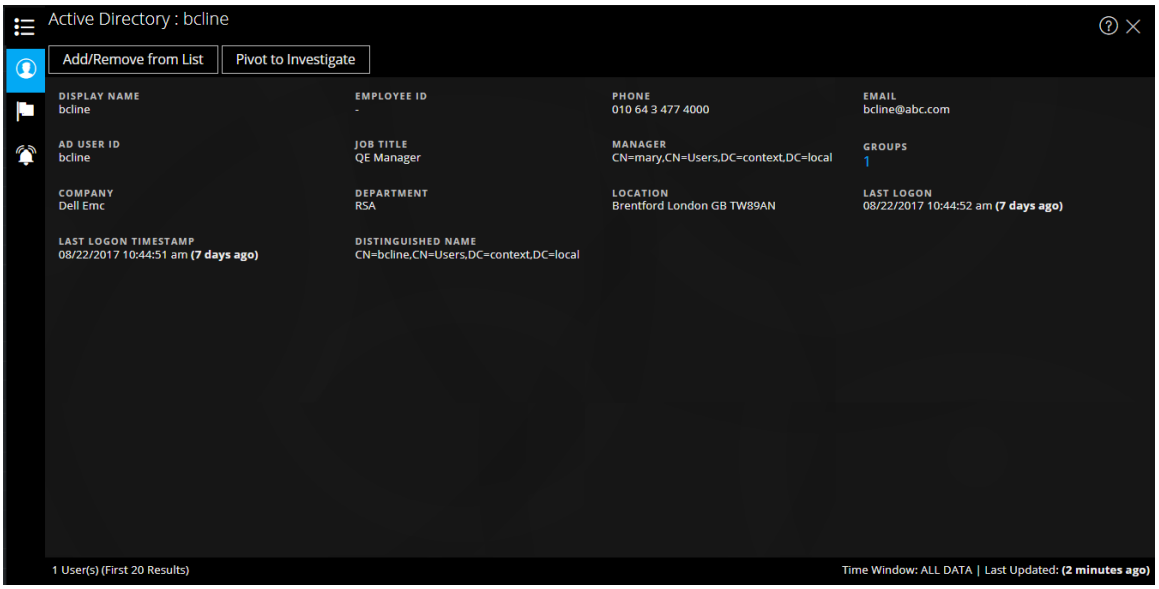
Field	Description
Criticality Rating	The device operational criticality based on the applications it supports. The criticality ratings can be set as Not Rated, Low, Medium-Low, Medium, Medium-High, or High.
Risk Rating	The calculated risk rating for the device based on the most recent assessment and the average risk rating of facilities using the device. The risk rating can be set as Severe, High, Medium, Low, or Minimal.
Device Name	The unique name of the device.
Host Name	The host name of the device.
IP Address	The primary internal IP address of the device.
Device ID	The automatically populated value that uniquely identifies the record across all applications within the system.
Type	The device type, for example, server, laptop, desktop, and others.
Facilities	Links to records in the Facilities application that are related to this device.

Field	Description
Business Unit	Links to records in the Business Unit application that are related to this device. For more than three business unit values, you can hover over the field to view the values.
Device Owner	The person who is responsible for the device and receives read and update rights of the record.
Count	The number of assets available.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Responses dialog. By default, all data for Archer is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

Note: In the localized versions, only these twelve fields are displayed: Criticality Rating, Risk Rating, Device Owner, Business Unit, Host Name, MAC Address, Facilities, IP Address, Type, Device ID, Device Name, and Business Processes.

Active Directory Tab

The following figure is an example of a Context Lookup panel for Active Directory.



The Context Lookup panel for Active Directory displays all the related information, incidents, and alerts for a user. You can perform a look up using the following formats:

- userPrincipalName
- Domain\UserName
- sAMAccountName

If the user exists in multi-domain or multi-forest, all the related context information is displayed for the specific user.

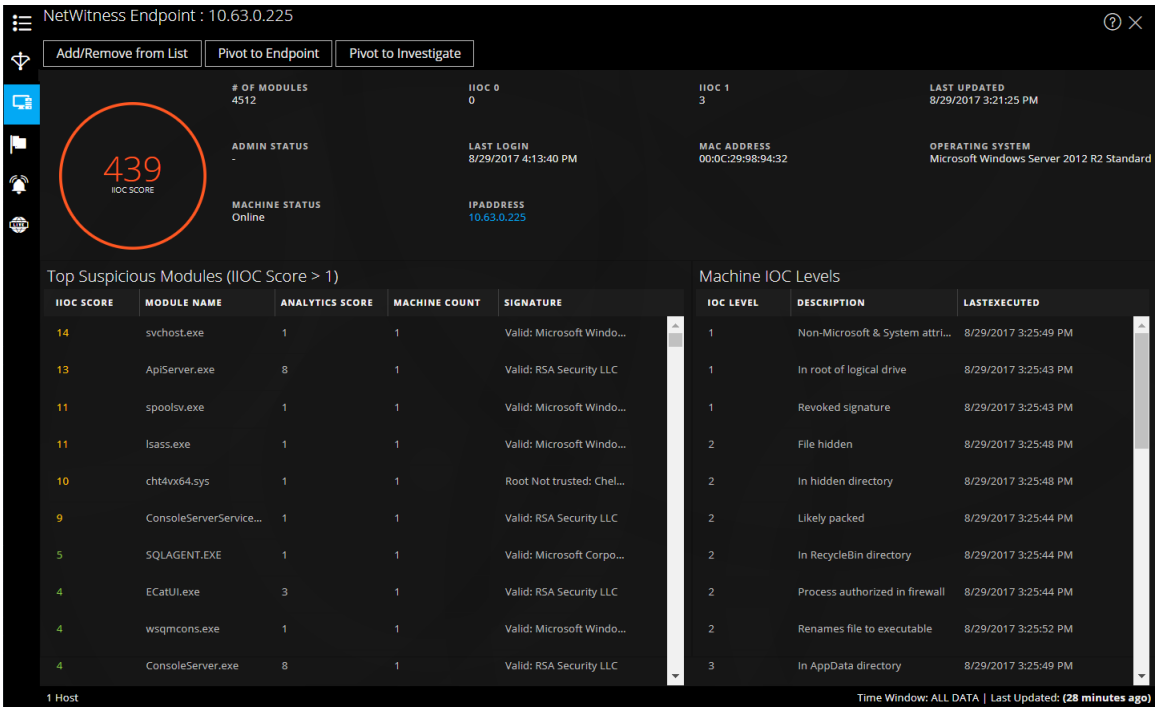
The following information is displayed for Active Directory.

Field	Description
Display Name	The name of the user.
Employee ID	The employee ID of the user.
Phone	The phone number of the user.
Email	The email ID of the user.
AD User ID	The unique identification of the user within an organization.
Job Title	The designation of the user.
Manager	The name of the user's manager.
Groups	The list of groups of which the user is a member.
Company	The name of the user's company.

Field	Description
Department	The department name to which the user belongs within the organization.
Location	The location of the user.
Last Logon	The time when the user logged into the system, only if the Global Catalogue is defined.
Last Logon TimeStamp	The time when the user logged into the system.
Distinguished Name	The unique name assigned to the user.
Count	The number of users.
Time Window	The time window based on the value that is set for the "Query Last" field in the Configure Data Source Settings dialog. By default, all data for Active Directory is fetched.
Last Updated	The time when Context Hub fetched and stored the lookup data in cache.

NetWitness Endpoint Tab

The following figure is an example of the Context Lookup panel for NetWitness Endpoint.



The following information displayed for IIOCs.

Field	Description
# Of Modules	The number modules that are looked up.
Admin Status	The admin status (if any).
Last Updated	The time when the data was last refreshed.
Last Login	The time when the user last logged in.
MAC Address	The Machine MAC Address.
Operating System	The Version of the Operating System used by the NetWitness Endpoint machine.
Machine Status	The state of the module being viewed: Online, Offline, Active, or Inactive.
IP Address	The IP address of the specific module.

The following information is displayed for modules.

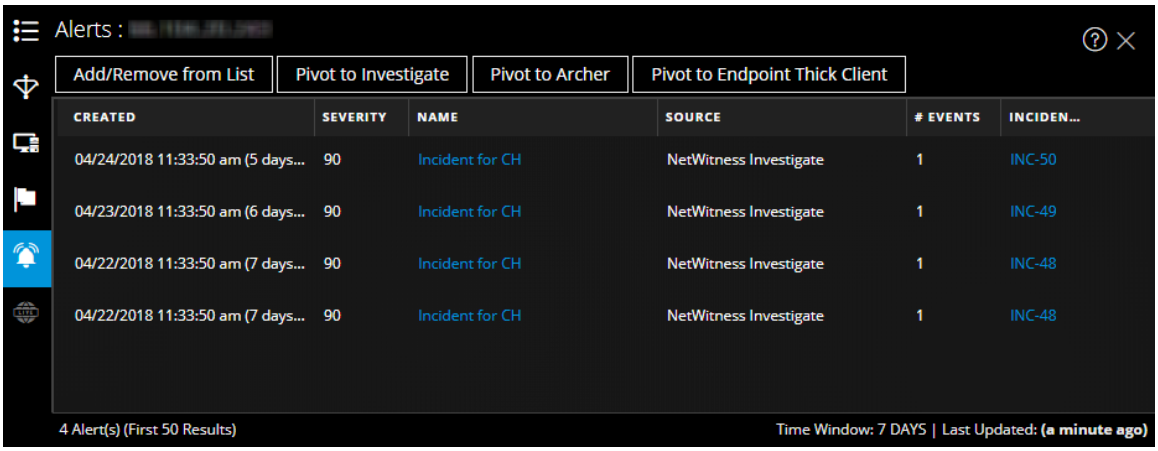
Field	Description
IIOC Score	A machine IIOC score is an aggregated score based on the module scores. This is based on the value set for Minimum IIOC Score field in the Context Hub Data Source Settings dialog. The default value for Minimum IIOC Score is 500. See "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Module Name	The name of the module that is being looked up.
Analystic Score	The number of active files for the selected machine.
Machine Count	The number of machines on which that particular IOC got triggered.
Signature	Indicator of whether the file is signed or unsigned, valid or invalid, and signatory information. For example, Google, Apple, and so on.

The following information is displayed for machines.

Field	Description
IOC Levels	The IOC levels.
Description	The description for he IOC level if available.
Last executed	The time when the action was executed.
Count	The number of hosts that are being looked up.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, all data for NetWitness Endpoint is fetched.
Last Updated	The time when scan results were last updated in NetWitness Endpoint database.

Alerts Tab

The following figure is an example of Context Panel for Alerts that is displayed based on time first (Newest to Oldest) and then severity.



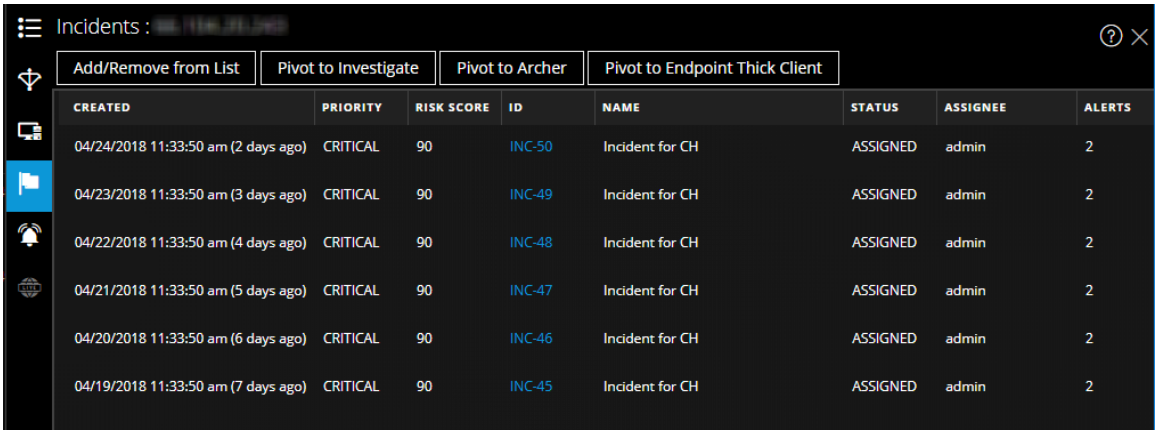
The following information is displayed in the Context Lookup panel for Alerts.

Field	Description
Created	The date and time when the alert was created.
Severity	The severity value of the alerts.
Name	The name of the alert. You can click the name to view the details of a specific alert.

Field	Description
Source	The alert source name from which the alert is triggered.
#Events	The number of events associated with the alert.
Incident ID	The ID of the incident (if any) with which the alert is associated. You can click the ID to view the details of a specific alert.
Count	The number of alerts. By default only the first 100 alerts are displayed. For more information on how to configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

Incidents Tab

The following figure is an example of the Context Panel for Incidents, which is based on time first (Newest to Oldest) and then priority status.



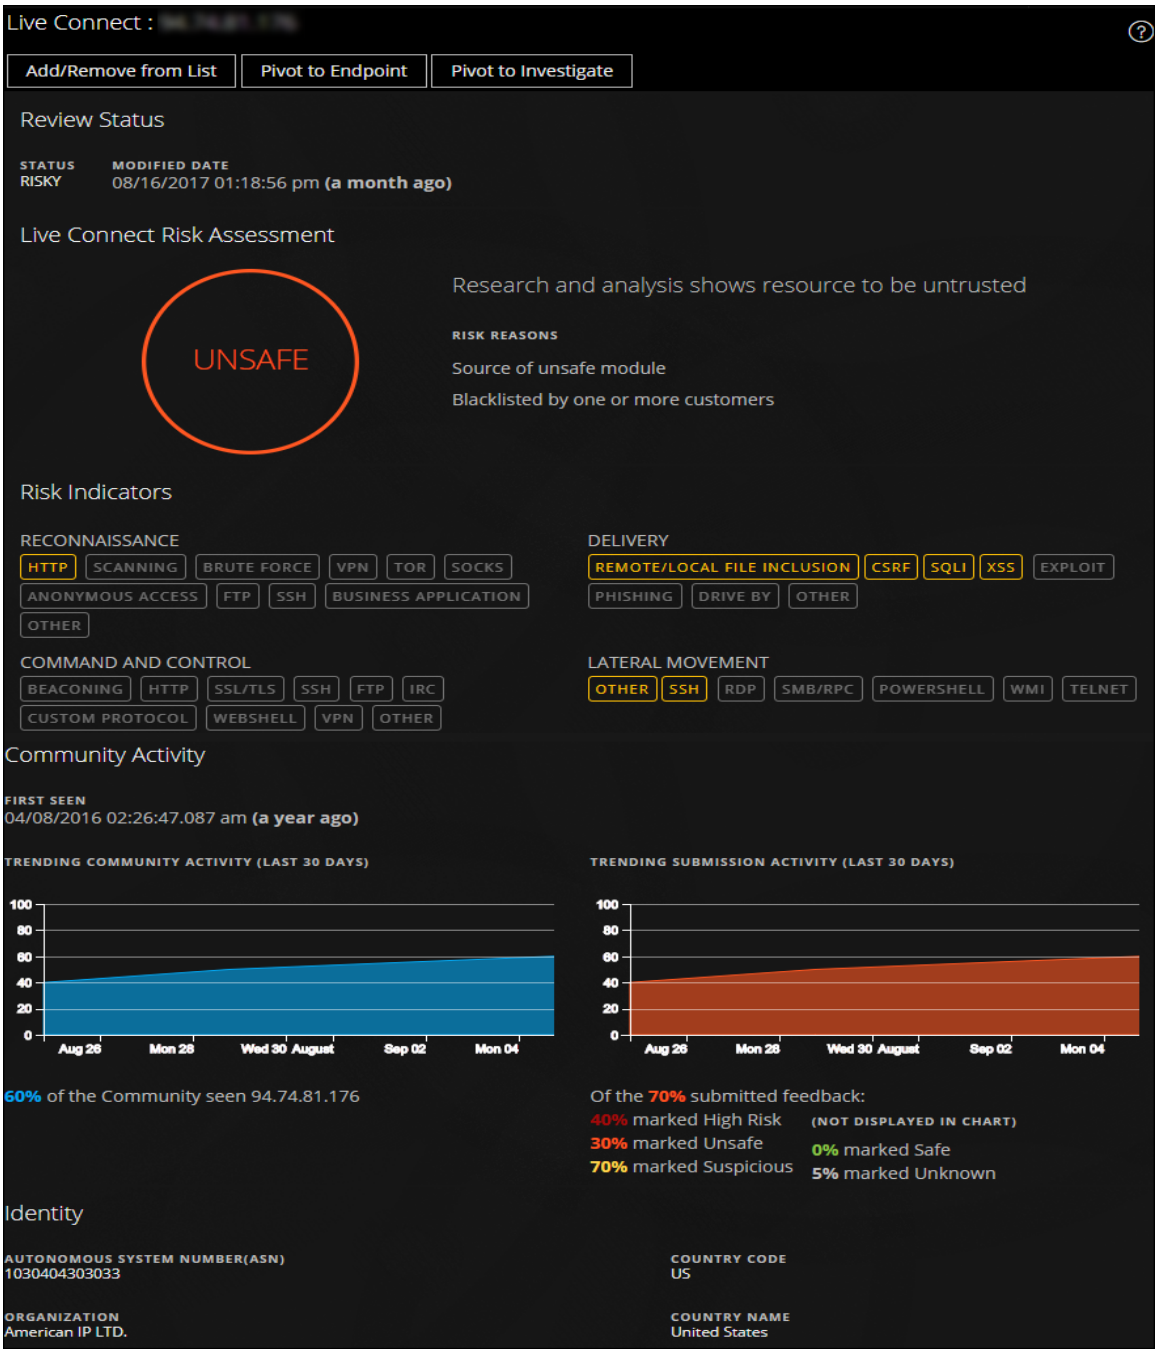
The following information is displayed in the Context Lookup panel for Incidents.

Field	Description
Created	The date when the incident was created.
Priority	The priority status of the incidents.
Risk Score	The risk score of the incidents.

Field	Description
ID	The Incident ID of the incident. You can click on the ID to display further details about the incident.
Name	The incident name.
Status	The status of the incident
Assignee	The current owner of the incident.
Alerts	The number of alerts associated with the incident.
Count	The number of incidents. By default only the first 100 incidents are displayed. For more information on how configure the settings, see "Configure Context Hub Data Source Settings" in the *Context Hub Configuration Guide*.
Time Window	The time window based on the value set for the Query Last field in the Configure Data Source Settings dialog. By default, the alert data for last 7 days is fetched.
Last Updated	The time when contextual data was last fetched from data source.

Live Connect Tab

The following figure is an example of a Context Panel for Live Connect, and the table describes the information displayed.



Field	Description
Review Status	The review status of the selected Live Connect entity (IP, file, or domain) based on the analyst activity. This gives the visibility of the analyst activity within an organization. **Status** Below are the types of status: • **New:** Lookup results for an IP address are viewed for the first time within the organization. • **Viewed:** Any analyst within the organization has already viewed the lookup results for an IP address. • **Marked as Safe:** Any analyst within the organization has already viewed the lookup results and marked the IP address as safe. • **Marked as Risky:** Any analyst within the organization has already viewed the lookup results and marked the IP address as risky.
Risk Assessment	The risk assessment for the selected Live Connect entity (IP, file, or domain) based on the Live Connect analysis and analyst feedback. The Risk Assessment categories are: • **Safe:** The Live Connect entity is considered to be safe. • **Unknown:** Live Connect does not have enough information about this entity to calculate the risk. • **High Risk**: Marked as high risk based on the analysis and risk reasons provided by the community. Entities marked as high risk require immediate attention. • **Suspicious**: Marked as suspicious based on the analysis and risk reasons provided by the community. The analysis indicates potentially threatening activity that requires action. • **Unsafe:** Marked as unsafe based on the analysis and risk reasons provided by the community. The entity is rated as High Risk, Suspicious, or Unsafe and displays the associated risk reasons accordingly.

Field	Description
Risk Assessment Feedback	 Risk Assessment Feedback allows the analyst to submit threat intelligence feedback about an entity to the Live Connect server. • **Analyst Skill Level** Below are the Analyst skill level options: ◦ **Tier 1** - Analysts at this level define procedures for remediation, and decide if an incident should be escalated to other areas in a Security Operation center (SOC). This is the default value. ◦ **Tier 2** - Analysts who investigate incidents and capture intelligence from an investigation to feed back into the various workflows in a SOC. ◦ **Tier 3** - Analysts who share the investigation results to the SOC organization. They generally manage incidents and have a wide breadth and depth of skills and tools necessary for incident response. **Note:** While creating a new user for NetWitness Platform (Analyst), an administrator should be able to identify the user as Tier 1, Tier 2, or Tier 3 Analyst. • **Risk Confirmation** - The risk confirmation for the selected Live Connect entity (IP, file, or domain). The Risk confirmation categories are: ◦ **Safe**: The Live Connect entity is considered to be safe. ◦ **Unknown**: The analyst does not have enough information to provide a risk confirmation ◦ **High Risk**: Marked as high risk based on the analysis and risk reasons provided by the community. Entities marked as high risk require immediate attention. ◦ **Suspicious**: Marked as suspicious based on the analysis and risk reasons provided by the community. The analysis indicates potentially threatening activity that requires action. ◦ **Unsafe**: Marked as unsafe based on the analysis and risk reasons provided by the community. • **Confidence Level** - The confidence level of an analyst in providing feedback for the Live Connect entity. The confidence level categories are: High, Medium, and Low. • **Risk Indicator Tags** - Allows you to select a tag category based on the analysis.

Field	Description
Community Activity	Community activities such as: • Date first seen in the community. • Time since the IP/File/Domain was seen for the first time (Current time - First seen time). **Trending Community Activity:** If the IP address is known within the RSA community, a graphical representation of the community activity trend is displayed for the following: • Users (in %) who have viewed the IP address in the Live Connect community over time. • Users (in %) who submitted feedback for the IP address. • Users (in %) who marked the IP address as unsafe over time.
Risk Indicators	 Risk indicators are highlighted based on the tags that are assigned by the community to the entities (IPs, Files, or Domains). The tags are categorized as follows: Reconnaissance, Delivery, Command and Control, Lateral Movement, Privilege Escalation, and Packaging and Exfiltration. These tags are samples and vary based on the inputs received from the community on the Live Connect server. The analyst can choose the appropriate risk indicator tags while providing the review feedback. A highlighted tag indicates that the selected entity is associated with that particular category and tag. Clicking a highlighted tag displays the description of the tag.
Identity	Provides the following identity information for the selected entity or meta value: For IP address: Autonomous System Number (ASN), Prefix, Country Code and Country Name, Registrant (Organization), and Date. For File Hash: File Name, File Size, MD5, SH1, SH256, Compile Time, and Mime Type. For Domain: Domain Name and Associated IP Address.
Certificate Information	Provides the following certificate information for the selected file hash: Certificate Issuer, Validity of the Certificate, Signature Algorithm, and Certificate Serial Number.

Field	Description
WHO IS Information	 The **WHO IS** information provides the ownership details for a given domain. The following information about the domain owner is displayed: Created Date, Updated Date, Expired Date, Type (Registration Type), Name, Organization, Address with Postal code, Country, Phone, Fax, and Email.
Related Files	Related Files are displayed for entity types IP and Domain. A list of known associated files is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), File Name, MD5, Compile Time and Date, API Function, Import Hash, and Mime Type.
Related Domains	Related Domains are displayed for entity types IP and Files. A list of known associated domains is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), Domain Name, Country Name, Registered Date, Expired Date, and Registrant Email address.

Field	Description
Related IPs	
Related IPs are displayed for entity types Domain and Files. A list of known associated IPs is displayed along with the following information: Live Connect Risk Rating (Safe, Risky, or Unknown), IP Address, Domain Name, Country Code and Country Name, Country Name, Registered Date, Expired Date, and Registrant Email address.

Introduction

RSA NetWitness UEBA (User and Entity Behavior Analytics) is an advanced analytics solution for discovering, investigating, and monitoring risky behaviors across all users and entities in your network environment. NetWitness UEBA is used for:

- Detecting malicious and rogue users
- Pinpointing high-risk behaviors
- Discovering attacks
- Investigating emerging security threats

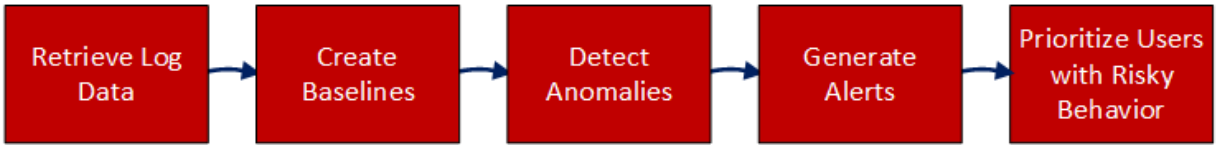
Note: Only Windows logs are supported out of the box. You can add additional log sources to feed existing models. For more information, see Supported Log Sources.

NetWitness UEBA leverages existing data in NetWitness Platform logs and empowers enterprise SOC and analysts with the insights and investigative capabilities to mitigate cyber threats.

This guide is designed for Analysts and SOC Managers, and provides information and instructions for using all NetWitness UEBA functions and capabilities. It describes key investigation methodologies, the main system capabilities, common use cases, and step-by-step instructions for recommended workflow strategies.

How NetWitness UEBA Works

NetWitness UEBA uses analytics to detect anomalies in log data and derives behavioral results from them. There are five basic steps to this process, as shown in the following diagram:



The following table provides a brief description of each of these steps.

Step	Description	More Information
1. Retrieve Log Data	NetWitness UEBA retrieves log data from the NetWitness Platform Database (NWDB) and uses the data to create analytic results.	See Retrieve Log Data
2. Create Baselines	Baselines are derived from detailed analysis of normal user behavior, and are used as a basis for comparison to user behavior over time.	See Create Baselines

Step	Description	More Information
3. Detect Anomalies	An anomaly is a deviation from a user's normal baseline behavior. NetWitness UEBA performs a statistical analysis to compare each new activity to the baseline. User activities that deviate from expected baseline values are scored accordingly to reflect the severity of the deviation.	See Detect Anomalies
4. Generate Alerts	All the anomalies found in step 3 are grouped into hourly batches. Each batch is scored based on the uniqueness of its indicators. If the indicator composition is unique compared to a user's historic hourly batch compositions, it is likely that this batch will be transformed into an alert.	See Generate Alerts
5. Prioritize Users with Risky Behavior	NetWitness UEBA prioritizes the potential risk from a user by using a simplified additive scoring formula. Each alert is assigned a severity that increases a user's score by a predefined number of points. Users with high scores either have multiple alerts associated with them, or have alerts of high levels of severity associated with them.	See Prioritize Users with Risky Behavior

Retrieve Log Data

The NetWitness UEBA server connects to the Broker or Concentrator service to retrieve log data from Concentrators. You can use the Broker service that is available on the NetWitness Platform Admin server if you do not have an exclusive Broker in your deployment. During NetWitness UEBA installation, the administrator specifies the IP address of the Broker service.

For more information, see the "(Optional) Task 2 - Install NetWitness UEBA" topic in the *NetWitness Platform 11.2 Physical Host Installation Guide*.

Create Baselines

NetWitness UEBA uses machine learning to analyze multiple aspects of a user’s actions within a stream of log data and gradually builds a multi-dimensional baseline of typical behavior for each user. For example, the baseline can include information about the hours in which a user typically logs on.

Behavioral baselines are also created on a global level to describe common activities observed throughout the network. If a working hour was abnormal for a user, but is not abnormal for the organization, the false-positive reduction algorithms decreases the impact on the alert score.

Models are updated frequently and are constantly improving as time goes on.

Note: NetWitness UEBA requires 28 days of historical log data to create a proper baseline for all the users in your network. However, RSA recommends that you configure NetWitness UEBA to start baselining your data two months prior to your deployment date <today-60days>. The first 28 days will be used for model training and will not be scored. The remaining 32 days are leveraged to improve and update the model, and are also scored to provide initial value.

Note: For version 11.2, there is limited support for environments with multiple domains. Distinct username values, that are registered under different domains, will be normalized, and then combined into one modeled entity. As a result, different users, who share the same username in different domains, will wrongfully be attributed to a single normalized entity.

Detect Anomalies

After establishing a behavioral baseline for all the users in your environment, each incoming event is compared to the baseline, and is given a score to determine if the new behavior is abnormal, and particularly, if it is a strong deviation from the baseline. For example, if a user's normal working hours are 9:00 AM to 5:00 PM, a new activity at 6:00 PM or 7:00 PM is not a strong deviation, and is probably not scored as an anomaly. However, an authentication at midnight is a strong deviation and is scored as an anomaly.

If anomalies are detected, they are turned into Indicators of Compromise, described as Indicators in the UI. NetWitness UEBA uses indicators to define validated anomalous activity, such as suspicious user logons, brute-force password attacks, unusual user changes and abnormal file access. Indicators either represent anomalies found in a single event or multiple events batched over time.

Generate Alerts

All the anomalies that are found are grouped into username and hourly batches. Each batch is scored based on the uniqueness of the composition of its indicators. If a composition is unique compared to the user's history, it is likely that this batch will be transformed into an alert, and the anomalies into indicators. A high-scored batch of anomalies becomes an alert that contains validated indicators of compromise.

For example, one abnormal activity by itself, even if it happens hundreds of times a day in a large corporate environment, does not necessarily reflect an account compromise. However, an abnormal behavior that occurs with a lot of other abnormal behaviors could indicate that the account is compromised. These three behaviors occurring together may indicate that additional analysis is required.

- Authentication from an abnormal computer
- Multiple authentication attempts identified in a short time frame
- Multiple files have been deleted by this user from the corporate file share

Note: The NetWitness UEBA user interface can initially appear as empty because alerts are not generated until the baselines are established. If there is no historical audit data when NetWitness UEBA is enabled, the system starts generating the baselines from the time it is deployed, and require 28 full days to elapse before beginning to generate new alerts. If historical audit data is processed when NetWitness UEBA is enabled, alerts appear after the historical data has been processed, usually within two to four days.

Prioritize Users with Risky Behavior

User scores are a primary tool for incident prioritization. The user score is based on a simple additive calculation of the user's alerts. Alerts and analyst feedback are the only factors in the user score calculation, with the impact on the scores determined by their levels of severity.

A unified color code is used for user and alert scores:

Severity	Color	Score
Critical	Red	+20
High	Orange	+15
Medium	Yellow	+10
Low	Green	+1

Supported Log Sources

NetWitness UEBA natively supports the following Windows log sources:

- Windows Active Directory
- Windows Logon and Authentication Activity
- Windows File Servers

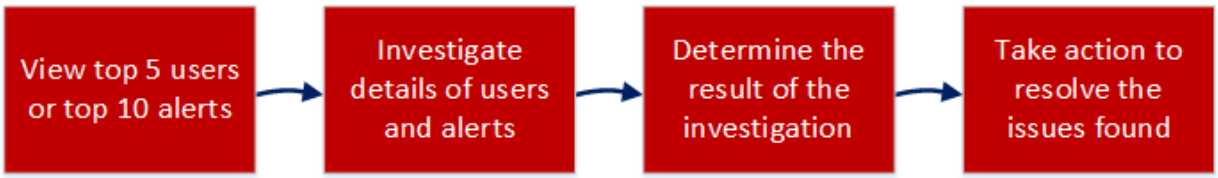
Recommended Workflows

To use NetWitness UEBA most effectively, there are two workflows; Detection workflow and Forensic workflow, that you can follow.

Detection Workflow

The detection workflow allows you to gain an overview of the health of your environment, and then focus on investigating the top high-risk users and alerts that are displayed in the Overview tab.

The following flowchart illustrates the steps you can follow to begin detecting suspicious behavior in your environment.



The following table describes each step in the workflow.

Step	Description	Instructions
View top five users or top 10 alerts	In the Overview tab, note the users with the riskiest behaviors and the top most critical alerts.	Investigate High-Risk Users and Investigate Top Alerts
Investigate details of users and alerts	Drill into detailed information about risky user behaviors and critical alerts to try to determine the cause of these actions and how to resolve them.	Investigate High-Risk Users and Investigate Indicators
Determine the result of the investigation	Analyze the summary information provided in the user interface from the previous steps and identify areas to focus on to resolve the issues you found.	Identify High-Risk Users and Investigate Indicators
Take action to resolve the issues found	Target specific user behaviors and events to address, and use the results of this investigation to improve and sharpen future investigations.	Take Action on High-Risk Users

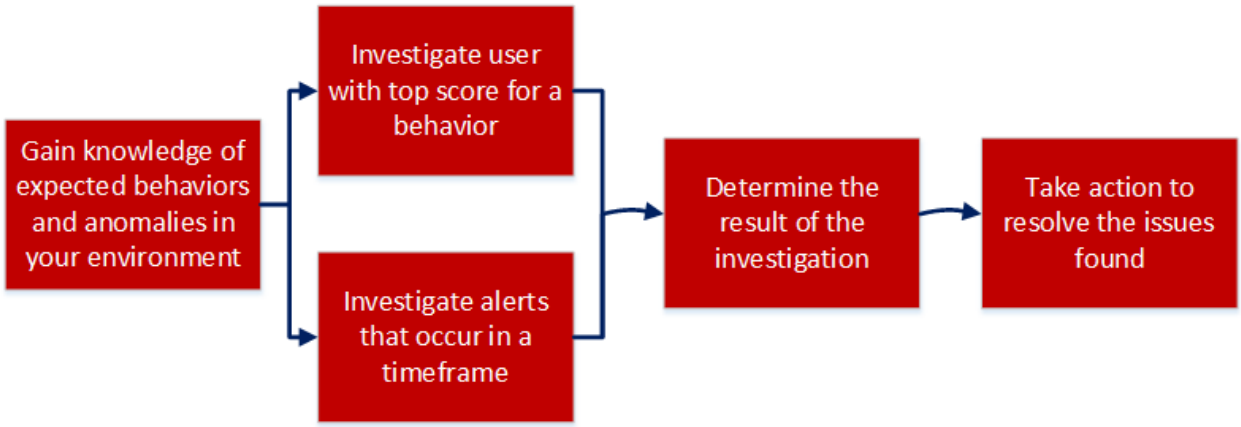
Forensic Workflow

The forensic workflow is recommended when you have gained an understanding of the typical user behaviors and anomalies in your environment, and helps you focus on specific forensic information that is based on a user behavior, or a specific timeframe in which suspicious events occurred.

Using Forensics information, the analysts may determine the actions and behaviors that the attacker is likely to attempt using the following questions:

- What fundamental techniques and behaviors are common across all intrusions?
- What evidence do these techniques leave behind?
- What do attackers do?
- What are normal behaviors of my accounts and entities?
- Which are my sensitive machines and where are they located?

The following flowchart illustrates how to perform your investigation on forensic information that is based on a specific user behavior, or a specific timeframe in which suspicious events occurred.



The following table describes each step in the workflow.

Step	Description	Instructions
Gain knowledge of expected behaviors and anomalies in your environment	Establish a baseline of normal behaviors, expected anomalies, and unexpected anomalies, so that you can focus on anomalies that are significant for your environment.	Retrieve Log Data, Detect Anomalies, and Generate Alerts.
Investigate user with top score for a specific behavior	Select a user with a high score for a specific behavior and gather detailed information.	Investigate High-Risk Users and Investigate Indicators.
Investigate alerts that occur in a specific timeframe	Determine a timeframe of interest, and in the Alerts tab, select that timeframe to see detailed information about alerts that occurred during that time period.	Investigate Indicators

Step	Description	Instructions
Determine the result of the investigation	Based on your knowledge of expected user behavior, focus on the indicators that are displayed during the specified time period and determine if the anomalies that were discovered need to be resolved.	Investigate Indicators and Identify High-Risk Users
Take action to resolve the issues found	Target specific user behaviors and events to address, and use the results of this investigation to improve and sharpen future investigations.	Take Action on High-Risk Users

Access NetWitness UEBA

Note: To access the NetWitness UEBA service and Users tab, you must be assigned to either the UEBA_Analyst role or Administrators role. For information about how to assign these roles, see the "How Role-Based Access Control Works" topic in the *System Security and User Maintenance Guide*. You must also ensure that you have proper NetWitness UEBA licensing configured. For information about NetWitness UEBA licensing, see the "User and Entity Behavior Analytics License" topic in the *Licensing Management Guide*.

To access NetWitness UEBA, log into NetWitness Platform and go to **Investigate** > **Users**. The Users view, which contains all the NetWitness UEBA features, is displayed.

NetWitness UEBA Indicators

The following tables list indicators that display when potentially malicious activity is detected.

Windows File Servers

Indicator	Alert Type	Description
Abnormal File Access Time	Non-Standard Hours	A user has accessed a file at an abnormal time.
Abnormal File Access Permission Change	Mass Permission Changes	A user changed multiple share permissions.
Abnormal File Access Event	Abnormal File Access	A user has accessed a file abnormally.
Multiple File Access Permission Changes	Mass Permission Changes	A user changed multiple file share permissions.
Multiple File Access Events	Snooping User	A user changed multiple file share permissions.
Multiple Failed File Access Events	Snooping User	A user failed multiple times to access a file.
Multiple File Open Events	Snooping User	A user opened multiple files.
Multiple Folder Open Events	Snooping User	A user opened multiple folders.
Multiple File Delete Events	Abnormal File Access	A user deleted multiple files.

Active Directory

Indicator	Alert Type	Description
Abnormal Active Directory Change Time	Non-Standard Hours	A user made Active Directory changes at an abnormal time.
Abnormal Active Directory Change	Abnormal AD Changes	An abnormal change to an Active Directory attribute was made.
Multiple Group Membership Changes	Mass Changes to Groups	A user successfully made multiple changes to groups.
Multiple Account Management Changes	Abnormal AD Changes	A user successfully made multiple Active Directory changes.

Indicator	Alert Type	Description
Multiple User Account Management Changes	Abnormal AD Changes	A user successfully made multiple sensitive Active Directory changes.
Multiple Failed Account Management Changes	Abnormal AD Changes	A user failed to make multiple Active Directory changes.
Admin Password Changed	Admin Password Change	An admin's password was changed.
User Account Enabled	Sensitive User Status Changes	A user's account was enabled.
User Account Disabled	Sensitive User Status Changes	A user's account was disabled.
User Account Unlocked	Sensitive User Status Changes	A user's account was unlocked.
User Account Type Changed	Sensitive User Status Changes	A user's type was changed.
User Account Locked	Sensitive User Status Changes	A user's account was locked.
User Password Changed	Sensitive User Status Changes	A user's password was changed.

Logon Activity

Indicator	Alert Type	Description
Abnormal Logon Time	Non-Standard Hours	A user logged on at an abnormal time.
Abnormal Computer	User Login to Abnormal Host	A user attempted to access an abnormal computer.
Multiple Successful Authentications	Multiple Logons by User	A user logged on multiple times.
Multiple Failed Authentications	Multiple Failed Logons	A user failed multiple authentication attempts.
Logged onto Multiple Computers	User Logged into Multiple Hosts	A user attempted to log on from multiple computers.

NetWitness UEBA Use Cases for Windows Logs

NetWitness UEBA focuses on providing advanced detection capabilities to guard enterprises from insider threats. These could either be compromised trusted users of the network, or alternatively, a malicious external attacker taking advantage of credentials acquired by using advanced account takeover techniques.

Identity theft typically begins with the theft of credentials, which are then used to obtain unauthorized access to resources and to gain control over the network. Attackers may also exploit compromised non-admin users to obtain access to resources for which they have administrative rights, and then escalate those privileges.

An attacker who uses stolen credentials may trigger suspicious network events while accessing resources. Detecting illicit credential use is possible, but requires that you separate attacker activity from the high volume of legitimate events. NetWitness UEBA helps you separate possibly malicious activity from the otherwise abnormal, but not risky, user actions.

The following use cases define certain risk types, and the corresponding system capabilities used for their detection. You can review the use cases, represented by their Alert Type and Description, to gain an initial understanding of the related risky behavior of each. Using NetWitness UEBA, you can then drill down into the Indicators that reflect the possibly risky user activities to learn more. For more information about NetWitness UEBA-supported indicators, see NetWitness UEBA Indicators.

Alert Type	Description
Mass Changes to Groups	An abnormal number of changes have been made to groups. Investigate which elements have been changed, and decide if the changes were legitimate or possibly the result of risky or malicious behavior. This activity is usually associated with the **Multiple Group Membership Changes** indicator.
Elevated Privileges Granted	Elevated account privileges have been delegated to a user. Attackers often use regular user accounts, granting them elevated privileges, to exploit the network. Investigate the user that received the elevated privileges, and decide if these changes were legitimate or possibly the result of risky or malicious behavior. This activity is usually associated with the **Nested Member Added to Critical Enterprise Group** and **Member Added to Critical Enterprise Group** indicators.
Multiple Failed Logons	In traditional password cracking attempts, the attacker tries to obtain a password through guesswork or by employing other low-tech methods to gain initial access. The attacker risks getting caught or being locked out by explicitly attempting to authenticate; but with some prior knowledge of the victim's password history, may be able to successfully authenticate. Look for additional abnormal indications that the account owner is not the one attempting to access this account. This activity is usually associated with the **Multiple Failed Authentications** indicator.

Alert Type	Description
User Logins to Multiple AD Sites	Domain controllers store credential password hashes for all accounts on the domain, so they are high-value targets for attackers. Domain controllers that are not stringently updated and secured are susceptible to attack and compromise, which could leave the domain vulnerable. User privileges on multiple domains could indicate that a parent domain has been compromised. Determine if user access to and from multiple sites is legitimate or is an indication of a potential compromise. This activity is usually associated with the **Logged into Multiple Domains** indicator.
User Login to Abnormal Host	Attackers often need to reacquire credentials and perform other sensitive activities, like using remote access. Tracing the access chain backwards may lead to the discovery of other computers involved in possibly risky activity. If an attacker's presence is limited to a single compromised host or to many compromised hosts, that activity can be associated with the **Abnormal Computer** indicator.
Data Exfiltration	Data exfiltration is the unauthorized copying, transfer, or retrieval of data from a computer or server. Data exfiltration is a malicious activity performed through various techniques, typically by cyber criminals over the Internet or other network. This activity can be associated with the **Excessive Number of File Rename Events**, **Excessive Number of Files Moved from File System**, and **Excessive Number of Files Moved to File System** indicators.
Mass File Rename	Ransomware is a type of malware that encrypts desktop and system files, making them inaccessible. Some ransomware, for example, "Locky", encrypts and renames files as part of their initial execution. Use this indication of mass-file-renaming to determine if your file system has been infected with ransomware. This activity can be associated with the **Multiple File Rename Events** indicator.
Snooping User	Snooping is unauthorized access to another person's or company's data. Snooping can be as simple as the casual observance of an e-mail on another's computer, or watching what someone else is typing. More sophisticated snooping uses software programs to remotely monitor activity on a computer or network device. This activity can be associated with the **Multiple File Access Events**, **Multiple Failed File Access Events**, **Multiple File Open Events**, and **Multiple Folder Open Events** indicators.
Multiple Logons by User	All authentication activity, malicious or not, appears as normal logons. Therefore, administrators should monitor unexpected authorized activity. The key is that attackers use these stolen credentials for unauthorized access, which may provide an opportunity for detection. When an account is being used for unusual activities, for example, authenticating an unusual amount of times, the account may have been compromised. This activity can be associated with the **Multiple Successful Authentications** indicator.

Alert Type	Description
User Logged into Multiple Hosts	Attackers typically need to reacquire credentials periodically. This is because their keychain of stolen credentials naturally degrades over time, due to password changes and resets. Therefore, attackers frequently maintain a foothold in the compromised organization by installing backdoors and maintaining credentials from many computers in the environment. This activity can be associated with the **Logged onto Multiple Computers** indicator.
Admin Password Change	Shared long-term secrets, for example, privileged account passwords, are frequently used to access anything from print servers to domain controllers. To contain attackers that seek to leverage these accounts, pay close attention to password changes by admins, and ensure they have been made by trusted parties and have no additional abnormal behavior associated with them. This activity can be associated with the **Admin Password Change** indicator.
Mass Permission Changes	Some credential theft techniques, for example, Pass-the-Hash, use an iterative, two-stage process. First, an attacker obtains elevated read-write permission to privileged areas of volatile memory and file systems, which are typically accessible only to system-level processes on at least one computer. Second, the attacker attempts to increase access to other computers on the network. Investigate if abnormal permission changes have taken place on the file systems to ensure that they were not compromised by an attacker. This activity can be associated with the **Multiple File Access Permission Changes**, **Multiple Failed File Access Permission Changes**, and **Abnormal File Access Permission Change** indicators.
Abnormal AD Changes	If an attacker gains highly-privileged access to an Active Directory domain or domain controller, that access can be leveraged to access, control, or even destroy the entire forest. If a single domain controller is compromised and an attacker modifies the AD database, those modifications replicate to every other domain controller in the domain, and depending on the partition in which the modifications are made, the forest as well. Investigate abnormal changes conducted by admins and non-admins in AD to determine if they represent a possible true compromise to the domain. This activity can be associated with the **Abnormal Active Directory Change**, **Multiple Account Management Changes**, **Multiple User Account Management Changes**, and **Multiple Failed Account Management Changes** indicators.

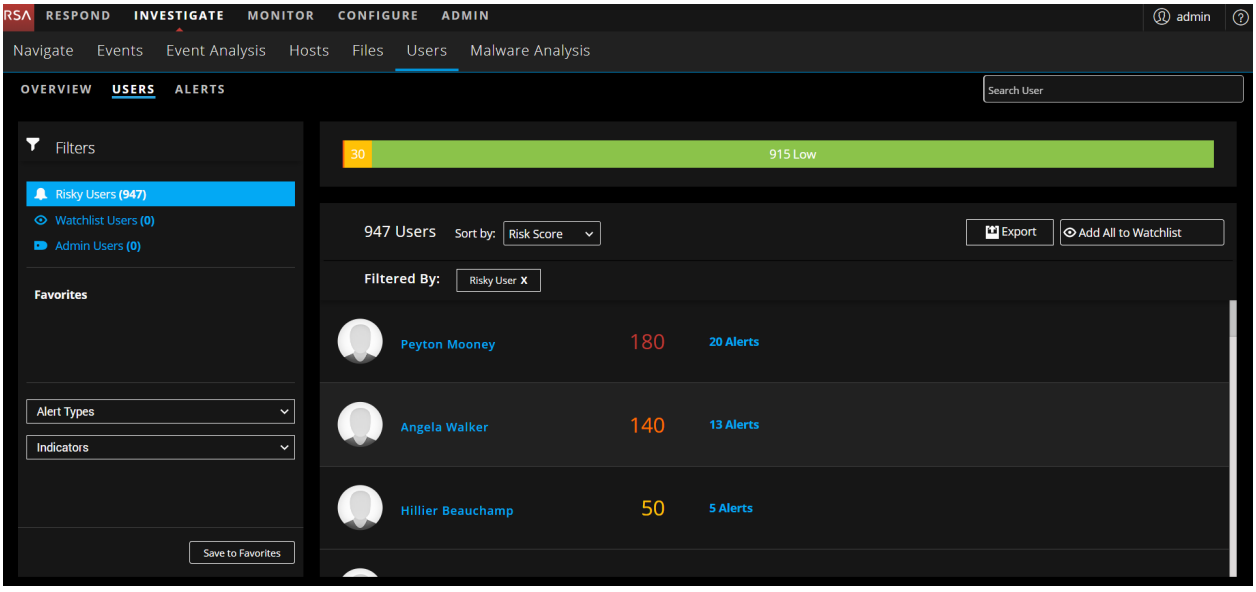
Alert Type	Description
Sensitive User Status Changes	A domain or enterprise administrator account has the default ability to exercise control over all resources in a domain, regardless of whether it operates with malicious or benign intent. This control includes the ability to create and change accounts; read, write, or delete data; install or alter applications; and erase operating systems. Some of these activities trigger organically as part of the account's natural life cycle. Investigate these security sensitive user account changes, and determine if it has been compromised. This activity can be associated with the **User Account Enabled**, **User Account Disabled**, **User Account Unlocked**, **User Account Type Changed**, **User Account Locked**, **User Password Never Expires Option Changed**, **User Password Changed by Non-Owner**, and **User Password Change** indicators.
Abnormal File Access	Monitor for abnormal file access to prevent improper access to confidential files and theft of sensitive data. By selectively monitoring file views, modifications and deletions, you can detect possibly unauthorized changes to sensitive files, whether caused by an attack or a change management error. This activity can be associated with the **Abnormal File Access Event** and **Multiple File Delete Events** indicators.
Non-Standard Hours	All authentication activity, malicious or not, appears as normal logons. Therefore, administrators should monitor unexpected authorized activity. The key is that attackers use these stolen credentials for unauthorized access, which may provide an opportunity for detection. When an account is being used for unusual activities, for example, authenticating an unusual number of times, the account may have been compromised. Use the indication of an abnormal activity time to determine if the account has been taken over by an external actor. This activity can be associated with the **Abnormal File Access Time**, **Abnormal Active Directory Change Time**, and **Abnormal Logon Time** indicators.

Investigate High-Risk Users

A user score is built based on the alert score and the alert severity. Using the user score, you can identify users that require immediate attention, perform deeper investigation, and take required action. You can identify high-risk users from either the **Overview** tab or the **Users** tab.

The following figure is an example of top five high-risk users in the **Overview** tab.

The following figure is an example of all the risky users in your environment in the **Users** tab.



The following is a high-level process to investigate high-risk users in your environment.

1. Identify the high-risk users. You can identify the high-risk users using the following ways:
   - The **Overview** tab shows the top five risky users in your environment. From the listed users identify the users with critical severity or user score more than 100.
   - The **User** tab shows all the risky users in your environment, sorted by risk score. Identify how many users are marked Critical, High and Medium or based on the forensic investigation, identify the malicious user behavior and build use-case driven target user lists using behavioral filters. Additionally, you can also use different types of filters (Risky, Admin, or Watchlist) to identify targeted group of high-risk users.

   Note: The Investigation should mostly focus on Critical, High and Medium severities. Low scoring users are not typically worth much investigation.

   Hover over the number of alerts associated with the risky users to quickly see what they are and determine if there is a good mix.

   Note: The number of alerts doesn't always correlate to the highest scores as some alerts only contribute small scores to the overall user score, but the more alerts there are, the easier it is to demonstrate a timeline of activity that resulted in the high score.

   For more information, see Identify High-Risk Users topic.
2. In the **User Profile** view, investigate the alerts and indicators of the user.
   a. Review the list of alerts associated with the user and the alert score for each alert, sorted by severity.
   b. Expand the alert names to identify a threat narrative. The strongest contributing indicator determines the alert's name that suggests why this hour is flagged.
   c. Use the alert flow timeline to understand the abnormal activities.
   d. Review each indicator associated with the alert to see the details about the indicator, including the timeline in which the anomaly occurred. Also, you can further investigate the incident using external resources such as SIEM, network forensics, directly reaching out to the user or a managing director and so on.

   For more information, see Begin an Investigation of High-Risk Users topic.
3. On completion of the investigation, you can record your observation as follows:
   a. Specify if an alert is not a risk
   b. Save the behavioral profile for the use case found in your environment
   c. If you want to keep a track of user activity, you can add users to the watchlist, and watch user profile

   For more information, see Take Action on High-Risk Users topic.

Identify High-Risk Users

You can identify high-risk user in your environment in the following ways:

- View top five high-risk users
- View all the high-risk users
- View users of specific group
- View users based on forensic investigation

View Top Five Risky Users

In the **Overview** tab, you can view the list of top five high-risk users in your environment along with the user score.

To view the top five risky users:

Log into **NetWitness Platform** and go to **Investigate** > **Users**.
The Overview tab is displayed with the high-risk users displayed in the High Risk Users panel.

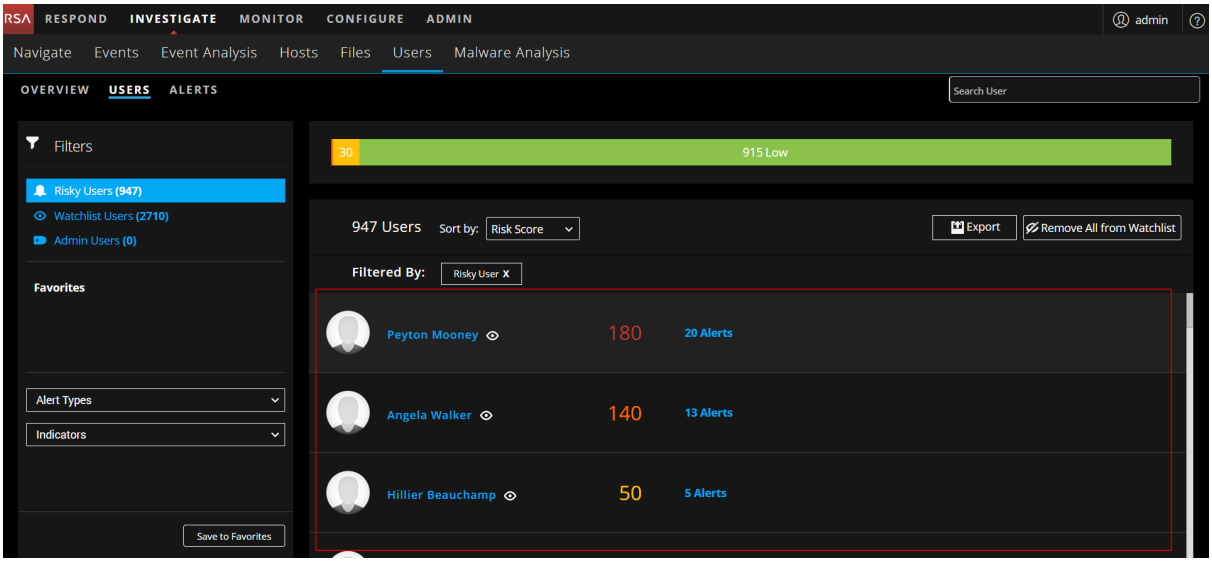
View All High-Risk Users

In the **Users** tab, you can view the list of all the high risk users in your environment along with the user score and total number of alerts associated with the users.

To view all high-risk users:

1. Log into **NetWitness Platform** and go to **Investigate** > **Users**.
   The Overview tab is displayed.

2. Click **Users** tab.
   The list of all high-risk users is displayed.

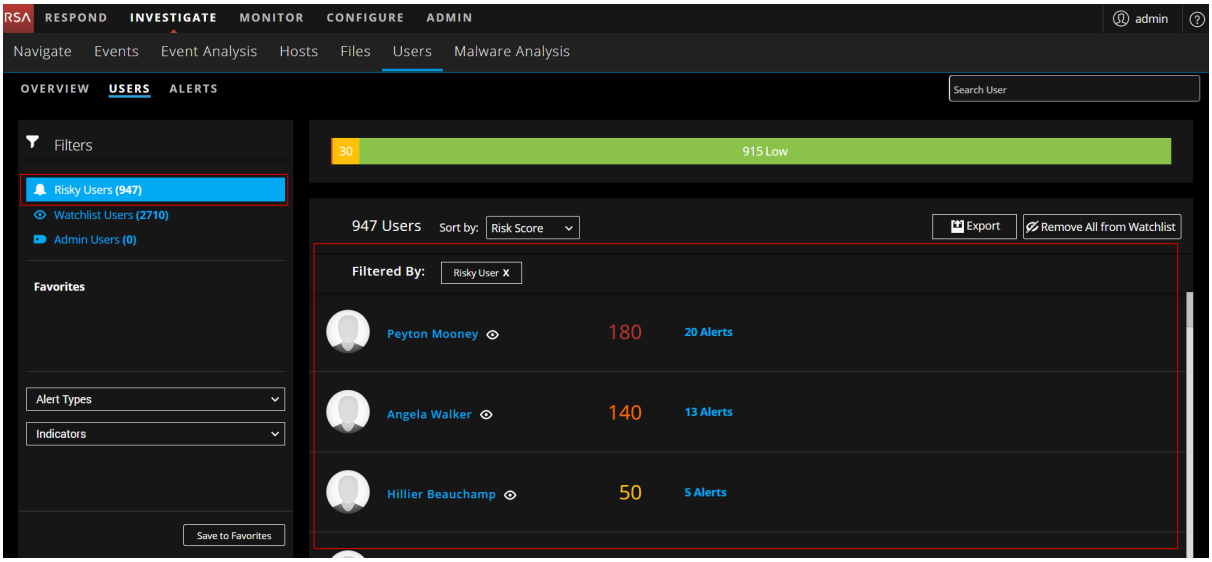


View Users of Specific Group

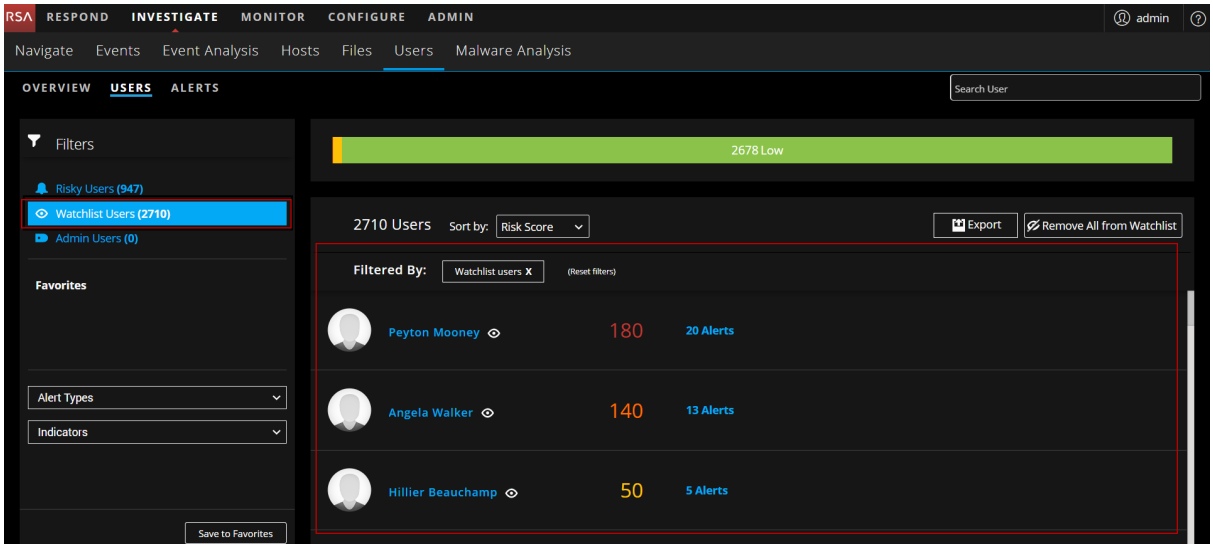
In the **Users** tab, you can use different types of filters to identify targeted group of high-risk users.

To view users of specific group:

1. Log into **NetWitness Platform** and go to **Investigate** > **Users**.
   The Overview tab is displayed.
2. Click **Users** tab.
3. In the **Filters** panel, do any of the following:
   - **Risky Users**: To view all the risky users in your environment, select **Risky Users**. By default, risky users along with their user score are displayed.



- **Watchlist Users**: To view the list of users that you added to the watchlist to monitor for specific changes, select **Watchlist Users**.



- **Admin Users**: To view all users who are marked as admin in the events, select **Admin Users**.

Note: You can view users of one or more group by selecting one or more filters. For example, if you want to view the list of admin users who are risky users, select the **Admin Users** and **Risky Users** filters.

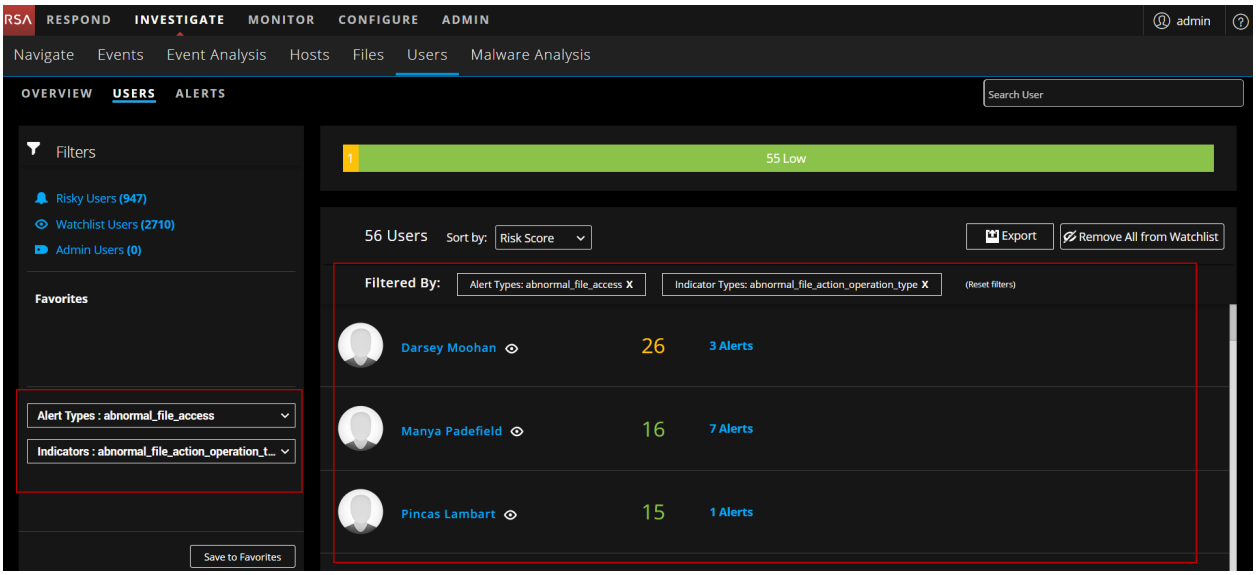
View Users Based on Forensic Investigation

In the **Users** tab, you can use Alert Types and Indicators which are behavioral filters to view high-risk users based on forensic investigation. For more information on forensic investigation, see *Forensic Workflow* in the Introduction topic.

To view users based on specific forensic investigation:

1. Log into **NetWitness Platform** and go to **Investigate** > **Users**.
   The Overview tab is displayed.
2. Click **Users** tab.
3. To create a behavioral filter using alert types, select one or more alerts in the **Alert Types** drop-down list.
4. To create a behavioral filter using indicators, select one or more indicators in the **Indicators** drop-down list.

