

# Warehouse Connector Configuration Guide

for RSA NetWitness® Platform 11.5

## **Contact Information**

RSA Link at https://community.rsa.com contains a knowledge base that answers common questions and provides solutions to known problems, product documentation, community discussions, and case management.

## Trademarks

RSA Conference Logo, RSA, and other trademarks, are trademarks of RSA Security LLC or its affiliates ("RSA"). For a list of RSA trademarks, go to https://www.rsa.com/en-us/company/rsa-trademarks. Other trademarks are trademarks of their respective owners.

## License Agreement

This software and the associated documentation are proprietary and confidential to RSA Security LLC or its affiliates are furnished under license, and may be used and copied only in accordance with the terms of such license and with the inclusion of the copyright notice below. This software and the documentation, and any copies thereof, may not be provided or otherwise made available to any other person.

No title to or ownership of the software or documentation or any intellectual property rights thereto is hereby transferred. Any unauthorized use or reproduction of this software and the documentation may be subject to civil and/or criminal liability.

This software is subject to change without notice and should not be construed as a commitment by RSA.

## **Third-Party Licenses**

This product may include software developed by parties other than RSA. The text of the license agreements applicable to third-party software in this product may be viewed on the product documentation page on RSA Link. By using this product, a user of this product agrees to be fully bound by terms of the license agreements.

## Note on Encryption Technologies

This product may contain encryption technology. Many countries prohibit or restrict the use, import, or export of encryption technologies, and current use, import, and export regulations should be followed when using, importing or exporting this product.

## Distribution

Use, copying, and distribution of any RSA Security LLC or its affiliates ("RSA") software described in this publication requires an applicable software license.

RSA believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

THE INFORMATION IN THIS PUBLICATION IS PROVIDED "AS IS." RSA MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WITH RESPECT TO THE INFORMATION IN THIS PUBLICATION, AND SPECIFICALLY DISCLAIMS IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

## **How Warehouse Connector Works**

Warehouse Connector collects meta and events from Decoder and Log Decoder and writes them in AVRO format into a Hadoop-based distributed computing system. You can set up the Warehouse Connector as a service on existing Log Decoders or Decoders.

The Warehouse Connector contains the following components:

- Data Source
- Destination
- Data Stream

## **Data Source**

Warehouse Connector collects data from the data source to store it in the destination. The supported data sources are Log Decoder and Decoder.

## Destination

Destination is the Hadoop-based distributed computing system that collects, manages, and enables reporting on security data. The following are the supported destinations:

- RSA NetWitness Warehouse (MapR) deployments
- HortonWorks Data Platform
- Any Hadoop-based distributed computing system that supports WebHDFS or NFS mounting of HDFS file systems.

Example: Commercial MapR M5 Enterprise Edition for Apache Hadoop

## **Data Streams**

A data stream is a logical connection between the data source and destination. You can have multiple streams for different subsets of data collected. You can setup streams to segregate data from multiple Decoder and Log Decoder services. You can create a stream with a single data source and destination or with multiple data sources and a single destination.

The Warehouse Connector:

- Aggregates session and raw log data from Decoders and Log Decoders.
- Transfers the aggregated data to supported destinations like Hadoop based deployments.
- Serializes the aggregated data that includes both schema and data into AVRO format.

## **Meta Filters**

Meta filters enables you to filter the meta keys that should be written into the Warehouse. For more information, see <u>Specify Meta Filters for a Stream</u>.

#### Multi-Valued Meta Keys

RSA NetWitness Warehouse supports multi-valued meta keys. The multi-valued meta keys is the meta field with the array type. You can use the meta keys library to determine the meta fields of type array and write HIVE queries with the correct syntax for arrays. By default, the following meta keys are treated as multi-valued and are defined in the file, **multivalue-bootstrap.xml** located at /etc/netwitness/ng in the Warehouse Connector:

- alias.host
- action
- username
- alias.ip
- alias.ipv6
- email
- device.group
- event.class

## **Checksum Validation**

You can validate the file integrity of the AVRO files that are transferred from the Warehouse Connector to the data destinations. You need to enable checksum validation option when you configure the Warehouse Connector.

## Lockbox Support

Lockbox provides an encrypted file that Warehouse Connector uses to store and protect sensitive data. You need to create the lockbox by providing a lockbox password while configuring the Warehouse Connector for the first time.

Note: You can orchestrate Warehouse Connector on a Log Decoder or a Decoder appliance.

The following is an overview on how to install and configure the Warehouse Connector service on Log Decoder or Decoder.

- Configuring the Warehouse Connector service on NetWitness,
- Configuring data sources,
- Destinations,
- Streams for Warehouse Connector,
- Configuring alert notifications on NetWitness.