Note: You can select combination of one or more alert types and indicators to create a behavioral filter based on your requirement. For example, to monitor abnormal access to confidential files and theft of sensitive data, you can create a behavioral filter with Alert Types = **Abnormal File Access** and Indicators = **Abnormal File Action Operation Type**.



You save these behavioral filters as favorites for future investigation.

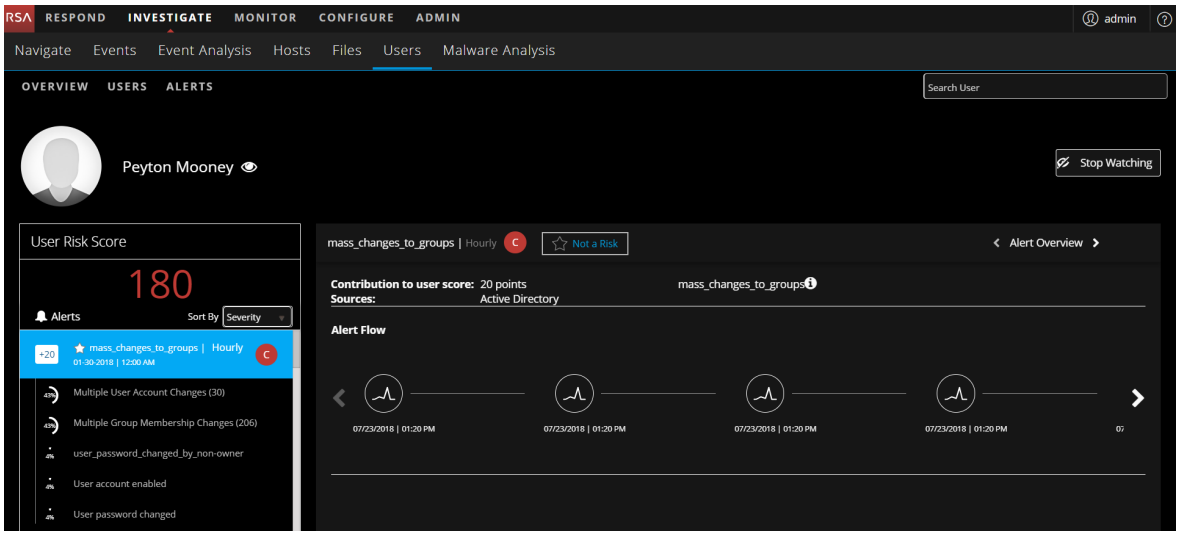
Begin an Investigation of High-Risk Users

After identifying the high-risk users, you can begin the investigation of high-risk users.

To investigate high-risk users:

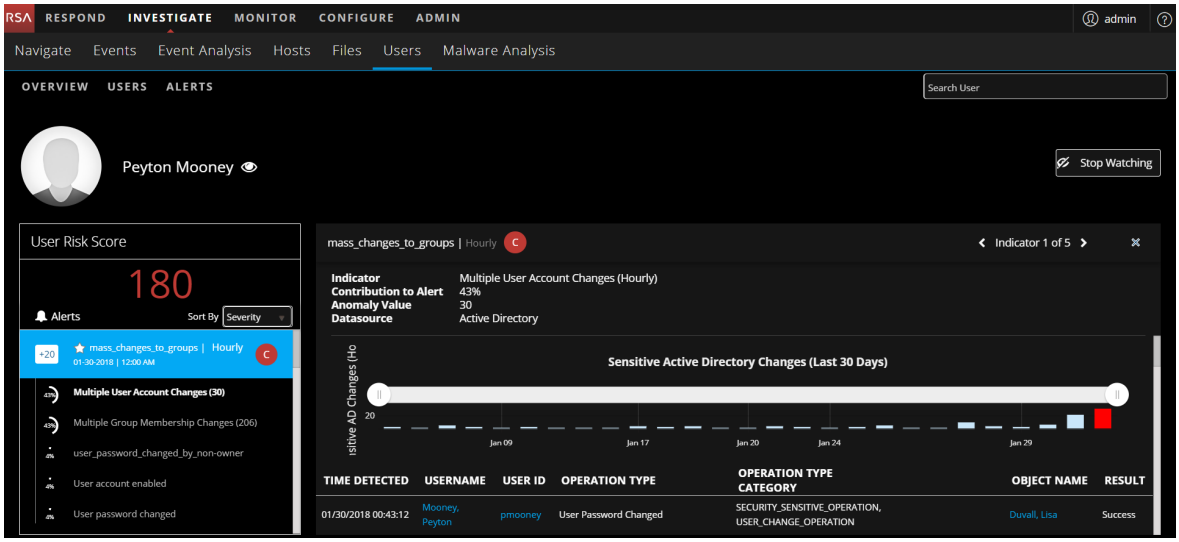
1. Log into **NetWitness Platform** and go to **INVESTIGATE** > **Users**. Do any of the following:
   a. In the **Overview** tab, in the **High Risk Users** panel, select a user you want to investigate and click on either the username or the user score.
   b. In the **USERS** tab, select the user you want to investigate and click on the username. The User Profile view is displayed.
2. To investigate the alerts of the user, click the alert name in the **User Risk Score** panel. The following information is displayed:
   - The alert name
   - The timeframe of the alert (Hourly or Daily)
   - The severity level icon
   - The contribution to the user score value (for example, +20)
   - The data sources for the alert (for example, Logon)
     The middle panel is the Alert Flow panel. This panel provides a timeline of events that are related to the formation of the alert. The timeline of events can help to determine if the alert is an actual

risk.



3. To investigate the indicators associated with an alert of a user, in the **User Risk Score** panel, select an alert and then select an indicator. The following information is displayed:
   - The indicator name and a description of the indicator type
   - Contribution to Alert
   - The anomaly values
   - The data source of the events found in the indicator

   The central panel display changes depending on which indicator is selected.



Take Action on High-Risk Users

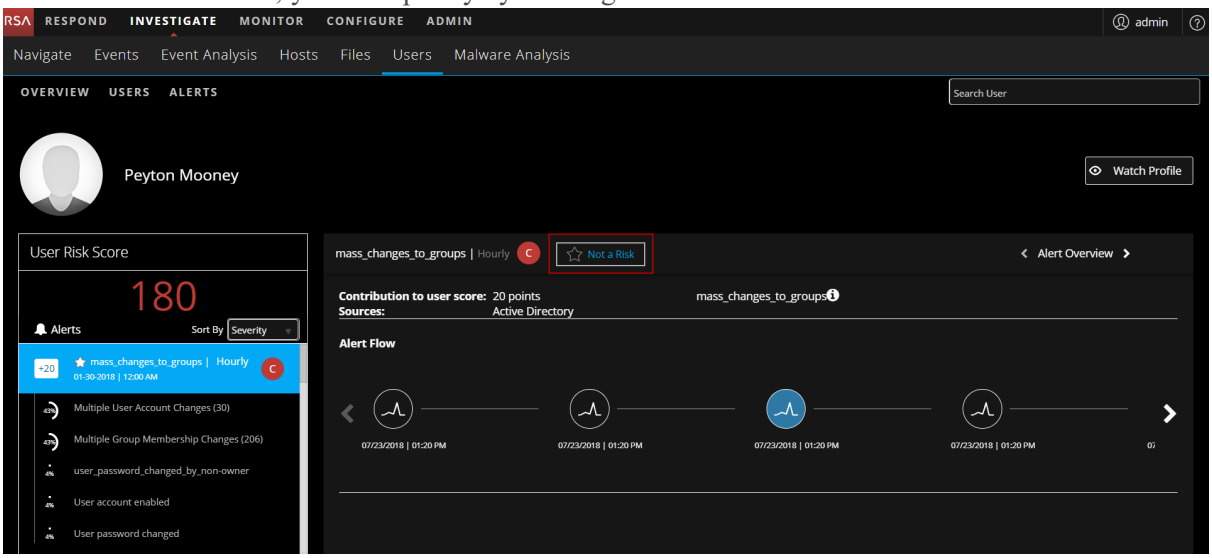
After investigation, you can take action on the risky users to reduce or prevent further damage caused by malicious attackers in your organization. You can take any of the following actions:

- Specify if the alert is not risky
- Save the behavioral profile for the use case found in your environment
- Add users to the watchlist, watch user profile, if you want to keep a track of the user activity

Specify if the alert is not risky.

To specify if the alert is not risky:

1. Log into **NetWitness Platform** and go to **INVESTIGATE** > **Users**.
2. Take action on the users from any of the following tabs:
   a. In the **Overview** tab, in the **High Risk Users** panel, select a user and click either on the username or user score.
   b. In the **Users** tab, select a user and click on the username.
   The User Profile view is displayed.
3. If the alert is not a risk, you can specify by clicking **Not a Risk** .



When an alert is marked as **Not a Risk**, the user score is reduced automatically.

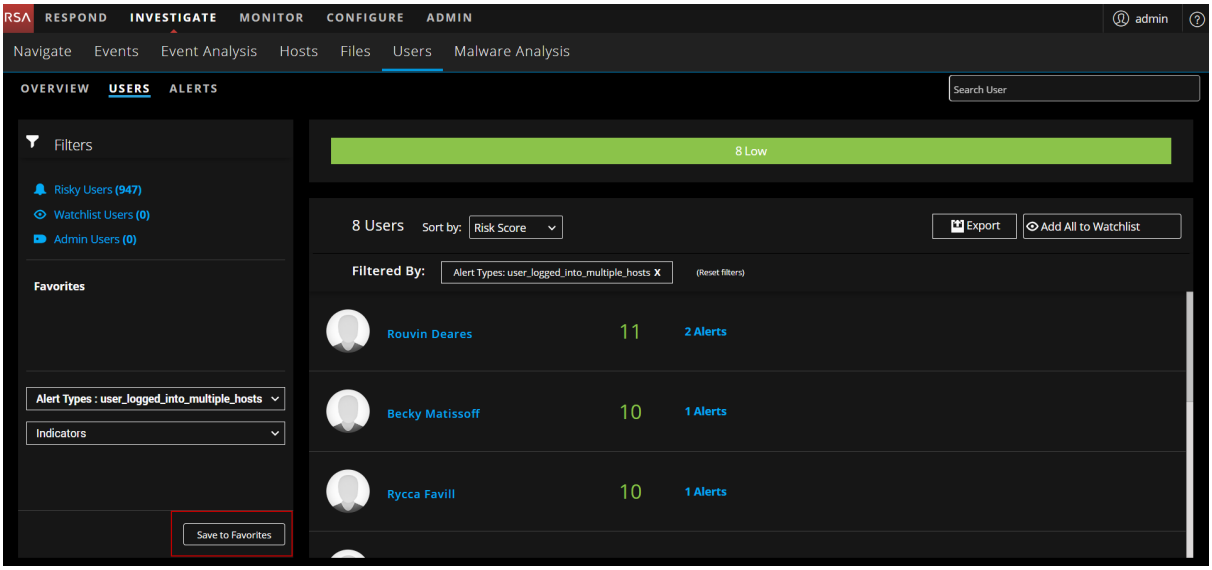
Save Behavioral Profile

The combination of the alert types and indicators you select during the forensics investigation is a behavioral profile. You can save the behavioral profile, so you can monitor this use case in future.

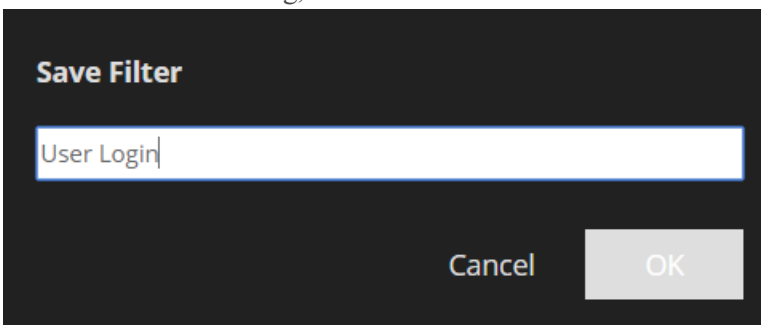
For example, if your organization is attacked and the attackers penetrated by brute forcing user accounts, you can select filters using the brute force alert type. This can be saved as favorite. You can proactively monitor for future brute force attempts. To do so, you can click the favorite to see if new users were subjected to this type of attack.

To save behavioral profile:

1. Log into **NetWitness Platform** and go to **INVESTIGATE** > **Users**.
   The Overview tab is displayed.
2. Click **Users** tab.
3. In the **Filters** panel, select the alert in the **Alert Type** drop-down and Indicators in the **Indicators** drop-down.
4. Click **Save to Favorites**.



5. In the **Save Filter** dialog, enter the name of the filter and click **Ok**.



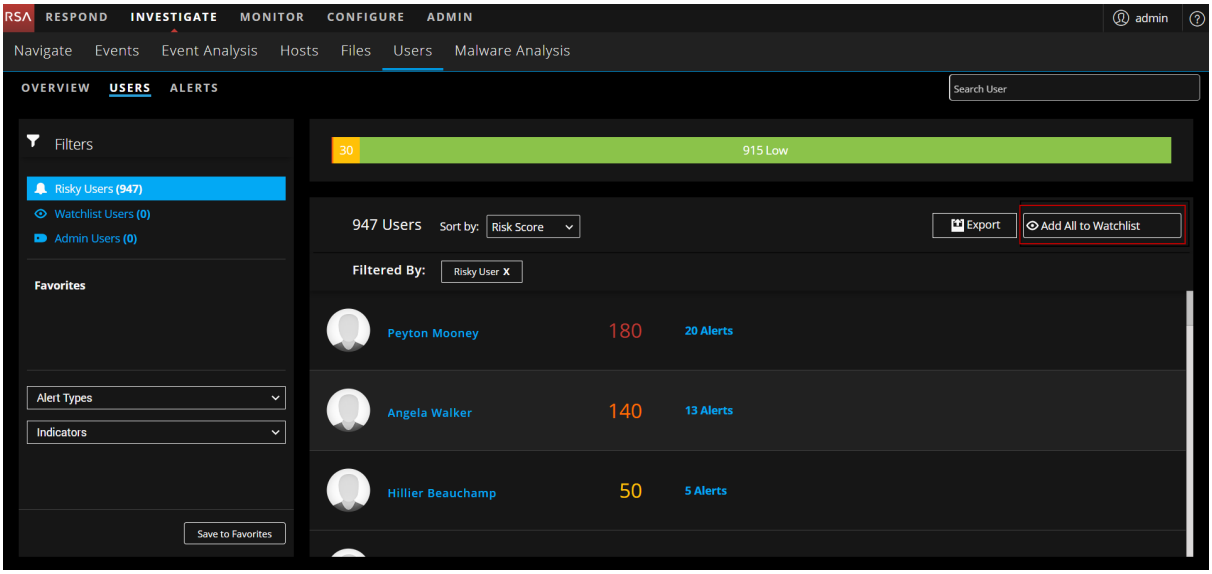
The behavioral profile is saved and displayed in the Favorites panel. You can click on the profile in the Favorites to monitor the users.

Add All Users to the Watchlist

If you want to keep track of users with recent activity but do not want to follow up with an immediate investigation, you can add the users to the watchlist and revisit over time to see if the risk score is elevated.

To add all users to the watchlist:

1. Log into **NetWitness Platform** and go to **INVESTIGATE** > **Users**.
   The Overview tab is displayed.
2. Select the **Users** tab.
3. Select the users of specific categories using filters.
4. Click **Add All to Watchlist**.



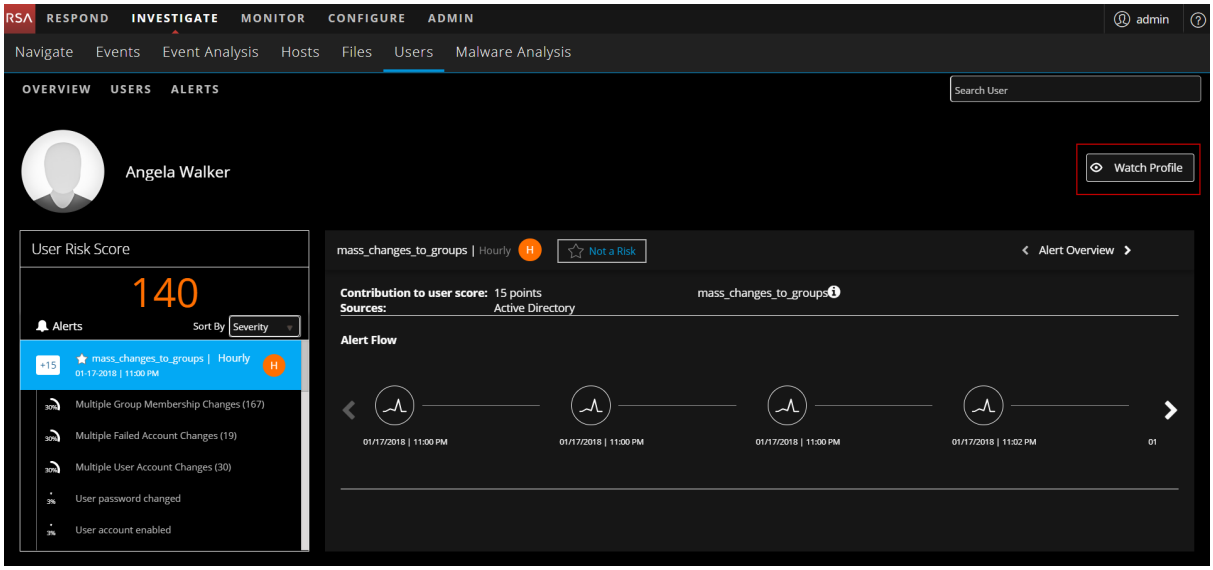
The list of users are added to the watchlist.

Watch User Profile

The watch user profile is a list of users that you want to monitor for potential threats. The watch user profile marks a user so that the users can be quickly referenced on the dashboard. This is essentially a bookmark to monitor the suspicious users.

To watch user profile:

1. Log into **NetWitness Platform** and go to **INVESTIGATE** > **Users**. Do any of the following:
   a. In the **Overview** tab, under **High Risk Users** panel, select a user and click on either the username or the user score.
   b. In the **Users** tab, select a user and click the username.
   The User Profile view is displayed.
2. Click **Watch Profile** in the upper right corner of the User Profile.



The user is added to the watchlist.

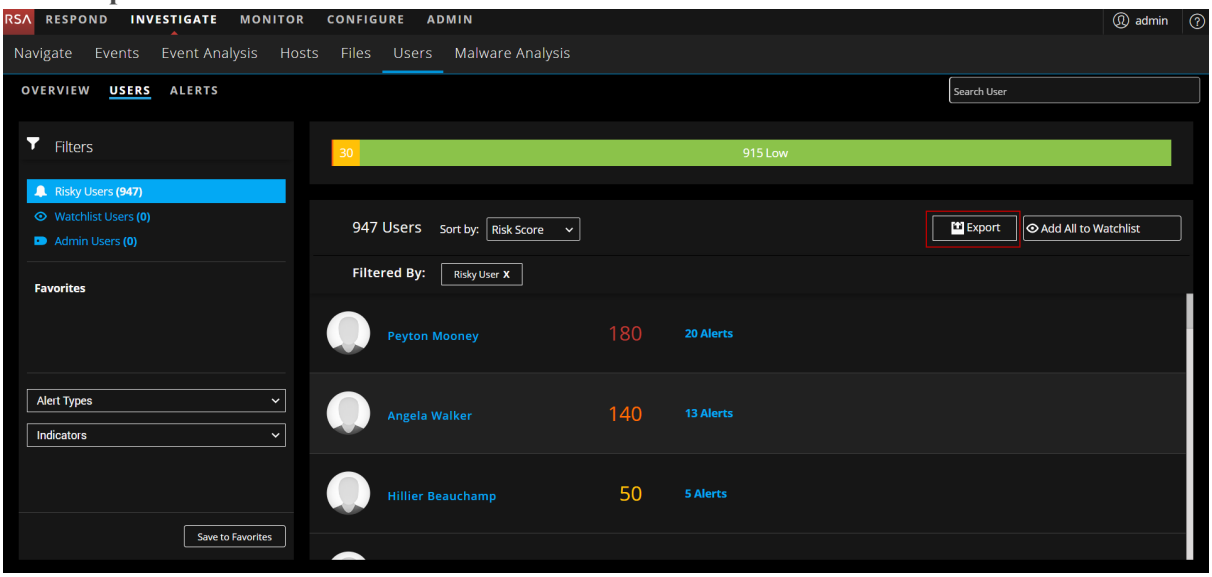
Export High-Risk Users

You can export a list of all users and their scores in a .csv file format. You can use this information to compare with other data analysis tools like tableau, powerbi, zeppelin.

To export high-risk users:

1. Go to **INVESTIGATE** > **Users**.
   The Overview tab is displayed.
2. Select the **Users** tab.

3. Click **Export**.



The list of all users and the associated user score is downloaded in the .csv file format.

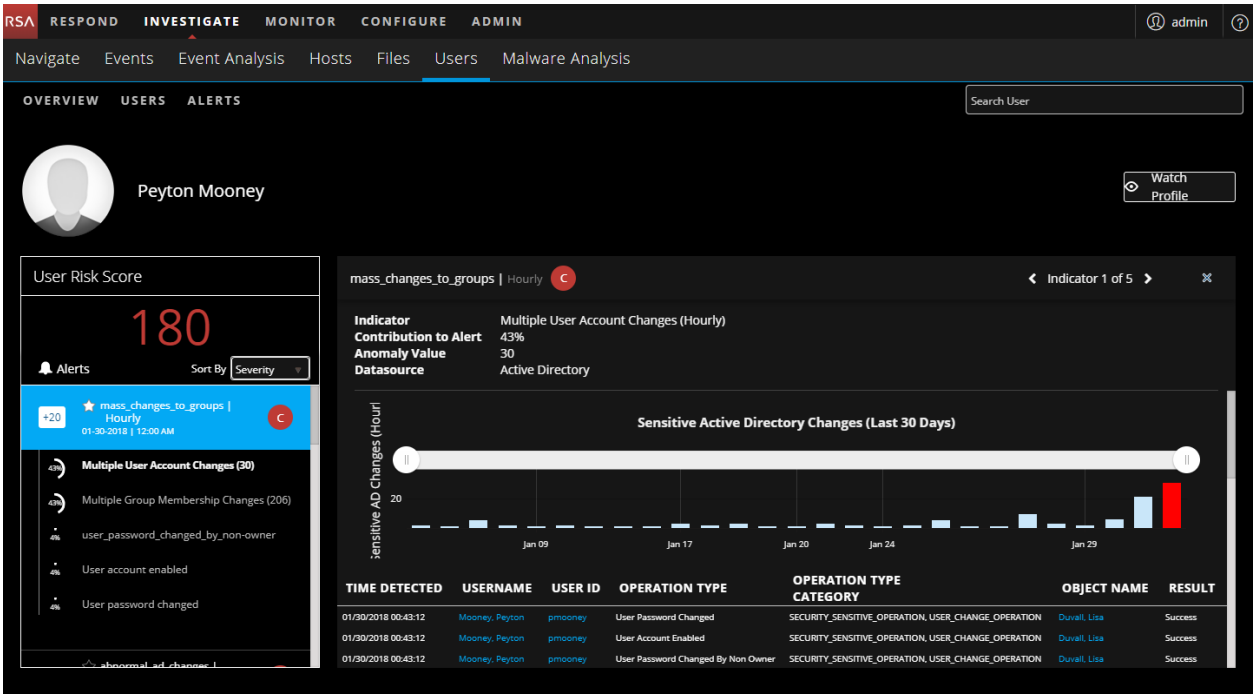
Investigate Top Alerts

Anomalies that are found as incoming events are compared to the baseline are compiled into hourly alerts. Relatively strong deviations from the baseline, together with a unique a composition of anomalies, are more likely to get a higher alert score.

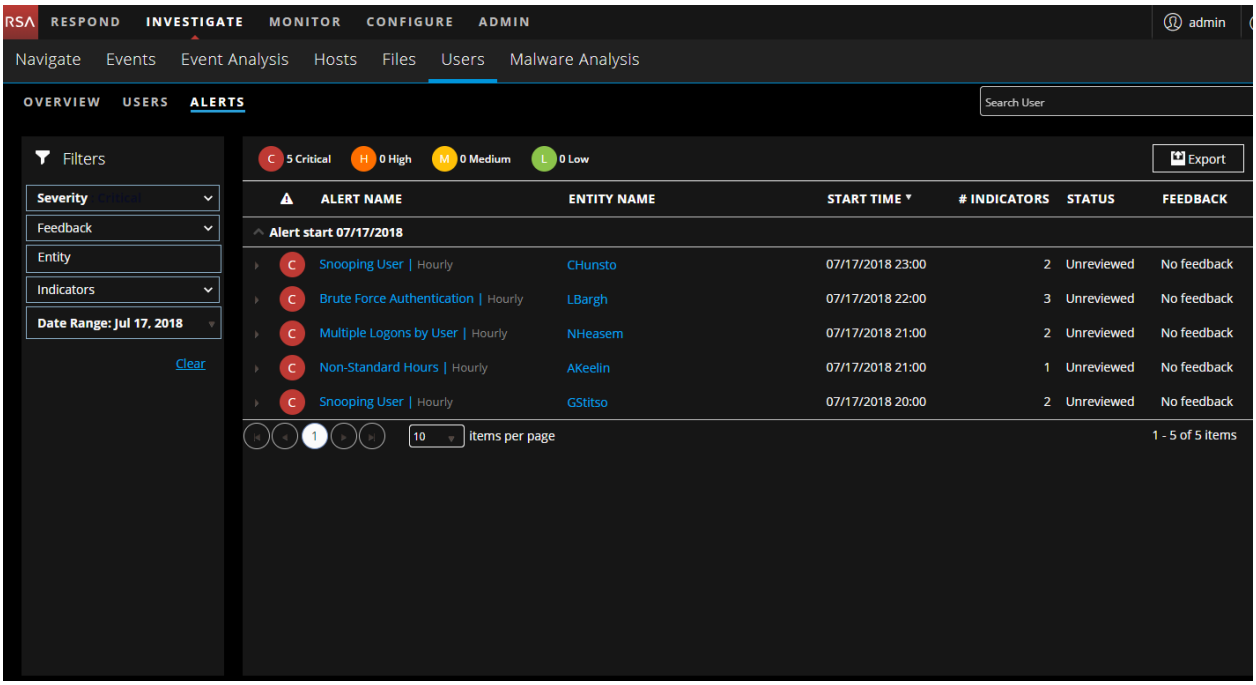
You can quickly view the top most critical alerts in your environment, and start investigating them from either the OVERVIEW tab or the ALERTS tab. The following figure is an example of Top Alerts in the OVERVIEW tab. The alerts are listed in order of severity and the number of users who generate the alerts.

To investigate an alert on this page, click an alert in the **Top Alerts** section to see details about the alert.

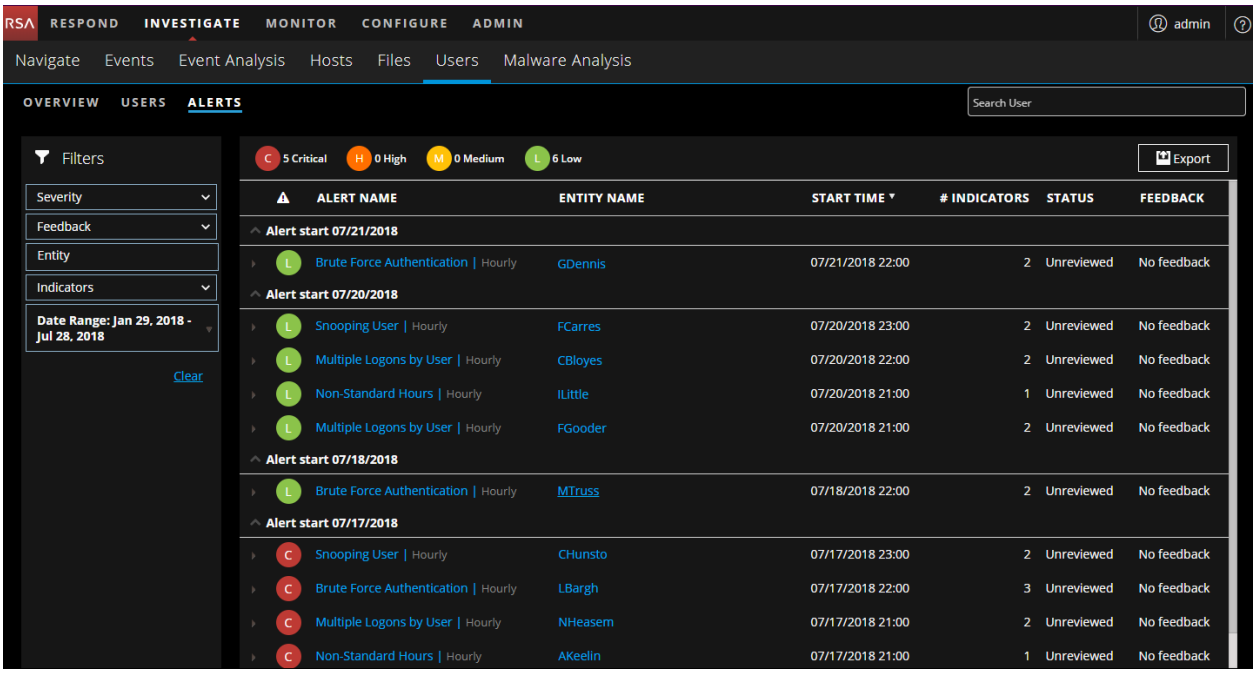
The following figure shows details about the event that caused the alert, and the timeframe in which it occurred.



From the OVERVIEW tab, in the Alerts Severity panel, you can click on a bar in the graph to review top alerts in the ALERTS tab, as shown in the following figure.



Investigating alerts is particularly useful when you want to focus on a timeframe in which you believe your systems were compromised. You can view forensic information based on a timeframe and gather detailed information about events that occurred during that time in the Alerts tab.



Begin an Investigation of Critical Alerts

You can begin your investigation of critical alerts in the following ways:

1. On the Overview tab, look at the Alerts Severity.

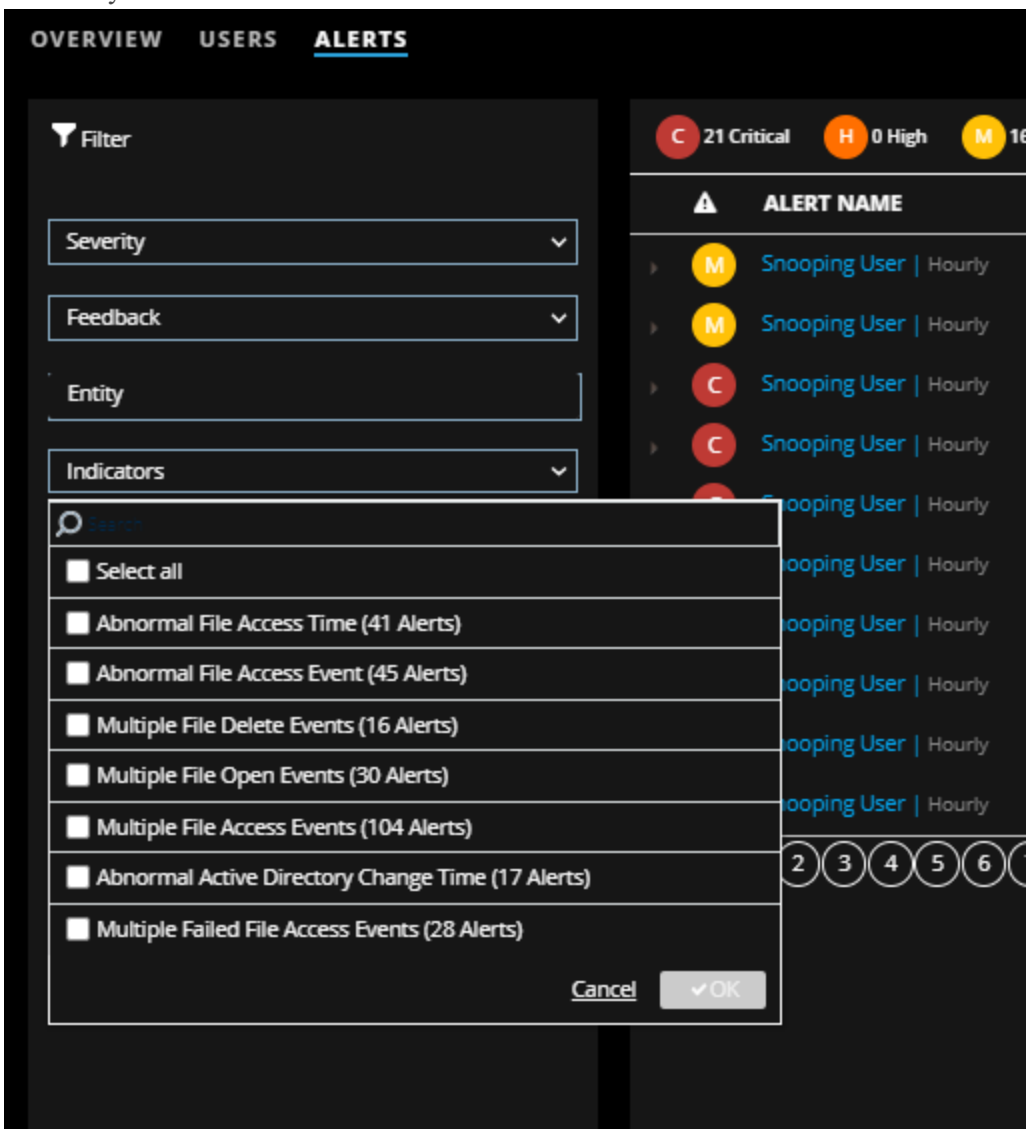
   Is there an even distribution of alerts or are there a few days when there was a noticeable spike? A spike could indicate something suspicious like malware. Make a note of those days so you can inspect the alerts (the bar from the chart links directly to the alerts for that specific day).

2. In the Alerts tab, sort by the number of indicators:

   Ensure that the alerts that aggregated the most number of indicators show at the top of the list. Similar to identifying the users with the highest number of alerts, more indicators help illustrate a more interesting story and provide you with a more solid timeline that you can follow.

3. Expand the top alerts in the list:
   - Look for alerts that have varied data sources. These show a broader pattern of behavior.
   - Look for a variety of different indicators.
   - Look for indicators with high numeric values, specifically for high values that are not indicative of activity that a human can perform manually (for example, a user accessed 8,000 files).
4. Look for unique Windows event types that users do not typically change as these can indicate suspicious administrative activity.

5. Search by indicators:



The list shows the number of alerts raised that contain each indicator.

- Look for the top volume indicators; filter by one and review by user to find users who experienced the highest number of these indicators.
- In general, you can ignore time-based alerts (for example, Abnormal Logon Time) as these are very common. However, they provide good context when combined with higher interest indicators.

6. Drill into more detail:
   - Leverage alert names to begin establishing a threat narrative. Use the fact that the strongest contributing indicator usually determines the alert's name to begin explaining why this user is flagged.
   - Use the timeline to layout the activities found and try to understand what could explain the observed behaviors.

- Follow up by reviewing each indicator anddemonstrating how supporting information, in the form of graphs and events, can help analysts verify an incident. Suggest possible next stages of investigation using external resources (for example, SIEM, network forensics, and directly reaching out to the user or a managing director).
- Conclude the investigation by prompting for feedback and leaving a comment.

7. Take action to address threats determined by your investigation of alerts. For more information, see Take Action on High-Risk Users.

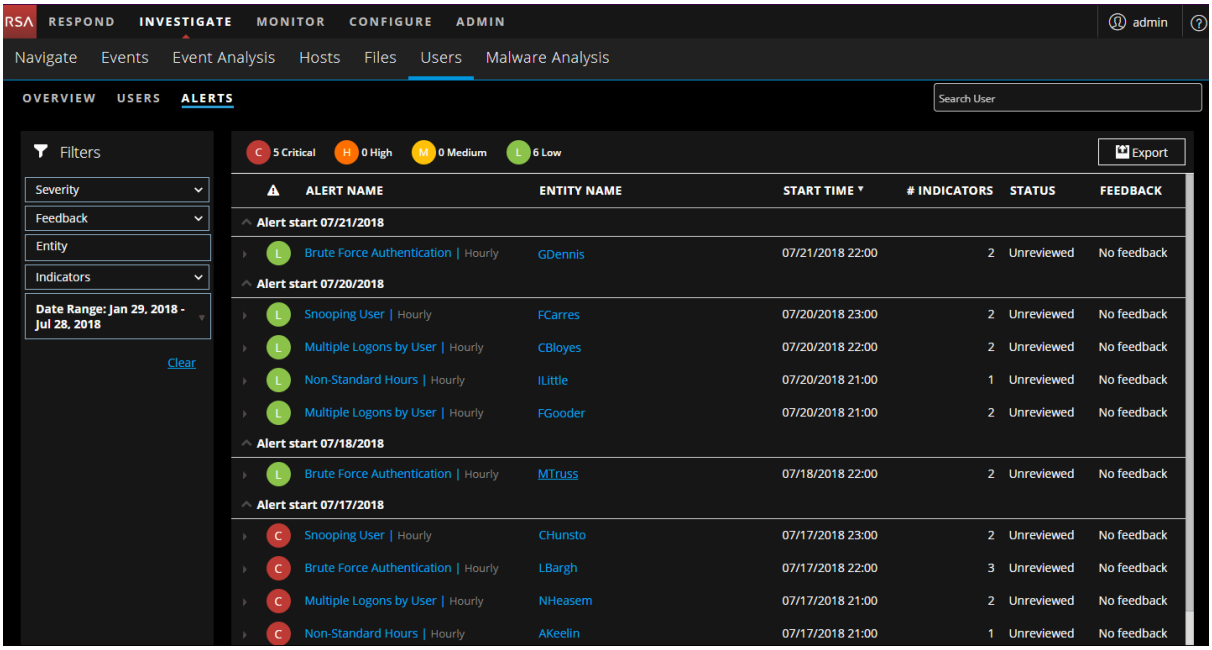
The following topics explain various ways to investigate alerts.

- Filter Alerts
- Investigate Indicators
- Manage Top Alerts
- View NetWitness UEBA Metrics in Health and Wellness

Filter Alerts

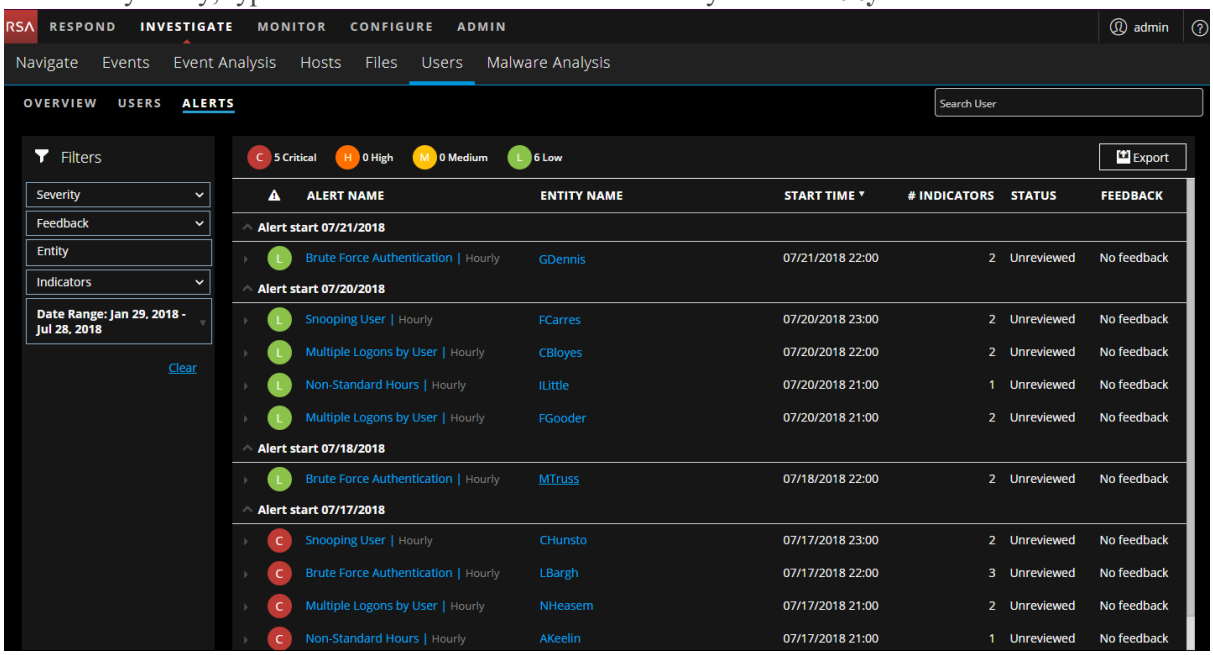
You can filter the alerts displayed in the Alerts tab by severity, feedback, entity, indicators, and date range.

1. Log into NetWitness Platform and go to **INVESTIGATE** > **Users** > **Alerts**. The Alerts tab is displayed.



2. To filter by severity, click **Severity** in the **Alert Filter** panel, select one or more options, and then click **OK**. The options are Select all, Critical, High, Medium, and Low.
3. To filter by feedback, click the down arrow under **Feedback**, select one or more options, and then click **OK**. The options are Select all, No feedback, and Not a risk.

4. To filter by entity, type a user name or the name of an entity in the **Entity** field.



5. To filter by date range, click the **Date Range** down arrow under , select an option, and then click **OK**. The options are Last week, Last month, and Select Range.

The alerts are displayed in the right pane according to the filter you selected. To clear filters, in the left pane, click **Clear**.

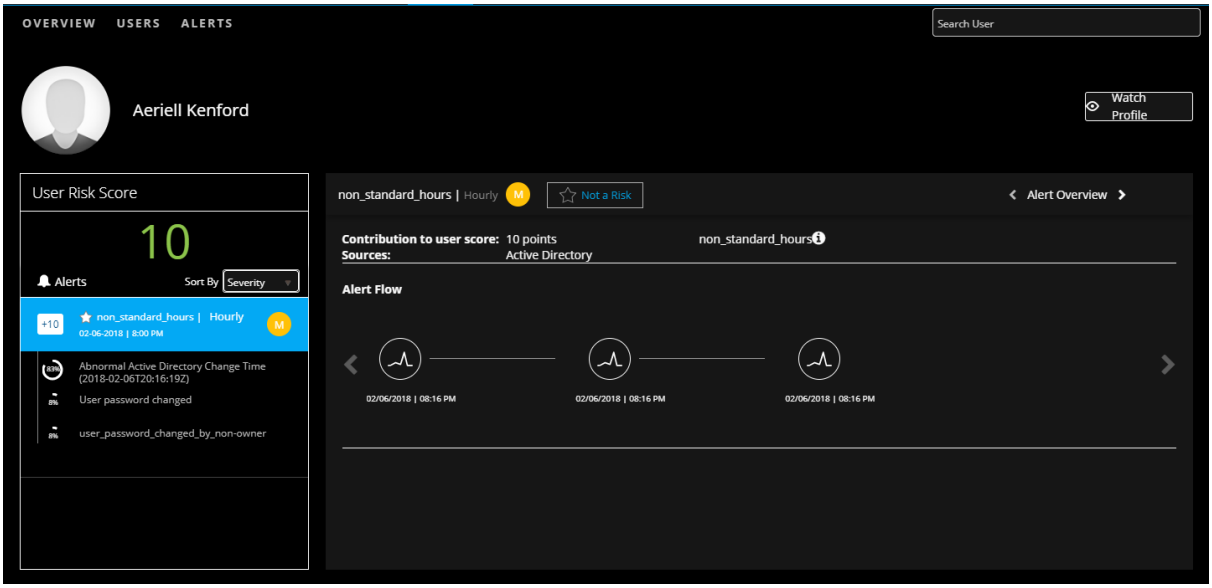
Investigate Indicators

You can view all the indicators that form an alert in the ALERTS tab. Each indicator also displays its anomaly value in parentheses. You can find the indicator name and a description of the indicator type, the anomaly values, and the data source of the events found in the indicator. You can also view a chart that shows details about a specific indicator. You can investigate an indicator to look for related activity across a time range by pivoting to the **INVESTIGATE** > **Events** view. In the Users view, values that enable pivot are highlighted in light blue, and you can click on a value to open the Event view. Once in the Event view, the selected value is set in all meta keys, and the time range is set to one day. You can change the time range.

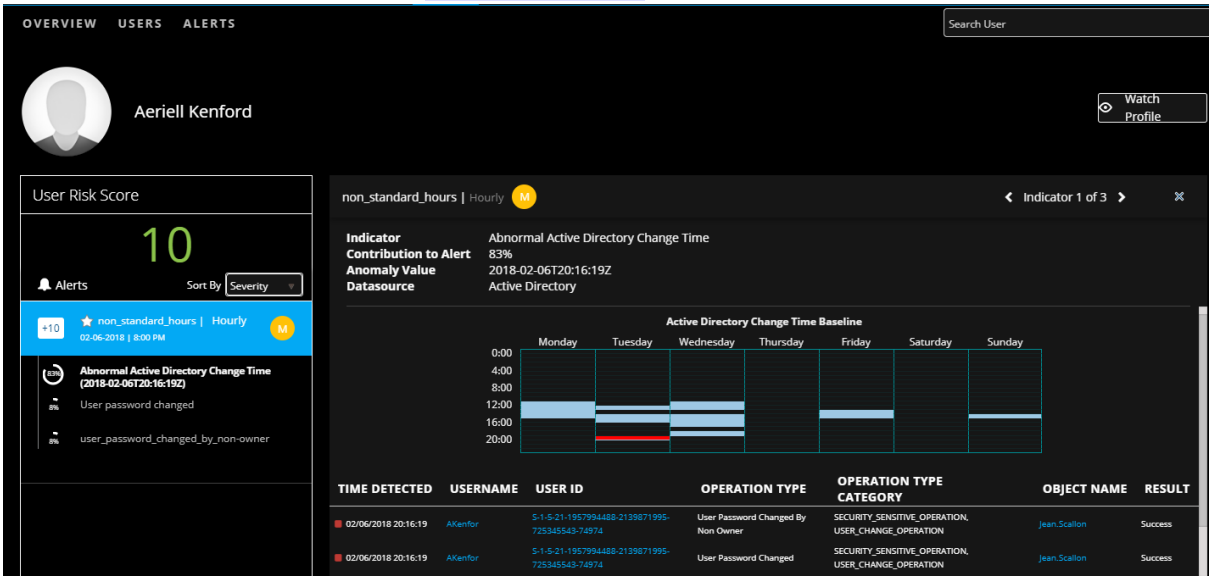
To see all the threat indicators that comprise an alert:

1. Log into NetWitness Platform and go to **INVESTIGATE** > **Users** > **ALERTS**.

2. Under **ALERT NAME**, click an alert name.
   The indicators are displayed , along with the anomaly value, data source, and start time.



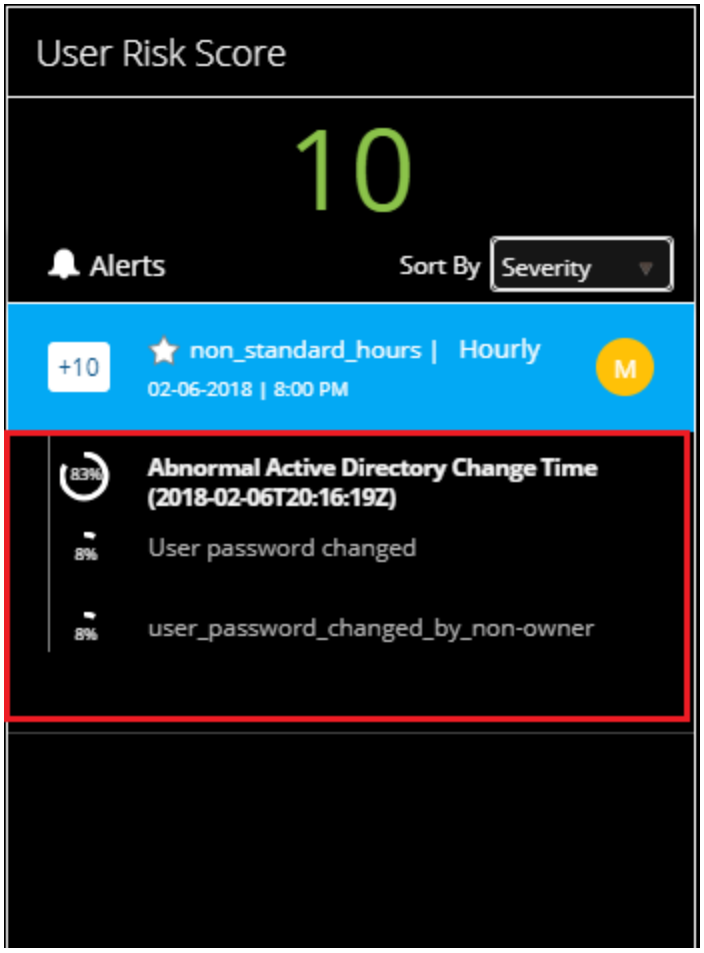
3. Under **Alert Flow**, click on the graph icon.
   A graph is displayed that shows details about a specific indicator, including the timeline in which the anomaly occurred and the user associated with the indicator. The following figure shows an example of a graph. The type of graph can vary, depending on the type of analysis performed by NetWitness UEBA. For more information , see User Profile View.



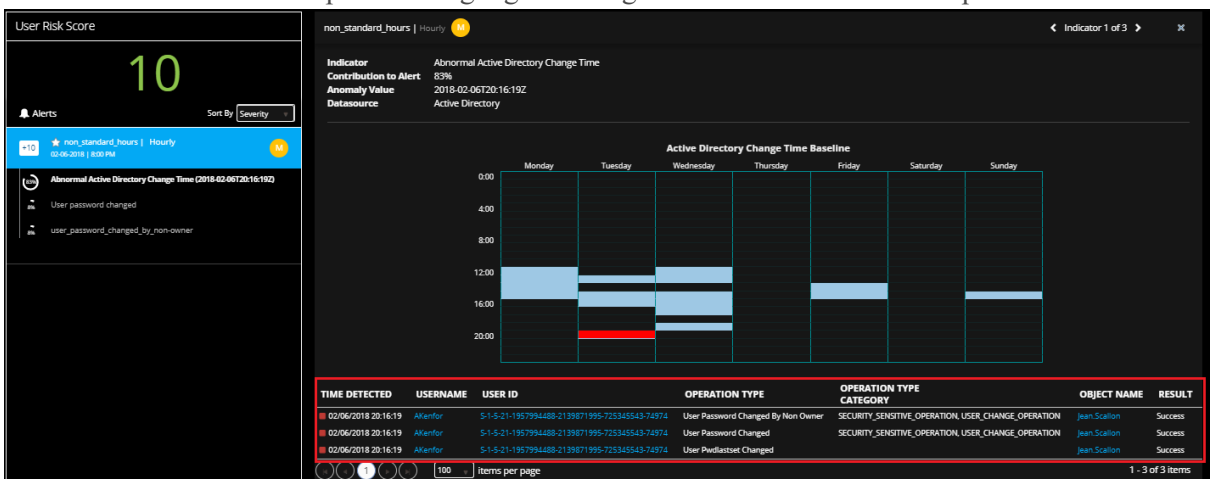
To pivot to Events view:

1. Go to **INVESTIGATE** > **Users**, and select an alert or a user.

2. Under **User Risk Score**, select an alert name.
   Indicators are displayed under the alert.



3. Select an indicator of interest.
   Values that can be used to pivot are highlighted in light blue at the bottom of the panel.



4. Click on an indicator element highlighted in blue.
   The Events view opens and details about the indicator element are displayed.

The date in the Events view is the day the alert occurred. The text in the search field is the value that you selected. The events that are displayed are all the events related to the selected value.

For information about investigating items of interest in the Events view, see "Investigating Raw Events in the Events View" in the *NetWitness Investigate User Guide*.

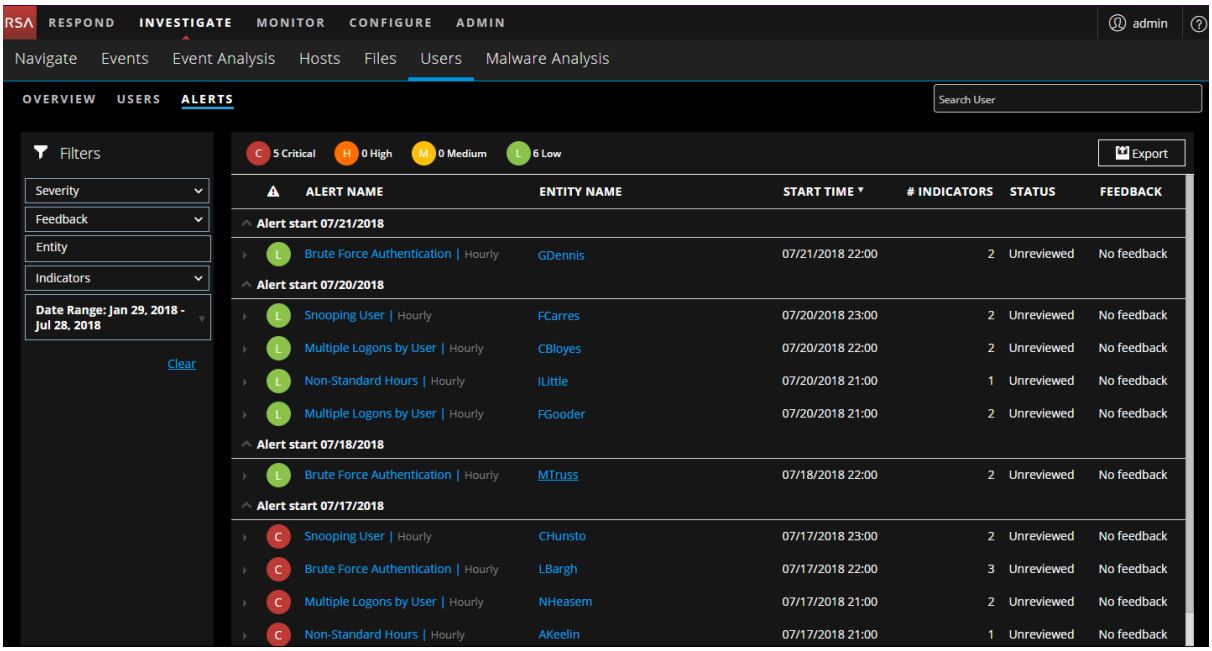
For more information about threat indicators, see the Threat Indicators section in Introduction

Manage Top Alerts

You can export a list of all alerts to a .csv file format. An analyst can use this information to compare the data from other sources in other data analysis tools like tableau, powerbi, zeppelin.

To export alert data to a .csv file:

1. Log into NetWitness Platform and go to **INVESTIGATE** > **Users** > **ALERTS**.
   The Alerts tab is displayed.



2. At the top right, click **Export**.
   All the alert data is downloaded in a .csv file format. Here is an example of the exported alert data in .csv format:

	A	B	C	D	E	F	G
1	Alert Name	Entity Name	Start Time	# of Indicators	Status	Feedback	Severity
2	Brute Force Au	presidio_4769_u	Jul 21 2018 22:0	2	Reviewed	No Feedback	Low
3	Snooping User	4769_user122	Jul 20 2018 23:0	2	Reviewed	No Feedback	Low
4	Multiple Logon	presidio_4769_u	Jul 20 2018 22:0	2	Reviewed	No Feedback	Low
5	Non-Standard I	4769_user122	Jul 20 2018 21:0	1	Reviewed	No Feedback	Low
6	Multiple Logon	PRESIDIO_USER:	Jul 20 2018 21:0	2	Reviewed	No Feedback	Low
7	Brute Force Au	presidio_4769_u	Jul 18 2018 22:0	2	Reviewed	No Feedback	Low
8	Snooping User	4769_user122	Jul 17 2018 23:0	2	Reviewed	No Feedback	Critical
9	Brute Force Au	presidio_4769_u	Jul 17 2018 22:0	3	Reviewed	No Feedback	Critical
10	Multiple Logon	PRESIDIO_USER:	Jul 17 2018 21:0	2	Reviewed	No Feedback	Critical
11	Non-Standard I	4769_user122	Jul 17 2018 21:0	1	Reviewed	No Feedback	Critical

View NetWitness UEBA Metrics in Health and Wellness

RSA NetWitness UEBA sends metrics to the System Stats Browser tab in **ADMIN** > **Health & Wellness**. Along with basic system usage information, metrics that are specific to NetWitness UEBA users, alerts and events are provided.

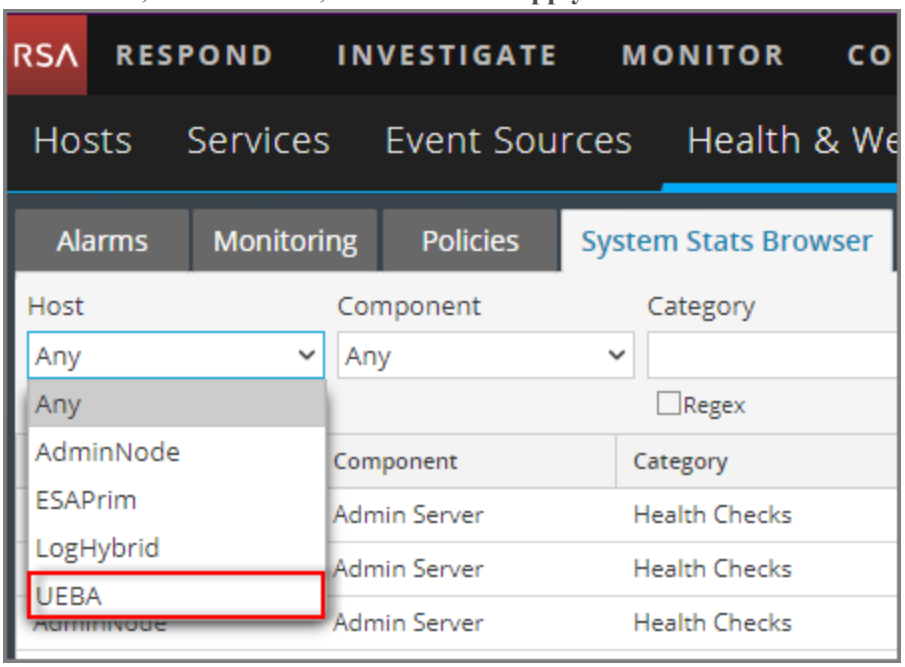
Analysts can use these metrics in the following ways:

- Confirm that the currently procured license is in compliance with their license agreements, and by how much per day.
- Determine if the system is functioning as required.
- Actively monitor new events.
- Monitor the creation of new indicators and alerts.

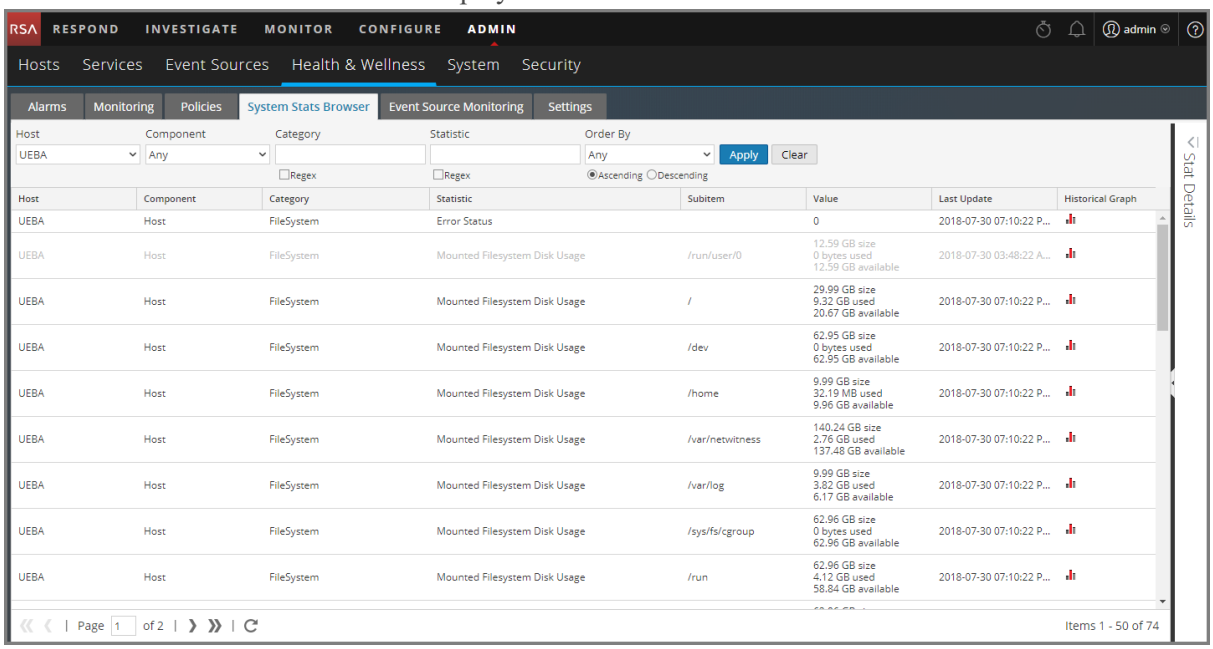
If these critical metrics are reported as "0", it could indicate a system malfunction.

To view NetWitness UEBA metrics in the System Stats Browser in Health & Wellness:

1. Log in to NetWitness Platform and go to **ADMIN** > **Health & Wellness**.
2. Click the System Stats Browser tab.
   The System Stats Browser is displayed.
3. Under Host, select **UEBA**, and then click **Apply**.

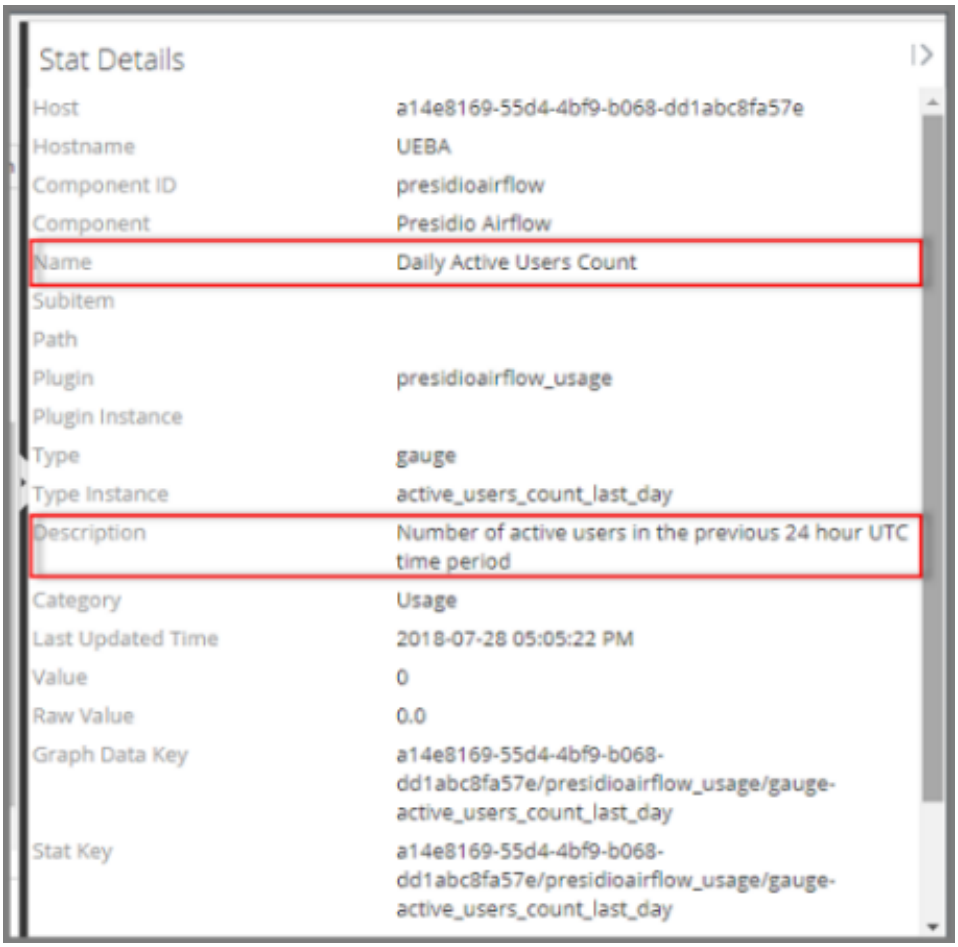


Results for NetWitness UEBA are displayed.



4. To view details for a statistic, click **Stat Details**.

Details about the statistic are displayed.



The **Name** and **Description** fields provide a summary of the metrics that are displayed.

For more information about Health & Wellness and the System Stats Browser tab, see "Monitor System Statistics" in the *System Maintenance Guide*. Go to the Master Table of Contents to find all NetWitness Platform Logs & Network 11.x documents.

Reference

This section provides information about the RSA NetWitness UEBA user interface.

Overview Tab

The **Overview** tab provides an initial view into the recent and most important user activities in the environment. Each panel shows either prioritized incidents for investigation or consolidated metrics reflecting potential risks to the enterprise.

Workflow

Quick Look

The following figure shows the Overview tab.

To access this view, go to **INVESTIGATE** > **Users**.

The Overview tab consists of the following panels:

1 High Risk Users panel
2 Top Alerts panel
3 All Users panel
4 Alerts Severity panel

High Risk Users Panel

The High Risk Users panel lists the top five high-risk user along with the user score.

The following table describes the high risk users panel elements.

Name	Description
Username	The name of the user.

Name	Description
User Score	The user score of the user, with the color indicating the severity of the score. Red indicates Critical, orange represents a High risk, yellow indicates a Medium risk, and green represents a Low risk.

Top Alerts Panel

The Top Alerts panel displays a list of alerts for the associated user, severity, alert creation date, and number of indicators. The list consists of the top ten alerts in the last 7 days.

The following table describes the top alerts panel elements.

Name	Description
Severity Icon	The alert severity icon. The options are Critical, High, Medium, or Low.
Alert Name	The name of the alert.
Alert Creation Date	The date when an alert is generated.
Number of Indicators	The number of indicators associated with the alert.

All Users Panel

The All Users panel displays the number of users in each of the NetWitness UEBA predefined groups.

The following table describes all users panel elements.

Group	Description
Risky	All users with a risk score greater than 0.
Watched	All users who are currently flagged as Watched.
Admin	All users who have been previously tagged as Admin.

Alerts Severity Panel

The Alert Severity panel graphically displays the number of alerts, by severity level generated during the last year.

The following table describes alert severity panel elements.

Name	Description
Last year	The number of alerts generated during last year.

Name	Description
Severity level	The severity is color coded, where red indicates a Critical alert, orange represents a High risk alert, yellow indicates a Medium risk alert, and green represents a Low risk alert. For example: 

Users Tab

The **Users** tab is a proactive threat hunting console. You can use behavioral filters to build use case driven target lists, and to continuously monitor the environment for specific risky behavior patterns.

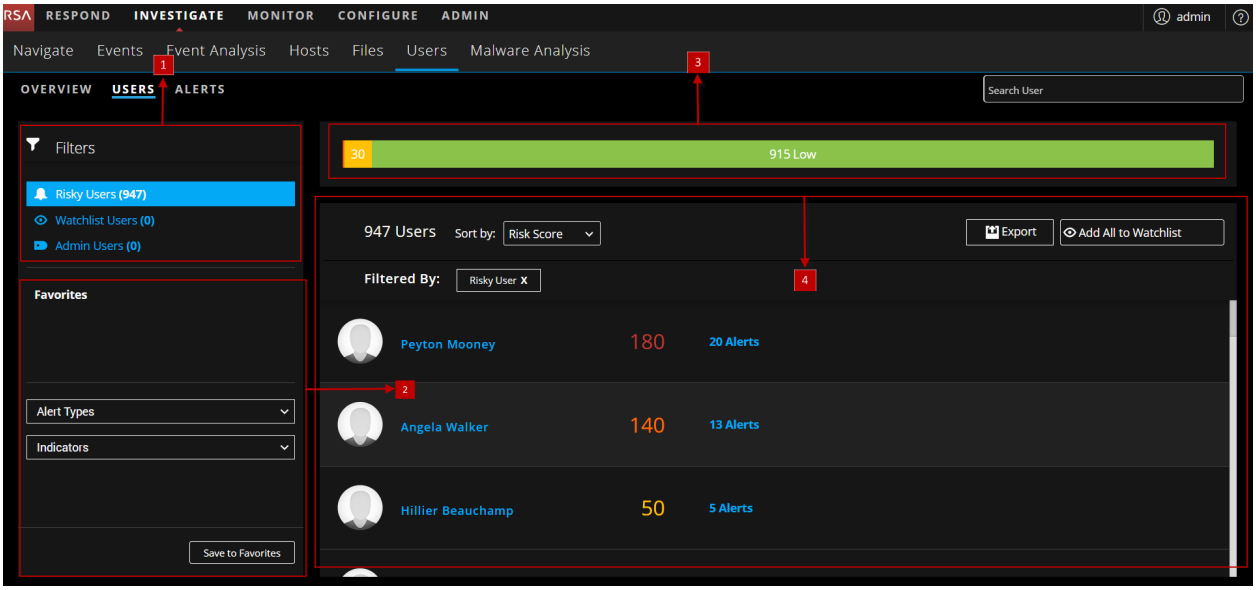
Related Topics

- Begin an Investigation of High-Risk Users
- Investigate Top Alerts

- Filter Alerts
- Investigate Indicators
- Export High-Risk Users

Quick Look

The following figure shows the Users tab.



To access this view:

1. Go to **INVESTIGATE** > **Users**.

   The Overview tab is displayed.

2. Click **Users**.

The Users tab consists of the following panels:

1	Filters panel
2	Favorites panel
3	Risk Indicator panel
4	User List panel

Filters Panel Filters

The Filters panel lists three pre-defined filters, with the number of users associated with each in parentheses.

The following table describes the filter types.

Filter Type	Description
Risky Users	All users with a risk score greater than 0.
Watchlist Users	All users who are currently flagged as Watched.
Admin Users	All users who have been previously tagged as Admin.

Favorites Panel

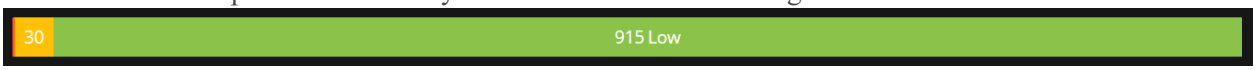
The Favorites panel displays the list of behavioral profiles that are saved as favorites.

The following table describes the behavioral profile filters types.

Filters	Description
Alert Types	Any of the existing alert types that describe the supported distinct use cases (e.g. Brute Force Attempt, Snooping User, Abnormal AD Change, Data Exfiltration).
Indicators	Any of the existing behavioral features modeled by NetWitness UEBA. This filter can also be used to target only alerts from a specific data source or application.

Risk Indicator panel

The Risk indicator provides a severity-based breakdown of the target users.



The following table describes the risk indicator panel elements.

Color	Severity
Red	Critical
Orange	High
Yellow	Medium
Green	Low

User List Panel

The User List panel displays the list of all the users in your environment along with the user score and number of alerts associated with the user.

The following table describes the User List panel elements.

User Data	Description
Username	The name of the user.
Score	The user score of the user.
Number of alerts	The total number of alerts generated for the user.
Sort by	The Sort by drop-down menu allows you to select the sorting method for the list. The options are: Risk Score, Name, Alerts.
Export	Export a list of all users and their scores in a .csv file format.
Add All to Watchlist	Adds all users in the filtered view to the watchlist.
Search User	Searches for a user name that you typed and select it from the list that is displayed matching your entry.

Alerts Tab

The Alerts tab displays details about all the alerts in your environment. You can view forensic information about suspicious activity in your environment that is based on a specific timeframe.

Workflow

What do you want to do?

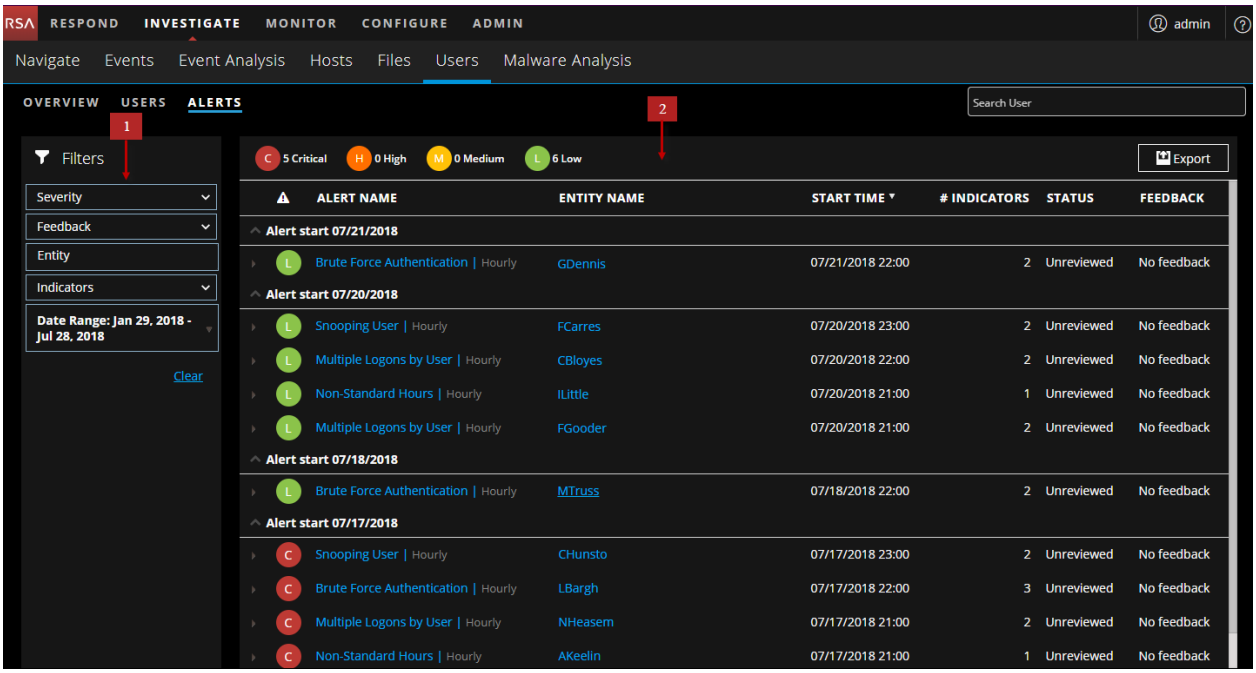
User Role	I want to ...	Documentation
UEBA Analyst	Investigate alerts in my environment*.	Investigate Top Alerts
UEBA Analyst	Sort alerts to focus my investigation*.	Filter Alerts
UEBA Analyst	Investigate incidents based on threat indicators*.	Investigate Indicators
UEBA Analyst	Share alert data in spreadsheet format.	Manage Top Alerts
UEBA Analyst	Quickly see a summary of user alerts.	View User Alert Summaries

*You can complete the tasks here.

Related Topics

- Investigate Top Alerts
- Filter Alerts
- Investigate Indicators
- Manage Top Alerts

Quick Look



To access this view:

1. Go to **INVESTIGATE** > **Users**.

   The Overview tab is displayed.

2. Click **Alerts**.

The Alerts tab consists of the following panels:

1 Filters panel
2 Alerts panel

Filters Panel

Use the filters panel to refine your investigation of alerts. The filters are automatically applied as you make your selections. You can clear all currently set filters by clicking **Clear**.

The following table describes the filters types.

Filter Name	Description	Options
Severity	Filters the list of alerts to include alerts for one or more severity levels.	Critical, High, Medium, or Low.
Feedback	Filters the list of alerts to include alerts for one or more feedback types.	Select All, No Feedback, or Not a Risk.
Entity	Filters the list of alerts to include only alerts for a specific user name.	NA.

Filter Name	Description	Options
Indicators	Filters the list of alerts to include alerts for one or more indicators.	Examples of indicators are: • Active Directory - Abnormal Logon Time • Authentication - Logged onto Multiple Computers • Multiple File Access Failures
Date Range	Filters the list of alerts to include alerts created during a specific time range.	Last Week, Last Month, or a specified range

Alerts Panel

The Alerts panel displays the following information for each alert:

- Severity Icon: An icon next to the alert name that indicates the severity level of the alert
- Alert Name: The name of the alert and the alert timeframe
- Entity Name: The name of the entity (user account) that generated the alert
- Start Time: The date and time when this alert was first detected
- # Indicators: The number of unique behavior anomalies (indicators) associated with the alert
- Status: Indicates if the alert has been marked as Unreviewed or Not A Risk
- Feedback: Indicates if a feedback value has been assigned for the alert

At the beginning of each alert line is an icon that expands the alert to display additional details. Once expanded, the following fields are displayed:

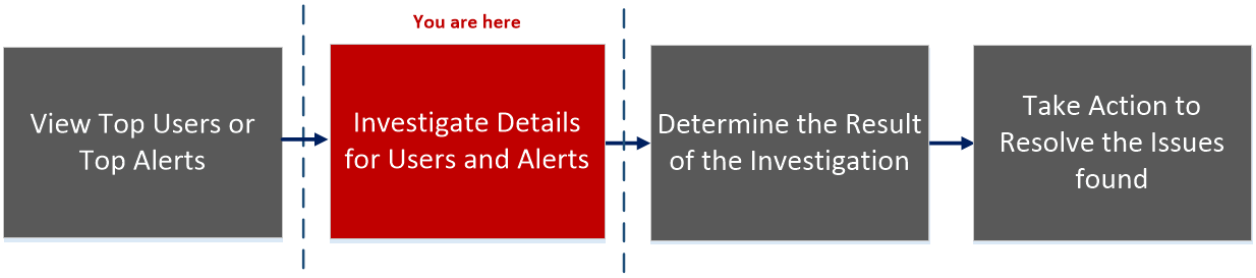
- Indicator Name – The name of each unique indicator that is associated with the alert
- Anomaly Value – The indicator's value, representing the deviation amount or value as it differs from the user's normal behavior
- Data Source – The type of data where the indicator was found
- Start Time – The date and time when this indicator was first detected
- # Events – The number of events in the indicator

The data that is currently displayed in the central pane can be exported to a .csv file by clicking Export at the top right of the pane.

User Profile View

The **User Profile** view provides detailed information about all the alerts and related indicators of a user.

Workflow



What do you want to do?

User Role	I want to ...	Documentation
UEBA Analyst	View high-risk users*	Identify High-Risk Users
UEBA Analyst	Begin an investigation of high-risk users*	Begin an Investigation of High-Risk Users
UEBA Analyst	Take action on high-risk users.	Take Action on High-Risk Users
UEBA Analyst	Export high-risk users.	Export High-Risk Users
UEBA Analyst	Begin an investigation of critical alerts*	Investigate Top Alerts
UEBA Analyst	Investigate threat indicators.	Investigate Indicators

*You can complete the tasks here.

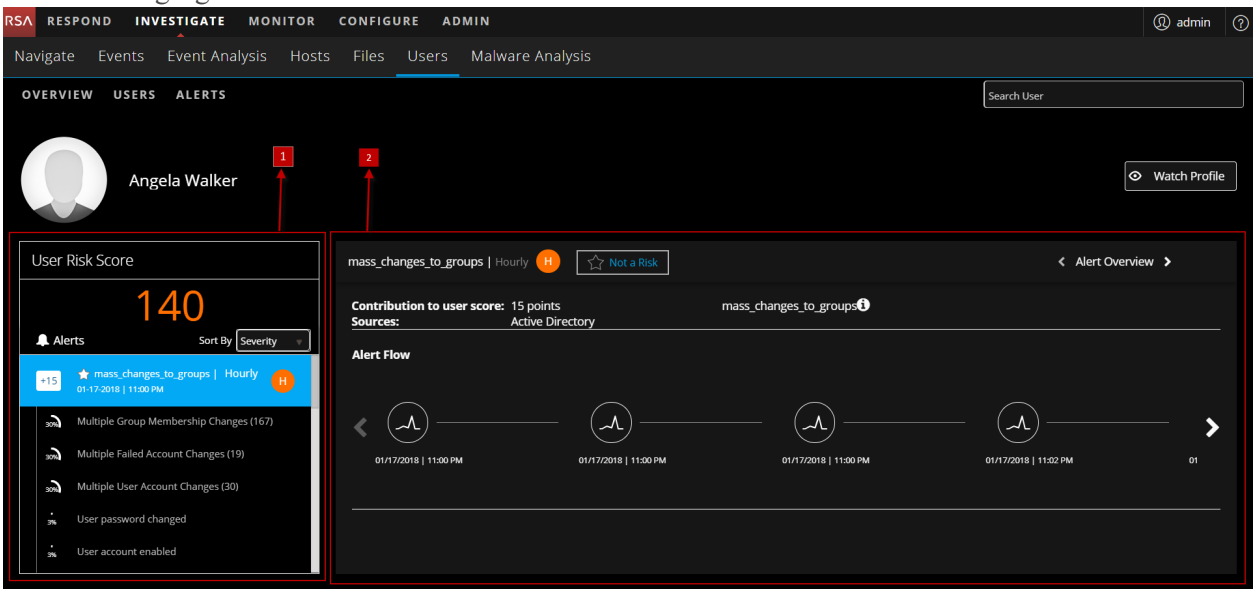
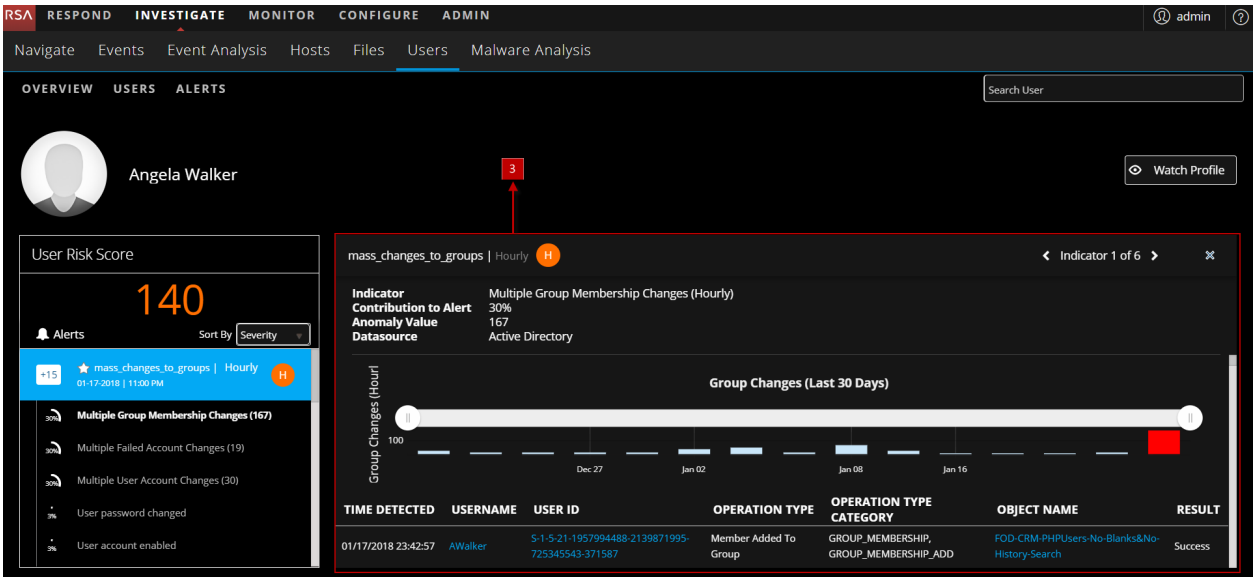
Quick Look

The following figure shows the User Profile view.





To access this view:

1. Go to **INVESTIGATE** > **Users**. Do any of the following:
   a. In the **OVERVIEW** tab, under **High Risk Users** panel, select a user and click on either the username or the user score.
   b. In the **USERS** tab, select a user and click on the username.
   c. In the **ALERTS** tab, select an alert name or an entity name.

The Users Profile consist of the following panels:

1 User Risk Score Panel
2 Alerts Flow Panel
3 Indicator Panel

User Risk Score Panel

The User Risk Score panel contains the following information:

Name	Description
User Score	The user score of the user highlighted based on the severity.
Alerts	The following information is displayed: • The alert names • The severity level icon • The start date and time for the alert • The timeframe of the alert (Hourly or Daily) • The risk score of the alert (+20) • A list of alert indicator names and the number of times the indicator events occurred.
Sort by	The alerts are sorted based on Severity and Date. By default, it is sorted by severity.

Alert Flow Panel

The Alert Flow panel displays the following information:

Name	Description
Alert name	The name of the alert.
Timeframe	The timeframe of the alert (Hourly or Daily).
Severity level	The severity of the alert.

Name	Description
Contribution to the user score	The contribution to the user score value (e.g. +20).
Sources	The data sources for the alert (e.g. Active Directory).
Timeline graph	The timeline of events that are related to the formation of the alert.

Indicator Panel

Click on a graph icon in the Alert Flow panel to open the Indicator panel. The following table describes the indicator panel elements:

Name	Description
Indicator	The name of the indicator with timeframe of the indicator in parentheses. For example, Multiple Group Membership Changes (Hourly).
Contribution to Alert	The alert contribution percentage.
Anomaly Value	The Anomaly value.
Datasource	The datasource from where the alert is triggered.
Time Detected	The date and time when an indicator is triggered.
Username	The name of user for whom an indicator is triggered.
User ID	The user id of the user for whom an indicator is triggered.
Operation Type	The action performed by the user. For example, Member Added To Group.
Operation Type Category	The type of operation category. For example, GROUP_MEMBERSHIP.
Result	The status of the action performed by the user.

Appendix: NetWitness UEBA Windows Audit Policy

In order to achieve the maximum benefit from RSA NetWitness UEBA, RSA recommends that you implement the Windows audit policies described here.

For a base set of policies to audit, refer to the "Windows Server 2016, Windows Server 2012 R2, Windows Server 2012, Windows Server 2008 R2, and Windows Server 2008 Audit Settings Recommendations" section of this article from Microsoft: Audit Policy Recommendations.

The policies under "Stronger Recommendation" are required, as well as the following policies, to ensure that all of the required Authentication and Active Directory events are audited:

- Audit Detailed File Share
- Audit File Share
- Audit File System

RSA recommends that you enable auditing for both success and failures.

The following Windows events must be audited:

For the Authentication models:

4624	4625	4769

For the AD models:

4670	4717	4720	4722	4723	4724	4725	4726
4727	4728	4729	4730	4731	4732	4733	4734
4735	4737	4738	4739	4740	4741	4742	4743
4754	4755	4756	4757	4758	4764	4767	4794
5136	5376	5377					

For File Access Models:

4660	4663	4670	5145

Reporting Overview

Reporting is a collection of data as a result of monitoring the network traffic, which can be used for further analysis. In NetWitness Platform you can run a report against NetWitness Platform Database core services to identify the network activities. For example, if you want to identify the Top Source Countries and Destination Countries, or top Threat and Risk trends that help monitor any changes to the normal categories or monitor the users and services that may potentially have malicious activities etc.

The reporting typically consist of: Reports and Charts. You can report on the log, packet and endpoint data collected, and customize the reports and charts to enhance the visual appearance. You can create real-time reports for historical data. You can create charts and dashlets, that can be added in the real-time chart dashlets as well.

Reporting Engine

Reporting relies on the Reporting Engine to provide data for the reports, alerts and charts. Hence, you must configure the Reporting Engine as a service to NetWitness Platform before you can generate the reports. You must also specify the data source in the Reporting Engine from which the data is extracted.

The data that you can report or alert depends on the configuration of Reporting Engine and the data sources that you specify as part of the rule definition.

Note: Make sure you have access to the components in the Reporting.

Note: Make sure you have access to the required data sources. Only privileged users with access to sensitive information have the permission to certain data sources. To manage access control to data sources, see the "Add a Role and Assign Permissions for Warehouse Analytics" However, for the existing reports, alerts and charts, if the user role or permissions are modified for the data sources, then it is not applicable unless you manually update the permissions.

Note: Reporting is accessible based on the role based access, defined for the user.

Report

A report is a combination of rules and other formatting objects such as headers and HTML-formatted notes that describe and identify data pertaining to a particular area of interest. Reports are defined and managed in the Build Report page and can be scheduled to run on an adhoc or timely basis. Once a report is run, results are stored centrally and can be automatically sent over email, SFTP, URL, and NFS to users, viewed via the NetWitness Platform web interface, downloaded as PDF and CSV files.

A report consists of the following:

Property	Description	Example
Report Name **Note:** For **Name** field, the icon to extend the column size is not displayed at the end of the column field. You have to hover the mouse a little to the left side to see the icon for extending the column.	Used to identify the report to schedule them at a later time.	Report1

Property	Description	Example
Text	Pre-defined text fields used within a report to make the report more meaningful to the user.	Header1, Comment
Rules	The rules (queries) used to create a report.	select user.dst where ip.src = 10.10.10.1

Note: In the Reporting user interface, the displayed date or time is always according to the user-selected time zone profile.

Rule

A rule is the basic and essential building block in the Reporting. You must create a rule which can be used in a Report, Chart or Alert.

A rule represents a unique query that detects and summarizes the requested information within a collection of network data.

The rule syntax is very similar to that of Standard Query Language (SQL) where you can use the select clause, where clause, sort and group options and limits for the result set. A rule consists of the following:

Property	Description	Example
Name	The name of the rule.	Windows System Account Activity
Select	List of meta types that are returned in the result set. The list of meta types is provided in the Meta Library. Meta Library in the Rule Builder is continually synchronized with the index configuration of the NetWitness Platform host to which NetWitness Platform is connected. The number of meta types that this property can represent depends on how the rule is to be sorted. If the Sort by property is 'None' or Custom, a rule can have more than one select field, for example, for each match, include the ip.src, ip.dst, size, time in the rule result. If a rule is set to be sorted, either by session count, session size, or packet size, then there can only be one field on which to select.	
Where	A clause that is the base query for the rule.	alert='cleartext_ftp_password'
Then (Rule Actions)	A series of functions that manipulate the original result set of a rule in order to make the output in a report more meaningful or add additional functionality other than querying and displaying data.	lookup_and_add ('username','ip.src',10);

Property	Description	Example
Sort By	Determines how the data in the result set is sorted. The various possibilities are: • Total • Value • Column Name	Total
Limit	Designates how large a result set can be for the given rule. Users must note that if a result set is sorted by count or size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.	20

Note: In the User Interface (UI), the date or time displayed depends on the time zone selected by the user.

Rule Types

There are different rule types in the Reporting. Rule types designate the source of data for the report rule. Following are the rule types:

Rule Type	Description
NetWitness Database (**NetWitness DB**)	The NetWitness database extracts the meta from a Reporting Engine configured to use a Concentrator, Broker and Archiver as the data sources and provides the meta for rules.
Warehouse Database (**Warehouse DB**)	The Warehouse database, also referred to as the RSA NetWitness Warehouse, warehouses large volumes of data. The Warehouse is designed so that you can retrieve large volumes of data easily and efficiently. The Warehouse also extracts the meta from the Reporting Engine.
Respond Database (**Respond DB**)	The Respond database contain alerts and incidents generated from different services and you can create a report on those alerts and incidents.

Note: In the User Interface (UI), the date or time displayed depends on the time zone selected by the user.

List

A list is a variable that refers to a series of comma-separated values (CSV). You can insert a list into a rule or use it as an argument to a rule action. Lists can act as placeholders for other values, which you can populate and update as needed.

You can create, manage and view lists that can be used to define rules for Reporting and Alerting.

Lists cannot be empty or have duplicate or blank values.

Note: If you are defining a report with a rule which has lookup_and_add in the **Then** clause and direct the report output to a list, the list is not populated with the result.
For example, if you create a rule with ip.src in the **Select** clause and lookup_and_add ('ip.dst','ip.src', 10) in the **Then** clause, the report displays the result, but if you have redirected the output to a list, the list will be empty

Chart

Chart is a tabular or grid representation of data. It consists of the following:

Property	Description	Example
Chart Name	Identifies the chart.	Chart1
Rule Basis	Identifies the rule path chosen from the folder hierarchy.	

Any NetWitness Platform DB rule in the Reporting Engine system which is not sorted by none can be used to instantly create a chart. In NetWitness Platform, the chart interval can be adjusted from the chart definition panel itself. Each time a chart runs, it stores its result data locally in the Reporting Engine, so that it can be reviewed in either the Dashboard View or Chart View without any performance considerations.

Note: In the Reporting user interface, the output for the field where Date and Time are displayed is always according to the user-selected time zone profile.

Note: The Reporting Engine (RE) will automatically check for the available disk space before you execute a Test Rule, Report, Chart and Alert. If the RE disk space (in percentage) is less than the minimum disk space threshold (default value is 5), the RE will stop the current execution and an error message 'Available disk space of Reporting engine home is <5%, please clean up the space to proceed further' is displayed. Additionally, you may also configure the minimum disk space threshold by using the following path: **RE>Config>General>System Configuration>Mini disk space threshold in %.**

Reporting Guidelines

This section lists the RSA recommended guidelines to enhance the execution time of your reporting entities such as rules, reports, alerts, charts, and lists. The guidelines are provided for the following:

- NWDB Rules
- Timeout Configuration for NWDB Rules
- Lookup and Add rule action
- List value Reports

NWDB Rules

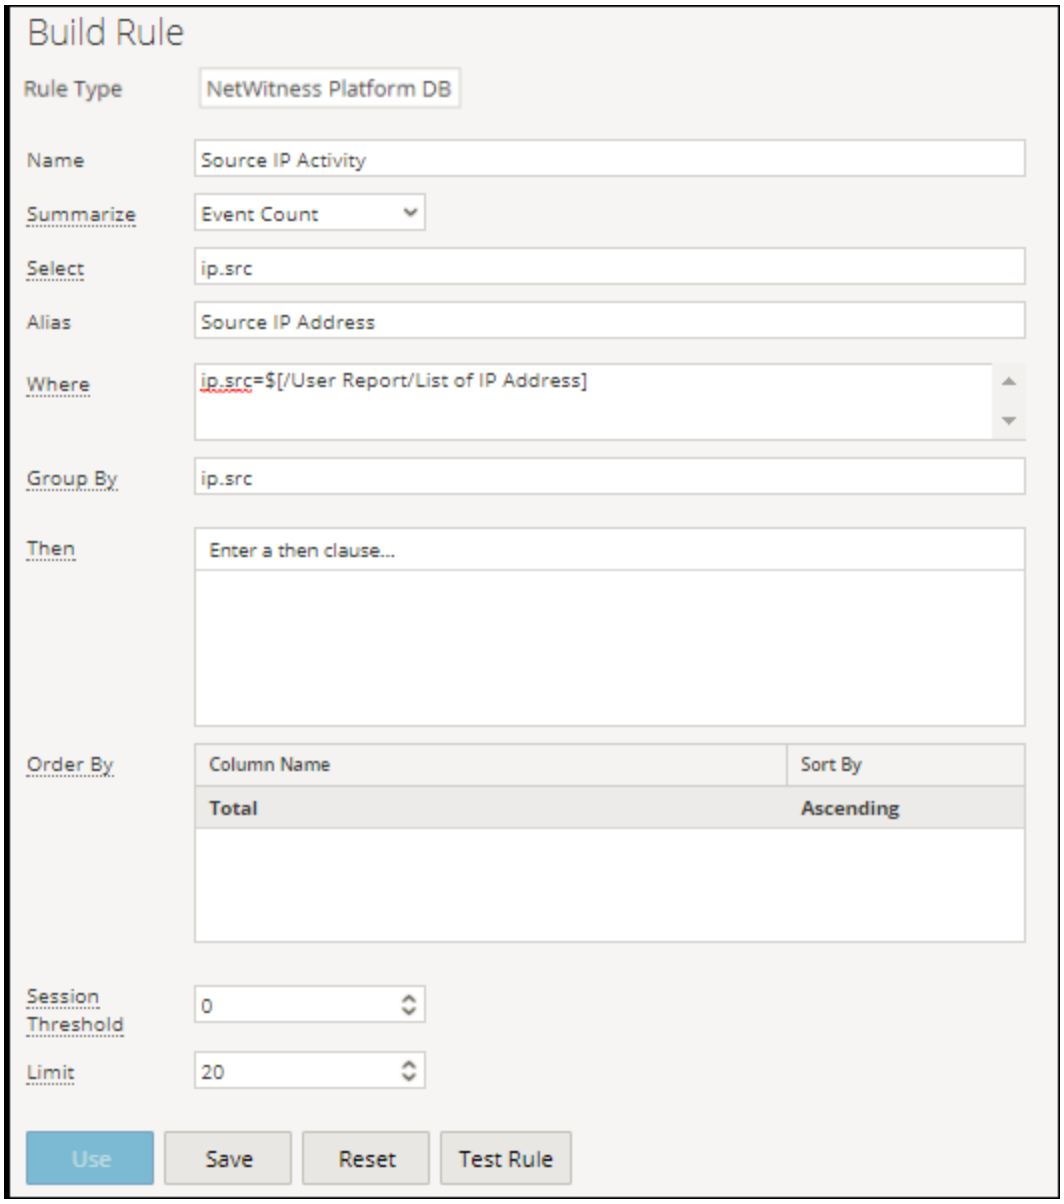
If the reporting entities such as report, alert, or chart contain NWDB rules (in most cases where the query contains Group By) takes a long time to execute, you may do the following:

1. Refine the Where clause:

   You may limit the number of sessions scanned by using or refining the Where clause (especially when you use the Group By option). For example, consider the following rule.

   If you use a Where clause as mentioned above, the number of sessions aggregated is huge. To avoid this, you can filter only required sessions by specifying the list of IP addresses or creating a List (list of IP Address) that contains relevant IP addresses.

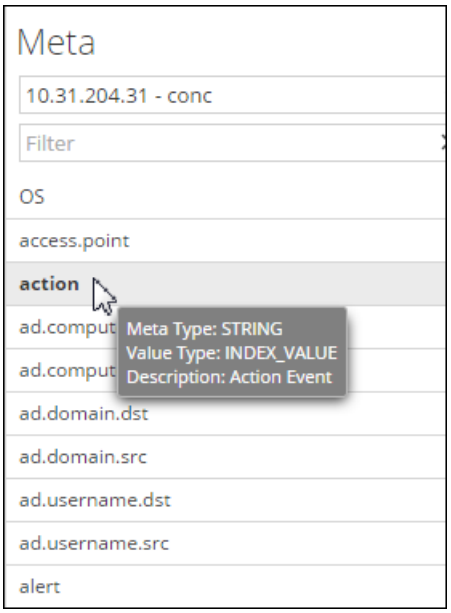
   Note: The NWDB rule where clause is appropriately quoted if the syntax has an invalid quote. For example, in case of an invalid meta, or missing separator, the status and the error message is updated appropriately.



2. Using indexed Meta keys in the Where clause:

   To understand if the Meta is indexed or not, mouse hover the Meta List present on the right panel. If the Value Type is INDEX_VALUE, then the Meta is indexed. The Value Type is INDEX_KEY or INDEX_NONE if the Meta is not indexed.

   Below is a snapshot of a Meta key that is indexed.



3. Configure the Timeout option:

   If the query is taking a long time and fails due to timeout issues, you can configure the timeout for the NWDB rule executions. For more information, see below section "Timeout Configuration for NWDB Rules".

4. Schedule the queries to run at different times:

   If multiple query aggregates are concurrently executed and timeout occurs, you may schedule the queries to run at different times without much overlap.

Timeout Configuration for NWDB Rules

Note: It is a good practice to check the statistics of the Reporting Engine and the NWDB data sources before you make any changes to the configuration. For more information, see the "Monitor Service Details" topic for Reporting Engine and "Monitor System Statistics" topic in the *System Maintenance Guide*.

If NWDB rule execution fails due to timeout, you may get the following errors on the View a Report page:

- Reporting Engine timeout error

  “Data source ‘`10.31.x.x Concentrator`' did not respond within the configured time `30` minutes for the ‘`/sdk/values`' request.”

- NWDB timeout error

  "Error occurred while fetching data from source '`10.31.x.x Concentrator`'. `{Timeout message from NWDB}`”

In such cases, you may do the following:

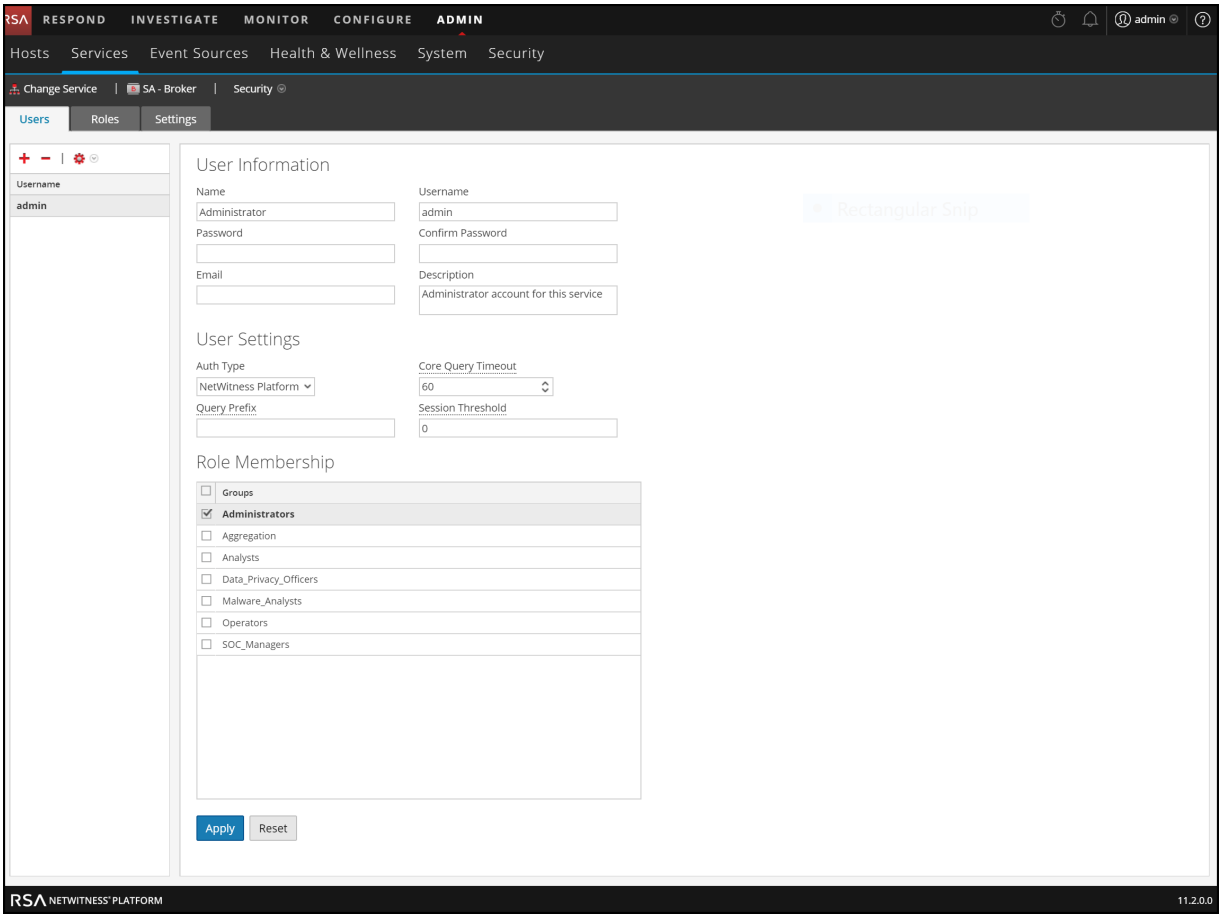
- Reporting Engine timeout

  In case of Reporting Engine timeout, you may set the timeout to a longer duration so the long running queries can be executed. For more information on setting the `NWDB Queries Time Out` and `NWDB Info Queries Time Out` option for the Reporting Engine, see "Step 2. Configure Reporting Engine Settings" topic in the *Reporting Engine Configuration Guide*. RSA recommends you set the `NWDB Query Time Out` to zero minutes (implies no timeout) and `NWDB Info Queries Time Out` to 60 minutes.

- NWDB timeout

  In case of NWDB timeout, you may need to configure the `query.level.timeout` and `max.concurrent.queries` parameters for the NWDB data source based on the recommendations in the *Core Database Tuning Guide* to fine tune the queries.

  The following figure is an example of Explorer view where you can set the parameters for NWDB data source.



- Schedule Reports at different times

  If the NWDB core devices are heavily utilized, you may schedule the reports to run at different times without overlap.

- Split the Report

If you have many rules in a Report, split the report into multiple reports with each report containing logical set of rules. If you have multiple rules, all rules will begin to execute at the same time based on available threads, therefore you may group the rules logically into separate reports.

LookupAndAdd Rule Action

If a rule that consists of single or multiple `lookup_and_add` rule actions, takes a long time to execute the report, it is because each of the rule action triggers multiple lookup queries on the NWDB data source resulting in longer execution time.

To improve the report execution time, you may do the following:

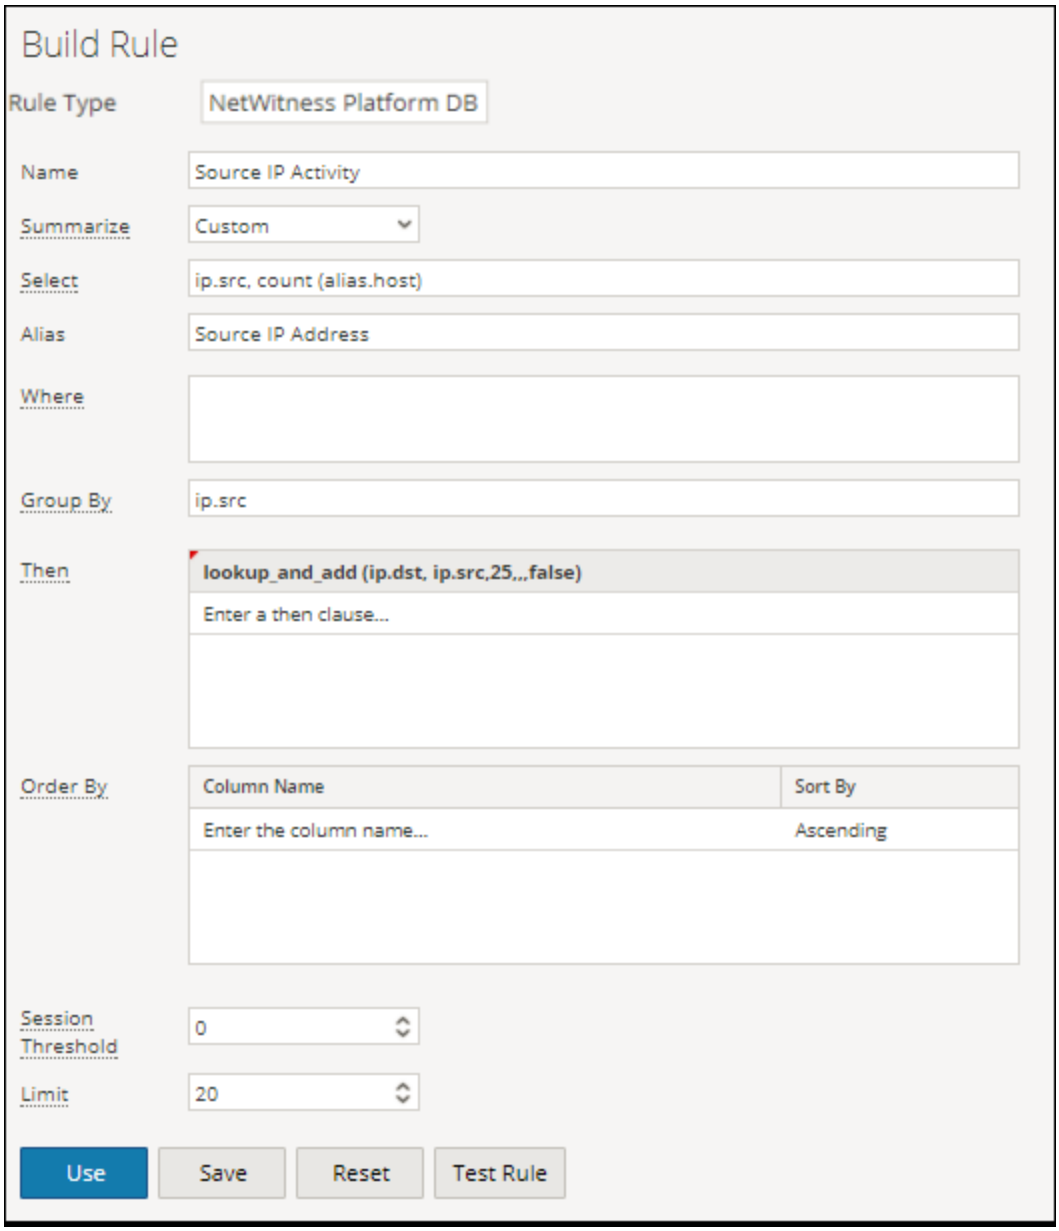
- Refine the Where clause in the following:
  - Rule that contains the `lookup_and_add` rule action
  - `lookup_and_add` rule action
- Set Limits

  You must set appropriate limits for the rule and rule actions. If the limit is high it will result in many queries being triggered and hence the report will take a long time to execute.
- Set the boolean aggregate parameter

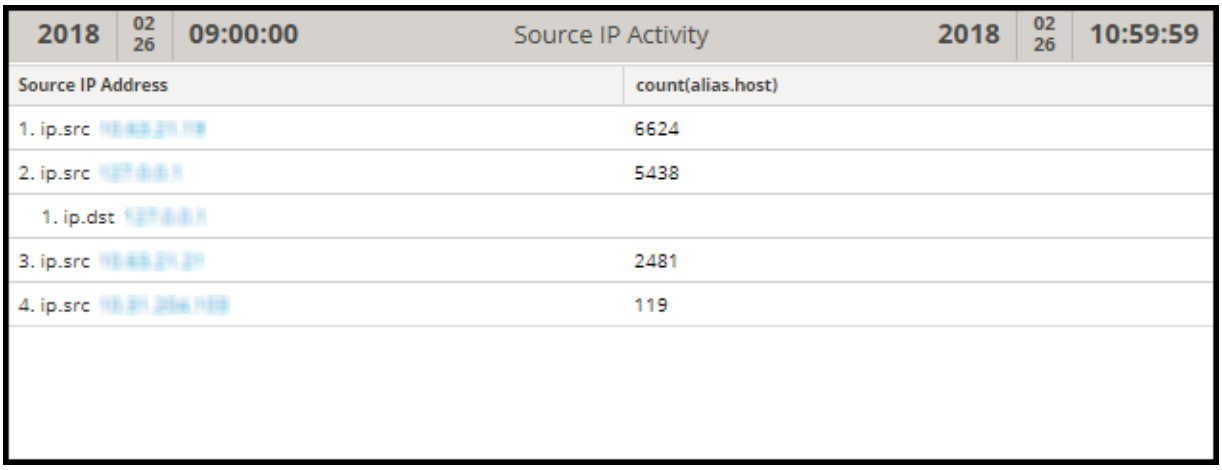
  If you do not want the aggregate value such as `sum(meta), count(meta)` etc. for the lookup values, set the boolean aggregate parameter to false in the `lookup_and_add` rule action. For more information, see the "NWDB Rule Syntax" section in Rule Syntax.

  ```
  lookup_and_add(string select, string field, int limit, boolean inherit,
  string extraWhere, boolean aggregate)
  ```

  Consider the rule with lookup_and_add rule action:



The output is displayed:

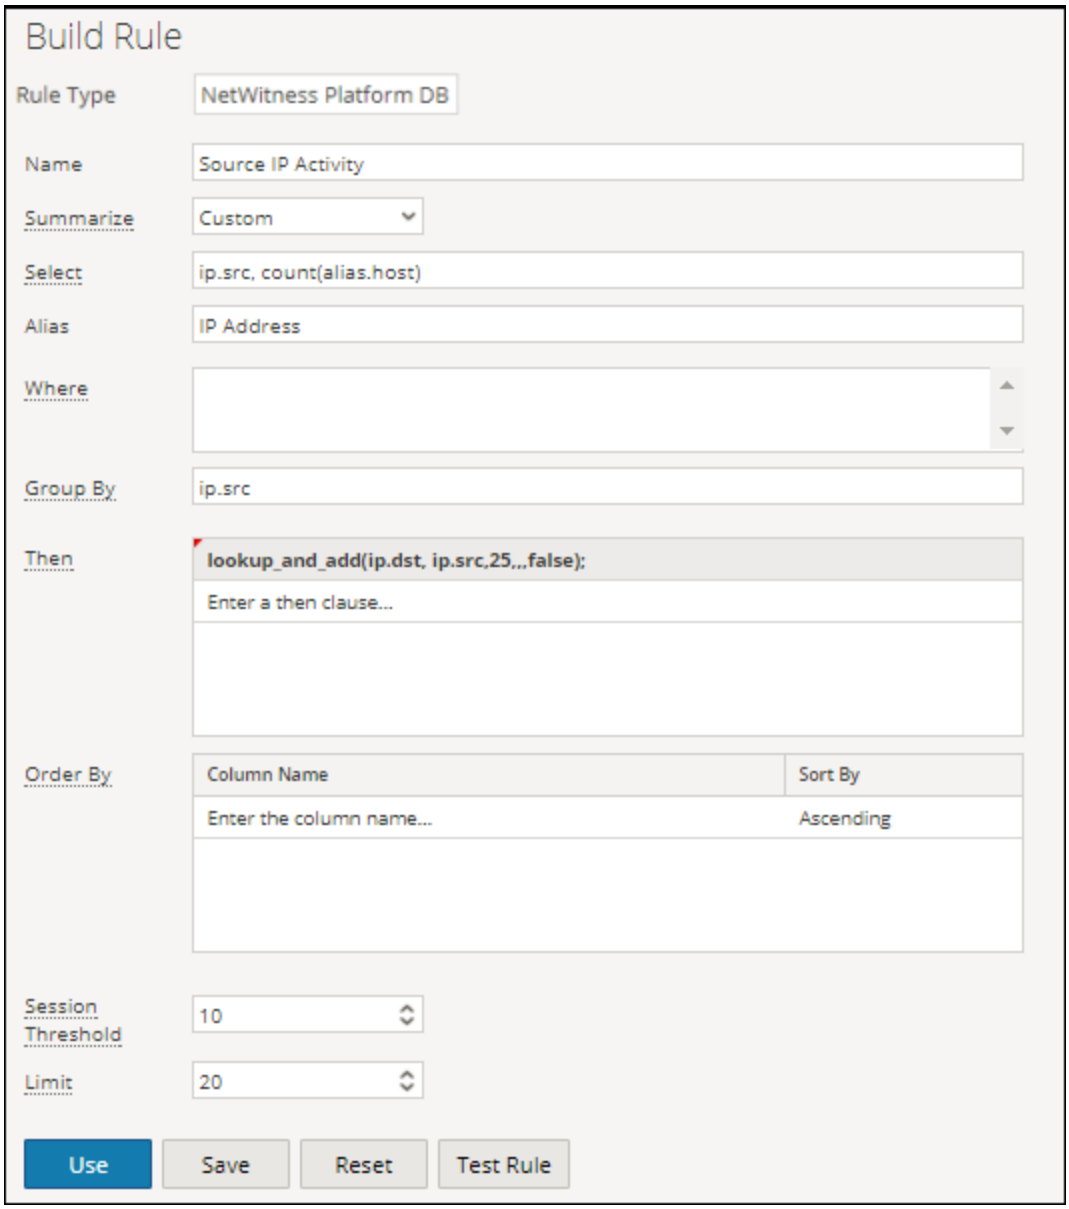


- Each `lookup_and_add` rule action triggers by default two concurrent lookup queries on the data source. RSA recommends that you retain the default setting, however if you want to increase the value you may want to ensure the value of `Max # of Concurrent LookupAndAdd Queries` parameter in Reporting Engine is less than the `Max Concurrent Queries` value in the NWDB data source configuration.

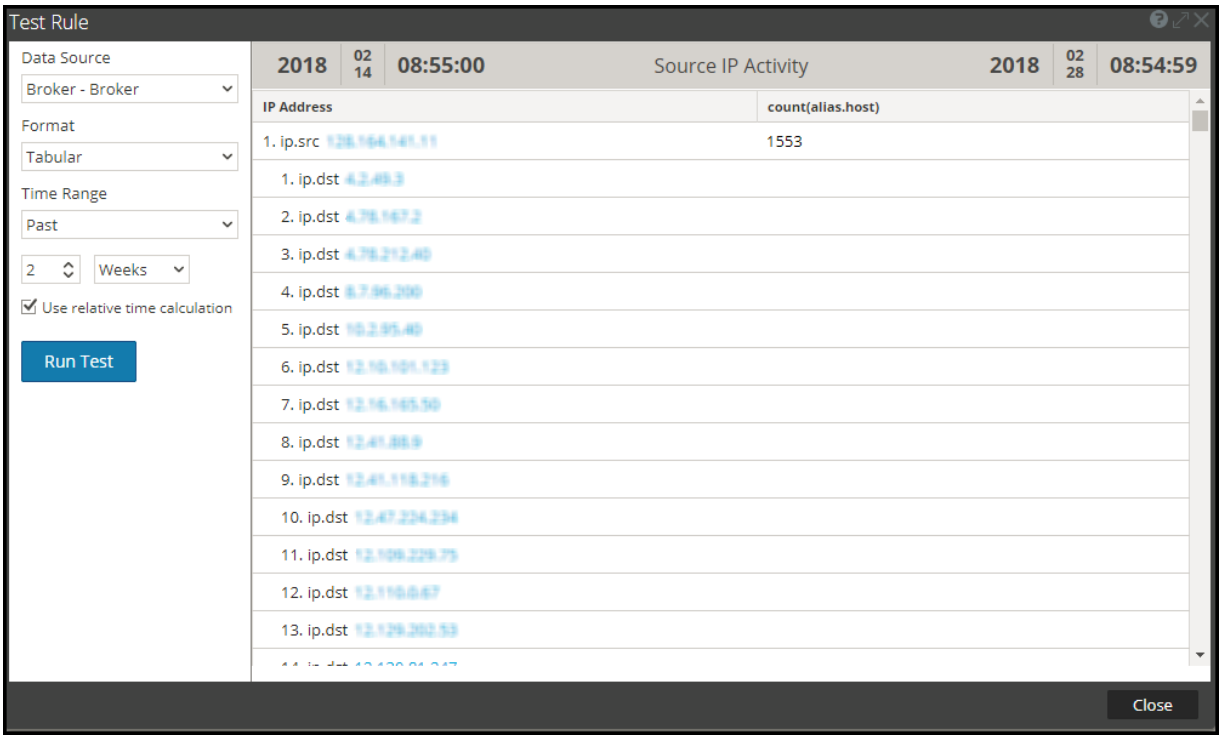
  If the NWDB data source is shared across other services, then you may retain a low value for the `Max # of Concurrent LookupAndAdd Queries` parameter in Reporting Engine as increasing it will impact the queries from other services. For more information, see "Reporting Engine General Tab" topic in *Reporting Engine Configuration Guide*.

- If you are interested only in unique values and not accurate aggregates, then set the `Session Threshold` to a non-zero value for the NWDB rule. For more information, see "Create a Rule Using NetWitness Data Source" section in Configure a Rule. The higher the value, the longer is the rule execution. If the value is set to zero it will take a longer time but will provide accurate aggregates.

  Consider a rule with lookup_and_add rule action and Session Threshold set to 10.



The output is displayed:



List Value Reports

Use a Refined List:

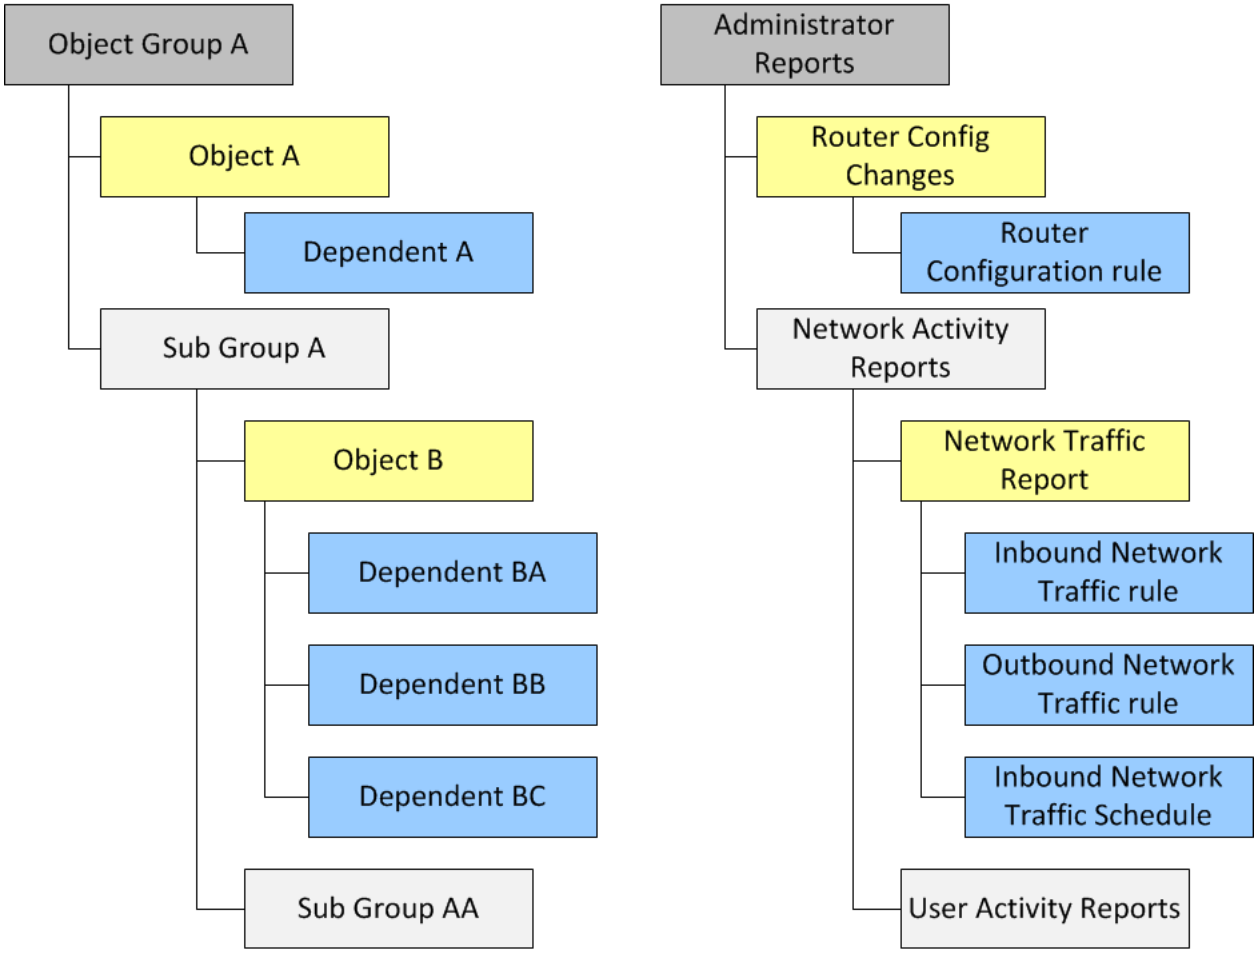
In case of List value reports (for any data source type), individual reports will be generated for each value in the list. Therefore, more the number of values in the list the longer the reports will take to execute. Hence, you must use a refined list to generate such reports.

Access Control for Reporting

Reporting Module provides you the option to set up access control for all the components in the module. In NetWitness Platform, you can define different roles and specify the access control for each of the role from the System Security module. You can define the access control to be provided for the Reporting module for each role. For more information, see "Step 1: Review the Pre-Configured NetWitness Platform Roles" and "Step 2: (Optional) Add a Role and Assign Permission" topics in the *System Security and User Management Guide*.

In the Reports module, you can modify the role permissions or access to the following Reporting objects:

The Following is an example of the hierarchy of the object groups, objects and dependents. This is an illustration of the Report Groups and Reports hierarchy.



Report Groups and Reports Hierarchy

Permission for Object Groups

- You must have the Read & Write permission to set the permissions for the Object Group, Objects, or Dependents. The dependents with “No Access” permission are grayed out and dependents with “Read-Only” permission are indicated with an icon.
- When you set the permission for the Object Group, the Objects and Dependents in the Object Group do not inherit the permission automatically. You must select the "Apply these permissions to sub-groups and <Objects> in this group" option to achieve this. For example, if you do not want Operators roles to access reports in Report Group A, then you must set the permission on Group A to No access for the Operator role and select the "Apply these permissions to sub-groups and Reports in this group" option.
- When you set the permissions for the Object Group and select the "Apply these permissions to sub-groups and <Objects> in this group" option, the dependents such as rules or schedules in the objects do not inherit the permissions automatically. You must use the "Apply Read-only permission to Rules in the <Object>" option to apply the permission to the rules.