**Note:** RSA NetWitness Platform has added a Health & Wellness stat for Warehouse Connector to indicate the status of its Lockbox. Also, an out-of-the-box rule has been added so that a Health & Wellness alarm is raised when the Lockbox does not exist or cannot be opened.

To install and configure the Warehouse Connector service, perform the following:

- 1. Install Warehouse Connector Service on a Log Decoder or Decoder or Hybrid
- 2. Configure a Warehouse Connector Service
- 3. Configure the Data Source for Warehouse Connector
- 4. Configure the Destination
- 5. Configure a Stream
- 6. Monitor a Warehouse Connector
- 7. Add Warehouse as a Data Source to Reporting Engine
- 8. Analyze a Warehouse Report
- 9. Manage a Stream

# Install Warehouse Connector Service on a Log Decoder or Decoder or Hybrid

To install (fresh install) the Warehouse Connector service on a Log Decoder or Decoder or Hybrid:

1. Log in to NW Admin server

Guide.

- Enter the following command on NetWitness Server: warehouse-installer --help The command line interface (CLI) usage descriptions are displayed.
- 3. Install Warehouse Connector service by executing the following command: warehouse-installer --host-key <ID, IP address, hostname or display name of Decoder, Log Decoder, or Hybrid host>
- 4. Restart the Warehouse Connector using following command: service nwwarehouseconnector restart

The Warehouse Connector service is successfully installed on the Log Decoder or Decoder or Hybrid.

Note: If you have custom-defined host entries in /etc/hosts, make sure to have the same entires in /etc/hosts.user. Run the following command to ensure that the host names are updated in this installation: nw-manage --refresh-host --host-key <ID, IP, hostname or display name of host> For more information, see "Manage Custom Host Entries in /etc/hosts" in the System Maintenance

# **Configure a Warehouse Connector Service**

You can configure the Warehouse Connector service using the following procedure.

To set the Lockbox password:

- 1. Log on to NetWitness Platform.
- 2. Go to **(Admin) > Services**.
- 3. In the Services view, select the added Warehouse Connector service, and select > View > Config.
- 4. In the Services Config view of Warehouse Connector, click the Lockbox Settings tab.

RSA Investiga	te Respond Users Hosts Files Dashboard Reports	Ωē	3 %	admin 🗸

- 5. In the Create New Lockbox section, perform the following:
  - a. In the Lockbox Password field, enter the new lockbox password.

**Note:** The lockbox password must be at least eight characters in length and it must contain at least three of the following groups: one uppercase character [A-Z], one lowercase character [a-z], one numeral [0-9], and one special character.

- b. In the Confirm Lockbox Password field, enter the added lockbox password to confirm.
- c. Click Apply.

The Lockbox password is set.

# **Configure the Data Source for Warehouse Connector**

There are two procedures for configuring the data source for the Warehouse Connector:

- 1. First, you must configure the data source.
- 2. Then, you need to update the Port Number and SSL Settings for the Data Source.

# **Configure the Data Source**

To configure the data source:

- 1. Log on to NetWitness Platform.
- 2. Go to **36 (Admin) > Services**.
- In the Services view, select the added Warehouse Connector service, and select >View > Config. The Services Config view of Warehouse Connector is displayed.
- 4. On the Sources and Destinations tab, in the Source Configuration section, click +.

Ava	ilable Services		
ø	Name ^	Address	Туре
ø	Decoder		Decoder
ø	Log Decoder		Log Decoder
			Cancel OK

5. In the **Available Services** dialog, select the Log Decoder or Decoder services that you want to add as a source to the Warehouse Connector service and click **OK**. The selected Log Decoder and Decoder services are listed in the **Source Configuration** section.

# Update the Port Number and SSL Settings of the Data Source

If there is change to the port number or SSL settings of the Warehouse Connect data sources, you can update the changes in Explore view of the Warehouse Connector.

Make sure that:

- You have the changed port number or SSL settings of the data source.
- You have stopped the streams related to the data source that is updated with the port number or SSL settings.

To update the port number or SSL settings:

- 1. Log on to NetWitness Platform.
- 2. Go to **(Admin) > Services**.
- 3. In the Services view, select the added Warehouse Connector service and select > View > Explore.

The Service Explore view of Warehouse Connector is displayed.

Note	e: You can also update the port number and ssl settings simultaneous by adding space	
betw	veen the parameters.	
Paramet	ters port=443 ssl=on	Send

- 6. Restart the Warehouse Connector service.
- 7. Start the streams.

Send

# **Configure the Destination**

You can configure the destination using NFS, SFTP, and WebHDFS. Change the destination to which the Warehouse Connector service needs to write the collected data using NFS:

- RSA NetWitness Warehouse (MapR) deployments
- Commercial MapR M5 Enterprise Edition for Apache Hadoop deployments

You can configure the Warehouse Connector to write to a remote destination using Secure File Transfer Protocol (SFTP). The remote destination can be a remote server that is NFS mounted to the MapR cluster or it can be a remote staging server.