- When you set the permissions for the Objects, you must ensure that the Objects in hierarchy should always have a permission that is less than or equal to the one above in the hierarchy for the permission to be applied. For example, if the reports in a Report Group have Read & Write permission and you apply a Read-Only or No Access permission at the Report Group level and select the "Apply these permissions to sub-groups and Reports in this group" option, then the permission on the rules will remain unchanged.
- The permissions are cascaded from top to down in the hierarchy and not vice-versa. For example, if you apply a permission to a rule, it does not change the permission of the Report that contains the rule.

Permission for Objects or Dependents

- You must have the Read & Write permission to set the permissions for the Objects or Dependents.
- You can specify the permission for multiple objects at once instead of setting the permission for each object.
- When you set the permission for the Object, the dependents in the Object do not inherit the permission automatically. You must select the "Apply Read-only permission to Rules in the <Object>" option to achieve this.

When you apply the permission to dependents the permission is applied based on the existing permission for the role. For example, consider an Analyst and a Operator with the following permissions for the different dependents (Report A object has Rule AA, Rule AB, and Rule AC as dependents).

Object or Dependent	Analyst	Operator
Report A	Read & Write	No Access
Rule AA	Read & Write	No Access
Rule AB	Read and Write	Read and Write
Rule AC	Read-only	No Access

When the Analyst applies a Read & Write permission for the Operator role and selects the option "Apply Read-only permission to Rules in the <Object>", then the permissions will be set for the different dependents as follows:

Modify the Permissions

- **Group Level:** Set the permissions at the Object Group level and for all the object and entities in the Group. For example, if you have 80 reports in the Administrators Reports group and you do not want anyone except the Administrator to add or modify these reports, you can set the permission for all the other roles at the group level to Read-Only and select the option to apply it to all the reports and sub-groups in the report group.
- **Multiple Objects:**Select multiple objects and specify the access for all the selected objects. For example, if you have 10 reports in the Network Traffic sub group with sensitive information that you do not want anyone to access, select the 10 reports and then set the permission for all the roles as "No Access".

- **Single Object:** Select only the object and specify the permission. For example, select the Network Traffic Report and specify the Read-Write permission for the Security Analyst role or select the Login Failure Alert and specify the Read-Write permission for a Security Analyst role.

Object or Dependent	Operator (Before Permission is applied)	Operator (After Permission is applied)
Report A	No Access	Read & Write
Rule AA	No Access	Read-only
Rule AB	Read and Write	Read & Write
Rule AC	No Access	Read-only

Roles and Permissions for Reporting Module

Although NetWitness Platform has five pre-configured roles, you can add custom roles. For example, in addition to the pre-configured Analysts role, you can add custom roles for AnalystsEurope and AnalystsAsia.

Role	Permission
Administrators	Full system access
Operators	Access to configurations but not to data
Analysts	Access to data but not to configurations
SOC_Managers	Same access as Analysts and an additional permission to handle incidents
Malware_Analysts	Access to malware events only

Depending on the user role, you can set the following access permissions to access the Reporting module components (Rules, Reports, Charts, Alerts, Lists):

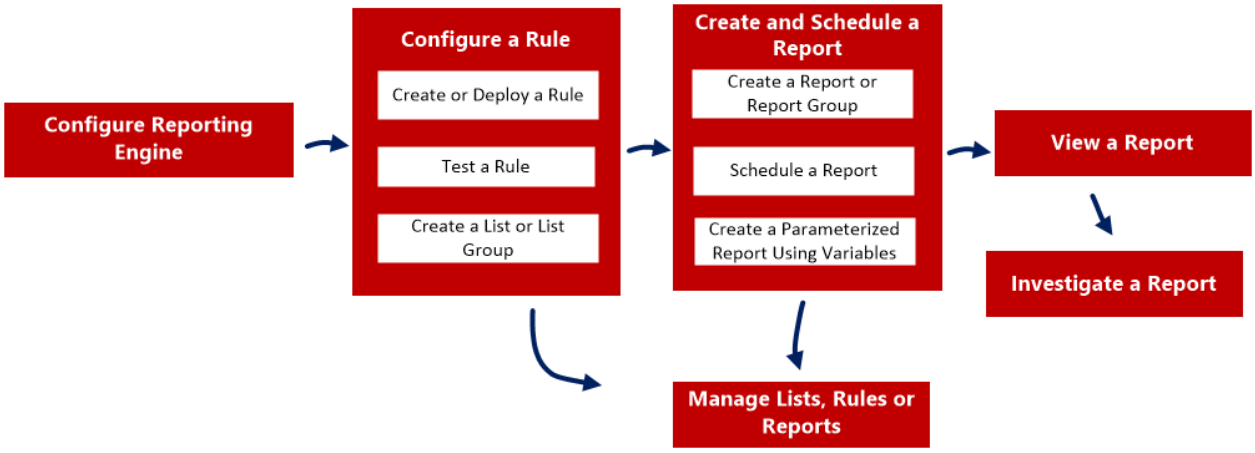
- Create
- Delete
- Export
- Manage
- View

Note: You must enable all these permissions for a user role to be able to define, delete, manage and view each of the Reporting modules. You must also have appropriate permissions for the data source to be listed, while defining the reports, charts, or alerts. For more information, see "Configure Data sources Permissions" topic in the *Reporting Engine Configuration Guide*.

For a detailed list of permissions and how to add a role and assign permissions, see "Role Permissions" and "Step 2. (Optional) Add a Role and Assign Permissions" topics in the *System Security and User Management Guide*.

Configure and Generate a Report

This figure is an overview of the entire process of configuring and generating a report.



To configure and generate a report, perform the following tasks:

1. Configure Reporting Engine - You must configure the Reporting Engine before you can configure and generate a report. You must also specify the data source in the Reporting Engine from which the data is extracted. For more information on how to configure Reporting Engine, see "Configure Reporting Engine" topic in the *Reporting Configuration Guide*.
2. Configure a Rule
3. Create and Schedule a Report
4. View a Report
5. Investigate a Report
6. Manage Lists, Rules or Reports

Configure a Rule

You can create a new rule or deploy an existing rule from the Live Services which can be used in a report. You can use different conditions to refine the data or information in the data sources such as :

- Select clause
- Where clause
- Group By
- Order By and so on

For example, you can write a rule to view the top 20 web addresses that the users visit daily.

You can create different type of rules using different data sources. Based on your requirements you can select any of the following options to create a rule:

- Create a Rule Using NetWitness Data Source
- Create a Rule Using Warehouse Data Source
- Create a Rule Using Respond Data Source

You can also use a list in a rule to refine a search result from the data source. Once a rule is created you can test a rule to see the results returned by the rule.

Create a Rule Group

To create a rule group or rule sub-group, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Do one of the following.
   - To define a rule group:
     a. In the Rule Groups Panel, click + .
     The new rule group is added to the Rule Groups panel.
     b. Enter the name for the rule group and click ENTER.
   - To add a rule sub-group:
     a. In the Rule Groups panel, select the rule group to which you want to add a sub-group.
     b. Click + .
     The new rule sub-group is added to the rule group.
     c. Enter the name for the rule sub-group and click ENTER.

Create a Rule Using NetWitness Data Source

You can create a rule to fetch data or events from a NetWitness data source. The same procedure is used to define a rule to fetch data or events from an Archiver data source.

The Archiver data source can be added in the Services Config View of the Reporting Engine. For more information, see "(Optional) Add Archiver as a Data Source to Reporting Engine" topic in the *Archiver Configuration Guide*.

Prerequisites

Make sure that you understand how custom meta keys are created using custom feeds. For more information, see "Create Custom Meta Keys using Custom Feed" topic in the *Decoder and Log Decoder Configuration Guide*.

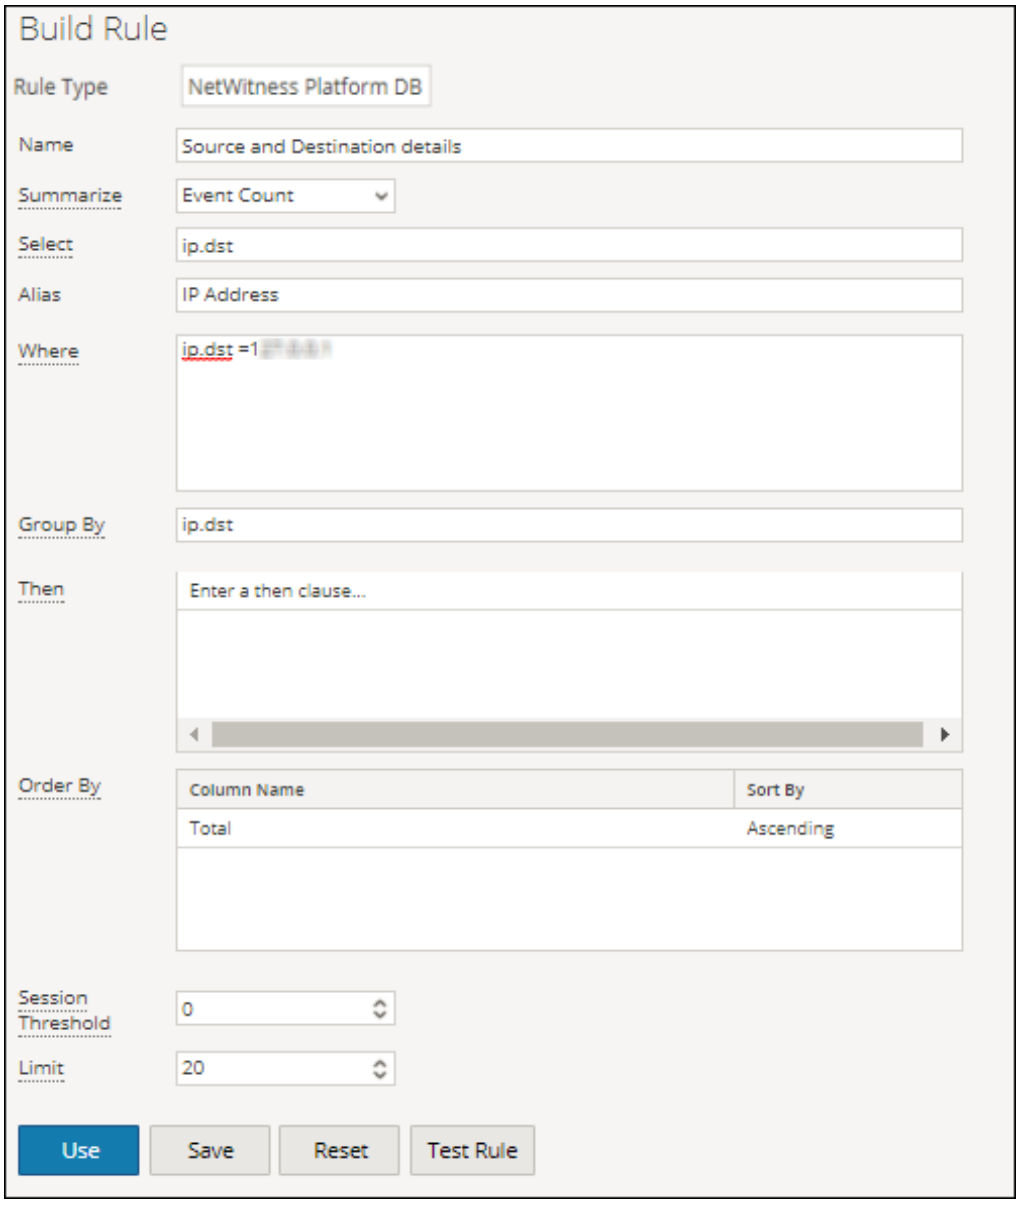
To create a rule to fetch data or events from a NetWitness Data Source, perform the following:

1. Go to **MONITOR**> **Reports**.

   The Manage tab is displayed.

2. In the Rule toolbar, click + > **NetWitnessDB**.

   The Build Rule view tab is displayed.



3. In the **Rule Type** field, **NetWitness DB** is selected by default.
4. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.
5. The **Summarize** field determines the type of summarization or aggregation for the rule. Based on the type of rule to be defined, you must select one of the following:
   - To define a **Non-Aggregate** rule without any grouping, select: **None**
   - To define an **Aggregate** rule with special aggregation like the collection (sessions/events/packets) related aggregates, select one of the following:
     - Event Count
     - Packet Count
     - Session Size

- To define an **Aggregate** rule with meta values and custom aggregates like sum(), count(), and so on, select: **Custom**

  Choosing 'Custom' in the **Summarize** field enables you to define aggregate function of your choice in the *Select* clause. For example, select ip.src, countdistinct(ip.dst), distinct(ip.dst). The supported aggregate functions are:

  - sum (<meta>)
  - count(<meta>)
  - countdistinct(<meta>)
  - min(<meta>)
  - max(<meta>)
  - avg(<meta>)
  - first(<meta>)
  - last(<meta>)
  - len(<meta>)
  - distinct(<meta>)

  For more detailed information about Aggregate and Non-aggregate rule, see "NWDB Rule Syntax section" in Rule Syntax.

6. In the **Select** field, enter a meta or select a meta from the list of available meta types provided in the Meta Library. For more information, see "Meta Panel" in Build Rule View. The meta name to fetch raw log is raw. raw can only be used in the **Select** field. It cannot be used in the **Where** and **Then** fields. Multiple aggregate functions are supported for Custom aggregate rule in the **Select** field. For example, Select: *ip.src, username, service, distinct(country.src), sum(payload).*
7. In the **Alias** field, enter the alias name for columns used in the Select clause.
8. In the **Where** field, enter a meta or select a meta from the list of available meta types and use the operators to construct the Where clause for the base query criteria.
9. The **Group By** field is a read-only field which gets populated with meta that are defined in the Select clause. For a Non-Aggregate function, this field is not visible. A maximum of six meta are supported in the **Group By** field.

   Note: In earlier versions of NetWitness Platform, only one meta was supported for Custom aggregate rule in the **Group By** clause. From now, a maximum of six meta are supported in the **Group By** clause.

10. In the **Then** field, enter the rule actions that manipulate the original result set of a rule in order to make the output in a report more concrete or add additional functionality other than querying data and displaying it, for example, creating a feed from the results. For a complete list of available rule actions, see "NWDB Rule Syntax" in Rule Syntax.

    Note: When a rule is executed for an Archiver data source, it is recommended not to use query intensive rule actions such as lookup_and_add() and show_whats_new().

11. In the **Order By** field, perform the following:

a. In the **Column Name** column, enter the name of the columns by which you want to sort the results. By default, the value is empty. The value gets populated based on the value selected in the **Summarize** field.

- For Summarize 'None', if no **Order By** is selected, then by default it is ordered by session or collection time.
- For other Summarize values, the default sorting is based on the first 'group by' meta selected when no 'order by' is defined. For Event Count, Packet Count, and Session size, the accepted values are Total and Value.

b. In the **Sort by** column, select one of the following ways to sort the results:

- Ascending Order
- Descending Order

12. In the **Session Threshold** field, enter the optimization setting to stop scanning the matching sessions for each possible unique value for the selected meta. The threshold is an integer between 0 (default) and 2147483647.

> **Note:** This is applicable to only NWDB Aggregate rules. If the default value is specified, all the matching sessions will be scanned and the accurate value will be returned. A higher session threshold allows accurate counts for a value. However, this causes longer rule execution time. For example, consider you set the Session Threshold as 1000 for ip.src. If there are 5000 matching sessions then for a particular ip.src value which is present in more than 1000 sessions, NWDB stops the scan after 1000 sessions and returns the extrapolated aggregate value. This optimizes the query execution time. If the value is present in less than 1000 sessions, then the actual value is returned.

13. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by event count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.
14. Click **Save**.

> **Note:** Unlike parsed meta, raw logs are fetched from decoders. When both raw log and parsed meta are queried in a single rule, due to different retention periods, parsed meta might be available and raw logs missing in the same session. So the result will have parsed meta values and empty raw value for those sessions. For example, for the rule Select **ip.src**, **ip.dst**, **service**, **username**, **raw**, the parsed meta might be populated and the **raw** meta remains empty for a few sessions.

Create a Rule Using Warehouse Data Source

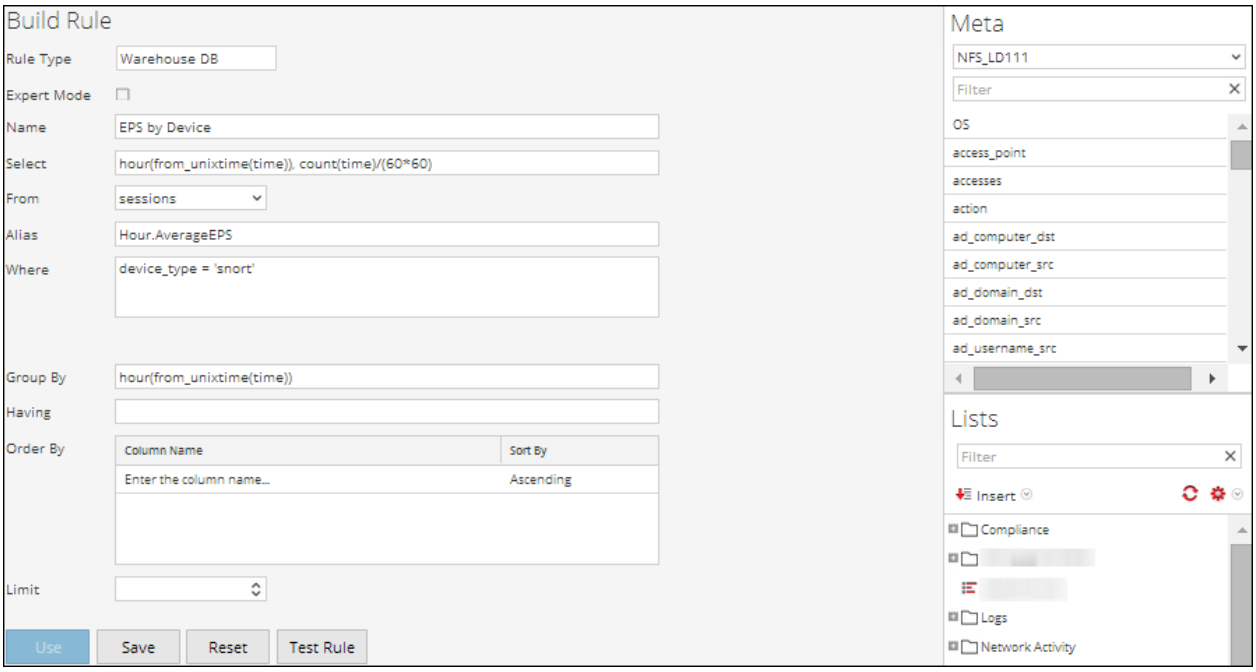
You can create a rule to fetch data or events from a Warehouse event source. You can define the rules in two modes:

- Default Mode
- Expert Mode

Default Mode

In Default Mode, you can create rules containing simple SQL like HIVE queries that contain clauses like Select, Where, Group By, and Having. By default, you can create rules to query sessions or raw logs. For more information on "Simple query syntax and examples", see Warehouse DB Simple Rules Syntax.

The following figure is an example of the **Build Rule view** that displays when you select **Warehouse DB** for **Rule Type** without the Expert Mode selected.

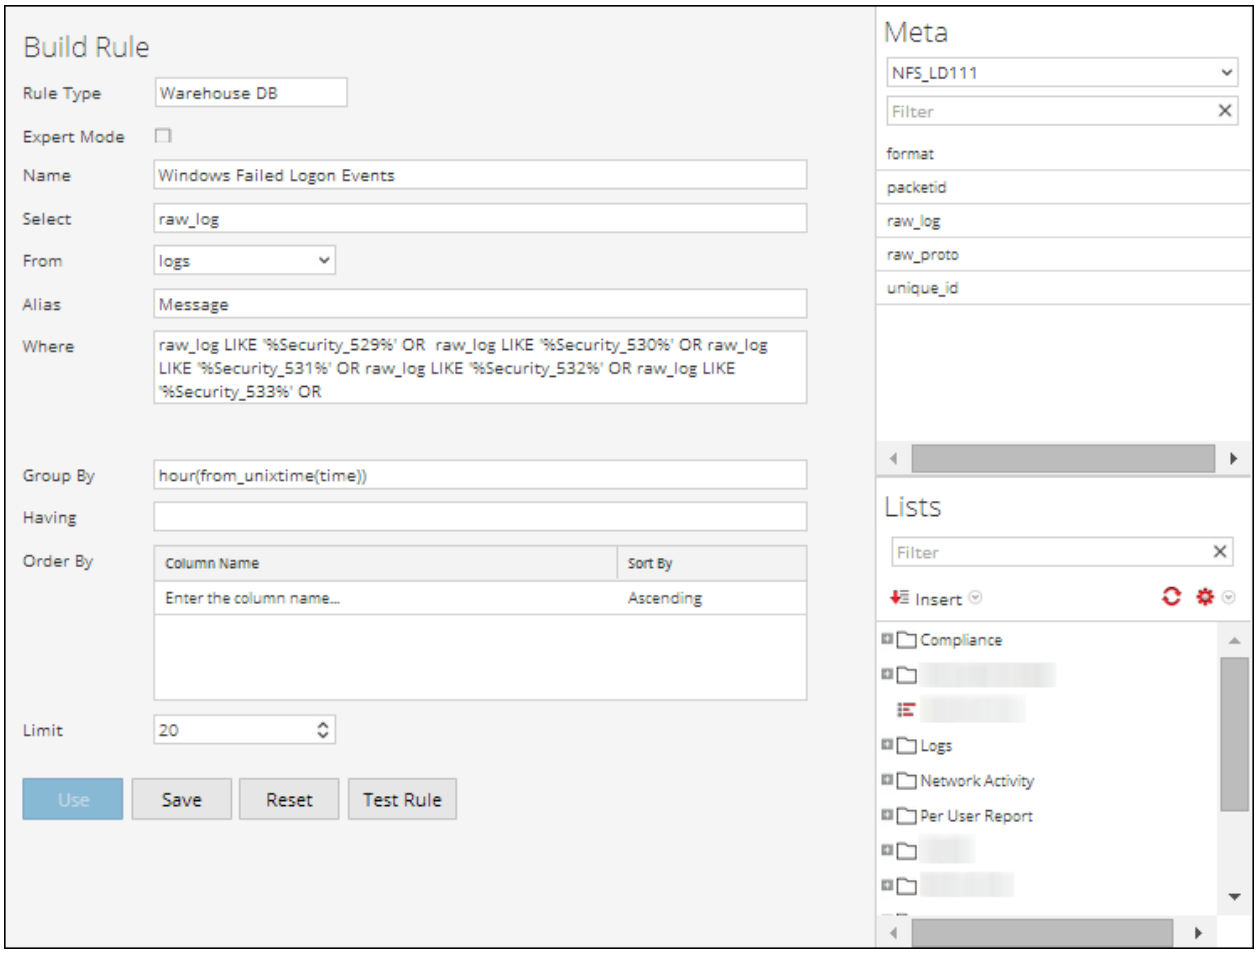


Querying Raw Logs

The raw log format is used in the select or where clause to query for raw logs.

Note: The time range that you can specify in your query is a day (24 hours). If you have specified a time range less than a day in your query, the result set contains data of at least a day (24 hours).

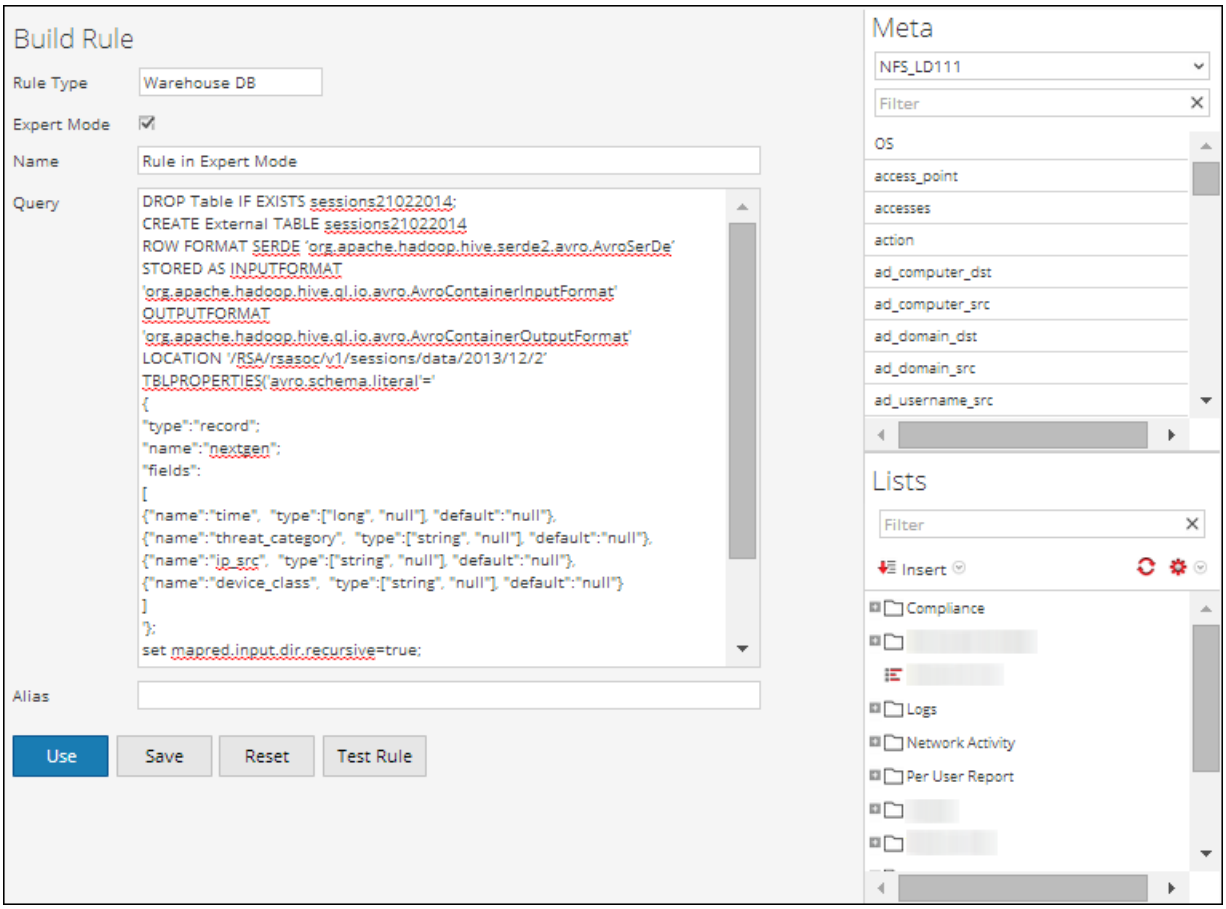
The following figure is an example of the **Build Rule view** that displays when you select **Warehouse DB** for **Rule Type** and create a rule for querying raw logs.



Expert Mode

Advanced rules are defined using complex HIVE queries created using the clauses DROP, CREATE, and so on. Unlike simple rules, we always insert the results into a table. For more information on "Advanced HIVE query language", see *HIVE language manual*.

The following figure is an example of the **Build Rule view** that displays when you select **Warehouse DB** for **Rule Type** with Expert Mode selected.



If you want to generate a report for a specific time range, you need to manually define the time range in the query using the following two variables:

- ${report_starttime} - The starting time of the range in seconds.
- ${report_endtime} - The ending time of the range in seconds.

For example, **SELECT col1, col2 FROM custom_table WHERE timecol >= ${report_starttime} AND timecol <= ${report_endtime};**

Note: By default, Reporting Engine treats `${keyword}` as a variable. If you want to specify HIVE variables, you must mention the complete syntax of a variable. For example, `${hiveconf:hive.exec.scratchdir}`.

Prerequisites

Make sure that you understand how custom meta keys are created using custom feeds. For more information, see "Create Custom Meta Keys using Custom Feed" topic in the *Host and Services Configuration Guide*.

To create a rule to fetch data or events from a Warehouse data source, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. In the Rule toolbar, click

> **Warehouse DB**.

The Build Rule view is displayed.

3. In the **Rule Type** field, **Warehouse DB** is selected by default.

   If you are defining the rule in Default mode, perform the following:

   a. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.

   b. In the **Select** field, enter a meta or select the meta from the drop-down or select a meta from the list of available meta types provided in the Meta Panel. For more information, see " Meta Panel" in Build Rule View.

   c. In the **From** drop-down menu, select one of the following:

      - Session
      - Logs

   d. In the **Alias** field, enter the alias name for columns used in the Select clause.

   e. In the **Where** field, enter a meta or select a meta from the list of available meta types provided in the Meta Panel. The Where clause provides the base query criteria for the rule.

   f. In the **Group By** field, enter the meta selected in the Select clause, so that the result set is grouped based on the meta.

   g. In the **Having** field, enter the criteria to filter the result set for aggregated queries.

   h. In the **Order By** field, perform the following:

      1. In the **Column Name** column, enter the name of the columns by which you want to group the results.
      2. In the **Sort by** column, select one of the following ways to sort the results:

         - Ascending Order
         - Descending Order

   i. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by session count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.

   j. Click **Save**.

4. If you are defining the rule in Expert mode, select the **Expert Mode** checkbox and perform the following:

   a. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and reports.

   b. In the **Query** field, enter the Hive query statement to query the data source.

   c. In the **Alias** field, enter the alias name for columns used in the Select clause.

   d. Click **Save**.

Create a Rule Using Respond Data Source

You can create a rule to fetch incidents or alerts from a Respond data source.

Prerequisites

Make sure that you:

- Ensure Reporting Engine service is up and running.
- Ensure the Incident Management service is up and running. For more information, see "Configure a Database for the Respond Server Service" topic in the *NetWitness Respond Configuration Guide*.
- (Optional) Ensure the Event Stream Analysis service is up and running. For more information, see "Step 2. Configure Advanced Settings for an ESA Service" topic in the *ESA Configuration Guide*.
- (Optional) Ensure the Malware Analysis service is up and running. For more information, see " (Optional) Configure Auditing on Malware Analysis Host" topic in the *Malware Configuration Guide*.

Note: You need to configure any one of the services (Event Stream Analysis, Reporting Engine, Malware Analysis, or Endpoint) based on your requirement and the type of alerts or incidents you want to generate.

To create a rule to fetch data or events from a Respond Data Source, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. In the Rule toolbar, click + > **RESPOND**.

   The Build Rule view tab is displayed.

3. In the **Rule Type** field, Respond is selected by default.
4. In the **Name** field, enter a name that is used to Identify or label the rule in alerts and incident reports.
5. The **Summarize** field determines the type of summarization or aggregation for the rule. Based on the type of rule to be defined, you must select one of the following:
   - To define a **Non-Aggregate** rule without any grouping, select **None**
   - To define an **Aggregate** rule with meta values and custom aggregates select **Custom**

     Choosing 'Custom' in the **Summarize** field enables you to define aggregate function of your choice in the *Select* clause based on the report type you have selected.

     For more detailed information about Aggregate and Non-aggregate rule, see Rule Syntax.
6. In the **From** field, based on the type of report output to be displayed, you must select one of the following:
   - Alert
   - Incident
7. In the **Select**field, enter a meta or select a meta from the list of available meta types provided in the Meta Library. For more information, see "Meta Panel" in Build Rule View. It cannot be used in the

Where field. Only one aggregate function is supported at a time in a query.

For example, the supported metas for alert are:

- alert_host_summary
- alert.name
- alert.numEvents
- alert.severity
- alert.source
- alert.timestamp
- incidentCreated
- incidentId
- receivedTime

For example, the supported metas for incident are:

- categories
- created
- priority
- riskScore
- sealed
- status

For more detailed information, see "Aggregate and Non-aggregate rule" topic in the Rule Syntax.

8. In the **Alias** field, enter the alias name for columns used in the Select clause.
9. In the **Where** field, enter a meta or select a meta from the list of available meta types and use the operators to construct the Where clause for the base query criteria.
10. The **Group By** field is a read-only field which gets populated with meta that are defined in the Select clause. For a Non-Aggregate function, this field is not visible. A maximum of six meta are supported in the **Group By** field.
11. In the **Order By** field, perform the following:
    a. In the **Column Name** column, enter the name of the columns by which you want to sort the results.

    Note: by default the first meta in the select clause will be dispalyed.

    b. In the **Sort by** column, select one of the following ways to sort the results:
    - Ascending Order
    - Descending Order

12. In the **Limit** field, enter the limit to be put on the query while fetching data from the database. If a result set is sorted by the limit represents the top (or bottom) N values to be returned. If the result set is not sorted, the first N values are returned.
13. Click **Save**.

Deploy a Rule

In RSA NetWitness Platform you can deploy the selected rules on the service (for example, Reporting Engine), using the Deployment Wizard.

Prerequisites

Make sure that:

- The services on which you deploy a rule is up and running.
- The Live Services is configured.

To deploy a rule, perform the following:

1. Go to **CONFIGURE > LIVE CONTENT**.
2. In the **Search Criteria** panel, search Live resources (for example, search for the **Application Rule** resource Type).
3. In the **Matching Resources** panel, select **Show Results > Grid**.
4. Select the checkbox to the left or the rules that you want to deploy.
5. In the **Matching Resources** toolbar, click 

.
6. Click **Next**.
7. Select the service on which you to deploy a rule (For example, Reporting Engine) and click **Next**.
8. Click **Deploy**.
   The rule is deployed successfully.

Use Meta Aliases for Reporting

When you refer to meta data in Reports and Charts, you can only view aliases for the meta names. These aliases makes them more understandable to a broader audience.

You cannot provide alias values for any meta in the WHERE clause because NetWitness Platform uses the WHERE clause to fetch data from the data source (for example, in the Concentrator) and data sources do not support aliases. In other words, you cannot provide the alias value **HTTP** for the HTTP port # 80.

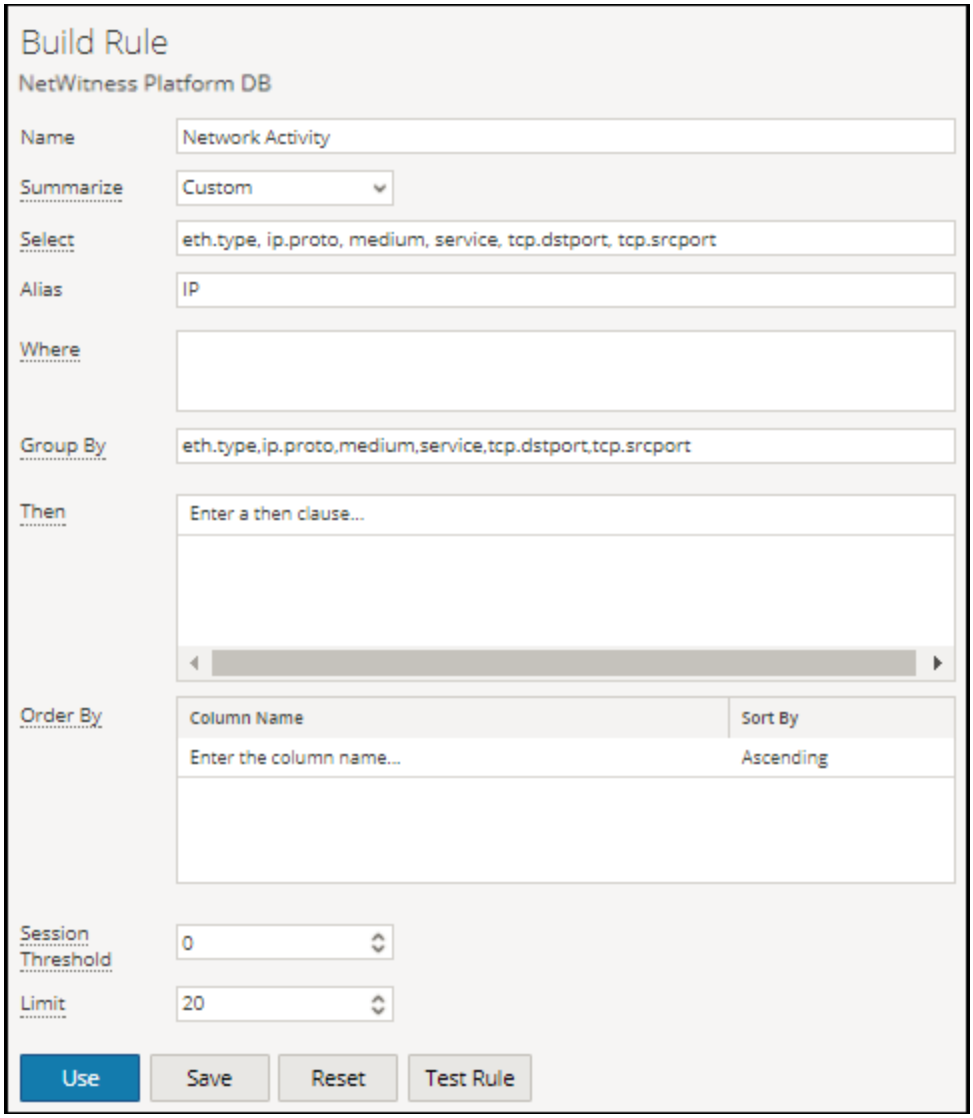
Note: * You cannot create aliases for meta other than the ones that have existing aliases by Reporting Engine. Also, the format of the aliases cannot be changed.
* Aliases are not supported for Alerts and CSV reports.

To use alias in a rule, perform the following:

1. Go to **MONITOR** > **Reports**.
   The Manage tab is displayed.

2. In the Rule List panel, do one of the following:
   - Select a rule and click in the Rules toolbar.
   - Click > **Edit**.
3. Specify the meta with aliases in the **Select** field.

The following example specifies the **eth.type**, **ip.proto**, **medium**, **service**, **tcp.dstport**, and **tcp.srcport** meta in the Select field.



4. Click **Test Rule**.
   The following example displays the results under the **eth.type**, **ip.proto**, **medium**, **service**, **tcp.dstport**, and **tcp.srcport** alias columns that were specified in the **Select** field of the rule.

	IP	IP Protocol	Network Medium	Service Type	TCP Destination Port	TCP Source Port
1	IP	ICMP	Ethernet	OTHER		
2	IP	IGMP	Ethernet	OTHER		
3	IP	TCP	Ethernet	OTHER		
4	IP	TCP	Ethernet	OTHER	daytime	3180
5	IP	TCP	Ethernet	OTHER	daytime	3204
6	IP	TCP	Ethernet	OTHER	daytime	4437
7	IP	TCP	Ethernet	OTHER	ssh	3023
8	IP	TCP	Ethernet	OTHER	ssh	3153
9	IP	TCP	Ethernet	OTHER	ssh	43915
10	IP	TCP	Ethernet	OTHER	ssh	43971
11	IP	TCP	Ethernet	OTHER	ssh	44064
12	IP	TCP	Ethernet	OTHER	ssh	44100
13	IP	TCP	Ethernet	OTHER	ssh	49055
14	IP	TCP	Ethernet	OTHER	ssh	53969
15	IP	TCP	Ethernet	OTHER	ssh	61292

RSA-Supplied Alias Definitions

The alias files in this section are examples only and are based on current alias definitions in the Reporting Engine. NetWitness Platform cannot modify these definitions in the Reporting Engine depending on the changes in the concentrator xml file. Since any changes in the Concentrator xml file are not reflected in the Reporting Engine.

The details of different meta are explained in each of the **meta.aliases**.

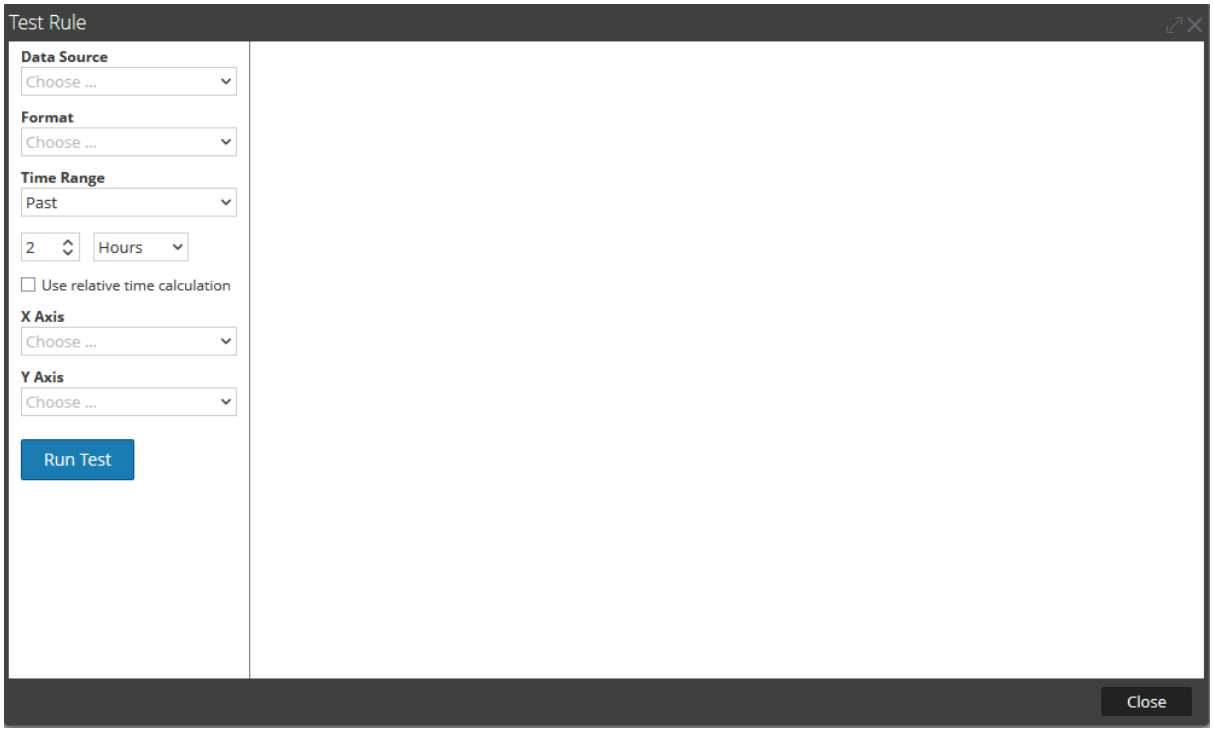
Test a Rule

You can test a rule based on the time range and the data source selected.

To test a rule, perform the following:

1. Go to **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the Rule List panel, do one of the following:
   - Select a rule and click in the Rules toolbar.
   - Click > **Edit**.
     The Build Rule view tab is displayed.
3. Click **Test Rule**.
   The Test Rule view is displayed.



> **Note:** When you click **Test Rule**, the rule is not saved. You have to click **Save**in the Build Rule view to save the rule.

4. From the **Data Source** drop-down list, select a data source.
   You must select the appropriate data source for the rule defined.
5. From the **Format** drop-down list, select the format in which you want the result displayed.
6. From the **Time Range** drop-down list, select one of the following.
   - **Past** -To specify number of years, days, weeks, months, days or hours.
   - **Range** - To specify a date range and time period.

> **Note:** In the User Interface (UI), the date or time displayed depends on the time zone profile selected by the user.

7. **X-Axis** and **Y-Axis** are used to specify the meta to be plotted in charts.
   In **X-Axis**, the Meta for the 'Group by' rule is displayed. In **Y-Axis**, the aggregate functions used in the rule are displayed.

Note: Sum, Count, Countdistinct and Average are the supported aggregate functions for rule. By default, for Custom Rules with multiple 'Group by', you can select only the first meta in **X-Axis**.

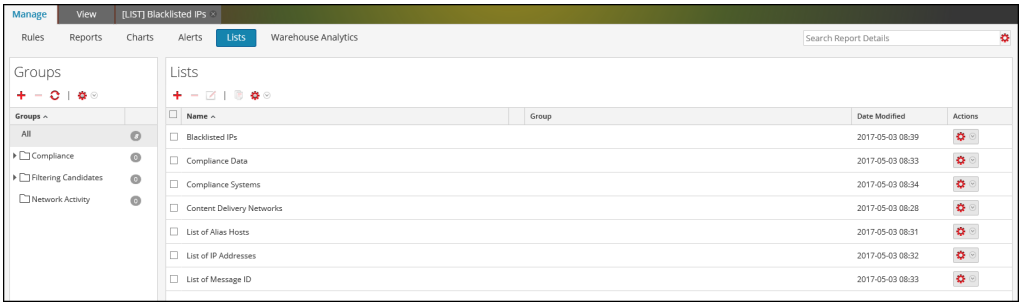
8. Click **Run Test** to execute the rule.
   The rule data (if any) for the selected time range is displayed.

Create a Lists or List Group

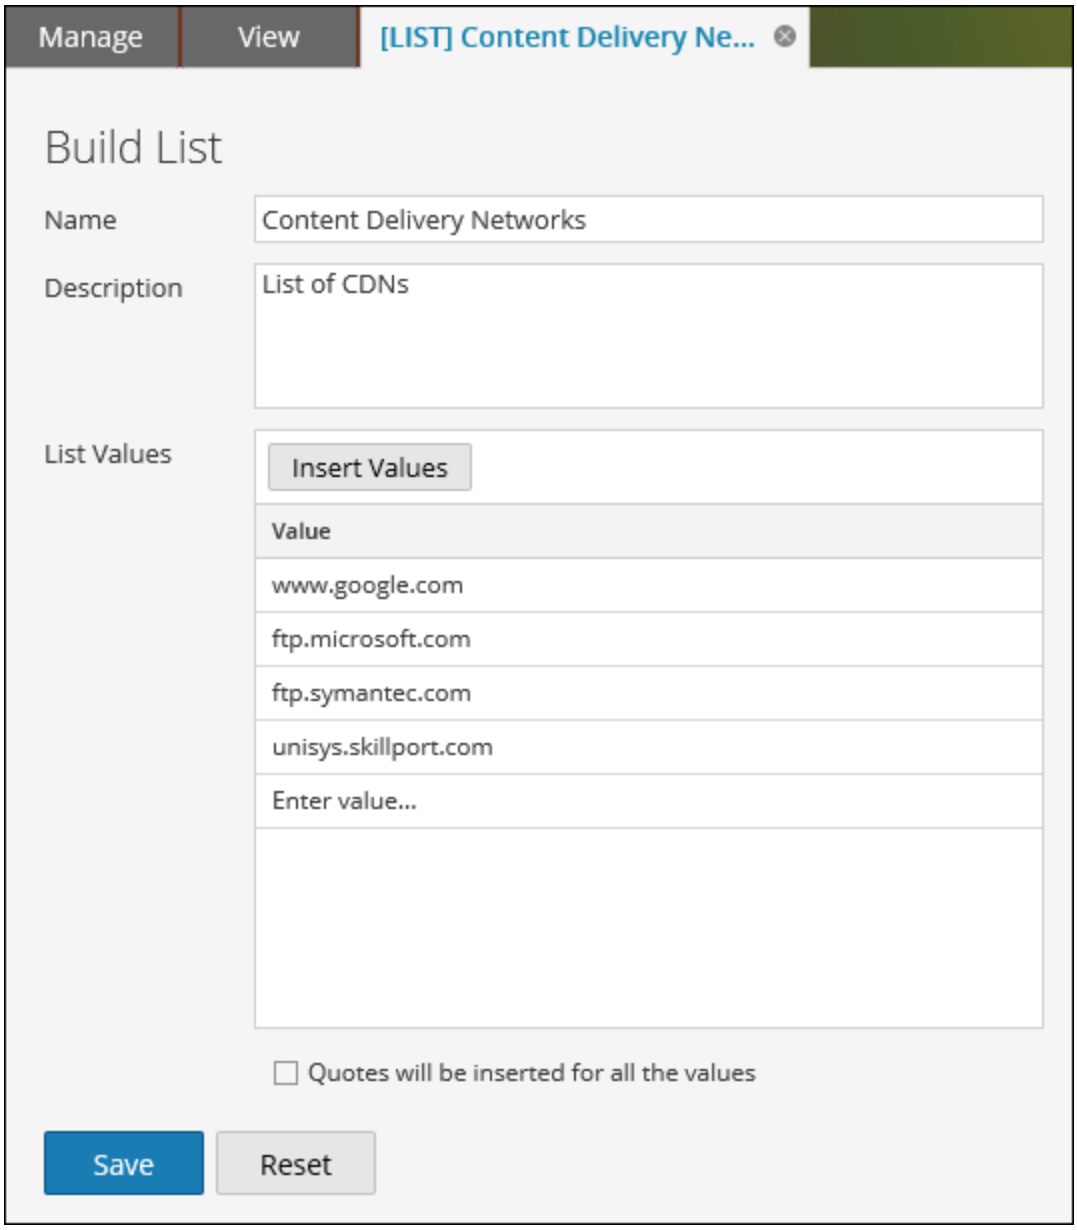
To create a list, perform the following:

Lists can be added within a group or in the root folder.

1. Go to **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.
   The List view is displayed.



3. In the **List** toolbar, click +.
   The Build List view tab is displayed.



4. In the **Name** field, enter a unique name for the list.
5. In the **Description** field, enter a description for the list.
6. In the **List Values** field, do one of the following:
   - Click **Insert** and enter the values separated by commas. You can paste a list of values from a file or other lists.
   - In the **Value** column, enter the values.
7. If you want quotes to be inserted directly for the values at runtime, select **Quotes will be inserted for all the values**.
8. Click **Save**.

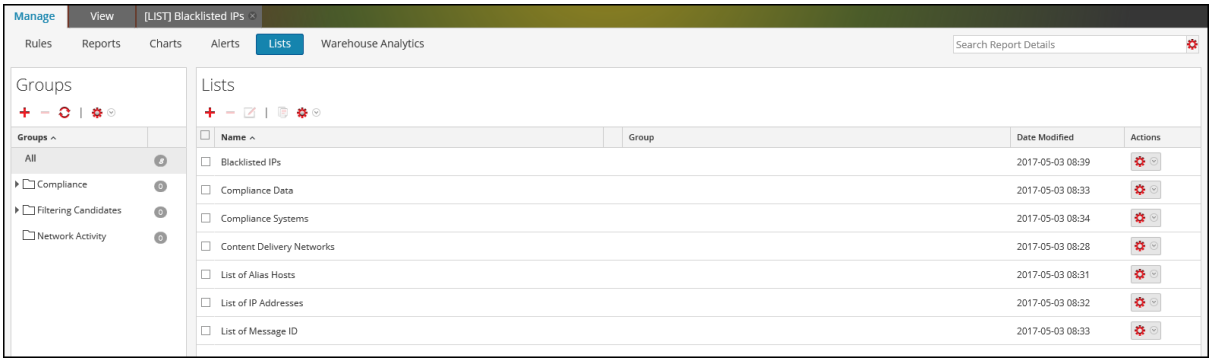
To create a list group, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.



3. Do the following:

   - To create a list group:

     1. In the List Groups panel, click + .

        A new list group is added to the List Groups panel.

     2. Enter the name for the list group and press ENTER.

   - To create a list subgroup:

     1. In the List Groups panel, select the list group to which you want to add a subgroup.
     2. Click +.

        A new list subgroup is added to the list group.

     3. Enter the name for the list subgroup and press ENTER.

Create and Schedule a Report

You can create a simple or complex report and configure its execution properties by scheduling a report. A report can include multiple rules and you can schedule different time range to execute the same report. For example, depending on your requirement, you can schedule a report to run daily, weekly or monthly.

When you run a report, the results are stored in Reporting Engine.

After you generate a report, you can perform the following:

- Send the reports by email to other users by configuring the output actions. You can also configure the output actions before generating a report.
- Download the reports as PDF or Comma-Separated Values (CSV) format files.

Note: The cancel operation is not supported for Respond Reports.

Create a Report or Report Group

To create a report to a group or sub-group, perform the following:

1. Go to **MONITOR** > **Reports**.

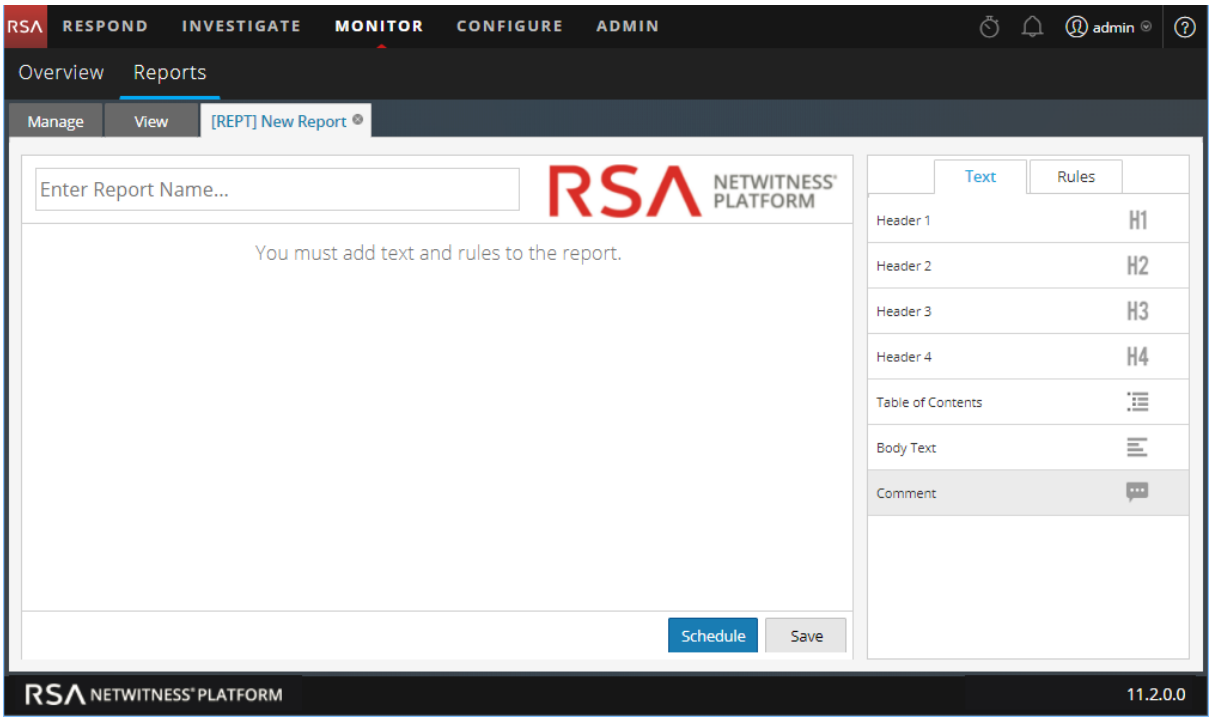
   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Reports** toolbar, click  .

   The Build Report tab is displayed.



4. Enter the name of the report.
5. Drag and drop the text and rules to the report.

> **Note:** The text entered is optional and you may need this option only when you want to display user-defined headers or content.

6. Click **Save**.

   A confirmation message that the report is saved successfully is displayed.

To create a group to the default folder or add sub-groups under a report group, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.
2. Click **Reports**.

   The Report view is displayed.
3. In the **Report Groups** panel, click **+**.

   A default group is added in the Report Groups panel.
4. Enter the name of the new group.
5. Press **Enter**.

   The group is added to the Report Groups panel.

Schedule a Report

Note: When you schedule a Warehouse report, you can use a supported task scheduler to allocate specific resources in a cluster for the scheduled job. For more information on "supported task schedulers", see Task Scheduler for Warehouse Reporting.

To schedule a report, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

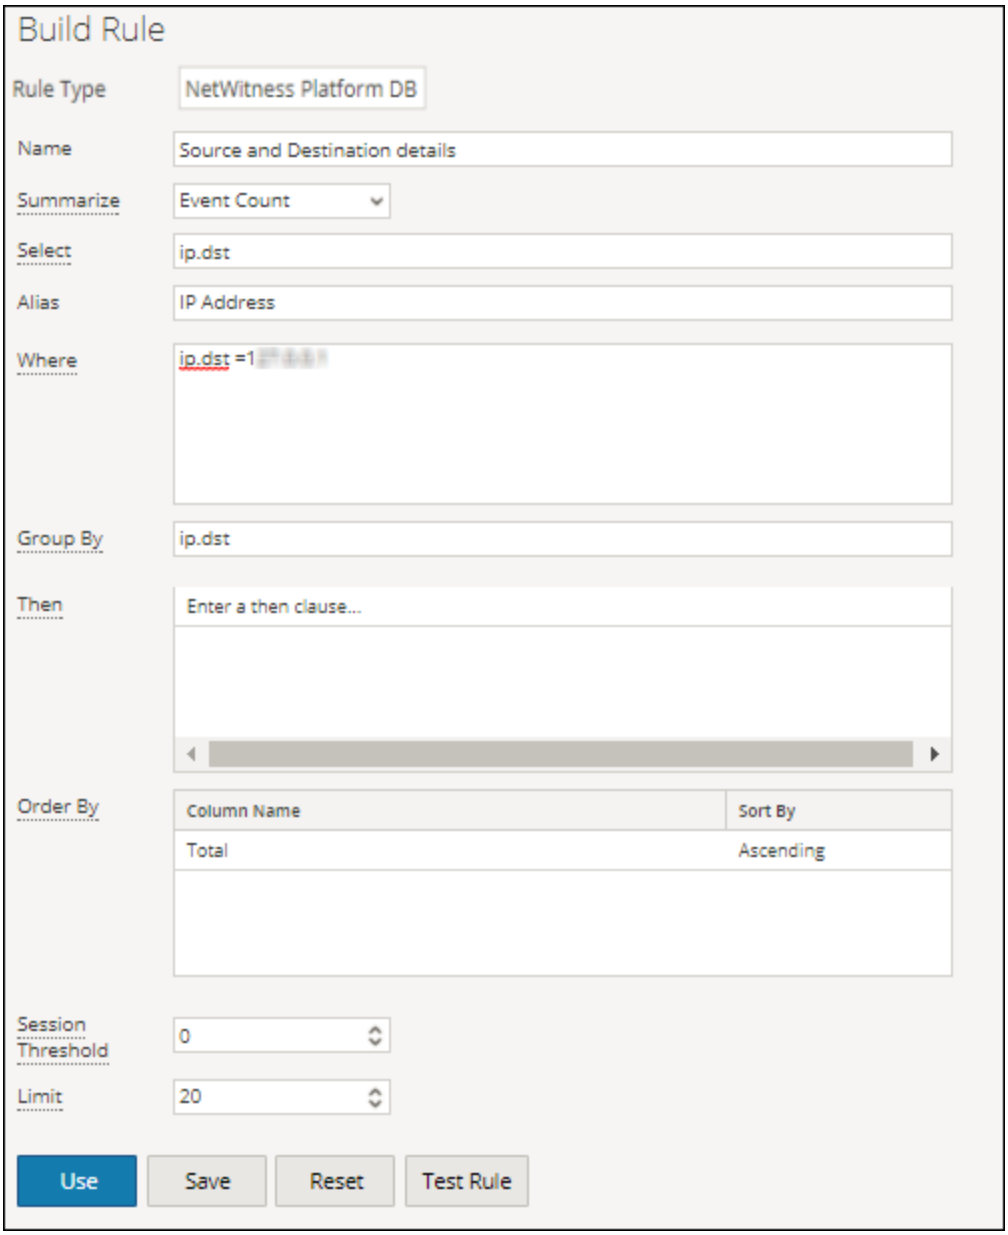
2. Click **Reports**.

   The Report view is displayed.

3. In the **Build Rule** page, click + to create a rule.

4. Click **Save**.

5. Click **Use**.



6. Select the **New report** or **Existing Report**.
7. Select a report group and click **Select**.
8. Enter the Report name and select the rule.
9. Click **Schedule**.

   The Schedule Report view is displayed.

   If you provide another user with access permissions to a report, you must also provide permissions for the report group, the rules used in the report, and the rule groups otherwise an error message is displayed.
10. To execute the reports as per the schedule, select the **Enable** checkbox.
11. In the **Schedule Name** field, enter a name for the schedule report configuration.

12. From the Data Source field, select the data source.

    Note: If the data source is not listed, then ensure you have **Read**permissions set for the data source. This is applicable for NWDB, Respond and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in *Reporting Engine Configuration Guide*.

13. (Optional) From the **Warehouse Resource Pool** drop-down, select the pools or queues available in the cluster to schedule the report to run on either the pool or queue. This drop-down list is available only if you select a Warehouse DB report.

    Note: All the queues or pools you specified in the Explore page for the Reporting Engine are listed. If no pools or queues are configured in the Explorer page, this drop-down is disabled and the jobs are submitted to the clusters without any a queue or pool name.

    Note: If the pool or queue configured in the report schedule is removed from the Cluster, then in the Capacity Scheduler, the queue name remains undefined. However, in the Fair Scheduler, the specified pool name will be created using the property mapred.fairscheduler.allow.undeclared.pool.

14. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format. This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).

15. From the **Run** field, select the type of run schedule. (For example, Now or Hourly).

    Depending on the type of run schedule, choose one of the following:

    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.

    Note: While scheduling a report, if you select **Past** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.

    For information on how to generate a report with variables, see Create a Parameterized Report Using Variable.

16. (Optional) In the **Output Actions** panel, do the following:

    a. Enter the email address and subject.

    b. Edit the body of the message for the report.

    c. Select the format of the attachment.

    d. Enter a value for the CSV and Multi-value delimiters.

    e. (Optional) In the Other Options field, do the following:

i. Click  and select SFTP, URL, or Network Share output action.

A row gets added with the selected output action.

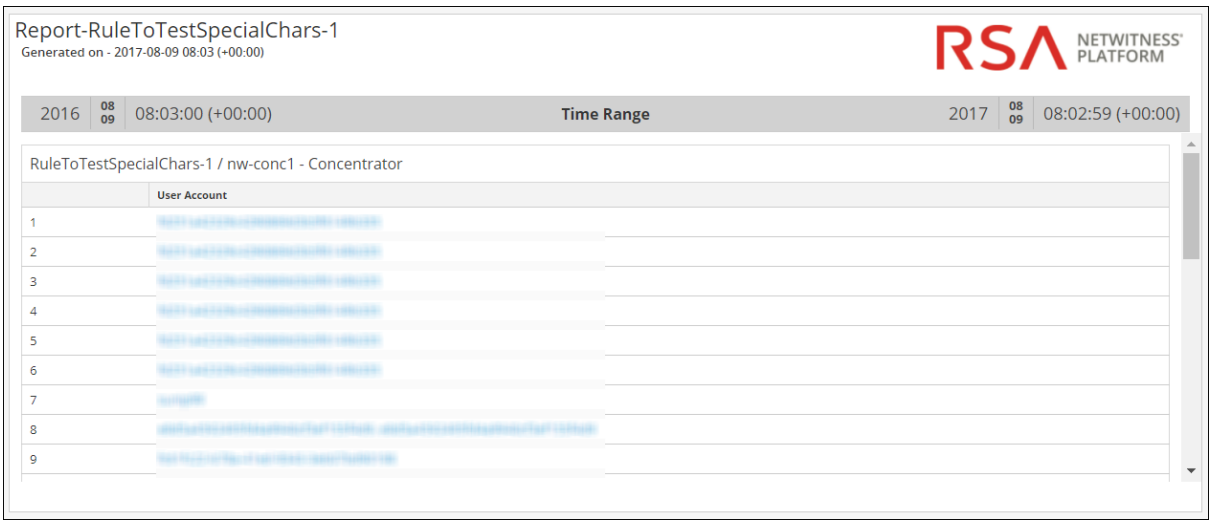
ii. Select the appropriate options to send the report in PDF or CSV format, or both to the RE configured SFTP, or URL, or Network Share output action.

17. (Optional) To add a list in the Dynamic List panel, see Generate a List from the Scheduled Report.
18. (Optional) To choose a logo in the Logo panel, see "Manage and Select a Report Logo" section in Manage Lists, Rules or Reports.

Note: If you do not specify a logo, the default RSA logo will be used.

19. Click **Schedule**.

The scheduled report executes as scheduled and provides the configured outputs.



After you create and Schedule a report, you can perform any of the following tasks:

- You can notify the email recipient when the report execution completes and send reports in PDF and CSV formats as attachments in the email.
- You can generate a list based on the scheduled report and view them in the **Lists** module.
- You can send a scheduled report in PDF or CSV format, or both to the RE configured SFTP location, or URL, or Network Share.
- You can change the default logo and view them in the scheduled report.
- You can modify the NetWitness Platform Reporting Engine config details, by navigating to the Reporting Engine General Tab. See the "Reporting Engine General Tab" topic in the *Reporting Engine Guide*.

Examples

When you schedule reports in the Schedule Report view, by default, the results for the **Past** option are presented based on the user specified time zone. The following examples provide a clear picture on what results to expect when you select **Hours**, **Days**, **Weeks**, **Months**, or **Years** for the **Past** option based on the absolute or relative duration.

Note: By default, the relative duration checkbox is de-selected. This implies that the results for the **Past** option are presented based on the absolute duration.

- **Based on Absolute duration** - Absolute Duration allows a report to be scheduled at an absolute time with respect to the current time, excluding the seconds and considering the time interval as a whole. For example, 12.00pm is the absolute time with respect to the current time (12.45 pm).
  - Hours - Suppose that you select Hours and specify one hour. If the current user specified time is 4.20PM, the report is generated for the time range, 3.00PM to 4.00PM.
  - Days - Suppose that you select Days and specify one day. If the current date is August 27, 2014 and the current user specified time is 10.15AM, the report is generated for the range: August 26, 2014, 12.00AM to August 27, 2014, 12.00AM.
  - Weeks - Suppose that you select Weeks and specify one week. If the current date is August 27, 2014 2.30PM and the day is Wednesday, the report is generated for the range: Saturday, August 16, 2014, 12.00AM to Saturday, August 23, 2014, 12.00AM.
  - Months - Suppose that you select Months and specify one month. If the current date is August 27, 2014 2.30PM, the report is generated for the range:
    July 01, 2014, 12.00AM to July 31, 2014, 12.00AM.
  - Years - Suppose that you select Years and specify one year.If the current date is August 27, 2014 2.30PM, the report is generated for the range:
    January 01, 2013, 12.00AM to December 31, 2013, 12.00AM.
- **Based on Relative duration** - Relative Duration allows a report to be scheduled at a time relative to the current time which might vary based on the current time. For example, 12.45 pm is the relative time with respect to the current time (12.45 pm).
  - Hours - Suppose that you select Hours and specify one hour. If the current user specified time is 4.20PM, the report is generated for the time range, 3.20PM to 4.20PM.
  - Days - Suppose that you select Days and specify one day. If the current date is August 27, 2014 and the current user specified time is 10.15AM, the report is generated for the range: August 26, 2014, 10.15AM to August 27, 2014, 10.15AM.
  - Weeks - Suppose that you select Weeks and specify one week. If the current date is August 27, 2014 12.30PM and the day is Wednesday, the report is generated for the range: Thursday, August 21, 2014 12.30PM to Wednesday, August 27, 2014 12.30PM.
  - Months - Suppose that you select Months and specify one month. If the current date is August 27, 2014, 2.30PM the report is generated for the range:
    July 27, 2014 2.30PM to August 27, 2014 2.30PM.
  - Years - Suppose that you select Years and specify one year.If the current date is August 27, 2014 2.30PM, the report is generated for the range: August 27, 2013 2.30PM to August 27, 2014 2.30PM.

Generate a List from the Scheduled Report

You can generate a list from the output of the scheduled report. Make sure that your lists are created in NetWitness Platform prior to generating a list to schedule a report.

To generate a list from the Build Report view, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report List** panel, select a report and click > **Schedule Report**.

   The Schedule a Report view tab is displayed.

4. In the **Dynamic List** panel, click .

   The Generate List dialog box opens.

5. Click **Browse**.

   The List Selection panel is displayed.

6. Choose a list item and click **Select**.

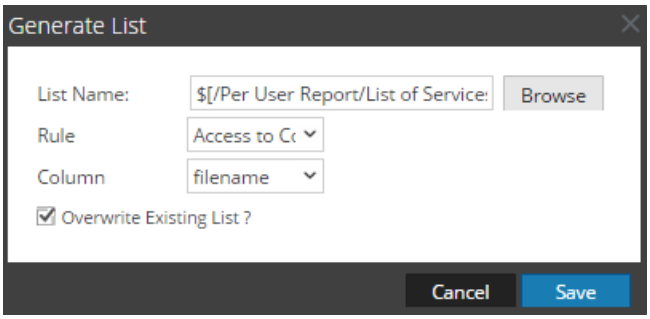
   The list name gets populated in the List Name field.

7. Select a valid rule to filter the report results further based on the rule definition.
8. Select a value for the **Column** field.

   The column forms the values for the list that gets created.

9. If you want to overwrite the existing list, select the **Overwrite Existing List?** checkbox.
10. Click **Save**.

    The list name gets populated in the Generate List panel.



11. (Optional) Select a list from the Generate List panel and click to delete the selected list.
12. (Optional) Select a list from the Generate List panel and click to edit the list details.

Create a Parameterized Report Using Variable

You use variables for reporting in the RSA NetWitness Platform Reporting module. Parameterized reporting allows you to specify values dynamically at runtime without changing the rule definition so you can view the results based on a particular value. You can achieve parameterize reporting by using variables in the query or rule. For information on adding a rule, see Configure a Rule. At runtime, you can enter the value for the variable or select the value from the list based on which the result set is displayed.

The syntax to specify the variable is as follows:

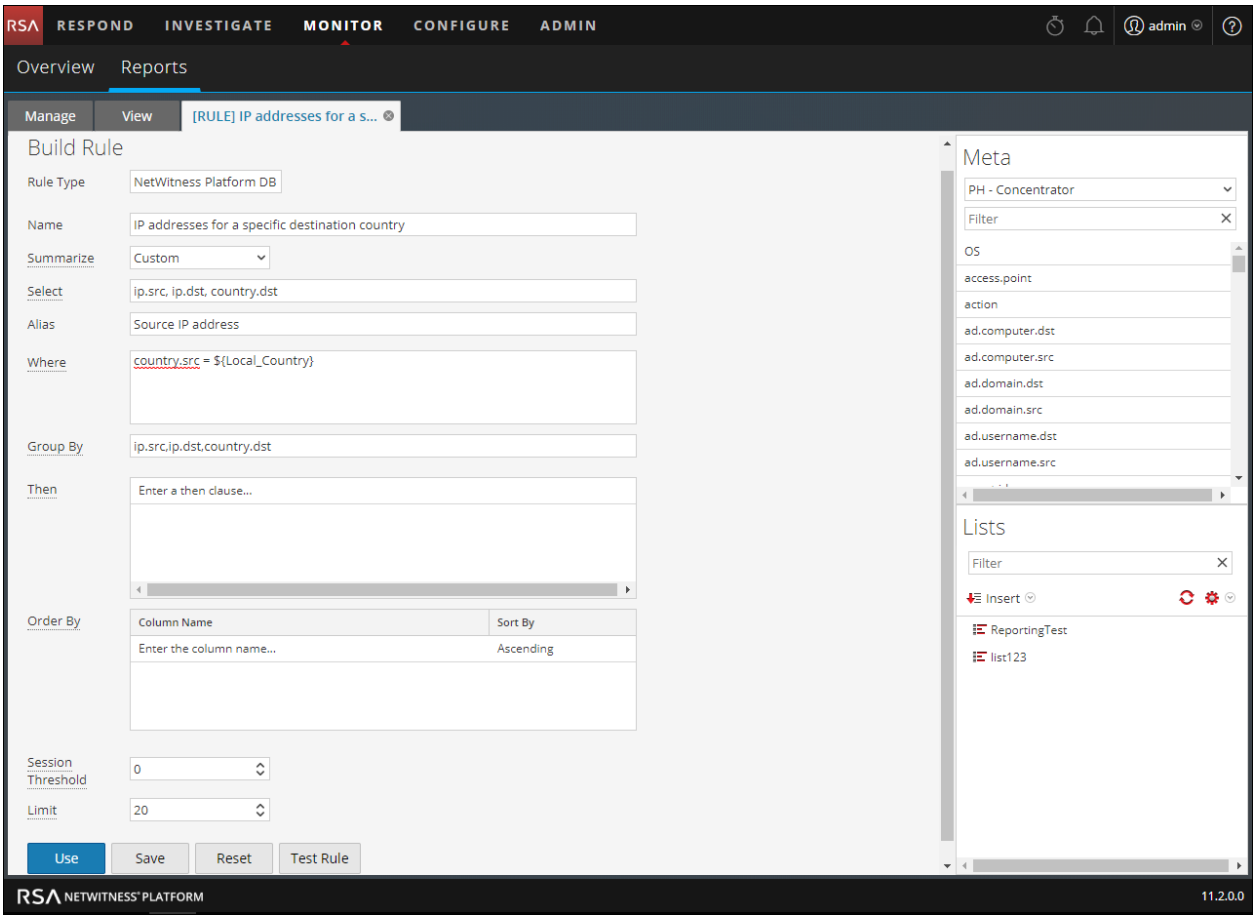
Description	Examples of Supported Syntax
Insert `$` before a variable. Enclose a variable within braces.	`columnname=${<variable>}`

The syntax to define the variable is the same for NetWitness DB and Warehouse DB data sources. When you assign the value of the variable in a Run Configuration, you must enclose the value within single quotes: `'<value>'`.

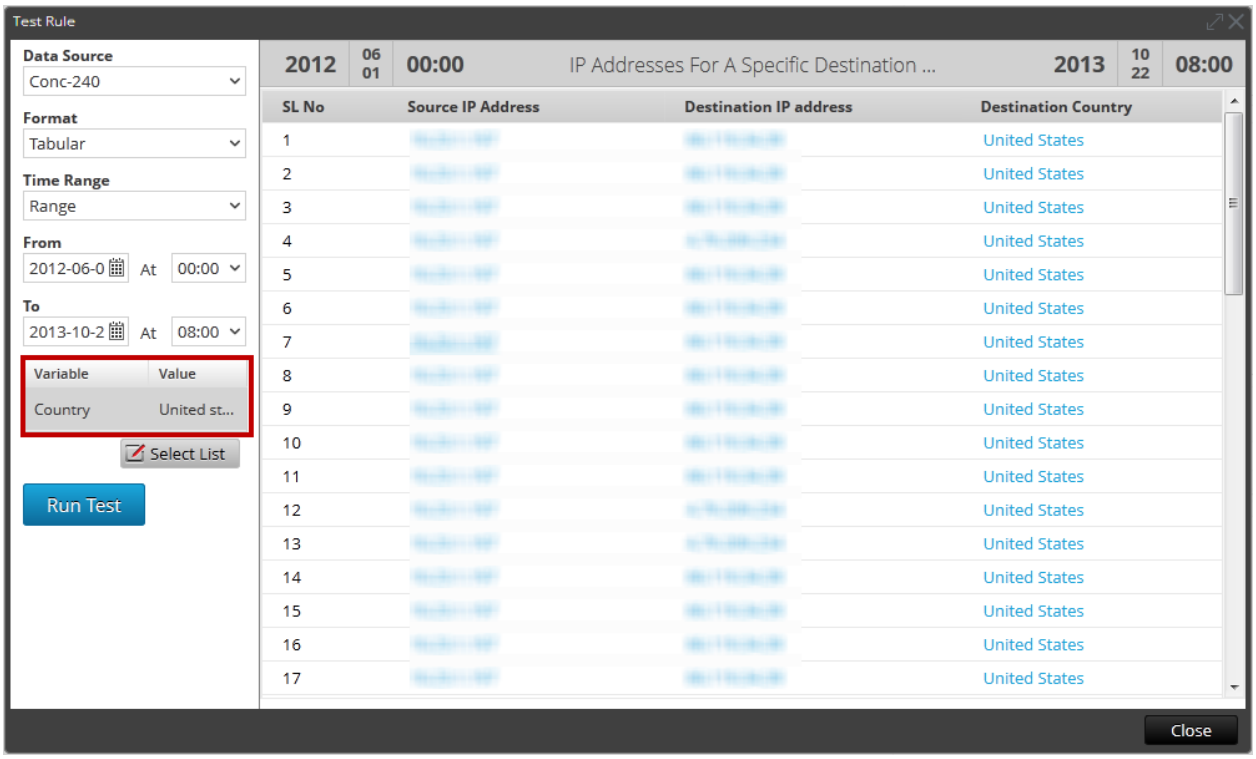
Some examples where a variable can be used are provided in this section.

View Source IP Addresses for a Specific Destination Country

The following is an example of a NetWitness DB rule to view the source and destination ip addresses for a specific destination country. Here the value for source country is defined as a variable `${local_country}`.



At runtime, you are prompted to enter the value for the variable. The figure below shows the `local_Country` variable where you can enter the value. If you enter the value as **United states**, all the source and destination ip addresses with destination country as United states are listed.



You can use the above rule to schedule a report. You can schedule two types of reports:

- Report with Dynamic Variables
- Iterative Report

Report with Dynamic Variables

Dynamic variables allows the user to specify the values for a variable defined in a rule while scheduling a report.

To schedule a report with Dynamic Variable, perform the following:

1. Go to **MONITOR** > Reports.

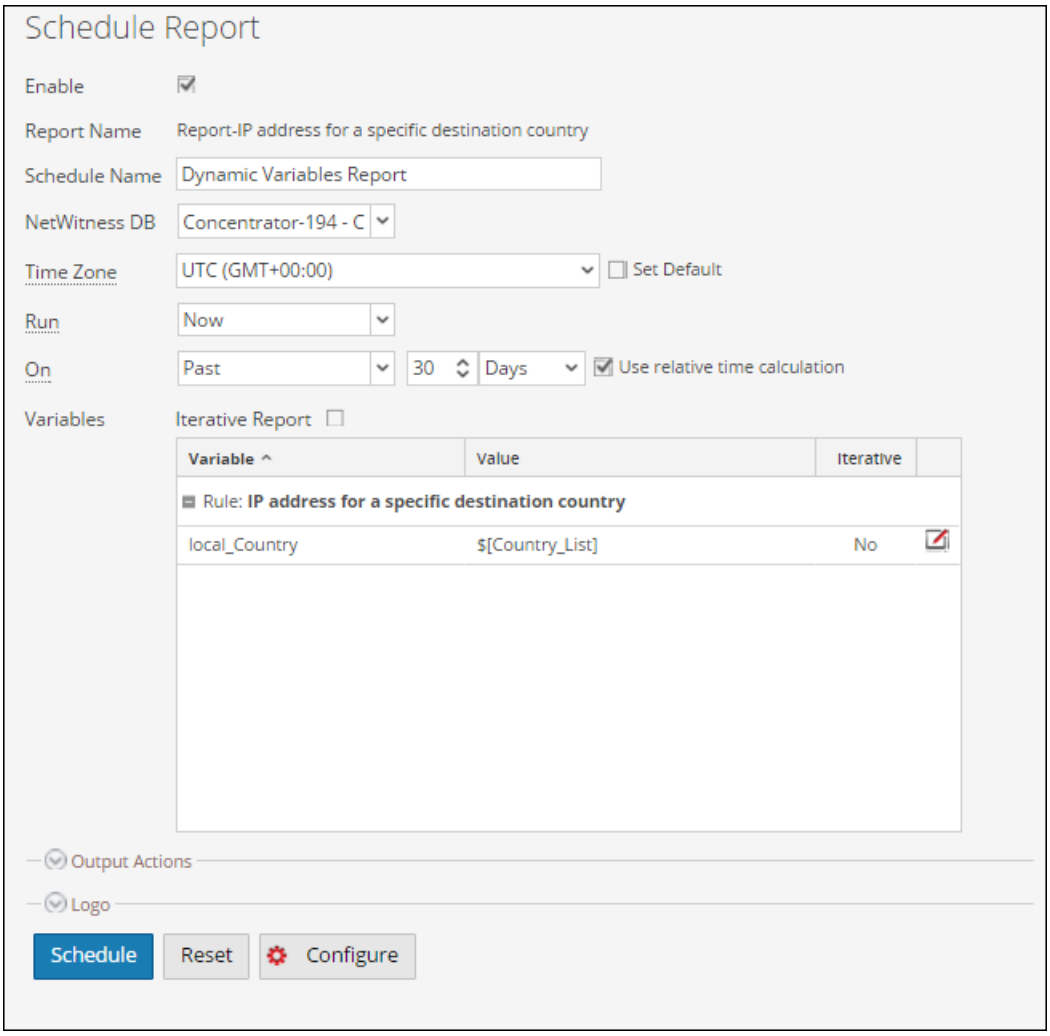
   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. On the **Build Report** page, click + to create a report.
4. Add the rule by drag and drop which has the user defined variable from the Rules tab.
5. Click **Schedule**.

   The Schedule Report view tab is displayed.



6. To execute the reports as per the schedule, select the **Enable** checkbox.
7. In the **Schedule Name** field, enter a name for the schedule report configuration.
8. From the **Data Source** field, select the data source.

   Note: If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in the *Reporting Engine Configuration Guide*.

9. (Optional) From the **Warehouse Resource Pool** drop-down, select the pools or queues available in the cluster to schedule the report to run on either the pool or queue. This drop-down list is available only if you select a Warehouse DB report.

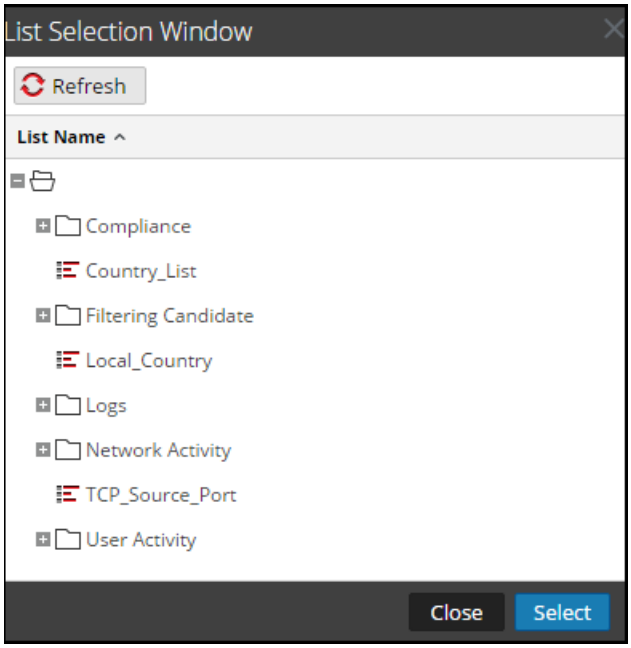
   Note: All the queues or pools you specified in the Explore page for the Reporting Engine are listed. If no pools or queues are configured in the Explorer page, this drop-down is disabled and the jobs are submitted to the clusters without any a queue or pool name.

Note: If the pool or queue configured in the report schedule is removed from the Cluster, then in the Capacity Scheduler, the queue name remains undefined. However, in the Fair Scheduler, the specified pool name will be created using the property `mapred.fairscheduler.allow.undeclared.pool`.

10. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format.This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).
11. From the **Run** field, select the type of run schedule. (For example, Now or Hourly). Depending on the type of run schedule, do either of the following:
    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a time value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.

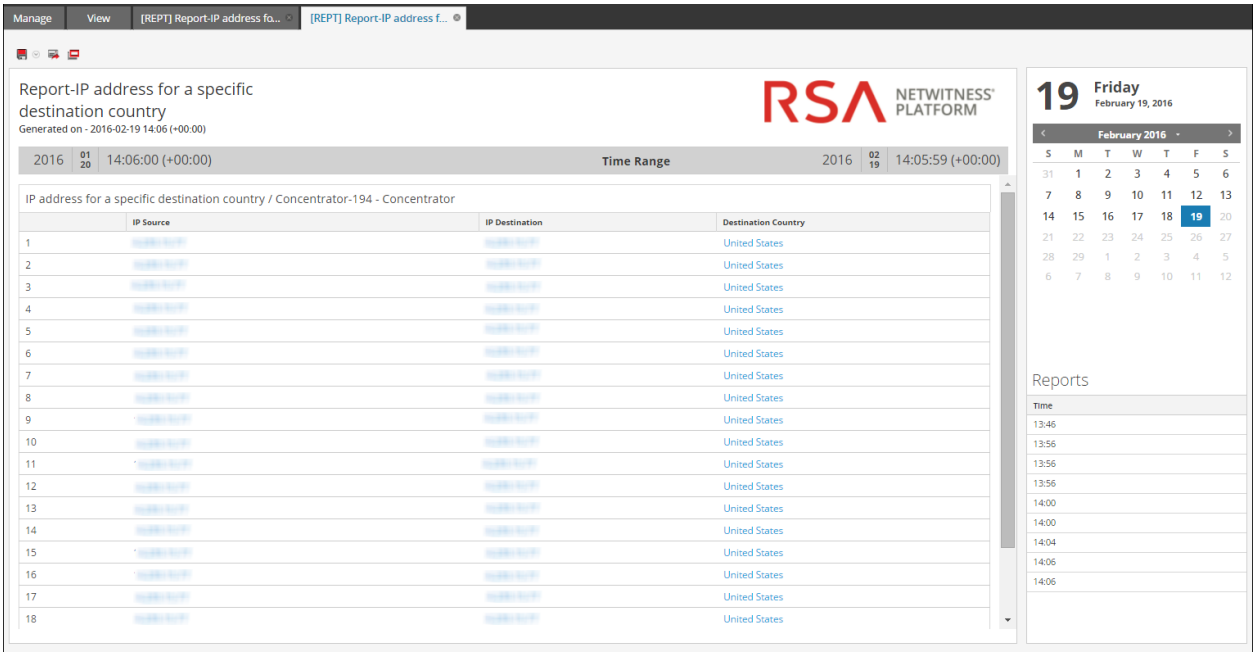
Note: While scheduling a report, if you select **Paste** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.

12. In the variables field, click .
13. Do one of the following:
    - Enter the value for the variable, or
    - Choose the list value for the variable.



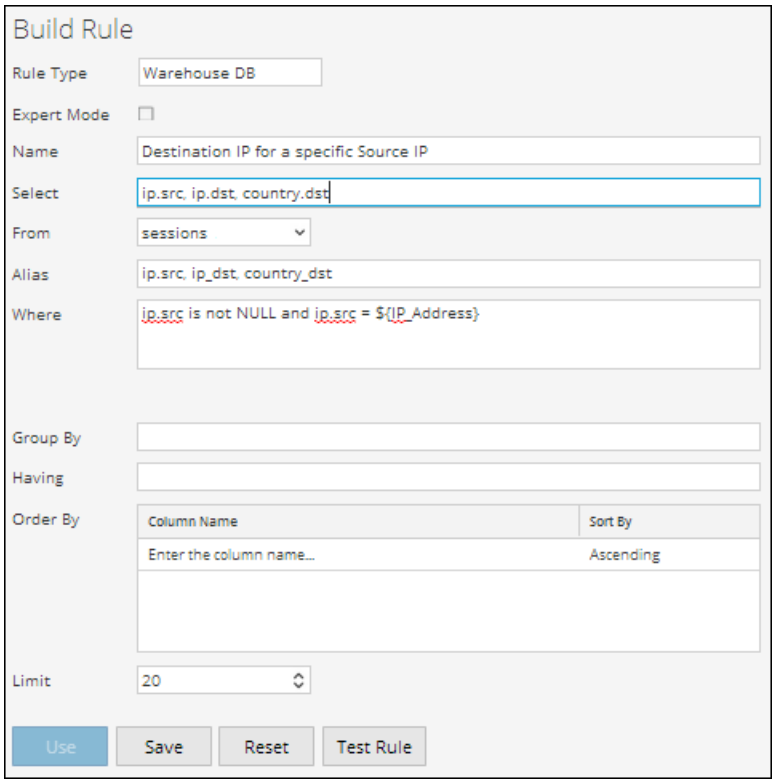
14. Click **Select**.
15. Click **Schedule**.

    The scheduled report executes as scheduled and provides the configured outputs.

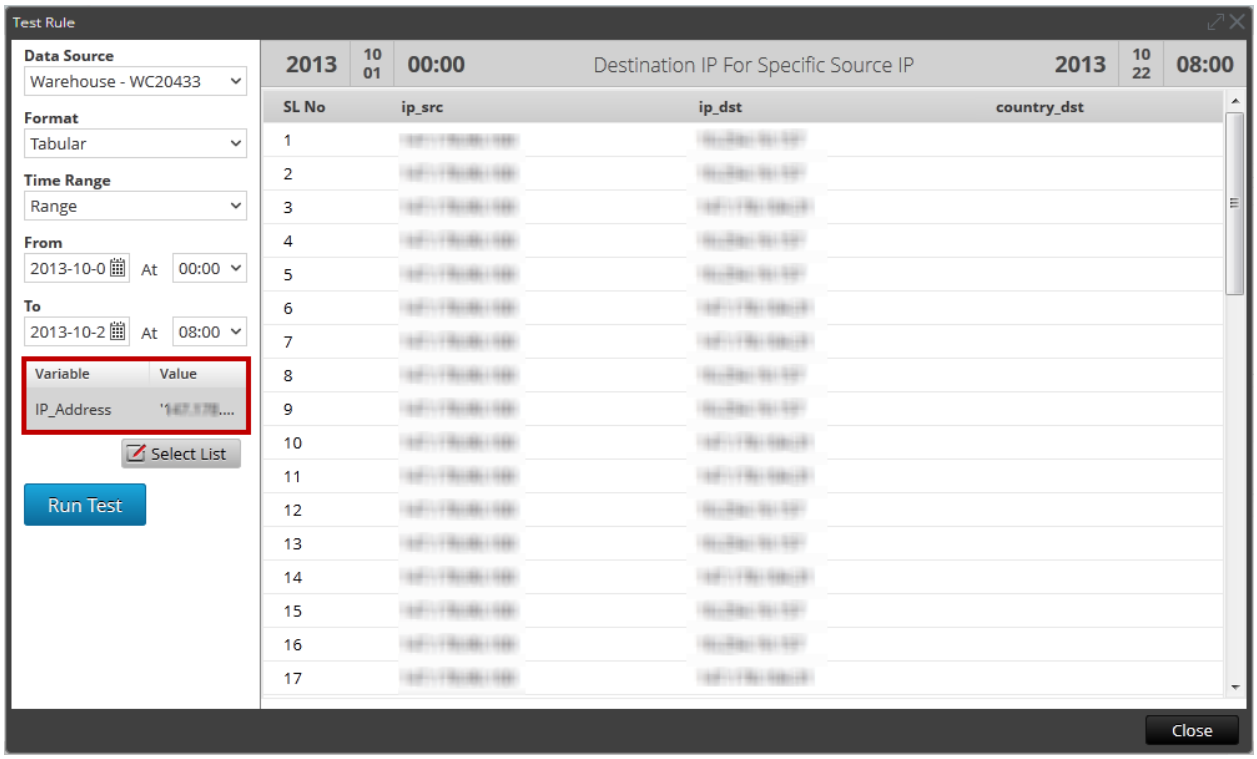


View All Destination IP Addresses for a Source IP Address

The following is an example of a Warehouse rule to view all the destination IP addresses for a specific source IP. The source IP address `ip_src` is defined as a variable `${IP_Address}`.

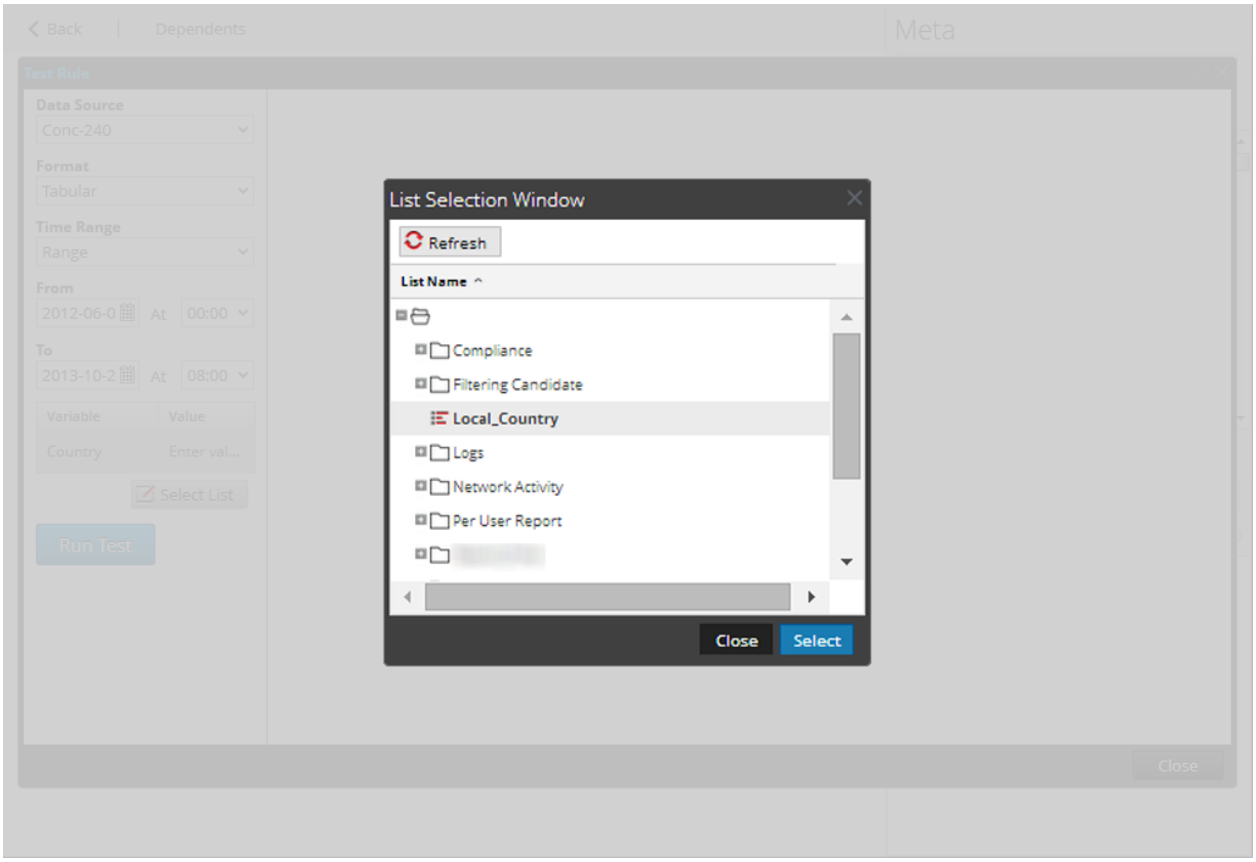


At runtime, you are prompted to enter the source IP address. The figure below shows the `IP_Address` variable, and you can enter a valid source IP address. All the destination IP addresses with the specified source IP are listed.



Associate a Variable to a List of Values

You can associate the variable to a list. For example, you can create a list called `Local_Country` and enter all the country names as values. You can select the list `Local_Country` as the value for the variable `Local_Country`. At Run Configuration, the `Local_Country` list is populated and you can select the country based on which results are displayed.



Iterative Report

An iterative report generates a report for every value in the list.

To schedule an iterative report, perform the following:

1. Go to **MONITOR** > Reports.

   The Manage tab is displayed.

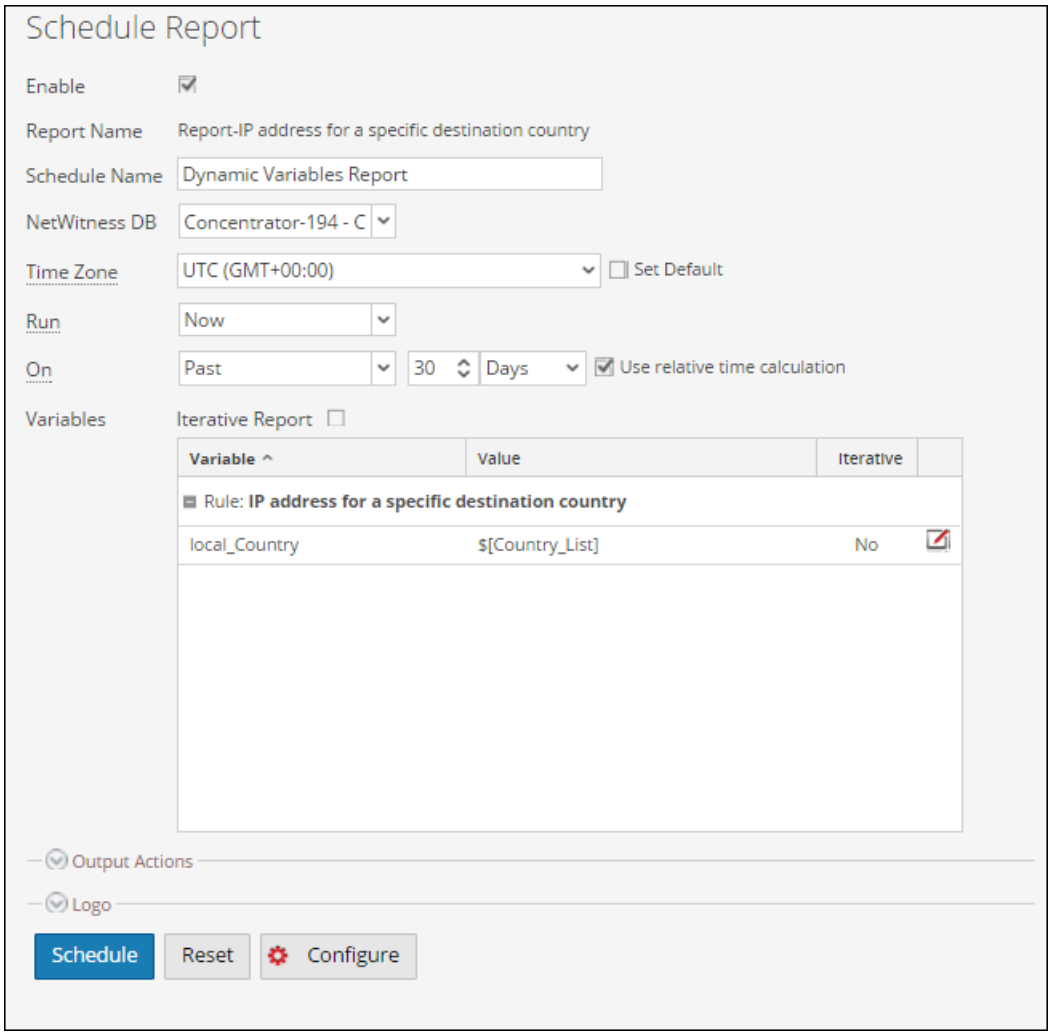
2. Click **Reports**.

   The Report view is displayed.

3. On the **Build Report** page, click + to create a report.

4. Add the rule which has the user defined variable from the Rules tab.

5. Click **Schedule**.
   The Schedule Report view tab is displayed.



6. To execute the reports as per the schedule, select the **Enable** checkbox.
7. In the **Schedule Name** field, enter a name for the schedule report configuration.
8. From the **Data Source** field, select the data source.

   Note: If the data source is not listed, then ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in the *Reporting Engine Configuration Guide*.

9. (Optional) From the **Warehouse Resource Pool** drop-down, select the pools or queues available in the cluster to schedule the report to run on either the pool or queue. This drop-down list is available only if you select a Warehouse DB report.

   Note: All the queues or pools you specified in the Explore page for the Reporting Engine are listed. If no pools or queues are configured in the Explorer page, this drop-down is disabled and the jobs are submitted to the clusters without any a queue or pool name.

Note: If the pool or queue configured in the report schedule is removed from the Cluster, then in the Capacity Scheduler, the queue name remains undefined. However, in the Fair Scheduler, the specified pool name will be created using the property `mapred.fairscheduler.allow.undeclared.pool`.

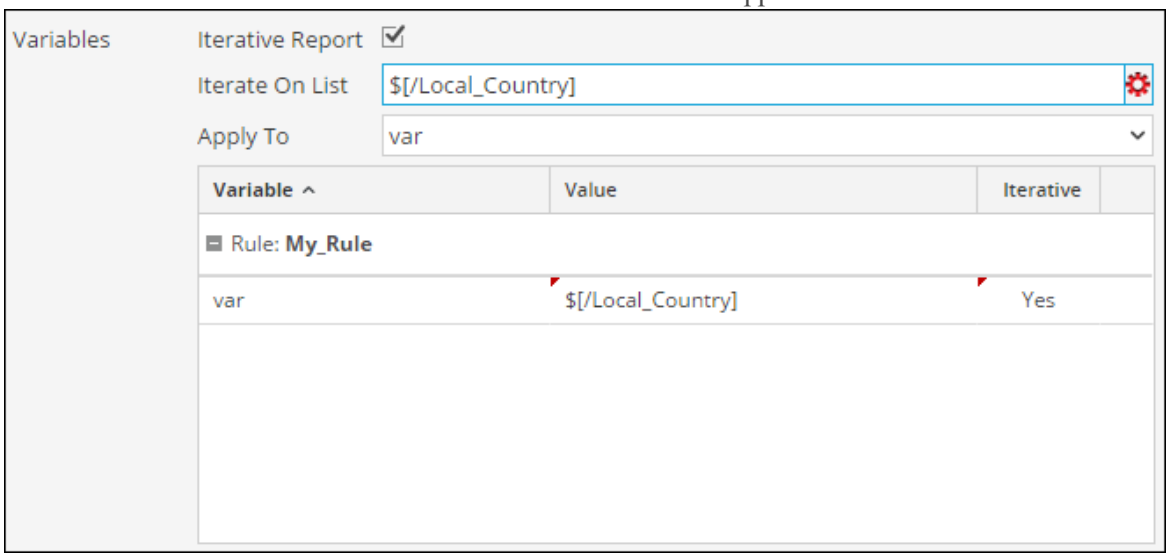
10. From the Time Zone drop-down, select a time zone to display all the time-related data in a report output in the specified format. This setting is configurable from the Reporting Engine Explore view (/com.rsa.soc.re/configuration/reportoutputformatterconfig/reportoutputformatterconfig).
11. From the **Run** field, select the type of run schedule. (For example, Now or Hourly). Depending on the type of run schedule, do either of the following:
    - If you select a **Later** or **Monthly** run schedule, you must provide a value for the day and time in the respective field provided.
    - If you select an **Hourly** run schedule, you must specify the minutes in the **At Minute** field.
    - If you select a **Daily** run schedule, you must enter a time value in the **At** field.
    - If you select a **Weekly** run schedule, you must enter a value in the **At** field and also select the week days.

    Note: While scheduling a report, if you select **Paste** option or **Range (specific/generic)** option or an end time range very close to the current time, you must ensure that the aggregate data in the data source is returned. If there is an aggregation delay in the data source, the end time you choose must account for the delay, otherwise reports lose non-aggregate data for that time range.
12. In the variables field, do the following:
    a. To run iterative reports, select the **Iterative Report** checkbox.
    b. To Iterate on List value, click  .

       The List Selection Window opens.
    c. Choose a list and click **Select**.

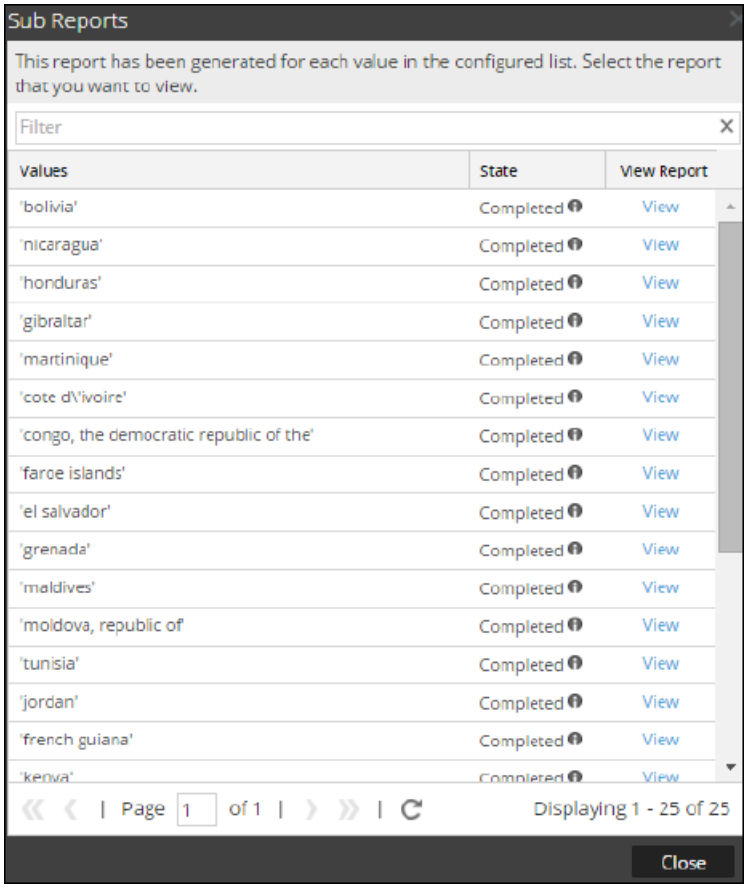
       The list item selected gets added to the **Iterate on List** field.

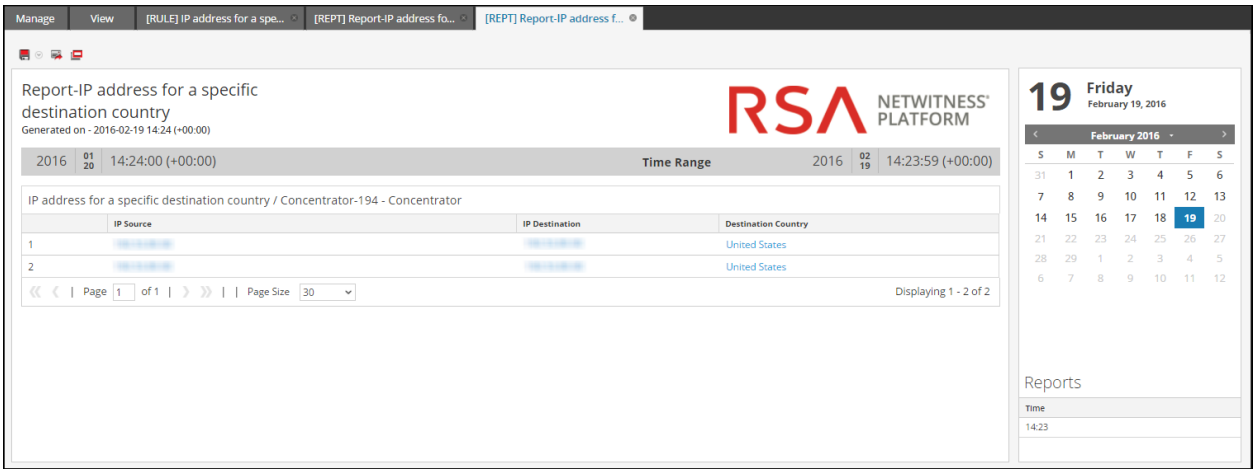
d. Select the variable on which the selected list value has to be applied.



13. Click **Schedule**.
    The scheduled report executes as scheduled and provides the configured outputs.

The following figure shows the Iterative Report view.





Create a Report Using a Rule

You can create a report using a rule. When you create a report using a rule, a default report is created with this single rule. You can further edit the report to add more rules.

To create a report using a rule, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Choose any of the following:

   - Create a report using a rule when you create or edit the rule:

     a. In the **Build Rule** view, click **Use**.

        The Use Rule dialog is displayed.

     b. Click **Report**.

     c. Select **New Report** or **Existing Report** based on your requirement.

     d. Click **Select**.

   - Select a rule in the Rule List panel and click  in the Rule toolbar. From the drop-down menu, select **Use** > **Report**.

   - In the Rule List panel click  > **Create Report**.

Note: Custom rules can be used to create a Report and If you select the view for the rule as "Area" or "Pie", a window pops up for **X-Axis** and **Y-Axis** inputs. By default, you can select only the first meta in **X-Axis**.

View a Report

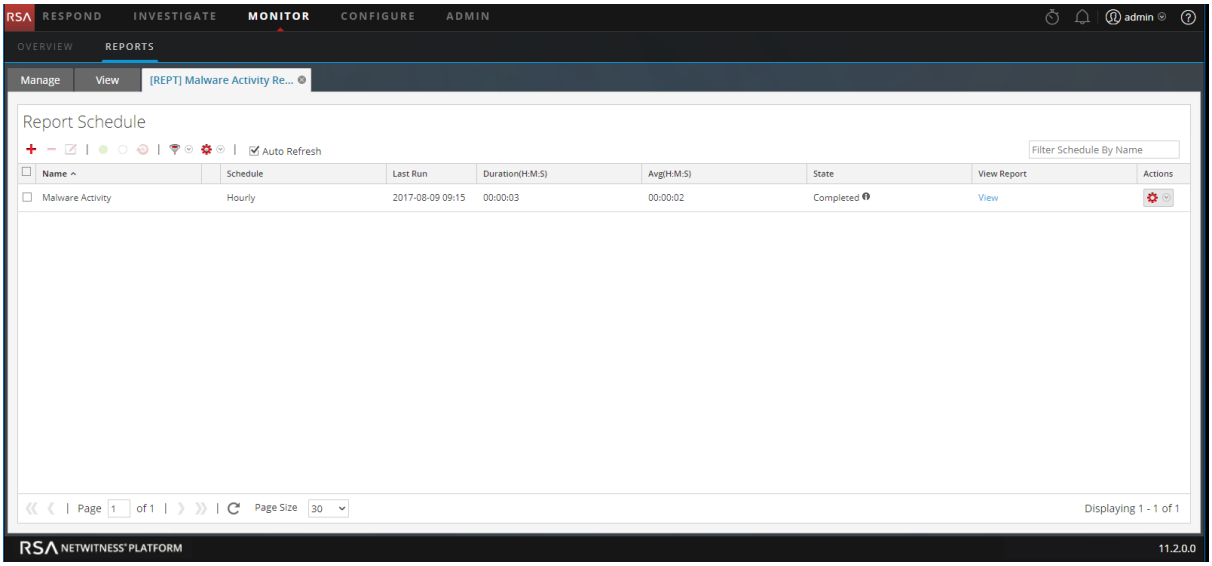
You can view a report or list of all reports. You can also view the scheduled reports to know the state of the scheduled report. If the scheduled report is in a stop or disable state, you can start or enable the scheduled report.

After you view a report, you can perform any of the following tasks:

1. You can print, save, email and view reports on full screen.
2. You can also select a date from the calendar to view a list of successfully run reports for the chosen date.

To view a report, perform the following:

1. Go to **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, click  > **View Scheduled Reports**.
4. Click the **#Schedules** column.
   The Schedule Reports view tab is displayed with the status of each of the scheduled report.



5. Select a scheduled report and click **View**.
   One of the following is displayed:
   - The selected report.
   - The Sub reports panel for a scheduled report having 'Iterative' selected.

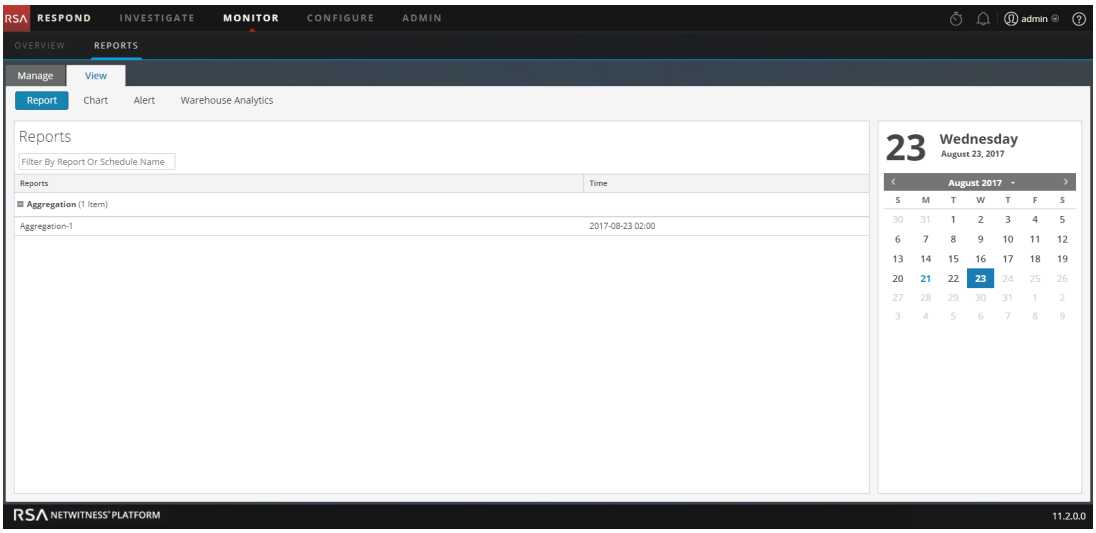
For each value in the configured list a report is displayed.

Note: If the report status is partial or complete, the "last run timestamp" and the "last run (seconds)" are updated. However, the average time taken to run the report is updated only when the report status is complete and not when it is partial.

To view a list of all reports, perform the following:

1. Go to **MONITOR** > **Reports**.
   The **Manage** tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report** panel, click **View All Reports**.
   A list of reports along with their schedule name and time are displayed on the View tab.

Note: If no list is displayed, select a date from the calendar to view a list of reports for that date.



4. You can select a scheduled report and print, save as PDF/CSV, send email notifications, or view it on full screen.

Investigate a Report

You can investigate a report by directly navigating to the Investigation View from the report. With the Investigate a report option, you can investigate each event mentioned in the report.

To investigate a report, perform the following:

1. Go to **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report** toolbar, click **View All Reports**.
   The View All Reports tab is displayed.

   Note: If no reports are displayed in the View All Reports, select a date for which you want to display the reports.
4. Double-click the report name to view the report details.
   The Report details screen is displayed.

   You can click on the session analysis to investigate on the report.

Note: If you want to manually copy the result data and use it for investigation, make sure that the binary values are prefixed with 'hex:'.

Manage Lists, Rules or Reports

You can set access control, delete, edit, import, or export a list, rule or report.

Manage a List

You can perform the following procedures to manage a list.

- Access Control for a List and List Group
- Edit a List
- Delete a List or List Group
- Duplicate a List
- Export a List or List Group
- Import a List or List Group

Access Control for a List and List Group

You can set up the access permissions for the user roles to manage lists or list groups. The Reporting provides access control at the list and list group level. Only a user who has the right set of permissions can perform the tasks in the Reporting. The access control is managed by the administrator from the **ADMIN > Security > Roles** tab.

As an administrator you must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

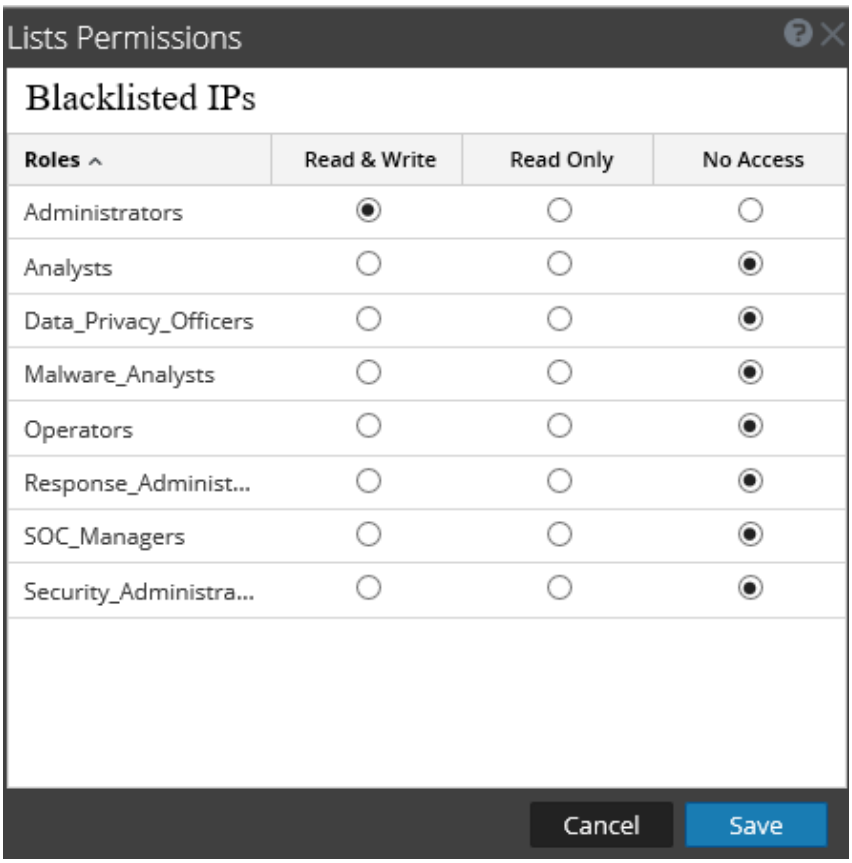
Lists or list groups can be assigned to a specific set of user roles. When users log into NetWitness Platform, they can access only those lists to which they belong. Users who belong to a user role with the **Read & Write** access permission have full access rights on the lists. Further, the access can be strengthened so that lists are accessed only by those who have the **Read Only** access.

Note: You must have **Read Only** permission for a list group to view the lists within that group.

For example, if you want **Security Analysts** to have access to all the lists in a list group, you can set the permission **Read & Write** at the list group level. And, if you do not want the **Operator** role to have access to a specific set of lists in a list group, you can set the permission **No Access** at the list group level.

At the list or list group level, you can set the following access permissions for the user roles in NetWitness Platform. For more information, see List View:

- Read & Write
- Read Only
- No Access



The following table lists the columns in the Lists Permissions panel:

Column	Description
Roles	Describes roles of the users logged into the NetWitness Platform user interface.
Read & Write	Allows users to access, view, edit, delete, import, and export lists on the Lists view. Users can also change the permission on the rule.
Read Only	Allows users to only access and view the list on the lists view.
No Access	Doesn't allow users to access or view the lists.

Access Control for a List

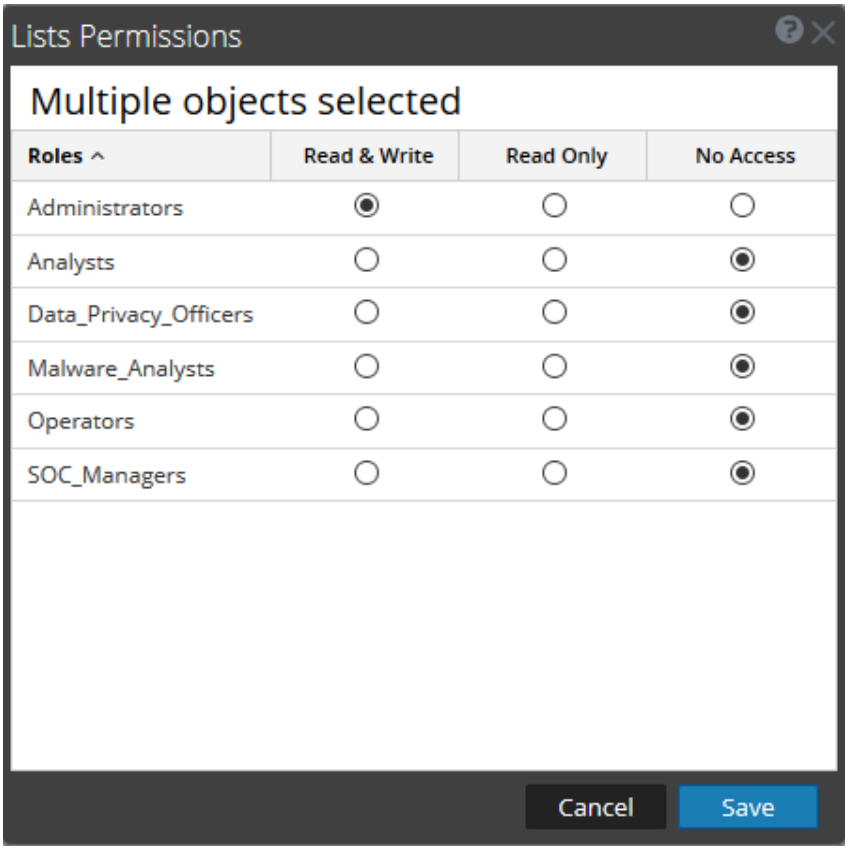
To change the list permissions, you must select a list and set access permissions using the List Permissions panel.

If you want to change the access permission for a specific user role, you must set it at the list level. Except for administrators, the default permission set for all the other user roles is **No Access** before applying job permissions.

Access Control Multiple Lists

You can select multiple lists at once and set access permissions using the Lists Permissions Panel. The access permission that you choose is applied to all the selected lists.

Note: The "*" beside the role name indicates that other permissions are available for the user role. If you want to change the access permission for the required user role, select the user role and change the access permission.



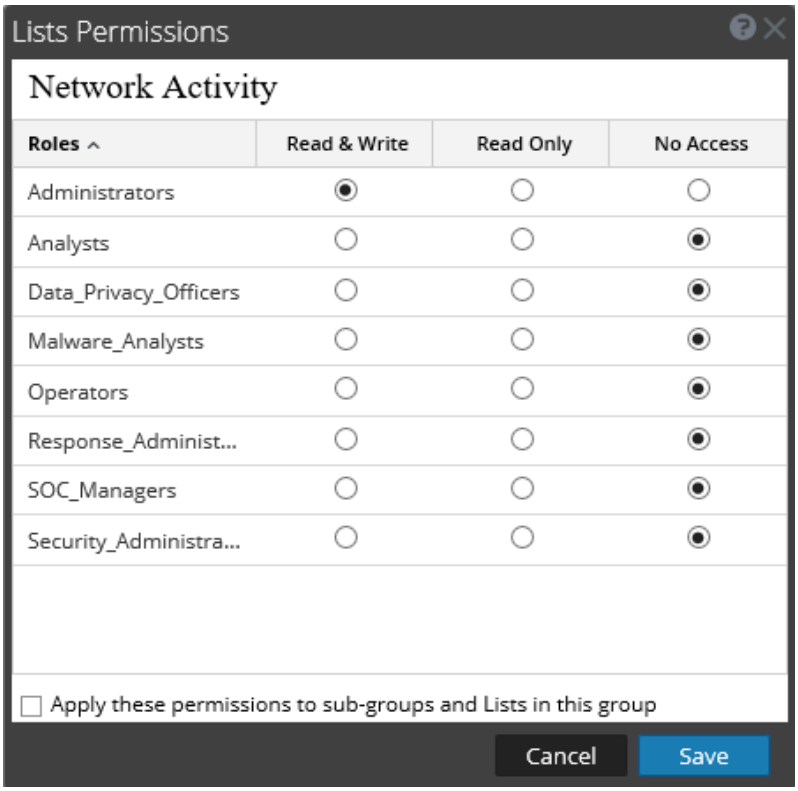
Note: If a user (other than ADMIN) creates a list, ADMIN cannot access that list.

Access Control for a List Group

To change the list group permissions, you must select a list group and set access permissions using the Lists Permissions panel.

If you want to change the access permission for a specific user role, you must set it at the list group level. Except for administrators, the default permission set for all the other user roles is **No Access** before applying job permissions.

You can also apply permissions to subgroups and lists in the group by selecting the checkbox.



The following scenarios describe defining permissions for list groups or subgroups and lists in the groups:

- Scenario 1: Permissions applied to list group or subgroup based on the user role.

  Each of the levels will have a permission set depending on the user role. For example, if a list group is assigned the role of Security Analyst, permissions are set to Read & Write for the list group.

- Scenario 2: Permissions applied to subgroups and lists in the group.

  The access permissions that you set can be applied to subgroups and child objects of this group. Permission at the list group level will be inherited by the subgroups and lists in the group.

Role (Analysts)	Permissions applied to list group or subgroup based on the user role	Permissions applied to subgroup and lists in the group
Group	Read & Write	Read & Write
Subgroup	Read	Read & Write - Inherited
Lists	Read	Read & Write - Inherited

Access permission for a list or list group

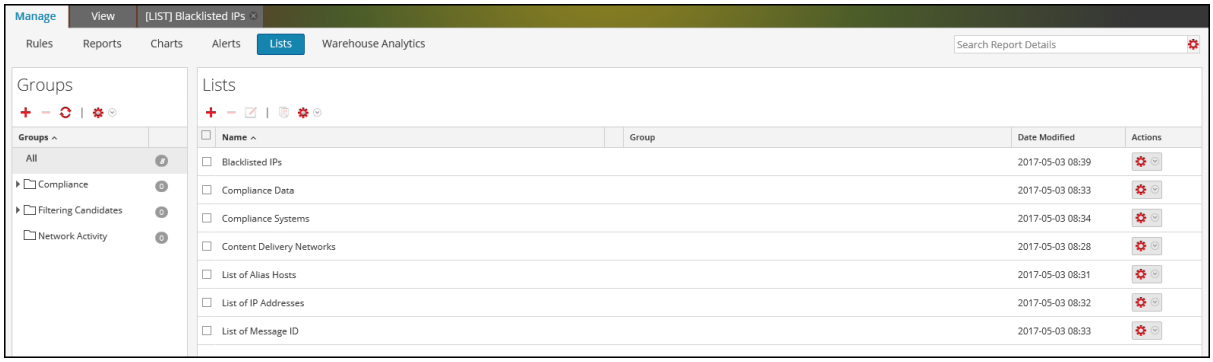
Ensure that you have at least **Read & Write** access permission so that you can set access permissions for lists or list groups.