By default, in the remote destination the Warehouse Connector writes data in the following directory structure:

- /<staging\_ folder>/rsasoc/v1/sessions/data/<year>/<month>/<day>/<hour>/
- /<staging\_folder>/rsasoc/v1/logs/data/<year>/<month>/<day>/<hour>/<Where <staging\_folder> is the folder on the remote server where the Warehouse Connector writes the data.

If you are using a remote staging server as the remote destination, you need to manually copy or move the directory structure to any of the following deployments:

- RSA NetWitness Warehouse (MapR)
- Commercial MapR M5 Enterprise Edition for Apache Hadoop
- HortonWorks HD

To generate reports from the data written by Warehouse Connector, make sure that in your Hadoop deployment you maintain a similar directory structure that is created by Warehouse Connector in the remote destinations.

The following illustration describes how you can use SFTP to write data from Warehouse Connector to a remote destination.

You can configure the Warehouse Connector service to write the collected data to a Hadoopbased distributed computing system that supports WebHDFS.

# **Configure the Destination Using NFS**

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see "Add a Service to a Host" in the *Hosts and Services Getting Started Guide*.
- Set up NFS on Warehouse Connector. For more information on how to set up NFS on Warehouse Connector, see "Configure Warehouse Connector to Write to Warehouse" in the *Warehouse (MapR)* Configuration Guide.

To configure the destination using NFS:

- 1. Log on to NetWitness Platform.
- 2. Go to (Admin) > Services.
- In the Services view, select the Warehouse Connector service, and select >View > Config. The Services Config View of Warehouse Connector is displayed.

RSA Investigate Respond Users Ho	sts Files Dashboar	d Reports			
HOSTS SERVICES EVENT SOURCES ENDPOINT					
A Change Service   Warehouse Connector   Config					
Sources and Destinations Streams Lockbox Settings	General Appliance Ser	vice Configuration			
Source Configuration			Destination Configuration		
+ -			+ - 🛛		
Name	Address	Port	Name	Туре	Path
	1111-10128	56004	NFS	nfs	/root/test/kaushal
logdecoder2 - Log Decoder	1111-12-18	56002	SFTP SFTP	sftp	/root/test

- 4. On the Sources and Destinations tab, in the Destination Configuration section, click 🕇.
- 5. In the Add Destination dialog, from the Type drop-down list, select NFS.
- 6. In the Name field, enter a unique symbolic name for the destination.

Note: The Name field does not support spaces or special characters except underscore (\_).

7. In the Local Mount Path field, enter the locally mounted directory for HDFS where you want the

Warehouse Connector to write the data. For example:

If /saw is the local mount point for HDFS that you have configured while mounting the mapr NFS cluster on the host where you have installed the Warehouse Connector service to write to RSA NetWitness Warehouse (MapR), create a directory named Ionsaw01 under /saw and the corresponding Local Mount Path for the destination would be /saw/Ionsaw01.

For more information, see "Mount the Warehouse on the Warehouse Connector" topic in the *Warehouse (MapR) Configuration Guide*.

Add Destination				×
Type *	NFS		~	
Name *				
Local Mount Path *				
		Cancel	Save	

The /saw mount point implies to / as the root path for HDFS. The Warehouse Connector writes the data to /Ionsaw01 in HDFS.

- 8. Click Save.
- 9. (Optional) If you want to enable checksum validation, perform the following:
  - a. Go to **%** (Admin) > Services.
  - b. In the Services view, select the added Warehouse Connector service, and select > View > Explore.

The Explore view of Warehouse Connector is displayed.

# **Configure the Destination Using SFTP**

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see the "Add a Service to a Host" in the *Hosts and Services Getting Started Guide*.
- For the SFTP destination type, the destination host should be listed in the /root/.ssh/known\_hosts file used by the ssh service (for example, sshd) running on the Warehouse Connector.

## Add Destination from Warehouse Connector Host

To add the destination host to the /root/.ssh/known\_hosts file, from the Warehouse Connector host, initiate a secure connection to the destination host:

- 1. Log in to the Warehouse Connector.
- 2. Enter ssh root@<SAWIP> or ssh username@<SAWIP>.
- 3. Select Yes and enter the password.
- 4. Add the host key in the /root/.ssh/known\_hosts file

**Note:** After you upgrade Warehouse Connector to 11.0, you must make sure that the destination host is listed in the /root/.ssh/known\_hosts file used by the SSH service (i.e. sshd) running on the Warehouse Connector. If you do not perform this action, the streams configured with SFTP in Warehouse Connector will not start.

• If you want to use SFTP to write data into the destination using SSH key-based access, you need to configure SSH key-based access between the Warehouse Connector and the Warehouse host or Hadoop node. For more information, see **Configure SSH Keys** below.