To set access permission for a list, perform the following:

1. Go to **MONITOR** > **Reports**.

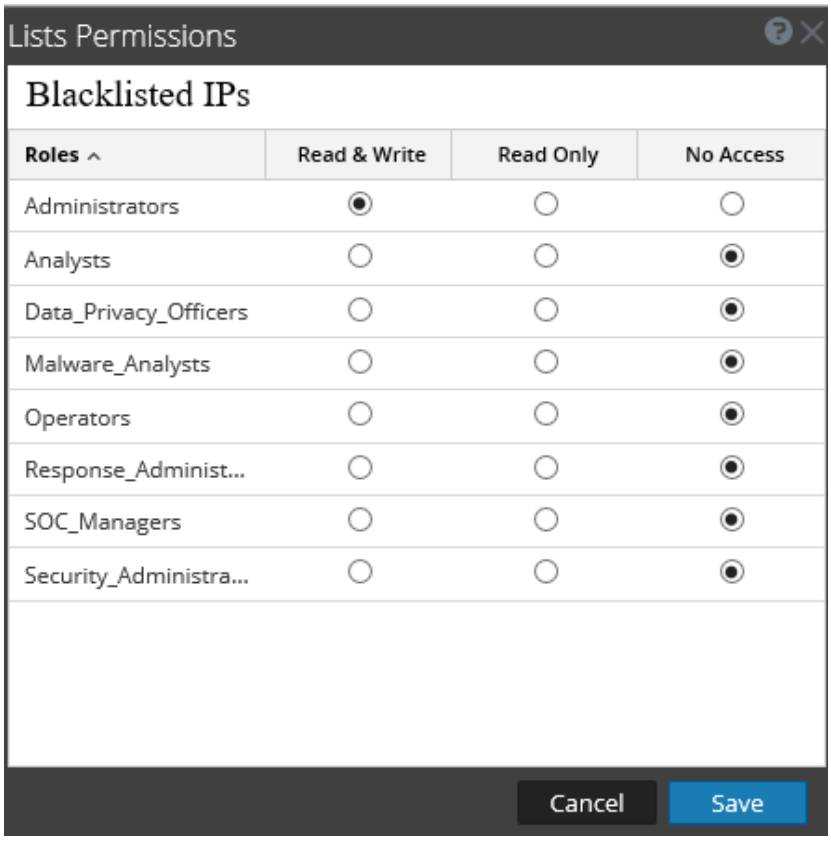
   The Manage tab is displayed.

2. Click **Lists**.
   The List view is displayed.



3. In the **List View** panel, select a list.

4. Click  > **Permissions** in the List toolbar.
   The List Permissions dialog is displayed.



5. Select the appropriate access permission for each of the user roles and click **Save**.

   A confirmation message that the permission is successfully set for the selected list is displayed.

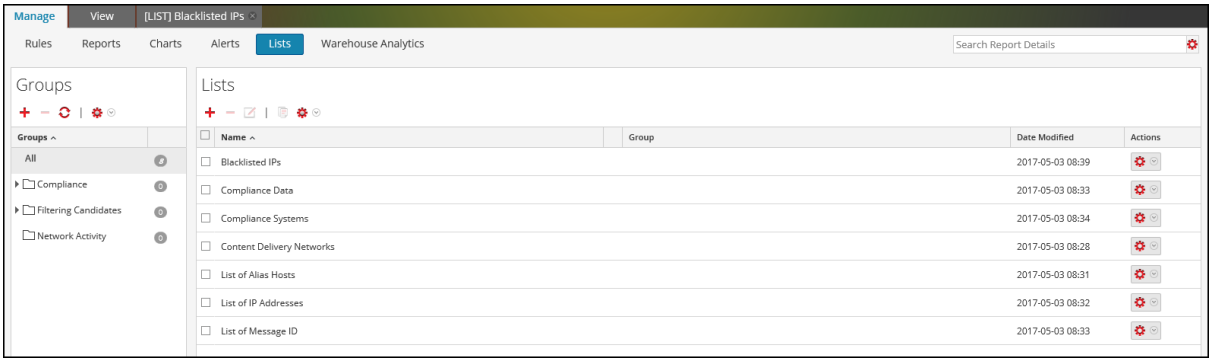
To set access control for a list group, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

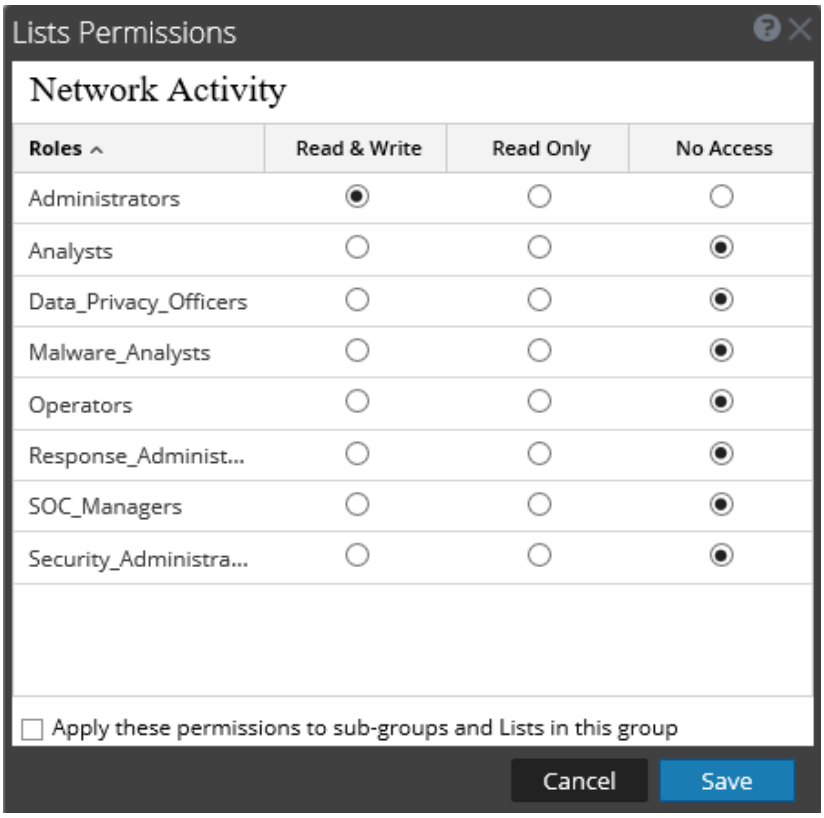
   The List view is displayed.



3. In the **List Groups** panel, select a list group.

4. Click  > **Permissions**.

   The List Permissions dialog is displayed.



5. (Optional) Select the appropriate checkbox to apply these permissions to subgroups and child objects of this group.
6. Click **Save**.

   A confirmation message that the permission is successfully set for the selected list group is displayed.

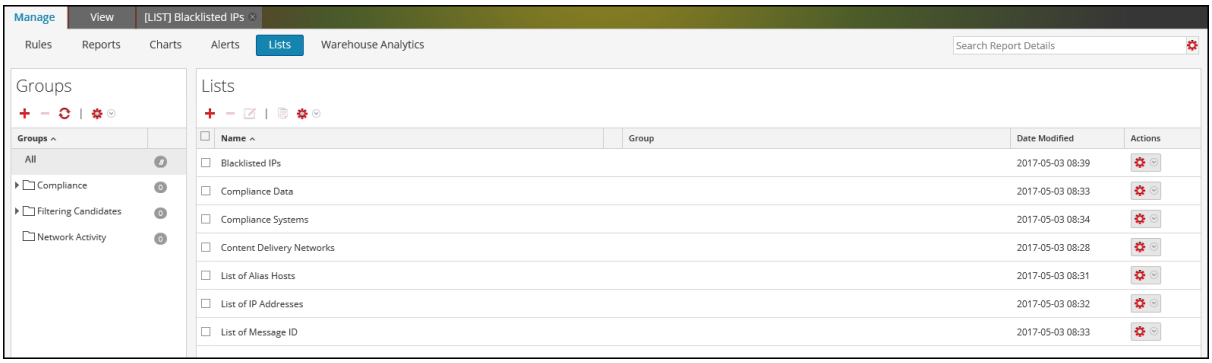
Edit a List

To edit a list, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.
2. Click **Lists**.

   The List view is displayed.



3. In the **List View** panel, select a list that you want to edit and do one of the following.
   - Click  in the List toolbar.
   - In the List View panel, click  > **Edit**.

   Note: You can only edit one list at a time.
4. Modify the required fields and add new values to the list.
5. Click **Save**.

   A confirmation message that the list is saved successfully is displayed.

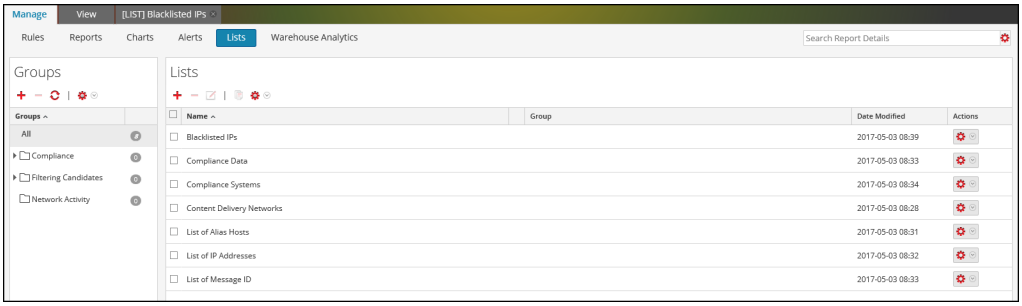
Delete a List or List Group

To delete a list, perform the following:

1. Go to **MONITOR** > **Reports**.

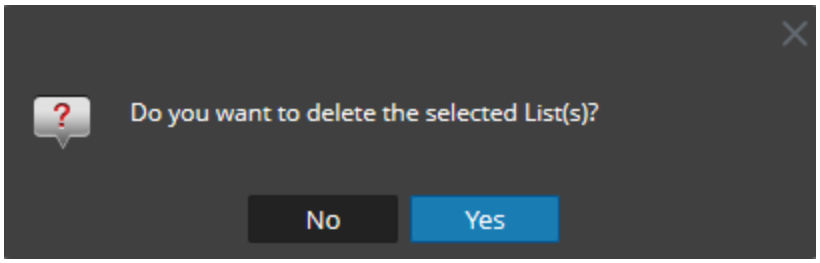
   The Manage tab is displayed.
2. Click **Lists**.

   The List view is displayed.



3. In the **List View** panel, do one of the following:
   - Select a list or multiple lists that you want to delete and click in the **Lists** toolbar.
   - In the **Actions** column, click  > **Delete**.

     A confirmation dialog is displayed.



Note: Before you delete a list, make sure that the list is not associated with any rule.

4. Click **Yes** to delete the list.

   A confirmation message that the list is deleted is displayed and the selected list is deleted from the List View panel.

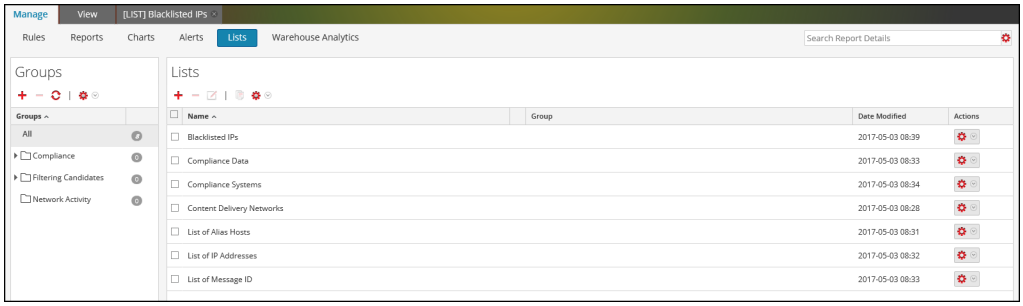
To delete a list group, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

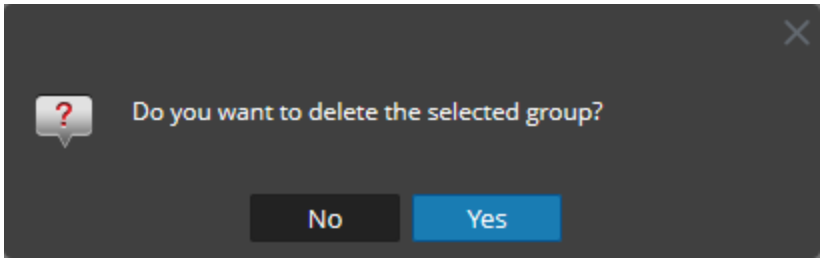
2. Click **Lists**.

   The List view is displayed.



3. In the **List Groups** panel, select the group and click .

   A confirmation dialog is displayed.



Caution: If you delete a group, all subgroups and lists in that group are deleted.

4. Click **Yes** to delete the selected group.

Note: If you try to delete a list group that has lists referenced in a rule or an alert, a warning message that **Lists are referenced in a rule** is displayed.

Duplicate a List

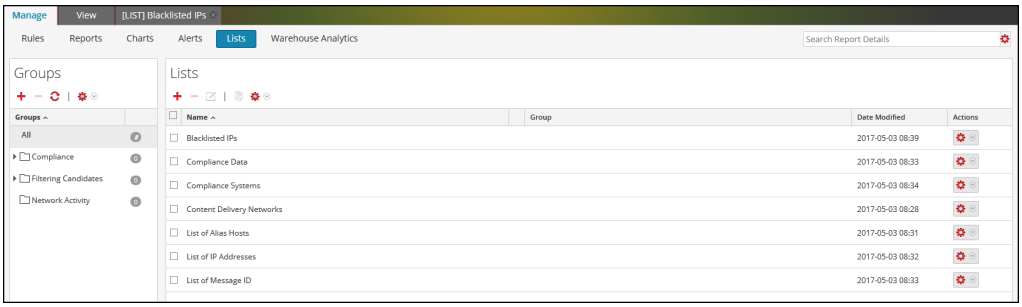
To duplicate a list, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.



3. In the **List View** panel, select a list that you want to duplicate.

   Note: You can only duplicate one list at a time.

4. In the **List** toolbar, click  .

Export a List or List Group

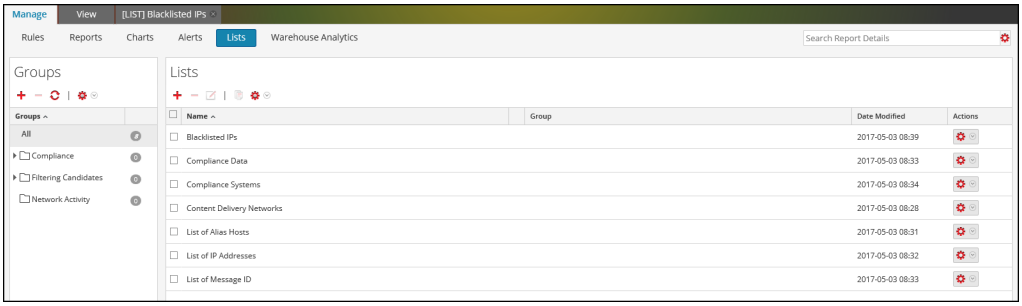
To export a list, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.



3. In the **List View** panel, do one of the following:

- Select a list and click  > **Export** in the List toolbar.
- In **Actions** column, click  > **Export**

You can export multiple lists at a time. To select multiple lists, select the checkbox of the lists to be exported. A browser-specific export dialog may be displayed allowing you to open or save the file.

To export a list group, perform the following:

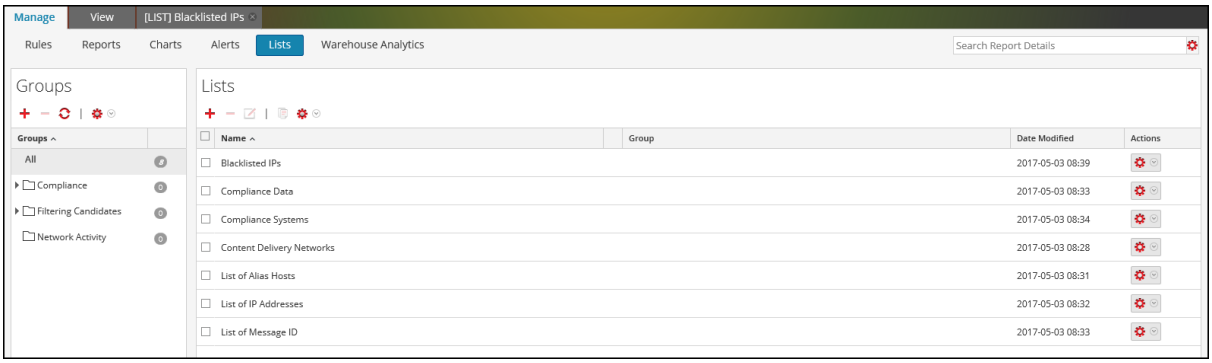
You can export selected list groups to an external file that can be later imported to NetWitness Platform. If nothing is selected in the List Library panel, the entire list tree is exported. When you export, the result is a single export file in binary format.

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

   The List view is displayed.



3. In the **List Groups** panel, select the list group containing the lists which you want to export.
4. Click  > **Export**.

   You can export multiple list groups at a time. To select multiple list groups, press and hold the CTRL button and select the list groups to be exported. The exported file is saved to the local drive.

Import a List or List Group

To import a list, perform the following:

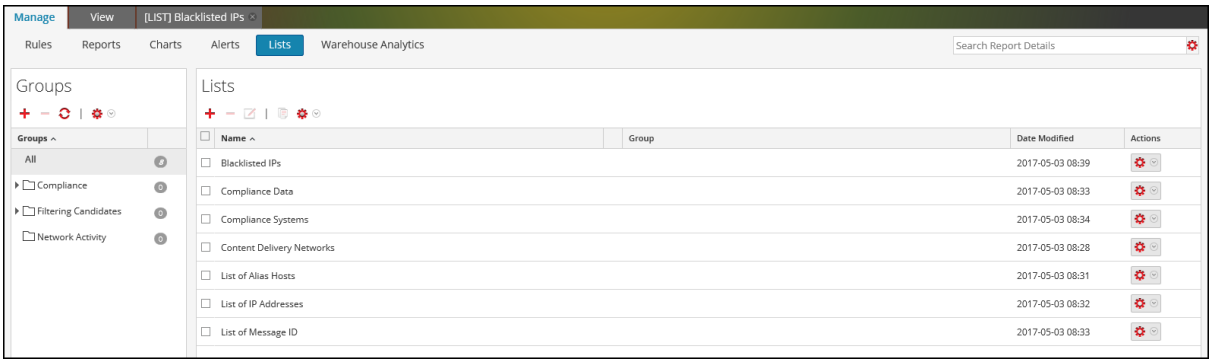
You can import lists from instances of NetWitness Platform into the list tree in the List View panel. Lists must be in a valid binary file exported from a NetWitness Platform instance.

1. Go to **MONITOR**> **Reports**.

   The Manage tab is displayed.

2. Click **Lists**.

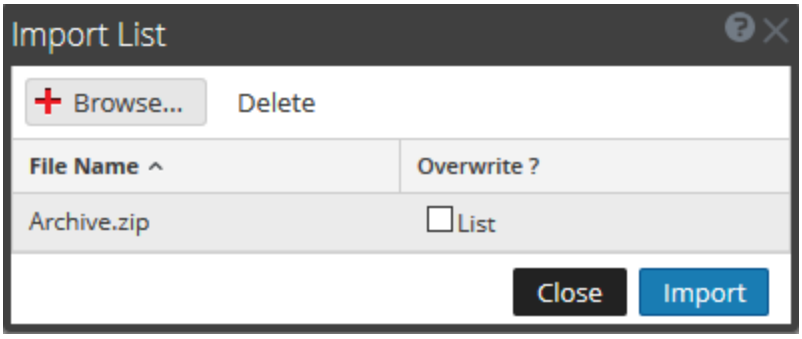
   The List view is displayed.



3. In the **List** toolbar, click  > **Import**.

   The Import List dialog box is displayed. You can import multiple lists at a time. To select multiple lists, press and hold the CTRL button and select the lists to be imported.

4. Click **Browse** and select archived file containing the lists.



5. Click **Import**.

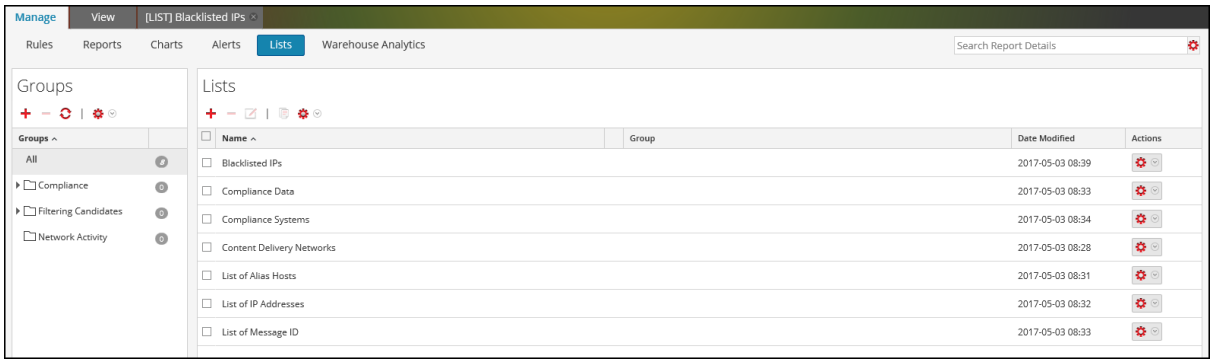
Note: During the import process, if a duplicate list exists and you do not select the overwrite option, the list is imported and no message about duplicate lists is displayed.

To import a list group, perform the following:

You can import list groups from instances of NetWitness Platform into the list tree in the List Groups panel. Lists must be in a valid binary file exported from a NetWitness Platform instance.

1. Go to **MONITOR**> **Reports**.
   The Manage tab is displayed.
2. Click **Lists**.

   The List view is displayed.



3. In the **List Groups** panel, click  > **Import**.

   The Import List dialog box is displayed.

4. Click **Browse** and select archived file containing the list groups.

   You can import multiple list groups at a time. To select multiple list groups, press and hold the CTRL button and select the list groups to be imported.

5. Click **Import**.

Note: During the import process, if a duplicate list group exists and you do not select the overwrite option, the list group is imported and no message about duplicate list group is displayed.

Manage a Rule

You can perform the following procedures to manage a rule.

- Access Control for a Rule and Rule Group
- Delete a Rule or Rule Group
- Duplicate a Rule
- Edit a Rule
- View Dependents of a Rule
- Export a Rule or Rule Group

Access Control for a Rule and Rule Group

To set access permissions the user will have depending on the user role to manage a rule or rule group. The Reporting provides access control at the rule and rule group level. Only a user who has the right set of permissions can perform the tasks in the Reporting. The access control is managed by the administrator from the **ADMIN > Security > Roles** tab.

When creating users and user roles, the administrator must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

Rules or Rule Groups can be tied to a specific set of user roles so that when a user logs into NetWitness Platform, the only rules they can access are rules accessible to the group to which the user belongs. Users that belong to a user role with the 'Read & Write' access permission have full access rights on the rule. Further, the access can be tightened so that rules are accessed only by those who have the 'Read Only' access.

Note: You must at least have 'Read Only' permission on a group to view the rules within that group.

At the rule level, you can set the following access permissions for the user roles:

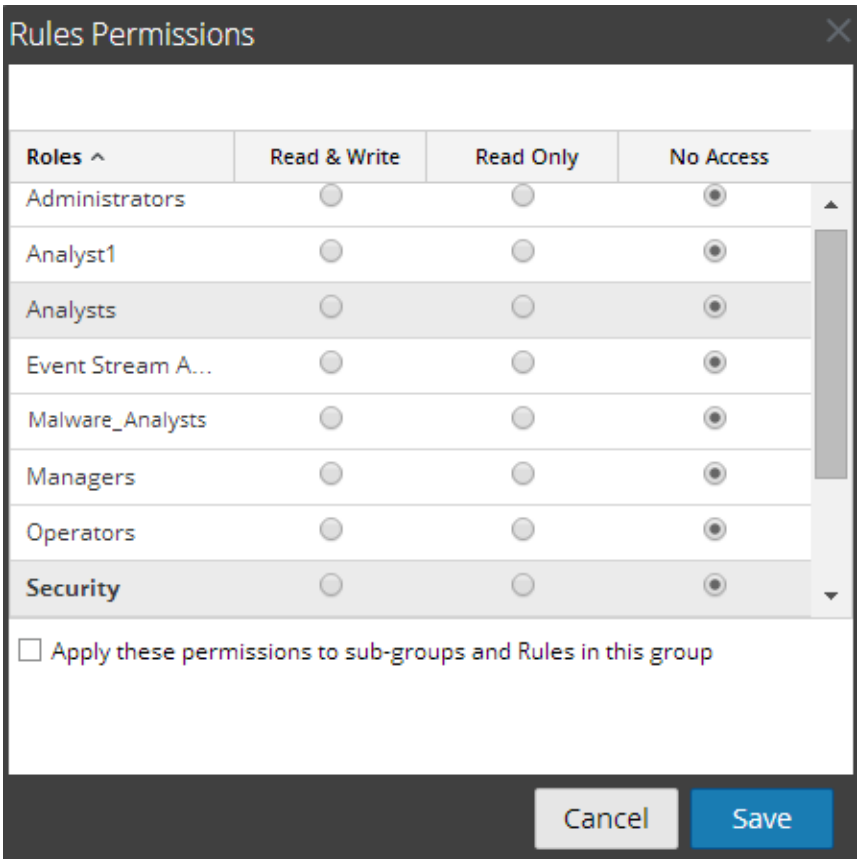
- Read & Write
- Read Only
- No Access

Suppose, you want the **Security Analysts** to have access to all the rules in a Rule Group, you can set the permission '**Read & Write**' at the Rule Group level. And, if you do not want the **Operator** role to have access to a specific set of rules in a rule group, you can set the permission '**No Access**' at the Rule Group level. The permission is set only for the rule group but not the rules or subgroups in the Rule Group.

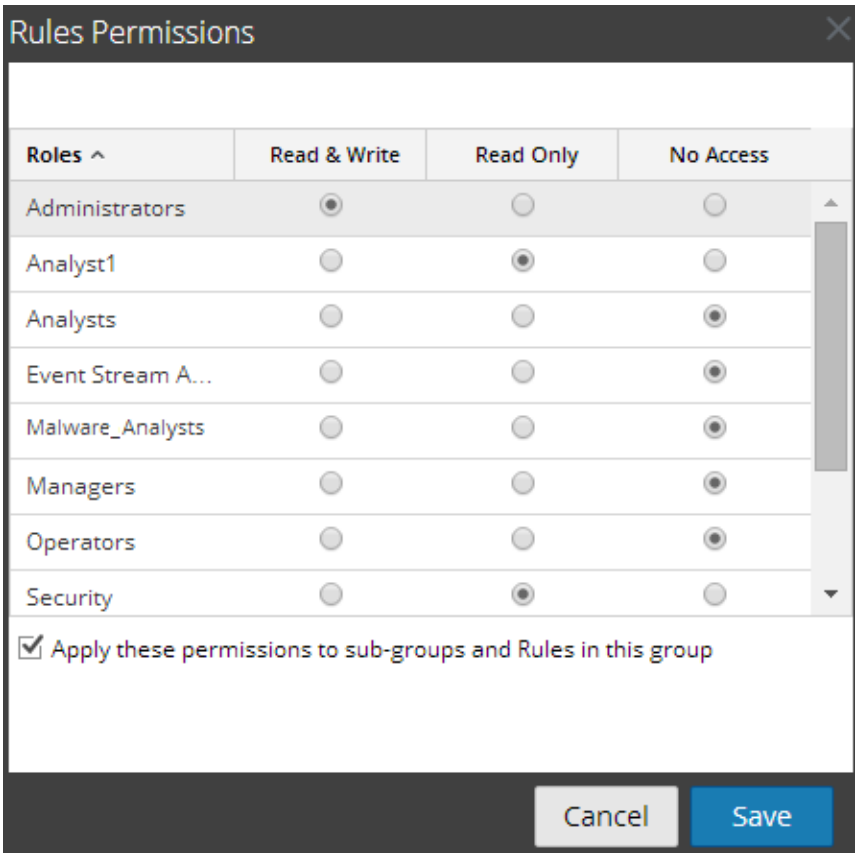
Access Control for a Rule Group

When you want to change the rule group permissions, you must select a rule group and set access permissions using the Rule Permissions panel.

Before applying rule group permissions, the default permission set for all the user roles is 'No Access' permission, and the checkboxes are deselected.



If you want to change the access permission for a specific user role, you must set these at the rule group level, as shown in the figure. Suppose, you want the **Administrators** to have access to all the rules in a Rule Group, you can set the permission '**Read & Write**' in the Rule Group Permissions panel.



You can also apply permissions to subgroups and rules in the group by selecting the checkbox.

The two scenarios are explained in brief:

- Scenario 1: Permissions applied to Rule Group/ Sub Group/ Rules based on the user role.
- Scenario 2: Permissions applied to Sub Group and Rules in the Group.

Role (Analysts)	Permissions applied to Rule Group/ Sub Group/ Rules based on the user role	Permissions applied to Sub group and Rules in the Group
Group	Read & Write	Read & Write
Sub Group	Read	Read & Write - Inherited
Rules	Read	Read & Write - Inherited

The access permissions that you set can be applied to subgroups and child objects of this group.

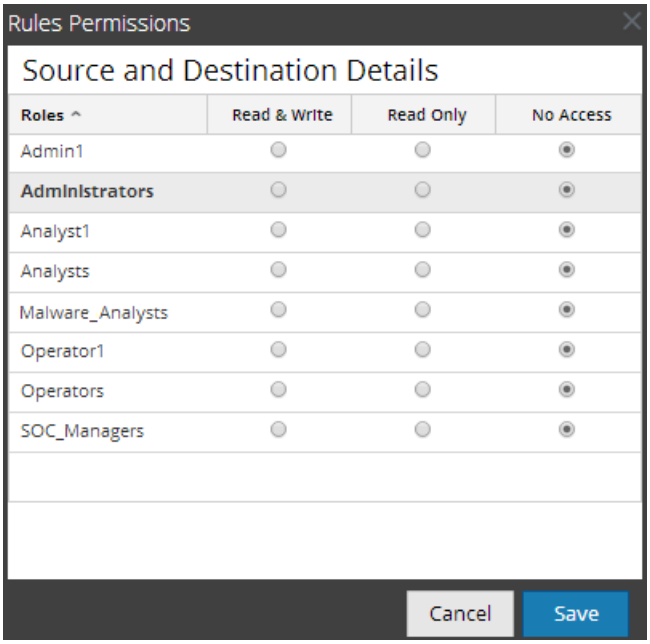
The Rule Group will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** rule group.

For scenario 1, each of the levels will have a permission set depending on the user role. For scenario 2, the permission at the Rule Group level will be inherited by the Sub Group and Rules in the Group.

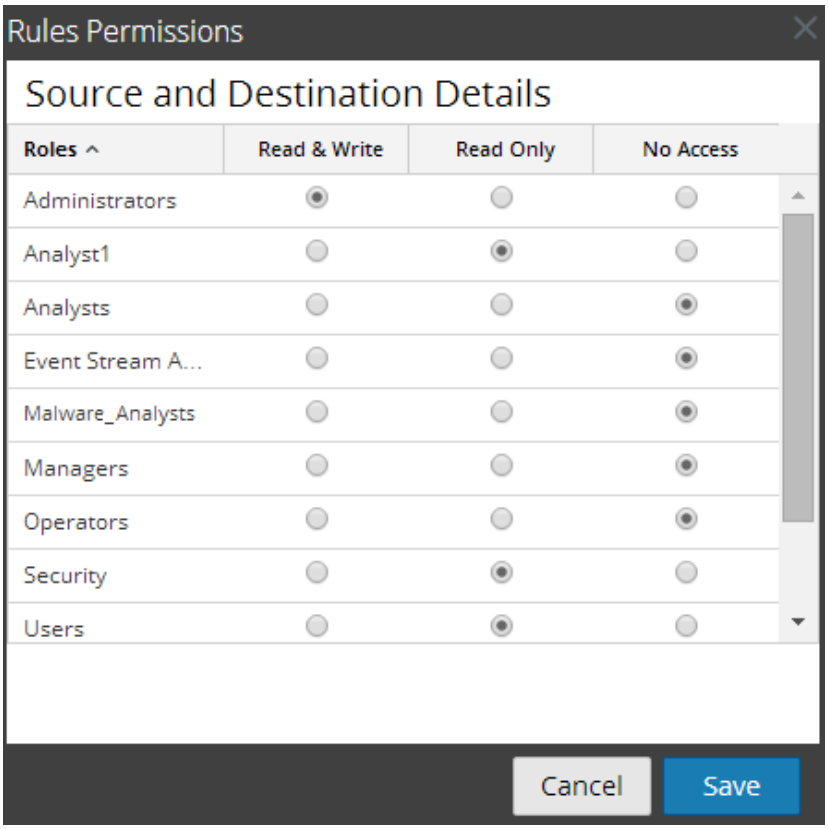
Access Control for a Rule

When you want to change the rule permissions, you must select a rule and set their access permissions using the Rule Permissions panel.

Before applying the Rule permissions, the default permission set for all the user roles is 'No Access' permission and the checkbox is deselected.



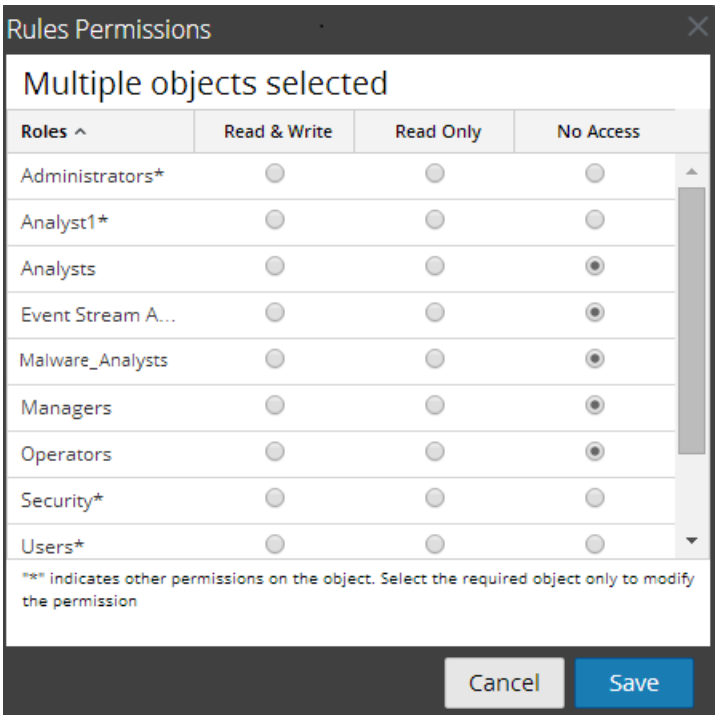
If you want to change the access permission for a specific user role, you must set these at the rule level, as shown in the figure. Suppose, you want the **Administrators** to have access to a specific rule, you can set the permission '**Read & Write**' in the Rule Permissions panel.



Access Control for a Rule When Multiple Rules are Selected

When you want to change permissions of multiple rules, you can select multiple rules at a time and set their access permissions using the Rules Permissions Panel. The access permission that you choose will be applied to all the selected rules.

Note: The '*' besides the role name indicates the other permissions available on the user role. If you want to change the access permission for the required user role, select the user role and change the access permission.



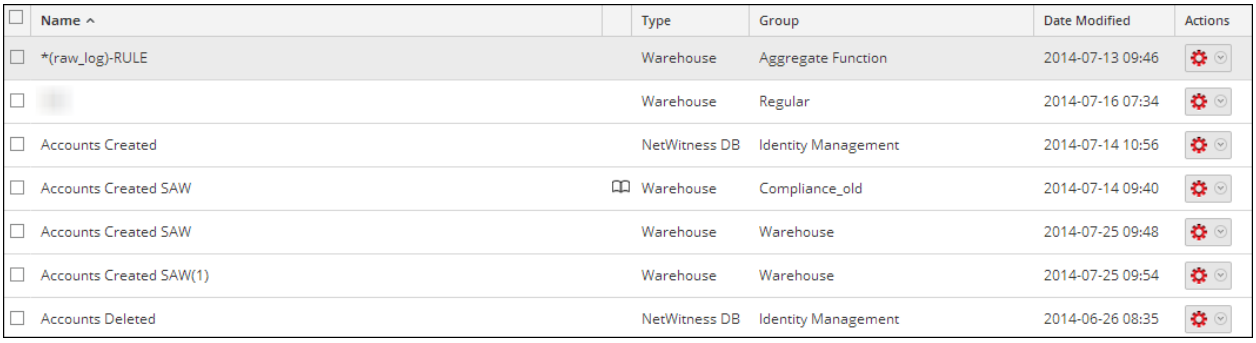
Log in as a specific user and view the access details

When you log in to the NetWitness Platform UI as a user having 'Read access' permission, all the rules will be denoted with the symbol (📖) and when you click on the symbol the 'Read Only' callout is displayed on the Rules List panel.

When you log in to the NetWitness Platform

UI as a user not having 'Read & Write' access permission on a Rule, all the rules will be denoted with the symbol (👁‍🗨) and the rules appear grayed out on the Rules List panel.

The following figure shows the Rules List panel when logged in with minimal 'Read & Write' access permission.



Note: If a user (other than administrator) creates a rule, ADMIN cannot access that rule.

Tabular Listing

The following table lists the columns in the Rules Permissions panel:

Column	Description
Roles	The role of the user logged into the NetWitness Platform user interface.
Read & Write	The user can access, view, edit, delete, import, and export rules on the Rules view. The user can also change the permission on the rule.
Read Only	The user can only access and view the rule on the Rules view
No Access	The user cannot access or view the rule for which this permission is set.

Set Access Control for a Rule

You can set access control for a rule. The Reporting Engine provides access control at the rule level. Only a user who has the right set of permissions can perform tasks on the rule. The administrator when creating users and roles must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

At the rule level, you can set the following access permissions for the user roles in NetWitness Platform:

- Read & Write – View or edit the rules in the rule group.
- Read Only – View the rules in the rule group.
- No Access – Cannot view or edit the rules in the rule group.

Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a rule.

To set access control for a rule, perform the following:

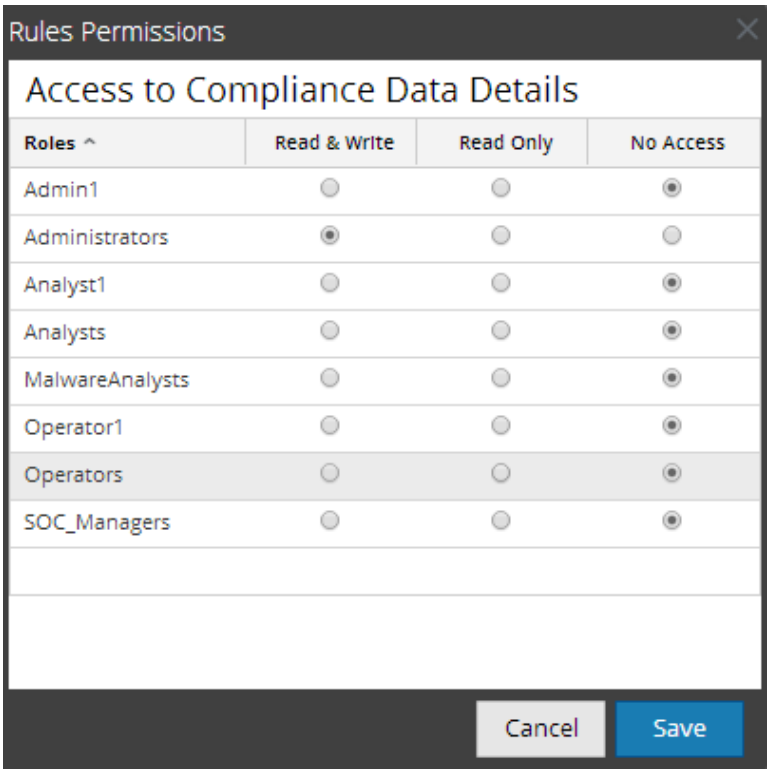
1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. In the **Rules** list panel, select the rule.

3. Click  > **Permissions** in the Rule toolbar.

   The **Rules Permissions** dialog is displayed.



4. Select the following appropriate access permission for the user role and click **Save**.
   - Read & Write
   - Read Only
   - No Access

Set Access Control for a Rule Group

You can set access control at the rule group level. Only a user who has the right set of permissions can perform the tasks on the rule. The administrator when creating users and roles must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

At the rule group level, you can set the following access permissions for the user roles in NetWitness Platform:

- Read & Write – View or edit the rules in the rule group.
- Read Only – View the rules in the rule group.
- No Access – Cannot view or edit the rule in the rule groups.

Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a rule group.

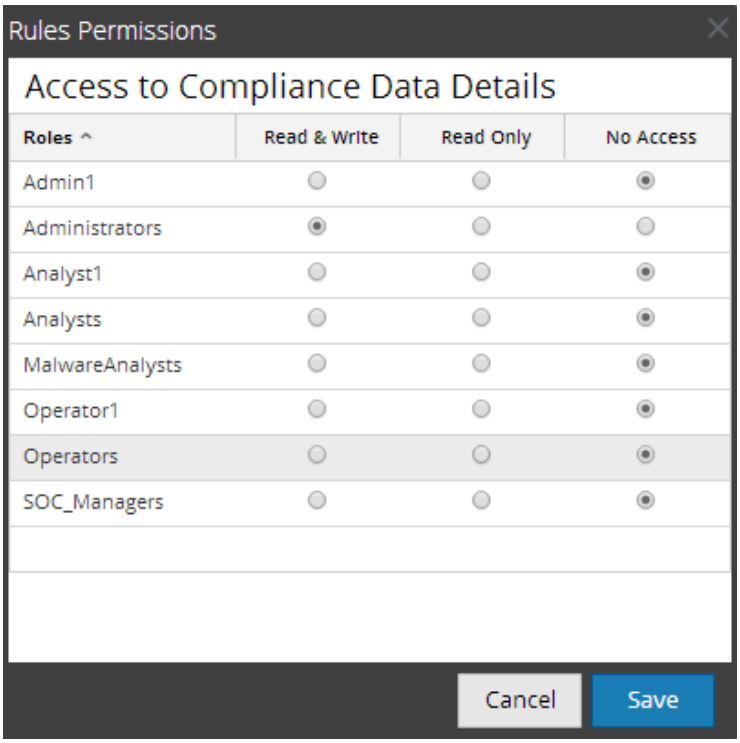
To set access control for a rule group, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. In the **Rule Groups** panel, select the rule group and do one of the following:
   - Click and select **Permissions**.
   - Right-click the selected rule group and select **Permissions**.

   The **Rules Permissions** dialog is displayed.



3. (Optional) Select the appropriate checkbox to apply these permissions to subgroups and child objects of this group.
4. Click **Save**.

   A confirmation message that permission is successfully set for the selected rule group is displayed.

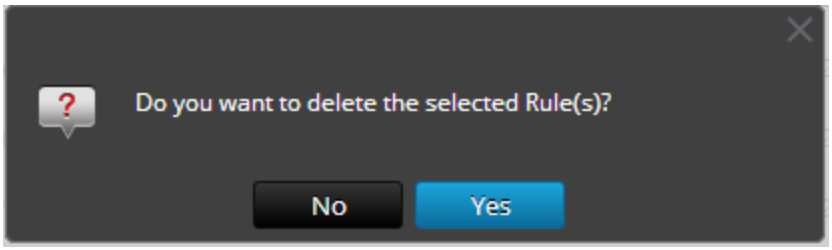
Delete a Rule or Rule Group

To delete a rule, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.
2. In the **Rules** panel, do one of the following.
   - Select a rule and click in the Rule toolbar.
   - Click > **Delete**.

     A confirmation dialog is displayed.



Note: If a rule is being used in a report, a warning that the rule is in use and cannot be deleted is displayed.

3. Click **Yes** to delete the rule.

   A confirmation message that the rule is deleted successfully is displayed and the selected rule is deleted from the Rule List panel.

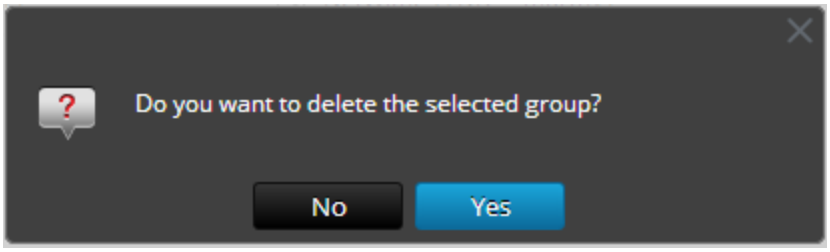
To delete a rule group, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. In the **Rule Groups** panel, select the rule group that you want to delete.
3. Click −.

   A confirmation dialog is displayed.



Note: If any one of the rules in the group is being used in reports, a warning that the rule is in use and cannot be deleted is displayed.

4. Click **Yes** to delete the group.

   A confirmation message that the group is deleted successfully is displayed and the selected group is deleted from the Rule Groups panel.

Duplicate a Rule

To duplicate a rule, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. In the **Rules** list panel, select a rule that you want to duplicate.
3. In the Rule toolbar, click .

Edit a Rule

To edit a rule, perform the following:

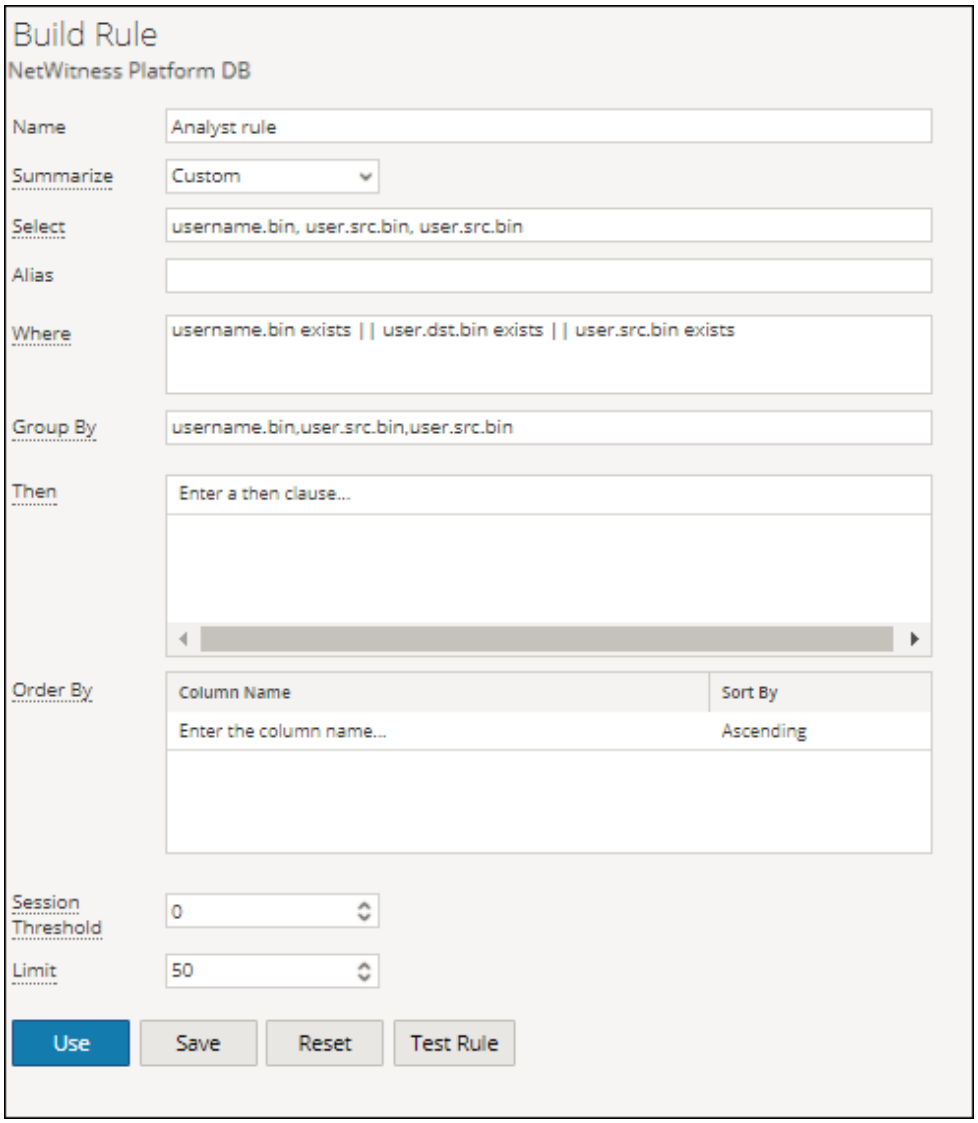
1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. In the **Rules** list panel, do one of the following:

   - Select a rule and click in the Rule toolbar.
   - Click > **Edit**.

     The Build Rule view tab is displayed.



Note: If a rule is edited, the updated rule definition is applied to the Reports, Charts, and Alerts where the rule is included.

3. Modify the required fields.
4. Click **Save**.

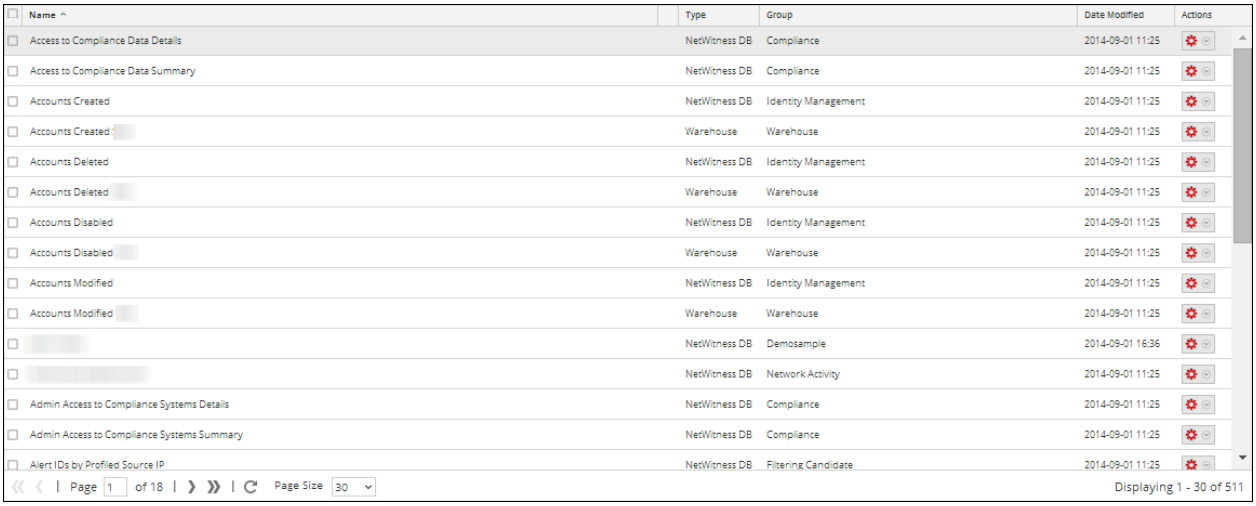
   A confirmation message that the rule is saved successfully is displayed.

When you edit a rule, ensure to re-select the Rule for which you want the Chart to be generated, so that the edited rule is applied. If you do not re-select the Rule and attempt to save or test the rule, the rule is saved and a warning message is displayed.

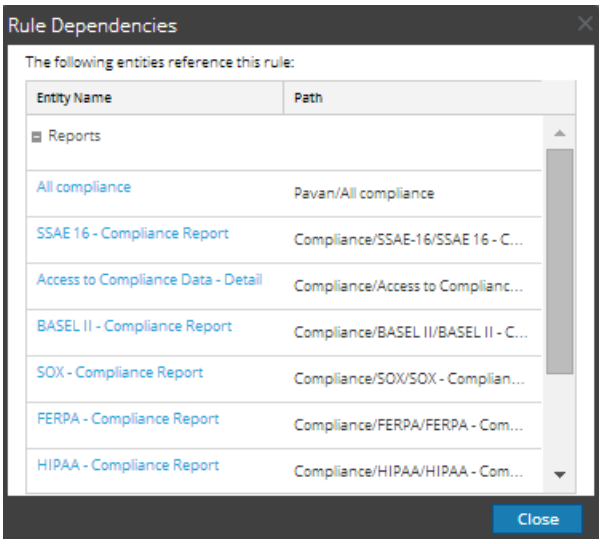
View Dependents of a Rule

You can view dependents of a rule. You must traverse a rule list, select a rule for which you want to identify the dependency over a report, chart, or alert.

The following figure shows the Rule View where you select the rule 'Access to Compliance Data Details'.



The following figure shows the dependency of the rule over alerts and reports.



The following table lists the various columns in the Rule Dependencies dialog and their description.

Column	Description
Entity Name	The name of the entity referencing the rule.
Path	The path where the entity is located in the user interface.

To view dependents of a rule, perform the following:

1. Go to **MONITOR** > **Reports**.

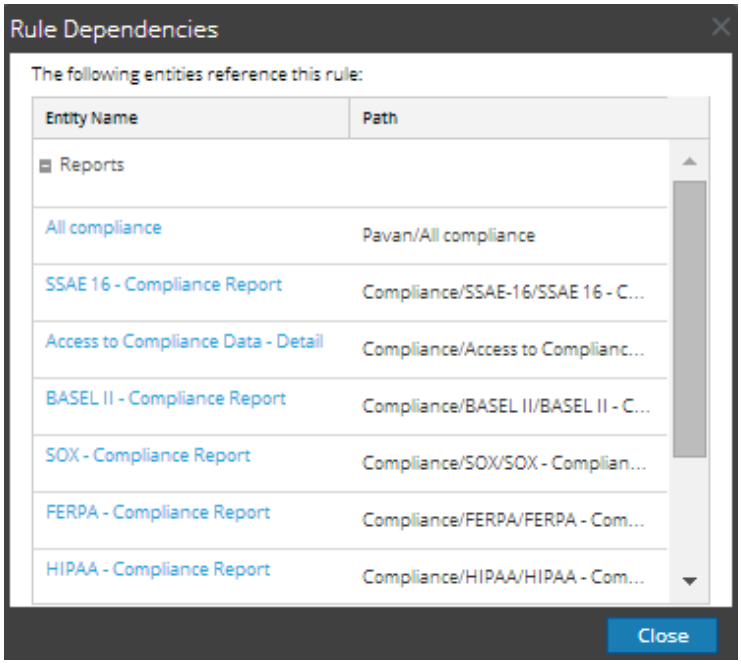
   The Manage tab is displayed.

2. Click **Rules**.

   The Rule view is displayed.

3. In the **Rule List** panel, click  > **Dependents**.

The Rule Dependencies dialog is displayed.



Export a Rule or Rule Group

Note: Make sure that you have rules in the rule group.

To export a rule, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

   In the **Rules** list panel, do one of the following:

   - Select a rule and click > **Export** in the Rule toolbar.
   - Click > **Export**.
2. A browser-specific export dialog may be displayed, allowing you to open or save the file. You can export multiple rules at a time. To select multiple rule, press and hold the CTRL button and select the rules to be exported.

To export a rule group, perform the following :

1. Go to **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. In the **Rule Groups** panel, select the rule group containing the rules which you want to export. You can export multiple rules groups at a time. To select multiple rule groups, press and hold the CTRL button and select the rules groups to be exported.
3. Click > **Export**.
   A browser-specific export dialog may be displayed allowing you to open or save the file.

Manage a Report

You can perform the following procedures to manage a report.

- Access Control for a Report or Report Group
- Delete a Report or Report Group
- Duplicate a Report
- Edit a Report
- Refresh a Report Group or Report List
- Edit a Scheduled Report
- Delete a Scheduled Report
- Export a Report
- Export a Report Group
- Import a Report or Report Group
- Enable or Disable a Scheduled Report
- Start or Stop a Scheduled Report
- View an Execution History of a Scheduled Report
- Manage and Select a Report Logo
- Search Reporting Details

Access Control for a Report or Report Group

This section covers the access permissions the user has depending on the user role to manage a report and report group. The Reporting provides access control at the report and report group level. The user who has the right set of permissions can only perform the tasks in reporting module. The access control is managed by the administrator from the **ADMIN > Security > Roles** tab.

When creating users and user roles, the administrator must ensure that the roles created for specific tasks have access to all the permissions higher in the hierarchy of roles.

Reports and Report Groups can be tied to a specific set of user roles so that when a user logs into NetWitness Platform, the reports with the access rights for the specific user role can be viewed. Users that belong to a user role with the 'Read & Write' access permission can define reports. Further, the access can be tightened so that reports are accessed only by those who have the 'Read Only' access.

Note: You must have 'Read Only' permission for a group to view the reports within that group.

At the report level, you can set the following access permissions for the user roles in NetWitness Platform:

- Read & Write
- Read Only
- No Access

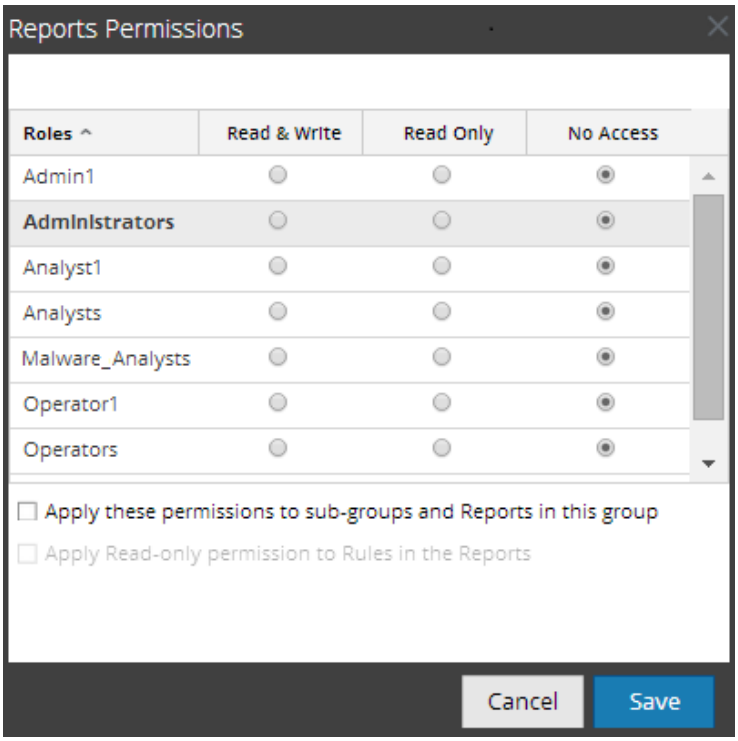
Suppose, you want the NetWitness Platform to have access to all the reports in a Report Group, you can set the permission '**Read & Write**' at the Report Group level. And, if you do not want the **Operator** role to have access to a specific set of reports in a report group, you can set the permission '**No Access**' at the Report Group level.

The permission is set only for the report group but not the reports, rules, or subgroups in the Report Group.

Access Control for a Report Group

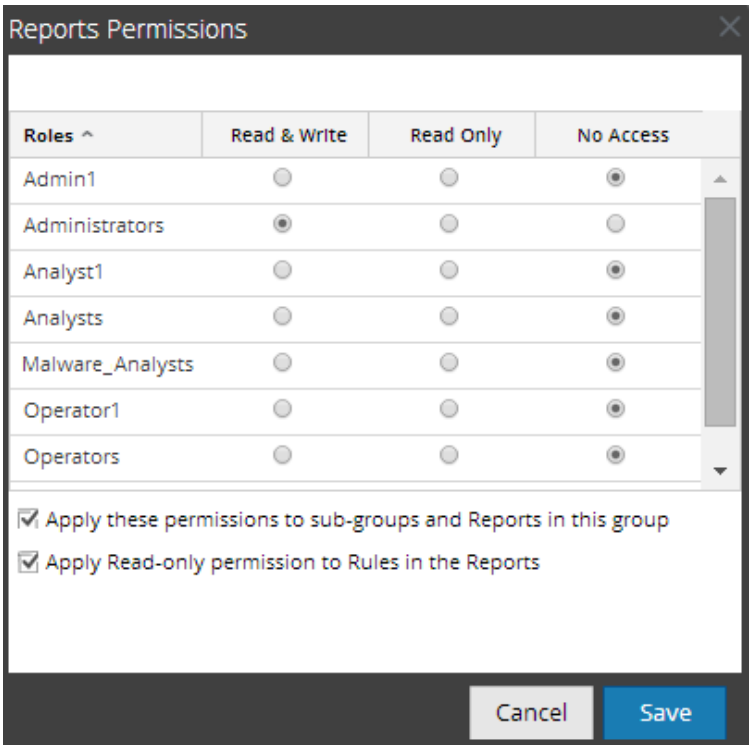
When you want to change the report group permissions, you must select a report group and set access permissions using the Reports Permissions panel.

Before applying report group permissions, the default permission set for all the user roles is 'No Access', except for Administrators, as shown in the figure.



If you want to change the access permission for a specific user role, you must set these at the report group level, as shown in the figure. <suppose,>Administrators to have access to all the reports in a Report Group, you can set the permission '**Read & Write**' in the Report Group Permissions panel.

You can also apply permissions to subgroups and reports in the group, as well as apply read-only permission to rules in the reports by selecting the appropriate checkboxes, as shown in the figure.