**Note:** If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you generate the keys without setting the passphrase and do a key exchange between Warehouse Connector and the warehouse nodes.

## **Configure SSH Keys**

To configure SSH key-based access between the Warehouse Connector and the Warehouse host or Hadoop node:

- 1. Generate SSH keys on the Warehouse Connector at the default location. Perform the following:
  - a. SSH to the Warehouse Connector.
  - b. Type the following command and press ENTER:
    - \$ OWB\_FORCE\_FIPS\_MODE\_OFF=1 ssh-keygen -t ecdsa -b 521
  - c. The command prompts you to enter the file in which to save the generated key.

Enter file in which to save the key (/root/.ssh/id\_ecdsa):

d. Enter the file in which you want to save the key and press ENTER.

The command prompts you to enter and confirm the passphrase.

**Note:** If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you do not set the **passphrase**. Then, the below steps e, f, g, and h are not applicable.

```
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
```

The public key is generated and is saved in the location that you provided.

**Note:** If the SSH key is not generated in the default location (/root/.ssh/id\_ecdsa), you need to configure the destination for warehouse connector through Explore view. For more information, see <u>To configure the destination through Explore view</u>:

e. Change the directory by entering the following command:

cd /root/.ssh/

f. Move the generated key to the below location:

```
mv ~/.ssh/id_ecdsa ~/.ssh/id_ecdsa.old
```

g. Type the following command and press ENTER:

```
$ OWB_FORCE_FIPS_MODE_OFF=1 openssl pkcs8 -topk8 -v2 des3 -in id_
ecdsa.old -out id ecdsa
```

The command prompts you to enter and confirm the passphrase.

- h. Enter the encryption passphrase.
- i. Run the following command to change the file permission:

chmod 600 ~/.ssh/id\_ecdsa

- j. Copy the generated public key to append to the remote Warehouse host or Hadoop node. ssh-copy-id -i ~/.ssh/id ecdsa.pub root@<destination host ipaddress>
- 2. SSH to remote Warehouse host or Hadoop node as "ssh '<user>@<ip address>", if identity key file is at default location.

or

SSH to remote Warehouse host or Hadoop node as "ssh '<user>@<ip address> -i <identity file path>", If identity key file is not at default location.

3. Append the generated public key to the remote Warehouse host or Hadoop node's authorized keys list located at ~/.ssh/authorized keys.

**Note:** Make sure that you copy the public keys to the Hadoop node and while copying the public key ensure that you provide the login details of the user using which the WebHDFS destination would be added.

You can now securely communicate between Warehouse Connector and Warehouse nodes or Hadoop nodes.

## Configure Warehouse Connector to use SFTP destination

Note: If the SSH key is not generated in the default location (/root/.ssh/id\_ecdsa), you need to configure the destination through Explore view. For more information, see To configure the destination through Explore view:

#### To configure the destination through User Interface:

- 1. Log on to NetWitness Platform
- 2. Go to **(Admin) > Services**.
- 3. In the Services view, select the added Warehouse Connector service, and select > View
   > Config.

The Services Config view of Warehouse Connector is displayed.

e. Restart the respective stream.

To configure the destination through Explore view:

- 1. Go to (Admin) > Services.
- In the Services view, select the added Warehouse Connector service, and select > View
   Explore.

## Aggregate Metas and Raw Logs for a Log Session

To aggregate raw logs and metas from Log Decoder into a single AVRO file instead of two folders.

- 1. Go to **ADMIN** > **Services**.
- Select a Warehouse Connector service and click > View > Explore. The Explore view for the Warehouse Connector is displayed.
- 3. Open warehouseconnector/streams/<stream name>/loader/config and in the right pane, select the export.logAndsession.avro.enabled parameter.
- 4. Change the value to **yes**.
- 5. Restart the service.
- 6. Go to **ADMIN** > **Services**.
- 7. Select a Warehouse Connector service and click > View > Config.
- 8. On the Streams tab, select the stream that you want to reload.
- 9. Click Reload.

# **Configure the Destination Using WebHDFS**

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the hostname (or FQDN) and IP address of the warehouse nodes and Warehouse Connector to the DNS server. If the DNS server is not configured, add the hostname (or FQDN) and IP address of the warehouse nodes and Warehouse Connector to the file in the host on which the Warehouse Connector service is installed.
- If you want Kerberos authentication between the warehouse connector and the warehouse cluster, make sure that you perform the following:
  - Kerberos Key Distribution Center (KDC) Server is configured in your network environment and the Kerberos Keytab file is copied to the host on which you have installed Warehouse Connector.
  - Kerberos authentication is enabled in the warehouse cluster.
- If you want to enable checksum validation to validate the integrity of the AVRO files that are transferred from the Warehouse Connector to the destinations, make sure that you generate the keys without setting the passphrase and do a key exchange between the Warehouse Connector and the warehouse nodes. You need to configure SSH key-based access between the Warehouse Connector and the Warehouse host or hadoop node. For more information, see 'Configure SSH Keys' in Configure the Destination Using SFTP.

## Configure Warehouse Connector to Write to SFTP destination

To configure the destination:

- 1. Log on to NetWitness Platform.
- 2. Go to **(Admin) > Services**.
- 3. In the Services view, select the added Warehouse Connector service and select > View
   > Config.

The Services Config view of Warehouse Connector is displayed.

e. Restart the respective stream.

# **Configure a Stream**

You can configure the data stream to define the data source and destination combinations.

Make sure that you have:

- Installed the Warehouse Connector service or virtual appliance in your network environment.
- Added the Warehouse Connector service to NetWitness. For more information, see "Add a Service to a Host" in the *Hosts and Services Getting Started Guide*.
- Configured the data source from which the Warehouse Connector service needs to collect data. For more information, see Configure the Data Source for Warehouse Connector.
- Configured the destination to which the Warehouse Connector service needs to write the collected data. For more information, see Configure the Destination.

#### To configure the stream:

- 1. Create a stream
- 2. Finalize the stream
- 3. Start the stream

# **Create a Stream**

#### To create a stream:

- 1. Go to (Admin) > Services.
- In the Services view, select the added Warehouse Connector service and select >View > Config.

The Services Config view of Warehouse Connector is displayed.

3. Click the **Streams** tab.

RSA Investigate Respond Users	Hosts Files Dashboard Reports	δĻ	z % 🕐 admin 🗸

- 5. In the Add Stream dialog, perform the following steps:
  - a. In the Stream Name field, enter a name for the stream.

Note: The Stream Name field does not support spaces or special characters except underscore ().

b. In the **Select Destination** drop-down menu, select a destination from the list of destinations added to the Warehouse Connector.

- c. In the Select Source field, select sources from the list of sources displayed.
- d. In the Session ID column, enter the last session id.
   If you provide any session id, the Warehouse Connector will start the aggregation from that session, whereas if this is left blank, the aggregation will start from the current session.
- e. Click Save.

# **Finalize a Stream**

#### To finalize the stream:

- 1. Go to **(Admin) > Services**.
- In the Services view, select the added Warehouse Connector service and select >View > Config.

The Services Config view of Warehouse Connector is displayed.

3. On the **Streams** tab, select the stream that you have created.

4. Click Finalize.

# Start a Stream

**Note:** If you have deployed a Warehouse Connector Virtual Appliance, make sure that you change the default value of the Maximum Message Hold Count parameter to 800000. For more information, see <u>General Tab Settings</u>.

#### To start the stream:

- 1. Go to (Admin) > Services.
- In the Services view, select the added Warehouse Connector service and select >View > Config.

The Services Config view of Warehouse Connector is displayed.

3. On the Streams tab, select the stream that you have created.

4. Click Start.

# **Monitor a Warehouse Connector**

By monitoring a Warehouse Connector, you can automatically generate notifications when critical thresholds concerning Warehouse Connector and its storage have been met.

To monitor a Warehouse Connector:

- 1. Go to **(Admin) > Services**.
- In the Services view, select the added Warehouse Connector service and select > View
   Config.

The Services Config view of Warehouse Connector is displayed.

- 3. Click the Streams tab.
- At the bottom of the Streams tab, click To configure the alert mechanisms related to the Warehouse Connector navigate here.

The Warehouse Connector Monitoring view is displayed.

This page is deprecated and will be removed in a future release.

5. In the Source or Destination Status section, select the number of minutes or hours in the Notify Offline For field.

You will receive a notification if the source or destination connection fails for the defined number of minutes or hours.

- 6. In the Stream Status section, perform the following:
  - a. In the **Notify Stopped For** field, define the number of minutes or hours after which you would like to receive a notification when the stream goes offline.
  - b. In the **Disk Is** field, define the limit on the percentage of disk usage after which you would like to receive a notification.
  - c. In the **Source is Behind** field, define the number of sessions. A notification is raised if the source goes behind the defined number of sessions.
  - d. In the **Rejected Folder Size is** field, define the limit on the percentage of folder usage after which would like to receive a notification.
  - e. In the **Number Of Files in Permanent Failure Folder** field, define the limit on the number of files in the permanent failure folder after which you would like to receive a notification.
- 7. In the Notification Type field, perform the following:
  - a. Click **Configure email or distribution list** to configure email so that you can receive notifications in NetWitness. For more information, see the "Configure Email Server and Notification Account" topic in the *System Configuration* guide.
  - b. Click **Configure Syslog and SNMP Trap servers** to configure audit logs. For more information, see the "Configure Syslog and SNMP Settings" topic in the *System Configuration* guide.
  - c. Select the following notification mechanisms as per your requirement:

- NetWitness Console To get notifications on the NetWitness UI notification toolbar.
- Email To get email notifications.
- Syslog Notification To generate syslog events.
- SNMP Trap Notifications To get audit events as SNMP traps.