The three scenarios are explained in brief:

- Scenario 1: Permissions applied to Report Group/ Sub Group/ Report based on the user role.
- Scenario 2: Permissions applied to Sub Group and Report in the Group.
- Scenario 3: Read-only permission applied to Rules in the Report.

	Role (Analyst)	Permissions applied to Report Group/ Sub Group/ Report based on the user role	Permissions applied to Sub group and Report in the Group	Permission (Read-only) applied to Rules in the Report
Group	Read & Write	Read & Write	Read & Write	Read & Write
Sub Group	Read	Read	Read & Write - Inherited	Read & Write
Report	Read	Read	Read & Write - Inherited	Read & Write
Rules	Read	Read	Read	Read

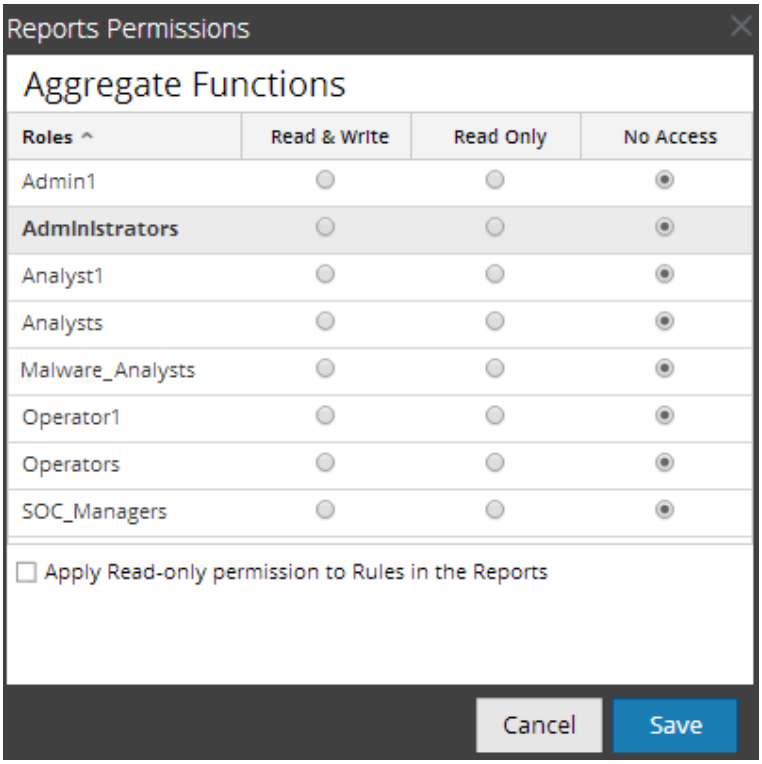
The Report Group will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** report group.

For scenario 1, each of the levels has a permission set depending on the user role. For scenario 2, the permission at the Report Group level (Read & Write) is inherited by the Sub Group and Reports in the Group. For scenario 3, the Read permission is set for the Rules except that the permission set for the rules cannot be higher than the permissions set for the Report Group.

Access Control for a Report

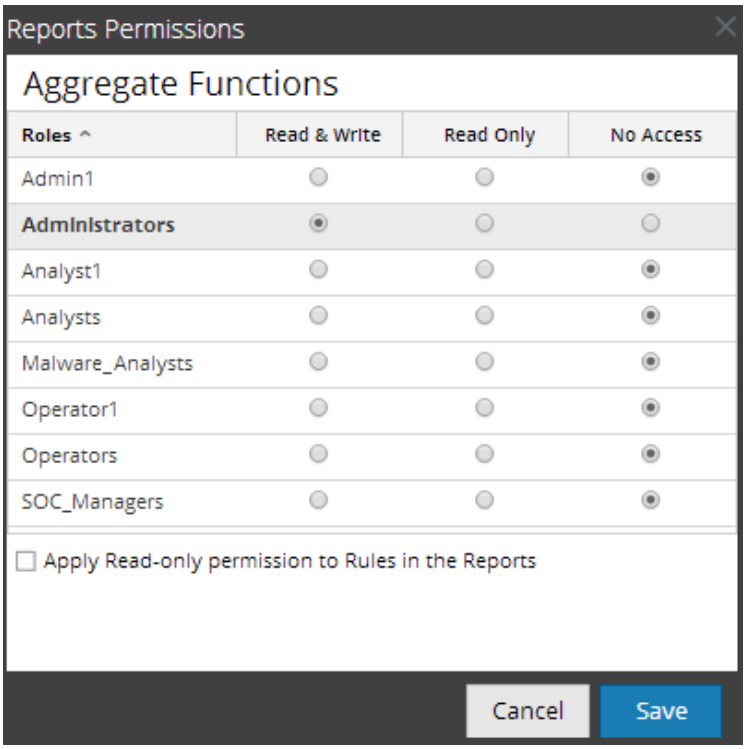
When you want to change the report permissions, you must select a report and set their access permissions using the Report Permissions panel.

Before applying the Report permissions, the default permission set for all the user roles is 'No Access' permission and the checkbox is unchecked, as shown in the figure.



If you want to change the access permission for a specific user role, you must set these at the report level, as shown in the figure. Suppose, you want the **Administrators** to have access to a specific report, you can set the permission '**Read & Write**' in the Report Permissions panel.

You can apply read-only permission to rules in the reports by selecting the checkbox, as shown in the figure.



The two scenarios are explained in brief:

- Scenario 1: Permissions applied to Report Group/ Sub Group/ Report/ Rules.
- Scenario 2: Read-only permission applied to Rules in the Report.

	Role (Analysts)	Permissions applied to Report Group/ Sub Group/ Report/ Rules based on the user role	Permission (Read-only) applied to Rules in the Report
Group	Read & Write	Read & Write	Read & Write
Sub Group	Read	Read	Read & Write
Report	Read	Read	Read & Write
Rules	Read	Read	Read

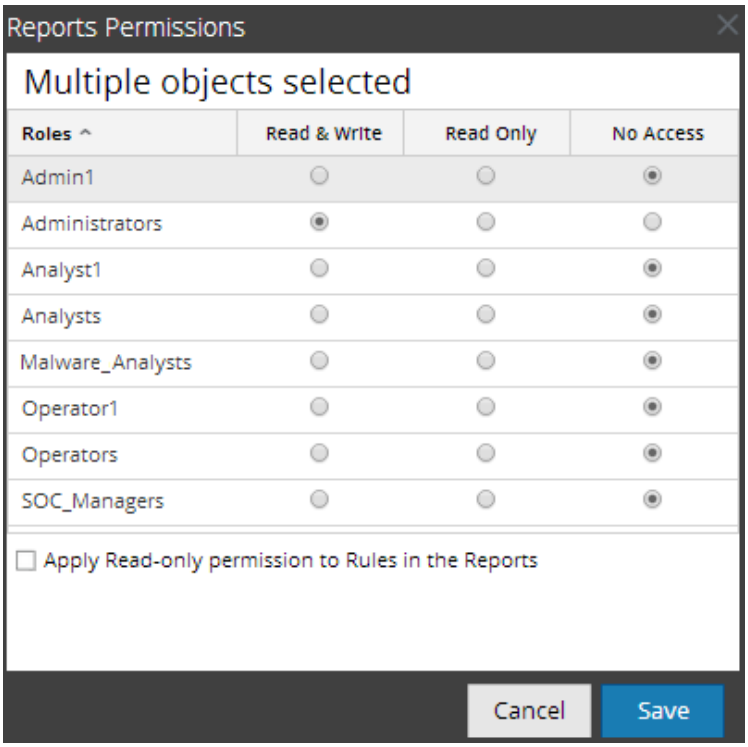
The Report will be assigned the role of a **Security Analyst** and permissions are set to **Read & Write** reports.

For scenario 1, each of the levels has a permission set based on the user role. For scenario 2, the Read permission is set for the Rules except that the permission for the rules cannot be higher than the permission for the Reports.

Note: If the permission for the rules is higher than the permission for the Reports then the permission is be applied only to the reports. For example, if you set the permissions for the Report Group as **No Access** and then specify the option *Apply Read-only permission to Rules in the Reports*, then the read-only permission is not set for the rules.

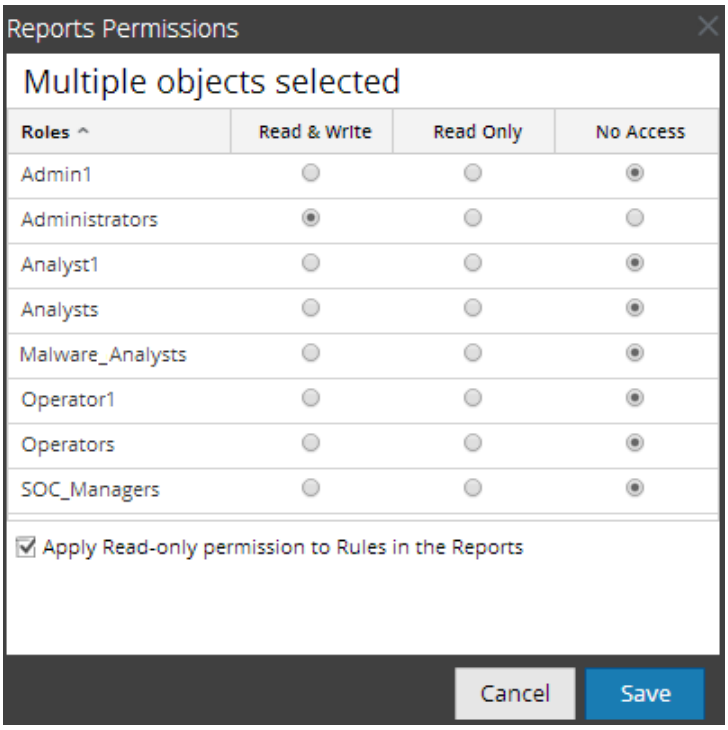
Access Control for a Report When Multiple Reports are Selected

When you want to change permissions of multiple reports, you must select several reports and set their access permissions using the Report Permissions panel. The access permission that you choose is applied to all the selected reports.



Access Control for a Report When Multiple Reports with several rules are Selected

When you want to change permissions when multiple reports with several rules are selected, you must select the checkbox in the Report Permissions panel, as shown in the figure. The read-only access permission is applied to all the rules of the selected reports, provided that the permission of the rules are lower than the permission of the reports.

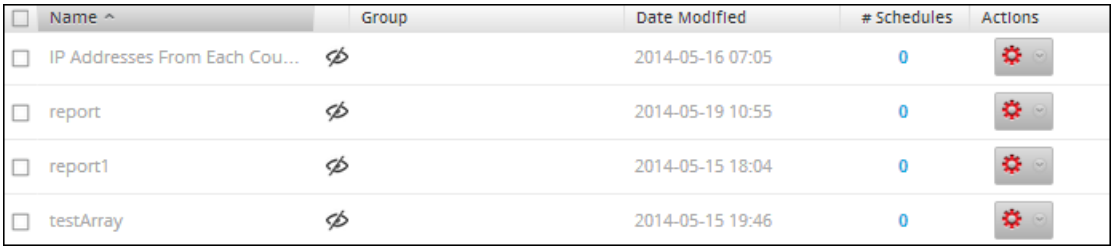


Log in as a specific user and view the access details

When you log in to the NetWitness Platform UI as a user having 'Read access' permission, all the reports is denoted with the symbol (📖) and when you click on the symbol the 'Read Only' callout is displayed on the Report List panel.

When you log in to the NetWitness Platform UI as a user not having 'Read & Write' access permission on a Report, all the reports are denoted with the symbol (⊘) and the reports appear grayed out on the Report List panel.

The following figure shows the Report List panel when logged in with minimal 'Read & Write' access permission.



Note: If a User (other than the super user) creates a report there will be no access to that report for the super user.

Tabular Listing

The following table lists the various columns in the Reports Permissions Panel:

Column	Description
Roles	The role of the user logged into the NetWitness Platform UI.

Column	Description
Read & Write	The user can access, view, edit, import, export, and delete the report on the Reports view. The user can also change the permission on the report.
Read Only	The user can only access and view the report on the Reports view.
No Access	The user cannot access or view the report for which this permission is set.
Apply these permissions to subgroups and Reports in this group	Select the checkbox to apply the selected permissions to the report group, subgroups in the group and reports in the group. **Note:** This checkbox is populated only when you set access permissions for a Report Group.
Apply Read-only permission to Rules in the Reports	Select the checkbox to automatically apply permissions to the rules in the reports.

Set Access Control for a Report

Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a report.

To set access permissions for a report, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

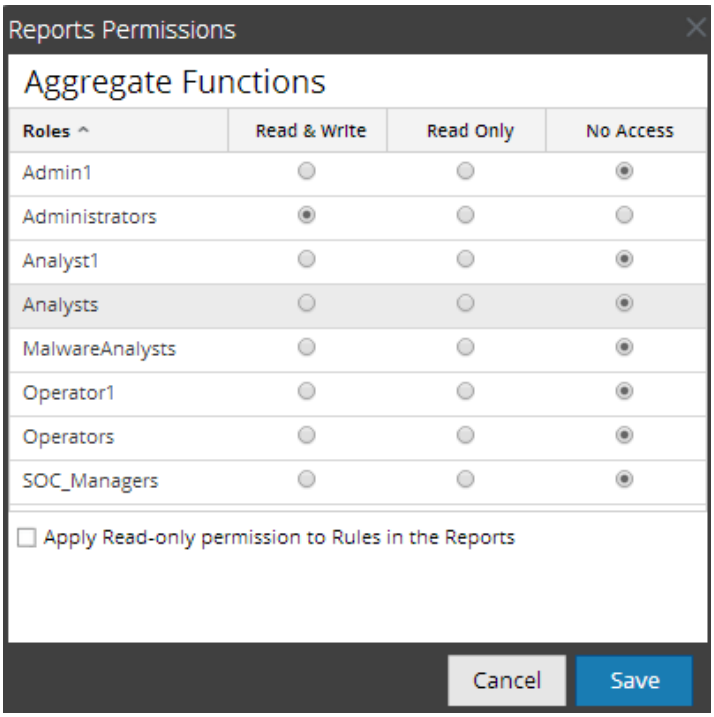
2. Click **Reports**.

   The Report view is displayed.

3. In the **Report List** panel, select a report.

4. Click > **Permissions**.

   The Reports Permissions dialog is displayed.



5. Based on the user role, select the appropriate buttons.
6. (Optional) Select the checkbox, if you want to provide read access permission to rules in the reports.

   Note: On selecting the check box, all dependent rules are given READ access permission, provided the permissions for the report is higher compared to the permissions of the rules.

7. Click **Save**.

   A confirmation message that the permission is set for the selected report is displayed.

Set Access Control for a Report Group

Prerequisites

Make sure that you have a minimal 'Read & Write' access permission to set access permissions for a report group.

To set access permissions for a Report Group, perform the following:

1. Go to **MONITOR** > **Reports**.

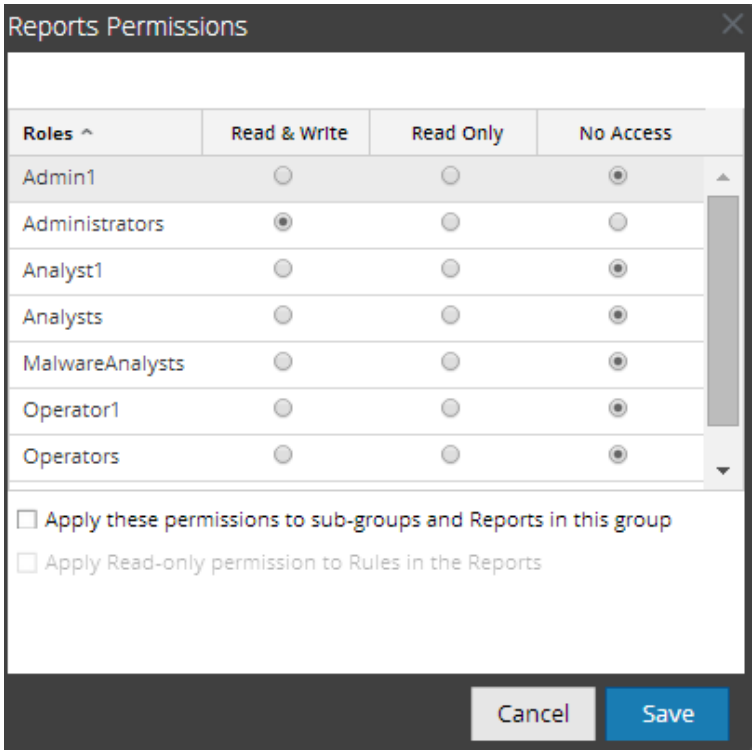
   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report Groups** panel, select or right-click on a report group.
4. Click > **Permissions**.

The Reports Permissions dialog box is displayed.



4. Based on the user role, select the appropriate buttons.
5. (Optional) Select the appropriate checkbox to apply the selected permissions to subgroups and reports in the group.
6. (Optional) Select the appropriate checkbox to provide read access permission to rules in the reports.

   Note: On selecting the check box, all dependent rules is given READ access permission, provided the permissions for the report is higher compared to the permissions of the rules.

7. Click **Save**.

   A confirmation message that the permission is successfully set for the selected report group is displayed.

Delete a Report or Report Group

To delete reports in a group or subgroup from the Report List panel:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

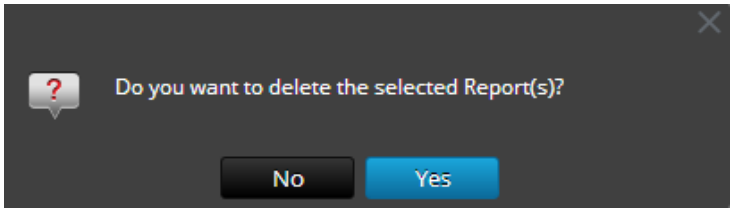
2. Click **Reports**.

   The Report view is displayed.

3. In the **Report List** panel, do one of the following:

- Select the reports and click −.
- Click ⚙ > **Delete**.

  A confirmation dialog is displayed.



4. Click **Yes** to delete the report.

   A confirmation message that the report is deleted successfully is displayed and the selected report is deleted from the Report List panel.

Delete a Report Group

Prerequisites

Make sure that you have no reports associated with the report group.

To delete report groups in the default folder or subgroups under a report group, perform the following:

1. Go to **MONITOR** > **Reports**.

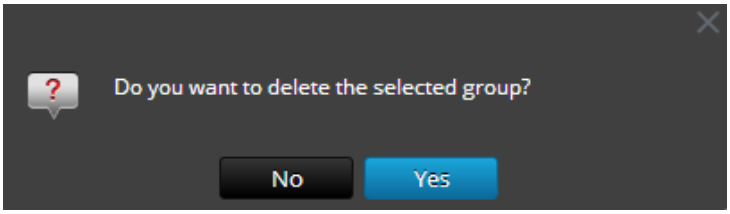
   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report Groups** panel, select the report group and click −.

   A confirmation dialog is displayed.



4. Click **Yes** to delete the group.

   A confirmation message that the group is deleted successfully is displayed and the selected group is deleted from the Report Groups panel.

Duplicate a Report

You can duplicate a report to schedule multiple report for the same report. The duplicated report is displayed in the Reports List panel with suffixes. For example, Report (1).

Generally, the duplicate option is used in two scenarios:

- You want to make a copy of the report, to move the same report to another group.
- You want to retain most of the configuration settings for an object but modify few of these settings. For example, when you have a complex query in a rule or several rules in a report, it is very much appropriate to use the duplicate option.

To duplicate an existing report, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report List** panel, select a report that you want to duplicate and click .

   The report is saved successfully and added to the Report list.

You can move the duplicated report to another group.

Edit a Report

To edit reports in a group or subgroup from the Report List panel, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. The Build Report view tab is displayed.

4. Modify the text and add more rules to the report (if required).
5. Click **Save**.

   A confirmation message that the report is saved successfully is displayed.

Refresh a Report Group or Report List

You can refresh a report group or reports to view the re-arrangement of groups or reports.

To refresh a report group or reports, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. Do the following to move the group or reports to a new location:

   - In the **Report Groups** panel, drag and drop the group.
   - In the **Reports List** panel, drag and drop the reports to the desired group in the Report Groups panel.

     The report group or reports are moved to the new location.

4. Do the following to refresh a group or report list:

   - In the **Report Groups** panel, click  .

     The report group gets refreshed.

   - In the **Report List** panel, click  .

     The Report list gets refreshed.

Edit a Scheduled Report

To edit a scheduled report from the Scheduled Reports List panel, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report List** panel, select a report and click  > **View Scheduled Reports**.

   The View Scheduled Reports tab is displayed.

4. In the **Scheduled Reports List** panel, do one of the following:

   - Select a report and click  .
   - Select a report and click  > **Edit Schedule**.

The Schedule Report tab is displayed.

5. In the Schedule Report tab, do the following:
   a. In the **Schedule Name** field, modify the name for the schedule report configuration.
   b. To execute the reports as per the schedule, select the **Enable** checkbox.
   c. From the **Data Source** field, select the datasource.

   Note: If the data source is not listed, ensure you have **Read** permissions set for the data source. This is applicable for NWDB and Warehouse data source. For more information, see "Configure Data Source Permissions" topic in the *Reporting Engine Configuration Guide*.
6. (Optional) From the **Warehouse Resource Pool** drop-down, select the pool or queue for the report.

   Note: The **Warehouse Resource Pool** drop- down is displayed only if the Warehouse Rule is selected. If no pools or queues are entered for the Reporting Engine, this field is disabled.
7. From the **Run** field, select the type of run schedule. (For example, Now or Hourly).
8. Select the date range to run the query based on absolute duration or select the **Use relative time duration** checkbox to run the query based on relative duration.
9. (Optional) In the Output Actions panel, do the following:
   a. Type the email address and subject.
   b. Edit the body of the message for the report.
   c. Select the format of the attachment.
   d. Type a value for the CSV and Multivalue delimiters.
10. (Optional) In the Other Options field, do the following:
    a. Click  > **SFTP** or **URL** or **Network Share**. Based on the selected option, a row gets added in the Other options field.
    b. Select the appropriate options to send the report in PDF or CSV format to the configured SFTP, URL or Network Share.
11. (Optional) To add a list in the Dynamic List panel, see Generate a List from the Scheduled Report section in Create and Schedule a Report.
12. (Optional) To choose another logo in the Logo panel, see Manage and Select a Report Logo section.

    Note: If you do not specify a logo, the default RSA logo is used.
13. Click **Schedule**.

    The scheduled report executes as scheduled and provides the configured outputs.

Delete a Scheduled Report

To delete a scheduled report from the Scheduled Reports List panel, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

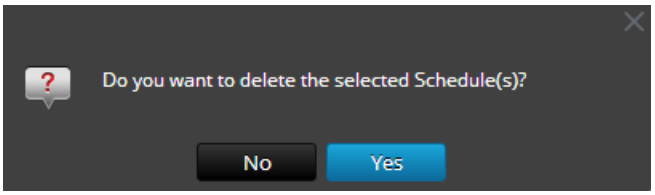
3. In the **Report** toolbar, click **View All Schedules**.

   View Scheduled Reports is displayed.

4. In the **Scheduled Reports List** panel, select the report.

5. Click  >**Delete Schedule**.

   A confirmation dialog is displayed.



6. Click **Yes** to delete the scheduled report.

   A confirmation message that the scheduled report is deleted successfully is displayed and the selected schedule is deleted from the Scheduled Reports List panel.

Export a Report

You can export the selected reports to an external file that can be later imported to another NetWitness Platform environment.

Prerequisites

Make sure that you have reports in the report group.

To export selected reports in the Report Groups panel to an external file, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

   In the **Report List** panel, do one of the following:

   - Select a report and click  > **Export**.
   - Click  > **Export**.

3. You can export multiple reports at a time. To select multiple reports, check the checkbox of the report to be exported. The exported file is saved to the local drive in an archived format.

Open CSV files with Unicode characters in MS Excel

To open downloaded CSV files containing Unicode characters in MS Excel, follow these steps:

1. Download and save the CSV file.
2. Open Microsoft Excel and navigate to the **Data** tab.

3. Click on **From Text** menu item; find the CSV file that you downloaded and click **Import**.
   The Text Import Wizard is displayed.
4. Select **Delimited** or **Fixed Width** data type from the **Original data type** radio button.
5. Click **File origin** drop down list and select **65001: Unicode (UTF-8)** and click **Next**.
6. Select the delimiter that was used in the file that you imported and click **Next**.
7. Select the data format for each column of data that you want to import and click **Finish**.
   The correct output is displayed in an MS Excel sheet.

Export a Report Group

You can export a selected report groups to an external file that can be later imported to another NetWitness Platform environment.

Prerequisites

Make sure that you have reports in the Report Group.

To export selected report groups in the Report Groups panel to an external file, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.
2. Click **Reports**.

   The Report view is displayed.
3. In the **Report Groups** panel, select a report group and click and select one of the following:

   - **Export** - This selection exports a report in a .zip file.
   - **Export as Text** - This selection exports all the content from the Reporting Engine in a .zip file which contains the data in text format.

   You can export multiple report groups at a time. To select multiple report groups, press and hold the CTRL button and select the report groups to be exported. The exported file is saved to the local drive.

Import a Report or Report Group

You can import a group containing subgroups and reports from other instances of NetWitness Platform into Report Groups panel. Reports must be in a valid binary file that was exported from another NetWitness Platform instance.
During the import process, you select the binary file and specify whether existing reports with the same name must be overwritten or not by the reports contained in the binary import file.

- If you choose to overwrite, all duplicate rules, lists and reports are overwritten by the contents of the binary import file.
- If you choose not to overwrite, and a duplicate rule, list or report exists in the target folder, the import fails and display a message about duplicate reports.

You cannot import reports to a specific report group. The imported files are stored in the **All**root folder.

Prerequisites

Make sure that you have the reports or report groups exported from other instances of NetWitness Platform.

To import groups containing subgroups and reports from other instances of NetWitness Platform into Report Groups panel, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report Groups** panel, select a folder to import the file.
4. Do one of the following:

   - In the **Report Groups** panel, click  > **Import** to import a group.
   - In the **Report** toolbar, click  > **Import** to import a report.
     The Import Report dialog is displayed. You can import multiple reports and report groups at a time. To select multiple reports or report groups, press and hold the CTRL button and select the reports or report groups to be imported.

5. Click **Browse** to select the binary file.

   NetWitness Platformprovides a file system view of the files.

6. Locate the binary file and click **Open**.

   The file gets added to the Import Report list.

7. (Optional) To overwrite any existing rule in the library with an identically named rule in the binary file when importing, check the **Rule** checkbox. If you do not select the Overwrite option, and an identical rule is encountered in the binary file, the binary file is imported and no error message is displayed.
8. (Optional) To overwrite any existing list in the library with an identically named list in the binary file, check the **List** checkbox. If you do not select the Overwrite option, and an identical list is encountered in the binary file, the binary file is imported and no error message is displayed.
9. (Optional) To overwrite any existing report in the library with an identically named report in the binary file when importing, check the **Report** checkbox. If you do not select the Overwrite option, and an identical report is encountered in the binary file, the binary file is imported and no error message is displayed.
10. Click **Import** to import the binary file.

Enable or Disable a Scheduled Report

To enable or disable a scheduled report from the Scheduled Reports List panel, perform the following:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, select a report and click  > **View Scheduled Reports**.
   View Scheduled Reports is displayed.
4. Select a report from the Scheduled Reports List panel.
5. Click  > **Enable**.
   The state of the report is changed to 'Running', if the report is scheduled to run immediately.
6. Click  > **Disable**.
   The state of the report is changed to 'Inactive'.

Start or Stop a Scheduled Report

To start or stop a scheduled report, perform the following:

1. Go to **MONITOR** > **Reports**.
   The Manage tab is displayed.
2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, select a report and click  > **View Scheduled Reports**.
   The View Scheduled Reports view is displayed.
4. Select a report from the Scheduled Reports List panel.
5. Click  > **Start**.
   The state of the report is changed to 'Running', if the report is scheduled to run immediately.
6. Click  > **Stop**.
   The state of the report is changed to 'Completed'.

View an Execution History of a Scheduled Report

You can view the execution history of a scheduled report. You can view the history of a scheduled report that is run. You can view the history based on the following criteria:

- Number of past schedules executed
- Start date and end date for the date range

You can view the details such as how many times the scheduled report was executed, the time of execution (seconds), execution state. You can also view the report generated on a full screen.

To view the execution history of a scheduled report, perform the following:

1. Go to **MONITOR** > **Reports**.
   The Manage tab is displayed.

2. Click **Reports**.
   The Report view is displayed.
3. In the **Report List** panel, do one of the following:
   - Click  > **View Scheduled Reports**.
   - Click the **#Schedules** column.
     The Schedule Reports view tab is displayed with the status of each of the scheduled report.
4. Do one of the following:
   - Select a scheduled report and click  > **Execution History**.
   - Select a scheduled report and click .
     The Execution History view is displayed.

   Note: By default, you can view 10 number of execution history of a scheduled report. The execution history shown depends on the Retain Report History Configuration set on the **General**tab of the **ADMIN > Services > Reporting Engine Config**view.
   For example, if you set the Retain Report History Configuration to 100 days, the data displayed on the Execution History view. is the past 100 days execution history details considering the current date information.
5. From the **Get history by:** field, select the type of history to be fetched. (For example, Past or Range (Specific))
6. In the **Count** field, enter the number of executions to be displayed.
7. Click **Show History**.
   The execution history of the scheduled report is displayed.

Manage and Select a Report Logo

Prerequisites

Make sure that you have the Reporting Engine service defined prior to managing a logo.

Manage Report Logos

To manage logos, perform the following:

1. Go to **ADMIN** > **Services**.
   The Services view is displayed.
2. In the **Services List** panel, select an Reporting Engine service and click **View** > **Config**.
   The services config view is displayed.
3. Select the **Manage Logos** tab.
   All the available logos are displayed.

Add a Logo

To add a logo, perform the following:

1. In the **Manage Logos** tab, click +.

   A file browser opens where you can choose the file from the local drive.

2. Select the logo and click **Select**.

   The selected logo gets added to the Manage Logos section.

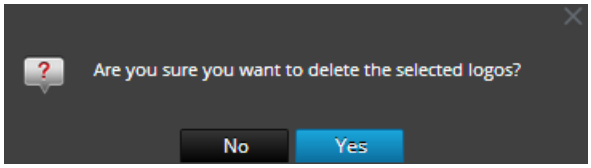
Delete a Logo

To delete a logo, perform the following:

1. In the **Manage Logos** tab, do one of the following:

   - Select the logo and click − .
   - Perform (Ctrl+click) to select multiple logos and click −.

   A confirmation dialog is displayed.



2. If you want to delete the logo, click **Yes**.

   The selected logo is deleted from the Manage Logos section.

Set Default Logo

To set a default logo, perform the following:

In the **Manage Logos** tab, select a logo and click Set default.
The chosen logo is set as the default logo for the RE service.

Select a Logo

To select a logo, perform the following:

1. Go to **ADMIN** > **Reports**.

   The Manage tab is displayed.

2. Click **Reports**.

   The Report view is displayed.

3. In the **Report List** panel, select a report.

4. Click > **View Scheduled Reports**.

   The View scheduled reports view tab is displayed.

5. Select a scheduled report and click > **Edit Schedule**.

   The Schedule a Report view tab is displayed.

6. In the Logo panel, click **Change Logo**.

The Change a Logo dialog box is displayed.

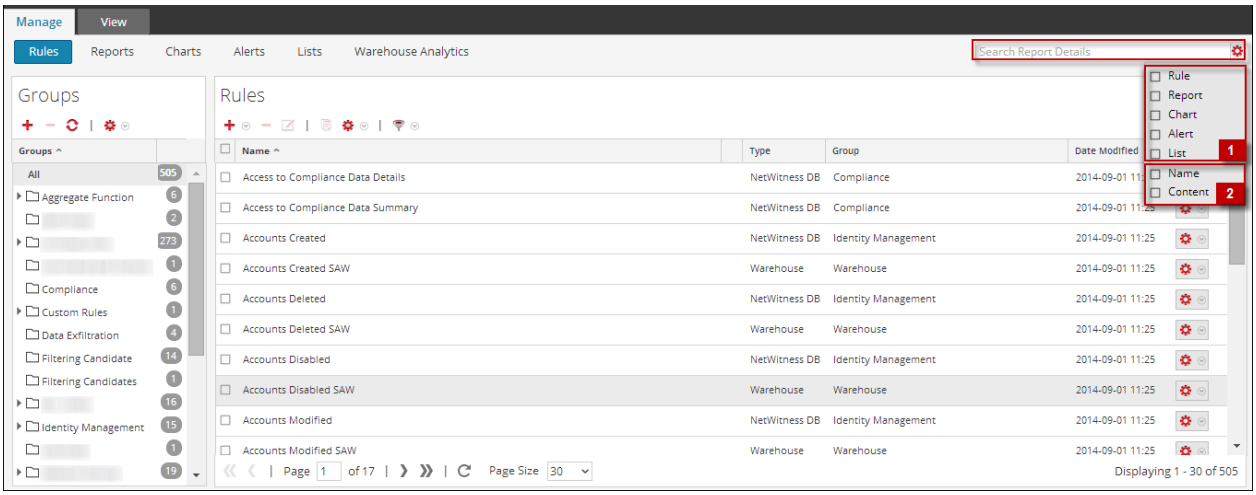
7. Do one of the following:
   - Click **Upload new logo** to upload another logo.
   - Select a logo from the list.
8. Click **Select**.
   The selected logo is available on the Logo panel.

Search Reporting Details

This section provides instructions on how to perform a keyword search on name and content for each of the Reporting components. You can perform a keyword search on name and content for each of the Reporting components (Rule/Report/Chart/Alert/List) on the Reporting UI.

Note: You cannot search based on date and numeric values.

The following figure shows the search parameters available in the Reporting Module:



The following are the search parameters available on the Reporting UI:

1. Search for entities (rule, report, chart, alert, list).
2. Search for the entities based on either the name or content.

Note: Searches are case insensitive. For example, Completed is equivalent to completed.

Prerequisites

In the Reporting Module, you can perform a keyword search based on the name and content (definition). In this context, content implies definition of each of the reporting components. For instance, the value defined in the rule, report, report schedule, chart, and alert panel. You can also prioritize your search by selecting either or all of the components: Rule, Report, Chart, Alert, or List.

Note: You cannot search based on the List values and list path stored in schedule definition panel.

For example, to search for the rule name (ExpertRule), you must select **Rule, Name, and Content** in the **filtering options** drop-down to view all the rule names that matched the search. You can similarly search for a report, chart, alert, or list definition.

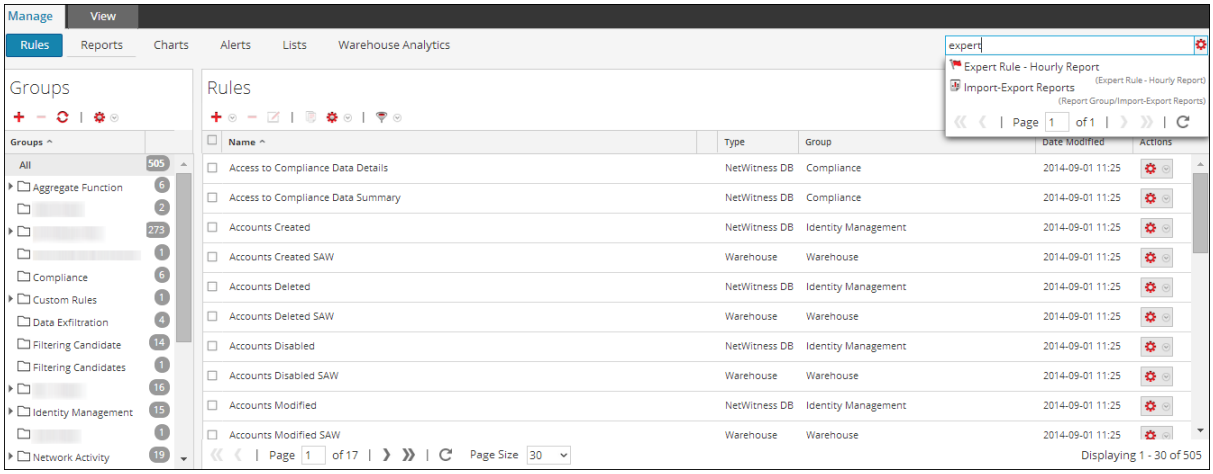
To search for reporting details from the Manage tab, perform the following:

1. Go to **MONITOR** > **Reports**.

   The **Manage** tab is displayed.

2. Click  and select the appropriate criteria to search.
3. In the **Search** field, enter the text to be searched.

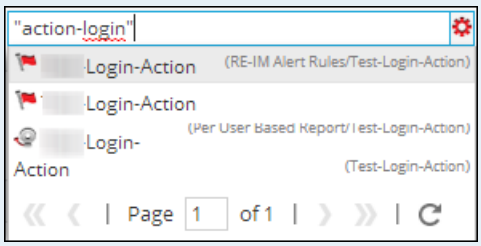
   The search drop-down list is displayed:



Search Syntax and Different Types of Search

The following table explains the search syntax and the possible searches that can be performed on the Reporting UI.

Search Types	Description
Word or phrase based search	**Word Based Search:** To search for a word such as "action" or "meta", you must enter the word in the search box. The following figure shows the search results for the text **action**.  **Phrase based search:** A Phrase is a group of words surrounded by double quotes such as "action meta". To search for a phrase, you must enclose phrases in double-quotes in the search box. The following figure shows the search results for the phrase "action meta". 
Search Types	Description

Wildcard Search (Single/ Multiple/ Special Character Search)
 	
The question mark "**?**" symbol is used to perform a single character wild card search and asterisk "*" symbol is used to perform multiple character wildcard search.
	Single character search:
	The single character wildcard search looks for terms that match with the single character replaced. For example, to search for "Expert" or "Export" you can use the search syntax:
	`Exp?rt`
	The following figure shows the search results for the wildcard character **Exp?rt**.
	 	Multiple character search:
	Multiple character wildcard search looks for 0 or more characters. For example, to search for Expert, or Experts, you can use the search syntax:
	`Expert*`
	The following figure shows the search results for the wildcard multiple character **Expert***.
	 	Special character search:
	Certain punctuation and special characters are ignored during search (@#$%^&*(){}"~=+-[]\?|!:,.). For example, a search for action-login will be interpreted during search as "action" "login", that is, if rules exist with name "action-login" and "action@login" and search string is "action-login", the search result will return both the rules.
	 


Search Types	Description
Search based on name or content	**Search based on name:** When you want to search based on the name of a report, select **Report**and **Name**box from the filtering options drop-down. For example, to search for the report name "Report With Multiple Rules", you can use the search syntax: "Access to Compliance Data" **Note:** When you search for a report, it implies you can search for the report schedules as well. The search result will return the report containing the specific name.  **Search based on content:** When you want to search for the content within an alert, say alert description, select **Alert** and **Content** box from the filtering options drop-down. For example, to search for the alert description "Device IP Got Detected", you can use the search syntax: "Device IP Got Detected"  The search will return the result having the specific content. 
Troubleshooting

This section provides troubleshooting instructions for issues faced when using the Reporting module in NetWitness Platform.

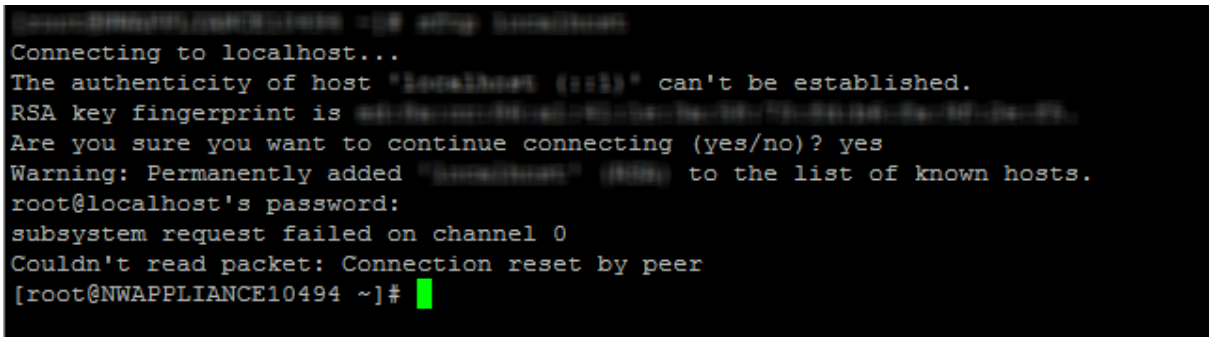
Configuring SFTP Server Issue

Procedure

Try the following steps if you face any issues while configuring the Linux SFTP server:

1. If the Report Output Action for the configured SFTP fails, you must SSH to the SFTP server and try to connect locally to check if SFTP is working fine.

   Connect to SFTP server:

2. If the Local connection fails, open the file **sshd_config> vi /etc/ssh/sshd_config.**
3. Check for the entry in the file:

   ```
   # override default of no subsystems
   Subsystem sftp /usr/libexec/openssh/sftp-server
   ```

4. If this entry does not exist, add the two lines mentioned in Step 3 at the bottom of the file and **Save** it.
5. Restart service from **SSH > service sshd restart**.
6. Retry the SFTP connection now.
7. Make sure SFTP port is not blocked by SA server appliance firewall. Update iptables rules to allow sftp port.

Meta Values in Investigation Link Issue

Issue	When the device information on the datasource is changed, the Investigation link for the meta values of the executed reports is not displayed on the NWDB results page.
Resolution	Remove and re-add the datasource to Reporting Engine. *Note: This workaround is not applicable for reports that are already generated.*

Internet Explorer 10 Browser Issue

Issue	When you click the Test Rule multiple times in quick succession, results with large input data may not displayed in Internet Explorer 10.
Resolution	If this issue occurs, try one of the following steps: • Close the Test Rule window on Internet Explorer 10 and run the test again. • Use other browsers like Chrome or Mozilla Firefox to test the rule execution.

Dynamic List Editing Issue

Issue	A dynamic list cannot be added from the Edit option on the 'View All Schedules' page to an existing schedule.
Resolution	1. Reports > Select the report > 2. Click the #Schedules for the specific report 3. Select the schedule to be modified from the Report Schedule page 4. Edit the schedule

Deployment Failure Issue

Issue	Deployment of reports fail, if the dependencies of certain compliance reports in Live are not deployed prior to the reports.
Resolution	Retry the deployment. If the problem persists, try to deploy the rule or list dependencies first and then deploy the reports.

Respond Server Issue

Issue	When the Forward Alerts to Respond option is enabled and RabbitMQ connections to the Respond Server are blocked, some of the Reporting Engine threads may be blocked.
Resolution	Disable the Forward Alerts to Respond option until the RabbitMQ broker in the NetWitness Platform server at the Respond has begun and accepts the connections.

Post-Upgrade Issue

Issue	Post-upgrade from 10.6.x to 11.2, Categories meta for incident collection is not supported.
Resolution	When using the Categories meta for incident collection, the results rendered are in an

	incorrect format. Hence this meta is not supported and you cannot use the categories meta in either select clause or where clause. Also, it is not available in the list of metas for selection in the Rule Builder page.

Appendix

This section provides detailed information about the supported aggregate functions, rule syntax, advanced rules query syntax in Reporting and task scheduler for Warehouse Reporting.

Rule Syntax

This section describes the different rule syntax supported in the Reporting Engine.

NWDB Rule Syntax

The NWDB rule is one of the rule syntax supported in the Reporting Engine. To enhance the execution time of your reporting entities, see "Reporting Guidelines" section in Reporting Overview.

A Rule is a function that manipulates the result set of a rule in order to make the output in a report more meaningful or add additional functionality to a rule other than querying data and displaying it. Any combination of these rule actions can be used to create unique and interesting representations of the information collected by NetWitness Platform.

The Reporting Engine supports the following categories of NWDB data source rule syntax:

- **select** clause
  - Non-Aggregate Rule
  - Aggregate Rule
- **alias**
- **where** clause
- **where** clause Operators
- **then** clause
- **Limit** field
- Rule Actions
- Rule Operators

Select Clause

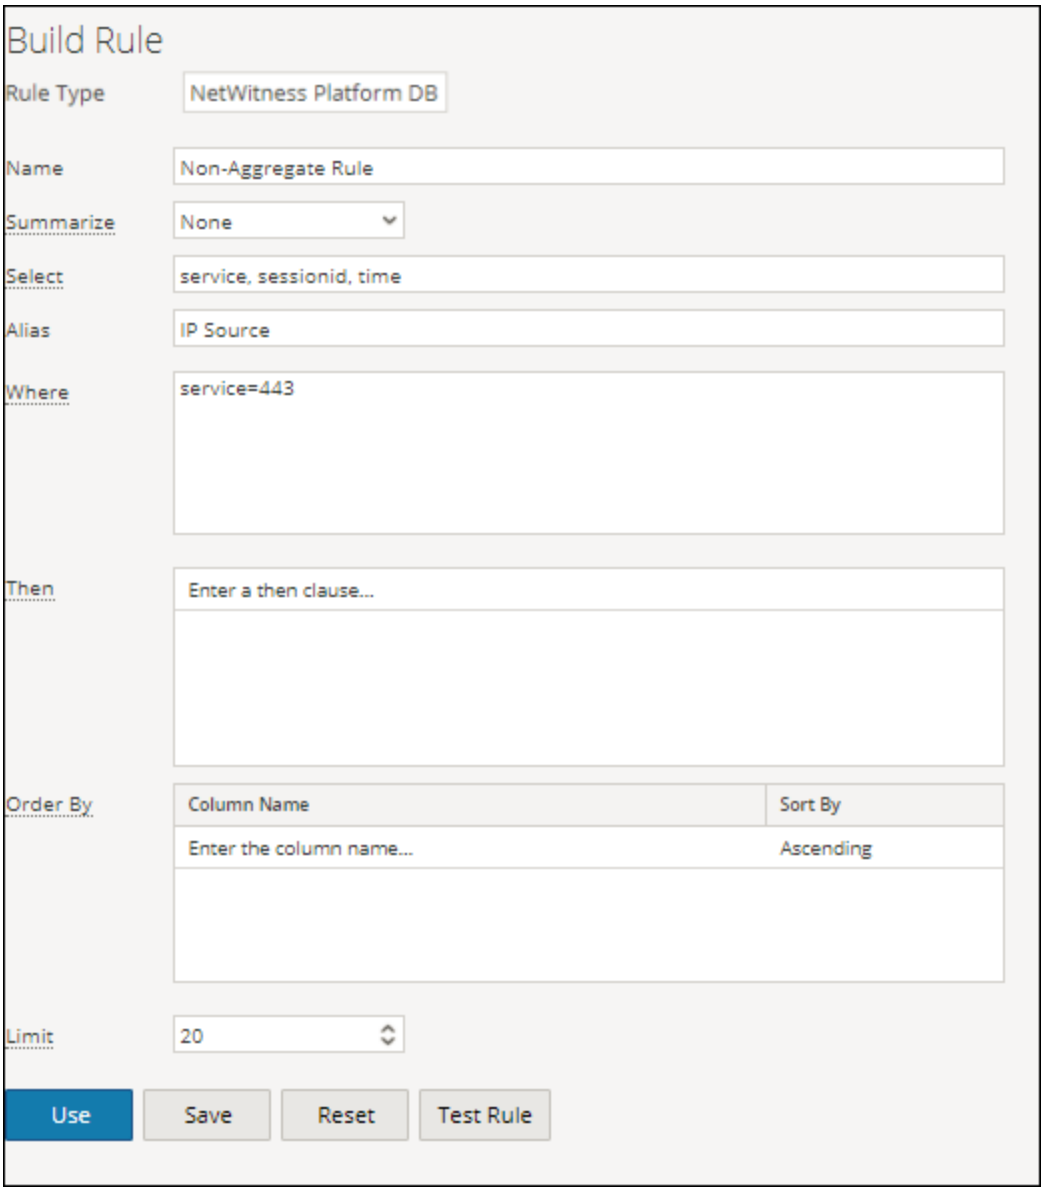
The select clause is a comma separated list of values. For example: select sessionid,time,service.

There are two types of select clause for NWDB Rule:

- Non-aggregate rule
- Aggregate rule

Non-Aggregate Rule

When you want to define a rule without any grouping, choose 'None' in the Summarize field. In a non-aggregate rule, you can select any number of metas in the *Select* clause. For example, select service, sessionid, time.

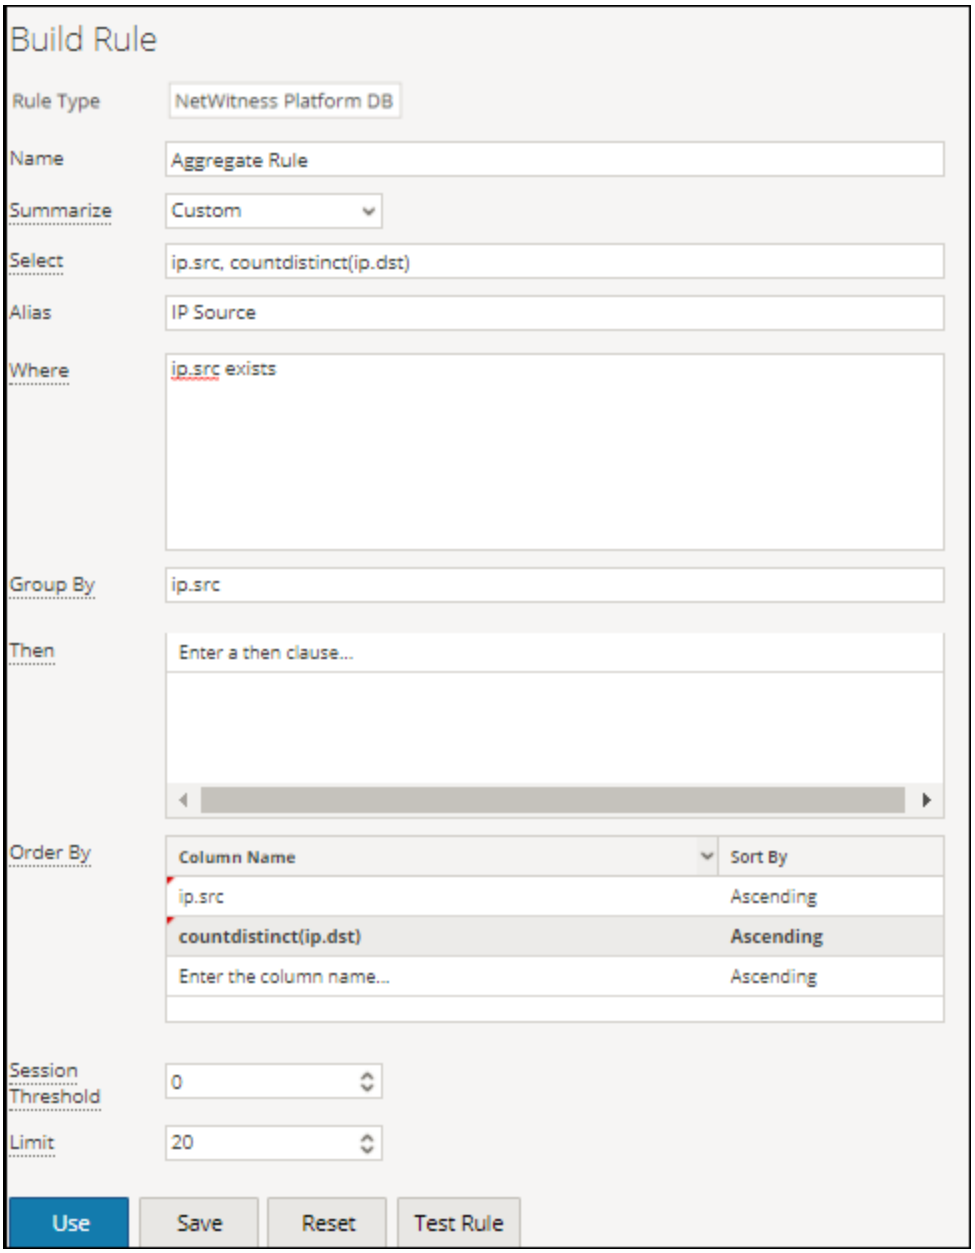


Aggregate Rule

When you want to query for a specific meta and its associated aggregate value then you must use the Aggregate rule. To get an aggregate, you must choose either of the three metas (Event Count, Packet Count, Session Size) or choose 'Custom' in the **Summarize** field to include an aggregate function in the *Select* clause. For example, select ip.src, sum (ip.dst). When Custom aggregate rule is enabled, the following fields are populated in the user interface:

- Group By
- Order By
- Session Threshold

The following figure shows the Build Rule view for Aggregate Rule.



There are two types of aggregate values that can be queried:

- Collection aggregation
- Meta aggregation

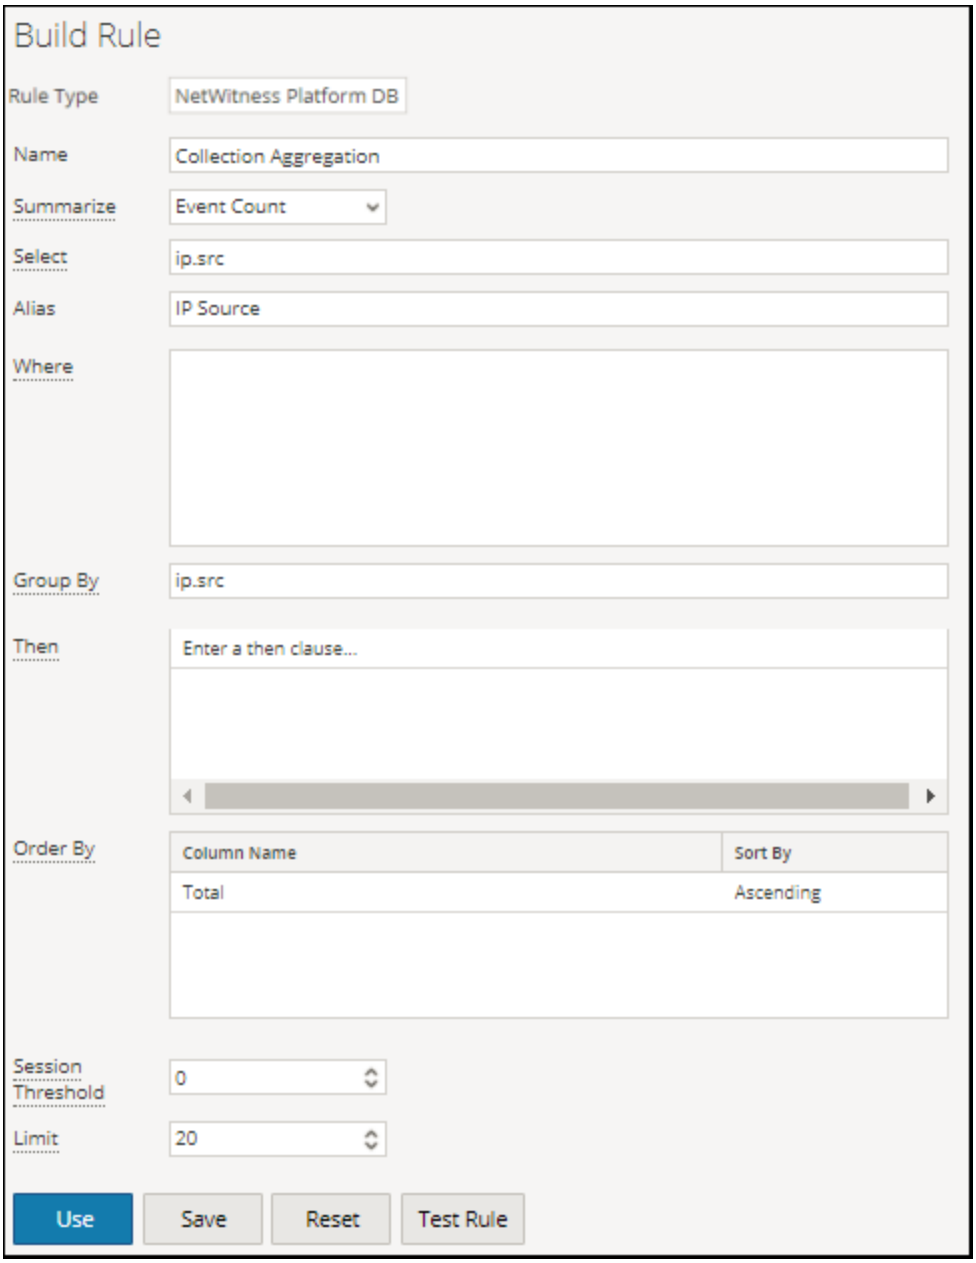
Collection Aggregation

With collection aggregation, you can get aggregates related to Event, Session or Packets. The following values can be queried in a collection aggregation:

- **Event Count**: The total count of events.
- **Packet Count**: The total count of packets.

- **Session Size**: The total session size.

These options are listed in 'Summarize' field and any one of them can be selected in a rule.
For example, choose any of the Collection aggregates (Event Count or Packet Count or Session Size) in the 'Summarize' field and select ip.src.



Meta aggregation

With meta aggregation, you can get aggregates of meta values. The following are the supported meta aggregate functions:

- sum(meta)
- count(meta)
- countdistinct(meta)
- min(meta)
- max(meta)
- avg(meta)
- first(meta)
- last(meta)
- len(meta)
- distinct(meta)

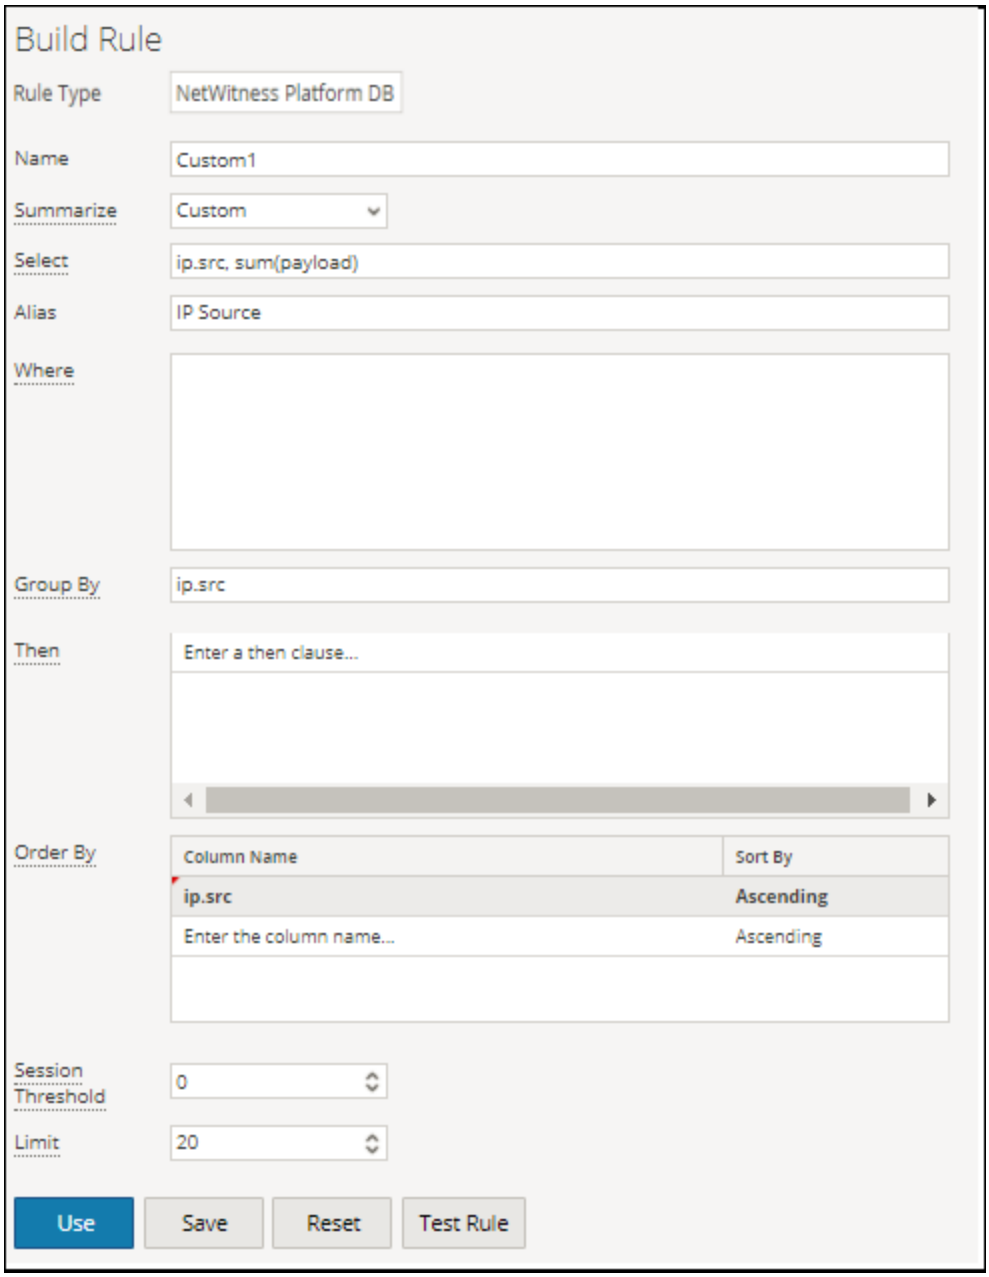
Supported Meta Aggregate Functions

The NWDB service supports the following meta aggregate functions and syntax in this release.

Syntax	Function
sum (<meta>)	The sum of all meta values. For example, if you provide the field sum(payload) in the select clause, the resultset is the sum of payload size. **Note:** The meta field chosen for the sum aggregate function must be of numeric data type.
count (<meta>)	The total number of meta fields that would be returned. For example, if you provide the field count(ip.dst) in the select clause, the resultset is the number of times an ip.dst value is returned.
countdistinct (<meta>)	The total number of distinct meta fields that would be returned. For example, if you provide the field countdistinct(ip.dst) in the select clause, the resultset is the number of times a distinct ip.dst value is returned.
min (<meta>)	The minimum of all meta values. For example, if you provide the field min(payload) in the select clause, the resultset is the min of payload size.
max (<meta>)	The maximum of all meta values. For example, if you provide the field max(payload) in the select clause, the resultset is the max of payload size.