# Add Warehouse as a Data Source to Reporting Engine

You must add Warehouse as a data source to Reporting Engine to make this data source available to report against this Reporting Engine. For more information, see "Add Warehouse as a Data Source to Reporting Engine" in the *Reporting Engine Configuration Guide*.

# Analyze a Warehouse Report

The Warehouse modules provide analysts with reports of early indicators of compromise. The following Warehouse reports can be analyzed in NetWitness:

- Suspicious Domains report
- Suspicious DNS Activity report
- Host Profile report

For more information, see "Step 4. Analyze a Warehouse Report" in the Warehouse Guide.

# **View the Warehouse Connector Service**

While the information displayed in the Services System view is the same for all types of core services, several options in the toolbar are relevant only for Warehouse Connector.

To access this view:

- 1. Go to **(Admin) > Services**.
- In the Services view, select a Warehouse Connector and select > View > System. The Systems view for the selected Warehouse Connector is displayed.

The following is an example of toolbar options for Warehouse Connectors.

Host Tasks, Shutdown Service, Shutdown Appliance Service or (Shutdown Appliance), and Reboot are common to all services and are described in the *Hosts and Services Getting Started Guide*.

# **Troubleshoot the Warehouse Connector**

The following information suggests the possible issues that NetWitness users may encounter when adding a Warehouse service to the Reporting Engine as a data source for reporting in NetWitness. Look for explanations and solutions in this section.

While adding a Warehouse service to the Reporting Engine as a data source for reporting, you may observe some of the errors listed in this document. Information is provided on how to troubleshoot the errors and add the data source successfully.

New Service		Ø×
		1
Source Type *	WAREHOUSE ~

### Add SFTP Destination

To add SFTP destination to Warehouse Connector, you need to follow the below steps:

- 1. SSH to NetWitness Host and run the following command to edit ssd\_config file: vi/etc/ssh/sshd\_config file
- 2. Do not comment HostKey/etc/ssh/ssh\_host\_rsa\_key
- 3. You must append KexAlgorithms +diffie-hellman-group14-sha1, diffie-hellmangroup-exchange-sha1
- 4. Run the following command to restart NetWitness Host: systemctl restart sshd
- 5. On Warehouse Connector Host SSH to NetWitness Host and run the following command: ssh -o "HostKeyAlgorithms ssh-rsa" root@<NWhost\_IP> For example, ssh -o "HostKeyAlgorithms ssh-rsa" root@10.10.10.10
- 6. Run the following curl command on Warehouse Connector Host to authenticate: curl -vvvv sftp://root:netwitness@<NWhost\_ip>:22/root/ For example, curl -vvvv sftp://root:netwitness@<10.10.10.10>:22/root/
- 7. You can now add SFTP Destination from UI.

# Manage a Stream

You can manage a stream using the following procedures:

- Edit a Stream
- Reload the Stream
- Specify meta filters for a Stream
- Define multi-valued metas

## Edit a Stream

You can edit a stream to perform the following:

- Add data sources to the stream.
- Delete existing data sources from the stream.

To edit a stream:

- 1. Go to **%** (Admin) > Services.
- 2. In the Services view, select the added Warehouse Connector service and select > View
   > Config.

The Services	Config view	of Warehouse	Connector is	displayed.

RSA Investigate Respond Users He	osts Files Dashboa	rd Reports			ÖД 🗷 % ?) admin ✔

Edit Stream		×
Stream Name		
Destination		
Available Sources Current Sou	irces	
-	At least	one source is required
□ Name	Address	Port
:50002		50002
		Cancel Save

## **Reload the Stream**

When you reload the stream, the Warehouse Connector updates the schema file for the stream. You must reload the stream when you add a new custom meta to the Log Decoder or Decoder.

#### To reload the stream:

- 1. Go to **(Admin) > Services**.
- 2. In the Services view, select the added Warehouse Connector service and select > View > Config.

The Services Config view of Warehouse Connector is displayed.

- 3. On the Streams tab, select the stream that you want to reload.
- 4. Click Reload.

### Specify Meta Filters for a Stream

You need to specify the filter for each stream in the export.session.meta.fields parameter in the Explore view of the Warehouse Connector.

The following table lists the values that you can provide as a filter:

Values	Description
*	All the collected metas are written to SAW.
*, metal, meta2	All the metas except the defined metas are written to SAW. For example, Filter:*, ip.src All the metas except ip.src is written to SAW.
metal, meta2, meta3	Only the defined metas are written to SAW.
Note: By default, the	following metas are written to Warehouse even if you specify

- ng\_source
- unique id
- time

#### To specify meta filters for a Stream:

- 1. Go to **(Admin) > Services**.
- In the Services view, select a Warehouse Connector services and select >View > Config. The Explore view of the Warehouse Connector service is displayed.

filter:

5. Restart the stream.

### **Define Multi-valued Metas**

You can also define an existing meta or a custom meta to be treated as multi-valued meta.

#### To define multi-valued metas:

**Caution:** Defining an existing meta to be treated as multi-valued may change the data type of the meta and cause the associated reports to fail.

- 1. Create a new file with the filename multivalue-users.xml in the /etc/netwitness/ng directory.
- 2. Add the following entries:

Where NEWMETANAME is the existing meta or a custom meta to be treated as multi-valued meta.

Caution: Make sure that you do not add metas that are by default treated as non multi-value.

3. Restart the stream.

#### View the current schema

You can view the current schema that is used by warehouse connector for writing in AVRO files.

#### To view the current schema:

- 1. Go to **(Admin) > Services**.
- In the Services view, select a Warehouse Connector services and select >View > Explore.
   The Explore view of the Warehouse Connector service is displayed.
- 3. In the options panel, select warehouseconnector > streams > <stream\_name> > config.
- 4. Set the value for refresh.schemanode.enabled parameter to true. By default, this value is set to false.

# Manage a Lockbox

You can change the lockbox password, as well as refresh the lockbox.

#### Lockbox Status

**Note:** RSA NetWitness Platform has added a Health & Wellness stat for Warehouse Connector to indicate the status of its Lockbox. Also, an out-of-the-box rule has been added so that a Health & Wellness alarm is raised when the Lockbox does not exist or cannot be opened.

To see the rule details, go to (Admin) > Health & Wellness > Policies > Warehouse Connector and select Warehouse Connector Monitoring Policy.

	11.5.0.0
	0.0.01

When you add a Warehouse Connector service, default values are in effect. RSA designed the default values to accommodate most environments and recommends that you do not modify these values because it may adversely affect performance.

The following table describes the System Configuration parameters:

Name	Config Value
Compression	Determines the minimum amount of bytes before a message is compressed. If set to zero, messages are not compressed.
Port	Determines the port used by the service.          Note: If you change the port number, ensure that you restart the service.
SSL	If enabled, all the data transferred in the network will be encrypted using SSL.
Stat Update Interval	Determines how often (in milliseconds) statistic nodes are updated in the system.
Threads	Determines the number of threads in the thread pool to handle incoming requests.

# **Appliance Service Configuration Tab Settings**

The Appliance Service Configuration tab displays the appliance configuration settings for Warehouse Connector service. For more information, see "Appliance Service Configuration" in the *Hosts and Services Getting Started Guide*.

The Sources and Destinations tab includes the following two sections:

Source Configuration
 Destination Configuration

#### **Source Configuration**

The Source Configuration section allows you to configure the data sources from which the Warehouse Connector service needs to collect data.

The following is an example of the Source Configuration section.

Sc	ource Configuration		
+	-		
	Name	Address	Port
	logdecoder1 - Log Decoder		56004
	logdecoder2 - Log Decoder	10 A 11 - 10 A 10	56002

The Source Configuration section allows you to perform the following:

Features	Description
+	Add the data source.
-	Delete the data source.

### **Destination Configuration**

The Destination Configuration section allows you to configure the destination to which the Warehouse Connector service needs to write the collected data.

Destination Configuration						
+ - 🗷						
Name	Туре	Path				
NFS	nfs	/root/test/				
SFTP	sftp	/root/test				

The Destination Configuration section allows you to perform the following:

Features	Description
+	Add the destination.
-	Delete the destination.
	Edit the destination.
	<b>Note:</b> You can only edit the SFTP destination type.

# **Add Stream Dialog**

You can configure and add a stream to a Warehouse Connector in this dialog

Name	Sources	Destination	Status
To configure the alert mechanisms related to the Warehous	e Connector navigate here.		
RSA NETWITNESS" PLATFORM			11.5.0.0

The Streams tab allows you to perform the following:

Features	Description
+	Add a stream.
-	Delete a stream.
	Edit the stream.

Features	Description
Start	Start the stream.
Stop	Stop the stream.
Finalize	Finalize the stream.
Reload	Reload the stream. If you have added a new meta or if a new meta is added as part of content update to any of the sources, Log Decoder or Decoder, you need to reload the stream for the meta to be visible in the schema for the Reporting Engine. Reloading a stream does not have any impact on the data, but only the new meta list is fetched from the sources.

The following table describes the fields in the Streams tab:

Parameter	Description
Name	Name of the stream.
Sources	The sources associated with the stream.
Destination	The destinations associated with the stream.
Status	Status of the stream.