Syntax	Function
avg (<meta>)	The average of all meta values. For example, if you provide the field avg(payload) in the select clause, the resultset is the avg of payload size. **Note:** The meta field chosen for the avg aggregate function must be of numeric data type.
first (<meta>)	The first occurrence of the meta value. For example, if you provide the field first(ip.src) in the select clause, the resultset is the first occurrence of ip.src for that group.
last (<meta>)	The last occurrence of the meta value. For example, if you provide the field last(ip.src) in the select clause, the resultset is the last occurrence of ip.src for that group.
len(<meta>)	Converts all field values to a UInt32 length instead of returning the actual value. This length is the number of bytes to store the actual value, not the length of the structure stored in the meta database. For instance, the meta value "NetWitness" returns a length of 10. All IPv4 fields, like ip.src, returns 4 bytes.
distinct (<meta>)	The distinct values of the meta. For example, if you provide the field distinct(ip.src) in the select clause, the resultset is all the distinct ip.src for that group.

You must select 'Custom' in 'Summarize' field and provide the meta and the meta aggregate functions in the select clause.



Note: Meta aggregate functions cannot be used in a WHERE clause and the rule actions like min_threshold/max_threshold can be used to filter aggregate functions. It is advised to use a more refined WHERE clause to get a better rule performance while using 'group by'.

Aggregate Query for Multiple Meta

To execute aggregate query for multiple Meta, follow these steps:

1. Go to **MONITOR** > **Reports**.

   The Manage tab is highlighted and the **Rules** view is displayed.

2. In the Rule toolbar, click + > **NetWitnessDB**.

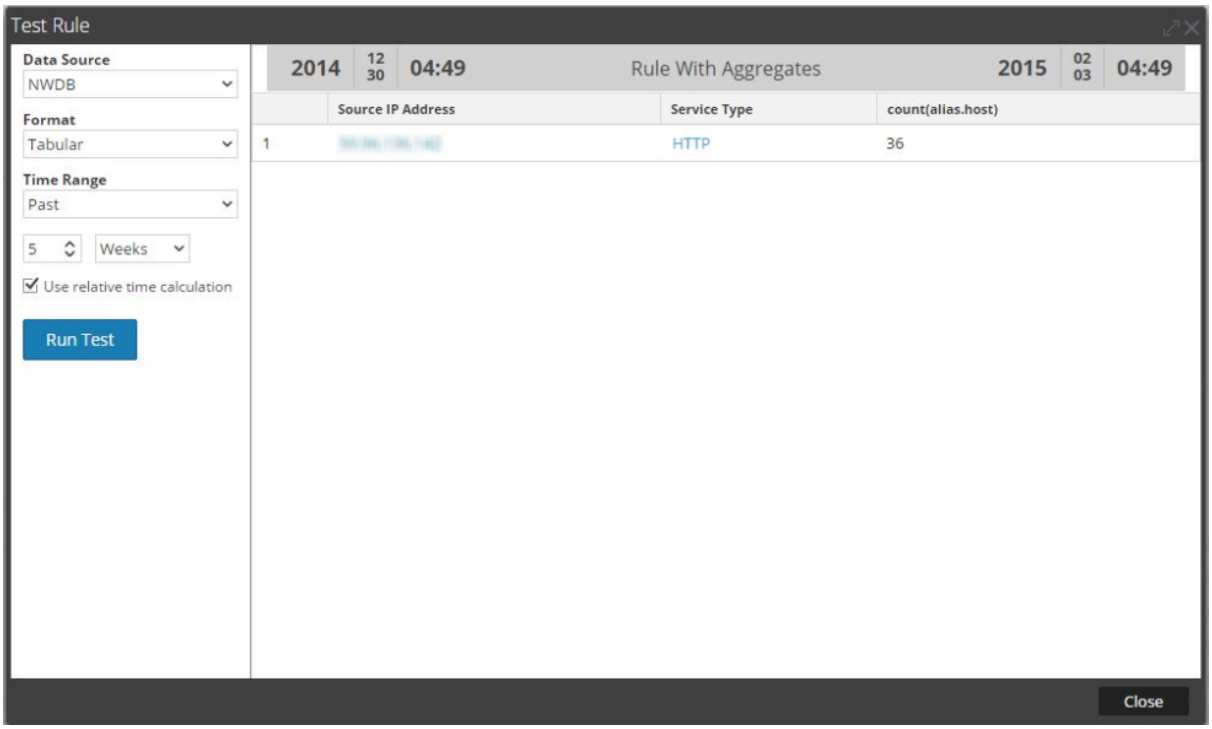
   For example, enter the following meta in the fields highlighted below:

   SELECT: ip.src, service, count(alias.host)
   ALIAS: Source IP Address, Service Type, count(alias.host)
   WHERE: ip.src = 59.96.136.142

   Note: In the alias field you can enter a name for columns used in the select clause. If you do not specify the alias for one of the field in the select clause, then the default description will be used. For example, if the select clause has Field1, Field2, Field3, Field4, and alias has only Field1, Field3, Field4, then for Field2 a default description is used.

3. Click the **Test Rule** button at the bottom of the screen.

   The Test Rule page is displayed.



Summarize

Summarize determines the type of summarization or aggregation for the rule.

Name	Config Value
Summarize	To query metas without any custom grouping, select: • **None**: The data is grouped by session in this case. To get collection (sessions/events/packets) related aggregates, select either of the following: • **EventCount**: The total count of events. • **Packet Count**: The total count of packets. • **Session size**: The total session size. To get meta based aggregates, select: • **Custom**: This indicates that expected meta aggregate function is defined in rule select clause.

Order By

Order By determines how to sort the result set.

Name	Configuration Value
Column Name	The **Column Name** is the name of the columns by which you want to sort the results. By default, the value is empty. When you click on a column, the value gets populated based on the Summarize field. • For 'None' and 'Custom', the value gets populated based on the entries made in the Select field. You can select from this list or add custom name. • For Event Count, Packet Count and Session size, accepted values are Total and Value. • Total - sort by aggregate value • Value - sort by group by meta
Sort By	**Sort By** determines the order in which you want to sort the results. The following are the values: • Ascending Order • Descending Order

Session Threshold

The session threshold is the optimization setting to stop scanning the matching sessions for each possible unique value for the selected meta. The threshold is an integer between 0 (default) and 2147483647. The threshold 0 scans for all matching sessions.

Note: If you provide a non-zero value (a value higher than zero), the aggregate results are inaccurate. This can be used only when you are interested in unique values and not aggregate values.

Supported where Clause

Syntax	Description
where <field1> [<field-operator>] < value1>,<value2>,<value3-value4> <logic-operator> <field2>,and so on	The where clause is a comma separated list of language field values and ranges that is used by NwValues function. In the where clause, string values have to be enclosed within single quotes. For example, where username = 'admin' && service = 22.
where <field1> [<field-operator>] <List1>	You can use a list in the where clause if you have multiple values to report on. For example, where ip.src exists && alias.host exists && alias.host contains $[User Reports/List of Alias Host]. When you use the list you must specify in the format $[<path>/<List name>].

In the where clause, make sure the syntax is correct based on the meta type.
For example,
For all text meta type use quotes for example, username = ‘user1’.
For all IP Addresses, Ethernet Addresses, and Numeric meta types do not use quotes for example, service = 80 && ip.src = 192.168.1.1.
For date and time meta types, if the date and time format is 'YYYY-MM-DD HH:MM:SS‘, use quotes.
If the date and time format is 1448034064 (number of seconds since EPOCH (Jan 1, 1970)), do no use quotes.

Note: If list is used in the rule, make sure that the list values are quoted or unquoted based on the type of the meta used. Checking the **Quotes will be inserted for all the values** checkbox in list definition page (for more information see, "Create Lists or List Groups" section in Configure a Rule) would quote all the list values.

Supported where Clause Operators

Syntax	Description
=	Returns results where the field is equal to any provided value. For example, tcp.dstport = 21-25,110 returns session with TCP destination ports of 21, 22, 23, 24, 25, or 110.
!=	Returns results for fields that do not match the values specified. For example, eth.type !=0x0800 returns sessions outside of hex value (decimal value of 2048) that is all non-IP based protocols.
begins	Checks for a value at the beginning of a text or binary field.
contains	Searches a text or binary value for a partial match.
ends	Checks for a value at the end of a text or binary field.
exists	If the field value exists, regardless of value, the operation evaluates to true.
!exists	If the field value does not exist, the operation evaluates to true.
length	Evaluates the length of the field. For example, username length 20-u returns any username that is 20 or more characters long.

Syntax	Description
regex	Performs a regular expression search against text or binary values.
not	Not operator is used to negate a clause or condition. For example, (not(user.dst ends "$")) will not display values for user destination.

Supported then Clause

Syntax	Description
then <rule action>	The then clause contains a rule action that manipulates the original result set of a rule in order to make the output in a report more concrete or add additional functionality other than querying data and displaying it. For example, dedup (filename).

Limit field

This indicates the limit to be put on the query while fetching data from the database. If a result set is sorted by event
count, packet count, or session size, the limit represents the top (or bottom) N values to be returned. If the result set is not
sorted, the first N values are returned.

Rule Actions

The NWDB data source rule syntax supports the following rule actions:

- dedup
- filter_on
- filter_out
- lookup_and_add
- max_threshold
- min_threshold
- regex
- sum_count
- sum_values
- show_whats_new

dedup (string field)

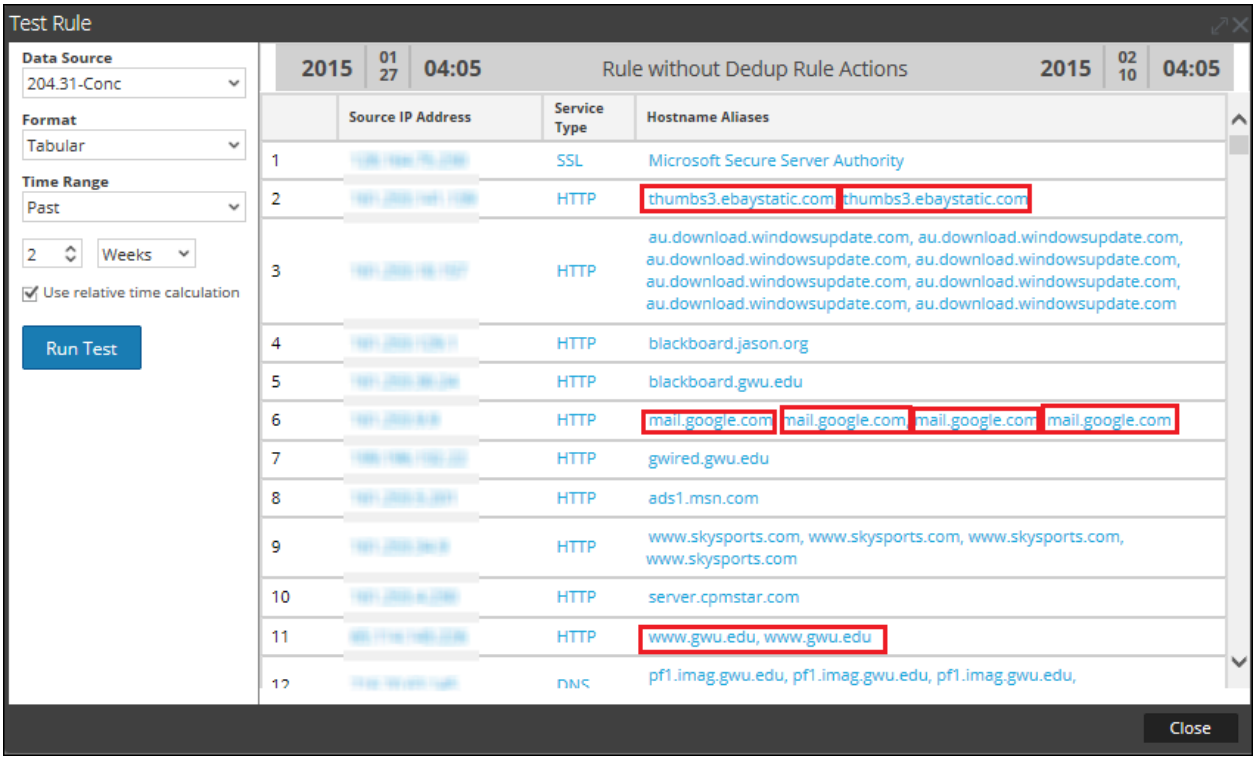
dedup removes the duplicate entries in an unsorted result set and displays only pertinent data.
The dedup rule action removes duplicate entries of a specific field in the report, so that only the first occurrence of that value is listed in the report.

Note: The dedup rule action cannot be used with an aggregate rule.

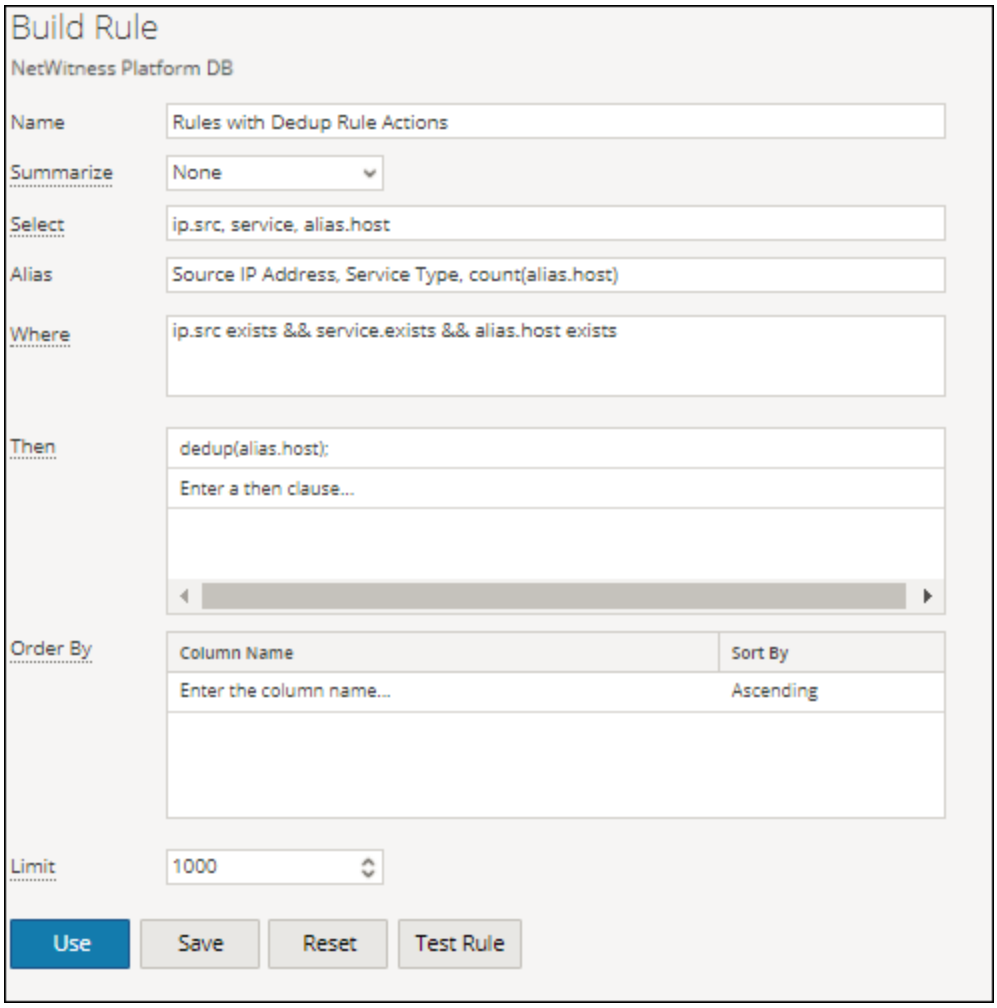
For example, the meta data generated by an individual session is often repetitive, especially when you have sessions with a lot of DNS lookups or web sessions that access the same host multiple times for various resources (such as, javascript, css). To remove the duplicate entries of the host, you can use the dedup rule action.

Example:

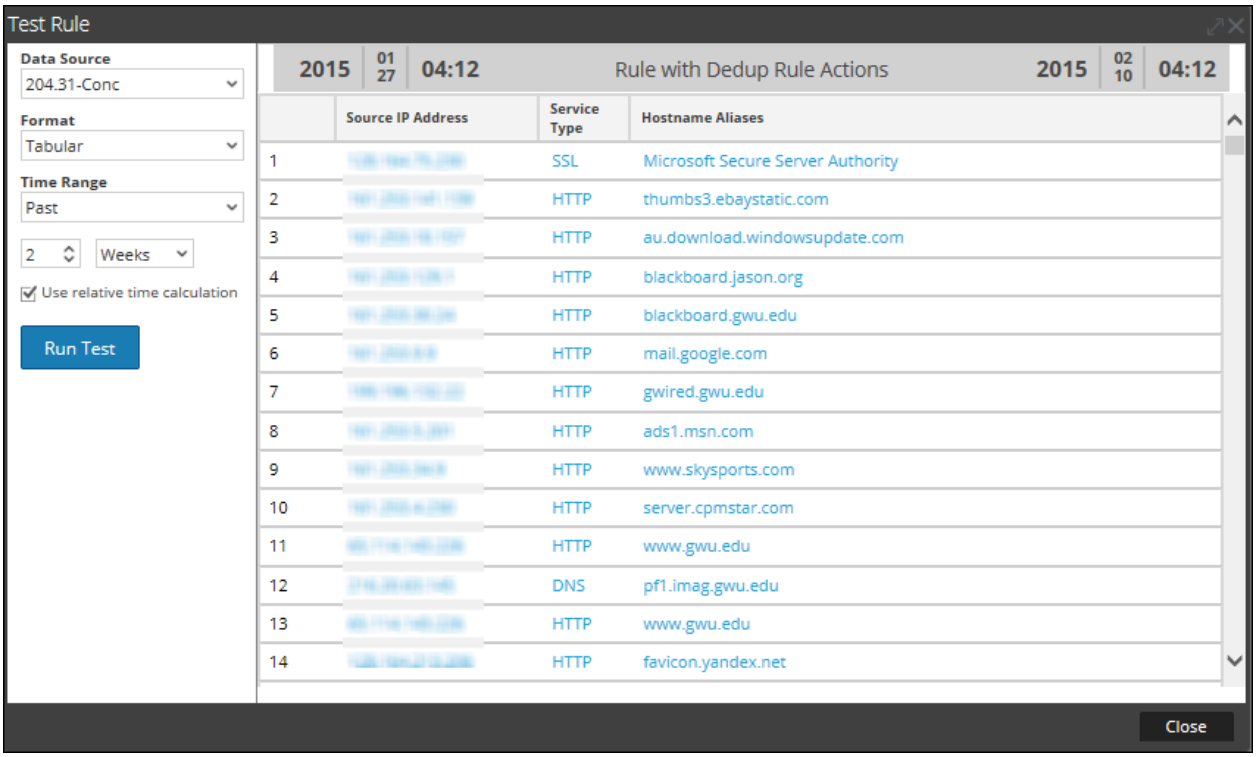
The following example is a lengthy result set that can be trimmed by removing the duplicate values in the same session.



The following figure shows the use of dedup rule action to remove the duplicate entries from the result set.



The duplicate value for each entry in the rule result set is reduced to one value.



filter_on (string filter, string field, bool matchExact)

`filter_on` removes values that do not contain the `filter` criteria from the result set. If the result set contains multiple fields, you must select a specific field to which the filter is applied. To add additional results to a single result set, include function such as lookup_and_add.

The matchExact parameter determines if the match is an exact match or contains a match.

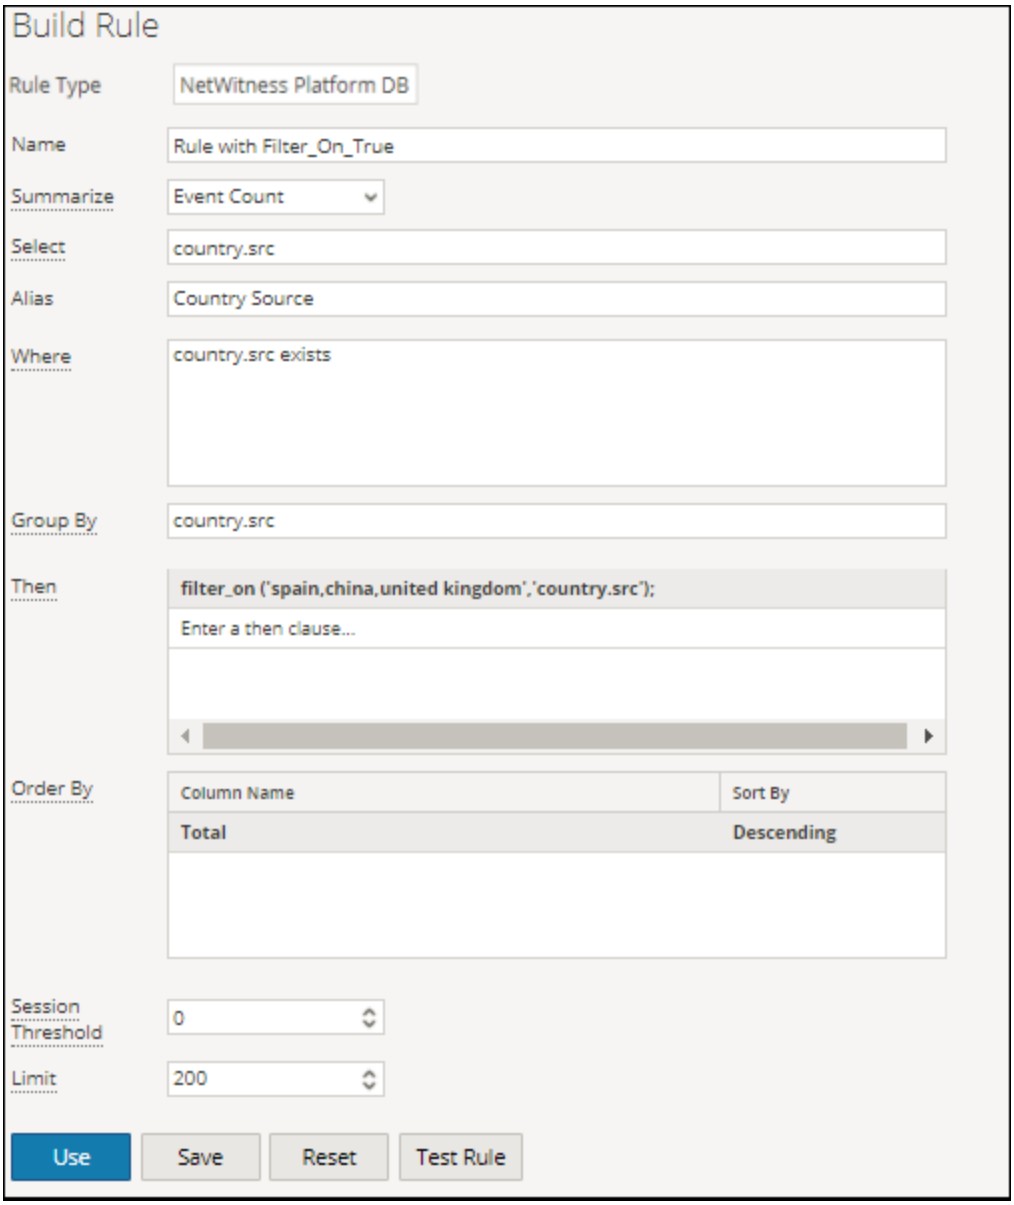
- If matchExact is set to `false`, any value that contains the filter text is considered a match.
- If matchExact is set to `true`, only values that match the provided filter text is included in the result set.

Note: Unless the matchExact parameter is specified, the default behavior of the rule action is to match exactly the text specified in the filter parameter. To specify that results containing the filter text must be kept in the result set, users must set the matchExact parameter to false.

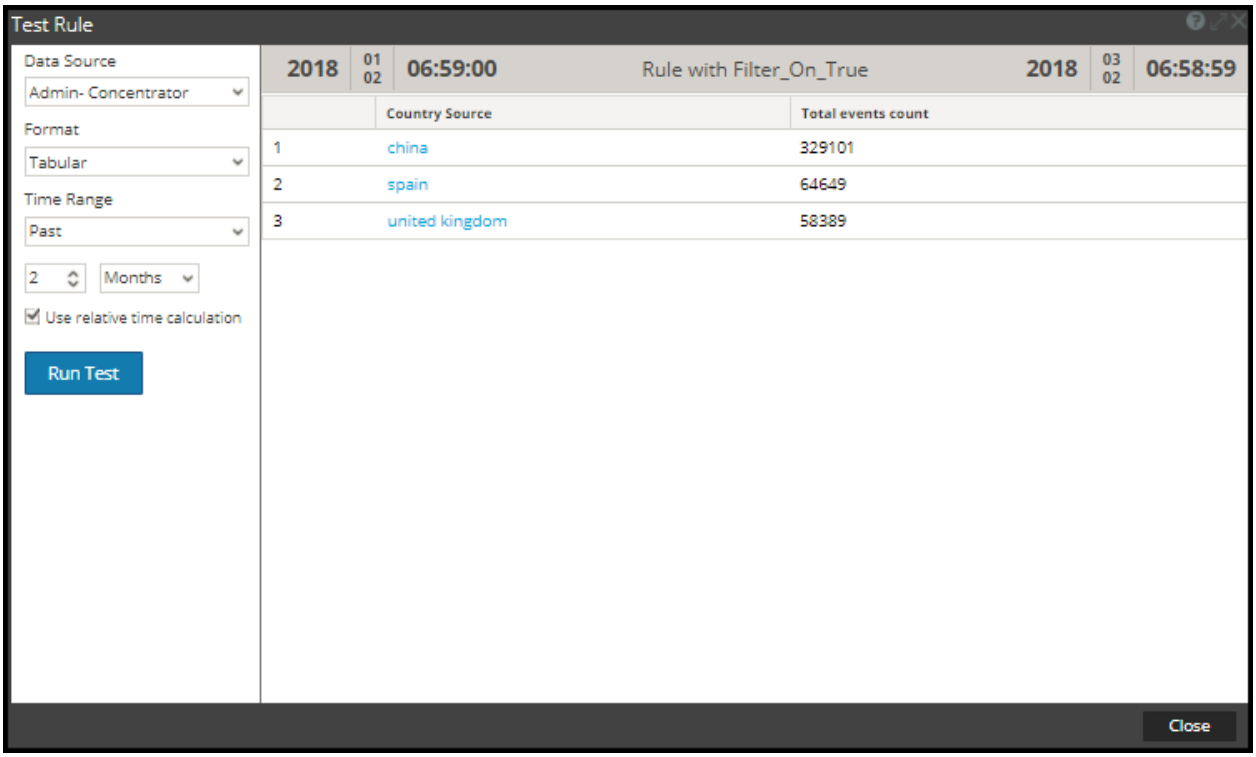
Example:

The following figure displays the list of countries and their event count.

The following figure shows a filter_on rule action to filter out countries except Spain, China, United States and United Kingdom from the result set.



The following figure shows the output with the filter_on rule action.



Another way of filtering out the entries from the result set is to create a list of variables which you want to filter out. For example, you can create a list with United Kingdom, France and Germany as values in the list. You can use this list in the rule action to get the same result set. For example, if you create a list called COUNTRY_LIST, you can use the list as follows:

```
filter_on ('$COUNTRY_LIST', 'country.src', 'false');
```

```
filter_out (string filter, string field)
```

```
filter_out (string filter, string field, bool matchExact)
```

filter_out removes the values that contain the *filter* criteria from the result set. If the result set contains multiple fields, you must select a specific field to which the filter is applied (for example, you can use a lookup_and_add to add results to a single result set).

The matchExact parameter determines if the match is an exact match or contains a match.

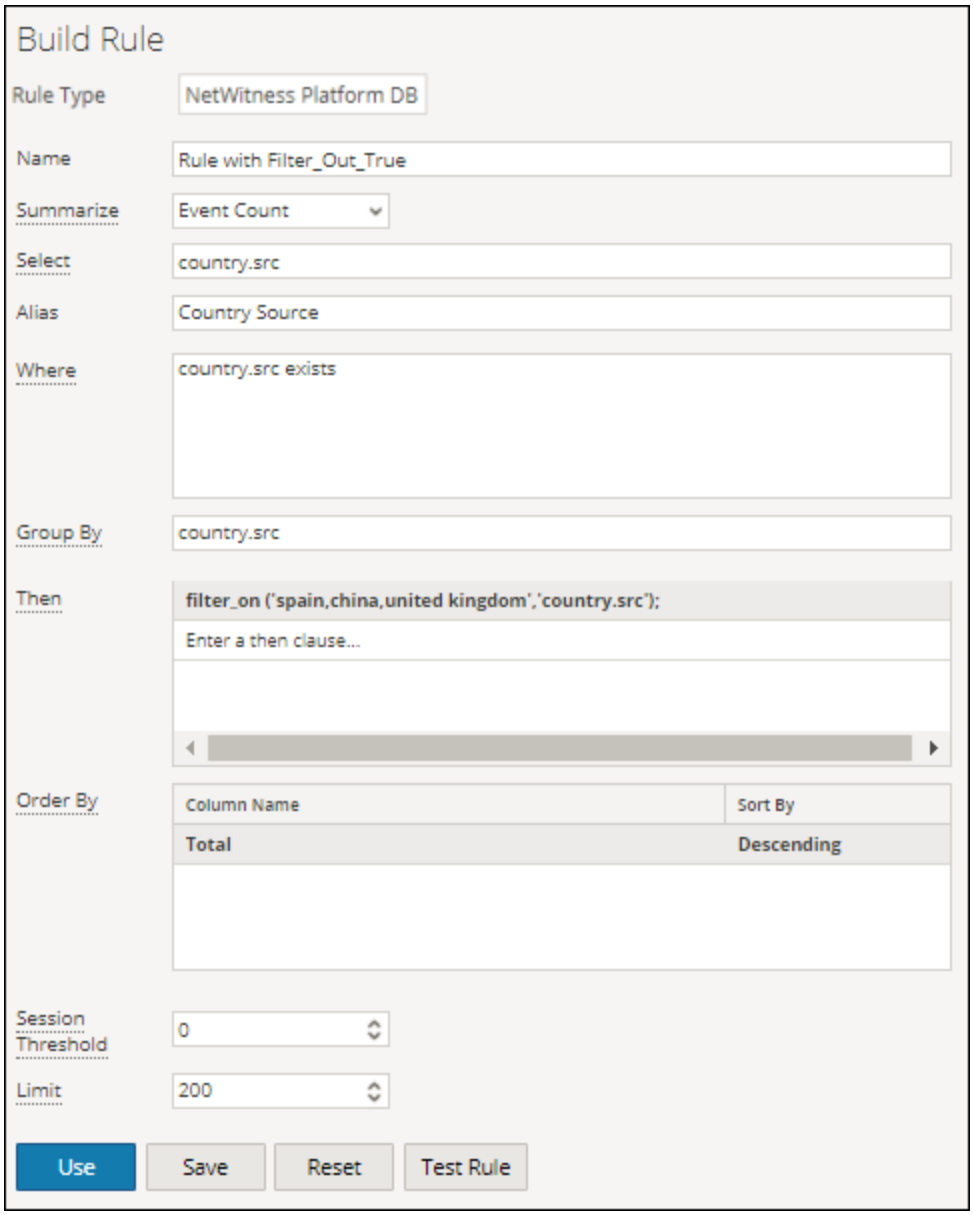
- If matchExact is set to false, any value that contains the filter text is considered a match.
- If matchExact is set to true, only values that match the provided filter text is excluded from the result set.

Note: Unless the `matchExact` parameter is specified, the default behavior of the rule action is to match exactly the text specified in the filter parameter. To specify that results containing the filter text must be removed from the result set, users must set the `matchExact` parameter to false.

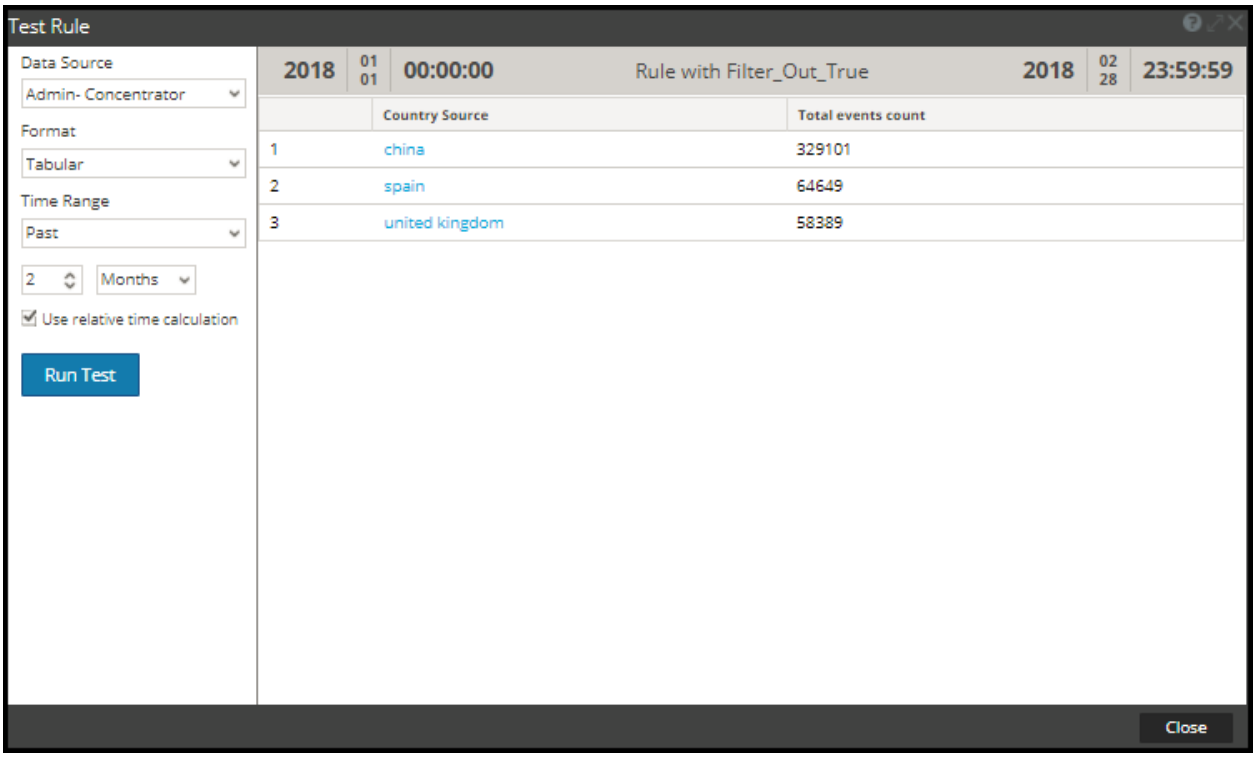
Example:

The following figure displays the list of countries and their event count.

The following figure shows the filter_out rule action to remove the event count for Spain, China, United States and United Kingdom from the result set.



The following figure shows the output with the filter_out rule action.



```
lookup_and_add (string select, string field)
lookup_and_add (string select, string field, int limit)
lookup_and_add (string select, string field, int limit, boolean inherit)
lookup_and_add (string select, string field, int limit, boolean inherit, string extraWhere)
lookup_and_add(string select, string field, int limit, boolean inherit, string extraWhere, boolean aggregate)
```

This rule action iterates through a list of values in a result set and lookup additional meta data to further describe the relationships between various elements in a result set.

Note: The lookup_and_add rule action can be used only with an aggregate rule.

The first parameter, select, designates the type of meta data that must be added to elements of the result set. The second parameter, field, specifies where in the result set the append must apply to. Also, a limit can be applied to avoid crowding the result set with a large result set.

By default, subsequent queries to the SDK will inherit the where clause of the parent rule. To use a unique where clause, you can specify a boolean value in the fourth parameter as false and in the fifth parameter you can specify a different where clause.

Note: If you are using a unique where clause in your query, make sure that you use a single quote (') for enclosing arguments and double quotes (") for string values.

Now, with the addition of **Custom** summarization and **Group By** feature, the result can be achieved even without having lookup_and_add rule action. The new rule syntax with groupby displays the result in a flat structure which is better than the earlier rule syntax without groupby Hence it is recommended to manually edit/update rules with lookup_and_add rule action and use groupby clause wherever it is applicable.

Note: Lookup_And_Add rule action is supported only if the SELECT clause has one meta and aggregate function.

For example, see below scenarios: In Example **2a**, lookup_and_add rule action is used. Instead of using lookup_and_add rule action, the same result can be achieved by using **Custom** summarization and **Group By** feature. See Example **2b** below.

But, lookup_and_add rule action is still supported for NWDB rules on the following conditions:

- All versions of NWDB rules with Summarization as Event Count, Packet Count, or Session Size.
- For Custom summarization, the lookup_and_add rule must have only one group by meta with only one aggregate function where the aggregate function must be either sum() or count().

Note: It is not supported for “Summarize-None”.

For example, lookup_and_add rule action can be used for the following rules:

- select ip.src, sum(size) group by ip.src
- select ip.src, count(filename) group by ip.src

It cannot be used for the following rules:

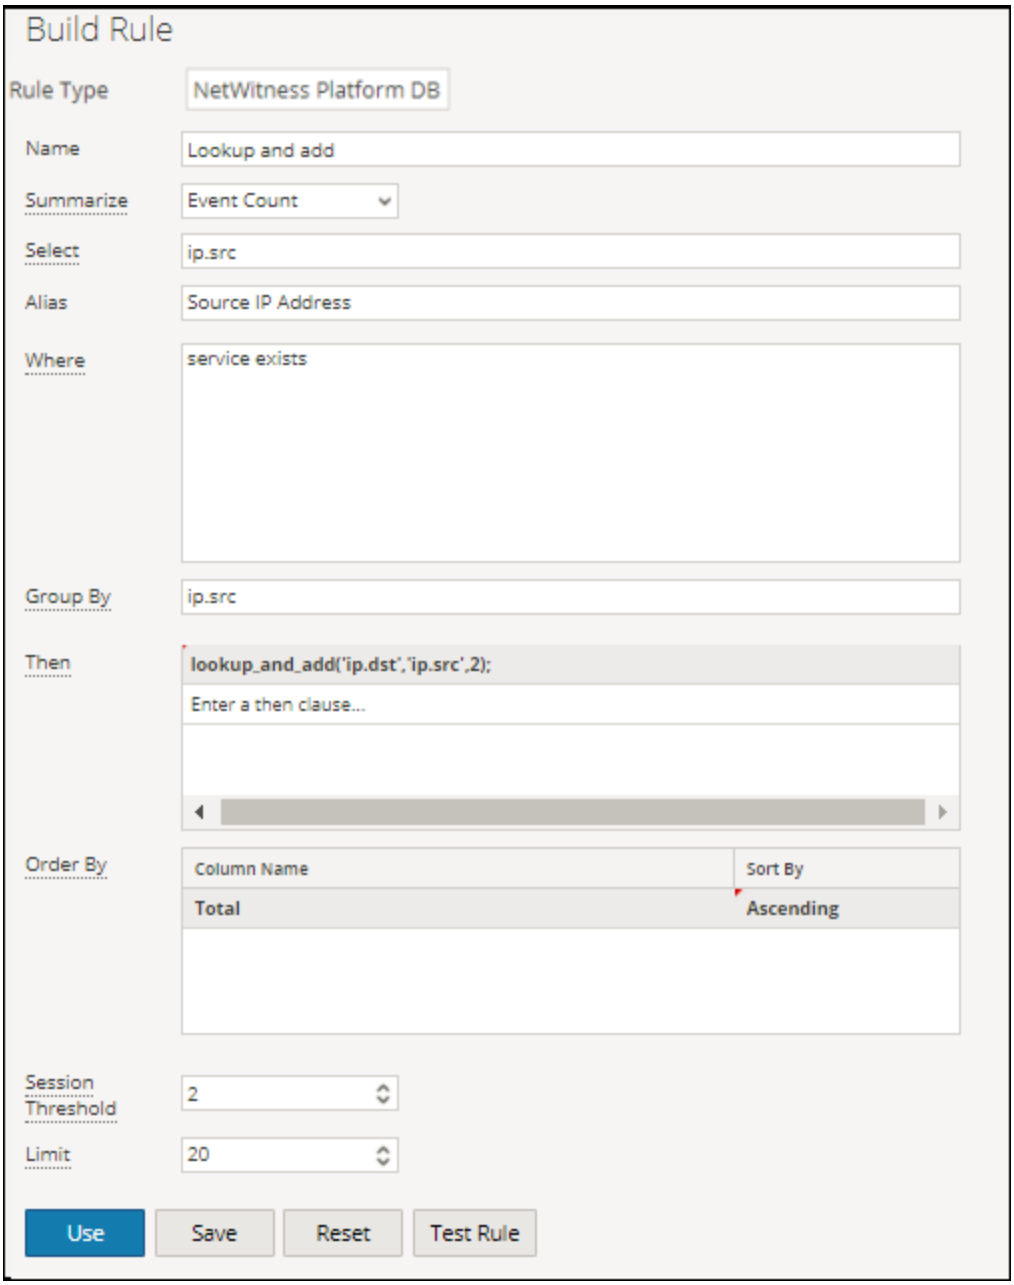
- select ip.src, sum(size),count(filename) group by ip.src
- select ip.src, sum(size),avg(size) group by ip.src
- select ip.src,ip.dst count(filename) group by ip.src,ip.dst

Examples:

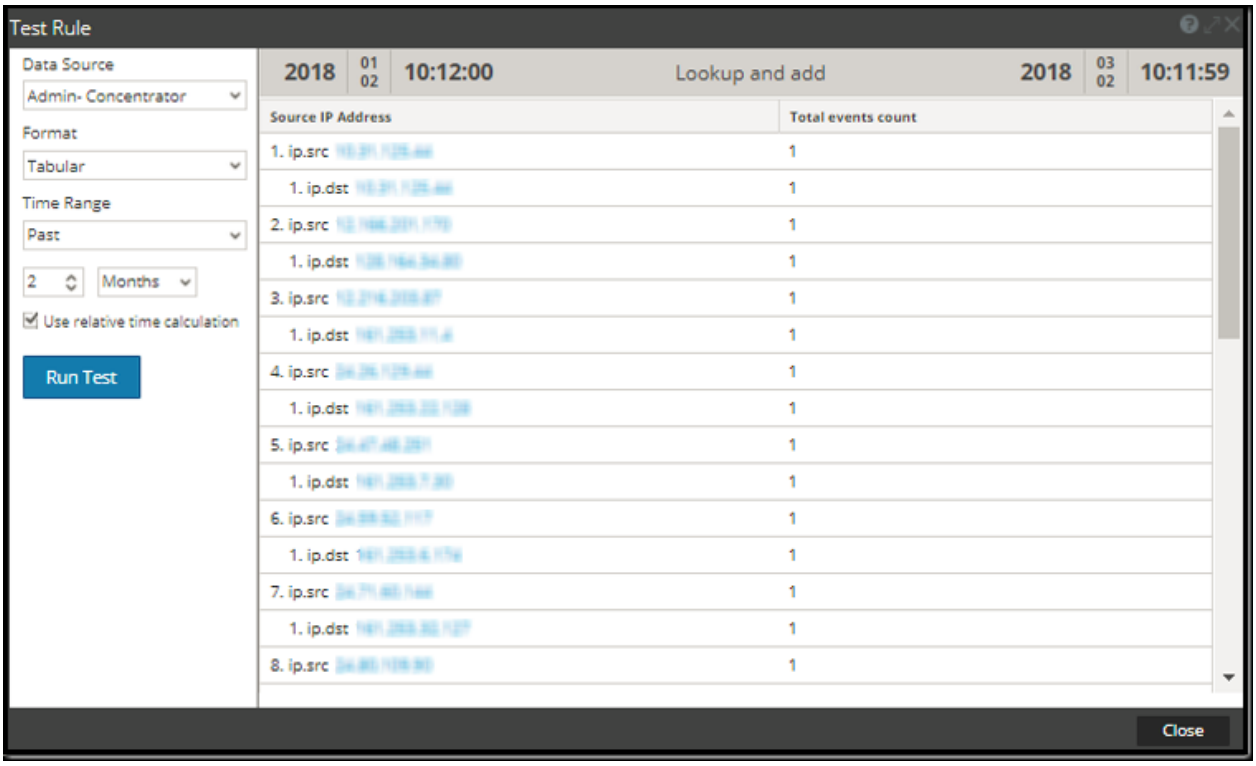
1. lookup_and_add('ip.dst','ip.src', 2);

This rule action would iterate through each ip.src in the initial result set and lookup the top two destination IP addresses with each ip.src.

The following figure shows the rule definition.



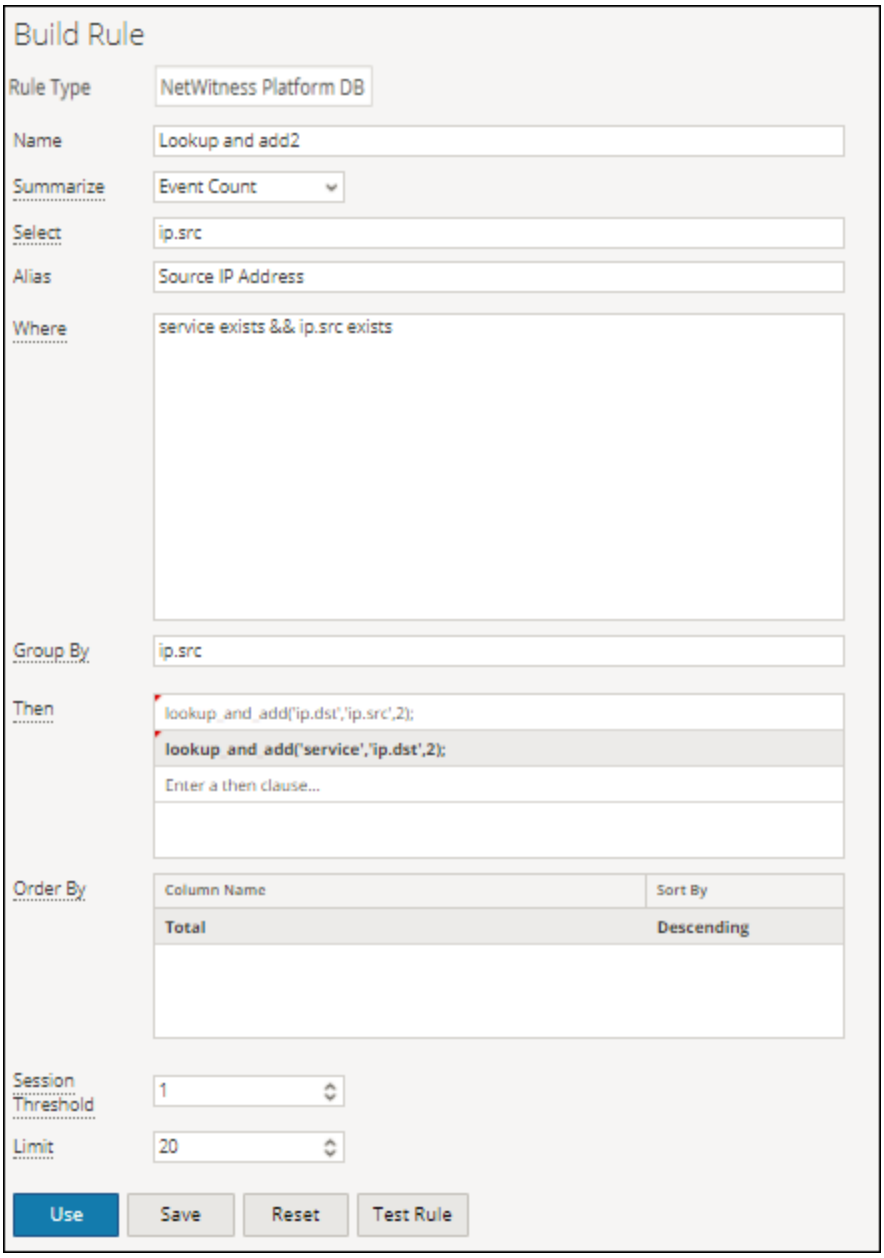
The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src.



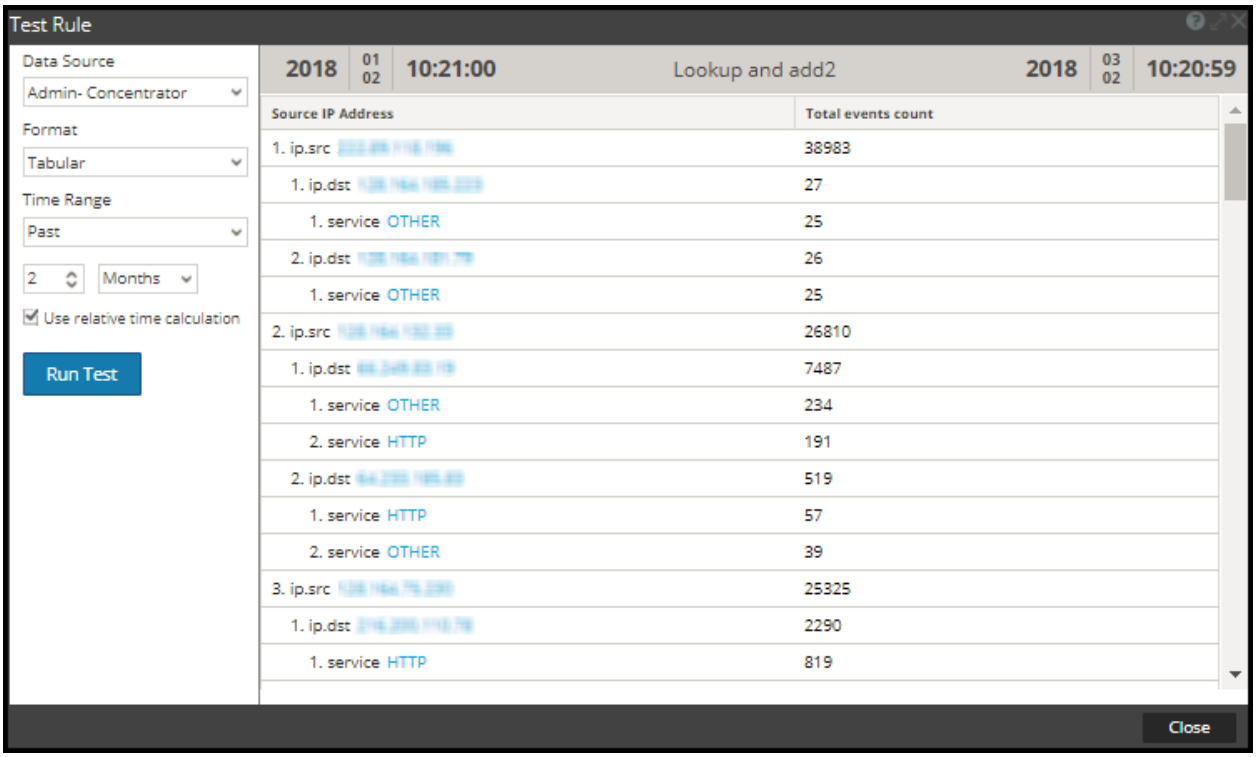
2a. lookup_and_add('ip.dst','ip.src', 2); lookup_and_add('service','ip.src', 3);

This rule action would iterate through each ip.src in the initial result set and lookup the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.

The following figure shows the rule definition.



The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.

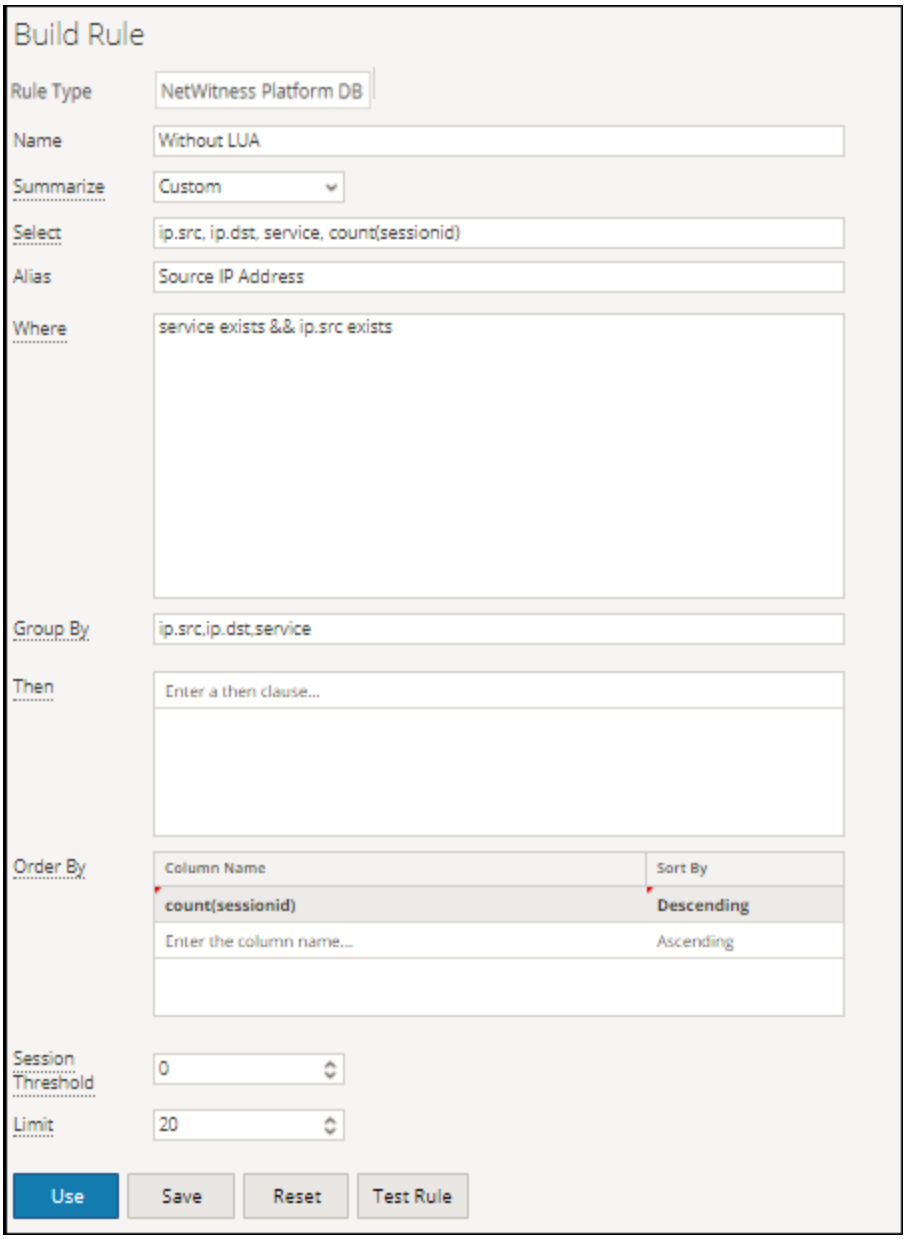


You can make the query as complex as you want by selecting different fields in the result set and by appending to different parts. For example, you may want to know what files each source IP had touched. However, because the parent rule has a WHERE clause of service = 6667 and the default behavior of this rule action is to append to the original WHERE clause, it becomes necessary to override the parent WHERE clause. The easiest way to understand this concept is to look at the previous lookup_ and_add call lookup_and_add('ip.dst','ip.src',2). The actual query that is sent to the server is SELECT ip.dst WHERE service = 6667 &&ip.src = 206.42.199.194. In order to force the WHERE clause to override the service = 6667 portion of the WHERE clause (inherited from the parent rule), the user can specify a 4th parameter of false as shown in example 3.

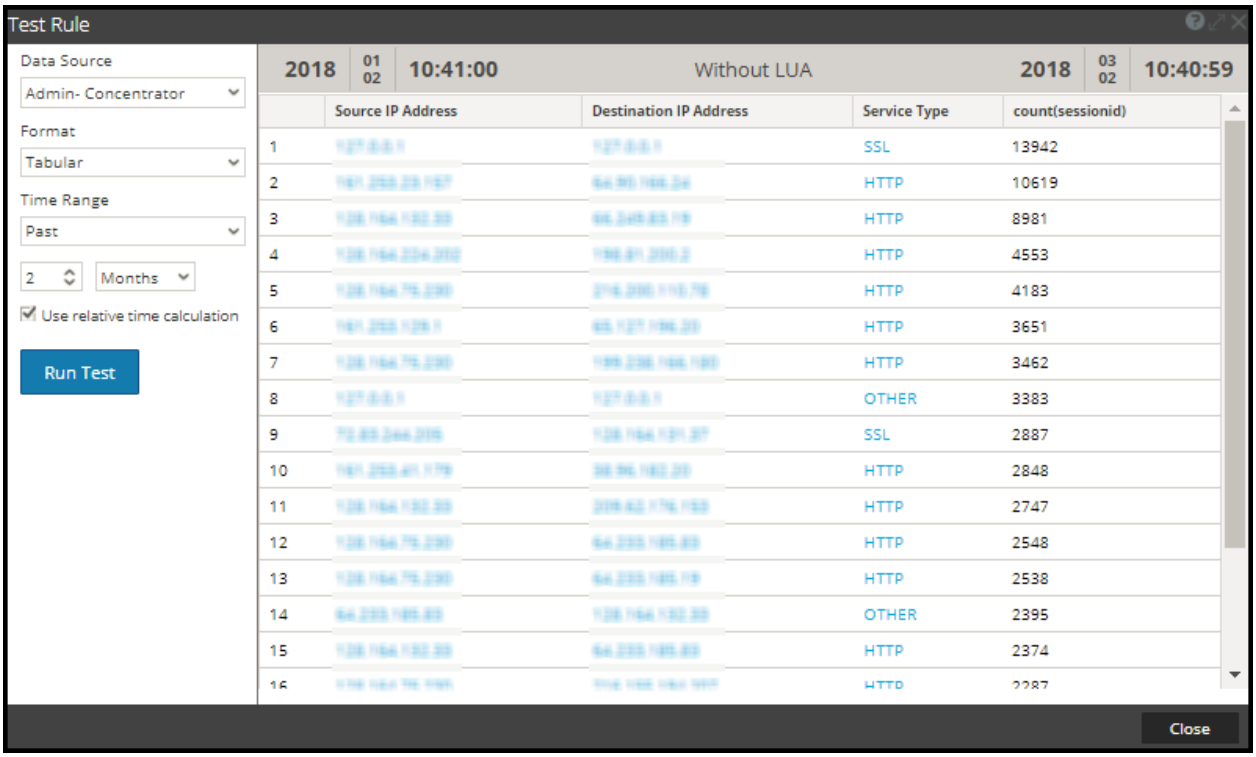
2b. Without Lookup_and_add Rule

This rule uses the Custom summarization and Group By feature to sort the results.

The following figure shows the rule definition.



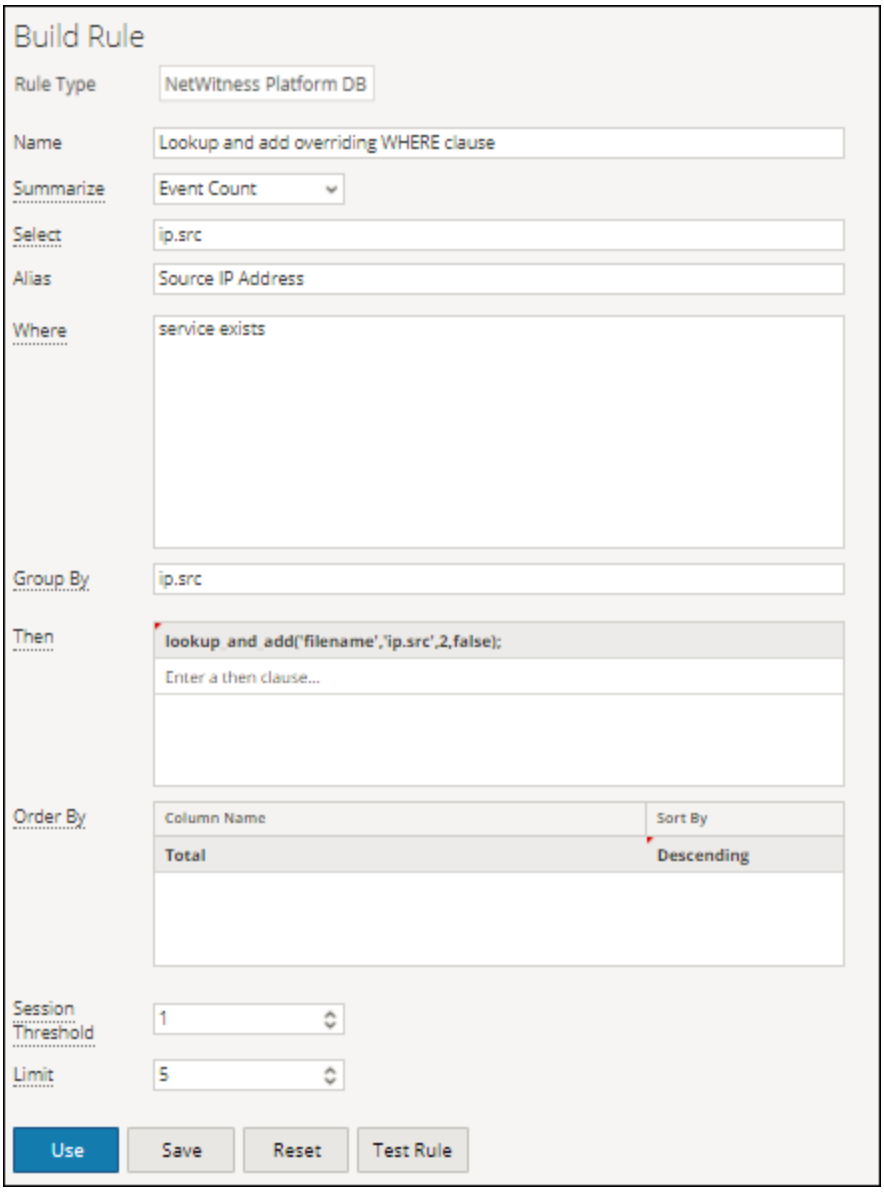
The following figure shows the result set containing the source IP addresses and the top two destination IP addresses with each ip.src and the top three ports used by each ip.src.



3. lookup_and_add('filename', 'ip.src', 2, false);

This call would issue a query to the server, like `SELECT filename WHERE ip.src = 90.0.0.142` rather than `SELECT filename WHERE service = 6667' && ip.src = 90.0.0.142` because you have specified the rule action to ignore the initial `WHERE` clause of the parent rule.

The following figure shows the rule definition.



The following figure shows the result set.