### **Stream Statistics**

You can view the statistics of a configured stream. Click the  $\bigcirc$  icon next to the name of the stream.

RSA Investigate Respond Users Host	s Files Dashboard Reports		ै û 로 % ⑦ admin ✔
HOSTS SERVICES EVENT SOURCES ENDPOINT	SOURCES HEALTH & WELLNESS SYSTEM SECURITY

Mame Source	IS	Destination	Status
Stream Statistics Stream (Testing) Number of files in the permanent rejected folder : 0 Rejected folder usage in percentage: 0 Session Rate : 7 Destination (Testing) Status : online Survers (10.3.1152.546.50002) Status : consuming Session Behnd: 0 Last Session Red: 16998	2 == -50002		running

The following parameters are displayed in the Stream Statistics:

Section	Parameter	Description
Stream		

Section	Parameter	Description
	Number of files in the permanent rejected folder	Determines the number of files in the permanent rejected folder (named, <b>permfail</b> ) in the Warehouse Connector. The permanent rejected folder contains the files that Warehouse Connector failed to write to the destination.
	Rejected folder usage in percentage	Determines the disk usage of the rejected folder.
	Session Rate	Determines the rate at which the session is processed by the Warehouse Connector for the source.
Destination		
	Status	Indicates the status of the destination.
Source		
	Status	Indicate the status of the source.
	Sessions Behind	Determines that number of sessions that needs to be processed by the Warehouse Connector.
	Last Session read	Determines the last session id processed by the Warehouse Connector.

## Change Stream Configuration

You can change configuration of a stream in runtime. In the **Streams** tab, click **Change Configuration** to change the configuration of the selected stream.

Change Configuration :	×
Stream Configuration	
Name	Config Value 🗸
⊟ Aggregation Configuration	
Aggregate max sessions	1000
Aggregation Interval	10
∃ Loader Settings	
Compress files on disk.	deflate
Export Rollup Interval	hour
Maximum Message Hold Count	100000
Maximum Message Hold Interval (Seconds)	60
Maximum Message Hold Size	512 MB
Page Size	200000
Remote Export Path	/
Session Meta Fields Exported	*
Session Remote Export	$\checkmark$
∃ Stream Settings	
Auto Startup	
	Close Apply

You can change the following parameters of the Stream Configuration:

**Note:** If you change the value of any parameter in stream configuration, make sure that you restart the stream.

After upgrading, if the values of Maximum Message Hold Count, Maximum Message Hold Interval and Maximum Message Hold Size are 3000000, 60 and 128 respectively, ensure that you assign the following values to the streams:

- Maximum Message Hold Count 2400000
- Maximum Message Hold Interval 600
- Maximum Message Hold Size 512

You can assign these values by modifying the existing Stream configuration.

Parameter	Description	
Aggregation Configuration		
Aggregate max sessions	Determines the maximum number of sessions in a response for an aggregation request from the Warehouse Connector to the source .	
Aggregation Interval	Determines the time between the responses from the source.	
	Loader Settings	
Compress files on disk	Enable to compress files on disk. Supported values:	
	• Deflate - Provides smaller compressed files and good performance while generating reports.	
	• Off By default, the parameter is set to <b>deflate</b> .	
Export Rollup Interval	Determines the roll-up interval for export files and also the directory structure the Warehouse Connector writes to the destination. For example: If the parameter is set to:	
	Value Directory Structure	
	hour /rsasoc/v1/[logs   sessions]/data/{year}/ {month}/{day}/{hour}	
	minute /rsasoc/v1/[logs   sessions]/data/{year}/ {month}/{day}/{hour}/{minute}	
	day /rsasoc/v1/[logs   sessions]/data/{year}/ {month}/{day}	
	If you change the value of the parameter, ensure that you restart the stream. Recommended value is <b>hour</b> .	
Maximum Message Hold Count	Determines the maximum number of sessions to store in the memory before processing.	
	<b>Note:</b> If you have deployed a Warehouse Connector Virtual Appliance, make sure that you change the default value of the parameter to 800000.	
Maximum Message Hold Interval (Seconds)	Determines the maximum time (in seconds) to hold the sessions in memory before processing.	
Maximum Message Hold Size	Determines the maximum size for the sessions to store in the memory before processing.	
Remote Export Path	Determines the remote local mount point for HDFS (nfs://) and the location to export the data.	
Page Size	Determines the maximum pages.	

Parameter	Description			
Stream Settings				
Auto Startup	Enable to automatically start the stream whenever the Warehouse connector process is restarted. By default, the parameter is set to <b>off</b> .			

## **Lockbox Settings**

The Lockbox Settings tab for a Warehouse Connector in the Services Config view provide a way to manage the lockbox settings.

### Workflow
